OAK RIDGE NATIONAL LABORATORY

1

To: Listed Distribution

August 5, 1953

From: W. D. Powers and G. C. Blalock

Subject: ENTHALPY AND HEAT CAPACITY OF LITHIUM
CHLORIDE, POTASSIUM CHLORIDE EUTECTIC

DISTRIBUTION:

LEGAL NOTICE

This report was prepared as an account of Government sponsored work. Neither the United States, nor the Commission, nor any person acting on behalf of the Commission:

A. Makes any warranty or representation, express or implied, with respect to the accuracy, completeness, or usefulness of the information contained in this report, or that the use of any information, apparatus, method, or process disclosed in this report may not infringe privately owned rights; or

B. Assumes any liabilities with respect to the use of, or for damages resulting from the use of any information, apparatus, method, or process disclosed in this report.

As used in the above, "person acting on behalf of the Commission" includes any employee or contractor of the Commission to the extent that such employee or contractor prepares, handles or distributes, or provides access to, any information pursuant to his employment or contract with the Commission.

ENTHALPY AND HEAT CAPACITY OF LITHIUM
CHLORIDE, POTASSIUM CHLORIDE EUTECTIC

The enthalpy and heat capacity of the eutectic mixture of lithium chloride and potassium chloride (59 mole % lithium chloride) was determined for Brookhaven National Laboratory over the temperature range of 100° to 840°C. The measurements were made by dropping the sample contained in a welded stainless steel capsule from a furnace into a Bunsen ice-calorimeter. In this method the difference in enthalpy of the sample between the furnace temperature and 0°C is measured directly by the volume change caused by the melting of the ice in the calorimeter. Corrections are made for enthalpy of the capsule. The relationship between the enthalpy and temperature is determined by least squares. The heat capacity is the derivative of the enthalpy with respect to temperature.

The enthalpy of the liquid (97 determinations) and solid (10 determinations) were found to be:

$$351^{\circ} - 840^{\circ}\text{C}$$

$$H_T(\text{liquid}) - H_{00\text{C}}(\text{solid}) = 30 + 0.32(5)T$$

$$C_p = 0.32(5) \pm 0.02$$

$$97^{\circ} - 351^{\circ}\text{C}$$

$$H_T(\text{solid}) - H_{00\text{C}}(\text{solid}) = -4 + 0.23(6)T$$

$$C_p = 0.23(6) \pm 0.03$$

where H is the enthalpy in cal./g.

C_p is the heat capacity in cal./g. °C

T is the temperature in °C

The heat of fusion is about 64 cal./g.
