ABSTRACT

A technique introduced by Symanzik is used to derive a series of equations obeyed order by order in perturbation theory by the structure functions W_1 and νW_2 entering the cross section for inelastic electron scattering. These equations relate the q^2 , ν and coupling constant dependence of W_1 and νW_2 in a manner reminiscent of the renormalization group results of Gell-Mann and Low. The equations are used to compute the leading logarithmic contribution to νW_2 in a theory of fermions coupled to pseudoscalar particles and a theory of fermions coupled to vector particles.

I. INTRODUCTION

The simple scaling behavior¹ of the structure functions W_1 and νW_2 ² observed³ for q^2 and $mv \geq 2 \text{ BeV}^2$ has caused considerable interest in the large q^2 and ν dependence of the matrix element

$$\begin{aligned} & \frac{1}{8\pi m} \sum_{s=\pm\frac{1}{2}} \int e^{-i q \cdot x} d^4x \langle p, s | J_\mu(x) J_\nu(0) | p, s \rangle \\ &= \left(\delta_{\mu\nu} - \frac{q_\mu q_\nu}{q^2} \right) W_1(q^2, \omega) + \frac{1}{m^2} \left(p^\mu - q^\mu \frac{p \cdot q}{q^2} \right) \left(p^\nu - q^\nu \frac{p \cdot q}{q^2} \right) W_2(q^2, \omega) \end{aligned} \quad (1)$$

where $|p, s\rangle$ is a single nucleon state with four-momentum p and z component of spin s , $J_\mu(x)$ is the usual electromagnetic current⁴. In this paper we investigate the behavior of W_1 and νW_2 for large q^2 and fixed $\omega = 2mv/q^2$ as computed to arbitrary order in the perturbation expansion of a renormalizable field theory.

As is well known⁵, the large q^2 and ν behavior of the matrix element (1) can be determined from the singularity of the product $J_\mu(x) J_\nu(0)$ on the light cone, $x^2 = 0$. We begin with Wilson's operator expansion^{6,7} for the short distance limit of the product $J_\mu(\frac{x+y}{2}) J_\nu(\frac{-x+y}{2})$

$$\begin{aligned} J_\mu\left(\frac{x+y}{2}\right) J_\nu\left(\frac{-x+y}{2}\right) &= \left(\delta^{\mu\nu} \frac{\partial}{\partial x_\alpha} \frac{\partial}{\partial x_\alpha} - \frac{\partial}{\partial x_\mu} \frac{\partial}{\partial x_\nu} \right) \frac{1}{x^2 + i\epsilon x_0} \\ &\quad \left\{ \sum_{n=0}^N \sum_{i=0}^n F_n^{(i)}(x^2 + i\epsilon x_0) O_{\mu_1 \dots \mu_n}^{(i)}(y) x_{\mu_1} \dots x_{\mu_n} \right. \\ &\quad \left. + R_N^{(i)}(x, y) \right\} + \left(\delta^{\mu\nu} \frac{\partial}{\partial x_\alpha} \frac{\partial}{\partial x_\beta} \right. \end{aligned}$$

$$\begin{aligned}
& + \delta_{\alpha\mu} \delta_{\beta\nu} \frac{\partial}{\partial x_\rho} \frac{\partial}{\partial x_\rho} - \frac{\partial}{\partial x_\alpha} \frac{\partial}{\partial x_\mu} \delta_{\beta\nu} - \frac{\partial}{\partial x_\alpha} \frac{\partial}{\partial x_\nu} \delta_{\beta\mu}) \\
& \times \left\{ \sum_{n=0}^N \sum_{i=0}^{u_n} E_n^{(i)}(x^2 + i \epsilon x_0) O_{\alpha, \beta, \mu_1, \dots, \mu_n}^{(i)}(y) x_{\mu_1} \dots x_{\mu_n} + R_N^{(i)}(x) \right\} \quad (2)
\end{aligned}$$

where $O_{\alpha_1 \dots \alpha_n}^{(i)}(y)$ are finite local operators, traceless and symmetric with respect to each pair of Lorentz indices⁸. $F_n^{(i)}(x^2)$ and $E_n^{(i)}(x^2)$ are C-number functions given by a perturbation expansion of the form

$$\begin{aligned}
F_n^{(i)}(x^2) &= \sum_{l=0}^{\infty} \sum_{r=0}^{l+1} \mathcal{F}_n^{(i)}(l, r) g^{2l} \ln^r(x^2) \\
E_n^{(i)}(x^2) &= \sum_{l=0}^{\infty} \sum_{r=0}^{l+1} \mathcal{E}_n^{(i)}(l, r) g^{2l} \ln^r(x^2) \quad (3)
\end{aligned}$$

where g is the coupling constant. The remainder terms $R_N^{(i)}(\lambda x, y)$ and $R'_N{}^{(i)}(\lambda x, y)$ approach zero as λ^{+N+1} for λ approaching zero and $x^2 \approx 0$ ^{9,10}. The structure functions W_1 and νW_2 can be directly determined from the coefficients $F_n^{(i)}(x^2)$, $E_n^{(i)}(x^2)$, $0 \leq n < \infty$, by substituting the expansion (2) into eq. (1) and carrying out the indicated Fourier transformation.

Using a technique introduced by Symanzik¹¹, we derive a set of coupled, first order, partial differential equations satisfied by the functions $E_n^{(i)}(x^2)$, $1 \leq i \leq u_n$ and by the functions $F_n^{(i)}(x^2)$, $1 \leq i \leq u_n$. The derivation is based on the Callan-Symanzik¹² equations obeyed by Green's functions containing the product $J_\mu(x) J_\nu(0)$. The equations obtained are of the sort predicted in other situations by renormalization group^{13,14} arguments and connect the x^2 and coupling constant dependence of $F_n^{(i)}(x^2)$, $E_n^{(i)}(x^2)$. The equations don't completely determine the

functions $E_n^{(i)}(x^2)$, $F_n^{(i)}(x^2)$ but are instead constraints which must be obeyed to arbitrary order in perturbation theory. When combined with explicit calculations in lowest order perturbation theory, the equations directly determine the coefficients $E_n^{(i)}(l, l+1)$, $F_n^{(i)}(l, l+1)$ of the leading logarithm in x^2 appearing in every order of perturbation theory.

These equations obeyed by the coefficients $E_n^{(i)}(x^2)$ and $F_n^{(i)}(x^2)$ in the Wilson expansion are derived for two specific field theories in Sect. II. We begin the Section by reviewing the connection between the light cone behavior of the product $J_\mu(x) J_\nu(0)$, specified by the expansion (2), and the large q^2 and ν limit of the structure functions W_1 and W_2 . Then, in Sect. II B, a theory of neutral pseudo-scalar particles interacting with charged spin $\frac{1}{2}$ particles is considered and the equations for the coefficients $E_n^{(i)}(x^2)$ and $F_n^{(i)}(x^2)$ derived. Next, in Sect. II C, the corresponding equations valid for a theory of neutral vector particles interacting with charged spin $\frac{1}{2}$ particles are obtained. In both cases there are two distinct operators $O_{a_1 \dots a_n}^{(i)}$, $i = 1, 2$ which appear for each n and the resulting equations are two coupled, first order, partial differential equations. In Sect. III these equations are combined with lowest order perturbation theory calculations to obtain $E_n^{(i)}(x^2)$ in the leading logarithmic approximation for each of these theories. The results are identical to those previously obtained from a detailed analysis of Feynman amplitudes to all orders in perturbation theory by Gribov and Lipatov.¹⁵ In Sect. IV we discuss the general solution to these equations. First two sets of approximate equations are considered which are obeyed by amplitudes in the pseudo-scalar theory containing no self energy or vertex corrections. One set is valid for all such amplitudes while the other applies only to those amplitudes which do not contain a two pseudo-scalar intermediate state. Both sets of equations imply a simple power dependence for $E_n^{(i)}(x^2)$

$$E_n^{(i)}(x^2) \sim v_n^{i,1}(x^2)^{v_n^{(1)}} + v_n^{i,2}(x^2)^{v_n^{(2)}} \quad (4)$$

for small x^2 where the power $v_n^{(i)}$ is a non-trivial function of n and the $v_n^{i,j}$ are constants. Finally the general solution to our equations is obtained for the vector theory, determining the two functions of two variables $E_n^{(i)}(x^2, g)$, $i = 1, 2$ in terms of seven functions of a single variable. The possibility that there exists a root g_∞ of the Gell-Mann Low eigenvalue condition¹³ is investigated and shown to determine somewhat more explicitly the small x^2 behavior of this solution.

II. DERIVATION OF EQUATIONS FOR $E_n^{(i)}(x^2)$, $F_n^{(i)}(x^2)$

In this section we derive a set of first order partial differential equations obeyed by the functions $E_n^{(i)}(x^2)$ $1 \leq i \leq v_n$ and by the functions $F_n^{(i)}(x^2)$, $1 \leq i \leq v_n$, to arbitrary order in perturbation theory. The make up of the operators $O_{a_1 \dots a_n}^{(i)}$ appearing in the expansion (2) and the precise form of the equations to be derived depend, of course, on the particular field theory considered. We will deal explicitly with two distinct theories. The first contains a charged spinor field $\psi(x)$ coupled bilinearly to a neutral pseudoscalar field $\phi(x)$ through the interaction Lagrangian $\mathcal{L}_I(x) = i g \bar{\psi}(x) \gamma_5 \psi(x) \phi(x)$. In the second theory, the charged spinor field couples to a vector field V_μ and $\mathcal{L}_I(x) = i g \bar{\psi}(x) \gamma_\mu \psi(x) V_\mu(x)$.

A. RELATION BETWEEN W_1 , vW_2 and $E_n^{(i)}(x^2)$, $F_n^{(i)}(x^2)$

Before deriving these equations for $E_n^{(i)}$ and $F_n^{(i)}$ it is useful to recall the connection between W_1 , vW_2 and the coefficients $E_n^{(i)}$ and $F_n^{(i)}$ in the Wilson expansion (2). Consider the invariant amplitudes T_L and T_2 entering the spin averaged forward Compton scattering amplitude

$$\begin{aligned} & \frac{i}{8} \sum_{s=\pm\frac{1}{2}} \int e^{-i q \cdot x} d^4x \langle p, s | T (J_\mu(x) J_\nu(0)) | p, s \rangle \\ &= -(\delta_{\mu\nu} - \frac{q_\mu q_\nu}{q^2}) T_L + \frac{2}{(q^2)^2} (p^\mu p^\nu q^2 + \delta^{\mu\nu} (p \cdot q)^2 - p^\mu q^\nu (p \cdot q) \\ & \quad - p^\nu q^\mu (p \cdot q)) T_2. \end{aligned} \quad (5)$$

The amplitudes T_L and T_2 are functions of q^2 and ω , related to W_1 and

νW_2 by

$$W_1 \approx \frac{2}{\pi m} \operatorname{im} \left[T_L + 2 \left(\frac{p \cdot q}{q^2} \right)^2 T_2 \right] \quad (6a)$$

$$\nu W_2 = -\frac{4}{\pi} \operatorname{im} \left[\frac{p \cdot q}{q^2} T_2 \right] \quad (6b)$$

for $\omega \geq 1$. If the Wilson expansion (2) is used to evaluate the left hand side of equation (5) and the Fourier transform performed, we find that for q_μ large¹⁶

$$T_2(q^2, \omega) = \sum_{n=0}^N (\omega)^n \sum_{i=1}^n \tilde{E}_n^{(i)}(q^2) c_{n+2}^{(i)} + r_N(q^2, \omega) \quad (7a)$$

$$T_L(q^2, \omega) = \sum_{n=0}^N (\omega)^n \sum_{i=1}^n \tilde{F}_n^{(i)}(q^2) c_n^{(i)} + r'_N(q^2, \omega) \quad (7b)$$

where

$$\tilde{E}_n^{(i)}(q^2) = \frac{i}{8} (q^2)^{n+2} \frac{\partial^n}{\partial (q^2)^n} \int d^4 x e^{-i q \cdot x} E_n^{(i)}(x^2 + i\epsilon) \quad (8a)$$

$$\tilde{F}_n^{(i)}(q^2) = \frac{i}{4} (q^2)^{n+1} \frac{\partial^n}{\partial (q^2)^n} \int d^4 x e^{-i q \cdot x} \frac{F_n^{(i)}(x^2 + i\epsilon)}{x^2 + i\epsilon} \quad (8b)$$

and

$$\begin{aligned} \frac{1}{2} \sum_{s=\pm\frac{1}{2}} \langle p, s | O_{a_1 \dots a_n}^{(i)} | p, s \rangle &= c_n^{(i)} p_{a_1} \dots p_{a_n} (+i)^n \\ &+ (\text{terms containing } \delta_{a_i a_j}) \end{aligned} \quad (9)$$

For large q^2 and small ω the remainder terms $r_N(q^2, \omega)$, $r'_N(q^2, \omega)$ are of order ω^{n+1} . Note that only the term proportional to $p_{a_1} \dots p_{a_n}$ in

equation (9) yields leading terms in the Wilson expansion (2) on the light cone. The matrix element (9) of $O_{a_1 \dots a_n}^{(i)}$ is proportional to the single symmetric traceless tensor that can be formed from the four vector p_μ . All terms in this tensor, other than the $p_{a_1 \dots a_n}$ term¹⁰ contain factors of $p^2 = -m^2$ and therefore give contributions to T_L and T_2 smaller by a factor of $m^2/q^2 u^2$.

The analyticity of T_L and T_2 in v for fixed q^2 implies that to any finite order in perturbation theory the limit $N \rightarrow \infty$ of the sums in equation (7) defines two analytic function of u near $u = 0$ ¹⁷

$$T_2^{AF}(q^2, u) = \sum_{n=0}^{\infty} (u)^n \sum_{i=0}^u \tilde{E}_n^{(i)}(q^2) c_{n+2}^{(i)} \quad (10a)$$

$$T_L^{AF}(q^2, u) = \sum_{n=0}^{\infty} (u)^n \sum_{i=0}^u \tilde{F}_n^{(i)}(q^2) c_n^{(i)}. \quad (10b)$$

These asymptotic forms for T_L and T_2 can be continued into the entire u plane with the exception of branch points at $u = \pm 1$, and used in equation (6) to compute W_1 and vW_2 for large q^2 and fixed $u > 1$. The familiar connection between the large q^2 , fixed u behavior of T_L or T_2 and the $x^2 = 0$ singularity of the coefficients $E_n^{(i)}(x^2)$, $F_n^{(i)}(x^2)$ can be seen from equation (8).

The relationship between the coefficients $\tilde{E}_n^{(i)}(q^2)$, $\tilde{F}_n^{(i)}(q^2)$ and the asymptotic behavior of the structure functions W_1 and vW_2 implied by equations (6) and (10) can be neatly inverted. Using Cauchy's theorem eq. (10a) can be written

$$\sum_i c_{n+2}^{(i)} \tilde{E}_n^{(i)}(q^2) = \frac{1}{2\pi i} \oint_c d\omega \omega^{-n-1} T_2(q^2, \omega)^{AF} \quad (11)$$

where c is a contour circling the origin in a counter-clockwise direction. Since T_2^{AF}

has branch points in ω at ± 1 and is even in ω , we can open up the contour to obtain

$$\sum_i c_{n+2}^{(i)} \tilde{E}_n^{(i)}(q^2) = \frac{2}{\pi} \int_1^\infty \omega^{-n-1} d\omega \operatorname{Im} T_2(q^2, \omega)^{AF} \quad (12)$$

or using eq. (6a)

$$\begin{aligned} \sum_i c_{n+2}^{(i)} \tilde{E}_n^{(i)}(q^2) &= \int_1^\infty \omega^{-n-2} \nu W_2(q^2, \omega)^{AF} d\omega \\ &= \int_0^1 \left(\frac{1}{\omega}\right)^n \nu W_2(q^2, \omega)^{AF} d\left(\frac{1}{\omega}\right), \end{aligned} \quad (13a)$$

likewise

$$\sum_i c_n^{(i)} \tilde{F}_n^{(i)}(q^2) = \int_1^\infty \omega^{-n-1} \left[\frac{\omega}{2} \nu W_2^{AF}(q^2, \omega) - m W_1^{AF}(q^2, \omega) \right] d\omega. \quad (13b)$$

Equation (13) interpretes the Callen-Gross and Cornwall-Norton sum rule¹⁸ in the language of the Wilson expansion. It also identifies $\sum_i c_{n+2}^{(i)} \tilde{E}_n^{(i)}(q^2, \omega)$ as the Mellin transform of $\nu W_2(q^2, \omega)^{AF}$ with respect to the variable $1/\omega$. This transformation can be inverted, giving

$$\nu W_2(q^2, \omega)^{AF} = \frac{-i}{2\pi} \int_{\delta-i\infty}^{\delta+i\infty} dn \omega^{n+1} \left[\sum_i c_{n+2}^{(i)} \tilde{E}_n^{(i)}(q^2) \right] \quad (14a)$$

and similarly

$$\frac{\omega}{2} \nu W_2^{AF} - m W_1^{AF} = \frac{-i}{2\pi} \int_{\delta-i\infty}^{\delta+i\infty} dn \omega^n \left[\sum_i c_n^{(i)} \tilde{F}_n^{(i)}(q^2) \right] \quad (14b)$$

for sufficiently large, real positive δ .

B. PSEUDO-SCALAR THEORY

Let us now consider the pseudo-scalar case, specified by the Lagrangian

$$\begin{aligned} \mathcal{L} = & -\bar{\psi}(\gamma_{\mu} \partial_{\mu} + m) \psi - \frac{1}{2} \partial_{\mu} \phi \partial_{\mu} \phi - \frac{1}{2} \mu^2 \phi^2 + i g \bar{\psi} \gamma_5 \psi \phi + \frac{1}{4!} h \phi^4 \\ & + (\text{counter terms}) ; \end{aligned} \quad (15)$$

m and μ are the physical masses of the spin $\frac{1}{2}$ and the pseudo-scalar particles while g and h are renormalized coupling constants. The renormalization procedure is specified in Appendix A.

The starting point of our derivation is the Callan-Symanzik equations¹² for the matrix elements

$$\begin{aligned} \Gamma_{\mu\nu}^{(1)}(p, x) &= \frac{i}{2} \int d^4z d^4y e^{i p \cdot (z-y)} \langle 0 | T \{ \bar{\psi}(y) J_{\mu}(x) J_{\nu}(0) \bar{\psi}(z) \} | 0 \rangle_A \\ &< 0 | T \{ \bar{\psi}(y) J_{\mu}(x) J_{\nu}(0) \bar{\psi}(z) \} | 0 \rangle_A \end{aligned} \quad (16a)$$

$$\begin{aligned} \Gamma_{\mu\nu}^{(2)}(p, x) &= i \int d^4z d^4y e^{i p \cdot (z-y)} \langle 0 | T \{ \bar{\psi}(y) J_{\mu}(x) J_{\nu}(0) \bar{\psi}(z) \} | 0 \rangle_A \\ &< 0 | T \{ \bar{\psi}(y) J_{\mu}(x) J_{\nu}(0) \bar{\psi}(z) \} | 0 \rangle_A \end{aligned} \quad (16b)$$

where the subscript A means that the propagators corresponding to external lines have been removed. The Callan-Symanzik equations obeyed by these matrix elements and derived in Appendix A are

$$D_1 \Gamma_{\mu\nu}^{(i)}(x, p) = \Delta \Gamma_{\mu\nu}^{(i)}(x, p) \quad (17)$$

for $i = 1, 2$. The differential operator D_1 is given by

$$D_1 = m^2 \frac{\partial}{\partial m^2} + \mu^2 \frac{\partial}{\partial \mu^2} + \beta \frac{\partial}{\partial g} + \beta' \frac{\partial}{\partial h} - 2\gamma_1 \quad (18)$$

while¹⁹

$$\Delta \Gamma_{\mu\nu}^{(1)}(x, p) = \frac{1}{2} \int e^{i p \cdot (z-y)} d^4 z d^4 y (\rho)_{\delta\sigma} <0 | T \{ \psi_\sigma(y) j_\mu(x) j_\nu(0) u \bar{\psi}_\delta(z) \} | 0 >_A \quad (19a)$$

$$\Delta \Gamma_{\mu\nu}^{(2)}(x, p) = \int e^{i p \cdot (z-y)} d^4 z d^4 y <0 | T \{ \rho(y) j_\mu(x) j_\nu(0) u \rho(z) \} | 0 >_A \quad (19b)$$

The operator u , in the notation of Zimmerman²⁰, is

$$u = \frac{1}{2} \int d^4 x \left\{ m \delta_1 N [\bar{\psi}(x) \psi(x)] + \mu^2 \delta_2 N [\rho(x) \rho(x)] \right\} \quad (20)$$

where the symbol N indicates the inclusion of subtraction terms, chosen in a manner specified in Appendix A, so that all matrix elements of u are finite. The dimensionless constants $\beta, \beta', \gamma_1, \gamma_2, \delta_1, \delta_2$ are functions of g, h , and m/μ and can be computed to arbitrary order in perturbation theory. The Callan-Symanzik equations (17) are exact but not very useful as they stand since they relate the behavior of the quantities of interest, (16), to that of two new unknown functions (19). However, if we consider the small x_μ limit of equation (17) and substitute the Wilson expansion (2) into both the right and left hand sides, then we find that the small x_μ dependence of both sides is determined by the same functions $E_n^{(1)}(x^2)$ and $F_n^{(1)}(x^2)$ [1, 2].

The resulting equations are

$$D_i \left\{ \sum_{n=1}^{\infty} \sum_{j=1}^{u_{2n}} E_{2n-2}^{(j)}(x^2) b_{2n}^{i,j} (x \cdot p)^{2n-2} \right\} = \sum_{n=1}^{\infty} \sum_{j=1}^{u_{2n}} E_{2n-2}^{(j)}(x^2) a_{2n}^{i,j} (x \cdot p)^{2n-2} \quad (21)$$

for $i = 1, 2$ and $p^2 = 0$. The constants $a_n^{i,j}$ and $b_n^{i,j}$ are related to the relevant matrix elements of $O_{a_1 \dots a_n}^{(i)}$ by

$$\begin{aligned} & \frac{1}{2} \int e^{i p \cdot (z-y)} d^4 y d^4 z (\not{p})_{\delta\sigma} \langle 0 | T \{ \psi_{\sigma}(y) O_{a_1 \dots a_n}^{(i)} \bar{\psi}_{\delta}(z) \} | 0 \rangle_A \\ &= b_n^{1,j} p_{a_1} \dots p_{a_n}^{(i)^n} + (\text{terms containing } \delta_{a_i a_j}) \end{aligned} \quad (22a)$$

$$\begin{aligned} & \int e^{i p \cdot (z-y)} d^4 y d^4 z \langle 0 | T \{ \not{p}(y) O_{a_1 \dots a_n}^{(i)} \not{p}(z) \} | 0 \rangle_A \\ &= b_n^{2,j} p_{a_1} \dots p_{a_n}^{(i)^n} + (\text{terms containing } \delta_{a_i a_j}) \end{aligned} \quad (22b)$$

$$\begin{aligned} & \frac{1}{2} \int e^{i p \cdot (z-y)} d^4 y d^4 z (\not{p})_{\delta\sigma} \langle 0 | T \{ \psi_{\sigma}(y) O_{a_1 \dots a_n}^{(i)} u \bar{\psi}_{\delta}(z) \} | 0 \rangle_A \\ &= a_n^{1,j} p_{a_1} \dots p_{a_n}^{(i)^n} + (\text{terms containing } \delta_{a_i a_j}) \end{aligned} \quad (22c)$$

$$\begin{aligned} & \int e^{i p \cdot (z-y)} d^4 y d^4 z \langle 0 | T \{ \not{p}(y) O_{a_1 \dots a_n}^{(i)} u \not{p}(z) \} | 0 \rangle_A \\ &= a_n^{2,j} p_{a_1} \dots p_{a_n}^{(i)^n} + (\text{terms containing } \delta_{a_i a_j}) \end{aligned} \quad (22d)$$

for $p^2 = 0$ and $1 \leq a_i \leq 3$, $1 \leq i \leq n$ and n even. Bose symmetry and charge conjugation invariance imply that the left hand sides of these equations vanish for odd n .

In equation (22) we use $p^2 = 0$ so that the quantities $a_n^{i,j}$ and $b_n^{i,j}$ depend only on m^2/μ^2 , g , h . Equating the coefficients of equal powers of $(x-p)^n$, we obtain a series of equations diagonal in the index n

$$D_i \left\{ \sum_j E_{n-2}^{(j)}(x^2) b_n^{i,j} \right\} = \sum_j E_{n-2}^{(j)} a_n^{i,j} \quad (23)$$

$2 \leq n \leq \infty$, $i = 1, \dots, u_n$, for even n . Equations (21) and (23) are also obeyed by $F_n^{(i)}(x^2)$ and $0 \leq n \leq \infty$. These equations can be Fourier transformed yielding identical equations for the quantities $\tilde{E}_n^{(i)}(q^2)$

$$D_i \left\{ \sum_j \tilde{E}_{n-2}^{(j)}(q^2) b_n^{i,j} \right\} = \sum_j \tilde{E}_{n-2}^{(j)}(q^2) a_n^{i,j}, \quad (24)$$

which are also obeyed by the functions $\tilde{F}_n^{(i)}(q^2)$.

Let us now determine explicitly the operators which appear in the Wilson expansion (2) for the particular theory at hand. Because of the requirements of symmetry in the Lorentz indices and the absence of $\delta_{a_i a_j}$ factors, there are only two N^{th} rank tensor operators with the smallest dimension which can be formed²²

$$\begin{aligned} O_{a_1 \dots a_n}^{(1)}(y) &= -\frac{1}{4n}(1+(-1)^n) \sum_{j=1}^n N \left[\bar{\psi}(y) \partial_{a_1} \dots \partial_{a_{j-1}} \gamma_{a_j} \partial_{a_{j+1}} \dots \partial_{a_n} \psi(y) \right] \\ &\quad + (\text{terms containing } \delta_{a_i a_j}) \end{aligned} \quad (25a)$$

$$\begin{aligned} O_{a_1 \dots a_n}^{(2)}(y) &= \frac{1}{2} N \left[\not{\psi}(y) \partial_{a_1} \dots \partial_{a_n} \not{\psi}(y) \right] + (\text{terms containing } \delta_{a_i a_j}) \end{aligned} \quad (25b)$$

where the symbol N again indicates that sufficient subtractions have been made so that the resulting operator is finite. The subtractions will be chosen so that

$$b_n^{i,j}(g, h, m^2/\mu^2) = \delta_{ij} . \quad (26)$$

The equations obeyed by $\tilde{E}_n^{(i)}(q^2)$ for $i = 1, 2$, $2 \leq n \leq \infty$ (and $\tilde{F}_n^{(i)}(q^2)$, $i = 1, 2$, $0 \leq n \leq \infty$) then become

$$D_i \tilde{E}_{n-2}^{(i)}(q^2) = \sum_{j=1,2} a_n^{i,j} \tilde{E}_{n-2}^{(j)}(q^2) . \quad (27)$$

These two coupled first order differential equations can be written as uncoupled second order equations

$$(D_2 - a_n^{2,2}) \frac{1}{a_n^{1,2}} (D_1 - a_n^{1,1}) \tilde{E}_n^{(1)}(q^2) = a_n^{2,1} \tilde{E}_n^{(1)}(q^2) \quad (28a)$$

$$(D_1 - a_n^{1,1}) \frac{1}{a_n^{2,1}} (D_2 - a_n^{2,2}) \tilde{E}_n^{(2)}(q^2) = a_n^{1,2} \tilde{E}_n^{(2)}(q^2) . \quad (28b)$$

These equations (27 or 28) are the desired equations for the pseudo-scalar theory. They are the generalization of Symanzik's exceptional momentum equation to all the operators in the Wilson expansion on the light cone. These equations will be used in Section III to compute the leading logarithmic contribution to νW_2 and in Section IV to speculate about the exact asymptotic behavior of νW_1 and νW_2 .

C. MASSIVE VECTOR THEORY

We now consider the theory of a vector field V_μ of mass μ interacting with a spin $\frac{1}{2}$ field of mass m , specified by the Lagrangian

$$\begin{aligned} \mathcal{L}(x) = & -\bar{\psi}(\gamma_\mu \partial_\mu + m)\psi - \frac{1}{4} G_{\mu\nu} G_{\mu\nu} + i g V_\mu \bar{\psi} \gamma_\mu \psi - \frac{1}{2} \mu^2 V_\mu V_\mu \\ & + (\text{counter terms}) \end{aligned} \quad (29)$$

where g is the renormalized coupling constant and

$$G_{\mu\nu}(x) = \partial_\mu V_\nu(x) - \partial_\nu V_\mu(x). \quad (30)$$

In analogy²³ with equation (16) we define the amplitudes

$$\begin{aligned} \Gamma_{\mu\nu}^{(1)}(p, x) = & \frac{i}{2} \int d^4z d^4y e^{i p \cdot (z-y)} (\not{p})_{\delta\alpha} \\ & \langle 0 | T \{ \psi_\delta(y) J_\mu(x) J_\nu(0) \bar{\psi}_\alpha(z) \} | 0 \rangle_A \end{aligned} \quad (31a)$$

$$\begin{aligned} \Gamma_{\mu\nu}^{(2)}(p, x) = & \frac{1}{3} \int d^4z d^4y e^{i p \cdot (z-y)} \langle 0 | T \{ V_\rho(y) J_\mu(x) J_\nu(0) V_\rho(z) \} | 0 \rangle_A. \end{aligned} \quad (31b)$$

As is shown in Appendix A, these amplitudes obey the Callan-Symanzik equation

$$D_i \Gamma_{\mu\nu}^{(i)}(p, x) = \Delta \Gamma_{\mu\nu}^{(i)}(p, x) \quad (32)$$

for $i = 1, 2$; where

$$D_i = \left[m^2 \frac{\partial}{\partial m^2} + \mu^2 \frac{\partial}{\partial \mu^2} + \beta \frac{\partial}{\partial g} - 4\gamma_2 - 2\gamma_1 \right] \gamma_3^2 \quad (33)$$

and

$$\begin{aligned} \Delta \Gamma_{\mu\nu}^{(1)}(x, p) = & \frac{1}{2} \int d^4z d^4y e^{i p \cdot (z-y)} (\not{p})_{\rho\sigma} \gamma_3^2 \\ & \langle 0 | T \{ \psi_\sigma(y) J_\mu(x) J_\nu(0) u \bar{\psi}_\rho(z) \} | 0 \rangle_A \end{aligned} \quad (34a)$$

$$\Delta r_{\mu\nu}^{(2)}(x, p) = \frac{1}{3} \int e^{i p \cdot (z-y)} d^4 z d^4 y \gamma_3^2$$

$$\langle 0 | \tau \{ V_\rho(y) J_\mu(x) J_\nu(0) + V_\rho(z) \} | 0 \rangle_A \quad (34b)$$

for $\beta = g\gamma_2$ and

$$u = \frac{1}{2} \int d^4 x \left\{ m \delta_1 N [\bar{\psi}(x) \psi(x)] + \mu^2 \delta_2 N [V_\rho(x) V_\rho(x)] \right\}. \quad (35)$$

Substituting the Wilson expansion (2) into eq. (32) and equating equal powers of $x \cdot p$ we obtain an equation identical in form to eq. (23)

$$D_i \left\{ \sum_{j=1}^{u_n} E_{n-2}^{(i)} b_n^{i,j} \right\} = \sum_{j=1}^{u_n} E_{n-2}^{(i)} a_n^{i,j} \quad (36)$$

for $i = 1, 2, n$ even and $2 \leq n < \infty$. The constants $a_n^{i,j}(m^2/\mu^2, g)$ and $b_n^{i,j}(m^2/\mu^2, g)$ are defined by equations obtained from eq. (22) by replacing $\psi(y)\bar{\psi}(z)$ by $1/3 V_\rho(y) V_\rho(z)$ and multiplying the left hand sides of eqs. (22c and d) by γ_3^2 . The longitudinal coefficients $F_n^{(i)}$ also obey eq. (36) for $0 \leq n < \infty$.

Just as in the pseudo-scalar case there are two types of operators that can contribute:

$$O_{a_1 \dots a_n}^{(1)} = -\frac{1}{4n} (1 + (-1)^n) \sum_{j=1}^n N \left[\bar{\psi} (\partial_{a_1} - i g V_{a_1}) \dots \gamma_{a_j} \dots (\partial_{a_n} - i g V_{a_n}) \psi \right]$$

$$+ (\text{terms containing } \delta_{a_i a_j}) \quad (37a)$$

$$O_{a_1 \dots a_n}^{(2)} = \frac{3}{4} \frac{1}{(n-1)n} \sum_{j=1}^n \sum_{i \neq j}^n N \left[G_{\gamma a} \partial_{a_1} \dots \delta_{a_j \beta} \dots \delta_{a_i \alpha} \dots G_{\beta \gamma} \right]$$

$$+ (\text{terms containing } \delta_{a_i a_j}) \quad (37b)$$

The number of possible operators is limited to only two, for a given n , by gauge invariance. Both the operator $J_\mu(x) J_\nu(0)$ and the first three terms of our Lagrangian (29) are invariant under the transformation

$$\begin{aligned} V_\mu(x) &\rightarrow V_\mu(x) + i g \partial_\mu \Lambda(x) \\ \psi(x) &\rightarrow e^{i g \Lambda(x)} \psi(x) . \end{aligned} \quad (38)$$

Although the mass term $-\frac{1}{2} \mu^2 V_\rho V_\rho$ breaks this gauge symmetry, the leading terms in Wilson's expansion (2) are independent of μ^2 and hence are left unchanged by the transformation (38).

Thus only two series of functions $E_n^{(1)}(x^2)$ and $E_n^{(2)}(q^2)$ are needed to determine vW_2 in the large q^2 and v region. If we choose the subtractions required to make the operators (37) finite in such a way that

$$b_n^{i,j} = \delta_{ij} \quad (39)$$

and transform to momentum space, then eq. (36) becomes

$$D_1 \tilde{E}_{n-2}^{(i)}(q^2) = \sum_{j=1,2} a_n^{i,j} \tilde{E}_{n-2}^{(j)}(q^2) \quad (40)$$

for $i = 1, 2$, $2 \leq n < \infty$, an equation identical in form to that found for the pseudo-scalar theory. This equation is also obeyed by the functions $F_n^{(i)}(q^2)$, $i = 1, 2$, $0 \leq n < \infty$.

III. PERTURBATION THEORY CALCULATIONS

In this section we use the equations derived in Section II to calculate the inelastic electroproduction structure function νW_2 in a leading logarithmic approximation. Various authors^{15, 24, 25, 26} have performed such calculations by applying infinite-momentum methods directly to specific classes of Feynman graphs. Such approaches require considerable expertise in the art of extracting asymptotic behavior from Feynman amplitudes. We will show how these leading logarithmic results emerge rather trivially from eqs. (27) and (40). Altogether three specific examples will be considered: (A) the ladder graphs in the pseudo-scalar theory calculated by Chang and Fishbane²⁴, (B) the complete leading logarithmic behavior in the pseudo-scalar theory, first computed by Gribov and Lipatov¹⁵ and (C) the complete leading logarithmic behavior in the vector theory, also computed by Gribov and Lipatov¹⁵.

A. CHANG-FISHBANE CALCULATION

Chang and Fishbane consider the ladder graphs of Fig. (1) in the leading logarithmic approximation. In our notation this means that they keep all terms in $\tilde{E}_n^{(1)}(q^2)$ of the form $(g^2)^r (g^2 \ln q^2)^l$ with $r = 0$. Since no intermediate state containing only two pseudo-scalar particles appears in the Feynman diagrams of Fig. (1), the operator $O_{a_1 \dots a_n}^{(2)}$ should be omitted from the Wilson expansion of $J_\mu(x) J_\nu(0)$ ⁷; therefore, we set $\tilde{E}_n^{(2)}(q^2) = 0$. Furthermore, there are no propagator or vertex corrections included in this set of graphs so $\beta = \beta' = \gamma_1 = \gamma_2 = 0$. (In Chang and Fishbane's language we are taking only their outer rainbow graphs.) Thus eq. (27) becomes simply

$$\left[m^2 \frac{\partial}{\partial m^2} + \mu^2 \frac{\partial}{\partial \mu^2} \right] \tilde{E}_n^{(1)}(q^2) = a_{n+2}^{1,1} E_n^{(1)}(q^2). \quad (41)$$

Since $\tilde{E}_n^{(1)}(q^2)$ is a dimensionless function of q^2 , m^2 and μ^2 we may replace $m^2 \frac{\partial}{\partial m^2} + \mu^2 \frac{\partial}{\partial \mu^2}$ by $-q^2 \frac{\partial}{\partial q^2}$ so that eq. (41) can be rewritten

$$q^2 \frac{\partial}{\partial q^2} \tilde{E}_n^{(1)}(q^2) = -a_{n+2}^{1,1} \tilde{E}_n^{(1)}(q^2) \quad (42)$$

whose solution is

$$\tilde{E}_n^{(1)}(q^2) = v_n \exp \left[-a_{n+2}^{1,1} \ln(q^2) \right] = v_n (q^2)^{-a_{n+2}^{1,1}} \quad (43)$$

To obtain the leading logarithmic behavior of $\tilde{E}_n^{(1)}(q^2)$ we need only compute the parameter $a_{n+2}^{1,1}$ from eq. (22a) to lowest order in g and determine the integration constant v_n from the $g^2 = 0$ Born term. This calculation of the quantities $a_n^{1,1}$ involves the evaluation of a simple lowest order vertex correction and is carried out in Appendix B, yielding

$$a_{n+2}^{1,1} = - \frac{g^2}{16\pi^2} \frac{1}{(n+2)(n+3)} \quad (44)$$

for even n . Since to lowest order in g , the $c_n^{(i)}$ of eq. (9) equals 1 and

$$vW_2 = \delta \left(1 - \frac{1}{u} \right) \quad (45)$$

eq. (13a) implies $v_n = 1$ so that in leading logarithmic approximation

$$\int_0^1 d\left(\frac{1}{u}\right) \left(\frac{1}{u}\right)^{n+1} vW_2^{AF}(q^2, u) = \tilde{E}_n^{(1)}(q^2) = (q^2)^{\frac{g^2}{16\pi^2} \frac{1}{(n+2)(n+3)}} \quad (46)$$

This is exactly the result of Chang and Fishbane for the set of outer rainbow amplitudes.

Thus the Mellin transform used so judiciously by Chang and Fishbane and by Gribov and

Lipatov is nothing other than the index-continued Wilson expansion, the continuation being analogous to the Sommerfeld-Watson continuation of a partial wave expansion.

B. GRIBOV -LIPATOV CALCULATION FOR THE PSEUDO-SCALAR THEORY

We will now find all the leading logarithmic terms in $\tilde{E}_n^{(1)}(q^2)$ for the γ_s theory. The basic equations for this calculation are given by eq.(27) which we write in full as

$$\begin{aligned} \left[-q^2 \frac{\partial}{\partial q^2} + \beta \frac{\partial}{\partial g} + \beta' \frac{\partial}{\partial h} - 2\gamma_1 \right] \tilde{E}_n^{(1)}(q^2) &= a_{n+2}^{1,1} \tilde{E}_n^{(1)}(q^2) + a_{n+2}^{1,2} \tilde{E}_n^{(2)}(q^2) \\ \left[-q^2 \frac{\partial}{\partial q^2} + \beta \frac{\partial}{\partial g} + \beta' \frac{\partial}{\partial h} - 2\gamma_2 \right] \tilde{E}_n^{(2)}(q^2) &= a_{n+2}^{2,1} \tilde{E}_n^{(1)}(q^2) + a_{n+2}^{2,2} \tilde{E}_n^{(2)}(q^2) \end{aligned} \quad (47)$$

for even $n \geq 0$. Following Gribov and Lipatov we set h and therefore β' equal to zero. (In a regularized theory with no ϕ^4 interaction term h is of order g^4 .) The quantities β , γ_1 , and γ_2 can be computed to lowest order in g from eq. (A9) of Appendix A while in Appendix C the $a_n^{i,j}$ are determined and their connection with various graphs indicated. The results are

$$\begin{aligned} \beta &= \frac{5g^3}{32\pi^2} & \gamma_1 &= \frac{g^2}{64\pi^2} & \gamma_2 &= \frac{g^2}{16\pi^2} \\ a_{n+2}^{1,1} &= -\frac{g^2}{16\pi^2} \frac{1}{(n+2)(n+3)} & a_{n+2}^{1,2} &= -\frac{g^2}{16\pi^2} \frac{1}{(n+3)} \\ a_{n+2}^{2,1} &= -\frac{g^2}{4\pi^2} \frac{1}{(n+2)} & a_{n+2}^{2,2} &= 0 \end{aligned} \quad (48)$$

Since in leading logarithmic approximation $\tilde{E}_n^{(i)}(q^2)$ depends only on $g^2 \ln(q^2)$ it is

convenient to introduce the variable

$$\xi = -\frac{1}{5} \ln \left[1 - \frac{5q^2}{16\pi^2} \ln(q^2) \right]. \quad (49)$$

The reader will note that

$$-q^2 \frac{\partial}{\partial q^2} + \beta \frac{\partial}{\partial g} = -\frac{g^2}{16\pi^2} \frac{\partial}{\partial \xi} \quad (50)$$

when acting on a function of ξ alone. Using eqs. (48) and (50), we can rewrite eq. (47) as

$$\begin{aligned} \left(\frac{\partial}{\partial \xi} + \frac{1}{2} \right) \tilde{E}_n^{(1)}(\xi) &= \frac{1}{(n+2)(n+3)} \tilde{E}_n^{(1)}(\xi) + \frac{1}{(n+3)} \tilde{E}_n^{(2)}(\xi) \\ \left(\frac{\partial}{\partial \xi} + 2 \right) \tilde{E}_n^{(2)}(\xi) &= \frac{4}{(n+2)} \tilde{E}_n^{(1)}(\xi). \end{aligned} \quad (51)$$

which are equivalent to

$$\left\{ \frac{\partial^2}{\partial \xi^2} + \left[\frac{5}{2} - \frac{1}{(n+2)(n+3)} \right] \frac{\partial}{\partial \xi} + 1 - \frac{6}{(n+2)(n+3)} \right\} \tilde{E}_n^{(1)}(\xi) = 0 \quad (52)$$

$$\text{and } \tilde{E}_n^{(2)}(\xi) = (n+3) \left[\frac{\partial}{\partial \xi} + \frac{1}{2} - \frac{1}{(n+2)(n+3)} \right] \tilde{E}_n^{(1)}(\xi). \quad (53)$$

Eq. (52) implies that $\tilde{E}_n^{(1)}(\xi)$ has the form

$$E_n^{(1)}(\xi) = C_n e^{v_n \xi} + C'_n e^{v'_n \xi} \quad (54)$$

where

$$v_n = -\frac{5}{4} + \frac{1}{2(n+2)(n+3)} + \left[\left(\frac{3}{4} + \frac{1}{2(n+2)(n+3)} \right)^2 + \frac{4}{(n+2)(n+3)} \right]^{\frac{1}{2}}$$

$$v'_n = -\frac{5}{4} + \frac{1}{2(n+2)(n+3)} - \left[\left(\frac{3}{4} + \frac{1}{2(n+2)(n+3)} \right)^2 + \frac{4}{(n+2)(n+3)} \right]^{\frac{1}{2}} \quad (55)$$

The integration constants C_n and C'_n are determined from the known $g^2 = 0$ limit given by the Born terms

$$\tilde{E}_n^{(1)}(\xi) \Big|_{\xi=0} = 1 \quad (56a)$$

$$\tilde{E}_n^{(2)}(\xi) \Big|_{\xi=0} = 0 \quad (56b)$$

which requires

$$C_n = \frac{1}{v'_n - v_n} \left[\frac{1}{(n+2)(n+3)} - \frac{1}{2} - v'_n \right]$$

$$C'_n = \frac{1}{v'_n - v_n} \left[\frac{1}{(n+2)(n+3)} - \frac{1}{2} - v_n \right] \quad (57)$$

A continuation of eq. (54) to complex values of the index n , when substituted in eq. (14a) yields

$$vW_2(q^2, \omega) = \frac{-i}{2\pi} \int_{\delta-i\infty}^{\delta+i\infty} dn \omega^{n+1} \left[C_n e^{v_n \xi} + C'_n e^{v'_n \xi} \right] \quad (58)$$

in exact agreement with Gribov and Lipatov for the leading logarithmic behavior of the structure function νW_2 for deep inelastic scattering of electrons off the q field. The reader is referred to the work of Gribov and Lipatov for a discussion of the physical significance, if any, of this result.

C. GRIBOV-LIPATOV CALCULATION FOR THE MASSIVE VECTOR THEORY

Finally we turn to the calculation of the leading logarithms in νW_2 for the vector theory studied in Sect. II. C. Since this calculation proceeds much as in the pseudo-scalar case, we will simply outline the procedure for obtaining the result — identical to that of Gribov and Lipatov. The quantities $\beta = 2\gamma_2$, γ_1 and γ_3 , determined in Appendix A, can be computed in the Feynman gauge to lowest order in g with the result

$$\beta = \frac{g^3}{24\pi^2}, \quad \gamma_1 = \frac{g^2}{32\pi^2}, \quad \gamma_3 = 1. \quad (59)$$

Similarly, the constants $a_n^{l,i}$ are evaluated in Appendix C to order g^2 :

$$\begin{aligned} a_{n+2}^{1,1} &= -\frac{g^2}{8\pi^2} \left[\frac{1}{(n+2)(n+3)} - \sum_{l=0}^n \frac{2}{l+2} \right] \\ a_{n+2}^{1,2} &= \frac{3g^2}{16\pi^2} \frac{n^2 + 5n + 8}{(n+1)(n+2)(n+3)} \\ a_{n+2}^{2,1} &= \frac{g^2}{6\pi^2} \frac{n^2 + 5n + 8}{(n+2)(n+3)(n+4)} \\ a_{n+2}^{2,2} &= 0. \end{aligned} \quad (60)$$

Introducing the variable

$$\xi = -\frac{3}{4} \ln \left[1 - \frac{g^2}{12\pi^2} \ln(q^2) \right],$$

we can rewrite eq. (40) for $\tilde{E}_n^{(i)}(q^2)$ as

$$\left\{ \frac{\partial^2}{\partial \xi^2} - \left[3 + \psi_1(n+2) + \psi_3(n+2) \right] \frac{\partial}{\partial \xi} + \frac{20}{9} + \frac{4}{3} \left[\psi_1(n+1) + \psi_3(n+2) \right] - \psi_2(n+2) \right\} E_n^{(1)}(\xi) = 0$$

$$E_n^{(2)} = -\frac{g^2}{16\pi^2} \frac{1}{a_{n+2}^{1,2}} \left[\frac{\partial}{\partial \xi} - \frac{5}{3} - \psi_1(n+2) - \psi_3(n+2) \right] E_n^{(1)} \quad (61)$$

where

$$\psi_1(j) = \frac{2}{j(j+1)}$$

$$\psi_2(j) = \frac{8(j^2 + j + 2)^2}{(j-1)j^2(j+1)^2(j+2)}$$

$$\psi_3(j) = -4 \sum_{l=2}^j \frac{1}{l} \quad (62)$$

in the notation of Gribov and Lipatov. These equations, when coupled with the requirement²⁷ (56) can be explicitly solved as in the preceding section yielding the Gribov-Lipatov result.

IV. GENERAL SOLUTION

We now consider the general solution to the equations (23) and (36) obeyed by the coefficients $E_n^{(i)}(x^2)$, $F_n^{(i)}(x^2)$ appearing in the Wilson expansion (2). We first study the simplified equations which govern the Chang-Fishbone calculation of Section III. A in which all self energy corrections, vertex corrections and amplitudes containing a two pseudo-scalar intermediate state have been omitted. Next, those amplitudes containing a two pseudo-scalar intermediate state are included and the resulting equations solved. In both cases the functions $\tilde{E}_n^{(i)}(q^2)$ show a power dependence on q^2 , where the exponent of q^2 depends explicitly on n . Thus for these examples the operators $O_{a_1 \dots a_n}^{(i)}$ possess an n -dependent anomalous dimension in the sense of Wilson.⁶ Finally the general solution of eq. (40) for the vector theory is found, determining $\tilde{E}^{(i)}(q^2, g)$ in terms of two unknown functions of a single variable and the quantities $\beta(g)$, $\gamma_1(g)$, $a_n^{i,j}(g)$. If we assume that $\beta(g)$ has a zero at $g = g_\infty$, and that the quantities $\tilde{E}_n^{(i)}(q^2, g)$, $\gamma_1(g)$ and $a_n^{i,j}(g)$ are regular at $g = g_\infty$, then this solution also shows power dependence in q^2 , with the power depending on n . Although in each of these three cases we find or hypothesize solutions which display a power behavior in q^2 , we see no suggestion that these powers should be identically zero for all n as is required if the structure function $\nu W_2(q^2, u)$ is to be independent of q^2 for large q^2 .

A. CHANG-FISHBANE AMPLITUDES

We begin by examining the set of amplitudes first studied by Chang and Fishbane. These amplitudes contain no self energy corrections, no vertex corrections and no intermediate state composed of only two pseudo-scalar particles. As was shown in Sect. III. A,

the resulting functions $\tilde{E}_n^{(1)}(q^2)$ have the form

$$\tilde{E}_n^{(1)}(q^2) = v_n x(q^2)^{-a_{n+2}^{1,1}} \quad (63)$$

where the constants v_n and $a_{n+2}^{1,1}$ can be computed in perturbation theory:

$$v_n = 1 + O(g^2)$$

$$a_{n+2}^{1,1} = \frac{-g^2}{16\pi^2(n+2)(n+3)} + O(g^4) \quad (64)$$

The position space function $E_n^{(i)}(x^2)$ follows from eqs. (8a), (23) and (63)²⁸:

$$\begin{aligned} E_n^{(1)}(x^2) &= -\frac{v_{n+2}}{2\pi^2 a_{n+2}^{1,1}} \frac{\Gamma(1 - a_{n+2}^{1,1})}{\Gamma(n + a_{n+2}^{1,1} + 2)} (x^2/4)^{a_{n+2}^{1,1}} \\ &= \frac{v_{n+2}}{a_{n+2}^{1,1}} (x^2)^{a_{n+2}^{1,1}} \end{aligned} \quad (65a)$$

where $\Gamma(z)$ is Euler's gamma function. A similar argument yields the longitudinal coefficients $F_n^{(1)}(x^2)$,

$$F_n^{(1)}(x^2) = \frac{v'_n}{a_n^{1,1} - 1} (x^2)^{a_n^{1,1}} \quad (65b)$$

If these expressions are substituted into the Wilson expansion (2), we find

$$\begin{aligned} J_\mu\left(\frac{x+y}{2}\right) J_\nu\left(\frac{-x+y}{2}\right) &\sim 4 \sum_{n=0}^{\infty} \left\{ g^{\mu\nu} x_{\alpha_1} x_{\alpha_2} \left[(a_n^{1,1} - 1) v_n - (a_n^{1,1} + n - \frac{1}{2}) v'_n \right] \right. \\ &\quad \left. \delta_{\mu\alpha_1} \delta_{\nu\alpha_2} x^2 \left[a_n^{1,1} v_n - \frac{1}{4} \frac{n(n-1)}{a_n^{1,1} - 1} v'_n \right] \right\} \end{aligned}$$

$$\begin{aligned}
& - (x_\nu x_{a_2} \delta_{\mu a_1} + x_\mu x_{a_2} \delta_{\nu a_1}) \left[(a_n^{1,1} - 1) V_n + \frac{n}{2} M_n^2 \right] \\
& - x_\mu x_\nu x_{a_1} x_{a_2} \left[(a_n^{1,1} - 2) V_n + \frac{1}{x^2} \right] \} (x^2)^{a_n^{1,1}} O_{a_1 \dots a_n}^{(1)} x_{a_3} \dots x_{a_n}
\end{aligned}
\tag{66}$$

for $V_0 = V_1 = 0$.

Thus if we consider only amplitudes containing no self energy or vertex corrections and no two pseudo-scalar intermediate states, the operators $O_{a_1 \dots a_n}^{(1)}$ possess an anomalous dimension d_n

$$d_n = 2 + n + 2a_n^{1,1} \tag{67}$$

in the sense of Wilson. Here d_n is just the dimension (in units of mass) of the current $\times$ current product on the left hand side of eq. (66), minus the dimension of the singular coefficient of the operator $O_{a_1 \dots a_n}^{(1)}$ on the right hand side of that equation. The dimension d_n clearly depends on n in a rather complicated way since to order g^2

$$d_n = 2 + n - \frac{g^2}{8\pi^2 n(n+1)} \tag{68}$$

B. AMPLITUDES WITH SELF ENERGY AND VERTEX CORRECTIONS OMITTED

Next we study all the amplitudes of the pseudo-scalar theory which do not contain self energy or vertex corrections. The resulting functions $\tilde{E}_n^{(i)}(q^2)$ obey eq.(27) with $\beta = \gamma_1 = \gamma_2 = 0$. Thus

$$-q^2 \frac{\partial}{\partial q^2} \tilde{E}_n^{(1)} = a_{n+2}^{1,1} \tilde{E}_n^{(1)} + a_{n+2}^{1,2} \tilde{E}_n^{(2)}$$

$$-q^2 \frac{\partial}{\partial q^2} \tilde{E}_n^{(2)} = a_{n+2}^{2,1} \tilde{E}_n^{(1)} + a_{n+2}^{2,2} \tilde{E}_n^{(2)}. \quad (69)$$

The general solution to this set of coupled first order differential equations is

$$\begin{aligned} \tilde{E}_n^{(1)}(q^2) &= v_{n+2}^{(1)} x(q^2)^{-v_{n+2}^{(1)}} + v_{n+2}^{(2)} x(q^2)^{-v_{n+2}^{(2)}} \\ \tilde{E}_n^{(2)}(q^2) &= -v_{n+2}^{(1)} \left(v_{n+2}^{(1)} + a_{n+2}^{1,1} \right) \frac{1}{a_{n+2}^{1,2}} (q^2)^{-v_{n+2}^{(1)}} \\ &\quad - v_{n+2}^{(2)} \left(v_{n+2}^{(2)} + a_{n+2}^{1,1} \right) \frac{1}{a_{n+2}^{1,2}} (q^2)^{-v_{n+2}^{(2)}} \end{aligned} \quad (70)$$

where the $v_n^{(i)}$ are integration constants and

$$v_n^{(i)} = \frac{a_n^{1,1} + a_n^{2,2}}{2} + (2i-3) \left[\frac{1}{4} (a_n^{1,1} - a_n^{2,2})^2 + a_n^{1,2} a_n^{2,1} \right]^{\frac{1}{2}} \quad (71)$$

for $i = 1, 2$. As in the previous case, we can obtain the position space functions

$E_n^{(i)}(x^2)$ and $F_n^{(i)}(x^2)$ and substitute them into the Wilson expansion (2), with the result

$$\begin{aligned} J_\mu \left(\frac{x+y}{2} \right) J_\nu \left(\frac{-x+y}{2} \right) &\approx 4 \sum_{j=1,2} \sum_{n=0}^{\infty} \left\{ \delta^{\mu\nu} x_{a_1} x_{a_2} \left[(v_n^{(j)} - 1) v_n^{(j)} - (a_n^{1,1} + n - \frac{1}{2}) v_n^{(j)} \right] \right. \\ &\quad + \delta_{\mu a_1} \delta_{\nu a_2} x^2 \left[v_n^{(j)} v_n^{(j)} - \frac{1}{4} \frac{n(n-1)}{v_n^{(j)} - 1} v_n^{(j)} \right] \\ &\quad - (x_\mu x_{a_2} \delta_{\nu a_1} + x_\nu x_{a_2} \delta_{\mu a_1}) \left[(v_n^{(j)} - 1) v_n^{(j)} + \frac{n}{2} v_n^{(j)} \right] \\ &\quad \left. - x_\mu x_\nu x_{a_1} x_{a_2} (v_n^{(j)} - 2) v_n^{(j)} \frac{1}{x^2} \right\} (x^2)^{v_n^{(j)}} \end{aligned}$$

$$\left[O_{a_1 \dots a_n}^{(1)} - \frac{v_n^{(j)} + a_n^{1,1}}{a_n^{1,2}} O_{a_1 \dots a_n}^{(2)} \right] x_{a_3} \dots x_{a_n} \quad (72)$$

Here the constants $V_n^{(i)}$, $V_n^{(i)}$ can be obtained from the $v_n^{(i)}$, $v_n^{(i)}$ by using eq. (8),

where $v_n^{(j)}$ is the integration constant multiplying $(q^2)^{v_n^{(j)}}$ in the expression for $\tilde{F}_n^{(i)}(q^2)$ analogous to eq. (70). Equation (72) implies that the operator

$$O_{a_1 \dots a_n}^{(1)} - \frac{v_n^{(j)} + a_n^{1,1}}{a_n^{1,2}} O_{a_1 \dots a_n}^{(2)} \quad (73)$$

has anomalous dimension

$$d_n^{(j)} = n + 2 + 2v_n^{(j)} \quad (74)$$

for $j = 1, 2$.

C. GENERAL SOLUTION

Finally we solve the exact equations (40) obeyed by the functions $\tilde{E}_n^{(i)}(q^2)$ in the vector theory. Eq. (40) can be rewritten as

$$\left[-q^2 \frac{\partial}{\partial q^2} + \beta \frac{\partial}{\partial g} + A_n^{(1)}(g) \right] \begin{bmatrix} \tilde{E}_n^{(1)}(q^2, g) \\ \tilde{E}_n^{(2)}(q^2, g) \end{bmatrix} = \begin{bmatrix} B_n^{(2)}(g) \tilde{E}_n^{(2)}(q^2, g) \\ B_n^{(1)}(g) \tilde{E}_n^{(1)}(q^2, g) \end{bmatrix} \quad (75)$$

where $A_n^{(i)}$ and $B_n^{(i)}$ are linear combinations of γ_i and $a_n^{i,k}$. Now define the new independent variables

$$\rho(g) = \int_{g_0}^g \frac{dg'}{\beta(g')} \quad (76a)$$

$$z(q^2, g) = \ln q^2 / q_0^2 + \rho(g) \quad (76b)$$

for some fixed values g_0, q_0^2 . Let $G(p)$ be the inverse of the function $p(g)$ defined by eq. (76a). In terms of these new variables eq. (75) becomes

$$\begin{bmatrix} \frac{\partial}{\partial p} + A_n^{(1)}(G(p)) \\ \frac{\partial}{\partial p} + A_n^{(2)}(G(p)) \end{bmatrix} \begin{bmatrix} \tilde{E}_n^{(1)} \\ \tilde{E}_n^{(2)} \end{bmatrix} = \begin{bmatrix} B_n^{(2)}(G(p)) \tilde{E}_n^{(2)} \\ B_n^{(1)}(G(p)) \tilde{E}_n^{(1)} \end{bmatrix} \quad (77)$$

where the functions $\tilde{E}_n^{(i)}(q_0^2 \exp(z - p), G(p))$ are to be treated as functions of z and p . This set of two first order coupled differential equations in the single variable p has a general solution of the form

$$\begin{aligned} \tilde{E}_n^{(1)}(q^2, g) &= v_n^{(1)}(\ln q^2/q_0^2 + p(g)) L_n^{(1)}(p(g)) + v_n^{(2)}(\ln q^2/q_0^2 + p(g)) \\ &\quad L_n^{(2)}(p(g)) \\ \tilde{E}_n^{(2)}(q^2, g) &= \frac{v_n^{(1)}(\ln q^2/q_0^2 + p(g))}{B_n^{(2)}(g)} \left[\frac{d}{dp} B_n^{(1)}(p(g)) + A_n^{(1)}(g) L_n^{(1)}(p(g)) \right] \\ &\quad + \frac{v_n^{(2)}(\ln q^2/q_0^2 + p(g))}{B_n^{(2)}(g)} \left[\frac{d}{dp} L_n^{(2)}(p(g)) + A_n^{(1)}(g) L_n^{(2)}(p(g)) \right] \end{aligned} \quad (78)$$

where $v_n^{(1)}(z)$ and $v_n^{(2)}(z)$ are integration "constants" which can depend on $z = \ln q^2/q_0^2 + p(g)$ while $L_n^{(1)}(p)$ and $L_n^{(2)}(p)$ are the two independent solutions of the second order differential equation

$$\begin{aligned} \left(\frac{d}{dp} + A_n^{(2)}(G(p)) \right) \frac{1}{B_n^{(2)}(G(p))} \left(\frac{d}{dp} + A_n^{(1)}(G(p)) \right) L_n^{(i)}(p) \\ - B_n^{(1)}(G(p)) L_n^{(i)}(p) = 0 \end{aligned} \quad (79)$$

Thus the original equations (40) allow the two functions $\tilde{E}_n^{(i)}(q^2, g)$ which depend on two variables to be determined in terms of the two unknown functions $v_n^{(i)}(z)$ of a single variable.

Now let us speculate about a possible large q^2 behavior of the solutions $\tilde{E}_n^{(i)}(q^2, g)$ given by eq. (78). Since the unknown functions $v_n^{(i)}(z)$ appearing in eq. (78) depend only on the sum of $\ln q^2/q_0^2$ and $\rho(g)$, the large q^2 behavior and the large ρ behavior of the functions $\tilde{E}_n^{(i)}(q^2, G(\rho))$ are directly related once the large ρ behavior of $A_n^{(i)}(G(\rho))$, $B_n^{(i)}(G(\rho))$ and $L_n^{(i)}(\rho)$ is known. In fact, carrying out the algebraic steps outlined in Appendix D, we find:

$$\tilde{E}_n^{(i)}(q^2, g) = \sum_{j=1,2} w_n^{i,j}(\ln q^2/q_0^2 + \rho(g), g) \tilde{E}_n^{(j)}(q_0^2, G(\ln q^2/q_0^2 + \rho(g))) \quad (80)$$

where the quantities $w_n^{i,j}(z, g)$, defined in Appendix D, are rational functions of $A_n^{(k)}$, $B_n^{(k)}$ and $L_n^{(k)}$. Thus the large ρ behavior of $\tilde{E}_n^{(j)}(q_0^2, G(\rho))$ determines, through eq. (80), the large q^2 dependence of $\tilde{E}_n^{(i)}(q^2, g)$. Following Gell-Mann and Low, we consider the possibility that $\beta(g)$ has a root, g_∞ , so that

$$\lim_{g \rightarrow g_\infty} \rho(g) = \infty. \quad (81)$$

If we assume that the quantities $\tilde{E}_n^{(i)}(q_0^2, g)$ are well defined and finite at the point $g = g_\infty$, then eq. (78) determines the large q^2 behavior of $\tilde{E}_n^{(i)}(q^2, g)$ in terms of the functions $\rho(g)$, $A_n^{(i)}(g)$ and $B_n^{(i)}(g)$ which appear in our equation.

A particularly simple asymptotic q^2 behavior of $\tilde{E}_n^{(i)}(q^2)$ results if we assume that g_∞ is a simple root of $\beta(g)$ and that $A_n^{(i)}(g)$ and $B_n^{(i)}(g)$ are regular at g_∞ . As is shown in Appendix D, these assumptions when combined with eqs. (79) and (80) imply a simple power behavior for $\tilde{E}_n^{(i)}(q^2)$.

V. CONCLUSIONS

Using a technique of Symanzik and the Callan-Symanzik equations, we obtain a series of equations obeyed to arbitrary order in perturbation theory by all the c-number coefficients of the operators appearing in the light cone expansion of $J_\mu(x) J_\nu(0)$. These equations are used to determine the leading logarithmic behavior of νW_2 for two specific field theories, giving results in agreement with previous, more laborious calculations. For simplified classes of amplitudes in which no coupling constant renormalization is required, the equations predict a power law behavior of the coefficients $E_n^{(i)}(x^2)$ and a corresponding anomalous dimension $d_n = 2 + n + \nu_n$ for linear combinations of the operators $O_{a_1 \dots a_n}^{(i)}$ appearing in the Wilson expansion. In general, the added quantity ν_n depends in a non-trivial fashion on n . Since the same operators $O_{a_1 \dots a_n}^{(i)}$ enter both the transverse and longitudinal terms in the Wilson expansion, the functions $E_n^{(i)}(x^2)$ and $F_n^{(i)}(x^2)$ both obey the same set of equations. Thus, in this formalism only the presence of different integration constants distinguishes the small x^2 behavior of the transverse and longitudinal components of the product $J_\mu(x) J_\nu(0)$. Finally, these equations allow us to speculate about the large q^2 and ν behavior of W_1 and W_2 , following the path previously considered by Gell-Mann and Low, Wilson⁶, and Symanzik¹¹.

APPENDIX A

In this appendix we provide a derivation^{12, 29} of the Callan-Symanzik equations used in Sect. II. Let us begin by considering the pseudo-scalar theory specified by the Lagrangian (13). The complete Lagrangian, including counter terms is

$$\begin{aligned} \mathcal{L} = & -\bar{\psi}(\gamma_{\mu}\partial_{\mu} + m)\psi - \frac{1}{2}\partial_{\mu}\phi\partial_{\mu}\phi - \frac{1}{2}\mu^2\phi^2 + \frac{h}{4!}\phi^4 + i\bar{\psi}\phi\bar{\psi}\gamma_5\psi \\ & - \delta m Z_2 \bar{\psi}\psi - \frac{1}{2}\delta\mu^2 Z_3 \phi^2 - (Z_2 - 1)\bar{\psi}(\gamma_{\mu}\partial_{\mu} + m)\psi - \frac{1}{2}(Z_3 - 1) \times \\ & (\partial_{\mu}\phi\partial_{\mu}\phi + \mu^2\phi^2) + i(Z_1 - 1)\bar{\psi}\phi\bar{\psi}\gamma_5\psi + (Z_4 - 1)\frac{h}{4!}\phi^4. \quad (A1) \end{aligned}$$

In order to specify the subtraction procedure represented by the above counter terms we consider the propagators $S(\phi, m, \mu)$, $\Delta(k^2, m, \mu)$ and the amputated vertex functions $\Gamma^5(p_1, p_2)$, $\Box(k_1, k_2, k_3)$ defined by

$$\begin{aligned} S(\phi, m, \mu) &= i \int e^{i p \cdot x} d^4x \langle 0 | T(\psi(0) \bar{\psi}(x)) | 0 \rangle \\ \Delta(k^2, m, \mu) &= i \int e^{i k \cdot x} d^4x \langle 0 | T(\phi(0) \phi(x)) | 0 \rangle \\ \Gamma^5(p_1, p_2, m, \mu) &= -i \int e^{i(p_1 \cdot x - p_2 \cdot y)} d^4x d^4y \langle 0 | T(\psi(y) \phi(0) \bar{\psi}(x)) | 0 \rangle_A \\ \Box(k_1, k_2, k_3, m, \mu) &= -i \int e^{i(k_1 \cdot x + k_2 \cdot y + k_3 \cdot z)} d^4x d^4y d^4z \\ &\quad \langle 0 | T(\phi(x) \phi(y) \phi(z)) | 0 \rangle_A. \quad (A2) \end{aligned}$$

The subtraction constants $Z_1, Z_2, Z_3, Z_4, \delta\mu^2$ and δm^2 are chosen so that the following conditions are satisfied:

$$S^{-1}(\not{p}, m, \mu) = 0; \quad \frac{\partial}{\partial \not{p}} S^{-1}(\not{p}) = -1 \quad \text{at } \not{p} = m$$

$$\Delta^{-1}(k^2, m, \mu) = 0; \quad \frac{\partial}{\partial k^2} \Delta^{-1}(k^2) = 1 \quad \text{at } k^2 = -\mu^2$$

$$\Gamma^5(p_1, p_2, m, \mu) = i \gamma_5 g \quad \text{at } \not{p}_1 = \not{p}_2 = m, \quad (p_1 - p_2)^2 = -\mu^2$$

$$\square(k_1, k_2, k_3, m, \mu) = h \quad \text{at } k_1^2 = k_2^2 = k_3^2 = -\mu^2,$$

$$(k_1 - k_2)^2 = (k_1 - k_3)^2 = (k_2 - k_3)^2 = -\frac{4}{3}\mu^2. \quad (A3)$$

Having made this choice of subtraction constants we can now calculate order by order in perturbation theory each Green's function $\Gamma(p_1, \dots, p_{2n}, k_1, \dots, k_\rho)$ for

$$\begin{aligned} \Gamma(p_1, \dots, p_{2n}, k_1, \dots, k_\rho) &= \frac{2n}{i} \pi \int d^4 x_i e^{i p_i \cdot x_i} \frac{\rho}{i} \int d^4 y_i e^{i k_i \cdot y_i} \\ &< 0 | T(\psi(x_1) \dots \psi(x_n) \bar{\psi}(x_{n+1}) \dots \bar{\psi}(x_{2n}) \\ &\quad \phi(y_1) \dots \phi(y_\rho)) | 0 > \end{aligned} \quad (A4)$$

as a function of g, h, m and μ .

In order to derive the Callan-Symanzik equations we consider a second procedure for computing the Green's functions of this theory in which the subtractions are carried out at arbitrary points λ_1 and λ_2 . We rewrite the Lagrangian $\mathcal{L}$ in terms of fields $\psi_\lambda, \phi_\lambda$ and coupling constants g_λ, h_λ normalized at these new points

$$\mathcal{L} = -\bar{\psi}_\lambda (\gamma_\mu \partial_\mu + m) \psi_\lambda - \frac{1}{2} \partial_\mu \phi_\lambda \partial_\mu \phi_\lambda - \frac{1}{2} \mu^2 \phi_\lambda^2 + \frac{h_\lambda}{4!} \phi_\lambda^4$$

$$\begin{aligned}
& + i g_\lambda \not{\phi}_\lambda \bar{\psi}_\lambda \gamma_5 \psi_\lambda - \delta m Z_{2,\lambda} \bar{\psi}_\lambda \psi_\lambda - \frac{1}{2} \delta \mu^2 Z_{3,\lambda} \phi_\lambda^2 - (Z_{2,\lambda} - 1) \bar{\psi}_\lambda \not{x} \\
& (\gamma_\mu \partial_\mu + m) \psi_\lambda - \frac{1}{2} (Z_{3,\lambda} - 1) (\partial_\mu \not{\phi}_\lambda \partial_\mu \not{\phi}_\lambda + \mu^2 \phi_\lambda^2) + i (Z_{1,\lambda} - 1) g_\lambda \not{\phi}_\lambda \bar{\psi}_\lambda \gamma_5 \psi_\lambda \\
& + (Z_{4,\lambda} - 1) \frac{h_\lambda}{4!} \phi_\lambda^4
\end{aligned} \tag{A5}$$

The subtraction constants $Z_{1,\lambda}$, $Z_{2,\lambda}$, $Z_{3,\lambda}$, $Z_{4,\lambda}$, δm , $\delta \mu$ are so chosen that the functions S_λ , Δ_λ , Γ_λ^5 and $\square_\lambda$ defined from eq. (A2) by replacing the fields ψ , ϕ by ψ_λ , ϕ_λ satisfy the following normalization conditions

$$S_\lambda^{-1}(\not{p}, m, \mu) = 0 \text{ at } \not{p} = m, \quad \frac{\partial}{\partial \not{p}} S_\lambda^{-1}(\not{p}, \lambda_1, \lambda_2) = -1 \text{ at } \not{p} = \lambda_1 \tag{A6a}$$

$$\Delta_\lambda^{-1}(k^2, m, \mu) = 0 \text{ at } k^2 = -\mu^2, \quad \frac{\partial}{\partial k^2} \Delta_\lambda^{-1}(k^2, \lambda_1, \lambda_2) = 1 \text{ at } k^2 = -\lambda_2^2 \tag{A6b}$$

$$\Gamma_\lambda^5(p_1, p_2, \lambda_1, \lambda_2) = i \gamma_5 g_\lambda \text{ at } \not{p}_1 = \not{p}_2 = \lambda_1, \quad (p_1 - p_2)^2 = -\lambda_2^2 \tag{A6c}$$

$$\square_\lambda(k_1, k_2, k_3, \lambda_1, \lambda_2) = h_\lambda \text{ at } k_1^2 = k_2^2 = k_3^2 = -\lambda_2^2,$$

$$(k_1 - k_2)^2 = (k_1 - k_3)^2 = (k_2 - k_3)^2 = -\frac{4}{3} \lambda_2^2.$$

(A6d)

The Lagrangians (A1) and (A5) are equal, the quantities g_λ , h_λ being functions of g , h , m , μ , λ_1 , λ_2 . The Greens functions $\Gamma_\lambda(p_1, \dots, p_{2n}, k_1, \dots, k_p)$ computed by replacing the fields ψ , ϕ by ψ_λ , ϕ_λ in eq. (A4) are proportional

to the original $\Gamma(p_1, \dots, p_{2n}, k_1, \dots, k_p)$

$$\Gamma(p_1, \dots, p_{2n}, k_1, \dots, k_p) = z_{2,\lambda}^n z_{3,\lambda}^{p/2} \Gamma_\lambda(p_1, \dots, p_{2n}, k_1, \dots, k_p). \quad (A7)$$

The Callan-Symanzik equations can be obtained by differentiating eq. (A7) with respect to m and μ and then setting $\lambda_1 = m$, $\lambda_2 = \mu$

$$D \Gamma = \left\{ n(Dz_{2,\lambda}) + \frac{p}{2}(Dz_{3,\lambda}) + (Dg_\lambda) \frac{\partial}{\partial g_\lambda} + Dh_\lambda \frac{\partial}{\partial h_\lambda} + m^2 \frac{\partial}{\partial m^2} + \mu^2 \frac{\partial}{\partial \mu^2} \right\} \Gamma_\lambda \Big|_{\substack{\lambda_1 = m \\ \lambda_2 = \mu}} \quad (A8)$$

for $D = m^2 \frac{\partial}{\partial m^2} + \mu^2 \frac{\partial}{\partial \mu^2}$.

When computed in perturbation theory from the Lagrangian (A5), the Green's function Γ_λ is determined as a function of g_λ , h_λ , m , μ , λ_1 , λ_2 ; the last two partial derivatives in eq. (A8) of this function Γ_λ , $\partial/\partial m^2$ and $\partial/\partial \mu^2$, are to be performed with g_λ and h_λ held fixed. This can be recognized as just the Callan-Symanzik Eq. (18), if we (a) identify

$$\gamma_1 = \frac{1}{2} Dz_{2,\lambda}, \quad \gamma_2 = \frac{1}{2} Dz_{3,\lambda}, \quad \beta = -Dg_\lambda, \quad \beta' = -Dh_\lambda \quad (A9a)$$

$$\Delta \Gamma = \left[m^2 \frac{\partial}{\partial m^2} + \mu^2 \frac{\partial}{\partial \mu^2} \right] \Gamma_\lambda \quad (A9b)$$

all evaluated at $\lambda_1 = m$, $\lambda_2 = \mu$; (b) set $n=1$, $p=0$ or $n=0$, $p=2$; and (c) insert $J_\mu(x) J_\nu(0)$ into the time ordered product defining Γ and Γ_λ . We need only show that the amplitude $\Delta \Gamma$ can be obtained by inserting the mass operator u of eq. (20) into the time ordered product (A4) defining Γ . Since only the normalization

condition for S_λ and Δ_λ involve the masses m and μ , the operation $m^2 \frac{\partial}{\partial m^2} + \mu^2 \frac{\partial}{\partial \mu^2}$ when applied to the amplitude Γ_λ yields a series of terms, each obtained from Γ_λ by (a) replacing a spinor propagator $S_\lambda(p)$ by

$$-S_\lambda(p) \left\{ \left[m^2 \frac{\partial}{\partial m^2} + \mu^2 \frac{\partial}{\partial \mu^2} \right] S_\lambda^{-1}(p) \right\} S_\lambda(p) \quad (\text{A10a})$$

or (b) replacing a pseudo-scalar propagator $\Delta_\lambda(k^2)$ by

$$-\Delta_\lambda(k^2) \left\{ \left[m^2 \frac{\partial}{\partial m^2} + \mu^2 \frac{\partial}{\partial \mu^2} \right] \Delta_\lambda^{-1}(k^2) \right\} \Delta_\lambda(k^2) . \quad (\text{A10b})$$

On the other hand, the effect of inserting $-i\epsilon$ into the time ordered product defining Γ is similar, yielding a sum of terms obtained for Γ by (a) replacing a spinor propagator $S(p)$ by

$$\int e^{i p \cdot x} d^4 x < 0 | T \left[\psi(0) \bar{\psi}(x) \right] | 0 > \equiv -S(p) U_1(p) S(p) \quad (\text{A12a})$$

or (b) changing a pseudo-scalar propagator $\Delta(k^2)$ to

$$\int e^{i k \cdot x} d^4 x < 0 | T \left[\phi(0) \phi(x) \right] | 0 > \equiv -\Delta(k^2) U_2(k^2) \Delta(k^2) . \quad (\text{A12b})$$

It is not difficult to see that $U_2(k^2)$ and

$$\left(m^2 \frac{\partial}{\partial m^2} + \mu^2 \frac{\partial}{\partial \mu^2} \right) \Delta_\lambda^{-1}(k^2) \Big|_{\lambda_1 = m, \lambda_2 = \mu^2}$$

obey Dyson integral equations with the same kernel. Since the normalization condition for $\partial/\partial k^2 \Delta_\lambda^{-1}(k^2)$ in eq. (A6b) does not involve m or μ , $Z_{3,\lambda}$ depends on g_λ and h_λ but not on m or μ . Thus the Dyson equations obeyed by both quantities contain only a constant inhomogeneous term. Therefore the two functions of k^2 must be

proportional. If we let

$$\delta_2 = \left[m^2 \frac{\partial}{\partial m^2} + \mu^2 \frac{\partial}{\partial \mu^2} \right] \Delta_\lambda^{-1}(k^2) \Big|_{\substack{\lambda_1 = m, \lambda_2 = \mu \\ k^2 = -\mu^2}} \quad (A13a)$$

and normalize the finite operators $N[\bar{\psi}(x) \psi(x)]$, $N[\not{p}(x) \not{p}(x)]$ so that

$$\begin{aligned} \langle p, s | N[\bar{\psi}(x) \psi(x)] | p, s \rangle &= \langle k | N[\not{p}(x) \not{p}(x)] | k \rangle = 1 \\ \langle p, s | N[\not{p}(x) \not{p}(x)] | p, s \rangle &= \langle k | N[\bar{\psi}(x) \psi(x)] | k \rangle = 0 \end{aligned} \quad (A14)$$

where the state $|k\rangle$ contains a single pseudo-scalar particle of momentum k , then

$$\left[m^2 \frac{\partial}{\partial m^2} + \mu^2 \frac{\partial}{\partial \mu^2} \right] \Delta_\lambda^{-1}(k^2) \Big|_{\substack{\lambda_1 = m \\ \lambda_2 = \mu}} = U_2(k^2) . \quad (A15a)$$

Similar arguments imply

$$\left[m^2 \frac{\partial}{\partial m^2} + \mu^2 \frac{\partial}{\partial \mu^2} \right] S_\lambda^{-1}(\not{p}) \Big|_{\substack{\lambda_1 = m \\ \lambda_2 = \mu}} = U_1(\not{p}) \quad (A15b)$$

if

$$\delta_1 = 2 \left[m^2 \frac{\partial}{\partial m^2} + \mu^2 \frac{\partial}{\partial \mu^2} \right] S_\lambda^{-1}(\not{p}) \Big|_{\substack{\lambda_1 = m, \lambda_2 = \mu \\ \not{p} = m}} . \quad (A13b)$$

Thus equation (A9b) is justified and the Callan-Symanzik equations proved for the neutral pseudo-scalar theory.

Let us now consider the vector theory. The complete Lagrangian, including

counter terms, for this theory is

$$\begin{aligned}\mathcal{L} = & -\bar{\psi}(\gamma_{\mu}\partial_{\mu} + m)\psi - \frac{1}{4}G_{\mu\nu}G_{\mu\nu} - \frac{1}{2}\mu^2 V_{\rho}V_{\rho} + igV_{\mu}\bar{\psi}\gamma_{\mu}\psi \\ & - \delta m Z_2 \bar{\psi}\psi - \frac{1}{2}\delta\mu^2 Z_3 V_{\rho}V_{\rho} - (Z_2 - 1)\bar{\psi}(\gamma_{\mu}\partial_{\mu} + m)\psi \\ & - \frac{1}{2}(Z_3 - 1)(\frac{1}{4}G_{\mu\nu}G_{\mu\nu} + \mu^2 V_{\rho}V_{\rho}) + i(Z_1 - 1)g\bar{\psi}\gamma_{\mu}\psi V_{\mu} .\end{aligned}\quad (A16)$$

Introducing the propagators³⁰ and vertex functions

$$\begin{aligned}S(\not{p}, m, \mu) &= i \int e^{i p \cdot x} d^4x \langle 0 | T(\psi(0) \bar{\psi}(x)) | 0 \rangle \\ \Delta(k^2, m, \mu)(\delta_{\mu\nu} - k_{\mu}k_{\nu}/k^2) &= i \int e^{i k \cdot x} d^4x \langle 0 | T(V_{\mu}(0) V_{\nu}(x)) | 0 \rangle \\ \Gamma_{\mu}(p_1, p_2, m, \mu) &= -i \int e^{i p_1 \cdot x - i p_2 \cdot y} d^4x d^4y \\ &\quad \langle 0 | T(\psi(y) V_{\mu}(0) \bar{\psi}(x)) | 0 \rangle\end{aligned}\quad (A17)$$

we choose the subtraction constants $Z_1, Z_2, Z_3, \delta m, \delta\mu^2$ so that

$$\begin{aligned}S^{-1}(\not{p}, m, \mu)\Big|_{\not{p}=m} &= 0 ; \quad \frac{\partial}{\partial \not{p}} S^{-1}(\not{p}, m, \mu)\Big|_{\not{p}=m} = -i \\ \Delta^{-1}(k^2, m, \mu)\Big|_{k^2=-\mu^2} &= 0 ; \quad \frac{\partial}{\partial k^2} \Delta^{-1}(k^2, m, \mu)\Big|_{k^2=-\mu^2} = 1 \\ \Gamma(p_1, p_2, m, \mu)\Big|_{\substack{\not{p}_1=\not{p}_2=m \\ (p_1-p_2)^2=-\mu^2}} &= ig\gamma_{\mu} .\end{aligned}\quad (A18)$$

The electromagnetic interaction of the charged spinor field is now included by adding the interaction term

$$\begin{aligned} \mathcal{L}_Y = & + i e A_\mu \bar{\psi} \gamma_\mu \psi + \frac{1}{2} f F_{\mu\nu} G_{\mu\nu} + \frac{1}{2} \delta f Z_3^{\frac{1}{2}} F_{\mu\nu} G_{\mu\nu} + \frac{1}{2} f (Z_3^{\frac{1}{2}} - 1) F_{\mu\nu} G_{\mu\nu} \\ & + i e (Z_1 - 1) A_\mu \bar{\psi} \gamma_\mu \psi \end{aligned} \quad (A19)$$

where the subtraction constant δf is so defined that

$$\Delta_1(k^2, m, \mu) \Big|_{k^2 = -\mu^2} = f \mu^2$$

for

$$\begin{aligned} \Delta_1(k^2, m, \mu) \left[\delta_{\mu\nu} - k_\mu k_\nu / k^2 \right] &= i \int e^{i k \cdot x} d^4 x \\ &\quad \langle 0 | T(V_\mu(0) A_\nu(x)) | 0 \rangle_A . \end{aligned} \quad (A20)$$

We have not included counter terms of order e^2 or higher in eq. (A19). Just as in the pseudo-scalar case we can consider fields ψ_λ , $V_{\lambda\rho}$ and coupling constants g_λ , f_λ defined according to a second normalization scheme:

$$S_\lambda^{-1}(p, m, \mu) \Big|_{p=m} = 0 ; \quad \frac{\partial S_\lambda^{-1}}{\partial p}(p, \lambda_1, \lambda_2) \Big|_{p=\lambda_1} = -1 \quad (A21a)$$

$$\Delta_\lambda^{-1}(k^2, m, \mu) \Big|_{k^2 = -\mu^2} = 0 ; \quad \frac{\partial \Delta_\lambda^{-1}}{\partial k^2}(k^2, \lambda_1, \lambda_2) \Big|_{k^2 = -\lambda_2^2} = 1 \quad (A21b)$$

$$\begin{aligned} \Gamma_{\lambda\mu}(p_1, p_2, \lambda_1, \lambda_2) \Big|_{\substack{p_1 = p_2 = \lambda_1 \\ (p_1 - p_2)^2 = -\lambda_2^2}} &= i g_\lambda \gamma_\mu \end{aligned} \quad (A21c)$$

$$\Delta_{1,\lambda}(k^2, \lambda_1, \lambda_2) \Big|_{k^2 = -\lambda_2^2} = f_\lambda \lambda_2^2 . \quad (A21d)$$

Differentiating eq. (A7), rewritten for the vector case, we find

$$D \Gamma = \left\{ n(Dz_{2,\lambda}) + \frac{p}{2}(Dz_{3,\lambda}) + (Dg_\lambda) \frac{\partial}{\partial g_\lambda} + (Df_\lambda) \frac{\partial}{\partial f_\lambda} + m^2 \frac{\partial}{\partial m^2} + \mu^2 \frac{\partial}{\partial \mu^2} \right\} \Gamma_\lambda \Big|_{\lambda_1=m, \lambda_2=\mu} \quad (A22)$$

This is the complete Callan-Symanzik equation obeyed by the amputated time ordered product of $2n$ spinor fields, p vector fields and r electromagnetic currents,

$$e J_\mu = \partial_\nu F_{\nu\mu} \quad (A23)$$

The quantities $Dz_{2,\lambda}$, $Dz_{3,\lambda}$ and Dg_λ can be identified with γ_1 , γ_2 and $-\beta$ of eq. (33) respectively while an argument similar to that given in the preceding pseudo-scalar case shows that

$$\tilde{\gamma}_3 \Delta \Gamma = (m^2 \frac{\partial}{\partial m^2} + \mu^2 \frac{\partial}{\partial \mu^2}) \Gamma_\lambda \Big|_{\lambda_1=m, \lambda_2=\mu} \quad (A24)$$

Finally we can directly compute Df_λ by noting that $\Delta_1(k^2, m, \mu)$ and $1/g \Delta^{-1}(k^2, m, \mu)$ can, by definition, differ only by a first degree polynomial in k^2 so that eq. (A20) and current conservation ($\Delta_1(0, m, \mu) = 0$) implies

$$\Delta_1(k^2, m, \mu) = -fk^2 + \frac{k^2 + \mu^2}{\mu^2} \frac{1}{g} \Delta^{-1}(0, m, \mu) + \frac{1}{g} \Delta^{-1}(k^2, m, \mu) \quad (A25a)$$

Likewise

$$\begin{aligned} \Delta_{1,\lambda}(k^2, m, \mu) &= -f_\lambda k^2 + \frac{k^2}{\lambda_2} \frac{1}{g_\lambda} \Delta_\lambda^{-1}(0, \lambda_1, \lambda_2) + \frac{1}{g_\lambda} \Delta_\lambda^{-1}(k^2, m, \mu) \\ &\quad + \frac{1}{g_\lambda} \Delta_\lambda^{-1}(k^2, m, \mu) \end{aligned} \quad (A25b)$$

where the coefficient of k^2 is guaranteed by our subtraction procedure to be independent of m and μ for fixed f_λ and is therefore determined by the condition (A21d). In analogy with eq. (A7) of the pseudo-scalar case we have

$$\Delta_{1,\lambda}(k^2, m, \mu) = z_{3,\lambda}^{-\frac{1}{2}} \Delta_1(k^2, m, \mu) \quad (\text{A26a})$$

$$\Delta_\lambda^{-1}(k^2, m, \mu) = z_{3,\lambda}^{-1} \Delta^{-1}(k^2, m, \mu) \quad (\text{A26b})$$

$$S_\lambda^{-1}(p, m, \mu) = z_{2,\lambda}^{-1} S^{-1}(p, m, \mu) \quad (\text{A26c})$$

$$\Gamma_{\lambda,\mu}(p_1, p_2, m, \mu) = z_{3,\lambda}^{-\frac{1}{2}} z_{2,\lambda}^{-1} \Gamma_\mu(p_1, p_2, m, \mu) \quad (\text{A26d})$$

Eqs. (A26c) and (A26d) together with the Ward identities

$$\frac{1}{g}(p_1 - p_2)_\mu \Gamma_\mu(p_1, p_2) = S^{-1}(p_1) - S^{-1}(p_2)$$

$$\frac{1}{g_\lambda}(p_1 - p_2)_\mu \Gamma_{\lambda,\mu}(p_1, p_2) = S_\lambda^{-1}(p_1) - S_\lambda^{-1}(p_2), \quad (\text{A27})$$

implied by current conservation and our normalization procedures (A18) and (A21), yield

$$g_\lambda = z_{3,\lambda}^{-\frac{1}{2}} g. \quad (\text{A28})$$

Combining eqs. (A25), (A26a), (A26b) and (A28) we obtain

$$f_\lambda = z_{3,\lambda}^{-\frac{1}{2}} f - \frac{1}{g_\lambda} \frac{\Delta_\lambda^{-1}(0, \lambda_1, \lambda_2)}{\lambda_2^2} + \frac{1}{g} z_{3,\lambda}^{-\frac{1}{2}} \frac{\Delta^{-1}(0, m, \mu)}{\mu^2}, \quad (\text{A29})$$

or

$$Df_\lambda \Big|_{\lambda_1=m, \lambda_2=\mu} = -\gamma_2 f + \left[\beta \frac{\partial}{\partial g} - \gamma_2 \right] \frac{1}{g} \frac{\Delta^{-1}(0, m, \mu)}{\mu^2}; \quad (\text{A30})$$

so that our complete Callan-Symanzik equation reads

$$\left\{ m^2 \frac{\partial}{\partial m^2} + \mu^2 \frac{\partial}{\partial \mu^2} + \beta \frac{\partial}{\partial g} - 2\gamma_1 - \rho \gamma_2 + \left[\gamma_2^f - \left(\beta \frac{\partial}{\partial g} - \gamma_2 \right) \frac{1}{g} \frac{\Delta^{-1}(0, m, \mu)}{\mu^2} \right] \frac{\partial}{\partial f} \right\} \Gamma = \gamma_3^T \Delta \Gamma. \quad (\text{A31})$$

If Γ is computed to lowest order in e , the dependence on f is known, allowing the partial derivative with respect to f in eq. (A31) to be explicitly carried out. If we assume that each electromagnetic current carries a momentum transfer squared much greater than μ^2 , then eq. (A25a) implies that if each current $J_\mu(x)$ is replaced by

$$\left[f + \frac{1}{g\mu^2} \Delta^{-1}(0, m, \mu) \right] V_\mu(x),$$

the Green's function Γ is not changed. Thus

$$\left[gf + \frac{1}{\mu^2} \Delta^{-1}(0, m, \mu^2) \right]^{-T} \Gamma$$

is independent of f and eq. (A31) can be rewritten

$$\left\{ m^2 \frac{\partial}{\partial m^2} + \mu^2 \frac{\partial}{\partial \mu^2} + \beta \frac{\partial}{\partial g} - 2\gamma_1 - \rho \gamma_2 + 2\gamma_2 \right\} \left(gf + \frac{1}{\mu^2} \Delta^{-1}(0, m, \mu) \right)^{-T} \Gamma \approx \Delta \Gamma \quad (\text{A32})$$

for

$$\gamma_3 = \left[gf + \frac{1}{\mu^2} \Delta^{-1}(0, m, \mu) \right]^{-1}, \quad (\text{A33})$$

which is just eq. (33). In obtaining the form (A32) we have used the relationship

$$\beta = g\gamma_2$$

(A34)

implied by eq. (A28).

APPENDIX B

In this appendix a detailed calculation of $a_n^{1,1}$ to order g^2 is presented for the pseudo-scalar theory. Recall that

$$\int e^{i p \cdot (z-y)} \frac{1}{2} (p)_{\delta\sigma} < 0 | T (\phi_\sigma(y) O_{\alpha_1 \dots \alpha_n}^{(1)}(0) \phi_\delta(z)) | 0 > \Big|_{p^2=0}$$

$$= (i)^n a_n^{1,1} p_{\alpha_1} \dots p_{\alpha_n} + (\text{terms containing } \delta_{\alpha_i \alpha_j}) \quad (B1)$$

for $1 \leq \alpha_1 \leq 3$. Since to lowest order in g^2 no counter terms must be added to make the operator $O_{\alpha_1 \dots \alpha_n}^{(1)}$ finite,

$$O_{\alpha_1 \dots \alpha_n}^{(1)}(x) = -\frac{1}{4n} (1+(-1)^n) \sum_{j=1}^n \bar{\psi}(x) \partial_{\alpha_1} \dots \gamma_{\alpha_j} \dots \partial_{\alpha_n} \psi(x) + (\text{terms containing } \delta_{\alpha_i \alpha_j})$$

$$(B2)$$

Figure (2a) illustrates the three graphs contributing to $a_n^{1,1}$ to order g^2 . In fact, to order g^2 , $a_n^{1,1}$ requires no renormalization of any sort, either within the operator $O_{\alpha_1 \dots \alpha_n}^{(1)}$ or of propagators or other vertices. Consequently, the effect of the operator u is simply to differentiate the order g^2 matrix element of $O_{\alpha_1 \dots \alpha_n}^{(1)}$ represented by figure 2b with respect to the internal masses:

$$a_n^{1,1} p_{\alpha_1} \dots p_{\alpha_n}$$

$$= \frac{1}{4n} \sum_{j=1}^n \frac{g^2}{(2\pi)^4} \int d^4 k \left[m^2 \frac{\partial}{\partial m^2} + \mu^2 \frac{\partial}{\partial \mu^2} \right] \frac{\text{tr} \{ \not{p}(k+m) \not{k}_{\alpha_1} \dots \gamma_{\alpha_j} \dots \not{k}_{\alpha_n} \not{k}(k+m) \}}{[k^2 + m^2 - i\epsilon]^2 [(k-p)^2 + \mu^2 - i\epsilon]^2}$$

$$+ (\text{terms containing } \delta_{\alpha_i \alpha_j}) \quad (B3)$$

for $p^2 = 0$. (The quantities δ_1 and δ_2 appearing in the definition (20) of u are both unity to lowest order in g .) It is useful to observe that the mass terms in the numerator do not contribute to the $p_{\alpha_1} \dots p_{\alpha_n}$ terms since, if the differentiation $m^2 \partial/\partial m^2 + \mu^2 \partial/\partial \mu^2$ were performed after the integration over k , then upon integration such terms would yield finite functions of μ^2/m^2 which would be annihilated by the derivatives.

The $p_{\alpha_1} \dots p_{\alpha_n}$ term in the above integral can be easily evaluated if the integration variables are changed to those of Sudakov. Let

$$p = (0, 0, p, i p), \quad \bar{p} = (0, 0, +p, -i p)$$

and

$$k = \alpha \bar{p} + \beta p + k_{\perp}$$

for

$$k_{\perp} = (k_1, k_2, 0, 0). \quad (B4)$$

In terms of the variables α, β, k_1, k_2 , eq. (B3) becomes

$$a_n^{1,1} = \frac{2p^2 g^2}{(2\pi)^4} \int_{-\infty}^{\infty} d\alpha \int_{-\infty}^{\infty} d\beta \int d^2 k \left[m^2 \frac{\partial}{\partial m^2} + \mu^2 \frac{\partial}{\partial \mu^2} \right] \frac{-i\beta^{n-1} k_{\perp}^2}{[4p^2 \alpha \beta + k_{\perp}^2 + m^2 - i\epsilon]^2 [4p^2 \alpha(\beta-1) + k_{\perp}^2 + \mu^2 - i\epsilon]} \quad (B5)$$

where we have equated the coefficients of $p_{\alpha_1} \dots p_{\alpha_n}$ and evaluated the trace in eq. (B3) according to

$$\text{tr}(\not{p} \not{k} \gamma_{\alpha_1} \dots \gamma_{\alpha_n}) = -4 i k_{\perp}^2 p_{\alpha_1} + (\text{terms with } \bar{p}_{\alpha_i} \text{ or } (k_{\perp})_{\alpha_i}). \quad (B6)$$

The integral over α can be performed using contour integration so that

$$\begin{aligned}
 a_n^{1,1} &= \frac{g^2}{2(2\pi)^3} \int_0^1 d\beta \int d^2k \left[m^2 \frac{\partial}{\partial m^2} + \mu^2 \frac{\partial}{\partial \mu^2} \right] \\
 &\quad \frac{(1-\beta)\beta^{n-1}k_1^2}{\left[\beta\mu^2 + (1-\beta)m^2 + k_1^2 \right]^2} \\
 &= -\frac{1}{16\pi^2} \int_0^1 d\beta \beta^{n-1} (1-\beta) = -\frac{1}{16\pi^2} \frac{1}{n(n+1)} \quad . \quad (B7)
 \end{aligned}$$

APPENDIX C

We now give the results of a calculation of all the constants a_n^{ij} to order g^2 in both the pseudo-scalar and vector theories. The values of a_n^{ij} found for the pseudo-scalar theory are shown in figure 3. Also shown are Feynman diagrams representing those amplitudes which when differentiated with respect to the internal masses give the adjacent values of a_n^{ij} . The vertex joining two photon lines and two fermion lines represents the factor

$$-\frac{1}{2} \frac{1}{n} \sum_{j=1}^n p_{a_1} \cdots \gamma_{a_j} \cdots p_{a_n} \quad (C1)$$

in the corresponding Feynman amplitudes, where p is the four-momentum carried by the incoming fermion line. Likewise, the vertex connecting two photon and two pseudo-scalar lines represents the factor

$$k_{a_1} \cdots k_{a_n} \quad (C2)$$

where k is the momentum carried by one of the pseudo-scalar particles.

The results in the vector theory, shown with their corresponding graphs in fig. 4, are somewhat more complicated. The presence of the vector fields V_{a_1} in the operator $O_{a_1 \dots a_n}^{(1)}$ defined in eq. (37a) implies that this operator not only contributes the two photon - two fermion vertex found in fig. 4, representing the factor (C1), but also gives a two photon - two fermion - vector particle vertex contributing to $a_n^{1,1}$ and $a_n^{2,1}$. This vertex represents the factor

$$\frac{ig}{2n(n-1)} \sum_{l=1}^n \sum_{\substack{j=1 \\ j \neq l}}^n (p+k)_{a_1} \cdots (p+k)_{a_{l-1}} \delta_{p_{a_l} p_{a_{l+1}}} \cdots \gamma_{a_j} \cdots p_{a_n} \quad (C3)$$

where $\vec{p}$ and $\vec{k}$ are the momenta carried in by the spinor and vector particles respectively while ρ is the vector particle's polarization index. Finally the two-photon - two vector particle vertex in fig. 4 represents the factor

$$\frac{3}{2n(n-1)} \sum_{l=1}^n \sum_{\substack{j=1 \\ j \neq l}}^n (k_{a_1} \dots \delta_{a_l \mu} \dots \delta_{a_j \nu} \dots k_{a_n})$$

$$(k_{\mu} k_{\nu} \delta_{\sigma \rho} + k_{\rho \mu}^2 \delta_{\sigma \nu} - k_{\rho} k_{\nu} \delta_{\sigma \mu} - k_{\sigma} k_{\nu} \delta_{\rho \mu}) \quad (C4)$$

where k is the momentum carried by the vector line and ρ, σ the vector particles' polarization indices.

APPENDIX D

Finally, we investigate the large q^2 behavior of the solutions (78) to eq. (75). First the large q^2 limit of $\tilde{E}_n^{(i)}(q^2, g)$ is related to the large p limit of $A_n^{(i)}(G(p))$, $B_n^{(i)}(G(p))$ and $\tilde{E}_n^{(i)}(q_0^2, G(p))$. Then we consider the possibility, first identified by Gell-Mann and Low, that the function $\beta(g)$ has a zero at $g = g_\infty$. In that case, if $\tilde{E}_n(q^2, g)$ is well defined and non-zero at $g = g_\infty$, then the asymptotic behavior of $\tilde{E}_n^{(i)}(q^2, g)$ for large q^2 is determined by the functions $A_n^{(i)}(g)$, $B_n^{(i)}(g)$ and $\rho(g)$. If in addition g_∞ is a simple zero of β and $A_n^{(i)}(g)$, $B_n^{(i)}(g)$ are regular at g_∞ then a power behavior in q^2 for $\tilde{E}_n^{(i)}(q^2, g)$ is deduced for large q^2 .

First, q^2 is replaced by q_0^2 in eq. (78) so that $z = \rho(g)$, or $g = G(z)$, and the resulting equation solved for the functions $v_n^{(i)}(z)$:

$$\begin{aligned}
 v_n^{(1)}(z) &= \frac{1}{w(z)} \left\{ \left[\frac{d}{dz} L_n^{(2)}(z) + A_n^{(1)}(G(z)) L_n^{(2)}(z) \right] E_n^{(1)}(q_0^2, G(z)) \right. \\
 &\quad \left. - B_n^{(2)}(G(z)) L_n^{(2)}(z) E_n^{(2)}(q_0^2, G(z)) \right\} \\
 v_n^{(2)}(z) &= -\frac{1}{w(z)} \left\{ \left[\frac{d}{dz} L_n^{(1)}(z) + A_n^{(1)}(G(z)) L_n^{(1)}(z) \right] E_n^{(1)}(q_0^2, G(z)) \right. \\
 &\quad \left. - B_n^{(2)}(G(z)) L_n^{(1)}(z) E_n^{(2)}(q_0^2, G(z)) \right\}
 \end{aligned} \tag{D1}$$

where

$$w(z) = \left[\frac{d}{dz} L_n^{(2)}(z) \right] L_n^{(1)}(z) - \left[\frac{d}{dz} L_n^{(1)}(z) \right] L_n^{(2)}(z). \tag{D2}$$

The equations can now be used to eliminate the functions $v_n^{(i)}(z)$ from eq. (78), yielding

an expression for $\tilde{E}_n^{(i)}(q^2, g)$ in terms of $E_n^{(i)}(q_0^2, G(\ln(q^2/q_0^2) + \rho(g)))$ so that the large q^2 and the large ρ behavior of $\tilde{E}_n^{(i)}(q^2, G(\rho))$ are related:

$$\tilde{E}_n^{(i)}(q^2, g) = \sum_{j=1,2} w_n^{i,j}(z, g) \tilde{E}_n^{(i)}(q_0^2, G(z)) \quad (D3)$$

for $z = \ln q^2/q_0^2 + \rho(g)$ and

$$\begin{aligned} w_n^{1,1}(z, g) &= \frac{1}{w(z)} \left\{ \left[\frac{d}{dz} L_n^{(2)}(z) + A_n^{(1)}(G(z)) L_n^{(2)}(z) \right] L_n^{(1)}(\rho(g)) \right. \\ &\quad \left. - \left[\frac{d}{dz} L_n^{(1)}(z) + A_n^{(1)}(G(z)) L_n^{(1)}(z) \right] L_n^{(2)}(\rho(g)) \right\} \\ w_n^{1,2}(z, g) &= \frac{1}{w(z)} \left\{ L_n^{(1)}(z) L_n^{(2)}(\rho(g)) - L_n^{(2)}(z) L_n^{(1)}(\rho(g)) \right\} B_n^{(2)}(G(z)) \\ w_n^{2,1}(z, g) &= \frac{1}{w(z)} \left\{ \left[\frac{d}{dz} L_n^{(2)}(z) + A_n^{(1)}(G(z)) L_n^{(2)}(z) \right] \left[\frac{d}{d\rho} L_n^{(1)}(\rho(g)) \right. \right. \\ &\quad \left. \left. + A_n^{(1)}(g) L_n^{(1)}(\rho(g)) \right] - \left[\frac{d}{dz} L_n^{(1)}(z) + A_n^{(1)}(G(z)) L_n^{(1)}(z) \right] \right. \\ &\quad \left. \left[\frac{d}{d\rho} L_n^{(2)}(\rho(g)) + A_n^{(1)}(g) L_n^{(2)}(\rho(g)) \right] \right\} [B_n^{(2)}(g)]^{-1} \\ w_n^{2,2}(z, g) &= \frac{B_n^{(2)}(G(z))}{B_n^{(2)}(g)} \frac{w(\rho(g))}{w(z)} w_n^{1,1}(\rho(g), G(z)). \quad (D4) \end{aligned}$$

If we assume that $\beta(g)$ has a root g_∞ and that $\tilde{E}_n^{(i)}(q_0^2, g)$ is regular and non-zero at $g = g_\infty$, then eq. (D3) determines the asymptotic form of $\tilde{E}_n^{(i)}(q^2, g)$, for $g < g_\infty$, in terms of the functions $A_n^{(i)}(g)$, $B_n^{(i)}(g)$ and $\rho(g)$ appearing in our eq. (75). In particular, if we assume that $A_n^{(i)}(g)$, $B_n^{(i)}(g)$ are regular at g_∞ and that g_∞ is a

simple zero of $\beta(g)$, then a power behavior for $\tilde{E}_n^{(i)}(q^2)$ is implied by eq. (D3)³¹. In order to show this, we must determine the large z behavior of $L_n^{(i)}(z)$ and hence of $w_n^{i,i}(z,g)$. It is not difficult to see from eq. (79) that, under these conditions on $A_n^{(i)}(g)$, $B_n^{(i)}(g)$ and $\rho(g)$, the functions $L_n^{(i)}(z)$ can be so chosen that

$$L_n^{(i)}(\ln y) \sim y^{v_i} \left[1 + O\left(\frac{1}{y}\right) \right] \quad (D5)$$

for y large and

$$v_n^{(i)} = -\frac{1}{2} (A_n^{(1)}(g_\infty) + A_n^{(2)}(g_\infty)) + (2i-3) \left[\frac{1}{4} (A_n^{(1)}(g_\infty) - A_n^{(2)}(g_\infty))^2 + B_n^{(1)}(g_\infty) B_n^{(2)}(g_\infty) \right]^{\frac{1}{2}}. \quad (D6)$$

This asymptotic form for $L_n^{(i)}(z)$ can then be substituted into eq. (D3) yielding

$$\begin{aligned} \tilde{E}_n^{(1)}(q^2, g) &= \sum_{i=1,2} \sigma_n^{(i)} B_n^{(2)}(g) L_n^{(i)}(\rho(g)) (q^2)^{-v_n^{(i)}} \\ \tilde{E}_n^{(2)}(q^2, g) &= \sum_{i=1,2} \sigma_n^{(i)} \left[\frac{d}{d\rho} L_n^{(i)}(\rho(g)) + A_n^{(i)}(g) L_n^{(i)}(\rho(g)) \right] (q^2)^{-v_n^{(i)}} \end{aligned} \quad (D7)$$

for

$$\sigma_n^{(1)} = \frac{(q_0^2)^{v_n^{(1)}}}{e^{\rho(g)v_n^{(1)}}} \frac{B_n^{(2)}(g_\infty) E_n^{(2)}(q_0^2, g_\infty) - [v_n^{(2)} + A_n^{(1)}(g_\infty)] E_n^{(1)}(q_0^2, g_\infty)}{(v_n^{(1)} - v_n^{(2)}) B_n^{(2)}(g)}$$

and

$$\sigma_n^{(2)} = \frac{(q_0^2)^{v_n^{(2)}}}{e^{\rho(g)v_n^{(2)}}} \frac{B_n^{(2)}(g_\infty) E_n^{(2)}(q_0^2, g_\infty) - [v_n^{(1)} + A_n^{(1)}(g_\infty)] E_n^{(1)}(q_0^2, g_\infty)}{(v_n^{(2)} - v_n^{(1)}) B_n^{(2)}(g)}.$$

This would imply that the operator

$$B_n^{(2)}(g) L_n^{(j)}(\rho(g)) O_{a_1 \dots a_n}^{(1)} + \left[\frac{d}{d\rho} L_n^{(j)}(\rho(g)) + A_n^{(j)}(g) L_n^{(j)}(\rho(g)) \right] O_{a_1 \dots a_n}^{(2)} \quad (D9)$$

has anomalous dimension

$$d_n^{(j)} = n + 2 + 2\nu_n^{(j)} \quad (D10)$$

for $j = 1, 2$.

16. All terms in these sums with odd n must vanish because of the crossing relations $T_2(q^2, \omega) = T_2(q^2, -\omega)$, $T_L(q^2, \omega) = T_L(q^2, -\omega)$.
17. Following Symanzik (reference 11) we shall use the superscript AF on a function, $f(q^2, \omega)$, to indicate that only those terms containing the highest power of q^2 are retained in each order of perturbation theory. That is, if

$$f(q^2, \omega) = (q^2)^n \sum_{k=0}^{\infty} \sum_{\ell=0}^{\infty} f_{k,\ell}(\omega) (q^2)^{-k} (\ln q^2)^\ell$$

where $f_{k,\ell}(\omega)$ is a power series in g , then $f(q^2, \omega)^{AF}$ contains only the $k=0$ terms

$$f(q^2, \omega)^{AF} = (q^2)^n \sum_{\ell=0}^{\infty} f_{0,\ell}(\omega) (\ln q^2)^\ell$$

19. When appearing on a matrix element containing the mass insertion operator u , the subscript A indicates that all propagators corresponding to external lines have been removed and that all amplitudes in which u acts on an external line have been dropped.

20. Zimmerman, see reference 7.
21. It should be noted that the Wilson expansion (2) is valid for matrix elements containing the mass operator u . In a renormalizable theory all subgraphs appearing in the matrix elements of a traceless, symmetric operator $O_{a_1 \dots a_n}^{(i)}$ of lowest canonical dimension will have degree of divergence less than or equal to zero. Therefore, the insertion of the operator u will require no additional subtractions.
22. These are the only two operators for a given n which are charge conjugation even and may have non-vanishing, spin averaged matrix elements between two identical pseudo-scalar or fermion states.
23. For simplicity we use the same notation to represent analogous quantities in the pseudo-scalar and vector theories. It should always be clear from the context to which theory a given symbol refers.

27. The requirement (56a) is valid only if we set equal to zero the direct, renormalized photon coupling constant f , introduced in eqs. (A19) and (A20).
28. If the right hand side of eq. (65a) is expanded in powers of g^2 , we find a term behaving as $1/g^2$. This term is independent of x^2 and is therefore annihilated by the derivatives appearing in eq. (2).
29. For a derivation of the Callan-Symanzik equations in quantum electrodynamics that follows similar lines, see A. Sirlin, Phys. Rev. D 5, 2132 (1972).
30. Throughout our discussion of the vector theory we work in the Feynman gauge using $\delta_{\mu\nu} \Delta(k^2, m, \mu)$ for the photon propagator.

31. A somewhat different asymptotic behavior is implied if g_∞ is a multiple root or an essential singularity of β . For a discussion of these various possibilities see S. Adler, IAS preprint.

FIGURE CAPTIONS

Figure 1. Ladder graphs representing the "outer rainbow" amplitudes considered in the Chang-Fishbane calculation. The solid lines represent fermion propagators, the dashed lines pseudo-scalar propagators and the wavy lines virtual photons.

Figure 2. a) Diagrams representing the matrix element which determines $a_n^{1,1}$ to order g^2 in the pseudo-scalar theory. The cross indicates insertion of the mass operator u while the two photon - two fermion vertex represents the factor given in (C2). b) The diagram representing the order g^2 , two fermion matrix element of the operator specified by eq. (B2).

Figure 3. The results of a calculation of $a_n^{i,j}$ to order g^2 in the pseudo-scalar theory and those Feynman diagrams, described in Appendix C, from which their values were obtained.

Figure 4. The quantities $a_n^{i,j}$ computed to order g^2 in the vector theory accompanied by the corresponding graphs as described in Appendix C. Here the dashed lines represent vector particle propagators.
