BIBLIOGRAPHY: EFFECTS OF RADIATIONS ON THE
LUNG WITH REFERENCES THROUGH 1972

C. L. Sanders and E. H. Groff

This bibliography is intended to provide rapid access to the literature on the biological effects of various radiations delivered to the lung of man and experimental animals. A limited number of the more relevant papers published up to 1947 are included along with a comprehensive survey of the literature from 1947 to 1972. Papers that describe the biological effects of radiations from occupational exposure, clinical diagnostic or radiotherapy exposure and experimental radiobiological studies with animals are included in the survey. Individual emphasis may be on the molecular, biochemical, cytological, cellular kinetic, physiological or histopathological effects of radiations, although the latter emphasis is the subject of the majority of papers. The most-often described radiations include external x-rays, gamma rays, or neutrons and pulmonary deposited beta or alpha emitting radionuclides. Papers concerned only with dosimetry, metabolism of radionuclides, radiographic diagnosis of pulmonary disease, or clinical efficacy of radiotherapy are not included in the bibliography. With few exceptions, only papers published in the open literature are included. The bibliography is arranged alphabetically by author.
