READING SCHEDULES FOR THE MSA PARTICLE SIZE ANALYZER

by

Robert E. Cowan and Verna L. Gardiner

ABSTRACT

Reading schedules for the MSA Particle Size Analyzer were calculated using a digital computer. A total of 1221 schedules are tabulated to cover K values between 0.80 and 40.0×10^4 .

The MSA Particle Size Analyzer, manufactured by Mine Safety Appliances Company, is a useful instrument for measuring the particle size distribution of powders. Its speed and simplicity of operation make it ideal for routine measurements on a wide variety of materials.

Centrifuges are employed to reach the submicron range of particle sizes because gravity sedimentation requires impractical amounts of time. The use of centrifuges requires that extensive calculations be made to determine the time at which certain particle sizes may be measured.

These calculations are the major disadvantage in the use of the particle size analyzer. A new reading schedule must be calculated for each new combination of particle density and fluid viscosity which is encountered. These calculations are time-consuming and are not easily mastered by unskilled personnel.

To simplify this portion of the operation, tables of reading schedules have been prepared using MANIAC II, an electronic digital computer. With the use of these tables, an operator needs only to make one simple computation of the value of K and then find the proper reading schedule from the table.

The computer program used the method for calculating reading schedules given in the instruction manual for the MSA Particle Size Analyzer. All starting and stopping time corrections were included. The highest possible centrifuge speed was used provided that its running time was greater than its starting time. The reading schedules were based on

a given sequence of particle sizes between 0.10 and 40.0 microns. The intervals were chosen to give nearly equal spacings when plotted on semi logarithmic graph paper. The computations were made using centrifuge speeds of 600, 1200, and 1800 rpm. They cannot be used in instances where a 300-rpm centrifuge is used between the gravity and 600-rpm portions of the table.

The reading schedule tables are arranged with a column of particle sizes at the left followed by five schedules. Each schedule consists of a centrifuge speed and a corresponding time value. Zero centrifuge speeds refer to gravity readings. The value of K for each schedule is calculated from the equation

$$K = \frac{18.37 \times 10^6 \times \mu_0}{\rho - \rho_0}, \text{ where}$$

μ_0 = viscosity of sedimentation liquid in poise,

ρ = density of particles in grams per cm^3 , and

ρ_0 = density of sedimentation liquid in grams per cm^3 .

The time values shown are elapsed times for the gravity portions and timer settings (corrected times) for the centrifuge portions of the tables. The time values are listed in minutes and seconds. (The period or decimal point is interpreted as a colon.) A blank space preceding a digit in the seconds column is interpreted as "0", e.g., 1. 5 is read one minute and five seconds.

The following reading schedules for 1221 K values should cover the range of viscosity and density values most generally encountered in practice.

D. MICRONS	$K = 0.80 \times 10^{-4}$			$K = 0.81 \times 10^{-4}$			$K = 0.82 \times 10^{-4}$			$K = 0.83 \times 10^{-4}$			$K = 0.84 \times 10^{-4}$
