## STANDARDIZED EDUCATIONAL TEST SCORES IP0294S

The Congressional Research Service receives numerous requests for information concerning standardized educational test scores of specific States and local communities. Standardized test scores typically are compiled only by the schools or school districts that administer the exams; in general, they can be obtained only by contacting school officials in each locality. Of increasing concern are the nationwide average scores on both the American College Test (ACT) and the Scholastic Aptitude Test (SAT).
This Info Pack provides basic information and background on standardized educational tests. Statistical material is included to reflect the most recent results of those who have taken these tests who intend to go to college.
Additional information on this subject, primarily in newspapers and periodicals, may be found in a local library through the use of indexes such as the Education Index, Public Affairs Information Service (PAIS), Readers' Guide to Periodical Literature, and the New York Times Index.
Members of Congress who want additional information may contact CRS at 287-5700.
We hope this information is useful.

 STANDARDIZED EDUCATIONAL TEST SCORESThe Congressional Research Service receives numerous requests for standardized educational test scores of specific States and local communities. With one exception, we are unable to provide such data. Standardized test scores typically are compiled only by the schools or school districts that administer the exams; in general, they can be obtained only by contacting school officials in each locality. While some school officials regularly provide test score data to the public (sometimes local newspapers publish them), others regard the scores as confidential and not for release. Where scores are available, normally school officials provide only averages or other group measures; they do not divulge scores of individual students except to parents or guardians.

At the present time, 44 States and the Districts of Columbia have some kind of statewide testing program in which all or most public school students in certain grades normally participate. (A list of these programs is attached.) In some States, students must attain at least a specified minimum score in order to be promoted or to graduate; in others, student scores are used only to diagnose strengths and weaknesses. While a number of States have developed their own tests for these assessments, reflecting their own priorities and curricula, others use one of several widely-administered exams such as the California Achievement Test or the Iowa Test of Basic Skills. Information about these tests can be obtained by writing to State departments of education. (The names and addresses of these agencies are attached.)

In the United States, students applying to college frequently are asked to take either the American College Test (ACT), sponsored and administered by the American College Testing Program of Iowa City, Iowa, or the Scholastic Aptitude Test (SAT) sponsored by the College Entrance Examination Board of New York City and administered by the Educational Testing Service of Princeton, New Jersey. The national mean (that is, average) scores for these exams are released annually. (Attached are tables showing the respective national means for the ACT since the 1969-1970 testing year and for the SAT since the 1951-1952 testing year.)

Recently, Educational Testing Service has begun releasing State mean SAT scores. (A copy of the latter for the 1982-83 testing year is attached.) To obtain State mean ACT scores, one must contact the appropriate State department of education. To obtain school district or individual school mean ACT or SAT scores, one must contact local school officials. Local district or individual school scores are not always available.

It is not clear what inferences, if any, can legitimately be drawn from the State SAT score means. The proportion of high school seniors taking the SAT or ACT varies so much from State to State (as does the proportion of children completing high school) that comparisons among States may be deceptive. For similar reasons, comparisons of ACT or SAT scores among school districts or individual schools may be misleading.

Care must also be taken in drawing inferences from State SAT score means about variations in the quality of education among the States. The SAT is designed to measure aptitude for college study, not to measure academic
achievement; it aims to predict who will do well in college, not to identify who has learned the most in elementary and secondary school. By itself, the SAT should not be considered a good indicator of the quality of previous schooling. (Standardized achievement tests in various academic subjects are also sponsored by the College Entrance Examination Board and administered by the Educational Testing Service. While these exams do measure the quality of academic preparation, they are taken by relatively few students who are not representative of college applicants, let alone of high school seniors in general.)

One nationally administered examination that can be used to help assess the quality of American elementary and secondary education is the National Assessment of Educational Progress (NAEP), a congressionally authorized series of tests for 9 -year olds, 13-year olds, 17-year olds, and young adults in reading, mathematics, science, social studies, writing, and other subjects. Test results are available for a number of different student characteristics such as sex, race, parents' education, and type and size of community; they also are avallable both for the country as a whole and for four regional divisions. NAEP results are not available by State, school district, or individual school. (Attached is a paper summarizing trends in NAEP results in reading, science, and mathematics.) Further information about the results of NAEP tests may be obtained by writing the National Assessment of Educational Progress, P.O. Box 2923, Princeton, New Jersey, 08541.

## AMERICAN COLLEGE TEST (ACT) AND SCHOLASTIC APTITUDE TEST (SAT) NATIONAL MEAN SCORES

Table 1 on the next page shows the estimated national mean (average) scores on the American College Test (ACT), a four-part multiple-choice exam designed to measure academic abilities students will need in postsecondary education. Students are measured in each part on the basis of the number of answers they get correct on scales of 1 to 33 (English), 1 to 36 (mathematical), 1 to 34 (social studies), and 1 to 35 (natural sciences); they also receive a composite score on a scale of 1 to 35 . Candidates with high scores, such as 25 , are generally considered to be more likely to have academic success in college than are candidates with low scores, such as 12. College officials use test results not only for deciding who should be admitted but also for guidance and placement.

The ACT is one of several postsecondary assessment exams sponsored and administered by the American College Testing Program, a private nonprofit organization.

| $1982-83$ | 17.8 | 16.9 | 17.1 | 20.9 | 18.3 |

1/ Source: American College Testing Program, based upon a 10 percent sample.

Table 2 on the next page shows the national mean (average) scores on the Scholastic Aptitude Test (SAT), a two-part examination designed to measure aptitude for college study. It consists of a verbal section and a mathematical section, each of which has multiple choice questions that test a variety of intellectual abilities. Candidates are measured on the basis of the number of answers they get correct (though to discourage guessing, a fraction of the number of incorrect answers is subtracted from the number that are correct), and are given a score for each section on a scale of 200 to 800 . Candidates with high scores, such as 700 , are generally considered to have greater aptitude for college work than candidates with low scores, such as 400 . Test results are used by college officials primarily to help them decide who should be admitted. They also are used for placement and guidance.

The SAT is one of several postsecondary education admissions tests sponsored by the College Entrance Examination Board, a private, nonprofit association. The Educational Testing Service has responsibility for preparing, administering, and scoring the SAT.

# SATs Are Getting in the Way of Education 

 Who cares about high scores? The question is: Have they learned anything?
## By Dan Morgan

Q Test (SAT) is: . Test (SAT) is.
$\square$ A clever device used by the educational establishment to avoid its responsibilities.

A hurdle of much-exaggerated importance for high school seniors trying to get into college.

One symbol of what's wrong with high school education in America.

The SAT itself does not allow an answer of "all of the above," but in this case, that is the correct answer. The declining status and significance of this test is one sign that the hidebound American secondary educational system is at last undergoing some significant changes.

Old institutions die slowly, and the SA'T still has a powerful mystique. It remains a tense rite of passage for nearly half of all high

Dan Morgan is an editor of Outlook.
school seniors. Yesterday, some 267,000 filed nervously into classrooms and auditoriums around the country to agonize over its multiple choice questions about vocabulary, grammen and math.
Yet there is a growing belief among educetors that the SAT is an outmoded educetonal instrument that is sending the wrong message, or at least an incomplete one, to the nation's high schools. In the 58 years of its existence, its creators have yet to define satisfactorily what, exactly, the SAT tests. It comes too late in high school careers to be much use in spotting areas where students need more help. And it does not examine how
well kids have actually mastered high school subjects such as chemistry, Spanish, American history or geography.

One sign of changing times was a little-noticed report from Harvard College this winter. Harvard confirmed that it was considering allowing future candidates for admission to skip the SAT altogether. Instead, applicants would have the option of submitting the results of tests that evaluate their mastery, or "achievement," in five high school academic subjects.

The new thinking about testing is part of a
fundamental reevaluation of what is needed to improve the quality of American secondary education, a reevaluation that marks a clear (and controversial) break with the recent past.
Educational reformers have been urging schools to radically revamp their curriculums, to eliminate the junk courses that have accumulated in them over the past two decades, and to require all students, not just collegebound ones, to master academic subjects such as world history and science.
For that, the nation clearly will need an overhauled testing system that helps students identify their strengths and weaknesses early
in the game, instead of one that sorts out the gifted (or the good test-takers) from the not-so-gifted at the end of the academic process.
The United States, alone of all major in: dustrial countries, relies primarily on a vague concept called "aptitude" to evaluate secondary school students.
This year 1.5 million seniors will take the SAT, the nation's leading aptitude test. Defenders of the exam say it tests a student's ability to think and reason. Many of the questions certainly do that; they are abstract puzzles requiring skills that some feel are beyond the schools' ability to teach. The defenders also say the SAT does test a certain kind of verbal and mathematical achievement. But the SAT does not test knowledge of high school courses.
That is not the main purpose, either, of the American College Testing Program exam (the ACT), which 900,000 students, most of them in the Midwest, will take this year.
knowledge of foreign language, history, English, science and math. The questions are made up after extensive consultation with high school teachers and college professors all over the country.)

It is easy to see why the U.S. educational establishment has been loath to test what high school students have learned.

As several major reports issued in the last few months state, high school curriculums in America are a "smorgasbord." The National Commission on Excellence in Education has reported that high schools have a "cafeteria-style curriculum in which the appetizers and desserts can easily be mistaken for the main course." Only 31 percent of high school graduates complete intermediate algebra and only 16 percent finish a geography course.

In an Illinois sample, it turned out that more than 2,100 different subjects were taught in the state's high schools, and a large portion of them were non-academic. That was in 1977. Since then, economic cuts and state-ordered reforms have sharply reduced electives, but curriculums everywhere are still bloated with such courses. Large high schools typically offer 150 or more courses, including subjects such as driving, speed-reading, gourmet cuisine, bowling, office management, food services, medical careers, "tots and toddlers" (baby care), women in society, wilderness survival and whale watching.

The available evidence is not reassuring about what high school students actually do learn. In 1976, one out of seven 17-year-olds thought the president did not have to obey the Law and only 12 percent were aware that plastics are petroleum products.

International comparisons are risky, given the uniquely broac bast
of U.S. public education, but results of such comparisons have not been flattering to the United States. In one, done between 1973 and 1977, American 13-to-18-year-olds tested near the bottom of industrial countries in civics, mathematics and reading comprehension.

Why has a schoolroom "smorgasbord," and its shoddy results, been tolerated for so long in a country that constantly boasts of its commitment to education? The answer is that the nation's educational leaders - its college deans, teachers' organizations, testing companies, high school principals and state and local authorities - have found convenient excuses to avoid taking action. They have persisently claimed that they can't agree among themselves on what students should know. And they have fallen back on an almost religious-sounding incantation: local authorities, not outsiders, should decide what is taught in local schools.

The SAT, with its alleged objectivity and its claim to be "curriculum free", has helped educators avoid the real issues of educational quality. For years, it provided admissions offices at elite colleges and universities with a convenient way to finesse the problem of identifying students' accom:
plishments, while still funneling gifted applicants to them.
Because it almost defied definition, the SAT enabled educators to duck the charge that they were dictating what schools should teach.
What makes recent proposals for educational reform so intriguing is that the proposals take a first stab at identifying the knowledge and skills that American students should acquire in high school. Several of the proposals call in so many words for something this country has never had: a high school curriculum, rooted in academic subjects and specific academic skills, that is generally accepted nationwide.
Last year, the College Board, a non-profit organization of 2,500 colleges, schools and school systems, issued a 36 -page booklet identifying "what [college] students need to know and be able to do." It listed six academic subjects (English, the arts, mathematics, science, social studies and foreign language), and six academic "competencies" (reading, writing, speaking and listening, mathematics, reasoning, and studying). The booklet was general enough to avoid charges that the College Board was "dictating" to the schools, but it went much further than ever before in saying that there are a set of definable goals for all schools. In some areas it got specific. Under world history, it said students should not only know about the Renaissance and the Industrial Revolution, but also "the spread of Islam."

The booklet was followed last sum. mer by the release of two major reports that questioned current high school curriculums.

One, the report of the National Commission on Excellence in Education, recommended that state and local authorities require all students seeking a diploma to take four years of English, three years of mathemat-

These SAT sample questions measure "aptitude." They require an ability to reason and comprehend abstractions - qualities that some feel are difficult to teach in a classroom. Six out of 10 students get the right answer to Question 1. Slightly less than one out of 10 correctly answer Question 2. (For correct answers, see box below.) By contrast, achievement tests measure how well students have mastered specific high school subjects. History achievements ask about the dates or significance of actual events and chemistry questions may test a student's knowledge of chemical reactions. The questions are from "Taking the SAT," the College Board's guide for high school students.

(A)

1. In the figure above, a rectangular piece of paper ABCD is folded along dotted line WZ so that $A$ is on top of $X$ and $D$ is on top of $Y$ and then folded along XY so that B is on top of W and C is on top of Z . A small semicircle $S$ with diameter on BC is cut out of the folded paper. If the paper is unfolded, which of the answers at right could be the result?
(B)

(C)

(D)

(E)

2. How many minutes will it take a rocket to travel 4,000 miles if its average rate is 100 miles every $t$ seconds?
(A) $\frac{2 t}{3}$
(B) $\frac{3 t}{2}$
(C) $\frac{2}{3 t}$
(D) $40 t$
(E) $2,400 t$

For better or worse, the testing system is sure to have a major impact on whether these curriculum reform proposals get off the ground.

The SAT became a mass, nationwide test after World War II, when higher education was expanding rapidly and colleges and universities needed some uniform indicators. Initially, SAT scores were thought to be an excellent predictor of college performance. When subsequent studies questioned that assumption, the rationale for the SAT changed.

The current, more modest view of the College Board, which sponsors the test, is that it is "one helpful piece of information."

Spokesmen for some college admissions offices say SAT scores help students evaluate their own scholastic strengths, so that they can "selfselect" colleges that fit those abilities. It identifies "gifted" (if high scores automatically warrant that adjective) students who otherwise might get lost in the admissions shuffle because they attend an undistinguished high school. And it provides a check on whether grades on high school transcripts accurately reflect a student's ability.

But Boyer and others suggest that the most important use of the SAT today is one for which it was never intended: as a report card on schools, not students. The decline in average SAT scores starting in 1964 has been a prime mover in calls for educational reform. And rightly or wrongly, communities often judge the quality of individual schools on how well students score on the test.

Most colleges, and ETS itself, have come to recognize the limitations of the SAT. Nevertheless, it is still associated with academic "merit," through the Preliminary SAT (PSAT), the exam in junior year which is used to select semi-finalists for National Merit Scholarships. If anything, students, parents and schools seem more obsessed than ever with SAT results, and a whole industry has grown up around coaching students to raise their scores.
This is ironic in view of considerable evidence that SAT scores will have little bearing on whether the vast majority of high school students enter the college of their choice.
"Most private colleges in America today, including some with rather

## ANSWERS:

Question 1: The answer is A.
uchievement (not aptitude), linking it to a "core" academic curriculum. Ah accompanying questiomaire could collect information about their inter. eata, goals, job history and expert ences. That information could then be used to help them choose suitable academic or employment opportuni; ties.

ETS has already begun work on a new series of diagnostic tests that teachers could use in classrooms to pinpoint students' strengths and weaknesses all through the academic year.
"We need better testing at the school level for purposes of instruction and learning," says ETS president Gregory Anrig. "Our present tests don't answer the question, 'How am I doing in progressing toward my goals?' We don't have tests that are helpful teaching tools."
A revamped testing system would create a new set of standards for schools and students. One obvious possiblity would be combining achievements and SATs, to get a more complete picture of a student's ability to reason and master academic subjects. Such a test could do a better job of recognizing personal qualities such as hard work, determination, curiosity and love of learning - all indispensable for doing well in academic subjects, but not necessarily for scoring high on aptitude tests.
Changes of this magnitude would face bureaucratic resistance. If implemented, there would be less need for teachers of "electives," but more demand for teachers who are really competent in their academic fields, as European and Japanese secondary school teachers tend to be.
Such reforms are bound to run into criticism that they favor students from affluent school systems blessed with gifted teachers. There is concern that raising academic standards too high might force kids out of school, especially minorities. That would defeat the purpose of U.S. public education, which has always strived to be open rather than exclusive. But it is hard to see how that could happen. It is the lack of higher education facilities, not the tests, that make European education selective. There are only 40 academic colleges in all of England, while nearly two out of three U.S. high school students go on to one of the nation's 3,000 colleges and universities.

The pressing issue for the United States is not wider access to higher education. It is the disappointing level of knowledge, academic skills and motivation of young people who feel, unjustifiably, that they have had a good education in high school.
highly selective, prestige colleges such as Swarthmore, Yale or the University of Virginia, SATs are still important. But such students are in a minority nationwide.

Of this year's $1,750,000$ collegebound seniors, nearly 700,000 will enter two-year colleges that, for the most part, have open enrollments. Another 400,000 will enter state universities, most of which - the Big Ten schools in the Midwest, for example - accept all applicants from their states. (The University of Wisconsin stopped requiring the test entirely in 1972.)

Another $650,000 \mathrm{go}$ on to four-year colleges. Many of these do use tests and are selective; but they are not nearly as selective as many students believe.
In all, probably no more than 80,000 of next year's freshman places will be in the 100 or so institutions where the combined math and verbal ,scores of entering freshmen average 1,100 or better out of a possible 1,600 , according to UCLA's Astin. In other words, a score of 650 on the verbals and 450 on the math would still be high enough to give a student a reasonable chance at a selective college. A combined score of 1,200 is high enough to get a student into 90 percent of the 50 most selective schools, Astin estimates.

One concern of educators such as George Hanford, president of the College Board, is that the message of Boyer and other reformers may be misinterpreted as a call for a return to a rigid curriculum emphasizing rote and fact learning. In emphasizing achievement and mastery, he warms, we could sacrifice thinking and reasoning. And in a rapidly changing world, those two qualities will be more important than acquiring knowledge.
In Hanford's view, the SAT is a good test of those important qualities. "I worry about too much emphasis on achievement," he says.
But even if the SAT does serve some useful purposes, it seems urgently in need of major modification.
For one thing, it ignores the needs of hundreds of thousands of students who are not going on to college, but who still need guidance in planning their futures. Boyer proposes replacing the SAT with a Student Achievement and Advisement Test (SAAT), which all students would take. It would evaluate their academic
By Lawrence Feinberg
Washmutom l'ost Stall writer
William J. Bennett, chairman of the National Endowment for the Humanities, was more cautious.
"Maybe you can say we're holding "Maybe," you can sarked, "hut we're steady at the bottom."
In 1963, just before the scores began their slide, the nationwide SAT average was 478 on the verbal
part and 502 on the mathematics part and 502 on the mathematics
part.
By 1980 and 1981, when the scores reached their lowest level, the combined average score had declined

 Last year, the scores rose 2 points
in verbal and 1 point in math.
"After dropping so much, this is just flat," Bennett said of the last two years' results. "Nobody can say

 800 points. The lowest is 200. The test is taken by about a third of all
high school seniors.
In math, the exam concentrates on problem-solving, using arithme-

The verbal part measures reading
comprehension and vocabulary. The new report is based on SAT After rising last year for the first time in almust two decades, the nationwide average score on the Scholastic Aptitude Test remained unchanged this spring, the College While last year's rise was celebrated as a possible "watershed" for American schools, the failure of this year's SAT scores to continue $t o$ ad-
vance was a disappointment to educators. The SAT is the nation's most
widely used college entrance exam, taken by almost 1 million high school seniors a year. The mathematics average on this year's exam was 468 , up one point from 1982, hut the verbal average fell one point to 425 .
"I think the trend line seems to indicate that we've leveled offi, that the slippage has stopped," said Robert G. Cameron, executive director of research and development for the tion of about 2,500 schools and col-
leges. ture," Cameron continued, "but I'm still optimistic that with all the reformers on the loose there will be some real improvement."
school systems will be available next week.

George H. Hanford, president of the College Board, said the 1-point rise in the nationwide SAT average in math "is apparently due to the improved performance of women, as the average score for women rose 2 points from 1982, while the average score for men remained the same."

Hanford said the score rise "coincides with increases in the amount of math that women report taking in high school and parallels their increasing interest in careers in such fields as business and computer science."

Even with the increase, however, the average math score for female students is 48 points below that of males. On the verbal part of the test, the average for males is 10 points ahead. Both sexes dropped 1 point on the verbal test last year.

Despite the mixed results on the test, data collected from students who take it indicate a continuing trend toward enrolling in more academic courses.

Since 1977, the average amount of study in major high school academic subjects-English, social studies, mathematics, foreign languages, and science-has increased from 15.8 to 16.3 years.

The greatest increases were in mathematics and physical science, particularly among female students, though males continue to take more courses in both subjects.
"I'm afraid we don't know what goes on in those courses," Cameron said. "We don't know how rigorous they are."

Average grades reported by high school students were unchanged for the fourth year in a row, though they are still down only slightly from the peaks of grade inflation reached in the mid-1970s.

Last year, the College Board reported that gains by blacks and other minority groups played a major role in the SAT increase, but scores for different ethnic groups on ,this year's test will not be published until December.

After a spurt during the 1970s, the proportion of test-takers who are black dropped slightly to 8.8 percent, down from a peak of 9.1 percent in 1980.

Asian students continued to increase rapidly, reaching 4.2 percent, more than double the 2.0 percent reported in 1975.

The proportion of students in private schools also rose, climbing from 17.5 percent to 19.7 percent since 1978.
