Half of incisions in skin of back of 66 rats were x rayed (100 kv, 2 mm Al) immediately, 24 and 48 hr after incision, and biopsy specimens were taken 1-9 days after incision. Delayed healing was observed in wounds irradiated at 24 hr interval. Effects were readily apparent 7-8 days after incision. Irradiation effect on connective tissue was greater than that on epithelium. BA 9-11241.

3564

ALTERATIONS IN THE pH OF THE BLOOD IN CANCER FOLLOWING ROENTGEN AND GAMMA IRRADIATION. Janetta Wright Schoonover, Ethol Hall Shiels and Bernard

P. Widmann. Am. J. Roentgenol. Radium Therapy 31(4), 532-7(1934).

No definite trend in blood pH was found during course of radiation therapy. Slight changes observed in either direction were only transient. BA 9-11243

3565

CHRONIC RADIUM POISONING IN RATS. Horace E. Thomas and Frank H. Bruner. Am. J. Roentgenol. Radium Therapy 29(5), 641-62(1933).

Four male and 4 female rats were injected subcutaneously with 40-60 micrograms $RaCl_2$ over 126-191 days. Detailed description of results given, including decreased weight gain, anemia, bone marrow injury and extramedullary hematopoiesis, destruction of lymphocytes in lymphoid tissue, morphological changes in salivary glands, adrenal glands and testes, myocardial fibrosis, parenchymatous nephritis, resorption of fetuses by radioactive mothers and abnormal deposition of Ca salts in bone, predisposing to fractures. Abscesses in soft tissues around the mandible were frequently found. BA 9-11246.

3566

SOME OBSERVATIONS OF THE EFFECTS OF RADIUM IRRADIATION ON TISSUE CULTURES. W. G. Whitman. Am. J. Cancer 17(4), 932-45(1933).

Changes observed in tumor cells (rat sarcoma) and normal tissue in tissue cultures exposed to Ra emanation were compared. Marked increase in number of abnormal mitoses was noted, the depression being greater in normal cells (macrophages) than in tumor cells. BA 9-11247

3567

THE INFLUENCE OF ROENTGEN RAYS ON THE GROWTH AND PHOSPHATASE ACTIVITY OF BONE. Walter E. Wilkins and Eugene M. Regen. Radiology 22(6), 674-7(1934).

Puppies 30-40 days old were given a 600 r x ray dose to the left foreleg, (right used as control) and killed 3-34 days later. Irradiated bone was heavier for few days post-exposure. Growth was retarded more in wt. than length. Phosphatase activity decreased to minimum in 1-3 wk, then recovered. No decrease in enzyme activity followed irradiation of bone extract and blood plasma with 1200 r. BA 9-11248

3568

THE EFFECT OF ROENTGEN IRRADIATION OF THE ENTIRE ANIMAL ON THE PHOSPHATASE ACTIVITY AND ELECTROLYTE CONTENT OF ITS WATER EXTRACT. Walter E. Wilkins and Eugene M. Regen. Radiology 23(4), 443-5(1934).

Rabbits given whole-body exposure to 500-1100 r x irradiation. Whole body extracts made 1 wk later showed that phosphatase activity of irradiated animal was appreciably lower than that of controls. No appreciable change was observed in total P. inorganic P. chlorides, Ca, Mg, Na, and K. BA 9-11249

3569

GASTRIC SECRETION FOLLOWING IRRADIATION OF THE EXPOSED STOMACH AND THE UPPER ABDOMINAL VISCERA BY ROENTGEN RAYS. Albert M. Snell and Jesse L. Bollman. Am. J. Digest. Diseases Nutrition 1(3), 164-8(1934).

Irradiation of intact upper abdomen of dogs produces variable and temporary reduction in gastric acidity and destruction of gastric mucosa. Similar effects followed irradiation of the surgically exposed and isolated stomach. Effects were temporary; acidity subsequently returned to normal. It is suggested that improvement of ulcer patients given x ray therapy may be due to effect on local

leukocytic infiltration, not to direct effect on gastric secretion. BA 9-11433.

3570

ACTION-CURRENTS OF THE RETINA ON IRRADIATION WITH RADIUM. P. F. Thier. Acta Brevia Neerl. Physiol., Pharmacol., Microbiol. 4(1), 17-19(1934).

On irradiation of frog eyes with Ra, action-currents arose in retina and were of the same general shape as those obtained with light, but all phases developed more slowly. Beta rays main cause of Ra E. R. G., γ rays had much smaller effect. CO_2 had specific damaging influence on functions of the retina. BA 9-11488

3571

RADIUM POISONING A REVIEW OF PRESENT KNOWLEDGE. Robley D. Evans. Am. J. Public Health 23(10), 1017-23(1933). BA 9-11549

3572

LEUKEMOID AND LEUKEMIC CONDITIONS IN WHITE MICE WITH SPONTANEOUS MAMMARY CARCINOMA. W. C. Hueper. Folia Haematol. 52(2), 167-78(1934).

X ray irradiation of cancerous mice produced a marked increase in the incidence of leukemia. Hyperplastic myeloid or lymphoid proliferations were changed into leukemic ones by x rays. BA 9-11581

3573

THE THERAPEUTIC ACTION OF RADIUM ON SPONTANEOUS MAMMARY CARCINOMATA OF THE MOUSE. W. Cramer. Sci. Rept. Invest. Imperial Cancer Research Fund 11, 127-45(1934).

Spontaneous mammary carcinomata of the mouse show considerable differences in sensitivity to Ra. Reactions of radiosensitive and radioresistant tumors are described. Both radiosensitive and radio-resistant tumors show nonlethal damage of irradiated cells, but only in the former is this followed by prolific macrophage invasion and subsequent fibrosis. BA 9-11625

3574

THE CARBOHYDRATE TOLERANCE IN CANCER PATIENTS, AND THE EFFECT UPON IT OF ROENTGEN RAY RADIATION. F. H. L. Taylor and Henry Jackson, Jr. Am. J. Cancer 22(3), 536-47(1934).

In only 11 of 35 cancer patients studied was decreased tolerance for glucose found prior to the institution of x-ray therapy. No consistent x-ray effect on sugar tolerance was observed in these patients. BA 9-11687

3575

INFLUENCE OF GRENZ RAYS ON PATHOGENIC FUNGI IN SKIN MATERIAL. Emanuel Muskatblit and Boris Ouspensky. Arch. Dermatol. and Syphilol. 27(6), 953-5(1933).

Hairs from 17 children with tinea capitis, containing 5 fungus species, were exposed to Grenz rays in 22 experiments. Microsporon audouini, M. lanosum, Achorion schonleinni, and Trichophyton crateriforme were unaffected by doses as high as 50,000 r. T. violaceum was unaffected by 30,000 r, its growth delayed or inhibited by 50,000 r. Cultures from hairs irradiated showed no peculiarities in gross or microscopic morphology. BA 9-11972.

3576

RADIUM AND LETHAL MUTATIONS IN DROSOPHILA. FURTHER EVIDENCE OF THE PROPORTIONALITY RULE FROM A STUDY OF THE EFFECTS OF EQUIVALENT DOSES DIFFERENTLY APPLIED. Frank Blair Hanson and Florence Heys. Am. Naturalist 66, 335-45(1932).

A series of dosages as nearly equivalent as possible but applied in different ways gave approximately equivalent results. Effect was proportional to total energy absorbed. BA 9-13081

3577

CHEMICAL ACTION, ELECTRIC RESISTANCE, AND TISSUE DAMAGE. Alberto Pirovano. Riv. biol. (Perugia) 16(2), 1-18(1934)

Comparison of effects of **magnetic flux and x rays** on developing ears of maize. BA 9-13333

3578

BIOLOGICAL DOSIMETERS IN RADIOLOGY. Charles Packard. Cold Spring Harbor Symposia Quant. Biol. II, 264-74(1934).

Author discusses the advantages of using *Drosophila* eggs as biological dosimeters. BA 9-13452.

3579

THE EFFECTS OF X-RADIATION UPON CELL GROWTH AND STRUCTURE. George L. Clark. Cold Spring Harbor Symposia Quant. Biol. II, 248-63(1934). BA 9-13452

3580

CHEMICAL-PHYSICAL FOUNDATION OF THE BIOLOGICAL ACTIVITIES OF X-RAYS. Hugo Fricke. Cold Spring Harbor Symposia Quant. Biol. II, 241-8(1934). BA 9-13452.

3581

RESPIRATION AND DEVELOPMENT OF INDIVIDUAL MUD-DAUBER WASP LARVAE FOLLOWING X-IRRADIATION. Joseph Hall Bodine and Titus Carr Evans. Physiol. Zool. 7(4), 550-6(1934).

Activity developing larvae of *S. caementarium* proved to be more sensitive to x rays than were blocked or "diapause" larvae. Organisms that were irradiated and immediately subjected to periods of normal or artificially produced developmental blocks showed marked powers of resistance to, or recovery from, harmful irradiation effects normally shown by developing organisms. BA 9-13565.

3582

EFFECT OF X-RAYS ON THE TRANSPARENT MEDIA OF THE EYE. A. P. Devirts and S. M. Khaulin. Izvest. Akad. Nauk SSSR. Otdel. Mat. i Estestven. Nauk 1933(1), 161-72(1933). (In Russian).

Changes in lens of eyes of rabbits irradiated with 4 H units of x rays (delivered to the head) are described. Cloudiness of the posterior surface of lens was perceptible 2-3 months post-exposure. Similar changes are seen in lens, vitreous humor and cornea in humans after therapeutic x irradiation. BA 9-13567

3583

THE RATE OF RECUPERATION OF HUMAN SKIN FOLLOWING IRRADIATION. James J. Duffy, A. N. Arneson, and Edward L. Voke. Radiology 23(4), 486-90 (1934).

Authors studied the quantity of radiation necessary to produce threshold erythema in single and divided doses of 200 kv x rays (0.5 mm Cu and 2 mm Al). Threshold erythema dose was 525 r; for equal amounts of radiation at 24 hr interval it was 400 r per exposure; for 48 hr intervals 425 r per exposure. BA 9-13568

3584

EXPERIMENTS ON THE CHORIO-ALLANTOIC MEMBRANE OF THE CHICK EGG WITH REGARD TO THE ACTION OF HOMOGENOUS X-RAY IRRADIATION. E. S. Duthie. Brit. J. Radiol. 7, 238-46(1934).

No x-ray effect on chorio-allantoic membrane of 8-10 day old chick embryos was demonstrated under the condition of the experiment. BA 9-13569

3585

RESPIRATION AND VISIBLE DEVELOPMENT OF INDIVIDUAL GRASSHOPPER EGGS FOLLOWING X-IRRADIATION. Titus Carr Evans. Physiol. Zool. 7(4), 556-72(1934).

Visible development and respiratory rates of grasshopper eggs was immediately but temporarily affected by

irradiation of <1000 r; above this level hatching was suppressed. Above 2000 r, embryos died at earlier stages. Initial movements of blastokinesis were resistant to all doses below 10,000 r. Some recovery occurred with refrigeration (9-10°C) for several days immediately after exposure, none if refrigeration was delayed. BA 9-13570.

3586

STUDIES ON THE EFFECT OF CONTINUOUS EXPOSURE OF MICE TO GAMMA RAYS OF RADIUM. J. Furth and D. H. Kabakjian. Am. J. Roentgenol. Radium Therapy 32(2), 227-34(1934).

Mice were exposed continuously to γ rays emanating from 0.003 to 5 mgm. Ra. Radiation from 1-5 mgm shortened life span and the leucocyte count of those exposed to 5 mgm dropped much below normal in one week although mice lived 2-3 months. Exposure to 0.3 mgm did not prevent development of spontaneous neoplasm. Radiation increased susceptibility to transmitted lymphomatosis. Mice already afflicted with the lymphomatosis showed some prolongation of life under continuous irradiation from 1-5 mg radium. BA 9-13571

3587

AUDITORY EFFECTS OF ROENTGEN RAYS IN DOGS. II. Edward Girden and Elmer Culler. Am. J. Roentgenol. Radium Therapy 32(5), 675-9(1934).

Temporary increase in auditory acuity (average gain 5.5 decibels) was noted in 8 dogs following irradiation of head with small doses (80-100 kv, 5 ma, 25 cm). Second shorter period of increased acuity appeared, in 4 cases, upon subsequent exposure. Cumulation of over 4,400 r and 11,000 r did not impair auditory function. Cumulated doses of 67 r and 3500 r at 200 kv, 5 ma produced no change in function. BA 9-13572

3588

THE TIME-INTENSITY FACTOR IN RELATION TO THE GENETIC EFFECTS OF RADIATION. H. D. Griffith and K. G. Zimmer. Brit. J. Radiol. 8(1), 40-7(1935).

Author reviews studies of time-intensity in radiation showing a time factor of unity for all intensities for genetic changes. BA 9-13573

3589

ACTION OF SOFT AND HARD RAYS ON THE FORMATION OF OSSEOUS CALLUS. M. Lambranzi. Arch. radiol., Parte I. 9(2), 247-50(1933). (In Italian).

In group of 18 rabbits hard rays appeared to promote callus formation more effectively than did soft rays. BA 9-13574.

3590

ON THE ALTERATION IN THE SENSITIVITY OF CELLS TOWARDS RADIATION PRODUCED BY COLD AND BY ANAEROBIOSIS. J. C. Mottram. Brit. J. Radiol. 8(1), 32-9(1935).

Broad bean roots exposed to x and γ rays in ice water were more retarded in growth than were those irradiated in water at 24°C. Irradiation in N atmosphere was less effective than in air. BA 9-13577

3591

EFFECTS OF RADIATION ON TISSUE CULTURES OF LYMPH NODE. Wilhelm Stenstrom and Joseph T. King. Proc. Soc. Exptl. Biol. Med. 31(8), 909-10(1934).

Preliminary paper. BA 9-13581

3592

HISTOLOGICAL CHANGES IN THE ANTERIOR LOBE OF A ROENTGEN IRRADIATED HUMAN HYPOPHYSIS. E. Stockl. Zentr. Gynakol. 58(20), 1160-6(1934). (In German).

About 2/3 of anterior lobe of pituitary underwent necrosis 38 days after 610 r x ray dose (woman 56 yrs). Marked basophil content of anterior lobe is attributed to

heart trouble, excretion of albumin in urine and possibly anemia. BA 9-13582

3593

CERTAIN PHYSIOLOGICAL EFFECTS OF X-RAYS ON EUPLANARIA DOROTOCEPHALA. I. DIFFERENCES IN SUSCEPTIBILITY. H. H. Strandskov. *Physiol. Zool.* 7(4), 572-86(1934).

Of two hundred animals exposed to x rays from 172-864 r, 113 were perceptibly affected, the degree of effect varying in general with length of exposure. Antero-posterior gradient of susceptibility to x rays was similar in pattern to susceptibility gradients brought out by other agents in same animal. Surviving affected animals subsequently regenerated some or all of the tissues destroyed by exposure. BA 9-13583.

3594

REACTION OF TRANSPLANTABLE MOUSE SARCOMA NO. 180 TO RADIATIONS OF DIFFERENT WAVE LENGTHS (200 kv. ROENTGEN RAYS AND GAMMA RAYS). Kanematsu Sugiura. *Am. J. Roentgenol. Radium Therapy* 31(5), 614-27(1934).

Viability of mouse sarcoma irradiated *in vitro* and then transplanted was destroyed by 10 min unfiltered x rays (2,400 r) or 63 min filtered (2,800 r), both usually at 200 kv, or 7 hr of γ rays. Effect of sub-lethal doses on growth are described. Bunsen-Roscoe law was found to be applicable within limits of the experimental conditions. BA 9-13584

3595

THE EFFECT OF RADIATION FROM FILTERED RADON IMPLANTS ON THE GROWTH OF CARCINOMA AND SARCOMA IN ANIMALS. Kanematsu Sugiura and Stanley R. Benedict. *Am. J. Cancer* 20(4), 813-26(1934).

An experimental attempt to determine MLD of radiation from a radon seed in terms of skin erythema dose (SED) using Flexner-Jobling rat carcinoma and Sugiura rat sarcomas as test systems. Tumors were irradiated *in vivo*. BA 9-13585

3596

EFFECT OF ROENTGEN RAYS ON THE THYROID OF GROWING ORGANISMS. A. Viethen. *Z. Kinderheilk.* 56(4), 400-4(1934). (In German).

Thyroid gland of young rats received a dose of 25-1,000 r, that of adults a dose of 100-1,000 r. Inhibition of function was observed in young gland, but radiation had no effect in adults. Effect varied with size of dose and time of examination. BA 9-13586

3597

ENDOCRINE REACTIONS IN FEMALE RATS AFTER X-RAY TREATMENT. W. T. Levine and Emil Witschi. *Proc. Soc. Exptl. Biol. Med.* 30(8), 1152-3(1933).

Preliminary paper. BA 9-13915

3598

EFFECT OF X-RAYS UPON THE DEVELOPMENT OF SEXUAL CHARACTERISTICS. A. F. Rolf, Carl H. Schroeder, and W. A. Higgins. *Poultry Sci.* 13(5), 274-7(1934).

Exposure of 6 wk cockerels to 1,750, 2,200, and 2,700 r or 2 exposures of 1,750 r at intervals of 10 days reduced development of testes, comb and wattles, and destroyed ability to crow. External characteristics were of "slip" rather than of capon. Results indicate that production of hormone responsible for these characters was not inhibited completely. Weight gain was significantly reduced. BA 9-13941

3599

A CASE OF MULTIPLE RADIUM CANCERS OF THE SKIN. H. Droschl. *Z. Krebsforsch.* 38(3), 274-82(1933). (In German).

Author presents a detailed account of a case of human cancer of the skin, developed after years of exposure to Ra. Death in this case (a physician) was due to severe aplastic anemia. BA 9-14043

3600

STIMULATING ACTION OF RADIO-ACTIVE DEPOSITS IN THE BODY. Frederick B. Flinn. *Radiology* 23(3), 331-8(1934).

Exposure to Ra caused no direct stimulation of tissue *in vitro*. Clinically, its action was found to be always destructive, due to impact of α particle on cell nucleus. Lesions observed in several cases are described histologically. Amounts of Ra in cases observed had no effect on germ cells. Observations suggest slow wearing down of bone tissue. Sarcomas which developed are attributed to continuous stress on the injured bone. BA 9-14045

3601

THE ACTION OF RADIUM ON THE INORGANIC STRUCTURE OF TUMOUR CELLS AS SHOWN BY MICROINCINERATION. E. S. Horning. *Sci. Rept. Invest. Imperial Cancer Research Fund* 11, 67-73(1934).

Paraffin sections of adenocarcinoma 27 were obtained 4 hr-24 days after irradiation and incinerated at 650°C., then examined by dark field microscopy. Increase of cytoplasmic salts occurred in tumor cells 6-8 hr after exposure. It was maintained until 24 hr after Ra application and was accompanied by cellular hypertrophy on 3rd day. BA 9-14052

3602

STUDIES ON THE EFFECT OF ROENTGEN RAYS ON LYMPHOMATOSIS OF MICE. J. Furth. *Am. J. Roentgenol. Radium Therapy* 32(3), 377-83(1934).

Total irradiation of lymphomatous mice prolonged life, did not prevent fatal termination of illness. Prolongation of life was proportional to dose, the optimum dose being 400 r, the minimum, 150 r. Complete regression of tumor of leg occurred following 3000 r applied to tumor, 2000 and 1000 r caused only partial regression. Death rate due to intercurrent diseases was greater among irradiated mice. BA 9-14096.

3603

EFFECTS OF ARTIFICIALLY INDUCED LYMPHOPENIA IN CANCER RESISTANT AND CANCER-SUSCEPTIBLE RATS. M. F. Guyer, F. E. Mohs, and F. M. Shebesta. *Arch. Pathol.* 19(1), 66-74(1935).

Lymphopenia due to repeated x irradiation did not destroy immunity in a strain of cancer-resistant rats nor alter response of a highly susceptible strain to cancer implants. The characteristic lymphocytic and fibrotic response to cancer implants was greatly reduced in irradiated rats. BA 9-14128

3604

THE DELETERIOUS EFFECTS OF DEEP ROENTGEN IRRADIATION ON LUNG STRUCTURE AND FUNCTION. V. C. Jacobsen. *Am. J. Roentgenol.* 44, 235-49(1940).

A patient with bronchial carcinoma received deep x-ray therapy to the chest in amounts totaling 18,300 r over a period of 9 years. The tumor was almost totally destroyed: was identified at autopsy from a small remnant remaining (it was not the direct cause of death). Complications of the extensive irradiation included: atelectasis, chronic interstitial fibrosing pneumonitis, chronic bronchitis, hemoptysis from granulation tissues, extensive arterial obliteration in the affected side.

3605

ON THE BREEDING OF WILLOW. V. N. Sukachev. *Sbornik Trudov Tsentral Nauch-Issledovatel' Inst. Lesnogo Khoziaistva (Bull. USSR Central Forestry Research Inst.)* 1, 51-85(1934).

Shoots of cuttings subjected to x rays showed modifications with general trend towards narrowing of leaves. In one case convolute leaves, and in another an acceleration of shoot growth were noted. BA 9-14503

3606

CHROMATIC INCLUSIONS IN THE CYTOPLASM OF CELLS AFTER GAMMA RADIATION, AND CHANGES IN THE NUCLEOLUS. J. C. Mottram. J. Roy. Microscop. Soc. 53(1), 28-34(1933).

Root tip cells of *Vicia faba* exposed to γ radiation (radium) are described. Cytoplasmic inclusions observed are considered to be extrusions from nucleolus. Nucleolus is considered a "factory for chromatin"; irradiation inhibiting normal passage of chromatin to spireme. BA 9-15273

3607

OVARIAN IRRADIATION AND SEXUAL PRECOCITY IN THE RAT. James L. Mandel and E. N. Grisewood. Proc. Soc. Exptl. Biol. Med. 32(1), 155(1934).

Immature females were x irradiated (200 kv, 3 ma, 25 cm dist., 41.4 r/min) with doses ranging from 540-1,240 r. Vaginae of all irradiated animals opened at 14 days, 3 wk before those of controls. Examination of ovaries revealed abnormally large follicles, their growth and activity apparently stimulated by x rays. Vaginal canalization was markedly precocious. BA 9-15811

3608

THE QUESTION OF THE EFFECT OF ROENTGEN RAYS ON THE LUNGS AND ON THE HEART OF DOGS. M. I. Karlin and B. N. Mogilnitsky. Frankfurt. Z. Pathol. 43(3), 434-47(1932). (In German).

Dogs and rabbits were exposed to one of the following: (1) single erythema dose (ED) to one anterior and 1 posterior field or (2) 3 exposures of 1 ED/field at monthly intervals. No changes were apparent during the 4 mo observation period from (1), (2) caused peribronchial and perivascular proliferations of connective tissue: epicardial thickening and perivascular connective tissue thickening in the heart. BA 9-16083

3609

EXPERIMENTAL CHRONIC NEPHRITIS PRODUCED BY RADIUM. Leyland J. Adams, William C. Egloff, and James P. O'Hare. Arch. Pathol. 15(4), 465-89(1933).

Intravenous injection of active deposit of Ra emanation produced chronic renal insufficiency without hypertension in 17 dogs (1 control), longevity varied inversely with Ra dosage. Pathological changes in kidney are described. Early attempt at regeneration of tubular epithelium was thought to be considered probably secondary to Ra effects on cement and collagen throughout kidney. BA 9-16112

3610

EFFECT OF X-RAY ON EXPERIMENTAL ENCEPHALITIS IN MICE INOCULATED WITH THE ST. LOUIS STRAIN. Samuel A. Goldberg, Maurice Brodie, and Phyllis Stanley. Proc. Soc. Exptl. Biol. Med. 32(4), 587-90(1935).

The data presented indicate that x rays either prevent or cure encephalitis in mice inoculated intranasally. Treatments: 135 kv, 5 ma, 15 in. dist., 3 mm Al, for 5 min; 38 mice treated daily until death, or up to 12 treatments. Report of favorable x-ray therapy results in cases of encephalitis is included. BA 9-16324

3611

A NOTE ON BACTERICIDAL EFFECTS OF X-RAYS. Fred L. Mohler and Lauriston S. Taylor. J. Research Natl. Bur. Standards 13(5), 677-9(1934).

It is assumed that biological effects localized in the columns of ionization along path of each high-speed electron. Studies by others on the killing of colon bacilli by cathode rays and x rays are analyzed in terms of effective collision area of the column of ionization and of the

bacillus. Authors find that column must pass through a particular point in the bacillus to cause death. BA 9-16401

3612

THE FORMATION OF GIANT CELLS IN CULTURES OF BONE MARROW UNDER THE INFLUENCE OF RADIUM EMANATION. M. Torrioli and M. Gusti. Policlinico II (Rome) (Sez. med.) 41(7), 381-7(1934).

In cultures of guinea pig bone marrow exposed to radon, protoplasmic and nuclear fusion of adjacent myeloid cells produced giant cells resembling Sternberg cells especially megakaryocytes. BA 9-16897

3613

THE EFFECTS OF X-RADIATION ON CHROMOSOMES IN THE MICROSPORES OF TRILLIUM ERECTUM LINN. C. Leonard Huskins and A. W. S. Hunter. Proc. Roy. Soc. (London) 117, 22-33(1935).

Microspores were irradiated in homoeotypic telophase or early resting stage of pollen tetrads. No morphologic effects were noted immediately although mitosis was delayed. Lateral translocations of chromosome fragments onto a broken chromatid were observed frequently in 1st postirradiation mitotic prophase. Later effects are also described. BA 9-17606

3614

TRANSFORMATIONS OF CHROMOSOMES UNDER INFLUENCE OF X-RAYS. G. A. Levitskii and A. C. Araratian. Trudy Priklad. Botan. Genet i Selektii (Bull. Appl. Bot., Genet. and Plant-Breed.) 27(1), 265-303(1931). (In Russian and English).

Young seedlings of *S. cereale*, *V. sativa*, and *C. capillaris* (*virens*) exhibited chromosome fragmentation as a common postirradiation effect. BA 9-17612.

3615

THE EFFECT OF RADIATION UPON CELL RESPIRATION Leon C. Chesley. Biol. Bull. 67(2), 259-72(1934).

Wheat seedlings were x and γ irradiated with doses sufficient to impede growth 40% by 24 hr post exposure. O_2 consumption and fresh wt were determined at various intervals. Except at 6 hr interval postirradiation, O_2 consumption/gm was unaffected, at 6 hr O_2 /gm was higher in irradiated than in control plants. Growth was inhibited before respiratory rate changes were apparent. *Arbacia* and *Chaetopterus* eggs were studied in similar experiments BA 9-17898

3616

STUDIES OF FACTORS IN TISSUE RADIOSENSITIVITY OTHER THAN MORPHOLOGIC PHENOMENA. BIOLOGICAL CHARACTERISTICS OF RESTING TISSUES. Joseph Lambert. Arch. biol. (Liege) 44(4), 621-739(1933). (In French).

Radiosensitivity of dry and soaked peas depends on the duration of swelling and is maximal shortly before mitosis. Sensitivity is dependent solely on respiration and fermentation in seedlings, but no direct relationship between swelling, respiration and fermentation curves could be established. Great radioresistance of latent tissues is suggested presumably due to low rate of metabolism in these tissues. BA 9-17900

3617

PHYSIOLOGY OF METABOLISM. Erwin Bunning. Fortschr. Botan. 3, 63-82(1933-4). (In German).

This review includes a section on the basis of radiation effects. BA 9-17971

3618

MODIFICATION OF X-RAY INJURY BY CO_2 AND AMMONIA. R. E. Zirkle. Am. J. Physiol. 109(1), 115(1934).

Ammonia decreases and CO_2 increases the radio-sensitivity of the fern, *Pteris longifolia*, to soft x rays. BA 9-17974

3619

ACUTE TOXICITY OF RADON. Donald A. Morken.
A. M. A. Arch. Ind. Health 12, 435-8(1955). NSA 10-533

3620

SOME EFFECTS OF X-RAY IRRADIATION ON DEVELOPING GRASSHOPPER (*MELANOPLUS DIFFERENTIALIS*) EGG.
Titus Carr Evans. Anat. Record 57(4, Suppl.), 44(1933).

(Abstract of paper). Eggs were irradiated with 100-1500 r just before beginning of later stages of development. Changes in the rate of oxygen consumption and visible morphological changes during subsequent development are described. Increases in oxygen consumption are closely related to developmental processes.
BA 9-18105

3621

RECOVERY OF NON-DEVELOPING MUD WASP (*SCELIPHON CAEMENTARIUM*) LARVAE AFTER IRRADIATION WITH X-RAYS. J. H. Bodine and T. C. Evans. Anat. Record 57(4, Suppl.), 66(1933).

(Abstract of paper). Low doses of x rays accelerate the rate of oxygen consumption and development of larvae, but doses of approximately 600 r temporarily retard both. If larvae are in diapause when irradiated, effects will have disappeared by the time development takes place. Disappearance of radiation effects was also observed if the organism was maintained at a low temperature for a few weeks following exposure.
BA 9-18105

3622

X-IRRADIATION OF THE OVARIES OF GUINEA PIGS AND ITS EFFECT ON SUBSEQUENT PREGNANCIES.
Ida T. Genther. Anat. Record 57(4, Suppl.) 60(1933)

(Abstract of paper.) Ovaries of sexually mature and of immature guinea pigs were x rayed with a minimum sterilizing dose or with 2/3 of this dose. The relationship of subsequent pregnancies to morphological ovarian changes is described. BA 9-18105

3623

EFFECT OF RÖNTGEN IRRADIATION OF THE SPLEEN ON IRON METABOLISM IN ANIMAL ORGANS. J. J. Arkusky. Strahlentherapie 49(3), 455-62(1934). (In German).

After Fe balance determinations on 6 male rabbits, 1 was splenectomized, others were given a 710-4260 r x ray dose to spleen. Fe intake and excretion temporarily decreased following splenectomy or larger doses, and Fe was stored in spleen and liver (Kupffer cells) organs that were ordinarily free of Fe deposits, none was found in kidneys or lungs. BA 9-18106

3624

THE EFFECT OF RADIUM EMANATION ON THE FORMATION OF BONE CALLUS. Alessandro Bich. Arch. ital. chir. 34(2), 223-32(1933).

Experiments on 30 rats with fractures of the diaphysis of the radius showed that subcutaneous injection of small doses of Ra emanation in distilled water inhibits callus formation. BA 9-18107

3625

X-RAY AND RADIUM PROTECTION, WITH SPECIAL REFERENCE TO THE DEPARTMENT OF RADIOLOGY, PERTH HOSPITAL, PERTH, WESTERN AUSTRALIA. Geoffrey Bourne. J. Cancer Research Comm. Univ. Sydney 5(3), 142-54(1933).

Blood counts taken from hospital x ray and radium staff showed no case in which the blood picture was seriously affected by amount of irradiation received, although occasional abnormalities apparently occurred.
BA 9-18108.

3626

BIOLOGICAL EFFECTS OF PENETRATING RADIATIONS.

V. Rivera. Cerebro 13(5), 396(1934). (In Italian).
Abstract of paper. BA 9-18110

3627

BIOLOGICAL EFFECT OF PENETRATING RADIATIONS. V. Ducceschi. Cerebro 13(5), 395(1934). (In Italian).
Abstract of paper. BA 9-18110

3628

ACTION OF X-RAYS ON THE NEUROFIBRILLAR RETE. A. Donaggio. Cerebro 13(5), 388(1934) (In Italian)
Abstract of paper. BA 9-18110

3629

BIOLOGICAL EFFECT OF ROENTGEN RAYS ON NORMAL TESTES. R. Balli. Cerebro 13(5), 388(1934). (In Italian). BA 9-18110.

3630

A MUTATION OF THE TAIL OCCURRING IN THE OFF-SPRING OF MALE MICE WITH IRRADIATED TESTICLES. N. Dobrovol'skaia-Zavad'skaia. Cerebro 13(5), 386(1934). (In French).

Abstract of paper. BA 9-18110.

3631

ACTION OF X-RAYS AND γ RAYS ON PLANTS. V. Rivera. Cerebro 13(5), 385(1934). (In Italian).
Abstract of paper. BA 9-18110

3632

EARLY VASOCONSTRICTION INDUCED IN THE ISOLATED RABBIT'S EAR BY X-RADIATION. P. M. Brooks, H. B. Gerstner and S. A. Smith. Radiation Research 4, 500-9(1956).

A method for obtaining continuous recordings of perfusion flow rates was developed. With this technique, measurements were performed on 112 isolated rabbit ears prior to, during and after exposure to various doses of x-radiation administered at a dose rate of 1 kr/hr. Doses in excess of 5 Kr induced a marked vasoconstriction. This reaction became noticeable several minutes after start of radiation and progressed to complete arrest of perfusion flow at higher doses. Approximately 20 minutes after cessation of perfusion flow, the vascular bed opened again and subnormal or normal flow rates were resumed even when radiation was continued. The irradiated ears showed marked protein washout.

3633

THE EFFECT OF A MINIMAL LETHAL DOSE OF X-RAYS UPON CHICK EMBRYOS. H. Ernest Crow. Kansas Univ. Sci. Bull. 21(paper 16), 479-523(1933).

Chick embryos of 28, 48, 60, 75, 96, and 120 hr incubation were exposed to unfiltered x rays (22 a, 90 v, for 15 min at 18 cm). This dosage was found to be the minimal lethal dose, causing death in 15-20 hr. Although all tissues were affected, the greatest modifications occurred in blood and nervous systems. Histological studies of serial sections made at periods from 20 min to 20 hr after exposure are described. BA 9-18111.

3634

ACTION OF RADIUM ON TISSUE CULTURES. F. B. Flinn, J. Victork, N. Stillman, and D. MacDonald. Am. J. Cancer 22(2), 351-8(1934).

Exposure to Ra in amounts of 5 and 2.5×10^{-1} to 10^{-11} mg produced no evidence of direct stimulation in hanging drop and flask cultures of fibroblasts, leukocytes, and bone marrow. Euglena showed no evidence of direct stimulation. BA 9-18112.

3635

THE TIME FACTOR IN THE BIOLOGICAL ACTION OF X-IRRADIATION. II. STUDIES ON ALGAE AND DROSOPHILA PUPAE. Arne Forssberg. Acta Radiol. 14(4), 399-407 (1933).

Scenedesmus basiliensis, Chlorella vulgaris, Mesotaenium caldarium were given 22-3, 235 r/min in 5, 000 and 10, 000 r doses in periods ranging from 227 min, 16 sec to 1 min, 32 sec, Drosophila pupae were given 2, 000 r, intensity 5-3, 235 r/min, in from 400 min to 37 sec. Maximum effect on algae was produced at 1, 620 r/min; on Drosophila, at 20 r/min. BA 9-18113

3636

STUDIES ON THE EFFECT OF ROENTGEN RAYS AND GAMMA RAYS UPON THE EGGS OF DROSOPHILA MELANOGASTER. Otto Glasser and F. R. Mautz. Am. J. Roentgenol. Radium Therapy 29(6), 815-25(1933).

In a comparative study it was found that 300 r x rays equalled 450 r gamma rays of Ra with respect to effect on survival (to hatching) of Drosophila eggs. BA 9-18115

3637

A STUDY OF THE EFFECT OF IRRADIATION UPON THE LUMBAR SYMPATHETIC GANGLIA IN RATS. J. Q. Griffith, Jr. and E. P. Pendergrass. Radiology 23(4), 463-5 (1934).

Degeneration of the sympathetic nerve fibers in adventitia of arteries which they supply occur in 45-60 days after ablation of the sympathetic ganglia. Irradiation (800 r) in 16 rats had no effect on the adventitial plexus. BA 9-18116

3638

CHANGES IN SUSCEPTIBILITY OF DROSOPHILA EGGS TO X-RAYS. II. CORRELATION OF BIOLOGICAL ACTIVITY AND RADIOSENSITIVITY. P. S. Henshaw. Radiology 24(4), 438-443(1935).

During cleavage and blastulation Drosophila eggs were very susceptible to radiation injury, with onset of gastrulation resistance suddenly increased, then decreased again after gastrulation. Author believes irradiation affects regulators of cellular activity. BA 9-18117

3639

DOES IRRADIATION OF THE ABDOMEN AFFECT GASTRIC ACTIVITY? Anna Iugenburg and R. I. Gurevich. Vestnik. Rentogenol. i Radiol. 12(1/2), 38-42(1933). (Russian with Ger. summary).

Study of 107 patients (gastric ulcer, duodenal ulcer, pericolicitis, cholecystitis, peptic ulcer) subjected to x-ray therapy showed decreased gastric acidity in 15%, increased in 16%, and no change in 69%. In some cases of gastric achylia, acidity returned to stable norm. BA 9-18119

3640

A BIOLOGIC STUDY OF THE ACTION OF X-RAYS TO MALIGNANT TUMORS, ESPECIALLY ON THE ATTITUDE OF THE PARENCHYMAL TISSUES OF MALIGNANT TUMORS TO X-RAYS. H. Kawakami. Japan. J. Obstetr. Gynecol. 17(5), 378-86(1934).

Transplantation of tumors to mice and rats while hosts were reacting to whole body x irradiation was more successful than transplantation to normal animals. Tumors often began to atrophy as recovery from irradiation began. Radiation is considered to interfere with protective power of animal against foreign protein. Studies of one irradiated and one non-exposed tumor in same host indicated that radiation effect was purely local. BA 9-18123

3641

CLINICAL AND EXPERIMENTAL OBSERVATIONS ON THE QUESTION OF FRACTIONATED RADIATION OF CARCINOMAS. Fr. Keller. Strahlentherapie 47(4), 636-45(1933). (In German).

In 30 mice application of 2750, 5500, or 7000 r in 42-7 days caused no hair loss but hair was more easily pulled out after the two higher doses. Epilation occurred after 6 ED at one session. X-ray effect on size of tumors of mice and on survival of tumor bearing mice is described. Fractionated doses of Ra and radioactive Bi in 5 patients caused severe complications. BA 9-18124

3642

ACTION OF X-RAYS ON THE FORMATION OF MYELIN IN THE WHITE RAT. G. Leboucq. Rev. belge sci. med. 6(5), 383-7(1934). (In French).

New-born white rats were irradiated (120 kv, 2 ma, filter 2 Al, 25 cm, 1000 French r per seance) up to 4 times at intervals of 3-5 days. One dose (at birth) interrupted myelinization of motor pathways for 1-2 days after which it resumed normally; 2 doses; also caused temporary arrest of myelinization; 3 doses seriously interfered with myelinization; 4 doses hastened destruction of neuron, only glial elements being resistant. BA 9-18125

3643

ON THE INHIBITION OF MITOTIC ACTIVITY BY X RADIATIONS OF DIFFERENT QUALITIES. W. H. Love. Med. J. Australia 22(Vol. 1 No. 8), 247-8(1935).

In material derived from the heart of fowl embryos, grown in fowl plasma and chicken extract by classical hanging drop technic, the quantitative biological reaction, as measured by inhibition of mitotic activity in tissue cultures, was apparently independent of penetration of radiation over range of 100-175 kv. BA 9-18126

3644

THE PHYSICAL BASIS OF THE BIOLOGICAL EFFECTS OF HIGH VOLTAGE RADIATIONS. W. V. Mayneord. Proc. Roy. Soc. (London) A146, 867-79(1934).

Ranges in mm. of secondary high speed electrons produced in cells by irradiation with x rays of various wave lengths tabulated; for photoelectrons (from data on Al) and for recoil electrons (by use of Klein-Nishina equation). Survival curves calculated for mass of cells irradiated at various wave lengths and used in discussion of selective action of x rays on rapidly-growing tissues. BA 9-18127

3645

X-RAY ABSORPTION. E. Momigliano. Ann. ostet. e ginecol. 56(10), 1565-1622(1934).

X-ray dose required to interrupt pregnancy in rabbits 50-200% of ED measured at surface; over uterus dose calculated at depth of 3-4 cm is reduced 30-35%. During 1st half of pregnancy dose caused death of embryo, and its resorption rather than expulsion; in second half it caused birth of dead or non-viable fetuses. An apparent relation between percentage of mortality and irradiation intensity noted. BA 9-18128

3646

THE RADIOSENSITIVITY OF ADENOCARCINOMA OF THE BODY OF THE UTERUS. Emanuele Momigliano. Arch. ostet. e ginecol. 42(2), 85-129(1935).

Epithelium of uterine horns in 16 rabbits completely refractory to action of Ra. Author deduces selective action of Ra, sparing normal and destroying neoplastic tissues. Failures in Ra therapy of cancer in body of uterus attributed to errors in dosage or to presence of complications (e.g. fibroma) which prevent Ra action on cancer cell. BA 9-18129.

3647

ON THE EFFECT OF RADIUM EMANATION ON URIC ACID METABOLISM. Shinkichi Okaue. Folia Pharmacol. Japon. 18(1), 87-93(1934). (In German).

On 2nd day after 4 cc Ra emanation was injected subcutaneously in rabbits, blood uric acid concentration began to decrease, total uric acid in urine to increase. Later there was considerable increase in uric acid in blood and urine accompanied by increase in total- and ammonium-N in the urine. Increased uric acid production and excretion are thought probably to be secondary to destructive effect of Ra on cell nuclei. BA 9-18130

3648

THE EFFECT OF ROENTGEN RAYS ON AN ORGANISM,

ESPECIALLY ON THE ACTIVITY OF PLASMA. H. Joseph and S. Prowazek. *Zeitsch. Allg. Physiol.* 1, 142-153(1902).

3649

ACTION OF X-RAYS ON LEPTOMAS IN RATS. R. Prudhomme. *Bull. soc. pathol. exotique* 27(10), 917-20 (1934). (In French).

Of 20 rats inoculated with rat leprosy, 10 were x rayed at site of inoculation every 2 or 3 days for 2 months for total of 3-12 hr. Course of disease retarded and death delayed for several months as compared to controls. Bacilli from infected cells destroyed by irradiation produced infection when transferred. BA 9-18132.

3650

HISTOLOGICAL CHANGES IN SQUAMOUS CELL CARCINOMA OF THE CERVIX OF THE UTERUS AFTER RADIATION. N. M. Alter. *Jour. Med. Res.* 40, 241-264 (1919-1920). (See also *IBID.* 41, 439-456).

3651

THE EXPONENTIAL LAW OF TISSUE RECOVERY APPLIED TO RADIUM AND RADON DOSAGE. Marvin M. D. Williams. *Radiology* 23(1), 64-70(1934).

Author postulates that since primary radiation effects are due to absorption of energy, recovery must represent a loss of energy. Formulae are derived giving amount of excess energy present at any time during treatment of following treatment when either radon or radium element is used. Tables and curves are presented showing residual tissue dosage at various times for various initial intensities. BA 9-18134

3652

THE ORIGIN OF BLOOD PROTEINS. H. A. Reimann, G. Medes, and L. Fisher. *Folia Haematol* 52(2), 187-202(1934).

Leukocyte destruction caused by injections of benzol and by exposure to x rays accompanied by increase in fibrinogen and decrease in total blood proteins. BA 9-18281

3653

X-RAY IRRADIATION OF THE HYPOPHYSIS AND PARTIAL REACTIVATION OF THE OVARY UNDER THE ACTION OF ADRENAL CORTEX HORMONE: EXPERIMENTS BASED ON THE ANALOGIES BETWEEN ADRENAL CORTEX HORMONE AND PROLAN B. Angelo Migliavacca. *Z. wiss. Biol. Abt. B, Z. Zellforsch. u. mikroskop. Anat.* 17(4), 662-80(1933). (In Italian).

Luteinization of peripheral connective elements of atresic follicles produced, with no appreciable direct action on uterus, in guinea pigs castrated by x radiation of hypophysis. Irradiated animals also showed hypertrophy of adrenal cortex. BA 9-18491

3654

INFLUENCE OF CURIETHERAPY AND X-RAY THERAPY ON THE BLOOD PROTEINS OF CANCER PATIENTS. P. Cristol, P. Monnier, and J. Bassaget. *Arch. soc. sci. med. biol. Montpellier* 14(2), 53-8(1932-3). (In French).

Serum protein levels of cancer patients were increased by Ra treatment, but not so predictably as following x ray therapy. Serum protein changes were not dose-dependent. Action of x rays and Ra on cells are compared and authors suggest that Ra acts more slowly in liberating globulin from neoplastic tissue and that action of x rays is more rapid, causing sharp increase in serum albumin. BA 9-18906.

3655

THE EFFECT OF ROENTGEN RADIATION ON THE DEVELOPMENT OF MESOTAENIUM CALDARIORUM. Arne Forssberg. *Acta Radiol* 15(6), 803-7(1934). (In German).

Multinucleated giant cells develop in alga M. caldarium after x irradiation; size increased with dose

to 15,000 r, followed by decrease toward normal with very large doses. Growth curve after irradiation normal up to 15,000 r, irregular with large doses. BA 10-325.

3656

GROWTH MODIFICATIONS IN CITRUS SEEDLINGS GROWN FROM X-RAYED SEED. C. P. Haskins and C. N. Moore. *Plant Physiol.* 10(1), 179-85(1935).

Morphological variations found in citrus seedlings from seed exposed to high-voltage x rays; albinism, premature flowering (both higher percent than normal), nanism, twisting of stem, peloric leaf formation, production of high percent of bi- and trifoliate leaves. BA 10-326

3657

INHIBITORY EFFECT OF RADIUM ON THE GROWTH OF ROOTLETS OF LENS ESCULENTA MOENCH; ANTAGONISTIC EFFECT OF MAGNESIUM ON RADIOLESIONS OF THE ACTIVE OR DORMANT PLANT CELL. A. Sartory, R. Sartory, J. Boyer, and J. Ernst. *Bull. acad. med. (Paris)* 111(3), 140-2(1934). (In French).

MgSO₄ antagonized effects of Ra irradiation on lentils germinating in solution of the salt. BA 10-331

3658

HISTOLOGIC CHANGES IN RABBITS AND IN DOGS FOLLOWING THE INTRAVENOUS INJECTION OF THORIUM PREPARATIONS. Evan Shute and M. Edward Davis. *Arch. Pathol.* 15(1), 27-34(1933).

Thorotrast and other thorium preparations injected intravenously in rabbits and dogs for visualization of spleen and liver caused intense degeneration of liver, spleen; abortion; spleen rupture; fatal postpartum hemorrhage. Placenta appears to be effective barrier to thorium. BA 10-539

3659

A COMPARATIVE STUDY OF THE OPERATIVE AND X-RAY CASTRATIONS. S. Tomita. *Japan J. Obstet. Gynecol.* 17(2), 116-84(1934).

Operative and x-ray castration apparently brought about same essential changes, differing only quantitatively and in time required. Castration with x ray did not destroy static and atresic follicles. BA 10-812

3660

EXPERIMENTAL INDUCTION OF OSTEOGENIC SARCOMA WITH RADIUM IN RABBITS. O. Schurch and E. Uehlinger. *Schweiz. med. Wochschr.* 64(28), 664-7(1934). (In German).

Description of case considered to be first in which Osteogenic sarcoma was produced (in rabbit) by purely exogenous irritant (3-5 μ gm Ra or mesothorium in vaseline implanted in femur). Metastasizing spindle cell sarcoma produced. BA 10-1022

3661

EXPERIMENTAL STUDIES ON OTOCEPHALY AND BASIC MALFORMATIONS OF THE FACE. (PRELIMINARY NOTE). Etienne Wolff. *Arch. Anat., Hist. et Emb.* 18(5/8), 229-62(1934). (In French).

Chick embryos irradiated in 8-15 somite stages; monsters produced are described. Malformations attributed to lesion of presumptive anlagen of facial processes, precise localization of which is found in relation to primary cerebral vesicles as landmarks. BA 10-1985

3662

THE EFFECTS OF X-RAYS ON ANTERIOR REGENERATION IN LUMBRICULUS INCONSTANS. Clarence Donnell Turner. *J. Exptl. Zool.* 71(1), 53-82(1935).

X irradiation of 78 r completely inhibited anterior regeneration in this worm. BA 10-2000.

3663

THE RELATIONSHIP OF THE MESODERM ANLAGEN ON REGENERATION IN RHYNCHELMIS LIMOSELLA.

(STUDIES ON THE EFFECT OF ROENTGEN RAYS ON REGENERATION AND TRANSPLANTATION.) L. Zhinkin. Zool. Anz. 105(11/12), 305-12(1934). (In German).

After x-ray destruction of neoblasts normally regenerating the mesoderm, only initial regeneration appeared in intestine and epithelium. After grafting irradiated segments on normal worm, normal regenerate resulted; neoblasts migrated from host. BA 10-2004.

3664

ON THE PRODUCTION OF HEREDITARY CHANGES IN *OENOTHERA BIENNIS GIGAS* BY MEANS OF ROENTGEN RADIATION. H. Langendorff. Biol. Zentr. 54(9/10), 547-51(1934). (In German).

Fifty seedlings 2 days old x rayed for 30 min with dosage of 36000 r. Exposed plants exhibited defects in form, shape, size, and color of leaves. F₁ and F₂ seedlings showed high mortality and various abnormalities. BA 10-2621.

3665

THE QUESTION OF DELAYED BREAKAGE IN THE CHROMOSOMES OF *DROSOPHILA*. J. T. Patterson. J. Exptl. Zool. 70(2), 233-42(1935).

Scute-8 apricot flies, possessing X-chromosome with very long inversion, x rayed and crossed with normal flies. F₁ females mated to yellow males with 6 other sex-linked recessive gene markers. Analysis of experimental data indicates that, in strict sense, no delayed effect was produced. BA 10-2639

3666

THE INFLUENCE OF X-RAYS ON SEED AND POLLEN OF TREES AND SHRUBS. I. N. Nikitin. Sbornik Trudov Tsentral. Nauch-Issledovatel' Inst. Lesnogo Khoziaistva, I, 86-104(1934). (Russian with English Summary).

Increase in per cent germination reportedly caused by x irradiation described in several species. BA 10-2879

3667

A CYTOLOGIC STUDY OF THE LIVING BODY IRRADIATED WITH A HARD RAY. I. INFLUENCE OF A HARD RAY UPON THE DEVELOPMENT OF BEANS AND THE ABNORMALITY OF THE NUCLEI AND CELL-DIVISION. T. Saito. Japan. J. Obstetr. Gynecol. 17(4), 285-90 (1934).

Hard ray radiation inhibited development of root tip cells of *V faba minor*; abnormal cell division and nuclear division result. Radiosensitivity of cells highest during division. BA 10-2880

3668

ROENTGEN RADIATION AS A MEANS OF COMBATTING THE DIPHTHERIA BACILLUS IN CARRIERS. M. Bychowsky, J. Fraenkel, and M. Eisenberg. Fortschr. Gebiete Rontgenstrahlen 50(6), 586-8(1934). (In German).

X-ray treatment of child and adult diphtheria patients is described. The majority became bacillus-free after treatments varying from 10-15 ESD with 4 mm Al for children and from 25-30 ESD with 0.5 mm Zn + 1 mm Al for adults. BA 10-3906

3669

THE APPLICATION OF ROENTGEN RADIATION TO DIPHTHERIA CARRIERS AND PATIENTS WITH DIPHTHERIA POSITIVE DISCHARGES. E. D. Dubowiy, N. A. Grinberg, M. T. Prodan, and O. W. Geftter. Fortschr. Gebiete Rontgenstrahlen 50(3), 294-9(1934). (In German).

X-ray therapy described which rendered diphtheria carriers, and patients still excreting bacilli 4-8 weeks after onset of the disease, bacillus-free. BA 10-3908

3670

DO GERM CELLS DEVELOP FROM THE FOLLICULAR CELLS OF YOUNG TESTES OF RATS? G. G. Shchegolev. Arkh. Anat. Gistologii i Embriologii 13(2), Russ. 309-14; Ger. 399-403(1934).

Results of x irradiating young rats indicate germ cells and follicular cells are different cellular elements present in same gland, physiologically closely related but different in origin and fate. BA 10-4375.

3671

SENSITIVITY OF DIVIDING AND NON-DIVIDING CELLS TO RADIATION. W. H. Love and J. C. Mottram. Nature (London) 134, 252-3(1934). BA 10-5047

3672

CYTOLOGICAL OBSERVATIONS OF DEFICIENCIES INVOLVING KNOWN GENES, TRANSLOCATIONS AND AN INVERSION IN *ZEA MAYS*. B. McClintock. Missouri Agr. Exptl. Sta. Research Bull. 163, 130(1931).

Maize plants with known genetic constitutions which arose from x rayed pollen or x rayed embryos, were examined at mid-prophase of meiosis permitting measurement of short deficiencies in chromosomes (which are elongated in mid-prophase). Inversions and translocations were studied cytologically. BA 10-5062

3673

RACE FORMATION IN *T. GLUTINIS* AFTER X-RAY IRRADIATION. G. S. Filippov. Vestnik Roentgenol. i Radiol. 10, 512-45(1932). (Russian with French and German summary).

Single-cell cultures of 3 pink, 1 orange, and 2 white races of *Torula glutinis* irradiated for 5 min. -2 hrs; doses ranged from 1270-1340 r to 30480-32160 r. Source race split into 5 basic groups: pink, orange, yellow, brownish-yellow, and white. Splitting greater, quantitatively, after large doses and more successful in old cultures and in those given multiple doses. BA 10-5102

3674

ARTIFICIAL MUTATIONS IN *P. PUPARUM* INDUCED BY RADIUM IRRADIATION. R. L. Dozortseva. Doklady Akad. Nauk SSSR 4(1/2), 88-94(1934). (Russian and English).

Homozygous virgin female wasps (*P. puparum*) irradiated and then allowed to lay eggs on 4 *Pieris brassicae* (cabbage butterfly) pupae on which they are parasitic. Observations made relative to survival, visible abnormalities, fertility and hereditary changes due to irradiation. BA 10-5122.

3675

EXPERIMENTAL STUDIES ON IRRADIATION OF THE OVARIES IN RATS. Erich Fels. Semana med. (Buenos Aires) 42, 1453-62(1935). (In Spanish).

Studies on (40 rats) confirm the difficulty of obtaining x-ray castration in this species. Dose required is about 3000 r, and this destroys only follicles; corpora lutea undergo physiologic involution. Results of smaller doses are variable, and no persistent lesion was discernible after irradiations of less than 1200 r. BA 10-5535

3676

CYTOLOGIC CHANGES IN THE SPERMATOGONIAL NUCLEI CORRELATED WITH INCREASED RADIO-RESISTANCE. L. C. Foga and R. F. Cowing. Exptl. Cell Research 4, 107-15(1953)

Types A and B spermatogonia differ in radiosensitivity. Some type A cells remain even after 1500 r whereas all type B cells are gone after 200 r x ray doses. (The apparent LD₅₀ for B spermatogonia was about 50 r, the LD₅₀ for type A about 100 r).

3677

THE EFFECT OF ROENTGEN RAYS ON THE ESOPHAGUS AND TRACHEA. Rolf Bull Engelstad. Acta Radiol. 15(3), 608-14(1934). (In German).

Reaction to subepidermicidal doses of x rays (1700 r) given to 10 rabbits usually slight, subsided in 2-3 months, reaction to epidermicidal (2200-6830 r) given to 35 animals, and lethal (9000-13,500 r) given to 9,

often had not subsided in 5-6 months. Changes began earlier, developed more acutely in esophagus, those in trachea often dominated picture in later stages. All doses applied in 1-4 sessions at 24-48 hr intervals to rt. thorax field. BA 10-5976

3678

ACTION OF THOROTRAST ON JENSEN SARCOMA OF THE WHITE RAT. C. H. Oberling and M. Guerin. Bull. assoc. franc etude cancer 22(7), 469-89(1933). (In French).

Intraperitoneal injections of 1 cc thorotrast in 1 cc serum given twice a week for 5 weeks to 20 rats with Jensen sarcomas and to 5 normal controls. Ten of 20 rats with tumors died from the tumors, in the other 10, tumors disappeared. All injected rats showed non-malignant "thorotrast granulomas" of peritoneum. Thorotrast appeared not to incite neoplasia. BA 10-6028

3679

TRANSMISSION OF THE VIRUS OF POLIOMYELITIS TO MICE. Maurice Brodie, Samuel A. Goldberg, and Phyllis Stanley. Science 81, 319-20(1935).

Mice rendered susceptible to infection with virus of poliomyelitis by repeated x raying. Pathology in infected mouse found mainly in brain and meninges. Infectious agent from brains transmitted from mouse to mouse, from mouse to monkey and back to same mouse. Virus filterable through Seitz filters and neutralized by antipoliomyelitic serums. BA 10-6255.

3680

IRRADIATION WITH α RAYS FROM RA EMANATION ON VARIOUS CELL TYPES CULTURED IN VITRO. L. Buccianto and A. Foa. Monit. zool. ital. 44(Suppl.), 58-60(1933). (In Italian).

Irradiation, with α rays by means of very fine needles of Ra emanation inserted with micro-manipulator of (1) nerve fibers of chick embryo in vitro caused fragmentation of the fibers, (2) hepatic epithelial cells caused destruction of severe injury and regression of cells in mitosis or the formation of binuclear cells. BA 10-6857

3681

THE ACTION OF X RAYS IN INFLAMMATIONS FROM PYOGENIC GERMS. Michele Proto. Morgagni 75(37), 1111-18(1933). (In Italian).

Suspension of *S. aureus* injected subcutaneously into 14 guinea pigs, (1) 6 irradiated from time abscess appeared; (2) 4 irradiated daily for 3-day period ending 24 hr before inoculation, (3) control. In (1) abscess was resorbed in 6-7 days from beginning of irradiation, 9-11 days from appearance of abscess. In (2) abscess formed on 2nd day, was resorbed in 4-5 days. In (3) suppurative process ran 15-20 days before recovery. BA 10-6336.

3682

ON SOME EFFECTS OF X-RAYS ON THE DEVELOPING CHICK EMBRYO. R. J. Gladstone and Hector A. Colwell. J. Anat. 68(1), 85-95(1933).

Single massive dose, 4 P. D., administered to 9-day embryos. Action appeared purely destructive; effects of unfiltered rays more pronounced than in screened series. Highly differentiated embryonic tissues and organs appeared more susceptible than those less highly developed. Cytological changes described. BA 10-6977

3683

ON THE BIOLOGICAL EFFECT OF VERY LARGE ROENTGEN RAY DOSES. H. Langendorff and M. Langendorff. Strahlentherapie 47(4), 723-6 (1933). (In German).

Axolotl eggs in meta-telophase of first segmentation division were irradiated in 5 series with doses ranging

from 30,000 r in 1/2 min, to 600,000 r in 10 min. Segmentation was abnormal in only one part of 1st series; none developed beyond blastula. Delayed, atypical segmentation occurred with 120,000 r in 2 min and all segmentation was inhibited with 300,000 r in 5 min. Immediate death followed 600,000 r. BA 10-8004

3684

EXPERIMENTAL ANIMAL STUDIES ON THE EFFECT OF DOSE FRACTIONATION ON LATE EFFECTS. G. Miescher. Acta Radiol. 16(1), 25-38(1935). (In German).

Problem of fractional x irradiation was studied using rabbit ears; action measured by secondary effect (condition 1-4 yr after exposure). Results show increase in tissue tolerance and dose fractionation bear a relation to one another that may be illustrated graphically. (Late effects studied: permanent baldness, atrophy, necrosis, and hyperkeratosis.) BA 10-8006

3685

THE EFFECT OF ROENTGEN RAYS ON THE BRAIN: EXPERIMENTAL INVESTIGATION BY MEANS OF THE CONDITIONED REFLEX METHOD. M. I. Nemenow. Radiology 23(1), 94-6(1934).

Dogs x irradiated at early age on cerebral hemispheres walked in circles, and growth, weight increase, and mental development were retarded for several months afterward. Death followed occurrence of epileptoid fits in some cases. BA 10-8007

3686

ON THE REDUCTION IN THE MULTIPLICATION OF A PROTOZOON (*BODO CAUDATUS*) CAUSED BY THE EXPOSURE TO GAMMA-RAY IRRADIATION WITH A STUDY OF THE SENSITIVE PERIOD OF THE LIFE OF THE CELL. II. A STUDY OF THE BEHAVIOR OF CULTURES OF *BODO CAUDATUS* UPON RELEASE FROM IRRADIATION WITH GAMMA RAYS AND OF THE EFFECT UPON THE GROWTH OF INTERRUPTED OR REPEATED IRRADIATIONS. M. Robertson. Brit. J. Radiol. 8, 502-27; 570-88(1935).

B. caudatus was not killed by large γ -ray doses, but constant irradiation changes were produced. These are described. Division rate and cell size were both affected. BA 10-8010.

3687

ATTEMPT AT SOLUTION OF THE QUESTION OF SKIN PERMEABILITY TO RADIUM EMANATION. W. Santholzer. Strahlentherapie 48(3), 519-34(1933). (In German).

Amount of emanation entering body during period of immersion in water saturated with Ra emanation measured in blood samples with ionization chamber. Maximum value reached after 30-60 min in bath; distinct decrease followed. Decrease in skin permeability unexplained. BA 10-8011.

3688

STUDY OF X-RAY EFFECT ON TAIL REGENERATION IN THE TADPOLE *PELOBATES FUSCUS*. I. STUDIES OF THE REGENERATE AFTER VARIOUS SINGLE DOSES. E. A. Scheremetjewa and V. V. Brunst. Z. wiss. Biol. Abt. D. Wilhelm Roux' Arch. Entwicklunsgemech. Organ. 130(3/4), 777-91(1933). (In German).

Regeneration of amputated tail inhibited by x-ray doses of 750-7500 r, both total and local. Variations in sensitivity exhibited by various tissues of stump. No x-ray stimulation of regeneration demonstrated. BA 10-8012.

3689

THE CONSTITUTIONAL EFFECTS OF X-RAYS AS DETERMINED BY BLOOD SERUM TESTS. S. Gilbert Scott and F. Hernaman-Johnson. Brit. J. Radiol. 8, 365-72(1935).

Shift in acidity of ortho-vanadic acid precipitation in blood serum described in cases of asthma, spondylitis, and cancer treated by x rays. BA 10-8013.

3690

THE RELATIONSHIP BETWEEN VASCULARITY AND THE REACTION TO RADIUM OF SQUAMOUS EPITHELIUM. M. G. Seelig, C. T. Eckert, and Z. K. Cooper. *Am. J. Cancer* **25**(3), 585-91(1935).

After compromising the circulation of the entire thickness of the rabbit's ear by making pedicled flap, there was no alteration in its radiosensitivity following the application of Ra to the flap, suggesting that radiosensitivity is an inherent quality of cell which varies in individuals of same species. BA 10-8014

3691

INFLUENCE OF X-RAY TREATMENT ON SOME PHASES OF POSTEMBRYONIC DEVELOPMENT OF RAT TESTIS. G. G. Shchegolev. *Ark. Anat., Gistologu i Embriologu*, **13**(2), 315-26 (Russ.), 404-14(Ger.); (1934)

Day old rats x rayed on posterior third of body and killed at 2-day intervals, littermates served as controls. Up to 7th or 8th day number of gonocytes in irradiated testes greater per cross section area than in controls, but length of tubules was greater in controls. Spermatogonia developed in controls after 7th day, while gonocytes disintegrated in exposed individuals. BA 10-8015

3692

EARTH γ RAYS AND COSMIC RAYS. Rolf M. Sievert. *Acta Radiol.* **16**(2), 155-68(1935). (In German).

Historical review of research on radiations present on surface of earth, especially cosmic radiation. Germination of *R. sativus* and development of *D. melanogaster* in vessel with iron wall 15 cm thick studied. Percent germination smaller within vessel than in controls, but development per individuum quicker. Similar results obtained with *Drosophila*. Amount of radiation within houses varies with Ra and Th content of building materials. Small doses do have biological effect. BA 10-8016

3693

THE ACTION OF SOFT X-RAYS ON CLADOCERA (*DAPHNIA MAGNA*). G. Snider and H. Kersten. *Physiol. Zool.* **8**(4), 530-8(1935).

Effect of x rays studied in regard to: lethal dose; differential action on anterior and posterior halves of animal, susceptibility of eggs in mother's brood-pouch, influence on growth and development of young, effect of heart shielding, effect of age and developmental stage at time of exposure. BA 10-8017

3694

STUDIES ON THE EFFECTS OF X-RAYS UPON THE DEVELOPMENT OF A POND SNAIL, *LYMNAEA (RADIX) JAPONICA* JAY, Shubel Sonehara. *J. Sci. Hiroshima Univ. Ser. B, Div. I* **2**(8/13), 151-9(1933).

Small x-ray doses caused no apparent ill effect on egg production in *L. japonica*, but reportedly accelerated rate of reproduction. Eggs of irradiated females were affected in development; toxic effect increased with increased exposure. Resistance gradually increased with age. BA 10-8018.

3695

RADIUM AND CANCER. A MONOGRAPH. H. S. Souttar. London, William Heinemann. (Medical Books), Ltd. 1934. 387p.

Included in this treatise on radiology is section dealing with biological effects of radiation, technique of radiation treatment, principles of radiotherapy, dosage measurement and therapy for specific conditions. BA 10-8019

3696

SUPPLEMENTARY NOTE ON THE BIOLOGICAL RESPONSE TO GAMMA RAYS OF RADIUM AS A FUNCTION OF THE INTENSITY OF RADIATION. F. G. Spear and L. G. Grimmett. *Brit. J. Radiol.* **8**, 231-4(1935).

Calculations of γ ray intensities used in a previous report were rechecked with more accurate instruments, relative values agree with published values, but actual ones are 24% higher. Optimum intensity for reducing mitosis in tissue cultures is in region of 77 lmc. BA 10-8020.

3697

THE EFFECTS OF X-RADIATION ON THE RECONSTITUTION OF *STENOSTOMUM TENUICAUDA* AND SOME OTHER WORMS. C. D. Van Cleave. *Biol. Bull.* **67**(2), 304-14 (1934).

Maximum dosages of approximately 30,000 r applied over 9 hrs, and of approximately 20,000 r applied in 36 min had no apparent effect on normal reconstitution in *Stenostomum*. Lethal effect of latter dosage indicated by disintegration of completely reconstituted worms and isolated unoperated worms 4 days postirradiation. *Pristina longisetia* unfavorably affected by apparently non-lethal dosage of 20,000 r over 4½ hr; *Dero limosa* specimens cytolized. BA 10-8023

3698

STUDY ON THE TISSUE RESPIRATION AND GLYCOLYSIS IN OBSTETRICS AND GYNECOLOGY. J. Toyoshima. *Japan. J. Obstetr. Gynecol.* **16**(6), 520-37(1933).

Observations on respiratory activity, aerobic glycolysis in human fetal organs and in normal and cancerous uterine tissue, effect of x rays thereon. BA 10-8130

3699

ON THE EFFECTS OF HARD X-RAY IRRADIATION ON THE GROWTH, CELL-DIVISION, AND MITOSIS OF FLAT BEAN ROOTS. T. Saito. *Japan J. Obstetr. Gynecol.* **17**(1), 69(1934).

Abstract of paper. BA 10-8215

3700

A COMPARATIVE STUDY OF THE EFFECTS OF X-RAY AND OPERATIVE CASTRATION ON THE MOVEMENT OF INTESTINES IN SITU. T. Tomita. *Japan J. Obstetr. Gynecol.* **17**(1), 76(1934).

Abstract of paper. BA 10-8215

3701

EFFECT OF ROENTGEN RAYS ON THE CENTRAL NERVOUS SYSTEM: RESULTS OF LARGE DOSES ON THE BRAINS OF ADULT DOGS. R. S. Lyman, P. S. Kupalov, and W. Scholz. *Arch. Neurol. Psychiat.* **29**(1), 56-87(1933).

In 4 dogs, heavy x-ray dosage on occipital part of head was followed by physiologic variations, determined by conditioned reflexes. Histologic examination showed diffusely scattered degenerative changes in precapillaries and capillaries of brain 6 wk postirradiation. Late effects as observed clinically and at autopsy described for one dog. BA 10-8306

3702

HISTOLOGICAL STUDIES OF THE LIVER, SPLEEN AND BONE MARROW IN RABBITS FOLLOWING THE INTRAVENOUS INJECTION OF THORIUM DIOXIDE. Ernst A. Pohle and Gorton Ritchie. *Am. J. Roentgenol. Radium Therapy* **31**(4), 512-9(1934).

Roentgenographic and histologic studies representing eighty rabbits observed for 493 days after injection are described. Thorotrast was seen in r-e cells of liver, spleen, bone marrow, and scattered in fine granules throughout liver cells. Degenerative changes in liver, spleen, and bone marrow are described. BA 10-8463

3703

ON THE FORMATION OF NEW STABLE RACES OF LOWER FUNGI BY MEANS OF X-RAYS. G. Nadson and G. Philippov. *Compt. rend.* **186**, 1566-8(1928). (In French).

3704

THE EFFECT OF RADON IMPLANTS ON THE CYTOLOGY OF THE LIVER OF THE ALBINO RAT. J. C. Thomas Rogers and George M. Higgins. *Radiology* 22(1), 93-8 (1934).

Gold-filtered radon seeds were implanted in livers of rats and the irradiated tissue was studied histologically at periods of 6 hr-60 days. Increase in number and size of local histocytes was noted at 12 hr, maximal activity at 48 hr. Amitosis occurred by fragmentation and budding. At 14 days large hyaline areas surrounded by radiating and diffuse connective tissue fibers characterized the lesion. BA 10-8518

3705

A QUANTITATIVE COMPARISON OF THE EFFECTS OF THE BETA RAYS OF RADIUM ON THE AGENT OF THE ROUS SARCOMA, ON THE BACTERIOPHAGE, ON TETANUS TOXIN AND ON CERTAIN BACTERIA, ANTIBODIES AND FERMENTS. S. L. Baker. *Brit. J. Exptl. Pathol.* 16(2), 148-55 (1935).

Study of relative susceptibility of the various bodies to β rays shows: Rous sarcoma falls into bacterial group, tetanus toxin is equally susceptible, antibodies much less susceptible, ferments still more resistant. BA 10-8696

3706

STUDIES OF SPLEEN CULTURES FROM IRRADIATED GUINEA PIGS. Karl Haszler and Alexander Farago. *Arch. Exptl. Zellforsch. Gewebezücht. (Explantation)* 17(3), 306-17 (1935). (In German).

Guinea pigs were irradiated (3600 r, 0.8 Cu, and 0.5 Al filters, 180 kv and 6 ma, 40 r/min) 3 days prior to spleen explantation. In cultures of exposed spleen, plasma liquefied sooner than in controls, lymphocytes were decreased in number. After several transplantations new lymphocytes developed from follicular cells. Fibroblasts, macrophages or giant cells were unaffected by irradiation. Observations on phagocytic activity of the various cells are included. BA 10-9454.

3707

MEDULLARY AND NON-MEDULLARY ERYTHROPOIESIS WITH SPECIAL REFERENCE TO THE PLASMA-CELL ERYTHROPHAGE OR RUSSELL BODY CELL, AND TO THE ERYTHROCATHERETIC (ERYTHROLYTIC) FUNCTION OF LYMPH NODES AND HEMAL NODES. Nicholas A. Michels. *Am. J. Anat.* 57(3), 439-501 (1935).

In lymph nodes undergoing fatty involution after x raying, plasma cells and Russell body cells are very numerous. Plasma cells result from combined effects of x-ray irritation and involution. Russell bodies represent phagocytised erythrocytes or erythrocyte fragments. BA 10-16959

3708

STUDIES ON LIMB REGENERATION IN X-RAYED AMBLYSTOMA LARVAE. Elmer G. Butler. *Anat. Record* 62(3), 295-307 (1935).

From study of x-ray effect on limb regeneration in larvae *A. punctatum*, the author concludes that prevention of regeneration is due to local action of radiation on cells in limb and is not result of general action of radiation on body of animal. BA 10-17062

3709

BIOLOGICAL EFFECTS OF ROENTGEN RAYS. THE DETERMINATION OF CRITICAL PERIODS IN MAMMALIAN DEVELOPMENT WITH X-RAYS. Thesle T. Job, George J. Leibold, and H. A. Fitzmaurice. *Am. J. Anat.* 56(1), 97-117 (1935).

Administration of specific doses of x rays on 9th day of gestation produced hydrocephalic condition in young rats, on 10th day, defective eye development, on 11th day, defective jaw development. Males in utero were

definitely more susceptible than female, with exception of jaw defect. Certain doses appeared to exert sex-differentiating influence when administered during 9th, 10th, and 11th days of gestation. BA 10-17072

3710

THE EFFECTS OF X-RADIATION ON LIMB DEVELOPMENT AND REGENERATION IN AMBLYSTOMA. William O. Puckett. *J. Morphol.* 59(1), 173-213 (1936).

Regeneration of early fore-limb bud of larvae was prevented by x radiation. Histologic studies show that failure to regenerate is due to destruction of undifferentiated mesenchymal cells which normally furnish materials for the process. Failure of limb stump to differentiate into components of new limb after irradiation is ascribed to effect on cellular differentiation rather than on cellular proliferation. BA 10-17079

3711

THE EFFECT OF RÖNTGEN RAYS ON RYE. L. P. Breslavetz, G. B. Medwedewa, and A. S. Afanassjewa. *Protoplasma* 23(4), 520-33 (1935). (In German).

Pronounced increase in grain yield was obtained by exposing seeds and seedlings to hard x rays, optimum yield with dose of 250 r (114 r/min, 30 cm, 2 min 12 sec). State of nuclei of root-tip cells paralleled grain yield. After 250 r, 2 nuclei of equal size, several of unequal size, and polyploid nuclei were noted. BA 10-7571

3712

THE EFFECT OF X-RAYS UPON THE CHROMOSOMES OF CIRCOTETIX VERRUCULATUS (ORTHOPTERA). Edwin R. Helwig. *J. Morphol.* 55(2), 265-311 (1933). BA 10-7602

3713

X-RAY TREATMENT OF OENOTHERA CHROMOSOMES. D. G. Catchside. *Genetica* 17(3/4), 313-41 (1935).

Untreated ovules of *O. blanda* were fertilized by x irradiated pollen. F₁: normal plants, no pollen sterility; normal plants with 50% pollen sterility, and variant plants with over 50% bad pollen. Quantitative relation appears to exist between x-ray dosage and percentage of variants, pollen steriles, and interchange heterozygotes. BA 10-7635

3714

X-RAY INDUCED MODIFICATIONS OF FLOWER COLOR IN THE PETUNIA. C. N. Moore and C. P. Haskins. *J. Heredity* 26(9), 349-55 (1935).

Petunias hybrid for factors inducing stippling and variegation in flower coloration were x rayed (Collidge tungsten-target tube, 85 kvp, 10 ma). Both somatic flower bud tissue and seeds were treated. Stippling and variegation were recessive, F₁ normals were plain colored. Both factors were recovered in small percentage of treated seed, recurrence occurred invariably in bud-rayed material. BA 10-7653.

3715

THE EFFECT OF X-RAYS ON SORGHUM POLLEN. F. N. Rangaswami, Ayyangar and V. Panduranga Rao. *Madras Agr. J.* 22(12), 448-9 (1934).

Sorghum pollen x irradiated for 5, 10, and 15 min (70 kv, 4 ma, 16 cm, no Al filter) showed 30.1, 29.2, and 28.9% germination in artificial media. Stigmas treated with rayed pollen gave 41.7% setting for 5 min exposure, 18% for others. One plant from irradiated seeds showed absence of top 8 leaf blades, showing only an ensheathed stem. BA 10-7661

3716

"SALTATIONI" IN HETEROSPORIUM GRACILE. Cesare Sibilia. *Boll. regia staz. patol. vegetale* 14(4), 447-74 (1934). (In Italian).

From monoconidial cultures of *H. gracile* on Iris, variations and saltations were obtained. With Ra, 2 saltations were secured, none with ultraviolet. Effect

of temperature and toxic concentrations of $ZnSO_4$ were also studied and found to produce saltations. BA 10-7668.

3717

EFFECT OF X-RAYS OF FUNGI Jagtar Singh. Proc. Indian Sci. Congr. 20, 305(1933).

Abstract of paper. BA 10-7846

3718

SUMMARY OF SMITHSONIAN RESEARCHES ON RADIATION AND PLANT GROWTH. F. S. Brackett. Proc. Pacific Sci., Congr., Pacific Sci. Assoc., 5th Congr., Canada, 1933, 3, 1721-7(1934). BA 10-7887

3719

MODIFICATION OF LEAF STRUCTURE BY X-RAYS. Yakichi Noguchi. Plant Physiol. 10(4), 753-62(1935).

Irregular coloring of blades was frequently induced by x irradiation in *Helianthus annuus*. X-ray injuries seem localized and confined to directly-treated region. BA 10-7890

3720

THE TELEUTOSPORES OF P. GRAMINIS AND THEIR NON-RESPONSIVENESS TO THE ACTION OF X-RAYS. L. Pasinetti. Rev. pathol. vegetale 21(5/6), 137-43 (1931). (In Italian).

Moist and dry samples of teleutospores were exposed to rays of 3 ma, 100 kw, at 25 cm focal dist., no filter at 23°C. Treated and untreated material showed no change (in hanging drop preparations). BA 10-7891

3721

A SUMMARY OF MEDICAL PHYSICS. Andre Strohl. Paris, Masson et Cie. 1935. 723p. (In French).

Section on x rays and x-ray therapy is included. BA 10-7929

3722

EXPERIMENTAL RESEARCH ON THE ACTION OF X-RAYS UPON BONE MARROW. Annibale Casati. Radiobiologia 1(4), 91-5(1934). (In Italian).

Rabbits were x rayed twice at 15 day intervals (8H or 400 r; 140 kw, 2.5 ma, 40 cm, 0.5 mm Zn and 2 mm Al filter). One group was injected with trypan blue after exposure, one before. Histologic examination of both groups showed transitional cells to be radiosensitive. These cells did not take vital stain, hence are considered not to be R-E cells. Reticular cells were normal, some presenting trypan blue granules deposited on fibrils. BA 10-7985

3723

MECHANISM OF THE BIOLOGICAL ACTION OF IONIZED AIR. A. L. Chizhevskii. Trudy Tsentral'noi Nauchno-Issledovatel'skoi Laboratorii Ionifikatsii (Central Lab. Sci. Res. Ionization) 1, 167-218(1933). (In Russian).

Study of action of intensely ionized air on healthy and sick rats, guinea pigs, chimpanzees, rabbits, pigs, cattle, sheep, chickens, bees; and on seeds and bacteria is reported. Stimulating and therapeutic effect was observed. BA 10-7987

3724

IONIZATION OF GAS AND ATMOSPHERIC AIR. A. L. Chizhevskii. Trudy Tsentral'noi Nauchno-Issledovatel'skoi Laboratorii Ionifikatsii Central Lab. Sci. Res. Ionization, 1, 1-38(1933). (In Russian).

Air is considered to be normally ionized to a certain degree; role of radiation from radioactive materials in earth in maintaining this ionization is discussed. BA 10-7987

3725

THE INHIBITION OF REGENERATION BY X-RAYS IN URODELE, *TRITURUS VIRIDESCENS*. Pressley L. Crumley. Am. Naturalist 69, 9194(1935).

Average tail regeneration of adult *Triturus* after 1704 r (given in 20 min) was less than 1 mm in 105 days, over 9 mm in non-irradiated controls in same time. Bodies were lead-shielded. BA 10-7990

3726

VARIATIONS IN SUSCEPTIBILITY TO X-RAYS OF *MELANOPLUS DIFFERENTIALIS* EGGS DURING DEVELOPMENT. Titus C. Evans. Physiol. Zool. 8(4), 521-9(1935).

Arrest of development and lessening of O_2 consumption rate were noted in irradiated eggs. The observed x-ray resistance or recovery of diapause egg was apparently associated with its inactivity during and after irradiation. BA 10-7991

3727

TISSUE CULTURE. I. THE ADVANTAGES AND LIMITATIONS AS A RESEARCH METHOD. II. ITS APPLICATION TO RADIOLOGICAL RESEARCH. III. ITS APPLICATION TO RADIOLOGICAL RESEARCH (CON.) Honor B. Fell. Brit. J. Radiol. 8, 27-32; 68-87, 280-98(1935).

Direct and indirect effects of x and γ rays on growing cells are described. In vitro and in vivo experiments are compared. Effects observed included alterations in: mitotic rate, cell migration, metabolic processes. Indirect effects were studied by irradiating embryos. BA 10-7993.

3728

LEUCOCYTIC VARIATIONS IN RADIUM WORKERS. I AND II. D. R. Goodfellow. Brit. J. Radiol. 8, 669-84; 752-81(1935).

Systematic blood counts carried out at intervals of 2-4 wk on 32 workers in Ra and x rays for 6 month-3 yr indicated that the only sign of early overexposure common to all workers was leucopenia due to reduced circulating neutrophils. Individuals' sensitivities vary. Eosinophilia and early or abnormal leukocytes were seen in some cases. BA 10-7994

3729

A SUMMARY OF CHANGES NOTED IN THE ALLANTOIC MEMBRANE OF THE CHICK IN 500 EXPERIMENTS. Elnor S. Hunt. J. Proc. Roy. Soc. N. S. Wales 68(2), 184-91(1934-5).

Allantoic membrane of embryo chick prepared according to method of Moppett was exposed for 2 hr-6 days to radiation from 3 mg Ra needle. Abnormalities are described. Mere exposure to a blank needle holder (without Ra) appeared to have a "sensitizing" effect that could not be attributed to infection. BA 10-7999

3730

STRUCTURE OF THE INCOMPATIBILITY GENE. IV. TYPES OF MUTATIONS IN *PRUNUS AVIUM* L. D. Lewis and L. K. Crowe. Heredity 8, 357-363(1954).

Spontaneous and x-ray-induced mutations of the S complex in *P. avium* have been found to be of three types: 1) permanent loss of the component governing pollen activity, 2) revertible mutation affecting the component for pollen activity, and 3) a permanent loss of the part determining stylar activity.

3731

CHROMOSOME RING IN X-RAYED RICE. K. Ramiah, N. Parthasarathi, and S. Ramanujam. Proc. Assoc. Econ. Biol. 2, 1-4(1934).

Dry, soaked (24 hr), and germinating seed of 3 pure lines were exposed 1, 2, and 3 hr each. Wet and germinated seed were badly affected, in dry seed, survivals decreased with increased dose. Survivals showed changes in stature, grain size, leaf size, chlorophyll differences and varying amount of sterility. An observed ring of 4 chromosomes is believed due to segmental interchange of 2 non-homologous chromosomes and may be cause of pollen sterility. BA 10-10159

3732

CYTOLOGICAL INVESTIGATION OF THE PROGENY OF

THE VETCH (*V. SATIVA*) SUBJECTED TO X-RAY TREATMENT. P. F. Savchenko. Trudy Priklad Botan, Genet i Selektan (Bull. Appl. Bot., Genet. and Plant-Breed.) Ser. 2 8, 59-79(Russ.); 183-9(Eng. summ.), (1935).

Frequency of aberrants was 3.4% in F_1 of *V. sativa* x rayed in germinating seeds. Aberrants include: heterozygous translocations, homozygous translocations; shifts in locus of spindle fibre attachment, trisomics, chromosomal fragments present in some cells of an individual, not in others: karyologically normal, phenotypically aberrant individuals. BA 10-10162

3733
RADIATION AND LIFE IN THE PLANT WORLD. Vincenzo Rivera. Nuovo giorn. bot. ital. 39(1), 1-18(1932). (In Italian).

Author presents a generalization on effect of whole range of electromagnetic waves, from cosmic rays to radio wave lengths. Wave lengths longer than those of visible light believed to stimulate cell division in meristem of normal and pathological plant tissues, those shorter than visible light supposedly depress cell multiplication. BA 10-10403

3734
BIOLOGICAL EFFECTIVENESS OF ALPHA PARTICLES AS A FUNCTION OF ION CONCENTRATION PRODUCED IN THEIR PATHS. R. E. Zirkle. Am. J. Cancer 23(3), 558-67(1935).

Irradiation of *Pteris longifolia* spores with α particles was followed by inhibition of cell division and chlorophyll development and cracking of spore wall; the effects being attributed to irradiation of nucleus. Biologic effectiveness was found empirically to vary approximately as 2.5 power of the ion concentration in the path of α particle. (Spores were arranged so that their nuclei were traversed by one of seven segments of the α particle path and biological effectiveness of the various path segments were compared). BA 10-10406

3735
THE EFFECT OF BITEMPORAL X-RAY IRRADIATION ON ALIMENTARY HYPERGLYCEMIA. Bruno Bonomini and Mario Testolin. Atti. soc. med.-chir. Padova 12(3), 132-5(1934). (In Italian).

Blood sugar curves after ingestion of glucose were determined before and after 2 bitemporal irradiations, made a day apart, in group of normal, one Basedowian, and one hyperthyroid subject. Effects of irradiation were irregular in normal subjects, in those with decreased tolerance for carbohydrate, exposure invariably lowered the glucose tolerance curve. BA 10-10639.

3736
INFLUENCE OF X-RAYS IRRADIATION UPON UROPOIETIC SYSTEM. I. INFLUENCE OF ROENTGEN IRRADIATION UPON RABBIT KIDNEY. S. Takita. Japan. J. Obstet. and Gynecol. 16(3), 184-207(1933).

X irradiation of rabbit kidney was followed by swelling, congestion of glomerular loops with blood, acceleration of renal discharge of intravenously injected dye. No marked histologic or functional change was observed following dosage up to 2.8 S. E. D.; degeneration, and atrophy followed heavier doses. BA 10-10892

3737
INFLUENCE OF X-RAY IRRADIATION UPON UROPOIETIC SYSTEM. II. INFLUENCE OF ROENTGEN IRRADIATION UPON EXPERIMENTAL NEPHRITIS. S. Takita. Japan. J. Obstet. and Gynecol. 16(3), 207-24(1933).

In experimental cantharidin and uranium nephritis, x irradiation hastened and intensified recessive degeneration in tubular system, congestion of blood vessels, albuminuria and decrease in quantity of urine. BA 10-10892.

3738
INFLUENCE OF X-RAY IRRADIATION UPON UROPOIETIC SYSTEM. III. EXPERIMENTAL STUDY ON THE RADIOSENSIBILITY OF KIDNEY. S. Takita. Japan. J. Obstet. and Gynecol. 16(4), 365-77(1933).

Subcutaneous injection of various heavy metals increased sensitivity of kidney immediately following irradiation in ascending order: Ag, Cu, I ion, Bi, and Hg. Uroselectan and abrodil did not increase radiosensitivity, KI did. BA 10-10892

3739
EFFECTS OF X-RAYS ON THE BIOLOGIC PRODUCTION OF HEMOLYSINS. A. Gualdi. Boll. ed atti accad. med. Roma 60(7/8), 254-60(1934). (In Italian).

Irradiation of spleen region with weak ($1/3$ E. D.) x-ray dose produced in 2 rabbits hemolytic titers of $1/1500$ and $1/1400$, strong (E. D.) dose produced in 2 other rabbits titers of $1/2000$ and $1/2200$; in 4 rabbits injected with previously irradiated antiship antigen, titers of $1/2300$ - $1/2800$ developed. BA 10-11149

3740
VOLUME-INCREASE OF BACTERIA FROM X-RAY IRRADIATION. Thomas J. Dietz. Radiology 24(1), 31-8 (1935).

Bacillus coli suspensions were irradiated with sub-lethal doses of x rays and growth was estimated by means of turbidity measurements with spectrophotometer. Increase in volume of irradiated in comparison with normal bacteria was noted and accredited to increase in active protoplasmic volume stimulated by irradiation and to increased water absorption through altered cell membrane. BA 10-11409

3741
PULMO-RADIOGRAPHY AND ITS END RESULTS. I. ALVEOLAR (PULMOALVEOLOGRAPHY), AND 2. LYMPHATIC (PULMO-LYMPHOGRAPHY). S. Kadrnka and R. Junet. Acta Radiol. 16(3), 361-78(1935). (In French).

Radiologic and histologic examinations of rabbit lungs given colloidal thorium intravenously in fractionated doses and varying total amounts were made at various intervals up to 3 yr after injection. Spleen, liver, and bone marrow were aided by lungs in removing excessive doses. Thorium granules always lie within cells. BA 10-11908

3742
AN EXPERIMENTAL STUDY OF OVARIAN IRRADIATION AND TRANSPLANTATION IN THE RAT. James Mandel. Anat. Record 61(3), 295-309(1935).

Irradiating ovaries of the immature albino rat 7-10 days old caused precocious vaginal opening and estrual changes at about 22 days. Many large ovarian follicles; normal genitalia 6 wks were observed after (a) 540 r dose to ovarian region (immature rats), mostly proliferative cords and interstitial tissue, few large follicles after (b) 830-1240 r. Ovaries of (a) transplanted to immature female castrates hastened sexual maturity. BA 10-11944.

3743
STUDY OF EFFECT OF X-IRRADIATION ON THE LIVERWORT *SPHAEROCARPUS* BY MEANS OF POLLEN ANALYSIS. Edgar Knapp. Z. induk. Abstamm.-u. Vererbh. 70(3/4), 532(1935). (In German). BA 10-12639

3744
RESULTS OF AN ATTEMPT TO OBTAIN ARTIFICIAL MUTATIONS IN SOLANACEAE. M. F. Ternovsky. Genetica 17(5/6), 499-546(1935). (In German).

Differential response of flower buds of *Solanum annuum* and *Nicotiana tabacum* followed x irradiation. Flower buds of pepper fell off more rapidly following treatment than did those of tobacco. No visible mutations

were detected in pepper; young flower buds were more sensitive than old. In tobacco, mutants were detected as early as seedling stage; were characterized by such abnormalities as irregular leaf shape and excessive branching. BA 10-12656

3745

ARTIFICIAL MUTATIONS IN THE SILK-WORM (BOMBYX MORI L.) EXPERIMENTAL PRODUCTION OF SEX-LINKED LETHALS BY GAMMA RADIATION OF RADIUM. B. L. Astaurov. *Genetica* 17(5/6), 409-60(1935).

Ten sex-linked lethals and 1 dominant autosomal mutation are reported as result of treating pupae with γ rays of Ra. Dominant mutation produces yellow color in hemolymph; 6 of lethals cause death in early egg development, 2 in larval stage. Frequency of occurrence of spontaneous sex-linked lethals in this species estimated at less than 0.6%; 2.5% for Ra-treated material. BA 10-12664

3746

A NEW PHENOTYPIC EFFECT OF THE Y-CHROMOSOME IN DROSOPHILA MELANOGASTER. N. P. Dubinin and M. A. Heptner. *J. Genetics* 30(3), 423-46(1935).

Dominant mutation, A, produced by x rays causes darkening of eye color to brown, and is found to be located in chromosome II. BA 10-12672

3747

FURTHER STUDIES ON ARTIFICIALLY PRODUCED CROSSING-OVER IN D. MELANOGASTER. G. Frizen. *Doklady Akad. Nauk SSSR* 3(3), 179-82(1934). (Russian and German).

Crossing over, mostly near spindle fibre attachment, between homologous chromosome was induced in males by x raying pupae. Resulting crossover chromosomes were viable in homozygous condition; inversions in 2nd chromosome (suppress crossing over in females) have little or no effect on induced crossing over in males. Possible explanation for normal absence of crossing over in males is suggested. BA 10-12676

3748

EFFECTS OF X-RADIATION ON PRODUCTION OF MOSAIC MALES AND ON SEX RATIO IN HABROBRACON. Raymond J. Greb. *Am. Naturalist* 67, 88-93(1933).

Dosage of 2000 r was administered to 2/3 (397) of females heterozygous for 3 genes affecting eye color; 1/3 kept as controls. X rays increased mosaicism based on egg binuclearity, and lowered percentage of females in bisexual fraternities. BA 10-12680

3749

MUTATIONS PRODUCED BY X-RAYS IN THE PARASITIC WASP P. PUPARUM. A. P. Gul'. *Doklady Akad. Nauk SSSR* 4(1/2), 95-102(1934). (In Russian and English).

X irradiation (3500-4500 r) of larvae caused almost complete sterility. Controls averaged 66 sons, treated adults 33, treated pupae only 14.4. High death rate was noted among larvae, pupae and young adults of treated mothers. BA 10-12682

3750

THE PRODUCTION OF STERILITY IN DROSOPHILA MELANOGASTER BY X-RAY TREATMENT. W. G. Moore. *Am. Naturalist* 68, 508-15(1934).

Following x irradiation, little increase in sterility was noted in adults; sterility of 72-hr females greatly increases; in 36-hr larvae, 33% and 55.8% sterility were produced in females and males, respectively. Sterility is attributed to mutation and chromosome abnormality. BA 10-12701

3751

THE PRODUCTION OF MUTATIONS IN DROSOPHILA MELANOGASTER BY IRRADIATION WITH ALPHA-RAYS. Frances D. Ward. *Genetics* 20(3), 230-49(1935).

Reproductive cells at amicropolar end of developing egg were exposed to α or x rays; somatic cells at opposite end were shielded. Treatment increases mutation rate by factor of 4600. α rays were less effective than x rays. Sterility ranged from 20% to 59% with doses of 3.8-10 millicurie seconds and increased rapidly with dosage. (Control sterility rate was 3%.) BA 10-12718

3752

CARCINOGENIC ACTION OF THORIUM DIOXIDE IN THE WHITE RAT. G. Roussy, Ch. Oberling, and M. Guerin. *Bull. acad. med. (Paris)* 112, 809-16(1934). (In French).

Of 15 rats which lived 1-1½ yr after subcutaneous injection with thorium dioxide, 8 died of subcutaneous or intra-abdominal, serially transmissible, sarcoma. BA 10-13447

3753

THE ROLE OF HISTOLOGICAL EXAMINATION IN THE THERAPEUTIC TREATMENT OF CANCERS WITH RADIUM. De Nabias. No. 4 of *Huit Conférences De Cancerologie*, Paris, Masson et Cie. 1931. 229p. BA 10-13557.

3754

THE RADIOSENSIBILITY OF TISSUES AND ITS RELATION TO THE TREATMENT OF CANCERS. Simone La Borde. No. 5 *Huit Conférences de Cancerologie*, Paris, Masson et Cie. 1931. 229p

Author considers role of: type of tissue, radiation dose, mitotic activity, dose fractionation, condition of circulation in the irradiated tissue, indirect effects of radiation in response of tissues to therapeutic irradiation. BA 10-13557

3755

PATHOGENESIS, PROPHYLAXIS AND THERAPY OF ROENTGEN SICKNESS. Anna Jugenburg, L. H. Peretz, and R. S. Mostowa. *Fortschr. Gebiete Rontgenstrahlen* 51(3), 280-90(1935). (In German).

Dogs with fistulae in left half of transverse colon exhibited marked change in colonic flora after x raying; loss in floral ratio, particularly decrease in percentage of coli bacilli and increase in other microbes. Patients given x-ray therapy were fed B. coli milk to test theory that depleted B. coli and upset floral ratio cause x-ray sickness. Return of correct bacterial ratio was accompanied by recovery from x-ray sickness. BA 10-13594

3756

THE ACTION OF X-RAYS ON CERTAIN BACTERIA. A. T. Pugsley, T. H. Oddie, and C. E. Eddy. *Proc. Roy. Soc. (London)* B118, 276-98(1935).

X rays (0.25-2 A) kill Sarcina lutea, B. coli, and Phytomonas medicaginis var. phaseolicola (in order of increasing sensitivity). With equal doses in r-units, higher killing rate with longer wave lengths was observed. Bacteria irradiated in colonies yield survivor-curve differing from that for single bacteria; results are consistent with one-quantum-hit-to-kill mechanism, with added effects due to absorption and scattering of x rays in colony. Media was also altered, suggesting it may become toxic. BA 10-13964

3757

THE EFFECT OF CERTAIN X-RAYS ON THE ELECTROPHORETIC MOBILITY OF ESCHERICHIA COLI. Margaret E. Smith, Martin W. Lisse, and Wheeler P. Davey. *J. Bacteriol.* 31(3), 275-86(1936).

Extreme doses (greater than lethal dose) is required to cause decreased motility. A wave length effect is indicated. BA 10-13972

3758

LEAF AND STEM STRUCTURE OF SOME X-RAYED

PLANTS. Evelyn Wolcott. Univ. Colo. Studies 23(3), 223-33(1936).

Seedlings of *Hordeum*, *Brodiaea*, *Eurphobia*, *Ricinus*, *Helichrysum*, *Mesembryanthemum*, *Nemophila*, *Raphanus*, *Silene*, and *Zinnia* were x rayed with doses of 1000 to 3500 r. Leaves of irradiated plants were generally small, deformed, thick and rough in texture and of variegated occasionally albescent, coloring. Stems and petioles were often ridged and twisted, occasionally fasciated. Abnormal colorless areas developed in parenchyma of mesophyll. Further alterations are described, including decrease in vessel size in stems. BA 10-14393.

3759

ON THE EXPERIMENTAL SEXUAL INVERSION OF THE OVARIAN ANLAGE IN THE CHICK EMBRYO. Vera Dantchadoff. Compt. rend. soc. biol. 120, 597-9(1935). (In French).

Inversion of the morphogenetic process in ovarian anlage is obtained by introduction of male hormone after partial sterilization by x rays. Partial inversion of male to female occurs by irradiation of egg at hatching. After irradiation, use of folliculin causes definite inversion of male chick embryo. BA 10-14549

3760

MORPHOGENETIC PROCESSES IN SEXUAL INVERSION IN THE OVARY. Vera Dantchakoff. Compt. rend. soc. biol. 120, 599-601(1935). (In French).

In female embryo, x-ray atrophy of ovarian anlage allows male factors to predominate. BA 10-14549.

3761

EFFECT OF MIXED AND MONOCHROMATIC X-IRRADIATION ON TISSUE GROWTH IN VITRO. II. TISSUE CULTURES OF EMBRYONIC CHICK HEARTS IN AMNIOTIC FLUID. V. Wendrowsky and H. Zapolska. Arch. exptl. Zellforsch. Gewebezucht. (Explantation) 18(1), 17-41(1935). (In German).

Cultures of 8-10 day-old chick hearts were irradiated with: (1) Ag and Mo anticathodes for mixed x rays or (2) same anticathodes plus Pd and Zr filters for monochromatic x rays. From data author concludes x rays hinder development of mesenchymal cells into more differentiated cell types. BA 10-14576.

3762

NEW STUDIES OF THE NUCLEUS IN THE GENUS "NARCISSUS." Abilio Fernandes. Bol. soc. Broteriana 9, 3-198(1934). (In French).

Study of several species and hybrids of *Narcissus* has shown existence of 2 basic chromosome numbers, 7 and 10, with polyploid series from diploid to hexaploid. X and γ irradiation produced aneuploids, γ rays and cosmic rays in nature are believed to be responsible for existence of aneuploid populations. BA 10-15227.

3763

REGULARITIES IN CHROMOSOME TRANSFORMATIONS INDUCED BY X-RAYS. G. A. Levitskii and M. A. Sizova. Doklady Akad. Nauk SSSR 4(1/2), 84-7(1934). (Russian and English).

X ray induced chromosome transformations (116) are classified into 6 types. Fragmentation is more frequent in certain regions of certain chromosomes, long arms of A and D being most common donors; C donates rarely. Breakage frequency varies along length of chromosome arm; fragments unite with end of any chromosome which happens to be closest. BA 10-15258.

3764

THE SENSITIVE-VOLUME OF THE MEIOTIC CHROMONEMATA OF GASTERIA AS DETERMINED BY IRRADIATION WITH X-RAYS. A. G. Marshak. Proc. Natl. Acad. Sci. U. S. 21(4), 227-32(1935).

Flower spikes of *Gasteria* were exposed to various doses of x rays and anthers of each bud examined when cells reached first meiotic anaphase. Three types of chromosome abnormalities were observed, all effects being in chromonema of chromatid without involving matrix. Rectilinear relation between dosage and frequency of abnormalities was found. Results are interpreted in terms of "sensitive volume" of chromonemata. BA 10-15262.

3765

THE BEHAVIOR OF MEIOTIC CHROMOSOMES AFTER X-IRRADIATION. K. Mather. Hereditas 19(3), 303-22 (1934).

Chief x-ray effects on meiotic behavior of chromosomes in irradiated plants of *V. faba* and *Tradescantia braotecta*: extensive chromosome fragmentation before metaphase in *Tradescantia*, at late metaphase and anaphase in *Vicia*; changes in chromosome structure; increase in frequency of chiasma formation in nuclei at meiosis some time after treatment. BA 10-15264.

3766

THE LIFE-HISTORY OF THE NUCLEUS AND NUCLEOLUS AND THE EFFECT OF β RADIATION UPON THEM. J. C. Mottram. J. Roy Microscop. Soc. 52(4), 362-9 (1932).

β radiation inhibits evolution of nucleus at two specific stages, apparently thus stopping mitotic process. BA 10-15268.

3767

HISTOLOGIC BEHAVIOR OF CONNECTIVE ELEMENTS IN IRRADIATED CANCER OF THE UTERINE CERVIX. Luigi Puccioni. Ann. ostet. e ginecol. 55(10), 1647-99 (1933). (In Italian).

Successive biopsies on 9 cases of Ra-treated uterine cervix cancer showed that first changes occur about 96 hr after therapy, and consist of degeneration of neoplastic tissue, proliferation of connective tissue, reaching height about 12-15 days after Ra treatment in dosage of 2880-3600 mg/hr. Further changes are also described. BA 10-16159.

3768

MICROINCINERATION STUDIES: II. LOCALIZATION OF ASH-YIELDING SUBSTANCES DURING MEIOSIS AND ITS POSSIBLE SIGNIFICANCE IN X-IRRADIATION PHENOMENA. Fred M. Uber and T. H. Goodspeed. Botan. Gaz. 97(2), 416-20(1935).

Pollen mother cells of *Lilium longiflorum* and *Kniphofia* were incinerated. Chromosomes were delineated distinctly by their ash from prophase through anaphase. Regarding x-ray effects, this distribution of heavy elements may account for greater sensitivity of nuclei over cytoplasm and may give rise to wave-length identification method. It may also affect size of "sensitive volume." BA 10-15286.

3769

STUDY OF THE GROWTH-INHIBITING EFFECT OF X-RAYS. Fritz Gessner. Biol. Zentr. 34(11/12), 567-87 (1934). (In German).

Power of and time of germination of *Helianthus annuus* seeds was unaffected by x irradiation for 2 hr (7.5 ma, 60 kv, 13 cm) but seedlings of these seeds were stunted. Power of extensibility of cell walls was lowered by x rays; change in extensibility believed cause of growth inhibition rather than an effect. BA 10-15470

3770

EFFECT OF RADIATION, LACTATE AND IODOACETIC ACID ON TUMORS. W. R. Franks and M. M. Shaw. Am. J. Cancer 22(3), 601-5(1934).

Authors studied 445 mice inoculated with 2 mouse tumors and treated with x ray, Ra, Na lactate, and iodoacetic acid in various combinations with and without

asphyxia. Regressions were obtained in 29 mice. Variables are evaluated in terms of experimental results. BA 10-16119

3771
PRELIMINARY NOTE OF MORPHOLOGICAL VARIATIONS OCCURRING IN X-RAYED STOCK IN THE ATTACINE MOTH, *CALLOSAMIA PROMETHIA* DRU. C. P. Haskins. J. N. Y. Entomol. Soc. 42(2), 145-54(1934).

Thirty cocoons were exposed at 50 cm to 300-9600 r from Coolidge tube, no filter. Lethal limit was reached only with larvae in 2nd instar receiving 64-min exposure. Effects: sterile females from pupae rayed before emergence; abnormal development of larval tubercles, attempt of larvae to pupate naked, tendency to microcephaly with reduction of antennae. BA 10-17751

3772
FUTHER STUDIES OF THE EFFECT OF RADIUM UPON BACTERIA. R. R. Spencer. U.S. Public Health Repts. 50(47), 1642-55(1935).

By irradiating bacteria over many generations, profound morphological and cultural changes were induced in 6 out of 20 tests, while continuous irradiation of same culture for 30 days produced no genetic changes. Tests in contamination-proof box yielded no changes. Author concludes irradiation of bacteria does not induce genetic changes as frequently as does irradiation of certain higher forms. BA 10-17731

3773
THE EFFECT OF LIGHT UPON THE SENSITIVITY OF WHEAT SEEDLINGS TO X-RAYS. Leon C. Chesley. J. Cellular Comp. Physiol. 6(1), 69-84(1935).

Wheat seedlings were sprouted in dark and in light from 75 watt bulb at 50 cm and 18 hr after germination were exposed to graded doses of x rays. Light-sprouted seedlings were found less sensitive to x rays, especially small doses. One hr exposure to light immediately before x ray treatment gave optimal protective effect. X ray destruction of auxin is suggested. BA 10-18024.

3774
BIOLOGICAL EFFECTS OF RADIATION. MECHANISM AND MEASUREMENT OF RADIATION, APPLICATIONS IN BIOLOGY, PHOTOCHEMICAL REACTIONS, EFFECTS OF RADIANT ENERGY ON ORGANISMS AND ORGANIC PRODUCTS. Benjamin M. Duggar, Ed. New York, McGraw-Hill Book Co. 1936. Vol. I, 676p.; Vol II 1343p. BA 10-18025

3775
THE INHIBITION OF GROWTH IN POLLEN AND MOLD UNDER X-RAY AND CATHODE RAY EXPOSURE C. P. Haskins and C. N. Moore. Radiology 23(6), 710-19(1934).

The amount of incident energy required for hard x rays to produce given effect is greater than that for soft x rays by factor of 2.1 for mold and 6.0 for pollen. Disparity between cathode rays and hard x rays is considered to be insignificant. BA 10-18027.

3776
STUDIES IN CONSTITUTION AND LIGHT BIOLOGY IN WOMEN, WITH PARTICULAR REGARD TO THE CONDITION IN PREGNANCY. Friedrich Ellinger. Arch Gynakol. 156(3), 471-96(1934). (In German).

Parallelism in reaction of skin to ultraviolet and to x rays is stressed and also its use as means of preventing injury by exposure to these rays. Influence of factors such as age, sex, complexion, and skin vascularity is considered. Studies were carried out in a women's clinic. BA 10-18171

3777
THE PROTECTION OF STAFF AND PATIENTS IN RADIOOTHERAPY. I. THE PROTECTION OF RADIOLOGY STAFFS FROM THE EFFECTS OF RADIUM AND X-RAYS. II. THE PROTECTION OF PATIENTS UNDERGOING DEEP THERAPY TREATMENT. Geoffrey Bourne and A. H.

Merritt. J. Cancer Research Comm Univ. Sydney 6(1), 39-55(1934)

Regular blood counts at intervals of not more than 1 month is suggested as best protection against effects of x and γ radiation for radiologists. Blood counts of cancer patients undergoing deep x-ray therapy showed generally a fall in red blood cell count and inconsistent reaction in white blood cell count. BA 10-18189.

3778
ON THE INFLUENCE OF TEMPERATURE ON THE BIOLOGICAL EFFECT OF ROENTGEN RAYS E. Dubowy. Fortschr. Gebiete Rontgenstrahlen 52(2), 183-5(1935). (In German).

D. melanogaster larvae were irradiated at 25.5° and 4° with 410 and 540 r. More than 30 experiments, each with 40-70 larvae, showed temperature difference had no marked effect on biological action of x rays BA 10-18191.

3779
EFFECT OF X-RAYS ON REGENERATION OF CHELIPEDS OF *ATYA BISULCATA*. Charles Howard Edmondson. Bernice P. Bishop Mus. Occas. Papers 11(16), 1-15 (1936).

Regeneration of *Atya* chelipeds was retarded during irradiation, normal rate was recovered after exposure. Irradiation effects decreased as period of treatment was extended. Retardation was less marked on regeneration that was well started. Continuous doses of sufficient strength had greater effect than same dosage spread over long period of time. Irradiation of posterior half of body did not retard regeneration. Destruction of mesoderm forming cells by x rays is suggested as mechanism of observed effect. BA 10-18192.

3780
DO COSMIC RAYS HAVE BIOLOGICAL EFFECTS? R. B. Engelstad. Strahlentherapie 51(4), 672-5(1934). (In German).

Comparison of 108 mice during first 6 mo of life, in a deep mine where ionization was 4.63 ions/cc/sec, with 68 controls at earth's surface where ionization was 8.52 ions/cc/sec showed 8.9% greater body wt in first group. No difference in appearance or rate of breeding was observed. BA 10-18193

3781
FACTORS IN THE RADIOSENSITIVITY OF TISSUES J. Firket. Bull. acad. roy. med. Belg. 15(2), 66-98 (1935). (In French).

Author discusses physical and biological factors responsible for tissue radiosensitivity and calls attention to metabolic exchanges which might have a bearing on radiosensitivity. Studies relative to effects of: respiratory and glycolytic intensity, ischemia, and the metabolic stimulant, cyclopentylidinitrophenol on radiosensitivity are reported. Observations were made on pea seeds, and young and embryonic guinea pig thymus. BA 10-18195

3782
THE BIOLOGICAL ACTION OF X-RAYS ON THE GRAVID UTERUS. A. Galli. Boll. soc. Eustachina 31(1/2), 33-6 (1933). (In Italian).

Abortion or resorption of the fetus in rabbits treated with x rays suggested the existence of a chemical action through production of a roentgencytolysin. Injections of serum obtained after irradiation caused termination of pregnancy. Microscopic studies indicated serum acted specifically to inhibit cell mitoses. BA 10-18196

3783
EFFECT OF ROENTGEN RAYS UPON HEARING IN DOGS Edward Girden J. Comp. Physiol. Psychol. 20(2), 263-90(1935).

Auditory acuity of dogs was determined by conditioned reflex method. X irradiation (80-100 kv, 5 ma) produced

transient gain in acuity of about 5.5 decibels which lasted 2 to 5 wks. Gradual accumulation of large doses (up to 11,100 r) did not apparently impair hearings although skin burns and loss of hair were produced. BA 10-18197.

3784
RADIOBIOLOGICAL STUDIES ON THE BASIS OF THERAPY WITH HIGH ENERGY CATHODE RAYS. R. Glocker, G. A. Kugler, and H. Langendorff. *Strahlentherapie* 51(1), 129-38(1934) (In German)

Cathode rays generated at 1.7 million volts have range of 1 cm in water, give maximum lethal effect on *Drosophila* eggs at 2 mm in water. At this depth intensity is 150% of surface intensity BA 10-18198.

3785
THE EFFECT OF X-RAYS ON CLEAVAGE IN *ARBACIA* EGGS: EVIDENCE OF NUCLEAR CONTROL OF DIVISION RATE. P. S. Henshaw and D. S. Francis. *Biol. Bull.* 70(1), 28-35(1936).

Time required for first cleavage was prolonged when eggs were irradiated before fertilization, same effect produced by irradiating sperm before they fertilized normal eggs. Results indicate that nuclei of cells studied exert some control over rate of cell division. BA 10-18200

3786
METABOLISM OF TISSUES GROWING IN CULTURE. VI. EFFECT OF RADIUM ON THE LACTIC DEHYDROGENASE AND ARGINASE SYSTEMS OF EMBRYONIC TISSUES. Barbara Elizabeth Holmes. *Biochem. J. London* 29(10), 2285-90(1935).

Arginase in embryo rat kidneys was unaffected by dose of γ rays sufficient to inhibit glycolysis. Lactic dehydrogenase system of young embryo tissue was more sensitive to γ radiation than was older tissue. Preliminary studies suggest that co-enzyme is the part of the system injured by γ rays. BA 10-18202

3787
INFLUENCE OF RADIUM ON THE COLORATION, THE DEVELOPMENT AND THE OXYGEN CONSUMPTION OF LARVAE OF *T. MOLITOR*. Viktor Janda. *Vestník Kralov. Ceske Spolecnosti Nauk, Trida Mat. Prirod.* (Mem. Soc. Roy. Sci Boheme Cl. Sci.) 1932 (paper 9), 1-26(1933) (French Sum.).

Larvae exposed to 5 mgm $RaCl_2$ with and without Pb and Pt filters, for 30 sec to 12 and 28 days at 8 mm with unfiltered, and 2.5 cm with filtered rays. Unfiltered rays produced raised spots which nearly covered larval integument. From these normal adults developed. Larger doses arrested development, caused incomplete pigmentation of eyes, legs, head, and prothorax. BA 10-18205.

3788
THE BIOLOGICAL ACTION OF THE RAYS FROM RADIOACTIVE SUBSTANCES. I. THE EFFECTS OF SMALL-DOSE RADIATION UPON THE REPRODUCTIVE ACTIVITY OF UNICELLULAR ORGANISM. Yukichi Kimura. *Sci. Papers Inst. Phys. Chem. Research (Tokyo)* 28, 27-47 (1935).

Prolonged irradiation (3-12 wk) with low doses of radioactive substances (pitchblende, monazite, and UX preparation) promoted reproduction in *Paramecium caudatum*. Effect was maintained during exposure without any distinguishable after-effects, and was due to direct action of rays on organism. Gamma rays are considered to be essential in producing observed effects. BA 10-18207.

3789
COMPARATIVE STUDY OF THE ACTION OF X- AND GAMMA RAYS ON THE LIVING CELL. RADIOBIOLOGICAL DOSIMETRY WITH THE AID OF *LUCILIA SERICATA* EGGS. Lucien Mallet and M. Bouchard. *J. radiol. et electrol.* 19(4), 155-61(1935). (In French).

Response of *L. sericata* eggs was independent of quality of radiation, but was a function of dose. Method does not give absolute values in r units but may be used for comparative measurements on given apparatus. BA 10-18210.

3790
INFLUENCE OF γ RAYS ON *MACROSIPHUM ROSAE* L. Livia Pirocchi. *Atti soc. ital. sci. nat. e museo civico storia nat. Milano* 74(1/2), 195-203(1935).

Colonies of *M. rosae* on first plant stock were subjected to radiation from Ra salts (1.02 mgm) which were shielded so only γ rays could escape. Exposure for 72 to 18 hr killed all aphids exposed, exposure for 15 to 3 hr resulted in reproduction after a few days, followed in 1-3 days by death of all parents and young. Exposure for 90 to 20 min speeded reproduction up to 4th generation. BA 10-18211.

3791
EXPERIMENTAL RADIUM POISONING. I. BONE MARROW AND LYMPH NODE CHANGES IN RABBITS, PRODUCED BY ORAL ADMINISTRATION OF RADIUM SULPHATE. Maurice Rosenthal and Edwin J. Grace. *Am. J. Med. Sci.* 191(5), 607-18(1936).

Oral administration of radium sulphate in rabbits resulted in: jaw necrosis, early erythropoietic hyperplasia and decreased maturation of erythroblasts and replacement with myelocytes in bone marrow; later fibrosis of marrow; initial stimulation of stem cells in lymph nodes followed by depletion and atrophy of lymphoid tissue, absolute lymphopenia in circulating blood and extramedullary myelopoiesis. BA 10-18215.

3792
THE BIOLOGICAL ACTION OF HOMOGENEOUS AND HETEROGENEOUS X-RAYS. C. M. Scott. *Proc. Roy. Soc. (London)* B112, 365-83(1933).

Homogeneous and heterogeneous x rays produced identical biological effects on allantois of hens' eggs. BA 10-18216.

3793
ACTION OF X-RAYS ON THE EGGS OF CALLIPHORA. C. M. Scott. *Proc. Roy. Soc. (London)* B115(792), 100-21(1934). (App: Method of Preparing Microscopic Sections for the Eggs of *Calliphora erythrocephala*, by D. Kilgour)

Raising of flies and handling of eggs are described. Dosage: 40 r/min, 47.1 cm, 79 kv, 5 amps, 0.01 cm AC filter, time varied. During development, radiosensitivity of egg decreases in a non-uniform manner. Author concludes that since change from uni- to multi-nuclear stage is abrupt and is accompanied by sudden decrease in radiosensitivity, the decrease is related to division of entire cell. BA 10-18217.

3794
RESULTS OF X-RAY IRRADIATION OF THE TEMPORAL REGIONS IN CERTAIN CASES OF DIABETES. Bruno Bonomini and Mario Testolin. *Atti. soc. med.-chir. Padova* 11(6), 690-702(1933). (In Italian).

In 8 cases of diabetes, irradiation of temporal region produced temporary reduction in glycosuria. Irradiation effects varied in intensity and duration. In cases previously treated with insulin, bitemporal irradiation seemed to diminish dose of insulin necessary to maintain aglycosuria. Findings are considered compatible with theory of importance of tuberohypophyseal region in carbohydrate metabolism. BA 10-18259

3795
STUDIES ON THE X-RAY DESTRUCTION OF THE ANTERIOR PITUITARY LOBE. I. X-RAY DESTRUCTION OF THE ANTERIOR PITUITARY LOBE AND MG-, CA-, AND

P METABOLISM. L. Cannavo and R. Beninato. *Endokrinologie* 15, 389-404(1935). (In German).

Four x-rayed rabbits showed severe destruction of all cell types in anterior pituitary, no apparent injury in neural lobe or adjacent brain, compared with 4 untreated controls. Treatment was followed by cachexia and death. Serum P and Mg, and excretion of P and Mg were lessened. Ca metabolism was apparently unchanged. BA 10-18382.

3796

THE EFFECT OF LARGE DOSES OF X-RAYS ON THE GROWTH OF YOUNG BONE. Eugene M. Regen and Walter E. Wilkins. *J. Bone and Joint Surg.* 18(1), 61-8(1936).

Eight of 14 rabbits were treated over left forelegs with 2,600 r and x-ray pictures were taken of both forelegs each month until growth in controls stopped. Within first month, growth in treated bones ceased completely, did not begin again in period of observation. Growth in untreated bones of experimental animals was unaffected. BA 10-18603.

3797

HISTOPATHOLOGY IN EXPERIMENTS WITH "THOROTRAST" INJECTION. Eiichi Jin. *Mitt. allgem. Pathol. u. pathol. Anat. (Japan)* 8(3), 439-60(1935). (In German).

Intravenous Thorotrast injections in rabbits were absorbed by liver, spleen, bone-marrow, lymph nodes, kidneys, adrenals, and lungs in respective reticular or endothelial cells. Spleen takes up the most the quickest, liver absorbs considerable amounts more slowly, other organs absorb small amounts. As result of absorption, some R-E cells become necrotic, desquamate, enter circulation, are deposited in spleen and liver. Toxic effects on hemopoietic system were noted. BA 10-18696.

3798

THE EFFECT OF X-RAYS ON THE INCUBATION PERIOD, SEXUAL DEVELOPMENT AND EGG-LAYING IN THE WHITE AND BROWN LEGHORN CHICKENS. J. M. Essenberg. *Poultry Sci.* 14(5), 284, 293, 317(1935).

White and Brown Leghorn chicken eggs (600) were x rayed with dosages of 30-600 r at incubation ages of 19-243 hr. Viable chicks were observed for 3 yr. Development during incubation in x rayed eggs varied with dosage. Less than 80 r accelerated, over 80 r, retarded development. Sexual development was accelerated. Average egg production for exposed group, 8.8/mo; for controls, 22/mo. BA 10-19208.

3799

THE ORIGIN OF NEW EPIDERMAL CELLS IN THE SKIN OF NORMAL AND X-RAYED FROGS. John Andrew Cameron. *J. Morphol.* 59(2), 327-49(1936).

Few mitotic figures were seen in skin of irradiated tadpoles and frogs (leopard and bullfrogs) by tenth day of larval life. Spindle-shaped "traveling cells" on vertical connective tissue fiber bundles connecting lower dermal layer with epidermis, are believed to be the source of replacement in normal and irradiation-induced desquamation. Number of mitoses and period of mitotic activity were both reduced by x ray in proportion to dose. BA 10-19565

3800

SURVEY OF PHENOMENA OF THE RECONSTRUCTION OF THE CHROMOSOMAL APPARATUS. Th. G. Dobzhansky. *Trudy Priklad. Botan. Genet. i Seloktsii, Seria 2 (Bull. Appl. Bot., Genet. and Plant-Breed., Ser. (2) 6*, 143-71 (1934). (In Russian).

Literature on spontaneous and x-ray-induced chromosomal aberration up to the year 1930 is reviewed. Bearing of these phenomena on various problems of genetics, such as cytological maps, permanence of spindle fiber attachments and mechanism of meiosis is discussed. BA 10-20261.

3801

CONSTANCY OF CHLOROPHYLL CONTENT AND CHROMATOPHORE DEGENERATION OF CHLOROPHYLL-MUTANT BARLEY LINES. H. V. Euler, B. Bergman, H. Hellstrom, and D. Burstrom. *Hereditas* 21(2/3), 119-28(1936). (In German).

Study of chlorophyll distribution in x-ray induced mutants of barley is reported. BA 10-20290.

3802

STUDIES ON THE EFFECT OF X-IRRADIATION ON THE LIVERWORT SPHAEROCARPUS, BY MEANS OF POLLEN ANALYSIS. Edgar Knapp. *Z. Induk. Abstamm. -u. Verebl.* 70(2), 309-49(1935). (In German).

Results of irradiation of spore mother cells shortly before meiosis, of young spore tetrads shortly after meiosis, and of mature tetrads are described. BA 10-20293.

3803

THE EFFECT OF α IRRADIATION OF PROTOPLASM AND CHLOROPLASTS. Richard Biebl. *Protoplasma* 24(2), 225-57(1935). (In German).

Leaves of Bryum were exposed to α rays of Po preparations. Similar effects were produced with different Po preparations by application of equivalent doses. Chloroplasts exhibit the first irradiation injury, protoplasm injury being apparent later. BA 10-20582

3804

REPORTS ON THE ROENTGENBIOLOGY OF MAN AND PLANTS. E. Ingber. *Radiobiologia* 1(2), 37-47(1932). (In Italian).

Bean seedlings were exposed to x rays of different wave lengths and intensities. There was no apparent effect from 11 r, little or none with 22 r, injury to plants from 44-330 r, lethal effect from 440-550 r. Pre-irradiation treatment of plants with chloral hydrate tended to shift borderline between reversible and irreversible effects, result of combining the 2 elements more than addition of effects. Author describes parallelism between x-ray effect on plants and man. BA 10-20586.

3805

DO AVERAGE AMOUNTS OF RADON IN SOIL-AIR HAVE AN EFFECT ON SEED DEVELOPMENT IN THE SOIL? W. Kosmath and V. Hartmair. *Protoplasma* 24(1), 8-13(1935). (In German).

Vicia faba seedlings were grown in quartz-sand through which Ra emanation, 100×10^{-16} Curie/cm, was passed. Results failed to support claim of Stoklasa that Ra emanation in soil-air is of ecological importance. BA 10-20588.

3806

A MODEL SYSTEM FOR EXAMINING THE RADIO-SENSITIVITY OF METABOLISING LAYERS OF CELLS. O. C. A. Scott. *Brit J. Cancer* 11, 130(1957).

Tumor cells separated from their oxygen supply by a compact layer of metabolising cells no more than 250 microns thick become anoxic within a few minutes at room temperature and are then much more resistant to radiation than are the same cells when adjacent to their oxygen supply.

3807

EXPRESSION OF SERUM FROM BLOOD CLOTS AND SYNERESIS. (COLLOID CHEMISTRY STUDIES ON THE THROMBO-EMBOLISM PROBLEM.) II. PHYSICAL FACTORS. H. Lampert and A. Ott. *Z. ges. exptl. Med.* 94(3), 309-22(1934). (In German).

Study of nature of formation of an embolus from a thrombus indicates parallelism between syneresis of blood clot and of other organic and inorganic gels. Effects of pressure and temperature are described. Ultraviolet and x irradiation had no effect upon syneresis. BA 10-20636

3808

IRRADIATION INDUCED MALIGNANT HYPERTENSION;
CURED BY NEPHRECTOMY W. M. Levitt and M. S.
Ogram. Brit. Med. J. 2, 910-12(1956).

An example is recorded of severe malignant hypertension induced by renal damage from irradiation. Patient became normotensive after nephrectomy. The blood pressure fell slightly over a period of 7 months, and responded at once, and satisfactorily, to moderate doses of reserpine orally.

3809

PRELIMINARY OBSERVATIONS CONCERNING THE
EFFECTS OF ROENTGEN IRRADIATION IN THE PRESENCE
OF FLUORESCIN. Murray E. Goodrich. Am. J.
Roentgenol. Radium Therapy 34(3), 378-80(1935).

Fairly soft radiation apparently exerts increased ionization effect in a scattering medium containing small amounts of fluorescein (paraffin phantom) and small amounts of fluorescein in malignant tissue decrease its resistance to roentgen irradiation. BA 10-20693.

3810

STUDIES ON THE EFFECT (INDIRECT) OF LOCALIZED
ROENTGEN IRRADIATION ON NORMAL AND PATHO-
LOGICAL WHITE BLOOD CELL PRODUCTION E. Hayer,
Z. ges. exptl. Med. 86(5/6), 623-37(1933). (In German).

X irradiation of thigh of dogs before start of turpentine abscess of the ear, and before and after perforation of the abscess appears to affect white blood picture although dosage (600 r) was applied at some distance from the inflammatory focus. BA 10-20694.

3811

ON THE EFFECT OF RADIUM RAYS AND ULTRAVIOLET
LIGHT ON THE COLORATION, METAMORPHOSIS AND
OXYGEN CONSUMPTION OF PUPAE OF TENEbrio
MOLITOR L. Viktor Janda. Biol. Generalis 10(2),
483-520(1934). (In German). BA 10-20696

3812

INFLUENCE OF A HYPERTHERMAL RADIOACTIVE
SULFURATED ATMOSPHERE ON SOME CHEMICAL
COMPONENTS OF THE BLOOD A. Krijanovsky. Compt.
rend. soc. biol. 120(40), 1236-8(1936). (In French).

Blood of patients who had been in "radio-vaporarium" exhibited decrease in blood sugar, blood N and blood cholesterol, blood cell chloride increased and plasma chloride decreased. BA 10-20699

3813

VARIATIONS IN THE SENSITIVITY OF THE CELL TO
RADIATION IN RELATION TO MITOSIS. J. C. Mottram.
Brit. J. Radiol. 8, 643-51(1935)

Tumor cells vary greatly in sensitivity to Ra irradiation when submitted to conditions affecting cellular respiration. Exposure to cold or HCN increases radio-sensitivity, N or CO anaerobiosis decrease it. No correlation found by author between sensitivity and state of mitosis at time of irradiation. BA 10-20700.

3814

STUDIES OF THE DIRECT AND INDIRECT EFFECTS OF
ROENTGEN RAYS. (EXPERIMENTAL INVESTIGATION
OF THE BLOOD FORMING ORGANS.) P. W. Sspowsky.
Beitr. pathol. Anat. u. allgem. Pathol. 94(1), 1-19
(1934). (In German).

Irradiation effects on rabbit bone marrow showed lymphocytic series including megakaryocytes and hematoblasts to be most sensitive, myeloid series, endothelial and reticulum cells followed in that order. BA 10-21261

3815

CONSIDERATIONS RELATIVE TO A CASE OF SIMMOND'S
DISEASE. Leandre Cervera, Albert Folch, and Bonaventura
Benaiges. Barcelona Libreria Catalonia. 1933. 15p.
(In Spanish).

X-ray stimulation of pituitary is recommended for specific case of Simmond's disease, believed by authors to be hypopituitarism. BA 10-21287.

3816

THE EFFECT OF X-RAYS ON BACTERIA IN MEDIA OF
HIGH SPECIFIC GRAVITY. Wayne A. Johnston. Radiology
20(3), 195-201(1933).

Cultures of *S. aureus* were mixed with Beck's paste and with lipidol and x irradiated (110 kv, 5 ma, 0 filter, 10 in. focal dist.). Subcultures made at 5, 10, 30, and 60 min exhibited growth inhibition which increased with each interval. Growth in presence of **meat was** inhibited somewhat after 1 hr irradiation. Author attributes x-ray effect to secondary rays of heavy metals in Beck's paste (bismuth) and lipidol (iodine); and to proteins of high mol wt in meat. BA 10-21672

3817

EXPERIMENTAL STUDIES ON CYCLOPIA Etienne Wolff.
Arch. anat., hist. et embryol. 18(1/4), 145-67(1934).
(In French).

Local x irradiation of chick embryos on prosencephalon at stage of: cephalic prolongation resulted in complete cyclopia with median unpaired eye, at 2-15 somites resulting in 2 eyes developing in same orbit with continuous eyelid. Other irradiation-induced abnormalities are also described. BA 10-22267.

3818

FURTHER STUDIES ON THE CHROMOSOME ALTERATIONS
BY X-RAYS IN LOXOBLEMMUS ARIETULUS. Kazuo
Suzuki. Proc. Imp. Acad. (Tokyo) 10(4), 233-35(1934).

In spermatogonia of irradiated insects, fusion of normally separate chromosomes into rods, fragmentation of rods and fragmentation of V-chromosomes were observed. All changes were in direction of increase of chromosome number. BA 11-94

3819

A NEW FORM OF TETRAPLOIDY AFTER ROENTGEN
IRRADIATION. M. J. D. White. Naturwissenschaften
23, 390-1(1935). (In German).

X irradiated *Locusta migratoria* males produced spermatogonia in which chromosomes split twice between successive mitoses, without division of spindle attachment. Resulting cell has v-shaped instead of rod-shaped chromosomes, which consist of 2 homologous arms united proximally. Every such chromosome is structurally analogous to "attached-X" chromosome in *D. melanogaster*. BA 11-99.

3820

A PRELIMINARY EXPERIMENT ON CROSSING OVER
IN THE FEMALE OF BOMBYX MORI. Daigoro Moriwaka.
Proc. Imp. Acad. (Tokyo) 11(10), 453-4(1935).

Crossing over was produced twice (in 1158 trials) by x-raying, never (in 899) by heat. BA 11-152.

3821

MECHANISM OF MOSAIC FORMATION DUE TO THE
EFFECT OF X-RAYS IN *D. MELANOGASTER*. M. K.
Neigauz. Zool. Zhur. (Zool. J. USSR) 13(3), 507-10
(1934). (Russian, English summary).

Fractional mutations were studied in offspring of x-rayed flies. Treated males were crossed to attached X females immediately after treatment or after 5, 10, 15, or 20 days. Frequency of fractional mutations obtained in male offspring proved independent of time lapse between treatment and mating. BA 11-153

3822

COMPARISON OF THE MUTATION-ELICITING EFFECT
OF ROENTGEN AND RADIUM RAYS ON *DROSOPHILA*
MELANOGASTER. A CONTRIBUTION TO RADIATION
GENETICS. Arthur Pickhan. Strahlentherapie 52(3),
369-88(1935). (In German).

Percentage of sex-linked lethal mutations induced in *D. melanogaster* by x rays or hard γ rays strictly proportional to dosage, has time-factor of unity, shows no dependence on wave length when correct physical dosage measurement is employed. 2.48% of induced mutations found/1000 r with error of $\pm 0.36\%$, proportion of visible to lethal mutations 3.5% for both x and γ rays. BA 11-157

3823

REACTION OF PROTOPLASM TO RADIUM RADIATION.

William Seifriz. *Protoplasma* 25(2), 196-200(1936)

Protoplasm of slime molds is highly resistant to Ra emanation (β and γ rays). When rays are concentrated on small bit of plasmodium, spreading and streaming stops and there is a slight increase in viscosity. BA 11-361

3824

"ANOMALOUS OSMOSIS" IN ANIMAL CELLS. W. A. Dorfman. *Protoplasma* 14(3), 341-59(1932).

Addition of thorium salts causes anomalous swelling of frog erythrocytes or sea-urchin eggs, whether medium be an iso-, hyper- or hypotonic solution of electrolytes or non-electrolytes. Thorium causes swelling of the nucleus when medium is hypertonic NaCl. Possible interpretations are discussed. BA 11-402

3825

STUDIES ON THE EFFECT OF X-RAYS ON TAIL REGENERATION IN TRITON AFTER A SINGLE EXPOSURE TO VARIOUS DOSES. V. Brunst and E. Cheremetieva. *Arch. biol. (Liege)* 46(3), 357-68(1935). (In French).

Stump of amputated tail destroyed by 15,000 r in *Triton cristatus*. After 3750 r, stump destroyed in 73% of animals, regeneration followed 1,500 r dose in 63.3%, 65% normal after 750 r, 35% retarded. BA 11-475

3826

STUDIES ON THE ROLE OF TISSUE METABOLISM IN THE RADIOSENSITIVITY OF THE GUINEA PIG THYMUS. M. Chevrement. *Arch. biol. (Liege)*, 46(3), 507-98 (1935). (In French).

From studies on young guinea pigs, author concludes that local metabolic factors are fundamental in radiosensitivity, that it is anaerobic fermentation and not respiration that determines cellular radiosensitivity BA 11-476

3827

EFFECT OF X-RAYS ON DEVELOPING LONG BONES: RADIOGRAPHIC AND ANATOMICAL STUDY. Bjarne Dahl. *J. Radiol. et electrol* 18(3), 131-40(1934). (In French).

Lower femur and upper tibia of young rats were irradiated with nearly epidermicidal dose of x rays. Studies indicate: early resorption of bone marrow; arrest of endochondral and periosteal ossification, early calcification and slow devascularization of metaphyses and epiphyses; fractures and resorption of diaphyses, arrest of proliferation of cartilage of union, resistance of epiphyseal cartilage to radiation. BA 11-478

3828

EFFECTS OF FRACTIONATED DOSES OF X-RAYS ON THE MORPHOLOGY OF THE OVARY OF THE ADULT RABBIT. ATTEMPT AT STATISTICAL INTERPRETATION OF OBSERVED PHENOMENA. Paul Desai. *Arch. biol. (Liege)* 46(3), 475-506(1935). (In French).

Follicles in single ovaries exposed to 210, 420, 840, and 1470 r were counted and ratios of atretic to normal follicles calculated. After 14 days, during which ovary received successive doses of x rays, almost complete degeneration of ovary was observed. X ray action is contrasted to that of prolan. BA 11-479

3829

ATTEMPT TO DUPLICATE TELERADIUM TREATMENT

USING ROENTGEN RADIATION. Erik Ebbehøj.

Strahlentherapie 52(2), 338-43(1935). (In German)

Skin and tissue reactions following teleradium treatment are precisely reproducible by x-ray treatment if focusing distance and quality are chosen to give similar dosage-rate and depth dose. Sievert unit (1mc) must be taken as 4.0 r/hr (biological determination of Braun), not as 8.2 r/hr (physical measurement). BA 11-480.

3830

THE EFFECTS OF ADMINISTRATION OF THORIUM DIOXIDE.

A. J. Fleming and W. H. Chase. *Surg. Gynecol. Obstet.* 63(2), 145-8(1936).

Microscopic evidence of proliferative reaction in connective tissue is presented in 2 human cases. Radio-activity in liver tissue 5 mo after injection was demonstrable by photographic methods. Authors conclude that intravenous injection of this material as contrast media is dangerous if life expectancy is over 2 yr. BA 11-482

3831

ON A BIOLOGICAL AND BIOCHEMICAL EFFECT OF γ RAYS, WITH PARTICULAR REGARD TO THE EFFECT OF SIMULTANEOUS ACTION OF OTHER FACTORS (TEMPERATURE, LIGHT, U.S.W.). (PRELIMINARY COMMUNICATION). Arne Forssberg. *Acta Radiol.* 16(2), 204-16(1935). (In German).

Authors studied effects of various doses of continuous γ radiation (Ra) on catalase and peroxidase, germinating wheat and oat seeds, and *Drosophila* eggs at various temperatures to determine whether γ radiation effect is always one of retardation. BA 11-483

3832

EFFECT OF ROENTGEN RAYS ON AUTOLYSIS AND PROTEOLYSIS OF THE NUCHAL LIGAMENT OF THE OX. E. Hayer. *Strahlentherapie* 49(4), 678-93(1934). (In German).

Extension and tearing tests were made on nuchal ligaments (maintained in vitro) before and at various intervals after exposure to 600 r or 2400 r x rays (0.9 mm Cu half value layer). After 600 r autolysis was delayed. Resistance to stress was maintained for longer periods, and normal collagenous tissue staining was maintained still longer. No change in optical properties of tissue was detected. Autolysis was uneven after 2400 r Biochemical implications of results are considered. BA 11-485

3833

TEMPERATURE AND BIOLOGICAL EFFECT OF α RAYS. T. Hercik. *Strahlentherapie* 49(4), 703-6(1934). (In German).

Irradiation of bacteria cultures with α particles from Po gives lethal effect which has zero temperature coefficient. BA 11-486.

3834

THE ROLE OF ROENTGEN-RAY WAVE LENGTH IN SKIN TOLERANCE. Paul C. Hodges, Alexander Brunschwig, and S. P. Perry. *Am. J. Roentgenol. Radium Therapy* 34(2), 234-40(1935).

Skin reactions in 8 rabbits and 4 humans showed no difference after exposure to radiation produced by 200 kv, filtered by 1 mm Cu, λ , 0.146, and radiation produced by 80 kv, filtered by 1 mm Al, λ , 0.41A. Authors conclude that skin reaction to irradiation is independent of wave length, and that this is also true of radiation of over 200 kv. BA 11-488.

3835

THE EXPERIMENTAL INTRAVENOUS ADMINISTRATION OF COLLOIDAL THORIUM DIOXIDE. Dudley A. Irwin. *Can. Med. Assoc. J.* 27(2), 130-5(1932).

Varying doses of thorium dioxide injected intravenously into 25 rabbits were found chiefly in reticuloendothelial cells with traces in suprarenal glands and ovaries. Doses to 5 cc of 25% suspension/kilo body wt were well tolerated. There was no evidence of elimination for at least 4 mo BA 11-489.

3836

SUSCEPTIBILITY OF SOFT X-RAYS OF DAPHNIA MAGNA DURING ITS DEVELOPMENT FROM EGG TO YOUNG IN THE BROOD POUCH. G. Snider and H. Kersten. J. Exptl. Zool. 74(1), 1-6(1936).

Results of irradiating eggs or embryos of D. magna (soft x-rays, 80 sec, 8 cm, gas x-ray tube, Cu target, 25 kv, 10 ma) show that eggs are more easily injured by soft x rays in segmentation stage, more difficult to injure in gastrula and subsequent developmental stages. BA 11-492.

3837

RADIATION EXPERIMENT ON CHICK EMBRYOS IN VITRO AND IN VIVO USING RADIUM GAMMA RAYS. C. W. Wilson, A. F. Hughes, A. Glucksmann, and F. G. Spear. Strahlentherapie 52(3), 519-24(1935). (In German).

Irradiation of whole embryos with γ ray dosage of 116 Sievert units for 8 min was followed by diminution of mitotic rate relative to controls, then rapid rise to above normal rate, and return to normal after 6 hr. BA 11-494.

3838

STUDIES OF GROWTH FACTORS OF EMBRYO EXTRACT. W. C. Hueper, A. Allen, M. Russell, G. Woodward, and M. Platt. Am. J. Cancer 17(1), 74-105(1933).

Surface tension of embryo extract was not changed materially by radon irradiation and growth-promotion was unaffected by x rays and radium emanation. Only slight destruction of glutathione in extract was caused by x rays. Spectrograms taken of normal embryo extract and extract irradiated with ultraviolet, x rays and radium are presented. BA 11-782

3839

MESOBlastic TUMOURS PRODUCED IN FOWLS BY EXPOSURE TO RADIUM. J. C. Mottram. Proc. Roy. Soc. Med. 29(1), 15-18(1935).

Small exposures to β radiation were given 12 cockrels at weekly intervals for 2 yr. Birds developed mesoblastic tumors near the point of radiation. Tumors were spindle-cell sarcoma, a fibrosarcoma and a lymphosarcoma none of which grew when grafted into other birds. BA 11-1094.

3840

ON THE GENETICS, HISTOLOGY AND CYTOLOGY OF A NEW RADIUM-INDUCED DEGENERATIVE MUTATION IN ANTIRRHINUM MAJUS. Emmy Stein. Z. indukt. Abstamm.-u. Vererbbl. 70(3/4), 525-31(1935). (In German).

Mutant of A. majus (A. m. var. cancroidea) obtained in F_2 of irradiated seed is described. Plants are stunted, with abnormal flowers, and are male sterile. Chromosome numbers observed in mutant somatic cells: 16, 32, and 64, normal number is 16. BA 11-10353.

3841

THE STRUCTURE OF THE CHROMOSOMES OF THE SALIVARY GLAND OF DROSOPHILA MELANOGASTER. Alfred Marshak. Am. Naturalist 70, 181-4(1936).

X-ray treatment of eggs results in deficiencies in adjacent pairs of chromatic bands, these in turn possibly being caused by inactivation of a unit in achromatic region. Chromosome abnormalities are believed to be the result of indirect, not direct effect of irradiation, since exposure of older larvae produces no visible effects. Last normal mitosis apparently occurs 6-8 hr after egg is laid. BA 11-10368.

3842

NEW EVIDENCE FOR THE POSITION EFFECT HYPOTHESIS. I. B. Pansin. Compt. rend. acad. sci. URSS 4(1/2), 85-8(1935).

X irradiated wild-type flies were crossed to untreated flies homozygous for 3rd chromosome recessive, curled. Cytological study of F_1 flies showed the curled effect revealed 3rd chromosome break in vicinity of curled locus in most instances. Study of crossovers shows that changes are apparently due to position effect. BA 11-10371

3843

A MUTATION OF THE TAIL, APPEARING IN THE DESCENDANTS OF MALE MICE WITH IRRADIATED TESTES. [N.] Dobrovolskaia-Zavadskaja. Arch. electr. med. 42, 460-5(1934). (In French).

Effects of irradiation of testicles (25-29 cm, 4 mm Al, 4 ma, 230-6.75 r) is described for 48 white mice and their descendants. Histological examination revealed that germinal epithelium was affected more than were interstitial cells. Two mutations were seen in descendants, "waltz" and "short tail." Author suggests that x rays did not cause the "short tail" mutation but influenced conditions to permit a larger incidence to appear. BA 11-10382

3844

TWO UNUSUAL MODIFICATIONS OF EYE COLOR IN DROSOPHILA MELANOGASTER. E. V. Enzmann and C. P. Hoskins. Nature (London) 138, 165(1936).

X irradiation of eggs and larvae of mutant white-eyed flies of Florida wild-type Drosophila (red eye) apparently caused 2 full reversions to wild-type (white to red eye). No reversions were noted in 5000 controls. Four individuals in stock culture of 30,000 eosin Drosophila exhibited mutation to color darker than eosin but lighter than wild-type. Three were from irradiated stock; 4th obtained from control population, raised on old and contaminated molasses. BA 11-10388.

3845

SOME EMBRYONIC ABNORMALITIES CAUSED BY X-RAYS. Titus C. Evans. Proc. Iowa Acad. Sci. 42, 207-8 (1935-36).

Effective dosage of x rays caused various abnormalities, especially in the embryos, of Melanoplus differentialis. These are described. BA 11-10389

3846

A STUDY OF THE QUESTION OF THE RELATIONSHIP BETWEEN ROENTGEN RAY DOSE AND INDUCED MUTATION RATE. K. G. Zimmer. Strahlentherapie 51(1), 179-84(1934). (In German).

Analysis of published results show that when correct mathematical treatment is used, induced mutation rate in drosophila can be shown to be strictly proportional to x-ray dosage applied. BA 11-10413

3847

MODIFICATION OF RADIOSENSITIVITY BY MEANS OF READILY PENETRATING ACIDS AND BASES. R. E. Zirkle. Am. J. Roentgenol. Radium Therapy 35(2), 230-7 (1936).

Pteris longifolia spores kept in equilibrium with various concentrations of (1) CO_2 , (2) H_2S or (3) NH_3 . As concentration of (1) increased from 0% to 20% in atmosphere (0-0.006M in culture solution) radio-sensitivity increases from 1.0 to 1.5; further increase decreased radiosensitivity. Variation with (2) similar to that with (1). BA 11-10532

3848

RADIUM EMANATION AND THE PHOSPHOROUS OUTPUT OF FROG MUSCLES. O. V. Hykes and J. Rerabek. Biochem. Z. 278(1/2), 123-32(1935). (In German).

Amount of P given off by frog-muscle-nerve preparations (resting or stimulated) into surrounding Ringer's solution was increased by pre-irradiation of solution with Ra emanation. BA 11-11135.

3849

EXPERIMENTAL BASIS OF ROENTGEN THERAPY IN ACUTE INFLAMMATORY PROCESSES. J. P. Mischtschenko, M. M. Forenko, T. F. Feszenko, S. N. Ledanow, and A. W. Morgatschow. *Strahlentherapie* 52(3), 464-96 (1935). (In German).

Biological effects of x rays on experimentally produced inflammation (*S. albus*, Diphtheria toxin and Pneumococcus) studied with rabbits, guinea pigs and mice. Increase in phagocytosis and leucocyte destruction, and R-E system reaction occurred. X rays observed to affect all elements of focus of infection. Optimal dose higher in initial than in cicatrical stage. Disproportionately high doses caused spread of inflammatory reaction and perhaps sepsis. BA 11-11373.

3850

HISTOLOGICAL INVESTIGATIONS ON THE RAT SPLEEN AFTER GRADED DOSES OF ROENTGEN RADIATION. Ernst A. Pohle and C. H. Bunting. *Strahlentherapie* 57(1), 121-31(1936). (In German).

Spleens of 181 rats were x rayed (100 kv, 2.0 mm Al, λ eff. = .34A, doses of 5 -- 5000 r at varying intervals). Chief x-ray effects noted in fixed and circulating blood cells of the organ, lymphocytes appeared most susceptible. Decisive lesions first found at 30 min. histological changes well marked at 3 hr. BA 11-11379

3851

THE INFLUENCE OF THE AGE AND SEX OF THE GERM CELLS ON THE FREQUENCY OF MUTATIONS IN *DROSOPHILA* STIMULANT. K. V. Kosikov. *Compt. rend. acad. sci. URSS* 2(3), 115-8(1936)

Author suggests that lethal mutations occurring in X chromosome of immature male germ cells kill or hinder multiplication of these cells, female cells are somewhat protected (having 2 X chromosomes) against effect of recessive lethal in one chromosome. Percentage of lethals in cultures from gametes at 1-6, 6-12, and 12-24 days postirradiation was determined and mutation frequency was found to be lower in immature cells than in nature. BA 11-10399.

3852

A PRELIMINARY NOTE ON THE PREPARATION OF NON-TOXIC SHIGA DYSENTERY VACCINES BY IRRADIATION WITH SOFT X-RAYS. Helen Norris Moore and H. Kersten. *J. Bacteriol.* 31(6), 581-4(1936).

Concentrated saline suspensions of *Shigella dysenteriae* were irradiated (38 kv, 20 ma, 30-300 min). Vaccines receiving large doses were rendered non-toxic and retained antigenic properties; those given small doses (even though more than sufficient to kill organisms) were still toxic. (Most intense portion of the soft x rays consisted of K_{α} and K_{β} lines of Cu.) BA 11-11514

3853

A NOTE ON BACTERICIDAL EFFECTS OF ROENTGEN RAYS. F. L. Mohler and Lauriston S. Taylor. *J. Roentgenol. Radium Therapy* 34(1), 89-91(1935).

Author postulates that biological effects of x ray are localized in columns of ionization along path of each high speed electron in liquid. Area of a bacillus is such that passage of column through such an organism is not generally fatal, and column must pass through a particular vulnerable point to cause death. BA 11-11780

3854

SOME EFFECTS OF GAMMA RAYS OF RADIUM ON THE DEVELOPING CHICK EMBRYO. I. THE DEPENDENCE OF THE DELAYED LETHAL DOSE ON THE AGE OF EMBRYO.

II. THE RECOVERY AND DEVELOPMENT OF CHICK EMBRYOS AFTER IRRADIATION AT VARIOUS AGES.

C. W. Wilson. *Acta Radiol.* 16(6), 719-34(1935).

Chick embryos were exposed to γ -ray irradiation of 5.3 r/min for 3 hr exposures, total dose 1,000 r. Radiosensitivity of chick embryo was found to decrease for first 3 days of incubation, to decrease more rapidly from 3-5 days, then remain stationary. BA 11-12384.

3855

ON THE FORMATION OF AN AXIAL ROW OF SOMITES IN THE CHICK EMBRYO AFTER IRRADIATION OF HENSEN'S NODE. Etienne Wolff. *Compt. rend. soc. biol.* 118(5), 452-5(1935). (In French).

X irradiation of a delimited area containing Hensen's node in postprimitive streak embryos was followed by varying degrees of arrest of cord and tube, and concentration of mesoderm in median line. BA 11-12386

3856

RESULTS OF A LESION IN THE REGION OF HENSEN'S NODE ON THE DEVELOPMENT OF THE CHICKEN. Etienne Wolff. *Compt. rend. soc. biol.* 118(1), 77-80 (1935). (In French).

X-irradiation of small circular area containing Hensen's node in 32 post-primitive streak embryos of varying ages up to 5 somites, yields constant results which disagree with those obtained by Dantschakoff with Ra. Embryos surviving beyond 4th day exhibited various malformations, chiefly of the cord BA 11-12385

3857

INFLUENCE OF RADON EMANATIONS ON THE DEVELOPMENT OF THE EGGS OF *R. ESCULENTA*. P. Pasquini. *Atti Pontificia accad. sci. Nuovi Lincei* 85, 424-86(1932).

Eggs were subjected to radon radiation at successive stages, from early morula to tail-bud stage; dosages ranged from 2-3 mc to 108 mc. Histogenic changes depend on dosage, morphological changes upon stage of development treated. As gastrulation advances, radiation seems to affect nervous tissue more profoundly. BA 11-2023

3858

AN ANOMALY, ATYPICAL MITOSIS. A. J. Atabekova. *Compt. rend. acad. sci. URSS* 1(3), 133-6(1936). (In German).

Cytological examination of *Pisum sativum* showed disturbance in synchrony of mitosis in x-irradiated seeds. BA 11-5260

3859

MUTATION EXPERIMENTS WITH *OENOTHERA HOOKERI*. C. F. Rudloff and H. Stubbe. *Flora* 29(4), 247-362(1936). (In German).

X irradiated pollen of *O. hookeri* was used to pollinate untreated flowers. Narrow-leaved forms, dwarfs, weaklings and other variants appeared in F_1 . In F_2 variety of abnormal types appeared, many of which are interpreted as gene mutations, but genetical analyses are incomplete. Names and descriptions of 24 gene mutations included. BA 11-5296

3860

THE EFFECT OF X-RAYS ON THE PRODUCTION OF STERILE RICE. Yoshitaka Imai. *Japan J. Genetics* 10(3/4), 233-6(1935).

Sterility mutations in treated series averaged 6.39%: in controls, 0%. Exposure at microsporogenesis produced more frequent mutations than treatment at flowering, longer exposures produced more frequent mutations than shorter ones. Of sterile plants induced, 7.18% were mosaic for sterility of different degrees or for sterile and fertile ears. BA 11-5318.

3861

KARYOGENETIC STUDIES ON X-RAYED SEX CELLS

AND THEIR DERIVATIVES IN TRITICUM MONOCOCCUM. Yoshiwo Katayama. J. Coll. Agri. Tokyo Imp. Univ. 13(4), 333-62(1935).

Flowers of T. monococcum ($2n = 14$) and Secale cereale were subjected to different x-ray dosages. Abnormalities in meiosis and development are described. Chromosomal changes observed in F_1 are attributed to simple translocation, with or without deletion, between 2 non-homologous chromosomes. Incidence of abnormal mitoses was greater when material was fixed 1-5 hr. post-exposure than when fixed immediately. Frequency of abnormalities was roughly proportional to dose. BA 11-5322.

3862

EFFECT OF RADIUM EMANATION AND OF RADIO-ACTIVE EARTH ON YEASTS. E. Ia Rokhlina. Microbiologia 5(2), 248-52(1936). (Russian, English summary).

Stable variants of Saccharomyces cerevisiae which differed from one another and from parent culture morphologically, physiologically, and especially in increase of fermentation rate, were obtained by subjecting yeast cultures to x, Ra, and ultraviolet radiation. BA 11-5328.

3863

THE SEMI-LETHAL EFFECT OF X-RAYS ON D. MELANOGASTER. F. A. Smirnov. Trudy Leningrad. Obshchestva Estestvoispytatelei (Trav. Soc. Nat. Leningrad) 63(3), 379-85(1934). (Russian, German summary).

Author presents results to support idea that one of most frequent classes of mutations consists of minor changes that produce small effects, especially small decreases of viability. BA 11-5369

3864

EFFECT OF X-RAYS ON THE FORMATION OF ARTIFICIAL DECIDUA IN THE RABBIT. A. Lacassagne, A. Fehr, and W. Nyka. Compt. rend. soc. biol. 121(5), 385-7(1936). (In French).

Irradiation of rabbit ovary shortly after copulation and with a dose sufficient to kill ovum does not prevent pregravid proliferation of endometrium nor formation of artificial decidua, corpus luteum regresses prematurely. Uterine mucosa is only slightly radiosensitive. BA 11-5959

3865

CLASSIFICATION OF PHYSIOLOGICAL OR PATHOLOGIC EFFECTS OF IRRADIATION. American Roentgen Ray Society, Committee on Safety and Standards. Am. J. Roentgenol. Radium Therapy 35(2), 266-7(1936). (Roentgen Rays or Radium.) BA 11-6138.

3866

PURIFICATION OF VARIOLA VACCINE BY MEANS OF X-RAYS. Baruch Samuel Levin. Compt. rend. 200(16), 1441-3(1935). (In French).

Tubes containing variola vaccine were exposed to massive x-ray doses (anticathode of Cr: 30 kv, 20 ma, at 30 mm for 2 min). Contaminating organisms were destroyed and immunizing strength of variola vaccine was only slightly if at all diminished, as shown by tests on rabbits. BA 11-6324.

3867

CONCERNING THE QUESTION OF THE MITOTIC DIVISION OF THE SERTOLI CELLS IN MAMMALS. G. G. Shchegolev. Arkh. Anatomii, Gistologii i Embriologii (Arch. Russe Anat. Hist. et Emb.) 14(2), 198-220 (Russian), 306-8(German Summary) (1935).

Newborn rats were x irradiated with 200-680 r to destroy germ cells, sacrificed 60, 90, 100 or more days later. No metaphases, prophase, or anaphases were found in Sertoli cells, indicating lack of cell division after their development from follicular cells. Author believes Sertoli cells belong to ultra stabile type. BA 11-2648.

3868

TRANSFORMATION OF HAPLOID GENOTYPE FEMALE GAMETOPHYTES OF SPHAEROCARPUS DONNELLI INTO MALES BY MEANS OF ROENTGEN RAYS. Gerhard Lorbeer. Planta 25(1), 70-83(1936). (In German).

Growing points of gametophytes of S. donnellii which were subjected to intermittent x radiation to total dose of 14,000 r, then exposed in damp chambers to unilateral illumination, gave rise to numerous outgrowths; 34 haploid female growing points so treated producing 275 outgrowths, of which 11 bore antheridia instead of archegonia, 1 was sex-mosaic. BA 11-2679

3869

ELICITATION OF CROSSING-OVER IN DROSOPHILA MALES BY ROENTGEN IRRADIATION OF THE IMAGO. H. Friesen. Genetica 18(1/2), 187-92(1936). (In German).

Day-old males were x irradiated and mated to virgin females at 3 day intervals. With one exception, no cross-overs resulted until 6-7 days after exposure. Of 174 flies recorded during this period, 10.9% were crossovers. Results indicate that crossing-over can be induced during spermatogenesis in adult stage of male flies. BA 11-2697.

3870

EXPERIMENTAL STUDIES OF GENOVARIATION IN DROSOPHILA MELANOGASTER UNDER THE INFLUENCE OF ROENTGEN AND RADIUM RAYS. R. Gassul and W. Slepko. Arch. exptl. Zellforsch. Gewebezucht. (Explanation) 11(1/2), 133-5(1931). (In German). BA 11-2698

3871

THE EFFECT OF X-IRRADIATION ON AUXIN AND PLANT GROWTH. Folke Skoog. J. Cellular Comp. Physiol. 7(2), 227-70(1935).

Application of hard x rays inactivated auxin in solution or in plant. Destruction is believed to be due to oxidizing agents formed by irradiation. Mechanism of auxin transport and capacity of growth were not affected by exposure. Effect of irradiation on auxin and on its formation is studied to be the factor in immediate x-ray inhibition of plant growth. BA 11-2919

3872

ACTION OF RADIO-EMANATION ON THE GERMINATION OF GRAINS. M. de Caraman and Ch. Champy. Compt. rend. soc. biol. 121(8), 750-2(1936). (In French).

Irradiation of oats increased weight of stems and roots of seedlings about 10-fold. BA 11-2944

3873

THE RELATION OF X-RAY DOSAGE TO DEGREE OF INJURY IN NEMOPHILA AND ZINNIA. Edna Louise Johnson. Am. J. Botany 23(6), 414-8(1936).

Extreme ray susceptibility of N. insignis and Z. elegans seedlings was indicated by lethal response to 2500 r. Seedling growth in both species when treated with 1000, 1500, and 2000 r showed definite relation between dosage and effects produced with respect to: percent living for 3 mo, average height at various periods, average green wt of above-ground parts at maturity and percent of plants producing flowers and fruit. Use of these plants as dosimeters is held to be impractical. BA 11-2946.

3874

SUSCEPTIBILITY OF SEVENTY SPECIES OF FLOWERING PLANTS TO X-RADIATION. Edna L. Johnson. Plant Physiol. 11(2), 319-42(1936).

Seedlings of 70 plants were irradiated with medium doses of x rays when cotyledons were expanded and growing tips were visible. Of these, 15 species were apparently unaffected, 15 slightly affected, particularly during early growth, 40 species noticeably affected. Experiments represent 10 year study of morphological

effects of x rays on above-ground parts of 70 species of flowering plants. BA 11-2947.

3875
DEVELOPMENT OF ROOTS AND UNDERGROUND STEMS AS INFLUENCED BY X-RADIATION. Edna Louise Johnson. Univ. Colo. Studies 23(3), 169-87(1936).

Underground parts as well as aerial portions of plants were found to be radiosensitive in study of 22 sp. In fibrous roots, medium doses decreased growth (length) as well as number and length of secondary roots. Sprouted corms and bulbs of Iridaceae and Liliaceae were unaffected or showed decrease in above ground parts. Number and length of roots decreased by 50% and flower stalk development was retarded in paper-white narcissus bulbs. Iris rhizomes and Jerusalem artichoke were also radiosensitive. BA 11-2948

3876
EFFECT OF X-RADIATION UPON GROWTH AND RESPIRATION OF NARCISSUS BULBS. Mary Fleishman Meserve. Univ. of Colo. Studies 23(3), 199-207(1936).

Sprouted bulbs (100) were irradiated with 3500 r and CO₂ production was determined in these and in an equal number of controls for periods of 10 min to 478 hr. Shoot growth was retarded; respiration depressed at time of irradiation, remaining so throughout experiment. BA 11-2950

3877
EFFECTS OF THORIUM ON BLOOD AND LIVER ENZYMES OF WHITE RATS. Bernard S. Gould. Proc. Soc. Exptl. Biol. Med. 35(1), 77-8(1936).

Preliminary paper. BA 11-3062

3878
STUDIES OF THE INFLUENCE OF THERAPEUTIC RADIUM-AND ROENTGEN-IRRADIATION ON THE BLOOD CHOLESTEROL AND THE LIVER Kurt Fuge. Strahlentherapie 50(1), 157-66(1934). (In German).

In 31 carcinomatous women blood cholesterol level was normal. After therapeutic doses of Ra or x rays it sank more often than it rose, but average and absolute variations were about equal. **Change in percent of ester-** to total-cholesterol were too slight to indicate injury to liver parenchyma. BA 11-3059

3879
SOME EFFECTS OF GAMMA RADIATION ON THE DEVELOPING RAT RETINA. A. Glucksmann and Katharine Tansley. Brit. J. Ophthalmol. 20(9), 497-509 (1936).

Eyes of young rats were exposed to γ radiation. Undifferentiated cells of retina degenerated, amount of degeneration depending on dosage and age of rat. Eye size was reduced; new fiber layer formed, dividing inner nuclear layer into 2 parts. Under certain conditions, rosettes may result. Last two effects are secondary to degeneration, not direct irradiation effects. BA 11-3061

3880
CERTAIN X-RAY EFFECTS UPON PARAMECIUM. Robert T. Hance. Proc. West Va. Acad. Sci. 5(2), 56-7(1931).

X rays uniformly increased permeability of paramecia, as measured by time of decolorization of intracellular nuclear red by NH₄OH. Cell age was a significant factor in demonstrating this effect. Increasing the ionizing power of x rays (6 times) decreased the permeability 20% below controls. BA 11-3063.

3881
CHEMICAL PHENOMENA WHICH ACCOMPANY RESORPTION OF IRRADIATED TISSUE. Jean Loiseleur. Compt. rend. 199(15), 686-8(1934). (In French).

Effects observed in rabbits following irradiation of thymus glands (150 kv; 6 amps; 6 mm Al; 30 cm,

focus-skin dist., for 38 min, skin dose, 1350 r): nuclear disintegration disclosed by free phosphate, enrichment of cellular residua in chlorine, increased alkali reserve and pH of blood, decreased urea in erythrocytes as C1 content increases, hyperphosphaturia and hypochloruria. BA 11-3065

3882
PATHOLOGY OF MONKEYS EXPOSED TO MASSIVE DOSES OF TOTAL BODY GAMMA RADIATION. C. C. Lushbaugh and C. Houck. Federation Proc. 14, 411-12 (1955).

Complete autopsies were performed on monkeys dying after total-body exposure to ionizing radiation, in doses from 1,000-30,000 r. Necrosis of the gastric parietal cells, the adrenal cortex, the pancreatic islets, and the adenohypophysis, and lymphoid atrophy resulting from phagocytosis of apparently intact lymphocytes were observed.

3883
RADIATION QUALITY AND SKIN REACTION G. Schwarz and A. Frank. Strahlentherapie 50(1), 145-56(1934). (In German).

With 20.16-0.33 Å (half value layer 0.95-0.133 mm Cu) 1600 r x rays (rate: 40 r/min) produced distinctly greater x-ray dermatitis when harder rays were used on comparative 4 cm² thigh fields, 7 subjects, contradicting usual view that softer x rays produce greater skin injury. BA 11-3067

3884
THE TIME FACTOR IN THE BIOLOGICAL ACTION OF ROENTGEN RAYS. 3. INVESTIGATIONS AT VERY SHORT IRRADIATION TIMES. Rolf M. Sievert and Arne Forssberg. Acta Radiol. 17(3), 290-8(1936).

Drosophila eggs were x irradiated with 165 r for 0.39-1.16 sec 24,000-7,800 r/min and results were compared with those obtained with same dose given in 2.1 sec-30 min. Results suggest that irradiation effect diminishes at very short irradiation times. Death rate was reduced at 0.39 sec by more than 20%. BA 11-3068.

3885
GIANT CELLS IN THE BONE MARROW OF ANIMALS IRRADIATED WITH X-RAYS. Mario Torrioli and Sergio Fiorentini. Pathologica 27, 37-42(1935). (In Italian).

After treating bones of guinea pigs with massive dosages of deep x rays, cell fusions forming typical megakaryocytes were seen. BA 11-3069

3886
THE RADIOSENSITIVITY OF THE CELLS OF THE MAMMARY GLAND. C. W. Turner and E. T. Gomez. Am. J. Roentgenol. Radium Therapy 36(1), 79-93(1936).

X-irradiation effects on rudimentary duct system of normal young rabbits, on young rabbits with growth stimulated by estrogen, on mature virgin rabbits, on rabbits during pseudo-pregnancy, and on lactation described. Indications were that x irradiation permanently affected cells concerned. BA 11-3070

3887
ON THE REACTION OF SKIN TO LONG WAVE LENGTH ROENTGEN RAYS AND CATHODE RAYS. Ernst Wilhelmy. Strahlentherapie 55(3), 498-523(1936). (In German).

With x rays generated at 2.5-15 kv, half value in Al 0.001 mm to 0.043 mm, early erythema appears in 8 days, followed by a principal erythema appearing 3-4 wk after exposure. Threshold dose for early erythema falls from 4000 r to 80 r as voltage rises from 2.5 to 15 kv; for principal erythema from 20,000 r at 3 kv to 600 r at 9 kv. Figures quoted apply to one particular typical individual. BA 11-3071

3888
ELECTROSTATIC MEASUREMENTS ON INDIVIDUAL

MOTOR ENDPLATES AND MUSCLE FIBERS. II. EFFECT OF CURARE-POISONING AND RADIUM IRRADIATION. Fritz Buchthal and J. Lindhard. Skand. Arch. Physiol. 72(1/2), 35-50(1935). (In German).

End plate-fiber potential difference and irritability to indirect stimulation disappeared, when solution of curare was applied or when fiber was exposed to Ra emanation. Potential differences along muscle fiber were unaffected. Curare and Ra effects were reversible within limits. BA 11-3523

3889

ON HIROSE'S CHOLIN GRANULES IN THE LIVER.

K. Yamaoka. Fukuoka Acta Med. 28(4), 602-54 (Jap.); 34 (Ger. summ.) (1935).

Immediately after and up to 168 hr after exposure of cholin granules in liver (obtained by Hirose's process) were exposed to 60-600 r, the amount of cholin first diminished, later increased far above normal, then underwent second decrease. Size of granules was also changed. BA 11-3720.

3890

ON THE EFFECT OF ROENTGEN RAYS ON THE PHAGOCYTIC ACTION OF GIANT CELLS. W. G. Garschin, M. A. Zacharjewska, and W. W. Ossinska. Frankfurt Z. Pathol. 49(2), 252-61(1936). (In German).

X rays (3-6 erythema doses) retarded development of xanthomogranuloma in tissues injected with cholesterol. Growth of granulation tissue in cholesterol deposit was stopped; formation of macrophages checked. X-ray effect on phagocytic activity: retarded infiltration of connective tissue in foreign body deposits and reduction in number, size, and digestive activity of macrophages. (Solution of cholesterol crystals by cells was inhibited by x rays). BA 11-3743

3891

X-RAY MUTANTS IN SOFT WHEAT. A. A. Sapegin. Trudy Priklad. Botan., Genet. i Selektii, Ser. 29, 3-37 (1936). (Russian, English summary).

Triticum vulgare plants were x rayed shortly before or during flowering. F_1 plants were "extremely polymorphic". Up to 60% of deviating types were characterized by various chromosomal abnormalities (fragmentation, univalents, multivalents). These were fewer variations in F_2 than in F_1 . BA 11-7848.

3892

COSMIC RAYS AND THE MUTATION PROCESS. Henrich Friesen. Compt. rend. acad. sci. URSS 1(4), 183-6(1935). (In German).

Wild Naltschick stock *Drosophila* males were subjected to cosmic radiation in stratosphere balloon. Following exposure of 100-150 ion pairs per cm^2/sec for 2 hr, 2724 chromosomes were tested for sex-linked lethals. Fewer mutations found in these than in controls. Thus cosmic radiation is believed to play no significant part in evolution by the production of mutations. BA 11-7867

3893

SPERMATOGONIAL CROSSING-OVER IN *DROSOPHILA*.

H. Friesen. Z. indukt. Abstamm.-u. Vererbl. 71(4), 501-26(1936). (In German).

Day-old males (*D. melanogaster*) heterozygous for 8 recessive genes of 3rd chromosome (ru, h, th, st, cu, sr, es, ca) were x rayed and mated to 15 females homozygous for same genes. Of 164 males, 45 produced crossover in the F_1 and the same crossover type tended to occur in many individuals of same progeny. This is believed to result from crossing over in an early spermatogonial division, with subsequent production of large number of gametes containing the same crossover chromosome. Frequency of crossing over was greater near the attachment construction, little occurring near the distal ends. BA 11-7868

3894

X-RAY MUTATIONS IN *D. SIMULANS*. K. V. Kosikov. Trudy Inst. Genet. 10, 189-97(1935). (Russian English summary).

Wild-type male flies were x rayed at 50 kv, with 4 ma, 1 mm Al filter. With dose of 3240 r the number of recessive lethal x ray mutations in sex chromosome of *D. simulans* is 11 times that of controls. Lethal mutations increased with increase in dose. Mutations in this species are compared with those in *D. melanogaster* and *funnebris*. BA 11-7872.

3895

CROSSING OVER IN THE MALE OF *DROSOPHILA VIRILIS* INDUCED BY HEAT AND X-RAYS. Daigoro Moriwaki.

Proc. Imp. Acad. (Tokyo) 11(6), 242-3(1935).

Heterozygous males of constitution ru a/st es were crossed with females (ru st a es). Male larvae 3-5 days old were then exposed to 35-37°C for 24 hr, or to 50 kv x rays (4 ma, 25 cm) for 20 min. Of 2922 flies exposed to heat 3 exhibited crossovers; in 5808 x-rayed flies 6 crossovers appeared; in control group, no crossovers in 6846 flies. BA 11-7882

3896

PHYSICAL-CHEMICAL EFFECT OF ROENTGEN RAYS ON ORGANISMS. V. G. D. Lieber. Strahlentherapie 52(3), 497-511(1935). (In German).

Distribution of K and Ca in *V. faba* root tips was extensively modified by x irradiation of 4000-7000 r. K was lost first by cytoplasm, then by nucleus on further irradiation. Ca is concentrated in region of cell walls and around nucleus. Minimum wave length band used was 0.07-0.09 Å. BA 11-8013

3897

STIMULATION OF GROWTH OF SOY BEAN SEEDS BY SOFT X-RAYS. Theo P. Long and H. Kersten. Plant Physiol. 11(3), 615-21(1936)

Dry soy beans were irradiated with soft x rays (Cu target tube, varying voltage, 10 ma, 3.3 cm, 5-25 sec). Plants from seeds irradiated at 20 kvp for 10 sec had an average wet weight 2.3% greater than controls. Each of 3 lots of plants from seeds exposed at 25, 30, and 35 kvp showed maximum wet weight increase following to 5 sec of irradiation, average of the 3 lots was 5.9% greater than control. BA 11-8015

3898

STUDIES ON THE EFFECTS OF X-RAYS RADIATION UPON GERMINATION, GROWTH AND YIELD OF RICE PLANTS. Hideaki Saeki. J. Soc. Trop. Agr. (Taiwan) 8(1), 28-38 (1936).

Rice seeds and seedlings were continuously exposed for different periods to unfiltered x rays from Coolidge tube with Cu anticathode. Seed germination, number of tillers, ears and grains, weight of straw, roots and grains were favored by certain doses. Large doses had inhibitory effect. Dose is expressed as MA. M/D^2 at 30 KV, where MA is secondary current intensity; M, exposure time in minutes; D, target object distance. BA 11-8019

3899

THE TISSUE CHLORINE OF THE RAT AFTER TOTAL BODY ROENTGEN IRRADIATION. Alois Beutel and K. Anton Winter. (Strahlentherapie 54(1), 89-95(1935). (In German).

Six rats were subjected to total body irradiation of either (1) 800 r (single dose), or (2) 750-1000 r (fractionated dose), 0.5 Cu + 1 Al filter at 180 kv, 4 ma, 40 cm. Increase in tissue Cl occurred in all tissues but liver whether examined on 2nd, 5th, or 8th day after (1), or on 1st or 3rd after (2). Of 16 tissues and organs examined, liver showed decrease without exception. BA 11-8159.

3900

STUDY OF EFFECT OF ROENTGEN IRRADIATION ON BLOOD SUGAR OF HUMANS. Knud Brochner-Mortensen. *Strahlentherapie* 51(4), 675-84(1934). (In German).

Blood sugar was determined in 10 patients at 15 min intervals after x irradiation with 75-500 r. In 4 cases (150-400 r) blood sugar remained within 10 mg percent distance of initial value before exposure, in 4 cases (100-385r) value rose 13 to 17 mg percent, in 5 cases (75-500 r) rise of 21 to 52 mg percent occurred. BA 11-8160.

3901

STUDIES ON THE EFFECT OF ROENTGEN RAYS UPON THE INTESTINAL EPITHELIUM AND UPON THE RETICULO-ENDOTHELIAL CELLS OF THE LIVER AND SPLEEN. Sv. A. Chrom. *Acta Radiol.* 16(6), 641-60(1935).

A histological and bacteriological study was made on x irradiated white mice. Total body exposure to 250-580 r resulted in general infection with intestinal bacteria. Abdominal irradiation with spleen and liver shielded did not. Observed effect is believed to reflect damage to protective functions of intestinal epithelium and to liver and spleen. BA 11-8161

3902

BIOLOGICAL EFFECT OF ROENTGEN RAYS ON TISSUE CULTURES. Alexander Farago. *Strahlentherapie* 54(4), 626-38(1935). (In German).

At 24 hr after x raying of chick-embryo tissue cultures (100-2500 r) fat globules were seen in cell. Globules/cell were proportional to dosage up to 700 r when delivered in one fraction at 40 r/min and were independent of wave length between 1.18 mm Cu and 0.13 mm Cu half value layers. BA 11-8163.

3903

THE BIOLOGICAL ACTION OF NEUTRON RAYS. John H. Lawrence and Ernest O. Lawrence. *Proc. Natl. Acad. Sci. U. S.* 22(2), 124-33(1936).

Whole-body neutron-irradiated white rats exhibit leukopenia; lymphocytes are more affected than polymorphs. Neutrons are much more effective/unit of ionization than are x rays in producing this effect in rats, due to greater ionization produced in tissues as compared to x and γ rays. (Neutron source: beryllium bombarded with deuterons.) BA 11-8166.

3904

THE EFFECT OF γ -RAY IRRADIATION UPON THE GROWTH AND NITROGENOUS METABOLISM OF THE PROTOZOON, *BODO CAUDATUS*. Norman Risborough Lawrie and Muriel Robertson. *Biochem. J.* (London) 29(5), 1017-20(1935).

Rate of NH_3 production was used as index of N metabolism in γ -irradiated Bodo cultures. Exposure bodos were larger than controls. Increasing periods of exposure were followed by, first an inhibition of NH_3 production, then a marked increase, then less marked increase. Greatest stimulation of NH_3 production coincided with greatest effects on size and division rate. BA 11-8167

3905

BIOLOGICAL EFFECTS AND THERAPEUTIC POSSIBILITIES OF NEUTRONS. Gordon L. Locher. *Am. J. Roentgenol. Radium Therapy* 36(1), 1-13(1936).

Various means of producing intense neutron beams are described; personnel protection stressed. Applications to biology and medicine are considered. BA 11-8168

3906

THE QUANTITATIVE EFFECT OF X-RAYS ON MITOSIS IN THE MOUSE TUMOUR S-37. Wm. H. Love. *Med. J. Australia* 1(24), 814-5(1936).

Number of dividing cells in 200 fields diminished from 240 to 173 after 100 r. After 200 r the number of mitoses was 86; after 300 r, 53; after 400 r, 38, after 500 r, 34. BA 11-8169

3907

RADIOSENSITIVITY IN RELATION TO THE TIME FACTOR R. McWhirter. *Brit. J. Radiol.* 9, 287-99(1936).

Daily treatments (7) were administered to corresponding areas on each individual, one series with high intensity, one with low, to same total dose. With variations of 106 times in intensities, reactions on normal skin were similar. In treating rodent ulcer and carcinoma, there was no apparent difference in rate of regression of lesion with change in intensity. Results held for both Ra and x rays. BA 11-8170.

3908

THE BIOLOGICAL EFFECT OF ROENTGEN IRRADIATION ADMINISTERED IN VARIOUS FRACTIONS. Hayes E. Martin. *Strahlentherapie* 57(1), 73-86(1936). (In German).

Author describes technique of fractionated x irradiation of pharyngeal cancer and technique of fractionated x radiation to be used in conjunction with radon seeds and Ra capsules. Biological effects differ markedly after fractionated, and single massive doses BA 11-8172.

3909

ON THE INFLUENCE OF ROENTGEN RAYS ON URIC ACID METABOLISM. Shinkichi Okaue. *Folia Pharmacol. Japan.* 19(2), 259-66(1934). (Japanese with German summary.)

Rabbits exposed 80-120 min to x rays had decreased urine volume on the 1st days, general decrease in total urine N, increased uric acid content on 2nd day. Directly after irradiation, blood uric acid increased; was normal in 1 hr. then gradually decreased and was still below normal 24 hr post-exposure. BA 11-8173.

3910

THE INFLUENCE OF X-RAYS ON THE RETICULO-ENDOTHELIAL SYSTEM. K. I. Safronova. *Voprosy Onkologii* (Problems of Oncology) 5, 58-63(1934). (In Russian).

Storage of intravenously injected 1-3% trypan blue solution in R. E. system was diminished by application of massive x-ray doses ($3\frac{1}{2}$ - $10\frac{1}{2}$ HED) to heads of rabbits and dogs. Weaker fractionated dosage ($1/3$ - $3/4$ HED) increased storage in R. E. system. BA 11-8175

3911

CHROMOSOMES INVOLVED IN A SERIES OF INTER-CHANGES IN MAIZE. E. G. Anderson and I. W. Clokey. *Am. Naturalist* 68, 440-5(1934).

Fourteen chromosomal interchanges were isolated from x-rayed maize. Intercrosses with known interchanges, linkage and cytological identification were used to determine chromosomes involved in interchanges. Chromosomes interchanged: 5. 6, 2. 9, 4. 5, 3. 9, 1. 10, 4. 8, 3. 5, 6. 9, 2. 6, 4. 5, 2. 10, 3. 7, 5. 7, 3/8. BA 11-7818

3912

RADIATION QUALITY AND SKIN REACTION. F. Schwarz and A. Frank. *Strahlentherapie* 54(1), 83-8(1935). (In German).

Irradiation with 170 kv x rays in ionometrically equal dose, is believed to be more dangerous to skin than irradiation of 110 kv. There was no difference in skin reaction over the range from 110 kv to 80-60 kv when dose was measured with integrating thimble ionization chamber, since decreasing sensitivity of ionization chamber has compensatory effect below 80 kv. BA 11-8176.

3913

ATTEMPT TO DEVELOP REDUCED RADIO-SENSITIVITY IN JENSEN RAT SARCOMA BY MEANS OF ROENTGEN IRRADIATION. Bjorn Snellman. *Acta Radiol.* 16(5), 545-56(1935).

Reduced radiosensitivity reported in descendants of irradiated tumors is associated with slower growth, lower incidence, higher content of collagen substance, fewer

mitoses. Lethal dose in vivo for this strain of Jensen rat sarcoma is 4,000-4,500 r. BA 11-8177.

3914

STUDY OF THE QUESTION OF RADIATION EPILATION IN REFERENCE TO MENTAL DEVELOPMENT IN CHILDREN. Theo Symann. *Strahlentherapie* 55(2), 248-61 (1936). (In German).

Of 53 children subjected to x-ray epilation at 3-13 yr, 8 showed mild to marked mental retardation. No definite proof was found relating this condition to x-ray treatment. Atrophy of hair and skin; darkening of hair, lightening of hair; loss of curly hair which grew in again, but straight, were some effects noted. BA 11-8178.

3915

EFFECT OF THE ROENTGEN RAYS ON THE LIPIDS OF THE EPIDERMIS. U. J. Wile, O. J. Cameron, and H. C. Eckstein. *Arch. Dermatol. and Syphilol.* 32(1), 69-72 (1935).

Skin samples from unembalmed cadavers were irradiated (900 r unfiltered x rays, 120 kv, 30 cm, 5 ma, 9 min). Results of analysis made following extraction of lipids indicates that phospholipids and sterols of skin are readily altered by x ray. BA 11-8179

3916

CONTRIBUTION OF THE GENERAL EFFECT OF ROENTGEN RAYS. E. Woenckhaus. *Arch. exptl. Pathol. Pharmacol.* 183(2/3), 294-309(1936). (In German).

Reinjection of 200 cc of defibrinated human blood was followed by transient fall in blood sugar and by leucopenia. Reinjection of x-irradiated defibrinated blood causes white cell changes like those seen in irradiated animals; lymphopenia, rise in blood sugar, shorter coagulation time. BA 11-8180.

3917

RADIUM AND THE HUMAN LEUCOCYTES. David R. Goodfellow. *Acta Radiol.* 17(1), 1-50(1936).

Lymphocytes were blood cells most affected in 61 patients receiving Ra therapy. Mathematical relationship was demonstrated between rate of lymphocyte disappearance and dosage of irradiation. BA 11-8708

3918

THE EFFECT OF RADIUM AND ROENTGEN RAYS ON MAGNESIUM CONTENT OF SERUM AND CARCINOMA TISSUE OF UTERINE CARCINOMA. Hellmuth Winkler. *Strahlentherapie* 54(2), 294-311(1935). (In German). BA 11-8829

3919

NON-SPECIFIC "DESENSITIZATION" THERAPY FOR ALLERGIC CONDITIONS. A. Engel, C. E. Haeggstrom, and Ernst B. Salen. *Proc. 16th. Congr. Internal Med., Acta Med. Scand. Suppl.* 59, 444-62(1934). (In German).

Treatment of asthma with sulphur, tuberculin, and x rays was attempted. Specific effects of the individual treatment are not described. Seven areas of chest were exposed in succession to 1/2-1/4 H. E. D. of x rays. Results are considered not to indicate the use of x-ray therapy for allergy and asthma. BA 11-8888

3920

THE ACTION OF RADIUM EMANATION OF GRAPE YEASTS. G. K. Burgvidzh and A. A. Bachinskaya. *Microbiologia* 5(2), 240-7(1936). (Russian, English Summary).

Addition of 0.48-1.17 mc of Ra emanation/30 cc of grape juice inoculated with *S. ellipsoideus* hastened fermentation. Stimulation persisted in cultures transplanted twice. Ra emanation also affects shape of cells and produces greater vacuolation and increase in fat content of yeast cells. BA 11-9137

3921

ON THE EFFECT OF RADIUM EMANATION ON *AZOTOBACTER CHROOCOCCUM*. E. A. Shtern and N. N. Sushkina. *Microbiologia* 5(2), 253-8(1936). (Russian, English summary).

When Ra emanation capillary tubes (2.4-7.0 mc) were placed in center of Petri dishes of *A. chroococcum* cultures more active N fixing dissociates resulted. One of the new strains was able to fix 8.96 mgms of N, contrasted with 6.09 mgms/plate of Ashby medium fixed by parent culture used as control. BA 11-9168

3922

IS THERE GERM CELL SELECTION IN *DROSOPHILA MELANOGASTER*? N. I. Sapiro. *Compt. rend. acad. sci. URSS* 2(3), 119-22(1936).

Beadex Curley males were x rayed and crossed to C1B; Lobe females. C1B/Bx F₁ females were analyzed for lethals in 2nd chromosome; L/t for lethals in 2nd chromosome. Progeny from 1-6 days (post-exposure) were compared with those from 20-26 days to determine whether there was a differential effect of x rays on mature and immature germ cells in X and 2. Germinal selection of about 50% for sex-linked lethals was found. BA 11-17907

3923

THE EFFECT OF ROENTGEN RAYS ON SUMMER WHEAT (*TRITICUM VULGARE*, VAR. 'CAESUM' 0111). A. S. Afanassjeva. *Protoplasma* 25(1), 77-91(1936). (In German).

Air-dried seeds were irradiated with 125-16000 r and germinated. No effect on time of germination was observed, compared with controls; doses <16,000 r did not affect development. Cytological examination of rootlets fixed 4 days post-irradiation showed doses to 1000 r have little effect on cells although tetraploidy, more nucleoli and binucleation were seen in few instances. Larger doses caused cytoplasmic inclusions, nuclear budding, adhesion of chromosomes to equatorial plate and abnormal disjunction. BA 11-18236

3924

THE EFFECT OF ROENTGEN IRRADIATION OF DORMANT AND GERMINATING SEEDS. A. J. Atabekowa. *Protoplasma* 25(2), 234-60(1936). (In German).

Doses of 250 to 36,000 r were applied to pea (*Pisum*) seeds; 1800-2400 r decreased tendency to germinate; 36,000 r proved lethal to all seeds tested. Tetraploidy and abnormal chromosomal behavior were induced by 1000 r; disintegration of chromatin, unequal separation and shortening of chromosomes follows 8000 r. Abnormal anaphases were observed in seedlings treated with 250 r. Sensitive dose for seedlings was 250 r, for seeds, 1000 r. BA 11-18239

3925

A CONSIDERATION OF THE BIOLOGICAL FACTORS INFLUENCING THE RADIOSENSITIVITY OF CELLS. P. S. Henshaw and D. S. Francis. *J. Cellular Comp. Physiol.* 7(2), 173-95(1935).

Dry wheat was soaked for 30 min, and planted in dark, moist chambers at 26° C. Effect of radiation on growth was investigated as follows: (2) 18 hr seedlings were dried and irradiated before, during and after re-soaking; (3) seedlings were exposed to reduced O₂ supply and low temperature before irradiation to retard growth during exposure; (4) normally germinated seedlings were irradiated before, during and after asphyxiation in N. Results: no clear relationship between radiosensitivity and biological processes studied. BA 11-18244

3926

STRUCTURAL CHANGES PRODUCED IN LEAF TISSUE OF SOY BEAN PLANTS BY IRRADIATION OF THE DRY

SEEDS WITH SOFT X RAYS. Theo P. Long and H. Kersten. *Plant Physiol.* 12(1), 191-7(1937).

Dry dormant Wilson Black soy beans were irradiated with soft x rays (maximum intensity $1.54 \text{ \AA}$). Leaves of plants from these seeds showed 6 types of injury which are described. BA 11-18245

3927

EFFECTS OF X-RAYS ON ZEA MAYS. Mary A. Russell. *Plant Physiol.* 12(1), 117-33(1937).

Sprouted corn was irradiated with doses of 75-10,000 r and planted. With increasing doses, more time was required for lateral roots to appear and their point of origin on primary root became farther removed from the grain. Low temperatures after irradiation apparently lessened resulting injury. BA 11-18252

3928

RELATIVE EFFECTIVENESS OF X-RAYS AND FAST NEUTRONS IN RETARDING GROWTH. Raymond E. Zirkle and Paul C. Aebersold. *Proc. Natl. Acad. Sci. U. S.* 22(2), 134-8(1936).

Both fast neutrons and x rays retard linear growth of wheat seedling roots. In producing this effect, one ionization unit of fast neutrons is equivalent to several units of x rays. BA 11-18257

3929

THE BIOLOGICAL MEASUREMENT OF DEPTH DOSAGE WITH 165 KV AND 650 KV ROENTGEN RAYS. P. S. Henshaw and D. S. Francis. *Am. J. Roentgenol. Radium Therapy* 34(6), 789-97(1935).

Depth intensity measurements at 6 levels in paraffin phantom were obtained with 165 kv and 650 kv x rays for wheat seedlings, *Drosophila* eggs and ionization chamber. Results indicate that error may be encountered in basing biological depth dosages on measurements made with an ionization chamber for the biologically effective dose did not vary in the same manner as the dose registered by the instrument. BA 11-18368

3930

ON THE EFFECT OF INTRAVENOUS RADON INJECTION ON THE BLOOD. (EXPERIMENTAL INVESTIGATION). M. Nemenow and R. Gurewitsch. *Strahlentherapie* 50(4), 693-704(1934). (In German).

Ra emanation was applied intravenously to mice and rabbits. Fall in number of lymphocytes proportional to amount of emanation. Regeneration starts 4-6 days after treatment; normal value reached in 20 days. Many large lymphocytes seen during regeneration; erythrocytes apparently unaffected. BA 11-18369

3931

THE EFFECTS OF X-RADIATION ON THE REGENERATION OF THE HYDROID, *PENNARIA TIARELLA*. William O. Puckett. *Biol. Bull.* 70(3), 392-9(1936).

Regeneration of amputated hydranths was prevented by x irradiation; effect being apparently on differentiation rather than on proliferation of cells. Fresh tissue was regenerated but appeared powerless to differentiate into new hydranths. Effect of lead-shielding of part of an irradiated colony indicated that radiation effects are local. BA 11-18370.

3932

THE EFFECT OF X-RAYS ON THE SEX GLANDS AND THE SECONDARY SEXUAL CHARACTERS IN *L. RETICULATUS*. G. V. Samokhvalova. *Trudy po Dinamike Razvitiia Dynamics Development* 10, 213-29(1935). (Russian with English summary).

Dose of 20 H caused sterility and decreased gonad size but did not affect secondary sex characteristics of adult male fish. Testes may regenerate 3-4 mo post-exposure. Doses of 60 H caused death in 3-4 wk; 10 H reduced number in first litters by 50%, 20 H by 75%.

Underdevelopment of gonads was observed in x rayed immature males. BA 11-18371

3933

SECOND FATAL CASE OF FIBROSIS OF THE LUNGS OWING TO INDUSTRIAL RADIUM EFFECTS. Elisabeth Tonges and Heinrich H. Kalbfleisch. *Frankfurt. Z. Pathol.* 50(1), 100-22(1936). (In German). BA 11-18845

3934

THE EFFECT OF X-RADIATION ON TUMOUR PRODUCTION BY A CHEMICAL COMPOUND IN MICE, AND THE ASSOCIATED BLOOD CHANGES. W. V. Mayneord and L. Dorothy Parsons. *J. Pathol. Bacteriol.* 45(1), 35-48(1937).

Irradiation of mice either previous to or during their injection with Na 1:2:5:6-dibenzanthracene-9;10-endo- $\alpha\beta$ -succinate accelerates tumor formation and gives rise to greater number of sarcomas. Eosinophil counts show high peak at variable point during latent period in mice developing sarcomas, but not in non-sarcoma-bearing mice. Progressive rise was observed in immature cells in blood of tumor bearing animals, greatest at death. BA 11-18871

3935

STIMULATION OF LOCAL ANTIBODY FORMATION IN THE CORNEA BY GRENZ RAYS. Richard Thompson, Richard Pfeiffer, and Eduardo Gallardo. *Proc. Soc. Exptl. Biol. Med.* 36(2), 179-82(1937).

Local formation of precipitins following injection of purified egg-albumin into rabbit's cornea was increased by exposure of cornea to Grenz rays. Effect was most marked when exposures were made for several days prior to injection of antigen. BA 11-18940

3936

CHANGES IN THE NONDIVIDING NUCLEUS FOLLOWING GAMMA RADIATION. J. C. Mottram. *J. Roy. Microscop Soc.* 53(3), 213-9(1933).

Nuclei of *Infusoria*, of Jensen's rat sarcoma cells and of bean root increased in size 2-3 days after radiation when either β or γ rays were used, due to great increase in nucleoplasm accompanied by stretching of nuclear membrane. Nucleolus also increased in size. Meshes of linin network were widened. Chromatin was more dispersed and appeared to be diminished, but actually remained quantitatively the same. BA 11-12942

3937

STRUCTURAL CHANGES IN CHROMOSOMES INDUCED BY IRRADIATION OF PHYSIOLOGICAL MODIFIED CELLS. M. A. Sizova. *Compt. rend. acad. sci. URSS* 2(5), 197-8(1936).

X-ray treatment of seedling root tips resulted in more structural changes after pre-treatment with CO_2 or ammonia than in controls with no pre-treatment. BA 11-12957

3938

PRODUCTION OF MUTATIONS IN *DROSOPHILA MELANOGASTER* BY MEANS OF α PARTICLES FROM AN ATMOSPHERE CONTAINING RADON. K. G. Zimmer and N. W. Timofeefressovsky. *Strahlentherapie* 55(1), 77-84(1936). (In German).

Flies exposed for 24 hr to atmosphere containing ca 0.002 mc radon show mutation rate about 8 times the normal one. BA 11-12993.

3939

ON THE ARTIFICIALLY INDUCED MUTATIONS AND POLYPLOID PLANTS OF RICE OCCURRING IN SUBSEQUENT GENERATIONS. Kichitaro Ichijima. *Proc. Imp. Acad. (Tokyo)* 10(6), 388-91(1934).

X rays, ultraviolet rays, and temperature variations were used to produce genic and chromosomal mutations in rice. Some mutant characters appeared in immediate

progenies, others in 2nd or 3rd generations. Partial and total sterility were common. Haploid, trisomic, triploid, and tetraploid plants were identified cytologically in 2nd generations. BA 11-13001.

3940

ON HEREDITARY CHANGES PRODUCED EXPERIMENTALLY IN YEASTS. Georges Adam Nadson. Compt. rend 200(22), 1875-6(1935). (In French).

In pure cultures derived from single cell, new races were produced by x rays and radium in *Saccharomyces*, *Zygosaccharomyces*, *Torulopsis*, *Nadsonia* and *Sporobolomyces*; and also by extremes of temperature, chloroform, cyanides in *S. cerevisiae*. New races diverse and stable in various media. Changes included altered: cell size, mode of budding, colony appearance, fermentation, growth rate, and viability. BA 11-13006

3941

X-RAY MUTATIONS IN DURUM WHEAT. A. A. Sapegin. Botan. Zhpr. SSR (Botanical Journal USSR) 20(1), 3-9 (1935). (Russian with English Summary).

Spikes of *Triticum durum melanopus* were x rayed with 300 r x-ray dose prior to blooming. Seed from those spikes showed 37% germination (check, 87%). Of 266 plants from treated seed, 89 showed numerous changes in external morphology. Cytological study of F_1 showed abnormalities in meiosis. Some normal individuals gave normal F_2 plants, others showed segregation into normal and modified individuals. Nine of 89 modified plants were fertile; gave modified progenies in F_2 . BA 11-13017.

3942

MODIFICATIONS OF THE COMPOUND EYE OF *DROSOPHILA MELANOGASTER* ARISING UNDER X-IRRADIATION. C. P. Haskins and E. V. Enzmann. Am. Naturalist 1, 87-90 (1937).

Modifications of eye color and form in homozygous eosin stock of *D. melanogaster* are shown in figures and described. These modifications were found during study of production of mosaic patches of whitened or lightened ommatidia in imagos arising from x-rayed eggs and larvae. Most modifications were observed in x-rayed stock, a few were found in lower frequency in controls. BA 11-13036

3943

DOES IRRADIATION OF THE SOMA PRODUCE MUTATIONS IN THE GERM-CELLS? IU. IA. Kerkis. Doklady Akad. Nauk SSSR (Comp. Rend. Acad. Sci. URSS) 1(1), 55-61 (1935). (Russian and English).

Developing *Drosophila* pupae were irradiated over head and thorax, or over abdomen or whole body. There was no difference in number of lethal mutations seen in these groups, compared with normal mutation rate, i. e. no increased incidence of mutations after exposure to Roentgen rays was found by this investigator. BA 11-13037

3944

THE CONTRIBUTORY EFFECT OF COLD WITH IRRADIATION IN THE PRODUCTION OF MUTATIONS. N. N. Medvedev. Compt. rend. acad. sci. URSS 4(6/7), 283-5(1935).

Frequency of lethal mutations in *D. melanogaster* was determined by C1B method, compared in cultures x rayed at 0°C and at room temperature (20°C), in 4 studies with x-ray dosage ranging from 2500 to 7000 r. Mutation frequency was higher in cold series, average difference being 4.6 times the standard error. Fertility of treated parent males and F_1 flies was considerably lower in cold series. BA 11-13044

3945

ELICITING VIABILITY MUTATIONS BY ROENTGEN IRRADIATION OF *DROSOPHILA MELANOGASTER*. N. W. Timofeeff-Ressovsky. Strahlentherapie 51(4), 658-63(1934). (In German).

Irradiation (6000 r) induces recessive mutations which cause slight physiological changes as shown by decreased viability, the rate being 2.5 times greater than more extreme mutations. Total induced sex-linked mutation rate is about 1% per 20-30 r. BA 11-13051.

3946

THE EFFECT OF ROENTGEN IRRADIATION AND NONSPECIFIC STIMULI ON THE CARBOHYDRATE METABOLISM AND ERYTHROPOIESIS IN EXPERIMENTAL SARCOMA IN RATS. III. M. W. Lepskaja and A. F. Goldberg. Z. Krebsforsch. 44(5), 432-9(1936). (In German).

During growth of implanted sarcomas in rats there occurred an increase in blood sugar with terminal drop before death; decrease of Hb and red cell count. Changes were marked in irradiated animals. Least change in blood sugar and blood picture occurred in animals irradiated and subcutaneously injected with $MgSO_4$. Injection of casein lysate, along or with irradiation gave no definite results. BA 11-13922.

3947

THE QUESTION OF SKIN SENSITIVITY TO RADIATIONS IN XERODERMA PIGMENTOSUM. B. B. Heft. Acta Dermato-Venereol. 16(2), 146-55(1935). (In German).

Author found, in patient with classical xeroderma pigmentosum; normal sensitivity to ultraviolet rays in healthy parts of skin, reduced sensitivity in pathologically involved skin, normal sensitivity to heat rays and x rays, reduced sensitivity of diseased skin to chemical irritation. BA 11-14041.

3948

SPLITTING OF PROTEIN MOLECULES BY ULTRAVIOLET LIGHT AND α RAYS. T. Svedberg, Nature 143, 938(1939).

3949

METHODS FOR PRODUCING A UNIFORM ANTHRAX VACCINE AND KILLING CULTURES FOR THE VACCINE. W. K. Tschakowsky. Zentr. Bakteriell. Parasitenk. I. Orig. 134(3/4), 239-44(1935).

Anthrax vaccine was prepared which stands midway between Pasteur's Vaccine I and II. Anthrax culture was x irradiated at 135,000 volts, 25 cm distance, and a sterile disc of Pb foil was placed on culture to increase number of secondary photoelectrons. BA 11-14122.

3950

EXPERIMENTAL PRODUCTION AND CAUSE OF AN UNKNOWN MONSTROSITY: ANTERIOR SYMMELIA. Etienne Wolff. Compt. rend. 199, 1673-5(1934). (In French).

Hensen's node regions of chick embryos were irradiated at head process stage (17-20 hr incubation). After 3 days, in 5 of 6 cases, a condition resulted in which wings were either very close together or actually fused in middle of back. Other wing anomalies also were noted. Production of the anomaly was governed by law that 2 organs, normally paired, unite to form single median organ if embryonic elements normally between them before their differentiation are destroyed. BA 11-14887.

3951

ROENTGEN PATHOLOGY OF MITOSIS. I AND II. Hans Marquardt. Z. Botan 32(9/10), 401-94(1938). (In German).

Scilla campanulata root tips irradiated during four 1 min intervals in 24 min period and fixed every hr for 7½ hr and after 12 and 24 hr. Results described. Primary and secondary effects of 700 r on pollen mitosis of *Bellevalla romana* studied in second part of investigation. Effects on diploid and haploid mitosis similar. BA 12-15591

3952

THE STATE OF MITOSIS AT WHICH CHROMOSOMES ARE

RENDERED LESS SENSITIVE TO X-RAYS BY AMMONIA. Alfred Marshak. *Proc. Soc. Exptl. Biol. Med.* 39(1), 194-8(1938).

Ammonia, like x rays, apparently inhibited onion root cells from entering the prophase. Chromosome abnormalities produced by ammonia occurred chiefly in metaphase when x ray effect is negligible. Apparently, positive charged surfaces develop in chromonemata at onset of prophase and are gradually neutralized during prophase. BA 12-15592

3953

VARIATION IN DEVELOPMENT OF F₁ MICE AFTER ROENTGEN IRRADIATION OF SPERMATOGONIA, FERTILE AND UNFERTILE SPERMATOOZOA. Paula Hertwig. *Biol. Zentr.* 58(5/6), 273-301(1938) (In German).

Animals were exposed to doses of 1500-4000 r. Light doses were well tolerated, even 4000 r did not inactivate spermatozoa, but animals were sterile after 14 days. Males temporarily sterilized by 400-2000 r; F₁ showed increased embryonic mortality, defective development, decreased fertility (effects not persistent). Order of decreasing x ray sensitivity: spermiogenesis, mature sperm, spermatogonia. BA 12-15603

3954

INACTIVATION OF SPERM BY X-RADIATION IN HABROBRACON. Jane Maxwell. *Biol. Bull.* 74(2), 253-5(1938).

Different females of inbred stock were bred as follows: (1) unmated or mated to unrelated males, (2) untreated or (3) x rayed with 41,000 r or (4) 142,000 r. Offspring/day from (1): 3.12 males, (2) 1.05 males, 3.01 females; (3) 1.41 males, (4) 2.01 males. There were fewer offspring from unmated females than from mated controls, indicating presence of recessive lethals. Increasing sons/day with increasing dosage indicates failure of some sperm to fertilize and thus to kill eggs. BA 12-15615.

3955

EFFECT OF ULTRAVIOLET LIGHT AND X-RAYS ON *PERANEMA TRICHOPHORUM*. L. B. Shettles. *J. Cellular Comp. Physiol.* 12(2), 263-72(1938).

Exposure of 20 min was required to kill *Peranema* with x rays of wave length 0.03 to 0.5 mμ. BA 12-15856

3956

CYTOPLASMIC CHANGES INDUCED IN THE WALKER RAT SARCOMA 256 BY X-RADIATION OF DIFFERENT INTENSITIES. Lloyd C. Fogg and Shields Warren. *Proc. Soc. Exptl. Biol. Med.* 39(1), 91-3(1938).

Rats bearing Walker carcinoma 256 were given x ray dose of 800 r, 200 kv, at 15, 20, 25 ma. There was little variation in changes produced by different ma; series at 25 ma showed least effect or quickest recovery. BA 12-15857

3957

A THEORY OF THE ACTION OF RADIATIONS ON BIOLOGICAL MATERIALS CAPABLE OF RECOVERY. I. THE TIME-INTENSITY FACTOR. II. DELAY IN CELLULAR DIVISION. D. E. Lea. *Brit. J. Radiol.* 9(127), 489-98, (128) 554-66(1938).

Author proposes that while there are alternative mechanisms for recovery, they all lead to dose-intensity curves of practically the same shape. Cumulative dose theory is discussed. BA 12-15858.

3958

THE EFFECT OF GAMMA RADIATION ON CELLS IN VIVO. SINGLE EXPOSURES OF THE NORMAL TADPOLE AT ROOM TEMPERATURE. F. G. Spear and A. Glucksmann. *Brit. J. Radiol.* 9(128), 533-54(1938).

Effects of γ radiation (268 r/70.5 min) on tadpoles 3-6 wk and 11-14 wk old include: reduction in cell division, altered ratio of the different mitotic phases, appearance

of degenerate cells that were mitotic or premitotic. Recovery was possible after this dose and was twice as rapid in metamorphosing animals. BA 12-15859.

3959

EFFECT OF ROENTGEN RAYS ON THE PHYTOPHARMACOLOGICAL REACTION OF BLOOD. David I. Macht. *Proc. Soc. Exptl. Biol. Med.* 39(1), 1-8(1938).

Phytopharmacological study of blood samples from animals pre- and post-exposure to x rays revealed the presence of substance inhibiting plant growth. Substance was detectable a few hr. post-exposure; was found in largest amounts 24 hr later. BA 12-15914

3960

THE APPEARANCE OF INTRAPARENCHYMATOUS MYELOID FOCI DURING REGENERATION OF THYMUS TRANSPLANTS PREVIOUSLY IRRADIATED WITH X-RAYS. Ch. Gregoire. *Compt. rend. soc. biol.* 127(14), 1481-4(1938). (In French).

Under conditions of the experiment there seemed to be definite metaplasia of thymocytes into cells of myeloid series beginning with promyelocytes and going on to metamyelocytes and polymorphonuclear leukocytes. BA 12-16024.

3961

TRANSMISSION OF CHLOROLEUKEMIA OF MICE. John W. Hall and Frederick J. Knoke. *Am. J. Pathol.* 14(2), 217-25(1938).

Authors describe a strain of chloroleukemia of mice that is readily transmitted to related mice by intravenous injection of suspension of leukemic cells. Subcutaneous inoculation produces local tumor that is slower in development and less often fatal than generalized leukemia produced by intravenous injection. X ray dose of 400 r before injection results in greater percent of successful subcutaneous inoculations, but does not render unrelated mice of two different stocks susceptible to the disease. BA 12-6621

3962

QUANTITATIVE STUDIES ON THE EFFECT OF X-RAYS ON NEOPLASTIC CELLS. J. Furth, A. Tuggle, and C. Breedis. *Proc. Soc. Exptl. Biol. Med.* 38(4), 490-2 (1938).

Different neoplastic cells of mice exhibit various x ray susceptibilities, viruses producing neoplasms are far more x ray resistant than tumor cells. Exposure in vitro to 15,000 r may distinguish between virus-containing and virus-free neoplasms, as exposure renders the latter incapable of transmitting the disease. BA 12-6620.

3963

THE INFLUENCE OF X-RADIATION ON THE DEVELOPMENT OF IMMUNITY TO HETEROLOGOUS TRANSPLANTATION OF TUMOURS. Johannes Clemmesen. (Translated by Robert Fraser) London. Oxford University Press. 1938. 160p.

Subjects include: lowered resistance of rats against hetero-transplants as result of x ray exposure; serial passage of mouse sarcoma 180 in x rayed rats; effect of x irradiation before and after tumor transplantation, x ray dose and inhibition of resistance. Results of experiments using carcinoma and sarcoma are included showing that rats can be made temporarily susceptible to operative inoculation with mouse tumors by in toto exposure to strong x irradiation. BA 12-6616

3964

DIFFERENCES IN THE RELATIVE ACTION OF NEUTRONS AND ROENTGEN RAYS ON CLOSELY RELATED TISSUES. Raymond E. Zirkle and Isadore Lampe. *Am. J. Roentgenol. Radium Therapy* 39(4), 613-27(1938).

Action of neutron rays and of 200 kv x rays on roots and shoots of wheat seedlings and on *Drosophila* eggs is expressed by an X/N ratio, where X is dose in r of x

rays producing a given effect and n the number of arbitrary neutron units producing same effect. For *Drosophila* eggs 1½, 4, and 6 hr old ratios were 2, 3.2, and 2.8. For wheat-seedling roots, ratio varied from 6.2 - 11.8, for shoots 5.9--9. BA 12-6087

3965

SKIN REACTIONS CAUSED BY 1,000 KILOVOLT AND 200 KILOVOLT RADIATIONS. Robert S. Stone. Radiology 30(1), 88-93(1938).

Author compares skin effects after 200 kv and 1000 kv x rays. While an increase of 25% in r dose measured in air can be given with 1000 kv radiations, increase in dose as measured on skin, with addition of exit dose, is negligible. Amount of energy absorbed in depths as measured by thimble chamber ionization meter is not greater in many thin parts for 1000 kv than for 200 kv radiations.

BA 12-6086

3966

THE QUALITATIVE CHANGES IN THE FORMED ELEMENTS OF THE BLOOD FOLLOWING THERAPEUTIC IRRADIATION. Karl Kornblum, Fred Boerner, and Samuel G. Henderson. Am. J. Roentgenol. Radium Therapy 39(4), 601-12(1938).

In 48 patients referred for radiation therapy, analysis of blood counts indicate: occasional but insignificant reduction in number of erythrocytes, definite reduction in total leukocytes, most marked in lymphocytes, less in neutrophils, definite reduction in platelets during exposure, returning to normal after cessation of therapy.

BA 12-6084

3967

THE EFFECT OF X-RAYS ON TRYPANOSOMES.

L. Halberstaedter. Brit. J. Radiol. 11(124), 267-70 (1938).

Mouse blood rich in trypanosomes was irradiated in hollow slide with 35 kv x rays of very high intensity. A dose of about 600,000 r was required to kill all trypanosomes. About 1/50 of this dose suppressed normal division and ended infectivity. Wide variation in x ray susceptibility was found among individual organisms. Doses of same order of magnitude have same effects on *Paramecia*

BA 12-6083

3968

ABERRANT FORMS IN *DROSOPHILA* AND SEX DIFFERENTIATION. J. T. Patterson. Am. Naturalist 72(740), 193-206(1938).

Presence of a possible major sex factor was sought by x ray fragmentation of X chromosomes of *D. melanogaster*. Such a factor was not found except in small section of 4 bands located in mid-region of the chromosome. Efforts to secure males hyperploid for this small section failed, such flies apparently being non-viable.

3969

HEREDITARY DAMAGE DUE TO RADIATION. A. Pickhan. Strahlentherapie 62(2), 240-50(1938). (In German).

Author presents an analysis of effect of radiation on mutations. All rays of short wave length, ultraviolet through Ra γ rays, may cause mutations and the effect is in direct, linear proportion to order of magnitude of dose. Mutation rate is believed to be independent of λ and dose rate. Experiments on *Drosophila* are described; x ray therapy of humans discussed. Author concludes that 20 r is maximal safe dose to gonads.

3970

SALIVARY CHROMOSOME STUDIES OF LETHALS IN *DROSOPHILA MELANOGASTER*. B. M. Shizynski. Genetics 23(3), 283-90(1938).

Comparative study of spontaneous and induced lethal changes in X chromosome is reported. Crossover tests were used for genetic determinations, salivary gland chromosomes for cytological analyses. Of spontaneous

lethals, 43.3% were found to be small deficiencies as compared with 30% of induced lethals. This is believed to indicate that there is no primary difference between these two types of lethals. BA 12-10970

3971

THE INDUCTION OF OOGONIAL CROSSING OVER IN *DROSOPHILA MELANOGASTER*. Maurice Whittinghill. Genetics 23(3), 300-6(1938).

Crossing over in oogonial cells of asynaptic (Gowen) females was demonstrated by excessively clumped distribution of recombination offspring. Comparisons are made between meiotic crossing over and the various mitotic varieties, oogonial, spermatogonial, and somatic crossing over.

3972

RESULTS OF SEVERAL YEARS OF BIOLOGICAL EXPERIMENTS WITH EARTH RAYS. Karl M. Muller. Allgem. Forstg-u. Jagdztg. 114(5), 149-56(1938). (In German).

The author discusses the work of Jenny, Oehler, and Stauffer on the biological effects of the "earth rays" in Switzerland and Lautenschlager's experiments on the same problem at Munich.

3973

THE EFFECTS OF RADIATIONS ON PATHOGENIC EUMYCETES AS A FUNCTION OF THE RESPIRATION COEFFICIENT. L. Pasinetti and P. Grancini. Riv. patol. vegetale 28(5/6), 193-203(1938). (In Italian).

Study of effects of radiations on respiration of cultures of (1) *Corticium rolfsii*, (2) *Sclerotium delphinii*, and (3) *Alternaria brassicae* indicated: x rays had stimulating action, ultraviolet and sun rays a depressing effect or none at all, (1) and (2) were extra sensitive to Ra γ rays, sporulation of (3) was hastened after x ray or Ra-treatment. Biological effects were related to quantity of energy applied.

BA 12-11099

3974

THE BIOLOGICAL ACTION OF X-RAYS. A THEORETICAL REVIEW. J. A. Crowther. Brit. J. Radiol. 11(123), 132-45(1938).

Action of x rays on single cells and unicellular organisms is considered. "Poison" and "target" hypotheses are discussed.

3975

ON THE ROENTGEN RAY SENSITIVITY OF LECITHINS AND THE SENSITIVE POINTS IN PROTEIN MOLECULES. G. Kogel. Z. Krebsforsch. 47(2), 169-75(1938). (In German).

Points of x ray sensitivity of gelatin are at H-C groups, resulting in breaking up of gelatin molecule into peptid-like substances in which -CO-NH- arrangement was intact.

3976

CHANGES IN THE RETICULOCYTE LEVEL IN THE ROENTGEN IRRADIATED WHITE MOUSE. H. Langendorff. Strahlentherapie 62(2), 304-14(1938). (In German).

Effects of single doses (0.5-8 r/min) and protracted fractional doses (1 r/min) were compared for total doses of 100-1000 r. Effect of fractional method without protraction was much more pronounced on reticulocytes and organism as whole than was effect of protracted fractional dose. In general, tolerance was greater for protracted fractionated dose than for simple fractionated dose.

BA 12-11195

3977

RADIOSENSITIVITY AND CELL DIVISION. Wolfgang Luther. Strahlentherapie 62(3), 436-49(1938). (In German).

Frog eggs were exposed immediately after fertilization at intervals of 6, 10, 15 min for 5 or 6 min to Ra rays at rate of 20 r/min. Death curve for all eggs injured

before gastrula are plotted. Curve following exposures at 15 min intervals at 20°C is very similar to that for x rays at 11°C. Sensitivity of irradiated eggs was apparently dependent on stage of mitosis. BA 12-11197.

3978

ON PROTRACTED ROENTGEN DOSES. K. Nitzge and H. Iven. *Strahlentherapie* 62(1), 91-108(1938). (In German).

X ray injury curves are given for tobacco plant. Protracted dose was used, intensity 2-32 r/sec. Irradiated plants were observed on 4 different days after exposure and data are recorded. BA 12-11198

3979

ON A NEW ROENTGEN EFFECT. K. Staunig and J. Lobering. *Strahlentherapie* 62(1), 73-90(1938). (In German).

Samples of tissue taken from cattle immediately after death (sacrifice) were x irradiated and, together with controls samples, were submerged in double distilled H₂O for 24 hr. Weights of specimens before and after submersion revealed some irradiated tissues absorbed more, some less H₂O than untreated controls. "Roentgen negative" and "roentgen positive" properties are postulated. BA 12-11201.

3980

CHROMOSOME STRUCTURE. XII FURTHER RADIATION EXPERIMENTS WITH *TRADESCANTIA*. B. R. Nebel. *Am. J. Botany* 24(6), 365-72(1937).

Occurrence of "half-chromatid" lesions in chromosomes of *T. reflexa*, irradiated previous to synapsis were investigated under varying doses of x, Grenz, and γ rays. Half-chromatid lesions of presynaptic chromosomes were found in 92 cases, indicating that in living material the presynaptic chromatid is split. No wave length effect was found. BA 12-3997

3981

FREQUENCY OF INDUCED BREAKS IN CHROMOSOMES OF *DROSOPHILA MELANOGASTER*. B. P. Kaufmann and M. Demerec. *Proc. Natl. Acad. Sci. U. S.* 23(9), 484-8(1937).

Salivary chromosome analysis of 262 breaks induced by x rays in sperm indicates that these breaks occur with equal frequency in the heterochromatic Y-chromosome and in the essentially euchromatic autosomes, indicating that structure of chromonema is similar in all regions of the chromosomes. BA 12-4017

3982

ALTERATION OF CHROMOSOME SENSITIVITY OF X-RAYS WITH NH₄OH. Alfred Marshak. *Proc. Soc. Exptl. Biol. Med.* 38(5), 705-13(1938).

When *V. faba* and *A. cepa* seedlings were treated with various concentrations of NH₄OH before and during x irradiation, the percentage of chromosome abnormalities in anaphases 3 hr post exposure was greatly reduced. CO₂ in concentrations up to 80 vols percent gave no change in percentage of abnormalities induced by x rays. BA 12-7440

3983

ARTIFICIALLY INDUCED FATUOIDS IN A DWARF MUTANT OAT. R. A. Derick and R. M. Love. *Science Agr. (Ottawa)* 17(11), 703-6(1937).

Three lots of 25 seeds each of dwarf and intermediate oats were subjected to 5, 10, and 15 min x ray treatments (70 kv, 5 ma, at 12 in., no filter). Only dwarfs x rayed for 10 min produced mutations, 11 homozygous fatuoids appearing among 2000 progeny of 25 treated seeds. Mutation rate for this material was over 3%. Irregular dwarf form has a terminally attached pair of chromosomes. Induced fatuoid dwarfs have 2 quadrivalents, indicating that translocation of part of a chromosome has occurred. BA 12-4035

3984

CAUSE FOR REDUCED LITTER SIZE IN MICE AFTER ROENTGEN IRRADIATION OF SPERM. Paula Hertwig and Hildegard Bienneke. *Z. Indukt. Abstamm.-u. Vererbh.* 72(3/4), 483-7(1937). (In German).

Males irradiated to dosage of 4000 r and mated to normal females proved to be as fertile as controls. Abnormalities appear before implantation in early cleavage stages with supernumerary nuclei arising in 2-cell stage. These abnormal zygotes increase with dosage, incidence being greater than 90% after 4000 r. Further reduction in litter size is due to intra-uterine mortality as result of dominant lethals or chromosome aberrations. BA 12-4072

3985

A STUDY OF RENAL FUNCTION IN ROENTGEN RAY INTOXICATION. I. McQuarrie and G. H. Whipple. *J. Exptl. Med.* 35, 225-42(1922).

With x-ray exposures of the abdomen and shielding of the kidneys fatal intoxication may be produced without the slightest disturbance of kidney function as measured by the ability of the kidney to eliminate phenolsulfonphthalein and urea.

3986

THE COMPARATIVE EFFECTS OF NEUTRONS AND X-RAYS ON THE WHOLE BODY. John H. Lawrence and Robert Tennant. *J. Exptl. Med.* 66(6), 667-87(1937).

Clinical, bacteriological, and pathological studies on a large number of mice irradiated over whole body with neutrons or x rays indicated that similar effects occur after both forms of irradiation. Intestinal mucosa, lymphoid tissue, bone marrow, and spleen are most radiosensitive. For same amount of radiation, neutrons are more destructive biologically than are x rays. BA 12-4514.

3987

THE TIME FACTOR IN THE IRRADIATION OF MALIGNANT TUMORS. Perry J. Melnick and Albert Bachem. *Arch. Pathol.* 23(6), 757-92(1937).

Massive, fractional, protracted-fractional, and saturation methods of treating tumors with x rays were compared on 131 transplantable rat tumors. In these experiments no difference was found between effect of protracted-fractional method and simple fractional method; saturation method was found most effective. BA 12-4515

3988

SOME BIOLOGICAL EFFECTS OF CONTINUOUS GAMMA IRRADIATION, WITH A NOTE ON PROTECTION. S. Russ and G. M. Scott. *Brit. J. Radiol.* 10(116), 619-30(1937).

Rats were exposed to 148 mg Ra at distances of 50, 107, and cm for 4 mo. Controls showed faster weight increase. Of rats given largest dose, males were sterile for several months; females fertile, but young died in utero or within 2 or 3 days after birth. Those given smaller doses had lower birth rates than controls but offspring were apparently healthy. Death rate of irradiated rats was higher than that of controls. Need for adequate protection of humans in radiation work is stressed. BA 12-4516.

3989

SOME QUANTITATIVE ASPECTS OF THE BIOLOGICAL ACTION OF X AND γ RAYS. C. M. Scott. (Gr. Brit.) Privy Council Med. Res. Council Spec. Rept. Ser. 223, 1-99(1937).

Brief survey of literature on this subject is included. X irradiation of 100,000 r (80 kv, 5 ma, 12 cm, 0.1 mm Al, 550 r/min) did not change rate, rhythm or amplitude of contraction of isolated *R. esculenta* heart, 16,500 r did not affect heart's respiration or its conversion of

carbohydrate to lactic acid. Contraction of isolated auricles was unaffected by continuous exposure to β and γ rays of 5 mg Ra. X-ray effect on hatching of *Calliphora erythrocephala* eggs is described. BA 12-4517.

3990

SKIN GRAFTING AS A METHOD OF DETERMINING THE BIOLOGIC EFFECT OF RADIATION John Ungar, Jr and Shields Warren. Arch. Pathol. 23(3), 299-30(1937).

In 55 skin grafts on rabbits, irradiated skin was transplanted to normal corium. In another 55, normal skin was transplanted to irradiated corium. Epidermis irradiated sufficiently to become necrotic survived in significant proportion to cases if transplanted to normal corium immediately postexposure. Effects of combined β and γ rays are caused by both direct and indirect activity. BA 12-4518

3991

EXPERIMENTAL INVESTIGATION OF THE BIOLOGICAL EFFECT OF NEUTRONS. H. Yamashita. Gaun 31(6), 629-59(1937). (In German).

Twenty-day-old rats were irradiated with neutrons (2.4, 1.3 r/hr at 3.5 cm). Weight loss and death in 17 days occurred following 30.8 r and marked reduction in leucocytes was noted. Erythrocytes and Hb slowly decreased. Spleen, testis, ovary, and bones were reduced in size (These "r" units not comparable to roentgen doses.) BA 12-4519

3992

ELICITATION OF MUTATIONS BY BETA RAYS OF RADIUM IN *D. MELANOGASTER*. K. G. Zimmer, H. G. Griffith, and N. W. Timofeeff-Ressovsky. Strahlentherapie 59(1), 130-8(1937). (In German).

Number of sex-linked mutations was directly proportional to β ray dosage. For equivalent ionizing ability, β rays are equal in effectiveness to x and γ rays. BA 12-4520

3993

INCREASED ACOUSTIC SENSITIVITY IN DOGS FOLLOWING ROENTGEN RADIATION OF THE HYPOPHYSIS. W. J. Brogden and Elmer Culler. Am. J. Physiol. 119(1), 13-23 (1937).

Previously reported transient grain in acoustic sensitivity after x irradiation of the head was confirmed for 3 frequencies (125, 1000, and 8000 cycles). Magnitude and duration of effect were constant throughout the dosage range of 75-675 r, latency decreases as dosage increases. Relation of effect to sugar level in body fluids is suggested. BA 12-4808.

3994

LEUCOCYTIC INFILTRATION OF IRRADIATED MOUSE SARCOMA 180. Robert Chambers and C. G. Grand. Proc. Soc. Exptl. Biol. Med. 36(5), 673-5(1937).

Irradiation of sarcoma 180 induces changes which call forth an accumulation of granulocytes in the tumor. Granulocytic response and necrosis accompany one another in irradiated tumors but not in spontaneous necrotic changes of non-irradiated tumors of sarcoma 180. BA 12-4948.

3995

PRODUCTION OF EPITHELIAL TUMORS BY IRRADIATION OF A PRECANCEROUS SKIN LESION. J. C. Mottram. Am. J. Cancer 30, 746-8(1937).

Application of 1000 r of γ radiation to precancerous skin lesion was followed by more epithelial tumors than would have occurred without irradiation. BA 12-4965.

3996

EFFECT OF ROENTGEN RAYS ON THE BLOOD UREA OF RATS IMMUNE TO JENSEN'S SARCOMA. Isabella H. Perry. Arch. Pathol. 23(4), 515-6(1937).

Blood urea of immune rats was reduced after x raying, that of tumor bearing animals was not. BA 12-4969

3997

THE EFFECT OF SOFT X-RAY IRRADIATION ON BACTERIOPHAGES. Elizabeth V. Wright and H. Kersten. J. Bacteriol. 34(6), 639-44(1937).

Lytic activity of *S. aureus*, hemolytic *Streptococcus*, *E. coli* and Shiga dysentery bacilli was partially or completely inhibited by soft x rays (gas x ray tube, Cu target, most intense radiation: K_{α} 1.54 Å). Species varied in sensitivity, inhibition increased with increased dose. BA 12-5150

3998

ON SOME HISTOLOGICAL CHANGES PRODUCED IN THE MAMMALIAN BRAIN BY EXPOSURE TO RADIUM. H. A. Colwell and R. J. Gladstone. Brit. J. Radiol. 10(115), 549-64(1937).

Six rats, 18 mo old, were Ra-irradiated (Ra applicator 1.5 cm diam., 0.2 mm Ag screen, 14.63 mg Ra) over the head for 3 hr, killed at intervals up to 136 days later. Brain examination showed vascular engorgement, alteration in nerve cells, especially larger cells of cortex of hemispheres and cerebellum, basal ganglia, pons and medulla oblongata, hemorrhages, contraction of arterioles, necrosis. BA 12-5516

3999

CHROMOSOME ABERRATIONS INDUCED BY X RAYS. Karl Sax. Genetics 23(5), 494-516(1938).

Analysis of x ray induced chromosome aberrations in *Tradescantia microspores*. BA 12-12645

4000

NEW MUTANTS IN *SCIARA* AND THEIR GENETIC BEHAVIOR. H. V. Crouse and Helen Smith-Stocking. Genetics 23(3), 275-82(1938).

Six new mutants are described occurring in *Sciara* among descendants of Ra-treated flies: "stop", autosomal dominant in *S. coprophila*, "yellow", sex-linked recessive in *S. ocellaris*, "puff" and "vesiculated", autosomal dominants, "Jagged" and "ruffled", sex-linked dominants and "yellow" sex-linked recessive in *S. reynoldsi*. BA 12-7464

4001

THE PRODUCTION OF MUTATIONS IN *DROSOPHILA* WITH NEUTRON RADIATION. Mary A. Nagai and Gordon L. Locher. Genetics 23(2), 179-89(1938).

Adult *Drosophila* males (eosin) were treated with fast neutrons dislodged from Be by 4 gr of Ra and offspring were examined for lethals in X chromosome by C1B method. Lethal mutation rate in treated series was 2.6 times that of γ ray controls. Slow neutrons produced 1 lethal/300.8 F_1 flies. BA 12-7467

4002

ON THE EFFECT OF PERFUSATES FROM ROENTGEN IRRADIATED HIND LEGS OF FROGS ON THE ELECTRICAL POTENTIAL OF THE ADRENALS. Bun-ichi Hasarao. Pfluegers Arch. ges. Physiol. 240(2), 165-70(1938). (In German).

Hind legs of *R. nigromaculata* were exposed to x ray (20 min, 150 kv, 3 ma, 25 cm). Five cc perfusion fluid was injected into dark adapted frogs, unpolarizable electrodes applied to adrenals to register potentials. Perfusion fluid increased negative potential of adrenals and produced light adaptation of retinae. Effects are attributed to release of epinephrine. BA 12-7652

4003

PROXIMAL IRRADIATION THERAPY AND THE HEMATOLOGIC CURVE IN NORMAL RATS. B. Luchetta. Bol. inst. med. exptl. estud. cancer (Buenos Aires) 14(45), 521-6(1937). (In Spanish).

In proximally x irradiated rats, relative and absolute decrease in blood cells of myelogenic origin and lymphoid elements, low degree of anemia and an increase in endothelial cells were observed. Changes were less marked than those observed by others using distant irradiation. BA 12-8269

4004

THE EFFECT OF PROXIMAL RADIOTHERAPY ON MALIGNANT CELLS CULTURED IN VITRO. A. E. Roffo, Jr. Bol. inst. med. exptl. estud. cancer (Buenos Aires) 14(45), 277-98(1937). (In Spanish).

Growth after implantation of transplantable rat fibrosarcoma x irradiated with 400 r was completely arrested. With doses less than 300 r, effect was less pronounced. BA 12-8280

4005

THE EFFECT OF PROXIMAL RADIOTHERAPY ON THE MALIGNANCY OF NEOPLASTIC TISSUES A. E. Roffo, Jr. Bol. inst. med. exptl. estud. cancer (Buenos Aires) 14(45), 381-446(1937). (In Spanish).

Transplantable rat carcinoma and spindle cell sarcoma were irradiated, implanted into animals and observed 40 days later. Malignancy was diminished after irradiation and effect was greater with increase in voltage and in time of irradiation. Carcinoma showed the greater radiation effect. BA 12-8282

4006

THE SUSCEPTIBILITY OF THE GERM CELLS OF ORYZIAS LATIPES TO X-RADIATION AND RECOVERY AFTER TREATMENT. Archie N. Solberg. J. Exptl. Zool. 78(4), 417-34(1938).

X ray sensitivity and recovery of O. latipes was measured by ability of germ cells to produce normal embryos. Spermatozoa were 3-4 times as sensitive as ova; required twice as long to recover from same x ray dose. Early stages of spermatogenesis and oogenesis were most sensitive. Formation of spermatocytes from spermatogonia was inhibited by 1980 r. BA 12-8900

4007

THE SUSCEPTIBILITY OF FUNDULUS HETEROCLOTUS EMBRYOS TO X-RADIATION. Archie N. Solberg. J. Exptl. Zool. 78(4), 441-65(1938).

Changes in x ray sensitivity were measured in Fundulus embryos for 4 different doses. Except for slight rise in sensitivity in later stages of gastrulation, susceptibility decreased during development. Dose which deforms embryos at 108 hr is 10 times that required to deform embryos during cleavage. BA 12-8954

4008

DECREASE IN BIPARENTAL MALES BY X-RAYING SPERM IN HABROBRACON. P. W. Whiting. Proc. Penna. Acad. Sci. 12, 74-6(1938).

X raying of males decreased the number of male and female biparental offspring at same rate. For controls and for dosages of 2500 r, 5000 r, and 7500 r, $\frac{00}{++}$ /day were: 1.83, 0.97, 0.31, 0.06, biparental males: 1.20, 0.59, 0.17, 0.05; number of azygous males was unaffected. Results indicate that radiation is no more lethal to males than to females; type of fertilization is unchanged. BA 12-12667

4009

DEMONSTRATION OF ORGAN SPECIFIC PROTEASES IN THE URINE AFTER ROENTGEN RADIATION. R. Abderhalden. Fermentforschung 15(4), 529-35(1937). (In German).

Proteases appear in urine 15 hr after x irradiation and permit breakdown of protein from irradiated tissue cells. Secondary derangement of endocrine system follows x ray injury of pituitary. After liver irradiation there is disintegration of erythrocytes and leucocytes, liver and spleen plus transitory injury of endocrine glands. BA 12-12786

4010

EFFECT OF ROENTGEN RAYS ADMINISTERED WITHOUT FRACTIONATION OF THE DOSE ON THE TESTICLES OF THE RAT, WITH REGARD TO THE STERILIZATION OF THE

SEMINAL EPITHELIUM. R. Ferroux, Cl. Regaud, and N. Samssonow. Compt. rend. soc. biol. 128(16), 170-3(1938). (In French). BA 12-13071

4011

COMPARISON OF EFFECTS PRODUCED ON THE TESTICLES OF THE RABBIT WITH REGARD TO STERILIZATION OF SEMINAL EPITHELIUM BY EQUAL DOSES OF X-RAYS, SOME ADMINISTERED WITHOUT FRACTIONATION: SOME FRACTIONATED AND PROTRACTED. R. Ferroux, Cl. Regaud, and N. Samssonow Compt. rend. soc. biol. 128(16), 173-6(1938). (In French). BA 12-13072

4012

A SYMPOSIUM ON CANCER GIVEN AT AN INSTITUTE ON CANCER CONDUCTED BY THE MEDICAL SCHOOL OF THE UNIVERSITY OF WISCONSIN. Leiv Kreyberg. Madison, University of Wisconsin Press. 1938. 202p.

Included are papers discussing: influence of wave length on biological action of radiation, reaction of tissue cells to irradiation; radiosensitivity of various cancers. BA 12-13287.

4013

THE INFLUENCE OF WAVE-LENGTH ON GENETIC EFFECTS OF X-RAYS. Hugo Fricke and M. Demerec. Proc. Natl. Acad. Sci. U. S. 23(6), 320-7(1937).

D. melanogaster males were x irradiated with rays of 0.9 Å and 2.2 Å. Frequency of induced X chromosome lethals, determined by genetic methods, was the same for both wave lengths. BA 12-9146

4014

HABROBRACON AS A MEANS FOR TESTING THE EFFECTIVENESS OF PHYSICAL AGENTS IN CAUSING MUTATIONS. P. W. Whiting. Proc. Penna. Acad. Sci. 11, 50-2(1937).

Production of dominant lethals by radiation of sperm is manifest in Habrobrakon by decrease in female progeny/day, not compensated by increase in impatinate males (produced when sperm are lacking or inactivated). Number of females per day is reduced following a dose of 10,000 r, no females were produced after 20,000 r. Neutrons produced dominant lethals. BA 12-9165

4015

EFFECTS OF THE LENGTH OF X-RAY WAVES ON SEEDS. Arthur A. Bless. Proc. Natl. Acad. Sci. U. S. 23(4), 194-6(1937).

Seeds of corn were subjected to 5 dosages of filtered x rays (0.12-0.6 Å). Effects depended on energy absorbed, not on λ ; longer exposures produced temporary inhibitory effects. Optimum dose varied with stage of growth. BA 12-9416.

4016

TUBERIZATION OF THE COLORADO WILD POTATO AS AFFECTED BY X-RADIATION. Edna Louise Johnson. Plant Physiol. 12(2), 547-51(1937).

Results of 5 trials with numerous tubers indicate that 1 dose of 1500 r to mother tubers of Solanum jamesii favored tuberization. Treatment of unsprouted tubers gave slight increase in number of progeny and in average wt/hill. Irradiation of sprouted mothers gave marked increase in average number and weight of offspring/hill and in average wt/tuber. BA 12-9417

4017

THE STIMULATION OF YEAST RESPIRATION BY RADIATIONS. I. II. THE INFLUENCE OF KILLED CELLS ON THE RESPIRATION OF LIVING CELLS. John C. Fardon, M. Jordan Carroll, and M. Veronita Ruddy. Studies Inst. Divi Thomae I(1), 17-39(1937).

Respiration of yeast suspensions was stimulated by direct ultraviolet and x irradiation. Addition of cells killed by ultraviolet irradiation or by autoclaving to fresh yeast suspensions stimulated respiration. Growth, pH, age of culture, and storage temperature had little effect on ultraviolet stimulating effect. BA 12-9422

 ON QUANTUM BIOLOGY. P. Jordan. Biol. Zentr. 59(1/2), 1-39(1939). (In German).
- Quantum biology is defined. X ray injury, production of mutations, action of poisons and effective substances, ultraviolet light sensitivity, division of single cells, and results of virus investigations are discussed as biological quantum effects. Author postulates that cell contains an organ consisting of a small number of molecules and serving as controlling center of cell. BA 13-8868
- 4031**
 MITOTIC BEHAVIOR OF INDUCED CHROMOSOMAL FRAGMENTS LACKING SPINDLE ATTACHMENTS IN THE NEUROBLASTS OF THE GRASSHOPPER. J. Gordon Carlson. Proc. Natl. Acad. Sci. U.S. 24, 500-7(1938).
- Behavior of x ray induced chromosomal fragments in dividing neuroblasts of *Chortophaga viridifasciata* which lack spindle attachments is described and significance of the observations is discussed. BA 13-8912
- 4032**
 STUDY OF THE ACTION OF RADIUM ON CERTAIN CYTOPLASMIC PROPERTIES OF THE EGGS OF PHOLAD BARNEA CANDIDA. S. Simon. Arch. biol. (Liege) 50(2), 95-203(1939). (In French).

Eggs of pholas were β and γ irradiated with Ra. No alterations appeared if no environmental adaptations were necessary. Permeability was modified; weak doses accelerated entry of H_2O ; strong doses retarded it. Mechanical resistance of membrane was also modified. Additional changes are also described. BA 13-9107

4033

COMPARATIVE EFFECTS ON PRIMORDIAL TISSUES OF X-RADIATION AND TREATMENT WITH CERTAIN GROWTH-PROMOTING SUBSTANCES. Virginia C. Irvine. J. Colorado-Wyoming Acad. Sci. 2(5), 29(1939).

Young plants (sunflower, zinnia, tomato) treated with indole-3-acetic acid, colchicine, and α - and β -naph-oxy-acetic acid showed joining of leaf primordia and deranged phyllotaxy, effects similar to those following X irradiation. BA 13-10302

4034

AN X-RAY INDUCED INTERCALARY DUPLICATION IN *DROSOPHILA* INVOLVING UNION OF SISTER CHROMATIDS. B. P. Kaufmann and Ruth C. Bate. Proc. Natl. Acad. Sci. U. S. 24, 368-71(1938).

Intercalary mirror-imaged duplication ("reversed repeat") in left limb of 3rd chromosome was found in salivary glands of F_1 larval female descended from irradiated father. Origin of duplication is attributed to fusion at identical loci of broken ends of two sister chromatids of paternal 3rd chromosome. BA 13-7118

4035

ON A BIO-PHYSICAL ROENTGEN EFFECT. K. Staunig and J. Loebering. Kolloid-Z. 84(3), 319-23(1938). (In German).

Swelling capacity of several animal tissues was irreversibly modified by x ray treatment; due to macromolecular structure of swelling substance, not to cell structure. Medical importance; possibility of sub-microscopic method of testing for radiosensitivity. Author views x ray therapy problems as being related to electro-osmotic compensation. BA 13-7256

4036

INVESTIGATIONS ON THE EFFECT OF ULTRA SHORT WAVES ON TUMOR IMPLANTS. H. Langendorff and M. Langendorff. Strahlentherapie 64(3), 512-9(1939). (In German).

Male white mice with implanted Ehrlich-Fischer carcinoma were treated with (1) x rays (60 kv, 5 ma, 400 r/min, 2000 r effective dose in tumor), (2) short electric waves (3.2-3.8 M) combined with (1); (3) control. Combined method (2) destroyed 64.4% more tumors than (1). BA 13-7282

4037

LIFE CYCLE OF THE CELL AND RADIATION INTENSITY IN IRRADIATION. N. Motida and T. Adati. Strahlentherapie 64(3), 468-76(1939). (In German).

Doses of 5000-75000 r (80 kv, 1 mm Al, 12.25-20.05 cm FSD, 3-10 ma, 27.7-417 r/min intensity over 3 hr period) were administered to yeast cells. Optimal intensity for killing cells with minimal dose was 10,000 r at 55.5 r/min. BA 13-7283.

4038

THE CYCLOTRON. ITS APPLICATION IN MEDICINE. J. D. Cockcroft. Brit. Med. J. 1939(4071), 81(1939).

Three applications are described: (1) generation of neutrons; (2) production of isotopes, (3) production of extremely energetically charged protons, deuterons, and alpha particles. Neutron effects in tissues are considered. BA 13-7319

4039

SOME CARCINOGENIC SUBSTANCES. L. P. Bosman. S. African Med. J. 12(2), 66-8(1938).

This is a review article in which chemical constitution of carcinogenic hydrocarbons and experimental carcinogenesis

by arsenic, radioactive substances, and aniline dyes are briefly considered. BA 13-7824

4040

LUNG CANCER AMONG MINE WORKERS IN JOACHIMSTHAL. Sigismund Peller. Human Biol. 11(1), 130-43(1939).

Occurrence of all pulmonary chronic diseases, tuberculosis, silicofibrosis, and lung cancer were increased above the average in radium mine workers who died 1929-30 and 1933-38. BA 13-7848

4041

MORPHOGENESIS STUDIES BY MEANS OF X-RAYS. II. NOTE ON AN INHERITED CUTICULAR TUMOR IN *DROSOPHILA*. III. X-RAY INDUCED PERSISTENCE OF A LARVAL CHARACTER IN *DROSOPHILA*. E. V. Enzmann and C. P. Haskins. Roux' Arch. Entwicklungsmech. Organ. 138(1), 159-62(1938).

II. In flies of known genetic constitution and low viability, cuticular tumors appear frequently near the posterior edge of the mesonotum. Tumors develop less frequently in flies x rayed as larvae. III. X ray-induced localized growth which may be a persistent larval spiracle in *Drosophila* imago is described. BA 13-8055

4042

THE TREATMENT OF TRICHINOSIS-A REVIEW OF METHODS. Vernon D. Van Someren. Brit. Med. J. 1939(4077), 376-81(1939).

Methods of treatment described include use of Ra irradiation. BA 13-8713

4043

ON THE RADIOSENSITIVITY OF THE BLOOD AND OTHER TISSUES AFTER RADIUM INJECTION. van Hove. Strahlentherapie 61(2), 300-8(1938). (In German).

Radium content of blood was studied in humans by means of photographic films following intravenous injection of .01-.03 mg Ra. Ra content dropped rapidly on 4th day in some cases; 2 mo later, in others. At first, adrenals, bone marrow, kidneys, spleen, liver, lungs, pancreas, and uterus contain Ra, several weeks, later it is still found in liver, spleen, and bone marrow. BA 13-3572

4044

IS THE PHYSIOLOGICAL ACTIVITY OF POTASSIUM DUE TO ITS NATURAL RADIOACTIVITY? Anthony J. Glazko and David M. Greenberg. Am. J. Physiol. 125(2), 405-9(1939).

Physiological activity of natural K is not due to its radioactivity. Salts of artificially radioactive elements (Na^{24} , P^{32} , K^{42}) are shown to be incapable of replacing K in maintaining beat of isolated perfused frog heart. Emission of β particles by K is too low to be of physiological significance. BA 13-3545

4045

THE RATES OF ABSORPTION OF THE RADIOACTIVE ISOTOPES OF SODIUM, POTASSIUM, CHLORINE, BROMINE AND IODINE IN NORMAL HUMAN SUBJECTS. Joseph G. Hamilton. Am. J. Physiol. 124(3), 667-78(1938).

Radioactive elements were prepared in the cyclotron and given by mouth in isotonic solutions to normal human subjects in fasting state. Atoms of Na, Cl, Br, and I could be detected (by Geiger counter) in hand within 3-6 min; absorption was apparently complete in 3 hr. Atoms of K appeared in 6-15 min; complete absorption required 5 hr. BA 13-3546

4046

INVESTIGATIONS ON THE PROBLEM OF RADIUM POISONING. III. ON THE ACCUMULATION OF LONG LIVED DISINTEGRATION PRODUCTS OF INJECTED RADON IN THE ORGANISM. K. Inouye and A. Krebs. Strahlentherapie 61(2), 269-78(1938). (In German).

Following administration of emanation, long-lived disintegration products are deposited in organism,

especially in bone, bone marrow, spleen, and liver. After application of emanation in solution, Ra salts are deposited in organism. Tolerance dose for various disintegration products, especially polonium, was determined and compared with tolerance for x rays. BA 13-3573

4047

BIOLOGICAL EFFECT OF ALPHA RAYS WITH REGARD TO THE PROBLEM OF SMALL-DOSE RADIUM THERAPY. K. Inouye. *Strahlentherapie* 64(1), 175-200 (1939). (In German).

Effect of 2.55×10^{-6} gm Ra/cc of media on fibroblasts and sarcoma in tissue cultures was studied. Definite relationships was found between dose and metabolism. Effect was dependent upon temperature. Patients were placed in bath containing 17,000 to 60,000 ME (Mache-units). Leukocytosis appeared 4 to 5 hr after treatment followed at 20 hr by leukopenia. Definite correlation was found between emanation concentration in blood and variation in leukocyte count. BA 13-3574

4048

INDUCTION BY FAST NEUTRONS OF MUTATIONS IN ANTIRRHINUM AND MYOSOTIS. R. M. Chatters. *Science* 88(2280), 241-2(1938).

Some plants grown from day seeds which had been exposed to stray cyclotron neutrons produced flowers that differed in color and morphology from their controls. BA 13-1738

4049

OBSERVATIONS ON THE GRAINS OF PROVENCE. CROSS POLLINATION X-RAYS, SHORT WAVES AND MUTATIONS. L. Fondard, E. German and F. Cabasson. *Compt. rend. assoc. franc. avance. sci.* 60, 254-7 (1936-7). (In French). BA 13-1744

4050

A DETERMINATION OF THE MAGNITUDE OF THE CELL "SENSITIVE VOLUME" ASSOCIATED WITH THE WHITE-EYE MUTATION IN X-RAYED DROSOPHILA. III. C. P. Haskins and E. V. Enzmann. *Proc. Natl. Acad. Sci. U. S.* 24(3), 136-41(1938).

Young eosin larvae were x rayed at 4°C , 26°C or 46°C . Radii of corresponding sensitive volumes: 6.39×10^{-7} cm, 6.52×10^{-7} cm, 7.10×10^{-7} cm. BA 13-1769.

4051

THE INDUCTION OF DOMINANT AND RECESSIVE LETHALS BY RADIATION IN *HABROBRACON*. P. W. Whiting. *Genetics* 23(6), 562-72(1938).

Dominant lethals were induced in sperm of *Habrobracon* by x irradiation of males following a dose of 10,000-20,000 r all sperm had at least one lethal. Given 41,000-142,000 r some sperm were inactivated, some carried dominant lethals into eggs. BA 13-1784

4052

PROSPECTS FOR THE APPLICATION OF ARTIFICIAL RADIOACTIVITY. Enrico Fermi. *Ist. Sanita Pubblica* (Rome), *Renduconti* 1(2), 421-32(1938). (In Italian).

This is an account of apparatus in Instituto di Sanita Pubblica for Production of α , β , and γ rays, neutrons and artificial radioactivity substances; and of studies projected for applying these to various biological problems. BA 13-1906

4053

RADIOBIOLOGICAL STUDY ON DROSOPHILA PUPAE. A. Liechti, W. Minder, and J. H. Muller. *Strahlentherapie* 63(4), 689-700(1938). (In German).

Drosophila pupae were exposed to: (1) Grenz rays (11 kv, 200 r/min at 10 cm); (2) x rays (80 kv, no filter, and 190 kv, 1 mm Cu); (3) Ra emanation (applicators of 160, 180, 200 mg. 1.0 mm Pt filter). LD_{50} 's: (1) 4,000 r; (2) 2800 $\pm$ 200 r; (3) 4252 r (1 mgh = 7.5 r). Mortality curves are compared. BA 13-1907

4054

FURTHER STUDIES ON THE EFFECT OF ROENTGEN RAYS ON THE BONE MARROW. Hans-Wolfgang Wunsche. *Arch. exptl. Path. Pharmacol.* 189(5/6), 581-99(1938). (In German).

Bone marrow samples from irradiated rabbits showed accelerated cell maturation, with marked decrease of normoblasts and increase in polymorphs. Large doses caused rapid atrophy of marrow. Red elements were more radioresistant than white. Observations of liver, spleen, and unirradiated portions of the marrow are included. BA 13-1908

4055

THE INFLUENCE OF INGESTED RADIOACTIVE MATERIALS UPON THE THYROID GLAND OF RATS. H. D. Griffith, J. T. Irving, and E. M. Mason. *J. Physiol.* 95(4), 516-24 (1939).

Rats failed to develop any thyroid enlargement when given various radioactive substances, either when intake was adequate, or when it was abnormally low. Author concludes that radioactive substances have no influence upon the thyroid. BA 13-10859

4056

INFLUENCE OF PROTRACTION OF IRRADIATION ON THE REACTION CAUSED BY X-RAYS IN NORMAL TISSUE. D. den Hoed and B. Levie. *Acta Brevia Neerl. Physiol. Pharmacol. Microbiol.* 9(5), 115-18(1939).

Rabbit ears were irradiated with equal total doses, different intensities. Greatest intensity caused greatest injury as indicated by differences in new growth of hair, atrophy, and necrosis. BA 13-10860

4057

CONTRIBUTION TO THE KNOWLEDGE OF THE SPIRAL STRUCTURE OF CHROMOSOMES. A. de S. da. Camara. *Z. indukt. Abstamm.-u. Verebl.* 74(2), 202-15(1938). (In German).

Plants of *Aloe arborescens* were x rayed (65 kv, 5 ma for 10, 15, and 30 min, no filter), and smears made of meiosis in P. M. C. Dicentric chromatids were numerous and are attributed to end-to-end fusion of chromosomes. Chromatids contained 2 spiral chromonemata. Chromonemata were photographed. Acentric fragments were also observed. BA 12-14119

4058

ON THE ANALYSIS OF A DOMINANT EFFECT, A MUTATION WITH VARIABLE EXPRESSION IN *ANTIRRHINUM MAJUS*. H. Stubbe. *Biol. Zentr.* 58(7/8), 394-411(1938). (In German).

Observations on the x ray-induced dominant mutant *Atardata* which is viable only when heterozygous are presented. BA 12-14148

4059

NOTE OF AN UNUSUALLY TRANSMITTED LETHAL EFFECT IN X-RAYED SORGHUM. R. M. Whelden and C. P. Haskins. *Botan. Gaz.* 99(4), 872-6(1938).

Sorghum seeds x rayed at 120 r/min for 4, 8, 16, 32, 64, and 128 min, viable plants produced by all seeds except those exposed 128 min. Second generation of plants from seeds exposed 2-32 min normal. Those from 64 min group uniformly stunted with short, curled leaves and short roots. BA 12-14151

4060

POSSIBILITY OF GENE SENSITIZATION. IU. IA. Kerkis. *Izvest. Akad. Nauk SSSR, Otdel. Mat. Estestven. i Tekh. Nauki, Ser. Biol.* 1938(1), 67-74(1938). (In Russian).

Author reports results of experiments to check another's results indicating that x raying *D. melanogaster* in pupal stage may "sensitize" genes so that subsequent x radiation in adult stage approximately doubles expected mutation rate. BA 12-14156

4061

THE ATTENUATION BY X-RAYS OF THE VIRULENCE OF HUMAN TUBERCLE BACILLI. W. F. Drea. *Am. Rev. Tuberc.* 38(2), 205-28(1938).

Human tubercle bacilli, strain H37, were x rayed almost every day for several years. Virulence of descendants of x rayed bacilli, compared with that of control nonirradiated culture series from same parent, was considerably attenuated. Cultures consisted of attenuated and relatively fewer virulent bacilli. BA 12-15094

4062

THE BEHAVIOR OF *AZOBACTER CHROOCECCUM* UNDER ABNORMAL CULTURAL CONDITIONS. De Jong, Dooren, and L. E. Den. *Arch. Mikrobiol.* 9(2), 223-52(1938). (In German).

Morphological modifications in *A. chroocecum* produced under influence of Ra are described. BA 12-15139

4063

ON THE EFFECT OF ROENTGEN RAYS ON ERYTHRO-POIESIS. II. REPORT. EXPERIMENTAL INVESTIGATION OF RETICULOCYTES AFTER ROENTGEN IRRADIATION. Klaus Mardersteig. *Strahlentherapie* 61(1), 107-29(1938). (In German).

Rabbits were given total body exposure to 180 kv x rays through 0.5 mm Cu FSD 1m up to 100 r and 50 mc for doses over 100 r. Dose of 50 r stimulated bone marrow temporarily; 250 r produced brief stimulation, then inhibition, followed by regeneration; 3000-6000 r stopped bone marrow function. Irradiation of blood samples *in vitro* (up to 300 r) did not affect reticulocytes; 500-1000 r inhibited their development. BA 13-3576

4064

THE LEVEL OF RETICULOCYTES FOUND IN STUDIES ON RADIATION WORKERS. Klaus Mardersteig. *Strahlentherapie* 61(2), 279-99(1938). (In German).

Examination of blood of workers in roentgen tube factory revealed changes in white cell picture and occasional increase in erythropoietic function (expressed as increase of reticulocytes or Hb and erythrocytes). Author concludes determination of reticulocytes is reliable method for recognition of bone marrow stimulation in x ray laboratory workers. BA 13-3577

4065

COMPARATIVE INVESTIGATION OF THE QUESTION OF THE SPECIFICITY OF THE ROENTGEN EFFECT. LIGHT-, HEAT-, ROENTGEN- AND THORIUM-X-REACTION. G. Miescher. *Strahlentherapie* 61(1), 4-37 (1938). (In German).

Effect of light, heat, x rays, and thorium X on skin of guinea pig ear and human skin was studied. Effect of 300-120,000 r of x rays and thorium X paint delivering α rays absorbed in 0.1 mm thickness of tissue include: abnormal karyokinesis, amitosis, polymorphism of nuclei, and hypertrophy of entire cell which appeared as late effects. BA 13-3578

4066

THE PHYSIOLOGICAL ACTION OF NATURAL AND ARTIFICIAL RADIOACTIVITY. Joseph G. Hamilton and Gordon A. Alles. *Am. J. Physiol.* 125(2), 410-B (1939).

Effects upon pulse, respiration, and blood pressure in dogs of intravenously and intra-arterially injected isotonic solutions of chlorides of Na, K, and Rb and their artificially prepared radioactive isotopes were studied. There was no difference in physiological responses to natural as contrasted with artificial radioactive elements. Ra emanation administered intra-arterially produced no effect. BA 13-4116

4067

INORGANIC NUCLEAR CONTENT AS AN INDEX OF TUMOUR

RADIOSENSITIVITY. I. A. B. Cathie. *J. Pathol. Bacteriol.* 48(1), 1-10(1939).

Inorganic ash content of malignant tumor, demonstrated by technique of micro-incineration, affords an indication of its degree of radiosensitivity. Current theories of radiosensitivity discussed, biological variation theory supported. Author concludes that the variant in question is amount of inorganic material in nucleus. BA 13-4185

4068

ON THE DISTRIBUTION OF RADIOACTIVE SUBSTANCES IN THE BODY OF TUMOR BEARING MICE AFTER THEIR INJECTION AS THORIUM B-LINKED SOLUTIONS. C. Dittmar. *Z. Krebsforsch.* 48(2), 121-8(1938). (In German).

Selective deposition of Thorium B was attempted by its injection in "linkage" with tumor extracts, serums, colloidal metals, etc. This was unsuccessful, radioactive material being found predominantly in spleen, liver, kidneys, and bones in all instances. Author suggests that normal distribution of several metals, after artificial induction of radioactivity, might be used in cancer therapy, however. BA 13-4189

4069

NOTE ON THE BIOLOGICAL EFFECTS OF DENSELY IONIZING RADIATION. K. G. Zimmer and N. W. Timofeeff-Ressovsky. *Phys. Rev.* 55(4), 411(1939).

Authors point out that in biological reactions involving single ionization within small volume (e.g., gene mutations), uniform ionization is more effective than same amount of ionization produced in few dense tracks. X ray dose of 1000 r produces $1\frac{1}{2}$ times as many mutations as equal neutron dose, ratio maintained in range 200-2000 r. BA 13-5305

4070

THE BEARING OF THE FREQUENCIES OF X-RAY INDUCED INTERCHANGES IN MAIZE UPON THE MECHANISM OF THEIR INDUCTION. D. G. Catcheside. *J. Genetics* 36(2), 321-8(1938).

Study of x ray induced interchanges in F_1 from irradiated pollen shows individuals with 2 rings of 4 chromosomes are more frequent than those with ring of 6. Similar relation between 2 classes of rings was found after various doses. Possible interpretations of results are discussed. BA 13-5311

4071

THE EFFECT OF X-RAY DOSAGE UPON THE FREQUENCY OF INDUCED STRUCTURAL CHANGES IN THE CHROMOSOMES OF *DROSOPHILA MELANOGASTER*. D. G. Catcheside. *J. Genetics* 36(2), 307-20(1938).

Frequency of induced structural changes of chromosomes in F_1 larvae of x rayed males shows direct linear proportionality with dosages of 1000-4000 r. BA 13-5334

4072

AN EXPERIMENTAL STUDY OF THE ACTION OF RADIUM ON DEVELOPING BONES. D. Engel. *Brit. J. Radiol.* 11(132), 779-803(1938).

Bones of extremities of young animals were γ irradiated from Ra tubes or needles (filter, 0.5 mm Pt) fixed to skin or applied directly to bone. Doses of 4-25 day/mg were employed. Complete arrest of bone growth or curvature was achieved, according to whether whole epiphyseal cartilage or only part was exposed, effect proportional to dose. Chickens were less susceptible than rabbits, and these less than dogs and goats. Radiosensitivity decreased rapidly with age. BA 13-5471

4073

THE INHERITANCE STRUCTURE OF THE CELL AND ITS RELATION TO IRRADIATION EFFECTS. John W. Gowen. *Am. J. Roentgenol. Radium Therapy* 41(1), 91-7(1939).

Author explains lethal x ray effect on *Drosophila* eggs, and ultraviolet light on tobacco mosaic virus, on basis of absorption of energy within gene and chromatin structure. BA 13-5472

4074

THE BIOLOGICAL MEASUREMENT OF RADIATION QUANTITIES. P. S. Henshaw and D. S. Francis. Am. J. Roentgenol. Radium Therapy 40(6), 906-12(1938).

Authors obtained survival curves or growth retardation curves with 4 qualities of radiation (30 kv, 200 kv, 650 kv x rays, and γ rays) with a number of biological organisms in free air, on surface of large paraffin mass, and within paraffin mass. Comparative back scatter and depth dose data are presented BA 13-5473

4075

ALARM REACTION PRODUCED BY THE ACTION OF X RAYS ON THE ABDOMEN OF THE RAT. G. Segal and C. P. Leblond. Compt. rend. soc. biol. 129(26), 279-81 (1938). (In French).

Irradiation of rat abdomen provokes non-specific reaction characterized by atrophy of lymphatic organs and hypertrophy of adrenals. Reaction resembles that of shock and variety of infections. BA 13-5475

4076

HEREDITARY CHANGES IN DESCENDANTS OF FEMALE MICE EXPOSED TO ROENTGEN RAYS. George D. Snell and Forrest B. Ames. Am. J. Roentgenol. Radium Therapy 41(2), 248-55(1939).

White female mice x rayed over ovarian region (240-280 r, 200 kv, filter 0.5 mm Cu, and 1 mm Al) were mated to normal males. Of 56, 18 yielded no litters, 37 a single litter, one, 2 litters. Of 159 offspring, 3 were semisterile, 3 completely sterile, and 9 gave rise to lines probably carrying altered heredity. Offspring of controls were normal. BA 13-5476

4077

THE EFFECT OF ULTRAVIOLET RADIATION AND OF SOFT X-RAYS ON THE SEDIMENTATION BEHAVIOR AND LIGHT ABSORPTION OF PURIFIED HUMAN SERUM ALBUMIN Edward B. Sanigar, Laura E. Krejci, and Elmer O. Kraemer. Biochem. J. 33(1), 1-16(1939).

Three hr irradiation with soft x rays (29,000 r) caused no detectable change in sedimentation behavior or absorption spectrum of serum albumin. BA 13-5510

4078

CHANGES IN THE GENITAL TRACT OF GUINEA PIGS ASSOCIATED WITH CYSTIC AND "INTERSTITIAL GLAND" OVARIES OF LONG DURATION. Ida Genther Schmidt. Endocrinology 24(1), 69-81(1939).

After irradiation of ovaries of guinea pigs, normal ovarian stroma was replaced by interstitial gland cells formed from follicles of all sizes and irregular estrous cycles occurred. Within a year after exposure small endometrial cysts were common. Uterine musculature and tunica propria were replaced by fibrous tissue. Epithelial downgrowths occurred in vaginae. BA 13-5644

4079

ARGENTAFFIN (CARCINOID) TUMORS OF THE SMALL INTESTINE. REPORT OF 11 CASES AND REVIEW OF THE LITERATURE. Irving M. Ariel. Arch. Pathol. 27(1), 25-52(1939).

Regression of tumor following roentgen therapy suggests that carcinoid tumors may be radiosensitive. BA 13-5799

4080

THE EFFECT OF ROENTGEN RAYS ON TUMORS IN ANIMALS TREATED BY PROLONGED CONTINUOUS EXPOSURE OF ENTIRE BODY. Halsey J. Bagg. Am. J. Roentgenol. Radium Therapy 40(3), 418-26(1938).

Mice inoculated with mouse sarcoma 180 were kept under continuous irradiation (20 hr daily) for several

days or weeks. Tumor growth was retarded during irradiation period, while after removal from radiation room, tumors frequently resumed growth. Transplanted tumors grew as rapidly as control tumors. No summation of radiation effect was noted. There was no histological change in tumor after 20 generations of irradiation. BA 13-5800

4081

PROPERTIES OF THE TUBERCLE BACILLUS IRRADIATED WITH α RAYS. H. R. Olivier and P. Bonet-Maury. Compt. rend. soc. biol. 129(26), 301-4(1938). (In French).

Tubercle bacilli, α irradiated, act differently (with respect to allergy) than do living bacilli. BA 13-6085

4082

ON THE ACTIVATION EFFECT OF ROENTGEN RAYS ON TOBACCO MOSAIC VIRUS G. A. Kausche and H. Stubbe. Naturwissenschaften 26(45), 740-1(1938). (In German). BA 13-6651

4083

ON THE ACTIVATION EFFECT OF GAMMA RAYS ON TOBACCO MOSAIC VIRUS. G. A. Kausche. Naturwissenschaften. 26(45), 741(1938). (In German). BA 13-6652

4084

THE EFFECT OF RADIOACTIVE WATER FROM HOT SPRING ON THE LIFE SPAN UNDER OXYGEN DEPRIVATION. (STUDIES ON *DAPHNIA PULEX*). A. Fröhlich. Arch. intern. pharmacodynamic 59(1), 128-32(1938) (In German).

Daphnia deprived of air live longer in water containing Ra emanation than in their usual media, but effect is due only partly to Ra emanation. BA 12-14434

4085

AN EXPERIMENTAL STUDY OF THE EFFECTS OF ROENTGEN RAYS ON THE GONADS OF THE DEVELOPING CHICK. J. M. Essenberg and Anton Zikmund. Radiology 31(1), 94-103(1938).

Eggs before and during incubation and newly hatched chicks were exposed to 40-480 r doses of x rays and gonads were studied histologically. Dose of 100 r was sufficient to reduce mitotic index in germinal cortex of ovaries. Effects of larger doses on germinal epithelium of males and females are described. Testes were found to be more resistant than ovaries. BA 13-12695

4086

THE BIOLOGICAL ACTION OF MUSTARDS ON DORMANT SEEDS OF BARLEY AND WHEAT. J. MacKey. Acta Agr. Scand. 4, 419-429(1954).

Mustard compounds are less active than x-rays in their influence upon cells at the resting stage and their effects are less immediate. The toxicity of the mustards tends to obliterate their mutagenicity. (from abstract)

4087

MEIOSIS AND CROSSING-OVER. CYTOGENETIC INVESTIGATION OF *ANTIRRHINUM MAJUS* L. Hans Ernst. Z. Botan. 34(2), 81-111(1939). (In German).

X ray effect was reduction of chiasmata at diakinesis in strain of 50 *A. majus*. Structural changes in chromosomes from x ray treatment were cytologically visible. BA 13-12501

4088

STUDIES ON THE GENETIC BASIS OF CHLOROPHYLL FORMATION AND THE MECHANISM OF INDUCED MUTATING. A. Gustafsson. Hereditas 24(1/2), 33-93(1938).

Further results from the investigating of x raying barley seeds are reported. BA 13-12525

4089

SENSITIZATION TO X-RADIATION BY THE DIRECT ELECTRIC CURRENT. John Russell Carty. Radiology 31(4), 414-17 (1938).

X ray dose of 1500 r following 4 milliamperes at 30 volts applied to skin of rabbit produced erythema, epilation, and thrombosis. Reaction was more severe under negative pole than control under positive pole.

4090

ACTION OF WEAK RADIOACTIVITY ON THE GERMINATION OF SEEDS. D. Montet. *Compt. rend.* 194, 304-6(1932). (In French).

4091

THE EFFECT OF RADIATION APPLIED DIRECTLY TO THE BRAIN AND SPINAL CORD. I. EXPERIMENTAL INVESTIGATIONS ON MACACUS RHESUS MONKEYS. Leo M. Davidoff, Cornelius G. Dyke, Charles A. Elsborg, and Isidore M. Tarlov. *Radiology* 31(4), 451-63(1938)

Single doses (1000-7200 r) were applied to exposed CNS tissue. Motor effects and histological changes are described. After 4000 r to cerebrum; immediate paralysis of contralateral limbs, after 2000-3000 r, hemiparesis delayed several months. Immediate paraplegia occurred after 5000 r to midthoracic spinal cord, delayed after 4000 r. BA 13-12694

4092

SOME BIOLOGICAL EXPERIMENTS WITH A CONDENSER DISCHARGE TYPE OF X-RAY TUBE. K. H. Kingdon. P. A. Zahl, C. P. Haskins, and H. E. Tanis, Jr. *Radiology* 31(1), 52-8(1938).

Condenser charged to 105 kv was discharged through x ray tube at 200 r/min (3.5 r/discharge; one discharge/sec). Effects were not significantly different from those produced by usual x ray tubes on, survival of *Drosophila* eggs, fermentation of *Aspergillus* spores, elongation of wheat coleoptiles. Imposing magnetic field of 23,000 oersteds during exposure of same material caused no added effects. BA 13-12696

4093

THE ACTION OF IONIZING RAYS ON SEA URCHIN. I. THE EFFECTS OF ROENTGEN, GAMMA, AND BETA RAYS UPON UNFERTILIZED EGGS AND SPERM. Mituo Miwa, H. Yamashita, and K. Mori. *Gann* 33(1), 1-12 (1939).

Rays delayed first cleavage longer than second in *Pseudocentrotus depressus*. Effects lessened when there was an interval between exposure and insemination. There was no recovery of sperm when they were irradiated alone. Three types of radiation had similar effects on cleavage. BA 13-12699

4094

EFFECTS OF ROENTGEN RAYS ON THE ACTIVATION AND PRODUCTION OF THE ENZYME TYROSINASE IN THE INSECT EGG. (ORTHOPTERA). O. Malcolm Ray. *Radiology* 31(4), 428-37(1938).

There was no inactivation of enzyme in solution 5 min-10 days after doses up to 5000 r; no decreased activity of enzyme present in egg even after lethal doses (up to 30,000 r), but enzyme production was reduced after doses as low as 250 r. One day old eggs were most sensitive as regards depression of enzyme production. Effects on rate of production were slight when rate was maximal. BA 13-12704.

4095

THE ACTION OF IONISING RAYS ON SEA URCHIN. II. THE EFFECTS OF ROENTGEN, GAMMA, AND BETA RAYS UPON FERTILIZED EGGS. Hisao Yamashita, K. Mori, and M. Miwa. *Gann* 33(2), 117-21(1939).

Delayed cleavage was observed in irradiated *Pseudocentrotus depressus* eggs when nuclei were in early prophase. Delay of first cleavage greater than second. BA 13-12705

4096

A NEW CONCEPT OF THE RELATIONSHIP BETWEEN CELLULAR METABOLISM AND RADIOSENSITIVITY. Ph. Joyet-Lavergne. *Arch. phys. biol.* 15(1), 94-5 (1938). (In French).

Radiosensitivity and cellular metabolism are somewhat related, since both are dependant upon a respiratory enzyme which in part determines the rate of metabolism and is very sensitive to radiations. BA 13-12780

4097

INVESTIGATION OF GASEOUS METABOLISM IN HETEROPLASTIC TRANSPLANTED TUMORS. C. Seller. *Z. Krebsforsch.* 48(6), 520-31(1939). (In German).

Heterotransplanted mouse carcinoma in the rat shows accentuation of anaerobic glycolysis. After irradiation the transplanted tumor shows a shift towards normal metabolism. Fractional irradiation produces a more marked effect than single dose. BA 13-13231

4098

CUTANEOUS AND MUCOUS TYPE SQUAMOUS CARCINOMAS OF THE UPPER RESPIRATORY AND ALIMENTARY CANAL, WITH REFERENCE TO THEIR RADIOSENSITIVITY. F. Zwimpl. *Z. Krebsforsch.* 49(1), 109-36(1939). (In German).

Mucous type squamous cell carcinoma is more radiosensitive than cutaneous type. Both types are more sensitive in larynx and pharynx, cutaneous cancers of tongue are least susceptible to irradiation. BA 13-13235

4099

THE EFFECT OF LIGHT AND ULTRAVIOLET RADIATION ON PLANT RESPIRATION. Fritz Gessner. *Planta* 29(1), 165-78(1938). (In German)

Oxygen consumption of fresh water plants was not affected by 2460 r x ray treatment, in contrast to marked increase in O₂ consumption following exposure to visible light and ultraviolet. BA 13-14011

4100

STRUCTURAL ABNORMALITIES IN COTTON LEAVES FOLLOWING EXPOSURE OF THE SEED TO X-RADIATION. B. N. Singh, R. S. Choudhri, and S. L. Kapoor. *Ann. Botany (London)* 3(1), 307-12(1939).

Authors describe specific damages to leaves from dry, soaked, and germinated seeds exposed 5, 15, and 30 min. to x ray. Radiation effect was less on dry than on soaked seeds; and less on soaked than on germinated seeds. Tissues differed in their responses to irradiation. BA 13-14013

4101

A CYTOLOGICAL STUDY OF X-RAYED GRASSHOPPER EMBRYOS. Eleanor E. Carothers. *J. Morphol.* 66(3), 529-53(1940)

Single x ray doses in early prediapause produce gross morphological abnormalities, all cells in late prophase, metaphase, or anaphase during treatment die at anaphase within 24 hr. Mitotically active cells are injured most. There also occurs: engulfment of pycnotic nuclei by adjacent cells, liquefaction of cytoplasm (48 hr), lesions due to cytolysis (5 days). BA 14-11550

4102

MITOSIS IN HAIR FOLLICLE CELLS OF MICE FOLLOWING X-RADIATION. Robert T. Hance. *J. Morphol.* 66(3), 409-22(1940).

Erythema doses of x rays stimulate mitosis in follicle cells and this effect spreads even to follicles in unexposed areas (more dividing cells were found in shielded than in exposed areas). Stimulation by x ray was similar to that due to shaving except that the latter remained localized. Excision of x rayed area stopped all mitotic activity in neighboring tissue. Factor causing stimulation develops gradually and is soluble. BA 14-11553

4103

RADIATION, MUTATION AND THE GENE. P. W. Whiting. *Am. J. Roentgenol. Radium Therapy.* 43(2), 271-74 (1940).

X rays (dose of 2000-5000 r) were found to be convenient for producing mutations in *Drosophila*. Ultraviolet,

neutrons, and various culturing temperatures also effect mutations. Short radio waves and all chemicals investigated produced no results. BA 14-11563

4104

WHITE FLOWER CHARACTER FROM X-RAY TREATMENT OF TOMATO SEED. P. A. Young. J. Heredity 31(2), 78-9(1940).

White-flowered character (discovered in 1938) originated by mutation stimulated by x ray treatment of the ancestor Marglobe tomato seed. Yellow-flowered is dominant over white-flowered and segregated in 3/1 ratio. BA 14-11576

4105

RADIATION GENETICS. N. W. Timofeeff-Ressovsky and K. G. Zimmer. Strahlentherapie 66(4), 684-711 (1940). (In German)

This review contains numerous reference and important radiation genetic data in tabular and graphical form. Effects of dose, interrupted exposure and wave length including ultraviolet and neutron radiation) are discussed in terms of the physical mechanism of their effects. Various types of induced genetic change and failure of "natural" radiation to account for spontaneous mutation rates are discussed. BA 14-11599

4106

THE EFFECT OF ROENTGEN IRRADIATION UPON ERYTHROCYTES. D. H. Drummond, J. P. Tollman, and F. L. Richards. J. Phys. Chem. 44(2), 172-80(1940).

X irradiation of sheep erythrocytes caused swelling. Membrane damage resulted either from irradiation or injury due to swelling. Diminution of volume after treatment was observed in cells refrigerated for some time. Earlier findings are confirmed; no adequate explanation is believed possible. BA 14-11668

4107

RADIATION EFFECT ON DROSOPHILA. H. Langendorff and K. Sommermeyer. Fundamenta Radiol. 4(5/6), 196-209(1939). (In German).

X ray doses (55 kv, 1 mm Al, 700 r/min, less than 100 sec), administered to 2-9 hr old Drosophila eggs produce S-shaped killing curves which, according to quantum-hit theory, corresponds to 1-24 hits the highest value being characteristic for 6-hr old eggs. Doses to prevent 50% of eggs from hatching increased with age of eggs. X rays and ultraviolet effects are compared. BA 14-11670

4108

STUDIES ON THE TRANSMISSION OF FLORAL PATTERNS IN PETUNIAS. Albert Levan. Hereditas 25(2), 145-84 (1939). (In German).

X ray treatment of seeds of self-colored line causes a sector of plant to have extreme type of flower pattern which is genetically induced, due not to unstable genes, but to a number of flicking genes. BA 13-14360

4109

COMPARATIVE INVESTIGATION OF THE EFFECT OF 200 KV ROENTGEN AND GAMMA RADIATION ON THE PUPAE OF DROSOPHILA MELANOGASTER. I. DETERMINATION OF "EQUIVALENT ROENTGEN VALUES" FOR GAMMA RAYS. II. INVESTIGATION OF THE SUMMATION OF ROENTGEN AND GAMMA RAYS. J. H. Muller. Strahlentherapie 64(4), 633-54(1939). (In German). BA 13-14372

4110

INFLUENCE OF LOW TEMPERATURE ON RECOVERY FROM ROENTGEN RAYS. Evelyn Vanderwilt Cook. Radiology 32(3), 289-93(1939).

Ascaris equorum, (*Megalocephala*), var. *univalens* were x rayed with 5000 r and transferred to 5° and 25°C temperature. Cleavage was delayed at both temperatures for 2-5 hr. There was a higher percentage of normal embryos

at 5°C and percent normals increased with storage time at 5°. Controls at 5° were not affected. Recovery from x ray injury may occur in absence of appreciable metabolism. BA 13-14465

4111

NOTES ON THE ACTION OF X-RAYS ON GOLDFISH. Friedrich Ellinger. Proc. Soc. Exptl. Biol. Med. 41(2), 527-9(1939).

Single x ray doses 1,500-10,000 r (HVL 6 mm Al, 230 r/min, field 15 x 15 cm, 50 cm target/surface distance) were lethal within 14 days to *Carassius auratus*. Doses of 1000 r: 50% lethal in 14 days; fish before death (in second week) exhibiting pigment change, less activity, dyspnea. Lethal effect is attributed to destruction of lymphoid tissue in nodes and spleen. BA 13-14467

4112

ROENTGEN TREATMENT OF CERTAIN HEMORRHAGIC DISORDERS. L. H. Garland. Calif. and West. Med. 49(2), 123-7(1938).

Single x ray doses of 160 r to spleen cause an increase in blood platelets, decreased bleeding time with coincident decrease or disappearance of hemorrhagic tendency. Such a treatment method is considered for controlling post-operative capillary oozing. BA 13-14468

4113

THE EFFECT OF RADIATION ON CELL RESPIRATION. I. RESPIRATION AND ANAEROBIC GLYCOLYSIS OF MOUSE KIDNEY IN VITRO FOLLOWING RADIATION. Anna Goldfeder and Jennings L. Fershing. Radiology 31(1), 81-8(1938).

No change in O₂ consumption or R. Q. was observed following x ray (200 kv) doses of 1,800-30,000 r at 4°C or 375 mg hr Ra at 37.5°C or 4°C with up to 4,164 mg hr Ra to mouse kidney in vitro. Rn (β , γ rays) exposure of 1,180-6,170 mg hr decreases O₂ consumption and glycolysis but not R. Q. BA 13-14469

4114

THE EFFECT OF WEAK ROENTGEN RADIATION ON THE FORMATION AND COMPOSITION OF LYMPH IN DOGS. Josef Granatowicz. Wien. Arch. inn. Med. 32(5), 261-72(1938). (In German). BA 13-14470

4115

TREATMENT OF DISEASES OF THE EYE WITH GRENZ RAYS. Raymond I. Pfeiffer. Arch. Ophthalmol. (Chicago) 21(6), 976-86(1939).

Ultralong x rays of 2 Å, generated by special tube and apparatus, were found to be especially adapted to treatment of eye diseases because of low penetrance to deeper tissues. Treatment of 302 cases demonstrated this radiation to be most effective in inflammatory diseases. BA 13-14473.

4116

RESEARCHES IN THE PROBLEM OF RADIUM POISONING AND THE TOLERANCE DOSE OF RADIUM. B. Rajewsky. Radiology 32(1), 57-62(1939).

Ra content of the normal human body is given as 1.5×10^{-8} gs. Doses of 1.5×10^{-6} curie hr will alter metabolism. The lethal dose is one γ of Ra equivalent. (Study is based on tissue distribution of Ra in 2 cases of Ra poisoning.) BA 13-14474

4117

FURTHER STUDY OF THE DIRECT AND INDIRECT ACTIONS OF RADIATION ON MALIGNANT CELLS. I. TRANSPLANTATION OF TISSUE CULTURES OF MOUSE SARCOMA 180 AFTER EXPOSURE TO ROENTGEN RAYS. II. CULTURES OF TUMORS IRRADIATED IN VIVO. Kanematsu Sugiura and Irving Cohen. Radiology 32(1), 71-6(1939).

Doses of 100-10,000 r have no effect on outgrowth of sarcoma fragments. Cultures exposed to 2000 r or more

produce tumors in mice. Tumors cultured several days after in vivo exposure to 1500 r grow less readily than those cultured within 24 hr after exposure. Tumor-growth inhibitor in normal tissue is postulated. BA 13-14910

4118

OVARIAN IRRADIATION. ITS EFFECT ON THE HEALTH OF SUBSEQUENT CHILDREN. D. P. Murphy. Surg., Gynecol., Obstet. 47, 201-215(1928).

4119

SOME UNSOLVED PROBLEMS OF BIOLOGICAL RADIATION, (EXPERIMENTAL INVESTIGATION). P. del Buono. Strahlentherapie 65(1), 108-20(1939). (In German).

Effect of x ray, (140-180 kv, 0.6 mm Cu, 23-35 cm, 3 ma) on pea, wheat and sorghum seedlings depends on dose and on condition of plants. Growth may increase with low doses, diminish with doses over 100 r. BA 13-15751

4120

THE EFFECT OF α -RADIATION ON THE CELL WITH FURTHER CONSIDERATION OF NUCLEAR REACTION. Ferdinand Hercik. Strahlentherapie 64(4), 655-70(1939). (In German).

Epidermal cells of Allium cepa bulbs were irradiated with Po α -particles. Survival ratios are plotted and give curves corresponding to a 3-hit-to-kill mechanism. Dose for 50% survival: 34×10^7 α -particles/sq mm (5.1×10^5 r). Author feels "sensitive volume" is in nucleus. BA 13-15752.

4121

FLORAL DEVELOPMENT OF CERTAIN SPECIES AS INFLUENCED BY X-RADIATION OF BUDS. Edna L. Johnson. J. Colorado-Wyoming Acad. Sci. 2(5), 39(1939).

White stippling, spotting, color, and shape changes, and many other abnormalities followed one medium x ray dose given to Salpiglossis plants in bud; but buds over 1 cm long at the time of irradiation developed normally. BA 13-15753

4122

SENSITIVITY TO X-RAYS OF DIFFERENT MEIOTIC STAGES IN UNLAID EGGS OF HABROBRACON. Anna R. Whiting. J. Exptl. Zool. 83(2), 249-69(1940).

Haploid eggs of unmated irradiated females (212 r, 425 r, 850 r, 1275 r, 2500 r) may degenerate within ovary or, if laid, may not produce adults. Degeneration of eggs is correlated with dependence upon nurse and follicle cells. Lowest mortality was observed when laid eggs were exposed in late prophase, highest when eggs were treated in utero. Cleavage was observed in 64.1% of uterine eggs from treated females although most failed to hatch. BA 14-7971.

4123

ALTERATION OF CHARACTERS IN CROP PLANTS INDUCED BY X-RAY IRRADIATION. Fuyuwu Kagawa. Japan. J. Botany 10(1/2), 35-41(1939).

Germinating seeds of Secale cereale, and Solanum melongena subjected to x rays produced some plants with variegated leaves (lack of chlorophyll). X-rayed Oryza sativa plants produced normal leaves but were partially sterile, seeds produced 3.7% yellow or white plants of green sister plants (partially sterile) in third generation, 50% normal, 50% chlorophyll deficient. Self- and cross-pollination experiments, indicated that gene mutations were induced by x rays. BA 14-7981

4124

THE INFLUENCE OF LOW TEMPERATURE ON THE FREQUENCY OF TRANSLOCATIONS PRODUCED BY X-RAYS IN DROSOPHILA MELANOGASTER. George H. Mickey. Genetica 21, 386-407(1939).

X raying at 4°C increased production of translocations and much sterility in adult male flies compared to exposure at room temperature. Chromonema spiraling in mature

sperms is suggested as being ideal for small loop formation leading to chromosome breakage and interchange. Genetic changes are effected through changes in immediate gene environment. BA 14-8011

4125

THE NATURE AND PATHOLOGY OF RADIATION SICKNESS. V. H. Moon, K. Kornblum, and D. R. Morgan. J. Am. Med. Assoc. 116, 489-493(1941).

Exposure of the abdomen causes physiologic disturbances like those of shock arising from other causes. Deep roentgen irradiation causes delayed necrosis of the intestinal mucosa. The resulting signs of illness are likewise delayed in onset.

4126

EFFECTS OF ROENTGEN IRRADIATION UPON THE BLOOD VESSELS OF REPAIR TISSUE AND THE BROWN-PEARCE RABBIT EPITHELIOMA. Vincent Downing, Francis W. Bishop, and Stafford L. Warren. Am. J. Roentgenol. Radium Therapy 43(2), 249-61(1940).

Within 1 hr of irradiation (10,000 r) in vivo, red haze was observed around blood vessels (controls and tumor tissue). Gross erythema was present on fifth post-exposure day. Vessels of tissues after second day became beaded, irregular, with erratic blood flow. Endothelial reaction was the same in control and normal vessels and recovery occurred after one week. Animals were refractory to reirradiation after tumor destruction by irradiation. BA 14-8133

4127

CHANGES IN RESPIRATION FOLLOWING IRRADIATION WITH X-RAYS. John C. Fardon. William A. Sullivan, Gustave C. Brotzge, M. Kenneth Loeffler, and Mary Basilia Andrus. Studies Inst. Divi Thomae 2(2), 203-14(1939).

In vivo irradiation (45 kv, 10 ma, 25 min, target dist. 20 cm) sufficient to produce a "burn," depresses respiration of mouse skin for 13 days, followed by stimulation for 35 days. BA 14-8134

4128

SOME EFFECTS OF ROENTGEN RAYS ON SACCHAROMYCES CEREVISIAE. P. S. Henshaw and H. Turkowitz. Am. J. Roentgenol. Radium Therapy 43(1), 93-106(1940).

Growth curves obtained revealed that growth processes were delayed but not impaired by intense 200 kv x ray beams. Delay was due to death of some organisms since survivors were as vigorous as controls. Exponential form of survival curve indicates that S. cerevisiae is in the "1 hit-to-kill" category. Cells affected lethally may divide to 40 cell stage before succumbing. BA 14-8135

4129

THE EFFECT OF ROENTGEN RAYS UPON BACTERIOPHAGE. STUDIES IN BACTERIAL METABOLISM CXI. Arthur Isaac Kendall and Charlotte Anne Colwell. Am. J. Roentgenol. Radium Therapy 43(2), 262-65(1940).

Pure bacteriophages freed from all protein-like substances and containing 0.5 mg N per 100 cc were prepared for B. Coli, Flexnor and Staph. aureus; suspended in dist. water and filtered. Layers of phage 6 mm deep in uncovered Petri dishes were exposed to 8000-24,000 x ray units. No significant effect was produced. BA 14-8137

4130

STUDIES ON THE RADIOSENSITIVITY OF SEEDS AT THE ONSET OF GERMINATION. J. Lambert. Compt. rend. soc. biol. 110, 580-3(1932). (In French).

4131

THE DEVELOPMENT OF FIBROSARCOMA AS A RESULT OF THE INTRAARTICULAR INJECTION OF RADIUM CHLORIDE FOR THERAPEUTIC PURPOSES. A NEW FORM OF RADIUM POISONING IN HUMAN BEINGS.

Flemming Norgaard. Am. J. Cancer 37(3), 329-42 (1939).

Author reports a case of tibial fibrosarcoma produced by injection of 10 γ of RaCl_2 into knee joint 8 or 9 yr previously. Hyperplasia of marrow and radiation osteitis were also produced. BA 14-8139

4132

THE IMMEDIATE AND DELAYED ACTION OF X-RAYS UPON THE PROTOZOAN DUNALIELLA SALINA. H. S. Ralston. Am. J. Cancer 37(2), 288-97(1939).

Survival curves change in form with time after x irradiation. Author suggests two separate processes: (1) immediate death and cytoplasmic effects; (2) delayed death by inhibiting reproduction through action on the nucleus. BA 14-8140

4133

THE BIOLOGICAL MEASUREMENT OF GAMMA RAYS IN "EQUIVALENT ROENTGENS" WITH MOUSE SARCOMA 180 AS THE TEST OBJECT. Kanematsu Sugiura. Am. J. Cancer 37(3), 445-52(1939).

Survival curves for sarcoma 180 irradiated in vitro with 200 kv x rays and γ rays are almost identical, indicating that they produce the same types of effects. "Equivalent roentgen" value for γ rays was 96 to 114 r/min/g. With 1 cm distance, filtration of 0.5 mm platinum. This differs little from results of others' determinations on *Drosophila* eggs and pupae; and from purely physical measurements. BA 14-8143

4134

RESPIRATORY CHANGES IN VITRO IN NORMAL AND MALIGNANT TISSUES FOLLOWING IRRADIATION. Anna Goldfeder. Am. J. Cancer 36(4), 603-8(1939). BA 14-8530

4135

NEOPLASM STUDIES. VI. GRANULOCYTIC ACCUMULATION FOLLOWING IN VIVO ROENTGEN IRRADIATION OF MOUSE SARCOMA 180. C. G. Grand. Am. J. Cancer 36(4), 540-50(1939).

In vivo irradiation of mouse sarcoma causes: accumulation of granulocytes in tumor, tumor necrosis; absorption of necrotic tumor. Effects are less marked with smaller doses. Absorption begins in 6-12 hrs, is pronounced in 48-80 hr after tumor-lethal dose. Observations were checked by in vitro studies on cultures taken at various times after exposure. BA 14-8533

4136

TUMOR RESPONSE AND STROMA REACTION FOLLOWING X-RAY OF A TRANSPLANTABLE TUMOR IN INBRED STRAINS OF MICE. A. W. Oughterson, R. Tennant, and E. A. Lawrence. Yale J. Biol. and Med. 12(4), 419-25 (1940).

Histological changes and curability of tumors treated with 2500 r and 5000 r x ray doses in tumor-resistant and tumor-susceptible strains of mice as well as host reaction are discussed. Experiments emphasize importance of the host in determining tumor response to radiation. BA 14-8560.

4137

MODIFICATIONS OF THE MYELOGRAM DURING THE COURSE OF ROENTGEN THERAPY. R. Brauner and F. Gottlieb. Sang 13(9), 963-72(1939). (In French).

Small x ray doses accelerate maturation of granulocytes, increasing the number of polymorphonuclear cells in bone marrow. There is a progressive decrease in percent of immature stages; increase in more mature stages. Large doses inhibit marrow cells. Marrow changes were observed 8 min after exposure; maximum effect was observed in 24-48 hr. BA 14-8613

4138

THE EFFECTS OF X-RAYS AND RADIUM UPON

REGENERATION OF BRYOPHYLLUM CALYCINUM.

E. Naylor. Am. J. Botany 27(1), 15-17(1940).

Regeneration from leaf notches was retarded 5 min after x irradiation of B. calycinum leaves (1-85 min, 60 kv, 4-5 ma, 5-8 in. distance) and was markedly inhibited after 30 min. Results were similar after RaBr_2 exposure of 1-120 min. No marked structural changes were observed in irradiated material. BA 14-9387

4139

EFFECT OF X-RAYS ON A TUMOR OF KNOWN GENETIC CONSTITUTION. S. G. Warner and M. C. Reinhard. Proc. Soc. Exptl. Biol. Med. 42(3), 673-76(1939).

Tumors (D br B and new Buffalo) which were negative when transplanted into 3 other pure strains of mice were x rayed with doses of 50-100 r, λ effective 0.16 Å. Controlled experiments show 40% positive transplants in formerly resistant strains; carried through 4 transplant generations. Small x ray doses caused constitutional change in tumors. BA 14-4754

4140

IMMEDIATE EFFECTS OF 250 r OF X-RAYS ON THE DIFFERENT STAGES OF MITOSIS IN NEUROBLASTS OF THE GRASSHOPPER, CHORTOPHAGA VIRIDIFASCIATA. J. Gordon Carlson. J. Morphol. 66(1), 11-23(1940).

All middle prophase through early telephase stages had disappeared within 2 hr after 250 r x ray dose. Middle prophase is believed to be most radiosensitive. BA 14-6036

4141

FRAGMENTATION OF THE SECOND CHROMOSOME IN THE FEMALE OF BOMBYX MORI INDUCED BY X-RAYS AND ITS PROBABLE REFERENCE TO CROSSING OVER. Tunco Takasaki. Japan. J. Genetics 14(16), 256-9(1938). (Preliminary Note)

Heterozygous p-Y-Oa females were x rayed with 1500 r. Examination of genetic constitution of resulting apparent recombination individuals showed that they were all due to chromosome aberrations, mostly fragmentation of second chromosome. No unequivocal case of crossing over was found. BA 14-6038

4142

CONTRIBUTORY EFFECT OF HEAT WITH IRRADIATION IN THE PRODUCTION OF MUTATIONS. N. N. Medvedev. Compt. rend. acad. sci. URSS 19(4), 301-2(1938).

Temperatures of 30-39°C applied during x raying of D. melanogaster caused decrease in mutation frequency as compared with controls irradiated at room temperature. BA 14-6197

4143

UTILIZATION OF BIOLOGICAL TESTS FOR X-RAY DOSIMETRY. Fr. Carter Wood. Acta Unio Intern. contra Cancrum 4, 165-74(1939). (In French).

Drosophila eggs are believed to be ideal test objects for measuring x ray dose. LD with x rays and Ra is not influenced by wave length. Ra affects *Drosophila* less intensely than indicated by purely physical measurements. BA 14-6200

4144

ACTION OF PROTRACTED AND FRACTIONATED IRRADIATION ON CERTAIN CHEMICAL EQUILIBRIA OF THE BLOOD. H. Tellez Plasencia. Acta Unio Intern. contra Cancrum 4, 333-58(1939). (In French).

Due to cell destruction there is hydremia, decline in albumin-globulin and a decrease in chlorine content of red cell and plasma. Disturbed interrelations between endocrine and nervous regulation were noted, associated with diminished alkali reserve, increased acetone bodies and circulating glutathione; decreased blood sugar and cholesterol. BA 14-6202

4145

SOME INDICATIONS FOR ROENTGEN RAY TREATMENT.

U. V. Portmann. Calif. and Western Med. 51(4), 241-4 (1939).

Author recommends x ray therapy for: (1) superficial non-tubercular lymphadenitis, (2) Hodgkin's disease, leukemia, (3) certain endocrine disturbances: hyperthyroidism, pituitary basophilism, functional menstrual irregularities, hypopituitary amenorrheas; hypoovarian amenorrheas; dysfunction of anterior lobe of pituitary causing water retention and premenstrual edema. BA 14-6203

4146

THE IRRADIATION OF MICROORGANISMS. Ralph W. G. Wyckoff. Acta Unio Intern. contra Cancrum 4, 231-36 (1939).

Factors influencing results in experiments testing the killing, or injuring effect of radiations are discussed critically; mathematical formulae describing radiation lethal effect on larger and smaller microorganisms are presented. Lethal dose of ionizing radiation (bacteria, yeast, molds) is 10^{-6} ergs/cm³; yeast are damaged by 1/10 of this dose. Eggs of higher animals; seedlings are injured by less than 1/1000 of the lethal dose. BA 14-6204

4147

THE EFFECT OF X-RAYS ON THE GLUCOSE AND HEXOSE-PHOSPHATE GLYCOLYSIS OF TUMOR TISSUE. Barbara Elizabeth Holmes. Proc. Roy. Soc. (London) 127B(847), 223-36(1939).

Irradiation of tumors at 0°C by x or γ rays inhibits lactic acid formation from glucose. X ray dose inhibiting breakdown of glucose had no effect on formation of lactic acid from hexose di- or monophosphates or from glucose-1-phosphate. Decreased activity of dehydroglucose system in irradiated young embryonic brains was corrected by adding Co-enzyme I to the tissue. BA 14-6641

4148

PATHOLOGICAL MITOSIS IN CONNECTIVE TISSUE CELLS AFTER SINGLE ROENTGEN IRRADIATION. Wilhelm Pfuhl and Helmut Kuntz. Z. Anat. Entwicklungsgeschichte. 110(1), 98-121(1939). (In German).

Two stages of abnormal mitoses in rabbit connective tissue cells are described. These are simple "pykno-mitosis" and a "pykno-mitosis with chromosomorphosis," which are described. BA 14-6772

4149

BACTERICIDAL ACTION OF X-RAYS IN THE PRESENCE OF DYES. Chien-Liang Hsu and T. Tung. Proc. Soc. Exptl. Biol. Med. 42(3), 828-30(1939).

Pneumococcus and Streptococcus hemolyticus were killed by nonlethal x ray dose in presence of mercurochrome, similar effect of x rays in presence of Safranin O and Eosin was demonstrated on *Shigella paradysenteriae* Flexner, *Ebertheila typhosa*, and *E. coli*. *S. aureus*, sporebearing, and acid fast organism were resistant to the combined action. *S. aureus* killed by x rays and dye in presence of H₂O₂. BA 14-7096

4150

THE BLOCKING OF EXCYSTMENT REACTIONS OF COLPODA DUODENARIA BY ABSENCE OF OXYGEN. Morden G. Brown. Biol. Bull. 77(3), 382-90(1939).

Influence of temperature, concentration of excystment solution, O₂ tension, and x irradiation on time required for excystment is discussed briefly. BA 14-7743

4151

AN ANALYSIS OF X-RAY INDUCED CHROMOSOMAL ABERRATIONS IN TRADESCANTIA. Karl Sax. Genetics 25(1), 41-68(1940).

Irradiation of Tradescantia microspores produce 1-hit and 2-hit aberrations in chromatids and chromosome. Equations for aberration frequency are given. Frequency

of x ray induced initial breaks was relatively independent of temperature, but frequency of aberrations was greater in cells kept at low temperature during or after exposure, due to greater reunion of broken ends in original position at high temperatures. BA 14-4091

4152

AN X-RAY ANALYSIS OF PROGRESSIVE CHROMOSOME SPLITTING. Karl Sax and Kenneth Mather. J. Genetics 37(3), 483-90(1939).

The chromosomes of a diploid Tradescantia become effectively double with respect to x rays between 30 and 23 hr before metaphase of the first pollen grain mitosis. During this period chromosome and chromatid breaks are similarly distributed; splitting of chromosomes is accomplished in a shorter period. Chromosome and chromatid breaks progress distally from centromere. BA 14-4092

4153

INVESTIGATION OF SEX LINKED MUTATIONS DUE TO ALPHA PARTICLES. Ilse Beleites. Fundamenta Radiol. 5(3/4), 142-52(1939). (In German).

Following a 20-80 hr period of respiring in Rn atmosphere, *Drosophila melanogaster* males were tested for sex linked mutations by "CIB" technic. Internally emitted alpha particles increased mutation rate from spontaneous value by 0.19-3.69%. Radioactivity of flies checked by Geiger counter. Increase in mutation rate was proportional to time of exposure to radon but not to total ion-pair production in treatment chamber. BA 14-4122

4154

A CONTRIBUTION TO THE QUESTION OF APPLICATION OF RADIATION TO LIVING MATERIAL. B. Belluci. Strahlentherapie 65(4), 547-68(1939). (In German).

Decrease in respiratory CO₂ immediately following intense x irradiation was due to utilization of CO₂ in forming K or Na carbonates to neutralize amino acids released from protein cleavage. Respiratory CO₂ was minimal at 1 hr, maximal at 4 hr after treatment. Increased permeability of intestinal tract is attributed to release of K and Na to form carbonate buffers. BA 14-4272

4155

RADIOBIOLOGICAL CHANGES IN NORMAL BLOOD AND HEMATOPOIETIC TISSUE. G. Bignami. Haematologica Arch. 20(6), 561-616(1939). (In Italian).

Author reviews extensive literature on effect of irradiation on blood and blood forming organs and tissues in the normal state. Bibliography is not included. BA 14-4273

4156

EXPERIMENTAL EVIDENCE OF THE BIOLOGICAL EFFECT OF COSMIC RADIATION. J. Eugester, A. Sperlich, W. Hauptmann, H. Holzl, and L. Jager. Fundamenta Radiol. 5(3/4), 134-41(1939). (In German).

The effects of cosmic rays were observed in seeds of *Linum usitatissimum*, *Antirrhinum majus*, and eggs of *D. melanogaster*, and female rabbits shielded with 18 mm Pb plate at altitude of 24000 m. Preliminary results (effects on growth of seeds and eggs; changes in ovaries) are expressed qualitatively. BA 14-4274

4157

RADIUM POISONING; A REVIEW OF PRESENT KNOWLEDGE IN RELATION TO WAR RISKS. J. Read. Brit. J. Radiol. 12(143), 632-7(1939).

Author reviews the literature on radium poisoning and inhalation of dust; no new material presented. Possibility or probability of an individual receiving a lethal dose of radioactive material through occupational exposure is considered. Brief abstracts of more important articles are included. BA 14-4280.

4158

THE TREATMENT OF TUBERCULOSIS OF THE ANTERIOR PORTION OF THE EYE WITH BETA RAYS OF RADIUM.

A. C. Woods. Arch. Ophthalmol. 22(5), 735-42(1939)

Ten cases of tuberculosis keratitis showed subsidence of all inflammation after one treatment with β rays of Ra. There were two recurrences. Three cases of tuberculous scleritis showed greater resistance and required treatment over greater period of time. Possible mechanisms of β ray effect are discussed. BA 14-4285

4159

THE LAMBDA FACTOR IN RADIO-BIOLOGY. M. Lapenna. Strahlentherapie 65(2), 247-82(1939). (In German).

Wave length effect of x ray and Ra on skin, tumors, biochemical reactions, and smaller test organisms is reviewed. Original data on growth of *Vicia faba equina* seedlings following 160 kv and 110 kv x-ray treatment, all doses 570 r-units of Ra radiation are included. Clinical experiments on cholesterol are also reported. BA 14-4279

4160

IRRADIATION OF CANCER FOLLOWING INJECTION OF COLCHICINE. M. F. Guyer and P. E. Claus. Proc. Soc. Exptl. Biol. Med. 42(2), 565-68(1939).

By administering colchicine 15 to 18 hr before irradiation to rats bearing actively growing carcinoma, the effectiveness of x ray in destroying or retarding growth of the cancer was increased. Light frequent dosages of x ray were more effective than heavy infrequent doses. BA 14-4729

4161

EWING'S TUMOR SIMULATING SARCOMA OF SOFT-TISSUE ORIGIN. A CLINICAL, PATHOLOGICAL, AND RADIOTHERAPEUTIC STUDY OF FOUR CASES. Henry Potosky and Jacob R. Fried. Am. J. Cancer 36(1), 1-11(1939).

Soft tissue component of tumor regressed rapidly after radiotherapy, original tumors in each case being radiosensitive. Two recurrent tumors were irradiated and proved radioresistant. Resistance is attributed to alteration in stroma of neoplasm. BA 14-4747

4162

THE EFFECTS OF HARD X-RAYS AND ULTRA VIOLET LIGHT UPON FOWL POX VIRUS IN VITRO. Robert Graham, C. A. Brandly, and Norman D. Levine. Cornell Vet. 29(4), 383-91(1939).

Irradiation of aqueous suspensions of fowl-pox virus with hard x rays in dosages up to 888 r had no effect on the virus. Effect of ultraviolet is described for comparison. BA 14-5055

4163

FLORAL DEVELOPMENT OF CERTAIN SPECIES AS INFLUENCED BY X-RADIATION OF BUDS. Edna Louise Johnson. Plant Physiol. 14(4), 783-95(1939).

Blossoms of *Salpiglossis sinuata*, *Phlox drummonal*, and *Nicotiana tabacum* x irradiated in reproductive stage with single medium dose showed 10 types of floral anomalies: stippling, spotting, streaking of corolla and color changes in early blooming, split corolla, dissected margin of corolla lobes, puckered corolla tissue, abnormal number of corolla lobes, dwarf blossoms in middle and later flowering period. BA 14-5643

4164

THE EFFECT OF ROENTGEN IRRADIATION ON THE LYMPHATIC TRANSPORT OF INDIA INK. Everette Sugabaker and Kanematsu Sugiura. Am. J. Roentgenol. Radium Therapy 44(5), 756-61(1940).

Young albino rats were injected with India ink-distilled water solution and subsequently x irradiated (750, 1500, or 3000 r at 200 kv). Deposition of pigment in axillary or mediastinal nodes was no greater in irradiated than in non-irradiated animals. BA 15-7692

4165

DEVELOPMENTAL EFFECTS RESULTING FROM EXPOSURE TO X RAYS. II. DEVELOPMENT OF LEOPARD FROG EGG ACTIVATED BY BULL PROG SPERM.

Roberts Rugh and Frank Exner. Proc. Am. Phil. Soc. 83(5), 607-17(1940).

Hybrid crosses involving irradiated sperm enhanced development beyond gastrula stage, when dose was raised to 66,000 r, up to 80% developed to tadpole stage, most of which were parthenogenetic-like haploids. Some maternal diploids were also produced. Exposure-effect relation suggests progressive abolition of hereditary function of sperm. (Hybrid cross with non-rayed sperm produced nonviable embryo.) BA 15-8181

4166

DOSIMETRIC AND RADIO-BIOLOGIC STUDY WITH FAST NEUTRONS. III. Karl G. Zimmer. Strahlentherapie 68(1), 74-8(1940). (In German).

Phantom of stearin-paraffin mixture was exposed to fast Li and D neutrons and x rays. Ionization produced (measured by condensor type chambers) was approximately the same for a field of 150 cm², distance 23 cm, neutron irradiation as with x rays of an HVL of 1.35 mm Cu. BA 15-7694

4167

THE INFLUENCE OF INTRACELLULAR ACIDITY ON THE RADIOSENSITIVITY OF VARIOUS ORGANISMS.

Raymond E. Zirkle. J. Cellular Comp. Physiol. 16(3), 301-11(1940).

Drosophila eggs 2 hr and 4.5 hr of age were exposed during x irradiation to various concentrations of penetrating acid (CO₂) and radiosensitivity was deduced from percent hatching and survival curve in comparison for values for normal eggs. Radiosensitivity-acidity curves are explained by assuming that total radiosensitivity is due to several reactions, each with maximal yield at a characteristic pH. BA 15-8645

4168

COMMON ERRORS IN THE DIAGNOSIS AND TREATMENT OF THE ANEMIAS. P. A. Tuckwiller. Southern Med. J. 33(2), 216-18(1940).

X rays are listed as one cause of anemia. BA 15-8462

4169

THE INDEPENDENT ORIGIN OF AMPHIBIAN RED CELLS AS SHOWN BY DIFFERENTIAL SUSCEPTIBILITY TO X-RAYS. John A. Cameron. Biol. Bull. 79(3), 419-22(1940).

Exposure of neurulae of *Ambystoma jeffersonianum* to 1000 r of x rays produced 9 with no hemopoiesis in blood island, 21 with reduced or retarded hemopoiesis. Heart and endothelium formed in all cases (not eliminated by x-rays) thus implying the physicochemical, morphological, and positional distinction between the anlage of the hemopoietic centers and those of the heart and endothelium. BA 15-8614

4170

THE ROENTGEN RADIATION OF PAPILLOMA VIRUS (SHOPE).

I. THE EFFECT OF X-RAYS UPON PAPILLOMAS ON DOMESTIC RABBITS. J. T. Syverton, R. A. Harvey, J. P. Berry, and S. L. Warren. J. Exptl. Med. 73(2), 243-8(1941).

Tumors on rabbit ears were irradiated in vivo with graded, massive and fractional (600 r on successive days) doses from 250-6000 r, 200 kv, 25 ma, 160 r per min. Papillomas were permanently destroyed by 3600 r (80% destroyed by 3000 r) administered massively or fractionally. BA 15-8850

4171

ACTION OF RADIOACTIVE RADIATION ON THE MULTIPLICATION AND STRUCTURE OF MICROORGANISMS.

S. Metelnikov and A. Yakimach. Ann. inst. Pasteur 64(1), 47-54(1940). (In French).

Cultures of *Sarcina*, Tubercle bacilli, and other organisms were exposed to radium emanations (through capillary tubes introduced in cultures). Growth was stimulated by weak doses, growth inhibition or death occurred after strong doses. After irradiation, cocci and rods with various forms, sizes and pigment variations appeared. BA 15-9057

4172
EFFECT OF X-RAYS ON THE STRUCTURAL VISCOSITY OF PROTOPLASM. H. T. Northen and R. MacVicar. *Biodynamica* 3(59), 28-32(1940).

Contents of filaments of *Spirogyra* exposed to 250-5000 r from tungsten target were more easily displaced by centrifugation than filament contents in controls. Decreasing structural viscosity was followed by rise or fluctuation after longer exposures. Changes are attributed to dissociation and re-association of protein molecules in protoplasmic network. BA 15-9395

4173
DIFFERENTIAL SENSITIVITY OF CELLS TO X-RAYS. Karl Sax and C. P. Swanson. *Am. J. Botan.* 28(1), 52-9 (1941).

Cell sensitivity to x rays, measured by frequency of induced chromosomal aberrations, is greatest shortly before mid-prophase in *Tradescantia*. Microporocytes are most radiosensitive, generative cells most resistant, haploid microspores more sensitive than diploid microspores. Difference in sensitivity is attributed to differences in chromosome structure and freedom of movement. BA 15-9434

4174
RADIOACTIVE ION DISTRIBUTION IN PROTOPLASMIC GRANULES. Lorin J. Mullins. *Proc. Soc. Exptl. Biol. Med.* 45(3), 856-8(1940).

Internodal cells of *Nitella* species were immersed for 0.25-8 hr in 0.01 M radioactive K^*Cl or $Na_2HP^*O_4$, then centrifuged to displace all granules longitudinally. Radioactive determinations of bisected cells show that radioactive elements concentrate in granules during immersion. BA 15-9463

4175
STUDIES ON THE TWORT-D' HERRELLE PHENOMENON. VI. EVALUATION OF THE SIZES OF BACTERIOPHAGES BY MEANS OF X-RAYS. E. Wollman and A. Lacassagne. *Ann. Inst. Pasteur* 64(1), 5-39(1940). (In French)

Radioresistance of bacteriophage is apparently dependent upon particle size. (Several phages on agar plates were subjected to x rays and plates were then inoculated with appropriate organisms. Observations on these were compared with observations when phase suspensions were irradiated first and then spread on plates along with bacteria). BA 15-8856

4176
EFFECTS OF FAST NEUTRONS UPON PLANTS, II. ABNORMAL BEHAVIOR OF MITOSIS IN *VICIA FABA*. Y. Nishina, Y. Sinoto, and D. Sato. *Cytologia* 10(3), 406-21(1940).

Primary effects of fast neutrons on mitosis in *V. faba* root-tips are: precocious chromosome formation, aberration and acceleration of mitotic process from metaphase to telophase. Chromosome formation ceases 40 hr after irradiation, commences again after 96 hr, showing such secondary effects as fragmentation, fusion of chromosomes, and irregular divisions. BA 15-14132

4177
AN ANALYSIS OF X-RAY INDUCED SINGLE BREAKS IN NEUROBLAST CHROMOSOMES OF THE GRASSHOPPER (*CHORTOPHAGA VIRIDIFASCIATA*). J. Gordon Carlson. *Proc. Natl. Acad. Sci. U. S.* 27(1), 42-7(1941).

Hypothesis that a single chromosomal break results from a single ionization or excitation is supported by:

(1) linear proportionality between dosage (r units) and number of breaks, (2) absence of threshold below which no breaks occur, (3) close correspondence between observed and expected distribution of breaks among different cells after each dose. Only a small percentage of ionizations produced are effective in producing breaks. BA 15-14187

4178
MECHANISM OF THE ORIGIN OF THE X-RAY INDUCED NOTCH DEFICIENCIES IN *DROSOPHILA MELANOGASTER*. M. Demerec and U. Fano. *Proc. Natl. Acad. Sci. U. S.* 27(1), 24-31(1941).

Most short deficiencies (including less than 15 bands on chromosome) probably arise as result of a "single event" process, having a radius of action of about 600 A. Deficiencies of more than about 15 bands result from two independent events. BA 15-14188

4179
THE TIME INTERVAL BETWEEN X-RADIATION OF SPERM OF *DROSOPHILA* AND CHROMOSOME RE-COMBINATION. B. P. Kaufmann. *Proc. Natl. Acad. Sci. U. S.* 27(1), 18-24(1941).

Sperm of *D. melanogaster* was x irradiated with two equivalent doses, one continuously, one fractionally. No appreciable "healing" occurred, even with 16-day interval between fractions. Presence of multiple-break, complex rearrangements following fractionated treatment supports theory that breakage precedes reunion. BA 15-14196

4180
ON A SET OF SERIAL INVERSIONS IN THE X-CHROMOSOME OF *DROSOPHILA VIRILIS*. Taku Komai and Takesi Takaku. *Japan J. Genetics* 16(1), 10-13(1940). (In Japanese, Eng. sum.)

Strain bearing two independent inversions on X chromosome was obtained by x irradiation. When inversions exist together, crossing-over is suppressed in parts included in inversion, also in uninverted intercalary segment. Part distal to both of them shows only slight suppressing effect. BA 15-14197

4181
THE EFFECT OF RADIATION ON AMPHIBIAN SKIN BEFORE AND AFTER METAMORPHOSIS. Wolfgang Luther. *Naturwissenschaften* 27(43), 713-20(1939). (In German).

Effects of 235-1100 r x ray dose on macroscopic and microscopic characters of salamander larvae skin include: increased black pigment granules in epidermal cells, blocking of reproduction in tissues, absence of multicellular glands, inhibition of regeneration (complete at 660 r), slow development, eventual death due to epidermolysis. BA 15-14330

4182
STUDIES ON THE GLUTATHIONE CONTENT OF THE TISSUES OF RABBITS IN WHICH PART OF THE HYPOPHYSIS HAD BEEN IRRADIATED WITH X-RAY. Takao Yaguchi. *Sei-i Kai Med. J.* 59(6), 700-14(1940). (In Japanese with English Summary).

Small x ray doses directed to hypophysis of rabbits increase the glutathione content of the ovary. Large dose causes a remarkable increase in glutathione content of suprarenal glands. BA 15-14331.

4183
CONTRIBUTION TO THE STUDY OF THE ACTION OF POLONIUM ON PLANT CELLS. R. Villars. *Compt. rend. soc. biol.* 131(19), 677-80(1939). (In French)

Polonium hydrochloride solution containing 0.8% NaCl, traces of HCl, 200 microcuries of Po(RaF) per cc, acting upon meristems of radicles of *Vicia faba*, *Pisum sativum*, and *Pinus pinea*, affected cells in mitosis but did not affect spindle. Hence, polonium is a poison

for chromatin (unlike colchicine-type chemicals); does not affect chondriome. BA 15-15549

4184

THE INFLUENCE OF X-RAY DOSAGE ON GERMINATION. K. Froler and A. Gustafsson. Svensk Botan. Tidskr. 35, 43-56(1941).

X ray effect on seeds of winter wheat and barley were studied. Mortality diagrams are presented and discussed in relation to variations in water content of seeds. BA 15-15570

4185

THE EFFECT OF GAMMA RADIATION ON THE PERMEABILITY OF THE CELL. J. Petrova. Beih. Bot. Centr. 60A(1/2), 843-87(1940). (In German).

In *Zygnema*, hard γ rays of Ra reduced absorption of KNO_3 , permeability of cells to M solution of urea, and absorption of dilute (0.05-0.1 M) KI solution. Both absorption and cell division exhibited wave of injury, recovery, and again injury. Biological effects of β and γ rays are apparently the same when equal amounts of energy are absorbed. BA 15-15574

4186

THE EQUIVALENT EFFECT OF X-RAYS OF DIFFERENT WAVE LENGTH ON THE CHROMOSOMES OF *TRADESCANTIA*. A. C. Faberge. J. Genetics 40(3), 379-84(1940).

Chromosome bodies in *Tradescantia* pollen grain divisions were scored after treatment with 1500 r at 0.44 A and 0.077 A. Means were 8.27 and 8.16, respectively, their difference being less than its S. E. No evidence of a differential wave-length effect on chromosome breakage was found. BA 15-10006

4187

TWO EXTREME X-RAY MUTATIONS OF MORPHOLOGICAL INTEREST. Ake Gustaffson and Ewert Aberg. Hereditas 26(3/4), 257-61(1940).

Irradiated barley of Golden var. (*Hordeum distichum* var. *nutans*) produced: (1) 2-flowered mutant (2 flowers within each lemma) yielding a segregation of 3 normal to 1 mutant, the latter being sterile; (2) mutant with lemma-like glumes with a long awn (normal glume in this variety is linear with short awns). BA 15-10008

4188

GOITER INCIDENCE IN NEW ZEALAND CORRELATES WITH RA EMANATION IN CITY WATER. R. R. D. Milligan. Trans. Proc. New Zealand Inst. 58, 283-5(1927).

Ra emanation experimentally fed to rabbits did not produce goiter.

4189

EFFECTS OF X-RAYS ON THE PERMEABILITY OF ERYTHROCYTES TO WATER AND CERTAIN NON-ELECTROLYTES. T. P. Ting and Raymond E. Zirkle. J. Cellular Comp. Physiol. 16(3), 268-76(1940).

Following 33,000 x ray dose, beef erythrocytes exhibited the following increase in permeability as compared with non-irradiated controls: to water, 20%, to thiourea, 6%, and to ethylene glycol, 3.5%. BA 15-10255

4190

EFFECTS OF X-RAYS ON THE VAPOR PRESSURE OF BLOOD AND ITS COMPONENTS. T. P. Ting and Raymond E. Zirkle. J. Cellular Comp. Physiol. 16(3), 277-83(1940).

After 33,000 r x ray dose, human and beef erythrocytes and whole blood exhibited easily measurable decreases in vapor pressure. Practically all the change occurred in erythrocytes. BA 15-10256

4191

STUDIES ON THE CELL DIVISION IN IRRADIATED TUMORS. Luigi Gallavresik. Tumori 26(3/4), 171-263(1940). (In Italian).

Following intense irradiation of 3 cases of mouth epithelioma and 1 case of skin spindle cell sarcoma there

was a definite decrease in number of mitoses and an increase in atypical mitoses. Appearance of multinucleated cells was observed over a long period. Occurrence of amitosis was little influenced showing greater resistance of this process to irradiation. Effects of fractionated and prolonged exposures are compared. BA 15-10578

4192

AN UNSTABLE BACTERIAL MUTANT OBTAINED EXPERIMENTALLY. S. Ghelelovitch. Ann. Inst. Pasteur 64(3), 255-63(1940). (In French).

A *Sarcina* with salmon colored colonies was derived from a strain with yellow colonies by irradiation, when Ra-irradiated again 9 months later, a non-pigmented variant resulted which dissociated after 4-6 days into salmon colored form with properties of original culture. Salmon colonies fermented dextrose and liquefied gelatin; colorless forms did not. BA 15-11054

4193

EFFECT OF X-RADIATION ON THE GERMINATION OF CHLAMYDOSPORES OF *USTILAGO HORDEI*. H. A. Rodenhiser and L. R. Maxwell. Phytopathology 31(2), 175-81(1941).

Chlamydospore germination was not materially affected by doses to 100 kilo-roentgens (kr); non-viable spores and germination time of viable ones increased with dosage up to 1000 kr which is LD₁₀₀. Effects of certain doses on promycelium length and sporidium development are described. Doses of 50 and 100 kr apparently had no effect on mutation rate of *U. hordei* in these studies. BA 15-11381

4194

DOMINANT VS. RECESSIVE MUTATION. E. R. Dempster. Proc. Natl. Acad. Sci. U. S. 27(6), 249-50(1941).

After x ray, Oregon R strain of *D. melanogaster* exhibited both a lower recessive and higher dominant lethal mutation rate than did the Swedish-b strain. Sensitivity of sperm chromosomes to induction of dominant lethal mutations increased with age of the males (1% in 1-day old, 60% when 16 days old). Neutron-produced ions used in the induction of recessive sex-linked mutations were only 0.75 as efficient as x ray produced ions. BA 15-23116

4195

HEMATOLOGICAL STUDIES ON PATIENTS TREATED BY TOTAL-BODY EXPOSURE TO X-RAYS. B. V. A. Low-Beer and R. S. Stone. p. 338-418 of Industrial Medicine on the Plutonium Project. (NNES IV-20). Robert S. Stone, ed. New York, McGraw-Hill Book Co., Inc. 1951.

Patients were exposed to x-rays (100, 200, or 1000 Kv). The most consistent change was a decrease in absolute number of lymphocytes. Decrease of nuclear lobes per 100 neutrophils; increase of monocytes; deviations in total white blood cell count were also observed. (from authors' summary).

4196

FURTHER INVESTIGATIONS ON THE TRANSMISSION OF INDUCED TUMORS IN FOWL. J. B. Murphy and E. Sturm. Cancer Research 1(8), 609-19(1941).

X ray given in sufficient amount to damage tumor cells, but in an amount insufficient to inactivate filterable agents, destroys transplantability of induced tumors. Results confirm earlier reports on necessity of intact living tumor cells for positive transplanting in fowls and mammals. BA 15-23697

4197

FURTHER STUDIES ON THE EFFECT OF X-RAYS ON A TUMOR OF KNOWN GENETIC CONSTITUTION. M. C. Reinhard, S. G. Warner, and H. L. Glotz. Cancer Research 1(8), 653-55(1941).

Simpson tumors were exposed in vivo to radiation doses of 25-1000 r; after 1 week they were transplanted to mice (C₅₇ Black) which failed to support growth of non-irradiated tumor (934 animals). Doses of 25 r increased takes to 34%, 400 r to 70%, while doses above 400 r decreased percentage of takes. Results are explained as genetic change caused by x rays. BA 15-23698.

4198
BLOOD VARIATIONS IN CANCER CASES TREATED WITH REMOTE, ULTRA-DEEP X-RAY THERAPY. A. H. Roffo and B. Luchetta. Bol. inst. med. exptl. estud. cancer (Buenos Aires) 18(56), 241-76(1941). (In Spanish).

Changes probably due to radiation included reduction of thrombocytes, reduction of lymphocytes, at times with appearance of early forms, rarely immature polymorphonuclear leukocytes, some tendency to shift to left in Schilling differential. BA 15-23703

4199
ALTERATIONS ON PH VALUE OF BLOOD ASSOCIATED WITH HIGH VOLTAGE ROENTGEN THERAPY. A. H. Roffo and A. E. Roffo, Jr. Bol. inst. med. exp. estud. cancer (Buenos Aires) 18(56), 137-48(1941). (In Spanish).

During application of radiation therapy from 400-600 kv, a fall in blood pH occurred, although the fall was not proportional to dosage. Decrease occurred during course of irradiation; after fluctuating, reached stationary level 0.4 pH units lower than the normal, reattaining normal value about a week later. BA 15-23705

4200
THE INACTIVATION OF BACTERIOPHAGES BY X-RAYS: INFLUENCE OF THE MEDIUM. S. E. Luria and Frank M. Exner. Proc. Natl. Acad. Sci. U.S. 27(8), 370-5 (1941).

X rays have an "indirect" effect in water of saline suspensions of bacteriophages. Some agent may be produced in the medium which oxidizes or reduces the phages. In presence of foreign proteins bacteriophages are also inactivated by x rays, but radiosensitivity is reduced, the effect in this case being "direct" effect on phage itself. BA 15-23914

4201
STUDIES ON THE PRODUCTION OF ABNORMAL TYPES OF FERN SPORES AND GAMETOPHYTES. Wilhelm Rottmann. Beitr. Biol. Pflanz. 26(1), 1-80(1939). (In German).

Numerous morphological and cytological abnormalities were induced by treatment of Aspidium filix mas, Pteris aquilina, and P. serrulata spores with varying temperatures, Ra and x ray. Numbers of nucleoli and chromosomes were increased by Ra and x ray, increasing dosages causing reduced germination but the reduction was not directly proportional to dose. BA 14-1925

4202
CROSS-FERTILIZATION, X-RAYS, SHORT WAVE RADIATION AND MUTATIONS IN THE GRAINS OF PROVENCE. Schribaux. Compt. rend. acad. agr. France 25(13), 503-9(1939). (In French). BA 14-1926

4203
THE EFFECT OF ROENTGEN-RAY ON THE BLOOD CODEHYDROGENASES I AND II. William B. Bean, Richard W. Vilter, and Tom D. Spies. Ann. Internal Med. 13(5), 783-86(1939).

Levels of blood codehydrogenases I and II were measured before and after x irradiation in eight subjects. X radiation caused 60-90% fall in the two enzymes within 12 hr, return to normal levels within 24 hr. Nicotinic acid before radiation gave slower fall in enzyme activity (to 50% of original). Authors believe that Roentgen sickness is probably due to changes in oxidative and reductive enzyme systems. BA 14-2117

4204
THE EFFECT OF SINGLE ROENTGEN DOSES ON THE BONE MARROW OF WHITE MICE. H. Langendorff and W. Papperitz. Strahlentherapie 65(4), 624-9(1939). (In German).

The entire body of 3 mos old male white mice was exposed to single x ray dose (180 kv, 4 ma, 0.5 Cu, 21 r/min, dose given 400 r). Histological changes in bone marrow beginning 30 min after exposure are presented graphically and reveal cyclic reactions. Karyolysis was observed 2-3 hr after exposure. Normal status of bone marrow was seen again after 100 days. BA 14-2142

4205
EXPERIMENTAL INVESTIGATION OF THE EXCRETION AND DISTRIBUTION AND BIOLOGICAL EFFECT OF RADON D, E, F INJECTED INTO ORGANISMS. Mituo Miwa and Hisao Yamashita. Gann 32(5), 395-431(1938).

Ra D, E, and F were given intravenously to adult rabbits in 100-600 mc amounts (single or divided doses), to young rats in 5-25 mc amounts. Excretion, retention, and distribution of elements, change in peripheral blood picture, and pathological changes in various organs were studied and observations are reported. BA 14-2143

4206
THE ACTION OF IONISING RAYS ON SEA-URCHIN. IV. THE EFFECTS OF ALPHA RAYS UPON UNFERTILIZED EGGS. Mituo Miwa, Hisao Yamashita, and Kazuo Mori. Gann 33(4), 323-31(1939).

Following moderate doses of α irradiation, eggs of Strongylocentrotus purcherrimus were severely damaged and first cleavage was retarded. At higher doses some eggs were killed immediately. Bombarding eggs with α rays of various ranges showed nucleus to be the most sensitive structure, although some eggs were severely damaged when cytoplasm only was irradiated. BA 14-2144

4207
THE EFFECT OF IONIZING RAYS ON THE SEA URCHIN. III. FURTHER OBSERVATIONS OF RECOVERY FROM THE EFFECTS OF BETA RAYS UPON UNFERTILIZED EGGS AND SPERM, WITH ADDITIONAL STUDIES ON THE TIME FACTOR PROBLEMS. Kazuo Mori, Mituo Miwa, and Hisao Yamashita. Gann 33(4), 316-22(1939).

The occurrence of recovery in eggs of Pseudocentrotus depressus and Strongylocentrotus purcherrimus and its absence in sperm is due to an essential difference in composition between eggs and sperm. BA 14-2145

4208
ROENTGEN RAY THERAPY. Daniel G. Morton. Calif. and Western Med. 31(5), 298-302(1939).

Results of 100 cases of cervical cancer treated with 200 kv radiation indicate the superiority of x ray therapy over the use of Ra alone. Severe immediate reactions appeared in about one fifth of the cases especially when more than 3000 r per field was given. There were six deaths associated either directly or indirectly with x ray therapy. BA 14-2146

4209
RESUME OF COMPARATIVE STUDIES CONCERNING THE ACTION OF BENZOL AND THORIUM X ON LEUCOCYTIC REACTIONS. Gunter Wallbach. Sang 13(7), 719-38(1939). (In French).

Author's previous publications on action of benzol and thorium X on the blood are summarized. BA 14-2615

4210
A CYTOLOGICAL STUDY OF THE PROGENY OF X-RAYED CREPIS CAPILLARIS WALLS. G. A. Lewitsky. Cytologia 11(1), 1-29(1940).

C. capillaris seedlings were x rayed; aberrant mature plants selected for study. Cytological study of F₁ root tips revealed 17.1% (84) aberrations of which 74 were structural chromosome changes, 10 were numerical (polyploid) changes. BA 15-16191.

4211

X-RAY INDUCED CHROMOSOME REARRANGEMENTS IN THE FEMALES OF SCIARA. J. Paul Reynolds. Proc. Natl. Acad. Sci. U.S. 27(4), 204-8(1941).

In *Sciara* eggs, all rearrangements seem to be induced by x rays before the end of the first meiotic division. After treatment, viability of the eggs is low (1-3%). BA 15-16223

4212

CHROMOSOMAL ALTERATIONS INDUCED BY X-RAYS IN BAJRI, (*PENNISETUM TYPHOIDES*, STAPF AND HUBBARD). N. Krishnaswami and Rangaswami Ayyangar. J. Indian Bot. Soc. 20(3), 111-18(1941).

Dry resting seeds were exposed to x rays (15 ma, 42,000 kvp., target distance 19 cm, Cu anticathode) for 1.2 and 3 hr. A three hr exposure proved lethal. Green and albino seedlings, from seeds exposed for 1 and 2 hr, showed 4 plants with ring formation at meiosis with inversion bridges in one of these. Plants were semisterile. Cytological behavior of plants is described. BA 15-16248

4213

BIOLOGICAL STUDIES RELATING TO THE EFFECTS OF RADIATION AND METALS. Samuel Schwartz. p. 197-242 of Industrial Medicine on the Plutonium Project. (NNES IV-20). Robert S. Stone, ed. New York, McGraw Hill Book Co., Inc. 1951.

Biochemical effects of radiation was studied in: ten patients after total-body exposure to x-ray in total dose of 75 to 310 r, 5 patients given 20 to 36 millicuries of P^{32} ; and 5 workers accidentally exposed. Investigations of liver function, white blood cell chemistry, urinary constituents are described. (from author's abstract).

4214

REDUCTION OF BLOOD CO AFTER X-RAY TREATMENT. John A. Cameron. Proc. Soc. Exptl. Biol. Med. 46(4), 558-60(1941).

Rats and monkeys given slightly sub-lethal exposures to CO recover within few minutes after 700-1000 r treatment; controls recover slowly and laboriously. Hilger Spekker spectrophotometric and Hilger (medium quartz) spectrographic analysis of untreated, CO exposed, and CO plus x ray exposure blood of albino rats showed a significant reduction of CO content in the blood of x rayed as compared to unrayed animals (7 completed experiments). BA 15-16532

4215

THE BIOLOGICAL FUNDAMENTALS AND RADIATION THERAPY. Friedrich Ellinger. (Eng. Transl. by Reuben Gross) New York, Elsevier Publishing Co., Inc., 1941. 360p.

Author presents a brief summary of x, γ and ultraviolet ray effect on tissues with emphasis on therapeutic effects. Biological effects are omitted or noted only briefly. BA 15-16533

4216

LOW TEMPERATURE AND RADIOSENSITIVITY OF SKIN OF NEW-BORN RATS. II. RESISTANCE AT DIFFERENT DOSAGES. T. C. Evans, W. A. Robbie, J. P. Goodrich, and J. C. Slaughter. Proc. Soc. Exptl. Biol. Med. 46(4), 662-4(1941).

Lowering temperature to 0-8°C increases skin resistance to roentgen radiation; dosage increase of 1200-1700 r were required to produce comparable injury to that produced by radiation at room temperature. Ratio of dose required at low temperature to that at room temperature can be read from a graph showing the "units" of injury at doses of 300-3300 r (in steps of 300 r) for rats irradiated at room temperature and rats irradiated while packed in ice. BA 15-16534

4217

COMPARATIVE EXPERIMENTAL STUDIES OF 200 KILOVOLT AND 1000 KILOVOLT ROENTGEN RAYS. III. THE BIOLOGICAL EFFECT ON THE SKIN OF THE ALBINO RAT. Edward A. Gall, James R. Lingley, and John A. Hilcken. Am. J. Pathol. 17(3), 319-33(1941).

Histologic changes were studied in two groups of rats given graded x ray doses (600-3000 r) at 200 or 1000 kv to skin of thigh. Doses of 1800-3000 r (200 kv) caused severe permanent injury to skin; equal dose of 1000 kv rays caused only mild transient changes. In another study, 3000 r (1000 kv) was given directly or through wax sheath encasing the limb. Ensheathed skin lesions after 1000 kv x radiation were identical with lesions after same dose of 200 kv rays to bare skin. BA 15-16535

4218

HYPERTHERMIA AS SECONDARY RAY SENSITIZER IN ROENTGEN IRRADIATION. W. Wynen. Strahlentherapie 22, 503-13(1926). (In German)

The effects of the Roentgen rays were observed in tissue made hyperthermic by diathermic by diathermy or sympathectomy. Experiments were made on dogs.

4219

EFFECTS OF RADIATION ON DROSOPHILA EGGS. V. THE DAMAGE BY ROENTGEN RADIATION IN 6 HOUR OLD EGGS IN RELATION TO WAVE LENGTH. H. Langendorff and K. Sommermeyer. Strahlentherapie 68(4), 656-68(1940). (In German).

Killing curves for 6 hr old eggs were determined using x rays having mean wave lengths of 0.16, 0.51, 0.95, 1.23, and 20 Å. On basis of quantum "hit" theory, the number of "hits" required to kill at these wave lengths were 18, 16, 10, 8, and 6, respectively. No variation with wave length was found for 3 hr old eggs. BA 15-16538

4220

ON A POSSIBLE APPLICATION OF RADIOCHEMICAL REACTIONS IN AQUEOUS SOLUTIONS TO RADIOBIOLOGICAL EFFECTS. K. G. Zimmer. Fundamenta Radiol. 5(5/6), 168-75(1940). (In German).

Experimental data on course of in vitro reactions under the influence of x rays are summarized with regard to their applicability to behavior of radiated biological systems. No obvious interpretation of radiobiological reactions in terms of radiochemical reactions in aqueous solutions seems evident. BA 15-16540

4221

ON THE STATISTICAL ANALYSIS OF THE EFFECT OF HARD RAYS ON BIOLOGICAL OBJECTS. I. K. Sommermeyer. Strahlentherapie 68(4), 845-55(1940). (In German).

The quantum "hit" theory of biological effects of x rays is discussed with reference to an ionization path of a fast electron constituting a "hit". Expectations are discussed for variations in wave length, hit-number, half-value dose, and for radiochemical yield. BA 15-16539

4222

WHETHER AND IN WHICH EMBRYONIC STAGE DOES THE RETINA OF CHICKENS BECOME SENSITIVE TO VARIOUS RADIATIONS? Bun-ichi Hasama. Pflugers Arch. ges. Physiol. 244(3), 337-46(1941). (In German)

Neither x ray, Ra radiation, nor other radiation produced pigment change in chick embryo retinae taken from eggs kept in dark. BA 15-17292

4223

THE EFFECT OF PROLONGED X-RADIATION ON THE CONGO RED INDEX OF RABBITS. Cornelia Hoch-Ligeti. Cancer Research 1(1), 28-33(1941).

Whole body of rabbits (except heads) was exposed to 150 r applied in equal parts to both sides of body (55 mc,

0.5 Cu-filter, 140 kv, 5 ma). Total dose of 300-1050 r was given during a year at different intervals. Congo-red indices of exposed rabbits fluctuate more than do those of rabbits untreated or treated with no carcinogenic hydrocarbons; but fluctuate less than those of animals treated with carcinogenic hydrocarbons. BA 15-17627.

4224

TUMORS OF THE SPLEEN IN RABBITS BY MEANS OF INJECTIONS OF THOROTRAST. C. J. van Mervennee and P. A. ten Thije. Ned. Tijdschr. Geneesk. 83(4), 5622-31(1939). (In Dutch).

The injection of 3 to 4 cc of thorotrast per kg kills rabbits in 8-10 hr. After the injection of repeated smaller doses, development of tumors in the spleen (with metastases) was observed. BA 15-17652.

4225

THE INFLUENCE OF THE NATURAL CONTENT OF RADIUM EMANATION (RADON) IN THE ATMOSPHERE UPON THE ORIGIN OF RICKETS. J. L. Dols and B. C. P. Jansen. Ned. Tijdschr. Geneesk. 84(3), 3050-52(1940). (In Dutch).

Of two groups of a litter of new born rats kept on a rachitogenic diet, those housed 10 meters (upper story) above ground developed severe rickets while those housed in the basement (where radon content was higher due to emanations from the ground) had no rickets at all. Both rooms were darkened. BA 15-17772

4226

IS IT POSSIBLE TO KILL NORMAL TISSUES WITH ROENTGEN RADIATION? Paul Busse Brawitz. Arch. pathol. Anat. u. Physiol. 906(9), 570-7(1940). (In German). BA 15-17936

4227

EFFECT OF TEMPERATURE DURING IRRADIATION ON THE X-RAY SENSITIVITY OF MAIZE SEED. J. H. Kempton and Louis R. Maxwell. J. Agr. Research 62(10), 603-18(1941).

In temperatures ranging from -187 to 66°C, maximum x ray sensitivity of air dry (8% moisture) maize seed occurred in the range from 0°C to room temperature. Increases or decreases of seed temperature from these values resulted in a reduction of x ray sensitivity. BA 15-19807.

4228

RADIOBIOLOGIC ACTION AND THE KILLING EFFECTS OF X-RAYS ON ACHROMOBACTER FISCHERI. K. P. Lorenz and P. S. Henshaw. Radiology 36(4), 471-81 (1941).

Average survival percent following irradiation (2925-35100 r) gives exponential curve when graphed, indicating that A. fischeri is destroyed in single "hit to kill" manner. BA 15-18575.

4229

THE SIGNIFICANCE OF ANATOMICAL CHANGES ACCOMPANYING REGENERATION OF X-RAYED BRYOPHYLLUM LEAVES. B. N. Singh and S. N. Mehra. J. Indian Botan. Soc. 19(5/6), 263-72(1940).

Bryophyllum leaves were x irradiated at notches (54 kv, 5 ma, 15 cm, for 2-35 min). A 2-min exposure caused slight stimulation, higher doses inhibited regeneration. After 35-min exposure regenerating leaves were asymmetrical, thick, rolled with an entire margin and a mosaic appearance associated with decreased chlorophyll. Other morphologic changes are also described. BA 15-19808

4230

THE FLUORESCENT-MICROSCOPE ANALYSIS OF ALPHA RADIATION EFFECTS. Ferdinand Hercik. Protoplasma 32(4), 527-35(1939). (In German).

Effect of radiation on epidermal cells of Allium cepa was studied by intra-vital staining with fluorescein and

microscopic examination in ultraviolet. Cells subjected to α irradiation of 34×10^{-7} α /mm for 1-2 hr could be classified into four groups: (1) healthy unaffected cells (nucleus and cytoplasm light green), (2) cells with dye stored in vacuole, plasma and nucleus unstained, (3) plasma and nucleus both stained, (4) cells nearly fluorescein-free and dead. BA 15-19850

4231

STUDIES ON THE EFFECT OF X-RAYS ON THE PATHOGENICITY OF EIMERIA TENELLA. Anthony A. Albanese and Hans Smetana. Am. J. Hyg. 26(1), 27-39 (1937).

Chicks were infected with irradiated suspensions of E. tenella. Infection with oocysts given 9000 r at 75 r/min was less severe than that of controls; 13,500 r at 75/min was the minimum prophylactic dose. Oocysts given 22500-4500 r at 75 r/min caused increased production of organisms during latent period and a stimulating effect of sublethal doses is suggested. High intensity x rays (104 r/min) were more damaging than low intensity. Non-sporulated oocysts were 15 times more sensitive than sporulated ones. BA 12-5096

4232

THE BEHAVIOR OF X-RAY INDUCED CHROMOSOMAL ABERRATIONS IN ALLIUM ROOT TIP CELLS. Karl Sax. Genetics 26(4), 418-25(1941).

Both chromatid and chromosome aberrations were produced by irradiation of growing root tip cells, aberrations accompanied by deficiencies being eliminated after few cell generations. Cells of dormant bulbs were more sensitive than those of dry seeds. Delayed germination of irradiated onion seed increased aberration frequency but delayed germination of bulbs had no such effects. BA 15-21071

4233

THE EFFECTS OF X-RAYS ON MITOTIC AND MEIOTIC CHROMOSOMES AND CELL DIVISION IN CHORTHIPPUS LONGICORNIS. Margaret Creighton. J. Exptl. Zool. 87(3), 347-68(1941).

Mitosis in spermatogonia and embryo cells is very sensitive to x rays, primary spermatocytes are more radioresistant. Most sensitive stage for mitotic chromosomes is 3 hr before anaphase, for meiotic chromosomes, 9 hr before anaphase. In embryo also, cells just prior to prophase or in early prophase are most sensitive to inhibition of mitosis by x rays. BA 15-21076

4234

THE FREQUENCY OF ABNORMAL PLANT PHENOTYPE IN F_1 GENERATION FROM POLLEN OF ANTIRRHINUM MAJUS, VARIOUSLY SWOLLEN AND IRRADIATED. R. Kaplan. Z. indukt. Abstamm. -u. Vererb. 77(4), 568-79 (1939). (In German).

Pollen of A. majus was subjected to shrinking in $MgCl_2$, swelling in NaCl solutions and irradiation. Results indicated that chromosomes are more susceptible to x ray breakage when in hydrated condition. BA 15-21095.

4235

THE INFLUENCE OF NUTRITION IN FORMING GENETIC CHANGES. H. Stubbe. Angew. Chem. 52(38), 599-602 (1939). (In German).

Data are presented from experiments in which mutation-induction was studied in Antirrhinum majus under (1) irradiation and (2) deficiencies of N, P, and S. BA 15-21118

4236

THE QUESTION OF INCREASING THE MUTATION RATE BY ROENTGEN RADIATION THROUGH THE INTRODUCTION OF SALTS OF HEAVY METALS INTO THE ORGANISM. II. H. J. Born and K. G. Zimmer. Z. indukt. Abstamm. -u. Vererb. 78(2), 246-50(1940) (In German).

Flies fed salts of Fe and U exhibited a 1% increase in x ray absorption, mutation rate in fed flies increased 30-50%. Authors conclude that the marked increase in mutation rate in fed flies cannot be accounted for by greater absorption of x rays. BA 15-21125

4237

THE VARIABILITY OF THE MUTATION RATE IN *DROSOPHILA MELANOGASTER* THROUGH SEVERAL GENERATIONS DUE TO EXPOSURE TO CHEMICALS. H. Dotterweich. Z. indukt. Abstamm. -u. Vererbl. 78(2), 261-72(1940). (In German).

Addition of the alkaloid-pilocarpine to culture medium prior to irradiation of males (2900 r) increased the x ray-induced mutation rate. A 2% solution of the agent gave most marked increase, 0.3% and 1% solutions being less effective. Results are attributed to a sub-threshold effect of the alkaloid, made evident by x rays. An apparent adaptive process occurs with return to normal mutation rate after several generations. BA 15-21128.

4238

A STATISTICAL STUDY OF THE LATE EFFECTS OF HEAVY ROENTGEN IRRADIATION ON HEALING OF SKIN WOUNDS. W. H. H. Dobbs. Am. J. Roentgenol. Radium Therapy 45(1), 107-8(1941).

Wounds of rats receiving irradiation showed considerable decrease in tensile strength as compared with normal wounds. X rays were applied to 4 x 1 cm ventral skin field, total dosage 4,500 r in weekly fractions of 1,500 r each (95 kv, 4 ma, 25 cm, 152 r/min.) Incisions were made and closed surgically 60 days post exposure. BA 15-21291.

4239

AN ERYTHEMATOUS SKIN REACTION PRODUCED BY AN ALPHA-PARTICLE BEAM, CASE REPORT. J. C. Larkin. Am. J. Roentgenol. Radium Therapy 45(1), 109-10(1941).

Exposure of hand to beam of 32,000,000 volt α particles for approximately 1 sec caused erythema. Effects of exposure were still evident 4 mo later. BA 15-21296

4240

HEREDITARY SEMISTERILITY IN ROENTGEN RADIATED MICE, DUE TO RECIPROCAL CHROMOSOME TRANSLOCATIONS. P. Hertwig. Z. indukt. Abstamm. -u. Vererbl. 79(1), 1-27(1940). (In German).

Progeny from male mice of which sperm were irradiated were studied. Reduced fertility due to lethality of both gametes and zygotes was found. Transmission ratios of semisterility indicate the presence of translocation. Some individuals homozygous for the translocation survive. BA 15-21132.

4241

THE EFFECT OF ROENTGEN RAYS ON THE PRODUCTION OF PIGMENT IN RABBIT HAIR. E. Lubnow. Z. indukt. Abstamm. -u. Vererbl. 77(4), 516-32(1939). (In German).

X irradiation of 1000-1500 r does not affect growth of new hairs but destroys pigment and lipochondria. BA 15-21135

4242

THE EFFECT OF ROENTGEN RADIATION ON THE SEGREGATION OF ATTACHED X-CHROMOSOMES IN *DROSOPHILA MELANOGASTER*. F. Mainx. Z. indukt. Abstamm. -u. Vererbl. 78(2), 238-45(1940). (In German).

Among progeny of x rayed attached x females, 254 female and 168 male disjunctional exceptions were found. There was a significantly higher frequency of exceptions at 4000 and 4500 r than expected on basis of linear relation found at lower doses, suggesting that each separation is not due to an intramolecular process. BA 15-21139

4243

COSMIC RAYS AND THE MUTATION RATE IN *DROSOPHILA MELANOGASTER*. B. N. Rajewsky and N. W. Timofeeff-Ressovsky. Z. indukt. Abstamm. -u. Vererbl. 77(4), 488-500(1939). (In German).

Mutation rates in *D. melanogaster* were determined after exposing groups of males to cosmic radiation by keeping flies (1) in wooden boxes, (2) boxes with 15 mm, and (3) 60 mm Pb walls, (2) and (3) being included in order to observe effects of secondary rays. There were no statistically significant difference among mutation rates under the three sets of conditions. BA 15-21140

4244

RECOVERY OF CARBON MONOXIDE POISONED MONKEYS UNDER X-RAY TREATMENT. John A. Cameron. Radiology 36(4), 486-7(1941).

Monkeys were exposed to 12.5% CO by volume in air. Some of the monkeys were exposed for 5-6 min to x rays (140 kvp, 4 ma, distance of 10", 130 r/min). Results: x ray therapy shortened time required to attain various phases of recovery from CO poisoning. BA 15-21289

4245

SOME EFFECTS OF X-RAYS ON THE GERM CELLS OF *CHORTHIPPUS LONGICORNIS* (ORTHOPTERA). Margaret Creighton and Byron H. Evans. J. Morphol. 69(1), 187-202(1941).

Male grasshoppers were x rayed with 3000 r. Spermatogonia and secondary spermatocytes exhibit many chromosome abnormalities during division within 90 min after irradiation and division was stopped by 12 hr. As a result of inhibition of division, primary and secondary spermatocytes differentiate directly into spermatozoa, forming giant spermatids. Capacity to differentiate into spermatozoa is evidently independent of maturation divisions. BA 15-21290

4246

RADIOSENSITIVITY OF SKIN OF NEW-BORN RATS. III. SENSITIVITY AT DIFFERENT TEMPERATURES. T. C. Evans, J. P. Goodrich, and J. C. Slaughter. Proc. Soc. Exptl. Biol. Med. 47(2), 434-7(1941).

New born rats were irradiated (2010 r) at temperatures of 0-40°C. Skin sensitivity increased with increase in temperature. Since rate of heart beat and O₂ consumption respond to temperature in same manner as radiosensitivity, it is thought that temperature exerts its effect on radiosensitivity through its control of such metabolic processes as these. BA 15-21292

4247

EFFECTS OF ROENTGEN IRRADIATION AT LOW TEMPERATURE ON THE SKIN OF YOUNG RATS. Titus Carr Evans. Am. J. Roentgenol. Radium Therapy 45(6), 888-94(1941).

Rats irradiated with 130 kv x rays while in chilled state showed markedly less reaction than did litter mates exposed in same manner at room temperature. BA 15-21293

4248

EXPERIMENTAL STUDIES WITH "CONTACT" ROENTGEN RAYS. THE TIME-INTENSITY FACTOR OF THE "TUMOR DOSE" FOR RAT SARCOMA 39 IN SITU. J. Gershon-Cohen, Harry Shay, and S. S. Fels. Am. J. Roentgenol. Radium Therapy 45(4), 600-4(1941).

Using Chaoul contact x ray apparatus at 60 kv, 0.12 mm Cu filter, 3 cm focal-skin distance, 45 r/min. lethal dose for rat sarcoma 39 in situ was 10,000 r given in single dose (tumor 10-15mm in diam.). With divided doses, effect was less, the decrease in effect becoming more marked as total irradiation period became greater. BA 15-21294

4249

EFFECTS ON THYMUS AND TESTIS OF THE RAT WHEN THE THYMUS IS IRRADIATED. B. Jolles. Am. J. Roentgenol. Radium Therapy 45(2), 259-264 (1941).

Rats received 4 doses of 550 r, 130 kv x rays to thymus on 4 consecutive days between 1 and 5 days of age. No changes were observed in testis up to 92 days. Complete atrophy of thymus occurred within a few days. BA 15-21295.

4250

CYTOLOGICAL CHANGES IN VAGINAL SMEARS IN RADIUM AND ROENTGEN IRRADIATION OF UTERINE CARCINOMA AND THEIR PROGNOSTIC SIGNIFICANCE. A. M. Nielsen. Acta Radiol. 37, 479(1952).

4251

THE DEPENDENCE OF THE BIOLOGICAL EFFECT OF RADIATION ON INTENSITY AND WAVE LENGTH, AS MEASURED BY THE DELAYED LETHAL ACTION ON CHICK EMBRYOS. D. E. Lea. Am. J. Roentgenol. Radium Therapy 45(4), 605-13(1941).

Chick embryos were irradiated with γ rays, 160 kv x rays, or 60 kv x rays after 6 days' incubation. Doses necessary to produce same effect were in ratio 1.0:0.6:0.55. When dose was delivered in single exposure at intensity greater than 10 r/min. effect was practically independent of intensity. For lower intensities or divided doses, effect of given dose was less. Theory of recovery under such conditions is presented. BA 15-21297

4252

THE EFFECT OF HIGH VOLTAGE ROENTGEN RAYS ON THE HEART OF ADULT RATS. John E. Leach and Kanematsu Sugiura. Am. J. Roentgenol. Radium Therapy 45(3), 414-25(1941).

Lethal single dose of 200 kv x rays given over whole body of rats was 400 r; given over heart only, at least 10,000 r. Myocardial changes produced: hemorrhage, round cell infiltration, myocardial degeneration, and necrosis. Pericardium and endocardium withstand single doses up to and including 20,000 r. BA 15-21298

4253

THE EFFECTS OF ROENTGEN RADIATION ON SPINAL GANGLIA OF ALBINO RATS. W. C. Ma and Chien-Liang Hsu. Am. J. Cancer 40(3), 335-42(1940).

In a parallel cytological study of direct and indirect x ray effects on spinal ganglia of rats, using special stains, it was found that extent of cellular change varied directly with dosage. Effects: shrinkage and irregularity of cell-outlines, decrease in size and staining quality of nuclei, decrease or increase in mitochondria, loss of Nissl substance and reduction of Golgi apparatus. BA 15-21299

4254

THE PRIMARY REACTION IN THE BIOLOGICAL EFFECT OF RADIATION. K. Sommermeyer. Argew. Chem. 52(6), 140(1939). (In German).

Review article. BA 15-21300

4255

THE EFFECT OF GAMMA RADIATION ON CELLS IN VIVO. F. G. Spear and A. Glucksmann. Brit. J. Radiol. 14(158), 65-77(1941).

Tadpoles were exposed to 538 r of γ rays in single exposures of low or high intensity, or in two treatments separated by various intervals. Mitotic counts in brain and eye cells were made at various subsequent times. In every case mitotic action was reduced, greater effects being noted with high intensity radiation over short intervals. Radiation also increased number of degenerate cells. BA 15-21301

4256

SKIN REACTIONS PRODUCED BY 200 KV AND 1000 KV

RADIATIONS: A COMPARISON. Robert S. Stone and J. Maurice Robinson. Calif. and Western Med. 55(1), 11-14(1941). BA 15-21302

4257

STUDIES ON THE LIBERATION OF SULFURIC ACIDS FROM THE GRANULES OF THE MAST CELLS IN THE SUBCUTANEOUS CONNECTIVE TISSUE AFTER EXPOSURE TO ROENTGEN AND GAMMA RAYS. (Preliminary Report) Bengt Sylven. Acta Radiol. 21(2), 206-12(1940).

A 25 cm² abdominal field of rats was exposed to 1000 or 1500 r of x rays, or to 1050, 1575, or 2100 r of γ rays. Histological examination of tissues 2 days postirradiation indicated some of the sulfuric acid in mast cell granules had left cytoplasm and spread diffusely through connective tissue. Effect was more pronounced after γ rays than after x rays. BA 15-21303

4258

THE ROENTGEN RADIATION OF PAPILLOMA VIRUS (SHOPE). II. THE EFFECT OF X-RAYS UPON PAPILLOMA VIRUS IN VITRO. J. T. Syverton, G. P. Berry, and S. L. Warren. J. Exptl. Med. 74(3), 223-4(1941).

Virus preparations derived from naturally-occurring papillomas in rabbits were x irradiated (90 kv, 40 ma, no filter distance 6 cm, 10400 r/min). Doses of 1-4 million r lowered titer, prolonged the incubation period, decreased size attained by papillomas. Dosages in excess of 5 million r were required to inactivate virus completely. BA 15-22235.

4259

THE INFLUENCE OF ROENTGEN RAYS UPON THE NITROGEN FIXATION BY AZOTOBACTER. R. M. Whelden, E. V. Enzmann, and C. P. Haskins. J. Gen. Physiol. 24(6), 789-96(1941).

Nitrogen fixation decreased markedly and linearly with increasing doses of x rays in A. Chroococcum, A. vinelandii, and A. agilis, respiration apparently was affected only indirectly at these dosages, by some inhibition of cell multiplication. Slight transient increase in rate of O₂ uptake under light x irradiation was observed. BA 15-22369

4260

EFFECT OF X-RADIATION UPON THE GROWTH OF LEMNA MINOR. Edna Louise Johnson. Colo. Univ. Studies. Ser. D. 1(3), 165-75(1941).

Following light and medium x ray doses to parent plants, number of daughter fronds produced was reduced. Doses of 2000 and 2500 r were followed by still slower increase in number of daughter fronds and caused early etiolation and frequent deformity of daughter fronds. BA 15-22679

4261

INFLUENCE OF X-RAYS UPON THE FORMATION OF LEAVES IN NICOTIANA RUSTICA. E. K. Zankevich. Izvest. Akad. Nauk SSSR. Otdel Mat. Estestven Nauk. Ser Biol. 1940(4), 621-7(1940).

X raying of germinated seeds (750-6000 r) induced these leaf changes: undulate and curly leaf membrane, narrow asymmetrical leaves, double and triple leaves, double and split stems. BA 15-22680

4262

DELAYED KILLING OF MAIZE SEEDS X-RAYED AT LIQUID AIR TEMPERATURE. Louis R. Maxwell and J. H. Kempton. J. Wash. Acad. Sci. 29(9), 368-74(1939).

Delayed death was unaffected by 70,000 r at -187°C. Cooled, irradiated plants, however, grew significantly taller than those exposed without cooling. BA 13-16180

4263

MUTATION RATE IN DROSOPHILA MELANOGASTER FOLLOWING IRRADIATION AT VARIOUS TEMPERATURES.

N. W. Timoffeff-Ressovsky and K. G. Zimmer. Biol. Zentr. 59(7/8), 358-62(1939). (In German).

Doses of 1200 r at 7°, 32° and 2750 r at 3°, 33° produced sex-linked mutations by CLB method at same average rate. Mutation was constant (average rate per/t) about 2.88×10^{-5} , for all temperatures. Authors, conclude that x-ray effect is independent of temperature at time of irradiation. BA 13-16206

4264
PHYSIOLOGICAL EFFECTS OF RADIATION. III. THE LETHAL EFFECT OF ROENTGEN RADIATION PRODUCED BY VARIOUS KILOVOLTAGES (50 to 1000 kv) UPON THE BROWN-PEARCE RABBIT EPITHELIOMA. Roger A. Harvey, Richard Dresser, and Stafford L. Warren. Am. J. Roentgenol. Radium Therapy 42(1), 110-21(1939).

No definite wavelength effect found in an experiment using 50, 90, 200 and 1000 kv x ray. Completely lethal dose was between 5000 and 6000 r to the tumor. BA 13-16320

4265
STUDIES ON LEUKEMIA WITH THE AID OF RADIOACTIVE PHOSPHORUS. John H. Lawrence, K. G. Scott, and L. W. Tuttle. New intern. Clinics 3, 33-58(1939).

Studies on six leukemic patients treated with radioactive phosphorus are reported. Response in the patients is compared with response of patients with the same disease to x radiation. BA 13-16321

4266
EFFECT OF ROENTGEN RAYS ON THE TOXICITY OF BLOOD. David J. Maacht. Am. J. Roentgenol. Radium Therapy 41(5), 709-12(1939).

Blood from irradiated mammals was more toxic than that from unirradiated to root growth of Lupinus albus seedlings grown in 1% whole blood or serum in standard physiological solution. Amount of toxic substances was maximum 24 hr after irradiation. BA 13-16322

4267
SOME INDICATIONS FOR ROENTGEN RAY TREATMENT. U. V. Portmann. Calif. and Western Med. 51(3), 151-4 (1939).

Author lists conditions in which x ray and Ra treatment are useful. Suggested as probable mechanisms of therapeutic effectiveness in inflammatory diseases: destruction of phagocytic blood cells and liberation of antibodies and other protective substances. BA 13-16323

4268
BIOLOGICAL EFFECTS OF GAMMA RADIATION. (SERIES II) S. Russ and G. M. Scott. Brit. J. Radiol. 12(139), 440-1(1939).

Authors compared effects of continuous exposure of rats to γ rays (a) without interruption and (b) with 2 days interruption (lost days made up by extending time of exposure so that total dose was the same as in (a)). Biological effects were equally marked in (a) and (b). Radiation increased the death rate during experimental period; accelerated aging, decreased fertility. BA 13-16324

4269
PHYSIOLOGICAL EFFECTS OF RADIATION. II. THE IN VITRO LETHAL SINGLE MASSIVE ROENTGEN-RAY DOSE (AT 200 KV) FOR THE BROWN-PEARCE RABBIT EPITHELIOMA. Otto de Puy Sahler and Stafford Warren. Am. J. Roentgenol. Radium Therapy 41(6), 954-61(1939).

X ray dose lethal to tumor in vitro was studied by irradiating: (1) tumor fragments, (2) tumor mass in vitro and cutting it into fragments for implantation, (3) tumor in situ followed by removing and fragmenting it. Tumor-lethal dose lay between 5000 and 6000 r for (1), (2), and (3). BA 13-16325

4270
CONTINUED OBSERVATION OF IRRADIATED CELL

NUCLEI. Kurt Wottge. Arch. exp. Pathol. Pharmacol. 193(1), 96-106(1939). (In German).

Dark field examination of protein coagulation processes that were initiated by sublethal x ray treatment showed increased permeability of the nuclear membrane following irradiation of Unio tumidus eggs. BA 13-16325

4271
THE DEVELOPMENT OF HIGH VOLTAGE X-RAY TUBES AT THE CALIFORNIA INSTITUTE OF TECHNOLOGY. Charles C. Lavritsen. Radiology 31(3), 354-61(1938).

Total x ray energy which can be administered to a human through a fixed area (human skin reaction being the limiting factor) was calculated for voltages up to 1000 kv. Depth doses at high and low voltages were compared. At 500 kv or more where range of electrons becomes large, there may be a change in biological effectiveness. BA 13-16391

4272
THE INFLUENCE OF ROENTGEN RADIATION ON IMMUNITY TO SHOPE FIBROMA VIRUS. Johannes Clemmesen. Am. J. Cancer 35(3), 378-85(1939).

After roentgen irradiation, rabbits given Shope fibroma virus intravenously show prolonged growth of the fibroma following injection, prolonged resorption of fibroma and generalized fibromatosis. Development of immunity to repeated injections was delayed in x rayed rabbits. Results suggest that roentgen rays act on reticuloendothelial system. BA 13-16845

4273
THE PRODUCTION OF TRANSPLANTABLE CARCINOMA AND SARCOMA IN GUINEA PIGS BY INJECTIONS OF THOROTRAST. L. Foulds. Am. J. Cancer 35(3), 363-73 (1939).

Four of 9 guinea pigs had tumors produced by 4 injections of 0.2-0.3 cc thorotrast at base of nipples; average induction time was 37 mo. Carcinoma, sarcomata and fibrosarcoma were produced and all were transplantable. BA 13-16851

4274
GROWTH OF WHEAT PLANTS FROM DRY AND SOAKED IRRADIATED GRAINS. Edna L. Johnson. Plant Physiol. 14(3), 493-504(1939).

Author studied survival of wheat grains irradiated (1) dry and (2) soaked. Doses up to 10,000 r were without effect, 20,000 r proved lethal to more than 50%; more than 20,000 r killed all of (1). After only 5000 r, all of (2) died within 3 weeks, and all of (2) (even after lowest doses) made less growth than controls and (1). There was evidence of increased growth and tillering of (1) after doses up to 10,000 r. BA 13-17714

4275
EXPERIMENTS ON THE EFFECT OF X-RAY ON PENNISETUM TYPHOIDEUM RICH., NICOTIANA TABACUM LINN. AND BRASSICA JUNCEA HK. F. AND T. L. S. S. Kumar and W. V. Joshi. Indian J. Agr. Sci. 9(4), 675-84(1939).

Impaired seed production and germination resulted from x irradiation (varying frequency) of anthers, seeds, and ovaries of P. typhoideum and seeds of mustard and tobacco. Soaked seeds were injured more than dry ones. X rayed soaked tobacco seed gave plants deficient in leaf number, height, and leaf factor. X irradiated plants showed weakening. BA 14-9859

4276
THE EFFECT OF X-RAYS ON SEX IN DROSOPHILA SUBOBSCURA AND ACCOUNT OF SOME SEX-LINKED CHARACTERS. A. L. M. Christie. J. Genetics 39(1), 47-60(1939).

Treatment with 578 and 775 r yielded 2.3% and 5.4% of verified sex-linked lethals; 1.02% of sex-linked visible

mutations produced at 578 r. For given dose, frequency of induced lethals in *D. subobscura* approximates that in *D. melanogaster*, but frequency of visibles was higher in the former. Ten autosomal dominant and two autosomal recessive mutants also found in treated cultures and six spontaneous mutants were found. Linkage map for 9 loci of the x chromosome is presented. BA 14-9868

4277

X-RAYS IN DIAGNOSIS AND TREATMENT OF GAS GANGRENE. James F. Brailsford. Brit. Med. J. 1940 (4128), 247-9(1940).

Treatment by x rays morning and evening for three days over all involved tissue was found to be curative in many cases. X irradiation is recommended in cases where infection has extended beyond reasonable bounds for amputation or where surgery is contra-indicated.

BA 14-10011

4278

PATHOLOGY OF IRRADIATION SICKNESS; A NEW METHOD FOR INDUCING SHOCK. Virgil H. Moon, Karl Kornblum, and David R. Morgan. Proc. Soc. Exptl. Biol. Med. 43(2), 305-6(1940).

Dogs given abdominal x irradiation developed delayed sickness. Vomiting, diarrhea, low blood pressure, hemoconcentration, prostration, and death resulted. Postmortem findings were those of shock; capillo-venous congestion, petechial hemorrhages in mucosae and serosae, edema of soft tissues and parenchymatous degeneration. X ray injury caused delayed necrosis of intestinal mucosa, syndrome of shock is attributed to this. BA 14-10013

4279

CLINICAL ASPECT OF ELECTRICALLY PRODUCED GAMMA RAYS. Albert Soiland Calif. and Western Med. 52(4), 172-6(1940).

There was little apparent difference in results obtained in California Institute of Technology where radiation between 600 and 1200 kv was used and at Los Angeles Tumor Institute which operated within range of 600 kv. Numerous patients with neoplastic lesions showing little response to standard x ray technique may be successfully treated by electrically produced γ rays, however. BA 14-10014

4280

PROTECTION OF THE RADIATION WORKER. G. W. C. Kaye. Nature 145(3671), 370-3(1940).

Author describes various precautionary measures now in use for protection of both operators and patients; X ray protection, Ra protection, electrical precautions, ventilation and lighting, and neutron protection. Historical notes are included. BA 14-10503

4281

RADIORESISTANCE OF HOG CHOLERA VIRUS AND THE VIRUS OF AUJESKY'S DISEASE. G. Hirt. Arch. wiss. u. prakt. Tierheilk. 75(2), 144-9(1939). (In German).

Virulence and invasiveness of the virus of Aujeszky's disease resisted x ray doses equal to 165 skin erythema doses; virus of hog cholera resisted 193 skin erythema doses. BA 14-10781

4282

THE SIZE OF THE TOBACCO MOSAIC PARTICLE FROM X-RAY DETERMINATIONS. John W. Gowen. Proc. Natl. Acad. Sci. U. S. 26(1), 8-10(1940).

Tobacco virus and several derivatives were irradiated with x rays from Cr, Cu, and Ag, having effective wavelengths of 2.1, 1.5, and 0.7 Å. Inactivation rates were used to compute size of entity inactivated. Computed values corresponding to absorption data; average size of "vital volume" of mosaic particle 7.5×10^{-18} cm³, atomic volume 940,000; molecular wt 15,000,000. BA 14-11237

4283

ELIMINATION OF RADIOACTIVE ELEMENTS IN PATIENTS WHO HAVE RECEIVED THOROTRAST INTRAVENOUSLY. Wilhelm Stenstrom and Irwin Vigness. Proc. Soc. Exptl. Biol. Med. 44(1), 18-22(1940).

Patients were studied 6 and 7 yr after intravenous thorotrast. Found: thorium X and small amounts of mesothorium 1 in feces, unidentified radioactivity in ashed urine, thorium B from breath (thoron gas).

BA 14-11992

4284

DEVELOPMENTAL EFFECTS RESULTING FROM EXPOSURE TO X-RAYS. I. EFFECT ON THE EMBRYO OF IRRADIATION OF FROG SPERM. Roberts Rugh. Proc. Am. Phil. Soc. 81(3), 447-71(1939).

Sperm suspensions were irradiated with 15-50,000 r of 200 kv x rays then used to inseminate eggs. Even 15 r caused exo-gastrulation in some embryos. Exponential curve was obtained when percent hatching was plotted against dose (97.8% hatched at 15 r, 1.6% at 10,000 r). With doses greater than 10,000 r, higher percent hatched, reflecting gynogenetic development of eggs activated by severely damaged sperm. BA 14-12129

4285

AN EXPERIMENT ON CHROMOSOME FRAGMENTATION IN TRADESCANTIA BY X-RAYS. A. C. Faberge. J. Genetics 39(2), 229-48(1940).

Analysis of variance within data shows that the effect of increasing dosage is linear. Amount of rejoining is an inverse function of initial number of breaks. Higher temperatures allow more breaks to rejoin, unlike the situation in *Drosophila*. Amount of rejoining depends on total dose. Effect of dose fractionation is also reported. BA 14-12885

4286

INDUCTION BY FAST NEUTRONS OF MUTATIONS IN ANTIRRHINUM. II. GENETICS. Roy Milton Chatters. Am. Naturalist 74(752), 289-5(1940).

Mutations were produced (or hastened) by irradiating dry seeds with fast neutrons. Mutants, after self pollination, produced like progeny in significantly large number of cases. BA 14-12903

4287

HISTOLOGICAL AND RADIOBIOLOGICAL STUDY OF TUMORS OF THE UTERINE CERVIX TREATED WITH RADIATION. G. Frola. Arch. intern. med. exptl. 8, 289(1933). (In French).

4288

THE EFFECT OF RADIATION FROM RADIOACTIVE INDICATORS ON THE PENETRATION OF IONS INTO NITELLA. Lorin J. Mullins. J. Cellular Comp. Physiol. 14(3), 403-5(1939).

Studies made with radioactive Na indicate that it is physiologically identical with the stable isotope except that when concentration of radioactive ion is raised, increasing intensity of radiation above 1 mc/l, the amount of ion penetrating internodal cells of *Nitella* is decreased. Comparable x irradiation also produced such a decrease. BA 14-15376

4289

VARIATION IN PELT COLOR OF DESCENDANTS OF ROENTGEN IRRADIATED RABBITS. Rolf Danneel and Ernst Lubnow. Biol. Zentr. 59(11/12), 588-97(1939). (In German).

Black Alaska male rabbits, Abcdg/anBCDg, given 1000 r, regained fertility within 6 mo after treatment; produced 53 young from 9 matings. Young showed high mortality. Six survivors were strikingly lighter on posterior half of body. Color effect disappeared with

first shedding of hair, and recurred more weakly in some F_2 and F_3 progeny. Similar results followed treatment of another male with 1600 r. BA 14-12932

4290
A RADIATION METHOD FOR DETERMINING THE NUMBER OF GENES IN THE X-CHROMOSOME OF DROSOPHILA. D. E. Lea. J. Genetics 39(2), 181-8(1940)

Densely ionizing radiation (neutrons) was less efficient than x rays in producing sex-linked **lethal mutations**. X rays ionize less densely by a ratio of 1-1.6. Average target size was calculated to have radius of 1.89×10^{-7} cm. From target volume the number of genes in X chromosome capable of lethal mutation is estimated at 1860. BA 14-12943

4291
THE PROBLEM OF ROENTGEN THERAPY OF CARCINOMAS. E. G. Mayer. Z. Krebsforsch. 49(3), 290-1(1939). (In German).

Determination of dosage is considered to be the essential problem of irradiation therapy. Systemic reactions and behavior of tumors vary greatly and cannot be predicted. Reactions of normal irradiated tissue also vary. Types of reactions encountered are considered. BA 14-13376

4292
REPORT ON THE SCHNEEBERG INVESTIGATIONS B. Rajewsky. Z. Krebsforsch. 49(3), 315-40(1939). (In German).

Author discusses geological distribution of emanative material in dust, water, and rocks, and deposition of emanation in miners and the general population, with special regard to determining lethal and tolerance levels. Some pulmonary cancer cases showed excessive emanative activity; others did not. Author places tolerance of emanative activity between 30 and 3 M. E. BA 14-13384

4293
A PRELIMINARY REPORT OF THE EFFECT OF X-RAY ON TRICHINOSIS IN THE RAT. Ralph F. Honess. J. Colorado-Wyoming Acad. Sci. 2(6), 44(1940).

Normal infestation was reduced about 26% by using 800 r; in rats fed irradiated Trichina, 800 r reduced infestation about 85%. BA 14-14045

4294
THE EFFECT OF FAST NEUTRONS ON THE CHROMOSOMES OF TRADISCANTIA. Norman Giles. Proc. Natl. Acad. Sci. U. S. 26(9), 567-75(1940).

There is no qualitative difference in results following neutron and x ray treatment of chromosomes. Quantitatively, neutrons are 16-17 times as effective as x rays in producing dicentric chromatid aberrations. There is a linear relationship between exchange-break aberrations produced and neutron dosage; an exponential relationship exists with x ray dosage due to difference in ionization paths produced by x rays and neutrons. BA 15-1832

4295
A COMPARISON OF CHROMOSOMAL ABERRATIONS INDUCED BY X-RAY AND ULTRA-VIOLET RADIATION. Carl P. Swanson. Proc. Natl. Acad. Sci. U.S. 26(6), 366-73(1940).

X irradiation of the generative nucleus (g. n.) in Tradescantia pollen grains splits chromosomes into sister chromatids, both having aberrations at identical loci. Irradiation of g. n. in pollentube produces considerable number of chromatid deletions, occasional chromatid exchanges. Ultraviolet radiation of g. n. in pollen tube induces only simple chromatid deletions. BA 15-1843

4296
UNEQUAL BREAKS IN TWO SISTER CHROMATIDS INDUCED BY X-RAYS IN DROSOPHILA MELANOGASTER. M. Demerec and Eileen Sutton. Proc. Natl. Acad. Sci. U. S. 26(8), 532-6(1940).

Cytogenetic analysis of N264-86, obtained from an x rayed male showed 2 strands affected in x chromosome. One strand was deficient from 3C8 to 3E5 inclusive and showed changes in fa and rst loci, while a piece from 3C7 to 3E5, inclusive, was lacking from the other strand and inserted into the chromocenter of 4. Thus, right breaks occurred at the same point, left breaks occurred at different points but close to each other BA 15-1870

4297
AN ANALYSIS OF THE PROCESS OF STRUCTURAL CHANGE IN CHROMOSOMES OF DROSOPHILA. H. J. Muller. J. Genetics 40(1/2), 1-66(1940).

Frequency of gross structural changes induced by irradiation of chromosomes in spermatozoa is proportional to ionization produced regardless of wavelength (50 kv x rays - γ rays), concentration of dose in time, fertilization immediately or after 1 mo, radiation intensity (0.04 - 250 r/min), and temperature (5° - 37°C). Primary radiation effects accumulate independently until fertilization. BA 15-1876

4298
CYTOLOGY AND DEVELOPMENT OF THE EMBRYOS OF X-RAYED ADULT DROSOPHILA MELANOGASTER. B. P. Sonnenblick. Proc. Natl. Acad. Sci. U.S. 26(6), 373-81(1940).

Adult males and females were x rayed and mated with untreated flies. Embryonic mortality among their offspring was high. Mature oocytes were very susceptible, development, meiosis, and mitosis were distorted. BA 15-1878

4299
THE FAILURE OF INTRAPERITONEAL INJECTION OF 3, 4-BENZOPYRENE SOLUTION TO INCREASE THE GENERAL SUSCEPTIBILITY TO CANCER. S. Beck. Brit. J. Exptl. Pathol. 21(3), 133-5(1940).

Mice (110) were injected intraperitoneally with 1 mg of 3, 4 benzopyrene in 0.5 cc olive oil and 3 mo later subjected to cauterization, x rays and ultraviolet light. No tumors occurred at irritated sites. BA 15-2332

4300
THE EFFECT OF COLCHICINE AND X-RAY ON A TRANSPLANTABLE MAMMARY CARCINOMA IN MICE. John W. Hirshfeld, Robert Tennant, and Ashley W. Oughterson. Yale J. Biol. and Med. 13(1), 51-60(1940).

Combination of x rays (single dose of 2500 r) and colchicine (0.0010 mg/g) producing maximum accumulation of mitosis, yielded slightly higher rate of curability of Yale Ca, No. 1 than did x ray alone. BA 15-2345.

4301
ON THE PREVENTION OF ROENTGEN LEUCOPENIA. C. Carrie. Acta Unio. Intern. contra Cancrum 4, 816-7(1939). (In German).

Leukopenia is considered to be a C-avitaminosis. BA 15-2366

4302
X-RADIATION AND GROWTH SUBSTANCES AS AFFECTING PLANT PRIMORDIAL TISSUES. Virginia C. Irvine. Proc. Soc. Exptl. Biol. Med. 43(3), 453-5(1940).

In sunflower, zinnia, and tomato seedlings after moderate x ray doses the meristematic region becomes divided into 2 or 3 parts with separate groups of leaves, leading to distortion or fasciation of leaves, disturbed phyllotaxy and stunted growth of whole plant. Application of β -naphthoxyacetic acid in lanolin paste gives similar results. BA 15-2920

4303
YEAST GROWTH: A POSSIBLE TEST ORGANISM FOR X-RADIATION. Oscar W. Richards. Radiology 34(3), 317-26(1940).

X irradiation of pure strains of *Saccharomyces cerevisiae* with 9500-28,000 r at 70 kv, and with 200-38,000 at 200 kv x rays; retards the increase in number of cells per unit volume, increases optical densities of populations with doses up to 15,000 r, decreases the densities with higher doses. BA 15-2923

4304

STUDIES ON *CLONORCHIS SINENSIS* IN VITRO. IV. COMBINED EFFECT OF GENTIAN VIOLET AND X-RAYS. H. J. Chu and Chien-Liang Hsu. Chinese Med. J., Suppl. 3, 260-6(1940).

Gentian violet (1/400,000) combined with 4000 r or 2000 r of x rays was more destructive to *Clonorchis* than either agent alone. X rays did not increase the effect of 1/40,000 gentian violet (a therapeutic concentration). BA 15-3224

4305

X-RAY STUDIES ON THE FIELD BEAN. Clarence F. Genter and Hubert M. Brown. J. Heredity 32(1), 39-44 (1941).

Dormant and germinated *Phaseolus vulgaris* seeds were x rayed (2160, 6500, 13,000, and 26,000 r). Of 1434 second generation progenies grown from treated seed, 150 showed mutations. Characters affected: plant size, branching, leaf size, shape, texture; fertility; earliness of maturity. Chlorophyll abnormality was the most common irregularity. BA 15-11772

4306

ON THE QUESTION OF INCREASED X-RAY MUTATION RATE BY DEPOSITION OF SALTS OF HEAVY METALS IN THE ORGANISM. W. Buchmann and K. G. Zimmer. Z. indukt. Abstamm. -u. Vererb. 78(1), 148-54(1940). (In German).

D. melanogaster males were fed ferrum oxydatum saccharatum liquidum and irradiated with hard and soft x rays. No statistically significant difference was found in mutation rate as compared with similarly irradiated flies fed a standard medium. BA 15-11802

4307

ABSENCE OF A TIME FACTOR IN THE PRODUCTION OF TRANSLOCATIONS IN *DROSOPHILA* SPERM BY X-IRRADIATION. Everett R. Dempster. Am. Naturalist 75(757), 184-7(1941).

Genetical tests of translocations produced in *Drosophila* sperm by 5000 r of x rays (220 kvp, $\frac{1}{2}$ mm Cu and 1 mm Al filter) showed 117 translocations (17.2 + 1.46 %) when irradiation was applied at 167 r/min and 136 translocations (17.0 + 1.33%) when applied at 12.5 r/min. BA 15-11808

4308

ON THE LOCUS OF BOBBED GENE IN THE Y-CHROMOSOME OF *DROSOPHILA VIRILIS*. Sukeichi Fugii. Japan J. Genetics 16(3), 91-6(1940).

Mutual translocation involving Y and 2nd chromosomes was obtained by x irradiation. Breakage points and resulting phenotype are described. BA 15-11813

4309

RADIATION AND THE CELL. Paul F. Henshaw. J. Natl. Cancer Inst. 1(3), 277-90(1940).

There is a close, if not direct, relationship between certain radiobiologic results observed and the initial irradiation effect produced. Three types of direct cell response are indicated; single-event action and multiple-event actions in which effect is manifested in (1) holistic fashion or (2) by degree. Implications of the three types of events with regard to biology are discussed. BA 15-11976

4310

COMPARATIVE EXPERIMENTAL STUDIES OF 200 KILOVOLT AND 1000 KILOVOLT ROENTGEN RAYS. II. THE BIOLOGICAL EFFECTS ON THE BONE MARROW OF THE ALBINO RAT. James R. Lingley, Edward A. Gall,

and John A. Hilcken. Am. J. Pathol. 16(6), 845-954 (1940).

Rats were given 600-3000 r of 200 or 1000 kv x rays in region of femoral bone marrow. Cell changes in the marrow are described. Results showed no essential difference in effect on marrow of equal amounts of the two types of rays. Effects on marrow was proportional to dose. BA 15-11977

4311

COMBINED INFLUENCE OF X-RAY INTENSITY AND INTRACELLULAR ACIDITY ON RADIOSENSITIVITY. Raymond E. Zirkle. J. Cellular Comp. Physiol. 17(1), 65-70(1941).

Germinating fern spores were x irradiated in presence of graded concentrations of CO₂ and ammonia. Author found radiosensitivity to be maximal and minimal at definite concentrations of the penetrating acid and base. Heights of maxima and minima were modified by change in x ray intensity, while concentrations at which maxima and minima occur were not changed by x radiation. BA 15-11978

4312

THE VALUE OF LIVER EXTRACT IN CASES INTOLERANT TO ARSENICALS, HEAVY METALS, AND RADIATION. George Miller MacKee and Girsch David Astrachan. J. Invest. Dermatol. 3(5), 409-42(1940).

Of 107 patients, 5 exhibited unfavorable reactions to radiation therapy, which are described. Liver extract injections improved blood counts and proved valuable as a therapeutic or prophylactic agent in cases of drug and radiation intolerance. BA 15-12508

4313

TUMORS IN MICE INJECTED WITH COLLOIDAL THORIUM DIOXIDE. H. B. Andervont and M. B. Shimkin. J. Natl. Cancer Inst. 1(3), 349-53(1940).

Two spindle-cell sarcomas and one hemangioma were induced in 9 mice 15-18 mo. following subcutaneous injection of colloidal thorium dioxide. The compound did not induce primary pulmonary tumors in strain A mice following intravenous injection of 0.2 to 0.8 cc. BA 15-12552

4314

EFFECT OF CARCINOGENS ON SMALL FREE-LIVING ORGANISMS. I. *EBERTHELLA TYPHI*. R. R. Spencer and M. B. Melroy. J. Natl. Cancer Inst. 1(2), 129-34 (1940).

E. typhi, exposed continuously to methylcholanthrene for 240 consecutive transfers, and to γ rays of Ra for 192 transfers, showed no structural, functional, or immunological changes other than immediate stimulation of cell division. Earlier reports are confirmed. BA 15-12593

4315

LOCALIZATION OF LITHIUM IN TUMOR TISSUE AS A BASIS FOR SLOW NEUTRON THERAPY. Paul A. Zahl and Franklin S. Cooper. Science 93(2403) 64-5(1941).

By injection of Li salts of dyes into tumor bearing mice, an increase of about 43% in radiation dosage to the tumor over that delivered to other tissues was obtained. BA 15-12599

4316

INFLUENCE OF DEEP RADIATION UPON PLANT GROWTH. Vincenzo Rivera. Nuovo Gior. Bot. Ital. 47(3), 559-71(1940). (In Italian).

Vicia sativa seedlings, grown in lead boxes, were subjected to deep radiation: one set (a) shielded with heavy Pb cover, the other set (b) left exposed. After treatment, (a) were heavier than (b) (average wt of seedlings, 5.01 gm, average wt of 17 irradiated seedlings 4.56 g). Stem length averaged 3.6 (a), 1.5 cm (b); root length, 3.2 cm (a); 1.5 cm (b). BA 15-13579.

4317

ROOT-MODIFICATIONS INDUCED IN *VICIA FABA* BY

IRRADIATING DRY SEEDS WITH SOFT X-RAYS. G. F. Smith and H. Kersten. *Plant Physiol.* **16**(1), 159-70 (1941).

Unsoaked *V. faba* seeds were exposed to radiation from gas x ray tube (Cu target, Al window, 30 kv, 10 ma, at 8 cm for 20 min). Roots of seedlings from these seeds exhibited these external modifications; absence of lateral roots, poor development of root tip, and occurrence of "delayed Killing" after 8-day germination period. Histological modifications are also described. BA 15-13580.

4318
X-RAY EFFECTS ON THE GROWTH AND REPRODUCTION OF WHEAT. D. J. Wort. *Plant Physiol.* **16**(2), 373-83 (1941).

Marquis spring wheat seedlings were x irradiated (19-228 r, 1 mm Al screen). Regardless of seed age (9 or 57 mo), greatest growth rate and height produced by 114 r. Greatest fresh and dry weights of plants from older seeds resulted from 76-4 dose, of fresh seeds, from 57 r. Heading and flowering accelerated in plants from old seed by 76-114 r, retarded by same dose in those from fresh seed. Height and weight of Fulhio winter wheat seedlings increased by all doses used, maxima at 114 r. BA15-13582

4319
DISSOCIATION OF PNEUMOCOCCUS BY RADON IRRADIATION. T. T'ung and Chien-Liang Hsu. *Proc. Soc. Exptl. Biol. Med.* **43**(4), 744-46(1940).

Dissociation of *Pneumococcus* type I by culturing in presence of γ rays of radon took place after eleventh generation, much earlier when combined with immune serum. The effect (appearance of R colonies) was more abrupt with γ rays alone than with serum alone, although dissociants were morphologically, culturally and serologically identical. Radon dissociants (not serum cultured dissociants) however, were avirulent and irreversible by animal passage. BA 14-12434

4320
FURTHER STUDIES WITH SEEDLINGS ON THE QUESTION OF WAVELENGTH DEPENDENCE OF RADIOBIOLOGICAL REACTIONS. P. S. Henshaw and D. S. Francis. *Am. J. Cancer* **35**(3), 386-400(1939).

Triticum and *Lycopersicum* seedlings were exposed to 200 and 700 kv x rays. Harder radiation was more effective. BA 14-12615

4321
THE COMBINATION ACTION OF ROENTGEN RAYS AND SULFANILAMIDE ON *STAPHYLOCOCCUS AUREUS*. Rubin Flocks, O. N. Fellowes, and H. Dabney Kerr. *Am. J. Roentgenol. Radium Therapy* **44**(1), 115-16(1940).

Staphylococcus aureus cultured in meat broth containing 0.4% prontosil soluble or sulfanilamide. After incubation, colony count was less in those cultures which had been irradiated with 100 and 200 r of low voltage x rays. *Staphylococcus*-infected mice had slightly lower survival rate when treated with drug plus x ray than when treated with either one alone, i. e., there was no synergistic reaction between drug and x ray. BA 14-16074.

4322
ENZYMES IN ONTOGENESIS (ORTHOPTERA). XII. SOME PHYSIOLOGICAL CHANGES IN EGGS THE EMBRYOS OF WHICH HAVE BEEN DESTROYED BY X-IRRADIATION. Joseph Hall Bodine, Loren D. Carlson, and O. Malcolm Ray. *Biol. Bull.* **78**(3), 437-43(1940).

Six-day-old grasshopper eggs (*M. differentialis*) were x irradiated with 1000 r. The embryo was destroyed but there was no apparent effect on rest of egg. Amounts of protyrosinase and its natural activator, as well as O₂ consumption were determined in control and irradiated egg. BA 14-16268

4323
THE QUALITATIVE AND QUANTITATIVE HISTOLOGICAL EXAMINATION OF BIOPSY MATERIAL FROM PATIENTS TREATED BY RADIATION FOR CARCINOMA OF CERVIX UTERI. A. Glucksmann and F. G. Spear. *Brit. J. Radiol.* **18**, 313(1945).

4324
THE ATTENUATION BY X-RAYS OF HUMAN TUBERCLE BACILLI. W. F. Drea. *Am. Rev. Tuberc.* **41**(4), 507-11 (1940). (Second Paper.)

Subcultures of H37, x irradiated for 36 hr, (60, 480 r) showed attenuated virulence. Effect more pronounced with treatment of successively transplanted cultures (exposures of 360 to 1,092 hr, 628, 992 to 2,044, 224 r). than with single treatment of initial culture for 36 hr. Direct action of x rays upon bacilli indicated as cause of attenuation. BA 14-16309

4325
THE EFFECT OF ROENTGEN RAYS ON SKIN REACTIVITY TO HISTAMINE AND BACTERIAL VACCINE WITH REVIEW OF THE LITERATURE AND A DISCUSSION OF THE MODE OF ACTION OF THE ROENTGEN RAYS IN INFLAMMATORY PROCESSES. Bertram Shaffer. *J. Invest. Dermatol.* **3**(3), 159-91(1940).

Following intracutaneous injection of histamine into x irradiated skin (125 r or 3 daily doses of 125 r), size of wheal, size, and intensity of flare were less than in non-irradiated skin. Injection of catarrhal vaccine resulted in papule generally larger on irradiated skin (3 daily doses of 125 r) than on control sites. BA 14-15811

4326
ON THE NATURE OF X-RAY INDUCED DELETIONS IN TRADESCANTIA CHROMOSOMES. Charles M. Rick. *Genetics* **25**(5), 466-82(1940).

X ray doses of 200-500 r were delivered to inflorescences of a clone derived from cross *T. canaliculata* X *T. humilis* while in post-meiotic resting stage cells were examined while in gametophytic mitosis. Several types of simple deletions were produced in addition to, and independently of, formation of ring and dicentric chromosomes. X rays applied at 3°C produced more chromosome deletions than same dose applied at 33°C. Dose-effect relation is discussed. BA 14-15648

4327
THE TIME FACTOR IN X-RAY PRODUCTION OF CHROMOSOME ABERRATIONS. Karl Sax. *Proc. Natl. Acad. Sci. U. S.* **25**(5), 225-99(1939).

X irradiation at high intensity was more effective than at low, and continuous irradiation was more effective than intermittent in producing chromosomal aberrations in *Tradescantia* microspores. The effect of time-intensity factor was due to the fact that aberrations depend upon two independent x ray hits, limited in time and space. Time-intensity factor has no effect upon 1-hit chromatid aberrations. BA 14-15649

4328
GLAUCOMA FOLLOWING IRRADIATION. Louis Bothman. *Arch. Ophthalmol. (Chicago)* **23**(6), 1198-1212(1940).

Influence of x rays and Ra on eye tissues is discussed and experimental studies on rabbits are reviewed. Report of a case of glaucoma from irradiation is included. BA 14-15806

4329
THE PRODUCTION OF GIANT SPERMATOCYTES IN *PHILOSAMIA CYNTHIA* BY MEANS OF X-RAYS. Pauline H. Dederer. *J. Morphol.* **67**(1), 159-70(1940).

X irradiation caused formation of giant spermatocytes during growth period, abnormal cells increasing with dosage from 2000-8000 r. Spermatogonia were relatively unaffected, no specific effect on chromosomes was

observed. Similar cells in testis were affected unequally; some degenerated as spermatocytes, others completed formation of spermatozoa. BA 14-15808

4330
BIOLOGICAL EFFECT OF X-RAYS AND GAMMA RAYS. Brit. Med. J. 1940(4122), 21(1940).

LD_{50} (x rays) for Colpidium culture was 330,000 r, for calliphora eggs, 40 r. "Absorption theory" of x and γ ray effects and "Catalytic theory" of x ray effects is discussed. Authors favor the latter as offering a better explanation for the remarkable differences in radiosensitivity among living organisms and for certain "stimulating" effects of radiation (ovaries and R-E system). BA 14-15812.

4331
BIOLOGICAL EFFECTS OF NEUTRONS. Brit. Med. J. 1940(41-44) (1940).

Lethal effects of neutrons upon *B. coli*, spores of *B. mesentericus*, as well as degenerative effects upon rat retina indicate qualitative similarity of neutron radiation to that of γ and x rays. Quantitative biological differences exist which depend on ionic density. Effects of neutrons on mitosis of bean root cells are described. BA 14-15813.

4332
RADIATION AND THE HEREDITARY MECHANISM. M. Delbruck. Am. Naturalist 74(753), 350-62(1940).

Critical review. BA 14-14217

4333
ON THE RADIOACTIVITY THEORY OF ENDEMIC GOITRE. H. Lederer and M. Messerli. Schweiz. med. Wochschr. 69(1), 408(1939). (In German).

Authors find no correlation of goitre with local Ra emanation content of air in Canton Waadt, rather, increased atmospheric radioactivity is associated with low goitre incidence. Others arrived at same conclusion in Austria. BA 14-14298

4334
NEW RACES WITH STRUCTURALLY CHANGED CHROMOSOMES IN THE PROGENY OF THE X-RAYED *CREPIS CAPILLARIS* WALLR. G. A. Levitskii. Arkh. Anatomii. Gistologii i Embriologii (Arch. Russes Anat., Hist. et Emb.) 25(1), 3-23(1940). (English Summary) (In Russian).

Of 491 F_1 plants (from aberrant parents derived from x rayed seedlings), 84 had aberrant chromosomes, 69 showed structural changes in single chromosomes, 10 were polyploid. None produced any specific morphological changes. Selfing of F_1 plants also produced aberrant F_2 plants. BA 15-7473

4335
NATURE OF THE HEREDITARY FACTORS FOR RESISTANCE AND SUSCEPTIBILITY TO PULLORUM DISEASE IN THE DOMESTIC FOWL. E. Roberts, J. M. Severens, and L. E. Card. World's Poultry Congr. Proc. 7, 52-4(1939).

Resistance of domestic fowl to pullorum disease increases with increased number of lymphocytes in the blood which normally occurs with aging. Decrease of lymphocyte count by x raying lowers resistance. BA 15-7538

4336
A COMPARISON OF X-RAY INDUCED AND NATURALLY OCCURRING CHROMOSOME VARIATIONS IN *DROSOPHILA PSEUDOBOESCA*. R. G. Helfer. Genetics 26, 1-22(1941).

Distribution of 347 breaks induced by x ray treatment in the chromosomes of *D. pseudoobscura* was studied. Frequencies of breaks and induced inversions were compared with those occurring naturally. Results appear to favor "breakage first" rather than "contact" hypothesis on origin of chromosomal aberrations. BA 15-7534

4337
CONTRIBUTION TO THE PROBLEM OF THE BIOLOGICAL EFFECT OF RADIATION. THE ESTABLISHMENT OF SUSCEPTIBILITY OF ORGANS TO ROENTGEN RADIATION

IN VIVO WITH THE AID OF A BIOCHEMICAL METHOD. Rudolph Abderhalden. Strahlentherapie 68(1), 17-29 (1940). (In German).

Using as an index the amount of urinary ferment present in the urine after irradiation of organs and capable of acting upon proteins of treated organs only, lower limit of radiosensitivity in rabbit organs was found to be; liver 330 r, brain 247.5 r, and hypophysis 165 r. Injurious doses to hypophysis affected whole endocrine system. BA 15-7683

4338
QUALITATIVE ROENTGEN RADIATION AND SKIN REACTION. Heinz Bade. Strahlentherapie 68(1), 53-62(1940). (In German).

Skin of 25 rats exposed to 2000 and 2500 r of soft rays (50 kv, HVL in Al 1.0 mm), or hard rays (180 kv, HVL in Cu 1.7 mm) showed no difference histologically or in gross skin reaction when only small areas were exposed. For large fields, tolerance dose for short waves was lower than for radiation of longer waves. BA 15-7685

4339
SOME ASPECTS OF THE BIOLOGICAL ACTION OF IONIZING RADIATIONS (JANEWAY LECTURE, 1939). G. Failla. Am. J. Roentgenol. Radium Therapy 44(5), 649-64(1940).

Author discusses physical and molecular changes in cells following irradiation with special reference to cellular osmotic pressure and comparison of irradiated mouse sarcoma in vivo and in vitro. Generalizations from experimental data are employed to interpret certain findings in radiation therapy. BA 15-7687

4340
SOME EXPERIMENTS UPON THE BIOLOGICAL EFFECTS OF FAST NEUTRONS. L. H. Gray, J. C. Mottram, John Read, and F. G. Spear. Brit. J. Radiol. 13(155), 371-89 (1940).

Methods of measuring neutron dosage are described: one based on ionization, one on radio-activation of P. Neutron and γ ray inhibition of mitosis in chick embryo fibroblast cultures and in broad bean roots are compared. Neutron effect curve is exponential, γ ray curve sigmoidal. There is no intensity dependence in neutron experiments. Sensitive volume was found to be about 2μ for the chick fibroblast and 3μ for bean roots. A hypothesis to account for the relatively greater efficiency of neutrons as compared with γ rays is proposed. BA 15-7688

4341
FURTHER INVESTIGATION OF THE PROCESS OF CELL DIVISION IN THE ROENTGEN IRRADIATED SKIN OF SALAMANDER LARVAE. Wolfgang Luther. Strahlentherapie 68(2), 185-205(1940). (In German).

X irradiation of salamander skin with 500 r inhibits mitosis. Fractional doses of 100 r/sitting gives curve which depends on chromosome injury, thus x ray effect is considered secondary. Difference was noted in recovery time of two cell types: when epidermal cells have returned to normal, connective tissue cells in cornea show abnormal mitosis. BA 15-7689

4342
EFFECTS OF X-RAY UPON THE SNOWY TREE CRICKET, *DECANTHUS NIGRI CORNIES ARGENTINUS*. Edith Penfield Beach. Trans. Kansas Acad. Sci. 41, 303-15 (1938).

Irradiation of adults reduces number of eggs laid, inhibits cell division, causes polyploidy. Chromosomes tend to fragment, and to show other abnormalities. Some evidence was found indicating breaks are caused by x ray effect upon chromosome matrix. BA 13-51

4343
SOME EFFECTS OF X-RADIATION ON THE NEUROBLAST

CHROMOSOMES OF THE GRASSHOPPER, CHORTOPHAGA VIRIDIFASCIATA. J. Gordon Carlson. *Genetics* 23(6), 596-609(1938).

Mitosis of grasshopper embryo neuroblasts treated with 100, 125, 250, 500, 750, and 1000 r was prevented for intervals proportional to dosage. Hypothesis is suggested to account for 3 forms (V's, rings, and pairs of rods) assumed by chromatids of fragments lacking spindle attachments when separating at early anaphase. BA 13-58

4344
MUTATION STUDIES ON THE MOSS, PHYSCOMITRIUM PIRIFORME. A. Barthelmess. *Z. Indukt. Abstamm. -u. Vererbh.* 74(3/4), 479-518(1938). (In German).

Many mutant gametophytes resulted from irradiation of spores with α and x rays. Mutations described include changes in: size and structure of spores, cell form, size, habit, development of protonema, stem length, reproductive ability, sex differentiation, cells of perichaetial leaves, paraphyses; antheridia, and archegonia. BA 13-64

4345
X-RAY INDUCED CHROMOSOMAL ALTERATIONS IN DROSOPHILA MELANOGASTER. Hans Bauer, M. Demerec, and B. P. Kaufmann. *Genetics* 29(6), 610-30(1938).

Chromosome rearrangements were studied by salivary chromosome analysis of 1765 F₁ larvae from a cross of untreated females and x rayed males. Data are given on: frequency of breaks and relation to dosage, distribution of breaks within the chromosome and among various chromosomes; relation of breaks to each other. BA 13-87

4346
NON-EFFECT OF IRRADIATION OF THE HYPOPHYSIS IN STERILE MONKEY FEMALES. Carl G. Hartman and Charles Smith. *Proc. Soc. Exptl. Biol. Med.* 39(2), 330-2(1938).

Single x ray dose (between 60 and 400 r) administered to pituitary gland of non-ovulating rhesus monkeys failed to cause increase of ovarian size in 11 cases. (No harmful sequelae followed treatment) 1/3 of monkeys ovulated and conceived later. BA 13-202

4347
DOSIMETRIC AND RADIOBIOLOGICAL STUDY WITH FAST NEUTRONS. I. Karl G. Zimmer. *Strahlentherapie* 63(3), 517-27(1938). (In German).

Results indicate that small ionization chambers with walls containing H are suitable for measuring fast neutrons. Results obtained with ionization method and Ag-indicator agreed within 20%. Using 1-2.0 (15 Aerion) condenser chamber, ionization current of 1 ESU for 3.9 million volt neutrons corresponds to an ionization in tissue of 1.8 r. BA 13-202

4348
DOSIMETRIC AND RADIOBIOLOGICAL STUDY WITH FAST NEUTRONS. II. K. G. Zimmer and N. W. Timofeeff-Ressovsky. *Strahlentherapie* 63(3), 528-36(1938). (In German).

Definite increase in mutation rate in fruitfly followed exposure to fast neutrons and the increase was directly proportional to dose. Effect per dose unit or per pair of ions produced in tissue was less than that of roentgen or γ rays. Results are in good agreement with those calculated according to target theory. BA 13-205

4349
GROWTH OF WHEAT PLANTS FROM IRRADIATED DRY AND SOAKED GRAINS. Edna L. Johnson. *J. Colorado-Wyoming Acad. Sci.* 2(4), 24(1938).

Plants from seeds soaked before x irradiation with 5000 r or over died within 3 wk, dry groups given 1000-5000 r exceeded controls in tillering, height, and weight. Seedlings from soaked grains surpassed controls only in tillering. BA 13-1385

4350
STUDY OF THE EFFECT OF X-RAY ON APOCYNUM VENETRUM. E. Saurow. *Genet. agrar.* 20, 409-22(1938). (In German)

X irradiation of A. venetum with 11 dosages ranging from 125-32,000 r did not shorten developmental cycle. In first year's growth: growth was stimulated by light doses, depressed by heavy doses which caused mutation-like variants, second year's growth: depressing effect of heavy doses was absent, stimulating effect of 500 and 2000 r was undetectable. Certain doses affected fiber length, all doses increased fineness of fibers. BA 13-1387

4351
SOME EXPERIMENTS IN BIOPHYSICS. Malcolm C. Hyland. *J. Colorado-Wyoming Acad. Sci.* 2(4), 18(1938).

Tulip bulbs affected with Botrytis, disease causing break down of flower colors, were x rayed with doses of 1,500 to 12,000 r in attempt to kill the parasite. In first season after treatment, no effect was evident. BA 13-1466

4352
THE PRODUCTION OF MUTATIONS IN AMERICAN UPLAND COTTON BY RADIATIONS. W. R. Horlacher and D. T. Killough. *Proc. Sixth Intern. Congr. Genet.* 2, 87(1932), Ithaca, N. Y. BA 8-151

4353
CHROMOSOME UNBALANCE AND THE ASYNAPTIC CONDITION AS INDUCED IN NICOTIANA BY X-RADIATION. T. H. Goodspeed. *Proc. Sixth Intern. Congr. Genet.* 2, 67(1932), Ithaca, N. Y. BA 8-151

4354
A STUDY OF THE INHERITANCE OF ANATOMICAL DEFECTS OCCURRING IN THE DESCENDANTS OF X-RAYED MICE. Halsey J. Bagg. *Proc. Sixth Intern. Congr. Genet.* 2, 5(1932), Ithaca, N. Y. BA 8-151

4355
THE EFFECT OF X-RAYS ON THE FERTILITY OF THE MALE HOUSE MOUSE. George D. Snell. *Proc. Sixth Intern. Congr. Genet.* 2, 188(1932), Ithaca, N. Y. BA 8-151

4356
FURTHER STUDIES ON REGULARITIES IN CHROMOSOME TRANSFORMATIONS IN CREPIS CAPILLARIS INDUCED BY X-RAYS. G. Levitsky and M. Sizova. *Compt. rend. acad. sci. URSS* 4(1/2), 71-5(1935).

X-ray translocations in Crepis were mostly reciprocal and came about as result of two independent breaks at metaphase and two subsequent translocations. BA 11-15447

4357
A DETERMINATION OF THE MAGNITUDE OF THE CELL "SENSITIVE VOLUME" ASSOCIATED WITH THE WHITE-EYE MUTATION IN X-RAYED DROSOPHILA. C. P. Haskins. *Proc. Natl. Acad. Sci. U. S.* 21(10), 561-6(1935).

Homozygous eosin stock of D. melanogaster were exposed as eggs or young larvae to x rays (Coolidge tungsten target tube, 85 kv, 10 ma, focal distance 5 in., 78.1 r/min measured by Failla ionization chamber). Results, when substituted in modified Curie expression for "sensitive volume", give radius for locus of white eye of 7.62×10^{-7} cm on assumption that genic locus is spherical. BA 11-15466

4358
FACTORS INFLUENCING RECOVERY AFTER WHOLE BODY RADIATION. E. Paterson. *J. Fac. Radiol.* 5, 189-99(1954).

4359
THE VASCULAR REACTION IN THE WEB OF FROGS (RANA TEMPORARIA) AFTER ROENTGEN IRRADIATION. Bjarne Dahl. *Acta Radiol.* 17(3), 275-83(1936). (In German).

Circulatory reaction of frog to x rays was observed in web of foot. Doses of 2000 r were followed by retardation of the blood stream, 2000 to 4000 r caused edema leading to necrosis. No true stasis or vasoconstrictor action was observed. Vascular reaction was similar to that after application of mustard oil. BA 11-15814

4360
THE PHYSIOLOGY OF COLD DARKENING IN BLACK RABBITS. II. THE INFLUENCE OF ROENTGEN RAYS ON PIGMENT PRODUCTION. Rolf Danneel and Ernst Lubnow. *Biol. Zentr.* 56(11/12), 572-84(1936). (In German).

X-irradiation of de-haired spots on black Alaska rabbit caused new hair to grow in gray-mottled, or with higher dose (1920 r) white. Threshold dose for positive effect was between 750 and 960 r. Author suggests that x rays destroy pigment production function of mitochondria of hair-forming cells. BA 11-15815

4361
ACTION OF ROENTGEN THERAPY. L. Insulin and Adrenalin. F. Eichholtz, H. G. Zwerg, and L. Kluge. *Arch. Exptl. Pathol. Pharmacol.* 174(1/2), 210-16(1934). (In German).

Rats were given one unit of insulin/kg subcutaneously 2 hr before x-ray treatment of rat sarcoma. The insulin injection approximately doubled the growth-inhibiting action of treatment (judged by lactic acid measurements in tumor). Subcutaneous adrenalin (0.1 cc of 1:1000) 2 hr before exposure produced increased growth of sarcoma. BA 11-15816

4362
STUDY OF POSSIBLE BIOLOGICAL EFFECTS OF COSMIC RAYS. Rolf Bull Engelstad and N. H. Moxnes. *Acta Radiol.* 16(4), 485-97(1935). (In German).

Two groups of white mice were kept for 10 mo. either in mine at depth of 350 m or in cellar. Ratio of ionization inside to that outside was 4.63 to 8.58. In four generations of mice, no anatomical or radiographic differences were observed. Only result of life underground was slightly higher average weight. Possible inhibitory effect of cosmic radiation on growth is suggested by author. BA 11-15817

4363
ON THE EFFECT OF ROENTGEN RAYS ON VARIED HARDNESS AND INTENSITY ON THE AUTOLYTIC FERMENT OF CANCER TISSUE. Alexander Farago. *Strahlentherapie* 55(3), 481-97(1936). (In German).

Autolytic activity of pepsinase and tryptase were tested in minced human breast tumor tissue buffered with acetate and phosphate after x irradiation (180 kv, 6 ma, 0.8 Cu + 0.5 mm Al or 100 kv, 6 ma, 1.0 mm Al) for 90 r/min or 10 r/min. Action of ferments was enhanced by doses to 2500 r, with further increase in dose the activity decreased. Radiation effect was dependent on radiation intensity, provided dosage was the same BA 11-15818

4364
RADIATION-INDUCED LYMPHOPENIA. David R. Goodfellow. *Brit. J. Radiol.* 9(107), 695-711(1936).

Total and differential blood counts were made before and after exposure on blood samples from thumb and from ulcerating area undergoing x or γ ray treatment in ten cases of carcinoma. Author found virtually identical figures for both regions in all cases. Suggest migration of lymphocytes does not account for lymphopenia, and that better explanation is (1) destruction of circulating cells, (2) damage of lymphogenic centers, and (3) lymphocyte withdrawal into bone marrow. BA 11-15820

4365
THE FIBRINOGEN LEVEL OF THE BLOOD UNDER THE

INFLUENCE OF ROENTGEN IRRADIATION AND THE PRIMARY RADIATION EFFECT. A. Held and H. Hulbach. *Strahlentherapie* 51(4), 664-71(1934). (In German).

Rabbits recieved total body exposure to x rays in doses of 5, 10, 30, and 50% HED, 180 kv, 4 ma, focus skin distance 50 cm through 0.5 mm Cu + 1 mm Al. Fibrinogen level of venous blood fell to minimum at 10 min, then rose to normal (2-3 hr) and above. Fibrinogen content of lienalis artery blood of irradiated dogs rose after few hours, in lienalis vein there was pronounced and prolonged diminution of fibrinogen content. BA 11-15821

4366
THE ROENTGEN IRRADIATION OF MONGOLIAN IDIOTS. E. Hofmann-Lydtin. *Z. Kinderheilk* 58(2), 155-64(1936). (In German).

Nineteen mongolian idiots, 2 mo-11 yr old were repeatedly x irradiated for varying periods (6 mo to 1 yr). In no case was improvement of bodily stigmata observed. There was no evident effect on dentition. Resistance to infection was not modified, nor was there any objective evidence of facilitation of speech or improvement of intelligence. BA 11-15822

4367
EFFECT OF ROENTGEN RAYS ON THE PERMEABILITY OF THE BARRIER BETWEEN BLOOD AND CEREBROSPINAL FLUID. Y. K. Hsu, C. P. Chang, C. K. Hsieh, and R. S. Lyman. *Chinese J. Physiol.* 10(3), 379-90(1936).

Heads of deteriorated schizophrenic patients were x irradiated through 6 portals: skin dosage 180-270% ESD/portal, even distribution through brain of about 400% ESD. Analyses of blood and cerebrospinal fluid showed drop of bromide quotient, rise of ratios of distribution of chlorides and sugar, implying increased permeability between blood and cerebrospinal fluid $4\frac{1}{2}$ to $6\frac{1}{2}$ wk postirradiation. Irradiation of thighs for control had no such effect. BA 11-15823

4368
SOME X-RAY EFFECTS ON GLUTATHIONE, PHOSPHATASE, ESTERASE AND A THEORY OF THE ACTION OF SHORT-WAVE RADIATIONS. V. Everett Kinsey. *Univ. Pittsburgh Bull.* 32(1), 163-71(1935).

Glutathione, phosphatase, esterase, and vitamin C were exposed to varying amounts of x rays (0.56 A) up to 100,000 r. Only glutathione was affected by these doses; destruction of potency varying in linear relation with dosage. Evidence is presented suggesting production of H in tissues may be a mechanism by which radio-biological changes are produced. BA 11-15824

4369
THE INFLUENCE OF STRONG DOSES OF RADIUM ON GLYCOLYSIS (FORMATION OF LACTIC ACID) IN TISSUE-CULTURES. M. I. Kolomietz. *Voprosy Onkologii* (Problems of Oncology) 6, 94-9(1934). (In Russian English and French summary).

Irradiation of cultures of embryonic fibroblasts for 8 hr. with 10 mgm Ra reduced amount (after 48 hr) of new-formed lactic acid to one half that in control cultures (on average amount formed being 22.9 mgm % instead of 44.2 mgm %). Strong doses of Ra inhibited glycolysis (formation of lactic acid) in tissue cultures. BA 11-15825

4370
COMPARATIVE EFFECTS OF X-RAYS AND NEUTRONS ON NORMAL AND TUMOR TISSUE. John H. Lawrence, Paul C. Aebersold, and Ernest O. Lawrence. *Proc. Natl. Acad. Sci. U. S.* 22(9), 543-47(1936).

Mice were whole-body irradiated with various doses of 200 kv x rays and neutrons. Qualitatively, lethal effects of neutrons were similar to those of x rays: destruction of hemopoietic and lymphoid tissues, epithelium of small

intestine, and of Sarcoma 180 irradiated in vitro.
BA 11-15826

4371

ON THE SIGNIFICANCE OF THE TIME FACTOR IN THE DETERMINATION OF THE QUANTITATIVE BIOLOGICAL REACTION TO A GIVEN DOSE OF RADIATION. Wm. H. Love. *Brit. J. Radiol.* **10**(109), 38-46(1937).

Mathematical analysis is made of expected effect on different constituents of a cell group, depending on percentage of cells passing through radiosensitive stage during irradiation period. Quantitative reaction to given dose may (1) increase with time factor, reach maximum and then decrease, (2) remain independent of time factor temporarily, then decrease, or (3) decrease continuously. Analysis can be made for any type of survival curve.
BA 11-15828

4372

OUR CHANGING CONCEPTS REGARDING THE SKIN DOSE, WITH SOME NOTES ON THE PRODUCTION OF EPIDERMOLYSIS. Walter L. Mattick. *Am. J. Roentgenol. Radium Therapy.* **34**(4), 491-7(1935).

Writer has computed and tabulated tissue recovery coefficients for various wave lengths of x rays and Ra
BA 11-15831

4373

A FURTHER CONTRIBUTION ON THE SPACING OF RADIATION ACCORDING TO VARIATION IN RADIO-SENSITIVITY. J. C. Mottram. *Brit. J. Radiol.* **10**(114), 494-7(1937).

In general, given amounts of x radiation administered continuously in short time had greater injurious effect on tissues than same amount administered fractionally over long time. When fractional doses were spaced to irradiate cells in stage of active growth, situation was reversed and spaced treatments produced greater effect. This is demonstrated by studies on mouse carcinoma.
BA 11-15833

4374

THE EFFECT OF SINGLE AND DIVIDED DOSES OF HIGH INTENSITY X-RAYS ON THE EGGS OF *DROSOPHILA*. Charles Packard. *Am. J. Cancer* **30**(1), 130-8(1937).

High intensities (125-135 r/min) are more effective than low intensities (10-30 r/min) on developing *Drosophila* eggs, difference being most clearly seen after large doses. When high intensity dose is divided into two parts, effect of total dose is equal to or greater than that of single dose, depending on interval between exposures. BA 11-15835

4375

EXPERIMENTAL RADIUM POISONING. II. CHANGES IN THE TEETH OF RABBITS PRODUCED BY ORAL ADMINISTRATION OF RADIUM SULPHATE. Maurice Rosenthal. *Am. J. Med. Sci.* **193**(4), 495-501(1937).

Observations on animals given Ra sulphate per os show that radium is stored not only in the alveolar bone of the jaw but also in the teeth themselves, producing pronounced alteration of entire morphologic picture of tooth, which is described. BA 11-15836

4376

THE CARCINOGENIC ACTION OF RADIUM IN THE RABBIT, THE EFFECT OF PROLONGED IRRADIATION WITH SCREENED RADIUM. Joan M. Ross. *J. Pathol. Bacteriol.* **43**(2), 267-76(1936).

When Ra-filled Pt tubes 1 cm in length (filtration 0.55 mm Pt) containing 0.1 mg Ra element, were implanted into tissues of 9 rabbits, 7 developed malignant new growths in area of tubes. Five sarcomas and two squamous cell carcinomas developed. Author concludes that γ radiation of weak intensity but long duration (97-167 wk) was carcinogenic factor in these cases and that type of growth depends on nature of tissue in which tube is embedded.
BA 11-15837

4377

ON THE EFFECT OF PENETRATING ENVIRONMENT (NATURAL) RADIATION ON THE DEVELOPMENT RATE OF *DROSOPHILA MELANOGASTER*. Rolf M. Sievert. *Strahlentherapie* **56**(2), 354-60(1936). (In German).

D. melanogaster eggs placed within iron chamber 15 cm thick as screen against natural radiation developed at slower rate than control eggs. Chamber of 1 cm thick seemed to retard rate of lesser degree. BA 11-15838

4378

CERTAIN PHYSIOLOGICAL EFFECTS OF X-RAYS ON *EUPLANARIA DOROTOCEPHALA*. H. H. Strandkov. *Physiol. Zool.* **10**(1), 14-20(1937).

Flatworms were exposed to various dosages of x rays, then cut into pieces at various intervals post exposure. Maximum degree of regeneration decreased with increased dosage, also with each increase in interval between irradiation and time of cutting. Visible disintegration followed longer exposures. All pieces surviving disintegration of anterior regions retained their power to regenerate. BA 11-15839

4379

EFFECTS OF A GIVEN X-RAY DOSE ON CYSTS OF *COLPODA STEINI* AT SUCCESSIVE STAGES OF THEIR INDUCED EXCYSTMENT. C. V. Taylor, M. G. Brown, and A. G. R. Strickland. *J. Cellular Comp. Physiol.* **9**(1), 105-16(1936).

Effect of constant dose (38,400 r) of intense soft x rays on time required for induced excystment of *C. steini* cysts was studied. Diverse reactions suggest difference in time of transition from stage of low x ray susceptibility to one of marked susceptibility. Transition period was found to be about 7 min during which profound changes associated with cytoplasmic reorganization take place.
BA 11-15840

4380

THE RELATIVE BIOLOGICAL EFFECTIVENESS OF FAST NEUTRONS AND X-RAYS UPON DIFFERENT ORGANISMS. Raymond E. Zirkle, Paul C. Aebersold, and Everett R. Dempster. *Am. J. Cancer* **29**(3), 556-62(1937).

Relative effectiveness of fast neutrons and x rays, per unit of ionization, were determined for *Drosophila* eggs, wheat seedlings, and fern spores. Neutron: x ray ratios of effectiveness were, respectively, 2.1, 5, and 2.5. Authors believe that the relative susceptibility of various types of cells to neutrons may differ greatly from their relative x ray susceptibility. BA 11-15843

4381

PRODUCTION OF NEPHRITIS IN DOGS BY ROENTGEN RAYS. Irvine H. Page. *Am. J. Med. Sci.* **191**(2), 251-6(1936).

Blood changes in irradiation-produced nephritis include: slow rise in urea-N and total lipid N, and maintenance of total lipids, total, free and ester cholesterol, lipid amino N and lipid P, within limits normal for dogs on same diet. Kidney lesions were produced by repeated irradiation of kidneys which had been transplanted to flank beneath the skin. Lesion produced lead to death in course of a few months. BA 11-16160

4382

INULIN AND CREATININE CLEARANCES IN DOGS WITH NOTES ON SOME LATE EFFECTS OF URANIUM POISONING. A. A. Richards, B. B. Westfall, and P. A. Bott. *J. Biol. Chem.* **116**(2), 749-55(1936).

While plasma clearance of injected inulin and creatinine studied in 11 dogs were found the same under all ordinary experiments circumstances, a dog previously poisoned with U excreted inulin at faster rate than creatinine. This is interpreted as back-diffusion of creatinine, possibly owing to tubular damage. BA 11-16164

4383

THE EFFECT OF RADIATION UPON RETICULUM IN SQUAMOUS CELL CARCINOMA OF THE UTERINE CERVIX. Zola K. Cooper and M. G. Seelig. *Am. J. Cancer* 30(1), 32-8(1937).

No correlation was demonstrable between amount of reticulum in tumor and its radiosensitivity, nor with clinical results following x-ray treatment. There was some indication that inconsequential increase in amount of reticulum occurs after application of Ra. Neither x ray nor Ra has any qualitative histological effect upon reticular fibrils. BA 11-16372

4384

ON TRANSPLANTATION OF TUMOR CELLS TO NORMAL AND PREIRRADIATED HETEROLOGOUS ORGANISMS. Johannes Clemmesen. *Am. J. Cancer* 29(2), 313-32 (1937).

Crocker mouse sarcoma 180 inoculated operatively into rats previously irradiated with 500-600 r, produced transient growths in all animals still alive on 14th day. Successful achievement of serial passages through period of 85 days is held to be proof that x irradiation creates conditions for tumor growth in heterologous organism superior to conditions in normal rats. BA 11-16411

4385

OCCUPATIONAL CANCER OF THE LUNG. L. Teleky *J. Ind. Hyg. and Toxicol.* 19(2), 73-85(1937).

It does not appear that dust inhalation gives rise to lung cancer. Two industrial causes for its development that have been determined are: inhalation of chromate dust, which also may produce cancer of the digestive tract and inhalation of Ra and Ra-containing dust. The disease has also been observed in workers in Ra laboratories. BA 11-16442

4386

ON THE DEPENDENCE OF DIFFERENTIATION OF THE NERVOUS SYSTEM DURING REGENERATION IN *LUMBRICUS VARIEGATUS*. L. Zhinkin. *Wilhelm Roux' Arch. Entwicklungsmech. Organ.* 134(2), 251-61(1936). (In German).

Using *L. variegatus* the author performed three series of experiments: (1) tail cut off 24 hr after irradiation, (2) irradiation 12 hr after amputation, (3) irradiation 2 days after amputation. Results indicate that the nervous system is regenerated only where neoblasts are or have been present, they act as inductors. Presence of mesoderm is also necessary. BA 11-17215

4387

RECESSIVE MUTATIONS INDUCED IN *OENOTHERA BLANDINA* BY X-RAYS. D. G. Catcheside. *Genetics* 19(1/3), 134-42(1937).

Three recessive genes, buckled leaf (bk), helicoid leaf (he) and narrow leaf (nl) are reported for progeny of about 36 F₂ families whose grand-parental pollen had been subjected to x rays. BA 12-69

4388

MUTATIONS IN PARTHENOGENETIC CLADOCERA INDUCED BY X RADIATION. John B. Harris, Arthur F. McBride, Alan W. Fraser, and Vasil Obreshkove. *Physiol. Zool.* 10(3), 269-75(1937).

X-ray induced mutations in *Simoclethrus vetulus* females are described: a change in structure of terminal post-abdominal claws and a temporary physiological change. Critical period of radiosensitivity of egg to x-ray dose used was 2 hr before eggs were laid. BA 12-133

4389

X-RADIATION AND THYROID-INDUCED METAMORPHOSIS IN ANURAN LARVAE. William O. Puckett. *J. Exptl. Zool.* 67(2), 303-2(1937).

Rana sylvatica tadpoles subjected to sub-lethal dosages of x rays and subsequently fed thyroid substances showed heightened susceptibility to thyroid treatment; accomplished early regressive phases of metamorphosis more quickly than controls; but were hampered in later stages of differentiation. Further experiments strengthened theory of x-ray inhibition of cellular differentiation. BA 12-652.

4390

EFFECTS OF ROENTGEN RADIATION ON EMBRYONIC ORGANIZATION AND REGULATION IN *MELANOPLUS DIFFERENTIALIS* (ORTHOPTERA). Titus Carr Evans. *Physiol. Zool.* 10(3), 258-68(1937).

Irradiation of grasshopper eggs 6-8 days old (25°C) resulted in many duplications of parts and aberrant growths from the head, some of the latter outgrowths being extensive enough to show tendency to form one or more secondary embryos. Stage yielding most frequent aberrations after irradiation was comparable to gastrulation (likewise susceptible in vertebrates and other insects). BA 12-2027

4391

EXPERIMENTAL OBSERVATIONS ON THE OPALINID INFUSORIANS WITH SPECIAL REFERENCE TO THE INFLUENCE OF RADIUM RADIATION UPON THE CYTOPLASMIC INCLUSIONS. E. S. Horning. *J. Morphol.* 61(2), 285-300(1937).

Following Ra irradiation mitochondria are reoriented so they assume transverse polarity to longitudinal axis of organism, and later are segregated by radiations so that they lie apart from the vegetative granules with which they are normally in close association. BA 12-2048

4392

ON THE OCCURRENCE OF THREE DIFFERENT SEX-REALIZORS IN THE LIVERWORT. Gerhard Lorbeer. *Planta* 27, 708-17(1938). (In German).

X-irradiation of haploid gametophytes changed female sex realizor γ of *Riella helicophylla* and *Marchantia polymorpha* to σ (synoecous realizor) or to α (male sex realizor). It was not possible to obtain σ in *Sphaerocarpus donellii*. BA 12-7454

4393

HEREDITARY EFFECTS OF X-RAY RADIATION. M. Demerec. *Radiology* 30(2), 212-21(1938).

Review of work (1928-38) on x-ray-induced mutations. Difference in x-ray sensitivity of various strains of *Drosophila* explained by differences in gene environment. Differential action of x rays on various tissues accounted for in same manner. BA 12-2430.

4394

EFFECTS OF X-RAYS ON SEEDS. A. A. Bless. *Plant Physiol.* 13(1), 209-11(1938).

Radish, bean, lettuce, and corn seed were subjected to varying doses of 100,000 volts filtered x rays. There was no significant effect on mature corn and radish plants. Substantial weight increase over controls was observed in beans and lettuce after certain doses. BA 12-2594

4395

ON THE USE OF *DROSOPHILA MELANOGASTER* AS A TOOL IN THE STUDY OF DELAYED KILLING BY X-RAYS. E. V. Enzmann and C. P. Haskins. *Am. Naturalist* 72(739), 184-9(1938).

In study of morphological and physiological modifications of x rayed *D. melanogaster*, a marked difference in x-ray sensitivity was found between larval and imaginal tissue during larval life. BA 12-2643

4396

THE EFFECTS OF IRRADIATION ON THE NORMAL BLOOD CELLS AS DETERMINED BY THE BLOOD COUNT. Karl Kornblum, Fred Boerner, and Samuel G. Henderson. *Am. J. Roentgenol. Radium Therapy.* 39(2), 235-60 (1938)

Group of 120 patients undergoing radiation therapy had blood counts a day before exposure and weekly afterward. No significant effect was noted on red cell count or Hb. There was a general drop in leucocyte count, with greatest decrease in lymphocytes. White cells returned to the normal pre-irradiation state in 5 wk. No relation between effect on leukocytes and part of body irradiated was apparent. BA 12-2644

4397
THE EFFECT OF ROENTGEN RAYS ON THE COLLOIDAL PROPERTIES OF ERYTHROCYTES. Helen Quincy Woodard. J. Phys. Chem. 42(1), 47-54(1938).

Volume and susceptibility to hemolysis of erythrocytes were increased when exposed in fresh preparation, effect reversed in cells irradiated after storage in physiological saline for several days at low temperature. Hb of fresh cells is believed to be split into compounds of smaller molecules by x rays, while that of aged cells is coagulated. BA 12-2645

4398
THE EFFECT OF ATROPHY OF THE THYMUS FOLLOWING ROENTGEN IRRADIATION. NOTES ON CHANGES OBSERVED ON BODY GROWTH, THE GONADS, PITUITARY, AND ADRENALS. J. Gershon-Cohen, Harry Shay, S. S. Fels, T. Meranze, and D. Meranze. Am. J. Roentgenol. Radium Therapy 39(2), 263-70(1938).

Rats were irradiated over thymus daily from second day after birth (130 kv, 5 ma, 25 cm, 2 mm Al filter, portal 8-10 mm diam, 6 min exposure giving 550 r). With doses of 2000 r, atrophy of thymus results; testes development is suppressed; pituitary and adrenals enlarge. Growth was stunted after 20 days of irradiation. BA 12-2827

4399
THE DIVERSIFIED CLINICAL AND PATHOLOGICAL PICTURES OF FAILING OVARIAN FUNCTION. Rita S. Finkler and Milton Friedman. Endocrinology 22(1), 104-10(1938).

Six cases of ovarian hypofunction are described in detail. Treatment with hormone and x rays was felt to be beneficial in some cases. BA 12-2908

4400
THE EFFECT OF X-RADIATION ON THE BLOOD AND LYMPHOID TISSUE OF TUMOR-BEARING ANIMALS. J. R. Clarkson, W. V. Mayneord, and L. Dorothy Parsons. J. Pathol. Bacteriol. 46(2), 221-35(1938).

Growth of mouse sarcoma in whole body irradiated rats was more rapid, percentage of graft takes was higher, and tumor was larger than in nonirradiated rats. Diminution in lymphoid tissue, anaemia and changes in gland structure were among x ray effects. Deposit of Fe in tissues of x rayed and tumor-bearing animals is described. BA 12-3120

4401
THE PATHOLOGICAL PHYSIOLOGY OF RADIATION INJURY IN THE MAMMAL. I. PHYSICAL AND BIOLOGICAL FACTORS IN RADIATION ACTION. H. M. Patt. p. 919-58 of Radiation Biology, Vol. I, Part 2. A. Hollaender, ed. New York, McGraw Hill Book Co., Inc. 1954.

This is a comprehensive review and discussion.

4402
THE EFFECT OF HYPERTROPHIC CARTILAGE ON BONE MARROW GROWTH. Charles Huggins and Kenneth McLane Smith. J. Exptl. Med. 67(1), 41-7(1938).

Colloidal ThO₂ injected into rabbits was deposited in reticuloendothelial cells of bone marrow; could not be displaced by anemia or plethoria. In zones of subsequent growth, macrophages of new marrow were Th-free, and revealed growth pattern of marrow which is described. Marrow is thus shown to increase in length principally in region of hypertrophic cartilage at metaphyses, facilitated

by presence of macrophages which assist in destruction of wasted cartilage cells. BA 12-3707

4403
INVESTIGATIONS ON THE PROBLEM OF RADIUM POISONING. II. EXPERIMENTAL DETERMINATION OF RADIUM DEPOSITION IN THE HUMAN BODY. A. Jantzky, A. Krebs, and B. Rajewsky. Strahlentherapie 61(2), 254-68 (1938). (In German).

Absolute amount of Ra deposits, distribution in various body tissues, and emanation emitted were measured. Amounts of radioelements as small as 1 μ gm in body were found sufficient to produce irreparable damages. BA 13-3575

4404
EFFECT OF ROENTGEN RAYS ON GERMINATION AND GROWTH OF SOME SEEDS. David I. Macht. Am. J. Physiol. 126(3), 572(1939). BA 13-12643

4405
EFFECTS OF FAST NEUTRONS ON CHROMOSOMES IN MITOSIS. A. Marshak. Proc. Soc. Exptl. Biol. Med. 41(1), 176-80(1939).

Abnormal anaphases in mouse tumors following various doses of neutron and x ray radiation were qualitatively similar. Tumors were affected approximately the same by a given neutron dose, but exhibited a differential response to an x ray dose. Difference in effect of the two radiations is explained on the basis of the ionization pattern produced. BA 13-12698

4406
THE EFFECT OF ROENTGEN RADIATION ON THE MEIOTIC CHROMOSOMES OF VICIA FABA L. A. de Sausa da Camara. Bol. soc. Broteriana Ser. 2, 13, 187-209(1938-9). (In German).

Flower buds were x rayed (64 kv, 5 ma, at 30 cm, no filter, for 15-20 min). After 24 hr many cells showed chromosome fragmentations translocations, segmental interchanges, and polyploidy. BA 15-12

4407
THE MODE OF ACTION OF A SINGLE GENE FOR COAT COLOR IN THE RABBIT. R. Danneel. Zool. Anz. Suppl. (Verhandl. deut. zool. Ges. 41) 12, 237-44(1939). (In German).

Following local x irradiation, hair of black rabbits falls out and is replaced by white hair. Histological study shows cause is prevention of lipochondria formation in matrix cells of hair root producing pigment. BA 15-51

4408
CONCERNING THE INFLUENCE OF CHEMICALS ON THE MUTABILITY OF DROSOPHILA MELANOGASTER. H. Dotterweich. Zool. Anz. Suppl. (Verhandl. deut. zool. Ges. 41) 12, 244-53(1939). (In German).

Using the C1B-cross, percentage of sex-linked lethal mutants was increased in cultures in which pilocarpin, caffeine, seawater, or progynon were mixed with food. Normal and chemically treated flies were x irradiated. Mutation rate (unaltered by chemical treatment alone) was increased by single x ray treatment after one or more generations had been reared on chemically altered food. BA 15-53

4409
TWO X-RAY INDUCED MOSAICS IN DROSOPHILA PSEUDOOBSCURA. R. G. Helfer. Proc. Natl. Acad. Sci. U. S. 26(1), 3-7(1940).

One set of mosaic salivary glands contains four tissues, five possibilities of their origin are discussed. Another set contains two tissue types due to chromosome inversion. BA 15-57

4410
THE INDUCTION BY IRRADIATION WITH NEUTRONS OF HEREDITARY CHANGES IN MICE. George D. Snell. Proc. Natl. Acad. Sci. U. S. 25(1), 11-14(1939).

Of 44 F₁ animals in the experimental group there were: 3 semisterile, 1 almost completely sterile male, and 3 completely sterile males with abnormal spermatogenesis. These conditions were absent or very rare in controls. No evidence was found for occurrence of recessive visible mutations following neutron irradiation. BA 15-59

4411
ACTION OF X-RAYS ON EXTERIORIZED CIRCULATING BLOOD. J. Ducuing, L. Bugnard, and O. Miletzky. *Acta Unio contra Cancrum* 4, 825-31(1939). (In French).

Pathogenesis of slow and progressive anemia following irradiation of animal in toto was studied by exteriorizing circulating blood on 6 dogs and irradiating blood only. No progressive anemia developed. Syndrome consisting of leucopenia, thrombopenia, and progressive anemia is not an expression of direct injury to blood, author believes. BA 15-566

4412
LETHAL AND DISSOCIATIVE EFFECTS OF X-RAYS ON BACTERIA. Sol Haberman and Louis D. Ellsworth. *J. Bacteriol.* 40(4), 483-503(1940).

Purified cultures of *Staphylococcus aureus* and *Serratia marcescens* were more effectively killed by hard x rays of Cu and Mo than by soft rays of same intensity. Linear survival curve (percentage of cells surviving plotted semilogarithmically against exposure time) was obtained. X rays increase dissociation rates, especially in proliferating cells. BA 15-975

4413
RELATIONSHIP BETWEEN VARIOUS CHROMOSOMAL CHANGES IN *DROSOPHILA MELANOGASTER*. M. Demerec. *Cytologia (Tokyo) (Fuj. Jub. Vol.)*, 1125-32(1937).

X irradiation of *D. melanogaster* with 2500-3000 r produced 61 lethals at known loci of the X chromosome. Inversions and translocations were induced in 26 of these, in 92.3% of cases, breakage point of chromosome aberration coincided with region of lethal. X-ray-induced chromosome aberrations increase with dosage. BA 15-3690

4414
THE NATURE AND CAUSE OF THE HEMOLYSIS PRODUCED BY X-RAYS. T. P. Ting and Raymond E. Zirkle. *J. Cellular Comp. Physiol.* 16(2), 189-95(1940).

The hemolysis observed in defibrinated beef or human blood 15-20 hr after exposure to 33,000 r of x rays is attributed to increased permeability to salts. BA 15-3772

4415
THE KINETICS OF THE DIFFUSION OF SALTS INTO AND OUT OF X-IRRADIATED ERYTHROCYTES. T. P. Ting and Raymond E. Zirkle. *J. Cellular Comp. Physiol.* 16(2), 197-206(1940).

After exposure to 33,000 r of x rays, human erythrocytes became permeable to Na and K ions, remained impermeable to Mg ions. Behavior of irradiated beef erythrocytes was qualitatively similar to that of human cells. BA 15-3773

4416
ROENTGEN-PIGMENTATION IN THE GOLDFISH. Friedrich Ellinger. *Proc. Soc. Exptl. Biol. Med.* 45(1), 148-50 (1940).

Roentgen pigmentation (spread of astrospherical black chromatophores) also occurs in albino fish *Carassius auratus*. Formation of glia fibers was observed in chromato-motor nerve center in medulla oblongata of irradiated goldfish brains. Roentgen pigmentation in mammals is a photochemical process; in the goldfish it depends on disturbance of the chromato-motoric nervous system and may extend over total innervated area (not confined to irradiated site). BA 15-3799

4417
COMPARATIVE EXPERIMENTAL STUDIES OF 200 KILOVOLTS AND 1000 KILOVOLTS ROENTGEN RAYS.

I. THE BIOLOGICAL EFFECTS ON THE EPIPHYSIS OF THE ALBINO RAT. Edward A. Gall, James R. Lingley, and John A. Hilcken. *Am. J. Pathol.* 16(5), 605-18(1940).

Single x-ray doses of 600-3000 r at 200 or 1000 kv were given to rats 50-54 days old. Radiation was directed at thighs and knees of one hind leg. Growth was impeded by all doses, completely inhibited by higher dosages. There was no detectable difference in effect produced by equal doses of the two intensities. BA 15-3801

4418
FURTHER STUDIES ON THE ACTION OF ROENTGEN RAYS ON THE GAMETES OF *ARBACIA PUNCTULATA*. I. DELAY IN CELL DIVISION CAUSED BY EXPOSURE OF SPERM TO ROENTGEN RAYS. Paul S. Henshaw. *Am. J. Roentgenol. Radium Therapy.* 43(6), 899-933 (1940).

All possible combinations of normal and x-rayed eggs and sperm of *Arbacia punctulata* as well as zygotes were irradiated at various periods up to 45 min after insemination and were studied for delay in cleavage time and associated cytological changes. Eggs were more radiosensitive than sperm for doses of 7800-31,200 r, zygote more sensitive than either. Effect of O₂ uptake and temperature on sensitivity was observed, and abnormal cleavage (multipolar in high percent if dose was large enough) after radiation was noted. BA 15-3802

4419
THE VARIATION WITH WAVELENGTH OF THE BIOLOGICAL EFFECT OF RADIATION. Ilse Lasnitzki and D. E. Lea. *Brit. J. Radiol.* 13(149), 149-62(1940).

Inhibition of mitosis in tissue cultures by x- and γ-ray doses of 20 to 200 r was measured. X-rays with effective wave lengths of 0.107, 0.150, and 0.363 Å were not significantly different in effect per roentgen, γ rays were much less effective. Data from other experiments show variation in x-ray dose biologically equivalent to 1 r of γ rays depending on reaction studied. BA 15-3804

4420
THE EFFECT OF X-RAYS ON CELLS CULTIVATED IN VITRO. Ilse Lasnitzki. *Brit. J. Radiol.* 13(152), 279-84 (1940).

Tissue cultures of 9-11 day old chick embryo choroid and sclerotic were x rayed (97 r, 160 kv). Fall in mitosis was followed by attempted recovery in cell division, accompanied by appearance of degenerate cells. Degeneration occurred in 24 hr due mainly to breakdown of cells which had completed prophase. Radiation effect is believed to be independent of effect on blood circulation, since these *in vitro* effects were closely similar to those following *in vivo* exposure. BA 15-3805

4421
EFFECTS OF IRRADIATION ON LEUKEMIC CELLS IN MARROW CULTURES. Edwin E. Osgood. *Proc. Soc. Exptl. Biol. Med.* 45(1), 131-5(1940).

There was no apparent tendency for irradiation to hasten maturation of leukemic cells, onset of mitotic or amitotic division was apparently prevented. Doses used clinically do not kill directly either normal or leukemia cells. Relative radiosensitivity of lymphocytes and progranulocytes is the same with doses of 50 r and 400 r, and increment of effect is only 1.7 when the dose is increased from 50 r to 400 r. BA 15-3807

4422
ACTION OF X-RAYS ON WATER AND ITS CONSEQUENCES. C. Piffault. *Compt. rend. soc. biol.* 130(1), 43-44(1939). (In French).

Exposure of water to x rays makes it toxic to protozoa. The effect is attributed to formation of H₂O₂. BA 15-3808

4423
THE EFFECT OF X-RAYS UPON TUMOR GROWTH WHEN

THE TUMOR ITSELF IS NOT IRRADIATED. S. Suss and G. M. Scott. Brit. J. Radiol. 13(152), 267-272(1940).

Pairs of rats with inoculated tumors of Jensen rat sarcoma were simultaneously exposed to 1200 r x rays. In one of each pair, only the tumor was irradiated, in the other, only the tumor bed. With dose direct to tumor, 70% of tumors disappeared, dose to tumor bed: 37% and in unirradiated controls; 7% of tumors disappeared. BA 15-3811

4424
SOME IN VIVO EFFECTS OF LOCALIZED NUCLEAR DISINTEGRATION PRODUCTS ON A TRANSPLANTABLE MOUSE SARCOMA Paul A. Zahl, Franklin S. Cooper, and John R. Dunning. Proc. Natl. Acad. Sci. U. S. 26(10), 589-98(1940).

Transplantable mouse sarcomas were injected with various forms of slow-neutron-capturing material. When injected tumor-animal was irradiated with slow neutrons, a significant increase in tumor regression resulted. BA 15-4401

4425
EFFECTS OF X-RAYS UPON THE REGENERATION OF FEATHERS IN THE COMMON FOWL. Benjamin De Boer. J. Morphol. 67(2), 299-318(1940).

Feather regeneration after irradiation with from 2000 to 3000 r in pre- and post-plucked, and desiccated-thyroid injected birds is described. Results show that pre-epidermal melanophore cells of feather are localized in follicle of juvenile bird, and that these cells or follicle cells, destroyed by x rays, are not replaced by migration or overgrowth of cells from uninjured areas. BA 15-4489

4426
THE EFFECTS OF CASTRATION BY PARASITES AND X-RAYS ON THE SECONDARY SEX CHARACTERS OF PRAWNS (LEANDER SPP.) H. G. Callan. J. Exptl. Biol. 17(2), 168-179(1940).

Breeding Leander females develop an elaborate incubatory chamber under the abdomen. This did not develop in parasitized females (which did not carry eggs) and in 30 surviving females castrated by x rays. BA 15-4527

4427
THE EFFECTS OF ULTRAVIOLET RADIATION AND OF ROENTGEN RAYS UPON BACTERIOPHAGE. Arthur Isaac Kendall and Charlotte Anne Colwell. Intern. Congr. Microbiol., Rept. Proc., 3rd Congr., New York, 294-9 (1939-40). BA 15-4697

4428
FACTORS INFLUENCING THE INACTIVATION OF THE RABBIT PAPILLOMA VIRUS BY X-RAYS. William F. Friedewald and Rubert S. Anderson. Proc. Soc. Exptl. Biol. Med. 45(2), 713-15(1940).

Berkefeld filtrates, which contained large amounts of virus were inactivated by exposure to 2-4 million r of x irradiation. A dose of 400,000 to 800,000 r had same effect when virus was partially purified by differential centrifugation. Normal rabbit serum and noninfectious supernatant fluids from centrifuged virus filtrates protected virus suspended in them. Thus, both the virus concentration and extraneous material present influence effect of x rays on virus. BA 15-4703

4429
AN ATTEMPT TO DIFFERENTIATE BETWEEN INFECTIVE AND NONINFECTIVE TUMOURS AND THEIR RESPONSE TO RADIUM TREATMENT. P. R. Peacock. Intern. Congr. Microbiol., Rept. Proc., 3rd Congr., New York, 334-47(1940). BA 15-4716

4430
THE ACTION OF RADIOACTIVE RADIATIONS ON BACTERIA. R. B. Hanes and D. E. Lea. Intern. Congr. Microbiol., Rept. Proc., 3rd Congr., New York, 264(1940). BA 15-4728

4431
THEORETICAL INVESTIGATION OF THE KILLING OF MICROBES BY RADIATION. P. Jordan. Intern. Congr. Microbiol., Rept. Proc., 3rd Congr., New York, 263(1940). (In German). BA 15-4728

4432
THE RADIOBIOLOGICAL IMPORTANCE OF THE ENERGY DISTRIBUTION ALONG IONIZATION TRACKS. Raymond E. Zirkle. J. Cellular Comp. Physiol. 16(2), 221-35 (1940).

Role of linear energy absorption (E_L) along tracks of ionizing particles was investigated by irradiation (1) spores of *Aspergillus*, (2) vegetative cells of *Saccharomyces cerevisiae*, and (3) cells of *Bacterium coli*. X-ray action (low E_L) was compared to that of α rays (high E_L). With increased E_L , effectiveness per unit dose on (1) increases sharply, on (2) increases slightly, on (3) decreases. BA 15-6396

4433
DIRECT AND INDIRECT EFFECTS OF ROENTGEN RADIATION ON THE BLOOD-FORMING ORGANS OF RATS. Chien-Liang Hsu and W. A. Ma. Am. J. Cancer 39(3), 319-33(1940).

Albino female rats, 6-9 mo old, 350-450 gm wt, received daily doses of 125 r in 10 min on skin of posterior surface of hind leg to maxima of 1000, 2500, and 5000 r, 100 kv, 4 ma, 4 mm Al, at 30 cm. After 24 hr, examination of spleen, submaxillary lymph nodes and femoral marrow revealed decrease in marrow cells in proportion to dosage, and decrease in lymphoid cells in nodes and spleen. BA 15-8400.

4434
COMPARABLE ACTION OF X-RAYS ON THE DYSENTERY BACTERIOPHAGES. A. Lacassagne and E. Wollman. Compt. rend. soc. biol. 131(20), 857-9(1939). (In French).

Irradiation (monochromatic x rays of 0.53 Å with molybdenum anticathode tube) of phages in bouillon with about 210,000 γ (calculated for surface of liquid) inactivated elements of C. 16 while in S. 13 about 825,000 γ were required for same result. Lysates of C. 16 and S. 13 had same titer. S. 13, having greater volume, is more resistant to x rays than C. 16. BA 15-18442

4435
THE INFLUENCE OF ULTRA-VIOLET AND ROENTGEN RADIATION OF SPLEEN ON THE RELATIONSHIP BETWEEN CEPHALIN AND PROTEIN FRACTION IN THE BLOOD PLASMA OF RABBITS. Norio Yosida. J. Biochem. (Tokyo) 32, 1-9(1940). (In German).

X-rays induce marked and persisting increase of cephalin, ultraviolet irradiation produces temporary increase. Changes in cephalin concentration are accompanied by counter changes in concentration of euglobulin. BA 16-1383.

4436
DISSOCIATION OF STAPHYLOCOCCI BY X-RAYS: TOXIN-PRODUCING ABILITIES OF X-RAY VARIANTS. Sol Haberman. J. Bacteriol. 42(1), 148-9(1941).

An abstract. BA 16-1500

4437
THE SENSITIVITY OF THE ACTINOMYCETALES TO RADON. N. A. Krasil'nikov. Mikrobiologiya 7, 721-31(1938).

Great difference in sensitivity to Rn exists between strains of bacteria as well as between species. All red, yellow, and yellow-green pigment strains (*Proactinomyces ruber*, *citreus*, *Myco-bacterium luteum*, and others) are more sensitive to Rn. Rn was found to stimulate growth of *P. ruber* and *M. rubrum* but not that of *P. album* and *M. album*. BA16-1509

4438

THE ROENTGEN RAY TREATMENT OF BRONCHIAL ASTHMA. J. von Palugyay. *Wien. klin. Wochschr.* 53, 783(1940).

Best results were obtained from two series of irradiation treatments to lung and spleen at intervals of 4-6 wk in patients who had asthma for only a short time. In 15 or 20% of cases there was no response to treatment, in 25-30% results were excellent. Author advises that x-ray therapy be used in conjunction with allergic treatment. BA 16-1678

4439

THE BACTERIAL ACTION OF X-RAYS, NEUTRONS AND RADIOACTIVE RADIATIONS. D. E. Lea, R. B. Haines, and E. Bretscher. *J. Hyg.* 41(1), 1-16(1941).

Aqueous suspensions of *E. coli* and *B. mesentericus* were irradiated with gamma rays, neutrons, and hard x rays. Rates of killing were constant, LD varied with different radiations, was largest for vegetative cells with radiations of highest ion density (not true for spores). LD was independent of intensity and temperature. Target theory discussed in interpreting results. Bactericidal action is considered explicable on basis of production of lethal mutations in bacterial cell. BA 16-1843

4440

ADVENTITIOUS ROOTS OF RAGI (*ELEUSINE CORACANA*, GAERTN.). N. Krishnaswamy and G. N. Ranswamy Ayyangar. *Current Sci. (India)* 10(2), 79-80(1941).

In plants grown from x-rayed seeds, long, thin, and wiry roots developed in almost every node, down along the stem to leaf sheath base, where they encircled the stems. BA 16-2767

4441

EXPERIMENTAL AND THEORETICAL INVESTIGATION OF THE MECHANISM OF GERMINATION INJURY BY ROENTGEN RADIATION IN POLLEN OF *ANTIRRHINUM MAJUS*. Reinhard Kaplan. *Biol. Zentr.* 60(5/6), 298-318 (1940). (In German).

The percentage of injured pollen grains tended to increase exponentially with increasing x-ray doses under various conditions. Doses of $180-400 \times 10^3$ r produced 50% injured grain and depended on dried or swollen state of pollen before and after exposure. Results are considered in light of "poison" hypothesis and quantum-hit theory. BA 16-2795

4442

THE EFFECT OF PH ON THE INACTIVATION OF TOBACCO-MOSAIC VIRUS BY X-RAYS. Alfred Marshak and William N. Takahashi. *Phytopathology* 31(9), 862 (1941).

An abstract. BA 16-2915

4443

ON THE REACTION OF *PHYCOMYCES BLAKESLEEANUS* TO ROENTGEN AND γ -RAYS. Arne Forssberg. *Acta Radiol.* 22(12), 252-9(1941). (In German).

P. blakesleeanus was irradiated with x rays and γ rays over a wide range of doses and intensities. A reduction in growth rate was observed after doses as small as 0.001 r. BA 16-11805

4444

THE PROBLEM OF ROENTGEN IRRADIATION OF NORMAL LUNG ON THE PREVENTION OF SUBSEQUENT METASTATIC TUMOR GROWTH. Robert P. Barden. *Radiology* 37(5), 608-15(1941).

Rabbits were subjected to x irradiation of right lung, then inoculated intratesticularly with tumor. Irradiation prevented pulmonary metastasis and this effect is attributed to effect on blood supply which prevents implantation of neoplasms. (Radiation: 120 kv, 4 mm Al filter, 5 ma, 78 r/min. 20 cm distance, 300-900 r single dose or divided into two doses given on successive days.) BA 16-15891

4445

THE ROENTGEN PATHOLOGY OF MITOSIS. III. FURTHER INVESTIGATIONS OF THE SECONDARY EFFECTS OF ROENTGEN RADIATION ON THE HAPLOID MITOSIS OF *BELLVALIA ROMANA*. H. Marquandt. *Z. Botan* 36(6/8), 273-386(1941). (In German). BA 16-11561

4446

CHROMOSOME BREAKAGE AND STERILITY IN THE MOUSE. P. C. Koller and C. A. Auerbach. *Nature* 148 (3756), 501-2(1941).

Hereditary partial sterility was produced in three strains of mice by x rays. BA 16-11575

4447

GENETIC CONTROL OF BIOCHEMICAL REACTIONS IN *NEUROSPORA*. G. W. Beadle and E. L. Tatum. *Proc. Natl. Acad. Sci. U. S.* 27(11), 499-506(1941).

X-rays induce mutant strains in *Neurospora* which are characterized by: loss of ability to synthesize vitamin B₆ (which is differentiated by a single gene from ability to elaborate this vitamin), absence of ability to synthesize thiazole half of vitamin B₁, non-synthesis of para-aminobenzoic acid. It was later established that inability to synthesize both thiazole and p-aminobenzoic acid is also inherited as though differentiated from normal by single genes. BA 16-11592

4448

PRODUCTION OF SOMATIC MUTATIONS IN THE PIGEON WITH X-RAYS. Leon J. Cole and Harold E. Finley. *Anat. Record*, 81(4), Suppl. 48(1941). BA 16-11618

4449

X-RAY INDUCED CHANGES IN *DROSOPHILA* AND SELECTIVE FERTILIZATION. John W. Gowen. *Anat. Record*, 81(4), Suppl. 112-13(1941).

An abstract. BA 16-11621

4450

THE EXPERIMENTAL MODIFICATION OF THE SENSITIVITY OF YEAST TO ROENTGEN RAYS. Robert S. Anderson and H. Turkowitz. *Am. J. Roentgenol. Radium Therapy* 46(4), 537-41(1941).

Cultures of *Torula cremoris* were irradiated in presence or absence of atmospheric O₂, with 190 kv x rays (unfiltered) at 190 r per min. Air was removed by de-aerating culture or by allowing culture to grow until so crowded that O₂ lack was produced, controls were aerated by vigorous shaking. In either case, cells irradiated in presence of O₂ were more sensitive to x rays than those which lacked it. BA 16-11800

4451

STABILITY OF THE STANDARD DOSAGE-EFFECT CURVE FOR RADIATION. C. I. Bliss and Charles Packard. *Am. J. Roentgenol. Radium Therapy* 46(3), 400-4(1941).

Standard dosage-effect curve for *Drosophila* eggs and x irradiation was tested for statistical accuracy and possessed greater stability in both slope and position than had been generally reported in investigation on toxic effects. BA 16-11801

4452

EXPERIMENTAL MODIFICATION OF INJURY PRODUCED BY ROENTGEN RADIATION. T. C. Evans, J. P. Goodrich, and J. C. Slaughter. *Anat. Record* 81(4), Suppl. 33(1941).

Radiation injury to the skin of young rats was decreased by lowering the temperature during irradiation, lowering the breathing rate and by blocking circulation. Radio-resistance of *Arbacia* sperm was increased by decreasing the amount of water present, packing sperm to reduce their mobility and by adding substances such as egg albumin, gelatin and *arbacia* egg jelly to the suspension. BA 16-11802

4453

INHIBITION OF EMBRYO FORMATION IN CERTAIN NEMATODES BY ROENTGEN RADIATION. T. C. Evans,

A. J. Levin, and N. M. Sulkin. Proc. Soc. Exptl. Biol. Med. **48**(3), 624-8(1941).

Studies with *Trichinella* and *Rhabditis pello* are described. BA 16-11803

4454

THE RELATIVE BIOLOGICAL EFFECTIVENESS OF ROENTGEN RAYS AND NEUTRONS ON THE REGENERATION OF THE FORELIMB OF AMBLYSTOMA LARVAE.

Edward C. Horn. Am. J. Roentgenol. Radium Therapy **46**(5), 727-31(1941).

Forelimbs in 3 digit stage were amputated immediately following irradiation with different doses of neutrons from cyclotron beam or of 60 kv x rays. Animals receiving more than 62 n of neutrons or more than 850 r of x rays showed no evidence of regeneration. On this basis an x ray dose of 13-14 times that of the neutron dose, as measured with a Victoreen 100 r chamber, is required to prevent regeneration. BA 16-11806

4455

NON-HARMFUL EFFECTS OF IRRADIATION OF THE PITUITARY REGION OF RABBITS. J. Kotz, Joseph F. Elward, and Elizabeth Parker. Am. J. Roentgenol. Radium Therapy **46**(4), 543-9(1941).

Twenty adult male rabbits, under light nembutal anesthesia treated with varying x ray doses ranging from 200 - 500 r in region of pituitary and killed at varying intervals. Pituitary, ovaries, thyroid, and adrenals were examined histologically. No evidence of degenerative changes was observed. Lack of anatomical changes is not indicative of lack of functional change, however. BA 16-11807

4456

EFFECTS OF REPEATED SMALL DOSES OF ROENTGEN RAYS ON CANINE BLOOD AND BONE MARROW. R. M. Mulligan. Proc. Soc. Exptl. Biol. Med. **48**(3), 607-11(1941).

X-ray doses of 75-100 r applied to caudal half of left thorax and cranial half of left abdomen of four dogs under nembutal anesthesia, at intervals of a week or more for several months, caused depression of total leucocyte count, shift to left in neutrophile granulocyte line, occasional eosinophilia, and moderate anemia in peripheral blood, hypoplasia and decrease in myeloid-erythroid ratio in bone marrow, and no evidence of interference with general activity of the animals. BA 16-11808

4457

STUDIES OF IRRADIATION EFFECTS ON CANCER CELLS. I. PRELIMINARY REPORT: THE PRODUCTION OF LIVER CANCER IN WHITE RATS. G. Z. Williams, M. K. Cary, and J. T. Williams. Virginia Med. Monthly **69**(2), 93-5(1942).

Liver cancer was produced in 78 rats by feeding butteryellow and a deficient diet. Roentgen irradiation, totaling 2000 r was applied over the liver in one group previous to cancer development and in another group following cancer development. Irradiation had no effect on incidence or mortality. The strain of rats used showed a tumor incidence of 85% while a strain of hooded rats showed 75% incidence. BA 16-12158

4458

CHANGES OF CYTOPLASMIC ELASTICITY IN SPIROGYRA. Y. Sinoto and D. Sato. Botan. and Zool. (Syokubutu Ovobi Dobutu) **9**(1), 9-16(1940).

By subjecting *Spirogyra* cells to centrifugation in a lateral direction, the authors studied the effects of neutrons, acenaphten (0.003%), colchicine (0.5%) and chlorhydroxylamine (0.05%) on intracellular migration of chloroplasts. Both neutrons and chemical agents facilitated migration. Observed effect is attributed to decrease in structural viscosity of protoplasm. BA 16-13375

4459

TYPES AND FREQUENCIES OF CHROMOSOMAL ABERRATIONS INDUCED BY X-RAYS. K. Sax. Cold Spring Harbor Symposia Quant. Biol. **9**, 93-101(1941).

Frequency of x ray-induced breaks in only 1 of the 2 sister chromatids increases, while breaks involving both sister chromatids decrease in frequency, as prophase stage develops and sister chromatids become more widely separated. BA 16-15756

4460

CHROMOSOME MUTATIONS DUE TO ROENTGEN RADIATION IN *DROSOPHILA MELANOGASTER*. Hans Bauer. Z. Zellforsch. u. mikroskop. Anat. Abt. B. Chromosoma. Z. Zellkern-u. Chromosomenforsch. **1**(3), 343-90(1939). (In German).

Cytological study of salivary glands of 3404 female larvae from offspring of x rayed males is reported. BA 16-15761

4461

ON THE MECHANISM OF RADIATION-INDUCED CHROMOSOME MUTATIONS IN *DROSOPHILA MELANOGASTER*. K. Eberhardt. Z. Zellforsch. u. mikrosk. Anat. Abt. B. Chromosoma; Z. Zellkern -u Chromosomenforsch. **1**(3), 317-35(1939). (In German).

Frequency of x ray-induced changes of cubitus interruptus is taken as an index of total frequency of break induced within a certain region of the 4-chromosome and is found to be approximately proportional to x ray dosage. BA 16-15764

4462

HEREDITARY SUSCEPTIBILITY TO X-RAY INJURY IN *TRITICUM MONOCOCCUM*. Luther Smith. Am. J. Botany **29**(2), 189-91(1942).

Einkorn wheat mutant was found which is more severely injured by 4000-20,000 r x ray treatment of dormant seeds than are other mutants or normal varieties tested. In one trial, germination of normal line was reduced 12% by 20,000 r, in susceptible mutant was reduced 84%. Injury was exhibited by greater flecking on leaves, slower growth, and death from smaller doses than are required to produce similar effects in nonsusceptible seeds. BA 16-14156

4463

AN ANALYSIS OF GROUP DIFFERENCES ARISING FROM A POISSON DISTRIBUTION OF OBSERVATIONS OBTAINED FROM IRRADIATION EXPERIMENTS. Holly Clair Fryer. Iowa State Coll. J. Sci. **16**(1), 49-51(1941). BA 16-14163

4464

INVESTIGATION OF THE INFLUENCE OF RADIUM EMANATION ON PLANT GROWTH. C. Mayer. Balneol. **5**(6), 260-5(1938). (In German).

Growth was stimulated by regular feeding with emanation-containing water. BA 16-15362

4465

THE RELATION BETWEEN XYLEM THICKENING IN PRIMARY ROOTS OF *VICIA FABA* SEEDLINGS AND ELONGATION AS SHOWN BY SOFT X-RAY IRRADIATION. G. F. Smith and H. Kersten. Bull. Torrey Botan. Club **69**(3), 221-34(1942).

Type of secondary wall thickening found in vessels is determined by extent of elongation in surrounding tissues. Histological study was made of roots of seedlings from irradiated unsoaked seeds (soft x rays, 30 kv, 10 ma, 8 cm distance for 0, 15, 30, 60, 90, 120 min). Roots showed decreasing total elongation with increasing doses of x rays. BA 16-15365

4466

HISTAMINE IN BLOOD AND TISSUES UNDER THE INFLUENCE OF SHORT WAVES, DIATHERMY AND

FANGO (RADIOACTIVE MUD). F. Hildebrandt. Arch. exptl. Pathol. Pharmacol. 197(2), 148-60(1941). (In German).

Shortwave therapy, diathermy or fango (radioactive mud) packing, in cats, dogs and rabbits increased histamine content of blood, drawing histamine from tissues. The degree, speed of onset and duration of the effect differed markedly in individual animals. BA 16-17630

4467
THE EVOLUTION OF EXPERIMENTAL RADIATION ULCERS OF THE INTESTINE. N. B. Friedman and S. Warren. Arch. Pathol. 33(3), 326-33(1942).

Irradiation of rabbit intestine resulted in an altered and damaged mucous membrane which was especially susceptible to ulceration. Ulceration, though focal, was not localized by vascular occlusion, appeared to be the chance effect of mechanical trauma and subsequently infection acting on a mucosa and bowel wall structurally and functionally damaged by radiation and imperfectly regenerated. BA 16-17789

4468
BLOOD CHANGES IN 27 CANCER CASES TREATED WITH ULTRADEEP TELERADIOLOGY. A. E. Roifo and B. Luchetta. Bol. inst. med. exptl. estud. cancer (Buenos Aires 18(57)), 607-26(1941).

Studies of blood of patients with various cancers, treated with ultra-deep high voltage (600 kv) roentgen radiation showed, in 40%, a definitely increased red cell content. In remaining 60% there was less definite evidence of diminished blood destruction. Thrombocytes and lymphocytes were reduced in number. Immature members of lymphocytic series were not seen. BA 16-18173

4469
ANTI-LEUCOCYTIC SHEEP SERUM AS SENSITIZING AGENT IN CHRONIC MYELOID LEUKEMIA REFRACTORY TO DEEP X-RAY THERAPY. J. B. Thiersch. Med. J. Australia 29(8), 225-9(1942).

Patients who ordinarily became refractive to x rays remained sensitive to ray therapy after administration of anti-leucocytic serum. Serum caused strong reactions in the patient and did not cure the leukemia (acute myeloblastic) or prolong life. BA 16-18218

4470
RADIATION EFFECTS ON NERVOUS SYSTEM AND ROENTGEN-PIGMENTATION OF GOLDFISH (CARASSIUS AURATUS). Charles Davison and Friedrich Ellinger. Proc. Soc. Exptl. Biol. Med. 49(3), 491-5(1942).

Histological examination of central nervous system of x irradiated goldfish revealed pronounced pathological changes, predominantly in medulla oblongata, extending into anterior horns of spinal cord. Extent of damage was dependent upon dose. Destruction of chromatomotoric nerve center is believed to be the cause of roentgen pigmentation occurring post-exposure. BA 16-17586

4471
THE ABSORPTION OF RADIOPHOSPHOROUS IN IRRADIATED AND NON-IRRADIATED MICE. L. D. Marinelli and J. M. Kenney. Radiology 37(6), 631-7(1941).

Mice were given tracer doses of P^{32} intraperitoneally as Na_2HPO_4 immediately after exposure and sacrificed at various intervals. P^{32} content/g of muscle or skin was the same in irradiated and control legs, higher in irradiated bone than in control bone. BA 16-17587

4472
THE BIOLOGICAL EFFECTS OF ROENTGEN RAYS OF LONG AND SHORT WAVELENGTH ON THE TOTALLY IRRADIATED RAT. J. Craig Potter. Radiology 37(6), 724-5(1941).

Comparative lethal effects of three different wave lengths, and irradiation effects on rat fertility following

ovarian irradiation were studied (total of 500 rats over 8 yr period). BA 16-17588

4473
THE INFLUENCE OF ROENTGEN RAYS ON VARIOUS SYMPATHOMIMETIC HORMONES AFFECTING THE BLOOD SUGAR LEVEL. I. STUDIES WITH ADRENALIN. Eiskoku Sai. Japan J. Med. Sci. IV. Pharmacol. 14(1), 1-12(1941). (In German).

Hyperglycemic action of adrenalin in rabbits was intensified by x raying adrenalin solution with doses up to 4800 r, effect was proportional to dose, above this the effect decreased. After 9000 r the hyperglycemic action of adrenalin was diminished. Erythrosin, tryptaflavin, methylene blue act as photocatalyzers in augmenting x ray effect. BA 16-17590

4474
THE INFLUENCE OF ROENTGEN RAYS ON VARIOUS SYMPATHOMIMETIC HORMONES AFFECTING THE BLOOD SUGAR LEVEL. II. STUDIES WITH TYRAMINE. Eiskoku Sai. Japan J. Med. Sci. IV. Pharmacol. 14(1), 31-42(1941). (In German).

X-irradiation of tyramine with doses to 300 r increased the hyperglycemic action of tyramine in rabbits; 2400 r resulted in decreased action. Addition of erythrosin, tryptaflavin, methylene blue, or rose bengal to solution before exposure had a photocatalytic effect. BA 16-17590

4475
IN VITRO RESPONSE OF LYMPHOCYTES TO MINIMAL DOSES OF X-RAYS. Wilhelm K. Stenstrom, Austin F. Henschel, and Joseph T. King. Proc. Soc. Exptl. Biol. Med. 49(4), 525-7(1942).

Response of lymphocytes from rabbit mesenteric lymph node to small doses of x rays was studied. Migration rate in tissue culture clots was measured at 24 hr after exposure. A 5.3% inhibition was noted after 20 r. At $\frac{1}{2}$ this dose the results were of questionable significance. BA 16-17591

4476
ELIMINATION OF RADIOACTIVE ELEMENTS BY PATIENTS AND RABBITS AFTER THE INJECTION OF THOROTRAST. Wilhelm Stenstrom. Radiology 37(6), 698-703(1941).

Each of three rabbits received 2 cc of colloidal thorotrast intravenously. Five hours later, almost all thorotrast was cleared from blood and 10% of Th X formed in 24 hr was excreted in urine and feces. In rabbit killed 127 days after injection, radioactivity per gram of tissue was in following amounts relative to amount in liver: spleen, 20, bone marrow. There was relatively little in bones. Activity in blood and lymph nodes was due mostly to Th X. BA 16-17592

4477
PHYSICAL AND BIOLOGICAL CONSIDERATIONS IN THE USE OF SLOW NEUTRONS FOR CANCER THERAPY. Paul A. Zahl and Franklin S. Cooper. Radiology 37(6), 673-682(1941).

Injected Li salts were used in combination with neutron therapy in treatment of spontaneous mammary tumors and implanted sarcoma 180 tumors in mice. Neutron absorption was increased by previously introduced B or Li. BA 16-17593

4478
REGARDING WOUND HORMONES. B. C. G. Science and Culture (India) 7(6), 299(1941).

Cells injured by lethal doses of ultraviolet or x rays release "wound hormones" which promote cellular proliferation. Similar substances seem to be produced by irradiated tumor cells (Mitchell). These hormones may be of purine and pyrimidine nature according to earlier experiments on irradiated Saccharomyces cerevisiae (other investigators). BA 16-19027

4479

THE LESIONS PRODUCED IN THE GASTRO-INTESTINAL TRACT BY IRRADIATION. GENERAL REVIEW WITH AN ILLUSTRATIVE CASE REPORT. R. M. Mulligan. Am. J. Pathol. 18(3), 315-26(1942).

Literature on radiation damage to gastrointestinal tract is summarized, including literature on human and experimental cases. Effect on epithelium per se and on vascular supply are considered as well as role of bacterial invasion through the injured wall in development of roentgen ray intoxication. BA 16-19791

4480

CLINICOPATHOLOGIC CONFERENCE. J. W. Pickren. N. Y. State J. Med. 57, 1083-90(1957).

A male had a radical retroperitoneal lymph node dissection followed by deep x-ray therapy from a 1,000,000-volt generator. A dose of about 5000 r was delivered. Treatment was followed by severe radiation changes of the skin and soft tissues with chronic radiation dermatitis and immobilization of the spine due to surrounding fibrosis. A case history of his symptoms is presented.

4481

PATHOLOGY AND PATHOLOGIC DIAGNOSIS OF RADIATION LESIONS IN THE GASTRO-INTESTINAL TRACT. Shields Warren and Nathan B. Friedman. Am. J. Pathol. 18(3), 499-510(1942).

Thirty-eight cases are presented in which stomach or intestinal lesions developed following irradiation. Histologic alteration in epithelial, vascular, connective, and muscle tissue is described. BA 16-19809

4482

THE INFLUENCE OF ROENTGEN RADIATION ON THE VARIOUS SYMPATHOMIMETIC HORMONES AFFECTING THE BLOOD SUGAR LEVEL. III. USING PHENYLETHANOLAMINE. IV. USING SYMPATOL. Eiskoku Sai. Japan J. Med. Sci. IV. Pharmacol. 14(1), 91-8, 125-9 (1941). (In German).

X-irradiation of phenylethanolamine does not increase its hyperglycemic action in rabbits and large doses diminish or abolish it. In presence of dyes, irradiation causes even greater loss of hormonal effect. Sympatol, irradiated with doses up to 600 r, had increased effect; higher doses decreased its action. BA 16-20132

4483

THE PROGNOSIS IN CASES OF BRAIN TUMOR AND THE RESULTS OF SURGERY AND RADIATION THERAPY. Ricardo Morea. Rev. neurol. 6(4), 423-42(1941). (In Spanish).

Results of radiotherapy in cases of brain tumor extremely variable. Author suggests augmenting x-ray effect by use of lipiodol within tumor where secondary rays are given off. BA 16-20195

4484

SERUM AND TISSUE PHOSPHATASE DETERMINATIONS AS AN AID IN EVALUATING THE RADIATION THERAPY OF BONE TUMORS. H. Q. Woodard and N. L. Higinbotham. J. Am. Med. Assoc. 116(15), 1621-7(1941).

An x ray dose of 4000 r inactivates phosphatase-producing mechanism of tumors and decreases serum phosphatase content. After radiation therapy of metastatic bone tumors, serum phosphatase values decrease only after healing. BA 16-20212

4485

THE INACTIVATION OF TOXIC BACTERIAL FILTRATES BY ROENTGEN RADIATION. Charles M. Carpenter, Herbert E. Stokinger, Helen Ackerman and Stafford L. Warren. J. Bacteriol. 43(1), 75-7(1942).

An abstract. BA 16-20448

4486

THE MECHANISMS OF X-RAY EFFECTS ON CELLS. Karl Sax. J. Gen. Physiol. 25(4), 533-7(1942).

Irradiation of resting nuclei of *Tradescantia* microspores did not increase their sensitivity at prophase. Frequency of x-ray induced chromosomal aberrations at prophase was slightly reduced by previous irradiation at resting stage, due to production of less sensitive acentric chromosome fragments. Deleterious x-ray effect on single cells is believed to be due to "direct hit" mechanism. BA 16-21080

4487

SIGNIFICANT DIFFERENCES IN X-RAY SENSITIVITY AMONG VARIOUS SPECIES AND STRAINS OF YEASTS. Raymond E. Zirkle. J. Bacteriol. 43(1), 119(1942).

An abstract. BA 16-21081

4488

MUTATION OF *PHYTOMONAS STEWARTII* BY X-RAY IRRADIATION. Ralph E. Lincoln and John W. Gowen. Genetics 27(4), 441-62(1942).

Mutations were observed in colony color, surface appearance, and size of colonies. Rate of mutation was increased above the spontaneous mutation rate by x-irradiation. (X rays applied so that 1×10^8 viable cells suspended in broth were reduced to about 1×10^3 in 25 min of treatment.) X-ray-induced mutations differ from spontaneous mutations only in frequency of occurrence. BA 15-21125

4489

ON THE QUESTION OF THE RELATIONSHIP BETWEEN RADIATION-INDUCED POINT- AND CHROMOSOME-MUTATIONS IN DROSOPHILA. N. W. Timofeef-Ressovsky. Z. Zellforsch. u. mikroskop. Anat. Abt. B; Chromosoma; Z. Zellkern. -u Chromosomenforsch. 1(3), 310-6(1939). (In German).

Frequency of x-ray-induced sex-linked lethals was proportional to x-ray dose, in spite of the fact that lethals are partly due to chromosomal rearrangements, the frequency of which is roughly proportional to the square of the dose. BA 16-15771

4490

RELATIVE EFFECTS OF X-RAYS AND NEUTRONS ON CHROMOSOMES IN DIFFERENT PARTS OF THE "RESTING STAGE." Alfred Marshak. Proc. Natl. Acad. Sci. U. S. 28(2), 29-35(1942).

Chromosome abnormalities were directly proportional to dose at all stages if allowance was made for multiple hits. Ratio of neutrons to x-ray efficiency (n/x) was constant for different species at prophase, and was increased by a factor of 2 during nuclear resting stage of single species. Neutrons were more effective than x rays on chromosomes of resting nucleus. Daily "safe dose" for neutrons is less than for x rays. BA 16-15772

4491

ON THE BIOLOGICAL EFFECT OF ULTRA-VIOLET LIGHT QUANTA. P. Jordan. Proc. Indian Acad. Sci. 8A, 281-8(1938). (In German).

Theoretical interpretation of inactivation curves obtained with x rays and ultraviolet on bacteria, yeast, and urease is presented. Radiation effect is compared with function of such toxic substances as phenol and $HgCl_2$. Genetical interpretation of killing curves is suggested. BA 16-15888

4492

THE PHYSIOLOGICAL EFFECTS OF NEUTRON RAYS. Paul C. Aebersold and John H. Lawrence. Ann. Rev. Physiol. 4, 25-48(1942). BA 16-15890

4493

CLEAVAGE DELAY IN *ARBACIA PUNCTULATA* EGGS IRRADIATED WHILE CLOSELY PACKED IN CAPILLARY TUBES. Irving Cohen. Radiology 35(5), 561-2(1940).

With both high and low voltage, eggs packed in glass capillaries were more radioresistant than those in sea water. Criterion for x-ray effect was a delay in appearance of initial cleavage. BA 16-15892

4494

CHANGES IN THE EPITHELIUM OF BLOOD VESSELS AFTER ROENTGEN IRRADIATION. L. Eiskind. Acta Pathol. Microbiol. Scand. 17(4), 481-93(1940). (In German).

Rabbits (30) were given single dose of 2500 r to aorta and large veins; 5 men were given total doses of 3500-4500 r in fractionated exposure. Epithelium of aorta and large veins exhibit considerable radioresistance. Nonspecific changes observed: nuclei became rounder, stained darker; perinuclear cytoplasmic vacuoles appeared; multinucleate cells which appeared to be result of normal mitoses without subsequent cytoplasmic cleavage were observed. BA 16-15893

4495

THE GOLDFISH AS A NEW BIOLOGIC TEST OBJECT IN EXPERIMENTAL RADIATION THERAPY. Friederich Ellinger. Radiology 35(5), 563-74(1940).

Irradiation effects appeared between second and third weeks after exposure depending on dosage. Brownish-black pigmentation appeared on both sides of trunk. Autopsy revealed: atrophy and shrinkage of lymphoid tissue, pyknosis of lymphocytes, increased fibrosis, complete disappearance of lymphoid elements from spleen accompanied by proliferation of macrophages. BA 16-15894

4496

DEPTH DOSAGE MEASUREMENTS BY MEANS OF GOLDFISH. Frederick Ellinger and Reuben Gross. Radiology 37(6), 717-21(1941).

Author compares mortality curves obtained following administration of a lethal dose at the surface with mortality curves for the calculated depth dose. Anticipated depth effect did not occur (lethal effect from depth dose exceeded expected effect). BA 16-15895

4497

RADIATION THERAPY. Stephan Epstein. Dermatologica 82, 400(1940). (In German).

Survey of radiobiology and therapy with x rays, Bucky rays, radioactive substances, short and long ultraviolet rays, and short waves. BA 16-15896

4498

THE INACTIVATION OF VACCINIA VIRUS BY RADIATIONS. D. E. Lea and M. H. Salaman. Brit. J. Exptl. Pathol. 23(1), 27-37(1942).

Inactivation of suspensions of Vaccinia virus by α , γ , and x rays was determined from results of intradermal inoculation of serial dilutions in rabbits. Effect appears to be due to single ionization in a sensitive constituent of the virus that occupies approximately 1/2 per cent of total virus volume. Results are contrasted with observations on the size of the sensitive volume in small plant viruses and phages and the implications of the difference are discussed. BA 16-16651

4499

CYTOLOGICAL IRREGULARITIES INDUCED IN PETUNIA BY X-RAY TREATMENT OF POLLEN. Charles M. Rick. Genetics 27(1), 164(1942). BA 16-8701.

4500

CANCER OF THE LUNG IN THE MINERS OF THE JACHYMOV (JOACHIMSTAL). A. Pichan and H. Siki. Am. J. Cancer 16, 681-721(1932).

In five cases studied there was dissemination by way of the lymphatics as well as via the blood stream. The bones were involved in 4 cases. In 3 there was compressive myelitis due to metastases in the vertebrae.

4501

CELL-LINEAGE STUDIES IN ROOT MERISTEMS BY MEANS OF X-RAY INDUCED CHROMOSOME REARRANGEMENTS. R. T. Brumfield. Genetics 27, 135(1942).

Meristems of primary root tips of *V. faba* and *C. capillaris* grown (3 wk) from seed irradiated during

germination, were in many cases found to be chimeras. Both normal and rearranged chromosome complements occurred in the same root. BA 16-8741

4502

AN ANALYSIS OF THE INTENSITY FACTOR IN X-RAY INDUCED CHROMOSOMAL ABERRATIONS IN TRADE-SCANTIA. N. H. Giles and B. R. Nebel. Genetics 27, 143-3(1942).

The number of chromosome aberrations per cell was determined for microspores exposed to 308 r of x rays at intensities ranging from 1.3 to 1200 r/min. BA 16-8746

4503

X-RAY AND ULTRA-VIOLET INDUCED MUTATIONS IN NEUROSPORA. I. X-RAY MUTATIONS. Carl C. Lindegren and Gertrude Lindegren. J. Heredity 32(11), 404-12 (1941).

X-irradiation of unnucleate spermatia of *N. crassa* induced both gene mutations and chromosomal aberrations, one of which was specifically identified as an inversion. BA 16-8756

4504

X-RAY DOSAGE CURVES IN TRADESCANTIA. B. R. Nebel, G. B. Wilson, and L. Marinelli. Genetics 27(1), 158 (1942). BA 16-8762

4505

CYTOLOGICAL DEMONSTRATIONS OF CHROMOSOME BREAKS SOON AFTER X-IRRADIATION. D. W. Bishop. Genetics 27(1), 132(1942).

An abstract referring to studies on *Chortophaga viridifasciata* and *Melanoplus bivittatus*. BA 16-8783

4506

SENSITIVITY OF SPERMATOCYTE CHROMOSOMES TO ABERRATIONS INDUCED IN THE EMBRYOS BY X-IRRADIATION. D. W. Bishop. Genetics 27(1), 132-3 (1942).

An abstract referring to studies on grasshoppers (*Circotettix verruculatus*). BA 16-8784

4507

THE PRODUCTION OF SOMATIC MUTATIONS IN THE PIGEON WITH X-RAYS. Leon J. Cole and Harold E. Finley. Genetics 27(1), 138(1942).

Authors describe x ray-induced flecking in feathers of the pigeon wing following exposure of the empty follicles to 750 r - 1000 r, localized exposure. The increased flecking is attributed to x-ray induced mutations in feather germs. BA 16-8793

4508

GENETIC EFFECTS PRODUCED BY NEUTRONS IN DROSOPHILA MELANOGASTER. M. Demerec, B. P. Kaufmann, and E. Sutton. Genetics 27(1), 140(1942). BA 16-8798

4509

X-RAY SENSITIVITY OF FIRST MEIOTIC PROPHASE AND METAPHASE IN HABROBRACON EGGS. Anna R. Whiting. Genetics 27(1), 174-5(1942).

Hatchability percentages (survival curves) are presented (and analyzed) for unfertilized eggs x irradiated in late prophase I and late metaphase I. Injury in both stages represents chromosome breaks. BA 16-8851

4510

THE REACTION OF KIDNEY TUBULES IN TISSUE CULTURE TO ROENTGEN RAYS. Robert Chambers and Gladys Cameron. Radiology 37(2), 186-93(1941).

Hanging drop cultures of teased fragments of mesonephros from a 10-day chick embryo were exposed to 200 kv x rays, 30 ma through each tube (dual tube machine), 2700 r/min at treatment point. Doses: 5000-75,000 r. Cultures proved to be highly radioresistant. Sensitivity was greater when phenol red was added (this is a secretory stimulant).

Damages were not related to production of toxic products.
BA 16-9050

4511
ROENTGEN RADIATION IN EXPERIMENTAL CLOSTRIDIUM WELCHII INFECTION (GAS GANGRENE) IN DOGS: PRELIMINARY REPORT. Andrew H. Dowdy and Robert L. Sewell. *Radiology* 37(4), 440-2(1941).

Irradiation in experimentally produced *C. welchii* infection permitted a greater number of recoveries than in unirradiated controls. Best results were obtained when radiation therapy was begun within 4 hr of inoculation with *C. welchii*. Radiation of 120 kvp (half value layer of 3.55 mm Al) was more effective than 200 kvp x rays (half value layer of 0.95 mm Cu). BA 16-9051

4512
THE EFFECT OF ROENTGEN RADIATION ON THE JELLY OF NEREIS ZYGOTE. T. C. Evans. *Biol. Bull.* 81(2), 298(1941).

Unirradiated Nereis eggs exude their jelly through the cell membrane (to form a protective coat around the zygote) within a few minutes after insemination. After an x ray dose of 44,000 r this phenomenon is prevented and fertilization is followed by extreme swelling of the fertilization membrane. BA 16-9052

4513
THE ROENTGEN TREATMENT OF EXPERIMENTAL PNEUMONIA IN THE GUINEA PIG. Carl Fried. *Radiology* 37(2), 197-202(1941).

Non-lethal lesions can be produced in lungs of guinea pig by introducing into the bronchi an emulsion of *Staph. aureus hemolyticus*. Such animals, irradiated 6, 12, or 24 hr after infection, exhibited well-defined clinical improvement not shown by controls. Microscopic examination of lung tissue indicates that irradiation interrupted full development of pneumonia even when applied late in the disease. BA 16-9055

4514
EFFECT OF ROENTGEN IRRADIATION UPON LYMPHATIC FLOW IN RATS. Philip J. Hodes and John Q. Griffith. *Radiology* 37(2), 203-4(1941).

In studies on rats combining x irradiation and injection of thorotrast, convincing evidence was found to support the assumption that x-ray therapy interferes with lymphatic flow. BA 16-9057

4515
EFFECT OF RADIO-PHOSPHOROUS ON BLOOD OF MONKEYS. K. G. Scott and J. H. Lawrence. *Proc. Soc. Exptl. Biol. Med.* 48(1), 155-158(1941).

Administration of radio-phosphorous lowers absolute numbers of red cells, lymphocytes, and granulocytes in the blood. Monkeys tolerate doses of 0.76 and 0.71 mc of P^{32} /lb of body weight, but 1.04 mc of P^{32} /lb was fatal. BA 16-9212

4516
CARCINOMA FROM THE STANDPOINT OF TISSUE TOXICOLOGY. E. Gross. *Angew. Chem.* 53(3)/32, 368-72(1940) (In German)

Industrial cancers due to radiation (heat, ultraviolet, x rays, and Ra), tar products, arsenic, asbestos, and chromate are discussed, together with bladder cancers. BA 16-9671

4517
THE EFFECT OF THORIUM DIOXIDE ON NORMAL AND ESTRINIZED TUMOR-BEARING RATS. J. Heiman. *Cancer Research.* 2, 25-7(1942).

Thorotrast did not produce malignant epithelial changes in benign epithelial tumors. Combined thorotrast and estrogen did not induce malignant change in either spontaneous or transplanted benign epithelial tumors, nor did these combined elements elicit malignant epithelial

tumors in normal rats. Granuloma and sarcoma were induced by thorotrast whether or not the rat bore spontaneous or transplanted benign fibroadenoma. BA 16-9675

4518
INVESTIGATIONS ON THE INFLUENCE OF THE TIME-FACTOR IN X-RAY TREATMENT OF A TRANSPLANTABLE MOUSE-CARCINOMA. Otto Kaalund-Jorgensen. *Ugeskrift Laeger* 102(51), 1365-7(1940).

Greater effect upon tumor tissue apparently results from protracted in contrast to fractionated irradiation with doses of 1500 and 2250 r. BA 16-9679

4519
THE EFFECT OF COMBINING BACTERIAL TOXINS AND X-RAY IRRADIATION IN THE TREATMENT OF A TRANSPLANTABLE MOUSE CARCINOMA. E. A. Lawrence and F. Duran-Reynals. *Yale J. Biol. and Med.* 14(2), 177-81(1941).

Length of life of groups of strain A mice bearing a transplantable mammary carcinoma and treated with *Coli*, Paratyphoid B and typhoid toxins plus x irradiation is compared with that of mice treated with x ray alone. Data indicate that toxins have no effect in prolonging length of life over what is obtained with x ray alone. BA 16-9682

4520
THE EFFECT OF ROENTGEN THERAPY UPON INFECTIONS PRODUCED IN THE SKIN OF RABBITS WITH CULTURES OF *STREPTOCOCCUS HAEMOLYTICUS* AND *STAPHYLOCOCCUS AUREUS*. Murray Angevine and Allan Tuggle. *Am. J. Roentgenol. Radium Therapy.* 46(1), 96-103(1941).

X-irradiation (100 kv, at 25 cm) of skin before infection has no influence on the course of infection. In skin irradiated after infection, necrosis developed earlier in treated than untreated lesions and irradiated lesions were larger than those in controls. More organisms were recovered from irradiated lesions and lymph nodes. BA 16-9989

4521
BOTANICAL SCIENCE HELPS TO DEVELOP A NEW RELIEF FOR HUMAN SUFFERING. C. L. Horn. *J. New York Botan. Gard.* 42(496), 88-92(1941).

Leaves of *Aloe vulgaris* described as being an effective remedy for common burns and for x-ray and Ra burns. BA 16-10190

4522
EFFECT OF TEMPERATURE ON THE X-RAY SENSITIVITY OF MAIZE SEEDS. Louis R. Maxwell, J. H. Kempton, and Vernon M. Mosley. *J. Washington Acad. Sci.* 32(1), 18-24(1942).

Dry seeds were subjected to 35 kilo-roentgens. Seeds were heated or cooled before, during, or after irradiation. To decrease radiosensitivity, high or low temperatures must prevail during exposure. A varying amount of recovery occurred during the time elapsing between irradiation and planting for all treatments used. BA 16-10836

4523
THE INDUCTION OF MULTIPOLAR CELL DIVISION WITH X-RAYS AND ITS POSSIBLE SIGNIFICANCE. Paul S. Henshaw. *Radiology* 36(6), 717-24(1941).

Irradiation of either gamete of *Arbacia punctulata* before fertilization caused production of several rather than two blastomeres. Doses of 50,000 r did not affect sperm motility or ability to fertilize. Multipolar cleavage, caused by exposure of either gamete, was evident by late prophase. BA 16-6208

4524
TWO INDEPENDENT INVERSIONS IN THE X-CHROMOSOME OF *DROSOPHILA VIRILIS* AND THEIR EFFECTS ON CROSSING OVER AND DISJUNCTION. T. Komai and T. Takaku. *Cytologia* 11(2), 245-60(1940).

A strain of *D. virilis* with two inversions in the X-chromosome was obtained by x radiation. BA 16-6210

4525

THE BIOLOGIC ACTION OF RADIATIONS IN RELATION TO THE MUTATIONS IN PLANTS. Federico Worschitz. Agronomia (Buenos Aires) 30(1), 37-50(1940).

Author presents general observations on mutation and modification in plant morphology and affirms that effective rays are those lying between beginning of ultraviolet and x rays. Mutations vary in quantity and quality with variation in dosage and with stage and condition of vegetative material under study. BA 16-6235

4526

EFFECTS OF ROENTGEN IRRADIATION UPON LINEAR RATE OF FLOW IN CUTANEOUS LYMPHATICS OF HUMANS. J. N. Ane and George E. Burch. Proc. Soc. Exptl. Biol. Med. 48(2), 471-3(1941).

Data indicate that small x ray doses (220-450 r) applied to skin of humans are not likely to disturb linear flow of lymph in cutaneous lymphatics, while larger doses sufficient to produce a first degree skin reaction will probably reduce rate of lymph flow. BA 16-6378

4527

ANALYSIS OF THE CONVULSIVE PHENOMENA INDUCED IN THE FROG BY IRRADIATION OF THE CENTRAL NERVOUS SYSTEM WITH RADIUM EMANATION. E. I. Bakin. Fiziol. Zhur. SSSR 30(5), 568-73(1941).

Complex convulsive fits of epileptiform character, lasting 1-5 days, were produced in frog by exposure of various segments of spinal cord to Ra emanation. No attacks were produced if cerebral cortex or lower division of cerebrum were irradiated. Mechanism by which Ra emanation produces convulsions is considered similar to that for strychnine. BA 16-6379

4528

STUDIES ON RADIOSENSITIVITY OF ANIMAL CELL IN VITRO. I. RADIOSENSITIVITY OF MUSCULAR AND CILIARY MOVEMENT. G. Goldhaber and A. Back. Proc. Soc. Exptl. Biol. Med. 48(1), 150-51(1941). BA 16-6381

4529

ON THE INFLUENCE OF EMANATION ON THE DEVELOPMENT OF EXPERIMENTAL RICKETS IN YOUNG RATS. J. van Niekerk. Acta Brevia Neerl. Physiol., Pharmacol., Microbiol. 11(6/7), 142-7(1941).

Rats kept on rachitogenic diet in atmosphere with high content of emanation did not show healing of rachitic bone deformations. Controls were kept in (1) normal atmosphere, (2) an almost ionless atmosphere, or (3) an ionless atmosphere with shielding against Ra emanation and cosmic rays. Development of rickets was the same in all groups over period of two weeks. BA 16-6382

4530

STUDIES OF THE ROENTGEN ERYTHEMA OF THE HUMAN SKIN. I. SKIN CAPILLARY CHANGES AFTER EXPOSURES TO UNFILTERED RADIATION. E. A. Pohle. Radiology 6, 236-45(1926).

After exposure to 1/2-1 skin unit dose of unfiltered roentgen radiation, very characteristic changes occur in the skin capillaries, as observed by Mueller. Complete restitution ad integrum takes place in one to three months.

4531

p^{32} UPTAKE BY NUCLEI. A. Marshak. J. Gen. Physiol. 25(2), 275-91(1941-42).

An x ray dose of 200 r altered the distribution of p^{32} in lymphoma. Concentration in the nucleus was remarkably increased shortly after irradiation; concentration in cytoplasm was decreased. Decrease was greater the longer the time after exposure. Altered distribution may be correlated with x-ray induced mitotic inhibition. BA 16-7068

4532

IMMUNIZATION AGAINST CECAL COCCIDIOSIS IN CHICKENS BY THE USE OF X-RAY ATTENUATED OOCYSTS. S. H. Waxler. J. Am. Vet. Med. Assoc. 99(777), 481-5(1941).

Eimeria tenella oocysts, attenuated by exposure to 9000 r, caused a decrease in Hb concentration but no deaths when fed to 35-day-old chicks. Chicks infected with standardized x-ray attenuated dose resisted a subsequent heavy reinfection almost as well as did survivors of severe infection. BA 16-7393

4533

THE SIZE OF STREPTOCOCCUS BACTERIOPHAGES AS DETERMINED BY X-RAY INACTIVATION. Frank M. Exner and S. E. Luria. Science 94(2443), 394-5(1941).

Using x-ray inactivation technique, three phages showed sensitive volume diameters of 26, 33, 43 $m\mu^3$ respectively. BA 16-7456

4534

THE RELATIONSHIP OF CATALASE RATIO TO GERMINATION OF X-RAYED SEED AS AN EXAMPLE OF PRETREATMENTS. B. N. Singh. J. Am. Soc. Agron. 33(11), 1014-6(1941).

Author anticipates that catalase ratio may serve as useful guide in some agronomic practices as it is a sensitive test of metabolic status of tissues, and a rather precise indicator of physiological responses of developing seeds to pre-sowing treatments such as irradiation. BA 16-8011

4535

THE CYTOLOGICAL EFFECT OF DIFFERENT SEED-TREATMENTS IN X-RAYED BARLEY. Olov E. V. Gelin. Hereditas 27(3/4), 209-19(1941).

After 10,000 r of x rays, seeds with 10% moisture showed 12.66% disturbed divisions; with 15% moisture, 27.99%. Seeds soaked 23 hr in water or 0.01% heteroauxin had 53.8 and 50.99%, respectively. Cells first entering division were disturbed most. Proportion of bridges to fragments was 1:2 and was about the same for all division stages. BA 16-3517

4536

EFFECTS OF FAST NEUTRONS UPON PLANTS. IV. CYTOPLASMIC CHANGES IN SPIROGYRA. Y. Nishina, Y. Sinoto, and D. Sato. Cytologia 11(2), 311-18(1940).

Elasticity of Spirogyra cytoplasm, measured by centrifuge method, decreased when exposed to neutron rays. Effect is attributed chiefly to alteration in condition of peripheral cytoplasm, especially to Rinneplasma, which connects chloroplasts to cell membrane. BA 16-3530

4537

GERMINATION AND VITALITY IN OATS AND WHEAT FOLLOWING VARIOUS ROENTGEN DOSES. Kare Froier. Hereditas 27(3/4), 360-70(1941). (In German).

X-ray dosage necessary to decrease percent of germination to 5-20% in di-, tetra-, and hexaploid oats and wheat was determined to be 45,000-55,000 r for Victory (hexaploid oat); 15,000 r was insufficient for *Triticum monococcum* (diploid wheat), 15,000 r and 25,000 r were too low for *T. dicoccum* and *T. durum* (tetraploids), respectively; and 25,000 r was insufficient in *T. vulgare* (hexaploid) wheats. BA 16-3563

4538

MUTATION EXPERIMENTS IN BARLEY. Ake Gustafsson. Hereditas 27(3/4), 225-42(1941).

Seeds of "Golden" barley were x rayed with 5000 and 10,000 r. Three degrees of seed hydration were used; 10 and 15% moisture and seed soaked for 24 hr in water or auxin solution. Author believes direct proportionality (in barley) between dosage and mutation rate is only apparent, not real. BA 16-3567

4539

AUTOSOMAL AND SEX CHROMOSOMAL TRANSLOCATIONS

AND VIABILITY IN APOTETTIX EURYCEPHALUS HANCOCK.

Robert K. Nabours, Florence M. Stebbins, and W. R. B. Robertson. J. Exptl. Zool. 88(2), 239-60(1941).

Two x-ray-induced translocations of chromatin were found in A. eurycephalus; (1) an exchange between 1st and 4th autosomes with depletion in amount of chromatin for former and augmentation of the latter; (2) an exchange between a 1st autosome and the sex chromosome, with increase in chromatin and an extra centromere for the latter. In (1) both aberrant autosomes survived, in (2) donor autosome, deprived of centromere, did not. BA 16-3609

4540

THE BIOPHYSICAL ANALYSIS OF THE PROCESS OF KILLING OF DROSOPHILA EGGS BY RADIATION. Karl G. Zimmer. Biol. Zentr. 60(5/6), 287-98(1940). (In German).

Data from 40 papers are analyzed. Killing of Drosophila eggs by x rays, γ rays, and fast neutrons follows as S-shaped curve with increasing dosage, similar to that required by quantum-hit theory for a reaction which requires several hits. Mortality is independent of wave length; LD₅₀ is dependent on ionization density. Half-value dose changes with increasing age of developing eggs, decreases with increasing temperature during irradiation. BA 16-3618

4541

ON A TYPE OF LESION PRODUCED IN PARAMECIUM CAUDATUM BY X-RAYS. A. Back. Compt. rend. soc. biol. 131(22), 1103-6(1939). (In French).

After irradiation with 2/3-5/6 of lethal dose (600,000 r, Ott tube, 35 kv and 30 ma; Al window 0.3 mm thick, distance between Cu-anticathode and surface of drop with infusoria 37 mm), paramecia can live for several weeks without dividing. BA 16-3779

4542

A NOTE ON THE EFFECT OF DERMAL AND ENTERAL IRRADIATION BY RADIOPHOSPHORUS ON THE BLOOD LEVELS OF DOGS. L. A. Erb. Am. J. Med. Sci. 202(5), 650-4(1941).

Beta-radiation (emitted by radio-P) applied dermally to dogs was followed by a slight decrease in the absolute number of circulating lymphocytes; applied internally, by significant decreases. BA 16-3780

4543

EFFECTS OF ROENTGEN RADIATION ON THE JELLY OF THE ARBACIA EGG. T. C. Evans, H. W. Beams, and Marshall E. Smith. Biol. Bull. 80(3), 363-70(1941).

X-ray doses of 6,100 r removed jelly from eggs, 61,000 r made jelly negative to Janus green test (test was positive when jelly was mechanically removed but not radiated). Jelly was not affected by solutions previously irradiated. Radiation produced slight shift in pH of unbuffered egg-water toward acid side. BA 16-3781

4544

GRENZ-RAY TREATMENT OF EXPERIMENTAL INFECTION OF THE CORNEA. E. Gallardo, R. Pfeiffer, and R. Thompson. Am. J. Ophthalmol. 23(1), 41-6(1940).

Lesions and resulting scars produced by intracorneal injections of staphylococci in rabbits were definitely and consistently smaller in eyes treated by application of Grenz rays following the infection than were those in the untreated eyes of the same animals. BA 16-3782

4545

RESISTANCE VARIATIONS TO MUTAGENIC AGENTS IN ESCHERICHIA COLI. I. X-RAYS AND U.-V. RAYS. L. L. Cavalli and N. Visconti di Modrone. Ricerca sci. e ricostruz. 18(7), 785-9(1948). (In Italian).

Survival curves of x-irradiated strain of E. coli and of isolated mutant B/r were studied. Curve of coli B/r is of "single hit" type for whole range of doses examined,

that of coli B is not. A theoretical and mathematical discussion indicates that coli B strain is composed of at least 3 types of organisms, sensitive, phenotypically resistant, and genotypically resistant, namely, B/r. BA 23-24046

4546

THE EFFECT OF ROENTGEN RADIATION ON PIGMENT PRODUCTION IN THE BIRD FEATHER. Walter Grete. Biol. Zentr. 60(5/6), 258-67(1940). (In German).

First generation feathers grown from irradiated follicles (500, 700, 1000, 1250, 1500, or 2000 r) on breast of carrier pigeons exhibited effects ranging from weak brightening of feather tip to complete inhibition of pigment formation and retarded feather growth. BA 16-3783

4547

ATROPHY OF GERMINAL EPITHELIUM OF THE RABBIT'S TESTIS INDUCED BY ROENTGEN RAYS. C. K. Hu and C. N. Frazier. Proc. Soc. Exptl. Biol. Med. 48(1), 44-8(1941).

Testes of adult rabbits subjected to a series of x ray doses aggregating 2268 r (4.4 E.S.D.) over a period of 15 days showed complete atrophy of germinal epithelium. Secretory function (judged by maintenance of normal sized penis and scrotal sacs, and by normal psycho-sexual behavior of animals) was unaffected as long as 6 mo following irradiation. BA 16-3784

4548

A COMPARATIVE STUDY OF NEUTRON- AND X-RADIATION UPON BIOLOGICAL TISSUES IN THE CANCER PROBLEM. Isador Lampe. Ohio J. Sci. 41(3), 135-8(1941).

Qualitative similarities in tissue reactions to neutrons and x rays include: mutation production, suppression of mitosis, inhibition, and impairment of embryological development, suppression of cell division and tissue growth, destructive action on mammalian tissues. Quantitative comparisons using various biological test objects indicate that neutrons are apparently more efficient per unit quantity of ionization than are x rays. BA 16-3786

4549

INFLUENCE ON DEVELOPMENT OF CERTAIN DOMINANT LETHALS INDUCED BY X-RAYS IN DROSOPHILA GERM CELLS. B. P. Sonnenblick and P. S. Henshaw. Proc. Soc. Exptl. Biol. Med. 48(1), 74-9(1941).

An x-ray-induced dominant lethal which is expressed in cellular multiplication without differentiation, is apparently due to absence or deficiency of gene loci necessary for development. At an age when normal embryos are highly differentiated, some of embryonic offspring of irradiated parents were virtually sacs of cells without any vestige of structure or organization. About 1 in 30 treated gametes produced this effect. BA 16-3787

4550

COMPARATIVE EFFECTS OF NEUTRONS AND X-RAYS ON THREE TUMORS IRRADIATED IN VITRO. Dorothy Axelrod, Paul C. Aebersold, and John H. Lawrence. Proc. Soc. Exptl. Biol. Med. 48(1), 251-6(1941).

Three tumors of Strong-A strain mouse, a mammary carcinoma, a lymphoma and a lymphosarcoma were exposed to neutrons or x rays (220 kv). Appearance of irradiated tumors was uniformly delayed compared to controls, mammary carcinoma more so than others. X ray/neutron doses at 50% survival point: lymphoma-5.8, mammary carcinoma-6.1, lymphosarcoma-7.5. BA 16-4333

4551

THE SPERM OF SEA-URCHIN AS A BIOLOGICAL TEST OBJECT IN ROENTGEN DOSIMETRY. Mituo Miwa,

Hisao Yamashita, and Kazuo Mori. *Gann* **35**(2), 127-32 (1941).

Study of x- and γ -ray effects upon fertilized eggs of *Pseudocentrotus depressus* and *Strongylocentrotus pulcherrimus* is reported. Relation between dosage and cleavage delay appears to be independent of wave length. Depth-dose, determined by this biological method, showed discrepancy when compared with ionization chamber measurements. BA 16-4357

4552

THE EFFECT OF HIGH AND LOW BODY TEMPERATURES UPON THE GROWTH OF IRRADIATED MOUSE SARCOMA 180. Kanematsu Sugiura. *Radiology* **37**(1), 85-93(1941).

Tumor regression following x-irradiation was enhanced by short wave exposure. Effectiveness of x-ray exposure on this sarcoma was reduced by cold. BA 16-4370

4553

LOCALIZATION OF COLLOIDAL DYES IN ANIMAL TUMORS. Paul A. Zahl and L. L. Waters. *Proc. Soc. Exptl. Biol. Med.* **48**(1), 304-10(1941).

X-irradiation treatment did not appreciably alter the amount of Evans blue and Li-carmin localized in tumors of mice. BA 16-4376

4554

INFLUENCE OF EXTRANEEOUS PROTEIN AND VIRUS CONCENTRATION ON THE INACTIVATION OF THE RABBIT PAPILLOMA VIRUS BY X-RAYS. William F. Friedwald and Rubert S. Anderson. *J. Exptl. Med.* **74**(5), 463-87(1941).

Dose of 2-4 million r was required to inactivate crude papilloma extracts (Shope); 100,000 r or less to inactivate purified samples. Addition of normal rabbit serum or crystalline egg albumin increased amount of radiation required for inactivation. The percent destruction of virus in purified suspensions varied inversely with concentration of suspension. As little as 3000 r inactivated much of virus in very dilute suspensions. Indirect effect of x rays is discussed. BA 16-4782

4555

A TRANSLOCATION BETWEEN THE B- AND D-CHROMOSOMES AND THE TRISOMIC EFFECT OF THE B-CHROMOSOME IN *CREPIS TECTORUM* L. Helen Gerassimova. *Izvest. Akad. Nauk SSSR, Otdel. Mate. i Estest. Nauk. Ser. Biol.* **1940**(1), 31-44(1940). (With English Summary).

Mature megagametes of *C. tectorum* were x rayed; and resulted in a plant with reciprocally interchanged B- and D-chromosomes. Break occurred within satellite of D, near kinetic constriction of B. BA 16-143

4556

ON THE SIZE OF THE SATELLITES OF THE CHROMOSOMES. Helen Gerassimova. *Izvest. Akad. Nauk SSSR, Otdel. Mat. i Estest. Nauk. Ser. Biol.* **1940**(1), 45-55(1940).

Chromosome with a "gigantic" satellite was formed as translocation product of an x-rayed female gamete of *Crepis tectorum*. BA 16-144

4557

CHROMOSOME ABNORMALITIES PRODUCED IN INTER-PHASE NUCLEI WITH X-RAYS AND NEUTRONS. A. Marshak. *Genetics* **26**(1), 161(1941).

An abstract. Experiments with root tips of *Vicia faba*, *Pisum*, and *Allium* are reported briefly. BA 16-151

4558

EVIDENCE OF DELAY IN REATTACHMENT OF CHROMOSOME FRAGMENTS FOLLOWING X-RADIATION OF SPERM OF *DROSOPHILA MELANOGASTER*. B. P. Kaufmann. *Genetics* **26**(1), 157(1941).

An abstract. Continuous vs. fractionated exposure were compared with respect to chromosome breaks and rearrangement. BA 16-167

4559

NEW INVESTIGATIONS ON THE EXPERIMENTAL PRODUCTION OF MUTATIONS. H. Stubbe. *Biol. Zentr.* **60**(3/4), 113-29(1940). (In German).

In *Antirrhinum majus*, mutation frequency for leaf and flower form, and leaf and flower color were increased if nutrient medium was N, P, or S deficient. When *N. crassa* and *A. majus* were x rayed (6000 r) mutation frequency was significantly increased in P-deficient pollen. BA 16-170

4560

EXPERIMENTALLY PRODUCED HAPLOIDS IN *NICOTIANA TABACUM* BY MEANS OF X-RAYS. N. P. Badenhuizen. *Natuurw. Tijdschr. Ned. Indie.* **101**(8), 240-2(1941).

Pistils were fertilized with x-ray treated pollen (5000 r) of a dwarf mutant. Higher x-ray doses produced a majority of nongerminating seeds. Many aberrant types were obtained, often due to chromosomal change in pollen mother cells. Seven haploids were found with somatic chromosome number of 24, all scattered over entire spindle. Haploids have smaller flowers than diploids but otherwise resemble them closely. BA 16-176

4561

DIFFERENTIAL REACTIONS OF VARIOUS SCUTE STOCKS OF *DROSOPHILA MELANOGASTER* TO X-RADIATION. R. Blanc and C. Villee. *Genetics* **26**(1), 140(1941).

An abstract. Effects of x rays on bristles were found to differ with different stocks. BA 16-237

4562

THE B^S TRANSLOCATION IN *D. MELANOGASTER* AND MODIFICATIONS OF THE BAR EFFECT THROUGH IRRADIATION. A. B. Griffen. *Genetics* **26**(1), 154-5 (1941).

An abstract. BA 16-259

4563

THE INDUCTION OF CHROMOSOME LOSSES IN *DROSOPHILA* SPERM AND THEIR LINEAR DEPENDENCE ON DOSAGES OF IRRADIATION. G. Pontecorvo. *J. Genetics* **41**(2/3), 195-215(1941).

At dosages of 0, 1000 r, and 4000 r the frequencies of nonlethal losses vary approximately as a linear function of the dosage. BA 16-281

4564

POSTIRRADIATION CHANGES IN THE LEVELS OF ORGANIC PHOSPHOROUS IN THE BLOOD OF PATIENTS WITH LEUKEMIA. J. C. Abels, J. M. Kenney, Lloyd Craver, L. D. Marinelli, and C. P. Rhods. *Cancer Research* **1**(10), 771-5(1941).

Ingestion of subtherapeutic dose of P³² by 5 leukemic patients was followed by rapid and marked change in concentration of organic acid-soluble phosphorous of leukocytes and erythrocytes. No such change was seen after ingestion of comparable amount of non radioactive P(P³¹). Results indicate that "tracer doses" may in some cases disturb normal cell function. BA 16-1063

4565

VAGINAL ESTRUS IN IRRADIATED MICE. RELATIONSHIP OF VAGINAL ESTRUS TO OVARIAN CHANGES AND PRODUCTION OF BIOLOGICALLY ACTIVE OVARIAN TUMORS AFTER ROENTGEN IRRADIATION. Samuel H. Geist, Joseph A. Gaines, and George C. Escher. *Endocrinology* **29**(1), 59-63(1941).

Effects of x irradiation on estrous cycle of female mice was studied by daily smears over 14½ mo. Vaginal changes reflect those within ovaries and are described in correlation with them. BA 16-1088

4566

HISTOLOGICAL CHANGES PRODUCED IN ORAL SQUAMOUS CELL EPITHELIOMAS BY FRACTIONAL EXTERNAL

IRRADIATION. John W. Hall and Milton Friedman. Am. J. Pathol. 17(4), 625(1941). BA 16-1089

4567

INDUCED CHROMOSOMAL CHANGES AND THEIR SIGNIFICANCE IN GROWTH AND DEVELOPMENT.

J. M. Beal. Am. Naturalist 76(764), 239-52(1942).

Types of changes induced by x rays and other agents are reviewed. BA 16-21479

4568

THE ACTION OF X-RAYS ON THE CELL. I. THE CHROMOSOME VARIABLE. H. B. Newcombe. J. Genet. 43(1/2), 145-71(1942).

Action of x rays on division in tulip, hyacinth, Allium, Tradescantia pollen grains, and Drosophila sperms are described. BA 16-21493

4569

CONTRIBUTION TO THE CYTOLOGICAL STUDY OF THE EFFECT OF X-RAYS ON PLANT CELLS. R. Villars. Compt. rend. soc. biol. 131(21), 947-50(1939). (In French).

In Pinus pinea, Vicia faba, Lupinus albus, Helianthus uniflorus, and Hyacinthus ammuus, atypic divisions become less and less frequent with time after exposure. About 3 hr after irradiation (50 kv, 30 ma, dose 450 r/sec, without filter, anticathode distance 12.5 cm), a resting phase commences, being more or less prolonged according to species and dose. BA 16-21501

4570

THE ACTION OF X-RAYS ON THE CELL. II. THE EXTERNAL VARIABLE. H. B. Newcombe. J. Genetics 43(1/2), 237-48(1942).

Of x-ray induced chromosomal changes in Tradescantia pollen grain mitosis, simple chromosome breaks vary as the square of dose or above, 2-break changes vary as 1.5 power; minute fragments (mostly ring) are intermediate. All types vary at higher power of dose when duration of dose is kept constant than when intensity is constant. Intensity effect is attributed to inhibition of both restitution and new reunions of broken ends by irradiation, the inhibitory effect increasing with dosage more rapidly when dose is administered more rapidly. BA 16-21523

4571

AN ANALYSIS OF DATA ON X-RAY INDUCED VISIBLE GENE MUTATIONS IN DROSOPHILA MELANOGASTER H. C. Fryer and John W. Gowen. Genetics 27(2), 212-27 (1942).

Results show: (1) genes within sets observed have same basic mutation rate, (2) mutation rate at specific locus is directly proportional to radiation dosage, (3) if sets of genes used are representative of their respective chromosomes, fundamental mutation rates in these chromosomes are the same, (4) for particular gene and fixed dosage, wave length of x rays used does not affect mutation rate. BA 16-21536

4572

AQUA VIVA. H. Tschelnitz. Anais Paulistas Med. e Cir. 43(3), 199-205(1942).

Author suggests possible physiochemical reactions of radioactive waters on colloidal systems and furnished possible explanation of how such waters may effect living protoplasm when used medicinally. BA 16-21680

4573

NATURE OF THE X-RAY EFFECT IN CO RECOVERY. John A. Cameron. Proc. Soc. Exptl. Biol. Med. 50(2), 234-6(1942).

CO-poisoned animals, x irradiated, showed less CO in blood than others CO-poisoned but not x rayed (spectrographic examination). Change occurs too soon post-irradiation to be due to newly-released red cells or reserve

cells from spleen. In vitro experiments with CO-saturated water or blood revealed no significant changes in content after x irradiation, hence direct chemical change is not indicated. CO-poisoned animals exhibit improved ventilation following irradiation. BA 16-21686

4574

INDIVIDUAL ACTION AND SUMMATION EFFECTS OF X-RADIATION AND COMMONLY USED DERMATOLOGICAL PREPARATIONS ON THE SKIN OF THE ALBINO RABBIT. Frank E. Cormia and William W. Bryan. J. Invest. Dermatol. 5(1), 15-28(1942).

Mild dermatological preparations may be safely used in conjunction with fractional doses of x radiation, but tar and other strongly stimulating preparations should not be combined with x radiation except when an extraordinary stimulation of an extremely chronic and thickened process is desired. (Authors studied effect of (1) fractionated doses with locally applied preparations and (2) large x ray doses before or after topical therapy.)

BA 16-21687

4575

TEMPERATURE AND RADIOSENSITIVITY OF SKIN OF NEW-BORN RATS. IV. EFFECTS OF DECREASED CIRCULATION AND BREATHING DURING IRRADIATION. T. C. Evans, J. P. Goodrich, and J. C. Slaughter. Radiology 38(2), 201-6(1942).

New-born rats were irradiated under conditions in which metabolic rate was lowered. In all cases, radio-resistance of skin to x ray was increased. BA 16-21688

4576

THE EFFECT OF ROENTGEN RAYS UPON THE GROWING LONG BONES OF ALBINO RATS. I. QUANTITATIVE STUDIES OF THE GROWTH LIMITATION FOLLOWING IRRADIATION. Charles L. Hinkel. Am. J. Roentgenol. Radium Therapy 47(3), 439-56(1942).

Growing epiphyseal regions of right hind legs of albino rats of various ages were x irradiated with 200 kv filtered rays in various doses. Degree of stunting was proportional to dose, age is a definitely a factor affecting recovery. BA16-21690

4577

THE X-RAYS. Claude Pascal. Bol. Inst. Portugues Oncol. 8(11), 1-3(1941).

Short survey of the nature, production, and various applications of x rays is presented. BA 16-21691

4578

THE 1941 YEARBOOK OF RADIOLOGY. Charles A. Waters et al. Chicago, Year Book Publishers Inc. 1941. 440p.

A summary of radiological literature of the world is presented in digest form, including sections on radiation biology and radiation in general medicine. BA 16-21693

4579

SOME CYTOLOGIC EFFECTS OF REPEATED DOSES OF RADIATION ON MOUSE SARCOMA 180. L. C. Fogg and S. Warren. Cancer Research 2(7), 517-20(1942).

Quantitative study of cumulative effect of repeated x-ray doses (1200 r at 10 day intervals) on production of abnormal mitoses and multicentriolar cells in mouse sarcoma 180, using C₅₇ black mice is reported. Five consecutive doses produced gradual increase in cells with more than 2 centrioles. Results suggest that one radiation effect is prolonged suppression of cleavage without cessation of kinetic apparatus function. BA 16-22286

4580

Argonne National Lab., Lemont, Ill.
CARCINOGENIC EFFECTS OF DIFFUSE AND POINT-SOURCE BETA IRRADIATION ON RAT SKIN: FINAL SUMMARY. p.31 of QUARTERLY REPORT FOR AUGUST, SEPTEMBER, AND OCTOBER 1952, DIVISION OF BIOLOGICAL AND MEDICAL RESEARCH. Austin M. Brues, ed. 78p. (ANL-4932).

A total of 159 tumors appeared in the 405 experimental rats. Carcinomas were three times as frequent in those treated with diffuse sources as in those treated with point sources.

4581

AN ANALYSIS OF NEUTRON AND X-RAY EFFECTS ON REGENERATION OF THE FORELIMB OF LARVAL AMBLYSTOMA. Edward C. Horn. *J. Morphol.* 71(1), 185-219(1942).

Exposure of amputated forelimbs to 62 n of neutron radiation prevents regeneration; 42 n allows some cartilage replacement. Histological studies following dosage of 62 n, 42 n, 20r, and 10 n reveal that the ability of blastema cells to produce cartilaginous structures varies with the dose. BA 16-22400

4586

HYPOTHYROIDISM FOLLOWING ROENTGEN THERAPY FOR HYPERTHYROIDISM. Arnold L. Bachman and Irving S. Dichter. *Radiology* 39(4), 482-5(1942).

Case report and literature review are presented. BA 17-8552

4587

STUDIES ON X-RAY TREATMENT OF PHLOX. John S. Bangson. *Univ. Microfilm Publ.* 253, 1-69(1940).

X-ray doses were administered to (1) buds, (2) dry seeds, (3) soaked seeds, (4) pollen, (5) pollen and buds of two strains of *Phlox drummondii*. Many buds were killed, survivors set fewer buds and irradiated seeds showed reduced germination, especially irradiated soaked seeds. Seedlings were stunted and many died. Much of the treated pollen was not visible. BA 17-222

4588

THE EFFECT OF ROENTGEN IRRADIATION ON EPIPHYSEAL GROWTH. I. EXPERIMENTAL STUDIES ON THE WHITE RAT. Joseph S. Barr, James R. Lingley, and Edward

A. Gall. *Am. J. Roentgenol. Radium Therapy* 49(1), 104-15(1943).

Histologic and roentgenographic examination of groups of 30, 90, and 180-day old albino rats with one knee joint subjected to x-ray doses of 665-1165 r revealed moderately severe changes. Doses of 1335-1800 r showed severe damage; disruption of cartilage cell columns and destruction of chondrocytes. No evidence of stimulation; almost none of regeneration of epiphyseal cartilage. No degenerative or traumatic changes in joints even after 9 mo. All doses retarded growth; doses above 1300 r stopped growth. BA 17-13006

4589

BLOOD. REVIEW OF THE RECENT LITERATURE. Frank H. Bethell, Cyrus C. Sturgis, Robert A. Hetting, and Otto Tod Mallery, Jr. *Arch. Internal Med.* 69(5), 856-926(1942).

Articles on formed elements and coagulation published in 1941, including radiation effects, are reviewed. BA 17-896

4590

EXPERIMENTAL STUDIES OF THE MECHANISM OF ACTION OF X-RAY THERAPY UPON INFECTION. J. Dewey Bisgard, Howard B. Hunt, Orvis A. Neely, and Paul Scott. *Radiology* 39(6), 691-6(1942).

Rabbits were inoculated with *Escherichia coli* and irradiated with x-ray doses of 100-200 r. There were no survivals when irradiation took place after inoculation. If radiation was given 24 hr prior to inoculation, half the animals survived. Protection reached its peak in 48 hr and then was rapidly lost. Possible mechanism of protection by pre-inoculation irradiation is discussed. BA 17-13007

4591

SPERMATOCYTE CHROMOSOME ABERRATIONS IN GRASSHOPPERS SUBJECTED TO X-RADIATION DURING EMBRYONIC STAGES. David W. Bishop. *J. Morphol.* 71(2), 391-429(1942).

Chromosome aberrations in *Circotettix verruculatus*, constrictions and breaks, were produced during first meiotic anaphase in tetrad chromosomes, regardless of how many cell generations had intervened since treatment. Aberrations were not distributed at random, more than 1/3 of aberrations occurring in one of the smallest chromosomes. BA 17-4160

4592

COMMERCIAL LEAD AS A POSSIBLE INCITING FACTOR IN BRONCHIOGENIC CARCINOMA. REPORT OF TWO CASES. Charles E. Black. *Arch. Pathol.* 35(3), 366-72(1943).

Two cases of bronchiogenic carcinoma are reported, apparently due to inhalation of commercial Pb containing Ra D. BA 17-18533

4593

PHENOCOPIES AND X-RADIATION IN *DROSOPHILA MELANOGASTER*. Richard Blanc and Werner Braun. *Univ. Calif. (Berkeley) Publs. Zool.* 49(1/7), 31-50(1942).

Pupae of inbred Oregon-R stock were x rayed at 0-12 hr (1/4 to 4-1/2 min at 940 r/min). Percentage of flies showing phenocopies increased with dose to 100% at 3290r, with S-curve showing linear relation from 235 to 2115 r. Increase in phenocopies per fly was in linear proportion to radiation increase from 1410 to 3290 r. The typical mortality curve showed a sharp drop in viability from 2350 to 3290 r. BA 17-301

4594

THE EFFECT OF X-RADIATION UPON THE BRISTLE PATTERN IN *DROSOPHILA MELANOGASTER*. Richard

Blanc and Claude A. Villee, Jr. Univ. Calif. (Berkeley) *Publs. Zool.* 49(1/7), 51-60(1942).

Effects of x radiation on bristle reduction were compared for wild Canton-S controls and several scute and heterozygous scute stocks and compounds with genetic suppression of various bristles. Number and percentages of suppression effects and differences between treated and control males and females are tabulated. Most cases of extreme increase following treatment occur for suppression of bristles which are genetically affected in some of controls. BA 17-302

4595
ARTIFICIAL RADIOACTIVITY AND ITS APPLICATION IN PROBLEMS OF MODERN SCIENCE. Marietta Blau. *Ciencia (Mex.)* 2(4), 145-54(1941). (In Spanish).

Biological applications are briefly described. BA 17-822

4596
STIMULATION OF THE DEVELOPMENT OF THE AVIAN EMBRYO BY X-RAYS. Arthur A. Bless and Alexis L. Romanoff. *J. Cellular Comp. Physiol.* 21(2), 117-21 (1943).

Moderate x ray doses reportedly stimulated early embryonic development in chicken eggs, 250 r dose being most effective. Large doses inhibited early growth and increased embryo mortality, 5000 r being 100% lethal. X-ray action on preheated eggs was not much different from that on cooled eggs. Hatching time was relatively unaffected by heavy x-ray doses. Studies employed Coolidge W target, 55 kv, 10 ma, 1.2 mm Al. BA 17-18584

4597
RADIATION EFFECTS ON BLOOD VESSELS. I. II. III. J. Borak. *Radiology* 38(4), 481-92, (5), 607-17, (6), 718-27(1942).

This is a review article consisting of a discussion centered around author's own theory that observations on capillaries are to be explained as direct effects of radiation on endothelial cells. Part I deals with skin erythema and edema. In Part II, inflammation produced by irradiation, degeneration, suppression of growth capacity of capillaries, retrogression of blood vessels and radionecrosis are discussed. Part III deals with etiology of teleangiectasis and the effects on lymph vessels. BA 17-823

4598
THE BRITISH EMPIRE CANCER CAMPAIGN. ANNUAL REPORT. E. Boyland. *Nature* 151(3833), 451-2(1943). BA 17-21658

4599
EFFECTS OF IRRADIATION ON OOCYTES OF *SCIARA*. M. L. Bozeman. *Genetics* 28(1), 71(1943).

Cytological studies on salivary gland preparations from larvae produced by adult females irradiated 20-55 hr after eclosion are described. Aberrations included inversions, deletions, transpositions and repeats. BA 17-12729

4600
THE DIFFERENTIAL ACTION OF X-RAYS ON THE ANTERIOR AND POSTERIOR REGIONS OF *TUBIFEX TUBIFEX*. H. Branson and H. Kersten. *Radiology* 34(2), 200-4(1940).

Changes in *T. tubifex* after exposure of somites at anterior tip or heart region to intense collimated x-ray beam included formation of tuberosities at site of irradiation and disintegration progressing away from site of irradiation. Irradiation of middle section was followed by breaking apart at point of exposure. With x-ray dose too small to produce 100% killing, survivors showed either no apparent change or death of posterior region only. BA 17-10802

4601
CELL-LINEAGE STUDIES IN ROOT MERISTEMS BY MEANS OF CHROMOSOME REARRANGEMENTS INDUCED BY X-RAYS. Robert T. Brumfield. *Am. J. Botany* 30(2), 101-10(1943).

Primary root meristems in germinating seeds of *Crepis capillaris* and *Vicia faba* were x rayed and allowed to grow for 3 wk. Cytologic study of chromosomes showed many chromosomal chimeras which are described. BA 17-16938

4602
METABOLISM OF INDUCED AND SPONTANEOUS LEUKEMIAS IN MICE. Dean Burk, Herbert Sprince, Juliet M. Spangler, Mary C. Boon, and Jacob Furth. *J. Natl. Cancer Inst.* 3(3), 249-75(1942).

Metabolism (Q value) and derived quotients of lymphoid, myeloid, monocytic, and atypical leukemias induced in two stocks of mice Rf and Rf/Ak by methyl cholanthrene painting were the same with or without x irradiation. BA 17-13597

4603
EFFECTS OF LOCALIZED X-RADIATION ON REGENERATION OF THE URODELE LIMB. E. G. Butler and J. P. O'Brien. *Anat. Record* 84(4), 407-13(1942).

A limb, having been incapable of manifesting any regenerating capacity after amputation through the x-irradiated region, was able to regenerate only when a new level of amputation was established proximal to the radiated zone. BA 17-11583

4604
THE EFFECTS OF CONTINUOUS IRRADIATION BY TRITIUM ON CELLS CULTIVATED IN VITRO. A. N. Stroud. *Ann. N. Y. Acad. Sci.* 67, 11-34(1956).

Effects of continuous exposure to β radiation on tissue culture cells, especially on their mitotic activity, using chick embryo skeletal muscle and tritium as a radiation source are described. Mitosis, especially metaphase, is prolonged so that metaphases tend to accumulate in cultures.

4605
IMMEDIATE EFFECTS OF 31 R OF X-RAYS ON THE DIFFERENT STAGES OF MITOSIS IN NEUROBLASTS OF *CHORTOPHAGA*. J. Gordon Carlson. *J. Morphol.* 71(3), 449-62(1942).

Treatment of neuroblasts of grasshopper (*C. viridifasciata*) with 31 r of x rays at 200 r/min leads to alterations in average number of middle prophase, late prophase, metaphases, anaphases, and early telophases per embryo. Some evidence suggesting that mitosis is altered mainly through x-ray effect on prophase chromosomes is presented. BA 17-10666

4606
CAUSES OF CELL DEATH IN IRRADIATED HUMAN TISSUES. B. D. Pullinger. *J. Pathol. Bacteriol.* 35, 527-40(1932).

Hyperaemia is an essential reaction to therapeutic irradiation with radium and x rays. Thin-walled loosely supported capillaries and veins are most readily affected and react in deep structures as well as at surfaces.

4607
THE EFFECT OF ROENTGEN RAYS ON THE BLOOD. E. Kolta and J. Forester. *Strahlentherapie* 21, 644-67 (1926).

4608
THE INFLUENCE OF ROENTGEN-RAY TREATMENTS OF THE HYPOPHYSIS ON REPRODUCTIVE SYSTEMS OF THE GROUND SQUIRREL AND RAT. Rollin Henry Denniston, II. *J. Exptl. Zool.* 91, 237-63(1942).

Annual-breeding ground squirrels, *Citellus tridecemlineatus* were x rayed with 7-4000 r over the

pituitary at various times during annual breeding cycle. No stimulating effect of x rays was observed. Gonads and pituitaries of quiescent animals were resistant to massive x-ray doses. Age-correlated effects followed x-ray exposure of rat pituitaries, 1000 r reducing growth rate of young rats 50%, 2000 r inhibiting spermatogenesis in similar animals, 6000 r being required to depress adult gametogenesis. BA 17-11129

4609

A RE-EXAMINATION OF THE PROBLEM OF MANIFOLD EFFECTS OF GENES IN *DROSOPHILA MELANOGASTER*. Th. Dobzhansky and A. M. Holz. *Genetics* 28(4), 295-303(1943).

X-ray treatment induced 10 alleles of yellow, 4 of white, 2 of ruby, and 1 each of vermilion, dusky, and forked. All of whites, 9 of the 10 yellows, and the vermilion modified the shape of the spermatheca. Therefore, genes of white, yellow and vermilion have manifold effects, they are "pleiotropic" genes. BA17-21051

4610

RADIOBIOLOGICAL STUDIES ON TISSUE CULTURES. I. THE IMMEDIATE EFFECT OF X-RAYS ON CELL OUTGROWTH IN CULTURES OF FIBROBLASTS. L. Doljanski and G. Goldhaber. *Growth* 6(3), 235-49(1942).

Chick fibroblast cultures were x rayed with doses of 500-300,000 r; intensity of 10,500 and 85,000 r/min. X-ray effects were detectable at 2500 r, and were very noticeable at 5000 r. With doses of 5000-100,000 r growth rate was gradually depressed. Effects of 100,000 r or more; with increasing dose, more and more cultures showed no outgrowth. All outgrowth in all cultures was stopped by 260,000 r. Dose-effect curve suggest that there are two main x-ray effects namely, inhibition of mitosis and alteration of outwandering. BA 17-1626

4611

EFFECT OF RADIATION THERAPY ON THE MORPHOLOGY AND BIOCHEMISTRY OF THE BLOOD IN PATIENTS WITH CANCER OF THE UTERINE CERVIX. G. L. Dozortseva and R. S. Mariasin. *Bull. Eksp. Biol. Med.* 12, 94-6 (1941). BA 17-4383

4612

THE DIFFERENCES BETWEEN 200 KILOVOLT AND SUPERVOLTAGE ROENTGEN THERAPY. R. Dresser, J. C. Rude, and B. J. Cosman. *Radiology* 34(1), 13-16 (1940).

Effect of 200,000 and 1,000,000 volt x rays on *Drosophila* eggs both on surface and in depths of phantom are described and clinical observations on skin and tumors are presented. Advantages of million volt rays: larger depth dose with greater biological effect, depth dose independent of size of portal of entry, less general reaction in patient, more satisfactory immediate regression of deep-seated neoplasms. BA 17-8187

4613

HYPOCHLOREMIA IN SURGERY. M. Dubinskis. *Latvijas Biol. Biedrības Raksti Acta Biol. Latvica* 9, 19-24(1939). (In German).

Indispositions often resulting from x-ray therapy were relieved by administration of NaCl in wafer form in fifty cases. BA 17-10907

4614

THE PROBLEM OF RECOVERY FROM RADIATION EFFECTS. F. Ellinger. *Radiology* 40(1), 62-71(1943).

Recovery from radiation effects is discussed from point of view of cellular physiology, photochemistry, and clinical application. "True recovery," "pseudo-recovery," and "clinical recovery" are defined. BA 17-15498

4615

CHANGES IN THE CENTRAL NERVOUS SYSTEM OF GOLD-FISH IRRADIATED IN THE DEPTHS OF A WATER

PHANTOM. F. Ellinger and C. Davison. *Radiology* 39(1), 92-5(1942).

Histologic examination of brains of goldfish x irradiated in depths of water phantom revealed marked changes in medulla oblongata: disappearance of nerve cells, chromatolysis, shadow cell appearance, ischemia, and severe cell changes in nissl bodies. Results agree with previous findings that a greater lethal effect and more pronounced pigmentation are produced by x-ray doses in depths of a water phantom. BA 17-4329

4616

AN EXPERIMENTAL STUDY OF THE EFFECTS OF ROENTGEN RAYS ON THE GONADS OF THE SEXUALLY MATURE DOMESTIC FOWL. J. M. Essenberg and R. J. Karrasch. *Radiology* 34(3), 358-65(1940).

In 71 animals (10 were controls), initial injury to ovarian follicles was produced by 400 r, follicular disintegration by 800 r, and total destruction of follicles by 1800-2200 r. Initial injury to germinal epithelium occurred with 400 r, total destruction with 1200 r. Acclimatization to effects of cumulative x-ray doses was noted in testes and ovaries of treated birds. Gonads of birds appear to be more radioresistant than gonads of mammals. BA 17-10803

4617

INFLUENCE OF THE MEDIUM ON RADIATION INJURY OF SPERM. T. C. Evans, J. C. Slaughter, E. P. Little, and G. Failla. *Radiology* 39(6), 663-80(1942).

Identical x-ray doses were administered to *A. punctulata* sperm in concentrated form and in sea water suspensions of increasing dilution. Irradiation inactivated an increasingly larger percentage of sperm the more dilute the suspension. Addition of seminal fluid, egg water, egg albumen, gelatin, gum arabic, glycylglycine (pH 8.2), and glycine (pH 8.2) decreased the percentage of sperm inactivated by a given dose of x rays. BA 17-13009

4618

INFLUENCE OF THE MEDIUM ON RADIATION INJURY OF SPERM. T. C. Evans, J. S. Slaughter, G. Failla, and E. P. Little. *Anat. Record* 84(4), 492(1942). BA 17-13008

4619

OBSERVATIONAL AND EXPERIMENTAL EVIDENCES RELATING TO THE ORIGIN AND DIFFERENTIATION OF THE DEFINITIVE GERM CELLS IN MICE. N. B. Everett. *J. Exptl. Zool.* 92(1), 49-91(1943)

X-ray treatment of ovaries of post-partum mice (*Peromyscus* and albino) destroys all germ cells and results in permanent sterility. Since somatic epithelial cells are not affected by x rays, it is concluded that they lack the capacity to form germ cells. Possibility of somatic sex reversal after x-ray treatment is suggested. BA 17-13740

4620

ON THE INTERPRETATION OF RADIATION EXPERIMENTS IN GENETICS. U. Fano. *Quart. Rev. Biol.* 17(3), 244-52(1942).

Lack of wave length effect of x rays in their genetic action is understandable independent of the hit theory. A generalized treatment of the dependence of radiation effectiveness on ion density enables one to consider the influence of several hitherto neglected factors. A modified pattern of biophysical analysis of x-ray action is suggested. BA 17-17813

4621

NEUTRON-INDUCED LETHALS IN *DROSOPHILA*. U. Fano. *Genetics* 28(1), 74-5(1943). BA 17-12795

4622

GENERAL RADIOCHEMISTRY. W. Fertiknecht. *Radiol. Clin* 10(2), 17-35(1941). (In German).

Primary processes involved in absorption of radiation are examined. Significance of quantum yields of various photochemical reactions are related to primary processes and behavior of free atoms and radicals. Energies of various types of radiation are compared (in tables) with chemical binding energies. Characteristics of the action of ionizing radiations are discussed. BA 17-4330

4623

A PHYSICAL-CHEMICAL THERAPY PROCEDURE FOR OSTEOMYELITIS. Francisco Finocchiaro. *Anais Paulistas med. e cir.* 44(2), 95-147(1942).

Tissues of affected areas were saturated with Durate's I solution and then x irradiated. Secondary emanations from irradiated I atoms increased sensitivity of cells and cures were much more rapid than those obtained by either I injection or x ray treatment alone. BA 17-13636

4624

THE SUSCEPTIBILITY OF THE SOUTH AFRICAN GERBILS (GENUS TATERA) TO RICKETTSIAL DISEASES AND THEIR USE IN THE PREPARATION OF ANTI-TYPHUS VACCINE. J. Gear and D. S. H. Davis. *Trans. Roy. Soc. Trop. Med. Hyg.* 36(1), 1-7(1942).

X-ray treatment makes gerbils (*T. brantsi* and *T. afra*) susceptible to heavy infections with three types of rickettsial organisms (murine typhus, endemic typhus, and tick-bite fever). BA 17-5437

4625

COMPARATIVE STUDIES OF THE CYTOGENETICAL EFFECTS OF NEUTRONS AND X-RAYS. Norman H. Giles, Jr. *Genetics* 28(5), 398-418(1943).

Author compared effect of neutrons and x rays on *Tradescantia paludosa* by cytological analysis of chromosomal rearrangements induced in developing microspores. Rearrangements produced were the same qualitatively but different quantitatively. For equal total tissue doses of ionization, neutrons were more efficient than x rays in breaking chromosomes, 7.5 mev neutrons more efficient than 15 mev neutrons. Results of similar study on *D. melanogaster* are included. BA 17-23009

4626

RELATION BETWEEN RADIATION EFFECTS AND CELL VIABILITY AS INDICATED BY INDUCED RESISTANCE TO TRANSPLANTED TUMORS. Anna Goldfeder. *Radiology* 39(4), 426-31(1942).

Tumors in mice produced by implants of sarcoma 180 previously irradiated with 800 to 2000 r tended to regress and in doing so, to confer resistance to the tumor. Resistance was also induced by tumor implants exposed to 2200-5000 r, which failed to produce detectable tumors. No resistance was induced with implants irradiated with 60,000 r, a dose preventing proliferation of tumor cells of sarcoma 180 in vitro. BA 17-10804

4627

RADIOBIOLOGICAL STUDIES ON TISSUE CULTURES. II. THE DELAYED EFFECT OF X-RAYS ON CELL OUTGROWTH IN CULTURES OF FIBROBLASTS. G. Goldhaber and L. Doljanski. *Growth* 6(4), 357-66(1942).

Chick fibroblast cultures x rayed (Cu anticathode x-ray tube, 35 kv, doses of 2500, 5000, 12,500, 25,000, 50,000 r) with a dose of 2500 r had their growth rate retarded, 5000 r proved lethal after several passages. With increase in dosage to 12,500 and 25,000 r, no shortening of survival period was found, reduced survival occurring only after increasing the dose to 50,000 r. BA 17-13742

4628

EXPERIMENTAL MODIFICATION OF RADIOSENSITIVITY OF EMBRYONIC CELLS. J. P. Goodrich. *Radiology* 40(2), 179-87(1943).

In egg of Grasshopper, *Melanoplus differentialis*, low temperature decreases sensitivity before third day of prediapause development and increases sensitivity during remainder of prediapause and first two days of postdiapause. Dehydration increases sensitivity before fifth day of prediapause and decreases sensitivity during remainder of prediapause and on second day of postdiapause. Possible mechanism through which these effects may be produced are discussed. BA 17-15499

4629

EXPERIMENTAL INDUCTION OF HERITABLE AND OTHER ALTERATIONS IN THE FUNGUS *NEUROSPORA TETRASPERMA*. T. H. Goodspeed. *Proc. Am. Sci. Cong.* 8th Congr., Wash., D. C., 1940 3, 223-9(1942).

N. tetrasperma was exposed to heat treatment, Grenz rays of shorter wave lengths, neutrons, and combination of temperature treatment, and high frequency radiation. Altered pigmentation in substratum, sclerotia, perithecia, or conidiospores, and changes in growth of various parts resulted. Different types of sex reaction were easily induced. Moisture and temperature postirradiation are important influences on production of the observed changes. BA 17-8025

4630

LETHAL AND DISSOCIATE EFFECTS OF X-RAYS ON BACTERIA. Sol Haberman. *Ohio State Univ. Abstr. of Doctoral Dissett.* 36, 135-46(1941, 1942).

Staph. aureus suspensions were x rayed (Cu tube at 36 kv, 20 ma for 5, 10, 20, 40, 80 min. Killing was dependent on exposure time and was proportional to number of bacteria present. Short wave lengths were more effective than long wave lengths of same intensity. X-ray effects on hereditary mechanisms of (1) *Staph. aureus*, (2) *Staph. albus*, (3) *Serratia marescens*, and (4) *Leuconostoc mesenteroides* were compared. X-rays increased dissociation rate in (1) and (3) to greater extent in activity proliferating cells. BA 17-16356

4631

THE EFFECT OF X-RAYS ON SINGLE COLONIES OF PANDORINA. L. Halberstaedter and A. Back. *Brit. J. Radiol.* 15(172), 124-8(1942).

Death was produced within 45 min after irradiation with 300,000-600,000 r, 35 kv x rays. All daughter cells of same clone were killed by approximately the same dose. In wild cultures however, lethal dose varies over the above range, indicating that different colonies have varying degrees of radiosensitivity. With doses of 3000-300,000 r, cells behave normally until time for division, then become immobile and cytolyse. Doses below 3000-4000 r do not produce demonstrable effects. No recovery was observed. BA 17-2971

4632

THE USE OF RADIOACTIVE TRACERS IN BIOLOGY AND MEDICINE. Joseph G. Hamilton. *Radiology* 39(5), 541-72(1942).

This is a review article emphasizing important therapeutic possibilities in the use of selective irradiation. BA 17-10805

4633

THE EFFECTS OF ROENTGEN RADIATION ON TUMOR INCIDENCE IN *DROSOPHILA MELANOGASTER*. E. W. Hartung, Jr. *Cancer Research* 2(12), 837-40(1942).

Drosophila eggs, strain T3, were exposed to x-ray doses of 250-5000 r. Tumor incidence increased with doses at doses greater than 500 r, reaching a peak value of 48.3% at 1500 r. With increasing doses from 1500-5000 r the incidence decreased, and was below control value (15%) at 5000 r. Wild strain, irradiated with doses of

1000-5000 r, failed to show increase or decrease comparable to that found in tumor-bearing strains. BA 17-11458

4634

PECULIAR GROWTH LESIONS IN FROGS INDUCED BY IRRADIATION OF SPERM CELLS WITH X-RAYS. Paul S. Henshaw. J. Natl Cancer Inst. 3(4), 409-17(1943).

Changes responsible for abnormal growth lesions apparently occur in nucleus of irradiated cell. Sperm nucleus after heavy x irradiation will enter the egg but will not fuse with egg nucleus. Growth abnormalities were not obtained in those cases in which sperm nucleus was not functional. BA 17-18473

4635

RESPONSES OF DROSOPHILA PUPAE TO X-RAYS. P. S. Henshaw and I. M. Golomb. Radiology 34(6), 721-30(1940).

Drosophila pupae maintain strikingly uniform radiosensitivity during first 18 hr of pupal period; after this resistance increases rapidly. Three phases in normal development were observed: 0.-2 hr, destruction and removal of larval organs; 24-48 hr, relative quiescence; 48-96 hr, active organogenesis. Positive correlation was found between O_2 uptake and developmental activity (decrease during phase 1, minimal during 2, increased during 3), but not between either of these and radiosensitivity. BA 17-15198

4636

THE EFFECT ON THE EMBRYOS OF X-RADIATION OF THE MALE RAT. Margaret Henson. Anat. Record 84(4), 467(1942). BA 17-13406

4637

THE EFFECT OF ROENTGEN IRRADIATION OF SPERM UPON THE EMBRYONIC DEVELOPMENT OF THE ALBINO RAT (MUS NORVEGICUS ALBINUS). Margaret Henson. J. Exptl. Zool. 91(3), 405-33(1942).

Mature rats with scrotal region irradiated with 100 or 500 r and mated with normal females during subsequent week, produced litters of normal size but poor survival value; litters from later matings had normal viability. Matings after scrotal exposure of 1000 r produced small litters with low viability, histological evidence of resorption and regression of germinal epithelium within one month. No litters were produced when 3000 r was used. Irradiation did not affect mortality or fertilizing capacity of sperm. BA 17-13010

4638

THE CYCLOTRON AS A MEDICAL INSTRUMENT. Fred Jenner Hodges. Radiology 39(4), 440-54(1942). BA 17-10806

4639

STUDIES ON THE MODE OF ACTION OF RADIATIONS ON BACTERIOPHAGES. Fernand Holweck, Salvatore Luria, and Eugene Wollman. Compt. rend. 210, 639-42 (1940). (In French).

Dysentery bacillus bacteriophage was exposed to: (1) monochromatic x rays of 17 kv; (2) non-monochromatic x rays (200 kv); (3) particulate radiation (radon and active deposit). For all radiations studied, proportion of active virus diminished exponentially as a function of radiation dose. BA 17-1939

4640

CONTROL BY RADIUM OF GASTRIC ACIDITY. James A. Jenkins and Murray McGeorge. Arch. Internal Med. 70(5), 714-21(1942).

Gastric hyperacidity in cases of duodenal ulceration was reduced by intragastric radiation of gastric mucosa with Ra. BA 17-11088

4641

IRRADIATION OF THE SPLEEN AND PITUITARY FOR

CONTROL OF PUERPERAL BLEEDING. BIRTH OF A NORMAL CHILD FOLLOWING TREATMENT OF THE MOTHER. Ira I. Kaplan. J. Am. Med. Assoc. 121(15), 1199-1201 (1943). BA 17-19924

4642

STIMULATIVE EFFECTS OF X-RAYS ON PLANTS. H. J. Kersten, H. L. Miller, and G. F. Smith. Plant Physiol. 18(1), 8-18(1943).

Primary root growth was stimulated by x raying dry seeds of corn at voltages of 17.5 to 20 peak kv, but not at lower or higher voltages. BA 17-14617

4643

FAILURE OF ROOT TIPS OF TOMATO SEEDLINGS GERMINATED FROM X-RAYED SEEDS TO GROW IN VITRO. H. Kersten and G. F. Smith. Plant Physiol. 17(2), 321-3(1942).

Root modifications in seedlings from x rayed seeds are believed to represent direct effects of x raying on meristem development and not to depend upon abnormalities occurring elsewhere in the seedling. X-irradiation in this study was supplied by Cu target gas x ray tube at 30 kv, 10 ma for 0.30 min, seeds 8 cm from focal spot. BA 17-2972

4644

PERMANENT CHANGES OF CHLOROPLASTS INDUCED BY X-RAYS IN THE GAMETOPHYTE OF POLYPODIUM AUREUM. Lewis Knudson. Botan Gaz. 101(4), 721-68 (1940).

Abnormal chloroplasts produced in prothallia of P. aureum by x raying of spores are described. Growth rate decreased after 10,000 r dose to spores; decreased progressively more with higher doses. Doses greater than 30,000 r to spores decreased percentage germination as well. BA 17-6958

4645

THE ADDITIVE EFFECTS OF RADON AND NEUTRAL RED UPON CHAOS CHAOS. V. Koehring. Radiology 35(3), 229-35(1940).

X-irradiation of C. chaos with doses up to 10,000 r in one session, or exposure to Ra radiation (4,225 mc/hr of Rn) was not directly harmful to weakly stained or unstained amoebae. C. chaos is resistant to neutral red, granular staining concentrations of this dye producing no permanent effects. By simultaneous irradiation and staining, however, the amoeba becomes much less radiation-resistant; is then killed with smaller doses of Rn emanation. BA 17-20937

4646

X-RAY-INDUCED STRUCTURAL CHANGES IN THE CHROMOSOMES OF DROSOPHILA PSEUDO-OBSCURA. P. C. Koller and I. A. R. S. Ahmed. J. Genetics 44(1), 53-72(1942).

When males were treated with 4500 r of x rays, changes occurred in 40% of treated sperms. (Salivary glands of 425 larval offspring were examined for induced chromosomal breaks.) BA 17-15201

4647

NORMAL AND ABNORMAL RADIOACTIVITY OF HUMAN AND ANIMAL TISSUE. Adolf Kreds. Fundamenta Radiol. 5, 89-112(1939).

Content of radioactive matter in normal human tissue is stated to be of the order of magnitude of 10^{-12} gram-equivalent of radioactive matter per gram. Tissue activity increases with age. Concentration of 10^{-10} gram-equivalent of Ra per gram may lead to serious injury and death. BA 17-8188

4648

CERTAIN ABNORMALITIES IN MILLETS INDUCED BY

X-RAYS. N. Krishnaswami and G. N. R. Ayyangar. Proc. Indian Acad. Sci. Sect. B., 16, 1-9(1942).

Alterations in chlorophyll characters and in panicles are the most common mutations observed in progenies of x-rayed seeds of *Eleusine coracana* and *Pennisetum typhoides*. BA 17-8027

4649
SOME PHYSIOLOGICAL CHANGES IN THE SKIN PRODUCED BY NEUTRONS. John C. Larkin. Am. J. Roentgenol. Radium Therapy. 47(5), 733-9(1942).

Vasodilation and vasoconstriction of capillaries, changes in their sensitivity produced by neutron irradiation, changes produced by injecting chemical substances into skin, and effects of neutron irradiation on skin temperatures were studied with 60-in. cyclotron. In skin showing radiation erythema, scratch test shows persistent white reaction (increased sensitivity of endothelial tubules), no wheal (refractory to histamine). Flare formation is normal. BA 17-826

4650
NUCLEAR PHYSICS AND THERAPY: PRELIMINARY REPORT ON A NEW METHOD FOR THE TREATMENT OF LEUKEMIA AND POLYCYTHEMIA. J. H. Lawrence. Radiology 35(1), 51-60(1940).

Possible uses of artificially radioactive isotopes in medical investigation and therapy are briefly discussed. Preliminary results of treatment of chronic leukemia and polycythemia with radio-P are summarized. Changes in blood picture during such treatment are illustrated. BA 17-16168

4651
THE NEW NUCLEAR PHYSICS AND MEDICINE (THE CALDWELL LECTURE OF THE AMERICAN ROENTGEN RAY SOCIETY). John H. Lawrence. Am. J. Roentgenol. Radium Therapy. 48(3), 283-301(1942)

Author presents a summary of his subject including a detailed explanation of use of radioactive tracers and radioassay of biological material, illustrated by accounts of various experiments. Possibilities for clinical use of radioisotopes and of neutrons are emphasized by statements of results obtained in certain types of diseases. BA 17-13011

4652
INCORPORATION OF PHOSPHORUS-32 AND MUTAGENESIS DURING SPERMATOGENESIS IN DROSOPHILA. Per Oftedal and Jeanne Mossige (The Norwegian Radium Hospital, Oslo). Nature 179, 104-5(1957). NSA 11-4240

4653
THE INACTIVATION OF PLANT VIRUSES BY RADIATIONS. II. THE RELATION BETWEEN INACTIVATION DOSE AND SIZE OF VIRUS. D. E. Lea and Kenneth M. Smith. Parasitology 34(2), 227-37(1942).

Studies on inactivation of viruses of tomato bushy stunt, tobacco necrosis, tobacco ring spot, tobacco mosaic, and potato X by γ , x, and α rays are described. Dose for inactivation increases in the order: γ rays, 1.5 Å x rays, and α rays. Target sizes are calculated for the various viruses. BA 17-22561

4654
LATE EFFECT OF HIGH VOLTAGE ROENTGEN RAYS ON THE HEART OF ADULT RATS. John E. Leach and Kanematsu Suguira. Am. J. Roentgenol. Radium Therapy 48(1), 81-7(1942).

No demonstrable late effects on the heart (similar to those on skin, subcutaneous tissue, muscle, and bone) were detected 2-14 mo after irradiation with single doses up to and including 7500 r. BA 17-827

4655
DIFFERENTIATION BETWEEN THE DIRECT AND INDIRECT EFFECTS OF ROENTGEN RAYS UPON THE ORGANS OF

NORMAL AND ADRENALECTOMIZED RATS. C. P. Leblond and G. Segal. Am. J. Roentgenol. Radium Therapy 47(2), 302-6(1942).

Large x-ray doses produce a series of secondary symptoms in organs distant from field or direct irradiation, namely thymolymphatic atrophy, adrenal hypertrophy, fatty liver, and stomach ulcerations. In adrenalectomized animals, thymolymphatic atrophy and fatty livers are not found, but the gastric lesions and the lethal effects of the rays are increased. BA 17-828

4656
RADIATION EFFECTS ON GENERAL BIOLOGICAL REACTIONS. F. E. Lehmann. Radiol. Clin. 10(2), 76-92(1941). (In German).

Production by x rays of mutations and chromosome deficiencies and their role in "quantum-hit" theory are considered. Suppression of mitosis by x rays in *Amphibia* and viability of tissues deprived of mitosis are discussed. With regard to effects of x rays, two types of biological structures may be distinguished: nonregulative and regulative. BA 17-829

4657
THE EFFECTS OF X-RAYS ON "COLCHICINE TUMORS" ON THE ROOT TIPS OF THE COMMON ONION. Michael Levine. Am. J. Botany 29(10), 13s(1942). BA 17-12767

4658
MECHANISM OF THE BIOLOGICAL EFFECTS OF RADIATION. Ad. Liecht. Radiol. Clin. 10(2), 50-67(1941). (In German).

Characteristics and limitations of ultraviolet and x rays are considered with reference to irradiation of biological systems. Mechanisms of ultraviolet and x-ray action are compared. Primary act of x rays is an emission of secondary electrons, that of ultraviolet is an absorption. Changes in permeability produced by x rays are probably secondary effects and are related to such phenomena as protein denaturation. BA 17-4331

4659
THE THERAPEUTIC USE OF ARTIFICIALLY PRODUCED RADIOACTIVE SUBSTANCES. RADIOPHOSPHORUS, RADIOSTRONTIUM, RADIOIODINE, WITH SPECIAL REFERENCE TO LEUKEMIA AND ALLIED DISEASES. Bertram V. A. Low-Beer, John H. Lawrence, and Robert S. Stone. Radiology 39(5), 573-97(1942).

Authors stress difficulties in dosimetry in this type of radiation therapy and base their discussion on clinical cases studied. BA 17-10807

4660
THE INHERITANCE OF INDUCED MUTATIONS IN *NEUROSPORA TETRASPERMA*. Walter Scott Malloch. Mycologia 34(3), 325-47(1942).

X-irradiations considered to be a good method for production of valuable new strains of fungi. BA 17-263

4661
EFFECTS OF X-RAYS AND NEUTRONS ON MOUSE LYMPHOMA CHROMOSOMES IN DIFFERENT STAGES OF THE NUCLEAR CYCLE. Alfred Marshak. Radiology 39(5), 621-6(1942).

Mouse lymphoma cells are sensitive to neutrons and x rays at onset of prophase and also during resting stage (sensitivity even greater). Since neutrons are more efficient in producing chromosome abnormalities in resting stage, author concludes they will produce regression in tumors resistant to x rays. Radiation factors were: 220 kv, 15 ma, 0.5 mm Cu, field 10 x 10 cm, target surface distance 35 cm. Neutron source was Be target bombarded by 16 mev deuterons produced by a cyclotron. BA 17-13012

4662
THE EFFECT OF FAST NEUTRONS ON CHROMOSOMES

IN MEIOSIS AND ITS BEARING ON PACHYTENE PAIRING. A. Marshak and W. S. Malloch. *Genetics* 27(6), 576-83 (1942).

Neutron sensitivity of pachytene chromosomes in *Vicia faba* was found to be the same as that of somatic chromosomes at onset of prophase. Ratio of neutron to x-ray sensitivity was approximately 6 for somatic chromosomes of several species. Diameter of sensitive portion of chromonema is calculated to be 10^{-7} cm.

BA 17-8029

4663

THE EFFECT OF PH ON INACTIVATION OF TOBACCO MOSAIC VIRUS BY X-RAYS. A. Marshak and William N. Takahashi. *Proc. Natl. Acad. Sci. U.S.* 28(5), 211-16 (1942).

More electrons produced by x rays in suspending medium reach virus particles when the latter carry a net positive charge than when charge is negative. The greater the net positive charge the more electrons will be attached. BA 17-10287

4664

INDUCTION OF LEUKEMIA IN MICE BY METHYL-CHOLANTHRENE AND X-RAYS. D. P. McEndy, Mary C. Boon, and Jacob Furth. *J. Natl. Cancer Inst.* 3(3), 227-47 (1942).

Incidence of leukemia induced in mice by repeated percutaneous applications of methylcholanthrene was higher when application was made in conjunction with x rays. BA 17-13616

4665

THE INACTIVATION OF FERTILIZIN AND ITS CONVERSION TO THE "UNIVALENT" FORM BY X-RAYS AND ULTRAVIOLET LIGHT. Charles B. Metz. *Biol. Bull.* 82(3), 446-54 (1942).

Arbacia sperm, after treatment with fertilizin inactivated by x rays, showed the same resistance to subsequent agglutination by untreated fertilizin as did sperm which had reversed after treatment with unirradiated fertilizin. X-rays are considered to convert fertilizin to a non-agglutinating "univalent" form. BA 17-830

4666

MECHANISM OF THE BIOLOGICAL EFFECTS OF RADIATION. IL W. Minder. *Radiol. Clin.* 10(2), 67-75 (1941). (In German).

Various mathematical formulations for x ray destruction curves are considered. Mathematical functions required do not depend upon any particular hypothesis as to mechanism of action. Such expressions can therefore imply no more than formal agreement with the experimental data. BA 17-4334

4667

STUDIES WITH RADIOACTIVE DI-AZO DYES. III. THE DISTRIBUTION OF RADIOACTIVE DYES IN TUMOR-BEARING MICE. Francis D. Moore, Lester H. Tobin, and Joseph C. Aub. *J. Clin. Invest.* 22(2), 161-8 (1943).

Studies relative to the possibility that radioactive dyes might be taken up preferentially by tumors are reported. Within tumors, accumulation of dye was roughly proportional to vascularity. BA 17-21671

4668

RECOVERY FUNCTION OF IRRADIATED TISSUES; A THEORETICAL AND EXPERIMENTAL STUDY. A. Mutscheller. *Radiology* 38(1), 53-73 (1942).

The four parts of this paper deal with (1) quantitative relations between physical measurements and observable changes from irradiation of biological materials, (2) radiation effects on cells and tissues, (3) tissue injury and recovery equilibrium, (4) biological action rate and cell-killing curves for various tissues. BA 17-4335

4669

THE EFFECTS OF AGE AND IRRADIATION ON CHROMOSOMAL ABERRATIONS IN ALLIUM SEED Charles Nichols, Jr. *Am. J. Botany* 29(9), 755-9 (1942).

X-irradiation of five varieties of *A. cepa* produced chromosomal aberrations of root tip cells and delayed germination. There was no correlation between age of seed and radiosensitivity. Number of aberrations was greater when moisture content of seed was increased during period of delayed germination. BA 17-8030

4670

STUDIES ON THE EFFECTS OF X-RAYS ON REGENERATION IN THE FRAGMENTING OLIGOCHAETE, *NAIS PARA-GUAYENSIS*. John P. O'Brien. *Growth* 6(3), 203-29 (1942).

X-ray inhibition of regeneration results from a selective deleterious effect of the rays on regenerative cells, the effect being local and direct, as demonstrated by regional irradiation experiments BA 17-1642

4671

IS THE ACTION OF ROENTGEN RAYS DIRECT OR INDIRECT? (AN INVESTIGATION OF THIS QUESTION BY THE METHOD OF HUMAN MARROW CULTURE.) Edwin E. Osgood. *Am. J. Roentgenol. Radium Therapy* 48(2), 214-20 (1942).

Suspensions of 100,000,000 nucleated marrow cells (obtained from sternal puncture) in 50 cc of culture medium were used. When medium alone was irradiated and then added to nonirradiated cells, there was no effect on cells. Irradiation of both cells and medium or cells alone caused increasing cell destruction with increasing doses. BA 17-15500

4672

THE TUMOR RESPONSE TO ROENTGEN IRRADIATION AS INFLUENCED BY THE HOST-TUMOR RELATION. A. W. Oughterson, Jules Plaut, and E. A. Lawrence. *Am. J. Roentgenol. Radium Therapy* 47(2), 207-9 (1942).

There is evidence that the environment of a cell *in vitro* or of a tumor *in vivo* may influence the effect of irradiation. Response of a transplantable mammary tumor, inoculated into the groins of mice and subsequently treated with x rays was studied in various host-relations. BA 17-831

4673

RADIATION AND HEREDITARY MAMMARY CANCER S. E. Owen and A. E. Williams. *Radiology* 34(5), 541-4 (1940).

Roentgen rays (140 kv, 0.25 mm Cu, 1 mm Al, or 100 kv, 3.0 mm Al) in small doses did not increase breast cancer incidence in nonbreeding females of high breast tumor strain mice. Doses as low as 100 r decreased late incidence of spontaneous mammary cancer in C3H mice. BA 17-10808

4674

THE BIOLOGICAL MEASUREMENT OF HIGH VOLTAGE RADIATIONS. Ch. Packard. *Radiology* 34(1), 17-23 (1940).

Effects of 200-900 kv x rays on *Drosophila* eggs were studied. With doses of 400-900 kv, biologic dose is about 80% of physical dose. Measurements indicate little increase in biologically measured depth dose when voltage is increased from 500-900 kv. BA 17-8189

4675

GYNANDROMORPHS IN *DROSOPHILA MELANOGASTER*. J. T. Patterson and Wilson Stone. *Univ. Texas Publ.* 3825, 1-66 (1938).

Data are given for 335 gynanders. About 2/3 of mosaics result from elimination of whole or part of a daughter X chromosome at first cleavage division. Irradiation of sperm has differential effect, causing paternal X chromosomes to be eliminated more frequently. In spontaneous gynanders, or gynanders from x-rayed mothers, either X is eliminated with equal frequency. Not all gynanders can be explained by X elimination, however. BA 17-17834

4676

THE IRRADIATION OF TRANSPLANTED BAGG-JACKSON AND YALE CARCINOMAS IN MICE, AS AFFECTED BY

DIET AND FOSTER NURSING. J. A. Plaut, Robert Tennant, and Ashley W. Oughterson. *Cancer Research* 2(8), 546-50(1942).

Hosts to mammary carcinomas were F_1 hybrids obtained by crossing C_{57} Black, A, and Y strains. Foster nursing alone had no influence on radiosensitivity of tumors. This was used as an index of biological behavior of neoplasms. Differences in two diets (commercially used animal foods) did not affect tumors. Baggs-Jackson and Yale tumors behave differently with respect to each other but had same response to diet and host differences. BA 17-5030

4677
RESIDUAL CHROMIC INDEX OF THE PLASMA AFTER TUNGSTIC AND AFTER CADMIUM HYDROXIDE CLARIFICATION. Michel Polonovski and Paul Jarrige. *Compt. rend. soc. biol.* 135, 258-61(1941). (In French).

I.C.R. after tungstic precipitation (I.C.R._T) and after $Cd(OH)_2$ precipitation (I.C.R._{Cd}) was studied in cancerous patients during radiation therapy. Initial index 2.47 was obtained. There was inversion of indices in cancerous patients but not in normal subjects or in a dog subjected to seven treatments of 225 r and then 500 r. Index inversion corresponds well to liberation of oxidizable substance in plasma of cancerous subjects under influence of irradiation. BA 17-5031

4678
INHERITANCE OF MATURE PLANT CHARACTERS IN SORGHUM INDUCED BY RADIATION. J. R. Quinby and R. E. Karper. *J. Heredity* 33(9), 323-7(1942).

Nine new mature plant characters produced by x radiation are described. Characters (zebra stripe, midget, dwarf, and leaf modifications) are inherited as simple recessives with deficiencies of recessive homozygotes in several cases. A total of 72 recessive mutations, each deleterious in effect, consisting mostly of common seedling chlorophyll deficient types, were induced. Although favorable material in which to detect progressive mutation was x rayed, no progressive mutations were produced. BA 17-10681

4679
INHIBITORY EFFECT OF RADIUM ON THE GROWTH OF ROOTS OF LENS ESCULENTA: MODIFICATIONS OF THE MINIMUM GROWTH INHIBITING DOSE BY CERTAIN IONS. A. Sartory, R. Sartory, J. Meyer, and E. Meyer. *Compt. rend.* 198, 386-8(1934). (In French)

4680
A PRELIMINARY REPORT ON THE EFFECT OF X-RAYS ON A TUMOR OF KNOWN GENETIC CONSTITUTION. M. C. Reinhard and S. G. Warner. *Radiology* 34(4), 438-9(1940).

Authors report on x ray effects on spontaneous mouse adenocarcinoma which gave 100% takes when transplanted to other mice of same strain, no takes when transplanted to mice of other pure strains. After exposure of tumor to 100 r, 50% of animals in three strains which previously reacted negatively to nonrayed tumor were susceptible to radiated tumor. BA 17-11489

4681
THE GENETIC NATURE OF X-RAY INDUCED CHANGES IN POLLEN. C. M. Rick. *Proc. Natl. Acad. Sci. U. S.* 28(12), 518-25(1942).

X-radiation of microspores of diploid species of *Tradescantia* shortly after meiosis increases variability in pollen grain length and percentage of aborted grains. Effect was greater after treatment at 3° than at 33°. Similar radiation of autotetraploid species failed to give similar results. BA 17-17820

4682
THE X-RAY INDUCED MUTATION RATE IN POLLEN IN RELATION TO DOSAGE AND THE NUCLEAR CYCLE. Charles M. Rick. *Genetics* 28(3), 237-52(1943).

Mean length and variation of length of pollen grains, and percentage of aborted grains were studied for 2 mo after exposure of diploid *Tradescantia* inflorescences to 62.5, 125, 250, and 500 r. Mutational response of pollen abortion after treatment during post-meiotic period varied approximately linearly with dose, response of length variance was intermediate between linear and squared relationship. Length changes were nearly all toward smaller grains. BA 17-19481

4683
CYTO-GENETIC CONSEQUENCES OF X-RAY TREATMENT OF POLLEN IN PETUNIA. Charles M. Rick. *Botan. Gas.* 104(4), 528-40(1943).

Petunia pollen x irradiated with 10,000-100,000 r was applied to stigmas of untreated plants, pollen exposed to 50,000 r functioned to produce viable seed. Gross chromosomal aberrations were seen in 33 X_1 plants. BA 17-21044

4684
ROENTGENOLOGIC IRRADIATION IN ACUTE PERITONITIS AND ITS EFFECT ON THE CELLS OF NORMAL PERITONEAL FLUID IN GUINEA PIGS. Frank J. Rigos. *Radiology* 39(6), 681-90(1942).

As studied in 8 weeks-old, 420-450 gm male guinea pigs with peritonitis induced by intraperitoneal injection of 1 cc suspension of *E. coli*, roentgenotherapy with doses less than 100 r had little effect on cell count of peritoneal fluid but did cause relative increase of macrophages and lymphocytes. A dose of 100 r increased total cell count, 200 r or more caused a decrease of cell count but a relative increase in percentage of macrophages. BA 17-13014

4685
THE EFFECT OF ULTRAPENETRATIVE IRRADIATION ON ANIMAL CELLS GROWN IN VITRO. A. E. Roffo, Jr. *Bol. inst. med. exptl. estud. cancer* (Buenos Aires) 19(60), 531-58(1942). (In Spanish).

Using x rays with voltages from 100-600 kv, it is shown that with 200 r, lethal effect on cultivated cells (normal chick heart embryo and rat sarcoma) begins at 300 kv and becomes more pronounced at higher voltages. Effect appears to have no relation radiation frequency but is associated with its absorption. BA 17-23850

4686
THE INFLUENCE OF OXYGEN ON THE PHYSIOLOGICAL EFFECTS OF X-RADIATION IN THE MICROSPORES OF *TRADESCANTIA PALUDOSA*. A. V. Beatty and J. W. Beatty. *Genetics* 39, 958(1954).

4687
THE EFFECT OF X-RAY STIMULATION ON BIOELECTRIC POTENTIALS OF THE AVIAN EGG. A. L. Romanoff and A. A. Bless. *Proc. Natl. Acad. Sci. U. S.* 28(8), 306-11(1942).

P. D. between blastoderm and albumen was measured every 6 hr for 24 hr following irradiation of fresh white leghorn eggs in vivo and in vitro at 0.24-0.36 A with 8-5000 r at 600 r/min. Potential difference was increased up to a maximum of 250% normal at 250 r, larger doses were inhibitory. Stimulating dose was greater for cold eggs than for those preheated 3 hr at incubation temperature. BA 17-13020

4688
EXPERIMENTS SHOWING THE INFLUENCE OF ONE GROWING TUMOR UPON ANOTHER. S. Russ and G. M. Scott. *Brit. J. Exptl. Pathol.* 23(3), 127-33(1942).

The growth of primary normal tumors was slowed down to half that of controls if the second graft on the opposite flank was made from pieces of tumor whose growth had been inhibited by sublethal doses of x rays. (Studies on rats.) BA 17-5041

4689
THE DISTRIBUTION OF X-RAY INDUCED CHROMOSOMAL

ABERRATIONS. Karl Sax. Proc. Natl. Acad. Sci. U. S. 28(6), 229-33(1942).

Relative frequencies of various types of chromosomal aberrations indicate that secondary factors play an important part in determining the frequency of effective breaks induced by x rays. Secondary factors include (1) spatial relations of the chromosomes, (2) stresses imposed by centromere in maintaining polarity, and (3) stage of chromosome development in the nuclear cycle. BA 17-4169

4690

EFFECT OF COMBINED FEVER AND X-RAY THERAPY ON FAR ADVANCED MALIGNANT GROWTHS. H. S. Shoulders, E. L. Turner, L. D. Scott, and W. H. Grant. Radiology 39(2), 184-93(1942).

Authors review the literature on heat therapy combined with x irradiation in treating experimental cancer. Results show that such combined therapy is potentially more effective than x irradiation alone. BA 17-8190

4691

THE EFFECT OF RADIATION ON ORGANIC MATERIALS. R. Signer. Radiol. Clin. 10(2), 36-49(1941). (In German).

Photochemical decomposition of ketones, interconversions of sterols, and hydrolysis of amides are considered as simpler cases of radiation effects on organic systems. X-ray are effects compared with those produced by longer wavelengths. Protein denaturation by x rays is explained in terms of localized heating effects. Complexities of biological systems (e.g. photosynthesis) and attendant difficulties of investigation are emphasized. BA 17-4336

4692

EXPERIMENTAL INVESTIGATION OF THE EFFECT OF RADIUM AND ROENTGEN RAYS ON FERMENTING MICROORGANISMS. III. ON THE CONDITIONS FOR FERMENTATION OF CITRIC ACID BY ASPERGILLIS NIGER RADIUMRASAE III. M. Simo. J. Agric. Chem. Soc. Japan 16(8), 129(1940). BA 17-11872

4693

EXPERIMENTAL INVESTIGATION OF THE EFFECT OF RADIUM AND ROENTGEN RAYS ON FERMENTING MICROORGANISMS. M. Simo. J. Agric. Chem. Soc. Japan 16(10), 148(1940). In Japanese. pp. 965-78. (German Title). BA 17-24499

4694

RADIATION OSTEITIS AND FRACTURES FOLLOWING IRRADIATION. Danely P. Slaughter. Am. J. Roentgenol. Radium Therapy 48(2), 201-12(1942). (With Report of Five Cases of Fractured Clavicle.)

Radiation effect in bone is one of degree, depending on amount of energy absorbed. With light doses, complete recovery is possible. With heavier doses, damage increases until radio-necrosis occurs. This may leave dead bone as a sterile foreign body. Infection may occur if overlying tissues are damaged. Fractures may occur in weight bearing bones. In cases cited, tissue dose in damaged bone varied from 1500-6000 r. BA 17-13015

4695

AUXIN AND CALINES IN SEEDLINGS FROM X-RAYED SEEDS. G. F. Smith and H. Kersten. Am. J. Botany 29(9), 785-91(1942).

Alterations in seedlings from x-rayed seeds include: increase in auxin destruction (production and transport relatively unaffected), inactivation of phylloclaine, interference in caulocline translocation. No indications of x-ray synthesized growth inhibitors were found. BA 17-10201

4696

ROOT MODIFICATIONS INDUCED IN ZE A MAYS SEEDLINGS BY IRRADIATING DRY SEEDS WITH SOFT X-RAYS. G. F. Smith and H. Kersten. Plant Physiol. 17(3), 455-64(1942).

Unsoaked seeds were x rayed with gas-type Cu target x-ray tube at 30 peak kv, 10 ma for 100 min. External modifications and histological changes are described. BA 17-2974

4697

MUTANTS AND LINKAGE STUDIES IN TRITICUM MONOCOCCUM AND T. AEGILOPOIDES. Luther Smith. Research Bull. Missouri Agr. Expt. Sta. 298, 1-26(1939).

Dormant seeds of T. monococcum vars. vulgare and flavescens were subjected to 12,500 r x-ray treatment and 56 of more than 80 mutants produced are described. All mutations tested behaved as recessives except two which were possibly cytoplasmic. Crosses between mutants involving 106 combinations were sufficiently tested in F₂ and F₃ to indicate presence or absence of linkage. BA 17-280

4698

RELATION OF POLYPOIDY TO HEAT AND X-RAY EFFECTS IN THE CEREALS. Luther Smith. J. Heredity 34(5), 131-4(1943).

X-ray tolerance of dormant seeds increases with chromosome number. Heat treatment given before irradiation decreases x-ray injury, heat treatment postirradiation decreases injury. Author describes x-ray effects on mutation frequency, production of chromatic bridges in root tips, production of translocations. Frequency of x-ray-induced translocations, complex rearrangements, and deficiencies increased markedly with polyploidy. BA 17-19462

4699

ROENTGEN RAY TREATMENT OF HYPERTHYROIDISM. Mayo H. Soley and Robert S. Stone. Arch. Internal Med. 70(6), 1002-16(1942).

Of 43 hyperthyroid patients treated with roentgen therapy of 1800-2700 r (22 of which received I in conjunction with treatment) 25 (or 58.1%) were entirely free of hyperthyroidism in an average of 8-7/10 mo from onset of treatment, 8 (or 18.6%) were improved. Both groups (with I and without) had coincidental decrease in size of thyroid to within normal limits. Complications; tracheitis and esophagitis in 15 patients. BA 17-13373

4700

OBSERVATIONS ON THE RADIOBIOLOGICAL DETERMINATION OF GENE NUMBERS IN THE X CHROMOSOME OF DROSOPHILA MELANOGASTER. K. Sommermeyer. Z. indukt. Abstamm. -u. Vererb. 79(2), 240-4(1941). (In German).

"Saturation effect" of Timofeeff-Ressovsky and Zimmer's neutron-induced lethal mutations is related to a greater size of those radiosensitive volumes pertaining to chromosome injury than of those pertaining to recessive lethal mutation, D. E. Lee's calculations of gene number are based on assumption that an ionization within a gene's radiosensitivity volume would almost always induce a recessive lethal mutation. BA 17-15211

4701

RADIATIONS, CELLULAR METABOLISM AND CANCER RESISTANCE. George Sperl Spertl. Studies Inst. Divi Thomae 3(1), 17-38(1941).

Review article. BA 17-8859

4702

THE GENETIC NATURE OF X-RAY AND ULTRAVIOLET INDUCED MUTATIONS AFFECTING THE GENE A IN MAIZE. L. J. Stadler and Herschel Roman. Genetics 28(1), 91(1943).

An abstract. BA 17-12784

4703

THE CORRELATION BETWEEN ROENTGEN DOSAGE AND LYMPHOID CELL MIGRATION IN TISSUE CULTURES. Wilhelm Stenstrom, Joseph T. King, and Austin F. Henschel. Radiology 38(4), 477-80(1942).

Fragments of adult rabbit mesenteric lymph nodes were x rayed (200 kv, 30 ma, 1 mm Al filter, 50 cm target distance, HVL 0.28 mm Cu, 162r/min), cultured, and fixed. Dose of 39 r inhibited cell migration 8.8%. Inhibition increased rapidly with increased dose up to 620 r, more slowly above this level. No lymphoid cells appear ameboid 48 hr after 40,000 r. It is assumed tentatively that lymph nodes contain two groups of cells which differ in radiosensitivity. BA 17-4337

4704

STUDIES ON THE EFFECT OF LIQUID AIR, RAYS, AND EMANATIONS ON HONEY YEASTS. W. A. Stephen. Sci. Agr. 23(2), 117-26(1942).

Effect of these agents on *Zygosaccharomyces barkeri*, *Z. richteri*, *Z. nussbaumeri*, *Z. priorianus*, and *Z. rugosus* were studied. X-rays showed no evidence of killing in agar, possibly some in honey. One hour exposure to Ra had no effect. BA 17-11875

4705

RADIUM POISONING. R. H. Stevens. Radiology 39(1), 39-47(1942).

Patient received total of 440 γ of Ra chloride intravenously for Hodgkin's disease over five year period 1925-1930. Successive roentgenograms of dorsal spine taken from 1936-1941 showed destructive lesions at first attributed to the disease, later found due to Ra poisoning. Radionecrosis of jaw was also observed. Fractional retention after period of 15 yr amounted to 11.4 γ of total 440 γ or 2.5%. BA 17-4338

4706

THE TREATMENT OF CANCER WITH FAST NEUTRONS. Robert S. Stone and John C. Larkin. Radiology 39(5), 608-20(1942).

Author found 1 n equal to 6 r as judged by threshold skin reactions. Of various cancers treated, 17% showed complete regression, 48% showed partial regression. BA 17-11496

4707

DIFFERENTIAL SENSITIVITY OF PROPHASE POLLEN TUBE CHROMOSOMES TO X-RAYS AND ULTRAVIOLET RADIATION. C. P. Swanson. J. Gen. Physiol. 26(5), 485-94(1943).

Increase in total chromosome breaks is progressive up to 4 hr after exposure of pollen tubes of *Tradescantia* to x rays. Thereafter, the total number of breaks decreases. BA 17-19484

4708

THE EFFECTS OF ULTRAVIOLET AND X-RAY TREATMENTS ON THE POLLEN TUBE CHROMOSOMES OF *TRADESCANTIA*. C. P. Swanson. Genetics 27(5), 491-503(1942).

Dosage-break relationship was linear for short (2536A) and long (2967 and 3022A) wave lengths. Breaks (simple deletions) were more frequent near medial and distal regions of chromosome arms. As chromosomes enter prophase stages, they become less resistant to x rays, more resistant to ultraviolet as judged from breakage data. BA 17-201

4709

GENETIC CONTROL OF BIOCHEMICAL REACTIONS IN *NEUROSPORA*: AN "AMINO BENZOICLESS" MUTANT. E. L. Tatum and G. W. Beadle. Proc. Natl. Acad. Sci. U. S. 28(6), 234-43(1942).

X-rays induce mutant strain in *N. crassa* which requires *p*-aminobenzoic acid for growth which is a function of the amount of acid supplied. Mutant differs from normal by single gene, which must therefore control an essential step in the synthesis of *p*-aminobenzoic acid. Both normal and mutant strains are inhibited by sulfanilamide, several substances related to *p*-aminobenzoic acid can replace it but are less adequate than *p*-aminobenzoic acid. BA 17-4181

4710

THE EFFECTS OF IONIZING RADIATIONS ON THE CHROMOSOMES OF *TRADESCANTIA BRACTEATA*. A COMPARISON BETWEEN NEUTRONS AND X-RAYS.

J. M. Thoday and D. E. Lea. J. Genetics 43(1/2), 189-210 (1942).

Neutrons produce same types of chromosome aberrations as x rays, but are more effective per ionization produced. Ratio of x-ray dose to neutron dose required to produce equivalent effects varies with type of aberration: 2.4 for chromatid breaks, 3.6 for isochromatid rejoins, 4.5 for chromosome breaks, and 5-10 for interchanges. BA 17-287

4711

EFFECT OF COMBINING ESTROGEN WITH LETHAL DOSES OF ROENTGEN-RAY IN SWISS MICE. Anne deG. Treadwell, W. U. Gardner, and J. H. Lawrence. Endocrinology 32(2), 161-4(1943).

Groups of mice were exposed to 400-550 r. One-third of mice were also given estrogen during irradiation, one-third given estrogen nine days before irradiation. After four days, survival of irradiated mice was 20.6%, of mice given estrogen and x rays at same time, 11.7% and of estrogen nine days before irradiation, 75%. BA 17-13295

4712

PRESENT STATUS OF RESEARCH IN CANCER. Carl Voegtlin. Am. J. Public Health 32(9), 1018-20(1942).

This is a brief review of experimental research and accomplishments in the last 40 years. There is evidence that excessive exposure to x rays, Ra, or ultraviolet light can produce cancer. Author feels these cases can be reduced by proper construction and handling of apparatus. BA 17-11502

4713

GROWTH AND DETERMINATION IN THE DEVELOPMENT OF *DROSOPHILA*. C. H. Waddington. Nature 149(3775), 264-5(1942).

In larvae irradiated with 7000 r of x-ray for 12 hr before and 18 hr after forming puparium, large numbers of individual cells died. In larvae more than 24 hr past pupation, damage was confined chiefly to bristle and wing morphogenesis. Most general malformations were caused in larvae irradiated 60-90 hr after laying. Many of these anomalies apparently are the same as those of known genetic origin. BA 17-334

4714

THERMOSENSITIVITY OF BACTERIOPHAGES. Eugene Wallman and Elizabeth Wallman. Compt. rend. 211, 270-2(1940). (In French).

The smaller the bacteriophages, the more resistant they are to x rays and the more sensitive they are to heat. Temperature required for protein coagulation increases with their molecular weight. BA 17-24306

4715

PHYSARUM AS A RADIATION TEST OBJECT. Shields Warren and Oliver K. Scott. Proc. Soc. Exptl. Biol. Med. 52(2), 149-51(1943).

P. polycephalum is a moderately sensitive object for β radiation reacting by cessation of growth in the field of radiation and sometimes reversal of protoplasmic streaming. BA 17-17989

4716

BRONCHIAL AND LUNG CANCER. C. Wegelin. Schweiz. med. Wochschr. 72, 1054(1942). (In German).

Author mentions that some irritants undoubtedly give rise to carcinomata, e. g. asbestos dust and Ra emanations in Schneeberg mines. BA 17-18494

4717

HATCHABILITY AND CHROMOSOME CHANGES OF *HABROBRACON* EGGS X-RAYED IN PROPHASE I AND

METAPHASE I. Anna R. Whiting. *Genetics* 28(1), 94-5 (1943).

An abstract. Dose hatchability curves for unfertilized x rayed *Habrobracon* eggs were studied in parallel with cytological examinations of chromosomes. BA 17-12828

4718

THE PREVENTION OF IRRADIATION SICKNESS. William H. Whitmore. *Am. J. Roentgenol. Radium Therapy* 49(1), 83-97(1943).

On the basis of similarity of symptoms of vitamin B₁ deficiency and those of radiation sickness, thiamine chloride was administered to patients undergoing irradiation therapy. Radiation sickness is usually prevented by administration of 6-9 mg daily during therapy; if symptoms of sickness develop, the dose of thiamin may be increased. BA 17-13016

4719

THE OSMOTIC NATURE OF SO-CALLED NONOSMOTIC HEMOLYSIS. W. Wilbrandt. *Pflügers Arch. ges. Physiol.* 245(1), 22-52(1941). (In German).

Effect of x rays (and of several other hemolysins) is characterized by abolition of normal impermeability of erythrocytes to cations. BA 17-13001

4720

EVALUATION OF THE RELATIVE SIZE OF BACTERIOPHAGES BY MEANS OF THEIR RADIOSENSITIVITY. E. Wollman and A. Lacassagne. *Compt. rend. soc. biol.* 131(21), 959-61(1939) (In French).

Classification of seven phages according to decreasing size: phage of *B. subtilis*, T105a, Staph. S3K and C16, phage of megatherium, phage of coli 36, S13. Classification according to radiosensitivity differs in that T105a is slightly larger and more radioresistant than Staph. S3K and C16. BA 17-1962

4721

VARIATION IN *PENICILLIUM NOTATUM* INDUCED BY THE BOMBARDMENT OF SPORES WITH NEUTRONS. Hazel Jean Hanson, W. G. Meyers, Grant L. Stahly, and J. M. Birkeland. *J. Bacteriol.* 51(1), 9-18(1946).

Spore suspensions isolated from strain NRRL 1249. B21 were bombarded with slow neutrons for periods of from 1 hr-134 days. Variants (150) were isolated and characterized by differences in color, texture, rate and quantity of vegetative growth and sporulation, color and amount of transpired fluid, and color of reverse of the colonies. Variants increased with time of exposure; differed greatly in capacity to produce penicillin. BA 20-13262

4722

IMMATURE MALES AND HIGH VISIBLE MUTATION RATE FROM EGGS (OF *HABROBRACON*) IRRADIATED IN PROPHASE I. Anna R. Whiting. (*Genetics* 31(2), 235-6(1946).

Abstract. BA 20-11803

4723

THE INCIDENCE OF LEUKEMIA IN RADIOLOGISTS. Helmuth Ulrich. *New Engl. J. Med.* 234(2), 45-6(1946).

Author studied 34,626 obituaries in AMA Journal for period 1935-44. Incidence of leukemia among 205 physicians listed as radiologists was 3.9% compared to 0.44% among those not listed as radiologists. This is presented as evidence that exposure to radiation is a potential cause of leukemia. BA 20-12715

4724

STUDIES ON THE CELLULAR BASIS OF REGENERATION IN *NAIS PARAGUAYENSIS* AND THE EFFECTS OF X-RAY THEREON. John P. O'Brien. *Growth* 10(1), 25-44(1946).

X-rays inhibit regeneration anteriorly and posteriorly, by way of selective inhibition of those cellular elements through which regeneration is normally accomplished. Neoblasts are more radiosensitive than ectodermal

epithelium. Small knobs, formed anteriorly and posteriorly in x rayed specimens, bear stomodeal and proctodeal invagination but do not represent true regenerative activity. BA 20-12823

4725

A NEW METHOD OF LOCAL TREATMENT OF RHEUMATOID AND TRAUMATIC AFFECTIONS OF THE JOINTS WITH EMPHASIS ON A NEW APPROACH IN THE MANAGEMENT OF ARTHRITIS AND ALLIED CONDITIONS. Otto C. Kestler. *Geriatrics* 1(2), 159-63(1946).

Rn ointment was used to treat arthritis and traumatic conditions. In 65 cases treated, clinical improvement was observed in all but two and no deleterious effects were experienced. BA 20-12649

4726

LOW-DOSAGE IRRADIATION TO THE PITUITARY GLAND AND OVARIES IN AMENORRHEA AND DYSFUNCTIONAL UTERINE BLEEDING. L. Reidenberg. *Am. J. Obstet. Gynecol.* 45, 971(1943).

Author reports observation on a series of 136 patients indicating, he feels, that preconceptional irradiation had no deleterious effect upon generative organs or upon offspring of first generation. BA 20-12432

4727

LOW-DOSAGE IRRADIATION IN THE TREATMENT OF AMENORRHEA. C. Mazer and R. Greenberg. *Am. J. Obstet. Gynecol.* 46, 648(1943).

Low dosage x radiation was delivered to pituitary and ovaries of 92 women with varying degrees of infrequent or no bleeding. Ages of the patients varied from 17-36 years. Authors feel that cure rate is inversely proportional to severity of amenorrhea. BA 20-12427

4728

THROMBOPLASTIC STUDIES ON HEMOPHILIA. David I. Macht and Marcus Ostro. *Science* 103(2674), 402 (1946).

Observations by Moldavsky (in man) that injections of penicillin cause decrease in blood coagulation time are confirmed in experiments using rabbits and cats. Effect was not found in two hemophiliacs but shortening of clotting time was produced in their blood by 200 kv x rays. (Blood exposed *in vitro* to 60-80 r clotted in 1/2 to 1/3 original time.) BA 20-12084

4729

HEALTH PROTECTION ACTIVITIES OF THE PLUTONIUM PROJECT. SYMPOSIUM ON ATOMIC ENERGY AND ITS IMPLICATIONS. Robert S. Stone. *Proc. Am. Phil. Soc.* 90(1), 11-20(1946).

This report gives tolerance doses for x rays, β rays, γ rays, fast, and slow neutron radiations and confirms the general held opinion that radiation acts upon tissues roughly in proportion to specific ionization whether radiation comes from outside or from radioactive element inside the body. BA 20-12005

4730

THE BIOLOGICAL EFFECT OF PENETRATING RADIATIONS. A REVIEW. F. G. Spear. *Brit. Med. Bull.* 4(1), 2-10 (1946).

Topics include: physical dose and biological response, radiochemistry, biological indicators, genetic effects of radiations, lethal and injurious radiation effects, radiations and malignancy. Cell differentiation and division in normal and irradiated tissues of: chick fibroblasts, rat embryo, frog tadpole eye, rat eye are compared. Photomicrographs show genetic effects of radiation on chromosomes in *Tradescantia* and *Drosophila*. BA 20-12004

4731

THE EFFECT OF X-RAYS ON THE OVARIES AND OESTROUS CYCLE OF THE GOLDEN HAMSTER (*CRICETUS*

AURATUS WATERHOUSE). Kathleen P. Saxon. J. Tenn. Acad. Sci. 21(1), 128-34(1946).

Ovaries of adult virgin female hamsters were subjected to 900 r in two equal doses one week apart and studied at intervals of 1 day, 7, 15, 30, and 45 days postexposure. Small follicles appear more radiosensitive than large follicles. Abnormal mitosis and multinucleate ova were among the effects observed. Effect on oestrous cycle is described. BA 20-12003

4732

TREATMENT OF ROENTGEN SICKNESS WITH ORAL ADMINISTRATION OF PYRIDOXINE HYDROCHLORIDE (VITAMIN B₆). Robert J. Reeves. Southern Med. J. 39(5), 405-7(1946).

Daily dose of 100 mg of pyridoxine hydrochloride was found to be most effective drug regimen in treating irradiation sickness. Because of easy administration and effectiveness, oral administration is advocated with reliance on intravenous injection in cases which fail to respond. BA 20-12002

4733

REACTIONS OF THE HEMOPOIETIC SYSTEM TO AGENTS USED IN THE TREATMENT OF DERMATOSES. EFFECT OF LOW VOLTAGE ROENTGEN RAY THERAPY. Frances Pascher and Ben Kanee. Arch. Dermatol and Syphilol. 53(1), 1-5(1946).

Low voltage x irradiation of eight patients with generalized dermatoses of various types was followed by leukopenia, or leukopenia and hyperchromic anemia, quantitative changes similar to those following high voltage irradiation. Individual variations in radiosensitivity and dosage are believed to be the primary influences in development of these changes. BA 20-12001

4734

CHAIN PROCESSES AND THEIR BIOPHYSICAL APPLICATIONS. II. THE EFFECT OF RECOVERY. I. Opatowski. Bull. Math. Biophys. 8(1), 7-15(1946).

Biologic effects of radiations were studied on basis of general probabilistic model of successive transformations (Markoff chains). Recovery process is regarded as series of reverse transitions. Gives methods for calculating probability of subjecting microorganisms to an observable change within an assigned time during process of irradiation of homogeneous aggregate of microorganisms. BA 20-12000

4735

COMPARATIVE STUDIES OF THE BIOLOGICAL EFFECTS OF X-RAYS, NEUTRONS AND OTHER IONIZING RADIATIONS. L. H. Gray. Brit. Med. Bull. 4(1), 11-18(1946).

Author describes studies on measurements of neutron energy absorbed in living cells, comparison of effects of x rays, γ rays, neutrons and other ionizing radiations on enzymes, colloids and numerous plant and animal tissues, both normal and malignant. BA 20-11998

4736

CHAIN PROCESSES AND THEIR BIOPHYSICAL APPLICATIONS. I. GENERAL THEORY. I. Opatowski. Bull. Math. Biophys. 7(4), 161-80(1945).

"Hit theory" involving concepts of "sensitive volume" or "target area" is evaluated and developed. BA 20-11999

4737

EXAMPLE OF NEED FOR DERMATOLOGIC PUBLICITY OF DEVELOPMENTS IN RADIOLOGIC PHYSICS. John C. Belisario and Robert E. Pugh, Jr. Arch. Dermatol. and Syphilol. 53(2), 115-18(1946).

Authors call attention to four professions concerned with x ray doses, and to the need for acceptance and understanding of standards and units. BA 20-11997

4738

DOSAGE AND INTENSITY RELATIONS IN THE IRRADIATION

OF DROSOPHILA. Claude E. Villee. Genetics 31(2), 234 (1946).

Abstract. BA 20-11801

4739

SOME DEVELOPING EFFECTS OF IRRADIATING DROSOPHILA. Claude A. Villee. Genetics 31(2), 233-4(1946).

Abstract. BA 20-11800

4740

GREYING INDUCED BY X-RAYS IN THE MOUSE. Herman B. Chase. Genetics 31(2), 213-4(1946).

Abstract. BA 20-11767

4741

A CASE OF INHERITED RESISTANCE TO RADIATION IN BACTERIA. Evelyn M. Witkin. Genetics 31(2), (1946).

Abstract. BA 20-11760

4742

GENETIC EFFECTS OF RADIATIONS. D. G. Catcheside. Brit. Med. Bull. 4(1), 18-23(1946).

Topics include: stability of chromosomes and genes, radiation-induced mutation in *D. melanogaster*, induced chromosome aberrations. Chromosome break, symmetrical interchange and asymmetrical interchange are diagrammed (*Tradescantia*). BA 20-11766

4743

LINKAGE RELATIONS IN HABROBRACON AND THE EFFECTS OF TEMPERATURE, X-RADIATIONS, AND AGE ON CROSSINGOVER. Arnold M. Clark. Proc. Penna. Acad. Sci. 17, 47-64(1943).

Age, temperature, or x-radiation were not found to alter crossingover in this parasitic wasp. BA 20-76

4744

RELATIONSHIP BETWEEN MORPHOLOGY AND X-RAY EFFECTS IN IMPLANTS OF MOUSE SARCOMA 180 IRRADIATED WITH 5000 AND 60,000 ROENTGEN (IN AIR). A Goldfeder. Radiology 45(1), 49-55(1945).

After irradiation with 5000 or 60,000 r/air (200 kv, 20 ma, 0.5 mm Cu and 1.0 mm Al filter, HVL 0.85 mm Cu, distance 12.5 cm, 612 r/min) implants of mouse sarcoma 180 showed no increase in size during ten successive days. Extensive degenerative changes including nuclear pyknosis and fragmentation, and cytoplasmic changes were observed. No cytologic differences were observed between the two groups of cells. BA20-707

4745

AN UNUSUAL FORM OF RADIUM POISONING IN THE LUMINOUS PAINT INDUSTRY. P. Rossing. Arch. Gewerbepathol. Gewerbehyg. 11(3), 395-401(1942). (In German).

Author describes a case in which midbrain was inadvertently exposed to α rays of radium, causing uncontrollable drowsiness, headaches and leucocytosis, and depressed basal metabolism. Author suggests that radioactive material in upper nasal region (inhaled and introduced by fingers) exerted direct action on sleep center in floor of third ventricle. BA 20-798

4746

ACTION OF IONIZING RADIATIONS ON BACTERIA. Ph. Lasseur, P. Florentin, P. Jacob, A. Dupaix-Lasseur. M. Th. Gavaille, J. Melcion, and R. Giabicani. Trav. lab. microbiol. fac. pharm. Nancy 13, 224-83(1942-44). (In French).

Agar plates inoculated with Ra, Rb, and S types of *Bacillus aurantiacus* Tingitanius, Ra and S types of *B. prodigiosus* (*Serratia marcescens*), and Ra type of *B. lactis niger* were exposed to γ rays of Ra for 16-95 hr, to x rays for 20-60 min and to ultraviolet rays for 2-40 min. Ultraviolet rays were more bactericidal than

others studied. Exposure for 55-65 hr to γ rays was required to produce bactericidal effect (varied with species). With x rays, number of cells killed increased with distance between culture plate and source. None of the radiations produced a permanent change in bacterial type. Observed effects were altered to ionization and variation in effectiveness of the radiations was attributed to differences in absorption. BA 20-976

4747
REVIEW OF IRRADIATION EFFECT ON CELLS AND TISSUES OF THE SKIN. W. F. Harvey. Edinburgh Med. J. 49(9), 529-52(1942).

Damaging effects of x rays and radium emanation on cells and tissues of skin are reviewed. A section on blood vascular system is included. Bibliography given. BA 20-2318

4748
DEGENERATIVE EFFECTS OF LARGE DOSES OF ROENTGEN RAYS ON THE HUMAN BRAIN. T. J. Wachowski and H. Chenault. Radiology 45(3), 227-46(1945).

Case reports of six patients showing definite symptoms of brain damage following intensive x irradiation for brain tumors are presented. Total tumor doses varied between 6150 r in 32 days and 8809 r in 106 days. Cytological and histological changes are also described. BA 20-2319

4749
INDUSTRIAL HYGIENE. Irving R. Tabershaw. New Engl. J. Med. 233(15), 437-43(1945).

A review which considers the following topics: pneumoconiosis, Al therapy and prophylaxis in silicosis, industrial poisons, physical hazards, radioactive substances and dermatitis. BA 20-2832

4750
THE INFLUENCE OF SUBSTRATE ON THE VARIATION OF BR. BRONCHISEPTICA. Lois Dickinson. J. Pathol. Bacteriol. 57(3), 285-94(1945).

The production of a stable, nonpathogenic variant of Brucella bronchiseptica which can be completely suppressed by NaCl concentrations below 0.02 M or cis-acids is described. Monovalent anions and x radiation induced the variant, which then rapidly outgrew the parent form. BA 20-2966

4751
ACTION OF COLD OR REPAIR OF RADIOLESIONS IN A YEAST AND IN A BACTERIUM. Raymond Latarjet. Compt. rend. 217, 186-88(1943). (In French).

Saccharomyces ellipsoideus kept at 5°C remains metabolically active and able to inhibit x-ray damage. In Bacillus "paradysenteriae Y" at 5°C the primary lesions remains latent and develops on rise of temperature. Response of yeast resembles that of Ascaris ova described in Radiology 32, 289(1939). BA 20-3813

4752
X-RAY INDUCED MUTATIONS IN THE PHYSIOLOGY OF OPHIOTOMA. N. Fries. Nature 155(3947), 757-8 (1945).

X-rays induced twelve physiological mutations (strains) in the fungus O. multiannulatum. Physiological properties were heritable. BA 20-2166

4753
IRRADIATION EFFECTS ON GENETIC RESISTANCE OF MICE TO MOUSE TYPHOID. John W. Gowen and M. R. Zelle. J. Infectious Diseases 77(2), 85-91(1945).

Resistance of mice to Salmonella typhimurium decreases exponentially with increased x-ray dosage. Rate of the decrease per r is small and is similar for six strains of mice studied, although the strains vary greatly in their natural resistance to mouse typhoid. Authors consider the possibility that decrease in resistance may be related to decrease in leukocytes. BA 20-4315

4754
DIFFERENCES IN SENSITIVITY, HATCHABILITY CURVES, AND CYTOLOGICAL EFFECTS BETWEEN HABROBRACON EGGS X-RAYED IN FIRST MEIOTIC PROPHASE AND METAPHASE. Anna R. Whiting. Biol. Bull. 89(2), 191(1945).

Abstract. BA 20-4320

4755
ROENTGEN RADIATIONS IN BIOLOGICAL RESEARCH. Ch. Packard. Radiology 45(5), 522-33(1945).

Historical review of various phases in study of biologic effect of x rays and principal results of experimental studies are presented. BA 20-4453

4756
EFFECT OF X-RAYS ON THE TRANSMISSIBILITY OF FOWL SARCOMA IN ITS NON-FILTERABLE PHASE. B. Miszurski, M. Piekowski, G. Goldhaber, and I. Doljanski. Cancer Research 5(7), 422-5(1945).

Five of ten slowly-growing Rous fowl sarcomas were found to be nontransmissible. After irradiation with doses lethal for sarcoma cells, but harmless to causative agent, three of the five tumors could be transmitted, two could not. BA 20-4869

4757
INCREASED PARASITEMIA IN CHICKEN MALARIA (PLASMODIUM GALLINACEUM AND PLASMODIUM LOPHURAE) FOLLOWING X-IRRADIATION. William H. Talaferro, Lucy Graves Talaferro, and Eric L. Simmons. J. Infectious Diseases 77(2), 158-76(1945).

Irradiation induced increased parasitemia in both avian malaras but affected different periods of the two infections. Effectiveness of given x-ray dose varied with age and susceptibility of chicken, species of parasite, period of infection; extent of infection at time of irradiation. Role of lymphocyte destruction in resistance is discussed. BA 20-5886

4758
INFLUENCE OF BIOLOGICAL FACTORS ON THE FORM OF ROENTGEN-RAY SURVIVAL CURVES. EXPERIMENTS ON PARAMECIUM CAUDATUM. A. Back and L. Halberstaedter. Am. J. Roentgenol. Radium Therapy 54(3), 290-5(1945).

X-ray exposure (35 kv, Cu target, Al foil window in roentgen-ray tube) at 90,000 r/min stops all motility within 10-15 min after irradiation. Dose varies between 200,000 and 700,000 r for families, but for any particular family, all individuals died at same dose when immediate descendants were studied. In case of remote descendants (clones) variation among families was the same but individuals within clone died at different doses. BA 20-5945

4759
NEUROSPORA. II. METHODS OF PRODUCING AND DETECTING MUTATIONS CONCERNED WITH NUTRITIONAL REQUIREMENTS. G. W. Beadle and E. L. Tatum. Am. J. Botany 32(10), 678-86(1945).

Among 68,198 single-spore strains of N. crassa and N. sitophila derived from material treated with x rays, ultraviolet radiation or neutrons, more than 380 strains were obtained with altered nutritional requirements for B-vitamins, amino acids, or purine and pyrimidine bases. Genetic study proves that many of these differ by single genes from wild type. One gene-one enzyme relationship is discussed. BA 20-6177

4760
EFFECT OF ROENTGEN RAYS ON BONE GROWTH IN PIGEONS. Leon J. Cole. J. Exptl. Zool. 100(3), 487-95 (1945).

Irradiation of right wings of 1-15 day-old birds caused shortening of bones (most marked in birds exposed at 1-3 days) but affected bones were not different in proportions from those of untreated left wing. Dose of

750 r produced no observable effects; 1000 r, 1500 r, and 2000 r were increasingly effective. Results suggest initial retardation after irradiation and subsequent growth at a normal rate rather than any specific nuclear change in cells which survive and resume division. BA 20-6303

4761

STUDIES ON THE EFFECTS OF X-RAYS ON PHAGOCYtic INDICES OF HEALTHY RABBITS. A PRELIMINARY REPORT. John C. Glenn, Jr. *J. Immunol.* 52(1), 65-9(1946).

Effect of variation in kilovoltage from 90 to 400 (at 100 r) was studied in 4 groups of 4 rabbits each; 2 rabbits used as controls. The effect, studied by measuring phagocytic indices on a strain of hemolytic *Staph. aureus*, was not significantly different except in one group treated with 100 r at 140 kv where a significant rise of phagocytic indices in all animals was observed 48-96 hr following irradiation. BA 20-8542

4762

AN ATTEMPT AT A SYNTHESIS OF THE PHYSIOLOGICAL AND CYTOLOGICAL CONCEPTS OF THE GENE. J. A. Serra. *Bol. soc. Broteriana* 19(2a ser. Pt. I), 327-69 (1944).

Generalizing with respect to the localization of factors in chromomeres, author postulates the existence of active zones and linking zones, extending type of organization visible in salivary chromosomes to elementary chromomeres, or to genes. Effects of a hit in radiated material are discussed in relation to this hypothesis, as are origins of position effects and gross chromosome rearrangements. BA 20-9443

4763

EFFECT OF RADIUM EMANATIONS ON STERIGMATICYSTIS NIGRA. A. Sartory, R. Sartory, and B. Wurth. *Compt. Rend.* 218, 328-9(1944). (In French).

4764

PROTECTION AGAINST X-RAYS AND GAMMA RAYS. E. H. Quimby, R. S. Stone, P. S. Henshaw, R. B. Taft, G. C. Henry, G. Singer, and G. C. Lawrence. *Radiology* 46(1), 57-76(1946).

Topics include: tolerance dose or tolerance intensity, radiation injury, genetic injury; human factors, x-ray protection in industrial fluoroscopy, materials and methods of x-ray protection. The report was prepared for Standardization Committees of the Radiological Society of North America and the American Roentgen Ray Society. BA 20-9767

4765

SUPERFICIAL "BURNS" OF SKIN AND EYES FROM SCATTERED CATHODE RAYS. L. L. Robbins, J. C. Aub, O. Cope, D. G. Cogan, J. L. Langohr, R. W. Cloud and O. E. Merrill. *Radiology* 46(1), 1-23(1946).

"Burns" following few seconds exposure to scattered cathode rays from 1200 kv electrostatic generator are described (six men). BA 20-9768

4766

A COMPARISON OF TWO LEVELS OF ROENTGEN AND NEUTRON IRRADIATION ON NORMAL AND LYMPHOMATOUS MICE, USING RADIOPHOSPHORUS AS AN INDICATOR OF CELLULAR ACTIVITY. K. G. Scott. *Radiology* 46(2), 173-5(1946).

Neutrons and x rays depress phosphorous uptake of lymphomatous tissue in mice as measured by radio-phosphorus. Technique is useful as another method for study of effects of radiations on normal and neoplastic tissues. BA 20-9769

4767

RADIATION SICKNESS IN NAGASAKI. PRELIMINARY REPORT. Joseph J. Timmes. *U. S. Naval Med. Bull.* 46(2), 219-24(1946).

Some of effects observed and described; skin burns, alopecia, aplastic anemia, agranulocytosis, loss of platelets, petechiae, gross haemorrhage, and oral damage. BA 20-9770

4768

MOTHERLESS MALES FROM IRRADIATED EGGS. Anna R. Whiting. *Science* 103(2669), 219-20(1946).

Unmated females of an inbred wild type stock of *Habrobracon* were heavily x rayed, then mated to untreated males with recessive mutant traits. Progeny included, among expected wild type males and females, a few males normal in structure and behavior and with recessive mutant traits. Breeding tests showed that their gonads were also paternal in origin. Their normal fertility was proof of their haploidy. BA 20-9496

4769

EFFECT OF RADON-CONTAINING OINTMENT ON CUTANEOUS LYMPH FLOW AND MINUTE VESSELS OF THE SKIN. J. Q. Griffith, Jr., E. P. Pendergrass, C. R. Perryman, and J. Hooker. *Proc. Soc. Exptl. Biol. Med.* 61(1), 70-2(1946).

Results of studies on men and rats suggest that Rn ointment produces active hyperemia and increases lymph formation and lymph flow without increasing capillary permeability to colloids. Therapeutic effect of ointment may be apparent in cases where lymph flow is diminished. Other evidence suggests that lymph flow is diminished in a limb previously exposed to excessive x radiation. BA 20-9810

4770

INDUCED MUTATIONS AND POSSIBLE MECHANISMS OF THE TRANSMISSION OF HEREDITY IN ESCHERICHIA COLI. M. Demerec. *Proc. Natl. Acad. Sci. U. S.* 32(2), 36-46(1946).

Rate of mutation from sensitivity to resistance to bacteriophage T₁ in B strain (radioresistant) of *E. coli* was measured after x irradiation with 10,000-50,000 r. Mutation rates increased initially but returned to normal within 13 generations. Increase in mutation rate was higher with higher doses BA 20-11736

4771

MUTATION OF ASPERGILLUS NIGER VAN TIEGHEM BY MEANS OF SOFT X-RAYS. Violet M. Diller, Alfred A. Tytell, and H. Kersten. *J. Bacteriol.* 51(3), 404(1946).

Abstract describes a mutant form differing from the parent strain in appearance, growth and metabolism BA 20-11737

4772

THE INFLUENCE OF SEED SIZE AND HULLS ON X-RAY SUSCEPTIBILITY IN CEREALS. K. Froier and A. Gustafsson. *Hereditas* 30(4), 583-9(1944).

Increase in seed size caused better germination and more vigorous growth postexposure except following the highest dose used. Hull covering in barley and oats makes seeds more radioresistant. BA 20-11742

4773

GENES AND THE CHEMISTRY OF THE ORGANISM. G. W. Beadle. *Am. Scientist* 34(1), 31-53, 76(1946).

Genes can be inactivated (in *Neurospora crassa*, an organism favorable for genic and biochemical analysis) by treatment with x rays, ultraviolet radiation, and neutrons. The experimental method is described by which it can be ascertained that strains modified by such treatment usually differ from normal strain by one unit of inheritance. BA 20-14668

4774

GENETICAL STUDIES ON THE CHLOROPHYLL APPARATUS IN OATS AND WHEAT. K. Froier. *Hereditas* 32, 297-406 (1946).

Dry seeds of oat and wheat diploids exposed to low-medium x-ray dosages develop a great number of chlorophyll mutations. Exposure of hexaploid oats and wheat varieties yields very high chlorophyll mutation frequency in oats, no such mutations in wheat which produced speltoids and compactoids. BA 20-14672

4775

DRASTIC MORPHOLOGY MUTATIONS IN BARLEY.

A. Gustafsson. *Hereditas* 32, 120-2(1946).

Three groups of morphological mutations in barley, artificially induced, required differences in irradiation for their induction. Highly intense x-ray action was required to produce drastic mutations (profoundly altered flower and spikelet structure). The more drastic a mutation, the lower its yield production. BA 20-14674

4776

TRANSLOCATIONS IN *SCIARA*. THEIR BEARING ON CHROMOSOME BEHAVIOR AND SEX DETERMINATION.

H. V. Crouse. *Res. Bull. Missouri Agr. Expt. Sta.* 379, 1-75(1943).

X-irradiation of mature sperm with 5000-6500 r yielded: 4 translocations involving X chromosome of *S. reynoldsi*, 5 involving X chromosome of *S. coprophila*, and 5 involving autosomes of *S. coprophila*. BA 20-14700

4777

SOME EFFECTS OF X-RAYS ON DEVELOPMENT IN *DROSOPHILA*. Claude A. Villee. *J. Exptl. Zool.* 101(2), 261-80(1946).

Drosophila larvae, prepupae and pupae of 11 genotypes and a variety of ages were irradiated with 1096-7000 r at different intensities. Phenocopies produced varied with age of fly, stock, and intensity and total dose of irradiation. Pupation was retarded by all but smallest doses, high intensity radiation (5540 r/min) caused much higher lethality than lower intensity radiation (78 r/min). Waddington's concept of an indirect action of x rays is discussed. BA 20-14715

4778

THE PRIMARY BIOLOGIC EFFECT OF RADIATIONS AND THE STRUCTURE OF MICROORGANISMS. Raymond Latarjet. *Rev. canadienne biol.* 5(1), 9-47(1946). (In French).

Author states that the primary effect of radiation on cell or microorganism is to initiate a chain reaction leading to **observable injury**. Photochemical event affects limited number of molecules. Effects in yeast, bacteria virus, and bacteriophages are described, with reference to the amount of energy required to produce chemical change. BA 20-14901

4779

SOME PROSPECTIVE MEDICAL USES OF ATOMIC ENERGY.

Wm. F. Bale. *J. Am. Pharm. Assoc. Pract. Pharm. Ed* 7(3), 81-2(1946). BA 20-14904

4780

THE EFFECT OF ROENTGEN THERAPY ON EXPERIMENTAL VIRUS PNEUMONIA I. ON FELINE VIRUS PNEUMONIA.

G. J. Baylin, I. N. Dubin, and W. G. Gobbel, Jr. *Am. J. Roentgenol. Radium Therapy* 55(4), 473-7(1946).

Control animals infected with feline virus pneumonia were acutely ill for an average of 10.3 days, while infected animals treated with x rays 25 hr after onset of symptoms were sick only 5 days. Similar x-ray therapy given 48 hr after initial appearance of symptoms had no appreciable influence upon course of disease. No differences were seen in tissues of control and test animals. BA 20-14905

4781

EARLY CHANGES INDUCED IN PURKINJE CELLS OF RABBIT BY SINGLE MASSIVE DOSES OF ROENTGEN RAYS. Berry Campbell, Stanley C. Peterson, and Rosalind Novick. *Proc. Soc. Exptl. Biol. Med.* 61(4), 353-5(1946).

Immediate and severe changes seen in Purkinje cells of cerebellum after doses of 1000-4000 r include: chromatolysis, vacuolization, appearance of clear marginal zone. Changes were transient and were replaced within 24 hr by pyknosis and neuronophagia. BA 20-14906

4782

THE EFFECT OF ROENTGEN THERAPY ON EXPERIMENTAL VIRUS PNEUMONIA. II. ON PNEUMONIA PRODUCED IN WHITE MICE BY SWINE INFLUENZA VIRUS. I. N. Dubin, G. J. Baylin, and W. G. Gobbel, Jr. *Am. J. Roentgenol. Radium Therapy* 55(4), 478-81(1946).

X-ray therapy instituted 24 hr after inoculation of mice with swine influenza virus had no effect upon mortality of this disease. Similar therapy given 48 hr before infection of animal produced significant (1/3) decrease in mortality. BA 20-14907

4783

STUDIES ON THE EFFECTS OF RADIOACTIVE SODIUM AND OF ROENTGEN RAYS ON NORMAL AND LEUKEMIA MICE. T. C. Evans and Edith H. Qumbly. *Am. J. Roentgenol. Radium Therapy* 55(1), 55-66(1946).

Radioactive Na and whole body x rays were equally effective in reducing white and red blood counts and in shortening life. Mice with enlarged nodes and extremely high leukocyte counts were especially sensitive to radio-sodium. Marked response was apparently due to radio-sensitivity of abnormal leukocytes rather than to any selective concentration of material in lymph nodes. BA 20-14908

4784

THE HISTOLOGIC EFFECTS OF RADIOPHOSPHORUS ON NORMAL AND LYMPHOMATOUS MICE. W. S. Graff, K. G. Scott, and J. H. Lawrence. *Am. J. Roentgenol. Radium Therapy* 55(1), 44-54(1946).

Characteristic radiation effects on hematopoietic tissues were observed. There was no evidence of increased radiosensitivity of neoplastic cells. Limiting factors in use of x rays and P³² in leukemia therapy are discussed. BA 20-14909

4785

THE COAGULOGRAM AS A CRITICAL INDICATOR OF IRRADIATION EFFECT. J. Kaufmann. *Am. J. Roentgenol. Radium Therapy* 55(4), 464-72(1946).

Coagulogram, which includes: platelet count, bleeding time, clot retraction, prothrombin time, fibrin time, and complete coagulation, appears to be most important in revealing early changes due to irradiation. Fibrin, prothrombin, and coagulation times are reportedly lengthened before changes appear in red or white cell count. BA 20-14910

4786

TIME COURSE OF CHANGES IN SENSORY CELLS OF TRIGEMINAL GANGLION OF THE RABBIT FOLLOWING IRRADIATION. Rosalind Novick. *Proc. Soc. Exptl. Biol. Med.* 61(4), 355-8(1946).

In series of rabbits irradiated in head with single dose of 3000 r, examination of Nissl-stained trigeminal ganglion cells reveals injury which may be separable, by time course, into three histological phases which are described. BA 20-14911

4787

STUDIES ON ROENTGEN DEATH IN MICE. I. SURVIVAL TIME AND DOSAGE. H. Quastler. *Am. J. Roentgenol. Radium Therapy* 54(5), 449-56(1945).

Mice weighing 20 g were irradiated with high voltage x rays of 200-25,000 r, irradiation was uniform throughout body. Reactions were classified as subacute (200-600r), acute (1175-12,000r), hyperacute (12,000-25,000r). Survival time was used as quantitative measure of irradiation effect and simple mathematical formulae for survival time-dosage relations are given. BA 20-14912

4788

STUDIES ON ROENTGEN DEATH IN MICE. II. BODY WEIGHT AND SENSITIVITY. H. Quastler. Am. J. Roentgenol. Radium Therapy 54(5), 457-61(1945).

Survival time after administration of definite dose of x rays to mice of same age is proportional to weight, provided this time is between 11 1/4 and 3 1/3 days. Infant mice survive longer than adults after the same dosage. BA 20-14913

4789

BIOLOGICAL EVALUATION OF 20 MILLION VOLT ROENTGEN RAYS. L. ACUTE ROENTGEN DEATH IN MICE. Henry Quastler and Robert K. Clark. Am. J. Roentgenol. Radium Therapy 54(6), 723-8(1945).

Effects of twenty million volt x rays (produced by betatron) and those produced by 200 kv x rays on mice are qualitatively the same. Quantitative comparison was made using Victoreen r-meter as physical measure, and survival time of mice postirradiation as biological measure. One r of 20 million volt rays were found to be equivalent to about 0.78 r of 200 kv rays. BA 20-14914

4790

THE EFFECT OF X-RAYS ON THE SURVIVAL OF CELLS. STUDIES IN VITRO ON CELLULAR PHYSIOLOGY. R. Schrek. Radiology 46(4), 395-410(1946).

Cellular suspensions from thymus, spleen, bone marrow, and testes (rabbits), and leukocytes of normal and leukemic human blood were exposed to 20-5000 r x rays (250 kv, 10 ma, 50 cm distance, 1 mm Al filter, 120 r/min, HVL 0.7 Cu) and examined periodically by unstained cell counts and dry smears. Rapid decrease in unstained thymus and spleen cells began about 3 hr after 1000 r; irradiated normal and leukemic leukocytes had shortened survival time. BA 20-14915

4791

DETERMINATION OF THE EFFECT OF IRRADIATION BY X-RAY ON P-AMINOBENZOIC ACID, USING CLOSTRIDIUM ACETOBUTYLICUM FOR ASSAY. Ivan C. C. Tchaperoff. Can. J. Research 24E, 49-54(1946).

As determined by assay with *C. acetobutylicum*, p-aminobenzoic acid in concentration of 1×10^{-4} g/ml is inactivated by x-ray dose of 50 r at 190 kv. Significance of this inactivation in connection with treatment of infective lesions is discussed. BA 20-15091

4792

THE ACTION OF TOXINS ON CELLS IN DIVISION. Paul Senten. Montpellier, Imp. Causse. 252p. 1941. (In French).

Combined x rays (300 r) and colchicine (0.001%) were tested on Bufo tadpoles. Radiation banished prophase and accelerated degeneration of blocked premetaphases. Another section describes an ulcerated pigmented epithelioma injected three times in 48 hr with colchicine 0.005 g/ml oil, then irradiated. Primary neoplasm healed, but cutaneous metastases developed. Three injections into an abdominal metastasis of an ovarian neoplasm blocked mitosis; regression followed radiation therapy BA 20-15424

4793

THE BACTERIOSTATIC ACTION OF IONIZING IRRADIATION AS SHOWN BY RESPIRATORY STUDIES. P. Bonet-Maury, R. Perault, and M. C. Erichsen. Ann. inst. Pasteur 69, 189-92(1943). (In French).

Studies on the effect of radon emanations on suspensions of *E. coli* indicated that, within certain limits of suitably arranged irradiation doses, it was possible to prepare bacterial suspensions in which respiratory O_2 consumption remained unaffected while the power of bacterial multiplication was destroyed. BA 20-15617

4794

INHERITED DIFFERENCES IN SENSITIVITY TO RADIATION

IN *ESCHERICHIA COLI*. E. M. Witkin. Proc. Natl. Acad. Sci. U. S. 32(3), 59-68(1946).

Strain B of *E. coli* yields variants resistant to both ultraviolet and x rays, detectable by selective action of these radiations. Resistance is a stable heritable character. Number of resistant bacteria in normal cultures determined after irradiation with 50 ergs/mm. This permits 100% survival of resistant organisms. Subsequent incubation (3 hr) and re-exposure (700 ergs/mm) gives one visible colony for each resistant individual. BA 20-15636

4795

SUMMATION EXPERIMENTS WITH U. -V. AND X-RAYS ON *V. FABA EQUINA*. Vincenz Rosli. Univ. Berne, Dissertation. 15 p. 1942. (In German). BA 20-16207

4796

THE INFLUENCE OF X-RAYS ON THE GROWTH OF *V. FABA EQUINA*. Anton Salzmann. Univ. Berne, Dissertation. 15p. 1942. (In German). BA 20-16208

4797

THE ACTION OF X-RAYS ON THE CYTOPLASM OF VEGETATIVE PLANT CELLS. Hans Wanner. Schweiz. Z. Pathol. u. Bakteriologie 8(suppl.) (1945). (In German).

Author describes irradiation-induced changes in cytoplasm. First changes are vacuolation, morphological changes of mitochondria, sudden decrease of cytoplasmic viscosity (reversible). Water uptake of entire plant is accelerated by irradiation. Retarding effect of intense irradiation on melanin formation of cultured potato tissue is also mentioned. BA 20-16210

4798

RADIATION AND MUTATIONS. E. Guyenot. Arch. Julius Klaus-Stift. 20(3/4), 431-42(1945). (In French).

General review and discussion of radiation-induced mutation. BA 20-16661

4799

A PRELIMINARY NOTE ON THE X-RAY MUTANTS OF PUSA (52) WHEAT. Shri Ranjan. Proc. Indian Acad. Sci. 12A, 62-6(1940).

Of eleven mutant types produced by x-ray treatment of young Pusa (52) wheat seedlings, four are awned and the rest awnless—the degree of awnlessness varying from short to no awns. Spikes of mutants, in first yr are much smaller than those of Pusa(52). Spikes of all eleven mutant types show much greater length in next generation. BA 20-16672

4800

QUANTITATIVE HISTOLOGICAL ANALYSIS OF RADIATION-EFFECTS IN HUMAN CARCINOMATA. Alfred Glucksmann. Brit. Med. Bull. 4(1), 26-30(1946).

As radiation continues, number of viable resting and mitotic cells decreases, and non-viable differentiating and degenerating cells may increase if radiation therapy is effective. BA 20-17492

4801

BACTERIAL NUCLEI. ELECTRON MICROSCOPE OBSERVATIONS AND BIOPHYSICAL ANALYSES WITH X-RAYS IN *ESCHERICHIA COLI*. L. Cavalli. Atti ist. botan. "Giovanni Briosi" e lab. crittogam univ. Pavia 6V(1), 5-25(1945).

Analysis of lethal action of x rays on *E. coli* is presented along with following conclusions: (1) death of bacteria (all ages) is due to hitting single vulnerable point, (2) target volume is smaller in old than in young bacteria. BA 20-17777

4802

PENICILLIN PRODUCTION BY A SUPERIOR STRAIN OF MOLD. Marvin J. Johnson, J. J. Stefaniak, F. B. Gailey, and B. H. Olson. Science 103(2678), 504-5(1946).

Several penicillin-producing mold cultures were tested. X-ray mutant strains of *Penicillium chrysogenum* (Culture

No. X-1612) were found to produce yield greatly in excess of that produced by normal strain (Culture No. 1951-B25). Yield was greatly influenced by nutrition, aeration, and agitation. Yield was a function of corn steep liquor level used in presence of excess lactose. BA 20-18107

4803

THE EFFECT OF BETA RADIATION ON THE PRODUCTION OF PENICILLIN. M. W. Jennison and J. W. Irvine, Jr. J. Bacteriol. 51(5), 598(1946).

Beta radiation from P^{32} inhibited penicillin production by the fungus in culture as judged by standard assay procedures. In submerged cultures, activity of about 100 $\mu\text{C}/\text{ml}$ of medium was required to reduce the amount of penicillin significantly. BA 20-18106

4804

THE EFFECTS OF COLCHICINE AND ACENAPHTHENE IN COMBINATION WITH X RAYS ON PLANT TISSUE.

Michael Levine. Bull. Torrey Botan. Club 72(6), 563-74 (1945), 73(1): 34-59; (2), 167-83(1946).

Author describes studies on root tips of Allium cepa. Colchicine was used as 0.01% solution; x-rays in 900, 1500, or 3000 r dose. X-radiation (all doses) impaired growth; recovery time was shorter than that after combined x-ray chochine treatment. Combination of acenaphthene and x rays gave results similar to those with x rays alone. BA 20-18598

4805

A COMPARISON OF THE EFFECTS OF HEAT AND X-RAYS ON DORMANT SEEDS OF CEREALS WITH SPECIAL REFERENCE TO POLYPOIDY. Luther Smith. J. Agr. Research 73(4), 137-58(1946).

Tolerance to x rays increased with number of chromosomes in diploid, tetraploid, and hexaploid species of wheat and oats; in diploid and autotetraploid barley maize, and rye; and in Aegilops uniaristata and an amphidiploid hybrid of A. uniaristata and diploid wheat. Frequency of bridges in root tips, number of translocations, and frequency of mutations were increased by x raying. BA 20-19301

4806

CHANGES IN THE BLOOD VESSELS AFTER INTRAVENOUS INJECTION OF THORIUM DIOXIDE (THOROTRAST). L. Efskind. Acta Chir. Scand. 84, 177-86(1941).

Thorotrast (3 ml) was injected in ear vein of rabbits. Histological examination made 1-160 days later revealed deposits of thorotrast in vessel walls which had been epithelialized and had caused wide-spread degeneration in elastic tissue. Thorotrast was not phagocytized by vascular epithelium. No pathologic cell division was observed in vessels. BA 20-19881

4807

LOCALIZED CHANGES AFTER INTRAPERITONEAL INJECTION OF THORIUM DIOXIDE (THOROTRAST). L. Efskind. Acta Chir. Scand. 84, 79-95(1941). (In German).

Histological study made at intervals up to six months after intraperitoneal injection of thorotrast showed slow absorption of material via lymph channels; most of it was deposited locally. Degenerative changes which develop, reaching maximum at 8-12 wk, are similar to changes after x irradiation. BA 20-19949

4808

THE EFFECT OF GAMMA RADIATION UPON MIMOSA PUDICA L. A. Lima-de-Faria. Portugaliae Acta Biol. 1A(2), 95-109(1945).

Large gamma ray dose inhibits seismonastic movements of M. pudica leaves during period of 2-10 days. Author concludes that inhibitory power of radiation is inversely proportional to the wave length. BA 20-21107

4809

RECTAL PATHOLOGY DUE TO RADIATION. J. C. Ahumada and Raul M. Chevalier. Rev. asoc. med. argentina 57(505/506), 86-91(1943). (In Spanish).

Twenty cases with rectal lesions following Ra therapy of uterus are summarized. BA 18-4362

4810

X-IRRADIATION OF RABBIT SPERMATOZOA IN VITRO. E. C. Amoroso and A. S. Parkes. Nature 152(3852), 244 (1943).

Rabbits injected with gonadotrophin to produce superovulation were artificially inseminated with x irradiated semen and subsequently killed. Tubal or uterine contents were examined 40 hr, 9 days, or 28 days after ovulation. Doses: 50-100,000 r. Irradiated sperm penetrated eggs at all doses. Doses over 1000 r prevented implantation. At 100,000 r polar bodies formed and sperm pronuclei migrated to, but did not fuse with egg pronuclei. BA 18-6041

4811

SAFE HEALTH PRACTICES IN THE USE AND HANDLING OF RADIOACTIVE LUMINOUS PAINTS. Anonymous. Publ. Massachusetts Dept. Labor and Indust. Div. Indust. Hyg. 290, 1-8(1942).

Various requirements applying to factories in Massachusetts in which radioactive luminous compounds are stored or applied are summarized. Included are: qualifications of employees, allowable exposure to radon and γ rays, protective clothing, personal hygiene, plant operating rules, general and equipment requirements, ventilation, and lighting. BA 18-8657

4812

RADIO-ACTIVE ELEMENTS FOR CANCER. Anonymous. Science and Culture (India) 10(1), 46(1944).

Treatment of 100 patients with combinations of x rays, radio-active phosphorus and iodine, etc., resulted in definite improvement in cases of leukemia, lymphosarcoma, plasma cell myeloma, Hodgkin's disease and polycythemia vera. Certain tissues are susceptible to specific substances. Radioactive Zn is deposited in pancreas, S in skin, and Sr in bone cortex. BA 19-2751

4813

DIFFERENCES BETWEEN DISSOCIANTS OF LACTOBACILLI. F. W. Barber and W. C. Frazier. J. Bacteriol. 47(5), 418(1944).

Dissociation was induced in Lactobacillus bulgaricus, L. helveticus, and L. lactis by variations of time, temperature and medium for growth and by ultraviolet and x-ray irradiation. Fuzzy (R), disc (S), and intermediates were studied. BA 18-13700

4814

STUDIES ON THE INDIRECT EFFECT OF ROENTGEN RAYS IN SINGLE AND PARABIOTIC MICE. W. A. Barnes and O. B. Furth. Am. J. Roentgenol. Radium Therapy 49(5), 662-81(1943).

Two of four mice in each group were joined in parabiosis. In 2-4 wk one single mouse and one twin were irradiated with 300-6000 r of 200 kv lightly filtered x rays, other twin and single mouse were shielded. Slight leukopenia occurred in shielded parabiont after exposure of twin to 800-1000 r. Leukopenia was less severe in irradiated parabiont than in irradiated single animal. BA 18-221

4815

MALIGNANCY IN RELATION TO ORGANIZATION AND DIFFERENTIATION. N. J. Berrill. Physiol. Rev. 23(2), 101-23(1943).

In reference to "tumor induction," the following agents for inducing tumors are discussed in relation to protein synthesis, cell division (cytology and surface conditions), and organizing forces: radium, x ray, ultraviolet, polycyclic hydrocarbons, sex hormones, tumor extracts, butter yellow, arsenic, and viruses. BA 18-880

4816

THE INFLUENCE OF IRRADIATION OF THE OVARIES

UPON ESTRUS AND NEOPLASTIC DEVELOPMENT IN MARSH-BUFFALO MICE. F. Bischoff, H. J. Ullmann, and L. P. Ingraham. *Radiology* 43(1), 55-8(1944).

Groups of 40 Marsh-Buffalo mice received x-ray doses of 200 or 400 r (HVL 1.15 mm Cu) over ovaries following establishment of vaginal canalisation. Lower dose reduced estrus markedly, higher dose suppressed it entirely. Recovery is described, X-ray effect on incidence of adenocarcinoma of breast and incidence of lymphoid tumors was also studied. BA 18-18745

4817

EFFECT OF X-RAY IRRADIATION UPON BACTERIAL TOXEMIA IN RABBITS. J. D. Birgard, H. B. Hunt, and R. H. Dickinson. *Radiology* 43(4), 330-2(1944).

Doses of 100 r/air were administered to 24 rabbits (140 kv, 15 ma, 3 mm Al and 0.5 mm Cu and 1 mm Al filtration, 50 cm distance, intensity 20 r/mm). Either chest or extremities were exposed, rest of body lead-shielded. Minimal lethal dose of diphtheria toxin or hemolytic *E. coli* was given 48 hr post exposure. All untreated controls died within 48 hr after injection while irradiated animals injected with diphtheria toxin survived and 9 of 12 injected with *E. coli* toxin lived. Minimal protective dose was 20 r/in air. Authors conclude that irradiation causes the release of a non-specific antitoxin from tissues, regardless of specific body region irradiated. BA 19-3008

4818

FURTHER RADIATION EXPERIMENTS WITH *VICIA FABA EQUINA*, WITH SPECIAL REGARD FOR THE TIME FACTOR. Karl Bolken. Berne, Dissertation. 1941. 25p. (In German). BA 19-20935

4819

THEORIES ON THE EFFECTIVENESS OF ROENTGEN THERAPY IN INFLAMMATORY CONDITIONS. J. Borak. *Radiology* 42, 249-54(1944).

X-ray induced dilation of capillaries is called a "heat-like" effect, narrowing of arterioles, a "cold-like" effect. Author believes x irradiation embodies properties of both physical agents, heat and cold, known to be effective in treating inflammations. BA 18-13414

4820

THE EFFECT OF HEPARINIZATION ON EXPERIMENTAL POST-IRRADIATION TISSUE CHANGES IN THE LUNG. F. Boys and I. D. Harris. *Am. J. Roentgenol. Radium Therapy* 50(1), 1-8(1943).

Rabbits were heparinized to keep coagulation time above 20 min. Entire thorax was irradiated with a total dose of 4200-4900 r in 2 wk. Lung damage was less than in nonheparinized animals given same radiation dose BA 18-6097

4821

ALTERATION OF ERYTHROCYTE PERMEABILITY BY ROENTGEN RADIATION. Kasper Burgen. Berne, Dissertation. 1942. 15p. (In German). BA 19-21248

4822

THE PROBLEM OF CHROMOSOMAL FRAGMENTATION INDUCED BY X-RAYS, STUDIED IN *T. MONOCOCCUM*. A. Camara. *Agronomia Lusitana* 3(4), 341-59(1941).

Seeds of *T. monococcum* var. *vulgare* were x irradiated with 1000, 2000, or 3000 r (115 kv, 5 ma, 13.5 cm distance, 1 mm Al filter). Various types of chromosome fragmentation are described, measurements of fragments and altered chromosomes are presented. BA 18-9796

4823

CROSSING-OVER IN MALES OF *D. MELANOGASTER* INDUCED BY X-RAYS. A. Camara and Sarah de Vasconcellos. *Agronomia Lusitana* 3(3), 195-208(1941).

Dose of 242 r/min induced 26 verified cross-overs among 275 male res/+ pupae 2-3 days of age. Salivary

chromosomes of larvae, obtained by back-crossing to res/res were examined for transpositions of heterochromatic regions. Nearly 50 per cent of cross-overs in males were accompanied by transposition of heterochromatic material. BA 18-2032

4824

EFFECTS OF IONIZING RADIATIONS ON CHROMOSOMES. D. G. Catcheside. *Biol. Rev. Cambridge Phil. Soc.* 20(1), 14-28(1945).

Information about process of chromosome breakage and structural change in somatic chromosomes, especially of *Tradescantia*, is reviewed, effectiveness of x rays, α particles, and neutrons in producing such changes is discussed. BA 19-20917

4825

THE EFFECT OF IONIZATION DISTRIBUTION ON CHROMOSOME BREAKAGE BY X-RAYS. D. G. Catcheside and D. E. Lea. *J. Genetics* 45(2), 186-96(1943).

Chromatid breakage in pollen grain and pollen tube nuclei is maximal with x rays of 4.1 Å, falls off slowly with decreasing wave lengths of 1.5-0.15 Å and rapidly with increasing wave lengths up to 8.3 Å. This is interpreted as meaning that only densely ionizing tails of the electron tracks are effective in breaking chromosomes and only then if they completely traverse the chromosome. Since the electron track of Al-K radiation (8.3 Å) is shorter than a chromatid diameter, it is relatively ineffective. BA 18-9816

4826

EFFECTS OF TOTAL SURFACE BETA RADIATION. John R. Raper. *Radiology* 49, 314-24(1947).

Tumor induction was particularly striking in rats exposed to doses of 4000 and 5000 rep. All animals developed a great multiplicity of tumors.

4827

TISSUE CULTURE, A BIOLOGICAL MEANS OF EXPERIMENTATION. N. N. Das. *Science and Culture (India)* 9(4), 161-4(1943).

Use of tissue culture in studying action of x rays, neutrons, and Ra on living cells is described briefly. BA 18-13581

4828

FREQUENCY OF DOMINANT LETHALS INDUCED BY RADIATION IN SPERMS OF *DROSOPHILA MELANOGASTER*. M. Demerec and U. Fano. *Genetics* 29(4), 348-60(1944).

Frequency of dominant lethals is a function of radiation dosage, in agreement with Pontecorvo's concept of the origin of dominant lethals. Relationship between dosage and modification of the sex ratio, however, requires some modification of Pontecorvo's interpretation. Proportion of organisms dying during larval stage is approximately the same for different radiation treatments of parent males, and equal treatments are approximately equally effective in inducing dominant lethals in different stocks of flies. BA 18-18607

4829

RADIOBIOLOGICAL CONTRIBUTION TO THE STUDY OF THE OVARY. P. Desave. *Arch. biol. (Liege)* 51, 587-922(1940). (In French).

Disappearance or alteration of meiosis is the most typical x-ray lesion of the follicle maturation stages. BA 18-6333

4830

DELAYED LETHAL EFFECT OF X-RAYS ON FIBROBLASTS CULTIVATED IN VITRO. L. Doljanski and G. Goldhaber. *Proc. Soc. Exptl. Biol. Med.* 53(2), 114-16(1943).

Irradiation with; 3000 r does not produce permanent damage of cell cultures except for a few cultures which, after several passages show a normal growth rate. After 4000 r, 11 cultures succumbed in the course of

succeeding transfers, 6 cultures survived. Prolonged cultivation of cell colonies is impossible after 5000 r. Dose of 5000 r is considered to be minimal "delayed lethal dose" for chick fibroblasts. BA 18-222

4831

COMPARATIVE STUDIES ON THE RADIOSENSITIVITY OF NORMAL AND MALIGNANT CELLS IN CULTURE. II. THE DELAYED LETHAL EFFECT. L. Doljanski, G. Goldhaber, and L. Halberstaedter. *Cancer Research* 4(2), 106-9(1944).

Delayed lethal dose of x rays for rat sarcoma cells cultivated in vitro is 2000 r. This is less than half the equivalent dose for chicken normal fibroblasts, whose proliferative capacity is irreversibly checked only after irradiation with 5000 r. BA 18-10622

4832

EFFECT OF RADIOACTIVE ELEMENTS (RA) AND RARE EARTHS (TR) UPON YIELD AND RUBBER CONTENT OF KOK-SAGHYZ. A. A. Drobkov. *Compt. rend. acad. sci. URSS* 32(9), 667-8(1941). (In Russian).

Ra was more effective than rare earths in increasing root yield, but less effective in increasing rubber content. BA 18-17761

4833

THE EFFECT OF ROENTGEN RAYS, RADON AND RADIOACTIVE PHOSPHORUS ON THIAMIN CHLORIDE. C. E. Dunlap and F. C. Robbins. *Am. J. Roentgenol. Radium Therapy* 50(5), 641-7(1943).

Exposure to Rn and radioactive P in vitro partially destroyed activity of aqueous solutions of thiamin chloride as tested on *Phycomyces* and *Phytophthora*. Large x-ray doses had no effect. Heavy irradiation in vivo produced no detectable change in thiamin content of mouse blood or liver. BA 18-4184

4834

TRANSPLANTABLE OSTEOGENIC SARCOMAS INDUCED IN RATS BY FEEDING RADIUM. Charles E. Dunlap, Joseph C. Aub, Robert D. Evans, and Robert S. Harris. *Am. J. Pathol.* 20(1), 1-18(1944).

Osteogenic sarcomas appeared in vertebrae and pelvic bones in 9 of 13 rats after feeding each animal 100 γ of Ra. Induction time from Ra feeding to discovery of tumors averaged 365 days. In addition to osteogenic sarcomas, rats showed widespread necrosis of bone and atypical new bone formation. Bone marrow was hypoplastic and showed generalized immaturity and abnormal deposits of hemosiderin. BA 18-8589

4835

CHANGES INDUCED IN YEAST CELLS BY X-RAYS AND CHEMICAL SUBSTANCES. I. Hans von Euler, Lucie Ahlstrom, and Bertil Hogberg. *Hoppe-Seyler's Z. physiol. Chem.* 277(1/2), 1-17(1942). (In German).

Irradiation caused a decrease in reproduction rate of yeast cells and a decrease of 10-20% in nucleic acid in cells. BA 18-3066

4836

CHANGES INDUCED IN YEAST CELLS BY X-RAYS AND CHEMICAL SUBSTANCES. II. H. von Euler, Lucie Ahlstrom and Bertil Hogberg. *Hoppe-Seyler's Z. physiol. Chem.* 277(1/2), 18-25(1942). (In German).

This study to determine whether colchicine increases radiosensitivity of yeast cells yielded inconclusive results. BA 18-3067

4837

PROTECTION OF RADIUM DIAL WORKERS AND RADIOLOGISTS FROM INJURY BY RADIUM. Robley D. Evans. *J. Ind. Hyg. Toxicol.* 25(7), 253-69(1943).

A review including: real value of Rn determinations of expired air against alleged value of cytologic blood examinations of Ra dial painters; technique of obtaining

samples of respired air for analysis for radon; importance of inhalation of Ra-bearing dusts as a pathogenic factor; and the theory of practice of protective measures to be taken against poisoning by radioactive materials in industry. BA 18-999

4838

MODIFICATION OF RADIOSENSITIVITY OF THE SKIN. VI. EFFECTS OF COMPRESSION AND LOW TEMPERATURE ON THE ROENTGEN IRRADIATION REACTION OF HUMAN SKIN. T. C. Evans and H. D. Kerr. *Am. J. Roentgenol. Radium Therapy* 50(5), 629-35(1943).

Slight, variable decrease in radiation reaction was observed in cancer patients undergoing radiotherapy when area of exposure was chilled during treatment. BA 18-4185

4839

THE USE OF RADIO-ACTIVE TRACER ATOMS IN CHEMICAL AND BIOLOGICAL RESEARCH. F. Fairbrother. *Chemistry and Industry* 1945(9), 7(1945). BA 19-21221

4840

EXPERIMENTS ON MUTATIONS INDUCED BY NEUTRONS IN *DROSOPHILA MELANOGASTER* SPERMS. U. Fano. *Genetics* 29(4), 361-9(1944).

New measurement of frequency of neutron-induced dominant lethals is reported, but comparative efficiency of neutrons and x rays in producing various types of chromosomal change in *Drosophila* sperm is not satisfactorily elucidated thereby, according to author. BA 18-18609

4841

RADIOTHERAPY COMBINED WITH IODINE IN PULMONARY MYCOSIS. M. Finocchiaro. *Annali Paulistas med. e cir.* 46(1), 29-32(1943). (In Italian).

Combining iodine injections with radiotherapy increases the probability and rapidity of recovery from pulmonary conditions due to the presence of various types of mold infections. BA 18-13976

4842

THE EFFECTS OF ROENTGEN RAYS ON CELL-VIRUS ASSOCIATIONS. FINDINGS WITH VIRUS-INDUCED RABBIT PAPILLOMAS AND FIBROMAS. William F. Friedwald and Robert S. Anderson. *J. Exptl. Med.* 78(4), 285-304(1943).

Virus-induced papillomas of cottontail and domestic rabbits regress completely within a few weeks after a 5000 r x-ray dose. X-rays do not kill papilloma cells immediately, but lead to death by inhibiting cell division and producing pathological changes in cells which then continue to differentiate. Virus persists in undiminished amounts during regression. BA 18-2152

4843

ENHANCEMENT OF LEUKEMOGENIC ACTION OF METHYLCHOLANTHRENE BY PRE-IRRADIATION WITH X-RAYS. J. Furth and M. C. Boon. *Science* 98(2536), 138-9(1943).

Pre-irradiation of mice greatly enhanced the leukemogenic action of small doses of methylcholanthrene and hastened the onset of leukemia. X-rays alone were less leukemogenic than methylcholanthrene. BA 18-893

4844

THE EFFECT OF X-RAYS UPON THE ACTION OF A SPECIFIC GENE IN *DROSOPHILA MELANOGASTER*. Bentley Glass. *Genetics* 29(5), 436-46(1944).

Embryos, 10 hr old, of brown scarlet (bw; st) stock were exposed to 1000 r and maintained at 26°C. Of 221 flies emerging as adults, 94.1% had growth from center of one or both eyes, varying from mere protrusion in the central area to eruption of a palp-like structure bearing bristles; sometimes segmented. There was no such effect on other stock. Effect is due to semidominant gene in chromosome 3, and to semidominant gene in chromo-

some 2 of bw;st stock. One semidominant gene is suppressor of the other, x ray inactivates the suppressor. BA 18-20999

4845

FURTHER STUDIES ON THE EFFECT OF IRRADIATION ON PROLIFERATION AND METABOLIC PROCESSES OF NORMAL AND MALIGNANT TISSUES. IV. EFFECTS PRODUCED BY DIFFERENT DOSAGE RATES OF X-RAY RADIATION ON THE PROLIFERATION OF VARIOUS TISSUES GROWN IN VITRO. A. Goldfeder. Radiology 35(2), 210-28(1940).

Freshly excised fragments of (1) kidneys and (2) spleen of day old rats, (3) chick embryo hearts (7-8 days old), (4) mouse sarcoma 180, are x irradiated. Critical dosage (i.e. one permitting only limited recovery processes) using 936 r/min are (1) 90,000-95,000 r, (2) 50,000-60,000 r, (3) 140,000-160,000 r, (4) 50,000-60,000 r. Influence of time factor is discussed. Criteria for x-ray effect, latent period, extent of new growth and time of earliest cell degeneration. BA 18-223

4846

COMPARATIVE STUDIES ON THE RADIOSENSITIVITY OF NORMAL AND MALIGNANT CELLS IN CULTURE. III. FURTHER STUDIES ON THE INHIBITORY EFFECT OF X-RAYS ON CELL OUTGROWTH. G. Goldhaber, L. Doljanski, and L. Halberstaedter. Cancer Research 4(2), 110-12(1944).

Minimum x-ray dose causing appreciable inhibition of growth rate in an irradiated sarcoma cell culture is 500 r. The corresponding dose for normal chicken fibroblast is 2500 r. BA 18-10625

4847

GROSS EFFECTS OF BETA IRRADIATION ON RESTRICTED SURFACE OF RABBITS. IN: BIOLOGICAL EFFECTS OF EXTERNAL BETA RADIATION. (National Nuclear Energy Series IV. 22E). p. 42-62. Raymond E. Zirkle, ed. New York, McGraw Hill Book Co., Inc. 1951.

Skin tumors were induced in mice and rats, but not in guinea pigs or rabbits, by single sublethal surface doses of β rays. Effect was more striking in rats after doses of 4000 and 5000 rep. Tumors of virtually every known type were observed in the rats.

4848

METABOLIC CHANGES OCCURRING AS THE RESULT OF DEEP ROENTGEN THERAPY. I. THE EFFECT OF 200 KILOVOLT ROENTGEN THERAPY. Douglas Goldman. Am. J. Roentgenol. Radium Therapy 50(3), 381-91(1943).

N partition studies show some increase, during periods of x-ray therapy, in total and in uric acid N excretion, and in total acidity of urine, followed by retention of amino-acid N after irradiation was stopped. Definite relation between chloride metabolism and x-ray sickness is suggested. Creatinine and Ca excretion were unaffected by x irradiation. No specific radiation-induced changes were found in all patients. BA 18-4186

4849

TREATMENT OF CANCER BY FAST NEUTRONS. L. H. Gray and J. Read. Nature 152(3845), 53-4(1943).

Fast neutrons from 60-inch cyclotron did not damage skin, but did injure deep tissues. BA 18-6486.

4850

THE GENETICS OF THE MOUSE Hans Gruneberg. New York, MacMillan Co. 1943. xii + 412p.

Author includes an account of x-ray studies. BA 18-4052

4851

THE EFFECT OF X-RAYS ON DEVELOPMENT OF INSECTS. I. IRRADIATION IN LARVAL STAGE. L. Halberstaedter, G. Goldhaber, and O. Hecht. Growth 7(4), 413-25(1943).

Death of Caliphora larvae is produced almost uniformly by 300,000 r. Almost all larvae given 30,000 r form pupae, pupae from larvae given 4000 to 5000 r never produced

adults. Development of larvae into imagos is virtually unaffected by doses below 1000 r. Larval stages of Culex are killed by 12,000 r and below, doses of 3000 r or less are without apparent effect on subsequent imago formation. (Cell division is vital to larval development in Culex, not in Calliphora.) BA 18-10044

4852

THE USE OF FEVER THERAPY IN THE TREATMENT OF THE CHRONIC LEUKEMIAS. Frederick L. Hartmann. Clinics (Philadelphia) 4(1), 81-6(1945).

Roentgen irradiation over spleen, long bones, and lymph nodes has heretofore been the most successful measure, but there is evidence that the use of typhoid vaccine to produce fever enhances effect of x-ray treatment during the febrile period and may restore susceptibility at least temporarily when the leukemia has become resistant to radiation alone. BA 19-21848

4853

SEASON, NUTRITION, IMMUNITY, DRUGS, AND X-RAY AS FACTORS INFLUENCING THE COURSE OF A COCCIDIAN INFECTION. Theodore Hauschka. J. Parasitol. 30(3), 162-72(1944).

Unfiltered x ray (1000-7000 r) interferes with host fission and produces aberrant sporogony in 30-100% of total zygotes in *Dero limosa*. BA 19-3924

4854

ROENTGEN RADIATION INDUCED MUTATIONS IN *PELLIA NEESIANA*. E. Heitz. Verhandl. Schweiz. naturforsch. Ges. 120, 170-1(1940). (In German).

X-ray effects on chromosomes of *P. neesiana* and *Sphaerocarpus* are compared. BA 19-20945

4855

FURTHER PROBLEMS IN X-RAY PROTECTION. II. IRRADIATION INJURY AND TOLERANCE DOSE. P. S. Henshaw. Radiology 44(6), 569-80(1945).

There is a "threshold dose" or level of exposure for effects such as skin ulceration, sterility, anemia and death in the sense that relatively large doses are required. Such doses may be delivered in relatively short periods in certain radiation workers and in clinics. Other changes, such as premature aging and carcinogenesis, may occur long after exposure. There appears to be no threshold for genetic effects. BA 19-21128

4856

INFLUENCE OF IRRADIATION-KILLED CELLS ON TUMOR GROWTH. Paul S. Henshaw. J. Natl. Cancer Inst. 4(3), 303-7(1943).

Results of this study indicate that irradiation-killed cells or their decomposition products exert no inhibitory influence on growth potentiality of viable tumor cells. BA 18-6491

4857

INCIDENCE OF LEUKEMIA IN PHYSICIANS. Paul S. Henshaw and James W. Hawkins. J. Natl. Cancer Inst. 4(4), 339-46(1944).

Leukemia was found 1.7 times more frequently among physicians than among white males in the general population. This observation is in accord with findings in experimental studies of radiation-induced leukemia in animals. BA 18-16204

4858

EXPERIMENTAL ROENTGEN INJURY. I. EFFECTS ON THE TISSUES AND BLOOD OF C_3H MICE PRODUCED WITH SINGLE SMALL WHOLE-BODY EXPOSURES. Paul S. Henshaw. J. Natl. Cancer Inst. 4(5), 477-84(1944).

After applications of 50-r x-ray dose to C_3H mice, slight leukocytosis developed in 2-4 hr followed in 6-12 hr by mild, persistent leukopenia. There was a small amount of nuclear debris in lymph nodes at 204 hr; this disappeared and mild hyperplasia developed in 8-12 hr. Seminiferous tubules of testis showed reduction in spermatogonia and

primary spermatocytes at 1 wk and of secondary spermatocytes at 2. Tubules appear normal again in 4-6 wk. BA 18-16200

4859

EXPERIMENTAL ROENTGEN INJURY. II. CHANGES PRODUCED WITH INTERMEDIATE-RANGE DOSES AND A COMPARISON OF THE RELATIVE SUSCEPTIBILITY OF DIFFERENT KINDS OF ANIMALS. Paul S. Henshaw. J. Natl. Cancer Inst. 4(5), 485-501(1944)

Doses of 50, 100, 200, and 400 r were applied to whole bodies of C₃H and LAF₁ mice and to guinea pigs. Hematologic and histopathologic changes were studied postexposure. Lymphoid organs, bone marrow, and testis were studied histologically. BA 18-16201

4860

EXPERIMENTAL ROENTGEN INJURY. III. TISSUE AND CELLULAR CHANGES BROUGHT ABOUT WITH SINGLE MASSIVE DOSES OF RADIATION. Paul S. Henshaw. J. Natl. Cancer Inst. 4(5), 503-12(1944).

Guinea pigs, rabbits, and mice were given a 50,000 r x-ray dose. Guinea pigs died during treatment, rabbits within 3-6 hr, mice within 24-48 hr. Death appeared to be due to distinctive type of shock, symptoms of which were generalized toxemia, hyperthermia, hyperesthesia with intermittent seizures and cyanosis. Widespread tissue destruction was observed. BA 18-16202

4861

EXPERIMENTAL ROENTGEN INJURY. IV. EFFECTS OF REPEATED SMALL DOSES OF X-RAYS ON BLOOD PICTURE, TISSUE MORPHOLOGY, AND LIFE SPAN IN MICE. Paul S. Henshaw. J. Natl. Cancer Inst. 4(5), 513-22(1944).

Small daily doses of 5, 10, 15, 20, 25 r/day were applied to whole bodies of C₃H mice. Leucocyte level fell due to lymphocyte loss, amount of fall varied progressively as treatments proceeded and the decrease varied directly with size of daily dose. Leukemia developed in some mice receiving 15 and 20 r daily. Life span was shortened BA 18-16203

4862

THE EFFECT OF ROENTGEN RAYS UPON THE GROWING LONG BONES OF ALBINO RATS. II HISTOPATHOLOGICAL CHANGES INVOLVING ENDOCHONDRAL GROWTH CENTER Charles L. Hinkel. Am. J. Roentgenol. Radium Therapy 49(3), 321-48(1943).

Female Sherman strain albino rats of various ages were irradiated with 600-2500 r of filtered 200 kv x rays over a 5 mm field including femoral growth center, left femur served as control. Stunting and injury to vessels. Osteoblasts and marrow cells are described. Cartilage was still able to regenerate after 2000 r. BA 18-224

4863

THE EFFECT OF IRRADIATION UPON THE COMPOSITION AND VASCULARITY OF GROWING RAT BONES C. L. Hinkel. Am. J. Roentgenol. Radium Therapy 50(4), 516-26(1943).

Roentgen irradiation of femora of young growing rats was followed by an almost immediate increase in bone ash and fat content, associated with drop in matrix and water. Several days postirradiation there follows a diminution in number and caliber of metaphyseal blood vessels. Slow return toward normal content of ash, matrix and fat was observed during a period of several months after irradiation. BA 18-4187

4864

IRRADIATION SICKNESS. A HYPOTHESIS CONCERNING THE BASIC MECHANISM AND A STUDY OF THE THERAPEUTIC EFFECT OF AMPHETAMINE AND DEXTRO-DESOXYEPHEDRINE. E. L. Jenkinson and W. H. Brown. Am. J. Roentgenol. Radium Therapy 51(4), 496-503(1944).

Irradiation sickness is explained as an increased capillary permeability which results in disturbance of intracellular and extracellular equilibrium of electrolytes and fluids, followed by local congestion, edema, and stasis of circulating blood. A cycle is set in motion by reduced blood volume and tissue anoxia. Action of drug is to maintain peripheral circulating blood volume and prevent visceral stasis. (Of 69 cases treated, 55 are well controlled by one of the two medications). BA 18-16106

4865

STUDIES ON SYNERGISM OF LEUKEMOGENIC AGENTS IN MICE. Henry S. Kaplan and Arthur Kirschbaum. Proc. Soc. Exptl. Biol. Med. 55(4), 262-4(1944).

Irradiation, when used in conjunction with methylicholanthrene, failed to increase the incidence or to accelerate the onset of carcinogen-induced leukemia in strain Db a and strain F mice. BA 18-16208.

4866

INDUCTION OF LEUKEMIA IN MICE. Arthur Kirschbaum and Henry S. Kaplan. Science 100(2599), 360-1(1944).

Various strains of mice differed greatly in their tendency to develop spontaneous leukemia and leukemia after x ray or methylcholanthrene administration. BA 19-2731

4867

THE EFFECT OF RADIATION ON POLLEN GRAIN DEVELOPMENT, DIFFERENTIATION AND GERMINATION. P. C. Koller. Proc. Roy. Soc. Edinburgh 61B (Pt. 4, paper no. 29), 398-429(1943).

A 360-r x ray dose (at 16-24°C) applied to *Tradescantia bracteata* pollen grains suppresses beginning of prophase, which reduces rate of change from 1 to 2 nuclei. Cells within 1 hr of pollen grain mitosis are apparently unaffected. Prophase-suppressing effect is greatest 3 hr after radiation, lasts 2 hr. Metaphase is prolonged, sometimes to 3 hr. BA 18-54

4868

SEGMENTAL INTERCHANGE IN MICE P. C. Koller. Genetics 29(3), 247-63(1944).

Three interchange lines, A, B, and T, each from different male, were obtained by irradiation (600-900 r). BA 18-12651

4869

DIFFERENTIAL TISSUE RESPONSE TO NEUTRON AND ROENTGEN RADIATIONS. J. Lampe and F. J. Hodges. Radiology 41(4), 344-50(1943).

Complete aspermatogenesis and failure of scrotal skin to heal were observed in rabbits (20) exposed to 2100 r of neutron irradiation. A dose of 700 n caused aspermatogenesis and severe cutaneous damage, 313-650 n produced complete aspermatogenesis without permanent skin damage in half the cases. Sterilization without severe damage to scrotal skin was apparently impossible with x rays. BA 18-2153

4870

THE EFFECT OF X-RAYS ON CELLS CULTIVATED IN VITRO. II. RECOVERY FACTOR. Ilse Lasnitzki. Brit. J. Radiol. 16(132), 61-7(1943)

Cultures of 9-11 day chick choroid and sclerotic were exposed to 160 kv x rays (100 r once, or twice, separated by 48 or 96 hr, 1000 r once, or twice separated by 10 days). Effects: marked fall in mitosis with temporary small wave of abnormal mitosis. Subsequently: recurrence of cell division and appearance of degenerate cells, followed by second wave of abnormal mitosis. Recovery occurred 48 hr after 100 r, 10 days after 1000 r. BA 18-225

4871

THE RESPONSE OF CELLS IN VITRO TO VARIATIONS IN X-RAY DOSAGE. Ilse Lasnitzki. Brit. J. Radiol. 16(185), 137-41(1943).

Cultures of 9-11-day-old chick embryo choroid and sclerotic were irradiated with 160 kv lightly filtered x rays and fixed. Doses of: 100-1000 r temporarily inhibited mitosis; 2500, 5000, and 10,000 r allowed no mitotic recovery, produced many degenerated cells. Results indicated degeneration is due to breakdown of resting cells. BA 18-226

4872

THE SPATIAL DISTRIBUTION OF IONIZATION IN IRRADIATED TISSUE, AND ITS RELATION TO BIOLOGICAL EFFECTS. D. E. Lea. Brit. J. Radiol. 16(191), 338-9 (1943).

Neutrons are much more effective per ionizing particle than x rays in producing chromosome breaks. Author attributes this to denser ionization path of the proton ejected by the neutron (in comparison to the electron ejected by x rays). Ejected electron gives dense ionization only at end of path, and only this portion is considered capable of producing chromosome break. BA 18-6043

4873

SOME OF THE EFFECTS OF ROENTGEN IRRADIATION ON THE CARDIOVASCULAR SYSTEM. J. E. Leach. Am. J. Roentgenol. Radium Therapy 50(5), 616-28(1943).

Single dose of 10,000 r of high voltage x rays was necessary to produce microscopic evidence of myocardial damage in adult rats. Those receiving up to 7500 r showed no late changes over a period of a year. Disturbances in heart and circulation observed in patients given x-ray therapy are attributed to incidental effects or to cancer itself, rather than to the x-ray therapy. BA 18-4188

4874

EFFECT OF ROENTGEN THERAPY ON THE HEART. John E. Leach. Arch. Internal Med. 72(6), 715-45(1943).

Group of 86 patients treated with high voltage x-ray therapy were studied before, during and after therapy by means of roentgenograms of chest and serial electrocardiograms. One group received therapy not over chest, another group was treated over many body regions including thorax; third group treated over thorax only. Heart was apparently unaffected by x rays in these patients. ECG changes in patients treated over thorax are due largely to changed relation of heart to other structures. BA 18-8493

4875

RADIOACTIVITY AND LUNG CANCER: A CRITICAL REVIEW OF LUNG CANCER IN THE MINERS OF SCHNEEBERG AND JOACHIMSTHAL. Egon Lorenz. J. Natl. Cancer Inst. 5(1), 1-15(1944).

While it is generally assumed that radon is the only factor responsible for high incidence of pulmonary cancer, animal experiments have not shown that inhalation of Rn will induce pulmonary tumors. Author concludes: opinion that radon is sole cause of lung cancer in miners cannot be maintained and other contributing factors exist. BA 18-21748

4876

RADIOBIOLOGICAL INVESTIGATION WITH THE PUPAE OF THE FRUIT FLY, DROSOPHILA MELANOGASTER. Helene Lowy. Bern. Dissertation. 1940. (In German).

Course of lesions induced in *Drosophila* pupae by x rays depends on irradiation conditions. Independence of wave length was not proven but seems probable. Results confirm that x and γ rays under same irradiation conditions damage pupae qualitatively and quantitatively in same manner. Lesion curves for x and γ rays are sigmoids, those for ultraviolet light are exponential. BA 18-18614

4877

TWO CASE HISTORIES OF RADIUM NECROSIS OF THE MYOCARDIUM. E. Renter. Cancer 4, 431-41(1927).

4878

THE EFFECT OF RADIATION THERAPY IN CLOSTRIDIUM INFECTION IN SHEEP. E. A. Merritt, A. J. Den, and U. V. Wilcox. Radiology 43(4), 325-9(1944).

X-ray exposure of sheep following injection of *C. welchii* reduced severity of disease, as compared with controls. Dose of x ray varied according to the severity of the disease. Recoveries were not complete and were faster in animals receiving initial dose of 300 r and a second dose of at least 200 r within 6 hr. BA 19-3316

4879

METABOLIC EFFECTS OF THERAPEUTIC DOSES OF X AND GAMMA RADIATIONS. J. S. Mitchell. Brit. J. Radiol. 16(191), 339-43(1943).

Disturbances of carbohydrate metabolism by irradiation were studied by measuring inhibition of glycolysis, disturbances of nucleic acid metabolism by comparing ultraviolet absorption spectra of irradiated and nonirradiated tissues. Ionic efficiencies were of same order for disturbances of both types of metabolism, and effects are believed due to enzyme inactivation. BA 18-6044

4880

DISTURBANCE OF NUCLEIC ACID METABOLISM PRODUCED BY THERAPEUTIC DOSES OF X AND GAMMA RADIATIONS.

I. METHODS OF INVESTIGATION. J. S. Mitchell. Brit. J. Exptl. Pathol. 23(6), 285-95(1942).

Detailed description for quantitative estimation of the effect of therapeutic doses of x and γ rays on the nucleic acid metabolism of tissues is presented. Method employs monochromatic ultraviolet light of 2537 Å for photomicrographically recording results of examination of unstained specimens. BA 18-220

4881

DISTURBANCE OF NUCLEIC ACID METABOLISM PRODUCED BY THERAPEUTIC DOSES OF X AND GAMMA RADIATIONS. II. ACCUMULATION OF PENTOSE NUCLEOTIDES IN CYTOPLASM AFTER IRRADIATION. J. S. Mitchell. Brit. J. Exptl. Pathol. 23(6), 296-309 (1942).

Data indicate that therapeutic doses of x and γ radiations increase capacity of normal and neoplastic tissues to absorb ultraviolet light due to production of pentose nucleotides. BA 18-2154

4882

DISTURBANCE OF NUCLEIC ACID METABOLISM PRODUCED BY THERAPEUTIC DOSES OF X AND GAMMA RADIATIONS. III. INHIBITION OF SYNTHESIS OF THYMONUCLEIC ACID BY RADIATION. J. S. Mitchell. Brit. J. Exptl. Pathol. 23(6), 309-13(1942).

Study with microphotometer indicates that x and γ rays in therapeutic doses inhibit thymonucleic acid synthesis in nuclei of neoplastic tissues, allowing ribonucleotides to accumulate in cytoplasm. BA 18-2155

4883

CHARACTERISTICS OF A LIPOSARCOMA GROWN IN VITRO. Margaret R. Murray and Arthur Purdy Stout. Am. J. Pathol. 19(5), 751-60(1943).

Explants were made of a myxoid type liposarcoma which developed in the forearm of a 64 yr old negro, and metastasized to upper arm. Explants grew readily and were maintained for 51 days. X-irradiation of cultures with light doses had little effect but heavier dosages lengthened lag period before growth began, produced greater numbers of bizarre cells incapable of reproduction and profoundly affected the nutrition of cells. BA 18-913

4884

TISSUE CHANGES PRODUCED IN C_3H MICE BY 50 R WHOLE BODY EXPOSURE. A. Nettelshp. Radiology 42(1), 64-70(1944).

Whole body exposure of C₃H mice to 50 r/air of hard x rays produced these tissue changes: swelling and eosinophilic staining of cell cytoplasm with reduced nuclear staining; cell destruction within lymph node follicles; lymphopenia; reduction of mitotic rate and destruction of spermatogenic cells with slow return to normal. Changes were small and are considered to be threshold irradiation effects. BA 18-10045

4885

CELLULAR CHANGES IN LYMPH NODES OF EXPERIMENTAL MICE WITH SPECIAL REFERENCE TO PLASMA CELL DEVELOPMENT. L. Dorothy Parsons. J. Pathol. Bacteriol. 55(4), 397-407(1943).

Occurrence of generalized plasmacytosis in glands of x-irradiated and tumor-bearing mice is described. Fixed reticulum cells proliferating in these lymph nodes are suggested as direct precursors of plasma cells. BA 18-6500

4886

EFFECTS OF RADIATION ON WORKERS. Ralston Paterson. Brit. J. Radiol. 16(181), 3-5(1943).

Author presents a summary of known information and a plea for an extensive and authoritative study of the subject. BA 18-1011

4887

ATOM TRANSFORMATION AND MEDICINE. A. Pickhan. Deut. med. Wochschr. 67(32), 871-3(1941). (In German).

Biologic results of exposure to fast neutrons, and physiologic applications of artificially radioactive elements are discussed. BA 18-2156

4888

THE INFLUENCE OF X-RAYS ON THE MATURATION OF GRANULOCYTES. Von Norbert Piechl. Folia Haematol. 66(1), 41-7(1942). (In German).

Abnormalities in maturation of granular leucocytes were observed following a 3000 r x-ray dose. Sternal puncture demonstrates early segmentation of myelocytes following irradiation of sternum. The effect is local. BA 18-2157.

4889

THERAPEUTIC USES OF THORIUM X. J. Plesch. Lancet 2, 653(1943).

Note is made of research from 1909-1912. BA 18-10551

4890

RADIATION THERAPY IN CARCINOMA OF THE RECTUM AND SIGMOID. AN EXPERIMENTAL STUDY OF THE "DANGER" DOSE OF ROENTGEN RAYS FOR THE INTESTINAL MUCOSA IN DOGS AND AN ANALYSIS OF 195 CASES TREATED IN THE STATE OF WISCONSIN GENERAL HOSPITAL DURING 1928-38. E. A. Pohle, J. B. McAneny, and B. K. Lovell. Radiology 41(3), 225-32(1943).

Single dose of 900 r (175 kv, 15 ma, 0.5 mm Cu + 1.0 mm Al, 50 cm, 40 r/min) (effective in normal intestinal mucosa of dogs) can be tolerated without serious damage; 1300 r (effective in intestinal wall) caused obstruction, perforation, generalized peritonitis, and death. BA 18-4598

4891

EFFECT OF X-RAYS ON THE RATE OF EGG-LAYING IN *DROSOPHILA MELANOGASTER* RACE KALYAN. S. S. Prabhu and M. S. Dalal. J. Univ Bombay 12(3), 33-46(1943).

Closely inbred flies, maintained under optimal conditions, were treated with either 800 or 2400 r. In the majority of treated flies no significant effect on rate of egg-laying was observed. A few flies were obtained that either laid no eggs or eggs of abnormal appearance, due to defects produced in flies by x-ray treatment. BA 18-9859

4892

CHANGES IN THE DISTRIBUTION OF POTASSIUM AND CALCIUM IN THE HISTOLOGICAL PICTURE OF THE LIVER AND KIDNEY IN TOTALLY IRRADIATED DOGS. Norbert Preminger. Berne. Dissertation. 1940, 15p. (In German). BA 18-21150

4893

EFFECT OF ROENTGEN IRRADIATION ON THE HORMONE CONTENT AND SECRETION OF THE ADRENAL MEDULLA. W. Raab and A. B. Soule, Jr. Radiology 41(1), 56-60(1943).

Rats, anesthetized with Nembutal, were x irradiated with single doses of 100 r or 1000 r (200 kv, 20 ma, 0.5 mm Cu, and 2.0 mm Al filtration) on the back over the adrenal area. Hormone content, determined by a modification of Shaw's colorimetric determination of "adrenalin," showed no significant change in glands within 68 hr postexposure. After 68 days there was an indication of diminished secretory activity following a dose of 100 r; similar decrease with slightly diminished hormone production after irradiation with 1000 r. BA 18-558

4894

THE EFFECT OF X-RAYS ON THE MITOTIC ACTIVITY OF EXPLANTED BONE MARROW. M. Rachmilewitz, A. Rosin, G. Goldhaber, and L. Doljanski. Proc. Soc. Exptl. Biol. Med. 59(2), 129-31(1945).

X-irradiation (250, 500, 1000, 2500, 5000 r) of rabbit bone marrow cultures produced at first a profound decrease in number of mitoses. With doses of 1000 r and less, mitotic decrease was followed by complete recovery of mitotic activity. With doses of 2500 r or more, recovery of mitosis was incomplete and irradiation resulted in aplasia of the bone marrow. BA 19-21129

4895

MOVEMENT, AGGLUTINATION, BRIDGES AND DISTENTION OF THE CHROMOSOMES IN MITOSIS. Flavio Resende. Bol. soc. Broteriana 15(2A ser.), 163-200(1941).

In *Aloe striata* X *saponaria* treated with x rays, a limited area in one plant was found to have completely asymmetric anaphases, lagging chromosomes, and the chromosomes were longer than in untreated tissues. BA 18-15355

4896

EFFECT OF ROENTGEN IRRADIATION ON CAPILLARY PERMEABILITY AND INFLAMMATION IN THE SKIN OF THE RABBIT. R. H. Rigdon and Howard Curl. Am. J. Roentgenol. Radium Therapy 49(2), 250-7(1943).

Small shaven areas on sides and back of adult rabbits were irradiated with 680-2720 r of 86 kv unfiltered x rays. Areas irradiated 1 hr or less prior to intravenous administration of trypan blue became blue; areas irradiated 3 hr or more before injection showed no dye accumulation. Effect is attributed to irradiation-induced changes in cell permeability. BA 18-227

4897

METABOLIC CHANGES OCCURRING AS THE RESULT OF DEEP ROENTGEN THERAPY. II. THE EFFECT OF 1,000 KILOVOLT ROENTGEN THERAPY. J. E. Robertson. Am. J. Roentgenol. Radium Therapy 50(3), 392-9(1943).

Seven patients were subjected to study of N and chloride metabolism before, during and after 1000 kv x-ray therapy. N studies show increase in total and uric acid N excretion resulting from x raying, followed by period of retention or diminished excretion after cessation of treatments. Negative chloride balance was seen less frequently in cases given 1000 kv than in those given 200 kv therapy. Chloride change is believed to be a secondary effect, due to disturbed water balance. BA 18-4189

4898

ACCEPTED STANDARDS IN RADIOLOGICAL PROTECTION. S. Russ. Brit. J. Radiol. 16(181), 6-7(1943).

Great need is expressed for investigation of blood changes as warning to x-ray dangers. Author proposes 10^{-10} curies/liter as allowable Rn content in Ra workshops and luminous material factories. BA 18-228

4899

BOTANY: PROGRESS OF BOTANY WITH SPECIAL REFERENCE TO ECONOMIC PLANTS. T. S. Sabnis. Science and Culture (India) 9(8), 358(1944).

Progress in improvement of economically important plants has been made by use of irradiation with controlled dosages of visible, infra-red, x rays, and ultraviolet rays. BA 18-15381

4900

MALIGNANCY SUBSEQUENT TO IRRADIATION OF THE UTERUS FOR BENIGN CONDITIONS. Lewis C. Scheffey. Am. J. Obstet. Gynecol. 44(6), 925-51(1942).

Author reports 20 new cases of uterine malignancy occurring after irradiation for supposedly benign conditions. Time between radiation and discovery of malignancy was 2-11 yr, carcinoma was squamous cell in type. BA 19-2745

4901

FURTHER RADIOBIOLOGICAL STUDY WITH DROSOPHILA PUPAE. Maximilian Schweigert. Berne, Dissertation. 1939. 16p. (In German).

With x rays (time ratio 1:4), time factor (rate of administering a given dose) is 0.67, for unfiltered ultraviolet, considering experimental errors, no time factor exists. Hard β rays, when relating to the same ionization and considering the time factor, present the same lesion rates as respective amounts of x or γ rays. BA 18-21004

4902

MYELOMALACIA OF THE CERVICAL PORTION OF THE SPINAL CORD, PROBABLY THE RESULT OF ROENTGEN THERAPY. Lewis D. Stevenson and Robt. E. Eckhardt. Arch. Pathol. 39(2), 109-12(1945).

Signs of transverse myelitis developed in region of fourth cervical segment about 2 years after intensive radiation therapy in the cervical region. Myelitis progressed and terminated fatally in this patient. BA 19-21130

4903

X-RAY AND ULTRAVIOLET STUDIES ON POLLEN TUBE CHROMOSOMES. I. THE EFFECT OF ULTRAVIOLET (2537 Å) ON X-RAY INDUCED CHROMOSOMAL ABBERATIONS. C. P. Swanson. Genetics 29(1), 61-8 (1944).

Treatment of pollen tube chromosomes with ultraviolet tends to increase resistance of chromosomes to x-ray breakage. Effect is most pronounced if ultraviolet is given prior to x rays. Degree of inhibition increases with dose of ultraviolet. Post-x-ray treatment with ultraviolet does not alter x-ray production of double deletions, may effect single deletions and translocations depending on time of treatment. Ultraviolet is believed to facilitate restitution of broken ends. BA 18-9842

4904

EXPERIMENTS WITH X-RAY TREATMENTS ON THE SEEDS OF CERTAIN CROP PLANTS. Wendell Russel Tascher. Univ. of Michigan, Thesis. 1929. (Microfilm available from University Microfilms, Ann Arbor, Michigan.)

Dormant and germinating seeds were x rayed with different intensities of continuous and intermittent doses and at different temperatures. LD_{50} for 24 field crops (8 botanical families) varied from 4000-85,000 r. Effect of stage of germination and of temperature and species differences on radiosensitivity were studied.

Morphological and some physiological effects of irradiation are described. BA19-3676

4905

X-RAY INDUCED MUTANT STRAINS OF ESCHERICHIA COLI. E. L. Tatum. Proc. Natl. Acad. Sci. U. S. 31(8), 215-19(1945).

Following a second x-ray treatment with 180,000 r of two mutant strains of E. coli, 16 new mutant strains were obtained from 1741 single colony isolations. Only one mutant was obtained from 1902 isolations from unirradiated material. (Mutants had altered growth-factor requirements.) BA 19-22054

4906

THE HISTOPATHOLOGY OF RADIATION LESIONS. Shields Warren. Physiol. Rev. 24(2), 225-38(1944).

A review (35 references), dealing with therapeutic types of radiation, electromagnetic, corpuscular (including radioisotopes), and neutron. Uses described and mode of action of radiation on cells, tissues and entire organism is analyzed. BA 18-18746

4907

TREATMENT OF THE SO-CALLED ROENTGEN SICKNESS WITH DESOXYCORTICOSTERONE. Ursula Weichert. Strahlentherapie 71, 127(1942).

Treatment of patients with desoxycorticosterone resulted in immediate improvement in almost all cases. Roentgen sickness, which resembles Addison's disease in many ways, is considered to be due to adrenal insufficiency and to result from increased protein destruction by radiation. BA 18-560

4908

RADIATION AND PLANT RESPIRATION. Robert L. Weintraub. Botan. Rev. 10(7), 384-459(1944).

Author reviews and discusses: effects of visible radiation on respiration, effects of nonvisible radiation, mechanism of radiation effects on respiration. Experiments with many types and parts of plants are described and evidence arising from numerous methods of approach is summarized. BA 18-22899

4909

DOMINANT LETHALITY AND CORRELATED CHROMOSOME EFFECTS IN HABROBRACON EGGS X-RAYED IN DIPTOTENE AND IN LATE METAPHASE. I. Anna R. Whiting. Biol. Bull. 89(1), 61-71(1945).

Unlaid eggs x rayed in diptotene (LD_{100} 45,000 r) and allowed to develop parthenogenetically show fragments, bridges, or both in division I, either or both in division II. Bridges in division I may be permanent. Unlaid eggs x rayed in late metaphase I (LD_{100} 1400 r) show fragments but no bridges in division I, bridges, fragments, or both in division II. BA 19-20974

4910

THE QUESTION OF THE INFLUENCE OF HEAVY MAGNETIC FIELDS ON THE BIOLOGICAL EFFECT OF ROENTGEN RAYS AND ULTRA-VIOLET LIGHT. Renate Wilbrandt. Radiol. Clin. 9(3), 143-51(1940). (In German).

Naked eye and microscopic examination after 1-2 days reveal that arrested growth produced by x rays and ultraviolet rays on bacteria (Bacillus prodigiosus) is not influenced by a magnet applied at right angles to the rays during radiation. Any marked effect of the magnetic field can, therefore, be excluded. BA 18-18747

4911

THE RADIOSENSITIVITY OF EGGS OF ARBACIA PUNCTULATA IN VARIOUS SALT SOLUTIONS. Karl M. Wilbur and Richard O. Recknagel. Biol. Bull. 85(3), 193-200(1943).

Treatment of A. punctulata eggs with 0.35 M K citrate reduced x-ray-induced inhibition of cell division slightly, mainly at high doses (30,400 and 53,200 r).

Radiosensitivity was unaffected by increasing Ca or Mg content of seawater medium. X-ray doses which markedly altered rate and normal course of cell division produced no detectable change in viscosity of unfertilized egg. BA 18-6642

4912

THE FREQUENCY OF X-RAY-INDUCED CHROMATID BREAKS IN TRADESCANTIA AS MODIFIED BY NEAR INFRARED RADIATION. C. P. Swanson and Alexander Hollaender. Biol. Bull. 91(2), 242(1946).

Abstract. BA 21-5115

4913

X-RAY INDUCTION OF CHROMOSOME MUTATIONS IN D. MELANOGASTER. II. THE FREQUENCY OF PRIMARY BREAKS ACCORDING TO STUDIES ON THE RING-X-CHROMOSOME. Hans Bauer. Z. Zellforsch. u. mikroskop. Anat. Abt. B. Chromosoma; Z. Zellkern-u. Chromosomenforsch. 2(4), 407-58(1942). (In German). NSA 10-7401

4914

THE BEHAVIOR OF CHROMOSOMES OF A. MEGALOCEPHALA AFTER X-IRRADIATION. Hans Bauer and Jean Le Calvez. Z. Zellforsch. u. mikroskop. Anat., Abt. B. Chromosoma; Z. Zellkern-u. Chromosomenforsch. 2(6), 593-617(1944). (In German).

Chromosomes of A. megalcephala eggs fragment after x irradiation. Fragments show no tendency to rejoin, but exhibit same behavior as natural ends of normal chromosomes. Chromosomes become irregularly shaped and are crowded together during meta- and anaphases after strong irradiation. BA 21-5123

4915

INDUCTION OF ZYGOTIC-LETHAL MUTATIONS IN P. FENESTRALIS BY X-RADIATION OF SPERM. Hans Bauer and Witta Lerche. Z. Zellforsch. u. Mikrosk. Anat., Abt. B. Chromosoma; Z. Zellkern-u. Chromosomenforsch. 2(5), 482-92(1943). (In German).

P. fenestralis females were fertilized by irradiated males. Death rate depends on dose; lethality curve indicates 25% mortality due to induced dominant lethal gene mutations or to single chromosome breaks, 75% due to multiple chromosome breaks. Mutation rate in Phyryne is much higher than that in Drosophila. BA 21-5124

4916

THE EFFECT OF ROENTGEN RADIATION ON PROTOPLASMIC VISCOSITY DURING MITOSIS. Walter L. Wilson. Biol. Bull. 91(2), 229(1946).

Viscosity of irradiated Arbacia punctulata ova fertilized with irradiated sperm, or of irradiated ova fertilized with un-irradiated sperm, remains high two-three times longer than in normal ova fertilized with normal sperm. BA 21-5143

4917

THE BEARING OF RADIATION EXPERIMENTS ON THE SIZE OF THE GENE. D. E. Lea and D. G. Catcheside. J. Genetics 47(1), 41-50(1945).

Authors dismiss objections to target theory. Gene size of Drosophila is estimated at 4-8 μ diameter, length of euchromatic region of X chromosome in sperms is deduced to be 10-20 μ . BA 21-5145

4918

THE INFLUENCE OF NUTRITION ON THE PRODUCTION OF MUTATIONS. H. Stubbe. Scientia Genet. (Torino) 1(4), 370-84(1940). (In Italian).

Plants grown in absence of P, when x-irradiated (600 r), exhibited a higher mutation rate than plants which had received normal nutrition and same x-ray dose. BA 21-5163

4919

CONTRASTS BETWEEN VISIBLE AND DOMINANT LETHAL MUTATION RATES IN X-RAYED HABROBRACON

EGGS. Anna R. Whiting and H. C. George. Biol. Bull. 91(2), 214(1946).

Abstract. BA 21-5188

4920

INCREASE IN INCIDENCE OF PULMONARY TUMORS IN STRAIN A MICE FOLLOWING LONG-CONTINUED IRRADIATION WITH γ -RAYS. Egon Lorenz, Walter E. Heston, Margaret Deringer, and Allan B. Eshenbrenner. Cancer Research 6(9), 485-6(1946).

Abstract. BA 21-5925

4921

ON SOME QUESTIONS OF THE ORIGIN OF SPECIES. E. Heitz. Arch. Julius Klaus-Stift. Vererbungsforsch. Sozialanthropol. u. Rassenhy. 19(3/4), 510-28(1944). (In German).

Numerous mutations were obtained by x-raying Pellia neesiana. Most of the clones with chromosome translocations showed no morphological change from normal even after long cultivation, indicating that gene changes are generally not position effects. BA 21-7945

4922

CHROMOSOME BREAKAGES AND REARRANGEMENTS INDUCED BY X-RAYING. A. Camara. Scientia Genet. (Torino) 1(4), 339-53(1940). (In Spanish).

Chromosome mutations in Aloe arborescens, produced by x-ray dosages ranging from 100-700 r, reveal that there are weak points in the chromosomes where breakage is more likely. As a rule breakage takes place first and is followed by reunion of broken ends. Translocations may occur as consequence of chromatic bridges. BA 21-7957

4923

PRODUCTION OF BIOCHEMICAL MUTATIONS IN PENICILLIUM. David Bonner. Am. J. Botany 33(10), 788-91(1946).

Each of 398 mutant strains of P. notatum-chrysogenum produced by ultraviolet or x rays differed from the parent strain by having one additional nutritional requirement. Individual requirements include vitamins, biotin, choline, inositol, nicotinic acid, p-amino-benzoic acid, pyridoxine, thiamine, and several amino acids. BA 21-7991

4924

FREQUENCY OF RECESSIVE LETHALS INDUCED IN DROSOPHILA BY NEAR INFRA-RED RAYS AND X-RAYS. Berwind P. Kaufmann and Helen Gray. Anat. Record 96(4), 530(1946).

An abstract. BA 21-8020

4925

DOMINANT LETHALS INDUCED BY X-RAYS IN SPERM OF THE WASP MELITTobia SP. (C). Jean Kerschner. Anat. Record 96(4), 60(1946).

An abstract. BA 21-8021

4926

X-RAY MUTATIONS IN THE GIANT MULTINUCLEAR AMEBA, CHAOS CHAOS LINN. A. A. Schaeffer. Anat. Record 96(4), 531(1946).

An abstract. BA 21-8029

4927

ANDROGENETIC MALES FROM EGGS X-RAYED WITH DOSE MANY TIMES LETHAL. Anna R. Whiting. Anat. Record. 96(4), 11-12(1946).

An abstract. BA 21-8032

4928

A STRONGLY INTERSEXUAL FEMALE IN HABROBRACON. P. W. Whiting. Biol. Bull. 91(3), 243-6(1946).

This specimen, more strongly intersexual than a group previously reported, lacks gonads and has defective poison apparatus. It is the third type of Habrobracon intersex reported. X-radiation may have modified a sexallele, resulting in an intersexual heterozygote rather than a normal male. BA 21-8033

4929

ACTION OF VARIOUS IONIZING RADIATIONS ON THE YEAST *SACCHAROMYCES ELLIPSOIDEUS*. M. Frilly and R. Latarjet. *Compt. rend.* 218, 480-1(1944). (In French).

4930

PHYSIOLOGICAL ABERRATIONS FOLLOWING TOTAL BODY IRRADIATION OF DOMESTIC ANIMALS WITH LARGE DOSES OF GAMMA RAYS. J. H. Rust, B. F. Trum, and U. S. G. Kuhn III. *Vet. Med.* 49, 318(1954).

Physiological changes in mules exposed to whole body irradiation are described and include: brain edema, gliosis, prolonged blood clotting time, leukopenia, abnormal cardiac rhythm, interference with oestrus cycle and marked changes in respiratory quotient.

4931

PROTECTIVE ACTION OF DESOXYCORTICOSTERONE ACETATE AGAINST X-RAY-INDUCED LIVER CHANGES. Friedrich Ellinger. *Science* 104(2709), 502-3(1946).

Mice were exposed to total-body x irradiation (200 kv, 10 ma, 0.25 mm, Cu plus 1.0 mm Al filters, 50 cm distance, 20 x 20 cm field, 23.4/min, HVL 0.75 mm Cu) of 500 and 1000 r/air in 1 exposure or in daily doses of 100 r. Daily doses of 0.25 or 0.5 mg DOCA were given subcutaneously 6 times weekly, total doses of 2.5-8.0 mg given in 10-19 days. Striking reduction in amount of fat was observed in livers of animals x rayed and DOCA-treated when compared with those x rayed only. BA 21-8492

4932

TREATMENT OF RADIATION SICKNESS WITH TRASENTINE AND TRASENTINE-PHENOBARBITAL: PRELIMINARY REPORT. J. C. Glenn Jr. and R. J. Reeves. *Radiology* 47(4), 392-6(1946).

Of 65 patients 39 were completely relieved of symptoms, 6 showed no relief after administration of trasentine-phenobarbital (three 75 mg tablets 4 times a day up to totals of 1000 mg). BA 21-8696

4933

PERORAL ADMINISTRATION OF VITAMIN B₆ (PYRIDOXINE HYDROCHLORIDE) IN THE TREATMENT OF RADIATION SICKNESS. A. Oppenheim and Bjorn Lih. *Radiology* 47(4), 381-5(1946).

Fifty patients received 75-100 mg of pyridoxine $\frac{1}{2}$ hr before meals, 3-4 times/day. In 30 cases (60%) results were excellent, in 6 cases (12%), good, in 8 cases (16%), fair, and no results in 6 cases (12%) Symptoms were aggravated in one instance, dermatitis was produced in one instance. BA 21-8719

4934

THE USE OF PYRIDOXINE IN RADIATION SICKNESS. H. I. Van Haltem. *Radiology* 47(4), 377-80(1946).

A total of 81 patients received 25-50 mg pyridoxine intravenously. Excellent results were obtained in 44 cases (54%), good results in 28 cases (35%), and in 9 cases (11%), vomiting was not entirely relieved and a troublesome degree of nausea remained. BA 21-8746

4935

STUDIES IN VITRO ON THE PHYSIOLOGY OF CELLS. FACTORS AFFECTING THE DELAYED CYTOTOXIC ACTION OF X-RAYS. Robert Schrek. *J. Cellular Comp Physiol* 28(3), 277-304(1946).

Cell suspensions were studied after in vitro exposure to x rays and incubation under varying conditions. Cells studied included thymic cells of rabbit and kitten, lymphocytes, granulocytes. Effect of altered temperature and pH on radiosensitivity is described. BA 21-8995

4936

THE REPLACEMENT OF *p*-AMINO BENZOIC ACID IN THE GROWTH OF A MUTANT STRAIN OF *ESCHERICHIA*

COLL. J. O. Lampen, R. R. Roepke, and M. J. Jones. *J. Biol. Chem.* 164(2), 789-90(1946).

For growth of x-ray mutant strain of *E. coli*, *p*-aminobenzoic acid can be replaced by a combination of thymine, the purines and an amino acid mixture of which methionine is the most important component. Data indicate that at least with this organism, *p*-aminobenzoic acid functions in the synthesis of thymine, the purines, and one or more of the amino acids. BA 21-9127

4937

TEMPERATURE EFFECTS ON X-RAY-INDUCED CHROMOSOME ABERRATIONS. Karl Sax. *Genetics* 32(1), 75-8(1947).

Frequency of ring and dicentric chromosomes was more than double when *Tradescantia* microspores were irradiated at 3°C, compared with the same x-ray dosage at 36°C. Temperature differences had little or no effect on frequency of rod deletions. Subjection of microspores to high and low temperatures before or after irradiation produced no consistent differences in x-ray-induced aberrations. BA 21-10990

4938

AN "INVISIBLE" CHROMOSOME. M. Kodani and Curt Stern. *Science* 104(2713), 620-1(1946).

Chromosomal rearrangements in offspring from males of *D. melanogaster* which were x irradiated with doses of 4000 r are described. BA 21-10998

4939

EFFECTS OF TEMPERATURE DURING X-RADIATION ON *DROSOPHILA*. Edward D. King. *Genetics* 32(1), 93-4(1947).

An abstract. BA 21-11065

4940

DOSE-ACTION CURVES FOR X-RAY-INDUCED DOMINANT LETHAL AND VISIBLE MUTATIONS IN *HABROBRACON* EGGS. Anna R. Whiting and Bernice Goldis. *Genetics* 32(1), 112(1947).

An abstract. BA 21-11083

4941

X-RAY INDUCED PARATHIOTROPHY IN *OPHIOSTOMA*. Nils Fries. *Svensk Botan. Tidskr.* 40(2), 127-40(1946).

Of 94 x-ray induced physiological mutations in *O. multiannulatum*, 13 were parathiotrophic (unable to assimilate 6-valent S). BA 21-11019

4942

RADIATION SENSITIVITY OF BONE MARROW. Torfinn Denstad. *Acta Radiol. (Stockholm)* 22(3), 347-59(1941).

Response of bone marrow in patients treated with 125-3000 r and large amounts of radium was studied. Erythropoietic cells of bone marrow were found to be more radiosensitive than myelopoietic cells. X-ray effects are believed to be indirect. Total-body irradiation with small doses is believed to be the best therapy in blood dyscrasias (leukemia and polycythemia). An extensive review of the literature is included. BA 21-11293

4943

PITUITARY-ADRENAL CORTICAL CONTROL OF LYMPHOCYTE STRUCTURE AND FUNCTIONS AS REVEALED BY EXPERIMENTAL X-RADIATION. Thomas F. Dougherty and Abraham White. *Endocrinology* 39(6), 370-85(1946).

Authors suggest that x rays exert both direct and indirect effect on lymphocytes. Indirect effect is mediated via pituitary-adrenal cortical mechanism. BA 21-11299

4944

QUANTITATIVE HISTOLOGIC ANALYSIS OF THE EFFECT OF X-RADIATION ON THE INTERSTITIAL TISSUE OF THE TESTES OF LA₁ MICE. Allen B. Eschenbrenner and Eliza Miller. *J. Natl. Cancer Inst.* 6(6), 343-8(1946).

Exposure of mice to x rays sufficient to produce severe damage of spermatogenic elements resulted in a relative, not an absolute increase of interstitial tissue in testes. Chalkley's method for quantitative morphologic analysis was used. BA 21-11300

4945

ACTION OF RADIATIONS ON THE MALIGN TRANSFORMATIONS OF INFECTIOUS PAPILLOMA OF THE RABBIT. A. Lacassagne and G. Rudali. Bull. assoc. franc. etude cancer 30(2), 74-89(1942). (In French).

Rabbits x irradiated either before or after inoculation with Shope papilloma virus showed partial regression of papilloma but malignant changes occurred in the growths. Other rabbits given implantations of radon tubes in an already formed papilloma also showed induced malignant transformation. Authors do not favor the hypothesis that malignant change in infectious papilloma of the rabbit is due to direct action of the infectious agent.

4946

CLINICAL INVESTIGATION OF A COMPLICATION, FISTULA RECTO-VAGINALIS, AFTER RADIUM THERAPY OF CERVICAL CARCINOMA. A. M. Ritala. Acta Obstet. Gynecol. Scand. 26(2), 193-224(1946).

Of 160 cases of cervical carcinoma treated with Ra (standard doses 3000 mg hr intracervically plus 5000 mg hr intravaginally), 42% had slight to severe rectal symptoms. Following Ra therapy patients characteristically lost weight, developed hypochromic anemia, and often had ascending genital infections. BA 21-11678

4947

OCULAR EFFECTS OF RADIANT ENERGY. Charles F. Kutscher. Trans. Am. Acad. Ophthalmol. Otolaryngol. 1946, 230-40(1946). BA 21-11732

4948

THE BLOOD PLATELETS. THE RATE OF THEIR UTILIZATION IN THE CAT. John S. Lawrence and William N. Valentine. Blood. 2(1), 40-9(1947).

Radiated, thrombopenic cats were cross-circulated with normal cats to deliver normal platelets to the thrombopenic animal. Platelets disappeared from recipient's circulation at rate of 1600-28,000/ mm^3 /hr. Platelets from splenectomized donors disappeared twice as fast as the average for the group. BA 21-11764

4949

STUDIES ON DEFECTIVE DEVELOPMENT FOLLOWING X-RAY-RADIATION. I. APPLICATION OF SUBLETHAL DOSES. H. A. L. Trampusch. Acta Neerl. Morphol. 6(1/2), 43-58(1948).

X-ray dose of 100 r was lethal to decapsulated blastulae of *Amblystoma mexicanum*. Embryos with capsules were less sensitive and in them, the x ray effect was primarily inhibition of invagination of entoderm and mesoderm, the degree of inhibition being proportional to dose. A later effect is reduction in size of special sense organs and the head. This effect was also proportional to dose. BA 23-23987

4950

ORGANIZATION OF THE CHROMOSOME. I. BREAK DISTRIBUTION AND CHROMOSOME RECOMBINATION IN *DROSOPHILA MELANOGASTER*. Berwind P. Kaufmann. J. Exptl. Zool. 102(3), 293-320(1946).

Chromosome rearrangements obtained following x radiation of mature spermatozoa of *D. melanogaster* are described. BA 21-63

4951

RADIOACTIVATION OF COLLOIDAL GAMMA FERRIC OXIDE. M. Blau, H. Sinason, and O. Baudisch. Science 103(2687), 744-8(1946).

Reticulo-endothelial cells can be influenced and their antibody actions stimulated if colloidal γ iron oxide particles are combined with some therapeutically acting

material, such as certain radioactive substances. Method is described. BA 21-352

4952

ACTION OF INCREASING DOSES OF X-RAYS ON THE SEEDS OF *LYCOPERSICON ESCULENTUM* MILL. M. LeFort. Compt. rend 239, 1401-4(1954). (In French).

4953

A CLINICAL SYNDROME FOLLOWING EXPOSURE TO ATOMIC BOMB EXPLOSIONS. Paul D. Keller. J. Am. Med. Assoc. 131(6), 504-6(1946).

Signs of delayed illness in 21 patients exposed to atomic bomb explosions included: destruction or suppression of hemopoietic system, disturbed liver function, and increased erythrocyte sedimentation rate. There was evidence of extensive tissue destruction within body. BA 21-354

4954

ACTION OF RADIATIONS ON THE NORMAL CELL. Jacques Lavedan. Paris. Gauthier-Villars. 1945. 128p. (In French).

Author emphasizes the importance of effects of ionizing radiation (x rays, α , β , and γ rays). BA 21-355

4955

THE PROBABILISTIC APPROACH TO THE EFFECTS OF RADIATIONS AND VARIABILITY OF SENSITIVITY. I. Opatowski. Bull. Math. Biophys. 8(3), 101-19(1946).

Calculation of size of the sensitive volume in irradiated biological systems is discussed from the viewpoint of the probabilistic theory of these phenomena, based on concept of random "effective events". "Mean life" (a measure of radioresistance) under radiation of 1r/min is calculated for processes with and without recovery. The case of variable sensitivity is also discussed. BA 21-356

4956

ON THE PARTIAL INHIBITION OF NUCLEIC ACID FORMATION PRODUCED BY ROENTGEN RAYS. L. Ahlstrom, H. v. Euler, and G. V. Hevesy. Arkiv Kemi 18B(13), 1-5(1945). (In German).

Jensen rat sarcoma was x irradiated and radioactive P as Na_3PO_4 was injected. Two hours later, radioactive nucleic acid P was determined as a measure of new nucleic acids formed during this time and indicated that nucleic acid formation was decreased about two-thirds. BA 21-821

4957

RESERPIN FACTOR IN CANCER IN RELATION TO THE RETICULO-ENDOTHELIAL SYSTEM. H. C. Connel. L. A. Munro, and A. Medley. Can. Med. Assoc. J. 54(2), 161-4(1946).

X-ray therapy has an effect on reticulo-endothelial system. Weak doses stimulate and high doses damage the system as indicated by congo red index. BA 21-839

4958

EXPERIMENTS ON RAY SENSITIVITY AND RAY TREATMENT OF SYMPATHOGONIOMA (*NEUROBLASTOMA SYMPATHICUM*). Abdul Rahman Patschadj. Strahlentherapie 70, 26(1941). (In German). BA 21-885

4959

COMPARISON OF THE PRIMARY ACTIONS OF X-RAYS AND U.-V. ON THE PARADYSENTERY BACILLUS Y6R. Raymond Lataret. Ann. inst. Pasteur 69(7/8), 205-14(1943). (In French).

No difference was detected in survival of bacteria following exposure to x or ultraviolet rays. Dose allowing 50% survival is 225 ergs/ mm^2 (200 ergs for *E. coli*). Theoretical deductions on action of both radiations are presented. BA 21-1187

4960

EVALUATION OF THE SIZE OF THE VIRUS OF HOOF AND MOUTH DISEASE BY ALPHA RADIATION. P. Bonet-Maury. Ann. Inst. Pasteur 69(1/2), 22-6(1943). (In French).

Using α irradiation methods, the virus of foot-and-mouth disease was shown to have diameter of 20-40 μ , contrasted to the 10-20 μ dimension shown by classical ultra-filtration studies. Results indicate relation between virulence of virus and size of particles after irradiation. BA 21-1312

4961

ACTION OF ALPHA RADIATION OF RADON ON THE VIRULENCE AND ANTIGENIC POTENTIAL OF VACCINIA VIRUS. C. Levaditi and R. Perault. Am. Inst. Pasteur 69(5/6), 139-45(1943). (In French).

Under influence of large α -ray doses, vaccinia virus loses its activity and its antigenic properties. Smaller doses do not wholly destroy immunizing properties. BA 21-1325

4962

THE RATE OF INDUCTION OF DOMINANT LETHALS IN *DROSOPHILA MELANOGASTER* SPERM BY X-RAYS. D. G. Catcheside and D. E. Lea. J. Genetics 47(1), 1-9(1945).

Dominant lethals were induced in Oregon-R wild type and in w mutant flies by 5 x-ray doses ranging from 1124-11,420 r. Found: at low doses 12% per 1000 r for death in embryo stage and 20% per 1000 r for death at stages between zygote and adult. At higher doses both rates increased. The dose-action curve fits (approximately) the single-hit type of action only at low doses. Ratio of females to males declines 2.5% per 1000 r. BA 21-2553

4963

DOMINANT LETHALS AND CHROMOSOME BREAKS IN RING X-CHROMOSOMES OF *DROSOPHILA MELANOGASTER*. D. G. Catcheside and D. E. Lea. J. Genetics 47(1)25-40(1945).

Ring X-chromosomes were treated with 4000 r of x rays and results of cytological analysis are presented. BA 21-2554

4964

THE RELATION BETWEEN RECESSIVE LETHALS, DOMINANT LETHALS, AND CHROMOSOME ABERRATIONS IN *DROSOPHILA*. D. E. Lea and D. G. Catcheside. J. Genetics 47(1), 10-24(1945).

Authors develop the theory that radiation-induced recessive lethals are all, or in very large part, due to chromosome breaks. About 1/3 of primary breaks are lethal. Quantitative theory of dominant lethals is also developed. BA 21-2558

4965

RADIATION EFFECTS OF THE ATOMIC BOMB AMONG THE NATIVES OF NAGASAKI, KYUSHU. James S. P. Beck and William A. Meissner. Am. J. Clin. Pathol. 16(9), 586-92(1946).

Clinical observations made 6-7th wk after bombing showed anemia, neutropenia and thrombocytopenia due to depression of marrow. In 7 postmortem examinations, there was confirmatory evidence of bone marrow damage. Evidence of recovery of bone marrow was found both clinically and at post mortem examination. Histologic evidence of lipid depletion of cells of adrenal cortex was found. Aspermatogenesis was noted in some instances. BA 21-2788

4966

ACTION OF X-RAYS ON THE TRANSFORMATION OF NUCLEIC ACID IN JENSEN'S SARCOMA. H. v. Euler and G. v. Hevesy. K. Danska Videnskab. Selskab Biol. Medd. 17(8), 1-38(1942). (In German).

Studies using radioactive P showed that the amount of thymus nucleic acid synthesized in 2 hr corresponded to 2-3% of total nucleic acid in the tumor. Exposure of rat sarcomas to 1000 I. U. of x rays or to 450 r decreased RNA synthesis during experimental period from 1/2 to 1/3 only 5 of 45 sarcomas showed normal

nucleic acid metabolism after x irradiation. Irradiation had no influence on regeneration of acid-soluble P fractions. BA 21-2789

4967

FACTORS AFFECTING THE CYTOCIDAL ACTION OF X-RAYS IN VITRO. Robert Schrek. Cancer Research 6(9), 498(1946).

The 50% survival time of hemic cells in suspension, irradiated with 1000 r at various temperatures, was compared for that of unirradiated cells. BA 21-2790

4968

MUTATION BREEDING IN POLYPLOID CEREALS. J. MacKey. Acta Agr. Scand. 4, 549-557(1954).

In general, the frequency of mutants in the X_2 is higher at the polyploid level than the diploid chiefly on account of the tolerance of chromosome rearrangement at the former level.

4969

THE PATHOLOGIC EFFECTS OF AN INSTANTANEOUS DOSE OF RADIATION. Shields Warren. Cancer Research 6(9), 449-53(1946).

Chief physiologic and pathologic effects of radiation from atomic bomb; (1) effects of heat, producing primary thermal injury of flash burn type, and secondary thermal injuries due to induced fires; (2) effects of short-wave radiation and neutrons, paralleling closely the effects noted in studies of biologic effects of x rays. Immediate and delayed effects are described in detail. BA 21-2792

4970

THE PATTERN OF INJURIES PRODUCED BY THE ATOMIC BOMBS AT HIROSHIMA AND NAGASAKI. S. Warren and R. H. Draeger. U. S. Naval Med. Bull. 46(9), 1349-53(1946).

Individuals exposed to ionizing rays only (not to thermal effects), exhibited: subjective malaise and nausea, lymphocytopenia, injury to gonadal tissue and bone marrow, leukopenia, thrombocytopenia with hemorrhage and anemia. BA 21-3882

4971

COMPARISON OF THE PRIMARY EFFECTS OF X-RAYS AND ULTRAVIOLET ON THE GROWTH OF YEAST. Raymond Latarjet. Ann. Inst. Pasteur 70(9/10), 277-85(1944). (In French).

For both radiations the energy sufficient to stop division of the yeast was measured, and the amounts of energy proved comparable. Minimum volume to be hit, in order to stop reproduction, proved to be 1.32×10^{-16} ml, being a sphere of 64 μ diameter. BA 21-4425

4972

THE BIOCHEMISTRY OF THE MALARIA PARASITE. IV. THE IN VITRO EFFECTS OF X-RAYS UPON *PLASMODIUM GALLINACEUM*. Joseph Ceithaml and E. A. Evans, Jr. J. Infectious Disease 78(3), 190-7(1946).

Exposure of washed parasitized chicken erythrocytes to: 30,000 r in vitro destroyed infectivity and increased oxygen and glucose consumption appreciably, 10,000 r reduced infectivity with no apparent influence on respiration and glucose metabolism; 1000 r, no effect. Injection of irradiated parasitized erythrocytes (30,000 or 10,000r) conferred some degree of immunity to malaria. BA 21-4641

4973

CHANGES IN SENSITIVITY OF CHROMOSOMES TO X-RAY BREAKAGE DURING MICROSPOROGENESIS. A. H. Sparrow. Genetics 32(1), 106-7(1947).

Radiosensitivity curves for Trillium chromosomes show a gradual increase of sensitivity from early meiotic prophase up to metaphase I. Range of sensitivities is large (1-27) and high and low sensitivity stages, respectively, correspond to stages of high and low concentrations of DNA in the chromosomes. BA 21-13302

4974

THE FREQUENCY OF X-RAY-INDUCED CHROMATID BREAKS IN TRADESCANTIA AS MODIFIED BY NEAR INFRARED RADIATION. C. P. Swanson and Alexander Hollaender. Proc. Natl. Acad. Sci. U. S. 32(12), 295-302(1946).

Experiments are reported in which near infrared radiation combined with x rays significantly increased frequency of x-ray induced breaks and rearrangements in microspore chromosomes of Tradescantia. BA 21-13306

4975

CONSTITUTION OF THE SECOND CHROMOSOME OF DROSOPHILA MELANOGASTER AS INDICATED BY X-RAY ANALYSIS. John W. Gowen and Marie S. Gowen. Genetics 32(1), 89(1947).

An abstract. BA 21-13314

4976

CYTOLOGICAL AND EXPERIMENTAL STUDIES ON THE OOCYTES OF FRESH WATER PULMONATES. Ernest W. Hartung, Jr. Biol. Bull. 92(1), 10-22(1947).

Cytoplasmic pattern or ground substance inherent in oocyte was unaffected by x-ray doses below killing intensity. As dosage increased there was a decrease in number of eggs completing embryonic development, no decrease in number of eggs able to initiate development. BA 21-13315

4977

MODIFICATION OF THE FREQUENCY OF CHROMOSOMAL REARRANGEMENTS INDUCED BY X-RAYS IN DROSOPHILA. I. USE OF NEAR INFRARED RADIATION. Berwind P. Kaufmann, Alexander Hollaender, and Helen Gay. Genetics 31(4), 349-67(1946).

Frequency of x-ray-induced chromosomal rearrangements was detected by analysis of salivary gland chromosomes of *D. melanogaster* and was found to be affected by use of near infrared radiation (10,000 Å). BA 21-13316

4978

MODIFICATION OF THE FREQUENCY OF CHROMOSOMAL REARRANGEMENTS INDUCED BY X-RAYS IN DROSOPHILA. II. USE OF ULTRAVIOLET RADIATION. Berwind P. Kaufmann and Alexander Hollaender. Genetics 31(4), 368-76(1946).

Ultraviolet radiation (2537 Å) used subsequent to x rays in treatment of *D. melanogaster* spermatozoa effected a decrease (as compared with controls receiving equivalent x-ray dose) in frequency of chromosomal rearrangements. BA 21-13317

4979

MODIFICATION OF THE FREQUENCY OF CHROMOSOMAL REARRANGEMENTS INDUCED BY X-RAYS IN DROSOPHILA. III. EFFECT OF SUPPLEMENTARY TREATMENT AT THE TIME OF CHROMOSOME RECOMBINATION. Berwin P. Kaufmann. Genetics 31(5), 449-53(1946).

Near infrared radiation is reported to facilitate recombination among breaks induced by x rays. This effect is attributed to selective action on certain cellular components rather than to an extension of the range of temperature within which fertility and viability may be maintained. BA 21-13318

4980

MODIFICATION OF THE X-RAY INDUCED MUTATION RATE IN FUNGI BY PRETREATMENT WITH NEAR INFRARED. Alexander Hollaender and C. P. Swanson. Genetics 32(1), 90(1947).

A significant increase in x ray produced mutations in *Aspergillus terreus* and *Trichophyton mentagrophytes* was observed if spores were previously irradiated with infrared radiation with 7000-18,000 Å, with maximum effect at 10,000 Å. Infrared alone did not produce mutation. BA 21-13338

4981

THE PROBLEM OF HAPLOIDY. (CYTOGENETIC STUDIES ON NICOTIANA HAPLOIDS AND THEIR BEARING ON SOME OTHER CYTOGENETIC PROBLEMS.) Dontcho Kostoff. Bibliographic Genetica (Gravenhage) 13(1), 1-48(1941).

Author mentions increased frequency of haploids induced by x irradiation. BA 21-13340

4982

AFTER THE FIFTEENTH YEAR OF X-RAY TREATMENT OF TULIPS FOR PROMOTING MUTATIONS. W. E. de Mol. Landbouwk. Tijdschr. 1944(687), 173-90(1944).

Among 98 mutations observed in tulips treated with 100-200 r were: 32 of paler color than original, 18 darker, 5 mutating from violet to pink, 4 from pink to violet, 5 producing yellow plastids, 1 yellow producing anthocyan, 12 mutating leaf color, and 20 showing differently shaped flowers or combining different shape and color mutation. Five showed mosaic-like symptoms but it could not be determined whether this is really a virus disease. BA 21-13343

4983

A QUANTITATIVE STUDY OF PHENOCOPY PRODUCTION WITH MONOCHROMATIC ULTRAVIOLET IRRADIATION. Claude A. Villee. Biol. Bull. 92(1), 1-9(1947).

Effect of x rays and ultraviolet rays were compared with respect to phenocopy production in *Drosophila*. BA 21-13375

4984

MEDICAL EXPERIMENTS ON HUMAN BEINGS IN CONCENTRATION CAMPS IN NAZI GERMANY. Kenneth Mellanby. Brit. Med. J. 1947(4490), 148-50(1947).

Among experiments performed on humans in Nazi concentration camps was the sterilization of individuals with x rays. BA 21-13475

4985

PYRIDOXINE HYDROCHLORIDE (VITAMIN B₆) IN THE CONTROL OF RADIATION SICKNESS: PRELIMINARY REPORT. L. D. Scott and G. J. Tarleton. Radiology 47(4), 386-91(1946).

None of 20 patients, irradiated for therapy of various malignant tumors and who also received 25 mg of pyridoxine intravenously, developed nausea or vomiting. BA 21-14334

4986

OBSERVATIONS ON THE EFFECT OF IRRADIATION IN CHRONIC ACQUIRED HEMOLYTIC ANEMIA EXHIBITING HEMOLYTIC ACTIVITY FOR TRANSFUSED ERYTHROCYTES. Robert S. Evans and Rose T. Duane. Blood 2(1), 72-84(1947).

Splenectomy in a 58 yr old woman with chronic, acquired hemolytic anemia was followed by a temporary remission for 18 mo. Irradiation of mediastinal and periaortic nodes was followed by a fall in leucocyte and lymphocyte counts and lessened hemolysis after blood transfusion. BA 21-14359

4987

THE COMBINED EFFECT OF COLCHICINE AND X-RAYS ON THE GROWTH OF ALLIUM CEPA SEEDS. A. Back. Growth 10(4), 375-80(1946).

X-ray doses of 2000 r applied to seeds previously treated with colchicine inhibits linear growth of onion seedlings by 20%. Either treatment alone has no effect on growth. Inhibition is explained on the assumption that colchicine provokes nuclear changes (e.g., polyploidy), thus sensitizing a considerable number of cells to x irradiation. BA 21-15573

4988

THE ABSORPTION OF BETA-RAYS IN PLANT LEAVES AND IN WOOD. S. Prat. Vestník Kralov. Ceske Spolecnosti Nauk, Trida Mat. -prirod 1940(9), 22(1940).

Penetrability of plant tissues by β rays was studied. Plants used: Tradescantia, Aucuba japonica, Abutilon thompsoni, Oplismenes, Adiantum capillus veneris, and Allium cepa. BA 21-15576

4989

INVESTIGATION ON THE BIOLOGIC EFFECT OF SHORT WAVE RADIATION OF ELEMENTS. II-V. INVESTIGATION OF THE BIOLOGIC EFFECT OF PENETRATING RADIATION OF THE ELEMENTS. Daniel Feher. Erdeszeti Kiserletek 45(1/4), 341-60, 162-8(1945). (In German).

Author describes chemical elements known at that time which develop biologically effective, penetrating radiation. From results of radiation experiments with plants, author postulates that living cells of roots absorb radiation and transmit it to tissues and organs that influence growth. BA 21-15530

4990

INCREASE IN INCIDENCE OF LUNG TUMORS IN STRAIN A MICE FOLLOWING LONG-CONTINUED IRRADIATION WITH GAMMA RAYS. Egon Lorenz, Walter E. Heston, Margaret K. Deringer, and Allen B. Eschenbrenner. J. Natl. Cancer Inst. 6(6), 349-53(1946).

Strain A mice of both sexes were exposed daily for 8 hr to radiation (8.8 r of γ) and were killed after 9½ mo of daily exposure (total dose 2500 r $\pm$ 10%). Incidence of pulmonary tumors was approximately 50% higher in experimental mice than in controls. BA 21-16583

4991

ROENTGEN IRRADIATION OF TULIPS AND HYACINTHS FOR THE PRODUCTION OF SOMATIC MUTATIONS. Willem Eduard de Mol. Z. Pflanzenzucht. 26(3/4), 353-403(1944). (In German).

Many somatic mutations produced in tulips and hyacinths are first manifested as sectors and after some years of propagation may be isolated as new clones. X-ray-induced mutations are apparently same as those arising spontaneously. Exposure may activate mosaic virus. BA 21-16315

4992

THE ACTION OF ULTRA-HARD ROENTGEN RAYS ON DROSOPHILA EGGS. D. den Hoed and A. G. Stoel. Acta Radiol. 21, 591-6(1940).

Ultra-hard x rays generated at 825 kv have smaller lethal action than the commonly used 180 kv x rays. No explanation for the observation was found. BA 21-16334

4993

EXPERIMENTS WITH X-RAYS ON COCK SPERMS IN REGARD TO MOTILITY AND FERTILITY. K. J. Johansson. Acta Agr. Suecana. 1(3), 335-43(1946).

Cock sperm were x irradiated with doses of 305-24,000 r (1220 r/min). Less than 610 r had no effect on motility. Higher doses did not reduce motility immediately, but effect was evident after 1 hr. There was no effect on fertilizing capacity of sperm nor on hatchability of egg. BA 21-16336

4994

APPLICATIONS OF β RADIATION OF RADIOACTIVE SUBSTANCES ON THE CEREBRAL CORTEX OF THE CAT. S. de Carvalho. Portugallae Acta Biol. 1A(3), 175-84(1946). (In French)

Cerebral cortices of 17 normal cats were exposed to filtered β rays of Ra E. Only the more penetrating rays, which passed Al filters of 0.10-0.15 mm, gave rise to evident histologic lesions. BA 21-16581

4995

ACTIONS OF RADIATIONS ON LIVING CELLS. D. E. Lea. New York, Macmillan Co. 1947.

Biologic effects produced by x rays, γ rays, electrons, neutrons, and ultraviolet rays on Drosophila, maize, Tradescantia, viruses, bacteria, and Arabacia are described.

Target theory is discussed extensively. Extensive tabular and graphical data are presented. BA 21-16582

4996

THYROID IRRADIATION AND ITS EFFECT ON THE OVARIES. L. Gabbianelli. Pathologica 32(587), 350-63 (1940). (In Italian).

Small x-ray doses applied to thyroid gland of rabbits stimulated development of ovaries; large doses brought on rapid evolution of folliculi followed by immediate involution tending toward cystic degeneration. Results are discussed with reference to the practical field of gynecology. BA 21-16991

4997

THE EFFECTS OF X-RAYS ON A STRAIN OF EBERTHELLA TYPHOSA. Thomas H. Grainger, Jr. J. Bacteriol. 53(2), 165-72(1947).

A strain of Eberthella typhosa isolated from blood of typhoid patient was exposed to x rays of maximum characteristic radiation of 0.712 Å. Loss of motility and change in colony formation from smooth to intermediate form was observed. No organism survived longer than 4½ hr. BA 21-17520

4998

EFFECT OF RADIOACTIVE ELEMENTS UPON DEVELOPMENT OF THE ROOT-NODULE BACTERIA AND UPON THE ASSIMILATION BY THEM OF THE MOLECULAR NITROGEN OF THE ATMOSPHERE. A. A. Drobkov. Compt. rend. acad. sci. URSS 49, 224-6(1945).

Following elimination of Ra and other radioactive elements from nutrient medium, no root nodules are formed on peas. Addition of Ra is followed by development of root-nodule bacteria which assimilated nearly twice as much N as control. Weight of leaves, seeds, and roots increased; plants did not mature earlier than controls. BA 21-17817

4999

PRODUCTION OF STRUCTURAL CHANGES IN SOMATIC CHROMOSOMES OF DROSOPHILA MELANOGASTER. B. M. Slizynski. Nature 159(4028), 66-7(1947).

Either a 5-12 hr exposure to 400 r or exposure to vapor of allyl isothiocyanate produced structural changes in chromosomes of fully grown larval salivary gland. BA 21-18815

5000

THE IMPORTANCE OF THE TIME FACTOR IN THE PRODUCTION OF MUTATIONS BY RADIATION. Karl Eberhardt and Karl G. Zimmer. Fortschr. Gebiete Rontgenstrahlen 61, 176-80(1940). (In German).

Rate of x-ray-induced lethal sex-linked mutations does not depend on dose, while that of ray-induced chromosomal mutations does. Importance of these results for study of mechanism of "release" of mutations and for questions of hereditary lesions and for ray protection is discussed. BA 21-18816

5001

INFLUENCE OF X-RAYS ON RESPIRATION OF NUCLEI OF FOWL ERYTHROCYTES. A. Back and L. Bloch-Frankenthal. Proc. Soc. Exptl. Biol. Med. 66(2), 366-8(1947).

X-ray dose of 1 million r stimulates O₂ uptake of both whole fowl erythrocytes and their isolated nuclei. This dose increased O₂ uptake by nuclei to four times that of whole erythrocyte. Effect was masked when nuclei were suspended in fluids containing albumen or hemolyzed blood. BA 22-15740

5002

EARLY EFFECT OF X-RAYS ON OVARIES OF NORMAL AND ADRENALECTOMIZED RATS. M. Ickowicz. Proc. Soc. Exptl. Biol. Med. 66(3), 646-9(1947).

Adrenalectomy before x irradiation prevented the appearance of pycnotic lesions of cells in the granular layer of the ovarian follicles of rats. Lesions otherwise appeared 4 hr post-exposure. BA 22-15742

5003

STRUCTURAL CHANGES PRODUCED IN MICROSPORES OF *TRADESCANTIA* BY α -RADIATION. J. P. Kotval and L. H. Gray. *Genetics* 48(2), 135-54(1947).

Structural changes observed in chromosomes of *Tradescantia* after immersion of anthers in radon solution resemble those seen after x and γ irradiation; number increases linearly with dose. Changes involving incomplete fusion of broken ends were more numerous than had been observed after comparable exposures to other kinds of radiation. BA 22-15515

5004

EFFECT OF OXYGEN ON THE FREQUENCY OF CHROMOSOME ABERRATIONS PRODUCED BY X-RAYS. J. M. Thoday and John Read. *Nature* 160(4070), 608(1947).

Vicia faba roots were exposed on second day to 175-320 r, while either N_2 or air was bubbled through the medium. Inhibition of subsequent growth was much greater when radiation was delivered in presence of available O_2 . Microscopic study of root tip anaphases 8-12 hr. after irradiation showed more (90% vs 30%) aberrations (bridges or fragments) when irradiation had occurred in the presence of O_2 . BA 22-15524

5005

THE INFLUENCE OF X-RAYS AND NEAR INFRA-RED RAYS ON RECESSIVE LETHALS IN *DROSOPHILA MELANOGASTER*. Berwind P. Kaufmann and Helen Gay. *Proc. Natl. Acad. Sci. U. S.* 33(12), 366-72(1947).

Supplementary treatment of *D. melanogaster* spermatozoa with near infrared radiation does not increase frequency of x ray-induced recessive, sex-linked lethal mutations. Infrared rays are believed to facilitate recombination, at expense of restitution, among ends of chromosomes broken by ionizing radiation. BA 22-15531

5006

INDUCED REVERSIONS OF BIOCHEMICAL MUTANTS IN *NEUROSPORA CRASSA*. Norman H. Giles, Jr. and Esther Zimmer Lederberg. *Am. J. Botany* 35(3), 150-7 (1948).

Effects of various mutagenic agents in inducing adaptations of a number of biochemical mutants in *N. crassa* were studied. X-rays, radiophosphorus, and nitrogen-mustard have proved effective in inducing reversions of inositolless mutant. Genetic and physiological tests, particularly with inositolless mutant, indicate that these adaptations represent reverse mutations to the original wild type allele. BA 22-15545

5007

SPERMATOGONIAL CROSSING OVER BETWEEN THE THIRD CHROMOSOMES IN THE PRESENCE OF THE CURLY INVERSIONS OF *DROSOPHILA MELANOGASTER*. Maurice Whittinghill. *Genetics* 32(6), 608-14(1947).

Author studied the possibility of interchromosomal effects of several inversions upon x-ray induced (± 1000 or less) crossing over in male flies. Offspring of normal males were compared with those of males bearing inversions in 2nd or 3rd chromosome. BA 22-15587

5008

HEPARINEMIA (?) AN ANTICOAGULANT IN THE BLOOD OF DOGS WITH HEMORRHAGIC TENDENCY AFTER TOTAL BODY EXPOSURE TO ROENTGEN RAYS. J. Garrott Allen, Margaret Sanderson, Mary Milham, Alice Kirschon, and L. O. Jacobson. *J. Exptl. Med.* 87(1), 71-86(1948).

After lethal x-ray dose, blood of dogs may prolong clotting time of normal dog blood. Inhibitor substance behaves like heparin, and anti-heparin substances protect

against hemorrhage despite severe thrombocytopenia. BA 22-15739

5009

LOCAL INJURIES OF THE SKIN FROM THE ACTION OF DEUTERONS. Gerhard Schubert and Wolfgang Riezler. *Naturwissenschaften* 33(9), 285-6(1947). (In German).

Irradiation of a 0.5 cm² skin area in guinea pigs for 4-90 sec with deuterons (3.6 mev, tissue penetration -0.12 mm) caused no immediate gross morphologic alteration. Swelling, scabbing, and superficial ulceration were noted on following days, however. After healing, irradiated skin had irregular papillae, elastic fibers were absent. BA 22-15743

5010

MANAGEMENT AND TREATMENT OF EXPOSED PERSONNEL. J. E. Wirth. p. 264-275 of *Industrial Medicine on the Plutonium Project*. (NNEs IV-20). Robert S. Stone, ed. New York, McGraw Hill Book Co., Inc. 1951. (ch. 3761)

Maximum permissible level of exposure to radiation was 100 mr in any 24 hours. If washing failed to cleanse contaminated skin, then potassium permanganate solution followed by a solution of sodium acid sulfite sufficed. (Also used for open skin lesions). Recommendations for treatment of wounds and contamination through inhalation or ingestion are included.

5011

RADIOACTIVITY UNITS AND STANDARDS. R. D. Evans. *Nucleonics* 1(2), 32-43(1947).

Definitions and numerical equivalent values of: electron volt, curie, rutherford, roentgen, roentgen-equivalent-physical, and roentgen-equivalent-man are presented. Discussions, examples, and sample calculations should be useful to biologists concerned with health physics and exposure to radiation during isotope studies. BA 22-15745

5012

THE USE OF ISOTOPES IN SURGICAL RESEARCH. F. D. Moore. *Surg. Gynecol. Obstet.* 86(2), 129-47(1948).

Some practical problems relative to the biologic use of isotopes are discussed briefly. BA 22-15749

5013

THE INHIBITION OF RIBO- AND THYMO-NUCLEIC ACID SYNTHESIS IN TUMOUR TISSUE BY IRRADIATION WITH X-RAYS. Barbara E. Holmes. *Brit. J. Radiol.* 20(239), 450-3(1947).

Uptake of P^{32} in thymo-nucleic acid fraction in Jensen rat sarcoma markedly was inhibited by x rays, ribonucleic acid fraction was inhibited to a lesser extent. Nembutal inhibited uptake of P^{32} in both fractions and should not be used. Hevesy's observation that irradiation of one tumor can affect nucleic acid metabolism of another tumor in the same animal is confirmed. BA 22-16388

5014

PROTOPORPHYRIN 9 AS A PRECURSOR OF CHLOROPHYLL. S. Granick. *J. Biol. Chem.* 172(2), 717-27(1948).

A brown mutant of *Chlorella vulgaris*, containing no green or yellow pigments, was induced by x irradiation for 10-20 min at a rate of 2050 r/min. The brown pigment was isolated and identified as protoporphyrin 9. This porphyrin is identical with porphyrin of blood heme, and is postulated to be a normal metabolic precursor in the synthesis of chlorophyll by *Chlorella*. BA 22-17179

5015

MUTATIONS IN *A. THALIANA* PRODUCED BY X-RAYS. Erna Reinholz. *Naturwissenschaften* 34(1), 26-8(1947).

X-rayed seeds of *A. thaliana* produce chiefly normal plants, a few with fasciations, cleaving of leaves, and other deformations and a single mutant with larger leaves and stronger growth. Second x-rayed generation had variation rate of 62.5%. New leaf characters persisted through eight generations. BA 22-17663

5016

THE GENETICS OF CANCER IN MICE. C. C. Little. Biol. Rev. Cambridge Phil. Soc. 22(4), 315-43(1947).

Genetic implications in transplantability of tumors are discussed. Mechanical factors, x rays, and parabiosis increase probability of growth of implants. Carcinogenic effects of x rays, ultraviolet light, and various chemical substances are mentioned. BA 22-17673

5017

THE DIFFERENCE IN HISTOLOGICAL LESIONS PRODUCED IN THE SKIN OF MICE BY ULTRAVIOLET RAYS AND ROENTGEN RAYS. A. Lacassagne. Acta Radiol. 28(56), 461-7(1947). (In French). BA 22-17822

5018

PTEROYLGLUTAMIC ACID AND RELATED COMPOUNDS. T. H. Jukes and E. L. R. Stokstad. Physiol. Rev. 28(1), 51-106(1948).

Relationship between pteroylglutamic acid and radiation sickness is considered in the course of the review. BA 22-17987

5019

INFLUENCE OF PHARMACOLOGICAL AGENTS ON THE EFFECTS OF IRRADIATION. F. Billinger. Radiology 50(2), 234-43(1948).

Desoxycorticosterone acetate markedly decreased the lethal effect of various x-ray doses in mice and prevented x-ray induced fatty changes in liver; pregnenolone did not show these effects. Vitamin B-complex reduced fatty changes in liver. Vitamin C and B-complex did not produce significant changes in x-ray effects on spleen. BA 22-18335

5020

FURTHER STUDIES ON THE RELATION BETWEEN RADIATION EFFECTS, CELL VIABILITY, AND INDUCED RESISTANCE TO MALIGNANT GROWTH. IV. COMPARISON OF EFFECTS OF ROENTGEN RAYS ON MAMMARY TUMORS AUTOGENOUS TO INBRED STRAINS OF MICE (DBA AND C3H). A. Goldfeder. Radiology 49(6), 724-32(1947).

Dose of 5000 r/air (200 kv, 20 ma, 0.5 mm Cu and 1.0 mm Al filter, HVL 0.9 mm Cu) to adenocarcinoma in vitro was required to prevent implant from producing tumor in dba mice, 2700 r/air required to produce same result in C3H strain. BA 22-18408

5021

RELATIVE EFFECTIVENESS OF DIFFERENT INTENSITIES OF GAMMA RADIATION IN RETARDING MITOSIS IN THE GRASSHOPPER NEUROBLAST. J. Gordon Carlson, Mary Louise Snyder, and Alexander Hollaender. Anat. Record 99(4), Abstract no. 54. p581(1947).

Eggs of *Chortophaga viridifasciata* containing embryos at age of 14 days at 26°C were exposed to x ray doses of (1) 8 r (2) 32 r or (3) 128 r at 32 r per min and 2 r/min. Dose rate (intensity) affected response only in (3) where 32 r/min proved more effective in retarding mitosis. BA 22-19722

5022

EFFECTS OF HEAT ON BREAKAGE OF CHROMOSOMES BY X-RADIATION. Mary Esther Gaulden. Anat. Record 99(4), Abstract no. 53. 581(1947).

Chortophaga viridifasciata embryo neuroblasts were heat-treated by immersing eggs in hot water under various conditions, prior to x irradiation and the number of chromosome fragments was determined. BA 22-19725

5023

CHROMOSOME SENSITIVITY TO X-RADIATION IN OOCYTES OF SCIARA. C. W. Metz. Anat. Record 99(4), 26(1947).

An abstract. BA 22-19730

5024

THE INHERITANCE OF THE GIANT CELL FORMATION IN YEAST, INDUCED BY RADIUM IRRADIATION. R.

Bauch. Arch. Mikrobiol. 13, 352-64(1942/43). (In German). BA 22-19742

5025

MUTATION AND ISOLATION EXPERIMENTS INFLUENCING THE SEX OF *S. FIRNICOLA*. (A CONTRIBUTION TO THE PROBLEM OF THE STABILITY AND LABILITY OF THE SEXUAL REACTIONS IN MONOECIOUS AND DIOECIOUS PLANTS.) Hans Greis. Z. Botan. 37(1/3), 1-116(1941/42). (In German).

Single-spore cultures were x irradiated during ascal meiosis. More than 50,000 single spores isolated from these cultures gave 73 sexual mutations. BA 22-19765

5026

MUTATION INVESTIGATION AND BREEDING. A. Gustafsson. Zuchter 14, 57(1942). (In German).

Author describes x-ray-induced mutations in barley. BA 22-19766

5027

X-RAY TREATMENT OF HEMP. W. Hoffman and E. Knapp. Zuchter 12, 1-9(1940). (In German).

With increased x ray dosage to seeds, plant damage of hemp increased, survivors decreased, sex ratio changed in favor of the females, and percentage of tendrilled plants increased. Authors conclude that it is possible by x irradiation to change sexuality of hemp and to get from the normal dioecious hemp a constant monoecious strain. BA 22-19775

5028

BACK-MUTATION AND ADAPTATION OF NUTRITIONAL MUTANT. F. J. Ryan. Cold Spring Harbor Symposia Quant. Biol. 11, 215-27(1946).

Biochemical deficiencies similar to those inducible in *Neurospora* may be induced in *E. coli* by irradiation and chemical means. Back mutations of these mutants occur in one step and are spontaneous in that they are not induced by absence of nutritional factors from the medium. BA 22-19824

5029

THEORIES OF THE BIOLOGICAL ACTIONS OF IONIZING RADIATIONS. C. B. Allropp. Brit. J. Radiol. 21(242), 72-4(1948).

Author discusses "poison" and "target" hypotheses. BA 22-20114

5030

EFFECTS OF ROENTGEN-RAY IRRADIATION ON THE TESTES OF RABBITS. POSSIBLE HARMFUL EFFECTS ON HUMAN TESTES FROM LOW VOLTAGE ROENTGEN-RAY THERAPY. J. Lamar Callaway and Sherwood W. Barefoot. Arch. Dermatol. and Syphilol. 56(4), 471-9(1947).

In rabbits, doses of 300-400 r suppress spermatogenesis; 600-650 temporarily arrests it; 950-1500 r produces permanent arrest; doses over 1200 r produced sterility. No arrest of spermatogenesis is apparent following 300, 600, or 900 r of x rays directed to human testes. BA 22-20115

5031

AGENTS INFLUENCING EXPERIMENTAL RADIATION INJURY. EFFECT OF FOLIC ACID AND PYRIDOXINE. Anna Goldfeder, Lionel Cohen, Charlotte Miller, and Margaret Singer. Proc. Soc. Exptl. Biol. Med. 67(3), 272-8(1948).

Treatment of mice with folic acid or pyridoxine hydrochloride for a period before and after exposure to 350 r significantly prolonged survival. No appreciable effect of these drugs on hemopoietic system was noted. BA 22-20116

5032

STUDIES ON RADIOSENSITIVITY OF CELLS. L. O. Jacobson, E. K. Marks, E. O. Gaston, E. L. Simmons, and M. H. Block. Science 107(2775), 248-50(1948).

Effect of whole body exposure of animals with previously induced regenerative anemia to an 800 r x ray dose was compared with effect of same dose on normal similarly irradiated animals. Normal irradiated animals developed anemia that reached its maximum in 14 days; animals with previous anemia developed no further anemia. Data (including marrow studies) indicate that increased mitotic activity and erythropoiesis does not increase radiosensitivity. BA 22-20117

5033

STUDIES ON THE EFFECTS OF RADIATION UPON THE MOBILE VISIBLE LIPIDS IN HUMAN BLOOD. K. Setälä. Ann. Med. Exptl. et Biol. Fenniae (Helsinki) 25 (Suppl. 1), 1-58(1947).

Data are presented to show that Ra and x rays regularly cause changes in amount and in metabolism of mobile visible blood lipids in both healthy and tumor-bearing individuals. Greatest effects were produced when radiation was applied to lower abdomen, liver, chest, and body organs harboring necrotic tumors. BA 22-20118

5034

SOME BIOLOGICAL EFFECTS DUE TO NUCLEAR FISSION. C. A. Tobias, P. P. Weymouth, L. R. Wassermann, and G. E. Stapleton. Science 107(2770), 115-8(1948). MDDC-1239

Colloidal U oxide, enriched with radioactive U^{235} , was injected into mice; 3 days later they were bombarded with sublethal dose of slow neutrons. All these mice died within 3 wk, some within 8 days. Neutron bombardment without U killed no control mice; neither did U that had not been subjected to fission by neutron bombardment. Mice also lived when x rays were substituted for neutrons. BA 22-20126

5035

VALUE OF INDUSTRIAL RESEARCH INSTITUTES TO FOOD TECHNOLOGY. W. L. Campbell. Food Technol. 1(4), 497-502(1947).

Comments are made on use of sonic, supersonic, and radar frequencies in food sterilization; use of x rays and cathode rays in this work and some limitations of the ionizing radiations are mentioned. BA 22-20358

5036

CONTROL OF HEMORRHAGIC SYNDROME AND REDUCTION IN X-IRRADIATION MORTALITY WITH A FLAVANONE. Paul E. Rekers and John B. Field. Science 107(2766), 16-17(1948).

Twenty-five dogs received 50 mg of rutin 3 times/day orally for 1 wk before irradiation and continuing throughout the test, while 25 others were irradiated and served as controls receiving no rutin. Following single 350 r dose, 16 control dogs died in 13-30 days, while 3 of 25 treated dogs died in 16, 28, and 31 days later. BA 22-20912

5037

INDUCTION OF LEUKEMIA IN EIGHT INBRED STOCKS OF MICE VARYING IN SUSCEPTIBILITY TO THE SPONTANEOUS DISEASE. Arthur Kirschbaum and Harry W. Mixer. J. Lab. Clin. Med. 32(6), 720-31(1947).

Of several agents capable of inducing leukemia in mice, x rays are probably the only one effective in all strains and are less dependent upon genetic constitution of stock involved than are most other agents. BA 22-20977

5038

IRRADIATION OF EXPERIMENTAL CEREBRAL TUMORS. I. EXPERIMENTAL PRODUCTION OF BRAIN TUMORS IN MICE II. SOME OBSERVATIONS ON THE EFFECT OF X-RADIATION ON EXPERIMENTAL GLIOMATA IN MICE K. Tansley and C. W. Wilson. Radiology 49, 62-71(1947).

Implanted tumors in mice were irradiated (180 kv, 0.5 mm Cu and 1.0 mm Al, HVL 0.93 mm Cu, distance 25 cm, intensity 154 r/min) with doses of 1623, 2434,

2850, and 3247 r/air. Arrest of growth increased with increasing dose, in no case was tumor entirely destroyed. Histological effects of irradiation are described. BA 22-20104

5039

DESTRUCTION OF THE GENITAL GLANDS OF THE THIRTEEN DAY OLD MOUSE EMBRYO BY IRRADIATION WITH X-RAYS. Albert Raynaud and Marcel Frilley. Ann. endocrinol. (Paris) 8(5), 400-19(1947). (In French).

Local x irradiation of genital primordia region of 3 male and 3 female 13-day mouse embryos in utero was followed by histologic examination at term. Except for complete destruction of gonads, genital organs and mammary glands of the females were normal. In the males, primordia of accessory sexual glands were undeveloped; external genitalia were feminized. BA 22-21170

5040

MUTATIONS IN BACTERIA INDUCED BY RADIATIONS. M. Demerec and R. Latarjet. Cold Spring Harbor Symposia Quant. Biol. 11, 38-50(1946).

X-irradiation (0.35 A) induces mutations in *E. coli* causing them to be resistant to bacterial viruses (T-1). Sterilization rate is higher with x rays than with ultraviolet, but mutation rate is higher with ultraviolet. BA 22-21268

5041

RADIATIONS AND CELL DIVISIONS. Arthur C. Giese. Quart. Rev. Biol. 22(4), 253-82(1947).

Ionization by x rays and γ rays, neutrons, and particulate radioactive emanations lowers rate of cell division mainly by increasing the interval between divisions. Author discusses "target" and "poison" theories. BA 22-22896

5042

THE EFFECTS OF X-RAYS ON THE MITOTIC ACTIVITY OF MOUSE EPIDERMIS. Norman P. Knowlton, Jr., Louis H. Hempelmann, and Joseph G. Hoffman. Science 107(2789), 625-6(1948).

CF_1 mice, 6-8 wk old, were exposed to 250 kvp x rays, 50 r/min. Change in mitotic index was studied for doses of 5-325 r. In animals receiving 35-325 r, minimum mitotic activity is < 1 mitosis/100,000 cells, which is reached less than 2 hr postexposure. Return to normal varies from 5 hr at 35 r to 6 days at 325 r. Overcompensation is evident at 325 r, with mitotic activity more than double that of normal on the 8th day postirradiation. BA 22-22961

5043

CROPS AND PLANT BREEDING. G. D. H. Bell. J. Roy. Agr. Soc. Engl. 108, 1-14(1947).

The use of x rays and cholechicine in the production of new lines of crop plants in Britain is reviewed. BA 22-22980

5044

Naval Radiological Defense Lab., San Francisco. THE EFFECTS OF COMBINED ADMINISTRATION OF STRONTIUM-90 AND EXTERNAL RADIATION. S. H. Cohn and W. L. Milne. May 21, 1956. 24p. Project NM 006-015. 04. (USNRDL-TR-89).

Platelet levels, body weight, mortality, bone alkaline phosphates and thymine and spleen weights were studied following administration of Sr^{90} and total body x irradiation alone and in combination. Platelet level was the most sensitive index of injury. It (1) fell faster, recovered more slowly after simultaneous Sr^{90} and x irradiation; (2) fell in proportion to Sr^{90} dose, alone or with x rays, (3) indicated residual damage proportional to Sr^{90} body burden when marrow was stressed (625 r x rays) 30 days after Sr^{90} . Acute effects and additivity of Sr^{90} and x ray effects are described also. NSA 10-7400

5045

THE EFFECT OF ROENTGEN IRRADIATION ON EPIPHYSEAL GROWTH. II. EXPERIMENTAL STUDIES UPON THE DOG. John A. Reidy, James R. Lingley, Edward A. Gall, and

Joseph S. Barr. J. Bone and Joint Surg. 29(4), 853-73 (1947).

Twelve puppies of both sexes were x rayed (300-1200 r) over selected joints the treated areas including joint, epiphysis, and adjacent metaphysis. Weight and torso size were unaffected, longitudinal growth of treated **extremities was retarded in all cases. There was less retardation of growth after 800 r than after 1000r, no difference in effect on radius and ulna between 1000 and 1200 r.** BA 22-23202

5046

INFLUENCE OF X-RAYS ON PITUITARY BODY CHANGED THROUGH TREATMENT WITH ESTRONE OR CASTRATION. A. Baidins, L. Claesson, and A. Westman. Gynaecologia 125(1/2), 9-20(1948). (In German).

Rats treated with estrone and x rays, compared with those treated only with estrone, showed increase in weight and strong luteinization, but no difference in the histologic picture of pituitary bodies. X-rays have no effect on pituitary bodies of castrated female rats. BA 22-23827

5047

THE TRANSMISSION OF RADIO-STRONTIUM AND PLUTONIUM FROM MOTHER TO OFFSPRING IN LABORATORY ANIMALS. Miriam F. Finkel. Physiol. Zool. 20(4), 405-21(1947).

Radio-Sr and Pu decreased the incidence of pregnancy in mice and rats and increased number of stillbirths. Offspring of Sr treated (when pregnant) mothers show retarded growth, long bone malformation, anemia, and osteogenic sarcoma. BA 22-23848

5048

SERUM CALCIUM FOLLOWING ROENTGEN-INHIBITION OF THE HYPOPHYSIS OF PREGNANT WOMEN. T. Paladino. Boll. soc. ital. biol. sper. 22(4), 299-301 (1946). (In Italian).

Twelve pregnant females were given x-ray treatment of hypophysis for 10-30 days during third trimester of pregnancy. Serum Ca in milligrams percent diminished from an average of 11.03-9.62. BA 22-23882

5049

PHYTOPHARMACOLOGICAL EXPERIMENTS WITH URETHANE. David I. Macht. Proc. Soc. Exptl. Biol. Med. 67(2), 237-40(1948).

Root growth of normal seedlings of *Lupinus albus* were only slightly affected by solutions of ethyl carbamate or urethane. Seedlings irradiated with short x rays, 500 r, and vernalized seedlings were very readily poisoned by these drugs. BA 22-25403

5050

CYTOTOXICOLOGICAL STUDY OF THE EFFECT OF DIVERSE PHYSICAL AND CHEMICAL AGENTS ON WHEAT SEEDLINGS. Henri Ollivier. Rev. can. biol. 7(1), 35-160(1948). (In French).

An account of x ray and Ra emanation effects on germination of wheat is included. BA 22-25404

5051

COMPARISON BETWEEN THE ACTION OF HEAT AND OF α -IRRADIATION ON THE ANTIGENIC POWER AND THE PROPERTIES OF TYPHOID BACILLI. H. R. Olivier and P. Bonet-Maury. Ann. inst. Pasteur 72(3/4), 222-9 (1946). (In French).

Typhoid and paratyphoid bacilli after exposure to α rays become avirulent but remain motile and show normal respiration and are more antigenic than bacilli killed by heat. Thus α irradiation separates the virulence and antigenic power and offers general method of obtaining vaccines which have most of the properties of bacteria but have lost virulence. BA 22-24598

5052

A MATHEMATICAL THEORY OF CHROMOSOMAL

REARRANGEMENTS. J. B. S. Haldane and D. E. Lea. J. Genetics 48(1), 1-10(1947).

A theory covering the process of structural rearrangement of chromosomes following irradiation is given. BA 22-10558

5053

DIFFERENTIAL REJOINING AS A FACTOR IN APPARENT SENSITIVITY OF CHROMOSOMES TO X-RAY BREAKAGE. Arnold H. Sparrow. Am. J. Botany 34(10), 589(1947).

An abstract. BA 22-10571

5054

THE PRODUCTION OF MUTATIONS. H. J. Muller. J. Heredity 38(9), 259-70(1947).

This review includes a discussion of chromosomes analysis, radiation effects, somatic radiation effects, and frequency of mutations. Induced and natural mutations are compared. Author emphasizes responsibility of radiologists in protecting human germ plasma against radiation injury. (Paper is in text of Nobel Prize lecture). BA 22-10627

5055

THE METABOLISM OF THE FISSION PRODUCTS AND THE HEAVIEST ELEMENTS. J. G. Hamilton. Radiology 49(3), 325-43(1947). BA 22-10789

5056

THE BIOLOGIC EFFECTS OF PILE RADIATIONS. P. S. Henshaw, E. F. Riley, and G. E. Stapelton. Radiology 49(3), 349-60(1947).

Studies made with CF₁, ABC, A, and C58 mice to determine early and late effects of periodic and single exposures to fast neutrons, slow neutrons, γ rays, and β rays are reported. Late effects of all types of exposure were: generalized atrophy and neoplasia in the hemopoietic organs, weight loss, histological changes and shortened life span. Survival time was one of the most sensitive responses. BA 22-10790

5057

HEMATOLOGICAL EFFECTS OF IONIZING RADIATIONS IN THE TOLERANCE RANGE. L. O. Jacobson and E. K. Marks. Radiology 49(3), 286-96(1947).

Possibility of detecting blood changes in chronic exposure to ionizing radiations was studied in mice, rabbits, guinea pigs, dogs and human beings. Lymphocyte reduction in peripheral blood is most sensitive indicator of acute or subacute exposure to externally originating ionizing radiation or internally deposited radioisotopes. BA 22-10791

5058

CARCINOGENIC PROPERTIES OF RADIOACTIVE FISSION PRODUCTS AND OF PLUTONIUM. H. Lisco, M. Finkel, and A. Brues. Radiology 49(3), 361-2(1947).

Late effects of various modes of treatment with radiostrontium, Y, Ce, Ra, and Pu were studied in mice, rats, and rabbits. BA 22-10792

5059

BIOLOGICAL STUDIES IN THE TOLERANCE RANGE. E. Lorenz, W. L. Heston, A. B. Eschenbrenner, and M. K. Deringer. Radiology 49(3), 274-85(1947)

Mice, guinea pigs, and rabbits were exposed (whole body) to irradiation at dose rates of 8.8, 4.4, 2.2, 1.1, and 0.11 r given in 8 hr or 24 hr/day during their entire life span or for limited periods. Effects on: ovaries, weight, life span, hematopoietic system, and induction of tumors are described. BA 22-10793

5060

THE CLINICAL SEQUENCE OF PHYSIOLOGICAL EFFECTS OF IONIZING RADIATION IN ANIMALS. C. L. Prosser, et al. Radiology 49(3), 299-312(1947).

Clinical picture and conditions resulting in death vary with dose rate and duration of exposure for both external and internal irradiation. Six patterns of reaction to exposure

are described (patterns determined by magnitude of dose).
BA 22-10794

5061

COMPONENTS OF THE ACUTE LETHAL ACTION OF SLOW NEUTRONS. R. E. Zirkle. *Radiology* 49(3), 271-3(1947)

Author discusses the two principal components of lethal action of slow neutrons. One acts through recoil protons and carbon nuclei produced in the transmutation of nitrogen, $N^{14}(n,p)C^{14}$, another acts through γ radiation emitted when hydrogen captures neutrons, $H^1(n,\gamma)D^2$. Induced radioactivity accounts for only 1% of total lethal action. BA 22-10796

5062

EFFECTS OF RADIOTOXIC DOSAGES OF I^{131} UPON THYROID AND CONTIGUOUS TISSUES IN MICE. Aubrey Gorbman. *Proc. Soc. Exptl. Biol. Med.* 66(1), 212-3(1947).

Single intracutaneous doses of I^{131} ranging from 3-50 mc/kg were given to mice. Histological changes in thyroid are described. Lesions were noted in tracheal epithelium with all doses and in recurrent laryngeal nerve with higher dosages. BA 22-10798

5063

INDUCTION OF OVARIAN TUMORS IN MICE BY X-RAYS. J. Furth and M. C. Boon. *Cancer Research* 7(4), 241-5(1947).

Following irradiation of 4-6 wk old mice with 87, 175, or 350 r, ovarian tumors began to appear when mice were about 11 mo of age. Frequency of these neoplasms increased with time and almost every mouse that lived 17 mo developed either unilateral or bilateral ovarian growth, irrespective of dose. BA 22-11295

5064

MORPHOLOGIC CHANGES IN THE LYMPHOCYTES OF PERSONS EXPOSED TO IONIZING RADIATION. A. Dickie and L. H. Hempelmann. *J. Lab. Clin. Med.* 32(9), 1045-59(1947).

In individuals chronically exposed to ionizing radiation, the total leucocyte count is statistically decreased. Absolute number of percentage of lymphocytes is without significant change, but there is a striking increase in cytoplasmic bodies. These appear in supravital stained preparations but not in fixed specimens. BA 22-11351

5065

LETHAL AND SUBLETHAL EFFECTS OF X-RAYS ON *ESCHERICHIA COLI* AS RELATED TO THE YIELD OF BIOCHEMICAL MUTANTS. Raymond R. Roepke and Florence E. Mercer. *J. Bacteriol* 54(6), 731-43(1947).

Authors present an equation showing that the greater the percentage of cells killed by x rays, the greater will be the percentage of mutant cells among survivors. The ratio does not hold, however, with very high doses. BA 22-11475

5066

THE INFLUENCE OF THE IRRADIATION EFFECT ON THE OXYGEN UTILIZATION. H. Kubo. *Strahlentherapie* 33, 70-88(1929). (In German).

Urinary C:N in rabbits was lower after x ray exposure of various parts of body, returned to normal in approximately two weeks. Effects differed from those following exposure to ultraviolet, Ra, and Th.

5067

X-RAY SENSITIVITY OF THE STAGES OF MITOSIS. Alan D. Conger. *Am. J. Botany* 34(10), 582(1947).

An abstract. BA 22-13028

5068

GENETIC AND GENERAL BIOLOGICAL EFFECTS OF RADIATION AS FUNDAMENTALS OF OUR VIEWS ON

HEREDITARY LESIONS. Gerhard Schubert. *Roentgen-Praxis* 13(1), 1-14(1941). (In German). BA 22-13048

5069

GENETICS OF PEARS. HYBRIDS PRODUCED WITH POLLEN TREATED EITHER WITH ELECTROMAGNETIC CURRENTS OR WITH ULTRA-VIOLET OR X-RAYS. M. R. Celestre. *Italia agric.* 83(8), 455-60(1946).

Pollen used in crossing highly fertile pear varieties was exposed to either electromagnetic fields, ultraviolet, or to x rays. Trees grown from seed developed slowly and resembled wild trees with thorny branches in early years; only in later years did they resemble cultivated plants. Some of the progeny were disease resistant (especially to *Fusicladium*) others showed increased drought resistance. BA 22-13055

5070

HISTOLOGICAL CHANGES FOLLOWING RADIATION EXPOSURES. W. Bloom. *Radiology* 49(3), 344-7(1947).

Effects of x rays, fast and slow neutrons, γ rays from Ra, β rays of P, Ra, Pu, Na^{24} , P^{32} , Ba^{140} - La^{140} , Sr^{89} , radio Zr, Y^{91} , and radio Ce; on mice, rats, rabbits, guinea pigs, and chickens are summarized. LD_{50-30} and fractions thereof were used in most studies. BA 22-13280

5071

SENSITIZATION TO HEAT BY X-RAYS. Arthur C. Glese and H. Duane Heath. *J. Gen. Physiol.* 31(3), 249-58(1948).

Soft x rays (20 kv, Ag target) at dosage rate of 56,000 r/min killed *Paramecium caudatum* after dose of 600,000 r if protozoans were kept in irradiated medium, but only after double this dose when immediately transferred to fresh medium. Dosages of 56,000-280,000 r sensitized the cells to heat, 1/8 the lethal heat exposure was required to kill. BA 22-13281

5072

EFFECTS OF X-RAY IRRADIATION ON VISCOSITY OF SYNOVIAL FLUID. C. Ragan, C. P. Donlan, J. A. Coss, Jr., and A. F. Grubm. *Proc. Soc. Exptl. Biol. Med.* 66(1), 170-2(1947).

In vitro reduction of synovial fluid viscosity after exposure to x rays varies directly with dose. Reduction in viscosity of pure Na hyaluronate solutions was also noted but to lesser degree. Hyaluronic acid content was stable and still susceptible to enzymatic hydrolysis after exposure to x rays. It is suggested that x rays may cause breaking of secondary valences present in synovial fluid hyaluronic acid without change in hyaluronic acid molecule. BA 22-13284

5073

PRIMARY AND SECONDARY VACUOLES IN THYMIC CELLS EXPOSED IN VITRO TO X-RAYS. Robert Schrek. *J. Cellular comp. Physiol.* 30(3), 203-24(1947).

Rabbit thymus cell suspensions were irradiated with 1000 r and incubated aerobically at 37°C. After 3 hr incubation, cells were viable, but many had primary, intra-nuclear, acidophilic vacuoles, after 24 hr, secondary "vacuoles" were seen which were shown in stained sections to be pyknotic nuclei. BA 22-13283

5074

ON THE EFFECT OF X-RAYS ON FEATHER GROWTH. J. Steinbacher. *Zool. Anz.* 142(7/8), 151-9(1943). (In German)

Results of irradiating plucked areas of doves with various doses at various intervals indicate that differentiating feathers are more radiosensitive than the undifferentiated feather germ. Doses ranged from 200-1000 r. BA 22-13285

5075

THE MUTATIONS FOR REDUCED PRODUCTION OF PENICILLIN. P. de Somer. *Bull. soc. chim. biol.* 29, 364-6(1947). (In French).

Irradiation by ultraviolet light or x rays results in diminution of penicillin produced by four types of Penicillium (designated as 2000, NRRL 1951B25, St63638, 1984A). Rare cultures may show marked increase in yield of penicillin but diminished or suppressed pigment formation. BA 22-14314

5076
THE DISTRIBUTION OF ROENTGEN-INDUCED ALTERATIONS IN THE CHROMOSOMES OF BELLEVALIA ROMANA. Hans Marquardt. Bern. deut. botan. Ges. 60(2), 94-124(1942). (In German).

Study of 2700 mitoses in Roman hyacinth pollen x-rayed prior to division showed all chromosomes to be equally liable to alteration by x rays, frequency of breaks and translocations was proportional to chromosome lengths. Breaks occurred more often in commissure-to-subterminal end than in subterminal end than in subterminal-to-median region. Translocations increased in frequency from subterminal end to commissure in all four chromosomes BA 19-52

An abstract. BA 19-214

5080
LEUKEMIA IN MICE FOLLOWING EXPOSURE TO X-RAYS. P. S. Henshaw. Radiology 43, 279-85(1944)

C57 mice were x irradiated with single doses of 200 r/air (200 kv, 20 ma, 0.5 mm Cu and 1.0 mm Al filter, distance 38 cm) over whole body at four-week intervals as long as there was no apparent effect on health of animals. Continuous blood records showed general depression of leucocyte level during treatment, followed by slow return to normal after treatment was discontinued. Some animals developed marked leukocytosis during phase and at death had leucemic infections. Hyperplasia of hematopoietic was organs seen in all these cases. BA 19-215

5081
SOME ASPECTS OF THE BIOLOGICAL ACTION OF X-RAYS ON COCK SPERMATOOZOA. Igor L. Kosin. Physiol. Zool. 17(3), 289-319(1944).

Fertilizing capacity of cock spermatozoa was destroyed by soft x-ray dose of 5544-6488 r in vitro. No effect was seen for 10 days after exposure, but total functional life span has shortened. X-irradiation of male gametes resulted in preponderance of male chicks hatching from zygotes fathered by such gametes. Lethality of embryos fathered by irradiated spermatozoa was associated with increased frequency of abnormal development. BA 19-216

5082
EFFECT OF ROENTGEN RAYS ON THE MINUTE VESSELS OF THE SKIN IN MAN. E. P. Pendergrass, P. J. Hodes, and J. Q. Griffith. Am. J. Roentgenol. Radium Therapy 52(2), 123-7(1944).

Changes in relative count of cutaneous capillaries (number visible/total number present) following administration of 300 r, 200 kv x rays in 3/4 min, 7.2 min, and 30.8 min were the same, an increase after 6 hr was almost gone after 24 hr. Same dose of 50 kv x rays resulted in a mild effect at 6 hr, was much more pronounced at

24 hr. (Total number capillaries was determined after local administration of histamine.) BA 19-217

5083
ACTION OF RADIOACTIVE SUBSTANCES ON THE SPEED OF GROWTH OF PENICILLIUM NOTATUM AND THE PRODUCTION OF A POTENT PENICILLIN. Richard Jähnel, Ethel Guberman, and Rafael Kazdan. Science 100(2596), 298(1944).

Experiments are described which demonstrate possibility of decreasing time required for growth of P. notatum and obtaining active penicillin in presence of radon and its deposits. Addition of a fluorescent substance to medium in which radioactive substances are present improves effects of radioactive elements. BA 19-1267

5084
RADIOBIOLOGICAL STUDIES ON THE LYSOGENIC SYSTEM IN E. COLI K₁₂. I. X-RAYS. H. Marcovich. Ann. Inst. Pasteur 90, 303-19(1956).

Author presents an analysis of dose-response relationship in studies in which the criterion of effect was the number of phage centers observed in cultures of a lysogenic bacterium. As dose increased, number of induced colonies increased to a maximum and then decreased with further increases in dose. Possible explanations (1) x rays induced conversion of prophage to vegetative phage and simultaneously damaged ability of bacteria to synthesize phage or (2) a system that was merely inactivated by a single event may have been destroyed by two such events.

5085
THE EFFECT OF IONIZING RADIATION ON THE BROAD BEAN ROOT. IV. SUMMATION OF THE EFFECT OF RADIATION OF DIFFERENT ION DENSITY. A NEUTRON PLUS GAMMA RADIATION. B. ALPHA PLUS X RADIATION L. H. Gray and John Read. Brit. J. Radiol. 17(201), 265-71(1944).

Bean roots were exposed in succession to either (1) γ plus neutron rays or (2) x plus alpha rays. Data from (1) were inconclusive. For (2) to kill $\frac{1}{2}$ the roots, it was necessary to administer slightly more than half a mean lethal dose of each. Primary cell injury responsible for death of root was apparently the same for whichever radiation was used. Differences in mean lethal doses are ascribed to difference in radiation efficiency. BA 19-1619

5086
A NOTE ON THE PRELIMINARY STUDIES ON THE EFFECTS OF X-IRRADIATION UPON GROWTH AND DEVELOPMENT OF JUTE PLANT. B. C. Kundu. Science and Culture (India) 9(12), 559(1944).

Vitality of plants from irradiated seedlings was first depressed, then enhanced in later growth stages. X-ray effects included: bifurcation at tips, bushiness, number of leaves at single internode different from control, increase in amount of xylem. Moist seeds were more radiosensitive than dry ones. BA 19-1620

5087
ON THE COMPARISON OF α -RADIATION SENSITIVITY OF NUCLEUS AND CYTOPLASM. J. Petrova. Ber. deut. botan. Ges. 60(2), 148-51(1942). (In German).

Zygnema cells were irradiated with α rays of Po with depth of penetration limited by filters, radiation concentrated on either the nucleus or cytoplasm of the algal cell. Dosage required to kill cell by irradiation of cytoplasm was 700 times that required to kill cell by exposure of nucleus. BA 19-1622

5088
EFFECT OF X-IRRADIATION OF RATS UPON THEIR RESISTANCE TO TRYPANOSOMA LEWISI. Dorothy Neuhoof Naiman. J. Parasitol. 30(4), 209-28(1944).

Infection ranged from 2 to 8 times as high in irradiated rats as in controls. Ability to produce antibody against *T. lewisi* was diminished by exposure. Sharp reduction in circulating leucocytes following x irradiation was considered not to be the major factor in decreased resistance since leucocyte level had returned to normal at peak of infection. BA 19-1806

5089
EFFECT OF X-RAYS UPON FLECKING IN THE DOMESTIC PIGEON. Leon J. Cole. *Physiol. Zool.* 18(2), 167-75 (1945).

Number and extent of flecks in feathers of pigeons heterozygous for two colors is definitely increased by exposure of follicles to 750 and 1000 r x-ray doses. Author concludes that x rays increase frequency of change which is the same type as that occurring spontaneously in feather germs of pigeons of genotypes concerned BA 19-15284

5090
THE INEFFECTIVENESS OF TEMPERATURE IN INFLUENCING THE PRODUCTION OF MUTATIONS BY X-RAYS. J. K. Makhiani. *J. Univ. Bombay* 13(16), 1-13(1944).

Cy D D. melanogaster males were x rayed (50 kv, 10 ma, 1 mm Al filter, 17 cm target distance, for 20 min, dose of 2000 r) at 4-6°C and 36-38°C. Males were crossed with C1 B/scar virgin females. No significant difference in lethal mutations and translocations was observed in F₁ and F₂ of the two groups. Temperature coefficient for lethal mutations and translocations during exposure was very nearly 1. BA 19-15302

5091
EFFECTS OF X-RAYS ON HATCHABILITY AND ON CHROMOSOMES OF HABROBRACON EGGS TREATED IN FIRST MEIOTIC PROPHASE AND METAPHASE. Anna R. Whiting. *Am. Naturalist* 79(782), 193-227 (1945). BA 19-15318

5092
CELLULAR DYNAMICS IN THE INTESTINAL MUCOSA: THE EFFECT OF IRRADIATION ON EPITHELIAL MATURATION AND MIGRATION. Nathan B. Friedman. *J. Exptl. Med.* 81(6), 553-8(1945).

Although irradiation of the duodenum of rats inhibits mitosis in crypts and halts normal passage of cells up the villi, maturation of goblet cells is unaffected. BA 19-15862

5093
A CONTRIBUTION TO THE TREATMENT OF POST IRRADIATION NECROSIS. J. E. Moseley. *Radiology* 44(3), 262-5(1945).

Author reports two cases of postirradiation necrosis in which application of estrogenic ointment brought about complete healing of ulcers. BA 19-15948

5094
FURTHER STUDIES ON THE RELATION BETWEEN RADIATION EFFECTS, CELL VIABILITY AND INDUCED RESISTANCE TO MALIGNANT GROWTH. II. EFFECTS OF ROENTGEN RAYS ON BAGG-JACKSON MOUSE CARCINOMA 755 IRRADIATED IN VITRO AND IN SITU. A. Goldfeder. *Radiology* 44(3), 283-92(1945).

X-ray dose necessary to prevent an implant from producing a tumor does not differ widely from that required to destroy a tumor in situ, provided an inbred strain of mice is used. BA 19-16207

5095
EXPERIMENTAL ROENTGEN INJURY. V. EFFECTS ON HEMATOPOIETIC RESERVES AND REGENERATIVE CAPACITY. Paul S. Henshaw, Jean W. Thompson, and Henry L. Myer. *J. Natl. Cancer Inst.* 5(4), 233-47(1945).

C₃H mice were exposed to 0, 12½, 25, 50, 100, 200, or 400 r. Mild injury in hematopoietic organs was seen after repeated small exposures, acute extensive destruction after large doses. Guinea pigs exposed to 25, 50, or 100 r showed same effects, but exhibited greater general susceptibility. BA 19-16215

5096
CHANGES IN THE UTERUS AFTER ERADICATION OF ENDOMETRIAL ADENOCARCINOMA BY RADIOTHERAPY. John F. Sheehan, Herbert E. Schmitz, and Janet Towne. *Arch. Pathol.* 39(4), 237-56(1945). BA 19-16247

5097
INFLUENCE OF THE ALKALINE CHLORIDES (LITHIUM, CALCIUM, AMMONIUM, CESIUM, RUBIDIUM) AND THE THORIUM-URANIUM RAYS ON COLD-SENSITIVITY AND SPORES FORMATION OF MEGATHERIUM AND MESENTERICUS ON AGAR SLANTS. M. Cicconi. *Zentr. Bakteriöl., Parasitenk. Abt. I. Orig.* 150(5), 263-7 (1943). (In German).

Radiation with Th-U appeared to stimulate viability and spore formation, spores remaining viable at ice box temperature. BA 19-16580

5098
THE RELATIVE SUSCEPTIBILITY OF NORMAL AND X-RAYED MICE OF DIFFERENT STOCKS TO PNEUMOTROPIC VIRUSES. P. F. DeGara and J. Furth. *J. Immunol.* 50(5), 255-64(1945).

Total irradiation with 300 r given 24-48 hr before intranasal infection significantly increased susceptibility of mice of all stocks studied to small infecting doses of pneumotropic viruses. BA 19-16777

5099
THE RADIOACTIVITY OF THE MINERAL WATERS OF CACHEUTA. Natalia M. Sales de Cogorno. *Rev. asoc. med. argentina* 58(539), 649-51(1944). (In Spanish).

Therapeutic effects of thermal springs at Cacheuta are attributed to Ra emanation in water. Average radioactivity of the different springs in 56.7 Mache U/1. (Equivalent to 206.4 emans.) BA 19 18110

5100
RADIOSENSITIVITY OF LYMPHOCYTES AND GRANULOCYTES IN VITRO ACCORDING TO THE METHOD OF UNSTAINED CELL COUNTS. Robert Schrek. *Proc. Soc. Exptl. Biol. Med.* 58(4), 285-6(1945).

Suspensions of lymphocytes from thymus and spleen (rabbits) and from normal and lymphocytic leukemic blood of patients were irradiated and then incubated at 37°C. Dose of 1000 r caused death of lymphocytes after latent period of 3 hr, 50 r had minimal cytotoxic effect on thymic lymphocytes; granulocytes were resistant to 1000 r. Cytotoxic effect on lymphocytes was noted only when exposure and incubation were carried out aerobically. BA 19-18111

5101
STUDIES ON THE NUCLEAR AND NUCLEOLAR CYCLES OF DEVELOPMENT IN PLANTS, ANIMALS AND MAN, PARTICULARLY WITH REFERENCE TO THE AGING OF CHROMATIN AND OTHER CYTOGENIC PHENOMENA. Doncho Kostoff. *Bull. chambre culture natl. (Sofia), Ser. biol., Agr. et silvicult.* 1(1), 1-86(1946).

New interpretation of chromosome breakage and rearrangement as related to aging, X rays and other irradiation and to temperature changes is included. BA 22-77

5102
ARTIFICIAL EVOLUTION. J. B. S. Haldane. *Neue Auslese* 2(3), 97-9(1947).

Experiments with x-ray induced mutations in agricultural plants and their economical significance are discussed, with special regard to Gustafsson's results on barley. BA 22-96

5103

NOTE ON THE THEORY OF RADIATION-INDUCED LETHALS IN *DROSOPHILA*. U. Fano. Science 106(2743), 87-8(1947).

Author contradicts previous theory of induced lethals (Lea and Catsheside, 1945), stating that in radiation-induced lethals in *Drosophila* it is difficult to ascertain the dependence of mutation frequency on dose. There is a nonlinear effect, leading to a significant discrepancy between the previous theory and experimental data. BA 22-103

5104

THE RELATIONSHIP OF X-RAY INDUCED RECESSIVE LETHALS TO CHROMOSOMAL BREAKAGE. I. H. Herskowitz. Am. Naturalist 80(795), 588-92(1946).

Employing the C1B technique, recessive lethal changes were obtained in Canton S stock of *D. melanogaster* after x irradiation of 1000 and 5000 r. Analysis of data suggest that x ray induced lethals are produced primarily at breakage points. Position effects and nonbreakage mutation appear to be much less important as sources of recessive lethals. BA 22-105

5105

TOLERANCE CONCENTRATIONS OF RADIOACTIVE SUBSTANCES. Karl Z. Morgan. J. Phys. Colloid Chem. 51(4), 984-1003(1947).

Elementary equations and procedures involved in determining tolerance concentrations of radioactive substances when taken into the human system are reviewed. BA 22-296

5106

THE RADIOSENSITIVITY OF THE TESTIS IN COMPARISON TO THE OVARY IN THE HERMAPHRODITE GLAND OF *ARION EMPIRICORUM* FER. H. R. Schinz and U. Cocchi. Radiol. Clin. 13(6), 301-10(1944). (In German).

Dose of 600 r had no effect on sex cells of the snails, female sex cells were damaged only by a dose four times that necessary to damage male sex cells. BA 22-297

5107

FURTHER DEVELOPMENT OF THE THEORY OF BIOLOGICAL REACTIONS CAUSED BY ROENTGEN-RAYS. J. Th Van der Werff. Acta Radiol. 28(2), 168-84(1947).

Author applies his "equation of metabolism" to A. Forssberg's studies on x ray effect upon growth rate of *Phycomyces blakesleeanae*. Theory can also be applied to phenomena of nerve excitation. BA 22-299

5108

THE USE OF ARTIFICIALLY RADIOACTIVE ISOTOPES FOR THE PRODUCTION OF LOCALIZED BIOLOGICAL RADIATION. II. DIRECT INJECTION INTO BIOLOGICAL TISSUE, ESPECIALLY TUMORS. J. H. Muller. Experientia 2, 372-4(1946).

Following subcutaneous and intramuscular injection of Zn^{63} (suspended in pectin) into rabbits, no diffusion of radioactive substances into blood or other tissue was observed. In two cases of human cancer of uterine cervix, injection of Zn^{63} into tumor caused almost no radioactivity in blood or urine. BA 22-306

5109

PLASMA AND RED CELL RADIO-IRON FOLLOWING INTRAVENOUS INJECTION. STERILE ABSCESES IN NORMAL AND ANEMIC DOGS. Charles L. Yuile, Chauncey G. Bly, and John C. Wells. Federation Proc 6(1), 400(1947).

An abstract. BA 22-308

5110

MITOTIC NON-DISJUNCTION IN THE CASE OF INTER-CHANGES INVOLVING THE B-TYPE CHROMOSOME IN MAIZE. Herschel Roman. Genetics 32(4), 391-409(1947).

Eight interchanges between B-type chromosomes and various members of the basic set obtained by x irradiation are described. BA 22-2707

5111

THE EFFECTS OF TOTAL BODY X-IRRADIATION ON THE PERIPHERAL BLOOD AND BLOOD FORMING TISSUES OF THE RAT. S. P. Stearner, E. L. Simmons and L. O. Jacobson. MDDC-1319, ANL-4001, 42p. (April 7, 1947).

Effects of single large and small daily doses of x rays on certain blood constituents are described. Effects of x-rays on rabbits and rats are compared.

5112

LETHAL EFFECT OF X-RAYS ON MARINE MICROPLANKTON ORGANISMS. Kelshaw Bonham, Allyn H. Seymour, Lauren R. Donaldson, and Arthur D. Welander. Science 106(2750), 245-6(1947).

Chlorella, *Nitzschia closterium*, and unidentified green carteriid mastigophoran with four flagella and an unidentified brown mastigophoran with two flagella were irradiated (200 kv, 20 ma, 1 mm of Al and 0.5 mm of Cu, at 132 r/min, target distance of 13 or 6.5 in.) with total doses of 1000, 10,000, 25,000, 50,000, and 100,000 r. Dose of 50,000 r immobilized 50% of organisms in 24 hr; 100,000 r was nearly 100% effective. BA 22-2868

5113

COSMIC RADIOCARBON AND NATURAL RADIOACTIVITY OF LIVING MATTER. A. V. Grosse and W. F. Libby. Science 106(2743), 88-9(1947).

Effect of radiocarbon in man is compared to that due to Ra and its decay products, or K, and to action of cosmic rays. Results show that radiocarbon occupies second place in biological importance. Based on number of disintegrations, it is a little below half of K, much above Ra and other natural radio-elements. BA 22-2958

5114

A CONSTANT CURVE OF BLOOD PROTEINS IN RADIUM THE RAPY OF UTERINE CARCINOMAS. C. Fua. Boll. soc. ital. biol. sper. 22, 171(1946). (In Italian).

No changes were noted during 5-6 days of application of Ra. After its removal, usually on second day, there was a sharp drop of protein level ranging from 1-2g per cent. After several days, curve returned to normal. BA 22-3019

5115

EFFECTS OF INHALATION OF AN AIR RENDERED RADIOACTIVE BY PASSAGE OVER THORIUM OXIDE. J. Cluzet. Compt. rend. soc. biol. 135, 949-51(1941). (In French).

Author compares the biological effects of inhalation of air made radioactive by exposure to thorium oxide with effects of inhalation of thorium *per se* (i.e. exposure to gaseous vs. particulate activity). Weight and appetite of guinea pigs chronically exposed to the radioactive gas remained normal. Red cell counts did not change, leukocyte counts increased transiently and then returned to normal. BA 22-3241

5116

RADIUM DIAL PAINTING-MEDICAL STATUS OF WORKERS. Irving Tabershaw. J. Ind. Hyg. Toxicol. 28(5), 212-6(1946).

Fifty-two Ra painters employed for a minimum of 18 mo and maximum of 4 yr failed to show any deleterious effects when amount of Ra in body was kept below 0.1 μ . Determination of breath radon in practical control measure in determining Ra retention, 10-12 curies of radon/l. considered safe standard. BA 22-3830

MUTATION FREQUENCY AS CONDITIONED BY THE
MANNER OF APPLICATION OF RADIATION. J. K.
Makhijani. Indian J. Genet. and Plant Breeding 5(1),
15-31(1945).
Studies with D. melanogaster indicate that differences
in timing of treatment and fertilization caused no significant
difference in frequencies of sex-linked lethals in
spermatozoa. Radiation apparently produces gross
rearrangements by breaking chromosomes, ends later
undergo recombination. Broken ends cannot rejoin
within free spermatozoon, but after fertilization some
changes in conditions makes union of pieces possible.

DEPENDENCE OF THE RATE OF RADIATION-INDUCED
REARRANGEMENTS IN D. MELANOGASTER ON TEMPERATURE
DURING IRRADIATION. A. Kanellis. Naturwissenschaften
33(1), 27(1946). (In German).
Frequency of translocation obtained between 2nd
and 3rd chromosomes of spermatozoa and D. melanogaster
after x-ray dose of 4000 r (70 kv, 66.7 r/min) was 17.1%
at 2°C and 12.33% at 32°. Presumably at low temperatures,
probability of regeneration of fractures of chromosomes
is less than at high. Thus at low temperatures more
fragments will be available to form new combinations.

THE DYSGENIC EFFECT OF INDUCED RECESSIVE
MUTATIONS. J. B. S. Haldane. Ann. Eugenics 14(1),
35-43(1947)
A statistical study showing that total number of deaths
from recessive mutations to be expected as the result
of an atomic bomb explosion is a small fraction of the
number killed immediately and is spread over thousands
of generations. BA 22-8149
- 5132**
THE RADIOSENSITIVITY OF ERYTHROBLASTS. Margaret
A. Bloom and William Bloom. J. Lab. Clin. Med. 32(6),
654-9(1947).
Mammalian bone marrow exposed to total body x
irradiation and fast and slow neurons revealed depressed
hematopoiesis. Injury varies with dose. Radioactive
isotope injections produce much the same effect
Erythropoietic cells are more sensitive than the myelocyto-
poietic and these in turn more sensitive than megakaryocytes.
Findings in chickens were similar. Degenerating erythroblasts

are not to be confused with degenerating lymphocytes.
BA 22-8314

5133

HAEMOLYSIS AND FIXATION OF ERYTHROCYTES BY X-RAYS. L. Halberstaedter and J. Leibowitz. *Biochem J.* (London) **41**(2), 235-9(1947).

Suspensions of erythrocytes down to concentration of 0.5% respond to irradiation with an effective x-ray dose by hemolysis independently of nature of medium in which they are suspended, at concentrations below 0.5% response does depend on medium. In isotonic NaCl, KCl, CaCl₂, NaNO₃, (NH₄)₂SO₄, MgSO₄, and glycerol, effective x-ray dose causes cell fixations and loss of ability to hemolyze, in isotonic glucose, KH₂PO₄, Na₂NHPO₄, NaHCO₃, and glycine, the effect is hemolysis. BA 22-8316

5134

THEORIES AS TO THE BIOLOGICAL ACTION OF RADIATION. N. Koyenuma. *Physik. Z.* **42**, 213-7(1941). (In German).

Author includes mathematical speculations as to effects of radiation upon biological systems with regard to mutations, etc. BA 22-8318

5135

THROMBOCYTES OBSERVED IN DARK FIELD ILLUMINATION UNDER THE INFLUENCE OF RADIUM RAYS. Luis Maissen. *Radiol. Clin.* **15**(4), 237-57(1946) (In German).

In contrast to effects of x rays, change of the active form into the inactive resting state is upset by Ra radiation. Deformed cells are observed, number increasing with dose. Thrombocyte holding power is reduced; thromboplastic fixation to carrier takes longer than in x irradiated or unexposed thrombocytes. BA 22-8319

5136

AN ATTEMPT TO INTERPRET THE BIOLOGICAL ACTION OF RADIATION IN KINETIC TERMS. W. Minder. *Radiol. Clin.* **15**(1), 30-5(1946). (In German).

X-ray induced changes within the cell occur in conformity to a rigid pattern of the type in which substance A is activated, converted into an intermediate product B which, in turn, is converted into final product X, conversion being quantitatively determined by radiation dose. Activation of water may play an important part. BA 22-8321

5137

PLASMA PROTEINS AND PLASMA VOLUME IN RATS FOLLOWING TOTAL-BODY X-IRRADIATION. H. Supplee, J. D. Hauschildt, and C. Entenman. *Am. J. Physiol.* **169**, 483-90(1952).

In rats given 750 r, the plasma volume, expressed as milliliters/100 gm final body weight, decreased to values 20 per cent below the controls by the third post-exposure day. No decrease was observed in animals given 400 or 600 r. Plasma volumes then increased in all irradiated rats. Plasma protein concentration of rats exposed to 600 and 750 r decreased to 20 per cent below control values.

5138

ON THE THEORETICAL-MATHEMATICAL TREATMENT OF PROBLEMS ON RADIOBIOLOGICAL EFFECTS. R. M. Sievert. *Acta Radiol.* **22**, 237(1941). (In German). BA 22-8323

5139

THE PATHOLOGIC CHANGES INDUCED BY IONIZING RADIATIONS IN THE BIKINI ANIMALS. John L. Tullis. *Am. J. Pathol.* **23**(5), 891(1947).

An abstract. BA 22-8324

5140

THE MATHEMATICAL THEORY OF BIOLOGICAL REACTION PHENOMENA ESPECIALLY TO ROENTGEN RADIATION. J. Th. van der Werff. *Acta Radiol.* **23**, 603(1942). (In German).

Author discusses Sievert's theoretical considerations. Reactions after irradiation are subordinated to general

biological reactions. Many experimental observations are cited in support of the thesis, especially Forssberg's studies on rate of growth of *Phycomyces Blakesleeanus* after roentgen irradiation. Author applies his theory in explaining phasic nature of reactions (as did Sievert). BA 22-8325

5141

BLOOD VOLUME AND OTHER STUDIES IN HAMSTERS X-IRRADIATED WITH UPPER BODY SHIELDED. M. N. Swift and S. T. Taketa. *Federation Proc.* **16**, 126(1957).

Circulating blood volume began to decline about the third post-exposure day. The weight of the small intestine contents was moderately increased from the third day on, owing to the fluid increase

5142

THE UTILIZATION OF ARTIFICIALLY RADIOACTIVE ISOTOPES FOR THE PRODUCTION OF LOCALIZED BIOLOGICAL EFFECTS. J. H. Muller and P. H. Rossier. *Experientia* **3**, 75-6(1947).

Localized radiation in lungs was obtained by intravenous injection of radioisotope Zn⁶⁸, suspended in a solution of pectin. BA 22-8335

5143

ADRENAL RESPONSE TO TOTAL BODY X-RADIATION. H. M. Patt, M. N. Swift, E. B. Tyree, and E. S. John. *Am. J. Physiol.* **150**(3), 480-7(1947)

Adrenal cholesterol decreased 40-50% 3 hr after irradiation of white male rats with either 650 r or 900 r. Decrease was followed by gradual rise toward or above normal after which (terminally) a precipitous falling off was observed. Adrenal weight changed little initially but increased (50-100%) in intermediate and terminal periods after treatment with either dose. After 200 r there was little change in adrenal activity. BA 22-8748

5144

THE EFFECT OF ROENTGEN RAYS AND EXPOSURE TO RADIUM ON FERTILITY. Charles E. Dunlap. *Human Fertility* **12**(2), 33-9(1947).

Ra and x-ray treatment during pregnancy should be restricted to very clear and urgent indications, and diagnostic x-ray examinations should not be repeated frequently. Author feels that any pregnancy which has been subjected to therapeutic radiation should be interrupted because of the high percentage of defective children born after such treatment. BA 22-8812

5145

EFFECTS ON EMBRYONIC DEVELOPMENT OF X-IRRADIATION OF RABBIT SPERMATOZOA IN VITRO. E. C. Amoroso and A. S. Parkes. *Proc. Roy. Soc. (London)* **134B**(874), 57-72(1947).

Rabbits in which ovulation was induced artificially were inseminated with spermatozoa x rayed in vitro with 50-100,000 r. After 250-1000 r, normal divisions dropped progressively below normal (80-90%) to 2% independent of intensity or type or irradiation and time between exposure and insemination (5-17 hr). Cytological damage to spermatozoa nuclei appeared after 10,000 r, polyspermy after 1000 r. Following doses of 50-250 r fertile young were born, no living young following 1000 r. BA 22-9148

5146

INVESTIGATIONS OF THE BIOLOGICAL EFFECTS OF SOFT X-RAYS. V. Hardung. *Helv. Phys. Acta* **18**(1), 45-71(1945).

Large variations were found in the mean dose of 20 kv and of Al K x rays necessary to stop division in *E. coli*. Curves obtained with *Bacillus pyocyaneus* and Al K x rays showed "multiple hit" type of effect, those with 4000 V x rays, "one hit" effect. An attempt was made using *B. pyocyaneus* to prove the hit theory by comparing effects of equal doses of radiation at several x-ray wave lengths. BA 22-9241

5147

THE EFFECT OF ROENTGEN RAYS AND UV RADIATION ON THE PERMEABILITY OF YEAST. G. Hevesy and K. Zerahn. *Acta Radiol.* 27(3/4), 316-27(1946).

Dose of 30,000 r was sufficient to kill about 10% of yeast cells and to influence amount of free radio-phosphorus (P^{32}) and radio-potassium (K^{42}) migrating daily from yeast cells into nutrient solutions, but only to very slight extent. BA 22-9982

5148

A QUANTITATIVE ANALYSIS OF THE EFFECT OF GAMMA RADIATION ON MALIGNANT CELLS IN VITRO AND IN VIVO. I. Lasnitzki. *Brit. J. Radiol.* 18, 214-20 (1945).

Effect of 198 r of gamma rays was qualitatively and quantitatively similar on mouse adenocarcinoma 63 in vitro and in vivo. Recovery was more rapid in vivo. BA 19-18659

5149

TWENTIETH ANNUAL REPORT OF THE BRITISH EMPIRE CANCER CAMPAIGN 1943. J. B. Lockhart-Mummery, ed. London, British Empire Cancer Campaign. 1943.

Description of effect on ovary of rabbits of varying doses of Ra and Rn is included. BA 19-18663

5150

THE EFFECTS OF ROENTGEN RADIATION ON THE THYMONUCLEIC ACID CONTENT OF TRANSPLANTABLE MAMMARY CARCINOMAS. Robert E. Stowell. *Cancer Research* 5(3), 169-78(1945).

In 6 rat tumors given 4000 r, thymonucleic acid/unit volume was decreased by statistically significant amounts and 2 tumors showed significant decrease in amount/cell. In 9 of 16 irradiated mouse tumors, decrease in thymonucleic acid/unit volume was significant; and in four of these decrease/cell was significant. BA 19-18686

5151

EFFECT OF RADIATION ON MALARIA. AN EXPERIMENTAL STUDY IN THE CHICK AND DUCK. R. H. Rigdon and Hillyer Rudisell, Jr. *Proc. Soc. Exptl. Biol. Med.* 59(2), 167-70 (1945).

Plasmodium lophurae was injured by x rays in vivo and in vitro (studied development of parasitemia in chick). Dose necessary to produce significant effect in vivo is near lethal dose for chick, Ra bromide had no effect on *P. lophurae*, but produced severe degenerative changes in treated birds. BA 19-20372

5152

SUPPLEMENT TO THE WORK "ON THE PHYSICAL OCCURRENCE OF ELICITATION OF GENE MUTATIONS BY RADIATION." K. G. Zimmer and N. W. Timofeeff-Ressovsky. *Z. indukt. Abstamm.-u. Vererb.* 80(4), 619 (1942). (In German).

A few points regarding the comparison of "pairs of ions per cm^3 tissue" produced by x rays and neutron radiation, as used in the original paper are explained. BA 19-4215

5153

INFLUENCE ON MUTATION PRODUCTION AND OTHER EFFECTS OF X-RAYS ON *ANTIRRHINUM MAJUS* OF VARIATION IN SWELLING OF IRRADIATED SEEDS. E. Knapp and R. Kaplan. *Z. indukt. Abstamm.-u. Vererb.* 30(4), 501-50(1942). (In German).

Results indicate that gas exchange as well as water content affect physiological processes which alter radiosensitivity of seeds. BA 19-4224

5154

THE VALIDITY OF THE BUNSEN-ROSCOE LAW IN THE PRODUCTION OF MUTATIONS BY RADIATION OF EXTREMELY LOW INTENSITY. S. P. Ray-Choudhuri.

Proc. Roy. Soc. Edinburgh 62B(pt. 1 paper no. 9), 66-72 (1944).

Drosophila sperm were irradiated in body of impregnated females (70 mg of Ra for 720 hr, 2 dosages of 2000 r and 400 r, at 0.556 r and 2.78 r/hr). Frequency of sex-linked lethals was directly proportional to dosage; independent of irradiation intensity. Mutation rate was independent of duration of treatment when flies were given 29 r/hr and a (maximal) total dose of 1300 r. BA 19-4250

5155

X-RAYS AND THE REPRODUCTIVE CYCLE OF RING-NECKED PHEASANTS. Leonard B. Clark and Gardiner Bump. *Biol. Bull.* 87(2), 134-7(1944).

Ring-necked pheasants given 50, 75, 225, and 425 r of x rays applied to head region show disturbances in reproductive cycle by decreased egg production, decreased length of laying period, and possibly decreased viability of eggs laid. Decrease is related to amount of radiation. Rate of egg laying is decreased in experimental animals but is not correlated with x-ray dose over range studied. BA 19-4364

5156

RADIUM METABOLISM IN RATS AND THE PRODUCTION OF OSTEOGENIC SARCOMA BY EXPERIMENTAL RADIUM POISONING. R. D. Evans, Robert S. Harris, and J. W. M. Bunker. *Am. J. Roentgenol. Radium Therapy* 52(4), 353-73(1944).

Oral or intradermal administration of 25-100 γ of Ra in young male rats always resulted in chronic Ra poisoning and, in a high percentage of cases, in development of primary osteogenic sarcoma. Rats are of no use in obtaining estimate of toxic Ra dose for humans, as its tolerance/kg of body weight is much higher. BA 19-4365

5157

THE EFFECTS OF REPEATED IRRADIATION OF THE GASTRIC REGION WITH SMALL DOSES OF ROENTGEN RAYS UPON THE STOMACH AND BLOOD OF DOGS. W. C. Hueper and J. de Carvajal-Forero. *Am. J. Roentgenol. Radium Therapy* 52(5), 529-34(1944).

Seven dogs were x irradiated over gastroduodenal region, rest of abdomen lead-shielded. Minor changes in gastric mucosa with moderate and transitory anemia were caused by total of 4875 r in small individual doses, administered within 25 wk. Total of 6000 r, within 4 wk (single doses of 300 r) produced marked loss in body wt, moderate to severe secondary anemia and perforating gastric ulcers. BA 19-4366

5158

ALPHA RAYS IN THE TREATMENT OF WOUNDS. E. M. Uhlmann. *Surg. Gynecol. Obstet.* 79(4), 412-18(1944).

Author reports his observation on lesions in 8 patients treated with α rays incorporated in neutral fat and administered as ointment in strength of 1000 electrostatic units/10 ml of final preparation. Histological study showed formation of new capillaries, ulceration with impaired local blood supply healed better than with other surgical therapy. Rate of wound healing was accelerated, resulting scars were soft, smooth, nonadherent, and promoted good function. BA 19-4367

5159

DIRECT AND INDIRECT ACTIONS OF RADIATION ON VIRUSES AND ENZYMES. D. Lea, K. M. Smith, Barbara Holm, and Roy Markham. *Parasitology* 36(1/2), 110-18 (1944).

Inactivation of tobacco mosaic virus at various concentrations by x rays is described. Inactivation dose is independent of concentration at high concentrations, at low concentrations it is also constant but lower in value. Mechanism of direct and indirect inactivation

are compared. There appears to be no difference in x-ray inactivation of viruses and enzymes. BA 19-5398

5160
PISUM SATIVUM MUTATIONS INDUCED BY X-RAYS. G. von Rosen. Hereditas 28, 313-38(1942).

Three lines of P. sativum were x irradiated. In two lines several types of chlorophyll-deficient plants and an albaviridis-chimaera type appeared; in 22 mutations no pure albino forms were produced. Mutations also appeared in third line which was tall and had thick shells. All mutations found were concerned with chlorophyll content of plants. BA 19-5977

5161
A COMPARISON OF X-RAY INDUCED MUTATIONS AND MUTATIONS OCCURRING SPONTANEOUSLY IN RING CHROMOSOMES IN MAIZE. Edward Allan Weaver. University of Missouri, Thesis. 1942. BA 19-5981

5162
THE PRODUCTION OF CHROMOSOME MUTATIONS BY ROENTGEN IRRADIATION. A CRITICISM OF THE WORKS OF H. MARQUARDT. Hans Bauer. Z. Botan. 38(1), 26-41(1942). (In German).

The authors criticism of Marquardt's new hypothesis of origin of chromosome mutations is based on lack of agreement between observed and expected frequencies of complete and incomplete recombinations. Author claims that if calculations are corrected, data do not contradict prevailing hypothesis. BA 19-7821

5163
ANALYSIS OF ROENTGEN-INDUCED CHROMOSOME VARIATIONS AND CHROMOSOME MUTATIONS. A REPLY. Hans Marquardt. Z. Botan. 38(1), 42-63(1942). (In German).

This report is an answer by the author to criticisms of his theory by Bauer. Marquardt maintains that Bauer's calculations do not take into account the impossibility of precise localization of break- and contact-points, nor the fact that experimental material on which ratios are based necessarily includes only viable eggs. BA 19-7822

5164
X-RAY INDUCED GROWTH FACTOR REQUIREMENTS IN BACTERIA. C. H. Gray and E. L. Tatum. Proc. Natl. Acad. Sci. U. S. 30(12), 404-10(1944).

E. coli and A. melanogenum were x rayed until 99.99% cells were killed. From 800 isolations of survivors of E. coli, 2 strains differed from parent, of 575 from A. melanogenum, 4 strains differed with respect to growth factor requirements. X-irradiation apparently modified ability of bacteria to carry out specific biochemical reactions, growth of each mutant being a function of concentration of the required supplement. BA 19-7830

5165
GROWTH RATES OF THE PRIMARY FLIGHT FEATHERS OF THE PIGEON AND THE EFFECTS OF IRRADIATION. Rose E. Frisch. J. Exptl. Zool. 97(3), 199-229(1944).

Squabs were irradiated with 1000, 1500, or 2000 r at varying interval after hatching. Data suggest that axial growth of feather was reduced by constant factor after exposure. BA 19-7851

5166
A GROWTH-DELAYING EFFECT OF ULTRAVIOLET RADIATION ON BACTERIAL VIRUSES. S. E. Luria. Proc. Natl. Acad. Sci. U. S. 30(12), 393-7(1944).

Growth-delaying effect induced by ultraviolet-irradiation was apparently brought about by action of quanta which did not act lethally, and since effect was progressive, it is reasoned that it results from cumulative effect of ultraviolet quanta absorbed by virus particles. No similar effect was found on virus particles surviving x irradiation,

hence surviving particles probably had not absorbed any radiation at all. BA 19-8914

5167
INACTIVATION OF MALARIAL PARASITES BY X-RAYS. B. E. Bennison and G. Robert Coatney. Public Health Repts. U. S. 60(5), 127-32(1945).

Sporozoite and trophozoite suspensions of Plasmodium gallinaceum were exposed to graded x-ray doses. Trophozoites were inactivated by 20,000 r, but not by 10,000 r; sporozoites, by 8000 r but not by 6000 r. Trophozoite suspensions exposed to 2000 and 8000 r produced infections characterized by lengthened prepatent periods and lengthened survival times. Sample of human blood parasitized by P. malariae and exposed to 5000 r failed to produce an infection in susceptible patient. BA 19-9556

5168
IS THE ESTABLISHMENT OF COLONIES OF TRYCHOPHYTON ON THE SKIN INFLUENCED BY RADIATION? ROENTGEN RAYS AND U.-V). K. von Berde. Dermatologica 84, 320-9(1941). (In German).

Experiments on 75 persons with healthy skin showed that neither an epilation dose of x rays nor an erythema dose of quartz lamp rays is sufficient to cause biological, physical, or physico-chemical changes of skin in which the epidermis of a hairless patch would be in a condition to prevent establishment and especially the development of Trychophyton gypseum asteroides. BA 19-8928

5169
REDUCED CHROMONEMA ELONGATION AND ABNORMAL SPIRALIZATION FOLLOWING X-RAY TREATMENT OF MEIOTIC CHROMOSOMES. A. H. Sparrow. Genetics 30(1), 23(1945).

Author describes observations on pollen mother cells of Trillium. BA 19-9837

5170
X-RAY INHIBITION OF MITOSIS IN RELATION TO CHROMOSOME NUMBER. A. Marshak and Muriel Bradley. Proc. Natl. Acad. Sci. U. S. 30(9), 231-7(1944).

Root tips of Triticum (T. monococcum, T. dicoccum, T. vulgare) and of Bromus (B. carinatus, B. arizonicus) with chromosome numbers 14, 28, 42, 56, and 84 respectively were irradiated and after 3 hr incubation fixed and stained with acetocarmine. Counts of metaphases and anaphases show that inhibition varies inversely as the chromosome number but is neither directly nor inversely proportional to chromosome length. Inhibition by x rays occurs through action on centromeres. BA 19-9843

5171
THE EFFECT OF ULTRAVIOLET RADIATION AND X-RAYS ON MUTATION PRODUCTION IN PENICILLIUM NOTATUM. Alexander Hollaender and E. M. Zimmer. Genetics 30(1), 8(1945).

An abstract. BA 19-9869

5172
QUANTITATIVE EFFECTS OF RADIATION ON MUTATION PRODUCTION IN NEUROSPORA CRASSA. E. R. Sansome, A. Hollaender, E. Zimmer and M. Demerec. Genetics 30(1), 19-20(1945).

An abstract. BA 19-9884

5173
THE EFFECT OF X-RAYS UPON DOMINANT MUTATION IN MAIZE. L. J. Stadler. Proc. Natl. Acad. Sci. U. S. 30(6), 123-8(1944).

Gene "a" (colorless aleurone) rarely shows spontaneous mutation, but mutates frequently in presence of factor "Dt". X-rays failed to induce mutation of "a" to "A" (or to any other aleurone allele) in populations large enough to yield approximately 400,000 mutations to "A" under influence of homozygous "Dt" or 900,000 losses of "A" by deficiency or by mutation to a colorless allele. BA 19-9886

E OCCURRENCE OF X-RAY INDUCED DOMINANT LETHAL MUTATIONS IN HABROBRACON. Gertrude Idenhalt. *Genetics* 30(2), 197-205(1945).

Haploid males were x rayed with 500-10,000 r. In 3-allele crosses all F_1 males were haploid, all males diploid. Number of F_1 males remained constant, males decreased with increasing x-ray dose. Dominant lethal mortality curves were similar to those of *Drosophila*. Doses of 152,000 and 168,000 r caused at least one dominant lethal in each sperm and inactivated %. BA 19-9907

75

RELATIVE SENSITIVITY OF CHROMOSOMES TO ULTRAVIOLET RAYS. III. COMPARISON OF CARCINOMA AND LYMPHOSARCOMA IN THE RAT.

Marshak and Muriel Bradley. *Proc. Natl. Acad. Sci. U. S.* 31(2), 84-90(1945).

Chromosomes of Walker 256 carcinoma were more radiosensitive than those of a lymphosarcoma. Ratio of mutation to x-ray efficiency (n/x) was approximately 6 at all time intervals in lymphosarcoma, while carcinoma increased from 6 at 3 hr to 10.8 at 24 hr. BA 19-9918

76

POST-IRRADIATION BONE CHANGES. F. R. Gratzek, G. Holmstrom, and L. G. Rigler. *Am. J. Roentgenol. and Radium Therapy* 53(1), 62-76(1945).

X-ray therapy in infancy or childhood may result in retardation of bone growth. In adults it may be followed by spontaneous fracture or aseptic necrosis. BA 19-10093

77

METHOD OF DISTRIBUTING BETA-RADIATION TO THE VASCULO-ENDOTHELIAL SYSTEM AND ADJACENT TISSUES. Hardin B. Jones, Charles J. Wrobel, and William R. Lyons. *J. Clin. Invest.* 23(5), 783-8(1944)

Method is given for preparation of $CrP^{32}O_4$ which, in suspension, has average particle size of 1μ . In mice, radiation doses which deplete the spleen do not affect the liver. Doses of 80,000 r in liver may induce hepatoma. BA 19-10094

78

CUPATION OF HEALTH, ENCYCLOPAEDIA OF HYGIENE, TECHNOLOGY AND SOCIAL WELFARE, STUDIES FROM THE POINT OF VIEW OF LABOUR, INDUSTRY AND TRADES SPECIAL SUPPLEMENT. INDUSTRIAL HEALTH IN WARTIME. Montreal International Labour Office. 1944

This review of developments in industrial toxicology includes a section on radioactive materials. BA 19-10604

79

EFFECT OF X-RAYS ON THE FREQUENCY OF A BACTERIAL MUTATION. Raymond Croland. *Compt. rend.* 216(13/22), 13-8(1943). (In French).

In *Moraxella lwoffii* var. *brevis* radiation acts directly on S^- bacteria and increases rate of their transformation into S^+ bacteria. Mutation frequency is a function of increasing doses of radiation absorbed. BA 19-10784

80

METHOD FOR STUDYING THE BIOLOGICAL EFFECT OF COSMIC RAYS. J. Eugster. *Schweiz. Z. allgem. med. u. Bakteriolog.* 2, 109-10(1939). (In German).

Special photographic plates were exposed under Pb cosmic rays for some months together with soil spores homogeneously distributed on sterile Petri dishes. Growth-inhibiting influence of cosmic rays on soil bacteria is apparent after period of exposure of 8-10 months. BA 19-11129

81

INFLUENCE OF X-RAYS ON THE DEVELOPMENT OF THE ENDOTHELIAL STAGE OF AVIAN MALARIA (*PLASMODIUM*

GALLINACEUM). H. Zain. *Deut. Tropenmed. Z.* 47(3), 68-71(1943). (In German)

X-rays do not suppress exoerythrocytic stages of *P. gallinaceum*, instead the parasites are increased in number. Effect may be due to x-ray induced activation of reticulo-endothelial system. BA 19-11685

5182

X-RAY SENSITIVITY CHANGES IN MEIOTIC CHROMOSOMES AND THE NUCLEIC ACID CYCLE. A. H. Sparrow. *Proc. Natl. Acad. Sci. U. S.* 30(7), 147-55(1944).

Relative effects of x-rays on stages of meiosis and on microspore resting nuclei studied in *Trillium erectum* are described. Ratio of chromosome aberrations was 1:2:6:9:1 for early meiotic prophase, pachytene, metaphase, anaphase, and post meiotic resting nuclei, respectively. High radiosensitivity is believed to be related to high content of DNA. BA 19-12054

5183

ALTERATION OF THE FREQUENCY OF X-RAY-INDUCED CHROMOSOMAL BREAKS BY USE OF ULTRAVIOLET AND NEAR INFRARED RADIATION. Berwind Kaufmann and Alexander Hollaender. *Genetics* 30(1), 11-12(1945).

Authors present observations on the number of altered sperm and the number of chromosome breaks in *Drosophila*. BA 19-12081

5184

LETHAL DOSE STUDIES WITH X-RAYS. F. P. Ellinger. *Radiology* 44(2), 125-42(1945)

Minimal lethal dose for mice was 200 r/air, absolute lethal dose, 1000 r/air for mice, 500 r/air for guinea pigs. Lethal effect of x-rays was correlated with destruction of Malpighian bodies of spleen. Relationship between dose and lethal effect followed S-shaped curve in both species. BA 19-12367

5185

EFFICACY OF HEMATOPOIETIC PROCEDURES IN RATS X-IRRADIATED WITH INTENSIVELY SHIELDED. N. M. Swift, T. Taketa, and V. P. Bond. *Radiation Research* 4, 186-92(1956).

A postirradiation dose of 60 mg of bone marrow per 100 gm of body weight was slightly more effective than 30 mg per 100 gm in reducing mortality in rats given 1200 r with the gastrointestinal tract shielded.

5186

PERSISTENCE OF THE EFFECT OF X-RAYS AND OF RADIUM RAYS ON DORMANT SEEDS. H. Guillemot. *Compt. rend. soc. biol.* 68, 309-11(1910).

5187

ARTIFICIAL AND RADIOACTIVE BODIES IN PHYSIOLOGY AND MEDICINE. N. N. Das Gupta. *Science and Culture (India)* 10(6), 221-7(1944).

Author describes experiments using radioisotopes of As, Br, C, Ca, Cl, Fe, I, K, N, Na, P, S, Si, and Y. BA 19-12504

5188

RESPONSE OF THE LIVER TO IRRADIATION. F. P. Ellinger. *Radiology* 44(3), 241-54(1945).

Threshold dose producing liver injury produced 70-80% mortality rate. Small daily x-ray doses produced liver damage only when accumulated dose equaled lethal single dose. Irradiation effects are ascribed to combined influence of direct x-ray action plus those accounted for by histamine theory. BA 19-12626

5189

RESPONSE OF THE RETINA TO THE DIRECT ROENTGEN BEAM. A METHOD OF ASSESSING THE CONDITION OF THE RETINA AND AN AID IN LOCALIZING INTRAOCULAR FOREIGN BODIES. E. W. Godfrey, H. P. Schenck, and L. E. Silcox. *Radiology* 44(3), 229-36(1945). BA 19-12743

5190

NEW STRAINS OF PENICILLIUM NOTATUM INDUCED BY BOMBARDMENT WITH NEUTRONS. W. G. Myers and Hazel Jean Hanson. Science 101(2623) 357-8(1945).

About 100 mutations were produced in P. notatum by neutron bombardment from cyclotron. Antibiotic activity of many of the new strains was qualitatively similar to parent strain. Number of new strains was fairly proportional to amount of bombardment. BA 19-13618

5191

PHYSIOLOGICAL INFLUENCE OF METALS AT A DISTANCE. THE BUCKWHEAT TEST, A NEW BIOLOGIC TRACE INDICATOR OF EXCEPTIONAL SENSITIVITY FOR RADIOACTIVE ELEMENTS. Werner Schmidt. Ber. deut. botan. Ges. 61(3), 75-80(1943). (In German).

Tropism in buckwheat seedlings was positive at 240-290 cm from a 10^{-8} g Ra source. Response was negative in immediate vicinity of Ra. Tropism is ascribed to β rays. BA 19-14461

5192

COLCHICINE AND X-RAYS IN THE TREATMENT OF PLANT AND ANIMAL OVERGROWTHS. Michael Levine. Botan. Rev. 11(3), 145-80(1945).

Topics discussed are: effect of colchicine on animals and on plants, colchicine and x rays, colchicine and bacterial filtrates acenaphthene and other chemicals, colchicine in genetics, colchicine in cytology, effects of colchicine on the endocrines, and irradiation with x rays. BA 19-15190

5193

THE EFFECT OF COLCHICINE AND X-RAYS ON ONION ROOT TIPS. Michael Levine. Cancer Research 5(2), 107-19(1945).

Author reports on combined effect of 0.01% aqueous solution of colchicine and x rays on Allium cepa var. Yellow Globe and A. cepa var. Brigham Yellow Globe. Effects on root and leaf growth are described. BA 19-15249

5194

THE BIOLOGICAL EFFECTS OF X-RAYS AS A FUNCTION OF INTENSITY. A. A. Bless. Proc. Natl. Acad. Sci. U. S. 30(5), 118-21(1944).

Various x-ray intensities (from 25 r/min to 5000 r/min) produced no significant differences in length of stems of Big Club var. wheat sprouts from irradiated seeds when dosage was constant. BA 19-15229

5195

QUANTITATIVE IRRADIATION EXPERIMENTS WITH NEUROSPORA CRASSA. II. ULTRAVIOLET IRRADIATION. Alexander Hollaender, Eva R. Sansome, E. Zimmer, and M. Demerec. Am. J. Botan. 32(4), 226-35(1945).

Occurrence of sterility in association with mutants in microconidia was less frequent in ultraviolet mutants than in x-ray mutants. Authors suggest that ultraviolet effects are localized, while x-ray effects are more diversified, including chromosome breaks and rearrangements. BA 19-15243

5196

GENETIC PROOF OF HETEROKARYOSIS IN PENICILLIUM NOTATUM. G. Pontecorvo and A. R. Gemmell. Nature 154(3912), 514-15(1944).

Four of the 5 x-ray mutations tested behaved as if they were recessive, involving 4 different loci. BA 19-15262

5197

QUANTITATIVE IRRADIATION EXPERIMENTS WITH NEUROSPORA CRASSA. I. EXPERIMENTS WITH X-RAYS. Eva R. Sansome, M. Demerec, and Alexander Hollaender. Am. J. Botan. 32(4), 218-26(1945).

In x-irradiated microconidia, increase in mutation rate with increase in energy followed straight line relationship at low dosages and reached 78.5% at 126,000 r. Increased intensity led to increased mutation rate. Partial

sterility was often observed in phenotypic mutants from irradiated spores and is believed to be the result of chromosomal aberration. Two types of mutants are described. BA 19-15268

5198

ON THE DEPENDENCE OF ROENTGEN INDUCED TRANSLOCATION RATES ON THE RIPENESS OF IRRADIATED GAMETES IN MALE DROSOPHILA MELANOGASTER. A. Catsch and G. Radu. Naturwissenschaften 31(31/32), 368-9(1943). (In German).

Wild type males were x rayed (1 hr, 70 kv, 0.5 mm Al filter, dose of 4000 r). Progressive decline of translocation rate, from 12% to 0, was noted with aging of original males. Authors suggest that spermatogonial cells either react differently from sperms to x rays, or some selective elimination occurs in former. BA 19-15282

5199

DOSE PROPORTIONALITY AS DETERMINED BY ROENTGEN-INDUCED TRANSLOCATIONS BETWEEN CHROMOSOMES II AND III IN DROSOPHILA MELANOGASTER. A. Catsch, G. Radu, and A. Kanellis. Naturwissenschaften 31, (31/32), 368(1943). (In German).

Wild type males were x rayed (300 min, 70 kv, 0.5 mm Al filter, doses of 1000, 2000, or 4000 r). Translocation rate was approximately 1.5 power of dosage times a constant. Multiple hits and lethal eliminations are suggested to account for exponent value of < 2. BA 19-15283

5200

GENERAL BIOLOGICAL REACTIONS ON RADIATION INFLUENCE. F. E. Lehmann. Radiol. Chn. 10, 130-46(1941). (In German).

Includes discussion of: mutations, chromosome deficiencies, "quantum-hit" theory, suppression of mitosis by x rays in amphibia, and viability of those tissues devoid of mitosis. BA 21-18817

5201

EFFECTS OF HYDROGEN PEROXIDE PRODUCED IN THE MEDIUM BY RADIATION ON SPERMATOZOA OF ARBACIA PUNCTULATA. Titus C. Evans. Biol. Bull. 92(2), 99-109(1947).

Sperm of A. punctulata, suspended in heavily irradiated water (over 100,000 r), caused reduction of survival time and delay in first cleavage when such sperm were used to inseminate fertile eggs. Agent in water responsible for effects is considered to be H_2O_2 . BA 21-19065

5202

SOME EXPERIMENTS IN IRRADIATING DROSOPHILA EGGS WITH ROENTGEN-RAYS AND γ -RAYS IN A MAGNETIC FIELD. A. Forssberg. Acta Radiol. 21, 213-219(1940).

Drosophila eggs that were irradiated with x and γ rays during simultaneous application of magnetic field of 6,000 Gauss exhibited a small increase in irradiation effect. BA 21-19066

5203

PRODUCTION OF INCREASED CAPILLARY FRAGILITY IN RATS FOLLOWING IRRADIATION. J. Q. Griffith, Jr., Eleanor Anthony, E. P. Pendergrass, and R. Perryman. Proc. Soc. Exptl. Biol. Med 64(3), 331-2(1947).

Rn ointment, 500 E. S. U. in 1 ml, was introduced into peritoneal cavity of normal rats. One - 8 wk later, increase in capillary fragility was demonstrable in peritoneal vessels. BA 21-19067

5204

EFFECT OF RUTIN ON RECOVERY TIME FROM RADIATION INJURY IN RATS. J. Q. Griffith, Jr., Eleanor Anthony, E. P. Pendergrass, and R. Perryman. Proc. Soc. Exptl. Biol. Med. 64(3), 332-3(1947).

All animals in the experiment were given 2385 r to one leg (single dose, 200 kv, 15 ma, $\frac{1}{2}$ mm Cu plus 1 mm Al filter, 26 cm skin target distance). Half were used as

controls; other half given rutin, 20 mg every third day, implanted subcutaneously as pellet. Time of onset of reaction and height of reaction were essentially the same for the two groups, but rutin-treated rats recovered more rapidly. BA 21-19068

5205

THE EARLY EFFECTS OF X-RAYS ON THE OVARIES OF THE RAT. L. Halberstaedter and M. Ickowicz. *Radiology* 48, 369-73(1947).

In ovaries of normal rats, pyknosis in granular layer is generally restricted to follicles whose ovule contains nucleus in state of division. Four hr postirradiation with at least 400 r/air (150 kv, 4 ma, 0.5 mm Cu filter, 30 cm distance, 100 r/min), pyknoses are evident in follicles whose ovule contains a resting nucleus as well as in primary follicles. BA 21-19069

5206

ATTEMPTS TO FIND PRODUCTS BLOCKING NUCLEIC ACID FORMATION IN THE CIRCULATION OF AN IRRADIATED ORGANISM. L. Ahlstrom, H. v. Euler, G. Hevesy, and K. Zerahn. *Arkiv. Kemi, Mineral. Geol.* 23A(10), 1-6(1947).

Blood (9-23 ml), of 4 wk-old rabbits irradiated with 7500-10,000 r was transfused to nonirradiated paired litter-mates. Radioactive phosphate (20 μ c) was administered subcutaneously to nonirradiated rabbits and after 2 hr, activity of DNA and P extracted from liver, kidneys, and intestinal mucosa was compared with free P extracted from corresponding organisms and plasma. Results indicate slower formation of DNA in kidney and liver, no effect in labeled intestinal mucosa in transfused animals. BA 21-19070

5207

THE OVARY OF THE MOUSE AFTER X-RAY TREATMENT. G. J. van Eck-Vermande. *Acta Brevia Neerl. Physiol., Pharmacol., Microbiol.* 14(1/3), 40-2(1946).

Detectable changes in mouse ovary one day after x-ray treatment are: damaged egg cells of large follicles with disorganized and destroyed granulosa, enlargement, vacuolation and more fat deposition of interstitial cells, in some follicles an atretic appearance and cells joining surrounding interstitial tissue, sporadic estrus, production of estrogenic substances by interstitial cells. Young primary follicles and primordial egg cells show no symptoms of degeneration. BA 21-19504

5208

MECHANISM OF RADIATION EFFECTS AGAINST MALIGNANT TUMORS. Shields Warren. *J. Am. Med. Assoc.* 133(7), 462-3(1947).

A brief discussion of current theories of effect of x rays and radioactive radiations upon normal and diseased tissues is presented. BA 21-19815

5209

THE ATOMIC BOMB EXPERIMENTS IN THE PACIFIC WITH A CONSIDERATION OF THE RELATIONSHIP OF ATOMIC ENERGY TO THE FUTURE OF MEDICINE. E. P. Pendergrass. *Trans. Studies Coll. Physicians Phila.* 14(3), 107-12(1946). BA 21-19076

5210

PROTECTIVE METHODS IN RADIOLOGY. W. Binks. *Brit. Med. Bull.* 4(1), 58-64(1946).

Author describes safeguards for protection of operators of x-ray equipment, and considers factors importance in establishing tolerance doses. BA 21-19877

5211

MEASUREMENTS OF RADIOACTIVITY IN AN INDUSTRIAL PAINTING ROOM. C. J. Braudo and J. D. Craggs. *Brit. J. Ind. Med.* 3(1), 15-9(1946).

Industrial hazards arising from use of radioactive luminous compound are reviewed; tolerance limits set

by British and American authorities summarized. Simple calculation of ventilation requirements are given for certain idealized conditions. BA 21-19878

5212

MEDICOLEGAL ASPECTS OF INJURIES FROM EXPOSURE TO ROENTGEN RAYS AND RADIOACTIVE SUBSTANCES. (SYMPOSIUM ON SCIENTIFIC PROOF AND THE RELATIONS OF LAW AND MEDICINE.) Charles E. Dunlap. *Occupational Med.* 1(3), 237-301(1946).

Radiation injuries include: dermatitis, skin cancer, bone necrosis, gastroenteritis, sterility, damage to blood forming tissue, and damage to fetus in utero. It is recommended that use of Ra and x rays be limited by law to properly qualified persons. BA 21-19879

5213

THE ROLE OF ADRENAL CORTICAL INJURY IN THE TOXIC EFFECTS OF X-RAY EXPOSURE. Bradford N. Craver. *Federation Proc.* 6(1), 319(1947).

Two series of Wistar male rats were x irradiated with 660 r whole body exposure and 29 days later exposed to 880 r. Protected series (lead strip 1 inch wide placed over adrenal region) showed significantly lower mortality and morbidity up to the time of their disposal (30 days) after second exposure than did control series (lead strip $\frac{1}{2}$ inch wide placed above and below adrenal area). BA 21-21501

5214

QUANTITATIVE HISTOLOGIC STUDY OF THE EFFECT OF CHRONIC WHOLE-BODY GAMMA IRRADIATION ON MOUSE TESTES. Allen B. Eschenbrenner, Egon Lorenz, and Eliza Miller. *Federation Proc.* 6(1), 391(1947).

An abstract. BA 21-21502

5215

THE ROLE OF INTENSITY IN CHRONIC IRRADIATION WITH GAMMA AND X-RAYS. Egon Lorenz. *Federation Proc.* 6(1), 395-6(1947).

An abstract. BA 21-21503

5216

NONSPECIFICITY OF THE PATHOPHYSIOLOGY OF THE RADIATION SYNDROME. E. E. Panter. *Federation Proc.* 6(1), 175(1947).

An abstract. BA 21-21504

5217

THE CLINICAL SEQUENCE OF RADIATION DAMAGE. C. L. Prosser, E. E. Panter, and M. N. Swift. *Federation Proc.* 6(1), 182-3(1947).

An abstract. BA 21-21505

5218

EXPERIMENTAL PRODUCTION OF NEW FORMS OF CULTIVATED PLANTS. POSSIBILITIES OF THE ACTUAL METHODS. Francesco Crescini. *Italia agr.* 78(1), 13-20(1941).

Author reviews publications on the creation of polyploids through exposure to low and high temperatures, to x rays, or to action of electromagnetic currents. BA 21-21286

5219

MEDICINE AT THE CROSSROADS. R. H. Draeger and S. Warren. *U. S. Naval Med. Bull.* 47(2), 219-25(1947).

Biologic experiments conducted during operation Crossroads are described. Test objects included: goats, pigs, rats, mice, guinea pigs, insects, bacteria, seeds, sera, hormones, and other materials such as soil and drugs. BA 21-21511

5220

REMARKS ABOUT THE APPLICATION OF THE BETATRON IN CANCER THERAPY. Henry Quastler. *Illinois Med. J.* 91(3), 119-21(1947).

Author describes production of beta rays and x rays by betatron, and biological applications in treatment of

tumors without damaging tissues outside the tumor area.
BA 21-21518

5221
ARTIFICIAL RADIOACTIVE TRACERS: APPLICATIONS TO CHEMISTRY AND MEDICINE. Glenn T. Seaborg. Science 105(2727), 349-54(1947).

Availability of large quantities of radioactivity has opened the possibility of its wide use in industry, biology, medicine, etc. Several of the present uses of the induced radioactivities are described. BA 21-21520

5222
HYPERHEPARINEMIA; CAUSE OF THE HEMORRHAGIC SYNDROME ASSOCIATED WITH TOTAL BODY EXPOSURE TO IONIZING RADIATION. J. Garrett Allen and L. O. Jacobson. Science 105(2728), 388-9(1947).

Authors describe experimental observations that indicate the presence of an anticoagulant in the peripheral blood of heavily irradiated experimental animals. BA 21-21634

5223
CANCEROGENIC EFFECT OF RADIATIONS. B. Bugyi. Orvosok Lapja 2, 305(1946).

General review. BA 21-22290

REACTIONS OF CONNECTIVE TISSUES AFTER PROTRACTED FRACTIONATED IRRADIATION OF LARYNGEAL CARCINOMA. Frank Windholz. Radiology 48(2), 148-56(1947).

Three stages of injury are described following protracted, fractionated irradiation of larynx in patients with malignant tumors. BA 21-22343

5226
PROBLEMS OF ACQUIRED RADIORESISTANCE OF CANCER: ADAPTATION OF TUMOR CELLS. F. Windholz. Radiology 48, 398-404(1947). BA 21-22344

5227
THE EFFECTS OF EXPOSURE TO BETA RAYS ON THE CEREBRAL CORTEX OF THE CAT. Rosalind Novick. Anat. Record 97(3), 359-60(1947).

An abstract. BA 21-22485

5228
EFFECT OF X-RAYS IN VIVO ON THE AGGLUTINATION OF BRUCELLA. M. Azzariti. Pathologica 32(582), 157-8(1940).

A group of rabbits which were immunized by antigens of Brucella without flagella, were irradiated. Sera from such rabbits gave higher titer of "floccular" agglutinins than "granular" agglutinins, in contrast to controls. This behavior appears to depend on x-ray doses. Floccular character, if present, remains for several days after stimulus has ceased. BA 21-22639

5229
EFFECT OF X-RAY IN VITRO UPON THE CONTRACTILITY OF THE ISOLATED INTESTINE OF THE CAT. Bradford N. Craver. Federation Proc. 6(1), 319(1947).

An abstract. BA 21-21500

5230
DARK-FIELD OBSERVATIONS ON LYMPHOCYTES EXPOSED TO X-RAYS AND OTHER INJURIOUS AGENTS. Robert Schrek. Proc. Soc. Exptl. Biol. Med. 64(3), 381-4(1947). BA 21-21986

5231
HISTOPATHOLOGICAL EFFECTS OF PLUTONIUM, FISSION PRODUCTS, FAST AND SLOW NEUTRONS, AND X-RAYS ON THE THYMUS. Raymond G. Murray. Anat. Record 97(3), 358(1947).

5232
EXPERIMENTS WITH DIFFERENT METHODS OF ISOLATING PHYSIOLOGICAL MUTATIONS OF FILAMENTOUS FUNGI. Nils Fries. Nature 159(4032), 199(1947).

Author classifies 463 of 600 mutants of *Ophiostoma multiannulatum*, some were from irradiated ascospores, but most were from irradiated conidia. Exposure of conidia impregnated with uranyl nitrate gave higher incidence of mutants but no obvious shift in proportions of types. BA 21-23987

5233
PLUM-PEACH HYBRIDS. Alberto Pirovano. Italia agric. 78(10), 681-5(1941). (In Italian).

Plum (*Prunus domestica*) flowers were pollinated with peach (*P. persica*) pollen exposed to β and γ Ra rays, 6 seeds were obtained. Trees from these seeds, observed 18 years later, exhibited characters of plum trees with white, fertile flowers. Fruits were small and deep fissures appeared causing desiccation of pulp before fruits ripened. Stones resembled plum stones. BA 21-23993

5234
PRELIMINARY NOTE ON SOME STUDIES OF GEOGRAPHICAL PHENOMENA IN MEXICO AND GUATEMALA. A. Sharp. Rev. soc. mex. hist. nat. 7(1/4), 35-9(1946). (In Spanish).

Natural radiation from rocks and soils in volcanic region in Guatemala and Mexico are suggested as a probable and important factor in evolution of plants. BA 21-24085

5235
ORGANIC AND FUNCTIONAL CHANGES IN PLANTS EXPOSED TO RADIUM. G. Fabre. Compt. rend. soc. biol. 69, 523-4(1910). (In French).

5236
INFRARED ABSORPTION AND TEMPERATURE STUDIES ON THE BUDS AND CHROMOSOMES OF *TRADESCANTIA PALUDOSA*. C. P. Swanson, C. S. Rupert and H. T. Yost, Jr. Am. J. Botany 40, 557-565(1953).

Infrared radiation, when combined with x-rays, increases the frequency of chromatid breaks, although infrared is without effect itself. Use of over-lapping filters localized the effective region of infrared around 9600A, but absorption studies of anthers, sepals, and petals revealed no striking lines in this region. (from abstract). BA 28-10153

5237
INDUCED BIOCHEMICAL MUTATIONS IN *BACILLUS SUBTILIS*. Paul R. Burkholder and Norman H. Giles, Jr. Am. J. Botany 34(6), 345-8(1947).

Irradiation of spores or vegetative cells of *B. subtilis* with either ultraviolet or x rays resulted in production of numerous biochemical mutant strains differing from parent strain in their inability to synthesize specific growth factors. BA 21-25268

5238
GENETICS OF RESISTANCE TO RADIATION IN *ESCHERICHIA COLI*. Evelyn M. Witkin. Genetics 32(3), 221-48(1947).

Strain B of *E. coli* gives rise to a radio-resistant (to ultraviolet and x rays) variant which originates as a spontaneous mutation at a rate of 10^{-5} mutations/bacterium/generation, but can be induced by ultraviolet. X-ray survival curves are linear for both strains. Technique for absolute selection of mutants is described and applied in experiments to prove their spontaneous origin. BA 21-25295

5239
PRELIMINARY STUDY OF THE UTILIZATION OF X-RAY INDUCED MUTATIONS FOR BREEDING. I. THE EVIDENT EFFECTS OF IRRADIATION ON THE FIRST GENERATION OF SUMMER BARLEY. R. Freisleben and A. Lein. Z. Pflanzenzucht. 25(3/4), 325-54(1943). (In German).

Germination apparently was not influenced by 4000-25,000 r, but sprouting ability showed definite dose-dependent effect. Genetic nature of changes in survival after exposure are considered. BA 23-66

5240

PRELIMINARY STUDY OF THE UTILIZATION OF X-RAY INDUCED MUTATIONS FOR BREEDING. II. MUTATIONS OF THE CHLOROPHYLL APPARATUS AS TEST MUTATIONS FOR SELECTING X-RAY INDUCED MUTATIONS IN BARLEY. R. Freisleben and A. Lein. Z. Pflanzenzucht. 25(3/4), 255-83(1943). (In German).

5241

ARTIFICIAL VARIEGATION IN IRRADIATED MICE. N. Dobrovolskaja-Zavadskaia and M. Rodzevitch. Compt. rend. soc. biol. 135(15/16), 1303-5(1941).

Two strains of mice (black, strain XLI and silver gray, strain XLII) were irradiated with 600-650 r in 8-12 min (anticathode 40 cm from skin, 155 kv, 5 ma, 1 mm Al filter). Two weeks later the coats began to lose color, after 3-5 mo decolorization was complete. Strain XLII became entirely white, but black eyes were retained. Strain XLI showed decolorized zones in fur completely distinct from colored parts. Authors conclude that strain XLII is predisposed to regional coloring which becomes manifest through influence of external agent. BA 23-325

5242

PROCESSES OF THE FIXATION OF OXYGEN IN RADIO-BIOLOGY. R. Latarjet and J. Loiseleur. Compt. rend. soc. biol. 136, 60-3(1942).

One of first and most important effects of x rays upon a solution containing dissolved free O₂ (as in biologic solutions) is ionization of the O₂. This is considered to be one of primary radiobiologic effects. BA 23-326

5243

SOME HEMATOLOGIC EFFECTS OF IRRADIATION. W. Bloom and L. O. Jacobson. Blood. 3(5), 586-92(1948).

Studies utilizing acute and chronic application of externally originating ionizing radiations and internally deposited radioisotopes failed to demonstrate primary stimulation of hematopoiesis. Leukocytosis during first 24 hr after acute exposure is considered to be a reaction to injury. BA 23-331

5244

THE THERAPEUTIC USE OF RADIOACTIVE ELEMENT IN MALIGNANCY. P. F. Hahn and C. W. Sheppard. Ann. Internal Med. 28(3), 598-606(1948).

Of 450 radioactive isotopes only 6 or 8 were found to be useful in therapy of malignant diseases, some of these having more than one isotope. These include Na²⁴, Cu⁶⁴, As⁷⁶, Y⁹⁰, Ag¹¹¹, I¹³¹, I¹³³, Au¹⁹⁸, Au¹⁹⁹, and Br²⁰⁷. Others were found unsuitable because of objectionable half-lives, radiation spectra, biological behavior, poorly understood chemistry, or expensive production. Various means of utilizing isotopes are discussed. BA 23-333

5245

THE EFFECT OF RADIATION THERAPY ON THE NOCTURNAL GASTRIC SECRETION IN PATIENTS WITH DUODENAL ULCER. Erwin M. Levin, Anna Hamann, and Walter Lincoln Palmer. Gastroenterologia 8(5), 565-74(1948).

In 9 patients studied during period of x-ray therapy directed at the fundus of the stomach, a reduction in volume and free acidity of night secretion was noted during first week of therapy in 7, an increase occurred in 2. Comparable results were obtained in gastric secretory response to histamine. BA 23-662

5246

EFFECTS OF X-RAY IRRADIATION ON THE DEVELOPMENT OF OVARIAN TUMORS IN INTRA-SPLENIC GRAFTS IN

CASTRATED MICE. Min Hsin Li, W. U. Gardner, and Henry S. Kaplan. J. Natl. Cancer Inst. 8(3), 91-8(1947).

Granulosa-cell tumors, luteomas, or mixed tumors developed in irradiated (400 r), intrasplenic ovarian grafts in 7 of 9 castrated female mice and in all of 8 castrated male mice. Irradiation of hypophysis and adjacent tissues (400 r) did not inhibit formation of intrasplenic ovarian tumors (developed in 9 of 12 mice). Ovaries irradiated in vitro and subsequently grafted into spleens of castrated hosts gave rise to tumors, but the incidence was lower than with grafts exposed in vivo. BA 23-979

5247

MAGNESIUM PROTOPORPHYRIN AS A PRECURSOR OF CHLOROPHYLL IN CHLORELLA. S. Granick. J. Biol. Chem. 175(1), 333-42(1948).

Author describes x-ray mutant of *C. vulgaris*. BA 23-1968

5248

INHIBITION OF PLANT GROWTH BY IRRADIATION. I. DISCRETE STEPS OF GROWTH INHIBITION AND PATTERN OF DOSE-RESPONSE-RELATION. Henry Quastler and Marianne Baer. J. Cellular. Comp. Physiol. 31(2), 213-34(1948).

Irradiated seeds of mung beans show growth inhibition when allowed to develop. Four qualitative different reactions are distinguished: (1) beans completely developed through sometimes stunted, (2) beans developing only primary root and hypocotyl, (3) beans with abortive growth of primary root only, and (4) complete abolition of growth. BA 23-1992

5249

LETHAL MUTATIONS PRODUCED BY ULTRA-VIOLET AND X-RAY IRRADIATION OF FUNGAL SPORES. Joan Munro Ford. Australian J. Exptl. Biol. Med. Sci. 26(3), 245-51(1948).

Irradiation of spores of *Chaetomium globosum* with ultraviolet and x rays produces many new, small lethal colonies. These spores stop growing when less than 1 mm in diameter. From 7053 germinated spores, 3860 lethal microscopic mutants were obtained. The small lethal colonies were also found in association with macroscopic mutants of known characteristics, and appeared in their progeny through many generations. BA 23-2585

5250

EXPERIMENTS WITH DROSOPHILA ON THE DEPENDENCE OF RAY INDUCED CHROMOSOME MUTATIONS UPON DOSAGE. Alexander Catsch. Z. Indukt. Abstamm.-u. Vererb. 82(2), 155-63(1948). (In German).

X-ray induced translocations between chromosomes II and III of *D. melanogaster* were studied in hybrids where certain deficiencies and duplications are lethal. Rates of observed translocations (1.33% at 1000 r, 3.79% at 2000 r, 11.09% at 4000 r in spermatozoa used for fertilization on the first day postirradiation) lie between those expected for 1-hit curve and 2-hit curve. BA 22-2633

5251

FURTHER INVESTIGATIONS ON THE STERILIZATION OF CHICKEN EMBRYOS BY GAMMA RAYS. CONSTANCY OF DETERMINATION OF THE FEMALE SEX IN IRRADIATED EMBRYOS. R. Dulbecco. Atti accad. nazl. Lincei Rend., Classe sci. fis., mat. e nat. Ser. 8A 2(5), 659-62(1947).

Author's previous results (that chicken embryos sterilized by gamma rays are invariably female) are confirmed on a larger scale and discussed. BA 23-2637

5252

LEG-LIKE ANTENNAE IN HABROBRACON. P. W. Whiting. J. Heredity 39(5), 153-4(1948).

A single sterile female with leg-like antennae, probably a mutant resulting from an x-rayed egg, is reported. The

proximal rather than the distal region of antennae is modified. BA 23-2652

5253
RADIOACTIVE EMANATIONS: THEIR NATURE, MECHANISM OF ACTION, BIOLOGICAL EFFECTS AND TOLERANCE LIMITS. B. N. Craver. J. Ind. Hyg. Toxicol. 29, 196-200 (1947).

This is a review including a brief discussion of nature, measurement, and biological effects of radiations, cyclotron, betatron, and mechanism of radiation effects. Accepted limits of tolerance for radiation exposure are given. Leukemia, osteogenic sarcoma, and pulmonary neoplasm are briefly mentioned. BA 23-2945

5254
Naval Radiological Defense Lab., San Francisco.
INCREASED URINARY EXCRETION OF TAURINE AND UREA BY RATS FOLLOWING X IRRADIATION. R. E. Jay, J. C. Early, and C. Entenman. July 10, 1956, 20p. (USNRDL-TR-98).

Whole body exposure to x ray doses of 175-2500 r caused increased urinary excretion (per 24 hours) of urea, taurine and sulfate in fasting rats. Increase was greater with greater doses between 75-2500 r. Larger doses caused no further increase. Sequence of changes in excretion rates of the three compounds is described, as is the effect of adrenalectomy on the rats. NSA 10-9924

5255
HYPERTHYROIDISM OF ACROMEGALY. Saint-Milco. Ann. endocrinol. (Paris) 8, 503-9(1947). (In French).

Seven patients suffering from acromegaly with signs of hyperthyroidism were treated with x irradiation of hypophysis. Urinary excretion of thyrotropic hormone was increased before treatment and fell to normal values at same time as clinical signs of hyperthyroidism diminished. Thyrotropin excretion was normal in four cases of acromegaly without hyperthyroidism. BA 23-3576

5256
THE TOXICITY OF SOME ZIRCONIUM AND THORIUM SALTS IN RATS. L. T. McClinton and Jack Schubert. J. Pharmacol. Exptl. Therap. 94(1), 1-6(1948).

Solutions of citrate and gluconate salts of Zr and citrate salt of Th were administered to rats intraperitoneally and acute LD₅₀s determined. Rats which survived for 36 hr invariably recovered and exhibited no toxic symptoms as long as 6 mo later. No hematologic or histologic signs of Zr toxicity were found. 3600 mg/kg of Zr citrate was tolerated by rats when given in daily doses of 450 mg/kg. BA 23-3863

5257
EFFECT OF X-RAYS ON PHOSPHOLIPID TURNOVER. G. Hevesy. Arkiv Kemi 24A(26), 1-21(1947).

Evidence is presented indicating that x rays probably do not influence penetration of labeled P to sites of phospholipid synthesis. Irradiation causes a decrease in phospholipid turnover rate in cytoplasm and nuclei of sarcoma cells. Even greater effect (60% decrease) on liver nuclei. BA 23-3975

5258
COMPARATIVE SUSCEPTIBILITY OF THE LYMPHOID TISSUES OF STRAIN C57 BLACK MICE TO THE INDUCTION OF LYMPHOID TISSUES BY IRRADIATION. Henry S. Kaplan. J. Natl. Cancer Inst. 8(4), 191-7(1948).

Young mice were killed at successive intervals after fractional whole-body irradiation, and lymph nodes, spleens, and thymus glands subjected to gross and histologic examinations and to bio-assay. Fifteen of 28 mice (54%) developed lymphoid tumors 57 to 135 days after the beginning of irradiation. BA 23-3981

5259
EFFECTS OF URETHANE, X-RAYS, POTASSIUM

ARSENITE, BENZOL, ON SURVIVAL TIME IN TRANS PLANTED MOUSE LEUKEMIA. Arthur Kirschbaum, Sister Teresita Judd, Chen San Lu, Ruby M. Engstrom, and Harry Mixer. Proc. Soc. Exptl. Biol. Med. 168(2), 377-80(1948)

Survival time was lengthened significantly in three transfer lines of mouse myeloid leukemia by treatment with either potassium arsenite, urethane, x rays or benzol, in decreasing order of effectiveness. Two transfer lines of lymphoid leukemia grown in genetically identical hosts did not respond favorably to the same treatment. BA 23-3984

5260
ADDITIVE EFFECTS OF X-RAYS AND METHYLCHOLANTHRENE IN INDUCING MOUSE LEUKEMIA. H. W. Mixer and A. Kirschbaum. Radiology 50(4), 476-80(1948).

Total dose of 1100 r/air of x rays (140 kv, 2 mm Al filter, HVL 4.2 mm al) in 11 weekly treatments of 100 r was applied (total body) to 34 mice. Equal number received 18 skin applications of methylcholanthrene, 48 mice received both. Leukemogenic agents acted in an additive fashion except in CBA mice which were susceptible only to x rays. BA 23-3993

5261
LUMINOUS RADIO-ACTIVE SUBSTANCES. N. S. Wales. Govt. Gaz. 1945, 173(1945).

A girl employed on operations requiring use of radioactive substances developed sore lips. Substance causing condition was removed by solvent and recovery followed. (The girl had had respiratory infection and used handkerchief repeatedly while working without removing gloves.) BA 23-4088

5262
FURTHER OBSERVATIONS ON THE USE OF THREE-MILLION-VOLT ROENTGEN THERAPY. R. Dresser. Radiology 50(5), 645-8(1948).

With this type of super-voltage x rays it is possible to deliver upwards of 5000 r to a single portal in daily doses of 300-400 r without visible skin erythema or epilation. Systemic reaction of patients to supervoltage x-ray therapy is also less, possibly because scattering is reduced and relatively smaller volume of tissue is irradiated. BA 23-4107

5263
PHYSICAL BASIS FOR THE HIGH SKIN TOLERANCE OF SUPER-VOLTAGE ROENTGEN RAYS. J. G. Trump. Radiology 50(5), 649-56(1948). BA 23-4114

5264
MUTATION IN STREPTOMYCES FLAVEOLUS INDUCED BY X-RAYS AND ULTRAVIOLET LIGHT. Albert Kelner. J. Bacteriol. 56(4), 457-65(1948).

In *S. flaveolus* ATCC 3319 irradiated with ultraviolet and x rays, the most common mutants were "yellow," "asporogenous," and "restricted." Doses of x rays up to 300,000 r were used. Mutation frequency rose with dosage up to 200,000 r, above which rate of increase leveled off. Results were more uniform with x rays than with ultraviolet rays. BA 23-4315

5265
PRODUCTION OF PENICILLIN. Milislav Demerec. U. S. Patent 2,445,748. 1946. Issued July 27, 1948.

P. chrysogenum treated with 50,000-100,000 r (suitable 75,000 r) of x rays gave rise to a mutant capable of increased penicillin production under submerged conditions of growth. BA 23-4710

5266
FILARIASIS IN THE DOG DUE TO *DIROFILARIA IMMITIS* LEIDY PERIODICITY. ACTION OF PHYSICAL FACTORS, PARTICULARLY X-RAYS. Henri Galliard. Ann. parasitol. humaine et comparee 22(3/4), 148-57(1947). (In French)

Application of x rays to cardiac region of dog was followed by immediate reduction of number of microfilariae. Over a period of more than five months, decline in microfilarial number was progressive, but periodicity persisted. X-ray treatment did not affect development of microfilariae in *Aedes*. BA 23-5371

5267
INFLUENCE OF THE BETA-RAYS ON THE PUPAL WING OF BUTTERFLY. (PRELIMINARY NOTE.) Sanji Kishi, Mituo Miwa, and Kazuo Mori. Zool. Mag. (Tokyo) 54(12), 502-5(1942).

Pupae of *Papilio xuthus*, *P. demetrius*, and *P. sarpedon nipponus* had a limited area of pupal wing on one side irradiated with β rays. Wing of imago when it emerged from treated pupa was deformed, showing wrinkling, scalelessness, formation of bubbles containing green fluid, intense wrinkling like a burn, and asymmetry. Younger pupae were more sensitive than older ones. Transparent spot often appeared at middle of scaleless area of irradiated wing of young pupa. BA 23-5626

5268
THE USE OF RADIOACTIVE TRACERS IN PLANT NUTRITION STUDIES. P. R. Stout, Roy Overstreet, Louis Jacobson, and Albert Ulrich. Soil Sci. Soc. Amer., Proc. 12, 91-7(1947, 1948).

When radioactivity concentration of principal long-lived fission products was 0.1 μ c/g soil, pronounced injury to plants was observed. BA 23-19650

5269
THE EFFECT OF RADIUM ON PLANTS. G. Fabre, Compt. rend. soc. biol. 70, 419-20(1911). (In French).

Author had previously irradiated lily blossoms and found effects (atrophy of flowers) were manifest in neighboring blossoms of the same stem. Additional studies are reported here on the growth and development of plants subsequently (7 stalks surviving previous irradiation). All had sterile or decayed rhizomes. Radiation effects on plant reproductive organs are considered to be the result of effects of decay secondary to atrophy of the vascular (conductive) system.

5270
THE EFFECT OF ADRENAL CORTICAL INJURY ON THE TOXICITY OF ROENTGEN RAYS. Bradford N. Craver. Am. J. Roentgenol. Radium Therapy 59(3), 404-7(1948).

X-ray effects from single doses of 660 r were diminished in white rats which had adrenal area protected by lead during exposure as compared to rats which had adrenal area exposed and surrounding tissue protected. Possibility that radiation sickness may be due to adrenal cortical injury is discussed. BA 23-6165

5271
DEVELOPMENT OF GONADS IN THE ABSENCE OF GERMINAL CELLS IN CHICKEN EMBRYO. TOTAL STERILIZATION THROUGH TREATMENT WITH GAMMA-RAYS ON THE PRIMITIVE-STREAK STAGE. R. Dulbecco. Atti accad. nazl. Lincei, Rend., Classe sci. fis. mat. e nat. Ser. 8A 1(11), 1211-19(1946).

After irradiation of primitive streak stages with Ra needles for 24 hr, only 3 embryos survived up to 7th, 8th, and 12th days. They were normally developed but gonocytes were entirely lacking. BA 23-6166

5272
PHYSIOBIOLOGY AND GENERAL MANAGEMENT OF CHRONIC ULCERATION OCCURRING AFTER IRRADIATION. H. B. Hunt and D. H. Breit. Am. J. Roentgenol. Radium Therapy 59(1), 9-18(1948).

Radiobiology of cellular necrosis and tissue repair were discussed at length along with various types of treatment for radiodermatitis. BA 23-6167

5273
INJURIOUS EFFECTS OF WHOLE BODY NEUTRON

IRRADIATION IN ANIMALS. T. Leucutia. Am. J. Roentgenol. Radium Therapy 59(1), 133-6(1948).

It is established that pure neutron source can produce systematic effect which is much more harmful than that produced by equivalent doses of x or γ rays when whole body is irradiated. Small doses given over prolonged periods of time are dangerous, for malignant tumor formation may occur. Adequate protection against neutron radiation is important in medicine and industry. BA 23-6168

5274
THE TIME FACTOR IN RADIATION THERAPY. Charles L. Martin. Am. J. Roentgenol. Radium Therapy 59(1), 1-8(1948). BA 23-6169

5275
OXYGEN UPTAKE FROM AMPHIBIAN EMBRYOS TREATED WITH LETHAL DOSES OF X-RAYS. E. Urbani-Mistruzzi. Atti. accad. nazl. Lincei Rend., Classe sci. fis. mat. e nat. Ser. 8A 1(10), 1097-1102(1946). (In Italian)

Embryos of *Rana esculenta* at tail-bud stage were x irradiated for 60 min. Five hours after treatment there was no difference in O_2 uptake, as compared with controls. Later, a marked decrease in O_2 uptake was observed. BA 23-6172

5276
USE OF ARTIFICIAL RADIOACTIVE ISOTOPES FOR PRODUCTION OF LOCALIZED BIOLOGIC IRRADIATION EFFECTS. I. H. Mueller. Gynaecologia 121, 129-31(1946). (In German).

Radioactive Zn, suspended in purified and buffered pectin to prevent diffusion, was applied intraperitoneally to animals. A very strong localized irradiation effect was observed. Results of therapeutic attempts in man (two cases of advanced peritoneal carcinomatosis) are also described. BA 23-6178

5277
PROBLEM OF RADIOACTIVE WASTE DISPOSAL. Forrest Western. Nucleonics 3(2), 43-9(1948).

Radiobiologic characteristics and tolerance levels of a number of reactor and fission produced isotopes are considered with reference to possible contamination of immediate environment of a population. Table of tolerance concentrations of certain isotopes in drinking water is included. Radiobiological limitations determine the levels which are tolerable. BA 23-6181

5278
STUDIES ON THE GENETICS OF ANTIBIOTIC FORMATION; THE INDUCTION OF ANTIBIOTIC-FORMING MUTANTS IN ACTINOMYCETES. Albert Kelner. J. Bacteriol. 57(1), 73-92(1949).

After *Streptomyces albosporus*, *S. albus*, *S. cellulosa*, *S. fleveolus*, *S. griseus*, *S. violaceus*, and *S. viridochromogenus* were treated with x or ultraviolet rays, active mutants found in all but two cultures, indicating that probably most actinomycetes can be induced to form antibiotically-active mutants. BA 23-19223

5279
EFFECT OF LARGE DOSAGES OF IRRADIATION ON GASTRIC ACIDITY. I. B. Brick. New Engl. J. Med. 237, 48-51(1947).

No definite pattern of effect on gastric acidity is seen after radiation injury, there was no effect after two months. Author discourages radiation treatment for peptic ulcers, since it may produce perforation and hemorrhage or no change. BA 23-6542

5280
CONTRIBUTION TO THE STUDY OF MECHANISM OF FOLLICULAR DEVELOPMENT AND INVOLUTION IN THE OVARY OF THE ADULT RABBIT. P. Desave. Arch. biol. (Leige) 59(1), 31-146(1948). (In French).

X-ray sterilization limits the stimulative effect of prolactin on follicular development to two waves. Sub-

sterilizing x-ray doses, particularly when divided, temporarily inhibits the follicular cycle. Effects of pregnancy, pseudo-pregnancy, hypophysectomy, and thyroidectomy on follicular cycle in the rabbit are discussed. BA 23-6838

5281
THE USE OF HIGH VOLTAGE ROENTGEN THERAPY IN THE TREATMENT OF AMENORRHEA AND STERILITY IN WOMEN. Ira I. Kaplan. Am. J. Roentgenol. Radium Therapy 59(3), 370-1(1948).

X-ray therapy of amenorrhea and sterility may also produce: direct stimulating effect on ovaries; stimulation of an undeveloped uterus; hyperemia with subsequent swelling of tissues and rupture of ovarian cysts, and rupture of a persistent corpus luteum which prevents menstruation. Specific x-ray action is undetermined. BA 23-6857

5282
GASTRIC ULCER FOLLOWING RADIATION. F. E. Hamilton. Arch. Surg. 55, 394(1947).

Of 256 patients receiving massive high voltage x-ray therapy for malignant growths of the testis, 80% of seminoma cases, and 50% of teratocarcinoma cases exhibited an apparent clinical cure. Half of the patients treated experienced epigastric distress 2-3 mo post-irradiation, 35 of these developed gastric ulcer. Individual sensitivity to radiation is considered to be a factor. BA 23-7198

5283
EXPERIMENTAL CONTRIBUTION TO THE PROBLEM OF RADIOSENSITIZATION. E. Fischel. Rev. can. biol. 6(3), 436-8(1947). (In French).

In 4 of 5 patients, x ray produced more pronounced erythema on biceps region of arm when region had been previously treated with infrared rays. Visibility of skin reaction with Wood's light differed according to reaction: marked in infrared reaction, slight in x ray erythema. BA 23-7373

5284
TRANSPLANTATION OF THE EYE AMONG X-IRRADIATED AND NORMAL EMBRYOS AND LARVAE. N. Frontali. Atti. accad. nazl. Lincei, Rend., Classe sci. fis. mat. e nat. Ser. 8A 1(7/8), 865-9(1946). (In Italian).

Eyes of *Rana esculenta* embryos in tail-bud stage, x irradiated for 30 and 60 min and transplanted on normal larvae can survive, grow, and differentiate. A normal eye, transplanted on an irradiated larva and then retransplanted on a normal larva, is not influenced as to growth or differentiation. BA 23-7441

5285
CEPHALIC MALFORMATIONS IN AMPHIBIAN EMBRYOS WITH PARTICULAR RESPECT TO X-IRRADIATION EXPERIMENTS. T. Perri. Atti. accad. nazl. Lincei. Rend. Classe sci. fis. mat. e nat. Ser. 8A 2(2), 213-17 (1947). (In Italian) BA 23-7451

5286
INDUCED BIOCHEMICAL MUTANTS OF *AZOTOBACTER AGILIS*. J. L. Karlsson and H. A. Barker. J. Bacteriol. 56(5), 671-7(1948).

Among morphological and physiological x ray-induced variants of *A. agilis*, a stable mutant was discovered which, because of a complete genetic block, is unable to convert pyruvate to acetate. Due to necessity of acetate for growth this substrate is unable to develop on glucose and succinate substrates which are arrested at pyruvate stage. BA 23-7531

5287
BIOELECTRIC POTENTIALS AS AN INDEX OF X-RAY ACTION. A. A. Bless. Phys. Rev. 74(9), 1209(1948).

Functional relations between effects of x rays on vital activity of corn seeds and on bioelectric potential were found to be similar. The hypothesis that biological

effects of x rays may be traced through variations of electrical potentials of the material is suggested.

BA 23-8820

5288
POLYPLOIDY IN BACTERIA? A. Buzzati-Traverso, N. Visconti di Modrone, and L. L. Cavalli. Nature 162(4112), 295(1948).

Of three stocks of *E. coli*, stock Ida (both R and S) was more resistant to x irradiation than were stocks 76 or 111. Assuming that survival rate is a measure of target volume and that the target may be the "nucleus", cells were measured. Those with larger target volume were significantly larger. This analogy with nucleoplasmic ratio might imply polyploidy in some bacterial stocks. BA 23-9756

5289
POSTIRRADIATION TREATMENT OF MICE AND RATS. CIBA FOUNDATION SYMPOSIUM ON IONIZING RADIATIONS AND CELL METABOLISM. D. W. H. Barnes and J. F. Loutit. p. 140-153. Little, Brown and Co., Publishers 1956.

5290
EXPERIMENTAL X-IRRADIATION OF THE RAT THYROID. A. E. Bender. Brit. J. Radiol. 21, 244-8(1948).

Treatment of rat thyroid with 50-5000 r x-ray doses produces no change in the rats, O₂ consumption, nor in histological picture of the glands in mature males, young growing rats, and mature animals in which gland had been rendered hyperplastic by oral thiouracil. Dose greater than 5000 r invariably resulted in death of animal 9-10 days later, which could be delayed or prevented by subcutaneous injection of glucose-saline. Although death was due to insufficient intake of fluid, no cause for this was found. BA 23-10025

5291
HEALTH ASPECTS OF RADIOACTIVE WORK. D. F. Brown. Proc. Conf. Nuclear Chem., Hamilton, Ontario 1947, 205-11(1947).

Biological effects of radiation and health hazards connected with radiological work are discussed. Personnel monitoring and radiation protective devices are considered. BA 23-10028

5292
CURRENT AND FUTURE ENVIRONMENTAL CONTROL PROBLEMS ATTENDANT ON THE USE OF RADIOACTIVE ENERGY. L. F. Curtiss. Am. Ind. Hyg. Assoc. Quart. 8, 14-18(1948).

Consideration of medical aspects of the radiation problem connected with nuclear transformations is included in this discussion. BA 23-10029

5293
THE EFFECT OF BETA RAYS ON CELLS CULTIVATED IN VITRO. Ilse Lasnitzki. Brit. J. Radiol. 21, 265-9(1948).

Tissue cultures of avian fibroblasts were exposed to 1000 r of pure β rays from uranium UX-1. Steep fall in mitosis, appearance of abnormal mitotic figures and degenerate cells were observed shortly after exposure, followed by return of mitotic activity accompanied by more abnormal mitosis and cell degeneration. Mitotic recovery to half normal value had occurred at end of observation period. Changes produced by same dose of x rays was qualitatively similar, total damage is of same order, but time relation differs. BA 23-10030

5294
THE THEORY OF THE BIOLOGICAL EFFECT OF X-RAYS. L. Neu and V. Neu. Med. Woman's J. 54, 17-23(1947).

Permeability of cell membranes increased after x raying and unstable cell membranes were found to be more radiosensitive. Hypothesis advanced showing close connection between periodic behavior of permeability of

cell membranes and erythema (a recurring x-ray effect). Concentration of ions in cell increases with irradiation time, primary effect of x rays is described as irreversible poisoning of living cell. BA 23-10032

5295

GAMMA-RAY PROTECTION IN RADIUM THERAPY.

C. W. Wilson and J. R. Greening. Brit. J. Radiol. 21, 211-30(1948).

Calculations and measurements of local dosages and integral dose received by Ra mold technicians and Ra therapists were made. On basis of observations reported, implications of various proposed standards of protection are examined and evaluated with reference to actual working conditions. Protection is considered in relation to: local exposure of hands, local exposure of gene material, and integral dose throughout whole body. BA 23-10034

5296

CONFERENCE ON METABOLIC ASPECTS OF CONVALESCENCE. Edward C. Reifstein, Jr., ed. Transactions of the Fifteenth Meeting, March 31-April 1, 1947, New York, N. Y. Josiah Macy, Jr. Found., New York. 1947. 163p.

Topics include: use and hazards of isotopes in biological and clinical investigation, effects of Sr and Be on bone metabolism, relation of cell permeability to isotope studies. BA 23-10156

5297

LIVER INJURY. F. W. Hoffbauer. Transactions of the Seventh Conference, January 15 and 16, 1948, New York, N. Y. Josiah Macy, Jr. Foundation, New York. 1948. 95p.

Topics include: effects of Pu on the liver. BA 23-10552

5298

Texas Agricultural Experiment Station, College Station, Tex.

FINAL REPORT ON AEC PROJECT 815. July 2, 1956. 11p. (ORO-152).

Data are presented from a study of the effects of doses of whole-body x radiation ranging from 50 to 500 r administered at various ages on: the pituitary gland, thyroid gland, pancreas, and spleen of cockerels, egg production of the progeny of irradiated male chickens, the reproductive performance of progeny of irradiated males, and the sex ratio of chicks dying during the third week of incubation as related to irradiation dosage of the sire of both parents of these chicks. NSA 10-7396

5299

FANCY AND FACTS CONCERNING PROGRESS IN AGRICULTURAL RESEARCH WITH RADIOACTIVE MATERIALS. Malcolm H. McVickar. Fertilizer Rev. 23(6), 3-5(1948).

Recent experiments with radioactive materials are reviewed to show that radioactivity is not beneficial to crop growth, but is a valuable research tool in studying deposition of fertilizer nutrients in soils, plants, and animals. BA 23-12048

5300

THE INFLUENCE OF α IRRADIATION ON THE MOVEMENT OF THE PROTOPLASM IN THE ONION EPIDERMIS. J. Chury. Biol. Listy 28(2), 89-91(1947).

Pieces of epidermis of yellow onions irradiated for 15 min exhibited more rapid movement than cells not irradiated. Increased protoplasmic motility was also observed in cells adjacent to irradiated cells but protected from rays by Al. BA 23-12580

5301

EFFECT OF RADIATION ON PLANT PROTOPLASM. R. Biebl. Mikroskopie 2(9/12), 328-35(1947). (In German).

Author surveys present knowledge on influence of ultraviolet α , β , and γ rays on permeability and irritability of plant protoplasm. BA 23-12577

5302

INFLUENCE OF RADIOACTIVE MATERIALS ON CROP PLANT GROWTH TO BE STUDIED. Am. Fertilizer 108(7), 12-13(1948).

Proposed studies outlined are intended to: (1) measure effect of adding radioactive material to soil on growth, yield, and maturity and composition of crops; (2) determine influence of low activities of α , β , and γ radiation on seed germination and on seedlings, and (3) determine effect of radioactivity on soil microbiology. BA 23-12589

5303

CHROMOSOME ABERRATIONS IN TRADESCANTIA PRODUCED BY X-RAY TREATMENT AT LIQUID AIR TEMPERATURE. A. C. Faberge. Genetics 33(6), 609 (1948).

The number of chromosome aberrations (in Tradescantia pollen) produced by a given dose of x-rays is much smaller when pollen is exposed in liquid air than when exposure takes place at room temperature, but the types of aberration are not different under the two conditions. BA 23-13702

5304

CYTOLOGICAL EFFECTS OF X-RAYS ON COLCHICINIZED ROOT-TIPS OF ALLIUM CEPA. Michael Levine. Am. J. Botany 35(10), 795(1948).

An abstract. BA 23-13712

5305

THE CYTOGENETIC EFFECT OF SONIC ENERGY APPLIED SIMULTANEOUSLY WITH X-RAYS. Alan D. Conger. Genetics 33(6), 607(1948).

Combination of x irradiation (250 r, 78 r/min) and sonic treatment caused increase in frequency of all types of chromosome aberrations in inflorescences of *Tradescantia paludosa*. BA 23-13753

5306

EXPERIMENTS ON ANALYSIS OF GENE EFFECTS IN A. MAJUS. F. Mainx. Oesterr. bot. Z. 94(3), 355-84 (1948). (In German).

Correlations between morphological and physiological components of mutations were studied in x ray-induced mutants of Müncheberg strain "S 50", which was taken as control. BA 23-13770

5307

EXPERIMENTAL MODIFICATION OF THE BIOLOGICAL EFFECTS OF X-RAYS. Luther Smith, R. S. Caldecott, and Barbara Hayden. Genetics 33(6), 629(1945).

Tests with dormant and germinating seeds of barley and Einkorn have shown that the atmosphere surrounding seeds during x raying, or heat either before or after irradiation, profoundly modifies radiation effects. Three criteria used in making comparisons were: injury symptoms, frequency of chromatinic bridges in root-tip cells, and frequency of seedling mutants in F_2 . BA 23-13775

5308

GENETIC DIFFERENCES IN RADIATION EFFECTS ON RESISTANCE OF MICE TO TYPHOID, SALMONELLA TYPHIMURIUM. John W. Gowen. Genetics 33(6), 611 (1948).

An abstract. BA 23-13798

5309

EFFECTS OF BETA-RAYS ON HABROBRACON JUGLANDIS. A. Martin, Jr., J. N. Dent, and L. Joseph. Genetics 33(6), 619-20(1948).

Wild type females exposed to dried P^{32} produced progeny about 25% of which were abnormal. BA 23-13814

5310

LETHAL CHANGES INDUCED BY X-RAYS IN PARAMECIUM AURELIA. E. L. Powers, Jr. and Deborah Shefner.

Genetics 33(6), 624-5(1948).
An abstract. BA 23-13819

5311
THE PRODUCTION OF PHENOCOPIES IN THE MOUSE
BY MEANS OF X-RAY TREATMENT OF EMBRYOS. Liane
Brauch Russell and W. L. Russel. Genetics 33(6), 627
(1948).

Mouse embryos of various developmental stages were
x irradiated by (250 kvp, total body exposure) by exposing
pregnant females, 2-17 days gravid. Total doses of 200-
500 r at 72 and 84 r/min produced characteristic and consistent
results for various stages. Treatment on 9th, 10th,
11th, and 12th days produced abnormalities resembling
known gene mutations. BA 23-13824

5312
FAILURE OF RUTIN TO DECREASE THE MORTALITY
OF ACUTE IONIZING RADIATION ILLNESS IN MICE
E. P. Cronkite, D. C. Eltzholtz, C. R. Sipe, W. H.
Chapman, and F. W. Chambers, Jr. Proc. Soc. Exptl.
Biol. Med. 70(1), 125-8(1949).

Mortality and weights of rutin-treated white Swiss
mice, irradiated with mid-lethal doses of 1000 kv x rays,
were compared with values for untreated irradiated mice.
Rutin increased rate at which mice died BA 23-14167

5313
THE EFFECT OF X-RAYS ON ASCORBIC ACID CONCEN-
TRATION IN PLASMA AND IN TISSUES. C. H. Kretzsch-
mar and F. Ellis. Brit. J. Radiol. 20(231), 94-9(1947).

Observation made of 35 patients during course of
x ray treatment (31 with malignant disease) revealed, in
most cases, that the ascorbic acid content of plasma was
below the pre-exposure level. In one case this fall paralleled
x ray leukopenia. Using normal rabbit blood and in vivo
muscle and kidney tissue from rats, it was found that x
rayed tissues had lower ascorbic acid content than did
nonirradiated tissues. BA 23-14169

5314
HEALTH HAZARDS IN THE USE OF RADIOACTIVE
ISOTOPES. William F. Bale. Madison, Univ. Wisconsin
Press. 1948. 445p. A Symposium on the Use of Isotopes
in Biology and Medicine (Edgar S. Gordon, Chairman).
BA 23-14175

5315
NEUTRON EFFECTS ON ANIMALS. Ellice McDonald.
Baltimore, Williams and Wilkins Co. 1947 198p.

Opening chapter briefly reviews general problems of
radiation effects on cells, balance of book deals directly
with problems of neutron irradiation, its theory, methodology,
and biological effects. Experimental material includes:
rats, microorganisms, mice, Zea mays, rabbits, chickens,
and dogs. BA 23-14180

5316
DOSAGE DETERMINATION WITH RADIOACTIVE ISOTOPES.
I. FUNDAMENTAL DOSAGE FORMULAE. II. BIOLOGICAL
CONSIDERATIONS AND PRACTICAL APPLICATIONS L.
D. Marinelli, Edith H. Quimby, and G. J. Hine Nucleonics
2(4), 56-66, (5), 44-9(1948).

Authors present formulae and numerical values by
which it is possible to calculate dosage of energy originating
from isotopes absorbed by living tissue. Concept of effective
half-life of isotope in the body is emphasized (biological
half-life). BA 23-14181

5317
SARCOMA ARISING IN IRRADIATED BONE. William G.
Cahan, Helen Q. Woodard, Norman L. Higinbotham, Fred
W. Stewart, and Bradley L. Coley Cancer 1(1), 3-29
(1948).

Histories of 11 patients in whom osteogenic sarcoma
developed 6-22 yr after x- or γ -ray therapy are presented.
Authors feel that such therapy is inadvisable for benign

tumors of bone and associated bone conditions. Radio-
resistance of benign bone lesions and potential disturbance of
epiphyseal growth centers in children are contra-
indications to wide use of irradiation. BA 23-15221

5318
EFFECT OF ATOMIC RADIATION ON THE ORAL STRUCTURES.
Joseph L. Bernier. J. Dental Research 27(6), 731(1948).

Changes in the oral mucosa and gingival of patients
who received lethal or sublethal radiation exposure at
Hiroshima and Nagasaki are described. BA 23-15321

5319
THE EFFECT OF X-RAYS ON EPITHELIAL CELLS.
W. Jadassohn, E. Bujard, R. Paillard, and P. Gaudin.
Dermatologica 97(Suppl.), 36-43(1948). (In French).

Male guinea pig nipples were rubbed with estrogens
to produce acanthosis. Before excision, colchicine was
injected intradermally to make mitosis visible. After
33 hr, many pycnotic mitoses were observed. In animals
irradiated before treatment with 2400 r no such histological
changes were found, although acanthosis was produced.

EYE TRANSPLANTATION BETWEEN NORMAL AND
X-IRRADIATED LARVAE OF B. VULGARIS AND B.
VIRIDIS. F. Chelli. Atti accad. nazl. Lincei, Rend.,
Classe sci. fis. mat. e nat. Ser. 8A 4(1), 140-5(1948).

Eye of larvae of B. vulgaris irradiated with strong
x-ray doses undergoes degeneration when transplanted
on normal larva. With weaker doses the eye can metamorphose
and have well preserved retina but degenerating lens. Eyes
from normal larvae, transplanted to irradiated larvae, grow
and differentiate well. BA 23-15455

ON THE FREQUENCY AND TRANSMITTED CHROMOSOME
ALTERATIONS AND GENE MUTATIONS INDUCED BY
ATOMIC BOMB RADIATIONS IN MAIZE. E. G. Anderson.
Proc. Natl. Acad. Sci. U. S. 34(8), 387-90(1948).

Maize seed was exposed to atomic bomb radiation on
ships (Bikini). In one lot, partial pollen sterility indicated
chromosomal alterations in 4.5-5% of progenies in outcrosses
with nonexposed seed or pollen. More than 50% of gametes
of the exposed generation are believed to carry one or
more gene mutations. Aberrant characters are described.

Atomic Energy Project, Univ. of Rochester
THE EFFECTS OF IRRADIATION WITH PHOSPHORUS-32

ON THE VIABILITY AND GROWTH OF RAT EMBRYOS.

M. R. Sikov and T. R. Noonan. Oct. 8, 1954. 27p. (UR-327). Contract W-7401-eng-49.

Effects of β radiation on rat embryos of 6, 8, 9, and 10 days of gestational age were studied after intraperitoneal administration of P^{32} to pregnant females. Values for LD_{50} were found in terms of doses of P^{32} which, when administered to the mother, would be expected to kill 50% of the fetuses by 14th day of gestation. Uptake was found to be proportional to injected dose. All doses produced depression of embryo weight. NSA 9-19

5345

LATE EFFECTS OF THERMAL NEUTRON IRRADIATION IN MICE. A. C. Upton, J. Furth, and K. W. Christenberry. Cancer Research 14, 682-90(1954).

Pathological effects produced in mice by irradiation in the thermal column (thermal neutrons and gamma rays) were indistinguishable from those of x rays. Relative biological effectiveness of thermal neutron radiation was essentially the same for most late effects, and several times higher for cataract induction than for acute lethality. The RF mouse, like man, is susceptible to induction of myeloid leukemia by relatively low doses of ionizing radiation. NSA 9-20

5346

SOME LATE EFFECTS IN MICE OF IONIZING RADIATION FROM AN EXPERIMENTAL NUCLEAR DETONATION. Jacob Furth, Arthur C. Upton, Kenneth W. Christenberry, Walter H. Benedict, and Jack Moshman. Radiology 63, 562-9(1954).

Authors summarize late effects of ionizing radiations on mice 30 months after exposure to nuclear detonation (high energy γ rays, small component of fast, and a still smaller component of slow neutrons). Topics discussed include: mortality, cataracts, iris defects, graying, leukemia, ovarian tumors, pituitary tumors, harderian gland tumors, mammary gland tumors, other tumors, and nephrosclerosis. NSA 9-21

5347

THE EFFECT OF X-IRRADIATION ON THE GROWTH AND HISTOCHEMISTRY OF ADRENAL AUTOTRANSPLANTS IN THE RAT. Leland C. Wyman, Rae Whitney, Patricia L. Griffin, and Donald L. Patt. J. Cellular Comp. Physiol. 44, 33-47(1954).

Effects of direct x irradiation (2000 r) of adrenal glands of rats or of local irradiation of site of implantation on subsequent growth of intramuscular, autoplasic, adrenocortical transplants were studied. Site irradiation was more effective in preventing establishment of implants, but once established, implants were affected more by direct exposure than by irradiation of site. Other differences between gland and site irradiation were also noted. NSA 9-22

5348

THE EFFECT OF IONIZING RADIATION ON DEOXYRIBONUCLEASE ACTIVITIES OF BODY FLUIDS. I. THE EFFECT OF TOTAL BODY EXPOSURE ON THE URINARY EXCRETION OF DEOXYRIBONUCLEASES. O. D. Kowlessar, Kurt I. Altman, and Louis H. Hempelmann. Arch. Biochem. and Biophys. 52, 362-72(1954)

Some properties of urinary DNases of the rat are described. It has been shown that there is increased acid and neutral DNase activity in the urine of rats exposed to total-body x rays. NSA 9-23

5349

THE 'OXYGEN-EFFECT' IN IONIZING IRRADIATION. H. Laser. Nature 174, 753(1954).

Bacteria representing strict and facultative aerobes and anaerobes and some yeasts, were exposed to 190-kv x rays to study (1) whether "oxygen effect" requires maintenance of normal respiration during irradiation,

and (2) possible relation of "oxygen effect" to a particular type of cellular metabolism. No washed, nongrowing cells (except yeast) were affected by x rays but all cells showed "oxygen effect" when transferred into growth-promoting media. NSA 9-24

5350
RELATIONSHIP BETWEEN BLOOD LIPIDS AND RADIATION INJURY IN RABBITS. Lawrence J. Milch, Richard A. Yarnell, James V. Stinson, John G. Collins, Lesly G. Robinson, Beulah L. Croye, and Sherman S. M. Chang. Science 120, 713-14(1954).

Groups of rabbits were subjected to varying doses of local x rays up to 30,000 r. Plasma lipid and lipoprotein components showed changes over this dose range corresponding to increasing continuum of muscle injury. NSA 9-25

5351
BIOLOGICAL EFFECTS OF THE PERIODICALLY INTERRUPTED X RADIATION. Andre Denner. J. radiol. et electrol. 35, No. 7-8, 578-81(1954). (In French).

Periodic x radiation is reported to have same biological effect as dose of continuous radiation twice as large. When distance between source and target is varied, there is summation effect for periodic radiations between 5 and 10 cm. (Rabbits and grains studied.) NSA 9-26

5352
EFFECT OF RADIATIONS ON PLANT CELLS AND THEIR METABOLISM. E. De Bernardi and E. Macciotta. J. Radiol. et electrol. 35, No. 7-8, 569-71(1954). (In French).

Narcissi and onions placed in $U(NO_3)_4$ solution exhibited more robust development than those in KNO_3 , $Ca(NO_3)_2$, $Ca_3(PO_4)_2$, $MgSO_4$, or KCl . Plants receiving a medium dose developed best. Some preliminary measurements of effect of radiation on salt uptake are reported. NSA 9-27

5353
THE EFFECT OF CHRONIC GAMMA RADIATION ON ENDOSPERM MUTATIONS IN MAIZE. W. Ralph Singleton. Genetics 39, 587-603(1954).

Data from studies of effects of chronic γ radiation from a Co^{60} source on mutation rates in the male gametophyte in maize are tabulated. NSA 9-28

5354
DOSE-RESPONSE RELATIONSHIPS IN RADIATION INDUCED MUTATION. H. B. Newcombe and J. F. McGregor. Genetics 39, 619-27(1954).

In most organisms, x-ray-induced mutations increase linearly with dose while corresponding ultraviolet-induced changes rise to a plateau or peak followed by decline. Response of streptomyces spores, however, is similar to both radiations and varies nonlinearly with dose. NSA 9-29

5355
A NONLINEAR RELATION BETWEEN X-RAY DOSE AND RECOVERED LETHAL MUTATIONS IN DROSOPHILA. H. J. Muller, I. H. Herskowitz, S. Abrahamson, and I. I. Oster. Genetics 39, 741-9(1954).

X rays dose of 1000 r was delivered to adult male *D. melanogaster* that had hatched not more than 24 hr previously. Offspring derived from sperm of these males ejaculated 7-9.5 days after exposure exhibited induced recessive lethal mutation rate in exposed X chromosomes of $6.5\% \pm 0.3\%$, a value twice the normal rate. NSA 9-30

5356
EFFECT OF IRRADIATION ON THE SERUM PROTEIN IN RATS HAVING A BENZOPYRENE-INDUCED TUMOR. V. Verga and G. Giordano. Boll. soc. ital. biol. sper. 30, 614-15(1954). (In Italian). NSA 9-31

RESISTANCE OF BACTERIAL SPORES TO GAMMA IRRADIATION. Bruch H. Morgan and James M. Reed. Food Research 19, No. 4, 357-66(1954).

Importance, in γ ray studies, of thoroughly investigating effect of culture conditions during spore production and spore irradiation is stressed, since different conditions can increase or decrease sterilization requirement for a particular type of organism. (*Cl. botulinum* mentioned.) NSA 9-33

5359
LABORATORY STUDIES FOR EVALUATING THE BIOLOGICAL EFFECTS OF PRIMARY COSMIC RADIATION. Ann C. Birge. J. Aviation Med. 25, 326-30(1954).

Biological effects of primary cosmic radiation are discussed with reference to laboratory studies on effects of ionizing radiations. Possible radiation hazards to aviators from this source are postulated. NSA 9-34

5360
Atomic Weapons Research Establishment, Aldermaston, Berks, England.
AGRICULTURAL AND BIOLOGICAL INVESTIGATIONS PERTAINING TO CONTAMINATION BY FISSION PRODUCTS. (MISCELLANEOUS PAPERS). July 16, 1954. 26p. (FWE-10)

Brief summaries are presented from studies of the uptake of fission products by both plants and animals following exposure in the environs of Operations Hurricane and Totem. NSA 9-35

5361
California. Univ. Los Angeles. Atomic Energy Project.
EFFECT OF BEEF EMBRYO EXTRACT ON SURVIVAL TIME IN IRRADIATED MICE. Thomas J. Haley, W. G. McCormick, and Eve F. McCulloh. Oct. 19, 1954. 13p. Contract AT-04-1-Gen-12. (UCLA-311).

Injections of beef embryo extract into mice on either days one and two or three and four gave slight increase in ST_{50} but had no effect on total mortality. Daily injections were not beneficial. Results appeared to be related to presence of a beneficial and a detrimental factor in the extract. Separation of these factors from one another was not possible with fractionation procedures used. NSA 9-37

5362
SPLEEN ADENOSINE TRIPHOSPHATASE ACTIVITY IN IRRADIATED MICE TREATED WITH SPLEEN HOMOGENATE. Willie W. Smith, William Anderson, Jr., and Gilbert Ashwell. Am. J. Physiol. 178, 471-3(1954).

Changes in ATPase activity, spleen weight, and leucocyte count were studied in LAf_1 mice treated with spleen homogenate after 650 r. Duration of spleen involution and high ATPase activity was less marked in homogenate-treated than in irradiated controls. Total spleen ATPase showed little change in treated mice. In irradiated mice, spleen ATPase was decreased for 3 wks; increased in 4th week after exposure. NSA 9-38

5363
EFFECT OF GRANULOCYTE COUNT AND LITTER ON SURVIVAL OF IRRADIATED MICE. Willie W. Smith, Leon Gonschery, Ilo Alderman, and Jerome Cornfield. Am. J. Physiol. 178, 474-6(1954).

Survival of mid-lethally irradiated mice was found not to be associated with granulocyte count taken either 4 or 7 days after irradiation. Clustering of survival in litters was highly significant in contrast to clustering of relatively high granulocyte counts. Occurrence of *Pseudomonas*, *Proteus*, α -streptococcus and negative cultures, but not of *E. coli*, in postmortem blood was significantly influenced by litter. NSA 9-39

5364
THE INITIAL MEDICAL AND INDUSTRIAL USE OF

RADIOACTIVE MATERIALS. William B. Looney. Am. J. Roentgenol. Radium Therapy Nuclear Med. 72, 838-48 (1954).

Author presents a historical account of first administration of radioactive materials as therapeutic agents and the changes subsequently observed in persons with such exposure histories. Importance of locating as many of these individuals as possible and referring them for careful follow-up studies is stressed. NSA 9-40

5365

A PROTECTIVE EFFECT OF INORGANIC MAGNESIUM AGAINST ROENTGEN RADIATION DAMAGE TO HYDRA. George E. Daniel and Helen D. Park. Am. J. Roentgenol. Radium Therapy Nuclear Med. 72, 857-66(1954).

Magnesium given in proper amount postirradiation markedly alleviated and prevented damage caused in Hydra by 15,000 r of x rays. Preirradiation treatment was ineffective and no synergistic action was seen between pre- and postirradiation treatment. Fe, Mn, Be, Ba, Ca, and K did not protect. Mg/Ca ratio may be varied over wide range without destroying magnesium's beneficial effect. Physiological implications and biological mechanism are discussed. NSA 9-41

5366

INFLUENCE OF POTENTIAL ANESTHESIA ON THE MORTALITY RATE OF IRRADIATED GUINEA PIGS. Charles M. Gros and Jean Comsa. Compt. rend. 239, 832-4(1954).

Very satisfactory radiation protection was obtained by injecting 3-chloro-10-(3'-dimethylaminopropyl) phenothiazine and the ethyl ester chlorohydrate of 1-methyl-4-phenyl-4-piperidinecarboxylic acid. Maximum resistance to radiation injury was obtained when animals were irradiated 10 hr after injection. Beneficial effects disappeared after 24 hr. NSA 9-43

Naval Medical Research Inst., Bethesda

AN ANALYSIS OF THE EFFECTS OF TOTAL-BODY X-IRRADIATION ON THE BODY WEIGHT OF WHITE SWISS MICE. 1. THE WEIGHT AND MORTALITY OF MALE AND FEMALE MICE IN THE LETHAL X-RAY DOSE RANGE. William H. Chapman. Aug. 14, 1954. 15p. (NM-006 012.04.67).

In studies on 60-80 day old mice it was found that male mice gained proportionately more weight than females after 740 r or less of x rays, lost proportionately more weight after higher doses. Male 28-day survivors of mid-lethal and high-lethal doses showed greatest weight loss 2 wk postexposure, females, 4 days postexposure. The 28-day mortality of males was greater than that of females for same doses in LD₀₋₁₀₀ range. NSA 9-477

Air Force Radiation Lab., Univ. of Chicago

QUARTERLY PROGRESS REPORT NO. 13. Oct. 15, 1954. 136p. Contract AF33(038)-27353 (NP-5419).

Includes reports on: effects of partial shielding on 5-nucleotidase and ATP-ase activity of hematopoietic tissues of irradiated rats, alteration of the ATP-ase activity of hematopoietic tissues by implanting exogenous hematopoietic tissue after exposure, x ray effect on metabolism of hematopoietic tissues of rats, biochemical and histopathological effects of large doses of total-body x rays on rat tissues, and their modification by increased temperature, effects of thiourea derivatives and 2,4-dinitrophenol on mortality of irradiated mice, effects of total-body x rays on metabolism of sulfanilamide and phenolic compounds by guinea pigs and rats. NSA 9-480

5376

Naval Radiological Defense Lab.

EFFECT OF REPETITIVE EXPOSURE TO GAMMA RAYS ON THE HEMATOPOIETIC SYSTEM OF THE RAT.

S. J. Baum, D. J. Kimeldorf, and E. M. Jacobsen.

Aug. 27, 1954. 22p. (USNRDL-TR-12).

Male rats were exposed one or more times to 75 r of γ rays at 7-day intervals. Hematological examinations after last exposure indicated that maximum changes were largely independent of number of exposures and reflected mostly effects of last irradiation. Observed results are attributed to capacity of hematopoietic system to recover during 7-day intervals. NSA 9-482

5377

INVERSE RELATIONSHIP BETWEEN THE WATER CONTENT OF SEEDS AND THEIR SENSITIVITY TO X-RAYS. Richard

S. Caldecott. Science 120, 809-10(1954).

Seeds with water contents of 7, 9, 13, 16, and 24% were subjected to x-ray doses of 10,000, 20,000, 30,000, 40,000, and 50,000 r. An inverse relationship was found between water content and radiosensitivity as determined by seedling heights at 7 days. NSA 9-483

5378

ORAL MANIFESTATIONS OF IONIZING RADIATION. II. EFFECT OF 200 KV. X-RAY ON RAT INCISOR TEETH WHEN ADMINISTERED LOCALLY TO THE HEAD

IN THE 1500 R DOSE RANGE. James A. English, Carl A. Schlack, and Friedrich Ellinger. J. Dental Research 33, 377-88(1954).

Three littermate groups of 21-day-old white rats were given single dose of localized head x radiation, maximum dose of 1500 r. Striking changes were observed in developing incisor teeth of irradiated animals sacrificed 100 days postexposure. NSA 9-484

5379

METABOLISM OF BENZOIC ACID IN NORMAL AND IRRADIATED RATS. Kurt Schreier, Kurt I. Altman, and Louis H.

Hempelmann. Proc. Soc. Exptl. Biol. Med. 87, 61-3 (1954).

Evidence is presented to show that benzoic acid is a normally-occurring metabolite in rats. When x-ray effect on ability of starved rats to conjugate benzoic acidcarboxyl- C^{14} was tested, no defect was detected under experimental conditions used. NSA 9-486

5380

WOUND HEALING AND MORTALITY AFTER TOTAL BODY EXPOSURE TO IONIZING RADIATION.

Antolin Raventos. Proc. Soc. Exptl. Biol. Med. 87, 165-7(1954).

Standardized laparotomy wound was produced in mice after whole-body x-ray dose of 500 r and tensile strength of healing wounds was compared to that of wounds in unirradiated mice. The 30-day mortality was determined for mice subjected to wounding, irradiation and to wounding plus irradiation. Irradiated mice showed significant retardation of wound healing from 6th-11th

day after wounding, not thereafter. Wounding did not alter postirradiation mortality. NSA 9-487

5381

EFFECT OF TOTAL BODY X-IRRADIATION ON DESOXYRIBONUCLEASE ACTIVITY OF RAT SPLEEN.

Vias M. Fellas, I. Meschan, Paul L. Day, and Carl D. Douglas. Proc. Soc. Exptl. Biol. Med. 87, 231-3 (1954).

Acid-active DNAase of rat spleen was found to increase markedly after 500 r of total-body x rays. Such change was not apparent in neutral enzyme of liver or spleen. Maximum elevation of DNAase activity occurred 24-48 hrs postirradiation, and maximal response was elicited by a dose of 200 r. NSA 9-488

5382

EFFECT OF TOTAL BODY X-IRRADIATION ON SERUM ELECTROLYTE LEVELS AND ELECTROCARDIOGRAMS OF THE GOLDEN HAMSTER. George P. Fulton and Frederick N. Sudak. Am. J. Physiol. 179, 135-8(1954).

Disturbances in serum potassium and sodium concentration, electrocardiogram and circulation in the cheek pouch were demonstrated in moribund hamsters following total body exposure to 1000 r of x irradiation. NSA 9-489

5383

IONIZING RADIATIONS AND MUTATIONS. Juan De Dios Leal Luna. Bol. radiactividad (Madrid) 25, 66-78(1952-53). (In Spanish).

Author discusses effects of ionizing radiation in producing mutations and the influence of such processes on evolution. NSA 9-490

5384

EFFECT OF IONIZING RADIATIONS ON THE VIRUS POLIOMYELITIS SK. G. Comba Ezquerria. Bol. radiactividad (Madrid) 25, 79-92(1952-53). (In Spanish). NSA 9-491

5385

PHYSIOLOGIC AND HISTOCHEMICAL CHANGES IN CONNECTIVE TISSUE OF RAT INDUCED BY TOTAL BODY IRRADIATION. A. C. Upton and W. D. Gude. Arch. Pathol. 58, 258-64(1954).

Evans blue injected intradermally in rats after whole-body x irradiation spreads faster and more widely than in nonirradiated controls. Radiation-induced permeability of dermal connective tissues appears 4-7 days postirradiation and persists for 2-3 wk, coinciding with increased vascular permeability and purpura. Heightened permeability is associated with increased stainable acid polysaccharide in ground substance of dermis and panniculus, and decreased number of mast cells in dermis. NSA 9-492

5386

IONIZING RADIATION CATARACTS. David Shoch and Irving Puntenney. Quart. Bull. Northwestern Univ. Med. School 28, 359-63(1954).

Investigations to date have shown that the ciliary body is injured only temporarily by ionizing radiation and although this temporary damage may play a part in development of the radiation cataract, it is at best a minor factor. Authors conclude that the site of injury in radiation cataract is the lens itself. NSA 9-494

5387

THE EFFECT OF X-RAYS ON THE RESPIRATORY METABOLISM OF EGGS AND EMBRYOS OF THE GRASSHOPPER CHORTOPHAGA VIRIDIFASCIA 1A. S. R. Tipton and G. S. St. Amand. Physiol. Zool. 27, 311-17(1954).

X ray doses of 10,000 r and above significantly reduced oxygen consumption of 14-day Chortophaga eggs in first hour after treatment. Doses of 3500 r and above significantly reduced respiration of embryos in the hour following irradiation. Reduction in respiration was greater with larger doses of x rays. NSA 9-495

5388

Hanford Works

GASTRO-INTESTINAL ABSORPTION OF PLUTONIUM

2. EFFECT OF PLUTONIUM CONCENTRATION IN SOLUTION
FED. Joseph Katz, Maurice H. Weeks, and Roy C. Thompson.
Jan. 4, 1954. 9p. (HW-30220).

Concentration of plutonium in solution fed had no effect on gastrointestinal absorption of plutonium over range of 10^{-5} $\mu\text{g/ml}$ to $1 \mu\text{g/ml}$. Average absorption was 0.0028% of amount fed, with 0.0025% of amount fed being deposited in skeleton. NSA 9-501

5389

THE EFFECT OF THE ROENTGEN RAYS ON THE AUTONOMIC NERVOUS SYSTEM OF THE RABBIT.

T. Toyoma. Tohoku J. Exptl. Med. 22, 335-47(1933).

Roentgen rays acting on the ganglion cells of the heart's autonomic nervous system have an agitating effect that is similar in rabbits and frogs.

5390

Radiological Research Lab., Columbia Univ.

X-IRRADIATION OF THE FROG EMBRYO; GROSS EFFECTS.

Roberts Rugh. Sept. 1, 1954. 26p. (NYO-474).

Uterine egg and early stages of development of frog from fertilization through neurulation were exposed in toto to 180-2880 r of x rays, and studied for developmental effects. At any exposure level there was wide range of variation in response. In embryonic development, it appears that the differentiating rather than the merely dividing cell is more radiosensitive. NSA 9-820

5391

BIOLOGICAL LEVELS OF THE RADIOSENSITIVITY OF SOMATIC CELLS. A. Glucksmann. Brit. J. Radiol.

27, 660-9(1954).

Factors affecting radiosensitivity of somatic cells are reviewed, concept linking radiosensitivity and hormonal factors is discussed. NSA 9-821

5392

THE LETHAL EFFECTS OF X RAYS ON THE CHICK EMBRYO. THE MODE AND TIME OF DEATH AND THEIR BEARING ON THE DETERMINATION OF THE LD_{50}

John Boland. Brit. J. Radiol. 27, 680-7(1954).

Lethal effects of x rays on chick embryo are re-examined, method for estimating LD_{50} is described. NSA 9-822

5393

RADIOBIOLOGICAL STUDIES WITH TRADESCANTIA AT NUCLEAR TEST DETONATIONS. Alan D. Conger. Am. Naturalist 88, 215-24(1954).

Yield of chromosome aberrations in *Tradescantia* as a function of dose was used to determine the radiobiological effects of mixed radiations from a nuclear test detonation. Correlation between instrumentally measured dose and biologically estimated dose is discussed. NSA 9-823

5394

VISIBLE AND LETHAL MUTATIONS IN DROSOPHILA.

George H. Mickey. Am. Naturalist 88, 241-55(1954).

Author compares effectiveness of cyclotron fast neutrons (1 Mev) and 250 kvp x rays in producing specific loci mutations at res markers in 3rd chromosome of *D. melanogaster*, dominant visible mutations, sex-linked recessive lethal mutations. It appears, with all biological criteria used to measure genetic damages of radiations in *Drosophila*, that fast neutrons cause a much greater effect than do x rays. NSA 9-824

5395

THE RELATIVE EFFECTIVENESS OF NEUTRONS FROM A NUCLEAR DETONATION AND FROM A CYCLOTRON IN INDUCING DOMINANT LETHALS IN THE MOUSE W. L. Russell, Liane B. Russell, and A. W. Kimball. Am. Naturalist 88, 269-86(1954).

Dominant lethality in offspring of male mice exposed in lead hemispheres to neutron radiation from nuclear detonation was determined for 10 doses by mating males to unexposed females, dissecting females at late stage of pregnancy and recording number of living and dead embryos, resorption sites, and corpora lutea. Data from early and late matings are tabulated separately and compared with results from similar experiments with cyclotron fast neutrons. NSA 9-825

5396

SURVIVAL AND MUTATIONS IN NEUROSPORA EXPOSED AT NUCLEAR DETONATIONS. K. C. Atwood and Frank Mukai. Am. Naturalist 88, 295-314(1954).

Conidia of *Neurospora* were exposed to mixed radiations from nuclear devices at several stations, both inside and outside the seven-inch-thick lead neutron-shielding hemispheres. Data are presented on survival of conidia under conditions of forced heterokaryosis, when supplied with supplemented medium, and on frequency of nuclei carrying recessive lethal mutations. NSA 9-826

5397

HEMANGIOMA. AN EXPERIMENTAL AND MORPHOLOGICAL STUDY. T. Balı and J. Furth. Oncologia 7, No. 3, 231-44(1954).

Three hemangioendotheliomas occurring in x rayed mice were studied in serial passages. One mimicked chorionepithelioma, then assumed angiomatous features, second was benign, did not change in 7 yr except for increase in growth rate and third was malignant. Evidence indicates these can be induced by x rays as well as by other agents. NSA 9-827

5398

ELECTROPHORESIS OF PLASMA PROTEINS AND ASCITIC FLUID OF DOGS WITH RADIATION CIRRHOSIS.

Doris H. Clouet, Con O. T. Ball, George R. Meneely, and Paul F. Hahn. Proc. Soc. Exptl. Biol. Med. 87, 362-5(1954).

Electrophoretic patterns for plasma of dogs with livers irradiated (intravenous injection of Au^{198}) showed significantly lower serum albumins and significantly higher gamma globulin components than did patterns for controls. NSA 9-829

5399

INHIBITION OF INFLAMMATORY RESPONSES IN BETA-IRRADIATED SKIN. Georges Ungar and Evelyn Damgaard. Proc. Soc. Exptl. Biol. Med. 87, 383-6(1954).

Beta radiation depresses local reaction of rat skin to certain inflammatory stimuli. Response to histamine is not inhibited but histamine liberator 48-80 fails to elicit response within a few hours after irradiation. Histamine content is not diminished after β irradiation. Results suggest that β rays interfere with a tissue protease system which is important in mechanism of inflammation. This inflammation-inhibiting action may be applied to early detection of radiation injury. NSA 9-830

5400

ALTERATIONS IN THE GLIAL CELLS FOLLOWING IRRADIATION OF THE BRAIN IN PRIMATES. Arthur Arnold and Percival Bailey. Arch. Pathol. 57, 383-91(1954).

Normal adult glial cell of primate brain may be adversely affected by irradiations. Alterations in function and structure of the cells can be correlated with total radiation dose, intensity, uniformity of dose distribution, and time after exposure. NSA 9-831

5401

INTOLERANCE OF THE PRIMATE BRAINS TO HIGH ENERGY RADIATIONS. Arthur Arnold, Percival Bailey, and Roger A. Harvey. Neurology 4, 575-85(1954).

Studies indicate brainstem and hypothalamus of man and monkey are intolerant to large x ray dose from conventional x ray equipment and to biologically equivalent doses of radiations from the betatron, due to the fact that these areas subserve many functions essential for survival, and that these areas are much more radio-responsive than cortical areas. Moderate x ray doses also are effective. NSA 9-832

5402
EFFECTS OF X-IRRADIATION ON THE HYPOTHALAMUS: A POSSIBLE EXPLANATION FOR THE THERAPEUTIC BENEFITS FOLLOWING X-IRRADIATION OF THE HYPOPHYSIAL REGION FOR PITUITARY DYSFUNCTION. Arthur Arnold. *J. Clin. Endocrinol. and Metabolism* 14, 859-68(1954).

Author suggest that therapeutic benefits reported following x irradiation of the hypophyseal region for pituitary dysfunction are due to effects of x ray on the hypothalamus, especially the paraventricular and supraoptic nuclei, since these have considerable influence on pituitary. NSA 833

5403
ON THE CHANGES PRODUCED IN THE LIVER OF RATS IRRADIATED WITH GAMMA RAYS. INCREASE OF LIVER WEIGHT AND THE AUGMENTATION OF P^{32} INCORPORATED IN THE PHOSPHOLIPIDS AND NUCLEOPROTEINS. Aleksander D. Becarevic, Katica L. Kacanski and Desanka D. Mancic. *Bull. Inst. Nuclear Sci. "Boris Kidrich" (Belgrade)* 4, 105-9(1954).

Author describes effects on rats of daily doses of 38.4 r of γ radiation. There is first a fall, then an increase in body weight, increase in liver weight, increase in fat metabolism. NSA 9 834

5404
EFFECT OF LINEAR ENERGY TRANSFER ON RADIATION-INDUCED CHROMOSOME ABERRATIONS IN TRADESCANTIA MICROSPORES. Norman H. Giles and C. A. Tobias. *Science* 120, 993-4(1954).

Yields of isochromatid and chromatid aberrations were compared for microspores exposed to (1) 190 MEV deuterons and (2) 380 MEV α particles. Yields of both types of aberration were increased with increased energy loss. Relative effectiveness of the radiations are given in terms of RBE. NSA 9-835

5405
ERYTHEMA EFFECTS OF A PURE BETA EMITTER (STRONTIUM 90) ON HUMAN SKIN. Victor H. Witten, Earle W. Brauer, Vera Holmstrom, and Robert Loevinger. *J. Invest. Dermatol.* 23, 271-85(1954).

Clinical biologic effects produced by strontium-90 β rays in 19 subjects indicate: (1) the greater the source-skin distance, the greater the reactions for any given dose and (2) the greater the dose, the greater the biologic effects (erythema). NSA 9-836

5406
PROTECTION AGAINST IONIZING RADIATION. THE "RECOVERY FACTOR" IN SPLEEN AND BONE MARROW. J. F. Loutit. *J. Nuclear Energy* 1, 87-91(1954) Atomic Energy Research Establishment Harwell Berks, England. Mice have been shown to survive a "normally" lethal x ray dose when treated with spleen and bone marrow preparations. Author concludes that the mechanism involved may be explained as well by the cellular hypothesis as by the humoral theory. NSA 9-837

5407
INFLUENCE OF CORTISONE ON THE MORTALITY OF X-IRRADIATED ADRENALECTOMIZED MICE. George A. Santisteban, J. Z. Bowers, and T. F. Dougherty. *Endocrinology* 55, 794-807(1954).

Influence of cortisone in acute x irradiation syndrome was studied by making statistical comparisons of cumulative mortality curves of groups of x irradiated (650 r whole-body) adrenalectomized CBA mice, some nontreated and others treated with intraperitoneal injections of graded doses of the hormone. Data are presented graphically and discussed. NSA 9-838

5408
BIO-FLAVONOIDS IN RADIATION INJURY. III. CLINICAL STUDIES. Isidore Arons, John Freeman, and Solomon Weintraub. *Brit. J. Radiol.* 27, 696-8(1954).

Bio-flavonoids were administered (600 mg daily) for 5-7 days prior to initial x irradiation and during whole course of x ray therapy to 403 patients with malignant growths. Marked increase in tolerance to radiation occurred in this group as compared with 613 control cases receiving no bio-flavonoids. NSA 9-839

5409
PROTECTIVE EFFECT OF BREPHOPLASTIC GRAFTS OF BONE MARROW AGAINST THE ACTION OF X-RADIATION IN MICE. Raoul-Michel May and Noubar Arpiarian. *Compt. rend.* 239, 1151-3(1954). (In French).

Favorable results (radiation protection of mice) were obtained by grafting bone marrow from new-born mice into the irradiated adult animal. NSA 9-841

5410
THE EFFECTS OF PRE- AND POSTIRRADIATION CENTRIFUGATION ON THE CHROMOSOMES OF TRADESCANTIA AND VICIA. Sheldon Wolff and R. C. von Borstel. *Proc. Natl. Acad. Sci. U S A* 40, 1138-41(1954).

In *Tradescantia* microspores and *Vicia* seed, pre-irradiation centrifugation decreases aberrations as compared with noncentrifuged controls. Postirradiation centrifugation increases aberrations (if done before chromosome breaks rejoin). *Tradescantia* cells irradiated in nitrogen show no increase of aberration yield caused by centrifugation. Explanations of these phenomena are offered. NSA 9-842

5411
THE EFFECT OF THE HOST ON THE PROPERTIES AND SENSITIVITY OF A BACTERIAL VIRUS. Murray Friedman. *J. Bacteriol.* 68, 274-8(1954).

Three strains of *Bacillus megaterium* served as hosts for one virus, M-5. Hosts react similarly with respect to the virus's latent period, thermal, x ray, and deuteron inactivation. NSA 9-1153

5412
Brookhaven National Lab. CHROMOSOME REJOINING CAPACITY WITH RESPECT TO BREAKAGE SENSITIVITY TO X-RAYS AND THERMAL NEUTRONS. Eleanor Deschner and A. H. Sparrow. [1954]. 35p. (BNL-2045).

Experiments were carried out to determine the relative biological effectiveness of x rays and thermal neutrons on induction of breakage and degree of rejoining during various stages of microsporogenesis in *Trillium*. NSA 9-1154

5413
Brookhaven National Lab. DECREASE IN UPTAKE OF IRON BY DUCK ERYTHROCYTES IN VITRO FOLLOWING WHOLE-BODY X-IRRADIATION. J. Raymond Klein. [1954] 6p. (BNL-2071).

Whole-body x irradiation of ducks is followed by a decrease in uptake of iron by blood cells *in vitro*. Since uptake by leucocytes and decrease in leucocyte level of blood postirradiation does not account for decrease, a diminished ability of erythrocytes to take up iron *in vitro* is suggested. NSA 9-1155

5414
Tennessee Univ. AGRICULTURAL RESEARCH PROGRAM. SEMI-ANNUAL

PROGRESS REPORT FOR JANUARY 1, 1954 TO JUNE 30, 1954. Dec. 1954. 91p. (ORO-133).

Includes report on: toxicity of Ra and Sr⁹⁰ for lambs, radiotoxicology of Ni⁶³ for rats, and of Cr⁵¹ and Zn⁶⁵ for cattle; physiological effects on burros of chronic γ ray exposure, initial signs, gross pathology, degree of healing, and chronic histopathologic changes in skin of burros, horses, cattle and sheep following exposure to β rays applied in activated amorphous red phosphorous plaques, bacterial transfer in burros after lethal total-body irradiation, toxicity of irradiated flesh. NSA 9-1156

5415

X-RADIATION, TEST OF GROWTH AND MUTATIONS.

A. Moes. J. belge radiol. 37, No. 4, 572-87(1954).

(In French).

Physiological action of x rays can be demonstrated by growth test on *Hordeum sativum* Jess., using conventional methods. Data obtained are compared to results in terms of survival rate, fertility of surviving plants and to mutation rates. Growth test may be applied to such questions as relation between radiosensitivity and corn development, wavelength effect, and differences in radiosensitivity among different tissues and species. NSA 9-1159

5416

CHANGES IN THE LATENT PERIOD OF A BACTERIAL

VIRUS. Ernest Pollard, W. R. Adams, and Shirley Robbins. Radiation Research 1, 514-22(1954).

Latent period of T1 bacteriophage which has been dried and either treated or irradiated by ionizing radiation has been observed to increase. Data are given for: deuteron and α -particle bombardment, x irradiation, and wet x irradiation. Author suggests presence of about 100 long, thin units, some of which are vital to survival and others of which are rate increases, inside the virus, and that these are the units inactivated by ionizing radiation. NSA 9-1160

5417

EFFECT OF WHOLE-BODY X-IRRADIATION ON LIPIDS IN THE LIVER, KIDNEY, AND SPLEEN OF FASTED RATS.

W. E. Cornatzer, J. P. Davidson, O. D. Engelstad, and Carol Simonson. Radiation Research 1, 546-50(1954).

Phospholipid synthesis was somewhat reduced in spleen. No significant changes were observed in lipid P in the kidney, or in the concentration of cholesterol in the spleen, liver, and kidney due to irradiation. NSA 9-1161

5418

RELATIONSHIP BETWEEN *BARTONELLA MURIS* INFECTION AND ACUTE RADIATION EFFECTS IN THE RAT. J. K.

Scott and J. N. Stannard. J. Infectious Diseases 95, 302-8(1954).

Latent *Bartonella muris* infection in the rat can be activated by injecting polonium²¹⁰, or by whole-body exposure to 600 r of 250 kv x rays. Anemia develops less rapidly and is not as severe as when infection is activated by splenectomy. Authors conclude that presence of active bartonella infection does not exacerbate lethal effects of an acute radiation dose, although hematological response may be markedly altered. NSA 9-1164

5419

IRRADIATION AND ADRENAL STEROIDOGENESIS. STEROID TRANSFORMATION BY IRRADIATED ISOLATED PERFUSED CALF ADRENALS. George Rosenfeld, Frank Ungar, Ralph L. Dorfman, and Gregory Pincus. Endocrinology 56, 24-9(1955).

Exposure of isolated calf adrenal to moderate doses of γ rays (Co⁶⁰) during perfusion of various steroid substrates caused significant reduction in ability of the gland to carry out 11 β -, 17 α -, and 21-hydroxylations as well as the oxidation of the Δ^5 -3 β -hydroxyl group to the Δ^4 -3-ketone group. NSA 9-1165

5420

IRRADIATION AND ADRENAL STEROIDOGENESIS. INFLUENCE OF IRRADIATION OF ISOLATED ACTH-STIMULATED CALF ADRENALS ON THEIR CORTICAL OUTPUT. Frank Ungar, George Rosenfeld, Ralph L. Dorfman, and Gregory Pincus. Endocrinology 56, 30-6 (1955)

Exposure of the isolated, ACTH-stimulated calf adrenal to moderate γ ray (Co⁶⁰) doses during perfusion resulted in a significantly decreased secretion of hydrocortisone, corticosterone, and unidentified Porter-Silber chromogens. No marked morphological alterations were seen in cortex, but it is still considered a radioresponsive tissue. NSA 9-1166

5421

SEARCH FOR AN EFFECT OF HYDROSTATIC PRESSURE ON X-RAY INACTIVATION OF YEAST. Victor W. Burns. Arch. Biochem. Biophys. 53, 450-6(1954).

Evidence has been presented to show that lethal inactivation of haploid *S. cerevisiae* by x rays is not altered by hydrostatic pressures reaching 10,000 lb/in.² applied during and after irradiation. From these results it is inferred that the lethal mutation process probably does not initially involve macromolecular unfolding. NSA 9-1167

5422

EARLY RADIATION DEATH IN GUINEA PIGS. K. C. Brace, H. L. Andrews, and E. C. Thompson. Am. J. Physiol. 179, 386-9(1954).

Guinea pigs were exposed to whole-body x rays of 1000-25,000 r at constant dose rate of 50 r/min. Doses of: 1000 and 5000 r caused death in 4-6 days, progressive depression with few other neurological symptoms, brief, transient granulocytosis, 7500 r proved lethal in less than 24 hr, elicited state of hypersensitivity with convulsive seizures, and marked granulocytosis, 6000 r caused equal numbers of the two types of death. Irradiation of the head alone produced similar effects. NSA 9-1168

5423

LARGE DOSES OF I¹³¹ IN DOGS. RADIATION DOSAGE CORRELATED WITH HISTOLOGIC AND AUTORADIOGRAPHIC CHANGES. Martin B. Levene, Gould A. Andrews, and Ralph M. Kniseley. Am. J. Roentgenol. Radium Therapy Nuclear Med. 73, 88-97(1955).

Normal dogs were given 1.5 millicuries/kilograms of I¹³¹. Inflammation and necrosis of thyroid developed after 3rd day. Destruction of the gland was correlated with release of I¹³¹ from the thyroid into the blood stream. A patchy rim of preserved follicles was seen in the thyroids of dogs sacrificed on 6th and 9th days. At later intervals necrosis was complete, and autoradiographs showed focal zones of radioactivity. NSA 9-1169

5424

MODIFICATION IN STEROL METABOLISM OF YEAST ORGANISMS UNDER THE INFLUENCE OF X-RAYS. R. D. Gal'tsova, M. N. Metsel, and L. A. Seliverstova. Doklady Akad. Nauk. S. S. S. R. 98, 1013-16(1954). (In Russian).

Data on ergosterol content, respiration, and fermentative power of *Saccharomyces cerevisiae* cultures following exposure to 2000-100,000 r of 160 kv x rays are tabulated and discussed. NSA 9-1170

5425

BLOOD RADIATION DOSE DURING RADIOIODINE THERAPY OF METASTATIC THYROID CARCINOMA. S. M. Seidlin, A. Aaron Yalow, and Edward Siegel. Radiology 63, 797-813(1954).

Blood radioiodine concentration was determined for 1-35 days after ingestion of therapeutic doses of I¹³¹ by 26 patients with thyroid carcinoma, and specific radiation dose to the blood was computed. NSA 9-1173

- 5426**
THE EFFECT OF BONE-MARROW INJECTION ON THE INCORPORATION OF FORMATE-CARBON-14 INTO DESOXYRIBONUCLEIC ACID PURINES OF X-IRRADIATED RATS. C. A. Erikson, R. K. Main, and L. J. Cole. Oct. 15, 1954. (USNRDL-TR-14).
Injection of bone-marrow causes an over-recovery of previously inhibited incorporation in the DNA purines of bone-marrow and spleen on 8th postirradiation day. Results for small intestine and liver were inconclusive. NSA 9-1176

THE MECHANISM OF INDUCTION AND THE CHARACTERISTICS OF PITUITARY TUMORS INDUCED BY THYROIDECTOMY. Jacob Furth, James Norman Dent, William T. Burnett, Jr., and Evelyn L. Gadsden. J. Clin. Endocrinol. and Metabolism 15, 81-97(1955).
Studies on mice led to conclusion that sustained deficiency of thyroid hormone gives rise to thyrotropic pituitary tumors, whether the thyroid deficiency be brought about by ionizing radiation or by other agents. NSA 9-1450
- 5432**
COMPARATIVE EFFECTS OF X-RAY AND ULTRAVIOLET RADIATION ON THE DIFFERENTIATED CHROMOSOMES OF THE TOMATO. Donald W. Barton. Cytologia (Tokyo) 19, Nos. 2-3, 157-75(1954).
Cytological analysis, at pachytene stage, of F_1 tomato plants following x ray and ultraviolet pollen treatment has established that there is a higher proportion of deficiencies to translocations after ultraviolet treatment than after x irradiation. Both radiations produced both terminal and interstitial deficiencies in tomato chromosomes. Chromosome breakage was highly localized in chromatic regions of chromosomes after both x ray and ultraviolet treatment. NSA 9-1451
- 5433**
PROTECTIVE EFFECT OF d, 1- α -OCTADECYLGLYCEROL-ETHER IN MICE GIVEN TOTAL BODY X-IRRADIATION. T. Edlund. Nature 174, 1102(1954).
Batyl alcohol was found to have beneficial therapeutic effect on irradiation injuries in mice. NSA 9-1454
- 5434**
ALKOXYGLYCEROLS IN THE TREATMENT OF LEUKOPAENIA CAUSED BY IRRADIATION. Astrid Broholt. Nature 174, 1102-3(1954).
Treatment with alkoxyglycerols administered by mouth proved effective in raising white blood count of patients suffering from radioinduced leukopenia. NSA 9-1455

UTILIZATION OF THE GROSS FISSION PRODUCTS. PROGRESS REPORT NO. 7. L. E. Brownell, L. C. Anderson, H. J. Gombert, L. L. Kempe, J. J. Martin, J. V. Nehemias, and R. A. Wolfe. Dec. 1954. 249p. (AECU-2981).
Low doses of γ rays increased refrigerator storage life of raw, ground pork and beef and prepackaged coleslaw. Irradiation sufficient to prevent insect infestation of flour or wheat had no undesirable effects on taste and baking qualities of wheat flour. Low γ ray doses prevented sprouting of stored potatoes and onions. Also studied: effect of irradiated diet on animals, effect of radiation on plants, and on tissue transplants for dogs. NSA 9-1550
- 5437**
THE ACTION OF X-RAYS ON THE NUCLEIC ACID METABOLISM IN PROLIFERATIVE AND SECRETORY CELLS. M. de Nicola. Experimentia 6(11), 432-3(1950).
X rays inhibit DNA-synthesis and conversion of DNA into RNA in *Asellus aquaticus*. Effects on germ cells and follicular secretory cells are described. Author concludes that x ray action is essentially specific for nucleic acids and not for some intermediate substance for their metabolism, and that stickiness, metaphasic block, and chromosome abnormalities are probably a secondary effect. CLINICAL THERAPEUTIC RADIOLOGY. U. V. Portmann. New York, Thomas Nelson and Sons. 1950. 748p.
Author describes use of x rays and Ra in medicine, and includes section on biological effects of radiation. BA 25-16297
- 5440**
THE ELECTROPHORESIS OF LECITHIN- AND CHOLESTEROL-TREATED OIL EMULSIONS. Suzanne Bazin and Gaston Meynel. Compt. rend. soc. biol. 144(1/2), 9-11(1950).

Paramecia were protected by lecithin and cholesterol in suspensions of oils from lethal effects of x rays. BA 25-16313

5441
THE EFFECT OF IRRADIATION ON THE DEVELOPING DENTAL SYSTEM OF THE SYRIAN HAMSTER. K. W. Bruce. J. Oral Surg. Oral Med. and Oral Path. 3(11), 1468-77 (1950).

Effects on rats of 3 hr of exposure of the head to radon emanation in variable doses included: greying of hair, retardation of skull development, retarded dental growth and development in younger animals, dwarfing of teeth roots, diminution in tooth size, and anodontia. BA 25-174021

5442
EFFECT OF SENSITIZATION AND IRRADIATION ON THE FATE OF I^{131} -LABELLED BOVINE GAMMA GLOBULIN IN RABBITS AND MICE. F. J. Dixon, G. J. Dammin, and S. C. Bukantz. Federation Proc. 9(1), 380(1950).

An abstract. BA 25-17606

5443
IRRADIATION OF VIRUSES WITH SOFT X-RAYS. W. R. Guild. Bull. Am. Phys. Soc. 26(1), 15(1951).

T-1 bacteriophage of *Escherichia coli* is inactivated easily by x rays (500-3500 volts). BA 25-17784

5444
EFFECT OF SUPERVOLTAGE CATHODE RAYS ON BACTERIAL FLORA OF SPECIES AND OTHER DRY FOOD MATERIALS. Bernard E. Proctor, Samuel A. Goldblith, and Harvest Fram. Food Research 15(6), 490-3(1950).

Cathode ray dosage of 1.33×10^6 rep was found to result either in complete destruction or, in a few instances, in survival of only a few of aerobic mesophilic and thermophilic bacteria in sugar, flour starches, egg and milk powders. BA 25-17879

5445
X-RAYS IN THE CENTROMERE PROBLEM OF *LUZULA PURPUREA* LINK (1). D. de Castro, A. Camara, and Nydia Malheiros. Gent. Iberica 1(1), 49-54(1949).

Seeds of *L. purpurea* were x irradiated with 20,000 r, seedlings with 10,000, 5000, and 1000 r. All doses produced: chromosome breakage, fragments, rings, chains, and lateral attachments. In mitotic anaphase, fragments all moved to poles as if they were independent units. This behavior persisted in subsequent cell-generations until onset of meiosis. Author believes data show clearly that chromosomes of *L. purpurea* lack localized centromeres. BA 25-19220

5446
DIFFERENCES BETWEEN EFFECTS OF CHEMICAL AND PHYSICAL MUTAGENS. C. Auerback. Pubbl. staz. zool. Napoli Suppl. 22, 1-21(1950).

Compares effects of mustard gas and x rays on *Drosophila melanogaster*. BA 25-19292

5447
HISTAMINE CONCENTRATION AFTER IRRADIATION WITH X-RAYS. H. Baur and M. Ludin. Radiol. Clin. 19(5), 268-76(1950).

X rays reportedly cause increased blood histamine concentration in man and animals amounting to 5-6 times normal values. In vitro irradiation of blood gives no increase. Author feels experiments indicate that histamine production is caused by radiation effect on the reticuloendothelial system or the bone marrow. BA 25-19536

5448
EFFECT OF ADRENALECTOMY AND GLUTATHIONE ON X-RAY-INDUCED MORTALITY IN MICE. E. P. Cronkite and W. H. Chapman. Federation Proc. 9(1), 329(1950).

An abstract. BA 25-19984

5449
HORMONAL CHANGES FOLLOWING LOW DOSAGE IRRADIATION OF PITUITARY AND OVARIES IN ANOVULATORY WOMEN.

A. E. Rakoff. Fertility and Sterility 1(6), 504-16(1950).

Endocrine studies were made before, during and after low dosage irradiation to the pituitary and ovaries of 12 women with persistent anovulatory sterility. Improvement in hormonal pattern occurred in all 3 types of endocrine dysfunction, but was most consistent in patients with gonadotropic deficiency. Results indicate primary beneficial effect was upon ovaries, possibility of a primary effect upon pituitary in some instances not eliminated. BA 25-20085

5450
ADAPTATION AND X-RAY IRRADIATION. A. Lenoir. Radiol. Clin. 13(5), 264-76(1944).

Since vitamin A deficiency parallels decrease in faculty of adaptation, and patients exhibit decreased faculty of adaptation after x irradiation, author postulates a reduction of vitamin A content postirradiation. (Considers three components of adaptation: accommodation of pupil, adaptation of cones, adaptation of rods). BA 22-3414

5451
DEPOSITION OF METHYLCHOLANTHRENE IN SOME ORGANS OF THE RAT. Ole Esmarch. Acta. Path. Microbiol. Scand. 19(1), 79-99(1942).

Groups of 10 animals were injected with methylcholanthrene, half of each group x rayed (160 kv, 4 ma; 4 mm Al; half layer value, 0.55 Cu, 60 cm dist., at 11.9 r/min, total body dose of 330 r). Tumor formation was studied in mammary glands, striated muscle, thyroid, peritoneum, liver, spleen, lung, uterus, testes, and brain. Radiation had no effect on character of tumors, tendency to metastasis, length of latent period before appearance or proportion of growths obtained. BA 18-889

5452
THEORETIC CONSIDERATIONS AND CLINICAL USE OF GRENZ RAYS IN DERMATOLOGY. Frederick Kalz. Arch. Dermatol. and Syphilol. 43(3), 447-72(1941).

This is a review article. BA 16-15898

5453
ROENTGEN TREATMENT OF ASTHMA. Charles K. Maytum and Eugene T. Leddy. J. Allergy 10(2), 135-45(1938-39).

Reasons for beneficial effects of x-ray therapy are not definitely known. One conclusion is that x rays decrease secretory power of mucous glands in trachea, liberate antibodies by destruction of leucocytes, and may stimulate production of eosinophils. BA 13-17172

5454
ON THE PRODUCTION OF HEREDITARY PHYTOCARCINOMA BY RADIUM IRRADIATION IN *ANTIRRHINUM MAJUS*. Emmy Stein. Phytopathol. Z. 4(5), 523-38(1932). (In German).

Author describes a heritable disease (capable of being transmitted through at least 4 generations) which was produced by irradiating *A. majus* embryo for 6 hr β rays of Ra. BA 7-7726

5455
INDUCTION OF DOMINANT LETHAL EFFECTS BY X-RADIATION IN HABROBRACON. D. W. Bishop. Genetics 22(4), 452-6(1937). BA 11-17887

5456
THE EFFECTS OF X-RAYS ON THE DISSOCIATIVE RATES OF CERTAIN BACTERIA. Sol Haberman and Louis D. Ellsworth. J. Bacteriol. 38(2), 237-8(1939).

No abstract. BA 13-17456

5457
AN INTERNATIONAL BIBLIOGRAPHY ON ATOMIC ENERGY. VOL. II. SCIENTIFIC ASPECTS. United Nations Atomic Energy Groups, Dept. of Security Council Affairs. New York, Columbia University Press. 1951. 880p.

Scientific aspects of atomic energy as described in books and articles from all parts of the world between 1925 and 1949 are included. Subjects include: basic nuclear science; biological and medical effects of high-energy radiations; isotopes in biology and medicine, radioactive tracers. NSA 5-5240

5458
X-RAY FRACTIONATION AND CHROMOSOME BREAKAGE. George Roy Lane. *Heredity* 5(1), 1-35(1951).

Results of experiments with *Tradescantia bracteata* show following effects of separating an x ray dose of 360 r into 2 equal fractions: (1) as time period between fractions increases, breakage frequency decreases, then recovers, until at 8 hr separation it is little below that from full continuous dose; (2) frequency of breakage and reunion is reduced, at 4 hr separation, to less than twice the breakage frequency which would be expected from the half dose. BA 25-22445

5459
STUDIES OF THE EFFECTS PRODUCED BY X-RAYS, POLONIUM, AND SOME CHEMICAL REAGENTS ON THE MERISTEMATIC CELLS OF HIGHER PLANTS. R. Villars. *Rev. gen. botan* 56, 205-31, 258-81, 318-32, 364-80, 404-23(1949). (In French).

Author describes x ray effects on mitosis in root tips of *Pisum sativum*, *Vicia faba*, *Helianthus uniflorus*, *Allium cepa*, *Hyacinthus orientalis*, and *Pinus pinea*; and effect of solutions of polonium on *V. faba*, *P. sativum*, and *P. pinea*. BA 25-22455

5460
TWENTY-FIVE YEARS OF TULIP IMPROVEMENT BY X-RAYS. Willem Eduard DeMol. *Papers Mich. Acad. Sci.* 35, 9-14(1949).

Microscopic study of x-irradiated tulips show (1) number of chromosomes varied owing to arrest of nuclear divisions, (2) separated **chromomeres stretched into** filaments, (3) chromosomes remained in cytoplasm after nuclear reconstruction, (4) pollen became sterile, (5) somatic mutations occurred. Visible changes are described. Treatment in August or September with dosages not in excess of 800 r were most successful. BA 25-22492

5461
PROTECTIVE ACTION OF SOME SULFUR-CONTAINING AND SULFUR-FREE COMPOUNDS AGAINST X-RAY DAMAGE IN BACTERIA. W. T. Burnett, G. E. Stapleton, and A. Hollaender. *Federation Proc.* 10(1), 22(1951).
An abstract. BA 25-22782

5462
RESPONSE OF *CHILOMONAS PARAMECIUM* TO IONIZING RADIATION. Howard S. Ducoff and John O. Hutchens. *Federation Proc.* 10(1), 37(1951).
An abstract. BA 25-22785

5463
SURVIVAL OF RATS ADRENALECTOMIZED AFTER X-IRRADIATION. Abraham Edelmann and Seymour Katsh. *Federation Proc.* 10(1), 38(1951).

Life span was reduced when time between radiation and adrenalectomy was reduced. Thus, need for adrenal hormones is most acute immediately after irradiation and rapidly diminishes after 3-5 days. BA 25-22786

5464
PROTECTION OF MICE FROM LETHAL EFFECTS OF X-RADIATION WITH INTRAVENOUS INJECTION OF METHYLENE BLUE. B. Vincent Hall. *Federation Proc.* 10(1), 58-9(1951).
An abstract. BA 25-22790

5465
DESOXYRIBONUCLEIC ACID CONTENT PER NUCLEUS IN RAT THYMUS DAMAGED BY β -RADIATION. Helen

Harrington and Paul S. Lavik. *Federation Proc.* 10(1), 194-5(1951).

An abstract. BA 25-22792

5466
PREVENTION OF INJURY FROM X-RADIATION. Francis R. Holden, Eugene Tochilin, Charles H. Hine and Leon Lewis. *Calif. Med.* 74(3), 188-92(1951).

Authors discuss **occupational radiation injuries** from the point of view of preventive medicine. BA 25-22793

5467
EFFECT OF TERRAMYCIN ON ACUTE RADIATION SYNDROME IN DOGS. J. W. Howland, F. W. Furth, and M. P. Coulter. *Federation Proc.* 10(1), 67(1951).
An abstract. BA 25-22794

EFFECTS OF DIBENAMINE AND CORTIN UPON COMPOSITION OF BLOOD PLASMA DURING ACUTE RADIATION SYNDROME. Henry I. Kohn. *Federation Proc.* 10(1), 74(1951).
An abstract. BA 25-22797

5469
EFFECT OF X-IRRADIATION ON IRON OF SERUM AND TISSUE OF RATS. Stephan Ludewig and Alfred Chanutin. *Federation Proc.* 10(1), 218(1951).
An abstract. BA 25-22800

5470
ON THE EFFECTS OF RADIOACTIVE IODINE ON THE HYPOPHYSIS AND OVARIES OF MAMMALS. L. A. Kashchenko. *Med. Radiol. No. 2*, 70-5(1956). (In Russian). NSA 10-11017

5471
FLUID BALANCE STUDIES IN GUT, MUSCLE, AND SKIN OF RATS AFTER TOTAL BODY X-RADIATION. E. E. Painter and M. A. Cooley. *Federation Proc.* 10(1), 100-1(1951).
An abstract. BA 25-22801

5472
ACUTE INTESTINAL RADIATION DEATH. Henry Quastler. *Federation Proc.* 10(1), 106(1951).
An abstract. BA 25-22802

5473
SEVERE RADIATION INJURY OBSERVED IN THE ERYTHROCYTE SEDIMENTATION OF DOGS. G. A. Sacher, M. N. Swift, and J. Gurian. *Federation Proc.* 10(1), 116(1951).
An abstract. BA 25-22804

5474
THERMAL FRAGILITY OF RAT ERYTHROCYTES FOLLOWING WHOLE-BODY X-IRRADIATION. Falconer Smith and Marie M. Grenan. *Federation Proc.* 10(1), 128(1951).
An abstract. BA 25-22806

5475
POTASSIUM TOLERANCE FOLLOWING IRRADIATION. Willie W. Smith. *Federation Proc.* 10(1), 129(1951).
An abstract. BA 25-22807

5476
THE EFFECT OF OVER-ALL TIME OF EXPOSURE UPON SURVIVAL OF YOUNG CHICKS FOLLOWING ROENTGEN IRRADIATION. Phyllis Stearner and Emily J. B. Christian. *Am. J. Roentgenol. Radium Therapy* 65(2), 272-6(1951).

Survival following exposure to fractionated x ray dosages indicates that over-all time is of **greater importance** than dosage rate in determining lethal effect of given dosage for newly hatched chicks. Additional results indicate that recovery does not occur at linear rate. BA 25-22810

5477
BODY RADIUM CONTENT OF INDIVIDUALS WITH NO

KNOWN OCCUPATIONAL EXPOSURE. John B. Hursh and Allan A. Gates. *Nucleonics* **7**(1), 46-59(1950).

Radium content of bodies of 25 adults and 6 stillborn infants or fetuses was determined. Average value for adults was found to be 0.50×10^{-13} g of Ra per g of ash, for stillborns, 0.32×10^{-13} g Ra/g ash. Daily dose to bone is estimated as 1.13×10^{-2} millirep. BA 25-22851

5478

RADIATION SICKNESS IN MICE DURING REDUCED BAROMETRIC PRESSURE. L. B. Bychkovskaya, G. S. Strelin, and I. V. Shiffer. *Central Research Inst. of Roentgen Radiology*, No. 3, 85-92(1956). (Russian). NSA 10-11007

5479

THE HISTOGENESIS OF RADIATION-INDUCED AND OF BENZOPYRENE-INDUCED EPIDERMAL TUMORS IN THE MOUSE. A. Glucksmann. *J. Pathol. Bacteriol.* **63**(1), 176-7(1951).

Tumors induced by β rays appear following destruction of directly irradiated skin and production of severe vascular damage and arise in regenerating epidermis after about 14 months. Weekly paintings with benzpyrene leads to formation of epidermal tumors in 3 months by direct stimulation of treated epidermis. BA 25-23979

5480

COMBINED THERMAL AND PRIMARY IONIZATION EFFECTS ON A BACTERIAL VIRUS. W. R. Adams and Ernest Pollard. *Bull. Am. Phys. Soc.* **26**(3), 39(1951).

Inactivation of dry T-1 bacteriophage proceeds definitely faster when virus is bombarded by deuterons or x rays at temperatures above room temperature. BA 25-24427

5481

PHYSICAL CATALYSTS IN THE PLANT WORLD. Vincenzo Rivera. *Italia agric.* **87**(7), 415-8(1950). (In Italian).

Discusses: effect of naturally occurring ultragamma radiations on bacteria and yeast, effect of exposing *Vicia faba* seeds to 400 mg of Ra for 24 hr at 3 cm, effect of x rays on growing points or on pathological tissues such as tumors due to *Pseudomonas tumefaciens*. BA 25-25403

5482

THE EFFECT OF X-RADIATION ON INDOLEACETIC ACID AND AUXIN LEVELS IN THE PLANT. S. A. Gordon and R. P. Weber. *Am. J. Botan.* **37**(8), 679(1950).

An abstract. BA 25-25418

5483

Naval Radiological Defense Lab.
COMBINED EFFECTS OF TOTAL BODY X IRRADIATION AND RADIANT ENERGY THERMAL BURNS. 3. OSMOTIC AND MECHANICAL FRAGILITY OF THE ERYTHROCYTE. E. L. Alpen, J. A. Alexander, A. K. Davis, and W. M. Davis. Nov. 23, 1953. 28p. (USNRDL-419, AFSWP-474)

Osmotic and mechanical fragility of rat erythrocytes were measured during the 30-day interval following severe and moderately severe burns, 100 and 500 r of whole-body ionizing radiation, and combinations of the two traumata. NSA 8-2095

5484

Naval Radiological Defense Lab.
COMBINED EFFECTS OF TOTAL BODY X IRRADIATION AND RADIANT ENERGY THERMAL BURNS. 2. ANEMIA. A. K. Davis, E. L. Alpen, G. E. Sheline, and W. M. Davis. Nov. 23, 1953. 28p. (USNRDL-423, AFSWP-732)

Effects of 25% and 15% body area burns, and 100, 475, and 500 r of total-body x irradiation were compared with the effects of three combinations of these on blood volume, red cell volume, hematocrit, red cell count, hemoglobin, and reticulocyte population in rats. NSA 8-2096

5485

Radiological Lab., Univ. Calif., San Francisco, School of Medicine Physics and Biology Sections
ANNUAL REPORT FOR 1953. 26p. Contract AT-11-1-GEN-10. (UCSF-8).

Includes reports on: tests of relative biological efficiency of x radiation and response of various mouse organs and tissues to x radiation as a function of dose rate and fractionation. NSA 8-2098

5486

Los Alamos Scientific Lab.
BIOLOGICAL EFFECTIVENESS OF THERMAL NEUTRONS IN PRODUCING TESTICULAR ATROPHY IN MICE. John B. Storer, Wright Langham, Phyllis Sanders, and William Schweitzer. May 1953. 14p. Contract W-7405-eng-36 (LA-1630).

Using testicular atrophy in mice 4 wk postexposure as the biological indicator of radiation effect, a comparison was made of relative effectiveness of the thermal column and 250 kvp x radiation. Results showed approximately 8×10^3 thermal n/cm² produced an effect equivalent to 1 r of 250 kvp x rays. NSA 8-2282

5487

National Bureau of Standards
THE RELATIVE BIOLOGICAL EFFICIENCY OF DIFFERENT IONIZING RADIATIONS. John W. Boag. Dec. 30, 1953. 147p. (NBS-2946).

Author discusses general aspects of biological effect of different radiations and defines terms used. Several experiments are reviewed, including those on whole animals or organs, and those on microorganisms and other simple materials. Relative RBE values are tabulated. Appendices give linear energy transfer distribution in water or tissues irradiated by fast neutrons and by x ray beams. NSA 8-2283

5488

Air Force Radiation Lab., Univ. of Chicago
QUARTERLY PROGRESS REPORT NO. 10. Jan. 15, 1954. 126p. Contract AF-33(038)27353 (NP-5055).

Includes reports on: application of 5-nucleotidase measurements on hematopoietic tissues for evaluating protective efficacy of chemical agents against radiation injury, x ray effect on sulfanilamide metabolism *in vivo*, x ray effects on O consumption by spleen and thymus, on respiration in rat tissue slices, on neurohumoral mechanisms of gastrointestinal, hematopoietic and other tissues of rats, on O consumption and production of CO₂ and acetone by rats, on survival of amoeba, effects of antihistaminic agents and mouse liver catalase on lethality of x irradiation in rats. NSA 8-2284

5489

Atomic Energy Project, Univ. of Calif., Los Angeles
SOME FACTORS INFLUENCING THE METABOLISM OF RADIO-STRONTIUM BY ANIMALS. Warren J. Gross, Janice F. Taylor, and James C. Watson. Jan. 6, 1954. 20p. (UCLA-274).

Metabolism of ingested strontium in rats was studied. Attainment of published value for maximum Sr⁹⁰ + Y⁹⁰ body burden in man is discussed. NSA 8-2285

5490

Atomic Energy Project, Univ. of Rochester
PRENATAL MORTALITY RATES OF SEVENTEEN RADIATION INDUCED TRANSLOCATIONS IN MICE. Eileen M. Otis. Nov. 23, 1953. 60p. Contract W-7405-eng-49 (UR-291).

Seventeen chromosome translocations (semi-sterile lines) in the mouse were investigated to determine prenatal mortality rates of lethally affected zygotes. Seven translocations were obtained from exposure to low chronic x ray doses, and ten from single exposures to 600 r at

34. 9 r/min and 48. 5 r/min. Data are tabulated.
NSA 8-2286

5491

Atomic Energy Project, Univ. of Rochester
QUARTERLY TECHNICAL REPORT [FOR] OCTOBER 1
THROUGH DECEMBER 31, 1953. Feb. 9, 1954. 31p. Contract
W-7401-eng-49. (UR-311).

Included are reports on (1) use of an immunizing agent (Bacterin), a blood coagulant (Koagamin), and an acetylation antagonist (Antabuse), which failed to alter post-irradiation course, morbidity, and mortality of dogs. (2) Aureomycin appeared to have some influence on maintenance of body weight of irradiated animals. Data are included from studies of toxicity of inhaled UO_2 fumes in rats. NSA 8-2287

5492

Atomic Energy Project, Univ. of Rochester
ANOTHER POSSIBLE CAUSE OF SPONTANEOUS MUTATIONS.
Robert L. Brent. Feb. 22, 1954. Contract W-7401-eng-49
(UR-313).

Author reports that naturally occurring C^{14} can account for between 0.1% and 6% of spontaneous mutations in nature. Proposes that effects of atomic transformation should be included in all estimates of maximum permissible dose of radioisotopes which might be incorporated into genes. NSA 8-2288

5493

Naval Radiological Defense Lab.
QUANTITATIVE SEROLOGICAL DETERMINATION OF
ANTIBODY FORMATION IN X-IRRADIATED RABBITS.
M. S. Silverman and P. H. Chin. Dec. 23, 1953. 18p.
(USNRDL-422).

Even though antigen was administered with adjuvant, presumably permitting a prolonged, slow antigenic stimulation, response of animals receiving 400 r total body x rays was lower than that of nonirradiated animals. NSA 8-2289

5494

INCORPORATION OF P^{32} INTO TRICHLOROACETIC ACID
FRACTIONS OF LIVER FROM IRRADIATED AND
NONIRRADIATED MICE. F. G. Sherman and A. Forssberg.
Arch. Biochem. and Biophys. 48, 293-9(1954).

Specific activity of ortho P and acid-labile P from livers of irradiated mice was markedly increased, but had decreased when determined 1 hr and 24 hr after exposure. Irradiation of excised livers *in vitro* had negligible effect. NSA 8-2290

5495

THE IRRADIATION OF BACTERIAL SPORES WITH LOW-
VOLTAGE ELECTRONS. Marguerite Davis. Arch. Biochem
and Biophys. 48, 469-81(1954).

Spores of *Bacillus subtilis* were found to have three radiosensitive regions, but no evidence of a single organized nucleus containing particles of maximum radiosensitivity was found. NSA 8-2291

5496

EFFECT OF TOTAL BODY X-IRRADIATION ON THE
TRYPTOPHAN PEROXIDASE ACTIVITY OF RAT LIVER.
John F. Thomson and Eleanor T. Mikuta. Proc. Soc.
Exptl. Biol. Med. 85, 29-32(1954).

Total body x irradiation produces a dose-dependent increase in tryptophan peroxidase-oxidase system of rat liver within a few hours after exposure. Increase does not occur in adrenalectomized rats hence cannot be construed as a direct irradiation effect. NSA 8-2292

5497

SUBLETHAL TOTAL BODY IRRADIATION AND I^{131}
METABOLISM IN THE RAT THYROID. Robert A. Monroe,
John H. Rust, and Bernard F. Trum. Science 119, 65-7
(1954).

Comparative values are presented for uptake and binding of I^{131} by thyroid of rats at various intervals after exposure to 665 r of γ or 500 r of x radiation. Comparison is made with observations on excited thyroids of irradiated burros. (Uptake increased after exposure in both species.) NSA 8-2293

5498

DEPIGMENTATION OF HAIR AS A BIOLOGICAL
RADIATION DOSIMETER. Jack Moshman and Arthur C.
Upton. Science 119, 186-7(1954).

Study of large numbers of mice exposed to graded doses of whole-body ionizing radiation led to conclusion that degree of depigmentation of mouse fur is correlated closely enough with radiation dose to constitute a convenient biological dosimeter. Correlation varied markedly with different regions of coat, and for mice studied, it was more constant for fur on top of the head. NSA 8-2294

5499

SKIN REACTION TO PROTRACTED BETA IRRADIATION.
H. D. Griffith, J. F. Philip, and G. E. Swindell. Brit.
J. Radiol. 27, 107-12(1954).

Skin reactions consequent upon handling glass-screened radioactive material were classified in parallel with dose of β radiation received, protraction being up to four years. NSA 8-2295

5500

THE CHEMISTRY OF BIOLOGICAL AFTER-EFFECTS OF
ULTRAVIOLET AND IONIZING RADIATIONS. (A
SYMPOSIUM). X. MODIFICATION OF RADIATION DAMAGE
AFTER EXPOSURE TO X RAYS. Alexander Hollaender and
George E. Stapleton. Brit. J. Radiol. 27, 117-21(1954).

Effects of temperature and nutrient substances on post-exposure recovery of *E. coli*; changes produced on x ray sensitivity of *E. coli*, *Drosophila*, and other tissues by various agents are described. NSA 8-2296

5501

THE CHEMISTRY OF BIOLOGICAL AFTER-EFFECTS
OF ULTRAVIOLET AND IONIZING RADIATIONS. (A
SYMPOSIUM). XI. AFTER-EFFECTS OF RADIATION
AND CHEMICALS ON CHROMOSOMES AND GENES.
C. Auerbach. Brit. J. Radiol. 27, 122-4(1954).

After-effects of nuclear changes in chromosomes and genes produced by exposure to ionizing radiations and chemical and physical mutagens are discussed. Modification of effects of various mutagens by various post-treatments are reviewed, and an attempt is made to explain some of mechanisms of mutation. NSA 8-2297

5502

THE CHEMISTRY OF BIOLOGICAL AFTER-EFFECTS OF
ULTRAVIOLET AND IONIZING RADIATIONS. (A
SYMPOSIUM). XII. DELAYED EFFECTS IN CHROMOSOME
BREAKAGE BY X-RAYS. K. C. Bora. Brit. J. Radiol.
27, 124-7(1954).

Theories of nature of delayed radioinduced chromosome breakage are reviewed. NSA 8-2298

5503

THE CHEMISTRY OF BIOLOGICAL AFTER-EFFECTS OF
ULTRAVIOLET AND IONIZING RADIATIONS. (A
SYMPOSIUM). XIII. THE OXIDATIVE PHOSPHORYLATION
BY MITOCHONDRIA ISOLATED FROM THE SPLEEN OF
RATS AFTER TOTAL BODY EXPOSURE TO X RAYS.
D. W. van Bekkum, H. J. Jongepier, H. T. M. Niswenderk,
and J. A. Cohen. Brit. J. Radiol. 27, 127-30(1954)

Four hours after 1100 r of x rays, phosphorylation, O uptake, and P/O ratio are significantly reduced. Effect is observed with succinate as well as with α -ketoglutarate as substrate. NSA 8-2299

5504

THE CHEMISTRY OF BIOLOGICAL AFTER-EFFECTS OF

ULTRAVIOLET AND IONIZING RADIATIONS. (A SYMPOSIUM). XIV. RADIATION PROTECTIVE COMPOUNDS: A COMPARISON OF THEIR EFFECTS IN IN VIVO AND IN VITRO SYSTEMS. P. Alexander, M. Fox, and S. F. Hitch. *Brit. J. Radiol.* 27, 130-1(1954).

In vivo and in vitro methods for evaluating protective effects of various compounds against radiation injuries are discussed. Results are summarized from comparative experiments using the two systems, mouse and polymer. Possible mechanisms in radiation protection are discussed. NSA 8-2300

5505

THE CHEMISTRY OF BIOLOGICAL AFTER-EFFECTS OF ULTRAVIOLET AND IONIZING RADIATIONS. (A SYMPOSIUM). XV. FREE RADICAL PRODUCTION IN OXIDATION-REDUCTION REACTIONS OF PEROXIDASE, CATALASE AND METMYOGLOBIN. Philip George and D. H. Irvine. *Brit. J. Radiol.* 27, 131-7(1954). NSA 8-2301

5506

THE EFFECT OF RADIATION DOSE FRACTIONATION ON CHROMOSOME ABERRATION FREQUENCIES IN TRADES-CANTIA MICROSPORES. II. STUDIES WITH FAST NEUTRONS. Norman H. Giles, Frederick J. De Serres, Alvin V. Beatty. *Genetics* 38, 416-20(1953).

Single or fractionated dose of 25 n produced the same aberration frequency. Results are compared with data from x-ray studies. NSA 8-2303

5507

COMPARATIVE EFFECTS OF COBALT 60 AND RADIUM WHEN UTILIZED IN IDENTICAL DOSES ON THE SKIN OF RABBITS. Isadore Meschan and Anderson Nettleship. *Am. J. Roentgenol. Radium Therapy Nuclear Med.* 71, 306-19(1954).

Of 58 rabbits subjected to externally applied Ra^{226} and Co^{60} , 30 exhibited identical reactions to the two elements; 27 had more severe reactions to Co^{60} , while in one, the Ra^{226} reaction was more severe. Microscopic study indicated an earlier hyperplastic and greater ulcerative reaction due to Co^{60} . NSA 8-2304

5508

THE EFFECT OF X IRRADIATION AND LOWERED METABOLIC RATE ON THE MORPHOGENESIS OF DEVELOPING MELANOPLUS DIFFERENTIALIS EMBRYOS. Theodore N. Tahmisian, Janet V. Passonneau, and Dorothy M. Adamson. *J. Natl. Cancer Inst.* 14, 941-53(1954).

Sequence of biological susceptibility to x irradiation was found to be, in order of decreasing susceptibility, tissue differentiation, cell division, anabolism, catabolism, in developing grasshopper embryos. Anaerobic conditions during exposure increased radio-resistance tenfold. NSA 8-2305

5509

WEIGHT RESPONSE OF IRRADIATED ACCESSORY SEX ORGANS OF THE CASTRATE MALE RAT TO TESTOSTERONE PROPIONATE. Walter Fleischmann and John T. Brackin, Jr. *Endocrinology* 54, 227-8(1954).

Growth induced by testosterone propionate in accessory sex organs of castrated male rats was only partially inhibited by x rays. NSA 8-2306

5510

Naval Radiological Defense Lab. STUDIES ON THE TREATMENT OF INTERNAL RADIO-ACTIVE CONTAMINATION. 4. EFFECT OF ZIRCONIUM CITRATE AND EDTA ON THE DISTRIBUTION AND EXCRETION OF A MIXTURE OF LONG-LIVED FISSION PRODUCTS. J. K. Gong, W. L. Milne, and S. H. Cohn. *Dec. 24*, 1953. 16p. (USNRDL-426).

Zirconium citrate administered before the fission products afforded the most effective prevention of their deposition in the skeleton. NSA 8-2308

5511

MODIFICATION OF LETHAL IRRADIATION INJURY IN MICE BY INJECTION OF HOMOLOGOUS OR HETEROLOGOUS BONE. Egon Lorenz and Charles C. Congdon. *J. Natl. Cancer Inst.* 14, 955-61(1954).

Bone of mouse and rat transplanted intraperitoneally protected LAF₁ mice from lethal x ray dose. Homologous bone induced bonemarrow formation in the transplant. Heterologous rat bone marrow protected LAF₁ mice also, but bone marrow formation did not occur in transplant. NSA 8-2309

5512

PROTECTION OF IRRADIATED RATS BY PARABIOSIS WITH ADRENALECTOMIZED OR SPLENECTOMIZED PARTNERS. Martin Schneider, Robert C. Wybourn, Robert Binhammer, and John C. Finerty. *Radiology* 62, 234-40(1954).

Postexposure parabioses permanently protected a majority of rats from lethal effects of irradiation, but only if the non-irradiated partner had a spleen. NSA 8-2310

5513

Tennessee Univ. AGRICULTURAL RESEARCH PROGRAM. SEMI-ANNUAL PROGRESS REPORT FOR JULY 1 TO DECEMBER 31, 1953. Apr. 1954. 114p. Contract AT-40-1-GEN-242. (ORO-110).

Data are tabulated on clinical and pathological response of burros subjected to daily whole-body doses (until death) of γ radiation of: 400 r/day, 100 r/day, 50 r/day, and 25 r/day. Other work reported includes: suppression of gonadotropin principles by whole body x rays in rabbit, alteration of thyroid function and reduction of serum alkaline phosphatase in burro. NSA 8-2735

5514

Brookhaven National Lab. SEX-LINKED LETHAL MUTATIONS INDUCED BY THERMAL NEUTRONS IN MALE AND FEMALE DROSOPHILA MELANOGASTER. Robert C. King and Eunice M. Wood. (1953). BNL-1778

Authors describe recessive lethal mutations, loss and fragmentation of X-chromosomes in spermatozoa and oocytes of D. melanogaster produced by thermal neutrons. NSA 8-2737

5515

OBSERVATIONS ON EFFECTS OF X-IRRADIATION ON ACHROMOBACTER FISCHERII. R. D. Higginbotham and John Z. Bowers. *Proc. Soc. Exptl. Biol. Med.* 86, 303-5(1954).

Reproductive mechanism of A. fischerii is more sensitive to x radiation at all measured dosage levels than is the luminescent system of this organism. These findings indicate that cells sterilized by x rays are capable of metabolic activity for a measurable length of time after exposure. NSA 8-5476

5516

Los Alamos Scientific Lab. BIOLOGICAL EFFECTIVENESS OF 14 MEV NEUTRONS. SPLEEN AND THYMUS WEIGHT LOSS IN MICE AS THE BIOLOGICAL INDICATOR. Payne S. Harris, L. Edward Ellinwood, E. C. Anderson, Rowland W. Davis, William Schweitzer, and Phyllis Sanders. *Dec. 1953*. 16p. Contract W-7405-eng-36. (LA-1629).

Biological effectiveness study of 14 Mev neutrons and 250 kvp x rays indicates that a dosage of 1×10^8 n/cm² is equivalent to 1 r of x rays, and RBE of 7-Mev recoil protons is calculated to be between 1 and 2 for biological indicator used (spleen and thymus atrophy in female CF₁ mice). NSA 8-2738

5517

Atomic Energy Project, Univ. of Rochester

THE EFFECT OF SINGLE VS. DIVIDED DOSES OF X-IRRADIATION ON SURVIVAL OF RATS. John B. Hursh, Florence Van Slyke, and George Casarett. Mar. 16, 1954. 14p. Contract W-7401-eng-49. (UR-317).

Studies performed on male rats demonstrate that the average shortening of life of 60-day survivors of a single 600 r x ray dose (19%) is significantly greater than the average life shortening produced by a total dose of 600 r divided into either 10 daily doses of 60 r/day or 30 daily doses of 20 r/day. NSA 8-2739

5518

Atomic Energy Project, Univ. of Rochester
USE OF A TEST DOSE TO ESTIMATE LIFE SHORTENING PRODUCED IN RATS BY A SINGLE DOSE OF X-IRRADIATION. John B. Hursh, Florence Van Slyke, and George Casarett. Mar. 16, 1954. 15p. Contract W-7401-eng-49. (UR-318).

Male rats, 60-day survivors of single 650 r x ray dose, were tested by second dose and LD₅₀ was found to be 548 r. Reduction in LD₅₀ is believed to be caused by an irreparable injury produced by initial dose and to reflect reduction in survival established in earlier experiments as a consequence of high single dose irradiation. NSA 8-2740

5519

Atomic Energy Project, Univ. of Rochester
INFLUENCE OF DIET ON SURVIVAL OF RATS FOLLOWING WHOLE BODY X-IRRADIATION OR POLONIUM INJECTION. Thomas R. Noonan and J. N. Stannard. Mar. 23, 1954. 12p. Contract W-7401-eng-49. (UR-320).

The 30-day mortality of rats following either 625 r of whole-body x rays or the intravenous injection of 38 μ c of polonium per kilogram body weight is not significantly changed by feeding synthetic diets with either 25% casein and 32% fat or 10% casein and 5% fat as compared to a standard Fox Chow diet. NSA 8-2741

5520

Naval Radiological Defense Lab.
ALTERATIONS IN ORGAN AND BODY GROWTH OF RATS FOLLOWING DAILY EXHAUSTIVE EXERCISE, X IRRADIATION, AND POST-IRRADIATION EXERCISE. D. J. Kimeidorf and S. J. Baum. Dec. 23, 1953. 24p. (USNRDL-427).

Male rats were subjected to the stress of repeated exhaustive swimming exercise or to several doses of x rays or to various numbers of exhaustive swimming trials after irradiation. Data describing body weight and weights of 9 organs at various intervals after imposition of the experimental condition are analysed. NSA 8-2742

5521

PREVENTION OF TRICHINOSIS BY GAMMA IRRADIATION OF PORK AS A PUBLIC HEALTH MEASURE. S. E. Gould, H. J. Gomberg, and F. H. Bethell. Am. J. Public Health 43, 1550-7(1954).

Gamma irradiation of raw pork is considered as method for preventing Trichinosis and advantages of radiation treatment are summarized. NSA 8-2743

5522

THE EFFECT OF TUMOR GROWTH AND X-RADIATION ON THE INCORPORATION OF RADIOCARBON FROM 4-AMINO-5-IMIDAZOLECARBOXAMIDE-C¹⁴ INTO NUCLEIC ACIDS. Gaylord M. Conzelman, Jr., H. George Mandel, and Paul K. Smith. Cancer Research 14, 100-2 (1954).

Sarcoma-bearing mice showed greater incorporation of 4-amino-5-imidazole-carboxamide into nucleic acid purines isolated from liver than did control mice. After total body x radiation of 400 r, incorporation into PNA purines was higher, into DNA purines slightly lower than for control mice. NSA 8-2745

5523

THE PROBLEM OF THE MECHANISM OF THE ACTION OF PENETRATING RADIATION ON THE SYNTHESIS OF NUCLEOPROTEIDS IN THE SPLEEN. A. M. Kuzin and E. V. Budilova. Doklady Akad. Nauk S. S. R. 91, 1183-6(1953). (Russian).

Suppression of incorporation of P³² into the protein fraction of rat spleen by irradiation occurred 19-20 hrs after P³² injection when radiation was applied immediately before injection. Results following irradiation of spleen only are compared with results following irradiations of spleen-shielded rats. NSA 8-2746

5524

THE EFFECT OF X RAYS ON THE MACROMOLECULAR ORGANIZATION OF ESCHERICHIA COLI. Daniel Billen and Elliot Volkin. J. Bacteriol. 67, 191-7(1954).

Data are presented from studies of x-ray effects on structure of macromolecular components of E. coli, as determined with aid of analytical ultracentrifuge and by chemical analysis. NSA 8-2747

5525

EFFECT OF IONIZING IRRADIATION ON INFRARED SPECTRA OF THE BONE MARROW IN RATS. H. P. Schwarz, H. E. Riggs, C. Glick, J. McGrath, R. Childs, E. Bew, Jr., and F. Stone. J. Phila. Gen. Hosp. 4, 165-8(1953).

X-irradiation produces changes in the infrared absorption spectrum of the bone marrow as a result of a considerable decrease of nucleic acid content. NSA 8-2748

5526

RADIATION STERILIZATION. VI. RELATIVE MERITS OF CATHODE RAYS AND GAMMA RADIATIONS. Samuel A. Goldblith and Bernard E. Proctor. Nucleonics 12, No. 2, 32-5(1954).

Problems of ionization distribution and bactericidal effects are discussed for cathode rays and γ radiation. It is pointed out that while γ rays can provide more uniform distribution of energy, the efficiency of utilization is much lower than for β particles. NSA 8-2749

5527

MAXIMUM PERMISSIBLE CONCENTRATION OF RADIO-ISOTOPES IN FOOD, WATER AND AIR AND MAXIMUM PERMISSIBLE EQUILIBRIUM AMOUNTS IN THE BODY. Karl Z. Morgan. Acta Radiol. 41, 30-46(1954). NSA 8-2750

5528

SKIN EFFECTS OF COBALT 60 TELECURIE THERAPY. C. C. Burkell, T. A. Watson, H. E. Johns, and R. J. Horsley. Brit. J. Radiol. 27, 171-6(1954).

Skin effects, in general, have been much less with Co⁶⁰ therapy than with conventional x radiation, even though higher tumor doses and fewer fields were usually employed. (A report of clinical experiments.) NSA 8-2753

5529

THE ROLE OF ATOMIC ENERGY IN AGRICULTURAL RESEARCH. PROCEEDINGS OF THE FOURTH ANNUAL OAK RIDGE SUMMER SYMPOSIUM, AUGUST 25-30, 1952. C. L. Comar and S. L. Hood, comps. Oak Ridge National Lab. and Oak Ridge Inst. of Nuclear Studies. Jan. 1953. 492p. (TID-5115).

Topics include: agricultural radiobiology and the national welfare, nuclei and radioactivity, ecological effects of radioactive effluents. NSA 8-2757

5530

Chicago Univ., School of Medicine
THE TREATMENT OF POST-IRRADIATION INFECTION. Carolyn W. Hammond. [1953]. 23p. (AECU-2836).

Experimental studies on the use of antibiotics and tissue homogenate in treating postirradiation infection in dogs, rats, and mice are reviewed. NSA 8-3189

5531

Brookhaven National Lab.

STEM RUST RESISTANCE IN OATS INDUCED BY NUCLEAR RADIATION. Calvin F. Konzak. [1954]. 20p. (BNL-1792).

Rust-resistant mutants of oats produced after exposure of seeds to thermal neutrons. Resistance apparently is inherited as simple dominant factor and is believed to be radioinduced. Mutation frequency was greater for higher radiation dosages. Other mutations were also observed. Results indicate that radiations may be profitably used in plantbreeding programs. NSA 8-3190

5532

Field Research Lab., Fort Knox

A STUDY OF MITOTIC ACTIVITY IN THE INTESTINAL EPITHELIUM OF THE ALBINO RAT AND ITS ROLE IN THE RECOVERY PROCESS AFTER X-IRRADIATION.

O. Czerwonka, J. Gregg, W. Parr, W. Luther, and A. Krebs. Nov. 25, 1950. 15p. (NP-5116, MSFRL-6-64-12-06-(40)). NSA 8-3191

THE BIOCHEMISTRY OF TISSUE TRAUMA PART 7. LIPOPROTEIN CHANGES AFTER LOCAL ISCHEMIA AND LOCAL RADIATION INJURY. Lawrence J. Milch, Robert F. Redmond, and William W. Calhoun. Feb. 1954. 11p. (NP-5124).

Plasma lipoprotein levels were measured in rabbits subjected to two degrees of ischemia and in rabbits exposed to 30,000 r of x rays. Both (1) leg ischemia maintained for 3 hr and (2) irradiation of hind limbs induced hyperlipoproteinemia. NSA 8-3192

5534

Boston Univ. School of Medicine

THE EFFECTS OF X-IRRADIATION ON PHYSICAL EXERCISE AND BEHAVIOR IN THE DOG; RELATED HEMATOLOGICAL AND PATHOLOGICAL CONTROL STUDIES. Walter W. Jetter, Ogden R. Lindsley, and Frederick J. Wohlwill. [1953]. 365p. Contract AT(30-1)-1201. (NYO-4548).

Mortality was increased in dogs exhaustively exercised following exposure to 300 r total-body x irradiation when compared with unexercised dogs exposed to the same radiation dose. Data from clinical, histopathological, and hematological studies made on irradiated and control dogs are included. NSA 8-3193

5535

THE INFLUENCE OF PROLONGED EXPOSURE TO RADIUM GAMMA RADIATION ON ROOT-TIP MITOSIS IN THE BROAD BEAN PLANT. Karl Peters. *Strahlentherapie* 93, 263-73(1954).

Broad bean root tips were exposed to Ra (50 r, 5, or 0.5 r/min). Long-term irradiation was more effective with respect to inhibition of mitosis. Protracted irradiation did not influence phase distribution, appearance of pathologic ana- and telophases, nor the development of paranuclei as a result of fragmentations. NSA 8-3194

5536

THE EFFECTS OF IONIZING RADIATION ON NON-GERMINATING PLANT SEED. E. Zdansky, L. Drexler, and H. Werkgartner. *Strahlentherapie* 93, 289-94(1954).

Roentgen irradiation of dry wheat seeds with 100 r resulted in a temporary inhibition of growth in roots, extent of which varied with the seasons. NSA 8-3195

5537

THE BEHAVIOR OF MITOCHONDRIA IN THE MOUSE SPLEEN FOLLOWING TOTAL-BODY X IRRADIATION. E. Scherer and F. Stolle. *Strahlentherapie* 93, 317-20(1954).

After a single total irradiation there is a significant decrease in the number of granules vitally stained with

Janus green in the splenic cells of mice. The smallest number of granules is found between the 5th and 7th days after exposure. Changes are interpreted as a sign of damage to cell plasma, particularly to enzymes. NSA 8-3196

5538

MORTALITY IN SWINE EXPOSED TO GAMMA RADIATION FROM AN ATOMIC BOMB SOURCE. John L. Tullis, Baldwin G. Lamson, and Sidney C. Madden. *Radiology* 62, 409-15(1954).

Results are based on observations of swine exposed to radiation from an atomic bomb and indicate 100 per cent mortality after 390 r, 50 per cent mortality after 230 r, and 100 per cent survival after 130 r. These results agree closely with expected results and, when variables are taken into account, with previous 2000 kvp x irradiation control studies. NSA 8-3197

5539

THE RELATION OF RADIORESISTANCE TO BUDDING IN *SACCHAROMYCES CEREVISIAE*. C. A. Beam, R. K. Mortimer, R. G. Wolfe, and C. A. Tobias. *Arch. Biochem. Biophys.* 49, 110-22(1954).

Survival of haploid yeast after x irradiation is established as consisting typically of 2 components; an initial exponential of $LD_{50} = 3100$ r, which represents the survival of about 90% of a population of growing cells, and a complex multiple-hit component which represents that of the remainder ($LD_{50} \approx 60,000$ r). Effect of nitrogen starvation and budding on radioresistance was also studied. NSA 8-3198

5540

EFFECT OF CHLORPROMAZINE ON EMESIS AFTER RADIATION. Herman I. Chinn and George L. Sheldon. *Proc. Soc. Exptl. Biol. Med.* 86, 293-5(1954).

Chlorpromazine in doses of 10 mg/kg injected subcutaneously protected dogs against vomiting after 800 r x radiation. Injections of 5 mg/kg were ineffective as were 10 mg/kg prepared from solutions allowed to stand for 2 hrs at room temp before injection. No protection was conferred by cysteamine. Increased survival was noted with both chlorpromazine and cysteamine. Mechanisms of protection are discussed. NSA 8-5479

MEDICAL AND HEALTH PHYSICS QUARTERLY REPORT [FOR] JANUARY, FEBRUARY, MARCH 1954. May 16, 1954. 60p. Contract W-7405-eng-48. (UCRL-2605).

Studies on acute and chronic effects of lethal amounts of I^{131} and At^{211} in the rat are described. NSA 8-5770

5545

Air Force Radiation Lab., Univ. of Chicago
QUARTERLY PROGRESS REPORT NO. 12. July 15, 1954. 125p. Contract AF-33(038)-27353. (NP-5266).

Report includes studies on, protective effects of cysteine and mercaptoethylamine against radiation injury, effects of combinations of these drugs on enzymes in hematopoietic tissues of x rayed animals, effect of acute x irradiation on alkaline phosphatase hematopoietic activity in rats and mice, effect of sublethal x ray doses on biochemistry of rat tissues, relationship of age, sex, and species to radiosensitivity of liver catalase, possible role of Fe in radiation syndrome, effect of a naturally occurring inhibitor of hyaluronidase on response to whole body x radiation NSA 8-5775

5546

Atomic Energy Medical Research Project, Western Reserve Univ.
SYNERGISTIC EFFECT OF RADIOISOTOPES USED IN COMBINATION. Paul R. Salerno and Hymer L. Friedell. Aug. 6, 1954. 39p. (NYO-4965).

Authors conclude that marked capacity of uninjured spleen to stimulate proliferative activity of the bone marrow is rather unique in the mouse and that extrapolation of data to other species must be supported by specific experimentation. NSA 8-5776

5547

Naval Radiological Defense Lab.
STUDIES ON THE EFFECT OF RADIATION PROTECTION FACTOR ON INCORPORATION OF FORMATE- C^{14} INTO NUCLEIC ACID PURINES IN X-IRRADIATED MICE. R. K. Main, L. J. Cole, and V. P. Bond. June 3, 1954. 31p. (USNRDL-444)

The x ray induced inhibition *in vivo* of the incorporation of formate- C^{14} into the nucleic acid purines (adenine and guanine) of bone marrow, small intestine and spleen was investigated in LaF₁ mice. Effects of intraperitoneal injection of spleen homogenate are described. NSA 8-5777

5548

A STUDY ON THE EFFECT OF S^{35} -LABELLED SODIUM SULPHATE ON FERTILITY IN MICE. Erik Odebal and Harry Bostrom. Acta Radiol. 41, 525-8(1954)

Groups of adult female mice were given amounts of S^{35} (sulfate) varying from 0.5 to 60 μ c/g. Even at highest dosage levels studied, complete inhibition of fertility failed to occur, and histologic damage of ovaries was not observed with certainty. NSA 8-5778

5549

IMPROVED STORAGE QUALITY OF POTATO TUBERS AFTER EXPOSURE TO Co^{60} GAMMAS. A. H. Sparrow and E. Christensen. Nucleonics 12, No. 8, 16-17(1954)

Katahdin variety potato tubers were exposed to about 1250, 5000, 10,000, 20,000, 80,000, and 106,250 r and effects on taste, sprouting shrinkage, internal black spotting, and texture were observed over a period of months. NSA 8-5779

5550

X RADIATION TELANGIECTASIA AS A LATE SYMPTOM. G. Miescher, J. Pluss, and B. Weder. Strahlentherapie 94, No. 2, 223-33(1954). (In German).

Data reveal that it takes 5 years and more after irradiation for telangiectasia to develop completely, and no differences exist between soft and hard rays with respect to inducing its production. Predisposition of skin of trunk and extremities toward telangiectasia is considerably greater than that of skin of the face. NSA 8-5780

5551

LETHAL DOSE STUDIES WITH BURROS AND SWINE EXPOSED TO WHOLE BODY COBALT-60 IRRADIATION. John H. Rust, Bernard F. Trum, James L. Wilding, Charles S. Simons, and C. L. Comar. Radiology 82, 569-74(1954).

$LD_{50/30}$ of Co^{60} γ rays for burros and swine was found to be 784 r and 618 r respectively. Burros exposed to Co^{60} had significantly higher $LD_{50/30}$ than those exposed to Ta^{100} . NSA 8-5781

Massachusetts Inst. of Tech.
BACTERICIDAL EFFECTS OF IONIZING RADIATIONS ON *E. COLI*, *S. THERMOACIDURANS*, AND *CL. SPOROGENES* AS INFLUENCED BY DIFFERENT CONDITIONS OF ATMOSPHERE, MEDIUM, AND PHYSICAL STATE IN WHICH SAMPLES ARE IRRADIATED. FINAL REPORT FOR THE PERIOD JANUARY 1, 1954 THROUGH JUNE 30, 1954. Bernard E. Proctor and Samuel A. Goldblith. June 30, 1954. 44p. (NYO-3344).

This is a report on effects of atmosphere, medium, and freezing on radio-resistance of *E. coli* and spores of *B. thermoacidurans* and *Cl. sporogenes*. NSA 8-6050

5560
Radiological Research Lab., Columbia Univ
ANNUAL REPORT ON RESEARCH PROJECT. G. Failla and H. H. Rossi. Apr. 1, 1954. 149p. (NYO-4582).

Report includes studies on protection, tissue hydration, and fertility changes following total-body x irradiation of various animals, radiation-induced cataracts in rabbits, mechanism whereby an anemia is produced in animals by irradiation of the exteriorized spleen alone. NSA 8-6051

5561
Atomic Energy Project, Univ. of Calif., Los Angeles
GLUCOSE TRANSPORT ACROSS THE WALL OF THE INTESTINE OF IRRADIATED AND NON-IRRADIATED RATS. Lawrence E. Detrick, Harvey C. Upham, Dorothy Highby, Virginia Debley, and Thomas J. Haley. Sept 3, 1954. 17p. Contract AT-04-1-Gen-12. (UCLA-302).

Acute whole-body x irradiation inhibited glucose absorption in perfused, surviving intestinal segment of the rat, greatest degree of inhibition observed on 3rd to 6th day. Attempt to correlate histological picture with glucose absorption in intestine after whole-body irradiation revealed that histological evidence of recovery after injury gave no guarantee of functional recovery. NSA 8-6052

5562
Radiological Lab., Univ. of Calif., San Francisco. School of Medicine.
PROGRESS REPORT [FOR] JANUARY 1, 1954-JULY 31, 1954. Aug. 27, 1954. 25p. Contract AT-11-1-GEN-10. (UCSF-9).

Includes reports of studies on: relative biological effectiveness (RBE) of 22.5-Mv x rays in yeast test, nature of reaction of mouse thymus to x rays and its suitability for use in RBE tests, effect of dose fractionation upon reaction of mouse testes to x rays, effect of sodium menadiol diphosphate (Synkavite) upon survival curves of *E. coli* and *S. cerevisiae*. Progress made in determining recovery rates of mouse, hamster, and rat from sublethal doses of total-body x irradiation is also reported. NSA 8-6053

5563
Atomic Energy Project, Univ. of Rochester
STUDIES ON THE ACUTE EFFECTS OF X-IRRADIATION AND P-32 ON 21 AND 32 DAY OLD RATS. Melvin R. Sikov and Thomas R. Noonan. Aug. 4, 1954. 13p. Contract W-7401-eng-49. (UR-352).

LD-50/30 for rats at 21 days of age is 350 r, and at 32 days, 420 r, LD-50 does not differ from that of adult when irradiation is administered on 60th day of life. LD-50/30 for P^{32} does not differ significantly from adult value when isotope is administered on either 21st or 32nd day of life, being 4.54 and 4.05 $\mu\text{c/g}$, respectively. NSA 8-6054

5564
ON INCONSISTENCIES BETWEEN RADIOHEMATOLOGIC OBSERVATIONS. Matts Helde and T. Wahlberg. *Anta Radiol.* 42, 75-80(1954).

Relationship between direct and indirect effects of radiation on blood picture, and factors contributing to inconsistencies in data are discussed. The report is concerned with repeated low-level exposures in man (occupational exposures). NSA 8-6055

5565
MEASUREMENT AND CONTROL OF SOME DIRECT AND INDIRECT EFFECTS OF X-RADIATION. Felix L. Haas, Edna Dudgeon, Frances E. Clayton, and Wilson S. Stone. *Genetics* 39, 453-71(1954).

Studies to determine extent of x-ray damage due to indirect effects were carried out by varying physiological conditions during irradiation of the test organism, *Drosophila virilis*. Effects of temperature, oxygen, carbon monoxide, and carbon dioxide in various combinations were tested. NSA 8-6056

5566
GENETIC DRIFT IN IRRADIATED EXPERIMENTAL POPULATIONS OF *DROSOPHILA MELANOGASTER*. Timothy Prout. *Genetics* 39, 529-45(1954).

Effect of genetic drift was investigated in 3 experimental populations of *D. melanogaster*, 2 of which received treatment with γ rays. Data are reported from studies on allelism of lethals in second chromosomes, from which the conclusion is drawn that genetic drift operates in at least small populations. NSA 8-6057

5567
X-RAY-INDUCED DOMINANT LETHALS IN *DROSOPHILA ROBUSTA*. Armon F. Yanders. *Genetics* 39, 558-64(1954).

D. robusta males, 10 or 17 days old, were exposed to 0.2500 or 5000 r of x rays and mass mated. Values for induced dominant lethals in groups aged 10 days were similar to values for *D. melanogaster* at corresponding dosages. Sperm of males aged 17 days exhibit greater sensitivity. NSA 8-6058

5568
EFFECTS OF BETATRON RADIATION ON THE BRAIN OF PRIMATES. Arthur Arnold, Percival Bailey, and John S. Laughlin. *Neurology* 4, 165-78(1954).

Clinical and pathological effects of 375 to 14,000 r doses of 23-Mev x rays from betatron on brain of monkeys are described and compared with effects of 225 to 8400 r doses of 400-kev x rays. NSA 8-6059

5569
LITERATURE SURVEY OF THE PROPERTIES OF FISSION PRODUCT OXIDES, FLUORIDES AND OXYGLUCOSIDES. G. Tennenhouse and M. J. Steindler. 1959. 75p. (ANL-RCV-SL-1545). NSA 8-6061

5570
RADIATION EFFECTS ON PNEUMOCOCCAL INFECTION PRODUCED BY SUBCUTANEOUS INJECTIONS INTO WHITE MICE. William E. Clapper, James E. Roberts, and Grace H. Meade. *Proc. Soc. Exptl. Biol. Med.* 86, 420-2 (1954).

Mice with artificially produced pneumococcal infection showed little or no effect from 350 r (x rays) when inoculation and exposure were given at same time. Time from inoculation to death, and time required for bacteremia to develop were reduced when exposure was made 3 days prior to inoculation. Times from inoculation to death

and bacteremia to death were reduced when exposure antedated inoculation by 6 days. NSA 8-6062

5571
ACETYLATION OF P-AMINOBENZOIC ACID IN X-IRRADIATED RATS. John F. Thomson and Eleanor T. Mikuta. Proc. Soc. Exptl. Biol. Med. 86, 487-8(1954).

Rats exposed to 1000 r of x rays retained their capacity to acetylate p-aminobenzoic acid and sulfanilamide for at least 3 days after exposure, an indication that Coenzyme A is not indiscriminately destroyed by whole-body irradiation. NSA 8-6063

5572
GROWTH OF VACCINIA VIRUS IN X-IRRADIATED CHICK EMBRYO TISSUES AS STUDIED IN TISSUE CULTURE. N. J. Schneider and F. S. Cheever. Proc. Soc. Exptl. Biol. Med. 86, 591-4(1954).

Irradiation of chick embryonic tissue in ovo appeared to diminish its ability to support viral growth in tissue culture, *in vitro* irradiation had no such effect. Evidence suggesting that the differences noted are due chiefly to secondary radiation effects is discussed. NSA 8-6064

5573
AMPHOPHIL TUMORS OF THE HYPOPHYSIS INDUCED IN MICE BY I^{131} . Agnes S. Burt, Benjamin H. Landing, and Sheldon C. Sommers. Cancer Research 14, 497-502 (1954).

Histological studies of hypophyses of 38 C57 mice suggest that the hypophyseal adenomas induced by large doses of I^{131} are derived from cells morphologically similar to thyrotrophic basophils of rats and to sparsely granulated basophils or intermediate mucoid cells of man. Thyroidectomy cells found in the adenomas strongly resemble the hypertrophic amphophils previously found in some types of human adrenal hyperactivity and carcinoma of the breast. NSA 8-6065

5574
AN ABCOPAL EFFECT OF X-RAY UPON MOUSE SPLEEN WEIGHT. Antoin Raventos. Radiation Research 1, 381-7 (1954).

Irradiation of spleen plus remainder of body resulted in spleen weight losses showing marked dependence on x ray dosage over 300-750 r range, an effect not seen when only the spleen was irradiated. Author concludes that irradiation of remainder of body probably provokes splenic atrophy, perhaps through cortical action, and suggest that shielded spleen is able to respond to hematopoietic needs of the irradiated animal. NSA 8-6066

5575
ON THE QUESTION OF THE TOLERANCE DOSE OF HUMAN ORGANISMS ON INHALATION OF RADIUM EMANATION O. Henn. Strahlentherapie 94, No. 3, 441-54(1954). (In German).

Results obtained in examinations of human bone marrow suggest that tolerance dose for Ra emanation has to be estimated lower by 1 to 2 decimal powers, than that for x and γ rays. Apart from other factors, an essential causal importance is attributed to specific organotropy of Ra emanation. NSA 8-6067

5576
THE EFFECTS OF CORTISONE ON THE DEVELOPMENT OF SPONTANEOUS LEUKEMIA IN MICE AND ON ITS INDUCTION BY IRRADIATION. A. C. Upton and J. Furth. Blood 9, 686-95(1954)

Development of spontaneous lymphoma in a high-leukemia strain of mice was inhibited by administration of cortisone, although hormone-induced atrophy of thymus and other lymphoid tissues was only transient. High incidence of myeloid leukemia was induced in a low-leukemia strain of mice by single 350-r x ray dose and cortisone was without effect on the incidence. NSA 8-6068

5577
INDUCTION OF STERILITY IN MALE MICE BY CHRONIC GAMMA IRRADIATION. T. C. Carter, Mary F. Lyon, and Rita J. S. Phillips. Brit. J. Radiol. 27, 418-22(1954). NSA 8-6069

5578
HISTOPATHOLOGICAL EXAMINATION OF MICE IRRADIATED AFTER INJECTION WITH CYSTEINAMINE. M. A. Gerebtzoff and Z. M. Bacq. Experientia 10, 341-3(1954). (In French with English summary).

Injection of β -mercaptoethylamine to C-57 black mice before irradiation (700 r) effects partial protection of liver and spleen. It has a strong accelerating action on regeneration in spleen, intestine, and probably thymus. Experiments suggest that this action is related to a protection of glucidic metabolism NSA 8-6071

5579
DECREASE OF RADIOSENSITIVITY OF THE ADULT RAT IN DEEP HYPOTHERMY. S. Hajdukovic, A. Herve, and V. Vidovic. Experientia 10, 343-4(1954). (In French, with English Summary).

Rats irradiated in state of deep hypothermy (rectal temperature of 14-15°C) with lethal doses of 800 and 900 r of x rays, are partially protected, 50% of these survived more than 30 days, while all control animals died after 17 days. Same degree of protection is obtained if cooling is carried out in presence of oxygen or under an air pressure of 1.25 atmosphere. NSA 8-6072

5580
PROTECTIVE EFFECTS OF COMBINED HYPOXIA AND CYSTEINE TREATMENT ON WHOLE-BODY IRRADIATION OF MICE Finn Devik. Brit. J. Radiol. 27, 463-6(1954)

Mice were exposed to 200, 600, 800, and 1100 r of x rays at 170 to 190 kv. Frequency of irradiation-induced chromosome injuries in bone marrow and acute lethality were used as indicators of protective effects of buffered cysteine hydrochloride and hypoxia. Protective effect of α -cysteine was the same as that of β -cysteine, an observation which suggests that the protective effect is radiochemical rather than biochemical. NSA 8-6073

5581
INVESTIGATIONS ON A BIOLOGICAL RADIATION PROTECTION VII THE INFLUENCE OF NARCOTICS ON RADIATION INJURED MICE. H. Langendorff and R. Koch. Strahlentherapie 94, No. 3, 411-20(1954). (In German).

Results indicate that ether and urethane are apt to increase radiosensitivity of mice in the presence of ethyl alcohol or Megaphen + Dolantin, which tend to decrease the radiosensitivity. NSA 8-6074

5582
RADIATION SICKNESS. A STUDY OF ITS RELATION TO ADRENAL CORTICAL FUNCTION AND THE ABSOLUTE EOSINOPHIL COUNT. Elliott C. Lasser and K. Wilhelm Stenstrom. Am. J. Roentgenol. Radium Therapy Nuclear Med. 72, 474-87(1954).

Data suggest that the adrenal cortex undergoes definite changes in course of irradiation, but that these probably are not related to radiation sickness. Similarity of direction of change of the symptom indexes and the absolute eosinophil counts suggest an etiological factor common to both. Low estrogen level is believed to be related to high radiosensitivity. NSA 8-6075

5583
Mound Lab.
BIOLOGICAL RESEARCH QUARTERLY PROGRESS REPORT THROUGH JUNE 17, 1954. D. S. Anthony. July 13, 1954. 15p. Contract AT-33-1-GEN-53. (MLM-989).

There was no indication that maintenance of an average body concentration of 0.01 μ c Po/kg of body weight in rats for duration of their adult life has any effect on body weight,

tumor incidence or longevity. Studies of: gross effect of Ac on rats and mice, effects of Ac on rat reproduction, myelogenous leukemia induced by low doses of Ac and its transfer to young rats, chemical inhibition of cell division are described. NSA 8-6079

5584

Brookhaven National Lab.

QUARTERLY PROGRESS REPORT [FOR] APRIL 1 - JUNE 30, 1954. (UNCLASSIFIED SECTION). 58p. (BNL-299).

Results of several experiments on x-ray and neutron sensitivity of dormant barley seeds in relation to H₂O content showed increased radiosensitivity with increased H₂O content for fast neutrons, reverse relationship for thermal neutrons. Effects of x rays on germination of Neurospora, the x ray sensitivity of Trillium as a function of phase of cell division, and effects of x radiation on liver glycogen content of rats are described. NSA 8-6374

5586

THE EFFECTS OF LOCALIZED CATHODE RAY PARTICLE IRRADIATION OF THE HYPOPHYSIS AND WHOLE BODY X-IRRADIATION ON ADRENOCORTICOTROPHIN, GONADOTROPHIN AND THYROTROPIN CONTENT OF THE RAT PITUITARY. G. M. Mateyko and Abraham Edelmann. New York Univ. and Brookhaven National Lab. [1954?]. 35p. (BNL-1939). NSA 8-6381

5587

SOME EFFECTS OF A LETHAL DOSE OF X-RADIATION UPON MEMORY. A CASE HISTORY STUDY. (Report No. 2, Project No. 21-3501-0003). Sylvan J. Kaplan, School of Aviation Medicine and George Gentry, Univ. of Texas and Air Force Radiobiology Lab. June 1954. 18p. (NP-5321).

Lethal x ray dose (1000 r) does not entirely destroy monkey's memory for a learned task. Manifestations of retention were obtained during the period between 8 hr postirradiation until 21 hr before death. Survival time for 4 monkeys studied ranged between 151 and 168 hr. NSA 8-6382

5588

THE EFFECT OF NEUTRONS ON THYMIC AND CIRCULATING LYMPHOCYTES IN THE MOUSE. R. E. Carter and V. P. Bond, Naval Radiological Defense Lab. and Eugene P. Cronkite, Naval Medical Research Inst., Bethesda. Nov. 19, 1953. 24p. (USNRDL-443).

Neutron radiation employed was less effective in decreasing lymphocyte count in peripheral blood (RBE of approximately 4) than it was in producing thymic weight loss (RBE of approximately 8), indicating that ratios for neutron effectiveness can differ for similar tissues in the small mammal as well as in lower organism used in previous experiments. EFFECTS OF X IRRADIATION ON LIPID METABOLISM.

1. PLASMA PHOSPHOLIPID LEVELS IN SEVERAL SPECIES. C. Entenman, R. A. Neve, H. Supplee, and C. A. Olmsted. June 11, 1954. 28p. (USNRDL-TR-2).

Authors describe occurrence of opalescence of serum in irradiated rats, dogs, guinea pigs, and mice, and relation of this condition to level of plasma phospholipid phosphorus. NSA 8-6385

5590

Naval Radiological Defense Lab.

EFFECTS OF X IRRADIATION ON LIPID METABOLISM.

2. UPTAKE OF P³² INTO RAT LIVER PHOSPHOLIPIDS.

E. O. Weinman, S. R. Lerner, and C. Entenman. June 17, 1954. 26p. (USNRDL-TR-3).

Liver slices from rats 24 hr postexposure (2500 r) incorporated more P³² into phospholipids than did slices from unirradiated rats. No increase in P³² incorporation into phospholipids of whole liver or cell fractions was noted in rats injected with P³² 24 hr following exposure to 2500 r. NSA 8-6386

5591

ECONOMICS OF PORK IRRADIATION. H. J. Gomberg, S. E. Gould, J. V. Nehemias, and L. E. Brownell. Nucleonics 12, No. 9, 66-70 (1954).

Results are presented from a cost study of meat-processing plant designed to use γ radiation from a Cs¹³⁷ source to irradiate hog carcasses for the purpose of breaking the trichinosis cycle in pork. NSA 8-6388

5592

HUMAN FEEDING STUDIES OF IRRADIATED FOOD TO START: ARMY TEST WILL HASTEN COMMERCIAL APPLICATION. Nucleonics 12, No. 9, 78-9 (1954).

The start of a program in which 12 volunteers will include irradiated meat in their diets for one year is reported. NSA 8-6389

5593

PRESERVING FOOD IN THE ATOMIC AGE. L. E. Brownell. (Univ. of Michigan, Ann Arbor). In the Story of Our Time. New York, The Grolier Society, Inc. 1954.

Problems associated with the successful use of radiation in the sterilization of food are briefly reviewed. NSA 8-6390

5594

Naval Medical Research Inst., Bethesda

GLUTATHIONE IN RADIATION INJURY. (LECTURE AND REVIEW SERIES NO. 54-1). Eugene P. Cronkite, Robert A. Conrad, and W. H. Chapman, Naval Medical Research Inst., Bethesda and George Brecher, National Inst. of Arthritis and Metabolic Diseases, National Institutes of Health. Jan. 3, 1954. 16p. (NP-5328).

Mechanisms of protective action of anoxia and of sulfhydryl compounds against radiation injury are reviewed. Comparative histologic changes observed in unprotected mice and in mice protected with para-aminopropiophenone and with glutathione prior to irradiation are described. NSA 8-6392

5595

EFFECT OF RADIOACTIVE PHOSPHORUS ON TUMOR CELLS LABELED WITH THIS ELEMENT. Frederic Ludwig. Compt. rend. 239, 453-4 (1954). (In French).

After a 24-hr period, 100% more dead cells were found in the serum of mice treated with 15 to 50 μ c of Na₂HP³²O₄ than in serum of mice injected with nonradioactive Na₂HPO₄. NSA 8-6403

5596

Oak Ridge National Lab.

HEALTH AND PHYSICS DIVISION SEMIANNUAL PROGRESS REPORT FOR PERIOD ENDING JULY 31, 1954. Sept. 27, 1954. Contract W-7405-eng-26. (ORNL-1763).

Includes report of maximum-permissible concentration of γ radiation from Co⁶⁰ for mice. NSA 8-6609

5597

SUSCEPTIBILITY OF THE INTESTINAL TRACT TO INFECTION FOLLOWING TOTAL BODY IRRADIATION. David Ruml, Dorothy B. Cooper, Carolyn W. Hammond, and C. Philip Miller. [1954?]. 18p. (AECU-2931).

On 5th day postirradiation (550 r), standard dose of 10 million *Pseudomonas aeruginosa* was inoculated into

stomach of mice. More of irradiated mice retained larger numbers of inoculated bacteria than did unirradiated controls. Fasting was nearly as effective as irradiation in slowing down elimination of bacteria. NSA 8-6614

5598

ENDOGENOUS INFECTION IN MICE IRRADIATED WITH FAST NEUTRONS OR GAMMA RAYS. Howard H. Vogel, Jr., John W. Clark, Carolyn W. Hammond, Dorothy B. Cooper, and C. Phillip Miller. Argonne National Lab. and Univ. of Chicago [1954]. 27p. (AECU-2932).

Close correlation between bacteremia and time of death was observed following irradiation with either slow neutrons or γ rays. The bacteremia, as measured by colony counts on heart's blood culture, was less severe in the neutron-irradiated than in the γ irradiated mice. NSA 8-6615

5599

THE EFFECT OF STREPTOMYCIN THERAPY ON MICE IRRADIATED WITH FAST NEUTRONS. Carolyn W. Hammond, Howard H. Vogel, Jr., John W. Clark, Dorothy B. Cooper, and C. Phillip Miller. Univ. of Chicago and Argonne National Lab. [1954]. 19p. (AECU-2933).

Streptomycin significantly reduced mortality in female mice during the first 10 days following fast-neutron irradiation but failed to alter it during the remainder of the acute phase. Beneficial effect is attributed to its action in preventing occurrence of fatal bacterial infections. NSA 8-6616

5600

Chicago Univ.

EFFECT OF X RAYS ON HEMOLYSIN FORMATION FOLLOWING VARIOUS IMMUNIZATION AND IRRADIATION PROCEDURES. William H. Taliaferro and Lucy Graves Taliaferro. [1954]. 33p. (AECU-2934). NSA 8-6617

5602

EFFECTS OF IONIZING RADIATIONS ON SEEDS OF BARLEY. Richard S. Caldecott. [1954]. 26p. (BNL-1973).

Water content and/or physiological state of seeds of barley were modified by a variety of treatments prior to subjecting them to x radiation, thermal neutrons, or fast neutrons. After irradiation, seeds were germinated and grown for 7 days at which time heights were measured. NSA 8-6619

5603

Brookhaven National Lab.

STUDIES OF THE RADIATION SYNDROME IN *DROSOPHILA MELANOGASTER*. R. C. King and Louise P. Wilson. Brookhaven National Lab. and Wellesley Coll. [1954]. 24p. (BNL-1978).

Effects of 60,000 r on: mortality, phosphorus turnover, weight, growth, food intake, and oxygen consumption in *D. melanogaster* are described. NSA 8-6620

5604

RADIOSENSITIVITY OF SEVERAL MEIOTIC STAGES OF LILIUM. C. C. Bowen and A. H. Sparrow. Genetics 39, 960(1954).

5605

BACTERIAL VIRUS; RADIATION AND FUNCTION. D. J. Fluke and E. C. Pollard. Brookhaven National Lab. and Yale Univ. [1954]. 20p. (BNL-2012).

T-1 bacteriophage in dry state was subjected to cyclotron bombardment at 5 values of linear energy loss

and subsequently tested with respect to 3 virus functions. Results are discussed in relation to bacteriophage composition and function and target theory of radiation inactivation. NSA 8-6622

5606

THE RELATION OF GENOME NUMBER TO RADIO-SENSITIVITY IN *HABROBRACON*. A. M. Clark, Brookhaven National Lab. and Univ. of Delaware. [1954]. 14p. (BNL-2014).

No constant difference in radiosensitivity was found between haploids and diploids of *Habrobracon*. Relative radiosensitivities differed for different stages of development. Results indicate that no simple relation between genome number and radiosensitivity exists. NSA 8-6623

5607

Naval Medical Research Inst., Bethesda

REPRODUCIBILITY OF THE LETHAL EFFECT OF TOTAL BODY IRRADIATION IN MICE. (LECTURE AND REVIEW SERIES NO. 53-9). Friedrich Ellinger, Jasper E. Morgan, and Ellsworth S. Cook. Nov. 23, 1953. 16p. (NP-5340).

Under certain conditions, mortality caused in mice by a stated x ray dose given as total-body irradiation can be reproduced over several years. At certain points of the dose-response curve a high degree of accuracy in discriminating biologically between lethal effects of various x ray doses can be attained, permitting optimum discrimination of a dose difference of $\pm 2.5\%$. NSA 8-6624

5608

Radiation Lab., Univ. of Calif., Berkeley

MEDICAL AND HEALTH PHYSICS QUARTERLY REPORT [FOR] APRIL, MAY, JUNE 1954. July 29, 1954. 83p. Contract W-7405-eng-48. (UCRL-2661).

Report includes studies on: effects of x rays and influence of nitrogen mustard and colchicine on incorporation of P^{32} into deoxyribose nucleic acid of mouse tissues, toxicology of Ra^{223} in rats, pathological effects of I^{131} and At^{211} in rats and monkeys. NSA 8-6625

5609

Naval Radiological Defense Lab.

DELAYED GASTRIC EMPTYING IN RATS AFTER WHOLE- AND PARTIAL-BODY X IRRADIATION. M. N. Swift, S. T. Taketa, and V. P. Bond. June 25, 1954. 36p. (USNRDL-TR-6).

Delayed gastric emptying was demonstrated in rats after whole- or partial-body x irradiation. Degree of inhibition obtained increased with whole-body dosage. Head and abdominal regions were found to be most radiosensitive with respect to producing delayed gastric emptying. NSA 8-6627

5610

INFLUENCE OF TEMPERATURE AND PHASE STATE ON X-RAY SENSITIVITY OF YEAST. Thomas H. Wood. Arch. Biochem. and Biophys. 52, 157-74(1954).

Radiosensitivity of haploid yeast increases slowly for increased irradiation temperatures in range from 0 to 40° with a temperature coefficient of 0.0034/deg. At 50° and above there is a greatly increased radiosensitivity. Additivity studies using heat and x rays are reported. There is no significant change in radiosensitivity from -10 to -0.5° , suggesting that inactivation below 10° is due to direct action of radiations. Studies of T2 bacteriophage are described. NSA 8-6628

5611

THE HEMATOLOGICAL EFFECTS RESULTING FROM INJECTION OF RADIOACTIVE PHOSPHORUS (P^{32}) INTO ALBINO RATS. John Stephen Latta and Ronald E. Waggener. Anat. Record 113, 357-85(1954).

Authors describe changes observed in blood picture of rats at intervals of 1-15 days following injection of a

single dose of 4.5 μ c of P^{32} /gm of body weight. NSA 8-6629

5612

EFFECT OF MULTIPLE LOW-DOSE IRRADIATION AND SPLENECTOMY ON THE STABILITY OF DOG ERYTHROCYTES.

Marguerite A. Constant and Paul H. Phillips. *Am. J. Physiol.* 178, 367-70(1954).

Erythrocytes of irradiated (100 r/wk for life) splenectomized dogs showed marked decrease in fragility as compared to normal non-irradiated dogs; those of nonsplenectomized irradiated dogs also became less fragile, but change was less and occurred later than in splenectomized animals. Rise in fragility was found in several dogs in terminal stages of x ray sickness. No correlations were apparent between degree of fragility and life expectancy, hemoglobin levels, platelet, or target cell counts. NSA 8-6630

5613

DOSE DEPENDENCE AND SEQUENTIAL CHANGES IN MOUSE SMALL INTESTINAL WEIGHT INDUCED BY IONIZING RADIATION.

Robert A. Conard. *Proc. Soc. Exptl. Biol. Med.* 86, 664-8(1954).

Data are presented to illustrate the biological effects of various doses of x and γ radiation on mice. Weight of the small intestine at various times post irradiation was used as the criterion of effect. NSA 8-6631

5614

RADIATION-INDUCED EXCHANGES IN DROSOPHILA FEMALES.

D. R. Parker. *Proc. Natl. Acad. Sci. U. S.* 40, 795-800(1954).

Author found that most radiation-induced detachments involved exchanges with chromosome 4 in attached-x females lacking a Y chromosome. The presence of a Y chromosome increased the frequency of induced detachments and when only Y's were present, detachment frequency was increased further. Author suggests that the long arm of the Y protects the short arm against induced exchanges with the X chromosome. NSA 8-6632

5615

BLOOD MODIFICATIONS CAUSED BY RADIOTHERAPY.

P. DePlaen, G. Lion, and R. van Male de Ghorain. *J. belge radiol.* 37, No. 1, 41-57(1954). (In French).

Describes effects of radiotherapy for malignant diseases on: red cells, hemoglobin, color index, eosinophilia, bilirubinemia, and plasmatic density. Found that a period of 3 months after completion of therapy was necessary for organism to restore hematologic status to normal. NSA 8-6633

5616

REPEAT DOSE X-IRRADIATION ON SINGLE-TYPE CELLS. TIME INTERVAL OF IRRADIATION EFFECT.

L. C. Fogg and R. F. Cowing. *Exptl. Cell Research* 6, 263-70 (1954).

Effects of irradiation on spermatogonia and prespermatogonia were studied in testes of 68 partially shielded C^{57} black mice and in testes of 144 animals that received a dose of 138 r followed by a second dose of 138 r. Results confirm clinical observations that recovery is delayed after a repeat dose. NSA 8-6634

5617

HISTOCHEMICAL AND HISTOMETRIC INVESTIGATIONS ON THE ADRENAL CORTEX OF WHITE RATS AFTER DIFFERENT DOSES OF TOTAL BODY X IRRADIATION. I. ON THE INDIRECT RADIATION EFFECTS AND THE PRESENT STATE OF RESEARCH ON THE ADRENAL CORTEX.

R. Birkner, G. Suchowsky, and J. Trautmann. *Strahlentherapie* 94, 497-505(1954). (In German).

Present stage of research with respect to the role of the adrenal cortex in radiation injury is surveyed. Authors stress importance currently attributed to the adrenal cortex in field of radiobiology and radiotherapy. NSA 8-6635

5618

HISTOCHEMICAL AND HISTOMETRIC INVESTIGATIONS ON THE ADRENAL CORTEX OF WHITE RATS AFTER DIFFERENT DOSES OF TOTAL-BODY X IRRADIATION.

II. HISTOCHEMICAL OBSERVATIONS. R. Birkner, G. Suchowsky, and J. Trautmann. *Strahlentherapie* 94, 506-26(1954). (In German).

Adrenal cortex of albinotic rats after various doses of total x irradiations (250, 500, 1000, 2000, and 3000 r) was studied histochemically. Four hours after exposure, a progressive increase in cortical activity began, the magnitude of the increase being proportional to dose. NSA 8-6636

5619

RADIATION INJURY BY IONIZING RADIATION.

Hermann Murth. *Strahlentherapie* 94, 527-38(1954). (In German).

Author discusses various types of ionizing radiations and differences in their biological effects. Survey of lesions due to single short-period total-body irradiation with x and γ rays is presented. Concept of time factor is explained, problems involved in establishing tolerance dose are discussed. Table of data pertinent to the evolution of cancer after incorporation of artificial radioactive isotopes is presented. NSA 8-6637

5620

EXPERIMENTAL INVESTIGATIONS ON THE BEHAVIOR OF BIOLOGICALLY PREFORMED THIOL COMPOUNDS AFTER TOTAL-BODY IRRADIATIONS.

Ludwig Rausch and E. Heinz Graul. *Strahlentherapie* 94, 539-46(1954). (In German).

Authors studied behavior of biologically pre-formed low-molecular thiol compounds in blood and liver of mice submitted to total-body irradiation with 700 r. Initial SH increase was followed by decrease beneath control level in liver, slow fall in the blood level was observed. NSA 8-6638

5621

INVESTIGATIONS ON THE RELIABILITY OF THE GENETIC METHOD FOR THE ESTABLISHMENT OF THE MUTATION FREQUENCY OF PLANTS.

Hans Marquardt. *Strahlentherapie* 94, 608-31(1954). (In German).

Effects of x raying pollen grains (1000, 2500, 4500, and 5000 r) of *O. Hookeri* were studied in F_1 and F_2 . Amount of pollen on stigmas, ripeness of seeds, and viability of plants used as female parent, greatly influenced germinating power of seed and number of aberrant F_1 plants. Percentage of mutation in F_2 depends on dose, coincidence of mutations involving lethal aberrations, and on environment. NSA 8-6639

5622

THE EFFECT OF CERTAIN GASES ON THE RADIO-SENSITIVITY OF HABROBRACON DURING DEVELOPMENT.

A. M. Clark and E. B. Herr, Jr., Marine Biological Lab., Woods Hole, Brookhaven National Lab., and Univ. of Delaware. [1954]. 21p. (BNL-1963).

Groups of *Habrobracon* during postembryonic development were exposed to x rays in presence of oxygen, carbon dioxide, nitrogen, and hydrogen. Effects on development to adulthood were observed. Results show radiosensitivity can be modified by presence of hydrogen. NSA 8-6640

5623

INVESTIGATIONS ON THE EFFECTIVENESS OF RADIATION PROTECTIVE SUBSTANCES IN PLANTS.

Erna Reinholz and Karl Aurand. *Strahlentherapie* 94, 646-56(1954). (In German).

Despite extensive experiments on plants it proved impossible in every case to reduce the radiation effects by preliminary treatment with the protective substances known from animal experiments. An irradiation in nitrogen atmosphere, however, remarkably decreased x ray injuries. NSA 8-6642

5624

GRANULOCYTE COUNT, RESISTANCE TO EXPERIMENTAL INFECTION AND SPLEEN HOMOGENATE TREATMENT IN IRRADIATED MICE. Willie W. Smith, Robert Q. Marston, H. Jeanette Ruth, and Jerome Cornfield. *Am J. Physiol.* 178, 288-92(1954).

Survival of sublethally irradiated mice that were challenged by a subcutaneous injection of *Pseudomonas* was related to leucocyte count as recovery from damaging effects of radiation progressed (with or without treatment with spleen homogenate). Similar relationship found among mice of each treatment group was shown to depend on granulocyte count, with no measurable lymphocyte contribution NSA 8-6643

5625

Atomic Energy Project, Univ. of Rochester
THE DISTRIBUTION AND EXCRETION OF ORALLY ADMINISTERED POLONIUM IN THE RAT. J. N. Stannard. Sept. 17, 1954. 17p. Contract W-7401-eng-49. (UR-299). NSA 8-6653

5626

STUDIES ON CELL DIVISION. NITROGEN COMPOUND CHANGES IN YEAST ACCOMPANYING AN INHIBITION OF CELL DIVISION. Edward Spoerl and Richard Carleton. *J Biol. Chem.* 210, 521-9(1954).

Growing yeast cells were treated with α particles, x rays, and triethylenemelamine to inhibit division of cells so that they enlarged in size. Major nitrogen fractions of division-inhibited cells were measured chemically, and the free amino acids, amides, and glutathione of cells were measured by paper chromatography. Patterns of change caused by the three agents were similar. NSA 8-6914

5627

INFLUENCE OF HYDROGEN ION CONCENTRATION ON RADIATION EFFECTS. Tikvah Alper and M. Ebert. *Science* 120, 608-9(1954).

Role of oxidation and reduction reactions in radiation injury of living cells and influence of pH on these reactions is discussed. NSA 8-6915

5628

X-RAY INACTIVATION OF SACCHAROMYCES DURING THE BUDDING CYCLE. A. Sarachek. *Experientia* 10, 377-8(1954). (In English).

The data presented provide additional evidence that inactivation of yeast cells by x radiation is in large part a consequence of induction of chromosomal aberrations. NSA 8-6916

5629

A GAMMA-RAY SOURCE FOR STERILIZING INSECTS. E. B. Darden, Jr., E. Maeyens, and R. C. Bushland. *Nucleonics* 12, No. 10, 60-2(1954).

A Co^{60} irradiation unit is described which was constructed for the purpose of sterilizing insects, insect larvae, and insect-infested material. Techniques are described for utilizing radiation in large-scale control of the screw worm, and preliminary results are reported. NSA 8-6917

5630

RADIOBIOLOGY OF THE C3H MOUSE MAMMARY CARCINOMA. EFFECT OF IMMUNOGENETIC FACTORS ON THE RADIOSENSITIVITY OF THE TUMOR TREATED IN SITU. A. Cohen and L. Cohen. *Brit. J. Cancer* 8, 303-12(1954).

Median effective dose for C₃H adenocarcinoma (1) growing in C₃H hosts was 5700 r, (2) growing in factor-harboring F₁ hybrids was 5100 r and (3) growing in factor free F₁ hybrids was 3950r. Radiosensitivity of a tumor appears to reflect, quantitatively, subliminal host-resistance resulting from immunogenetic differences in host-tumor relationship. NSA 8-6918

5631

RADIOBIOLOGY OF THE C3H MOUSE MAMMARY CARCINOMA INCREASED RADIOSENSITIVITY IN SITU OF HOMOPLASTS

ATTENUATED PRIOR TO IMPLANTATION. A. Cohen and L. Cohen. *Brit. J. Cancer* 8, 313-19(1954).

Mammary carcinoma of C₃H mice was attenuated by means of an x ray dose of 2000-2500 r and then transplanted to normal C₃H mice. Recipients of the tumor grafts then received local x ray therapy to the grafts. The LD₅₀ of the attenuated grafts was 4500 r, which is lower than the LD₅₀ (5700 r) for unattenuated grafts. Increased radiosensitivity of the graft was the same if it was transplanted to a second site on the original host (after it had become established following the initial transplantation) prior to irradiation. Authors suggest that implantation of the attenuated tumor fragment induces a state of subliminal resistance in the host and that this resistance enhances the radiosensitivity of the tumor. NSA 8-6919

5632

STUDIES ON RADIOSENSITIVITY AND "IMMUNIZING" ABILITY OF MAMMARY TUMOURS OF MICE. Anna Goldfeder. *Brit. J. Cancer* 8, 320-35(1954). NSA 8-6920

THE EFFECT OF TOTAL BODY X-IRRADIATION ON HEPATIC AND RENAL FUNCTION IN ALBINO RATS. Kee-Chang Huang, James R. Almand, and Lila A. Hargan. *Radiation Research* 1, 426-36(1954).

A single dose of total-body irradiation was given to albino rats. Livers in only 3 of 63 lost their capacity to inactivate antidiuretic hormone. No morphological change in livers was observed. PAH clearance and QO₂ changes are described. NSA 8-6921

5634

THE EFFECTS OF LOCALIZED CATHODE-RAY PARTICLE IRRADIATION OF THE HYPOPHYSIS AND WHOLE-BODY X-IRRADIATION ON GONADOTROPHIN, THYROTROPHIN, AND ADRENOCORTICOTROPHIN OF THE RAT PITUITARY. G. M. Mateyko and Abraham Edelman. *Radiation Research* 1, 470-86(1954). NSA 8-6922

5635

THE ACCUMULATION AND DESTRUCTIVE ACTION OF ASTATINE²¹¹ (LKA-IODINE) IN THE THYROID GLAND OF RATS AND MONKEYS. Joseph G. Hamilton, Patricia W. Durbin, and Marshall Parrott. *J Clin. Endocrinol. and Metabolism* 14, 1161-78(1954).

Disturbance in growth rate and other effects of Astatine²¹¹ are described. Initial effect on growth is attributed to acute radiation injury, later disturbance to endocrine changes secondary to depression of thyroid secretion. NSA 8-6923

5636

HISTOLOGIC EFFECTS OF VARIOUS TYPES OF IONIZING RADIATION ON NORMAL AND HYPER-PLASTIC HUMAN THYROID GLANDS. Stuart Lindsay, Morris E. Dailey, and Malcolm D. Jones. *J. Clin. Endocrinol. and Metabolism* 14, 1179-1218(1954).

Lesions observed in thyroid glands irradiated with I¹³¹, x rays, radon, or neutrons were qualitatively similar and are described NSA 8-6924

5637

PATHOGENESIS AND PATHOLOGY OF POST-IRRADIATION INFECTION. V. P. Bond, M. S. Silverman, E. P. Cronkite. *Radiation Research* 1, 389-400(1954).

Various phases of the acute radiation syndrome are described and physiological derangements leading to death are discussed. NSA 8-6925

5638

SUSCEPTIBILITY OF IRRADIATED ANIMALS TO INFECTION. L. L. Shechmeister. *Radiation Research* 1, 401-9(1954).

Animals exposed to either lethal or sublethal doses of x rays demonstrate increased susceptibility to experimental infection and bacteremia produced in these animals as a result of irradiation is an important factor in radiation death. Sublethal radiation was found to activate subclinical or latent infection in mice and possibly in rats. NSA 8-6926

5639

THE TIME-INTENSITY RELATIONS OF WHOLE-BODY ACUTE X-IRRADIATION AND PROTECTION BY β -MERCAPTOETHYLAMINE. Roberts Rugh and Helen Clugston. *Radiation Research* 1, 437-47(1954). NSA 8-6927

5640

BIO-FLAVONOIDS IN RADIATION INJURY. I. THE EFFECT OF IONIZING RADIATION ON CAPILLARIES. Isidore Arons, John Freeman, Boris Sokoloff, and Walter H. Eddy. *Brit. J. Radiol.* 27, 583-5(1954).

Pretreatment for 10 days with 600 mg/day of bio-flavonoids, extracted from citrus fruit and known as CVP or citrus-vitamin P, afforded protection against radiation injury to capillaries of nail-bed in healthy human subjects subjected to 200 r of x rays administered as single dose. NSA 8-6928

5641

MODIFICATION OF RADIATION INJURY IN EXPERIMENTAL ANIMALS. Leon O. Jacobson. *Am. J. Roentgenol. Radium Therapy Nuclear Med.* 72, 543-55(1954).

Measures which affect survival and recovery of blood-forming tissues of mammals following exposure to LD₅₀ doses of ionizing radiation are reviewed. Possible mechanisms of action of protective measures are discussed. NSA 8-6929

5642

STUDIES WITH RADIOPHOSPHORUS IN DROSOPHILA. IV. EXPERIMENTS ON FLIES HOMOGENEously LABELED WITH P³². R. C. King and Louise P. Wilson. *J. Exp. Zool.* 126, 401-17(1954).

Death of adults occurs when over-all phosphorus content of tissues rises above 0.4%. No detectable difference was noted between labeled and control *Drosophila* with respect to egg hatchability, eclosion, time required for development from egg to adult, and sex ratio of resulting adults. Fecundity and fertility of F₁-labeled females were lowered. NSA 8-6936

Rochester, N. Y. Univ. Atomic Energy Project. INDEX OF REPORTS AND PUBLICATIONS BY THE UNIVERSITY OF ROCHESTER ATOMIC ENERGY PROJECT. Henry A. Blair. July 31, 1955. 213p. Contract W-7401-eng-49. (UR-423).

This index covers the declassified and unclassified work of the University of Rochester Atomic Energy Project from its beginning in 1943 until July 1955. It contains titles of the work described in Manhattan District and Atomic Energy Commission reports as well as of material published in books and journals. The titles are grouped under broad subject headings, and an author index is included. NSA 10-3092

5645

RADIATION STERILIZATION. VII. PROBLEMS IN USING HIGH-VOLTAGE ELECTRONS FOR STERILIZATION. W. D. Bellamy and E. J. Lawton. *Nucleonics* 12, No. 4, 54-7(1954).

Results are presented from a study of bacteria and enzyme inactivation by electrons from modified 1-Mev peak resonant-transformer x ray unit. Machine was operated

at 800 kv peak and 200 μ a beam current, delivering a dose of approximately 286,000 rep/sec at a distance of 10 cm from the stainless steel window. Dose-rate dependence and side effects are discussed, and other areas where research is needed are pointed out. NSA 8-3200

5646

EFFECT OF 200 ROENTGENS FRACTIONAL WHOLE BODY IRRADIATION IN THE BURRO. John H. Rust, Bernard F. Trum, John Heglin, Eve McCulloh, and Thomas J. Haley. *Proc. Soc. Exptl. Biol. Med.* 85, 258-61(1954).

Response of burro to 200 r fractional Co⁶⁰ γ ray whole-body exposure was similar to but slower than that observed with a daily dose of 400 r. Platelet response is described. Significant hyperferremia was observed in the burro after whole body exposure to one or more 600 r doses. NSA 8-3201

5647

INFLUENCE OF TOTAL-BODY X-IRRADIATION UPON TISSUE MAST CELL NUMBER. Douglas E. Smith and Yvette S. Lewis. *Proc. Soc. Exptl. Biol. Med.* 85, 306-7(1954).

Mast cell counts were made on cheek pouches of hamsters subjected to total-body x ray exposure. Marked increase in number of atypical mast cells was accompanied by reduction in total number of mast cells postexposure. Repopulation of cheek pouch with mast cells is relatively slow, being incomplete even at the end of 33 days. NSA 8-3202

5648

THE EFFECT OF RADIATION ON ASCITES TUMOUR CELLS. Ilse Lansitzki. *Brit. J. Radiol.* 27, 288-35(1954).

Mouse ascites tumor cells, which grow freely suspended in the abdominal cavity of the animals, can be considered an anaplastic form in contrast to the more differentiated spindle cells from which they are derived. On explanation into tissue culture and on subcutaneous injection *in vivo* the free round cells become transformed into spindle cells. T2146 and S37 ascites tumor cells were exposed *in vitro* to γ radiation before and after establishment of the spindle forms in tissue culture and injected subcutaneously into C3H mice immediately after radiation. The radiation effect on the tissue cultures, as measured by the number of tumors obtained from irradiated grafts of cultures, was the same in both tumor strains and independent of whether the cells were exposed as round or spindle forms. Exposure to γ radiation *in vitro* of S37 ascites tumor cells and S37 spindle cells derived from subcutaneous tumors showed the former to be much more radiosensitive. The MLD was 500 r units for the ascites form and 2600 r units for the subcutaneous sarcoma. It is tentatively suggested that the great radiosensitivity of the ascites tumor cells may be related to the fact that many of these cells do not reconstruct fully after mitosis and be due to an action of radiation similar to that seen on premitotic cells in other tissues, and to their low metabolic activity. 5649

Los Alamos Scientific Lab. SPECIFIC IONIZATION AND RELATIVE BIOLOGICAL EFFECTIVENESS OF IONIZING RADIATION IN MAMMALIAN SYSTEMS. THE APPLICATION TO THE PROBLEM OF COSMIC RAY HAZARDS. John B. Storer and Adolph T. Krebs, Army Medical Research Lab., Fort Knox and John E. Furchner, Los Alamos Scientific Lab. [1954]. 24p. (AECU-2835).

Authors attempt to evaluate potential hazard from cosmic radiation at various altitudes. Data on origin, incidence, and energy of cosmic particles are reviewed, and data are tabulated from studies of relative effectiveness of various particles in producing biological effects.

5650

Atomic Energy Project, Univ. of Calif., Los Angeles
INFLUENCE OF POST-IRRADIATION MEDICATION
WITH ANTIBIOTIC JM-57H ON SURVIVAL TIME IN MICE.
Thomas J. Haley, Eve F. McCulloh, and W. G. McCormick,
Apr. 5, 1954. 11p. Contract AT-04-1-GEN-12. (UCLA-287)

Results obtained indicate that medication must be
started during the first post-irradiation week before
massive bacteremia occurs, otherwise such therapy will
not be beneficial. NSA 8-3206

5651

INVESTIGATIONS OF BIOLOGICAL RADIATION PROTECTION.
III. THE INFLUENCE OF SPLEEN PROTECTION AND OF
SPLEEN AND LIVER IMPLANTS ON THE SURVIVAL OF
THE X-IRRADIATED MOUSE. Hanns Langendorff, Ruprecht
Koch, and Hedwig Sauer. *Strahlentherapie* 93, 274-80
(1954).

Intraperitoneal implantation, into mice, of homologous
and heterologous spleen material, and heterologous liver
material, raises radioresistance. Humoral factor is
suggested as source of the protection observed. NSA 8-3207

5652

INVESTIGATIONS OF BIOLOGICAL RADIATION PROTECTION.
IV. THE SIGNIFICANCE OF SULFHYDRYL COMPOUNDS
IN BIOLOGICAL RADIATION PROTECTION. Hanns Langendorff,
Ruprecht Koch, and Hedwig Sauer. *Strahlentherapie* 93,
281-88 (1954).

Cysteine, cysteine + cortineurine, cysteamine,
N-acetylcysteamine, cystinamine, and thiourea have
protective effect against x ray action in mice, Dithiopropanol
does not. N-acetylcysteamine and thiourea display this
effect even if given 2 hr prior to exposure. X ray resistance
is not increased by all components containing the SH group.

CYSTEINE PROTECTION OF THE CORNEA AGAINST
BETA RADIATION. James E. McDonald. *Arch. Ophthalmol.*
51, 301-10 (1954).

In rabbit eyes, subconjunctival injection of a total
of 1 cc of 8% cysteine (free base) in two areas protects
the epithelium, stroma, and endothelium of the cornea
against the application of 40,000 rep of β radiation one
hour later, using the Sr^{90} ophthalmic applicator. NSA 8-3210

5655

STATE CONTROL OF PROTECTION AGAINST IONIZING
RADIATION. Lauriston S. Taylor. *Am. J. Roentgenol.
Radium Therapy Nuclear Med.* 71, 691-702 (1954).

Practices in various countries relating to protection
against ionizing radiation are reviewed. Problems in
development of a philosophy and codes of practice relative
to the use of radiation and its control by the state are
discussed. NSA 8-3212

5656

PROTECTION AGAINST THE LETHAL EFFECTS OF X
RADIATION IN MICE BY 4-ACYLPYROGALLOL.
Antoine Lacassagne, Jean-François Duplan, and N. P. Buu-Hai.
Compt. rend. 238, 1279-81 (1954). (In French).

Ketones derived from pyrogallol, particularly
4-decanoylpyrogallol and 4-lauroylpyrogallol, are found
to protect mice effectively against the lethal effects of
x radiation. NSA 8-3213

5657

EFFECTS OF EARLY EXSANGUINOTRANSFUSION ON
IRRADIATED DOGS. Charles P. Powell and Herbert B.
Gerstner. *J. Lab. Clin. Med.* 43, 595-602 (1954).

Method has been developed for replacement of more
than 90% of a recipient dog's blood by stored donor blood
In 20 dogs so treated within 2 hr following exposure to a

lethal dose (420 r) of total body x radiation there were
no significant differences between treated and untreated
groups in general clinical course, in most laboratory
studies, nor in survival time. Marked leukocytosis
occurred post-irradiation in transfused dogs, and
persisted for 2 days, in contrast to leukopenia in untreated
controls. NSA 8-3214

5658

CLINICAL OBSERVATIONS OF ATOMIC BOMB RADIATION
SICKNESS (PART I). Koichi Ishibashi. *Nagoya J. Med.
Sci.* 14, 163-75 (1951).

Author summarizes observations of 108 patients who
suffered either directly or indirectly from radiation at
time of the atomic explosion at Hiroshima. NSA 8-3215

5659

CLINICAL OBSERVATIONS OF ATOMIC BOMB RADIATION
SICKNESS. (PART II). Koichi Ishibashi. *Nagoya J. Med.
Sci.* 14, 176-83 (1951).

Author summarizes observations on 60 patients during
the year following their exposure to radiation from the
atomic explosion at Hiroshima. NSA 8-3216

5660

CLINICAL OBSERVATIONS OF ATOMIC BOMB RADIATION
SICKNESS. (PART III). Koichi Ishibashi. *Nagoya J.
Med. Sci.* 14, 184-92 (1951).

Clinical observations made on 62 patients who suffered
from burns and mechanical injuries, as well as radiation
sickness, at time of atomic explosion at Hiroshima are
summarized. NSA 8-3217

5661

CLINICAL OBSERVATIONS OF ATOMIC BOMB RADIATION
SICKNESS. (PART IV). Koichi Ishibashi. *Nagoya J. Med.
Sci.* 14, 193-205 (1951).

Author presents a summary of hematological data on
injured patients. Data were collected over a 3 year
period following the atomic explosion at Hiroshima.
NSA 8-3218

5662

Los Alamos Scientific Lab.
THE CHRONIC TOXICITY OF URANIUM²³³ AND URANIUM²³⁸.
DELAYED EFFECT IN RATS FOLLOWING A SINGLE
INJECTION. John B. Storer, Wright Langham, L. E.
Ellinwood, J. E. Furchner, W. Schweitzer, and P. Sanders.
June 1953. 17p. Contract W-7405-eng-63. (LA-1634).

Rats were studied for 50 wk after single injection of
 U^{233} and U^{238} , doses ranged from 1/82 to 1/2 the $\text{LD}_{50/30}$.
There was no shortening of survival time, decrease in
weight gain, or increase in tumor incidence, no radio-
graphic evidence of skeletal damage, no indication of
impaired kidney function, and no histologic evidence of
kidney damage. NSA 8-3221

STUDIES OF THE EFFECTS OF MASSIVE, RAPID DOSES OF GAMMA RAYS ON MAMMALS. Wright H. Langham, Samuel M. Rothermel, Kent T. Woodward, Clarence C. Lustbaugh, John B. Storer, and Payne S. Harris. Nov. 1953. 60p. Contract W-7405-eng-36. (LA-1643).

Results are reported from detailed studies of pathological, hematological, and biochemical radiation syndrome in mice and rats following exposure to various massive doses of γ radiation. Data are included on dose rate effect on splenic and thymic weight loss of mice and median survival time of monkeys, and on effect of cysteine on median survival time of rats. NSA 8-3640

5666

USING Co^{60} AND FISSION PRODUCTS IN PORK IRRADIATION EXPERIMENTS. H. J. Gomberg, S. E. Gould, J. V. Nehemias, and L. E. Brownell. Nucleonics 12, No. 5, 38-42(1954).

Gamma radiation from a 10-kilocurie Co^{60} source and from spent fuel slugs was used to study feasibility of controlling trichinosis by irradiation of pork. Exposure of hog carcasses in routine manner was found to be feasible. Techniques and dosimetry used in tests are described. NSA 8-3641

5667

HOW BIOLOGICAL EFFECTIVENESS VARIES WITH X-RAY ENERGY. Walter S. Moos. Nucleonics 12, No. 5, 46-9(1954).

Studies indicating difference in radiation effects with variation of x ray energy are reviewed. Data on biological effectiveness of x radiation of various voltages on survival of bacteria are presented. Author concludes that biological effectiveness is dependent on x ray wavelength and is affected by transition effect, absorption, and specific ionization. NSA 8-3642

5668

THE DIAGNOSTIC VALUE OF THE IMMEDIATE PERIPHERAL LEUKOCYTE RESPONSE FOR THE RAT TO WHOLE BODY ROENTGEN IRRADIATION. J. Gershon-Cohen and M. B. Hermel. Am. J. Roentgenol. Radium Therapy, Nuclear Med. 71, 846-52(1954).

Several groups of rats were exposed to 85 to 5000 r. Initial progressive lymphopenia occurred during first 4 hr after exposure, initial drop being directly proportional to dose. Lethal doses caused lymphocyte counts to fall below $500/\text{mm}^3$. Following doses of irradiation in midlethal ranges, leukocytosis occurred almost simultaneously with lymphopenia during first few hours postirradiation. NSA 8-3643

5669

IRRADIATION OF T-1 BACTERIOPHAGE WITH LOW VOLTAGE ELECTRONS. Marguerite Davis. Arch. Biochem. and Biophys. 49, 417-23(1954).

Author's data on bombardment of T-1 bacteriophage with low-energy electrons which corroborate evidence for existence of an internal morphology of the virus. NSA 8-3644

5670

CHANGES IN LENS DURING THE FORMATION OF X-RAY CATARACT IN RABBITS. Ruth van Heyningen, Antonette Pirie, and J. W. Boag. Biochem. J. (London) 56, 372-9(1954).

Glyoxalase and acetaldehyde oxidase activity and levels of coenzyme A and nicotinic acid in lens decrease during development of x ray cataract, aldolase activity decreases only when lens is opaque. Significance of these observations is considered in relation to known changes in glutathione and protein sulfhydryl groups in cataract. NSA 8-3645

5671

STUDIES ON CELL DIVISION. II. X-RADIATION AS A DIVISION INHIBITING AGENT. Edward Spoerl, L. E. Loveless, T. H. Weisman, and R. J. Balske. J. Bacteriol. 67, 394-401(1954).

Effects of continuous and short-term x radiation upon division, growth, and viability of yeast and *E. coli* cultures were as follows; cell division was inhibited selectively with either method of irradiation and, in addition, a small inhibition of yeast growth occurred simultaneously with inhibition of yeast cell division. Inhibition of division included inhibition of budding and of cell separation process. NSA 8-3646

5672

SOME OBSERVATIONS ON THE EFFECT OF GAMMA IRRADIATION ON THE BIOCHEMISTRY OF REGENERATING RAT LIVER. John F. Thompson, Magdalene S. Carttar, and Wallace W. Tourtellotte. Radiation Research 1, 165-75 (1954).

The only consistent biochemical effects of γ radiation (800 r) found in regenerating rat liver were a diminution in concentration and turnover of DNA phosphorus. Increased rate of incorporation of P^{32} into cytoplasmic RNA in regenerating rat liver was contributed to by all subcellular cytoplasmic elements (to approximately the same extent by each). NSA 8-3648

5673

SOME CHARACTERISTICS OF BIOLOGICAL DAMAGE INDUCED BY IONIZING RADIATIONS. L. H. Gray. Radiation Research 1, 189-213(1954).

Mechanisms of biological damage induced by ionizing radiations are reviewed. Aspects of radiation damage which may be considered characteristic of the agent producing them, and early methods of detecting the damage are discussed. NSA 8-3649

5674

THE RELATIVE BIOLOGICAL EFFECTIVENESS OF RADIATION FROM A NUCLEAR DETONATION OF TRADES-CANTIA CHROMOSOMES. Alan D. Conger. Science 119, 36-42(1954).

Data are presented to demonstrate the biological effectiveness of radiation from a nuclear detonation as compared with γ and fast neutron irradiation administered in the laboratory in production of chromatid aberrations in Tradescantia. NSA 8-3650

5675

AN INTERESTING PHENOMENON ASSOCIATED WITH IRRADIATION OF DRY MAIZE SEEDS. Drew Schwartz. Science 119, 45-6(1954).

Data are presented (graph of relationship between seedling height and radiation dose) on maize plants grown from a nuclear detonation and comparison is made with data from similar studies in which seeds were exposed to γ radiation from Co^{60} source. Apparent growth following exposure to high doses was due to cell elongation and the maximum height of seedlings was reached in 5 days. NSA 8-3651

5676

THE PRODUCTION OF DOMINANT LETHALS IN DROSOPHILA BY FAST NEUTRONS FROM CYCLOTRON IRRADIATION AND NUCLEAR DETONATIONS. William K. Baker and Elizabeth Von Halle. Science 119, 46-9(1954).

Authors present data on relative biological effectiveness of fast neutrons from cyclotron irradiation and from nuclear detonations. The criterion of effect was the induction of dominant lethals in Drosophila. It is concluded that frequency of dominant lethals may be useful as a rather rapid, but crude, biological measurement of fast neutron dosage at high levels. Data are compared with those on Tradescantia. NSA 8-3652

5677

X-RAY BREAKAGE OF LILY CHROMOSOMES AT FIRST MEIOTIC METAPHASE. Helen V. Crouse. *Science* **119**, 485-7 (1954).

Studies indicate that x radiation produces an effect on fully condensed meiotic lily chromosomes which is **detectable at first meiotic division in form of bridges** which are interpreted as being half-chromatic bridges. NSA 8-3653

THE BIOLOGICAL AND MEDICAL ASPECTS OF IONIZING RADIATION. REPORT NO. 7. THE EFFECT OF ANESTHETIC AGENTS ON RATS FOLLOWING WHOLE BODY IRRADIATION. Kenneth H. Burdick. Feb. 1954. 9p. (AF-SAM-21-3501-0005-7).

Effects of five anesthetic agents (cyclopropane, ethylene, ether, nitrous oxide, and thiopental) were observed in 375 rats, irradiated with 570 r and anesthetized at 1 to 3 hr, 24 hr and 7 days after irradiation. Results suggest that a critical change in response to anesthesia may occur immediately after irradiation, before onset of acute radiation syndrome. NSA 8-3655

5679

Army Medical Research Lab., Fort Knox

EFFECT OF PARTIAL SHIELDING BY GRIDS ON SURVIVAL OF X-IRRADIATED RATS. J. G. Kereiakes, W. H. Parr, J. B. Storer, and A. T. Krebs. Feb. 12, 1954. 12p. (AMRL-139). *Proc. Soc. Exptl. Biol. Med.* **86**, 153-56 (1954).

Exposure of rats to equal volume-dose of x radiation (200 kg roentgens) through grids having various hole size diameters but a constant ratio of open area to closed area, **resulted in increasingly greater survival as the hole size was decreased.** It is concluded that increased survival probably results from repair initiated in irradiated areas by adjacent normal tissue. Importance of these local effects in comparison to remote effects is discussed. NSA 8-3656

5680

Radiation Lab., Univ. of Calif., Berkeley

CHEMISTRY DIVISION QUARTERLY REPORT [FOR] SEPTEMBER, OCTOBER, NOVEMBER 1953. Jan. 11, 1954. 70p. Contract W-7405-eng-48. (UCRL-2455).

Data on effect of irradiation of mice on concentration of coenzyme A and DPN-TPN in liver are included in this report. NSA 8-3666

5681

THE EFFECTS OF FAST NEUTRONS FROM A NUCLEAR DETONATION ON CHROMOSOME BREAKAGE IN TRADE-SCANTIA. J. S. Kirby-Smith, C. P. Swanson, C. W. Sheppard, and E. B. Darden, Jr. *Science* **119**, 42-5 (1954).

Relative biological efficiency for detonation neutrons as compared with fast neutrons from cyclotron was calculated as $1 \pm 25\%$. Use of *Tradescantia* as biological dosimeter for fast neutrons is discussed. NSA 8-3819

TESTS FOR A ROLE OF H_2O_2 IN X-RAY MUTAGENESIS. II. ATTEMPTS TO INDUCE MUTATIONS BY PEROXIDE. R. F. Kimball, J. Z. Hearon, and N. Gaither. Radiation Research 3, 435-43(1955). NSA 10-1986

5693
IRRADIATION OF PARTS OF INDIVIDUAL CELLS. Raymond E. Zirkle and William Bloom. Science 117, 487-93(1953).

In mitotic cells of newt heart cultures, a few dozen protons delivered to chromosomes produce severe aberrations, whereas a few thousand to cytoplasm, spindle, or centriolar region are without detectable effect. Some of these types of chromosome aberrations are readily localized and help in the study of certain aspects of mitotic movement. NSA 8-3956

5694
OXYGEN POISONING AND X-IRRADIATION: A MECHANISM IN COMMON. Rebeca Gerschman, Daniel L. Gilbert, Sylvanus W. Nye, Peter Dwyer, and Wallace O. Fenn. Science 119, 623-6(1954).

It is concluded that both irradiation and oxygen poisoning produce some of their lethal effects through at least one common mechanism, possibly that of the formation of oxidizing free radicals. NSA 8-3957

5695
STUDY OF THE THYROID FUNCTION IN THE IRRADIATED ANIMAL. P. Marques, A. Bru, H. Planel, A. Serres, and L. Chardon. J. radiol. et electrol. 35, No. 1-2, 15-21(1954). (In French).

Thyroid function during the course of radiation sickness was studied in 32 dogs and 30 guinea pigs which received total-body irradiation or total-body irradiation with thyroid protected. NSA 8-3958

5696
IMPAIRED ORGANIC BINDING OF RADIOIODINE BY THE THYROID FOLLOWING RADIOIODINE TREATMENTS OF HYPERTHYROIDISM. Richard H. Kirkland. J. Clin. Endocrinol. and Metabolism 14, 565-71(1954).

Results suggest that radioiodine acts upon the thyroid in such a manner as to prevent or impair organic binding of the trapped iodide. NSA 8-3959

5697
PROTECTIVE ACTION OF LOW OXYGEN TENSION AND EPINEPHRINE AGAINST X-RAY MORTALITY IN THE CHICK. S. Phyllis Stearner, Emily J. B. Christian, and Austin M. Brues. Am. J. Physiol. 176, 455-60(1954).

Epinephrine in oil, or low oxygen tension, markedly reduced radiation mortality in young chicks, while combined treatment had a synergistic protective effect. It is postulated that the decreased supply of oxygen to the tissues

produced by exposure at low oxygen tension is augmented by epinephrine, resulting in more severe hypoxia of the visceral organs. NSA 8-3961

5698
INVESTIGATIONS ON BIOLOGICAL RADIATION PROTECTION. V. FURTHER INVESTIGATIONS ON THE EFFECT OF HETEROLOGOUS SUPRARENAL IMPLANTATION ON THE SURVIVAL RATE OF THE X-IRRADIATED MOUSE. H. Langendorff, R. Koch, and H. Sauer. Strahlentherapie 93, 381-8(1954). (In German).

Postirradiation (650 or 500 r) implantation of heterologous adrenal tissue (rats) into mice resulted in increased survival from 8 to 20% for males, and from 10-52% for females irradiated with 500 r. No influence on survival was observed in those irradiated with 650 r. NSA 8-3962

5699
THE EFFECT OF LEVULOSE ON RADIATION SICKNESS. K. Fochem. Strahlentherapie 93, 466-72(1954). (In German).

Damage to liver during high x ray dosages and therapeutic effects of fructose determined by means of bromosulphthalein test. NSA 8-3963

5700
ANOXIA AS A FACTOR OF RADIORESISTANCE. A. Lacassagne. J. radiol. et electrol. 35, No. 1-2, 12-15(1954). (In French).

Author proposes that the mechanism of radioresistance appears to be the lessening of reactions of secondary oxidations, caused by the oxidizing agents freed by irradiation, that the best means of augmenting radioresistance is to diminish the amount of free O_2 in the tissues. NSA 8-3964

5701
ON THE PERCUTANEOUS RADIATION EFFECT OF THORIUM X. Eberhard Günsel. Strahlentherapie 93, 573-8(1954). (In German).

Studies with young rats show that γ rays of Ra^{224} may cause radiation sickness, death and strong reactions of the bone marrow. Genetic damages, changes in zones of cartilage growth and atrophic alterations of testicles are discussed. NSA 8-3965

MORPHOLOGIC EFFECTS OF IRRADIATION OF THE SALIVARY GLANDS OF RATS. James A. English. Feb. 1, 1954. 12p. (NM-006-012. 04. 66).

Salivary glands of rats were examined 16 hr to 100 days following application of 200 kvp x rays (1000 or 1500 r). Postirradiation changes consisted primarily of alteration in size, shape and staining characteristics of nuclei of acinar cells. Changes were observed in other salivary glands, but were not characteristic enough to serve as invariable means of identification. Normal rat salivary glands are described. NSA 8-4188

5706

School of Aviation Medicine
BIOLOGICAL AND MEDICAL ASPECTS OF IONIZING RADIATION. EFFECTS OF WHOLE-BODY X-RADIATION IN GUINEA PIGS WHILE UNDER VARIOUS SIMULATED FLYING CONDITIONS. REPORT NO. 11. Eugene B. Konecni and William F. Taylor. Apr. 1954. 12p. (NP-5179).

Results indicate that the general conditions met while flying were not detrimental to the guinea pig in combination with exposure to ionizing radiation. (Major variables were (1) cold, (2) hypoxia, (3) breathing 100% oxygen, and (4) diet, in various combinations.) NSA 8-4189

5707

Atomic Energy Project, Western Reserve Univ.
QUARTERLY PROGRESS REPORT [FOR] JANUARY-MARCH 1954. Hymer L. Friedell. 8p. Contract W-31-109-eng-78. (NYO-4960).

This report includes data on: incorporation of P^{32} into acid-soluble tissue fractions in normal and irradiated rats, and effects of bone marrow injections on radiation injuries. NSA 8-4190

5708

CHANGES IN CLOT RETRACTION TIME AND PLATELET ADHESIVENESS FOLLOWING WHOLE BODY IRRADIATION. J. Philip Savitsky and Sol Sherry. Proc. Soc. Exptl. Biol. Med. 85, 587-90(1954).

Inhibition of platelet adhesiveness and a prolongation of clot retraction time were observed in blood of dogs 3 days after exposure to whole-body radiation. Inhibition of clot retraction time was reversed *in vitro* by adding an excess of Ca. A plasma factor, which decreased platelet adhesiveness and inhibited clot retraction, was demonstrated 8 days postirradiation and was most pronounced during thrombocytopenia. NSA 8-4192

5709

EFFECT OF DIET AND TRACE MINERALS ON ERYTHROCYTE FRAGILITY AND X-IRRADIATION MORTALITY IN RATS. Marguerite A. Constant and Paul H. Phillips. Proc. Soc. Exptl. Biol. Med. 85, 678-82(1954).

Data indicate that fragility of erythrocytes pre-irradiation was less important in determining lethality of irradiation for rat than were the type and adequacy of diet. Long term feeding of polycythemic levels of cobalt increased the mortality rate of animals given whole body irradiation. NSA 8-4193

5710

PROLONGATION OF THE LAG PHASE OF IRRADIATED ESCHERICHIA COLI. E. Beutler, Melba J. Robson, and L. O. Jacobson. Proc. Soc. Exptl. Biol. Med. 85, 682-5 (1954).

Authors studied modifying effects on E. coli growth of: temperature during growth, storage of irradiated organisms, and the addition of mouse blood, inactivated rabbit serum, 0.5% cysteine solution, filtrate of actively growing E. coli cultures, fresh spleen, liver and kidney mash, and growing non-irradiated E. coli cultures. Evidence that sublethal effects of x irradiation in bacteria differ from lethal effects is discussed. NSA 8-4194

5711

EFFECT OF X-RAYS ON THE PERMEABILITY AND BARRIER FUNCTIONS OF SUBCUTANEOUS CONNECTIVE TISSUE AND LYMPHATIC NODES. P. N. Kiseley. Vestnik Roentgenol. i Radiol., No. 6, 8-14(1953). (In Russian).

Data obtained by irradiating mice and infecting them show that therapeutic doses of x rays affect permeability and barrier functions of lymphatic nodes in same manner as the affect those functions of skin or connective tissue. Doses higher than 300 r damage lymphatic nodes permanently and do not increase their barrier action. (Lower doses reduce barrier action transiently, then increase it.) NSA 8-4196

5712

EFFECTS OF ANEURIN (VITAMIN B_1) ON THE GLYCOGEN FORMATION FUNCTION OF LIVER OF RATS DURING GENERAL EXPOSURE TO VARIOUS DOSES OF X-RAYS. B. M. Graevskaya, R. Ya. Keylina, and S. E. Manoylov. Vestnik Rentogenol. i Radiol., No. 6, 22-5(1953). (In Russian).

Experiments conducted on 15 rats showed that the glycogen forming function of the liver may be partially restored if vitamin B_1 is given after rats have been exposed to x rays. Doses of 500 r were found to be adequate to suppress oxidation systems of entire organism. Possible mechanisms of observed effect are considered. NSA 8-4197

5713

THE EFFECTS OF TESTOSTERONE PROPIONATE AND TESTOSTERONE CYCLOPENTYLPROPIONATE UPON MORBIDITY AND MORTALITY IN MICE FOLLOWING LETHAL TOTAL-BODY IRRADIATION. Mitchell W. Spellman, James C. Carlson, and C. Walton Lillehei. Cancer 7, 617-21(1954).

Testosterone cyclopentylpropionate (long-acting), injected once every 14 days with or without pretreatment, significantly reduced mortality and morbidity in mice following lethal doses of total-body irradiation, while testosterone propionate enhanced morbidity and gave no protection against lethal effects. NSA 8-4199

5714

THE ROLE OF HIGH IONIC CONCENTRATIONS IN PROTECTION AGAINST X-IRRADIATION. C. S. Bachofer and M. Aelred Pottinger. J. Gen. Physiol. 37, 663-75 (1954).

Various levels of protection against x ray injury in bacteriophage were achieved by addition of inorganic salts to aqueous virus suspensions during exposure. Highest survival values were obtained with nitrite salts. Data are included to show protective effects afforded by various concentrations of nitrate ions, sulfate ions, chloride ions, ammonium salts, metallic salts, and by variations in pH. NSA 8-4200

5715

ON THE RADIOSENSITIVITY OF THE ADULT RAT IN HYPOTHERMY. Francois Baclesse and Maurice Marios. Compt. rend 238, 1926-8(1954). (In French).

Hypothermy caused by administration of 3-chloro-10(3-dimethylaminopropyl)-phenothiazine (I) and refrigeration increases x ray resistance of adult male rats.

Modification is not caused by (I) but by lowering of body temperature. NSA 8-4201

INFLUENCE OF X-IRRADIATION UPON BODY WEIGHT
AND FOOD CONSUMPTION OF THE RAT. Douglas E.
Smith and Ella B. Tyree. Am. J. Physiol. 177, 251-60
(1954).

Beginning on the 1st day after irradiation there were
changes in body weight and in consumption of food that
fell into distinct patterns in relation to x-ray dosage.
Similar changes occurred after exposure of practically any
region of the body. Degree and duration of effects depended
upon portion of body irradiated. Possible relationship
between results and known histological and functional
alterations in gastrointestinal tract are discussed.

VARIABLE EFFECTIVENESS OF 180-KEV AND 31-MEV
RADIATION FOR LETHAL EFFECTS ON C57 MICE.
Hedi Fritz-Niggli. *Experientia* 10, 209-10(1954). (In
German with English Summary).

Mice were subjected to whole body irradiation with
homogeneous dose of 31 mev and 190 kev x rays. A
quantitative evaluation of effectiveness was obtained, using
survival time of mice (between irradiation and death).
The 180 kev rays were more effective than the 31 mev
rays. NSA 8-4480

5723

HETEROLOGOUS TRANSPLANTATION OF TUMORS
AFTER TREATMENT OF THE HOST ANIMAL WITH
RADIOACTIVE ISOTOPES. W. Bollag and Cl. Meyer.
Experientia 10, 215-16(1954). (In German, with English
Summary).

Successful heterologous transplantation of mouse
Crocker sarcoma on young rats that were pretreated with
 P^{32} and Au^{198} are described. Growth tendency of tumors
varied according to character of the radioisotope, mode
of administration, and interval between injection of
radioactive substance and heterotransplantation. NSA 8-4481

5724

STUDIES ON SUSCEPTIBILITY TO INFECTION FOLLOWING
IONIZING RADIATION. I. THE TIME OF ONSET AND
DURATION OF THE ENDOGENOUS BACTEREMIAS IN MICE.
Carolyn W. Hammond, Marianne Tompkins, and C. Phillip
Miller. J. Exptl. Med. 99, 405-10(1954).

Most bacteremias occurred between 7th and 15th
days after exposure to 550-r total-body x irradiation.
Duration varied with microorganism, *Pseudomonas bacteremia*
was always rapidly fatal, those caused by *Proteus* and *E. Coli*
continued for 72 and 48 hrs.; bacteremia caused by *Para-
colobactrum* was tolerated for as long as 5 days. NSA 8-4482

5725

THE QUANTITATIVE ASPECTS OF PERMANENT AND
TEMPORARY STERILITY INDUCED IN FEMALE
HABROBRACON BY X-RAYS AND β RADIATION. Daniel
S. Grosch and Robert L. Sullivan. Radiation Research
1, 294-320(1954).

Study made of radioinduced sterility in female
Habrobracon. Data on egg production and hatchability
following exposure to various doses of x and β radiation
are presented and factors influencing induction of sterility
are discussed. NSA 8-4483

5726

MORTALITY DUE TO X-RAY IN SPLENECTOMIZED
MICE. Antolin Raventos. Am. J. Physiol. 177, 261-3
(1954).

Infant and pubertal mice were subjected to a mid-
lethal x ray dose after splenectomy. Postirradiation
mortality was only slightly higher in splenectomized mice
than in their unoperated or sham-operated litter mates.
No difference in influence of splenectomy upon radio-
sensitivity was found between the two age groups.
NSA 8-4485

5727

DEVELOPMENTS IN INTERNAL DOSE DETERMINATIONS.
K. Z. Morgan and M. R. Ford. *Nucleonics* 12, No. 6,
32-9(1954).

Choice of values for maximum permissible concentrations
(MPC) of a radioisotope for chronic exposures, and the
basis of calculation of the MPC for single exposures are
discussed. Criteria for recalculation of certain MPC
values based on radiation dose to gastrointestinal tract
for continuous exposure are reviewed. NSA 8-4486

MODIFICATION OF THE RADIATION SYNDROME IN THE
CHICK BY PARTIAL BODY SHIELDING. S. Phyllis

Stearner, Emily J. Christian, and Austin M. Brues.
Radiation Research 1, 270-81(1954).

Shielding small areas of the body during x irradiation reduced subsequent mortality in young chicks. Shielding kidney region prevented severe renal lesions, but normal function was not maintained. Irradiation of kidney region alone produced renal lesions and substantial mortality, especially in initial postirradiation period. NSA 8-4488

5729

MUTATION IN DROSOPHILA MELANOGASTER MALES EXPOSED TO β -RADIATION FROM NEUTRON ACTIVATED PHOSPHORUS-BAKELITE PLAQUES. R. C. King, Brookhaven National Lab., Upton, N. Y. [1954]. 21p. (BNL-1849).

Beta rays from neutron-activated, phosphorus-bakelite plaques were found to be 60% as efficient as 90-kv x rays in producing sexlinked recessive lethal mutations. Recalculation of earlier data indicated that experimental and calculated values for fraction of total P^{32} β -particle energy absorbed by the gonad of P^{32} -labeled *Drosophila* males do not disagree as was previously thought. NSA 8-4855

School of Aviation Medicine
BIOLOGICAL AND MEDICAL ASPECTS OF IONIZING RADIATION. (A PRELIMINARY INVESTIGATION). SEQUELAE FOLLOWING APPLICATION OF HIGH-INTENSITY X-RADIATION TO THE HEAD OF RABBITS. Herbert B. Gerstner, John E. Pickering, and Alois J. Dugi. May 1954. 8p. Project No. 21-3501-0005, Report No. 15. (NP-5222).

Heads of 28 rabbits were exposed to high-intensity x rays; total dose to brain was 12,500 r (12.5 kv) $\pm$ 1500 r. Sequelae included; latent or prodromal period, convulsive phase, somnolent phase, **atoxic phase**, and death. NSA 8-4859

5733

Atomic Energy Project, Univ. of Calif., Los Angeles
EFFECT OF X-IRRADIATION ON GASTRIC SECRETION AND THE ACCOMPANYING GROSS AND HISTOLOGICAL CHANGES IN THE "SHAY" RAT STOMACH. Lawrence E. Detrick, Harvey C. Upham, Dorothy Highby, Virginia Debley, and Thomas J. Haley. July 2, 1954. 19p. Contract AT-04-1-Gen-12. (UCLA-298).

Pre-irradiation of rats subjected to pyloric ligation resulted in great variation in response. Effects on pepsin-HCl activity are described, and results compared to changes resulting from irradiation alone. NSA 8-4860

5734

Atomic Energy Project, Univ. of Rochester
THE EFFECTS OF X-RADIATION ON THE METABOLISM OF BAKERS' YEAST. William J. Bair. May 26, 1954. 254p. Contract W-7401-eng-49. (UR-321).

Results of an investigation of effects of 90,000 r of 250-kv x rays on active transport of cations by bakers yeast cells are presented. Studies of cell growth suggest that there are two effects of radiation: (1) permanent growth inhibition and (2) temporary inhibition of cell division. NSA 8-4861

5735

INDEPENDENT X-RAY EFFECTS ON CHROMOSOME BREAKAGE AND REUNION. Sheldon Wolff and K. C. Atwood. Proc. Natl. Acad. Sci. U. S. 40, 187-92(1954).

Effects of x ray dose fractionation on two-hit chromosome aberrations in root tips of *Vicia faba* with and without protective agent, BAL were studied. Findings indicate that chromosome breakage and radiation-induced delay of reunion are different and independent effects of radiation. NSA 8-4862

5736

INDUCED POLLEN LETHALS FROM SEEDS OF DATURA STRAMONIUM EXPOSED TO RADIATION FROM A NUCLEAR DETONATION. J. L. Spencer and A. F. Blakeslee. Proc. Natl. Acad. Sci. U. S. 40, 441-6(1954).

Relative effectiveness of fast neutrons from a nuclear detonation appeared to be about 13 or 14 times that of either gamma rays or x rays when mutation rates based on pollen lethals in *Datura* were compared. NSA 8-4863

5737

THE EFFECTS OF FAST-NEUTRON RADIATION FROM A NUCLEAR DETONATION ON CHROMOSOME ABERRATION IN DATURA. Henry T. Yost, Jr., Jean Cummings, and A. F. Blakeslee. Proc. Natl. Acad. Sci. U. S. 40, 447-51(1954).

Data obtained from this material indicate that the relative biological efficiency of fast neutrons to γ or x rays is about 14. Types of aberration and number of aberrations per affected cell are the same for neutrons, x rays, and γ rays. No new or unusual types of biological change were observed as result of exposure to extremely high intensity of radiation from the explosion. NSA 8-4864

5738

EFFECT OF PHOSPHORUS-32 ON GROWTH AND VIABILITY OF RAT EMBRYOS. Melvin R. Sikov and Thomas R. Noonan. Federation Proc. 13, 453, 137(1954).

Results from study of effects of various doses of intraperitoneally injected P^{32} solutions on growth and viability of rat embryos are summarized. NSA 8-4865

5739

DAMAGE TO POSTERITY CAUSED BY IRRADIATION OF THE GONADS. H. J. Muller. Am. J. Obstet. Gynecol. 67, 467-83(1954).

Damage to future generations resulting from irradiation of the gonads, and the amount of damage caused by a given dose of radiation are discussed. Data from genetic studies on *Drosophila* and on mice are reviewed and applied in predicting damage to posterity. NSA 8-4866

5740

5750
INDUCED CHROMOSOME MUTATIONS IN DROSOPHILA MELANOGASTER BY FAST ELECTRONS AND X RADIATION. G. Hohne and G. Schubert. Strahlentherapie 94, 72-8(1954). (In German)

Drosophila melanogaster was exposed to a 3-Mev electron beam from a betatron and to 200-kv x radiation, such as is generally used in therapy, for the purpose of studying the effect of these radiations on chromosome mutations. With respect to the reciprocal translocations between the 2nd and the 3rd chromosome that were covered by the analysis of the crossing over, it was found that the increase in the rate of mutation induced by the radiation was a little greater than proportional to the dose. No differences were found between the effects produced by these two radiations of unlike differential ionization. NSA 8-5091

5751
ON THE INFLUENCE OF SMALL REPEATED RADIATION DOSES ON THE FERTILITY AND LITTER SIZE OF THE WHITE MOUSE. H. Langendorff and M. Langendorff. Strahlentherapie 94, 119-25(1954). (In German).

If male mice are irradiated daily with 2.5 r and paired with normal females, fertility decreases more rapidly than in controls. Decreased fertility is preceded by initial fluctuation which often results in a minor temporary increase in fertility. Number of offspring are unaffected. Genetic factors are believed not to be involved. NSA 8-5092

5752
MALFORMATIONS OF THE ADULT CLAW FROG (XENOPUS LAEVIS DAUD.) AFTER X RADIATION IN THE EMBRYONIC STAGES. Hans R. Schinz and Hedi Fritz-Niggli. Strahlentherapie 94, 147-51(1954). (In German).

Irradiation of Xenopus laevis in early embryonic stages did not prevent some of the animals from developing into full-fledged toads. Majority were normal; malformations observed in the remainder are described. NSA 8-5093

5753
DIFFERENTIATION AND THE REACTION OF RAT EMBRYOS TO RADIATION. James G. Wilson. J. Cellular Comp. Physiol. 43, Supplement 1, 39-75(1954).

Rats embryos on 8th, 9th, 10th, or 11th day of gestation were exposed to doses of 12.5 to 600 r directly through an abdominal incision in the mother. Irradiated and non-irradiated embryos were compared as to weight, malformations, and rate of intrauterine motility. NSA 8-5094

5754
THE EFFECT OF IONIZING RADIATIONS ON AMPHIBIAN DEVELOPMENT. Roberts Rugh. J. Cellular Comp. Physiol. 43, Supplement 1, 39-75(1954).

Studies on effects of radiation on amphibia undergoing metamorphosis are reviewed, and data are presented from studies of radiosensitivity of each developmental stage, most frequent types of abnormality following irradiation of embryos, and modifications produced in radiation injury by cysteinamine. NSA 8-5095

5755
THE EFFECT OF AUXIN ON FLOWER INITIATION. A. C. Leopold and K. V. Thimann. Am. J. Bot. 36(4), 342-7(1949).

Exposure of barley to weak x ray doses or solution of coumarin increases flower formation about 25%. There was generally strong positive correlation between the number of flower primordia and the weight of plants, indicating that auxin affects flower formation in a manner parallel to its effect on growth. Studies with x rays are only a small part of the total study reported. BA 23-24794

5756
CHANGES IN SOME GASTROINTESTINAL FUNCTIONS FOLLOWING X-IRRADIATION. Paul F. Fenton and Harrison M. Dickson. Am. J. Physiol. 177, 528-30(1954).

Gastric emptying and food intake in mice were reduced for less than 24 hrs after 500 r exposure. Inhibitory effect

of hypertonic solutions on gastric evacuation was abolished by radiation. Fecal output of total solids and of nitrogen were reduced for 48 hr postexposure. Irradiation had no effect on pancreatic and intestinal amylase content under these conditions. Amylase content of pancreas was found to decrease with age. NSA 8-5090

5757

A STUDY OF THE OUTCOME OF PREGNANCY IN WOMEN EXPOSED TO THE ATOMIC BOMB BLAST IN NAGASAKI. James N. Yamazaki, Stanley W. Wright, and Phyllis M. Wright. *J. Cellular Comp. Physiol.* **43**, Supplement 1, 319-28 (1954).

Among 30 mothers (pregnant at the time of A-bombing) with one or more major signs of radiation injury, there were 7 fetal deaths (23.4%), 6 neonatal and infant deaths (26%), and 4 instances of mental retardation among 16 surviving children (25%). Over-all morbidity and mortality was approximately 60% in this group. In mothers without major signs, but within 2000 meters of blast, over-all mortality was 10%, in controls, 6%. NSA 8-5097

5758

PROBABLE SIDE-EFFECT OF NUCLEAR REACTIONS IN THE BIOLOGICAL ACTION OF FAST PROTONS. Lars Ehrenberg and Goran Andersson. *Nature* **173**, 1086 (1954).

Dry dormant seeds of Bonus barley were irradiated with 160-Mev protons in synchrocyclotron. Certain qualitative effects were found to be intermediate between those of sparsely ionizing (x and γ rays) and densely ionizing radiations (pile neutrons and α particles). Unexpected effects are attributed to secondary ionization by short-range particles resulting from inelastic collisions of high-energy protons with the nuclei of the seed. NSA 8-5098

5759

CELLULAR DESTRUCTION AND PROTEIN BREAKDOWN INDUCED BY EXPOSURE TO X-RAYS. I. Kurt Schreier, Nicola DiFerrante, George W. Gaffney, Louis H. Hempelmann, and Kurt I. Altman. *Arch. Biochem. and Biophys.* **50**, 417-20 (1954).

Breakdown of C^{14} -labeled tissue proteins was investigated. Data suggest that radiation causes an expansion in the first glycine pool as evidenced by increased correction dilution coefficient during the 6 to 24 hr and 0 to 18 hr collection periods. Level of hippuric acid excretion remains unchanged after exposure to ionizing radiation. NSA 8-5099

5760

EFFECT OF TOTAL BODY IRRADIATION ON RABBIT PITUITARY AS MEASURED BY GONADOTROPIN RESPONSE IN CHICKS. John J. Lane, John R. Paysinger, R. L. Murphree, John H. Rust, and Bernard F. Trum. *Proc. Soc. Exptl. Biol. Med.* **86**, 36-8 (1954).

Rabbit pituitaries from animals exposed to (1) 750 and (2) 1100 r of total body Co^{60} γ irradiation showed an early suppression of gonadotropin principles as measured by chick gonad response. Suppression was evident 8 days after (1), and 1 day (2) and effect was sustained for 7 days. Thereafter, gonadotropin activity in both groups returned to normal level. NSA 8-5100

5761

USE OF TISSUE CULTURE MEDIUMS STERILIZED WITH GAMMA RADIATION FROM COBALT-60. Donald J. Merchant, Richard D. Stewart, Lloyd I. Kempe, and John T. Graikoski. *Proc. Soc. Exptl. Biol. Med.* **86**, 128-31 (1954).

Plasma, serum, and embryonic extract contaminated with gram negative and non-sporeforming gram positive bacteria have been sterilized by a dosage of 2×10^5 rep of γ radiation from Co^{60} , without damage to the materials with regard to their use in tissue culture media. NSA 8-5101

5762

IRRADIATION OF THE PITUITARY OF THE RAT WITH HIGH ENERGY DEUTERONS. C. A. Tobias, D. C. Van

Dyke, M. E. Simpson, H. O. Anger, R. L. Huff, and A. A. Koneff. *Am. J. Roentgenol. Radium Therapy Nuclear Med.* **72**, 1-21 (1954).

Pituitary glands of rats were exposed to 3150 to 25,200 rep. Degree of destruction after irradiation was found to be a function of time as well as of dose. NSA 8-5102

5763

MODIFICATION OF ERYTHROPHAGOCYTOSIS IN VITRO AFTER SINGLE TOTAL IRRADIATION OF NORMAL AND SPLENECTOMIZED RATS. Jean-Francois Duplan, Geraud de Brien, and Odette Lartigue. *Compt. rend.* **238**, 2567-9 (1954). (In French).

Radioinduced modifications in erythrophagocytosis in spleen were demonstrated by comparing data on erythrophagocytotic index of normal, splenectomized, normal-irradiated, and splenectomized irradiated rats. NSA 8-5103

5764

SEX HORMONES AS PROTECTIVE AGENTS AGAINST RADIATION MORTALITY IN MICE. E. A. Mirand, J. G. Hoffman, M. C. Reinhard, and H. L. Goltz. *Proc. Soc. Exptl. Biol. Med.* **86**, 24-7 (1954).

Diethylstilbestrol and estradiol benzoate reduce acute radiation mortality in mice. Testosterone propionate and dephostosterone cyclopentylpropionate do not protect against acute lethal radiation dose. Estrogens protect when given for 7 days before or after exposure. No toxic effects due to estrogens or androgens were seen when hormones were administered for 7 days postexposure. NSA 8-5106

5765

PROTECTIVE EFFECT OF HYPOXIA AGAINST IRRADIATION INJURY OF THE RAT BONE MARROW AND SPLEEN. W. A. Rambach, H. L. Alt, and John A. D. Cooper. *Proc. Soc. Exptl. Biol. Med.* **86**, 159-61 (1954).

Rats irradiated in hypoxic atmosphere show a slightly higher cellularity and much greater rate of DNA synthesis in bone marrow and spleen after 96 hr than do rats irradiated at "ground level." Thirty hr of intermittent hypoxia preceding irradiation at low oxygen tension does not give additional protection. Irradiation of animals at low oxygen pressures appears to reduce biological effectiveness of 800 r on bone marrow to 600 r. NSA 8-5107

5766

EFFECTS OF PANTOTHENIC ACID AND ITS ANALOGS IN RADIATION INJURY BY P^{32} . Camillo Artom. *Proc. Soc. Exptl. Biol. Med.* **86**, 162-5 (1954).

Significant protection against injurious effects of P^{32} were observed when pantothenic acid was administered to mice on a deficient diet. Pantoyltaurine was almost as effective as the natural vitamin. ω -methyl pantothenate was totally ineffective. NSA 8-5108

5767

EFFECTS OF RADIOMIMETIC SUBSTANCES ON EMBRYONIC DEVELOPMENT, WITH SPECIAL REFERENCE TO NITROGEN MUSTARDS. Dietrich Bodenstein. *J. Cellular Comp. Physiol.* **43**, Supplement 1, 179-205 (1954).

Studies of effects of nitrogen mustard and of sex hormones on amphibian embryonic development are reviewed, radiomimetic effects of these substances are discussed. NSA 8-5115

5768

INFLUENCE OF X-IRRADIATION ON OXYGEN POISONING IN MICE. Rebeca Gerschman, Daniel L. Gilbert, Sylvanus W. Nye, and Wallace O. Fenn. *Proc. Soc. Exptl. Biol. Med.* **86**, 27-9 (1954).

Survival time of mice in 6 atmospheres of oxygen was about 40 min. Average survival times were prolonged 12, 22, 34, and 146 min, respectively, when mice were irradiated (8800 r) 30, 48, 72, and 84 hr previously.

Anorexia may have contributed to observed protection.
NSA 8-5116

Radiation Lab., Univ. of Calif., Berkeley
MEDICAL AND HEALTH PHYSICS QUARTERLY REPORT
[FOR] OCTOBER, NOVEMBER, DECEMBER, 1953. Apr.
1954. 62p. Contract W-7405-eng-48. (UCRL-2553).

Several new macromolecular components were found in extracts of dividing yeast cells, not in extracts from resting cells. X irradiation was found to have no influence on stability of microsomes or on ability of yeast cells to produce the new components when induced to divide. Histopathological effects of At in rats were studied, and results compared with effects of ^{131}I . NSA 8-5466

5770

CHANGES IN THE PROTEOLYTIC AND ANTIPROTEOLYTIC ACTIVITY OF THE BLOOD SERUM IN MAN AND ANIMALS FOLLOWING EXPOSURE TO X-RAYS. (PROJECT NO. 21-3501-0004, REPORT NO. 4). Kenneth L. Burdon and Rufus K. Guthrie. Baylor Univ. Coll. of Medicine and School of Aviation Medicine. Feb 1954. 28p. (NP-5257).

Profound and prolonged disturbance in normal levels of serum proteolytic and antiproteolytic activity occurred after exposure to x radiation in both humans and guinea pigs. Degree of this disturbance was related to intensity of radiation. NSA 8-5470

5771

Naval Radiological Defense Lab.
SPLEEN DESOXYRIBONUCLEIC ACID CONTENT AS AN INDEX OF RECOVERY IN X-IRRADIATED MICE INJECTED WITH SPLEEN HOMOGENATE. L. J. Cole and M. E. Ellis. June 2, 1954. 29p. (USNRDL-438).

Results indicate that the spleen DNA level provides a sensitive biochemical index of recovery following x irradiation. It is proposed that this endpoint be employed as a biochemical assay for the spleen radiation protection factor. NSA 8-5471

BIOLOGICAL AND MEDICAL ASPECTS OF IONIZING RADIATION. CHANGES IN STRIATED MUSCLE FOLLOWING SINGLE INTENSE DOSES OF X-RAYS. R. B. Lewis. Sept. 1953. 9p. (NP-4921, Report No. 6).

Author describes effects of large x ray doses on rabbit legs. Doses of 6000r caused slight muscle atrophy, 12,000-24,000 and 36,000 r caused coagulation necrosis of smaller muscle areas and atrophy of muscle fibers in nonnecrotic areas, 72,000 r produced destructive lesions of scattered muscle fibers within 3 hr postexposure, and damage increased with time postexposure. NSA 8-40

GENETIC EFFECTS OF THERMAL NEUTRON IRRADIATION IN PLANTS. E. F. Frolk, p.81-87 of CONFERENCE ON THE USE OF ISOTOPES IN PLANT AND ANIMAL RE-

SEARCH HELD ON JUNE 12, 13, AND 14, 1952. (Kansas State Coll. and Argonne National Lab. and Isotopes Div., AEC). Apr. 1953. 276p. (TID-5098).

Data are presented to illustrate effects of irradiation of F₁ maize pollen on F₁ plants, seedling development following irradiation of maize and barley seed, and chromosomal aberrations produced by thermal neutrons. Biological effects produced by thermal neutrons and x rays are compared. NSA 8-41

5786

EFFECTS OF RADIATIONS ON THE GROWTH AND DEVELOPMENT OF PLANTS. Norbert J. Scully. p.242-47 of CONFERENCE ON THE USE OF ISOTOPES IN PLANT AND ANIMAL RESEARCH HELD ON JUNE 12, 13, AND 14, 1952. (Kansas State Coll. and Argonne National Lab. and Isotopes Div., AEC). Apr. 1953. 276p. (TID-5098).

X-ray effects on plant growth and development are reviewed. Chromosomal aberrations, arrest of cell division and radiosensitivity of seeds are discussed. Cytological and growth and development responses of plants subjected to external radiation (x rays and slow neutrons), and of individual plants subjected to internal radiation (C¹⁴-labeled natural organic constituents of plant) are discussed. LUMINOUS BACTERIA AS A RADIOBIOLOGICAL TEST ORGANISM, WITH SPECIAL REFERENCE TO THE RADIATIONS FROM A 130-INCH FREQUENCY MODULATED CYCLOTRON. G. Hoyt Whipple. Aug. 25, 1953. 86p. Contract W-7401-eng-49. (UR-249).

Total light emission from suspension of luminous bacteria (*Achromobacter fischeri*) during an interval of about 8 hr is shown to be convenient index of biological damage produced by penetrating radiations. Doses as small as 500 r were measured. System was used to estimate biological effectiveness of high energy radiations from frequency modulated cyclotron. NSA 8-46

TOLERANCE OF CERTAIN HIGHER PLANTS TO CHRONIC EXPOSURE TO GAMMA RADIATION FROM COBALT⁶⁰. Arnold H. Sparrow, and Eric Christensen. [1953]. 8p. (BNL-1588).

Radiation tolerance of 31 species of higher plants to chronic γ irradiation from Co⁶⁰ was determined. Most sensitive plants: Lilium longiflorum and Tradescantia paludosa, most resistant: broccoli and Gladiolus. It is suggested that plants with large chromosomes tend to be more sensitive than most plants with small chromosomes. There was a severe effect on growth of: Lilium and Tradescantia with daily exposure of 30-40 r, broccoli and Gladiolus with daily exposures of 2500 and 6000 r. NSA 8-434

OSSEOUS DAMAGES IN IRRADIATION OF RENAL TUMORS IN INFANCY AND CHILDHOOD. Walter M. Whitehouse and Isadore Lampe. Am. J. Roentgenol. Radium Therapy Nuclear Med. 70, 721-9(1953).

Vertebral damage and unilateral underdevelopment of ilium were exhibited by patients given irradiation therapy for renal tumors in childhood. Degree of bone damage appears to be related to factors in dosage. NSA 8-441

5809

EFFECTS OF IRRADIATION ON ANABOLISM OF ANTIBODY AND OF SERUM ALBUMIN AND GLOBULIN. Kingsley M. Stevens, Irving Gray, and Melvin S. Schwartz. Am. J. Physiol. 175, 141-6(1953).

Effects of 500 r of whole-body x irradiation upon uptake of S^{35} -methionine into (1) antibody, (2) serum globulin, (3) serum albumin and (4) total protein in normal and immunized rabbits were studied. Results indicate (1) is depressed 30-50%; (2) and (3) are greatly stimulated. Effects are attributed to primary effect upon desoxyribonucleic acid metabolism. NSA 8-442

5810

SYNERGISTIC EFFECT OF INTERNAL IRRADIATION AND PHLEBOTOMY ON PRODUCTION OF CIRRHOSIS AND ASCITES IN DOGS. P. F. Hahn, Ella Lea Carothers, and Houston Brummit. Am. J. Physiol. 175, 162-6(1953).

Intravenous administration of large amounts of radioactive Au colloid may result, in young dogs, in ascites and hepatic cirrhosis, but in large series of adult dogs under similar conditions ascites did not develop. Phlebotomy superimposed upon such irradiation procedures, however, did result in production of ascites in adult dogs, even when total irradiation of liver and spleen was several times smaller than that used with Au injections alone. NSA 8-442

5811

INDUCTION OF PITUITARY TUMORS BY MEANS OF IONIZING IRRADIATION. A. C. Upton and J. Furth. Proc. Soc. Exptl. Biol. Med. 84, 255-7(1953).

Pituitary tumors were induced in mice by single exposure to ionizing radiation, greatest incidence occurred among mice exposed to doses of γ radiation below LD_{50} . Tumors were four times more frequent among females than among males. Neutrons were apparently more efficient than γ rays in inducing these neoplasms, data suggest 40-70 rem is an effective dose. Latency period was very long, with maximum incidence at 17 to 25 months postirradiation. NSA 8-444

5812

EVIDENCE FOR X-RAY INDUCED RECESSIVE LETHAL MUTATIONS IN YEAST. Robert K. Mortimer and Cornelius A. Tobias. Science 118, 517-8(1953).

X ray induced recessive lethal mutations were demonstrated following exposure of diploid yeast to doses of 2500 r and 7500 r of x rays. Extension of radiobiological data on haploid and diploid yeast to triploid and tetraploid yeast cells indicates that some other form of lethal damage is also induced by x rays. NSA 8-445

RECENT ATTEMPTS TO ALTER THE RESPONSE TO IONIZING RADIATIONS. Wilbur A. Selle, George D. Mason, and Robert H. Newman. Sept. 15, 1953. 73p. Contract AT-04-1-Gen-12. (UCLA-264).

Authors summarize 118 recent papers concerning attempts to alter response of animals to ionizing radiations. Data from studies of role of animal's own normally functioning reticulo-endothelial system in defense against radiation effects are included. NSA 8-447

5815

Atomic Energy Project, Univ. of Calif., Los Angeles

INFLUENCE OF GANGLIONIC BLOCKING AGENTS ON SURVIVAL TIME IN RADIATED MICE. Thomas J. Haley, John Heglin, and Eve McCulloh. Oct. 16, 1953. 9p. Contract AT-04-2-Gen-12. (UCLA-269).

Banthine, nicotine, Prantal, tetraethylammonium chloride, Su-1194, and Pendiomide Dibromide (0.45, 0.9, 1.35, and 1.8×10^{-6} M), administered intramuscularly daily to mice receiving 550 r acute whole body x irradiation did not significantly increase survival time or decrease total mortality. While not beneficial, they were judged not detrimental. NSA 8-448

5816

Atomic Energy Project, Univ. of Calif., Los Angeles
INFLUENCE OF WATER SOLUBLE VITAMIN E ON SURVIVAL TIME IN RADIATED MICE. Thomas J. Haley, Eve F. McCulloh, and W. G. McCormick. Nov. 2, 1953. 9p. (UCLA-271).

Injection of water-soluble vitamin E (25.5% α -tocopherol) in daily doses of 0.5, 1.0, 2.0, and 3.18 mg/animal, prior to and throughout postirradiation period, did not benefit mice receiving 550 r acute whole-body x irradiation. The two higher doses significantly decreased both the ST₅₀ day and the day of total mortality, indicating that these doses acted synergistically with the irradiation. NSA 8-449

5817

COMPARATIVE PROTECTIVE EFFECT OF CYSTEINE AGAINST FAST NEUTRON AND GAMMA IRRADIATION IN MICE. Harvey M. Patt, John W. Clark, and Howard H. Vogel, Jr. Proc. Soc. Exptl. Biol. Med. 84, 189-93 (1953).

Cysteine pretreatment confers significant protection against acute lethal effects of (1) γ and (2) fast neutron irradiation in mice. Protection observed with (2) is about half of that found with (1). Data supports concept of a true dose-reduction in the sense that primary mechanisms are involved. Inverse relation between protective efficiency and ionization density is comparable to that noted for oxygen effect, may be interpreted in terms of spatial distribution of radicals formed in H₂O, and their reactions. NSA 8-450

COMBINED EFFECTS OF TOTAL BODY X IRRADIATION AND RADIANT ENERGY THERMAL BURNS; 1. STUDY OF BLOOD COAGULATION. W. M. Davis, A. K. Davis, W. Lee, and E. L. Alpen. Oct. 22, 1953. 24p. (USNRDL-413, AFSWP-473).

Total-body x irradiation (500 r) produces rapidly developing thrombocytopenia and defective clotting mechanism; 100 r dose is followed by brief thrombocytosis then transient mild thrombocytopenia. Combined effects of thermal burns and total-body x rays; brief initial fall in platelets (seen in burns alone) followed by same degree of thrombocytopenia seen in rats receiving exposure at particular dose given. Clotting defect is not so severe in

combined injury animals as in irradiated animals.

THE EFFECT OF RADIATION WITH HIGH DOSES OF
X-RAYS ON THE CONNECTIVE BASOPHILE GRANULOUS
CELLS. Massimiliano Campani. Translated from Boll.
soc. med. chir. Modena 48, 3-8(1948). 3p. (AEC-tr-1745).

Intense whole-body x irradiation increased liberation
of metachromatic granules from connective basophile
granulous cells in skin of mice and caused their diffusion
into the surrounding tissues. NSA 8-713

5829

THE EFFECT OF LOW AND HIGH X-RAY DOSAGE ON
THE ASCORBIC ACID CONTENT OF THE SUPRARENAL.
A. Hochman and L. Bloch-Frankenthal. Brit. J. Radiol.
26, 599-600(1953).

Low and high doses of total-body x irradiation exerted
equal effect on ascorbic acid content of rat adrenals.
(Ascorbic acid content is decreased after total body x
irradiation.) Therapeutic effect of x rays on some ailments
is discussed. NSA 8-714

5830

A STUDY OF THE PHASES OF RADIATION RESPONSE IN
THE RAT. II. THE EFFECTS OF NON-UNIFORM IRRADI-
ATION. L. F. Lamerton, L. A. Elson, and E. B. Harriss.
Brit. J. Radiol. 26, 568-76(1953).

Acute phase of irradiation response was much more
marked under conditions of uniform whole body irradiation
than with partial body irradiation. Preliminary investigations
on nature of radiation-induced anemia, using radioactive
Fe, are described. Studies utilized young rats to evaluate
"initial reaction" (change in growth rate and blood picture in
first few days post-exposure) and "acute reaction"
beginning about 10 days postexposure. NSA 8-715

5831

RADIATION HAZARDS FROM THE USE OF DENTAL X-RAY
UNITS. W. E. Nolan and H. W. Patterson. Radiology 61,

ON THE STIMULATION OF PLANT BUDS BY X-RAYS.
P. Reiss. Compt. rend. soc. biol. 92, 984-6(1925).
(In French).

5838

Hanford Works
INHIBITION OF GROWTH OF *CHLORELLA PYRENOIDOSA*
BY BETA-EMITTING RADIOISOTOPES. J. W. Poner and
H. J. Knauss. Oct. 19, 1953. 17p. Contract W-31-109-
eng-52. (HW-29666).

C. pyrenoidosa cells were grown for 3 days in presence
of several levels of H₂O, P³², Sr⁹⁰-Y⁹⁰, and S³⁵ and then
subcultured for 3 days in nonradioactive inorganic nutrient
solution. Growth rates decreased in proportion to radiation
dose above levels of 1000 rep/day. Reduced rate continued
in subculture. Increase in average cell size occurred
during growth of algae in radioactive solutions. NSA 8-975

5839

Atomic Bomb Casualty Commission
THE GROWTH AND DEVELOPMENT PROGRAM OF THE
ATOMIC BOMB CASUALTY COMMISSION. ANALYSIS OF
OBSERVATIONS ON MATURATION, BODY BUILD AND
POSTURE TAKEN IN 1951 ON 4,800 HIROSHIMA CHILDREN.
Earle L. Reynolds. Oct. 30, 1952. 69p. (NYO-4459).
NSA 8-976

5840

Rochester, Univ., N. Y. Atomic Energy Project
SEVERE NEUROLOGICAL DYSFUNCTION IN A FASTING
DOG FOLLOWING 550 r EXPOSURE TO 250 Kvp X-RAYS
IN: QUARTERLY TECHNICAL REPORT [FOR] JULY
1 THRU SEPTEMBER 30, 1953. Nov. 10, 1953. 47p.
Contract W-7401-eng-49. (UR-290).

Severe neurological dysfunction and multiple subarachnoid
hemorrhages were observed in a dog following total body
exposure to 550 r of x rays. NSA 8-977

5841

VERTEBRATE RADIOBIOLOGY; EMBRYOLOGY.
Roberts Rugh. Ann. Rev. Nuclear Sci. 3, 271-302(1953).

Results of the better controlled experiments of the
last several years concerning radiation effects on embryos
are summarized. Most deal with highly penetrating x or

γ rays. Author also considers factors affecting the gamete. NSA 8-978

5842

VERTEBRATE RADIOBIOLOGY: HISTOPATHOLOGY AND CARCINOGENESIS. J. Furth and A. C. Upton. Ann. Rev. Nuclear Sci. 3, 303-38(1953).

Survey of recent literature disclose trend to correlate radiation sensitivity with nucleic acid synthesis and enzyme activity. Authors emphasize the marked difference between neoplasms due to local action and those dependent to some extent on an indirect mechanism. All species appear to be susceptible to former. Includes 204 references. NSA 8-979

5843

CELLULAR RADIOBIOLOGY. Arnold H. Sparrow and Frederick Forro, Jr. Ann. Rev. Nuclear Sci. 3, 339-68 (1953).

Authors review research designed to determine complete picture of radiation effects on cells. Includes 279 references. NSA 8-980

5844

PRACTICAL ASPECTS OF RADIATION INJURY. Louis H. Hempelmann and Joseph G. Hoffman. Ann. Rev. Nuclear Sci. 3, 369-32(1953).

Authors describe: acute radiation injury in man; possible therapy suggested by current animal experimentation; late tissue reactions which arise at various dosage levels. NSA 8-981

5845

SOME OBSERVATIONS ON THE RELATION BETWEEN DOSE MEASURES AND BLOOD CHANGES. Matts Helde and T. Wahlberg. Acta Radiol. 40, 435-42(1953).

Relationship between frequency of blood picture changes of certain types and irradiation received during various periods of time in occupational exposure was investigated. Relationship between effect and dose per short periods shows considerably better correlation than does effect with dosage per week. NSA 8-982

5846

HISTOLOGIC LESIONS IN THE THYROID GLANDS OF PATIENTS RECEIVING RADIOIODINE FOR HYPERTHYROIDISM. Morris E. Dailey, Stuart Lindsay, and Earl R. Miller. J. Clin. Endocrinol. and Metabolism 13, 1513-29(1953).

Authors describe variety of lesions observed upon histologic examination of thyroid glands from 23 patients who had received ^{131}I for diagnosis or treatment of hyperthyroidism. Pathogenesis of lesions is discussed. NSA 8-983

5847

LACK OF PROTECTIVE EFFECT OF ALLYL THIOUREA AGAINST X-IRRADIATION. Robert N. Feinstein and Gladys J. Cotter. Science 118, 552(1953).

Authors describe their experiments in which allyl thiourea had no protective effect whatsoever. NSA 8-984

5848

THE EFFECT OF EXPOSURE TO THE ATOMIC BOMBS ON PREGNANCY TERMINATION IN HIROSHIMA AND NAGASAKI: PRELIMINARY REPORT. J. V. Neel, W. J. Schull, D. J. McDonald, N. E. Morton, M. Kodani, K. Takeshima, R. G. Anderson, J. Wood, R. Brewer, S. Wright, J. Yamazaki, M. Suzuki, and S. Kitamura. Science 118, 537-41(1953).

Data collected over 7 yr period are analyzed. NSA 8-985

5849

STUDIES OF THORIUM X APPLIED TO HUMAN SKIN. III. THE RELATIVE EFFECTS OF ALPHA AND BETA-GAMMA IRRADIATION IN THE PRODUCTION OF ERYTHEMA. Victor H. Witten, Earle W. Brauer, Vera

Holmstrom, and Robert Loevinger. J. Invest. Dermatol. 21, 249-57(1953).

Relative biologic effectiveness of α component was found to be many times greater than that of the β - γ component as judged by degree of erythema and pigmentation produced. NSA 8-986

5850

PREVENTIVE AND THERAPEUTIC EFFECTS OF CERTAIN CHEMICAL SUBSTANCES AGAINST RADIATION. Andre Herne. Bruxellas-med. 33, 2267-77(1953). (In French).

Efficacies of several substances in reducing physical and chemical effects of radiation are reviewed. It is concluded that cysteine-amine offers most protection and is least toxic. Includes 23 references. NSA 8-989

5851

Radiation Lab., Univ. of Calif., Berkeley
CHEMISTRY DIVISION QUARTERLY REPORT, JUNE, JULY, AUGUST, 1953. Sept. 30, 1953. Contract W-7405-eng-48. 96p. (UCRL-2355).

Includes a report on effect of x irradiation of mice on liver concentration of a number of coenzymes. NSA 8-1002

5852

EFFECTS OF IRRADIATION BY X-RAY UPON ANAEROBIC GLYCOLYSIS IN SPLEEN HOMOGENATES. Jean Hickman and Gilbert Ashwell. J. Biol. Chem. 205, 651-9(1953).

Glycolytic enzymes in spleen homogenates prepared from spleens of mice exposed to a lethal dose of radiation were studied. Effects were as follows: (1) Triosephosphate dehydrogenase was unaffected (2) phosphorylation coupled to oxidation of triosephosphate was decreased (3) glycolysis proceeding from hexosediphosphate to lactic acid was decreased (4) adenylic acid which disappeared was completely accounted for as the sum of adenosine, hypoxanthine and hypoxanthine riboside (author). NSA 8-1045

5853

Brookhaven National Lab.
QUARTERLY PROGRESS REPORT [FOR] JULY 1 - SEPTEMBER 30, 1953. (Unclassified section). 57p. (BNL-259).

Reports studies on: induced resistance to stem rust in oats by thermal neutron irradiation of seed; γ ray effects on keeping qualities of potatoes; and tumor induction in radiothyroidectomized mice by x irradiation of whole body or of head. NSA 8-1276

5854

Air Force Radiation Lab., Univ of Chicago
[PHYSIOLOGICAL EFFECTS OF RADIATION]. p.1-70 of QUARTERLY PROGRESS REPORT NO. 9. Oct. 15, 1953. 131p. Contract AF-33(038)-27353. (NP-4961(p. 1-70)).

Reports studies on: protective effects of cysteine and/or p-amino-propiophenone on radioinduced increase in adenosine triphosphatase activity of rat spleen and thymus, effects of 10,000 and 30,000 r on increasing 5-nucleotidase activity of mouse tissues; effect of caffeinedexedrine, and benzedrine on postirradiation weight loss and survival of rats; metabolic activity of irradiated rat tissue slices; x ray effect on mouse tissue cholinesterase activity. NSA 8-1283

5855

Air Force Radiation Lab., Univ. of Chicago
[RADIATION EFFECTS]. p. 71-120 of QUARTERLY PROGRESS REPORT NO. 9. Oct. 15, 1953. 131p. Contract AF33-038-27353. (NP-4961(p. 71-120)).

Includes reports on: protective effects of various anesthetic agents (thiopental sodium, cyclopropane, p-aminopropiophenone, catalase, and mixtures of O_2 , H_2 , He, and N_2) on radiation mortality in mice, rats, and amoeba; effects of x rays on amount of acetone and

ammonia in expired air of rabbits; effect of whole-body x rays on adenylic acid levels in rat spleen. NSA 8-1284

5856

THE INITIATION AND DEVELOPMENT OF CELLULAR DAMAGE BY IONIZING RADIATIONS. L. H. Gray. Brit. J. Radiol. 26, 609-18(1953).

Author reviews modern concepts of this subject.

Influence of primary localization of ionizing particles and influence of radioinduced chemical changes on biological damage are discussed. NSA 8-1286

5857

EFFECT OF WHOLE BODY X-IRRADIATION ON ASCORBIC ACID OF RAT TISSUES. H. L. Oster, A. L. Kretchmar, and F. H. Bethell. Proc. Soc. Exptl. Biol. Med. 84, 470-3(1953).

While mid-lethal whole-body x rays may directly reduce tissue ascorbic acid of Long-Evans strain rats, animals of Wistar strain exhibited a tendency toward an increase (except for adrenals). X ray effects are attributed to activation of the pituitary. NSA 8-1287

5858

REPRODUCIBILITY OF X-RAY SURVIVAL CURVES FOR YEAST CELLS. Thomas H. Wood. Proc. Soc. Exptl. Biol. Med. 84, 446-52(1953).

Accurate and reproducible x ray survival curves were obtained for both haploid and diploid yeast under carefully controlled conditions. NSA 8-1288

5859

INFLUENCE OF HIBERNATION ON SURVIVAL TIME AND WEIGHT LOSS OF X-IRRADIATION GROUND SQUIRRELS. John Doull and Kenneth P. DuBois. Proc. Soc. Exptl. Biol. Med. 84, 367-70(1953).

While hibernation markedly increased survival time in *Citellus tridecemlineatus* following lethal x ray doses, it did not alter ultimate mortality. NSA 8-1289

5860

ROENTGEN PARALYSIS IN THE MOUSE. V. V. Brunst. Am. J. Roentgenol. Radium Therapy Nuclear Med. 71, 131-8(1954).

Mice 1, 2, 3, 4, 5, 6, 10, 15, 20, and 25 days old were x irradiated with 3400 and 5000 r midway between fore and hind limbs through localizer slit 4 mm wide. Results indicate that a change in x ray sensitivity of spinal cord occurs approximately 4-5 days after birth. NSA 8-1290

5861

INFLUENCE OF WHOLE BODY X-IRRADIATION, COLD EXPOSURE AND EXPERIMENTAL ACIDOSIS ON PROTEIN COMPOSITION AND AZORUBIN BINDING CAPACITY OF RAT SERUM. Ulrich Westphal, Stanley G. Priest, John F. Stets, and George L. Selden. Am. J. Physiol. 175, 424-8(1953).

Total protein and albumin were significantly reduced in rat serum 2 and 3 days post irradiation, α and β globulin increased, γ globulin decreased. No effect on azorubin-binding capacity was noted. NSA 8-1291

5862

THE CONCENTRATION OF OXYGEN DIFFUSED IN TISSUES AT THE TIME OF IRRADIATION AS A FACTOR IN RADIOTHERAPY. L. H. Gray, A. D. Conger, M. Ebert, S. Hornsey, and O. C. A. Scott. Brit. J. Radiol. 26, 638-48(1953).

X ray sensitivity of tumor cells increased in well-oxygenated medium, sensitivity to fast neutrons was affected only slightly. Influence of O tension on x ray effects on cells in tissue culture was studied. NSA 8-1292

5863

BRAIN AND LIVER PHOSPHORUS METABOLISM IN THE ACUTE IRRADIATION SYNDROME. Warner H. Florsheim and M. E. Morton. Am. J. Physiol. 176, 15-19(1954).

Incorporation of peripherally administered tracer phosphate into brain tissue was not changed by x irradiation (20,000 r). Phosphorylative efficiency of liver slices irradiated *in vitro* likewise was unchanged. Clinical and histological irradiation changes are not attributable to changes in levels of blood glucose or brain cholinesterase. NSA 8-1293

5864

EFFECTS OF PLOIDY AND LINEAR ENERGY TRANSFER ON RADIOBIOLOGICAL SURVIVAL CURVES. Raymond E. Zirkel and Cornelius A. Tobias. Arch. Biochem. and Biophys. 47, 282-306(1953).

Radiobiological influence of linear energy transfer was investigated with respect to inhibition of cell division in a diploid strain of yeast, a haploid strain of yeast derived from the diploid, and a unicellular green algae. NSA 8-1294

5865

A STUDY ON THE PROTECTIVE ACTION OF 2,3-DIMERCAPTOPROPANOL (BAL) ON RADIATION-INDUCED CHANGES IN THE OVARIAN FOLLICLES IN MICE. Erik Odeblad. Acta Radiol. 40, 493-9(1953).

Mice were given P^{32} (5 μ c/g) or total-body dose of 400-600 r of x rays; some mice were treated with BAL. Histological studies of ovaries obtained by sacrificing animals 4 or 6 days postexposure revealed significant radiation protection afforded by BAL in P^{32} treated mice only, no protection in x rayed mice. NSA 8-1295

5866

CITROVORUM AND IRRADIATION INJURY. Dorothy J. Buchanan, William N. Pearson, Chandra Amarasingham, Granville W. Hudson, and William J. Darby. Am. J. Physiol. 175, 437-9(1953).

Citrovorum factor (1 mg/day) injected intraperitoneally prior to and following whole-body irradiation failed to alter clinical course or leucopenia and subsequent leucopoiesis in female albino rats. NSA 8-1296

5867

TIME AS A FACTOR IN POSTIRRADIATION PROTECTION BY PARABIOSIS. R. T. Binhammer, M. Schneider, and J. C. Finerty. Am. J. Physiol. 175, 440-2(1953).

Significant number of irradiated animals without postirradiation treatment for as long as 4 days escaped seemingly inevitable radiation death when paired (parabiosis) with nonirradiated partners. Critical period for postirradiation protection by parabiosis lies between 6th and 10th post-irradiation days. NSA 8-1297

5868

TRANSPORT OF RADIUM SULFATE FROM THE LUNG AND ITS ELIMINATION FROM THE HUMAN BODY FOLLOWING SINGLE ACCIDENTAL EXPOSURES. L. D. Marinelli, W. P. Norris, P. F. Gustafson, and T. W. Speckman. Radiology 61, 903-15(1953).

Authors present data on 6 persons accidentally exposed to $RaSO_4$ dust and studied for one year. Excretion of Ra was found to differ from observations made in cases of chronic Ra poisoning in man. Significance of observations is discussed. NSA 8-1299

5869

[UTILIZATION OF FISSION PRODUCTS] THE EFFECTS OF GAMMA RADIATION ON SOME PHARMACEUTICAL PRODUCTS. J. Controulis, C. A. Lawrence, and L. E. Brownell. Parke, Davis and Co.; Phoenix Project Univ. of Mich. and Fission Products Lab., Engineering Research Inst., Univ. of Mich. [1953]. 13p. (AECU-2711).

Authors report effects of γ rays on: B. subtilis, Ca gluconate, ascorbic acid, pituitary gland fraction, estrone, diphtheria-tetanus-pertussis antitoxin-antiserum,

penicillin, streptomycin, aureomycin, chloromycetin, and terramycin. Complete sterility was obtained in samples contaminated with *B. subtilis* at end of 24-hr exposure to 2.04×10^6 rep γ radiation as measured in air. NSA 8-30

5870

ENZYMATIC ADAPTATION IN NON-VIABLE CELLS.

S. Spiegelman, L. S. Baron, and H. Quastler. Federation Proc. 10(1), 130-1(1951).

Viability and adaptability in *Saccharomyces cerevisiae* Strain K could not be separated by cell destruction methods. Ultraviolet and N-mustard treatment gave an indication that non-viable cells could adapt. Doses of x rays, while resulting in 99.9% loss in viable cells, did not decrease capacity to adapt to either galactose or maltose

5878

NEW INTERPRETATIONS OF SOME PROBLEMS CONCERNING ABNORMAL MITOSES. H. Marquardt. Naturwissenschaften 37, 416-424, 433-438(1950).

The possible types of injury to the nucleus and methods of analysing chromosome breaks are described. A survey is given of previous research and the theory relating to the cause of breaks. (from abstract). PBA 21-813

5879

THE ROLE OF CONNECTIVE TISSUES IN THE RADIATION OF TUMORS. B. Jolles. Brit. Cancer 4, 77-89(1950).

Analysis of radiation reaction in 18 cases of accessible tumors treated by sieve-chessboard method reveals that rate and degree of indirect radiation reaction depends on histological organization of stroma and on the dose. The sieve, in effect, protects connective tissue which, it is felt, acts as a local defense system against the tumor. BA 25-27897

5880

EFFECTS OF RADON RADIATION UPON MOUSE TUMORS. M. Spiegel-Adolf and R. Robbins. Federation Proc. 10(1), 250-1(1951).

An abstract. BA 25-27921

5881

AN ATTEMPT AT ELIMINATING INJECTED THOROTRAST FROM RABBITS BY 2,3-DIMERCAPTOPROPANOL (BAL). B. E. W. Nordenstrom-Blomquist. Acta Radiol. 34(6), 533-45(1950).

Author describes unsuccessful attempt to effect excretion of intravenous thorotrast in rabbits by 2,3-dimercaptopropanol (BAL). BA 25-27950

5882

EFFECT OF X-RADIATION ON FERMENTATION OF GLUCOSE BY LOW AND HIGH NITROGEN YEAST. F. G. Sherman. Federation Proc. 10(1), 125(1951).

An abstract. BA 25-28555

5883

THE ACTION OF X-RAYS ON CELLS IN ACTIVE NUCLEIC ACID METABOLISM. M. de Nicola. Pubbl. staz. zool. Napoli 22, 283-93(1950). (In Italian).

In testis of *Asellus* irradiated with doses of 250 r to 5000 r, mitosis and meiosis are arrested and germinal epithelium degenerates. Spermatogonia lose capacity to divide and DNA is slowly converted into RNA which is lost from cell which then dies. Author suggests x rays act specifically upon DNA. BA 25-29924

ANEMIA AND ERYTHROPOIESIS IN THE IRRADIATED RAT: AN EXPERIMENTAL STUDY WITH PARTICULAR REFERENCE TO TECHNIQUES INVOLVING RADIOACTIVE IRON. C. F. Baxter, E. H. Belcher, E. B. Harriss and L. F. Lamerton. Brit. J. Haematol. 1, 86-103(1955).

5887

EFFECTS OF A SINGLE WHOLE-BODY EXPOSURE TO THE DEUTERON BEAM ON THE BLOOD AND TISSUES OF THE WHITE MOUSE. Paul D. Rosahn, Cornelius A. Tobias, and John H. Lawrence. Federation Proc. 10, 369(1951).

An abstract. BA 25-30109

5888

THE RESPONSE OF MICE TO INOCULATION WITH CERTAIN AVIRULENT BACTERIA AFTER EXPOSURE TO SUBLETHAL TOTAL BODY X-IRRADIATION. I. L. Shechmeister and V. P. Bond. Federation Proc. 10(1), 418(1951).

An abstract. BA 25-30111

5889

EFFECT OF ACUTE WHOLE BODY X-IRRADIATION UPON WATER AND ELECTROLYTE BALANCE. Robert J. Soberman, Richard P. Keating, and Roy D. Maxwell. Am. J. Physiol. 164(2), 450-6(1951).

Simultaneous measurements of total body water, extra-cellular space, Na space, whole blood, red cell and plasma volume, and plasma electrolytes were carried out repeatedly in adult female dogs following 450-500 r whole-body x irradiation. Except for an increase in plasma volume and a decrease in red-cell volume, no consistent changes were noted in any of the determinations. BA 25-30112

5890

BIOLOGY OF ASCITIC CARCINOMA OF MICE. III. THE EFFECTS OF FAST ELECTRONS AND X-RAYS ON ASCITIC CARCINOMA CELLS. W. Homann and Dieter Hofmann. *Strahlentherapie* 83(2), 291-300(1950). (In German).

Irradiation of ascites cells with fast electrons and x rays influences cell number and morphology. Damage after fast electron irradiation is very specific in nuclei (vacuolization and polymorphism), while cytoplasm shows only minor changes. X ray effects are more massive but less widely distributed (affect fewer cells than do fast electrons). BA 25-30988

5891

THE DIAGNOSIS, PROGNOSIS AND TREATMENT OF RADIATION INJURIES PRODUCED BY ATOMIC BOMBS.

E. P. Cronkite. *Radiology* 56(5), 661-9(1951).

Author reviews animal experimental data concerning effects of lethal total body irradiation with x rays on mice, dogs, and goats with special consideration of changes produced in the blood BA 25-32855

5892

INJURY FROM ATOMIC BOMBS. E. DeCoursey. *Radiology* 56(3), 645-52(1951).

Author presents a brief review of forces of atomic bomb and describes pathologic effects and clinical symptoms produced in man. BA 25-32856

5893

THE QUESTION OF GENETIC INJURY FOLLOWING X-RAY IRRADIATION OF THE OVARIES IN THE TREATMENT OF STERILITY. Ira J. Kaplan. *J. Obstet. Gynaecol. Brit. Empire* 57, 767-79(1950). BA 25-32858

5894

REPORT OF "SYMPOSIUM ON RADIATION CHEMISTRY." F. H. Krenz. *Nucleonics* 7(4), 67-70(1950).

Participants all agreed that there were chemical effects on solutes in irradiated solutions which were due to free radicals and H_2O_2 formed from the solvent. "Target area" of an organism or cell structure, therefore, is larger than the particular physical or chemical structure actually damaged. BA 25-32859

5895

THE EFFECT OF X-IRRADIATION ON RATS WITH AND WITHOUT BARTONELLA MURIS. Paul E. Rekers. *J. Infectious Diseases* 88(3), 224-9(1951).

Rats free of a common laboratory infection, such as B. muris, showed a mortality rate of 90% when exposed to single dose, total body x irradiation. When these rats had become infected with B. muris for 10 days or longer and then irradiated, there was not only prolongation of the survival period but a reduction in the mortality rate to 50%. Infection apparently increased their tolerance to x irradiation. BA 25-32861

5896

PROTECTION AGAINST RADIATION HAZARDS. Shields Warren and Austin M. Brues. *Nucleonics* 7(4), 70-6(1950).

Authors present a general review of principles serving as basis for present ideas of radiation safety with special references to peculiarities arising from radioactive isotopes in the body. BA 25-32870

5897

EFFECTS OF VIRUSES ON THE RADIOSENSITIVITY OF

GRAFTED TUMORS OF ALBINO MICE. Edoardo Gallico. *Bull. soc. vaudoise sci. nat.* 63(267), 269-96(1946).

Three groups of mice with adenocarcinomas grafted on mammary tissues received: (1) anti-variola vaccine injection into tumorous tissue; (2) x-ray therapy up to 7000 r; (3) both treatments. After 1 month, controls had tumor volume of 4950 cc; those given vaccine 1950 cc; and those irradiated, 700 cc. Vaccine was destroyed in tumors by x rays. In another study, vaccine given after each x-irradiation caused regression of tumors to 190 cc. BA 25-33740

5898

SENSITIVITY OF SOME BACTERIA TO SOFT ROENTGEN RADIATIONS (PLESIOROENTGEN). C. Gastaldi and E. Caffaratti. *Giorn. batteriol. e immunol.* 41(4), 218-27(1949).

Several bacterial species were exposed to soft x rays. Gram-negative bacteria were more sensitive to such radiation than gram-positive bacteria, spore-forming bacteria were most resistant. BA 25-34145

5899

SVALOF PRIMEX WHITE MUSTARD. G. Andersson. *Sveriges Utoadesforen. Tidskr.* 60(2), 234-6(1950).

This new variety selected from x-rayed material of common commercial seed, gives 4% higher seed yield and 6% higher oil yield. Whether improved characters are due to induced mutations or are based upon normal recombinations of genes within mother strain is unknown. A light yellowing of petals with a more reddish-brown tinge is ascribed to an x-ray effect on the mother line. BA 25-34524

5900

CONTINUOUS GAMMA RADIATION SUPPRESSES CROWN-GALL FORMATION IN TOMATOES. A. E. Dimond. *Phytopathology* 41(1), 10-11(1950).

Galls did not develop when inoculated plants received 30,000 r of gamma radiation at 80 r/hr. BA 25-34919

5901

BIKINI REPORT. Neal O. Hines. *Sci. Monthly* 72(2), 102-13(1951).

Bikini Atoll continues to show higher rate of radiation than was expected in view of fact that ocean water is constantly changing. It is believed that plants absorb and concentrate certain radioactive materials and that predators eating plants may increase concentration. BA 25-35701

5902

THE ACTIVITY OF ENZYMES EXTRACTED FROM YEAST CELLS EXPOSED TO RADIATION FROM RADON. K. D. Stewart and J. G. Aldous. *Proc. Nova Scotian Inst. Sci.* 22(4), 62(1950).

An abstract. BA 25-35812

5903

STUDIES ON RADIATION INJURY. Leon O. Jacobson. *Proc. Inst. Med. Chicago* 18(14), 326(1951).

Survival of adult mice exposed to whole-body x ray doses of 550 r or greater is enhanced if the spleen is exteriorized and shielded with lead during irradiation. BA 25-35835

5904

PROTECTION FROM X-RAY INDUCED INJURY BY HYDRATION. R. S. Caldecott. *Genetics* 40, 565(1955).

In experiments in which inhibition of seedling growth and frequency of chromosome aberrations were used as criteria of x ray effects, it was found that the effects decreased as H_2O content of the plant embryo increased from about 4% to 8%. Further hydration did not affect radiosensitivity further if embryo was kept in cold environment during irradiation.

5905

HYALURONIDASE ACTION IN NORMAL AND IN ROENTGEN-IRRADIATED RABBIT SKIN. Ray O. Noojin and Hugh B. Praytor. Arch. Dermatol. and Syphilol. 63(2), 191-9 (1951).

Irradiation of rabbits with x ray doses up to lethal dosages did not appear to alter appreciably the spreading effect of hyaluronidase injected into the skin of the irradiated animal. Administration of 1600 r at one time produced an immediate leukopenia and fall in hematocrit, and death of 3 of 6 animals within 3 weeks. BA 25-35838

5906

EFFECT OF X-IRRADIATION ON THE HYALURONIDASE-HYALURONIC ACID SYSTEM. Melvin D. Schoenberg, Robert E. Brooks, John J. Hall, and Herman Schneiderman. Arch. Biochem. 30(2), 333-40(1951).

X irradiation (9000 r) causes reduction in viscosity of vitreous humor and umbilical cord hyaluronate solutions and a continuing loss in viscosity after cessation of irradiation. Exposed solutions of hyaluronidase showed a marked decrease in enzymatic activity. BA 25-35842

5907

INDUCTION OF CATARACTS IN MICE BY SLOW NEUTRONS AND X-RAYS. K. W. Christenberry and J. Furth. Proc. Soc. Exptl. Biol. Med. 77(3), 559-60(1951).

An LD₅₀ dose of slow neutrons, was at least twice as effective in inducing cataracts as an LD₅₀ of x rays. (Total body x irradiation in dose as low as 32 r caused slight increase in percentage of mice developing lenticular opacities.) BA 25-36443

5908

X-RAY STIMULATION OF THE CICATRIZATION OF EXPERIMENTAL SKIN INJURIES IN RABBITS. M. Lupo and G. Pisanì. Ricerca sci. 21(6), 956-9(1951). (In Italian).

Two identical and symmetrical incisions were made in abdomens of rabbits. One wound was treated with x rays filtered through 6 cm layers of 20% agar in contact with wound; other wound (control) was lead shielded. Irradiated wound was stimulated in cicatrization, especially between 5th and 10th day postirradiation. BA 25-36814

5909

THE EFFECTS OF RIBONUCLEOTIDES ON MITOSIS IN THE GERMINAL EPITHELIUM OF IMMATURE RAT OVARIES CULTURED IN VITRO. James H. Berrian and Ernst J. Dornfeld. J. Exptl. Zool. 115(3), 513-20(1950).

Authors refer to experiments in which x and gamma irradiated tissue with blocked mitoses exhibited; cytoplasmic increases in ribonucleic acid derivatives and production of diffusible substances capable of spreading the effect. It is suggested that nucleotides may be the causal agents in radiation effects, since addition of nucleotides to cultures of rat ovaries produced effects on mitosis like those seen after irradiation. BA 25-36828

5910

ON THE EXPERIMENTAL PRODUCTION OF CASTRATION, STERILIZATION, AND INTERSEXUALITY AT AN EARLY STAGE OF DEVELOPMENT IN BIRDS BY LOCALIZED X-RADIATION. Etienne Wolf. Commun. 3^e, journees cyto-embryol. belgo-neerland 1949, 41-5(1949).

Author describes effects of x ray doses of 300-500 r on duck and chick embryos. He also studied effect of total-body irradiation with 300 r followed by localized radiation with 1100 r after 24 hours. BA 25-36928

5911

EVALUATION OF RADIOLOGICAL HAZARDS AND THERAPY OF RADIATION ILLNESS. C. F. Behrens. Radiology 56(5), 675-81(1951).

Author reviews radiologic hazards from point of view of military medicine and civilian defense, including

discussion of moral factors, calculated risk, and short discussion of therapeutic agents suggested for treatment of radiation illness. BA 25-37244

5912

Technical Information Service, AEC
UNCLASSIFIED BIBLIOGRAPHIES OF INTEREST TO THE ATOMIC ENERGY PROGRAM. Paul E. Postell, and Hugh E. Voress, comps. Oct. 2, 1953. 60p. (TID-3043).

This compilation contains annotated references to bibliographies prepared by the AEC project and to some from commercial, scientific, and other government organizations. The bibliographies are arranged by subject, and multiple listings are made for those which cover more than one subject. A table of contents lists the subjects covered. An author index is included. NSA 8-1

5913

Atomic Energy Commission
THE RESEARCH PROGRAM OF THE ATOMIC ENERGY COMMISSION BIOLOGY BRANCH. N. Edward Tolbert. p.31-40 of Conference on the Use of Isotopes in Plant and Animal Research. Apr. 1953. 10p. (TID-5098(p. 31-40)). NSA 8-2

5914

School of Aviation Medicine
THE EFFECT OF STRESS ON THE METABOLISM OF ASCORBIC ACID. PART II. INCREASED EXCRETION OF DEHYDROASCORBIC AND DIKETOGULONIC ACIDS BY RATS AFTER X-RAY IRRADIATION. Mary Mills Monier and Roslyn J. Weiss. Sept. 1953. 12p. (NP-4911, Report 2).

Following exposure of adult albino rats to 800 r single-dose total-body x irradiation, urinary excretion of DHA increased 150%, DKA excretion increased 230%. Increase in excretion of oxidized AsA in urine may be a general response to stress. NSA 8-4

5915

Ohio Agricultural Experiment Station
THE PHYSIOLOGY AND GENETICS OF PLANT PATHOGENIC MICROORGANISMS WHEN GROWN IN THE PRESENCE OF VARIOUS RADIOISOTOPES. T. Kommedahl, R. S. Davidson, Nancy J. Hockman, S. B. Hughes, and C. Kuehner. [June 1953] 16p. (AECU-2705).

Authors summarize data: on germination of spores in fungi grown on media containing P³², variants found after exposure to P³² in growth media, effects of Cs¹³⁴, P³², Sc⁴⁶, Co⁶⁰, or Ti²³⁴ on growth, biochemical effects of radiation on fungi, radiation effects on pathogenicity of fungi. NSA 8-28

5916

THE EFFECT OF WHOLE BODY X-IRRADIATION ON THE SUSCEPTIBILITY OF MICE TO BACTERIAL AEROSOLS. I. L. Shechmeister and V. P. Bond. Bacteriol. Proc. 1950, 103(1950).

An abstract. BA 24-35315

5917

EXERCISE FOLLOWING WHOLE-BODY (X-) IRRADIATION OF MICE. Falconer Smith and Willie W. Smith. Federation Proc. 9(1), 117(1950).

Exercise did not increase mortality or survival time nor did x radiation decrease ability to tolerate exercise. BA 24-35316

5918

RADIOACTIVE WASTE DISPOSAL. HOW WILL IT AFFECT MAN'S ECONOMY? Kenneth G. Scott. Nucleonics 6(1), 18-25(1950). BA 24-35320

5919

THE USE OF RADON SEEDS TO PRODUCE DEEP CEREBRAL LESIONS. S. N. Stein and E. W. Peterson. Proc. Soc. Exptl. Biol. Med. 74(3), 583-5(1950).

Radon seeds were precisely placed, by means of a stereotaxic instrument, through single small hole of entry,

in deaths of brain in monkeys. They produced large lesions associated with little shock. It is suggested that the method may be applicable for human neurosurgery. BA 24-36326

5920

INFLUENCE OF X-RAYS ON SEXUALITY AND THE FORMATION OF MUTANTS IN LESSER FUNGI. G. A. Nadson and G. S. Philippon. *Compt. rend. soc. biol* 93, 473-5(1925). (In French).

5921

THE EFFECT OF X-RAY IRRADIATION ON THE DEVELOPMENT OF THE MANDIBULAR JOINT OF THE MOUSE. M. S. Burstone. *J. Dental Research* 29(3), 358-63(1950).

Immature mice were x irradiated in area of mandibular condyle using contact x ray machine, diameter of irradiated field 5-7 mm, doses of 1500, 3000, and 5000. Characteristic radiation changes in condyle were reduction or cessation of osteoblastic activity, marrow aplasia, and subsequent fibrosis of the marrow. Ten days postirradiation, osteoblastic activity is slowly restored. Late changes are also described. BA 24-36351

5922

THE RELATION OF GROWTH PATTERNS IN RADIOACTIVE MEDIA TO THE MECHANISM OF GENETIC CHANGE IN *ESCHERICHIA COLI*. B. A. Rubin and P. Steinglass. *Bacteriol. Proc.* 1950, 51(1950). Abstract. BA 24-36691

5923

THE EFFECT OF THE IONTOPHORESIS OF ANTIHISTAMINES ON ULTRAVIOLET AND GRENZ RAY ERYTHEMA. F. Kalz and C. Bower. *Dermatologica* 101(1), 20-32(1950).

Influence of Neo-antergan and Pyribenzamine on erythema produced by Grenz rays was quite irregular. BA 24-36793

5924

THE INCIDENCE OF PENICILLIN-SENSITIVE VARIANT COLONIES IN PENICILLINASE-PRODUCING STRAINS OF *STAPHYLOCOCCUS PYOGENES*. Mary Barber. *J. Gen. Microbiol.* 3(2), 274-81(1949).

Attempts to increase rate of penicillin-sensitive colony formation with x rays and by growing them in presence of other organisms was unsuccessful. BA 24-36816

5925

INGESTION OF COLLOIDAL THORIUM DIOXIDE BY REPRESENTATIVE MINNOWS FROM THE CHICAGO REGION. Peter Frank and W. C. Allee. *Physiol. Zool.* 23(2), 134-9(1950).

Roentgenograms demonstrated that all of the several families of fresh water fishes tested engulf thorium dioxide during an exposure of 24 hr or less. Swallowing water that contained the suspension is most plausible explanation of method of intake. BA 24-38266

5926

STRUCTURE OF THE INCOMPATIBILITY GENE. II. INDUCED MUTATION RATE. D. Lewis. *Heredity* 3(3), 339-55(1949).

An abstract. BA 24-11299

5927

STUDIES ON THE RANJAN X-RAY MUTANT WHEATS. I. GENETICAL ANALYSIS OF THE ELEVEN VARIANTS. S. Ranjan. *Proc. Natl. Acad. Sci. India* 16B(5/6), 287-92(1946).

Of the 11 mutants studied, 8 bred true while 3 mutants broke (in reference to awn) and continued breaking from 3 to several generations. X ray treatment was felt to have produced modifications of molecular constitution of some genes. Such modifications led to newly adjusted states in a single generation in some mutants but in other strains continued to break, even in 7th generation. BA 24-11315

5928

COMPARATIVE LETHAL AND MUTAGENIC EFFECTS OF IONIZING RADIATIONS ON *ASPERGILLUS TERREUS*.

George E. Stapleton and F. L. Martin. *Am. J. Botan.* 36(10), 816(1949). BA 24-11325

5929

GROWTH OF KELOID AND CONSTITUTION. M. Hirao. *J. Constitutional Med.* 14(4/6), 96-103(1949).

Somatometry on 61 individuals suffering from keloid growth, as a mass-disease under special condition in a certain district (atomic bomb disease in Hiroshima) is reported. No correlation between growth of keloid and body-build was observed. BA 24-11360

5930

NITROGEN EXCRETION IN URINE AFTER ROENTGEN AND RADIUM IRRADIATION. K. F. Schultze. *Strahlentherapie* 37, 642-58(1930). (In German).

Author observed increased amounts of nitrogen in urine following radiation therapy.

5931

THE KINETICS AND SPECIFICITIES OF DEAMINATION OF NITROGENOUS COMPOUNDS BY X-RADIATION. W. M. Dale, J. V. Davies, and C. W. Gilbert. *Biochem. J.* 45(1), 93-9(1949).

Experiments are described showing deamination by x rays of some amino acids and their derivatives, polypeptides, and related nitrogenous compounds. Biological significance of results is discussed. BA 24-11723

5932

GROWTH AND O₂ CONSUMPTION, AS AFFECTED BY X-IRRADIATION, USING THE BACTERIUM, *SERRATIA MARCESCENS*. Ann C. Fowle and Kenneth C. Fisher. *Federation Proc.* 8(1), 50(1949).

An abstract. BA 24-12772

5933

SOME PHYSIOLOGICAL AFTER-EFFECTS OF X-RADIATION. Roberts Ruch. *J. Exptl. Zool.* 110(3), 357-74(1949).

Salamander larvae (*Amblystoma opacum*) were x rayed with single lethal dose of 25,000 r or 50,000 r. Neuro-muscular responses initially increased over controls, dropped off rapidly until 3rd or 4th day, recovered partially, and were lost completely 48 hr before cessation of cardiac activity. Other x ray effects: "freezing" of chromatophores in embryonic state, cessation of hind limb and gill development, and considerable hemorrhage. Effects of pre-exposure feeding of larvae are also discussed. BA 24-5753

5934

THE BIOLOGICAL EFFECT OF INJECTED RADIOACTIVE ISOTOPES. G. Schubert and W. Riezler. *Strahlentherapie* 76, 407-16(1947). (In German). BA 24-5759

5935

ALTERATION OF THE X-RAY SENSITIVITY OF *DROSOPHILA* BY MEANS OF RESPIRATORY INHIBITORS. William K. Baker and Elizabeth Sgourakis. *Genetics* 35(1), 96(1950).

An abstract. BA 24-8342

5936

EFFECTS OF HIGH DOSAGES OF X-RAYS IN *PARAMECIUM AURELIA*. E. L. Powers and Deborah Shefner. *Genetics* 35(1), 131(1950).

An abstract. BA 24-8395

5937

SOME EFFECTS OF GAMMA RAYS UPON RECOMBINATION FREQUENCIES AND ON CROSSING OVER IN *DROSOPHILA MELANOGASTER*. Maurice Whittinghill. *Genetics* 35(1), 140-1(1950).

An abstract. BA 24-8416

5938

RADIOACTIVE IMPURITIES IN THE AIR AS BIOCLIMATIC FACTORS. A. Krebs. Bioklimatische Beilblätter 8(3/4), 81-2(1941). (In German).

Radioactive substances in air of cellars and closed rooms was found in concentrations up to 10^{11} curie/cm³ which correspond with values effective in therapy with weak Ra emanation. Air of mines had especially high concentrations of radioactive substances. Because of inter-individual variability in sensitivity to radiations these radioactive substances in the air must be considered to be biologically significant. BA 24-8529

5939

STUDIES IN THE GENETICS OF DROSOPHILA. VI. ARTICLES ON GENETICS, CYTOLOGY AND TAXONOMY. 7. X-RAY PRODUCED MUTATIONS, DELETIONS AND MOSAICS IN *DROSOPHILA VIRILIS*. Eb. C. Girvin. Univ. Texas Publ. 4920, 42-56(1949).

Studies revealed a number of gynandromorphs and mosaics characterized by erratic distribution of nuclei to imaginal disc cells which form adult exoskeleton. A "yellow" mottled was found and involved a mutual X-6 translocation. Several loci studied had different mutation rates; rate of lethal mutations and deletions was found to be less in *D. virilis* than in *D. melanogaster*. BA 24-8364

5940

ACQUIRED RADIORESISTANCE OF THE CRYPT EPITHELIUM OF THE DUODENUM. M. A. Bloom. Radiology 55, 104-115(1950).

Female Carworth mice given repeated daily total body exposures to 60 r of x rays (200 kv, 15 ma, 0.5 mm Cu, 1.0 mm Al), histological studies carried out on duodenum. With continued irradiation, crypt cells became resistant to the radiation dose applied, showing negligible debris and persistent mitotic activity even after cumulative dose of 2100 r. Other observations also presented and discussed. BA 25-416

5941

RADIATION EFFECTS ON MICE AS RELATED TO SURVIVAL. John W. Gowen. Genetics 35(1), 111(1950).

When 6 inbred mouse strains of characteristically different WBC counts and typhoid susceptibility (8-90%) were x rayed with 0-700 r/sq cm of body surface, all 6 reacted alike. The decrease in resistance caused by radiation was exponential function of dosage. Decrease in WBC count observed at 1 and 2 wk postexposure. Altered resistance of irradiated mice attributed to destruction of phagocytic cells by the acute irradiation. BA 25-420

5942

EFFECT OF BODY EXPOSURE TO X-RAYS ON RATE OF INCORPORATION OF C¹⁴ CARBOXYL-LABELED ALANINE INTO MOUSE PROTEIN. L. H. Hempelmann, H. S. Carr, L. D. Frantz, Jr., R. Masters, and E. Lamdin. Federation Proc. 9(1), 183(1950).

An abstract. BA 25-421

5943

EFFECT OF OXYGEN ON RESPONSES OF LIVING CELLS TO X-RAYS WITH SPECIAL EMPHASIS ON BACTERIA. Alexander Hollaender, G. E. Stapleton, and F. L. Martin. Federation Proc. 9(1), 61-2(1950).

An abstract. BA 25-422

5944

PHYSIOLOGICAL AND PHARMACODYNAMIC STUDIES OF BLOOD FROM X-RAY PERSONNEL. David I. Macht and Stanley H. Macht. Federation Proc. 9(1), 82-1(1950).

An abstract. BA 25-424

5945

SENSITIVITY OF X-RAYED ANIMALS TO INFUSION OF HISTAMINE, ADENOSINE, AND TRYPSIN. K. D. Venters

and E. E. Painter. Federation Proc. 9(1), 129-30(1950). An abstract. BA 25-429

5946

THE CLINICAL USE OF RADIOACTIVE ISOTOPES. John H. Lawrence. Bull. New York Acad. Med. 26(10), 639-69(1950).

Author reviews tracer and therapeutic application of radioactive isotopes. BA 25-435

5947

ISOTOPIC TRACERS AND NUCLEAR RADIATIONS WITH APPLICATIONS TO BIOLOGY AND MEDICINE. William E. Siri. New York, McGraw-Hill Book Co., Inc. 1949.

Simplified statement of theory, methods, and principles involved in use of isotopic tracers is presented, with special reference to biology and medicine. Bibliography of more than 2000 papers dealing with general phases of the subject is included. BA 25-438

5948

EFFECT OF HIGH-VOLTAGE CATHODE RAYS ON AMINO ACIDS IN FISH MUSCLE. Bernard E. Proctor and Darshan S. Bhatia. Food Technol. 4(9), 357-61(1950).

Arginine, histidine, leucine, lysine, methionine, phenylalanine, threonine, tryptophan, valine, and cystine determinations were made on haddock fillets before and after irradiation with super-voltage cathode rays produced by a pressure-insulated, electrostatic Van de Graaff generator. BA 25-805

5949

AN EXPERIMENTAL STUDY ON THE EFFECT OF VARIOUS ALUMINUM COMPOUNDS UPON THE GROWTH AND THE RADIOSENSIBILITY OF MALIGNANT TUMOR. II. THE EFFECT OF VARIOUS ALUMINUM COMPOUNDS UPON THE RADIOSENSIBILITY OF MALIGNANT TUMOR. Tateki Hamawaki. Japan J. Obstet. Gynecol. 24(2), 11-15(1941).

An organic Al compound, called "Al No. 2" intensified the sensitivity of rabbit sarcomas to x irradiation with 1200 r. Action is attributed to Al content. "Al Nos. 4 and 5" likewise intensify radiosensitivity of rabbit sarcoma. Eosin and iodine content were also important. BA 25-1622

5950

THE ACTION OF THE GAMMA RAYS OF RADIUM ON GONAD DEVELOPMENT AND ON SEXUAL SOMATIC CHARACTERS IN THE CHICK EMBRYO. R. Dulbecco. Mem. accad. Lincei. 3(1), 1-20(1948). (In Italian).

Chick embryos (180) from primitive streak stage to 5-8 somites were exposed to γ rays for 24 hr. Fourteen survived for more than 8 days, 1 survived to 16th day. Germinal elements were absent in the 14 survivors, all had gonads of female sex. Of 20 embryos irradiated for 16 hr, 11 survived past 8th day, sexual elements were greatly reduced. BA 25-1841

5951

DEVELOPMENT OF MULLERIAN DUCTS IN MALE MOUSE FETUSES WHOSE TESTICLES WERE IRRADIATED WITH X-RAYS AT FOURTEEN DAYS OF AGE. Albert Raynaud and Marcel Frilly. Ann. endocrinol. (Paris) 11(1), 32-48(1950). (In French).

X irradiation of testicular region of 14-day-old male mouse fetus produced considerable destruction of testicular and surrounding tissues, including portions of Wolffian ducts. After treatment 4 fetuses developed varying portions of Mullerian ducts, 2 had well-developed uterine body, one with small right uterine horn. BA 25-1854

5952

KALANCHOE TUBIFLORA AS INFLUENCED BY RADIATION. Edna L. Johnson and Dorothy B. Kingsbury. Univ. of Colo. Studies, Ser. Biol. 1, 1-14(1950).

X irradiated leaf tips suspended in water developed more plantlets than did control leaves. BA 25-2970

5953

EFFECT OF X RAYS ON TESTES OF DECTICUS. U. Cocchi and B. Uggeri. *Strahlentherapie* 75, 96-109(1944). (In German).

X ray effects on testis of Decticus: 25 r caused pycnosis of secondary spermatogonia and primary spermatocytes; 100 r-all secondary spermatogonia were damaged, dosage 600 times higher than this damages all spermatocytes, and one 2400 times as great damages spermatids. Primitive spermatogonia, mature spermatozoa, and epithelial cells are more resistant. BA 25-3396

5954

THE EFFECT OF X-RAYS AND FAST ELECTRONS ON MITOTIC PROCESSES IN BARLEY ROOT TIP CELLS. H. Bleek, W. Paul, H. J. Schmermund, and G. Schubert. *Naturwissenschaften* 36(1), 28-9(1949). (In German).

Barley grains which had undergone inhibition (hydration) were exposed to x rays and/or fast electrons in doses of 500-2000 r. With increasing amounts of radiation, total number of mitoses decreased, while number of chromosome fragments and breakages increased. Equal doses of the two radiations were equally effective. Data indicate that effects are produced by more than a single hit. BA 25-3580

5955

EFFECT OF FAST ELECTRONS OF A 6 MEV-BETATRON ON DROSOPHILA EGGS. W. Dittrich, H. Fass, G. Hoehne, and G. Schubert. *Strahlentherapie* 81(2), 223-32(1950). (In German).

Drosophila eggs 3, 4, and 7.5 hr old were irradiated with fast electrons ($E = 3$ Mev) and x rays (180 kv, HWL; O, 25 mm Cu with doses up to 5000 r. Effects are described. BA 25-4009

5956

IMITATION OF CHONDRODYSPLASIA BY LOCALIZED ROENTGEN RAY INJURY. AN EXPERIMENTAL STUDY OF BONE GROWTH. A. Langenskiold and W. Edgren. *Acta Chir. Scand.* 99, 352-73(1950).

After irradiation (8000-20,000 r) of distal epiphyseal cartilage in femur, radius, and ulna in rabbits, deformities appeared which were similar to those seen in chondrodysplasia. BA 25-4001

5957

WHAT'S NEW IN ISOTOPES, 1950. R. R. Newell. *Calif. Med.* 73(1), 11-15(1950).

Author discusses treatment of injury due to total body irradiation, danger of cataracts, beta ray burns, industrial uses of atomic power, medical and biological research, new atomic instruments, and tracer elements. BA 25-4017

5958

VITAMIN "P" PROTECTION AGAINST RADIATION. Boris Sokoloff, James B. Redd, and Raymond Dutcher. *Quart. J. Florida Acad. Sci.* 12(3), 185-9(1949)(1950).

British brown breed rats (50) received a single total body exposure to 800 r x rays. In 20 controls, mortality rate was 80%, in 10 given 4 mg vitamin P for 3 days before and 7 days after exposure, mortality was 40%. Decrease in mortality to 10% occurred in 20 rats given 5 mg vitamin P daily for 7 days prior to exposure and 23 days afterward. In these rats, petechial hemorrhages were not pronounced, adrenal appeared normal. All controls showed gross hemorrhages and pathologic lesions in adrenal. BA 25-7446

5959

SOME PROBLEMS OF PARABIOSIS STUDIED IN AMPHIBIANS. I, II. Lea Urbani-Mistruzzi. *Atti. accad. nazl. Lincei Rend. Classe sci. fiz., mat. e nat., Ser. 8*, 6(4), 530-4; (6), 758-65(1949).

I. Amphibian embryos treated by lethal x ray doses and united in parabiosis with normal embryos, failed in competition with latter; were sometimes absorbed almost completely. II. *Rana esculenta* embryos at tail bud stage were x rayed and united in parabiosis with normal embryo suffers only mechanically from degeneration of exposed parabiont. Results show (1) x ray alterations are not transmitted to the parabiont, (2) cells and tissues exhibit differential radiosensitivity. BA 25-8332

5960

THE EFFECT OF THE VERNALIZATION OF THE SEEDS OF WINTER WHEAT ON THE SENSITIVITY OF THE BUDS TO THE ACTION OF X-RAYS. O. S. Engel. *Akad. Nauk. SSSR, Doklady* 71(6), 1151-3(1950). BA 25-9160

5961

AGE CHANGES IN THE SENSITIVITY OF SPROUTS OF X-RAYS. R. G. Trudova. *Akad. Nauk. SSSR, Doklady* 71(6), 1139-42(1950). BA 25-9165

5962

ON THE POSSIBILITY OF PROTECTING THE LIVING ORGANISM AGAINST ROENTGEN RAYS BY CHEMICAL MEANS. A. Forseberg. *Acta Radiol.* 33(3/4), 296-304(1950).

Cysteine, given to bacterial cells immediately before radiation, partly protects culture from irradiation injury. Other SH-containing chemicals act similarly, but not related chemicals without a sulphhydryl group. Cysteine, injected into the skin of guinea pigs, tends to prevent epilation after doses which without cysteine treatment result in epilation. BA 25-10032

5963

ON THE USE OF RADIOACTIVE SUBSTANCES IN SWEDEN, WITH SPECIAL REFERENCE TO IRRADIATION RISKS AND PROTECTION MEASURES. S. Benner. *Acta Radiol.* 33(3/4), 281-95(1950). BA 25-10034

5964

RADIOACTIVE ISOTOPES IN BIOLOGICAL EXPERIMENT. W. P. Rogers. *J. Proc. Australian Chem. Inst.* 17(3), 101-12(1950).

Nomenclature, definitions, nature, and application of isotope tracer experiments and effects of radiation on biological systems are discussed. BA 25-10040

5965

RESULTS OF TREATMENT OF GASTRIC HYPERACIDITY BY RADIUM, WITH SPECIAL REFERENCE TO DUODENAL ULCERATION. Murray McGeorge. *Quart. J. Med.* 19(74), 111-28(1950).

Patients with gastric hyperacidity (most had duodenal ulceration also) were treated by placing Ra in stomach. Method reduced acidity of resting juice and secretion of free acid after histamine stimulation, effect sometimes lasted several years. Symptoms were relieved in some cases. BA 25-10335

5966

DIFFERENTIATION AND IRRADIATION. S. R. Anderson. *Acta Radiol.* 33(1), 57-68(1950).

Therapeutic irradiation of 660 malignant tumors from mice and human beings with x rays and Ra failed to produce increased differentiation. Histologic changes observed in radiated tumors are considered to be nonspecific cellular degeneration. BA 25-10335

5967

THE INFLUENCE OF RADIATION UPON FISH EGGS. (1). THE INFLUENCE OF KC1 UPON THE HEART OF AN EMBRYO WHICH HAS BEEN KEPT UNDER RADIATION BY X-RAYS. Koichi Murachi. *Zool. Mag. (Dobutsugaku Zasshi)* 56(8), 5-7(1944). (In Japanese).

Embryonal red killifish were x irradiated in artificial sea water in vitro, eggs were subsequently cultured then

transferred to 1M KCl. Radiated embryos showed cessation of heart beat earlier than nonirradiated controls (in KCl), presumably because irradiated eggs were more permeable to KCl. BA 25-10928

5968

THE CYTOLOGY OF SULPHUR BACTERIA AFTER IRRADIATION WITH ALPHA RAYS. F. Hercik, Z. Hradecna, M. Nermut, and M. Rosenberg. Spisy Lekarske Fak. Masaryk. Univ. 22(8), 1-8(1948).

Sulfur bacteria were exposed to heavy doses of α rays (2,000,000 r) of Radon. Both irradiated and non-irradiated bacteria showed abnormally long plasmodesmids. Destruction of various structures by α rays was studied by means of electron microscope. BA 25-11055

5969

STUDIES ON THE STIMULATING ACTION OF THORIUM ON PLANT GROWTH. C. V. Gillern. J. Landwirtsch. 89(3), 233-9(1943). (In German).

Observations that thorium stimulated growth of plants is reportedly confirmed. Stimulating effect is believed to reflect better utilization of nutrients in the soil. BA 25-11908

5970

THE BIOLOGY OF BIKINI ATOLL, WITH SPECIAL REFERENCE TO THE FISHES. Leonard P. Schulz. Ann. Rept. Smithsonian Inst. 1947(3931), 301-16(1948).

Although countless animal individuals must have perished because of atomic bomb experiments, over-all picture of life on the reefs has changed very little. BA 25-12608

5971

DISTURBANCES IN NUCLEIC ACID METABOLISM PRODUCED BY X AND GAMMA RADIATIONS IN HUMAN MALIGNANT TUMORS. L. Hamilton. J. Nat. Cancer Inst. 10(6), 1374(1950).

An abstract. BA 25-13045

5972

CAPILLARY FRAGILITY AND VITAMIN P PROTECTIVE ACTION AGAINST RADIATION. Boris Sokoloff, James B. Redd, and Raymond Dutcher. Federation Proc. 9(1), 372(1950).

An abstract. BA 25-13144

5973

IRRADIATION, A NEW PROCESSING METHOD. M. C. Heffner and H. Barth. Am. Egg and Poultry Rev. 11(11), 12-4(1950).

In preliminary experiments, irradiation increased quality storage life of eggs. BA 25-13306

5974

OVARIAN AND LYMPHOID TUMORS IN FEMALE MICE SUBSEQUENT TO ROENTGEN-RAY IRRADIATION AND HORMONE TREATMENT. W. U. Gardner. Soc. Exptl. Biol. Med. 75(2), 434-6(1950).

Groups of 50 mice were irradiated (380-280 r total body) and then given weekly subcutaneous injection of: (1) 0.05 ml sesame oil, (2) 1.25 mg testosterone propionate, (3) 16.6 gamma estradiol benzoate. Survival: (1) 45, (2) 45, (3) 42 mice. Ovarian tumors occurred in: (1) 24, (2) 29; (3) 0 mice lymphoid tumors in: (1) 21; (2) 9; (3) 23 mice respectively. Estradiol enhanced lymphoid tumors and prevented ovarian tumors. Testosterone propionate largely inhibited lymphomagenic action of x rays. BA 25-13771

5975

SOLITARY PLASMACYTOMA OF HUMERUS IN A MESOTHORIUM WORKER. G. D. Lamb. J. Pathol. Bacteriol. 62(4), 585-9(1950).

Patient's skeleton contained 0.25 equivalent μ g of Ra an amount believed insufficient to account for neoplastic proliferation, but considered to be a possible cause for bizarre cell appearances found histologically. Dis-

articulation of arm produced specimen showing soft tumor composed of plasma cells, typical and atypical, including numerous multinucleate varieties with foamy cytoplasm, a type seen in tumors after irradiation. BA 25-13856

5976

THE EFFECT OF IRRADIATION ON THE DEVELOPING DENTAL SYSTEM OF THE SYRIAN HAMSTER. A ROENTGENOGRAPHIC STUDY. Karl W. Bruce. J. Dental Res. 29(5), 665(1950).

An abstract. BA 25-13895

5977

THE EFFECT OF CHRONIC X-RAY IRRADIATION ON THE RAT DENTITION. Peter P. Dale. J. Dental Res. 29(5), 687(1950)

An abstract. BA 25-13899

5978

THE EFFECTS OF SINGLE DOSES OF IRRADIATION UPON THE ERUPTION OF THE UPPER RAT INCISOR. H. Medak, I. Schour, and W. A. Klauber, Jr. J. Dental Res. 29(6), 839-42(1950).

Eighty rats were irradiated (100 kv, 5ma, std 12.5 cm, no filter, HVL 1 mm Al, 2.5 cm field, 320 r/min) on area of upper incisors. Following a dose of 500 and 1000 r, eruption proceeded at same rate as in controls; 2000 r, rate was depressed for 6-7 wks, then normal, 3000 and 4000 r, eruption stopped within 3 wks. BA 25-13928

5979

HIGH-INTENSITY ELECTRONS AS A TOOL FOR PREPARATION OF VACCINES. I. PREPARATION OF RABIES VACCINE. Ulrich Frædmann, Frederick B. Traub, and Wolfgang Huber. Federation Proc. 9(1), 382(1950). BA 25-14245

5980

EFFECT OF X-IRRADIATION ON ENTERIC CHOLERA AND COPROANTIBODY RESPONSE IN THE GUINEA PIG. William Burrows. Federation Proc. 9(1), 379(1950).

An abstract. BA 25-14410

5981

THE PRODUCTION OF MUTATIONS AT INDIVIDUAL LOCI IN DROSOPHILA BY IRRADIATION OF OOCYTES AND OOGONIA. H. J. Muller, R. M. Valencia, and J. I. Valencia. Genetics 35(1), 126(1950).

An abstract. BA 24-8388

5982

THE EFFECTS OF SUPPLEMENTARY TREATMENT WITH INFRA-RED RADIATION ON X-RAY INDUCED LETHALS AND CHROMOSOME ABERRATIONS IN FEMALES OF DROSOPHILA MELANOGASTER. Bentley Glass. Genetics 35(1), 109-10(1950).

An abstract. BA 24-8365

5983

INCIDENTAL FINDINGS OF MEGALOBlastic-LIKE CELLS IN BONE MARROW OF ONE OF TWO SWINE WITH MACROCYTIC ANEMIA AND ACHLORHYDRIA. F. Douglas Lawrason and E. P. Cronkite. Yale J. Biol. and Med. 22(1), 57-66(1949-50).

Hematological observation on two swine during period of about 17 months after exposure to atom bomb radiation at Bikini revealed macrocytic anemia and achlorhydria in both, and hyperplastic megaloblastic-like marrow in one. BA 24-5752

5984

BIOLOGICAL HAZARDS AND TOXICITY OF RADIO-ACTIVE ISOTOPES. A. M. Brues. J. Clin. Invest. 28(6 pt. 1), 1286-96(1949). BA 24-11709

5985

PENICILLIN ISOLATED BIOCHEMICAL MUTATIONS IN SALMONELLA TYPHIMURIUM; THEIR PROPORTIONALITY TO X-RAY DOSAGE, AND THEIR FAILURE TO SHOW RECOMBINATION. H. H. Plough. Genetics 35(1), 129-30(1950).

An abstract. BA 24-11310

5986

THE EFFECT OF OXYGEN ON THE FREQUENCY OF X-RAY INDUCED CHROMOSOMAL ABERRATIONS IN TRADESCANTIA MICROSPORES. Herbert Parkes Riley and Noiman H. Giles. *Genetics* 35(1), 131-2(1950).
An abstract. BA 24-11236

5987

X-RAY INDUCED GENETIC EFFECTS IN GERMINAL AND SOMATIC TISSUE OF DROSOPHILA MELANOGASTER. George Lefevre, Jr. *Genetics* 35(1), 120(1950).
An abstract. BA 24-14046

5988

MILLION VOLT X-RAY THERAPY. I. G. Williams. *Proc. Roy. Soc. Med.* 41(10), 709-18(1948).

No evidence of any biological difference in response (patients with incurable malignant disease) to million-volt therapy due to shorter wave length was found.
BA 24-14215

5989

PATHO-ANATOMICAL INVESTIGATION OF A CASE OF CUSHING'S DISEASE CURED AFTER X-RAY TREATMENT. K. Gaertner. *Virchow's Arch. pathol. Anat. u. Physiol.* 310, 388-94(1943). BA 24-14622

5990

STUDY OF THE TYPES OF REACTIONS OF STROMA OF ADULT OVARY WITH REGARD TO CHANGES IN HISTOLOGICAL COMPOSITIONS OF THE FOLLICLES. Paul Desai. *Arch. biol. (Lege)* 60(4), 409-39(1949). (In French).

Rabbit ovarian stroma, comprising 87-90% of normal gland, is reduced to 82% following x irradiation with 1050 gamma; increased to 94% when given divided doses of 970-1140 gamma. During pregnancy an ovary sterilized by x ray hypertrophies and takes on a pseudoglandular character simultaneously with intact ovary. Responsiveness and adaptability of ovarian stroma are thus demonstrated.
BA 24-14664

5991

INVESTIGATION ON AMENORRHEA CAUSED BY THE ATOMIC BOMB, IN FEMALE STUDENTS IN HIROSHIMA-SHL. Masaichi Ishizawa. *Japan J. Clin. and Exptl. Med.* 24, 30-3(1947).

Delay of appearance of menses and occurrence of amenorrhea are attributed to effects of atomic bomb. Author suggests lowered nutritional level and psychological disturbances may also have exerted some influence.
BA 24-14700

5992

THE TREATMENT OF AMENORRHEA IN YOUNG WOMEN. L. M. Randall. *Am. J. Obstet. Gynecol.* 53, 453-8(1948).

Use of low dosage x irradiation of pituitary body and/or ovaries in selected cases of amenorrhea is one method of treatment mentioned. BA 24-14745

5993

RADIUM AND ROENTGEN THERAPY IN THE TREATMENT OF MENOPAUSAL UTERINE BLEEDING. H. Schmitz and J. E. Towner. *Am. J. Obstet. Gynecol.* 53, 199-206(1947).

Among other effects observed following radiation therapy, myomas occurred among 236 of 412 patients who received radiation therapy for functional climacteric uterine bleeding. BA 24-14754

5994

EXPERIMENTAL STUDIES CONCERNING THE INTERRUPTION OF FUNCTION OF THE KIDNEYS BY MEANS OF ROENTGEN RADIATION. Tadahiro Miyakawa. *Tohoku J. Exptl. Med.* 40(2), 168-88(1941). (In German).

Author describes x ray effects on urine, blood, P. S. P. excretion and kidney tissues of male rabbits given 3000, 6000, 9000 r (single dose), or 6000 r (divided dose),

applied to kidneys. The localized irradiation had a marked effect on peripheral blood leukocyte picture.
BA 24-14819

5995

THE PRESERVATION OF RABBIT CORNEA FOLLOWING EXPOSURE TO THE CAPACITRON. T. D. Duane and O. S. Lee. *Am. J. Ophthalmol.* 32(5), 671-8(1949).

Most striking phenomenon exhibited by irradiated corneas was loss of capacity to swell. Author suggests effect may be interpreted as denaturation of corneal proteins by fast electrons. (Corneas were irradiated *in vitro* then stored for periods up to 53 days in air, N₂, saline, *in vacuo*, or frozen.) Respiration and bacterial growth also inhibited, and transplants of the corneas healed well but remained opaque. BA 24-14858

5996

EXPERIMENTAL INVESTIGATIONS OF THE EFFECTS OF ROENTGEN RAYS ON THE EYE. Erik Poppe. *Skrifter Norske Videnskaps-Akad. Oslo, Mat.-Naturv. Kl.* 1942(2), (1942). BA 24-14911

5997

ADENOCARCINOMA OF THE UTERUS. J. E. Hundley, S. Diggs, and T. Kardash. *Am. J. Obstet. Gynecol.* 57(1), 52-68(1949).

Study of effects of x ray therapy of adenocarcinoma of uterus revealed marked variations in tissue reaction. Where growth was confined to endometrium, necrosis, coagulum formation, cellular enlargement with nuclear destruction, fragmentation, and giant-cell formation were common responses to radiation. Radiation was less effective in cases where growth involved myometrium. Extreme sensitivity of follicular system of ovary to radiation was noted. BA 24-15685

5998

DEMONSTRATION OF PROTECTIVE ENZYMES IN THE URINE OF TUMOR PATIENTS BY MEANS OF THE ABDERHALDEN REACTION, AND EXPERIMENTAL PROVOCATION OF THE FORMATION OF SPECIFIC PROTECTIVE PROTEINASES BY MEANS OF X-RAYS. R. Merten. *Z. ges. exptl. Med.* 109, 333-46(1941). (In German).

By giving small x ray doses it was possible to provoke formation of specific protective proteinases in cancer patients whose urine might otherwise contain only very small amounts of the cancer specific proteinases.

BA 24-15699

5999

THE EXPONENTIAL COURSE OF THE IRRADIATION EFFECT CURVES. W. Minder. *Radiol. Clin.* 18(5), 300-5(1949). (In German).

Inactivation of bacteriophages and viruses by ionizing rays follows exponential curves. Sensitive regions in cells can be calculated from target theory giving values ranging from 80 to 400 A in diameter. Calculations made from experiments with irradiated chemical compounds lead author to conclude that biological sensitive regions are to be interpreted as volumes within which radiation energy may be transferred without loss. BA 24-16329

6000

CHANGE OF MATING TYPE IN PARAMECIUM BURSARIA FOLLOWING EXPOSURE TO X-RAYS. Ho Lee. *J. Exptl. Zool.* 112(1), 120-30(1949).

Mating types A, B, C, and D of var. I of *P. bursaria* (stock culture number: A-BG35, B-La3, C-Wat 1, and D-WM1) were subjected to x irradiation for 4 sec at 10 min intervals (50 kv, 10 ma). Change in mating types (A to D, D to A, C to B, and B to C) is believed to indicate that x ray effect is indirect, inducing autogamy which results in change of type. Percentage of change increases with time of exposure. BA 24-16966

6001

EFFECT OF X-RAYS UPON ARMADILLIDIUM. Kiyoshi Takewaki. *Dobutsugaku Zasshi* (Zool. Mag.) 57(1/2), 6-8(1947). (In Japanese).

Samples of *A. vulgare* were x irradiated (50-100 min, 150 kv, no filter, 5 ma, 31 cm focus to sample, 75 r/min). Death ratio of females was higher than that of males; molting was inhibited or delayed. Testes were unaffected; ovaries were injured to various degrees. Fat tissue did not increase as it does in castration. BA 24-17036

6002

RADIOACTIVE MATERIALS GIVE CROPS NO BENEFIT, FIRST TESTS INDICATE. *Am. Fertilizer* 109(11), 12-13(1948).

Studies conducted in 14 states with low level radioactive materials show no beneficial effect upon crop growth or quality of: cotton, sweet potatoes, corn, oats, alfalfa, wheat, barley, beans, potatoes, tobacco, peanuts, sugar beets, and tomatoes. BA 24-21342

6003

ABOUT THE REFERENCE BETWEEN CHOLESTEROL TISSUES CHANGES AND THE ROENTGEN INDISPOSITION. R. Hammel. *Strahlentherapie* 38, 308-14(1930). (In German).

In the human body the cholesterol level usually decreases after x-ray therapy. A relationship between the cholesterol decrease in the serum and the roentgen-sickness has not been established.

6004

THE INFLUENCE OF THE ROENTGEN IRRADIATION ON THE SODIUM CONTENT OF THE BLOOD SERUM. K. Adler and M. Adler. *Strahlentherapie* 42, 584-90(1931). (In German).

6005

THE EFFECT OF X-RAYS ON THE BONE MARROW. R. Toppner. *Z. ges. exptl. Med.* 109(3), 369-405(1941). (In German).

Author describes effect of various x ray doses on rat bone marrow. Effect is concluded to be a direct one. Effects were seen as early as 30 min postexposure. Small doses (25-300 r) caused initial shift to left; larger doses caused shift to right and decrease in total cellularity of marrow parenchyma. Other changes are also described. BA 24-17521

6006

INJURIES BY IRRADIATION OF ORAL CANCERS. F. Vándor. *Fogorvosi Szemle* 42(7), 260-7(1949). (In Hungarian).

Acute and late effects on teeth, gums, and jaws are described. Late effects are: atrophy of gums leading to periodontoclasia; teeth often become fragile. Gingival retraction followed by caries of tooth neck. In some instances, bone necrosis of jaws occurred. BA 24-17522

6007

SAFETY CRITERIA IN RADIOACTIVE WATER MONITORING. H. A. C. McKay and G. N. Walton. *Nucleonics* 5, 12-21 (1949).

Basic principles of monitoring water containing radio-isotopes are discussed mathematically with regard to maximal permissible concentration consistent with biological safety. Tables are given for reference in determining hazards associated with most commonly used and most dangerous isotopes when disposed of in water. BA 24-17528

6008

APPLIED BIOPHYSICS. A SYMPOSIUM. N. Howard-Jones. Brooklyn, Chemical Publ. Co. 1949. 293p.

Applications of radiology and nuclear physics to biological problems described are. Effects of x rays, neutrons, α rays, β rays, and other ionizing radiations are considered. BA 24-17550

6009

RADIATION DAMAGE TO THE GENETIC MATERIAL. H. J. Muller. *Am. Scientist* 38(1), 33-59(1950).

Origin of mutations and general effect on population are reviewed. Harmful mutations are discussed. BA 24-17296

6010

EFFECTS OF X-RAYS ON THE METABOLISM OF NUCLEIC ACIDS IN HEMATOPOIETIC TISSUES. C. E. Carter. *Federation Proc.* 8(1), 351(1949).

An abstract. BA 24-18228

6011

THE EFFECT OF X-RADIATION ON THE JAWS OF MICE. M. S. Burnstone and B. M. Levy. *J. Dental Research* 28(6), 656(1949).

An abstract. BA 24-18600

6012

ACTION OF RADIOTHERAPY ON THE DEVELOPMENT OF THE MAXILLAE. THE DENTAL GERMS AND THE SALIVARY GLANDS. J. Cauhepe Dechaume and M. Goudaert. *Presse med.* 57(20), 262-3(1949).

Two cases of angioma treated by x rays or Ra are described. Authors feel that certain factors which hinder development of the mandible and induce facial deformations act as radiation does, by electively modifying proliferation of cartilage or periosteum. BA 24-18605

6013

MICROGENIA AS A LATE SEQUENCE OF X-RAY INJURY. THREE CASE REPORTS. Gy. I. Fodor. *Fogorvosi Szemle* 42(2/3), 55-8(1949).

Three years after application of x ray therapy for hypertrichosis of face, a progressive microgenia began to develop. BA 24-18621

6014

THE EFFECT OF X-RAY IRRADIATION ON THE ERUPTION OF THE UPPER INCISOR OF THE ALBINO RAT. H. Medak, I. Schour, and W. A. Klauber. *J. Dental Research* 28(6), 633-4(1949).

An abstract. BA 24-18668

6015

THE EFFECT OF A SINGLE EXPOSURE TO X-RAY IRRADIATION ON THE GROWTH RATE OF DENTIN OF THE RAT INCISOR. M. Weinreb, I. Schour, H. Medak, and W. A. Klauber, Jr. *J. Dental Research* 28(6), 633(1949).

An abstract. BA 24-18700

6016

ERYTHEMA MULTIFORME FOLLOWING HIGH VOLTAGE ROENTGEN THERAPY. REVIEW OF THE LITERATURE AND REPORT OF THREE CASES. Harry L. Arnold, Jr. *Arch. Dermatol and Syphilol* 60(1), 143-9(1949).

Deep x ray therapy may exceptionally be followed in a few days by generalized reaction (erythema multiforme and/or fever), probably resulting from allergenic effect of absorption of tissue killed by irradiation. BA 24-18710

6017

UNUSUAL LOSS OF HAIR FOLLOWING X-RAY IRRADIATION. Charles Gefferth. *Paediatrica Danubiana* 3(3), 124-33 (1948). (In French).

In feeble-minded children, x irradiation with a dose below that used for epilation may cause extensive loss of hair even if no direct rays fall on skull according to the author. BA 24-18738

6018

EFFECT OF GRENZ RAYS ON LEPROUS INFILTRATIONS. III. RESPONSE OF LESIONS OF THE ANTERIOR PORTIONS OF THE EYEBALL. F. Sager and B. Miterstein. *Arch. Ophthalmol.* (Chicago) 38(1), 78-88(1947).

Grenz rays (6-14 kv, 700-1200 r/dose, total doses of 5500-11,600 r) were applied to lepromatous changes of anterior segments of eyeball in (1) 3 practically sightless eyes, and (2) 3 eyes with fairly good vision. In (1) all 3

lepromas became reduced in size or disappeared, (2) only 2 exhibited favorable response. No damage to cornea, lens or deeper structures of eye was noted during 2-4 yr observation period. BA 24-19945

6019

RADIATION THERAPY IN THE TREATMENT OF LAMENESS IN HORSES. Myron Thom. North Am. Veterinarian 30(12), 762-70(1949).

Author summarizes effect of radiation on inflammatory lesions, suggests radiation therapy as substitute to firing in the horse. BA 24-20523

6020

RADIORESISTANCE AND RADIOSENSITIVITY OF SWINE EXPOSED TO ATOMIC BOMB RADIATION. John L. Tullis. Federation Proc. 8(1), 373(1948).

An abstract. BA 24-20544

6021

FERTILIZATION EXPERIMENTS WITH PLANTORADON. H. H. Baetge and E. Begemann. Z. Pflanzenernähr., Dung. u. Bodenk. 44(2/3), 198-200(1949).

Considerable increases of yield attributed to radio-active complement of fertilizer, "Plantoradon" were not confirmed in these experiments with tomato and kohlrabi, although a slight effect could not be denied, according to authors. BA 24-20960

6022

ON THE EFFECT OF RADIOACTIVE RAYS ON TROPISMS AND GROWTH OF PLANTS. W. Schmidt. Rundschr. deut. bot. Ges. 1244(1), 3-4(1944). (In German).

Radiation of walls of room affected phototropic testing of pine seedlings. Room effect was diminished by hardening the seedlings. BA 24-21545

6023

THE ROLE OF THE ENZYME CATALASE IN PLANT EXTRACTS. IL Hans v. Euler, Sif Edels and Inger Gernow. Arkiv. Kemi 26A(5), 1-10(1948). (In German).

Germination of *Hordeum distichum*, *Secale cereale*, *Lepidium sativum*, *Phleum pratense*, and *Raphanus radiculicola* in 0.001M streptomycin depressed catalase activity of leaf extracts and caused defective chlorophyll formation, but had little effect on catalase activity of roots or seeds. Seedlings surviving strong ultraviolet or x ray irradiation during germination were chlorophyll deficient and had subnormal catalase activity. BA 24-21681

6024

EFFECTS OF CONTINUOUS GAMMA RADIATION ON TOMATO PLANTS AND FUSARIUM WILT. A. E. Dimond. Phytopathology 40(1), 7(1950).

Irradiation reduced fruit set of tomatoes before terminal growth was inhibited. It did not inhibit Fusarium wilt. BA 24-21818

6025

A COMPARISON OF X-RAY INDUCED GENETIC EFFECTS IN GERMINAL AND SOMATIC TISSUES OF *DROSOPHILA MELANOGASTER*. George Lefevre, Jr. Univ. of Michigan, Dissertation. 1949. 146p

After comparing data on influence of various intrinsic and extrinsic factors on x ray induced and spontaneous mutation, it was concluded that the two mutation processes are qualitatively different. Author believes mutation induced by ionizing radiation in *Drosophila*, as in maize, are losses or destructions of genetic material, and unlike spontaneous mutations, induced mutations are incapable of further change. BA 24-22526

6026

WIDE FIELD IRRADIATION AND THE PLATELET COUNT. W. M. C. Brown. Acta Radiol. 32(5/6), 407-27(1949).

Effect of wide field x ray treatment on platelet count is described for normal and abnormal hemopoiesis and the relative merits of platelet, lymphocyte, and total white

cell counts as biological indicators of exposure are considered. BA 24-22693

6027

INCREASED TOLERANCE OF MICE TO LETHAL X-RADIATION AS A RESULT OF PREVIOUS SUBLETHAL EXPOSURES. Eugene P. Cronkite, Clyde R. Sipe, Dean C. Eltzholtz, William H. Chapman, and F. W. Chambers. Proc. Soc. Exptl. Biol. Med. 73(2), 184-6(1950).

Exposure of mice to three successive weekly, sublethal doses of x ray (144 r) followed by one month of rest produced an increased resistance to administration of 703 r as shown by increased survival. BA 24-22695

6028

EFFECTS OF RADIATION UPON THE BLOOD. M. Jeanne Fairweather. Texas J. Sci. 1(4), 29-33(1949).

Mice were subjected to a single 200 r x ray dose. Average total leucocyte count dropped from 15,610/cm³ to 3880/cm³ on first day postirradiation, average differential count was altered from 83% lymphocytes and 17% neutrophils to 72% and 28%, respectively. Erythrocyte count increased slightly, immediately after exposure, decreased within a few days. Hemoglobin level exhibited slow and steady decrease. BA 24-22697

6029

A NOTE ON THE FAILURE OF NON-ISOTOPIC URANIUM TO INHIBIT RESORPTIVE PROCESSES IN THE RAT FEMUR. W. F. Neuman, M. W. Neuman, and B. J. Mulryan. J. Biol. Chem. 182, 151-152(1950).

Previously reported inhibition of resorptive processes in bones of rats injected with radioactive uranyl nitrate were compared with similar studies using non-isotopic uranyl nitrate. Results indicate that previously observed inhibition was due to radiation, not to specific chemical effect of uranium. BA 24-22699

6030

RESULTS AND EXPLANATIONS OF BIOLOGICAL-RADIATION DOSAGE-EFFECT CURVES. K. G. Zimmer. Biol. Zentr. 63, 72(1943).

Results and illustrations of tests on biological material are presented in three groups: 1) tests on genes, viruses, phage, and chromosomes; 2) tests on bacteria, yeast cultures, and unicellular organisms; 3) tests on multicellular animals, plants, eggs, etc. Hit theory is considered to provide best explanation of results. BA 24-22703

6031

A COMPARISON OF CHEMICAL CHANGES IN MACKEREL TISSUES TREATED BY IONIZING RADIATION. J. T. R. Nickerson, S. A. Golblith, and B. E. Proctor. Food Technol. 4(3), 85-8(1950).

Proteolytic action of enzymes in mackerel flesh was nearly as potent in irradiated as in nonirradiated tissue. (Whole mackerel or fillets were irradiated with supervoltage cathode rays, dose of 1,500,000 rep). BA 24-22994

6032

ROENTGEN STIMULATION OF CULTURES OF *S. TYPHI* AND *S. AUREUS*. O. Andreoni, M. Lupo, and G. Pisani. Ricerca sci. e ricostruz. 19(11/12), 1305-7(1949).

Stimulation is said to be produced when the relation between primary and secondary radiations (generated in the organic matter) attains an optimal value, which may be experimentally determined. BA 24-24047

6033

THE EFFECTS OF X-RAY ON RHABDITIS SPECIES. Lyell J. Thomas and Henry Quastler. J. Parasitol. 35(1, Sec. 2), 20(1949).

Abstract describes mutations in Rhabditis exposure to various doses of x rays when in (1) dry and (2) wet or normal condition. BA 24-25447

6034

RADIOACTIVE MATERIALS IN SOIL-FERTILIZER RESEARCH. F. W. Parker. *Plant Food J.* 2(2), 4-9, 33(1948).

Use and influence of radioactive materials on plant growth is discussed. Experimental results show considerable variation in various crop responses to P fertilizers. Soil fertility directly affects amount of fertilizer P that is used by the plant. BA 24-24908

6035

SOME PHYSICAL OCCURRENCES IN GENE-MUTATIONS DUE TO RADIATION. H. Pasqual Jordan, K. G. Zimmer, and N. W. Timofeeff-Ressovsky. *Z. indukt. Abstamm.-u. Vererbl.* 82(1), 67-73(1948). (In German).

Authors present a critique of the target theory with regard to what constitutes a "hit." BA 24-25883

6036

A SOFT X-RAY MUTANT OF *ASPERGILLUS NIGER* VAN TIEGHEM. Violet M. Diller, Alice G. Tytell, Alfred A. Tytell, and H. Kersten. *Plant Physiol.* 25(2), 340-54 (1950).

An atypical strain of *A. niger* isolated from colony subjected to soft x rays from Cu target is described. Pigmentation was practically absent, sporulation was depressed, and growth rate was much slower than for normal strain. BA 24-25885

6037

HEMOLYTIC EFFECT OF RADIATION. OBSERVATIONS ON RENAL BILE FISTULA DOGS SUBJECTED TO TOTAL BODY RADIATION AND ON HUMAN BLOOD IRRADIATED *IN VITRO*. R. Wendell Davis, Nieves Dole, Mary Jane Izzo, and Lawrence E. Young. *J. Lab. Clin. Med.* 35(4), 528-37(1950).

Excretion of urine bilirubin increased after total-body irradiation although accelerated destruction of mature erythrocytes could not be established or disproved. Heparinized normal human blood exposed *in vitro* to x radiation gave similar findings. BA 24-26045

6038

RADIATION. Leslie F. Nims. *Ann. Rev. Physiol.* 11, 527-44(1949).

Author reviews mechanism of ionizing radiation effects on living cells, blood and hematopoiesis, skin, and other tissues, and effects of internal radiation. Includes 156 references. BA 24-26049

6039

FAILURE OF CORTISONE OR ACTH TO REDUCE MORTALITY IN IRRADIATED MICE. Willie W. Smith, Falconer Smith, and E. C. Thompson. *Proc. Soc. Exptl. Biol. Med.* 73(3), 529-31(1950).

In mice given whole body x irradiation of LD₉₅₋₁₀₀ daily, intraperitoneal injection of 0.2 mg cortisone failed to prevent death, increase survival or reduce x-ray effect on RBC count, Hb, reticulocytes, WBC count or body weight, pre-exposure injection did not reduce mortality. Subcutaneous adrenocorticotrophic hormone, 0.25 mg twice per day, or in 2 injections prior to exposure did not delay or prevent death of mice given LD₃₀₋₆₀. BA 24-26050

6040

THE BEHAVIOR OF EOSINOPHILIA AS INDICATOR OF SUCCESS IN X-RAY IRRADIATION. H. Vieten. *Arztl. Wochschr.* 1946, 226-9(1946).

Blood pictures were followed during and after 5 therapeutic x irradiations of 75 r in children and 8 in adults on 5 successive days (total of 30 patients). If irradiation was therapeutically satisfactory, blood eosinophilia regressed, otherwise eosinophilia remained high or fluctuated widely. Result can vary from series to series in same patients. BA 24-26051

6041

EFFECT OF X-IRRADIATION ON INTESTINAL MOTILITY.

Robert A. Conrad. *Federation Proc.* 9(1), 24(1950).

Abstract describes *in vivo* and *in vitro* observations on intestinal motility before and after irradiation of the rat. Effects of atropine, nicotine, physostigmine and vagotomy were also observed. BA 24-26525

6042

ADRENAL CORTEX AND SURVIVAL OF RATS AFTER X-IRRADIATION. Abraham Edelmann. *Federation Proc.* 9(1), 36(1950).

An abstract. BA 24-26595

6043

EXPERIMENTAL STUDIES ON THE PATHOLOGICAL PHYSIOLOGY OF CORNEAL EPITHELIUM; CELL MOVEMENT IN WOUND HEALING, CELL DIVISION, MITOSIS INHIBITION AND OTHER NUCLEAR PHENOMENA. W. Buschke. *Ophthalmologica* 118(4/5), 407-33(1949).

X rays are one of several factors capable of inhibiting mitosis in corneal epithelium of rat. BA 24-26765

6044

CONTRIBUTION TO THE STUDY OF THE MIGRATION OF REGENERATIVE CELLS IN PLANARIA. Francoise Dubois. *Bull. biol. France et Belg.* 93(3), 213-83(1949). (In French).

X irradiation in sufficient amount can suspend regeneration and cause death in 3-7 wk in decapitated animals. When anterior 2/5 of animal is irradiated and the head subsequently removed, regeneration occurs only after a delay of about 30 days. During this delay period, regenerative cells migrate from uninjured areas to the top of the irradiated area. The greater the migration the greater the delay. BA 24-28405

6045

TESTS ON THE EFFECT OF DIFFERENT RADIATIONS AND ELECTROMAGNETIC FIELDS UPON *TRIBOLIUM DESTRUCTOR* UYT. (Col., Tenebrionidae). O. Silvo. *Ann. Ent. Fennici* 15(3), 141-2(1949).

When x rayed (40 kv, 60 ma, 50 kv, 50 ma, 60 kv, 40 ma, 6 periods, 5 sec each, total 30 sec radiation), *T. destructor* adult and larvae beetles completely lost their ability to propagate. BA 24-28527

6046

AUTOSOMAL LETHALS IN EXPERIMENTAL POPULATIONS OF *DROSOPHILA MELANOGASTER*. Bruce Wallace. *Evolution* (New York), 172-4(1950).

Three experimental populations of *D. melanogaster* were analyzed for second chromosome lethals. **Treatments:** (1) males, 7000 r, females, 1000 r, (2) both sexes, 1000 r, (3) not irradiated. Lethal frequency in (3) increased on the average 0.53% per generation in (1) frequency decreased from 18.3 to 10.1% in 3 generations, remaining constant for another 2 generations. Author concludes that half of induced lethals were deleterious in heterozygous condition, possibly through effects of coincident chromosomal aberrations. BA 24-28795

6047

INFLUENCE OF DIET ON THE BIOLOGICAL EFFECT CAUSED BY A SINGLE IRRADIATION OF THE WHOLE BODY BY X-RAYS. M. Lourau and O. Lartigue. *Experimentia* 6(1), 25-6(1950). (In French).

Diet proved to have an important effect on x ray sensitivity of guinea pigs. Two diets were fed, differing only in the fresh vegetable which supplemented the basal ration of oats and bran. Cabbage was added in first instance, beets in the second. The latter diet increased considerably the mortality rate as well as the hemorrhages, but had no effect on bone marrow damage. BA 24-29205

6048

THE INFLUENCE OF CANCER OF THE UTERUS AND

ITS RADIUM TREATMENT ON THE LIPOID BALANCE. Sakari Paivainen, and Tauno Kalaja. Acta. Soc. Med. Fennica "Duodecim" Ser. A 24(3), 75-95(1947).

Relatively small therapeutic doses of roentgen and radium rays were found to cause changes in blood lipid values. BA 24-29929

6049

COMPARISON OF THE OLIGODYNAMIC EFFECT AND THE ACTION OF SECONDARY RADIATION ON BACTERIA. Y. Seuderling. Acta Soc. Med. Fennica "Duodecim" Ser. Fennica A. 23(2), 121-4(1947).

Author compares oligodynamic action of elements on bacteria to effect of secondary radiation from same elements evoked by soft and hard primary x rays. Combined action of above-mentioned factors was also studied. Results show that oligodynamic action is chiefly chemical, but action of secondary radiation is of physical nature. BA 24-30374

6050

INHIBITION OF PLANT GROWTH BY IRRADIATION. III. SUCCESSIVE RADIATION EFFECTS, HOMOLOGOUS RESPONSES. Henry Quastler, and Marianne Baer. J. Cellular Comp. Physiol. 35(1), 75-94(1950).

Growing seedlings of Mung beans (*Phaseolus aureus*) were subjected to x irradiation. Resulting diverse responses, when analyzed into distinct components, were homologous to reactions found in dry seeds. Different radiation effects are characterized by their timing, making it possible to distinguish distinct growth mechanisms by their differential response to irradiation. BA 24-30984

6051

FORM-BUILDING MIGRATION OF REGENERATIVE MATERIAL IN HYDRA. V. F. Evlakhova. Compt. rend. acad. sci. URSS 53(4), 369-72(1946).

Fragments of *Pelmatohydra oligactis* were x rayed, then grafted onto (1) untreated pieces of same species, (2) untreated pieces of different species, or (3) untreated stalks of same species without interstitial cells. Hydras in (1) and (2) lived and regenerated, those in (3) disintegrated. When oral ends were amputated, x rayed hydras all died, unexposed hydras lived. In regeneration, interstitial cells migrate from intact to injured area. BA 24-31268

6052

THE ANALYSIS OF WAVE-LENGTH FACTOR FROM THE VIEW-POINT OF QUANTUM BIOLOGY. Fred Hercik. Spisy lekarske fak. Masaryk. univ. (Brno C. S. R) 22(6), 1-18(1948).

Dry spores of *Rhizopus nigricans* were irradiated with alpha, gamma, and monochromatic x-rays with wavelength of 0.56 and 4.1A. Survival curves for alpha and x-rays of wave-length 4.1A had 1-hit character while that for wave-length of 1.54A had 2-hit and for 0.56A had 4-hit character. Mean lethal dose was found to increase with increased number of hits required. Author suggests possibility of these targets being identical with genes. BA 24-31661

6053

ROENTGENOTHERAPEUTIC CHANGES IN THE SMALL INTESTINE, SURGICAL ASPECTS. Horace M. Wiley and Everett D. Sugarbaker. Cancer 3(4), 629-40(1950).

Radiation reaction in small intestine was observed in 9 patients out of 600 treated for cancer of uterus, 300 of whom were treated 4 or more years previously. Average time for radiation treatment until development of incapacitating symptoms was 26.5 months. Pathological picture was one of extensive fibrosis of intestinal wall with ulceration of mucosa and secondary inflammatory changes. Medical and surgical aspects of therapy are discussed. BA 24-31950

6054

PUBLIC HEALTH ASPECTS IN THE DEVELOPMENT OF ATOMIC ENERGY. Shields Warren. Bull. New York Acad. Med. 26(7), 435-9(1950).

Safe handling of radioactive materials is discussed. Instruments can detect one millionth of therapeutic dose of radioactive P and work with radioactive isotopes should not be considered dangerous. Hazards of radioactive wastes must be considered and guarded against. BA 24-31958

6055

RADIATION THERAPY AS A METHOD OF TREATMENT FOR THE RELIEF OF AMENORRHEA AND STERILITY. Ira Kaplan. J. Mt. Sinai Hosp. 14(3), 424-41(1947).

Because of successful results of irradiation in a large number of cases, and absence of adverse effects according to subsequent follow-up of children born of irradiated mothers, author concludes that irradiation, when properly given, is harmful neither to mother nor to offspring and is a valuable therapeutic procedure for treatment of amenorrhea and relief of sterility. BA 24-32616

6056

PROSPECTS OF TREATMENTS BY NITROGEN MUSTARDS AND BY RADIOACTIVE ISOTOPES. A. Herve. Rev. med. Leige 3(19), 555-62(1948).

Author describes pathology of digestive tract, lymphoid tissue and bone marrow under the influence of radioisotopes and nitrogen mustards. BA 24-32823

6057

CASTRATION OF THE AVIAN EMBRYO. Etinne Wolff. Compt. rend. soc. biol. 144(7/8), 526-9(1949).

X-ray castration of duck and chick embryos was performed in order that neutral individuals could be studied. Irradiation was localized to medial angle of coelomic cavity, total dose 3500 r, applied before sexual differentiation of gonads could be observed histologically BA 24-3309A

6058

INVESTIGATIONS ON THE EFFECT OF ELECTRO-MAGNETIC AND X-RAY TREATMENTS ON PLANT TROPISMS. Garbiele Gaetani d' Aragona. Ann. sperim. agrar. (Rome) 3(5), 1081-1100(1949).

Subsequent to treatment of young growing points of *Centaurea americana*, *Ipomoea japonica* var. *coerulea*, *Helianthus annuus* var. *nanus*, *Solanum lycopersicum*, *Brassica campestris* var. *rapa* and *Triticum vulgare*, with electromagnetic fields and x rays, they were placed in horizontal position and orthotropic bending studied. Low frequency treatment reportedly accelerated bending, high frequency delayed bending. BA 24-34294

6059

CHROMOSOME BREAKAGE BY X-RAYS AT LOW TEMPERATURE AND THE RADIODECOMPOSITION OF WATER. A. C. Faberge. Genetics 35(1), 104-5(1950).

Effect of temperature on sensitivity of Tradescantia pollen chromosomes to x irradiation parallels its effect on H₂O₂ production by x irradiation of O₂-containing water, except that H₂O₂ production stops below -116°C. BA 24-35040

6060

THE EFFECT OF BORON ENRICHMENT ON SLOW NEUTRON IRRADIATED TISSUES. Alan D. Conger. Genetics 35, 102(1950).

Inflorescences from Tradescantia plants grown in boric acid solution for about 2 mo were exposed to slow neutrons, and frequency of chromatid aberrations was compared with frequency in normal (non-boron-enriched) inflorescences. Boron enriched plants showed 4-5 times more aberrations than controls. BA 24-35080

6061

BACTEREMIA AS A FACTOR IN THE LETHAL EFFECT OF X-RADIATION. Carolyn W. Hammond, C. Phillip Miller, and Marianne Tompkins. *Bacteriol Proc.* 1950, 104(1950).

An abstract. BA 24-35310

WATER AND ELECTROLYTE CHANGES IN RAT INTESTINE AFTER TOTAL BODY X-RADIATION. E. E. Painter and E. W. Pullman. *Federation Proc.* 9, (1), 97(1950).

An abstract. BA 24-35314

6064

X-RAY INDUCED PHYSIOLOGICAL MUTATIONS IN *O. MULTIANNULATUM*. Nils Fries. *Arkiv Bot.* 32A(8), 1-9(1945). (German).

Ascospores were irradiated on agar (Coolidge tube, 50 kv, 2-3 ma, for 100 min, at 6 and 12 cm). Six of 527 single-cell cultures were very slow growing; each lacked ability to synthesize a chemical necessary for growth (biotin, p-aminobenzoic acid, unidentified substances in malt and yeast extracts and adenin) and 2 of the 6 were unable to reduce and assimilate 4- and 6-valent S. Five of the 6 mutants were hereditary; inability to utilize 4 valent S was not. BA 24-66

6065

LATE EFFECTS OF RADIUM AND PLUTONIUM ON BONE. Margaret A. Bloom and William Bloom. *Arch. Pathol* 47(5), 494-511(1949). NSA 1-16

6066

A DIFFUSIBLE SUBSTANCE IN IRRADIATED TISSUES. B. Jolles. *Nature (London)* 164(4158), 63-4(1949).

When 2 small skin areas near each other were x-irradiated, the reaction was greater than when irradiated areas were farther apart. Minimal separation for no increase (over effect on exposed symmetrical single area) for areas of 2.5 x 2.5 cm was 3 cm. BA 24-285

6067

THE INFLUENCE OF RADIATION ON THE ENZYMIC ACTIVITY OF INTESTINAL JUICE. Masataka Matsuo and Masamitsu Kawaharada. *Tohoku J. Exptl. Med.* 40(5/6), 535-41(1941).

X-radiation had no effect on enzyme activity of intestinal fluid *in vitro* in terms of peptonase and esterase components. Irradiation of a Thiry-Vella intestinal loop produced marked variations in enzymatic activity. BA 24-726

6068

INJURY AND RECOVERY OF MOUSE TESTES FOLLOWING WHOLE-BODY EXPOSURE IN X-RADIATION. Allen Eschenbrenner. *Federation Proc.* 8(1), 354(1949).

6069

RADIOTHERAPY IN SMALL DOSES AS A STIMULANT IN OVARIAN INSUFFICIENCY. Romeo do. Nizza. *Rev. med. Rosario* 37(1), 69-79(1947).

"Stimulant" radiotherapy in menstrual disturbances is discussed in light of the 24 case reports presented. BA 24-1121

6070

MUST WE HIDE? R. E. Lapp. Cambridge, Mass. Addison-Wesley Press, Inc. 1949. 182p.

Medical and public health aspects of atomic bombing are discussed. BA 24-2238

6071

RELATION BETWEEN THE RADIATION DOSE TOLERATED

BY THE SKIN AND THE DISTANCE OF THE RADIANT SOURCE FROM THE SKIN. J. Klumpar. *Acta Radiol.* 31(3), 223-32(1949).

Surface dosage of γ rays required to produce certain degree of skin reaction during a course of Ra therapy depends on distance from radiophore to skin surface. At small distances a 5-times greater surface dose may be applied than at greater distances. Depth dose 4 mm below surface believed responsible for skin reaction. BA 24-3405

6072

DEPOSITION AND FATE OF PLUTONIUM, URANIUM, AND THEIR FISSION PRODUCTS INHALED AS AEROSOLS BY RATS AND MAN. K. G. Scott, D. J. Axelrod, J. Crowley, and J. G. Hamilton. *Arch. Pathol.* 48(1), 31-54(1949). NSA 3-1178

6073

PRODUCTION OF RADIOACTIVE MOSQUITOES. C. C. Hassett, and D. W. Jenkins. *Science* 110(2848), 109-10(1949).

Second-instar larvae of *Aedes aegypti*, reared in distilled water containing 0.05-10 $\mu\text{c/ml}$ of $\text{Na}_2\text{HP}^{32}\text{O}_4$, were greatly retarded in development, particularly at higher concentrations. In 1 $\mu\text{c/ml}$, adults emerged in 15 days and showed marked accumulation of radio-phosphorus. Third and early fourth instar larvae developed normally in 10 $\mu\text{c/ml}$ concentration of radioactive salt. BA 24-3410

6074

RELATION OF EXIT DOSE AND OTHER DOSAGE FACTORS TO ROENTGEN INJURIES. June C. Shafer, Carl B. Braestrup, and Jerome K. Fisher. *Arch. Dermatol and Syphilol* 59(4), 472-83(1949).

Authors review 160 cases of chronic radiodermatitis (85 occurring after treatment of benign dermatoses) with reference to exit dose of x radiation as factor in production of chronic roentgen injuries. Importance of using low voltage in therapy of superficial inflammatory dermatoses in order to avoid late roentgen damage to skin is emphasized. BA 24-4200

6075

BEHAVIOR OF EMBRYOS OF *R. ESCULENTA* WHICH ARE FIRST EXPOSED TO LETHAL AND SUB-LETHAL DOSES OF X-RAYS AND THEN JOINED WITH NORMAL EMBRYOS IN PARABIOSIS. Lea Mistruzzi. *Acta Pontificia Acad. Sci.* 8(12), 101-6(1944).

The data presented demonstrate the beneficial influence of the normal organism on the vitality of an irradiated individual which otherwise would have succumbed. BA 24-4272

6076

MULTIPLE BASAL CELL EPITHELIOMAS IN A FIVE-YEAR-OLD CHILD. Isabel M. Scharnagel and George T. Pock. *Am. J. Diseases Children* 77(5), 647-51(1949).

Authors describe occurrence of several hundred basal cell epitheliomas in 5 yr old boy who had had 4 x ray treatments for enlarged thymus shortly after birth. BA 24-4110

6077

EFFECT OF OXYGEN ON THE FREQUENCY OF CHROMOSOME ABERRATIONS PRODUCED BY ALPHA-RAYS. J. M. Thoday and John Read. *Nature* 163(4134), 133-4(1949).

Anaerobic exposure of *Vicia faba* root tips to α radiation (radon solution) produced less inhibition of 10 day growth and a smaller percent of anaphase abnormalities (fragments and bridges) than did aerobic exposure. These differences were less than those observed following x radiation under similar conditions. Authors propose that since O_2 promotes decomposition of water by these radiations,

H₂O₂ may be associated with processes involved in chromosome structural changes. BA 23-25450

6078

THE GERM-PLASMA PROBLEM. Edgar Knapp. *Naturwissenschaften* 32, (14/26), 139-47(1944).

This review includes a section on x ray effects, explains why germ plasma must be a well-defined atomic structure. BA 23-25481.

6079

MUTANT STRAINS OF *OPHIOSTOMA MULTIANNULATUM* REQUIRING COMPONENTS OF DIFFERENT NUCLEOTIDES. Nils Fries. *Arkiv Botan.* 33A(7), 1-7(1946).

Out of 94 x ray-induced physiological mutants of ascospores and conidia, 36 strains showed the following types: 13 mutants grew with uracil, 3 required adenine, 19 required adenine but hypoxanthine also produced good growth, 1 mutant required guanine. Nucleotides bound in tobacco-mosaic virus could not be utilized by mutants tested. BA 23-25501

6080

INHERITANCE OF MUTATIONAL CHANGES INDUCED BY RADIATION IN *PARAMECIUM AURELIA*. R. F. Kimball. *Genetics* 34(4), 412-24(1949).

Reduced vigor observed in exautogamous progeny of irradiated paramecia is an expression of micronuclear mutations induced by β and x radiation. BA 23-25539

6081

THE ACTION OF TESTOSTERONE PROPIONATE ON THE REGENERATION OF TESTES DAMAGED BY X-RAY. C. A. Joel. *Endokrinologie* 24(5/6), 310-71(1942).

Testes of 24 rats were exposed to 360 and 450 r; 12 received testosterone propionate (total dose 30 mg) and remaining rats served as controls (no treatment). Treated rats exhibited same degenerative changes in spermatogenesis at 25 days postexposure as untreated, irradiated controls. On the 50th day after exposure they showed regeneration to normal (control showed degeneration, no regeneration). Author concludes that x rays have direct action on germinal epithelium and spermatogenic function. BA 23-26236

6082

ON THE TENDENCY OF EWING'S SARCOMA TO HEAL SPONTANEOUSLY AND ON THE ALTERATIONS DUE TO IRRADIATION. Lars Unander-Scharin. *Acta Orthopaed. Scand.* 18(4), 436-76(1949).

In 17 cases given irradiation therapy, disintegration of tumor cells was closely related to irradiation. There was quantitative but not a qualitative difference between late effects of irradiation and spontaneous changes in a tumor. Author concludes that effect of irradiation is to intensify changes which take place spontaneously.

BA 23-26555

6083

REPORT OF EXPERIMENTAL BREEDING WORK WITH SOYA BEAN AT THE SWEDISH SEED ASSOC. IN THE YEARS 1944-1946. G. Andersson, and G. Olsson. *Sveriges Utsadesforen. Tidskr.* 57(5), 460-82(1947).

Extensive material was obtained from experiments involving the x raying of dormant seeds. Mutants showing earlier and higher yields than initial material have been produced by x rays. BA 23-28090

6084

MUTATION EXPERIMENTS WITH CULTIVATED PLANTS. I. X-RAY TREATMENTS OF WINTER AND SUMMER BARLEY VARIETIES. H. Stubbe and G. Bandlow. *Zuchter* 17/18(10/12), 365-74(1947).

Forty thousand kernels of each of two summer barley varieties, Donaria and Haisa (*Hordeum distichum nutans*) and two winter barley varieties, Friedrichswerther

Berg and Peragis (*H. vulgare pallidum*), were treated with 5000-15,000 r of x rays. Large percentages of progeny were lost due to cold winter and war; 34 mutants found in those remaining are described. BA 23-28144

STUDIES ON THE CHEMICAL NATURE OF THE RADIATION PROTECTION FACTOR IN MOUSE SPLEEN. 1. ENZYMATIC INACTIVATION BY DESOXYRIBONUCLEASE AND TRYPSIN. L. J. Cole, and M. E. Ellis. *Nov.* 23, 1953. 32p. (USNRDL-418).

Authors conclude that spleen radiation protection factor is non-cellular in nature and that chemically it is a desoxyribonucleoprotein. NSA 8-1499

6087

RELATIVE BIOLOGICAL EFFECTIVENESS OF FAST NEUTRONS, GAMMA RAYS, X RAYS ON GRASSHOPPER NYMPH OVARIOLES. (*MELANOPLUS DIFFERENTIALIS*.) Theodore Tahmisian and Howard H. Vogel, Jr. *Proc. Soc. Exptl. Biol. Med.* 84, 538-43(1953).

In order to destroy every egg in each grasshopper ovariole, with the exception of the most advanced, it was necessary to irradiate the total body with 350 r x rays, 420 r Co⁶⁰ γ rays, or 22.5 rep of fast neutrons. Thus, the relative biological effectiveness of Co⁶⁰ γ rays; 200 kv x rays; fast neutrons, for this specific effect, is 1.0: 1.2: 19. This is correlated with relative specific ionization and linear energy transfer. It is suggested that damage to the grasshopper ovariole could be used as a biological dosimeter for fast neutron doses in the range 10 to 50 rep. NSA 8-1501

EFFECTS OF IONIZING RADIATION ON IMMUNITY.
William M. Hale, Institute of Pathology, Coll. of Medicine,
Univ. of Tenn., Memphis, and Richard D. Stoner, Brook-
haven National Lab. [1953?] 30p. (BNL-1665).

Ionizing radiation has been found to reduce markedly,
or to abolish, active or passive immunity to bacterial
infections and reduce resistance and active immunity to
animal parasite infections. It has little effect on acquired
immunity to viral infection or active or passive immunity
to bacterial toxins. Antibody formation may be greatly
inhibited, this effect varying with radiation dose, species,
time of antigenic stimulus, nature of stimulus, and route
of administration of antigen. NSA 8-1774

THE CHEMISTRY OF BIOLOGICAL AFTER-EFFECTS OF
ULTRAVIOLET AND IONIZING RADIATIONS. A SYMPOSIUM.
III. INACTIVATION OF BACTERIOPHAGE AFTER IRRADIATION.
Tikvah Alper. Brit. J. Radiol. 27, 50-4(1954).

During a series of experiments to determine the
effect of O on radioinduced inactivation of bacteriophages
it was observed that part-inactivated phage particles retain
their ability to adsorb to bacteria and to reproduce themselves,
unless acted on by certain specific agents. There is some
evidence that, at room temperatures, part-inactivated phage
in air-free suspensions does undergo slow inactivation on
standing, but the possible presence of H₂O₂ in small amounts
has not been excluded. The agents acting on part-inactivated
phage appear to be of a reducing nature. Neither OH nor HO₂
radicals have been found to cause part-inactivation or
immediate inactivation. Part-inactivation is a surface
phenomenon. It does not occur in the irradiation of phage
by ultraviolet light, nor in the x irradiation of suspensions
highly protected against indirect action NSA 8-1786

6102

THE CHEMISTRY OF BIOLOGICAL AFTER-EFFECTS OF
ULTRAVIOLET AND IONIZING RADIATIONS. A SYMPOSIUM.
VII. ATTEMPTED ESTIMATION OF ORGANIC PEROXIDES IN
X-IRRADIATED MICE. V. J. Horgan, and J. St. L.
Philpot. Brit. J. Radiol. 27, 63-72(1954).

Mice were given LD₁₀₀ of x rays and carcasses were
then extracted with n-butanol. Properties of oxidizing
extract did not show it to be identical with any known
peroxides. NSA 8-1790

6103

THE CHEMISTRY OF BIOLOGICAL AFTER-EFFECTS OF
ULTRAVIOLET AND IONIZING RADIATIONS. A
SYMPOSIUM. VIII. PROTECTION OF MICE AFTER
WHOLE-BODY X IRRADIATION. P. Bonet-Maury, and F.
Patti. Brit. J. Radiol. 27, 72-6(1954).

Pre-irradiation exposure to coal gas, KCN, and
malontrile gave definite protection as indicated by
percentage mortality and by observation of animals
surviving longer than one month. None of post-treatments
tested led to survival of mice exposed to lethal doses
of 800 r. Data are tabulated on dose, mode of administration,
number of animals, mean survival time, and percent
surviving. NSA 8-1791

6104

ADENOSINE TRIPHOSPHATASE AND 5-NUCLEOTIDASE
ACTIVITY OF HEMATOPOIETIC TISSUES OF IRRADIATED
ANIMALS. Kenneth P. Dubois and Donald F. Petersen.
Am. J. Physiol. 176, 282-6(1954).

Periodic adenosine triphosphatase and 5-nucleotidase measurements on spleen and thymus glands from rats and mice exposed to sublethal doses of x rays show that these tissues exhibit an increased ability to hydrolyze adenosine triphosphate and 5-adenylic acid. Effect becomes evident as early as 3 hr post irradiation and reaches a maximum within 72 hr. Dose-effect relationship is described. NSA 8-1793

6105

Brookhaven National Lab.

PROTECTIVE PROPERTIES OF CYSTEINE, SODIUM HYPOSULFITE AND SODIUM CYANIDE AGAINST RADIATION INDUCED CHROMOSOME ABERRATIONS. Knut Mikaelson. [1953] 17p. (BNL-1674).

Protective effects of these agents against chromosome fragmentation induced by γ irradiation in Tradescantia is demonstrated. NSA 8-1794

6106

GLUTATHIONE AND X-RAY INJURY IN HYDRA AND PARAMECIUM. George E. Daniel, and Helen D. Park. J. Cellular Comp. Physiol. 42, 359-67 (1953).

Glutathione added to irradiated saline media prevented damaging effects on the tentacles of hydra and reduced lethal effects on paramecia, observed when animals were placed in untreated irradiated saline. NSA 8-1796

6107

RADIATION SICKNESS IN THE MONKEY. Earl Eldred, and William V. Trowbridge. Radiology 62, 65-73 (1954).

Authors describe various features of radiation sickness in the monkey. Alterations in blood picture, reported elsewhere, appear to be the most sensitive index of radiation injury. NSA 8-1797

6108

RELATIVE BIOLOGICAL EFFECTIVENESS OF RADIUM AND OTHER ALPHA EMITTERS IN CF NO. 1 FEMALE MICE. Miriam P. Finkel. Proc. Soc. Exptl. Biol. Med. 83, 494-8 (1953).

Paper compares Pu^{239} , Po^{210} , U^{233} , Th^{223} , AND Ra^{226} with respect to LD_{50} for mice during a period of 20-100 days after intravenous administration. These emitters are also compared with respect to number of bone tumors produced. NSA 8-1802

AN INTERNATIONAL BIBLIOGRAPHY ON ATOMIC ENERGY. VOL. 2. SCIENTIFIC ASPECTS, SUPPL. 2. United Nations, N. Y., Atomic Energy Section, Department of Security Council Affairs, 1953. 320p. (AEC/INF/10/Rev. 1/Add. 2).

This bibliography lists 7997 articles from world literature published during 1951-52. One section is devoted to biological and medical effects of high energy radiation. It is not annotated. NSA 8-1814

6110

HOW OXYGEN CAUSES AN INCREASE IN CHROMOSOMAL ABERRATION YIELD. D. Conger. Genetics 40, 568 (1955).

In tradescantia, oxygen causes an increase in x-ray induced aberration yield by increasing the primary breakage rate.

6111

RETINAL CHANGES FOLLOWING IONIZING RADIATION. P. A. Cabis and D. V. L. Brown. Am J. Ophthalmol. 40, 84-88 (1955).

Histological changes in eyes of monkeys receiving whole body exposure to 2000 r are described. Rods were completely destroyed by 2000 r. To effect change in all three types of retinal neurons required a dose of more than 30,000 r.

6112

Hanford Works

THE EFFECT OF TRITIUM OXIDE ON SOME SYNTHETIC

PROCESSES OF CHLORELLA PYRENOIDOSA. J. W.

Porter and H. J. Knauss. Dec. 29, 1953. 12p. (HW-30252) Contract No. W-31-109-Eng-52.

Irradiated cells synthesized 2-8 times as much triglycerides as did control cells. Irradiated cells also incorporated more C^{14} into the nucleic acid fraction, and less into the chlorophyll a fraction, than did controls. NSA 8-2086

THE DIFFERENTIAL EFFECT OF X-IRRADIATION ON THE INCORPORATION OF DESOXYRIBONUCLEIC ACID PRECURSORS. Helen Harrington and Paul S. Lavik. Feb. 1, 1954. 17p. (NYO-4023)

Irradiation markedly and consistently inhibited the incorporation (1) of P^{32} into DNA phosphorus, (2) of crotic acid-2- C^{14} into DNA pyrimidines and (3) of sodium formate- C^{14} into DNA guanine. Incorporation of adenine-8- C^{14} into DNA purines was not inhibited, and even appeared to be above normal in some instances. There was no significant effect on incorporation of formate- C^{14} into DNA thymine or adenine. NSA 8-2089

6116

Radiation Lab., Univ. of Calif., Berkeley

MEDICAL AND HEALTH PHYSICS QUARTERLY REPORT [FOR] JULY, AUGUST, SEPTEMBER, 1953. Nov. 27, 1953. 38p. Contract No. W-7405-eng-48. (UCRL-2418).

Includes reports on: chronic histopathological effects of injected At^{211} in rats, with particular attention to thyroid and parathyroid tissues, chronic At^{211} toxicity experiments on monkeys. Evidence is presented to show that x-ray induced lethal mutation frequency of haploid yeast is not altered by hydrostatic pressures reaching 10,000 psi. NSA 8-2090

6117

Radiological Lab., Univ. of Calif., San Francisco, School of Medicine

HEMATOLOGY AND RADIOIODINE SECTIONS. p. 27-67 of ANNUAL REPORT [FOR] 1953. 45p. Contract AT-11-1-Gen-10. (UCSF-8(p. 27-67)).

Hematological effects of total-body irradiation and effects of I^{131} on bone marrow are described. NSA 8-2092

6118

Atomic Energy Project, Univ. of Rochester

EFFECTS OF DAILY LOW DOSES OF X-RAYS ON SPERMATOGENESIS IN DOGS. George W. Casarett. Nov. 25, 1953. 67p. Contract W-7401-eng-49. (UR-202).

Effects on spermatogenesis of daily whole-body exposure to low doses of x rays for an indefinite time were studied in dogs. Decline in absolute sperm count was first observed after 20 wk (60 r) and reached lowest levels generally after about 60 wk (180 r) of exposure.

Data on semen analysis and results of test breeding are tabulated. NSA 8-2093

6119

Atomic Energy Project, Univ. of Rochester
RECOVERY FROM RADIATION INJURY IN MICE AND ITS EFFECT ON LD₅₀ FOR DURATIONS ON EXPOSURE UP TO SEVERAL WEEKS. H. A. Blair. Feb. 10, 1954. 22p. Contract W-7401-eng-49. (UR-312).

Lethality of x and γ irradiation applied for various durations from short times up to a few weeks is representable by an appropriate solution of the differential equation $dI/dt = A\gamma - \beta(I - \alpha\gamma t)$ in which I is injury, γ the dose rate, t the time of exposure and A, β , and α are constants. NSA 8-2094

6120

EVIDENCE FOR A NUCLEAR PRECURSOR OF RIBO- AND DESOXYRIBONUCLEIC ACID. Alfred Marshak. J. Cellular Comp. Physiol. 32(3), 381-406(1948).

Theory is advanced to explain the mode of action of ionizing radiation in inhibiting mitosis. BA 23-20236

6121

A MUTATION OF *O. hookeri* INDUCED BY X-RAYS SHOWING A DIVERGENT HEREDITARY REACTION. Hans Marquardt. Flora 37, 152-65(1943).

Normal *O. hookeri* was pollinated with pollen grains treated with x rays. From seeds of 35 capsules only 32 flowering plants were obtained. One of these was a large-leaved and large-flowering mutant. Mutant characteristics persisted. Chromosome number of the mutant was normal (14), but a translocation had occurred between 2 chromosomes in irradiated pollen, resulting in a ring of 4 chromosomes. BA 23-20279

6122

ACHIEVEMENTS AND AIMS IN THE BREEDING OF FRUIT TREES AND SHRUBS. M. Schmidt. Zuchter 19(5/6), 135-53(1948).

Artificial somatic mutations were obtained by treating sprouts with x rays. BA 23-20287

6123

CHROMOSOME MUTATIONS OF *D. MELANOGASTER* BY ROENTGEN RAYS OF VARIOUS WAVE LENGTHS. A. Catsch, A. Kanellis, Gh. Radu, and P. Welt. Naturwissenschaften 32(27/39), 228(1944).

Effectiveness of 1000, 2000, and 4000 r doses of soft and hard x rays was not statistically differentiable in this study of induction of chromosome mutations. BA 23-20296

6124

A COMPARISON OF THE EFFECTS OF ROENTGEN RAYS AND HIGH SPEED NEUTRONS ON THE CHROMOSOME MUTATION RATE OF *D. MELANOGASTER*. A. Catsch, O. Peter, and P. Welt. Naturwissenschaften 32(27/39), 230-1(1944).

Neutrons found to be less efficient than x rays in producing chromosome mutations. Author concludes that with x rays a multiple hit process is involved, with fast neutrons, a single hit process. BA 23-20297

6125

THE INDUCTION OF MUTATIONS IN *PARAMECIUM AURELIA* BY BETA RADIATION. R. F. Kimball. Genetics 34(2), 210-22(1949).

P. aurelia were exposed to beta radiation from plaques of P³² in doses ranging up to 13,000 rep. Irradiated animals and their descendants showed no effect as long as they multiplied vegetatively; but considerable death and reduced fission rate occurred after autogamy (which produced homozygous condition). Irradiation within 1 hr before cytoplasmic division was least effective. Fractionated doses were as effective as same total dose in single exposure. BA 23-20304

6126

CALCIUM AND POTASSIUM METABOLISM (ASSIMILATION) IN ROENTGEN IRRADIATED RABBITS. K. Adler and M. Adler. Strahlentherapie 44, 481-88(1932).

Increased fluid loss was observed in x irradiated rabbits. Elimination of calcium was increased during the 1st 24 hr., following which there was retention. Elimination of K is increased during the first 4-5 post-exposure days; the greatest loss occurring on the 3rd day when fluid loss is also maximal. After this initial period of K loss, the element tends to be retained.

6127

THE EFFECT OF ROENTGEN IRRADIATION ON THE CHANGES OF MINERAL SUBSTANCES IN RATS BEARING MULTIPLE SARCOMATA. L. Kluge and H. G. Zwerg. Strahlentherapie 46, 293-310(1933). (In German).

Roentgen irradiation produced a big increase in calcium contents of the tumors of female rats weighing 150-200 g. This increase can also be produced by irradiating parts of the body other than the tumor. Hormone levels may be changed by irradiation.

6128

PHARMACOLOGICAL MODIFICATION OF RESISTANCE TO RADIATION. A PRELIMINARY REPORT. John B. Graham and Ruth M. Graham. Proc. Nat. Acad. Sci. U. S. A. 35(2), 102-6(1949).

Horse serum, if administered 10 days before x irradiation of mice, increases resistance, if administered 10 days after irradiation it has opposite effect. Testosterone propionate, estradiol benzoate, stilbesterol, and desoxycorticosterone (each in oil) were also tested for their possible value in increasing resistance to radiation. BA 23-20485

6129

X-RADIATION EFFECTS ON THE RESTITUTION OF DISSOCIATED MICROCIONA. C. K. Liu. Biol. Bull. 95(2), 259(1948).

An abstract. BA 23-20487

6130

EFFECT OF RADIUM BAND γ RAYS ON THE SPROUTING OF SEEDS OF *PISUM SATIVUM*. R. Bruynoghe and J. Maisin. Compt. rend. soc. biol. 93, 851-2(1925).

6131

MATING TYPES AND CONJUGATION OF FOUR DIFFERENT RACES OF *PARAMECIUM CALKINSI* AND THE EFFECT OF X-RAYS ON THE MATING REACTION. Ralph Wichterman. Biol. Bull. 95(2), 271(1948).

An abstract. BA 23-20491

6132

A SYMPOSIUM ON THE PROTEINS. (MEDICINE AND BIOLOGY MONOGRAPHS NO. 5) Marcel Florkin. Liege Maison Desoer. 1947. 283p. (In French).

Contains paper, "Action of X-Rays on the Nucleo-proteins of the Cell Nucleus", by M. Errera. BA 23-20523

6133

CELLULA. PART 3. H. Handovsky. Tabulae Biol. 19(3), 1-316(1948).

This is a series of reviews, largely tabular, including a section on actions of x rays and corpuscular radiation on cells and tissues, by A. Dognon and H. Biancani. BA 23-20524

6134

SOME EFFECTS OF THE ADMINISTRATION OF THORIUM NITRATE TO MICE. S. J. Patrick. Can. J. Research. 26E(6), 303-16(1948).

The LD₅₀ for an aqueous solution of Th(NO₃)₄ administered orally to mice were between 1.76-2.0 g Th/hg of body wt. Mice supplied with 0.1% solution of Th(NO₃)₄ as their only source of water exhibited a greater mortality than a control group. Subcutaneous injection of 50 mg of Th as

the nitrate solution into mice produced acute, necrotizing, inflammatory reaction at site of injection, but no other effects. Aerosol solution had no effect on mortality. BA 23-21149

6135

UNILATERAL ATROPHY OF THE RAMUS DUE TO ROENTGEN THERAPY. Michel Dechaume and Jean Cauhepe. Dental Rec. 68(11), 262-5(1948).

Authors describe deformity of the right mandible which appeared at age of 12 in boy who at 5 months received 6 doses of 300 r and again at 5 years was treated by 4 doses of 300 r. At 19 deformity consisted of shortening of right ramus of mandible, length of body of mandible was not affected. Other effects described. BA 23-21274

6136

THE EFFECT OF RADIUM AND URANIUM ON THE GROWTH OF SKELETONEMA COSTATUM GREV. B. Peterson. Medd. Goreborgs Botan Tradgard 17, 107-12 (1947).

Pure Skeletonema cultures were studied using nutrient solution containing one of 4 concentrations of RaCl. Concentration ranged from 10^{-11} - 9×10^{-6} g/litre had an obstructive effect on diatom growth. BA 23-22148

6137

THE ACTION OF RADIATIONS ON VIRUSES AND BACTERIA. D. E. Lea. Brit. Med. Bull. 4(1), 24-6(1946).

Chemical effects of radiation on inorganic and organic solutes are described. Inactivation of phage S-13 and vaccinia virus is explained on basis of target theory. Effects of radiation on bacteria; mutations, reduction of motility, temporary inhibition of division and lethal action. Interference with division (allowing growth in the sense of increasing volume, but no division so that rod-shaped bacteria become long filaments) results when bacteria are grown in irradiation media. BA 20-15791

6138

CYTOLOGICAL EFFECT OF SLOW NEUTRONS. Alan D. Conger. Federation Proc. 8(1), 27(1949).

Slow neutrons cause chromosome breaks in Tradescantia. Breaks are lethal to the cell at subsequent mitosis. Slow neutron exposures of 15 min. duration produced visible aberrations in 50% of cells. Chromosome breaks increase linearly with dose and most important action in slow neutron irradiation appears to be nitrogen capture with emission of a proton. BA 23-25430

6139

THE PRIMARY PHYSICAL EFFECT INDUCING CHROMOSOME MUTATIONS. II. INFLUENCE OF AGING OF SPERM AFTER IRRADIATION ON THE TRANSLOCATION FREQUENCY IN D. MELANOGASTER. A. Buzzati-Traverso. Rept. Inst. Lombardo Sci. e Lett. Cl. Sci. 77, 31-6(1943/44).

Frequency of x ray induced translocation in D. melanogaster sperm shows nonsignificant variation when x-rayed males fertilize females immediately after irradiation and when sperm are utilized 15 days later. A 15-day aging of sperm should not reduce ability of chromosome breaks to rejoin in new positions. BA 23-28160

6140

DOMINANT LETHALS INDUCED BY X-RAYS IN SPERM OF THE CHALCIDOID WASP NASONIA BROVICORNIS ASHMEAD (MORMONIELLA VITINERIS (WALKER) FIDE MUESEBECK IN LIT.) D. T. Ray. Biol. Bull. 95(2), 257(1948).

An abstract. BA 23-28177

6141

INVESTIGATIONS OF THE EFFECTS OF ROENTGEN RAYS ON THE DEVELOPMENT OF AMPHIBIA. II. THE EFFECT OF LOCAL ROENTGEN RAYS ON THE DEVELOPMENT OF THE TAIL OF THE AXOLOTL. V. V. Brunst. Zool.

Jahrb. Abt. Allg. Zool. u. Physiol. Tiere 61(1/2), 45-74(1945).

Local roentgen experiments confirmed earlier studies using whole body irradiation in which x rays caused inhibition of growth and cell-increase, but not of differentiation process. A stimulating effect of x rays is found for only a short time. BA 23-28362

6142

BODY CONTENT OF RADIUM IN INDIVIDUALS WITH NO KNOWN EXPOSURE. J. B. Hursh and A. A. Gates. Federation Proc. 8(1), 958(1949).

An abstract. BA 23-28517

6143

THE EFFECT OF SUPERVOLTAGE CATHODE RAYS ON THE NON-ENZYMATIC BROWNING REACTION OF DRIED FRUITS AND ON CHEMICAL COMPOUNDS RELATING THERETO. Bernard E. Proctor and Samuel A. Goldblith. Science 108, 519-22(1949).

Authors suggest that radiation probably changes hydroxymethylfurfural to levulinic acid but that this is not the major basis of cathode ray bleaching of fruit. BA 23-28665

6144

THE NATURE OF INTESTINAL RADIATION DEATH. Henry Quastler. (University of Illinois and the Carle Foundation, Urbana, Illinois). Radiation Research 4, 303-20(1956). NSA 10-7421

6145

INVESTIGATION OF THE STIMULATING EFFECT OF THORIUM NITRATE ON PLANT GROWTH. C. von Gillern. Bodenkunde u. Pflanzenernahr. 27, 197-202 (1942). (In German).

Stimulating effect of thorium is stronger on clay than on sandy soils. In cereals thorium increases straw yield rather than grain yield, it also has a beneficial effect on grass development. These results show that stimulating effect of thorium applies more to stalks than to fruit. BA 23-30145

6146

ON THE TETRAPLOID SPERMATOCYTES PRODUCED BY IRRADIATION IN PODISMA MIKADO (ACRIDIDAE). Sajiyo Makino. Japan J. Genetics 15(2), 80-82(1939).

Several tetraploid spermatocytes were found in testes of irradiated animals. These cells contained 22 chromosomes (2 x's) which show heteropycnosis and remain separate throughout subsequent stages. BA 14-59

6147

THE SIGNIFICANCE OF PHOSPHORUS DEFICIENCY IN RADIATION-INDUCTION OF MUTATIONS IN ANTIRRHINUM MAJUS. H. Doring and H. Stubbe. Z. indukt Abstamm. -u. Vererbl. 75, 352-57(1938).

Pollen of normal and phosphorus-deficient plants was irradiated, pollen was then used to fertilize normal plants. Radiation had a higher mutational value in P-deficient pollen than in normal pollen. (Mutation rate in normal and P-deficient nonirradiated plants was equal.) BA 14-73

6148

RECOVERY OF CARBON-MONOXIDE POISONED RATS AFTER X-RAY TREATMENT. John A. Cameron. Proc. Soc. Exptl. Biol. Med. 42, 29-30(1939).

Albino rats were exposed in pairs to CO gas containing 5% O₂ until breathing ceased. One of each pair was then exposed 5-10 min to x rays delivered at 123 r/min. In 3 cases both rats recovered, in 21 cases both died, in 15 other cases the radiated rat recovered and control died. BA 14-269

6149

THE EFFECT OF GAMMA RADIATION ON CELLS IN VIVO. PART II. (1) SINGLE EXPOSURES OF THE FASTING

TADPOLE AT ROOM TEMPERATURE. (2) SINGLE EXPOSURES OF THE NORMAL ANIMAL AT LOW TEMPERATURES. A. Glucksmann, and F. G. Spear. Brit. J. Radiol. 12, 486-98(1939).

Tadpoles (in which mitotic activity may be depressed by fasting and by low temperature) were exposed to 208 r of γ radiation. Effects on the response to radiation of 1 and 2 week periods of fasting, refeeding after fasting, chilling and return to room temperature after chilling were studied, using counts of mitotic cells and of degenerated cells as major criteria of radiation effects. There was less degeneration in fasting and in chilled tadpoles after irradiation, but degeneration began to increase if fasting animals were fed or chilled animals were warmed. BA 14-270

6150

ROENTGEN RAY THERAPY IN PNEUMOCOCCUS TYPE I INFECTION IN RABBITS. W. Paul Havens and Stephen Casper. Proc. Soc. Exptl. Biol. Med. 42(1), 179-80 (1939).

Roentgen irradiation 30 min after inoculation of rabbits failed to (1) prevent bacteremia and (2) protect animals given Type I pneumococcus intradermally. Large doses of x rays had deleterious effect on host's response; bacteremia was more pronounced and mortality was higher. BA 14-271

6151

CULTURE OF HUMAN MARROW: STUDIES OF THE EFFECTS OF ROENTGEN-RAYS. Edwin E. Osgood and George J. Bracher. Ann. Internal Med. 13, 563-75(1939).

Marrow cultures were x rayed *in vitro* and compared with control cultures at various times after exposure. In irradiated cultures, the number of lymphocytes decreased first, followed by granulocytes in order of increasing maturity. Observations on some colchicine treated cultures after radiation are also presented. BA 14-272

6152

ACTION OF X-RAYS ON THE FUNCTION OF THE CORTICAL MOTOR CENTERS. V. Rascanu, M. Kapri, and Gh. Popovici. Compt. rend. soc. biol. 129, 710-12(1938). (In French).

X rays and ultraviolet were found to increase the sensitivity of motor centers to electrical stimulation. BA 14-273

6153

NOTE ON THE WORK OF H. SCHERIBER, "ON THE PRIMARY EVENT IN THE BIOLOGICAL EFFECT OF RADIATION." K. Sommermeyer. Arch. exptl. Zellforsch. Gewebezuchr. 23, 249-50(1939). (In German). BA 14-274

6154

ON THE ROENTGEN RESISTANCE OF CAUSATIVE AGENTS OF TRANSMISSIBLE FOWL LEUKOSIS IN COMPARISON WITH TRANSMISSIBLE MOUSE TUMORS AND THE CAUSATIVE AGENTS OF TRANSMISSIBLE FOWL SARCOMA. Karl Jarman. Arch. wiss. u. prakt. Tierheilk. 74, 67-74 (1939). (German).

Causative agents of transmissible fowl sarcoma and erythroleukosis are radioresistant and are considered to be of the nature of enzymes since x rays have little effect on enzymes in comparison to living organisms. BA 14-788

6155

NOTE OF MODIFICATIONS IN THE MORPHOGENESIS OF *DROSOPHILA MELANOGASTER* OCCURRING UNDER NEUTRON BOMBARDMENT. E. V. Enzmann, and C. P. Haskins. Am. Naturalist 73, 470-472(1939).

Developmental abnormalities arising in young larvae after exposure to (1) neutrons, and (2) x rays were compared. Qualitative and quantitative differences were noted and are described BA 14-940

6156

CONTRIBUTION TO THE STUDY OF "RADIO-RACES"

OF YEASTS. II. PHYSIOLOGIC CHARACTERISTICS OF SOME RADIO-RACES OF A WINE YEAST. A. Lacassagne, M. Schoen, and P. Beraud. Ann. fermentations [Paris] 5, 130-158(1939). (French).

Cultures of *Saccharomyces ellipsoideus* var. *chambertin* were exposed to α radiation from Po in the medium during the period 1930-1936. Seven new "radio-races" were isolated from irradiated cultures, all having stable characteristics which are described. The new strains had smaller "giant" colonies than did parent strain and greater respiration rate. The cytochrome content was found to be greater in the "radio-races." The characteristics of the new strains were nearly obliterated if they were grown in the same culture with the original race. Increase fermentation observed in the new races under aerobic conditions is attributed to the increased respiration. BA 14-1245

6157

FURTHER STUDIES ON THE EFFECT OF INFRA-RED RADIATION ON X-RAY-INDUCED CHROMATID ABERRATIONS IN *TRADESCANTIA*. C. P. Swanson. Proc. Natl. Acad. Sci. U. S. 38(5), 237-44(1949).

Treatment with infra-red at any time interval after x raying up to fixation produced significant increase in exchange aberrations. Somewhat less marked increases were recorded for single and double deletions at all time intervals except at 4 and 18 hrs in the case of double deletions. BA 23-22792

6158

STRAIN INTERMIXTURE IN *ASPERGILLUS FONSECAECUS*. Kenneth B. Raper and Dorothy I. Fennell. Am. J. Botany 35(10), 802(1948).

Color mutants characterized by tan to light brown conidial heads sometimes develop naturally in members of the *A. niger* group and mutants of this type may apparently be produced from almost any strain by the application of various external stimuli, including ultraviolet and x-irradiation. Such mutants remain stable when serially retransferred upon suitable laboratory media. BA 23-22826

6159

DETECTION OF THE MUTAGENIC EFFECT OF TRANS-MUTATION. Benjamin A. Rubin. Genetics 33(6), 626-7 (1948).

A mutagenic effect of P^{32} radiation (β rays) on bacteria much beyond that expected from total calculated ionization is attributed to another force, probably transmutation (radioactive decay.) Calculations and data are included. BA 23-22827

6160

SOME RADIOBIOLOGICAL PROBLEMS. L. Halberstaedter. Progr. med. 2, 105-21(1948).

Mechanisms of x ray effects in unicellular and lower animals are reviewed. X rays have a direct effect according to target-hit theory, and an indirect effect associated with intermediate ionization of water molecules. The more concentrated the object, the more prominent is the former. Effects are more complicated when x ray is used in therapy or in experiments in higher animals. BA 23-23045

6161

FIRST RESULTS OF THE RADIOBIOLOGICAL RESEARCHES BASED ON THE RADIOSENSITIVITY OF THE EGGS OF *B. MORI*. P. Lamarque and Ch. Gros. Rec. trav. inst. Natl. Hyg. 2(1), 320-32(1945).

Advantages of *B. mori* eggs for use in radiobiological experiments and experimental technic for cultivation and irradiation are given. Small size of eggs allows irradiation of great numbers simultaneously. Lethal dose is about 5000 r. BA 23-23047

6162

INFLUENCE OF GRENZ RAYS ON CELL DIVISION AND WOUND HEALING IN THE CORNEAL EPITHELIUM. G. K. Smelser and R. L. Pfeiffer. Arch. Ophthalmol. 39(1), 1-8(1948).

Right eyes of a series of rats were irradiated with a dose of 410 r, mitotic figures in both eyes were counted at intervals of 6 hr-12 days. Grenz rays caused prompt cessation of mitosis which recovered slightly in 12 hr, but 60-80% fewer mitotic figures were found in irradiated eyes for 5 days. From 6 to 10 days the number of mitoses was normal or above, but not sufficiently increased to compensate for the 5 day depression. Eyes of 12 or 13 irradiated animals given thermal burns 8 days after exposure healed more slowly than normal. BA 23-23051

RADIATION EFFECTS ON TISSUES STUDIED WITH C¹⁴-LABELED GLYCINE. Kurt L. Altman, George W. Cassarett, Thomas R. Noonan, and Kurt Salomon. Federation Proc. 8(1), 349(1949).

Young adult male rats were exposed (total body) to a 300 r or 600 r x ray dose and received C¹⁴ labeled glycine by stomach tube or intravenous injection at various times after exposure. Rats receiving 2 μ c of the labeled compound immediately after exposure and killed 24 hr later retained remarkably high proportion of the label in the gastro-intestinal contents (16.7% retained after 300 r, 32.8% after 600 r; 0.82% in controls). After i.v. injection, uptake by muscle was depressed in all irradiated rats. When glycine was injected 48 hr after exposure, C¹⁴ content of brain was approximately 3x that of controls. Other changes were noted in expired CO₂ (increased C¹⁴ when labeled compound was given 48 hrs after exposure), in testes, kidneys and liver. BA 23-23052

6164

EFFECT OF ACUTE X-RADIATION ON DISTRIBUTION AND EXCRETION OF RADIO SODIUM IN THE RAT. L. R. Bennett, Vera C. Bennett, and Joe W. Howland. Federation Proc. 8(1), 350(1949).

6166

INFLUENCE OF THE ADRENALS ON HEMATOPOIETIC REGENERATION IN THE X-IRRADIATED RAT. H. Betz. Compt. rend. soc. biol. 145, 465-7(1951).

Rats subjected to adrenalectomy before x irradiation did not show the marked erythroblastic and myeloblastic changes seen in the spleen of rats subjected to irradiation only. Administration of desoxycorticosterone acetate negated the effect of adrenalectomy.

6167

MECHANISM OF THE PROTECTIVE ACTION OF POTASSIUM CYANIDE AGAINST THE LETHAL ACTION OF X-RAYS IN MICE. H. Betz. Compt. rend. soc. biol. 144, 593-5 (1950).

Injection of 0.1 mg of KCN intraperitoneally into mice immediately before subjecting them to whole body exposure to 720 r of x rays prevented shock but did not prevent degenerative changes in lymphoid tissues and testes.

6168

INFLUENCE OF POTASSIUM CYANIDE ON THE MORTALITY OF MICE X-IRRADIATED IN FRACTIONAL DOSES. H. Betz and L. Fruhling. Compt. rend. soc. biol. 144, 595-7(1950).

Injection of 1/60 mg of KCN intraperitoneally immediately before each of 12 consecutive daily whole body exposures to 84 r (x rays) increased the mortality among the exposed mice. Authors suggest that the adverse effect may be due to accumulation of SCN-which is known to enhance x ray toxicity.

6169

THE EFFECT OF RAYS ON LIFE PROCESSES OF INDIVIDUAL CELLS. P. Wels. Strahlentherapie 47, 401-7 (1933).

Author suggest that primary action of radiation on living cells is some change in viscosity of cell contents, which results in inhibition of cell division.

Rochester, N. Y. Univ. Atomic Energy Project COMPARISON OF X AND β RADIATION EFFECTS IN RABBITS. F. W. Bishop. Also included in NNES VI, 2, H. A. Blair, ed. McGraw-Hill Book Co., N. Y. 1954. [nd]. Decl. Aug. 17, 1946. Sp. (MDDC-203).

The effectiveness of various doses of 30 Kv x rays and of β rays in causing erythema of the locally irradiated rabbit ear was studied. The dose of β rays required to produce minimal erythema was about 3 times as large as the x ray dose producing the same effect. The β ray doses producing first signs of epilation and definite epilation in all animals were 4 x and 4.5x (respectively) the corresponding x ray doses.

ISOTOPES: RADIOACTIVE: TOXICITY. Austin Brues and O. Glasser. Vol. 2, p. 465-71 of Medical Physics, The Year Book Publishers Inc., Chicago(1950).

Authors discuss nature of hazards, chronic radiation toxicity changes induced by isotopes, dosimetry and clinical use of isotopes.

6200

CARCINOGENIC ACTION OF SOME SUBSTANCES WHICH MAY BE A PROBLEM IN CERTAIN FUTURE INDUSTRIES. Austin M. Brues, H. Lisco and M. P. Finkel. Cancer Research 7, 48(1947).

6201

Argonne National Lab., Lemont, Ill.
RETENTION OF C¹⁴ ADMINISTERED AS BICARBONATE TO ADULT AND EMBRYONIC MICE. Austin M. Brues and Agnes N. Stroud. Nov. 1950. 19p. (AECU-1091, UAC-326).

6202

Argonne National Lab., Lemont, Ill. Chicago University, Metallurgical Lab.
EFFECT OF TOTAL BODY X RAY ON WEIGHTS OF ORGANS IN THE RAT. A. M. Brues, G. Sacher and H. O. France. June 1946. Decl. Aug. 7, 1947. 15p. (MDDC-1197; CH-3835).

Weights of major visceral organs were affected proportionately less than the body weight as a whole in growing male rats receiving a total dose of 1498 r in daily doses of 13.82 r. Weights of lymphoid tissue and gonads were reduced proportionately more than was body weight. Retardation in growth of irradiated animals is similar to that in inanition except for changes in highly radiosensitive organs.

6203

COMPARATIVE CARCINOGENIC EFFECTS BY X-RADIATION AND P³². Austin M. Brues, George A. Sacher, Miriam P. Finkel and H. Lisco. Cancer Research 9, 545(1949).

The lymphomagenic action of injected P³² was compared with that of single and fractionated doses of x rays in CF, female mice. Effectiveness of both types of radiation tended to increase with dose until a "saturation" dose level was reached.

6204

HISTAMINE AND ROENTGEN INTOXICATION. REPORT ON THE THERAPEUTIC ACTION OF A SYNTHETIC ANTIHISTAMINE PREPARATION; DIMETINA. P. E. Panzironi and E. Zilli. Nuntius Radiol., Belluno, 13/3-4 167-85(1947).

6205

EFFECTS OF FAST ELECTRONS OF A 6 MEV-BETATRON ON BIOLOGICAL SUBJECTS. Gerhard Schubert. Intern. Congr. Radiol., 6th Congress, London, 1950. p. 164.

Studies using B. coli, Hordeum, V. faba, D. melanogaster, S. maculosa, chick heart fibroblasts, rat erythroblasts and Ehrlich's carcinoma were carried out to evaluate the biological effectiveness of physically equal doses of fast electrons (2-6 MeV) and 200 kV x rays. In most instances there were quantitative differences in the effectiveness of equal doses of the two types of radiation and these are attributed to differences in specific ionization and ion cluster formation. Qualitative differences in response were observed in some systems and these are interpreted in light of "concentration", "saturation" and "accumulation."

6206

THE EFFECT ON THE NURSING MOUSE OF THERAPEUTIC DOSES OF I¹³¹. Roberts Rugh. Intern. Congr. Radiol., 6th Congress, London, 1950. p. 168-9.

Suckling mice begin to remove I¹³¹ by way of milk of their I¹³¹-bearing mothers within 8 min. of the time that the mothers are injected with the isotope. Within 4 hr. after injection, I¹³¹ in the nursing litter may exceed that in the mother. Ratios of I¹³¹ in tissues of nursing vs. non-nursing mothers are presented to show that distribution of the isotope is drastically altered by lactation. Histological observations of thyroid glands of mothers and litters are also described.

6207

THE VIABILITY OF INDIVIDUALS HETEROZYGOUS FOR RECESSIVE LETHALS. E. Novitski and C. Stern. Science 108, 538-9(1948).

The assumption that individuals heterozygous for recessive lethals are equivalent to homozygotes free of lethal alleles was tested for 33 sex-linked lethals in D. melanogaster and found not to be correct for the majority of them.

6208

INFLUENCE OF OXYGEN TENSION ON RADIOSENSITIVITY. John Read. Internat. Congr. Radiol., 50, 6th Congress, London, 1950. p. 50.

After reviewing previous studies of the influence of oxygen on the response of normal and tumor tissue to x radiation experiments of V. faba roots are described. Qualitatively, histological changes (abnormal anaphases) are similar in root tips irradiated in presence and in absence of oxygen, but are quantitatively much greater in the oxygen series. Oxygen exerts its effect only if it is present during irradiation. Radiosensitivity readjusts itself after only a brief lag period if the oxygen concentration in a root is suddenly changed. The effect of anaerobiosis is the same regardless of gas used to displace oxygen in the medium during exposure. Anaerobiosis does not diminish the effect of nitrogen mustard. Oxygen enhances the effect of all x ray doses studied to the same extent, specifically by a factor that increases with concentration in a sigmoid fashion to a maximum of 3 with x rays and 1.3 with α rays.

6209

INFLUENCE OF VARIOUS LIPIDS UPON THE HEALING PROCESS OF EXPERIMENTAL RADIATION BURNS. Emanuel Revici. Internat. Congr. Radiology, 6th Congress, London, 1950. p. 175.

The author produced radiation "burns" in rats by means of 10 mg radium needles and studied the effect of locally administered lipids that varied with respect to their polar groups (carboxyl or hydroxyl) on the healing process. Lipids with a hydroxyl radical promoted rapid healing, lipids with carboxyl groups retarded healing.

6210

NEW OBSERVATIONS AND EXPERIMENTAL FINDINGS ON THE EFFECT OF VERY SMALL ROENTGEN DOSES. R. Pape. Radiol. Austriaca 4, 35-51(1951).

Rats and guinea pigs were used in these studies in effects of repeated exposure to very small x ray doses. Single or repeated exposure to doses of from 1-20 r caused nuclear changes in cells of spleen, 312 doses of 0.25 caused a 3 fold increase in leukocyte counts of rats. A combination of doses was found which increased spermatogenesis. Tuberculous guinea pigs exposed to small doses showed stimulation of the reticulo-endothelial system, decreased exudation and increased cell resistance. The author discusses the neurohormonal aspect of transient leukocyte depression following small doses. Observations on growing plants are also included.

6211
IMPORTANT VARIATIONS IN THE ORGANIC FINDINGS AFTER TOTAL AND LOCAL IRRADIATION AND THE PARTICULAR EFFECTS OF SMALL SCALE DOSAGES. THE SPLEEN AS A TEST FOR VARIOUS RADIATION EFFECTS. R. Pape and N. Jellinke. Radiol. Austriaca 3, 43-62(1950).

Histological studies were carried out on spleens (rat) that had been irradiated locally (in vivo) with x ray doses of (1) 100 r or more (2) 30 r or less. Lymphoblasts showed nuclear changes when examined 3 hr. after 2-5 r. Recovery following local exposure to larger doses occurs by rapid influx of mature lymphocytes by way of the circulation in contrast to the recovery pattern after total body exposure to the same larger doses when regeneration is slow and delayed. Preliminary small dose of 3-20r appeared to confer considerable protection against a subsequent dose of 300 r

6212
HISTOLOGICAL FINDINGS AFTER VERY SMALL DOSES OF IRRADIATION. R. Pape. Internat. Congr. Radiol., 6th Congress, London, 1950. p. 162-3.

Changes in the rat spleen following total body exposure to single or repeated doses of 1-20 r and after daily doses of 0.25 r for 1 year are described. Lymphocytes increased in the spleen (to 3x normal) after a year of 0.025 r/day. Effects of larger doses (300-600 r) following repeated small doses are also described. Effects of small doses on the spleen are considered in light of changes observed in the inflammatory response in various tissues and in spermatogenesis. Small doses are considered to have a protective effect on cells.

6213
EFFECTS OF RADIO-PHOSPHORUS IN MINUTE DOSES ON BLOOD AND SOME IMPORTANT ORGANS. R. K. Pal and B. N. Mitra. Indian. J. Physiol. and Allied Sci. 4, 42-9(1950).

Rabbits sustained severe injury of their bone marrow after being injected with P^{32} . There was also a marked hypercalcemia and injury of thyroid, kidneys and liver.

6214
DELAYED EFFECT OF X-RAYS ON PEPSIN. R. S. Andersen. Brit. J. Radiol. 27, 50(1954).

There is some immediate loss of enzyme activity in pepsin when it is irradiated in either the presence of absence of oxygen. On standing, there is a further loss which is temperature-dependent and is more marked following irradiation in air. The observed changes are not affected by the concentration of the enzyme in solution during irradiation and appear to be due to changes in the protein molecule *per se*.

6220
TIME-INTENSITY FACTORS IN TOTAL-BODY IRRADIATION. Edith Paterson. Internat. Congr. Radiol., 6th Congress, London, 1950. p.161. also: Brit. J. Radiol. 25, 427(1952).

Mice exposed to 250 Kv x rays were used in this study of the role of over-all time of irradiation in the biological effectiveness of a given dose. Criteria of effectiveness included LD_{50} , mean survival time and variance. Over-all times of 10 min. were compared with times of 24 and 48 hr, and with 5, 10 and 20 days. For any given time factor, probits of mortality % plotted against dose gave a straight line. The LD_{50} rises as over-all time is extended to daily doses. Other observations are also reported and discussed.

6221
THE EFFECT OF RADIO-ACTIVE PHOSPHORUS ON THE BLOOD OF THE GROWING CHICK. K. G. Scott and S. F. Cook. Proc. Natl. Acad. Sci. U. S. 23, 265-72(1937).

Hematological effects of P^{32} administered as H_3PO_4 to birds were different from effects of x rays. Lymphocytes were relatively little affected by P^{32} but neutrophil granulocytes were markedly reduced in number, probably due to deposition of the isotope in bones. Growth of the treated birds was normal and the birds showed no permanent injury.

6222
PATHOLOGY OF SWINE EXPOSED TO TOTAL BODY GAMMA RADIATION FROM AN ATOMIC BOMB SOURCE. J. L. Tullis, B. G. Lamson and S. C. Madden. Am. J. Pathol. 31, 41-61(1955).

Lymphoid organs in swine reacted similarly to an amount of total body gamma radiation which was 100% lethal. Necrosis of lymphoid cells, arrest of mitotic activity, depletion of hematopoietic cells of marrow, damage to the epithelium lining basal mucosal glands of the small intestine, destruction of spermatogonia and ulcers in the alimentary tract were observed.

6223
EFFECT OF EXTRA VITAMIN B FEEDING ON RATS EXPOSED TO WEAK GAMMA RADIATION. G. M. Scott. Brit. J. Radiol. 19, 329-32(1946).

General condition, weight gain and fertility were studied in rats exposed to 60-85 r of γ radiation per week for 4 months. Some of the rats received Vitamin B supplements, some did not. Rats receiving the supplement had greater weight gain, better coats and some lessening of radiation effect on fertility. Irradiated females had normal incidence of pregnancies but many abortions. Irradiated male rats sired no offspring.

THE EFFECT OF TEMPERATURE ON X-RAY INDUCED CHROMOSOME ABERRATIONS. Karl Sax and E. V. Enzmann. Proc. Natl. Acad. Sci. U. S. 25, 397-405 (1939).

When nuclei are irradiated during resting stage or mid-prophase, high temperatures accelerate reunion of broken ends, many breaks being reunited in their original positions. Low temperatures delay reunion and result in many illegitimate unions (chromosome aberrations). The temperature effect is reversed in early prophase chromosomes. Physiological and genetic factors that may account for the various response to altered temperature are discussed.

6240

X-RAY INDUCED CHROMOSOME ABERRATIONS AND THEIR SUBSEQUENT BEHAVIOR. Karl Sax. Genetics 25, 134(1940).

Both chromosome and chromatid aberrations produced by x-rays. Frequency of aberrations produced by single breaks shows a linear relation to dosage, while those dependent upon two breaks increase as the square of dosage. Many aberrations produce single or double chromatid bridges at anaphase. When these bridges break, new fusions of broken ends occur, although some broken ends appear to behave as normal ends.

SOME BIOLOGICAL PHENOMENA UNDERLYING RADIATION MORTALITY. George Sacher and Sylvanus A. Tyler. August 1, 1947. Decl. May 26, 1948. 33p. (AECD-2024-F) NSA 1-40F

In recent years much progress has been made in the application of modern statistical methods to the evaluation and comparison of dosage-mortality curves based on small samples. In this paper an extensive body of dosage-mortality data is analyzed. Records on some thousands of mice which received single doses of X-rays were available. These mice were irradiated in groups which were kept together throughout the period of observation. On each group of mice, information was obtained on (1) the X-ray dose given, (2) age, (3) the proportion of the group which died within twenty days after treatment, and (4) the mean survival time of the nonsurvivors. The analysis was directed toward exhibiting the relations between these variables as clearly and completely as possible. The aim was to determine whether mortality could be investigated as a physiological variable, i.e., whether degree of killing and mean time to death could reveal anything about the functional nature of the mechanisms of radiation injury and mortality. There are several observations which can be made. First, the existence of successive orders of injury can be postulated. A given order of injury can appear only when injury of the previous order has reached a certain degree of severity. Second, if successive orders of injury exist, and if the appearance or non-appearance of a certain order of injury depends on external factors other than the administered dose, then multiple-valued relations between dose and mortality can exist. Present evidence indicates that the rate of mortality at a given time after irradiation is dependent on the instantaneous intensity of injury existing at that time, and further that rate of mortality is a rapidly increasing function of intensity of injury. The results so far reported are sufficient to justify the further investigation of the process of radiation injury and mortality, by methods which could be developed for use with data from properly designed experiments.

CONCERNING THE REGENERATION OF LYMPHORETICULAR TISSUE AFTER RADIATION INJURY. Rudolph Pape and Alexandra Piringer-Kuchinka. Strahlentherapie 101, 523-35(1956).

Regeneration of lymphoreticular tissue of spleen after 1000 r regional irradiation has been examined in 39 rats. Rapid destruction is matched by proliferation of the remaining large and small reticulum cells. Within 27 to 30 hours, follicles poor in cells become abundant in cells. The amitosis and especially the meromitosis are of highest importance. Destructive processes are dependent on dose while regeneration is subordinate to physiological changes in rest of the body. THE LETHAL ACTION OF X-RADIATION, STABLE ISOTOPES OF FISSION ELEMENTS, Sr^{89} AND (Ba-La)¹⁴⁰ ON GOLDFISH. C. Ladd Prosser, C. W. Hagen, Jr., and W. Grundhauser. July 1947. Decl. Nov. 20, 1947. 21p. (MDDC-1480, ANL-4017).

Solutions of stable barium at 1 ppm killed 50 per cent of goldfish within 30 days. Cerium was toxic at 10 ppm, and bromine, at 1000 ppm. Solutions of strontium and iodine were nontoxic, at least up to 1000 ppm. Single doses of 850 r X radiation killed 50 per cent of goldfish within 30 days. Half a group of goldfish receiving 100 r daily were dead at 26 days; half a group at 50 r daily were dead at 33 days, whereas half the controls and those receiving 25 r daily were dead at 40 days. Calculations of radiation dosage show that in solutions containing fission products at 1 $\mu\text{c}/\text{ml}$, the dose due to external radiation is a small fraction in comparison with that due to internal radiation. In solutions of Sr^{89} at an initial concentration of 0.1 $\mu\text{c}/\text{ml}$, deaths were no more frequent than among controls. At an initial concentration of 0.4 $\mu\text{c}/\text{ml}$, however, a significant number of deaths occurred. On the basis of measurements of accumulated Sr^{89} , the median total accumulated dose of internal beta radiation varied from 1,580 to 27,550 rep at daily (24 hour) rates of 50 to 680 rep. Lethal doses for goldfish in aquaria in which Sr^{89} was replenished monthly were similar to those given in a single dosage. This similarity was also observed for lethal doses in single experiment with (Ba-La)¹⁴⁰.

ACCUMULATION AND DISTRIBUTION OF RADIOACTIVE STRONTIUM, BARIUM-LANTHANUM, FISSION MIXTURE AND SODIUM IN GOLDFISH. C. Ladd Prosser, William

Pervinsek, and Jane Arnold. Feb. 15, 1945. Decl. Nov. 18, 1946. 40p. (MDDC-496, CH-3233).

Small non-feeding goldfish accumulated radioactive strontium, barium-lanthanum, fission mixture elements and sodium from solution in which they were immersed. Accumulation was rapid initially and continued at a rate greater than the loss of radioactivity in the medium by decay and adsorption. Hence, the ratio of the concentration of active material in the fish to that in the solution increased with time. After a few days this concentration ratio was usually between 10 and 100. The concentration ratio was independent of dose over the range investigated (0.01 μc to 1.0 $\mu\text{c}/\text{ml}$). Calcareous tissues, such as skeleton and scales, accumulated about 75 per cent of the radio-strontium and radio-barium in the whole fish. Lanthanum and a mixture of cerium, yttrium and zirconium-columbium appeared to be accumulated in visceral tissues, especially the intestine, and to be more actively adsorbed on feces and glass than were the alkaline earths. The comparable distribution, particularly of bone-seekers, on immersion and injection indicated that these elements were taken up through gill and oral membranes and were distributed by the blood. Radio-strontium was present in greater proportion in the gills at six hours than later. Fission mixtures shifted in abundance from soft parts to bony portions of the gills during the first few days. Injection experiments indicated that there was no fecal excretion of strontium but that there was a small amount of fecal excretion of Ba^{140} - La^{140} and of fission mixture. Some fission mixture components appeared to be taken out of the medium, either from feces of water, and precipitated along the intestinal folds. The yolk of eggs in ripe ovaries accumulated some components of fission mixture but not strontium or barium. Young growing or regenerating bone accumulated more radioactive material than did older bone, cartilage accumulated none of the bone-seekers. Large mature goldfish accumulated radioactive material more slowly than did small fish. This may have been in part related to their calcium turnover. Uptake of strontium⁸⁹ and uptake of fission mixture were shown to be greater when the surrounding pond water was low in calcium (1.8 p.p.m.) than when it was high in calcium (36 p.p.m.). Inactive strontium also retarded the uptake of radio-strontium. When the fish were transferred from active to inactive pond water they lost some Ba-La and fission mixture radioactivity from soft tissues during the first few hours but they did not lose the major part of their radioactivity any faster than by decay alone. The rate of loss of radio-strontium appeared to be unaffected by the calcium content of the water. Goldfish were unable to desorb any appreciable quantities of fission elements from suspended clay.

LETHAL EFFECTS OF P^{32} ON PARAMECIUM AURELIA. E. L. Powers, Jr., Deborah Shefner, M. J. Richard and R. Sato. August 1, 1947. Decl. May 26, 1948. 4p. (AECD-2024-P, ANL-4078). NSA 1-40P

Further results on the response of *P. aurelia* to exposure to P^{32} , Sr^{89} , 90 and Y^{90} have been obtained, and a partial summary statement of observations to date is presented.

There is observed increasing death with increasing P^{42} radioactivity. Death following exposure to the Sr solution increases with increasing activity. Comparison of survival following phosphorus exposure to that following strontium treatment at the same activity level, reveals that in all instances survival of the phosphorus-treated animals is the same or significantly lower than survival of strontium-treated animals. From these data it appears that the phosphorus-treated animals are injured to a greater extent than the strontium-treated animals. NSA 1-40P.

PHYSIOLOGICAL OBSERVATIONS ON RABBITS EXPOSED TO SINGLE DOSES OF X RAYS. E. E. Panter, C. Ladd Prosser and M. C. Moore. 1946. *Decl. Mar.* 4, 1947. 79p. (MDDC-761; CH-3727).

Most of the acute deaths among rabbits after single total-body X-radiation occur in the first two days or at 10-15 days after irradiation. Signs of clinical depression are seen in survivors of sublethal doses during each of these periods, termed the initial shock period and the principal acute radiation death period. The femoral arterial blood pressure of unanesthetized rabbits declined rapidly from a control of approximately 98 mm Hg to a minimum of about 50 mm Hg at 1-1/2 hours after doses of 600 r or greater. Proportionately smaller reductions in blood pressure occurred after 400 and 200 r. The threshold for 10-20 mm drop was approximately 50 r. During the first few hours the heart rate increased and rectal temperature rose, although the latter effect was largely due to confinement in treatment boxes. Survivors of the initial shock period showed partial recovery of blood pressure, but at about 10 days, blood pressure again declined, particularly in rabbits which died acutely. Low blood pressures were not observed at this time after doses of 400 r or less. Plasma protein concentration declined slightly during the acute post-irradiation period. Plasma volume as measured by Evans blue space was not significantly altered in the initial shock period after a dose of 800 r. Intradermally injected dye (Evans blue) spread more rapidly in the irradiated than in non-irradiated skin during the first few hours after irradiation. At the same time intravenously injected dye appeared in the interstitial space of a patch of irradiated skin much earlier than in non-irradiated skin. At 10-20 days after irradiation, intravenously injected fluorescein appeared within a few seconds in an irradiated area of skin and in several minutes in a non-irradiated area. These results indicate increased flow in skin lymphatics in the first few hours and increased passage out of capillaries in this period as well as during the period of maximum erythema. During the day following a dose of radiation in the lethal range, rabbits eat less than 20 per cent and drink less than 60 per cent of their normal amounts. Thereafter, food and water consumption increase partially but remain below normal in rabbits which die in the acute period. Recovery in survivors occurs gradually over about a month. Average weight loss is marked (10-15 per cent) in the first three days; weight remains diminished for about one week, after which some rabbits die and others begin a gradual recovery in weight which is not complete by 30 days. Some individual

rabbits show two minima in food and water intake and in weight; one at 1-2 days, and the second, at 10-15 days. Rabbits show a polyuria on the 2nd day after receiving 800 r. Thereafter urine output decreases slightly below control values but not as much as water intake decreases. Non-irradiated rabbits were transfused with 50 ml of blood from irradiated rabbits. Blood removed from rabbits 1-1/2 hours after 800 r caused an average fall of 26.2 mm in arterial blood pressure of the recipients, blood removed 5-12 days after irradiation caused variable but much smaller fall in the pressure of the recipient. Blood from non-irradiated donors had no significant depressant effect. Histamine analyses of blood and plasma were made by the method of Code. The plasma of non-irradiated rabbits had an average of 0.3 μ g/ml, while plasma removed about 1-1/2 hour after 800 r contained a mean of 0.6 μ g/ml. The values for whole blood declined due to removal of cells in subsequent sampling.

RADIO CERIUM (^{140}Ce). R. Overstreet, L. Jacobson, K. Scott, and H. Fisher. [nd]. *Decl. July 14, 1947*. 1p. (MDDC-1142-B, CH-554; A-678).

Preliminary results of experiments in which animals received radio-cerium by intramuscular or intraperitoneal injection or by stomach tube are included in this report. These studies were intended primarily to determine distribution and retention of the isotope.

6281

INTRA-UTERINE DEATH TIME IN SEMI-STERILE MICE. Eileen M. Otis. *Anat. Record* 105, 533(1949).

"Inviability" of zygotes considered to be due to unbalanced chromosomes, was studied in semisterile mouse pedigrees descended from chronically x irradiated males. The time of intrauterine death is compared with the times of appearance and differentiation of various organs and tissues in the embryos. Extrapolating from the time scale for the mouse to that for man, it is suggested that the observed time of intrauterine failure in the mouse would correspond to the 2nd to 6th week of human pregnancy

EXPERIMENTAL STUDIES ON THE EFFECT OF ROENTGEN RAYS ON THE BLOOD AND SOME COMPARISONS WITH THE EFFECT OF RADIUM AND ULTRA VIOLET LIGHT. P. Linser and E. Helber. *Dtsch. Arch. Klin. Med.* 83, 479(1905). (In German).

Barley embryos at various stages of development were exposed to x ray doses ranging from 50 r to 800 r. Less mature embryos were affected by doses as low as 200 r, in contrast to nearly mature embryos which showed little effect after 500 r. There appeared to be a threshold dose for cytological effects and this dose was lower than that required to produce effects at a tissue or organ level.

REPORT ON HAND STUDY. Margaret Nickson. Aug. 1, 1945. *Decl. Aug. 29, 1947* 37p. (MDDC-1270; CH-3368).

Observations have been made of the hands of 973 laboratory and office personnel. Deviations from normal have been noted and photographs taken. Finger ridge impressions have been made of 1287 individuals of whom 15 showed some abnormality. Capillary counts have been done on 838 individuals. The number of capillaries in a given area of nail fold shows some correlation with possible exposure to radioactive materials.

Capillary photographs have been taken of 93 individuals. There is a rough correlation between the morphology of the capillaries and the exposure of the hands of young individuals. Normal aging tends to produce the same or similar changes. Further capillary studies are necessary to confirm or deny the apparent relationship between hand exposure and increased or prematurely aged terminal capillaries. Photographs and a bibliography of 119 references are included.

Argonne National Lab., Lemont, Ill.
EFFECT OF SINGLE DOSE X RAY TO THE NAIL FOLD AREA OF HUMAN SUBJECTS. PRELIMINARY REPORT. M. Nickson. June 20, 1947. *Decl. Sept. 11, 1947*. 6p. (MDDC-1269; CH-3833).

The nail told area of the left fourth finger of fifteen subjects was observed before and after a single radiation exposure. The total dose ranged from 200 r to 600 r. From this brief and incomplete study it appears that radiation exposures of 600 r or less when given as a single dose under the conditions described, produce no constant microscopic or macroscopic reaction. The transitory effects were most often microscopic and consisted of hyperemia of the small terminal vessels and dilation of vessels visible in this area before and after radiation.

6294

Argonne National Lab., Lemont, Ill.
SECOND REPORT OF HAND STUDY PROGRAM. M. Nickson and L. Warner. January 1947. 21p. (MDDC-1217; CH-3753).

Methods to determine early radiation damage or damage which has occurred without the individual's being conscious of any change fall into two categories, macroscopic and microscopic. Two methods were used in the laboratory for determining macroscopic changes: (1) direct inspection of the hands. (2) The hands were photographed, the photographs enlarged and the enlarged photographs were studied. There are two macroscopic changes in the skin after acute and chronic radiation, namely erythema following acute radiation, and atrophy after chronic radiation. Unfortunately, both radiation erythema and/or atrophy will also result from stimulation other than radiation. Microscopic examinations of the vessels at the base of the nail were made. Of the 593 individuals studied for radiation damage to finger ridges, 18% had some abnormality. All of these abnormalities were minimal. Reversible changes due to mechanical flattening of the ridges were found among machinists, carpenters, and others doing manual labor. Such findings which may be confusing after a single examination can be excluded by repeated studies after time intervals to allow for regeneration. Capillary counts were found to range between 18 and 22 in over half of the individuals studied and between 18 and 27 in 80%. Persons with dark skin pigment had slightly lower counts whereas persons over 50 years of age had counts in the high portion of the average range. Sex had no effect on the count. Radiation exposure at levels received in the laboratory had no effect on the count during the period of time covered by this study. This report is a continuation of studies described in MDDC-1270.

6295

SECTORING IN COLONIES FROM IRRADIATED CELLS OF *ESCHERICHIA COLI*. H. B. Newcombe. *Genetics* 36, 570(1951).

With ultraviolet doses of 500 and 100 to 100 ergs/mm² 15-20% of colonies sectoried; with gamma dose of 40,000 to 80,000 r 6-7% sectoried. Sectoring, which survives selection, could be due to delayed mutation, genetic interchange between two nuclei in treated cells, mutation in incompletely split chromosomes, or mutation in hereditary particles other than chromosomal genes. (from abstract).

6300

THE EFFECT OF IRRADIATION ON THE PLASMA ERYTHROPOIETIC STIMULATING FACTOR. J. W. Linman and F. H. Bethell. *Blood* 12, 123-29(1957).

An erythropoiesis-stimulating factor could be demonstrated in protein-free filtrates of rabbits made anemic by x-irradiation alone or made anemic by administration of phenylhydrazine after x irradiation. Data suggest that the erythropoiesis-stimulating factor is not produced by a highly radiosensitive tissue.

6305

INDUSTRIAL MEDICINE ON THE PLUTONIUM PROJECT. Robert S. Stone. New York, McGraw Hill Book Company, Inc. 1951. 511p. (National Nuclear Energy Series Division IV, Volume 20).

This volume includes chapters on medical services of the Plutonium Project, biological bases for maximum permissible exposures, protective measures for personnel, clinical and hematological studies on personnel, retention and excretion of plutonium and uranium, biochemical effects of radiation and metals, and clinical and hematological studies on patients receiving whole body x irradiation.

6306

BIOLOGICAL EFFECTS OF EXTERNAL BETA RADIATION. Raymond E. Zirkle. New York, McGraw Hill Book Company, Inc. 1951. 242p. (National Nuclear Energy Series Division IV. Plutonium Project Record Volume 22E).

Reports of the initial Plutonium project studies of the effects of β radiation on laboratory animals are collected in this volume. Dosimetry, laboratory methods, clinical and histological studies on experimental animals and studies of lethality of extensive exposure to β rays are described. Studies on tumor induction in acutely and chronically exposed animals are included.

6307

Argonne National Lab., Lemont, Ill., Chicago University, Metallurgical Lab.

THE RADIOBIOLOGICAL IMPORTANCE OF SPECIFIC IONIZATION. R. E. Zirkle. Sept. 21, 1943. Decl. Oct. 9, 1946. 30p. (MDDC-444; CH-946).

The relative effectiveness of fast neutrons, x rays and γ rays on plants and animals are compared and the effectiveness ratios are shown to reflect the specific ionization of the radiations. Ratios differ depending on the effect measured. Implications of the differences in effectiveness of the three types of radiation with respect to health protection are discussed.

6308

SOME EFFECTS OF ALPHA RADIATION UPON PLANT CELLS. R. E. Zirkle. J. Cellular Comp. Physiol. 2, 251-74(1932).

Alpha rays from polonium retard and inhibit three processes in the germination of spores of *Pteris longifolia*: cracking of the spore wall, development of chlorophyll and cell division. Numbers of unscreened α particles per protoplast required to produce 50% inhibition of cracking, greening and division are 33,000, 13,000 and 4,000, respectively. (2,000, 800 and 250 α -particles per nucleus and 8.3×10^{-6} , 3.3×10^{-6} and 1.0×10^{-6} ergs, respectively, per μ^3 of the protoplast). (from author's summary).

6309

Oak Ridge National Lab., Tenn.
THE EFFECT OF AGE ON THE RADIOSENSITIVITY OF MICE. R. E. Zirkle, E. Anderson, E. F. Riley and H. J. Curtis. Mar. 28, 1946. Decl. Oct. 29, 1946. 6p. (MDDC-418, MonH-89).

The dose of radiation required to kill 50% of groups of male and female mice of age groups ranging from 1.5 to 12 months was determined. Females were more resistant than males, but no change in radiosensitivity with age was observed.

6310

PLUTONIUM PROJECTS SYMPOSIUM. Raymond Zirkle, et al. Radiology 49, 269-365(1947).

These papers report studies on the acute lethal action of slow neutrons on mice and effects of chronic irradiation on mice, guinea pigs and rabbits. Individual papers are included and indexed as separate references in this bibliography.

6314

THE ACTION OF IONIZING RAYS ON SEA-URCHINS. V. THE MITOTIC OBSERVATIONS ON THE EFFECTS OF ROENTGEN RAYS UPON THE UNFERTILIZED EGGS AND SPERM. H. Yamashita, K. Mori and M. Miwa. Gann 34, 239-45(1940).

All stages of mitosis between fertilization and first cleavage were studied in normal and x irradiated sea urchin eggs. Delay in first cleavage was found to be a phenomenon of the nuclear streak phase and prophase. On the basis of these and earlier observations, the author suggests that the nuclear streak phase is a critically important stage with respect to radiation injury of living cells. (from authors' abstract).

6315

SOME EFFECTS OF RADIATION ON LIVING BONE. Helen Qumcey Woodard. Internat. Congr. Radiol., 6th Congress, 1950. p. 161-2.

Approximately 1.5 cm of one hind leg of male albino mice was x irradiated; rest of body shielded. Alkaline phosphatase activity of irradiated and control legs was measured at intervals of 4-50 days after exposure. Doses of 900 r-1500 r depressed the enzyme activity in irradiated bones within 4-7 days. There was partial recovery but not complete recovery even after 50 days following 900 r. A dose of 3000 r nearly abolished alkaline phosphatase activity and was not followed by recovery.

6316

GLUTATHIONE AND ASCORBIC ACID IN THE TISSUES OF NORMAL AND TUMOR-BEARING ALBINO RATS. G. E. Woodward. Biochem. J. 29, 2405-12(1935).

Doses of x ray sufficient to retard tumor growth decreased the values of glutathione in Walker No. 256 carcinoma and Philadelphia No. 1 sarcoma. An ascorbic acid-like substance in the tumors was decreased only in sarcoma after irradiation. Tumors resistant to radiation showed no change in either chemical constituent after irradiation.

6317

A STUDY OF THE LOCAL ROENTGEN REACTION ON THE SKIN OF MICE, WITH SPECIAL REFERENCE TO THE VASCULAR EFFECTS. F. Devik. Acta. Radiol., Suppl., 119, 1-72(1955).

Dermal necrosis following irradiation reflects epithelial damage paralleling that seen in the intestinal tract. Mitosis and differentiation stop, the basal layer disappears. These changes are followed in turn by squamous metaplasia, acanthosis, dyskeratosis and parakeratosis. Ulceration represents failure to replace shed epithelium. Epithelial cells within the heavily irradiated field - not the neighboring shielded cells - are the ones that become hyperplastic.

6318

DIFFERENCE IN THE EFFECTS OF X-IRRADIATION IN RAT EMBRYOS OF DIFFERENT AGES. James G. Wilson and John W. Karr. Anat. Record 106, 259-60 (1950).

Development of embryos exposed and irradiated in utero on the 9th day of gestation was more seriously affected than was that of embryos irradiated on the 10th day. The lethal dose was 200 r on the 9th, 400 r on the 10th day. Sublethal doses caused specific malformations in survivors, the eye being the most common site, followed by brain. Other abnormalities found are also described.

6319

EFFECTS OF X-IRRADIATION ON EMBRYONIC DEVELOPMENT IN THE RAT. James G. Wilson. Anat. Record 103, 520-1(1949).

6320

CHANGES IN CHROMOSOME SENSITIVITY TO X-RAYS. G. B. Wilson and B. R. Nebel. Genetics 25, 140(1940).

Microspores of *Tradescantia reflexa* Raf. were irradiated at various stages preceeding first pollen-grain metaphase. Using degree of chromosome alteration at first pollen-grain metaphase as an index of radio-sensitivity, the authors found a positive correlation between speed of mitotic development and "sensitivity."

6321

THE NON-INDUCTION OF MUTATIONS BY X-RAYED CYTOPLASM. Anna R. Whiting. Genetics 35, 139-40(1950).

Habrobracon eggs irradiated with x ray doses greater than 2500 r during first meiotic metaphase failed to hatch and were found to have chromosome injury severe enough to prevent movement of the egg pronucleus. Such eggs, when fertilized, may develop into haploid androgenetic males. No mutations appeared in any such males (sperm

were not irradiated) and they transmitted only paternal traits to their offspring.

6322

THE EFFECTS OF ATOMIC ENERGY ON THE BLOOD. Lionel Whitby. Prensa med. argent. 34, 648-50(1947).

Effects of radiation on the blood are reviewed and illustrated by the changes observed in victims of atomic bomb explosion.

6323

PHYSIOLOGICAL AND PATHOLOGICAL CHEMISTRY OF THE SKIN. E. Urbach and H. Schnitzler. Klin. Wochschr. 8, 2179-84(1929). (In German).

Toxic action of massive doses of x ray is described. Blood urea nitrogen level increased three fold; Cl decreased. Effects were similar to those of protein intoxication. (Experiments on animals).

6324

ASPECTS OF THE CHEMICAL AND BIOLOGICAL ACTION OF RADIATIONS. J. Weiss. Trans. Faraday Soc. 43, 314-24(1947).

Author discusses absorption of energy from x rays, γ rays, α particles and neutrons; free radical formation, recombination of free radicals and the target theory.

THE RADIOSENSITIVITY OF AUXIN BIOSYNTHESIS. R. P. Weber and S. A. Gordon. p. 91-3 of DIVISION OF BIOLOGICAL AND MEDICAL RESEARCH; QUARTERLY REPORT, AUGUST, SEPTEMBER, OCTOBER, 1951. Austin M. Brues. [nd]. 133p. (ANL-4713).

Preliminary experiments on the radiosensitivity of the enzyme complex involved in the conversion of tryptophan to auxin in bean seedlings are summarized.

6327

Argonne National Lab., Lemont, Ill.
THE RADIOSENSITIVITY OF AUXIN BIOSYNTHESIS. R. P. Weber and S. A. Gordon. p. 79-80 of DIVISION OF BIOLOGICAL AND MEDICAL RESEARCH, QUARTERLY REPORT MAY, JUNE, JULY, 1951. Austin M. Brues. [nd]. 112p. (ANL-4676).

The ability of plant tissue to produce auxin is rapidly decreased by doses of ionizing radiation in the range of 25-100 r. The authors' experiments indicate that the radiosensitivity is due to the lability of enzymes involved in auxin production rather than to sensitivity of intermediates formed during auxin synthesis of auxin itself. (from authors' abstract).

Argonne National Lab., Lemont, Ill.
RADIATION INDUCED CHANGES IN ULTRAVIOLET ABSORPTION SPECTRA OF URINE: II. QUANTITATIVE SPECTROPHOTOMETRIC STUDIES. Lee Wattenberg, and Samuel Schwartz Nov. 1946. Decl. Feb. 26, 1947. 33p. (MDDC-701; CH-3661).

Quantitative analysis (U-V absorption at 245 mu) for kynurenic acid was carried out on urine of 13 dogs after lethal x ray doses administered as a single or multiple exposures. An increase in kynurenic acid was observed in urine of 12 of the 13 dogs shortly before death. A similar increase was observed shortly before death in urine of 1 of 2 dogs dying from injury due to injected plutonium.

6329

Argonne National Lab., Lemont, Ill.
RADIATION INDUCED CHANGES IN ULTRAVIOLET ABSORPTION SPECTRA OF URINE: I. GENERAL EFFECTS.

L. Wattenberg and Samuel Schwartz. June 18, 1946. Decl. Feb. 25, 1947. 31p. (MDDC-700; CH-3541).

Changes in the ultraviolet absorption spectra of urine from dogs receiving either external or internal radiation are described. Increases in kynurenic acid and uric acid were observed.

6330

INACTIVATING MUTATIONS PRODUCED BY X-RAYS IN BACTERIOPHAGES. J. D. Watson. Genetics 33, 633-4 (1948).

In addition to inactivating phage, x rays suppress the phages ability to infect bacteria. For every 3 inactivating hits, one adsorption-suppressing hit occurs. Mechanisms of x ray and ultraviolet inactivation and reactivation of phage are discussed.

6331

ROENTGEN RAY INTOXICATION. II. THE CUMULATIVE EFFECT OR SUMMATION OF X-RAY EXPOSURES GIVEN AT VARYING INTERVALS. S. L. Warren and G. H. Whipple. J. Exptl. Med. 38, 725(1923).

The clinical and histological consequences of a single large x ray dose over the abdomen of dogs was compared with effects of sublethal doses to the same area followed, during the period of clinical intoxication, by smaller doses. Small but repeated doses of radiation given within a 5 or 6 day period caused almost the same cell injury and clinical intoxication as did a single dose equal to the sum of smaller doses. If the smaller doses were given at intervals of 6 days or longer, their effects no longer appeared to be additive.

STUDIES IN RADIATION SICKNESS: II. VITAMINS B₁ AND C AND SMALL INTESTINAL CHANGE IN RADIATION SICKNESS. W. S. Wallace. Southern Med. J. 34, 170-3 (1941).

6337

THE SITE OF DAMAGE IN AMOEBAE EXPOSED TO X-RAYS. M. J. Ord and J. F. Danielli. Quart. J. Microscop. Sci. 97, 29-37(1956).

Authors studied the role of nucleus and cytoplasm (using technique of nuclear transplantation) in irradiation damage in *Amoeba proteus*. Evidence is presented to show that irradiated cytoplasm can damage the unirradiated nucleus, i. e. not all nuclear damage need be direct. Cytoplasmic effect is reversible. The 50% lethal doses

were in the ratio of 120,000 r for nuclei to 290,000 r for cytoplasm.

6338

SUBCELLULAR FRACTIONATION OF MOUSE SPLEEN RADIATION PROTECTION ACTIVITY. L. J. Cole, M. C. Fishler and V. P. Bond. *Federation Proc.* 12, 27(1953).

Various subcellular fractions of LAF₁ mouse spleen homogenates were tested for their protective effect in LAF₁ mice exposed to an LD₁₀₀ x ray dose. Only the fraction consisting of nuclei conferred protection. A crude nuclei acid extract prepared from the nuclei did not retain the protective properties.

6339

EXPERIMENTAL STUDIES ON EARLY LENS CHANGES AFTER ROENTGEN IRRADIATION. I. MORPHOLOGICAL AND CYTOCHEMICAL CHANGES. Ludwig von Sallman A. M. A. Arch. Ophthalmol. (Chicago) 45, 149-64(1951).

An x ray dose of 2000 r to the eyes of rabbits caused cataractous changes within 4-10 weeks in 53 of 56 animals exposed. The histological changes in lenses at various intervals after exposure are described.

6340

INTENSITY OF RADIATION AND SELECTIVE ACTION.

J. VanRoojen. *Brit. J. Radiol.* 12, 547-53(1939).

Author considers 2 hypothetical cell types that differ with respect to radiosensitivity and reparability and mathematically constructs a dose-intensity curve to predict the action of x rays on them. Implications of this type of analysis for tumor therapy are a major consideration.

THE EFFECT OF ULTRAVIOLET AND ROENTGEN RAYS ON THE REDOX-POTENTIAL OF THE FROG MUSCLE IN VIVO. Y. Uchimura. *J. Biochem.* 25, 207-17(1937).

Irradiation with ultraviolet or x rays increased the redox potential of frog muscle, the U-V effect being manifest shortly after irradiation, the x ray effect after a latent period. Recovery occurred sooner after U-V effect than after x ray effect. The author suggest that radiant energy acts by activating reducing agents in tissue.

6348

ALTERATION OF ISOELECTRIC POINT OF CELL COLLOIDS IN PLANTS UNDER THE INFLUENCE OF X-RAYS. R. G. Trudova. *Doklady Akad. Nauk. S.S.S.R.* 72, 197-9(1950). (In Russian).

Results of exposure of plants to 250, 500 and 13,000 are presented in tabular form. Following 250 r, maximal dislocation of the isoelectric point for nuclear colloids was observed one hour after, for plasma colloids five hours after x radiation. Following 500 r, a significant dislocation of the isoelectric point of nuclear colloids was observed 15 minutes after radiation. The maximum was attained one hour after radiation for nuclear colloids, and for plasma colloids the dislocation gradually decreased with time. Following 13,000 r a significant dislocation of the isoelectric point of colloids of plasma and nucleus occurred immediately after radiation; maximal dislocation being observed 15 minutes after irradiation.

Tennessee Univ.

QUARTERLY PROGRESS AND WORK ACCOMPLISHMENT REPORT FOR QUARTER ENDING SEPTEMBER 30, 1951. [nd]. 33p. (ORO-54).

Progress is reported in the study of the fission-products metabolism in domestic animals and the dependence of their behavior upon normal mineral metabolism. Blood-volume values for swine were determined using the P³²-labeled red-cell method. Swine with average body weight of 10 lb were found to average 7.4 ml of blood per 100 g body weight, while those averaging 344-lb body weight had 4.6 ml of blood per 100 g body weight. Values for intermediate body-weight groups are also included. Blood values for the south-western burro (*Equus asinus asinus*) were determined and are presented in tabular form. The multicurie irradiation field for large animals was loaded, calibrated, and placed in operation. Normal blood values for the healthy burro have been established to serve as a basis for following the changes caused by irradiation. Particular attention is invited to the results of a preliminary experiment on the

effects of whole-body irradiation upon the subsequent fertility of the male rabbit. These data emphasize the fact that observations on the sperm themselves or even on the initial fertilization do not suffice to give a true measure of irradiation effects on fertility; it is necessary, therefore, to use the number of viable young produced as the criterion. As an indication of results, it was shown that while control rabbits in 34 matings produced an average of 6.56 viable young per mating, the values for males exposed to 100, 200, and 300 r were 3.4 in 15 matings, 4.5 in 26 matings, and 3.2 in 16 matings, respectively. NSA 6-504

6355

THE EFFECTS OF X-RADIATION ON THYMUS NUCLEIC ACID. Babette Taylor, Jesse P. Greenstein and Alexander Hollaender. Science 105, 263-4(1947).

Authors studied viscosity changes in irradiated solutions of thymus nucleate.

THE EFFECT OF BETA IRRADIATION ON THE RESPIRATION AND MORPHOLOGY OF MELANOPLUS DIFFERENTIALIS EMBRYOS. Theodore N. Tahmsian and Jeanne Gasvoda. p. 154-80 of BIOLOGICAL AND MEDICAL DIVISIONS. QUARTERLY REPORT AUGUST 1948 TO NOVEMBER 1948. Austin M. Brues and Hermann Lisco. Nov. 1, 1948. 210p. (ANL-4227, AECD-2053).

Respiration of grasshopper embryos was increased during exposure to low doses of β radiation and decreased following exposure. Chromosome injury was observed and is considered to be both a direct and an indirect effect of exposure.

6361

THE EFFECT OF ADRENAL CORTICAL EXTRACT ON ADRENAL RESPONSE TO TOTAL BODY X-IRRADIATION. M. N. Swift, H. M. Patt and E. B. Tyree. Federation Proc. 7, 121-2(1948).

6362

THE ACTION OF INFRARED RADIATION ON THE CHROMOSOMES OF TRADESCANTIA. C. P. Swanson and Henry T. Yost, Jr. Genetics 36, 579(1951).

Primary action of infrared radiation was found to be the induction of metastable states in the chromosomes. Such chromosomes react more readily with free radicals released by ionizing radiation in surrounding area and yield a higher frequency of primary breaks per given dose of x-rays. X-rays induce a reservoir of loci which can be acted upon by the infrared and brought to the level of primary breaks, after which they can enter into recombination with the other similarly broken ends. (from abstract).

6363

Univ. of Rochester
RESPONSE OF HEMATOPOIETIC SYSTEM TO X RAYS. G. M. Suter. March 22, 1947. Decl. Apr. 1947. 8p. (MDDC-824).

Hematological studies on dogs, rats, rabbits and monkeys exposed to acute and chronic x irradiation are described.

Argonne National Lab., Lemont, Ill.
THE EFFECT OF FOLIC ACID ON THE RESPONSE OF THE PERIPHERAL BLOOD OF THE RAT TO STRONTIUM⁸⁹. S. Phyllis Stearner and Leon O. Jacobson. p. 36-48 of BIOLOGY DIVISION QUARTERLY REPORT FEBRUARY 1947 TO MAY 1947. June 1, 1947. 178p. (MDDC-1418).

Folic acid had no effect on the macrocytic anemia that followed the administration of Sr⁸⁹. At least in the case of radioactive strontium, the injury is probably exerted directly on the bone marrow and is not caused indirectly by a damage to the gastro-intestinal tract or to the liver. The action of folic acid has been reported to be similar to that of liver extract and it therefore should correct any deficiency resulting from radiation damage to liver or stomach and subsequent failure to form an anti-anemic factor. Folic acid was equally ineffective in alleviating the effect of irradiating on the number of circulating leucocytes. This failure to affect the leucopenia that followed the administration of Sr⁸⁹ does not substantiate the suggestion by Watson that folic acid may be effective as a treatment for the leucopenia following exposure to radiation. It is concluded that folic acid is ineffective as a treatment for the hematological effects of internal radiations and probably by implication, for those of external radiations as well. Since total body irradiation is more likely to damage visceral organs, however, the latter question is being investigated. Six references.

Argonne National Lab., Lemont, Ill.
ACUTE TOXICITY OF INHALED 275-DAY Ce^{144} . H. C. Seibert and Richard Abrams. July 25, 1946. Decl. Sept. 6, 1946. 28p. (MDDC-329; CH-3539).

In an attempt to estimate the acute toxicity of insoluble, radioactive material in the lungs, rats were exposed to smokes containing 275-day Ce^{144} . Groups of 200 g rats received the following doses: 3, 2, 14, 39, 50, and 200 μ c/rat. Weight loss was significant only in those exposed to 200 μ c. These had a median survival time of 39 days and were all dead within 120 days. The 39 μ c rats had a median survival time of 282 days, while 90 percent of the 14 μ c animals were still alive after 300 days. As had been demonstrated in tracer experiments, absorption from the lung was slow, and liver and skeleton were the primary sites of deposition of the absorbed material. It was not possible to show any definite effect of dose on distribution. Radiation doses to the various tissues were calculated, but, in general, it was not possible to correlate death with the dose to any single tissue. Preliminary histological examination revealed some tendency for the bronchial epithelium to undergo a squamous proliferation.

ON THE HISTOLOGICAL PROCESSES OF THE DESTRUCTION OF THE HYPOPHYSIS BY RADON. A. Lacassagne and W. Nyka. *Compt. rend. soc. biol.* 117, 956-8(1934). (In French).

6403

ON THE EFFECT OF IRRADIATION OF THE HYPOPHYSIS (WITH RADON OR X-RAY IRRADIATION) ON THE OVARIES. A. Lacassagne. *Strahlentherapie* 54, 477(1935). (In German).

6404

A LACK OF SENSITIVITY TO X-RAYS ON THE PART OF NEWBORN MICE IN A STATE OF ASPHYXIA. A. Lacassagne. *Compt. rend. acad. sci. U.S.S.R.* 215, 231-2(1942).

Radiosensitivity of newborn mice was decreased by exposure to environmental temperature below 0°, by Nitrogen asphyxia and by CO₂ asphyxia.

6405

THE INFLUENCE OF WAVE-LENGTHS ON CERTAIN LESIONS PRODUCED BY THE IRRADIATION OF MICE. A. Lacassagne. *Proc. Roy. Soc. Med.* 39, 605-12(1946).

Radiation of 3 different wave lengths (1. K radiation of Mo, 2. L radiation of Ag and 3. U-V) was applied over the dorso-lumbar region of mice. A dose of 3000 r (760 ergs/mm²) of 1 produced only epilation, no other skin injury, but produced complete sterilization of the underlying ovaries and destruction of uriniferous tubules. Selective radioepidermitis was produced by 2 and 3. The very soft x rays (2) caused skin destruction as did U-V (3) but the histological picture differed in the two cases.

EFFECTS OF MASSIVE, RAPID DOSES OF RADIATION ON MAMMALS. W. Langham. Presented at Radiation Research Society, Cleveland, May 17-19, 1954. *Radiation Research* 1, 502(1954).

Dose-response curves differed quantitatively with respect to the threshold dose for CNS phase of the acute radiation syndrome in mice, rats and monkeys exposed to massive doses of radiation. Four phases of the CNS "hyperacute radiation syndrome" are described.

6409

Argonne National Lab., Lemont, Ill.

THE METABOLISM OF SHORT-LIVED AIR-BORNE FISSION PRODUCTS. H. C. Lanz and J. D. Teresi. May 1945. Decl. May 14, 1947. 39p. (MDDC-954, CH-2844).

A fission recoil apparatus has been constructed in which uranium foil is subjected to neutron bombardment in the pile. Gas passing over the foil picks up the fission recoil atoms and carries them to animal exposure chambers and measuring equipment located outside the pile shield. The time taken for an atom to go from the foil to the exposure chamber (hold-up time) varied from 1.8 to 30 sec. A special ionization chamber was developed to measure the activity, which varied from 17 to 0.5 $\mu\text{C/cc}$. It has been shown that this gas contains not only the noble gas fission products but also all fission products which normally exist in the solid state. Rats and mice exposed to this gas in an exposure chamber suffer damage and die, but no more so than would be expected from the amount of external gamma radiation which they received while in the exposure chamber. A special apparatus was constructed which would allow rats to breathe the gas without receiving external radiation. Rats receiving exposures of 8 hours per day for 5 consecutive days received burns of the mouth and upper respiratory tract. Some of these animals lived but most of them died, apparently from starvation because of failure to eat. Metabolism experiments have shown that of the material that is inhaled, about 25% goes to the skeleton and is excreted very slowly, about 8% stays in the lungs and is excreted slowly; about 6% goes to the liver and is slowly excreted, and the remainder is excreted with moderate rapidity. The highest specific activity is found in the thyroid. A histological study of tissues of animals sacrificed at various times following exposure has shown that the most severe treatment possible with this apparatus has failed to produce any detectable tissue damage which could be attributed to internal deposition of radioactive materials. Radioautographs showed that the activity was deposited uniformly over the bronchial and alveolar surfaces. It was concluded that for short-lived air-borne fission products the hazard is very much greater from external radiations than from internally deposited radioactive materials.

6410

THE EFFECT OF RADIUM RAYS ON THE CARBOHYDRATE CONTENT OF THE TISSUES. A. A. Krutowski. *Klin. Wochschr.* 8, 1578(1929). (In German).

6411

DISTRIBUTION OF RADIATION IN THE ATOMIC BOMBING OF NAGASAKI. John C. Larkin. *Am. J. Roentgenol. Radium Therapy* 55, 525-32(1946).

Clinical records of 95 patients in 3 hospitals in Nagasaki after the A bombing were analyzed and classified according to the patients' distance from the epicenter at the time of the explosion. Clinical characteristics associated with exposure in the various geographical zones are described.

6412

A QUANTITATIVE ANALYSIS OF THE DIRECT AND INDIRECT ACTION OF X-RADIATION ON MALIGNANT CELLS. I. Lasnitzki. *Brit. J. Radiol.* 20, 240-7(1947).

Mouse adenocarcinoma was irradiated in vivo or in vitro and studied, after exposure, in tissue culture. For each culture, 300-500 cells were classified as resting, dividing or degenerated. Effects on the tumors and their vascular supply are also described. Inhibition of mitosis, abnormal mitosis, increased cell size and various degenerative changes were seen in the irradiated tumor cells. A large group of degenerate cells in tumor was related to vascular changes. Effects of irradiation in vitro and in vivo were qualitatively similar. Effects on circulation to the tumor are emphasized as an important aspect of radiation effects on tumor cells per sec.

6413

PROTECTIVE ACTION OF CERTAIN SUBSTANCES AGAINST INACTIVATION OF A BACTERIOPHAGE BY

X-RAYS. R. Latarjet and E. Epharati. *Compt. rend. soc. biol.* 142, 497-9(1948).

Aqueous suspensions of T-2 phage, active on *E. coli*, were studied. Protective effect (in order of decreasing effectiveness) was observed with thioglycolic acid, tryptophan, glutathione, cystine and cysteine and slight protective effect with sucrose, ascorbic acid, phenylalanine, alanine and histidine. Protective action of all the agents was less when phage was irradiated in deoxygenated medium.

6414

CELL CONSTITUENTS IN RELATION TO RADIOSENSITIVITY. R. Latarjet. *Internat. Congr. Radiol.*, 6th Congress, London, 1950. p. 49-50.

The author discusses and illustrates by examples the role of the number of cellular "targets" that must be altered to produce an observed effect of the cell volume in determining cellular radiosensitivity. He also discusses the role of intracellular chemical factors (oxygen, peroxidase, buffers, etc., etc) that affect radiosensitivity and radioresistance. Factors influencing recovery of cells after radiation injury, especially polyploidy, are also considered.

6415

BLOOD CHEMISTRY IN DOGS EXPOSED TO CHRONIC X-RADIATION. Kathryn F. Fink. p. 339-351 of *Biological Effects of External Radiation (NNE VI-2)*. Henry A. Blair, ed. New York, McGraw-Hill Book Co., Inc. 1954.

Concentrations of serum protein, plasma fibrinogen, whole-blood NPN, serum cholesterol, serum chloride, and serum acid and alkaline phosphatase were not significantly altered in dogs subjected to chronic x radiation at 0.1, 0.5, and 10 r/day, 6 days a week. The only obvious changes in dogs given 10r/day were high fibrinogen concentrations. (from author's summary).

6416

EFFECTS OF X-RAYS AND RADIOMIMETIC AGENTS ON NUCLEIC ACIDS AND NUCLEOPROTEIN. CIBA FOUNDATION SYMPOSIUM ON IONIZING RADIATIONS AND CELL METABOLISM. J. A. V. Butler. Little, Brown and Co. Publishers 1956. p. 59-69.

CHRONIC LYMPHATIC LEUKEMIA, A STUDY OF 100 PATIENTS TREATED WITH RADIOACTIVE PHOSPHORUS. John H. Lawrence, B. V. A. Low-Beer and James W. J. Carpender. *J. Am. Med. Assoc.* 140, 585-8(1949).

6418

ROENTGEN IRRADIATION OF THE HYPOPHYSIS. J. H. Lawrence, W. O. Nelson and H. Wilson. *Radiology* 29, 446 (1937).

Female rats, 30-40 days old, were x-irradiated over the pituitary gland. Following 2 doses of 1040r given within a very short period, growth was inhibited, ovarian activity was suppressed and adrenal glands underwent atrophy. The changes were not irreversible. Histological changes in the irradiated hypophyses and in thyroids, adrenals and reproductive organs are described.

6419

THE PRODUCTION OF RADIOACTIVITY IN ANIMAL TISSUES BY HIGH ENERGY X-RAYS. D. A. Layne. *Internat. Congr. Radiol.*, 6th Congress, London, 1950. p. 180.

Oxygen and carbon are the elements mainly responsible for induced radioactivity in rat tissues exposed to the x ray beam from the 30 Mev synchrotron (γ -n reactions). Energy absorption in tissues from the disintegrations are calculated and are shown not to contribute significantly to the dose.

6420

INACTIVATION OF VIRUS BY RADIATION. D. E. Lea. *Brit. J. Radiol.* 19, 205-12(1946).

6421

THE MECHANISM OF THE INDUCTION BY RADIATION OF CHROMOSOME ABERRATIONS IN TRADESCANTIA.

D. E. Lea and D. G. Catcheside. *J. Genet.* 44, 216-45 (1942).

The relative efficiency of x rays and neutrons in producing chromosome aberrations in *Tradescantia* was determined and data were used to develop a theory encompassing quantitative aspects of energy dissipation in production of chromosome lesions.

6422

EXCRETION OF CALCIUM⁴⁵ BY NORMAL RATS. Maurice V. L'Heureux, Wilbur R. Tweedy and Elinor M. Zorn. *Proc. Soc. Exptl. Biol. Med.* 71, 729-32(1949).

6423

EARLY EFFECTS OF IRRADIATION. A. A. Liebow and S. Warren. *Am. J. Pathol.* 23, 888(1947).

Early skin effects observed in atomic bomb casualties are described.

6424

STUDIES ON THE EXCRETION AND DISTRIBUTION OF RADIOACTIVE CALCIUM. R. I. Lienke, George Cullen and Wallace D. Armstrong. *Trans. Conf. Metabolism Interrelat.*, 1st Conf., (1949). p. 73-6.

Absorption, excretion and retention of Ca⁴⁵ after intraperitoneal injection of the chloride into rats was studied.

6425

INVESTIGATION OF X-RAY HAEMOLYSIS BY THE ELECTRON MICROSCOPE. B. Lindemann. *Internat. Congr. Radiol.*, 6th Congress, London, 1950. p. 166.

X ray hemolysis is osmotic and can be measured in terms of the hemoglobin lost per cell as well as by the number of cells affected. The threshold dose of x ray hemolysis is approximately 6000 r and the effect appears not to be a "direct hit" phenomenon. Electron microscope observations of altered red cell membranes are described.

6426

Argonne National Lab., Lemont, Ill.
PROGRESS REPORT ON THE CHRONIC P³² MOUSE EXPERIMENT. H. Lisco, Miriam P. Finkel, and G. Hirsch, 1947. 180p. (AECD-2009-E).

Among radiation effects noted 290 days after a single intraperitoneal injection or monthly injections of P³² were; increased incidence of lymphoma in 10.0-5.0 μ c/g and 1.0-0.5 μ c/g/mo groups, increased incidence of lung tumors in 10.0-5.0 μ c/g and 1.0-0.1 μ c/g/mo groups, growth retardation in 1.0-0.5 μ c/g/mo group.

6427

SUITABILITY OF TUMOR-BEARING MICE FOR PREDICTING RELATIVE USEFULNESS OF ISOTOPES IN BRAIN TUMORS. COMPARATIVE CLINICAL AND LABORATORY STUDY IN LOCALIZATION AND TREATMENT OF BRAIN TUMORS WITH P³², Na²⁴m K⁴², and Sodium Borate. H. B. Locksley, W. F. Sweet, H. J. Powsner and E. Dow. *Arch. Neurol. Psychiat.* 71, 684(1954).

6428

INCREASED YIELD OF NUCLEIC ACID-LIKE SUBSTANCES FROM IRRADIATED YEAST. John R. Loofbourow, Mary Elizabeth Englert and Cecelia Marie Dwyer. *Nature* 148, 113-4(1941).

The yield of crude nucleic acid from irradiated yeast (4.5-8.5 g per 300 g of yeast) was, in each case, greater than that from non-irradiated yeast (3-4 g. m. per 300 g. m. from irradiated yeast was slightly higher than that from nonirradiated yeast, despite the greater yield of the former.

6429

EFFECT OF SHORT WAVE LENGTH RADIATIONS ON HUMAN FINGER RIDGE DETAIL. Roger A. Harvey. p. 352-371 of *Biological Effects of External Radiation*. (NNS

VI-2). Henry A. Blair, ed. New York, McGraw Hill Book Co., Inc. 1954.

An attempt was made to develop a method of detecting short-wave-length radiation injuries in finger ridge detail. Atrophy of ridges was detected in 68 per cent of the radiologists, 55 per cent of the orthopedists who use a fluoroscope, 40 per cent of the dentists who hold films during exposure to x rays, and 1.8 per cent of the controls. (from author's conclusions.)

6430

SOME BIOLOGICAL EFFECTS OF LONG-CONTINUED IRRADIATION. Egon Lorenz. *Am. J. Roentgenol. Radium Therapy* 63, 176-85(1950).

Chronic irradiation is shown to reduce the life span of experimental animals. Of the many factors involved in shortening life span, carcinogenesis appears to be the most important in mice and also in guinea pigs.

6431

Argonne National Lab., Lemont, Ill.
BIOLOGIC EFFECTS OF LONG CONTINUED WHOLE BODY IRRADIATION WITH GAMMA RAYS ON MICE, GUINEA PIGS, AND RABBITS, PART I. PRELIMINARY EXPERIMENTS. Egon Lorenz and Walter E. Heston. Oct. 29, 1946. Decl. Feb. 6, 1947. 19p. (MDDC-653, CH-3652).

Male and female mice of the C3H strain were continuously irradiated with 4.4 r, 1.1 r, 0.11 r and 0.044 r per day. No significant damage to the hematopoietic system as evidenced by blood counts was found although the highest total dose was over 200 r. Mammary tumor incidence was not changed significantly in the animals exposed on the different dose levels. Histologically only the gonad showed radiation damage and mainly in the animals exposed to 4.4 r per day. The damage consisted in the testes in diminished spermatogenesis and was reversible. Irradiation damage to the ovaries was irreversible and progressive and resulted in some cases in tubular downgrowths of the germinal epithelium which progressed to early tumor formation. Breeding experiments indicated that C3H females were permanently sterilized with total doses of 465 r given at the rate of 4.4 r per day. Subsequent generations reared and maintained in exposure fields of 1.1 r and 0.11 per day showed no damage to chromosomes as evidenced by raising of 5 to 6 generations with normal litter size and apparently normal life span.

Argonne National Lab., Lemont, Ill.
BIOLOGIC EFFECTS OF LONG CONTINUED WHOLE BODY IRRADIATION WITH GAMMA RAYS ON MICE, GUINEA PIGS, AND RABBITS, PART II. PHYSICAL SETUP. Egon Lorenz. Oct. 29, 1946. Decl. Feb. 6, 1947. 16p. (MDDC-654, CH-3653).

Experimental arrangements are described for the simultaneous irradiation of considerable numbers of animals with γ rays. Three experimental setups were available. In the first a source of approximately 1 g of radium element was used, with 4 sets of shelves forming part of a sphere surrounding the source. Daily doses at the different shelves were 8.8 r, 4.4 r, 2.2 r and 1.1 r in 8 hours. In the second setup a source of 1000 mg radium element in a lead box with a hinged lid was employed to irradiate one set of shelves. The daily dose at this set of shelves was 0.11 r in 8 hours. In the third setup a source of 250 mg element, also housed in a lead box, was used with 6 sets of shelves. Here the exposure was continuous, the daily doses amounting to 8.8 r, 4.4 r, 2.2 r, 1.1 r, 0.55 r, and 0.11 r in 24 hours. Dose measurements with calibrated 0.25 r, Victoreen ionization chambers, were made in every one of the animal cages which were placed on the different shelves. Errors are discussed which arise mainly from the dimensions of the cages. They are for

mouse and guinea pig cages approximately ± 15 per cent, and for rabbit cages ± 25 per cent. The precautions taken to reduce the residual dose to a minimum are described.

6433

Argonne National Lab., Lemont, Ill.
BIOLOGIC EFFECTS OF LONG CONTINUED WHOLE BODY IRRADIATION WITH GAMMA RAYS ON MICE, GUINEA PIGS, AND RABBITS, PART III. Egon Lorenz, W. E. Heston, L. O. Jacobson, Allen B. Eschenbrenner, Michael Shumkin, Margaret Deringer, and Jane Doniger. Nov. 14, 1946. Decl. Feb. 5, 1947. 118p. (MDDC-655; CH-3698).

Studies concerning the continuous gamma irradiation of mice (LAF hybrids), guinea pigs (hybrids, and inbred strains), and rabbits (hybrids) by means of the experimental arrangements described in Part II make possible the following conclusions. On all daily dose levels, including the 0.11 r level, there was a decrease in the life span of mice. The decrease in life span was pronounced in guinea pigs exposed to 8.8 r, 4.4 r, and 2.2 r per day. The life span of rabbits was decreased in the animals exposed to 8.84 and 4.4 r. Data on the life span of guinea pigs and rabbits exposed on the lower levels are not conclusive as yet since some of the animals are still alive. An increase in weight was found in irradiated animals on the lower exposure levels mounting, in male mice exposed to 1.1 r, to 50 per cent of that of the control animals. The hemopoietic system of rabbits is extremely radio resistant, and changes in the blood picture were found only in the animals exposed to 8.8 r per day. The hemopoietic system of mice is also radioresistant; the main effect of irradiation consisting in a depression of the lymphocyte count. No damage to bone marrow was observed (maximum accumulated dose 5800 r). The hemopoietic system of guinea pigs is very radiosensitive. Anemia and thrombocytopenia, were observed in all animals exposed to 8.8 r and in most animals exposed to 4.4 r and 2.2 r per day. Bone marrow damage of moderate to severe degree was associated with the anemia. The carcinogenic action of irradiation was mainly observed in mice, but some irradiated guinea pigs and rabbits also developed tumors after three years of irradiation. Of special interest were lung tumors of alveolar origin found in two guinea pigs. The most important tumors observed in the mice were; malignant lymphoma (leukemia), lung tumors, ovarian tumors, and tumors of the mammary gland. The induction of malignant lymphoma was roughly dependent upon dose rate and total dose. The greater the dose rate, the earlier the tumors appeared. The genesis of ovarian tumors was different from that of malignant lymphoma and lung tumors. The ovarian tumors rare in control animals but their incidence was increased considerably on the 0.11 r level. Associated with the ovarian tumors, in some cases were sarcomas of the mammary gland. Ovaries of guinea pigs and rabbits were radioresistant. Irradiation injury to testes of mice and guinea pigs was dependent on dose rate and was reversible. Damage to testes was also dependent upon intensity. Testes of mice irradiated six days per week with 8.8 r of X-rays in 1.5 minutes showed considerably greater damage than testes of mice irradiated daily with 8.8 r of gamma rays given in 8 hours (total doses 300 r or 600 r respectively.)

PACHYMEINGITIS OCCURRING AFTER ROENTGEN

IRRADIATIONS FOR SCALP LESIONS. A. Lorey and G. Schaltenbrand. Strahlentherapie 44, 747-58(1932). (In German).

6436

MODIFICATION OF THE GLYCEMIA PRODUCED BY IRRADIATION OF THE ENTIRE BODY WITH X-RAY. M. Lourau and O. Lartigue. Arch. sci. physiol. 4, 197-208(1950).

Increased blood glucose and decreased glucose tolerance were observed 15-48 hours after irradiation in fasting guinea pigs. Glucose tolerance curves may reflect altered intestinal absorption.

6437

EXTERNAL THERAPEUTIC USE OF RADIOACTIVE PHOSPHORUS. I. ERYTHEMA STUDIES. Bertram V. A. Low-Beer. Radiology 47, 213-22(1946).

Course and histology of the skin reaction to P^{32} applied to the skin of the forearm of 12 healthy persons are described. The erythema produced was monophasic and depth of the skin reaction was approximately 5 mm for erythema producing doses.

6438

RADIOACTIVE PHOSPHORUS AS AN EXTERNAL THERAPEUTIC AGENT IN BASAL CELL CARCINOMA, WARTS, AND HEMANGIOMA. Bertram V. A. Low-Beer. Am. J. Roentgenol. Radium Therapy 58, 4-9(1947).

Threshold erythema dose (man) was found to be $34 \mu\text{C}$ per cm^2 ; dose to produce mild erythema was $620 \mu\text{C}$ per cm^2 and dose to produce severe epidermitis was $4,400 \mu\text{C}$ per cm^2 . Therapeutic doses for various skin lesions varied from 300 to 5000 μC hr per cm^2 .

6439

REDUCTION IN FACET NUMBER IN FULL-EYED (REVERTED BAR) DROSOPHILA BY X-RAYS. W. M. Luce. Genetics 36, 563(1951).

In dosages ranging from 1000 to 3000 r at 500 r per min, x-rays reduced facet number of corneas of eyes by about 0.075 facets per r. X-rays applied before larvae were 54 hours old had no such effect, but prolonged larval development at rate of about 0.011 hrs. per r.

6440

THE RATE OF RECOVERY OF HUMAN SKIN FROM THE EFFECTS OF HARD OR SOFT ROENTGEN RAYS OR GAMMA RAYS. W. S. MacComb and E. H. Qumby. Radiology 27, 196-207(1936).

6441

TIME FACTOR IN IRRADIATION. G. MacKee, A. Mutscheller and A. C. Cipallaro. Arch. Dermatol. and Syphilol. 47, 490-7(1943).

Adjacent areas of skin on the inner surface of the forearm of 29 persons were exposed unfiltered 52kV and 10mA x rays and to 100kV and 5mA x rays. The respective half value layers were 0.5 mm Al and 0.8 mm Al. Distance and exposure time varied. Holthusen's radiation intensity curve was confirmed and a formula for the definition of radiation quantity is suggested, viz., $\log r/m = K (\log [r_t - r_l])$ in which r/m is r/min, r_t is total exposure time and r_l the value for latent radiation.

6451

DOSAGE DETERMINATION IN THE USE OF RADIOACTIVE ISOTOPES. L. D. Marinelli. *J. Clin. Invest.* 28, 1271-80 (1949).

When radioactive isotopes are employed either as tracers or in therapy, it is important to determine radiation dosage. This cannot, in general, be measured, but when the half life, radiation energy, and biological uptake and excretion are known, it can be calculated. Two extensive tables are presented, for beta and gamma rays, giving half life, radiation average energy, fraction disintegrating per day, and specific dosage data, including the safe tracer concentration, for 33 isotope elements. (from author's summary).

EFFECT OF RADIATION FROM RADIOACTIVE ISOTOPES ON THE PROTOPLASM OF SPIROGYRA. R. M. Muri. J. Cellular Comp. Physiol. 19, 244-7(1942).

β radiation from radioactive phosphorus increased the viscosity of protoplasm in Spirogyra when radioactive strength of the solution was 4.0m C./liter or 17.0m C./liter but had no effect when the radioactive strength was 2.1 m C./liter. Total concentration of phosphorus fluctuated in filaments immersed in solutions of radioactive phosphorus, but remained relatively constant for 0.001M and 0.005M solutions of the nonradioactive phosphorus and showed an accumulation for the 0.01M solution. Changes in total phosphorus content may result from permeability effects of β radiation from the radioactive isotope. (from author's summary)

6472

THE ROLE PLAYED BY RADIATION MUTATIONS IN MANKIND. H. J. Muller. Science 93, 438(1941).

The author has calculated the average number of generations to be expected between the production of a recessive genemutation in man and its manifestation in a homozygous individual. The chance of the mutated gene meeting another like it that had originated by an independent mutation depends on the frequency of such mutations, on the survival value of the abnormal type and on the randomness of breeding.

6475

THE SURPRISINGLY HIGH FREQUENCY OF SPONTANEOUS AND INDUCED CHROMOSOMES BREAKAGE IN DROSOPHILA, AND ITS EXPRESSION THROUGH DOMINANT LETHALS. H. J. Muller and G. Pontecorvo. Genetics 27, 157-8(1942).

Dominant lethal effect on irradiated females due to "simple breakage," which in rings must often be followed by formation of dicentrics, occasioned by twisting of chromonema or chromonema-pair before re-union. Over 75 per cent of these sister dicentrics are lethal. Breaks in non-rings are presumably induced by radiations as often as in rings, but here the majority are followed by perfect restitution. Frequency of spontaneous lethal and viable losses of rings is surprisingly high, and may be due to spontaneous breakage. (from abstract)

6476

PARTIAL DOMINANCE IN RELATION TO THE NEED FOR STUDYING INDUCED MUTATIONS INDIVIDUALLY. H. J. Muller. J. Cellular Comp. Physiol., Supple. 1, 35, 205-10(1950).

6477

THE LOCALIZATION OF THE MUTAGENIC ACTION OF NEUTRON-INDUCED IONIZATIONS IN DROSOPHILA. H. J. Muller and J. L. Valencia. Genetics 36, 567-8(1951).

Frequency of translocations induced by fast neutron irradiation of Drosophila spermatozoa varies linearly with dose even at doses sufficient to produce multiple proton tracks per sperm. Broken chromosome ends from different breaks caused by the same track undergo recombination with one another much oftener than with those of different tracks. Breaks caused by same track tend to occur near each other, this proximity favoring union between broken ends. (from abstract)

THE EFFECT OF IONIZING RADIATION ON THE ACTIVITY OF ENZYMES. E. S. Guzman Barron. p.10-16 of CONFERENCE ON BIOLOGICAL APPLICATIONS OF NUCLEAR PHYSICS; JULY 12-27, 1948. July 1948. 154p. (BNL-C-4).

The action of ionizing radiation is due mainly to the products of irradiation of water. In small doses, the effect may be limited to oxidation of sulfhydryl groups and inhibition of sulfhydryl enzymes. With larger doses, protein denaturation may result. Only effects of smaller doses are reversible.

A NOTE ON THE DEPRESSION OF BLOOD CHOLINESTERASE LEVEL FOLLOWING X-RAY THERAPY AND ITS BEARING ON THE MECHANISM OF RADIATION SICKNESS. R. D. Barnard. Med. Record 161, 350-2(1948).

Radiation therapy reduces the blood cholinesterase concentration and it is suggested that this may account for the cholinergic symptoms of radiation sickness.

6499

THE EFFECT OF X-RAYS UPON THE METABOLISM OF TUMOR TISSUE. George H. Bancroft and Victor E. Kinsey. Biochem. J. 31, 974-9(1937).

The respiratory quotient (R.Q.) of rat sarcoma *in vivo* was depressed by x radiation. Aerobic acid production (mostly lactic acid) was increased, indicating that the lowered R.Q. was not due to incomplete oxidation with formation of acids other than lactic. Under the same conditions, x rays did not alter metabolism of rat kidney slices. It appears that x rays attack carbohydrate oxidation before the pyruvic acid stage

ACTION OF X-RAYS ON NUCLEIC ACID METABOLISM

IN RAT ORGANS. Lucie H. Ahlstrom, Hans v. Euler and Georg v. Hevesy. Arkiv. Lemn. Mineral. Geol. A19, No. 9 (1944).

Nucleic acid metabolism was inhibited by 1/3 to 1/2 in the liver, spleen and intestinal mucosa of adult rats during the 2 hrs. following exposure to 1500-3000 r. Similar observations had been made on Jensen sarcoma. The percentage decrease of nucleic acid metabolism in organs of x irradiated rats 3-4 days old (normally producing nucleic acids very rapidly) was about the same as that in adults. The inhibitory effect of irradiation was enhanced by administering the dose over a 2 hr. period.

This paper deals with the metabolism, in rats, of air-borne fission products. Four different isotopes were used, selected for their long lives and as representatives of the various chemical species occurring in fission. There were Sr⁸⁸ (55 days), Zr⁹⁵ (65 days), Y⁹¹ (57 days), and Ce¹⁴⁴ (275 days). Aerosols of these materials were produced by atomizing aqueous solutions and by burning dried residues in a carbon arc. Strontium differs from the other elements investigated in the ease with which it is absorbed from the lungs. Over 50 percent left the lungs within a matter of minutes, and 95 percent was gone within 1 hour. Of the Sr⁸⁸ originally in the lung, 60 percent was deposited in the skeleton in less than 4 hours, and after 12 hours the total radiation dose to the skeleton exceeded that to the lungs. These results indicated that inhalation was as effective a means of administration as intravenous injection, and that lung damage as a result of inhalation of Sr⁸⁸ would be of less importance than bone marrow damage. The other three elements, Y, Zr, and Ce, may be grouped together insofar as they differ from Sr. They were all eliminated from the lungs much more slowly than was Sr. Thus the times required for 90 percent elimination were: Y⁹¹, 12 days; Zr⁹⁵, 25 days, and Ce¹⁴⁴, 45 days. In all cases the skeleton was the major site of deposition and eventually contained between 15 and 30 percent of the initial lung deposit. In no case, in periods ranging up to 200 days, did the total radiation dose to the bone exceed that to the lung, as it did within 12 hours with Sr. With all three elements the probability of radiation damage to the lung is great. Very little deposition occurred in the soft tissues. The kidney, contained about

0.5 percent of the dose with all the elements. Concentration in the liver was lower than in the kidney with all isotopes except Ce^{144} . This element showed a very high initial liver deposition, but this was gradually eliminated so that after 2 months the liver concentration fell below that in the kidney.

Oak Ridge National Lab., Tenn. Clinton Laboratories COMPARATIVE LATE EFFECTS OF PERIODIC DOSES OF FISSION NEUTRONS AND OF GAMMA RAYS. P. S. Henshaw. June 1946. Decl. Apr. 21, 1947. 90p. (MDDC-1253; MonH-115).

This study was undertaken to obtain information on occupational hazards associated with fast neutrons and gamma rays. Four strains of mice, picked for special characteristics, were used as test material. The all-purpose albino strain CF-1 was used for the large scale tests because of its sturdiness and availability. Colored ABC animals were used to check the CF-1, C58, and A-Strain mice were employed, respectively, because they normally show a high spontaneous incidence of leukemia and pulmonary tumors. Regarding the latter it was presumed that such animals would furnish the most fertile soil for blood and lung neoplasias and accordingly would provide the most sensitive test material for such effects. Small daily doses of fast neutrons 0.115 to 13.0 n) and gamma rays (1 to 17.2 r) were administered 6 times weekly to the whole bodies of treated animals. As a rule, each experimental group consisted of approximately 100 animals. Both general and specific control groups were maintained in equally large numbers. All animals were weighed and examined periodically. Records were kept of the time of death and regular sacrifices were made and tissues saved for histological examination. Autopsies were performed on all moribund or dead animals and the cause of death determined when possible. Most of the animals died either in a state of atrophy or with leukemia (mediastinal lymphomatosis). The time of death after treatment began, followed a regular pattern and furnished a means of quantitatively comparing the effectiveness of the different treatments and methods of exposure. The fast neutron doses measured in "n" were found to be from 8 to 35 times more effective than gamma rays measured in "r". The threshold value for this radiation was found to be below 0.115 n of fast neutrons per day and about 1 r of gamma rays. In CF-1 mice about 10 times as much radiation per day was required to produce a threshold change as was required to shorten the life span detectably. Some differences were noted in the responses of different strains of animals to radiation but these were more a matter of degree than of type, no fundamental differences were seen in the different sexes. The quantitative results based on survival time indicate that the degree of biologic effect varies not only with dose, but also the density of ionisation produced. Although the incidence of leukemia was significantly increased in CF-1 animals, the occurrence of lung tumors was only slightly, if any, modified by the treatment given. Only questionable evidence of increased lung tumor incidence was observed in animals which normally show a high spontaneous lung tumor incidence.

6541

Oak Ridge National Lab., Tenn. EFFECTS OF PERIODIC DOSES OF SLOW NEUTRONS ON MICE, PROGRESS REPORT FOR THE PERIOD BETWEEN FEBRUARY 1945 THROUGH MARCH 1946. P. S. Henshaw, R. S. Snider, E. F. Riley, G. E. Stapleton, and R. E.

Zirkle. Aug. 27, 1946. Decl. Feb. 28, 1947. 12p. (MDDC-754; MonH-118).

Periodic doses of a radiation designated as "slow neutron" were given to two groups of 100 CF-1 female mice. Each arbitrary unit of dose, expressed in $\bar{a}$, was composed of slow neutrons considerably contaminated with fast neutrons. The mice were exposed in a manner similar to that used for fast neutron exposures, but in the cart designed specifically for "slow neutron" irradiation. The results are very similar to those observed as a consequence of periodic fast neutron treatments. A comparison of the shortening of life induced by each radiation indicates that 1 n is as effective as 7.5 $\bar{a}$, a ratio roughly equivalent to that observed after single doses. A dose of 10 $\bar{a}$ per day depressed the leukocyte level to a range between 2000 and 3000 cells/mm³ more pronounced blood changes probably would have been noted had other strains been used. The terminal pathological condition of the experimental mice was essentially like that observed after periodic fast neutron or gamma ray irradiation.

COMPARATIVE LATE EFFECTS OF SINGLE DOSES OF FISSION NEUTRONS AND OF GAMMA RAYS. E. F. Riley and P. S. Henshaw. June 1946. Decl. Sept. 8, 1947. 51p. (MDDC-1254; MonH-116).

Having obtained information about the late effects of small daily doses of fast neutrons and gamma rays (MDDC-1253), the authors now present the results of a study of the late effects caused by the same radiations when single large doses are administered.

Experiments were carried out using CF-1 and ABC mice. As a rule more than 100 mice were used for each experimental sample. Single neutron doses of 26, 50, 78 and 90 n and single gamma ray doses of 500 and 700 r were given. Other special experiments to investigate the influence of dosage-rate and of massive doses were also carried out. Acute illness consisting of emaciation and weight loss, lymphopenia and histologic damage to germinal tissues occurred at four days to two weeks. Recovery was rapid in the animals that survived and at three weeks it was difficult to distinguish the experimental from control animals. Such treated animals nevertheless died prematurely more or less in accord with the amount of radiation delivered. Evidence was obtained suggesting that the length of life varied exponentially with dose. It has been noted that 1 n is consistently more effective than 1 r in causing biological injury, the superiority of a fast neutron unit is greater when judged by late effects than when judged by acute lethal action. The incidence of leukemia (mediastinal lymphomatosis) was greatly increased- from 15 per cent in the controls to more than 60 per cent in the case of gamma rays (incomplete results). The findings further substantiate the idea that the higher the concentration of ions the lower the dose of radiation required to produce a particular effect. Other evidence was obtained indicating that a single application of irradiation exposure is sufficient to induce malignant disease.

Oak Ridge National Lab., Tenn.
CORRELATION OF TISSUE RESPONSES FOLLOWING EXPOSURE TO PENETRATING RADIATIONS. P. S. Henshaw and R. S. Snider. July 1946. Decl. Dec. 16, 1946. 19p. (MDDC-569; MonH-144).

A review has been made of the available information concerning tumor formation and the accompanying changes in mammalian forms that take place following exposures to penetrating radiations. The tissues in the order of increasing resistance to radiation may be listed as follows: lymph nodes (small lymphocytes), germinal epithelium of the testis, erythrocytes and myeloblast gastrointestinal epithelium, ovary, skin, connective tissue, bone, liver, pancreas, kidney, nerve, brain, and muscle. It was pointed out that the most radiosensitive tissues are of the generative type - that is, those which in life are continually proliferating new cells which undergo maturation, serve a useful function for a limited period and then die. The skin, testis, hemopoietic organs, gastro-intestinal epithelium and perhaps other tissue series show a parallel type of differentiation with these features in common. In all cases, certain parent cells (but not the most primitive types), were found to be the most susceptible to radiation. It is plain that partial damage to a particular tissue series results in a limited period during which mature cells are being formed, whereas complete damage results in sterilization. Stress was laid on the fact that recovery to an apparently normal condition takes place even when the acute histologic destruction has been almost complete.

6547

ON THE QUANTITATIVE EFFECT OF BETA RAYS. F. Hercik. Strahlentherapie 68, 63-73(1940). (In German).

The author describes experiments carried out to determine the relative biological effectiveness of β rays on *Allium cepa* epidermis using as the staining of cells by erythrosin as a criterion of damage. Results are interpreted in light of the target theory. NSA 5-5240

CHEMICAL MODIFICATION OF THE LETHAL EFFECT OF X-RADIATION AND THE MECHANISM OF THE ACTION. Andre Herve, Z. M. Bacq and H. Betz. Internat. Congr. Radiol., 6th Congress, London, 1950. p. 169-70.

Injection of 0.1 mg of NaCN immediately before irradiation with an x ray dose of 700 r reduced the mortality of mice from 100% to 30%. The same dose given immediately after, rather than before, irradiation merely retarded death by 4 days and if given 15 min after exposure had no protective effect. Histological changes were not less severe in the "protected" animals but indications of "shock" were much less.

6549

EFFECT OF X-RAYS ON THE RATE OF TURNOVER OF PHOSPHATIDES. George von Hevesy. Nature 158, 268(1946).

The rate of turnover of the phosphatides in the nuclei of Jensen sarcoma and rat liver is markedly diminished under the effect of x-rays and that in the cytoplasm is also diminished. (the greater part of the phosphatides of the tissue is present in the cytoplasm). While irradiation of the sarcoma diminishes the rate of turnover of the total phosphorous of the tissue by 10

per cent only, the corresponding value for the sarcoma nuclei is reduced to a third of its normal value.

6550

EFFECT OF X-RAYS ON THE INCORPORATION OF C^{14} INTO ANIMAL TISSUE. George von Hevesy. *Nature* 164, 269(1949).

In x irradiated rapidly growing rats, the BMR is decreased but incorporation of C^{14} into body tissues is increased, probably due to increased incorporation into organic processes, not to a respiratory effect.

SYSTEMIC EFFECTS IN THE IRRADIATION TREATMENT OF A TRANSPLANTED MOUSE LYMPHOSARCOMA. Joanne Hollcroft and Egon Lorenz. *Internat. Congr. Radiol.*, 6th Congress, London, 1950. p. 173.

Mice bearing transplanted lymphosarcoma received whole body exposure or tumor-localized exposure to 400 r of x rays or an equivalent dose (in rep) of radon by injection. Whole body exposure to x rays or radon injection caused tumor regression, but an equivalent x ray dose localized to the tumor did not, although a tumor dose of 1000 r followed by a whole body exposure to 100 r did produce regression if the 100 r whole body exposure was given within a few hours after the larger tumor dose. It appears that a systemic effect is involved in radiation-induced tumor regression.

SERUM CHOLINESTERASE ACTIVITY DURING INFLAMMATION

AND X-IRRADIATION. Fritz Holle. *Z. ges. exptl. Med.* 115, 107-26(1949).

6558

SERUM CHOLESTEROL AND IRRADIATION SICKNESS. B. E. Holmes. *Brit. Med. J.* 1, 314(1941).

Serum cholesterol studies representing 11 patients receiving x ray therapy are reported. Patients developing symptoms ("radiation sickness") during therapy had no concomitant rise in serum cholesterol whereas asymptomatic patients did. Administration of cholesterol as a therapeutic agent for gastrointestinal symptoms developing during radiation therapy has been tried by other investigators and found to be therapeutically effective.

6559

PHYSICAL, BIOCHEMICAL AND THERAPEUTIC ASPECTS OF VOLUME DOSE. III. BIOCHEMICAL ASPECTS OF VOLUME DOSE. B. E. Holmes. *Brit. J. Radiol.* 18, 238-40(1945).

Author discusses therapeutic aspects of volume dose in patients receiving radiation therapy, and includes a discussion of certain biochemical changes observed during therapy, e.g. changes in serum cholesterol levels, liberation of histamine, etc., etc.

6562

THE EFFECT OF ROENTGEN RAYS ON ANIMAL ORGANS. F. Gabriel. *Strahlentherapie* 22, 107-24(1926). (In German)

Changes in skin, kidneys, and livers of rats exposed to large doses of x rays are described. Skin showed altered tonus and capillary circulation; livers examined histologically showed changes characteristic of epinephrine cachexia. Kidneys showed one of two types of vascular ("tonus") reactions, contraction or dilatation, depending upon the dose and quality of radiation.

6563

CHARACTERISTIC DIFFERENCES IN THE PRODUCTION OF CHROMOSOME STRUCTURAL CHANGES BY NITROGEN MUSTARD TREATMENT AND BY IONIZING RADIATIONS. C. E. Ford. *Internat. Congr. Radiol.*, 6th Congress, London, 1950. p. 46-7.

Nitrogen mustard and γ rays differ with respect to the relative frequencies of the types of chromosome aberrations they produce. For example, nitrogen mustard yields lower proportion of simple chromatid breaks and a higher proportion of minute fragments. Chromosome lesions occur sooner after irradiation than after nitrogen mustard. The two agents also differ with respect to the influence of low temperature on production of chromosome lesions. These and other observations are discussed and analyzed in terms of their implications about how the effects on chromosomes are produced.

SOME EFFECTS ON EMBRYO AND YOUNG RAINBOW TROUT (*SALMO GAIARDNERII* RICHARDSON) FROM EXPOSING THE PARENT FISH TO X-RAYS. R. F. Foster, L. R. Donaldson, A. D. Welander, K. Bonham and A. H. Seymour. Growth 13, 119-42(1949).

This document is a thesis. One hundred and forty-eight rainbow trout approximately twenty months old and approaching sexual maturity were divided into a control group and seven irradiated groups. Total body irradiation doses of 50 r, 100 r, 500 r, 750 r, 1000 r, 1500 r, and 2500 r were administered at a distance of 48 inches from the target of the x-ray tube, using 200 kilovolts and 20 milliamperes and filters of 0.5 millimeter of copper and 1.0 millimeter of aluminum. The average radiation intensity received by the fish was 8.25 r per minute. When the fish became mature about three months after irradiation, they were spawned and a total of 115,454 eggs were obtained from 67 females. The gametogenesis, egg development, abnormalities, fry mortality, early fingerling mortality, and growth of the fish are discussed at length and the results are tabulated.

Photographs of apparatus used and development stages are furnished. Included are a series of photographs showing: the stages of development of the rainbow trout eggs, the abnormal trout eggs from parents exposed to various doses of X-radiation, abnormal rainbow trout embryos reaching various stages of development, and common types of abnormal fry found among rainbow trout fry. 38 references. THE EFFECT OF X RAYS UPON ANTIBODIES. A STUDY OF HEMOLYSIN TITRATIONS IN SENSITIZED IRRADIATED RABBITS. H. Fredell. August 1, 1947. Decl. May 26, 1949. 24p. (AECD-2024-J).

Experiments were conducted using the rabbit as a test animal and measuring the antibody production in terms of hemolysins produced by sheep cell antigen. A group of sixteen rabbits was sub-divided into four groups of four animals each. The first group served as control, the second group was irradiated at the peak of the antibody response,

approximately 10 days after antigen administration, the third group was irradiated on the day of antigen administration, and the fourth group was irradiated on the day of antigen administration and re-irradiated at the peak of antibody response. All irradiated animals received about 550 r at dosage rates of 16 to 17.7 r per minute, using 0.5 mm Cu and 1.0 mm Al filters. In addition, the animals in group four received a second dose of 550 r. A single dose of 550 r total-body X-radiation depressed sheep cell antibody production in rabbits. When 550 r was administered at the time of sensitization, antibody production 10 days later was, for all practical purposes, completely inhibited within the period of study. NSA 1-40J

THE ANTIBODY RESPONSE OF ANIMALS EXPOSED TO X-RADIATION. III. THE PROTECTIVE EFFECT OF CHEMOTHERAPEUTIC AGENTS ON A SPECIFIC IMMUNE STATUS OF X-RADIATED MICE. John D. Fulton, Anna C. Arnold, Roland B. Mitchell. USAF School of Aviation Med., Randolph Field, Texas. Project no. 21-47-002, Report No. 3.

Adrenal cortical extract, thiourea, glutathione, reticulose and chloromycetin were tested for their ability to prolong the survival of mice that had been immunized against *S. typhimurium* and were challenged after irradiation with the live virulent organism. Only glutathione given pre-radiation and chloromycetin given post-radiation increased the survival time. The two agents used together gave the best results.

6574
NEOPLASTIC DISEASES PRODUCED IN MICE BY GENERAL IRRADIATION WITH X-RAYS. I. INCIDENCE AND TYPES OF NEOPLASMA. J. Furth and O. B. Furth. Am. J. Cancer. 28, 54-65(1936).

Mice exposed to single or repeated x ray doses at age 5-12 weeks subsequently showed marked increases in the frequency of occurrence of ovarian tumors, myelosis and lymphosarcoma and less marked increases for other tumors. Incidence of breast tumors decreased by half (breast cancer being conditioned by ovarian hormone levels which are lowered after irradiation but increased in the presence of ovarian tumors). Breast cancer and ovarian neoplasms tended to occur together. Radiation-induced tumors were indistinguishable from spontaneously occurring ones but tended to occur earlier.

SEQUELAE AFTER APPLICATION OF HIGH-INTENSITY X-RADIATION TO THE HEAD OF RABBITS. H. B. Gerstner, J. E. Pickering and A. J. Dugi. Proj. no. 21-3501-005. Rep. no. 15. Air Univ. USAF School of Aviation Med., Randolph Field, Tex. 1954. Radiation Research 2, 219(1955).

Total dose delivered to brain of rabbits was $12,500 \text{ r}$ (12.5 Kr) $\pm 1500 \text{ r}$. Sequelae occurred in several phases: latent or prodromal period, convulsive phase, somnolent phase, ataxic phase, and death. The most outstanding features of the convulsive phase were repeated epileptoid seizures. The characteristic symptoms of the ataxic phase were severe disturbances of posture, equilibrium, and movements. (from authors' summary).

THE EFFECT OF VARIATIONS IN THE DOSE-RATE OF GAMMA RADIATION ON CELL DEGENERATION IN THE FROG TADPOLE. A. Glucksmann, K. Tansley and C. W. Wilson. Brit. J. Radiol. 18, 158-64(1945).

Effects of a dose of 336 r of γ rays given at 5 different dose rates (5-20r/min) was studied in tadpoles. The criteria of effect were the numbers of mitotic and degenerate cells in brain and eye. Number of degenerate cells increased with increasing dose rate as did the time for maximum number of degenerate cells to appear. On an absolute basis, degeneration was maximal at a dose rate of 15 r/min. The observations are discussed with respect to interactions of the various biological processes involved.

FURTHER STUDIES ON THE RADIOSENSITIVITY OF THE ANALOGOUS MOUSE MAMMARY TUMORS dbrB AND C3H. Anna Goldfeder. Radiology 47, 845-63(1951).

The growth rates of mammary adenocarcinomas of mice were studied before and after irradiation. Chalkley's method (J. Nat. Cancer Inst. 4, 47-53(1943-44)) was applied for quantitative evaluation of growth activity of the tumors, taking the mitotic index as the criterion. A depression in mitotic activity in the irradiated tumors was noted, the extent of which depended upon the dose of radiation applied and the lapse of time between exposure and removal of the tumors for analysis. An earlier and more pronounced return of mitotic activity was noted in the faster-growing dbrB type tumors following sublethal doses of radiation, as compared with the slower-growing C3H type. The levels of the phosphorylated intermediates in the glycolytic cycle for the two mouse mammary adenocarcinomas were determined. The more rapidly growing mammary tumor (dbrB) shows significantly higher levels of glucose-1-phosphate, adenosine triphosphate, and possibly glycogen, and a lower level of inorganic phosphorus than the slower-growing C3H tumor. These findings strongly suggest that a higher level of energy is available for vital function in the dbrB tumor. Some of the compounds encountered in the phosphorylated glycolytic cycle, particularly adenosine triphosphate, may be more readily affected by irradiation in the C3H tumor than in the dbrB tumor. The metabolic processes were operative even after such large doses as 30,000 r for the dbrB tumor and 12,000 r for the C3H, although these doses proved to be lethal for their respective growth activities. Successful application in radiotherapy and advantages of applying large doses of x rays through small portals exposing only the tumor is discussed. NSA 6-1091

6590
IMMEDIATE EFFECT OF X-RAYS ON THE MOVEMENTS OF LARVAE AND PUPAE OF MOSQUITOES. F. Goldhaber and B. Feldman-Muhsam. Nature 153, 528(1944).

During x-ray experiments with larvae and pupae of mosquitoes, irradiated specimens were observed to accelerate their movements immediately after the onset of irradiation. When the irradiation was interrupted, they

returned at once to normal behavior. This phenomenon was studied in detail, with a radiation intensity of 38,000 r/min. Results are presented graphically. Activity is increased during irradiation by 20-60 movements per minute.

6591
EFFECT OF INTRA-UTERINE RADIUM THERAPY ON OVARIAN FUNCTION. G. Goldscheider. *Lancet* 1, 521-3 (1949).

The dose of intra-uterine radium given for benign menorrhagia did not produce an artificial menopause except in women of menopausal age, where a small dose might influence ovarian function. Radiation of the ovaries with x rays results in menopause. (from author's summary).

The effects of large and small doses of x-irradiation on the metabolism of alcohol by the reticulo-endothelial system were studied in dogs and sheep.

6594
RATE OF ELIMINATION OF C^{14} ADMINISTERED AS $BAC^{14}O_3$. J. Govaerts. *Science* 111, 467-9 (1950).

After a brief review of previous work, experiments are described in which nine mice received intravenous injections of a fine suspension of $BAC^{14}O_3$ in isotonic glucose in order to deposit the barium carbonate in the lungs in a time determined by preliminary experiments. The animals were placed in metabolic cages for the duration of the experiments. Expired CO_2 , urine, and feces were collected and analyzed for counts. After the animals were sacrificed, the lungs, kidney, liver, and spleen were removed and prepared for assay using the Van Slyke-Foche method. The data are presented graphically and discussed; the author concludes that most of the C^{14} absorbed by the organism as barium carbonate is expired by the lung as $C^{14}O_2$, and that the dangers to those who work with C^{14} are not so great as expected. Rochester, N. Y. Univ.
THE EFFECT OF ACUTE AND CHRONIC DOSES OF

ROENTGEN RAYS ON MONKEY FINGER RIDGE DETAIL. R. A. Harvey. n.d. Decl. Aug. 12, 1946. 16p. (MDDC-215).

Within the time limits of these experiments: 1. Acute roentgen exposures up to 800 r cause no detectable gross changes in finger ridge details of monkeys. Acute doses of 800 r to 1,100 r result in temporary atrophy of ridges. Acute doses above this level cause more severe atrophy, slower regeneration, less complete regeneration and some tendency to secondary weakening of detail. 2. Chronic roentgen exposures of 10 r per day for 50 treatments cause no change in ridge detail. Chronic exposures of 20 r or more per exposure for 50 exposures cause detectable weakening which like that following acute exposures is more severe with increasing dosage, shows a slower tendency to regenerate, less complete regeneration and more secondary weakening. 3. Similar total doses of acute and chronic roentgen exposure yield more severe initial changes in ridge details with acute than chronic exposure, less complete regeneration with chronic than acute exposure, and slightly more secondary weakening of ridge detail with chronic than acute exposure. The results of these experiments are similar to those observed in humans, but the dose of roentgen rays necessary to produce minimal changes in monkeys and man may not be very close, for the skin on the volar surface of a monkey's finger is much tougher than that of a human.

6613

EFFECTS OF HIGH ENERGY TOTAL-BODY GAMMA IRRADIATION OF THE BRAIN AND PITUITARY GLAND OF MONKEYS. W. Haymaker, F. S. Vogel, J. Cammermeyer and W. J. H. Nauta. Am. J. Clin. Pathol. 24, Suppl., 70(1954).

Author describes lethality and histological changes in brains and pituitary glands of young adult male monkeys exposed to 1000-30,000 r (air dose).

6614

EFFECTS OF IRRADIATION OF THE NERVOUS SYSTEM. FINAL REPORT, PREPARED FOR THE COMMITTEE ON PATHOLOGICAL EFFECTS OF ATOMIC RADIATION, NATIONAL ACADEMY OF SCIENCES NATIONAL RESEARCH COUNCIL. Webb Haymaker. Armed Forces Institute of Pathology, Washington, D. C. (1956).

SEMICARBAZONE OF ADRENOCHROME AND X-RAYS. A. Herve. Arch. intern. pharmacodynamie 85, 242-4 (1951).

Oral administration of the semicarbazone of adrenochrome to mice reduced the purpura produced by x rays, did not prolong survival.

6619

THE INFLUENCE OF X-RAYS ON HYDROGEN ION CONCENTRATION IN TISSUES UNDER VARIOUS EXPERIMENTAL CONDITIONS. T. Hornykiewytch. Intern. Congr. Radiology, 6th Congress London, 1950. p. 166-7.

Author measured pH in subcutaneous tissues of rat's thigh after single dose of 4000 r (x rays) and observed: initial acidity followed by alkalinity for about 3 days subsequently followed by 4 further alkaline "waves" at intervals of 5-6 days. Alkaline waves are not apparently related to erythema. The author also studied changes in pH following total body exposure to 200 r of x rays. Physicochemical changes are discussed and observed changes are compared with those following ultrasonic treatment

THE EFFECTS OF IRRADIATION FROM THE ATOMIC BOMB ON THE JAPANESE. J. W. Howland and S. L. Warren. (nd). Decl. Sept. 15, 1947. 21p. (MDDC-1301, Cancer Research 6, 449(1946)).

A brief description is given of the medical effects following the atomic explosions at Hiroshima and Nagasaki. A discussion of the immediate clinical human pathology resulting from blast and burns is included. The effects of acute whole body irradiation on the human are considered in detail as well as pertinent observations on living individuals observed one year later. The comparative clinical and pathological effects of whole body irradiation on animals are given briefly. The pathological findings on tissues sensitive to irradiation namely lymphatic system, bone marrow, gastrointestinal canal and gonads are discussed. Photographs are included.

6621

EFFECT OF NICOTINAMIDE ON LOCAL TOLERANCE OF THE SKIN AND DEEP TISSUES TO X-RAYS. E. Huant. Gaz. hopitauz (Paris) 120, 313-14(1947).

Administration of nicotinamide during x ray therapy increased skin tolerance by 50-75% in 70% of 110 patients.

6622

THE DEPENDENCE OF X-RAY ERYTHEMA ON WAVE LENGTH. J. C. Hudson. Radiology 29, 95-8(1937).

The erythema dose of x rays varying between 200 kv, 0.5 mm Cu filter and 100 kv, unfiltered is shown to depend chiefly on absorption of the x rays of varying wave lengths by tissue.

6624

BETA IRRADIATION OF THE EYE. W. F. Hughes, Jr. and C. E. Illiff. Am. J. Ophthalmol. 32, 351-60(1949).

Beta particles of radon represent a concentrated source of irradiation which is largely absorbed within the first 2 mm of tissue and is therefore useful in the treatment of superficial conditions of the lid, the conjunctiva, cornea, and sclera. The effective use of β -irradiation in ophthalmology depends upon an exact knowledge of the differential between the sensitivity of normal tissues and the pathologic tissues to be destroyed. In general, lymphoid tissues (the follicles in vernal conjunctivitis), epithelial growths (papillomas), and vascular endothelium (in corneal vascularization) form the most sensitive tissues which can be destroyed by β -irradiation without undue injury to the normal ocular structures. Because of the great sensitivity of the corneal epithelium and stoma cells, direct irradiation over the

cornea should be used with caution. Corneal vascularization is best obliterated by irradiation over the scleral portion of the limbus. An ocular condition associated with great cellular destruction or pyogenic infection may respond poorly to β -irradiation. NSA 2-1696

6625

THE EFFECT OF BETA IRRADIATION ON THE RABBIT'S EYE. W. F. Hughes, Jr. and C. E. Illiff. Am. J. Roentgenol., Radium Therapy 56, 502-12(1946).

Low doses of β radiation affect primarily the epithelium; larger doses all of the conjunctiva and cornea, but not the iris or lens. An initial latent period, which varies inversely with dose, is followed by disorganization of corneal epithelium, loss of epithelial cell cytoplasm, altered chromatin, loss of stomal cells, desquamation of corneal endothelium and edema of the stroma, relatively little inflammatory response, secondary iritis and late regenerative changes. Effects of repeated doses are cumulative.

6626

SULFUR-35 AS A MUTAGENIC AGENT. F. P. Hungate and T. Mannell. Genetics 36, 555-6(1951).

Neurospora crassa was grown on Fries Medium in which sulfur-35 was substituted for normal sulfur. When radioactive sulfur was undiluted with non-radioactive sulfur, a recovery of more than 10% biochemical mutants was obtained even when radiation was less than 10,000 reps. When non-radioactive sulfur was present, the mutation rate was reduced, suggesting that mutations may be induced not only by ionizing beta particle but also by transmutation itself.

REPORT OF INDUSTRIAL TOLERANCE CONFERENCE JANUARY 23-24, 1945. Decl. April 28, 1950. 95p. (AECD-2832).

The main purpose of this conference was to consider the validity and usefulness of the currently accepted human tolerance dosages for x- and γ -radiation, namely, 0.1 r/day for an unlimited length of exposure. Papers were presented on the following subjects: chronic experiments correlating near-tolerance dosages with survival, blood changes, aging, genetic mutations, and skin changes, the mechanism of radiation effects, and the human tolerance dose. NSA 4-3579

THE UPTAKE BY PLANTS OF PLUTONIUM AND SOME PRODUCTS OF NUCLEAR FISSION ADSORBED ON SOIL COLLOIDS. L. Jacobson and R. Overstreet. [nd]. Decl. June 5, 1947. 8p. (MDDC-1006). Soil Sci. 65, 128-34 (1948).

Barley and pea plants take up the fission elements Y, Ce, Zr + Nb, Te, Sr and the three valence states of Pu, even when these elements are present in trace amounts on surfaces of clay or soil particles. Greatest fixation is in or on roots. With exception of Sr, translocation occurs only to a limited extent. Activity levels of 0.1 microcurie per gram soil are sufficient to cause very pronounced injury over a three-month period.

EFFECTS OF X RAYS ON RABBITS. PART III. THE HEMATOLOGICAL EFFECTS OF TOTAL BODY X IRRADIATION IN THE RABBIT. L. O. Jacobson, et al. July 1946. 46p. (MDDC-1174; CH-3798).

The hematological constituents of the peripheral blood have been studied in Swift snuffle-free rabbits before and after the administration of acute total body X-irradiation. Doses of 25 r to 800 r were administered and studies made through 96 days in many experiments. From the observations made, the conclusions derived are: A significant non-mochromic anemia develops in groups of rabbits exposed to 500 and 800 r. A significant anemia develops only in individual animals within a group with doses below 500 r. Reticulocyte reduction is significant with doses of 100 r and above. An initial leucocytosis, significantly greater than controls, occurs within the first 24 hours after doses of 500 r. After 500 r and 800 r, a sharp rise in leucocytes occurs by 12 hours, followed by a decline and another peak of leucocytes at 24 hours. The leucocytosis during this period is due exclusively to an increase in heterophils. Lymphocytes decrease significantly within 24 hours after exposure to 25 r and above. Reduction is apparent 3 hours after irradiation with 100 r and above, with a minimum value at from 24 to 48 hours. Recovery proceeds slowly. Supravital staining (Janus green and neutral red) reveals an increase in neutral red granules after 200 r and above. Mitochondrial changes are variable. Monocytes decrease initially but return to normal limits or are increased by 4 to 6 days after 200 r and above. Heterophil values increase initially after 500 and above. No significant reduction was observed with doses of 300 r and below. Doses of 500 r to 800 r inclusive produce a significant depression within 96 hours, with recovery by 23 days or less. Platelet values are reduced in a manner paralleling the granulocytes. An "abortive rise" in lymphocytes and heterophils between the 4th and 11th day after X-irradiation characteristically precedes recovery with doses of 200 r and above, respectively. Morphological changes in erythrocytes, leucocytes, and platelets occur after doses of 100 r and above. The lymphocyte values of the peripheral blood are the most sensitive known indicator of effect of acute total body X-irradiation. A bibliography of 59 references is included.

COMPARATIVE ACTION OF CYCLOTRON FAST NEUTRONS AND X RAYS. II. HEMATOLOGICAL EFFECTS PRODUCED IN THE RABBIT BY FAST NEUTRONS. L. O. Jacobson and E. K. Marks. June 1946. Decl. Oct. 8, 1947. 35p. (MDDC-1372, CH-3839).

Methods of preparing anhydrous uranium trichloride, uranium tetrachloride, uranium hexachloride, and uranyl chloride are described which use uranium metal as the starting material. Uranium trichloride has been prepared by the action of hydrogen chloride on uranium hydride or powdered uranium metal at 250°C. The tetrachloride has been made by reaction of chloride with the trichloride and by direct reaction of chloride (diluted by an inert gas) on uranium hydride. The hexachloride has been prepared only by disproportionation of chlorides having a chlorine to uranium ratio of around 5.5. Uranyl chloride was found to be most satisfactorily made by the reaction of uranium tetrachloride and oxygen at 300°C. The densities of these compounds and of the pentachloride have been

measured by the liquid displacement method and also determined from X-ray diffraction data. The densities in g/cm³ obtained by liquid displacement method are 5.35 for uranium trichloride, 4.88 for the tetrachloride, 3.81 for the pentachloride, 1.56 for the hexachloride, and 5.38 for uranyl chloride, all at 25°C. The densities based on X-ray measurements are 5.51 for the trichloride, 4.87 for the tetrachloride, and 5.43 for uranyl chloride. Vapor pressure measurements have been made for uranium tetrachloride and uranium hexachloride by the transpiration method. The vapor pressure of the tetrachloride is 0.9 mm at 450°C and 100 mm at 675°C; that of the hexachloride is 0.06 mm at 75.5°C and 1.75 mm at 138°C. Uranium tetrachloride melts at 590°C and boils at 802°C under 740 mm pressure. There is X-ray and thermal evidence for a crystal transformation in uranium tetrachloride at 545°C. The reaction between chlorine and uranium tetrachloride or uranium trichloride has been shown to produce higher uranium chlorides in which the chlorine to uranium ratio varies with the reaction temperature. Corrosion studies have been made on nickel and stainless steel and some refractory materials at 600°C. A bibliography of 39 references is included.

RADIATION INDUCED CHROMOSOME ABERRATIONS. Berwind P. Kaufmann. p. 27-36 of CONFERENCE ON BIOLOGICAL APPLICATIONS OF NUCLEAR PHYSICS; JULY 12-27, 1948. July 1948. 154p. (BNL-C-4).

This report considers the problem of inducing structural rearrangements in Drosophila chromosomes, especially the susceptibility of various regions of the chromosomes to the effects of various types of radiation. The importance of near-infrared radiation in studies of breakage and recombination is stressed. This radiation modifies processes that lead to structural rearrangements but not processes responsible for gene mutation.

6642

INFLUENCE OF TEMPERATURE ON CHROMOSOME RECOMBINATION FOLLOWING X-RAY-INDUCED BREAKAGE. Berwind P. Kaufmann. Records Genetics Soc. Am. 12, 50(1943).

Increased temperature during chromosome recombination following x ray-induced breaks facilitates movements that result in reunion of broken ends. (Chromosomes of Drosophila sperm.)

6655

EFFECT OF COLCHICINE PRETREATMENT ON THE FREQUENCY OF CHROMOSOMAL ABERRATIONS INDUCED BY X-RADIATION. Robert T. Brumfield. Proc. Natl. Acad. Sci. U. S. 29, 190-3(1943).

Treatment of onion roots for 45 minutes with a 0.05% solution of colchicine prior to x radiation resulted in less than one-third as many chromatid aberrations as found in non-colchicine treated controls. The frequency of x ray induced chromosome effects was about the same in pretreated roots and controls. Colchicine pretreatment presumably reduces amount of chromosome movement in prophase where chromatid effects are induced, thus resulting in less opportunity for fusion of broken ends into new combinations. (from author's summary).

6656

RESISTANCE OF COENZYME A TO RADIATION. J. W. Gardella and E. J. Lichtler. Federation Proc. **15**, 70(1956).

Studies on the effects of radiation on coenzyme A were carried out on pigeon liver and Yoshida ascites tumor cells (*in vitro*) and on tissues from rats, mice and ducklings subjected to total body irradiation.

6661

THE EFFECT OF HEAVY METAL SALTS ON X-RAY INDUCED MUTATIONS IN DROSOPHILA MELANOGASTER. EXPERIMENTS USING URANYL ACETATE. W. Buchmann and G. Sydow. Biol. Zentr. **60**, 137-42(1940).

Mutation rate and lethality induced by 3000 r x ray dose were greater in *Drosophila* fed with medium containing 1% uranylacetate than in *Drosophila* fed on standard medium.

6662

INCREASE OF X-RAY INDUCED MUTATION RATE AS AFFECTED BY HEAVY ATOM SALTS INTRODUCED INTO THE ORGANISM. Walter Buchmann and Karl G. Zimmer. Z. Induktive Abstammungs- u. Vererbungslehre **79**, 192-8 (1941).

The rate of induction of lethal mutations in *Drosophila* is increased by feeding the flies Pb acetate before irradiation. The increase varies with x ray wave length in accordance with the mass absorption coefficient of Pb. In contrast, feeding Fe to the flies produces an increased incidence of mutations that does not conform to results expected on the basis of the mass absorption coefficient of Fe, indicating that the effect of Fe feeding cannot be accounted for simply on the basis of increased physical absorption of energy.

X ray doses of 300 r or more did not alter the nonimmune rate of elimination of labeled antigen by rabbits although the immune response was suppressed. Other observations are also described.

6664

A NOTE ON TUMORS IN MICE. H. Burrows and W. V. Mayneord. Am. J. Cancer **31**, 484-5(1937).

Spindle cell sarcomata were induced in mice injected subcutaneously with cholesterol which had been irradiated with x rays in doses of 2000-110,000 r.

6665

THE INTEGRAL DOSE RECEIVED FROM A UNIFORMLY DISTRIBUTED RADIOACTIVE ISOTOPE. F. Bush. Brit. J. Radiol. **22**, 96-105(1949).

Methods of calculation of the integral dose received in simple geometrical bodies containing a uniformly distributed γ -ray emitting radioactive isotope are described, and a general relation between this dose and the volume, and the elongation of the body, deduced. These calculations have been extended to the case of a "patient", composed of cylinders and elliptical cylinders. A table is given, showing the integral dosage-rates in patients of different heights and weights from a uniformly distributed γ -ray emitter. The effect of variation in the quantum energy of

the emitted radiation on the integral dose is examined. An expression is found which gives the fraction of the energy due to β -particle emission which is lost from the surface of the patient or animal. This loss may be important in the case of small animals. NSA 2-1280

6669

THE INFLUENCE OF HEAT TREATMENTS ON THE INJURY AND CYTO-GENETIC EFFECTS OF X-RAYS ON BARLEY. Richard S. Caldecott and Luther Smith. Genetics **36**, 546(1951).

Heat treatments alone had no influence on injury, chromosomal aberrations or mutations. Heat treatments before x-radiation (15,000 r) reduced injury. Effect on injury was more variable if x-radiation was followed by heat. In some cases injury was more and in others less than that resulting from x-radiations alone. Combination treatments resulted in a decrease in chromosomal aberrations and an increase in mutations.

ACUTE TOXICITY OF ZIRCONIUM, COLUMBIUM,
STRONTIUM, LANTHANUM, CESIUM, TANTALUM AND
YTTRIUM. Kenneth W. Cochran, John Doull, Marcella
Mazur and Kenneth P. DuBois. Arch. Ind. Hyg. Occupational
Med. 1, 637-50(1950).

Aqueous solutions or suspensions of compounds of
Zr, Nb, Sr, La, Cs, Ta, and Y were administered in
single doses by intraperitoneal injection or orally by stomach
tube to male and female rats. Observation was made for
10 days, since the animals either recovered or succumbed
during this period. The LD₅₀ values are given for the
various compounds used. Differences in these values
are pointed out for the several compounds of each element
studied, and the dependence of these values on the route
of administration (oral or injection) is discussed. 28

EFFECT OF RADIUM ON THE MITOCHONDRIA OF PLANT
CELLS. P. F. Milovidov. Compt. rend. soc. biol. 101,
676-8(1929). (In French)

Seedling roots of *Pisum sativum* were studied in an
apparatus permitting measurement of micrometric displacement.
The roots, in a moist atmosphere, were placed next to or
in contact with a tube of RaCl for 1, 2 or 5 hours. In
stained sections of exposed roots there were no mitoses
after 5 hr exposure, mitochondrial structure was altered
and vesicular changes were observed. Other changes

included atypical mitoses, abnormal chromosomes and abnormal chromosome distribution. Mitochondria appeared to be less sensitive than the nucleus to β and γ rays in contrast to their greater sensitivity to pressure, heat and many chemicals.

THE EFFECT OF AGE AND LOW PHOSPHORUS RICKETS ON CALCIFICATION AND THE DEPOSITION OF CERTAIN RADIOACTIVE METALS IN BONE. D. H. Copp, J. G. Hamilton, D. C. Jones, D. M. Thomson, and C. Cramer. Sept. 1951. 31p. (UCRL-1464).

The effect of age and low-P rickets on the retention of Ca^{45} , $\text{Sr}^{89, 90}$, Ba^{140} , Y^{88} , and Ce^{144} in bone was investigated. The radioactive metals were injected into young growing rats in which there was active growth of new bone, young rats with low-P rickets in which new osteoid matrix was forming but deposition of bone salt did not take place, and mature adult rats in which bone growth had practically ceased. Urine and feces were collected separately and the animals were sacrificed after 8 days. Excreta and tissues were analyzed for radioisotope and radioautographs prepared for thin undecalcified sections of bone. Data indicate the metabolism of Ca, Sr, and Ba was markedly affected by age and low-P rickets, while metabolism of other heavy metals such as Y and Ce was not affected. Radioautographs of rachitic femur show that $\text{Sr}^{89, 90}$ and Ca^{45} were deposited only in the presence of bone salt, while Y^{88} and Ce^{144} and other heavy metals were also laid down in uncalcified osteoid matrix. Kinetic studies of skeletal uptake and excretion of radiocalcium and radiostrontium showed considerable mineral exchange, even in adult rats. Skeletal uptake was more rapid and greater in growing animals, and the radioactive isotopes remained fixed in the new bone salt. In rachitic rats the initial uptake by bone was rapid, but Ca^{45} or $\text{Sr}^{89, 90}$ was then rapidly lost from the skeleton and excreted in urine. When normal animals were injected with Ca^{45} or $\text{Sr}^{89, 90}$, and then fed a diet low in P, the excretion of the radioactive isotopes in urine was increased, and removal from the skeleton was accelerated. NSA 5-6951

SUBACUTE TOXICITY OF RADIOACTIVE PHOSPHORUS AS RELATED TO THE COMPOSITION OF THE DIET. W. E. Cornatzer, George T. Harrell, Jr., David Cayer and Camillo Artom. Proc. Soc. Exptl. Biol. Med. 73, 492-5 (1950).

In the present investigation the subacute toxicity of P^{32} given parenterally to mice (in one dose in the form of Na_2HPO_4) was studied in relation to the possibility that changes in the composition of the diet might modify the action. It was found that in mice maintained on a 10% casein, 32% fat diet, the LD_{50} dose at the 21st day was 4 to 6 μc of P^{32} /g of body weight, neither the fatty infiltration of the liver or its prevention (by supplementing the diet with choline) changed the survival figures. The survival time of the mice was highest when they were maintained on a diet low in fat and protein and was significantly decreased when the level of either the fat or the protein or both was increased in the diet. Enrichment of the diets with inorganic phosphate seems to afford a moderate degree of protection against the injurious action of P^{32} . NSA 4-3357

THE METABOLISM OF CARRIER-FREE Be^7 IN THE RAT. Josephine F. Crowley, Joseph G. Hamilton and Kenneth G. Scott. July 15, 1948. Decl. Sept. 3, 1948. (AECD-2254, UCRL-148).

Recent studies have shown that the soluble Be compounds are toxic, and the toxicity is a function of both Be and the anionic part of the molecule. Acute beryllium poisoning manifests itself in at least three organ systems of the body, midzonal necrosis of the liver, necrosis of the distal third of the proximal convoluted tubule of the kidney, and poisoning of the hemopoietic system leading to anemia and leucocytosis. Owing to the necessity of using at least micrograms of material when studies are made with stable isotopes of beryllium, it is difficult to measure the normal

metabolism of beryllium because of its toxicity. When a radioactive isotope of this element is used the actual number of beryllium atoms which can be traced is reduced by a factor of at least 10^6 . For this reason it is possible to ascertain the manner in which the normal animal handles extremely minute amounts of beryllium which are far below the possible levels of chemical toxicity. The metabolism of beryllium in the rat has been investigated with tracer amounts of carrier-free Be^7 . About one half microcurie of Be^7 in an isotonic solution was administered to each rat via intramuscular injection. Within 24 hours 40% of the Be^7 had been absorbed from the injection site and 53% of the absorbed Be^7 had been eliminated from the body, mainly in the urine. By the 64th day after injection, a total of 80% had been absorbed from the injection site and 70% had been eliminated from the body. Of the absorbed Be^7 which remained in the body, the major portion was taken up by bone. Within 24 hours after injection, the bone had accumulated 29.4% of the absorbed Be^7 and maintained this level to the 64th day, when the bone contained 26.9% of the absorbed material. Many of the soft tissues of the body demonstrated a small initial uptake followed by a ten fold decrease in Be^7 content by the 64th day. The radioberyllium content of the spleen and muscle remained relatively constant throughout the interval of the experiments. Less than 0.1% of the Be^7 administered orally was absorbed from the intestinal tract. NSA 1-1092

BIOLOGICAL EFFECTS OF LONG CONTINUED WHOLE BODY IRRADIATION WITH GAMMA RAYS ON MICE, GUINEA PIGS, AND RABBITS, PART IV. BIOLOGIC ACTION OF GAMMA RADIATION ON THE BREEDING BEHAVIOR OF MICE. M. K. Deringer, W. B. Heston, and E. Lorenz. Oct. 25, 1947. *Decl. Aug.* 4, 1947. 30p. (MDDC-1247, CH-3729).

These experiments were designed to study the effects of continuous exposure to gamma radiation of low intensity on LAF_1 hybrid mice with respect to: (1) sterility (2) dominant mutations, particularly dominant lethals as evidence by reduced size of the litters of irradiated mice and (3) genetic changes (translocations) in the progeny of the irradiated mice. Female mice exposed to total doses of 770 r and 880 r on the 8.8 r and on the 4.4 r per 24 hours per day, and on the 8.8 r per 8 hours per day levels showed sterility effects, some producing litters of reduced size and others being sterile. Females exposed to a total dose of 550 r on the 4.4 r per 8 hours per day level bred but with reduced litter size. Male mice receiving a total dose of 1,760 r at a rate of 8.8 r per 8 hours per day were sterile on removal from the field but regained fertility in two months. Males receiving total dose of 880 r and 1,100 r on the 8.8 r per 8 hours per day level bred normal size. Males receiving total doses up to 1,100 r on the 4.4 r per 8 hours per day and on the 4.4 r per 24 hours per day levels bred comparably to the controls. Breeding results obtained for female mice on 1 hour, 8 hour, and 24 hour exposures do not differ significantly and failed to demonstrate any effect of the rate of administration of the dose. Female mice exposed to a single dose of 300 r whole body X radiation at the rate of 41 r per minute produced one litter of reduced size and were sterile thereafter. The sterilized females did not recover their fertility but the males did. Breeding results for female mice exposed to a total dose of 440 r at the rate of 4.4 r per 24 hours per age failed to show any age effects. No evidence for the production of genetic changes was obtained in mice receiving chronic exposures, or for the production of translocations in the offspring of male mice receiving a total dose of 1,100 r at the rate of 8.8 r per 8 hours per day or of female mice receiving a total dose of 770 r at the rate of 8.8 r per 24 hours per day.

THE USE OF AUTORADIOGRAPHS IN THE QUANTITATIVE DETERMINATION OF RADIATION DOSAGE FROM Ca^{45} IN BONE. R. A. Dudley and B. M. Dobyns. *Science* 109, 327-8(1949).

An autoradiographic technique capable of quantitatively measuring local dosage rates in tissue, currently being applied to the study of radioactive Ca^{45} dosages in bone, is described. The technique is similar to that described by Axelrod and Hamilton [*Amer J Path* 23 389 (1947)] in their radioactive sulfur and arsenic studies of mustard gas and lewisite concentration in the skin and eye tissues. It consists of making an autoradiograph of the tissue being studied, producing calibration exposures from radioactive sources of known activity on the same film, developing the tissue and calibration exposures simultaneously, and comparing their blackening microphotometrically. The application of the technique to studies on the Ca^{45} bone-uptake in the dog is discussed and autoradiographs and a microphotometer record obtained in such experiments are given. It is noted that, if the same dilution that exists in dogs also exists in humans, the maximum local dosage rate would be a permissible 0.034 reps/day. NSA 2-2040

6730

ASPECTS OF THE RADIOSENSITIVITY OF SEEDS PRIOR TO THE APPEARANCE OF MORPHOLOGICAL CHANGES. J. Lambert. *Compt. rend. soc. biol.* 110, 583-6(1932). (In French).

Pea seedlings were irradiated either in the dry state or after hydration and the length of the seedling roots was measured 12 days after germination. Hydrated seeds were more radiosensitive than were dry ones. Chemical composition did not change after hydration, except for the hydration per se. Author attributes the increased radiosensitivity associated with hydration to altered metabolic state ("dynamic processes") of the seeds and sites studied in other laboratories demonstrating the parallelism between catalysis of oxidation-reduction systems and water inhibition in support of his thesis.

6731

THE EFFECT OF RADIOACTIVITY ON CHLOROPHYLL-CONTAINING THE NON-CHLOROPHYLL CONTAINING CELLS. J. Stoklass, J. Penkava, and J. Bares. *Sbornik Ceskoslov. akad. zemedelske* 2, 57-104(1928).

The authors demonstrated that all enzymic processes were stimulated by the α rays of radon when it was released from the soil in sufficient amounts and in the presence of sufficient oxygen. Under the proper conditions, the intensity of respiration by chlorophyll-containing and non-chlorophyll-containing plants was found to be stimulated. The β and γ rays were found to activate primarily the glycolytic enzyme and to account for the intensive respiration of organisms having a high K content. They were also found to be, in some respects, antagonistic to α rays in their action. The β rays effect (at the cell surface) was the promotion of synthetic processes, α rays promoted decomposition of organic complexes and probably promoted oxidation by releasing Fe in the process (from abstract in CA). SYSTEMS. E. L. Powers. (Argonne National Lab., Lemont, Ill.). p.17-29 of A CONFERENCE ON RADIOACTIVE ISOTOPES IN AGRICULTURE HELD AT MICHIGAN STATE UNIVERSITY ON JANUARY 12, 13, AND 14, 1956. Jan. 1956. 420p. (TID-7512).

Literature pertaining to effects of radioactive decay in cell systems is reviewed and results of experiments with *Paramecium aurelia* are described. Evidence is presented to show that P^{32} incorporation into animal protoplasm is much more efficient in bringing about post-autogamous death than is Sr^{89} - Sr^{90} mixture at similar dose levels. Unlike P^{32} , Sr^{89} - Sr^{90} is not incorporated into protoplasm at critically important sites and differences in biological effectiveness of the isotopes are probably due to differences in their intracellular localization.

6735

THE EFFECT OF ROENTGEN RAYS ON THE STOMACH IN RABBITS. R. B. Engelstad. Am. J. Roentgenol. Radium Therapy 49, 243-63(1938).

Doses of 125-4500 r were delivered to the stomachs of rabbits. Doses of 2000 r or more caused a high mortality. Reaction in the first 24 hr was characterized by degeneration of lymphoid follicles and hyperemia. This was followed by a latent period and then by severe degenerative and inflammatory changes.

Argonne National Lab., Lemont, Ill.
BIOLOGICAL EFFECTS OF LONG CONTINUED WHOLE BODY IRRADIATION WITH GAMMA RAYS ON MICE, GUINEA PIGS, AND RABBITS, PART V. A. B. Eschenbrenner. Sept. 17, 1946. Decl. Jan. 24, 1947. 46p. (MDDC-642; CH-3644).

Histologic observations in animals exposed to long continued irradiation with γ rays were the following. Mice: -The lymphoid tissue was only affected in the 2.2 r, 4.4 r, and 8.8 r levels but changes observed initially did not progress with increasing total dose. Malignant lymphoma (leukemia), which was associated in only a small number of cases with a lymphomatosis in the circulating blood, involved all lymphoid tissues frequently with local invasiveness and metastases of many organs. The interstitia tissue of the testes appeared unaffected for the highest accumulated doses (approx. 5000 r). Damage to the testes was restricted to the tubules and the various spermatogenic elements, but even at the highest total doses occasional spermatogonia or spermatocytes, but no spermatozoa, were found. Damage to testes is dependent upon dose

rate rather than total dose. Damage to the ovaries is dependent upon total dose and is irreversible. It consists of diminution in the number of follicles and final disappearance of these structures followed by tubular down-growth of the germinal epithelium, and finally the development of several types of ovarian tumors. In a few cases of sarcoma at the site of the mammary gland was associated with the ovarian tumors. Guinea pigs: -The most important changes were observed in the blood forming organs. All animals of the 8.8 r and most of the animals of the 4.4 r and 2.2 r levels died of anemia and thrombocytopenia. Bone marrow in these animals was aplastic to varying degree. The testes were as radiosensitive as those of mice and showed a similar picture of damage. Ovaries were not affected and showed numerous developing follicles even for total doses as high as 4000 r. Lung tumors were observed in two animals that were exposed to total doses of 4000 r. These tumors were of alveolar origin.

6742

THE ACTION OF RADIUM EMANATION ON BACTERIA. H. Schroetter. Centr. Bakteriell Parasitenk. I. Abt. Orig. 104, 205-10(1927). (In German)

Ra emanation causes hyperthrophy of bacterial cells.

6743

TOXICITY OF ALPHA AND FAST NEUTRON RADIATION. R. D. Evans. Nature 146, 621(1940)

Results of experiments on neutron tolerance in animals cannot be accurately extrapolated to man because the relative radiation sensitivities are not known for small doses. The average specific ionization of the neutron recoil rays is closer to that of alpha rays than to any other radiation studied extensively in biological systems.

THE EFFECT OF X RAYS AND RADIUM ON THE BLOOD FORMATION DURING INCUBATION OF CHICK EGGS. M. M. Fomenko. Zhur. Eksptl. Biol i Med. 8, 354-9 (1928). (In German)

X-rays and Ra inhibit development of chick eggs, especially the development of erythrocytes. The younger the cell, the more sensitive it seems to be.

6746

RELATION BETWEEN THE ACTION OF COLD AND OF NITROGEN IN DECREASING THE FREQUENCY OF CHROMOSOME ABERRATIONS. A. C. Faberge. Genetics 35, 663(1950).

The frequency of chromosome breaks in x irradiated *Tradescantia* can be reduced by irradiating at very low temperatures or in the absence of O_2 . The author discusses the mechanism of modification of x ray effects by the two procedures, pointing out that the data available suggest an indirect effect of radiation, e.g. spread of effect around an ion cluster. The target theory is not compatible with those views.

6747

A THEORY OF THE BIOLOGICAL ACTION OF IONIZING RADIATIONS. G. Failla. in: SOME FUNDAMENTAL ASPECTS

OF THE CANCER PROBLEM. Publ. Am. Assoc. Adv. Sci. 4, 202-14(Suppl. Science, 85(1937)).

Author presents his theory of a mechanism which accounts for initial swelling of cells and nuclei and predicts the influence such a mechanism would have on normal physiological processes. According to the theory, radiation would be expected to exert its greatest effect on nuclei. Direct "hits" are important in damaging a very small entity in the cell and may cause localized damage of the cell membrane. Diffusion of chemical products of the breakdown of organic molecules is facilitated by thermal agitation and also by biological activity during which there is increased motion of fluids in protoplasm ("fluid flow" theory of biological action of ionizing radiations).

MEASUREMENTS OF THE FREQUENCY OF DOMINANT LETHALS INDUCED IN SPERM OF DROSOPHILA MELANOGASTER BY X-RAYS. U. Fano and M. Demerec. Genetics 26, 151(1941).

The fraction of eggs which after fertilization by x rayed sperms fail to give rise to adult flies has been taken as an indicator of dominant lethals. Production of dominant lethals is proportional to x ray dose for small dose and for high dose. Dose-effect curve does not fit the "single hit" type of curve. Percentage of dominant lethals produced by 1000 roentgens is too large to be accounted for by production of inviable chromosome aberrations.

ACUTE RADIOTOXICITY OF (BA-LA)¹⁴⁰ IN RATS AND MICE. PART IV. LETHAL ACTION AND CLINICAL SYMPTOMS. R. D. Finkle, R. H. Snyder and W. E. Kisielewski. June 1947. 6p. (MDDC-1207; CH-3825).

In the (Ba-La)¹⁴⁰ experiments, rats and mice were injected intraperitoneally with toxic doses of radiobarium. The dose of (Ba-La)¹⁴⁰ necessary to kill 50 per cent of the injected mice in one month was about 3 to 5 μ c/g. The dose required to kill half of the injected rats in 90 days was about 4 μ c/g. The mice that died and some of those that recovered showed outward symptoms of injury. They were lethargic, and there was usually some loss of hair. Before death, the eyes became watery and the lids encrusted, and finally, the eyes were sunken and nearly closed. The eye symptoms and lethargy noticed in the mice were also apparent in the rats. The animals were usually nervous and irritable when disturbed. Large quantities of inert barium chloride were injected subcutaneously into mice. A similar experiment with inert lanthanum was performed. The experiment designed to test chemical toxicity of barium and to test another route of administration was unsatisfactory.

6759

MANAGEMENT OF X-RAY REACTIONS. N. S. Finzi. Brit. J. Radiol. 15, 192-3(1942).

Undesirable reactions to radiation therapy and medications to relieve them are described for local reactions of the skin, mucous membrane, bone, intestine, eye, and lungs.

6760

REDUCED GLUTATHIONE CONTENT OF THE BLOOD AND TISSUES AFTER TOTAL-BODY IRRADIATION WITH LETHAL DOSES OF X-RAYS. P. Fischer, L. de Landscheer and J. Lecomte. Bull. soc. chim. biol. 32, 1009-11 (1950).

Mice and guinea pigs showed no change in reduced glutathione of blood, liver, kidney, heart or muscle after fatal x ray dose. Parenteral administration of H₂O₂ to unirradiated animals caused a decrease in reduced glutathione in the kidney only.

6761

ON THE EFFECT OF ROENTGEN RAYS ON THE BRAIN. H. Brunner. Arch. klin. Chir., Langenbecks 114, 332 (1920).

In dogs and cats a few days old, granule cells of cerebellum were found to be highly radiosensitive, as little as 4 HED causing destruction in several days.

6766

THE EFFECT OF ROENTGEN RAYS ON THE REGENERATION PROCESS IN THE BRAIN WITH SPECIAL CONSIDERATION OF THE NEUROGLIA. H. Brunner. *Arch. klin. Chir.*, *Langenbecks* 116, 489(1921). (In German).

6767

California. Univ., Berkeley. Radiation Lab. MEDICAL AND HEALTH PHYSICS QUARTERLY REPORT FOR JULY, AUGUST, SEPTEMBER 1955. Oct. 28, 1955 32p. Contract W-7405-eng-48. (UCRL-3208).

Includes report on: excretion of injected Sr^{90} in monkeys and their offspring; metabolism of At^{211} and I^{131} in salivaryectomized and thyroidectomized rats, effects of radiation on protein systems. NSA 10-1696

6768

Naval Radiological Defense Lab., San Francisco. MODIFICATION OF ACUTE INTESTINAL RADIATION SYNDROME THROUGH SHIELDING. M. N. Swift and S. T. Taketa. Sept. 22, 1955. 18p. Project NM 006 015. (USNRDL-TR-66). *Am. J. Physiol.* 185, 85-91(1956).

Mortality from intestinal injury in rats 3-5 days after 1000 r of x rays was significantly decreased by shielding small exteriorized section of duodenum or ileum during exposure. Recovery from radiation-induced small intestine weight loss began 4 days postexposure in shielded groups, no such recovery was observed in unshielded controls. Similar experiments with 875 r and 5000 r are described. NSA 10-1697

6769

PULMONARY EFFECTS FROM RADIOACTIVE BARIUM SULFATE DUST. H. Cember, T. F. Hatch, J. A. Watson and T. Grucci. *A. M. A. Arch. Ind. Health* 12, 628-34 (1955).

Rats were exposed by intratracheal insufflation to radioactive barium sulfate particles at levels of 4.5 mc, 45 μc and 4.5 μc radiosulfur and were serially killed over 9 mo. period. Results suggest intense radiation dose delivered to small volume of lung tissue in immediate vicinity of barium sulfate particles may not be as hazardous as expected, or that latent period for production of serious radiation injury is longer than 9 mo period over which these animals were observed. NSA 10-1698

6770

ROLE OF THE KIDNEY IN DEVELOPMENT OF VASCULAR HYPERSENSITIVITY FOLLOWING WHOLE BODY IRRADIATION. David F. Bohr, P. A. Rondell, L. E. Palmer, B. L. Baker and F. H. Bethell. *Am. J. Physiol.* 183, 331-4(1955).

Kidney shielding reduced the incidence of increased vascular sensitivity in irradiated rats in 2nd week post-irradiation. Kidney-shielded animals were in better general condition than controls. Vascular hypersensitivity during this period may parallel incidence of general debility rather than reflect presence of renal vasoexcitator material. No histologic change was detected in irradiated kidney. NSA 10-1699

6771

EFFECT OF MORPHINE AND N-ALLYLNORMOPHINE ON RADIATION MORTALITY. Howard L. Andrews and Ervin G. Liljegren. *Am. J. Physiol.* 183, 322-4(1955).

Either morphine or nalorphine, given alone prior to x-irradiation, produces significant decrease in 28-day mortality, despite essentially antagonistic actions of the

two drugs. Mixtures of the two have little effect on mortality statistics. NSA 10-1705

6772

THE APPLICATION OF EXTERNAL AND INTERNAL RADIATION EXPOSURE LIMITS. Karl Z. Morgan. *Am. Ind. Hyg. Assoc. Quart.* 16, 307-23(1955).

Units of measurement used for ionizing radiation are defined. Basic criteria for permissible exposures, types of experimental data needed to establish reliable maximum permissible exposure values, and administrative problems in applying maximum permissible exposure values are reviewed. 23 references. NSA 10-1706

6773

RADIATION EXPOSURE OF STAFF IN DIAGNOSTIC PROCEDURES. I. BLOOD COUNTS-RESEARCH OR ROUTINE? J. F. Loutit. *Brit. J. Radiol.* 28, 647-50(1955).

Biological system of monitoring through blood counts, and radiation damage in workers occupationally exposed to ionizing radiation are reviewed. Results obtained with physical methods of measuring dose are compared with results with biological methods. Author concludes that leukocytic pattern is not a reliable indicator of biological damage. Steinbock and Henry S. Kaplan. J. Natl. Cancer Inst. 15, 981-90(1955). NSA 9-2558

6780

SPONTANEOUS AND RADIATION-INDUCED PITUITARY ADENOMAS OF MICE. Arthur C. Upton and Jacob Furth. J. Natl. Cancer Inst. 15, 1005-21(1955).

Tumor incidence was increased by one whole-body exposure to ionizing radiation and tumor formation was hastened in proportion to dose. Neoplasms were 4-5 times more common in females than in males. NSA 9-2559

6781

EFFECT OF LOCAL ROENTGEN IRRADIATION ON THE FORMATION OF NEW CAPILLARIES AFTER INJURY. Ruth M. Merwin and Elizabeth L. Hill. J. Natl. Cancer Inst. 15, 1031-7(1955).

Within 6 hrs after an x ray dose of 400 - 1500 r, the skin of mice was injected by small burn or by insertion of wire stitch. As dose increased from 500-1500 r, revascularization of burned areas decreased; interval before capillaries began to invade coating around wires increased. New network of vessels in both injuries was sparser when dose exceeded 700 r. NSA 9-2561

6782

STUDY OF RECOVERY AT LOW TEMPERATURE OF X-IRRADIATED *E. COLI* CELLS. A. W. Pratt, W. S. Moos and M. Eden. J. Natl. Cancer Inst. 15, 1039-47 (1955).

Recovery was studied as function of time bacteria were stored in cold distilled water, citrate or broth suspensions. Some degree of recovery was observed in all suspensions, indicating mechanism of recovery is intrinsic to cell. NSA 9-2562

6783

LONG-TERM EFFECTS OF ACUTE AND CHRONIC IRRADIATION IN MICE. I. SURVIVAL AND TUMOR INCIDENCE FOLLOWING CHRONIC IRRADIATION OF 0.11 R PER DAY. Egon Lorenz, Joanne Weikel Hollcroft, Eliza Miller, Charles C. Congdon and Robert Schweisthal. J. Natl. Cancer Inst. 15, 1049-58(1955).

Survival time of LAF₁ male, but not female, mice exposed to Ra γ rays (0.11 r/8 hr day) from age 1 mo until death was significantly increased. Incidence of lymphosarcomas and other reticular tissue tumors was greater in both males and females postexposure. NSA 9-2563

6784

EFFECTS OF COMBINED LOCAL TREATMENT WITH RADIOACTIVE AND CHEMICAL CARCINOGENS. Arthur M. Cloudman, Katherine A. Hamilton, Ralph S. Clayton and Austin M. Brues. J. Natl. Cancer Inst. 15, 1077-83 (1955).

Methylcholanthrene and/or β -ray sources were applied to skin or subcutaneous tissues of mice. Carcinogenic effects on skin were approximately additive; possibly synergistic in producing papillomas. Agents were somewhat less than additive when given by subcutaneous pellet. Methylcholanthrene painted on skin reduced survival by 1/3. NSA 9-2565

6785

AMINOACIDURIA FOLLOWING TOTAL-BODY IRRADIATION IN THE HUMAN. Elaine J. Katz and Robert J. Hasterlik. J. Natl. Cancer Inst. 15, 1085-1107(1955).

After exposure of 4 workers to total-body irradiation with γ rays and neutrons of 25-180 rep, total daily urinary amino-acid excretion increased to as high as 10 times normal values. Amino aciduria is considered to be a sensitive and early (within 12 hr) indicator of relatively low levels of radiation exposure. NSA 9-2566

6786

LEVEL OF PROTEIN INTAKE AND NITROGEN EXCRETION IN RATS FOLLOWING TOTAL-BODY X IRRADIATION.

Julius White, Bernard E. Burr, Harriett T. Cool, Philip W. David and Mona S. Ally. J. Natl. Cancer Inst. 15, 1145-54(1955).

Rats fed low protein diet showed marked increase in nitrogen excretion; those fed 15- or 20-per cent casein diet showed much lower increase when both groups were given 450-500 r total-body x rays. Spleen shielding gave partial protection against increased N excretion post irradiation. NSA 9-2568

6787

CIRRHOSIS OF THE LIVER IN RATS FOLLOWING TOTAL-BODY X IRRADIATION. Julius White, Charles C. Congdon, Philip W. David and Mona S. Ally. J. Natl. Cancer Inst. 15, 1155-63(1955).

Cirrhosis of liver developed in 53% of rats fed low protein diet and surviving 450 or 500 r of total-body x rays. Those fed 15% or 20% casein diet, or diet in which 15% casein was replaced by amino acids for 30 days, showed no cirrhosis for 400 days after 450 or 500 r. Pulmonary infection was a prominent cause of death in most groups of irradiated rats. NSA 9-2569

6788

A COMPARATIVE ANALYSIS OF RADIATION LETHALITY IN MAMMALS EXPOSED AT CONSTANT AVERAGE INTENSITY FOR THE DURATION OF LIFE. George A. Sacher. J. Natl. Cancer Inst. 15, 1125-44(1955).

Data on radiation lethality in mice, rats, rabbits, dogs, guinea pigs, monkeys and burros are reviewed and analyzed and are tabulated according to species, strain, sex, radiation quality, length of exposure, daily dosages and treatment pattern. Relation between survival time and underlying injury process is analyzed. NSA 9-2567

6789

THE EFFECT OF LOW VOLTAGE ELECTRONS ON THE LATENT PERIOD OF T1 BACTERIOPHAGE. Marguerite Davis and Ernest Pollard. Radiation Research 2, 47-9(1955).

Low-voltage electron bombardment of T1 bacteriophage shows the property concerned with the length of the latent period is situated deep in the virus, probably at a depth exceeding 100 A. NSA 9-2570

6790

INFLUENCE OF EXTENDED TEMPERATURE TREATMENTS ON RECOVERY OF X-IRRADIATED ASCARIS EGGS. C. S. Bachofer and George Pahl. Radiation Research 2, 50-63 (1955).

Storage of x-rayed *Ascaris lumbricoides* suum in 0° and 5°C temperatures for up to 35 wk after exposure only served to decrease survival time. For maximum post irradiation survival, temperature should approximate that for maximum biological activity, thus a flowing replacement of constituents and removal of toxic elements. NSA 9-2571

6791

CHANGES IN RESPIRATORY GASES OF BURROS AFTER PROLONGED FRACTIONATED TOTAL-BODY γ -IRRADIATION. John J. Lane, James L. Wilding, John H. Rust, Bernard F. Trum and Joseph C. Schoolar. Radiation Research 2, 64-70(1955).

Metabolic studies have been carried out with total-body irradiated and with fasted nonirradiated burros. It was found that the R. Q. of the irradiated and fasted nonirradiated animals decreased, but that the R. Q. decreased much more drastically in animals irradiated with 200 r/day of total-body cobalt-60 γ -irradiation than with 25-r/day group. With the 25-r/day group and in the fasted nonirradiated animals the decrease was similar although the food consumption of the irradiated animals did not change. Oxygen consumption was reduced in both fasted and 200-r/day groups but not in the 25-r/day group. The carbon dioxide expired was reduced significantly in

both dose groups. Weight loss of the irradiated and fasted controls was very similar. The blood pyruvate level was increased on the twentieth day of irradiation and remained high until death. NSA 9-2572

6792
ANDROGENESIS AS EVIDENCE FOR THE NATURE OF X-RAY-INDUCED INJURY. Anna R. Whiting. Radiation Research 2, 71-8(1955).

Irradiated cytoplasm of *Habrobracon* eggs functioned normally after exposure to x ray dose many times greater than that lethal to nucleus. High doses prevented normal function, even in combination with an uninjured nucleus. Phenomenon of androgenesis is used as evidence. NSA 9-2573

6793
RESISTANCE OF COENZYME A TO X-IRRADIATION. Kenneth P. DuBois, Gladys J. Cotter and Donald F. Petersen. Radiation Research 2, 79-83(1955).

X ray doses of 400, 600, 800, and 1200 r in rats, and 400 and 800 r in guinea pigs failed to alter acetylation of sulfanilamide, indicating that x rays do not significantly change functional activity of coenzyme A of the liver *in vivo*. NSA 9-2574

6794
X-RAY-INDUCED "STICKINESS" OF THE CHROMOSOMES OF THE CHORTOPHAGA NEUROBLAST IN RELATION TO DOSE AND MITOTIC STAGE AT TREATMENT. J. Gordon Carlson and Nyra G. Harrington. Radiation Research 2, 84-90(1955).

Studies of x-rayed hanging drop preparations of grasshopper neuroblasts in artificial medium at short intervals immediately after treatment demonstrate that the earlier the mitotic stage the greater the effect for a given dose. NSA 9-2575

6795
THE EFFECT OF IONIZING RADIATION ON THE PHAGOCYTOSIS AND THE BACTERICIDAL POWER OF THE BLOOD. I. THE EFFECT OF RADIATION ON MIGRATION OF LEUCOCYTES. I. L. Shechmeister and M. Pishman. J. Exptl. Med. 101, 259-74(1955).

Rate or extent of migration of leucocytes was affected in rats by 600 r, in rabbits by 500 or 800 r. Effect of radiation on total and differential leucocyte counts and relation of this effect to migration is discussed. NSA 9-2577

6796
THE EFFECT OF IONIZING RADIATION ON PHAGOCYTOSIS AND THE BACTERICIDAL POWER OF THE BLOOD. II. THE EFFECT OF RADIATION ON INGESTION AND DIGESTION OF BACTERIA. M. Fishman and I. L. Shechmeister. J. Exptl. Med. 101, 275-90(1955).

Indices of opsonophagic and surface phagocytosis in x-rayed (600 r) rats are described. Increased susceptibility of irradiated rats to infection with *M. aureus* is attributed to granulopenia and abnormal granulocyte function. NSA 9-2578

6797
THE EFFECT OF IONIZING RADIATION ON DEOXYRIBONUCLEASE ACTIVITIES OF BODY FLUIDS. II. THE PLASMA DNASES AFTER TOTAL BODY IRRADIATION. O. D. Kowlessar, K. I. Altman and L. H. Hempelmann. Arch. Biochem. Biophys. 54, 355-8(1955).

Activity of DNase I and DNase II was markedly elevated in plasma of irradiated rats. Maximum activity of DNase I occurred 6 days postexposure; peak of DNase II activity occurred 1 day postexposure. NSA 9-2579

6798
DECREASE IN UPTAKE OF IRON BY DUCK ERYTHROCYTES IN VITRO FOLLOWING WHOLE-BODY X-IRRADIATION. J. Raymond Klein. Arch. Biochem. Biophys. 54, 556-7(1955). NSA 9-2580

6799
EFFECT OF CO⁶⁰ GAMMA RADIATION ON THE PROCESS OF OVULATION, FERTILIZATION, AND EMBRYONIC DEVELOPMENT OF THE FROG. A. V. Voino-Yasenetski. Doklady Akad. Nauk. S. S. S. R. 100, 389-91(1955). (In Russian). NSA 9-2581

6800
EFFECT OF HIGH-INTENSITY X-RADIATION ON VELOCITY OF NERVE CONDUCTION Herbert B. Gerstner, John S. Orth and Everett O. Rickey. Am. J. Physiol. 180, 232-6(1955).

Sciatic nerves of bullfrogs and rabbits were isolated and stored at 24°C. Conduction velocity was determined prior to, and at 1, 2, and 4 hr postexposure to total doses of 9 kr (9,000 r)/mm of x rays. Rabbit nerves proved much more radiosensitive than those of frogs. NSA 9-2582

6801
COMPARATIVE-CYTOLOGICAL INVESTIGATION OF THE EFFECT OF LOW DOSES OF X RAYS AND RADIUM ON INTUSSUSCEPTION IN THE PERICARP OF SPRING RYE L. P. Breslavets. Izvest. Akad. Nauk. S. S. S. R. Ser. Biol., No. 6, 38-51(1954). (In Russian). NSA 9-2583

6802
THE EFFECTS OF X RAYS ON DIVISION RATE AND SURVIVAL OF *TILLINA MAGNA* AND *COLPODA SP.* WITH AN ACCOUNT OF DELAYED DEATH. Josephine Bridgman and R. F. Kimball. J. Cellular Comp. Physiol. 44, 431-45(1954).

An amiconucleate strain of *T. magna* and a micronucleate strain of a large species of *Colpoda* received x ray doses ranging from 25 to 400 Kr. Doses of 200-400 Kr were invariably lethal to *Tillina*, although some animals recovered nearly normal division rate, dying only after 4-14 divisions. Percentage of lines showing delayed death is a function of dose but number of divisions to death decreases only slightly with increasing dose. Differences between *Colpoda* and *Tillina* are described (responses are generally similar). Lower doses decreased division rate and caused abnormal divisions. NSA 9-2584

THE EFFECTS OF X IRRADIATION ON BRISTLES OF *DROSOPHILA MELANOGASTER*. B. Naville. Oncologia 8, 55-67(1955). (In German).

The 5-hr-old chrysalis of *D. melanogaster* was exposed to 180 kv and 31 Mev x rays. Individual bristles showed a varied radiosensitivity, dose-effect curve was linear. X ray modifications are believed to represent phenocopies of known mutations due to chromosomal damage. NSA 9-2585

6804
LEUKEMOGENIC EFFECTS OF IONIZING RADIATION ON ATOMIC BOMB SURVIVORS IN HIROSHIMA CITY. William C. Moloney and Marvin A. Kastenbaum. Science 121, 308-9(1955).

Classification of survivors of the atomic bomb explosion in Hiroshima according to distance from the hypocenter and degree of irradiation permitted statistical confirmation of the suspected high incidence of leukemia among survivors. NSA 9-2586

6805
THE RESPONSE OF ADENOSINETRIPHOSPHATASE TO A SINGLE RADIATION WITH DIFFERENT HIGH RADIATION DOSES IN VITRO. Th. Hornykewytch and H. St. Stender. Strahlentherapie 96, 100-6(1955). (In German).

The author reports on *in vitro* irradiations, with doses from 0.5 to 100 kr, of diluted liver and muscle homogenates, containing adenosinetriphosphatase. With increasing dilution, the extent of inactivation of the ferments relative to the percentage of water increases up to an optimum. On the basis of the results, it seems unlikely that irradiations

are exerting a direct influence on the ATPase in the cells. NSA 9-2587

6806

CHANGES IN THE CENTRAL NERVOUS SYSTEM FROM LOCAL EFFECTS OF X RADIATION. P. F. Minaev. Inst. of Biological Physics Zhur. Obshchei Biol 15, 401-12(1954). (In Russian).

Histological, metabolic, and conditioned-reflex changes after irradiation of various portions of the brain in dogs, chickens, and rabbits with 500, 7000, or 30,000 r are described. NSA 9-2588

6807

Naval Radiological Defense Lab., San Francisco. CORTISONE AND X IRRADIATION IN RATS. F. T. Brayer, R. J. Holloway, and G. F. Leong. Jan. 14, 1955. 11p. (USNRDL-TR-28).

Physiological doses of cortisone increased median survival time (MST) in adrenalectomized, x-irradiated (720 r) rats, but had no such effect in intact, irradiated rats. Nonphysiological doses of cortisone decreased MST in both adrenalectomized, irradiated, and intact irradiated rats. NSA 9-2591

6808

THE EFFECTS OF OXYGEN ON THE FREQUENCY OF X-RAY-INDUCED MUTATIONS IN HABROBRACON EGGS. Anna R. Whiting. Genetics 39, 851-8(1954).

Metaphase I Habrobracon eggs were x-rayed in air or nitrogen, the latter administered only during exposure. Incidence of dominant embryo lethals, recessive embryo lethals and postembryo lethals, and visible mutations were all reduced at same relative frequency in nitrogen. NSA 9-2592

6809

RELATION OF CARBON DIOXIDE, OXYGEN, AND LOW TEMPERATURE TO THE INJURY AND CYTOGENETIC EFFECTS OF X-RAYS IN BARLEY. R. A. Nilan. Genetics 39, 943-53(1954).

X-rayed (15,000 r) barley seeds exhibited a constant mutation rate, whether exposed in air, O₂ or CO₂ (moderate temperature). Injury rate was reduced by low temp. but not by gases; aberration frequency was altered by both temp. and gases. Reunion of broken chromosome ends is believed to have been profoundly affected by gases and temperatures, while primary x-ray damage remained unaffected. NSA 9-2593

6810

THE RADIATION RECOVERY FACTOR: PRESERVATION BY THE POLGE-SMITH-PARKES TECHNIQUE. David W. Barnes and John F. Loutit. J. Natl. Cancer Inst. 15, 901-5(1955).

CBA mouse spleen (injected intravenously as a mush) led to recovery of homologous adult mice given an otherwise lethal x-ray dose. Recovery factor was not lost when infant spleens were stored in glycerol serum at -70°C for as long as 83 days. NSA 8-2594

6811

SOME NEW EXPERIMENTS ON PROTECTION AGAINST WHOLE-BODY IRRADIATION. A. Lacassagne, J. F. Duplan and N. P. BuuHoi. J. Natl. Cancer Inst. 15, 915-21(1955).

Reduced mortality and prolonged survival of x-rayed (total-body) mice and rats follows administration of (1) phenolic and naphtholic derivatives containing long-chain fatty acids and (2) glucosamine, if injection is made within 1 hr prior to exposure. Postirradiation survival of rats is increased by injecting them with an emulsion of fetal rat liver cells postexposure. NSA 9-2595

6812

THE TIME FACTOR IN INHIBITION OF LYMPHOID-TUMOR DEVELOPMENT BY INJECTION OF MARROW

CELL SUSPENSIONS INTO IRRADIATED C57BL MICE.

Henry S. Kaplan, Lincoln E. Moses, Mary B. Brown, C. Susan Nagareda and Barbara B. Hirsch. J. Natl. Cancer Inst. 15, 975-9(1955).

C57BL mice were x irradiated (total body) and injected intravenously with homologous bone-marrow cell suspensions at graded intervals. Lymphoid-tumor incidence was inhibited maximally when injection was made within 1.5 hrs after last x-ray dose. NSA 9-2597

6813

PROTECTION OF MICE AGAINST X IRRADIATION BY PLASMA PROTEINS. Agnes N. Stroud, Austin M. Brues and Mildred M. Summers. J. Natl. Cancer Inst. 15, 1109-23(1955).

Intravenous administration of serum or plasma, homologous or heterologous, or of plasma proteins to mice a few minutes before irradiation affords partial protection against death and other irradiation effects. NSA 9-2598

6814

THE PROTECTIVE EFFECT OF CARBON MONOXIDE AND OTHER GASES ON MICE IRRADIATED IN TOTO BY X RAYS. P. Bonet-Maury and F. Patti. J. radiol. et electrol. 35, No. 11-12, 851-3(1954).

Protection of mice against x-ray effects was accomplished by introduction (postexposure) of CO, H₂S, and KCN to their environment. Effect was evident up to gas concentrations which would normally be lethal. Protective mechanism is likened to that accompanying O₂ deficiencies. NSA 9-2599

6815

STUDIES ON THE NATURE OF RADIATION PROTECTION FACTOR IN MOUSE SPLEEN. L. J. Cole, M. C. Fishler and M. E. Ellis. Radiology 64, 201-9(1955).

On basis of results presented, it is concluded that the protective factor in spleens of young mice is a nondialyzable, unstable, heatlabile, radiosensitive substance with the nuclear fraction. NSA 9-2600

6816

THE MECHANISM OF THE PROTECTIVE EFFECTS OF CYSTEINE. D. Hofmann, R. K. Kepp, G. Oehlert and H. W. Vasterling. Strahlentherapie 96, 1-13(1955). (In German).

From the literature and from results of his own studies, author concludes that the action of cysteine is of the same complex nature as that of radiation. NSA 9-2601

6817

ERYTHEMA INHIBITION BY MEANS OF AMINO ACIDS. H. Theismann. Strahlentherapie 96, 107-10(1955). (In German).

Argonne National Lab., Lemont, Ill. REPORT ON BIOLOGICAL, MEDICAL AND BIOPHYSICS PROGRAMS PART I. QUARTERLY REPORT OF BIOLOGICAL AND MEDICAL RESEARCH DIVISION FOR APRIL, MAY, JUNE 1955. PART II. SEMIANNUAL REPORT OF RADIO-

LOGICAL PHYSICS DIVISION FOR JANUARY THROUGH JUNE 1955. July 1955. 147p. (ANL-5456).

Biological and Medical Research Division. Progress is reported on the following studies: the effects of exposure to x radiation on plasma amino acids in chick embryos; the effects of temperature on the radiosensitivity of frogs, the regeneration and recovery of the spleen and thymus after single doses of x irradiation, the effects of irradiation on tissue ascorbic acid levels, oxidative phosphorylation in mitochondria of brains of bats exposed to massive x irradiation, the pathological effects of continuous gamma irradiation on mice; the toxicity of Sr^{90} and Ca^{45} in mice, determinations on the circulating blood volume of adult roosters and 3- to 5-day-old chicks, the effect of mucopolysaccharide on the stability and structure of collagen, enzymatic factors affecting the mutation rate of *E. coli*, the biosynthesis of methionine by *A. aerogenes*, reaction mechanisms of amino acids, studies on protein biosynthesis using C^{14} -labeled lysine as a tracer, the toxicity of Ru^{106} for mice, the effects of tissue homogenates on radiosensitivity of amoeba, and development of a method for the separation of trace amounts of Be from bulk cationic mixtures, based on the affinity of salicylate analogs for Be. Radiological Physics Division. Modifications are described in instruments for the detection and measurement of neutrons and γ radiation. The natural body Ra content and rate of intake of Ra were measured for boys 16 to 18 years old, and results are compared with those previously obtained on adults. The performance of a scintillation detector for the counting of α particles from Rn and its radioactive daughters is described. Data are reported from a study of the movement of water in soil. Equipment for the scintillation measurement of the γ activity of the human body is described, and data are presented from measurements of background, Ra, and K^{40} body content. The absorption and scattering of B particles in gases and drift velocity of electrons in gases are discussed. Apparatus is described for the measurement of positive ion emission from potassium-sensitized platinum. Meteorology studies engaged during the period are summarized. (For preceding period see ANL-5426). NSA 9-6820

6821

Naval Medical Research Inst., Bethesda, Md. and Naval Radiological Defense Lab., San Francisco. THE RELATIVE BIOLOGICAL EFFECTIVENESS OF ATOMIC BOMB GAMMA RADIATION IN MICE. E. P. Cronkite, V. P. Bond, R. H. Lee, and W. H. Chapman. May 25, 1955. 24p. (NM-006-012. 04. 86).

The lethal effects of atomic bomb nuclear γ radiation as a function of distance from the weapon and as a function of measured dose was determined using mice as the test object. Data are compared with laboratory data on the effects of x radiation. NSA 9-6825

6822

Chicago. Univ. Air Force Radiation Lab. PHARMACOLOGICAL ACTION OF ANESTHETIC AGENTS IN IRRADIATED ANIMALS. (School of Aviation Medicine, Project No. 21-3501-0005, Report No. 20). James E. Wilson. July 1955. 8p. (NP-5758).

Administration of common anesthetic agents (cyclopropane, ethylene, nitrous oxide, ether and thiopental sodium) at various periods postirradiation produced no significant changes in 30-day mortality of x-rayed rats. Lowered tolerance to cyclopropane, and enhanced survival after use of ethylene are described. NSA 9-6826

6823

STUDIES ON NAGASAKI (JAPAN) CHILDREN EXPOSED IN UTERO TO THE ATOMIC BOMB. A ROENTGENOGRAPHIC SURVEY OF THE SKELETAL SYSTEM. Wataru W. Sutow and Emory West. Am. J. Roentgenol., Radium Therapy Nuclear Med. 74, 493-9(1955).

No differences in incidence of skeletal abnormalities were found between two groups of children exposed in utero to atomic bomb explosion - one group at less than 2000 meters from hypocenter, one group at 4000 and 5000 meters. NSA 9-6828

6824

ON THE CONTENT OF SULPHYDRYL GROUPS IN NORMAL MOUSE TISSUES AND FOLLOWING WHOLE-BODY EXPOSURE TO X RAYS IN LETHAL DOSES. E. Ya. Graevskii and L. I. Korchak. Doklady Akad. Nauk S. S. S. R. 102, 939-41(1955). (In Russian).

Doses of 700 r were given to white mice. The sulfhydryl content of brain, kidneys, liver, lungs, and spleen of normal and irradiated animals was determined 5-15 min., 3, 24 or 72 hours after radiation. Results are tabulated. NSA 9-6829

6825

ON THE SENSITIVITY OF PLANTS (OATS) TO THE EFFECTS OF RADIOPHOSPHORUS IN VARIOUS GROWTH PHASES. A. G. Shestakov, G. F. Ivanova, and N. I. Shmel'kova. Doklady Akad. Nauk S. S. S. R. 102, 1043-6(1955). (In Russian).

Comparatively high dose of radiophosphorus exerted a negative effect on the yield of seeds independently of the phase of development of the plants. Greatest negative effect of radiophosphorus on yield appeared in the phase of bushing out. Effect of radiophosphorus depends on the conditions of phosphate nutrition (or supply). NSA 9-6830

6826

SOME NUTRITIONAL ASPECTS OF BACTERIAL RECOVERY FROM IONIZING RADIATION. G. E. Stapleton, Anthony J. Sharra and Alexander Hollaender. J. Bacteriol. 70, 7-14 (1955).

B/r strain of *E. coli*, grown on a complete medium, e.g. nutrient broth, showed radiation-induced requirements for nutritional factors. Evidence was found indicating that bacteria showing new nutritional requirements are not stable auxotrophic mutants. Data suggest recovery process studied is related to synthesis of new enzymes in the irradiated cell. NSA 9-6831

6827

THE EFFECT OF TEMPERATURE ON X-RAY INDUCED MUTABILITY IN *ESCHERICHIA COLI*. E. H. Anderson and D. Billen. J. Bacteriol. 70, 35-43(1955).

Authors studied effects of several incubation temperatures on induction of mutations postexposure. Data suggest that at least a portion of x-ray-induced death is not the result of induced lethal mutants. Plating medium has a decisive influence on survival, as does temperature. NSA 9-6832

6829

Rochester, N. Y. Univ. Atomic Energy Project. THE EFFECTS OF A MAINTAINED BODY BURDEN OF POLONIUM IN THE RAT. III. MORTALITY, LIFE SPAN, AND GROWTH. J. N. Stannard, H. A. Blair and R. C. Baxter. May 18, 1955. 33p. Contract W-7401-eng-49. (UR-395).

The long term effects of a maintained body burden of polonium²¹⁰ in the rat are described. A total of 483 Wistar-Rochester rats were maintained on a monthly intravenous injection schedule from early maturity throughout life and comparison made with animals receiving a single intravenous injection. The four dosage levels used were 0.023, 0.1, 0.3 and 1.5 $\mu\text{C}/\text{kg}/\text{month}$ and the body burdens maintained, after equilibrium had been established, were approximately 0.05, 0.23, 0.60, and 2.4 $\mu\text{C}/\text{kg}$. Results are summarized. NSA 9-5584

6830

REPARATION OF THE FETAL EYE FOLLOWING RADIATION INSULT. Roberts Rugh and Joan Wolff. A. M. A. Arch. Ophthalmol. 54, 351-9(1955).

Fetal CF₁ mice were exposed on 12.5th gestation day to x rays (50-300 r). Eyes were examined at 4, 24, and 72 hr and at 6 days and 6 wk thereafter to determine cytological changes caused by irradiation. NSA 9-6838

6831

EXPERIMENTAL OCULAR EFFECTS OF HIGH-VOLTAGE RADIATION FROM THE BETATRON. Albert C. Biegel. A. M. A. Arch. Ophthalmol. 54, 392-406(1955).

A study of the clinical and histologic effects of irradiating the rabbit eye with 16 to 19-Mev electrons and 23-Mev x rays by means of the betatron for a wide dosage range is described. NSA 9-6839

6832

THE EFFECTS OF DOSE RATE VARIATION OF FISSION NEUTRONS AND OF Co⁶⁰ γ-RAYS ON SURVIVAL IN YOUNG CHICKS. Howard H. Vogel, Jr. and S. Phyllis Stearns. Radiation Research 2, 513-22(1955).

Three-day-old white leghorn chicks were irradiated with fast neutrons at dose rates of 1 rep/min and 4 rep/min and with Co⁶⁰ γ rays at dose rates of 6 r/min, 12 r/min, and 22 r/min. Chicks exposed at the lower dose rates showed a marked increase in survival. Twenty-one-day mortality curves are presented for each dose rate. Early (48-hr) mortality was evident after exposure to the higher dose rates of both types of radiation but was insignificant after exposure to the lower dose rates. The relative biological effectiveness of fast neutrons and Co⁶⁰ γ rays for producing 21-day lethality in the chick was found to be 3.72 when the high dose rate survival curves were compared. NSA 9-6840

6833

THE RESPONSE OF HYPOPHYSECTOMIZED RATS TO X-RADIATION AND REPLACEMENT THERAPY. E. A. Sellers and John C. Barlow. Radiation Research 2, 534-7(1955).

Hypophysectomy reduced the resistance of rats to total-body x irradiation. Of ACTH, growth hormone, insulin, thyroxine, cortisone, and testosterone, only thyroxine increased percentage survival. Hypophysectomized irradiated animals receiving insulin died sooner than hypophysectomized irradiated controls. NSA 9-6841

6834

THE REACTION OF THE SKIN EPITHELIUM OF THE TAILS OF RANA CATESBIANA TADPOLES TO LOCAL X-IRRADIATION. V. V. Brunst. Radiation Research 2, 556-67(1955).

Of 100 *R. catesbiana* tadpoles, one group had tails amputated and received 2000-4000 r after formation of tail regenerates. Second group were exposed to same dose without amputation. Formation of degenerating giant cell epithelium occurred much more often in group irradiated after formation of tail regenerates. NSA 9-6842

6835

COMPARISON OF HEMATOLOGIC EFFECTS OF INTERNALLY DEPOSITED RADIUM AND PLUTONIUM IN DOGS. Jean H. Dougherty, John Z. Bowers, Robert C. Bay, and Panit Keyanonda. Radiology 65, 253-9(1955).

The results of a study of the intravenous administration of Pu²³⁹ and Ra²²⁶ in adult pure-bred beagles under optimal conditions are given and discussed. NSA 9-6843

6836

THE RELATIVE BIOLOGICAL EFFECTS OF X-RAYS AND BETA RAYS. William B. Seaman, Michel M. Ter-Pogossian and William B. Ittner. Radiology 65, 260-4(1955).

With equal doses and similar physical distribution in tissue, β rays of P³² were found to be slightly less than 1/2

as efficient as 200-kv x rays in producing erythema of the rabbit's ear. NSA 9-6844

6837

EFFECT OF MAGNESIUM ON THE RESPONSE OF MICE TO LARGE DOSES OF WHOLE-BODY IRRADIATION. Henry C. Blount. Radiology 65, 250-2(1955).

Intraperitoneal injection of 15 mg (but not 5 and 10 mg) magnesium sulfate in 1 cc of water gave significant protection of mice exposed to whole-body x irradiation. Results may be due to fall in body temperature and presumably also a drop in metabolic rate. NSA 9-6846

6838

EFFECT OF HEMATOPORPHYRIN ON X-RADIATION SENSITIVITY IN PARAMECIUM. Frank H. J. Figge and Ralph Wichterman. Science 122, 468-9(1955).

Sensitization of paramecia to radiation by hematoporphyrin in presence of O₂ was demonstrated. A primary reason for increased x-ray susceptibility of dividing cells may be that they contain higher concentrations of porphyrin than do differentiated non-dividing cells. NSA 9-6847

6839

Naval Radiological Defense Lab., San Francisco. THE RELATIVE BIOLOGICAL EFFECTIVENESS OF FAST NEUTRONS IN MICE. R. E. Carter, V. P. Bond, and P. H. Seymour. Nov. 17, 1954. 22p. Project NM-006-015. (USNRDL-TR-20; AFSWP-759) Radiation Research 14, 413-23(1956).

RBE of fast neutrons (9 Mev mean energy), compared with 250 kvp x rays, was determined using reduction of spleen, thymus and gut weights, and mortality as biological endpoints. RBE values found: 1.7, 1.5, 2.3, and 1.6, respectively. NSA 9-6567

THE RESPIRATION OF THE EPIDERMIS AFTER EXPOSURE TO IONIZING RADIATION. W. Gahlen and G. Stutgen. Strahlentherapie 97, 259-65(1955). (In German). NSA 9-6569

6841

BLOOD HISTAMINE LEVEL AND SKIN ERYTHEMA DETERMINATIONS FOLLOWING EXPOSURE TO SINGLE DOSES OF X RADIATION. L. Koslowski, H. Poppe and E. Walther. Strahlentherapie 97, 266-71(1955). (In German).

The authors examined the histamine level in the blood of 20 individuals submitted to a single roentgen irradiation of 400 r. In 18 persons they determined an increase in histamine of 45 to 400 γ per liter, respectively of 33 to 253%. No formation of erythema was observed. It is assumed that histamine is formed from histidine or by decomposition of cells in the skin. NSA 9-6570

6842

THROMBOCYTOPENIC PURPURA IN X RAY TECHNICIANS. A. Bohme and Oberste-Berghaus. Strahlentherapie 97, 292-6(1955). (In German).

Authors describe case of two female x-ray technicians exhibiting mild thrombocytopenic purpura which disappeared upon interruption of their work, but returned when they resumed duty. NSA 9-6571

6843

COLIBACILLI AS BIOLOGICAL INDICATORS OF RADIATION DOSAGE. Hubertus Bottcher. Strahlentherapie 97, 403-17(1955). (In German).

Dose-effect curves representing colibacilli exposed to x rays (60-180 kv) are presented. Possibilities and limits of using colibacilli for biological dosimeter are discussed. NSA 9-6572

6844

EFFECT OF X-IRRADIATION AND CHOLINE ON THE RETICULO-endothelial SYSTEM OF THE RAT. N. R. Di Luzio. Am. J. Physiol. 181, 595-8(1955).

Blood clearance and organ distribution of colloidal radioactive gold were studied in normal, choline-treated, and whole-body x-irradiated anesthetized rats. NSA 9-6574

6845

CERTAIN EFFECTS OF IRRADIATION AND CHEMOTHERAPY ON CELLULAR DIVISION AND DIFFERENTIATION. Nathan B. Friedman, James A. Sargent, and Eileen Drutz. *Cancer Research* 15, 479-84(1955).

Analysis of the reactions produced in tissue by irradiation or the administration of chemotherapeutic agents reveals that such factors do more than merely interfere with cellular division. Some modalities inhibit the completion of mitosis in cells with the capacity of multiplication, some interfere with premitotic nuclear metabolism, and others inhibit an earlier cytoplasmic phase of synthesis. A comparable interference with cytoplasmic synthesis and an inhibition of differentiation are exercised by some of the drugs on the somatic cells which lack the ability to divide, while irradiation in therapeutic doses and other chemical agents do not interfere with differentiation. Although tumors in general are presumed to arise from reserve cells, spontaneous differentiation occurs not uncommonly. The possibility of enhancement of the tendency to differentiate is a relatively neglected but important effect of treating neoplasms by irradiation and selective chemotherapy. NSA 9-6575

6846

THE EFFECT OF X RADIATION ON THE GENERAL MITOTIC ACTIVITY AFTER VARIOUS INTERVALS. Annemarie Grossmann. *Oncologia* 8, No. 3, 259-72(1955). (In German).

Xenopus larvae of 12-mm length were irradiated with a dose of 500 r, killed after various intervals, and the mitotic activity of the tissues of the whole animal examined. The mitosis was diminished after 2 hours, completely stopped after 6 and 12 hours, recommenced in all organs after 24 hours, increasing appreciably above normal in the gills, and diminished again after 48 hours. Abnormalities were found 2, 24, and 48 hours after irradiation, sometimes occurring in cells, which, at the time of irradiation, had not been in mitosis. NSA 9-6576

6847

HETEROLOGOUS TRANSPLANTATION OF TUMORS AFTER PRE-TREATMENT WITH RADIOISOTOPES. W. Bollag and Cl. Meyer. *Oncologia* 8, No. 3, 300-9(1955). (In German).

Heterologous transplantation of mouse Crocker sarcoma on young rats is reported. Pretreatment of rats with P^{32} and Au^{190} led to development of heterologous tumors. Long interval between injection and heterotransplantation was more advantageous to tumor growth than was a short interval. Intraperitoneal Au^{198} application gave better tumor growth than did intravenous dose. NSA 9-6578

6848

LATENT CHANGES IN ERYTHROCYTES AND EXPERIMENTAL CANCER. Thilde Eilers. *Oncologia* 8, No. 3, 309-20(1955). (In German).

By means of special after-staining of vital preparations, it was possible morphologically to demonstrate damage to the erythrocytes of the circulating blood a short time after total x-ray irradiation and also after local irradiation of the peripheral blood in rats. After x-ray irradiation with high doses a latent change in the erythrocytes commenced which, with individual differences, was not always reversible when stopping the irradiation. A relationship between latent erythrocyte changes and tumour development after x-ray irradiation could be demonstrated. A similar relationship had been shown previously in experiments with rats to which 4-dimethylaminoazobenzol or benzyren was applied. NSA 9-6579

6849

MODIFICATION OF THE RADIATION-INDUCED INCREASES

IN PHOSPHATASE ACTIVITY OF HEMATOPOIETIC TISSUES BY CHEMICAL AGENTS. Donald F. Petersen and Kenneth P. DuBois. *Am. J. Physiol.* 181, 513-18 (1955).

P-Aminopropiophenone, cysteine and mercaptoethylamine administered prior to irradiation resulted in less increase of ATP-ase and 5-nucleotidase activity of rat spleens and thymus glands than did irradiation alone. NSA 9-6580

6850

RESEARCH ON BIOLOGICAL PROTECTIVE AGENTS. PART X. OXYGEN REDUCTION PROCEDURES IN RADIATION INJURIES AND PROTECTION FROM RADIATION. H. Langendorff, R. Koch, and U. Hagen. *Strahlentherapie* 97, 218-30(1955). (In German).

Roentgen irradiations of living yeast and bacteria have shown that irradiations in vivo do not induce changes in the cytochrome system. Irradiations of mice have proved that the protective effect produced by cysteine and glutathione is not due to the redox potential of these substances. Thio-glycollic acid, dialuric acid, iso-propyl alcohol and xanthin are ineffective as redox substances. Within the range of carbohydrate metabolism, the protective effect of pyruvic acid and of d-ribose is particularly striking. Lactate, acetate, and fructose are ineffective. NSA 9-6581

6851

THE EFFECT OF FOLIC ACID AND VITAMIN B_{12} ON THE BLOOD FORMATION IN IRRADIATED GUINEA PIGS. Dietrich Mucke, Adolf Morczek, and Werner Mischel. *Strahlentherapie* 97, 473-88(1955).

The author irradiated 56 guinea pigs with 250 r each and studied the protective effect produced by folic acid and vitamin B_{12} on the hematopoietic system. Regular examinations of the blood picture over a period of several weeks proved that both vitamins are capable of protecting against the damaging effect of roentgen rays. These vitamins cause the absolute leucocyte and erythrocyte values to drop more slowly. The numerical values of the average minima of the corpuscular constituents of the blood proved to be higher as compared to the non-treated controls. The most favorable results were obtained with folic acid and its administration prior to the irradiation produced the best effect. Combined application of both folic acid and vitamin B_{12} did not result in a summation of the therapeutic effects. NSA 9-6583

6852

New York Univ., New York. Post-Graduate Medical School and New York Univ., New York. University Hospital. STUDIES OF THORIUM X APPLIED TO HUMAN SKIN. IV. CLINICAL AND AUTORADIOGRAPHIC FINDINGS FOLLOWING THE INTRODUCTION BY IONTOPHORESIS. Paul Fleischnager and Victor H. Witten. 1955? 13p. (AECU-3061).

Studies carried out on living human skin *in situ* demonstrate that iontophoresis of weak thorium X solutions will increase its biologic effects as judged by erythema and pigmentation, and cause greater penetration as shown by autoradiography. NSA 9-6585

6853

RADIATION BIOLOGY IN THE TREATMENT OF CANCER. Werner Lorenz. *Strahlentherapie* 97, 325-37(1955). (In German).

Author reports on his experiments in mice vaccinated with Ehrlich ascites carcinoma and treated with cysteine before irradiation. Implication of the results for cancer therapy are discussed. NSA 9-6589

6854

ABSORPTION AND TISSUE DISTRIBUTION FOLLOWING THE INTRAPERITONEAL APPLICATION OF RADIOGOLD BRINE. Friedrich Pfander and Hanno Poppe. *Strahlentherapie* 97, 389-94(1955). (In German).

Strong, undesired radiation action on reticulo-endothelial system, particularly the liver and excretory organs, is reported. NSA 9-6591

HYPERGLYCEMIA AND INCREASED LIVER GLYCOGEN IN RATS AFTER X IRRADIATION. R. E. Kay and C. Entenman. Aug. 1, 1955. 14p. Project No. NM-006-015. (USNRDL-TR-55).

A quantitative study was made of the effect of whole-body x irradiation on liver glycogen and blood sugar levels of the rat. Each of three experiments used fed nonirradiated and fasted irradiated rats. The irradiated rats were prefasted 24 hr and exposed to 50, 750, 1200, 2500, or 5000 r, and analyses were made 24 and 48 hr later. Whole body x irradiation elevated both the liver glycogen and blood sugar levels of fasting rats. As the dose of radiation increased, the percentage of liver glycogen at 24 hr after the time of irradiation also increased. At all doses, except 5000 r, the percentage of liver glycogen was about the same at 24 hr and 48 hr after x irradiation. In no case did the liver glycogen levels of the fasting, irradiated rat exceed that of the fed, normal animal. Blood sugar

levels were elevated during the first 24 hr after irradiation and continued to increase over the next 24 hr. Forty-eight hours after the time of irradiation the blood sugar levels were, in every case, greater than in the fed, normal rat. NSA 9-7611

6861

EFFECTS OF IONIZING RADIATIONS ON THE FERTILITY OF MICE AND THE VIABILITY OF THEIR PROGENY. N. I. Nuzhdin, N. I. Shapiro, O. N. Petrova, and O. N. Kitaeva. Moscow, Publishing House of the Academy of Sciences of the U. S. S. R., p. 14-33 in MEETINGS OF THE DIVISION OF BIOLOGICAL SCIENCES. (1955). (In Russian).

Authors describe x-ray effects on mating capacity and litter numbers of male mice, and x- and γ -ray effects on oestral cycle of female mice. NSA 9-7613

6862

LOCAL ACTION OF ROENTGEN RAYS ON VARIOUS DIVISIONS OF THE CENTRAL NERVOUS SYSTEM. P. F. Minaev. Moscow, Publishing House of the Academy of Sciences of the U. S. S. R., p. 51-68 in Meetings of the Division of Biological Sciences. (1955). (In Russian).

Postirradiation changes included: leucocytosis after exposure of cerebral hemispheres, leucopenia after exposure of cerebellum. Some structural changes in blood cells were noted. NSA 9-7614

THE PECULIARITIES OF INACTIVATION OF MICRO-ORGANISMS BY MEANS OF RADIATION STERILIZATION. M. N. Meisel, T. S. Remezova, R. D. Gal'tsova, G. A. Medvedeva, N. A. Pomoshchnikova, M. N. Shal'nova, and V. M. Alekseeva. Moscow, Publishing House of the Academy of Sciences of the U. S. S. R., p. 106-26 in Meetings of the Division of Biological Sciences. (1955). (In Russian).

Authors report results of a comparative study of radiation and heat inactivation of non-spore forming micro-organisms upon incomplete (85%) and complete (100%) sterilization. NSA 9-7617

6864

EFFECT OF NUCLEAR RADIATIONS ON PLANTS. P. A. Vlasyuk. Moscow, Publishing House of the Academy of Sciences of the U. S. S. R., p. 127-48 in Meetings of the Division of Biological Sciences. (1955). (In Russian).

Effects of radioisotopes on various physiological processes of plants were found to vary according to nutritive conditions of the plants and external medium. Exposure of seeds is believed to be beneficial in stimulating metabolism and increasing crop yield. NSA 9-7618

6865

EFFECT OF NATURAL RADIOACTIVE SUBSTANCES ON THE YIELD OF AGRICULTURAL CROPS. N. G. Zhezheh. Moscow, Publishing House of the Academy of Sciences of the U. S. S. R., p. 149-61 in Meetings of Division of Biological Sciences. (1955).

Radioelements of uranium, thorium, and actinium series are described as possible powerful factors in increasing yield of agricultural crops. Experiments demonstrating this are described. NSA 9-7619

6866

IONIZING RADIATIONS AS A STIMULANT OF ERGOSTEROL BIOSYNTHESIS. R. D. Gal'tsova. Moscow, Publishing House of the Academy of Sciences of the U. S. S. R., p. 162-72 in Meetings of the Division of Biological Sciences. (1955). 339p. (In Russian).

Ergosterol content of yeast cultures increased post-exposure. Author attributes increase to increased production. NSA 9-7620

6867

BLOOD FORMATION AND IONIZING RADIATION. A. P.

Egorov and V. V. Bochkarev. Moscow, Medgiz. (1955). (In Russian).

The collection opens with an exposition of certain data on the structure of matter and on characteristics of ionizing radiation. The major part of the monograph is devoted to the general laws of radiation effect on the blood system and to the morphological changes in blood cells. (publisher's note). NSA 9-7621

6868

PRINCIPLES OF THE BIOLOGICAL EFFECT OF RADIO-ACTIVITY. B. N. Tarusov. Moscow, Medgiz (1955). 2nd Edition. (In Russian).

Includes: general laws of ionizing radiation effects; secondary processes occurring postexposure, toxicology of radioisotopes that are most active biologically. NSA 9-7622

6869

EFFECTS OF HIGH-ENERGY PARTICLES, X-RAYS AND AGING OF LENS EPITHELIUM. L. von Sallmann, C. A. Tobias, H. O. Anger, C. Welch, S. F. Kimura, C. M. Munoz, and A. Drungis. A. M. A. Arch. Ophthalmol. 54, 489-514 (1955).

Selective exposure of equatorial and central area of rabbit lens epithelium to deuteron beam confirmed earlier impression of high radiosensitivity of cells in germative zone and relative radioresistance of cells in large central part. Effects of α particles, deuterons and x rays on cell division are compared. NSA 9-7623

6870

EFFECT OF PARENTERAL INJECTION OF PARTICULATE MATTER ON RESISTANCE OF X-IRRADIATED MICE TO INFECTION. Willie W. Smith, Falconer Smith, and Ilo M. Alderman. Am. J. Physiol. 182, 400-2 (1955).

In mice given parenteral injection of particulate matter after midlethal irradiation, increased survival is attributed to reduced *Proteus* and *E. coli* infection. There was no change in *Pseudomonas* infection. Injection of particulate matter after sublethal irradiation increased resistance to *Proteus* or *Pseudomonas* challenge 5-12 days postexposure. NSA 9-7625

6871

FUNCTIONAL STUDIES OF THE HYPERPLASTIC SPLEEN OF MICE RECOVERING FROM RADIATION DAMAGE. Willie W. Smith, Ilo M. Alderman, and H. Jeanette Ruth. Am. J. Physiol. 182, 403-6 (1955).

Granulocyte counts were substantially higher in intact than in splenectomized mice 20 days, but not 15 days, after 600 r dose. Intact mice had higher resistance than splenectomized mice to *Pseudomonas* challenge 15 and 20 days after exposure to 600 r. Effects of spleen homogenate administration are described. NSA 9-7626

6872

ROLE OF HYPOTENSION IN THE INITIAL RESPONSE OF X-IRRADIATED CHICKS. S. P. Stearner, A. M. Brues, M. Sanderson, and L. J. Christian. Am. J. Physiol. 182, 407-10 (1955).

Severe hypotension developed in young chicks during initial postirradiation period after exposure to 1000 r of x rays (43 r/min). Shielding of kidneys during exposure did not alter effect. NSA 9-7627

6873

X-RAY BREEDING OF PEANUTS (*ARACHIS HYPOGAEA* L.). Walton C. Gregory. Argon. J. 47, 396-9 (1955).

Amounts of genetic variation in a quantitative character and yield of dried fruits were estimated in progenies of x-irradiated peanuts. Total genetic variance among randomly chosen irradiated normals was 4 times that of control progenies. Several high-yielding mutants were recovered from populations studied. NSA 9-7628

6874

THE EFFECT OF 180-KEV AND 31-MEV X-RADIATION

ON EHRLICH-ASCITES-CARCINOMA OF WHITE MICE.

Kurt Reiche. Strahlentherapie 97, 549-67 (1955). (In German).

Cellular structure, especially of mitosis, of Ehrlich-Ascites-Carcinoma, without and after irradiation was compared. Rhythm of mitosis after 500 r and effects of doses of (100-500 r) were analyzed. Results indicate that 31-Mev radiation is somewhat less effective than 180 Kev x rays. NSA 9-7629

6875

EFFECTS IN DOGS OF LARGE DOSES OF INTRAPERITONEALLY ADMINISTERED RADIOACTIVE COLLOIDAL GOLD (Au^{196}). Andrew H. Jackson and P. F. Hahn. Cancer 8, 482-7 (1955).

Clinical observation and hematological changes are presented on nine dogs receiving one to four intraperitoneal injections of radioactive colloidal gold. Histological changes in seven of these animals are described. A mean group weight loss of 14.1 per cent occurred. Peritoneal effusion occurred in eight of the nine animals following gold injection; however, no cases of adhesions or radiation ulcer were seen. Adjacent organ changes were not remarkable. An omental reaction to the injected substance was noted. Dogs receiving multiple injections suffered varying degrees of bone-marrow hypoplasia and anemia. NSA 9-4673

6876

RADIOSENSITIVITY WITH RESPECT TO THE ESTROUS CYCLE IN THE MOUSE. Roberts Rugh and Helen Clugston. Radiation Research 2, 227-36 (1955).

Male CF_1 mice are more radiosensitive than are females of the same strain, regardless of the phase of the estrous cycle in which the females are x-irradiated. Female CF_1 mice, if x-irradiated during any of the three major phases of the estrous cycle, are not equally radio-sensitive. Those in estrus are the most radioresistant, those in diestrus the most radiosensitive. This was demonstrated in three experiments involving 447 females. In every experiment the mice x-irradiated during estrus showed the best and those in diestrus the poorest survival value. However, the fact that this combined stage was the least consistent suggest that possibly one might well prove to be the most radioresistant of all stages, by virtue of its high estrogen production. It is postulated that the hypersecretion of estrogens during estrus, plus possibly the correlated endocrine and hydration changes, may be the cause of increased radioresistance during this phase in CF_1 female mice. NSA 9-4675

6877

ORGAN WEIGHT ANALYSIS IN MICE GIVEN FRACTIONATED X-IRRADIATION. A. N. Stroud, J. M. Gurian, A. M. Brues, and M. M. Summers. Radiation Research 2, 267-79 (1955).

CF_1 females 7-9 wks old were given weekly total-body x-ray doses totaling 400-1200 r, sacrificed 1 wk after last exposure. There was no relative weight change in kidneys, heart or adrenals, muscle and liver increased slightly; thymus, uterus, and ovaries lost exponentially with increasing dose. Spleen responded atypically. NSA 9-4076

6878

THE REACTION OF THE MOUSE THYMUS TO X-RAYS MEASURED BY CHANGES IN ORGAN WEIGHT. Robert F. Kallman and Henry I. Kohn. Radiation Research 2, 280-93 (1955).

In normal, nonirradiated CAF_1 mice, the weight of the thymus increased until the animals were approximately 45 days old when age involution began. Involution ceased at 80 to 90 days of age. With female mice 50 to 60 days old, the acute involution of the thymus after total-body exposure to 250-kv constant potential x rays was measured by changes in organ weight. Twenty-four hours of fixation in 10% formalin increased thymic weight by 20 to 40%, depending on the strain of mice, CAF_1 or A/He. Dose-effect analyses

of the weights of either fresh or fixed, wet or dry thymuses, however, yielded qualitatively similar results. Thymic weight was reduced as much as one-fourth by handling the mice preparatory to irradiation. Decreased food consumption per se could account for half the thymic weight loss after 400 r, total-body irradiation. The time of maximum weight loss to occur varied from 1 day for a dose of 30 r to 5 days for 800 r. Weight determined at 5 days after total-body irradiation was a linear function of the logarithm of radiation dose but was not a true measure of radiation injury, since some recovery had occurred at doses below 400 r. There was no significant difference in percentage weight loss per roentgen in the CAF₁ and A/He strains tested in this Laboratory. The dose for 50% weight loss was 150 r, significantly lower than 210 r for the Carworth Farms strain reported from Los Alamos. Minimum post-irradiation thymic weight was a curvilinear function of radiation dose. The interpretation of the curve was difficult, since total-body irradiation caused loss indirectly due to injury in other organs as well as directly. The dose for 50% loss was 90 r. The data were considered in terms of different dose-effect models. The best fitting equation was one which assumed that the thymus was composed of two independently reacting populations with different sensitivities. NSA 9-4677

6879

STUDIES ON THE MECHANISM OF RADIATION PROTECTIONS AND RECOVERY WITH CYSTEAMINE AND β -MERCAPTOETHANOL. Alexander Hollaender and C. O. Doudney. Radiobiology Symposium (Proceedings). p. 112-15(1954). Z. M. Bacq and P. Alexander. Eds. London, Butterworths Scientific Publications, 1954.

Results are reported from a comparison of the protection efficiency of cysteamine and β -mercaptoethanol against radiation injury and recovery of *E. coli*. NSA 9-4678

ELECTROPHYSIOLOGY OF THE X-RAY PHOSPHENE.
Leo E. Lipetz. Radiation Research 2, 306-29(1955).

Attempt has been made to test the hypothesis that x-ray phosphene results from direct action of rays on the photochemicals of retinal rods and cones. Electrical discharges of a single ganglion cell of a frog retina in situ were detected as an objective measure of retinal response. Results are summarized. NSA J-5214

6897

RESPONSE OF THE BAT (MYOTIS LUCIFUGUS) TO X-IRRADIATION. Douglas E. Smith, Donald R. Russ, and Eugenia M. Jackson. Radiation Research 2, 330-8 (1955).

Survival, blood, and histological studies were made in the bat (Myotis lucifugus) maintained in the laboratory at 23°C and exposed to x-rays (500 to 50,000 r). Non-irradiated starving bats survived much longer early than later in hibernation. In November experiments dosages as low as 500 r significantly shortened the life span of starving bats, but in February and March, exposures to 500 to 20,000 r were followed by survival times similar to those of simultaneously starved controls. Leucocytes were depressed by as little as 500 r, but the erythrocytes remained unchanged even after 20,000 r. Typical irradiation effects were found in bone marrow, spleen, lymph node, and duodenum after dosages as low as 500 r. These findings are compared with those of other irradiated mammals and frogs in an effort to establish the radiosensitivity of the bat. NSA 9-5215

6898

EVIDENCE FOR TWO TYPES OF X-RAY-INDUCED LETHAL DAMAGE IN SACCHAROMYCES CEREVISIAE. Robert K. Mortimer. Radiation Research 2, 361-8(1955).

Under proper conditions, haploid yeast cells of opposite mating types will conjugate when placed together by micro-manipulative techniques. When one of the two parent cells is x-irradiated before pairing, conjugation usually occurs normally, but the diploid zygote formed shows many evidences of radiation damage. These include division

delay, abnormal division, swelling, and death. The percentage of inviable zygotes increases with dose in a multiple-hit fashion. Irradiation of the one haploid parent in a nitrogen atmosphere results in a twofold effective dose reduction in the zygote survival curve. The reduction in zygote viability is found to be the same for irradiation of either parent cell. Irradiation of both parent cells before pairing results in a much larger reduction in zygote viability compared with the case where only one parent is irradiated. Doses which are lethal to a relatively large percentage of the irradiated haploid cells (i.e., 99.9%) still result in a relatively high zygote survival (i.e., 50%). Thus, many haploid cells receive damage which is lethal in the haploid state but which is nonlethal when incorporated into a diploid cell containing a normal set of alleles. This type of damage could correspond to recessive lethal mutations. The damage which is expressed in the diploid zygote is considered as dominant lethal, although the present study does not allow its positive identification with any particular component of the irradiated cell. The relative frequency of recessive lethal to dominant lethal damage in a haploid cell is about 15:1. X-ray-induced inactivation in diploid, triploid, and tetraploid cells is predicted to be primarily of the dominant lethal type, inactivation due to pairing of recessive lethals playing a minor role. NSA 9-5216

6899

SENSITIVITY AND TIME FOR DEGENERATION OF SPERMATOGENIC CELLS IRRADIATED IN VARIOUS STAGES OF MATURATION IN THE MOUSE. Eugene F. Oakberg. Radiation Research 2, 369-91(1955).

Reduction in number of spermatogonia after irradiation can be explained by killing of cells, without postulating a prolonged mitotic inhibition of type A spermatogonia. Degeneration of spermatogonia occurs primarily as damaged cells reach late interphase or early prophase of their first postirradiation division. A few cells may undergo one or more divisions before degenerating. Irradiation damage to primary spermatocytes remains latent until the cells enter meiotic metaphase and anaphase. Many abnormal figures typical of chromosomal aberrations then occur, and nuclei of resulting spermatids show as abnormal size variation. Spermatids and sperm show no visible changes with doses up to 1500 r. However, numerous investigators have established the sensitivity of these cells to genetic damage which is expressed after fertilization. Intermediate and type B spermatogonia are extremely sensitive to radiation. Type A spermatogonia are of heterogeneous sensitivities depending on mitotic activity and stage of development. Spermatogenic cells in the mouse show quantitative and qualitative differences in sensitivity that are correlated with the dramatic nuclear changes in spermatogenesis. The inference is clear that the primary reactions determining behavior of these cells is nuclear. This conclusion is strengthened by the fact that, when similar correlations between sensitivity and nuclear state at time of irradiation are observed in favorable cytological material, the damage proves to be chromosomal. NSA 9-5217

6900

EFFECT OF FREE-RADICAL ACCEPTORS ON RADIO-SENSITIVITY OF PSEUDOMONAS FLUORESCENS. Philip S. Ranc and Samuel A. Goldblith. Nucleonics 13, No. 6, 32(1955).

Cultures of P. fluorescens were irradiated in nutrient broth and pea puree suspensions with and without the free-radical acceptors (FRA) sodium ascorbate and disodium fumarate combined with monosodium glutamate. The data presented indicate that the inactivation dose is increased in the presence of free radical acceptors. NSA 9-5218

6901

INVESTIGATION OF MORPHOLOGICAL TISSUE RESPONSE TO RADIOPHOSPHORUS. W. Hellriegel and H. Pauly. *Strahlentherapie* 96, 557-68(1955). (In German).

Morphological changes in cell nuclei and cellular groups of mouse testicles, liver, spleen, and kidneys after administration of β -irradiation (total dose: 52.5 mc P^{32}) are described. Severe disturbances were induced in cells and tissue of the organs examined. NSA 9-5219

6902

THE EFFECT OF SMALL DOSES OF X RADIATION ON BONE MARROW. Ilse Martin, Rudolph Pape, and Alexandra Piringner-Kuchinka. *Strahlentherapie* 96, 569-75(1955).

The authors investigated the influence of rather high and of minimum doses of roentgen rays on the bone marrow, while taking into account the meromitoses as a special form of proliferation. Their studies confirmed the data of other authors with respect to doses of 600 r. Doses from 5 to 20 r seem to exert a mild stimulus to proliferation. It seems advisable to distinguish between vital and functional radiosensitivity. NSA 9-5220

6903

AN INVESTIGATION OF THE EFFECTS OF IRRADIATION ON SODIUM-POTASSIUM EXCHANGE IN ERYTHROCYTES. Adolf Morezek. *Strahlentherapie* 96, 618-24(1953).

In heparinized, x-irradiated blood, erythrocytes lost capacity of accumulating potassium ions from plasma against high concentration gradient. Instead, part of cellular K^+ migrated into the medium. Migration continued beyond period of irradiation, and loss was compensated by intake of an equivalent amount of Na^+ from plasma. Number of ions exchange varied linearly with x ray dose over the range 1000-16000 r. NSA 9-5222

6904

ON THE PROBLEM OF THE BEHAVIOR OF SERUM MAGNESIUM LEVELS IN THE COURSE OF DEEP X RAY THERAPY. Hans-Joachim Maurer. *Strahlentherapie* 96, 629-31(1955). (In German).

No characteristic changes in serum magnesium levels occurred during therapeutic radiation as contrasted with observations regarding behavior of ATP and other substances in the same patients. NSA 9-5223

GENETIC DAMAGE PRODUCED BY RADIATION. H. J. Muller. *Science* 121, 837-40(1955).

Regarding test explosions, author concludes that estimate of genetic damage must be weighed against potential benefits to be derived from such tests, or rather, against probable damage to society that would follow from the alternative policy. NSA 9-5226

6908

EFFECT OF FEEDING DOGS THE FLESH OF LETHALLY IRRADIATED COWS AND SHEEP. R. H. Wasserman and B. F. Trum. *Science* 121, 894-6(1955).

Analysis of data on weights gain, hematological findings, blood chemistry, and results of gross and histopathological examinations showed no statistical differences in dogs fed a diet of meat from lethally irradiated cattle and sheep, and controls fed meat from non-irradiated animals. NSA 9-5227

6909

LEUCOCYTE ADHESIVENESS FOLLOWING WHOLE BODY IRRADIATION. J. Philip Savitsky. *Am. J. Physiol.* 181, 215-17(1955).

An increased leucocyte adhesiveness is demonstrable within 15 hrs after total-body irradiation of dog and guinea pig. Complete correction of the increased adhesiveness in no way defers the subsequent leukopenia or survival. NSA 9-5228

6910

EFFECT OF WHOLE-BODY X-IRRADIATION ON UPTAKE OF IRON BY DUCK ERYTHROCYTES. J. Raymond Klein and Ralph Cavaheri. *Proc. Soc. Exptl. Biol. Med.* 89, 28-31(1955).

Decreased uptake of iron by duck erythrocytes in vitro after whole-body x-irradiation is attributed to decrease in number of one kind of reticulocyte, apparently the youngest in circulation. Decrease in erythropoiesis and normal maturation led to rapid loss of these cells and to loss of ability to remove iron from plasma. NSA 9-5230

6911

EFFECT OF ROENTGEN IRRADIATION AND OTHER TYPES OF INJURIOUS AGENTS ON CAPILLARIES. Peter Rieser. *Proc. Soc. Exptl. Biol. Med.* 89, 39-41(1955).

X-irradiation, heparin injection, trypsin, and peptone increased capillary fragility in mesenteric capillaries of the frog, apparently as a consequence of liberation of heparin into the circulation of the animals. NSA 9-5231

6912

COMPARISON OF BACTERIA ISOLATED FROM BLOOD TISSUES AND FECES OF X-IRRADIATED MICE. W. T. Bradner, S. E. Bernstein, and R. E. McCarthy. *Proc. Soc. Exptl. Biol. Med.* 89, 107-11(1955).

Organisms (*Proteus mirabilis*, *Paracolobactrum coliforme*, *Pseudomonas aeruginosa*) found in the blood and organs of x-irradiated mice were serologically identical to bacteria of same species found in the feces. NSA 9-5232

6913

CHROMOSOMAL ABERRATIONS IN DATURA DUE TO VARIOUS KINDS OF IRRADIATION. Jean M. Cummings, Lewis Goldstein, and A. F. Blakeslee. *Proc. Natl. Acad. Sci. U. S. A.* 41, 355-8(1955).

Thermal neutrons proved very damaging to *Datura* and authors suggest that they may cause a higher frequency of rings of four, plus rings of six than is caused by other radiations. Cyclotron neutrons were not as effective in causing chromosomal aberrations as were neutrons from nuclear detonation. NSA 9-5233

6914

MODE OF ACTION OF SOME SUBSTANCES WHICH PROTECT AGAINST THE LETHAL EFFECTS OF X-RAYS. P. Alexander, Z. M. Bacq, S. F. Cousins, M. Fox, A. Herve, and J. Lazar. *Radiation Research* 2, 392-415(1955).

More than 100 substances were studied as protective agents against x rays in two systems: mortality of mice, and degradation of dilute solutions of polymethacrylic acid in aerated water. Protective actions were parallel in the two systems. NSA 9-5237

6915

EFFECT OF HYPOPHYSECTOMY ON SURVIVAL AFTER X-IRRADIATION. J. F. Kent, B. L. Baker, E. C. Pliske, J. G. Van Dyke, and F. H. Bethell. *Proc. Soc. Exptl. Biol. Med.* **89**, 142-5(1955).

Hypophysectomy of 433 adult female rats reduced their capacity to survive total body x irradiation as compared with response of 542 nonhypophysectomized rats. In absence of pituitary gland, rats tended to die earlier after the lower doses of irradiation (0-157 r) although the % survival did not change with doses between 375-500 r. NSA 9-5238

6916

CONCERNING THE PROBLEM OF RADIATION PROTECTION BY INTRAVENOUS INJECTION OF ADENOSINE-TRI-PHOSPHATE. Hans-Joachim Maurer. *Strahlentherapie* **96**, 625-8(1955). (In German).

ATP injections did not prolong survival of rabbits, but rather, seemed to shorten survival time. Unfavorable influence of ATP is attributed to an increased stress on heart and circulation. NSA 9-5239

6917

PHARMACOLOGY OF IONIZING RADIATIONS. Werner Lorenz. *Strahlentherapie* **97**, 46-63(1955). (In German).

The author demands that all cancer patients receiving radiotherapy, be submitted to a general treatment prior to, parallel with and after the application of radiotherapy. He stresses, and demonstrates in animal experiments, the importance of vegetative-hormonal regulations. From the viewpoint of functional pathology the position of patients submitted to radiotherapy is a particular one. This situation therefore calls for a further development of radiopharmacology, covering the fields of research, instruction and practice. NSA 9-5240

THE INDUCTION OF X-RAYS OF RECESSIVE LETHALS IN THE MATURE SPERM OF MORMONIELLA VITRIPENNIS (WALKER). George B. Saul, II. Radiation Research 2, 447-60(1955).

Mature *M. vitripennis* (Walker) males were x rayed (568 to 5112 r) and mated to virgin females differing from them by an allele at a single locus. Numbers of lethals linked to two separate loci were computed for each dose. Mutation rate/roentgen = 0.004% for "R" locus; 0.001% for "black" locus. Dose-effect curve for recessive lethal inductions was linear. NSA 9-5846

6939

EFFECTS OF 50 ROENTGENS AND 25 ROENTGENS FRACTIONAL DAILY TOTAL-BODY γ -IRRADIATION IN THE BURRO. John H. Rust, Bernard F. Trum, John J. Lane, U. S. Grant Kuhn, III, John R. Paysinger, and Thomas J. Haley. Radiation Research 2, 475-82(1955).

A study has been reported on the response of the burro (*Equus asinus asinus*) to 50 r and 25 r fractional daily total-body Co⁶⁰ γ radiation. The mean survival time for the 50 r/day study was 30 days with a range of 25 to 35 days, and in the 25 r/day animals it was 63 days with a range of 47 to 87 days. All hematologic values were decreased. Lymphocytes were the most sensitive cell, and eosinophils the most resistant. Platelets were reduced significantly with 725 r at 25 r/day. A pronounced hyperferremia was observed after 500 r in the 50 r/day animals and after 200 r in the 25 r/day group. This elevation continued until near death. The clinical syndrome was characterized by weight loss, ulcerations, hyperesthesia, and hemorrhagic diathesis. The similarities of response of the animals receiving 50 and 25 r/day with those receiving 100 to 400 r/day were discussed. NSA 9-5847

BIOLOGICAL EFFECT ON ATOMIC BOMB GAMMA RADIATION. Eugene P. Cronkite, Victor P. Bond, W. H. Chapman, and R. H. Lee. Science 122, 148-50(1955).

Mice were exposed in aluminum containers to γ rays of a nuclear detonation, or to laboratory sources of x rays. With respect to lethality, the RBE of nuclear radiation as compared to laboratory sources was approximately 1. NSA 9-5850

6943

CONDITIONAL AVERSION TO SACCHARIN RESULTING FROM EXPOSURE TO GAMMA RADIATION. J. Garcia, D. J. Kimelforff, and R. A. Koelling. Science 122, 157-8 (1955).

Saccharin solutions and water were made available to 2 groups of rats. Before γ irradiation, both showed marked preference for saccharin. Postexposure, there was a definite decrease in this preference. A 30 r exposure negated the previous preference, while a 57 r exposure caused a definite aversion to saccharin. NSA 9-5851

6944

C¹⁴-ACETATE INCORPORATION INTO LIVER LIPIDS AND GLYCOGEN OF IRRADIATED RATS. Margaret G. Morehouse and Ronald L. Searcy. *Science* 122, 158-9 (1955).

Female albino rats were x irradiated, fasted and then fed C¹⁴. Irradiated animals showed significant increases in percent of liver glycogen, compared with controls. Total liver fatty acids showed that irradiation increased incorporation of C¹⁴ about ten-fold over controls. Same exposure and C¹⁴ feeding were repeated with group whose livers were extracted for lipids. It did not appear that radiation affected synthesis of phospholipids. NSA 9-5852

6945

RADIATION SENSITIVITY OF DORMANT AND GERMINATING BARLEY SEEDS. Calvin F. Konzak. *Science* 122, 197 (1955).

Striking differences in relative sensitivity of seeds to x rays and thermal neutrons were observed. These differences were thought to be associated with changes in physiological state, which differentially influenced the relative efficiency of the two radiations. NSA 9-5853

6946

RADIATION SICKNESS IN MAN FOLLOWING THE ADMINISTRATION OF THERAPEUTIC RADIOIODINE. John D. Abbatt and W. M. Court Brown. *Brit. J. Radiol.* 331, 358-63 (1955).

Radiation sickness occurring after therapeutic radioiodine administration as I¹³¹ has been observed on 28 out of 44 occasions. The symptoms have been described and their resemblance to the symptoms occurring after a single x-ray dose has been noted. The latent period prior to the onset of symptoms after radioiodine administration varied between 4 and 13 hours with a mean of eight hours. This finding has been contrasted with the latent periods of two to five hours after medium voltage x rays. The correlations between integral dose at eight hours per square meter and mean dose rate per hour to symptom onset per square meter and latent period have been noted. It is suggested that dose rate may be an important factor involved in the production of the symptoms of radiation sickness. NSA 9-5854

6947

THE DESTRUCTIVE EFFECTS OF RADIOACTIVE IODINE. J. A. Forbes. *Brit. J. Radiol.* 331, 378-80 (1955).

Effects of I¹³¹ radiation on thyroid gland and thyroid carcinoma tissue were observed in rats. No take-up and storage of I¹³¹ could be detected in uniformly cellular tumors in which no vesicles were observed or in cellular areas of well-differentiated thyroid-like tumors. Whereas normal thyroid was ultimately destroyed, destruction of well-differentiated tumor tissue was patchy. NSA 9-5855

6948

THE MODE OF ACTION OF THORIUM X ON HUMAN SKIN. Victor H. Witten and Marion B. Sulzberger. *Am. J. Roentgenol., Radium Therapy Nuclear Med.* 74, 90-7 (1955).

6952

IS THE CONCEPT OF "CRITICAL ORGAN" VALID IN DETERMINING THE MAXIMUM PERMISSIBLE LEVEL FOR EXPOSURE TO RADIOACTIVE MATERIALS? J. N. Stannard. *Proc. Internat. Congr. on Peaceful Uses of Atomic Energy, Geneva, Switzerland, Aug. 1955, Vol. 13*, p.205-210. United Nations Publication (1956). Contract W-7401-eng-49.

This paper reviews, in part, the rationale of the critical organ concept in calculations of maximum permissible exposures to radioactive materials. It is shown that in many instances there is little evidence to indicate the existence of a critical organ. Furthermore, the choice is frequently quite arbitrary and without real evidence of damage to the organ in a chronic exposure situation, or evidence that the organ is critical in producing damage to the body as a whole. Very frequently, the only information available is the concentration of radioactive material in the various body organs and the organ with the highest concentration is perforce chosen as the critical organ. On the other hand, a review of the quantitative differences seen in maximum permissible operating levels when various possible critical organs are chosen or even entirely independent approaches used reveals that most values will lie within an order of magnitude range. While some of these differences may be important, a range of 10 is considered small in a field involving as many assumptions as that concerning the long term effects of radioisotopes. A review of pertinent parameters is urged, however, in cases where large issues such as cost, plant operating practices, etc. are involved. NSA 9-5863

6953

THE EFFECT OF GROWTH HORMONE ON RECOVERY FROM EXPOSURE TO X-RADIATION. John C. Barlow and E. A. Sellers. *Radiation Research* 2, 461-6 (1955).

Growth hormone had no effect on survival, organ weights relative to body weight, or on histological changes postirradiation. Initial loss of body weight after sublethal radiation was partially prevented. NSA 9-5864

GENETICAL EFFECTS OF RADIATION FROM PRODUCTS OF NUCLEAR EXPLOSIONS. J. B. S. Haldane. Nature 176, 115(1955).

Serious nature of genetical effects of radiation is stressed. Upper and lower limits of radiation-induced human mortality are estimated. NSA 9-6157

6964

A FACTOR INFLUENCING THE SIGNIFICANCE OF RADIATION MORTALITY EXPERIMENTS. Antolin Raventos. Brit. J. Radiol. 28, 410-14(1955).

The distribution of post-irradiation mortality among apparently identical cages of mice was studied. It was found that the mortality of any single cage may be strongly influenced by a cage effect, which disappears when the mice are shuffled, each to a different cage every 24 hours. As a result of cage effect, the mortality of any single cage or small number of cages is a significantly less reliable estimate of the mortality of the entire population that can be accounted for by random variation alone. Therefore, a substantial difference in mortality between two experimental groups, although statistically significant by conventional tests, may be spurious if the groups are housed separately. Possible causes of cage effect are discussed, but no investigation of the causes was made. Cage effect can probably be avoided by caging each mouse individually, and this was found not to alter radiation sequelae materially. It was shown that valid mortality comparisons can be made with multiple animal caging if each cage originally contains an equal number of animals from each of the groups whose mortalities are to be compared. 6991

THE EFFECTS OF X-RAYS, X-MEV ELECTRONS, THERMAL NEUTRONS, AND FAST NEUTRONS ON DORMANT SEEDS OF BARLEY. Richard S. Caldecort. Ann. N. Y. Acad. Sci. 59, 514-35(1955).

The inactivation of the phages T_1 , T_2 , T_3 , T_5 , T_7 , and λ by decay of incorporated P^{32} has been studied. It was found that these phages fall into two classes of sensitivity of P^{32} decay: at the same specific activity of P^{32} in their deoxyribonucleic acid (DNA), T_2 and T_5 are inactivated three times as rapidly as T_1 , T_3 , T_7 , and λ . Since the strains of the first class were found to contain about three times as much total phosphorus per phage particle as those of the second, it appears that the fraction of all P^{32} disintegrations which are lethal is very nearly the same in all the strains. This fraction α depends on the temperature at which decay is allowed to proceed, being 0.05 at -196°C , 0.1 at $+4^\circ\text{C}$, and 0.3 at 65°C . Decay of P^{32} taking place only after the penetration of the DNA of a radioactive phage particle into the interior of the bacterial cell can still prevent the reproduction of the parental phage, albeit inactivation now proceeds at a slightly reduced rate. T_2 phages inactivated by decay of P^{32} can be cross-reactivated, i. e., donate some of their genetic characters to the progeny of a mixed infection with a non-radioactive phase. They do not, however, exhibit any multiplicity reactivation or photo-reactivation. The fact that at low temperatures less than one-tenth of the P^{32} disintegrations are lethal to the phage particle and the dependence of the fraction of lethal disintegrations on temperature can be accounted for by the double stranded structure of the DNA macromolecule. EXTENDING ONION STORAGE LIFE BY GAMMA IRRADIATION.

S. L. Dallyn, R. L. Sawyer, and A. H. Sparrow.

Nucleonics 13, No. 4, 48-9(1955).

White and yellow Sweet Spanish onions were exposed to 1000, 2000, 4000, or 8000 r for 24 hr, then stored at: (a) 60-65°F in 30-40% relative humidity; or (b) 50-55°F in 70-80% R.H. Table of data shows percent of sprouting in two groups and in a control group. NSA 9-3735

7027

EFFECTS OF DELAYED OVIPOSITION ON X-RAY-INDUCED STERILITY. Leo LaChance. *Nucleonics* 13, No. 4, 49-50(1955).

Effect of delay in period of oviposition on x-ray induced sterility was studied on the parasitic wasp, *Habrobracon*. NSA 9-3736

7028

INACTIVATION OF MEFl POLIOMYELITIS VIRUS BY IONIZING RADIATION. Ernest C. Pollard and Lisbeth M. Kraft. *Proc. Soc. Exptl. Biol. Med.* 88, 331-3(1955).

Poliomyelitis virus was bombarded by deuterons and α particles. Inactivation of infectivity corresponds to cross section of $7.1 \pm 3.5 \times 10^{-12}$ cm² for α particles; $6.0 \pm 5.3 \times 10^{-12}$ cm² for deuterons. Radius of assumed spherical sensitive volume = 15.7 ± 4.8 μ . NSA 9-3737

7029

BIOCHEMICAL CHANGES IN SPLEENS OF RATS AFTER LOCALIZED X-IRRADIATION. Donald F. Petersen, Frank W. Fitch, and Kenneth P. DuBois. *Proc. Soc. Exptl. Biol. Med.* 88, 394-7(1955).

Rats received dose of 800 r x rays to the entire body, or 800 r to exteriorized spleens with bodies shielded. ATP activity, 5-nucleotidase activity, DNA concentration, citric acid synthesis, and histology of spleens were studied. Results indicate that the effect of x rays on functions studied is not a direct one. NSA 9-3738

7030

STIMULATION OF ERYTHROPOIESIS IN IRRADIATED DOGS AND RATS. Frederick Stohlman, Jr., E. P. Cronkite, and G. Brecher. *Proc. Soc. Exptl. Biol. Med.* 88, 402-6(1955).

After whole-body sublethal x-ray doses, erythropoiesis was depressed in dogs and rats; could be markedly increased by bleeding animals shortly before or after exposure. Postirradiation administration of PAPP gave similar increase in erythropoiesis. Blood loss 24 hr postirradiation had no appreciable effect. Data indicate injury to erythropoietic system is reversed or modified; recovery of other marrow elements is unaffected. NSA 9-3739

7031

EFFECT OF WHOLE-BODY X-IRRADIATION ON CONCENTRATIONS OF DPN AND DPNH IN RAT LIVER.

Herbert J. Eichel and M. A. Spirtes. *Proc. Soc. Exptl. Biol. Med.* 88, 412-14(1955).

X-irradiation (700 r) of intact rats had little effect on concentration of oxidized and reduced DPN of liver; 980 r lowered level of reduced DNP by 15-32% without significantly altering amount of oxidized coenzyme. Possible explanations for results are discussed. NSA 9-3740

7032

AN X-RAY ANALYSIS OF CHROMOSOME DUPLICATION.

Karl Sax and Edward D. King. *Proc. Natl. Acad. Sci. U. S.* 41, 150-5(1955).

Time of chromosome duplication as indicated by types of x-ray-induced aberrations is compared with autoradiographs of DNA synthesis in microspore development and in the meiotic cycle. NSA 9-3027

7033

THE EFFECT OF HIGH AND LOW ROENTGEN INTENSITY ON DOMINANT LETHALS IN *DROSOPHILA MELANOGASTER*.

K. G. Luning, Bo Lindell, and R. Falk. *Acta Radiol.*

43, 89-92(1955).

Drosophila males were irradiated with 800-900 r from discharge roentgen tube, and after 7 days, mated to selected females of high egg-laying capacity. No significant difference in hatchability was seen when high, compared with low, intensity irradiation dose was used. NSA 9-3029

7034

EFFECTS OF PILE RADIATION ON BARLEY SEEDS.

L. Ehrenberg and E. Saeland. *J. Nuclear Energy* 1, 150-69(1954).

Barley seeds were irradiated in Kjeller heavy-water reactor, and effects of different pile radiations (thermal, epithermal, and fast neutrons; γ rays, x rays) on growth rate, survival in the field, fertility, and mutation rate were studied. NSA 9-3030

7035

THE INFLUENCE OF IONIZING RADIATION ON THE BODY FLUID COMPARTMENTS OF PATIENTS WITH MALIGNANT LYMPHOMA. Joseph Greenberg and Daniel Laszlo. *J. Clin. Invest.* 34, 405-16(1955).

Ionizing radiation caused expansion of the extracellular fluid and plasma volumes at the expense of the intracellular compartment in all 4 patients studied. Reduction in intracellular volume was much more marked in the 2 on the restricted diet (low in protein, deficient in B vitamin and certain minerals). NSA 9-3031

7036

California. Univ., Los Angeles. Atomic Energy Project. FAILURE OF HETEROLOGOUS SPLEEN EXTRACTS TO INCREASE SURVIVAL TIME IN IRRADIATED MICE. Thomas J. Haley, John Heglin, and Eve F. McCulloh. Contract AT-04-1-Gen-12. Oct. 27, 1954. 10p. (UCLA-312).

Crude beef spleen extract and its acidic and basic components were ineffective in counteracting lethal effects of 550 r acute whole-body x rays when administered to mice on postirradiation days 1 and 2. Extracts acted synergistically with irradiation, decreasing survival time when given on days 3 and 4. Possible reasons for such effects are discussed. NSA 9-3033

7037

ON THE PROTECTIVE MECHANISM OF THIOUREA ON MICE IRRADIATED WITH A LETHAL DOSE OF X RADIATION. E. H. Betz. *Compt. rend. soc. biol.* 148, 1915-18(1954). (In French).

Thiourea injected immediately before irradiation produced protective effects when not influenced by subsequent injection of thyroxine. Other tests were also made with thiourea administered orally over extended period prior to irradiation. In the latter case, radiation resistance disappeared when thyroxine was injected. NSA 9-3034

7038

REMARKS CONCERNING SULPHYDRYL PROTECTION AGAINST MAMMALIAN RADIATION INJURY. Harvey M. Patt. *Proc. of the Symposium held at Liege, Aug.-Sept., 1954*. London, Butterworths Scientific Publications, p. 105-9(1954).

Mechanisms involved in protective action of sulphhydryl substances, cysteine in particular, against radiation injury are reviewed. NSA 9-3035

7039

PROPHYLAXIS AND THERAPY OF RADIATION SICKNESS BY MEANS OF BETA-MERCAPTOETHYLAMINE. V. Albano

and L. Oliva. *Radiologia (Rome)* 11, 37-50(1955). (In Italian)

Beneficial effects of 200-400 mg doses of β -mercaptoethylamine administered to 23 patients suffering with radiation sickness following radium or x-ray therapy are described. NSA 9-3036

7040

COMPARATIVE SURVIVAL TIMES OF X-RAY TREATED VERSUS P^{32} TREATED PATIENTS WITH CHRONIC LEUKEMIAS UNDER THE PROGRAM OF TITRATED, REGULARLY SPACED TOTAL-BODY IRRADIATION. Edwin E. Osgood, Arthur J. Seaman, and Harold Tivey. *Radiology* 64, 373-81(1955).

Prognosis for survival was not significantly different following total-body irradiation delivered externally by spray technique from that following P^{32} therapy. NSA 9-3037

7041

CHANGES IN THE HUMAN LEUKOCYTE COUNT DURING X-RAY THERAPY FOR CANCER AND THEIR DEPENDENCE UPON THE INTEGRAL DOSE. Henry I. Kohn. *Radiology* 64, 382-91(1955).

Author describes changes in count of each kind of leukocyte in 48 patients undergoing conventional course of x-ray-therapy. Tumor dose varied from 3000 to 6000 r; integral dose varied from 1 to 50 megagram-r. NSA 9-3038

7042

EXPERIMENTAL AND CLINICAL STUDIES WITH RADIO-ACTIVE COLLOIDAL GOLD IN THE THERAPY OF SEROUS EFFUSIONS ARISING FROM CANCER. Campbell Moses, Edward Kent, Joseph B. Boatman, R. D. Cole, Joseph H. Sunder, R. S. George, Clem Russ, W. B. Ford, and E. R. Kutz. *Cancer* 8, 417-23(1955).

In dogs, 5 mc of Au^{198} kg given intrapleurally produced mild leukopenia, but no sharply deleterious effects. NSA 9-3041

7043

ANAEMIA AND ERYTHROPOIESIS IN THE IRRADIATED RAT. AN EXPERIMENTAL STUDY WITH PARTICULAR REFERENCE TO TECHNIQUES INVOLVING RADIOACTIVE IRON. C. F. Baster, E. H. Belcher, Eileen B. Harriss and L. F. Lamerton. *Brit. J. Haematol.* 1, 86-103(1955).

The distribution of subcutaneously injected radioactive iron in bone marrow, spleen and liver, its uptake in the red cells, and its elimination in the faeces have been studied in normal rats, and in rats receiving whole-body and partial-body x irradiation. Rats of two strains have been employed. By these means, it has been possible to follow quantitatively the radiation response of the erythropoietic system. The effects of shielding one hind limb and of splenectomy with and without hind-limb shielding on the pattern of response and the severity of the post-irradiation anaemia have been investigated. NSA 9-3050

7044

HYDRATION AND RADIOSENSITIVITY. Roberts Rugh and Helen Clugston. *Proc. Soc. Exptl. Biol. Med.* 88, 467-72 (1955).

Artemia, essentially in blastula stage in suspended development, can tolerate about 200,000 r more x radiation in the dry than in the wet state, if criteria of hatching and motility after 48 hrs hydration are considered. Further studies are described. NSA 9-3741

7045

DIFFUSION OF FLUIDS IN SKIN AFTER EXPOSURE TO X-IRRADIATION. G. Prodi and R. Miceli. *Proc. Soc. Exptl. Biol. Med.* 88, 472-5(1955).

India ink and diphtheria toxin were injected intradermally in rabbit in x rayed and normal skin areas. Spreading surface of injected agents was greater in irradiated than in control areas. Increased diffusion is assumed to be due to depolymerization of mucopolysaccharides of ground substance by x rays. NSA 9-3742

7046

THE INFLUENCE OF PRETREATMENTS AND POST-TREATMENTS ON BACTERIAL INACTIVATION BY IONIZING RADIATIONS. George E. Stapleton. *Ann. N. Y. Acad. Sci.* 59, 604-18(1955).

Studies on ability of a strain of *E. coli* to recover from radiation injury are described, including studies aimed at the identification of "recovery factors" obtainable from tissues (especially spleen) and yeast extracts. Findings suggest involvement of more than one biochemical system in the recovery process in *E. coli*. NSA 9-3743

7047

ATOMIC BOMB INJURIES. Nobuo Kusano, ed. Tokyo, Tsukiji Shokan Co., (1953). 112p.

Author summarizes of many studies and reports by Japanese scientists on effects of atomic explosions on Nagasaki and Hiroshima residents. 112 illustrations. NSA 9-3745

7048

EFFECT OF CHLORPROMAZINE ON SURVIVAL TIME IN IRRADIATED MICE. Thomas J. Haley, W. G. McCormick, and Eve F. McCulloh. *Proc. Soc. Exptl. Biol. Med.* 88, 475-7(1955).

Premedication with 5 mg/kg of chlorpromazine intraperitoneally significantly increased mean survival time in x-rayed mice. Postirradiation medication (same dose) was neither beneficial nor detrimental. Doses of 10 and 20 mg/kg shortened survival times, acted synergistically with irradiation. Sensitivity of irradiated animals to medication is discussed. NSA 9-3747

7049

Argonne Cancer Research Hospital, Chicago
SEMIANNUAL REPORT TO THE ATOMIC ENERGY COMMISSION. Leon O. Jacobson, ed. Sept. 1954. 170p. (ACRH-2).

Includes reports on: effect of sublethal x-ray dose on leukemia-resistant mice, role of spleen in resisting successful proliferation of injected leukemic cells, effect of intravenous injection of plasma from x-irradiated, spleen-shielded rats on erythropoiesis in normal rats, nature of splenic agent responsible for survival of mice after lethal x-ray exposure. NSA 9-3748

7050

Brookhaven National Lab., Upton, N. Y.
ANNUAL REPORT-JULY 1, 1954. 145p. (BNL-303).

Describes program and activities of Brookhaven National Laboratory for fiscal year 1954. NSA 9-4038

7051

Brookhaven National Lab., Upton, N. Y.
QUARTERLY PROGRESS REPORT FOR OCTOBER 1-DECEMBER 31, 1954. (UNCLASSIFIED SECTION) 56p. (BNL-380).

Includes data from studies on effect of: I^{131} on selected rat tissues, thiouracil on growth of pituitary adenomas in rats, thiouracil on thyroidal accumulation of At^{211} in rats, boron (as borax) on mice; boron on patients with brain tumors. NSA 9-4039

7052

Army Medical Research Lab., Fort Knox.
ADAPTATION TO IONIZING RADIATION. A. T. Krebs and John B. Storer. Feb. 2, 1955. 17p. (AMRL-175).

Acquired radioresistance is reviewed briefly. Theories of mechanism are discussed; original unsuccessful attempts to adapt mice to total body radiation are reviewed. It is concluded that adaptation does occur in certain tissues, but much more information is required before significance and possible importance of phenomenon can be evaluated. NSA 9-4043

7053

Brookhaven National Lab., Upton, N. Y.

THE EFFECT OF CHRONIC GAMMA RADIATION ON THE PRODUCTION OF SOMATIC MUTATIONS IN CARNATIONS. Alan Richter and W. Ralph Singleton. 1955. 13p. (BNL-2255).

Carnations grown under conditions of chronic gamma radiation produced somatic mutations which could be vegetatively propagated. Relation between mutation rate and dose rate is uncertain. NSA 9-4044

7054
LEUKEMOGENESIS BY IONIZING IRRADIATION. J. Furth and A. C. Upton. *Acta Radiol.* 116, Suppl. 469-76(1954).

Authors review major essential findings on the subject. Three sets of new experiments in mice are summarized. Threshold dose for induction of myelogenous leukemia in mice was found to be 128 r (mixed radiations from detonation of nuclear device). NSA 9-4047

7055
Rochester, N. Y. Univ. Atomic Energy Project.
AN EXPERIMENTAL APPROACH TO THE STUDY OF THE RESPIRATORY DEPOSITION AND RETENTION OF CERTAIN ALPHA EMITTERS. P. E. Morrow and Louis J. Casarett. Jan. 10, 1955. 25p. Contract W-7401-eng-49. (UR-308).

Authors describe their study of respiratory tract deposition and retention of certain airborne α emitters. NSA 9-4048

7056
Rochester, N. Y. Univ. Atomic Energy Project.
PERSONNEL PROTECTION IN THE RADIOACTIVE INHALATION PROGRAM. G. Hoyt Whipple, J. N. Stannard, G. J. Miller, M. Ingram, and T. T. Mercer. Feb. 4, 1955. 40p. Contract W-7401-eng-49. (UR-310). NSA 9-4049

7057
Naval Radiological Defense Lab., San Francisco.
RECOVERY FROM ACUTE RADIATION INJURY IN MICE FOLLOWING ADMINISTRATION OF RAT BONE MARROW. L. J. Cole, J. G. Habermeyer, and V. P. Bond. Jan. 19, 1955. 24p. (USNRDL-TR-29).

Data suggest that administration of cortisone may enhance protective effect of rat bone marrow in x-rayed mice. NSA 9-4051

7058
Rochester, N. Y. Univ. Atomic Energy Project.
THE ACUTE TOXICITY AND RETENTION OF ORALLY ADMINISTERED POLONIUM²¹⁰ IN THE RAT. R. J. Della Rosa, R. G. Thomas, and J. N. Stannard. Apr. 8, 1955. 11p. Contract W-7405-eng-49. (UR-392).

Authors conclude that there is no marked difference in toxicity of Po after gavage as compared with an equivalent body burden after intravenous administration. NSA 9-4055

7059
BIOCHEMICAL EFFECTS OF RADIATION. Kenneth P. DuBois and Donald F. Petersen. *Ann. Rev. Nuclear Sci.* 4, 351-76(1954).

Actions of ionizing radiations on enzyme systems, particularly alteration of enzyme reactions by high energy radiations are reviewed. (192 references.) NSA 9-3733

7060
LATE EFFECTS OF BETA RADIATION OF THE EYE. George R. Merriam, Jr. A. M. A. Arch. Ophthalmol. 53, 708-17(1955).

Conservatism in use of β rays in superficial ophthalmic lesions is urged. Numerous late effects have been observed including (telangiectasis of conjunctiva, keratinization of the conjunctival epithelium, atrophy of sclera, superficial punctate keratitis, corneal vascularization, corneal scarring, iritis, iris atrophy, radiation cataract. NSA 9-4347

7061
THE CONTRIBUTION OF RADIATION GENETICS TO AGRICULTURE. W. Ralph Singleton. *Argon. J.* 47, 113-17(1955).

Early studies on genetic effects of radiation on plants are reviewed and recent experiments on radioinduced mutations in corn are described. NSA 9-4348

7062
EXPERIMENTAL TUMORS PRODUCED BY COMBINED CHEMICAL AND PHYSICAL STIMULI. G. Castigiani. *Bull. Soc. Ital. Biol. Sper.* 2, 636-42(1927).

Formation of epithelioma in rats was accelerated by x rays and tar x ray stimulated production of preneoplastic and neoplastic cells. Histological observations are discussed. CA 22-1389

7063
BACTERIOPHAGE AS INDICATOR IN RADIATION CHEMISTRY. Tikvah Alper. *Radiation Research* 2, 119-34(1955).

Author reports results of studies on mechanisms of radioinduced inactivation of bacteriophage. Role of H₂O₂ formation and of O₂ on response to radiation are discussed. Use of bacteriophage as radiation chemical indicator is suggested. NSA 9-4350

7064
HEMATOLOGIC CHANGES IN RATS PROTECTED FROM LETHAL X-RADIATION BY POST-IRRADIATION PARABIOSIS. George Metz, Robert T. Binhammer, Martin Schneider, and John C. Finerty. *Radiation Research* 2, 159-65(1955).

Rats placed in parabiosis within 3 hr after lethal x irradiation showed early leucopenia similar to unprotected animals, but leucocyte count was normal by 8th post-irradiation day. NSA 9-4351

7065
EFFECTS OF ROENTGEN IRRADIATION ON THE TUMOR BED. I. THE INHIBITING ACTION OF LOCAL PRE-TRANSPLANTATION ROENTGEN IRRADIATION (1500 r₀) ON THE GROWTH OF MOUSE MAMMARY CARCINOMA. K. W. Stenstrom, H. Vermund, D. G. Mosser, and J. F. Marvin. *Radiation Research* 2, 180-91(1955).

Pretransplantation x-irradiation of 1500 r/air (half-value layer 4.2 mm Al) delivered locally to leg 48 hr before subcutaneous inoculation of tumor cell suspension inhibits development and growth rate of mouse mammary carcinoma. Authors attribute this to effect on tumor or normal cells. NSA 9-4353

7066
THE EFFECTS OF GAMMA AND ROENTGEN RADIATION ON THE INTACT SPINAL CHORD OF THE MONKEY. AN EXPERIMENTAL STUDY. Robert L. McLaurin, Orville T. Bailey, Griffith R. Harsh, III, and Franc D. Ingraham. *Am. J. Roentgenol., Radium Therapy Nuclear Med.* 73, 827-35(1955).

Thirty-five *M. rhesus* monkeys were γ -irradiated (radioactive tantalum) or x irradiated over the spinal cord. NSA 9-4354

7067
THE RELATIVE EFFECTIVENESS OF VARIOUS IONIZING RADIATIONS ON CHROMOSOME BREAKAGE IN TRADE-SCANTIA. J. S. Kirby-Smith, C. W. Sheppard, and Doris L. Craig. *Radiobiology Symposium (Proceedings)*. p. 262-4(1954). Z. M. Bacq and P. Alexander, eds. London, Butterworths Scientific Publications, 1954. NSA 9-4356

7068
Army Medical Research Lab., Fort Knox, Ky.
FURTHER STUDIES OF THE EFFECT OF PARTIAL SHIELDING BY GRIDS ON SURVIVAL OF X-IRRADIATED ANIMALS. J. G. Kereiakes and T. A. O'Neill. Mar. 4, 1955. 17p. (AMRL-178).

Results indicate that in rats exposed to equal volume x ray doses through grids of constant hole size but of various ratios of open to closed area, observed survival is the result of individual effects of interface area, tissue volume irradiated, and total incident dose. Results with mice are also described. NSA 9-4357

7069

Western Reserve Univ., Cleveland. Atomic Energy Medical Research Project.

STUDIES ON THE NATURE OF THE PROTECTIVE ACTIONS OF β -MERCAPTOETHYLAMINE AND CYSTEINE AGAINST X RAYS AND A NITROGEN MUSTARD. Paul R. Salerno and Hymer L. Friedell. Apr. 27, 1955. 10p. Contract W-31-109-eng-78. (NYO-4921).

Protective action of the chemical agents against nitrogen mustard is the result of direct interaction of free sulfhydryl groups of cysteine or Becaptan with cyclic ethylene imonium of HN_2 , but protection against x ray is mediated indirectly through reduction of intracellular oxygen tension. NSA 9-4358

7070

Chicago. Univ. Air Force Radiation Lab.

QUARTERLY PROGRESS REPORT NO. 15. Apr. 15, 1955. 144p. Contract AF 33(038)-27353. (NP-5645).

Reports x-ray effects on rat hematopoietic system tissue weight, respiration and enzyme activity, and on metabolism of borneols and phenols in rats, protective effects of methyl bis-(2-chlorethyl)-amine hydrochloride on shielded tissues, temperature and pressure effects on lethality in x rayed rats, effect of antipyretic analgesics on mouse survival, effect of various agents on survival of x-rayed rats and mice. NSA 9-4665

THE REVERSAL BY HIGH OXYGEN TENSION OF THE PROTECTIVE ACTION OF CYSTEINE IN IRRADIATED RATS. Paul R. Salerno and Hymer L. Friedell. Apr. 27, 1955. 25p. Contract W-31-109-Eng-78. (NYO-4920).

7073

Naval Radiological Defense Lab., San Francisco.

THE EFFECT OF WHOLE BODY X IRRADIATION OF MICE ON IMMUNITY TO TETANUS TOXOID. PART I. THE EFFECT OF PRE- AND POST-IRRADIATION INJECTIONS OF TETANUS TOXOID WITH RESPECT TO THE DEVELOPMENT OF IMMUNITY. M. S. Silverman and P. H. Chin. Mar. 3, 1955. 18p. (USNRDL-TR-37).

Post-antigen irradiation was as effective as pre-antigen irradiation in injuring the immunity mechanism. Injury was proportional to dose. The closer to the time of irradiation that toxoid is given, the greater the inhibition of immunity. NSA 9-4668

7074

OCULAR EFFECTS PRODUCED BY HIGH-INTENSITY X-RADIATION. Paul A. Cibis, Werner K. Noell, and Bertram Eichel. A. M. A. Arch. Ophthalmol. 53, 651-63(1955).

Effects of high-intensity ionizing radiation upon the eye of albinotic and pigmented guinea pigs, rabbits, rhesus monkeys, and dogs are reported. NSA 9-4669

7075

INCREASED RADIATION SENSITIVITY OF PERTUSSIS VACCINATED MICE. M. Rowen, W. S. Moos, and M. Samter. Proc. Soc. Exptl. Biol. Med. 88, 548-50(1955).

After pertussis vaccination, mice showed increased sensitivity to one half the $\text{LD}_{50/30}$ (total body exposure). Results were not altered by administration of antihistamine or hydrocortisone. (40 vaccinated and 40 control mice.). NSA 9-4670

7076

INDUCED POLLEN LETHALS FROM SEEDS OF DATURA STRAMONIUM EXPOSED TO DIFFERENT RADIATIONS.

J. L. Spencer and A. F. Blakeslee. Proc. Natl. Acad. Sci. U. S. 41, 307-12(1955).

Analysis of pollen lethals in Datura plants developing from radiated seeds demonstrates marked difference in RBE of (1) fast neutrons from nuclear detonation, (2) fast neutrons from cyclotron, and (3) α radiation. NSA 9-4671

7077

THE ROLE OF OXYGEN AND PEROXIDE IN THE PRODUCTION OF RADIATION DAMAGE IN PARAMECIUM. R. F. Kimball. Ann. N. Y. Acad. Sci. 59, 638-47(1955).

Reduced oxygen tension lowered x-ray induced mutation rate in *P. aurelia*. Effect could not be attributed to decreased production of H_2O_2 since this substance is ineffective as a mutagen either by itself or in combination with x rays. NSA 9-3672

7078

ON THE FREQUENCY OF THE RETARDATION OF SKELETON BY RADIATION TREATMENT OF HEMANGIOMA. Emil Fisher. Strahlentherapie 97, 599-607(1955). (In German).

In 14 of 73 patients irradiated (x ray or radium) for hemangioma of extremities in childhood, reduction in length of irradiated bone in vicinity of joint was observed. In all these cases, hemangioma had embraced large area of respective part of the extremity. NSA 9-7630

7079

SEX-LINKED LETHAL MUTATIONS INDUCED BY THERMAL NEUTRONS IN MALE AND FEMALE DROSOPHILA MELANOGASTER. R. C. King and Eunice M. Wood. Genetics 40, 490-9(1955).

Nitrogen capture protons are 1.5 times as effective in producing sex-linked lethal mutations in sperm as are 90 kv x rays. Over dose range used, lethal mutation rate/dose for X chromosomes of sperms appears linear. Differences in mutation rates induced in male and female germ line are discussed. NSA 9-7631

7080

AFTER-EFFECTS OF IONIZING RADIATION IN BARLEY. I. MODIFICATION BY STORAGE OF X-RAYED SEEDS IN OXYGEN AND NITROGEN. A PRELIMINARY REPORT. Jack D. Adams, R. A. Nilan, and Helga M. Gunthardt. Northwest Sci. 29, 101-8(1955).

Data are presented to show that storage of dormant barley seeds postexposure increases radiation damage as measured by frequency of chromosome bridges, seedling height, germination rate and emergence. The data presented suggest that oxygen enhances, nitrogen retards storage effect. NSA 9-7632

7081

HISTOCHEMICAL STUDY OF THE ACTION OF X-RAYS ON CHOLINESTERASES. S. Hajdukovic. Experientia 11, 356-7(1955). (French with English summary).

Using a histochemical method, the cholinesterase activity in mice after x irradiation was observed. Both types of cholinesterases were examined: AChE (specific ChE) of megacaryocytes of spleen and bone marrow, and AChE of motor endplates, and non-specific ChE of liver, pancreas, and prostate. There is no inactivation of AChE even after 5000 r. ChE is also very resistant. Activity is slowed down only 12 h or even a few days following irradiation and the inactivation remains slight. We suppose that the great alterations in cellular permeability caused by irradiation are not correlated with the enzymes. NSA 9-7633

7082

COMPARATIVE EFFECTIVENESS OF ROENTGEN RAYS OF 124 KV AND 50 MEV ON HABROBRACON EGGS

TREATED IN FIRST MEIOTIC METAPHASE. Gertrude Heidenthal, Leonard B. Clark, and John W. Gowen. *Am. J. Roentgenol. Radium Therapy Nuclear Med.* 74, 677-85 (1955).

No statistically significant difference was found between effects of the two irradiations in dose range of these experiments (low voltage: 100-1750 r; high voltage 100-1500 r). NSA 9-7634

7083
THE EFFECT OF GAMMA RADIATION ON THE CENTRAL NERVOUS SYSTEM. II. THE EFFECTS OF LOCALIZED IRRADIATION FROM TANTALUM 182 IMPLANTS. Edgar A. Bering, Jr., Orville T. Bailey, Fred D. Fowler, Peter H. Dillard, and Franc D. Ingraham. *Am. J. Roentgenol., Radium Therapy Nuclear Med.* 74, 686-700 (1955).

Gross and microscopic observations on a series of experiments on 18 monkeys exposed to large single doses delivered to the spinal cord are reported. Data suggest direct neuronal or glial effect. NSA 9-7635

7084
A STUDY OF PROTECTION OF THE ANIMAL ORGANISM AGAINST THE DELETERIOUS EFFECT OF IONIZING RADIATIONS. E. Ya. Graevskii. Moscow, Publishing House of the Academy of Sciences of the U. S. S. R., p. 34-50 in *Meetings of the Division of Biological Sciences* (1955). (In Russian).

Prophylactic protective effect for mice was obtained with CO, CO₂, heroin, morphine, adrenaline and penamine, therapeutic effect by i.-v. injections of homologous bone marrow, nuclear nucleoproteids and some alkaline and salt solutions. NSA 9-7637

7085
EFFECT OF PARENTERAL INJECTIONS OF PARTICULATE MATTER ON SURVIVAL OF X-IRRADIATED ANIMALS. Falconer Smith, Willie W. Smith, Howard L. Andrews, and Marie M. Grenaz. *Am. J. Physiol.* 182, 396-9 (1955).

Intraperitoneal injection of suspensions of limestone, quartz and Pyrex glass postirradiation (midlethal) increased the survival of mice/22 animals/100. Comparable results were obtained with guinea pigs and hamsters, but not rats. Defenses against postirradiation infection are believed to have been enhanced by the injections. NSA 9-7640

RESPONSE OF THE BLOOD CORPUSCLES IN HYPOPHYSECTOMIZED RATS TO IRRADIATION WITH X-RAYS. B. L. Baker, E. C. Pliske, J. F. Kent, J. D. McGinty, J. G. Van Dyke, and F. H. Bethell. *Endocrinology* 57, 472-81 (1955).

Three weeks after hypophysectomy, young adult female rats were given one dose (500 r) of total body x-irradiation. The ensuing depression in the erythrocyte and reticulocyte counts, hematocrit percentage and hemoglobin concentration was more severe than in the non-hypophysectomized, irradiated rats. During the 11-week period of observation, the erythrocyte count and hemoglobin concentration in hypophysectomized-irradiated rats returned toward the level of that shown by the non-irradiated hypophysectomized rats. The reticulocyte count and hematocrit percentage equalled or surpassed the values for the latter group. Macrocytosis resulted from irradiation in only the hypophysectomized rats. The total leucocyte count fell to the same level in both hypophysectomized and non-hypophysectomized rats but showed greater recovery in the hypophysectomized-irradiated animals. It was concluded that the capacity of the blood-forming tissues to recover from the damaging effects of x-irradiation is not completely dependent on the action of pituitary hormones. (auth). THE CONVERSION OF GLYCINE-1-C¹⁴ TO PROTEIN-C¹⁴ AND C¹⁴O₂ IN LIVER SLICES FROM X-IRRADIATED RATS. R. E. Kay and C. Entenman. Aug. 1, 1955. 19p. Project NM 006-015. (USNRDL-TR-54).

The effects of whole-body x irradiation upon protein synthesis in rat liver were investigated. The new incorporation of C¹⁴ from glycine-1-C¹⁴ into protein of liver slices was greater for x-irradiated, fasted rats than for fasting control rats. The incorporation in control rats falls off as the fast progresses. In contrast, the incorporation in x-irradiated rats increases with increasing time after irradiation and length of fast. The rate of conversion of glycine-1-C¹⁴ to C¹⁴O₂ is not the same for liver slices taken from x-irradiated and control rats. After a 1-day fast the liver slices from the control rats convert 18 to 28% of the glycine label of C¹⁴O₂. This rate increases to a peak value of 26 to 45% after 2 days of fasting and declines to 16 to 26% at the end of 3 days of fasting. In the irradiated rat, conversion is 20 to 30% after a 1-day fast and this amount rises steadily to 21 to 37% at the end of a 3-day fast. NSA 9-7234

 α -PARTICLE DOSIMETRY AND THE INHIBITION OF MITOSIS IN THE GRASSHOPPER NEUROBLAST BY LOW DOSAGE α -IRRADIATION. Robert W. Rogers. Radiation Research 3, 18-37 (1955).

Polonium α -particle sources and a microscope-adapted source holder were utilized for irradiating special mica hanging-drop living culture preparations of grasshopper embryos. A single-crystal zinc sulfide scintillation-photomultiplier technique was developed and employed for measuring α -particle traversal of single biological cell dimensions with improved dosimetry. Studies were made of polonium sources comparing scintillation, photographic, and mathematical techniques in measurement of the aberrant effects of nonuniform polonium deposition. The ranges of polonium α -particles in air and mica were determined, and the α -particle energy delivered to biological material was graphically computed. The scatter of α -particles in mica, the spatial distribution of particles, the random emission, and the Poisson dose distribution were studied. The effects of 56 rads of α -radiation on the mitotic rate of grasshopper neuroblast cells were determined, only 75% of normal mitotic activity being observed 6 hours after irradiation. Comparison with similar studies of β - and x-ray inhibition indicate that α -particles were most effective and β -particles least effective in producing inhibition of mitosis, with x-rays intermediate. A comparative study of inhibition of the midprophase and late prophase stages of the neuroblast by 56 rads of x-rays and α -particles showed greater radiosensitivity in early midprophase, the effectiveness of both radiations becoming inappreciable by prometaphase.

At this dose level, α - and x radiation effects on early and late midprophase are indistinguishable in terms of mitotic inhibition or failure to inhibit division. A low-dosage α -radiation study of five substages comprising midprophase showed that inhibition of mitosis was related to Poisson distribution of dosage in gross effect, the dose having been administered in 1 second with an average of 0.8 α -particle per second per neuroblast. The effects presumably attributable to a single α -particle were observed, with radiosensitivity decreasing with mitotic progress throughout the midprophase. NSA 9-7237

Authors found LD₅₀₋₃₀ days to be 7-8 μ c/g of Sr⁸⁹-Sr⁹⁰ administered intraperitoneally to mice, for rats and rabbits the LD₅₀₋₃₀ day dose was slightly less than 5 μ c/g. Observations on food intake and weight gain after smaller doses are also included.

7115
PRESERVATION OF POTATOES BY EXPOSURE TO X-RADIATION. Hans Otten and Christoph Pazold. Strahlentherapie 101, 152-7(1956). (In German).

The report deals with experiments on sprout inhibition in potatoes by means of x rays. A dose of 7000 r has proved sufficient for medium size tubers. There is no risk of toxic irradiation products, as far as can be ascertained up to now. A certain influence on vitamins is unavoidable. Changes in taste cannot be proved. The use of x rays is not an economic proposition. This may become possible with the help of radioactive isotopes, which will soon be available to a greater extent. (auth) NSA 11-1401

Argonne National Lab., Lemont, Ill.
RADIOTOXICITY OF INJECTED Na^{24} FOR MICE AND RATS. PART II. THE EFFECT OF Na^{24} ON THE LEUCOCYTES OF THE PERIPHERAL BLOOD OF MICE. Leon O. Jacobson and E. L. Simmons. June 1946. Decl. June 9, 1948. 11p. (AECD-2036, CH-3857).

Male mice given Na^{24}Cl in doses of 12, 47, 65 or 90 $\mu\text{c/g}$ by intraperitoneal injection developed leukopenia after all except lowest dose. Other changes in peripheral blood leukocyte picture are also described. NSA 1-14

Groups of male mice of the ABC and CF-1 strains were injected intraperitoneally with Na^{24} as the chloride in doses of 12, 23, 47, 65, and 90 $\mu\text{c/g}$. Leucocyte counts and differential blood smears were made on all animals before injection of the radioactive isotope and at intervals thereafter, through 10 days in one experiment and through 15 days in another. A moderate to severe leucopenia followed the injection of all the above doses except the 12 $\mu\text{c/g}$. Death of the animals in the groups which received 47, 65, or 90 $\mu\text{c/g}$ occurred before the eighth day. The number of neutrophils per cubic millimeter rose slightly for 3 days in the group which received 90 $\mu\text{c/g}$. No further sampling was possible in this group because of the death of all the animals. No reduction of neutrophils followed the injection

of 23 $\mu\text{c/g}$ in one experiment, 23, 47, and 65 $\mu\text{c/g}$ produced a marked neutropenia in another experiment. Lymphopenia occurred in all groups of animals which received 23, 47, 65, or 90 $\mu\text{c/g}$ and continued until sampling was discontinued or until death of the animals. NSA 1-14

Exposure to x rays causes pigmented hair of colored mice to fall out. This is replaced with uncolored or white hair. A tentative explanation based on the observed increases of oxidative activity of tyrosinase following x radiation is suggested. BA 6-6191

PHYSICAL STUDIES OF CELL DIVISION. STATISTICAL FLUCTUATIONS, EFFECTS DUE TO X RADIATION, TEMPERATURE, AND HYDROSTATIC PRESSURE (Thesis). Victor W. Burns. Dec. 9, 1954. 95p. Contract W-7405-eng-48. (UCRL-2812).

Effect of x rays on generation times of individual cells and their progeny was studied. Ploidy does not have same role in division-delay effects of x rays as it has in lethal x ray effects. Budding cells were resistant to lethal x-ray effects. P-chloro-mercuribenzoate gave some protection to yeast against lethal x-ray action, while application of high hydrostatic pressures to yeast before and during irradiation did not. NSA 9-1712

PERFORMANCE DURING EXPOSURE TO IONIZING RADIATION. PART I. FOOD AND WATER CONSUMPTION OF RATS DURING EXPOSURE TO GAMMA RADIATION. PART II. A CONDITIONED AVERSION TOWARDS SACCHARIN RESULTING FROM EXPOSURE TO GAMMA RADIATION. J. Garcia, D. I. Kimeldorf, E. L. Hunt, and B. P. Davies. Nov. 12, 1954. 28p. (USNRDL-TR-19).

Rats consumed less food and water and showed drop in body weight during exposure to low intensity γ irradiation. Normally high preference for saccharin-flavored water was nullified when it had been previously associated with exposure. NSA 9-2111

7165

THE EFFECTS OF HYPOPHYSECTOMY AND OF THYROXINE ON THE RADIATION-INDUCED CHANGES IN THE RAT THYROID. F. Maloof. *Endocrinology* 56, 209-14(1955).

Thyroids of rats previously given I^{131} showed cellular hypertrophy and morphologic alterations in the nuclei. Cellular hypertrophy was completely, and nuclear changes partially, inhibited by hypophysectomy or administration of D1-thyroxine. Some morphologic changes in thyroid after thyroidal sublethal doses of I^{131} appear to be secondary and not primary radiation effects. NSA 9-2113

7166

DELAYED TOXICITY OF RADIOSTRONTIUM IN MONKEYS. G. M. Edington, J. M. Judd, and A. H. Ward. *Nature* 175, 33(1955).

Six monkeys died after single injections of Sr^{90} of less than 0.2 mc/kg body-weight. Data on hematological findings and survival times are compared with those in animals that received higher doses. NSA 9-2114

7167

RELATION OF THE INDIGENOUS FLORA OF THE SMALL INTESTINE OF THE RAT TO POST-IRRADIATION BACTEREMIA. James G. Vincent, Robert C. Veomett, and Richard F. Riley. *J. Bacteriol.* 69, 38-44(1955).

Following 650-r x irradiation, lactobacilli in small intestine of rat fell to 1/4 their normal numbers, pseudomonads increased about 1000-fold by 7th day, and proteus organisms and coliforms showed less marked increases. Invasion by gram negative organisms was paralleled by bacteremia of types characteristic of gram negative invaders in the gut. Severity of invasion was correlated with severity of post-irradiation syndrome. NSA 9-2115

7168

INFLUENCE OF GAMMA RADIATION ON PROTEOLYTIC ENZYME ACTIVITY OF BEEF MUSCLE. D. M. Doty and James P. Wachter. *Agr. and Food Chem.* 3, 61-3(1955).

Irradiation with Co^{60} at dosages 1.6×10^5 rep reduced apparent proteinase activity of beef muscle about 50%. Loss occurred largely in fraction extractable at pH 9.6. At lower doses, little reduction in proteinase activity occurred. Irradiation reduced amount of tyrosine extractable from beef, which suggest that the amino acid is changed by exposure. NSA 9-2116

7169

NATURE OF UNDESIRABLE ODORS FORMED BY GAMMA IRRADIATION OF BEEF. O. F. Batzer and D. M. Doty. *Agr. and Food Chem.* 3, 64-7(1955).

Sulfur compounds are believed to be the source of some undesirable odors in irradiated meat. NSA 9-2117

7170

BETA RADIATION CATARACTS. James E. McDonald, William F. Hughes, Jr., and Vincent G. Peiffer. *A. M. A. Arch. Ophthalmol.* 53, 248-59(1955).

Studies on rabbit and human eyes exposed to β rays from radon and Sr^{90} - Y^{90} show localized cataractogenic effect of these emanations. Threshold dose on these effects is

lower when radiation is applied over the limbus, resulting in equatorial opacities and vacuoles which migrate posteriorly. Tentative cataractogenic dosage schedules are given. This complication should be considered in clinical use of β rays on the globe. NSA 9-2118

7171

EFFECTS OF X-IRRADIATION ON PURINE-METABOLIZING ENZYMES OF RAT LIVER AND SPLEEN. Herbert J. Eichel. *Proc. Soc. Exptl. Biol. Med.* 88, 155-8(1955).

Whole-body x irradiation had no effect on activities of rat liver adenosine deaminase and nucleoside phosphorylase studied at intervals over a 10-day period after exposure. Specific activity of spleen nucleoside phosphorylase was increased, although total organ enzyme activity was reduced as result of decrease in spleen size. NSA 9-2120

ON THE SIGNIFICANCE OF RADIATION INTENSITY ON ANIMAL ORGANISM DAMAGED BY X RAYS. B. M. Graevskaya and R. Ya. Keilina. *Doklady Akad. Nauk S. S. R.* 103, 425-6(1955). (In Russian). NSA 10-25

7177

DEUTERON CROSS SECTION OF β -AMYLASE IN VITRO AND IN VIVO. John Jagger and Dwight Wilson. *Radiation Research* 3, 127-34(1955).

Different preparations of malt β -amylase in the dry state have been bombarded with 3.75-Mev deuterons. The amylase was in a relatively pure form, in an immediately extracted form, and within barley seed slices. Although there is a wide spread of cross sections, the range of this spread is the same for all three preparations, and the spread is attributed to complex population of amylase molecules. It is concluded that β -amylase responds to ionizing radiation in essentially the same manner in all three cases and that, consequently, conclusions reached from radiation studies of semipurified enzymes can be extended to nonmetabolizing living systems in the dry state. NSA 10-31

7178

RECIPROCAL ACTION OF RADIATION WITH MATTER. W. Hanle. *Strahlentherapie* 38, 4-20(1955). (In German).

The importance of considering the reciprocal action of high-energy radiations with matter in biological and other technological studies is stressed. Characteristics of the different types of radiation and the origin of artificial radiations are reviewed. Factors affecting excitation, ionization, and chemical effects, and the influence of gases, liquids, and solids on these effects are discussed. NSA 10-27

REGENERATION OF X-RAYED SALAMANDER LIMBS PROVIDED WITH NORMAL EPIDERMIS. Florence C. Rose, Henry Quasler, and S. Meryl Rose. *Science* 122, 1018-19(1955).

Both forelimbs (distal to elbow) of adult *Triturus viridescens* were exposed to a single x ray dose ranging from 500 r - 10,000 r while the rest of the animal was shielded. Conclusions: the epidermis or any limb tissue can serve as the sole source of cells for limb regeneration. Regeneration was more complete when normal whole skin was transplanted than when muscle or bone was transplanted to the irradiated limb. NSA 10-521

7187

ACTH IN RADIOTHERAPY. A CLINICAL TRIAL. K. Sicher. *Brit. J. Radiol.* 28, 620-22(1955).

A brief survey is given of literature on the effects of ACTH on bone marrow and on radiation sickness. A personal experience of application of this drug in radiotherapy is described, and the results of a clinical trial are discussed. (auth) NSA 10-538

7188

MODIFICATION OF X-RAY SENSITIVITY OF BEAN ROOTS BY HYDROGEN GAS. Michael Ebert and Alma Howard. *Nature* 176, 828-9(1955).

Oxidizing action of hydroxyl radicals is responsible for part of the damage caused by radiation in bean roots. Presence of oxygen during radiation increases biological damage, indicating that HO₂ radicals are more damaging than hydrogen radicals. Reduction of growth rate in bean roots is due partly to the direct action of radiation and partly to energy absorbed in water molecules which exerts its influence via chemical intermediates. NSA 10-539

CELLULAR AND TISSUE RADIOLESIONS, THEIR CONSEQUENCES AND THEIR DISTRIBUTION. J. Maisin, H. Maisin, A. Dunjic, and P. Maldague. *J. belge radiol.* 38, 394-429(1955). (In French).

An intestinal syndrome appearing within 3 days after irradiation, and a hematopoietic syndrome occurring between the 9th and 15th day after irradiation were both found to contribute to the death of rats exposed to 700 r x radiation. Data on the protective effects of small lead screens and of mercaptoethylamine injections against radiation injuries in rats are summarized. NSA 10-532

7190

EFFECT OF X-IRRADIATION ON GLUCOSE ABSORPTION. H. M. Dickson. *Am. J. Physiol.* 182, 477-8(1955).

X irradiation reduced the rate of glucose absorption from the intestine in mice. This effect could not be attributed to retarded gastric emptying or to a diminution of intestinal hexokinase. (auth) NSA 10-531.

7191

ACTIONS OF RADIATION ON LIVING CELLS. D. E. Lea. Cambridge, England, University Press, 1955. 416p. (2nd Edition).

Fundamental actions of x radiation and other ionizing radiations on living cells are reviewed. Mechanisms of actions of radiation on viruses, and on the genes and chromosomes of higher cells are discussed in detail. A mathematical analysis of the data is included. 532 references. (C. H.) Chapters are abstracted individually NSA 10-38

7192
THE INCIDENT OF ENDOGENOUS BACTEREMIA IN X-IRRADIATED RABBITS. Carolyn W. Hammond and C. Phillip Miller. *Radiation Research* 3, 191-201(1955).

Daily blood cultures were made four to six days after exposure of rabbits to 900 r total-body x-radiation. Positive blood cultures never contained more than a few microorganisms. All bacteria recovered ante- or post-mortem were members of the rabbit's normal intestinal flora. There was no evidence that bacteremia in irradiated rabbit progresses to an overwhelming sepsis as it does in the mouse. Irradiated rabbit can combat endogenous infection more effectively than can the mouse. NSA 10-36

7193
FUNDAMENTAL PRINCIPLES OF X-RAY TREATMENT. R. du Mesnil de Rochemont. *Strahlentherapie* 98, 21-9 (1955).

Discussions presented during a brief post-graduate conference on the physical and biological fundamentals of radiotherapeutical methodology are summarized. (auth) NSA 10-47

7194
REPRESSION AND ENHANCEMENT OF IRRADIATION EFFECTS ON GRASSHOPPER CELLS BY METABOLIC POISONS AND OXYGEN. Theodore N. Tahmisian and Rosemarie L. Devine. *Radiation Research* 3, 182-90 (1955).

Grasshopper embryos irradiated in air undergo negative growth. Degree of negative growth is less if embryos are irradiated in 20% O₂: 80% CO in the dark. Protection is greater under anaerobic conditions. Cyanide protects if administered after radiation. Eggs that have high tetrazolium-reducing capacity are more resistant. There may be a relationship between resistance of a tissue to radiation and its dehydrogenase content. Radiation protection is dependent on hydrogen and electron transfer of tissues and cells. (from authors summary).

Naval Medical Research Inst., Bethesda, Md. and Naval Radiological Defense Lab., San Francisco. SKIN LESIONS, EPILATION AND NAIL PIGMENTATION IN MARSHALLESE AND AMERICANS ACCIDENTALLY CONTAMINATED WITH RADIOACTIVE FALLOUT. Robert A. Conrad, Nahum R. Shulman, David A. Wood, Charles L. Dunham, Edward L. Alpen, and L. Eugene Browning. Aug. 29, 1955. 28p. (NM-006-012.04.82).

Following the detonation of a thermonuclear device in the Marshall Islands in the Spring of 1954 a significant amount of radioactive fallout material was deposited on neighboring Pacific islands. Of the 239 Marshallese people and 28 Americans exposed, 64 Marshallese on the island of Rongelap received the highest dose of whole-body penetrating radiation (an estimated 175 r), the most extensive epilation and beta lesions of the skin, and small amounts of internal absorption of radioactive materials. Other island groups were less heavily irradiated. This report is concerned with the epilation and beta lesions which occurred. Many individuals in the higher exposure groups complained of burning and itching of the skin during the first 24 to 48 hr after exposure. Epilation and skin lesions were observed, beginning approximately two to three weeks after exposure, on skin areas contaminated with fallout. Bluish-brown pigmentation of the fingernails was also a common finding. No primary or secondary erythema was observed and consistently the first evidence of skin damage was increased pigmentation in the form of dark brown to black macules, papules, and raised plaques. The lesions developed largely on the exposed parts of the body not protected by clothing, and occurred usually in the following order; scalp (with epilation), neck axillae, antecubital fossae, feet, limbs, and trunk. Epilation and lesions of the scalp, neck, and foot (dorsal surface) were the most common. The majority of lesions were superficial without vesicle formation, and after simple dry desquamation healed and repigmented. Approximately 20% of the people in the highest exposure group developed deeper lesions, usually occurring on the feet or neck and were characterized by wet desquamation with ulceration, mild burning, itching, and pain accompanied the lesions. The majority healed rapidly with nonspecific therapy. Residual pigment aberration consisting of hyperpigmentation and lack of repigmentation

and mild atrophic changes were noted in some deeper healed lesions at six months and one year. Regrowth of hair, normal in color and texture, began about nine weeks post-exposure and was complete at six months. Biopsies of typical lesions at three to six weeks showed changes consistent with radiation damage with marked epidermal damage and much less severe dermal damage. Biopsies at six months showed only a few residual changes. The nail discoloration had grown out completely at six months in all but a few individuals. NSA 10-16

Mound Lab., Miamisburg, Ohio.
REPORT FOR BIOLOGICAL RESEARCH FOR MARCH 19, 1951 TO JUNE 18, 1951. July 23, 1951. Decl. with deletions Oct. 7, 1955. 66p. (AECD-3684).

Includes report on; effect of type of diet and presence of Po on lipid composition of rat tissue, bone marrow studies in rats injected with various doses of Po, roentgenographic changes in the skeletons of Po-bearing rats, effects of Po on cell metabolism, binding of Po by yeast cells, effect of Po on life span of rats, biological effects of Actinium; histopathological studies on tissues of Po-bearing dogs, minimally effective doses of injected Po for hematological and pathological changes, effects of injected Po on renal function in laboratory animals and effects on cholesterol content of rat blood. NSA 10-11

7203

A COMPARATIVE STUDY OF THE EFFECTS OF β -RAYS, γ -RAYS AND X-RAYS ON DEVELOPMENT IN HABROBRACON. Robert L. Amy. Radiation Research 3, 166-81 (1955).

Eggs of *H. juglandis* were exposed 1 to 3 hours after being laid, to various doses of β -rays from P^{32} , γ rays from Co^{60} , to 125-Kvp x rays under otherwise equivalent physical conditions. X rays were most effective in reducing percentage of eggs hatching, β rays were less effective, and γ rays were least effective. Effects on larval stage are discussed. Histological observations made on embryos exposed to x-, β -, or γ rays are included. At higher dose levels, radiation-induced damage was visible 4 hours after exposure. (from author's summary). NSA 10-35

7204

ON THE DIRECT AND INDIRECT EFFECTS OF X-RAYS ON THE TESTIS OF THE RAT. Henry I. Kohn. Radiation Research 3, 153-6 (1955).

Changes in weight and histologic appearance of the rat testis were studied after exposure to x rays. The testes were irradiated locally, with the rest of the body shielded, or along with the entire body. The tissue doses were 60, 180, and 210 r. The dose to the testis determined the changes in that organ. The dose received by the rest of the body had little if any effect on the testis. (auth) NSA 10-34

γ -IRRADIATION OF PNEUMOCOCCUS DEOXYRIBONUCLEIC ACID. Ruth M. Drew. Radiation Research 3, 116-20 (1955).

The effect of γ irradiation on pneumococcus type III DNA has been studied. The transforming activity of DNA irradiated in saline solution was destroyed at low radiation dose levels. A much higher tolerance was observed when DNA was irradiated in cysteine solution, and transforming activity could be demonstrated in material which had received as much as 250,000 rep. Highly active transforming principle was isolated from cells exposed to 100,000 rep. (auth) NSA 10-30

7206

EXCRETION PATTERNS OF RATS FOLLOWING TOTAL-BODY EXPOSURE TO X-RADIATION. Roy B. Mefferd, Jr. and Herman H. Martens. Science 122, 829-30 (1955).

Nitrogen and sulfur metabolism change radically following total-body exposure to ionizing radiation, with excretion increasing within 1 day and remaining high in nonsurvivors but decreasing after a period in survivors of 500 r dose. Effect on urine volumes, glycine, urea, alanine, phosphate, taurine, histidine, aspartic acid, uric acid, creatinine, glutamic acid, valine and body weight are discussed. NSA 10-28

7207

GENETICAL EFFECTS OF RADIATIONS FROM PRODUCTS OF NUCLEAR EXPLOSIONS. F. W. Spiers. (Included is a reply to this paper by J. B. S. Haldane, Univ. Coll., London). Nature 177, 226-7 (1956).

Relative effective radiation dose-rates to man and to *Drosophila* are discussed. Data previously presented by Prof. J. B. S. Haldane on the genetical effects of radiation resulting from nuclear explosions are reviewed. A reply from Prof. Haldane presents revised calculations of radiation dose rates. (C. H.) NSA 10-5471

MODIFICATION OF RADIATION INJURY IN THE RABBIT. L. O. Jacobson, E. K. Marks, and E. O. Gaston. Proc. Soc. Exptl. Biol. Med. 91, 135-9 (1956).

Postirradiation injection of mouse embryo cells or baby mouse liver or spleen cells enhances significantly the survival of rabbits exposed previously to 900 r total-body x radiation without producing an appreciable effect upon hematologic recovery as observed in the peripheral blood. NSA 10-5479.

7209

CHEMICAL PROTECTION AGAINST IONIZING RADIATIONS. Z. M. Bacq. Research 9, 62-6 (1956).

The protection of living organisms against ionizing radiation is of prime importance. Experiments have shown that certain radio-protectors are equally effective in reducing radio-damage. The protector competes with radio-sensitive molecules or groups for the free radicals formed from the products of water hydrolysis and their reaction with oxygen during radiation. (auth). PROBLEMS OF THE DELAYED EFFECTS OF IONIZING RADIATION. R. W. Brauer, J. S. Krebs, C. H. Murden, and H. W. Carroll. Mar. 2, 1956. 18p. Project NM 006 015. 04. (USNRDL-TR-30).

Authors discuss the delayed radiation syndrome, i. e. decreased life expectancy and various types of deterioration of general health seen in animals surviving 60 days or

longer after exposure to a large dose of radiation. Tumors, agranulocytosis and leukemia are among the cause of death associated with prior exposure in several species. In many instances, however, a specific cause of early death is not apparent and deterioration in such instances has been variously described as radiation cachexia, radiation atrophy, decreased vitality or premature aging. Mechanisms responsible for the deterioration include deposition of faulty cellular products in surviving tissues (e.g. cataracts), elimination of stem cells (e.g. in testes, skin), survival of cells with nuclear damage, genetic and cytogenetic changes. Reference is made to the life span shortening concepts of Blair and Sacher. NSA 10-4485

7214
CIRRHOSIS OF THE LIVER IN RATS FOLLOWING TOTAL BODY X IRRADIATION. Julius White. J. Natl. Cancer Inst. 15, Suppl., 1617-18(1955). Apr.

In studying nitrogen excretion of rats exposed to 450 to 500 r total-body x radiation, it was observed that rats ingesting a 6% protein (casein) diet failed to gain weight early in the post-radiation period, whereas animals ingesting a 15 or 20% casein diet, and isocaloric with the 6% casein diet, began to gain weight rapidly 3 days following radiation. NSA 10-4499

7215
THERMAL NEUTRON EQUIVALENCE OF WHOLE-BODY X-IRRADIATION. L. F. Nims and L. Lewis. Radiation Research 4, 42-8(1956).

Growth delay under standardized experimental conditions can serve as a convenient and practical dosimeter that is particularly useful for mixed radiations. The thermal neutron flux equivalent to 1 r of x rays for the biological end point of growth delay in rats is $0.79 \times 10^{10} \text{ n cm}^2$. (auth) NSA 10-4492

7216
EFFECTS OF ADRENALECTOMY ON SPECIFIC ACTIVITY OF DEOXYRIBONUCLEASE IN RAT SPLEEN AFTER TOTAL BODY X-IRRADIATION. Carl D. Douglass, Paul L. Day, and Thomas W. Snyder. Proc. Soc. Exptl. Biol. Med. 90, 702-3(1955).

Adrenalectomy has been found to have no effect on increased specific activity of rat spleen DNase II following total-body x irradiation, but size of spleen and therefore total quantity of enzyme changed in both irradiated and unirradiated animals. (auth) NSA 10-4496

7217
EFFECTS OF IRRADIATION ON THE METABOLISM OF NUCLEIC ACIDS AND THEIR ACID SOLUBLE DERIVATIVES IN THE RAT. A. Becarevic, K. Kacanski, D. Mancic, and Ljiljana Hadzic. Experientia 12, 23-4(1956). (In French).

In the rat, x irradiation leads to a decrease of the net RNA and DNA content of the spleen, without, however, increasing the low molecular weight nucleic acid derivatives in the acid-soluble fractions of the same tissue. It is suggested that alteration of the cell membranes could account for the apparent elimination of these nucleic acid degradation products which should normally appear in the acid-soluble fraction. 7251

A TECHNIQUE OF MEASUREMENT, AND THE EFFECT OF X-RAY ON THE LEAKAGE OF PAH OUT OF THE RABBIT KIDNEY SLICE. Mortimer L. Mendelsohn. Am. J. Physiol. 182, 119-23(1955).

Method was found for estimating leakage of PAH (paraaminohippuric acid) out of rat kidney cortex slice preparation, by determining rate of loss of a PAH concentration difference after chemical inhibition of the transport medium. After 150,000 r of x rays leakage of slices did not change due to x-ray interference with active transport mechanism. NSA 9-6837

7252

RADIOPATHOLOGIC CYTOLOGY. THE TECHNIQUE OF PROGNOSTIC CYTOLOGY. Carl Deden. Acta Radiol. 43, 417-20(1955).

Author investigated the significance of cytological changes, especially the occurrence of bizarre cell shapes, in vaginal secretion smears after irradiation. Need for careful technique to eliminate artifacts is stressed. With careful technique, some bizarre cell shapes are still observed during and after radiation therapy. They are considered to represent a response to irradiation; probably secondary to changes in cell viscosity. NSA 9-5860

7253

THE PROTECTIVE EFFECT OF CYSTEAMINE ON YOUNG MICE EXPOSED TO ROENTGEN RAYS. Arne Nelson. Acta Radiol. 42, 485-93(1954).

Protective effect of cysteamine against ionizing radiation were investigated in young mice. Observations on weight, per cent surviving and duration of survival indicate that cysteamine afforded a good protective effect if given about 30 min before a dose of irradiation of up to 800 r and was also of some value when x ray dose was 1000 r. Optimal effect was obtained when cysteamine was administered immediately before exposure. Toxic effects of cysteamine are noted. NSA 9-2121

7254

EFFECTS OF COMBINED WHOLE BODY ROENTGEN IRRADIATION AND HIGH EXPLOSIVE BLAST INJURY IN MICE. Carl-Johan Clemedson and Arne Nelson. Acta Radiol. 43, 161-72(1955).

Mice (480 white, male) were exposed x rays and/or high explosive blast. Doses of 145 kv x ray: 25-600 r, with 10 mice per dosage group. Effect of combined injuries was no greater than effect of either agent alone. Only in group exposed to highest radiation dose and highest blast pressure was the number of deaths correlated with radiation dose. Effect on body weight is also reported. NSA 9-3744

REMARKS ON THE RADIOSENSITIVITY OF UNICELLULAR ORGANISMS. Cornelius A. Tobias. Acta Radiol. 41, 105-108(1954).

Author discusses mechanism of radiation effects as shown by inhibition of cell division in haploid and diploid *Saccharomyces cerevisiae*. Lethal action is genetic in nature. Radiations used covered range of specific ionizations from 6×10^6 ev/g cm² (high energy deuterons and roentgen rays) to 2×10^9 ev/g cm² (low energy alphas).

7256

Hanford Atomic Products Operation, Richland, Wash. BIOLOGY RESEARCH-ANNUAL REPORT FOR 1954. Jan. 3, 1955. Changed from Official Use Only Nov. 9, 1955. 138p. (HW-35917). Contract W-31-109-Eng-52.

Progress is reported on studies of the effects of reactor effluent on aquatic and plant life; a radiobiological survey of the Columbia River; plant and animal absorption and metabolism of fission products, plutonium, and tritium; the chronic effects of I¹³¹ and external radiations administered to sheep; the toxicity of radioactive particles; and development of new or improved techniques applicable to radiobiology.

Results are reported from studies on: radiosensitivity of the eyes of fetuses and lens epithelium of laboratory animals; the postirradiation protection of rabbits by injection of splenic plasma; effects of x and ultraviolet radiation, alone and consecutively, on bacteriophage. Report includes summaries of work published during the period. NSA 10-516

7261

California. Univ., Los Angeles. Atomic Energy Project. NOTIONS ON SENSITIVITY OF CELLS TO RADIATION. Ole A. Schjeide, James F. Mead, and Lawrence S. Myers, Jr. Oct. 15, 1955. 19p. Contract AT-04-1-gen-12. (UCLA-348).

The cytoplasm of cells contain enzymes for reduction of oxygen, hence are constantly exposed to small amounts

of the radicals and oxidizing agents derived therefrom. Nuclei, however, are not concerned to the same degree with such reactions and may not be as readily protected. Ionizing radiation produces the same or similar destructive agents. It is proposed that initial radiation damage occurs at loci within the cell which lack protective mechanisms, i.e., the nucleus; and that certain cells owe their high radiation sensitivity to their relatively large nuclear component. NSA 10-517

7262

Naval Radiological Defense Lab., San Francisco. PHYSICO-CHEMICAL ALTERATIONS IN SPLEEN DEOXYRIBONUCLEOPROTEIN FOLLOWING IN VITRO X-IRRADIATION WITH 660 r. L. J. Cole and M. E. Ellis. Aug. 8, 1955. 30p. Project NM-006-015. (USNRDL-TR-58). Rad. Research 5, 252(1956).

The deoxyribonucleoprotein (DNP) complex was isolated from spleens of immature mice, and characterized chemically. It was observed that low doses (850 r) of x-ray *in vitro* elicit detectable physico-chemical changes in isolated spleen DNP. Results suggest that initial effect may involve labilization of protein-to-DNA bonds in the original complex. NSA 10-518

7263

HEMOLYSIN PRODUCTION IN IRRADIATED MICE GIVEN SPLEEN OR BONE-MARROW HOMOGENATE. Falconer Smith and H. Jeanette Ruth. Proc. Soc. Exptl. Biol. Med. 90, 187-91(1955).

Recovery of hemolysin production in irradiated mice receiving bone marrow or spleen cell homogenate occurred at the same rate as in litter-mate control mice exposed to 450 r of x rays. Recovery of antibody production (to injected sheep erythrocytes) is gradual; begins 4th week after exposure to 450 r. Recovery of the hemolysin response is not complete even at 7 wk after this dose. Time required for development of peak titer following a single immunizing injection was not lengthened by 450 r whole-body exposure. NSA 10-522

EFFECT OF X-RADIATION ON THE FLOW OF PERFUSION FLUID THROUGH THE ISOLATED RABBIT'S EAR. Herbert B. Gerstner, Phillips M. Brooks and Sidney A. Smith. Am. J. Physiol. 182, 459-61(1955).

Flow rate, protein washout, and weight gain were measured in 100 isolated rabbit's ears perfused with tyrode's solution at 24°C under pressure of 24 to 26 mm Hg. Fifty ears received x radiation from 1 to 8 kr; 50 served as controls. X radiation caused immediate but transitory reduction of flow rate, effect became more striking the higher the dose. Irradiated ears showed marked protein washout. NSA 10-529

EFFECTS OF RADIATION ON GLYCOGEN PROCESSES IN ANIMALS EXPOSED TO X RAYS. R. Ya. Keilina. Biokhimiya 20, 420-4(1955). (In Russian).

Investigation of glycogen reactions in animals exposed to lethal and sublethal doses of x rays were made with rats weighing 150 to 200 g. Various tables of results obtained before and after exposure to 500 r and after lethal doses of x rays are presented. Decay of liver glycogen in rats not exposed to x rays was basically phosphoryl. In rats 2 days after exposure to 500 r radiation, phosphoryl glycogen was depressed, glycogen decay took place as result of hydrolysis. Hexokinase activity was not disturbed NSA 10-533

7266

EFFECTS OF ULTRAVIOLET AND X RADIATION ON ALBUMIN SOLUTIONS. M. S. Volkova and A. G. Pasyanski. Biokhimiya 20, 470-8(1955). (In Russian).

7268

Naval Radiological Defense Lab., San Francisco.
GROWTH AND CONTINUED FUNCTION OF RAT MARROW CELLS IN X IRRADIATED MICE. P. C. Nowell, L. J. Cole, J. G. Habermeyer and P. L. Roan. Sept. 2, 1955. 13p. Project NM 006 015. (USNRDL-TR-59). NSA 10-537

Blood and bone marrow smears from rats and mice were treated for histochemical demonstration of alkaline phosphatase activity. In the rat, mature neutrophilic leukocytes showed marked activity of the enzyme, while immature myeloid cells, megakaryocytes, and nucleated red cells showed less activity. In mouse smears, no phosphatase was observed in corresponding cells. After intravenous injection of rat marrow cell suspension into x-irradiated mice (810 r), alkaline phosphatase-positive cells were found in blood and bone marrow of the mouse within 2 hr. At 7 days, the percentage of phosphatase-positive cells markedly increased in irradiated mice, in the second, third, and fourth weeks after irradiation, the cells composed almost the entire mouse marrow population and were morphologically indistinguishable from rat marrow cells. There was no evidence of a return of phosphatase-negative (i. e., mouse) marrow cells during the 28-day period studied. Findings indicate that injected rat marrow cells are able to survive, divide, and repopulate the marrow cavity of irradiated mice. The cells function hematopoietically and permit survival of the mice following otherwise lethal doses of radiation. NSA 10-537

7269

THE EFFECT OF CYSTEAMINE, CYSTAMINE AND HYPOXIA ON MORTALITY AND BONE MARROW CHROMOSOME ABERRATIONS IN MICE AFTER TOTAL BODY ROENTGEN IRRADIATION. Finn Devik and Francis Lothe. Acta Radiol. 44, 243-5(1955).

A total of 154 mice were subjected to 1100 r and 110 mice to 200 r total-body irradiation following the administration of cysteamine or cystamine. With the former dose, death of mice was the indicator of damage while, with the latter dose, chromosome aberrations in the bone marrow were evaluated quantitatively. In both series, the chemical compounds had protective effects, particularly when mice were hypoxic during exposure (oxygen tension of 8.4%). NSA 10-540

7270

MODIFICATION OF THE RADIOSENSITIVITY OF RAT BY DEEP HYPOTHERMY. S. Hajdukovic. Acta Radiol. 44, 249-56(1955). (In French).

Author found that 50% of rats, irradiated in state of deep hypothermy (rectal temperature 14-15°C) with lethal doses of 800 and 900 r, survived more than 30 days; all controls died within 17 days. The same degree of protection was obtained if the rats were cooled in the presence of oxygen or under an air pressure of 1.25 atmosphere. It is likely that the influence of hypothermy on the mortality of roentgen-irradiated mammals is related to the general level of metabolic processes and not only to anoxia. NSA 10-541

Rochester, N. Y. Univ. Atomic Energy Project.
THE BINDING OF POLONIUM BY RED CELLS AND PLASMA PROTEINS. Robert G. Thomas and J. N. Stannard. Oct. 19, 1955. 18p. Contract W-7401-eng-49. (UR-414).

An average of 97 and 83% of the red cell and plasma Po, respectively, appears to be bound to proteinaceous material when PoCl_3 is given either intravenously or orally to rats. Erythrocyte stroma preparations show a polonium concentration equal to that of hemoglobin. Globin binds all of the hemoglobin polonium and plasma proteins appear to share the metal according to their respective concentrations. Both red cell and plasma lipids give no evidence of radioactivity. It is proposed that an equilibrium exists between red cells, plasma, and tissues with respect to Po metabolism and that the relationship between each compartment is a direct function of the effective half life in each. Data on the uptake of Po by red cells soon after intravenous injection to the rat and rabbit are interpreted in terms of this proposal. NSA 10-556

7272

FAILURE OF Y^{90} TO ESCAPE FROM SKELETALLY-FIXED Sr^{90} . J. S. Arnold, B. J. Stover, and M. A. Van Dilla. Proc. Soc. Exptl. Biol. Med. 90, 260-3(1955).

The data presented demonstrate that Y^{90} produced in vivo from long term skeletal deposits of Sr^{90} in young dogs does not escape from the local areas of bone in which it is produced. The findings agree with previous experimental evidence. Implications: (1) combined energy of the Sr^{90} and Y^{90} β rays irradiates the skeleton, hence, dosimetric data determined in vitro can be directly applied to in vivo conditions; (2) Sr^{90} deposited in growing skeleton is probably intracrystalline. NSA 10-558

THE ADVANTAGES OF USING POLYTOMA UVELLA FOR STUDIES OF CELLULAR RADIOSENSITIVITY. A. Lacassagne and F. Holweck. *Compt. Polytoma rend. soc. biol.* 107, 120-2(1931).

Polytoma, a flagellate, grows well, forming colonies from isolated cells on gelatine medium. There is a remarkably regular rhythm of cell division (multiplied). There are several nearly synchronous divisions of new colonies, permitting studies of the rate of cell division in addition to other variables.

7279

CHANGES IN LENS DURING THE FORMATION OF X-RAY CATARACT IN RABBITS. Antonette Pirie, Ruth Van Heyningen, and P. H. Flanders. *Biochem. J. (London)* 61, 341-7(1955).

Radiation effects on organic phosphate compounds in the lens of the very young rabbit were studied by an enzymic method. No change was observed in high energy phosphate groups of ATP and ADP or in hexose monophosphates within few days of irradiation. Fall in glutathione was detected 24 hr post-exposure. Hexose and triose phosphate, determined enzymically, were less than when determined chemically, a discrepancy also found in other tissues. NSA 10-40

7280

INFLUENCE OF X-RAY ON OXYGEN CONSUMPTION OF SPLEEN AND THYMUS GLANDS OF RATS. Maurice F. Sullivan and Kenneth P. DuBois. *Radiation Research* 3, 202-9(1955).

Oxygen consumption of slices of spleen and thymus glands from rats given 400 r whole-body x-radiation were studied manometrically. Marked reduction in endogenous QO_2 was observed in both tissues. Maximal inhibition occurred 48 hours after x ray, after which time there was gradual reversal of inhibitory effect. Endogeneous respiration of irradiated tissues declined more rapidly than in case of normal tissues when incubation period was extended. (from authors' summary) NSA 10-37

7281

DOMINANT LETHAL MUTATION AND X-CHROMOSOME ELIMINATION AFTER X-IRRADIATION OF FEMALE DROSOPHILA MELANOGASTER. R. C. King. *Radiation Research* 3, 143-52(1955).

Author determined the frequency of dominant lethals and x-chromosome losses in eggs laid at successive daily intervals after x ray treatment of female *Drosophila*. There was no significant difference in fecundity between control and irradiated flies. X radiation induces many more chromosome breaks in mature eggs than in oocytes. (from author's summary) NSA 10-33

7282

EFFECT OF VARIOUS DOSES OF X-RAYS ON THE NUMBER OF CELLS SYNTHESIZING DEOXYRIBONUCLEIC

ACID. S. R. Pelc and Alma Howard. *Radiation Research* 3, 135-42(1955).

The number of cells synthesizing DNA (observed by means of autoradiographs as uptake of P^{32} into DNA in a form not removed by acid hydrolysis) in *Vicia faba* root meristems is reduced by moderate doses of x rays to about 60% of the normal value during the subsequent 12 hr. Reduction is the same after 50 r to 200 r dose. Result is considered to be due to greater radiosensitivity of cells which are in the first part of interphase (representing about 1/3 of the mitotic cycle) at the time of irradiation. NSA 10-32

Naval Radiological Defense Lab., San Francisco. TEMPORAL RELATIONSHIPS WITHIN THE CONDITIONING OF A SACCHARIN AVERSION THROUGH RADIATION EXPOSURE. J. Garcia, D. J. Kimeldorf, and R. A. Koelling. Aug. 10, 1955. 18p. Project NM-006-015. (USNRDL-TR-57).

The optimal sequence for establishing conditioned aversion in rats to saccharin flavored H_2O was saccharin consumption during irradiation. Drinking the fluid immediately post-exposure did not result in aversion according to post-exposure preference tests. Some conditioning was observed in rats receiving saccharin flavored water immediately pre-exposure. NSA 10-22

7284

Naval Radiological Defense Lab., San Francisco. CONDITIONED RESPONSES TO MANIPULATIVE PROCEDURES RESULTING FROM EXPOSURE TO GAMMA RADIATION. J. Garcia, D. J. Kimeldorf, and E. L. Hunt. Aug. 9, 1955. 17p. Project NM-006-015. (USNRDL-TR-56).

Confinement of rats in plastic radiation chambers without actual exposure to radiation resulted in decreased food and water consumption if rats had previously experienced eating and drinking during irradiation under similar confinement. Animals deprived of both food and water during exposure did not decrease food and water intake during subsequent confinement in the radiation chamber. Three of five 8-hr exposures (75 r each) were employed to produce these effects. NSA 10-21

7285

Rochester, N. Y. Univ. Atomic Energy Project. EXTRA EMBRYONIC VASCULAR DETERIORATION IN THE IRRADIATED CHICK EMBRYO. M. Goldman, S. R. Glasser, and L. W. Tuttle. Aug. 3, 1955. 10p. Contract W-7405-eng-49. (UR-296).

Chick embryos exhibit extensive intraembryonic hemorrhage a few hours after 12 day old fertile eggs are exposed to 800 r of 250 kvp x rays. Vascular degeneration was pronounced within 2 hr after irradiation; was maximal by 20 hr at which time 62% of the embryos were dead. On a five rank scale, vascular damage in irradiated eggs scored 3 to 4 prior to death compared with similarly handled in irradiated controls which scored 0-1 throughout the experiment. NSA 10-19

STIMULATION OF ERYTHROPOIESIS IN SUBLETHALLY IRRADIATED RATS BY A PLASMA FACTOR. Frederick Stohman, Jr. and George Brecher. *Proc. Soc. Exptl. Biol. Med.* 91, 1-4(1956).

Injection of plasma from anemic donors into rats immediately after exposure to sublethal x ray doses produced statistically significant increase in erythropoiesis as measured by Fe^{59} incorporation. Factor present in anemic plasma was nondialyzable, not present in supernatant after heat precipitation of protein. Normal plasma produced variable response. NSA 10-5454

7305

WATER INTAKE OF GUINEA PIGS AS PARAMETER IN ORAL DRUG THERAPY OF EXPERIMENTAL IRRADIATION. Friedrich Ellinger. *Proc. Soc. Exptl. Biol. Med.* 91, 172-4(1956).

Drinking habits of guinea pigs kept on a diet of dry food and drinking water have been studied to ascertain the amount of daily water consumption which may serve as a parameter for oral drug administration. NSA 10-5455

7306

STUDIES ON BONE MARROW LIPID IN NORMAL AND IRRADIATED RABBITS. Frederick Bernheim, Athos Ottolenghi and Karl M. Wilbur. *Radiation Research* 4, 132-8(1956).

Forty-eight hours after exposure of rabbit to 1400 r, marrow homogenates produced peroxides when incubated *in vitro*. Extracts from rabbits exposed to 800 r were less effective than extracts from normal animals in protecting the succinoxidase against peroxides. There was a significant increase in linoleic, linolenic and total fat in the marrow of the irradiated animals. Vitamins K, A and E inhibited peroxide formation in liver homogenates but did not protect succinoxidase against inhibition by peroxides. (from authors' summary). NSA 10-5458

7307

ACTION OF X-RAYS ON DIDINIUM NASUTUM. D. C. Shepard, A. C. Giese and C. L. Brandt. *Radiation Research* 4, 154-7(1956).

Direct irradiation of Didinium nasutum delays division by an amount that is greater the larger the dosage. Diet of paramecia irradiated just short of a cytolytic dosage does not affect division of didinia. Only possible positive effect was death of a small fraction of the population. Brief exposure of didinia to irradiated medium delays division, longer exposure kills. Implications of the results are discussed. NSA 10-5459

7308

MORPHOLOGICAL CHANGES IN THE MEDULLA OB-LONGATA NERVE CELLS OF WHITE MICE DURING

GENERAL ROENTGEN IRRADIATION. M. I. Sorokina. *Doklady Akad. Nauk. S. S. R.* 106, 51-3(1956). (In Russian).

Morphological changes in the nervous system under irradiation were studied by observing the process from initial moment of animal exposure to the moment of death. Adult white normal mice, and mice exposed to roentgen radiation (700 r, 1000 r, and 5000 r) were used in the experiments. Morphological changes used as criteria of effect revealed high sensitivity of nerve tissue to radiation. Destructive changes appeared in early stages of exposure. NSA 10-5461

7309

THE UPTAKE OF PHOSPHORUS-32 BY THE KNEE JOINT AND TIBIA OF SIX-WEEK-OLD MICE AND THE EFFECT OF X RAYS UPON IT. VARIATION OF UPTAKE WITH TIME AFTER A DOSE OF 2000 r OF KV X RAYS. C. W. Wilson. *Brit. J. Radiol.* 29, 86-91(1956).

7310

THE ELIMINATION OF RADIOACTIVE BARIUM SULFATE PARTICLES FROM THE LUNG. H. Cember, T. F. Hatch, J. A. Watson, T. Grucci and P. Bell. *Arch. Ind. Health* 13, 170-6(1956).

Radiation effect on the pulmonary clearance mechanisms were studied by exposing one group of rats to radioactive barium sulfate particles of high specific activity and another group to particles of very low specific activity. No difference between elimination rates of these two classes of particles was observed. Effective half life of particles in deep respiratory tract: two days. NSA 10-5470

7311

Naval Medical Research Inst., Bethesda, Md. and Naval Radiological Defense Lab., San Francisco. EMERGENCY LABORATORY ORGANIZATION FOR THE CARE OF LARGE NUMBERS OF HUMAN BEINGS ACCIDENTALLY EXPOSED TO IONIZING RADIATION. C. R. Sipe, P. K. Schork, C. P. A. Strome, and William H. Gibbs. Nov. 18, 1955. 13p. (NM-006,012,04,91).

Accidental exposure of a group of Marshallese and Americans to radioactive fallout (spring, 1954) necessitated organizing and equipping an emergency medical team to conduct essential laboratory and clinical examinations on the exposed individuals. The material, facilities, and personnel required for emergency laboratory analyses in an operation of this kind are discussed. NSA 10-5476

7312

THE EFFECT OF ACTH AND CORTISONE ON RADIATION PNEUMONITIS. Florence C. H. Chu, James J. Nickson and Ali R. Uzel. *Am. J. Roentgenol., Radium Therapy Nuclear Med.* 75, 530-41(1956).

A study of the effects of ACTH and cortisone on radiation pneumonitis in 15 cases is presented. A brief review of the reports in the literature is given. NSA 10-5483

7313

RADIUM INHALATION ACCIDENT-RADIUM EXCRETION STUDY. W. B. Looney and V. E. Archer. *Am. J. Roentgenol., Radium Therapy Nuclear Med.* 75, 548-58(1956).

A report is made of 2 cases of accidental radium inhalation. The only clinical observations included are those representing excretion by way of urine and feces and exhalation in the breath. NSA 10-5502

7314

HISTOLOGICAL CHANGES IN THE GASTRIC MUCOSA (PAVLOV POUCH) OF THE DOG FOLLOWING IRRADIATION. A. B. Dawson. *Am. J. Roentgenol.* 13, 320-330(1925).

7315

RADIODERMATITIS AMONG PHYSICIANS. E. T. Leddy and F. J. Rigor. *Am. J. Roentgenol. Radium Therapy* 45, 696-700(1941).

7316

RADIATION OSTEITIS. J. Ewing. *Acta Radiol.* 6, 399-412 (1926).

The author describes 4 cases (3 men, 1 woman) who developed osteitis after large therapeutic radiation doses (radium γ in 3 cases, 250 kv x rays in 1 case). Radiation osteitis, developing about 2 years post-exposure, resulted in multiple fractures, necessitated amputation.

7317
LEUKOPENIC ANEMIA OF THE REGENERATIVE TYPE DUE TO EXPOSURE TO RADIUM AND MESOTHORIUM. G. S. Reitter and H. S. Martland. *Am. J. Roentgenol.* 16, 161 (1926).

Autopsy of two chemists who handled Ra and Mesothorium 4-5 days a week in various quantities for 14 years without taking any protective measures revealed red marrow showing erythroblastic hyperplasia. Body burden of radioactive elements was estimated to be 14 μ g.

7318
THE BIOLOGICAL MEASUREMENT OF THE DEPTH DOSE OF ROENTGEN RAYS WITH LETTUCE SEEDLINGS. C. I. Bliss. *Am. J. Roentgenol., Radium Therapy* 58, 222-233 (1947).

Lettuce seeds in paraffin discs were exposed *in vitro* to single doses of 200 kv x rays (3.23 mm Cu, 2.4 mm celluloid, 12.2 r/min). Biological effectiveness of radiation decreased as the 2.45 power of expected value in air; intensity of direct radiation decreased as the 4.85 power. Author concludes that 50% of effective radiation in paraffin is scattered radiation.

7319
STUDIES OF THE EFFECTS OF MILLION VOLT ROENTGEN RAYS, 200 KV X-RAYS, RADIOACTIVE P AND NEUTRONS BY THE MARROW CULTURE TECHNIQUE. E. F. Osgood, P. C. Aebersold, L. A. Erf and L. A. Packham. *Am. J. Med. Sci.* 204, 372-381 (1942).

Major effect of all the types of radiation on human marrow exposed *in vitro* was inhibition of cell division. Lymphocyte response: same to 200 r of 200 kv and 1000 kv x rays; same to 15 r neutrons and 60 r of 220 kv x rays. Neutron dose of 15 r produced same effect on progranulocytes as 400 r of 220 kv x rays.

7320
ACTIVATED ERGOSTEROL IN RADIATION SICKNESS. L. A. Smith. *Am. J. Roentgenol.* 22, 317-22 (1929)

Ergosterol is said to be good prophylaxis for radiation sickness.

7321
THE EFFECT OF X-RAYS ON THE RESPIRATION OF FOWL ERYTHROCYTES. L. Frankenthal and A. Back. *Biochem. J.* 38, 351-354 (1944).

Erythrocytes from defibrinated blood of 6-8 wk old chickens were x irradiated *in vitro* (35 kv, 15 ma, Cu anticathod, 50 mm T. O., 60,000 r/min). Irradiation markedly increased respiratory rate of the cells, effect increasing with increasing dose over range of 500,000-1,000,000 r.

7322
THE EFFECTS OF X-RAY THERAPY ON THE PARTITION OF PHOSPHORUS COMPOUNDS IN THE BLOOD IN DISEASE. Milan Sokolovitch. *Brit. J. Exptl. Pathology* 12, 147-50 (1931).

Concentration of various P compounds was studied in human venous blood (1 man) before and after whole-body x irradiation (dose not reported). After irradiation, ester P of plasma rose, of cells decreased, lipin P of plasma plasma rose, of erythrocytes decreased.

7323
WHOLE BODY IRRADIATION AND THE HEALING OF FRESH FRACTURES. A. W. Spittler, J. W. Batch and B. A. Rutledge. *A. M. A. Arch. Surg.* 68, 93 (1954).

Doses of 300-900 r given before fracture of left femur of rats delayed healing and altered the normal development of cartilage and ossifying osteoid tissue.

7324
A CONTRIBUTION TO THE BIOLOGICAL ACTION OF ROENTGEN RAYS. M. Y. Nemenow. *Brit. J. Radiol.* 31, 302-309 (1926).

On the basis of theoretical considerations, author proposes that Roentgen irradiation causes rapid exhaustion of "vital energy" cells. The radiation causes disturbed metabolism and retention of metabolic products in cells. CA-21-23306

7325
THE INFLUENCE OF ROENTGEN RAYS ON WHITE MICE AND THEIR PROGENY. M. Levine. *Am. J. Roentgenol. Rad. Therapy* 17, 546-51 (1927).

Large groups of immature mice were irradiated repeatedly with 155 kv x rays (Coolidge tube, 3.5-4 ma, T. D. 55-57 cm, 1 mm Al, 0.5 mm Cu). When male and female radiated mice were mated, 29 females gave birth to 168 young; 143 of these survived. Gross anatomy studies revealed no visceral, eye, foot, or leg abnormalities.

7326
PROTECTIVE ACTION OF CARBON MONOXIDE IN MAMMALIAN WHOLE-BODY X-IRRADIATION. Eugene B. Konecci, William F. Taylor and Syrrrel S. Wilks. *Radiation Research* 3, 157-65 (1955).

Whole-body x-irradiated guinea pigs, rats, and rabbits were tested with carbon monoxide inhalation of 0.10% CO or by IP injection of 100% CO in a variety of treatments. Untreated guinea pigs given 500 r ($LD_{100(30)}$) died, whereas 50% of the guinea pigs pre-CO treated and 15% of those post-CO treated survived the 30-day test period.

7327
Rochester, N. Y. Univ. Atomic Energy Project. THE EFFECTS OF IONIZING RADIATIONS FROM EXTERNAL SOURCES ON GAMETOGENESIS AND FERTILITY IN MAMMALS. A REVIEW. George W. Casarett. May 1, 1956. 48p. Contract W-7401-eng-49. (UR-441).

Author reviews of some experimental and clinical data, other than purely genetic data, which pertain to effects of irradiation from external sources on the gonads, gametogenesis and fertility of mammals. NSA 10-4482

7328
Naval Radiological Defense Lab., San Francisco. INCIDENCE OF NEOPLASMAS IN MICE PROTECTED AGAINST LETHAL DOSES OF X-RAY BY SPLEEN HOMOGENATE. L. J. Cole, P. C. Nowell, and M. E. Ellis. Mar. 22, 1956. 21p. Project NM 006-015. 04. (USNRDL-TR-82). Also, *J. National Cancer Inst.* 17, 435-6 (1956).

Previous studies have shown that the injection of splenic homogenates after otherwise 100% lethal whole-body x radiation exposure (800 r) affords protection against acute mortality in mice. In the present study, a total of 138 survivors from these protection experiments have been maintained and observed until natural death in order to investigate long-term effects. Malignant tumors of the leukemia-lymphoma type occurred in less than 1% of these mice, whereas in a group of non-irradiated mice of the same age the incidence was 22%. The occurrence of other malignant tumors, of ovarian adenomas, and of nephrosclerosis in the irradiated spleen-treated mice was markedly increased over that of non-irradiated controls. Analysis of the incidence of nephrosclerosis with respect to age at death reveals a striking rise in the occurrence of this disease during the period when the largest numbers of mice are dying. The data imply that nephrosclerosis is a major cause of late death in these mice. The apparent specific action of spleen homogenate post-protection in preventing radiation-induced leukemia appears to be associated with its promotion of more rapid regeneration of the damaged hematopoietic and lymphoid tissue. (auth) NSA 10-4486

7329

A COMPARATIVE STUDY OF DOSE-ACTION CURVES FOR VISIBLE EYE-COLOR MUTATIONS INDUCED BY X-RAYS. THERMAL NEUTRONS, AND FAST NEUTRONS IN MORMONIELLA VITRIPENNIS. Marion Kayhart. *Radiation Research* 4, 65-76(1956).

Female wasps were treated with a series of doses of x rays, thermal neutrons, and fast neutrons. They were unmated, and their haploid sons were examined for bright eye-color mutants. Dose-action curves are presented for production of visible eye-color mutations of each of the three radiations. Shape of the curves is similar, each shows an initial linear portion and then a rise more rapid than that calculated for proportionality. (from author's summary). NSA 10-4493

7331

A STUDY OF THE PHOSPHORUS COMPOSITION AND P^{32} INCORPORATION IN IRRADIATED LYMPHATIC TISSUE. Helen Harrington and Paul S. Lavik. *J. Cellular Comp. Physiol.* 46, 503-15(1955).

A toxic dose of P^{32} given to adult rats caused a decrease in DNA phosphorus concentration in thymus and spleen and a smaller decrease in the RNA phosphorus concentration in thymus. Incorporation of P^{32} into DNA and RNA was reduced in the thymus and spleen of irradiated animals. The specific effect of radiation on the DNA of lymphatic tissue suggests that the results may be due to an inhibition of DNA synthesis and/or new cell formation. (from author's summary). NSA 10-4502

7332

EFFECT OF TOTAL-BODY X-IRRADIATION ON FAT BALANCE AND LIVER LIPIDS IN THE RHESUS MONKEY. John G. Coniglio, W. J. Darby, J. Ann Efner, Jim Fleming and Granville W. Hudson. *Am. J. Physiol.* 184, 113-18(1956). NSA 10-5450

7333

INITIAL RADIATION SYNDROME IN THE ADULT CHICKEN. S. Phyllis Stearner, Margaret Sanderson, Emily J. Christian, and Austin M. Brues. *Am. J. Physiol.* 184, 134-40(1956).

In the adult rooster the dose rate dependent early mortality that followed x irradiation was similar to that reported for young chicks. Although a small drop in blood pressure occurred within 30-60 minutes after exposure, a critical hypotension was not seen during the initial post irradiation period. The blood pressure fall did not affect renal function directly. Epithelium of adult kidney is not as radiosensitive as that of the young chick. Results of experiments on hemorrhagic shock indicate that the adult can compensate for much greater loss of circulating blood volume without a decrease in blood pressure than can the young chick. NSA 10-5452

7334

STUDIES ON CARCINOMA. IV. THE HYDROGEN ION CONCENTRATION. Heinrich Guthmann and Paul Wirz. *Arch. Gynakol.* 142, 530-46(1930). (In German).

In cancer patients treated with x ray, blood pH shifts to acid side in 6 hr, then shifts to alkaline side 24 hr after exposure. CA 25-5394

7335

INFLUENCE OF ROENTGEN RAYS ON GASTRIC SECRETION. A. Tugenburg. *Vestnik Rentgenol. i Radiol. Leningrad* 3, 247(1925).

Small doses of x rays caused increased gastric secretions, followed by a decrease. Large doses increased secretions.

7336

CINEMATOGRAPH DEMONSTRATION OF LIVING TISSUE CELLS GROWING IN VITRO. R. G. Cantl. *Arch. Exptl. Zellforsch.* 6, 86(1928). (English).

Normal and neoplastic cells were irradiated with intense β and γ rays and cinematographic records were made of effects on mitosis, amoeboid movement and morphology of chick embryo periaosteum, fibroblasts, and Jensen rat sarcoma.

7337

Naval Radiological Defense Lab. San Francisco. SOME RADIATION RESPONSES OF TWO SPECIES OF BATS EXPOSED TO WARM AND COLD TEMPERATURES. G. K. Osborn and D. J. Kimeldorf. *Feb. 9, 1956. 14p.* Project NM 006 015.04. (USNRDL-TR-76).

Bats kept at warm temperature and eating an artificial diet, died after total-body x irradiation within the lethal range for mammals. A long survival time was observed. Terminal loss of body weight, anorexia and gastrointestinal hemorrhage were similar to those observed in other mammals. The influence of a temporary period of cold exposure prolonged the latent period of various responses without abolishing their appearance. NSA 10-7399

7338

THE EFFECT OF ROENTGEN RAYS ON THE PROTOPLASM OF CELLS. Gosta Janssen. *Acta Radiol.* 8, 427-461(1927). (In German).

Cultures of human bone marrow cells were studied by darkfield microscopy after irradiation *in vitro*. Effects on neutrophils: disturbed amoeboid movement and pseudopod formation, abnormal Brownian movement of granules; cell death by liquefaction; death of myelocytes by coagulation. Myelocytes were more radiosensitive than neutrophils. In both cell types, cytoplasm changes were observed before, or in absence of nuclear changes.

7339

CARBOHYDRATE METABOLISM AFTER ROENTGEN AND RADIUM THERAPY OF UTERINE CARCINOMA. I. Lucas. *Arch. Gynakol.* 143, 389-411(1930). (In German).

Roentgen and radium rays were equally effective in treatment of uterine carcinoma. Observed changes in CO_2 combining power in patients following irradiation can be accounted for by hypocapnia. CA 25-2477

ALTERATION IN THERMAL FRAGILITY OF RAT ERYTHROCYTES FOLLOWING TOTAL BODY X-IRRADIATION. L. Goldschmidt, R. L. Rosenthal, V. P. Bond and M. C. Fishler. Feb. 14, 1950. 12p. (AD-199(B); NRDL-223).

7344

FAR REACHING EFFECTS OF GAMMA RAYS AND SHORT X-RAYS UPON HUMAN HEART. J. E. Gendreau. Ann. Surg. 93, 476-480(1931).

In man, the heart rate decreased, and auricular flutter and fibrillation and premature ventricular contractions were noted after radiation therapy. Authors show pictures of electrocardiograms representing patients receiving radiation therapy and emphasize that ECG changes are relatively common in such patients.

7345

POST-IRRADIATION CHANGES IN LUNGS AND THORAX, CLINICAL ROENTGENOLOGICAL AND PATHOLOGICAL STUDY; WITH EMPHASIS ON LATE AND TERMINAL STAGES. J. R. Fried and H. Goldberg. Am. J. Roentgenol. 43, 877-895(1940).

Clinical, roentgenographic and pathological changes in all stages of lung damage following x ray therapy are described as observed in 18 patients. Changes occurred in skin, bone and lungs. Right heart failure was often a complication in patients with extensive pulmonary fibrosis associated with contraction of the capillary bed of the lungs and increased vascular resistance.

7346

EFFECT OF ROENTGENOTHERAPY ON HUMAN HEART. E. S. Emery and B. Gordon. Am. J. Med. Sci. 170, 884-887(1925).

Therapeutic x irradiation over anterior thorax (man) was followed by premature auricular and ventricular beats, dyspnea, and chest pain.

7347

PHARMACOLOGIC RESPONSES OF THE ISOLATED RABBIT HEART DURING X-IRRADIATION L. E. Ellinwood, J. E. Wilson and J. M. Coon. Fed. Proc., Baltimore 11, 342 (1952).

After x irradiation with 34,000 r or more, the isolated rabbit heart responded atypically to (1) epinephrine (which produced arrest), (2) acetylcholine following atropinization (initial acceleration) followed by temporary arrest in diastole, and (3) nicotine (triphasic response consisting of arrest, stimulation and arrest again).

7348

ON THE ROLE OF CELLULAR METABOLISM AS A FACTOR IN THE RADIOSENSITIVITY OF SEEDS PRIOR TO THE APPEARANCE OF MORPHOLOGIC PHENOMENA. J. Lambert. Compt. rend. soc. biol. 112, 1570-3(1933). (In French).

Peas were irradiated under conditions in which their metabolic rate varied. The author concludes that the metabolic rate is an important factor in determining radiosensitivity.

THE EFFECT OF X-RADIATION ON CIRCULATION IN THE WING OF THE BAT. D. E. Smith, G. Svihla and H. M. Patt. *Physiol. Zool.* 24, 249-57(1951).

Whole-body exposure to less than 10,000 r of 250 kv x rays produced no vascular changes in the wing. Doses of 10,000-60,000 r caused slowing of blood flow. No changes were observed following localized exposure (wing) to doses below 50,000 r. Blood flow was slowed following localized exposure to 50,000-5,000,000 r.

7362

RADIATION-INDUCED CHROMOSOME BREAKAGE, DEOXYRIBOSE-NUCLEIC ACID SYNTHESIS AND THE MITOTIC CYCLE IN ROOT-MERISTEM CELLS OF *VICIA FABA*. J. M. Thoday. *New Phytologist* 53, 511-516(1954).

The proportion of isolocus-breaks showing no evidence of sister-union is high before the synthesis period and low after it, indicating that DNA synthesis and chromosome reproduction occur at the same period of interphase. (from abstract). BA 29-10240

7363

HISTOLOGICAL FINDINGS IN HEARTS WHICH HAVE BEEN EXPOSED TO RADIATION IN COURSE OF TREATMENT OF ADJACENT ORGANS. A. A. Thibaudeau and W. L. Mattick. *J. Cancer Research* 13, 251-259(1929).

Among findings in autopsy material after pre-cordial therapeutic x irradiation were: interstitial fibrosis, hyalin and fatty degeneration of muscle fibres, and necrosis of muscle.

7364

EFFECT OF ROENTGEN RAYS ON HEART; TOLERATION DOSE FOR MYOCARDIUM OF RATS. A. S. Warthin and E. A. Pohle. *Am. J. Roentgenol.* 25, 635-43(1931).

"Toleration dose" for myocardium was 500 r. One week after 700 r of 100 kvp x rays, the following changes were observed: marked dilation of right ventricle, congestion of myocardial capillaries, pyknosis of capillary endothelial cells.

7365

THE EFFECT OF RADIATION UPON THE ACIDITY OF BLOOD. H. Q. Woodard and H. R. Downes. *Am. J. Roentgenol.* 25, 271-275(1931).

Rabbits were given whole body exposure to 200 kv x rays (30 ma, 0.5 mm Cu, 45 cm TSD) for 20-40 min, a lethal dose. An immediate fall in blood pressure occurred.

7366

BIOLOGICAL EFFECTS OF EXTERNAL X AND GAMMA RADIATION. R. E. Zirkle, ed. New York: McGraw-Hill Book Co., Inc. (1954). NNES Div. IV. Vol. 22B.

Chapters are abstracted individually.

7367

EFFECT OF TOTAL BODY X-IRRADIATION ON SERUM ELECTROLYTES AND ELECTROCARDIOGRAMS OF THE

HAMSTER. G. P. Fulton and F. N. Sudak. *Fed. Proc.*, Baltimore 13, 50(1954).

7368

TISSUE CHANGES FOLLOWING ROENTGEN IRRADIATION. G. Domagk. *Ergeb. inn. Med. u. Kinderheilk.* 33, 1-62 (1928). (In German).

Histopathological changes in various tissues of man and animals after x irradiation are described in this review article. Author also describes damage following irradiation *in vitro* of cells in culture.

7369

BLOOD PRESSURE CHANGES IN CATS INDUCED BY X-IRRADIATION OF THE ABDOMINAL AREA. P. M. Brooks and B. B. Konecni. *Fed. Proc.* 13, 18(1954).

Anesthetized cats were given 5000 r of 260 kvp (350 r/min) x rays over the abdomen. Carotid blood pressure increased within 10 min following exposure, the increase persisting for several hours. Blood pressure changes are considered to be mediated by humoral factor(s) since non-irradiated cats showed similar changes when their circulatory system was connected with that of irradiated cats. The nonirradiated cats had blood pressure increases that equalled or exceeded those in the irradiated partner.

7370

Hanford Atomic Products Operation, Richland, Wash. A COMPARATIVE STUDY OF HANFORD AND UTAH RANGE SHEEP. L. K. Bustad, S. Marks, N. L. Dockum, D. R. Kalkwarf, and H. A. Konnberg. Nov. 30, 1953. 44p. (HW-30119).

Observations on sheep representing flocks in Utah adjacent to the Nevada Proving Ground were compared with findings made on experimental sheep exposed to various amounts of radioiodine. The Utah sheep showed no evidence of the radiation damage observed in experimentally treated sheep. Estimations of amounts of radioiodine on vegetation required to cause serious thyroid damage following a contamination event are included NSA 10-2577

7371

Kansas. Univ., Lawrence. EFFECTS OF X IRRADIATION ON THE PLASMAS OF CHICKENS AS REVEALED BY SEROLOGICAL ANALYSIS. PART I. WHOLE PLASMA COMPARISONS; PART II. ALTERATION OF PROTEINS OF THE LIVER; (A PRELIMINARY REPORT), PART III. AUTOANTIBODY FORMATION. (A PRELIMINARY REPORT). Charles A. Leone. 1955. 41p. (AECU-3133).

Antisera produced in rabbits against normal chicken plasma could distinguish plasmas from birds exposed to 600 and 900 r (x rays). Principal changes were in β globulins. Cytoplasmic protein constituents of liver cells were examined serologically in hope of detecting modified metabolic pathways. Plasmas from normal chickens did not differ in their effects on tissue cultures of embryonic chick heart and liver. NSA 10-2575

7372

THE OXYGEN CONSUMPTION FOLLOWING X IRRADIATION OF *ALLESCHERIA BOYDII* 1699 IN A BIOTIN-RICH MEDIUM. A. Morczek and D. Mucke. *Strahlentherapie* 98, 277-83(1955).

The authors investigated the O₂ consumption after roentgen irradiations of *Allescheria boydii* 1699, an ascomycete requiring biotin. The experiments were made by means of Warburg's apparatus in a suspension medium with and without biotin. In both series, a decrease of the O₂ quotient was observed following doses of 100 to 500 kr. NSA 10-1991

7373

Hanford Atomic Products Operation, Richland, Wash. RADIOLOGICAL SCIENCES DEPARTMENT RESEARCH AND DEVELOPMENT ACTIVITIES QUARTERLY PROGRESS REPORT FOR OCTOBER-DECEMBER 1954. H. M. Parker.

Jan. 10, 1955. Decl. with deletions Dec. 7, 1955. 27p. (AECD-3617).

Data are presented from a radiobiological ecological survey of the Columbia River and the Hanford area. Report includes studies on: toxicology of I^{131} in sheep; effects of whole-body x irradiation in sheep, the effects of radioactive particles on the skin of swine. NSA 10-2242

7374

Kansas. Univ., Lawrence.

GENETIC RESISTANCE TO X-IRRADIATION IN MICE.

Harold D. Swanson, C. A. Leone, and J. A. Weir. 1955. 15p. (AECU-3130).

Authors compared effects of x-irradiation on mice of the high leucocyte count strain, LCH (15000 cells/mm³), and low leucocyte count strains, LCL (5000 cell/mm³). Among 30-day old mice, the LCH strain had a lower mortality after irradiation; in 5-month old mice there was no difference between strains. Leucocyte counts of both strains drop to the same level (400 cells/mm³) several days after irradiation. NSA 10-2574

7375

Kansas. Univ., Lawrence.

SOME EFFECTS OF IRRADIATION ON THE IMMUNOCHEMICAL AND PHYSICOCHEMICAL IDENTITY OF SERUM PROTEINS OF RATS. Frank Dolyak. 1955. 60p. (AECU-3134).

It is postulated that irradiation may alter body proteins so they react as foreign bodies in their own physiological environment. *In vitro* x irradiation altered serological activity of hemocyanins from sera of American lobster, and produced quantitative changes in serum albumin and globulin of other animals. These components in sera of normal animals produced effects similar to serological reactions. β particles from internally deposited P^{32} produced chronic changes in some of the proteins of rat serum NSA 10-2576

7376

THE SPLEEN-THYMUS WEIGHT RESPONSE TO TOTAL-BODY X-IRRADIATION IN THE ADRENALECTOMIZED RAT AND MOUSE. Mortimer L. Mendelsohn. Radiation Research 3, 444-51(1955).

The fractional weight changes of spleen and thymus 5 days after total-body x radiation of the rat with doses from 150 to 600 r (and of the mouse with 450 r) have been found to be unaffected by prior bilateral adrenalectomy. Results are consistent with concept that lymphocytolysis is secondary to radiation, either through a direct effect, or through indirect effects independent of adrenal function. Such effects must be of sufficient intensity to obscure the adrenal effects on lymphoid tissues usually associated with stress. (from author's summary). NSA 10-1087

7377

FURTHER STUDIES OF EFFECTS OF X-RADIATION ON PARTIALLY SHIELDED LENS OF RABBIT. P. J. Leinfelder and E. F. Riley. Arch. Ophthalmol. 55, 84-6(1956).

Doses of x-radiation as high as 12,000 r produced only partial cataract in the exposed quadrant of the rabbit lens when two or three of the lens quadrants were shielded from the radiation. NSA 10-2580

7378

RADIOSENSITIVITY OF BACILLUS SUBTILIS UNDER DIFFERENT ENVIRONMENTAL CONDITIONS. Bernard L. Proctor, Samuel A. Goldblith, E. Marilyn Oberle, and William C. Miller, Jr. Radiation Research 3, 295-303 (1955). Nov. NSA 10-1194

7379

THE PROTECTIVE EFFECT OF CYSTEAMINE AGAINST ROENTGEN RAY INJURY ON EARS OF RABBITS IRRADIATED UNDER CONDITIONS OF COMPLETE ANOXIA. Francis Lothe and Finn Devik. Acta Radiol 44, 306-12(1955).

In experiments with roentgen irradiation of rabbits' ears temporarily isolated from the rest of the animal, it was

shown that conditions of complete anoxia and the presence of cysteamine during exposure had a protective effect against damage. Cysteamine seemed to give some slight additional protection when administered to ears irradiated in the anoxic state, indicating that cysteamine and anoxia to some degree act along different paths in the radiobiologic process. NSA 10-1196

7380

THE INFLUENCE OF PLOIDY AND DIVISION STAGE ON THE ANOXIC PROTECTION OF SACCHAROMYCES CEREVISIAE AGAINST X-RAY INACTIVATION. C. A. Beam. Proc. Natl. Acad. Sci. U. S. A. 41, 857-61(1955).

Lethal effects of x rays administered in presence and absence of oxygen were compared in dividing and interdivisional cells of haploid, diploid, and tetraploid strains of *S. cerevisiae*. An approximately two-fold dose reduction was effected by anoxia in all instances. These findings favor the involvement of oxygen in early radiochemical events rather than in terminal biological changes (from author's summary). NSA 10-1193

7381

REDUCTION IN X-RAY SENSITIVITY OF SEEDS BY HYDRATION. Richard S. Caldecott. Nature 176, 306(1955).

Conclusions: (1) x ray sensitivity of dry seeds can be decreased by periods of soaking at both 0°C. and 22°C, (2) the duration of the reduced sensitivity is related to the temperature of the steeping water and is probably associated with increased physiological activity. Results suggest that radio-decomposition of water may play a less significant part in modifying radiosensitivity than has previously been assigned to it. NSA 10-1192

7382

ON DEPRESSOR REFLEX FROM VAGUS NERVE DURING RADIATION SICKNESS. V. F. Cherkasov. (Central Research Inst. of Roentgen Radiology). Med. Radiol. No. 2, 57-64 (1956). (In Russian). NSA 10-1104

7383

CONCERNING THE DETECTION OF FUNCTIONAL DISTURBANCE IN CIRCULATION IN AN ISOLATED RABBIT EAR FOLLOWING X IRRADIATION. Paul Erich Gehrels, Hans-Joachim Heite, and Peter Otzen. Strahlentherapie 100, 129-36(1956). (In German).

To supplement former investigations the authors have developed refined methods to examine the reactivity towards arterenol of the x-rayed rabbit-ear through which, in isolation, tyrode solution was sent at different times after the irradiation. Already before the appearance of an erythema a diminution of the excitability of the constrictors can be proved, the extent of which grows considerably with the forthcoming erythema and which is reversible *in vivo* after 6 to 8 days. 7384

Pittsburgh. Univ. Graduate School of Public Health PROPOSAL FOR FURTHER STUDIES ON LUNG HAZARDS FROM INHALATION OF INSOLUBLE RADIOACTIVE PARTICULATE MATTER. Summary Report for year of July 15, 1953 to July 14, 1954. Herman Cember. 1955. 9p. (AECU-3135). NSA 10-2006

7385

EXPERIMENTAL RESEARCH ON THE EFFECT ON ACUTE RADIATION SYNDROME BY GANGLION BLOCKING DRUGS AND OTHER SIMILAR SUBSTANCES. Emil Heinz Graul. Strahlentherapie 100, 142-52(1956). (In German).

The present report deals with explorations of so-called ganglion blocking drugs, such as pendiomide, buscopan, penthonum, tetraethyl ammonium chloride, and megraphen as to the possibility of their application for the prophylaxis and therapy of the acute radiosyndrome. Their protective efficiency against rays is not very high; their positive or negative effect depends largely on the

interval between their application and the attack of rays. Basing his discussion on the present knowledge in radiobiology and of the patho-physiology of the radiosyndrome, the author tries to explain this phenomenon. (auth)
NSA 10-11002

CREATINURIA IN PREGNANT AND NON-PREGNANT RATS AFTER IRRADIATION. Z. N. Zhakhova and A. D. Braun. *Med. Radiol.* No. 3, 80-5(1956). (In Russian).
NSA 10-11006

7387

HEMATOLOGICAL RESEARCH ON THE EFFECT OF PROTECTIVE SUBSTANCE. PART I. THE EFFECT OF CYSTEINE ON THE BONE MARROW AFTER TOTAL BODY IRRADIATION. Helmut Hartweg. *Strahlentherapie* 100, 259-68(1956). (In German)

The author reports on hematologic and histologic investigations into the course of the radio-reaction in the bone marrow of albino rats, of which a certain number had been treated with cysteine. A diminution of the primary radiogenic damage by means of cysteine could not be observed. The animals, however, which had been previously treated with cysteine showed a more rapid and more intense recovery from the attack of rays. The cause of this effect seems to be a protection of higher regulation centres. NSA 10-11003

7388

STUDIES OF BLOOD PICTURE CHANGES DURING RADIATION SICKNESS. N. A. Kraevskii. *Med. Radiol.* No. 3, 6-11(1956). (In Russian). NSA 10-11005

7389

FAILURE OF MERCAPTOETHYLAMINE AND CYSTEINE TO PROTECT THE SILKWORM AGAINST THE MUTAGENIC AND LETHAL EFFECTS OF RADIATION. Yoshio Nakao, Yataro Tazuma, and Takashi Sugimura. *Radiation Research* 3, 400-6(1955).

Wild-type female moths, which received injection of MEA, cysteine or physiological salt solution, were irradiated with x rays and mated to double recessive pere/pere males. In other experiments eggs from mating wild females and w_2/w_2 males were immersed in MEA solution before radiation. Mutation rates were estimated as uncoverings of marked loci determined by examining egg color. There was no protective action of MEA and cysteine against the mutagenic and lethal effects of radiation in these experiments. (from authors' summary). NSA 10-1999

7390

THE FAILURE OF RADIATION PROTECTION WITH CYSTEINE, CYSTEAMINE, AND OTHER SULFHYDRYL COMPOUNDS. Hanns Langendorf, Ruprecht Koch, and Ulrich Hagen. *Strahlentherapie* 100, 137-41(1956). (In German).

1(-) 2-thiolhistidine, 1,3 dithiopropanol, thioacetamide, 4,6-dimethyl-2-mercaptopyrimidine, ortho-aminothiophenol, and dithiopentaerythrite have been examined for their protective effect against x rays in mice exposed to a total roentgen irradiation of 500 r. None of the substances produced a protective effect. In this connection, the authors point to the specific radioprotective effect of the cysteine-cysteamine-bodies as sulfhydryl substances. The increased radiosensitivity after thioacetamide results from its hepatotoxic effect. NSA 10-11001

7391

EFFECTS OF ACUTE X-IRRADIATION ON THE EVOKED CEREBELLAR RESPONSE. John C. Lee, Skuli Helgason and Ray S. Snider. *Radiation Research* 3, 267-71(1955).

The evoked neurological response of the cerebellum was recorded in cats while the animals were being irradiated with 220-kv x rays at rates of 50 to 120 r/min. Amplitude of the evoked cerebellar response began to decrease at an average

value of 6000 r but varied within a range of 1500 r on either side of this value. Animals to which more than 10,000 r was administered showed severe flattening of the response. Both the primary response and the after-discharge were affected by irradiation. Responses, reduced during exposure to radiation, showed a further reduction in the early post-irradiation period. NSA 10-1179

STUDIES ON SUSCEPTIBILITY TO INFECTION FOLLOWING IONIZING RADIATION. III. SUSCEPTIBILITY OF THE INTESTINAL TRACT TO ORAL INOCULATION WITH *PSEUDOMONAS AERUGINOSA*. Carolyn W. Hammond, David Ruml, Dorothy B. Cooper, and C. Phillip Miller. *J. Exptl. Med.* 102, 403-11(1955). NSA 10-1185

7393

UPTAKE OF RADIOSULPHATE IN DIFFERENT ORGANS AFTER TOTAL BODY IRRADIATION. Erik Odeblad and Donato Ziliotto. *Acta Radiol.* 44, 313-16(1955).

Total-body roentgen irradiation of rats and mice with doses in the lethal dose range did not appreciably change the uptake of radiosulphate within two days after irradiation, by the intestine, trachea, skin, ovary, and kidney, according to autoradiographic studies. NSA 10-1183

7394

ACTION OF A SINGLE X-RAY DOSE, ADMINISTERED IN TOTAL OR LOCAL IRRADIATION, ON THE NUCLEIC ACIDS OF THE BONE MARROW IN THE WHITE RAT. J. C. Rodesch, C. Jaudel, B. Chirpaz, and P. Mandel. *Experientia* 11, 437-8(1955). (In French with English Summary).

Wistar rats were exposed to 700 dose of x rays delivered to entire body or to extremities of the left side only. DNA and RNA in bone marrow of long bones of hind legs were measured at various times after exposure. Total body exposure produced a more severe and prolonged depression of DNA and RNA than did partial body exposure. The authors feel that general systemic effects of whole body irradiation contribute to effects on marrow. NSA 10-1184

7395

THE EFFECTS OF γ -IRRADIATION AND OF AMINOPTERIN ON THE METABOLISM OF FORMATE- C^{14} , GLYCINE-2- C^{14} , AND ADENINE-8- C^{14} BY CHICK EMBRYOS. J. V. Passonneau and J. R. Totter. *Radiation Research* 3, 304-14(1955).

Chick embryos were suspended in saline containing either formate- C^{14} , glycine-2- C^{14} or adenine-8- C^{14} . Uptake of each substrate into acid-soluble RNA, DNA, and protein fractions was studied as a function of time and concentration of substrate. Radiation of embryos with γ rays prior to exposure to substrates reduced uptake of formate- C^{14} and glycine-2- C^{14} into DNA only with doses higher than 1000 r but did not diminish fixation of adenine-8- C^{14} into the nucleic acids. Low doses of γ radiation do not have a direct and immediate effect on DNA synthesis. (from authors' summary). NSA 10-1182

7396

STUDIES ON SUSCEPTIBILITY TO INFECTION FOLLOWING IONIZING RADIATION. IV. THE PATHOGENESIS OF THE ENDOGENOUS BACTEREMIAS IN MICE. Lee E. Gordon, David Ruml, Helen Jo Hahne, and C. Phillip Miller. *J. Exptl. Med.* 102, 413-24(1955). NSA 10-1186

7397

RADIOSENSITIVITY OF ANOXIC SKIN IN RELATION TO TEMPERATURE. J. P. O'Brien, E. J. Frank and J. L. Garner. *Science* 122, 1140(1955).

Results are summarized from studies on the effect of temperature during irradiation on the radiosensitivity of skin when variations in oxygen tension are simultaneously precluded. It was concluded that the temperature prevailing in anoxic mammalian tissue at the time of irradiation is a significant factor in modifying dose effects. NSA 10-1190

7400

INFLUENCE OF YOLK ON MITOTIC RATE IN UNTREATED AND X-RAYED GRASSHOPPER NEUROBLASTS IN VITRO. Mary Esther Gaulden and Katherine L. Kokomoor. *Proc. Soc. Exptl. Biol. Med.* 90, 309-14(1955).

The frequency of mid-mitotic neuroblasts in grasshopper embryos in hanging drop cultures increases as the quantity of yolk in the culture is increased up to a quantity equivalent to 1/4 in the egg. The pronounced positive effect of yolk on recovery of neuroblasts from radiation damage demonstrates that, in this cell, some extracellular metabolite or metabolites greatly enhance repair of mitotic damage. (from authors' summary). NSA 10-1988

7401

COMPARISON OF BIOLOGICAL EFFECTS OF WHOLE-BODY IRRADIATION WITH 22.5-MEV X-RAYS, 18-MEV ELECTRONS, AND 400-KEV X-RAYS IN THE RAT. John B. Fuller, Irene Chen, John S. Laughlin, and Roger A. Harvey. *Radiation Research* 3, 423-34(1955).

No qualitative differences in responsiveness to high- and low-energy radiations were found, although consistent quantitative differences in responsiveness of the same order of magnitude as noted by others were found. In these rats, an immediate mechanism, causing death from 3 to 10 days post-radiation, was gastro-intestinal injury. A second delayed mechanism, causing death from 12 to 22 days post-radiation, was the result of injury to the hematopoietic system. (from authors' summary). NSA 10-1985

7402

METHEMOGLOBINEMIA INDUCED BY X-IRRADIATION. Robert M. Dowben and Jack K. Walker. *Proc. Soc. Exptl. Biol. Med.* 90, 398-400(1955). NSA 10-1989

7403

THE EFFECT OF ROENTGEN RAYS ON CELL METABOLISM. K. Erik and K. Posener. *Verhandl. deut. Ges. inn. Med.*, 411-15(1926). (In German).

Doses of 10,000-30,000 r on rat carcinoma, chicken sarcoma, chicken embryo and mature testes *in vitro* caused decreased anaerobic glycolysis by (about 40%). There were also effects on the retina of eye. Similar effects *in vitro* occurred only if irradiation was preceded by large doses of glucose. CA 21-2325

7404

PROTECTION OF MOUSE FETUS AGAINST X-IRRADIATION DEATH. Roberts Rugh and Helen Clugston. *Science* 123, 28-9(1956).

Cysteamine administered to pregnant mice 20 min before exposure provided some protection against x irradiation not only for the adult mouse, but also for the fetal mouse. NSA 10-1998

7405

A STUDY OF THE PROTECTIVE EFFECT OF DESOXYCORTICOSTERONE ACETATE AND DESOXYCORTICOSTERONE ENANTHATE ON SUPRARENAL CORTEX OF TOTAL X-IRRADIATED ALBINO RATS. Giselbert Suchowsky. *Strahlentherapie* 99, 577-82(1956). (In German).

Desoxycorticosterone acetate administered immediately and one hour before total body irradiation produces a protective effect on the dehydrogenase activity in the cortex of the suprarenal gland in rats. Desoxycorticosterone

enanthate administered 5 days before the total body irradiation considerably supports the dehydrogenase activity and thus the secretory function of the cortex of the suprarenal gland. NSA 10-10999

7406

PROTECTION BY SPLEEN HOMOGENATES AGAINST β -RAY-INDUCED SKIN INJURY IN RATS. Georges Ungar, Evelyn Damgaard, and Florence Williams. *J. Appl. Physiol.* 8, 287-8(1955-56).

Treatment with spleen homogenates was found to protect rats against β -ray-induced skin injury. In the spleen-treated group damage occurred later, was less marked and the over-all incidence was significantly lower than in the controls. NSA 10-2594

7407

THE EFFECT OF X RAYS ON COMPLEMENT OF X-RAYED GUINEA PIGS. E. Anderson, E. Emmerich. *J. Immunitats* 47, 565(1926). (In German)

X-irradiation of guinea pigs increased the activity of complement in the Wasserman reaction.

7408

THE IMPORTANCE OF CHOLESTEROL IN THE OCCURRENCE AND PREVENTION OF ROENTGEN-SICKNESS. F. Burghelm. *Deut. Med. Wochschr.* 53, 1858-9(1927). (In German).

In the clinical studies reported, x-ray sickness was associated with decreased cholesterol in blood. Cholesterol was administered therapeutically for radiation sickness.

7409

FURTHER RESULTS ON MUTATION RESEARCH. Hans Breider. *Strahlentherapie* 98, 616-27(1955). (In German).

An accumulated report on the most recent problems of research in mutation is presented. The following problems are considered: gene-environment-characteristic; judgement of a mutation from the viewpoint of the practitioner in genetics; judgement of a mutation from the viewpoint of the theorist in genetics; radiogenetics and human genetics, radiation dose and natural rate of mutation, atomic rays somatic mutations, and inactivated as well as reactivated genes. NSA 10-2590

7410

OBSERVATIONS ON RADIATION CANCERS. A. Beutel and F. Skopal. *Strahlentherapie* 98, 570-5(1955). (In German).

It has been shown that the maximum interval between the first irradiation and the appearance of cancer stretches over 35 yr. In special cases a roentgen-treatment of the radiogenic carcinoma is justified. In most cases the so-called radiogenic cancer is a defect caused by wrong combination of radiation and dose factors. Each case, therefore, must be strictly analysed. The development of cancer on sound skin is extremely infrequent. According to observations reported, first symptoms of a carcinoma could begin 6 yr after a post-irradiation following a Wertheim operation. In most cases of such slow onset, the so-called radiogenic carcinoma may involve tissue outside the irradiation field; it may spare the sound skin. NSA 10-2589

7411

RADIATION SENSITIVITY OF OVARIAN TISSUE AT -79°C. A. S. Parkes. *Nature* 176, 1216-17(1955).

Experimental results indicate that low temperatures reduce radiation damage in rat ovarian tissue. Criterion of damage was altered ability of gonadal tissue to form an endocrinologically active graft. NSA 10-2584

California. Univ., Los Angeles. Atomic Energy Project. ENDOGENOUS HISTAMINE EXCRETION IN THE RAT AS INFLUENCED BY X RAY IRRADIATION AND COMPOUND 48/80. James L. Leitch, Virginia Debley, and Thomas J. Haley. Jan. 30, 1956. 27p. Contract AT-04-1-Gen-12. (UCLA-359).

Histamine excretion was found to be of little or no importance insofar as lethality from acute whole-body irradiation in rats is concerned. Endogenous histamine excretion in female rats was found to be 9 to 10 times greater than in males. Data are included on the effects of diet, gonadectomy, compound 48/80, and hormone treatment on the excretion of histamine before and after irradiation. NSA 10-2967

THE PATHOGENESIS OF THE HEMORRHAGIC STATE IN RADIATION SICKNESS: A REVIEW. A. C. Upton. *Blood* 10, 1156-63(1955). NSA 10-2598

7424

MEDICAL AND INDUSTRIAL RADIUM AND THORIUM INJURIES. A. Gebauer and R. Heincker. *Strahlentherapie* 98, 558-69(1955). (In German)

Five sick persons suffering from heavy defects in the reticuloendothelial system, which had appeared 10 to 15 yr after thorotrast injection, were studied. One of the patients fell ill of a leucosis. All patients complained temporarily of pain in the epigastric regions, which is linked with the occasionally observed increased porphyrinuria. A chemist who, in his professional work, had to handle radium and mesothorium fell ill of a pneumo-fibrosis leading to death. These observations underline the danger in employing radioactive material. NSA 10-2597

SUBSEQUENT REGENERATION OF NEREIS DIVERSICOLOR

O. F. MULLER AFTER LOCAL IRRADIATION WITH X RAYS. Francoise Stephen-Dubois. Comp. rend. 241, 1175-7 (1955). (In French).

Each worm was isolated in a Petri dish. The grubs were amputated between 1/2 and 3/4 of the way from the end of the body, then irradiated with x rays. Totally irradiated worms did not regenerate, and regeneration of locally irradiated worms was delayed. NSA 10-1177

7429

ANTIBIOTIC INDUCED BACTERIAL CHALLENGE OF IRRADIATED MICE. William T. Bradner and Ann M. Hald. Antibiotics and Chemotherapy 5, 449-504 (1955).

A method of inducing intrainestinal bacterial challenge by feeding an antibiotic to mice is described. The results of an experiment in which irradiated mice were challenged in this manner indicate that there is a complex sequence of events culminating in the invasion of the general circulation of these animals (bactecemia). The concomitant maximum reduction of both infection and mortality by antibiotic treatment supports the theory of a causal relationship between infection and radiation death. NSA 10-1187

General Electric Co. Hanford Atomic Products Operation, Richland, Wash.

HISTOPATHOLOGY OF SHEEP THYROID IN CHRONIC ADMINISTRATION OF ¹³²I. S. Marks, N. L. Dockum, and L. K. Bustad. Aug. 23, 1955. 44p. Contract W-31-109-Eng-52. (HW-38758).

The pathologic effects in the thyroid glands of sheep receiving chronic orally administered ¹³¹I are reported. Dose levels ranged from 0.15 μ c to 1800 μ c per day. No pathologic alterations were observed with a daily feeding level of 0.15 μ c after a maximum period of observation of four years. Pathologic changes observed involve the interstitial tissue, epithelium, and blood vessels. Effects on interstitial tissue may be considered of primary significance in the early diagnosis of low-level chronic exposure to ¹³¹I in the species investigated. NSA 10-1163

THE RELATIVE PHYSIOLOGICAL AND TOXICOLOGICAL PROPERTIES OF AMERICIUM AND PLUTONIUM. Wright Langham, Robert E. Carter, Elizabeth Pusch, Ogden Johnson, Verda Strang, Theodore Trujillo, Marion Vier, Julia Wellnitz, and Agnes Williams. Nov. 15, 1951. Decl. Jan. 5, 1953. 57p. Contract W-7405-eng-36. (LA-1309).

Following intravenous administration of Am to rats, urinary and fecal excretions were similar to that of Pu as Pu(NO₃)₄. Acute toxicity and deposition of Am in tissues and organs was also similar, the liver and skeleton being major depots. Observations of survival, blood and bone marrow changes, and incidence of tumors and bone changes revealed that Am and Pu have about same chronic toxicity when given on equal μ c basis. NSA 10-1200

7434

EFFECT OF KIDNEY SHIELDING ON SURVIVAL FOLLOWING WHOLE BODY IRRADIATION. David F. Bohr, P. A. Rondell, L. E. Palmer, and F. H. Bethell. Am. J. Physiol. 183, 335-9 (1955).

Shielding only the exteriorized kidneys gave significant protection against lethal effects of whole body irradiation (rat). Even greater protection resulted from shielding superficial structure in lumbar region, a finding which parallels the observation of protective effects of shielding diverse isolated structures as reported by others. Possible mechanisms of protective effect are considered. Two strains of rats were found to vary with respect to radiosensitivity. NSA 10-1700

7435

THE PROTECTIVE EFFECT OF VARIOUS CHEMICAL COMPOUNDS AGAINST DAMAGE TO CHROMOSOMES BY GAMMA RADIATION. Herbert Parkes Riley. Am. J. Botany 42, 765-9 (1955).

Protection against x-ray damage to chromosomes, as measured by frequency of chromosome interchanges and deletions produced in cells of onion root tips, is conferred by sodium hydrosulfite and BAL (2,3-dimercaptopropanol) in 2×10^{-3} and 2×10^{-4} M concentrations. Neither chemical had any effect on aberration frequency or mitotic process which could be detected by cytological observation on unirradiated root tips. NSA 10-1197

7436

EFFECTS OF HYDRATION ON X-RAY SENSITIVITY IN HORDEUM. Richard S. Caldecott. Radiation Research 3, 316-30 (1955).

Prior to x-radiation the water content of seeds of barley has been modified by storage at different relative humidities, steeping for 16 hours at 0°C followed by various periods of desiccation, and steeping at 0°C and 22°C for different periods of time. Pooled data from all studies shows that the x-ray sensitivity of barley seeds, as measured by inhibition of seedling growth and frequency of chromosomal aberrations, decreases as embryo water content increases from about 4%-8%. NSA 10-1195

EFFICACY OF HEMATOPOIETIC PROTECTIVE PROCEDURES IN RATS X-IRRADIATED WITH INTESTINE SHIELDED.

M. N. Swift, S. T. Taketa, and V. P. Bond. Sept. 13, 1955. 14p. Project NM-006-015. (USNRDL-TR-64).

Bone marrow dosage of the order of 60 to 90 mg/100 g body weight was required for optimal protection against mortality in rats x-irradiated with the exteriorized gastrointestinal tract shielded. The protective potential of spleen or marrow per se is considerably lower in rat than in mouse. NSA 10-1189

7438

TESTS FOR A ROLE OF H_2O_2 IN X-RAY MUTAGENESIS. I. ESTIMATIONS OF THE CONCENTRATION OF H_2O_2 INSIDE THE NUCLEUS. John Z. Hearon and R. F. Kimball, Radiation Research 3, 283-94 (1955).

Equations are derived which permit estimation of the concentration of H_2O_2 in micronuclei of *Paramecium aurelia* when known concentrations of H_2O_2 are added to the medium and when the cells are irradiated. Approximate solutions presented. The ratio of the micronuclear concentration to the concentration in the medium is essentially the same when cells are placed in an H_2O_2 containing medium and when they are exposed to radiation. Therefore, rather precise comparisons of the two situations can be obtained. (from authors' summary). NSA 10-1181

California. Univ., Los Angeles. Atomic Energy Project. RELATIVE RETENTION OF STRONTIUM AND CALCIUM IN BONE TISSUE. George V. Alexander, Ralph E. Nusbaum, and Norman S. MacDonald. June 14, 1955. 21p. Contract AT-04-1-GEN-12. (UCLA-337).

Bones of laboratory-raised mice, rats, and guinea pigs, together with their respective diets were analyzed for Sr and Ca by an emission spectrographic technique. Kangaroo rats and rabbits from the Nevada desert areas were also investigated along with representative samples of their forage. The number of atoms of Sr/1000 atoms of Ca present in the bone samples ranged from 0.19 for rats to 2.5 for guinea pigs. NSA 10-2973

7449

THE X-RAY SENSITIVITY OF CUTTING OF CREEPING-ROOTED ALFALFA. Beatrice E. Murray. Can. J. Agr. Sci. 36, 120-6(1956).

A method for the determination of radiosensitivity of alfalfa is presented. Alfalfa stem cuttings were exposed to 9 dosage levels of x radiation, namely, control (no radiation), 500 r, 1000 r, 2000 r, etc., to 7000 r, subsequent to the initiation of root primordia at the base of each cutting. A reduction in the lengths and the number of roots per cutting was the initial manifestation of sensitivity to x radiation. Complementary information was contributed by axillary bud growth and leaf anomalies. No irradiation effects on root or axillary bud growth were visible in cuttings exposed to the 1000 r level or less. Growth of both roots and axillary buds was inhibited at dosage levels of 5000 r or more. Adventitious stems developed on the roots at the base of cuttings if the rooting portion were shielded from x radiation. NSA 10-11615

THE I^{131} -IRRADIATED RAT THYROID: ITS ALTERED RESPONSE TO VARIOUS STIMULI AND THE CHANGES INDUCED IN ITS IODINE METABOLISM. G. D. Potter, Alvin Taurog, and L. L. Chaikoff. Endocrinology 59, 12-26(1956).

Rats were injected with 5-300 μ c doses of carrier-free I^{131} . Radiation dosage to thyroid was calculated from in vivo uptake and disappearance of I^{131} from the glands. Two to 5 weeks after the I^{131} injection, irradiated thyroids were compared with control thyroids with respect to iodide-concentrating capacity, synthesis of organic I^{131} compounds, response to feeding propylthiouracil, response to cold, response to TSH injection, and cytology. Thyroid process concerned with growth appeared to be more sensitive than those concerned with I metabolism. NSA 10-11614

7454

ON THE PATHOLOGICAL CHANGES IN PULMONARY TISSUE AFTER HIGH DOSES OF X RADIATION. Harold Henzl. Strahlentherapie 100, 275-90(1956). (In German).

The author describes the changes of the pulmonary tissue after irradiation with high doses of ionizing rays. The irradiation causes lesions of the capillary wall, extravasation of liquid blood constituents with imbibition of water by the tissue, reaction of local cells and warping of the collagen substance. Afterwards, a tendency towards fibrosis can be observed. The process is compared with the virulent pneumonias and with classical inflammation. Bronchopneumonia is a frequent secondary complication. NSA 10-11642

7455

ON THE SERUM-ALBUMIN CHANGE UNDER THE INFLUENCE OF IONIZING RAYS. H. Eberle and Julius Ries. Strahlentherapie 100, 369-74(1956). (In German)

By means of our own electrophoretic examinations as well as after the original method explained by Takata we have not succeeded in reproducing the effect called vital ionization, which means, that the irradiation of an experimental person or the application of a direct current, respectively, should have a regular influence on the serum-albumin quality. By means of the paper-electrophoresis the serum-albumin picture of patients treated with x-rays or radium has been controlled after the irradiation. NSA 10-11641

THE EFFECT OF TOTAL RADIATION WITH AND WITHOUT A LEAD SCREEN ON THE SERUM ALBUMIN OF EXPERIMENTAL ANIMALS. Robert Bauer, Siegmund Piller, and Gerhard Schneider. Strahlentherapie 100, 16-29(1956). (In German).

By means of the plasma protein picture, and of the corpuscular blood picture as well as the bone marrow studies, the authors examine the effect of total roentgen radiation doses of 300-3000 r, with and without lead screen on white rats. There was a particularly striking difference between rats irradiated with 200 r without

the Pb screen and 3600 r (equal volume dose) with Pb screen. Dysprotenemia was less severe and there was nearly complete reparation in plasma protein and marrow pictures in latter. NSA 10-11633

7459

EFFECT OF X-RAYS ON MITOCHONDRIAL DESOXY-RIBONUCLEASE II. S. Okada and E. Kallee (Univ. of Rochester School of Medicine and Dentistry, N. Y.). Exptl. Cell Research 11, 212-14(1956). Aug.

Irradiated mitochondria suspended in 15 per cent sucrose have a higher activity of DNase II than do non-irradiated mitochondria. Exposure of mitochondria to sonic vibrations alone increased DNase II activity about five-fold as compared with non-treated mitochondria; prior x radiation does not produce a further increase in enzymatic activity of mitochondria so treated with sonic vibration. Results indicate that DNase II activity is not readily dissociated from fragments of disintegrated or radiation-damaged mitochondria.

COMPARISON OF BIOLOGICAL EFFECTS PRODUCED BY X-RAY AND RADIOACTIVE COBALT γ RADIATION. S. N. Aleksandrov, K. F. Galkovskaya, and Yu. G. Zil'berg (Central Research Roentgen-Radiological Inst.). Med. Radiol. No. 2, 80-7(1956) Mar.-Apr. (In Russian). AEC-TR-3272.

Non-pedigreed mice and C57 black mice in 2 age groups (young, approximately 1 mo. old and adults, approximately 3 mo. old) were exposed while packed together 10 to a box, to equal doses of 180 Kv x rays or to Co^{60} rays. Doses administered were (1) a single dose of 800 r or (2) 4 doses of 200 r each week for 4 weeks. Lethality, survival time, total and differential peripheral blood leukocyte counts, and the incidence of malignant tumors in survivors were selected as criteria of biological effect. Co^{60} radiation had a weaker lethal effect than did x radiation. Young animals showed more severe clinical symptoms and died earlier than did older mice. Co^{60} rays were also less effective in producing hematological effects. The strains of mice also differed with respect to hematological changes following exposure. Only with respect to induction of malignancy did Co^{60} radiation prove more effective than x rays. Principal causes of late death were septicemia and necrotic pneumonia. NSA 10-11624

7480

INTEROCEPTIVE REACTIONS OF LYMPH NODES DURING IRRADIATION. Yu. M. Zaretskaya. Med. Radiol. No. 3, 20-9(1956) May-June. (In Russian).

Lymph nodes in the mesentery of the small intestine of the cat were irradiated, with animals under ether anesthesia and nicotine (1×10^{-5} g/ml) and acetylcholine (2×10^{-5} g/ml) were introduced into

ligatured blood vessels. Ionizing radiation caused changes in the reflexes from the chemoreceptive apparatus of the lymph nodes during the 1st 6 days after the irradiation; there were definite phases in the changes. Penetrating radiation caused functional changes in the whole reflex arc, both in the center and the periphery. Lymph nodes damaged by the penetrating radiation could be the source of unusual, or pathological, impulses from the periphery to the center. Breathing and blood pressure were recorded daily for 6 days after operation.

INCORPORATION OF PHOSPHORUS INTO NUCLEIC ACID IN STABLE AND LABILE COMPOUNDS IN WHITE MICE ORGANS DURING TOTAL IRRADIATION. A. S. Orlov (Central Research Inst. of Roentgen-Radiology). Med. Radiol. 1, No. 2, 65-70(1956) Mar.-Apr. (In Russian).

White rats were irradiated with 500 r and killed at different times. Two hours before death, sodium phosphate p^{32} was injected. Nucleic acids of the proteins in the liver, kidney, spleen, and small intestine were studied. Immediately after irradiation phosphorus incorporation was normal, but then it changed, the magnitude of the change depending on the organ, type of acid and time after irradiation. After 48 hours, spleen values had increased but had not reached normal, small intestine values were above normal. Nucleic acid concentrations likewise decreased. In the liver and kidney proteins the decrease in phosphorus uptake was not accompanied by a drop in the nucleic acid concentration. Phosphorus inclusion in the stable and labile forms also differed in degree in the spleen and intestine, and in direction in the liver and kidney. NSA 10-11622

7485

A CORRELATION OF EARLY RADIATION CHANGES IN LYMPHATIC TISSUES WITH ANTITOXIN-PRODUCING ABILITY. William L. Williams, Richard D. Stoner, and William M. Hale (Univ. of Tennessee, Memphis and Brookhaven National Lab., Upton, N. Y.). Yale J. Biol. and Med. 28, 615-21(1955-56).

Results are reported from experiments which correlate the morphological changes in lymphatic tissues following gamma irradiation with the alteration in ability of the animal to produce antitoxin, and the morphology of aging of the thymus with its increasing ability to produce antitoxin in transplants. We believe we have demonstrated the ability of undifferentiated cells of the reticulo-endothelial system to produce antibodies in the absence of mature lymphocytes or plasma cells. (auth). Rochester, N. Y. Univ. Atomic Energy Project. ACUTE LETHALITY OF PARTIAL BODY IN RELATION TO WHOLE BODY IRRADIATION. H. A. Blair. Sept. 10, 1956. 10p. Contract W-7401-eng-49. (UR-462).

If to cause acute death from radiation the same amount of lethal substance or injury must be produced, whether the whole-body or segments thereof are irradiated, it is shown that the reciprocal of LD_{50} for the whole body, will be equal to the sum of the reciprocals of LD_{50} for the separate segments, all doses being measured in roentgens. Existing data are compatible with this view but they involve irradiation of large segments of the body. For small segments undoubtedly the rule will fail. Some general aspects of partial-body irradiation are discussed. (auth). NSA 10-11609

7488

RADIOACTIVITY INJURY AND RECOVERY FROM IONIZING RADIATION EXPOSURE. Joe W. Howland (Univ. of Rochester School of Medicine and Dentistry, N. Y.). *Ann. Rev. Med.* 7, 225-44(1956).

A survey of literature on the biological effects of ionizing radiations in animals and man is reported. Concepts of cellular damage, chemical factors modifying the effect of radiation, the role of spleen and bone marrow in recovery, the nature of infection, hemorrhage, and anemia in radiation injury, endocrine response, and irreversible effects of radiation injury are discussed in detail. (F.S). NSA 10-11616

7489

EFFECT OF SEED TREATMENTS WITH X-RAY AND PHOSPHORUS 32 ON TOMATO PLANTS OF FIRST, SECOND, AND THIRD GENERATIONS. J. W. Lesley and Margaret M. Lesley (Univ. of California Citrus Experiment Station, Riverside.). *Genetics* 41, 575-88 (1956) July.

Treatment with 10,000 r x rays for 33 minutes, or soaking seeds in P^{32} solution, caused formation of unequal pairs, segmental interchange, weakened pairing, inversion, and elongation and stickiness in meiosis of R_1 plants from treated seeds of tomatoes. Both x ray and P^{32} caused much pollen sterility in R_1 and R_2 . NSA 10-11610

7490

THE PROBLEM OF TOTAL AND PARTIAL BODY IRRADIATION. B. Rajewsky. *Strahlentherapie* 100, 5-15(1956) May. (In German).

The time of survival of rats, mice and guinea-pigs has been examined within a range of doses from 100 to 200,000 r. Between 1200 and 15,000 r, the animals die after 3.5 days. In order to clear the cause of decrease, intra-operative irradiation of certain body regions or organs was carried out. The irradiation of adrenalectomized, hypophysectomized and splenectomized rats has shown the great importance of the system of the hypophysis and the cortex of the suprarenal body for the 3.5 days effect. Furthermore, the author has examined the secretion of the adrenal cortical hormones and tissue metabolism. (auth). NSA 10-11632

7491

REACTIVE PROCEEDINGS AFTER GENERAL AND LOCAL IRRADIATION. Theophil Hornykiewytch and Hans-Stephan Stender. *Strahlentherapie* 100, 113-20 (1956) May. (In German).

The course of reactions after total or local irradiation is decisively influenced by the initial conditions of the organism. This effect can be observed especially if certain organs are under the specific influence of stimulants. (auth). NSA 10-11635

7492

THE SIGNIFICANCE OF THE REGULATING FACTORS OF RADIATION REACTION IN BONE MARROW. Helmut Hartweg. *Strahlentherapie* 100, 121-8(1956) May. (In German)

By means of comparisons between total and local irradiation the regulating factors in the bone marrow have been examined. The results show that there are intense extramedullary impulsions in the stage of damage and especially during repair. The marrow that was not damaged by the local irradiation imitates in a weaker form the reaction of the marrow damaged by the rays. (auth). NSA 10-11636

7493

CYTOLOGICAL INVESTIGATION OF RADIATION EFFECT ON THE LIVER AND SPLEEN. PART II. INVESTIGATION OF THE SPLEEN. Eberhard Scherer. *Strahlentherapie* 100, 211-24(1956) June. (In German).

Results of quantitative cytological methods indicate that the liver is an extremely radio-sensitive organ. The reticulum cells of the spleen, which have formerly been thought radio-resistant, are subject to distinct changes suggesting that these cells are most important in the defensive activity; and the observed cell changes can be provoked also by irradiation of the head or other remote regions of the body, the result being typical for each different case. RADIATION DOSAGE FROM BREATHING RADON AND ITS DAUGHTER PRODUCTS. Jacob Shapiro (General Dynamics Corp., Gorton, Conn.). *Arch. Ind. Health* 14, 169-77(1956) Aug. NSA 10-11665

7496

Naval Radiological Defense Lab., San Francisco. INFLUENCE OF SPLEEN HOMOGENATE INJECTION ON POST-IRRADIATION INFECTION. M. S. Silverman, V. Greenman, M. Ellis, and L. J. Cole. Aug. 14, 1956. 14p. Project NM 006-015-04. (USNRDL-TR-107).

Injections of spleen following whole-body x irradiation in the LD_{100} range of LAF_1 mice resulted in a decreased incidence of post-irradiation infection and an increased survival of the animals. The data presented provide further evidence of the critical role of infection in the death of mice following severe radiation injury to the hematopoietic tissue. If an accelerated repair of this injury is accomplished, a more rapid recovery of the anti-microbial defenses of the animal results. This leads to increased survival following irradiation. (auth). 7497

NEUTRON AND X-RAY EXPERIMENTS IN WHEAT AND A REVISION OF THE SPELTOID PROBLEM. James MacKey. Lund, Berlingska Boktryckeriet, 1954. 200p.

Results are presented from a study of the observable mutations in 6x-wheat and, for comparison, 2x-barley, where dormant seeds were treated with successively increasing doses of x-rays and fast neutrons. (254 references.) (C. H.) NSA 10-11660

7498

RECOVERY FROM IRRADIATION FOLLOWING THE ADMINISTRATION OF CULTURED TISSUES. Carol L. Miller. (Atomic Energy Research Establishment, Harwell, Berks, England). *Nature* 178, 142(1956).

Liver and spleen tissue from infant mice may be stored and preserved for treatment of x-ray lethal doses. Spleen fragments are stored with glycerol at 79°C and cultured in rabbit serum and glucose. Embryonic liver fragments may be cultured with rabbit serum and glucose. The cultured embryonic liver is active for four days although two days have been taken as a standard culture time.

7499

THE EFFECT OF SMALL RADIATION DOSES ON THE SPLEEN AND THYMUS OF THE RAT AFTER A SINGLE AND REPEATED APPLICATION. Rosemarie Fluhr, Lothar Weib, and Wolfgang Gehlen. *Strahlentherapie* 100, 225-40(1956).

The authors have studied the effect of small roentgen doses (10 r, 3 times 10 r, 30 r, 50 r) on the spleen and thymus of white rats. After irradiation of 10 r there were no changes; the application of 3 times 10 r caused distinct injury, above all in the spleen; 30 r provoked considerable activation of spleen and thymus, 50 r caused slight injury up to the 12th day, then activation of spleen and thymus. (auth)

7500

RADIATION DOSAGE AND CELL DECOMPOSITION. Eberhard Koch, Theophil Hornykiewytch, and Hans Stephan Stender. *Strahlentherapie* 100, 253-8(1956) June. (In German).

The behavior of leucocytic decomposition cells of the rat, 6 hours after an irradiation of the whole body with 5 to 1200 r can be characterized by a dose effect curve, which shows a rectilinear course in the logarithmic screen. The authors discuss the possibility of estimating the administered dose of rays by determining the number of the decomposition cells. NSA 10-11640

7501

BIOLOGICAL HAZARDS OF NUCLEAR AND OTHER RADIATIONS. C. Auerbach. *Nature* 178, 453-4(1956) Sept. 1.

A comparison of authoritative digests by Great Britain and the United States was discussed. Both reports show that the present dangers arise much more from excessive use of x rays than from bomb fall-out or from atomic energy establishments. (J. H. M.) NSA 10-11667

7502

THE EFFECTS OF CONTINUOUS IRRADIATION BY TRITIUM ON CELLS CULTIVATED IN VITRO. Agnes N. Stroud (Argonne National Lab., Lemont, Ill.). *Ann. N. Y. Acad. Sci.* 67, Art. 2, 11-34(1956) Aug. 29.

The effects of continuous irradiation with tritium oxide on chick embryo skeletal muscle tissue cultures were studied by means of stained preparations, time-lapse cinematographs, and serial photographs of large areas. Irradiation was delivered by the incorporation of tritium oxide into the water of the culture medium, which permitted observations to be made safely during irradiation. Data are summarized. (auth.) NSA 10-11619

7503

LONG-TERM RADIATION OF BONE FOLLOWING ADMINISTRATION OF C¹⁴-BICARBONATE. Howard E. Skipper, Linda Simpson, and Martelia Bell (Southern

Research Inst., Birmingham, Ala.). *Proc. Soc. Exptl. Biol. Med.* 92, 549-50(1956) July.

Studies have been carried out on retentions in the bones of mice of C¹⁴ from labeled bicarbonate. A single dose of 100 µc per mouse (a 280 millicurie man-equivalent) provided daily radiation of the most active areas of the long bones of above 0.05 rep/day for a period of approximately one year. (auth.) NSA 10-11618

7504

THE EFFECT OF FORMALDEHYDE ON THE MUTAGENIC ACTION OF X-RAYS IN DROSOPHILA. F. H. Sobels (Institute of Genetics of the State University, Utrecht, Netherlands). *Experientia* 12, 318-21(1956) Aug. (In English).

Results of experiments with two different concentrations of formaldehyde are presented. Pre-treatment with a concentration of 0.05 molar solution caused a significant increase in x ray induced mutation rates. Pre-treatment with 0.042 M formaldehyde solution enhanced mutation rates produced by the radiation. The data clearly show that pretreatment with low "sub-mutagenic" concentrations of formaldehyde enhances mutagenic action of x rays. NSA 10-11617

7505

Naval Medical Research Inst., Bethesda, Md. LONG-TERM OBSERVATIONS OF RADIATION CHANGES IN SALIVARY GLANDS AND THE GENERAL EFFECTS OF 1,000 r to 1,750 r OF X-RAY RADIATION LOCALLY ADMINISTERED TO THE HEADS OF DOGS. James A. English, Merrill G. Wheatcroft, H. W. Lyon, and Clarence Miller. *Oral Surg. Oral. Med., Oral Pathol.* 8, 87-99(1955). Sept. 21, 1955. NM-006-012. 04. 74.

Considerable morphologic alteration was observed in the salivary glands of dogs which had received 1,750 r of 200 kvp x ray radiation locally to the head. From a total of 6 dogs which were irradiated, 5 were sacrificed during a 5 to 16 months' period following exposure and provided the experimental material for histologic study. Normal glands were obtained from 7 unirradiated dogs for comparison. NSA 10-1164

7514

A STUDY OF THE IMMEDIATE EFFECTS OF X RAYS ON THE FUNCTIONS OF CERTAIN TISSUES AND ORGANS. M. B. R. Swann. *Brit. J. Radiol.* 29, 195-219(1924).

Includes brief review of literature on x ray effects on patients (hematological and radiation sickness) and on experimental animals (kidney and liver function, g. 1. physiology, lethal effects). Experiments utilized cats, rabbits, guinea pigs; whole body exposures to x rays. Measured: blood pressure (abrupt fall in immediately lethal exposures), heart action (fibrillation in the immediately lethal cases), respiration reflex stimulation of respiration by galvanic stimulation of sciatic nerve effects on autonomic nervous system. Also studied effect on isolated heart (frog and rabbit), isolated uterus (guinea pigs) and intestines (g. pigs, cats, rabbits). Concludes: x rays lower blood pressure and prolonged exposures cause death from this effect which may, in early stages, be due to dilatation of arterioles and capillaries. Short exposures stimulate, long ones depress respiration, the effect probably being mediated via effects on sensory nerve endings, not the medulla. Bronchial muscular constricts. Autonomic nerves (vagus, sympathetic, and splanchnic) rendered more sensitive (greater reaction) by short exposures, may be less sensitive after long exposures. X rays cause isolated rabbit heart, but not frog heart, to die in systole. (short exposures increase contractibility). Isolated guinea pig uterus is driven into tonic contraction, later showing alternate periods of contraction and large automatic movement. In the intact animal, x rays send uterus into series of forceful contractions but latent period is longer than for isolated g. p. uterus. Isolated intestine; steadily increasing tonus. In vivo intestine slight rise in tonus, increased movement.

RESEARCHES ON THE MODIFICATIONS IN THE NUMBER AND FORMULA OF THE ELEMENTS OF THE BLOOD BROUGHT ABOUT BY WEAK DOSES OF X RAYS TO THE SPLEEN. C. Vianello. *Radiol. Med.* 10, 139-61 (1923).

Doses have cumulative action. Minimum dose applied once brings about leucocytosis; when applied repeatedly brings about leucopenia.

7524

CERTAIN BIOLOGICAL PRINCIPLES OF RADIATION THERAPY. S. Winters. *Am. J. Roentgenol.* 10, 776-781 (1923).

The cellular reaction to radiation depends upon the amount of radiant energy absorbed, whether it be primary or secondary in origin. The susceptibility to short wave length therapy is a cellular characteristic depending upon a definite histological structure. The normal tissue reaction to radiation and neoplastic invasion depends to a large degree upon the well being of the body as a whole. There is sufficient data extant to predicate on a priori grounds those tissues or tumors which will prove radio-resistant or radiosusceptible.

7525

THE MECHANISM OF THE ACTION OF ROENTGEN RAYS ON THE DEVELOPMENT OF SPONTANEOUS TUMORS IN MICE. James B. Murphy, Joseph Maisin, and E. Sturte. *Compt. rend. soc. biol.* 90, 972-4(1924).

Experiments led to the conclusion that tumor cells in vivo are no more sensitive to roentgen rays than they are in vitro.

Analysis of the effects of x and gamma rays on the testicles of mammals is presented.

7530

SPECIAL HISTOLOGICAL LOCALIZATIONS OF POLONIUM WITHIN CERTAIN ORGANS. Antoine Lacassagne and Jeanne Lattes. *Compt. rend. soc. biol.* 90, 485-7(1924). (In French).

Polonium was injected into rabbits. Large amounts of polonium became fixed in cortex of kidney, liver, and pulmonary epithelium.

7531

HISTOLOGIC LOCALIZATION OF POLONIUM WITHIN THE HEMATOPOIETIC ORGANS. Antoine Lacassagne and Jeanne Lattes. *Compt. rend. soc. biol.* 90, 487-9(1924). (In French).

Large amounts of polonium are fixed in the cells of the phagocytic reticulo-endothelial apparatus. Fixation of polonium in hematopoietic organs interferes with the formation of blood cells.

7532

ROENTGEN-RAY STIMULATION OF THE PANCREAS IN EXPERIMENTAL PANCREATIC DEFICIENCY. William F. Petersen and Clarence C. Saelhof. *Am. J. Med. Sci.* 163, 391(1922).

7533

THE EFFECTS OF ROENTGEN RAYS AND RADIOACTIVE SUBSTANCES ON LIVING CELLS AND TISSUES. Leo Loeb. *Am. J. Roentgenol.* 9, 497-501(1922).

There are intrinsic sources of radioactivity within the body. Different cells have different degrees of sensitivity to radiation. Radiation affects cytoplasm as well as nucleus. There is a graded series of effects of radiation on cell function. The intensity of radiation required for these graded effects varies with the sensitiveness of the cells and tissues upon which it acts. In some cases, there is a latent period separating the time of application of the rays and the appearance of the first manifest consequences stimulation or depression. Some indications that through repeated radiations, an immunization of tissues against the effect of radiation can take place. Cancer cells are especially susceptible to radiation. Some discussion on effects of radiation on tumors.

7534

THE EFFECT OF ROENTGEN RAYS UPON GROWTH ACCELERATION AND RETARDATION. V. Altmann, D. Rochlin and E. Gleichgewicht. *Fortschr. Gebiete Roentgenstrahlen* 31, 49-51(1923). (In German).

Studies on plants indicated that the initial effects of small x ray doses was accelerated development. Ultimately, the effect was detrimental. Authors then considered the implications of such studies for the effects of x ray in therapy and the biological effects in general.

7535

THE ACTION OF ROENTGEN RAYS UPON THE TESTICLE

OF THE ROOSTER. Jacques Benoit. *Compt. rend. soc. biol.* 90, 802-5(1924). (In French).

Irradiation of the animals resulted in complete and permanent disappearance of seminal cells but did not interfere with development of crest. This indicates that hormone responsible for this secondary sex character is derived from interstitial cells or cells of Sertoli.

7536

THE EFFECT OF ROENTGEN RAYS ON ENDOCELLULAR AND METABOLIC PROCESSES. O. Strauss. *Strahlentherapie* 16, 195-207(1924). (In German).

7537

A CONTRIBUTION TO THE STUDY OF THE EFFECTS OF RADIUM UPON RABBIT OVARIES. Howard A. Weis. *Surg. Gynecol. Obstet.* 36, 373-82(1923).

Author found no evidence that ova and maturing follicles were affected by 600 mg hrs of radium in these experiments using radium barium sulfate and shielding to exclude secondary γ rays.

7538

EFFECTS OF IRRADIATION ON FETAL DEVELOPMENT. Harold Bailey and Halsey J. Bagg. *Am. J. Obstet. Gynecol.* 5, 461(1923).

Authors describe experimental and clinical studies relating to the effects of radium and x-ray irradiation upon the functional activity of the ovary and the reaction upon the developing fetus, when irradiation is given before or during the various stages of pregnancy. Irradiation before fertilization resulted in greater deformities in fetus than did irradiation after conception, but irradiation in early pregnancy caused greater damage to fetus than irradiation late in pregnancy.

7539

A STUDY OF THE COMBINED ACTION OF X-RAYS AND OF VITAL STAINS UPON PARAMECIA. W. M. Baldwin. *Biol. Bull.* 39, 59(1920).

7540

THE EFFECT OF X-RAYS ON THE LENGTH OF LIFE OF *TRIBOLIUM CONFUSUM*. Wheeler P. Davey. *J. Exptl. Zool.* 22, 573(1917).

X rays have a lethal effect on *T. confusum*. The lethal effect bears a definite mathematical relation to the logarithm of the total x ray dose. An extension of the Psycho-physic law gives a theoretical explanation of the experimental data, if the resistance rather than the susceptibility of the organism to the x-rays is considered. (from author's summary).

7541

EARLY DIAGNOSIS OF PULMONARY TUBERCULOSIS BY THE USE OF THE X-RAYED GUINEA PIG. W. H. Eckford. *J. Lab. Clin. Med.* 3, 175(1917).

It is possible by means of the x ray to increase susceptibility of guinea pigs to tuberculosis. Frequently-repeated doses have a more certain effect than a single dose. Destruction of lymphoid cells in itself is insufficient to explain the decreased resistance.

7542

EFFECT OF RADIOACTIVE SUBSTANCES ON MOUSE CANCER. A. VanWassermann. *Deut. med Wochschr.* 40, 524(1914).

Author concludes that radioactive substances act directly on cancer cells. They do not kill cells but stop mitosis. The bactericidal forces of the body kill the sterile cells.

7543

THE EFFECT OF RADIANT ENERGY UPON THE CIRCULATION IN THE ISOLATED FROG'S HEART. Kawashima. *Strahlentherapie* 17, 381-89(1924). (In German).

7544

EXPERIMENTAL INVESTIGATIONS OF THE BIOLOGICAL EFFECT OF THORIUM X, ESPECIALLY ON THE BLOOD.

A. da Silva Mello. Z. klin. Med. 81, 285-354(1915). (In German).

Reports on results of various experiments with rabbits and rats in which thorium X, diluted with salt solution, was subcutaneously injected.

7545

REGARDING THE GROWTH-PROMOTING EFFECT OF ROENTGEN RAYS ON HIGHER PLANTS. G. Schwartz, Czepa, and Schindler. Fortschr. Gebiete Roentgenstrahlen 31, 665-80(1924). (In German).

Experiments with a great variety of plants are described. White filter paper without nutrient solution was used as culture medium. Irradiation was started on the third day after the planting of the seed. Authors conclude that roentgen-ray doses inhibit plant growth.

7546

EFFECT OF X-RAYS ON BACILLUS PRODIGIOSUS.

P. S. Meyer. Klin. Wochschr. 2, 297(1932). (In German).

Culture of Bacillus prodigiosus, after being irradiated once with x rays, is damaged in its growth. After continuous radiation, resistance develops. Resistance is towards x rays and does not exist towards ultraviolet light.

7547

CONCERNING THE INDIRECT DAMAGING EFFECTS OF IRRADIATION ON THE BODY THROUGH IRRADIATION OF ISOLATED ORGANS. Fritz. Poos. Klin. Wochschr. 1, 836(1922). (In German).

7548

SOME PHASES OF RADIUM ACTION WITH SPECIAL REFERENCE TO THE HEMATOPOIETIC SYSTEM.

John A. P. Millet and Theodore Mueller. J. Cancer Research 3, 127-179(1918).

The blood of ten cases of squamous cell carcinoma of the cervix, uteri and vagina was studied, in order to ascertain the immediate and remote effects of radium and x ray treatment upon the formed elements of the blood.

7549

THE ROENTGEN SENSITIVENESS OF ACTINOMYCETES.

Hans Kleesattel. Strahlentherapie 17, 390-2(1924). (In German).

7550

THE EFFECT OF ROENTGEN RAYS ON PROTEINS OF THE PLASMA. H. W. Knipping and H. L. Kowitz. Fortschr. Gebiete Roentgenstrahlen 31, 660-64(1924). (In German).

Plasmic protein determinations in patients receiving radiation therapy are reported.

7551

THE ACTION OF PRIMARY AND SECONDARY ROENTGEN RAYS UPON BACTERIA. L. Halberstaedter and P. S. Meyer. Fortschr. Gebiete Roentgenstrahlen 29, 489-495 (1922). (In German).

B. prodigiosus was irradiated with 180 K. V., 2.5 ma, 20 cm. distance, with or without filtration through glass. Twenty minutes exposure interfered with growth and coloration, 2-hr exposure sterilized culture. Since dose required to affect bacteria is so great, it is doubtful that it will have much practical application.

7552

THERAPEUTIC EXPERIMENTS IN "EXPERIMENTAL CANCER OF PLANTS." A. Gosset, A. Gutmann, G. Lakhovsky, and J. Magrou. Compt. rend. soc. biol. 91, 626-8(1924). (In French).

Palargonium zonatum was inoculated with Bact. tumefaciens in order to produce tumors. Plants were irradiated daily for 3 hrs. Continued treatment resulted in necrosis of the tumor. None of the normal tissues of the plant showed injury.

7553

EXPERIMENTAL RESEARCHES ON THE ACTION OF THE BETA AND GAMMA RAYS OF RADIUM IN THE TISSUES FOLLOWING RADIUM-PUNCTURE. Antoine Lacassagne. J. radiol. et electrol. 5, 160(1921). (In French).

Chicago Univ. Metallurgical Lab.

ACUTE TOXICITY OF INTUBATED PLUTONIUM. Richard Abrams, Henri Seibert, Lyman Forker, David Greenberg, Hermann Lisco, Leon O. Jacobson, and Eric L. Simmons. June 1946. Decl. Dec. 20, 1955. 56p. Contract W-7401-eng-37. (M-5176, CH-3875).

Pu in 4^+ state and in the absence of complexing agents was administered intratracheally to rats. Five groups of animals received doses ranging from 7.5 to 500 μ c per 200 gram rat. All of these doses were lethal, mean survival time ranged from 203 days for the lowest dose to 26 days for the highest. The 150-day LD_{50} inhalation dose was only 0.1 that of intravenous dose. Pu seemed to be tightly bound in lungs. Dose remained in lung after 210 days. Approximately 15% of the initial dose was deposited in the skeleton. NSA 10-8757

7568

THE EFFECT OF ORALLY ADMINISTERED FAT EMULSION ON SURVIVAL OF THE IRRADIATED RAT. Polly Vance Akin, John G. Conglio, and Granville W. Hudson. Radiation Research 6, 543-7(1957). (Vanderbilt Univ. School of Medicine, Nashville, Tenn.).

The possible effect of forced feeding of a fat emulsion to rats irradiated with 750 r or 1000 r Co^{60} x irradiation and with 800 r x irradiation was studied. No definite effects due to the emulsion were noted at the lower level of Co^{60} irradiation. With 1000 r Co^{60} and 800 r x irradiation, rats fed fat emulsion had lower food consumption, more severe diarrhea, greater stomach distension, and shorter survival times than irradiated controls forced-fed water. There was no effect on hematological values. NSA 11-8805

"DIRECT EVIDENCE THAT BIOLOGICAL EFFECTS OF X-RAYS ARE NUCLEAR AND THAT FINAL X-RAYS

EFFECTS DO NOT DEPEND ON INITIAL CHANGE IN CYTOPLASM." B. L. Astaurov. Zhur. Obsheci Biol. 8, 421-41(1947). (In Russian).

7592

California. Univ., Berkeley, Div. of Medical Physics. IMMEDIATE AND DELAYED BIOCHEMICAL AND BIOLOGICAL EFFECTS OF IRRADIATION OF ANIMAL TISSUES. STATUS REPORT NO. 3 (FOR) JUNE 1947 TO DECEMBER 1947. 14p. Contract N6-ORI-III. (ATI-37462).

Methods which affect selective localization of radioactive compounds have been perfected for liver, spleen, and bone marrow. These are summarized with the status of the various investigations dealing with these specific irradiated tissues. A preliminary report of the effect of irradiation upon thyroid metabolism is attached, and it is noted that there is remarkably little effort upon iodine metabolism in the thyroid gland even with extreme irradiation dosages to the thyroid gland. NSA 11-4225

7593

AN INFLUENCE OF PLOIDY ON THE TIME OF EXPRESSION OF DOMINANT LETHAL MUTATIONS IN HABROBRACON. K. C. Atwood, R. C. von Borstel, and A. R. Whiting (Oak Ridge National Lab., Tenn. and Univ. of Pennsylvania, Philadelphia). Genetics 41, 804-13(1956).

Frequencies of x ray-induced dominant and recessive lethal mutations in *Habrobracon* oocytes are unchanged by subsequent fertilization with irradiated sperm. A significant proportion of the dominant lethal effect induced at metaphase I is expressed at a later stage in diploids than in haploids. Lethality caused by observable chromosome breakage can be delayed, whereas that due to other causes cannot. (from authors' summary). NSA 11-5147

7594

SENSITIVITY OF THE MOUSE TESTIS TO THE MUTAGENIC ACTION OF X-RAYS. C. Auerbach and B. M. Slizynski (Inst. of Animal Genetics, Edinburgh). Nature 177, 376-7 (1956).

Male mice were exposed to x ray doses from 400 to 600 r. A table presents the overall translocation frequency after the fourth litter, translocation frequency rises to a higher level, which is maintained to the end of the pre-sterile period. Authors conclude that spermatids are more sensitive to the mutagenic action of x rays than are mature spermatozoa. NSA 10-6476

7595

EFFECTS OF SINGLE AND FRACTIONATED DOSES OF X-RAYS ON MOUSE EMBRYOS. Robert Auerbach. (Oak Ridge National Lab., Tenn.). Nature 177, 574(1956).

The results of studies on the effects of single and fractionated doses of x radiation on developing mouse embryos *in vivo* indicates that while the incidence of malformation is not affected by fractionation, the severity of embryonic defects is far greater in response to a fractionated dose than in response to a single dose. NSA 10-7416

7596

EFFECTS OF X RADIATION ON INDUCTION OF LOCALIZED INFECTIONS. B. G. Avetkryan and A. G. Artemova (Inst. of Experimental Medicine). Med. Radiol. 1, No. 4, 35-41(1956). (In Russian).

A feces-free section of caecum was isolated by ligatures to produce a focus of auto-infection. Two days after the operation, mice received a 300 r dose of x rays. In unirradiated mice the infected segment contained bacteria in numbers of the order of 10^4 , in irradiated mice of the order of 10^5 and 10^6 , the maximum number being observed 2 days post exposure. Lymphatic nodes of

irradiated mice were found to be unable to fix bacteria and irradiated mice had much more extreme bacteremia. Authors feel that irradiation suppressed antimicrobial properties of the tissues. NSA 11-852

7597

RELATIONSHIP OF CATALASE AND SODIUM NITRITE TO PROTECTION AGAINST X-RAYS. C. S. Bachofer. (Univ. of Notre Dame, Ind.). Exptl. Cell Research 10, 665-74(1956).

Bacteriophage T1 was irradiated in presence of varying concentrations of catalase and sodium nitrite. High protection was conferred by high concentrations of catalase and of nitrite, with gross protection falling off rapidly when low concentrations of solute were used, although specific protection (protection per microgram of solute) was increased. With two protective agents combined there was impairment of ability of catalase to protect T1 against x rays. (from author's summary). NSA 10-9977

7598

ENHANCEMENT OF ACTIVITY OF NERVES BY X-RAYS. C. S. Bachofer. (Univ. of Notre Dame, Ind.). Science 125, 1140-1(1957).

Paired ventral caudal nerves of rats were irradiated on platinum electrodes at 280 Kv (peak) and 20 ma at a dose rate of 6 Kr/min. There was an initial small increase in conduction velocity followed by a steady decrease independent of the increase in spike amplitude. Conduction velocity showed an average increase of 5.8 per cent. Increase in spike amplitude is greatest for nerves kept in solution the shortest time prior to radiation. NSA 11-8782

THE DANGERS FROM ROENTGENOLOGICAL DIAGNOSTIC EXAMINATIONS. Z. M. Bacq. J. belge radiol. 39, No. 5, 685-95(1956). (In French).

Increase of radioactivity of the earth, ignorance of irradiation which might increase the frequency of mutations in man (from the genetic point of view all doses are additive), the vast majority of these mutations are detrimental, and therefore genetic degeneration of mankind is to be feared. Physicians and radiologists should limit doses of radiation in all persons who might have children. Unnecessary or long exposure in x-ray procedures are to be avoided. Irradiation of the pelvic region, especially in pregnant women, and the testicles in young men should be refused. Dose levels should be reduced to a minimum. Chemical protection will eventually reduce danger. NSA 11-880

Oak Ridge Gaseous Diffusion Plant, Tenn. MAXIMUM ALLOWABLE CONCENTRATION FOR AIRBORNE BETA CONTAMINATION. J. C. Bailey and H. F. Henry. July 5, 1951. Change from OUO Nov. 28, 1956. 16p. (AECD-3753; KS-213).

By comparing the damage produced by β particles and uranium α particles emitted by material uniformly distributed in the lungs, an equation was derived by which the maximum allowable atmospheric concentration of a β -emitting isotope for which lung damage is the limiting consideration can be calculated. It was calculated that the maximum allowable concentration is 20 counts per minute ft^3 as measured by the counter presently in use at K-25 for air sample β counting.

SIMILARITIES IN KILLING BY HEAT AND BY X-RADIATION IN THE INSECT DAHLBOMINUS FUSCIPENNIS (ZETT). William F. Baldwin. (Atomic Energy of Canada Ltd., Chalk River, Ont.). Radiation Research 5, 46-51 (1956). July.

Parallels in response to heat and to x irradiation were shown in the insect Dahlbominum fuscipennis (Zett.). The immediate consequence of high doses in both cases is a coma from which the insects may recover, to die later of the delayed effects. Tolerance diminishes with age, prior conditioning with moderately high temperatures increases female tolerance; diploid females are more resistant than haploid males, sharp breaks were found in curves relating dose and effect. All these observations are true for both agents. NSA 10-9951

PHYSIOLOGICAL PARAMETERS FOR ASSESSING THE HAZARD OF EXPOSURE TO RUTHENIUM RADIOISOTOPES. II. CHRONIC EXPOSURE STUDIES. J. D. Ballou and R. C. Thompson. Dec. 1, 1956. 15p. Contract W-31-109-eng-52. (HW-46409).

Chronic exposure of rats to Ru^{106} in their drinking water for periods of up to 500 days resulted in tissue Ru concentrations of comparable hazard concern in kidneys, bone, and gonads. Because of uncertainties inherent in the extrapolation of the rat data to man, an unequivocal choice of critical organ among these three possibilities cannot be made. Based on a permissible dose to the critical organ of 0.3 rem per week, the maximum permissible concentration for Ru^{106} in water is calculated to be 4×10^{-9} uc/ml. NSA 11-3649

ON THE MECHANISM OF THE PROPHYLACTIC ACTION OF CHRONIC HYPOXIA UPON RADIATION SICKNESS. (LABORATORY OF EVOLUTIONARY PHYSIOLOGY). Z. I. Barbashova. Doklady Akad. Nauk S. S. S. R. 107, 761-4(1956). (In Russian).

Preliminary acclimatization of rats to chronic hypoxia increases their resistance to ionizing radiation. Comparative evaluations were made to determine the functions of various systems in irradiated animals, acclimatized to hypoxia, and in control animals. Resistance to hypoxia was determined during the most active period of radiation sickness. NSA 10-9079

7609

RADIOIODINE STORAGE AND THYROID FUNCTION AFTER WHOLE-BODY IRRADIATION OF LIVING RATS. Gunther Barth and Friedrich Wolf. Strahlentherapie 99, 369-74(1956). (In German).

Iodine¹³¹ storage after whole-body irradiation of rats under protective covering of the thyroid gland has been compared to storage in normal controls. The result is demonstrated by a curve of biphasic course showing that after an initial decrease (depending on the dose) of the storage of 40 or 65% of the norm there follows, in case of irradiation with 650 r, an increased storage lasting about 50 to 55 days with adult animals and about 25 days with juvenile ones. NSA 10-9066

7625

MODIFICATION OF THE RELEASE OF CELLULAR CONSTITUENTS BY IRRADIATED ESCHERICHIA COLI. Daniel Billen (Oak Ridge National Lab., Tenn.). Arch. Biochem. Biophys. 67, 333-40(1957).

Release of cellular constituents occurred when x irradiated (60,000 r) suspensions of E. Coli B/r were incubated in phosphate buffer-glucose solution at 37°C. ATP accounted for less than 10% of total 260 m μ absorbing material released by such cells other constituents (maximum absorption of 260 m μ) lost from exposed cells were nucleic acid fragments from free bases to complex nucleic acid fragments - no release of peptides above that found with unirradiated cells. Release of nucleic acid fragments was inhibited under following conditions (a) absence of phosphate in suspending fluid, (b) absence of exogenous metabolite; (c) presence of arsenate, (d) low temp. of incubation. Ultra violet light-exposed cells, suspended in glucose-phosphate solution at 37°C released 360 m μ -absorbing material. This release was dependent on same conditions as for x ray exposed cells. PREMATURE CHANGE IN BONES OF FULLY DEVELOPED GUINEA PIGS AFTER IRRADIATION. Rudolf Birkner, Julius Frey, and Karl-Heinz Ueberschar. *Strahlentherapie* 100, 574-90(1956). (In German).

The authors describe the early histological changes of the long bones of fully developed guinea-pigs after a single roentgen irradiation with 5000 r. As a direct consequence, the irradiation entails already during the first week a complete necrosis of the bone cells, which is considered the most significant criterion of the bone death. The tissue of the soft parts of the bones is less damaged and still starts slight reparative reactions, which, however, are stopped during the fourth week by the forthcoming changes in the parossal and compacta vessels. THE RELATIVE BIOLOGICAL EFFECTIVENESS OF THERMAL NEUTRONS AND OF THE HEAVY PARTICLES FROM THE B^{10} (n, α) Li^7 REACTION FROM ACUTE EFFECTS IN THE MOUSE. (Brookhaven National Lab., Upton, N. Y.). V. P. Bond, O. D. Easterday, E. E. Stickley, and J. S. Robertson. *Radiology* 67, 650-64 (1956).

Single whole-body doses of thermal neutron radiation were delivered by the Brookhaven reactor to female CFI mice injected intravenously five minutes previously with boron in the form of borax. The biological endpoint was studied. NSA 11-868

7640

RADIATIONS ON BACTERIA. F. Bonet-Maury and H. R. Olivier. *Bull. soc. chim. biol.* 19, 1598-1608(1937). (In French).

The authors, after reviewing modern theories of the biological action of ionizing radiations, emphasize the significance of studies of irradiation of bacteria. Two methods of irradiation with α rays are described (using suspensions of bacteria) and results are compared with those reported by B. d'Eberth and B. deKoch. Their results indicate that it is possible to inhibit reproduction of organisms without killing them, and they suggest possible use of this technique in studies of immunity to bacteria. (used Po and Rn as α sources).

7642

STUDIES WITH TRANSPLANTABLE Ak_4 MOUSE LEUKEMIA. I. SUSCEPTIBILITY OF SIX HETEROLOGOUS STRAINS OF MICE AFTER X-IRRADIATION. Irene U. Boone. (Los Alamos Scientific Lab., N. Mex.). *Radiation Research* 5, 450-8(1956).

Radiation doses ranged from 100 to 550 r. In four strains (CFW Swiss, Strong A, C57 Black and C57 Brown) it was possible to demonstrate a linear relation between the probit of per cent leukemic "takes" (equivalent to mortality in this case) 11 days after injection and log dose, and to calculate the LD_{50} dose. The possibilities of using this system to compare acute effects of other radiations on resistance to leukemia and to investigate the effects of radiation on innate immunity to leukemia discussed. (from author's summary). NSA 11-866

7643

STUDIES WITH TRANSPLANTABLE Ak_4 MOUSE LEUKEMIA. II. RELATIVE BIOLOGICAL EFFECTIVENESS OF THERMAL NEUTRONS AS COMPARED TO X-RAYS. Irene U. Boone, Betty S. Rogers, and Verda G. Strang. (Los

Alamos Scientific Lab., N. Mex.). *Radiation Research* **5**, 459-65(1956).

Values of RBE of thermal column radiation was established by determining incidence of successful AK₄ leukemia implants in three inbred strains of mice after 250-Kvp x ray and thermal column exposures. RBE's of mixed thermal column radiation were 1.1, 1.2 and 1.3 for Strong A, C57 Brown, and C57 Black strains of mice, respectively. By subtracting γ ray contribution of the mixed radiation, RBE values for the thermal neutron component ranged from 1.4 to 1.8. (from authors' summary). NSA 11-867

7644

COMPARATIVE BIOLOGIC EFFECT OF 30 Mev AND 220 kvp ROENTGEN RAYS AND 0.4 Mev GAMMA RAYS AT 8-9°C. K. C. Bora. (Indian Cancer Research Centre, Bombay). *Acta Radiol.* **47**, 321-6(1957).

Author studied production of chromosomal aberrations in *Tradescantia* at 8-9°C, found qualitative difference in biological actions of roentgen and γ rays. For same dose and intensity, 0.4 MeV gamma rays appeared to be less effective, in slowing the mitotic rate (i.e. synthesis of chromosomes). NSA 11-7049

7645

RADIATION-INDUCED DELAY OF PUPATION IN *DROSOPHILA*. Roco C. Bourgin, Rolf Krumins, and Henry Quastler (Univ. of Illinois and Carle Foundation, Urbana). *Radiation Research* **5**, 657-73(1956).

X-radiation induces delay of pupation in *Drosophila melanogaster*. The target zone for this effect is in the anterior third of the larva, probably it is the ring gland. An abnormal phase occurs between the time when a larva would normally pupate and the time when it actually pupates. Histological studies show two groups of changes: 1) changes in rapidly growing parts and 2) indirect changes connected with the abnormal phase of larval life. Implications of these findings on the normal hormonal control mechanism discussed. (from authors' summary). NSA 11-2792

7646

EFFECTS OF X-IRRADIATION, NITROGEN MUSTARD, FASTING, CORTISONE AND ADRENALECTOMY ON TRANSAMINASE ACTIVITY IN THE RAT. Myron Brin and Ralph W. McKee (Boston City Hospital, Boston, Mass. and California Med. School, Los Angeles, Calif.). *Arch. Biochem. Biophys.* **61**, 384-9(1956).

The enhanced transaminase activities in rat liver are probably secondary to the influence of hormonal outflow of the adrenal cortex. Cortisone resulted in increased, and adrenalectomy in decreased activities of these enzymes. Depressed transaminase activity in intestine following x irradiation and nitrogen mustard was correlated with concomitant destruction of mucosal cells. The glutamylalanine enzyme was far more sensitive to stress than the glutamic-aspartic enzyme. The relation between irradiation and adrenal stimulation was stressed. NSA 10-7406

7647

EFFECT OF LOCALIZED BRAIN STEM LESIONS AND SUPRADIAPHRAGMATIC VAGOTOMY ON X-IRRADIATION EMESIS IN THE MONKEY. Kenneth R. Brizzee (Univ. of Utah Coll. of Medicine, Salt Lake City). *Am. J. Physiol.* **187**, 567-70(1956). NSA 11-4232

THE PROMPT EFFECTS OF WHOLE-BODY IRRADIATION AT A HIGH DOSE RATE ON THE ELECTROENCEPHALOGRAM OF MONKEYS. Phillips M. Brooks (U.S.A.F. School of Aviation Medicine, Randolph AFB, Tex.). *Radiation Research* **4**, 206-16(1956).

Rhesus monkeys were irradiated at dose rate of 1000 r/min from a multikilocurie source of Ba¹⁴⁰-La¹⁴⁰.

Results: a decrease in brain electrical activity; initial depression followed by a period of recovery which in several instances occurred while animal was still being irradiated, up to 2500 r, recovery of brain electrical activity after initial depression approached pre-exposure level, with 5000 r or more, the EEG index after recovery phase and during remainder observation period fell off. (from author's summary). NSA 10-6480

7649

PROMPT PULMONARY VENTILATION AND OXYGEN CONSUMPTION CHANGES IN RHESUS MONKEYS ASSOCIATED WITH WHOLE-BODY GAMMA-IRRADIATION. Phillips M. Brooks, Everett O. Richley, and John E. Pickering (Randolph AFB, Tex.). *Radiation Research* **6**, 430-49(1957).

The respiration in rhesus monkeys given whole-body irradiation at a dose rate of 1000 r/min in doses of 1000 r, 2500 r, 5000 r, 10,000 r, and 30,000 r from a Ba¹⁴⁰-La¹⁴⁰ source was followed for 100 minutes from start of exposure. Data are tabulated and results discussed. NSA 11-6606

7650

RETICULUM-CELL SARCOMA OF RATS. APPARENT INHIBITION BY X-IRRADIATION. David V. Brown and Theodore A. Thorson (Univ. of Washington, Seattle, Washington). *J. Natl. Cancer Inst.* **16**, 1197-205(1956).

The prolonged subcutaneous injection of dilute solutions of trypan blue produced reticulum-cell sarcomas in rats. A group of young Wistar rats were given 400 r of total-body irradiation and then treated with trypan-blue injections for periods up to 547 days. A second group received only the trypan blue. The dye stained controls showed reticulum-cell sarcomas, none of the irradiated animals developed these tumors. The more primitive reticuloendothelial elements are relatively resistant to the destructive effect of irradiation, although they may also be stimulated. X rays may have modified reticulum cells so that they did not respond to trypan blue as usual. NSA 10-7414

7651

γ EFFECT OF CORTISONE ON THE RADIATION REACTION OF THE RAT LUNG. Reynold F. Brown (Univ. of California School of Medicine, San Francisco). *Am. J. Roentgenol. Radium Therapy Nuclear Med.* **75**, 796-806(1956).

The effect of cortisone on the radiation reaction of the rat was studied during a ninety-day period after irradiation (3000 r to the right lung in one exposure) by means of mortality, body-weight changes, serial roentgenograms of the lungs, and postmortem macroscopic and microscopic examinations of the lungs. Cortisone did not significantly increase or decrease survival. NSA 10-7430

X-RAY-INDUCED DIVISION DELAY OF INDIVIDUAL YEAST CELLS. Victor W. Burns (Univ. of California, Berkeley). *Radiation Research* 4, 394-412(1956).

Dose range used: 1000 to 50,000 r. Discusses: radiation of mature diploid cells before division, diploid cells irradiated during division; a comparison of the delay-versus-dose curves for cells irradiated before or during division; the lethal and delay effects of radiation on a mature bud. Radiosensitivity for delay increases in the order haploid, diploid, tetraploid, whereas radiosensitivity for lethality is known to increase in the order diploid, tetraploid, haploid. (from author's summary). NSA 10-9064

ELECTROLYTE METABOLISM AFTER TOTAL-BODY
X-IRRADIATION. W. O. Caster and W. D. Armstrong.
Radiation Research 5, 189-204(1956).

Sodium and chloride losses after total-body x
radiation are strongly influenced by extracellular fluid
movements and by the extent to which these elements
are held in the gastrointestinal contents. After radiation
total-body potassium loss is directly correlated with loss
of muscle mass. Changes in tissue potassium concentration
roughly parallel changes in DNA concentration but are
less pronounced. (from authors' summary).

MULTIPLICATION OF ST. LOUIS ENCEPHALITIS
VIRUS IN MICE EXPOSED TO ROENTGEN RADIATION.
F. S. Cheever and Lee W. Smith. (Univ. of Pittsburgh

Graduate School of Public Health). Lab. Invest. 5, 44-52
(1956).

Mice were exposed to x radiation at varying intervals
before or after inoculation with St. Louis encephalitis
virus. Under certain conditions, exposure prior to
inoculation appeared to increase susceptibility to
infection with the agent, but this increase was neither
dramatic nor consistent. Exposure to x radiation after
intranasal inoculation of the virus did not have a
demonstrable effect. (from authors' summary).

RADIATION EFFECTS ON A PNEUMOCOCCAL IN-
FECTION PRODUCED BY SUBCUTANEOUS INJECTIONS
INTO WHITE MICE. William E. Clapper and Grace H.
Meade. Oct. 1953. 44p. Report No. 1. (AECU-3267).

Whole body x irradiation of white mice with 350 r
had no effect on the course of bacteremia induced by
subcutaneous inoculation with pneumococci at the time
of exposure. When the radiation dose was given either
3 or 6 days before inoculation the death rate was in-
creased, and the time from bacteremia to death was
reduced when the radiation dose was given 6 days before
inoculation. NSA 11-1393

7679

GENETIC EFFECTS OF X-RAYS IN RELATION TO
DOSE-RATE IN DROSOPHILA. A. M. Clark (Univ. of
Melbourne, Australia). Nature 177, 787(1956).

Using dose rates of 100 r/min and 2000 r/min, it
had been confirmed that, for a given dose, a greater
amount of genetic damage is produced if the radiation
is delivered at high intensity. The intensity effect is
enhanced if the flies are injected with 0.005 M sodium
azide in saline just prior to irradiation. NSA 10-8150

7680

THE EFFECT OF X-RAYS ON BACTERIA. G. L. Clark
and C. S. Boruff. Science 70, 74(1929).

Roentgen rays act like sterilizing agents on cultures
of *B. coli* and *Erythrobacillus prodigiosus*. Death rate
curves show that total counts of viable cell decrease
logarithmically with time. *B. coli* did not show variation
or mutation after x irradiation. With increasing x ray
doses, *Erythrobacillus prodigiosus* showed tendency
towards lack of ability to produce red pigment. When
organisms were allowed to grow on agar plate for 5 days,
the greater proportion of colonies produced pigment.

7681

BIOLOGICAL EFFECTS OF FAST NEUTRONS AND
GAMMA RAYS. John W. Clark, Donn L. Jordan, and
Howard H. Vogel, Jr. (Argonne National Lab., Lemont,
Ill.). Am. J. Roentgenol. Radium Therapy Nuclear
Med. 77, 524-30(1957).

Evidence is presented showing that exposure to fission
neutrons and Co^{60} gamma rays produced death in mice
by different mechanisms: (a) absence of dose rate
dependence for neutrons in contradistinction to gamma
rays; (b) different modes of mortality; (c) departure
from additivity for mixtures in producing death. Incidence
of positive blood cultures correlates with time of death
for both gamma and neutron irradiated mice. Since
streptomycin appreciably reduces mortality it is concluded
that bacteremia is a significant cause of radiation
death in mice. Gamma rays and fission neutrons have
the same relative efficiency for reducing spleen weight as
for acute mortality. Pre-treatment with cysteine has
protective effect throughout acute lethal period following
these irradiations. NSA 11-4785

7683

EFFECT OF IN VITRO X IRRADIATION ON PIGMENTED AND PALE SLICES OF CLOUDMAN S91 MOUSE MELANOMA AS MEASURED BY SUBSEQUENT PROLIFERATION IN VIVO. Jewel Plummer Cobb (Univ. of Illinois Coll. of Med., Chicago and Harlem Hospital, N. Y.). *J. Natl. Cancer Inst.* 17, 657-66(1956).

The *in vitro* irradiation of pigmented and pale slices of the Cloudman S91 mouse melanoma with 2500, 2800, or 3000 r revealed that a larger number of pigmented slices remained viable following treatment. Viability was measured by the number of irradiated implants growing successfully in DBA mice, the strain of tumor origin. The relatively greater radioresistance *in vitro* of pigmented, as compared to pale, tissue was accompanied by an increased number of melanized cells. An explanation for this phenomenon is discussed. NSA 11-1741

MEDICAL SURVEY OF MARSHALLESE TWO YEARS AFTER EXPOSURE TO FALLOUT RADIATION. R. A. Conard, Bradford Cannon, C. E. Huggins, J. B. Richards, and Austin Lowery. (1956). 18p. (BNL-412).

The medical survey shows that the people are in a generally good state of health and nutrition and are making satisfactory recovery. Serious illness has occurred in two but can not be attributed to radiation effects. One death in May 1956, was due to hypertensive heart disease, undoubtedly present at the time of exposure. There is no evidence of improvement of hemopoiesis. Lowered levels of blood elements have not lowered resistance. Residual changes in the skin show improvement. No bone defects are apparent. BETA RADIATION LESIONS OF THE SKIN. MEMORANDUM REPORT 56-1. Robert A. Conard and Carl F. Tessmer. Dec. 9, 1955. 7p. (NP-5907).

A case history on a lesion of the forehead and right eyebrow region presumably due to irradiation from contamination with fission product material, is presented. The erythema, dry desquamation, depigmentation, symptoms of burning and itching, increased sensitivity to sunlight hyperesthesia, epilation of the eyebrows (with regrowth of hair) and minimal histological changes (17 months later) particularly in the elastic tissue were considered consistent with radiation damage to the skin. The most unusual feature of the lesion was the regrowth of white hair in the affected region of the right eyebrow which was formerly black in color. NSA 10-7390

7696

EFFECT OF INJECTION OF RAT MARROW ON RETICULAR TISSUES OF MICE EXPOSED TO X RADIATION IN THE MIDDLE THAL DOSE RANGE. C. C. Congdon, T. Makinodan, and N. Gengozian (Oak Ridge National Lab., Tenn.). J. Natl. Cancer Inst. 18, 603-13(1957).

The 100 per cent mortality in mice exposed to 710 r of total-body radiation and then injected with rat bone marrow was caused by a secondary degeneration of the transplanted bone marrow. Immediate cause of death was hemorrhage, infection and anemia. Effect on bone marrow, spleen, thymus and lymph nodes are described. NSA 11-8776

7697

THE EFFECT OF TRANSFUSIONS OF BLOOD SHOWING EXTREME LEUKOCYTOSIS ON SURVIVAL OF X-IRRADIATED MICE. C. C. Congdon, T. W. McKinley, Jr., H. Sutton, and P. Urso, Jr. (National Cancer Inst., Bethesda, Md. and Oak Ridge National Lab., Tenn.). Radiation Research 4, 424-34(1956).

Leukemoid blood from tumor-bearing mice promoted recovery of total-body irradiated mice as measured by regeneration of hematopoietic tissue and by survival.

Activity of the blood was associated with the formed elements. The extreme granulocytosis present suggests that the granulocyte may be capable of causing recovery from radiation injury. (from authors' summary) NSA 10-9077

7698

Naval Radiological Defense Lab., San Francisco.
RADIATION-INDUCED CHANGES IN TISSUE NUCLEIC ACIDS; RELEASE OF SOLUBLE DEOXYPOLYNUCLEOTIDES IN THE SPLEEN. L. J. Cole and M. E. Ellis. Oct. 12, 1956. 31p. Project NM-006-015.04. (USNRDL-TR-114).

Biochemical changes in nucleic acids of the spleen in mice were investigated at hourly intervals up to 14 hr following lethal whole-body x irradiation (810 to 850 r). The data suggest that spleen deoxyribonucleoprotein is the source of the free polynucleotide released after irradiation. NSA 11-2780

7699

BIOSYNTHESIS OF FATTY ACIDS IN LIVER AND INTESTINE OF INTACT NORMAL, FASTED AND X-IRRADIATED RATS. John G. Coniglio, Donald B. McCormick and Granville W. Hudson (Vanderbilt Univ. School of Medicine, Nashville. Am. J. Physiol. 185, 577-82(1956).

A 72 hour fasting period affects intestinal incorporation of C¹⁴-acetate into fatty acids to a smaller extent than it does hepatic incorporation. Glycogen concentration and hepatic incorporation of acetate into fatty acids increases in irradiated, fasted rats (750 r total body x irradiation) compared to fasted controls. Intestinal incorporation of C¹⁴ acetate into fatty acids decreases in the irradiated rat. A direct relationship between the amount of liver glycogen present and the amount of incorporation of C¹⁴ into fatty acids was not observed at these levels of hepatic glycogen and lipogenesis. CONCERNING THE VARIABLE DAMAGE TO THE PULMONARY TISSUE BY THERAPEUTIC X-RADIATION. Hans Cottier. Strahlentherapie 100, 385-98(1956). (In German).

Experiments in rats have shown that a single irradiation of the right lung with 3000 r does not lead to diffuse, uniform pulmonary lesions, but to inconstant, localized processes with transition into fibrosis. The causes of the localized apneumatoses (atelectasis, chronic pneumonia) are, in general, bronchial occlusions on the base of bronchitis. Atelectases in the irradiated pulmonary tissue show a high tendency towards fixation by connective tissue. Even 4 months later 40% of the animals showed significant fibrosis. NSA 11-38

7703

INTEGRAL DOSE, BODY SIZE, AND THE SITE OF IRRADIATION AS FACTORS DETERMINING THE SEVERITY OF RADIATION SICKNESS. W. M. Court-Brown and R. F. Mahler. J. Fac. Radiologists 5, 200-209 (1954).

It has been suggested that one possible explanation of the findings is that radiation releases a diffusible metabolite or metabolites.

7704

EFFECTS OF RADIATION ON MAMMALS. E. P. Cronkite and V. P. Bond (Brookhaven National Lab., Upton, N. Y.). *Ann. Rev. Physiol.* 18, 483-526(1956). NSA 10-9946

California. Univ., Berkeley. Radiation Lab.
A COMPARISON OF THE METABOLISM OF PLUTONIUM (Pu^{238}) IN MAN AND THE RAT. J. Crowley, H. Lanz, K. Scott, and J. G. Hamilton. May 31, 1946. Changed

from ORO Nov. 13, 1956. Contract W-7405-eng-48-A. (CH-3589).

The distribution of Pu among the tissues of the body and the average daily rate of excretion of this element are compared in man and in rats. These experiments show a high degree of prolonged retention of Pu in the body, with selective deposition in the skeleton, especially in the region adjacent to the bone marrow in the endosteum and trabecular bone. The elimination of Pu from the body occurs at higher rates in rats than in man. NSA 11-2244

UPTAKE, DISTRIBUTION, AND RETENTION OF FISSION PRODUCTS IN TISSUES OF MICE EXPOSED TO A SIMULANT OF FALLOUT FROM A NUCLEAR DETONATION. I. SIMULANT OF FALLOUT FROM A DETONATION UNDER SEAWATER. S. H. Cohn, W. B. Lane, J. K. Gong, J. C. Sherwin, R. K. Fuller, L. L. Wiltshire, and W. L. Milne. Dec. 5, 1955. 25p. Project No. NM-006-015. 04. (USNRDL-TR-77).

Authors discuss the influence of chemical agents on uptake, distribution, and retention of fission products. The relatively small uptake of fission products and rapid turnover in the tissues adds to the evidence that the internal radiation hazard following an acute inhalation exposure to fallout is very small. THE EFFECTS OF REPEATED POLONIUM INJECTIONS ON RATS. I. CROSS EFFECTS AND METABOLISM OF 2 μ c/Kg DOSES. R. K. Davis, W. T. Rockhold, and D. S. Anthony. April 9, 1954. 31p. Contract AT-33-1-GEN-53. (MLM-961).

A large number of rats were injected with multiple doses of polonium, averaging about 2.0 microcuries per kilograms of body weight, and these injections were repeated at 14 day intervals. The rats were serially sacrificed for tissue analysis. The blood and excreta of the living rats were analyzed periodically for polonium content. Food and water intake and body weight changes were recorded. Results of this experiment are presented in graphical form. NSA 11-4802

7717

RELATIVE BIOLOGICAL EFFECTIVENESS OF TRITIUM AND OF VARIOUS γ RADIATIONS Sylvie Davydoff. *Compt. rend.* **243**, 1455-7(1956). (In French).

A determination was made of the relative biological effectiveness of tritium and of various γ radiations with respect to a bacteria, *Serratia indica*. No matter what the intensity of the irradiation, the various radiations have had the same biological effectiveness, that of the tritium β ray being less, with a factor of relative biological effectiveness of 0.87. NSA 11-1733

7718

EFFECT OF NUTRITIVE FACTORS ON THE SURVIVAL OF *SERRATIA INDICA* AFTER GAMMA IRRADIATION. Sylvie Davydoff. *Compt. rend.* **243**, 1683-5(1956).

A comparison is made, after γ irradiation, of the survival portion of *S. indica* when the bacteria are scattered in a complete nutritive medium and a simple synthetic medium. NSA 11-1734

QUANTITATIVE ASPECTS OF THE EFFECTS OF X-RAYS ON LYMPHATIC TISSUE. Peter P. H. De Bruyn and M. Marcella Tornova-Svehlik (Univ. of Chicago, Ill.). *Radiation Research* **6**, 573-84(1957).

Based on volumetric measurements *in vivo*, a quantitative study was undertaken regarding destructive and regenerative processes occurring in the lymphatic tissue of the rabbit appendix after x-radiation. The quantitative changes were studied in relation to various doses administered. NSA 11-8781

7720

Rochester, N. Y. Univ. Atomic Energy Project. THE ACUTE TOXICITY AND RETENTION OF INTRATRACHEALLY ADMINISTERED POLONIUM²¹⁰ IN THE RAT. R. J. Della Rosa. March 5, 1956. 10p. Contract W-7401-eng-49. (UR-431).

The acute toxicity of intratracheally administered Po²¹⁰ in the rat has been studied. It is concluded that there is no marked difference in the toxicity of Po after intratracheal intubation as compared with equivalent body burdens attained by gavage or intravenous administration. This is true despite differences in tissue distribution and in the kinetics of excretion, and indicates that acute radiation death from Po may be dependent more upon the total amount of energy released within the body than its site of concentration. THE INDUCTION OF RECESSIVE LETHALS IN *DROSOPHILA MELANOGASTER* BY RADIATIONS OF DIFFERENT ION

DENSITY. Charles W. Edington (Oak Ridge National Lab., Tenn.). *Genetics* **41**, 814-21(1956).

Fast neutrons are 1.62 times as effective as gamma rays in inducing sex-linked recessive lethals. Any comparison of relative biological effectiveness involving x rays is dependent on dose. Frequency of recessive lethals induced by x rays departs from linearity as radiation dose increases, but neither the fast neutron nor gamma-ray dose curves depart significantly from linearity over the dose ranges studied. Frequency of recessive lethals induced by x rays in *In(1)EN* and *Xc* chromosomes were significantly different. (from author's summary). NSA 11-5148

7736

THE MOBILIZATION AND TURNOVER OF CELL POPULATIONS IN BLOOD AND BLOOD FORMING TISSUES. J. M. Yoffey. *J. Histochem. and Cytochem.* **4**, 516-30(1956).

Quantitative data concerning: (a) lymphocyte production as estimated by the lymphocyte content of thoracic duct lymph and (b) of the nucleated cells of bone marrow, measured by a special quantitative technique are presented. In a 400 g guinea pig, thoracic duct lymphocyte output over 24 hours is about 4x the lymphocyte content of the blood and about 1/8 of the total marrow lymphocyte population. Quantitative response of marrow to leucocytosis-promoting factor and to hypoxia is described. Lymphocyte increase in marrow and concomitant decrease in peripheral blood lymphocytes just before onset of marrow recovery in irradiated guinea pigs are described. BA 31-20943

SPLEEN DPNH CYTOCHROME C REDUCTASE ACTIVITY IN X-IRRADIATED RATS. Herbert J. Eichel (Hahnemann Medical Coll., Philadelphia). *Proc. Soc. Exptl. Biol. Med.* **95**, 38-43(1957). NSA 11-7915

7738

ELECTRON MICROGRAPHS OF X-RAY-TREATED *ESCHERICHIA COLI* CELLS. A. Eisenstark and G. L. Clark. *Science* **105**, 553-555(1947).

Purpose: to examine irradiated, elongated cells under the electron microscope and study ways in which they might differ from normal bacterial cells. Irradiation (50 Kv and 20 ma) produced irregular morphology. Some of the irradiated *E. coli* showed definite "breaks" in the cell. "Breaks" may occur because the enzyme which is responsible for pinching off the cell wall in normal bacterial fission has been destroyed by x rays while other enzyme systems still function.

7739

ON THE MODE OF ACTION OF X-RAY PROTECTIVE AGENTS. I. THE FIXATION IN VIVO OF CYSTEAMINE TO PROTEINS. Lorentz Eldjarn and Alexander Pihl. *J. Biol. Chem.* **223**, 341-52(1956). (Norwegian Radium Hospital, Oslo).

The metabolism of the x-ray protective agents cystamine and cysteamine in mice has been investigated with the aid of S^{35} -labeled compounds of extremely high specific activity. In principle the same results were obtained whether cystamine or cysteamine was administered. The radiobiological significance of the data is discussed. NSA 11-1756

7740

RELEASE OF POTASSIUM FROM THE X-IRRADIATED MAMMALIAN HEART. L. E. Ellinwood, J. E. Wilson, and J. M. Coon (Univ. of Chicago, Ill.). *Proc. Soc. Exptl. Biol. Med.* **94**, 129-33(1957).

X irradiation caused release of K from isolated rabbit heart. Rate of release reached a peak after a dose of approximately 2500 r delivered at 500 r/min.

Greatest average increase in perfusate was 12% over control level. K is liberated from isolated rabbit heart in small amounts following exposure to as little as 500 r x ray. When exposed to 1000 r more than 4 x as much K is released into the perfusate in 1 hr. than is released by non-irradiated hearts. X irradiated (in situ) dog heart released K into coronary circulation. Magnitude of effect and radiation dose producing it were approximately the same as in isolated rabbit heart. NSA 11-3667

7741

EFFECT OF ANTIGONADOTROPHIC SERUM ON POST IRRADIATION CHANGES IN THE REPRODUCTIVE SYSTEM OF FEMALE MICE. Charles A. Ely (Columbia Univ., New York). *Endocrinology* 60, 718-28(1957).

Antigonadotrophic serum (produced in rabbits by prolonged administration of crude sheep pituitary extract) was given to mice at intervals ranging from 0-24 weeks after total body irradiation. Ovaries of mice receiving injections of antihormone were smaller in wt. and volume than were those treated with control materials, and the hypertrophied lutein-like cells, characteristic of ovaries of irradiated mice were missing or showed degenerative changes. Absence or reduction of gonadotrophic stimulation was reflected in weight and histological appearance of uteri of antihormone-injected animals. With the exception of pituitary there were no alterations observed in other viscera or in body weight which could be attributed to antigonadotrophic serum. NSA 11-8772

7742

ENZYMATIC ACTIVITY OF RADIATED EXTERIORIZED SALIVARY GLANDS. James A. English (National Naval Medical Center, Bethesda, Md.). *Am. J. Physiol.* 186, 245-9(1956).

Exteriorized salivary glands were exposed to 2000 r while the rest of the animal (rat) was shielded. There was no general effect on the animal, no effect on weight of the glands. Values for glucose-6-phosphate dehydrogenase were higher in the irradiated glands in 17 out of 18 animals, the increase being most marked during the 2nd post-exposure week. There was no change in the isocitric acid dehydrogenase of the irradiated glands. NSA 11-23

Zurich. Universitat.
EFFECTS ON LIVING TISSUES OF PRIMARY COSMIC RAY PARTICLES. Jakob A. G. Eugster. Feb. 1956. 37p. (OSR-TR-56-19, AD-87528).

Results are presented from a series of experiments designed to determine the effects of cosmic rays on the living tissues of humans and animals. Excised tissues were exposed at the Junfraujoch at an altitude of 11,000 ft, in the Simplon Tunnel 8,000 ft below the mountain top, and during the flights of high-altitude and stratosphere balloons. Observations were made on the tissues following high-altitude exposures and following the reimplantation of the exposed tissues in the parent organisms. It is concluded that harmful effects occur extremely rarely. NSA 11-4782

7752

CONTENT OF CREATINE AND CREATININE IN THE URINE OF RATS EXPOSED TO X-RADIATION. T. A. Fedorova and M. A. Larina. *Med. Radiol.* 1, No. 6, 36-40(1956). (In Russian). NSA 11-3285

7753

INVESTIGATION OF THE ALKALINE PHOSPHATASE LEVEL IN RAT KIDNEY AFTER LOCAL IRRADIATION. Ulrich Feine and Georg Gerber. *Strahlentherapie* 102, 563-8(1957). (In German).

Rat kidneys, exposed surgically, were x irradiated and then studied serially by means of histochemical techniques (tissue sections) and biochemical analyses of cells and tissue homogenates. There was no initial decline in alkaline phosphatase in the kidney. The latent

period and the depression of alkaline-phosphatase levels were dose-dependent. Localization of enzyme within cells was altered only at doses causing necrosis. NSA 11-8788

7754

INTERPRETATION OF SOME ENZYME ACTIVITY INCREASES AFTER WHOLE-BODY X-IRRADIATION. Robert N. Feinstein (Argonne National Lab., Lemont, Ill.). *Radiation Research* 4, 217-20(1956).

Phosphoprotein phosphatase, the enzyme which hydrolyzes inorganic phosphorus from phosphoproteins without preceding proteolysis, appears to be increased in activity in the spleen and intestine after whole-body x irradiation, if the calculations are based on wet weight or protein content. It is pointed out that these data, like numerous other examples cited in the literature, are actually only mathematical artifacts due, in the case of spleen, to loss of organ weight and, in the case of intestine, to loss of protein. NSA 10-6481

7755

PROTECTION AGAINST X-IRRADIATION BY 3-AMINO-1,2,4-TRIAZOLE. Robert N. Feinstein and Sara Berliner (Argonne National Lab., Lemont, Ill.). *Science* 125, 936(1957).

Intraperitoneal injection of AT before whole body x radiation protects a large percentage of mice against 650 r of x rays and prolongs the survival of animals that receive 750 r or 850 r. If administered before a 1700 r dose, or after any dose of x rays, AT is without effect. The possibility cannot be excluded that a catalase mechanism is in some way relevant to the radiation protection. NSA 11-6619

7756

THE EFFECT OF X-RAYS ON *LEISHMANIA TROPICA* IN VITRO. B. Feldman-Muhsam and L. Halberstaedter. *Brit. J. Radiology*, 19, 41-43(1956).

Studies were carried out using 2 stages of *L. tropica*: L. D. Bodies and flagellate. Immediate lethal dose is 1,250,000 r. *In vitro* irradiation with 150,000 r destroys ability of flagellates to multiply in culture medium, 50,000 destroys infectivity for hamsters, 125,000 r destroys ability of L. D. bodies to multiply *in vitro* and 65,000 r destroys their infectivity for hamsters. Therapeutic effect of x-ray cannot be attributed to direct effect on parasite.

7757

A STUDY OF FACTORS AFFECTING X-RAY-INDUCED CHROMOSOME ABERRATIONS IN THE MICROSPORES OF *TRADESCANTIA PALUDOSA*. II. THE OXYGEN EFFECT. Robert H. Fetner (Emory Univ., Atlanta, Ga.). *Radiation Research* 5, 365-71(1956).

Microspores were x irradiated with 200 r and 400 r in atmospheres of helium, air and oxygen. Reduction in aberration frequencies with decreasing concentrations of atmospheric oxygen agreed with results of other workers. Data suggest that when radiations are performed in the absence of oxygen (in helium) there is less rejoining of initial breaks than when oxygen is present. (from authors' summary). NSA 11-861

7758

RELATIVE BIOLOGICAL EFFECTIVENESS OF INTERNAL EMITTERS. Miriam P. Finkel (Argonne National Lab., Lemont, Ill.). *Radiology* 67, 665-72(1956). NSA 11-869

Effectiveness of various internal emitters in inducing malignant bone tumors is estimated (Pu^{239} , Ra^{226} , Sr^{90} , Sr^{89} , Ca^{45}). NSA 11-869

7760

RADIATION DAMAGE DUE TO RADIOACTIVE SUBSTANCES. W. Flaskamp. *Strahlentherapie* 12

(Sonderbande) 1930 354 pages Urban and Schwarzenberg Publisher, Berlin (1930). (In German).

This is a long review article summarizing radiation effects on various tissues as well as generalized effects. First section considers skin reaction, theories of effects, reversibility and irreversibility of effects, acute and chronic damage and histological changes seen in both. Second section describes effects on internal organs; acute radiation syndrome. Prophylaxis and treatment are included. Internal organs include in review: muscle, bone, cartilage, teeth, serosal surfaces, lung, larynx, gastrointestinal tract urinary bladder and urogenital system, central nervous system, eyes, thyroid, thymus, hematopoietic tissues, hypophysis, prostate, liver, pancreas, salivary glands, breast, reproductive organs. Studies on animals are included along with the extensive material on man. Includes also consideration of effects on fertility, carcinogenesis and summary of methods to minimize adverse effects in therapy and methods of treatment available. Several hundred references (many not included in this bibliography) are appended. (Mostly in German).

7761

INTRAVENOUS APPLICATION OF RADIOACTIVE Au^{198} . Theodor Fliedner and Rudolf Stodtmeister. *Strahlentherapie* 101, 289-95(1956). (In German).

Intravenous application of colloidal radioactive gold (Au^{198}) causes destruction of the bone marrow of the rat by extinction of cells, edema, hemorrhage, and fat infiltration. The injury to the sinus system is of great pathogenic importance in this process. The findings underline the necessity of careful hematological control in the clinical use of gold colloid (Au^{198}). NSA 11-3290

THE EFFECT OF X-RADIATION OF THE YOSHIDA ASCITES TUMOR. I. INHIBITION OF MITOSIS BY A SINGLE IRRADIATION. John Gordon Freymann.

(Massachusetts General Hospital, Boston). *Cancer Research* **16**, 930-6(1956).

Total body x radiation with 425 r completely inhibits mitosis in Yoshida ascites tumor in one hour, this effect is sustained for another three hours. There is no inhibition of cells already dividing when radiation occurs. With moderate dosages most of the cells radiated in interphase have mitosis delayed. There is slow recovery from radiation. Normal mitotic rate is regained about twenty hours after radiation. (from authors' summary). NSA 11-1732

EFFECT OF REDUCED LIVER AND KIDNEY CATALASE CONCENTRATIONS ON LETHALITY OF X IRRADIATION IN RATS. Wallace Friedberg (Oak Ridge National Lab., Tenn.). *Proc. Soc. Exptl. Biol. Med.* **93**, 52-3(1956).

Liver and kidney catalase was markedly reduced in rats by the injection of 3-amino-1, 2, 4-triazole. X irradiation of these animals did not cause more deaths than in saline-injected control groups. It was concluded that differences in liver and kidney catalase levels cannot account for differences in sensitivity to the lethal effects of x irradiation. NSA 11-54

Naval Radiological Defense Lab., San Francisco. SPATIAL AVOIDANCE BEHAVIOR IN THE RAT AS A RESULT OF EXPOSURE TO IONIZING RADIATION. J. Garcia, D. J. Kimeldorf, and E. L. Hunt. June 20, 1956. 14p. Project NM 0006-015. 04. (USNRDL-TR-96).

The use of radiation as a stimulus to motivate a spatial avoidance response is under investigation. Following a series of four confinements in the exposure compartment, the partition between the compartments was removed and each animal was allowed a free choice of residence in the alley as a test of conditioning. With but one exception, all the irradiated animals demonstrated a decreased preference for the compartment in which they had been exposed. Both gamma and x

rays can serve as stimuli to establish spatial avoidance behavior in the rat. NSA 10-8142

EFFECT OF HEAD X-IRRADIATION IN RABBITS ON AORTIC BLOOD PRESSURE BRAIN WATER CONTENT AND CEREBRAL HISTOLOGY. Herbert B. Gerstner, Phillips M. Brooks, F. Stephen Vogel, and Sidney A. Smith. (U.S.A.F. School of Aviation Medicine, Randolph Field, Tex.). *Radiation Research* 5, 318-31(1956).

Rabbits received 14 Kr of x radiation to the head at a dose rate of 0.24 Kr/min. During the 3 hour post-radiation period, severe epileptoid seizures appeared in unanesthetized animals. Marked hypotension developed early during radiation and frequency progressed to circulatory collapse during the first post-radiation hour. Histologic studies showed early stages of developing meningitis, vasculitis, and pyknosis of the granule cells of the cerebellum. (from authors' summary). NSA 11-858

7786

EFFECTS OF IONIZING RADIATIONS ON PLANT TISSUES. I. QUANTITATIVE MEASUREMENTS OF THE SOFTENING OF APPLES, BEETS, AND CARROTS. R. E. Glegg, Frank P. Boyle, L. W. Tuttle, D. E. Wilson, and Z. I. Kertesz (Cornell Univ., Ithaca, N. Y.). *Radiation Research* 5, 127-33(1956).

The pressure required to crush small cylinders of plant tissues was measured objectively. Up to a certain level of γ -irradiation no measurable softening occurs in apple, beet, and carrot cylinders. Beyond this level of irradiation, progressive softening of the tissues takes place. The crushing loads obtained in the softening phase plotted against log roentgens give straight lines.

These straight-line plots allow graphical interpolation of threshold dosages of irradiation, which were 34,700, 166,000, and 316,000 for the varieties of apples, carrots, and beets investigated. NSA 10-9953

SURVIVAL STUDIES ON X-IRRADIATED MICE MEDICATED WITH SPLEEN-PREPARATIONS. Anna Goldfeder and Grace E. Clarke. (New York Univ.). *Radiation Research* 6, 318-28(1957).

Protein-free calf spleen preparations were tested for their efficacy in protecting mice against radiation induced injury. One preparation consisted of lipids alone and one of deoxyribonucleic acid (DNA). Mice were irradiated with 700 r. In some cases protection was observed. Preparations designated "total lipids" exerted a harmful effect. Whether or not a "humoral" factor is involved in protection by spleen or bone marrow is discussed. (from authors' summary). NSA 11-5740

7791

THE EFFECTS OF X-RAYS ON THE GROWTH OF SPINAL GANGLIA FROM 6- AND 12-DAY CHICK EMBRYOS IN TISSUE CULTURE. Irene Plactere Goldring (New York Univ., N. Y. and Brookhaven National Lab., Upton, N. Y.). *Radiation Research* 5, 390-403(1956).

Comparison of growth activities of spinal ganglia in tissue culture irradiated *in ovo* and *in vitro* reveals the greater sensitivity of spinal ganglia to x radiation *in ovo* than *in vitro*. The circulatory system is involved in the difference. Differential sensitivity of the three main cell types present in spinal ganglia was observed. Ganglia from 6-day embryos succumb more rapidly to x radiation *in ovo* than ganglia from 12-day embryos; 12-day ganglia withstand higher radiation doses than 6-day ganglia when irradiated *in vitro*. (from authors' summary). NSA 11-863

Naval Radiological Defense Lab., San Francisco. ON THE NATURE OF SERUM PROTEIN CHANGES IN THE X-IRRADIATED DOG. W. H. Goldwater and C. Entenman. May 9, 1956. 20p. Project NM 006-015. (USNRDL-TR-91).

Paper electrophoresis techniques have been applied to the study of serum protein, lipoprotein, and glyco-

protein changes in irradiated dogs. The loss of alpha-4 and gain of alpha-3 glycoproteins have been found as early as ten days prior to irradiation death, and the absence of lipoprotein or body temperature abnormalities. In dogs surviving irradiation doses near the LD₅₀, transitory lipoprotein changes were less pronounced than those found in the glycoprotein components. Possible mechanisms underlying these various serum protein changes are discussed. NSA 10-8140

FURTHER STUDIES ON THE EFFECTS OF X-RADIATION ON THE MULTIPLICATION OF *RICKETTSIA MOORSERI* IN EMBRYONATE EGGS. Donald Greiff, E. L. Powers, and Henry Pinkerton (St. Louis Univ., Mo. and Argonne National Lab., Lemont, Ill.). *J. Exptl. Med.* 105, 217-22 (1957).

Effect of x-rays on growth of rickettsiae in embryonate egg was studied. Intensifying effect of x radiation of the host on rickettsiae growth can be attributed to alterations of cells of host that persist at least 7 days. Greatest enhancement of growth of rickettsiae occurred when moderately infected cells were irradiated. Experiment indicates that x-rays may neutralize or reverse changes in the host that are unfavorable to growth of rickettsiae. Explanations of phenomena in terms of biochemical and biological alterations of cells of the host are presented. NSA 11-6199

PHYSICAL AND CLINICAL ASPECTS OF SUPER-VOLTAGE ROTATIONAL THERAPY H L Hare, S W Lippincott, Jr., D Sawyer, J G Trump, E W Webster, K A Wright, W W Evans, and R C Granke Radiology 57, 157-168(1951)

7830

EFFECT OF IRRADIATION ON IN VIVO P^{32} INCORPORATION BY FOUR TYPES OF ASCITES TUMORS. Helen Harrington, Diana Rauschkolb, and Paul S. Lavik (Western Reserve Univ., Cleveland) Cancer Research 17, 34-7(1957).

Of the four types of ascites tumors, only the Ehrlich tetraploid ascites tumor was affected by 1,000 r which reduced P^{32} incorporation to about 65% of normal. The lymphosarcoma 6C3HED cells were affected slightly by 2,000 r but the Lettre hyperdiploid Ehrlich ascites tumor cells and the TA 3 adenocarcinoma cells were not affected significantly by doses as high as 5,000 r. (from authors' summary). NSA 11-3653

7831

A STUDY OF DIRECT AND INDIRECT EFFECTS OF IRRADIATION ON P^{32} INCORPORATION BY EHRlich ASCITES TUMOR CELLS IN VIVO AND IN VITRO. Helen Harrington and Paul S. Lavik (Western Reserve Univ., Cleveland). Cancer Research 17, 38-42(1957).

An inhibition of P^{32} incorporation into DNA occurred only when irradiated cells were exposed to irradiated tumor tissue. Exposure to irradiated non-tumor tissue was not necessary during the actual incorporation period. P^{32} incorporation into DNA of tumor cells irradiated in vivo was inhibited only when the incorporation was carried out in vivo and not when carried out in vitro. (from authors' summary). NSA 11-3654

7832

EFFECTS OF MILLION VOLT IRRADIATION ON THE GASTROINTESTINAL TRACT. I. B. Brick. Arch. Internal Med. 96, 26-31(1955).

A dose greater than 4500 r is required to cause gastric ulceration in man. Ulceration may occur as a late complication of radiotherapy secondary to vascular sclerosis. Case histories of 9 young men who received 5000 r local doses of mid-line of abdomen for malignancy are presented.

7833

EFFECT OF CYSTEINE ON THE RESULT OF THE RADIATION REACTION ON BONE MARROW AFTER LOCAL IRRADIATION. Helmut Hartweg. Strahlentherapie 102, 65-72(1957). (In German). NSA 11-5168

HEMATOLOGICAL INVESTIGATION OF THE EFFECT OF PROTECTIVE MATERIAL. PART IV. ON THE CONDITION OF PERIPHERAL BLOOD PICTURE IRRADIATED AFTER TREATMENT WITH PROTECTIVE SUBSTANCES. Helmut Hartweg. Strahlentherapie 102, 311-14(1957). (In German). NSA 11-5745

7836

BETATRON CANCER THERAPY. Roger A. Harvey, Louis L. Haas, and John S. Laughlin. Radiology 58, 23-33(1952).

Clinical trials of the 24-mev betatron have shown advantageous dosage distribution. The extreme penetration and distribution of intensity of the x ray beam from the betatron require special attention in treatment planning. The betatron is not a substitute for early diagnosis and prompt treatment of cancer and does not prevent the appearance of metastases from disease already disseminated outside the treated area. (from authors' summary).

7837

CLINICAL REPORT OF FOUR INDIVIDUALS ACCIDENT-

ALLY EXPOSED TO GAMMA RADIATION AND NEUTRONS (REACTOR ACCIDENT AT ARGONNE). R. S. Hasterlik. Argonne National Laboratory Report (1953). ANL-4932.

Urinary amino-acid excretion was studied by paper partition chromatography in 4 humans exposed to γ rays and neutron radiation at levels below 200 r. All showed daily increase in amount of amino acid excreted after the accident.

7838

Brown Univ., Providence.

PENETRATION OF THE GUT WALL BY INTESTINAL BACTERIA AFTER X-IRRADIATION. PROGRESS REPORT FOR JUNE 1, 1955 TO JANUARY 31, 1956. M. H. Hatch. 9p. (AECU-3169).

Factors affecting bacterial invasion from the intestinal tract in x irradiated mice were investigated. *P.morganii* was administered in the drinking water on the seventh day following exposure to 600 r total-body x irradiation. Mortality increased from about 40% following irradiation alone to about 62% after radiation and bacterial challenge together. No effect on mortality was produced by immunization with *P. morganii* prior to irradiation or injection of spleen homogenates from normal mice shortly after irradiation. NSA 10-3250

7839

THE HAZARDS TO MAN OF NUCLEAR AND ALLIED RADIATIONS. London, Her Majesty's Stationery Office, 1956. 128p.

Existing scientific information on the biological effects of nuclear radiations is reviewed. The consequences to the individual and to society of increased environmental radioactivity are considered. It was concluded that the use of ionizing radiation entails risk, but the risk is controllable within limits that man can accept. The nature of the risk and the extent to which they can be controlled are discussed. NSA 11-55

7840

Hanford Atomic Products Operation, Richland, Wash. PROPOSED REVISION IN COMPUTATIONS OF MPC'S FOR LONG-LIVED RADIOISOTOPES. J. W. Healy. Mar. 1, 1955. Changed from OFFICIAL USE ONLY Nov. 26, 1956. 10p. Contract W-31-109-Eng-52. (HW-35663).

The computational techniques and basic concepts for finding the MPC's of Pu, Ra, U, and Sr longlived isotopes are illustrated. It is assumed that the excretion or retention follows a power law rather than an exponential law. NSA 11-2234

7841

Hanford Atomic Products Operation, Richland, Wash. A REVIEW OF THE MPC'S FOR NATURAL THORIUM. J. W. Healy. Nov. 21, 1955. 15p. Contract W-31-109-Eng-52. (HW-40105).

Since the chemical toxicity of Th is low by any route of administration, the radiation effects will limit the permissible levels. Data available on thorotrast administrations give little information on the hazards of other methods of exposure since the metabolism of thorotrast is different from that of thorium accumulated by ingestion or inhalation. The body deposition of thorium from intramuscular or oral administration is mostly in bone indicating bone as the critical organ for the more probable routes of accumulation. A review of excretion data for thorium indicates that it is too limited at this time to permit valid estimation of body burden. NSA 11-877

THE CALCULATION OF MAXIMUM PERMISSIBLE CONCENTRATIONS FOR LONG-LIVED RADIOISOTOPES. J. W. Healy (General Electric Co., Richland, Wash.). Radiation Research 4, 367-72(1956). NSA 10-9076

7843

EFFECTS OF IONIZING RADIATION ON THE SEX CELLS

OF MISGURNUS FOSSILIS. A. A. Neifakh. (Severtsov Inst. of Animal Morphology). Doklady Akad. Nauk S. S. S. R. 111, 585-8(1956). (In Russian).

The percentages of living embryos hatched from irradiated Misgurnus gametes were determined. The ϕ gametes were somewhat less radiation sensitive than the σ , although the curves for percentage of living embryos vs. dose were similar. Viability was minimum (20 per cent for σ , 35-48 per cent for ϕ) at 2000-3000 r, increasing to 70-85 per cent at 96,000 and 40,000 r, respectively. When both gametes were irradiated, the viability of the embryos became a probability function. Individual theoretical curves are similar but different from the experimental. The difference is explained by the fact that average values are plotted and by failure to take recessive lethal characteristics into account. NSA 11-3657

7849

INVESTIGATION OF THE EFFECT OF AN INTEGRAL DOSE DISTRIBUTION ON THE LIFETIME OF WHITE MICE AFTER TOTAL-BODY IRRADIATION (1200 r). Kurt Heub and Irmgard Wolf. Strahlentherapie 102, 539-42(1957). (In German).

White mice were irradiated with a surface integral dose of 1200 r. The dose distribution within the mouse was of rotational symmetry with respect to the axis of its trunk. The qualities of radiation used were between 2.5 and 30 mm HVL of tissue. The dose distribution was calculated and measured by the radiation-induced discoloration of plastics. There was a difference only

at a very inhomogeneous dose distribution. This effect may be explained by the peripheral position of the organs sensitive to radiation. NSA 11-8784

THE PROBLEM OF VARIABLE RADIOSENSITIVITY. D. Hofmann. *Strahlentherapie* 97, 231-8(1955). (In German).

This is a cumulative report on literature on this subject. Investigations to date seem to indicate that high-speed electrons and ultrahard x rays have greater therapeutic electivity than hard x rays. NSA 9-6568

7859

REPORT ON FURTHER RESEARCH OF THE BIOLOGICAL EFFECTS OF ULTRAFRACTIONATED IRRADIATIONS. D. Hofmann and K. Muller. *Strahlentherapie* 96, 403-7 (1955). (In German).

By means of stroboscopic disks with a great number of revolutions, the authors made more extensive investigations regarding the dependence of the biological

effect on the conditions of ultrafractionated irradiations (β -rays of radium). The eggs of *Drosophila melanogaster*, 1.5 and 4.5 hours old, were used in these experiments. The authors found complicated relations between frequency and effect which generally had at least one pronounced maximum of action. Their formation seems to be attributable to reciprocal actions between the radiation impulse and the restitutional pause. NSA 10-6485

INACTIVATION OF SOME ANIMAL VIRUSES WITH GAMMA RADIATION FROM Co⁶⁰. Russell T. Jordan and Lloyd L. Kempe (Univ. of Michigan, Ann Arbor and City of Hope Med. Center, Duarte, Calif.). Proc. Soc. Exptl. Biol. Med. 91, 212-15(1956).

Gamma radiation from Co⁶⁰ proves to be an effective method for inactivation of Lansing poliomyelitis, St. Louis encephalitis, Western equine encephalomyelitis and vaccinia viruses. Partially purified suspensions of viruses tested were more vulnerable to lethal effects of γ radiation than were crude suspensions. In crude and partially purified suspensions the smaller viruses required larger doses of radiation for inactivation than did the larger viruses. The rate of inactivation for viruses tested is an exponential function of the dosage of gamma radiation. NSA 10-6478

RADIATION BIOLOGY OF BACTERIA. EXPERIMENT AND THEORY. P. Jordan. Protoplasma 32, 464-80(1939). (In German).

A review and critical analysis of irradiation phenomena in bacteria leads to the following conclusions: Approximately the same lethal spectrum (2200 Å and below) characterizes a large series of bacteria and several other forms and this spectrum of nucleic acid. Where the author concluded from Wyckoff's findings that μ mortality is effected through a single hy absorption, he is now in position to localize the lethal hy absorption more closely. The effect works in the nucleic acid of cell nuclei (or nucleus like bodies) and the lethal unit ionization has been localized there, too. BA 14-7220

THE FATE OF RADIATION-INDUCED LETHALS IN A

YEAST POPULATION. A. P. James and C. E. Chaplin (Atomic Energy of Canada, Ltd., Chalk River, Ont. and Bacteriology Div., Science Service, Ottawa). Radiation Research 5, 162-6(1956).

The effect of radiation-induced recessive lethals on the well-being of heterozygotes in an asexually multiplying population of diploid yeast is described. Frequency of heterozygotes serves as a measure of phenotypic effect of a sample of induced lethals only in early postirradiation generations. Much of the decreased frequency of heterozygotes in the first five generations is attributed to partial dominance of recessive lethals. NSA 10-9956

Mound Lab., Miamisburg, Ohio. THE EFFECTS OF CELL DIVISION INHIBITION ON PHOSPHORUS METABOLISM OF *ESCHERICHIA COLI*. B. J. Katchman, E. S. Spoerl and H. E. Smith. May 24, 1954. 10p. Contract AT-33-1-gen-53. (MLM-976).

The effects of cell division inhibition on P metabolism of *Escherichia coli* due to treatment by radiation and certain organic compounds are reported. Filamentous cell forms are produced by treating the cells with the radiations and compounds cited. A method for partitioning and analyzing phosphorus compounds of normal and filamentous forms of *Escherichia coli* is described. Comparison between both types of cells shows no change in intracellular phosphorus content, except for some variation in those cells exposed to α radiation. NSA 10-3252

THE TIME FUNCTION OF P^{32} INCORPORATION INTO DNA OF REGENERATING LIVER: THE EFFECT OF IRRADIATION. Lola S. Kelly, J. Dorothy Hirsch, Genevieve Beach, and Wynne Palmer. Cancer Research 17, 117-21(1957).

An increase in P^{32} incorporation began 30 hours after a massive dose of CCl_4 , with a maximum at about 40 hours. DNA synthesis was depressed when mice were irradiated 0, 12, 72, or 96 hours after administration of CCl_4 , it was not affected when radiation was given between 24 and 48 hours after CCl_4 . Mitotic activity was absent 5 hours after radiation, began to return at 14 hours and reached the control value at 26 hours. (from authors' summary).

Michigan. Univ., Ann Arbor. Engineering Research Inst. COMBINED EFFECTS OF HEAT AND RADIATION IN FOOD STERILIZATION. REPORT NO. 9 (TERMINATION) (FOR) JUNE 7, 1954-OCTOBER 6, 1955. Lloyd L. Kempe. 48p. Project No. 7-84-01-002. Contract DA 44-109-gm-1826. (PB-121308).

An investigation was made on the combined effects of heat and radiation in food sterilization. Spores of several strains of *Clostridium botulinum* were tested for resistance to the killing effects of heat and radiation alone, in various combinations, and in the presence of various chemical agents. NSA 10-9919

7912

THE EFFECT OF X-RAYS UPON DISEASES OF BACTERIAL ORIGIN. C. Kempster. Lancet 2, 423-424(1917).

Tuberculous glands, subjected to x rays, atrophy and become sterile of tubercle bacilli. Similar glands exposed to stimulation, such as fomentations and iodine do not atrophy and become sterile, but increase in size and bacillary virulence. Conclusion: x rays acting upon diseases of bacterial origin do not have germicidal powers, but do have an inhibitory effect upon reproduction of bacteria. They stimulate living tissue, causing increased phagocytosis and destruction of unproductive colonies of micro-organisms.

7913

INFLUENCE OF TESTIS ON INDUCTION OF OVARIAN TUMORS OF MICE BY X-RAYS. Arthur Kirschbaum,

Annabel G. Liebelt, and Gilbert H. Fletcher (Baylor Univ. Coll. of Medicine, Univ. of Texas M. D. Anderson Hospital and Tumor Inst., and Texas Med. Center, Houston). Proc. Soc. Exptl. Biol. Med. 92, 221-2 (1956).

When irradiated ovaries were grafted into intact and into castrated male Balb/c mice, ovarian tumorigenesis proceeded. Functional normal ovarian grafts into previously irradiated Balb/c females inhibited tumorigenesis in the irradiated ovary. It appears that irradiation-induced ovarian tumorigenesis in this inbred strain is inhibited almost completely by ovarian, but only to a minor degree by testicular secretion. NSA 10-9941

7934

THE INFLUENCE OF STRAIN ON ACUTE X-RAY LETHALITY IN THE MOUSE. I. LD_{50} AND DEATH RATE STUDIES. Henry I. Kohn and Robert F. Kallman (Univ. of Calif. School of Med., San Francisco). Radiation Research 5, 309-17(1956).

Adult mice were irradiated with x rays. $\text{LD}_{50(19)}$ was the same as $\text{LD}_{50(28)}$. Females were slightly more resistant than males. Slope function of the probit-transformed dose-effect (killing) curve was the same for all strains. $\text{LD}_{50(28)}$ and death-rate curves for different strains are presented. (from authors' summary). NSA 11-857

7935

THE INFLUENCE OF STRAIN ON ACUTE X-RAY LETHALITY IN THE MOUSE. II. RECOVERY RATE STUDIES. Henry I. Kohn and Robert F. Kallman (Univ. of Calif. School of Med., San Francisco). Radiation Research 6, 329-38(1957).

Rate of recovery from a single, whole-body exposure to x rays (250 Kvcp, HVL 1.6 mm Cu, tissue-dose rate r 35 r/min) was determined with two-fraction technique for five types of adult mice (100 to 200 days old). Initial dose was 350 r. A 12-hour latent period preceded exponential recovery. Half-recovery times (RT_{50}) were influenced by constitutional factors, presumably genetic in origin. Fractionation did not fundamentally change the distributions of death, although it did perturb them. (from authors' summary). NSA 11-5728

7936

RELATIVE BIOLOGICAL EFFICIENCY OF 1000-KVP AND 250-KVCP X-RAYS. III. DETERMINATIONS BASED ON THE $\text{LD}_{50/28}$ AND THE KILLING TIME OF THE MOUSE. Henry I. Kohn and Robert F. Kallman (Univ. of Calif. School of Med., San Francisco). Radiation Research 5, 693-9(1956).

For the $\text{LD}_{50/28}$ relative biological efficiency (tissue dose) and its 95% confidence limits were 0.839 (0.807 to 0.873). Relative biological efficiency based on the killing time (range, 4 to 16 days) was the same as relative biological efficiency based on the $\text{LD}_{50/28}$. No difference in the biological mode of action of the two beams was noted. (from authors' summary). NSA 11-2793

7937

AGE, GROWTH, AND THE LD_{50} OF X-RAYS. Henry I. Kohn and Robert E. Kallman (Univ. of Calif. School of Med., San Francisco). Science 124, 1078(1956).

Radiation factors were 250-Kvcp x rays; half-value layer, 1.6 mm Cu; tissue-dose rate, approximately 35 r/min. Results: LD_{50} was a linear function of log age from 37 to 105 days, but was practically constant from 115 to 709 days. The diphasic dependence of the LD_{50} on log age was similar to that for log body weight, a parameter of growth. For the first 80% of the lifespan, LD_{50} increased until growth rate fell to its fully mature level, after which it remained constant. NSA 11-874

7938

RELATIVE BIOLOGICAL EFFICIENCY OF 1000 KVP AND 250-KVCP X-RAYS. IV. DETERMINATIONS BASED ON THE DOSE-RESPONSE CURVES FOR TESTICULAR WEIGHT IN THE MOUSE. Henry I. Kohn and Robert F. Kallman (Univ. of Calif. School of Med., San Francisco). Radiation Research 5, 700-9(1956).

Dose estimated was the tissue dose in the testes. Results of partial-body and whole-body exposures differed by less than 5% and their average was therefore considered to be practically independent of abscopal effects and of integral dose. From the combined results it was concluded that the relative biological efficiency lies between 0.78 and 0.87, the most likely value being 0.82. (from authors' summary). NSA 11-2793

7939

RELATIVE BIOLOGICAL EFFICIENCY OF 1000-KVP

AND 250-KVCP X-RAYS. V. DETERMINATIONS BASED ON THE LD₅₀ OF THE 4-DAY-OLD CHICK EMBRYO. Henry L. Kohn and Robert F. Kallman (Univ. of Calif. School of Med., San Francisco). *Radiation Research* 5, 710-14(1956).

Survival was judged by the number of surviving 7 hours after radiation. Value of the relative biological efficiency was 0.897 ± 0.019 . This value fell in the range 0.82 to 0.91. (from authors' summary). NSA 11-2793

ON THE ORIGIN AND MODE OF ACCUMULATION OF THE HEMOLYTIC FACTOR OBSERVED IN THE LIVER OF X-RAYED RATS. Yu. B. Kudryashov. *Doklady Akad. Nauk S.S.S.R.* 109, 515-18(1956). (In Russian).

The capacity of the liver for hemolysis appeared in the first hours after irradiation with 500 and 1000 r and increased with increasing duration of radiation sickness of the animals. The maximal hemolytic effect coincided with death of the animals after radiation. In surviving rats, however, (e.g. beginning on the fourteenth

day after 500 r) activity of the hemolytic factor gradually decreased, ultimately reaching zero. NSA 11-841

STRONTIUM-90 IN MAN. J. Lawrence Kulp, Walter R. Eckelmann, and Arthur R. Schuler (Columbia Univ., Palisades, N. Y.). Science 125, 219-25 (1957).

The world wide average Sr^{90} content of man was about 0.12 micromicrocurie per gram of calcium (1/10,000 of the maximum permissible concentration) in the fall of 1955. A few values as high as 10 times the average have been obtained. This value is in accord with the predicted value based on fallout measurements and fractionation through the soil-plant-milk-human chain. With the present burden of Sr^{90} this average level should rise to 1 to 2 micromicrocuries of Sr^{90} per gram of calcium by 1970. NSA 11-4257

Texas. Univ., Austin. Radiobiological Lab. URINARY COPROPORPHYRIN EXCRETION OF RATS FOLLOWING GAMMA IRRADIATION. Elwood H. LaBrosse and Joe E. Smith. June 8, 1955. 6p. (AF-SAM-55-135).

Daily urinary coproporphyrin excretion of 1-year-old female Sprague-Dawley rats was determined for 4 days pre-irradiation and 4 days post-irradiation. The rats were divided into 5 groups of 4 animals each and were exposed to gamma irradiation from a Co^{60} source at a dose rate of 100 r/min. Total doses were 100 r, 250 r, 500 r, 750 r, and 1,000 r. No relationship was observed between dose and post-irradiation coproporphyrin excretion. Urinary coproporphyrin excretion does not appear to offer promise as a biologic dosimeter. NSA 11-1394

INVESTIGATION OF BIOLOGICAL PROTECTIVE AGENTS. PART XVI. ON THE PROTECTIVE EFFECTS OF CYSTEAMINE ON ACUTE RADIATION MORTALITY OF MICE. Hanns Langendorff and Alexander Catsch. Strahlentherapie 101, 536-41(1956). (In German).

The influence of a preliminary application of cysteamine on the acute radio-mortality of mice is less pronounced in the case of fractionated irradiation than in the case of single irradiation. Cysteamine and/or fractionation of the radiation dose cause an increase of the LD₅₀ values and a change of the shape of the dose effect curves. NSA 11-3309

7972

INVESTIGATION ON A BIOLOGICAL PROTECTIVE SCREEN. XVII. THE EFFECT ON RADIATION PROTECTION OF CYSTEAMINE ADMINISTERED AFTER PARTIAL BODY IRRADIATION. Hanns Langendorff, A. Catsch, and R. Koch. Strahlentherapie 102, 51-7(1957). (In German).

Cysteamine administered to rats within the first 24 hours after a partial irradiation entails a reduction of the 30-days-mortality. The protective effect can be observed only in the range of medium ray doses and is less distinct than in an irradiation preceded by cysteamine treatment. The combined application of cysteamine and liver homogenate or liver hydrolysate respectively, has no effect. A proved explanation of the observed effect cannot yet be given. NSA 11-5176

7975

INVESTIGATION ON A BIOLOGICAL PROTECTIVE SCREEN. PART XVIII. THE EFFECT OF CENTRAL NERVOUS SYSTEM ON THE IRRADIATED ANIMAL. Hanns Langendorff and R. Koch. Strahlentherapie 102, 58-64(1957). (In German).

The radioprotective effect of oxytryptamine (serotine), benzedrine, d, 1-ephedrine (ephetonine) and cardiazol (pentamethylene tetrazol) were tried in mice which had been exposed to a total roentgen dose of 500 r. In keeping with a former observation with tryptamine, a protective effect was found with oxytryptamine and benzedrine; d, 1-ephedrine and cardiazol were ineffective. The existence of this phenomenon is attributed to a special central nervous mechanism. This theory is supported by the observation that, contrary to the increased central effect of benzedrine in the irradiated animal, the convulsion threshold of cardiazol remains invariable up to x ray doses capable in themselves of provoking central excitation. 7984

THE ACTION OF RADIATIONS ON VIRUSES AND BACTERIA. D. E. Lea. *Brit. Med. Bull.* 4, 24-26 (1946-1947).

Chemical effects of radiation on inorganic and organic solutes are described. Inactivation of phage 5-13, a macro-molecular virus, is explained and calculations of inactivation dose in millions of r and inferred "target" diameter in $m\mu$ are presented for phage exposed alpha, beta, gamma rays. Inactivation of vaccinia virus is also discussed. Effects of radiations on bacteria are mutations (permanent changes in form or color of colonies) reduction of motility, temporary inhibition of division and lethal action. Bacteria grown on a nutrient medium exposed to a suitable intensity of radiation fail to divide but continue to grow in the sense of increasing in volume. Hence, rod shaped bacteria grow into long filaments. BA 20-15791

7985

THE MECHANISM OF THE BACTERICIDAL ACTION OF RADIOACTIVE RADIATIONS. I. THEORETICAL. D. E. Lea, R. B. Haines, and C. A. Coulson. *Proc. Roy. Soc. (London)* 120B, 47-76(1936).

A technique is described for the preparation of bacteria in thin gelatin films for exposure to corpuscular radiations of low penetrating power. Results are expressed in terms of mean ionization dosage required to produce death and also in terms of the target size.

7986

THE ACTION OF RADIATIONS ON BACTERIA. III. γ -RAYS ON GROWING AND ON NON-PROLIFERATING BACTERIA. D. E. Lea, R. B. Haines, and C. A. Coulson. *Proc. Roy. Soc. (London)* 123B, 1-21(1937).

Authors describe lethal action of γ radiation on aqueous suspensions of *B. coli* and spores of *B. mesentericus*. Conclusion: the production of long forms is due to inhibition of division, while growth, in the sense of increase of volume, is unaffected.

COMPARATIVE STUDY OF THE PHYSIOLOGICAL EFFECTS OF X-IRRADIATION AND RESISTANCE TO TRAUMATIC SHOCK. J. M. McKenna and B. W. Zweifach (New York Univ. Bellevue Medical Center and Beth Israel Hospital, New York). *Radiation Research* 6, 126-36 (1957).

Total body x irradiation predisposes rats to subsequent traumatic shock. Effect is both time and dose dependent. Sublethal exposure (350 r, 500 r) leads to transient period (5-10 days) of increased susceptibility to trauma. Lethal doses (650 r, 750 r, 900 r) predispose rats for periods up to 50-60 days. No apparent relationship of predisposition to radiation induced leukopenia or bacteremia was demonstrated. Adaptation to trauma has no protective carryover against lethal effects of x irradiation. Mechanisms responsible for resistance to trauma could not be determined by exposure to x ray. Previously irradiated rats could be made resistant to trauma by a training regime. NSA 11-5159

HEALTH AND SAFETY IN A NUCLEAR POWER INDUSTRY.

A. S. McLean and W. G. Marky. *J. Brit. Nuclear Energy Conf.* 1, 24-34(1956).

A short review of general effects of radioactivity and ionizing radiation on human beings is presented, and basic problems of radiation protection are stated. Various features of nuclear development, chemical separation plants, and waste-disposal facilities are examined in relation to potential occupational and public health hazards and compared with health and safety problems elsewhere in industry. Experience of the Atomic Energy Authority is reviewed and used to indicate types of protective measures and procedures most likely to be effective in ensuring safe development in the industry. EFFECT OF IONIZING RADIATION ON CAROTENOID STABILITY. REPORT NO. 3 (FINAL) (FOR) NOVEMBER 15, 1954 TO FEBRUARY 29, 1956. 10p. Project No. 7-84-01-002. Contract DA-19-129-gm-254. (PB-121313).

Destruction of carotenoid pigments by gamma-radiation depends upon the extent to which the free radicals of peroxides formed in surrounding medium are available for reaction. Loss of carotenoids in irradiated whole tomatoes is small even at dosages of several million rep, but the internal structure of the tomato is destroyed. The problem is therefore one of pectin and carbohydrate instability. NSA 10-9922

EFFECTS OF LOW-LEVEL X-IRRADIATION ON OXYGEN CONSUMPTION OF BULLFROG ERYTHROCYTES. W. S. Martin, R. C. Grubbs, and M. A. Lessler. (Ohio State Univ. Coll. of Medicine, Columbus). *Am. J. Physiol.* 187, 505-8(1956).

Rate of oxygen consumption by 50% cell suspension of the nucleated erythrocytes (rbcs) of bullfrogs was determined at 25°C and at 30°C, the studies including irradiated cells (25 r or 60 r of x rays) as well as unirradiated cells. The 5° temperature drop (from 30° C to 25° C) decreased oxygen consumption of both types of cells by about 20%. Oxygen consumption was inhibited by 10-15% at 30°C following exposure to 25 r or 60 r and was inhibited by about 14% following 60 r but not 25 r at 25°C. Consistent correlations between dose and radiation effects were established. NSA 11-4231

ON THE BIOLOGICAL AND BIOCHEMICAL EFFECT OF IONIZATION ON RATS. PART IV. URIC ACID EXCRETION OF RATS AFTER TOTAL X IRRADIATION UNDER THE INFLUENCE OF ADENOSINE TRIPHOSPHORIC ACID. Hans-Joachim Maurer and Peter Schwarzmann. *Strahlentherapie* 100, 463-76(1956). (In German).

After total roentgen irradiation of 625 r the uric acid excretion of rats shows a wave-like course. After Doca the same changes can be stated. Here, however, the normalization seems to occur already after a shorter period. After administration of doses of adenosine triphosphoric acid an increased uric acid excretion before and after the irradiation could be observed. An influence on the radio-sensibility could not be found. NSA 11-42

PLASMA LIPROTEINS AND MUSCLE ADENOSINE TRIPHOSPHATE IN RABBITS AFTER LOCAL IRRADIATION. Lawrence J. Milch, James V. Stinson, and Harry G. Albaum (USAF, Randolph Field, Texas, and Brooklyn College, Brooklyn, New York). *Radiation Research* 4, 321-5(1956).

Rabbits were subjected to local irradiation of the hind limb with three dose levels of x irradiation and with 30,000 r of γ irradiation at varying dose rates up to 3800 r/min. The x-irradiated animals were sacrificed at 24 hr after exposure, separate groups of γ -irradiated rabbits were sacrificed at 24 and 96 hr postexposure. Analyses revealed that plasma lipid and lipoprotein concentrations were significantly increased in all irradiated rabbits and that the lipoprotein change was independent of dose, radiation type, and, in the instance of γ -radiation, dose rate and time after exposure up to 4 days. The ATP concentrations of the irradiated muscles, on the other hand, were consistently unaltered by 30,000 r of γ -rays and by all dosages of x rays except 25,000 r. NSA 10-7422

TOXICITY OF LIPID PEROXIDES IN THE RAT. J. S. Andrews, J. F. Mead and W. H. Griffith. *Federation Proc.* 15, 918(1956).

It was assumed that products of fat oxidation initiated by irradiation are essentially the same as products of autooxidation. Degree of oxidation was estimated by measuring peroxide content of fat. Rats were fed on diets which contained fat with peroxide numbers (PN) of 400, 800 and 1200. The 400 PN diet resulted in reduction in growth, increasing dietary PN increasing the growth depression until 1200 PN diet which caused death in about 3 weeks. The 800 PN diet caused moderate to severe diarrhea which subsided during the 8th week. Rats consuming the 100 PN diet for 8 weeks received total body x-irradiation of 600 r. After 30 days, 3 controls died and 7 rats on 100 PN

diet also died. Consumption of 100 PN diet caused slower than normal recovery from stress of radiation.

QUANTITATIVE OBSERVATION ON RECOVERY FROM WHOLE BODY IRRADIATION IN MICE. I. RECOVERY AFTER SINGLE LARGE DOSES OF RADIATION. R. H. Mole. Atomic Energy Research Establishment, Harwell, Berks, England. *Brit. J. Radiol.* 29, 563-9(1956).

Delayed deaths, 30-150 days post-irradiation, contribute significantly to the lethality following 2 doses at spaced intervals and to lethality following single exposure of older mice. Delayed deaths are associated with chronic wasting, moist feces and an excoriated anus. Recovery after radiation is an exponential function only if delayed deaths and very early deaths are ignored. Author discusses possible explanations for the two exceptional periods (very early; very late) including production of a toxic substance and altered radiosensitivity of normally dormant and radioresistant cell populations that are necessary for recovery. 8069
National Academy of Sciences. REPORT OF THE COMMITTEE ON GENETIC EFFECTS OF ATOMIC RADIATION: SUMMARY REPORTS, 1956. 123p. (NP-6017(p. 1-31)).

Radiations produce harmful mutations. It is difficult to estimate how much harm will appear in future generations. Geneticists agree the potential danger is great. A dose of not more than 10 r of manmade radiation to the reproductive cells in a maximum safe lifetime dose. The average person now receives some 3 or 4 r from x rays, roughly the same as the dose received from background radiation. The fall-out from nuclear weapons testing has, so far, led to considerably less irradiation than have the medical uses. NSA 10-7392

8070
National Academy of Sciences. REPORT OF THE COMMITTEE ON PATHOLOGICAL EFFECTS OF ATOMIC RADIATION. p. 32-44 of THE BIOLOGICAL EFFECTS OF ATOMIC RADIATION: SUMMARY REPORTS. 1956. 123p. (NP-6017(p. 32-44)).

A review was made of acute and chronic effects of radiation on animals and of such data on human beings as are available. The sequence of pathological changes is quite similar in man and in animals, although man has certain definable peculiarities. Some success has been achieved in the therapy of radiation injuries using antibiotics and properly timed blood transfusions. Shielding of a portion of the body seems to give a degree of protection disproportionately large for the mass shielded. NSA 10-7393

FIRST REPORT FROM NORSK HYDRO'S INSTITUTE FOR CANCER RESEARCH FOR THE PERIOD FROM ITS OPENING IN 1954 TO JULY 1, 1956. Oslo. Norsk Hydro's Inst. for Cancer Research. 1956. 51p. (NP-6318).

In addition to routine studies at the Institute a 31-Mev betatron was employed for comparative studies of high energy and conventional x radiation on various biological test systems. Cysteamine and cystamine labeled with S^{35} were employed in investigations on the radio-protective effects of these chemicals. A list of publications from 1954 to 1956 is included. NSA 11-8806
