INTRODUCTION

The use of organic scintillation materials for the detection of ionizing radiation is expanding rapidly. The detection of the free neutrino, the measurement of radioactive fallout in man and his foods, the investigation of large cosmic ray showers, and tracer studies on the causes of atherosclerosis are only a few examples of the diverse applications of this new counting technique. Clearly, the publications relating to this technique will be dispersed through a large number of journals and will often be difficult to identify, since the title of an article may fail to indicate the nature of the instrumentation used. This bibliography is based on a literature search for such papers. It is hoped that it will be of value to persons beginning studies with scintillation counters by directing their attention to existing publications.
