Nuclear Nonproliferation Issues

SUMMARY

The United States has been a leader of worldwide efforts to prevent the spread of nuclear weapons. To this end, the international community and many individual states have agreed to a range of treaties, laws, and agreements, known collectively as the nuclear nonproliferation regime, aimed at keeping nations that do not have nuclear weapons from acquiring them.

The nonproliferation regime has also been concerned with preventing terrorists from obtaining a nuclear weapon or the materials to craft one. The attacks on New York and Washington September 11 added a new level of reality to the threat that terrorists might acquire a nuclear weapon and explode it in a populated area.

Other nonproliferation concerns include a number of regional crisis points: the India-Pakistan arms race, North Korea, and the Middle East, primarily Iraq, Iran, and Israel. There is concern about China’s actions in expanding its nuclear force, and of Chinese and Russian activities that may encourage proliferation in the other regions.

Disposing of plutonium and highly enriched uranium from dismantled Russian nuclear weapons, while preventing it from falling into the hands of terrorists or other proliferators, is another current focus of nonproliferation activities. In the longer term, the major question is fulfilling the pledge in the Nuclear Nonproliferation Treaty (NPT) by the nuclear weapons states, including the United States, to pursue complete nuclear disarmament, in the face of skepticism about the possibility, or even the wisdom, of achieving that goal.

The terrorist attacks of September 11 added the suddenly more realistic threat of an even more unimaginable assault with a nuclear explosive. While terrorists have not been ignored in nonproliferation efforts, particularly with regard to Russian nuclear materials, the major focus has been on preventing nation states from developing weapons capabilities. While many features of the nonproliferation regime, such as export controls and monitoring, are applicable to the terrorist threat, some shift in focus may be necessary.

Numerous U.S. agencies have programs related to nuclear nonproliferation, but the major activities are carried out by the Departments of State, Defense, and Energy. DOE’s program is part of the National Nuclear Security Administration, which is responsible for the management of the U.S. nuclear weapons program.
MOST RECENT DEVELOPMENTS

On September 13, 2001, President Bush sent a message to a meeting of the International Atomic Energy Agency (IAEA) asking the agency to strengthen controls on nuclear power after the September 11 terrorist attacks on the United States. “The IAEA is central to the world’s efforts to prevent the proliferation of nuclear weapons,” the message said.

On November 1 the House and the Senate approved a Conference Report on Energy and Water Development Appropriations for FY2002 that increased funding for Defense Nuclear Nonproliferation programs in the Department of Energy from the $773.7 million requested by the Administration to $803.6 million. A proposal by Representative Edwards to redirect $130 million from other weapons program funding to increase non-proliferation activities in the Former Soviet Union was rejected by the Conference Committee, but during floor debate on the bill November 1 Energy and Water Development Subcommittee Chairman Callahan promised to seek the funding in another bill.

BACKGROUND AND ANALYSIS

Nuclear Nonproliferation Policy

One of the enduring nightmares of the post-Cold War world has been that terrorists might obtain a nuclear weapon, or the materials to craft one. For many, this nuclear nightmare was tempered by disbelief that terrorist organizations would be capable of exploding a nuclear device in a populated area, and merciless enough to carry out such an assault. The September 11 attacks on the World Trade Center and the Pentagon cast serious doubt on such reassuring considerations.

While attention may have been redirected to the terrorist threat, other concerns about the proliferation of nuclear weapons have not been diminished. The United States has long been a leader of worldwide efforts to prevent the spread of nuclear weapons to additional nations, as well as to nongovernmental entities. Since the 1950s these nonproliferation efforts have built up a broad international structure, including treaties, international organizations with inspection mechanisms, and other agreements, complemented by wide-ranging domestic legislation.

The centerpiece of this structure is the Nuclear Nonproliferation Treaty (NPT). Under the terms of the NPT, the five declared nuclear weapons states — the United States, the United Kingdom, Russia, France and China — agreed “not in any way to assist” any non-weapons state to acquire nuclear weapons. They also agreed to reduce and eventually eliminate their own nuclear arsenals. The non-weapons states agreed not to develop nuclear weapons and to allow the International Atomic Energy Agency to inspect their nuclear facilities and materials to ensure that peaceful nuclear technology is not diverted to military purposes. The NPT also guarantees non-weapons states access to peaceful nuclear
technology. Since the end of the cold war, participation in the NPT has been almost universal. Except for India and Pakistan, whose pursuit of nuclear weapons capabilities and 1998 tests of nuclear explosives are a principal nonproliferation concern, only Israel and Cuba have not signed the NPT.

Beyond the NPT, the United States relies on various positive and negative incentives to persuade countries that may be interested in nuclear weapons not to acquire them. For countries facing security threats, the United States has provided security guarantees in the form of alliances that address the underlying motivation to acquire nuclear weapons. Both Japan and Germany, for example, had nuclear weapons programs during the Second World War and might have continued to pursue nuclear weapons after the war if the United States had not included them as allies. After the Cold War, Ukraine, Belarus, and Kazakhstan relinquished their nuclear capabilities to ensure good relations with the West.

Another important nonproliferation tool is technology denial. The United States and other suppliers of nuclear technology try to prevent countries such as Iran, Iraq, India, North Korea, Pakistan, and Israel that are trying to develop nuclear weapons from buying the equipment they need to produce nuclear weapons. One potential problem after the Cold War could result from loose controls on nuclear technology, materials, and expertise in Russia and the former Soviet republics. The concern is that countries seeking nuclear weapons might circumvent international technology controls by purchasing or stealing materials and/or expertise from inadequately secured facilities in the former Soviet Union. The United States has spent over $3 billion since the end of the Cold War helping those countries improve security for nuclear assets.

Sanctions are another way the United States has tried to deter and punish proliferators. Sanctions cut off U.S. aid, economic assistance, military cooperation, and technology access to countries that violate nonproliferation agreements or take steps, such as testing nuclear weapons, that threaten U.S. national security objectives. However, sanctions are sometimes controversial, as in the case of India and Pakistan. The Executive Branch sometimes prefers not to impose sanctions to avoid damaging relations with other countries, and Congress has sometimes relaxed sanctions, as was the case with India and Pakistan after they tested nuclear weapons.

Finally, the Department of Defense tries to deter acquisition and use of nuclear weapons by maintaining a strong military force. If nonproliferation and deterrence fail, the Defense Department is prepared to use military force to destroy weapons of mass destruction. The military component of nonproliferation policy is often referred to as counterproliferation.

Nonproliferation efforts have been concerned with three major types of problems. In the short term they focus on a number of regional crisis points: the India-Pakistan arms race, North Korea, and the Middle East, primarily Iraq, Iran, and Israel. There is concern also about China’s actions in expanding its nuclear force, and of Chinese and Russian activities that may encourage proliferation in the other regions. A second problem is the disposal of plutonium and highly enriched uranium from dismantled Russian nuclear weapons, while preventing it from falling into the hands of terrorists or other proliferators. In the longer term, the major problem is fulfilling the pledge in the NPT by the nuclear weapons states, including the United States, to pursue complete nuclear disarmament, in the face of skepticism about the possibility, or even the wisdom, of achieving that goal.
To these concerns have now been added a suddenly more realistic threat that terrorists, having achieved such shocking devastation in the destruction of the World Trade Towers in New York, may be tempted to carry out an even more unimaginable assault with a nuclear explosive. While terrorists have not been ignored in nonproliferation efforts, particularly with regard to Russian nuclear materials, the major focus has been on preventing nation states from developing weapons capabilities. While many features of the nonproliferation regime, such as export controls and monitoring, are applicable to the terrorist threat, some shift in focus may be necessary.

International Nonproliferation Structures and Organizations

The International Nuclear Nonproliferation Regime

The nuclear nonproliferation regime to deter further spread of nuclear weapons consists of treaties, international organizations, and multilateral and bilateral agreements, augmented by various unilateral actions intended to prevent further proliferation.

Major components of the regime include:

- The Nuclear Nonproliferation Treaty (NPT), which entered into force in 1970. It commits non-nuclear weapons members not to acquire nuclear weapons, and to allow international inspection of all their nuclear activities to verify this commitment. It commits nuclear weapons states not to assist non-weapons states to develop nuclear weapons, and to pursue the goal of an end to the nuclear arms race and eventually to nuclear disarmament.

- The International Atomic Energy Agency (IAEA), an international organization of the United Nations, established in Vienna, whose safeguards system verifies NPT compliance. Non-weapons NPT parties negotiate inspection agreements with the IAEA to verify the peaceful use of their nuclear materials.

- Informal international groups, including the Nuclear Suppliers Group (NSG), a committee of nuclear supplier nations that maintains multilateral guidelines for nuclear exports, and the Zangger Committee, an NPT affiliate that maintains a “trigger list” of nuclear items requiring safeguards. The NSG and Zangger guidelines were strengthened in 1992, after the Gulf War and the crisis with Iraq’s nuclear weapons program. The Missile Technology Control Regime (MTCR), which restricts exports of nuclear-capable missiles, is another component of the nonproliferation structure.

The Nonproliferation Treaty and the IAEA

The NPT provides the legal and institutional basis for international nonproliferation policy. Like all international agreements, it depends for its success on the good will of its participants, and does not guarantee that countries will not violate their commitments. However, to reinforce the good intentions of the signatories, the NPT set up an inspection system called safeguards, based on agreements between non-weapons states and the IAEA that permit routine inspections. The IAEA has no enforcement power; it can only report discrepancies to the U.N. By presenting the prospect that clandestine proliferation activities will be detected and exposed, the inspection system is designed to deter proliferation through international pressure, disapproval, and possible sanctions and countermeasures.

In order to prevent proliferation, IAEA inspections must be effective, and the prospect of international disapproval strong enough to deter a non-weapons NPT member from pursuing nuclear weapons development. Since the Gulf War, efforts to strengthen IAEA inspection powers have been underway, culminating in May 1997 with the adoption of a “model protocol” agreement intended to give inspectors more access to a wider array of activities, information, and facilities.

IAEA Inspections. In the aftermath of the 1991 Persian Gulf War, U.N. inspectors were surprised at the scope of Iraq’s nuclear weapons program and the progress Iraq had made toward obtaining nuclear weapons despite regular IAEA inspections. A major weakness in the existing system was that inspectors only inspected sites and facilities listed in the safeguards agreements with the agency. The Strengthened Safeguards System adopted at the May 1995 NPT extension and review conference gives inspectors strengthened ability to detect clandestine nuclear activities. Strengthened safeguards include taking environmental samples, no-notice inspections of nuclear facilities, complete access to records to confirm that all nuclear materials have been declared, and remote and unattended monitoring. A new modification to IAEA safeguards agreements with member states requires an “expanded declaration” by all NPT members of nuclear-related activities such as uranium mining. It also authorizes IAEA access to any place. By March 2000, the new inspection protocol had been approved by and signed by 45 nations, and entered into force in 7.

To persuade other countries to accept the new inspections, the United States agreed to accept the new measures itself. In June 1998 the United States reached agreement with the IAEA on how the model protocol would be applied in the United States. For many years the United States has allowed the IAEA access to U.S. nuclear facilities, although the purpose of inspecting U.S. facilities for diversion is symbolic. The new agreement includes a provision that would allow the United States to restrict IAEA inspections to protect national security. Senate ratification of the agreement is necessary before it can take effect.

Enforcement. Even if IAEA inspectors detect clandestine nuclear weapons activity, the NPT contains no formal provisions for forcing a country to abandon the activity. Iraq’s nuclear program was dismantled because U.N. forces militarily defeated Iraq after driving it out of Kuwait in 1991. In the absence of such military force a defiant NPT signatory could presumably continue its activities if it were willing to resist nonmilitary international pressures and disapproval. North Korea, in the inspection crisis prior to the 1994 Agreed Framework that is now in effect, violated its obligations and announced that it was withdrawing from NPT. The Security Council did not take decisive action to enforce the NPT. North Korea
reversed its decision only after being promised two nuclear power reactors and shipments of fuel oil. (See section on North Korea, below.)

The efforts of the nonproliferation regime to prevent the spread of nuclear weapons have not been without critics. Some view IAEA activities as ineffectual and toothless, easy to evade by an entity determined to develop nuclear weapons capability. Nor is the NPT system without its critics among non-nuclear-weapons nations.

**NPT “Discrimination”**

Despite the successful recruitment of almost all nations into the NPT, and the agreement in 1995 to make it permanent, a current of discontent exists about the difference in treatment of the five declared nuclear weapons states – who get to keep their weapons – compared with all the rest.

**The Nuclear Bargain: Atoms for Peace.** Part of the discontent derives from the changed prospects of commercial nuclear power. When the NPT was negotiated, peaceful nuclear power was viewed as a technology with great economic potential for all countries, both industrialized and developing. Joining the NPT was a quid pro quo under which non-weapons states renounced nuclear weapons in return for obtaining access to the technology and materials necessary to exploit commercial nuclear power — a concept that goes back to President Eisenhower’s 1954 “Atoms for Peace” initiative (Article IV of the Nonproliferation Treaty). However, since then the economic advantage of nuclear power has declined significantly. Nuclear power is important in many countries, but is under strong competition from competing energy sources. The high capital cost of nuclear powerplants, and the technical skills required to operate them safely and economically, have been major barriers to use of nuclear energy by developing countries, even where the main alternatives are coal and imported fossil fuels. This part of the NPT bargain has thus not been very rewarding for many non-weapons states, although they continue to receive assistance in the uses of nuclear technology in medicine, agriculture, and scientific research.

**The Nuclear Bargain: Disarmament.** Another part of the original NPT bargain was a promise by all signatories, including the weapons states, to “pursue negotiations in good faith” for the “cessation of the nuclear arms race at an early date and to nuclear disarmament, and on a treaty on general and complete disarmament under strict and effective international control” (Article IV). At the time the NPT was negotiated, the first goal, an early end to the arms race between the United States and the Soviet Union, must have seemed unlikely, nuclear disarmament unattainable in the foreseeable future, and “general and complete disarmament” altogether utopian.

The nuclear powers did pursue negotiations over strategic arms limitations in the 1970s and 1980s, and the abrupt end of the Cold War and the collapse of the Soviet Union made deep reductions in nuclear armaments possible. However, some non-weapon NPT states want more progress toward the goal of nuclear disarmament.

The major vehicle for efforts in this direction in the 1990s was a treaty banning nuclear tests. However, when the Comprehensive Test Ban Treaty (CTBT) was finally negotiated and signed, and submitted to the Senate by President Clinton in September 1997, it was controversial (see CRS Issue Brief IB92099, Nuclear Weapons: Comprehensive Test Ban
The Senate declined to ratify the CTBT on October 13, 1999, by a vote of 48-51. Despite this action, U.S. delegates to the NPT review conference in 2000 reaffirmed the commitment to negotiate total nuclear disarmament.

**Proliferation Motives**

Peaceful nuclear power may have lost its glitter, and the prospect of complete nuclear disarmament may be dim. On the other hand, the motives for pursuing nuclear weapons remain unchanged. A few states facing urgent security threats might view nuclear weapons as the best way to deter attack. Noting that all five of the permanent members of the United Nations Security Council are nuclear weapons states, some might view them as important for prestige. Still others might view them as effective battlefield weapons that can be used to defeat enemies and conquer territory.

Despite these motivations, many countries have abandoned nuclear weapons and have sought other ways to ensure their security. Germany and Japan, both major powers, are non-weapons states. In 1991, South Africa, having made the transition to majority rule, revealed and dismantled its clandestine program and renounced nuclear weapons. Argentina and Brazil, both of which had secret nuclear weapons programs under military governments, abandoned them under civilian rule and joined the NPT. Former Soviet republics Ukraine, Belarus, and Kazakhstan returned the Soviet weapons left on their territory and joined the NPT. In these countries, nuclear weapons were seen as creating more problems than they solved. Many hoped that this trend of the early 1990s would continue.

Interest in nuclear weapons, however, did not disappear. Besides ongoing tensions in South Asia between India and Pakistan, tensions in the Middle East between Israel and its Arab neighbors, and between Iraq and Iran, persist. China and Russia remain proliferation concerns as potential sources of nuclear technology, and North Korea is still a serious proliferation threat. A major concern is that other countries, especially those bordering known proliferators, might feel compelled to acquire nuclear weapons to counter the nuclear, chemical, biological or conventional weapons of their neighbors.

**U.S. Nonproliferation Policy**

The United States has been and continues to be a leading proponent of the international nonproliferation regime. At the domestic level is a system of export control and licensing laws (and regulations) covering transfers of nuclear technology or materials, including dual-use technology that can contribute to nuclear weapons development. There are also laws requiring sanctions for violations of nonproliferation commitments, and sanctions against non-weapons states that obtain or test nuclear weapons. These sanctions were invoked in the case of India and Pakistan, but some were gradually suspended, and on September 22, 2001, President Bush lifted all sanctions imposed because of the 1998 tests.

**Nuclear Cooperation and Export Controls**

In order to engage in international trade in nuclear technology or materials (such as nuclear fuel), U.S. companies must obtain export licenses from the Nuclear Regulatory
Commission (NRC). Before an export license can be applied for, there must be in force a bilateral agreement for peaceful nuclear cooperation between the U.S. government and the government of the importing nation. The conditions necessary for drawing up and approving an agreement for cooperation, laid out in Section 123 of the Atomic Energy Act, include a 90-day review by Congress. In several cases, congressional review of an agreement for cooperation has been controversial; most recently, Congress allowed an agreement with China to take effect in 1997, but it is still subject to criticism. (See section on China, below.) Others have attracted less attention. Currently, agreements with Brazil, Kazakhstan, and Ukraine are under congressional review. A single agreement is in force between the United States and the members of the European Atomic Energy Community (EURATOM).

In addition to NRC’s licensing and regulation role, the Department of Energy (DOE) also participates in export controls. DOE authorizes the transfer of nuclear technology to countries having agreements for nuclear cooperation with the United States via “subsequent arrangements,” the details of which are spelled out in Section 131 of the Atomic Energy Act of 1954. In general, NRC deals largely with licensing hardware, while DOE licenses information and knowledge, under regulations defined in 10 CFR Part 810.

Finally, the Department of Commerce also is involved in regulating exports of dual-use, nuclear-related commodities under the provisions of the Export Administration Act of 1979. That law expired and successive Congresses have not passed new legislation, although there have been several attempts to do so. Commerce continues to play a role in export regulation, however.

**Nonproliferation Legislation**

The Atomic Energy Act of 1954 (P.L. 88-703, as amended) established rules for nuclear commerce which have become the international norm. The Atomic Energy Act requires that a bilateral nuclear cooperation agreement be negotiated between the United States and any foreign country before major nuclear technology can be exported to that country. The Nuclear Nonproliferation Act of 1978 (P.L. 95-242) strengthened those earlier rules and established the requirement of full scope safeguards as a condition of supply. This means that any country except the five NPT weapon-states that wants to import nuclear technology from the United States must accept IAEA safeguards on all of its nuclear facilities. This requirement has been adopted by all major nuclear suppliers except China.

**Sanctions.** In order to deter or punish proliferators, Congress has passed many laws imposing sanctions on countries that proliferate and those who assist them. The Arms Export Control Act and the Foreign Assistance Act contain provisions that cut off U.S. assistance to countries that illegally acquire nuclear weapons or the means to make them. These sanctions were imposed on Pakistan in the 1970s and 1980s when it was caught smuggling uranium enrichment equipment from Europe and the United States. However, the Pakistan sanctions were waived by Presidents Carter, Reagan, and Bush to allow continued U.S. aid to Pakistan during the Soviet invasion of Afghanistan. Aid was finally cut off in 1990 when President Bush did not provide the required certification that Pakistan did not possess nuclear weapons.

In 1994 Congress passed the Nuclear Proliferation Prevention Act, which requires sanctions against countries that aid or abet the acquisition of nuclear weapons or
unsafeguarded nuclear weapons materials, or non-nuclear weapons countries that obtain or explode nuclear devices. Sanctions include: cutoff of U.S. assistance, stringent licensing requirements for technology exports, and opposition to loans or credits from international financial institutions. These sanctions were imposed on India and Pakistan following their nuclear tests in May 1998, but were gradually relaxed. Legislation passed in the 106th Congress extended the President’s authority to relax sanctions on India and Pakistan for a year, and the Senate passed a bill suspending sanctions on the two countries for 5 years. The FY2000 Department of Defense Appropriations bill (P.L. 106-79) extends the authority to suspend sanctions. (See Economic Sanctions to Achieve U.S. Foreign Policy Goals: Discussion and Guide to Current Law, Dianne E. Rennack and Robert D. Shuey, CRS Report 97-949.)

Critics of sanctions argue that they mainly punish U.S. firms and are often undercut by foreign countries that continue to trade with proliferators. Supporters of sanctions argue that they send a strong signal to proliferators and to other countries that proliferation has negative consequences and will disrupt “business as usual.”

Federal Organization for Nonproliferation

The Departments of State, Energy, Defense, and Commerce; the intelligence community; and the U.S. Nuclear Regulatory Commission (NRC) are all involved in the formulation and implementation of nonproliferation policy.

- The National Security Council is the hub of nonproliferation policy, with the primary task of reconciling nonproliferation policy with foreign, trade, and national security policies.

- The State Department, in consultation with the Energy Department, negotiates U.S. agreements for nuclear cooperation and represents U.S. nonproliferation interests with other states and international organizations such as the IAEA.

- The Department of Defense is responsible for counterproliferation strategy and policy, and also administers programs to help Russia guard and control its nuclear weapons complex.

- The Department of Energy provides expertise in nuclear weapons to support nonproliferation policy and diplomacy, largely through its national laboratories. It issues permits for the export of nuclear information and knowledge under so-called Part 810 regulations. DOE also administers some programs to control fissile materials in the former Soviet Union.

- The Nuclear Regulatory Commission licenses nuclear exports subject to concurrence by the Department of State.

- The Department of Commerce oversees licensing of dual-use exports as mandated by Section 309(c) of the Nuclear Non-proliferation Act, which requires controls on “all export items, other than those licensed by the NRC,
which could be, if used for purposes other than those for which the export is intended, of significance for nuclear explosive purposes.”

- The Central Intelligence Agency has a Nonproliferation Center that coordinates intelligence aspects of nonproliferation policy.
  Several interagency working groups coordinate the various responsibilities for nonproliferation policy.

**Funding Nonproliferation Programs**

As indicated above, the major nonproliferation activities are carried out by the Departments of State, Defense and Energy. The tables below present the funding appropriated for FY2001 and the FY2002 budget request for these activities.

**Table 1. State Department Nonproliferation, Anti-Terrorism, Demining and Related (NADR) Programs**

Not all the activities of the NADR program are concerned with nuclear nonproliferation. Of those that are:

- The Export Control Assistance program helps countries in the former Soviet Union, in the Middle East, the Mediterranean and other areas develop their ability to control exports of materials involved in proliferation of weapons of mass destruction (WMD);

- The Science Centers program supports two facilities in Moscow and Kiev to redirect activities of former Soviet Union experts in WMD;
- Anti-Terrorism Assistance is largely a training program in Europe, the former Soviet Union, Near East Asia and other areas;

- The Comprehensive Nuclear Test Ban Treaty (CTBT) Preparatory Commission mainly supports an International Monitoring System for detecting nuclear explosions;

- The IAEA Voluntary Contribution supports activities, particularly nuclear inspections, that are vulnerable to the agency’s chronic funding crisis;

- The Korean Peninsula Energy Development Organization (KEDO) funds activities under the 1994 Agreed Framework with North Korea (see below), and,

- The Nonproliferation and Disarmament Fund provides funding for quick response to unanticipated or unusually difficult nonproliferation needs.

Proliferation R&D activities are aimed at techniques to monitor nuclear explosions, remotely detect the early stages of a nuclear weapons program, improve detection of foreign nuclear materials, and develop expertise in the areas of chemical and biological weapons. Arms control programs are concerned with international safeguards, export controls, treaties and agreements, and nonproliferation in Newly Independent States of the former Soviet Union. The last activity includes two programs dealing with the problem of employing former Soviet nuclear weapons experts. The Initiatives for Proliferation Prevention (IPP) program is a cooperative arrangement between DOE laboratories and science and engineering institutes in Russia, Ukraine, Kazakhstan and Belarus. The Nuclear Cities Initiative (NCI) involves efforts to develop commercial activities in 10 formerly secret cities in Russia where nuclear weapons activities were carried out.

The MPC&A program is concerned with reducing the threat posed by unsecured Russian weapons and weapons-usable material. The mission of the fissile material disposal program is to dispose of plutonium from dismantled weapons both in the United States and in Russia. This program is currently under review and subject to considerable controversy, as described below in the section on Russia. The Highly Enriched Uranium (HEU) Transparency Implementation program, also described below, finances the agreement with Russia to use HEU from dismantled Soviet weapons for fuel for nuclear power reactors.

**Nuclear Proliferation in Specific Regions**

**India and Pakistan**

The undeclared nuclear arms competition between India, Pakistan, and China reached a turning point on May 11, 1998, when India announced an underground test of three nuclear explosive devices, and followed it two days later with claims of two more. Declaring that
China, with whom India had a border war in 1962, was “encircling” India militarily, in part by providing its bitter rival Pakistan with nuclear weapons capability and missile weaponry. Indian Prime Minister Atal Bihari Vajpayee defended the test as necessary to correct the “deteriorating security environment, especially the nuclear environment, faced by India for some years past.” India has refused to sign the NPT, and has been a bitter critic of what it calls discrimination between the five weapons states and non-weapons states.

Pakistan said after the May 11 tests that it was being dragged into a nuclear arms race, and on May 28 claimed to have set off five nuclear blasts of its own. The United States responded by imposing sanctions on both countries and by engaging in intensive diplomacy over the next several years. Neither country has resumed testing, but relations between them has remained tense, fed by the volatile armed confrontation in the border state of Kashmir.

The Middle East and Israel

The ongoing confrontation between Islamic Middle East countries and Israel has long had a nuclear undercurrent. Israel has not signed the NPT, and has made no official acknowledgment of a weapons program. It is widely considered to have developed nuclear weapons capability, although it has not conducted a nuclear explosion. Israel's nuclear program has stimulated calls for an "Islamic bomb." Among Israel's neighbors, Iraq and Iran have been the focus of nuclear activity. Iraq, before its defeat in the Gulf War in 1991, actively pursued nuclear weapons development, despite having signed the NPT. Iran declares it has no nuclear weapons program, but the United States claims that it does.

Iraq's Nuclear Weapons Program: Gone But Not Forgotten. Before the 1991 Gulf War, Iraq had an extensive covert nuclear weapons program that was built under the guise of legitimate nuclear research and development. As a member of the NPT, Iraq had allowed inspections of declared facilities by the IAEA, but successfully concealed the true nature of its nuclear program. After the war, U.N. Resolution 687 established a Special Commission and gave it authority to locate and remove Iraq’s weapons of mass destruction. The U.N. Special Commission on Iraq (UNSCOM) conducted extensive investigations of Iraq’s nuclear program that revealed a multi-billion dollar effort to build nuclear weapons. UNSCOM and the IAEA then eliminated Iraq’s nuclear infrastructure and put in place a permanent monitoring system to warn of renewed nuclear activities.

UNSCOM continued its efforts to eliminate chemical and biological weapons programs in Iraq, with frequent crises and obstructions delaying the process. IAEA has several times declared that the nuclear weapons program has been dismantled, and several U.N. members have tried to get the nuclear portion of the U.N. mission declared completed, but U.S. opposition has so far prevented that.

Iran's Nuclear Program. Top U.S. officials have warned repeatedly that Iran has a program to acquire nuclear weapons. Iran has reportedly attempted to purchase nuclear materials from the former Soviet Union and nuclear equipment from many countries. The relatively effective embargo of nuclear sales to Iran is undermined by Russia’s efforts to complete a nuclear power plant at Bushehr, which had been started by Germany in the 1970s under the former Shah of Iran. The revolutionary government that overthrew the Shah in 1979 abandoned the project, then unsuccessfully tried to get Germany to revive it. Russia's
MINATOM agency has contracted to finish the plant with one of its own reactor designs, but progress has been slow.

Iran is a member of the NPT and allows inspections of its nuclear program. Nevertheless, many observers suspect that Iran, which possesses substantial reserves of oil and natural gas, is using its civilian nuclear program as a pretense to establish the technical basis for a nuclear weapons option.

**China**

China has long been a nonproliferation concern. Until 1992 it refused to join the NPT, even as one of the privileged five nuclear weapons states. It was widely viewed as the major supplier of Pakistan's nuclear weapons program in the 1980s and early 1990s, and also as a supplier of aid and technology to Iran, although Chinese officials continue to deny helping either country's weapons program. India, in justifying its own nuclear weapons tests, cited China's help to Pakistan as a major motive in developing nuclear weapons capability.

China gradually took steps to join the international nonproliferation community. In 1985, the United States negotiated a nuclear cooperation agreement that would facilitate the export of U.S. nuclear power reactors to China. Congress, however, attached conditions to the agreement, including a requirement that the President certify to Congress that China was abiding by its nonproliferation commitments before the agreement could go into effect. The certification was not made, largely because of evidence of China's aid to Pakistan. Finally, during the October 1997 visit of Chinese President Jiang Zemin, President Clinton announced that he would certify that China had met the requirements necessary to activate the agreement. Among actions cited by President Clinton was a written Chinese agreement not to participate in any new nuclear projects with Iran. The certification was submitted to Congress on January 12, 1998. It was required to lie before Congress for 30 days of continuous session before the agreement could take effect. Opposition to the President's action was expressed by some Members of Congress, but the agreement went into effect in March 1998 after the 30 days elapsed.

China's past involvement in Pakistan's nuclear weapons program, and India's accusation that it needed to test nuclear explosives because it was being "encircled" by China, made China a major player in the nuclear escalation in Southeast Asia. In addition, China in recent years has been expanding and modernizing its own nuclear arsenal, and has been involved with allegations of spying on U.S. weapons technology facilities in the Department of Energy.

**North Korea’s Noncompliance with its NPT and IAEA Obligations**

North Korea joined the NPT in 1985, but delayed inspections until 1992. In February 1993, North Korea denied access by IAEA inspectors to two sites that IAEA (and U.S. intelligence) believed held evidence of clandestine nuclear work. In March 1993, North Korea notified the United Nations Security Council that it was withdrawing from the NPT, which permits withdrawal after 3 months notice. It subsequently suspended its withdrawal, but claimed to have “unique status” under the NPT, and continued to block inspections. Former CIA Director James Woolsey and Secretary of Defense William Perry warned that North Korea probably had enough plutonium for two bombs and that the fuel unloaded from the 25 MW(thermal) reactor could contain enough plutonium for several more bombs.
In October 1994, the United States signed an agreement with North Korea under which North Korea would shut down, but not dismantle, its existing reactor and reprocessing plant (needed to extract plutonium from irradiated nuclear fuel), and halt construction on other weapons-potential facilities, in return for provision of light water reactors less suited for producing plutonium for bombs. North Korea is also receiving shipments of heavy oil to compensate for energy that theoretically might have been generated from the reactors it agreed to shut down. The deal requires North Korea to eventually resolve outstanding safeguards violations, including its undeclared plutonium, before completion of the new reactors. An international consortium called the Korean Peninsula Energy Development Organization (KEDO) was established in March 1995 to coordinate the reactor construction project. (For details on the North Korean nuclear situation, see CRS Issue Brief IB91141, North Korea’s Nuclear Weapons Program).

### Russian Nuclear Weapons and Weapons Material

Russia and the United States do not have in force an agreement for peaceful nuclear cooperation. However, U.S. aid is being extended to Russia to help maintain safety and safeguards of the vast nuclear arsenal inherited from the former Soviet Union. (For details on Russia's nuclear weapons complex, see CRS Issue Brief IB98038, Nuclear Weapons in Russia: Safety, Security, and Control Issues.)

Disposal of Russian nuclear materials from dismantled weapons is also a nonproliferation issue. In February 1993 the United States and Russia agreed that highly enriched uranium from weapons would be diluted to a low enrichment level suitable for use in commercial nuclear power reactors, and that the U.S. Enrichment Corporation (USEC) would buy the uranium to supply to its customers. The arrangement has been complicated by the July 1998 privatization of USEC, but is going forward.

Disposal of plutonium from weapons is more of a problem, since the use of plutonium in power reactors is not widespread. Eventually the large stocks of both U.S. and Russian weapons plutonium will have to be dealt with. The United States has proposed, as a means of disposing of weapons plutonium from its own nuclear arsenal, a "dual track" strategy of mixing plutonium with uranium as mixed oxide (MOX) fuel for commercial power reactors, and vitrification (dissolving in glass) and disposal of the plutonium unsuited for fuel and the resulting fission products. In July 1998 the Department of Energy issued a draft Environmental Impact Statement on the program. An agreement with Russia signed in September 2000 set up a similar program for Russian plutonium disposal.

The plan to use weapons plutonium as fuel for nuclear power reactors has raised opposition from some nonproliferation interest groups, who argue that immobilization and disposal is safer and less expensive than the MOX fuel option. The Russian MOX option is particularly troubled, because Russia does not have enough power reactors in which MOX can be used to dispose of significant amounts of plutonium, and has been asking for help to build new ones or to use the MOX in reactors in Germany or other countries.

(See CRS Report RL30170, Nuclear Weapons: Disposal Options for Surplus Weapons-Usable Plutonium.)
