ABSTRACT

Numerical values of differential cross sections for gamma rays produced by neutron reactions with tungsten have been obtained for neutron energies between 1.0 and 20 MeV for $\theta_Y = 125$ deg. The $d^2\sigma/d\omega dE$ values were obtained using a NaI spectrometer. These data consist of neutron and gamma-ray production group cross-section values of $d^2\sigma/d\omega dE$ for $0.7 \geq E_Y < 10.5$ MeV, with gamma-ray intervals ranging from 20 keV for $E_Y < 1$ MeV to 160 keV for $E_Y \sim 9$ MeV. Neutron energy intervals varied from 0.5 MeV for $E_n^Y = 1$ to 8 MeV to 3 MeV for $E_n = 14$ to 20 MeV.

INTRODUCTION

As part of a continuing program for determining numerical values of gamma-ray production cross sections for neutron-induced reactions, we have measured the absolute differential cross sections for gamma rays produced by neutron interactions with tungsten. The data are presented in this report in tabular and graphical forms.

The sample consisted of 8 sheets of tungsten metal, each approximately 8 in. by 14 in. by 0.03 in., mounted so as to give a sample of 0.040 atoms/barn thickness. Neutrons produced by the Oak Ridge Electron Linear Accelerator impinged on this sample, and the resulting gamma radiation was detected by a 5 in. by 5 in. NaI spectrometer. The data were binned into 20 neutron energy groups and then unfolded. Details of the experimental procedure and data reduction are given elsewhere.¹

The following graphs show the unfolded gamma-ray spectra obtained with the NaI spectrometer.

The computer output tables which follow the graphs give the data obtained with the NaI spectrometer at the ORELA Shield Test Station. The first set of tables contains data in coarse gamma-ray energy groups of 250 or 500 keV; the gamma-ray grouping is the same as in Reference 2 to facilitate comparison. The errors indicated in these tables represent half the area of the confidence interval given by the unfolding code FERD and are over-estimates since FERD output points were combined. The second set of tables give values of $d^2\sigma/dE d\omega$ for 125 mesh points of the response matrix used in FERD. The differential cross-section values given are the middle values of the confidence interval. Therefore, the errors do not include an absolute error of about 10% estimated for the neutron flux measurements, effective area of the beam and absolute efficiency of the detector. The relative errors for cross sections corresponding to adjacent neutron energy groups should be less than 5%. The neutron energy groups were selected so as to have enough counts in each pulse-height spectrum for the unfolding code FERD. The neutron group widths are 0.5 MeV from 1 to 8 MeV, 1 MeV from 8 to 10 MeV, 2 MeV from 10 to 14 MeV, and 3 MeV from 14 to 20 MeV.

ACKNOWLEDGEMENTS

We express our appreciation to H. A. Todd and his group for excellent accelerator operation and to R. E. McDonald of Metals and Ceramics Division for the loan of the tungsten used in the sample.
