ABSTRACT

Numerical values of differential cross sections for gamma rays produced by neutron reactions with tin have been obtained for neutron energies between 0.85 and 20 MeV for $\theta_\gamma = 125$ deg. The $d^2\sigma/d\omega dE$ values were obtained using a NaI spectrometer. These data are presented as gamma-ray production group cross-section values of $d^2\sigma/d\omega dE$ for $0.7 \leq E_\gamma \leq 10.5$ MeV, with gamma-ray intervals ranging from 20 keV for $E_\gamma \leq 1$ MeV to 160 keV for $E_\gamma \sim 9$ MeV. Neutron energy intervals varied from 0.15 MeV for $E_n = 0.85$ to 1 MeV to 3 MeV for $E_n = 14$ to 20 MeV.

INTRODUCTION

As part of a continuing program¹ for determining numerical values of gamma-ray production cross sections for neutron-induced reactions, we have measured the absolute differential cross sections for gamma rays produced by neutron interactions with zinc. The data are presented in this report in tabular and graphical forms.

The sample consisted of one piece of cast zinc metal, approximately 30 cm by 30 cm by 0.6 cm, giving a sample of 0.042 atoms/barn thickness. The sample was oriented at 45 deg with respect to the neutron beam line. Neutrons produced by the Oak Ridge Electron Linear Accelerator impinged on this sample, and the resulting gamma radiation was detected by a 12.7 cm by 12.7 cm NaI spectrometer. The data were binned into 21 neutron energy groups and then unfolded. Details of the experimental procedure and data reduction are given elsewhere.²

The first graph is an isometric representation of all the data. The following 21 graphs show the unfolded gamma-ray spectra obtained with the NaI spectrometer for the 21 neutron-energy bins.

The computer output tables which follow the graphs give the data obtained with the NaI spectrometer at the ORELA Shield Test Station. The first set of tables contains data in coarse gamma-ray energy groups of 250 or 500 keV; these correspond to those found, e.g., in request lists.³ The errors indicated in these tables represent half the area of the confidence interval given by the unfolding code FERD and are over-estimates since FERD output points were combined. The second set of tables give values of $d^2\sigma/dE d\omega$ for 125 mesh points of the response matrix used in FERD.

The differential cross-section values given are the middle values of the confidence interval. These errors do not include an absolute error of about 10% estimated for the combined uncertainties from neutron flux measurements, effective area of the beam and absolute efficiency of the detector. The relative errors for cross sections corresponding to adjacent neutron energy groups should be less than 5%. The neutron energy groups were selected so as to allow enough counts in each pulse-height spectrum for the unfolding code FERD. The neutron group widths are 0.15 MeV from 0.85 to 1 MeV, 0.25 MeV from 1 to 2 MeV, 0.5 MeV from 2 to 6 MeV, 1 MeV from 6 to 10 MeV, 2 MeV from 10 to 14 MeV, and 3 MeV from 14 to 20 MeV.

ACKNOWLEDGEMENTS

We express our appreciation to H. A. Todd and his group for excellent accelerator operation and to R. E. McDonald for fabricating the sample.
