Kelchner, Thomas Richard, A Study Of The Effects Of High School Scheduling Systems On Achievement Rates, Attendance Rates, And Dropout Rates. Doctor of Education (Educational Administration), May 2003, 401 pp., 4 tables, references, 21 titles

This study attempted to determine if the type of class schedule (traditional, A/B block, or accelerated block) used in Texas public high schools significantly affects students' achievement results, attendance rates and dropout rates. One thousand four hundred ninety (1490) Texas high school principals were surveyed to determine the type of schedule currently in use on each campus, the type of schedule previously used on each campus, the length of time the current schedule has been in place on each campus, and the length of time that the previous schedule was used on each campus.

This study is particularly significant in that this research provides information to assist principals in determining if block scheduling is instrumental in improving achievement in reading and mathematics, in improving attendance and in lowering dropout rates. The results of the study indicated that the use of a particular type of schedule: traditional, A/B block, or accelerated block is not directly correlated to improved achievement, attendance, or dropout rates. An expectation that the implementation of a traditional, A/B block, or accelerated block schedule will be the sole factor to cause improved student achievement, improved attendance rates or improved dropout rates is inappropriate.

Ultimately, campus and districts officials must assure that effective teaching practices are occurring on each campus, regardless of the schedule type.

Currently, a projected (Texas) state education funding shortfall is causing school district administrators to review cost-saving options for the 2003 – 2004 fiscal year. There is discussion in many districts regarding the fact that traditional scheduling is more economical than A/B

block or accelerated block scheduling. The results of this study indicate that the decision to move campuses from A/B block or accelerated block to traditional scheduling might be made as a cost-saving move without negatively impacting student achievement, attendance rates or dropout rates.

CHAPTER I

INTRODUCTION

Background

Over the last several years, various approaches to school improvement have been promulgated by reformers and practitioners. One of the major approaches has been the move toward a form of student scheduling that is known as “block scheduling.” Often seen as a panacea, block scheduling proponents believe that this form of scheduling, rather than traditional scheduling, promotes enhanced achievement, improved attendance rates and reduced dropout rates.

Block scheduling is a restructuring of the school day into classes much longer than the traditional 50-minute class period. One of the common forms is for students to have four long class periods per day instead of six, seven or eight periods of lesser length. A course that normally covered the entire school year could then be compressed into an intense half-year course or it could extend the entire school year but would only meet one-half as many times each semester. Fewer, longer classes are said to allow new styles of teaching rather than the old fashioned type of instruction. Education is supposed to become less stressful, more relaxed, and more enjoyable, bringing a long list of educational advantages. Many educators and parents see it as a recycled form of the Modular Scheduling concept which was tried and abandoned in the 70s and 80s.

The case for block scheduling in high schools is being pushed from a variety of sources. Some of these sources offer long lists of euphoric virtues of block scheduling without any hard data and without any serious consideration of the negative side. Regrettably, school boards across the country seem to be adopting an experimental program on the basis of its purported advantages without demanding or considering hard data. While there may be some interesting success stories at several schools, the case for block scheduling has not been established through serious, long-term rigorous studies. At best, the case for block scheduling is tenuous and, in some cases, is contradicted by some studies (Lindsay, 1998).

Current funding issues encountered by the recently convened 2003 Texas Legislature have revived the discussion concerning the virtues of block versus traditional scheduling. With the current state school-funding crisis, the issue of the cost-effectiveness of block vs. traditional scheduling has resurfaced as school district superintendents deliberate about doing away with block schedules as a cost-saving move. Comments included with survey responses from principals across the state indicate that the scheduling issue is a significant discussion topic in many districts.

Statement of the Problem

This study attempted to determine if the type of class schedule (traditional, A/B block, or accelerated block) used in Texas public high schools significantly affects students' achievement results, attendance rates and dropout rates.

Purpose of the Study

The purposes of this study are:

- to compare the impact of traditional high school scheduling with A/B Block scheduling on TAAS Reading scores, TAAS Mathematics scores, attendance rates and dropout rates;
- to compare the impact of traditional high school scheduling with Accelerated Block scheduling on TAAS Reading scores, TAAS Mathematics scores, attendance rates and dropout rates;
- to compare the impact of Accelerated Block scheduling with A/B Block scheduling on TAAS Reading scores, TAAS Mathematics scores, attendance rates and dropout rates;
- to provide useful data to persons who are interested in high school scheduling; and,
- to provide a basis for expanded studies on this topic.

Hypothesis

A total of twelve (12) hypotheses were tested in this study:

1. The use of A/B Block scheduling when compared with schools that use traditional high school scheduling will produce no significant difference in TAAS Reading scores.
2. The use of A/B Block scheduling when compared with schools that use traditional high school scheduling will produce no significant difference in TAAS Mathematics scores.
3. The use of A/B Block scheduling when compared with schools that use traditional high school scheduling will produce no significant difference in attendance rates.

4. The use of A/B Block scheduling when compared with schools that use traditional high school scheduling will produce no significant difference in dropout rates.
5. The use of Accelerated Block scheduling when compared with schools that use traditional high school scheduling will produce no significant difference in TAAS Reading scores.
6. The use of Accelerated Block scheduling when compared with schools that use traditional high school scheduling will produce no significant difference in TAAS Mathematics scores.
7. The use of Accelerated Block scheduling when compared with schools that use traditional high school scheduling will produce no significant difference in attendance rates.
8. The use of Accelerated Block scheduling when compared with schools that use traditional high school scheduling will produce no significant difference in dropout rates.
9. The use of A/B Block scheduling when compared with schools that use Accelerated Block scheduling will produce no significant difference in TAAS Reading scores.
10. The use of A/B Block scheduling when compared with schools that use Accelerated Block scheduling will produce no significant difference in TAAS Mathematics scores.

11. The use of A/B Block scheduling when compared with schools that use Accelerated Block scheduling will produce no significant difference in attendance rates.

12. The use of A/B Block scheduling when compared with schools that use Accelerated Block scheduling will produce no significant difference in dropout rates.

Limitations of the Study

Limitations of this study include:

- This study is limited to tenth grade students in the State of Texas.
- Performance and non-performance elements for the 2001 – 2002 academic school year were analyzed.
- Relatively few high schools use accelerated block scheduling causing a low representation in the sample analysis.

Definition of Terms

Traditional Schedule

A six, seven or eight period day; the length of each period is approximately fifty-five (55) minutes long. The schedule is the same each day and the students attend the same classes on a daily basis.

A/B Block Schedule

A/B block scheduling is based on eight (8) periods delivered over two calendar days. Generally the blocks are approximately ninety (90) minutes in length. ‘A’ Block

meets on one day; the 'B' Block meets the next day. The students attend a different set of classes each day.

Accelerated Block Schedule

Accelerated block scheduling is based on four (4) periods. Students attend the same four classes on a daily basis. The school year is divided into two (2) eighteen (18) week semesters. Thus, one traditional semester actually equals one year of instruction. This system is often referred to as a "4 X 4 Block."

Texas Assessment of Academic Skills (TAAS)

TAAS is the state-mandated test administered in Texas to students in grades 3 - 8, and 10. The tenth grade test is considered the exit - level test and is required for graduation from high school. The TAAS test is administered in three core content areas: reading, writing, and mathematics. Spring 2002 was the final administration of the TAAS in the state of Texas. A new instrument, the Texas Assessment of Knowledge and Skills (TAKS), replaces the TAAS in 2003.

Academic Excellence Indicator System (AEIS)

The AEIS is the system used in Texas to classify schools into categories of: low-performing, acceptable, recognized, and exemplary. Ranking indicators vary somewhat depending on the school level. Texas high schools are ranked on the basis of performance indicators (TAAS results) and non-performance indicators (attendance rates and dropout rates).

The AEIS program disaggregates student achievement results as follows:

- All Students

- African-American
- Economically Disadvantaged
- Hispanic
- Native American
- Asian/Pacific Islander
- Special Education
- White
- Male
- Female

Significance of the Study

Nationally, the trend in high school scheduling has moved toward some type of block scheduling. However, many principals have chosen this alternative without considering all of the factors that impact student achievement.

Block scheduling proponents believe that simply converting to some form of block scheduling will cause improved achievement, attendance rates and dropout rates. Little comparative data exists to support this supposition. It is clear that a great deal more research is needed to determine the effectiveness of block scheduling as compared to traditional schedules.

This study is particularly significant in that this research will provide data to assist in determining if block scheduling will assist in improving achievement in reading and mathematics, in improving attendance and in lowering dropout rates. While reports and studies specific to Texas exist, this study seeks to add to the research base specific to

Texas. This study provides a basis for further analysis; the study is particularly significant at this time with the sunset of the TAAS testing program as well as the educational funding crisis faced by the State of Texas.

CHAPTER II

REVIEW OF RELATED LITERATURE

Cawelti (1994), in *High School Restructuring: A National Study*, provides a broad national picture of the overall high school restructuring movement and the place of the innovation known as “block scheduling” within that movement. Five major components of high school restructuring were identified: curriculum/teaching, school organization, community outreach, technology, and monetary incentives. Within each of these categories, 36 specific indicators of restructuring activity were classified (Canady and Retting, 1995). Block schedule was listed as an indicator under ‘School Organization’. During spring 1993, all regionally accredited public and private high school principals in the United States were surveyed regarding the extent to which their schools had implemented each of the elements listed as Major Components And Elements of High School Restructuring. Approximately 33 % of the schools responded to the survey.

Block scheduling in the Cawelti study was defined as the following: “At least part of the daily schedule is organized into larger blocks of time (more than 60 minutes) to allow flexibility for varied instructional activities.” Almost 11 % of responding schools reported that block scheduling, as defined, was “in general use,” 12 % stated that it was “partially implemented”; 15 % reported that block scheduling was planned for next year; and 61 % of the responding schools reported that it was “not planned for next year” (Canady and Retting, 1995).

The variations of block scheduling are endless, and may involve reconfiguring the lengths of terms as well as the daily schedule. Some of the possibilities detailed by Canady and Retting include:

- Four ninety-minute blocks per day; school year divided into two semesters; former year-long courses completed in one semester.
- Alternate day block schedule: six or eight courses spread out over two days; teachers meet with half of their students each day.
- Two large blocks and three standard-sized blocks per day; year divided into sixty-day trimesters with a different subject taught in the large blocks each trimester.
- Some classes (such as band, typing, foreign language) taught daily, others in longer blocks on alternate days.
- Six courses, each meeting in three single periods, and one double period per week.
- Seven courses. Teachers meet with students three days out of four--twice in single periods, once in a double period.

There are many more. Any of these can be modified to meet the specific needs of a school.

Scheduling changes are usually linked to decreased reliance on the standard lecture-discussion-seatwork pattern, and an increase in individualization and creative teaching strategies. They are often part of a major restructuring effort (Irmsher, 1996).

Irmsher (1996) in an Educational Research Information Center (ERIC) article asks the question, “What’s Wrong with the Traditional Six or Seven Period Day?” She notes:

For starters, say critics, the pace is grueling. A typical student will be in nine locations pursuing nine different activities in a six and a half-hour school day. An average teacher must teach five classes, dealing with 125 – 180 students and multiple preparations. This frantic, fragmented schedule is unlike any experienced before or after high school.

“It produces a hectic, impersonal, ineffective instructional environment,” states Joseph Carroll (1994), provides inadequate time for probing ideas in depth, and tends to discourage a variety of learning activities. Opportunities for individualization of instruction and meaningful interaction between students and teachers are hard to come by.

No matter how complex or simple the school subject, the schedule assigns an impartial national average of fifty-one minutes per class period, say Robert Canady and Michael Retting (1995). And despite wide variation in the time it takes individual students to succeed at learning any given task, the allocated time is identical for all.

The 1994 report of the National Education Commission on Time and Learning states, “Schools will have a design flaw as long as their organization is based on the assumption that all students can learn on the same schedule.”¹

In addition, since most disciplinary problems occur during scheduled transitions, the more transitions, the more problems. And a great deal of time is lost in simply starting and ending so many classes in a day.

"Traditional, inflexible scheduling is based on administrative and institutional needs," say Gary Watts and Shari Castle (1993). Flexible scheduling patterns are a much better match for pedagogical practices that meet the educational needs of students and the professional needs of teachers.

Irmsher (1996) further discusses the perceived advantages of block scheduling:

Larger blocks of time allow for a more flexible and productive classroom environment, along with more opportunities for using varied and interactive teaching methods. Other benefits listed by Jeffrey Sturgis (1995) include: more effective use of school time, decreased class size, increased number of course offerings, reduced numbers of students with whom teachers have daily contact, and the ability of teachers to use more process-oriented strategies.

¹ Irmsher, Karen (1996) Block Scheduling. ERIC Digest, 104.

In evaluations of schools using block scheduling, Carroll found more course credits completed, equal or better mastery and retention of material, and an impressive reduction in suspension and dropout rates. He posits improved relationships between students and teachers as a major factor. Every school in Carroll's study benefited from the changes, though not all in the same ways or to the same degree.

Positive outcomes multiply when four "year-long" courses are taught in longer time blocks, each compressed into one semester, say Canady and Rettig. This pattern allows students to enroll in a greater number and variety of elective courses and offers more opportunities for acceleration. Students who fail a course have an earlier opportunity to retake it, enabling them to regain the graduation pace of their peers. Teachers have fewer students to keep records and grades for each semester, and schools require fewer textbooks. What's more, overall satisfaction in the learning process is greater for both students and teachers.

Proponents are quick to point out that there are advantages to block scheduling that are difficult to quantify using outcome based statistical techniques. These advantages include:

- less time lost in the hallways between classes;
- more time for student/teacher interaction;
- less student stress; and,
- more lab time.

The ascribed outcomes which have been linked with intensified scheduling include:

- fewer failing grades;
- reduced dropout rates; and,
- more concentrated teacher planning time.

Sharman (1990) found a link between block scheduling and dropout rates in his research.

The records of 4,886 students in 18 Ontario high schools revealed that, compared to traditional full-year schools, dropout rates in matched semestered schools were lower for general level students and much lower for basic level students. There were no differences for advanced level students.²

David Marshak (1997) in *Action Research on Block Scheduling* records action research findings from several Seattle-Puget Sound, Washington schools:

The Shorewood High School study... explores teachers' perceptions and beliefs about the kinds of teaching and learning activities that are effective in block periods. It also looks at the patterns of activities that teachers construct for use in long periods. The study compares teachers' reports about their teaching practice with perceptions of students about what kinds of teaching they experience with their block schedule classes.

The Gig Harbor study... begins to consider what combinations or sequences of learning activities are perceived by teachers and students to be most effective in block periods. The study, however, provided most useful insights about teachers' and students' perceptions of effective learning activities regardless of their sequence within a block period.

The Cedarcrest High School study... explores the use of time in block periods to some extent. Its central findings focus on students' and teachers' perceptions of various teaching and learning activities in the block period in terms of their effectiveness, their engagement of students, the effort that they require from students and teachers, and their frequency of use. The study explores students' perceptions of teachers' rationales for using various activities.

The Tahoma High School study... begins by devising and defining a central category - *connected learning*. The study explores teachers' and students' perceptions of connected learning, the ways in which block periods can support students' experiences of connected learning, and the relationships among connected learning, integrated curriculum, and block periods.

The Decatur High School study... explores teachers' reasons for using small groups in block periods and their responses to several key issues of group-based instruction, including the membership of groups, nature of time limits, assignment of roles, and evaluation of student work. The study also presents data about students' perceptions of group work.

The Lindbergh High School study... considers teachers' and students' perceptions of and beliefs about the uses of new educational technologies, particularly computer-based tools, in the block-period classroom. The study also explores the obstacles to more effective use of technology in the block.

...The Wilson High School study... raises the broadscale question of how block periods have improved the quality of student learning at Wilson.

2 Cited in Wronkovich, Hess, Robinson (1997).

Marshak (1997) notes that the action research studies described "...do not *prove* anything about teaching and learning in block periods." The results simply provide a "...knowledge base for effective teaching and learning in block periods...."

Wronkovich, Hess, and Robinson (1997) noted that block scheduling, Copernican scheduling, macro scheduling, four-by-four scheduling and a host of other acronyms have been applied in the past decade to re-structuring of the school day. Each of the variants features a structure of much longer class periods with the purpose of compressing yearlong courses into intensified half-year or one-third year courses. The reasons for the intensification have included a reduction of student stress levels, a more relaxed atmosphere in the classroom, an increase in enjoyment of learning, and an opportunity to take more units of credit in particular disciplines.

Irmsher (1996) states:

All change is painful, say Gerald Strock and David Hottenstein (1994), and often controversial. The process of making the transition is probably the biggest challenge: building support for altering such a time-honored tradition, and finding/creating the planning time needed to make the change.

"Imposing a scheduling model on a school will not ensure success," states the Northwest Regional Educational Laboratory (1990). The lab recommends a minimum of two year's planning time before implementation, to make sure the new schedule meets the needs of all concerned.

Adequate staff development time is also essential, say Canady and Rettig. Teachers who have taught in thirty-five to fifty-minute time blocks for years need help in gaining the necessary strategies and skills to teach successfully in large blocks of time.

They observe that teachers who are most successful in block scheduling typically plan lessons in three parts: explanation, application, and synthesis. Most teachers have much less experience with the latter two phases than with the first.

4 Marshak, David (1997). *Action Research on Block Scheduling*. Princeton, NJ: Eye on Education, Inc.

Teachers may also need training in cooperative learning, class building, and team formation.

Carroll (1990) presented a style of block scheduling he referred to as the Copernican Plan. His initial research into alternative scheduling was conducted in the 1980's in the Masconomet Regional Schools in Massachusetts. A Harvard research team conducted studies of the effects on learning at the Masconomet Regional High School subsequent to the implementation of Copernican scheduling. They reported five trends that they observed in their research.:

1. Students functioned well in the longer macro-class sessions;
2. Teachers found the longer classes stimulating and not at all overburdening. In fact the teachers found themselves re-thinking their pedagogical styles and implementing different and more effective techniques;
3. Students learned as much and performed as well as those in traditional programs using the measure of standardized tests;
4. Students in Copernican programs also retained material at comparable levels with traditional program students; and,
5. Most importantly, in the comprehensive Harvard research study, Copernican program students performed significantly better than traditional program student in higher order thinking skills.

Lockwood (1995) examined the impact of block scheduling in algebra and geometry. Comparing student results on geometry and algebra tests for those participating in intensified scheduling versus students participating in traditional algebra and geometry classes, Lockwood was unable to determine a statistically significant difference in performance of students (cited in Wronkovich, Hess, and Robinson, 1997).

Durkin (1997) suggests that block scheduling may be the time-structuring element required to achieve national standards in mathematics and science:

Where do you find time? The national standards for both science (National Research Council, 1996) and mathematics (National Council of Teachers of Mathematics, 1989) emphasize hands-on learning, inquiry-oriented laboratory experiences, and performance-based assessment of student achievement. Many state curriculum frameworks also call for remediation and enrichment programs. Can all of this be effectively accomplished within the traditional schedule of six to nine class periods in a school day? Perhaps it is time to consider a different way of structuring time in schools.

The national standards for science and mathematics education call for sufficient instructional time for inquiry-oriented activities, accompanying discussion, and explanations of concepts involved. The science standards prescribe a minimum of 300 minutes per week for science instruction in secondary schools, with at least 40% of that time devoted to inquiry or hands-on experiences. The mathematics standards contain similar guidelines and stipulate one hour of mathematics each day at all grade levels as being a "reasonable expectation."

Several of the standards will require increased time to achieve ambitious instructional goals. For instance, according to Science Teaching Standard D (NRC, 1996), teachers are to design and manage learning environments that provide students with the time, space, and resources needed for learning science. In doing this, teachers must:

- Structure the time available so that students are able to engage in extended investigations.
- Create a setting for student work that is flexible and supportive of science inquiry.
- Make the available science tools, materials, media, and technological resources accessible to students.
- Identify and use resources outside the school.

Many schools are turning to "block scheduling" as a way of meeting these goals. The term, "block," does not refer to a specific period of time, but it implies a schedule that is flexible enough to allow extended sessions for courses that would benefit from longer periods. Typical models of block scheduling have blocks of time ranging from 80 to 120 minutes in duration, but there is no minimum or maximum. It is also possible to have blocks split into smaller modules for those courses that are better accommodated by shorter time segments.

There is also the possibility of "alternate day" schedules where students take different courses on alternate days for the entire year, instead of different courses

6 Carroll, Joseph (1990). The Copernican Plan: Restructuring the American High School. Phi Del

each semester. The Copernican model (Carroll, 1994) has a 2.5 hour class for two subjects within a ten-week semester.

There is no one model that is right for every school or type of school. Each school must design the schedule that is right for local circumstances. When designing the schedule, the primary goal is to structure time to maximize student learning within each course. Implicit in this goal is the need to structure the schedule to provide teachers the time they need to plan and evaluate instruction, and to collaborate with each other in developing new and effective methods and materials.

Experienced teachers know the importance of engaging student interests, allowing them time to explore, encouraging them to ask questions, and helping them construct meaningful concepts. Schools must structure time to enable such practices, as well as make tools available, identify resources, and assess student performance. It is also generally accepted that "lecturing" is not an appropriate substitute for more effective instructional methods, but the lack of skills, facilities, support, and sufficient class time often inhibits the use of other approaches.

While the mathematics curriculum standards (NCTM, 1989) do not specifically refer to block scheduling, they do suggest that some reorganizing of schools will be necessary. For example, the standards state that, "Calculators and computers with appropriate software transform the mathematics classroom into a laboratory much like the environment in many science classes, where students use technology to investigate, conjecture, and verify their findings." As with the science standards, the mathematics standards emphasize the importance of meeting the needs of students along the full continuum of abilities and challenges to learning. This, too, implies a need for longer periods of instructional time during class sessions than is available in traditional schedules.

A 1998 Educational Resources Information Center (ERIC) Clearinghouse on Language and Linguistics article supports the use of block scheduling to enhance foreign language instruction:

While block scheduling offers a variety of benefits for all teachers and students, there are some advantages that are especially promising for foreign languages. For example, block scheduling allows for more concentration in the foreign language being studied. The longer class periods offer exciting opportunities for both learners and teachers at the higher levels of language study, where students are able to comprehend the language and work with a variety of texts (oral, visual, and written) and communicative activities. In block scheduling, students have more opportunities to work with teachers and with one another.

However, the ERIC article additionally notes these concerns:

There are several areas of concern that specifically affect block scheduling and foreign language education. These concerns need to be taken into consideration when planning a quality program.

"Sequencing of foreign language courses." It is especially important when planning the schedule to ensure that courses are offered sequentially so students have the option to continue the study of the language without long time lapses. It is equally important for students to realize that extended interruptions will have an impact on their level of language proficiency.

"Availability of courses." Students pursuing more advanced levels of language study are frequently enrolled in advanced courses in other disciplines as well. For this reason, it is essential to guarantee that singleton courses in the upper levels are scheduled in order to avoid potential conflict. In addition, students who delay their study of the foreign language until the last two semesters of their senior year must have the courses available to meet their college entrance requirements.

"Development of language proficiency." Foreign language educators are greatly concerned about the impact of the block schedule on the development of foreign language proficiency. Their concerns are based on the belief that language development occurs during a long, uninterrupted sequence of language study. At this time, there are no data, other than anecdotal, to support the positive or negative effects of block scheduling on language development.

"Articulation." Teachers on block scheduling have found articulation to be a difficult issue. It is of particular concern for language teachers who teach on a 4x4 plan. The alternate day (A/B day) is less bothersome, because it is set over one year. Foreign language teachers are concerned that unless students avoid long interruptions in foreign language learning, language loss will prevent students from reaching the necessary goals for functioning effectively at the next level of instruction. In addition, students who do not take the foreign language course sequentially (i.e., who wait one or more semesters in between courses) will be placed at a disadvantage when enrolled in a class with students who have just completed the previous course the previous semester.

"Retention." Anecdotal accounts of students' language retention seem to point out that the loss of language is no greater after a one or two semester break than it would be after the summer recess. Canady and Retting quote research dealing with retention rates at the college level: "Students retain 85% of what they had originally learned after 4 months and 80% of what they had originally learned after 11 months." They also point to another study that states that students have a tendency to forget the factual information they have learned very quickly, whereas when students have been involved in critical thinking and have had an opportunity to internalize information, they retain the information longer.

The College Board (1996) in an independent study of test results taken from students completing year-long courses versus block scheduled courses concluded:

Students who completed year-long courses offered only in the fall or only in the spring tended to perform poorly on Advanced Placement (AP) examinations in 1995 and 1996. Of the thirteen examinations in which there were 100 or more semester intensified block scheduled students, those who took the course over a full year averaged higher scores in 77% (20 of 26) of the cases. In calculus, history, and the sciences, mean grades for block scheduled students were 0.6 (about half a standard deviation) lower than the mean for the students who took the course over the full year (Wronkovich, Hess, and Robinson, 1997).

Opponents of block scheduling report deficiencies with block scheduling that include:

- Retention of material over time;
- Problems in transferring schools and credits; and,
- Problems with scheduling specialized programs in the arts (Wronkovich, Hess, Robinson, 1997).

Wronkovich, Hess, and Robinson (1997) in their study *Block Scheduling: An Objective Look at Math Outcomes Based on New Research*, found a statistically significant difference in performance on the Ohio Colleges Early Math Placement Exam between students who have received math instruction in Algebra I, Geometry and Algebra II in traditional, year-long structure versus students in an intensified block structure. The study reviewed results of students in college preparatory math programs. Wronkovich et al noted that their research indicated that students who studied math in a

7 Advanced Placement

8 The College Board. (1996). Guidance, Access and Assessment Services-AP and January Examination. (Cited in Wronkovich, Hess, and Robinson, 1997).

block schedule format were at a disadvantage when competing against those students who studied math under traditional formats.

Lonardi (1998) analyzed the failure of a block scheduling reform in a small, suburban district. The prevailing dynamics that obstructed success were fear of change, propagandizing of data, and a culture of complacency. These problems could have been avoided, the author notes, by training staff to work in longer periods, marketing new ideas to the community, and developing a collaborative work culture.

McCoy (1998) in a paper presented at the Annual Meeting of the Southwest Educational Research Association offered insights into scheduling strategies and the effects of block scheduling in one rural public secondary school. This case study revolved around three questions: (1) "What prompted the school's move to block scheduling?" (2) "How was block scheduling implemented?" and (3) "How has block scheduling affected perceptions of school climate, academics/instruction, and time/materials management for students, teachers, administrators, and guidance personnel?" Interviews were conducted at the school with students, teachers, and administrative/counseling personnel. Results revealed several themes: block scheduling helped students feel more empowered about learning, and teachers reported more empowerment in their instructional role. More assigned homework was being completed, and teachers indicated satisfaction about the demands on their time. Findings indicate that block scheduling basically benefited all students equally, regardless of ability level, attitude toward school, and degree of school success. Students' tardiness decreased and their management of books, materials, and

schoolwork improved. The report suggests that supports--materials and supplies--must be provided for the ongoing success of block scheduling.

Eineder and Bishop (1997) examined the effects of a block-scheduling arrangement on student achievement, behavior, and student-teacher relations in an Ohio high school. Results indicated that students earned higher grade point averages, more students attained the honor roll, disciplinary referrals were reduced, teacher-student relations were improved, and teachers and students preferred block scheduling.

Pisapia and Westfall (1997) report that in 1995 the Metropolitan Educational Research Consortium (MERC), Richmond (Virginia) commissioned a study of alternative high school scheduling modules to determine the effects of different schedules on teaching strategies, teacher and student satisfaction, and student and school performance. This report presents results of an analysis of student achievement and behavior data from 12 high schools: 3 inner city, 5 suburban and 4 rural. Two traditional-day schedules and four variations of block scheduling were compared. Teachers and students in alternating and semester block schools reported that learning is not watered down, but that it is different, with more focus on concepts than facts, more depth, and more problem solving. Students in semester block schedules experienced greater increases in overall grade point average than those in alternating block schedules. In general, verbal scores rose more in schools that switched to an alternating or semester block schedule than mathematics. Increases in Scholastic Aptitude Test scores were greater for students in alternating block schedules than for students in semester block schools, but after the first year, students in four of the seven schools that switched to either type of block scheduling experienced

increases in verbal scores. In two of four alternating block schools, student performance on advanced placement tests declined, as it did in the two semester block schools. Overall, attendance was not positively affected by the change, but in both alternating and semester block schools, students reported that school was "calmer" and teachers made fewer disciplinary referrals.

Guskey and Kifer (1995) in a paper presented at the Annual Meeting of the American Educational Research Association describe an interim evaluation of the Block Schedule Restructuring Program at Governor Thomas Johnson High School in Frederick, Maryland.

The program began in the 1992-93 school year, when the school changed from seven 48-minute class periods per day to a block schedule format of four 90-minute class periods. Classes are conducted on a semester basis, with each semester lasting 18 weeks (90 instructional days). The evaluation is based on the first year and a half of program implementation. Student performance on various achievement tests and final course grades have not varied much, but the scores of African American students on the Maryland Functional Tests and scores on Advanced Placement Tests have markedly improved. Student daily attendance and dropout have not changed, but there has been a dramatic reduction in student behavior problems. Perceptions of both students and faculty members regarding the block schedule program are overwhelmingly positive, with nearly 70% of students and 95% of faculty indicating they prefer the new 4-period day. A few procedural problems need to be addressed and additional staff development is needed, but the program appears quite successful to date.

Snyder (1992) in a paper presented at the 1997 Annual Meeting of the Midwest Educational Research Association describes the 2-year outcomes of one high school's implementation of an intensive 4-block schedule.

The study at Angola High School (Indiana) compared school wide grade-point averages (GPAs), standardized test scores, attendance data, and disciplinary records to school-baseline data from the 2 years prior to implementation of the block schedule. A questionnaire was administered to teachers and students before implementation of the new schedule, 3 months into the schedule, at the end of the

first year, and at the end of the second year. Findings indicate significant improvement in school wide GPAs for all except two departments and improvement in semester exam grades. There was an almost 8% increase in the percentage of students on the honor roll; an increase in American College Testing Assessment scores, the Indiana State Proficiency Exams, and Scholastic Aptitude Tests; and improved attendance. Advanced Placement scores dropped slightly. Students, faculty, and parents expressed a high level of satisfaction with the new schedule. The data also suggest that extensive planning for the schedule and aggressive staff training was instrumental in achieving the improvements.

Policy research conducted by the Texas Education Agency (1999) examined the effects of various schedules on a number of factors in Texas public high schools during the 1996 – 1997 academic year. The report concludes:

School context features (selected district characteristics, campus characteristics, and student demographics) appear to be much more closely associated with overall student performance than the types of schedules used by high schools.

Viewed in isolation, or without regard for potential complicating factors, student achievement on individual performance measures often varied by schedule type. However, when school context was held constant and multiple performance measures were examined at the same time, these differences disappeared. This does not preclude describing observed performance on the various measures. It simply means the reader must not attribute too much importance to variations in results associated with different types of high school schedules. Perhaps one of the most important observations to be made is that there were substantial pre-existing differences among the high schools that coincided with the types of schedules being used. For example, schools on accelerated block schedules were remarkably different from other high schools in the state. Conversely, schools using other types of schedules were systematically different from those on accelerated block schedules. These differences are important to consider in any impact assessment of high school schedules because they highlight contextual characteristics often found in research to relate to student performance.

ANALYSIS OF BLOCK SCHEDULING

Results from this study indicate that the following contextual factors were significantly related to aggregate student performance.

- Average student attendance rate for the campus
- Percentage of students enrolled on campus who were economically disadvantaged
- Campus enrollment
- ESC region
- District type (urban, suburban, etc.)

- Percentage of students enrolled on campus who were ethnic minorities
- Percentage of teachers on campus who were ethnic minorities

Description of Student Performance by Type of High School Schedule

Dropout rates. The average dropout rate was highest among schools on accelerated block schedules (2.2%) and lowest among schools on modified A/B block schedules (1.4%) Statewide, the annual dropout rate for Grades 7-12 was 1.8%.

Grade-level retention rates. At 10.9 %, the average grade-level retention rate in 1995-96 was highest among schools on six-period days. High schools using modified A/B block schedules had an average retention rate of only 3.7%. Statewide, the grade-level retention rate among high school campuses in 1995-96 was 9.7%.

TAAS, all tests taken (reading, mathematics, and writing). In spring 1997, high schools using modified A/B block schedules posted the highest average %age (74.5%) of 10th-grade students who passed all TAAS tests taken. The smallest average %age (64.3%) was observed among schools using accelerated block schedules. Statewide, 67.8% of all 10th-graders in the October subset passed all TAAS tests taken.

TAAS mathematics. Statewide, 72.6% of all 10th-graders in the October subset passed the mathematics portion of TAAS. Of the schools included in the analysis, those on eight-period days had the highest average passing rate for the test (79.0%). High schools using accelerated block schedules showed the poorest average performance (70.3%).

In the following paragraphs, student performance on selected measures is briefly described in relation to different types of high school schedules. In no case was variation in performance on the particular measure statistically significant when school context was held constant and multiple performance measures were examined at the same time.

TAAS reading. A total of 86.1% of 10th graders statewide passed the reading portion of TAAS in spring 1997. In the analysis, high schools using modified A/B block schedules had the highest average passing rate for the test (90.1%), while those using accelerated block schedules had the lowest average passing rate (83.2%) .

TAAS writing. In spring 1997, 88.5% of 10th-graders statewide passed the writing portion of TAAS. On average, high schools on modified A/B block schedules performed best on the TAAS writing test (92.5% passing), while those on accelerated block schedules performed the worst (86.2% passing)

Comparable improvement quartiles. Comparable improvement quartiles help gauge how well students in a particular school are learning (i.e., the value added to students' academic skills) when the school's aggregate performance is compared to that of the most demographically similar schools in the state. This information was of particular interest since the multivariate analysis showed that school context was closely related to aggregate student performance. Specifically,

30.3% of high schools on eight-period days were in the top quartile (Q1) for TAAS reading. In contrast, only 21.8 % of schools on A/B block schedules were in Q1 for reading. Schools on accelerated block schedules were just behind those on seven-period days in terms of percentages earning Q1 for TAAS reading (26.3% and 26.9%, respectively).

In mathematics, 33.9% of the high schools on eight-period days were in Q1. High schools on accelerated block schedules were close behind, with 31.6% having earned Q1 in mathematics while schools on six-period days accounted for the lowest percentage (20.3%). (Comparable improvement is not calculated for writing.) When the percentages in Q4 for reading and mathematics were examined by high school schedule type, again “best” and “worst” cases were of great interest. Schools on six-period days were least often grouped in Q4 for either reading (8.5%) or mathematics (18.6%). On a percentage basis, high schools using traditional seven-period days were most often in Q4 for TAAS reading (26.5%) while those on modified A/B block schedules were most often in Q4 for TAAS mathematics (29.6%).

These data reinforce the importance of examining performance in more than one way, in addition to considering key context characteristics, before attempting to discern benefits or weaknesses of various approaches to structuring the school day. Local educators’ primary goals for their students should help determine what aspects of performance are most important to examine in relation to the type of schedules they wish to use.

SAT/ACT participation and performance. Statewide, 64.7% of graduating seniors in 1995-96 took at least one of these two college admissions tests. High schools on modified A/B block schedules had the highest average participation rate for the two admissions tests (66.9%). In contrast, high schools using accelerated block schedules had the lowest average participation rate for the tests (61.0%). In the Texas integrated accountability system, performance on college admissions tests is reported and acknowledged in terms of the percentages of examinees who scored at or above a predetermined criterion score on either the SAT or the ACT tests. For 1995-96 examinees statewide, 26.3% scored at or above these criterion scores. When examined by type of schedule, schools on six period days in 1996-97 had the highest average percentage of examinees that scored at or above criterion on college admissions tests (25.4%) The average percentage of examinees scoring at or above criterion (17.7%) was found among schools on accelerated block schedules.

Advanced Placement exam participation and performance. In 1996-97, 8.5 % of students in 11th and 12th grades in Texas public schools took one or more AP examinations. Schools on modified A/B block schedules had the highest average participation rate for the AP examination (11.0%). At 6.3 %, schools on accelerated block schedules had the lowest average participation rate for the examination. School-level AP performance is reported in the Academic Excellence Indicator System (AEIS) in two ways: (a) the percentage of 11th- and 12th grade examinees earning a score of at least 3, and (b) the percentage of exam

scores of 3 or better (note that individual students may attempt AP examinations in more than one subject in any given year). The latter measure was used in this analysis because it more closely parallels performance on college admissions tests. Statewide, 61.7 % of examinees earned scores of 3 or better. High schools on six period days had the highest average percentage of examinees that performed this well on AP examinations (59.7%), while schools on eight period days had the lowest average percentage (40.4%).

Advanced course completions. In 1995-96, a total of 17.3 % of students in Grades 9-12 completed advanced courses identified in the state's AEIS glossary. On average, the advanced course completion rate was highest for high schools using modified A/B block schedules (19.6%) and lowest for high schools on traditional seven period days (16.4%).

CHAPTER III

PROCEDURES FOR COLLECTION AND TREATMENT OF DATA

This chapter contains the following five questions: (a) statement of the problem, (b) selection of the sample, (c) research questions, (d) procedures used in the collection of data and (e) analysis of data.

Statement of the Problem

This study attempted to determine if the type of class schedule (traditional, A/B block, or accelerated block) used in Texas public high schools significantly affect students' achievement results, attendance rates and dropout rates.

Population

The sample for this study is composed of Texas public high school tenth graders. One thousand four hundred ninety (1490) Texas high school principals were surveyed to determine current and previous schedule types utilized at each campus. Disciplinary alternative placement schools, alternative instructional programs and other special instructional programs defined as "alternative instructional programs" by the Texas Education Agency were excluded from the final sample. The final sample of five hundred sixty (560) high schools was selected by identifying the campuses defined as "regular instructional" programs by the Texas Education Agency. The study assumes that the large sample size provides an adequate cross – section of Texas high schools and high school students. Therefore, differences in demographics are absorbed by the large sample size. The final sample is categorized into sub-groups:

- By the type of current schedule
 - Traditional
 - A/B Block
 - Accelerated Block
- By the type of previous schedule
 - Traditional
 - A/B Block
 - Accelerated Block
- By the current schedule term
 - 1 – 3 years
 - 4 – 6 years
 - 7 – 11 years
 - Over 11 years
- By the previous schedule term
 - 1 – 3 years
 - 4 – 6 years
 - 7 – 11 years
 - Over 11 years

Procedures Used in Collection of Data

A list of Texas public high schools was procured from the Texas Education Agency. A cover memorandum and 4-question survey was developed (Appendix, page 396). The survey was used to determine current and previous scheduling models in each high school.

The survey consisted of the following questions:

1. What type of schedule is your school currently (2002–2003 school year) using?
 - Traditional 7 or 8 Period ● A/B Block ● Accelerated Block ● Other _____
2. How long has your school utilized the above schedule?
 - 1 – 3 Years ● 4 – 6 Years ● 7 – 11 Years ● More Than 11 Years
3. If your school has used the current schedule for 1 – 3 years, what type of schedule did your school use prior to the implementation of the current schedule:
 - Traditional 7 or 8 Period ● A/B Block ● Accelerated Block ● Other _____
4. How long did your school utilize the schedule noted in Question #3?
 - 1 – 3 Years ● 4 – 6 Years ● 7 – 11 Years ● More Than 11 Years

Surveys were mailed to 1490 Texas public high schools. Surveys were personally addressed to individual principals, if that information was included in the Texas Education Agency database file. The mailing included a cover memorandum and a postage-paid survey postcard.

In addition, a special website (www.kelchner.net) was established to allow respondents to reply to the survey via the internet. Respondents were also able to reply via fax and/or e-mail.

The Texas Education Agency database file included e-mail addresses for 400 schools and principals. A separate e-mail memorandum and survey was electronically transmitted to that group in addition to the mailing.

Hypotheses

A total of twelve (12) hypotheses were tested in this study:

1. The use of A/B Block scheduling when compared with schools that use traditional high school scheduling will produce no significant difference in TAAS Reading scores.
2. The use of A/B Block scheduling when compared with schools that use traditional high school scheduling will produce no significant difference in TAAS Mathematics scores.
3. The use of A/B Block scheduling when compared with schools that use traditional high school scheduling will produce no significant difference in attendance rates.
4. The use of A/B Block scheduling when compared with schools that use traditional high school scheduling will produce no significant difference in dropout rates.
5. The use of Accelerated Block scheduling when compared with schools that use traditional high school scheduling will produce no significant difference in TAAS Reading scores.
6. The use of Accelerated Block scheduling when compared with schools that use traditional high school scheduling will produce no significant difference in TAAS Mathematics scores.

7. The use of Accelerated Block scheduling when compared with schools that use traditional high school scheduling will produce no significant difference in attendance rates.
8. The use of Accelerated Block scheduling when compared with schools that use traditional high school scheduling will produce no significant difference in dropout rates.
9. The use of A/B Block scheduling when compared with schools that use Accelerated Block scheduling will produce no significant difference in TAAS Reading scores.
10. The use of A/B Block scheduling when compared with schools that use Accelerated Block scheduling will produce no significant difference in TAAS Mathematics scores.
11. The use of A/B Block scheduling when compared with schools that use Accelerated Block scheduling will produce no significant difference in attendance rates.
12. The use of A/B Block scheduling when compared with schools that use Accelerated Block scheduling will produce no significant difference in dropout rates.

Data Analysis

The dependent variables (TAAS reading scores, TAAS math scores, attendance rates, and dropout rates) for the 2001 – 2002 school year were analyzed for the 560 schools represented in the sample.

The study first employed a 4 X 6 Multiple Analysis of Variance (MANOVA) to determine if differences in the dependent variables may be attributed to the independent variables (types of schedule).

After evaluating the results of the first analysis, two additional analyses, not included in the original design, were used:

- A MANOVA was employed to determine if difference among student sub-groups may be attributed to the independent variables (types of schedule).
- A third MANOVA was employed to determine if a relationship between the length of time that a schedule is utilized and improved achievement, attendance and dropout rates can be established.

Design of the Study

This study focused on the effects on achievement, attendance rates, and dropout rates of block and traditional scheduling programs. Two types of block schedules, A/B and accelerated, were compared with traditional six, seven or eight period schedules and with each other. The study attempted to analyze the impact of a school's schedule on four factors: TAAS reading scores, TAAS math scores, attendance rates and dropout rates. The Texas Education Agency Academic Excellence Indicator (AEIS) Multi-Year History Report for selected campuses served as the database. One thousand four hundred ninety (1490) Texas public high schools were surveyed to determine the type of schedule currently used at each campus, the length of time that the current schedule has been implemented at each campus, the type of schedule that each campus utilized prior to implementing the current schedule, and the length of time that the previous schedule was employed.

This study attempted to support the hypothesis that no significant difference in achievement, attendance rates, and dropout rates may be attributed to the use of various scheduling programs. The following table illustrates the design of the study:

| | Traditional | A/B | Accelerated |
|------------------------|--------------------|------------|--------------------|
| TAAS Reading | % Passing | % Passing | % Passing |
| TAAS Math | % Passing | % Passing | % Passing |
| Attendance Rate | % | % | % |
| Dropout Rate | % | % | % |

Targeted Sample

The subjects were Texas high school tenth graders.

Sampling Procedure

From the survey responses, schools were chosen based on types of schedules currently and previously used at that campus. The sample was divided into groups based on current scheduling category. The schools were categorized into sub-groups by the type of schedule: traditional, A/B block, and accelerated block.

Data Collection Procedure

A mail survey was used. Respondents had several response options including:

- Postage paid postcard (included in the mailing)
- Electronic mail
- Fax
- Website

The survey gathered information including:

- Type of Current Schedule
- Length of Time on Current Schedule
- Type of Previous Schedule
- Length of Time on Previous Schedule

Test results, attendance data, and drop-out rates were gathered from the Texas Education Agency (TEA). The study focused on results in Exit Level Reading and Exit Level Mathematics on the Texas Assessment of Academic Skills (TAAS). TAAS Writing was not included.

Texas Assessment of Academic Skills Test

The Texas Education Agency (2003) provides the following technical information for the TAAS test.

Taas Test Development

The developmental phase of the TAAS testing program, which began in 1988-1989, included many activities designed to ensure the production of high-quality assessment instruments that would accurately reflect what Texas students are being taught. TEA held meetings with more than 1,000 educators and concerned citizens to identify those skills considered requisite for a Texas high school diploma. The agency consulted national experts to gather information on nationwide trends in the instruction

9 Texas Education Agency Office of Policy Planning Policy Research, Division of Research and Evaluation (1999) Block Scheduling in Texas Public High Schools. Report Number 13.

and assessment of mathematics, reading, writing, science, and social studies in order to guide the direction of the Texas assessment program.

Test Specifications and Blueprint

TEA staff members and advisory committees composed primarily of classroom teachers, content specialists, and school administrators worked together to develop the objectives on which the Texas tests are based. For each content area, the first step in this process was to examine the Texas Essential Elements, which was the statewide curriculum in effect at the time. The curriculum was carefully analyzed to identify the strands of learning that cross the curriculum from the primary through the secondary levels.

These strands of learning were then grouped into a broad set of test objectives for each subject area that are consistent across grade levels by subject area. The State Board of Education adopted the TAAS objectives for each subject assessed. After the objectives were adopted, TEA worked closely with educator committees to formulate specific instructional targets and item prototypes for each test objective. The instructional targets reflected and were correlated to subject- and grade-specific essential elements. Test objectives remained constant within a subject area and across all grade levels assessed; what differed by subject and grade level were the instructional targets. A portion of the instructional targets that composed an objective was assessed annually, but not every instructional target was assessed every year.

Working with educator committees, TEA then developed test specifications for each subject area and grade level tested. In addition to the test objectives and

instructional targets, the specifications also included an explanation of the content eligible for testing, a description of the test item formats, and sample test questions. Committees of Texas educators reviewed and refined drafts of these specifications. Texas classroom teachers, curriculum specialists, administrators, education service center personnel, and university professors served on these committees, which were organized by grade and subject area. TEA chose committee members to represent each education service center region, every type and size of school district, and the three major ethnic groups found in Texas. Each committee's suggestions were incorporated into both draft and final versions of the measurement specifications. In July 1989 TEA distributed TAAS writing, reading, and mathematics objectives and measurement specifications to all school districts and education service centers.

In July 1997, the State Board of Education adopted the Texas Essential Knowledge and Skills (TEKS) as the new statewide curriculum for Texas, replacing the essential elements. It became necessary to link the TAAS and end-of-course tests to the TEKS. The process started in the summer and fall of 1997, when educator committees met with TEA staff to closely examine the TEKS for each subject and grade tested in order to determine which knowledge and skills from the TEKS were appropriate for a statewide assessment. As result of these efforts, TEKS statements replaced the former instructional targets for each subject and grade level. The skills tested on TEKS-based TAAS and end-of-course tests are now expressed in the exact language of the TEKS. Using the same language supports classroom instruction by reinforcing the direct link between the student assessment program and the state-mandated curriculum.

In the fall of 1998, booklets were published reflecting the alignment of the TAAS tests with the TEKS for each grade and subject area tested. These booklets presented TEKS student expectations statements in relation to existing TAAS learning objectives, effectively replacing the instructional targets used under the former statewide curriculum.

The TAAS test for each subject area and grade level is based on a specific test blueprint that guides how each test is constructed. Test blueprints delineate the relative emphasis for each objective, as recommended by educator review committees and the agency's curriculum staff. TEA constructs the TAAS tests to

- represent the range of content and difficulty of the skills represented in the TEKS;
- include only those items judged to be free of possible gender, ethnic, and/or cultural bias and deemed acceptable by the educator review committees; and
- reflect problem-solving and complex thinking skills.

Reliability

Reliability is the first and foremost technical characteristic of any measurement endeavor. The reliability of the scores resulting from an assessment should be demonstrated before issues such as validity, fairness, and interpretability can be discussed. Because the TAAS and end-of-course tests provide observed scores that serve as a proxy for direct measurement of underlying achievement levels, the scores contain some amount of error, and test reliability quantifies this error. Suppose, for example, the true achievement level for a particular group of students were known. The correlation between these true scores and the observed scores obtained from TAAS or end-of-course testing would be the reliability of the test.

Internal Consistency Estimates

Test reliability indicates the consistency of measurement. TAAS and end-of-course test reliabilities are based on internal consistency measures, in particular on Kuder-Richardson Formula 20 (KR-20). Most KR-20 reliabilities are in the high .80s to low .90s range.

Procedures Used

Kuder-Richardson Formula 20 is a mathematical expression of the classical measurement definition of reliability. The classical definition of reliability states that reliability is the ratio of true score variance to observed score variance and is usually expressed symbolically as the following: where the observed score variance is defined as the combination of true score variance and error variance.

As error variance is reduced, reliability increases (i.e., a student's observed score is more reflective of the student's true score).

The internal consistency estimates of this reliability are mathematically defined as: where KR20 is a lower-bound estimate of the true reliability, k is the number of items in the test, σ^2_X is the observed score variance, and p_i is the proportion of examinees getting item i correct, i.e., the item p -value.

This formula is used when test items are scored dichotomously.

Standard Error of Measurement

The standard error of measurement (SEM) is calculated using both the standard deviation and the reliability of test scores and represents the amount of variance in a score resulting from factors other than achievement.

The standard error of measurement is based on the premise that underlying traits, such as academic achievement, cannot be measured exactly without a perfectly precise measuring instrument. For example, factors such as chance error, differential testing conditions, and imperfect test reliability can cause a student's observed score (the score actually achieved on a test) to fluctuate above or below his or her true score (the true ability of the student). The SEM is calculated using the formula:

$SEM = \sigma_X \sqrt{1 - r}$, where r is the reliability estimate and σ_X is the test standard deviation.

Use of the Standard Error of Measurement

The standard error of measurement can be helpful for quantifying the margin of error that occurs on every test. It is particularly useful for determining a student's true score, which is assumed to fall within one standard error of measurement of the observed score 68% of the time. The standard error of measurement is used to quantify the reliability of a test into the metric on which scores will be reported. Unless the test is perfectly reliable, a student's observed score and true score will differ. A standard error of measurement band placed around the observed score would result in a range of values that would most likely contain the student's true score. For example, suppose a student achieves a raw score of 50 on a test with reliability of 0.90 and a standard deviation of 6.3. The SEM is: $SEM = 6.3 \sqrt{1 - 0.90} = 2.0$

Placing a one-SEM band around this student's score would result in a score range of 48 to 52. Furthermore, if it is assumed that the errors are normally distributed, then it is likely that across repeated testings, this student's true score would fall in this band 68% of the time. Put differently, if this student took the test 100 times, he or she would be expected to achieve a raw score between 48 and 52 about 68 times.

Alternate Forms Reliability Estimates

At the current time no information regarding alternate or parallel forms reliability estimates is available, since no student takes more than one form of the test during any TAAS or end-of-course administration.

Validity

Validity is a process of collecting evidence to support inferences made from the scoring results of an assessment. In the case of the TAAS and end-of-course exams, test results are used to make inferences about students' knowledge and understanding of the TEKS.

Content Validity

Criterion-referenced assessments, such as the TAAS and end-of-course tests, are based on an extensive definition of the content they assess. TAAS and end-of-course test validity is therefore content-based and tied directly to the statewide curriculum. The 1999–2000 school years were a transition year, shifting from the essential elements to the new statewide curriculum, the TEKS. In order to ensure the highest level of content validity, the process of aligning TAAS to the new curriculum was carefully approached and included numerous committees of Texas educators. When TAAS was first designed as the criterion-referenced assessment for the essential elements—and later when the end-of-course tests were being developed—advisory committees consisting of educators from school districts across the state were formed for each subject area at each grade level. Teachers, test development specialists, and TEA staff members worked together in these committees to develop test objectives, instructional targets, specifications, and test item types. Similarly, committees met during the 1997–1998 school year to identify TEKS statements eligible for testing beginning with the 1998–1999 school year. In 1998–1999, test items were matched to the TEKS, and

TAAS assessed only areas common to the TEKS and the old curriculum. The 1999–2000 school year marked the full integration of statewide testing and the TEKS.

Relation to the Statewide Curriculum

As it has since the inception of TAAS and the end-of-course tests, the cycle of educator committee item review and data review continued for new and field-tested items, respectively. Since 1990 more than 11,000 Texas educators have participated in this process to ensure test validity. The item writers as well as the reviewers for each stage of development verify the alignment of test items with the objectives to ensure that the items measure appropriate content. The sequential stages of item development and item review provide many opportunities for Texas educators to offer suggestions for improving or eliminating items and to offer insights into the interpretation of the statewide curriculum. The nature and specificity of these various review procedures provide additional strong evidence for the content validity of the TAAS and end-of-course tests.

Educator Input

Not only do Texas educators provide valued input on the content and the match between the items and the statewide curriculum, but many current and former Texas educators and some educators from other states also work as independent contractors to write items specifically to measure the objectives. This provides for a system of checks and balances for item development and review that reduces single source bias. In other words, because test items are written by many different people with different backgrounds, it is less likely that items will suffer from a bias that might occur if items were written by a single author. The direct input from educators offers additional evidence regarding the content validity of constructed TAAS and end-of-course tests.

Test Developer Input

The staff at TEA as well as professional test developers from Harcourt Educational Measurement, NCS Pearson and BETA Inc. provide a wealth of test-building experience, including content-related expertise. Each internal review of an item by these experts increases the probability of the item being an accurate measure of the intended objective. Hence, these reviews are offered as additional evidence for the content validity of the TAAS and end-of-course tests.

Construct Validity

Content and construct validity are traditionally separate categories, but when discussing the validity of achievement tests, these distinctions become somewhat obscured. Content validity describes whether the test objectives adequately represent what students should be able to do and whether the items, which are based on test objectives, measure intended responses. Construct validity is the extent to which a test can be said to measure a theoretical construct or trait.

In the case of TAAS and end-of-course tests, the construct tested is the academic content required by the statewide curriculum. With curriculum-based achievement tests such as the TAAS and end-of-course tests, both types of validity are intertwined. The construct validity is grounded in the content validity of the test.

Criterion-Related Validity

Although the primary evidence for the validity of TAAS and end-of-course lies in the tests' content validity, TEA has conducted several studies that may be regarded as forms of criterion-related validity. Criterion validity indicates the relationship between

test performance and performance on some other measure. This other measure can be evaluated concurrently or predicted and is then correlated with the test score. In this way, the test score is compared to a criterion that is thought to be a reasonable estimate of the same construct the original test purports to measure. Most research on the TAAS and end-of-course programs deals with concurrent validity rather than predictive validity.

Validity Evidence for Subpopulations

The primary evidence for the validity of the TAAS and end-of-course tests lies in the content being measured. Since the tests assess the Texas state-mandated curriculum, which is required to be taught to all students, the tests are not more or less valid for use with one subpopulation over another subpopulation. In other words, because the TAAS and end-of-course tests are measuring what is required to be taught to all students and are given under the same standardized conditions to all students, the tests have the same validity for all students.

Moreover, great care has been taken to ensure that the items that make up the TAAS and end-of-course tests are fair and representative of the content domain as provided by the required curriculum and expressed in the measurement specifications and objectives. Additionally, much scrutiny is applied to the items and their possible impact on minority or subpopulation groups making up the population of the state of Texas. Every effort is made to eliminate items that may have ethnic or cultural biases.

CHAPTER IV

RESULTS OF THE STUDY

Introduction

This chapter presents the results of the evaluation procedures utilized to test the hypotheses of this study. The hypotheses were tested by computing the means scores of each independent variable. The independent variables were the types of high school schedules studied: traditional, A/B block, and accelerated block. The independent variables were evaluated to determine if a statistically significant difference existed in the dependent variables studied: TAAS reading, TAAS math, attendance rates, and dropout rates. The dependent variables were sorted by Academic Excellence Indicator System (AEIS) categories as follows:

- All Students
- African-American
- Economically Disadvantaged
- Hispanic
- Native American
- Asian/Pacific Islander
- Special Education
- White
- Male

- Female

Performance in each student group within each of the types of schedules was studied.

Several Multiple Analysis of Variance(s) (MANOVAs) were used to evaluate the data.

A one-way Multiple Analysis of Variance was used to evaluate differences among the three schedule types: traditional, A/B block, and accelerated block. Nine more one-way MANOVAs were used to evaluate performance within the demographic groups (African-American, Economically Disadvantaged, Hispanic, Native American, Asian/Pacific Islander, Special Education, White, Male, and Female) and for all students.

A third 3 X 4 MANVOA was used to evaluate variance based on the length of time that a campus utilized a particular type of schedule.

All of the Multiple Analysis of Variance tests analyzed the variables at the .05 level of significance. Wilks' Lambda was used for evaluation.

Presentation of Data

One thousand four hundred ninety (1490) Texas high school principals were surveyed to determine the type of schedule currently in use on each campus, the type of schedule previously used on each campus, the length of time the current schedule has been in place on each campus, and the length of time that the previous scheduled was used on each campus.

The survey results were categorized by type of schedule: Traditional, A/B Block, Accelerated Block and Other Types. The length of time for current and previous schedule

utilization was categorized into ranges: 1 – 3 years, 4 – 6 years, 7 – 11 years and over 11 years.

Seven hundred forty-eight (748) principals responded by the survey deadline. The results of the survey are summarized in Table 1.

| Table 1: Survey Results | | | | |
|--------------------------------|------------------|--------------------------|--------------------|--------------|
| Traditional | A/B Block | Accelerated Block | Other Types | Total |
| 374 | 200 | 78 | 96 | 748 |

From the survey results, a final random sample of five hundred sixty (560) high schools was selected for analysis. The final random sample is summarized in Table 2.

| Table 2: Final Random Sample | | | | |
|-------------------------------------|------------------|--------------------------|--------------------|--------------|
| Traditional | A/B Block | Accelerated Block | Other Types | Total |
| 282 | 155 | 45 | 78 | 560 |

Performance and non-performance results for the 2001 – 2002 academic school year were selected for analysis. Texas Education Agency (TEA) Academic Excellence Indicator System (AEIS) data elements were downloaded for each of the 560 high schools represented in the final sample. The data elements included: 2002 TAAS reading results, 2002 TAAS math results, 2001 attendance rate, and 2001 dropout rate.

Because of the volume of data, the TEA data elements codes were re-labeled to facilitate identification during analysis. The revised data element codes are displayed in

the Appendix, Table 3. The detailed table of data elements for the selected campuses is displayed in the Appendix, Table 4.

A 4 X 6 Multiple Analysis of Variance was utilized to evaluate the interaction the dependent variables and the independent variables. The multivariate test results follow:

| Effect | | Value | F | Hypothesis df | Error df | Sig. | Partial Eta Squared | Noncent. Parameter | Observed Power |
|--------|--------------------|-------|-------|---------------|----------|------|---------------------|--------------------|----------------|
| CURSCH | Pillai's Trace | .018 | 1.054 | 8.000 | 948.000 | .394 | .009 | 8.428 | .497 |
| | Wilks' Lambda | .982 | 1.052 | 8.000 | 946.000 | .395 | .009 | 8.417 | .497 |
| | Hotelling's Trace | .018 | 1.051 | 8.000 | 944.000 | .396 | .009 | 8.406 | .496 |
| | Roy's Largest Root | .013 | 1.506 | 4.000 | 474.000 | .199 | .013 | 6.022 | .467 |

1. The use of A/B Block scheduling when compared with schools that use traditional high school scheduling produced no statistically significant difference in TAAS Reading scores using Wilks' Lambda with the level of significance set at .05.
2. The use of A/B Block scheduling when compared with schools that use traditional high school scheduling produced no statistically significant difference in TAAS Mathematics scores using Wilks' Lambda with the level of significance set at .05.
3. The use of A/B Block scheduling when compared with schools that use traditional high school scheduling produced no statistically significant difference in attendance rates using Wilks' Lambda with the level of significance set at .05.
4. The use of A/B Block scheduling when compared with schools that use traditional high school scheduling produced no statistically significant difference in dropout rates using Wilks' Lambda with the level of significance set at .05.

5. The use of Accelerated Block scheduling when compared with schools that use traditional high school scheduling produced no statistically significant difference in TAAS Reading scores using Wilks' Lambda with the level of significance set at .05.
6. The use of Accelerated Block scheduling when compared with schools that use traditional high school scheduling produced no statistically significant difference in TAAS Mathematics scores using Wilks' Lambda with the level of significance set at .05.
7. The use of Accelerated Block scheduling when compared with schools that use traditional high school scheduling produced no statistically significant difference in attendance rates using Wilks' Lambda with the level of significance set at .05.
8. The use of Accelerated Block scheduling when compared with schools that use traditional high school scheduling produced no statistically significant difference in dropout rates using Wilks' Lambda with the level of significance set at .05.
9. The use of A/B Block scheduling when compared with schools that use Accelerated Block scheduling produced no statistically significant difference in TAAS Reading scores using Wilks' Lambda with the level of significance set at .05.
10. The use of A/B Block scheduling when compared with schools that use Accelerated Block scheduling produced no statistically significant difference in TAAS Mathematics scores using Wilks' Lambda with the level of significance set at .05.
11. The use of A/B Block scheduling when compared with schools that use Accelerated Block scheduling produced no statistically significant difference in attendance rates using Wilks' Lambda with the level of significance set at .05.

12. The use of A/B Block scheduling when compared with schools that use Accelerated Block scheduling produced no statistically significant difference in dropout rates using Wilks' Lambda with the level of significance set at .05.

The results indicated that no statistically significant difference exists among the three types of schedules studied.

Nine more one-way Multiple Analysis of Variance tests were used to evaluate the interaction of the student performance sub-groups (ethnicities, gender, economically disadvantaged, and special education) with the independent variables. The multivariate test results follow:

African-American

| Effect | | Value | F | Hypothesis df | Error df | Sig. | Partial Eta Squared | Noncent. Parameter | Observed Power |

| | Roy's Largest Root | .018 | 2.004 | 4.000 | 452.000 | .093 | .017 | 8.016 | .601 |

Special Education

| Effect | | Value | F | Hypothesis df | Error df | Sig. | Partial Eta Squared | Noncent. Parameter | Observed Power |
|--------|--------------------|-------|-------|---------------|----------|------|---------------------|--------------------|----------------|
| CURSCH | Pillai's Trace | .020 | .642 | 8.000 | 516.000 | .742 | .010 | 5.139 | .300 |
| | Wilks' Lambda | .980 | .642 | 8.000 | 514.000 | .742 | .010 | 5.137 | .300 |
| | Hotelling's Trace | .020 | .642 | 8.000 | 512.000 | .743 | .010 | 5.134 | .300 |
| | Roy's Largest Root | .018 | 1.184 | 4.000 | 258.000 | .318 | .018 | 4.738 | .370 |

The nine one-way Multiple Analysis of Variance tests results, using Wilks' Lambda with the level of significance set at .05, indicated that:

1. The use of A/B block scheduling produced no statistically significant difference among the student ethnic groups (African-American, Hispanic, White, Native American, and Asian/Pacific Islanders), gender groups (male and female), economically disadvantaged group, or the special education group studied.
2. The use of accelerated block scheduling produced no statistically significant difference among the student ethnic groups (African-American, Hispanic, White, Native American, and Asian/Pacific Islanders), gender groups (male and female), economically disadvantaged group, or the special education group studied.
3. The use of traditional scheduling produced no statistically significant difference among the student ethnic groups (African-American, Hispanic, White, Native American, and Asian/Pacific Islanders), gender groups (male and female), economically disadvantaged group, or the special education group studied.

A third 3 X 4 MANVOA was used to evaluate variance based on the length of time that a campus utilized a particular type of schedule (schedule term). The multivariate test results follow:

Schedule Term

| Effect | | Value | F | Hypothesis df | Error df | Sig. | Partial Eta Squared |
|---------|--------------------|-------|-------|---------------|----------|------|---------------------|
| CURSCH | Pillai's Trace | .012 | .693 | 8.000 | 926.000 | .698 | .006 |
| | Wilks' Lambda | .988 | .692 | 8.000 | 924.000 | .699 | .006 |
| | Hotelling's Trace | .012 | .691 | 8.000 | 922.000 | .700 | .006 |
| | Roy's Largest Root | .009 | 1.007 | 4.000 | 463.000 | .403 | .009 |
| CRNTTRM | Pillai's Trace | .048 | 1.901 | 12.000 | 1392.000 | .030 | .016 |
| | Wilks' Lambda | .952 | 1.906 | 12.000 | 1222.629 | .030 | .016 |
| | Hotelling's Trace | .050 | 1.910 | 12.000 | 1382.000 | .029 | .016 |
| | Roy's Largest Root | .035 | 4.099 | 4.000 | 464.000 | .003 | .034 |

| Effect | | Value | F | Hypothesis df | Error df | Sig. | Partial Eta Squared |
|---------------------|--------------------|-------|-------|------------------|-------------|------|------------------------|
| CURSCH * CRNTTRM | Pillai's Trace | .029 | .671 | 20.000 | 1860.000 | .858 | .007 |
| | Wilks' Lambda | .972 | .670 | 20.000 | 1533.231 | .859 | .007 |
| | Hotelling's Trace | .029 | .668 | 20.000 | 1842.000 | .860 | .007 |
| | Roy's Largest Root | .015 | 1.422 | 5.000 | 465.000 | .215 | .015 |

The Multiple Analysis of Variance tests results, computed using alpha = .05, indicate that a statistically significant difference existed for schools based on the number of years they have utilized a particular schedule type. A POST HOC analysis revealed that the schools who had utilized their current schedule type for seven (7) or more years are statistically different from schools utilizing their schedule type for one to six years. The significant difference is driven by TAAS math results and attendance rates. No significant difference emerged among TAAS reading or dropout rates.

CHAPTER V

CONCLUSION AND RECOMMENDATIONS

Purpose

The purpose of this study was to provide an evaluation of the impact of different types of high school scheduling systems on selected performance and non-performance indicators. The study evaluated dependent variable difference in Texas high schools utilizing traditional, A/B block, or accelerated block scheduling systems (the independent variables). The dependent variables were TAAS reading passing rates, TAAS math passing rates, attendance rates, and dropout rates. Difference among student demographic sub-groups as well as difference based on the length of time a campus utilized one of the schedule types were evaluated.

The data was analyzed using Multiple Analysis of Variance tests. The level of significance was set at .05.

Findings

In relation to the results of the first two Multiple Analysis of Variance tests:

1. The use of A/B Block scheduling when compared with schools that use traditional high school scheduling produced no statistically significant difference in TAAS Reading scores.

2. The use of A/B Block scheduling when compared with schools that use traditional high school scheduling produced no statistically significant difference in TAAS Mathematics scores.
3. The use of A/B Block scheduling when compared with schools that use traditional high school scheduling produced no statistically significant difference in attendance rates.
4. The use of A/B Block scheduling when compared with schools that use traditional high school scheduling produced no statistically significant difference in dropout rates.
5. The use of Accelerated Block scheduling when compared with schools that use traditional high school scheduling produced no statistically significant difference in TAAS Reading scores.
6. The use of Accelerated Block scheduling when compared with schools that use traditional high school scheduling produced no statistically significant difference in TAAS Mathematics scores.
7. The use of Accelerated Block scheduling when compared with schools that use traditional high school scheduling produced no statistically significant difference in attendance rates.
8. The use of Accelerated Block scheduling when compared with schools that use traditional high school scheduling produced no statistically significant difference in dropout rates.

9. The use of A/B Block scheduling when compared with schools that use Accelerated Block scheduling produced no statistically significant difference in TAAS Reading scores.
10. The use of A/B Block scheduling when compared with schools that use Accelerated Block scheduling produced no statistically significant difference in TAAS Mathematics scores.
11. The use of A/B Block scheduling when compared with schools that use Accelerated Block scheduling produced no statistically significant difference in attendance rates.
12. The use of A/B Block scheduling when compared with schools that use Accelerated Block scheduling produced no statistically significant difference in dropout rates.

In relation to the results of the third Multiple Analysis of Variance test, a statistically significant difference existed for schools that used a particular type (traditional, A/B block, or accelerated block) of schedule for seven or more years. This was true no matter which type of schedule was used.

Conclusion

No causal relationship can be concluded from this study. It cannot be stated that any of the independent variables caused variations in the dependent variables. It cannot be stated that the use of a particular type of schedule: traditional, A/B block, or accelerated block is correlated to improved achievement, attendance, or dropout rates. It can be stated, based on the types of schedules studied and the results of the third

MANOVA, that a statistically significant difference does exist the longer a particular type of schedule is used (no matter which schedule type is used), but only in the areas of TAAS math scores and attendance rates.

Therefore, educators must be conscious of the research when considering schedule implementation at the high school level. A/B block, accelerated block and traditional schedules in and of themselves do not lead to improved achievement, attendance, or dropout rates. Arguments can be made for many types of schedules. Consideration must be given to various contextual factors including campus characteristics and student demographics as well as staff training needs. Consistency in maintaining the same schedule type over time may be one of the most important factors.

Achievement rates and other non-performance variables (attendance and dropout rates) are influenced by the complex interaction of a number of variables. Schedule type is only one of those variables. An expectation that the implementation of a traditional, A/B block, or accelerated block schedule will be the sole factor to cause improved student achievement, improved attendance rates or improved dropout rates is inappropriate.

Recommendations

The results of this study lead to these recommendations for campus and school district officials:

Principals and other school district administrators, when reviewing methods to improve campus performance, must consider a number of factors including student demographics, campus characteristics, and staff training levels. Ultimately, campus and

districts officials must assure that effective teaching practices are occurring on each campus, regardless of the schedule type.

Currently, a projected (Texas) state education funding shortfall is causing school district administrators to review cost-saving options for the 2003 – 2004 fiscal year. There is discussion in many districts regarding the fact that traditional scheduling is more economical than A/B block or accelerated block scheduling. The results of this study indicate that the decision to move campuses from A/B block or accelerated block to traditional scheduling might be made as a cost-saving move without negatively impacting student achievement, attendance rates or dropout rates.

Recommendations for Further Study

The following recommendations for further study are made:

1. Many variations of “Other Types” of schedules exist. A comparable study should be conducted to evaluate those types of schedules.
2. Consideration should be given to conducting a study to analyze cross-group student performance and non-performance indicators.
3. A comparable longitudinal study utilizing performance and non-performance data from 1993 – 2002 should be conducted.
4. A comparable longitudinal study evaluating performance and non-performance data from campuses that have switched from one type of schedule to another type of schedule should be conducted.

5. Consideration should be given to conducting a comparable study to analyze the interaction of context variables with schedule types and performance/non-performance indicators.

High School Schedule Survey: Memorandum and Survey Questions

January 17, 2003

TO: Principal Addressed

FROM: Tom Kelchner

RE: **High School Scheduling Survey**

The question of block scheduling has long been debated. With the current state school-funding crisis, the issue of block vs. traditional scheduling is at the forefront as school district superintendents deliberate about doing away with block schedules as a cost-saving move. However, more research specific to Texas and to our accountability system is warranted. I hope to add to the literature with viable research on this topic.

I am currently completing my dissertation (at the University of North Texas) on the **effects of high school scheduling systems on TAAS Reading, TAAS Math, student attendance rates and dropout rates**. The study compares traditional and block schedules and their impact on these Academic Excellence Indicator System (AEIS) factors.

Please take a moment to complete the brief survey enclosed. Other response options, including an on-line format, are listed below. As a fellow administrator – a campus principal for over a decade, now a coordinator for the Special Education Department for the Dallas Independent School District, and Immediate Past President of the Dallas School Administrators Association – I fully appreciate the very hectic life of the campus principal. I hope that you will take the opportunity to assist with this important project. I will send a copy of the final results of the study to each respondent.

Please submit the completed survey by February 7, 2003. Thank you for your time and effort.

Texas High School Schedule Survey

You may respond by:

- Mailing the enclosed postage-paid postcard;
- Faxing the survey to 972-286-8985; or,
- E-mailing the survey to KELCHNERSURVEY@aol.com.

You may access and respond to the survey on-line at:

www.kelchner.net

Please submit the completed survey by February 7, 2003.

| |
|------------------------------|
| Survey Questions/Postcard |
|------------------------------|

Please circle the appropriate response. Return by February 3, 2003.

1. What type of schedule is your school currently (2002–2003 school year) using?
•Traditional 7 or 8 Period •A/B Block •Accelerated Block •Other_____
2. How long has your school utilized the above schedule?
• 1 – 3 Years • 4 – 6 Years •7 – 11 Years • More Than 11 Years
3. If your school has used the current schedule for 1 – 3 years, what type of schedule did your school use prior to the implementation of the current schedule:
•Traditional 7 or 8 Period •A/B Block •Accelerated Block •Other_____
4. How long did your school utilize the schedule noted in Question #3?
• 1 – 3 Years • 4 – 6 Years •7 – 11 Years • More Than 11 Years
