Science and Technology Policy: 
Issues for the 109th Congress

Updated September 1, 2006

Frank Gottron, Coordinator
Resources, Science, and Industry Division
Science and Technology Policy: Issues for the 109th Congress

Summary

Science and technology have a pervasive influence over a wide range of issues confronting the nation. Decisions on how much federal funding to invest in research and development (R&D), and determining what programs have the highest priority, for example, may have implications for homeland security, new high technology industries, government/private sector cooperation in R&D, and myriad other areas.

This report indicates the sweep of science and technology in many public policy issues, although it cannot provide a comprehensive examination of every science or technology issue which may be of interest to Congress. In some areas, such as global climate change and stem cell research, the importance of science and technology is explicit and in the forefront of the policy debate. In others, such as patent protection and telecommunications reform, science and technology may not be as explicit, but are important drivers affecting how policy makers may make decisions. This report also addresses key issues that directly affect, or are affected by, science and technology. Other mechanisms which may indirectly impact science and technology — such as tax, antitrust, and trade policies — are outside the scope of this report.

The appropriate level of federal funding for research and development (R&D) is among the issues facing Congress. Federal R&D funding spurs technological advancement, which contributes to economic growth, and plays a role in the education of future scientists and engineers. Members of congressional committees that oversee R&D have expressed concern about the possible repercussions of restraining R&D funding.

Science and technology also are important components of homeland security issues. Not only is Congress debating funding levels for R&D for counterterrorism, but issues concerning public access to scientific information, and technological and privacy aspects of “data mining” (a potential means to identity terrorist activities and track individual terrorists themselves). Congress is addressing a wide range of other science and technology policy issues, from tsunami forecasting and warning, to “telecom reform” (revising the Telecommunications Act of 1996), to cloning and stem cell research, to ocean policy and global climate change. Several energy issues are being debated, including President Bush’s Hydrogen Fuel Initiative, and reprocessing of spent nuclear fuel. The “transformation” of the National Aeronautics and Space Administration (NASA) as it implements President Bush’s “Vision for Space Exploration,” is receiving close attention as the agency announces related job cuts and program changes, including sharp cutbacks in aeronautics R&D.

This report identifies other CRS reports that treat most of those issues in more depth. It is updated occasionally. Many of the CRS reports cited herein are updated more often, and should be consulted for timely information.

Science and Technology Policy: Issues for the 109th Congress

Introduction

Science and technology are an underpinning of, and have a pervasive influence over, a wide range of issues confronting the nation. Decisions on how much federal funding to invest in basic and applied research and in research and development (R&D), and determining what programs have the highest priority, for example, could have implications for homeland security, new high technology industries, government/private sector cooperation in R&D, and myriad other areas.

Following are brief discussions of key science and technology issues being debated in the 109th Congress. Where available, additional CRS reports and issue briefs that discuss these topics in more detail are identified at the end of each section. Many of those reports are regularly updated, and should be consulted for timely information.

Research and Development Budget, Management, and Workforce

Federal Government Investment in R&D

The constrained fiscal environment is putting pressure on the full range of federal government spending, including funding for research and development (R&D). Debate is ongoing in the 109th Congress over how much to spend on various R&D activities (see next issue), but a more fundamental question is why the government invests in R&D at all rather than relying on the private sector, universities, and other non-profit groups.

Traditionally, the government’s role in R&D funding is to meet the mission requirements of the federal departments and agencies. Included is support for basic research — that work undertaken to gain knowledge and understanding of the fundamental aspects of nature. The payoff for basic research is generally long in coming, the results may be unmarketable, and the rewards often diffused among many users, making private sector investment less likely. However, as stated in the Analytical Perspectives accompanying President Bush’s FY2006 budget request, “R&D is critically important for keeping our nation economically competitive, and it will help solve the challenges we face in health, defense, energy, and the environment” (p. 61). As part of the “American Competitiveness Initiative,” announced by the President in the 2006 State of the Union address, the
Administration will attempt to double over 10 years funding for “innovation-enabling research” done in several government agencies.

In the United States, while the development of new products, processes and services for the commercial marketplace is primarily a private sector activity, the government may get involved for certain limited purposes. Federal support is often provided for those efforts that typically have been determined to be necessary for the “national good” but which cannot, or will not, be financed by industry. Government also plays a role in structuring the environment in which business decisions are made and thereby influences private sector behavior. Direct federal funding, tax policies, and the existence of government markets for certain technologies, including defense, public health, and information technology-related goods, have helped influence resource allocations in the business community.

According to the National Science Foundation’s *Science and Engineering Indicators 2006* (Appendix Table 4-5), in 2004 (the latest year for which data are available) industry funds accounted for 64% of U.S. R&D, while the government financed 30% of the total spending, with the remaining 6% provided by universities, colleges, and other non-profit institutions. Industrial support for R&D is concentrated on development rather than on research activities. The government encourages private investment in R&D through direct measures such as the research and experimentation (R&E) tax credit (see CRS Report RL31181), and through indirect measures including ownership of intellectual property and cooperative R&D activities (discussed below under Technology Development Issues).

The myriad effects of federal R&D spending highlight the importance of decisions regarding the amount and distribution of federal R&D funds. Choices made by the 109th Congress related to the financing of research and development may have immediate impacts on current programs as well as long term effects on the nation’s technological progress.

For Further Information

CRS Report RL33345, *Federal Research and Development Funding: FY2007*

**FY2007 R&D Budget**

The Bush Administration requested $137.2 billion in federal research and development (R&D) funding for FY2007. This sum represents a 2.6% increase over the estimated $133.7 billion that was approved in FY2006. As in the recent past, the FY2007 increase over the FY2006 estimated funding levels is due to significant funding increases in the Department of Defense (DOD) and the National Aeronautics and Space Administration’s (NASA’s) space vehicles development program.
According to the most recent NSF R&D data, in 2004, the United States spent $312.1 billion on R&D. Of that amount, $199 billion, or 63.8%, was spent by industry. The federal government was a distant second, accounting for $93.4 billion, or 29.9% of the national total. The remaining 6.3% is divided between universities (with $11.1 billion, or 3.6% of the national total) and nonprofits (with $8.6 billion, or 2.7% of the national total). The federal share of total national R&D expenditures declined below 50% for the first time in 1979. By 2000, the federal share of total R&D had reached a record low of 24.9% before it rose to 29.9% of total national R&D expenditures in 2004.

The centerpiece of the President’s proposed FY2007 R&D budget is the American Competitiveness Initiative (ACI). The President proposed this initiative in response to growing concerns about America’s ability to compete in the technological global market place. Over the next 10 years, the $136 billion initiative would commit $50 billion for research, science education, and the modernization of research infrastructure. The remaining $86 billion would finance a revised permanent R&D tax incentive over the next 10 years. The most recent federal research tax credit expired on December 31, 2005. In his budget request, the President asked Congress to pass a permanent Research and Experimental Federal tax credit.

As part of the $50 billion for research, the President has called for doubling federal R&D funding over 10 years. This increase would include the physical sciences and engineering research in three agencies: the National Science Foundation (NSF), the Department of Energy’s (DOE’s) Office of Science, and the National Institute of Standards and Technology (NIST). According to the Administration, in FY2007, the ACI overall funding increases for NSF, DOE, and NIST would be $910 million, or 9.3% above FY2006 estimated funding levels for the three agencies.

Government Performance and Results Act (GPRA) and the President’s Management Agenda

The Government Performance and Results Act of 1993 (GPRA), P.L. 103-62, is intended to produce greater efficiency, effectiveness, and accountability in federal spending and to ensure that an agency’s programs and priorities meet its goals. It also requires agencies to use performance measures for management and, ultimately, for budgeting. Recent actions have required agencies to identify more precisely R&D goals and measures of R&D outcomes. As underscored in The President’s Management Agenda, beginning in FY2001 and in each year thereafter, the Bush Administration has emphasized the importance of performance measurement, including for R&D. In a memorandum dated June 5, 2003, signed jointly by the Office of Science and Technology Policy (OSTP) Director and the Office of Management and Budget (OMB) Director regarding planning for the FY2005 R&D budget requests, the Administration announced that its effort to base budget decisions on program performance would continue and be expanded (OMB M-03-15). OMB
referred to this memo again in the FY2006 and FY2007 R&D budget guidance, which reiterated the importance of performance assessment for R&D programs (respectively, OMB M-04-23 and OMB M-05-18.)

As in recent years, Section 5 of OMB’s Analytical Perspectives, Budget of the U.S. Government, FY2007, discusses requirements for agencies to use OMB criteria to measure research outcomes, focusing on relevance, quality, and performance. R&D performed by industry is to meet additional criteria relating to the appropriateness of public investment, demonstrate a capability to measure benefits, and identify decision points to transition the activity to the private sector. The Administration assessed some R&D programs by use of the Program Assessment Rating Tool (PART) which uses the OMB R&D criteria and other measures. PART results for 102 R&D programs were used when making FY2007 budget decisions. OMB’s Analytical Perspectives volume reports that 29 programs were judged effective, 41 were moderately effective. Commentators point out that it is difficult to define priorities for most research and to measure the results quantitatively or qualitatively, since research outcomes cannot be defined well in advance and often take a long time to demonstrate. As a result some say they have little confidence that R&D performance measures can be used to recommend budget levels and suggest that Congress may not use such measures as much as the Administration. Congress may increase attention to using R&D performance measures in authorizations and appropriations as discretionary spending becomes constrained.

Interest continues in monitoring the PART process, as well as in the Administration’s budget and performance integration initiative and in implementation of GPRA. In the 109th Congress, the House Government Reform Committee has approved H.R. 185, to provide a statutory mandate for PART-like reviews; it is similar to H.R. 3826, which the committee reported favorably in the last Congress. Also in the 109th Congress, the Administration has proposed to create a sunset commission, which would require performance reviews and automatic program termination unless programs were reauthorized. Bills reflecting the Administration’s proposal have been introduced (S. 1399, H.R. 3276, H.R. 3277). Hearings were held in September 2005 on the two House bills. There are also proposals in the 109th Congress to create accountability commissions (H.R. 2470 and S. 1155). Some in Congress are not yet comfortable with using performance measurement data to make budget decisions and prefer to use traditionally formatted budget information, which focuses on inputs, rather than outputs, or political judgements to make budget decisions. (See Amelia Gruber, “Lawmakers Remain Skeptical of Linking Budget, Performance,” GovExec.com, Jan. 13, 2004, and GAO, Performance Budgeting: Observations on the Use of OMB’s Program Assessment Rating Tool for the FY2004 Budget, GAO-04-174, Jan. 2004).

For Further Information

CRS Report RL32164, Performance Management and Budgeting in the Federal Government: Brief History and Recent Developments
CRS Report RS22181, A Sunset Commission for the Federal Government: Recent Developments
Information Quality Act Implementation and Peer Review

The Information Quality Act (IQA), sometimes referred to as the Data Quality Act, was enacted in December 2000 as Section 515 of the Treasury and General Government Appropriations Act for Fiscal Year 2001 (P.L. 106-554). The act required OMB to issue guidance to federal agencies designed to ensure the “quality, objectivity, utility, and integrity” of information disseminated to the public. It also required agencies to issue their own information quality guidelines, and to establish administrative mechanisms that allow affected persons to seek correction of information maintained and disseminated by the agencies that they believe does not comply with OMB guidance. OMB’s February 2002 final guidance notes that IQA applies to virtually all federal agencies and defines “information” as “any communication or representation of knowledge such as facts or data, in any medium or form.” The guidelines define “dissemination” as any “agency initiated or sponsored distribution of information to the public.” OMB indicated that “quality” encompasses elements of utility, objectivity, and integrity, and said agencies can generally presume that data are “objective” if they have been subject to an independent peer review process.

In December 2005, OMB provided Congress with a report on the implementation of the IQA during FY2003 and FY2004. The report said the agencies received only 85 substantive IQA-related correction requests during those two fiscal years, but noted that the agencies received many other requests that were similar to those received before the IQA. Of the 85 requests, 45 were initially denied by the agencies. Of these, 28 were subsequently appealed, with 13 of those appeals denied by the end of FY2004. Some of the denied correction requests were handled through other means (e.g., treating them as comments on proposed rules), and OMB noted that many of the denials were based on reasonable interpretations of information. OMB indicated that the correction requests came from all segments of society, and said there was no evidence that the IQA had affected the pace of rulemaking. Comments from OMB and others suggest several possible areas for improvement of the IQA’s implementation.

A major test of the IQA may be whether agencies’ denials of information correction requests are subject to judicial review. In March 2006, the U.S. Court of Appeals for the Fourth Circuit ruled that the act does not permit judicial review. Two district courts had previously reached a similar conclusion, and the Department of Justice issued a brief stating that the IQA does not permit judicial review. The U.S. Chamber of Commerce has indicated that it plans to ask Congress to provide for judicial review of agencies’ actions under the act.

CRS Report RL32680, Peer Review: OMB’s Proposed and Revised Bulletins
Science and Technology Education

An important aspect of U.S. efforts to maintain and improve economic competitiveness is the existence of a capable scientific and technological workforce. The Bureau of Labor Statistics reports that science and engineering occupations are projected to grow by 21.4% from 2004 to 2014, compared to a growth of 13% in all occupations during the same time period. It is anticipated that approximately 65% of the growth in science and engineering occupations will be in the computer-related fields. Faster than average growth is expected in the life sciences, social science, and the science and engineering-related occupations of science manager. Simultaneous with predictions of the future scientific workforce are data reporting a decline in the number of students seeking degrees in certain fields. While 31.8% of the undergraduate degrees awarded are in science and engineering compared to degrees in all fields, the percentage has declined or been static in the past several years. Due in part to the impending retiring scientific and engineering workforce, there is growing concern by many in the scientific community, industry, research-driven federal agencies, and Congress about the production of the nation’s science, mathematics, engineering, and technical personnel.

The demographics of the science and engineering workforce have been the subject of debate. The demographics of the nation have been changing, with more than 25% of the U.S. population composed of certain minorities — blacks, Hispanics, and Native Americans. As a group, these minorities have traditionally been underrepresented in the science and engineering disciplines compared to their proportion of the total population. Another underrepresented group in the sciences is women, a group that comprises 50.8% of the population. Together, these groups comprise what some may call a “new majority.” While minorities have increased their share of degrees awarded in the past 10 years, poor preparation in science and mathematics is said to be a major factor limiting the appeal of science and engineering to many in these groups. In addition, a large number of blacks, Hispanics, and Native Americans lack access to many of the more rigorous college preparatory course offerings.

Several pieces of legislation have been introduced during the 109th Congress to address the reported needs in science and mathematics education. Some of the bills have been signed into law. P.L. 109-163, the National Defense Authorization Act of 2006, has, among other things, made permanent the Science, Mathematics and Research for Transformation program to address projected shortages of scientists and engineers in the national security workforce. P.L. 109-171, the Deficit Reduction Act of 2005, establishes the Academic Competitiveness Grants and the National Science and Mathematics Access to Retain Talent Grants programs. Both programs are directed at supporting students pursuing degrees in the physical, life, and computer sciences, mathematics, engineering, technology, and critical foreign languages.

Additional pieces of competitiveness legislation have been introduced in the 109th Congress that have as a key provision, funding and strengthening science and mathematics education. The bills are S. 2197, Protecting America’s Competitive Edge Through Energy Act, S. 2198, Protecting America’s Competitive Edge through Education and Research Act, and S. 2199, Protecting America’s Competitive Edge Through Tax Incentives Act, (S. 2197, S. 2198, and S. 2199 are commonly referred
to as the PACE legislation), and H.R. 4654, National Innovation Act of 2006. The proposed initiatives, expanded programs, restructured curricula, and funding levels included in the various components of the PACE legislation and H.R. 4654 differ to some extent, but are all directed at improving teacher recruitment and retention, improving the skills of existing teacher workforce, attracting and retaining students in science, mathematics, and engineering, and the establishment of centers of excellence, clearinghouses, and distinguished scholar programs.

H.R. 5358, Science and Mathematics Education for Competitiveness Act, renames the National Science Foundation’s (NSF) Mathematics and Science Partnership Program to become the School and University Partnerships for Science and Mathematics Education. Funding would not be limited to teachers improvement as originally outlined, but preference would be given to those applications that have teacher training as a focus. Grants would include teacher training activities to prepare science and mathematics teachers to teach Advanced Placement and International Baccalaureate courses. Funding would increase from $63 million in FY2007 to $103 million in FY2011. The bill extends the authorization of and expands NSF’s Science Technology, Engineering, and Mathematics Talent Expansion Program (STEP), which provides grants to institutions to improve their undergraduate science, engineering and mathematics programs. The bill supports both majors and non-majors taking science, engineering, and mathematics courses. Language is included directing the NSF to enforce the statutory requirement that a grant include a numerical target for increasing the number of science majors and that the target number be used in the evaluation of the grant. It is anticipated that the 109th Congress will continue to examine issues important to science and mathematics education, including those of the preparation and performance of U.S. students at the precollege level, the diversity of the scientific and technical workforce, and the impact of visa regulations on foreign students in graduate science and engineering programs (see next issue).

CRS Report RL33434, Science, Technology, Engineering, and Mathematics (STEM) Education Issues and Legislative Options

Foreign Science and Engineering Presence in U.S. Institutions and the Labor Force

The increased presence of foreign students in U.S. graduate science and engineering programs continues to be of concern. Enrollment of U.S. citizens in graduate science and engineering programs has not kept pace with that of foreign students in those programs. In many institutions, foreign graduate students on temporary visas comprise 40% to 50% of some science and engineering programs. In addition to the number of foreign students, a significant number of university faculty in the scientific disciplines are foreign, and foreign-born doctorates are employed in large numbers by industry.
Many in the scientific and engineering communities maintain that to compete with countries that are rapidly expanding their scientific and technological capabilities, the United States needs to bring in those whose skills will benefit society and will enable us to compete in the new-technology-based global economy. Individuals supporting this position believe instead of limiting the number of foreign students, the conditions under which foreign talent enters U.S. colleges and universities and the labor force should be more carefully scrutinized and controlled to address any security concerns. Furthermore, there are those who contend that the underlying concern of foreign students in graduate science and engineering programs is not necessarily that there are too many foreign-born students, but that there are not enough U.S. students.

The debate on the presence of foreign students in graduate science and engineering programs and the workforce has intensified as a result of the terrorist attacks of September 11, 2001. Concerns have been expressed about certain foreign students receiving education and training in sensitive areas. In addition, there has been increased discussion about the access of foreign scientists and engineers to R&D related to chemical and biological weapons. In May 2004, several higher education organizations released a combined statement on the impact of the new visa policies on higher education and the scientific enterprise. They maintain that the new procedures have made the visa system inefficient and that the tighter visa restrictions are a major deterrent to foreign students and scholars considering working and studying in this country. During the 108th Congress, several hearings were held to examine the visa system for foreign students. Discussions focused on the increased scrutiny of foreign students from countries that sponsor terrorism, and the restrictions placed on the participation of foreign students and scientists in military-sponsored projects and other types of R&D.

On February 15, 2005, the State Department announced that progress has been made in reducing the clearance time for the Visas Mantis process. Currently, the process averages 15 days. Additionally, the State Department has revised the clearance procedures by reducing the restrictions placed on students and scholars and extending the validity of the clearances (lengthening the time for each clearance). In February 2005, the Government Accountability Office released the report Border Security: Streamlined Visas Mantis Program Has Lowered Burden on Foreign Science Students and Scholars, but Further Refinements Needed which details the efforts and the improvements that have been made in the visa processing.

A May 10, 2005 report of the National Academies, Policy Implications of International Graduate Students and Postdoctoral Scholars in the United States, notes the importance of international students to U.S. society not only academically and economically, but in terms of global and cultural knowledge and understanding. However, NSF data reveal that the number of non-U.S. citizens enrolling in U.S. colleges and universities has slowed since 2001 because of the tightening of U.S. visa policies, increased global competition for graduates in scientific and technical disciplines, and reports that foreign students may encounter an “inhospitable environment.”

On September 13, 2005, the House Subcommittee on National Security, Emerging Threats, and International Relations held a hearing to examine the
procedures put in place to correct the gaps and vulnerabilities in the visa process. Attention was directed at the mechanisms that are necessary to strengthen the visa process as an antiterrorism tool while simultaneously facilitating legitimate travel by foreign students, scientists, researchers, and others in the United States. Witnesses testified that consular workloads have increased significantly, yet the visa-processing offices continue to lack strategic direction, adequate resources, and training. In addition, reliable data are not readily available, across and among departments and agencies, to determine security and visa fraud related issues and overall increased visa wait times. Witnesses stated that because visa policies and requirements are ongoing and can change quickly, clear procedures on visa issuance and monitoring operations worldwide are necessary to guarantee that visas are adjudicated in a consistent manner at each visa-issuing post.

On May 25, 2006, the Senate passed S. 2611, the Comprehensive Immigration Reform Act of 2006. The bill would, among other things, increase the numerical limits on H-1B visas from 65,000 to 115,000 and develop a formula for determining future admissions. In addition, S. 2611 would add a new exemption from the annual limits for H-1B holders who have been awarded graduate degrees in the scientific and technical disciplines from U.S. colleges and universities. It is anticipated that the 109th Congress will continue to monitor the participation of foreign students in graduate science and engineering programs and the processing of visas for foreign science students and scholars. In addition, there may be further debate regarding the increased scrutiny of foreign students from countries that sponsor terrorism, and the restrictions placed on the participation of foreign students and scientists in certain types of R&D. There are questions as to whether or not a continued reduction in the immigration of foreign scientists may impact negatively on the competitiveness of U.S. industry.

CRS Report RL33125, Immigration Legislation and Issues in the 109th Congress

Homeland Security Issues

Counterterrorism R&D

Since the terrorist attacks in 2001, additional federal funding has been devoted to counterterrorism R&D, and new planning and coordination mechanisms have been established both in individual agencies and in the White House. The Homeland Security Act of 2002 (P.L. 107-296) consolidated some R&D activities and coordination responsibilities in the new Department of Homeland Security (DHS), especially in its Directorate of Science and Technology (S&T). During the 108th Congress, oversight focused on the establishment of the S&T Directorate. In the 109th Congress, policy issues include the coordination of programs and priorities, both between agencies and within DHS; the use of performance goals and metrics to monitor S&T program accomplishments; the adequacy of R&D resources for topics
of particular congressional interest, such as cybersecurity; the integration of threat assessment information into R&D priority-setting and coordination; the objectivity and efficiency of S&T contract and grant awards; and the management of the directorate.

Coordination of federal counterterrorism R&D is a particular challenge because relevant programs exist in many different agencies and accurate information about their activities can be difficult to obtain. The R&D programs of DHS account for only about one-third of total expenditures for homeland security R&D. Other agencies with large counterterrorism R&D responsibilities include the National Institutes of Health (focused on bioterrorism) and the defense and intelligence agencies. Also involved are the Departments of Justice, Commerce, Energy, and Agriculture, the National Science Foundation, the Environmental Protection Agency, and others. Under the Homeland Security Act, DHS has some authority to coordinate and help set priorities for other federal homeland security R&D, including human health-related R&D. What that authority means in practice remains to be seen. The heads of other agencies have no formal role in DHS’s R&D priority-setting and coordination, and conversely, the role of the DHS Secretary in setting priorities for those agencies is undetermined. DHS’s effectiveness in planning and coordinating R&D may depend upon the Secretary’s ability to influence other agencies through his interactions with existing counterterrorism coordination mechanisms in OSTP, NSTC, and interagency committees.

Internal coordination and priority-setting within DHS are also of congressional interest. The FY2004 homeland security appropriations conference report (H.Rept. 108-280) expressed concern about the potential for duplication, waste, and inadequate management oversight, and directed DHS to “consolidate all Departmental research and development funding within the science and technology programs in the FY2005 budget request.” DHS did propose consolidating the Coast Guard RDT&E program and some smaller programs into the Science and Technology Directorate in FY2005, but Congress rejected the move of the Coast Guard program. For FY2006, DHS again proposed consolidating the Coast Guard program, along with the R&D activities of the Transportation Security Administration and some smaller programs. Congress again rejected the Coast Guard move. For FY2007, DHS proposed moving all radiological and nuclear R&D out of S&T into the new Domestic Nuclear Detection Office. Consolidation remains an issue for congressional oversight in the 109th Congress. Other issues include questions about how DHS sets priorities among its various R&D programs, how it utilizes the R&D capabilities of the national laboratories, and how it manages and oversees R&D procurement.

Federal funding for counterterrorism R&D has increased significantly since the terrorist attacks in 2001, despite the constrained budget environment. According to estimates by the American Association for the Advancement of Science, in FY2004 the government-wide total exceeded $3.5 billion, compared with less than $600 million in FY2001. For FY2006, Congress appropriated about $5.1 billion. The Administration requested about a 0.6% reduction for FY2007. The Administration has made homeland security a budget priority for interagency R&D planning, but further growth may pose challenges as the 109th Congress continues to balance competing needs in a tight budget. (For the current status of FY2007 funding for
Federal chemical, biological, radiological, and nuclear (CBRN) terrorism countermeasure research and development is concentrated in three departments: the Department of Health and Human Services (HHS), the Department of Homeland Security (DHS), and the Department of Defense (DOD). HHS, largely through the National Institutes of Health (NIH), has traditionally focused on basic research to support biomedical countermeasure development. Increasingly, HHS supports the development of new countermeasures by grants to fund advanced development and clinical trials. DHS CBRN research and development programs focus on threat awareness and characterization (including material threat determinations for Project BioShield), agent surveillance and detection, forensics, and post-event response and restoration. DOD has a significant biomedical countermeasure research and development program which focuses on protecting warfighters from CBRN weapons and tends to emphasize prophylaxis.

The three departments’ programs have the potential for either synergy or redundancy. Strong executive branch management and congressional oversight may be crucial for maximizing synergy and avoiding redundancy. In the 109th Congress, committees in both chambers have held hearings related to interagency coordination of CBRN defense efforts. This attention appears likely to continue for the remainder of the 109th Congress.

Enactment of the Project BioShield Act of 2002 (P.L. 108-276), a ten-year $5.6 billion biomedical countermeasures acquisition program, removed some of the barriers that had discouraged pharmaceutical and biotechnology companies from developing countermeasures. Both chambers have held hearings during the 109th Congress on the implementation of this program. Congressional concerns include the perceived slow rate that the program acquires countermeasures and the decision process for choosing countermeasures. This scrutiny is likely to continue with additional oversight hearings.

Congress is considering several bills which add to or modify the Project BioShield Act of 2002. As part the Department of Defense Appropriations Act, 2006 (P.L. 109-148), Congress limited the tort liability of biomedical countermeasure
producers. Some of remaining issues likely to receive congressional consideration are provisions removing additional barriers that discourage private-sector countermeasures development, such as streamlining the Food and Drug Administration drug approval process and helping transition products from basic research into advanced development. Additional financial incentives for companies developing countermeasures, including tax credits and patent extensions, are also likely to receive congressional consideration.

Bioagent Lab Registration and Security

A program to track organisms that could potentially be used for bioterrorism — the Select Agent program — was first established in the Antiterrorism and Effective Death Penalty Act of 1996 (P.L. 104-132). The law required the Secretary of HHS to regulate the transfer (though not the possession) of so-called select agents, which are viruses, bacteria, fungi, and toxins that may pose a severe threat to public health and safety. The initial regulation required the registration of any laboratory shipping or receiving the agents, and documentation of these transfers. The Public Health Security and Bioterrorism Preparedness and Response Act of 2002 (P.L. 107-188) expanded the scope of the program by requiring the registration of all facilities possessing select agents, not just those shipping or receiving them.

P.L. 107-188 gave the Department of Agriculture (USDA) similar authority to develop a list of biological agents and toxins that may pose a severe threat to crops and livestock and to regulate facilities that possess, use, or transfer those agents and toxins. The law instructed HHS and USDA to coordinate their activities regarding so-called overlap agents, those agents that affect both human and animal health and that therefore appear on both agencies’ lists.

P.L. 107-188 also instructed the HHS Secretary, in consultation with the Attorney General, to establish safety and security requirements for registered laboratories. Individuals given access to select agents must undergo background investigations conducted by the Federal Bureau of Investigation. Both P.L. 107-188 and the USA PATRIOT Act (P.L. 107-56) barred access by certain groups of individuals, based on criminal history, immigration status, and other factors. Congress authorized the Select Agent program through 2007, with an indefinite appropriation.

In December 2002, HHS and USDA issued interim final regulations to implement the expanded program. Both departments issued final rules, with only minor changes, in March 2005. The HHS regulation is codified at 42 CFR 73.0, and the USDA regulation at 7 CFR 331 and 9 CFR 121. In addition to the provisions
discussed above, all labs possessing select agents are required to submit detailed security, training, and record-keeping plans in order to be registered.

While the Select Agent program emphasizes the prevention of the intentional use of these agents by individuals seeking to cause harm, there have also been concerns about the unintentional release of these agents from registered facilities. Such releases could potentially result from the failure of environmental controls, or from improper laboratory practices. (Worldwide, there have been several instances in which laboratory workers became infected with communicable diseases in the course of their work, and went about in the community before the infections were recognized.) The Select Agent final rule requires that registered facilities have, in addition to the biosecurity provisions discussed above, biosafety plans to address good laboratory practices, worker safety, and related matters.

In 2003, in order to boost national capacity for bioterrorism preparedness and response, the National Institutes of Health awarded construction grants for two Biosafety Level 4 (BSL-4) labs (the type of lab with the highest level of containment, designed for work with dangerous and exotic agents that pose a high risk of life-threatening disease, e.g., Ebola virus), and nine BSL-3 labs (designed to handle pathogens with a lower level of risk, but still capable of causing life-threatening disease, e.g., West Nile virus). Despite the safety and security requirements imposed by the Select Agent rule, there has been opposition to the construction of these laboratories in some communities, due to concerns about the possible intentional or unintentional release of dangerous pathogens.

Public Access to Scientific Information

Policies to provide access to scientific and technical information that protect the nation against terrorist attacks require balancing issues of national security, scientific communication, and constitutional and statutory protections that permit public access to information used for accountability and oversight. Historically, the U.S. government has used classification procedures to protect scientific and technical information that might compromise national security. Fundamental scientific information whose release does not compromise security is to remain unclassified pursuant to Executive Order 12958 and National Security Decision Directive 189. After the 2001 terrorist attacks, the government widened controls on access to information and scientific components. Policies are being implemented to control access to federally owned information labeled “sensitive but unclassified” (SBU) or “sensitive homeland security information” (SHSI). This includes information that agencies previously posted on websites or made available upon request. Consideration is being given to preventing publication of some non-federally owned scientific and technical information.

Some critics say that criteria for identifying SBU information have not been defined clearly, causing inconsistency among agencies and complicating the design and implementation of policies to access and safeguard such information. White House directives and federal agencies have used the term SBU in various ways to label and control information. Some agencies refer to definitions for controlled information, such as for “sensitive,” found in the Computer Security Act, or to
information exempt from disclosure through the Freedom of Information Act (FOIA) or the Privacy Act. Those laws gave agencies some discretion and permitted use of risk analysis to identify information to be safeguarded. Pursuant to the Federal Information Security Management Act of 2002 (FISMA), the National Institute of Standards and Technology (NIST) has developed guidance for agencies to identify and use risk-based criteria to control access to unclassified, including sensitive, information and information systems. These were to become mandatory in December 2005, but many agencies do not appear to have developed policies and procedures responsive to NIST’s guidance.

P.L. 107-296, the Homeland Security Act, requires the President to prescribe and implement procedures for agencies to identify and safeguard sensitive but unclassified homeland security information (Secs. 891 and 892). OMB had planned to issue related guidance in 2003; on July 29, 2003, in Executive Order 13311, the President delegated his responsibility for preparing such guidance to the DHS Secretary; guidance has not been issued as of August 2006. On December 16, 2005, the President instructed federal agencies by memorandum to standardize procedures to designate, mark, and handle SBU information, and to forward recommendations for government-wide standards to the Director of National Intelligence (DNI). Government-wide policy is to be developed by December 2006. In 2004, DHS promulgated rules for safeguarding its own sensitive unclassified information and that provided to it by other agencies and nongovernmental entities. Issues of possible interest to Congress include whether agencies, which have some discretion to identify SBU, are using uniform criteria to identify such information, to control it, and to permit access to it while protecting information that should be withheld; design of an appeals process since the information is not classified; assessment of the pros and cons of wider SBU controls in relation to accountability; and possible classification of federally-owned basic research information, since heads of some agencies performing basic research were given original classification authority. Legislation has been introduced on these issues and the Government Accountability Office is taking inventory of the SBU procedures used by federal agencies.

The federal government has traditionally supported the open publication of federally funded, extramural research results conducted by nongovernmental scientists. In cases where release of fundamental research results might compromise national security (e.g. atomic energy and cryptography research), federal policy prescribes the use of classification to limit dissemination. A series of research publications have increased concern whether publication of some federally funded extramural research results could threaten national security. As a result, some have suggested that such research results should be reviewed for security implications before publication, while others say that such review would damage scientific progress and productivity. Most scientists and publishers have implemented some voluntary self-regulatory measures regarding publication of potentially sensitive manuscripts, but these efforts may not be considered stringent enough. The Department of Health and Human Services, following select recommendations presented by the National Academies report, Biotechnology Research in an Age of Terrorism, established the National Science Advisory Board for Biosecurity to provide guidance for the identification of research that may require special security attention. The controls designed by professional groups undoubtedly will be guided by federal policy as it develops.
One of the biggest challenges facing the Department of Homeland Security (DHS) is the ongoing effort to consolidate the computer and communications systems of the 22 agencies that comprise the Department. In many respects, DHS functions as a virtual department, connecting new and existing agencies into a network that capitalizes on their knowledge assets to facilitate information sharing and enhanced communication. Organizationally, this involves breaking down the “stovepipes” that have previously separated the agencies and developing an encompassing organizational culture that promotes cooperation and information sharing. Technologically, this involves integrating existing systems and infrastructures while simultaneously infusing new technologies as they become available. Rigorous oversight of these activities is continuing in the 109th Congress.

A critical variable that will contribute to the success or failure of these objectives is the development and implementation of an enterprise architecture for the Department. An enterprise architecture serves as a blueprint of the business operations of an organization, and the technologies needed to carry out these functions. It is designed to be comprehensive and scalable, to account for future growth needs.

As the Department moves forward with its enterprise architecture plans, it will encounter several issues. Its enterprise architecture is being used to identify common functions and eliminate redundancies among its component agencies. This requires making choices between competing systems and reallocating resources and staff accordingly. In doing so, DHS will need to improve the interoperability of its systems as well, by selecting common data formats, equipment, and processes. This, in turn, would enable DHS to carry out its information sharing responsibilities, as described in the Homeland Security Act and the National Intelligence Reform Act of 2004. Since some of these information sharing initiatives involve agencies and organizations at the federal, state, and local levels, as well as agencies within the Department, additional coordination with these external partners is necessary to ensure the smooth flow of information and compliance with security procedures. Other oversight issues Congress is considering include the authority and influence of the DHS chief information officer (CIO), IT funding, information security, outsourcing, and technology development. In addition, in light of the interrelationships between DHS and other departments, the impact of the DHS enterprise architecture on related e-government initiatives currently underway has also attracted interest.
Data Mining

Data mining has emerged as one of the key features of many homeland security initiatives, and an issue that is attracting strong congressional oversight. Data mining involves the use of data analysis tools to discover previously unknown, valid patterns and relationships in large data sets. In the context of homeland security, data mining is often viewed as a potential means to identify terrorist activities, such as money transfers and communications, and to identify and track individual terrorists themselves, such as through travel and immigration records.

Data mining is carried out in both the private and public sectors. Some common uses include detecting fraud, assessing risk, and measuring and improving program performance. While data mining represents a substantial advance in the type of analytical tools currently available, some of the homeland security data mining applications represent a significant expansion in the quantity and scope of data to be analyzed, compared to earlier efforts. Since September 2001, there have been a number of initiatives to use data mining to identify potential terrorists and/or terrorist-related activities that have attracted a high level of congressional interest. Some of these initiatives include DARPA’s Total Information Awareness (TIA) program and the U.S. Army’s Able Danger project, both of which are reported to have been discontinued; and the proposed Computer Assisted Passenger Prescreening System II (CAPPS II) project, which is being replaced by the Secure Flight passenger screening program, administered by the Transportation Security Administration. Most recently, some Members of Congress have called for a broader congressional review of domestic data mining activities following the public revelation of reported ongoing data collection and sharing activities being carried out by the National Security Agency (NSA) in an attempt to identify potential foreign terrorists who may be in the United States. Legislation has been introduced to clarify and reinforce the role of the Foreign Intelligence Surveillance Court to approve electronic surveillance of United States persons for foreign intelligence purposes.

While technological capabilities are important, there are other implementation and oversight issues that can influence the success of a data mining project’s outcome. One issue is data quality, which refers to the accuracy and completeness of the data being analyzed. A second issue is the interoperability of the data mining software and databases being used by different agencies. Interoperability is a critical part of the larger efforts to improve interagency collaboration and information sharing through e-government and homeland security initiatives. A third issue is privacy. Questions being considered include the degree to which government agencies should use and mix commercial data with government data, whether data sources are being used for purposes other than those for which they were originally designed, and applicability of the 1974 Privacy Act to these initiatives.

CRS Report RL31798, Data Mining and Homeland Security: An Overview
Technology Development Issues

Technological Innovation and the Economy: Impact of Federal R&D Funding

Technological advancement is an important factor in the nation’s economic growth. Experts widely accept that technical progress is responsible for up to one-half the growth of the U.S. economy and is one principal driving force for increases in our standard of living. Historically, industrial expansion was based on the use of technology to exploit natural resources. Today, such growth tends to be founded on scientific discoveries and engineering knowledge and is even more dependent than before on the development and use of technology. Technology can drive the economy because it contributes to the creation of new goods and services, new industries, new jobs, and new capital. It can expand the range of services offered and extend the geographic distribution of those services. The application of technologies also can contribute to the resolution of those national problems that are amenable to technological solutions.

Technological progress is achieved through innovation, the process by which industry provides new and improved products, manufacturing processes, and services. Research and development are important to this technological advancement in many ways. R&D contributes to economic growth by its impact on productivity. Generally, productivity growth in an industry or a firm is related to the amount spent previously on R&D in that industry or company. Analysts estimate that one-half of productivity increases (output per person) are the result of investments in research and development (see CRS Report RL32324). Others argue that innovations arising from R&D are the most important ones. Profound changes in our society have been brought about by advances in research, resulting in new products and processes in the areas of medicine, semiconductors, computers, and materials, just to name a few.

Traditionally, the government funds R&D to meet the mission requirements of the federal departments and agencies. The government also supports work in areas where there is an identified need for research, primarily basic research, not being performed in the private sector. Basic research, that work undertaken to gain knowledge and understanding of the fundamental aspects of nature, is the foundation of many important new innovations. However, the payoff for basic research is generally long in coming, the results may be unmarketable, and the rewards often diffused among many users. Yet, while basic research is usually performed with little certainty that it will produce goods and services in the future, it appears that there is a significant relationship between the conduct of basic research and increases in productivity.

Federal funding reflects a consensus that while basic research is important for innovation, the rate of return to society as a whole generated by investments in this activity is significantly larger than the benefits that can be captured by any one firm performing it. It is estimated that the social rate of return on R&D spending is over twice that of the rate of return to the inventor. Ideas often can be easily imitated, the knowledge associated with an innovation dispersed and adapted to other products and
processes. This, it is argued, often leads to underinvestment in research by the private sector and thus the need for federal funding.

Expert analysis has shown the importance of federally funded R&D to advancements in innovation (see CRS Report RL32076). Studies undertaken by economists in the field demonstrate that collaboration with publicly funded research organizations increased private sector productivity in many industries, findings that parallel additional work showing the importance of public science to innovation and technological advancement across industrial sectors. This federal R&D stimulates the additional and often substantial private investment necessary to bring new and improved technologies to the marketplace.

In the United States, the development of new products, processes and services for the commercial marketplace is primarily a private sector activity. The government generally becomes involved only for certain limited purposes, including activities that typically have been determined to be necessary for the “national good” but which cannot, or will not, be supported by industry. However, government plays a role in structuring the environment in which business decisions are made and thereby influences private sector behavior. Direct federal funding and the existence of government markets for certain technologies, including defense and information technology-related goods, have helped influence resource allocations in the business community.

The myriad effects of federal research and development spending on innovation and the economic growth generated by technological advancement highlight the importance of decisions regarding the amount and distribution of federal R&D funds. Choices made by the 109th Congress related to financing the research endeavor may have immediate impacts on current programs as well as long term effects on the nation’s technological progress.

For Further Information

**R&D Partnerships and Intellectual Property**

A major emphasis of R&D-related legislative activity has been to augment research in the private sector through efforts to encourage firms to undertake cooperative R&D arrangements. Various laws, including the Stevenson-Wydler National Technology Innovation Act (P.L. 96-418) and the “Bayh-Dole” Act (P.L. 96-517), as amended, have created an environment conducive to joint ventures between government and industry, or between industry and universities, as well as among companies. To date, Congress has determined that providing title to inventions made under federal funding to contractors and/or collaborating parties should be used to support innovation. In return for patent ownership, Congress has
accepted as satisfactory the anticipated payback to the country through goods and services to improve our health, welfare, and standard of living. These benefits have been considered more important than the initial cost of the technology to the government or any potential unfair advantage of one company over another in a cooperative venture.

As such cooperative efforts become more widespread, new and additional issues have emerged. Concerns have been expressed regarding the cost of drugs developed in part with federal funding or in conjunction with federal agencies. Conflicts have surfaced over federal laboratories patenting inventions that collaborating parties believe to be their own. In some agencies, delays continue in negotiating cooperative research and development agreements (CRADAs) because of disagreements over the dispensation of intellectual property. Questions have been raised as to the effects of patenting early stage discoveries (e.g. research tools) on additional innovation. The National Institutes of Health has encountered difficulties obtaining for government-sponsored research new experimental compounds developed and patented by drug companies because of concerns over diminished effectiveness of the intellectual property if additional applications are discovered. Given these issues, additional decisions may need to be made during the 109th Congress regarding the way to maintain a balance between the importance of bringing new products and processes to the marketplace and protecting the public investment in R&D.

Advanced Technology Program

The Advanced Technology Program (ATP) was created by P.L. 100-418, the Omnibus Trade and Competitiveness Act of 1988, to encourage public-private cooperation in the development of pre-competitive technologies with broad application across industries. Administered by the National Institute of Standards and Technology (NIST), a laboratory of the Department of Commerce, this activity has been targeted for elimination as a means to cut federal spending. Critics argue that R&D aimed at the commercial marketplace should be funded by the private sector, not by the federal government. Others stress that ATP is market driven and that investments in research are shared by industry and the public sector.
Beginning several years ago, the House of Representatives attempted to terminate ATP but strong support provided by the Senate, prior to the FY2007 budget, led to continued funding. However, for the first time, the Senate Committee on Appropriations reported out a bill (FY2007 Science, State, Commerce, Justice, and Related Agencies Appropriations Act) that did not contain funding for ATP. The Bush Administration also proposed eliminating the program in its FY2002, FY2004, FY2005, FY2006, and FY2007 budget requests. These actions have renewed the debate over the role of the federal government in promoting commercial technology development. In arguing for less direct federal involvement, opponents of the Advanced Technology Program believe that the market is superior to government in deciding which technologies are worthy of investment. They prefer mechanisms that enhance the market’s opportunities and abilities to make such choices. It is also suggested that agency discretion in selecting one technology over another can lead to political intrusion and industry dependency. On the other hand, supporters of direct methods maintain that reliance on indirect measures can be wasteful, inefficient, and ineffective and can compromise other goals of public policy in the hope of stimulating innovative performance. Proponents of ATP argue that it is important to put the nation’s scarce resources to work on those technologies which will have the greatest promise as determined by industry and supported by the private sector’s willingness to match federal funding. They assert that the government serves as a catalyst for companies to cooperate and undertake important new work, which would not be possible without federal participation. As Congress proceeds with the appropriations process in the 109th Congress, these issues are expected to be debated once again.

CRS Report 95-36, *The Advanced Technology Program*
CRS Report 95-50, *The Federal Role in Technology Development*

**Prescription Drugs: Costs, Availability, and Federal R&D**

Congressional interest in methods to provide prescription drugs at lower cost, particularly for the elderly, has focused attention on achieving a balance between the public’s interest in new and improved technologies and concern over providing companies valuable benefits without adequate accountability or compensation. The federal government has various programs and policies facilitating the development of pharmaceuticals and their availability in the marketplace. Several laws, including the Stevenson-Wydler Technology Innovation Act and the Bayh-Dole Act, encourage commercialization of federally-funded R&D through technology transfer, cooperative R&D, and intellectual property rights (particularly patent ownership). These laws are intended to stimulate the private sector investment often necessary to develop marketable products utilizing the results of the government’s research enterprise.

Congress also has acted to encourage the development of lower cost generic drugs through the Hatch-Waxman Act. This 1984 law made several significant changes to the patent laws as they apply to pharmaceutical products in an attempt to stimulate the search for innovative new drugs while providing less expensive generic
products. As a result of this legislation, generics generally are rapidly available after patent expiration and at lower prices than their brand name predecessors. Concurrently, given the increasing investment in pharmaceutical R&D and the gains in research intensity of the pharmaceutical industry, it appears that, on balance, the act has not deterred the search for, or the development of new drugs. However, Title XI of the Medicare Prescription Drug and Modernization Act of 2003 (P.L. 108-173) modified the Hatch-Waxman Act as it pertained to the listing of pharmaceutical patents in the Orange Book maintained by the Food and Drug Administration, patent challenges by generic firms, and the award of market exclusivity, among other things. It remains to be seen how these provisions affect the availability and cost of prescription drugs.

Concerns have been expressed by Members of Congress over whether the current legislative approach to encouraging innovation, particularly with respect to drug discovery, is appropriate. In the debate, some argue that the government’s financial, scientific, and/or clinical support of biomedical R&D entitles the public to commensurate considerations in the prices charged for any resulting drugs. Others view government intervention in price decisions based upon initial federal R&D funding as contrary to a long-term trend of government promotion of innovation, technological advancement, and the commercialization of technology by the business community. Supporters of existing incentives for technology development argue that they have given rise to robust pharmaceutical and biotechnology industries. Critics maintain that the need for such incentives in the pharmaceutical and/or biotechnology sectors is mitigated by industry access to government-supported work at no cost, monopoly power through patent protection, and additional regulatory and tax advantages such as those conveyed through the Hatch-Waxman Act. At issue, is which legislative initiatives, if any, can actually reduce the cost of safe and effective prescription drugs to individuals in the United States and what may be the long-term effects of these efforts on innovation in the pharmaceutical industry.

Telecommunications and Information Technology Issues

Telecommunications Act of 1996 Revision

The Telecommunications Act of 1996, signed into law on February 8, 1996 (P.L. 104-104), represented the first major rewrite of our nation’s telecommunications policy. The 1996 Act redefined and recast the 1934 Communications Act to address the emergence of competition in what were previously considered to be monopolistic markets. Despite its relatively recent enactment, however, a consensus has been growing that the 1996 Act is inadequate to address the convergence and technological changes now facing the telecommunications and broadcasting sectors. Whether a further rewrite is required, what form such a rewrite might take, and the timing of a rewrite, remains unclear; however, both the House and Senate are expected to continue to take an active role in examining and debating the issues related to a possible revision of existing telecommunications law. Included among the policy issues likely to be examined are: the universal availability of and access to broadband, the regulatory treatment of incumbent cable and telecommunications providers and the impact of recent mergers, the funding of and eligibility criteria for the universal service fund (USF), the impact and regulatory treatment of newly emerging technologies such as voice over internet protocol (VoIP) and broadband over power lines (BPL), municipal deployment of broadband, and the relationship between the Federal Communications Commission (FCC) and state regulatory bodies.

CRS Report RL32949, Communications Act Revisions: Selected Issues for Consideration
CRS Report RL33542, Broadband Internet Access: Background and Issues
CRS Report RS22444, Net Neutrality: Background and Issues
CRS Report RL32421, Broadband Over Powerlines: Regulatory and Policy Issues

Broadband Internet Regulation and Access

Broadband Internet access gives users the ability to send and receive data at speeds far greater than conventional “dial up” Internet access over existing telephone lines. Broadband technologies — cable modem, digital subscriber line (DSL), satellite, and fixed wireless Internet — are currently being deployed nationwide primarily by the private sector. While President Bush has set a goal of universal broadband availability by 2007, some areas of the nation — particularly rural and low-income communities — continue to lack full access to high-speed broadband Internet service. In order to address this problem, the 109th Congress is considering the scope and effect of federal broadband financial assistance programs (including universal service), and the impact of telecommunications regulation and new technologies on broadband deployment.

Some policymakers, believing that disparities in broadband access across American society could have adverse economic and social consequences on those left
behind, assert that the federal government should play a more active role to avoid a “digital divide” in broadband access. One approach is for the federal government to provide financial assistance to support broadband deployment in underserved areas. Others, however, question the reality of the “digital divide,” and argue that federal intervention in the broadband marketplace would be premature and, in some cases, counterproductive. Another issue under examination is whether present laws and subsequent regulatory policies are needed to ensure the development of competition and its subsequent consumer benefits, or conversely, whether such laws and regulations are overly burdensome and discourage needed investment in and deployment of broadband services. What, if any, role regulators should play to ensure the Internet remains open to all, often referred to as “open access” requirements or “net neutrality” is also a major and contentious part of the dialogue.

Finally, emerging broadband technologies — such as wireless (including “3G”, “wi-fi” and “Wimax”) and broadband over power lines (BPL) — continue to be developed and/or deployed, and have the potential to affect the regulatory and market landscape of broadband deployment. Congress and the FCC will likely consider policies to address the emergence of these and other new broadband technologies.

Transition to Digital Television

Digital television (DTV) is a new service representing the most significant development in television technology since the advent of color television in the 1950s. DTV can provide sharper pictures, a wider screen, CD-quality sound, better color rendition, multiple video programming or a single program of high definition television (HDTV), and other new services currently being developed. Initially, Congress and the FCC set a target date of December 31, 2006 for broadcasters to transition to DTV, cease broadcasting their analog signals, and return their existing analog television spectrum licenses to be auctioned for commercial services (such as broadband) or used for other purposes, such as public safety telecommunications. The Balanced Budget Act of 1997 (P.L. 105-33) required the FCC to grant extensions for reclaiming the analog television licenses in the year 2006 from stations in television markets where at least 15% of television households did not receive digital signals. However, given the slower-than-expected pace at which digital televisions have been introduced into American homes, and given the impetus to reclaim and auction analog spectrum, the 109th Congress enacted the Deficit Reduction Act of 2005 (P.L. 109-171), which established a “date certain” digital transition deadline of February 17, 2009.
A key issue in the Congressional debate over the digital transition has been addressing the millions of American over-the-air households whose existing analog televisions will require converter boxes in order to receive digital signals when the analog signal is turned off on February 17, 2009. The Deficit Reduction Act of 2005 allocates up to $1.5 billion for a digital-to-analog converter box subsidy program to be administered by the Department of Commerce. Remaining digital transition issues — not addressed by the Deficit Reduction Act of 2005 — include whether Congress should mandate or permit “must carry” requirements for digital multicasts, “downconversion” of broadcasted digital to analog signals for cable and satellite households, and copyright protection technologies such as the “broadcast flag” and the “analog hole.”

**Spectrum Management and Wireless Technologies**

Spectrum policy issues are characterized by economic, technological and regulatory complexity. Spectrum, a valuable resource governed by available technology, is regulated by the federal government with the primary objectives of maximizing its usefulness and efficiency, and preventing interference among spectrum users. To minimize interference, users are assigned radio frequencies within spectrum bands allocated for defined uses. Spectrum policy covers both satellite and terrestrial (primarily antenna-broadcast) transmissions. Members of Congress, through hearings and public statements, have expressed a willingness to address spectrum management issues.

The Intelligence Reform and Terrorism Prevention Act (P.L. 108-458) required the Chairman of the Federal Communications Commission, in consultation with the Secretary of Homeland Security and others, to prepare a study for Congress by year end 2005 on public safety uses of spectrum. In the study requested by Congress, the FCC sought comment on whether additional spectrum should be made available for public safety, possibly from the 700 MHz band. (*Report to Congress; on the study to assess short-term and long-term needs for allocations of additional portions of the electromagnetic spectrum for federal, state and local emergency response providers*, Federal Communications Commission, December 19, 2005.) Comments received from the public safety community overwhelmingly supported the need for additional spectrum, although other bands besides 700 MHz were also mentioned. The FCC did not make a specific recommendation for additional spectrum allocations in the short-term although it stated that it agreed that public safety “could make use of such an allocation in the long-term to provide broadband services.” It further announced that it would move expeditiously to see whether the current band plan for the 24 MHz at 700 MHz currently designated for public safety could be modified to accommodate broadband applications.
Spectrum is integral to wireless technology and so its management is connected to many issues that may be of interest to Congress. These include new technologies such as “third-generation” (3G) cell phone services, wireless Internet, mesh networks, software-defined radio (SDR), Ultra-Wideband (UWB) and location-finding technology. The latter includes applications for wireless enhanced 911.

Networking Information Technology R&D

At the federal level, almost all of the funding for information science and technology and Internet development is part of a single government-wide initiative, the Networking and Information Technology Research and Development program (NITRD). This program was previously (1997-2000) called the Computing, Information, and Communications program (CIC) and, prior to that (1992-1997), the High Performance Computing and Communications program (HPCC). The NITRD is an interagency effort to coordinate key advances in information technology (IT) research and leverage funding into broader advances in computing and networking technologies. Under the NITRD, participating agencies receive support for high-performance computing science and technology, information technology software and hardware, networks and Internet-driven applications, and education and training for personnel.

The FY2007 budget calls for $3.074 billion for the NITRD Program, an increase of $0.21 billion over the FY2006 budget estimate of $2.855 billion. In the 109th Congress, one NITRD-specific bill, H.R. 28, was introduced and passed in the House; the bill was received in the Senate and referred to the Committee on Commerce, Science, and Transportation on April 27, 2005.

Research emphases are focused on eight program component areas (also called PCAs): High-End Computing (HEC) Infrastructure and Applications, HEC Research and Development, Cyber Security and Information Assurance, Human Computer Interaction and Information Management, Large Scale Networking, Software Design and Productivity, High Confidence Software and Systems, and Social, Economic, and Workforce Implications of IT and IT Workforce Development. Key issues facing congressional policymakers include whether NITRD is accomplishing its goals and objectives to enhance U.S. information technology research and development, whether the funding level is appropriate or should be changed to reflect changing U.S. priorities, and defining the private sector’s role in this initiative.
E-Government

Electronic government (e-government) is an evolving concept, generally referring to the integration of information technology, especially Internet-related technology, into the delivery of government information and services. E-government initiatives vary significantly in their breadth and depth from state to state and agency to agency. A central issue is oversight of the coordination and implementation of the disparate e-government initiatives across the federal government.

Pursuant to the July 18, 2001, OMB Memorandum M-01-28, an E-Government Task Force created a strategy for achieving the Bush Administration’s e-government goals [http://www.whitehouse.gov/omb/inforeg/egovstrategy.pdf]. In doing so, the Task Force identified 23 interagency initiatives designed to better integrate agency operations and information technology investments. These initiatives, sometimes referred to as the Quicksilver projects, are grouped into five categories: government-to-citizen (G2C), government-to-government (G2G), government-to-business (G2B), internal effectiveness and efficiency, and addressing barriers to e-government success. Examples of these initiatives include an e-authentication project led by the General Services Administration (GSA) to increase the use of digital signatures, the eligibility assistance online project (also referred to as GovBenefits.gov) led by the Department of Labor to create a common access point for information regarding government benefits available to citizens, and the Small Business Administration’s One-Stop Business Compliance project, being designed to help businesses navigate legal and regulatory requirements. A 24th initiative, a government wide payroll process project, was subsequently added.

On December 17, 2002, President Bush signed the E-Government Act of 2002 (P.L. 107-347) into law. The law contains a variety of provisions related to federal government information technology management, information security, and the provision of services and information electronically. One of the most recognized provisions involves the creation of an Office of Electronic Government within OMB. The Office is headed by an Administrator, who is responsible for carrying out a variety of information resources management (IRM) functions, as well as administering the interagency E-Government Fund provided for by the law.

For the 109th Congress, some of the oversight issues attracting the most interest include agency funding contributions for OMB-led e-government initiatives; the development of a second generation of e-government initiatives based on the federal government’s lines of business (LoB) - core business functions common to most departments and agencies; efforts to develop a Federal Enterprise Architecture (FEA); and the implementation of the E-Government Act, as well as efforts to mediate the differences and capitalize on the similarities between e-government and homeland security priorities. In addition, the movement to expand the presence of government online raises as many issues as it provides new opportunities. Some of these issues concern: security, privacy, management of governmental technology
resources, accessibility of government services (including “digital divide” concerns as a result of a lack of skills or access to computers, or disabilities), and preservation of public information (maintaining comparable freedom of information procedures for digital documents as exist for paper documents). Although these issues are neither new nor unique to e-government, they do present the challenge of performing governance functions online without sacrificing the accountability of or public access to government that citizens have grown to expect (see CRS Report RL31057). For a discussion of evolving policies related to scientific and technical information access, see the Public Access to Scientific Information section above.

Open Source Software

Open source software refers to a computer program whose source code, or programming instructions, is made available to the general public to be improved or modified as the user wishes. In contrast, closed source, or proprietary, programs, which comprise the majority of the software products most commonly used, are those whose source code is not made available and can only be altered by the software manufacturer. Some examples of open source software include the Linux operating system and Apache Web server software.

The use of open source software by the federal government has been gaining attention as organizations continue to search for opportunities to enhance their information technology (IT) operations while containing costs. For the federal government and Congress, discussion over the use of open source software intersects several other issues, including, but not limited to, the development of homeland security and e-government initiatives, improving government information technology management practices, strengthening computer security, and protecting intellectual property rights. In the 109th Congress, the discussion over open source software revolves primarily around information security and intellectual property rights. However, issues related to cost and quality are also of interest.

For proponents, open source software is often viewed as a means to reduce an organization’s dependence on the software products of a few companies while possibly improving the security and stability of one’s computing infrastructure. For critics, open source software is often viewed as a threat to intellectual property rights with unproven cost and quality benefits. So far, there appear to be no systematic analyses available that have conclusively assessed security issues for closed source versus open source software. In practice, computer security is highly dependent on how an application is configured, maintained, and monitored. Similarly, the costs of
implementing an open source solution are dependent upon factors such as the cost of acquiring the hardware/software, investments in training for IT personnel and end users, maintenance and support costs, and the resources required to convert data and applications to work in the new computing environment. Consequently, some computer experts suggest that it is not possible to conclude that either open source or closed source software is inherently more secure or more cost efficient.

The growing emphasis on improved information security and critical infrastructure protection overall will likely be an influential factor in future decisions on whether to implement open source solutions. The rapidly changing computer environment may also foster the use of a combination of open source and closed source applications, rather than creating a need to choose one option at the exclusion of another.

**Wireless Privacy, Internet Privacy, and Spyware**

Wireless telecommunications devices are ubiquitous. Some consumers, already deluged with unwanted commercial messages (“spam”) via computers that access the Internet by traditional wireline connections, are concerned that such unsolicited advertising is expanding to wireless communications, further eroding their privacy. Another concern is that their cell phone numbers may soon become public because some of the wireless service providers are creating a “wireless 411” phone directory. Whether the service providers should be legally required to obtain customers’ consent before including their phone numbers in the directory, or if the service providers should be allowed to charge customers a fee if they want an unlisted number, is currently being debated. In addition, some cell phone records, including phone numbers dialed and the caller’s location, are being sold on the Internet, raising questions as to whether telephone companies are adequately safeguarding cell phone records.

Internet privacy issues encompass a range of concerns. One is the monitoring of electronic mail (e-mail) and Web usage by law enforcement officials or employers. In the wake of the September 11, 2001 terrorist attacks, debate over the issue of monitoring of e-mail and Web usage by law enforcement and government officials has intensified, with some advocating increased tools for law enforcement to track down terrorists, and others cautioning that fundamental tenets of democracy, such as privacy, not be endangered in that pursuit. The USA PATRIOT Act (P.L. 107-56) makes it easier for government and law enforcement officials to monitor Internet activities, and for Internet Service Providers to voluntarily disclose the content of e-mails under certain conditions.

Another Internet privacy issue, spyware, is also a focus of congressional concern. There is no firm definition of spyware, but one example is software products that include a method by which information is collected about the use of the computer on which the software is installed and the user. When the computer is connected to the Internet, the software periodically relays the information back to the
software manufacturer or a marketing company. Some spyware traces a user’s Web activity and causes advertisements to suddenly appear on the user’s monitor — called “pop-up” ads — in response. Typically, users have no knowledge that the software they obtained included spyware and that it is now resident on their computers. Congress is debating what restrictions, if any, should be placed on spyware.

Tsunamis and Other Emergencies: Forecasting and Warning Systems

Tsunami Forecasting and Warning

Some U.S. lawmakers became concerned about the possible vulnerability of U.S. coastal areas to tsunamis, and about the adequacy of early warning for coastal areas of the far Pacific possessions and western Atlantic Ocean. These concerns stem from the December 26, 2004 tsunami that devastated many coastal areas around the northern Indian Ocean, where few tsunami early warning systems were operating. Other lawmakers have questioned whether the risk for a major tsunami affecting the United States justifies such expenditures, however.

On February 14, 2005, the Bush Administration committed $30 million over two fiscal years to the National Oceanic and Atmospheric Administration (NOAA) National Weather Service (NWS) in the Department of Commerce to upgrade U.S. tsunami warning capabilities. The NWS is working toward expanded coverage for the Pacific Ocean and the U.S. Atlantic seaboard as well as the Caribbean Sea and Gulf of Mexico. The FY2005 emergency appropriations act (P.L. 109-13) provided emergency supplemental appropriations of $24.3 million to initiate that effort.

In December 2005, President Bush released a report Tsunami Risk Reduction for the United States: A Framework for Action, prepared by the National Science and Technology Council. This report outlines necessary actions to be taken to reduce tsunami risk domestically and in U.S. territories in the far Pacific Ocean and Caribbean Sea. By April 17, 2006, five new tsunami detection buoys and additional coastal tidal-gages had been deployed in the Atlantic Basin, and are capable of warning populations on the U.S. East Coast and in Caribbean Sea and Gulf of Mexico of an impending tsunami. Also of benefit to the United States, telecommunications enhancements were funded in P.L. 109-13 to enhance the real-time distribution of information associated with Global Seismic Network (GSN) detection of underwater earthquakes, which, in certain cases, may generate tsunamis. Congress funded the U.S. Geological Survey to upgrade the GSN with real-time
communication capabilities. For FY2007, President Bush has requested $12.4 million to procure the remainder of tsunami detection buoys for the NWS’s National Tsunami Warning Program which would be deployed in the far Pacific Ocean to protect U.S. territories there. The request would culminate the Administration’s revised commitment of $40 million toward that goal. Part of the funding is intended for long-term operation and maintenance of the tsunami early detection system. Periodic testing and emergency drills have been conducted since to evaluate the expanded network.

Some other developed nations currently have the technological capacity to build similar warning networks in other regions of the globe, and some have long established advanced emergency management capabilities. However, other nations will have to rely on an international consolidation of resources and expertise to (1) develop local tsunami warning capacity; (2) educate indigenous people and visitors about such disasters; and (3) learn to employ strategies for adapting to such risks. The development of a Global Environmental Observation System of Systems (GEOSS) by NOAA, and its system architecture, is how the United States plans to contribute to global tsunami warning challenges. NOAA is the lead agency for U.S. involvement in the 61-nation GEOSS program. Working through the U.N. Intergovernmental Oceanographic Commission (IOC), substantial progress has been made in developing international tsunami early warning networks of the caliber afforded to the United States.

CRS Report RL32739, Tsunamis: Monitoring, Detection, and Early Warning Systems

Technology for Warning Systems and Alerts

As was demonstrated on September 11, 2001, after the southeast Asian tsunami on December 26, 2004, and again when Hurricane Katrina struck the Gulf Coast in August 2005, the ability to provide effective communications before and after a disaster is a critical factor in saving lives. Today, the two major alert systems in the United States are the Emergency Alert System (EAS) and the NOAA Weather Radio (NWR) All-Hazards Network (NOAA is the National Oceanic and Atmospheric Administration, an agency of the Department of Commerce). The EAS is jointly administered by the Federal Communications Commission and the Federal Emergency Management Agency (FEMA). It depends on radio and television broadcasters, as well as most cable operators, to provide information in times of emergency. Widely used for local warnings about weather and other emergencies, EAS has never been activated for a national emergency. The other mainstay for emergency alerts is provided through the National Weather Service (NWS) of NOAA. NWS sends alerts through the NWR All-Hazards Network. NOAA continues to expand its weather alert system to include warnings for all hazards and is working to expand the network to include all types of media. Several initiatives are underway within the federal government to improve, expand, and integrate
existing warning systems. An important one — in terms of using, testing and
developing leading-edge technology — is the Integrated Public Alert and Warning
System (IPAWS), a public-private partnership in which the Department of Homeland
Security (DHS) has a leadership role.

Among the technologies proposed or being tested to expand broadcast
capabilities for emergency alerts are equipping cell phones with NOAA Weather
Radio receivers; developing data casting for digital broadcasting; and using cell
phone broadcasting technology. Data casting is a one-way broadcast transmission
using Internet Protocols. The broadcasts can carry voice and data, including videos,
graphics, and text messages. In an IPAWS pilot testing digital technologies, data
casting is being broadcast to digital televisions and antennae linked to computer
networks or directly to computers and laptops. Some advanced wireless phones and
other portable devices can receive digital TV broadcasts, as is being demonstrated in
several pilots. Some countries are advocating the use of cell broadcasting to send
alerts to cell phones based on location. The Netherlands, for example, requires cell
operators to transmit government warnings with cell broadcasts of text messages.
Satellite radio could also become part of the new era of digital signal alert systems.
XM Satellite Radio will broadcast emergency alerts to the D.C. region through a link
with the alert system of Arlington County, Virginia.

The convergence of communications technology, typified by the near-ubiquity
of the Internet and the wide availability of advanced wireless telephony, presages a
world of end-to-end communications for public safety communications, including
warning systems. The 9/11 Commission commented on the often inadequate
response of the 911 call centers serving New York City, and suggested that 911 call
centers be integrated into the emergency response team, in order to involve them in
providing up-to-date information and assistance to the public. In a bill enacted in
December 2004, Congress created an E-911 Implementation Coordination Office to
foster improvements in 911 call centers (P.L. 108-494, Title I).

and Other Services

Geosciences Issues

Ocean Commissions: Ocean Science and Oceanic Affairs

Legislation to create a U.S. Commission on Ocean Policy was enacted in August
of 2000 as P.L. 106-256. Earlier in 2000, the Pew Oceans Commission, an
independent group, was established and funded by the Pew Charitable Trusts to
campaign a national dialogue on the policies needed to restore and protect living
marine resources in U.S. waters. The Pew Commission released its final report in
June 2003, America’s Living Oceans: Charting a Course for Sea Change, with 26
recommendations that outlined a national agenda for protecting and restoring our
oceans. Bearing the official title An Ocean Blueprint for the 21st Century, the U.S.
Commission’s final report, with 212 recommendations on a coordinated and comprehensive national ocean policy, was delivered to the President and Congress on September 20, 2004. Those reports covered an array of issues, such as Law of the Sea (see “U.N. Convention on the Law of the Sea” below); national and regional governance; federal organization, regulation, and enforcement; offshore management regimes; funding for sound science and research and for implementing commission recommendations; oceanic education; coastal and watershed management; and ecosystem-based management. The same law that created the U.S. Commission (P.L. 106-256) also required the President to submit to Congress a statement responding to the commission’s recommendations for a national policy on ocean and coastal resources. That statement, *U.S. Ocean Action Plan*, was delivered to Capitol Hill on December 17, 2004, but it was largely limited to documenting current efforts. Many in the ocean community viewed the Administration’s response as limited and are seeking more extensive action through Congress. In the current Congress, thus far, committees of relevant jurisdiction have adhered to their own ocean action agendas, guided, in large part, by the Pew and U.S. Commission reports, and have shown little interest in holding hearings to assess the Administration’s statement.

In considering legislative responses to the findings and recommendations of those two ocean policy reports, the 109th Congress is addressing specific legislation relating to ocean exploration; ocean and coastal observing systems; marine debris research, prevention, and reduction; federal organization and administrative structure; and ocean and coastal mapping integration. Comprehensive bills encompassing a broad array of crosscutting concerns also are under consideration. However, a Joint Ocean Commission Initiative, established in September 2005 and made up of former members of both the Pew Commission and the U.S. Commission, has criticized the lack of progress made by Congress, the Administration, states, and non-governmental stakeholders in addressing hundreds of the Commissions’ recommendations and in implementing new measures. The February 2006 release of that assessment, *U.S. Ocean Policy Report Card*, was timed to accompany the roll out of the President’s FY2007 budget. The *Report Card* highlights where additional efforts are necessary and where opportunities for improvements exist. More information about the Joint Ocean Commission Initiative, and the complete *U.S. Ocean Policy Report Card*, may be found at [http://www.jointoceancommission.org].

**For Further Information**

**Global Climate Change**

Congress has maintained an active and continuing interest in the implications of, and the issues associated with, possible global climate change for the United States. Having received the required number of ratifications, the Kyoto Protocol to the United Nations Framework Convention on Climate Change entered into force on February 16, 2005, establishing binding commitments for reductions in greenhouse gases. The United States “signed” the protocol, but then-President Clinton did not submit it to the Senate for ratification. In March 2001, the Bush Administration indicated its opposition to the Kyoto Protocol and essentially rejected it, citing possible harm to the U.S. economy and lack of developing country participation.
On February 14, 2002, President Bush announced a U.S. policy framework for global climate change, outlining a Climate Change Research Initiative (CCRI) and a National Climate Change Technology Initiative (NCCTI), along with a new Cabinet-level Committee on Climate Change Science and Technology Integration to oversee their implementation. The CCRI and the NCCTI focus on short-term, policy-relevant objectives of climate change science and climate change technology applications, respectively. A previously established U.S. Global Change Research Program (USGCRP) supports long-term, fundamental, scientific research objectives, and a Climate Change Technology Program (CCTP) supports the federal government’s broader portfolio of climate change technology R&D. Both the new CCRI and the existing USGCRP were combined for the first time into the Climate Change Science Program (CCSP) in the FY2004 budget. The FY2007 budget requested a total spending level of $1.717 billion for research managed by the CCSP, which was $4 million (+0.2%) above the FY2006 funding estimate of $1.713 billion. Included in the $1.717 billion CCSP funds were $200 million for the CCRI. While funding for the embedded CCRI experienced growth over two fiscal years from FY2003 to FY2005, the FY2007 funding request for CCRI at $200 million was level with the FY2006 funding estimate of $200 million. That left the FY2007 funding request for the embedded USGCRP standing at $1.517 billion, which was $4 million (+0.3%) above the FY2006 funding estimate of $1.513 billion. Some $2.98 billion was in the requested FY2007 funding profile for technology research and development in the Climate Change Technology Program (CCTP) and its embedded NCCTI, an amount $207 million (+7.5%) above the FY2006 funding level of $2.773 billion. Five reports currently serve as guidance documents for those activities: *Climate Change Science Program Strategic Plan (2003), Results of a Technical Review of the U.S. Climate Change Technology Program’s R&D Portfolio (2006), Climate Change Technology Program Strategic Plan Public Review Draft (2006), U.S. Climate Change Technology Program: Technology Options for the Near and Long Term (2005), and U.S. Climate Change Technology Program: Vision and Framework for Strategy and Planning (2005).* Release by the CCTP of the completed and final Strategic Plan on Climate Change Technology is expected later on in 2006. Two issues of concern for Congress are the extent to which spending for the CCRI and CCTP represent new money versus how much is attributable to the reclassification of ongoing research and technology programs, and whether the overall reduced level of funding may be deemed necessary or sufficient to accomplish the work of the CCSP and the CCTP.

Discourse in Congress over the prospect of global warming and what the United States could or should do about it has yielded, over the last several years, a range of legislative proposals. Arguments have been presented that policy actions to reduce emissions of carbon dioxide and other greenhouse gases should be taken now, in line with the intent of the Kyoto Protocol. Alternative arguments have called for delay, citing challenging issues that were regionally complex, politically delicate, and scientifically uncertain: the need to expand technological options for mitigating or adapting to the effects of any climate change; and the associated high cost of certain mitigation schemes that would prematurely replace existing capital stock before the end of its economic life. Issues before the 109th Congress include greenhouse gas reduction and carbon dioxide emissions trading systems (see CRS Report RS22076 and CRS Report RL32721); energy issues relevant to climate change, especially those associated with energy efficiency and alternative energy sources; carbon
sequestration technologies and methodologies; federal and national response strategies vis-a-vis the prospect of abrupt climate change, climate change impacts, and climate system surprises; performance and results of federal spending on climate change science and technology programs, and, more broadly, on global change research programs; long-term research and development programs to foster new technologies to help stabilize greenhouse gas emissions; and efforts to promote climate change technology deployment both here and abroad.

**Energy and Water Issues**

**Hydrogen Fuel and Fuel Cell Vehicles**

Hydrogen fuel and fuel cell vehicles have been the focus of increased attention, especially with the announcement of the Hydrogen Fuel Initiative during the January 2003 State of the Union Address. Over five years, the Administration is seeking a total funding increase of $720 million. This initiative would fund research on hydrogen fuel and fuel cells for transportation and stationary applications, and would complement the existing FreedomCAR initiative, which focuses research on the development of advanced technologies for passenger vehicles. For FY2004, Congress approved an increase of approximately $82 million for the initiatives. For FY2005, Congress approved an additional $39 million above FY2004. In FY2006 Energy and Water Development Appropriations Act (P.L. 109-103), Congress approved an increase of $30 above FY2005 — $150 million above FY2003.

In addition to appropriations legislation, on August 8, 2005, the President signed the Energy Policy Act of 2005 (H.R. 6). Among other provisions, this bill includes authorizations for hydrogen and fuel cell R&D. The energy bill authorizes a total of $3.3 billion between FY2006 and FY2010. The bill also establishes tax credits for the purchase of hydrogen-fueled and fuel cell vehicles, and for the installation of hydrogen fueling infrastructure.

Issues facing Congress on hydrogen fuel and fuel cell vehicles include the proper role of the government in the research and development of consumer products; the ultimate viability of hydrogen and fuel cell technologies; the potential role for the government in expanding hydrogen fueling infrastructure; safety standards, codes, and liability concerns surrounding new technology and a new system for delivering energy; and issues related to future market penetration of fuel cell vehicles.
For Further Information

Reprocessing of Spent Nuclear Fuel

Spent fuel from commercial nuclear reactors contains plutonium produced during reactor operations and most of its original uranium. A fundamental issue in nuclear policy is whether spent fuel should be “reprocessed” to extract plutonium and uranium for new reactor fuel, or directly disposed of without reprocessing. Proponents of nuclear power point out that spent fuel still contains substantial energy that reprocessing could recover. However, reprocessed plutonium can also be used in nuclear weapons, so federal support for reprocessing could undermine U.S. nuclear nonproliferation policies, contend groups concerned about weapons proliferation.

In the 1950s and 1960s, the federal government expected that all commercial spent fuel would be reprocessed, even though commercial “light water reactors” — the type still in use today — produced relatively little plutonium. The federal strategy called for replacing light water reactors with “breeder reactors” that would convert uranium into enough plutonium to fuel new commercial breeder reactors indefinitely.

Increased concern about weapons proliferation in the 1970s and the slower-than-projected growth of nuclear power prompted President Carter to halt commercial reprocessing efforts in 1977, along with a federal demonstration breeder project. President Reagan restarted the breeder demonstration project, but Congress halted project funding in 1983 while continuing to fund breeder-related research and development in an “Advanced Liquid Metal Reactor” (or the Integral Fast Reactor). To address proliferation concerns, this program would have used electrometallurgical reprocessing to only partially separate plutonium and uranium. Congress stopped funding breeder-reactor development in 1993, and reduced appropriations for reprocessing research.

The Bush Administration’s 2001 National Energy Policy called for renewing federal support for reprocessing, or recycling, through the Advanced Fuel Cycle Initiative (AFCI) in the Department of Energy (DOE). The Energy Policy Act of 2005 (P.L. 109-58, Sec. 953) calls for AFCI to evaluate proliferation-resistant fuel recycling and transmutation technologies as an alternative to previously developed reprocessing technologies. This program also supports the evaluation of alternative national strategies for spent nuclear fuel and Generation IV advanced reactor concepts.

The President’s FY2006 budget request of $70.0 million for AFCI in FY2006 was increased $10 million by Congress (P.L. 109-103) to accelerate the design activities associated with a proposed Engineering Scale Demonstration.
The Administration’s Global Nuclear Energy Partnership (GNEP), announced in February 2006, would encourage the use of nuclear energy among developing nations under the condition that they return all spent nuclear fuel to supplier nations for reprocessing. The Administration requested $250 million for GNEP for FY2007, with all but $7 million (for program direction) aimed at AFCI. The House cut AFCI to $120 million, but the Senate Appropriations Committee voted to give the program a $36 million increase above the budget request, for a total of $279.0 million. In an August 2006 Notice of Request for Expression of Interest, DOE solicited industry comments on a Consolidated Fuel Treatment Center (CFTC) to support GNEP.

Fusion Research: ITER

The ITER project is an international scientific collaboration to construct a facility for fusion energy research. The international partners are China, the European Union, India (joined December 2005), Japan, Russia, South Korea, and the United States. A long-running disagreement over where to build the facility was resolved in June 2005 with the selection of a site in Cadarache, France, in preference to a site in Japan. (The United States initially supported the Japanese site.) In 1998, the United States withdrew from the design phase of ITER at congressional direction, largely because of concerns about cost and scope. The project has since been restructured, and in January 2003, the Administration announced its intention to reenter the project. The U.S. share of the cost of building ITER (about 9.1%) is expected to be about $1.1 billion through FY2014. Once construction is complete, the U.S. share of the cost of operating ITER is expected to be about an additional $58 million per year. (For the current status of FY2007 funding for ITER, see CRS Report RL3346, Energy and Water Development: FY2007 Appropriations.) Key issues in the 109th Congress are the cost of U.S. participation and the budget impact of ITER on the rest of the U.S. fusion program.

Water Supply Technology and Energy-Water Efficiency

Water resources research represents 0.5% of the approximately $130 billion annual federal R&D investment. This research is spread across almost twenty agencies. A 2004 report by the National Research Council (NRC), Confronting the Nation’s Water Problems: The Role of Research, called for a commitment to water resources research to address the nation’s water problems, and suggested a central role for federal research in informing water resources issues. In particular, the report promoted both federally-funded research on water use and institutions, and a more coordinated federal water research agenda.

Real levels of spending on water research have remained relatively constant, at $700 million (in 2000 dollars) annually since the mid-1970s. Although the overall level is constant, funding declined for some specific research categories, including
the water supply augmentation and conservation, water quality management and protection, water resources planning and institutions, and water resource data. In contrast, aquatic ecosystem research has increased substantially.

Growing demands on developed water supplies has increased interest in water supply technologies, and desalination in particular. Desalination — the process of removing dissolved solids (primarily dissolved salts and other minerals) from water — has become an increasingly attractive water supply option as the cost of the dominant technology in the nation — reverse osmosis — has fallen and the pressure to develop new water supplies has grown. Opportunities for using desalination are greatest for meeting water demands for coastal communities that can desalinate seawater or estuarine water, interior communities above brackish groundwater aquifers, and communities with contaminated water supplies. Desalination’s attraction is that it can create a new source of freshwater from otherwise unusable waters, and a more predictable source than freshwater supplies that rely more directly on annual or multi-year precipitation, runoff, and recharge rates. The Bush Administration has expressed support for current desalination research efforts aimed at reducing costs, while criticizing bills seeking financial support for specific desalination facilities.

Proposed legislation and enacted appropriations in the 109th Congress have aimed to reverse the declining trend in federal research funds for desalination and other water supply technologies. According to the 2004 NRC report, “water supply augmentation and conservation” research by federal agencies totaled $14.5 million in FY2000. In the past the federal government invested more in this area; in the late 1960s, federal research in desalination and other saline water conversion activities exceeded $100 million (in 2000 dollars) annually. Increasing federal funding for desalination research raises questions, such as: what should be the respective roles of federal agencies, academic institutions, and the private sector in conducting research and commercializing the results, and should federal research be focused on basic research or promoting the use of technologies?

Biomedicine Issues

National Institutes of Health (NIH): Budget, Organization, and Management Issues

The National Institutes of Health (NIH), the primary medical research agency of the federal government, is facing challenges in a number of areas that may interest the Congress. In the budgetary arena, the past three years have been a time of rapid transition from a period of marked growth in the NIH appropriation to the current climate of restrained domestic discretionary spending. Over a five-year period, Congress doubled the NIH budget, from $13.6 billion in FY1998 to $27.1 billion in FY2003. After FY2003, growth slowed to below the rate of inflation, and the final FY2006 appropriation represented a drop in funding for the first time since FY1970. The FY2007 request was for a level budget at $28.5 billion. House and Senate appropriators have proposed changing the amount only slightly.
Since the doubling, the extramural research community has expressed its concerns about the lack of growth in the NIH budget, asserting that sustained funding is necessary to maintain support of research grants, keep young investigators in the pipeline, and capitalize on the momentum of discoveries in both basic and applied research. NIH’s FY2006 grant funding policies involved cutbacks in grant budgets and in numbers of grants, tight competition for new awards, and possible postponement of some large projects previously anticipated, including clinical trials. Prospects for FY2007 are similar. Advocates warn that research advances on the major chronic conditions that burden our society, such as heart disease, cancer, stroke, and diabetes, may be slowed. Other commentators advise that coping with the reality of budget constraints will require NIH and the research community to rethink some of their traditional approaches to planning and organizing research. The resources of the doubling years have spurred development of unifying concepts of fundamental biology and understanding of disease processes that formerly were thought to be unrelated. Scientific leaders in and out of NIH urge critical examination of the best ways to transform knowledge into medical applications and allocate resources into the most critical priorities for return on the public’s investment.

A key factor in such rethinking is consideration of NIH’s organizational structure, which has expanded markedly over time along with the growth in the budget. The agency consists of 27 semi-autonomous institutes and centers, loosely coordinated by the central Office of the Director. As new entities have been created by Congress, each with its own mission, budget, staff, review office, and other bureaucratic apparatus, the costs and complexities of administering the enterprise have multiplied. Further, NIH wishes to emphasize a culture of inter-disciplinary teamwork, but many observers fear that the present structure of multiple independently operated institutes may undermine important initiatives in cross-disciplinary research, especially in fields such as neurosciences. To address these issues, NIH has been increasingly emphasizing an effort termed the “NIH Roadmap for Medical Research” [http://nihroadmap.nih.gov]. Launched in September 2003, the Roadmap has identified critical scientific gaps that may be constraining rapid progress in biomedical research, and which no one institute can tackle alone. NIH-wide priorities and initiatives have been developed in three broad areas, focusing on new paths to biological discoveries, more interdisciplinary research, and improving clinical research. Congress has been supportive of the goals of the Roadmap and of NIH’s efforts to improve the management of its research portfolio, including creation of a new office to concentrate on cutting-edge, trans-Institute research, the Office of Portfolio Analysis and Strategic Initiatives [http://opasi.nih.gov/].

The last major reauthorization of NIH was in 1993, although a number of laws focusing on individual NIH-related topics have amended the Public Health Service Act since then. Oversight hearings and discussions on a draft reauthorization bill have considered questions such as NIH’s stewardship of its resources; the relative roles of the NIH Director and the institutes; and the optimum alignment of budgetary accounts, organizational structure, and statutory authority. Possible proposals for change include giving the NIH Director’s Office more planning involvement and budgetary control over cross-institute research initiatives, grouping the institutes and centers differently for authorizations and/or appropriations, and, for the first time, setting overall authorization levels for NIH. Some other areas of concern which
Congress might consider include improving public reporting of research results, enhancing public access to scientific journal articles, and exploring ways to shorten the process for young researchers to become independent investigators. NIH has taken steps to address each of these issues.

An ongoing oversight issue is NIH’s implementation of new conflict-of-interest regulations. Depending on the level of their positions, NIH scientists and other employees are subject to restrictions on their financial holdings and their ability to consult with industry and outside interests and colleagues. Questions have been raised about the impact of the ethics regulations on recruitment and retention of employees.

**Human Cloning and Embryonic Stem Cell Research**

Embryonic stem cells have the ability to develop into virtually any cell in the body, and may have the potential to treat medical conditions such as diabetes and Parkinson’s disease. Human embryonic stem cells are derived from very early embryos (5-days-old) that were created by in vitro fertilization (IVF) either for infertility treatment or for research purposes. Work on human embryonic stem cells is controversial, as some oppose such research because the process of removing the stem cells destroys the embryo.

Another potential source of embryonic stem cells involves cloning: the nucleus of an egg is removed and replaced by the nucleus from a mature body cell, such as a skin cell. The cell created via cloning is allowed to develop for five days and then the stem cells are removed. Stem cells derived from cloned embryos may offer the best hope for understanding and treating disease. Although South Korean scientists had announced the creation of cloned human embryos and isolation of human stem cells from cloned embryos, an investigation in December 2005 found that the results had been fabricated — a major setback for the field. These developments and the unsubstantiated announcement by Clonaid in December 2002 of the birth of a cloned child have contributed to the controversy over research on human embryos.

One impediment to human stem cell research is the Dickey Amendment which has been added to each Labor, HHS and Education appropriations act from FY1997 through FY2006. It prohibits HHS from using appropriated funds for the creation of human embryos for research purposes or for research in which human embryos are destroyed. As a result, federal funds cannot be used for most forms of human embryo research including the isolation of new stem cell lines or the cloning of human embryos for any purpose.

In August 2001 President Bush announced that, for the first time, federal funds would be used to support research on human embryonic stem cells, but funding would be limited to “existing stem cell lines.” The National Institutes of Health (NIH) has established the Human Embryonic Stem Cell Registry which lists stem cell lines eligible for use in federally funded research. Although 78 embryonic stem cell
lines are listed, only 22 are currently available. Subsequently the debate has centered on whether the number of cell lines allowed under the Bush policy are sufficient to permit U.S. research to remain internationally competitive in this very important new technology. Scientists are concerned about the quality, longevity, and availability of the 22 stem cell lines. For a variety of reasons, many believe research advancement requires new embryonic stem cell lines. The Bush Administration established the President’s Council on Bioethics in November 2001 to consider all of the medical and ethical ramifications of biomedical innovation. In July 2002, the Council released its report on human cloning, which unanimously recommended a ban on reproductive cloning and, by a vote of 10 to 7, a four-year moratorium on cloning for medical research purposes. The Council released a second report on the issue, Monitoring Stem Cell Research, in January 2004.

In May 2005, the House passed H.R. 810 (Castle), which would allow federal support of research that utilizes human embryonic stem cells regardless of the date on which the stem cells were derived from a human embryo, thus negating the current policy that limits funding to stem cell lines in existence as of August 2001. Only excess IVF embryos that the individuals seeking fertility treatments have determined will not be implanted and will be discarded are eligible for stem cell derivation; written consent is required. In July 2006, the Senate passed H.R. 810 along with two other bills: S. 2754, which requires the development of alternatives to embryonic stem cells; and, S. 3405 which addresses the use of tissue from a later stage embryo or fetus. The House passed S. 3405 but did not pass S. 2754. President Bush vetoed H.R. 810, the first veto of his presidency and signed S. 3405. An attempt in the House to override the veto of H.R. 810 was unsuccessful.

Action on H.R. 1357 (Weldon), which passed the House in the 107th and 108th Congresses but stalled in the Senate, is also possible. The bill bans the process of cloning as well as the importation of any product derived from an embryo created via cloning. It bans not only reproductive applications, but also research on therapeutic uses, which has implications for stem cell research. Advocates of the legislative ban say that allowing any form of human cloning research to proceed raises serious ethical issues and will inevitably lead to the birth of a baby that is a human clone. Critics argue that the measure would curtail medical research and prevent Americans from receiving life-saving treatments created overseas. Legislation that bans only human reproductive cloning has also been introduced. On December 20, 2005, the President signed legislation which provides for the collection and maintenance of human cord blood stem cells (a type of adult stem cell) for the treatment of patients and for research (P.L. 109-129). For information on the status of 109th Congress legislation, see CRS Report RL31358 and CRS Report RL33540.

Human Genetics

Collectively, genetic diseases and common diseases with a genetic component pose a significant public health burden. With completion of the human genome sequence, scientists have turned their focus to elucidating the clinical implications of the sequence information. Clinical genetic tests are becoming available at a rapid rate as evidenced by the fact that some tests have been included in health insurance benefits packages. Certain components of genetic testing are regulated by the federal government, while others are not.

The National Human Genome Research Institute (NHGRI) supports genetic and genomic research, investigation into the ethical, legal and social implications surrounding genetics research, and educational outreach activities in genetics and genomics for HHS. In FY2006, NHGRI’s budget was $486 million, a decrease of $2.6 million from FY2005. The President’s budget request for NHGRI for FY2007 is $482.9 million, representing a further decrease of $3.1 million.

Issues surrounding genetic discrimination in health insurance and employment and genetic privacy are currently under debate in the 109th Congress. These include whether health insurance plans should be able to deny enrollment or charge higher premiums to individuals based on the individual’s or family member’s genetic information; appropriate privacy protections for genetic information; remedies; and whether employers should be able to make employment decisions (hiring, firing, promotion) based on an employee’s genetic information.

On the topic of genetic discrimination, the Senate unanimously passed the Genetic Information Nondiscrimination Act of 2005 (S. 306), on February 17, 2005. A companion bill, H.R. 1227, was introduced in the House on March 10, 2005. S. 306 and H.R. 1227 are supported by President Bush, industry, health care professionals and consumer groups. Many key stakeholders are concerned that the information generated by the human genome project, which represents a significant taxpayer investment, cannot be translated into advances in clinical medicine and improved health outcomes without explicit nondiscrimination protections. The U.S. Chamber of Commerce, which was previously a key opponent of the legislation, has modified its position in recognition of the fact that the fear of discrimination is negatively influencing participation in clinical research and utilization of health care services. Previously, the Chamber had taken the position that existing federal protections were sufficient to prevent genetic discrimination.

Impact of the “Vision for Space Exploration” on NASA’s Aeronautics and Other Space Activities

In January 2004, President Bush announced a new Vision for Space Exploration that directs NASA to focus its efforts on returning humans to the Moon by 2020 and some day sending them to Mars and “worlds beyond.” (See CRS Report RS21720.) The President’s plan calls for most of the funding for the Vision to come from redirecting spending from other NASA activities. Advocates of aeronautics research, space science, and earth science worry that funding for their activities will suffer. In the FY2006 Science, State, Justice, Commerce appropriations act (P.L. 109-108), which funds NASA, and the 2005 NASA authorization act (P.L. 109-155), Congress expressed its support for the Vision but stressed that NASA needs to maintain a balanced program that includes aeronautics and science.

The Vision also calls for the space shuttle fleet to be retired in 2010. Retiring the shuttle without another vehicle to replace it would make the United States dependent on Russia to take American crews to and from the International Space Station (ISS) until the new Crew Exploration Vehicle (CEV) is available (“no later than” 2014, according to NASA). Some argue that the shuttle should be retained until the CEV is available, while others want to retire it as soon as possible either because of safety concerns or so that its funding can be redirected to other parts of the Vision. Others worry that placing a fixed termination date on the shuttle system may create schedule pressure like the pressure that contributed to the February 2003 Columbia disaster (see CRS Report RS21408).

NASA officials have indicated that NASA plans to complete its use of the ISS by 2016. Moreover, under the original Vision, the only U.S. research conducted on the ISS would be that needed to fulfill the Vision by supporting human health and safety in exploring the Moon and Mars. (In the 2005 NASA authorization act, Congress modified this by directing that at least 15% of funding for ISS research be used for research not related to the Vision.) NASA spends about $2 billion a year on ISS, in addition to the costs of the shuttle program (about $4-5 billion annually). Some question whether ISS is worth that level of investment considering the modest research objectives that remain. NASA is building the ISS in partnership with Canada, Japan, Russia, and 10 European countries. Fulfilling U.S. commitments to those partners may be another rationale for continued U.S. involvement.

The Future of the Hubble Space Telescope

Two days after the President’s Vision speech (see above), NASA announced that it would not use the space shuttle to conduct further servicing missions to the Hubble Space Telescope (see CRS Report RS21767). Then-NASA Administrator Sean O’Keefe cited shuttle safety concerns as the primary reason for his decision. Widespread criticism led NASA to explore the possibility of a robotic servicing mission, but a report from the National Research Council (NRC) in December 2004 concluded that a robotic servicing mission was unlikely to succeed in the time available. The NRC recommended proceeding with a shuttle servicing mission instead, but Mr. O’Keefe did not change his mind. Dr. Michael Griffin, who became NASA Administrator in April 2005, has stated that he will reassess whether to use the shuttle to service Hubble after the shuttle returns to flight status and flies two successful missions. In the 2005 NASA authorization act (P.L.109-155), Congress supported this plan “unless such a mission would compromise astronaut safety.” It also required a status report on servicing plans within 60 days of the landing of the second successful shuttle flight. That second flight landed safely on July 17, 2006. Meanwhile, cost estimates of $1 billion or more have raised questions about the affordability of a servicing mission. NASA requested full funding for a Hubble servicing mission in its FY2007 budget, even though a decision to undertake one had not yet been made.

For Further Information

CRS Report RS21767, Hubble Space Telescope: Should NASA Proceed with a Servicing Mission?

National Security Space Programs

The Department of Defense (DOD) and the intelligence community conduct a space program larger in terms of funding than NASA. It involves building and launching satellites for communications, navigation, early warning of missile launches, weather, intelligence collection, and other purposes. Tracking the overall funding amount for the national security space program is difficult because it is not consolidated into a single account. According to the DOD Comptroller’s office, DOD requested $22.5 billion for space programs in FY2006. DOD has not released a figure for how much was appropriated. FY2007 figures are not yet available.

A number of DOD space programs are encountering cost growth and schedule delays, including the Air Force’s Space Based Infrared System-High for early warning of missile launches, the Air Force’s Advanced Extremely High Frequency communications satellite system, and the National Reconnaissance Office’s Future Imagery Architecture reconnaissance satellite system. DOD requests to initiate new programs, including the Transformational Satellite communications satellite program, and a Space Radar (formerly the “Space-Based Radar”) program, are controversial because of the potentially large costs involved (and therefore their affordability), and concern as to how to avoid the cost growth and schedule delays experienced in other DOD space programs.
