SUMMARY

Alternative fuels and advanced technology vehicles are seen by proponents as integral to improving urban air quality, decreasing dependence on foreign oil, and reducing emissions of greenhouse gases. However, major barriers — especially economics — currently prevent the widespread use of these fuels and technologies. Because of these barriers, and the potential benefits, there is continued congressional interest in providing incentives and other support for their development and commercialization.

In the 108th Congress, alternative fuels and advanced technology vehicles received a good deal of attention, especially in the debate over omnibus energy legislation (H.R. 6, among others). Major topics included tax incentives for alternative fuel production; the future of ethanol and the fuel additive MTBE, including the establishment of a renewable fuels standard (RFS); and research and development of hydrogen fuel and fuel cells. Other topics included government vehicle purchase requirements; tax credits for vehicle purchases; promotion of biodiesel fuel; and incentives for hybrid electric vehicles. It is likely that many of these topics will be addressed again in the 109th Congress.

The omnibus energy bill contained many provisions relevant to alternative fuels and advanced technology vehicles. Among its provisions, the bill would have extended and expanded existing tax incentives for the purchase of alternative fuel and advanced vehicles; authorized R&D funding for hydrogen fuel and fuel cells; required that gasoline contain ethanol or other renewable fuel; banned the use of the fuel additive MTBE; and expanded tax incentives for the production of ethanol and biodiesel.

On November 17, 2003, the conference committee on H.R. 6 issued its report (H.Rept. 108-375). The House approved the report, but a cloture motion on the bill failed in the Senate. Substitute bills were offered in the House and Senate, but the 108th Congress was unable to complete an energy bill.

Because of concerns over the energy bill, some alternative fuels provisions from the bill — especially those related to ethanol and MTBE — were inserted into other bills, including highway and tax legislation.

The conference on H.R. 3550 — the highway reauthorization bill — convened in June, 2004, but never issued its report. Among other provisions, the bill would have reauthorized existing programs for alternative fuel buses and other transit projects. Also, it would have modified the tax incentives for ethanol-blended fuel.

Some tax provisions from the energy bill, including tax credits for ethanol and biodiesel, were inserted into the conference report on the American Jobs Creation Act of 2004 (P.L. 108-357, H.R. 4520). Among other provisions, the new law replaces the existing ethanol tax exemption with a tax credit, and establishes tax credits for biodiesel.
**MOST RECENT DEVELOPMENTS**

**108th Congress**

On October 7, 2004, the House approved the conference report on H.R. 4520, a corporate tax bill. Among other provisions, the bill contains tax credits for ethanol and biodiesel. The Senate approved the conference report on October 11. On October 22, The president signed the American Jobs Creation Act of 2004.

On November 17, 2003, the conference committee on H.R. 6, the omnibus energy package, issued its report (H.Rept. 108-375). The House approved the report on November 18, but on November 21 a cloture vote on the bill failed in the Senate. H.R. 6 contained several key provisions related to alternative fuels and advanced technology vehicles. These included authorizations for hydrogen and fuel cell R&D funding, tax credits for the purchase of vehicles, and a requirement that gasoline contain ethanol or other renewable fuels.

**BACKGROUND AND ANALYSIS**

**Congressional Interest**

**Legislative Background.** A combination of concerns — the oil crises of the 1970s, the rise in awareness of environmental issues, energy security, vehicle emissions, and fuel conservation goals — have increased interest in moving the United States away from petroleum fuels for transportation and toward alternative fuels and advanced technologies. Most notably, the 102nd Congress passed the Energy Policy Act of 1992 (EPAct, P.L. 102-486). Among other provisions, this law requires the purchase of alternative fuel vehicles by federal, state, and alternative fuel providers. Under EPAct, a certain percentage — which varies by the type of fleet — of new passenger vehicles purchased for an agency’s or company’s fleet must be capable of operating on alternative fuels, including ethanol, methanol, natural gas, or propane. In addition, EPAct established a tax credit for the purchase of electric vehicles, as well as tax deductions for the purchase of alternative fuel and hybrid vehicles.

(For background on alternative fuels, including legislative history, see CRS Report RL30758, *Alternative Transportation Fuels and Vehicles*. For background on advanced vehicle technologies, see CRS Report RL30484, *Advanced Vehicle Technologies*.)

Other laws affecting alternative fuel and advanced technology vehicles include the Energy Policy and Conservation Act (P.L. 94-163), which established fuel economy standards for passenger cars and light trucks; the 1990 Amendments to the Clean Air Act (P.L. 101-549), which require cities with significant air quality problems to promote low emission vehicles; highway authorization bills, including TEA-21, which established and reaffirmed tax incentives for ethanol and other fuels; and numerous laws that authorize federal research and development on alternative fuels, advanced technologies, and enabling infrastructure.
Current Issues. Recent events have renewed interest in alternative fuels and advanced vehicles. For example, high pump prices for gasoline and diesel fuel have raised concerns over oil imports, energy security, and fuel conservation. In light of this, there is growing interest in more efficient vehicles or vehicles that abandon the use of petroleum altogether. This is especially true as the rapid growth in the sales of light trucks — these include sport utility vehicles (SUVs), mini-vans, and pickups — which tend to have lower fuel economy than passenger cars, has lowered the overall fuel economy of the new vehicle fleet.

Furthermore, ongoing developments in hybrid vehicles, fuel cells, and hydrogen fuel have raised key policy questions. These questions include whether more generous tax incentives for hybrid and fuel cell vehicles should be established; the costs associated with production of hydrogen as a major transportation fuel; and whether research and development funds should be focused on such potentially high-risk technologies as fuel cells or on near-term, conventional technologies, such as hybrids.

In light of these and other energy policy concerns, Congress has been working on comprehensive energy legislation since 2001. In the 107th Congress, an energy bill stalled in conference. The 108th Congress continued the debate over energy legislation (H.R. 6). The conference report (H.Rept. 108-375) included provisions on vehicle tax credits, amendments to vehicle purchase requirements under EPAct, a requirement that gasoline contain ethanol or other renewable fuels, and tax credits for ethanol and biodiesel fuels. However, this bill also stalled. It is likely that many of these topics will be addressed again in the 109th Congress.

Fuel Tax Incentives

There is ongoing interest in tax incentives for the production and purchase of alternative fuels. Supporters of this approach argue that the market favors conventional fuels, and that the widespread infrastructure and nearly ubiquitous use of conventional fuels in automobiles makes it difficult for alternative fuels to compete without economic incentives. Currently, some alternative fuels do receive incentives for their production or sale. Most notably, through the end of 2004, gasoline blended with ethanol received a partial exemption from the motor fuels excise tax. This exemption made ethanol-blended fuel (gasohol) price-competitive with regular gasoline. Because of this, more than 99% of ethanol produced in the United States is blended with gasoline, according to the Energy Information Administration.

However, the excise tax exemption was criticized because it reduced revenue for the federal Highway Trust Fund (HTF). For every gallon of gasoline sold in the United States, a federal tax of 18.4 cents is imposed, all but 0.1 cents of which goes to the HTF. The remaining 0.1 cents goes to the Leaking Underground Storage Tank (LUST) Trust Fund to mitigate problems from fuel leaks. However, gasohol with 10% ethanol was taxed at 13.2 cents per gallon (an exemption of 5.2 cents per gallon). Of the 13.2 cents, 10.6 cents went to the HTF (and an additional 0.1 cents goes to the LUST fund). The remaining 2.5 cents was transferred to the general Treasury fund for debt reduction. Therefore, for every gallon of 10% gasohol sold, the HTF “lost” 7.7 cents; the overall foregone revenue was 5.2 cents. (The exemption was prorated for blends with less ethanol.) The Joint Committee on Taxation estimates that the exemption has resulted in about $7.5 billion in cumulative
foregone revenue from FY1979 through FY2000, while the U.S. Treasury estimates the figure at about $11 billion. (The discrepancy in estimates arises from differing assumptions made by the Treasury and the Committee.)

Because of this concern, a Volumetric Ethanol Excise Tax Credit (VEETC) was proposed (S. 1548). This proposal would replace the existing excise tax exemption with a tax credit. While the total value of the incentive to blenders might not change, the incentive would be paid from the general Treasury fund, as opposed to the federal Highway Trust Fund. Therefore, while overall revenue concerns would not be addressed, the effects of the ethanol tax incentive on the HTF would be eliminated.

The VEETC was discussed as part of the debate over H.R. 6, and a version of this credit was inserted into the conference report on the bill. VEETC provisions were inserted into the conference report on the American Jobs Creation Act of 2004 (P.L. 108-357, H.R. 4520), which became law on October 22, 2004.

In addition to the credit for ethanol-blended gasoline, there is interest in promoting biodiesel fuel. In fact, the VEETC would apply to biodiesel as well. Because the biodiesel market is in its infancy, there has been interest in creating a per-gallon tax credit for the production of biodiesel fuel as well. P.L. 108-357 provides a tax credit of up to $1.00 per gallon for the production of biodiesel.

(For more information on the ethanol tax exemption, see CRS Report RL30369, Fuel Ethanol: Background and Public Policy Issues. For more information on the tax provisions in H.R. 6, see CRS Report RL32042, Energy Tax Incentives in H.R. 6: The Conference Agreement as Compared with the House Bill and Senate Amendment.)

Ethanol and MTBE

Outside of tax incentives, ethanol has been of key interest in recent Congresses, especially in its role as an alternative to MTBE (methyl tertiary butyl ether). MTBE and ethanol are used (among other purposes) to meet Clean Air Act requirements that reformulated gasoline (RFG), sold in the nation's worst ozone nonattainment areas, contain at least 2% oxygen (by weight), to improve combustion. Under the RFG program, areas with "severe" or "extreme" ozone pollution (90 counties with a combined population of 64.8 million) must use reformulated gas; areas with less severe ozone pollution may opt into the program as well, and many have. In all, portions of 17 states and the District of Columbia use RFG, and about 30% of the gasoline sold in the United States is RFG, according to the Environmental Protection Agency (EPA).

The law requires that RFG contain at least 2% oxygen by weight. Refiners can meet this requirement by adding a number of ethers or alcohols, any of which contains oxygen and other elements. By far the most commonly used oxygenate is MTBE. In 1999, 87% of RFG contained MTBE, a number since reduced to about 62%, according to EPA. MTBE has also been used since the late 1970s in non-reformulated gasoline as an octane enhancer, at lower concentrations. As a result, gasoline with MTBE has been used throughout the United States, whether or not an area has been subject to RFG requirements.
MTBE leaks, generally from underground gasoline storage tanks, have been implicated in numerous incidents of ground water contamination. The substance creates taste and odor problems in water at very low concentrations, and some animal studies indicate it may pose a potential cancer risk to humans. For these reasons, 17 states (AZ, CA, CO, CT, IL, IN, IA, KS, KY, MI, MN, MO, NE, NY, OH, SD, WA) have taken steps to ban or regulate its use, according to the Renewable Fuels Association. The most significant of the bans (in California, Connecticut, and New York) took effect at the end of 2003, leading many to suggest that Congress revisit the issue to modify the oxygenate requirement and set more uniform national requirements regarding MTBE and its potential replacements, principally ethanol.

Support for eliminating the oxygenate requirement on a nationwide basis is widespread among environmental groups, the petroleum industry, and states. In general, these stakeholders have concluded that gasoline can meet the same low emission performance standards as RFG without the use of oxygenates. But agricultural interests present a potential obstacle to enacting legislation to remove the oxygen requirement. According to the U.S. Department of Agriculture, roughly 13% of the nation’s corn crop is used to produce the competing oxygenate, ethanol. If MTBE use is reduced or phased out, but the oxygen requirement remains in effect, ethanol use would soar, increasing demand for corn. (In fact, according to EPA, ethanol use is already growing as MTBE begins to be phased out.) Conversely, if the oxygen requirement is waived by EPA or through legislation, not only would MTBE use decline, but so, likely, would demand for ethanol. Thus, some Members of Congress and governors from corn-growing states have taken a keen interest in MTBE legislation and related oxygenate requirements.

To help promote the market for ethanol if the oxygen standard were eliminated, a renewable fuels standard (RFS) has been suggested. This would require that all gasoline contain ethanol or other renewable fuel. This concept has been supported by agricultural interests, the oil industry, and some environmental groups. Opponents have included states that do not produce ethanol, due to fears that the mandate could raise gasoline prices.

As approved by the conferees, H.R. 6 (108th Congress) contained numerous MTBE and ethanol provisions. It would have banned the use of MTBE as a fuel additive, and would have repealed the Clean Air Act requirement to use MTBE or other oxygenates. In place of this requirement, the bill would have established a renewable fuels standard (RFS). Under the RFS, annual production of gasoline would be required to contain at least 5 billion gallons of ethanol or other renewable fuel by 2012. To prevent “backsliding” on air quality, the bill required that reductions in emissions of toxic substances achieved by RFG be maintained; it authorized grants to assist merchant MTBE production facilities in converting to the production of other fuel additives; it authorized funds for MTBE cleanup; and, perhaps most controversially, it provided a “safe harbor” from product liability lawsuits for producers of MTBE, ethanol, and other renewable fuels (product liability lawsuits have been used to force petroleum and chemical companies to pay for cleanup of ground and surface water contaminated by releases of fuels containing MTBE). A disagreement over the safe harbor provision for MTBE is seen as one of the issues that led to the failure of the bill.

(For a detailed comparison of the House and Senate provisions, see CRS Report RL31912, Renewable Fuels and MTBE: Side-by-Side Comparison of H.R. 6 and S. 2095. For additional background on the MTBE issue, see CRS Report 98-290, MTBE in Gasoline:
Clean Air and Drinking Water Issues. For information on ethanol, see CRS Report RL30369, Fuel Ethanol: Background and Public Policy Issues.)

Ethanol Imports

There is growing concern among some stakeholders over ethanol imports. Because of lower production costs and/or government incentives, ethanol prices in Brazil and other countries can be significantly lower than in the United States. To offset the U.S. tax incentive that all ethanol (imported or domestic) receives, most imports are subject to a 54-cent-per-gallon tariff. This tariff effectively negates the tax incentive for covered imports, and has been a significant barrier to fuel ethanol imports.

However, under certain conditions imports of ethanol from Caribbean Basin Initiative (CBI) countries are granted duty-free status. This is true even if the ethanol was produced in a non-CBI country. In this scenario the ethanol is produced in another country (historically Brazil or a European country), dehydrated in a CBI country, then shipped to the United States. This avenue for imported ethanol to avoid the tariff has been criticized by some stakeholders, including some Members of Congress. In the spring and summer of 2004, two companies announced plans to construct new dehydration facilities in CBI countries and shipping ethanol from Brazil. In response, two bills were introduced in the 108th Congress. S. 2762 (Grassley) would have established additional limits to the quantity of dehydrated ethanol that could be imported under the CBI. S. 2769 (Daschle) would have precluded the use of imported ethanol in any future renewable fuels standard (see above). Neither bill saw significant congressional action.

(For more information on ethanol imports from CBI countries, see CRS Report RS21930, Ethanol Imports and the Caribbean Basin Initiative.)

Vehicle Purchase Requirements

The Energy Policy Act of 1992 (EPAct, P.L. 102-486) established mandatory alternative fuel vehicle purchase requirements for various vehicle fleets. Under the law, 75% of the passenger vehicles purchased by federal and state vehicle fleets must be capable of operating on alternative fuels; 90% of the vehicles purchased by alternative fuel providers must be alternative fuel vehicles.

The alternative fuel vehicle provisions of EPAct have been criticized as ineffective because, while EPAct requires the purchase of vehicles, it does not mandate the use of alternative fuels. In most cases, the vehicles purchased to meet the requirement are dual-fuel vehicles (i.e., they can operate on either a conventional fuel or an alternative fuel). Further, those vehicles are primarily fueled using gasoline, because gasoline tends to be less expensive and more widely available than alternative fuels. In addition, despite the vehicle purchase mandate, many agencies have failed to meet their statutory obligation. As a result, in 2002 the Center for Biological Diversity filed a lawsuit with the U.S. District Court for the Northern District of California. In July 2002, the court ruled that several federal agencies failed to meet their quotas and ordered those agencies to prepare reports on their compliance with EPAct (Center for Biological Diversity v. Abraham, N.D. Cal., No. CV-00027).
In addition to the requirements for federal, state, and fuel provider fleets, EPAct grants the Department of Energy (DOE) the authority to extend the requirements to local government and private fleets. However, as of 2002, DOE had not made a determination on requirements for local and private fleets. As part of the above lawsuit, the Center for Biological Diversity also asked the court to force DOE to promulgate new rules. In ruling on the above case, the U.S. District Court for the Northern District of California ordered DOE to establish a timeline for a new rulemaking. DOE compiled a timeline, and on March 4, 2003, DOE issued a proposed rulemaking determining that such a program would not promote the goals of EPAct, neither reducing dependence on foreign oil nor leading to greater use of alternative fuel vehicles (68 Federal Register 10319).

The conference report on H.R. 6 would have significantly modified the existing requirements for EPAct compliance. First, all dual-fuel vehicles purchased to meet the EPAct quotas would have been required to operate on alternative fuels, unless an agency were granted a waiver by the Secretary of Energy. Second, fleets would have been permitted to purchase hybrid gasoline/electric (or diesel/electric) vehicles to meet their quotas. Third, an agency would have been permitted to waive the purchase requirement if the agency certified an alternative measure that reduced petroleum consumption as much as the use of alternative fuel vehicles. Finally, the Secretary of Energy would have been required to conduct a study of the effectiveness of the EPAct requirements.

(For more information on vehicle purchase requirements, see CRS Report RL30758, Alternative Transportation Fuels and Vehicles: Energy, Environment, and Development Issues.)

**Vehicle Purchase Tax Incentives**

Some supporters of alternative fuel and advanced technology vehicles argue that tax incentives for the purchase of vehicles and fuels are more effective than any purchase mandate. In addition to the mandatory purchase requirements, EPAct established a tax credit for the purchase of electric vehicles and a tax deduction for “clean-fuel vehicles,” including alternative fuel vehicles and hybrid vehicles. In 2005, taxpayers may claim a credit of 10% of the vehicle purchase cost, up to $4,000, for the purchase of a new electric vehicle. The clean fuel vehicle deduction is a maximum of $2,000 for passenger vehicles, $5,000 for heavy-duty vehicles up to 26,000 pounds, and $50,000 for the heaviest vehicles. Both the tax credit and the deduction are in the process of a phase-out, reaching zero after 2006. Opponents of the purchase incentives see them as supporting an already profitable industry — automakers — without significantly decreasing petroleum use.

However, because supporters see tax incentives as a key tool in promoting vehicle purchases, there is interest in extending the existing incentives or establishing new incentives. In the 108th Congress the CLEAR ACT (Clean Efficient Automobiles Resulting from Advanced Car Technologies Act, H.R. 1054 and S. 505) and the energy bill (H.R. 6) would have significantly expanded the vehicle purchase incentives. The conference report on H.R. 6 would have replaced the existing deductions for alternative fuel and hybrid vehicles with tax credits and established a tax credit for the purchase of fuel cell vehicles.

(For more information on these tax incentives, see CRS Report RS21277, Alternative Fuel Vehicle Tax Incentives and the CLEAR ACT.)
Biodiesel

Biodiesel (mono-alkyl esters) is a synthetic diesel fuel produced from oils, including soybean and canola oils, animal fats, and recycled cooking grease. It can be blended with conventional diesel fuel and used in diesel engines with few or no modifications. Further, with some engine modifications, it can be used in nearly pure form. Because biodiesel can displace conventional diesel without the use of new (and in many cases costly) vehicles, there is growing interest in its use. Further, because it can be produced from agricultural products, there is keen interest in its development by farmers (especially soybean and canola farmers), and some environmentalists as a way to promote rural economies, reduce agricultural wastes, and limit greenhouse gas emissions. However, biodiesel production is currently expensive: wholesale biodiesel from virgin oils costs roughly two to three times conventional No. 2 diesel; biodiesel from recycled grease is less expensive but still costs considerably more than conventional diesel.

The cost barriers for biodiesel production have generated interest in providing tax incentives for biodiesel, either in the form of production tax credits or an excise tax exemption, or both. Further there is interest in developing new technologies to help reduce production costs. However, the organic oils used as raw materials are one of the largest costs in production. Therefore, to significantly reduce biodiesel production costs, the costs of soybean oil and other oils would need to decrease substantially.

As was stated above, the American Jobs Creation Act (P.L. 108-357, H.R. 4520) provides a tax credit of up to $1.00 per gallon for the production of biodiesel. In addition, the law provides an excise tax credit for biodiesel blends (i.e. biodiesel and conventional diesel). Producers are eligible for one credit or the other, but not both. (see “fuel tax incentives” above).

(For more information on biodiesel, see CRS Report RL32712, Agriculture-Based Renewable Energy Production; and CRS Report RL30758, Alternative Fuels and Vehicles: Energy, Environment, and Development Issues.)

Hydrogen and Fuel Cells

Over the past few years, interest has grown substantially in hydrogen fuel and fuel cells. Hydrogen fuel can be produced using any energy source, and has thus been touted as a way to limit dependence on energy imports. Further, when hydrogen is used in a fuel cell (a device that produces electricity by converting hydrogen to water), only heat and water are produced, drastically reducing vehicle emissions. However, hydrogen fuel production is currently very expensive, as are fuel cells. In addition, depending on the original fuel source, overall fuel-cycle emissions can be a key concern.

Because of the potential benefits from hydrogen and fuel cells, and because of the existing barriers to their commercialization, the Bush Administration has strongly supported research and development (R&D). In January 2002, the Administration announced the FreedomCAR initiative, which promotes cooperative R&D between the “Big Three” American auto manufacturers (DaimlerChrysler, Ford, and General Motors) and the federal government. While the partnership is conducting research on many technologies, hydrogen and fuel cell vehicles are a key focus. Further, in his January 2003 State of the Union
address, President Bush announced the Hydrogen Fuel Initiative, which increased federal spending on hydrogen fuel and stationary fuel cell R&D. Overall, the President requested $1.8 billion over five years for both initiatives, including $720 million in new funding.

Opponents of the initiatives argue that hydrogen fuel and fuel cells may never be commercialized and that the initiatives draw funding away from near-term technologies such as hybrid vehicles. Further, some argue that research and development alone will not reduce petroleum dependence and that Congress should instead consider tightening fuel economy standards for all vehicles.

Congress agreed to increase funding for this research from $185 million in FY2003 to $237 million in FY2004 (P.L. 108-108 and P.L. 108-137) and $261 million in FY2005 (H.R. 4818). In addition to the appropriations bills, the conference report on the energy bill (H.R. 6) would have reauthorized hydrogen and fuel cell R&D at a level slightly higher than that requested by the President — $2.15 billion over five years, as opposed to the requested $1.8 billion. With or without this authorization, it is likely that increased federal hydrogen and fuel cell R&D funding will continue, as demonstrated by the congressional support for the Administration’s requested funding increases in FY2004 and FY2005.

(For more information on hydrogen and fuel cells, see CRS Report RL32196, A Hydrogen Economy and Fuel Cells: An Overview. For more information on the Administration’s initiatives, see CRS Report RS21442, Hydrogen and Fuel Cell Vehicle R&D: FreedomCAR and the President’s Hydrogen Fuel Initiative.)

Hybrid Vehicles

Hybrid gasoline/electric (and diesel/electric) vehicles are becoming increasingly popular in the United States. Hybrids combine a gasoline (or diesel) engine with an electrical motor system to improve efficiency. If their use becomes more widespread, they could help improve the overall efficiency of the vehicle fleet and could help limit oil consumption. Further, they could be used without significant changes to existing infrastructure, which has been a key barrier to the expanded use of alternative fuel vehicles. In model year 2005 Ford, General Motors, Honda, and Toyota will offer vehicles with hybrid powertrains. At the present time, only hybrid passenger cars, sport utility vehicles (SUVs), and one pickup are available in the United States, but hybrid versions of other vehicle models and classes are expected in the near future.

Because of their energy and environmental benefits, some states have provided drivers of hybrid vehicles an exemption from high occupancy vehicle (HOV) lane requirements. Under TEA-21 (which expired on September 30, 2003), states had the authority to grant HOV exemptions for so-called “Inherently Low Emission Vehicles” (ILEVs). The ILEV standard requires that a vehicle have no evaporative emissions, a standard that is not met by any current hybrid. However, because of the reduced emissions and improved fuel economy of hybrid vehicles, there is congressional interest in explicitly granting states the right to exempt them from HOV lane requirements. The conference report on H.R. 6 would have granted the exemption. Further, the highway reauthorization bill (H.R. 3550) would have reauthorized the HOV lane exemption and expanded it to certain “low-emission and energy efficient vehicles,” including some hybrids.
Further, as was stated above, there is interest in expanding the incentives for the purchase of hybrid vehicles (see “Vehicle Purchase Tax Incentives” above).

(For more information on hybrid vehicles, see CRS Report RL30484, Advanced Vehicle Technologies: Energy, Environment, and Development Issues.)

**LEGISLATION**

**108th Congress**

**H.R. 6 (Tauzin)**
Energy Policy Act of 2003. Title VII establishes an excise tax credit for ethanol and biodiesel fuels, establishes a tax credit for biodiesel production, and establishes tax credits for the purchase of alternative fuel, fuel cell, and hybrid vehicles. Title VIII authorizes $2.15 billion over five years for hydrogen and fuel cell R&D. Title XV requires renewable fuels in gasoline (3.1 billion gallons in 2005, increasing to 5.0 billion gallons in 2012), bans MTBE after 2014 unless the President determines otherwise (states can choose to authorize its use); eliminates RFG oxygen requirement, and authorizes funding for MTBE cleanup. Introduced April 7, 2003; referred to several committees; passed House April 11; passed Senate July 31; conference Report (H.Rept. 108-375) adopted by House November 18, 2003. Motion to invoke cloture failed in Senate November 21, 2003.

**H.R. 1054 (Camp)**

**H.R. 3550 (Young)**

**H.R. 4520, P.L. 108-357 (Thomas)**

**S. 505 (Hatch)**
CLEAR ACT (see H.R. 1054). Introduced March 4, 2003; referred to Committee on Finance.
S. 1548 (Grassley)
Volumetric Ethanol Excise Tax Credit (VEETC) Act of 2003. Eliminates the existing partial tax exemption for ethanol-blended gasoline. Establishes an excise tax credit for ethanol- and biodiesel-blended fuels. Establishes a tax credit (coordinated with the excise tax credit) for the use of biodiesel and biodiesel blends. Introduced July 31, 2003; referred to Committee on Finance; ordered reported by Finance Committee September 17, 2003; for more information see H.R. 4520.

S. 2762 (Grassley)
Amends the Tax Reform Act of 1986 to limit the quantity of duty-free imports of dehydrated ethanol from Caribbean Basin Initiative countries. Introduced July 22, 2004; referred to Committee on Finance.

S. 2769 (Daschle)
Precludes the use of imported ethanol to meet any future renewable fuels standard. Introduced July 22, 2004; referred to Committee on Environment and Public Works.
