THE EFFECT OF EXPOSURE TO THE ATOMIC BOMBS ON PREGNANCY TERMINATION IN HIROSHIMA AND NAGASAKI. J. V. Neel and W. J. Schull. Washington, National Academy of Sciences-National Research Council. 1956. 241p.

Irradiation and the outcome of 76,626 pregnancies terminating in Hiroshima and Nagasaki between 1948 and 1953 is presented. Aspects considered include sex, malformation, viability at birth, birthweight, and death during the first six postpartum days. On a sample of 19,818 pregnancy terminations followed up at age nine months, data were obtained on infant survival, malformations, and growth of the child. Variation in indicators of genetic changes were analyzed in relation to parents. NSA 11-3294

8080

RADIATION THERAPY WITH 20 MEV. R. Glocker. *Strahlentherapie* 78, 541(1949).

A review is given of work on the betatron and other high energy machines, particularly insofar as it applies to radiation therapy with energies up to 20 Mev. It is pointed out that depth-dosage curves for very hard x-rays show a maximum at a certain depth which is more pronounced and shifted toward greater depth with increasing hardness. This is due to the production of Compton electrons by the x-rays. Moreover, there is a decrease in the half-value thickness for energies through pair production. Finally, it is mentioned that irradiation with electrons rather than x-rays from high energy machines has the practical advantage of a more limited range of penetration for the same energy. 8104

THE INFLUENCE ON TISSUE RESPIRATION OF X RADIATION. Helmut Pauly and Boris Rajewsky. Strahlentherapie 99, 383-6(1956). (In German).

The authors report on their researches on organs of mice (liver, renal cortex, spleen) to determine the dependence of tissue respiration on the applied x-ray dose. The results of the experiments have shown that only after doses ranging about 100,000 r the tissue respiration decreases perceptibly. The dose effect curves are clearly described by means of a formula gained through considerations of hit-theoretical and reaction-kinetic character. NSA 10-9067

β-GLUCURONIDASE ACTIVITY IN LYMPHATIC TISSUES OF THE RAT AFTER X-RAY IRRADIATION OF THE WHOLE BODY. C. Pellegrino and G. Villani (Univ of Pisa, Italy). *Biochem J.* (London) 65, 599-603 (1957). NSA 11-5717

8106
FACTORS INFLUENCING DIURESIS IN RATS FOLLOWING TOTAL-BODY X-IRRADIATION. E. Irene Pentz and Robert J. Hasterlik (Univ. of Chicago, Ill.). *Am. J. Physiol.* 189, 11-14 (1957).

Immediate diuresis was observed in rats exposed to total body x ray doses ranging between 100 and 400 r. Highest dosage produced more consistent results. X-ray was used in conjunction with extirpation of various glands and other organs to determine mechanism that responds so promptly to x irradiation. Anterior pituitary and adrenal cortex are particularly important. Removal of anterior lobe of pituitary or removal of adrenal glands was sufficient to inhibit diuresis following 400 r x irradiation. This diuretic response was not dependent on presence of posterior pituitary since animals having only this gland removed showed diuresis following exposure to 400 r. This suggests that release of antidiuretic substances from tissues other than posterior pituitary, under control of anterior pituitary-adrenal cortex. NSA 11-8767

SUSCEPTIBILITY TO ORAL INFECTION IN MICE AS A FUNCTION OF POSTIRRADIATION TIME. Eugene H. Perkins, David M. Donaldson, and Stanley Marcus. 1955. 9p. (AF-SAM-56-51).

Total-body irradiation resulted in increased susceptibility to infections on first, third, fourth, and fifth postirradiation days. No difference in mortality was observed if mice were challenged at later dates or 1, 2, or 3 days prior to irradiations. Increased susceptibility to infection via the oral route depends on damage to the gastrointestinal tract in conjunction with depression of cellular and humoral defenses which develop later. BIOLOGICAL AND MEDICAL ASPECTS OF IONIZING RADIATION. MODIFICATION OF THE RADIATION-INDUCED INCREASES IN PHOSPHATASE ACTIVITY OF HEMATOPOIETIC TISSUES BY CHEMICAL AGENTS. Donald F. Petersen and Kenneth P. DuBois. (1955). 8p. (AF-SAM-55-61).

Experiments with p-aminopropiophenone, cysteine, and mercaptoethylamine showed that pretreatment with these agents reduced the increase in phosphatase activity observed in the spleens and thymuses of irradiated rats. Protective capacity of each compound against x-ray

mortality coincided with its ability to diminish phosphatase activity of hematopoietic tissues. These agents modify damage to the hematopoietic tissues. NSA 10-6489

ON THE CHANGES OF BLOOD PLATELETS DURING AN ACUTE RADIATION SICKNESS. A. S. Petrova. *Med. Radiol.* 1, No. 4, 52-6 (1956). (In Russian).

Rabbits were x-irradiated with 800 or 1500 r, and the number of thrombocytes, the thrombocyte formula, thrombocyte surface area, blood, coagulation time, clot retraction time and amount of prothrombin were determined. In both groups the number of thrombocytes decreased within 3 hours after irradiation and young forms decreased. The decrease in young forms was 92 per cent in the 1st group by the 8-1- day and 100 percent in the 2nd group by the 7th day. In 10-15 days, the average thrombocyte surface area increased 22-49 per cent. Coagulation time increased and the clot retraction time and prothrombin level were decreased beginning on the first day post exposure. NSA 11-888

PHYSIOLOGY AND TOXICOLOGY OF TRITIUM IN MAN. Ernest A. Pinson and Wright H. Langham (Los Alamos Scientific Lab., N. Mex.). *J. Appl. Physiol.* 10, 108-26 (1957).

Using tritium water as a tracer in man, H₂O absorption through G. I. tract was found to begin min. after ingestion and to be complete in 40-45 min. Vol. of H₂O transferred from intestine to blood increased linearly with time and was proportional to vol. of H₂O ingested, within range of 10-1000 ml. On exposure to HTO vapor, via inhalation, man absorbed through respiratory system 98-99% of activity inspired. Activity in venous blood increased sharply and shortly after inhalation exposure; then declined exponentially to reach equilibrium with a 1/2 time of about 12 mins. Average dilution vol. was 62.6% and biological half-time of tritium in body H₂O averaged 11.5 days. In man exposed to atmosphere containing HTO, the HTO entering body through lungs. Both man and rat slowly oxidized inspired HT to HTO. Radiation hazard from exchange of

tritium with H₂ in tissues after chronic or acute exposure to HTO was small. Based on human data, maximum permissible body burden of tritium is 3.7 mc; maximum permissible concentrations of tritium oxide in air and H₂O for continuous 24 hr. exposure estimated to be 5×10^{-6} $\mu\text{c}/\text{ml}$ and 0.1 $\mu\text{c}/\text{ml}$. ALTERATIONS IN ADENOSINE TRIPHOSPHATASE ACTIVITY DURING ACUTE AND SUBACUTE RADIATION SICKNESS. E. A. Prokudina. (Central Research Inst. of Roentgen-Radiology). *Med. Radiol.* 1, No. 6, 46-51 (1956). (In Russian)

Adenosinetriphosphatase (ATP-ase) activity was estimated in liver, kidney, brain, spleen, thymus, lymph nodes and testes of mice and rats after whole body exposure to an x ray dose of 1000 r or 3000 r. Only the lymphatic tissues and testes showed a change in the enzyme activity (marked increase) after irradiation. By means of spleen shielding and irradiating only the spleen, the ATPase activity and morphological changes were shown to be due to a direct radiation effect on that organ due either to increased release of the enzyme from the cells or to an alteration of the enzyme per sec. THE EFFECT OF X-RADIATION *IN VIVO* ON PROTEIN AND NUCLEOPROTEIN METABOLISM IN THE RAT. J. E. Richmond, Margery G. Ord, and L. A. Stocken (Univ. of Oxford). *Biochem. J.* (London) 66, 123-7(1957).

Authors studied incorporation of labeled glycine, lysine and phosphate into rat tissues 2 hours after 1000 r of x radiation. Uptake of P³² and 2-C¹⁴ glycine by rat thymus DNA was reduced by x radiation. Incorporation of glycine and lysine into thymus nucleoproteins was decreased, but uptake into liver nucleoproteins was not affected. Incorporation into cytoplasmic proteins of thymus, liver and pancreas was unaffected or slightly increased. The difference in the radiosensitivity of liver and thymus is discussed. Observations on blood and bone marrow proteins are also reported. NSA 11-7052

RADIATION-INDUCED ALTERATION OF FIBRINOGEN CLOTTING RATE AND CLOT LABILITY. Peter Rieser. (Univ. of Pennsylvania, Philadelphia and Marine Biological Lab., Woods Hole, Mass.). *Proc. Soc. Exptl. Biol. Med.* 91, 654-7(1956).

Purified bovine fibrinogen was exposed to single x ray doses in ranges of 25-100 r and 100-500 r. In each case the log of the thrombin clotting time increased linearly with increasing dose. Clotting delay due to irradiation was dependent on thrombin concentration but independent of fibrinogen concentration. Addition of sulfhydryl reagents prior to exposure failed to abolish radiation induced clotting defect. Irradiation of fibrinogen increased the rate of solution of fibrin clots in concentrated urea. Inconclusive results were obtained in this experimental trial of injecting 6.6 mc of Au^{198} into the subarachnoid space of a dog in order to learn whether the isotope could be used in place of x ray therapy in the treatment of medulloblastoma. NSA 10-9933

8156

EFFECT OF RADIATION ON DNA SYNTHESIS IN MAMMALIAN CELLS. L. S. Kelly. *Prog. Biophys. Chem.* 8, 143-163(1957).

Irradiation with doses of the order of 100-5000 r depresses the rate of incorporation of precursors into DNA of most mammalian tissues. Inhibition of DNA synthesis appeared to reflect changes in cell populations rather than specific aberrations in synthesis. Ascites tumor maintained normal DNA synthesis for a considerable time after radiation. Radiation may abolish mitosis without producing a discernable effect on DNA synthesis and it is suggested that radiation-induced mitotic delay may be due to some radiosensitive process that is independent of DNA synthesis. On the other hand, mitotic inhibition could influence DNA synthesis by preventing cells from entering the synthetic phase of the cell cycle. Biochemical changes are difficult to interpret in tissues composed of mixed cell populations. Tissues studied: spleen and thymus (rat), liver, regenerating liver, solid tumors (mice.)

EFFECT OF SUCKLING YOUNG OF X-IRRADIATION OF LACTATING MOTHER. Robert Rugh (Radiological Research Lab., Columbia, Univ.). *Proc. Soc. Exp. Biol. Med.* 93, 523-4(1956).

Increasing x irradiation of nursing female mouse caused increasing retardation of growth of suckling young. Some effect was detected after 50 r exposure of mother on 3rd day post-parturition; a pronounced effect following 200 r or more. There was no evidence of toxic substance passing through milk to the young. Effect is attributed to simple starvation caused by general debilitation of the irradiated mother. Newborn mice starved by x-irradiated mother recover rapidly if given to normal lactating mother 15 days post parturition and by 30 days will be equal controls in body weight. NSA 11-2787

EFFECTS OF TOTAL BODY X-IRRADIATION AND PLUTONIUM INJECTION ON THE CHOLINESTERASE OF ERYTHROCYTES AND BRAIN. Jean C. Sabine (Los Alamos Scientific Lab., N. Mex.). Am. J. Physiol. 187, 275-9(1956).

Both total body x-irradiation (25 to 300 r) and injected plutonium ($0.63 \mu\text{C Pu}^{+6}$) produce an increase in the cholinesterase activity of erythrocytes of mice on the 4th day. In mice receiving 300 r, high values were found on the 3rd-5th days. Subsequently there was a sharp fall in this titer to values far below normal at the end of the 1st week. During the 2nd week recovery began and was apparently complete by the end of the 3rd week. The reticulocyte count was significantly depressed during the 1st week, and there was a small but significant reticulocytosis during the 3rd. In the plutonium-injected mice, the same early peak was observed and the same fall to values well below normal. There was no recovery during 63 days of observation. Data are presented for the 4th day following doses of x-rays from 15-300 r. From 25 r upwards there is a significant increase in the mean cholinesterase titer. There appears to be a relationship between the proportion of high individual titers and the dose, and the highest individual values were observed at 300 r. Data are presented on a large series of control mice, and these are shown to conform well to the normal distribution as evaluated by k-statistics. NSA 11-1727

8169
INACTIVATION OF CHOLINESTERASE BY GAMMA RADIATION. Jean C. Sabine. Am. J. Physiol. 187, 280-2(1956).

In vivo exposure to 60,000 r of γ radiation caused no change in cholinesterase activity or activity-pS kinetics of brains of rats sacrificed while having violent convulsions and diarrhea postexposure. In vitro studies revealed (1) no change in cholinesterase titer in whole

human plasma after 100,000 r of 1 mev x rays, (2) inactivation of dilute solution of the enzyme in M/15 phosphate buffer by 10,000-100,000 r doses in "single hit" phenomenon. Results of in vitro studies considered not to be directly related to cholinergic response seen in irradiated intact animals. NSA 11-1728

8182

SEVERAL FACTORS WHICH INFLUENCE THE RATE OF AVENA COLEOPTILE RESPIRATION. A. R. Schrank (Univ. of Texas, Austin). J. Cell. Comp. Physiol. 48, 77-85(1956).

The endogenous respiration of individual Avena coleoptiles taken from seedlings 96 hours old was measured in aluminum microrespirometers. Uniform rates were maintained for at least two hours. Geotropic stimulation and decapitation cause slight increases in the rate of oxygen consumption. The rates of oxygen utilization of coleoptiles grown from seeds exposed to

gamma rays from Co^{60} are dependent on the radiation dosage. Doses from 5,000 to 10,000 r inhibit the rate of oxygen consumption. From 0 to 5,000 r there is a slight increase in the respiration rate, and from 10,000 to 100,000 r there are several cycles of increased and decreased rates which result in a net increase of 39%. Since coleoptiles grown from seeds exposed to 100,000 r manifest an increased rate of respiration but grown only one-fourth as long as controls, the inhibition of growth by gamma rays apparently is not dependent on the effects of irradiation on O_2 consumption. NSA 11-1740

8183

RADIATION DAMAGE ON HUMAN BONES AFTER DEEP ROENTGEN THERAPY TO FEMALE CARCINOMA. Gerd Schroder. Strahlentherapie 96, 469-73(1955). (In German).

Four cases of pathological fractures after intensive deep roentgen ray therapy for cancer of mamma with typical localization in the upper, anterior ribs are described. The tumor dose was approximately 4000 r. The latent period up to the time when changes could be detected by roentgenological means, and when pains were felt by the patient, varied from 3 months to 2 years. Most of the radiolesions will neither become manifest nor reveal symptoms. (from the authors' summary). NSA 10-6486

Naval Radiological Defense Lab., San Francisco THE EFFECT OF WHOLE-BODY X IRRADIATION ON THE ELECTRO-CONVULSIVE THRESHOLD IN THE RAT. J. S. Schwartzbaum, E. L. Hunt, B. P. Davies, and D. J. Kimeldorf. May 24, 1956. 16p. Project 006-015. 04.

Relatively little information is available concerning the effects of ionizing radiation upon the electrophysiological activity of the brain. The present study was designed to investigate the possible effects of x rays upon the threshold for electroshock induced seizure in the rat. Seizure thresholds were determined before and after x irradiation or sham-irradiation (control) treatment. Several groups of irradiated and control animals were tested during the first week post-irradiation in order to describe the time course for the effect. Following whole-body exposure to 5000 r the electroconvulsive threshold was reduced. This decrement persisted throughout the six-day period of testing postirradiation. Significant changes were not detected in the magnitude of effect within this time period. The degree of threshold change produced by radiation exposure extended beyond the effect attributable to the post-irradiation decrease in body weight. NSA 10-8141

Rochester, N. Y. Univ., Atomic Energy Project. THE RESPONSE OF DOGS TO BILATERAL WHOLE BODY Co^{60} IRRADIATION. PART I. LETHAL DOSE DETERMINATION. James N. Shively, Sol M. Michaelson, and Joe W. Howland. Oct. 17, 1956. 13p. Contract W-7401-eng-49. (UR-465).

The mid-line tissue $\text{LD}_{50/30}$ for dogs exposed to bilateral irradiation from a Co^{60} source has been estimated to be 335 r with 95% confidence limits of 310 to 358 r. The mean day of death was 17.3 days. The Co^{60} mid-line tissue $\text{LD}_{50/30}$ dose is higher than that reported for x-ray. This dose, however, is essentially the same as that for unilateral x-irradiation applied to the dorsal aspect. NSA 11-836

8204

A STUDY OF THE EFFECTIVENESS OF PYRIDOXINE AND DRAMAMINE ON CLINICAL RADIATION SICKNESS. Anna Silverman, Morton M. Kligerman, John W. Fertig, and Kent Ellis. (Columbia Univ. Coll. of Physicians and Surgeons, New York and Presbyterian Hosp., New York). Radiology 66, 403-7(1956).

Authors describe their controlled clinical study of effectiveness of dramamine and pyridoxine on the course of radiation sickness. The group, studied over a period of one year, included 185 patients receiving deep x ray therapy. No significant differences were found in the frequency or duration of symptoms attributable to radiation sickness in groups of patients receiving pyridoxine, dramamine, or placebo. NSA 10-6498

FAST NEUTRON AND X-RADIATION FROM LABORATORY SOURCES. M. S. Silverman, V. P. Bond, V. Greenman, and P. H. Chin. Nov. 20, 1956. 26p. Project NM-006-015. (USNRDL-TR-122).

Of a group of mice exposed to supralethal doses of neutron or combined neutron- γ radiation, 78% of the neutron group and 96% of the n- γ group were found (killed when moribund due to gastrointestinal injury) to be infected with organisms normally confined to the intestinal tract. The characteristics of the infectious process are described. Antibiotic therapy decreased the incidence of infection without influencing mortality or survival time. NSA 11-4783

8206

INFLUENCE OF SPLEEN HOMOGENATE INJECTION ON POSTIRRADIATION INFECTION. Myron S. Silverman, Vivian Greenman, Marie Ellis, and Leonard J. Cole. (U. S. Naval Radiological Defense Lab., San Francisco, Calif.). Radiation Research 6, 474-82(1957).

Injection of isologous spleen homogenate after a dose of x rays resulted in decreased mortality. This was accompanied by a decreased incidence of infection with the normal bacteria during the first 10 days. Although the number of mice from which bacteria were isolated increased during the latter portion of the second week, there was no increase in deaths. Sufficient recovery of the body against infection enabled the animals to combat the invading organism. NSA 11-6617

THE RESPONSE OF ADRENAL GLAND OF INFANTILE RATS TO STRESS EFFECTS OF X-RADIATIONS. Djurdjina S. Sladic, Miroslava R. Pavlovic, and Dusanka V. Radivojevic. Bull. Inst. Nuclear Sci. "Boris Kidrich" (Belgrade) 6, 199-202(1956).

New born rats up to 10 days of age do not react to stress effected by x rays. Fall in concentration of cholesterol, 3 hrs following x irradiation, was observed for the first time in animals 10 days old. Under our experimental conditions, adrenal ascorbic acid content begins to fall only in older infant rats, i.e., after 13 days of age. This decline was gradual and paralleled the age. An exposure of animals to the same conditions causes a different adrenal response with respect to adrenal ascorbic acid and cholesterol. (from authors' summary). NSA 11-1731

DISCUSSION OF A. D. CONGER'S PAPER, RADIATION EFFECTS ON ASCITES TUMOR CHROMOSOMES. A. H. Sparrow. *Ann. N. Y. Acad. Sci.* 63, 936-937(1956).

The ascites tumor cell lends itself well to the study of changes in chromosome number, chromosome morphology and mitotic rate and to quantitative studies of chromosome aberration frequency, all of which may be affected by ionization radiation. Phenomenon of mitotic inhibition may be due to (1) inhibition of synthesis of DNA or another essential component of the nucleus (2) production of a cell poison or anti-mitotic substance (3) chromosome breakage and aberration.

THE FORMATION OF POLYPLOID MICROSPORES IN TRILLIUM ERECTUM FOLLOWING X-RAY TREATMENT AT FIRST MEIOTIC METAPHASE. A. H. Sparrow and R. C. Sparrow. *Radiation Research* **1**, 229(1954).

Polyploid microspores are seen in Trillium erectum after exposure to x rays. Relationship between percentage of polyploid nuclei and x ray dosage delivered during first mitotic phases were studied. Chromosome counts at microspore metaphase following exposures to 0, 50, 100, 200 and 400 r showed polyploidy, which is attributed to destruction of the spindle. There was evidence that irradiation of meiotic stages interfered with formation of the spindle. (from authors' abstract).

Rochester, N. Y. Univ. Atomic Energy Project. THE EFFECT OF BAL (BRITISH ANTI-LEWISITE) ON DISTRIBUTION AND EXCRETION OF ORALLY ADMINISTERED POLONIUM²¹⁰. J. N. Stannard and Helen Haydon. Feb. 20, 1956. 16p. Contract W-7401-eng-49. (UR-429).

The effectiveness of intramuscular British Anti-Lewisite in influencing the metabolism of orally administered Po has been determined in the rat. In contrast to its effects on Po administered intravenously, BAL did not promote excretion of the metal in either urine or feces, did not reduce retention, and did not reduce the relative amounts of Po deposited in radiosensitive tissues. Instead, BAL facilitated absorption from the gastrointestinal tract, reduced fecal excretion, and increased retention. While relative toxicity was not determined in these experiments, it would not be predicted that BAL would materially reduce the effects of a given body burden received by the oral route. This again contrasts with the clearly reduced toxicity of intravenously administered Po when BAL treatment is given. It is thought that these contrasts reside in differences in the chemical form of Po in the body. In view of current trends toward adding chelating agents to food products, it is suggested that the effect of such agents on gastrointestinal absorption of trace metals be investigated. NSA 10-3259

8247

TEMPERATURE DEPENDENCE OF BACTERIAL INACTIVATION BY X-RAYS. G. E. Stapleton and C. W. Edington (Oak Ridge National Lab., Tenn.). *Radiation Research* **5**, 39-45(1956).

Inactivation of *E. coli* β/r has been investigated as a function of temperature during irradiation for O₂ saturated and O₂ depleted suspensions. O₂ saturated suspensions show a significant change in sensitivity at

subfreezing temp. and a discontinuous change at freezing point. In absence of O_2 no significant change in sensitivity occurs with decreasing temp. below freezing point. (from authors' summary.) NSA 10-9950

THE EFFECT OF O_2 PRESSURE ON THE SENSITIVITY TO RADIATION BY TOTAL BODY EXPOSURE. H. St. Stender and Th. Hornykiewytsch. *Strahlentherapie* 96, 445-52(1955). (In German).

In normal and adrenalectomized rats as well as in rats pretreated with cortisone and thyroxine, the radiosensitivity decreases if the oxygen tension in the breathing air is reduced below 10%. If the animals are pretreated with megaphen, then the protective effect produced by the reduced oxygen tension, is even considerably stronger. NSA 10-6500

8249

THE INFLUENCE OF MEGAPHEN ON THE SENSITIVITY TO RADIATION BY TOTAL BODY EXPOSURE. H. St. Stender and Th. Hornykiewytsch. *Strahlentherapie* 96, 453-7(1955). (In German).

A preliminary treatment of rats with Megaphen brings about an increase of the medium survival time after total-body irradiations with 800 and 1000 r, and of the survival rate after 600 r. A similar effect takes place in adrenalectomized rats after 600 r. Oxygen deficiency considerably increases the effect of Megaphen. An aftertreatment with Megaphen merely exerts a minor influence on the survival time. The author discusses the mechanism of action of the protective effect. NSA 10-6501

ON CERTAIN REGULARITIES IN BIOLOGICAL EFFECTS OF IONIZING RADIATION. G. S. Sterlin (Central Research Inst. of Roentgen Radiology). *Med. Radiol.* 1, 27-35(1956). (AEC-tr-3333).

Selective suppression of the processes of physiological and reparative regeneration is a characteristic feature of the biological action of ionizing radiation. This feature may be demonstrated in very diverse biological material. Lesions caused by irradiation may be clearly seen morphologically during regeneration. Radiation lesions not only appear during the process of regeneration but also disappear, and normal tissue is restored. The varying ability of tissues to repair radiation lesions is due to their inherent activity of physiological regeneration, and is determined by correlation between the sensitivity of the tissues and changes in the strength of the dose of irradiation. This conclusion is confirmed by a number of facts but cannot yet be considered completely proved. NSA 12-15220

LIVER CELL NUCLEI OF MICE AFTER IRRADIATION. Hella Sussman. *Onocologia* 9, No. 4, 373-86(1956). (In German).

(1) Mice were irradiated totally with 10 fractions of 100 r, with a single dose of 1000 r or with a single dose of 5000 r to the liver only. After 1000 and 5000 r, the average nucleus of liver cells increases by 15-18%. Following 1000 r the larger nuclei are prevalent; after 5000 r the medium sized one. Fractional irradiation (10 x 100 r) appears to have no or only little influence on the average nuclear size. The largest nuclei observed were found following such exposure, however. NSA 11-1398

California. Agricultural Experiment Station, Davis. Dept. of Food Technology. RELATIONSHIP OF RADIATION INDUCED FAT OXIDATION AND FLAVOR, COLOR, AND VITAMIN CHANGES IN MEAT. REPORT NO. 8 (FINAL) FOR DECEMBER 31, 1954 TO JANUARY 15, 1956. A. L. Tappel. 7p. Project No. 7-84-01-002. Contract DA-19-129-gm-256. (PB-121307).

Changes were produced in beef, pork, poultry, and fish by sterilizing radiation doses. Radiation that pasteurized meat did not effect flavor, but radiation for sterilization made meat unacceptable. Irradiation in nitrogen eliminated peroxides. Carbonyl compounds formed in oxygen or nitrogen. Irradiation effects on hematin, carotenoids, vitamins, enzymes, and texture are discussed. NSA 10-9918

Wisconsin Alumni Research Foundation, Madison. ANIMAL FEEDING STUDIES ON WHOLESOMENESS OF IRRADIATED FOODS. PROGRESS REPORT NO. 1 (FOR) JANUARY 15, 1955 TO MAY 15, 1955. L. J. Teply and B. E. Kline. 13p. Contract DA-49-007-MD-608. (AD-93911).

Twelve irradiated food items were used in eight-week feeding tests employing young rats. Food items tested include dried apricots, frozen brussel sprouts, frozen cherries, frozen cranberries, crackers, Jello powder, macaroni, dried pears, frozen peas, pound-cake, pork sausage, and frozen shrimp. In general there was no marked difference in the growth rates of control rats and those fed irradiated foods except for those fed diets with Jello powder. NSA 11-1723

Rochester, N. Y. Univ. Atomic Energy Project. THE METABOLISM OF THORIUM²³⁰ (IONIUM) ADMINISTERED BY INTRATRACHEAL INJECTION TO THE RAT. Robert G. Thomas. Dec. 10, 1956. 30p. Contract W-7401-eng-49. (UR-480).

Thorium is excreted in urine after intratracheal injection. Thorium²³⁰ has very low solubility in body fluids and excretion via urine is negligible after intratracheal administration. Lung appears to be the critical organ for calculating MPC for a single intratracheal dose. Almost all Th²³⁰ which does enter the circulation from respiratory tract localizes in bone. Fecal analysis during the week following a single exposure may permit estimation of lung or body burden. NSA 11-3674

8279

GENERALIZED ESSENTIAL RETICULOSIS RESULTING FROM EXPOSURE TO RADIATION. Abe Towbin, Michael Kenney, and Harry Weinranch (Veterans Administration Hospital, New York). *Cancer* **10**, 385-7(1957).

Authors describe development of generalized essential reticulosis in a man after chronic exposure to radiation. Patient was subjected over a period of many years to extensive amount of radiation while assisting in fluoroscopy and taking roentgenograms. At autopsy, enlargement of spleen and liver associated with rich reticulum cell proliferation in tissues confirmed the diagnosis of essential reticulosis. In this case the development of essential reticulosis is analogous to the development of cutaneous cancer and leukemia in man after chronic exposure to radiation (from authors' summary.) NSA 11-8770

8280

ANIMAL EXPERIMENTAL RESEARCH ON THE EFFECT OF SUBLETHAL AND SMALL RADIATION DOSES. Johannes Trautmann. *Strahlentherapie* **102**, 543-5 (1957). (In German).

Reports are given on the effects of small x ray doses on the progress of an experimentally produced general infection, on the effects of sublethal doses of total radiation on the female sex hormones of mice, and on the effect of total radiation doses of 200 r, applied during the main organization phase, on the fetuses. 8281

EFFECT OF X-RAY DOSE ON MORTALITY AND SKIN TRANSPLANTABILITY IN MICE RECEIVING F₁ HYBRID MARROW. J. J. Trentin (Baylor Univ. of Medicine and Univ. of Texas Dental Branch, Houston). *Proc. Soc. Exptl. Biol. Med.* **93**, 98-100(1956).

The 21-day LD₅₀ of x rays is approximately 600 r. Irradiation of CBA mice followed by intravenous administration of bone marrow suspension from Cb x CBA F₁ hybrids resulted in little or no 21-day mortality at 110, 330, 660, and 770 r, but in almost 100% mortality at 550 r. Homografts of Cb skin were accepted by mice

at 660 and 770 r dose levels but not by mice at 0, 110, and 330 r dose levels. None of the marrow-treated mice at 550 r survived to be skin grafted. NSA 11-35

Los Alamos Scientific Lab., N. Mex. BIOLOGICAL EFFECTS OF INHALATION OF HIGH CONCENTRATIONS OF TRITIUM GAS. T. T. Trujillo, F. C. Anderson, and W. H. Langham. Dec. 1955. 37p. Contract W-7405-eng-36. (LA-1986).

Mice fixed an LD₅₀₋₃₀ of tritium water (1.5 mc/cc body fluid or 800 rep-total body exposure) in about 45 min. when inhaling 1% tritium gas. Dose to lung surfaces: ~135,000 rep. which produced no histological acute change in lungs. The LD₁₀₀₋₈₀ is the same as that for mice given equivalent dose of HTO by injection. Lethality of inhaled tritium gas is attributed to fixation of HTO in body fluid, not to pulmonary effects. NSA 11-19

Rochester, N. Y. Univ. Atomic Energy Project. RADIATION CATARACTS. L. W. Tuttle. June 20, 1956. 8p. Contract W-7401-eng-49. (UR-443).

Among the approximately 8000 exposed survivors of the Hiroshima and Nagasaki bombings who have been examined during the decade following their exposure to nuclear radiations, there have been found 10 cases of severe cataract, approximately 25 cases with slightly unpaired vision, and perhaps two hundred cases with

minimal lenticular changes detectable only by careful aM1-lamp examination by specially trained personnel. It may be concluded that the Japanese atomic bomb explosions have resulted in negligible loss of vision to date. NSA 10-8138

8289

EFFECTS OF X RAYS ON THE REGENERATION OF MUSCULAR TISSUE. T. N. Tuzhilkova (Pavlov, Leningrad Med. Inst.). Med. Radiol. 1, No. 4, 14-21(1958). (In Russian).

Intact leg of adult white mice was locally irradiated before or after mechanical damage. Irradiation with doses as high as 3000 r had little effect on the muscle, but irradiation with 1500 or 3000 r prior to trauma decreased the rate of regeneration and increased the size of the wound. Even 6 months after 3000 r, regeneration ability of irradiated muscle was not back to normal. When the trauma occurred the 2nd day after 6000, 3000, or 1500 r irradiation, the muscle regeneration pattern was similar to that with trauma before irradiation, but only 6000 r had a marked effect when the trauma was on the 6th day after irradiation. On the other hand, 3000 r caused rapid development of radiation damage, with destructive changes in the skin. Both damage and repair were faster when accompanied by further mechanical damage, which tended to increase the proliferation. Healing process was observed microscopically in histological sections of muscle and epithelium.

LIVER DAMAGE AND HEPATOMAS IN MICE PRODUCED BY RADIOACTIVE COLLOIDAL GOLD. A. C. Upton, J. Furth and V. T. Burnett, Jr. (Oak Ridge National Lab., Tenn.). Cancer Research 16, 211-15(1956). Mar.

Colloidal radioactive Au¹⁹⁸ was injected intravenously into mice in large doses in an attempt to produce neoplasms of the reticuloendothelial cells. The Au¹⁹⁸ became rapidly concentrated in these cells, over 80% being retained in the liver. Of eight mice receiving 475 to 1350 μ c, seven died within 2 weeks with leukopenia, necrosis of the bone marrow, and hepatic degeneration, and one mouse surviving 9 months died with cirrhosis. A dose of 44 to 160 μ c of Au¹⁹⁸, estimated to deliver 850 to 3400 rep to the liver, caused no early deaths but produced chronic liver damage in 45 to 83% and hepatomas in 10 to 26% of mice injected. In five of 31 livers examined microscopically, foci of ossification with marrow formation were noted. The incidence of leukemia was not significantly altered, and neoplasms of reticuloendothelial cells were not produced by the colloidal Au¹⁹⁸. An increase in the incidence of pulmonary adenomas occurred in mice receiving both radioactive and nonradioactive colloidal gold. NSA 10-6474

8304

THE RELATIVE BIOLOGICAL EFFECTIVENESS OF NEUTRONS, X-RAYS, AND GAMMA RAYS FOR THE PRODUCTION OF LENS OPACITIES; OBSERVATIONS ON MICE, RATS, GUINEA-PIGS, AND RABBITS. A. C. Upton, K. W. Christenberry, G. S. Melville, J. Furth, and G. S. Hurst (Oak Ridge National Lab., Tenn.). Radiology 67, 686-96(1956).

For the production of cataracts in mice, rats, and guinea pigs, cyclotron neutrons of 1 to 2 Mev mean effective energy, administered at high intensity, were two to four times as effective as 250-kvp x rays and three to four times as effective as 1.2-Mev gamma rays, fission neutrons from an experimental nuclear detonation and thermal neutrons had a similar cataractogenic effectiveness in mice. The radiosensitivity of the lens varied appreciably with species, the mouse, rat, guinea-

pig, and rabbit exhibiting decreasing sensitivity in the order listed, all being presumably more sensitive than man. With fractionation of neutron or gamma irradiation, there appeared to be only slight, if any, reduction in dose effectiveness at low dose levels in mice. The RBE of fast neutrons of 2 to 3 Mev mean energy (Po-B) administered at relatively low intensities was approximately 9 for induction of mild opacities in mice and appeared to be greater than 9 for the production of threshold lens damage, the relative cataractogenic effectiveness of these and of the other fast neutrons varying inversely with the dose and with the severity of lens injury. RADIATION STRICTURE OF SMALL INTESTINE. R. E. Anderson, L. J. Witkowski and G. V. Pontius. Surgery 38, 605-9(1955).

Ulceration of the gastrointestinal tract may be a late effect of therapeutic irradiation. The lesions are secondary to vascular sclerosis.

8309

Western Reserve Univ., Cleveland. Atomic Energy Medical Research Project.
EFFECT OF X-IRRADIATION ON RAT SPLEEN ADENYLATE KINASE. Edwin M. Uyeki. Jan. 31, 1956. 13p. Contract W-31-109-eng-78. (NYO-4926).

Marked increase in activity of adenylate activity in spleens of rats followed exposure to sublethal doses of x rays. Activity was greatest at 3 days post-irradiation, followed by gradual return to normal enzyme activity. Results indicate that increase in adenylate kinase activity may contribute to a decrease in adenosine nucleotide content of spleen tissue brought about by x irradiation. NSA 10-3897

8310

EXPERIMENTAL INVESTIGATION OF THE QUESTION OF X-RAY SENSITIVITY OF BONE GROWTH IN ANIMALS. Pieter Van Caneghem and Carl Georg Schirren. Strahlentherapie 100, 433-4(1956). (In German).

Authors report results of studies on effect of hardness, total dose (1200 r and 12,000 r) and dose for fractionation of the effect of x rays on cartilages of the tarsometatarsal articulation of the chicken. Effects are contrasted with those observed in other tissues composed of dividing cells. NSA 11-40

8311

RELATIONSHIP BETWEEN CHANCES OF SURVIVAL AND REGENERATION OF HEMATOPOIETIC TISSUE IN IRRADIATED RATS. J. Van Lancker (Univ. de Louvain, Belgium). J. Natl. Cancer Inst. 18, 407-12 (1957).

The correlation of the chance of survival and degree of regeneration of bone marrow and spleen was studied in group of 67 rats that received 700 r after hepatic zone was shielded. Animals that died spontaneously did not regenerate bone marrow and spleen, but 44% of sacrificed animals regenerated hematopoietic tissue early (before 8th day). After 30 days all animals that survived had regenerated bone marrow and spleen. (from authors' summary.) NSA 11-5153

BIOLOGICAL ROLE OF K^{40} RADIOACTIVITY ON ANIMALS. A. P. Vinogradov and V. V. Koval'skii (Vernadskii Inst. of Geochemistry and Analytical Chemistry). Doklady Akad. Nauk S. S. S. R. 113, 315-18 (1957). (In Russian).

It has been found that the K^{40} radioactivity does not affect the biological and chemical reactions in the muscles of animals. NSA 11-8771

8316

ON THE EFFECT OF NUCLEAR RADIATION OF PLANTS. P. A. Vlasyuk and D. M. Grodzinskii. (Inst. of Plant Physiology and Agrochemistry). Doklady Akad. Nauk S. S. S. R. 106, 562-4 (1956).

Ionizing radiation produced 2-phase reactions. Small doses intensified physiological functions, large doses depressed them and undermined cell and tissue functions although eventually recovery occurred. Typical 2-phase reactions were observed in study of effects of Ca^{45} and P^{32} on *Saccharomyces cerevisiae* and in *Uromyces onobrychides*. From experiments using sugar beet leaves and oat seeds, it was concluded that effects of ionizing radiation are determined by the functional condition of the growing organism or by the condition of its separate organism and tissues. It is suggested that radiation may also provide background excitation for plants. NSA 10-8146

8317

EFFECTS OF SMALL DOSES OF IONIZING RADIATIONS ON OXIDATION-REDUCTION PROCESSES IN PLANTS. P. A. Vlasyuk, Z. M. Klimovitskaya, and E. S. Kosmatii (Ukraine Inst. of Plant Physiology and Agrochemistry). Doklady Akad. Nauk S. S. S. R. 106, 731-4 (1956). (In Russian).

Tracer studies of radioactive Ca^{45} (5 to 10 μ c per plant) effect on sugar beet yield and the effects of small doses of P^{32} , Ca^{45} , and S^{35} in the food supply of sugar beets and clover are tabulated and discussed. The studies established that in the early stages of growth of sugar beets the ionizing radiation increased the oxidation and lowered the reduction processes. Considerable increase of reduction processes over the oxidation which resulted in richer sugar beet yield were observed towards the end of the vegetative period. Larger ionizing radiation doses in clover plants increased oxidation and suppressed the reduction process. In clover plants small doses of radioactive S^{35} have intensified the oxidation, the tissue iodo-reducing properties, and the content of reducing forms of ascorbic acid. NSA 10-8147

8318

COMPARATIVE MORTALITY FOLLOWING SINGLE WHOLE BODY EXPOSURES OF MICE TO FISSION NEUTRONS AND Co^{60} GAMMA RAYS. Howard H. Vogel, John W. Clark, and Donn L. Jordan (Argonne National Lab., Lemont, Ill.). Radiology 68, 386-98 (1957).

Curves showing acute lethality following exposure to fission neutrons and Co^{60} γ rays are presented for three dosage groups representing LD_{50} , LD_{50} , and LD_{20} . Probability of death for each 24 hour period is calculated. NSA 11-5165

8319

COMPARATIVE MORTALITY AFTER 24-HOUR, WHOLE-BODY EXPOSURES OF MICE TO FISSION NEUTRONS AND COBALT-60 GAMMA RAYS. Howard H. Vogel, Jr., John W. Clark, and Donn L. Jordan (Argonne National Lab., Lemont, Ill.). Radiation Research 6, 460-8 (1957).

Effects of increasing time of irradiation from 1.5 hrs. to 24 hrs. were studied to test dose-rate dependence in experiments with fission neutrons and Co^{60} γ rays. The 30 day mortality curves are presented and are compared by means of probit regression lines (30 day mortality on dose) representing exposure to each radiation for 1.5-24 hr. irradiation periods. REACTIONS OF TEMPERATURE CONTROL CENTERS IN RABBITS VACCINATED BY PYROGENIC ORGANISMS AFTER TOTAL-BODY EXPOSURE TO X RADIATION. N. A. Volokhova (Inst. of Experimental Medicine). Med. Radiol. 1, No. 4, 25-30 (1956). (In Russian). NSA 11-851

8321

ACTION OF X-RAYS ON NUCLEIC ACID METABOLISM IN JENSEN SARCOMA. H. von Euler and G. Hevesy. Arkiv. Kem. Mineral. Geol. 17A, 60 (1944).

Nucleic acid metabolism in liver, spleen and intestinal mucosa of adult rats was depressed by 1/2 - 1/3 during a period of 2 hr. following total body exposure to 1500-3000 r, an effect similar to that found in Jensen sarcoma. In immature rats whose livers were increasing in weight at a rate of 10.2% per day, the increase in DNA was twice as fast and it was found that for the formation of every 3 DNA molecules, 1 old DNA molecule was lost. When the young rats were x irradiated, the depression of DNA metabolism was depressed to about the same extent as in adult rats. Spreading the dose over a 2 hr. period caused greater depression. Much of the inhibition appears to cease after the 2nd hour post-exposure.

8322

EXPERIMENTAL INVESTIGATIONS ON THE INFLUENCE OF ROENTGEN IRRADIATION ON THE GROWTH OF

MULTIPLE TUMORS. Antero Voutilainen (Univ. of Helsinki and General Hospital, Helsinki). *Acta Radiol.* 47, 149-56(1957).

The effects of roentgen irradiation on multiple ITB tumors transplanted subcutaneously into rats were studied. A tumor in the interscapular region was irradiated with 10 daily doses of 500 r, and growth phenomena were followed in a non-irradiated tumor in the gluteal region. The growth of this latter was inhibited, its size being significantly smaller, after 10 days of treatment, than that of a corresponding tumor in a non-irradiated control rat. Mitotic activity was found to be significantly less both 5 and 10 days after commencement of treatment. Some tumor inhibiting factor appears to be released from or activated by the irradiated tumor. NSA 11-5140

LONGEVITY AND CAUSES OF DEATH FROM IRRADIATION IN PHYSICIANS. Shields Warren. *J. Am. Med. Assoc.* 162, 464-8(1956).

In a study of Deaths of 82,441 physicians in 1930-1954, it was found that radiologists die on the average 5.2 years earlier than do other physicians. Non-radiology specialist exposed to radiation show shortening of life but less than radiologists. Radiation exposure is the predisposing factor in the life shortening. Precautions employed by some radiologists have not been adequate to protect them. Present standards appear adequate, but more determined effort should be made to live up to them. (from authors' summary). NSA 11-846

8328

THE RESPONSE OF EXPLANTED HUMAN TUMOR TO

RADIATION. Shields Warren and Olive Gates (Harvard Univ. and New England Deaconess Hospital, Boston, Mass.). *Cancer Research* 17, 163-6(1957).

In general, human tumors growing in hamsters varied in radiosensitivity to about the same extent as their general type appeared to do in man. Some transplanted cancer cells survived heavy doses of radiation and retained their ability to proliferate as long as fresh supporting tissues were provided. The authors emphasize that various cells from the same tumor may show significant differences in their radiosensitivity. NSA 11-6196

8329

AN INTERPRETATION OF ORGAN WEIGHT CHANGE INDUCED BY TOTAL-BODY IRRADIATION S D Warshaw (The Univ. of Chicago, Ill.). *Radiation Research* 5, 634-49(1956).

A simple mathematical model is introduced which attempts, with some success to correlate the normal growth pattern of an organ with time dependence of its weight after exposure. One simple result of model is that it predicts "insensitive fraction" of organ weight. Model is applied to two conventional experiments and is found to be consistent with the observations if gross qualitative features are emphasized. It is concluded that this model may or may not be adequate to cover any but a small class of problems involving response of large organism where response of only a small part of it is observed. For the determination of clinically important quantities like the RBE, the technique of observing organ weight changes is probably a valid one. Organs studied: rat spleen, thymus, mesenteric lymph nodes and cervical nodes. NSA 11-2790

THE EXPERIMENTAL ROENTGEN DAMAGE OF THE HEART MUSCLES. A. Werthemann. *Strahlentherapie* 38(4), 702-9(1930). (In German).

In 2 series of experiments on 11 rabbits, x-ray injuries to heart muscle, including injuries to parenchyma and changes in interstitial connective tissue, were observed. BA 6-16354

8335

California. Univ., Berkeley. Radiation Lab. CALIFORNIA CATTLE THYROID ACTIVITY ASSOCIATED WITH FALLOUT, 1955. Margaret R. White and Ernest L. Dobson. Mar. 28, 1956. 14p. Contract W-7405-eng-48. (UCRL-3355).

Thyroids from cattle were collected from February until September 1955 and followed for radioactivity. A period of elevated radioactivity was noted, which lasted from the end of March until the end of July. The total maximum beta-ray doses during this period was approximately 1 rep. This was maximum, not the average, dose delivered to the thyroid tissue studied. Evidence indicating that the radioactivity was taken into the body through food is presented. NSA 10-3899

8336

DIFFERENCES IN RESPONSE OF IRRADIATED EGGS AND SPERMATOCYTES OF *HABROBRACON* TO ANOXIA. Anna R. Whiting and W. L. Murphy (Oak Ridge National Lab., Tenn. and Univ. of Pennsylvania). *Genetics* 54, 297-303(1956).

Authors studied induction by x rays of dominant and recessive lethal and visible mutations in eggs and spermatozoa of *Habrobracon* exposed in air or in nitrogen. Eggs irradiated while in metaphase I or prophase I showed more dominant and recessive lethal mutations than did sperm. In metaphase I eggs, dominant lethal mutations associated with isochromatic breaks, lateral sister union and with conditions preventing restitution, decreased in the same ratio as did recessive lethals and visible mutations. The greater frequency of mutations in eggs suggests that mutation induction may be related to the greater amount of cytoplasm. (from authors' summary.) NSA 11-5719

8337

A NEW APPROACH TO THE MATHEMATICAL THEORY OF THE ACTION OF HIGH-ENERGY RADIATION ON SINGLE CELLS. I. FORMULATION OF THE THEORY. Robert A. Wijsman (National Institute of Health, Public Health Service). *Radiation Research* 1, 257-69(1956).

Discussion is centered around the yeast cell. Yeast cells of different ploidy respond very differently to radiation. Interaction between radiation and genetic material takes place in 2 different ways classified as direct action and indirect action. Theoretical expressions for probability of survival of an irradiated cell are complicated and uncertain. A new approach is proposed whereby the survival probability under any kind of high energy radiation is expressed in terms of survival probability under X rays. (from authors' summary). NSA 10-7419

8338

NUCLEAR RADIATION AT HIROSHIMA AND NAGASAKI. Robert R. Wilson (Cornell Univ., Ithaca, N. Y.). *Radiation Research* 4, 349-59(1956).

BLOOD CHANGES IN RADIUM WORKERS IN JOACHIMSTHALS. A. Woldrich. *Med. Klin. (Munich)* 27, 17-19(1931). (In German).

The author reports results of blood studies on 21 miners retired for at least 4 years, 8 active miners, 8 uranium mill workers and 2 laboratory workers. There was a tendency towards mild anemia and slight leukopenia.

8346

INACCURACY OF ANAPHASE BRIDGES AS A MEASURE OF RADIATION-INDUCED NUCLEAR DAMAGE. Sheldon Wolff and H. P. Luippold (Oak Ridge National Lab., Tenn.). *Nature* 179, 208-9(1957).

Discrepancy between experimental results and the expected one-hit or two-hit curves appears to be due to an artefact that is significant when anaphase bridges are scored. Cause of the artefact is not known. At low doses there were nearly as many aberrations detectable at anaphase as at metaphase but as dose increased, the discrepancy between curves representing anaphase

and metaphase increased. Metaphase curves are a more accurate indicator of the amount of nuclear damage. NSA 11-4241

8347

THE BIOCHEMICAL ASPECTS OF CHROMOSOME REJOINING. Sheldon Wolff and H. E. Luttpold. p.217-21 of INTERNATIONAL CONFERENCE ON RADIOBIOLOGY. Fourth, Cambridge, England, August 1955. Progress in Radiobiology. J. S. Mitchell, B. E. Holmes, and C. L. Smith, eds. London, Oliver and Boyd, Publishers and Springfield, Ill. Charles C. Thomas, Publishers. 1956. 557p.

Seeds of *V. faba* were soaked for 24 hours and then exposed to a 600 r dose of x rays *in vacuo* to produce chromosome breaks that remained open for 30 min. Immediately after irradiation, various enzyme inhibitions were added in an attempt to prevent rejoining and 75 min. later a second x ray dose of 400 r was delivered and effect on chromosome breaking and rejoining was observed. Effect of dose rate on rejoining was also tested. A generalized scheme for production of 2-hit aberrations by irradiation is presented as schematic drawings. NSA 11-5158

OBSERVATIONS ON GASTROINTESTINAL FUNCTION AFTER X-RAY AND THERMAL COLUMN EXPOSURES. I. EFFECT ON THE PROGRESS OF BARIUM MEAL. BODY WEIGHT, AND SURVIVAL. Kent T. Woodward and Samuel M. Rothermel (Los Alamos Scientific Lab., N. Mex.). Radiation Research 5, 441-9(1956).

Doses as small as 50 rep induced gastric retention of Ba in rats. The effect was greater and persisted longer following higher doses. Body weight increase was directly proportional to x ray dose and thermal neutron doses in the range 1200-9000 r. Surgical removal of the pylorus had no effect on gastric retention. Gastrectomized irradiated rats lost weight comparable to that lost by unoperated irradiated animals. Diminished food intake and weight loss are not related to acute gastric retention and dilatation. CHEMICAL AND BIOLOGICAL ALTERATIONS INDUCED BY IRRADIATION OF I¹³¹-LABELED HUMAN SERUM ALBUMIN. Rosalyn S. Yalow and Salomon A. Berson (Veterans Administration Hospital, Bronx 68, N. Y.). J. Clin. Invest. 36, 44-50(1957).

Biological alteration due to irradiation rendered albumin susceptible to rapid metabolic degradation *in vivo*. The effect was detectable when protein concentrations were 5 mg/ml or less and radiation doses were comparable to those received in 1 wk. by solutions initially containing at least 0.8 mc I¹³¹/ml. Magnitude of protein change was a direct function of radiation dose and was inversely related to the protein concentrations during irradiation. Potential radiation damage to I¹³¹ labeled proteins of high specific activity is discussed and a method for preventing radiation damage is suggested. (from authors' summary). NSA 11-4237

8354

THE EFFECTS OF COMBINED RADIATIONS ON CROSSING OVER IN *DROSOPHILA MELANOGASTER*. Henry T. Yost, Jr. and Robert N. Benneyan (Amherst Coll., Mass.). Genetics 42, 147-60(1957).

Infrared radiation for 24 hour at 10°C is unable to modify ionizing radiation effect on induction of crossing over. Data are considered in light of other work on induced crossing over. Infrared radiation may be one way to determine correspondence between chiasmata formation and genetic crossing over. NSA 11-8773

8355

CERTAIN PECULIARITIES IN THE EFFECTS OF RADIOACTIVE SUBSTANCES IN ORGANISMS. D. I. Zakutinski. Med. Radiol. 1, 63-70(1956). (In Russian).

Various radioactive elements were administered to white rats in various ways and animals were observed while living and after death. The intensity of the radiation, the rate of radioactive substances from the organism were shown to be related to their aggregate state, the carrier, their physico-chemical and chemical properties, the mode of entry of the radioactive substances into the organism, and the initial functional state of the organism on which they acted. Radioactive substances remaining in the organism for a long time, being a constant source of radiation, caused serious after effects. There was long term sexual damage, and progeny of animals containing radioactive substances were also carriers of these substances. Viability of the progeny was affected, with a lag in organ development and depression of immunity. In long-surviving damaged animals, malignancies developed and there was a clear relation between distribution of the radioactive substance and tumor induction. Some of the damaged animals aged early, and showed greatly decreased immunity. Histological studies in animals that died are reported. NSA 10-9051

8356

DELAYED PATHOLOGICAL EFFECTS INDUCED BY IONIZING RADIATION. D. I. Zakutinski. Med. Radiol. 2, 22-8(1957). (In Russian).

Results of experimental studies of late effects of ionizing radiations are described, including a decreased resistance to infection after either large single doses or prolonged chronic exposure, an increased propensity to develop blood diseases, altered sexual function, decreased fertility (with a high proportion of nonviable offspring). After prolonged exposures to radioactive isotopes, a variety of tumors of many tissues developed, and life span was markedly decreased. NSA 11-5722

THE ACTION OF RADIUM AND ITS EMANATIONS ON THE GERMINATION OF THE HIGHER PLANTS. Herni Agulhon and Robert Therese. *Ann. inst. Pasteur* 29, 261-273(1915). (In French).

There were three series of experiments carried out with various seeds during germination or during the period when the plant embryo lives at the expense of storage reserves. The radiation used was: (1) Ra in a sealed tube, (2) dilute solution of Ra Br and (3) Ra in an unsealed tube so that emanation could diffuse in the closed space in which seeds were growing. Germinating seeds exposed to (1) showed growth inhibition, (2) had no effect on seeds germinating in the solution (3) appeared to stimulate growth. CA 9-2772

8375

THE INFLUENCE OF ROENTGEN RAYS ON CELL DIVISION. W. Alberti and G. Politzer. *Arch. mikroskop. Anat. u. Entwicklungsmech.* 100, 83-109(1924).

Roentgen ray effects on mitosis in the larvae of *Salamandra Maculosa* and a triton species shows 3 periods: (1) decreased mitosis, (2) absence of mitosis, (3)

partial recovery of mitosis. The abnormal cell division observed was analogous to that induced by heat, cold, chemicals and electric current. CA 19-541

8376

THE BEHAVIOR OF THE NUCLEUS OF RADIUM-TREATED SPERMATOZOA OF CYCLOPS AFTER FERTILIZATION. F. Alverdes. Arch. mikroskop. Anat. u. Entwicklungsmech. 47, 375-98(1921).

Sperm cells of *Cyclops viridis* were exposed to RaBr_2 . Eggs fertilized with irradiated sperm developed abnormally when the exposure time was longer than 3 days. CA 16-3346

8377

THE EFFECT OF LARGE DOSES OF X-RAYS ON THE RESISTANCE OF MONKEYS TO EXPERIMENTAL POLIOMYELITIS. H. L. Amoss, H. D. Taylor, and W. D. Witherbee. Proc. Soc. Exptl. Biol. Med. 16, 54-5 (1918-19).

Monkeys were infected with experimental poliomyelitis after being irradiated for 6-7 days. The x-rays were sufficient to reduce greatly the number of circulating lymphocytes, but in non-rayed controls no symptoms were obtained. CA 13-2921

8378

CELLULAR RADIOSENSITIVITY. P. Ancel and P. Vintemberger. Compt. rend. soc. biol. 92, 517-20(1925).

Authors first discussed the significance of observations showing that some cells (and not others) in a given tissue are injured by radiation. They emphasize the fallacy of concluding that the two types of cells necessarily differ in radiosensitivity. Embryonated chick eggs irradiated in the cold and kept cold show no damage following irradiation. This does not mean that the embryo is not radiosensitive, for lesions become apparent if the egg is incubated long enough for embryonic development to commence. Histological studies of testes must be interpreted in the same light. Authors emphasize that manifestations of radiation injury are regulated by modifiers of cellular activity, and it is important to distinguish among (1) the radiolesion, (2) manifestations of lesions, and (3) recovery factors. CA 19-1870

8379

RADIOSENSITIVITY OF DIVIDING CELLS. P. Ancel and P. Vintemberger. Compt. rend. soc. biol. 92, 986-8 (1925). (In French).

It has been found that radiosensitivity of chick blastoderm cells in the resting phase are similar to those undergoing mitosis. CA 19-3547

8380

COMPARISON OF THE EFFECTS OF X-RAYS AND OF AGING ON CHICK EGGS. P. Ancel and P. Vintemberger. Compt. rend. soc. biol. 92, 1401-3(1925). (In French).

X rays produce a rapid change in chick cells which is comparable to the aging of chick eggs from eleven to forty days at 10°C . CA 19-3546

8381

EFFECT OF THE RATE OF DEVELOPMENT OF RADIATED EGGS OF RANA ON ITS SURVIVAL TIME. P. Ancel and P. Vintemberger. Compt. rend. soc. biol. 93, 281-3 (1925). (In French).

The chances of survival of x-irradiated frog eggs are increased by slowing down its development rate. CA 19-3547

8382

EXPERIMENTS ON RADIOACTIVE FERTILIZER. P. Andouard. J. agr. prat. 34, 470-1, 491-2(1920), Expt. Sta. Record 45, 517-18(1920). CA 16-3159

8383

CHANGE OF THE BLOOD'S CHOLESTEROL CAPACITY AFTER DEEP RADIATION. Maria Babarczy. Magyar Orvos Arch. 25, 403-11(1924).

The cholesterol level of the blood was measured by Bloor's colorimetric technique. Radiation caused an increase in blood cholesterol. The increase appears to be due to cholesterol mobilization. CA 19-1012

8384

DISTURBANCES IN MAMMALIAN DEVELOPMENT PRODUCED BY RADIUM EMANATION. Halsey J. Bagg. Am. J. Anat. 30, 133-61(1922).

The development of the nervous and reproductive systems of the rat embryo was inhibited when radiation was given near the end of pregnancy. Large amounts of subcutaneous connective tissue were destroyed, suggesting that radium may be specific for endothelium of blood vessels. CA 16-2913

8385

RADIUM AND ITS PHYSICAL PROPERTIES. O. Buseck *Hahnemannian Monthly* 51, 335-50(1916).

The physiological effects of radium are included in this review. CA 10-2113

8398
THE TREATMENT OF INFECTIOUS DISEASES WITH RADIUM. W. Caspari. *Landwirtsch Jahrb* 38. (In German).

Guinea pigs infected with diphtheria were treated with Ba SO₄ containing radium. Glandular Tuberculosis developed more slowly under treatment, while cutaneous tuberculosis was more successfully treated with Ra rays. CA 4-1189

8399
INFLUENCE OF VARIOUS RAYS ON THE EYE. A. Chalupecky. *Prague. Biol. listy*, 641, Zentr. Augenheilk 37, Suppl.-Heft 437(1915), Zentr. Biochem. Biophys. 18, 175-6(1915).

The influence of ultraviolet rays is explained by the fact that they are readily absorbed by the crystalline lens (also by the conjunctiva and cornea). Chem. transformations, such as production of globulins and insol. proteins with consequent opacity, result from this absorption. Roentgen rays produce changes in almost all portions of the eye (least pronounced in the crystalline lens, although they are absorbed by the lens to a considerable extent); Roentgen rays readily cause cataract formation. Ra produces conjunctivitis and smoky opacity of the cornea, contrary to Birch-Hirschfeld C. observed no changes in the soft spots of the eye. Em, in the form of radioactive H₂O, was absorbed without reaction when intraocularly injected. Meso-Th(10 mg. placed for 1-2 hrs. daily on the eyelids) caused pronounced conjunctivitis, suppurative and opacity of the cornea in rabbits, the crystalline lens and soft spots of the eye remained unaffected. CA 10-1546

8400
ACTION OF RADIUM ON THE EYE. J. Chalupecky. *Casopia Lekarn ceskysh* 49(1911). Zentr. Biochem. u. Biophys. 12, 630(1911-12). CA 7-165

8401
THE BACTERICIDAL ACTION OF RADIUM EMANATION. Helen Chambers and S. Russ. *Proc. Roy. Soc. Med.* 5, 188-212(1911-12).

Suspensions of bacteria in distilled water were exposed to radium emanation. Alpha and β rays were active, but γ were not, in causing agglutination of the

bacteria. Bacteria were destroyed more rapidly than were opsonin and leukocytes. CA 6-2248

8402
THE ACTION OF RADIUM EMANATION OF SOME OF THE MAIN CONSTITUENTS OF NORMAL BLOOD. Helen Chambers and Sidney Russ. *Proc. Roy. Soc. (London)* 84, 124-36(1912), *J. Chem. Soc.* 100, 809(1912).

Alpha rays cause hemolysis of erythrocytes, conversion of oxyhemoglobin into methemoglobin, and degenerative changes in leucocytes. Exposure of serum to alpha rays causes loss of specific properties of opsonin and hemolytic complement. CA 6-1031

8403
NOTE UPON THE EFFECT OF THE GROWTH OF RATS, RECEIVING A DIET DEFICIENT IN FAT-SOLUBLE VITAMINS, OF EXPOSING THEIR ENVIRONMENT TO THE EMANATION FROM RADIUM BROMIDE. Harriett Chick and Mary Tazellar. *Biochem. J.* 18, 1346-48(1924).

Glass containers for rats were irradiated, when empty, with radium for 10 minutes daily. No effect of radium on rats was noted. CA 19-1151

8404
VARIATION IN CONCENTRATION OF HYDROGEN IONS OF THE BLOOD IN ANIMALS UNDER THE INFLUENCE OF X-RAYS. J. Cluzet and T. Kofmann. *Compt. rend. soc. biol.* 91, 968-70(1924).

X-radiation causes a decrease in the hydrogen ion concentration of serum and plasma. CA 19-1296

8405
THE EFFECT OF RADIATION ON THE BACTERICIDAL POWER OF THE BLOOD. L. Colebrook, A. Eidenow, and Leonard Hill. *Brit. J. Exptl. Pathol.* 5, 54-64(1924).

It has been found in studies of irradiated rabbits that there is a bactericidal material produced. The author suggests that this material results from reactions of products from damaged tissue cells and is produced by leukocytes and serum. CA 18-2030

8406
A COMPARISON OF THE ALTERATIONS IN THE VELOCITY OF GROWTH OF CERTAIN SEEDLINGS THROUGH THE ACTION OF RAPID AND SLOW ELECTRONS OF THE BETA RAYS OF RADIUM, ALSO A COMPARISON OF THE ROLE OF CHEMICAL MAKE-UP AND OF PHYSICAL FACTORS IN DETERMINING THESE ALTERATIONS. E. D. Congdon. *Arch. mikroskop. Anat. u. Entwicklungsmech.* 34, 267-81(1912) CA 6-1627

8407
EFFECTS OF X-RAYS ON THE RATES OF SPECIFIC HEMOLYSIS. Karl Cori and G. W. Pucher. *J. Immunol.* 8, 201-9(1923).

The rate of hemolysis is enhanced by x-rays although this does not appear to be the case if radiation of individual components of the system are considered. CA 17-2610

8408
THE EFFECT OF ROENTGEN RAY AND MUSTARD GAS (DICHLORETHYLSULPHID) ON ACTIVE ANAPHYLAXIS IN THE GUINEA PIG. H. J. Corper, Louisa T. Black, and Mary Moore. *J. Infectious Diseases* 30, 50-7(1922).

Guinea pigs were given nonlethal doses of x rays and mustard gas before or coincident with the first and second injections in anaphylaxis. Some effect on the anaphylaxis reaction was noted at the time of the second injection. CA 16-1806

8409
ON BLOOD PLATELETS, THEIR BEHAVIOR IN VITAMIN A DEFICIENCY AND AFTER RADIATION, AND THEIR RELATION TO BACTERIAL INFECTIONS. W. Cramer, A. H. Drew, and J. C. Mottram. *Proc. Roy. Soc. (London)* 93B, 449-67(1922).

Rats develop the same type of thrombopenia when exposed to Ra radiation as did rats on a Vitamin-A-free diet. In addition, lymphopenia occurred but both conditions improved rapidly upon cessation of radiation. Another deleterious effect of the radiation on the rat was a lowering of

resistance to infection. This latter condition was reversible if platelet recovery occurred. CA 16-4216

THE ACTION OF X- AND RADIUM RAYS ON INTERNAL ORGANS, PARTICULARLY ON THE SPLEEN. Heimeke. Deut. med. Wochschr. 40, 1311-2(1914). (In German).

Author discusses effects of ionizing radiations on tumors in light of animal studies and of the variation in radiosensitivity among organs and tissues. CA 8-3203

8453

FURTHER STUDIES ON THE EFFECTS OF THE ROENTGEN RAY ON ANTIBODY PRODUCTION. Ludvig Hektoen. J. Infectious Diseases 22, 28-33(1918).

Dogs and rabbits irradiated with Roentgen rays at the time antigen was introduced showed a decrease in antibody production. If antibody production were at its peak at the time of irradiation, there was little effect on the antibodies in the blood. Results support the contention that antibodies are produced in spleen, lymphatic tissues, and marrow, since Roentgen rays affect these structures. CA 12-498

CURATIVE ACTION OF RADIUM ON CHICKEN SARCOMA.

H. Ozata. *Gann* 12, No. 4, 49 (1918). (In Japanese).

Jap. Med. Literature 5, 19 (1920).

When an inoculated fragment of tumor was irradiated, no change in size occurred, but there was a degeneration of cell nuclei. Growth of the tumor was inhibited by repeated radiation. CA 15-3687

8526

EFFECT OF RADIUM RADIATIONS ON THE DEVELOP-

MENT OF CHAETOPTERUS. Charles Packard. *Biol.*

Bull. 35, 50-67 (1918).

Unfertilized eggs of Chaetopterus were irradiated and then inseminated with normal sperm. Abnormal chromosomes developed and are described. CA 12-2098

8527

SUSCEPTIBILITY OF CELLS TO RADIUM RADIATIONS.

Charles Packard. *Biol. Bull. Marine Biol. Lab.* 46,

165-77 (1924). CA 18-1716

8528

DIFFERENCE IN THE ACTION OF RADIUM ON GREEN PLANTS IN THE PRESENCE AND ABSENCE OF LIGHT.

Charles Packard. *J. Gen. Physiol.* 1, 37-8 (1918-19).

CA 13-234

8529

THE EFFECT OF RADIUM RADIATIONS ON THE FERTILIZATION OF NEREIS. Charles Packard. *J. Exptl. Zool.* 16, 85-129 (1914).

Nereis eggs and spermatozoa were exposed to Ra emanations for varying lengths of time. Sperm nucleus and aster failed to develop and fuse with the egg nucleus. The egg nucleus developed without an aster. The germ nuclei developed abnormally and mitosis did not occur even with protoplasmic division. CA 8-1311

8530

THE EFFECTS OF THE β AND γ -RAYS OF RADIUM ON

PROTOPLASM. Charles Packard. *J. Exptl. Zool.* 19,

323-53 (1915).

Mitosis of *arbacia* eggs is accelerated by gamma rays from RaBr_2 , but the eggs of *Nereis* and *Drosophila* are not affected. Development is abnormal when both gamma and beta rays are used. CA 10-2939

8531

IRRADIATION EXPERIMENTS WITH X RAYS IN EINKORN

WHEAT. A. Matsumura. *Ann. Rept. Natl. Inst. Genet.*,

Mishima, Japan, 3, 36-37 (1953).

Relations between frequency of chromosome aberrations, mutation rate, dose and wave length are discussed. A list of induced mutants is given. The early and giant mutants are of possible value in breeding. CA 14-3282

8532

EFFECT OF X-RAYS ON THE ACID-BASE EQUILIBRIUM

OF THE BLOOD. P. Pagniez, F. Coste, and I. Solomon.

Compt. rend. soc. biol. 92, 489-91 (1925). (In French).

Alkalosis occurs in the blood following x-irradiation. This appears to be a result of damage to some regulating mechanism in the body. CA 19-2088

8533

THE BIOLOGICAL ACTION OF CONDENSED RADIUM

EMANATIONS. E. Partos. *Berlin klin. Wochschr.* 52,

181-3 (1915). (In German).

Ra emanation can bring about death in mice if they are exposed long enough. In smaller doses the chief effect is on the spleen where the leucocytes are destroyed and the connective tissue takes on a hyaline appearance. CA 9-2778

8534

INFLUENCE OF X-RAYS ON THE PRODUCTION OF

ANTIBODIES (HEMOLYSINS, DIPHTHERIA ANTITOXIN).

A. Paulin. *Compt. rend. soc. biol.* 92, 572-3 (1925).

Antibody formation occurs in irradiated rabbits after injection of antigen as well as in unirradiated rabbits. Antibodies already formed are not destroyed by large doses of radiation but their further production is decreased. CA 19-1895

8535

A STUDY OF THE EFFECT OF RADIUM UPON THE

EGGS OF *ASCARIS MEGALOCephala UNIVALENS*.

Fernandus Payne. *Arch. mikroskop. Anat. u.*

Entwicklungsmech. 36, 287-93 (1913).

Eggs were exposed to a Ra tube for 1-16 hr and then incubated at 37° until desired development stage was reached. Abnormalities occurred which resulted in the death of the embryo. The chromosomes were broken into granules. CA 7-2440

8536

ACTION OF RADIUM RAYS, X-RAYS, AND ULTRA-

VIOLET RAYS ON TRANSPLANTABLE CHICKEN

SARCOMA. F. Pentimalli. *Sperimentale* 78, 719-39

(1924). CA 19-1902

THE ACTION OF RADIUM EMANATIONS. E. Poulsson Arch. exptl. Pathol. Pharmacol. Naunyn-Schmiedeberg's Supplbd. 443-8(1908).

Experiments on rabbits and diabetic patients after the use of water containing radium emanations. CA 3-209

8548

OBSERVATIONS UPON THE EFFECTS OF RADIUM ON TISSUE GROWTH IN VITRO. Frederick Prime. J. Cancer Research 2, 107-30(1917).

Ra stopped mitosis in cultures of chicken embryonic heart muscle. Radiumized cells were able to wander out from the main tissue and this accounted for the increased area of the culture CA 12-187

8549

INFLUENCE OF X-RAYS ON GERMINATION. G. Promys and P. Drevon. Rev. gen. botan 24, 177-97(1912).

Lentils, wheat, beans, and lupines were irradiated with x rays. With a moderately high temperature, the development of the plants was accelerated. At ordinary temperature the effects on germination were variable. CA 7-3606

8550

MODIFICATION OF THE ARNETH NEUTROPHILE FORMULA OF THE BLOOD UNDER INFLUENCE OF INHALATION OF RADIUM EMANATION. Brissaud Rebattu and Richard. Compt. rend. soc. biol. 74, 471-3(1913).

Neutrophil production was increased by radium radiation. The uric acid of the blood disappeared at the same time. It is suggested that uricolytic enzymes secreted by polymorphonuclear leucocytes were activated. CA 8-1464

8551

A COMPARISON OF THE PHYSIOLOGICAL EFFECTS OF ALPHA AND BETA RAYS. A. C. Redfield Am. J. Physiol. 51, 189 (1920).

There was no apparent difference in the effects of either radiations on the marine worm Nereis limbota. CA 14-3282

8552

THE EFFECT OF RADIUM RADIATIONS UPON THE FERTILIZATION MEMBRANE OF NEREIS. A. C. Redfield and Elizabeth M. Bright. Am. J. Physiol. 45, 374-87(1918). CA 12-1489

8553

THE PHYSIOLOGICAL CHANGES PRODUCED BY RADIUM RAYS AND ULTRA-VIOLET LIGHT IN THE EGGS OF NEREIS. Alfred C. Redfield and Elizabeth M. Bright. J. Physiol. (London) 55, 61-85(1921).

The difference between radium and ultra-violet light is due to differences in the penetrating power of these radiations. The failure of visible light to affect the egg is attributable to the limited absorption of those wave lengths by protoplasm. CA 15-3337

8554

HEMOLYTIC ACTION OF RADIUM EMANATION. A. C. Redfield and Elizabeth M. Bright. Am. J. Physiol. 65, 312-7(1923).

Alpha rays are apparently the causative agent of Ra radiation responsible for in vitro sheep erythrocyte destruction. Both the hemolysis and stromatolysis appear to be independent of one another. The electrical resistance of the erythrocyte suspension increases during hemolysis but decreases when stromatolysis occurs. CA 17-3512

8555

THE PHYSIOLOGICAL ACTION OF IONIZING RADIATIONS. A. C. Redfield and Elizabeth M. Bright. Am. J. Physiol. 68, 354-67(1924).

When the eggs of *Nereis limbata* are exposed to x-rays and fertilized, the processes of membrane formation and jelly secretion are altered in a manner identical to that described previously for eggs exposed to β and γ radiation. The perivitelline space becomes uniformly enlarged on all sides of the egg and the volume occupied by jelly diminishes proportionately. Effects of hard and soft x-rays on jelly secretion are presented graphically. Physiological effects vary as the ionizing power of the primary x-rays vary. These observations support the theory that ionization is fundamental to the physiological action of ionizing radiations. CA 18-2920

8556

THE RELATIVE PHYSIOLOGICAL EFFECT OF β AND γ -RAYS UPON THE EGG OF NEREIS. Alfred Redfield and E. M. Bright. J. Gen. Physiol. 2, 25-9(1919-20).

When *Nereis* eggs are exposed to radium, the thickness of the fertilization membrane is increased. An increase in the intensity of radiation produces a corresponding increase in membrane thickness. CA 13-2715

8557

THE EFFECTS OF RADIUM RAYS ON METABOLISM AND GROWTH OF SEEDS. A. C. Redfield and Elizabeth M. Bright. J. Gen. Physiol. 4, 297-301(1922).

Radish seeds exposed to Ra rays show an increased production of CO_2 in comparison with untreated seeds. Germination is also retarded by radiation, however, those seeds which do not germinate continue to produce CO_2 . CA 16-1449

8558

THE ACTION OF β -RAYS OF RADIUM ON EXCITABILITY AND CONDUCTION IN THE NERVE TRUNK. E. S. Redfield, A. C. Redfield, and A. Forbes. Am. J. Physiol. 59, 203-21(1922). CA 16-2911

NOTES ON THE EFFECT OF X-RADIATIONS ON THE DEVELOPMENT OF CUMINGIA EGGS. A. Richards and D. J. Good. Biol. Bull. 37, 209-21(1919). CA 14-1388

8563

THE INFLUENCE OF ROENTGEN RAYS ON THE TISSUE CONTENT OF CHOLESTEROL. A. H. Roffo. Bull. soc. chim. biol. 7, 608-14(1925).

Cholesterol content in tissues diminishes in carcinoma tissue following x-irradiation. CA 19-2848

8564

THE EFFECT OF ROENTGEN RAYS UPON THE CHOLESTEROL CONTENT OF TUMORS. A. H. Roffo and L. M. Correa. Z. Krebsforsch. 22, 79-82(1924).

The cholesterol content was lowered in connective-tissue sarcomas following x-ray therapy. CA 19-1736

8565

THERAPY OF LEUKEMIA WITH THORIUM X. George Rosenau. Munch. med. Wochschr. 60, 2214-16(1913).

In some cases of leukemia Thorium X proved to be a therapeutic aid, but was not more effective than Roentgen rays. CA 8-374

8566

THE ANTITRYPSIN CONTENT OF THE BLOOD SERUM DURING LEUKOCYTOLYSIS BY THORIUM X. Georg Rosenow and Gerland Farber. Z. ges. exptl. Med. 3, 377-84(1914). (In German). CA 9-820

8567

THE RESISTANCE OF THE DIFFERENT TYPES OF LEUCOCYTES TO THORIUM X. Georg Rosenow. Z. ges. exptl. Med. 3, 385-96(1914). (In German).

Lymphocytes appear to be more radiosensitive at first to radiation from Ra-224. However, polymorphonuclear leukocytes disappear after temporarily increasing from 1.5 to 3 per cent and are replaced by lymphocytes. CA 9-820

8568

BIOLOGY OF THE METAL THORIUM. Arnold Rossel. Reference made in Chemical Abstracts, Vol. 7, 1913, as follows: Arch. sci. phys. et Nat. 32, 347.

Sea water containing a nutrient and varying (0-50%) amounts of Th powder was placed in 2-liter bottles. Rudimentary fish were raised in this water, and it was found the greater amount of Th, the better the condition of the fish. Author concludes that Th has properties which kill germs endangering life. CA 7-650

8569

BIOLOGICAL ACTION OF ROENTGEN RAYS OF VARYING QUALITY ON THE SKIN OF MAN AND OTHER ANIMALS. G. A. Rost. Strahlentherapie 6, 269-329 (1915). and Zentr. Biochem. Biophys. 18, 362(1915).

Author describes effects of massive irradiation with x-rays. Skin shows increased connective tissue and endothelial cells, decrease in number and atrophy of elastic fibers. Repair is slow and is accompanied by formation of atypical cells. Later, pigmentation appears, due to disintegration of pigment cells. CA 11-346

8570

THE EFFECT OF THORIUM X UPON RESPIRATORY METABOLISM. Nikolaux Roth and J. V. Benezny. Arch. pathol. Anat. u. Physiol. Vitenov' 213, 515-19(1913). (Budapest). CA 8-362

Human subjects were given large amounts of Th X (300-500 electrostatic units by mouth and 1500-2000 units intravenously.) Normal metabolism was previously determined. After large amounts of Th X, the CO_2 expired and respiratory quotient were correspondingly larger than after smaller doses. CA 8-362

8571

INFLUENCE OF X RAYS ON THE VEGETATIVE SYSTEM. J. Rother. Deut. med. Wochschr. 50, 1141-3 (1924), Physiol. Abstracts 9, 487.

When the abdominal region of rabbits is irradiated, a fall in blood pressure occurs. This is due to effects of radiation on the skin. The fall in blood pressure can be prevented by atropine. In dogs and rabbits a rise in blood sugar resulted from radiation of the liver or pancreas. CA 19-2240

8572

THE INFLUENCE OF THE ROENTGEN RAYS ON THE

PROTEIN METABOLISM IN BASEDOW'S DISEASE.

C. Rudinger. Deut. med. Wochschr. 33, 51(1907). (In German).

Author reports on metabolism experiments in which the nitrogen balance was determined. Exposure to x-rays induced a reaction of nitrogen. The nitrogen elimination fell gradually after exposure. There was no relation between the phosphorus and nitrogen metabolism. CA 1-744

8573

THE INFLUENCE OF RADIOACTIVE EARTH ON PLANT GROWTH AND CROP PRODUCTION. H. H. Rusby N. Y. Botan. Garden 16, 1-23(1915); Bull. Agr. Intelligence 6, 1318-9. CA 10-1247

8574

ON THE EFFECTS OF X RAYS OF DIFFERENT WAVE LENGTHS UPON SOME ANIMAL TISSUES-PROOF OF DIFFERENTIAL ACTION. S. Russ. Proc. Roy Soc. (London) 95, 131-142(1923-4).

Effects of radiation on the skin of rats and on Jensen's Rat Sarcoma are described. Measurement of radiation dose is discussed. Action of U-V, visible light and x-rays on bacteria were compared and results are presented and discussed. Germicidal action of radiation is said to stop at λ 2960 Å, and greater effect is observed with UV. A large series of studies on irradiation of tumor slices *in vitro* and subsequent injection in rats is also reported.

8575

THE ACTION OF RADIUM RAYS UPON THE CELLS OF JENSEN'S RAT SARCOMA. S. Russ and Helen Chambers. Proc. Roy Soc. (London) 86, 482-9(1913).

Jensen's rat sarcoma, exposed to Ra β rays *in vitro*, does not grow when transplanted to normal rats. Histological examination does not indicate that these cells were killed before inoculation. CA 7-3778

8576

EXPERIMENTAL STUDIES WITH SMALL DOSES OF X RAYS. S. Russ, H. Chambers, G. M. Scott, and J. C. Mottram. Lancet I, 692-95(1919).

Tumor growth is stimulated by large doses of x rays, while growth is inhibited by small doses. A condition of immunity is produced by small doses. CA 13-2233

8577

THE ELIMINATION OF RADIUM FROM NORMAL AND NEPHRECTOMIZED ANIMALS. W. Salant and G. M. Meyer. Am. J. Physiol. 20, 366-77(1907-8).

Found that nephrectomized rabbits eliminate radium through the liver and small intestines at a rate no more rapid than than observed in normal rabbits. CA 2-418

8578

INFLUENCE OF RADIUM ON THE PRODUCTION OF ANTIBODIES IN THE ANIMAL ORGANISM. Albert Schutze. Med. Klin. (Munich) 7, 1729-30(1911). CA 6-399

8579

ACTION OF X-RAYS ON GESTATION. M. Sebileau Compt. rend. soc. biol. 61, 637-8(1960).

Exposure of pregnant rabbits to the X Rays either induces abortion or prolongs the period of gestation. When the young are born they generally die or are very small and feeble. CA 1-736

8580

EFFECT OF THORIUM B ON DEPANCREATIZED ANIMALS AND ON DIABETICS. A. Slosse. Compt. rend soc. biol. 89, 817-8(1923).

Experiments show a distinct fall in the elimination of ketone bodies. CA 18-421

8581

SIGNIFICANCE OF RADIOACTIVITY IN PHYSIOLOGY.

Julius Stoklasa. Z. Strahlenther. 4, 1-18. Zentr. Biochem u. Biophys. 16, 890(1915). (In German).

Nitrifying bacteria growth is increased by alpha rays but decreased by both beta and gamma rays. *Saccharomyces* fermentation is increased by radiation from Ra. CA 8-3807

8591

BLOOD GAS ANALYSIS. XIII. THE INFLUENCE OF α -RAYS ON HEMOGLOBIN AND BLOOD CORPUSCLES. H. Straub and Kl. Gollwitzer-Meier. Biochem. Z. 136, 128-39(1923).

Alpha radiation affects the CO₂-combining power of hemoglobin in solution or erythrocyte saline suspensions. Suspected causes for this action are mentioned. CA 17-3191

8592

THE INFLUENCE OF RADIATIONS FROM RADIUM EMANATION UPON TUMOR SUSCEPTIBILITY IN ALBINO RATS. K. Sugiura. J. Cancer Research 8, 376-84 (1924).

Effects of radium on the growth of carcinoma in rats were studied. It appears that a slight immunity develops as a result of mild radiation. CA 19-340

8593

THE ACTION OF RADIUM EMANATION ON THE VITAMINES OF YEAST. Kanematsu Sugiura and Stanley R. Benedict. J. Biol. Chem. 39, 421-33(1919).

Ra emanation apparently effects the mechanism promoting growth in yeasts. The author speculates that this may be the mode of action of Ra on neoplasms. CA 13-3244

8594

SOME EFFECTS OF RADIUM RADIATIONS ON WHITE MICE. K. Sugiura and G. Failla. J. Gen. Physiol. 4, 423-36(1922).

The effects of radiation from radium (1.9 - 36.5 millicurie hrs.) on new born mice were studied. Small fractionally applied doses stimulated growth, larger doses retarded growth and still larger doses caused premature death. Large sublethal doses caused severe skin lesions, retarded body growth, but failed to sterilize males. CA 16-1811

8595

INFLUENCE OF RADIUM AND X RAYS ON FROG LEUCOCYTES. M. M. Sturges and Isaac Levin. Proc. Soc. Exptl. Biol. Med. 18, 295-7(1920-21).

The action of Ra or X rays on a frog results in the decrease of the relative number of lymphocytes. There is no noticeable change in the total blood count. CA 16-1112

8596

THE INFLUENCE OF X-RAYS UPON GASTRIC SECRETION Eugen Szego and Julius Tother. Z. ges. exptl. Med. 24, 270-88(1921).

Therapeutic doses of x rays have no effect on gastric secretion of dogs, but larger doses increase both the quantity of secretion and enzyme content. Increased gastric occurs following transient depression of function. Exposure to greater doses results in cachexia, atrophy of the gastric mucosa and burns of the intestinal mucosa. CA 16-127

8597

RAYING OF GLANDS AND COAGULATION OF BLOOD. A. Szenes. Munch. med. Wochschr. 67, 786-8(1920). (In German)

Coagulation time of the blood was decreased by roentgen irradiation of the spleen. When a solution of sodium chloride was injected there was a further decrease of coagulation time. When the thyroid gland was exposed to roentgen rays, no effect was noted. CA 15-394

8598

THE EFFECT OF INTRAVENOUS INJECTIONS OF ACTIVE DEPOSIT OF RADIUM ON METABOLISM IN THE DOG. Ruth C. Theis and Halsey J. Bagg. J. Biol. Chem. 41, 525-35(1920).

Dogs were injected with NaCl solutions of active deposits of Ra emanations. Chemical constituents of blood and urine were measured after exposure to determine the effects of the injected radioactivity on various metabolic processes. Measurements included: blood and urine nitrogen content, urea, albumin, sugar and creatinine. Blood counts and temperature measurements are also reported. CA 14-1713

8599

IMMUNITY AND RADIANT ENERGY. Carl Timm. Beitr. Klin. Tuberk. 48, 195-208(1921).

Roentgen radiation increased the nonspecific immunity, radium rays increased immunity against the A partial antigen and light (U-V and various portions of the visible spectrum) increased immunity against the F and N partial antigens. Visible light and U-V also increased nonspecific immunity and immunity against A, but to a lesser extent than did Ra. None of the radiations affect immunity against the L partial antigen. CA 16-2725

8600

THE EFFECTS OF RADIUM ON RABIES VIRUS. Guido Tizzoni and Alessandro Bongiovanni. Centr. Bakteriolog. Parasitenk. 43, 713-18(1907).

Irradiation of animals *in vivo* with Ra rays increases resistance of the animals to the Rabies virus. *In vitro*, Ra emanations act directly as a chemical product on the virus. CA 1-1743

8601

INFLUENCE OF THE RADIOACTIVITY OF THE AIR ON THE MICROORGANISMS OF THE ATMOSPHERE. A. Trillat and Fouassier. Compt. rend. 159, 817-19(1914). CA 9-1928

8602

RADIATION ACTION UPON CELLS ESPECIALLY UPON CANCER CELLS AND THE QUESTION OF THE CHEMICAL IMITATION OF THE SAME. Sergel Tschachotin. Munch. med. Wochschr. 59, 2379-81(1912).

Sea urchin eggs exposed to x-rays and frog and bird erythrocytes exposed to U-V seemed to become more alkaline as judged by neutral red staining. CA 7-173

8603

MESOTHORIUM, THORIUM X, AND THORIUM EMANATIONS, AND THEIR THERAPEUTIC USE. D. Turner. Edinburgh Med. J. 9, 220-3(1912).

In vitro experiments with thorium resulted in uric acid decomposing into urea and carbon dioxide. When Radium-224 was injected into tumors, a swelling occurred and this was followed by decrease in size of the tumor. CA 6-3287

8604

REVERSIBLE GEL FORMATION IN THE CELL. CHANGE IN THE PERMEABILITY OF THE PROTOPLASM BY RADIATION WITH RADIUM. M. A. van Herwerden. Ned. Tijdschr. Geneesk. 69, I, 1217-22(1925).

Author studied reversible gelation in epithelial cells in tadpole tails. This process makes the nucleus and nucleolus of the cells visible and is presented as evidence of penetration of dilute acetic acid. Exposed cells were surrounded by 0.05-0.07% HAC after irradiation by Ra Br₂. Gelation occurred immediately, but only after 20-30 min. in non-irradiated control material. Results were not significantly different when radiation was filtered through 2 mm of Pb. CA 19-2058

8605

RADIOACTIVITY AND HEART FUNCTION. G. Viale.

Arch. sci. biol. (Italy) 6, 209-43(1924), Physiol. Abstracts 9, 450.

The presence of uranium or thorium inhibits the effect of potassium on the heart. The heart beat is temporarily increased by sodium uranate. When the heart has been stopped by perfusion with potassium-free Ringer's solution, the beat can be restored by sodium uranate. CA 19-2240

8606

THE INFLUENCE OF RADIOACTIVE WATER ON THE GERMINATION OF PLANTS. D. Vidal. Compt. rend. agr. France 11, 402-6(1925).

Radioactive water containing dissolved lead salts gave contradictory results on plant germination studies. However, some stimulatory action appeared as a result of the use of this water. CA 19-2362

8607

THE WOBURN EXPERIMENTAL STATION OF THE ROYAL AGRICULTURAL SOCIETY OF ENGLAND. I. THE HILL'S EXPERIMENTS. THE INFLUENCE OF RADIOACTIVE ORE ON WHEAT. J. A. Voelcker. J. Roy. Agr. Soc. Engl. 77, 235-64(1916).

Ground radioactive ore containing 0.15% U_3O_8 was used in amounts of 500, 1000, and 2000 lbs/acre. The yields were: 100 for the control, 92, 94, and 93 for each of the amounts respectively. There was no effect on germination. CA 11-3089

8608

THE BIOLOGICAL ACTION OF THORIUM. Werner von Bolton. Reference made in Chemical Abstracts, Vol. 6, 1912, as follows: Z. Elektrochem. 17, 816.

Bacterial growth was visible on the surface of Th metal 6 months after it had been sealed in a vial containing 100 ml. of water. After 12 months, the surface bacteria were found to be non-viable. Author concludes that Th first promotes, but on long exposure inhibits bacterial growth. CA 6-1183

8609

ANAPHYLACTIC SHOCK AFTER TREATING SENSITIZED ANIMALS WITH ROENTGEN RAYS. Hans von Heinrich. Centr. Bakteriell. Parasitenk. I Abt., Orig. 70, 421-8 (1913). CA 7-4004

8610

THE INFLUENCE OF RADIUM EMANATION ON THE PHAGOCYTOSIS OF BACTERIA. C. v. Kleck. Z. Immunitätsforsch. 13, 589-604(1912).

Bacterial phagocytosis differs with different bacteria when in contact with Ra emanation in water solutions. Staphylococcus and E. coli had increased phagocytosis while Koch's bacillus had decreased action. CA 6-2653

8611

BIOLOGICAL ACTION OF RADIUM EMANATION. E. v. Knafli-Lenz. Z. Balncol. 5, No. 14 (1912); Zentr. Biochem. u. Biophys. 14, 244(1913).

Ra emanation has solvent action on lipoids and can decompose lecithin. This is demonstrated by its hemolytic action on red blood cells of guinea pigs and rabbits after adding lecithin. Effect of Ra emanation is considered to be analogous to effect of cobra venom in its lytic property. Emanation is also injurious to cerebral ganglionic cells. Author attributes favorable action of Ra emanation in gout to effect of nervous system. CA 7-1762

8612

ANALYSIS OF THE ACTION OF RADIOACTIVE SUBSTANCES ON CARCINOMA OF MICE. A. Wasserman. Deut. med. Wochschr. 40, 524-8(1914). (In German).

Mouse tissues were irradiated *in vitro* by γ rays, and it was found that the richer a tissue is in **genocceptors**

and the more it is inclined to regeneration and proliferation, the more sensitive it is to radioactive rays. Cancer cells derive their malignancy from the richness in **genocceptors**. CA 8-2184

8613

THE FORCING OF RESTING PLANTS BY X RAYS.

F. Weber. Biochem. Z. 128, 495-507(1922).

Irradiation of *Syringa vulgaris* with x rays during the winter rest-period resulted in a shortening of the ensuing development period. A high dose is necessary, but too high a dose will cause necrosis in the "oxalate nest" of the bud. CA 16-1971

8614

THE EFFECT OF ROENTGEN RAYS AND RADIUM RADIATIONS UPON THE VITALITY OF THE CELLS OF MOUSE CARCINOMA. B. H. Webb and S. Russ. J. Pathol. Bacteriol. 17, 1-11(1913).

Mouse tumors, when irradiated by X rays before transplantation into other mice, do not proliferate. Excised tumors, irradiated for 1 hr with β rays from $RaBr_2$, also do not proliferate, but tumors exposed for 18 hr to γ rays from $RaBr_2$ are not inhibited in their growth. CA 6-3461

8615

EFFECT OF ROENTGEN RAYS UPON TISSUE RESPIRATION. Paul Wels. Arch. ges. Physiol. Pfluger's 206, 268-73(1924).

The animal body and separate organs were irradiated. There was no effect on energy exchange of the tissues. CA 19-855

8616

EFFECT OF ROENTGEN RAYS UPON YEAST CELLS. Paul Wels and Mathilde Osann. Arch. ges. Physiol. Pfluger's 207, 156-64(1925).

Irradiation of yeast cells with Roentgen rays inhibited their reproductive rate. There was no change in O_2 consumption or the production of CO_2 . CA 19-1583

8617

THE BIOLOGICAL ACTION OF RADIUM RAYS. R. Werner. Munch. med. Wochschr. 57, (1914).

Upon exposure of hen's eggs to $RaEm$, 2/3 of the lecithin present was destroyed in 168 hr. CA 4-3083

8618

EFFECT OF RADIUM ON THE HEMOLYTIC AND ANTITRYPTIC PROPERTIES OF SERUM FROM CANCER PATIENTS. A. Wilbouchevitch and E. Bassier. Compt. rend. soc. biol. 89, 61-2(1923).

Radium therapy only rarely increases the hemolytic power of the serum but it increases the already high antitryptic index even further. CA 18-119

8619

SOME OBSERVATIONS ON THE ACTION OF RADIUM ON PLANT CELLS. Maud Williams. Ann. Botany (London), 39, 547-62(1925).

Author studied epithelial cells from the petiole of *Saxifraga umbrosa*, determining (1) permeability, by measuring stomatal apertures and (2) rate of plasmolysis by sugar solutions (hypertonic sucrose). Radium rays (0.1 gm Ra element and 0.51 mg of Ra Br with γ ray equivalent to 0.27 mg of element) caused considerable decrease in average stomatal gap and also a 2-20 fold increase in percentage of cells plasmolysed by a given solution of hypertonic sucrose. CA 19-3512

8620

EFFECT OF INTRAVENOUS INJECTIONS OF RADIUM ON A PERSISTENT POSITIVE WASSERMANN REACTION. Wilfield Ayres. Med. Record 88, 610(1915).

Negative reactions occurred in cases of syphilis after radium therapy. CA 9-3302

8621

INFLUENCE OF A SMALL QUANTITY OF RADIUM EMANATION UPON THE DEVELOPMENT AND METAMORPHOSIS OF BATRACHIANS. P. Wintrebert. *Compt. rend.* 143, 1259-62(1906).

The emanation of radium dissolved in small quantities in water has a favorable influence upon the development and metamorphosis of Batrachians. CA 1-738

8622

THE BIOLOGICAL ACTION OF X RAYS. F. Wolfers. *Rev. gen. sci.* 33, 141-4(1922).

Explanation of x-ray effect on the basis of emission of electrons in irradiated tissues and consequent ionisation is considered to be inadequate. Author believes main actions are photochemical. It is proposed that fluorescence is excited directly or indirectly in cells and x-rays merely provide a way of getting energy to the right place. Author emphasizes that presence of heavier trace elements in cells will greatly increase radiation damage and radiosensitivity can be manipulated selectively in this way. CA 16-1782

8623

ACTION OF RADIUM ON TRANSPLANTED TUMORS OF ANIMALS. F. C. Wood and F. Prime, Jr. *Ann. Surg.* 62(1915), *J. Am. Med. Assoc.* 66, 59(1916).

The relative importance of β and γ rays (large and small doses) in the effect of radium radiation on tumors was studied in experiments with various rat and mouse tumors studied either after removal from the host or *in situ*. CA 10-783

8624

THE ACTION OF RADIUM ON GROWING CELLS. F. C. Wood and F. Prime. *Proc. Soc. Exptl. Biol. Med.* 11, 140-2(1914).

Mouse carcinomas were not cured by treatment with RaBr_2 , but there was a decrease in size of the tumors. Growth of the Jensen rat sarcoma was prevented by RaBr_2 , and the Flexner rat carcinoma was inhibited. CA 9-3297

8625

COMPARISON OF THE EFFECTS OF ROENTGEN AND RADIUM RADIATION. H. Holthusen. *Strahlentherapie*, 46, 273-288(1933). (In German).

Author describes and discusses his observations on skin of human thigh and scalp skin of patients receiving therapeutic irradiation of the head. Effects of various doses and dose rates are analyzed, using erythema and epilation as criteria of effects.

8626

THE INFLUENCE OF RADIOSENSITIVITY ON DIS-SIMILATION PROCESSES. V. Zdobnický. *Vesník* 5 Sjez. Českoslov. Lékařsk. Prir. 431(1915) *Botan. Centr.* 129, 378(1915), *Exptl. Sta. Record* 35, 524.

Large amounts of radiations from radioactive materials injure plants while small amounts enhance the production of starch. CA 11-1674

8627

RADIOACTIVITY AND LIFE. H. Zwaardemaker. *Arch. neerl. physiol.* 4, 177-96(1920).

Frog hearts stopped beating after perfusion with potassium-free Ringer's solution. Pulsation was restored by perfusing the hearts with solutions of radioactive Rb, K, U and Th. CA 14-2204

8628

SUMMARY OF RECENT EXPERIMENTS ON IRRADIATION OF THE HEART. H. Zwaardemaker. *Arch. neerl. physiol.* 9, 115-7(1924).

Frog hearts were perfused with Ringer's solution containing radioisotopes instead of potassium. The action of isotopes was direct rather than on the potassium in the heart tissue. CA 19-1911

8629

THE RESTORING ACTION OF RADIUM RAYS UPON THE ISOLATED HEART WHICH HAS BEEN AFFECTED BY LACK OF POTASSIUM. H. Zwaardemaker. *Arch. ges. Physiol. Pfluger's* 169, 122-8(1917), *Physiol. Abstracts* 2, 622.

β rays from mesothorium restore the beat of a frog's heart *in vitro* after it has stopped because of lack of K in Ringer solution. CA 12-832

8630

IMPORTANCE OF RADIOACTIVITY IN ANIMAL LIFE. H. Zwaardemaker. *Geneesk. Blader* 20, 253-302(1918).

Author concludes that radioactive elements affect protoplasm by transmitting a negative or a positive charge to it. CA 14-1345

8631

PHYSIOLOGICAL RADIOACTIVITY. H. Zwaardemaker. *J. Physiol. (London)* 53, 273-89(1920).

Author summarizes his work showing that the activity of potassium in organs, especially the heart, is due to its radioactivity. It can be replaced, in a fluid perfusing an isolated heart, by another similarly radioactive element or by exposure to external radiation. Either α or β radiation may be effective but if applied together they neutralize each other. Fluorescein sensitizes tissues to radiation, calcium decreases their sensitivity. CA 14-2497

8632

RADIOBIOLOGY. H. Zwaardemaker. *Ned. Tijdschr. Geneesk.* 1, 239-52(1919), *Physiol. Abstracts* 4, 80(1919).

After lack of K has stopped the beating of a frog heart, radiation will restore it. K can be replaced by radioactive elements of equivalent amounts. Growth of bacteria was stopped by γ rays of Po and β rays of Ra or mesothorium. Combination of two types of radiation had no effect on the bacteria, since the two radiations antagonize each other. CA 14-1856

8633

RADIOACTIVE EQUILIBRIUM. H. Zwaardemaker. *Onderzoek. Physiol. Lab. (Utrecht)* 19, 262-85(1918), *Physiol. Abstracts* 4, 19. CA 14-1855

8634

POLONIUM RADIATION AND RECOVERY OF FUNCTION. H. Zwaardemaker. *Proc. Acad. Sci. Amsterdam* 22, 383-5(1920).

Frog's heart beat, after removal of K from circulating fluid, can be restored by replacing K with other radioactive elements, i.e., Rb, Th, U, Ra, I. Restorative action may be either direct or indirect with mesothorium, mica-screened Ra and polonium on Cu, but since the γ rays of Po and the β rays of K are antagonistic, it is concluded in this case that there is a direct action of radiation. CA 14-1714

8635

SENSIBILIZATION TO RADIOACTIVITY BY THE ACTION OF HORMONES. H. Zwaardemaker. *Proc. Acad. Sci. Amsterdam* 23, 838-41(1921), also *Onderzoek. Physiol. Lab. Univ. Utrecht.* 11 233(1921). (In German).

Studies with the cold blooded heart have shown that uranium α rays and potassium β rays both keep the heart going but the two may be balanced to produce heart stoppage. An excess of one or the other may start it again. Amounts necessary for equilibrium vary from winter to summer. When there is heart stoppage, a number of substances may start it again, e.g. choline, adrenaline. The charged particles send the radiation with great velocity through the lipid films on the cell surface and thus evoke a catalytic effect on stimulus. CA 15-2448

CANADA, MINISTER OF AGRICULTURE. REPORT FOR THE YEAR ENDED MARCH 31, 1951. 102p

This report discusses breeding of: wheat, oats, barley, forage grasses, lucerne, clovers, field bean, potato, fibre flax, tobacco, annual oilseed rape, linseed, fruits, cabbage, and tomato.

8667

THE INFLUENCE OF RADIOACTIVE ELEMENTS ON THE YIELDS OF PLANTS. A. A. Drobkov. *Izvest. Akad. Nauk SSSR. Ser. Biol.*, p. 783-801(1940).

Addition of small quantities of radium, uranium, thorium and actinium to nutrient solutions increases the yield of peas, flax and lucerne. Ra and U usually are relatively better consumed from those solns. in which they are present in the lowest concs. Ra enters the plant during the entire vegetative period, but is utilized more intensively during flowering and ripening. The positive action of radioactive elements manifests itself chiefly in an increase of the number of seeds and an acceleration of ripening. Addition of 10^{-10} - 10^{-8} g. of Ra, 10^{-2} g. of U, and 10^{-3} g. of Th per kg. of soil per flower pot (argillaceous soil of a moderately podzole condition) considerably increases the yield of cucumbers, accelerates their ripening and increases their sugar content. Positive results have also been obtained in sand cultures of carrots. BA 16-2748

8668

RESEARCH ON THE INDUCTION OF HAPLOIDY IN FLOWERING PLANTS. R. Ehrensberger. *Biol. Zentr.* **67**, 537-546(1948).

Experiments on induction of haploidy by x-irradiation of the sporophytes of *Gastria* spp. and *Antirrhinum majus* are reported. Maternal haploids and diploids were obtained after the application of irradiated pollen. Paternal haploids were obtained by pollinating x-irradiated egg cells.

8669

NOTE ON THE TIME-INTENSITY FACTOR IN RADIO-BIOLOGY. U. Fano and L. D. Marinelli. *Proc. Natl. Acad. Sci. U. S.* **29**, 59-66(1943).

Two x-ray doses, delivered within a sufficiently short time and separated by variable time intervals, appear most suitable for investigating recovery processes that express themselves through the time-intensity factor. From experimental data an index of recovery, R, can be calculated for *Tradescantia* microspores.

8670

THE OXIDATIVE PHOSPHORYLATION BY MITOCHONDRIA ISOLATED FROM THE SPLEEN OF RATS AFTER TOTAL BODY EXPOSURE TO X-RAYS. D. W. van Bekkum, H. J. Jongefrier, H. T. M. Nieuwerkerk, and J. A. Cohen. *Brit. J. Radiol.* **27**, 127(1954).

Phosphorylation, oxygen uptake and p/o ratio were significantly reduced in mitochondria from spleens of rats receiving total body exposure to 1100 r. The effect was observed whether the substrate was succinate or α ketoglutarate.

8671

AGRONOMIC MUTATIONS IN OATS INDUCED BY X-RAY TREATMENT. K. J. Frey. *Agron J.* **47**, 207-210(1955).

This paper includes data on the yield, test weight, heading date, plant height, lodging and stem-rust reaction of a few of the 61 mutants tested.

8672

MUTATIONS FOR STEM RUST RESISTANCE INDUCED IN OATS BY X-RAY TREATMENT. K. J. Frey and J. A. Browning. *Phytopathology* **45**, 490-492(1955).

Of 61 mutants obtained after x-irradiating seed of the oat variety Huron, 44 were resistant and three segregated for reaction to stem rust races 7 and 7A, six were resistant and eight segregated for reaction to race 8, and all were susceptible to race 6.

8673

ASPECTS OF THE AGRICULTURAL VALUE OF CERTAIN BARLEY X-RAY MUTATIONS PRODUCED AND TESTED AT THE SWEDISH SEED ASSOCIATION, SVALOF, AND

ITS BRANCH STATIONS. K. Froier. Acta Agr. Scand. 4, 515-543(1954).

The majority of the promising mutants will give their best performance in seasons with optimum precipitation, in districts with relatively good and favorably distributed rainfall, and on soils with satisfactory waterholding capacity.

8674
BARLEY BREEDING BY THE SWEDISH SEED ASSOCIATION. RESULTS OBTAINED AND FUTURE PROSPECTS. K. Froier. Sveriges Utsadesforen. Tidskr. 62, 401-414 (1952).

8675
X-RAY MUTANTS IN PEAS AND VETCHES. O. E. V. Gelin. Acta Agr. Scand. 4, 558-568(1954).

Following exposure to x-rays in both pea and vetch, robust multibranched types, and minus characters, such as dwarfness, chlorophyll defects or inhibited flowering, have occurred in the X_2 . A mutant of particular interest is a gigas form obtained from the fodder pea Parvus.

8676
FREQUENCY OF MITOTIC DISTURBANCES IN X-RAYED BARLEY. O. E. V. Gelin. Agr. Hort. Genetica 11, 66-81(1953).

The possible effects of variety, species and chromosome number or of temperature during germination upon the sensitivity of dormant grains of barley to increasing doses of x rays were investigated by estimating frequency of mitotic aberrations.

8677
WEIBULL'S STRAL PEA. AN X-RAY MUTATION FROM THE KOLSTER PEA. O. Gelin. Weibulls Illustrerade Arsbok 48, 28-30(1953).

The technique of inducing mutation by x-irradiation is explained and a preliminary description is given of the new x-ray mutant Stralart (Ray pea), derived in the X_2 of Kloster, a selection from Monopol X Ambrosia.

8678
THE OXYGEN EFFECT OR RADIATION-INDUCED CHROMOSOME ABERRATIONS; BREAKAGE-VERSUS-RECOMBINATION HYPOTHESES. N. G. Giles. J. Cellular Comp. Physiol. 45, (Suppl. 2), 271-284(1955).

Oxygen increases the frequency of chromosomal aberration in Tradescantia under x-irradiation by virtue of its effect on initial chromosome breakage rather than by its influence on recombination of broken ends.

8679
SPONTANEOUS AND INDUCED BUD MUTATIONS IN FRUIT TREES. I. Granhall. Acta Agr. Scand. 4, 594-600(1954).

A general review of the occurrence and value of bud sports is followed by an outline of work on the induction of somatic mutations in tree fruits by x-rays, fast neutrons and other radiations.

8680
REPORT ON THE WORK AT BALSARD IN 1951. I. Granhall. Foren. Vaxtforadling Fruktträd. 16p. (1952).

Author reviews studies on induction of mutation in apples, pears, plums, and cherries inducing treatment with x-rays, neutrons and radioactive phosphorus and sulfur.

8681
X-RAY MUTATIONS IN APPLES AND PEARS. I. Granhall. Hereditas 39, 149-155(1953).

The following x-ray-induced mutants are described: green and yellow striations of the fruits of the pear

Esperens Herre; brown-russeted fruits of this pear variety; chlorophyll deficiency in the foliage of a form of the Williams pear; and three types of red fruit in the apple Gravenstein.

8682
MUTATION BREEDING OF FRUIT TREES. I. Granhall. Nord. Jordbrugsforskn. 31-32, 401-411(1951).

Spontaneous mutations, cytological and chemical basis of mutation, and genome, chromosome and gene mutations in fruit trees are discussed.

8683
CHROMOSOME STUDIES BY MEANS OF X-IRRADIATION. T. Gage. Idengsku Zasshi 16, 23-35(1940).
A review.

8684
METHODS AND RESULTS OF IRRADIATION MUTATION BREEDING OF CULTIVATED PLANTS. H. Hansel. Bodenkultur 7, 354-362(1953).

This article includes information on the maximum doses of irradiation tolerated by various plant species and descriptions of valuable mutations induced in cereals by irradiation.

8685
COMPARATIVE OBSERVATIONS ON THE DEVELOPMENT OF INFLUORESCENCES IN LYCOPORSICUM ESCULENTUM MILL. AND IN AN X-RAY MUTANT. J. Helm. Zuchter 21, 89-95(1951). BA 21-3097

8686
BIOCHEMICAL ASPECTS OF THE RADIATION SYNDROME. M. G. Ord and L. A. Stocken. Physiol. Revs. 33, 356-386(1953).

Authors review studies on nucleic acid metabolism, carbohydrate metabolism, fat metabolism, nitrogen metabolism, serum proteins, immunity, individual enzymes, metals, Na and K, alterations in metabolic level and radiation protection. They present a four-page tabulated summary of methods and reagents used to combat radiation damage. (from abstract). BA 28-10407

8687
RESULTS OF MUTATION BREEDING. W. Hoffmann. Vorträge Über Pflamensuchung. Land-Und Forst-wirtch Forschunqarte e. V. Bonn p. 36-53(1951).

Tabulated details, illustrations, and descriptions are presented concerning the 586 mutations produced in Hairs barley by x-ray treatment and of a number of other artificial mutations produced in spring barley, winter wheat, flax and other plants.

8688
EFFECTS OF NEUTRON IRRADIATION ON SOYBEANS II. L. M. Humphrey. Soybean Dig. 14(7), 18-19(1954).

Lines derived from neutron-irradiated seed of Dortchsoy 2, showing some improvement in resistance to shattering and other characters are being tested.

8689
CYTOGENETICS OF NON-TUMOROUS TYPES OBTAINED BY TREATMENT WITH X RAYS OF THE TUMOROUS AMPHIDIPOID NICOTIANA GLAUCA GRAH. X NICOTIANA LANGSDORFFII WEINN. C. Izard, Intern. Congr. Botany, 8th Congr., Paris Rappts. et Communs. Ser. 10, 200-201(1954). BA 25-2610

8690
CYTOGENETICS OF THE OFFSPRING OF MUTANTS OF THE TUMOROUS HYBRID N. GLAUCA X N. LANGSDORFFII; AMPHIDIPOID, OBTAINED BY TREATMENT WITH X RAYS. COMPARATIVE STUDIES OF REDUCTONAL PROPHASES. C. Izard and H. Hites. Ann. inst. exptl. Tobac, Bergerac 2(1), 45-76(1954). BA 25-2261

8691
OBSERVATIONS ON X-RAYED POA PRATENSIS. C. Julien. Acta Agr. Scand. 4, 585-593(1954).

The percentage of aberrants increased from 2.0% in the control material to just over 14% in plants obtained from seed lots exposed to 20,000 and 25,000 r. The majority of the characters affected were morphological; most of the variants were smaller than normal.

8692

A CRITICISM OF THE EXPLANATION OF LINEAR DOSE EFFECT CURVES IN RADIOBIOLOGY ON THE BASIS OF SINGLE HIT FUNCTIONS. R. W. Kaplan. *Naturwissenschaften* **38**, 120-121(1951).

The curve for mutation rate against dosage conforms to the formula for a single-hit effect rather than to that for the cumulative effect of ionization.

8693

POSSIBILITIES OF INDUCING MUTATIONS IN PLANT BREEDING. R. W. Kaplan. *Z. Pflanzenzucht* **32**, 121-131(1953).

Data are presented from experiments in which various chemical or other agents were applied during or after irradiation in order to diminish adverse effects of radiation on chromosome structure during the induction of genetic change by irradiation.

8694

ONTOGENY OF THE SORGHUM INFLORESCENCE AS REVEALED BY SEEDLING MUTANTS. K. Kaukis and L. P. Reitz. *Am. J. Botany* **42**, 660-663(1955).

Air-dried dormant caryopses of *Sorghum vulgare* were x-irradiated or exposed to thermal neutrons. From the distribution of mutant X_2 seeds with the X_1 inflorescences, it was concluded that the tissues comprising an entire panicle usually derive from more than one cell in the dormant embryo. BA 26-431

8695

THE EFFECTS OF CARBON MONOXIDE AND OXYGEN ON THE FREQUENCY OF X-RAY INDUCED CHROMOSOME ABERRATIONS IN *TRADESCANTIA*. E. D. King, H. A. Schneiderman, and K. Sax. *Proc. Natl. Acad. Sci. U. S.* **38**, 34-43(1952).

Inflorescences of *T. paludosa* were enclosed in an air-filled lucite chamber compressed to the desired pressure with N_2 , O_2 , CO, or combinations of these gases. The sealed chamber was placed in an x-ray machine and exposed to 40 min for 10 min at room temperatures. Cytological observations of dicentric and centric rings were made. (from abstract). BA 26-20248

8696

THE EFFECTS OF CARBON DIOXIDE ON THE FREQUENCY OF X-RAY INDUCED CHROMOSOME ALTERATIONS IN *TRADESCANTIA*. Edward D. King and Howard A. Schneiderman. *Proc. Natl. Acad. Sci. U. S.* **38**, 809-812(1952).

Exposure to CO_2 without irradiation gave no chromosomal aberrations, whereas exposure to CO_2 during irradiation increased the frequency of aberrations over that produced in N_2 and/or air. It is believed that CO_2 tension is important in conditioning the response of chromosomes to irradiation. BA 27-26714

8697

THE RELATIONSHIP OF POLYPLOIDY TO THE EFFECTS OF THERMAL NEUTRON EXPOSURE ON PLANTS. C. F. Konzak and W. R. Singleton. *Genetics* **37**, 596-597(1952).

Autotetraploid rye, barley and maize showed less injury resulting from exposure of dry seeds to thermal neutrons than did the diploids, as indicated by measurements of seedling growth. Tetraploid oats were more resistant to such injury than hexaploid and diploid species.

8698

ABNORMAL MEIOSIS IN *PENNISETUM TYPHOIDES*. I. DESYNAPSIS. N. Krishnaswamy, V. S. Raman, and P. Madhavamenon. *Proc. Indian Acad. Sci.* **30B**, 195-206(1949).

When the seed of *Pennisetum typhoides* were subjected to x-rays, one offspring (X-161) produced proliferating panicles with 98.5% sterility. This sterility was traced to desynapsis. (from abstract).

8699

DIFFERENCES IN THE BIOLOGICAL ACTION OF DIFFERENT RADIATIONS IN YEAST. A. Lacassagne. *Compt. rend.* **190**, 524-526(1930). CA 24-2482

8700

X-RAY BREAKAGE EXPERIMENTS WITH ENDOSPERM. I. SUBCHROMATID BREAKAGE. L. F. LaCour and A. Rutishauser. *Chromosoma* **6**, 696-709(1954).

Subchromatid breakage was induced by irradiation only during the period between early and late prophase when chromosome in a diffuse condition with separated half-chromatids and monids. This condition coincides with the time of chromosome reproduction.

8701

IRRADIATION EXPERIMENTS WITH X RAYS IN *NICO-TIANA*. S. Matsumura and T. Fujii. *Ann. Rept. Natl. Inst. Genet.*, Mishima, Japan **3**, 39-40(1953).

8702

CHROMOSOME ABERRATIONS IN EINKORN WHEAT INDUCED BY X RAYS. S. Matsumura. *Ann. Rept. Natl. Inst. Genet.*, Mishima, Japan, **4**, 30-31(1954).

Adjustment in the thickness of the filter in inverse proportion to wave length changed the results of earlier experiments on Einkorn wheat.

8703

MUTATIONS IN TOBACCO INDUCED BY X RAYS. S. Matsumura and T. Fujii. *Ann. Rept. Natl. Inst. Genet.*, Mishima, Japan, **4**, 38-39(1954).

8704

GENE MUTATIONS IN EINKORN WHEAT INDUCED BY X RAYS. S. Matsumura and T. Fujii. *Ann. Rept. Natl. Inst. Genet.*, Mishima, Japan, **5**, 60-61(1955).

8705

MUTATIONS IN *NICOTIANA* INDUCED BY X RAYS. S. Matsumura and T. Fujii. *Japan. J. Breeding* **5**, 41-46(1955).

Chromosome aberrations included translocations, univalent and fragment formation and asynaptic figurations. Aberration frequency was linearly correlated with x-ray dose.

8706

RELATION BETWEEN QUALITY OF X RAYS AND CHROMOSOME ABERRATIONS. S. Matsumura. *Idengaku Zasshi* **24**, 28-29(1949).

Triticum monococcum was exposed to constant dose (8100 r) of x radiation, but under different conditions of voltage, time of irradiation and distance from the source. The number of aberrations was higher when higher voltages were used.

8707

THE PROTECTIVE PROPERTY OF THIOUREA AGAINST RADIATION-INDUCED CHROMOSOME ABERRATIONS. K. Mikaelson. *Exptl. Cell Research* **8**, 400-403(1955).

Concentrations of between 5×10^{-5} M and 10^{-3} M of thiourea were found to give marked protection against the deleterious effects of chronic γ irradiation on shoots of *Tradescantia paludosa*.

8708

PROTECTIVE PROPERTIES OF CYSTEINE, SODIUM HYPOSULFITE AND SODIUM CYANIDE AGAINST RADIATION-INDUCED CHROMOSOME ABERRATIONS.

K. Mikaelson. Proc. Natl. Acad. Sci. U.S. **40**, 171-178 (1954).

When added to the nutrient solutions in which cuttings of *Tradescantia paludosa* were kept during gamma radiation, each of the above chemicals had a protective effect upon chromosome fragmentation.

8709

CYTOLOGICAL EFFECT OF CHRONIC GAMMA IRRADIATION AND THE PROTECTIVE PROPERTY OF CERTAIN CHEMICALS AGAINST THE RADIATION-INDUCED CHROMOSOME ABERRATIONS. K. Mikaelson. Radiobiology Symposium, 1954. (Z. M. Bacq and Peter Alexander, (editors) page 316-20). Academic Press, Inc., N. Y. (1955).

Tradescantia paludosa was grown in nutrient solution during γ -irradiation for 48 hours at dose rates of 12.5, 25, 50, and 100 r/day. Addition of 10^{-5} to 1.5×10^{-3} M glutathione or thiourea to this solution reduced the frequencies of chromosome fragmentation. Cysteine, $\text{Na}_2\text{S}_2\text{O}_4$ and NaCN were also tested for possible protective effects. CA 49-9756

8710

THE COINCIDENTAL CHANGES IN ATOM-BOMBED BARLEY. C. C. Moh and L. Smith. J. Heredity **48**, 183-188(1952).

A mutant line, which on selfing gave 50% white seedling and 50% green plants which were heterozygous for both a reciprocal translocation and a mutant gene for white seedlings, was obtained from Trebi seed exposed to stomic radiation at Bikini.

8711

EFFECT OF URANIUM RADIATION ON VEGETATION. D. Montet. Compt. rend. acad. agr. France **18**, 28-31 (1932).

Wheat and balsam were grown in soil containing UO_2 . With small amounts of UO_2 , the yield was increased above that of controls. With larger quantities of UO_2 , the yields decreased, and with 1.7g. the plants were killed. CA 26-2005

8712

TRANSMITTED POLLEN AND CHROMOSOMAL ABERRANCIES INDUCED IN MAIZE BY TASSEL EXPOSURE IN A NUCLEAR REACTOR. R. Morris. Am. J. Botany **39**, 452-457(1952).

Mature tassels were exposed to thermal neutrons in a nuclear reactor for 0, 1, 2, 4, and 8 minutes, their pollen was then used to fertilize untreated plants.

8713

INDUCED RECIPROCAL TRANSLOCATIONS INVOLVING HOMOLOGOUS CHROMOSOMES IN MAIZE. R. Morris. Am. J. Botany **42**, 546-550(1955).

Eighteen interchanges involving opposite arms of homologous chromosomes were detected among 1636 plants raised from seeds treated with x rays or thermal neutrons.

8714

EFFECTS OF X-RAYS IN TRITICUM. J. W. Morrison. Heredity **6** (Suppl.), 83-91(1953).

Complete cell analysis of breakage and reunion was scored one to three days after x-ray treatment (100-800 r) of young root-tips of *T. monococcum*. BA 27-15129

8715

THE ACTION OF BETA RAYS ON ROOT MERISTEMS OF ALLIUM CEPA. M. M. Mouthinho-De-Oliveira and M. T. Cabral. Portugaliae Acta Biol., Ser. A. **4**, 297-314(1955).

Dispersion of the nuclei into particles, chromatic rarefaction, chromatic agglutination and lobed nuclei were produced in resting cells. Intense agglutination,

often leading to formation of bridges and pseudobridges, was observed in dividing cells.

8716

THE EFFECT OF X-RAYS ON THE PROTOPLASM, THE NUCLEUS, AND THE CHONDRIOME IN PLANT CELLS OBSERVED IN VIVO. G. A. Nadson and E. J. Rochlin. Protoplasma **20**, 31-41(1934).

Living cells of the epidermis of *Allium cepa* were x-irradiated and the sequence of events following are mentioned. These include an increase in protoplasm flow, fat droplets formation in the plasma, to the forming of a large vacuole in the cytoplasm. CA 28-1737

8717

POST-RADIATION STORAGE EFFECT ON CHROMOSOMES IN BARLEY SEEDS X RAYED AT NORMALLY INEFFECTIVE DOSAGES. R. A. Nilan. Genetics **40**, 588. Records Genet. Soc. Am. **24**, 588(1955).

Aberration frequency in treated seeds examined immediately was not significantly higher than in seeds that were stored. Storage did not affect the number of aberrations in nonirradiated seeds.

8718

A MUTANT LINE OF BARLEY INDUCED BY ATOMIC-BOMB RADIATION. THE EFFECT OF PARTIAL OVULE STERILITY ON THE INHERITANCE OF CREAM SEEDLINGS. R. A. Nilan. J. Heredity **46**(2), 49-52(1955).

The ovule sterility of the parental type plants averaged 40%. No pollen abortion occurred in these plants. (from abstract). BA 30-15778

8719

GENETICAL STUDIES ON PROGENIES OF RICE PLANTS ATTACKED BY AN ATOMIC BOMB. Y. Nishimura and M. Nakamura. Idengako Zasshi **24**, 72-73(1949).

Data on the degree of sterility, chromosome number and mutants.

8720

X-RAY INDUCED MUTANTS IN BARLEY. Y. Nishimura, H. Nuzeki, and T. Saito. Japan J. Breeding **1**, 193(1952).

Partial sterility associated with formation of multiple associations is described in the progeny of an x-irradiated barley sample.

8721

X-RAY INDUCED MUTATIONS IN BARLEY. Y. Nishimura, H. Nuzeki, and T. Saito. Japan J. Breeding **1**, 210-214 (1952).

Investigations on the X_1 and X_2 generations of x-irradiated samples of the Japanese barley Kanto 1 are reported.

8722

THE EFFECT OF X-RAY TREATMENT IN DORMANT SEEDS OF LUZULA PALLESCENS AND L. CAPITATA. H. Nordenskiöld. Kgl. Lantbrukshogskol. Ann., **22**, 257-267(1955).

Germination and seedling survival were normal at dosages up to 150,000 r. High tolerance of x-ray doses is attributed to possession of a diffuse centromere. Polyploidy appeared not to increase the tolerance as much as in some species with monocentric centromeres.

8723

GENETIC INVESTIGATIONS INTO BARLEY MUTATIONS INDUCED BY X RAYS. H. Notzel. Kuhn-Arch. **66**, 72-132 (1952)

Investigations on 34 morphological and 6 physiological mutants of Haisa barley are described. Purpose: to isolate mutant types and discover whether pheno-typically similar mutants are genetically similar.

8724

SOME EXPERIENCES FROM MUTATION EXPERIMENTS

IN CHLAMYDOMONAS. Nils Nybom. *Hereditas* 39, 317-324(1953).

Preliminary results from mutation experiments are described. Differences between lethal action of x-rays and u.-v. are described. Sensitivity to x-rays and u.-v. is decreased by lowering the redox potential and is increased by raising it. Mutations with increased resistance to sulfonamide and streptomycin are easily obtained. BA 27-18810

8725

THE PIGMENT CHARACTERISTICS OF CHLOROPHYLL MUTATIONS IN BARLEY. N. Nybom. *Hereditas* 41, 483-498(1955).

X ray sensitivity of presoaked germinating barley seeds was shown to be 6-7 times greater than that of dry dormant grains, suggesting some correlation between water content and sensitivity.

8726

NERVOUS CONTROL OF THE REACTION OF THE ANTERIOR HYPOPHYSIS TO X-IRRADIATION AS STUDIED IN GRAFTED AND NEWBORN RATS Z. M. Bacq, M. M. Martinovitch, P. Fischer, G. S. Shaditch, R. Pavlovitch and D. V. Rativojvitch. *Bull. de l'acad. roy. med. Belg.* (VI) 22, 328(1956).

X-irradiation does not act directly in the pituitary but through the hypothalamic centers that control the release of corticotropin (ACTH) by the anterior hypophysis. As radiation sickness develops, hypothalamic activation of the pituitary and adrenals is slightly beneficial. Among the observed results were: (1) grafted adrenals in adrenalectomized rats reacted normally to the ACTH discharged after irradiation, (2) hypophysectomized rats with pituitary transplants did not show the 2 drops in cholesterol content typical of normal or grafted adrenals after irradiation, (3) the first adrenal reaction of newborn rats to x-irradiation was favorable to survival and (4) the second had no relation to mortality or to the severity of radiation sickness.

8727

PROGRESS IN RADIOBIOLOGY (THE INTERNATIONAL PICTURE.) H. M. Patt. *Nucleonics* 12(12), 42-45(1954).

A report on new data and interpretations of papers presented at the Liege Conference (Aug. 30-Sept. 1st, 1954) on the second annual meeting devoted to radiobiology.

8728

EFFECT OF IRRADIATION ON DNA SYNTHESIS IN VICIA AS SHOWN BY AUTORADIOGRAPHS. S. R. Pelc and Alma Howard. *Acta Radiol. Suppl.* 116, 699(1954).

The proportion of cells synthesizing DNA during 12 hours postexposure period decreases with increasing radiation dose from 0 to 50 r of roentgen rays, then remains constant at 60% of the control value for doses up to 200 r. Synthesis prevented in cells in the first part of interphase at the time of irradiation. Slowing of growth rate and eventual recovery of roots after 140 r is described in different parts of the mitotic cycle.

8729

INFLUENCE OF RADIOACTIVITY ON GERMINATION. G. Petit and R. Ancelin. *Compt. rend.* 156, 903-5(1913).

Authors describe stimulatory effect of radiation on plant cell proliferation. CA 7-1893

8730

INHIBITION OF GROWTH OF CHLORELLA PYRINIDOSA BY BETA-EMITTING RADIOISOTOPES. J. W. Porter and H. J. Knauss. *Plant Physiol.* 29, 60-63(1954)

Cells were grown in concentrations of H_2O , P^{32} , S^{33} , and Sr^{90} - Y^{90} and then subcultured in nonradioactive inorganic nutrient solution. Growth rates of cells decreased in proportion to radiation dose above approximately 1000 rep/day. An increase in average cell size occurred during

the growth of algae in radioactive solutions. (from abstract). BA 29-9565

8731

CENTROMERE CONTROL OF CHROMOSOME SPLITTING AND BREAKAGE. H. Rees. *Heredity* 6(Suppl.), 235-245(1953).

Difficulty in the separation of anaphase chromosomes can be observed within a few hours of x-irradiation. BA 27-15131

8732

DEPENDENCE OF ACUTE RADIOSENSITIVITY ON AGE IN ADULT FEMALE MOUSE. G. A. Sacher. *Science*, 125, 1039-40(1957).

8733

THE COMPARATIVE EFFECT OF IONIZING RADIATIONS AND HEAT UPON THE STARCH CONTAINING CELLS OF THE POTATO TUBER. Edith A. Roberts and Bernard E. Proctor. *Food Research* 20, 254-63(1955).

A cathode ray dose of $2-3.0 \times 10^6$ rep, with a resulting temperature of less than $22^\circ C$, altered the middle lamellae, but did not weaken walls to the breaking point nor alter form of the starch grains. Dose of from $1-2.0 \times 10^6$ rep effected separation of cells but did not weaken walls to the breaking point or change physical appearance of the starch.

8734

INFLUENCE OF ANTAGONISTIC IONS ON INHIBITIVE ACTION OF RADIUM ON GROWTH OF ROOTLETS. A. Sartory, R. Sartory, J. Meyer, and E. Meyer. *Compt. rend.*, 198, 197-9(1934). (In French).

Rootlets of *Lens esculenta* moench were exposed to Rn while immersed in isotonic solutions of $MgSO_4$ or KCl , 24 hour exposure. Rootlets in $MgSO_4$ showed better protection against Rn effects than did rootlets in KCl . Effect is attributed to Mg. BA 28-27519

8735

THE PRODUCTION OF BENEFICIAL MUTATIONS IN BARLEY BY IRRADIATION. L. H. Skebeski, and T. Lawrence. *Can. J. Agr. Sci.* 34, 1-9(1954).

In view of a report that stiff straw in barley could be produced by radiation, an induced mutation program was initiated by treating the variety Montcalm with various sources of radiation. BA 28-27232

8736

EFFECT OF CATHODE RAYS ON GERMINATION AND EARLY GROWTH OF WHEAT. L. H. Soderholm and E. R. Walker. *Botan. Gez.* 116, 281-290(1955).

With a dose of 10,000-20,000 reps germination was not reduced, but subsequent growth was altered, 20,000-30,000 reps decreased the per cent germinating. With 40,000 reps mitosis ceased after three days. BA 30-20509

8737

THE EFFECT OF X-RADIATION ON THE FLOWERING OF CERTAIN CULTIVATED BULBS AND CORMS. J. L. Spencer. *Am. J. Botany* 42, 917-920(1955).

8738

INDUCED POLLEN LETHALS FROM SEEDS OF DATURA STRAMONIUM TREATED WITH THERMAL NEUTRONS. J. L. Spencer, W. R. Singleton, and A. F. Blakeslee. *Proc. Natl. Acad. Sci. U. S.* 39, 288-292(1953).

8739

ON THE GENETIC NATURE OF INDUCED MUTATIONS IN PLANTS. II. A HAPLOVIALE DEFICIENCY IN MAIZE. L. J. Stalder. *Missouri Univ. Agr. Expt. Sta. Bull.* 204, 1-29(1933).

8740

THE INFLUENCE OF RADIOACTIVITY ON THE PLANT ORGANISM. J. Stoklasa. *Proc. Intern. Congr. Plant Sci.* 1st Congr., Ithaca, 1926 2, 1149-1150(1929).

Author describes effects of radioactivity on energy exchanges and metabolism of plant and animal cells. CA 24-2161

8741

THE EFFECTS OF ULTRAVIOLET AND X-RADIATIONS UPON THE CENTROCHROMATIN OF *SACCHAROMYCES*. G. F. Townsend. *Cytologia* (Tokyo) **19**, 130-132(1954).

Unirradiated control cells commence budding ninety minutes after plating and complete development of at least one mature bud at the end of three hours.

BA 30-15722

8742

ON SOME CHROMOSOME ALTERATIONS INDUCED BY X-RAYS IN *CREPIS*. M. Navashin. *Proc. Intern. Congr. Botany*, 5th Congr., Cambridge. p. 241-242(1936).

8743

THE RESPONSIBILITIES OF THE MEDICAL PROFESSION IN THE USE OF X-RAYS AND OTHER IONIZING RADIATION. United Nations Scientific Committee on Effects of Atomic Radiation, *Radiation Research* **6**, 517-19(1957).

8744

EXCEPTIONALLY STRONG MUTAGENIC ACTION OF RADIOACTIVE ISOTOPES P^{32} AND S^{35} IN *EPILOBIUM*. P. Michaelis and R. W. Kaplan. *Naturwissenschaften* **40**, 534(1953).

Treatment of seeds of *Epilobium hirsutum* and *E. parviflorum* with radio-P or -S led to very high mutation rates depending on the dosage. BA 28-22672

8745

STUDIES ON THE RANJAN X-RAY MUTANT WHEATS. II. A PRELIMINARY ACCOUNT OF THE CYTOLOGY OF THE VARIANTS. S. P. Naithani, M. S. Mehrotra and K. P. Srivastava. *Proc. Natl. Acad. Sci. India* **16**, 24-7(1946).

Authors present cytological observations on the eleven wheat mutants described by Ranjan. Variations were observed in the sizes and shapes of the chromosomes but not in chromosome number.

8746

STUDIES ON THE BIOSYNTHESIS OF PENICILLIN.

D. Bonner. *Arch. Biochem.* **13**, 1-9(1946).

X-ray induced mutants of *Penicillium notatum* which produced little or no penicillin were investigated to study (1) possible production and identification of natural precursors of penicillin, and (2) response to compounds known to act as precursors. In tests of 53 mutant strains grown in mixed culture, in all combinations of two at a time, no penicillin production was observed.

BA 17-1593

8747

WHAT THE SCIENTISTS ARE DOING. X-RAY TREATMENT OF COTTON SEED. Anonymous. *Indian Farming* **7**, 360-1(1946).

Details are given of experiments carried out at the Institute of Plant Industry, Indore, on Treating the seed of M. U. 4 with X-rays, resulting in a new cotton variety with a higher ginning percentage and greater fibre length than M. U. 4.

8748

MUTATIONS IN AGRICULTURAL PLANTS. A. Gustafsson. *Hereditas* **33**, 1-100(1947).

Production of improved varieties of crop plants by means of X-rays induced mutation is reviewed. Improvements in yield, stiffness of straw, 1000-grain weight and earliness have been obtained in morphological mutants of the bright green or erectoid types. Physiological mutants have been obtained superior in yield to their parents.

8749

THE QUESTION OF THE PHYSICO-CHEMICAL STRUCTURE

OF THE CHROMOSOME. R. Kaplan. *Naturwiss.* **28**, 79-80(1940).

Physical constitution of the chromosomes is discussed and particular emphasis is placed on the energy relationships of thymonucleic acid, a subject which is discussed with special reference to X-ray induced mutations and chromosome breaks.

8750

RADIATION GENETICS. P. C. Koller. *Nature* **167**, 395-6(1951).

Author reviews papers given at the first unclassified information meeting for Biology and Medicine (March 26-27, 1948), sponsored by the Biology Division of the Oak Ridge National Laboratory. Papers deal with basic knowledge in the understanding of radiation effects and their consequences. Need for more information, particularly the need for additional cytogenetical research, is emphasized.

8751

CHROMOSOME CHANGES OBTAINED BY TREATMENT WITH NEUTRONS. D. Kostov. *Med. Fak., Godishnik, Sofia Univ.* **23**, 51-61(1943-44).

Cytological effects resulting from neutron irradiation of plants of *Crepis capillaris* are reported. Many seeds germinated but ultimately died. Possibly penetration of neutrons is impeded by the integument. Over 70% of the bombarded cells showed changes.

8752

GIANT JUTE PLANT GROWN BY X-RAY TREATMENT. Anonymous. *Crops and Soils* **2**, 25(1949).

Economically valuable mutants of jute and cotton produced by X-ray treatment at the Bose Research Institute, Calcutta are discussed.

8753

THE APPLICATION OF RESEARCH ON MUTATION OF FRUIT TREES. I. Granhall. *Sveriges Pomol. Foren. arsskr.* **50**, 105-26(1949).

A section of the paper reviews results obtained on induction of mutations in apples and pears by x-irradiation, neutron bombardment and treatment with radioactive phosphorus or mustard gas. Individual mutants are described.

8754

THE VIABILITY REACTION OF SOME INDUCED AND SPONTANEOUS MUTATIONS IN BARLEY. A. Gustafsson and N. Nybom. *Hereditas* **36**, 113-33(1950).

Data on the yield and other characters of seven mutants of Maja barley are analysed. These and other barley mutants are more productive, as compared with the parent strains; difference is greater is unfavorable than in favorable years. Maja mutants differ from Maja in response to different rates of manuring

8755

INFLUENCE OF LOW TEMPERATURE ON THE X-RAY MUTATION RATE OF DORMANT BARLEY GRAINS. R. W. Kaplan. *Naturwiss.* **34**, 316-17(1947).

Subjecting grains of the barley variety *Weihenstephaner II* to a temperature of -65°C , while being x-rayed produced no significant differences in the X-ray mutation rate.

8756

CHROMOSOME MUTATIONS AS A CAUSE OF STERILITY EFFECTS AFTER X-IRRADIATION OF BARLEY GRAINS. R. W. Kaplan. *Z. Induktive Abstammungs-u. Vererbungslehre* **83**, 203-19(1949).

Ripe barley grains were treated with X-rays. The results, when plotted to show distribution of frequencies of occurrence of ears with various degrees of sterility, exhibit maxima at 25%, at 45-55% and at 75-80%, i.e.,

values corresponding to Mendelian segregation frequencies.

8757

EXPERIMENTS ON A. MAJUS CONCERNING THE FREQUENCY OF FACTOR MUTATIONS AFTER X-IRRADIATION OF THE POLLEN IN DIFFERENT STATES OF TURGIDITY. R. Kaplan. Z. Induktive Abstammungs- u. Vererbungslehre 82, 164-86(1948).

Only mutations affecting leaf shape and in some cases also inducing chlorophyll deficiency reacted to soaking treatment, whereas the color factors were affected only by X-irradiation.

8758

INCOMPATIBILITY IN FLOWERING PLANTS. D. Lewis. Biol. Rev. 24, 472-96(1949).

Incompatibility is discussed with reference to the heteromorphic and homomorphic types, their genetic basis, incompatibility in polyploids and interspecific hybrids, and mutation of the S gene which determines incompatibility. Evidence is given that this gene consists of two parts which react to X-rays as independent units.

8759

THE BEHAVIOR OF X-RAY INDUCED RINGS OF FOUR WITH LARGE INTERSTITIAL SEGMENTS IN OE. HOOKERI. H. Marquardt. Z. Induktive Abstammungs- u. Vererbungslehre. 82, 415-29(1948).

In 22 plants with x ray induced translocations, two plants were discovered that exhibited (1) translocations resulting in two rings of four and (2) many cells showing other aberrant configurations not hitherto recorded in forms characterized by rings of four.

8760

PHOTOPERIODIC RESPONSE IN SOME X-RAY MUTANT WHEATS. G. Misra. Current Sci. (India) 18, 413-14 (1949).

Mutant strains Sarogini and Vijaya resemble other Indian wheats in the general trend of their photoperiodic response. Long day treatment during their vegetative phase accelerates their normal life cycle, although they tolerate short day conditions of India and set good grain

8761

BOSE RESEARCH INSTITUTE, OF CALCUTTA, CALCUTTA 9, INDIA, REPORT FOR 1951-52, 69p.

Reports on potato, cotton, jute, sesame, coconut, grape and mustard. Results of irradiation of jute, sesame, rape and mustard are described. BA 24-1720

8762

BOSE RESEARCH INSTITUTE OF CALCUTTA, CALCUTTA 9, INDIA, REPORT FOR 1952-53, 78p.

Corchorus olitorius types Chinsura Green (CG), R26 and a tall mutant, and *C. capsularis* types D154 and D386 were irradiated for 80 and 125 M. A. H. Plants resulting from these treatments and from seed of last season's X_1 plants were studied with regard to height, basal diameter and flowering period. Bengal types 10, 12, 16 and 20 and Madras types TMV 1 and 2 of sesame were irradiated with 100 and 14 M. A. H. The four Bengal types gave higher yields after treatment. BA 24-1721

8763

THE BIOLOGICAL EFFECTS OF PENETRATING RADIATIONS. F. G. Spear. Brit. J. Radiol. 20, 489 (1947).

A short review article based on the supplement to this journal, edited by this author.

8764

RADIUM EXPERIMENTS WITH DATURA. I. THE IDENTIFICATION AND TRANSMISSION OF LETHALS OF POLLEN-TUBE GROWTH IN F_1 'S FROM RADIUM-

TREATED PARENTS. J. T. Buchholz and A. F. Blakeslee. J. Heredity 21, 119-29(1930).

The following three conditions of genetic abnormalities obtained following radium treatment and which have become evident in the male gametophytes after pollination are described: (1) failure of half of the pollen grains to germinate, (2) early bursting of half the pollen tubes, (3) slower growth of half the pollen tubes to form a second mode of distribution.

8765

POLYEMBRYONY IN MAIZE AND LILY FOLLOWING X-IRRADIATION OF THE POLLEN. D. T. Morgan. J. Heredity 42, 91-93(1951).

Marked increases in the number of polyembryonic seeds and seedlings were obtained in maize and *Lilium regale* as a result of x-irradiation of pollen. Unattached and conjoined types were observed in both species. Root tip counts on polyembryonic maize seedlings from irradiated pollen crosses, and in twin seedlings in control plants, revealed diploid number of $2n = 20$ for each member. PBA 21-2635

8766

TWO NEW MUTANTS IN THE TOMATO, PROPELLER AND ROSETTE. L. Butler. J. Hered. 45, 25-7(1954).

Two mutant genes produced by X-rays were tested for monohybrid segregation and linkage relations. The character rosette (ro) shows a deficiency in its monohybrid ratio and a linkage with dwarf in group I. The mutant propeller (pr) shows good monohybrid ratios, but no linkage.

8767

MUTATIONS IN APPLES INDUCED BY X RADIATION. C. J. Bishop. J. Heredity 45, 99-104(1954).

Nine fruits that were sectorial chimeras for color were obtained from X-irradiated scions of Cortland. Observed color changes were in the direction of more or less red color compared with the fruits of the controls. PBA 24-3275

8768

EFFECT OF RADIOACTIVE SUBSTANCES ON PLANT GROWTH. S. Gericke. Landwirtschaft. Forsch., Suppl. 2, 72-6(1952). (In German).

Various American and German experiments on the stimulation of plant growth and yield by means of radioactive surface or fertilizer applications are summarized. Twelve references. NSA 7-1887

8769

POSSIBLE BIOLOGICAL SIGNIFICANCE OF THE ACTION OF IONIZING RADIATION ON NUCLEIC ACIDS. Joseph Weiss. Nature 169, 460-1(1952).

Nucleic acids in aqueous solution exposed to X-rays show definite chemical changes manifest as liberation of ammonia and inorganic phosphate and the formation of other low-molecular fragments. Author presents several conclusions regarding these experiments.

8770

EFFECT OF OXYGEN ON THE FREQUENCY OF CHROMOSOME ABERRATIONS PRODUCED BY 8-ETHOXYCAFFEINE. Bengt Kihlman. Nature 174, 561-2(1954).

Kihlman expands this subject by discussing recent experiments on the effect of oxygen on chromosome aberrations when 8-ethoxycaffeine is used. Results: 8-ethoxycaffeine is more effective in producing chromosome aberrations in oxygen than in nitrogen and while inhibition of mitosis by x-rays is increased by oxygen, no such increase was observed in the case of 8-ethoxycaffeine.

8771

EFFECT OF X-RAYS ON THE RESPIRATION ENZYME CHAIN. U. Hagen. Naturwiss. 42, 185(1955).

By detn. of the intensity of cytochrome bands in suspensions of *Escherichia coli* B and of bakers' yeast cells in reduced state the oxidation rate was found during O₂ addition. Cell metabolism was slowed in coli cells by cooling, in the baker's yeast cells by ethylurethan 0.82 M. Intensity of the 550 or 563 M bands, did not change before and after irradiation of the suspension with 10,000 to 40,000 r of x rays. CA 50-5803

8772

RADIATION INJURY FROM RADIOACTIVE PHOSPHORUS IN TRACER EXPERIMENTS WITH PLANTS. K. Strzemienski. New Zealand J. Sci. Technol. A34, 313-19(1952).

An experiment was made with short-rotation ryegrass grown in pots with four levels of P³² radioactivity, viz. 40, 160, 640, and 2560 µc per gram of phosphorus. No significant differences were found in either dry-matter production or phosphate absorption and distribution. NSA 7-2234

8773

THE PHYSIOLOGICAL ACTION OF α-, β- and γ-RAYS ON THE PROTOPLASM OF THE PLANT CELL. Julius Stoklasa. Naturwiss. 18, 567(1930).

Author's results do not agree with those obtained recently by Feichtinger (C. A. 24, 3261). CA 24-4808

8774

X-RAYS AND CELLS. P. C. Koller. Nature 155, 778-80(1945).

Koller gives a brief history of radiotherapy, discusses the use of x-rays for determining the properties of the cells.

8775

PHYSICO-CHEMICAL METHODS OF PROTECTION AGAINST IONIZING RADIATIONS. P. Alexander and A. Charlesby. Radiobiology Symposium, 1954 (Liege), 49, (Butterworth and Co., London, England, 362 pp., 1955). (Academic Press, Inc., New York in U.S., 1955).

8776

THE EFFECT OF HORMONES, X-RAYS AND CATHODE RAYS ON THE CAMBIUM ACTIVITY OF *BETA VULGARIS*. Helga Winter. Planta 44, 636-68(1954).

X-rays and fast electrons applied to 3-week-old plants in dosages varying from 500 - 10,000 r. Electron radiation was 0.4 as effective as X-rays. Low dosages decreased, higher doses completely inhibited all cambial activity. X-rays damaged dividing and resting cells equally; electrons (4-6000 r) damaged cambium more severely than the surrounding parenchyma. BA 30-2713

8777

THE STIMULATING EFFECT OF X RAYS ON PLANTS. A. I. Atabekova. Priroda 27, 56-62(1938).

Specific and general effects on the organism result from x radiation. Growth and development of the plant are also influenced by radiation. CA 34-7341

8778

CHRONIC ROENTGEN AND RADIUM DERMATITIS, AN ANALYSIS OF 259 CASES. T. S. Saunders and H. Montgomery. J. Amer. Med. Assoc. 110, 23(1938).

8779

EFFECT OF OXYGEN CONCENTRATION ON THE SENSITIVITY OF BARLEY SEEDLINGS TO GAMMA RAYS. T. Tanada. Am. J. Botany 39, 705-706(1952).

The inhibitory effect of gamma rays on growth of barley roots increased with increasing oxygen concentration up to about 2% O₂ in N₂. From 2 to 100% oxygen the inhibition increased only slightly. BA 27-10856

8780

STUDY OF FERTILIZER UPTAKE WITH RADIOACTIVE PHOSPHORUS. IV. THE AVAILABILITY OF PHOSPHATE CARRIERS IN CALCAREOUS SOILS. H. G. Dion, J. E. Dehm and J. W. T. Spinks. Sci. Agr. 29, 512-26(1949).

On wheat under semiarid conditions on soil containing a high level of Ca, the P³² tracer used did not affect plant growth. Total P taken up by plant showed a good correlation with amount of growth. NSA 4-3917

8781

PRELIMINARY INVESTIGATIONS WITH RADIOACTIVE ISOTOPE (P³²) ON JUTE SEEDS. R. K. Basu. Sci. and Culture (Calcutta) 19, 515-16(1954).

Exposing dry seeds of *Corchorus olitorius* to P³² resulted in three pure-green forms resembling the variety Chinsura Green, and three forms with deep scarlet stems, leaves and other organs. Treated population flowered one week earlier than the control plants.

8782

BLOOD CHANGES IN WORKERS WITH THE ROENTGEN RAY, AND APPARATUS FOR PROTECTION. M. M. Portis. J. Am Med. Assoc. 65, 20(1915).

8783

USE OF PARTIAL-CELL IRRADIATION IN STUDIES OF CELL DIVISION. R. E. Zirkle, W. Bloom and R. B. Uretz. Proc. Internat. Conf. on the Peaceful Uses of Atomic Energy, 11, 273-282(United Nations, New York, N. Y. 402pp., 1956).

Authors review the technique (and its uses) of selectively irradiating parts of cells as a means of studying the contributions of various cell components to radiation damage. The experiments described utilized Newt heart (*Triturus viridescens*).

8784

THE EFFECT OF TOTAL BODY IRRADIATION ON THE SURVIVAL OF HOMOLOGOUS SKIN GRAFTS ON CFW MICE. G. A. Hardin and A. A. Werden. Plastic and Reconstr. Surg. 13, 40-45(1954).

8785

THE INDUCTION OF CHROMOSOME ALTERATIONS BY INJECTION OF ACTIVE SUBSTANCES INTO THE BUDS OF *P. TENUIS*. J. L. A. F. Oehlkers and H. Marquardt. Z. Indukt. Abstamm. -u. Vererbhlehre 83, 299-317(1950).

A solution of m/20 ethylurethane + m/200 KC1 was injected into the flower buds in early stages of meiosis. The first noticeable effect was loosening of chromosomes, leading to various types of fragmentation, translocations and other aberrations similar to those produced by irradiation including half-chromatid translocation and various recombinations within a single chromosome.

8786

EVALUATION BY BREEDING OF MUTATIONS INDUCED BY X-RAYS IN PHYSIOLOGICAL CHARACTERS IN WINTER WHEATS. W. Oltmann. Z. Pflanzenz. 29, 76-89(1950).

Winter wheats Houter II, Heine IV and Walther I were irradiated by X-rays to obtain positive viable mutations for practical use and to evaluate mutants for breeding purposes. Induced mutations were found to be capable of effecting modifications in components of complex physiological characters. Variations were usually unfavorable, sometimes favorable. Some strains showed mutation in several characteristics.

8787

ABSORPTION OF X AND γ RADIATIONS AND THE

SECONDARY RADIATIONS WHICH ACCOMPANY THEM. Duc de Broglie. Brit. J. Radiol. 23, 55-62(1927).

The author stresses the importance of heavy elements in the transfer of energy to the biological medium. Observed effects are due to electrons and secondary radiations. CA 22-2113

8788

SOMATIC MUTATIONS IN ANTIRRHINUM PRODUCED BY CHRONIC GAMMA IRRADIATION. Arnold H. Sparrow, M. Denegre and W. J. Haney. Genetics 37, 627-8(1952).

F₁ plants of *Antirrhinum majus* with dark purple flowers but heterozygous for white, ivory, yellow, and lavender were exposed to chronic Co-60 gamma irradiation for several weeks at dose rates varying from a few roentgens to over 300 r/day. A mutation affecting any one of the factors observed causes corolla cells carrying the mutation to appear as a lighter spot.

8789

THE ANALYSIS OF CHROMOSOME BREAKS BY ENDOSPERM PHENOTYPE IN MAIZE. A. C. Faberge. Genetics 39, 966(1954).

Procedure: pollen carrying the dominant endosperm markers I, Sh, Bz, Wx, in the short arm of chromosome 9 was irradiated, the corresponding recessive was used as the female parent. A broken chromosome end may rejoin, rejoin with another free end to give an aberration, or remain free and give a chromatid breakage-fusion-bridge cycle. Since breakage-fusion-bridge cycle stems from a single break, the frequency of such breaks arising in marked chromosome segments may be used to constitute a map

8790

EFFECT OF TIME OF GAMMA RADIATION ON MICROSPORE MUTATION RATE IN MAIZE. W. R. Singleton and A. L. Caspar. Genetics 39, 993(1954).

Corn plants were irradiated at different stages in the microspore development with 1300 r from a Co⁶⁰ source. Meiosis was most sensitive period for pollen injury. Mutation production was most sensitive a few days before pollen shedding. Mutation production decreased sharply when irradiation occurred during the last 2 days before pollen shedding. Thus most mutations are produced at a time different from that of maximum chromosomal damage as measured by injury to pollen.

8791

INCREASED FREQUENCY OF X-RAY-INDUCED CHROMOSOMAL ABERRATIONS IN *TRADESCANTIA* PRODUCED BY A MINERAL-NUTRIENT TREATMENT. Dale Steffensen. Genetics 39, 996-7(1954).

After exposure to soft X-rays (100 KVP), chromatid exchanges were more frequent in buds grown in 1/10 concentrated Hoagland's solution than in those grown in regularly changed undiluted solution or in soil. Spontaneous aberration frequency of unirradiated plants grown in the depleted 1/10 concentration solution was no greater than that of the plants grown under either of the two other conditions.

8792

THE EFFECT OF PRE- AND POST-IRRADIATION CENTRIFUGATION ON THE CHROMOSOMES OF *TRADESCANTIA* AND *VICIA*. S. Wolff and R. C. Von Borstel. Genetics 39, 1001(1954).

Inflorescences of *Tradescantia* were irradiated with 200 r x-rays. Centrifugation of inflorescences within 30 seconds after cessation of irradiation increased the number of two-hit chromosome aberrations. Centrifugation prior to irradiation reduced the numbers of two-hit aberrations by a factor of two.

8793

MODE OF ADDITION OF X-RAY DOSES GIVEN WITH

DIFFERENT OXYGEN CONCENTRATIONS. John Read. Brit. J. Radiol. 25, 336-338(1952).

Mean growth of broad bean roots in the 10 days following x irradiation is a function of dose and of O₂ concentration. Graphs of mean growth vs. dose for all O₂ concentrations can be made to coincide by multiplying the dose scale by a factor F, a function only of the O₂ concentration. BA 27-4675

8794

THE EFFECT OF IONIZING RADIATIONS ON THE BROAD BEAN ROOT. XI. THE DEPENDENCE OF THE ALPHA RAY SENSITIVITY ON DISSOLVED OXYGEN. John Read. Brit. J. Radiol. 25, 651-661(1952).

Dissolved O₂ increased sensitivity of the bean roots to particles by a factor of about 1.4 as compared to 2.8 found with X rays. O₂ is considered to augment effectiveness of delta-rays which account for about half the ionization due to the α particles. BA 27-21498

8795

SOME UNRECOGNIZED DANGERS IN THE USE AND HANDLING OF RADIOACTIVE SUBSTANCES. H. S. Martland, P. Conlon and J. P. Knef. J. Am. Med. Assoc. 85, 1769(1925).

Observations on man: ingestion and inhalation of radium (360 μ g-5 mg for 6 months) resulted in pulmonary fibrosis, induration and neoplasia.

8796

PRELIMINARY REPORTS ON THE EFFECT OF CERTAIN CHEMICALS ON RADIATION DAMAGE TO CHROMOSOMES. H. P. Riley. Genetics 37, (5), 618-619(1952). Records Gent. Soc. Am. 21, 62-63(1952).

Onion roots, 1-3 cm. long were immersed in various solutions for 30 min., removed and irradiated with gamma radiation in air, returned to solutions for 10 min., transferred to H₂O for 3-4 days, then slides were prepared for study of chromosome aberrations. Solutions used: 0.02M, 0.002M, .0002M, .00002M and .000002M concentrations of sodium hydrosulfite or 2,3 dimer-captopropanol (BAL). Doses up to 280 r caused fewer aberrations than in *Tradescantia* microspores, in higher doses tended to inhibit or retard mitosis. Dose of 240 r produced .083 interchanges and 0.147 deletions/cell for roots in H₂O. Comparable results were found for same dose combined with .00002M + .000002M concentrations of both chemicals. Aberration frequency was reduced 1/2 in stronger concentrations. Dose of 420 r almost completely inhibited mitosis in roots in H₂O and in .0002M sodium hydrosulfite. About 1% of cells were in division in roots treated with .02M and .002M sodium hydrosulfite pre- and post-irradiation. Study indicates that certain concentrations of these 2 chemicals reduce the damage to onion root tip chromosomes caused by gamma radiation. BA 27-11840

8797

CYTOPLASMIC DAMAGE CAUSED BY GAMMA RADIATION IN *ALLOMYCES JAVANICUS*. Don Ritchie. Botan. Gaz. 115, 138-146(1953).

Mycelia of *Allomyces javanicus*, exposed to γ radiation from a Co⁶⁰ source showed no morphological changes after 96 x 10⁴ r or less. After 112 X 10⁴ r, mitochondria became swollen or vesiculate, after 128 X 10⁴ r, all mitochondria were severely damaged, death followed 144 x 10⁴ r. BA 28-25301

8798

LYMPHOPLNIA FOLLOWING EXPOSURES OF RATS TO SOFT X RAYS AND THE β RAYS OF RADIUM. J. C. Mottram and S. Russ. J. Exper. Med. 34, 271(1921).

Soft x rays are more penetrating than β rays, thus have a greater effect on lymphoid tissue. Small dose (1/150 rad) caused lymphopenia (50% decrease in

lymphocyte count.) Note: "rad" here is not the same as current unit of this name.

8799

THE SPECIFIC ABNORMALITY IN CELL DIVISIONS BY HIGHER DOSAGE OF IRRADIATION OF X RAY. II ON THE INTER-RELATIONSHIP BETWEEN THE DOSE OF X RAY AND ABNORMAL MATRIXES OF CHROMOSOMES. Tadashi Oyama. Jap. Jour. Genetics 30, 147-150 (1955). BA 30-30737

8800

IRRADIATION AND INTERSPECIFIC HYBRIDIZATION IN SECALE. Sam Price. Genetics 40, 651-667(1955).

Control Secale cereale L. X S. montanum Guss. F₁ hybrids exhibited maximum association of four bivalents plus a six-chromosome translocation chain. Univalents, laggards, and inversion bridges occurred infrequently. Original and induced chromosomal sterility was obscured by genic partial sterility. Variable intraspecific genic sterility may be the basis for interspecific sterility barriers. BA 30-12300

8801

THE EFFECT OF X RAYS AND OF ULTRAVIOLET LIGHT OF DIFFERENT WAVELENGTHS ON THE PRODUCTION OF CYTOCHROME-DEFICIENT YEASTS. Caroline Raut and W. L. Simpson. Arch. Biochem. Biophys 57, 218-228(1955).

Cytochrome-deficient "petite" yeast cells were shown to be due to loss or inactivation of nongenic self-duplicating elements from the cell. The number of such petites is only slightly increased among survivors of x irradiation. They are produced by UV irradiation with peak activity around 2600 Å. BA 30-12526

8802

THE EFFECTS OF TRANSLOCATIONS ON GROWTH IN ZEA MAYS. Lewis M. Roberts. Genetics 27, 166. Records Genet. Soc. Am. 10, 166(1942). BA 16-8769

8803

TRANSLOCATIONS INVOLVING "B" CHROMOSOMES IN MAIZE. Herschel Roman. Genetics 27, 167(1942). BA 16-8703

8804

RELATION OF MITOTIC ACTIVITY TO THE EFFECTS OF X RAYS AND NITROGEN MUSTARD AS INDICATED BY THE GROWTH OF CORN SEEDLINGS. Mary A. Russell and F. J. Michelin. Cancer Research 11, 687-693(1951).

Results: 1) seedlings which had greater numbers of dividing cells at the time of exposure to X-rays were damaged more than those with fewer; 2) seedlings with higher mitotic index were slightly more sensitive to methyl-bis (β-chloroethyl) amine hydrochloride, than were those with lower index. BA 26-5322

8805

INDUCTION OF RESISTANCE TO X-RAY INACTIVATION IN SACCHAROMYCES BY PRE-EXPOSURE TO 2537 Å ULTRAVIOLET RADIATION. A. Sarachek and W. H. Lucke. Experientia 9, 374-376(1953).

U. -V.-Induced resistance to X-ray inactivation depends on alteration in the cells. In Tradescantia and Drosophila u. -v. suppresses chromosomal alteration. By inference, yeast cell inactivation by x-rays depends on chromosome aberrations. BA 28-21625

8806

THE GENE AS A CHEMICAL UNIT. J. Schultz. Colloid Chemistry 5, 819-850(1944).

8807

BLAST-RESISTANT RICE. Anonymous. Indian Farming 2, 33(1941). BA 11-549

8808

STUDIES ON THE PHYSIOLOGY OF JUTE. J. C. Sen Gupta and N. K. Sen. Sci. and Culture (Calcutta) 9, 503-504(1944).

Delay in sowing time and the effects of photoperiod vernalization, storage and x-rays were studied in Corchorus capsularis and C. olitorius. Delay in slowing time reduced the vegetative phase, increased rate of growth in length, produced fewer internodes and leaves, reduced the branching and hastened shedding of leaves from the base. BA 19-1611

8809

THE EFFECT IN R₁, R₂, AND R₃ OF TREATING TOMATO SEEDS WITH X RAY AND P³². J. W. Lesley and Margaret M. Lesley. Genetics 40, 581-2(1955).

Seeds of inbred lines of tomatoes exposed to 10,000 r x rays or to P³² beta radiation, showed delayed irregular germination and growth. R₁ plants, especially after β irradiation, were variegated. Similar changes occurred in R₂. Some variegated R₁ plants gave albino seedlings in R₂. Seeds soaked for 5 days in solution containing 10.8 uc/P³² developed into plants with pheno-typically and cytologically different parts. Male sterility was frequent in R₁, mutants in R₂. BA 26-1881

8810

MUTANTS AND LINKAGE STUDIES IN TRITICUM MONOCOCCUM AND TRITICUM AEGILOPOIDES. Luther Smith. Missouri Univ. Agr. Exptl. Sta., Research Bull. 298, 1-26(1942).

Dormant seeds of T. monococcum variations vulgare and flavescens were subjected to 12,500 r of x-ray. Fifty-six of the 80 viable mutants are described. All mutations tested behaved as recessives except two that were possibly cytoplasmic. Crosses between mutants were studied to test for linkage. BA 17-280

8811

GENETICS AND PLANT BREEDING BY MUNTZING, A. in: Genetics in the 20th Century New York, The Macmillan Co., p. 473-492, L. C. Dunn, ed. BA 25-35579

8812

RECIPROCAL TRANSLOCATION IN RICE. A PRELIMINARY NOTE. HiKoichi Oka, T. T. Chang, and M. S. Hong. Japanese Jour. Genetics 28, 87-91(1953).

Several semi-sterile strains of rice plants were induced by x-ray irradiation. Their sterility was attributable to reciprocal translocations. BA 28-22674

8813

TRUE OR APPARENT SUB-CHROMATID BREAKAGE AND THE INDUCTION OF LABILE STATES IN CYTOLOGICAL CHROMOSOME LOCL. G. Ostergren and T. WaKong. Botan. Notiser 1954, 357-375(1954).

Sub-Chromatid structural changes of chromosomes may be due to full-chromatid changes that are masked by the matrix. Chromosome breaks induced by x rays and coumarin in Allium cepa were studied. Coumarin causes breakage only during mitosis, resting stage is insensitive. BA 30-15712

8814

STUDIES ON THE RIGHT-AND LEFT-HANDEDNESS OF SPIKELETS IN EINKORN WHEATS. V. EFFECTS OF X-RAY IRRADIATION. H. Ono, N. Sueoka, H. Suemoto and K. Kojima. Proc. Japan Acad. 30(3), 221-225(1954).

X-irradiation produces a disturbing effect in the manifestation of handedness. This effect is transmitted to subsequent generations. Radiosensitivity appears greater in lower spikelets. BA 30-8647

8815

ACTION OF URANIUM CHLORIDE AND OF GAMMA RAYS ON THE GEOTROPISM OF ROOTS. V. Bambacioni-Mezetti. Atti Soc. Ital. Progr. Sci. 22 (3), 56-57(1934).

The bean, *Vicia sativa*, showed no growth when exposed to uranium chloride solutions. The small roots did not show typical geotropism. Gamma rays did not have any effect. CA 28-6451

8816

ON THE ADAPTATION VALUE OF EXPERIMENTALLY PROVOKED HEREDITARY CHANGES IN YEASTS. J. M. Olenov. Arch. Mikrobiol. 7, 49-61(1936).

Growth of a basal race A and a mutant race G₁₁ derived from *Zygosaccharomyces mandshuricus* by radiation treatment was compared in pure and mixed cultures. Author concludes that basal Race A disappeared because of the "competition capability" in mutant G₁₁, an inheritable adaptation resulting from irradiation. BA 11-47

8817

THE EFFECT OF ROENTGEN RAYS ON THE RATE OF GROWTH OF SPONTANEOUS TUMORS IN MICE. J. B. Murphy and J. J. Morton. J. Exp Med 22, 800(1915).

Recovery from lymphopenia after x irradiation depends on extent of damage to lymphoid tissues and on the general condition of the animal. Studies were done on mice to determine whether total body exposures to a small x ray dose had the same effect on subsequent growth of spontaneously occurring cancer as the same dose delivered to the cancer in vitro. Mice with spontaneous cancer had the cancer removed surgically, then, received total body x ray followed by re-implantation of the cancer. In unirradiated mice the temporarily removed cancer grew briskly after re-implantation, in another site, while 26 of 52 x-rayed mice proved immune and the other 26 had a delayed "take" and slow cancer growth (partial immunity). The same dose to the tumor in vitro did not affect tumor growth following re-implantation. Immune mice had high peripheral blood lymphocyte counts.

8818

BREAKAGE OF CHROMOSOMES BY OXYGEN. Alan D. Conger and Lucile M. Fairchild. Proc. Natl. Acad. Sci. U. S. 28, 289-99(1952).

Dry pollen grains of *Tradescantia paludosa* were exposed in various ways to 99.5% O₂, then cultured on a lactose-agar-colchicine medium. By interpolation an equal effect was produced by 65% O₂ for 1 hr. and 350 r of X-rays. BA 26-33639

8819

CHROMOSOME AND GENE MUTATIONS IN *DATURA* FOLLOWING EXPOSURE TO RADIUM RAYS. C. Stuart Gager and A. F. Blakeslee. Proc. Natl. Acad. Sci. U S 13, 75-9(1927).

Offspring from one bud exposed to radium γ rays included a new compound chromosomal type, Nubbin, a high percentage of non-disjunctional chromosomal forms, and 2 new gene mutants, Albino and Swollen. BA 3-11046

8820

THE PROBABILITY OF A RADIOTROPIC RESPONSE. C. Stuart Gager. J. Biol. Chem. 4, xliii (1908).

Failure of the author and of other workers to secure a tropistic movement toward or away from the rays of radium is explained by the hypothesis that the rays are too penetrating to be felt, as a stimulus, unilaterally.

8821

ROENTGEN RAY IN PLANT BREEDING. Olov E. V. Gelin. Acta Radiol. Suppl. 116, 700-1(1954).

Two mutants are described in irradiated yellow looking peas: 1) a single gene mutant where all branches are fused and flowers and pods are on top of the plant and

grain yield is decreased about 15% and 2) a complex mutant differing from the parent strain by the yield (about 5% higher), 1,000 grain weight and number of branches.

8822

SOME REMARKS ON CHEMICAL PROTECTION AGAINST IONIZING RADIATION. A. Forssberg. Acta Radiol. 41, 56-8(1954).

Cysteine decreases x-ray damage of *Allium* roots by a factor of about 2. Chromosome disturbances (fragments, bridges) were reduced to 50% or less in cysteine treated roots and x-ray damage was repaired more rapidly than in untreated roots. BA 28-29623

8823

THE OXYGEN EFFECT AND CHROMOSOME BREAKAGE. C. P. Swanson. J. Cellular Comp. Physiol. 45, (Suppl. 2), 285-98(1955).

Author discusses possible levels at which oxygen can affect chromosome breakage. Oxygen participates in a reactive system that can modify the frequency of radiation-induced aberrations. Effect of O₂ tension on frequency of radiation-induced aberrations varies according to type of radiation. BA 26-825

8824

INHIBITION OF PLANT GROWTH BY IRRADIATION. IV. GROWTH ARREST VS. EFFECTS ON MITOTIC ACTIVITY. Henry Quastler, Ann M. Schertiger and Wilson N. Stewart. J. Cellular Comp. Physiol. 39, 357-69(1952).

Mitoses persist following irradiation even when growth is reduced to the radioresistant portion of the growth reserve; persist to a lesser extent, even when all measurable linear growth is stopped. Degrees of mitotic inhibition correlate poorly with degrees of linear growth inhibition.

8825

GROWTH RATE AND RADIOSENSITIVITY IN *TRITICUM* VULGARE. P. S. Henshaw and D. S. Francis. J. Cellular Comp. Physiol. 4, 111-22(1933).

Conclusions: 1) changing non-growing forms to growing by adding moisture (germination) enhanced radiosensitivity considerably; 2) changing growing forms to non-growing by lowering temperature did not change the susceptibility appreciably. A definite correlation between radiosensitivity and presence of mitotic cells was also observed.

8826

RADIOACTIVITY AND VEGETATION. G. Trauffaut. Gardener's Chronical 55, 378-9(1914).

Black oxide (U₃O₈) appears to increase plant growth though results are not conclusive. However, deleterious effects accompany the use of commercially made radioactive materials. CA 9-948

8827

EFFECT OF A BARBITURATE ON THE EARLY ADRENAL REACTION AFTER TOTAL BODY X-IRRADIATION OF THE RAT. P. Fischer. Arch. Intern. Physiol. 63, 134(1954).

8828

GROWTH INHIBITION BY RADIATION IN BEANS. Henry Quastler, Marianne Baer, Wilson N. Stewart, and Ann M. Schertiger. Cancer Research 9, 553(1949).

Irradiation inhibits growth in bean seedlings, irradiated plants falling into one of several well-defined reaction types that can be related to components of the normal growth mechanism. Thus radiation reactions can be used to study normal growth. By proper selection of exposure conditions, various types of reaction can be studied separately.

8829

EFFECT OF LARGE OXYGEN PRESSURES ON THE

X-RAY SENSITIVITY OF THE BROAD BEAN ROOT.

John Read. Brit. J. Radiol. 24, 635-6(1951).

When broad bean roots are x-irradiated in water containing 0-20 cc O₂/litre, each concentration increment acts like a simple multiplying factor on the dose when chromosome aberrations are used as the criterion of effect.

8830

EFFECTS OF ROENTGEN RAYS ON FUNGI IN VITRO.

H. P. Jacobson. Arch. Dermatol. and Syphilol. 38, 38-48(1938).

The results of investigation, while not conclusive, suggest that beneficial therapeutic effects of x-rays on clinical mycoses are due to the action of these rays on the tissues primarily. The tissues in turn, through some unidentified immune mechanism, have an adverse effect on the infecting parasites.

8831

CELL AND CHROMOSOME SENSITIVITY TO IRRADIATION.

P. C. Koller. Acta Radiol. Suppl. 116, 699-700(1954).

Author summarizes evidence indicating that the radiosensitivity of chromosomes is conditioned and influenced by the cytoplasmic environment or metabolic state of the cell. For example, 1) chromosomes of *Tradescantia* microspores are 5 times more breakable by x rays at end of mitotic interphase than at beginning, 2) chromosomes in the spermatogonial cells of *Drosophila* are less sensitive to x rays than are chromosomes in the mature sperm.

8832

THE EFFECT OF OXYGEN TENSION AND CHEMICALS ON ROENTGEN-RAY-INDUCED MUTATION PRODUCTION AND CHROMOSOME BREAKS. Alexander Hollaender. Acta. Radiol. Suppl. 116, 697(1954).

Author summarizes available information on X ray sensitivity of chromosome breaks and mutation production as influenced by air/N₂ ratio.

8833

THE LYMPHOCYTE IN NATURAL AND INDUCED RESISTANCE TO TRANSPLANTED CANCER. II. STUDIES ON LYMPHOID ACTIVITY. J. B. Murphy and J. J. Morton. J. Exp. Med. 22, 204(1915).

In mice, resistance to transplantable tumors is related to a lymphocytic crisis in circulating blood. Destruction of lymphoid tissue by x ray renders an animal susceptible to cancer inoculation.

8834

THE RADIUM IN AQUATIC ORGANISMS. V. Vernadskii. Compt. Rend. 191, 421-23(1930).

During the flowering season of *Lemna*, the radium concentration of the plant and the surrounding water was determined. There was considerably more radium in the plant than in the water. CA 25-315

8835

VITAMIN C CONTENT OF X-RAYED SEEDLINGS.

Friedl Weber. Phytol. Ann. Rei Botan. 4, 144-8(1952).

Seedlings of *Vicia faba*, developing from X rayed seeds (2000 r) contain, after 10 days of growth, much more vitamin C in the epicotyl, more in the cotyledons, and less in the apex of root, than do the control seedlings. BA 27-7718

8836

EFFECT OF EXPOSING GERM-CELLS TO THE RAYS OF RADIUM. C. S. Gager. Science 27, 335-6(1908).

Egg and sperm cells of *Onagra biennis* were exposed to radium rays. Results in the F₁ generation; 1) one side of the plant grew faster and more vigorously than the other, 2) on one side the leaves possessed characteris-

tics, not of the typical *O. biennis*, but of one of its mutants, 3) one of the shoot systems possessed the characteristics of the typical biennis, the other of one of its mutant derivatives.

8837

HIGH VOLTAGE CATHODE RAYS OUTSIDE THE GENERATING TUBE. W. D. Coolidge. Science 62, 84-7(1927).

With a specially designed hot cathode, high vacuum tube, it has been found possible to operate with as much as 200,000 volts and several milliamperes, using a metal window as large as 8 cm. in diameter. Many liquids and solids undergo marked chemical changes under the influence of the high speed electrons. Results occurred with castor oil, crystals of cane sugar, leaf of rubber plant, and ear of a rabbit, fruit flies, and bacteria.

8838

MUTATIONS IN BARLEY INDUCED BY X-RAYS AND RADIUM. L. J. Stadler. Science 68, 186-7(1928).

X-ray treatments were applied to germinating seeds, and the induced mutations recorded were in all cases somatic mutations affecting the progeny of only part of the plant.

8839

ARTIFICIAL TRANSMUTATION OF THE GENE. H. J. Muller. Science 66, 84-7(1927).

Drosophila melanogaster were exposed to x-rays. Treatment of the sperm with relatively high doses of x-rays induces true gene mutations in a high proportion. These mutants generally are stable in their inheritance, and behave in the manner typical of Mendelian chromosomal mutant genes found in organisms generally. Mutations (recessive for the lethal effects) greatly outnumbered the non-lethals producing a visible morphological abnormality.

8840

THE EFFECT OF THE FACTOR Ca₁ IN *ANTIRRHINUM MAJUS* (FROM GROUP A WITH INHERITANCE FACTORS MODIFIED BY RADIUM IRRADIATION). E. Stein. Z. Induktive Abstammungs- u. Vererbungslehre 74, 216-227(1938). (In German).

The factor Ca₁ acts like the complex GKD₁ but its destructive effects on tissues are less marked. BA 12-14147

8841

TRANSLOCATED SUGARLOAF, A PURE-BREEDING CHROMOSOMAL TYPE IN *DATURA* INDUCED BY RADIUM TREATMENT. A. D. Bergner, S. Satina, A. G. Avery and A. F. Blakeslee. Science 70, 562(1929).

As a result of radium treatment, the L chromosome of *Datura* was broken into two portions. One portion remained as an unattached fragment while the other, involving the Sugarloaf half of the 1 chromosome, became attached to one end of an M chromosome. By inbreeding, a race homozygous for the translocated Sugarloaf fragment was obtained, showing, at reduction divisions, four chromosomes consisting of two normal L chromosomes and 2 M chromosomes.

8842

PROGENIES FROM X-RAYED SEX CELLS OF TOBACCO. T. H. Goodspeed and A. R. Olson. Science 67, 46(1928).

Nicotiana tabacum var. *purpurea* in full flower were exposed to moderately hard X-rays. Within 48 hours all buds except those in which pollen was formed had fallen. At seedling stages variant plants were noted. At maturity over 20% were striking variants. With some marked exceptions, fertility in general parallels extent of total variation - the more abnormal, the more sterile.

8843

THE EFFECT OF X-RAYS ON GROWTH SUBSTANCE

AND PLANT GROWTH. Folke Skoog. Science 79, 256(1934).

Dosages varying from 20 to 5,000 r were given to growth substance in different media and solvents. A few species of plants were directly irradiated. Growth substance was inactivated by irradiation. Tips from irradiated plants, placed on agar blocks, showed a large decrease in growth substance. These experiments show that the primary action of x-rays on growth of plants is through the inactivation of growth substance.

8844

GENETIC AND NONGENETIC EFFECTS OF RADIATIONS IN NEUROSPORA. V. W. Woodward and C. M. Clark. Science 121, 641-2(1955).

Lethal effects of x-rays are mediated entirely through the nuclei in *Neurospora* conidia. Authors describe genetic and nongenetic effects of radiations in *N. crassa*, strain 74 A-3b. X-rays affect growth rate and conidial germinations similarly. Relationship between mutation rate and conidial survival is complex, the survival curve being a composite of conidial stimulation and activation. Survival value is a combination of both.

8845

THE INFLUENCE OF STIMULATING RADIATION ON THE GLANDS OF INTERNAL SECRETION. Manfred Fraenkel. Deutsch. Med. Wchnschr 49, 242(1921). (In German).

Improvement in cancer patients treated with x radiation is attributed to the stimulating effect of radiation on the endocrine glands. Author considers connective tissue to be an endocrine organ.

8846

DELAYED KILLING OF MAIZE SEEDLINGS WITH X-RAYS. G. N. Collins and Louis R. Maxwell. Science 83, 375-6(1936).

Seeds of dent corn received about 500 r per min. from Coolidge x-ray tube. Rate of elongation was progressively depressed following dosages of 1,000 to 20,000 r. Treatments above 40,000 r resulted in delayed killing. Percentage of germination remained unimpaired following doses of 60,000-100,000 r, but all plants died in the seedling stage. Dose of 2,000,000 r completely inhibited germination.

8847

INDUCTION OF ADDITIONAL HYBRID STERILITY IN *SECALE CEREALE* X *MONTANUM* BY IRRADIATION OF POLLEN. Samuel Price. Science 121, 625-6(1955).

The interspecific F_1 hybrids, *S. cereale* L x *montanum* Guss. exhibit great variability in pollen fertility and seed set. Of 26 r-hybrids, 17 contain additional induced translocations. Inversions have been induced in several plants. In r-hybrids, pollen fertility and seed set are weakly correlated, but neither is correlated with observable chromosomal irregularities.

8848

CONTRASTS IN THE GENETIC EFFECTS OF ULTRAVIOLET RADIATION AND X-RAYS. L. J. Stadler and G. F. Sprague. Science 85, 57-8(1937).

Ultra-violet radiation applied to mature pollen of maize induces mutation and deficiency, but unlike x-ray treatment, has little or no effect on frequency of translocation. Endosperm deficiencies induced by UV include a larger proportion of fractionals. Relative frequency of loss of specific marker genes differs distinctively from that following x irradiation.

8849

BREAKAGE OF CHROMOSOMES IN *TRADESCANTIA* WITH A CALCIUM DEFICIENCY. D Steffensen. Proc. Natl. Acad. Sci. U.S. 41, 155-160(1955).

Clonal divisions of a single plant of *Tradescantia paludosa* were grown in culture solutions containing 2, 5, 10 (suboptimal) and 250 (optimal) ppm. of Ca. There were 9.7% more chromosomal aberrations in plants grown

in suboptimal Ca than in those grown in optimal Ca, with a highly significant difference between the two groups.

California. Univ., Los Angeles. Atomic Energy Project. EVALUATION OF THE ACUTE INHALATION HAZARD FROM RADIOACTIVE FALL-OUT MATERIALS BY ANALYSIS OF RESULTS FROM FIELD OPERATIONS AND CONTROLLED INHALATION STUDIES IN THE LABORATORY. G. V. Taplin, O. M. Meredith, Jr., and H. Kade. June 1957. 26p. Project 37.3 (of) OPERATION TEAPOT. (WT-1172)

An evaluation of the acute inhalation hazard from radioactive fall-out materials has been made by analysis of results from animal exposures during field operations and from controlled inhalation studies in the laboratory. Rabbits and rats have been subjected to controlled inhalation exposures to dusts prepared by micropulverizing fused insoluble radioactive siliceous material obtained from Area 3 at the Nevada Test Site, Operation Upshot-Knothole. In these laboratory studies, field conditions were simulated in respect to duration of exposure, particle-size distribution, and levels of air-borne radioactivity involved. The relation between particle size, dust concentration, and duration of exposures to initial deposition in the lungs and gastrointestinal tract has been determined. In addition, the rates of removal have been measured. The laboratory studies demonstrate two important physiological-safety factors against the retention of dangerous quantities of inhaled particulate materials. These are, first, the filtration mechanism of the upper

respiratory passages which limits pulmonary retention to particles of small size (below 5.0μ), and, second, the normal clearance mechanisms of the upper and lower lung passages which remove initially deposited large and small particles at rapid rates. The results from exposing several groups of rabbits to fall-out material (by inhalation only) at stations located along two arcs, 7 and 106 miles from a tower detonation, are almost entirely negative. Urine specimens obtained during the first day following detonation contained minute but measurable amounts of soluble radioactive material which had a relatively short half life (1 to 2 days). Lung specimens had no detectable radioactivity when measured 60 to 21 days later, however, samples of intestine from the same animals still had measurable levels of beta activity. The total integrated internal radiation exposure could be expressed in millirep, even at the close stations, where the integrated external gamma-ray exposure was found to be 14 to 32 hr. At the 106-mile stations, no measurable radioactivity was present in specimens of lung or urine; however, the levels of radioactivity in intestine samples were either negative or several times lower than those found in animals at the near stations. The external gamma-ray dose was less than 4.0 r. From careful consideration of numerous pertinent physical and physiological factors and from analysis of field and laboratory investigations, it is evident that there is no apparent situation in nuclear warfare where, during the first few days after the detonation, one could inhale sufficient radioactive material to induce a serious radiation injury to lungs or intestines without simultaneously being subjected to supralethal doses of external beta-gamma radiation.

8868

Rochester, N. Y. Univ. Atomic Energy Project. FATE OF INDIUM SESQUOXIDE AND OF INDIUM¹¹⁴ TRICHLORIDE HYDROLYSATE FOLLOWING INHALATION IN RATS. P. E. Morrow, F. R. Gibb, R. Cloutier, L. J. Casarett, and J. K. Scott. Oct. 9, 1957. 33p. Contract W-7401-eng-49. (UR-508)

Rats in groups of 2 or 3 were exposed to submicronic aerosols of indium sesquioxide (2.5 mg/M^3) and the hydrolysis products of indium¹¹⁴ trichloride ($<0.1 \text{ mg In/M}^3$) for periods of 30 to 180 minutes duration. The inhalation doses were invariably too low to permit toxicologic studies. Data are presented on the deposition and retention of the two indium preparations in the respiratory tract. Body burdens and urinary and fecal excretion rates were studied up to 14 days for the sesquioxide and up to 6 days for the In¹¹⁴ hydrolysate. Some tissue distribution data are presented which demonstrate small but significant absorption of indium particularly during the first 24 hours after either form is inhaled and that the absorbed indium is widely distributed with the greatest amounts going to the liver and kidney. Autoradiographic findings suggest the role of phagocytosis in lung clearance, an absence of systemic transport in particulate form and a concentration in compact bone.

POST TREATMENT MODIFICATION OF X-RAY INDUCED INJURY IN BARLEY BY AEROBIC AND ANAEROBIC HYDRATION. Richard S. Caldecott, C. F. Konzak, and Elizabeth Bindloss Johnson (Univ. of Minnesota, Minneapolis and Brookhaven National Lab., Upton, N. Y.). Radiation Research 7, 308(1957) Sept.

Seeds of barley with either 4% or 16% water in the embryo were given x ray doses ranging from 5000 r to 45,000 r. Immediately after treatment they were plunged into boiled distilled water and aerated with either oxygen or nitrogen and permitted to hydrate at room temperature from 5 minutes to 8 hours. After hydration they were planted out in petri dishes and grown for 6 days after which time seedling height measurements were made. The seeds having an embryo water content of 4% at the time of x radiation manifested different degrees of growth inhibition dependent upon whether hydration occurred in the presence of oxygen or nitrogen, the former resulting in the greatest injury. Nonirradiated controls evidenced no injury modification attributable to the condition of hydration. A significant injury modification occurred during only 5 minutes of hydration and the maximum effect took place during 30 minutes of hydration. Subsequent studies have shown that if seeds with 4% water in the embryos are stored for 6 hours after x radiation, before hydration is initiated, the injury modification reported does not take place. In this same connection, it has been demonstrated that the greatest possible modification of injury occurs when the total dose of radiation is given in the shortest possible time. NSA 12-8265

California. Univ., Los Angeles. School of Medicine. THE EFFECTS OF IONIZING X-IRRADIATION ON THE ADULT AND IMMATURE MAMMALIAN BRAIN. C. D. Clemente, J. Yamazaki, L. Bennett, R. McFall, and E. H. Maynard. 13p. (A/CONF.15/P/891)

Prepared for the Second U. N. International Conference on the Peaceful Uses of Atomic Energy, 1958. Data are presented from which it is concluded that the central nervous system is liable to severe damage from ionizing radiation. In general, the adult mammalian brain can withstand higher radiations without the development of neurological signs than the new born brain. In rats an apparent and significant radioresistance in the central nervous system is developed within the first 6 to 8 days of life. Although pathology is sometimes seen in older rats following irradiation, it requires a higher dose than the development of the same signs by head irradiation of the new born. After large dosage irradiation to the heads of adult monkeys, the vital centers in the brain stem (hypothalamus and medulla) seem to be more radiosensitive than other regions in the nervous system. In our experiments this was recognized by neuronal, and neuroglial pathology and by the profound changes in vascular permeability observed in the hypothalamus and medulla following irradiation. A direct explanation of the differences in radiosensitivity of the new born brain and the two week old brain cannot as yet be given. It is possible that there is a significant change in the water content of the nervous system during this period although we have not been able to uncover data along these lines to support this hypothesis. COMPARISON OF THE EFFECTS OF RADIUM AND ROENTGEN RADIATION ON HUMAN SKIN. F. Wachsmann. Strahlentherapie 90, 438-45(1953). (In German)

Human and animal skin was exposed to roentgen irradiation (45-200kv) and to radium-gamma radiation while conditions were kept constant. It was ascertained that for small doses, approximately 3 times as much, for large doses approximately 2-1.5 times as much gamma radiation has to be applied to elicit the same reactions elicited by roentgen irradiation.

CONTRIBUTION ON THE SUBJECT OF "IMMUNIZATION" AGAINST EFFECTS OF IONIZING RADIATION. Liebknecht A. Dimitrow (Institut fur Pathologische Physiologie der Universitat Sofia, Bulgaria). Strahlentherapie 104, 436-41(1957). (In German).

The results of successive irradiation of dogs have confirmed the conjecture that a considerable resistance against ionizing rays can be produced, with the supra-renal gland apparently playing the mere part of an intermediate link in the total reaction of the organism. Remarkable in this connection are Kiselew's communications concerning antibody formation posterior to irradiation with sublethal doses. NSA 12-7667

METHOD OF ESTIMATING DOSAGE TO GROUND FROM A RADIOACTIVE CLOUD. C. C. Gamertsfelder and R. L. Waterfield. Oct. 1955. 27p. Contracts AF33(038)-21102 and AT(11-1)-171. (APEX-348)

Beginning with Sutton's diffusion equation, the authors develop mathematical expressions for the radiation dose to a point on the ground following the instantaneous emission of a point source of radiation. From a knowledge of weather conditions, reactor running history, and the power of the runaway, one can compute the beta and gamma dose to be expected from the following events: material inhaled into the lung; direct and scattered radiation from material in the air, and direct and scattered radiation from material deposited on the ground by rain-out or fall-out. Army Medical Nutrition Lab., Denver. DETERMINATION OF METABOLIZABLE ENERGY OF IRRADIATED FOOD AS FED TO RATS OF THE FIRST GENERATION IN LONG-TERM TOXICITY STUDIES. Howard K. Cahall, Harry J. Krzywicki, Merrill S. Read, and Herman F. Kraybill. Mar. 18, 1957. 25p. Project No. 6-60-11-020. (AMNL-201; AD-125591)

The metabolizable energy (ME) of a composite diet compounded from nine irradiated foods was compared to that of a similar diet of non-irradiated foods. The ME of the irradiated diet was significantly higher than that of the non-irradiated control. This increase was due to the greater apparent digestibility of protein and, possibly, carbohydrate in the irradiated diet. Further studies will be conducted to confirm these observations. GENETIC AND CYTOLOGICAL STUDIES ON THE PROGENY OF RICE PLANTS EXPOSED TO THE ATOMIC BOMB AS WELL AS OF THOSE IRRADIATED BY X-RAYS. Yonehachi Nishimura (National Inst. of Agricultural Sciences, Hiratsuka, Japan). pp 265-70 in "Proceedings of the International Genetics Symposia, 1956, Tokyo and Kyoto, September, 1956". Tokyo, International Genetics Symposia, 1956, Science Council of Japan, 1957. 702p.

Rice seeds were gathered in the autumn of 1945 from paddy fields near the epicenter of the atomic bomb explosion at Nagasaki. The fields were situated about 600 to 2,000 meters from the center of the explosion. In 1946 the seeds were sown and transplanted into five plots representing various distances from the center of the explosion. At the ripening stage the plants with morphological changes or decreased fertility were counted in the field. Crosses were made in more than 100 combinations, including plants subjected to x-ray treatment. Data are tabulated on morphology and sterility of the plants. Comparison is made with data on plants grown from seed exposed to x-ray doses of 10,000 to 20,000 r under both wet and dry conditions. NSA 12-15269

8893

TRANSLOCATION OF A PIECE OF AN AUTOSOME TO THE W CHROMOSOME, AND INDUCTION OF A DOMINANT LETHAL FACTOR IN THE SILKWORM BY X-RAYS. Haruo Hasimoto (Ministry of Agriculture and Forestry,

Matumoto, Japan). pp 248-51 in "Proceedings of the International Genetics Symposia, 1956, Tokyo and Kyoto, September, 1956". Tokyo, International Genetics Symposia, 1956, Science Council of Japan, 1957. 702p.

The translocation induced by chromosome irradiation is probably a reciprocal interchange involving the W chromosome and a Zebra-lemon autosome, where a W chromosome segment bearing the female-determining factor is combined with a segment bearing the Zebra gene, while the rest of the W chromosome is united with the part of the autosome bearing the lemon locus. The lemon locus-bearing segment apparently carries the factor in question. In ordinary circumstances the W chromosome is transmitted in the female line, but when the segment enters a male as in the present case, it produces a lethal effect. Therefore, it may be concluded that the W chromosome has a regional differentiation, and the female-determining factor occupies a certain restricted region of the chromosome, while the other region has a lethal effect for the male which carries it. EFFECTS OF X IRRADIATION ON CHOLESTEROL, FATTY ACID AND PROTEIN SYNTHESIS. R. Gordon Gould, Virginia L. Bell, Edith H. Lilly, Patricia Keegan, Jean Van Ripper, and Mary Lou Jonnard. Jan. 1957. 46p. Contract W-7405-Eng-36. (LA-2179)

Whole-body x irradiation of rats has been shown to result in an increase in the rate of cholesterol biosynthesis in liver and adrenal glands. This has been demonstrated by determination of the incorporation of acetate-1-C¹⁴ both in the intact animal and in tissue slices, and by the incorporation of tritium labeled body water into cholesterol. The effect was evident 24 hours after irradiation but was much larger 48 hours after. The increase in rate in liver in intact rats was about 100% per 100 r over the range 300 to 2400 r. X irradiation decreased the cholesterol concentration by about 20% and increased the liver weight about 40%, 48 hours after irradiation. The effect on fatty acid and protein synthesis and on cholesterol biosynthesis in certain other tissues was also studied and found to be either unchanged or increased to a much smaller extent than cholesterol biosynthesis in liver and the adrenal glands. A STUDY OF THE EFFECT OF GAMMA RADIATION ON APPLES. R. M. Smock and A. H. Sparrow (Cornell Univ., Ithaca, N. Y. and Brookhaven National Lab., Upton, N. Y.). Proc. Am. Soc. Hort. Sci. 70, 67-9 (1957).

Gamma radiation (cobalt source) of Rhode Island Greening apples did not lower the respiration rate. The

40,000 r lot had a higher than normal rate. This lot also softened more during the holding period at 74°F. Dosages over 10,000 r seemed to aggravate mealy breakdown. Dosages of 20,000 and 40,000 r reduced the production of ethylene and volatiles other than ethylene. The respiration rate of Cortland apples was reduced slightly by gamma radiation. Keeping quality of this variety in storage was not affected, except for the 30,000 r lot which was slightly softer. Weight losses were not affected by radiation. No commercially important benefits were observed with either variety. NSA 12-11250

CHANGES IN MORPHOLOGICAL BLOOD PICTURE OF YOUNG RATS IN ACUTE RADIATION SICKNESS. T. V. Fokina (Inst. of Pediatrics, Acad. of Medical Sciences, U. S. S. R.). Med. Radiol. 2, No. 6, 26-36(1957) Nov.-Dec. (In Russian).

Studies made with young rats exposed to x rays of 100, 500, and 250 r revealed various specific features

in the peripheral blood which were related to the age of the rats. Leukopenia developed more rapidly in young rats irradiated at 3 to 6 weeks. In suckling rats, irradiated the first few days after birth, it developed more slowly but was usually pronounced. The most pronounced changes were observed in the red blood of suckling rats, where following irradiation by 250 r the concentration of haemoglobin decreased 68% of its initial value, while in adult rats the same dose decreased the haemoglobin only by 13%. North American Aviation, Inc., Downey, Calif.
WBNS SURVEY. R. L. Koontz. Sept. 5, 1952. Decl. Mar. 11, 1958. 11p. (NAA-SR-Memo-406)

The radiation levels which exist at 100 milliwatts for 8 hr/day operation meet the required maximum permissible dosage rates of 1/10 the AEC standard dosage rates. On this basis a safe level of operation is considered 1000 milliwatt hrs/day or 5.0 watts-hrs/week. A simple explanation for the required 1/10 of the AEC maximum permissible exposure rate is the simultaneous existence of three so-called tolerance dosage rates and an unknown summative effect of fast neutrons, slow neutrons, and gamma radiation. In addition, there are potential exposures from other sources of radiation in the laboratory. It has been shown that the radiation levels existing are below the AEC permissible rates in working areas for each of the separate types of radiation. No attempt has been made to summate

the total exposure. If the WBNS is operated at the levels mentioned above, no harm to personnel in or around the WBNS should occur. NSA 12-7678

MECHANISM OF EMESIS FOLLOWING X-IRRADIATION. S. C. Wang, A. A. Renzi, and Herman I. Chinn. Oct 11, 1957. 6p. (AF-SAM-58-34)

It has been observed that normal dogs exposed to lethal doses of total-body x irradiation exhibited emesis during the remaining period of survival. However, neither acute nor delayed emesis due to irradiation was observed in dogs with chronic destruction of the chemoceptive emetic trigger zone and abdominal deafferentation. Studies of the effects of various visceral deafferentation procedures on postirradiation emesis indicate that delayed vomiting was mediated through the centrally located trigger zone and the peripheral visceral afferent receptors of the vagus and sympathetic trunks. POSTIRRADIATION CREATINURIA IN MACACA MULATTA MONKEYS. George M. Krise, Clyde M. Williams, and Donald R. Anderson. June 25, 1957. 4p. (AF-SAM-57-150)

Four adult male Macaca mulatta monkeys were placed on a creatine-free diet for seven to nine days. After the urinary level of creatine excretion had reached a plateau, the animals were irradiated with 1,000 rep of x rays. A creatinuria of approximately four times normal was excreted over the first four days in a pattern similar to that previously found in the rat. On the second postirradiation day the average creatinuria was about seven times normal. This effect is compared with other species reported in the literature. NSA 12-4028

THE ROLE OF CERTAIN ORGANS IN FRACTIONATED TOTAL BODY X-IRRADIATION STUDIES. J. G. Kereiakes, W. H. Parr, and A. T. Krebs. Oct. 22, 1956. 14p. Project No. 6-59-08-014. (AMRL-273; AD-125586)

Intervals between each of five 140 r doses of 1, 3, 5, 7, and 9 hours resulted in survivals of 15, 35, 55, 45, and 40%, respectively, for fractionated total-body x irradiation of mice. A 700 r single dose was 100% lethal. The pattern of the intestinal dry weight response to fractionated doses was similar to that for survival. Fractionating the dose did not seem to significantly alter the 700 r single dose spleen wet weight value. The findings suggest that the fast recovery of the mitotic process and of the nucleic acid metabolism in the small intestine at about five hours after irradiation with doses between 100 and 200 r may be responsible for the observed results for the five hour interval fractionated total-body x irradiated mice. EFFECT OF GLUCOSIDATION ON RADIOMIMETIC ACTIVITY. COMPARISON OF HYDROQUINONE AND ITS GLUCOSIDE, ARBUTOSIDE. Guy Deysson and Rene Truhaut (Institut du Cancer Gustave Roussy et Faculte de Pharmacie). Compt. rend. soc. biol. 151, 1719-22(1957) Oct. (In French).

Investigations were made to compare the radiomimetic effects of hydroquinone and its natural glucoside arbutoside on the roots of Allium sativum L. The results of the study showed that arbutoside exercises a radiomimetic action of the same type as hydroquinone, but of an intensity 4 times less. The glucosidation diminishes the toxicity and the efficiency of hydroquinone, but it does not remove the effect exercised on the chromosomes. NSA 12-15210

CHRONIC RADIATION HAZARDS. AN EXPERIMENTAL STUDY WITH FAST NEUTRONS. G. J. Neary, R. J. Munson, and R. H. Mole. New York, Pergamon Press, 1957. 198p.

Mice were subjected to chronic radiation exposure from a nuclear reactor for several years. The doses of fast neutrons, gamma radiation, and thermal neutrons were measured by the use of three chambers with different sensitivities to the three kinds of radiation. Quite precise estimates of the separate effects of the three kinds of radiation were possible by making use of an approximate value for the energy of the fast neutrons, and from this information the true tissue doses in rads could be obtained. The effect of 0.54 rads weekly of fast neutrons on the life span of mice was small and is statistically uncertain. The higher dose of 6.4 rads weekly did not effect the white blood cell count but caused a marked drop in body weight and shortened life by one third. After 2 to 5 months at 6.4 rads weekly, fertility in both males and females was seriously impaired. The reproductive function was found to be the most sensitive indicator of chronic radiation damage. Irradiation techniques and facilities are described. The interpretation of the results of chronic toxicological experiments are discussed. NSA 12-10318

THE EFFECTS OF HEAVY GAMMA IRRADIATION UPON PITUITARY GLANDS TRANSPLANTED INTO HYPOPHYSECTOMIZED TADPOLES OF BUFO BOREAS. Bennet M. Allen (Univ. of California at Los Angeles). J. Exptl. Zool. 136, No. 1, 185-98(1957) Oct.

The pituitary gland retains its ability to secrete thyrotrophic hormone and intermedin up to 108 days after very heavy irradiation. In these experiments hypophysectomy had been performed as usual on tadpoles at the tail bud stage and the pituitary glands of irradiated recently metamorphosed toads were transplanted into them after they had reached a trunk length of 6 to 8 mm. The activity of the transplant was largely conditioned by the amount of trauma that occurred in the operation. In more favorable cases the pars anterior produced thyrotrophic hormone sufficient to induce the thyroid gland of the hosts to secrete enough hormone to cause well advanced development toward metamorphosis by the end of 42 days. Tadpoles killed at 108 days show still further average development. The thyrotrophic function of the pars anterior was maintained after an irradiation of 27,000 r but it is probable that a still heavier irradiation would not have completely destroyed its capacity to secrete during this period of time. Color change induced by the secretory activity of the pars intermedia is very pronounced at 45 minutes after transplantation and continues through the 108 days of the experiment. These color effects are fully maintained in spite of an irradiation

of 27,000 r only slight diminution resulting from a dosage of 40,000 r. NSA 12-11243

THE DISTRIBUTION AND EXCRETION OF URANIUM IN MAN. S. R. Bernard, J. R. Muir, and G. W. Royster, Jr. (Oak Ridge National Lab., Tenn.). *Proc. Health Phys. Soc.* 33-48(1957).

The critical organ for radiation insult from storage of enriched uranium in the kidney when exposure is to a soluble substance. The disappearance of uranium from the body shows a slight dependence upon the amount injected into the bloodstream. The urinary excretion data can be described using the power function law. Integration of this function yields the retention as a function of time. The calculated retention agrees more closely with the retention in the critical organ than with retention in the body. A tentative MPC for exposure to soluble compounds is calculated to be 4×10^{-11} $\mu\text{C}/\text{cc}$ on the basis of the power function equation. A tentative MPC for urine is calculated using the power function law. The calculated value is 355 d/m/day, a factor of 5 greater than the present value employed, thereby indicating a margin of safety for exposure to soluble compounds. NSA 12-8285

ERYTHROPOIESIS IN RADIATION DISEASE COMBINED WITH BURN. I. T. Abasov (Azerbaijani Inst. for Research in Roentgenology and Radiology). *Bull. Exptl. Biol. Med. (USSR) (English Translation)* 43, 799-801 (1957) July.

Experiments with radioactive iron have demonstrated that in rats subjected to x-ray irradiation (500 r) erythropoiesis is for the first ten days inhibited, and restored at the end of the first week. In rats with burns of the distal parts, caused by boiling water, erythropoiesis is enhanced during the first days and then with the development of inflammatory complications, is inhibited, not being restored even at the end of two weeks. In animals subjected to both irradiation and burns, release of erythrocytes ceases almost completely and in surviving ones restoration of erythropoiesis proceeds very slowly. NSA 12-11238

THE GENETICS OF SOMATIC MAMMALIAN CELLS. Theodore T. Puck (Univ. of Colorado Medical Center, Denver). *Advances in Biol. and Med. Phys.* 5, 75-101 (1957).

New quantitative techniques have been described for rapid plating of isolated single cells from a wide variety of human tissues under conditions such that almost every cell produces a macroscopic colony. These methods make possible new kinds of studies of the growth and genetics of mammalian cells. Application of these methods to problems of growth rate analysis, cell morphology, mutant production and isolation, analysis of the action of ionizing radiations, study of virus-cell interactions, and to certain problems in clinical medicine has been indicated. Rochester, N. Y. Univ. Atomic Energy Project. ON THE MECHANISM OF SKELETAL FIXATION OF STRONTIUM. J. Boyd, W. F. Neuman, and H. C. Hodge. Nov. 14, 1957. 16p. Contract W-7401-eng-49. (UR-512)

The results of the present investigations permit a provisional description of the mechanisms underlying the skeletal fixation of strontium. Strontium ions from the extracellular fluids, diffusing into the bone areas, enter into the hydration jackets surrounding the individual bone crystals and exchange with certain calcium ions in the surfaces of mineral crystals. With passing time, these strontium ions become incorporated to some extent within

the crystals, presumably as the result of thermal diffusion and recrystallization. NSA 12-8294

THE EFFECT OF NARCOSIS AND NATURAL HIBERNATION ON THE RADIOSENSITIVITY OF ANIMALS. M. D. Pomerantseva (Inst. of Genetics, Academy of Sciences, USSR). *Zhur. Obshchei Biol.* No. 3, 194-207 (1957) May-June.

The radiosensitivity of animals under deep narcosis and in a state of hibernation was investigated. Several hundred mice were exposed to doses of x radiation of 500, 1500, 4000, and 10,000 r. The protection afforded by the administration of sodium Nembutal, Barbamil, Hedonal, Urethane, and ether both before and after irradiation was investigated. The effect of hibernation on the radiosensitivity of animals was investigated in the rodent, *Citellus major*, following exposure to 600 r x radiation, and hedgehogs exposed to doses of 700 to 850 r. Data are tabulated and presented graphically. The use of narcosis after irradiation of the mice proved ineffective in reducing radiation damage. The use of Nembutal, Barbamil, and ether to produce narcosis during irradiation increased the resistance of mice to the action of 500 r x radiation as demonstrated by an increase in survival rate, delay in time of death, and faster restoration of body weight. The use of Hedonal and Urethane for narcosis was practically ineffective. The use of oxygen decreased in mice under narcosis induced by Nembutal and Barbamil. Deep Nembutal narcosis was found to delay, until the subject awakens, the early reactions against irradiation with massive doses of x radiation. The natural hibernation of animals did not increase their radioresistance to lethal doses of x radiation but delayed, until awakening, the onset of acute symptoms of radiation sickness. NSA 12-9646

Some of the factors controlling tissue growth in animals and cell proliferation in unicellular organisms are reviewed. Radiation damage in diploid yeast cells manifests itself sometimes in delayed lethal effect and decreased cell division rate over several generations in the progeny of the irradiated cell. Recovery of the progeny of irradiated yeast cells from phenotypic expression of radiation damage can be delayed over many generations and is similar, in time rate of onset to the onset of radiation-induced animal tumors. A parallel suggests itself between the mechanism of somatic-radiation carcinogenesis and delayed recovery of unicellular organisms from radiation effect. NSA 12-1158

TIME OF APPEARANCE OF SKIN LESIONS FOLLOWING EXPOSURE TO BETA RADIATION A. K. Davis and E. L. Alpen. June 21, 1957. 19p. Project NM-006-015. (USNRDL-TR-173)

Measurements of the response of rat, guinea pig, dog, and pig skin to beta radiation have been made at doses of 450 to 100,000 rad. The results indicate that above the threshold for wet desquamation the sequence of events is an early erythema, a latent period of five to seven days during which the skin appears normal, and a short period of dry desquamation, lasting only one or two days, followed by necrosis and sloughing of the skin in the irradiated area. The wet ulcer is then covered by a dry crust which persists until healing is complete. A dose of 15,000 rad produced edema of the irradiated site by the first day in all rats and occasional edema in guinea pigs and dogs. Higher doses reduced the latent time before ulceration and increased the intensity of the erythema. At 100,000 rad immediate effects of the irradiation causes an intense erythema and accelerates the course of injury described for the doses above 15,000 rad. NSA 12-1160

THE EFFECT OF IONIZING IRRADIATION ON LONGEVITY. John B. Hursh. Aug. 22, 1957. 29p. Contract W-7405-eng-49. (UR-506)

Among the important late effects of ionizing radiation is the shortening of average length of life. Experiments on rats and mice have shown that for single sub-lethal doses of x-rays, this life shortening is 25 to 50% per 1000 roentgens, the proportional amount of shortening increasing with dose size. For chronic irradiation an estimate is made of approximately 10% per 1000 r. Generalizations which summarize this experimental information are reviewed. Finally the possible significance of this effect for maximum permissible exposure levels is discussed. NSA 12-1159

RETENTION AND TOXICITY OF RADIOSTRONTIUM IN MONKEYS. Presented at the International Conference on Radioisotopes in Scientific Research, Sept. 9-20, 1957 at Paris. No. UNESCO/NS/RIC/142. A. H. Ward. London, Pergamon Press, Ltd., 1957. 9p.

Experiments with Sr⁹⁰ administered to monkeys from a colony of 80 animals are described. Single doses, ranging from 1 to 0.001 mg/kg bodyweight were given to animals in three experimental groups distributed amongst three species. Relations between survival time and injection dose are discussed, and the lethal dose for 30 and 500 days estimated at 0.70 and 0.01 mc/kg bodyweight respectively indicates a higher toxicity in monkeys than in any other animal yet reported. A marked species difference is

seen in the toxicity of low injection doses. Excretion and retention of Sr^{90} and Y^{90} are discussed. NSA 12-57

Rochester, N. Y. Univ. Atomic Energy Project. THE DISTRIBUTION AND EXCRETION OF POLONIUM²¹⁰ AFTER INHALATION. H. L. Berke and A. C. DiPasqua. May 31, 1957. 42p. Contract W-7405-eng-49. (UR-495).

Rats have been exposed in a specially designated inhalation chamber to a controlled NaCl aerosol contaminated with small amounts of Po^{210} ($3.17 \times 10^{-6} \mu\text{c}/\text{ml}$ air, geometric mean diameter 0.098μ , $\sigma_g 1.81$). About 53% of the inhaled aerosol was deposited in the animal, equally divided between the lung-trachea and the gastrointestinal tract after five hours exposure. About 20% of the total Po^{210} deposited in the respiratory tree was cleared during this time. The rate of post exposure lung clearance was exponential with time and quite rapid during the first 30 days (10 day half-time), slower and less regular at later times. The tissue distribution after inhalation is different from that observed after the intravenous, oral or intratracheal route of entry as seen particularly in blood and spleen. Total excretion was lower following inhalation than that after intratracheal or intravenous administration. An intermediate value of 6:1 was observed for the ratio of fecal to urinary Po^{210} . It is concluded that the distribution and excretion of Po^{210} in the rat after an inhalation exposure represents a balance between that observed after intratracheal injection and that after the oral route of entry. Naval Radiological Defense Lab., San Francisco. THE EFFECT OF X-RAY DOSE ON THE PROTECTIVE ACTION AND PERSISTENCE OF RAT BONE MARROW IN IRRADIATED MICE. G. W. Santos, L. J. Cole, and P. L. Roan. Sept. 12, 1957. 20p. Project NM-006-015. (USNRDL-TR-181)

Rat bone marrow cell suspensions were injected intravenously into x-irradiated mice, with the addition of penicillin to the suspending medium. Various radiation dose levels in the midlethal, lethal, and supralethal range were employed (600 to 1000 r). This study shows that penicillin treatment on the day of irradiation significantly improved the 30-day survival of the rat marrow-treated mice, but not the 60-day survival. Treatment with rat bone marrow lowered the 30- and 60-day mortality (except at the 3 lowest doses, 600, 640, and 680 r, where there was no significant difference in mortality) as compared with control-irradiated mice injected with penicillin only. The 30-day mortality in rat marrow-treated mice was relatively constant, approximately 20 percent up to 870 r, at 1000 r mortality was 80 percent. The time of persistence of rat white blood cells, as detected by the alkaline-phosphatase reaction, was dose dependent up to 870 r, suggesting that the x-irradiated mouse is capable of recognizing and disposing of these foreign cells. The possible basis for difference between the present results and those of recent reports from other laboratories has been discussed. NSA 12-40

EFFECT OF TOTAL BODY IRRADIATION ON IRON METABOLISM IN HUMAN BONE MARROW. H. D. Suit, F. Ellis, and R. Oliver (Churchill Hospital, Oxford). Brit. J. Radiol. 30, 553-9(1957) Oct.

Results of hematological and iron metabolism investigations on 17 patients who received total body x irradiation are presented. *In vivo* iron tracer studies indicate that 25 to 50 r total body irradiation to man 24 hours before an injection of Fe^{59} does not delay the appearance of the radioactive iron in the peripheral erythrocytes. One hundred roentgens total body irradiation to man does not delay the appearance of Fe^{59} in the peripheral erythrocytes if the tracer is given two hours after the irradiation, but if the tracer is given 24 to 72 hours after irradiation there is a definite delay in the appearance of the Fe^{59} in the erythrocytes. The probable mechanisms for producing the delay in the appearance of the Fe^{59} in the peripheral erythrocytes are discussed. NSA 12-21

Washington. Univ., Seattle. Applied Fisheries Lab. A RADIOLOGICAL STUDY OF RONGELAP ATOLL, MARSHALL ISLANDS, DURING 1954-1955. Aug. 15, 1955. 75p. Contract AT(45-1)-540. (UWFL-42)

The detonation of shot one at Bikini Atoll on March 1, 1954, produced a fallout of radioactive ash upon Rongelap Atoll, Marshall Islands. The distribution of the radioactive ash on the islands and in the plants and animals of the area has been studied and evaluated. During the first expedition to Rongelap Atoll on March 26, 1954, biological samples were collected and measurements made of the radiation contamination. On three additional expeditions extensive collections of material were made for this study, the last on January 25-30, 1955. The decline in radioactivity was measured in 1499 samples of fish, invertebrates, land plants, algae, birds, plankton, soil, and water from the Rongelap area. During this study particular emphasis was placed upon evaluation of the radioactivity in food used by the natives. Coconut milk collected on March 26, 1954, contained 1.03 microcuries per kilogram of wet tissue while the coconut meat had 1.16 $\mu\text{C}/\text{kg}$. By January 25-30, 1955, the level in coconut milk had declined to 0.041 $\mu\text{C}/\text{kg}$ and the meat to 0.036 $\mu\text{C}/\text{kg}$. Fish muscle on March 26, 1954, averaged 2.74 $\mu\text{C}/\text{kg}$ and fish liver 204.0 $\mu\text{C}/\text{kg}$. The decline to January 25-30 was 0.10 $\mu\text{C}/\text{kg}$ for the muscle and 3.52 $\mu\text{C}/\text{kg}$ for the liver of fish. Somewhat similar declines were found for clam muscle, bird muscle and liver, and for squash, papaya, arrowroot and pandanus. The level of radioactivity was highest in the northern portion of the atoll, except for samples of algae and fish-eating birds, collected during January 1955 from the southern part of the atoll, which had higher levels of radioactivity than samples collected from the northern islands on the same date. This may indicate a translocation of radioactive materials within the lagoon. NSA 12-18

CHANGES IN THE HARD TISSUE TISSUES AFTER MULTIPLE EXPOSURES TO SMALL DOSES OF IONIZING RADIATION. A. A. Prokhunchukov (Moscow Medical Stomatological Inst.). Med. Radiol. 2, No. 4, 74-7(1957) July-Aug. (In Russian).

The hard tissues of rat's teeth exposed 25 to 36 times to small doses of x radiation (25 r) were studied with the aid of radioactive isotopes of P^{32} and Ca^{45} . It was revealed that the changes in phosphorus-calcium metabolism depends on the total doses of irradiation. After a total dose of 700 r the phosphorus-calcium metabolism is activated in the hard tissues of teeth and with 900 r it becomes pronounced. NSA 12-26

CONDITION OF THE CORTEX IN SUPRARENAL GLANDS DURING RADIATION SICKNESS. L. V. Bozhenko (Central Research Roentgen-Radiological Inst. of Ministry of Health, U. S. S. R.). Med. Radiol. 2, No. 4, 44-50(1957) July-Aug. (In Russian).

An active excretion of ascorbic acid was observed during the first hours after x irradiation with 300, 600, and 1500 r. Later the condition of the suprarenal changed according to the gravity of the pathological process. In subacute forms of radiation sickness (300 to 600 r), the process passed three stages: the period of enhancement, of depression, and normalization. In the acute form (1500 r) the function of the suprarenal cortex was depressed during the whole period of radiation sickness. NSA 12-24

8979

ON DISTURBANCE OF PIGMENT METABOLISM IN RADIATION SICKNESS. A. E. Ivanov. Med. Radiol. 2, No. 4, 18-23(1957) July-Aug. (In Russian).

Brownish pigment consisting of minute granules is frequently found in the tissues of irradiated animals. Evidently increased hemolysis of erythrocytes and their destruction takes place in the areas of hemorrhages resulting from irradiation. However, due to disturbed function of reticulo-endothelial cells and depression of erythropoiesis the iron is not utilized for erythrocytes and bile pigments; thus it accumulates in tissues in a form of brownish pigment in which iron is found in colloidal form. STUDIES WITH RADIOIODINE. VI. EVALUATION OF RADIOIODINE TREATMENT OF CARCINOMA OF THE THYROID BASED ON THE EXPERIENCE AT THE UNIVERSITY OF CALIFORNIA FROM 1938 TO 1954. Glenn E. Shelme and Earl R. Miller (Univ. of California School of Medicine, San Francisco). Radiology 69, 527-45(1957) Oct.

Between September 1945 and June 30, 1954, 124 patients with histologically proved primary carcinoma of the thyroid gland were studied. Only patients with residual inoperable neoplastic tissue were accepted for

I^{131} treatment, and, as a rule, they were treated only after the establishment of some degree of radioiodine uptake of the neoplastic tissue. In most cases the aim was to administer 100 millicuries of I^{131} per month as long as evidence of tumor avidity for I^{131} could be shown. In these cases total doses of several hundred millicuries were given, distributed over several months. Results are summarized. Selected case histories are included.

PATHOLOGICAL ANATOMY OF LESIONS DUE TO La^{140} . V. N. Strel'tsova. *Med. Radiol.* 2, No. 4, 78-83(1957) July-Aug. (In Russian).

Pathological morphology of lesions due to intravenous or intraperitoneal injection of La^{140} was studied. In chronic radiation sickness due to La^{140} a peculiar subacute hepatitis was observed in 40% and with cirrhosis in 20% of all treated rats. Large slowly healing ulcers were found in the appendix, in the intestine, and in the rectum. Malignant and benign tumors appeared on the skin or on the liver in 35% of the cases. A short acute stage followed by almost complete recovery was typical even in acute cases of radiation lesions caused by La^{140} . Pathological-anatomical changes caused by La^{140} are identical to those produced by Ce^{144} and Pm^{147} .

THE EFFECT OF X RAY EXPOSURE ON THE NUCLEAR SYSTEM OF A WALKERS CARCINOMA CELL. Heinz Karl Parchwitz and Erika Parchwitz. *Strahlentherapie* 104, 6-20(1957). (In German).

By means of karyometric methods and cytological observations the authors have examined the change of form of the nuclear system after a single x-ray irradiation of 8000 r. They observed a change of the nuclear contents and a change of form of the nucleole. These reactions, which have to be considered as a consequence of the ray insults, may be divided into two phases. The first phase has to be explained as a morphological expression of an increased function, the second phase must be regarded as a morphological equivalent to the prelethal state of the cells. A discussion of the results is included.

ON EXPERIMENTAL TUMOR PRODUCTION IN IRRADIATED TISSUE. Reinhard Schober and Oleg Erdely. *Acta Radiol.* 48, 307-18(1957) Oct.

A subcutaneous injection of an oily suspension of methyl cholanthrene in rats caused fibroblastic sarcomas to develop after about 20 weeks. When the injections were performed in animals which had previously received whole body radiation or been subjected to more or less large doses of local irradiation at the injection site, it was found that the lesion developed more rapidly, furthermore, no reduction in the latent period (interval between the time of injection and first appearance of the tumor) occurred and no tumor developed after a local pre-irradiation dose of 4,000 r. The possible ways in which the changes might have been effected by the radiation are discussed. NSA 12-3487

THE SHORTESTENING OF LIFE BY CHRONIC WHOLE-BODY IRRADIATION. G. Failla and Patricia McClement Am. J. Roentgenol. Radium Therapy Nuclear Medicine 78, 946-54(1957) Dec.

A statistical analysis was made of data on the effect of chronic irradiation on life span. Data on radiation injuries in mice were analyzed in terms of the Gompertz function in such a way that the resulting curves are internally consistent. Findings were extrapolated to man using available data. The present permissible limit for accumulated radiation dose for those occupationally exposed is 210 r at age 60. On the basis of the assumptions presented, life shortening of about 8 months is to be expected following chronic exposure to 0.05 r per day. If 500 r is assumed to be the average dose accumulated up to age 60, the life shortening is estimated at 1.5 years. NSA 12-3512

INVESTIGATION OF THE EFFECT OF X-RADIATION ON THE CARBOHYDRATE METABOLISM OF TUMOR CELLS. Heinrich Maass and Gunther Heinz Rathgen. *Strahlentherapie* 103, 668-94(1957). (In German).

After irradiating some inoculation tumors of the rat and of a human carcinoma with doses of from 10 to 25 kr, an unequivocal depression of the respiration and particularly of the aerobic and anaerobic glycolysis could be observed. The carbohydrate metabolism of the rat liver remained uninfluenced. By determination of some metabolite concentrations, the mechanism of the ray-induced inhibition of the glycolysis could be elucidated to a great extent. Accordingly it is probable that the point of attack of the ray effect must be searched for within the glycolysis chain at the step of the dehydrogenation of the triosephosphate. NSA 12-3502

BIPHASIC HYPERFERREMIA INDUCED IN RATS BY X-IRRADIATION. G. S. Melville, Jr. and F. P. Conte. Nov. 27, 1956. 4p. (AF-SAM-57-74; AD-132264)

The hyperferremia that developed in rats after a single dose of 75 to 225 r of total-body x irradiation occurred in two distinct phases. A transient rise in plasma iron occurred within the first twenty-four hours after irradiation, and a more prolonged elevation took place during the second week after exposure. The concentration of plasma iron in normal rats varied from day to day and in relation to the hour of sampling. NSA 12-3484

9016

STUDIES ON X-RAY EFFECTS. IX. THE ACTION OF SERUM FROM X-RAYED ANIMALS ON LYMPHOID CELLS (IN VITRO). J. B. Murphey, J. Heng Liu, and E. Sturm. *J. Exp. Med.* 35, 373(1922).

Lymphoid cells (rat thymus and lymph nodes) suspended in serum of a rat x-rayed 2 hours previously proliferated, increasing 15 to 30 per cent in number (many mitotic figures were found) during 2 hrs. of incubation. Normal serum causes rapid disintegration of suspended, incubated, lymphocytes. The x-ray effects on the donors serum persisted for 2 hours after exposure; was no longer present at 72 hrs. *In vitro* irradiation of serum did not produce the effect observed with *in vivo* irradiation. Serum from irradiated rats was not toxic to recipients normal rats.

INTESTINAL DAMAGE BY RADIATION AND ITS CHEMICAL MODIFICATION. R. H. Mole and Diana M. Temple (Atomic Energy Research Establishment, Harwell, Didcot, Berks). *Nature* 180, 1278(1957) Dec. 7. NSA 12-3493

9019

School of Aviation Medicine, Randolph AFB, Texas and Tennessee. Agricultural Experiment Station, Oak Ridge. EFFECT OF ACUTE TOTAL-BODY GAMMA IRRADIATION ON PLASMA IRON AND IRON UPTAKE IN THE BURRO AND THE SHEEP. George S. Melville, Jr. and Bernard F. Trum. June 27, 1957. 7p. (AF-SAM-57-154).

Groups of burros and sheep were exposed to the gamma radiations from zirconium⁹⁵-molybdenum⁹⁵ sources. Iron uptake in the red blood cells was depressed at all dose levels in both species, the maximum mean depression for all animals being 30%. A definite plasma hyperferremia was found in all the animals at all doses given. The response is of a double maximal nature: the first maximum occurred within 24 hr postexposure, the second, at approximately 1 week. NSA 12-3485

9020

DEPOSITION OF IRON IN NORMAL AND IRRADIATED LIVER OF FOETAL MOUSE. Habibollah Izadian and Jean Francois Duplan. *Compt. rend.* 245, 1756-8(1957) Nov. 13. (In French).

Irradiation of foetal liver resulted in increased iron content, the increase being directly proportional to the dose of x-rays. Proposed explanations: either (a) arrest of erythropoiesis and decreased utilization of iron or (b) excessive destruction of rbc. NSA 12-3488

9022

BLASTOMATOGENIC EFFECTS OF RADIOACTIVE STRONTIUM (Sr^{90}). N. A. Kraevskii and N. N. Litvinov. Med. Radiol. 2, No. 5, 33-9(1957) Sept.-Oct. (In Russian).

The optimal blastomatogenic doses of Sr^{90} were determined for the majority of animals. The latent period of tumor development is in reverse proportion to the instituted dose and varies in different species. The period of development of bone tumors, their localization, and number depend not only on the dose but, also, on the condition of the organism at the moment of administration of the isotope and on the age of the animal. Primary multiple development of bone tumors, reticular or hemocytoblastic type leukemias as well as leukemias with signs of tumor growth, are characteristic effects caused by strontium. NSA 12-3489

9023

MODIFICATION OF ANTIBODY RESPONSE IN X-IRRADIATED RATS BY INJECTION OF SPLEEN HOMOGENATES. Mariano F. La Via, Melba Robson, and Robert W. Wissler (Argonne Cancer Research Hospital and Univ. of Chicago, Ill.). Proc. Soc. Exptl. Biol. Med. 96, 667-70(1957) Dec.

Antibody formation, which is inhibited by 500 r of total body x-irradiation into the rat, can be restored partially by spleen homogenates injected soon after irradiation. No striking difference in the degree of recovery is observed when spleen cells from rats stimulated earlier with a different antigen are used in place of normal spleen cells. NSA 12-3524

BRAIN INJURY DUE TO ROENTGEN RADIATION. W. Brandenburg and H. J. Maurer. Strahlentherapie 95, 432-39(1954). (In German).

With sufficiently high dose of high intensity electrons, primary destruction of brain parenchyma occurs.

9025

AMINO ACIDURIA IN PRIMATES FOLLOWING IRRADIATION. C. G. Hunter (Univ. of Toronto). Proc. Soc. Exptl. Biol. Med. 96, 794-6(1957) Dec.

The daily urine amino N excretion of 4 monkeys was followed before and after whole body irradiation with doses in the lower lethal range. In 2 non-survivors, there was little change in the daily quantity excreted until terminally. In 2 survivors given the same food intake as in the irradiated study and sham irradiated, the daily urine amino N excretion during the first week differed but slightly from the values after irradiation, but in the second week more amino N was excreted after irradiation in one animal and less in the other. It would appear that amino aciduria in primates irradiated with doses in the lower lethal range is inseparable from the natural response of the over-all protein metabolism associated with any injury. NSA 12-3499

9026

RADIOACTIVE ISOTOPES AS CANCEROGENIC AGENTS. V. N. Strel'tsova and Yu. I. Moskalev. Med. Radiol. 2, No. 5, 39-51(1957) Sept.-Oct. (In Russian).

A comparative analysis is presented of the cancerogenic effects of 15 radioactive isotopes (Sr^{89} , Sr^{90} , mixture of Sr^{89} and Sr^{90} , Ba^{140} , Y^{90} , Y^{91} , mixture of β emitters, Cs^{137} , Ca^{45} , Nb^{95} , Ce^{144} , Pm^{147} , La^{140} , Ru^{106} , and Pu^{239}) which differ in their physical properties and distribution in the organism. The incidence of osteo-

sarcomas depends on the quantity of the radioactive substance introduced and on the period of actual fission, the higher the effective fission period the higher is the percentage of tumor development. The optimal osteosarcomagenic dose of absorbed energy is 10 to 20 krep, the minimum dose 2 to 3 krep. The incidence of leukemias induced by radioactive isotopes ranges from 3 to 10 per cent. The type of tumors, the location, and development processes depend on the character of distribution of the radioactive substances. NSA 12-3490

9027

BENEFICIAL EFFECT OF QUINOXALINE 1, 4-di-N-OXIDE IN RADIATION INJURY IN MICE. Thomas J. Haley, Anna M. Flesher, R. Veomett, and J. Vincent (Univ. of California at Los Angeles). Proc. Soc. Exptl. Biol. Med. 96, 579-82(1957) Dec.

It has been shown that premedication with Quinoxaline-1, 4-di-N-oxide is beneficial to irradiated mice, significantly increasing both the ST_{50} day and total number of survivors. The effect has been related to a significant reduction in number of enteric organisms causing the usual irradiation bacteremia. It has been demonstrated that lactobacilli were the predominating invaders under conditions of our experiments. The drug does not appear to have an effect on bone marrow. NSA 12-3523

9028

Arkansas. Univ., Little Rock. School of Medicine. STUDIES ON THE BIOCHEMICAL AND NUTRITIONAL ASPECTS OF X-IRRADIATION INJURY. Final Scientific Report, July 1, 1951-August 31, 1957. Paul L. Day, F. Douglas Lawrason, and John Tyler Caldwell. May 1, 1958. 6p. Contract AT(40-1)-1315. (ORO-175).

Results are summarized from studies on the biochemical effects of irradiation on chicks, rats, and rabbits. A list of publications during the period is included. NSA 12-11230

9029

INFLUENCE OF DIETARY POTASSIUM ON POTASSIUM-42, RUBIDIUM-86 AND CESIUM-134 RETENTION IN THE RAT. F. R. Mraz and Homer Patrick (Univ. of Tennessee Atomic Energy Commission Agricultural Research Program, Oak Ridge, Tenn.). Proc. Soc. Exptl. Biol. Med. 96, 497-9(1957) Nov.

An increase in dietary potassium has been shown to increase excretion of cesium-134, potassium-42 and rubidium-86. Interpretation of the first significant increase in excretion of these radionuclides as being the point at which dietary potassium is adequate would place the potassium requirement of the rat between 0.075 and 0.15%, probably between 0.1 and 0.15%. This is supported by the growth data. NSA 12-3538

9030

ON THE REVEALING TOXIC PROPERTIES IN THE BLOOD OF IRRADIATED ANIMALS IN EXPERIMENTS WITH ADRENALECTOMIZED MICE AND RATS. P. D. Gorizontov and S. A. Davidova. Med. Radiol. 2, No. 5, 51-5(1957) Sept.-Oct. (In Russian).

Effects of blood serum from irradiated and normal animals on the mortality rate of mice and rats are discussed. It is shown that the blood serum from animals exposed to ionizing radiation becomes toxic in large doses to adrenalectomized mice and rats. During the first 24 hours after irradiation the blood of irradiated rats and dogs was not toxic and even retarded the death of adrenalectomized mice. NSA 12-3535

EFFECT OF ISOTOPIC AND NON-ISOTOPIC CARRIERS ON THE BEHAVIOR OF Sr^{90} IN THE RAT. (Über den Einfluss isotopischer und nichtisotopischer Träger auf die Verteilung von Radiostrontium in Organismus der Ratte. A. Catsch. Translated for Oak Ridge National Lab. from *Experientia* 13, 312-13(1957). 2p.

The influence of calcium and magnesium levels on the bone deposition of intraperitoneally injected strontium-90 and yttrium-90 was investigated in rats. NSA 12-15313

9036

MODIFICATION OF THE GENETIC EFFECTS OF X RAYS BY TREATMENT AFTER IRRADIATION. R. F. Kimball (Oak Ridge National Lab., Tenn.). pp. 252-5 in "Proceedings of the International Genetics Symposia, 1956, Tokyo and Kyoto, September, 1956" Tokyo, International Genetics Symposia, 1956, Science Council of Japan, 1957. 702p.

It has been demonstrated that the mutational process in *Paramecium* is not completed for 1 or 2 hours after irradiation but is completed well before the end of the interdivision interval in which the radiation is given. It is suggested that radiation initiates a mutational process that is irrevocably completed during late interphase and that this process is subject to spontaneous reversal before that time. Agents that delay the late interphase decrease mutation by allowing more time for spontaneous reversal. NSA 12-15306

9037

MALFORMATIONS OBTAINED IN EMBRYOS BY USING P^{32} . Yoshiro Kameyama (Univ. of Nagoya, Japan). Compt. rend. soc. biol. 151, 1803-4(1957) Oct. (In French).

From 2 to 20 $\mu\text{c/g}$ of P^{32} were injected into pregnant mice on the 8th day of gestation. The embryos were examined after 5 days on the 13th day of gestation. The embryos were dead in all the mice receiving 20 $\mu\text{c/g}$. With doses from 2 to 15 $\mu\text{c/g}$, there was an abnormal formation in 10 to 20%, but the doses of 3 to 6 $\mu\text{c/g}$ chiefly excited the malformation. The malformation was in the central nervous system. Even embryos with a natural exterior had malformations in the central nervous system. NSA 12-15290

9038

RADIOBIOLOGICAL EFFECTS OBTAINED WITH RADIATION FROM 30 MEV GENERATORS. H. R. Schinz and H. Fritz-Niggli. Translated for Los Alamos Scientific Lab., N. Mex. from Radiol. Clin. 25, 371(1956). 10p. (AEC-tr-3375).

No qualitative differences were observed in the biological effects on a number of test systems of x rays produced by a 31-Mev betatron and an electron beam of comparable energy produced by a betatron. Quantitative differences were observed between conventional x rays and x rays produced by the 31-Mev betatron. The effectiveness of the latter is smaller by a factor of 0.6 to 0.9 depending on the object examined. Similar differences were observed between electrons generated by the 30-Mev betatron and conventional x rays. NSA 12-16876

9039

IRRADIATION OF DEVELOPING PLANT EMBRYOS. L. EFFECTS OF EXTERNAL IRRADIATION (X RAYS) ON BARLEY EMBRYOGENY, GERMINATION, AND SUBSEQUENT SEEDLING DEVELOPMENT. Leo W. Mericle and Rae Phelps Mericle (Michigan State Univ., East Lansing). Am. J. Botany 44, 747-56(1957) Nov.

Barley embryos in varying stages of development were subjected in situ to single doses of x radiation of 50 to 800 r. At intervals following irradiation, part of the developing grains were sampled for histologic examination, those remaining were allowed to mature so that effects of irradiation could be followed on their subsequent germination and seedling development. In the histological study, irradiation effects increased in number and severity with an increase in radiation level. Evidence from the germination-seedling study indicates the occurrence of hidden effects. NSA 12-11235

9040

PROTECTIVE EFFECTS OF AZOIC THYMOLICS ON THE MORTALITY OF X-IRRADIATED MICE. J. F. Duplan, R. Royer, and R. Michelet (Laboratoire Pasteur de l'Institut du Radium). Compt. rend. soc. biol. 151, 1655-7(1957) Oct. (In French).

Male and female mice, at least 100 days old, were injected peritoneally 8 to 10 minutes before x irradiation with (dimethyl-2,5 pyrryl)-4 thymol, benzene azo-4 thymol, dibenzene azo-2,4 thymol, or benzene azo-2 methyl-4 thymol. The results are tabulated, and all show some protective effects. A possible mechanism for the protection is discussed. NSA 12-15288

9041

Tennessee. Univ., Knoxville. AGRICULTURAL RESEARCH PROGRAM. Semi-Annual Progress Report for January 1, 1957 to June 30, 1957. 54p. Contract AT-40-1-GEN-242. (ORO-169)

Seventy-eight samples were irradiated at the plant and seed irradiation facility, including 67 seed samples; budwood of peach, chestnut, and grape; johnsongrass rhizomes, and sweetpotato roots. Pre-packaged irradiated barley seed and a mimeographed information letter, were prepared for distribution to high school science classes. The program is included for a symposium on Radiation in Plant Breeding held at Oak Ridge in January, 1958. Data are included from the following studies: factors controlling the metabolism of cesium and strontium in both plants and animals, the metabolism of calcium and strontium in rats, factors affecting the metabolism of calcium and phosphorus in lambs, radiation effects on reproductive physiology in cattle and rats, the relationship of survival time and whole-body gamma radiation dosage in swine, burros, and cattle, and a comparison of radium and strontium-90 toxicity in sheep. A list of publications during the period is included. (For preceding period see ORO-163). NSA 12-8251

EMBRYO MORTALITY AMONG THE PROGENY OF MALE DROSOPHILA FLIES FOLLOWING IRRADIATION WITH 180 kev AND 31 Mev. Rolf Steger. Translated for Los Alamos Scientific Lab. from *Oncologia* 9, 12-32(1956). 16p. (AEC-tr-3340)

A quantitative study was made of the effectiveness of x radiation produced by 180 kev and 31 Mev sources for including the occurrence of dominant lethal factors in the sex cells of male *Drosophila*. Following exposure to various radiation doses the male *Drosophila* were mated with previously unmated females and a count made of the ratio of hatched to unhatched eggs which resulted. A total of 94,389 eggs were counted. It is suggested that the enormous increase of unhatched eggs between days 6 and 12 may not have resulted from lethal factors, but to azoospermia induced by radiation. The 31 Mev betatron was shown to be only 0.8 times as effective as the stable voltage generator in producing dominant lethal factors. NSA 12-16088

9052

X-RAY INDUCED MUTATIONS IN EINKORN WHEATS WITH SPECIAL REFERENCE TO THEIR COMPLEX NATURE. K. 9054

RADIOSENSITIVITY STUDIES IN PEANUTS (ARACHIS HYPOGAEA L.). Walton C. Gregory (North Carolina State Coll., Raleigh). pp. 243-7 in "Proceedings of the International Genetics Symposia, 1956, Tokyo and Kyoto, September, 1956". Tokyo, International Genetics Symposia, 1956, Science Council of Japan, 1957. 702p.

From the data presented it appears that differences in radiosensitivity to x rays among certain lines of peanuts do not appear in the same manner when the same lines are treated with fast neutrons. However, differences in sensitivity to neutrons appearing among the lines and their hybrids suggest a qualitative different behavior of the lines and hybrids with respect to x rays and neutrons. Evidence for the association of genotype with radiosensitivity can be derived from both x ray and neutron treatments with different genotypes responding different ways to the two radiations. Oak Ridge Gaseous Diffusion Plant, Tenn. BASIC PRINCIPLES OF NUCLEAR SAFETY-SUB-CRITICAL SYSTEMS. H. F. Henry. Pt. A [of] STUDIES IN NUCLEAR SAFETY. Lectures Presented at the Nuclear Safety Training School Conducted by Union Carbide Nuclear Company, June 3-14, 1957. 33p. Contract W-7405-eng-26. (K-1380(Pt. A))

In this general discussion of the problem of nuclear safety as it applies to normally subcritical systems, attempts have been made to emphasize the following basic points of general applicability: The potential hazard from an accidental chain reaction has been such that facilities where it is a problem have considered it necessary to take rather stringent steps to prevent the occurrence of such an accident. The problem of nuclear safety is amenable to the standard safety-type methods of control with obvious attention to special technical requirements which are somewhat more difficult of solution than are many types of safety problems. Where practicable, operations involving fissionable materials are conducted in equipment or other wise under conditions where accidental criticality is virtually impossible and as little dependence as feasible is placed upon routine personnel actions; in general, it is maintained as a principle that no accident is possible without the simultaneous occurrence of at least two un-likely and independent events. General Electric Co. Hanford Atomic Products Operation, Richland, Wash. CALCULATION OF MAXIMUM PERMISSIBLE CONCENTRATION IN AIR, MPC (air), FOR Ru¹⁰⁶ PARTICLES. W. J. Bair. Oct. 1, 1957. 11p. Contract W-31-109-Eng-52. (HW-52287)

The calculation of the concentration of Ru¹⁰⁶O₂ in air that at equilibrium will result in an average dose rate of 0.3 rem/week to the lung of man is presented. Since data from mouse experiments are used the calculations are extrapolated on the basis of differences in organ weights and do not allow for difference in physiology. These calculations necessarily assume uniform distribution of Ru¹⁰⁶ throughout the lung tissue although it is known that Ru¹⁰⁶ is retained as particulates following inhalation of insoluble ruthenium oxide particles. An MPC (air) of 5×10^{-9} $\mu\text{c}/\text{ml}$ obtained using exponential functions to represent retention is compared with 8×10^{-9} $\mu\text{c}/\text{ml}$ obtained using power function equations. Oak Ridge National Lab., Tenn. THE SUSPENDED MICROBIOTA OF THE CLINCH RIVER AND ADJACENT WATERS, IN RELATION TO RADIOACTIVITY IN THE SUMMER OF 1956. J. B. Lackey. Nov. 13, 1957. 36p. Contract W-7405-eng-26. (ORNL-2410)

The Clinch River enters the Oak Ridge area virtually free of plankton. It is fertilized in this area and develops a considerable plankton by the time it enters Watts Bar

Lake. This plankton may acquire considerable amounts of radioactivity from the very small amounts contributed by the Oak Ridge operations. Some figures are presented showing the radioactivity accumulated by various species, and the rate of accumulation as compared to reproductive rates. Diminution of radioactivity in both plankton and water is traced downstream. Conditions in the Clinch and Columbia Rivers are compared. The principal source of radioactive wastes for the Clinch River insofar as known is the effluent from the ORNL settling basin, which empties via White Oak Creek. Along with this small quantity of radioactive waste the river received some nutrient materials and a mixed population of microorganisms. A small amount of radioactive seepage from the ORNL disposal pits may enter the creek. The Clinch and neighboring waters yielded 425 species of algal or protozoan microorganisms, which are listed in an appendix, in the summer of 1956. NSA 12-1188

TISSUE CULTURE AS A RADIOBIOLOGICAL METHOD OF RESEARCH. Henni Gartner. Strahlentherapie 103, 620-7(1957). (In German).

On the strength of accumulated experience and taking into consideration the experimental results of his own, the author gives a critical description of tissue-cultivation as a radio-biological method of research. Not only the advantages of the method, but the limits of its possibilities are discussed. The methods of evaluation show, that the trial object permits a multiple, combined assertion about the radio-biological efficaciousness of the selected doses and kinds of radiation and that thus, in one single object the possibilities of tests and counter-tests are given. Tissue cultivations, however, only represent a biological model of simplified histological structure. Therefore, no conclusions as to possible reactions of the entire organism should be drawn forthwith. NSA 12-3539

Atomic Energy of Canada Ltd. Chalk River Project. Chalk River, Ont. A PLAN FOR THE STUDY OF FERTILITY OF RELATIVES

OF CHILDREN SUFFERING FROM HEREDITARY AND OTHER DEFECTS. PART I. OUTLINE OF THE PLAN. PART II. DETAILS OF THE PROCEDURES. H. B. Newcombe, S. J. Axford, and A. P. James. Nov. 1957. 79p. (CRB-739; AECL-511)

It has been assumed that the load of serious hereditary defects in human populations is maintained largely by reason of new mutations which occur in each generation. Present estimates of the increase in the load, which would be expected from radiation-induced increases in mutation rate, are based on this belief. However, it is recognized that the assumption represents an oversimplification, and that it could lead to an error of unknown magnitude in the estimate of damage. An increased fertility in apparently unaffected carriers of the genes for defects may well be a major factor in maintaining the incidence of the defects. If this is the case, it will be necessary to re-assess the estimates of genetic damage from radiation. Unfortunately, there is little or no direct evidence from human populations, as to which factor is predominant in maintaining the present load of defects. It is here proposed that the most effective method of obtaining concrete information on differentials of fertility is through the appropriate use of provincial or national statistics which are already routinely collected. The present report describes the techniques available for a fertility study within one Canadian province over a limited period of time. By these techniques, present records of marriages, births, ill health and deaths (in punchcard form) can be arranged into family groups, so that the fertility of families in which the defects occur can be compared with that of families which are unselected for defects. It is believed that such techniques will eventually prove suitable for routine use in a national vital statistics system, and that they can open the way for an understanding of the genetics of human populations which cannot be obtained in any other manner.

ON THE PROBLEM OF RADIATION PROTECTION FROM A MEDICAL VIEWPOINT Hermann Holthausen. Strahlentherapie 104, 317-27(1957). (In German).

The dangers to which mankind is exposed through artificial radiation sources are discussed. Particular attention is paid to the charge of the human organism in consequence of medical application of rays, as well as to the importance of the international recommendations concerning the maximum admissible doses. The severe judgment of the dangers resulting from ionizing rays depends on the fact that the former conception of the existence of a threshold value of ray damage, and thus of a tolerance dose, had to be given up. The individual nature of the genetic ray damage entails a new kind of responsibility. NSA 12-7691

School of Aviation Medicine, Randolph AFB, Tex. MILITARY AND CIVIL DEFENSE ASPECTS OF THE ACUTE RADIATION SYNDROME IN MAN. Herbert B. Gerstner. July 19, 1957. 30p. (AF-SAM-58-6)

From a comparative analysis of human data derived from nuclear accidents, Japanese bomb casualties, and radiotherapy patients, emerges the clinical picture of the acute radiation syndrome with its three subdivisions-hematopoietic, gastrointestinal, and cerebral forms. Dependency of the picture on dose level and individual susceptibility is discussed, and the therapeutic management is outlined. Since penetrating ionizing radiation represents a potential casualty-causing agent, problems facing the practical physician under catastrophic conditions are evaluated. NSA 12-5188

9095

RELATIONSHIP OF BORON NUTRITION TO RADIO-SENSITIVITY OF SUNFLOWER PLANTS. John Skok (Argonne National Lab., Lemont, Ill.). Plant Physiol. 32, 648-58(1957) Nov.

Seven-day-old Mammoth Russian sunflower seedlings were grown in nutrient solutions with or without boron, for 2 to 5 days, after which they were x irradiated and again supplied with boron. Withholding boron for short intervals prior to x irradiation with doses that normally produce pronounced radiation symptoms, had a marked alleviating effect on the development of radiation injury. The absence of boron resulted in retardation of some phase of cellular activity and rendered the plants more radioresistant. This normally radiosensitive phase of cellular activity which may be rendered relatively radioresistant by withholding boron is, then, boron-dependent. An attempt was made to identify this growth phase by irradiating a series of germinating seedlings at different growth stages. It appears to be the phase of cellular maturation rather than cell division, suggesting that boron is required for some process or processes concerned with cellular maturation or differentiation. The apparent effect of boron on sugar translocation appears to be related to the effect of boron on cellular activity rather than to a direct enhancement of diffusion through membranes through formation of a sugar-borate complex. Naval Radiological Defense Lab., San Francisco. RADIOLOGICAL HAZARD EVALUATION - A CRITICAL REVIEW OF PRESENT CONCEPTS AND A NEW APPROACH THERETO. E. L. Alpen. Oct. 22, 1957. 33p. Project NM-006-015. (USNRDL-TR-186)

Data are reviewed on the biological effects of whole-body radiation on human beings and the rate of recovery following whole-body exposure as a function of amount of injury. Tabulated data are presented on the estimated medical effects of radiation doses from 75 to 650 r expressed as percentages of working force affected for healthy, young adults for times up to three months post exposure, the acute effects of whole-body penetrating ionizing radiation on human beings, the biological effects of radiation on the skin, and the absorber characteristics of fabrics. An attempt is made to establish criteria based on present knowledge of radiobiological response of human beings for the prediction of radiation injuries. Two estimated dose required (EDR) values are proposed. The estimated effective dose to produce sickness in 24

hrs is 200 r and the estimated effective dose to produce death is 400 r. The estimated effective dose is based upon estimated prompt gamma dose, residual gamma dose, and the neutron dose in rep with no correction for rbe. Corrections should be made for any protection factors present. Findings are applied in the evaluation of hazards and mission accomplishment in military radiobiological situations. NSA 12-2629

RESPONSE OF PAH TRANSPORT AND OXYGEN CONSUMPTION IN THE RABBIT KIDNEY SLICE TO GRADED DOSES OF X-RAY AND SEVERAL METABOLIC INHIBITORS. M. L. Mendelsohn. Am. J. Physiol. 180, 599 (1955).

Pressure or absence of oxygen during irradiation did not affect dose required to produce a 50% decrease in concentration gradient of PAH. Doses greater than 25,000 r of x rays caused a progressive increase in oxygen consumption and the author discusses the possibility that this may reflect acute cytoplasmic damage of the renal tubule cell.

9110

ACUTE UPTAKE OF PLUTONIUM AND URANIUM FOLLOWING WOUND CONTAMINATION. E. L. Geiger and S. M. Sanders, Jr. (E. I. du Pont de Nemours and Co., Aiken, S. C.). Proc. Health Phys. Soc. 61-6(1957).

Urinary excretion of plutonium during a 487-day period after an acute uptake by wound contamination was followed by the analyses of 99 urine samples. The data may be approximated by the function $Y = 141 t^{-1.07}$ where Y is the plutonium disintegrations per minute in a daily voiding after t days. The probability that the Langham equation for the excretion of plutonium fits the Savannah River Plant data as well as the above equation is only 1 in 1,000. The data, however, differed no more from the Langham equation, which is a mean equation, than data from some of the cases used to calculate the mean Zirconium citrate solution, administered intravenously approximately 3 hours after the accident, and Ca-EDTA, administered intravenously during the first 6 days after the accident, produced only a slight increase in the rate of plutonium excretion. Ca-EDTA was again administered on the 131st to 135th days after the accident and only a slight increase in the rate of plutonium excretion was observed. A second case followed was that of an employee hospitalized for burns caused by hot uranyl nitrate solution. Contrary to excretion data obtained from persons injected with soluble uranium, the excretion rate in this case decreased only slowly for the first 9 days following the accident. Between the ninth and fifteenth days, however, the daily excretion rate dropped a hundredfold. From the fifteenth to the fortieth day, the biological half-life for elimination was approximately 6 days. The data may indicate that the uranium was leached slowly from the burned tissue into the blood. NSA 12-8288

9111

General Electric Co. Hanford Atomic Products Operation, Richland, Wash.

DEPOSITION AND RETENTION OF Ru¹⁰⁶ FOLLOWING ADMINISTRATION OF Ru¹⁰⁶O₂ TO MICE BY INHALATION AND INTRATRACHEAL INJECTION. W. J. Bair, L. A. Temple, D. H. Willard, J. L. Terry, and A. Graybeal. Oct. 1, 1957. 24p. Contract W-31-109-Eng-52 (HW-52285)

The deposition and retention of Ru¹⁰⁶ in mice following inhalation of Ru¹⁰⁶O₂ as dust and as a fog were studied for two days following exposure. Almost 25% of the ruthenium oxide inhaled was present in the lungs immediately after exposure. This was reduced by half in 24 hours. The remainder was removed from the lung at a much slower rate. Inhalation of ruthenium oxide particles was compared with administration by intratracheal injection. Inhalation produced more uniform distribution of particles in the lung than did administration by intratracheal injection and much greater distribution of Ru¹⁰⁶ to tissues other than the lung. This was attributed to the larger quantities of particles passing through the gastrointestinal tract. The turnover of intratracheally administered particles from the lungs was negligible the first two days. NSA 12-8293

9112

IMMUNOLOGY OF BONE MARROW TRANSPLANTA-

TION. Takashi Makinodan (Oak Ridge National Lab., Tenn.). J. Cell. Comp. Physiol. **50**, Suppl. 1, 327-51 (1957) Dec.

The role of the recognition factor of an antibody-producing cell and its relative sensitivity to x rays has a great implication, not only to radiation immunology but to general biology. Obviously, much work is still required to elucidate this problem. From an immunologist's point of view, one of the most fascinating phenomena of the bone marrow transplantation studies is the delayed foreign bone marrow reaction. The task of circumventing or subduing the reaction is a formidable one, considering the large number of immunologically distinct antigens existing in a given bone marrow suspension. Preliminary studies seem to indicate that the nuclear membrane or the nuclear material, or both, are mainly responsible for the delayed foreign bone marrow reaction. Should the nuclear material be found to be the chief agent involved in this delayed reaction, the problem then becomes even more challenging since the antigenic material is chemically impure and its solubility in aqueous medium is limited. NSA 12-8922

9113

EFFECT OF IONIZING RADIATION OF THE HEMOLYSIS OF ERYTHROCYTES A. P. Belousov. Vestnik Rentgenol. i Radiol. No. 3, 5-14 (1957) May-June.

The saponin hemolysis method is a very effective way of determining the resistance of erythrocytes to radiolysis. The irradiation of rabbits with a dose of 700 r induces the formation of erythrocytes resistant to chemical hemolysis and the rapid disappearance from the blood stream of non-resistant ones. In the case of burns produced by boiling water, blood cell-hemolysis is temporarily increased during a period of acute toxicosis. In rabbits irradiated with a dose of 1000 to 1300 r, intensive hemolysis of erythrocytes starts immediately and continues for up to 30 days. The appearance of resistant erythrocytes in the blood is preceded by a period of active hemopoiesis and the restoration of hemoglobin. Increased resistance of erythrocytes to saponin hemolysis has been observed in rabbits who suffered loss of blood and were subsequently irradiated. Irradiation of the blood *in vitro* in large doses, as contrasted to small doses, lowers the resistance of erythrocytes to chemical hemolysis. Changes in the resistance of erythrocytes to saponin hemolysis are conditioned by the direct action of radiation on the blood cells and the secondary effect of hemolysins. Thus, knowing the mechanism of the hemolysis of erythrocytes under the influence of ionizing radiation allows a better insight into the pathogenesis of radiation sickness and helps the development of protective means to prevent the onset of hemolysis. ANTIBODY RESPONSE OF MICE TREATED WITH 2-MERCAPTOETHYLGUANIDINE HYDROBROMIDE AND LETHAL DOSES OF X-RADIATION, AND ITS SIGNIFICANCE TO THE RELATION OF ANTIGEN TO HOST. Takashi Makinodan, Isabel C. Shekarchi, and Charles C. Congdon (Oak Ridge National Lab., Tenn.). J. Immunol. **79**, 281-7 (1957) Oct.

No important difference between sheep and rat agglutinin production was observed in normal and MEG (2-mercaptoethylguanidine hydrobromide) treated mice. The sheep agglutinin response was higher than rat agglutinin response in the 475-r, 700-r, 950 r-IBM (isologous bone marrow) treated, and MEG-950 r mice. Such difference was based on the induction period of agglutinin response, peak agglutinin titer, and on the mean total agglutinin response. The rate of recovery of the immune mechanism of MEG-950 r mice was almost

comparable to that of the 475-r mice. The rate of recovery of the immune mechanism of MEG-950 r mice was not significantly different from that of the 950 r-IBM mice. The results permit the deductions that MEG protects predominantly nonantibody producing cells, that either multiple types of antibody producing cells exist or some antibody producing cell has the ability to recognize the difference between homologous, closely related heterologous, and distantly related heterologous antigens, and that the degree of destruction of antibody forming cells by x-irradiation is in the order mentioned. 9115

THE EFFECT OF ACTIVE IMMUNIZATION AGAINST INTESTINAL INFECTIONS AND TUBERCULOSIS ON THE RADIORESISTANCE OF ANIMALS. N. N. Klemparskaya, V. F. Sosova, O. R. Nemirovich-Danchenko, and G. M. L'vitsina. Translated from Med. Radiol. **2**, No. 5, 65-72 (1957). p. 70-84 [of] VARIOUS STUDIES ON THE USE OF RADIOACTIVE SUBSTANCES IN MEDICINE. 15p. (JPRS-210(p.70-84))

Active immunization against tuberculosis prior to exposure increased the radioresistance of laboratory animals. Other living bacteria vaccines did not produce an increase in the survival as did the tuberculosis vaccine. NSA 12-15228

9116

CIRCULATION IN THE BLOOD OF TISSUE ANTIGENS PRODUCED BY RADIATION SICKNESS. P. V. Petrov and L. I. Ilyina. Bull. Exptl. Biol. Med. (USSR) (English Translation) **44**, 917-23 (1957) Aug.

Abnormal tissue antigens have been demonstrated as a product of irradiation of the organism. Proteins labelled with methionin-S³⁵ have been obtained from the bone marrow, spleen, testes, and intestinal mucosa. Their passage via the blood stream to the liver has been demonstrated. Irradiation diminishes antigenic differences. As irradiation sickness progresses, these abnormal antigens must play an important role in the progress of the disease. Adsorption of the antigens against the normal tissues opens a tentative path into very interesting future research for possible treatment of irradiation sickness. NSA 12-11275

EARLY EFFECTS OF WHOLE BODY IRRADIATION ON CHOLINESTERASE ACTIVITY IN GUINEA-PIGS' BLOOD, WITH SPECIAL REGARD TO RADIATION SICKNESS. Johan Lundin, Carl-Johan Clemenson, and Arne Nelson (Research Inst. of National Defense, Sundbyberg, Sweden). *Acta Radiol.* 48, 52-64(1957) July.

Male guinea-pigs suffered a loss of cholinesterase activity in plasma amounting to about 30% during the first two days after whole-body roentgen irradiation with 400 r. No changes in the activity of acetylcholinesterase in erythrocytes to be ascribed to the irradiation could be demonstrated during the first two days. A routine method for determination of the cholinesterase activities has been tested but is found less suitable as a diagnostic tool for the early recognition of the effects of irradiation. 9145

ULTRAVIOLET AND X-RAY INDUCED CHROMOSOMAL ABERRATIONS IN WHEAT Lotti M. Steintz-Sears and E. R. Sears (Univ. of Missouri, Columbia). *Genetics* 42, 623-30(1957) Sept.

From wheat pollen given dosages of ultraviolet and x rays roughly comparable in capacity to break chromosomes, 56 and 124 plants, respectively, were obtained, all of which were analyzed cytologically. Reciprocal translocations and part- and whole-chromosome deficiencies were found following both types of treatment, but more of the ultraviolet translocations were deficient for an apparently terminal segment. This is regarded as evidence for less reunion and more healing of broken chromosomes following ultraviolet treatment. The virtual absence of translocations in previous ultraviolet experiments is attributed to the strong tendency of ultraviolet-induced translocation to involve deficiency. In diploid species these deficiencies would frequently cause inviability. The data suggest also that dicentric chromosomes are seldom lost in this material, but instead often break and give rise to chromosomes with terminal deficiencies. NSA 12-2656

9146

THE EFFECT OF X-RAY TOTAL-BODY IRRADIATION ON THE MAST CELL COUNT IN THE SKIN. AN EXPERIMENTAL INVESTIGATION ON GUINEA-PIGS. Tor Pettersson. *Acta. Pathol. Microbiol. Scand. Suppl.* 102, 1-62(1954).

The mast cell count of the connective tissue in the skin of the back of guinea pigs decreased about 50% following exposure to 600 r whole-body doses of x radiation. No further decrease occurred at doses of 1320 r. Since mast cells are sources of heparin, a possible correlation between the number of mast cells and the tendency to hemorrhage consequent to whole-body irradiation is suggested. 103 references. INDUCED TOLERANCE AND "HOMOLOGOUS DISEASE" IN X-IRRADIATED MICE PROTECTED WITH HOMOLOGOUS BONE MARROW. J. J. Trentin (Baylor Univ. Coll. of Medicine and Univ. of Texas Dental Branch, Houston). Proc. Soc. Exptl. Biol. Med. 96, 139-44 (1957) Oct. NSA 12-2700

9155

CHEMICAL PROTECTION AGAINST X-RAY DAMAGE TO CHROMOSOMES. Herbert Parkes Riley (Oak Ridge National Lab., Tenn.). Genetics 42, 593-600(1957) Sept.

Onion root tips were treated with x-rays while immersed in water or in various chemical compounds. The effect of the radiation was determined from the frequency of chromosome interchanges or deletions or of anaphase bridges. Protection against the formation of interchange

and deletions was conferred by 4×10^{-2} M sodium sulfhydrate, sodium thiosulfate, sodium hydrosulfate, and sodium pyrosulfate, and 1.7 M ethanol but not by 2.8×10^{-1} glucose or 4×10^{-3} M sodium peroxydisulfate and uracil or by 2×10^{-3} M sodium bisulfite, sodium bisulfate, and tryptophan. Protection against deletions but not significantly against interchanges was conferred by 4×10^{-3} M sodium metabisulfite, cysteine, and cystine. Protection against anaphase bridges was given by 4×10^{-4} M cysteine and cystine but not by sodium bisulfite or sodium bisulfate. When primary roots less than 1 cm long from freshly germinated seeds were irradiated in water, they showed fewer chromosomal interchanges and deletions and fewer anaphase bridges than did root tips from bulbs. Roots from older seedlings about 8 cm long had fewer interchanges and deletions than roots from bulbs but more than young roots from seeds. There seems to be some inherent protection against radiation in freshly germinated seeds that disappears as the roots get older. NSA 12-2697

9156

THE MECHANISM OF DEATH FOLLOWING WHOLE BODY RADIATION. Edith Paterson (Christie Hospital and Holt Radium Inst., Withington, Manchester). Brit. J. Radiol. 30, 577-81(1957) Nov.

During the period of the radiation syndrome, the changes in the blood, however dramatic, are probably not basic to the mechanism of death, but are an inevitable secondary consequence. Death, at the critical stage, may be precipitated by hemorrhage or anoxia, or by the occurrence of bacteremia. The prime cause of death must surely be the exhaustion of one or more stem cell types from the reticulum. Individual differences in quality or quantity of this cell factor determine the individual sensitivity of the subject. Hibernation will postpone, but not prevent, the train of events. But replacement of this factor sufficiently early in the post-irradiation period can prevent the diverse changes. It would seem to be of the utmost importance to find the function or the identity of this cell type. This would not only give us a real understanding of the mechanism and treatment of total body irradiation but might also enable us to understand some of those diseases of the reticuloendothelial system in which bone marrow failure is a characteristic termination. HEALTH PHYSICS DIVISION ANNUAL PROGRESS REPORT FOR PERIOD ENDING JULY 31, 1957. Nov. 26, 1957. 131p. (ORNL-2384)

Progress is reported in the following studies; the construction of a body burden counter which employs activation analysis to measure directly U^{235} injected in rats and mice; the tissue distribution of U^{233} in mice following ingestion of 0.12 μ c/day in drinking water for periods of from 30 to 120 days, the testing of an atmosphere exposure chamber, the tissue distribution of U in dogs following inhalation of uranium fumes or the ingestion of uranium oxides, development of a procedure for the radiometric determination of U in urine following ion exchange separation as a uranyl chloride complex, radiobiological-ecological studies on the drained bed of White Oak Lake, an impoundment used as a holdup basin for low-level radioactive wastes, the development of procedures for use in the collection of arthropods and insects, the effects of irradiation on population growth of Collembola, Coleoptera, and Caloglyphus, the uptake of fission product waste seepage by trees and smaller vegetation, a review of data on maximum permissible concentrations of radioisotopes for the human body, the tissue distribution of Sr^{90} and Y^{90} in mice, the spectrographic analysis of human tissues for trace elements, the performance of an aerosol generator for dispersing U aerosols, the development of radiochemical methods for the determination of trace amounts of fission products in water and soil samples, investigations of waste processing by evaporation, storage in deep wells and waste pits, adsorption on soil columns, solvent extraction, and sintering, assays of the soil movement and dilution of wastes from storage pits, and a survey of possible waste disposal sites. A review is presented of the Ichiban Project for the determination of the absorbed doses of fast neutrons and γ radiation received by survivors of the nuclear bombing of Hiroshima and Nagasaki. Data are included from a preliminary study of γ attenuation by Japanese house components. Applications of the information theory in studies of radioinduced tissue damage are discussed. A quantum theory for the dielectric constant of metals is presented and discussed. A procedure is described for the preparation of thin uniform sources for a beta-ray spectrometer. Studies on the theoretical physics of radiation dosimetry and the development of instruments for use as dosimeters are reported. Education, training, and consultation activities during the period are reported, and a list of publications during the period is included. (For preceding period see ORNL-2151). NSA 12-2693

9165
EFFECTS OF RADIOCOBALT IRRADIATION OF RABBIT SPERMATOZOA IN VITRO ON FERTILIZATION AND EARLY DEVELOPMENT. M. C. Chang, Dorothy M. Hunt, and E. B. Romanoff (Worcester Foundation for Experimental Biology, Shrewsbury and Boston Univ. Mass.). Anat. Record 129, Oct. 2, 211-29(1957). Oct.

Rabbit semen irradiated with gamma radiation from a Co-60 source in vitro at 90 r to 65,000 r was inseminated

artificially to females. The ova were examined at pronuclear, segmentation, blastocyst, and late fetal stages. The mortality of spermatozoa was damaged only at very high doses of irradiation, 32,200 to 65,000 r. Though incapacity of sperm to reach the site of fertilization may occur at these dose levels, the fertilizing capacity per se appears to be undamaged. The segmentation of fertilized ova was very much disturbed. The disturbance is in proportion to the dose level and the higher the dose level the earlier the failure of segmentation. With irradiation of sperm at 90 r, the proportion of morphologically normal fetuses is not significantly lower than after normal mating; following irradiation of sperm at 800 r the formation of normal blastocysts was impaired but once a normal blastocyst is formed implantation and development are assured, following irradiation of sperm at 6,500 r, no normal blastocyst is formed. Delayed penetration of sperm, a high proportion of polyspermic ova, haploidy and triploidy of ova, and delayed syngamy were not observed following the irradiation of sperm at 32,200 to 65,000 r. Fragmentation of female and male pronuclei, an irregularity of nucleus formation at segmentation, and one possible gynogenetic ovum out of 32 ova were observed. NSA 12-11237

THE DISTRIBUTION OF RADIOISOTOPES OF SOME HEAVY METALS IN THE RAT. Patricia W. Durbin, Kenneth G. Scott, and Joseph G. Hamilton. Univ. of Calif. (Berkeley) Publ. Pharmacol. 3, No. 1, 1-34 (1957)

A summary is presented of data on the biological half times and the principal deposition sites of 18 heavy metals in rats. Tracer techniques were used in the studies. Data are included on the following elements: Cd, Hg, In, Tl, Sn, Pb, Nb, Ta, Mo, W, Tc, Re Ru, Os, Rh, Ir, Pd, and Pt. NSA 12-5875

9167
USE OF SERUM FROM IRRADIATED RABBITS AND GUINEA PIGS AS COMPLEMENT IN BACTERICIDAL REACTIONS. Lottie Kornfeld (Univ. of Chicago). J. Bacteriol. 74, No. 6, 830-1(1957) Dec.

The preparation of serum for use in complement fixation studies is simplified by the in vivo radioinduced inactivation of normal antibodies in the blood of donor animals. Normal bacteridins for Bacillus subtilis disappeared from the sera of rabbits and guinea pigs following exposure to doses of x radiation ranging from 200 to 1000 r. The optimum time for bleeding seemed to depend on the size of the animal. Results are presented for bactericidal tests with a normal mouse serum pool in the presence of complements from several sources. A more sensitive reaction was obtained with serum from irradiated animals. NSA 12-11242

ON THE ABSORPTION OF RADIOACTIVE PHOS-

PHORUS FROM THE PLEURAL CAVITY. V. R. Faytel' berg-Blank and Yu. B. Sosyura. *Bull. Eksptl'. Biol Med.* No. 3, 64-8(1957) Mar.

Experiments on 15 rabbits indicate that radioactive phosphorus is very rapidly absorbed from the pleural cavity following intrapleural injection. Artificial pneumothorax slowed absorption of the radiophosphorus and increased deposition in the liver and lungs as compared with non-operated rabbits. The concentration of radiophosphorus was higher in the non-collapsed lung.

9171

THE RADIOACTIVE HAZARDS FROM THE EXPLOSION OF A HYDROGEN BOMB AND AN ORDINARY ATOMIC BOMB. O. I. Leypunskiy. *Atomnaya Energiya* 3, 530-9 (1957).

The hazards for the total world population caused by the long-lived fission products from the explosion of an atomic or hydrogen bomb are estimated. The dose of irradiation on the body are computed, and the number of cases of radiation injury (especially leukemia) developing afterwards is estimated. For a hydrogen bomb C^{14} and H^3 are the dangerous isotopes, and for an atomic bomb Sr^{90} , Cs^{137} , and C^{14} . The total decay energy of the fission products from a hydrogen bomb is about three times higher than that from an atomic bomb. However, the irradiation doses and the fatalities during the decay of the radioactive isotopes are equally high for both bombs. It cannot be said that the hydrogen bomb is less dangerous than the atomic bomb from the viewpoint of radiation injuries. NSA 12-10288

9172

RADIOPROTECTORS AND TISSUE METABOLISM AFTER IRRADIATION. A. de Schryver, J. de Witte, I. Leusen, and P. M. van Vaerenbergh. *Arch. intern. pharmacodynamie* 106, No. 1-2, 181-3(1956). (In French).

The radioprotective effect of β -mercaptoethylamine on the utilization of oxygen by the spleen was studied in the rat. Rats were irradiated with 750 r, receiving 1 mg of β -mercaptoethylamine per 100 g of weight 2 min before the irradiation. Five days later the rats were decapitated and the spleen examined. The results showed that the rats treated with the β -mercaptoethylamine had a much higher utilization of oxygen than the untreated rats. The value was halfway between the non-irradiated rats and the unprotected rats. NSA 12-9625

9173

THE PRIMARY SUTURE OF WOUNDS IN EXPERIMENTAL RADIATION SICKNESS. B. L. Razgovorov. *Eksperimental' naya Khirurgiya* No. 2, 47-50(1957) Mar.-Apr.

After guinea pigs, rabbits, and dogs were subjected to toxic doses of x radiation, various wounds were inflicted. Data are presented on recovery of animals. NSA 12-9588

9174

THE TREATMENT OF CHILDRENS' HEMANGIOMA AND NEVUS FLAMMEUS WITH Sr^{90} AND Y^{90} . Hanns-Joachim Lossel and Alfons Jakob. *Strahlentherapie* 104, 90-3(1957). (In German).

The authors report the excellent results obtained in the radiotherapy of the hemangioma of the child and of the nevus flammeus by means of strontium-90 and yttrium-90. The method is preferred to others as it reduces the charge of rays on the growing skeleton of the child and on the gonads. In case of smaller lesions the application of strontium-90 (total dose 3000 to 5000 rep) and surface irradiation by means of yttrium-90 foils (total dose 3000 to 4000 rep) produce good results. The single dose should be around 1000 rep. The dosage has to be fixed according

to the erythema which appears with medium intensity. To judge from the gathered experiences the results of this therapy are equivalent to those of radium treatment or Chaoul's close irradiation. NSA 12-3532

HEMATOLOGICAL INVESTIGATION OF THE EFFECT OF PROTECTIVE MATERIAL. PART V. THE RADIATION REACTION OF SPLEEN AFTER THE USE OF PROTECTIVE MATERIAL. Helmut Hartweg. *Strahlentherapie* 103, 559-63(1957). (In German).

The author reports on investigations in which the influence of homologous bone marrow, cysteine and vitamin P on the x-ray reaction of the spleen was tested in rats. The effect of these substances on the spleen is not as plain as on the bone-marrow. Lead protection on a shank and preliminary treatment with vitamin P leads to a regeneration that sets in 48 hours earlier. All the protected animals show complete recovery of the spleen structure on the 45th day, the control animals on the 60th day only. NSA 12-3526

9179

THE ALKALINE PHOSPHATASE LEVEL OF THE PLASMA FOLLOWING RADIATION INJURY. Johannes Pany (Physiologischen Institut der Universität, Vienna). *Strahlentherapie* 104, 507-13(1957). (In German).

The author investigates the changes caused by x rays in the alkaline phosphatase of the blood plasma of rats. No effect having been detected after small doses, a heavier x ray load showed a dose dependence of the occurrence of ferment in the plasma (load of 500 and 1000 r). The probable origin of the ferment is discussed. NSA 12-7086

9180

California. Univ., Berkeley. Radiation Lab. BIOLOGY AND MEDICINE QUARTERLY REPORT [FOR] JULY, AUGUST, SEPTEMBER 1957. Oct. 14, 1957. 19p. Contract W-7405-eng-48. (UCRL-8031)

Data are presented from studies on Sr^{90} metabolism in monkeys and the deposition of Ce^{144} in the developing fetal skeleton in rats. Progress is reported in the study of radiation-induced reactions of proteins in aqueous solution. The process of thermal-neutron-induced activation of indium foils was adapted to the measurement of fast neutrons. A radiation survey was made at the 184-inch cyclotron and recommendations were made regarding additional shielding. Routine health chemistry and health physics activities during the period are summarized. (For preceding period see UCRL-3880.) NSA 12-3486

9181

Utah. Univ., Salt Lake City. Coll. of Medicine. EFFECT OF PRE-RADIATION IMMUNIZATION ON

RESISTANCE TO AEROSOL-INDUCED INFECTION IN X-IRRADIATED MICE. Eugene H. Perkins and Stanley Marcus. Aug. 13, 1956. 7p. (AF-SAM-57-33; AD-132262)

The effect of active immunization prior to x radiation (acute and chronic whole-body exposure) was determined in mice infected with an aerosol of *Klebsiella pneumoniae*. Adult mice were immunized by multiple injections and irradiated seven days following the final injection. Control and immunized animals were then challenged four and six days following radiation exposure. Immunization prior to x radiation increased resistance to infection. This protective effect was not destroyed at sublethal or near mid-lethal levels of x radiation exposure. A large total dose, given in increments, was found to be far less detrimental to the host defenses than the same dose actually administered. NSA 12-3483

CHANGES IN RESPIRATORY GASES OF BURROS AFTER PROLONGED FRACTIONAL TOTAL BODY X IRRADIATION. J. L. Wilding, J. F. Lane, B. F. Trum, J. H. Rust, and J. C. Schoolar. Radiation Research 2, 64-70 (1955).

9188

THE INFLUENCE OF HEAT TREATMENTS ON THE INJURY AND CYTOGENIC EFFECTS OF X RAYS ON BARLEY. Richard S. Caldecott and Luther Smith. Genetics 37, 136-57(1952).

The following treatments were applied to dormant barley seeds to determine whether or not injury, chromosomal aberrations and mutations are necessarily correlated effects of x radiation, control, x irradiation

sublethal heat treatment; x irradiation followed immediately by heating; heat treatment followed immediately by x irradiation.

9189

ACTIVITIES INDUCED IN COMMON FOODS BY THERMAL-NEUTRON EXPOSURE. D. C. Peterson, S. H. Webster and E. J. Liljgren. Nucleonics 10(1), 33-36(1952).

It is possible to calculate neutron-induced radioactivities in foods from Na, K and P contents. Other elements are sometimes present in sufficient concentrations to increase activity over that calculated. Radioactivity induced in foods at 1700 ft. is so low that ingestion of a reasonable amount gives a radiation dose, insignificant compared to presently accepted tolerance doses. (from abstract). CA 45-10469

9190

DIFFERENCES IN THE EFFECTS OF X RAYS AND THERMAL NEUTRONS ON DORMANT SEEDS OF BARLEY. R. S. Caldecott, E. F. Frolk and Rosalind M. Morris. Genetics 37, 571-2(1952).

Dormant seeds of Himalaya barley subjected to 5,000, 10,000, 15,000 and 20,000 r of x radiation were compared with seeds exposed to thermal neutrons for 3, 6, 9 and 12 hours at a flux of 4.65×10^8 n th/cm²/sec. X-irradiated seedlings were much shorter 14 days after exposure.

9191

THE RELATIVE EFFECTS OF X RAYS, γ RAYS AND β RAYS ON TRADESCANTIA POLLEN. John S. Kirby-Smith and D. S. Daniels. Genetics 37, 596(1952).

Tradescantia pollen grains were irradiated with 250 Kvp x rays filtered by Al Cu, with γ rays from Co 60, and with β rays from P 32. In every instance the x rays were about twice as effective in producing chromosomal aberrations as equivalent roentgen doses of high energy γ rays or β rays. Thus, production of aberrations was not constant over the wave length range from medium-energy x rays to high-energy γ rays. Dose-aberration frequency curves are presented.

9192

THE NATURE OF CHROMOSOME DIVISION AND THE DURATION OF THE NUCLEAR CYCLE. A. Marshak. Proc. Natl. Acad. Sci. U.S. 502-10(1939).

Chromosome fragments containing a portion of only one chromonema are found after treating root tip of *Vicia faba* with neutrons or x rays. There are very few during the first 12 hours and later than 48 hours past exposure. There is a sharp maximum in frequency at 18 hours, attributed to a critical stage in the synthesis of new chromonemata in the "resting" nucleus.

9193

A COMPARISON OF THE SENSITIVITY OF MITOTIC AND MEIOTIC CHROMOSOMES OF *VICIA FABA* AND ITS BEARING ON THEORIES OF CROSSING-OVER. A. Marshak. Proc. Natl. Acad. Sci. 25, 510-16(1939).

Maximum number of chromosome abnormalities is observed at about 24 hours after x irradiation. The most sensitive stage in the meiotic cycle is pachytene. The sensitivity curve for meiotic chromosomes has almost exactly the same slope as that for somatic chromosomes. The relation of these observations to theories of crossing over is discussed.

9194

NATURAL AND INDUCED CHANGES IN CHROMOSOME STRUCTURE IN MAIZE ENDOSPERM. Donald F. Jones. Proc. Natl. Acad. Sci. U.S. 27, 431-5(1941).

Plants growing in the field were exposed to x rays, 75 to 78 hours after pollination. Doses of approximately

30 r increased the number of both single and paired losses in treated material. All the effects following radiation may also occur naturally, radiation increasing only the rate of occurrence.

9195

EFFECT OF X-RAYS ON CHROMATID ABERRATIONS. C. P. Swanson and Drew Schwartz. Proc. Natl. Acad. Sci. U. S. 39, 1241-50(1953).

Conclusions: (1) reduction in the number of chromatid deletions brought about by exposure of cells to 100 KVP, 15 ma, 50 r/min in nitrogen is less than for isochromatid deletions, (2) frequency of chromatid deletions in nitrogen is much higher than that induced in air. Other results are also reported.

9196

PHYSICAL AND CHEMICAL BREAKAGE OF CHROMOSOMES. C. D. Darlington. Pubbl. Staz. Zool. Napoli. Suppl. 22, 22-31(1950).

Breakage of chromosomes by physical and chemical means depends upon the influence which these agents have on nucleic acid and proteins. Chromosome effects vary according to the stage of the chromosome-cycle treated, the parts of the chromosome broken and the agent used. BA 25-22491

EFFECTS OF CHRONIC EXPOSURE TO X RADIATION

ON THE PERIPHERAL BLOOD OF EXPERIMENTAL ANIMALS. M. Ingram and W. B. Mason. p-253-267 in: Biological Effects of External Radiation (NNES VI-2) Henry A. Blair, ed. McGraw Hill Book Co., Inc. New York (1954).

Hematological examinations were made on dogs, rabbits, rats and monkeys exposed to whole body x radiation of 0.1 to 10.0 r/day for 2 years. Lymphocytes are the most sensitive indicators of damage, mature erythrocytes are the least. There is a difference in the response of dogs and rabbits. Reticulocyte depression is less pronounced than with exposure to one dose.

9202

EFFECTS OF CHRONIC EXPOSURE TO X RADIATION ON GROWTH AND SURVIVAL. Robert D. Boche p. 222-252 in: Biological Effects of External Radiation (NNES VI-2) Henry A. Blair, ed. McGraw-Hill Book Co., Inc. New York (1954).

Experiments on survival of rats following radiation are described. Frequency of death among 10 r/day animals was the same as among the controls during the first year, subsequently there was a marked increase in death rate. The concept of mortality per roentgen is discussed. The author describes effects of radiation on weight and the reproductive system.

9203

PATHOLOGY IN ANIMALS SUBJECTED TO REPEATED DAILY EXPOSURE TO X RAYS. Roger G. Metcalf. p.268-338 in: Biological Effects of External Radiation (NNES-VI-2). Henry A. Blair, ed. McGraw-Hill Book Co., Inc. New York. (1954).

Rats were exposed to x irradiation of 0.1, 0.5, 1.0 and 10 r/day for 2 years. In animals that died pulmonary infection, testicular atrophy, ulcers and leukemia occurred. There was no hemorrhage in the bone marrow or lymph nodes. In sacrificed animals, testicular atrophy was equivocal, lymph node follicles were hypoplastic. Bone marrow did not show hypoplasia.

RESPONSE OF THE BURRO TO 100 r FRACTIONAL WHOLE BODY GAMMA RAY IRRADIATION. T. J. Haley, E. F. McCulloh, W. G. McCormick, B. F. Trum and J. H. Rust. Am. J. Physiol. 180, 403-7(1955).

General symptoms of radiation injury in burros exposed to 100 r of γ rays per day are similar to but slower in developing than symptoms when daily dose of radiation was higher. Pronounced lymphopenia occurred 1 hr after the first 100 r dose. The thrombocytes followed the pattern of response obtained when either 100 r fractional or a single LD₅₀ dose of irradiation was given. Generalized bleeding from small wounds did not occur until 21st day in 200 r series. Hyperferremia was observed when the total dose reached 400 r.

9217

EFFECT OF RADIATION ON HUMAN HEREDITY. Geneva, World Health Organization, 1957. 168p. \$4.00.

The findings of a study group on the effect of radiation on human heredity are summarized. The group recommends the establishment of institutions and departments devoted to general genetics and human genetics. A registry of serious hereditary diseases and defects in various populations is suggested. It is pointed out that there is evidence that damage to body tissues produced by radiation after relatively small doses is, at least in part, mediated through effects on genes and chromosomes. There is also evidence that the life-span may be reduced in mammals even by relatively small radiation doses. The genetic hazards of man-made radiation from sources used in medicine, industry, commerce, and experimental science is stressed. The importance of reducing radiation exposures and shielding the gonads is emphasized. It is suggested that as both an approach to control and as a means of providing basic background information for relating quantitatively radiation exposure and effects on man, it is essential that methods be found of recording exposures to individuals and populations. Individual papers presented at the meeting of the study group are included.

TURNOVER AND TISSUE DISTRIBUTION OF RADIO-RUTHENIUM OXIDE IN THE LUNGS OF MICE. D. H. Willard, L. A. Temple, and W. J. Bair. Oct. 1, 1957. 18p. Contract W-31-109-eng-52. (HW-52286)

Whole-body turnover and tissue distribution of ruthenium in mice were studied for 427 days after single intratracheal injections of Ru¹⁰⁶O₂. Because of a continuously changing rate of turnover several values for the biological half life were calculated. Following the early

period of high turnover rate the biological half life was 280 days when estimated by resolution of the turnover curve into a series of three exponentials. The retention of Ru^{106} was best represented by a power function and the average biological half life obtained by integration of the power function curve over a period of 230 days was 170 days. Integration of the exponential curve over the same period gave an average half life of 110 days. After 164 days a portion of the animals were sacrificed to determine the tissue distribution of Ru^{106} . The total-body burden was 12% of the initial dose with 92% of the body burden in the lungs. Other tissues showing high concentrations of Ru^{106} were the lymph nodes, spleen, kidney, and ovaries. NSA 12-2722

RADIOLOGICAL PHYSICS DIVISION SEMI-ANNUAL REPORT FOR JANUARY THROUGH JUNE 1957. July 1957. 86p. Contract W-31-109-eng-38. (ANL-5755)

Progress is reported in the following studies: the autoradiographic mapping of the deposition of Ca^{45} in cortical bone in dogs, measurement of fission-product activity present in soil, factors affecting the performance of ionization chambers, calibration tests on the dibutyl phosphate method of isolating Th^{228} from solutions of ashed bone; microradiographic demonstration of changes in mineral density in dog bones, radiometric determination of radon in bone and in the atmosphere, changes produced in xylene by exposure to massive doses of Co^{60} γ radiation, applications of the human spectrometer in *in vivo* measurements of Cs^{137} build-up in humans, determinations of Cs^{137} atmospheric content as a function of time, development of a tracer method using K^{42} for measurement of exchangeable potassium in humans, determinations of the radium body burdens in former dial painters, and the atmospheric diffusion of stack particles. A meteorological model towing tank is described which was constructed as an alternative to a wind tunnel for model studies of atmospheric turbulent diffusion. Preliminary studies employing the apparatus are described. (For preceding period see ANL-5679). NSA 12-1186

INFLUENCE OF TOTAL BODY X-IRRADIATION ON THE LEVELS OF CREATINE PHOSPHATE, INORGANIC PHOSPHORUS AND ATP IN MUSCLE AND ON THE LEVELS OF CREATINE, CREATININE, N¹-METHYL-NICOTINAMIDE AND NITROGEN IN URINE. U. S. Kumta, S. U. Gurnani, and M. B. Sahasrabudhe (Atomic Energy Establishment, Bombay). J. Sci. Ind. Research (India) 16C, 179-81 (1957) Sept.

The influence of total-body irradiation on the levels of creatine phosphate (CP), adenosine triphosphate (ATP) and inorganic phosphorus (IP) in muscle has been investigated in rats. CP and ATP levels decrease by about 33% while those of IP increase 4 times in irradiated rats. Studies on the influence of irradiation on the excretion of creatine, creatinine and N¹-methyl-nicotinamide is increased two-fold while that of creatinine is increased by 160%. It is suggested that the low levels of creatine phosphate are probably due to an impairment in the phosphorylation of creatine or due to an adaptive breakdown of creatine phosphate leading to increased excretion of creatine and creatinine. Washington. Univ., Seattle. Applied Fisheries Lab. RADIOACTIVITY IN THE REEF FISHES OF BELLE ISLAND ENIWETOK ATOLL APRIL 1954 TO NOVEMBER 1955. Arthur D. Welander. May 17, 1957. 42p. Contract AT(45-1-540). (UWFL-49)

Studies of the radioactivity in reef fishes of Belle (Bogomongo) Island, Eniwetok Atoll, were made during a

period of about one year following the atomic detonations in 1954. Thirty-four different collections were made and 693 specimens were analyzed to determine the trend or decline of radioactivity. The decline of radioactivity during the period under study was generally similar in all species. The relative amount of radioactivity per gram of tissue was greatest in the alimentary tract, with the liver, skin, bone and muscle having successively lesser amounts. This relationship prevailed throughout the period. The rate of decline was greatest during the first 100 days, with a loss of 90% of the radioactivity during the period. Studies were made on the variation of total radioactivity in the tissues and species, on comparisons of the amount of radioactivity in the species and in their food, and on comparisons of the decline of radioactivity during the period with the decay of radioactivity in tissues collected soon after the shots. ALTERATION OF BETA RADIATION LESIONS OF THE SKIN BY CYSTEINE, NITRITE, HYPOXIA, SPLEEN HOMOGENATE, AND BONE MARROW HOMOGENATE. A. K. Davis, D. Cranmore, and E. L. Alpen. Aug. 15, 1957. 17p. Project NM-006-015. (USNRDL-TR-184)

The purpose of this investigation was to evaluate some of the more common agents which are known to reduce the lethal effects of whole-body ionizing radiation in terms of their specific action on radiation damage to skin. Hypoxia, cysteine, and nitrite were administered before or during radiation, and spleen and bone marrow homogenates were studied for their action when administered after irradiation. Rats were exposed to a dose of beta radiation which produced ulceration in all untreated rats (ED_{100}), and graded daily by the gross appearance of the irradiated area. The most effective protection was obtained by exposure of the rat to a 95 percent nitrogen-5 percent oxygen mixture during irradiation. Cysteine, 1.0 mg/gm body weight, as well as hypoxia prevented ulceration of the exposed area, nitrite was less effective. However, all the pretreatment procedures reduced the severity of the lesion. Injection of spleen or bone marrow homogenates had little effect on the damage to the irradiated area. None of the procedures prevented the occurrence of erythema or epilation in the exposed area. It would appear that beta radiation injury to skin could serve as a useful measure of radiation protection only when this protection is of a general nature. If the action is one involving a critical tissue, i. e., hematopoietic, skin injury is unlikely to provide an adequate estimate of the potential radiation protection that could be obtained. Sebago variety potatoes given as little as 5,000 rep of γ radiation show no signs of sprouting, but Russett Rurals given 20,000 rep show occasional evidence of arrested sprout development. Tiny sprouts (1 mm) form but do not proliferate. Nonirradiated potatoes, except those stored at 35°F, show definite sprout development. Most of the potatoes, irradiated and nonirradiated, except those stored at 35°F, show slight softening, usually confined to the skin. Weight losses during storage for irradiated and control Sebago and Russett Rural variety potatoes were determined as a function of radiation dose, temperature of storage, and duration of storage. 19 references. California. Univ., Berkeley. Radiation Lab. BIOLOGY AND MEDICINE QUARTERLY REPORT [FOR] APRIL, MAY, JUNE 1957 July 29, 1957. 33p. Contract W-7405-eng-48.

Data are tabulated on the incidence of and classification of tumors induced in female mice following administration of $\mu\text{C/g}$ body weight of At^{211} . Progress is reported in studies on the radiation chemistry of proteins, formic acid, and acetic acid. The effect of dose rate in the radiolysis of aquo-organic systems was investigated. Radiobiological studies reported include back-mutation studies of irradiated yeast, studies of hypothalamic-irradiated rats, the effects of x irradiation on egg hatch and egg-laying in wasps, tracer studies on the rate of formation and life span of lymphocytes, and studies on the embryonic nucleoprotein fraction that stimulates growth in tissue cultures. Health chemistry and health physics activity for the period are summarized. (For preceding period see UCRL-3758). NSA 12-2628

THE INFLUENCE OF OXYGEN ON THE RADIOSENSITIVITY OF MAMMALIAN TISSUES. E. A. Wright and P. Howard-Flanders (St. Mary's Hospital Medical School and Hammersmith Hospital, London). *Acta Radiol.* 48, 26-32(1957) July.

The radiosensitivity of growing bone in the tail of week-old mice has been determined when the tissues were made anoxic by compression and when the animals were breathing partial pressures of oxygen ranging from half an atmosphere of air to three atmospheres of oxygen. When irradiation doses in the form of fast electrons, delivered in approximately one second, were used the tail reached minimum sensitivity following compression in four seconds. The changes in radiosensitivity found under these conditions are discussed in relation to the special anatomy and physiology of the sensitive cartilage cells concerned with the growing of the bones. The relation of these results with other work on mammalian tissue and cells is also discussed and some possible practical applications to radiotherapy are considered. NSA 12-2631

EXPERIMENTS ON THE METABOLISM OF CERTAIN FISSION PRODUCTS IN DAIRY COWS. Presented at the International Conference on Radioisotopes in Scientific Research, Sept. 9-20, 1957 at Paris. No. UNESCO/NS/RIC/143 Helen M. Squire, L. J. Middleton, B. F. Sansom, and C. R. Coid. London, Pergamon Press, Ltd., 1957. 13p.

Dairy cows have been fed with separated carrier free I^{131} , Sr^{89} , Te^{132} , and Ru^{106} . The amounts of these isotopes recovered from the milk, urine and feces, and their rates of secretion and excretion, have been measured; estimates have also been made of the amounts retained in the body. Nineteen administrations of iodine have been made, twelve of strontium, five of tellurium and one of ruthenium. Wide variations in the amounts of I^{131} and Sr^{89} secreted into the milk have been observed. These were partly due to the variations in milk yield. Similar experiments have been carried out with fission products collected from trials of atomic weapons. There was no apparent difference between the metabolism of the fission products from the two sources. NSA 12-58

STEROL SYNTHESIS AFTER WHOLE BODY ROENTGEN IRRADIATION. H. K. Hanel, G. Hjort, G. Johansen, and P. R. Purser (Radium Centre, Copenhagen, Denmark). *Acta Radiol.* 48, 227-38(1957) Sept.

Male rats were irradiated with 400 r whole body irradiation. The *in vivo* incorporation of 2- C^{14} -acetate in liver cholesterol decreases during the first day after irradiation and subsequently increases. The hepatic cholesterol concentration falls immediately, rises above normal and slowly falls again. Histology shows no change in cell population. Total radioactivity incorporated in liver tissue, as shown by autoradiographs reaches a maximum at 1 day after irradiation. Incubation of rat liver slices with 2- C^{14} -acetate shown an increase in the metabolism of acetate of carbon dioxide, and an initial increase followed by a fall in the synthesis of digitonine-precipitable sterols from acetate. Chicago. Univ. Air Force Radiation Lab.
QUARTERLY PROGRESS REPORT NO. 25. Oct. 15, 1957.
129p. Contract AF-41(657)-25. (NP-6491)

Data are presented on the survival time, weight loss, and mortality of mice treated with 70 chemical compounds immediately prior to the administration of a lethal dose of whole-body x radiation. Marked protective effects were observed following the pre-irradiation intraperitoneal administration of dimethyldithiocarbamic acid dimethylammonium salt, diethyldithiocarbamic acid diethylammonium salt, 2-aminoethanol, dithiol, monothiohydroquinone, and furfuryl mercaptan. Significant although lesser protective effects were seen following the administration of various doses of some of the other chemicals tested. Exposure of rats to fast neutron irradiation at a dose rate of 3.5 rep/hr caused a dose-dependent increase in adenosine triphosphatase activity of the spleens and thymus glands throughout the range of 79 to 350 rep. A similar relationship between dose and enzyme alterations was noted after γ radiation under the same conditions of exposure in the dose range from 300 to 500 rep. Sublethal doses of fast neutron and Co^{60} γ irradiation were found to have effects qualitatively similar to x irradiation in depressing the endogenous respiration of spleen and thymus tissues of rats and these effects were found to be entirely reversible during a 14-day period. Data are included from studies on the effect of various steroids on the survival of x irradiated mice, studies on the antagonistic action of aminethylisothiuronium dichloride on the hyperglycemia induced by thiourea derivatives, and studies on the influence of fractionated exposures to low levels of γ and fast neutron irradiation on the mortality, survival time, and weight changes in mice. (For preceding period see NP-6398.)

THE ROLE OF SULFHYDRYL GROUPS AND PEROXIDE COMPOUNDS IN THE MECHANISM OF THE BIOLOGICAL ACTION OF IONIZING RADIATION. M. B. Gintsburg, E. M. Pandre, and N. M. Binus (Ukrainian Scientific Research for Sanitary Chemistry, Kiev). Biochemistry (USSR) (English Translation) 22, 431-8 (1957) May June.

Peroxide is formed under the action of x-rays in the excised tissues of irradiated rats, and the reactivity of the sulfhydryl groups contained in the enzyme systems is apparently increased. NSA 12-9584

9265

EFFECT OF WHOLE-BODY IRRADIATION ON THE CIRCULATION OF THE DOG. I. Leusen, G. Demeester, and P. M. Van Vaerenbergh. Arch. intern. physiol. biochem. 63, No. 4, 441-4(1955). (In French).

Dogs, weighing from 8 to 16 kg, received 400 r of whole-body irradiation. The arterial pressure and the cardiac flow were measured and the results are tabulated. No important modifications of the pressure or flow were observed either immediately after or for some days after the irradiation. However, in the terminal phase a large diminution of both these values was observed. NSA 12-8936

9266

X-IRRADIATION AND BONE MARROW. A. de Schryver, G. Demeester, and I. Leusen. Arch. Intern. physiol. biochim. 65, No. 4, 599-606(1957).

At 24 hours after a 600 r whole-body irradiation, the concentration of Fe^{59} , intracardially injected immediately after the irradiation appears to be significantly increased in the bone marrow of the rat. At the same time, the radioactivity in the peripheral blood cells is depressed to 2/3 of the activity found in the control animals. From these observations and from the study of the plasma clearance of Fe^{59} , it is concluded that this increased radioactivity of the bone marrow 24 hours after irradiation, the Fe^{59} having been injected immediately after the irradiation, is caused by the decreased output of Fe^{59} tagged cells into the circulation. At 48 and 72 hours after irradiation, the uptake of Fe^{59} in the bone marrow and in the blood is equally strongly depressed. NSA 12-8937

9267

MATERIALS FOR THE STUDY OF THE SPECIFICITY OF THE RESPONSE OF AN ORGANISM TO IRRADIATION. P. Domshlak, G. A. Avrunina, Yu. G. Grigor' yev, and N. G. Darenskaya. Vestnik Rentgenol. i Radiol. No. 2, 3-10(1957) Mar.-Apr.

The specificity of response of organisms to irradiation is discussed and substantiated by experimental data from studies using 400 mice and 115 rats. The biological effects of the same dose of radiation when administered internally and when administered externally were compared. The variation encountered was primarily in weight decrease. When irradiated internally by isotopes, animals started losing weight after 3 to 5 days, whereas under external irradiation, they lost weight from the very first day. Data are included on the radiosensitivity of the head, chest, and abdomen of rats. Encephalograms made on 17 patients undergoing roentgenological treatment were surveyed for direct and indirect effects of irradiation, on the central nervous system. Data are summarized from a survey of 4000 encephalograms. NSA 12-9623

ON THE CAUSES OF REGENERATION ABILITY LOSS

IN THE AXOLOTL EXTREMITY AFTER X-RAYING.

V. F. Sidorova (Lab. of Growth and Development, Inst. of Experimental Biology, Academy of Sciences, USSR, Moscow). *Bull. Exptl. Biol. Med. (USSR) (English Translation)* 43, 215-19(1957) Feb.

It was demonstrated that the amputation of an irradiated organ does not bring about its regeneration in the case of the denervation of the axolotl extremity x-rayed with the dose of 5000 r. Under the conditions of provisional denervation of the intact extremity followed by visual denervation of the intact extremity followed by irradiation, and amputation after innervation restitution, no regeneration was found. The loss of regeneration ability in the axolotl extremity is, apparently, unconnected with the change of peripheral nerve fibers in the stump. NSA 12-9582

9270

THE EFFECT OF IONIZING RADIATION ON THE PROTEINS OF STRUCTURAL ELEMENTS OF THE CYTOPLASM OF THE LIVER CELLS. L. I. Ilyina, V. O. Blohina, and M. S. Uspenskaya. Translated by Lydia Venters from *Med. Radiol.* 2, 23-30(1957). 13p. (AEC-tr-3234)

The yield of mitochondria and microsomes of rat's liver cells does not change in radiation sickness. The moisture content of these structures likewise remains normal. There is a change in the quantity of ribonucleoproteids and lipoproteids in mitochondria and microsomes of the liver cells in radiation sickness. The quantity of water-soluble proteins remains within the normal limits. The most abrupt changes in ribonucleoproteids and lipoproteids in radiation sickness are found in their protein component. This is manifested in much greater changes in the nitrogen contents, as compared with phosphorus. NSA 12-8929

9271

EFFECT OF IONIZING RADIATION ON THE ACTIVITY OF DIGESTIVE ORGANS IN DOGS. Yu. N. Uspenskiy. *Fiziol. Zhur. S.S.S.R.* No. 4, 328-35(1957) Apr.

The abdominal regions of six dogs were exposed to 660 r x radiation for 30 min. Five of the dogs died on the 5th, 18th, and 22nd days. The other five were alive after 2 months but in a state of extreme emaciation. Observations were made on digestive processes in the irradiated dogs by means of a Pavlov stomach and surgical fistulas. Disturbances in the secretory activity of the gastric glands fluctuated in all of the dogs. Hunger periodicity showed shorter rest periods and an intensification of hunger contractions. Determinations were made on the protein and protein fraction content of the blood serum and digestive juices. The sharpest changes in hemopoiesis were found to coincide with the most striking disturbances in the function of the digestive organs. NSA 12-9589

HORMONE INDUCED LYMPHOCYTE RELEASE FROM THE ISOLATED PERFUSED DOG SPLEEN. Marvin Goldman and L. W. Tuttle. Oct. 1, 1957. 35p. Contract W-7401-eng-49. (UR-511)

Data are presented on the effects of adrenal cortex extract, hydrocortisone, and cobalt-60 gamma irradiation on the release of splenic lymphocytes into the circulation. NSA 12-12915

9278

THE INFLUENCE OF NON-IONIZING RADIATION ON THE CATALASE AND HEMATOLOGICAL INDICES IN THE BLOOD, IN ANIMALS UNDER NOVOCAINE ANAESTHESIA. I. P. Neshchadimenko, M. S. Kostenko, and V. A. Shkapina. *Zdrav. Belarus.* No. 11, 51-2 (1956). (Translated from *Referat. Zhur. Biol.* No. 16, 1957, Abstract No. 71263).

The general clinical picture, activity of catalase, and blood morphology of irradiated animals, subject to amital or Novocain anesthesia of the skin of the back or belly, is the same as in irradiated control animals. In the development of radiation syndrome, at first there occurred reduction of the white and then red blood cells, and also the lowering of catalase activity. NSA 12-12135

9279

INFLUENCE OF IONIZING RADIATIONS ON THE SORPTION PROPERTIES OF THE TISSUES OF VARIOUS ORGANS IN VIVO. A. M. Kuzin and E. A. Ivantskaya (Inst. of Biophysics, Academy of Sciences of the U.S.S.R. Moscow). *Biophysics (USSR) (English Translation)* 2, 311-20(1957).

The sorption capacities of rat tissues were investigated *in vivo* 2, 24, and 48 hr after x irradiation using P^{32} -labeled colloidal chromic phosphate, I^{131} -labeled iodinated globulin, and Ag^{110} -labeled colloidal silver

solution. It is shown that about 70% of the colloid injected was absorbed by the liver. Within 24 to 48 hr after irradiation the absorptivity of the liver decreased. From 48 to 75 hr the sorption capacity of the liver again increased. It is suggested that this reduction may be due to physico-chemical changes in the macromolecules which form the surfaces, and in the protoplasm of cells in the reticuloendothelial system, and that it is closely linked with changes in antibody synthesis. Utah. Univ., Salt Lake City. Coll. of Medicine. THE EFFECT OF X-IRRADIATION ON PREFORMED ANTIBODY AND ITS ROLE IN THE PROTECTION OF X-IRRADIATED MICE. Eugene H. Perkins and Stanley Marcus. Aug. 15, 1957. 7p. (AF-SAM-58-18)

Induced agglutinin titers for human type A erythrocytes were not decreased by exposure to 300, 500, or 700 r of total-body x irradiation 3, 7, 11, or 15 days following radiation exposure in albino rats. Antibody derived from mice exposed to x irradiation did not lose capacity to effectively protect against infection. Passive immunization of normal (nonirradiated) or 300 or 400 r x-irradiated animals proved just as effective a measure for protection as did active immunization. At higher levels antibody (passive immunization) afforded no protection. The possible roles of antibody and cells in the irradiated animal are discussed. NSA 12-4671

9281

PHYSICOCHEMICAL PROPERTIES OF CIRCULATING RED BLOOD CELLS OF LETHALLY X-IRRADIATED MICE TREATED WITH RAT BONE MARROW. Takashi Makinodan and Norman G. Anderson (Oak Ridge National Lab., Tenn.). Blood 12, 984-92(1957) Nov.

Two months after injection of rat bone marrow into lethally x-irradiated mice (950 r-RBM mice), 100% of the circulating RBC were serologically of the rat type, indicating that the surface molecular configuration of RBC from these experimental mice are of the rat type. The hemoglobin was found to be also very much like the rat type in its ease in crystallization, its alkali denaturation property, its electrophoretic property, and its tendency to form a paracrystalline state at low temperature. These cells possessed dual osmotic properties, the relative hemoglobin concentration released when cells were lysed in water was more comparable to the rat type, but its temperature dependency was more comparable to the mouse type. 9282

STUDIES DIRECTED TOWARD THE USE OF ANTIBODIES AS CARRIERS OF RADIOACTIVITY FOR THERAPY. William F. Bale and Irving L. Spar (Univ. of Rochester School of Medicine and Dentistry, N. Y.). Advances in Biol. and Med. Phys. 5, 285-356(1957).

The relationship of immunological reactions to the growth of normal and abnormal tissues are reviewed. The highly selective localization of a radioactivity-carrying antibody in a particular normal or neoplastic tissue depends on the existence of an antigenic substance accessible to intravenously administered antibody. Procedures likely to be involved in using antibodies for the tissue-specific localization of radioisotopes in therapeutic dosage ranges are discussed. (156 references). NSA 12-8969

THE CHANGES IN THE OXYGEN INTAKE OF BRAIN TISSUE AFTER X-IRRADIATION. A. D. Snezhko. Biofizika No. 2, 67-78(1957).

X irradiation of various parts of the body of rabbits was found to induce changes in the concentration of oxygen in brain tissue. Changes were observed in blood circulation indicative of suppression of oxidizing activi-

ties in the cerebral cortex following exposure to ionizing radiation. NSA 12-9580

9284

X IRRADIATION AND SUCCINODEHYDROGENASE. A. de Schryver. Arch. intern. physiol. biochim. 64, No. 4, 587-93(1956). (In French).

A dose of 750 r of whole-body x irradiation in the rat causes in the liver a decrease of the succinodehydrogenase activity, which reaches 37% on the fifth day. This depression is in large part suppressed by the protection of the animal with a dose of cysteamine. Immediately after irradiation one observes no modification of the enzymatic activity. *In vitro* the succinodehydrogenase is very radioresistant. A dose of 100,000 r, however, inhibits it 33%. Cysteamine added at the ratio of 1 mg per 150 mg of tissue in the culture before its irradiation protects the enzymatic activity. NSA 12-9577

9285

Columbia Univ., New York. Radiological Research Lab. ANNUAL REPORT ON RESEARCH PROJECT. July 1, 1957. 128p. Contract AT-30-1-GEN-70. (NYO-2087)

Radiological Physics. Measurements of the tissue doses produced by radioisotopes variously distributed were continued. The average energy lost by S^{35} β rays per ion pair produced, or W , was determined to be 33.6 ± 0.3 ev. The value of W for water vapor relative to air was measured for β rays from S^{35} and from Ni^{63} . A new method for determining the disintegration rate of K-capture isotopes from their γ rays was tested with Au^{198} . A tissue-equivalent ionization chamber was developed and tested. Progress was made in applications of tissue equivalent ionization chambers for neutron dosimetry. Investigations were made of the mechanism of production of spontaneous and radioinduced mutants in *E. coli*. **Radiobiology.** Research in progress is summarized briefly. Progress is reported in studies on the protective effect of splenic plasma injected intraperitoneally into irradiated rabbits; the effect of hibernation and tranquilizing drugs on radiosensitivity of mice, the effect of radiation on the gonads in mice, and the effects of radiation on the developing mouse fetus. Lists are included of research published and submitted for publication during the period. (For preceding period see NYO-4698). NSA 12-4032

9287

USE OF γ -RADIATION FOR PREVENTING THE SPROUTING OF POTATOES. W. G. Burton and R. S. Hannan. J. Sci. Food Agr. No. 12, 707-15(1957) Dec.

Gamma irradiation at doses as low as 3500 r suppresses the sprouting of potatoes, but it may also have harmful effects. After storage for 6 months or more, sweetening rendered the tubers unsuitable for crisp or chip production. After 15 months, a great accumulation of sugar and complete breakdown were observed. Irradiation at 20,500 r and over increased the initial rate of water loss and subsequent wilting. Irrespective of irradiation, there was an apparent direct correlation between the rate of water loss and the cumulative loss which occurred. NSA 12-16114

New York. State Agricultural Experiment Station, Geneva. THE INDUCTION AND TESTING OF SOMATIC MUTATIONS IN APPLES, GRAPES AND OTHER ECONOMIC PLANTS. Progress Report for the Period February 1, 1956 to January 31, 1957. Charlotte Pratt and John Einset. 10p. Project No. 42. Contract AT(30-1)-1541. (AECU-3413)

Preliminary data are presented from observations on the response of three varieties of apples and one variety of grapes subjected to a wide range of radiation damage at growth stages ranging from seed to mature plants. Ultimate objectives of the study are the radioinduced production of mutations in apples and grapes. NSA 12-5812

9290

ANNUAL REPORT OF EXPERIENCES WITH TELECOBALT THERAPY. Arduino Ratti (Istituto di Radiologia dell' Università, Milan). Minerva Nucleare 1, 332-4 (1957) Nov. -Dec. (In Italian).

A report is made of the observations concerning the history-during and following treatment- of 319 patients with malignant new growths treated with a telecobalt therapy unit with an initial activity of slightly more than 1000 curies. The data referring to the blood picture, the local reactions and accidents are presented. The role of this form of therapy in the modern roentgenologic treatment of tumors is considered. NSA 12-6418

9291

TELECOBALT THERAPY OF DEEP TUMORS. E. Benassi and C. Sinistrero (Istituto di Radiologia dell' Università, and Centro di Telecobaltoterapia-Clinica Pinna Pintor, Turin). Minerva Nuclear 1, 308-21(1957) Nov. -Dec. (In Italian).

An apparatus for telecobalt therapy is briefly described, and the physical and biological properties of radio-cobalt are considered. A personal method of treatment is presented and the necessity is stressed of the physical and geometrical study of the mass to be irradiated. The various techniques employed in order to obtain correct centering are described, together with a series of tables of the various plans of treatment for the various localizations. The indications of the form of treatment are considered, together with the doses and the local and general reactions. Both immediate and long term results are discussed. The fundamental problem is finally considered: total sterilization of the tumor with sufficient respect for the healthy tissues. NSA 12-6417

9292

RADIATION DURATION AND TISSUE REACTIONS. Anton Kautzky. Strahlentherapie 104, 558-70(1957). (In German).

The tissue reactions, particularly the skin reactions, run in an autonomic rhythm, which is characteristic of the individual and can only be influenced within certain limits by changing physical irradiation conditions. The first course of reaction is promptly followed by a second reaction if appropriate irradiation is applied. Irradiation beyond the first course of reaction without obtaining a second reaction leads to gradual waste. NSA 12-7088

Los Alamos Scientific Lab., N. Mex. ESTIMATION OF WHOLE BODY DOSE (REM) FROM TRITIUM IN BODY WATER. James N. P. Lawrence. Nov. 15, 1957. 22p. Contract W-7405-eng-36 (LA-2163)

A detailed procedure is given for estimating the whole-body exposure from a known concentration of

tritium in body water. The permissible body burden of 3.7 mc, a 43.4 kg critical organ (total body water), and 1.7 RBE for tritium in the body are based on the accepted standards of 1956. NSA 12-5200

9294

THE ACTION OF VARIOUS DRUGS ON THE SUPRARENAL RESPONSE OF THE RAT TO TOTAL-BODY X-IRRADIATION. Z. M. Bacq and P. Fischer (Univ. of Liege, Belgium). Radiation Research 7, 365-72(1957) Oct.

A chemical protector, cysteamine (100 mg/kg intraperitoneally), inhibits the second irreversible drop in cholesterol and ascorbic acid which, in the controls, begins on the second day after a total-body exposure of rats to 800 r of x rays (250 kv). Morphine (20 mg/kg) preceded by Nembutal (20 mg/kg) is known to inhibit the hypothalamo-pituitary-adrenal response to stress. This pharmacological treatment prior to total-body irradiation prevents any change in ascorbic acid and cholesterol values in the rat's suprarenal during the first 24 hours after irradiation, but it does not decrease the mortality, and does not change the profound depression of these two values at the third day after irradiation, even if a morphine injection (40 mg/kg) is given daily. It is suggested that the first reversible reaction (during the 24 hours after irradiation) is a simple reaction to the physical stimulus of irradiation acting as a stress. The significance of the second reaction is not so clear because it happens at the third or fourth day when the general condition of the irradiated rat deteriorates. NSA 12-2701

Naval Radiological Defense Lab., San Francisco. THE EFFECT OF SUBLETHAL TOTAL BODY IRRADIATION ON THE BACTERICIDAL ACTIVITY OF RAT LEUCOCYTE MITOCHONDRIAL EXTRACTS. M. Fishman and M. S. Silverman. Dec. 2, 1957. 14p. Project No. NM-006-015.04. (USNRDL-TR-192)

Two different groups of rats were exposed to 300 and 500 r total-body x irradiation. Mitochondrial extracts were prepared from the leucocytes of these animals at various post-irradiation days. The bactericidal activity of these extracts was determined and compared to the activity obtained with extracts prepared from leucocytes from non-irradiated animals. The results showed that irradiation decreased the bactericidal activity per leucocyte, with the maximum depression occurring between the 3rd and 5th days after exposure. Recovery of the bactericidal activity was evident between the 8th and 12th post-

irradiation day in the 300 r group but was not noted in the 500 r group even on the 30th day after irradiation. NSA 12-4660

LONG-TERM EFFECT OF RADIATION ON CREATINE METABOLISM IN THE RAT. George M. Krise, Clyde M. Williams, and Donald R. Anderson. June 27, 1957. 5p. (AF-SAM-57-151)

The urinary output of creatine and creatinine was measured intermittently for 6 months in 3 female Sprague-Dawley rats surviving 435 rep of mixed radiation (neutron; gamma ratio of 3:1) and in 3 animals surviving 1,500 rep of Co⁶⁰ gamma radiation. No changes in output of creatine and creatinine were observed in the former group once the initial (5-day) postradiation interval was over. In the case of the animals surviving 1,500 rep of Co⁶⁰ gamma radiation, creatinine output was significantly depressed following radiation, and creatine output was significantly elevated during both intervals examined for the first 2 months postradiation. It was tentatively concluded that radiation does not have any immediate effect on creatine synthesis at doses up to 1,500 rep and that 1,500 rep of gamma radiation may permanently destroy tissue containing creatine. FREQUENCY OF BONE SARCOMA IN THE UNITED STATES IN RELATION TO LOW LEVEL RADIATION EXPOSURE. John C. Bugher and Pauline A. Mead. 16p. (A/CONF.15/P/1060)

Prepared for the Second U. N. International Conference on the Peaceful Uses of Atomic Energy, 1958. Between areas of the United States differing in natural background radioactivity by a factor of two, there is no corresponding relationship in the incidence of deaths from malignant tumor of bone as observed over the period 1949-1955. No evidence is found in this study which supports the assumption of linear relationship of bone tumor incidence and ionizing radiation at low doses. If a threshold exists for causation of bone tumors, it must lie well above 20 rads and probably nearer 1000 rads. The mortality experience from malignant tumors of bone in the United States can be described in terms of two populations, each exhibiting a Gompertz type of mortality. One of these populations is a small one behaving as though all of the individuals were destined at birth to die of bone sarcoma at an early age. NSA 12-14531

CONDITIONED FOOD AVOIDANCE ON A T-MAZE IN IRRADIATED RATS. Robert K. White and W. Lynn Brown. Nov. 12, 1957. 5p. (AF-SAM-58-48)

Two groups of rats, one irradiated and one sham-irradiated, were deprived of food for 21 hours preirradiation and 66 hours postirradiation before training on a T-maze. The irradiated group avoided the food arm of the maze a significantly greater number of times than the sham-irradiated group and also significantly more than by chance. This demonstrates that the avoidance motivation of irradiated rats is sufficient to motivate learning on a T-maze, that eating during irradiation is not a necessary condition for avoidance behavior at lethal levels, and that the value of food shifts from a pulse value to a minus value and not to zero. THE EFFECT OF WHOLE-BODY RADIATION UPON ASSOCIATION OF PERIPHERAL CUES. W. Lynn Brown, Richard M. Carr, and John E. Overall. Nov. 5, 1957. 5p. (AF-SAM-58-47)

Object-quality stimuli were presented as discrimination problems to rhesus monkeys of three treatment groups: nonirradiated, low-dose irradiated, and high-dose irradiated. The experiment was designed to determine whether the subjects associated peripherally placed stimuli and whether normal and irradiated subjects differed in the extent to which such association was made. The performance of nonirradiated subjects gave evidence of association of peripherally placed stimuli, no significant evidence of such association was observed in the performance of the irradiated monkeys. The results are interpreted as supporting the hypothesis of a shift in response thresholds to extraneous stimuli and the hypothesis of a narrowing of attention in irradiated subjects. NSA 12-8923

IRON-59 METABOLISM AS AN INDEX OF HEMATOPOIETIC DAMAGE AND RECOVERY IN MONKEYS EXPOSED TO NUCLEAR RADIATION. Quentin L. Hartwig, George S. Melville, Jr., Thomas P. Leffingwell, and Robert J. Young. Dec. 4, 1957. 7p. (AF-SAM-58-59)

Monkeys exposed to ionizing nuclear radiations were studied for changes in iron metabolism. Twenty-eight hours after exposure, iron-59 was injected, and 24 hours later the first blood sample was drawn. Iron uptake in the irradiated animals reflected marked depression of erythropoiesis. The average uptake in all irradiates 48 hours postexposure was 2.1% as compared to 10.7% in the controls. Only 3 of the original 10 irradiates survived. Repeating the iron-59 injection technic 34 days after exposure indicated repair and active erythropoiesis in survivors. Plasma iron exhibited periods of both hyper- and hypoferrremia. Those animals destined to die were consistently hypoferrremic for 2 to 3 days prior to death. Postexposure implications of iron-59 incorporation levels and plasma iron values are discussed. NSA 12-8926

THE DOSIMETRY AND LETHAL EFFECTS OF MATERNALLY ADMINISTERED PHOSPHORUS-32 AFTER 14 AND 17 DAYS OF GESTATION IN THE RAT. Melvin R. Sikov and James E. Lofstrom (Wayne State Univ. Coll. of Medicine, Detroit). Phys. in Med. Biol. 2, 157-68(1957) Oct.

Pregnant female albino rats were given graded doses of radiophosphorus after 14 or 17 days of gestation and sacrificed at intervals after injection through birth. One millicurie or less of P-32 did not increase prenatal mortality after administration on either of these two days. Two millicuries produced prenatal deaths when administered after 14 days of gestation but not after 17 days, some deaths attributable to the trauma of partition were noted in both cases. A depression of the growth curve and of birth weight was produced by doses of 0.4 mc and larger after 14 days and by doses of 0.6 mc and above after 17 days of gestation. The curves of accumulated radiation dose to the whole fetus and to various organs and systems as interpolated to one millicurie are presented and discussed. NSA 12-9607

RADIO-ACTIVE FALL-OUT AND ITS HAZARDS TO MAN. W. R. McMurray (South African National Physical Research Lab.). *S. African Med. J.* **31**, No. 49, 1246-52 (1957) Dec. 7.

The facts concerning radio-active fall-out from the testing of fission-type nuclear weapons are reviewed and summarized in a form convenient to the assessment of the resultant effects on man. These are seen to be twofold, namely the genetic effect and the effects of ingested strontium-90. The genetically effective dose from fall-out is compared with the very variable naturally occurring background radiation dose and it is concluded that the genetic aspect of fall-out hazard is relatively unimportant. The remaining uncertainties in the estimates of the effects of ingested strontium-90 are not sufficient to completely invalidate conclusions based on the available data. It is shown that should nuclear-weapon testing continue at its present rate of 10 Megatons per year, the dose of strontium-90 to the bone should not exceed the average dose from natural sources. The strong dependence of the intensity of natural background on the human environment is emphasized as a very relevant consideration. NSA 12-12189

THE INTERNAL DOSE TO VARIOUS ORGANS AS A FUNCTION OF ISOTOPIC COMPOSITION OF THE FISSION PRODUCTS IN A REACTOR WITH A SPECIFIC HISTORY OF OPERATION. James O. Alderman and Kent C. Humpherys. May 1957. 63p. Project 1809. (AFSWC-TN-57-22; AD-134699)

An evaluation was made of the relative importance of the various isotopes formed in a reactor to the radiation dose which might result from internal deposition following a reactor accident. Tabulated data and graphs are presented for use in making calculations of the internal dose which might be expected in any specific case, regardless of reactor power level and mode of operation. For the case of the reactor with a history of operation used in this report, and neglecting (n,γ) reaction, it is concluded that the external dose resulting from a 10 curie-sec/m³ exposure in an infinite cloud is 4.2 roentgens, a definite upper limit. The internal hazard is markedly greater than the external hazard from a 10 curie-sec/m³ exposure to U²³⁵ fission products at times greater than 4 hours after a reactor accident. NSA 12-12144

KINETIN, A CHEMICAL PRODUCT AFFECTING THE MAMMALIAN CELL DIVISION RATE AFTER TOTAL BODY X-IRRADIATION. Gustavo Cudkowicz (Istituto per Ricerche Terapeutiche «Carlo Erba», Milan). *Minerva Nucleare* **1**, 326-7 (1957) Nov.-Dec. (In Italian).

The effect of kinetin (6-furfurylaminopurine), a substance which markedly promotes cell division in plant tissues, on mitotic activity of mouse jejunum mucosa after a single total body irradiation with 100 r of x rays was studied. The intraperitoneal injection of 2.5 mg of kinetin after the exposure to x rays does not modify the value of mitotic delay, expressed in terms of number of mitoses per 100 crypts of Lieberkuhn at a given post-irradiation time. Nevertheless in the mice treated with kinetin after irradiation the recovery of mitotic activity was more active and the mitotic indexes are increased in comparison to those of the control animals. The results of these preliminary experiments are briefly discussed. NSA 12-6408

THE COURSE OF EXPERIMENTAL HEMOTHORAX IN RADIATION SICKNESS. Chzhu Chzhun lin. *Vestnik Khirurg.* No. 5, 104-9 (1957) May.

Experimental hemothorax induced by injecting 10 to 12 ml of autogenous blood into the pleural cavity of healthy rabbits was born well without any marked general reaction. Rabbits irradiated with 600 r were more affected by experimental hemothorax. Instead of absorption, exudation accumulated in the pleural cavity. In rabbits irradiated with 600 r, experimental hemo-

thorax markedly shortened the latent period of radiation sickness and hastened its climax. NSA 12-9643

9317

EFFECTS OF SOME CHELATING AGENTS ON THE SURVIVAL OF IRRADIATED MICE. C. Corradi, R. Paoletti, and E. Pozza (Universita Milan). Atti soc. lombarda sci. med. biol. 12, No. 3, 3p(1957). (In Italian).

White male mice were irradiated with a single dose of 1,000 r. Ten min. before the irradiation, the mice received an interperitoneal injection of some chelating agent equivalent to 1/3 or 1/6 of the lethal dose of the compound. Some of the chelating agents show a protective effect of the x-irradiated mice. Sodium diethyldithiocarbamate, sodium ethylenediaminetetraacetate, ammonium nitroso-phenyl-hydroxylamine, and sodium nitrilotriacetate show a more protective effect than the same quantities of cysteamine (with respect to the toxic doses). NSA 12-9629

STUDIES ON THE MECHANISM OF ACQUIRED RADIO-RESISTANCE IN CANCER. Alan D. Conger and Helen J. Luippold (Oak Ridge National Lab., Tenn.). Cancer Research 17, 897-903(1957) Oct.

The problem of the mechanism by which radio-resistance of a tumor can be acquired is examined. Three hypotheses to explain the phenomenon are commonly proposed, namely, radiation selection of spontaneous mutant resistant cells in the tumor population, radiation-induced mutation in a tumor cell to resistance, followed by selection, and a complex of radiation effects on the host that interact with the tumor to give the appearance of resistance to the tumor. An experiment with mouse ascites tumor, specifically designed to maximize the likelihood of producing a true, or genetically, radio-resistant tumor line is described, radioresistance was not produced. NSA 12-2650

9319

THE ENDOCRINE DEPENDENCY OF CERTAIN THYROID CANCERS AND THE DANGER THAT HYPOTHYROIDISM MAY STIMULATE THEIR GROWTH. George Crile, Jr. (Cleveland Clinic Foundation and Frank E. Bunts Educational Inst., Cleveland, Ohio). Cancer 10, 1119-37 (1957) Nov.-Dec.

Thyroidectomy or treatment with I^{131} or thiouracil may stimulate the growth of well-differentiated thyroid cancers or may even convert them to anaplastic carcinomas. Probably it is not the radiation from the I^{131} but the secondary hypothyroidism and the increased output of thyroid-stimulating hormone (TSH) that stimulates the cancer. Desiccated thyroid in doses of 3 gr or more daily inhibits the production of thyrotropic hormone and often causes regression of differentiated thyroid cancers. Most inoperable thyroid cancers should not be treated by I^{131} until they have been given a trial on treatment with desiccated thyroid. All patients operated on for thyroid cancer should be given desiccated thyroid to prevent recurrences. NSA 12-2709

X IRRADIATION AND TISSUE RESPIRATION: EFFECTS OF CYSTEAMINE. A. de Schryver. Arch intern. phys. biochim. 64, No. 4, 594-600(1956) (In French).

Five days after whole-body x irradiation of rats, weighing from 160 to 240 g, with a fatal dose of 750 r no modifications in the tissue respiration of the kidney and liver were observed. An average decrease of 25% was observed in the respiration of the myocardiac tissues. The preliminary administration of cysteamine suppresses the diminution of the respiration of the myocardiac tissues. Six hours after irradiation with

750 r, the utilization of oxygen by the spleen is depressed 21%. The preliminary administration of cysteamine reduces the diminution to 16%. The injection of cysteamine, considered as a radioprotector, does not seem by itself to affect the respiration of the spleen, myocardium, or liver. The injection of cysteine appears equally devoid of effects in the same conditions.

THE EFFECTS OF X-RAYS ON THE EMBRYONAL GROWTH AND DEVELOPMENT OF HORDEUM VULGARE L. A. M. Eunus (Michigan State Coll., East Lansing). J. Exptl. Botany 6, No. 18, 409-21(1955) Oct.

The effects of x rays on the developing embryos in barley plants were manifested by a number of abnormalities such as enlargement and vacuolation of cells, disturbances in cell walls, disintegration of cells leading to the formation of cavities, disturbances in distribution of meristematic tissues, a number of proliferations in different parts of the embryo, and retarded growth of the embryo during the early post-radiation period. In addition to these, deeply stained globular cytoplasmic bodies were observed in radiated embryonic cells. Very similar kinds of abnormalities were produced by softer x rays starting from 400 r and including 800 r. The frequency of occurrence and degree of proliferations in embryos irradiated with 800 r were relatively higher than those produced by 400 r and 500 r. Treatments with 300 r units of irradiation induced only the appearance of deeply stained globular bodies within cytoplasm and no effects were visible with dosages below 300 r. Comparative measurements of cell-lengths of the treated and control embryos at undifferentiated as well as at differentiated stages showed an increase in cell-lengths within radiated embryos. Radiated embryos showed defective pattern of germination. Harder x rays were found to be less effective in inducing embryonic abnormalities than softer rays when equal calculated dosages of the two were applied to the flowering spikes of *Hordeum vulgare* L. School of Aviation Medicine, Randolph AFB, Tex. PRELIMINARY STUDY OF THE EFFECTS OF X-IRRADIATION ON THE ANTIBODY-COMBINING CAPACITY OF HUMAN PROTEINS. William G. Glenn and Iowa W. Marable. Nov. 1, 1957. 4p.

Lyophilized human plasma, immune globulin, serum albumin, and pooled normal human serum were exposed in vitro to x radiation up to 200,000 r. These antigens were then titrated with homologous rabbit antisera by the alpha procedure and the extent of reactivity measured by the photorefractometric or light-scattering method. Only in irradiated serum albumin was any appreciable difference in affinity for homologous antibody observed. Such difference was apparently transitory. Serum agar analyses failed to confirm the observation of other workers that x radiation dimerizes protein. Except for serum albumin, highly concentrated human proteins, exposed to large doses of x radiation, undergo no change in antigenicity, as measured by affinity for homologous antibody. NSA 12-7071

INVESTIGATION OF VARIOUS RADIOACTIVE PHOSPHATE SUSPENSIONS AS TO THEIR THERAPEUTIC USE. Heinrich Kutzim (Der Hautklinik der Universität Cologne). Strahlentherapie 104, 551-7(1957). (In German).

The author examined numerous phosphate combinations as to their suitability for use in interstitial, intrapleural, and intraperitoneal therapy. Specially prepared chromium- and aluminum-phosphate suspensions proved singularly appropriate. Contrary to what happened in the case of the remaining combinations, these two were nearly insoluble in the animal organism and remained practically lying unchanged in the injected spot. They showed but a minimum move towards the organs. Even after injection into the venter cavity there was only a very reduced migration into the inner organs. NSA 12-7111

RADIOBIOLOGICAL INVESTIGATIONS AT THE BIOLOGICAL INSTITUTE OF THE ACADEMY OF SCIENCE OF THE U. S. S. R. IN 1956. A. M. Kusin. Atomnaya Energiya 3, No. 8, 178-80(1957).

The following problems were investigated at the Biological Institute of the Academy of Science of the U. S. S. R. in 1956: what physical-chemical structural changes occur in the tissue shortly after irradiation and what is the influence exercised by radiation on the central nervous system. A total of 25 works were published by the Institute. NSA 12-8940

9335

Texas. Univ., Austin. Radiobiological Lab. LATENT EFFECTS OF CHRONIC WHOLE-BODY IRRADIATION ON THE PERFORMANCE OF MONKEYS ON THE SPATIAL DELAYED-RESPONSE PROBLEM. A. A. McDowell and W. Lynn Brown. Nov. 18, 1957. 4p. (AF-SAM-58-50)

Eight normal, 13 low-dose irradiated, and 13 high-dose irradiated rhesus monkeys were tested for 24 trials a day over a 16-day period on a 10-second delayed-response problem. Previous delayed-response testing had failed to differentiate these groups during the first 100 days following the radiation exposure to which the experimental animals had been subjected two years prior to the initiation of the present experiment. The results of the present experiment demonstrated that the hypothesis of a facilitation of delayed-response performance by monkeys as a latent effect of whole-body irradiation is tenable. Normal monkeys can and do perform as efficiently at some points in time as chronic irradiated monkeys, but they appear to suffer interference from stimulus factors extraneous to solution of the problem at hand. HEALING BONE FRACTURES AND SIMULTANEOUS ADMINISTRATION OF RADIOISOTOPES OF SULFUR, CALCIUM AND YTTRIUM. N. S. MacDonald, P. C. Lorick, and L. I. Petriello (Univ. of California, Los Angeles). *Am. J. Physiol.* 191, 185-8(1957) Oct.

A mixture of carrier-free radioisotopes, Ca^{45} , Sn^{95} and Y^{91} , was injected into rats bearing left tibial fractures, in states of repair varying from 3 to 18 days. Twenty-four hours after injection, both tibias were removed and analyzed for content of each radioisotope. At all intervals up to 18 days, postfracture, the injured bone contained more of all three isotopes than the intact, contralateral mate. A maximum in 24 hours retention of radiosulfate in tissue at the fracture site, was reached by the 7th to 10th day, after which retentions of a dose of S^{35} declined rapidly. Retentions of a dose of Ca^{45} in the fractured bone also rose rapidly during the first 3 to 10 days of healing. Thereafter, 24 hour retention values continued to rise but at a reduced pace. The avidity of healing bone for yttrium increased sharply during the same 3 to 10 day interval during which radiosulfate deposition became most effective. After this time 24-hour retention values for Y_{91} increased only slightly, if at all. The data suggest that formation of the sulfated mucopolysaccharides of osteoid matrix and fibrocartilaginous callus began by at least the 3rd day, if not earlier. The healing fracture made its greatest demands for plasma sulfate during the 7th to 10th day, postfracture. New calcium was laid down at the fracture site just as early as new sulfate, but the demands for plasma Ca continued throughout the 18 days of observation, as might be expected for a mineralizing callus. Yttrium fixation in the healing bone appeared to be more closely related to events leading to organic matrix formation than to mineralization of the new tissue. NSA 12-2724

9339

THE EFFECT OF IRRADIATING THE EXTERIORIZED SMALL BOWEL ON SUGAR ABSORPTION. William T. Moss (Northwestern Univ. and Veterans Administration Research Hospital, Chicago, Ill.). *Am. J. Roentgenol Radium Therapy Nuclear Medicine* 78, 850-4(1957) Nov.

Irradiation of the exteriorized small bowel prolongs gastric emptying. It also decreases the rate of glucose and arabinose absorption from the small bowel but absorption of the glucose is influenced more severely. This suggests that phosphorylation is disturbed as well as the process of diffusion. However, the magnitude of the change in the absorption of both sugars suggests that a decrease in the rate of diffusion is the major factor. NSA 12-2637

GAMMA-RAY SENSITIVITY OF SPERMATOGONIA OF THE MOUSE. Eugene F. Oakberg (Oak Ridge National Lab., Tenn.). *J. Exptl. Zool.* 134, 343-56(1957) Mar.

Hybrid male mice were given a range of doses from 5 to 100 r of Co^{60} gamma rays, killed 72 hours after irradiation, and all spermatogonia counted in 100 tubule cross sections per mouse. Young primary spermatocytes at stages VII and VIII in the cycle of the seminiferous epithelium also were counted. Late type A, intermediate, and early type B spermatogonia were uniformly sensitive, with an LD_{50} of approximately 20 to 24 r of Co^{60} gamma rays. Scoring of all type A spermatogonia gave survival comparable to intermediate and type B cells at 5 to 23 r, and a significantly higher survival at 30 to 100 r. The curve obtained for type A cells has been interpreted as resulting from a mixed population of cells with at least

two different levels of sensitivity. These differences in sensitivity could not be correlated with specific stages in the cycle of the seminiferous epithelium, but appeared to exist even in the dormant period, where uniform radiation response might have been expected. Earlier work had shown that intermediate spermatogonia can be identified cytologically at stages II and III. On the basis of radiation data of the present investigation, this differentiation can be detected one stage earlier in the cycle of the seminiferous epithelium, namely, at late stage I to early stage II. Differentiation of intermediate spermatogonia from type A cells appears to be unaffected by radiation. NSA 12-8947

LESIONS IN SWINE EXPOSED TO TOTAL BODY GAMMA RADIATION FROM AN ATOMIC BOMB SOURCE. J. L. Tullis, B. G. Lamson and S. C. Madden. Am. J. Pathol. 28, 545 (1952).

Microscopic alterations were similar to those produced by 600 r total body x-radiation. Lymphocytes, erythroblasts, myeloblasts, spermatogonia and selected epithelial cells of small intestine showed the most extensive change. Capillary congestion, edema, hemorrhage, and growth of bacterial colonies were present in many organs in all animals dying spontaneously

9358

SECONDARY RAYS FROM LIPIODOL AND BISMUTH SUBNITRATE PASTES ON *STAPHYLOCOCCUS AUREUS* AND *BACILLUS COLI COMMUNIS*. M. Fries and M. Lenz. Proc. Soc. Exptl. Biol. Med. 26, 14-16 (1928).

Secondary rays from $BiONO_3$ powder, but not Bion $_3$ paste or Lipiodol inhibited growth of *Staph. aureus* or *B. coli*. Even when the iodine-containing Lipiodol was in contact with the surface of the culture during irradiation, inhibitory effect of secondary rays was slight. CA 23-4239

9359

MUTATIONS AT THE Yg_2 LOCUS IN MAIZE. D. Schwartz. Genetics 40, 594-5 (1955).

Mutagenic effects of ionizing radiations were studied by means of pseudoallelic series of chlorophyll markers on short arm of chromosome 9. Plants of the constitution $WdYg_2$ Py/wd df, heterozygous for an irradiated normal chromosome 9, and one deficient for the terminal 6 chromomeres, were scored for mutations (yellow-green phenotype) at the Yg_2 locus. Irradiation did not significantly increase incidence of yellow-green mutations. Accelerated transformation of genes to allelic forms by ionizing radiations was not proved.

9360

AN INDUCED GENE TRANSFER FROM *AEGILOPS* TO *TRITICUM*. E. R. Sears. Genetics 40, 595 (1955).

Plants with an added derived isochromosome involving the resistance-carrying arm were x rayed prior to meiosis, later used to pollinate normal, untreated plants. Of 6091 progeny, only 132 were resistant. Of these, 50 had a translocation involving the Aegilops chromosome. Pairing behavior of one translocated chromosome showed that resistance gene locus is near the centromere, thus reciprocal translocations involved almost the entire arm of this chromosome.

9361

EFFECT OF CHRONIC GAMMA-RADIATION ON SOMATIC MUTATIONS IN MAIZE. W. R. Singleton and A. L. Caspar. Genetics 40, 595-6 (1955).

Corn plants with genetic constitution P^{Tr}/p grown at different distances from a Co^{60} source received γ ray doses of 0.8 r - 185 r/day. Plants exposed to highest doses grew poorly and produced no seed. Frequency of mutations (greater than trace) increased linearly with increasing doses above 5 r/day; no increase at lower doses. Mutations involving a kernel or more were rare; showed little increase with increasing doses.

9362

IMMEDIATE EFFECT OF X RAYS ON THE DPN-DPNH RELATIONSHIP IN GRASSHOPPER EGGS. T. N.

Tahmisian and B. J. Wright. *Federation Proc.* **15**, 184 (1956).

Partial reduction follows irradiation. When the biological material is irradiated in the presence of O₂, more oxidative than reducing radicals are formed.

9363

STUDIES WITH RADIOACTIVE TRACERS IN PLANT NUTRITION. I. PROBLEMS IN THE USE OF RADIOACTIVE TRACERS. R. Scott Russell and R. P. Martin. *J. Exptl. Botany* **1**, 133-40 (1950).

Tracer methods can yield valid results only if the behavior of the tracer within the plant is indistinguishable from that of the normal element. Valid radioactive tracer studies require information about (a) isotope's chemical and physical behavior before disintegration, (b) effects of new substances formed by isotopic disintegration; (c) effects of the radiation emitted.

9364

COMPARATIVE GENE STABILITY IN GLOMERELLA AND NEUROSPORA. C. L. Markert. *Genetics* **36**, 564 (1951).

More than 100 auxotrophic mutants of Glomerella were induced by mutagenic radiations - u-v, x-rays, and fast neutrons and by specific nutritional requirements of 74 mutants determined by methods comparable to those used with Neurospora. There were no qualitative differences in types of mutants induced by the three radiations, but u-v appeared to induce the most easily repaired type of genetic damage.

9365

CHROMOSOME STUDIES ON TRILLIUM KAMTSCHATICUM PALL. AND ITS ALLIES. IX. CHROMOSOME ABERRATIONS INDUCED BY X-RAY TREATMENT. H. Matsuura and T. Haga. *Cytologia (Tokyo)* **16**, 37-47 (1950).

First meiotic and pollen grain divisions after x-irradiation of resting T. kamtschaticum pollen mother cells showed breakage and reunion of chromosomes and chromatids. At the first meiotic metaphase, there was evidence of union between two broken chromosomal ends or between broken and unbroken end. (from abstract). PBA 21-2358

9366

CHROMOSOME STUDIES ON TRILLIUM KAMTSCHATICUM PALL. XVI. ALTERATIONS OF THE NUCLEOLUS-CHROMOSOME SYSTEM DUE TO IRRADIATION. H. Matsuura. *Cytologia (Tokyo)* **12**, 271-88 (1942).

Pollen grains from x-irradiated pollen mother cells showed (1) disturbed relationship between chromosomes and nucleoli, often so profound that every chromosome end might function as a nucleolar organizer and (2) translocations and inversions involving terminal segments, the nucleolus organizing regions taking intercalary positions, thus giving rise to SAT constrictions. PBA 21-89

9367

THE RELATIONSHIP OF CHIASMATA AND CROSSING OVER IN LILIUM FORMOSANUM. Spencer W. Brown and Daniel Zohary. *Genetics* **40**, 850-73 (1955)

Frequency of a single chiasma in the deficient arm corresponded closely to equational separations at anaphase in plants heterozygous for either of two terminal deficiencies induced by x-irradiating pollen. Assuming random relationship among chromosomes involved, crossing over frequency at anaphase I did not vary from that expected on the basis of chiasma formation at diakinesis.

9368

DELAYED EFFECTS IN CHROMOSOME BREAKAGE BY X-RAYS IN TRADESCANTIA BRACTEATA. K. C. Bora. *J. Genet.* **52**, 140-151 (1954).

Chromosome breakage is delayed, not simultaneous with the passage of the ionizing particle. Mechanism of x ray induced breaks is indirect, probably through a series of biochemical processes. Most breaks either reconstitute or reunite within a short time after induction. Chromatid breaks and triradials occurring with chromosome aberrations suggests that some breaks may remain open.

9369

THE INFLUENCE OF TEMPERATURE ON THE PRODUCTION OF CHROMOSOME ABERRATIONS BY FRACTIONAL X-RAY DOSES IN THE MICROSPORES OF TRADESCANTIA BRACTEATA. I. EFFECT AT 25°C. K. C. Bora. *J. Genet.* **53**, 29-40 (1955).

Tradescantia microspores received fractionated x ray doses, total doses being 180, 300, 312, 340 and 360 r with corresponding intensities of 60, 3.26, 480, 170 and 18 r/min, temperature 25°C., 1-32 hour intervals separating the fractional doses. Tissue was fixed 36, 48, 72, or 120 hours. post exposure. No recovery of the breakage frequency was observed even with 32 hr. interval.

9370

THE INFLUENCE OF TEMPERATURE ON THE PRODUCTION OF CHROMOSOME ABERRATIONS BY FRACTIONAL X-RAY DOSES IN THE MICROSPORES OF TRADESCANTIA BRACTEATA. II. EFFECTS AT 10°C. K. C. Bora. *J. Genet.* **53**, 41-8 (1955).

Tradescantia microspores show no recovery of chromosome breakage frequency when two equal fractions of a 340 r dose (170 r/min.) are separated by intervals of 1-32 hr. Fractionation effect is independent of temperature during irradiation and the interval, and of the nuclear stage to which the radiation is delivered.

9371

SPLITTING THE GENE. D. Lewis. *Discovery* **8**, 168-73 (1947).

Incompatibility (physiological barriers to self fertilization and certain cross fertilizations in plants) is determined by an incompatibility gene that may be split by x irradiation. Thus, irradiation might make a small increase in economic fruit production.

9372

EFFECT OF X IRRADIATION ON FORMATION OF ROOTS IN BEAN CUTTINGS. R. G. Trudova. *Doklady Akad. Nauk SSSR* **85**, 429-32 (1952). (In Russian).

Meristem tissue growth is highly radiosensitive. Doses of 250-500 r delay and 2000 r and higher suppress cell division. Purpose of experiment: to study ability of meristem cells and specialized cells to undergo fission after X irradiation. No great difference in x ray sensitivity of meristem cells and specialized cells was observed, although meristem cells recovered more completely. (resumed cell division after irradiation)

9373

SENSITIVITY OF THE TISSUES OF POTATO TUBERS TO X RAYS DEPENDING ON THEIR PHYSIOLOGICAL CONDITION. O. S. Engel. *Doklady Akad. Nauk SSSR* **85**, 437-9 (1952). (In Russian).

Doses of 4000 to 6000 r, 610 r/min., increasing in geometric progression were delivered to parenchyma of potato tubers. Radiosensitivity was found to depend on physiological conditions during irradiation. Greatest sensitivity: onset of growth of tuber of the maternal plant. During resting period, parenchyma of potato tubers is less sensitive.

9374

EFFECT OF DEEP COOLING DURING IRRADIATION ON THE DISRUPTION OF THE SYNTHESIS OF GLUTATHIONE AND ASCORBIC ACID IN WHEAT KERNELS DURING

GERMINATION. S. D. Chigirev. Doklady Akad. Nauk SSSR 101, 1055-7(1955). (In Russian).

During germination in darkness, the speed of mobilization of reserve matter of wheat kernels is diminished; synthesis of glutathione and ascorbic acid is depressed by x ray doses of approximately 52,000 r. Irradiation of germinating kernels during deep cooling affects the expenditure of reserve matter, and synthesis of glutathione and ascorbic acid to a lesser degree.

9375
THE EFFECT OF X-RAYS ON THE TISSUE. F. Pordes. Fortschr. Roentgenstr. 31, 287-297(1923). (In German).

This is a general consideration of the biological effects of x rays. Specific cell structures are considered to vary in radiosensitivity according to their "stability," cytoplasm being unstable therefore easily injured, the nucleus being more stable therefore less easily injured. The author emphasizes, however, that the effect of radiation on chromatin and chromosomes is of central importance because of the genetic effects. Secretory cells are easily injured. Roentgen sickness is attributed to disturbed cellular function of spleen, liver and intestinal cells.

9376
ON THE ACTION OF ROENTGEN AND RADIUM RAYS ON TRYPANOSOMA LEWISII. Waldemar Loewenthal and Walter von Rutkowski. Brit. J. Radiol. 13, 317(1908).

T. Lewisii was propagated by intraperitoneal injection in rats. Blood from the tail was observed microscopically in hanging drop preparations to determine the effect of in vitro irradiation on the living parasites. Parasites showed no effects of exposures (as long as 22 hr) to Ra. In contrast, 15-30 min. x ray exposure immobilized, but did not kill them. The injured trypanosomes contained a characteristic vacuole which the author considered to represent disturbed osmotic function of the protozoa

9377
INHIBITION OF MITOSIS IN THE ROOT OF THE BROAD BEAN (VICIA FABA) BY NITROGEN MUSTARD. B. Wolff and J. Read. Brit. J. Radiol. 25, 560(1952).

Author compares effects of x rays on % mitotic cells in the bean root with effects after immersion for various times in solutions of N. mustard in μ mole range. Earlier studies comparing effects of the 2 agents on growth of the roots indicated that 50 r was equivalent to 1 μ mole hr. Present study shows that 46 and 47 r = 1 μ mole hr. when mitosis is the biological variable.

9378
EARLY RADIATION DEATH. K. C. Brace and H. L. Andrews. (United Nations Publication A/CONF. 8/11 United Nations, N.Y.). Proc. Internat. Conf. on Peaceful Uses of Atomic Energy; Geneva 11, 115-117(1956).

Adult guinea pigs were irradiated with 200 Kvp X-rays. Following a dose of 5000 roentgens they showed progressive depression leading to death in 120 hours. Above 6000 roentgens, hyperactivity replaced depression. First signs of radiation were observed after 2000 roentgens, a drop in rectal temperature and slight bradycardia. Changes in blood chemistry were comparatively small.

9379
INFLUENCE OF CATALYTIC FERTILIZERS AND OTHER LITTLE USED SUBSTANCES ON THE GROWTH OF THE SUGAR BEET. O. Munerati, Mezzadrolì and T. V. Zapparoli. Staz. Sper. Agrar Ital. 46, 486-498(1913).

Plants grown in the field and in pots were treated with uranium sulfate. Other salts used were those of Mn, B, and Al. There was no observed effect of uranium sulfate on plants grown in pots. Results of experiments with field plants indicated that the value of catalytic fertilizers is uncertain. CA 8-1482

9380
BLOOD CHANGES IN ROENTGENOLOGISTS. V. Jagic, N. G. Schwarz and L. Siebenrock. Berl. klin. Wschr. 48, 1220(1911).

Blood changes indicate narrow injury which may progress to a true aplasia.

9381
THE EFFECT OF FRACTIONATED X RAY DOSAGE ON THE FREQUENCY OF CHROMATID AND CHROMOSOME ABERRATIONS. Karl Sax, Edward D. King and Henry Luippold. Radiation Research 2, 171-9(1955). NSA 9-4352

9382
ON THE GENERAL EFFECTS OF EXPOSURE TO RADIUM ON METABOLISM AND TUMOR GROWTH IN THE RAT AND THE SPECIAL EFFECTS ON TESTIS AND PITUITARY. J. C. Mottram and W. Cramer. Quart. Exptl. Physiology 13, 209-226(1924).

Rats were given small doses of radiation over a long period to (1) whole body (2) testis (3) the pituitary. Animals gained weight due to increased adipose tissue. Following testicular exposure hypertrophy of seminiferous tubules and hypertrophy of interstitial cells of testis were followed by changes in all three parts of pituitary gland. Irradiated rats were more resistant to tumor inoculation than were control animals.

9383
PRESERVATION OF FOOD BY IONIZING RADIATIONS. F. H. Banfield. Nature 176, 731(1955).

Ionizing radiations, their generation, properties and technical problems associated with use are reviewed. Most suitable type of radiation and its optimum dose, the possibility of reactions initiated by dosage involving production of undesirable and toxic substances or the destruction of some essential constituent, all these need to be studied extensively.

9384
ACTION OF X RAYS ON THE TESTICLE OF THE WHITE RAT. J. Bergonie and L. Tribondeau. C. R. Soc. Biol. 58, 154(1905). 3rd note.

9385
URANIUM NITRATE AND MANGANESE SULPHATE, THEIR ADVANTAGEOUS EMPLOYMENT IN CULTURE OF FRUIT TREES. J. Ray and G. Pradier. L. engrais 24, 1029(1909).

Fertilizing with MnSo₄ increased the vegetation of apricot trees and the tree produced larger fruit. Nitrate and uranium favored development of young cherry and pear trees when spread about the trees in solution containing 0.0002 part per thousand. Treatment had no appreciable effect on trees five or six years old. (from abstract). CA 4-807

9386
ON THE MECHANISM OF LEUKOPENIA PRODUCED BY EXPERIMENTAL X IRRADIATION. Ch. Aubertin and E. Beaujard. Comptes rend. Soc. Biol. 64, 410(1908).

Studies on guinea pig bone marrow are reported. Authors observed stimulation of marrow, especially erythroid series, in irradiated animals. Leukopenia was attributed to destruction of mature circulating cells in excess of formation of new cells.

9387
ACTION OF X RAYS ON BLOOD AND BONE MARROW. Ch. Aubertin and E. Beaujard. Arch. de med. exper et d anat. pathol. 20, 273(1908). (In French).

Studies on the marrow of irradiated guinea pigs are reported.

9388
DISTRIBUTION OF LEAD IN THE CAT AFTER INTRAVENOUS INJECTION OF A COLLOIDAL LEAD PREPARATION

AND THE EFFECT OF RADIATION ON THIS DISTRIBUTION. B. L. Crawford, H. Stewart, C. Willoughby and F. Smith. *Am. J. Cancer* **33**, 401-422(1938).

Cats receiving i. v. lead preparation and x irradiation showed greater toxic manifestations than cats receiving Pb alone. The increased effect appears to be due to additive effects of Pb and x ray rather than to altered Pb distribution in the irradiated animal.

9389
SYNTHESIS OF PYRIDOXIN BY A "PYRIDOXINLESS" X RAY MUTANT OF *NEUROSPORA SITOPHILA*. J. L. Stokes, J. W. Foster, and C. R. Woodward. *Arch. Biochem.* **2**, 235-245(1943).

The ability of the mutant to synthesize pyridoxine in the pH range 5.8-7.3 and in the presence of ammonium N is limited by the x-ray-induced gene mutation. Pyridoxine is synthesized independently of pH and N source by the normal parent strain. CA 37-5441

9390
SYNTHESIS OF ALL TYPES OF RING COMPLEXES IN Einkorn wheats. K. Yamashita. *Genetics* **37**, 637-8 (1952).

9391
VITAMIN CHANGES IN DAIRY PRODUCTS AND PLANTS ON GAMMA IRRADIATION. Anonymous. *Nutrition Revs.* **12**, 138-9(1954).

Irradiation of fresh milk products at dosages of 80,000 to 2,000,000 r destroyed vitamins A and E, carotenoids, ascorbic acid and riboflavin. Phosphatase was inactivated slightly. In contrast to the rapid destruction of ascorbic acid in dairy products, there was an increase of ascorbic acid in green plants irradiated with gamma-rays from Co 60.

9392
RADIOACTIVE ISOTOPES IN THE SERVICE OF PLANT BREEDING. C. Kjørven. *Norsk. Landbruk* **20**(9) 192-3 (1954).

Author reviews the use of radioactive isotopes to induce mutations in economic plants. Irradiation of the barley *Domen* has produced plants 14 days earlier than the parent variety. During the previous year mutants were obtained in cereals, clover and tomatoes.

9393
ON RECENT INVESTIGATIONS OF THE ACTION OF RADIUM ON PLANTS AND ANIMALS. Louis Hussakof. *Med. Record* **72**, 89-94(1907).

Characteristics of alpha, beta, and gamma rays are discussed. Author then considers whether the change produced in living tissues by either the rays or the emanation is a physical or chemical change. Conclusion: it appears that the action is chemical.

9394
SOMATIC CHANGES INDUCED BY X RAYS IN THE NUMBER OF COTYLEDONS OF *ERANTHIS HIEMALIS*. B. Haccius and E. Reinholz. *Naturwiss* **40**, 533(1953)

Eranthis hiemalis embryos are very immature at seed maturity, development continues in mature seed through the summer. Seeds were irradiated before cotyledon development began. Cotyledon abnormalities, including polycotily, became numerous with doses of 2000 r or more. Treatment of seeds with growth substance solutions caused tricotily. BA 28-26939

9395
GENETIC RESEARCH ON VORSTENLAND TOBACCO N. P. Badenhuizen. *Landbouwk. Tijdschr (Wageningen)* **60**, 179-86(1948).

Seed treated with 0.2% colchicine in petri dishes between filter paper readily gave tetraploids, which are smaller than diploids. Haploids, obtained by irradiating

pollen, resemble diploids but flowers and cells are smaller. Doubling of these haploids by treating the growing point was difficult. PBA 19-1969

9396
MUTATION AND POLYPLOIDY IN PLANT BREEDING. W. Hoffmann. *Kuhn-Archiv* **67**, 17-32(1953).

Evolution by chance mutation and the importance of mutations in plant breeding are discussed. Under natural conditions, polyploid strains adopt to new or unfavorable conditions more readily than do diploids. (from abstract). PBA 24-1752

9397
AN UNUSUAL ASSOCIATION OF TWO MUTANT CHARACTERS. C. C. Moh, R. A. Nilan and F. C. Elliott. *J. Heredity* **46**, 35-40(1955).

A mutant line of barley characterized by a high frequency of yellow-green seedlings arising from partially sterile green plants was induced by atomic bomb radiation at Bikini in 1946. Average percentage of ovule and pollen abortion in the partially sterile green plants were 29.4 and 26.6. Three types of gametes produced by parental type plants were viable.

9398
WHAT IS A GENE? M. Demerac. *J. Heredity* **24**, 369-78(1933).

Literature concerning the size and behavior of genes is reviewed. Gene is likened to a single organic molecule and gene string to groups of organic molecules, such as occur in chain hydrocarbons. BA 8-17158

9399
CHROMOSOME BREAKAGE AND THE NUCLEIC ACID CYCLE. APPENDICE II: POLLEN GRAINS AND POLLEN TUBES. C. D. Darlington and L. F. LaCour. *J. Genet.* **46**, 263-267(1945).

Irradiation affects the time scale of development. Since radiation-induced chromosome breakage is variably measured referable to this time scale, single-time comparisons have shown discordant results. Comparison of pollen grains and pollen tubes shows their chromosomes have a similar breakability and inherent rejoinability.

9400
CHROMOSOME BREAKAGE AND THE NUCLEIC ACID CYCLE. APPENDICES I. THE CALCULATION OF SISTER-REUNION FREQUENCY (BU K. MATHER). C. D. Darlington and L. F. LaCour. *J. Genet.* **46**, 252-63 (1945).

Broken ends of *Trillium erectum* pollen grains show a higher rate of sister reunion when carried by acentrics than by centrics. Sister reunion of a break is independent of other breaks in the nucleus. Multiple breaks in one nucleus do not interfere with one another in the chromosome arms in which they occur. (from author's

9401
CHROMOSOME BREAKAGE AND THE NUCLEIC ACID CYCLE. C. D. Darlington and L. F. LaCour. *J. Genet.* **46**, 180-267(1945).

X rays act directly on nucleus and cytoplasm, and indirectly on each, through the other. The difficulty of separating these nuclear and cytoplasmic effects has been so great that the effects have been considered as being independent. By separating them in experiment and comparing experimental and spontaneous breakage, they are found to be associated by way of nucleic acid cycle. They can be used to study variations in this cycle.

9402
CYTOGENETICAL STUDIES ON THE STERILE WILD SENNA (*CASSIA TORA* L.). PRODUCED BY THE ATOMIC

BOMB EXPLOSION. IV. ON THE GIGAS MUTANTS SEGREGATED FROM THE ASYNAPTIC WILD SENNA (CASSIA TORA L.). T. Katayama. J. Fac. Agr. Kyushu Univ. 10, 119-32(1953).

The Gigas mutants had a later flowering date, high sterility, larger leaves and rachis, greater height and stem width and branched more frequently than the normal plants. They were trisomics with 27 chromosomes and showed various aberrations at meiosis. PBA 24-2354

9403

THE ACTION OF BURIED TUBES OF RADIUM EMANATION ON NEOPLASIAS IN PLANTS. Isaac Levin and Michael Levine. J. Cancer Research 7, 163-70(1922).

In normal adult tissue the only perceptible result of an insertion of a radium emanation tube is complete destruction of tissue in immediate vicinity of the capillary. Insertion of radium emanation tubes into crown gall tissue is followed by inhibited tumor development, mainly due to effect of soft B rays.

9404

ANALYSIS AND SYNTHESIS OF RECIPROCAL TRANSLOCATIONS IN BARLEY. Y. Nishimura and H. Kurakami. Japan J. Breeding 3, 45-7(1953). (In Japanese).

By intercrossing lines with 4-membered and 6-membered chromosome rings (obtained by x radiation), further lines with rings of 6, 8, 4 + 4 and 4 + 6 chromosomes were obtained. Data on the fertility of each line are given. PBA 24-2960

9405

MUTATIONS IN RICE INDUCED BY X IRRADIATION. Y. Nishimura and H. Kurakami. Japan J. Breeding 2, 65-71(1952).

Soaked seeds of four varieties Noain 8, 20, 25, and 29 were treated with approximately 20,000 r. Distribution and inheritance of sterility in the X1 and X2 generation is described. Partial sterility in X2 was associated with presence of multiple associations of 4 chromosomes, presumably due to reciprocal translocation in preceding generation. PBA 24-1120

9406

IRRADIATION OF SPIROGYRA CHROMOSOMES. M. B. E. Godward. Heredity 8, 293(1954).

After 3000r, each nucleus showed fragments, the mean per nucleus being 6. After 15,000 r about 90 fragments were found. They passed to the mitotic poles, and survived nine days. At this degree of fragmentation an occasional chromosome fragment was left on the equator of the mitotic spindle, suggesting the presence of non centromere material in chromosomes.

9407

THE EFFECT OF FRACTIONAL X-RAY DOSAGE ON THE FREQUENCY OF CHROMOSOME ABERRATIONS. Karl Sax and Henry Luippold. Heredity 6, 127-31(1952).

Experiments have not confirmed conclusions that reduction of chromosome aberration frequency following fractional dosage can be attributed to a "depressing effect on sensitivity to breakage." Effect of fractional dosage can be attributed to failure of breaks induced at first exposure to survive longer rest periods. Broken ends from first exposure cannot unite with broken ends from second exposure to produce the 2-hit chromosome aberrations. (from author's summary.)

9408

STRUCTURE OF THE INCOMPATIBILITY GENE. III. TYPES OF SPONTANEOUS AND INDUCED MUTATION. D. Lewis. Heredity 5, 399-414(1951).

Four alleles of incompatibility gene in *Oenothera organensis* have been tested for mutation. Two of these alleles have not mutated, either spontaneously or after

x irradiation, in a total of 80×10^6 gene divisions tested. The two other alleles have given both permanent and revertible mutations, which may occur spontaneously and are induced by x rays.

9409

THE CHEMICAL BREAKAGE OF CHROMOSOMES. C. D. Darlington and P. C. Koller. Heredity 1, 187-221(1947).

Dilute vapor of mustard gas applied to anthers for 2 minutes has a prolonged toxic action on cell, especially the nucleus, like that of continuous low intensity radiation. Mustard gas and x ray breaks differ from spontaneous breaks, the former being associated with a higher frequency of sister-reunion among acentrics, and a lower frequency of sister-reunion in cells with more breaks.

9410

SIGNIFICANCE OF RADIOACTIVITY IN PHYSIOLOGY OF PLANTS. J. Stoklasa. Centr. Bakteriöl. Parasitenk Abt. II. 40, 266-280(1914).

CO₂ production of O₂ consumption are increased in daylight under Ra emanation. The greatest increase in gas exchange was observed in plants exposed to 150-160 units of Ra emanation per 1 of air, 50,000 - 60,000 units per 1 produced harmful effects long after exposure. Roots were most resistant, blossoms less so, buds and leaves were least resistant. CA 8-2739

9411

RADIOACTIVITY OF POTASSIUM AND ITS SIGNIFICANCE IN NONCHLOROPHYLLOUS AND CHLOROPHYLLUS CELLS. I. J. Stoklasa. Biochem Z. 108, 109-139(1920).

Germination is stimulated by natural radioactivity much more effectively than by induced or artificial radioactivity derived from Ra emanations. Emanations of K can stimulate the processes of germination to a great degree. CA 15-248

9412

ANALYSIS OF DATURA STRAMONIUM PLANTS GROWN FROM SEEDS EXPOSED TO X-RAYS. A. S. Blakeslee, A. D. Bergner, S. Satina, A. G. Avery, J. L. Cartledge, and J. S. Potter. Anat. Record 44, 281(1929)

Plants grown from *Datura* seeds x irradiated for (1) 50 or (2) 65 minutes, showed chromosomal and pollen disturbances and gene mutations among their offspring. Abnormal chromosomal configurations and bad pollen were obtained from (parts only) three P1 plants.

9413

A COMPARISON OF THE LETHAL EFFECT ON THE IMMEDIATE PROGENY OF POLLEN TREATED WITH X-RAYS AND RADIUM. J. T. Buchholz and A. F. Blakeslee. Anat. Record 51(suppl.), 105(1931).

Pollen of normal plants of *Datura stramonium* were subjected to x-rays and gamma rays of radium from 15 minutes to nearly 18 hours. Untreated *datura stramonium* pollen was compared with x and γ irradiated (15 min nearly 18 hrs) pollen in self fertilization experiments. Irradiations reduced seed yield per capsule by 0 to 100 per cent of controls. Relative effectiveness of the two kinds of radiation was comparable.

9414

THE RATE OF INDUCED MUTATION IN RELATION TO DORMANCY, TEMPERATURE AND DOSAGE. L. J. Stadler. Anat. Record 41, 97(1928).

About 90% of x ray induced mutations in barley may be detected in the seedling stage. Mutation rate was much lower in irradiated dormant seed than in irradiated germinating seed. Dormant seed are more radioresistant than germinating seed. Radiation intensity, but not temperature, influenced mutation rate.

9415

EFFECTS OF X RAYS UPON GREEN PLANTS. IN:

BIOLOGICAL EFFECTS OF RADIATION. E. L. Johnson. B. M. Duggar, ed. 2v. 2, 961-85(1936) New York, McGraw-Hill. BA 10-18025

9416

ARTIFICIAL INDUCTION OF HAPLOID DURUM WHEATS BY POLLINATION WITH X RAYED POLLEN. A. K. Efeikin and B. I. Vasil'ev. Trudy Priklad. Botan. Genet. 1. Seleksiya 9, 39-5(1936). (In Russian with English summ).

Emasculated flowers of wheat were pollinated by pollen treated with 2200-2500 r. Among the few seeds produced some were normal diploids and others were haploid. One haploid plant was obtained from an Emmer wheat and one from T. persicum fuliginosum. Phenotypically they differed widely from the parents and showed morphological similarities to T. monococcum. BA 11-2665

9417

ARTIFICIALLY INDUCED MUTATIONS IN OATS. K. J. Frey. Agron. J. 46, 49(1954).

Mutants of agronomic value obtained from x irradiated huron include: (1) shorter and stiffer straw; (2) earlier maturity by 4-6 days; and (3) "field tolerance" to crown rust and resistance to stem rust apparently caused by race 7. PBA 24-1893

9418

INVESTIGATIONS IN THE BIOPHYSICS AND BIO-CHEMISTRY OF THE CELL NUCLEUS. Alfred Marshak. Trans. N. Y. Acad. Sci. 17, 506-19(1955).

The author reviews biophysical and biochemical studies dealing with (1) response of nuclei and chromosomes to ionizing radiations and (2) effects of ionizing radiation on meiosis and mitosis, including chromosome abnormalities, inhibition of mitosis and the behavior of chromosomes.

9419

THE EFFECTS OF RADIUM EMANATION ON THE CROWN GALL TISSUE. Michael Levine. Am. J. Roentgenol. Radium Therapy 14, 221-33(1925).

Small amounts of radium emanation sealed in glass capillaries and implanted in the crown gall tissue for short periods produced little effect on surrounding tissues. Longer exposures and larger doses induced necrosis of tissues, within a radius of 0.5 to 5mm.

9420

PRESERVATION OF FOODSTUFFS WITH IONIZING RADIATIONS. R. S. Hannan. Times Science Rev. no. 17, 6-8(1955).

The author discusses the use of ionizing radiations in extending the storage life of perishable foods. Potentially the most useful property of the ionizing radiations for the processing of foods is their ability to inactivate micro-organisms capable of cell division. Although inactivation of micro-organisms can be readily achieved, much more research is required before radiation is used commercially for food storage.

9421

THE FREQUENCY OF MUTATION OF SPECIFIC GENES IN MAIZE. L. J. Stadler. Anat. Record 47, 381(1930).

Frequency of 8 well known recessive mutations (C, I, Pr, R, Sh, Su, Wx and Y) was determined in x irradiated maize. Mutations were found for all genes tested except Wx. X irradiation of young ear shoots before megasporogenesis, in intensity sufficient to induce numerous recessive mutations for seedling characters, did not affect rate of mutation of R. Among 17, 292 x rayed gametes tested, 23 mutants were found.

9422

THE INHERITANCE OF TWO CHLOROPHYLL DEFICIENCIES IN ASIATIC COTTONS. R. Balasubrahmanyam

(Central Cotton Comm.). 1947. p.97-99 of THIRD CONFERENCE ON COTTON GROWING PROBLEMS IN INDIA, 1946.

An albino mutant of G. herbaceum var. frutescens and a xantha mutant of G. arboreum var. neglectum f. indica occurred as the result of x irradiation. Both types are lethal in the homozygous condition; normal green is completely dominant. (from abstract). PBA 19-1098

9423

ION DENSITY AND BIOLOGICAL EFFECTIVENESS OF RADIATIONS. Lars Ehrenberg. Acta. Radiol. Suppl. 116, 680(1954).

Dry dormant or presoaked germinating seeds were exposed to 175 k-v unfiltered x rays or neutrons. Observations on the following are reported: chromosome disturbances in first mitotic division, growth rate in green-house, field germination, number of maturing plants, fertility and mutation rate (number of chlorophyll deficient mutants in second generation.)

9424

NEW METHODS IN PLANT BREEDING. A. Gustafsson. Svensk Jordbruksforskning 39-44(1953).

Induction of polyploidy and of changes in particular genes or parts of chromosomes and the use of ionizing radiation as exemplified by research at Svalof and Kjeller's experiments in Norway on the treatment of seeds with slow neutrons, are reviewed. PBA 24-36

9425

TWO X RAY INDUCED AUXO-HETEROTROPHICS. N. Fries. Svensk. Botan. Tidskr. 39, 270-8(1945).

Two mutants of Ophiostoma multiannulatum obtained by x irradiating the ascospores, were unable to synthesize biotin and p-aminobenzoic acid. Details of growth response of strain 225 to inositol, malt extract and various doses of biotin, and of strain 617 to various doses of p-aminobenzoic acid are given. PBA 19-161

9426

ON STERILITY IN CASSIA TORA INDUCED BY THE ATOMIC BOMB. III. CYTOLOGICAL OBSERVATIONS ON THE ASYNAPTIC PLANTS. T. Katayama. Sci. Bull. Fac. Agr. Kyushu Univ. 14, 205-15(1953). (In Japanese, with English summary).

A detailed description of meiosis in the asynaptic plants is presented. PBA 24-3250

9427

ON STERILITY IN CASSIA TORA INDUCED BY THE ATOMIC BOMB. II. CROSSING EXPERIMENTS INVOLVING ASYNAPTIC PLANTS AND THE INHERITANCE OF THIS CONDITION. T. Katayama. Sci. Bull. Fac. Agr. Kyushu Univ. 14, 195-204(1953). (In Japanese with English Summary).

An asynaptic strain of C. tora obtained at Nagasaki following the 1945 atomic explosion was pollen sterile but partially fertile when pollinated by normal plants. A 3:1 ratio of normal: asynaptic plants was obtained in the F2, indicating that asynapsis depended on a single recessive gene. PBA 24-3249

9428

THE EFFECTS ON FERTILITY AND THE SEX-RATIO OF SUB-STERILITY EXPOSURES TO X RAYS. A. S. Parkes. Proc. Roy. Soc. (London) B98, 415-436(1952).

Male mice were irradiated before mating. Histologic changes in testes were: (1) large numbers of spermatocytes in tubules (2) abnormally large numbers of spermatids. Sex ratio of male/female offspring depended upon conception time after irradiation.

9429

THE EFFECTS OF IONIZING RADIATION IN BARLEY. L. Ehrenberg and A. Gustafsson. Acta. Radiol 41, 101-4(1954).

Studies on cytoplasmic and chromosomal changes directed towards producing useful mutants in barley are considered with respect to: immediate effects, later effects and second generation properties of mutation frequency and mutant viability.

9430

SOME BIOLOGICAL ASPECTS OF THE FACTOR IN BONE MARROW RESPONSIBLE FOR HEMATOPOIETIC RECOVERY FOLLOWING SYSTEMIC IRRADIATION.

Mary B. Brown, Barbara B. Hirsch, C. Susan Nagareda, Sarah K. Hochstetler, William G. Faraghan, Paul Toch and Henry S. Kaplan. *J. Natl. Cancer Inst.* **15**, 949-73 (1955).

Results of an extensive series of experiments are reported.

9431

COMPARATIVE EFFECT OF RADIOACTIVITY OF URANIUM COMPOUNDS ON GERMINATION AND DEVELOPMENT OF SEEDS. P. Verducci. *Boll. Soc. Ital. Biol. Sper.* **20**, 333-334 (1945).

The effects of uranium nitrate, uranium sulfate and uranyl acetate on grain were dependent on time of exposure, distance of seeds from the chemicals and free surface exposed. Sulfate was more effective than nitrate. *CA* 40-6123

9432

THE EMPLOYMENT OF RADIOACTIVE SUBSTANCES IN AGRICULTURE. J. A. de Vera. *Quim. E. Ind. (Barcelona)* **6**, 55-61 (1929).

Corn, cabbage, pimento, beans, potatoes and lettuce are fertilized with monazite, and the effects are described. Potatoes, tomatoes, wheat, barley, oats, beets and corn are fertilized with uranium and thorium. Monazite is more effective than uranium as a radioactive fertilizer. *CA* 23-2778

9433

LONG-TERM SURVIVAL FOLLOWING X IRRADIATION AND THE IRRADIATION OF THE α PARTICLES FROM RADON AND ITS DECAY PRODUCTS. Joanne Weikel Hollcroft, Egon Lorenz, Marion Matthews and Charles C. Congdon. *J. Natl. Cancer Inst.* **15**, 1059-69 (1955).

Male mice were: (1) x rayed (400 r), (2) radon treated (400 r), (3) controls. Mean survival time: (1) 425; (2) 165; and (3) 377 days. Radon damage is described, including unique alteration in renal cortex. *NSA* 9-2564

9434

NEW EVIDENCE FOR A TOXIC SUBSTANCE ELABORATED AFTER IRRADIATION. A. Edelmann. *Federation Proc.* **14**, 42 (1955).

Adrenalectomized rats, injected intraperitoneally with 4 ml of serum from other adrenalectomized rats which had been exposed (whole body) to 1000 r of x rays 24 hrs. earlier, die sooner than controls given serum from adrenalectomized (but not irradiated) rats.

9435

EFFECT OF RADIOACTIVITY ON THE DEVELOPMENT OF PLANTS. J. Stoklasa. *Compt. Rend.* **155**, 1096-1098 (1912).

Radioactive H_2O caused marked stimulation in the germination and growth of plants, roots, stalks and leaves of *Triticum vulgare*, *Hordeum disticum*, *Vicia faba*, *Pisum sativum*, *Lupinus angustifolius*, *Trifolium pratense* and *Pisum arvense*. Radioactive H_2O hindered growth of *B. mycoides*, *B. Fluorescens*, *liquefaciens* and *B. filifaciens*. *CA* 7-811

9436

NEUTRON AND X-RAY EXPERIMENTS IN WHEAT AND A REVISION OF THE SPELTOID PROBLEM. J. Mackey. *Hereditas* **40**, 65-180 (1954).

In experiments to compare induced mutability at diploid and polyploid levels, common wheat was used as the polyploid representative and barley as diploid. Dry seeds were subjected to treatment with x rays or neutrons. Mutations in wheat showed pronounced groupings, in contrast to random distribution of those in barley. Other results are included.

9437

IRRADIATION EFFECTS, SEED SOAKING AND OXYGEN PRESSURE IN BARLEY. L. Ehrenberg, A. Gustafsson, V. Lundqvist, and N. Nybom. *Hereditas* **39**, 493-504 (1953).

Seeds treated with X rays or neutrons were studied with respect to germination, the chromosomes in seedlings, seedling growth, fertility, and frequency of mutant characters in the X2 and X3, a low dosage of x irradiation increased frequency of mutation in pre-soaked seeds, high dosages caused a marked reduction. Other results are given. *PBA* 24-325

9438

BIOLOGICAL EFFECTS OF X-IRRADIATION AT LOW TEMPERATURES. N. Nybom, V. Lundqvist, A. Gustafsson and L. Ehrenberg. *Hereditas* **39**, 445-57 (1953).

Barley seeds were placed in liquid air (ca -190°C.) or water at 20°C., then X-irradiated. Chromosome distribution in X, Seedlings, growth and fertility of the X, and frequency of mutant characters in X2, indicated that low temperature, (-190°C) acted protectively against both physiological and genetical effects of irradiation. *PBA* 24-326

9439

MODIFICATIONS IN A CALLUS CULTURE OF *SEQUOIA SEMPERVIRENS* AFTER GROWTH OF P32 AND S35. Ernest Ball. *Growth* **17**, 215-28 (1953).

In calluses of *Sequoia sempervirens* treated with sublethal dose of P 32 or S 35 all cells except new initials of tracheid group failed to proliferate. Meristematic groups built up large masses of tissues separated by necrotic materials after several growth periods on a nonradioactive medium. Some treated calluses showed growth-recovery in marginal meristems and formation of normal tissues.

9440

THE EXPERIMENTAL ALTERATION OF HEREDITY. L. J. Stadler. *Growth* **3**, 321-2 (1939).

Mutation and various chromosomal derangements including deficiencies, interchanges, inversions, and intercolations are induced by x ray. Irradiation with UV of appropriate wave lengths results in embryo abortion, endosperm deficiency, and mutations. These may occur without appreciable effect upon frequency of translocation, hence the induced mutations are not merely effects of changed positions of genes.

9441

EVIDENCE FOR SISTER-STRAND CROSSING OVER IN MAIZE. Drew Schwartz. *Genetics* **37**, 623-4 (1952).

A large ring chromosome involving almost the whole of chromosome 6, the nucleolar organizer chromosome, was induced by x irradiating maize pollen. Gametophytes possessing the ring, thus deficient for chromatin in terminal regions of chromosome 6, are viable. Crossing over in heterozygote between ring and its homologous rod chromosome results in bridges in both A1 and A 11. Other results are included.

9442

AN ANALYSIS OF COMBINED INFRA-RED AND X-RAY EFFECTS ON *TRADESCANTIA* CHROMOSOMES. H. T. Yost, Jr. *Genetics* **35**, 700 (1950).

Increases of 50-120% in chromosomal aberrations were observed in infra-red treated cells. Treatments have been given as late as 96 hours after x ray with no

apparent decrease in the infra-red effectiveness. Type of aberration recovered is independent of time of recombination, and depends solely upon singleness or doubleness of chromosome at time of x-irradiation.

9443

ESTIMATION OF WHOLE-BODY RADIATION DOSES IN ACCIDENTAL FISSION BURSTS. J. G. Hoffman and L. H. Hempelmann. Am. J. Roentgenol. Radium Therapy 77, 144-160(1957).

9444

A FRAGMENTED CHROMOSOME IN TRITICUM MONOCOCCUM AND ITS USE IN STUDIES OF INHERITANCE. Luther Smith. Genetics 32, 341-9(1947).

X rays broke a chromosome in the centromere, producing two telocentric fragments. One later formed a secondary trisome. Plants with 14 normal chromosomes plus the telocentric chromosome and plants with 13 normal chromosomes plus two fragments were vigorous and fertile but differed from each other and from normals in macroscopic and cytologic characteristics.

9445

PEACEFUL USES OF ATOMIC ENERGY, BIOLOGY AND MEDICAL SESSIONS AT GENEVA. L. F. Lamerton. Nature 765-767(1955).

A review of papers in the field of biology and medicine.

9446

BIOCHEMICAL MUTATIONS IN THE CRUCIFER ARABIDOPSIS THALIANA (L) HEYNH. J. Langridge. Nature 176, 260-261(1955).

Plant biosynthesis was studied by the mutational block method, using x ray doses of 6000 r., 130 KV, to induce mutations in seeds. One mutation inhibits thiamine synthesis. Mutant plants have mottled cotyledons, and white leaves. All plants die above 27° C. Three lethal mutations prevent formation of plastids from proplastids. Formation of chlorophyll is prevented by another mutant.

9447

EFFECTS OF CATHODE RAYS ON VARIOUS MATERIALS. E. J. Lawton. Science 112, 420(1950).

A dose of 1 million r is lethal to most molds and bacteria. Absorption of 10^6 r produces a temperature rise of about 2° C/g of water. Sterilization dose in some cases produces undesirable changes in odor, taste and color of foods. Enzyme systems are deactivated by cathode rays. Plants from seeds irradiated with electrons produce flowers with color mutations. Chemical changes are produced in other materials irradiated with cathode rays. Enzyme systems mentioned are from both natural and isolated states.

9448

THEORY OF REVERTIBLE MUTATIONS. D. Lewis and Leslie K. Crowe. Nature 172, 501(1953).

Incompatibility gene complex in Oenothera organensis revealed: (1) inactivation, (2) revertible changes including delayed mutations, both induced by x rays. Incompatibility complex consists of two genes; one controls pollen the other style reactions. A seedling of Prunus avium was tested by self-pollination with pollen carrying an x ray-induced mutation. Revertible mutation occurred when irradiation period included prophase. Revertible mutation is due to a loss of polypeptide chains of the gene followed by recovery of the unaffected remainder.

9449

CHROMOSOME ABERRATIONS CAUSED BY RADIOACTIVE THYMIDINE. Henry A. McQuade, Morris Friedkin, and Alice A. Atchison. Nature 175, 1038-1039(1955).

Chromosome aberrations in onion root tips treated with 2-14 C-thymine deoxyriboside and 2-14 C-thymine were studied. Seeds of Allium cepa were germinated, and placed in contact with radioactive solutions. Radiothymidine (19 hr exposure) was more effective in causing chromosomal aberrations than was radiothymine. Chromosome aberrations increase with increased exposure to radiothymidine.

9450

STUDIES ON THE EFFECTS OF X-RAYS ON YEAST CELLS OF DIFFERENT PLOIDY. Robert Mortimer. Radiation Research 1, 225(1954).

Yeast cells exposed to x rays often develop into enlarged two-cell units, with a nucleus in only one cell, indicating cytoplasmic growth without nuclear division. X irradiation produces recessive lethal mutations in diploid cells. Probability that cell bearing recessive lethal mutations would survive increases with ploidy.

9451

ACTION OF GAMMA-RAYS ON SEEDS OF CANNABIS SATIVA L. J. Moutschen and J. Govaerts. Nature 172, 350-351(1953).

Seeds of Cannabis sativa were irradiated by tubes containing 200 mgm. radium. Root tips were fixed in acetic-alcohol, followed by Feulgen squashes. Giant cells with the following characteristics were produced: many nucleic, nuclear polymorphism, variability of chromatic bodies, presence or absence of nucleolus, atypical mitosis. High sensitivity of heterochromatin X to γ -rays is indicated by these results.

9452

HOMOLOGY PATTERNS OF X-RAY INDUCED LETHAL MUTATIONS IN NEUROSPORA. Frank Mukal. Radiation Research 1, 125(1954).

Nuclei of Neurospora bearing induced recessive lethal mutations can be propagated under a condition of heterokaryotic symbiosis with other nuclei not carrying the same mutation. When simple two-component heterokaryons bearing recessive lethals form complex heterokaryons, new combinations of lethal nuclei result, involving qualitatively different genetic determinants.

9453

AN EXCEPTIONAL X-RAY DOSE-MUTATION RELATIONSHIP. H. B. Newcombe. Radiation Research 1, 225(1954).

Deviations from linearity in dose-effect curves for x-ray-induced genetic changes for which two successive treatments have a greater than additive effect can be interpreted on the assumption that two or more separate events cause the effect. Deviations in opposite direction (two successive treatments having a less than additive effect) have been found in variants of Streptomyces, both with high and low doses of x rays.

9454

IONIZING RADIATION AND THE CELL. G. Pontecorvo. Nature 176, 1204-1205(1955).

Comparing loss of function by irradiation, one can infer something about size, shape and molecular stability of structures examined in a cell. A new use of ionizing radiations is probing structure by radiation "sounding" in which a series of beams of increasing energy are used to probe deeper and deeper into the system.

9455

THE EFFECT OF TRITIUM OXIDE ON SOME SYNTHETIC PROCESSES OF CHLORELLA PYRENOIDOSA. J. W. Porter and H. J. Knauss. Radiation Research 1, 253-261(1954).

Chlorella were grown 3 days in 20mc/ml of tritium oxide. Then for 30 hours in nonradioactive inorganic nutrient solution containing tracer quantities of C^{14} bicarbonate. Cells were then fractionated into several gross fractions. Irradiated cells synthesized 2-7 times more triglycerides than did controls.

9456

RADIATION INACTIVATION OF ENZYMES INSIDE AND OUTSIDE INTACT CELLS. Wilson F. Powell and Ernest Pollard. *Radiation Research* 2, 109-118(1955).

Enzyme invertase was bombarded by deuterons and electrons in intact yeast cells. No differences between in vivo and in vitro states were observed. Two respiratory enzymes are inactivated with a three ionizing requirement. Effect of 140,000 r on the respiratory enzymes and of 200,000 r on invertase in the intact cells in aqueous suspension is not measurable.

9457

THE ABSORPTION OF FISSION PRODUCTS BY PLANTS. J. H. Rediske, J. F. Cline, and A. A. Selders. Hanford Atomic Products Operation, *Biol. Research Ann. Report*. HW-35917 p 40-46(1954).

Concentration factors for nine fission products and plutonium indicate that radioisotopes of strontium are hazardous to agriculture. Iodine, barium, and cesium also have high concentration factors, with increased absorption as Ph decreases. As carrier concentration is increased the concentration factor for a particular fission product tends to increase. Concentration of fission product is greater in leaves than in any other organ.

9458

COMPARATIVE METABOLISM OF PROTIUM, DEUTERIUM AND TRITIUM IN THE BEAN PLANT. J. H. Rediske and J. F. Cline. Hanford Atomic Products Operation, *Biol. Research Ann. Rept.* HW-35917 p40-46(1955).

Red Kidney bean plants were grown from germination in a constant tritium oxide-labeled nutrient environment. After 28 days, concentration of H3 in water from the leaves was about 80% of the concentration present in the nutrient environment. Two factors may be responsible for differentiation of tritium and protium oxide in plants: absorptive mechanism of the root and transpiration.

9459

THE EFFECT OF X RAYS UPON THE GROWTH OF AVENA SEEDLINGS. Edgar F. Riley, Jr. *Radiation Research* 1, 227-228(1954).

Inhibition of growth by exposures to x rays was related to mitotic activity in Avena seedlings. Inhibition of elongation was due to inability of cells to utilize the growth regulators. Aqueous solutions of indole acetic acid were inactivated partially by exposures of 10,000 r or more, completely by 50,000 r.

9460

REPRODUCIBILITY OF THE LETHAL EFFECT OF TOTAL BODY IRRADIATION IN MICE. F. Ellinger, J. E. Morgan and E. S. Cook. *Radiology* 64, 210-18 (1955).

With certain experimental precautions, the mortality among mice exposed to a stated x ray dose given as total-body irradiation can be reproduced over a period of several years. At certain points of dose response curve, biological discrimination of lethal effects of various x ray doses differing by $\pm 2.5\%$ can be accomplished with good accuracy. Procedural measures prerequisite to such accomplishments are within the reach of every laboratory and are not prohibitively costly nor do they require excessive numbers of experimental animals.

9461

THE RELATIVE BIOLOGICAL EFFECTIVENESS OF VARIOUS HIGHLY IONIZING RADIATIONS ON YEAST CELLS. Joseph A. Sayeg and Ann C. Birge. *Radiation Research* 1, 560(1954).

The 120-Mev carbon nuclei penetrate 540 μ of tissue and have nine times the rate of energy loss of α -particles of the same velocity. Haploid *Saccharomyces cerevisiae* in dextrose buffer were irradiated. Results: increase in RBE with increasing rates of energy loss to maximum value of 2 and 3.2- MEV α -particles. For higher rates of energy loss produced by low energy carbon ions the RBE decreases to approximately 1.

9462

THE RELATIVE BIOLOGICAL EFFECTIVENESS OF X-RAYS AND β RAYS WITH BROAD BEAN ROOT. J. F. Spalding, Ernest C. Anderson and Wright Langham. *Radiation Research* 3, 348-349(1955).

Groups of broad bean roots were exposed to 200, 238, 336 and 400 r of x ray. Other groups were exposed in tritium water to 178, 229, 293, 371 and 471 rep. The MLD of x rays was 381 r; that of tritium β rays was 248 rep; the RBE of β rays from tritium 1.54. (from author's abstract).

9463

CURRENT RESEARCH IN RADIOBIOLOGY. A. Howard and M. Ebert. *Nucleonics* 11(12), 18(1953), see also *Acta Radiol. Suppl* 116(1954).

9464

VARIOUS EFFECTS OF X RAYS ON THE BONE MARROW CELLS AND A CONTRIBUTION TO THE TIME FACTOR PROBLEM. R. Bauer. *Strahlentherapie* 67, 424(1940).

Thighs of rabbits were exposed to doses of 50 r - 500 r administered as acute single, as fractionated and as protracted doses. Author concludes that erythroblasts are more sensitive than myeloid cells and that basophils are more resistant than eosinophil series. Cell depletion was proportional to dose. (In German)

9465

EXPERIMENTAL STUDIES OF THE HEMORRHAGIC DIATHESIS INDUCED BY ROENTGEN RAYS. J. Fabricus-Moller. Levin and Munksgaard, publishers. Copenhagen (1922).

Guinea pigs were exposed to large (usually lethal) doses of x rays. Post-exposure studies of bone marrow are described. Severe depletion of myeloid and megakaryocytic elements are described but the erythroid cells showed little injury.

9466

THE QUESTION OF THE TREATMENT OF BLOOD DISEASE WITH ROENTGEN RAYS. R. Milchener and M. Mosse. *Berlin. klin. Wschr.* 41, 1267(1904).

Authors report studies on bone marrow changes in irradiated hind limbs of rabbits. (In German)

9467

THE EFFECT OF ROENTGEN RADIATION ON THE BONE MARROW IN VIVO AND IN VITRO. A. Gregori. (In German). *Strahlenther.* 65, 163(1939).

Bone marrow from irradiated guinea pigs was studied in tissue culture. Irradiation decreased the ability of marrow cells to divide and regenerate and caused irreversible changes in most of the cells.

9468

ON THE EFFECT OF HARD ROENTGEN RAYS ON BLOOD AND BONE MARROW AND EXPERIMENTAL STUDIES OF THEIR EFFECTS IN THE CORRECTION OF ANEMIA. F. Shigeto. *Ref. Zbl. Ges. Radiol.* (1940).

Changes in the red and white cells of bone marrow in (rabbits) were observed after x irradiation and are described.

9469

ON THE REACTION PATTERNS OF HEMOTOPOIESIS IN THE BONE MARROW DUE TO ROENTGEN IRRADIATION. (EXPERIMENTAL STUDIES ON THE WHITE MOUSE.) W. Papperitz. Sonderabdruck Berichten Naturforsch. Gesellsch. zu Freiburg i. Br. 37, 1(1939). (In German).

Two days after total body exposure to 400 r, bone marrow of white mice was aplastic.

9470

EXPERIMENTAL STUDY OF THE EFFECT OF ROENTGEN RAYS ON BLOOD. E. Helber and P. Linser. Munch. med. Wochschr. 52, 689(1905).

Rats, rabbits and dogs received whole body exposures to x rays. Blood and bone marrow changes are described. Bone marrow aplasia is considered to be secondary to leukopenia due to deficiency imposed by the formation of leukocytes.

9471

HISTOLOGICAL, CYTOLOGICAL AND SEROLOGICAL STUDIES OF THE EFFECTS OF X-RAYS ON GUINEA PIGS. E. Frankel and W. Budde. Fortschr. Geb. Roentgenstr. 20, 355(1913). (In German).

Guinea pigs were exposed to large x ray doses and histopathological studies were carried out on many tissues including blood, bone marrow, spleen, lymph nodes, adrenals, testes and ovaries.

9472

EXPERIMENTAL INVESTIGATION OF THE EFFECT OF ROENTGEN RAYS ON INTERNAL ORGANS. H. Heineke. Mitteil. Grenzgeb. Med. U. Chir. 14, 21-94(1904-05). (In German)

Histopathological studies of many tissues in experimentally irradiated guinea pigs and rabbits are reported.

9473

EXPERIMENTAL INVESTIGATION OF THE EFFECT OF ROENTGEN RAYS ON BONE MARROW AND ROENTGEN TREATMENT OF LEUKEMIA, PSEUDOLEUKEMIA AND SARCOMAS. H. Heineke. Dtsch. Zschr. Chir. 78, 196(1905). (In German).

Great radiosensitivity of blood forming organs accounts for favorable response to therapy.

9474

ON THE EFFECT OF RADIUM RAYS ON INTERNAL ORGANS. H. Heineke, Munch. med. Wochschr. 51, 1382(1904). (In German).

A 150 gram radium capsule was applied to the left ventral side of guinea pigs. Animals were killed after 18 hours and sections of spleen and bone marrow were studied. Bone marrow changes occurred somewhat later than lymphoid tissue changes and required larger dose.

9475

HOW THE BLOOD BUILDING ORGANS ACT IN THE CASE OF MODERN DEEP X-RAY. H. Heineke. Munch. med. Wochschr. 60, 2657(1913). (In German).

Blood and hematopoietic tissues of dogs and guinea pigs were studied after administration of radium to the animals. Lymphoid tissues were found to be highly sensitive, showing nuclear pyknosis and fragmentation following even very small doses (15 min roentgen irradiation and 5 sec contact of intestinal and splenic follicles with a 20 mg radium bromide capsule.)

9476

ON THE THEORY OF X-RAY EFFECT PARTICULARLY ON THE LATENT PERIOD. H. Heineke. Munch. med. Wochschr. 61, 807(1914). (In German).

Author reviews experimental observations on the effects of x rays and radium rays on living plant and animal cells including rats, mice, guinea pigs, rabbits

and dogs. Studies on histopathologic effects of various doses at various times after exposure are reported.

9477

A CYTOLOGIC STUDY OF THE INTESTINAL EPITHELIUM OF THE MOUSE AFTER TOTAL-BODY X IRRADIATION. William Montagna and J. Walter Wilson. J. Natl. Cancer Inst. 15, 1703-35(1955).

X irradiation with 1000 r (200 kv., 20 Ma, 20 cm. dist. 1/2 mm Cu to 1 mm Al) stops mitosis in crypts of Lieberkuhn. Nuclear and cytoplasmic changes, goblet cells and "mucoid" changes and distribution of lipids are described. Mice irradiated with 550 r show qualitatively similar changes, but less severe damage, which is repaired 96 hrs. post-exposure.

9478

MECHANISM OF ACTION OF X-RAYS ON SEEDS. J. Maisin and S. Masy. Compt. Rend. Soc. Biol. 98, 886-8 (1928). (In French).

Growth was markedly inhibited in seeds of *Pisum Sativum* by x irradiation, but seeds did not die. Root remained dwarfed and microscopic examination revealed nuclear lesions. Results of studies on infra-red reversal of growth inhibition indicates that x rays probably destroyed some substances (factors A) whose presence is essential to elaboration of factors B which are essential for growth. Infra-red could restore activity of factor A CA 22-3193

9479

ISOTOPES AS TRACERS IN PLANTS. R. H. Burris. Botan. Rev. 16, 150-80(1950).

This review covers: radioactive tracers in studies of ion absorption and exchange, transport of nutrients, photosynthesis, heterotrophic fixation of carbon dioxide, biological nitrogen fixation, nitrogen and phosphorus metabolism, phytopathology, and plant-growth regulator mechanisms; compares stable and radioactive tracers. NSA 4-2976

9480

"BECQUEREL RAYS" AND THEIR PHYSIOLOGICAL AND PATHOLOGICAL EFFECTS. E. S. London. Berl. Klin. Wschr. 40, 523(1903).

Radium rays killed mice after a few days of continuous exposure. Author feels death was due to effect on central nervous system.

9481

THE IMPORTANCE OF MERCAPTOETHYLAMINE IN PROTECTION AGAINST THE OROPHARYNGEAL SYNDROME AND SERIOUS CUTANEOUS LESIONS. P. Maldague, A. Dunjic, H. Maisin and J. Maisin. Compt. Rend. Soc. Biol. 150, 1637(1956). (In French).

9482

COMMITTEE FOR COMPILATION OF REPORT ON RESEARCH IN THE EFFECTS OF RADIOACTIVITY. RESEARCH IN THE EFFECTS AND INFLUENCES OF NUCLEAR BOMB TEST EXPLOSIONS, VOL. I AND II. (Japan Society for the Promotion of Science, Veno, Tokyo, 823 and 1824 pp. (1956).

9483

THE PHYSIOLOGY OF SPORE GERMINATION IN FUNGI. D. Gottlieb. Botan. Rev. 16, 229-57(1950).

Review discusses following topics: water relations, nutrition, oxygen and CO₂, temp. pH, enzymes, dormancy, radiation, tropisms, time for germination, senescence, BA 25-2944

9484

ADDITIVITY OF X-RAYS AND ULTRAVIOLET LIGHT IN THE INACTIVATION OF HAPLOID AND DIPLOID YEAST. Robert B. Uretz. Radiation Research 2, 240-252 (1955).

Haploid and diploid yeast were inactivated by 250 Kv x rays and U-V light of 2537 Å. Diploid cells have duplicate sensitive sites and either member of a pair of sites is sufficient to maintain cell function. Lessened sensitivity in diploids is due to replication of sensitive sites of haploid. Sensitive sites in x ray and U-V inactivation are the same.

9485

RADIATION AND PLANT CYTOGENETICS. T. H. Goodspeed and Fred M. Über. *Botan. Rev.* 5(1), 1-48(1939).

This paper reviews physical nature and biological effects of x-rays, particulate and U-V radiation, including physical effects, wave-length, quantitative relationships, quantum hit theory, and variation of cytologically effective dosages and reviews the literature on non-heritable, cytoplasmic, and nuclear alterations and of cytogenetic consequences of chromosomal alterations. BA 13-8933

9486

ADDITIVITY OF X-RAYS AND ULTRAVIOLET LIGHT IN THE INACTIVATION OF HAPLOID AND DIPLOID YEAST. Robert B. Uretz. *Radiation Research* 1, 564-565(1954).

Haploid and diploid yeast were exposed to 250-Kv X rays and U-V light of 2537 Å. Additivity experiments showed interaction between two radiations for inactivation of diploid yeast but no interaction in haploid.

9487

RADIATION SENSITIVITY OF YEAST CELLS GROWN IN AEROBIC AND ANAEROBIC ENVIRONMENTS. Ann C. Birge and Cornelius A. Tobias. *Arch. Biochem. Biophys.* 52, 388-93(1954).

The survival curve of haploid yeast is exponential whether irradiation be carried out under aerobic or anaerobic conditions, but anaerobic conditions (a few minutes before and throughout exposure) gave dose reduction factor of approximately 2.

9488

DELAY OF CHROMOSOME REJOINING IN *Vicia faba* INDUCED BY IRRADIATION. Sheldon Wolff. *Nature* 173, 501-502(1954).

Fractionation of x ray dosage given to *Vicia faba* soaked in water causes no decrease in two-hit chromosome aberrations. When dose administration is protracted over more than 2 hrs there is a decrease in aberrations. Seeds pre-soaked for 1 hr. in 2×10^{-3} M, 2,3-dimercaptopropanol, had fewer aberrations.

9489

ON THE REJOINING OF RADIATION-INDUCED CHROMOSOME BREAKS IN *Vicia faba*. Sheldon Wolff. *Radiation Research* 1, 567(1954).

In vacuo radiation-induced chromosome breaks in seed of *Vicia faba* remain open for 1/2 hr., then rejoin. To determine whether an enzyme system is involved in the rejoining, dose-fractionation studies were performed. Author concludes that an enzyme system is involved. Whether it rejoins broken ends directly or only provides energy is unknown.

9490

THE ROLE OF OXIDATIVE METABOLISM AND ATP PRODUCTION ON THE REJOINING OF RADIATION-INDUCED CHROMOSOME BREAKS. Sheldon Wolff and H. E. Luippold. *Radiation Research* 3, 358(1955).

Soaked seed of *Vicia faba* was irradiated *in vacuo* to produce chromosome breaks that normally rejoin within 1/2 hour. A second dose was administered 75 minutes later. Inhibition of oxidative metabolism by low temperatures, cyanide, 95% CO + 5% O₂ in the dark but not in the light, or O₂ removal prevented rejoining.

Breaks treated with ATP rejoined in 30 minutes.

9491

STRUCTURE AND CONTENTS OF THE SEX CHROMOSOMES. Gerhard Lorbeer. *Ber. Deut. Botan. Ges.* 59, 369-418(1941).

Three genes are postulated, α for o, γ , for $\frac{O}{\gamma}$ and σ for synoecious plants. The γ -gene may be transformed into α by X-rays, the transformation into σ occurred by spontaneous mutation; an asexual mutant was also observed. A general cytogenetic theory of structure of sex chromosomes is developed. BA 22-22923

9492

CHANGES IN THE BLOOD DUE TO ACTINIC THERAPY. H. Treber. *Strahlentherapie* 6, 398(1915). (In German).

Patients with leukemia were treated with x ray and their blood pictures following exposure are described and related to dose administered.

9493

COMPARATIVE STUDIES OF X RAY-INDUCED FORWARD AND REVERSE MUTATION. Norman H. Giles, Frederick J. de Serres, and C. W. H. Partridge. *Ann. N. Y. Acad. Sci.* 59, 536-52(1955).

Attempts to reverse, by means of x-irradiation, mutations (inositol-less and purple adenine-less) originally induced by U-V irradiation of *Neurospora* indicated that x-rays can induce dominant, positive mutations resulting in the restoration of specific biochemical synthesis.

9494

SYMPOSIUM ON APPLICATIONS OF IONIZING RADIATION TO FOOD AND PHARMACEUTICAL PRESERVATION. W. D. Bellamy, S. A. Goldblith, G. C. Colovos, and C. F. Niven, Jr. *Bacteriol. Revs.* 19, 266-9(1955).

Drugs under proper conditions are stable to sterilizing doses of cathode rays. Many difficulties must be overcome before cold sterilization can be used for foods.

9495

ON THE ROENTGEN RAY EFFECT IN LEUKEMIA. T. Dale. *Nord. Med. Tidsskr* 5, 298(1933)

9496

THE RELATIVE BIOLOGICAL EFFECTIVENESS OF COBALT⁶⁰ GAMMA RADIATION AND FAST NEUTRONS. Howard H. Vogel, Jr., John W. Clark and Donn L. Jordon. *Anat. Record* 117, 529-30(1953).

Fast neutrons were 4-20 times more effective than physically equivalent doses of Co⁶⁰ gamma rays. The relative biological effectiveness of neutron and γ radiation appears related to their specific ionizations. Positive bacteremia was demonstrated in blood and spleen of 30-50% of neutron irradiated mice, 4-8 days after exposure. This period seems to be correlated with peak of high mortality. Preliminary experiments have been carried out to test effects of streptomycin on mice that previously were exposed to fast neutrons.

9497

A NEW METHOD OF ROENTGEN TREATMENT IN LEUKEMIA. T. Dale. *Acta Radiol.* 12, 263(1931).

Author maintains that general irradiation of the body from a distance of 1 meter, with head, neck and genitals shielded, is superior to local roentgen therapy.

9498

DIRECT ACTION OF X-RAYS ON TRANSPLANTABLE CANCERS OF MICE. E. Hill, J. J. Morton and W. D. Witherbee. *Jour. of Exper. Med.* 29, 89-96(1919).

Tumor was irradiated *in vitro* before transplantation to new host mouse. Direct action of x rays in doses greater than can be used therapeutically injuries but does not kill cancer cells. Furthermore, cancer cells

develop a resistance to irradiation after repeated doses. Softer x rays appeared to be more effective than harder x rays.

9499

THE ROENTGEN TREATMENT OF AGRANULOCYTOSIS. U. Friedemann and A. Elkeles. Dtsch. med. Wschr. 56, 947(1930). (In German).

9500

INFLUENCE OF CHELATES ON THE METABOLISM OF RADIOYTRIUM (Y-90). H. C. Dudley. J. Lab. Clin. Med. 45, 792-9(1955).

Rats and rabbits were injected with a solution of $Y^{90}Cl_3$. By selecting the proper reagent one may promote preferential deposition in selected tissue within 48 hrs. Yttrium complexed with a minimum quantity of ED-o1 is markedly concentrated in the stomach wall. Author suggests injection of Y-90 to deliver radiation of high energy to selected tissues, especially bone and stomach. NSA 9-4693

9501

BIOLOGICAL ACTION OF MESOTHORIUM, INFLUENCE OF THORIUM -X ON BLOOD COAGULATION. D. Grineff. Strahlentherapie 3, 94(1913). (In German).

Intravenously administered thorium X caused an increase in plasma fibrinogen and fibrin. Studies on dogs are included with results of fibrinogen and fibrin determinations.

9502

DEVELOPMENT OF DOSIMETRY (AN HISTORICAL SKETCH). E. Lorenz. Radiology 14, 340(1930).

A review of dosimetry, biological, chemical and the importance of dosimetry to radiation therapy.

9503

X-RAYS AND BLOOD COAGULATION. P. Pagniez, A. Ravina and I. Solomon. Presse Med. 32, 545-548(1924). (In French).

Studies on blood coagulability in patients receiving radiation therapy are presented and discussed. Radiation is considered to be an important hemostatic agent.

9504

ACTION OF X RAYS ON LEUKEMIC BLOOD. Ch. Aubertin and E. Beaujard. LaPresse Medic. 12, 533(1904). (In French).

Studies on the hematological responses of leukemic patients treated with x ray are reported.

9505

ON THE AMPLITUDE OF VARIATIONS IN RADIO-SENSITIVITY DURING THE FIRST SEGMENTATION DIVISIONS. P. Vintemberger. Compt. rend. soc. biol. 98, 536(1928).

There is a 6-fold difference in radiosensitivity between the stages of minimal sensitivity (resting nucleus) and maximum sensitivity (metaphase through telophase) in the fertilized egg of *Rana fusca*.

9506

VARIATIONS IN URINARY EXCRETION IN RABBITS AFTER X IRRADIATION. Loiseleus and VanderSchueren. Compt. rend. Soc. de Biol. 113, 1377(1933).

There is retention of chloride in the first few days after x irradiation. Potassium excretion is increased during this period.

9507

DIRECT OR INDIRECT ACTION OF X-RAYS. STUDY OF SURVIVING LYMPHOID TISSUES. A Lacassagne and G. Gricoureff. Compt. rend. soc. biol. 96, 862(1922). (In French).

Thymus, spleen, lymph nodes and bone marrow from rabbit show the same relative radiosensitivity in vitro as in vivo (with respect to differences in radiosensitivity between lymphoid elements and cells of fibro-

conjunctival stroma). Action of x rays on cells is a direct one. CA 21-2331

9508

ON THE VARIATIONS IN RADIOSENSITIVITY DURING THE FIRST SEGMENTATION DIVISION OF THE EGG OF *RANA FUSCA*. P. Vintemberger. Compt. rend. soc. biol. 98, 532(1928).

There are cyclic variations in radiosensitivity between the stage of fertilization and the 8 blastomere stage. The period of the variation is the same as the mitotic rhythm. During each division, a given stage of mitosis shows the same radiosensitivity. Sensitivity is minimal during the resting stage between mitoses; maximal during metaphase through telophase.

9509

RADIUM TREATMENT OF THE NASAL LESIONS OF LEPROSY. R. P. Sandidge and M. N. Neill. U. S. Publ. Health Service Public Health Bull. No. 168, 36(1927).

Radium treatment shrinks the nasal lesions of leprosy. Effect on the leprosy bacilli in the nose was uncertain. CA 22-3703⁹

9510

LATENT PERIOD OF X-RAYED DORMANT SEEDS. F. Weber. Wien. Klin. Wochschr. 36, 147-148(1923).

Growth-inhibiting effect of x ray treatment on air-dried seeds of *Vicia faba* is the same whether seeds are allowed to germinate immediately after radiation or after a passive latent period up to 5 months. (Total length of stalk plus main root stem is criterion used.) Primary injury of the nucleus by x rays can be effected in the resting, non-mitotic cell, and injury is not repaired during long passive rest periods. CA 17-2903

9511

EFFECT OF ZINC AND IRON COMPARED WITH THAT OF URANIUM AND COBALT ON GROWTH OF *ASPERGILLUS*. R. A. Steinberg. Botan. Gaz. 70, 465-468(1920).

Iron and zinc are requirements for the growth of *Aspergillus niger*. These elements can be partially replaced by chemical stimulants such as uranium and cobalt. CA 15-695

9512

SOME EFFECTS OF HIGH VELOCITY ELECTRONS ON WOOD. E. J. Lawton, W. D. Bellamy, R. E. Hungate, M. P. Bryant, and E. Hall. Science 113, 380-382(1951).

Irradiation of basswood with high velocity electrons makes insoluble carbohydrate components available to rumen bacteria. Cellulose is unaffected by enzymatic action of rumen microbes, digestibility is not increased by irradiation up to 6.5×10^6 r. At 10^8 equiv. r. maximum fermentability is reached. Lignin is unaffected by irradiation. Acids, sugar, and particle size are also discussed.

9513

A STUDY OF X-RAY INDUCED LETHAL DAMAGE IN YEAST. Robert K. Mortimer. Radiation Research 3, 338-339(1955).

Irradiated vegetative haploid cells of *Saccharomyces cerevisiae* were paired by micromanipulative techniques to unirradiated haploid cells opposite mating type. Zygote survival was high. Many haploid cells sustain damage which cannot be expressed in a diploid cell containing a normal set of alleles. Irradiation of both parents before conjugation results in greatly reduced zygote viability.

9514

DIMINUTION OF THERMAL NEUTRON EFFECT BY INCORPORATED NITROGEN-15. Thad Pittenger and K. C. Atwood. Radiation Research 1, 558(1954).

N15 was incorporated into the conidia of *Neurospora crassa* by growing cultures on a medium containing

nitrate with 65 atoms % N15 as nitrogen source. Conidia were exposed in a graphite reactor. Surviving fractions of irradiated N 15 conidia were higher than in controls. The n p reaction of N caused 20% of the biological effect.

9515
CONCERNING THE LOCAL AND GENERAL EFFECTS OF X RAY. G. Baermann and P. Linser. Munch. med. Wochschr. 51, 996(1904). (In German).

A group of patients receiving x ray therapy were studied to determine effect of x rays on skin. General changes such as temperature, were also studied and are reported. There was no change in leukocytes in irradiated segment of doubly ligated vein.

9516
BLOOD CHANGES AFTER WIDE FIELD IRRADIATION. K. Heim. Arch. Gynakol. 116, 291(1923). (In German).
RBC decreased following large doses.

9517
THE ACTION OF ROENTGEN RAYS ON HORMONES AND ORGAN POISONS. Bunjiro Terata and Ryoichi Ito. Folia Pharmacol. Japan 12, 67-73(1931).

X-rays increase activity of pituitrin, thyroid extracts and adrenalin on blood pressure. Large doses inhibit such action. Many organ poisons affecting blood pressure are hindered by x-rays. CA 25-3395

9518
HUMORAL ALTERATIONS IN CANCER AND PRECANCER. Slosse and Reding. Bull. acad. roy. med. Belg. (5), 7, 405-38(1927).

Patients with cancer have abnormally high glucose tolerance curves, no matter what the type of cancer, x irradiation reduces blood sugar level to normal. Radiation not only kills cancer cells but also has some effect on metabolism. CA 22-1386

9519
MODIFICATION OF GLYCEMIA IN NORMAL SUBJECTS BY IRRADIATION OF THE PANCREAS. F. Fonseca, et al. Compt. rend. Soc. Biol. 98, 1591-2(1928). (In French).

Blood sugar falls after exposing the pancreas to 1/2 E. d. of x rays. Effects are attributed to hyper-insulinism. CA 22-3180⁹

9520
EFFECT OF IRRADIATION OF THE PANCREAS ON THE LEVEL OF GLUCOSE IN BLOOD AND URINE OF DIABETICS. F. Fonseca, et al. Compt. rend. Soc. Biol. 98, 1593-4(1928). (In French).

Author cites his studies on patients following x-irradiation of the pancreas, and concludes that x rays stimulate the endocrine function of the pancreas and perhaps may have a place in the treatment of diabetes.

9521
PROGRESSIVE MUTATIONS INDUCED IN GOSSYPIUM HIRSUTUM BY RADIATIONS. W. R. Horlacher and D. T. Killough. Am. Naturalist 67, 532-538(1933).

Progressive mutations, produced by x-irradiation of dry seeds included: mutation from forked-leaf to normal-leaf shape, from virescent yellow leaf and plant color to normal green leaf and plant color. Evidence of reversible mutations in cotton is also presented. BA 8-12842

9522
TISSUE CHANGES IN LYMPHOCYTIC AND MYELOGENOUS LEUKEMIA AND THE INFLUENCE OF ROENTGEN RAYS. B. B. Varschawskata. Fortsch. a. d. Geb. d. Roentgenstrahlen 39, 458-468(1929). (In German).

Potassium excretion is increased after therapeutic radiation. QCI 6, 1434(1929).

9523
MUTATION PRODUCTION IN ANTIRRHINUM MAJUS. E. Baur. Z. Botan. Oltmanns Festschrift 23, 676-702 (1930). (In German).

The homozygous strain of snap-dragon used showed a spontaneous mutation rate of 1.5%. Stems of plants 6 to 8 weeks old were immersed in various solutions including solutions containing radioactivity. Of these, 216 flowered and set seed, two of the 216 became heterozygous for easily observed mutant characteristics. Neither kind nor strength of stimuli had any relation to the mutants found. BA 6-15185

9524
VARIATIONS IN THE COAGULABILITY, GLUCOSE AND CALCIUM OF THE BLOOD DUE TO RADIUM. E. Zunz and J. LaBarre. Compt. rend. Soc. biol. 96, 712(1927). (In French)

Rabbits received doses of 7.5 to 75 millicuries of radium. This decreased coagulation time of the blood and increased calcium and glucose content. The coagulation time of the blood was increased by 90 to 180 millicuries of radium. CA 21-1849

9525
EFFECTS OF X RAYS ON SNAILS, CRUSTACEA AND ALGAE. K. Bonham and R. F. Palumbo. Growth 15, 155-188(1951).

The dose required to kill 50% of the organisms was greater for shorter survival periods; thus 20 Kr were required to kill 50% of adult snails within 1 wk., while 8 Kr was the LD₅₀ for Radix in 6 wks. and 13 Kr for Thais at 23 wks. Algae grown on liquid media required a greater dose than algae on solid media. Hard x rays were twice as lethal as soft.

1 celled algae, LD₅₀/1 wk (hard x rays); chlorella, 8 Kr (plated), 18 Kr (liquid); ankistrodesmus, 11 Kr (liquid); chroococcus, 8 Kr (liquid); synechococcus, 100 Kr (liquid). BA 26-14402

9526
ROENTGEN RAY INTOXICATION. I. UNIT DOSE OVER THORAX NEGATIVE, OVER ABDOMEN LETHAL; EPITHELIUM OF SMALL INTESTINE SENSITIVE TO X RAYS. S. L. Warren and G. H. Whipple. J. Exptl. Med. 35, 187-202(1922).

Radiation dose of 512 ma min. to the thorax of dogs did not cause clinical signs of intoxication. Abdominal exposure to 350 ma min. almost invariably caused fatal intoxication. The significant lesions are found in the highly radiosensitive small intestine where epithelium of crypts and villi show almost complete necrosis. Thorax irradiation destroys much of the body's marrow, hence marrow hypoplasia is ruled out as a major factor in the characteristic systemic disturbances seen after abdominal irradiation. Intestinal epithelium is considered far more sensitive than cellular elements of abdominal lymph nodes and Peyer's patches. Spleen shows moderate atrophy after abdominal exposure but "plenty of cells" remain even after intensive irradiation.

9527
THE RESISTANCE OF THE THYROID GLAND TO THE ACTION OF RADIUM RAYS. THE RESULTS OF EXPERIMENTAL IMPLICATIONS OF RADIUM NEEDLES IN THE THYROID OF DOGS. J. O. Bower and J. H. Clark. Am. J. Roentgenol. and Radium Therapy 10, 632-42(1923).

Thyroid was found to be relatively radioresistant; nuclear degenerative changes and toxic symptoms were not observed post-exposure. Primary histological changes were hemorrhage and necrosis. Radiation effects are compared with effects produced by (1) quinine, (2) urea hydrochloride and (3) boiling H₂O. Parathyroids showed no changes.

9528
FACTORS INFLUENCING RESULTS OF RADIUM THERAPY. J. Ewing. Radium 5, 11, 73-79(1918).

Tissues differ markedly in their response to radium radiation. Factors influencing radiosensitivity are the

structural type of tumor, the complicating inflammatory and nutritive conditions of the tumor tissue and the environment in which it is growing.

9529

THE ORIGIN OF ALBINA AND XANTHA MUTATIONS IN BARLEY. Ake Gustafsson. Acta Radiol 27, 300-7(1946).

Albina mutations arise independently of x1 sterility and chromosome disturbances. Xantha mutations cannot arise from normally fertile x1- plants, but require special conditions that decrease fertility. The two types of mutation behave strikingly differently whether in fertile or in highly sterile series.

9530

DISTURBANCES IN THE ANIMAL ORGANISM DURING CHRONIC DAMAGE BY URANIUM FISSION PRODUCTS IN SMALL DOSES. En^U Klimova. p.71-74 of SUMMARIES OF PAPERS PRESENTED AT THE CONFERENCE ON THE REMOTE CONSEQUENCES OF INJURIES CAUSED BY THE ACTION OF IONIZING RADIATION. (1956). (NP-tr-207)

Uranium fission products in daily doses of 1×10^{-3} and 1×10^{-5} curie/kg were given to rats and dogs. Results: slight changes in behavior, slight decrease of leukocytes, decrease in weight after eight months. There was a decrease in lifetime. Causes of death: emaciation, bronchiectasis, disturbances of the reproductive system and infection due to decreased resistance.

9531

THE CHRONIC ACTION OF SMALL DOSES OF RADIOACTIVE STRONTIUM ON DOGS. L. N. Burykina. p.61-65 of SUMMARIES OF PAPERS PRESENTED AT THE CONFERENCE ON THE REMOTE CONSEQUENCES OF INJURIES CAUSED BY THE ACTION OF IONIZING RADIATION. (1956). (NP-tr-207)

Dogs were given daily doses of the chloride of Sr^{88} . There were no clinical signs of toxic effects. Death occurred in a state of apparent well-being. Changes were found in leukocytes, changes in neutrophils being less pronounced. Erythrocyte and hemoglobin did not change. Bone marrow cellularity decreased. There was a decrease of spermatogenesis. All pups of the females died within two months.

9532

CHANGES IN THE BLOOD DURING PROLONGED CHRONIC ACTION OF SMALL DOSES OF X RAYS. Laptera-Popova. p.66-70 of SUMMARIES OF PAPERS PRESENTED AT THE CONFERENCE ON THE REMOTE CONSEQUENCES OF INJURIES CAUSED BY THE ACTION OF IONIZING RADIATION. (1956). (NP-tr-207)

Hematopoiesis during chronic action of ionizing radiation passes through phases: lability of hematopoiesis, depression of hematopoiesis, temporary adaptation of hematopoietic processes to the irritant factor, then hematopoiesis becomes pathological. Duration of periods depends on radiation dose and individual resistance to ionizing radiation.

9533

INFLUENCE OF IONIZING RADIATION ON THE ACTIVITY OF DOG SPERMATOOZOA. N. E. Trusova. p.51-53 of SUMMARIES OF PAPERS PRESENTED AT THE CONFERENCE ON THE REMOTE CONSEQUENCES OF INJURIES CAUSED BY THE ACTION OF IONIZING RADIATION. (1956). (NP-tr-207)

Male dogs were exposed to x rays, neutrons and incorporated radioactive substances. Disturbance of testes occurred 3 months after x ray irradiation. Aspermia occurred and amount of ejaculate became 5-15 times as small. After 30 months spermatozoa returned to normal. Repeated irradiation weakened sexual potency. Progeny of these dogs showed weak sexual potency.

9534

PATHOMORPHOLOGICAL CHANGES IN ANIMALS AT LONG INTERVALS AFTER THE ACTIONS OF SMALL

DOSES OF RADIOTHORIUM. E. V. Etieksova. p.29-31 of SUMMARIES OF PAPERS PRESENTED AT THE CONFERENCE ON THE REMOTE CONSEQUENCES OF INJURIES CAUSED BY THE ACTION OF IONIZING RADIATION. (1956). (NP-tr-207)

Dogs and rats were given radiothorium. No sickness was observed for many months after receiving doses from 0.001 to 0.0005 microcurie/g. Signs of disease occurred during the last 2-3 months of life. Prolonged local irradiation in doses of 0.0001 microcurie/g leads to growth of malignant neoplasms. With 0.0005 microcurie/g, when death occurred earlier, there were no malignant growths.

9535

CHANGES IN THE PERIPHERAL BLOOD AND HEMATOPOIETIC ORGANS IN THE PROGENY OF ANIMALS POISONED BY URANIUM FISSION PRODUCTS. T. A. Ivanova. p.57-60 of SUMMARIES OF PAPERS PRESENTED AT THE CONFERENCE ON THE REMOTE CONSEQUENCES OF INJURIES CAUSED BY THE ACTION OF IONIZING RADIATION. (1956). (NP-tr-207)

One year after receiving uranium fission products, parents did not show abnormalities. Pups showed pronounced anemia accompanied by activation of erythropoiesis in bone marrow and spleen and absence of a high degree of leucocytosis. Bone marrow had an abundance of reticular cells. Ratio of erythroblast to leucoblast portions was below unity. All deviations are of a temporary character.

9536

THE REMOTE CONSEQUENCES OF COMBINED DAMAGE CAUSED BY SILICON DIOXIDE AND RADON TO ANIMALS. V. S. Kushneva. p.32-35 of SUMMARIES OF PAPERS PRESENTED AT THE CONFERENCE ON THE REMOTE CONSEQUENCES OF INJURIES CAUSED BY THE ACTION OF IONIZING RADIATION. (1956). (NP-tr-207)

Quartz dust, and especially radon, have a very pronounced effect on the general state of the animals. Death rate was greatest in animals given dust and radon. Peripheral blood showed greatest changes with quartz dust and radon. Lung changes were of the silicotic type. Epithelial cells in the bronchi showed morphological changes. Pneumonia also developed.

9537

DISTURBANCE OF HEMATOPOIESIS IN THE REMOTE PERIOD OF CHRONIC RADIATION SICKNESS INDUCED BY POLONIUM, RADIOTHORIUM AND RADON. A. A. Kanarenskaya and S. Yu. Poshetstnik. p.14 of SUMMARIES OF PAPERS PRESENTED AT THE CONFERENCE ON THE REMOTE CONSEQUENCES OF INJURIES CAUSED BY THE ACTION OF IONIZING RADIATION. (1956). (NP-tr-207)

Changes in blood in chronic radiation sickness caused by polonium, radiothorium and radon are described. Chronic radiation sickness develops with disturbances of hematopoiesis and activation of hematopoiesis was observed. Sites of compensatory hematopoiesis appear in the thorax and in diaphyses of tubular bones, normally containing fat marrow.

9538

SOME FEATURES OF THE STATE OF THE PERIPHERAL BLOOD AND HEMATOPOIETIC ORGANS IN DOGS AT LONG INTERVALS AFTER SINGLE X RAY EXPOSURES. A. N. Balashova. p.12-13 of SUMMARIES OF PAPERS PRESENTED AT THE CONFERENCE ON THE REMOTE CONSEQUENCES OF INJURIES CAUSED BY THE ACTION OF IONIZING RADIATION. (1956). (NP-tr-207)

Hematopoietic state of 24 dogs subjected to single x ray exposures in doses of 275, 400, 500 and 600 r was studied. Animals were active, hair was glossy weight normal. RBC and WBC counts were increased. Lymphocytes and percentage of young cells in bone marrow were below normal, number of mature cells was higher.

9539

REMOTE CONSEQUENCES OF THE ACTION OF FAST NEUTRONS ON THE ANIMAL ORGANISM. V. V. Sokolov. p.5-8 of SUMMARIES OF PAPERS PRESENTED AT THE CONFERENCE ON THE REMOTE CONSEQUENCES OF INJURIES CAUSED BY THE ACTION OF IONIZING RADIATION. (1956). (NP-tr-207)

Dogs and rabbits were exposed to fast neutrons. Changes in hair, weight, general condition, fertility and peripheral blood picture are described. Some rabbits developed cataracts.

9540

EXPERIMENTAL INVESTIGATIONS ON THE EFFECTS OF ROENTGEN RADIATION ON THE TUBERCLE BACILLUS AND TUBERCULOUS TISSUE. Hans Ritter and Moje. *Strahlentherapie* 15, 283(1923).

The effect of x radiation on tuberculosis in guinea pigs was studied. Exoised glands of treated and untreated tuberculous animals were examined histologically and were cultured.

9541

MORPHOLOGICAL CHANGES IN ANIMALS AT LONG INTERVALS AFTER THE ADMINISTRATION OF CERTAIN RADIOACTIVE SUBSTANCES. A. P. Novikova. p.19-22 of SUMMARIES OF PAPERS PRESENTED AT THE CONFERENCE ON THE REMOTE CONSEQUENCES OF INJURIES CAUSED BY THE ACTION OF IONIZING RADIATION. (1956). (NP-tr-207)

Animals were given uranium fission products in doses ranging from 1-5 and 0.005-0.2 microcurie/g. Animals died. Histological results: increased fat deposits, atrophy of testes and hematopoietic organs, disturbances of thyroid adrenals, alimentary canal, internal parenchymatous organs; damage of bone tissue, disturbances in cardiovascular system, dystrophy and dystrophic regeneration, pneumonia, mycosis, and postnatal complications.

9542

ROENTGEN TREATMENT OF SURGICAL TUBERCULOSIS. Otto Jungling. *Med. cor-bld. d wurt-temb artz. Landesver.* 91, (1922).

Epitheloid cells and bacilli are resistant to x rays. Radiation acts primarily on lymphoid elements and therapeutic results are especially good in tuberculosis of lymph nodes.

From abst. in *Am. J. Roentgenol* 10, ab, 1003(1923)

9543

A SUMMARY: TODAY'S PROBLEMS IN RADIATION HAZARDS AND WHAT IS BEING DONE TO CONTROL THEM. R. H. Chamberlain. *Am. J. Roentgenol Radium Therapy Nuclear Medicine* 78, 1000-2(1957) Dec.

Discussion includes a summary of effects of chronic low level exposures. NSA 12-3518

9544

INJURIES DURING ROENTGEN RADIATION OF MYOMATA AND HEMORRHAGIC MYOPATHIES. Egbert Schwartz. *Strahlentherapie* 15, 398(1923). (In German)

Injurious effects of radiation on the intestines, radiation sickness is described.

9545

ACTION OF RADIUM AND THE X RAYS ON THE BLOOD AND BLOOD-FORMING ORGANS. I. Levin. *Am. J. Roentgenol Radium Therapy* 9, 112(1922).

Frog and rabbit blood reacted identically after irradiation with x rays. Radium implants in frogs produced marked local effect on spleen and marrow. Rabbit implanted with radium 2 or 4 times the amount given to the frog showed no marked change. Radium has a marked local effect with less general disturbance of blood as compared with x rays.

9546

THE EFFECT OF HIGH VOLTAGE ROENTGEN RADIATION (200KV) UPON THE FERTILITY AND MOTILITY

OF THE SPERM OF THE RABBIT. S. A. Asdell and Stafford Warren. *Am. J. Roentgenology* 25, 81-87(1931).

A normal litter of rabbits was produced after insemination with sperm that had been radiated *in vitro* by roentgen rays at 200 kv. No immediate effects are brought about by filtered or unfiltered radiation.

9547

IRRADIATION SICKNESS. Rieder. *Strahlentherapie* 12, 573(1923). (In German).

Author states that radiation sickness can be minimized by ventilating the room during x irradiation. Laudanum-scopolamine is suggested as a good therapeutic measure.

9548

RADIATION POLYCYTHEMIA AND ERYTHROPOIESIS. F. Kromeke. *Dtsch. med Wochschr.* 52, 1127(1926). (In German).

Forty days after an erythema dose of x rays, author found some increase in erythroid cells in marrow and feels that roentgen radiation increases erythroblast production. (rabbits.)

9549

THE CHANGE IN THE BLOOD PICTURE AND ITS VALUE IN THE PROGNOSIS OF THE ROENTGEN TREATMENT OF CANCER. H. Zumpfe. *Strahlentherapie* 12, 696(1923). (In German).

Slight left shift in WBC and leukopenia were observed.

9550

THE DANGEROUS EFFECT OF LARGE DOSES GIVEN IN A SHORT TIME. A. Gunsett. *J. Radiol. et electrol.* 8, 481-508(1924). (In French).

Summarizes effects of large radiation doses including toxins in blood, nervous system effects, biochemical effects on cells, altered endocrine balance, altered liver function, most of these by inference from treated patients. Radiation sickness and radiation leukopenia are described. Other investigators have stated that small doses have a stimulating effect, including an increase in "natural defenses" as observed in mice. The author was unable to confirm the stimulating effect of weak doses on either plants or animals.

9551

EXPERIMENTAL AND HISTOLOGICAL INVESTIGATIONS ON THE EFFECTS OF ROENTGEN RAYS ON THE STAINING PROPERTIES OF TISSUES. Ernest A. Schmidt. *Strahlentherapie* 12, 517(1923). (In German).

Irradiated and unirradiated mice were given intravenous trypan blue injections. Two days after injection they were killed, tissues were examined. Radiated mice had more deeply stained tissues (mostly connective tissue) as a result of altered cell function.

9552

HUMAN CASTRATION BY THE X RAY. H. R. Schinz. *Schweiz. Med. Wchnschr.* 52, 866(1922). (In German).

Physiological effects and physical signs in radiation induced temporary and permanent aspermia and in total castration (destruction of all testicular elements) are described in case presentations.

9553

INJURIES FROM ROENTGEN RAYS IN DEEP THERAPY. Herman Wintz. *Am. J. Roentgenol* 10, 134(1923).

Late ill effects of therapy are described including bladder injury, skin burns and sequelae, and general tendency of previously exposed tissues to be intolerant of additional therapy. "Late radiation sickness" is described; changes in sensitive cell lipoids are discussed. Changes in peripheral blood in chronic occupational exposure include eosinophilia and leukocytosis.

9554

EFFECT OF X RAYS ON BLOOD AND BONE MARROW. Ch. Aubertin and E. Beaujard. *Folia Haemat.* 6, 31 (1908). (In French).

Studies on the marrow of irradiated guinea pigs are reported. Effects on lymphoid tissue are different from those on myeloid tissue, the latter seeming less radio-

sensitive. A dose producing lymphoid necrosis was capable of producing transient myeloid stimulation (several days). Leukopenia is felt not to be due to effects on bone marrow except perhaps in those few cases where severe radiation injury causes total destruction of the myeloid tissue. Reversible radiation leukopenia is attributed to a rate of leukocyte destruction that exceeds the production rate.

9555
NEW INVESTIGATIONS OF THE PROBLEM OF ROENTGEN-RAY DOSAGE. O. Glasser. *Am. J. Roentgenol.* **10**, 1(1923).

Author discusses the importance of the tissue reactions and problems of determining dose.

9556
COMPARATIVE MEASUREMENTS BETWEEN RADIUM AND X RAYS CONCERNING ENERGY ABSORBED AT A DEPTH. Harvey R. Gaylord and K. Wilhelm Stenstroem. *Am. J. Roentgenol.* **10**, 56(1923).

Discusses the importance of the difference in penetrating ability of x and radium rays and the need to consider this in predicting tissue response.

9557
RADIOSENSITIVITY OF THE BAT (*MYOTIS LUCIFUGUS*). D. E. Smith, D. R. Russ and E. M. Jackson. *Fed. Proc.*, **Balt.** **13**, 140(1954).

Bats were subjected to total body irradiation over a wide dosage range. Blood studies indicated that 500-20,000 r did not influence erythrocyte count. Leucocyte counts after exposures were much below those of starved control bats, where there was no effect on circulating blood cells. On basis of postirradiation blood changes the bat had a radiosensitivity similar to the frog. Starvation did not alter the blood counts. Bone marrow and intestinal damage were also seen.

9558
TWO IMPORTANT POINTS FROM THE RADIUM THERAPISTS STANDPOINT REGARDING CANCER IMMUNITY. Carroll Chase. *Am. J. Roentgenol.* **10**, 167(1923).

The author states that since blood loss and exposure to "solvent" anesthetics (chloroform, ether), both associated with surgery, tend to decrease the "immunity" to cancer, radiation therapy is a better form of treatment. It assumes that radiation does not decrease this "immunity".

9559
CELL DIVISION. I. A THEORETICAL APPROACH TO THE PRIMEVAL MECHANISM, THE INITIATION OF CELL DIVISION AND CHROMOSOMAL CONDENSATION. N. G. Anderson. *Quart. Rev. Biol.* **31**, 169-99(1956).

Author reviews effects of radiation on cell division including his hypothesis (and evidence supporting it) of events leading to initiation of cell division.

9560
CALICREIN AND RADIATION IN: BIOLOGICAL EFFECTS OF EXTERNAL RADIATION (NRES VI-2). Kathryn F. Fink. McGraw-Hill, N. Y. (1954) H. A. Blair, ed.

Author conducted studies on similarity of biological response of dogs and rats to large doses of radiation and to callicrein, a hypotension-producing substance present in most mammalian tissues in small concentration.

9561
THE CAUSE OF ROENTGEN RAY DERMATITIS AMONG PHYSICIANS. E. T. Leddy. *Am. J. Roentgenol.* **Radium Therapy** **36**, 310(1936).

This is a review of the first 55 cases studied at the Mayo Clinic.

9562
BIOLOGICAL APPLICATIONS OF TRITIUM. R. C. Thompson. *Nucleonics* **12**(9), 31-5(1954).

A review with 93 references and a section on tritium as a source of ionizing radiation and the radiation damage mechanism in experimental studies of this effect.

9563
REMOTE CONSEQUENCES OF SINGLE AND CHRONIC

INTAKE OF RADIOACTIVE ISOTOPES (Ce^{144} , Ru^{106} , Sr^{89-90}) AND OF A MIXTURE OF BETA EMITTERS THROUGH THE GASTROINTESTINAL TRACT. V. N. Streltsova and Yu. I. Moskalev. p.36-37 of *SUMMARIES OF PAPERS PRESENTED AT THE CONFERENCE ON THE REMOTE CONSEQUENCES OF INJURIES CAUSED BY THE ACTION OF IONIZING RADIATION*. (NP-tr-207)

Both tumorous and non tumorous forms of disease were found after single and chronic administration of the isotopes. The mixture of isotopes causes formation of osteosarcomas and occasional leucoses. Non-tumorous forms of sickness: chronic ulcerative inflammatory processes in the large intestine and chronic inflammatory processes in the buccal cavity.

9564
A COMPARISON OF THE EFFECTIVENESS OF RADIATIONS OF DIFFERENT ENERGIES IN PRODUCING CHROMOSOME BREAKS. T. J. Arnason and Margaret Morrison. *Radiation Research* **2**, 91-5(1955).

Tradescantia buds with microspore nuclei in the resting stage were exposed to x rays of various energies and to γ rays (Co^{60}). Frequency of chromosome breaks was determined by cytological examination of cells at first spore metaphase. The very high energy (betatron), x rays and γ rays produced fewer breaks than did 140-Kev and 200 Kev x rays. Reunion frequencies paralleled break frequencies. NSA 9-2576

9565
CHEMICAL PROTECTION FROM X-RADIATION. Z. M. Bacq and A. Herve. *Bull. Acad. Roy Med. Belg.* (6) **17**, 13(1952).

Cysteine protects pea roots against radiation injury, apparently by removing oxygen from the water around the roots. It is effective at a concentration of 1/5000.

9566
THE EFFECTS OF ROENTGEN RAYS ON BLOOD FORMING ORGANS. Patricelli, Biforaka Medica, (1907). Abstr. in *Brit. J. Radiol* **13**, 318(1908).

Roentgen rays caused anemia and leukopenia in experimentally exposed dogs.

9567
THE ENERGY TRANSFER FROM IONIZING PARTICLES TO AN AQUEOUS MEDIUM AND ITS BEARING ON THE INTERPRETATION OF RADIOCHEMICAL AND RADIOBIOLOGICAL CHANGE. L. H. Gray. *J. Cellular Comp. Physiol.* **39**, Suppl. No. 1, 57-74(1952).

Investigations of the dissipation of energy of ionizing particles in liquids are summarized. Studies of the effects of ionizing radiations on biological systems are reviewed and interpretation of radiobiological data is discussed. (from abstract). NSA 6-4707

9568
STUDIES ON INDUCED MUTATION IN MAIZE. E. J. Dollinger. *Genetics* **39**, 750-66(1954).

Recessive mutations were induced at the Yg locus by x ray treatment of pollen in 14 of the 15 mutants analyzed, mutation was associated with chromosomal alteration resulting in loss of the chromomere containing the Yg locus. Also studied the effect of γ irradiation on induction of the dominant phenotype in cells homozygous recessive for one of the factors whose dominant allele is ordinarily necessary for expression of the dominant phenotype. Attempts were made to induce recessive mutation by γ irradiation of premeiotic cells for the A1, A2, Bt, Pr and R loci.

9569
BIOLOGY OF RADIUM AND URANIUM (MONOGRAPH). J. Stoklasa, J. Penkarn, and Paul Parcey, Berlin(1932). 957pp.

This monograph considers effects of Ra and U on plants and animals including microorganisms, effects of radioactive elements on structure and function of plants,

animals, man; effects on bacterial metabolism, on seed germination; effects on metabolic processes in plant cells; pathological conditions produced by radium. BA 9-18133

9570
THE INFLUENCE OF X-RAY ORGAN STIMULATION ON THE COAGULATION MECHANISM. Clarence C. Saelhof. *Amer. J. Roentgenol.* 8, 179(1921).

Irradiating the splenic area in dogs shortens the blood clotting time. Similar effects were seen after irradiating liver and intestines. Mechanism of altered clotting time varies with the area exposed, spleen irradiation being followed by an increase prothrombin, some increase in antithrombin, a rather delayed increase in fibrinogen, with little alteration of the platelet count.

9571
SELECTIVE ORGAN STIMULATION BY ROENTGEN RAYS; ENZYME MOBILIZATION. W. F. Petersen and C. C. Saelhof. *Am. J. Roentgenol.* 8, 175(1921).

Dogs were irradiated over various organs and blood studied for: serum protein levels, coagulation, serum protease, anti-trypsin, complement. Leukocyte counts and differentials were also included and total nitrogen excretion was determined. Reactions, as determined by the blood studies, varied with the organ irradiated.

9572
DEEP X-RAY THERAPY. A REVIEW OF THE MECHANISM OF ACTION. Reginald Morton. *Am. J. Roentgenol.* 10, 119(1923).

Summarizes effect of radiation on cells (changes seem to be primarily in the nucleus) and states that changes are more readily induced in abnormal cells; especially undifferentiated and dividing cells. Tolerance doses for various tissues are listed.

9573
THE INTESTINAL REACTION TO THE ERYTHEMA DOSE. Charles L. Martin and Fred T. Rogers. *Am. J. Roentgenol.* 10, 11(1923).

Dog skin is more radio-resistant than human skin. An erythema dose (for dog skin) applied directly to the exposed dog intestine produces hyperemia contraction destruction and desquamation of mucosa. Clinical signs in patients suggest that similar reactions occur in man. This is probably the cause of roentgen cachexia.

9574
THE PROBLEM OF RAY DOSAGE. W. Friedrich. *Am. J. Roentgenol.* 10, 6(1923).

This discussion includes an evaluation of the importance of biological variables in estimating doses required and delivered, and distinguishes between "absolute dosage" and "relative dosage."

9575
A STUDY OF CASES OF ACCIDENTAL X RAY BURNS HITHERTO RECORDED. E. A. Codman. *Phil. Med. J.* 9, 438(1902).

Nearly 200 cases of x ray injuries, about 1/3 of them in x ray workers, are reviewed. More than 2/3 occurred in the first 2 years of the use of x-ray. Primary injury is said to be to the trophic nerves of skin. Susceptibility varies widely among individuals. Soft rays are more likely to cause burns.

9576
REVIEWED IN "MEDICAL REVIEW OF REVIEWS" 8, 871(1902) X RAYS IN SARCOMA. A. E. Sterne. *Indiana Medical Journal* Aug.(1902).

A patient received extensive x ray exposure for disseminated sarcomatosis. The sarcoma shrank rapidly but the patient died. Death is attributed to rapid release of toxic products from the irradiated sarcoma cells.

9577
ROENTGEN RAY AND RADIUM IN THE DIAGNOSIS AND

TREATMENT OF CARCINOMA OF THE PROSTATE. H. C. J. Bumpus. *Collected Papers, Mayo Clinic* 13, 380(1921).

The action of radium(needles) is localized to the area immediately around the needles. Histological studies on prostates soon and long after radium Rx are shown.

9578
AMERICAN LITERATURE ON RADIUM AND RADIUM THERAPY PRIOR TO 1906. Carroll Chase. *Am. J. Roentgenol.* 8, 766(1921).

This interesting review includes a suggestion from Alexander Graham Bell to the editor of *American Medicine* that radium be tried for treating deep cancers. Books with sections on radium prior to 1906 and a surprising number of articles are listed. One unintentionally humorous description of the way radium produces its effects is included as an amusing touch.

9579
THE RED CELL BLOOD CONTENT OF THOSE HANDLING RADIUM FOR THERAPEUTIC PURPOSES. J. C. Mottram. *Arch. Radiol. and Electrother* 25, 194(1920).

9580
THE TREATMENT OF PERNICIOUS ANEMIA WITH IRRITANT DOSES OF RADIATION TO THE BONE MARROW. O. Neu. *Munch. med Wochschr.* 68, 1452(1921). (In German).

9581
CLINICAL BLOOD STUDIES IN GYNECOLOGICAL DEEP RADIATION THERAPY. L. Nurnberger. *Dtsch. med. Wochschr.* 41, 700 and 730(1915). (In German).

9582
TREATMENT OF MALIGNANT GRANULOCYTOPENIA. N. G. Nordenson. *Nord. Med.* 8, 1899(1940).

9583
IRRADIATION OF THE ENTIRE HUMAN BODY IN THE TREATMENT OF BLOOD DISEASES. W. Teschendorf. *Fortschr. Geb. Rontgenstr.* (1927) Kongressheft 71. (In German).

9584
EXPERIMENTAL INVESTIGATION OF THE EFFECT OF ROENTGEN RAYS ON THE BLOOD AND BLOOD FORMING ORGANS OF THE WHITE LABORATORY RAT. E. Woenckhaus. *Naunyn-Schmiedeberg's Arch.* 131, 335(1928).

Rats were irradiated with 7-8 H units. There was destruction of myeloid and almost all erythroid marrow elements within a few days. Author attributes first rapid change to redistribution of cells.

9585
ON THE GENERAL EFFECTS OF ROENTGEN RAYS. E. Woenckhaus. *Arch. by Exp. Path. u. Pharmak.*, 150, 182(1930). (In German).

An initial transient decrease, then an increase in the number of circulating leukocytes is followed by a sustained leukopenia (10-12 days) in rats exposed to "moderate" doses of x-ray. The lymphocyte fall is seen immediately after exposure. Permanent leukopenia results from repeated irradiation.

9586
QUANTITATIVE EFFECTS ON HEMATOPOIESIS OF TOTAL IRRADIATION AT VARIOUS DOSES AND DOSE FRACTIONATION SCHEDULES. K. Wolff. *Strahlentherapie* 54, 68(1935). (In German).

Changes observed include thrombopenia and author states that megakaryocytes are highly radiosensitive.

9587
OBSERVATIONS ON THE BEHAVIOR OF WHITE BLOOD CELLS DURING AND AFTER THE FIRST DAY OF TREATMENT WITH ROENTGEN AND RADIUM RAYS. A. Wagner. *Strahlentherapie* 11, 140(1920).

Author describes a transient initial leukocytosis followed by leukopenia.

9588

STUDIES ON THE INFLUENCE OF ROENTGEN AND RADIUM RAYS ON PHAGOCYTOSIS. A. Westman. *Acta. Radiol.*, 2, 57(1923).

By means of a somewhat modified form of Wright's method for opsonic determinations, the author has carried out investigations to determine whether therapeutic roentgen and radium irradiations have any appreciable influence on the phagocytic function of the leukocytes. Phagocytosis has been examined before and after treatment of patients with uterine cancer, which in most of the cases was treated exclusively by radium, and several cases of hidradenitis that were roentgen treated. One case of post-operative prophylactic roentgen treatment was also studied. In all these cases, the radiological treatment had a more or less marked stimulating effect on phagocytosis. This is of special interest in cases with hidradenitis, where radiation had a beneficial influence on inflammatory processes.

9589

CHANGES IN THE BLOOD OF PATIENTS TREATED WITH X-RAYS AND RADIUM. A. Westman. *Acta. Radiol.* 22, 1, 349(1921). (In French).

Initial transient leukocytosis was followed by leukopenia. After small and medium doses, there was a slight increase in rbc and Hb.

9590

VARIATIONS IN BLOOD CELL PRODUCTION IN GYNECOLOGICAL PATIENTS TREATED WITH ROENTGEN, RADIUM AND MESOTHORIUM RADIATION AND THEIR CLINICAL SIGNIFICANCE. P. W. Siegel. *Strahlentherapie*, 11, 64(1920).

Authors observed a transient initial leukocytosis 2-6 days after beginning therapy, followed by leukopenia in irradiated patients. There was a consistent increase in rbc and Hb in gynecologic patients receiving radiation therapy. This is attributed to improved general health.

9591

OUR METHOD OF DEEP ROENTGEN THERAPY AND OUR RESULTS. L. Seitz and H. Wintz. *Strahlentherapie* 5, (1920). (In German).

Authors describe transient leukocytosis in therapeutically irradiated patients and attribute this to marrow stimulation. Slight decrease in rbc and Hb was observed after moderate or small doses, marked decrease after large doses.

9592

THE IMPORTANCE OF INDICATIONS FROM STERNAL PUNCTURE IN ROENTGEN THERAPY. O. Meller, F. Gottlieb and R. Brauner. *Radiology*, 31, 149(1938).

Authors describe early and later changes in the bone marrow picture in 8 patients receiving x-ray therapy. Effects of various doses are compared.

9593

IS A SPECIFIC LEUKOTOXIN PRODUCED IN THE BLOOD SERUM DURING ROENTGEN RAY THERAPY OF LEUKEMIA, PSEUDOLEUKEMIA AND LYMPHOSARCOMAS? C. Kleneberger and H. Zoepfritz. *Munch. med. Wochschr.*, 53, 850 and 911(1906). (In German).

Authors were not able to demonstrate presence of a toxin causing leukopenia.

9594

THE CLINICAL SIGNIFICANCE OF STUDIES BY MEANS OF INTRAVITAL BONE MARROW STAINING. STERNAL PUNCTURE STUDIES. S. J. Leitner. *Folia Haematol.* 65, 1(1941). (In German).

Patient with cancer of the oesophagus treated with x-ray had hypocellular sternal marrow with 2.5% normal-

blasts, a few early myeloid cells many lymphoid cells and reticular phagocytic cells. Mitosis was not seen.

9595

ON THE BIOLOGICAL VARIATION IN RESPONSE OF A GYNECOLOGICAL DISEASE TO WEAK ROENTGEN RAYS. E. Klasten. *Zentr. Chir.* 47, 1171(1923). (In German)

Initial transient leukocytosis was followed by leukopenia. No significant change was observed in rbc, Hb or platelets.

9596

THE DIRECT EFFECT OF RADIUM IRRADIATION ON LEUKOCYTES. R. G. Spurling and J. S. Lawrence. *Am. J. Med. Sci.*, 169, 157(1925).

Blood under stasis in an extremity of dogs and man was irradiated. Radium irradiation of blood retained in an extremity of a dog or man, or in a vein of a dog, produced no demonstrable changes in the percentage of the different types of leukocytes in one and a quarter hours. Likewise the stasis of unirradiated blood in an extremity or vein for a similar period of time was without effect on the leukocytes. The manipulation of dogs' superficial tissues in obtaining blood produces destruction of leukocytes much more readily than similar trauma in man.

9597

SERIAL HISTOLOGICAL MODIFICATIONS OF THE BLOOD FOLLOWING EXPERIMENTAL IRRADIATION. A. Lacassagne and J. Lavedan. *Paris Med.* 51, 97(1924). (In French).

9598

NOTES ON BLOOD PRODUCTION DURING RADIATION THERAPY. E. Hayer. *Strahlentherapie*, 44, 687(1932). (In German).

Author describes changes observed in peripheral blood of patients receiving x-ray therapy. Initial granulocytosis is considered to be a compensatory phenomenon, possibly due to indirect as well as direct effect.

9599

BLOOD STUDIES IN PROTRACTED, FRACTIONATED RADIATION. W. Gloor and A. Zuppinger. *Strahlentherapie*, 40, 488(1931). (In German).

Authors describe their studies on the blood picture in patients receiving radiation therapy. Transient leukocytosis is believed to be due, at least in part, to altered distribution of cells within the circulation. It is suggested that marrow does not need to be irradiated in order to produce the observed effects. Left shift in wbc picture represents response to resorption of products of degenerated cells produced by irradiation.

9600

THE EFFECT ON THE BLOOD OF IRRADIATION, ESPECIALLY SHORT WAVE LENGTH ROENTGEN-RAY THERAPY. G. R. Minot and R. G. Spurling. *Am. J. Med. Sci.* 168, 215(1924).

Authors studied the blood of 42 cases, chiefly of cancer, before and after 56 roentgen ray irradiation treatments. Most common effect was leukopenia and lymphopenia. Particular attention was given to the observations on 22 of the patients given 36 intensive short wave length treatments. Factors influencing the effects of irradiation, e.g. intensity of dose and surface area exposed, are discussed.

9601

THE EFFECTS OF INJECTING BLOOD X-IRRADIATED IN VITRO ON THE BLOOD PICTURE. S. Wermel. *Munch. med Wochschr.* 61, 299(1914). (In German)

Serum x-irradiated *in vitro* and injected into a non-irradiated recipient caused leukopenia.

9602

INFLUENCE OF LOW TEMPERATURE AND PHASE STATES ON X-RAY SENSITIVITY OF YEAST. Thomas H. Wood. *Radiation Research* 1, 234(1954).

In liquid suspensions, haploid *saccharomyces cerevisiae* radiosensitivity was independent of temperature. This was also true of solid suspensions from -30° to -10° but radiosensitivity was half that of the cells in liquid. From -10° to -0.5°, radiosensitivities of solid suspensions increased with temperature up to that of liquid suspensions.

9603

GENETIC AND PHYSIOLOGIC DIFFERENCES IN NEUROSPORA INDUCED BY DIFFERENT PHYSICAL MUTAGENS. Val. W. Woodward. *Radiation Research* 1, 567-568(1954).

Filtration and selective plating technique for isolating biochemical mutants of *Neurospora* was used to study mutation rates and rate of germination after treatment with mutagens. Mutation rates varied, depending on whether conidia were wet or dry. Radiations of different ion densities caused differences in time and rate of conidial germination. There was no correlation between physiologic stimulation and genetic change. (from author's abstract)

9604

CHROMOSOMAL FRAGMENTS IN DIPLOID WHEAT AND THEIR USEFULNESS IN GENETIC STUDIES. Luther Smith. *Genetics*, 32, 105(1947).

Two fragments were produced by an x-ray-induced break of an chromosome at the centromere. Plants with fragments are distinguishable morphologically but are fairly fertile. Of 330 progeny of plants with fragments and heterozygous for a recessive gene for yellowish seedlings, 216 were yellowish.

9605

THE ABSORPTION AND TRANSLOCATION OF SEVERAL FISSION PRODUCTS BY PLANTS. J. H. Rediske and A. A. Selders. Hanford Atomic Products Operation, Biol. Research-HW 28636p 122-127(1953).

Absorption of ruthenium from nutrient solution by red kidney bean was studied as a function of ruthenium concentration and pH. Uptake of ruthenium depends on concentration of ruthenium added to nutrient environment. Ruthenium uptake is not pH sensitive in bean plants. Yttrium is absorbed about 10 times and strontium 10,000 times more efficiently than ruthenium at pH of 6.0.

9606

EXPERIMENTAL STUDIES ON THE EFFECT OF X-RAYS ON THE BONE MARROW. III. A. Casati. *Strahlentherapie* 43, 582(1932). (In German).

Bone marrow goes through two phases after intensive x-radiation, the degenerative and restorative phases. Histological picture of the two phases is described. Studies are based on bone marrow from irradiated hind limbs of rabbits. Dose used: 400 r on each of 2 consecutive days with an identical second course after 2 weeks, and (2) a similar course using an 800 r dose instead of 400 r. Marrow was studied serially up to 50 days after the first exposure. Results: No effect on erythroblasts; disappearance of myeloid cells due to (1) transformation into connective tissue cells and (2) inhibition and abnormality of mitosis in blast cells.

9607

CONTRIBUTION TO THE QUESTION OF THE EFFECT OF X-RAYS ON THE BLOOD. E. Benjamin, A. V. Reuss, E. Sluka, and G. Schwarz. *Wien, klin. Wochschr.* 19, 788(1906). (In German).

Authors believe it is possible to cause radiation leukopenia without exposing the blood forming organs. Their experiments: rabbits ears only were irradiated and leukopenia developed.

9608

THE EFFECT OF ROENTGEN RAYS ON NEPHRECTOMIZED

ANIMALS AND THE QUESTION OF LEUKOTOXINS. J. Schmid and A. Geronne. *Munch. med. Wochschr.* 54, 457(1907). (In German).

Authors believe that radiation produces a circulating leucotoxin which acts on blood forming organs to produce the injury observed there.

9609

EVALUATION OF BONE MARROW FUNCTION THROUGH X-RAY DOSE STIMULATION. G. Bucky and H. Guggenheimer. *Klin. Wochschr.* 1, 11(1922). (In German).

Authors studied changes in the blood picture of patients with blood diseases treated with x-rays. Small x-ray doses appeared to produce a beneficial effect in one case of pernicious anemia. Authors concluded that thrombocytosis could be stimulated by x-rays.

9610

EFFECTS OF ROENTGEN RAYS ON BONE MARROW. H. W. Wunsche. *Naunyn-Schmiedeberg's Arch.* 189, 581(1938). (In German).

Author interprets change in marrow of irradiated lumbar vertebrae of rabbits to be the result of markedly accelerated maturation of cells. Describes course of marrow changes after 200 to 600 r doses repeated up to 6 times at intervals of a few days. Describes cellular abnormalities including giant hypersyncytic granulocytes. Changes were seen within 5 minutes after first dose. Very large doses completely destroyed the marrow. Erythroid series was less readily injured than myeloid series. Author observed immature cells that resembled monocytes and were indistinguishable from them once they reached peripheral blood. Monocytosis is considered characteristic; also increased plasma cells and reticular cells.

9611

FURTHER CONTRIBUTION ON THE BIOLOGICAL EFFECT OF THORIUM X. A. V. Domarus. *Strahlentherapie* 4, 674(1914). (In German).

A group of rabbits received thorium x in various doses subcutaneously. Hemoglobin determinations, red and white blood cell counts and bone marrow examinations were carried out. Some animals died with severe marrow aplasia but other animals showed hyperplasia. Storage of injected material in R-E cells accounted for, in part, for marked effect on bone marrow.

9612

THE X RAY TREATMENT OF BONE SARCOMA AND THE REACTION OF THE BONE TISSUE TO THE X RAY. B. Dahl. *Strahlentherapie* 54, 35(1935). (In German).

Bone sarcoma in man may be radiosensitive as demonstrated by author's cases. Effects of doses as low as 100-150 r and as high as 3000 r to marrow in irradiated area are described. Recovery occurs earlier after lower doses but some recovery is seen even after high doses. Erythroblasts regenerated more rapidly than myeloid series. Degenerative changes in cells and variations in sensitivity among cells are described.

9613

CONCERNING THE EFFECT OF X RAYS ON LEUKOCYTES IN VITRO. A. Neumann. *Strahlentherapie* 18, 74(1924). (In German).

Leukocytes *in vitro* react to x ray as though disintegration were accelerated. Cells finally rupture.

9614

EXPERIMENTAL ASPECTS OF NEW LEUKEMIA THERAPY. A. Pappenheim. *Zschr. exp. Path. u. Ther.* 15, 39(1914). (In German).

Author describes marrow hyperplasia after fatal doses of x rays (rabbits).

9615

THE EFFECT OF ROENTGEN RAYS ON HEMATOPOIESIS IN THE BONE MARROW OF MAN AND THE EFFECT OF VARYING THE INTENSITY OF THERAPEUTIC RAYS.

Englmann. Fortschr. Geb. Röntgenstr Kongressheft, 73, (1935). (In German).

Marrow from irradiated vertebrae and ribs in 46 autopsy cases was studied and compared with marrow from non-irradiated bone. Doses ranged from 100 r to 3800 r; and single dose and fractional-protracted doses are compared. Megakaryocytes were most radiosensitive, degenerating after only 100 r. Myeloid series was next most sensitive; erythroid series last. Author concluded that more mature cells were destroyed before stem cells. Describes degenerative changes in cells. No regeneration was observed after tumor therapeutic doses.

9616

FATAL APLASTIC ANEMIA IN A ROENTGEN RAY SPECIALIST. K. Faber. Acta Radiol. 2, 110(1923). (In French).

9617

SERIOUS INJURY OF THE BLOOD IN CONSEQUENCE OF TELEROENTGENTHERAPY OF THE WHOLE BODY. D. den Hoed, B. Levie and M. Straub. Acta Radiol. 19, 151(1938).

Post mortem findings are reported for 4 patients dying after total body x-irradiation for cancer. Doses ranged from 475 r to 925 r and hematopoietic failure was important contributory cause of death. Bone marrow changes are described. Patients had previously had large doses (up to 10,000 r) of localized therapy. Myeloid tissue was destroyed early. There was extreme splenic sclerosis, the evidence of severe hemolysis. Megakaryocytes had about the same sensitivity as myeloid cells.

9618

EXPERIMENTAL STUDIES ON PERIPHERAL WHITE BLOOD CELLS AFTER X-RADIATION. E. Hayer. Strahlentherapie 50, 193(1934). (In German)

Local and total body irradiation (dogs) are compared with respect to their effect on peripheral blood picture and blood forming organs.

9619

ON THE NATURE OF ROENTGEN-LEUKOTOXINS IN THE BLOOD IN LYMPHOCYTIC LEUKEMIA. H. Cuschmann and O. Gaupp. Munch. med Wochschr. 52, 2409(1905). (In German).

Believe that leukopenia represents direct destruction of circulating leukocytes by the radiation and that the injured cells in turn produce a leukotoxin that destroys additional cells. Injection of serum from irradiated patient or animal causes leukopenia when injected into non-irradiated recipient.

9620

THE RELATION OF RADIOSENSITIVITY TO BUDDING IN *SACCHAROMYCES CEREVISIAE*. Carl Beam, R. Mortimer, R. Wolfe, and C. Tobias. Radiation Research 1, 126(1954).

The X-ray survival curve of haploid *saccharomyces cerevisiae* is the sum of two exponentially decaying functions of dose. When log phase cells are irradiated, 70 to 95% survive and have MLD of 3500 r, those remaining are over 10 times as resistant with MLD of about 50,000 r. Resistant cells are dividing when irradiated. When haploid cells are shaken in a medium containing sugar, but no nitrogen source, the percentage of budding cells is reduced.

9621

THE REACTION OF PLANTS TO THE RADIOACTIVE EFFECT OF P^{32} IN THE FIRST AND FOUR SUBSEQUENT GENERATIONS. A. G. Shestakov, G. F. Ivanova, and N. I. Shmel'kova. Izvest. Timiryazev Sel'skokhoz. Akad. No. 1, 165-178(1955).

Seedlings grown without P were affected by small quantities of P^{32} , but seedlings grown in normal (P

containing) solutions were affected only by high doses of P^{32} . Content of P^{32} in different parts of plants depended on previous P nutrition. CA 49-14113

9622

CONDITIONS WHICH AFFECT THE BIOLOGIC DAMAGE RESULTING FROM EXPOSURE TO IONIZING RADIATION. L. H. Gray. Acta Radiol. 41, 63-83(1954).

Influence of O_2 tension on damage induced by x-ray follows a strikingly similar pattern in the case of 5 different biological responses in plant and insect cells. Influence on α ray and neutron damage is relatively slight. Pre-treatment of Vicia roots with a gaseous atmosphere of air and carbon monoxide caused increased x-ray sensitivity. CA 48-5890

9623

THE QUESTION OF THE GENETIC ACTIVITY OF HETEROCHROMATIN THROUGH STUDIES OF THE X-CHROMOSOMES OF *SPHAEROCARPUS DONNELLI*. E. Knapp. Ber. Deut. Botan. Ges. 53, 751-760(1935).

Most of the heterochromatic x-chromosome in *Sphaerocarpus* must be free of essential genes, since this chromosome is present only in ♀♀ and since plants in which a part of the x-chromosome is deleted (by x-rays) are viable. Author concludes that genes present are not necessary for life but have morphological effect. (from abstract). BA 11-60

9624

STUDIES ON THE MECHANISM OF ACTION OF IONIZING RADIATIONS. XI. INACTIVATION OF YEAST ALCOHOL DEHYDROGENASE BY X IRRADIATION. E. S. Guzman Barron and P. Johnson. Arch. Biochem. Biophys. 48, 149-153(1954).

Dilute solutions of crystalline yeast alcohol dehydrogenase were readily inactivated by x-ray. Degree of inactivation was proportional to x-ray dose. Glutathione completely protected the enzyme against x-ray inactivation but glutamic acid had no effect. H_2O_2 had no effect.

9625

HOW IS CELL GROWTH INFLUENCED BY HORMONES, VITAMINS BY THE D'ARSONVAL CURRENT, SHORT WAVES, AND X-RAYS? EXPERIMENTS ON EMBRYONIC, CULTURED (ANIMAL) AND PLANT CELLS. F. Ludwig and J. V. Ries. Strahlentherapie 67, 507-521(1940).

Influence of various chemical agents (pituitrin, insulin, progynon, dityran, prolan, preloban and vitamin B) on germinating wheat grain was studied. Effects of high-frequency radiations, ultraviolet and red light, and ultrashort waves were investigated.

9626

CYTOLOGICAL STUDIES ON IRRADIATED TISSUES. I. THE INFLUENCE OF RADIUM EMANATION ON THE MICROSPOROGENESIS OF THE LILY. M. Levine. Proc. Intern. Congr. Plant Sci. 1st. Congr., Ithaca 1, 271-297(1929).

Cytoplasmic changes and changes in chromatin material during reduction divisions are described. BA 4-10795

9627

CYTOLOGICAL STUDIES IN *ALLIUM*. I. CHROMOSOME MORPHOLOGICAL CONTRIBUTIONS. Albert Levan. Hereditas 16, 257-294(1932).

Forms with 18 somatic chromosomes may have arisen from those with 16 by fragmentation. Satellites may have arisen in the same way. Fragmentation was observed in three specimens and is described in detail in *A. allegheniense*. In one plant, with 2 fragments, one fragment was attached medially to one large, chromosome, evidently representing a case of translocation. BA 7-2537

9628

INFLUENCE OF RADIUM ON VEGETATION. A. Lepape and R. Trannoy. *Ann. Agron.* **4**, 319-354(1934).

Quantity of Ra measurable in crops varied with amount in soil. Least amount detected in fruits, most in leaves. Small or medium-large doses of Ra added to soil had no apparent effect but large doses were harmful. BA 11-2949

9629

THE SIGNIFICANCE OF SULFHYDRYL COMPOUNDS FOR RADIOBIOLOGY. R. Koch. *Arzneimittel-Forsch.* **5**, 271-275(1955).

Review of cysteine-cysteamine group of compounds as protective agents against radiation damages. CA 49-12565

9630

THE RELATIVE EFFECTS OF X-RAYS, GAMMA RAYS AND BETA RAYS ON CHROMOSOME BREAKAGE IN *TRADESCANTIA*. J. S. Kirby-Smith and D. S. Daniels. *Genetics* **38**, 375-388(1953).

Conclusions: X-rays (60 KeV) are twice as effective as Co^{60} γ or 400 KeV β rays in producing chromosomal aberrations; 1 MeV γ rays and 400 KeV mean energy β rays are closely similar in biological effects on *Tradescantia* dry pollen. Relative magnitude of the two-hit component is greater for γ and high energy β rays than for medium energy x-rays.

9631

THE EFFECTS OF THORIUM AND URANIUM SALT UPON THE CROPS. Z. Kasal. *Kyoto Daigaku Shokuryo Kagaku Kenkyujo Hokoku* **3**, 69-71(1950).

No effects of radioactivity (Th and U nitrates) were seen on wheat, barley, oats, rice, radish and pea crop growth or quality, except where compounds were administered by direct application. Suppressed growth and decrease in yields are attributed to chemical action, not radioactivity. CA 45-4860

9632

THE CHANGES IN THE CHROMOSOMES AND THE FORMATION OF CHROMOSOMAL CHIMAERAS UNDER THE INFLUENCE OF X-RAYS IN *CEPHALARIA SYRIACA* SCHRAD. N. T. Kakhidze. *Trudy Priklad. Botan. Genet. I. Seleksi.* Ser 2, **1**, 177-184(1932).

Seeds were exposed for 14, 18, 24, 30 and 36 min., at 108 Ku., 4 m A. 20-cm. distance, 1/2 mm. aluminum filter. In radicles and apical buds, translocations were observed; both showed chimaera structure in composition of cell nuclei. BA 8-5170

9633

THE PHYSIOLOGICAL EFFECT OF α , β AND γ RAYS OF RADIUM ON THE DYNAMICS AND ENERGETICS OF CARBON DIOXIDE ASSIMILATION. Julius Stoklasa, J. Hruban, and J. Penkava. *Biochem. Z.* **218**, 361-96(1930).

Author concludes that α rays inhibit photosynthesis and increase O_2 consumption of the plants. Respiration is slightly increased by β rays. Combined β and γ rays stimulate photosynthesis. Oxidation by means of absorbed O_2 is promoted by α rays only in absence of β and γ radiation. CA 24-3034

9634

THE USE OF RADIOACTIVE SUBSTANCES AS FERTILIZERS. W. H. Ross. *U. S. Dept. Agr. Bull.* **149**, 1-14(1914).

Radio-elements may be valuable in botanical research greenhouse practice, but have no practical value as fertilizers in general farming. Action of U on plants is due to chemical properties, not to radioactivity. Conflicting results obtained with radioactive fertilizers is explained by presence of U. CA 9-502

9635

THE CAUSE OF THE ACTION OF X RAYS AND GAMMA RAYS OF RADIUM UPON LIVING CELLS. F. Dessauer. *J. Radiol.* **4**, 411-415(1923).

The author proposes a theory called 'point heat', by which heat on a cell could be raised as a result of the release of an electron as a direct result of a radiation hit. Since this electron release could not be directed, it would concentrate in some cells and be absent in others. This might explain the irregular distribution of irradiated cells found following cancer therapy. CA 18-2040

9636

THE GENETIC EFFECT OF CHEMICAL AGENTS ON THE CELL. P. C. Koller. *Proc. Intern. Congr. Genet.* 8th Congr., Stockholm. 1948. p. 320-324(1949).

Ionizing radiation, ultraviolet, and chemicals may be used as mutagenic agents. Certain chemicals act as specific mutagens while others produce toxic effects only. CA 45-6235

9637

EFFECT OF RADIUM AND ULTRAVIOLET LIGHT ON GROWTH AND CITRIC ACID FORMATION IN *ASPERGILLUS NIGER*. E. K. Kresling and E. A. Shtern. *Trudy Nauch-Issledovatel. Inst. Pishchevoi Prom. Narkomish-cheproma SSSR* **3**, 5-24(1935).

Radium and ultra-violet inhibited growth and produced morphological changes in *Aspergillus* cultures on agar. Citric acid production was increased by radon. Radon also changed biological and hereditary properties. CA 30-5256

9638

THE RETENTION OF RADIOACTIVE PHOSPHORUS WHEN ADMINISTERED IN DIFFERENT CHEMICAL FORMS. S. Warren and R. F. Cowing. *Cancer Research* **4**, 113(1944). 113p.

9639

THE RETENTION OF RADIOACTIVE PHOSPHORUS IN LEUKEMIC PATIENTS. S. Warren. *Cancer Research* **3**, 872(1943).

9640

THE DISTRIBUTION OF DOSES OF RADIOACTIVE PHOSPHORUS IN LEUKEMIC PATIENTS. S. Warren. *Cancer Research* **3**, 334(1943).

9641

THE DISTRIBUTION OF DOSES OF RADIOACTIVE PHOSPHORUS IN RODENTS. S. Warren and R. F. Cowing. *Journ. Lab. Clin. Med.* **26**, 1014(1941).

P^{32} injected intravenously or intraperitoneally in mice, rats and rabbits in doses ranging from 5-17.5 μc (mouse), 30-329 μc (rat) and 50-84 μc (rabbit). Spleen, liver, kidney and bone showed high absorption and retention in all species although there were differences among species and among individual animals with respect to distribution to various organs. Urinary excretion of P^{32} was rapid, about 25% of injected dose being excreted within 48 hours.

9642

THE TREATMENT OF LEUKEMIA BY RADIOACTIVE PHOSPHORUS. S. Warren. *New England Journ. Med.* **223**, 751(1940).

9643

BONE MARROW CHANGES FOLLOWING THE ADMINISTRATION OF RADIOACTIVE PHOSPHORUS. S. Warren. *New England Jour. Med.* **228**, 111(1943).

Author describes studies of 8 patients who had come to autopsy following the administration of radioactive phosphorus, either orally or intravenously, as disodium

phosphate. The changes produced in bone marrow did not differ significantly from those produced by other radiation.

9644

USE OF RADIOACTIVE PHOSPHORUS IN TREATMENT OF LEUKEMIA. C. Webster. Texas Rep. Biol. and Med. 2, 83(1944).

9645

X-IRRADIATION AND LIVER REGENERATION IN PARTIALLY HEPATECTOMIZED RATS. L. L. Gershbein. Am. J. Physiol. 185, 245-49(1956).

Rats receiving 20,000 r to the liver immediately after partial hepatectomy showed normal regenerative ability of the liver. (Autopsied 11 days post-exposure).

9646

STUDIES ON NEOPLASMS WITH THE AID OF RADIOACTIVE PHOSPHORUS. THE PHOSPHORUS METABOLISM OF THE NUCLEOPROTEIN, PHOSPHOLIPID, AND ACID SOLUBLE FRACTIONS OF NORMAL AND LEUKEMIC MICE. L. W. Tuttle, L. A. Erf and J. H. Lawrence. Journ. Clin. Invest 20, 57(1941).

9648

DISCUSSION ON THE CONSTITUTIONAL EFFECTS OF RADIATION WITH SPECIAL REFERENCE TO VOLUME DOSE. D. W. Smithers. Brit. Journ. Rad., 15, 141 (1942).

Author discusses improvements that can be made in radiation therapy technique in order to obtain a more accurate measurement of effective dose received by the patient. Symptoms of radiation sickness are considered probably to be due to histamine and the use of antihistamines in the prevention of x-ray sickness is suggested.

9649

VOLUME DOSAGE IN X RAY THERAPY. PART II. THE CORRELATION OF BIOLOGICAL EFFECTS WITH VOLUME DOSE. F. Ellis. *Brit. Journ. Rad.*, 15, 194 (1942).

9673
VOLUME DOSAGE IN DEEP X RAY THERAPY. PART I. THE ESTIMATION OF VOLUME DOSE IN DEEP X RAY THERAPY FOR CLINICAL PURPOSES. F. Ellis. *Brit. Journ. Rad.*, 15, 174(1942).

9674
PROVISIONAL CALCULATION OF THE TOLERANCE FLUX OF THERMAL NEUTRONS. J. S. Mitchell. *Brit. Journ. Rad.*, 20, 79(1947).

Doses are considered in light of: surface of soft tissues, n- γ reaction in H, total surface dose, bone dose and diffusion-reflection of thermal neutrons at body surface. Based on MPE for x and γ rays (0.1r/day), author estimates MP flux of thermal neutrons to be 1250/cm²/sec for 8 hrs.

9675
PROVISIONAL CALCULATION OF THE TOLERANCE FLUX OF FAST NEUTRONS. J. S. Mitchell. *Brit. Journ. Rad.*, 20, 177-180(1947).

The flux of fast neutrons (2-20MeV) corresponding to the dose 0.1r/day of radium γ rays is estimated to be 85 neutrons/cm²/sec delivered in 8 hrs. Because of uncertainties in the estimate, author recommends that the provisional tolerance flux should not exceed 20 neutrons/cm²/sec.

9676
HISTOCHEMICAL STUDIES OF THE EFFECT OF IRRADIATION OF THE PLACENTA. A. G. Foraker, W. Denham, and D. D. Mitchell. *Arch. Pathol.*, 59, 82-89(1955).

Histological and histochemical changes in locally irradiated uterine horns and placenta in rabbits are described. Five days after 1200 r, changes include: decreased dehydrogenase activity, diffuse granular alkaline phosphatase staining, decreased glycogen (PAS stain), but normal tissue structure with H and E stain. Maximum placental damage is seen at maternal-fetal junction.

9677
DISCUSSION ON THE CONSTITUTIONAL EFFECTS OF RADIATION, WITH SPECIAL REFERENCE TO VOLUME DOSE. F. Ellis. *Brit. Journal. Radiol.*, 15, 143(1942).

Author discusses estimation of volume dose, relationship between symptoms of radiation sickness and total energy absorption and application of the concepts discussed to experimental work.

9678

RADIOACTIVE PHOSPHORUS IN TREATMENT OF POLYCYTHEMIA VERA. RESULTS AND HEMATOLOGICAL COMPLICATIONS. B. E. Hall, C. H. Watkins, M. H. Hargreaves and H. Z. Griffin. *Amer. Journ. Med. Sci.* 209, 712(1945).

9691

HEMATOLOGIC COMPLICATIONS OF THERAPY WITH RADIOACTIVE PHOSPHORUS. L. H. Hempelmann, E. H. Reinhard, C. V. Moore, O. S. Bierbaum, and S. Moore. Jour. Lab. and Clin. Med., 29, 1020(1944).

Authors used radioactive phosphorus as a therapeutic agent in treatment of 100 patients with various hematologic dyscrasias. Conclusion: P^{32} is a valuable therapeutic agent in the treatment of chronic leukemia and polycythemia, but severe leukopenia, thrombocytopenia, anemia and bone marrow aplasia may occur as a complication of therapy.

9692

ENTRANCE OF RADIOACTIVE PHOSPHORUS INTO SPHINGOMYELIN OF VARIOUS TISSUES OF CAT. F. E. Hunter. Proc. Soc. Exp. Biol. and Med. 46, 281(1941).

Greatest incorporation of P^{32} into sphingomyelin was observed in the liver, the lung and the intestinal mucosa. With the exception of the lung, the tissues may be ranked in approximately the same order for sphingomyelin activity as for total phospholipid activity. The lung is relatively higher with respect to sphingomyelin. Radioactivity in sphingomyelin reaches maximum about 2 days after injection in most tissues.

9693

CAUSES AND PREVENTION OF RADIOTHERAPEUTIC OEDEMA OF THE LARYNX. B. Jolles. Brit. J. Radiol. 18, 278(1945).

Movement of water and mineral salts was studied *in vitro* and *in vivo* after x-irradiation of the Larynx. Implications of results with respect to therapy are discussed.

THE EFFECT OF INSOLUBLE RADIOPHOSPHORUS (CHROMIUM PHOSPHATE) WHEN APPLIED INTERSTITIALLY IN THE TREATMENT OF ADENOCARCINOMA OF THE MAMMA IN MICE. H. Allen, L. H. Hempelmann, and N. A. Novack. Cancer Research 5, 239(1945).

Adenocarcinoma of the breast (mice) can be completely and safely destroyed by interstitial radiation. Where the neoplasms are larger than 1/5 the body weight of the animal, fatal toxemia often results from the absorption of broken-down tumor tissue. Most of the radioactive material apparently remains at the site of injection, although a small portion is carried to the regional lymph nodes, where its action can be noted. No microscopic evidence of distant parenchymatous damage was found.

9708

INHALATION OF RADIOACTIVE AEROSOLS AND ITS PREVENTION. Jech. Cestmir. Acta Radiol. et Cancerol. Bohemosloven. 5, 45-9(1951). (In English).

An α -emitting aerosol of 30 per cent Io (Th^{230}) and 70 per cent Th^{232} suspended in H_2O was inhaled for 3 min. by a rat, which was immediately killed. Nuclear-emulsion radioautographs of lung sections showed the particles to be 1-5 μ in diameter and to be located mainly in the walls of the bronchi, only rarely being found in alveoli. Inhalation of air containing $10^{-12}c$ of Rn and its decay products/cc resulted in 50 per cent retention of the radioactivity, as measured by the expired air (man). These results confirm those of other authors who found substantial retention of aerosols in the respiratory tract. Simple filtration through dry filter paper, cotton or sintered glass removes practically all aerosols from air. NSA 6-4348

9709

CALCULATIONS PERTAINING TO RADIUM PRODUCED IN VIVO FROM A THORIUM PATIENT. pp. 19-25. P. F. Gustafson and L. D. Marinelli. Division Semiannual Report. (January through June, 1956). John E. Rose, Director. (ANL-5596)

9710

A CLINICAL INVESTIGATION OF THE CHRONIC EFFECTS OF RADIUM SALTS ADMINISTERED THERAPEUTICALLY (1915-1931). R. J. Hasterlik, W. B. Looney, A. M. Brues and E. Skirmont. Argonne Cancer Research Hospital ACRH-2, Jacobson, Leon, editor, Semiannual report to AEC (September, 1954).

Authors describe results of clinical, radiographic and hematological studies on 20 persons who had been given radium (internally deposited) as a therapeutic procedure 20-30 years previously and on 6 radium dial pointers. Findings, including tumor incidence, are presented in detail.

9711

THE UPTAKE OF SUBCUTANEOUS AND INTRAMUSCULAR SILVER-COATED RADIOACTIVE GOLD COLLOIDS BY LYMPH NODES IN DOGS. A. H. Jackson, F. E. Staggars, P. F. Hahn. J. Lab. Clin. Med., 42, 739-45 (1953).

Silver-coated radioactive gold colloids administered subcutaneously to dogs were taken up by the regional lymph nodes in significant quantities. Quantitative differences between drainage from superficial and deep breast sites were noted. Some microscopic changes in regional nodes following infiltration of a large single dose of the gold colloid are presented and discussed.

METABOLISM OF FISSION PRODUCTS-RADIO TEL-LURIUM. L. Jacobson, R. Overstreet, I. Chalkoff and Associates, October, 1944 (CH-2258), Add-1, MDDC-1005.

After oral and i. m. administration of two forms of Te^{129} and Te^{127} , uptake, distribution and excretion were measured. Principle organs of deposition are blood, liver, kidney.

9717

VARIATIONS IN THE CATALASE AND LIPASE OF THE BLOOD IN ROENTGEN RAY TREATED PATIENTS. M. J. Goldstein and J. P. Neworoshkin. Strahlentherapie 36, 736-744(1930). (In German).

9718

ANEMIA OF INFECTION. XVII. EFFECTS OF TURPENTINE AND COLLOIDAL THORIUM DIOXIDE ON RAT PLASMA IRON LEVELS. W. N. Jensen, C. J. Gubler, G. E. Cartwright, and M. M. Wintrobe. (U. Utah,

Salt Lake City). Proc. Soc. Exptl. Biol. and Med. 80, (1), 33-36(1952).

Single intravenous injections of colloidal thorium dioxide in the rat produced a marked transient hypoferrremia. A more persistent hypoferrremia resulted from the administration of this substance daily for 3 days both in intact and splenectomized rats. The hypoferrremia-producing effect of turpentine was markedly decreased by prior administration of colloidal thorium dioxide. BA 26-30963

9721

THE LOCALIZATION OF P^{32} IN THE SUPRANUCLEAR ZONE OF THE COLUMNAR ABSORBING CELL OF THE WHITE RAT. Perry M. Johnston. J. Morph. 95, 77-94 (1954).

Three female white rats were injected intraperitoneally with approximately 1 mc of P^{32} as H_3PO_4 and sacrificed at 1, 3 and 5 days. Adjacent sections of duodenum with pancreas attached were fixed in alcohol-formalin and 2% osmic acid to bring out Golgi apparatus. Autoradiograms were made of sections of duodenum of control and experimental animals (Pelc's stripping film technique). Sections were also placed on NTB₃ and NTB plates. Autoradiograms were stained with Harris' hematoxylin. Grain counts above epithelial cells in a standard area was $100 \mu^2$. There was no marked selectivity for p^{32} .

9726

SELECTIVE SENSITIVITY OF THE FORMED ELEMENTS OF THE BLOOD OF THE WHITE RAT AS AFFECTED BY RADIUM CHLORIDE INJECTED INTRAPERITONEALLY. Paul G. Rooft (U. Kansas, Lawrence) Univ. Kansas Sci. Bull. 38(1), 323-330. Illus. (1956).

The total white cell count is lowered appreciably by giving radium chloride (in varying dosages over short period of time) intraperitoneally to young male albino rats. The polymorphonuclear leukocytes are slightly

more sensitive than lymphocytes. Blood platelets react more slowly, but show a pronounced drop. Until more accurate data are available concerning the rate of phagocytosis by liver, spleen, and bone marrow, as well as irradiation effect on phagocytes, quantitative irradiation effects upon formed elements of blood must wait. Also, uniform sampling must be used, for differences exist between various neural regions. For example, the white cell count of blood from the heart may well be different from that of periphery. (from author's discussion.)
BA 31-20357

9727

A STUDY OF THE EFFECTS OF PROTEIN FAST AND INTERNAL IRRADIATION ON THE BONE MARROW OF THE MALE ALBINO RAT. P. G. Rooft and M. Spencer. Univ. Kansas Sci. Bull. 37(1), 31-53(1955).

Two groups of experimental animals were used in the experiment, one subjected to protein fast, the other injected intraperitoneally with radium chloride. Differential counts were made on bone marrow by a random selection procedure. A toluidine blue stain was used to determine the effect on nucleic acid content of tissue. Cellular basophilia and nucleic acid content were not noticeably affected. Total bone marrow basophilia and nucleic acid content are reduced during protein fast, due chiefly to reduction in cellularity. Mitotic activity is decreased by protein fast and irradiation. In the bone marrow, erythropoietic elements are most easily affected by protein fast and internal irradiation, and granulocytopoietic elements are more susceptible than megakaryocytes.

9748

STUDIES OF RADIOACTIVE COPPER. M. O. Schultze and S. J. Simmons. J. Appl. Phys. 12, 315(1941).

Authors report studies with radioactive Cu in nutritional anemia of the rat. Cu fed to anemic and Cu-deficient rats produced accelerated cytochrome C oxidase of marrow, reticulocytosis and gradual increase in rbc count and Hb. Absorption and retention of Cu appear to be governed in part by amount of Fe present in tissues. Cu-deficient rats retain more of a single therapeutic dose of Cu than do Fe-deficient rats. Liver shows greatest retention of Cu.

FURTHER STUDIES ON THE GASTROINTESTINAL ABSORPTION OF PLUTONIUM. M. H. Weeks, J. Katz, W. D. Oakley, J. E. Ballou, L. A. George, L. K. Bustad, R. C. Thompson, and H. A. Kornberg. Radiation Research 4, 339-47(1956).

In chronic feeding experiments the concentration of plutonium in the solution fed had no effect on fraction absorbed from GI tract of rats over range 10^{-5} μ g 1 mL. Average absorption from a pH 2 Pu (IV) nitrate solution was 0.0028%. In single feeding experiments, absorption of plutonium (pH 2 Pu (IV) nitrate solution) from GI tract of 3 pigs was 0.0022%. Plutonium in mono acidic solutions and Pu(VI) were absorbed to a considerably greater extent. Excretion of plutonium in urine of rats during first 9 days after intragastric administration amounted to about 20% of total plutonium absorbed. Less than 1% of plutonium fed to rats remained in GI tract 2 days after feeding. (from authors' summary)
NSA 10-7458

9772

GASTRO-INTESTINAL ABSORPTION OF PLUTONIUM. III. COMPARISON BETWEEN RAT AND PIG. M. H. Weeks, L. A. George, W. D. Oakley, L. K. Bustad, and R. C. Thompson. (Hanford Works). Nov. 15, 1954. 14p. Contract W-31-109-Eng-52. (HW-33744)

In single feeding experiments, absorption of plutonium from GI tract of 3 pigs averaged 0.0022% with 95% confidence limits of ± 0.0013 . Plutonium absorbed and excreted in urine of rats amounted to less than 20% of total plutonium absorbed. Less than 1% of plutonium fed to rats remained in the animals 2 days after feeding.
NSA 9-1703

9773

INFLUENCE OF PLUTONIUM CONCENTRATION ON EFFECTIVENESS OF THERAPEUTIC AGENTS. M. H. Weeks, W. D. Oakley and R. C. Thompson. (Hanford Works). Aug. 1, 1954. 9p. Contract W-31-109-Eng-52. (HW-32399)

Retention of plutonium in bone and soft tissues (including pelt and GI tract) of rats was not significantly different in animals receiving plutonium in amounts varying by a factor of 10^5 . Effects of zirconium citrate and Ca EDTA in preventing retention of plutonium were not significantly influenced by plutonium concentration. Radiation: rats were injected intraperitoneally with 1 mL solution containing 1.4×10^{-8} g Pu(IV) as the citrate, pH6.

9774

EFFECTS OF VARIOUS DOSES OF RADIOACTIVE PHOSPHORUS ON THE PROTEIN METABOLISM. I. V. Savitskii and A. F. Leshchinskii (Odessa Pharmaceutical Inst.) Med. Radiol. 1, No. 6, 82-90(1956). (In Russian).

Authors studied action of tracer and therapeutic doses of P^{32} on protein metabolism in rabbits subjected to loss of blood. Total serum nitrogen, serum proteins (albumins, globulins, and fibrinogen), residual nitrogen, urea and concentration of amino-acids in blood and plasma were determined, as well as hematocrits. Conclusion: tracer doses of P^{32} can, under certain conditions stimulate protein metabolism whereas doses approaching those used clinically in therapy can delay healing processes. NSA 11-3664

EXPERIMENTAL ALTERATIONS OF CELL SIZE AND MITOTIC ACTIVITY IN THE OUTER ORBITAL GLAND OF THE WHITE RAT. VI INFLUENCE OF SINGLE DOSE ROENTGEN IRRADIATION. H. Teir. *Acta Pathol. Microbiol. Scand.* 32, 337-47(1953).

Through single dose roentgen irradiation of outer orbital gland of 2 week old rats, higher nuclear classes than normal were obtained with doses of 600, 1000, 1500 and 3000 r in the organ exposed. X rays caused a delay in growth of organ as a whole. Deviating mitoses can, at least in part, explain the occurrence of higher nuclear classes. The cells were sensitive to colchicine 6 weeks after dose of 1000 r. Author suggest that the system which under normal conditions controls growth of cells and their number is influenced by irradiation.

SOME EFFECTS OF ACCELERATED ELECTRONS OR CATHODE RAYS ON CERTAIN INSECTS AND ON THE WHEAT AND FLOUR WHICH THEY INFEST. V. H. Baker, O. Taboada, and D. E. Wiant. *Michigan State Coll. Agric. Expt. Sta. Quart. Bull.* 36, (1), 94-106 (1953).

Granary weavils and flour beetles were exposed to radiation from Van de Graaff 2-million-volt electron accelerator. After 1000 rep, 30% of flour beetle eggs hatched. Dose of 5×10^5 rep was lethal to all flour beetles, 2.5×10^5 rep lethal to 100% of granary weevils, 2.5×10^5 rep lethal to 92% flour beetles 1 wk after treatment, 1×10^5 lethal to 82% granary weevils 1 wk after treatment. (from authors summary).

9791

ENZYME FORMATION IN NON-VIABLE CELLS. L. S. Baron, S. Spiegelman, and H. Quastler. *J. Gen. Physiol.* 36, 631-641(1952-1953).

The only lethal agent yielding complete dissociation of viability from capacity to synthesize enzymes in yeast

cell was x ray. Dosage causing 99.9% lethality (and greater) did not inhibit capacity of treated suspensions to synthesize maltozymase and galactozymase. Suspensions retained ability to utilize externally supplied nitrogen from enzyme synthesis. (from author's summary).

9792

THE MECHANISM OF THE CATALYSIS OF CELL RESPIRATION AND THE INFLUENCE OF ROENTGEN RAYS. P. Ellinger and M. Landsberger. *Klin. Wochensch.* 2, 966-969(1923).

9793

ABNORMAL PLANT GROWTH. R. Bloch. *Brookhaven Symposia in Biol.* 6, 41-54(1954).

Three sections: I. Amorphous changes of histological nature, involving temporary or permanent loss of typical organization, II. Abnormal growth on an organ level, involving distortion of developmental patterns due to different etiological factors, III. Formed changes, involving harmonious alterations of histological organization and pattern. (from abstract). *BA* 28-29592

9794

NUTRITIVE VALUE OF PROTEIN AND ENERGY OF FOOD. B. C. Johnson and V. C. Motta. *Federation Proc.* 15, 907(1956).

Irradiation sterilization of beef, beans, peas, and milk has not been found to cause greater losses in the nutritive value of the protein of these foods than are caused by other food processing methods.

9795

SPONTANEOUS CHROMOSOME ABERRATIONS IN *TRADESCANTIA*. Norman H. Giles. *Genetics* 25, 69-87 (1940).

Types, frequency, and loci of spontaneous structural chromosome aberrations in a number of pure species and in F₂ generation of a natural species hybrid of *Tradescantia* were studied at the first post-meiotic mitosis. Aberrations are similar to chromosome alterations induced by low dosage x-rays in the developing microspore. (from author's summary).

9796

THE RELATION BETWEEN X-RAY INTENSITY AND THE FREQUENCY OF DEFICIENCY IN THE MAIZE ENDOSPERM. S. F. Goodsell. *Anat. Record* 47, 381-382(1930).

Effect of x-ray on frequency of deficiency in heterozygous maize endosperms was determined by irradiating young ears 48 to 54 hours after pollination with seven graded doses up to 1000 r and 10, 175 deficient areas were classified. Each locus frequency of deficiency is proportional to intensity of dose (from author's abstract).

9797

EFFECT OF VARIOUS RADIATIONS ON SURFACE FILMS OF PROTEINS. A. Dognon and C. Piffault. *Compt. Rend.* 208, 907-8(1939).

Measurements of surface tension show that films of serum albumin or hemoglobin are destroyed on exposure to x ray or to U-V light, the surface tension of H₂O covered with a film of either steadily rising on such exposure compared with that of pure H₂O.

9798

SUMMARIES OF PAPERS PRESENTED AT THE CONFERENCE ON THE REMOTE CONSEQUENCES OF INJURIES CAUSED BY THE ACTION OF IONIZING RADIATION. F. G. Krotkov, A. V. Lobedinsky, A. I. Ignatyev, eds. 1956. 74p. (NP-tr-207)

Papers are abstracted separately.

9799

INTRACELLULAR LOCALIZATION OF THE TRYPTOPHAN-LAA ENZYME SYSTEM. Solon A. Gordon. *Radiation Research* 3, 229(1955).

The enzyme system catalyzing the conversion of tryptophan to phytohormone, indoleacetic acid, is sensitive

in vivo to x rays. Irradiation of mung bean plant with 10 r decreases activity of one conversion stage by 20%. Damage is not mediated through nuclear or cell division but occurs in cytoplasm of meristematic or embryonic cells. (from author's abstract.)

9800

CHANGES IN THE BLOOD PICTURE IN ANIMALS AT LONG INTERVALS AFTER THE INTRODUCTION OF RADIOACTIVE SUBSTANCES INTO THE ORGANISM.

I. K. Petrovich. p. 9-11. "Summaries of Papers Presented at the Conference on the Remote Consequences of Injuries Caused by the Action of Ionizing Radiation." F. G. Krotkov, A. V. Lebedinskiy and A. S. Ignatyev, Eds. Translated from a publication of the State Medical Literature Press, Moscow, 1956. (NP-tr-207).

Mixed uranium fission products, a mixture of isotopes and uranium nitrate, given to dogs over more than a year did not cause acute radiation sickness but dogs developed leukocytosis, leukopenia and thrombosis. Uranium nitrate and Sr⁸⁹ altered white and red blood cell counts, Po²¹⁰ increased monocytes and decreased hemoglobin and lymphocytes.

9801

ENZYMATIC RADIOSENSITIVITY OF AUXIN BIOSYNTHESIS.

Solon A. Gordon and Robert P. Weber. *Radiation Research* 1, 218(1954).

Although auxin is not unduly radiosensitive, low doses of ionizing radiation cause immediate depression of free auxin levels. Depression occurs through radiosensitivity of auxin biosynthesis. Enzyme system in biosynthesis is readily inhibited by low dose irradiation. Radiosensitive locus appears to be the terminal aldehyde oxidation which gives rise to indoleacetic acid. Enzymatic inhibition can be integrated with changes in free auxin levels and their sequelae. (from author's abstract.)

9802

REMOTE CONSEQUENCES OF INJURIES CAUSED BY IONIZING RADIATION. D. I. Zakutinsky. p.1-4 of Summaries of Papers Presented at the Conference on the Remote Consequences of Injuries Caused by the Action of Ionizing Radiation. F. G. Krotkov, A. V. Lebedinskiy, and A. S. Ignatyev, eds. Translated from a publication of the State Medical Literature Press, Moscow, 1956. 74p. (NP-tr-207)

Internally deposited radioactive substances are continuous sources of radiation and in many cases cause malignant tumors. Late effects of exposure observed in atomic bomb victims include blood disturbances, sterility and defects in children. Late effects observed in experimentally irradiated animals include increased sensitivity to drugs such as caffeine, and bromine. Changes in the permeability of blood vessels were found. Inhibition of spermatogenesis is especially likely to occur following exposure to fast neutrons.

9803

QUANTITATIVE COMPARISON OF THE BIOLOGICAL EFFECTS OF NEUTRONS AND OTHER IONIZING RADIATIONS. L. H. Gray and J. Read. *Nature* 144, 509(1939).

With Li-D neutrons, the ratio of gamma-ray to neutron energy necessary to produce the same increase in mutation rate in *Drosophila* sperm is $\gamma/N = 0.7$, whereas for the lethal effect $\gamma/N = 11$. Explanation of the greatly increased sensitivity of certain tissues to neutron compared with x-ray energy, must be sought in terms of specific relationships between the distribution of ionization and biological structure.

9804

CLINICAL AND PATHOMORPHOLOGICAL INVESTIGATIONS OF THE PROGENY OF DOGS SUBJECTED TO THE ACTION OF URANIUM FISSION PRODUCTS. S. P.

Voskresensky and A. P. Novkova. p.54-56. "Summaries of Papers Presented at the Conference on the Remote Consequences of Injuries Caused by the Action of Ionizing Radiation." F. G. Krotkov, A. V. Lebedinskiy and A. S. Ignatyev. Eds. Translated from a publication of the State Medical Literature Press, Moscow, 1956. 74p. (NP-tr-207).

Uranium fission products affect sexual function.

Pregnancy and parturition were grossly normal, progeny decreased. Mammary glands were disturbed. In progeny, no changes in organs, atelectase and lipophages in lungs, lipemia, deviations in parenchymatous organs, earlier involution of Hassall's bodies in thymus, prolonged spermatogenesis and atypical mitotic forms in seminal epithelium.

9805

COMPARISON OF THE LETHAL EFFECT OF FAST NEUTRONS AND GAMMA-RAYS ON THE GROWING TIPS OF BROAD BEAN ROOTS. L. H. Gray, J. Read, and J. C. Mottram. *Nature* 144, 478-479(1939).

Growing tips of broad bean roots were irradiated by fast neutrons (~ 2.9 Mev). Results: 63 ± 6 energy units of neutrons or 690 ± 35 r of γ rays cause 50% mortality. Neutron energy appears to be ten times as efficient as gamma-ray energy in its lethal effect on bean roots.

9806

SOME CLINICAL AND BIOCHEMICAL INDICATIONS OF THE STATE OF THE ANIMAL ORGANISM AT LONG INTERVALS AFTER INJECTIONS OF RADIOTHORIUM. S. M. Mikhailovich. p.15-18. "Summaries of Papers Presented at the Conference on the Remote Consequences of Injuries Caused by the Action of Ionizing Radiation." F. G. Krotkov, A. V. Lebedinskiy and A. S. Ignatyev, Eds. Translated from a publication of the State Medical Literature Press, Moscow, 1956. 74p. (NP-tr-207).

Study of activity measured by γ radiation. Small doses of radiothorium proved lethal to dogs. Symptoms and signs: lassitude, immobility, anorexia, diarrhea, hemorrhages, weight loss, decrease of hemoglobin content and erythrocyte count, protein in blood and urine. Cholesterol ester of serum fell. Neoplasms formed. Hematopoiesis, liver, and kidney changes were also observed.

9807

THE SENSITIVITY OF SIX MICROORGANISMS TO X-RAYS. Shirley E. Gunter and Henry I. Kohn. *Radiation Research* 1, 498(1954).

Cells from young cultures, washed and resuspended in pH 7 phosphate buffer supplemented with magnesium sulfate, were irradiated at 25 to 27°C. Initial viable count of suspension was 20,000 cells/ml. The range of survival (visible colony formation) after incubation at 30°C. was 5 to 90%. (from author's abstract).

9808

DYNAMICS OF THE FORMATION AND DEVELOPMENT OF BONE SARCOMAS AFTER DAMAGE BY RADIOACTIVE STRONTIUM AND YTTRIUM. N. N. Litvinov. p.47-50. "Summaries of Papers Presented at the Conference on the Remote Consequences of Injuries Caused by the Action of Ionizing Radiation." F. G. Krotkov, A. V. Lebedinskiy and A. S. Ignatyev, Eds. Translated from a publication of the State Medical Literature Press, Moscow, 1956. 74p. (NP-tr-207)

Rats received radioactive Sr 90 intraperitoneally in doses of 0.4 microcurie per gm and radioactive Y 91 in doses of 0.6 microcurie per gm. Greatest damage is found in the metaphyses of the long tubular bones. Several initial tumor nodes develop in the same metaphysis of a given bone. The tumors are osteoblastic. The

tumors metaphysis most frequently into the lungs and mediastinum.

9809

INDUCED MUTATIONS AND THE VIABILITY PROBLEM. In: AGRICULTURAL GENETICS. CONFERENCE AT RIETL. A. Gustafsson. *Nature* 166, 292-294(1950).

Reports on: mutants obtained by x-ray irradiation of barley and the potentiality of irradiation as a tool in plant-breeding, artificial induction of mutations and polyploids; study of caryological interrelationships of species in wheat and other plants, significance of polysomics, oil plants, fruit breeding problems, and potentialities of special techniques such as artificial inductions of mutations and polyploidy for growing wheat.

9810

THE EFFECT OF IONIZING RADIATION ON INVERTASE IN CELLS. Franklin Hutchinson and Angela Preston. *Radiation Research* 3, 236(1955).

Dry and wet starved yeast cells were irradiated. Activity of irradiated invertase was determined as a function of dose. Rate of inactivation of invertase in dried yeast cells is the same as in dried purified preparations. Radiation sensitivity in wet cells is almost twice that in dried cells. In wet cells direct and indirect effect of ionizing radiation are equally important. (from author's abstract).

9811

REMOTE CONSEQUENCES OF PLUTONIUM DAMAGE. Z. M. Bukhtoyarova and V. K. Lemberg. p.38-9 of "Summaries of Papers Presented at the Conference on the Remote Consequences of Injuries Caused by the Action of Ionizing Radiation." F. G. Krotkov, A. V. Lebedinskiy, and A. S. Ignatyev, eds. Translated from a publication of the State Medical Literature Press, Moscow. 1956. 74p. (NP-tr-207)

Report describes damage after single intraperitoneal administration of plutonium nitrate to rats. Use of 6.3-10.3 and 1.89-10.3 microcuries g decreases leukocytes and shortens life. Osteosarcomas and tumors of soft tissues were produced. Greatest numbers of tumors were observed with doses of 1.89-10.3 microcurie/g, 6.3×10^3 and 1.89×10^3 microcurie/g resulted in earliest development of osteosarcomas.

9812

DEUTERON CROSS SECTION OF AMYLASE IN VITRO AND IN VIVO. John Jagger and Dwight Wilson. *Radiation Research* 1, 500(1954).

Malt β -amylase was bombarded in dry state by 3.7. Mev deuterons. Radiation sensitivity of amylase is the same in living barley seed and in a semipurified condition. Data indicate that radiation sensitivity is not changed by purification, studies on semi-purified enzymes provide accurate information regarding the state of these enzymes in living systems. (from author's abstract).

9813

HUMORAL FACTOR IN IRRADIATION PROTECTION; MODIFICATION OF LETHAL IRRADIATION INJURY IN MICE BY INJECTION OF RAT BONE MARROW. C. C. Congdon and E. Lorenz. *Am. J. Physiol.* 176, 297-300 (1954).

Recovery of irradiated mice after receiving heterologous marrow appears to be due to humoral factor from temporarily surviving intraabdominally transplanted cells.

9814

INFLUENCE OF THE SALTS OF URANIUM ON ALCOHOLIC FERMENTS. E. Kayser. *Compt. Rend* 155, 246-248(1913).

The salts of U behave toward the sugar as toward the yeast, and their toxicity is lessened by the presence of

large masses of yeast. Small doses of the salts stimulate alcoholic fermentation. (from abstract). CA 7-615

9815

DYNAMICS OF THE FORMATION AND DEVELOPMENT OF EXPERIMENTAL OSTEOGENIC SARCOMAS. R. I. Makarycheva. p. 45-46. "Summaries of Papers Presented at the Conference on the Remote Consequences of Injuries Caused by the Action of Ionizing Radiation." F. G. Krotkov, A. V. Lebedinskiy and A. S. Ignatyev, Eds. Translated from a publication of the State Medical Literature Press, Moscow. 1956. 74p. (NP-tr-207).

White rats received Sr90 intraperitoneally in doses of 0.4 microcurie/g. Osteogenic sarcomas developed in 84.5% of the animals. Multiple tumors were present in 73.5% of the animals. Tumors were most common in the distal metaphysis of the femur and at the proximal end of the tibia. Development of bone tumors was preceded by prolonged reconstruction of the bone tissue of the metaphyses.

9816

CHANGES IN THE GLIA IN DOG BRAINS AT LONG INTERVALS AFTER ACUTE RADIATION SICKNESS. L. L. Vannikov. p. 23-24. "Summaries of Papers Presented at the Conference on the Remote Consequences of Injuries Caused by the Action of Ionizing Radiation." F. G. Krotkov, A. V. Lebedinskiy and A. S. Ignatyev, Eds. Translated from a publication of the State Medical Literature Press, Moscow. 1956. 74p. (NP-tr-207).

Brains of 22 dogs received 400-600r doses of x rays. The dogs survived. White substance of the cortex and other regions showed increased numbers of astrocytes, with hypertrophy and thickening of bodies and processes. Hypertrophic diffuse gliosis of dystrophic origin was seen. The astrocytic glia system is damaged first, and then the neuron system.

9817

DEVELOPMENT OF TUMORS AT THE PLACE OF INTRODUCTION OF RADIOACTIVE SUBSTANCE. L. L. Khamaide. p. 40-44. "Summaries of Papers Presented at the Conference on the Remote Consequences of Injuries Caused by the Action of Ionizing Radiation." F. G. Krotkov, A. V. Lebedinskiy and A. S. Ignatyev, Eds. Translated from a publication of the State Medical Literature Press, Moscow. 1956. 74p. (NP-tr-207)

Radioactive preparations can produce malignant tumors at the site of introduction. Uranium fission products were given to male rabbits. Hyperemia, edema of the skin, purulent infiltration and necrosis resulted. The effects of various doses is discussed. Malignant neoplasms also occurred; the optimum dose for this was 0.1 microcurie/g.

9818

CHANGES IN LOOSE CONNECTIVE TISSUE IN CHRONIC RADIATION SICKNESS. V. V. Shikhodyrov. p. 25-28. "Summaries of Papers Presented at the Conference on the Remote Consequences of Injuries Caused by the Action of Ionizing Radiation." F. G. Krotkov, A. V. Lebedinskiy and A. S. Ignatyev, Eds. Translated from a publication of the State Medical Literature Press, Moscow. 1956. 74p. (NP-tr-207)

At the height of acute radiation sickness, the numbers of cellular elements decrease. Also noted; swelling and dissolution of collagen fibers, disintegration of argyrophilic structures, and an increase in chromotrophic substance.

9819

CHEMICAL ACTIONS OF IONIZING RADIATIONS ON AQUEOUS SOLUTIONS. PART I. INTRODUCTORY REMARKS AND DESCRIPTION OF IRRADIATION

ARRANGEMENTS. F. T. Farmer, Gabriel Stein and Joseph Weiss. J. Chem Soc., 3241-5(1949).

Free radical reactions studied in solutions in absence of interfering reagents are similar to reactions obtained in biological systems, containing the same molecules (x-rays, neutrons and α rays).

9820

RECENT STUDIES ON THE ETIOLOGY AND NATURE OF LEUKEMIA. J. Furth. Blood 6, 964(1951).

Author discusses induction of leukemia by ionizing radiation and suggests that virus-like agents, may cause leukemia in mammals as well as in fowls. NSA 6-20

9821

PROTECTIVE ACTION OF KCN AGAINST MORTALITY IN MICE IRRADIATED WITH VARIOUS DOSES OF X RAYS. H. Betz and A. Herve. Compt. rend. soc. biol. 144, 1015 (1950).

KCN administered intraperitoneally to mice before x irradiation gave some protection against a dose of 700 r, not 1200 or 1800 r. Mechanism of protective effect is discussed. NSA 5-1174

9822

EFFECT OF MENADIOL DIPHOSPHATE (SYNKAVITE) ON THE SENSITIVITY OF E. COLI AND S. CEREVISIAE TO X-RAYS. Henry I. Kohn and Shirley E. Gunter. Radiation Research 2, 351-353(1955).

Possible inhibitory effect of MDP on mitosis in microorganisms was studied using resting cell suspensions of Escherichia coli and Saccharomyces cerevisiae. LD₅₀ of both microorganisms was ~ 2000 r. At that dose MDP was without effect. After 10,000 r approximately 5% of cells survived. In the case of E. coli, MDP may have increased the killing, but increase was small.

9823

X-RAY MUTATIONS IN RICE. N. Parthasarathy. Nature 143, 340(1939).

Seeds of a pure line of rice were exposed to x rays under different conditions for 1-3 hours and various types of mutations appeared. A semi-sterile mutant gave in the F₃ generation normal fertile plants, semi-sterile and dwarfs in the ratio 1:2:1. The semi-sterility was found to be due to the association of four chromosomes in meiosis.

9824

THE GENE. L. J. Stadler. Science 120, 811-19(1954)

The author discusses the properties of the gene and reviews research for determining the characteristics of the gene including the work of such men as H. J. Muller and P. W. Bridgman. Studies on the mutation of specific genes and detection of spurious gene mutations are described.

9825

RADIATION DOSIMETRY. G. J. Hine and G. L. Brownell. New York Academic Press. 1956. 932p.

9826

DIFFERENTIAL SENSITIVITY OF SOAKED BARLEY SEEDS TO X-RAYS AND THERMAL NEUTRONS. Calvin F. Konzak. Radiation Research 1, 220(1954).

Seeds of Himalaya barley were on wet blotters for 0, 8, 16, and 24 hours before irradiation. Seeds were exposed to x ray doses of 0, 2, 4, 8, 16 x 10³r. Growth of seedlings from exposed seeds was reduced. Seedlings from soaked seeds showed more radiation damage than seedlings from dry seeds. (from author's abstract).

9827

PHYSICAL AND CHEMICAL ASPECTS OF SUPER VOLTAGE ROTATIONAL THERAPY. Hugh F. Hare, S. W. Lippincott, Jr., D. Sawyer, J. G. Trump, E. W. Webster, K. A. Wright, W. W. Evans, and R. C. Granke. Radiology 57, 157-68(1951).

This paper considers the physical and chemical aspects of 2 million volt x ray therapy combined with rotational administration, with particular reference to treatment of tumors. Treatment of the pituitary, larynx, head and neck is discussed. Supervoltage radiation of malignant disease depends on (1) type and extent of malignant lesions, (2) location, (3) ability of tumor to respond to any type of radiation, (4) amount of radiation given, and (5) time interval used in its administration.

9828

THE INFLUENCE OF OXYGEN TENSION ON THE GENETIC EFFECTS OF X-RAYS. C. F. Konzak. Radiation Research 1, 501-502(1954).

Maize endosperm mutations at al and sh 2 loci and pr locus were induced by irradiation of pollen. Irradiation in pure oxygen (compared with air) caused no change in mutation frequency, nitrogen produced a 62% reduction. Reduction by nitrogen attributed to removal of oxygen, which has direct action in production of chromosome breaks by x-rays. (from author's abstract).

9829

NUCLEIC ACID CHANGES IN RAT SPLEEN AFTER LOCALIZED X IRRADIATION. M. Bererbom. (Univ. of Kansas Medical Center, Kansas City). Radiation Research 5, 650-6(1956).

Effect of 400 r localized x radiation to the splenic area of rats on histological appearance of spleen, its weight, nucleic acid content and nucleic acid-base composition, for 7 days after irradiation is described. Effects of histological appearance, weight and nucleic acid content of the spleen were smaller than after the same dose of x rays given to the whole body. No changes in purine-pyrimidine composition of spleen, RNA or DNA were observed. (from authors summary).

NSA 11-2791

9830

THE EFFECT OF X RAYS ON CHROMOSOMES IN DIFFERENT STAGES OF MEIOSIS. A. Marshak. J. Gen. Physiol. 19, 179-98(1935).

Pollen mother cells exposed to low dosages of x rays at various stages show different frequencies of chromosome abnormalities in the first meiotic anaphase. Maximum frequencies of abnormalities were obtained in buds irradiated in the pachytene stage of the meiotic prophase and in the preceding mitosis. These results are taken to indicate that the x ray sensitive portions of the chromonemata are closely approximated in pairs in pachytene and in the early mitotic prophase. (from author's summary).

9831

ABNORMAL AND PATHOLOGICAL PLANT GROWTH. Brookhaven National Lab. Report of Symposium held August 3 to 5, 1953. Brookhaven Symposia in Biology No. 6, 310p. (BNL-258)

Topics included: use of in vitro cultures in investigating growth and differentiation in vascular plants, abnormal plant growth, genetic tumors in Nicotiana hybrids, nutrition and diseased plant growths, origin of crown-gall tumor cells, experimentally inhibited, plant tumor growth, size and shape of wound-tumor virus, virus induced abnormalities, nutritional aspects of virus-tumor growth, growth and regeneration in gametophytes and sporophytes of Gymnosperms, and aberrant growth in plants induced by ionizing radiation. (from abstract).

NSA 8-5464

9832

THE RESPONSE OF TRADESCANTIA POLLEN GRAINS TO RADIATION AT DIFFERENT DOSAGE RATES. P. C. Koller. Brit. J. Radiol. 19, 393-404(1946).

Irradiation was at 50, 5, 0.5 and 0.25 r/min. with x ray at 5, 0.5, 0.25, and 0.1 1-/min with γ rays.

Total dose was 200 r. The average number of breaks with both x rays and γ rays was less in samples fixed 72 hours after irradiation at 0.5 r/min. and for those fixed 48 and 72 hrs. after irradiation at 0.25 r/min. No evidence was found of any difference in breakage frequency of cells after x and γ radiation at the same dosage rate. (from author's summary).

9833

AGENTS MODIFYING CELLULAR METABOLISM. I. ACTION OF NEUTRONS, TRYPAFLAVINE, AND VEGETABLE EXTRACTS ON MITOSIS OF VEGETATIVE ROOT TIPS. Flavio Resende. Biol. Soc. Portuguesa Cienc. Nat. Ser 2.3, 182-211(1951). (In Portuguese, with English Summary).

Physiological and structural changes brought about by neutron radiations, tryptaflavine, and by three different plant extracts when applied to mitotic root tips cells of *Allium cepa* or of *Aloe Mitrifomis* var. *eommelinu*, are analyzed in light of their relationship to changes induced by the same agents in cancer therapy. NSA 7-1886

9834

CHROMOSOME BREAKAGE EXPERIMENTS WITH ENDOSPERM; SUB-CHROMATID BREAKAGE. L. F. La Cour and A. Rutishauser. Nature 172, 501-502 (1953).

Errors in chromosome separation at anaphase appear after x rays. Tissues were fixed at 1/2 hr. intervals after a dose of 54 r. A 6 1/4 hr. fixation in endosperm undergoing mitosis showed metaphases with chromatid breakage and anaphases with adhesions. Associations at non-homologous loci classified as intrachromatid and interchromatid. Conclusion; sub-chromatid breaks are induced by treatment during prophase but not during resting stage and metaphase.

9835

EFFECT OF OXYGEN ON THE RADIOSENSITIVITY OF GROWING BONE AND A POSSIBLE DANGER IN THE USE OF OXYGEN DURING RADIOTHERAPY. P. Howard-Flanders and E. A. Wright. Nature 175, 428(1955).

9836

ACTINOMYCOSIS OF THE FACE AND NECK TREATED WITH RADIUM. S. A. Heyderdahl. Brit. J. Radiol. 31, 1-14(1926).

Actinomycosis of face and neck were cured by gamma rays of radium. (from abstract). BA 1-744

9837

THE ARTIFICIAL INDUCTION OF MUTATIONS AND ITS THEORETICAL AND PRACTICAL RESULTS. P. Hertwig. Z. Induktive Abstammungs- u. Vererbungslehre 61, 1-35(1932).

Newer results of mutation research are discussed with special regard to chemical experiments on *Antirrhinum*, irradiation work on *Drosophila* and *Habrobracon*, and temperature work of Goldschmidt and Jollos. (from abstract). BA 7-20273

9838

MUTATIONS PRODUCED BY X-RAYS IN *PELLIA NEESIANA*. E. Heitz. Verhandl. Schweiz. Naturforsch. Ges. 1940, 170-171(1940).

For analysis of heterochromatin, thalli of a clone of *P. neesiana* were x irradiated. Among 1300 regenerates 160 had transpositions (in one experiment, up to 30%). Many transpositions are associated with physiological and morphological alterations. Irradiated individuals contain fractures in heterochromosome parts more frequently than in euchromosome regions. (from abstract). BA 19-20945

9839

DISTRIBUTION OF POLONIUM SUBCUTANEOUSLY INJECTED, THROUGHOUT THE TISSUES OF RATS

BEARING IMPLANTED CANCEROUS TISSUES. Antoine Lacassagne and Jeanne Lattes. Compt. rend. Soc. de biol. 90, 352-3(1924). (In French).

Largest amount of polonium became fixed in the spleen, while tumor tissues had less than other organs. Results indicate that cancerous tissue is not particularly susceptible to polonium.

9840

LOCALIZATION OF GLUTATHIONE RADIOPROTECTIVE MECHANISM IN TOTAL BODY IRRADIATION. F. L. Jennings and C. F. Tessmer. Radiation Research 5, 606(1956).

Results suggest that the primary radioprotective effect of glutathione in total-body irradiation can be localized in the spleen.

9841

THE IRRADIATION OF MEIOSIS IN *TRADESCANTIA*. A. Hague. Heredity 6, (suppl), 57-75(1953).

Three diploid specimens of *Tradescantia* were given x ray doses during meiosis and pollen-grain resting stage. Pollen mother cells were 20 times more sensitive than pollen grains. Spiralized chromosomes were 3 times more sensitive than unspiralized or diffuse chromosomes. High breakage is followed by high re-union. (from abstract) BA 27-15120

9842

THE FRACTIONATION EFFECT IN *TRADESCANTIA*. A. Hague. Heredity 6, (suppl), 35-40(1953).

T. paludosa anthers were given an x ray dose of 360 r. Chromosome breakage observed at 1st pollen-grain mitosis is reduced by fractionation with 4-hr interval but is restored to continuous dose level by 8- and 12 hr interval. Reduced breakage is outcome of physiological effect of first dose on later breakability, which disappears after 8 hrs. or more. (from abstract). BA 27-15119

9843

SOME OBSERVATIONS ON THE EFFECT OF GAMMA IRRADIATION ON THE BIOCHEMISTRY OF RABBIT BONE MARROW. J. F. Thomson, W. W. Tourtelotte, M. S. Cartarr, J. B. Storer. Arch. Biochem., Biophys. 42, 185(1953).

Effects of localized exposures of 310 r of γ rays Co^{60} on nucleic acid concentration in bone marrow are due to alterations in bone marrow cell population. There is selective elimination of cell types having a high concentration of cytoplasmic RNA.

9844

THE BIOLOGICAL ACTION OF THE BETA RAYS OF RADIUM. Isaac Levin. Proc. Soc. Exptl. Biol. Med. 21, 462-5(1924).

Capillary glass tubes, containing Ra, were inserted into normal and neoplastic tissues of plants and animals. Necrosis occurred in tissue immediately surrounding capillary, while second zone showed characteristic gamma radiation effects. In human tissues above conditions exist 1-2 weeks post-exposure but after 6-8 weeks recovery is almost complete. Action of β and γ rays is qualitatively similar, but quantitatively ratio of β to γ rays from a unit of Ra is approx 100 to 1.

9845

BIOLOGICAL EFFECTS OF IONIZING RADIATIONS FROM RADIUM AND POLONIUM ON CERTAIN FUNGI. S. Berk. Mycologia 4, 587-598(1952).

The effects on certain fungi of ionizing radiations from radium and polonium plated on metallic foils indicated that α particles were responsible for the biological effects. (from abstract). BA 27-7710

9846

THE DETECTION AND NATURE OF DOMINANT LETHALS IN *LILIU*. I. EFFECTS OF X RAYS ON THE HERI-

TABLE COMPONENT AND FUNCTIONAL ABILITY OF THE POLLEN GRAIN. S. W. Brown and M. S. Cave. *Am. J. Botany* **41**, 455-469(1954).

Dominant lethality, rather than injury to the functional ability of the pollen grain, is the result of 4000 r x ray dose delivered to pollen of *L. formosanum*, as demonstrated pollen grains. (from abstract). BA 29-2622

9847

THE STIMULATING ACTION OF ROENTGEN RAYS UPON EMBRYONIC DEVELOPMENT. P. Ancel and P. Vintemberger. *Compt. rend. soc. biol.* **91**, 606-9(1924). (In French).

Irradiation of hen eggs produced variable results. There was no developmental change in some cases, in others rapid or delayed development. Irradiation of 590 artificially inseminated *Rana fusca* eggs in various developmental stages for variable lengths of time did not accelerate development.

9848

THE DETECTION AND NATURE OF DOMINANT LETHALS IN LILIU. II. CYTOLOGICAL ABNORMALITIES IN OVULES AFTER POLLEN IRRADIATION. S. W. Brown and M. S. Cave. *Am. J. Botany* **41**, 469-483(1954).

Pollen of *L. formosanum* was exposed to an x ray dosage of 4000 r and placed on the stigma immediately. Fertilization occurred in nearly 100% of ovules. Cytological abnormalities in the developing embryo and endosperm consisted of large, irregularly lobed nuclei and micronuclei from fragmented chromosomes and a few bridges. (from abstract). BA 29-2623

9849

THE EFFECT OF X RADIATION ON GENIC MATERIAL. R. S. Caldecott. *Northwest Sci.* **27**, 25-32(1953).

Seedling mutation occurred in 6% of the x2 of barley seeds exposed to 15,000 r x ray dose. X ray induced fragments in root tips usually occurred in pairs at anaphase. No injury was seen in seedlings from dormant seeds exposed to 4000 r or less. Above this, progressive injury resulted. Persistent reciprocal translocations were the most common aberration. (from abstract). BA 27-18804

9850

THE CYTOLOGICAL EFFECTS OF IRRADIATION AT LOW INTENSITIES. P. C. Koller. *Heredity* **6** (suppl.) 5-22(1953).

Pollen grains of *Tradescantia bracteata* were irradiated by x and gamma rays at dosage rates 50, 5, 0.5, 0.25, and 0.1 r per min. Effects: stickiness of chromosomes, centric breakage errors of spindle formation, errors of spiralization (spurious breakage), chromatid and chromosome breaks, formation of micronuclei. Duration of irradiation was more important than dose in producing these effects. (from abstract). BA 27-15124

9851

THE LUZULA SYSTEM ANALYSED BY X RAYS. L. F. La Cour. *Heredity* **6** (suppl.), 77-81(1953).

Interchanges deriving from treatment of meiosis with x rays provide proof of an inverted meiosis in *L. purpurea* (2n=6). First division of meiosis is equational instead of reductional. Induced changes, such as a ring of four, appear at the 2nd division as a half-ring of four. Similar results are seen at meiosis in a tetraploid seedling derived from x ray treatment. (from abstract)

BA 27-15125

9852

THE PHYSIOLOGY OF CHROMOSOME BREAKAGE AND REUNION IN HYACINTHUS. L. F. LaCour. *Heredity* **6** (Suppl.), 163-179(1953).

Breakage and reunion in initial x ray broken cells (x1) and in X2 cells derived from them were studied in

roots of diploid garden hyacinths. Chromosome reunion occurs at X1 together with sister and chromatid reunion. At X2, chromosome reunion, arising mostly at telophase, is found. (from abstract). BA 27-24105

9853

INTERPRETATION IN X RAY CHROMOSOME BREAKAGE EXPERIMENTS. G. R. Lane. *Heredity* **6** (Suppl.), 23-24 (1953).

Physical and biological approaches to design and interpretation of quantitative experiments with ionizing radiation on biological material, particularly in relation to experiments on x ray chromosome breakage in *Tradescantia* pollen. (from abstract). BA 27-15126

9854

EFFECT OF RADIATION ON PROTOPLASM AND BIOCOLLOIDS. E. Bersa. *Protoplasma* **19**, 136-145 (1933). (In German).

A bibliography. BA 9-6735

9855

THE MECHANISM OF DELAYED KILLING OF MAIZE SEEDS WITH X-RADIATION. Louis R. Maxwell. *Proc. Natl. Acad. Sci. U.S.* **24**, 377-84(1938).

Killing comes at a particular stage in growth of seedlings as a result of irradiation of dry seeds with dosages of 50,000 to 100,000 r. One week after emergence of the plumule, elongation ceases and usually a thick crumpled first leaf will show. Seedling remains green for another week before dying. Experimental survival ratio-dosage relationships are given.

9856

THE EFFECT OF X-RAYS ON CHROMOSOMES IN MITOSIS. Alfred Marshak. *Proc. Natl. Acad. Sci. U. S.* **23**, 362-9(1937).

In mitosis, chromosomes are most sensitive to x rays at the onset of prophase, when division of chromonemata occurs. Separation of strands formed by this division occurs at the succeeding anaphase. In different species of plants and animals, the frequency of x ray induced chromosome abnormalities is independent of wave-length and varies directly as the total length of the chromonemata of the somatic chromosome complement. Other results are included. (from author's summary).

9857

GENETIC EFFECTS OF ULTRA-VIOLET RADIATION IN MAIZE. III. EFFECTS OF NEARLY MONOCHROMATIC 2537, AND COMPARISON OF EFFECTS OF X RAY AND ULTRA-VIOLET TREATMENT. L. J. Stadler and G. F. Sprague. *Proc. Natl. Acad. Sci. U. S.* **22**, 584-91(1936).

The proportion of fractionals is higher with U-V than with x rays. The proportion of germless seeds produced by U-V treated pollen is much lower than that produced by x rayed pollen. Proportion of haploviaible deficiencies may be higher with U-V than with x ray.

9858

THE LOCATION OF A GENE FOR DISEASE RESISTANCE IN MAIZE. Virginia H. Rhoades. *Proc. Natl. Acad. Sci. U. S.* **21**, 243-6(1950).

Cytological studies of x ray induced deficiencies and genetical studies of trisomic ratios indicate that the factor for resistance to physiologic form 3 of *Puccinia sorghi* is located in the short arm of the tenth and shortest chromosome of the haploid maize complement. (from author's summary).

9859

SOME EFFECTS OF HIGH TEMPERATURE ON POLY-PLOIDY AND OTHER VARIATIONS IN MAIZE. L. F. Randolph. *Proc. Natl. Acad. Sci. U. S.* **18**, 222-9(1932).

Effects of heat treatments (applied separately and in combination with x rays at the time of syngamy) on fertilization were studied.

9860

THE OCCURRENCE OF A NICOTIANA GLUTINOSA HAPLONT. Thomas H. Goodspeed and Priscilla Avery. Proc. Natl. Acad. Sci. U. S. 15, 502-4(1929).

Glutinosa haplont was one of 24 plants which grew from seedlings subjected to x rays 5 weeks after germination. Effect on external morphology was mostly ephemeral, when put into the field all except two were normal in appearance. One being the haplont. This plant was a replica of its diploid parent.

9861

GENETIC EFFECTS OF X-RAYS IN MAIZE. L. J. Stadler. Proc. Natl. Acad. Sci. U. S. 14, 69-75(1928).

Plants of three families heterozygous for C-Sh-Wx were treated by X raying young tassels at the time of maturation divisions. Treatments killed much of the pollen. Crossover percentage in male gametes in treated and untreated tassels are tabulated. When plants recessive for an endosperm character are pollinated by dominant heterozygous seeds produced include occasional mosaic individuals, in which a portion of endosperm shows recessive character. Effect of x rays discussed.

9862

STUDIES ON FACTORS AFFECTING THE SENSITIVITY OF BACTERIA TO HIGH VELOCITY ELECTRONS.

W. D. Bellamy and E. J. Lawton. Annals of the N. Y. Acad. of Sciences 59, 595(1955).

There is a great species difference in radiation sensitivity. Those organisms more resistant to heat are also more resistant to irradiation. Growth conditions greatly affect the sensitivity of most microorganisms. One of many factors involved is oxidation-reduction potential of cells. Reduced systems are much less sensitive in the presence of O₂ than oxidized systems. Evidence is presented showing difficulty in extrapolating from radiation effects on an isolated enzyme system to an intact cell.

9863

THE INFLUENCE OF NEAR INFRARED RADIATION ON THE PRODUCTION BY NITROGEN MUSTARD OF CHROMOSOMAL REARRANGEMENTS IN DROSOPHILA.

B. P. Kaufmann, H. Gay, and H. Rothberg, Jr. J. Exptl. Zool. 111, 415-436(1949).

In spermatozoa of irradiated Drosophila, chromosome breaks induced either by x rays or nitrogen mustard were distributed at random along chromosomes irrespective of division into euchromatic and heterochromatic regions. Frequency of rearrangements was increased (both x ray and nitrogen mustard) if males were first exposed to near infrared radiation.

9864

CYTOCHEMICAL STUDIES OF CHANGES INDUCED IN CELLULAR MATERIALS BY IONIZING RADIATIONS.

Berwind P. Kaufman, Margaret R. McDonald, and Maurice H. Bernstein. Ann. N. Y. Acad. Sciences 59, 533(1955).

Salivary gland cells of D. melanogaster and growing onion root tips were x irradiated. Structural nucleoproteins were partially degraded by x rays as shown by altered swelling of salivary gland cells under fast conditions and by altered staining reactions of onion cells. Effect of x rays on onion root tip cells are compared with effects of ribonuclease with respect to chromosome aberrations.

9865

IRRADIATION OF PARTS OF INDIVIDUAL CELLS. III. EFFECTS OF CHROMOSOMAL AND EXTRA CHROMOSOMAL IRRADIATION ON CHROMOSOME MOVEMENTS.

William Bloom, Raymond E. Zirkle, and Robert B. Uretz. Ann. N. Y. Acad. Sciences 59, 503(1955).

Cultures of cells from newt (Triturus viridescens)

were heart studied to determine effect of radiating specific portions of cells in vitro with a microbeam of (1) protons and (2) ultraviolet light.

9866

RADIATION STUDIES OF PROTEINS AND ENZYMES.

Richard Setlow. Ann. N. Y. Acad. Sciences, 59, 471(1955).

In the average, direct action of fast charged particle on large molecules is such that one primary ionization inactivates the specific function of one molecule. Some molecules required more than one ionization for inactivation, some are inactivated by a primary ionization in a neighboring molecule.

9867

VIOLET RAYS AND RADIO-ACTIVE MATERIAL FOR HASTENING PLANT GROWTH. Anonymous. Brit. J. Radiol. 18, 317(1914).

Both light from mercury vapor lamp and radioactive material in soil increase plant growth. Seeds germinated more rapidly in soil containing 1 mg of Ra salt/ 20 tons of soil and after U-V irradiation.

9868

INFLUENCE OF X-RAYS ON GERMINATION. G. Promsy and P. Dreyon. Rev. gen. bot. 24, 177-97.

Irradiated seeds had longer radicles, earlier gemmules, greater height, cells of epidermis lengthened radially, and pith cells were twice as large, when compared to control seeds. Lupin beans were soaked for 2 hours without removing shells and irradiated for 1 hour. Cellular activities as well as rate of growth increased. CA 7-3606

9869

IONIZING RADIATION METHODS FOR DETERMINING BIOLOGICAL STRUCTURE. Ernest Pollard Ann. N. Y. Acad. Sciences 59, 469(1955).

Inactivation of a large variety of biologically active molecules by x ray has permitted identification of the number and size of functional "sites" on the molecule. Similar studies on the inactivation of viruses, bacteria, etc., by means of radiations of varying penetration (β rays, slow, medium and fast deuterons, alpha particles and various velocities) permit similar "dissection" of these structures for identification of functionally important parts.

9870

USE OF CHARGED PARTICLES TO MEASURE SKIN THICKNESS AND OTHER SURFACE PROPERTIES.

Franklin Hutchinson. Ann. N. Y. Acad. Sciences 59, 494(1955).

Charged particles (electrons and protons) have a finite range in tissue, the range depending on the energy of the charged particle. If the energy is made sufficiently low, irradiation of an organism will be confined completely to the surface. Increasing the energy enables the charged particles to penetrate more deeply. It is by this method, that it is possible to measure the thickness of a surrounding layer or skin. E. coli and B. subtilis spores were used in the experiments described.

9871

RADIOACTIVE PLANT GROWTH STIMULANT. R. R. Adams. U. S. Patent 1,461,340(1923).

Spray for plants is prepared using a radioactive substance, e. g., Ra-bearing Ba salts, together with glue, casein or other adhesive. Pb arsenate or other insecticides or fungicides may be added to the mix. (from author's abstract). CA 17-2933

9872

HOMOLOGY PATTERNS OF X RAY INDUCED LETHAL MUTATIONS IN NEUROSPORA. K. C. Atwood and Frank Mukai. Radiation Research 1, 125(1954).

Nuclei of *Neurospora* in which recessive lethal mutations have been induced can be propagated under heterokaryotic symbiosis with the same mutation. Most large chromosomal deficiencies have an autonomous nuclear lethal effect that may account for much of the nuclear lethal effect of x rays.

9873

X-RAY INDUCED MUTATIONS IN GROWING MYCELIUM OF *NEUROSPORA*. K. C. Atwood and Thad Pittenger. *Radiation Research* 3, 212(1955).

When recessive mutations are induced by x rays in nuclei of actively growing *Neurospora* mycelium, progeny of mutant nuclei are carried forward and may be recovered in conidia formed at a great distance from point of induction. Doses up to 50,000 r have no permanent effect on mycelial growth rate. Induced mutation rate in growing cultures remains lower than in conidia.

9874

RADIUM EXPERIMENTS WITH *DATURA*. IV. VISIBLE GENE MUTATIONS IN RADIUM-TREATED AND CONTROL MATERIAL. A. G. Avery and A. F. Blakeslee. *Anat. Record* 41, 99(1928-1929).

Two recessive genes obtained from 18 F₁'s tested from a capsule treated with radium emanation, one recessive from 50 F₁'s from treated pollen. Haploidy induces gene mutations, out of 316 F₁'s from a haploid, 7, or 2.2%, were heterozygous for new genes. Except for one plant no new genes have been discovered in unirradiated plants. (from author's abstract).

9875

PROTECTIVE EFFECT OF SODIUM CYANIDE ON X-IRRADIATED PEA ROOTS. Z. M. Bacq and A. Herve. *Arch. Intern. Physiol.* 59, 348-356(1951).

The effect of x radiation on the roots of pea seedlings is diminished if the plants are treated with a 1:4000 solution of sodium cyanide 4 hours before irradiation. *CA* 47-5971

9876

ROLE OF ELECTROLYTES AND STARVATION IN ALTERING APPARENT RADIOSENSITIVITY OF BAKER'S YEAST. William J. Bair and J. N. Stannard. *J. Gen. Physiol.* 38, 493-504(1954) and (1955).

Effects of 90,000 r of 250 kv. x rays on respiration and fermentation of yeast depended on K⁺ and H⁺ of suspending medium. At pH 4.5, stimulatory effects were observed in KH₂PO₄ buffer and inhibition in K-free (T-S-T) buffer. At pH 6.5, situation was reserved. Starving increases radiosensitivity of respiration and fermentation. (from author's summary).

9877

AN IRRADIATION EFFECT ON ONION ROOTS. Matts Helde. *Acta Radiol. Suppl.* 116, 684(1954).

Influence of Ra γ irradiation on a spontaneous, rhythmic potential difference between root tip and any reference point on the root was studied in onions. Normal shape of this potential difference as a function of time is a sine-like wave with a characteristic voltage amplitude of 1-20 mV and a period of 10-30 min. The wave seems to be due to growth processes of the tip. When root tips are irradiated (dose 2r) in water saturated with oxygen an immediate check of the potential is observed

9878

THE EFFECT OF ROENTGEN RAYS UPON CELLS. DIMINUTION IN THE REACTIVITY OF A SENSITIVE ORGAN BY LIGATION OF THE AFFERENT ARTERIES. J. Jolly. *Compt. rend. soc. biol.* 91, 532-34(1924). (In French).

Rabbits, in which one iliac artery had been ligated were irradiated with roentgen rays and then killed.

Histologic changes in popliteal ganglia showed more serious lesions in unligated leg. Author concludes that normally functioning cells are more radiosensitive.

9879

COMPARATIVE SENSITIVITY OF DIFFERENT LYMPHOID ORGANS TO ROENTGEN RAYS. J. Jolly. *Compt. rend. Soc. biol.* 91, 354-6(1924). (In French).

Rabbits were irradiated for variable lengths of time. Differential results; lesions appeared in popliteal ganglion 2-6 hrs post exposure, 12 hrs post-exposure in femoral marrow. Recovery is complete in ganglion by 8th day, but may continue to 21st day in marrow.

9880

THE EFFECT OF ROENTGEN RAYS UPON CELLS. MODIFICATIONS ON THE RADIOSENSITIVITY BY LIGATION OF THE VASCULAR CONNECTIONS. J. Jolly. *Compt. rend. Soc. biol.* 91, 351-4(1924). (In French).

One lobe of guinea pigs thymus gland isolated from circulation by ligation. Neck region irradiated, animal killed 2-3 hrs afterwards. Ligated lobe had no lesions, while other lobe was extensively damaged. Results are attributable to reduced vitality of cell caused by lack of circulation. Concludes that normally functioning cells are more radiosensitive.

9881

THE PRODUCTION OF VARIATION IN *NICOTIANA* SPECIES BY X RAY TREATMENT OF SEX CELLS. T. H. Goodspeed and A. R. Olson. *Proc. Natl. Acad. Sci. U. S.* 14, 66-9(1928).

Authors attempted to produce heritable variations in *Nicotiana* by x irradiating sex cells at various stages of maturity. Over 1000 plants from the first x raying came to maturity. Over 20% of variant plants appeared. Variants showed striking alteration of some one, or all external morphological characters which distinguish *tabacum* var. *purpurea*.

9882

EXPERIMENTS ON THE RESPIRATION OF X-IRRADIATED BARLEY SEED. K. Mikaelson and H. Halvorsen. *Physiol. Plantarum* 6, 873-9(1953).

Germination was not affected in dry seeds of barleys jotun and maja treated with heavy doses of x rays. Doses of 5000-15,000 r had no influence upon the initial rate of respiration, but after 4-5 days of germination at 20°C. respiration was markedly reduced in irradiated seeds. The nature of the x ray effect on respiration is discussed in relation to observations on cytology and growth. (from abstract). *BA* 24-1094

9883

RESPIRATION OF PLANT TISSUE CULTURES AS A FUNCTION OF X-RAY DOSE. Mark W. Jones. *Phys. Rev.* 89, 899(1953).

Tissue cultures of corn root tips, grown in White's culture medium augmented by 10-5 mg IAA per liter nutrient were subjected to x ray doses of 100, 200, 400, 800, and 1400 r. Mean oxygen uptake decreased with increasing dose. Concomitant observations of dry weights indicate that their use for arbitrary correction of respiration rates of different weight cultures is not completely justified by the analysis of covariance between different series of observations. (from abstract).

9884

EFFECTS OF DELAYING OF GERMINATION OF SEEDS SUBJECTED TO RADIATION. June G. Jones and D. Pomeroy. *Phys. Rev.* 87, 179(1952).

When dry seeds are irradiated, subsequent development is affected. Extent of damage is influenced by delaying the germination of dry seeds, previously exposed to x rays. Radiation injury was measured by comparing the length of coleoptiles of control and irradiated seedlings four days after germination. (from abstract).

9885

THE INDUCTION OF VARIATIONS IN PENICILLIUM NOTATUM BY THE BOMBARDMENT OF SPORES WITH NEUTRONS. H. J. Hanson. Ohio State Univ., Columbus, Doctoral Dissertation 54, 149-54(1948).

Over 150 variations involving color, texture, rate and quantity of vegetative growth sporulation, color and amt. of transpired fluid were noted after exposure to slow neutrons for 1 hr. through 134 days. (from abstract). BA 23-28109

9886

ASSIMILATION OF RADIOACTIVE ELEMENTS BY PLANTS. V. I. Baranov. Compt. Rend. Acad. Sci. USSR 24, 951-954(1939).

U, Ra, Rd-Th, and Ac were placed in the nutrient medium for the following plants: Pisum sativum, Lactuca sativa, Cucumis sativus, Linum usitatissimum, and Avena sativa. Uptake of isotopes resulted in higher concentrations in leaves and stems than in the roots. CA 34-4108

9887

HISTOLOGICAL EFFECTS OF ABSORBED RADIO-ISOTOPES UPON THE CALLUS OF SEQUOIA SEMPERVIRENS. Ernest Ball. Bota. Gaz. 114(4), 353-363(1953).

Callus cultures of S. sempervirens grown 85 days on agar media containing P32, S35, and C14. Thickening resulted from formation of new cells at right angles to surface. Internal parenchyma was largely disintegrated. Marginal meristems underwent hypertrophy and ceased to form new cells. (from author's summary). BA 28-14639

9888

SOME EFFECTS OF RADIOISOTOPES ON THE CALLUS CULTURE OF SEQUOIA SEMPERVIRENS. Ernest Ball. Anat. Record 121, 466(1955).

Radioisotopes P32 and S35, accumulated in meristematic cells. Parenchymatous cells showed lower accumulation. Sublethal amounts of P32 and S35 destroyed parenchymatous cells of callus and marginal meristems. No permanent changes were noted after calluses were exposed to internal radiations from C14. Radioactive carbon compounds moved from the inoculum into new tissues produced by growth. (from author's abstract).

9889

ACTIVATION OF THE BACTERIAL OXIDATION PROCESSES BY URANIUM SALTS. H. Agulhon and R. Sazerac. Compt. Rend. 155, 1186-1188(1913).

Solution of U salts (1/1000) stimulate vinegar fermentation by Mycoderma aceti. U acetate was used because it is much less antiseptic than nitrate. Similar results were obtained with sorbase bacterium in its action on glycerol. (from abstract). CA 7-809

9890

SPONTANEOUS AND INDUCED CELL RESTORATIONS AFTER TREATMENTS WITH IONIZING AND NON-IONIZING RADIATIONS. R. Latarjet. Acta Radiol. 41, 84-100(1954).

Restoration phenomena in irradiated cells may depend on several different processes. Distinctions are made between 3 general processes: (1) restoration by reversion, (2) restoration by recovery, and (3) restoration by superimposed injury. (from abstract). Studies utilized E. coli and diploid yeast. BA 28-25502

9891

THE RADIATION RISKS OF THE ROENTGENOLOGIST. A. Barclay and S. Cox. Am. J. Roentgenol. Radium Therapy 19, 551-61(1928).

Measurements were made of the amount of radiation received by workers. It was concluded that a daily exposure of 0.00028 of a skin unit dose was a safe limit. CA 22-3421

9892

INFLUENCE OF X RAYS ON THE BLOOD. RESUME OF WORK DONE ON SUBJECT SINCE 1904. E. Dernerville. Revere Scrisse, The (1914). From abst. in Brit. J. radiol. 19, 152(1914).

9893

THE EFFECT OF X AND RADIUM RAYS ON PLANTS. M. Koernicke. Himmel und Erde 17, 1 and Nature 71, 373(1904).

The exposure of seedlings to Roentgen and radium rays caused retardation and eventually cessation of growth of stem and root, in some cases growth was resumed after an interval, in others the plants never recovered. The first effect of the rays on dry bean and turnip seeds was to accelerate germination, but while the beans ceased to develop after a time, the turnips did not even show signs of retardation.

9894

A CLINICAL STUDY OF THE EFFECT OF RADIATION ON BLOOD CHOLESTEROL IN MALIGNANT DISEASE. W. L. Mattick, et al. J. Cancer Res. 11, 86-100(1927).

9895

MUTATIONS IN ASPERGILLUS NIGER BOMBARDED BY LOW VOLTAGE CATHODE RAYS. R. M. Whelden. Mycologia 32, 630-44(1940).

The several variant strains of fungus produced differed markedly from the parent, most commonly in the color of the fruiting mycelium. One showed increase in size. They have been continued through several asexual generations without showing any appreciable change. At the voltage used (about 12 KEV) the electrons penetrate spores far enough to release most of their energy in the zone in which the nucleus is located. (from abstract).

9896

COBALT-60 FIELD IRRADIATION MACHINE. Otto A. Kohl, W. R. Singleton and B. Manowitz. Nucleonics 13, (7) 42(1955).

In the Brookhaven Laboratory Co 60 radiation field, utilizing a 1600 curie source, abundant endosperm mutations were produced in growing corn plants. A dose-response curve for such mutations was calculated. With a radiation dose of 1300 r., one-day exposures produced maize endosperm mutations at the rate of about 3% per gene if given at the most sensitive period, i.e., about a week prior to pollen shedding. A description of the machine is given. NSA 9-7571

9897

BEER PASTEURIZATION. Anonymous. Nucleonics 13(1), 71(1955).

Irradiation of packaged beer with 50,000 rep of Co 60 gamma rays inactivates yeast cells, resulting in complete biological stability. Because glass bottles darken and enamel inside steel cans is adversely affected, aluminum cans would be most suitable for beer irradiation. This was part of a report by Neil F. Ritchey, atomic energy advisor to the Reynolds Metal Company.

9898

ELECTRON BOMBARDMENT OF BIOLOGICAL MATERIALS II. THE RATE OF DEATH OF FUNGUS SPORES BOMBARDED IN VACUUM WITH CATHODE BEAMS FROM 4 Kv-15Kv. R. M. Whelden, C. E. Buchwald, F. S. Cooper and C. P. Haskins. J. Gen. Physiol. 23, 391-400(1940).

Effects: shortening of germination time was observed at very low voltage, germination became very irregular at voltages from 11-15 Kv and cultures from these spores showed several mutations, marked retardation of growth, and complete inactivation. The last is reported in detail. (from abstract). BA 15-2925

9899

X-RAY INDUCED MUTATIONS IN BARLEY. Nishimura, Yonehachi, N. Hirowo, and S. Takeo. Japanese J. Breeding 1, 210-14(1952). (In Japanese with English Summary).

Investigation of the X1 and X2 generations of x-rayed barley seeds revealed a difference of fertility among spikes of an individual plant in X1 generation. Progenies of spikes with normal fertility in X1 generation often segregate in the X2 into fertile and partially sterile plants, while partially sterile spikes often produce fertile plants only. The possibility of applying Burnham's multiple translocation method to barley is discussed. (from abstract). BA 27-8479

9900

ACTION OF X RAYS ON AMPHIBIAN EGG DEVELOPMENT. II. THE EFFECT OF OXYGEN ON THE RELATIVE SENSITIVITY AT VARIOUS STAGES DURING THE FIRST CLEAVAGE IN THE TOAD EGG. Y. Nakao. in: Progress in Radiobiology. C. C. Thomas Publishers, Ill. 1956. 557p.

9901

A PRELIMINARY REPORT ON SOME CHROMOSOME ALTERATIONS BY X RAYS IN CREPIS. M. Navashin. Am. Naturalist 65, 243-52(1931).

Chromosome alterations; addition or subtraction of entire haploid chromosome sets or individual chromosomes; rearrangement of chromosome material without any alterations in the total mass of the nucleus, alteration of the morphological characters of the chromosomes invariably connected with a change of the total mass of the nucleus, although often affecting different chromosomes independently, and appearance of new large "V-shaped" chromosome structures.

9902

THE TOLERANCE OF GOSSYPIUM HIRSUTUM FOR DEFICIENCIES AND DUPLICATIONS. Margaret Y. Menzel and Meta S. Brown. Am. Naturalist 88, 407-18(1954).

Exposure of germinating seeds of *G. hirsutum* to 1200r of x rays was effective in producing chromosome aberrations. Ten lines having 12 different translocation complexes were recovered, involving a minimum of 29 breaks and rearrangements. At least ten, and probably all twelve, of these complexes gave one or more viable and fertility-deficiency duplication genotypes when out-crossed. (author's summary)

9903

RADIOACTIVITY OF THE ERUPTION OF VESUVIUS AND OF THE COMPANION SOLFATARIA, AND THEIR INFLUENCE ON THE DEVELOPMENT OF BACTERIA AND HIGHER PLANTS. J. Stoklasa and J. Penkava. Compt. Rend. 179, 819-22(1924).

A considerably greater electrical condition was found in the air near the crater of Vesuvius, at the top of the Eifel Tower, and in Alsatian potash deposits, by comparison with the air at the base of each of these structures. These conditions are exceeded by the condition of gases at Pozzuoli. These conditions are attributed to Rn and K and are believed to favor photosynthesis. (from abstract). CA 19-602

9904

THE IMPORTANCE OF POTASSIUM FOR THE BUILDING UP OF NEW MATERIAL IN LIVING PLANTS. Julius Stoklasa. Ernähr. Pflanze 30, 299-307(1934).

Seeds of barley, wheat, oats, clover, peas, and the broad-bean exposed to both gamma and beta radiation from K metal and KCl showed an increased germination over the controls. Rays from other K salts such as KOH, K₂CO₃, KCl, and K₂SO₄ also improved germination. Plants showed high yields when treated with a residue from a Ra extraction process. CA 28-7294

9905

SOME ASPECTS OF THE CHEMICAL PROTECTION AGAINST RADIATION DAMAGE TO VICIA FABA CHROMOSOMES. Sheldon Wolff. Genetics 39, 356-64 (1954).

Seeds of *Vicia faba* were treated with 2×10^{-3} M solns. of BAL, sodium hydrosulphite, cysteine, glutathione, or sodium ascorbate, and were then given 500 r of x rays. BAL gave good protection against radiation-induced chromosomal aberrations. Sodium hydrosulfite gave some protection but less than BAL. The other chemicals did not enhance radioresistance. (from abstract). BA 28-27877

9906

THE EFFECT OF THERMAL NEUTRON RADIATION ON THE CHROMOSOMES OF DATURA. Henry T. Yost, Jr., W. R. Singleton, and A. F. Blakeslee. Proc. Natl. Acad. Sci. U. S. 39, 292-7(1953).

Seeds of *D. stramonium*, line 1, were exposed to radiation for 2 hrs. at a flux of approx. 4.6×10^8 thermal neutrons cm²/sec. Seeds were germinated and transplanted. Pollen was classified according to chromosomal type and gene type. Chromosomal aberrations were correlated with translocations and gene aberrations with 12 bivalents. (from abstract). BA 28-17609

9907

STUDIES ON X RAY INDUCED RECIPROCAL TRANSLOCATIONS IN EINKORN WHEAT. I. ANALYSIS OF SOME NEW RT TYPES. K. Yamashita. Seiken Zihō (Rept. Kihara Inst. Biol. Research) 4, 102-10(1950). (In Japanese with English Summary).

Studies deal with analysis of some new types of reciprocal translocations (RT types) in *Triticum aegilopoides* and *T. monococcum*. The chromosome constutions of 10 new RT types were established, based on the data of the crossing experiments with 6 standard Rt types. Attempts to combine RT sets of chromosomes were successful. (from abstract). BA 27-104

9908

STUDIES ON X-RAY INDUCED RECIPROCAL TRANSLOCATIONS IN EINKORN WHEATS II. Kosuke Yamashita. Seiken Zihō. (Rept. Kihara Inst. Biol. Research) 5, 1-41(1952).

The work deals with x ray induced reciprocal translocations (RT's) in *Triticum aegilopoides* and *T. monococcum*. General characteristics of the chromosome configurations in pollen mother cells of each type of RT-heterozygote are illustrated crosses were made among the RT-types and the behavior of chromosomes in metaphase I in PMC's of hybrids was analyzed. (from abstract). BA 27-26735

9909

GENETICS AND CYTOLOGY OF A MUTANT DWARF-SPORED GLOMERELLA. H. E. Wheeler. Am. J. Botany 40(9), 694-702(1953).

A variant of *Glomerella cingulata*, obtained from a culture grown on a medium containing radiocarbon, produced ascospores approximately 1/3 normal size and which lacked the curvature characteristics of the ascospores of this sp. The results of a genetic and cytological study indicated that the dwarf-spored character was controlled by a mutant designated dw 1 (dwarf). (from abstract). BA 23-12723

9910

EFFECT OF ROENTGEN RAYS UPON THE OXIDATION VELOCITY OF CELLS. P. Weis. (Pflugers) Arch. ges. Physiol. 203, 262-73(1924).

After exposure to x-rays for several hours, no change in oxidation velocity of cells observed in avian erythrocytes, frog muscle cells, yeast cells and

Staph. aureus. Staph. aureus showed inhibition of reproductive rate. Author concludes that growth inhibition and oxidation rate are not related.

9911

THE ACTION OF X RAYS IN THE FORMATION OF BONE CALLUS. F. P. Sgobbo. Riforma Med. Napoli **34**, 282-88 (1918). (In Italian).

Experiments with dogs showed that bone callus formation and fracture consolidation are retarded by strong x irradiation before and after fracture. Retardation, development limitation, or absence of callus resulted according to dosage used.

9912

ACTION OF ROENTGEN RAYS UPON THE COAGULATION OF THE BLOOD. P. Pagniez, A. Ravina and I. Solomon. Jour. Radiol Electrol **7**, 153-7(1923). (In French).

X ray radiation caused a decrease in coagulation rate of blood. Observations were made 1 hr. post-exposure, but in some cases effect was noted 5 min post exposure. Effect lasted 4-7 days.

9913

THE EFFECT OF X RAYS ON THE SKIN OF VITALLY STAINED WHITE MICE. Gerty T. Cori. J. Exptl. Med. **39**, 639-43(1924).

Mice, subcutaneously injected with trypan blue, were irradiated with a Kelly-Koett apparatus, Coolidge tube (4 ma, 95 kv., 2.5 mm, Al, 22 cm dist) on the left hind part of the back. Epilation occurred in a shorter time than in control mice who did not receive an injection of vital stain.

9914

CONDITIONS FOR THE BIOLOGICAL EFFECT OF X RAYS. III. EFFECT OF THE OXIDIZING SUBSTANCE ON SENSITIVITY. E. Petry. Biochem. Z. **135**, 353-383 (1923).

Oxidizing agents did not alter effect of x rays on development of seedlings. Previous treatment with H₂O₂ increased sensitivity to radiation, exposure to CO₂ had opposite effect. (from abstract) CA 17-3357

9915

OXYGEN CONSUMPTION DURING LATENT PERIOD OF X RAY INJURY. E. Petry. Wien. Klin. Wochschr. **36**, 51-52(1923). (In German).

Author believes that the primary effect is on ferments and cellular metabolic processes.

9916

THE IMMEDIATE CHANGES OBSERVED IN TISSUE CELLS AFTER EXPOSURE TO SOFT X RAYS WHILE GROWING IN VITRO. T. S. P. Strangeways and H. E. H. Oakley. Proc. Roy. Soc. (London) **95**, 373-81(1922-3).

Irradiation of choroids of 6 day old chick embryos resulted in (1) stoppage of cell division after 5 min exposure except in cells already in mitosis, (2) almost complete cessation of mitosis after 20 minute exposure. If cultures were replaced in incubator, mitosis occurred again. Changes in chromosomes and cell structure alterations are discussed.

9917

THE INFLUENCE OF X RAYS ON THE SEEDS OF VICIA FABA AS SHOWN IN THE DEVELOPMENT OF THE PLANTS. Th. Pfeiffer and W. Simmermacher. Landwirtsch. Vers.-Sta. **86**, 35-43(1915).

Germination is hastened by short exposure to x rays and checked by long exposure. Growth of plant above ground was somewhat increased by short exposure. Results were variable but indicated increase in total dry matter of plants from seeds exposed for a short time. (from abstract). CA 9-2925

9918

A NEW METHOD OF SYNTHESIZING PURE-BREEDING

TYPES WITH EXTRA CHROMOSOMAL MATERIAL IN DATURA. A. F. Blakeslee, A. D. Bergner and A. V. Avery. Am. Naturalist **70**, 255-7(1936).

Chromosomes used by the authors were a large "1" chromosome 5.6 and a small median "m" chromosome 19.20. By the action of x rays, segments of these two chromosomes were interchanged so that a prime type 3 race (PT39) was formed which had an m sized 5.20 and an l sized 6.19 chromosome. Through radium treatment, another prime type (PT53) was obtained which had breaks in the 5.6 and 19.20 chromosomes at different loci.

9919

IRRADIATION EXPERIMENTS WITH ULTRAVIOLET LIGHT, X RAYS, AND RADIUM IN THE CONTROL OF PLANT DISEASES. F. Pichler and A. Wober. Centr. Bakteriolog. Parasitenk **57**, 319-327(1922). (In German).

Acid sprays that contain free O or form O enhance action of X rays and ultra-violet in treating plant disease. X rays was more efficient than ultra-violet, Ra had no effect. (from abstract) CA 17-1270

9920

EFFECT OF RADIUM ON PLANTS IN WATER CULTURES. F. Pilz. Z. Landwirtsch. Versuchsw. Deut. Oesterr. **19**, 399-410. Biedermanns Zentr. **46**, 412-414. J. Chem. Soc. **112**, (pt I) 718-719(1916). (In German).

Dry matter of peas receiving 0.000116 mg of Ra was increased 28%, pods 43%. Dry matter of maize increased 15% yield of grain decreased 47%. Ra retards ripening. Percentage of N, P₂O₅ and Ca was lower in Ra treated plants than in controls. (from abstract). CA 12-1562

9921

EXPERIMENTAL STUDY OF MITOSIS AS A RADIO-SENSITIVITY FACTOR. P. Vintemberger. Arch. Anat. Hist., Embryology **12**, 229-464(1930-31). (In French).

9922

A POSITION EFFECT IN OENOTHERA. D. G. Catcheside. J. Genet. **38**, 345-352(1939).

In one of 3 x ray induced translocations in O. blanda, capacity of gene Ps to pigment flower buds is reduced. A single crossover plant was obtained in which PS was separated from translocation and restored to normal h blanda complement, whereupon it acted with normal force. (from abstract). BA 14-71

9923

MUTATION RATE INCREASED BY AGING SEEDS AS SHOWN BY POLLEN ABORTION. J. L. Cartledge and A. F. Blakeslee. Proc. Natl. Acad. Sci. U. S. **20**, 103-110(1934).

Storing dry seeds up to 10 yrs increased rate of pollen abortion mutations about a proportion to age of seeds. Most mutations occurred in sectors of plants as did mutations induced by radiation treatment of dry seeds. (from abstract). BA 9-4364

9924

THE EFFECT OF RADIUM ON THE GROWTH OF PLANTS. E. J. Russell. Nature **96**, 147-8(1915).

Action of radium through the soil: germination and growth were accelerated. The plants farthest away were stimulated most. Different plants and even different organs of the same plant, were differently affected, the root system responding more markedly than the aerial parts.

9925

EFFECT OF X RAYS ON MEIOTIC CHROMOSOMES OF VICIA FABA L. A. Camara. Boll. Soc. Broteriana Ser. **2**, 13, 187-209(1939).

Flower buds were subjected to x ray doses (64 KV. 5mA at 30 cm without filter) for 15-20 min. After 24 hrs many cells showed chromosome alterations, including

fragmentations, translocations, segmental interchanges and polyploidy. No evidence was found for increased chiasma frequency. (from abstract). BA 15-21

9926

INDUCED DOMINANT LETHALITY IN LILIU. S. W. Brown and M. S. Cave. Proc. Natl. Acad. Sci. U. S. 39, 97-102(1953).

Massive pollination with pollen of L. formosanum treated with x rays (2000-4000 r) gives little or no seed set. Treated grains functioned in fertilization at same rate as untreated. Various doses of x rays resulted in some germless seeds. Occurrence of occasional low seed sets is attributed to pseudogamous development. (from abstract). BA 28-12704

9927

ORIGIN OF SPONTANEOUS MUTATIONS. M. Navashin. Nature 131, 436(1933).

The author tested the effect of prolonged dormancy of seeds upon the rate of chromosomal mutations. After completing experiments with Crepis tectorum Navashin, he concluded that selective mortality had nothing to do with the enormous increase in the rate of mutation discovered and that increase in the mutation rate cannot be attributed to accumulation of the direct effects of some external agency like radiation.

9928

NATURAL IONIZING RADIATION AND RATE OF MUTATION. E. B. Babcock and J. L. Collins. Nature 124, 227-8 (1929).

An experiment was planned for the purpose of comparing the rates of occurrence of sex-linked lethal mutations in Drosophila melanogaster, following method already devised by Muller (Genetics 13, 279-357(1928)), and using a balanced lethal strain synthesized by him. As a result of the experiment, it was concluded that the natural ionizing radiation of the earth is a very important factor controlling the rate of which new inherited characters originate in animals and plants.

9929

THE ACTION OF THE ROENTGEN RAYS ON THE BLOOD FORMING ORGANS. Patricelli. Riforma Medica (1907). From abst. in Brit. J. Radiol. 13, 318(1908).

In experiments on healthy dogs, x rays caused depression of number of leucocytes and erythrocytes.

9930

ROOT PRODUCTION IN PLANTS FOLLOWING LOCALIZED STEM IRRADIATION. Eric Christensen. Science 119, 127-128(1954).

Seedling plants were exposed to 250 KVP, 30 ma x ray with 1 mm Al filtration. Xanthium shows chlorosis in 2 wks, at 3 wks the irradiated area is narrower than zones around it. In 4 wks. small papules which develop into normal roots result. Explanation: a phloem block impairs downward transport. An accumulation of organic materials explains the swelling. Irradiation did not interfere with height.

9931

ABSORPTION OF STRONTIUM INTO PLANTS FROM FIELD PLOTS. J. F. Cline. p.47-49 of BIOLOGY RESEARCH - ANNUAL REPORT 1954. Jan. 3, 1955. (HW-35917)

Plots containing barley were contaminated with one millicurie of Sr^{90} per plot. No significant difference occurred in the uptake of strontium by barley grown in the surface as compared to sub-surface irrigated plots. There was no effect of Sr^{90} on viability of seed. Uptake of Sr^{90} by barley was about 0.03% of the total amount applied to the soil.

9932

STUDIES ON X RAY EFFECTS. Herbert Taylor, W. Witherbee, J. B. Murphy. J. Exptl. Medicine 29, 53-73 (1919).

Various animals show an immediate decrease in circulating lymphocytes, followed by a rise to normal following x irradiation. Polymorphonuclear neutrophilic leucocytes, when affected, increase in number immediately after the administration of the x rays and then tend to decrease below their normal level. A return to normal precedes lymphocyte recovery.

9933

CEREAL PLANTS. J. F. Cline and J. H. Rediske. p.36-39 of BIOLOGY RESEARCH - ANNUAL REPORT 1953. Jan. 4, 1954. (HW-30437)

Millacre plots planted to barley were irrigated with reactor effluent water. Effluent water has an effect on seed nitrogen content, nitrogen concentration is greater in controls. This indicates impairment of protein synthesis. Spectrochemical analysis showed aluminum, calcium, chromium, iron, magnesium, sodium and zinc present in concentrations exceeding that considered desirable in good irrigation water.

9934

THE IMMEDIATE EFFECTS OF X RAYS ON THE BLOOD LYMPHOCYTES. S. Russ. Arch. Radiol. and Electrother. 26, 146(1921).

Rats irradiated for 2 minutes had 50% reduction in lymphocytes with recovery phase from 1-3 days. Simulated x ray with no radiation had no effect on rate before or after simulated test.

9935

CHRONIC EFFECTS OF PILE EFFLUENT WATER ON CEREAL PLANTS. J. F. Cline, A. A. Selders, and J. H. Rediske. p.39-42 of BIOLOGY RESEARCH - ANNUAL REPORT 1952. July 7, 1953. (HW-28636)

Millacre plots were planted to barley and irrigated with: 100% reactor effluent 5% reactor effluent and control well water. Results: no difference between control and 5% effluent-watered plots in size of plant, yield, or total nitrogen, activity densities of seed and vegetative parts for all three types did not vary significantly. Barley from 100% effluent water showed decrease in seed yield, vegetative parts and nitrogen.

9936

CHRONIC EFFECTS OF REACTOR EFFLUENT WATER ON CEREAL PLANTS. J. F. Cline, A. A. Selders, and J. H. Rediske. p.28-31 of BIOLOGY RESEARCH - ANNUAL REPORT 1954. Jan. 3, 1955. (HW-33917)

Effects on barley of irrigation with various dilutions of reactor effluent are described. Seed yield is significantly decreased by watering with 100% effluent. No significant effects resulted from watering with 5% effluent.

9937

EFFECT OF GAMMA IRRADIATION ON THE ASCORBIC ACID CONTENT OF GREEN PLANTS. Anson R. Cooke. Science 117, 588-589(1953).

Plants were constantly exposed to gamma rays. There was a rise in ascorbic acid before visible damage, followed a few days later by a rise in ascorbate level, followed by a second decrease. It is suggested that there is correlation between normal ascorbic acid content and sensitivity of a plant to irradiation. Ascorbic acid may offer a protecting action against irradiation in plants.

9938

CHROMOSOME CHEMISTRY AND GENE ACTION. C. D. Darlington. Nature 149, 66-69(1942).

The author discusses chromosomes, nucleic acids, mitosis and bridges between plants and animals, and super-charging of chromosomes produced by unflavorable conditions or by an x ray dose of 100 r. X rays act on the cell primarily by their effect on spindle fibre formation. Dose of 50 r will upset spindle development but germination of ripe pollen grains is not disturbed by 80,000 r.

9939

THE EFFECT OF CATHODE RAYS ON THE PROTEINS OF SERUM. L. E. Baker and R. B. Corey. J. Exptl. Med. **50**, 439-44(1929).

Chicken fibroblasts underwent change when cultivated in serum which was irradiated with cathode rays. Cells resembled those of colonies cultivated in proteoses or peptones. Cytoplasm was completely filled with granulations but maintained long, sharp, active pseudopods. Cells multiplied slightly more rapidly than control tissues that had not been irradiated. Phenomena indicate that cathode rays had produced certain chemical changes in serum. Chief effect of cathode rays on proteins is similar to that of ultraviolet light observed by Harris and of sunlight by Young. The most prominent effect of cathode ray exposure on proteins was denaturation. In pure protein solutions there was a small increase in non-protein nitrogen. Irradiation of solutions of pure protein showed that changes observed reflected properties of proteins and were not dependent on presence of other constituents of serum. CA 23-5479⁶

9940

THE EFFECT OF RADIATION DOSE FRACTIONATION ON CHROMOSOME ABERRATION FREQUENCIES IN TRADESCANTIA MICROSPORES. I. STUDIES WITH X-RAYS. F. J. DeSerres and N. H. Giles. Radiation Research **1**, 129(1954).

Tradescantia microspores were exposed to high and low radiation intensities to fractionated doses of x rays. Results do not support the theory of an inhibition-recovery sequence in production of chromosome aberrations with fractionated doses. Results support conclusions that reduction in chromosome aberration frequency with rest periods of 4, 8 or 12 hours does not exceed twice the aberration frequency induced by a single half-dose. (from author's abstract).

9941

RELATIVE BIOLOGICAL EFFECTIVENESS OF IONIZING RADIATIONS BY MICROBIOLOGICAL METHODS. H. J. Dishburger, M. P. Fujihara, F. P. Hungate, and H. A. Kornberg. p.167-72 of BIOLOGY RESEARCH - ANNUAL REPORT 1954, Jan. 3, 1955. (HW-35917)

The microbiological method for measuring the RBE on bacteria has been extended to yeast. Radiation was delivered to Saccharomyces cerevisiae and Lactobacillus casei. Growth-time curves; values for RBE of tritium as compared to P³² were 2.0 with L. casei and 1.8 and 2.3 with diploid and haploid strains of S. cerevisiae.

9942

RADIOPHOTOGRAPHIC DETERMINATION OF NATURAL AND ARTIFICIAL RADIOACTIVE ELEMENTS IN PLANTS. A. A. Drobkov. Doklady Akad. Nauk S.S.S.R. **68**, 177-180(1949).

Plant growth is improved by small amounts of uranium or radium. The determination of radioisotopes can be made from radiophotographs of leaves and stems. CA 44-710

9943

PROGRESS IN RADIOBIOLOGY. M. Ebert and A. Howard. Nature **176**, 683-684(1955).

Biological lesions due to ionizing radiations must originate in the absorption of primary energy. A number of metabolic steps occur between the initial chemical disturbance and damage. Genetic effects of radiation, factor influencing radiosensitivity of biological systems and the effects of oxygen on radiosensitivity are discussed. Carcinogenic effect of whole body x ray is discussed.

9944

ABNORMAL ELASTIC FIBERS. T. Gillman, J. Penn, D. Bronks and M. Roux. Arch. Pathol. **59**, 733-49(1955).

9945

VARIATION OF RADIOSENSITIVITY AND RELATIVE

EFFECTIVENESS OF HAPLOID YEAST. Mortimer M. Elkind and Carl A. Beam. Radiation Research **1**, 493 (1954).

Radiosensitivity of haploid Saccharomyces cerevisiae, SC-7, has been studied in the region of exponential survival with 50-KV x rays and Po 210 α particles. Cultures were grown on YED agar for 18 hours at 30°C. Survival studies with fresh cells and cells starved up to 9 days showed a change in x ray LD 50 from about 1.5 krep to 3.7 krep, respectively, and in α ray LD 50 from about 2.6 krep to 1.9 krep, respectively. (from author's abstract).

9946

VARIATION OF THE BIOLOGICAL EFFECTIVENESS OF X-RAYS AND α PARTICLES ON HAPLOID SACCHAROMYCES CEREVISIAE. Mortimer M. Elkind and Carl A. Beam. Radiation Research **3**, 88-104(1955).

A 1.5-fold decrease in x ray sensitivity of SC-7 occurred as a function of culture age. Yeast cells from a 2-day PD agar surface in M/15 KH₂PO₄ for 48 hours without dextrose had unaltered sensitivity to 250-KV x rays. Changes in sensitivity results from changes in target size. Radiosensitivity of Haploid Saccharomyces cerevisiae: (1) for interdivisional cells radiosensitivity depends on metabolic state, (2) budding cells are more radioresistant than interdivisional cells and more sensitive to α particles.

9947

CHANGES PRODUCED IN YEAST CELLS BY ROENTGEN RAYS AND CHEMICAL SUBSTANCES I AND II. H. V. Euler, L. Ahlstrom and B. Hogberg. Z. Physiol. Chem. **227**, 1-17, 18-25(1942).

Yeast cells surviving exposure to 5000 r and 50,000 r x rays, showed reduced rate of multiplication. Up to 40% showed an increase in size. Nucleic acid content was reduced about 20%. Under colchicine cells enlarge 20 to 50%. Doses of 15,000 r have no influence on fermenting power of yeast. This is not altered by pretreatment with colchicine. (from abstract). CA 37-5426I, CA 37-5426II

9948

CHROMOSOME BREAKAGE BY X RAYS AT VERY LOW TEMPERATURES. A. C. Faberge. Radiation Research **1**, 130(1954).

To get same number of chromosome breaks, pollen at 192° C requires twice the x ray dose needed at +25°C. Irradiation in nitrogen depresses number of breaks. Freezing per se was compensated by increasing dose, these values of isolated chromatid breaks resulted: 300 r at 25°C., in air = 190, in nitrogen = 87; 600 r at -192°C. in air = 180, in nitrogen, - 88. (from author's abstract)

9949

EXPERIMENTAL STUDY ON THE GENESIS OF THE HEMOCLASTIC CRISIS IN INTENSIVE IRRADIATION. M. G. Giraud and L. Pares. Presse med. **30**, 885-887 (1922). (In French).

9950

THE EFFECTS OF THE SHORTER WAVE-LENGTH ROENTGEN RAY ON THE GASTRIC SECRETION OF DOGS. Sidney Portis and Robert Ahrens. Am. J. Roentgenol **11**, 272-80(1924).

Gastric secretions were collected for one hour before a standard meal and hourly for four hours after the meal. The chest and abdomen were radiated for one hour on each of three days. Chest radiation has little or no effect, abdominal irradiation lowers gastric secretion and acidity.

9951

ON THE POSSIBILITY OF DISENTANGLING BY SPECTROLOGICAL MEANS THE COMPLEX OF GENETIC EFFECTS INDUCED BY RADIATIONS. L. J. Stadler. Genetics **23**, 170-1(1938).

Genetic alterations induced by penetrating radiations include translocations, deficiencies, and point mutations. In maize, "germless seeds" are produced, resulting from alterations which prevent normal embryo development. Comparison of x ray and U-V effects in maize indicates at least three of four are spectrologically separable. (from abstract).

9952

ROENTGEN THERAPY IN EXPERIMENTAL AND HUMAN TUBERCULOSIS OF THE LUNGS. O. De La Camp. *Strahlentherapie* 3, 546-50(1913).

Rabbits were injected with a culture of tubercle bacilli pathogenic for man. Four weeks later, the non-irradiated controls showed numerous small tubercles with typical macro- and microscopic characteristics. Irradiated rabbits had no macroscopically visible tubercles, but did have microscopic foci smaller than those in controls and lacking many characteristics of typical tubercle histologically. Author believes hard x rays early in disease may be beneficial clinically.

9953

MODIFICATION OF RADIATION RESPONSE. A. Hollaender. *Bull. Atomic Scientists* 12, 76(1956).

Author discusses the protective effect of cysteamine. Bacteria grown on a glucose-salt medium before irradiation did not need special nutrients to demonstrate protective effects of cysteamine after exposure, since they apparently could synthesize all metabolites without having to have specific factors (e.g. glutamine, uracil, guanine) added.

9954

OBSERVATIONS ON THE EFFECTS OF ROENTGEN IRRADIATION UPON NORMAL AND CARCINOMATOUS MICE. Friedrich Kok. *Strahlentherapie* 17, 327-30 (1924). (In German).

Various experiments on mice indicate that toxic effects of roentgen rays are neutralized to some extent by carcinoma. The criterion of effect was the number of days the animals lived after exposure.

9955

FURTHER OBSERVATIONS OF THE EFFECTS OF X RAYS UPON LYMPHOCYTES. S. Russ, H. Chambers and Gladys Scott. *Brit. J. Radiol.* 25, 377-80(1920).

Rats were given one 12 second exposure (x rays) or repeated exposures. One exposure reduced lymphocyte count 50%, repeated doses had little effect. Authors believe that recovery processes are active in spite of repeated doses. Authors further suggest that 2 types of lymphocytes, one resistant and one sensitive to radiation, are present in equal numbers in the blood.

9956

SOMATIC SEGREGATION AND ITS RELATION TO ATYPICAL GROWTH. Donald F. Jones. *Genetics* 22, 484-522(1937).

Seeds x irradiated shortly after fertilization show a marked increase of inter-chromosomal mosaics in adjacent areas. Time of treatment and length of exposure made no significant difference in frequency of mosaics.

9957

INHERITANCE IN *NICOTIANA TABACUM* XIII. THE CYTOGENETICS OF "DEFORMED", AN X-RAY DERIVATIVE. Thomas H. Goodspeed and Priscilla Avery. *Genetics* 18, 487-521(1933).

"Deformed" is characterized by: (1) abnormally shaped leaves, (2) narrower and sometimes shorter than normal flowers flecked with white. Some viable pollen is produced. Other results are also reported. (from abstract). BA 9-4374

9958

BIOLOGICAL REACTION OF X RAYS: THE INFLUENCE

OF X RAY TREATMENT ON THE COMPLEMENT CONTENT OF THE BLOOD OF CANCER PATIENTS. C. F. Cori. *Am. J. Roentgenol.* 10, 830-34(1923).

The increase or decrease in complement after x ray treatment varies more with the individual than with the dose. Complement values return to normal after treatment is concluded. Radiation of blood or serum in vitro uniformly decreased complement.

9959

STUDIES ON THE BIOLOGICAL EFFECTS OF X RAYS. J. W. Mavor. *Am. J. Roentgenol.* 10, 968-94(1923).

Effects of x rays on chromosomes are classified as (1) irregular distribution of chromosomes at cell division, a hereditary effect, (2) interchange of hereditary determiners between chromosomes. A given dose does not necessarily produce same effect on the various chromosome pairs or on various parts of any pair. (Studies on *Drosophila melanogaster*).

9960

CHROMOSOME BREAKAGE. L. F. La Cour. p.18-20 of Forty-Fourth Annual Report on the John Innes Horticultural Institution for 1953. (1954).

Point errors at anaphase are induced only in x irradiated scilla sibirica endosperm. Errors appear as chiasma-like structures and are attributed to breakage and reunion of subchromatids. Spontaneous chromosome breakage in endosperm of a *Lilium* hybrid and experiments on chemically induced localized breakage in *Vicia Faba* are discussed. (from abstract). PBA 24-2735

9961

THE EFFECT OF X-RAYS ON BONE MARROW. Ernest Falconer, Morris Laird and H. Ruggles. *Am. J. Roentgenol.* 11, 342-51(1924).

It was found that local irradiation (long bones) had little or no effect on bone marrow of long bones of old male dogs, and one anemic female dog. Experiments were performed on bone marrow that was in a normal state of balance. It was concluded that leucemia could not be treated by this method.

9962

CHROMOSOME BREAKAGE IN *ALLIUM* BY 8-ETHOXYCAFFEINE AND X-RAYS. B. Kihlman. *Exptl. Cell Research* 8, 345-68(1955).

Comparison of the effects of EOC and 75 and 100 r of x rays on root tip chromosome of *Allium cepa* showed that interphase sensitivity to breakage by the two agents was similar. Relative frequencies of chromatid and isolocus breaks at different times after treatment were also similar. Effect of oxygen tension on the radio-mimetic effect of EOC investigated. (from author's summary).

9963

EFFECTS OF POST TEMPERATURE TREATMENTS UPON THE X-RAY INDUCED CHROMOSOMAL ABERRATIONS. M. Kurabayashi. *Cytologia (Tokyo)* 18, 253-65(1953).

Post irradiation temperature of 0°C. caused delay in mitotic cycle of young ovular tissue of *Paris tetraphylla*, thus delaying appearance of chromosomal aberrations compared with that seen at 20°C. A pronounced increase in translocation frequency was seen at 0°. (from abstract). PBA 24-2660

9964

CHARACTERISTICS OF CHROMOSOME BREAKAGE BY DIFFERENT AGENTS. L. H. Gray. *Heredity* 6, (Suppl.). 331-315(1953).

Evidence points to different forms of primary damage leading to production of chromosome aberrations. The primary cause of chromosome breaks and translocations that follow is a physical or chemical change induced by a single ionizing particle. Various ionizing agencies dif-

fer with respect to production of chromosome breaks and dependence on molecular oxygen. (from abstract).

9965

INVESTIGATION INTO THE BIOLOGICAL ACTION OF ROENTGEN RAYS. W. Johanssen. Acta Radiol. 3, 251-2 (1924).

Victoria pea root tips were exposed to roentgen rays and measured after irradiation. Upon the completion of 70,000 measurements it was found that aluminum filtered roentgen rays were less powerful than copper filtered rays in inhibiting growth.

9966

THE RELATION OF TEMPERATURE CHANGE TO ROENTGEN RAY SKIN REACTION. Charles Martin and George Caldwell. Am. J. Roentgenol. 9, 152-61 (1922).

Rabbits (and other species) were subjected to altered temperature, ointment and adhesive applications during and after irradiation. Removal of adhesive after exposure appeared to accentuate reaction to radiation as did the ointments and application of an ice bag for several days after exposure.

9967

ROENTGEN RAY CACHEXIA Charles Martin and Fred Rogers. Amer. J. Roentgenol. 11, 280-286 (1924).

Each of six dogs received x irradiation (75 m a min.) to an isolated loop of bowel, the rest of the body being shielded by lead. Two dogs died within a week (peritonitis and infection) others remained well for various periods, eventually succumbing to slowly developing cachexia. Effects of irradiating a loop of bowel or the entire abdomen are compared. Large doses caused decreased fat absorption.

9968

OBSERVATION OF THE EFFECT OF X-RAYS AND RADIUM UPON THE MALARIAL PARASITE IN VITRO. Leon J. Menville. Radiology. 3, 399-401 (1924).

Plasmodium malariae cultures in glucose-blood medium were exposed to x ray and Ra. No direct killing effect was exerted by either type of radiation. Results obtained in vitro may not apply in vivo. It might be quite possible to produce enzyme or lysin production that might affect parasites if spleen were radiated in vivo.

9969

INFLUENCE OF INDIVIDUAL VARIATIONS OF SENSITIVITY TO ROENTGEN RAYS. H. Holthusen. Fortschr. Gebiete. Roentgenstrahlen 29, 777-805 (1922).

Radiosensitivity of *Ascaris megalocephala* varied with developmental stage, was increased when temperature was raised to 37° C. Author also describes studies on hemolysis of x rayed erythrocytes in various salt solutions. Concludes that x rays may cause formation of methemoglobin from hemolyzed blood depending on nature of salt solution in which it is suspended.

9970

STUDIES IN X RAY EFFECTS. Waro Nakahara. J. Exptl. Med. 38, 309-14 (1923).

Mice were radiated through an opening in a lead plate. After a period of 7 days, protected area as well as roentgen-rayed area was inoculated with cancer. In three weeks vigorous tumors appeared in the protected area. Only one tumor in six inoculations was observed in roentgen rayed area.

9971

RADIO DERMATITIS AND ITS EXPERIMENTAL PRODUCTION IN ANIMALS. Cecil Rowntree. Brit. J. Radiology, 14 (1909).

Rat tails were x-rayed with rest of body shielded by lead cage. Histological changes are reported. Rabbit ears were x rayed with rest of body shielded and histological and morphological changes noted. Ears received 18 days

of constant exposure. Marked changes in the skin of both irradiated species were studied and are described in detail. Author feels small doses are more harmful, causing severe hypertrophy and hyperplasia of skin.

9972

LETHAL DOSE OF ROENTGEN RAYS FOR CANCER CELLS. Francis Wood and Fredrick Prime. Jour. Amer. Med. Assoc. 74, 308-313 (1920).

Sarcoma and carcinoma cells were x irradiated with various doses *in vitro* and *in vivo* (in mouse). Sarcoma cells were killed by 6 erythema doses (ED) *in vitro*; by 5 ED *in vitro*. Carcinoma cells were killed by 6 ED *in vivo* by 4 ED *in vitro*. Concludes that 5-7 ED would be required to kill all cells of rapidly growing, highly cellular and highly malignant sarcoma and carcinoma in man when tumor is at the surface of the body.

9973

THE EFFECT OF X RAYS UPON TUMOR GROWTH IN MICE. K. C. A. Valken. Acta. Radiol. 3, 451-2 (1924).

Irradiation of mice (5 sec., 3 times a week, for 3-4 wks) produced an immunity against sarcoma inoculation in most cases. If mice were inoculated with sarcoma first and then irradiated, some immunity was produced. A second sarcoma inoculation resulted in absolute immunity. The mice were also immune to carcinoma.

9974

THE EFFECT OF DIRECT RADIATION OVER THE PRECORDIUM ON THE HEART SIZE, THE HEART MECHANISM AND THE MYOCARDIUM OF RABBITS. Gordon Burgess, G. F. Strong and E. S. Emery. Am. J. Roentgenol. 11, 328-30 (1924).

Post mortem examinations proved almost entirely negative except for clumps of fibrin in pericardium of one rabbit. There was moderate necrosis in the heart muscle, but not enough to bring about any special degenerative myocardial change. Authors concluded that there were no definite changes in heart size.

9975

ROENTGEN RAY INTOXICATION. S. L. Warren and G. H. Whipple. Am. J. Roentgenol. 98, 11 (1924); J. Am. Med. Assoc. 81, 1673 (1923) Nov.

Evidence from animal experiments and clinical observations indicates that human intestinal mucosa is peculiarly sensitive to hard, short wave length roentgen rays.

9976

EXPERIMENTAL STUDIES ON THE EFFECT OF IRRADIATED SERUM ON THE BLOOD. J. Glaubermann. Munch. med. Wochschr. 61, 1867 (1914). (In German).

Rabbits were injected subcutaneously with x irradiated (*in vitro*) or normal serum and serial studies of peripheral blood leukocyte and differential leukocyte counts were carried out during post injection period. Irradiated serum was observed to produced leukopenia in the non-irradiated recipient following a transient initial leukocytosis. Both granulocytes and lymphocytes were depressed but blood picture returned to normal in 24 hours. Author believed that cells defrayed in blood of irradiated animals produced a toxin causing effect in the recipient.

9977

PATHOLOGICAL TISSUE CHANGES AFTER RADIATION OF THE LIVER WITH ROENTGEN RAYS. R. Tsukamoto. Strahlentherapie 18, 320 (1924). (In German).

Increased blood amino acids were observed following irradiation. Also, plasma proteins were studied after irradiation.

9978

VERTEBRATE RADIOBIOLOGY; EMBRYOLOGY. John P. O'Brien, Marquette Univ., Milwaukee, Wis. Ann. Rev. Nucl. Sci. 6, 423-51 (1956).

The subject is reviewed under the following categories:

(1) Radiobiological Mechanisms. The primary aim is elucidating processes stemming from the first impact of radiation on the developing system to the earliest and later responses, (2) Morphogenetic Mechanisms- Mechanism and principles of vertebrate development, (3) Clinical Embryology - Clinical observations are included. (from abstract). NSA 11-5145

9979

CHANGES IN THE BLOOD OF PATIENTS TREATED WITH X RAYS AND RADIUM. Axel Westman. Acta Radiol, 1, 349-57(1921-22). (In French).

Relatively small doses of x-ray caused a slight increase in RBC and hemoglobin and also caused leukopenia

9980

HISTOLOGICAL CHANGES IN THE BONE MARROW OF RATS EXPOSED TO THE GAMMA RADIATIONS FROM RADIUM. J. C. Mottram. Arch. Radiol. and Electrother. 25, 197(1920).

Twenty three rats were exposed 12-460 hrs to varnished Ra applicators each containing 80 mgr. radium bromide. Bone marrow was less affected by x rays than was lymphoid tissue. Longer exposures caused a granulocytopenia and aplastic anemia, indicating interference with output of blood cells from bone marrow.

9981

BLOOD CHANGE DUE TO X RAYS AND SENSITIZATION TO X RAY EFFECT. H. Holthusen. Strahlentherapie 14, 561(1923). (In German).

Various types of radiation including ultraviolet and fluorescent wave lengths were studied with respect to their influence on response of peripheral blood erythrocytes pictured to x irradiation.

9982

PATHOLOGICAL EFFECTS OF ROENTGEN RAYS ON ANIMAL TISSUES. Harvey. Dublin Jour. of Med. Science Feb. (1907); Arch. Roentgen Ray 2, 145(1908).

9983

SULFUR-35 AS A MUTAGENIC AGENT IN NEUROSPORA. F. P. Hungate and T. Mannell. Genetics 37, 709-719 (1952).

Mutagenic effects of metabolized S^{35} were tested so that effect of transmutation of S^{35} into Cl^{35} could be quantitatively distinguished from radiation effect of β particle. Mutation frequency varied with specific activity of S^{35} . Variation in mutation rate could not be explained by radiation, appeared to be due to varying probability of S^{35} - Cl^{35} transmutation. (from abstract). BA 27-11814

9984

THE INFLUENCE OF β RAYS ON THE PERMEABILITY OF CELLS. J. Petrova. Botan. Cetr., Beih. Abt. A, 54, 369-428(1936).

Weak doses of beta radiation did not change cell permeability of the thread-like algae *Zygnema* over that of the controls. Strong doses inhibited cell division and caused diminished cell permeability especially in $Ca(NO_3)_2$. CA 30-4193.

9985

BIORADIOACTIVITY OF PLANTS AND THE EXISTENCE OF RADIUM ELEMENTS IN THEM. E. Burkser, I. Brun and K. Bronstein. Biochem. Z. 181, 145-148(1927).

Fresh and withered plant tissue showed radioactivity which was not due to moisture content. Emanation measurements showed that plants contain very little Ra. (from abstract). BA 4-591

9986

THE ROLE OF NATURAL RADIOACTIVE ELEMENTS IN THE LIFE OF PLANTS. A. A. Drobkov. Sovet. Agron 7, no. 9, 75-79(1949).

Cultures with sunflower, alfalfa, cotton, and cucumbers grown on purified salts without Ra, Th, or V lagged in development. When all β rays were supplied by small quantities of uranium X, sugar beets and their sugar content exhibited increases. Radioactivity concentrates in young growth. Intake of V increases during blooming and maturation. Plants utilize more radioactive elements when supplied in low concentration. (from abstract). CA 44-708

9987

ASSIMILATION AND DISTRIBUTION OF RADIOACTIVE ELEMENTS IN GRAFTED PLANTS AND THEIR EFFECT ON DEVELOPMENT OF TOMATOES. I. E. Glushchenko and A. A. Drobkov. Izvest. Akad. Nauk S.S.S.R., Ser, Biol., 6, 62-6(1952).

P32 distributes itself unevenly in graft combinations of tomatoes and nightshade. P and Ra are poorly retained by tomato tissues. Nightshade seems to retain these elements near the site of administration. Injection of radioactive causes their transport both up and down, but their distribution is uneven. Low doses of Ra stimulate early stages of growth of tomato plants. (from abstract).

9988

THE CHONDRIOME IS THE PART OF THE CELL MOST SENSITIVE TO X-RAYS. G. A. Nadson and E. I. Rochline. Gleichgewicht Compt. Rend. Soc. Biol. 95, 378-380(1926). CA 22-92

9989

EFFECT OF X RAY IRRADIATION ON SESAMUM SEEDS. C. V. Ramakrishnan and K. T. Jacob. J. Am. Oil Chemists' Soc. 31, 270(1954).

A reduction of seed lipase activity but an increased esterase activity resulted from seed irradiation. Other results included early flowering of plant and a larger fruit yield. CA 48-8885

9990

OXIDATION AND THE MECHANISM OF ACTION OF MUTAGENIC FACTORS. I. R. Rapoport. Zhur. Obshchei Biol. 4, 65-72(1943). (Russian with English Summary).

Chromosome breakage by short-wave energy is compared with rupture of ozonides at the points of unsaturation. Synapsis and crossing-over are explained as labile polymerization and depolymerization with regrouping of the unsat. points in chromosomes. The author concludes that ozone is the chemical mediator of the action of x rays as a result of using x rays together with heavy metals. CA 38-758

9991

THE ACTION OF METALS AT A DISTANCE. V. Rivera. Atti. Pontif. Accad. Sci., Nuovi Lincei 86, 184-188 Rev. Appl. Mycol. 13, 178(1933).

Petri dishes with spores of penicillium sown on meat broth agar were placed in Zn, Fe and Pb containers. Conidia were produced only in culture with Pb. In lower and higher plants, Pb also stimulated cellular multiplication. Effect is attributed to "secondary radiation." (from abstract) CA 28-4441

9992

THE EFFECT OF RADIATION-DOSE FRACTIONATION ON CHROMOSOME ABERRATION FREQUENCIES IN TRADESANTIA MICROSPORES. II. STUDIES WITH FAST NEUTRONS. Norman H. Giles, Frederick J. De Serres, and Alvin V. Beatty. Radiation Research 1, 131(1954).

A single dose of 25 N was given without fractionation, and in two equal fractions with intervals of 1, 2, 4, 8, and 12 hours. No effect of fractionation was found. Aberration frequencies from a dose of 12.5 N were half those of 25 N. Results do not indicate an inhibition-recovery sequence

in production of chromosome breakage by radiation.
(from author's abstract).

9993

CHAPTER TITLE: EFFECT OF URANIUM ON THE METABOLISM OF YEAST AND BACTERIA. J. A. Muntz, T. P. Singer, and E. S. C. Barron. Book: Toxicology Of Uranium (NNEs, IV-23) New York, McGraw-Hill p 246-261 A. E. Tannenbaum, ed. (1951).

Uranium has an inhibitory effect on utilization of glucose by yeast. This effect may be reversed by phosphates and NaHCO_3 . There was also an inhibitory effect on enzymes in cell-free yeast extract. Bacterial cells of different kinds were sensitive to uranium in varying degrees. CA 45-7190

9994

RADIUM RACES OF YEAST AND THEIR PRACTICAL SIGNIFICANCE. G. A. Nadson and E. Ya Pokhlina. Vestnik Rentgenol. 1. Radiol. 11, 239-254(1932).

New forms with distinct morphological and physiological properties are obtained from *Saccharomyces cerevisiae* XII subjected to Rn. New characteristics are hereditary. Type "A" is usually spherical, forms conglomerate masses. Type "B" cells are long, have one or several vacuoles. Cells reproduce at poles. In a fermenting mass, "B" type settles rapidly. Yeast yield of "B" exceeds yield from original form. (from abstract). CA 28-7293

9995

PROTEOLYTIC ENZYME STUDIES IN IRRADIATED RABBITS. N. K. M. De Leeuw, C. S. Wright and J. L. Morton. J. Lab. Clin. Med. 42, 592-597(1953).

Serum profibrinolysin and antitrypsin increased after total body irradiation. Spontaneous rapid lysis of clots was not observed. Thus, in irradiated rabbits a rise in serum profibrinolysin and antitrypsin may occur in the absence of spontaneous hemorrhage or spontaneous lysis. (author's summary).

9996

HANDBUCH DER RADIUM-BIOLOGIE UND THERAPIE. Paul Lazarus and J. F. Bergmann Wiesbaden. Reference from Brit. J. Radiol. 18(157), 117(1914).

9997

QUANTITATIVE EXAMINATION OF BONE MARROW IN GUINEA PIGS AFTER GAMMA IRRADIATION. P. F. Harris. Brit. Med. J., 2, 1032(1956).

Quantitative examinations of bone marrow in 400g male guinea pig have been made at varying intervals up to 5 weeks after total body irradiation. Results confirm that the lymphocyte is very sensitive to radiation but also indicate that there is a marked accumulation of these cells in bone marrow between 10 and 18 days after irradiation. During marrow regeneration, erythropoiesis seems to reach a peak at 20th day and myelopoiesis between 22 and 24 days. Evidence suggests that time taken for immature neutrophil to mature in guinea-pig bone marrow in recovery from irradiation is approximately 2-4 days.

9998

THE EFFECT OF BLACK OXIDE OF URANIUM IN THE COMMERCIAL CULTURE OF MUSHROOMS. D. Montet. Compt. rend. soc. biol. 111, 20-22(1932).

A 20-30 per cent increase in yields of mushrooms occurred following the addition of U_3O_8 to the usual manure fertilizer. The author attributes this increase to radioactivity. CA 27-119

9999

THE BEHAVIOR OF THE HEART UPON THE INTRODUCTION OF RADIOACTIVE SUBSTANCES INTO THE ORGANISM. A. Krebs. Ztschr. f. Kreislaufforsch 28, 701-710 (1936). (In German).

10000

EFFECT OF RADIUM ON CITRIC ACID FORMATION

BY *ASPERGILLUS NIGER*. E. K. Kresling. Trudy Nauch-Issledovatel. Inst. Pishchevoi Prom. Narkomisphepoma SSSR 3, 49-64(1936).

Citric acid production was not increased when radon was added at the time of inoculation. Some increase was observed when radon was added 2 days after inoculation. Acid production was not increased by adding radioactive ores of BaSO_4 . CA 30-5258

10001

EFFECTS OF X RADIATION ON FLOW OF PERFUSION FLUID THROUGH ISOLATED RABBIT'S EAR. H. B. Gerstner and P. M. Brooks. Fed. Proc., Balt. 14, 56(1955).

After 2000r dose of 260 Kv X ray, rate of flow of perfusion fluid first decreased then returned to normal in isolated rabbit ear.

10002

MICROBIOLOGICAL STUDIES OF STREPTOMYCIN-PRODUCING FUNGI. II. IMPROVEMENT OF STREPTOMYCIN-PRODUCING STRAINS BY ULTRAVIOLET AND X RAYS. H. Nakayama, Y. Ikeda, K. Kajikawa, M. Kawasaki, and Y. Serizawa. Kagaku Kenkyusho Hokoku 28, 395-404(1952).

Actinomyces strains KU and K-1 were exposed to ultraviolet and x rays. A mutant developed in strain KU which produced about twice as much streptomycin. A nonchromogenic mutant developed in strain K-1, but this did not produce more streptomycin. CA 47-8833

10003

DIFFERENT EFFECTS OF α RAYS ON NUCLEUS AND CYTOPLASM OF THE CELL. J. Petrova. Botan. Centr., Beih. Abt. A., 61, 399-431. Chem Zentr. 1943, 1, 1376-1377(1942). (In German).

When entire cell of alga *zygnema* was irradiated with Po α rays, injurious effects were same as after B- and γ -radiation. If only cytoplasm was irradiated, usual dose had no effect, while several hundred times this amount caused cell death within 24 hours. Cell nucleus is 700 times more sensitive than cytoplasm to radiation (from abstract) CA 38-4651

10004

CONDITION FOR THE BIOLOGICAL ACTION OF X RAYS I. E. Petry. Biochem. Z. 119, 23-44(1921). (In German).

Radiation of germinated seedling cooled to 4° or poisoned by KCN or AgNO_3 effectually retarded further root development. Toxic effect of x ray is independent of processes usually associated with metabolism and respiration of such organs. Presence of O_2 is not essential for harmful effect of x rays. (from abstract). CA 15-3302

10005

EXPERIMENTAL STUDY OF THE BIOLOGICAL EFFECTS OF POLONIUM INTRODUCED INTO THE ORGANISM. A. Lacassagne, J. Lattes and J. Lavedan. J. radiol. et electrol. Jan. 9, 1-14(1925). (In French).

After receiving 10-40 electrostatic units by injection, rabbits showed initial leukocytosis followed by severe leucopenia. The intensity of leucopenia was severe, with leucocytes dropping from 9200 to 10 in less than 8 days time. The animals all died.

10006

THE EFFECTS OF IONIZING RADIATIONS FROM POLONIUM ON THE SPORES OF *ASPERGILLUS NIGER*. S. Berk. Mycologia 45, 488-506(1953).

Dry conidial spores of *A. niger* FA300 irradiated with varying doses of alpha particles showed; interference with the production of conidial heads; inhibition of sporulation and cell division or the development of an extensive mycelium, slight inhibition of vegetative growth, inhibition of germination or production of germ tube. (from abstract). BA 28-4399

10007

THE PHYSIOLOGICAL ACTION OF THE ROENTGEN RAYS. Richter and Gerhartz. *Berliner klin. Wochenschr.* (1908). From abst. in *Brit. J. Radiol.* **13**, 78(1908).

Adrenalin exposed to x rays has decreased physiological activity with respect to elevating blood pressure and blood sugar. The properties of yeast, pepsin and pancreatin were not altered by x irradiation.

10008

CELLULAR DESTRUCTION AND PROTEIN DEGRADATION INDUCED BY EXPOSURE TO X-RAYS. K. I. Altman, G. L. Haberland, K. Schreier, and L. H. Hempelmann. *Radiation Research* **5**, 466(1956).

By means of C^{14} label, the fate of dietary glycine in x-irradiated CLD_{50} animals was studied. Irradiation caused a 10-fold increase in protein breakdown, the tracer studies suggesting that labeled glycine is transported to the liver from radiosensitive tissues. Glycine synthesis by liver is inhibited.

10009

RADIOACTIVE FERTILIZERS AND PLANT GROWTH. B. C. Aston. *New Zealand J. Agr.* **20**, 172-3(1920).

A brief review of work in England and America.

10010

RADIOACTIVITY AND NITROGEN FIXERS. E. Kayser and H. Delaval. *Compt. Rend.* **179**, 110-112(1924). (In French).

Presence of U material from Belgian Congo, (60 parts U3 O8 per 100) increased the amount of fixed N2 in three N-fixing microorganisms. This increase varied from 35 to 100%. (from abstract). CA 18-3001

10011

PLANT STUDIES - EFFECT OF RADIOACTIVITY IN PLANT PHYSIOLOGY. D. Montet. *Compt. Rend.* **195**, 582-84(1932). (In French).

The effects of uranium, thorium, radium and radon on the germination and development of plants have been studied. Plants studied include wheat, barley, balsam, hyacinth, tulip, *Clarkia* and *Pelargonium*. The effects of radioactivity can be shown by a smooth curve indicating effects similar to those on animal physiology. It appears that radiation acts on the surface of the grains since there is a considerable difference between small and large grained plants. Techniques are described for studying catalytic and radioactive effects of the isotopes. With weak doses of radiation a favorable influence on pigmentation is reported. CA 27-1380

10012

EFFECT OF X RAYS ON PLANTS. E. Miede and H. Coupe. *Compt. Rend.* **159**, 338-340(1914). (In French).

X rays exert very favorable action on growth of *Raphanus Sativus* and *Lepidium Sativum* as shown by an increase of 45% in the weight of the leaves and 59% for the whole plant. (from abstract). CA 9-3809

10013

DIFFERENTIAL RESPONSE TO X RAYS OF DIPLOID AND TETRAPLOID BARLEY. A. Muntzing. *Nature* **148**, 319(1941).

Tetraploid barley produced by temperature shocks on diploid Opal B variety has low fertility. Response of tetraploids to X-rays was less than that of diploids. A gene hit at one locus in a tetraploid is protected by three genes; there is only one gene for protection in a diploid (from abstract).

10014

EFFECT OF γ -RAYS ON THE SEROLOGICAL PROPERTIES OF OVALBUMIN. H. Fricke, C. A. Leone, and W. Landman. *Radiation Research* **6**, 478(1956). (Abstract).

10015

10016

STUDIES ON THE EFFECT OF X RAYS ON PLANTS.

G. Tolomei. *Nature* **57**, 323-324(1898).

Action of x-rays on vegetable life is identical with that of light (sunshine, electric, or magnesium light). *Elodea canadensis*, immersed in carbonic anhydride-charged water, was exposed to x-rays. Result was an evolution of bubbles, as in the presence of light. Other vegetable forms showed similar results.

10017

EFFECT OF X RAYS UPON AGRICULTURAL SEEDS.

A. Gustafsson. *Nature* **158**, 488(1946).

Effects of treating dormant seeds of various crops with X-rays are discussed. Critical dosage above which great lethality occurs varies among species. Peas require about 7,500 r; but *Brassica napus* and *Linum* are highly resistant at more than 50,000 r. Resistance is probably due to the oily or fatty nature of the cell contents. (from abstract).

10018

RADIUM AND PLANTS. H. H. Dixon. *Nature* **69**, 5(1903).

Seeds distributed over moist sand were exposed to radium bromide in the dark. Seedlings immediately under the radium tube were retarded in development; growth of other seedlings was nearly uniform. No other noxious effects appeared. Motile organisms showed little sensitivity to radiations. (*Volvox globator*).

10019

SUCCESSFUL SKIN HOMOGRAFTS AFTER THE ADMINISTRATION OF HIGH DOSAGE X RADIATION AND HOMOLOGOUS BONE MARROW. Joan Michel Main and Richmond T. Prehn. *J. Natl. Cancer Inst.* **15**, 1023-9 (1955).

Mice were irradiated (200 kv. 15 Ma, 54 cm. dist., 0.25 mm Cu and 0.55 mm Al) and treated in one of 3 ways: (1) 350 r; (2) 750-800 r, then injected intravenously with bone marrow homologous to skin grafts, (3) 750-800 r, injected with hybrid bone marrow homologous to recipient but containing antigenic components identical with skin graft antigens. Skin grafts from different strain were made 24-30 days after irradiation. Only grafts made on Group III took. NSA 9-2560

10020

RADIATION INDUCED INSTABILITIES IN STREPTOMYCES.

H. B. Newcombe. *J. Gen. Microbiol.* **9**, 30-36(1953).

Heritable changes affecting colony color and morphology were produced by γ - or u-v irradiation of spores of *Streptomyces* sp. The two types of radiation were equally effective. Gene mutations occurred frequently; initial changes may be chromosomal rearrangements. BA 28-17617

10021

AN ABSOLUTE TISSUE DOSIMETER FOR FAST NEUTRONS.

G. S. Hurst. *Brit. J. Radiol.* **27**, 353-57(1954).

10022

EFFECT OF RADIATION LETHALITY OF VARIOUS AGENTS RELEVANT TO THE H_2O_2 CATALASE HYPOTHESIS.

R. N. Feinstein, G. J. Cotter and M. M. Hampton. *Am. J. Physiol.* **177**, 156(1954).

10023

STUDIES ON THE MECHANISM OF ACTION OF IONIZING RADIATIONS IN PLANT SEEDS. Lars Ehrenberg. *Svensk Kem. Tidskr.* **67**, 207-224 (1955).

In case of irradiated resting barley seeds, it was found that readily titratable sulfhydryl, β -amylase, reducing sugars and bound auxin were independent of the water content at the time of radiation. However, irradiation of resting seeds was found to affect the α -amylase and auxin formation during the early germination stage. CA 50-8806

10024

THE EFFECT OF CHEMICALS AND RADIATIONS ON MITOSIS. J. Chury, V. Hudecek, M. Skalka and V. Slouka. Scripta Med. Fac. Med. Univ. Masarykianae et Palackyanae 23, 147-158(1949).

Influence of sulfanilamide, $K_2Cr_2O_7$ in certain dilutions, vapor of Br, and 80-KV x-ray on root cells of Allium cepa was judged mainly by breaking and swelling of chromosomes. The similarity of effects of the various agents indicates that a toxic substance formed in plasma on nucleus. (from abstract). CA 6-11341

10025

THE BIOLOGICAL ACTION OF RADIATIONS. FACTORS OF SELECTIVITY. I. THE TIME FACTOR. J. Palacios and H. Tellez-Plasencia. Anales Soc. Espan. Fis. Y. Quim 32, 677-681(1934).

In this theoretical study most of the work is devoted to the time when the action of x-rays is greatest, i.e. in the labile phase. Two possible simultaneous different equations are presented which represents the number of cells produced as a function of the time. CA 28-6448

10026

ABNORMAL PLANT GROWTH UNDER THE INFLUENCE OF VITAMINS, HORMONES, AND RADIATIONS. J. V. Ries and F. Ludwig. Rept. Proc. Intern. Congr. Microbiol., 3rd Congr., New York, 1939. 33, 552-553(1940).

The growth of germinating wheat grains is strongly stimulated by irradiation with 6 m. shortwaves for 2-5 mins., markedly inhibited by an irradiation for 10 mins. The embryonic development of frog spawn or frog tadpoles is inhibited by an irradiation for 5 mins., while a single or repeated irradiation for 10 mins. has an accelerating effect on the development. CA 35-1461

10027

SHORTENING THE REST PERIOD OF SEEDS OF AESCULUS HIPPOCASTANUM L. WITH URANYL NITRATE. R. Retovsky. Ber. Deut. Botan. Ges. 60, 355-366(1942).

When resting seeds are soaked in a solution of uranyl nitrate for 24 hours, the speed of germination is increased. With less dormant seeds small concentrations of the chemical give best results while higher concentrations may delay germination. CA 37-6707

10028

BIOCHEMICAL MUTATIONS IN NEUROSPORA. D. Bonner. Cold Spring Harbor Symposia Quant. Biol. II, 14-24 (1946).

Biosynthesis of vital substances by mutant strains of Neurospora appears to occur as a chain of reactions each yielding characteristic end products. The mechanism of genetic blocking of these reaction chains is discussed. (from abstract). BA 22-19745

10029

THE BIOLOGICAL ACTION OF X RAYS AS A FUNCTION OF INTENSITY. A. A. Bless. Phys. Rev 65, 356(1944)

Various x ray intensities (from 25 r/min to 5000 r/min) produced no significant differences in length of stems of Big Club Variety wheat sprouts from irradiated seeds when the dosage was constant. (from abstract). BA 9-15229

10030

EFFECT OF X RAYS ON THE PRODUCTION OF INDOPHENOL-BLUE FORMATION (NADI-REACTION) IN YEAST CELLS. E. Bautz. Naturwissenschaften 41, 375-376(1954).

An x ray dose of 50000 r causes 55 per cent of Rhodotorula rubra cells to die. There is an increase to 70 per cent of nadi-negative cells. The number of nadi-positive

cells determines the extent of the x ray effect. The nadi-negative cells recover more rapidly in new than in old nutrient media. CA 49-9734

10031

THE INFLUENCE OF URANIUM SALTS ON SOIL MICRO-ORGANISMS AND ON THEIR FUNCTION. G. Luchetti. Boll. Inst. Agrar., Pisa 8, 571-591(1932).

Soil microorganisms are enhanced by uranyl nitrate and uranyl acetate at low concentrations while at higher concentrations there is an inhibitory effect. The author states that the salts in low concentration apparently enhances nitrogen fixation in the soil while affecting ammonification. CA 27-3549

10032

POTASSIUM AS AN ANTAGONIST OF X RAYS AND RADIUM. G. A. Nadson and A. Zholkevich. Vestnik Rentenol, i Radiol. 3, 85-106(1924).

Seeds of Sinapis Alba were exposed to ultra-violet dipped into solutions of various salts or exposed to Ra rays, and the germination rate and number of germinating seeds determined. Seeds treated with KI and exposed to Ra grew better than those directly exposed to radium. Na salts showed no such action. (from abstract). CA 20-1649

10033

ELECTRONIC PRESERVATION OF FOOD. Wolfgang Huber. Electronics 21, 74-9(1948).

Foods and drugs can be preserved for long periods by exposure in sealed containers to ultra-short-time pulsed cathode rays from a capacitron. Energy from a capacitron is cold energy of considerable intensity, making it possible to treat products at temperatures below freezing in any physical state.

10034

EFFECT OF IRRADIATION ON FERMENTATIVE MICRO-ORGANISM I. MORPHOLOGICAL AND BIOCHEMICAL CHARACTERISTICS OF RACES OF ASPERGILLUS NIGER PRODUCTS BY RADIUM TREATMENT. R. Nakazawa and M. Simo. J. Agr. Chem. Soc. Japan 14, 895-910 (1938). (Nippon Nogei-Kagaku Kaishi).

RaBr was used to treat Aspergillus niger for varying lengths of time. This resulted in five races showing morphological and biochemical changes. CA 34-3308

10035

THE ACTION OF RADIUM AND X RAYS ON MICRO-ORGANISMS. II. THE PRODUCTION OF ACIDS BY RADIUM-IRRADIATED ASPERGILLUS NIGER. Ryozi Nakazawa and Mituo Simo. J. Agr. Chem. Soc. Japan 15, 547-552 (1939). (Nippon Nogei-Kagaku Kaishi).

After treatment with radium, some varieties of Aspergillus showed increased acid formation. Citric acid fermentation was increased in one and oxalic acid fermentation in another. CA 34-3308

10036

THE EFFECT OF X RAYS ON FERMENTS IN BARLEY SEEDS AND SPROUTS. V. P. Nilova. Trudy Priklad. Botan Genet. 1. Seleksi 14, 109-115(1936).

Barley seeds treated with x rays exhibited decreased catalase activity. X rays did not affect peroxidase of seeds or seedlings. Methylene blue was decolorized more slowly by extracts of irradiated seeds than by those of normal seeds. X rays did not affect amylase of seeds or seedlings. Irradiation increased proteolytic activity. CA 31-5840

10037

EXAMINATION OF THE POSSIBILITY OF THERAPY OF PLANT DISEASE WITH IONIZING RADIATION. P. E. Waggoner and A. E. Dimond. Phytopathology 42, 599-602(1952).

Therapy of Fusarium wilt of tomato by external sources of gamma or X-radiation were unsuccessful.

ful because hosts were injured at 10^5 roentgen (r) of gamma at 25 r/hr. or X-radiation at 20000 r/hr., while doses greater than 10^6 r are required to eliminate spores or vegetative cells of *Fusarium oxysporum* f. *lycopersici*. Radioisotopes could possibly be accumulated in diseased tissue as a result of metabolic accumulation or mechanical stoppage of trans-locative processes. Because of such effects, therapy might have been possible when a radioisotope was used which was accumulated in diseased tissues to such a degree that death of the parasite was favored while injury to the host was minimized. The amount of P^{32} arriving at the growing point following soil application was only slightly less in diseased than in healthy plants. Therefore, therapy of *Fusarium* wilt of tomato by internal sources of radiation seems unlikely. CA 47-2278

10038

RADIATION-INDUCED NUTRITIONAL AND MORPHOLOGICAL MUTANTS OF *GLOMERELLA*. Clement L. Markert. Genetics 37, 339-352(1952).

Of 10,839 colonies grown from irradiated spores, 2620 were mutant. No qualitative differences in mutagenic effect were found to be associated with any particular quantity of any of the three radiations used. Kinds or proportions of mutants did not change with dose or type of radiation. (from abstract). BA 27-3100

10039

EFFECT OF STARVING AND DOWEX 50 TREATMENT ON GROWTH OF NORMAL AND X-IRRADIATED YEAST. William J. Bair and J. N. Stannard. J. Gen Physiol. 38, 505-513(1954-1955).

Effects of starvation or treatment with dowex 50 resin on respiration and fermentation parallel effects of 90,000 r of 250 Kv. x-rays. Starvation increased radiosensitivity of cell division processes. Neither starvation nor resin altered growth of non-irradiated yeast. Two effects of radiation: (1) permanent inhibition of growth, (2) temporary inhibition of the remaining cells resulting in delay of growth. (from authors' summary).

10040

ANTIBIOTICS PRODUCED BY ACTINOMYCETES. II. X-RAY INDUCED MUTATION OF *STREPTOMYCES VINACEUS*. K. Minoura. Hakko Kogaku Zasshi 27, 100-103(1949).

Mutants of *Streptomyces vinaceus* were produced as a result of irradiation of the conidia. The mutants showed loss of antibiotic action against *Escherichia coli*. CA 47-11329

10041

THE ASSOCIATION OF DIFFERENT ALTERATIONS IN SELF-FERTILE X RAYED DERIVATIVE OF *NEUROSPORA TOTRA-SPERMA*. W. S. Malloch. Mycologia 33, 540-554(1942).

Cultures were grown from ascospores exposed to hard x rays and Grenz radiation. Frequency distributions for ascospore production, color of substratum, conidiospore production and perithecia development in the hard x ray and Grenz radiation, are presented. (from abstract). BA 16-5061

10042

GIANT PLASTIDS IN FERNS PRODUCED FROM X-RAYED SPORES. Lewis Knudson. Am. J. Botany 21, 712-13(1934).

In prothallia from x-irradiated *Polypodium aureum* spores large amoeboid-like plastids were observed. In older cells of prothallium in the region of rhizoids, plastids were more uniformly circular in cross section. In peripheral cells, amoeboid-shaped plastids were of various grotesque forms. Photographic and other

evidence indicates that giant amoeboid-like plastids are formed by the union of smaller plastids.

10043

FURTHER NOTES ON THE BIOLOGICAL ACTION OF METALS AT A DISTANCE. V. Rivera. Atti. Pontif. Accad. Sci. Nuovi Lincei 86, 240-242(1933).

Growth of organisms placed a few cm from metals of high atomic weight is stimulated presumably by radiations from the metal. Whether effect is stimulating or depressive depends on dosage, distance of metal or secondary source of radiation. (Reference found in Mycol. 13, 178(1933)). CA 28-4441

10044

STIMULATION OF GROWTH IN *ASPERGILLUS NIGER* UNDER EXPOSURE TO LOW VELOCITY CATHODE RAYS. C. E. Buchwald and R. M. Whelden. Am. J. Botany 26, 778-84(1939).

When irradiated with cathode rays of certain energies and densities and subsequently cultured on potato-maltose agar, spores of the Ascomycete fungus *Aspergillus niger* are definitely stimulated in growth. Earlier, more rapid swelling and germ tube production by a larger percentage of cells were found in the irradiated samples, as compared with controls.

10045

A RECIPROCAL TRANSLOCATION IN *SORGHUM VERSICOLOR* ANDERSS. E. D. Garber. Am. J. Botany 35, 295-7(1948).

In an X-ray induced reciprocal translocation in *S. versicolor* involving the nucleolus chromosome and one of the other chromosomes in the complement, semisterile plants had 50.6%, normal plants less than 5% aborted pollen grains. Normal plants had 85.5% fertile florets while semisterile plants had 34.2%. A study of quartets indicated 50% zigzag of one type of open ring configuration, and 26.8% of a second type.

10046

INTERMEDIATES IN CHLOROPHYLL SYNTHESIS USING *CHLORELLA* MUTANTS. S. Granick. Am. J. Botany 36, 825(1949).

By X-irradiation of *Chlorella*, mutants with altered chloroplast pigments have been obtained. Several key intermediates have been identified which permit a reasonable interpretation of the pathway of chlorophyll synthesis. Steps leading to chlorophyll synthesis are summarized. (from author's summary).

10047

IMMEDIATE EFFECTS OF 200 r AND 400 r OF X-RADIATION ON THE MICROSPORES OF *TRADESCANTIA PALUDOSA*. A. V. Beatty and J. W. Beatty. Am. J. Botany 41, 242-50(1954).

Tradescantia microspores were exposed to either 200 r or 400 r of x rays at 30°C. After both doses, chromosomes irradiated in the earlier part of midprophase reverted to an earlier stage, those irradiated in the latter part of midprophase showed clumping at metaphase and anaphase. (from abstract).

10048

CHROMOSOME TRANSLOCATIONS INDUCED IN *TRITICUM X AGROPYRON* HYBRIDS BY X RAYS, PHOSPHORUS³², AND SULFUR³⁵. Thomas S. Osborne and Fred C. Elliott. Am. J. Botany 42, 646-9(1955).

X-raying dormant grains with 12,000 to 20,000 r increased PMC interchange two to three times above controls, while imbibition of aqueous P^{32} or S^{35} in sublethal to lethal amounts produced little or no effect on interchange frequency. Dormant grains exposed to 12,000 to 14,000 r yielded 0.40 interchanges per PMC, storing dormant grains in oxygen these exposures yielded an average frequency of 0.61 interchanges. (from authors' summary).

10049

OBSERVATIONS ON THE ACTION OF X RAYS ON PLANT CELLS. Maud Williams. Ann. Botany (London) 37, 217-24(1923).

Strips of tissue from the upper surface of the petiole of *Saxifraga umbrosa* showed depressed circulation after x irradiation, and recovery in 24 hours. Viscosity of the protoplasm is lowered in the early stages of radiation. There is no direct influence of the rays upon the anthocyanin or chlorophyll. Solutes diffuse from the vacuole into the protoplasm which appears to coagulate. (from author's summary).

10050

RADIOISOTOPES IN SOILS RESEARCH AND PLANT NUTRITION. S. B. Hendricks and L. A. Dean. Ann. Rev. Nuclear Sci. 1, 597-610(1952).

Field and greenhouse experiments with P^{32} as well as other applications of radioisotopes to soils research and plant nutrition are reviewed. NSA 6-5726

10051

THE INACTIVATION OF DRY PENICILLIN BY DEUTERON BOMBARDMENT. Marquerite Davis and Ernest Pollard. Arch. Biochem. Biophys. 37, 112-16(1952).

Assuming that the random arrival of one primary ionization inactivates the molecule an inactivation volume of $700 \text{ \AA}^3$ is found for dry penicillin bombarded with deuterons. Actual molecular volume is $400 \text{ \AA}^3$. Inactivation volume is thought to be too large because of action of the various forms of energy in a primary ionization on more than one molecule. (from abstract). NSA 6-6263

10052

EFFECT OF HIGH VOLTAGE CATHODE RAYS ON RICKETS AND ON THE ACTIVATION OF CHOLESTEROL. D. Knudson and W. D. Coolidge. Proc. Soc. Exptl. Biol. Med. 24, 366-9(1927).

Because of damage to skin by rays, it is not possible to give dose necessary to activate enough cholesterol of skin to cure rickets. CA 22-2770

10053

INTRATHORACIC CHANGES FOLLOWING X RAY TREATMENTS, CLINICAL AND EXPERIMENTAL STUDY. K. S. Davis. Radiology 3, 301-322(1924).

Irradiation of the thorax of rabbits and dogs produced pulmonary and pleural lesions. Clinical observations are also discussed.

10054

EFFECTS OF FOOD IRRADIATED WITH X RAYS UPON MICE. J. K. Narat. Radiology 8, 41-3(1927).

Mice fed with x irradiated food show diminished activity, sluggish motions, retardation of growth (1/3 cases) weight loss in a few cases and increased mortality and morbidity.

10055

SPECULATIONS ON HAZARDS OF EXPOSURE TO RADIATIONS. John Keosian. Science 122, 586-7(1955).

Author speculates on mutations caused by increasing background radiation. (No experimental data). NSA 9-7248

10056

PRECONCEPTION OVARIAN IRRADIATION; ITS INFLUENCE UPON THE DESCENDANTS OF THE ALBINO RAT (*MUS NORVEGICUS*). D. P. Murphy. Surg. Gynecol. Obstet. 50, 588-593(1930).

Litter size of female rats whose ovaries were exposed to Radon before mating with non-irradiated male was decreased. First generation offspring showed delayed growth and fertility, probably attributable to effect of radiation on mother's health. No developmental defects were found in second generation, produced by mating with brothers or other males from irradiated mothers.

10057

ON THE OCCURRENCE OF THE OESTROUS CYCLE AFTER X RAY STERILISATION. PART IV. IRRADIATION OF THE ADULT DURING PREGNANCY AND LACTATION, AND GENERAL SUMMARY. A. S. Parkes. Proc. Roy. Soc. (London) B102, 51-62(1927).

Irradiation of mice with sterilizing dose of x rays during pregnancy resulted in abortions. Oestrus reappeared after irradiation. Mice were also sterilized during lactation, and after prolonged lactation oestrus reappeared. Irradiation did not affect corpora lutea of lactation and they became histologically "permanent." Duration of lactation is not affected by sterilization. CA 21-3660

10058

EFFECT OF METALS AT A DISTANCE ON GERMINATING SEEDS. G. A. Nadson and C. Shtern. Compt. Rend. 201, 159-161(1935).

Action of Al, Fe, Cu, Sn, Pt, Au, Pb on growth of germinating white mustard seeds is presented. Biological action of metal depends on thickness and dimensions of their surface. Action is due to emission of secondary rays, principally electrons, from the metals under the influence of radioactivity of the circumambient medium. (from abstract). BA 11-15720

10059

RADIOACTIVITY OF THE ROCKS IN THE FAR EAST AND ITS INFLUENCE ON FORESTS. L. L. Lagunov. Bull. Far East. Branch Acad. Sci. USSR no. 9, 105-109 (1934).

Ra is present in the igneous and sedimentary rocks of eastern Siberia as well as in small amounts in the soil. Tests showed that with an increase in radioactivity, there was a corresponding increase in self seeding with many more trees in a given area. However, with larger Ra concentrations, there was a marked decrease in the number of broad-leaved trees. CA 29-3910

10060

FIXATION BY PLANTS OF RADIUM AVAILABLE IN THE SOIL. A. Lepape and R. Trannoy. Compt. Rend. 199, 803-805(1934).

Plants tend to pick up Ra when present in soil either naturally or added as a fertilizer. This may result in the collecting of Ra in an animal body as a result of consumption of these plants. CA 29-870

10061

DISTRIBUTION OF RADIUM AND URANIUM IN PLANTS RAISED ON MEDIA WITH DIFFERENT CONCENTRATIONS OF THESE ELEMENTS. K. G. Kunasheva. Trav. Lab. Biogeochem. Acad. Sci. URSS 5, 197-200(1939).

Ra and U were added to Helriegel's solution in which *Pisum sativum* was grown. Ra was absorbed by all parts of the plant, while U was absorbed by the roots only. CA 34-4113

ENZYME ALTERATION BY IONIZING RADIATION. D. L. Aronson, M. J. Fraser and C. L. Smith. Radiation Research 5, 225(1956).

10065

EFFECT OF X RAYS ON MEIOTIC AND MITOTIC CELL DIVISION IN *TRITICUM VULGARE*. R. Imbert and J. Courtine. Ann. Univ. Montpellier, Suppl. Sci. Ser. Botan. 4, 30-42(1949).

Plants receiving an x ray dose of 2000 V on the 20th day showed greater development than controls and up to 30% more fertile flowers per head. Plants irradiated for 6 periods of 3.5 min. with intervals of 1 hr., developed slowly. Plants irradiated for 3 periods of 7 min. at intervals of 2 hrs 30 min were more retarded.

10066

INFLUENCE OF RADIUM ON THE DEVELOPMENT AND GROWTH OF THE LOWER FUNGI. J. Dauphin. *Nature* 69, 311(1904).

Radium rays arrest growth of the mycelium of *Mortierella*, but spores and mycelium are not killed. When returned to normal growing conditions, they can germinate and continue to grow. (from abstract).

10067

EFFECT OF PROCESSING CONDITIONS ON ORGANOLEPTIC CHANGES IN FOODSTUFFS STERILIZED WITH HIGH INTENSITY ELECTRONS. W. Huber, A. Brasch, and A. Waly. *Food Technol.* 7, 109-115(1953).

Since penetrating ionizing radiation may adversely affect food flavor and texture, commercial radiation sterilization will require development of technics to avoid such changes without increasing markedly the energy required for sterilization. Several such technics, both physical and chemical, are found in irradiation in the frozen state, irradiation in the absence of oxygen, and irradiation in the presence of radical acceptors. Oxygen is one of the principal factors. Since in many instances the oxygen threshold values were as low as 1 per cent of saturation, methods for oxygen removal were developed, including counter-current stripping with inert gases, and pre-storage in closed containers at controlled temps. Radical interceptors of chemical nature include spices and press juices of organs such as liver, brain and spleen. Tocopherol, esters of gallic acid and certain other polyphenols may be combined with synergists such as ascorbic acid and citric acid to enhance protective action for protection of flavor and color in foodstuffs. CA 47-12668

10068

BIOLOGICAL EFFECT OF THE PENETRATING RAYS OF THE ELEMENTS. XI. DETERMINATION OF THE PROPERTIES OF LEAD RADIATIONS AFTER THEIR PARTIAL ABSORPTION BY LEAD. P. Gyurko. *Erdeszeti Kiserletek* 49, 183-188(1949).

The tropism of germinating plants was used in determining the biological effect of penetrating rays from lead plates. CA 46-1055

10069

THE BIOLOGICAL EFFECT OF THE PENETRATING RAYS OF ELEMENTS. D. Feher. *Erdeszeti Kiserletek* 47, 212-221(1947).

The biological effect of penetrating rays of 72 elements (68 of which were not radioactive) and their salts was studied with peas. The following elements gave the most intense biological effect: He, Er, Yb, Na, Be, Kr and Ar. CA 45-1630

10070

INFLUENCE OF RADIOACTIVE MINERALS ON WHEAT. A. J. Ewart, Jr. Dept. of Agr. Victoria, Australia 9, 155-157(1910).

When radioactive rock containing 0.218% P_2O_5 , 0.740% K_2O , 0.400% CaO , 2.14% MgO was used as fertilizer, inconsistent results were obtained. (from abstract). CA 5-2508

10071

GROWTH ERGONES AND ANTIERGONES. H. von Euler. *Svensk Kem. Tidskr.* 58, 180-187(1946).

Proteus vulgaris showed increased growth in ribonuclein, diminished growth in colchicine, and no effect in DNA. *Streptococcus hemolyticus* also had a diminished growth in colchicine. Growth inhibiting actions of x rays applied to washed and germinating barley seeds were more acute than when seeds were unwashed. CA 41-3841

10072

INFLUENCE OF ROENTGEN RAYS ON YEAST CELLS. H. von Euler. *Svenska Bryggare foren. Manadsblad* (Stockholm) 57, 141-146(1942).

A 40 per cent increase in respiration, as measured by oxygen uptake, occurred in yeast cells treated with x rays. The respiration was not influenced by aniline; Na_2HAsO_3 influenced the cells to return to the normal rate of respiration. CA 37-5107

10073

THE EFFECT OF IONIZING RADIATIONS ON THE BROAD BEAN ROOT. PART IV. THE LETHAL EFFECT OF ALPHA RADIATIONS. L. H. Gray and John Read. *Brit. J. Radiol.* 15, 320-36(1942).

Bean roots were exposed to a known dose of α radiation by immersing the tissue in water containing dissolved radon. Compared on basis of ionization per unit volume of tissue, α radiation is about equal in efficiency to neutron radiation, and 9 times as efficient as γ radiation in killing bean roots. (from authors' summary)

10074

CHEMICAL STUDIES ON DIPLOID AND TRIPLOID ASPENS FROM NORMAL AND X-RAYED POLLEN. H. von Euler. *Arkiv. Kemi, Mineral, Geol.* 26A(30), 19p. (1942).

Crosses were made between tetraploid and diploid aspens with and without irradiated pollen. Leaves of triploid plants contained about 2.5 times as much ribonucleic acid and more chlorophyll than those of diploid plants. The amounts of ascorbic acid, catalase, and dehydrogenases for succinic and citric acids were the same in triploid and diploid leaves. CA 43-5831

10075

MECHANISMS INVOLVED IN THE ACTION OF RADIATIONS ON THE CELL NUCLEUS. M. Errera. *Ann. Soc. Roy. Sci. Med. Et. Nat. Bruxelles* 5, 65-176(1952).

Subjects reviewed include: blockage of mitosis, changes in cytology, x ray effects on virus and bacteriophages, genetic effects on nucleus, especially in salivary glands of drosophila. Direct chemical action of radiation is discussed in explaining biological effects. Author also compares effects of ionizing and U. V. radiation. (from abstract). CA 46-10230

10076

INVESTIGATION OF THE PACHYTENE OF NORMAL AND X-RAYED POLLEN MOTHER CELLS OF *SOLANUM LYCOPERSICUM*. Verner Gottschalk. *Chromosoma* 4, 298-341(1951).

Each inflorescence of Sieger tomatoes was exposed to an x ray dose of 300-1000 r, with a dose interval of 100 r. Pollen mother cells of Sieger tomatoes were studied in acetocarmine smear preparations. The 12 pairs of chromosomes were individually identified by length, symmetry, location of the centromere, the number of macrochromomers in the heterochromatin, and nature of telomere. X-radiation induced all types of aberrations. (from abstract). BA 26-10374

10077

THE STABILITY OF BROKEN ENDS OF CHROMOSOMES IN *ZEA MAYS*. Barbara McClintock. *Genetics* 26, 234-282(1941).

Using structural modifications of chromosome 9, dicentric chromatids were produced at meiosis following crossing-over. Many chromatids with broken end but

with complete complement of genes were produced. Fusion at the position of breakage between sister halves results in an anaphase bridge configuration. When a chromosome with a newly broken end is introduced, broken end heals. (from abstract). BA 15-14129

10078

A CORRELATION OF RING-SHAPED CHROMOSOMES WITH VARIATION IN ZEA MAYS. Barbara McClintock. Proc. Natl. Acad. Sci. U. S. 18, 677-681(1932).

Pollen carrying dominant allelomorphs of genes affecting pigmentation was x-rayed and placed on silks of recessive plants. Variegation, composed of dominant and recessive color types was found in F. plants possessing a ring-shaped chromosome. (from abstract). BA 8-5179

10079

COMPARISON OF X-RAY AND CHEMICALLY-INDUCED CHROMOSOME MUTATIONS IN THE PACHYTENE OF SOLANUM LYCOPERSICUM. Werner Gottschalk. Chromosoma 4, 342-58(1951).

Plants were treated with M/20 ethyl urethane in combination with M/200 KCl, or AlCl₃ in concentrations of M/50 and M/1000, for 24 hrs., then left in running water for 48 hrs. before fixing. On acetocarmine smears with all agents tested, majority of breaks occurred at insertion region. Effects of chemicals and x-radiation are broadly comparable. (from abstract). BA 26-10875

10080

THE INDUCTION OF PARTHENO-CARPY IN PETUNIA. Henry A. McQuade. Ann. Missouri Botan. Garden 39, 97-112(1952).

Parthenocarpic fruits were produced in Petunia with 2, 4-D x-rayed pollen, and x-rayed ovaries. Lethal doses for various tissues are discussed. BA 27-99

CHROMOSOME BREAKAGE INDUCED BY ABSORBED RADIOACTIVE PHOSPHORUS. T. J. Arnason. Cold Spring Harbor Symposia Quant. Biol. 13, 1-5(1948).

The use of radioisotopes to induce mutations is discussed and experiments on cytological effects of radioactive phosphorus upon germinating seed and seedlings of Triticum vulgare, T. durum, T. monococcum and Hordeum distichum are described. (from abstract).

10083

EFFECT OF INDOLEACETIC ACID ON ROOT GROWTH OF X-IRRADIATED PEAS. E. S. Mika. Botan. Gaz. 113, 285-293(1952).

Idaho White peas treated with different dosages of x-ray were observed for growth inhibiting effect. Irrespective of irradiation, development of axillary bud in decapitated seedlings was promoted in absence and inhibited in presence of IAA. Initiation and development of lateral roots in intact and decapitated plants were accelerated when IAA was present. (from abstract). BA 26-22583

10084

THE INFLUENCE OF THE ANTIQUITY OF THE CELL UPON CELL RESISTANCE TO RADIUM AND X-RAYS. R. H. Millwee. Radiology 22, 74-76(1934).

Cells of algae, molds, ferns, and others of this type have probably existed in the earth and have remained unchanged for long periods of time in spite of being irradiated by continuous exposure to natural radiation and cosmic radiation. The author speculates that this fact may be due to an acquired resistance by these cells. CA 28-2021

10085

MULTI-OVARY IN BARLEY. A MUTANT INDUCED BY

ATOMIC BOMB IRRADIATION. C. C. Moh and R. A. Nilan. J. Heredity 44, 183-184(1953).

Characteristic of mutant is its floral structures. Young florets have normal organs. During later development, anthers produce stigmata and stamens eventually become ovaries. Mutant behaves as simple recessive. (from abstract). BA 28-12716

10086

INDUCED MUTATIONS AND PLANT BREEDING. P. Jacquard. Compt. rend. Congr. Cinquantenaire. Ec. Colon. Agr. (Tunis) 1, 1-18(1950).

Methods, including irradiation, and results obtained in various countries by use of induced mutations in plant breeding are reviewed.

10087

THE ACTION OF X-RAYS ON THE RYE. III. X-RADIATION OF SEEDS. L. P. Breslavetz and A. S. Afanassieva. Cytologia 8, 110-27(1937).

X-ray doses of 250 r to 8000 r stimulate growth, development, and yield of plants. The dose 750r produced the greatest increase in number of seeds and weight and also increased fertility.

10088

A STUDY OF X-RAY INDUCED CHROMOSOMAL ABERRATIONS IN BARLEY. Richard S. Caldecott and Luther Smith. Cytologia (Tokyo) 17, 224-42(1952).

Chromosomes in resting embryo responded to x-irradiation (applied at 34 KVP and 27 doses ranging from 0 to 32,000 r) as though they were monopartite. Single bridges at anaphase in somatic cells were rare. Observations suggest acentric fragments may undergo one division, but do not persist beyond subsequent resting stage. Ordinarily, broken ends of chromosomes unite shortly after breakage but delayed attachments do occur. (from authors' summary).

10089

THE PROBLEM OF RADIATION DAMAGE IN FERTILIZER STUDIES WITH LABELLED PHOSPHATE. R. S. Russell, R. P. Martin and S. N. Adams. Trans. Intern. Congr. Soil Sci., 4th Congr., Amsterdam 2, 138-141(1950).

When young barley plants were treated with P^{32} , the rate of growth of roots and absorption of phosphates were significantly reduced. Winter wheat in soil culture pots containing P^{32} showed decreased phosphate absorption. CA 46-4612

10090

ACTION OF URANIUM NITRATE AND MANGANESE SULFATE WHEN ADDED TO GROWTH FACTORS, ON GERMINATION AND PRODUCTIVITY OF PISUM SATIVUM. Paul Becquerel and Jacqueline Rousseau. Compt. Rend. Acta. Sci. (Paris) 224(11), 773-775(1947). (In French).

Pea seeds were put to germinate after soaking in uranium nitrate, manganese sulfate, phenylacetic acid, β -indoleacetic acid, or a mixture of these. Uranium nitrate and $MnSO_4$ increase inhibition exercised on germination by phenyl- and indoleacetic acids. Mixture of Phenylacetic acid (10^{-5}) and $MnSO_4$ (10^{-4}) had favorable effect on yield of seeds. (from author's summary). BA 22-19247

BIOLOGICAL ACTION OF RADIOACTIVE SUBSTANCES. II. ACTION OF COLLOIDAL THORIUM OXIDE ON GERMINATION OF SEEDS. V. Bevilotti. Boll. Soc. Ital. Biol. Sper. 19, 283-285(1944). (In Italian).

Dilute solutions of colloidal ThO_2 accelerated wheat and corn germination while higher concentrations inhibited this action. If sprouting occurred, there was no difference in treated or untreated seeds following the first 10 days of growth. CA 41-1734

10092

F₁'s FROM RADIUM-TREATED POLLEN. A. F. Blakeslee, S. Satina, A. D. Bergner, J. S. Potter, and A. G. Avery. *Anat. Record* **47**, 383(1930).

Of 400 F₁ individuals from pollen treated with radium, nearly half were abnormal. Chromosomal abnormalities include segmental interchanges causing closed circles of four to six members, simple translocations causing chains of four or more members; deficiencies for a whole or part of a chromosome, additions of a chromosome or fragment. No gamete lethals exist. Individuals with circles are normal, those with chains are abnormal. (from authors' abstract).

10093

SYMPOSIUM ON PHYSIOLOGICAL EFFECTS OF RADIATION AT THE CELLULAR LEVEL. EFFECTS OF RADIATION ON MARINE ALGAE. L. R. Blinks. *J. Cellular Comp. Physiol. (Suppl. 2)* **39**, 11-18 (1952).

The marine algae surviving at the most radioactive spot accessible on the Bikini Island reefs, 1 yr. after the atom bomb explosions, were abundant, and like those of other, normal, regions nearby, both in appearance and in a variety of functions (pigment content, photosynthetic rate, respiratory rate, calcification, K content, permeability, bio-electric potential, and oxidase activity). Only in 1 function investigated, did algae from radioactive regions differ; their catalase activities were markedly enhanced, possibly in response to H₂O₂ produced by radiation. This suggests an adaptive enzyme effect. If injurious genetic effects had occurred, they were still recessive, or perhaps were missed in the rapid sampling carried on. CA 47-6464

10094

VARIATIONS IN THE EVENING PRIMROSE INDUCED BY RADIUM. W. H. Brittingham. *Science* **74**, 463-464 (1931).

After treatment with radon, evening primrose were self-pollinated. Effects: a necrotic area, abscission of buds, and necrosis of buds in meiosis or younger. Sowings were made of seed from treated buds. Unclassifiable leaf shapes, sizes and other peculiarities existed. The majority of atypical forms did not survive. Those that bloomed had abnormal characteristics, e. g. flowering tip was smaller bore fewer flowers, and had many buds drop before blooming.

10095

POLLEN-TUBE GROWTH AND SEED PRODUCTION AFTER RADIUM TREATMENT. J. T. Buchholz. *Anat. Record* **47**, 382(1930).

Describes; relation between dosage and physiological effect on pollen-tube growth, relation between dosage and proportion of seeds obtained when pollen is used in pollinations of untreated females, genes with no visible effects on heterozygous sporophytes, many of them transmitted through female gametophyte generation in 1:1 ratio and eliminated by gametophytic selection in male gametophyte. (from authors' abstract).

10096

RADIUM EXPERIMENTS WITH DATURA. I. THE IDENTIFICATION AND TRANSMISSION OF LETHALS OF POLLEN-TUBE GROWTH IN F₁'s FROM RADIUM-TREATED PARENTS. J. T. Buchholz and A. F. Blakeslee. *Anat. Record* **41**, 98(1928-1929).

An F₁ from treated pollen produced pollen in which half the pollen grains remained ungerminated on the stigma. F₂ progeny appeared normal. Many F₁ plants from radium-treated parents were heterozygous for lethal genes affecting pollen germination or growth. F₁

plants negative for pollen-tube lethal genes gave rise to F₂ progenies, free from lethals. (from authors' abstract).

10097

RADIUM EXPERIMENTS WITH DATURA. V. EFFECTS OF RADIUM ON POLLEN-TUBE GROWTH RATE, AND THE SEED OUTPUT FOLLOWING TREATMENT. J. T. Buchholz and A. F. Blakeslee. *Anat. Record* **41**, 101-102 (1928-1929).

Pollen from 2n plants of *Datura stramonium* were treated with radium-emanation tubes. Growth rate decreased in proportion to dosage. Seed capsules from treated pollen were aborted without enlargement and aborted after enlargement as dosage decreased. Differences in seed output per capsule occurred with dosage steps of 0.16 millicurie hour. (from authors' abstract).

10098

THE ROLE OF ATOMIC ENERGY IN AGRICULTURAL RESEARCH. J. C. Burgher. *Proc. Ann. Oak Ridge Summer Symposium*, 4th Ann. Symposium, Oak Ridge, Tenn., TID-5115, p. 11-23(1953). AGRICULTURAL RADIO-BIOLOGY AND THE NATIONAL WELFARE.

Future of agricultural research, especially as related to radiobiology. Advances include improved fundamental food plants (increased yield and disease-resistancy).

10099

CYTOGENIC EFFECTS OF X-RAY AND THERMAL-NEUTRON IRRADIATION ON DORMANT SEEDS OF BARLEY. Richard S. Caldecott. *Genetics* **39**, 240-259 (1954) also, *Radiation Research* **1**, 127(1954).

Different lots of dormant seeds of barley were subjected to doses of 5, 10, 15, 20, and 25 (X10³) r of x-ray and to 15 doses of thermal-neutron irradiation. Survival to maturity in X-rayed material decreased as dosage increased. Frequencies of interchanges and mutations were directly proportional to dosage. (from author's summary).

RADIUM EXPERIMENTS WITH DATURA. II. POLLEN ABORTION IN F₁'s FROM RADIUM-TREATED PARENTS. J. Lincoln Cartledge and A. F. Blakeslee. *Anat. Record* **41**, 98(1928-1929).

Among offspring of radium-treated daturas, two were new chromosomal types with + 50 and + 75% aborted pollen. Eleven other had + 50% abortion, one had + 85% abortion, three had half smaller sized or aborted pollen and half lighter-colored pollen. Two had + 25% of pollen aborted. Three with + 50% abnormal grains and one with + 25% abortion produced progenies with normal and abnormal pollen. (from author's abstract).

10101

EFFECTS OF IONIZING RADIATIONS ON SEEDS OF BARLEY. Richard S. Caldecott. *Radiation Research* **2**, 339-350(1955).

Experiments testing whether increased radio-sensitivity of seeds with high water content results from nature and frequency of radical species formed along tracks of ionizing electrons indicate that water content can be increased to 15% to 20% with no increase in sensitivity to X-rays (there is an inverse relationship) when seeds are soaked in H₂O at 3°C. There is no 1:1 relationship between sensitivity to X-rays and water content.

THE DISTRIBUTION OF ALPHA-RADIOACTIVITY IN NATIVE VEGETATION. J. T. Curtis and Ralph Dix (Univ. of Wisconsin, Madison). Botan. Gaz. 117, No. 3, 233-8(1956) Mar.

Analysis of the soil and of the plants in a variety of plant communities for alpha-emitting substances showed that a considerable concentration occurred in the A_0 soil layer. This concentration was greatest in coniferous forests growing on loess-free, igneous soils in cool climates. The humus beneath hemlock trees showed the greatest alpha radioactivity. A number of rare elements were found to be similarly concentrated in the humus of coniferous forests, including Cu, Ga, Pb, and Zr. The high concentration reached by these elements indicate that immediate soil environment of tree seedlings may be very different from that expected in ordinary soil analyses in the region. Food and Drug Administration, Washington, D. C. and Federal Civil Defense Administration, Battle Creek, Mich. EFFECTS OF NUCLEAR EXPLOSIONS ON BULK FOOD STAPLES. Sumner C. Rowe. Mar. 1956. 38p. (WT-1163)

Twenty-eight different selected packaged foods representing those of greatest volume in the American diet were exposed to nuclear detonations at the Nevada Test Site during the spring of 1955. The foods were divided into three groups: retail size packages, replicas of bulk packages, and bulk sizes (50 to 100 lb). The different packages were so placed that some were exposed to strong neutron and gamma flux, others to gamma radiation and blast effects, and still others to only blast effects. The foods were recovered as soon after exposure as feasible and were studied periodically for induced radioactivity, physical and chemical changes, organoleptic variations, nutritional adequacy, and toxicity. These studies showed that most foods were suitable for emergency feeding at presently suggested AEC tolerance within 15 days after exposure. The initial predominant radioactivity, in most cases, was demonstrated as resulting from sodium or potassium or both, the intermediate studies suggested phosphorus as the substance contributing the major portion of the radioactivity, and, in the final phase of the study, possibly the radiation effects on chlorine and trace elements predominated. Calculations were made of the levels of radioactivity and the half lives of the radio-

active elements predominating in the foods. The organoleptic evaluations demonstrated an accelerated deterioration in the quality of the dairy products and an off-color development in the table salt. There was an indication of a change in the baking characteristics of the exposed flour and corn meal. Flying glass created a hazard in that some of the foods contained glass particles resulting from broken windows produced by the blast effect. There were no significant losses of vitamin content or change in protein quality of the foods exposed. Furthermore, there was no indication that the rate of deterioration of vitamins during storage was affected by exposure to radiation. The pharmacological tests have not been completed as yet, although apparently a synthetic diet consisting of the exposed and control foods did not affect growth after a 36-week study of rats. Nineteen elements that may occur in foods were exposed in the form of their chemically pure salts with the area of strong neutron flux to determine whether, and to what degree, the elements would become radioactive. The samples were examined for induced radioactivity over a period of three months. Tin, zinc, cobalt, silver, chlorine, phosphorus, and sulfur were found to be the elements of greatest significance since residual radioactivity could be demonstrated after considerable time. NSA 12-7094

Rochester, N. Y. Univ. Atomic Energy Project. RADON SOLUBILITY IN BODY TISSUES AND IN FATTY ACIDS. Elmer Nussbaum. June 17, 1957. 169p. Contract W-7401-eng-49. (UR-503)

Data are given for the distribution coefficient of radon ($\mu\mu\text{c}/\text{ml}$ in gas divided by $\mu\mu\text{c}/\text{ml}$ in specimen at equilibrium) in fatty acids, olive oil, extracted animal fats, and samples of tissue from rat and man. The gamma activity of the 1 ml samples was determined by means of a well-type NaI crystal scintillation counter after radon and RaC had attained radioactive equilibrium. Fatty acids having 1 to 13 carbon atoms per molecule were equilibrated with radon at 50 and 37°C the distribution coefficient in formic acid was 0.96. Solubility increased with increasing number of carbon atoms per molecule of fatty acid, reaching a broad plateau in the region of heptanoic acid. In oleic and linoleic acids the distribution coefficient was 6.7 and 6.3, respectively. In olive oil and in extracted animal fats it ranged between 5.5 and 6.5. Selected rat tissues were dissected after *in vivo* equilibration with approximately 1 μc of radon per liter of air for periods of 30 minutes to 48 hours. At equilibrium the distribution coefficient had the following mean values; omental fat, 4.8, brain, 0.31; liver slices, 0.30, kidney, 0.28, heart, 0.22; skeletal muscle, 0.15, and venous blood, 0.40. Radon in omental fat attained a half-equilibrium value in about 30 minutes and 95 per cent of equilibrium in 6 hours. In-vitro equilibration of human blood and extracted fat yielded mean values for the distribution coefficient of 0.43 and 6.33, respectively. NSA 12-5139

California. Univ., Berkeley. Radiation Lab. HUMAN AND CATTLE THYROID RADIOACTIVITY ASSOCIATED WITH FALLOUT: OCTOBER 1955 TO OCTOBER 1956. Margaret R. White. Mar. 1, 1957. 15p. Contract W-7405-eng-48. (UCRL-3703)

Thyroids from humans, obtained at autopsy, were followed for radioactivity from January 1956 to October 1956. There is less than one chance in one thousand that human thyroid tissue could have been irradiated to the extent of 0.001 rep from ^{131}I fallout. The probable value is no more than 0.00016 rep during this period. Thyroids from cattle slaughtered in the San Francisco Bay Area were followed for radioactivity from October 1955 to

October 1956. Two periods of increase in radioactivity, possibly due to small-yield detonations in Nevada, were seen in December 1955 and January 1956. A period of high activity in cattle thyroid, probably due to a Russian detonation, began in March, and radioactivity from this delivered a maximum of 0.2 rep. Another period of high activity, presumably due to the Bikini tests, began in May 1956 and was continuing at the time this report ended. It delivered (up to October 11, 1956) a maximum of approximately 1.3 rep to cattle thyroid tissue. This level of radiation exposure would produce no change in physiological function of the thyroid and would not be detrimental to cattle. NSA 12-4673

10128

THE EFFECTS OF ATOMIC RADIATION ON OCEANOGRAPHY AND FISHERIES. Publication No. 551. Washington, National Academy of Sciences - National Research Council, 1957. 142p.

General Considerations Concerning The Ocean As A Receptacle for Artificially Radioactive Materials. An attempt was made to summarize both the present knowledge and the areas of ignorance concerning the oceans that must be taken into account in considering the biological effects of radiation. Physical and Chemical Properties of Wastes Produced by Atomic Power Industry. The range of physical and radiochemical characteristics that may be anticipated in concentrated fuel reprocessing wastes and approximate quantities of wastes produced are indicated. Comparison of Some Natural Radiations Received by Selected Organisms. The accumulation of natural radiations from various sources for man and fish for different levels in both air and water is described. Disposal of Radioactive Wastes in the Ocean: The Fission Product Spectrum in the Sea as a Function of Time and Mixing Characteristics. An attempt was made to construct a detailed quantitative picture of the fission product spectrum in the ocean, in steady state with a given fission rate. Transport and Dispersal of Radioactive Elements in the Sea. The physical processes whereby radioactive elements in true solution are diluted by mixing and are carried from one part of the ocean to another are described. The Effects of the Ecological System on the Transport of Radioactive Elements in the Sea. The processes which must be considered in order to evaluate biological effects on the ultimate distribution of radioisotope wastes or contaminants in the sea are described. Precipitation of Fission Product Elements on the Ocean Bottom by Physical, Chemical and Biological Processes. An attempt is made to define the processes by which materials may be carried to the bottom, to note the conditions under which these several processes can be expected to operate, and to assess the extent to which the processes have been responsible for the removal of activity to the bottom in cases where bottom accumulation has been measured. Ecological Factors Involved in the Uptake, Accumulation, and Loss of Radionuclides by Aquatic Organisms. Some experiments are described on the uptake, accumulation, and loss of radionuclides by various marine organisms. Accumulation and Retention of Radioactivity from Fission Products and Other Radiomaterials by Fresh-Water Organisms. These organisms include many biological forms such as vascular plants, algae and phytoplankton, protozoans, zooplankton and other invertebrate forms, and representatives of each of the five vertebrate classes. Effects of Radiation on Aquatic Organisms. The relative sensitivity of different groups of aquatic organisms to the effects of radiation is discussed. Isotopic Tracer Techniques for Measurement of Physical Processes in the Sea and the Atmosphere. The present status of our knowledge of the distribution and properties of various naturally occurring isotopes which are useful for studies

of atmospheric and oceanic transfer phenomena are discussed. On the Tagging of Water Masses for the Study of Physical Processes in the Oceans. Consideration has been given some of the problems involved in tagging water masses in the open ocean. Large-Scale Biological Experiments Using Radioactive Tracers. NSA 12-5848

10129

A DEFINITION OF "SIGNIFICANT AMOUNT" TO BE APPLIED TO RADIOISOTOPE WORK. R. J. Magill (Univ. of California, Berkeley). Proc. Health Phys. Soc. 192-4 (1957).

Although most legislative acts and authoritative sources of information concerning safe practices in working with radioactive materials suggest certain health protective measures for persons working with a "significant amount" of radioactivity, the amount considered significant is usually left undefined. It is suggested that the meaning for the term "significant amount" be that amount of material which in the case of a total accident would involve as much irradiation to a critical organ over a finite period of time, say one month, as a permissible body burden. 10136

THE EXPERIMENTAL BASE AND SIGNIFICANCE OF THE MAXIMUM ADMISSIBLE RADIATION DOSE. G. Joyet (l'Université, Zurich). Z. Med. Isotopenforsch. 1, No. 2, 135-60(1957) Nov. (In French).

A summary was made of the experimental basis and significance of the maximum permissible radiation dose. It was shown that significance may be properly attached to a maximum dose of 0.3 r per week, not because of the radiation effects on the recipient but because of the genetic effects. The genetic effects caused by modern sources of radiation- x-ray diagnosis, luminous watch dials, radiological aids to shoe fitting, and nuclear weapon tests- were calculated for the population as a whole. The special case of persons occupationally exposed to radiation was also considered. NSA 12-6414

10137

NUCLEAR AND ELECTRON PARAMAGNETIC RESONANCE AND ITS APPLICATION TO BIOLOGY. Power B. Sogo and Bert M. Tolbert (Univ. of California, Berkeley). Advances in Biol. and Med. Phys. 5, 1-35 (1957).

Electron spin resonance and nuclear magnetic resonance both involve the absorption of electromagnetic radiation in the radio-frequency range. They may be considered as extensions of ultraviolet, visible, and infrared spectroscopy. They comprise a unique branch of spectroscopy in that one can vary the absorption energy levels at will, instead of having to use the energy levels nature has given. This advantage arises from the fact that one can vary the strength of the applied magnetic field and thus vary the spacing of the electronic and nuclear magnetic energy levels. No fundamental new truths have been demonstrated in biology by the use of nuclear magnetic resonance. Electron spin resonance measurements are beginning to give information from which one can construct a detailed picture of the nature of some biochemical reactions, such as reactions involving one-electron oxidation-reduction reactions or the so-called free radical

reactions. The discovery by electron spin resonance of these free radicals in living material, and their correlation with biological activity, helps confirm what previously was only a hypothesis on certain types of enzymatic reactions. Studies to date employing electron spin resonance or nuclear magnetic resonance are reviewed. (91 references.)

CRITICAL OBSERVATIONS ON CONTACT THERAPY WITH Co⁶⁰ IN PARANASAL REGION. Kurt Ernst Scheer, Werner Schwab, and Werner Ey (Universität Heidelberg and Universitäts-Hals-Nasen-Ohrenklinik Heidelberg). Strahlentherapie 104, 398-404(1957). (In German).

Cobalt⁶⁰ contact therapy within a combined surgical-radiotherapeutic treatment is definitely indicated in the case of malignant tumors of the paranasal sinus, of the epipharynx, of the inner parts of the nose; malignant tumors of the tonsil, the floor of the mouth, the petrosal portion of the temporal bone, and the oesophagus. The advantages and limits of the Co⁶⁰ therapy are critically examined, the energy absorption displayed by the tissues being given particular consideration.

SOME PHYSICAL ASPECTS OF RELATIVE BIOLOGICAL EFFICIENCY. P. R. J. Burch (Univ. of Leeds). Brit. J. Radiol. 30, 524-9(1957) Oct.

After surveying the broad nature of the problem of relative biological efficiency, an account is given to methods which have been used to characterize the quality of ionizing radiations. These former methods have ignored the phenomenon of secondary or δ -track formation and reference is made to treatments which take this factor into account. The concept of local energy losses is defined, and tables are given for various radiations, showing the amounts of local energy dissipated in water with respect to particle kinetic energy range. The radiations considered are 1 Mev and Po²¹⁰ α particles, tritium β particles, 1 and 2 Mev monochromatic electrons, 25 Mvp, 220 and 100 kyp x rays and Co⁶⁰ γ rays. The special problem of the LET of electrons of less than 2 kev is considered and new values are derived from recently published experimental results. A mean LET is defined and calculated, its limitations are emphasized. NSA 12-20

Army Medical Nutrition Lab., Denver. ACCEPTABILITY OF IRRADIATED FOOD CONSUMED BY HUMAN SUBJECTS. Report 200. Virginia E. McGary, Margaret E. Shipman, Lester M. Levy, and Lionel M. Bernstein. Mar. 15, 1957. 23p. Project 6-60-11-020. (AD-125592)

Irradiated foods were fed to nine or ten human test subjects in four separate studies. In the first study irradiated foods provided approximately 35% of the total calorie intake, in the second, 61%, in the third, 80%, and in the fourth study, 100%. Acceptability data were obtained by use of questionnaires with an arbitrary hedonic scale, and by personal interviews with the individual subjects. Statistical analysis of the acceptability data showed significant differences between irradiated and control food in only 10 out of 42 items. Control foods were preferred to irradiated foods in nine of the 10 cases. NSA 12-34

WHOLE BODY X-IRRADIATION OF EXPERIMENTAL ANIMALS. M. J. Corp (Atomic Energy Research Establishment, Harwell, Berks, Eng.). Phys. Med. Biol. 1, 370-79(1957) Apr.

The use of conventional x-ray therapy machines for whole-body irradiation of experimental animals is de-

scribed. It is shown that irradiation from one side only gives what is probably a sufficiently uniform dose distribution in mice. In the case of rats and larger animals non-uniformity of dose distribution due to absorption is considerable although the average dose is seen to be very close to the dose measured in the absence of the animal but at the position its center would occupy. Bilateral techniques are therefore recommended if dose distributions uniform to 5% are desired. There is some evidence that dose distributions may be estimated fairly closely from standard depth dose tables for semi-infinite phantoms. NSA 12-9606

RADIOLOGICAL DEVELOPMENT ACTIVITIES IN HEALTH PHYSICS. Semiannual Progress Report [for] July-December 1956. L. J. Cherubin and J. J. Fitzgerald. 54p. Contract W-31-109-Eng-52. (KAPL-1887)

The efficiencies of respirator filter media (American Optical Type R-57 and MSA Type H Comfo Ultra Filter) were found relatively high under test conditions. Three reports on air sampling and collection efficiency studies were prepared for publication in technical journals. Several types of beta pocket dosimeters were constructed, tested, and evaluated. Correction factors for mixed radiation fields and beta energies were established. A fast-neutron pocket dosimeter was designed and constructed. Theoretical considerations concerning the selection of chamber gases are discussed with respect to the response to fast-neutron fluxes. Modifications in the foil badge neutron dosimeter system were introduced to facilitate the use and increase the effective sensitivity of the dosimeter. A method for calibrating and evaluating beta hand counters is discussed with reference to the use of single and multiple sources, and the use of uranium and mixed fission-product sources. Modifications in the methods of collecting fish and plankton were introduced to provide an improved and more representative sampling program. No significant accumulation of radioactive materials in plankton was detected during this period. Analyses of fish tissues indicate an apparent decrease in radioactive material concentrations in 14% of the specimens

analyzed, an increase in 48% of the analyzed specimens, and no increase or decrease in 38% of the analyzed specimens. Criteria are set forth to aid in the rapid and essentially complete evaluation of critical assembly environmental hazards. The probability, consequences, and ranges of hazards associated with a nuclear incident are discussed. A brief description of exclusion area, containment, shielding, plant layout, emergency planning, and evaluation procedure consideration is presented to aid in the development of adequate radiation protection measures. THE STATUS OF BIOASSAY TECHNIQUES FOR EVALUATION OF INTERNAL EXPOSURES FROM RADIOACTIVE ISOTOPES. J. W. Healy (General Electric Co., Richland, Wash.). *Proc. Health Phys. Soc.* 21-32(1957).

The interpretation of bioassay data in terms of the quantity of radioisotopes in the body is dependent upon the knowledge of the excretion rate of the substance by the human following acute administration. Other cases including chronic uptake and lung deposition may be evaluated from the acute case if other physical parameters are known. At the present time, one function of the bioassay laboratory should be the accumulation of data from any accidental exposures so that values for the parameters involved may be obtained for the human. STUDIES ON THE THYROIDAL UPTAKE OF ASTATINE IN THE RAT. C. J. Shellabarger and John T. Godwin. (1954), 27p. (BNL-1924)

Astatine has been found to be selectively concentrated by the rat thyroid gland. When the thyroidal uptake of astatine was compared to the thyroidal uptake of I¹³¹, more of the latter was taken up by the rat thyroid, although this advantage in favor of I¹³¹ was less apparent when the period between isotope administration and sacrifice was shortened. When rats were treated with thiouracil, the thyroidal uptake of astatine was enhanced, and only in thiouracil treated thyroid glands were clusters of alpha

tracts found, and these were thought to represent aggregates of astatine atoms. NSA 8-6396

THE METABOLISM OF IODINE COMPOUNDS. William T. Salter, Gopal Karandikar, and Paul Block. J. Am. Pharm. Assoc., Sci. Ed. 38, 626-41 (1949) Dec.

The fates of iodine and iodine compounds within the human body were studied with the aid of radioactive iodine, I^{131} . From the numerous and detailed observations, it was concluded that whenever an organic compound is administered to a mammal, varying amounts of iodide are liberated by decomposition, drugs like thyroxine are completely degraded down to the iodide ion alone. The organic iodine compounds are resolved into two great classes for discussion: those connected with the internal economy of the thyroid, and, those which are more strictly pharmaceutical in nature. In the first group, along with iodide, the chief compounds considered are diiodotyrosine and thyroxine, the latter group is extensive and is distinguishable by the tendency to concentrate in the liver and kidneys, creating a radio-opaque effect as an aid to diagnosis and to the identification of areas and organs. Careful and extensive studies on the pharmaceutical effects of iodine incorporation into organic molecules are indicated. 44 references. NSA 4-1666

AN INTRODUCTION TO THE NONCLASSIFIED LITERATURE DEALING WITH BIOCHEMICAL STUDIES OF EXPERIMENTAL URANIUM POISONING. Samuel Schwartz and Elaine J. Katz. "Toxicology of Uranium, Survey and Collected Papers." Albert Tannenbaum, ed. New York, McGraw-Hill Book Company, Inc., 1951. (NNS Div. IV, Vol. 23, Paper 13, p. 262-73).

The nonclassified literature dealing with the biochemical effects of uranium poisoning has been reviewed. Representative studies of various tests have been noted with special reference to the literature of the past two decades. Most of these tests are based on alterations in kidney function. Chief emphasis has been given to nitrogen retention, acidosis, albuminuria, and abnormalities in special renal-clearance tests. Although the latter appear to be sensitive and reliable indices of kidney dysfunction, several authors have pointed out that the classical interpretation of these tests does not hold in uranium poisoning, inulin clearance, for example, may be markedly diminished even when the glomeruli appear essentially normal histologically. This is believed to be due to increased back-diffusion of inulin through the damaged tubules. Nearly all the studies that have been reported are based on dog and rabbit experiments. 61 references. A SECOND-YEAR INHALATION TOXICITY STUDY OF ANIMALS EMPLOYING URANYL NITRATE HEXAHYDRATE AT 4 MG/M³. G. F. Sprague, Jr., A. Pettengill, B. Brown, and H. E. Stokinger. Dec. 19, 1948. Decl. Jan. 1949. 56p. (AEC-2442); (UR-51) For publication in NNS.

The chronic toxicity of uranyl nitrate hexahydrate has been studied for a second year in 23 dogs and 70 rats. The exposure conditions and toxicologic procedures resembled closely those of the previous year, but considerably more study was given to the determination of particle size of the nitrate dust. As a result of the exposure to uranyl nitrate hexahydrate dust at 4 mg/m³ daily for a second year, the following observations are made. The mortality among dogs and rats that could probably be attributed to uranium exposure was confined to 2 dogs previously exposed to uranium dioxide and one rat exposed to the nitrate, although the overall mortality amounted to 65 per cent of all animals dying or sacrificed because of advanced age or disease. Little change occurred in weight response in any of the animal groups with the exception of the dogs exposed previously to uranium dioxide and tetrafluoride. Dogs exposed previously to UF₆ showed greatest weight gain at the end of the second year; rats previously exposed to this compound were the only ones to lose weight. A greater number of abnormal values among biochemical constituents both in blood and urine appeared in the animals during the second year than during the first year. The greatest number and degree of changes occurred among those animals exposed to uranium compounds that produced the least effect during the first year, namely UO₂ and UCl₄. Animals previously exposed to the same level of the nitrate as in the current study showed fewest changes. Renal injury was found in all animals exposed, characterized respectively by necrosis, cellular desquamation and regeneration or tubular atrophy. The hematologic finding of anemia among both dogs and rats was noteworthy. Again this anemia was most marked in animals whose prior exposure had been to UO₂, UF₄, and UCl₄. The anemias observed were confined to decreases in red blood cell count and hemoglobin content, and were not associated with a rise in the percentage of reticulocytes. One of the more important observations from the second year study was the deposition of uranium in the tissues. Among the important depots of uranium storage were the bones and teeth. NSA 2-898

DISTRIBUTION OF THE RADIOACTIVE SUBSTANCE FOLLOWING INTRAVENOUS INJECTION OF PETEOSTHOR. I. THE THORIUM X AND THORIUM B CONTENT IN THE ORGANS OF THE RAT. Kurt Ernst Scheer. Arztl. Forach. 4, 1/161-1/164 (1950) Mar. 25. (In German).

Two groups of 8 rats each received intravenous injections of pure thorium or peteosthor. About 24 hr later the animals were sacrificed, and their tissues were examined for radioactivity, the content of Th X and Th B were computed. It was found that there was a clear distinction in the content of Th X and Th B in those organs which received thorium from those which received the peteosthor, but the livers of the animals treated with the latter substance contained about twice as much Th B. The testicles of all animals showed a low activity. The author concludes that the possible use of pure thorium as a clinical tool ought to be investigated. NSA 4-3352

CIBA FOUNDATION SYMPOSIUM ON IONIZING RADIATIONS AND CELL METABOLISM. D. W. van Bekkum. London, England. J. A. Churchill, Ltd. 1956. 318p.

Studies on spleen and thymus from irradiated rats demonstrated a biochemical defect as early as 30 min. after exposure. Similar results were found when the

spleen was exteriorized and irradiated with the rest of the body shielded. These effects were not reproducible *in vitro*. Specific activity of ATP and the relative specific activity of its labile phosphate groups were depressed in parallel with oxidative phosphorylation. Evidence is presented to show that a relative cytochrome c deficiency develops in spleen mitochondria shortly after irradiation. Possible relationship between the cytochrome c effect and the oxygen effect is considered.

ABSORPTION AND DISTRIBUTION OF THORIUM NITRATE IN THE RAT. Paul R. Salerno and Paul A. Mattis. Paper presented at the American Society for Pharmacology and Experimental Therapeutics Fall Meeting, Boston, Nov 13-15, 1950.

An abstract of this paper has appeared in *J. Pharmacol. Exptl. Therap.* 101, 31-2(1951) Jan. and is reproduced here in its entirety.

$\text{Th}(\text{NO}_3)_4$ was administered to adult male rats by several routes, and the tissue distribution was studied by means of UX_1 (Th^{234}) as a radioactive indicator. Studies on rats given 30 mg/kg by stomach tube revealed that maximal absorption had occurred within 4 days and that more than 90% of the absorbed dose was deposited in the skeleton. After 32 days, 100% of the retained Th, which represented 0.06% of the administered dose, was found in the skeleton. When larger doses of Th (700 to 800 mg/kg) were administered by oral intubation, no absorption could be measured, which indicates that less than 0.001% is absorbed at this dosage level. Absorption following subcutaneous administration was found to be progressive in that 0.03 and 0.07% of the injected dose was found in the skeleton at 16 and 30 days, respectively. Following the intraperitoneal injection of 60 mg/kg of Th, 1% of the dose was deposited in the skeleton after 30 days. $\text{Th}(\text{NO}_3)_4$ administered intravascularly by intracardiac injection was retained to the extent of 95, 89, and 83% at 3, 8, and 14 days, respectively. Tissue distribution in terms of per cent of injected dose was 16% to the skeleton, 55% to the liver, and 5% to the spleen after 14 days. Two hours after intracardiac injection, 50% of the Th is removed from the blood, and 7.6% is found in the skeleton. Less than 1% is found in the blood after 18 hr. Most of the Th which is excreted is found in the feces and apparently is transported from the liver via the bile. NSA 5-2093

THE RELATION BETWEEN MEAN PARTICLE-SIZE AND THE TOXICITY OF PARTICULATE URANIUM DIOXIDE. H. E. Stokinger. nd. Decl. Dec. 22, 1949 (Proposed for publication in NNES, Div VI, Vol 1, Chap 21, Sec F.). 81p. (AECD-2782)

Particulate uranium dioxide was separated into seven fractions differing in particle size over the range 11 to 0.35 μ . Equal weights of these fractions were administered to white rats by intratracheal injection, and the magnitude of the ensuing response was estimated by measurement (a) of weight change, (b) of accumulation of non-protein nitrogen in the blood, and (c) of the ability of the kidney to excrete phenolsulphonphthalein. The quantity of uranium in the lungs, kidneys, and femurs was de-

termined analytically. The following conclusions are reported: (1) administration of uranium dioxide in the lungs of rats leads to a typical response originating primarily in the damage which is produced in the kidney; (2) the intensity of this response is a function of the particle-size of the uranium dioxide such that the greater response is associated with the smaller particles and the lesser response with the larger particles; (3) particles smaller than 1 μ are relatively more active in causing damage than are particles greater than 1 μ , and there is no indication that a limit had been reached at 0.35 μ which was the smallest size tested; (4) the intensity of the reaction in the kidney is proportional to the quantity of uranium present in the kidney; (5) the variation of toxicity which is associated with variation in particle size reflects a corresponding variation in the quantity of uranium which gains access to the systemic circulation; (6) the quantity of uranium entering the systemic circulation cannot be measured by following the changes in the uranium content of the lung; (7) appreciable fractions of an administered dose of uranium dioxide are removed by some route which does not involve the circulating blood; (8) the amount of uranium removed by this route is a function of particle-size such that the efficiency is greater for larger particles and lesser for smaller particles; (9) the rate of solution of uranium dioxide in the lung could not be shown to be proportional to the amount of surface available, since large increases in surface led to relatively small increases in the amount of systemic uranium recovered; (10) a concept is offered for the distinction between deposition as an entity differing from retention in the lung. 48 references. TRACER STUDIES ON THE DISTRIBUTION AND EXCRETION OF URANIUM IN MICE, RATS, AND DOGS. Albert Tannenbaum, Herbert Silverstone, and Janet Koziol. October 31, 1946, decl. July 14, 1948. For publication in NNES. 72p. (AECD-2167, CH-3659)

The excretion of uranium and distribution of uranium in tissues following injection of uranyl nitrate was studied in mice, rats, and dogs. Highly radioactive isotopes of uranium were used either as tracers or alone, radioautographs as well as analytical data were obtained. The conclusions of the studies are summarized as follows:

(1) A high portion of the uranium is excreted in the urine within 24 hours after injection. Much smaller proportions are excreted during this period when the dosages are toxic. (2) Initially fecal excretion of uranium is relatively low, but as the urinary excretion rapidly decreases, the fecal uranium may assume significant proportions. (3) Less than 10% of the injected uranium remains in the body after one month following injection of non-toxic dosages of uranyl nitrate. When the injected dose is toxic as much as 40% may be retained. (4) The kidneys and bones are the principal sites of accumulation (retention) of the injected uranium. A greater proportion is retained in the kidneys with toxic dosages as compared with non-toxic dosages. Other tissues contain much smaller concentrations of uranium. (5) Radioautographs indicate that uranium accumulates in bone almost entirely in the cancellous portion (trabeculae) and endosteum. (6) Similar radioautographic studies on kidney reveal that the cortex is the essential site of accumulation with some

tendency for concentration at the cortico-medullary junction. (7) When the uranium at the site of injection has been depleted (or removed entirely) the daily rate of excretion of uranium from the body is of the order of 0.5 to 1.0 per cent of that present in the body. NSA 1-750

THE DEPOSITION OF CARRIER-FREE RADIO-VANADIUM IN THE RAT FOLLOWING INTRAVENOUS ADMINISTRATION. Kenneth G. Scott, Joseph G. Hamilton, and Patricia C. Wallace. May 18, 1951. 10p. (UCRL-1318)

Tracer studies in the rat have been conducted employing carrier-free radiovanadium (V^{48}). There is an initial relatively rapid excretion by way of the kidneys and digestive tract, following intramuscular administration of carrier-free pentavalent V^{48} in isotonic saline solution at pH 5 to 6. Four groups of three rats each were employed, and the groups were sacrificed at 1, 4, 15, and 64 days. At the 64-day interval approximately 10% of the V^{48} is retained in the body. Principal organs of retention at this interval are the skeleton, muscle, liver, testes, and kidney. The highest concentration per gram of wet tissue was observed in the skeleton, testes, kidney, and liver. Intragastric administration was performed on one group of three rats, and it would appear that approximately 0.5% was absorbed from the digestive tract. (auth) NSA 5-4363

INVESTIGATIONS ON METABOLISM OF FLUORIDE. III. EFFECT OF ACUTE RENAL TUBULAR INJURY ON URINARY EXCRETION OF FLUORIDE BY THE RABBIT. Frank A. Smith, Dwight E. Gardner, and Harold C. Hodge (Univ. of Rochester School of Medicine and Dentistry, N. Y.). Arch. Ind. Health 11, 2-10(1955) Jan.

Acute renal tubular injury was produced in rabbits by the subcutaneous administration of uranyl nitrate hexahydrate. Development of the acute uranium nephritis and recovery therefrom were followed by measuring urinary protein and chloride concentrations by determining urine volumes, and by renal histological examinations. The uranium-poisoned rabbit that has sustained an acute, high-grade tubular injury maintained a normal fluoride balance, i. e., neither retained nor excreted abnormal proportions of ingested fluoride. The calculated resorption of fluoride in the renal tubule was much less than that of chloride. The fluoride content in soft tissues, viz., blood, thyroid, heart, pancreas, liver, and kidneys, is normally low and is increased very little by doubling the fluoride intake, uranium injury to the kidney did not alter this tendency. Calculations based on the balance data are presented to show that the retained fluoride is deposited in the skeleton of the animal. (auth) NSA 9-1730

10164

THE METABOLISM OF AMERICIUM IN THE RAT.

Kenneth G. Scott, D. Harold Copp, Dorothy J. Axelrod, and Joseph G. Hamilton. Journal of Biological Chemistry 175, 691-703(1948) Sept. (See also AECD-1785)

An investigation of the metabolism of americium in the rat has been conducted, following its administration by intramuscular injection and by stomach tube. No appreciable absorption took place from the digestive tract. Within 24 hours after parenteral administration, 55% of the total amount of americium absorbed from the site of injection was deposited in the liver and 20% accumulated by the skeleton. Excretion occurred primarily by way of the digestive tract and most of the americium eliminated appeared to come from the liver. There was no significant change in the content of americium in the skeleton throughout the interval of the experiment. The distribution of americium in bone was studied by the radioautographic

technique with thin, undecalcified sections of the femur. Americium was heavily deposited in the region of trabecular bone below the epiphysis, at the endosteal and periosteal surfaces of the shaft, and throughout the cortical bone in the region of small blood vessels. 2 tables, 3 graphs, and 2 plates (radioautographs). 7 references. THE EFFECTS OF A MAINTAINED BODY BURDEN OF POLONIUM IN THE RAT. 2. PLAN OF LONG TERM EXPERIMENT, DISTRIBUTION, EXCRETION AND RETENTION DATA. J. Newell Stannard and Robert C. Baxter. Nov. 22, 1954. 33p. Contract W-7401-eng-49. (UR-376).

Detailed plans are given for a three year, life span experiment to determine the effects of a maintained body burden of Po^{210} in the rat. Four dosage levels were chosen to cover a range between one expected to produce little or no biological change to one expected to result in considerable radiation damage. They are nominally 0.023, 0.1, 0.3, and 1.5 μc per kilogram per month given intravenously as neutralized solutions. The basis for choice of animals, route of administration, and the experimental design is discussed. The mean body contents at equilibrium were found to be approximately twice the monthly dose. Earlier assumptions predicted that it should be between 1.25 and 1.5 times the monthly dose. This difference is most readily accounted for by the presence of a longer effective half life than the assumed value (40 days rather than 30 days) and may represent in part less rapid excretion of the polonium than expected from single dose experiments. Actual measurements of excretion rates were performed as a "spot check" at the two lower dosage levels and found to be slightly lower than the rates predicted from conservative criteria. Some very high retentions were seen which may indicate delayed excretion resulting from tissue damage. Tissue contents of polonium were maintained throughout the experiment in a pattern similar to that seen in the first month after a single intravenous dose. The redistribution with time seen after a single dose does not occur. Spleen, liver, and kidney remained high throughout the exposure period, predicting greater damage per μc of polonium disintegrating in the body than after a single dose. (For preceding report in series see UR-329.) NSA 9-1705

IRON METABOLISM. HEME SYNTHESIS IN VITRO BY IMMATURE ERYTHROCYTES. R. J. Walsh, E. D. Thomas, S. K. Chow, R. G. Fluharty, and C. A. Finch. *Science* 110, 396-8(1949) Oct. 14.

The results of studies on heme synthesis in vitro investigated with the Fe^{55} and Fe^{59} are presented. Blood samples from anemic and iron deficient patients and the bone marrow of rats and humans were used. It was determined that while blood containing less than 1% reticulocytes took up on measurable quantity of radioiron, the reverse was true with blood of high reticulocyte content; the radioactivity was localized in the immature cell population. The results also indicate that the physiological process of iron assimilation by the developing red cells is, first, the attachment of the iron to acceptors in the red cell stroma capable of removing iron from the serum and second, the synthesis of heme. It is also indicated that the reticulocytes are still capable of completing the process of hemoglobinization in the peripheral blood, in keeping with observations that tagged reticulocytes live a normal life span. The uptake of iron by normoblasts is much greater than with the reticulocytes; radioactive heme could also be demonstrated after incubation of radioiron with the marrow cells. It is concluded that the uptake of radioiron by reticulocytes may be used as an indicator of hemoglobin synthesis. NSA 4-8

Atomic Energy Project, Univ. of Rochester. THE EFFECTS OF A MAINTAINED BODY BURDEN OF POLONIUM IN RATS. [PART] 1. PILOT DISTRIBUTION AND EXCRETION EXPERIMENT. J. N. Stannard. Apr. 27, 1954. 21p. Contract W-7401-eng-49. (UR-329).

The kinetics of excretion and total retention of Po^{210} by rats following five small weekly doses are substantially the same over a period of 49 days as when a comparable total amount is administered in a single dose. The excretion half life is 50 to 55 days and the effective half life is 37 to 39 days. This is slightly longer than previously reported values of 30 to 35 days in the rat and 30 days for the mouse, but is not considered significantly different. Tissue distribution is not altered by dividing the dose with the possible exception of red blood cells which showed a lower relative concentration. The doses given would not produce observable radiation damage in 49 days. These data are to be used for a large multiple dose experiment to be reported subsequently. (auth). NSA 8-3968

ACUTE TOXICITY OF CARNOTITE ORE DUST. Herbert B. Wilson, H. E. Stokinger, and George E. Sylvester.

Arch. Ind. Hyg. and Occupational Med. 7, 301-9(1953). April.

Carnotite ore dust inhaled by animals under experimental conditions was found to be highly toxic to the rabbit, moderately toxic to the rat, and slightly toxic to the goat. The toxicity was characteristic of U poisoning and, in degree, closely resembled that of UO_2 . (auth) NSA 7-4030

10176

Atomic Energy Project, Univ. of Rochester. THE RELATION OF PARTICLE SIZE OF URANIUM DIOXIDE DUST TO TOXICITY FOLLOWING INHALATION BY ANIMALS-II. Herbert B. Wilson, George E. Sylvester, Sidney Laskin, Charles W. LaBelle, James K. Scott and H. E. Stokinger. June 6, 1952. 25p. (UR-197)

In two separate experiments, rabbits and rats were exposed to inhalation of UO_2 at a concentration of 80 mg/ m^3 , 7 hours daily, 5 or 6 days weekly for 37 calendar days. In the first, the mass median diameter (MMD) of the chamber dust particles was 2.3 μ ; in the second 0.5 μ . The dusts were produced by "atomizing" water suspensions of the particles, and precautions were taken to reduce, to negligible proportions, "fines" in the 2.3- μ study and hexavalent U in the 0.5- μ study. Greater toxicity of the 0.5- μ MMD particles was evidenced in the rabbit by slight retardation of growth, highly incidence of urinary protein, elevation of urinary amino acid N-creatinine ratios and of blood N. P. N. and by greater renal damage, in the rat by greater renal damage, retardation of growth, increase in lung weight and in apparent gross lung damage. Uranium in all tissues (lung, femur and kidney) of terminally sacrificed animals was greater following inhalation of the 0.5- μ MMD dust than of the 2.3- μ dust. An unusual granulomatous reaction was observed in the lungs of two terminally sacrificed rabbits of the 0.5- μ study. These results are compared with those of two preliminary experiments, conditions of which differed from those of the current studies in only two important respects: in the earlier studies (a) the MMDs of the particles of the "above 1 μ " study were smaller (b) significant percentages of hexavalent U were present in the 0.5- μ dust. (auth) NSA 6-4715

10177

THE EFFECT OF EXPOSURE OF RABBITS AND RATS TO INHALATION OF URANIUM DIOXIDE DUST AT 22 Mg/ M^3 CONCENTRATION AND 0.5 μ PARTICLE SIZE. Herbert B. Wilson and George Sylvester. (nd). Dec. Dec. 22, 1949. 15p. (AECD-2781)

Rats and rabbits were exposed to UO_2 of mass median particle size of approximately 0.5 μ and at a concentration of 22 mg/ m^3 for a total of 140 hr during a 28-day period. No evidence of toxicity was found in the rat. Slight toxic effects were noted in the rabbit. Five of 16 showed very mild renal injury on micropathological examination. Five rabbits revealed a slight tendency to proteinuria; whereas, possible significant elevation of amino acid N-creatinine ratios was observed in 2 cases. Weight response was normal for both species. Deposits of uranium in the tissues of rabbits subjected to the full 140 hr of exposure were found to average 8, 1.0, and 1.8 $\mu\text{g/g}$ of tissue for lung, kidney, and femur respectively; 30, 2.0, and 1.2 were the corresponding values for the rats. Atomic Energy Project, Univ. of Calif., Los Angeles
GASTROINTESTINAL ABSORPTION OF IONS; I. AGENTS DIMINISHING ABSORPTION OF STRONTIUM. Norman S. MacDonald, Ralph E. Nusbaum, Florita Ezmirlan, Richard Barbera, G. V. Alexander, Patricia Spain, and Donald E. Rounds. Nov. 13, 1951. 13p. (UCLA-169).

Thirty-two chemical agents, readily available in tonnage quantities, were screened for their ability to diminish the skeletal deposition of ingested Sr by gastrointestinal absorption. Aqueous SrCl_2 solution was administered to fasted rats by stomach tube, and followed immediately by an aqueous solution or suspension of the agent under study. After 24 hr. the Sr content of the femurs was determined by an emission spectrographic technique. The materials which definitely decreased skeletal accumulation of Sr^{++} are listed in order of decreasing efficacy: MgSO_4 , Na_2SO_4 , the ammonium salt of an amido-polysphosphate, two carboxylic type cation exchange resins, a colloidal phosphorylated glucoside, calcium phytate, pectin, bran cereal, castor oil and a hydrophilic laxative derived from plantago. None of the following materials significantly altered the amount of deposition, bentonite, kaolin, hydrated alumina, soluble starch, methyl cellulose, carboxy methyl cellulose, agar, gum acacia, crude lignified cellulose, gelatin, fresh egg white, oatmeal, phenolphthalein, mineral oil and the disodium salt of ethylene diamine tetra acetic acid. Powdered milk, tannic acid, inulin, sodium alginate and a carboxylic and sulfuric acid substituted starch, all increased the skeletal accumulation of ingested Sr. (auth) NSA 6-69

IMMEDIATE EFFECT OF X-RAYS ON GRANULE-BOUND DNA IN THE SPLEEN OF THE RATS. M. Goutier-Pirotte and A. Thonnard. Biochim. et Biophys. Acta, 22, 396(1956). (In French).

The authors determined the amount of DNase in the spleen of female rats before and 24 hrs. after whole body exposure to 850 r X-ray dose (LD_{100}). DNase was determined in veronal-acetate and citrate buffer extracts of spleens; aqueous homogenates of spleens were the controls. Optimum pH for the enzyme varied with radiation dose, being displaced towards acid side after irradiation; towards alkaline side in irradiated rats that had been pretreated with cysteamine or β mercaptoethylamine. Effects of irradiation and irradiation plus protective agents were also studied in vitro.

SPECIAL PROBLEMS AND EXPERIMENTAL CYTOLOGY. S. Phyllis Stearner, E. J. B. Christian, Howard S. Ducoff, B. Vincent Hall, J. V. Passonneau, Austin M. Brues, Katherine A. Hamilton, Walter E. Kisielecki, L. Seki, Agnes N. Stroud, R. B. Balder, Jr., C. P. Stroud, and J. M. Gurian. p.26-40 "Quarterly Report [for] August, September, and October 1952, Division of Biological and Medical Research." Austin M. Brues, ed. 15p. (ANL-4932)

Data on the effect of partial-body shielding on radiation-induced hypotension in young chicks are presented in tabular form. Paramecium transferred to previously irradiated medium showed a 2-hr growth delay, irradiated cells in fresh medium showed a 10-hr delay and irradiated cells

in irradiated medium were delayed about 12 hr. Possible explanations for the growth delay are discussed. Structural features of the glomerulus are described as observed in ultrathin sections of rat kidney under the electron microscope. Rats were exposed to β rays of $\text{Sr}^{90}\text{-Y}^{90}$ over a 35-cm² area using 1500 μc diffusely distributed or in the form of 10, 20, or 50 point sources. Following the death of the last rat 741 days after exposure it was determined that survival was significantly less in all of the irradiated groups than in controls at all times after 350 days. Malignant tumors were not seen in the 60 controls, while 71 skin carcinomas, 73 sarcomas, and 15 adenocarcinomas of mammary origin appeared in the 405 experimental rats. Fractions of human plasma administered intravenously in saline to mice 6 min before exposure to 800-r x radiation gave protection to 80% of the group when doses of 23 mg were used, while only 1% of the controls survived. Data are presented which indicate that diethylstilbestrol, when administered for a sufficient period, acts as a cocarcinogen in mice, accelerating the induction of uterine tumors by 20-methylcholanthrene and perhaps stimulating their growth. Preliminary data are presented for a study of the effect of weekly doses of x radiation on the organ weights of growing mice. (C. H.) NSA 7-2727

NEW RESULTS OF EXPERIMENTS WITH THORIUM X ON HUMAN TISSUES. E. Schoen and Heribert Moser. Munch. med. Wochschr. 93, 862-3(1951) Apr. 27. (In German).

While pointing out the possibility of the use of P^{32} in the diagnosis of tumors in certain organs, Cramer (Med. Monatsschr. 5, 118(1951)) excluded the liver and the spleen, because in these organs the radioactivity obtained is the same in healthy and altered tissues. Experiments are reported here showing that the necessary selectivity is observed also in these organs when ThX (Ra^{224}) is used. After an intravenous injection, measurements are made of the rate of the γ -activity decrease. Whereas in a tumorous liver the activity belongs mainly to Ra^{224} , in a nontumorous one it is determined chiefly by Pb^{212} (10.6-hr), a decay product of Ra^{224} . NSA 5-5547

RADIOIRON IN DUCKS AND CANARIES AND ITS EFFECTS ON THEIR INITIAL MALARIAL INFECTIONS. Paul E. Thompson, D. A. McGinty, D. L. Bush, and Mary L. Wilson. *Journal of Infectious Diseases* **83**, 23-32(1948) July-Aug.

Radioactive colloidal iron mixtures (Fe^{55} and 59) were administered parenterally in single and multiple doses to ducklings and canaries. These studies reveal the following: Radioactivity is evident in red cells 18 hours following single intravenous administration, during the next 70 hours, increasing amounts of radioactivity are found in blood cells with negligible amounts in plasma. Radioiron is utilized more rapidly by blood cells following intravenous injection than following intraperitoneal administration. Radioactivity of perfused tissues of ducklings receiving multiple doses of maximally tolerated amounts of radioiron over a period of 23 days was greatest in liver, bone marrow and spleen, lesser amounts occurred in other tissue studies. There was no evidence of intolerance to radioiron of specific activity of one millicurie per gram apart from the toxicity of iron itself. The in vivo effects of radioiron on two species of malarial parasites were studied. *Plasmodium cathemerium* infections were established in canaries having 0.12 microcuries per ml blood. *Plasmodium lophurae* infections were initiated in ducklings having 0.10 microcurie per ml blood. There was no evidence of radiation damage to the plasmodia on the basis of their morphology and ability to produce an acute parasitemia. 19 references. NSA 1-1057

10189

RELATION OF PARTICLE SIZE OF U_3O_8 DUST TO TOXICITY FOLLOWING INHALATION BY ANIMALS. Herbert B. Wilson and George E. Sylvester (Univ. of Rochester School of Medicine, N. Y.), Sidney Laskin (Institute of Industrial Medicine, New York), Charles W. La Belle (Jefferson Medical Coll., Philadelphia, Penn.), James K. Scott (Univ. of Rochester Atomic Energy Project, N. Y.) and H. E. Stokinger (Occupational Health Program, Cincinnati, Ohio). *Arch. Ind. Health* **11**, 11-16(1955) Jan.

U_3O_8 dust at a concentration of approximately 80 mg per cubic meter with a mass-median particle diameter of 0.5μ has been shown to be much more toxic than the same concentration with an average mass-median diameter of 2.5μ . This was evidenced in the rabbit by higher mean urinary protein values, by retardation of growth, and by significantly greater renal damage, as shown by histopathological examination of tissues; in the rat it was evidenced by retardation of growth, by renal damage shown histopathologically, and in serially killed rats by gross lung damage and increase in lung weight and by gross, probably secondary, weight abnormalities in other organs. In all tissues analyzed deposition of uranium was greater following inhalation of particles of 0.5μ MMD. The lungs showed the greatest differences. The results of this study have been compared with those of a corresponding UO_2 study. The quantitative toxic differences related to particle size were very much alike, whether the oxide was UO_2 or U_3O_8 , and, when adjusted for the difference in exposure hours, the amounts of uranium in the tissues of terminally killed animals were nearly identical. Some qualitative differences between the results of the UO_2 and U_3O_8 0.5μ MMD studies have been noted. (auth) NSA 9-1731

THE DISTRIBUTION OF P^{32} IN THE MONONUCLEOTIDES OF NORMAL AND REGENERATING LIVER RIBONUCLEIC ACIDS. Elliot Volkin and Charles E. Carter. Feb. 14, 1950. 13p. (ORNL-585)

This paper deals with the P^{32} turnover in liver ribonucleic acid purified by the guanidine salt method. The specific activities of the component monoribonucleotides were determined following mild alkaline degradation of the parent nucleic acid and separation of the mononucleotides on the anion-exchange resin, Dowex-1. One hour after injection of inorganic P^{32} into the rat, the adenylic acid moiety of the ribonucleic acid had about 50% higher specific activity than the other mononucleotides, the specific activities of the latter being comparable. The isomeric adenylic acids were equally labeled. The mononucleotide composition and specific activity of regenerating rat liver ribonucleic acid followed the same pattern as the normal, although specific activities of the mononucleotides were about 3 times higher than their normal counterparts. 13 references NSA 4-2214

METABOLISM OF I^{131} IN SEVERE ANOXIC ANOXIA. L. Van Middlesworth. Science 110, 120-1(1949) July 29.

The results of an investigation to determine whether there are any significant alterations in the metabolism of radioactive I in relatively acute exposures to severe anoxic anoxia are presented. Eighteen rats were fed a low I diet for eight weeks, after which one-half were exposed to 268 mm Hg air pressure at 15-20°C for 12 hr, returned to normal pressure and injected with I^{131} . They were then re-exposed to the low pressure for an additional 24 hr and sacrificed. All injections of I^{131} consisted of 10 μ c in 0.5 cc of physiological saline solution administered intraperitoneally, and each rat the total I^{131} was determined in the thyroid gland and in a sample of plasma. The anoxic rats demonstrated a pronounced reduction in protein bound I^{131} in plasma, the influences of anoxia upon the I^{131} in unfractionated plasma, in the thyroid, and in the urine were less pronounced. STUDIES OF PHOSPHORUS METABOLISM IN MAN; II. A STUDY OF THE PERMEABILITY OF THE HUMAN ERYTHROCYTE TO INORGANIC PHOSPHATE IN VITRO BY THE USE OF RADIOACTIVE PHOSPHATE (P^{32}). F. H. L. Taylor, S. M. Levenson, and M. A. Adams. Blood 3, 1472-1477(1948) Dec.

The phosphate exchange in red cells and plasma was studied in vitro using P^{32} in the form of sodium phosphate as a tracer. No phosphate was added other than the isotopic preparation of high specific activity. The inorganic phosphate exchanged freely between the plasma and the erythrocytes at 37.5°C in a period of four hours. The minimal transfer occurred at 7°C. Most of the added P^{32} which passed into the erythrocytes during this time remained in the inorganic fraction, less than 15% was found in the organic acid soluble fraction. The specific activity of the inorganic phosphate of the erythrocytes was equal to or greater than that obtained for the inorganic phosphate of the plasma at the end of the four-hour incubation period at 37.5°C. 8 references. 2 tables. RADIOACTIVE ISOTOPES IN THE STUDY OF IRON METABOLISM AND IN HUMAN THERAPY. Alfredo Vannotti. *Rend. 1st. super. sanita* 12, 595-607(1949).

One and a half hours after intravenous injection into rabbits of Fe^{59} ferrous lactate the activity is distributed as follows: Blood 26% (mostly in the plasma), liver 41%, spleen 0.6%, kidney 4%, intestines 7%, muscle 7%, bone 4%, skin 9%. After several days the activity of the blood is found mostly in the red corpuscles (hematin), while the activity of the skin, muscle kidney, and intestines becomes insignificant. The distribution of ferric lactate is initially slightly differed but it subsequently becomes equal to that of Fe^{++} . In rabbits with chronic anemia the percentage distribution after 1.5 hr is as follows for Fe^{++} and Fe^{+++} , respectively: Blood 37 and 41, liver 25 and 21, spleen 0.19 and 0.16, kidney 1.4 and 8, intestines 6 and 0.7, muscle 9 and 1.5, bones 19 and 24, and skin 1 and 1. In a healthy rabbit at an O_2 pressure corresponding to 7000 m altitude the Fe distribution in the organs cited in the same order as before is: 31, 23.5, 0.34, 2, 5, 14, 12, and 9%, respectively. In Pb-intoxicated rabbits the Fe circulating in the blood is distinctly lower while a concentration occurs in the bone marrow. Apparently the Fe cannot be used for the hemoglobin synthesis in this case. The Fe in erythroblasts is found in the cytoplasm rather than the nucleus. The synthesis of hemoglobin probably occurs in the cytoplasm. The synthesis of hemoglobin is more rapid than that of cytochrome c and that of myoglobin. Normally there is no renal elimination of Fe except in cases of excessive Fe in circulation. Some of the therapeutic applications of radio-P and radio-I are reviewed. NSA 4-4212

10208

NEW ACHIEVEMENTS IN THE FIELD OF THE METABOLISM OF IRON BY USING A RADIOACTIVE ISOTOPE. A. Vannotti, M. Closuit, and A. Jaccottet. *Bull. Schweiz. Akad. Med. Wiss.* 5, 427-47(1949) Dec. (In French).

Studies were made on iron metabolism in rabbits in both normal and pathological conditions using Fe^{59} as a tracer. In chronic anemia, there is strong fixation of iron in the bone-marrow to the prejudice of deposit organs. In hypoxia (6000 m altitude) iron is also accumulated in the bone-marrow depending upon the degree of erythropoieses. Likewise, in hyperthyroidism, bone-marrow activity is important, but an augmentation of iron in the myocardium (only muscle in activity during the tests) was also found. Finally, in acute inflammatory conditions, a considerable drop of circulating iron and a strong fixation of this metal in bone-marrow and musculature are noted. Physico-chemical alterations of proteins are at the origin of these modifications. The spleen is of but secondary importance in the fixation of iron during hemolysis, while the liver remains the regulating organ of the intermediate iron metabolism, which is chiefly governed by the hematopoiesis needs, and but secondarily by the metabolic necessities of other tissues. These functional differences in the repartition of iron during the synthesis of hemoglobin and the other cellular hemes are also apparent in the variation of the rapidity with which iron-based pigments are formed. If hemoglobin formation can proceed very rapidly cellular heme compounds syntheses,

especially that of cytochrome c, are much slower. 24 references. (auth) NSA 4-4526

A network of stations was established in 1951 throughout the United States and extended to many parts of the world in 1952 for the purpose of sampling fall-out from nuclear explosions. Gummed films representing a 24 hour collection of fall-out are ashed and counted for β activity which is then extrapolated to Sr^{90} content. Samples of rain water, tap water, vegetation, bone, milk, urine, fish, and soil collected at various places were also assayed for Sr^{90} content. Analytical results on samples collected from Sept. 1955 through Sept. 1956 are summarized. A fall-out collector is described in which fall-out material collects in a plastic funnel and is passed through a filter and ion exchange column to collect the activity. ACUTE RADIOTOXICITY OF INJECTED P^{32} IN MICE. PART I. METABOLISM AND SURVIVAL. D. S. Anthony and R. H. Snyder. Feb. 11, 1947. 17p. (MDDC-881; C-3772)

The results of pilot experiments on the metabolism and radiotoxicity of radioactive phosphorus are reported in the paper. Data were obtained on the toxicity of well-known radioactive element in the same strains of animals and under the same experimental conditions as data obtained with less familiar radioactive elements. Determinations of the relative radiotoxicity of different isotopes could therefore be made without reference to work done under different conditions. Since the effects of radioactive phosphorus on man had been studied, comparison of these effects with those on laboratory animals provided a basis for extrapolation with other radioactive elements. The experiments with radioactive phosphorus greatly facilitated planning and interpretation of later experiments on the toxicity of other heretofore rare radioactive elements.

Washington. Univ., Seattle. Applied Fisheries Lab. SURVEY OF RADIOACTIVITY IN THE SEA AND IN PELAGIC MARINE LIFE WEST OF THE MARSHALL ISLANDS, SEPTEMBER 1-20, 1956. Allyn H. Seymour, Edward E. Held, Frank G. Lowman, John R. Donaldson, and Dorothy J. South. Mar. 15, 1957. 63p. Contract AT(45-1)-540. (UWFL-47)

A survey of the radioactivity in the sea in the region of the North Equatorial Current from the Marshall Islands to the Marianas Islands was made in September 1956. Plankton samples were taken by oblique tows from 200 meters and water samples were taken from the surface, 25, 50, 100, and 150 meters at 74 stations. The general pattern of distribution of radioactivity shows a sharp decrease east of Bikini and a gradual but irregular decrease west of Eniwetok. A slight degree of contamination is indicated as far to the west as Guam, the western extremity of the survey. Non-fission products account for a large proportion of the radioactivity in plankton and fish samples. (auth) NSA 12-41

ON TRANSMISSION OF RADIOSTRONTIUM BY NUTRITIONAL CHAIN FROM THE OPENED WATER RESERVOIRS INTO THE HUMAN ORGANISM. A. N. Marei, M. M. Saurov, and G. D. Lebedeva. *Med. Radiol.* 3, No. 1, 69-76(1958) Jan.-Feb. (In Russian).

Water-living organisms (plankton, water plants, molluscs, fish) as well as domestic ducks concentrate a significant amount of isotopes in their tissues due to inhabiting water containing radiostrontium. Fish and ducks, which are the main links in the biological food-chain, transmit radiostrontium from the water reservoir into the human organism. The most significant is pollution of bone tissue, where most of the isotope is accumulated. It is passed into the broth in cooking fish and poultry. The

possibility of intake of radiostrontium not only with water, but with food products in amounts which are over the permissible levels, requires revision of standards of permissible concentrations for opened water reservoirs. (tr-auth) NSA12-9631

HAZARDS OF THE AREA SURROUNDING PWR DUE TO ATMOSPHERIC DIFFUSION OF RADIOACTIVITY R. F. Valentine. Sept. 1957. 85p. Contract AT-11-1-GEN-14. (WAPD-SC-548) Supplemental to WAPD-SC-541.

Results are presented of dosage calculations resulting from dissemination of radioactive contaminants to the atmosphere from the Shippingport reactor following a postulated loss-of-coolant accident. An evaluation is made of the hazards from gamma and beta radiation sustained directly from the passing cloud and from fallout and rain-out and the hazard resulting from inhalation of radioactive materials. Accumulated ground concentrations are calculated. The evaluation is made basically for four types of accidents, release to the atmosphere of primary coolant containing only corrosion products; release to the atmosphere of primary coolant containing fission products of the blanket UO_2 , release of the primary coolant followed by core meltdown and release of the liberated core fission products to the atmosphere through a breached or open plant container, and release of the primary coolant followed by core meltdown and seepage of fission products from an intact plant container. In each case the quantity of fission products assumed to be in-

involved is that amount present after 3,000 hours of operation at a power of 270,000 kw. Any accident which occurs earlier than this would result in a smaller degree of hazard because of the smaller quantity of fission products generated. (auth) NSA 12-2206

DOSES OF RADIATION FROM NATURAL AND ARTIFICIAL RADIOACTIVE SOURCES. L. F. Franzen, G. Myszynski, and G. Wiesenack. *Atomwirtschaft.* 2, 362-6(1957) Nov. (In German).

Only since quite recently has man been subjected to irradiation which, as the result of medical and industrial development has been added to the radiation from natural sources. According to the investigations quoted artificial radiation accounts for 20 to 25% of the total radiation level. Atomic test explosions have so far only made an insignificant contribution. The same can still be said of the industrial application of nuclear energy which is still in its infancy. It has been estimated that people living in Europe will over a period of 30 years be subjected to a total dose of radiation from 2,500 to 4,000 mr. Of this total dose received in 30 years about 750 to 850 mr will be contributed by medical and industrial apertenances, the overwhelming share of 600 to 700 mr being the result of medical x-ray diagnosis. The atmospheric radioactivity has been estimated (incl. rainfall etc.) at 20 to 30 mr over a period of 30 years and will therefore not represent any hazards as far as external, direct radiation is concerned. The possible absorption by an accumulation of radiating substances in the body must, however, be carefully studied and special consideration must be given to fission products with a long half-life. Regarding the accumulation of certain substances in plants and animals it is still not possible to make a generally valid statement though a great number of facts have been collected. The present internationally agreed permissible dose rates are used as a criterion specially for the maximum permissible concentrations of radioisotopes, isotope mixtures, short-term absorption, catastrophes, and also include soil contamination. MEASUREMENT OF RADIOACTIVITY IN HUMAN BREATH. A. H. Ward. *Nature* 167, 600(1951) Apr. 14. (Letter to the editor).

Alpha activity in the breath from patients with Ra or Th in their bodies has been measured by two methods. The first uses the α radiation breath-monitor, type A. E. R. E. 1056A, which is designed primarily for radon measurements and is not so suitable for quickly decaying activities. The second method permits continuous-flow measurements and has been developed at Harwell. Details of the continuous-flow counter are given. Results obtained indicate that patients having Th in their bodies have concentrations in the breath of about 100 to 300 $\mu\text{c}/\text{liter}$. The corresponding Th burden is 2 to 10g, initially equivalent to 0.2 to 1.0 μc . At most, 1% of the produced Th(Rn^{220}) escapes in the breath. The Ra-Rn tolerance figures are as follows: 40% of the total emanation produced from 0.1 μg Ra fixed in the body escapes in the breath giving the accepted tolerance dose 1 $\mu\text{c}/\text{liter}$ of breath.

A QUANTITATIVE STUDY OF PERCUTANEOUS ABSORPTION. V. TREATMENT OF CONTAMINATED SKIN AND WOUNDS TO PREVENT ABSORPTION OF RADIOACTIVE SALTS. (Technical Objective AW-6). R. Kenneth Loeffler and John W. Herron. Apr. 2, 1951. 21p. (AD-309(B))

Experimental data from previous reports (AD-225(B), 254(B), 290(B), 308(B)) on bodily absorption of $\text{Sr}^{89}\text{Cl}_2$ and $\text{Sr}^{89}\text{SO}_4$ through intact, mechanically-damaged, and thermally-burned skin were used as a basis for the testing of several methods and agents for treating contaminated skin and wounds. Pretreatment of skin, care of rats, preparation of contaminating material, and general analytical procedures are explained. It was found that neither arterial nor venous tourniquets prevent absorption of radiostrontium chloride through either intact or abraded rat skin. However, a tourniquet exerting pressure greater than normal venous pressure will lessen absorption into the system. An arterial tourniquet will prevent absorption of material into the system. A variety of cleansing agents were tested alone and in combination. Some of them were tap water, tincture of green soap, Ivory soap, TiO_2 slurry, the disodium salt of ethylene diamine tetraacetic acid (EDTA), and tannic acid. Tide alone and with Epinephrine gave the best results as decontaminants. Epinephrine effectively hinders absorption, especially from abraded skin, during the first hour after contamination. Included is a discussion of possible practical applications of results. NSA 5-4996

NECESSITY OF INDOLEACETIC ACID FOR THE DUPLICATION OF CROWN-GALL TUMOR CELLS. Richard M. Klein and Howard H. Vogel, Jr. (New York Botanical Garden, N. Y. and Argonne National Lab., Lemont, Ill.). Plant Physiol. 31, 17-22 (1956) Jan.

The reduction of the endogenous or biologically effective level of IAA in crown-gall tumor tissues was accomplished in vivo and in vitro by the use of ionizing radiations (x-rays, gamma rays, and fast neutrons) and by the use of a specific anti-auxin. In all cases, the primary effects were a reduction in the growth of the tissues. These inhibitions of growth could be reversed wholly or in part by supplying the tumor cells with appropriate concentrations of IAA. These results give presumptive evidence that IAA may be specifically required for the duplication of crown-gall tumor cells which presumably synthesize optimal amounts of auxin. (auth) NSA 10-9937

A STUDY OF THE TREATMENT OF PLUTONIUM AND RADIOYTTTRIUM POISONING BY ZIRCONIUM CITRATE. Jack Schubert. September 1, 1948, decl. October 22, 1948. 23p. (AEC-2358; ANL-HDY-592)

A study was made of the effect of a single dose of zirconium citrate on the excretion and distribution of plutonium and radioyttrium in rats and a growing dog. It was found that the administration of zirconium citrate to rats increased the excretion of Pu from 1 per cent to 50 per cent and that of Y from 25 per cent to 60 per cent of the injected dose during a 24-hour period. The amount of Pu and Y deposited in the skeleton was reduced by factors of 6 and 2.6 respectively. No significant changes in the Pu or Y contents of the feces, liver, spleen or kidneys were found. The administration of zirconium citrate to a dog 5 months after exposure to Pu was followed by a sustained increase in the urinary excretion of Pu. The extent of the increase was proportional to the dose of zirconium citrate. Two and one-half years after exposure to Pu the infection of a small amount of zirconium citrate was followed by a twofold increase in the urinary excretion of Pu. A discussion is given of the chemical concepts involved in applying metal displacement principles to the removal of radioactive metals from the body. NSA 1-1534

PROBLEMS OF RADIOACTIVE WASTE DISPOSAL.

Forrest Western. *Nucleonics* 3, No. 2, p. 43-49, August 1948.

The nature of the waste disposal problem as well as the general principles by which the problem may eventually be solved are mentioned. The possibilities of disposal are: (1) Dilution, where care must be taken that the radioactive chemicals do not become concentrated by absorption or adsorption. (2) Dilution by mixing with one or more stable isotopes of the same chemical element. (3) Storage to allow decay to stable isotopes. (4) Concentration of radioactive materials by removal from process fluids by ion exchange, adsorption, precipitation, sedimentation, extraction, and evaporation. (5) Placing in containers and disposal of materials in the ocean. Tables are given of tolerance concentrations of various radioisotopes in drinking water, decay time of some fission

products, and activities of certain long-life fission products in place after 100 days. NSA 1-945

PUBLIC HEALTH ASPECTS OF ATOMIC ENERGY (CONCLUDED). Roy J. Morton. *Mississippi Doctor* 28, 31-4 (1950) June.

The problems of radioactive waste disposal with a minimum objective of insuring that the radioactive isotopes released into drainage systems, atmosphere, or soil must be incapable of sufficient concentration to be harmful to plant or animal life, are discussed, and some of the measures taken by the Atomic Energy Commission to insure this are presented. Air contamination measurements, dust filter systems, decontamination, and reclamation of some products and storage of decaying materials beyond a danger time are discussed. A short history of the waste disposal unit which was set up to evaluate hazards, to study the factors that influence the extent and significance of the hazards, and to aid in the development of effective and economical measures for prevention and control of hazards is given, the study program is described in more detail comprising three main branches: survey studies consisting of field sampling and evaluation, process studies consisting of laboratory and pilot plant studies on wastes; corollary studies consisting of the improvement of instrumentation and laboratory techniques as well as cooperating efforts with geological, meteorological, and ecological study programs. NSA 4-4147

10259

THE MEDICAL PROGRAM OF THE ATOMIC ENERGY COMMISSION. Shields Warren. *Bulletin of the Atomic Scientists* 4, 233-234 (1948) Aug.

The medical program of the Atomic Energy Commission may be divided into four parts. First, the maintenance of health of the workers of the Commission and its contractors. Second, the protection of environmental health, this involves such problems as waste disposal, possible contamination of surrounding areas and the like. Third, the development of basic research in those problems peculiarly related to atomic energy, of which the effect of ionizing radiation on the plant, animal and human cell, both isolated and aggregated into organisms, must be determined. Such problems as permissible dose levels of ionizing radiation, metabolism of new or rare elements, the mechanism of radiation injury, the development of therapy for such injury, the character and mode of development of hereditary changes due to ionizing radiation are among those of basic importance. Fourth, the exploration of what, if any, values the new sources of energy available at the installation of the Atomic Energy Commission themselves and the value that very shortlived radioactive isotopes may have in cancer research and cancer therapy. The aims of the training program administered by the National Research Council for the AEC are summarized. NSA 1-857

POTENTIAL HAZARDS AND PATHOLOGICAL ASPECTS OF RADIOACTIVE ISOTOPEs. Hermann Lisco. nd. 7p. (AECU-521, UAC-86)

It is pointed out that health and safety programs have made it possible for people to handle kilograms of radioactive materials and to deal with sources of high energy radiations of various types without harm, in the vast majority of cases. Unknown factors still to be dealt with are mentioned as the nature and the mechanisms of the biological action of radiations in general and of radio-

isotopes in particular. Criteria that are being used to formulate and establish the laws and principles of toxicology as applied to radioactive isotopes are indicated. Some common pathological denominators are noted as for instance: the incidence of blood dyscrasias, abnormalities of the liver, neoplasms of bone, lung, and skin, and graying and loss of hair. The isotopes that have been studied have generally shown a distribution that included the skeletal system, the liver, and the blood-forming organs. Two aspects of potential hazards are given: proper handling of radioactive isotopes and care and judgment in applying radioactive isotopes in the diagnosis and treatment of disease. NSA 3-1834

INSURABILITY OF ATOMIC ENERGY WORKERS. H. M. Parker. General Electric Co., 1948. 18p.

The purpose of this pamphlet is to describe the facts concerning life expectancy of Atomic Energy Workers in the light of the best present knowledge, to discuss the estimated validity of such knowledge, to remove hysteria on the one hand, and to suggest legitimate areas of safeguards for insurance writers on the other. The damaging effects of ionizing radiation are stated in the subdivisions on acute exposure and chronic exposure, with special reference to possible effects on the life span of the individual. Estimates of the shortening of life are applied to the Hanford Works operating experience. The known operating risks for the future are indicated. Compensating increase of life span, compared with such occupations as normal chemical manufacture or radiation therapy, is expected to arise from the extensive medical and industrial safety controls applied in the field of atomic energy. The validity of present day permissible exposure limits is discussed. Legitimate safeguards for those proposing to write insurance without extra premium are proposed. NSA 3-1837

Rochester. Univ., New York.
THE RETENTION OF URANIUM DIOXIDE IN RABBITS. C. LaBelle, C. Booth, and R. Barrett. April 19, 1948. Decl. June 3, 1948. 32p. (AECD-2028; UR-24)

An apparatus, fitted with a system of electronic controls, has been constructed in which a rabbit breathes dusty air in a face-piece. The valves are operated in such a way that the exhaled air is drawn off through a filter paper sampler at a regulated rate to maintain the air pressure within the face-piece essentially equal to that of the atmosphere. A duplicate line continuously samples the same volume as the atmosphere is being inhaled, permitting calculation of the quantity of dust retained by the rabbit. When the retention in micrograms per minute per kilogram of body weight is plotted against dust concentration in micrograms per liter on a log-log plot, a straight line is obtained with a slope of $3/2$ over the concentration range from 10 to 250 milligrams per cubic meter. No significant differences could be shown between the retention of dust particles one micron and those one-half micron in diameter. The quantity of dust retained was directly proportional to the volume of air breathed, and was independent of the rate of breathing. Individual animals show a two to three-fold variation from the mean probably as a result of anatomical variation in the respiratory tract. NSA 1-41

RADIOACTIVE PHOSPHORUS (P^{32}) THERAPY IN BLOOD DYSCRASIAS. Bruce R. Brown. Bulletin of the New England Medical Center 10, 185-190(1948) Aug.

This paper points out that radioactive phosphorus has a rather limited application in the treatment of blood dyscrasias. It has no useful effect in Hodgkin's disease, multiple myeloma, lymphomas, and acute leukemias. It is useful in the treatment of polycythemia vera, chronic myelogenous leukemia, and chronic lymphatic leukemia, but it is in no way curative. It has not radically changed the treatment of blood dyscrasias although preliminary investigations had given rise to much optimism as to its clinical use. 7 references. NSA 1-1197

THE BIOLOGICAL SIGNIFICANCE OF RADIOGALLIUM (Ga^{72}). Horace C. Dudley. Naval Medical Research Institute Report No. NM-011-013-Report 6. May 12, 1949. 17p.

Details of preparation of the radioactive sample, shielding and safety precautions, preliminary toxicity data, results of radioautographic studies of skeletal tissues, and a discussion of the biological significance of Ga^{72} are reported. Radioautographic studies have been made showing that this element is deposited throughout all skeletal tissues and especially in those areas of greatest osteogenic activity. Toxicity studies of Ga^{72} indicated that in rabbits the dosage level of 2 millicuries Ga^{72} per kilogram approaches the acute atoxic level. Mice and rats were found to be more resistant to the effects of both radiation and the carrier Ga. On the basis of this work studies have been initiated on the effects of Ga^{72} on osteogenic neoplasms. NSA 3-1177

10268

USE OF ISOTOPES IN MAN. Austin M. Brues. Chicago Med. Soc. Bull. 51, 954-7(1949) May 28.

A general discussion of the uses of radioisotopes for experimentation and therapy is presented. Among the newer methods of treating patients, P^{32} is mentioned as a valuable agent for the treatment of diseases of the blood-forming organs. The effects of radioarsenic, As-76 in certain blood dyscrasias and in Hodgkin's disease are pointed out. The role of I^{131} in thyroid metabolism and treatment and the future of such tracer elements as C^{14} are discussed. It is noted that the use of these isotopes is being given as much encouragement as possible. NSA 3-264

10269

THE RADIATION HAZARDS OF RADIOTHERAPEUTIC STAFF. John R. Nuttall. Brit. J. Radiology 23, 35-40 (1950) Jan.

The subject of protection from ionizing radiations is discussed from the point of view of the radiologist. The

three main causes of skin damage from radiation are: repeated exposure of the hands to a beam of x-rays, such as that encountered in removing foreign bodies or setting fractures under a fluorescent screen, handling radium containers, and contamination from radon. The changes in the skin are described and consist of erythema around the nail beds, followed by hardening and cracking of the nails and the skin, and necrotization, the production of cancer usually occurs in the region of the most severe radiation damage, but the author has seen multiple lesions of the face of workers with serious hand damages. The hematopoietic effects and the radiation effects on the reproductive organs are outlined and presented. The author concludes that the hematopoietic changes remain the major danger to the radiological workers, the observed higher incidence of leukemia in radiologists indicating this, reduction of the dosage to the gonads is also concluded to be one of the major objects of radiation protection. The actual danger to the operator should be weighed against the usefulness of the form of treatment proposed. NSA 4-1856

10270

CLINICAL RADIATION DOSAGE. III. A BIOLOGICAL FACTOR IN RADON AND ISOTOPE DOSAGE. Lionel Cohen. *Brit. J. Radiology* **23**, 25-7(1950) Jan.

It has been shown that when relatively short-lived radioactive sources are used in therapy, there is a critical interval of time during which the biological efficacy is approaching a maximum; clinical dosage prescriptions must be calculated for this critical interval, doses based on longer or shorter time intervals are considered likely to prove excessive. A formula is given whereby the critical biological interval can be determined for isotopes having various half-lives, a nomogram relates tissue tolerance and cancer lethal doses to the half-life of the γ ray source used. It is suggested that permanent implants of moderately long-lived sources may have certain clinical advantages. NSA 4-1865

10271

RADIATION EXPOSURE OF PERSONNEL HANDLING THE MONEL METAL NASOPHARYNGEAL RADIUM APPLICATOR. Henry J. Rubin, Barney M. Kully, and Raymond D. Finkle. *Ann. Otol., Rhinol. and Laryngol.* **59**, 90-101 (1950) Mar.

In a carefully monitored series of treatments with the 50-mg Monel metals nasopharyngeal radium applicator, total-body irradiation did not exceed 6 mr/treatment for the physician and assistant, the tolerance dose for the whole body is 300 mr/week. The average exposure of the entire length of both index fingers of the physician was 26 mr, and of several finger tips 50 mr/treatment, 600 mr/week has been tentatively adopted as the permissible exposure for hands and fingers. The maximum number of treatments which one physician may administer weekly by the technique described is 12. The results suggest that generally accepted recommendations as to the number of treatments physicians may administer without endangering themselves are too high for safety, lead shields or other accessories for the radium applicator or modifications in its construction might reduce the dose delivered to the physician's finger tips and thereby permit a larger number of treatments. The authors conclude that if the technique of any physician differs appreciably from the one described, it should be monitored to ascertain the number of treatments he may administer by his method without exceeding tolerance. 18 references. EXHAUST VENTILATION ON MACHINE TOOLS USED ON MATERIALS OF HIGH TOXICITY. H. F. Schulte,

E. C. Hyatt, and F. S. Smith, Jr. [nd] Decl. Oct. 5, 1951. 9p. (AEC-3253, LADC-1040)

The following approximate concentrations ($\mu\text{g}/\text{m}^3$ of air) are the maximum permitted in Los Alamos machining operations; natural U, 50 ($3 \times 10^{-3} \mu\text{g}/\text{m}^3$), enriched U, 0.2 to 1.0 ($3 \times 10^{-5} \mu\text{g}/\text{m}^3$), Th, 100 ($3 \times 10^{-5} \mu\text{g}/\text{m}^3$), Be, 2, Tl, 150; Pb, 150. In addition to toxicity, conditions which must be considered in designing ventilating hoods are recoverability of material, pyrophoric danger, physical properties of metals and oxides, nature of operations, and ease of decontamination. Hoods for an enriched-U lathe, milling machine, index mill, shaper, power hack saw, handwork, break press, Be lathe, and Be grinder are illustrated. Data on ventilation and air concentrations are tabulated. NSA 5-6740

BIOLOGICAL STUDIES WITH ARSENIC⁷⁶. III THE EFFECT OF ARSENIC⁷⁶ UPON THE CLINICAL COURSE OF PATIENTS WITH TUMORS OF THE HEMATOPOIETIC TISSUES. Matthew Block, Leon O. Jacobson, and William Neal. nd. 25p. (AECU-533, UAC-108)

Twenty-four patients with tumors of the hematopoietic tissues, 2 with polycythemia rubra vera, and 1 with metastatic carcinomas have been treated with intravenous injections of radioarsenic (As^{76}). Since both arsenic and irradiation have been used independently in the treatment of tumors of the hematopoietic tissues it was thought that it might be advantageous to utilize radioarsenic (As^{76}), a substance that is metabolized like stable arsenic, exerts a similar chemotherapeutic effect, and is, at the same time, a source of radiation. In this way it might be possible to benefit the patient by simultaneous chemotherapy and radiation therapy. Results are described in each case. Considering various uncontrolled factors such as previous therapy, duration of the disease, supplemental therapy, rest, psychic factors, etc., this radio-

isotope appeared to offer no advantages over the types of therapy already in use for these conditions. 27 references. NSA 3-1842

ABSORPTION AND EXCRETION OF CARBON 14 AS CO_2 AND BICARBONATE. Austin M. Brues and Agnes Naranjo. nd. 1p (AECU-509, UAC-45)

This document is in abstract form, it is reproduced below in its entirety. As shown previously, the mouse exposed to $C^{14}O_2$ in a closed system rapidly attains a steady state in which the C^{14} in the animal approximates the amount originally in a volume of air ten times the volume of the mouse. This labile carbon compartment appears to be somewhat greater than the inorganic body carbon, excluding bone carbonate. Excretion rates after a 30-min. confinement period show a small portion of the body C^{14} to be in somewhat more stable combination. Because of the great rapidity of absorption of $C^{14}O_2$, we have measured the clearance of the tracer gas from air breathed through a tracheal cannula by rats under Nembutal anesthesia. Incidentally, the expired air contains less than one-half the $C^{14}O_2$ concentration of the inspired air, although the CO_2 concentration is naturally much higher. To make conditions as favorable as possible for fixation of C^{14} , mice were injected with labelled sodium bicarbonate and allowed to rebreathe expired air for 10 hr in a 20-liter chamber. Various tissues were analyzed at intervals up to 2 months after removal. It is estimated that less than 2% of the body carbon had exchanged with blood bicarbonate at the end of exposure. Of this retained carbon, about 90% was lost within a week, beyond this time the rate of loss was relatively slow. Newborn mice receiving C^{14} by exposure of their mothers prior to delivery lose C^{14} much more slowly than adult mice, but the specific activity of their body carbon decreases rapidly due to growth. THE ACCUMULATION OF RADIOACTIVE IODIDE BY THE THYROID GLAND IN NORMAL AND THYROTOXIC SUBJECTS AND THE EFFECT OF THIOCYANATE ON ITS DISCHARGE. M. Stanley and E. Astwood. Endocrinology 42, 107-123(1948).

After the administration of anti-thyroid medication, thyroid hormone synthesis was also almost completely inhibited, but the human thyroid gland was still able to collect appreciable quantities of radioactive iodine. After administration of thiocyanate or large quantities of

ordinary iodine the collected iodine was promptly, although not completely discharged from the thyroid gland. The uptake of radioactive iodine in thyrotoxic patients was much greater than normal, and the rate of discharge was more rapid after administration of thiocyanate or normal iodide. NSA 1-249

EXPERIMENTS ON THE DISPOSITION OF ACUTELY INHALED $C^{14}O_2$. Austin M. Brues and Agnes N. Stroud (Argonne National Lab., Lemont, Ill.). J. Natl. Cancer Inst. 15, 1071-6(1955) Feb.

Clearance of $C^{14}O_2$ from air into the blood of rats and mice proceeds with almost theoretical efficiency. Calculated rates of passage of alveolar CO_2 into the blood are $24 \mu M$ per minute in the mouse and $160 \mu M$ per minute in the rat. Uptake of C^{14} is essentially unaffected by the CO_2 concentration of inhaled air. Passage of C^{14} from the bicarbonate compartments into inner compartments proceed at a somewhat slower rate: $10 \mu M$ per minute in the mouse and $80 \mu M$ per minute in the rat. At the end of a 45-minute exposure, the specific activity of venous blood is 55 to 60 percent that of alveolar air. After a 45-minute exposure, one half of the absorbed C^{14} in the mouse and one third in the rat, have passed through the bicarbonate pool into inner compartments. These include bone carbonate and both alcohol-soluble and alcohol-insoluble organic compounds in tissue. (Auth) NSA 9-2611

Tennessee Univ.
AGRICULTURAL RESEARCH PROGRAM. SEMI-ANNUAL PROGRESS REPORT FOR JULY 1 TO DECEMBER 31, 1953. Apr. 1954. 114p. Contract AT-40-1-GEN-242. (ORO-110)

Data are presented which indicate that Sr^{90} and Ca^{45} were exchanged into bone and absorbed from the digestive tract to the same degree. However, ingested Ca^{45} was preferentially secreted into the milk of dairy cows by a factor of 6 to 10 over Sr^{90} . Also, dietary Ca was preferentially utilized for new bone formation in rats by a factor of 3 over Sr^{90} . Fecal excretion of Ca^{45} varied from 3% of the ingested dose in 10-day-old calves to 83% in aged cattle. The daily fecal endogenous Ca was in the range of 14 to 21 mg/kg of body weight for 30-day-old to aged cattle. The use of these methods is described for estimation of the maintenance requirement and true availability of Ca in various feeds. From Ca^{45} distribution results, it was estimated that in 6-month-old cattle, the percent of exchangeable bone Ca was somewhere between 9 and 60 whereas in aged cattle the value fell somewhere between 2 and 5. Estradiol administered to lambs was shown to increase the length of trabecular bone and also the amount of medullary bone. Mass spectrographic analysis of blood and milk Ca showed that there was no isotope effect in the secretion of Ca from blood to milk. Paper electrophoresis of Ca^{45} -labeled blood showed that all Ca in blood serum migrated as Ca ion. Similar studies on milk revealed the presence of large amounts of protein-bound or other colloidal Ca which exchanged only slowly with ionized Ca. In addition to the usual effects of Protamone on milk production, it was shown that this substance decreases the ability of the cow's thyroid to pick up I^{131} , of particular interest was the rapid return to normal of the thyroid function shortly after Protamone feeding was stopped. Data are tabulated on the clinical and pathological response of burros subjected to daily dosages until death of whole-body γ radiation at the following levels: 400 r/day, 200 r/day, 100 r/day, 50 r/day and 25 r/day. Specific reports are included which discuss the suppression of the gonadotropin principles by whole-body irradiation of the rabbit. Also presented are data which demonstrate the alteration

of thyroid function and the reduction of serum alkaline phosphatase by whole body irradiation of the burro. (For preceding period see ORO-98.) (auth) NSA 8-2735

PULMONARY PENETRATION OF PARTICLES ADMINISTERED BY INTERACHEAL INSUFFLATION. Herman Cember, Theodore F. Hatch, Joseph A. Watson, and Thomas B. Grucci (Univ. of Pittsburgh, Penna.). *Arch. Ind. Hyg. Occupational Med.* 10, 124-9(1954) Aug.

Radioactive barium sulfate particles were administered intratracheally to rats in order to study the pulmonary penetration and distribution of particles. Autoradiographs made from lung sections showed that, although the particles were generally distributed in all the lobes of the lungs, the distribution was not uniform. The radioactive particles were found in irregularly shaped areas throughout all parts of the lungs. Retention data showed that about 40% of the material inside the syringe actually was deposited in the deep respiratory tract. The method of intratracheal insufflation directly through the pharynx may therefore be considered useful for the investigation of particulates in the lungs. NSA 8-640

STUDIES OF THE METABOLISM OF GALLIUM. II. H. C. Dudley, J. I. Munn, and Katherine E. Henry. *J. Pharmacol. Exptl. Therap.* 98, 105-10(1950) Jan. (See also NSA 3-1179)

Radiogallium (Ga^{72}) with a specific activity of 0.11-0.12 mc/mg was injected subcutaneously as gallium citrate 20 mg amounts into a series of 12 rats in order to determine the distribution of the gallium. Similar experiments were performed with rabbits and dogs, in rabbits the excretion of the isotope was also investigated. It was found that in the rat, rabbit, and dog only bone and the kidneys receive large amounts of the element. Following the subcutaneous injection of the element as citrate, the rabbit excretes 30-55% of the total dose in the urine within 16 hr, while the osteoid structures absorb an additional 30-48% within this time. Definite amounts are also excreted into the stomach and intestines by the gastrointestinal mucosa, the contents of the tract contain 1-2% of the subcutaneous dose within 12-18 hr after injection. Naval Medical Research Inst., Bethesda
EFFECTS OF INJECTION OF RADIOGALLIUM (Ga^{72}).
H. C. Dudley, L. J. Louviere, and J. C. Shaw Sept.
15, 1951. 11p (NP-3509)

Radiogallium (Ga^{72}) citrate has been administered to five species of animals. The toxicity of the carrier gallium limits the radiation dosage of Ga^{72} so that the only effect of radiation observed was transitory reduction of leucocytes. A reduction of total leucocytes in the mouse, rabbit, and guinea pig have been produced at dosages of 2.3 to 9.0 mc of Ga^{72} /kg. The degree and duration of the leukopenia varies with the dose and species. Repeated injection of dogs and rabbits with gallium citrate indicates that this element is a cumulative poison for which these species cannot develop a tolerance. Subacute doses repeated twice weekly produced lethal results within four weeks. The final injection produced the typical results of an acutely toxic dose. In the dog, repeated injections of gallium citrate produced an exfoliating dermatitis which may appear several weeks after stoppage of the injections. Methods for the estimation of both total body radiation and individual tissue dose, as delivered by Ga^{72} citrate, are given. The total body irradiation (in roentgens) for man is estimated to be $D(\beta\gamma) = 86$ mc of Ga^{72} /kg of body weight. (auth) NSA 6-527

DEPOSITION OF RADIOGALLIUM (Ga^{72}) IN PROLIFERATING TISSUES. H. C. Dudley, G. W. Imire, Jr., and J. T. Istock. Radiology 55, 571-8(1950) Oct.

Radiogallium, Ga^{72} , has been shown to concentrate at areas of osteogenic activity, i.e., the epiphyseal junction and the callus of healing fractures in rabbits, and in osteogenic sarcoma of the mouse. In certain fibroadenomas, fibrosarcomas, and mixed mammary tumor of animals, no significant localization of Ga^{72} occurred. Autoradiographic studies of the deposition of Ga^{72} in bone, by impregnation of bone sections with liquid photographic emulsion, has made possible more detailed localization of this element. It is suggested that radiogallium citrate is worthy of clinical trials in tracer amounts for diagnostic purposes and at higher levels for possible therapeutic effect. (auth) NSA 5-329

TOXICITY OF TRITIUM OXIDE TO MICE. Austin M. Brues, Agnes N. Stroud, and Leola Rietz. Proc. Soc. Exptl. Biol. Med. 79, 174-6(1952) Jan.

A 30-day median lethal dose of H_2^3O for CF No. 1 female mice is about 1 mc per g body weight when given in a single injection. The estimated radiation dosage is about 800 rep in the first 3 days and about 1000 rep in the first 12 days after injection. It is concluded that no unexpected factor of biological effectiveness exists for tritium β rays in relation to x or γ rays (auth) NSA 6-1979

INFLUENCE OF VITAMIN D ON DEPOSITION OF GALLIUM IN BONE. H. C. Dudley and Leo Friedman. July 9, 1951. 7p (NP-3727, Memorandum Report 51-9).

Radiogallium (Ga^{72}) citrate when parenterally injected is deposited in the bones of both normal and rachitic rats. The age and body weight do not significantly affect the uptake of gallium, nor does the oral administration of vitamin D to rats on an adequate diet. Vitamin D orally administered to rachitic rats serves to increase the deposition of gallium in the ends of the long bones (epiphyseal region). Such deposition seems to be a result of normal increased metabolism rather than as a direct result of the vitamin D. Gallium does not seem to offer a reliable indication of vitamin D dosage. AUTORADIOGRAPHIC VISUALIZATION OF S^{35} INCORPORATION AND TURNOVER BY THE MUCOUS GLANDS OF THE GASTROINTESTINAL TRACT AND OTHER SOFT TISSUES OF RAT AND HAMSTER. Leonard F. Belanger (Univ. of Ottawa, Canada). Anat. Record 118, 755-71 (1954) Apr.

Following a subcutaneous injection of S^{35} -labeled H_2SO_4 , the radiosulfur has been localized by autoradiography to various tissues and organs, with a large range of relative radioactivity. The mineralizing tissues and the mucous glands have exhibited the largest synthesis, with the exception of the surface cells of the stomach and the Brunner glands of the duodenum which do not seem to pick up radiosulfur. The mast cells of connective tissue and all areas rich in collagen have taken in radiosulfur. The region of the basement membrane in the gastrointestinal tract and genito-urinary system have also shown evidence of sulfate fixation. The medulla of the kidney and the megakaryocytes of the spleen have also given positive S^{35} autoradiographs. All these localizations seem related to the building up and concentration of sulfopolysaccharides and stain metachromatically with toluidine blue. The radiosulfur has disappeared within two days from all mucous glands except from the olfactory mucosa. The connective tissue seems to have lost most of its organic bound sulfate at the end of that period with the exception of the mast cells which were still strongly positive after 4 days. NSA 8-4494

CHANGES IN THE SERUM LIPIDS OF RABBITS WITH ACUTE URANYL NITRATE POISONING. Frederick C. Bauer, Jr., Grant C. Johnson, Lynn Carbonaro, and Edwin F. Hirsch. Arch. Path. 51, 441-5(1951) Apr.

Uranyl nitrate poisoning in rabbits was associated with transient azotemia and lipemia of 2 to 3 weeks' duration. All lipids participated in this increase, but the greatest increase was in the neutral fat fraction. The nonprotein N returned to near the control level several days before the lipids. The significance of these results with other forms of nephritis is discussed. NSA 5-3856

Naval Medical Research Institute.
STUDIES OF THE ACUTE TOXICITY OF GALLIUM. Horace C. Dudley and Milton D. Levine. Jan. 13, 1949. 13p. (NM-011-013-Report No. 3)

Rats exposed to aerosols of gallium chloride were effected but slightly in concentrations of 0.125 μg Ga/liter of air in exposures of from one-half to four hours. The acidity of the solution (pH 2.2) of both gallium chloride and the sodium chloride controls produced the effects noted. The minimum lethal doses (LD₅₀) of gallium lactate for rats and rabbits is as follows:

Rats	Intravenous injection	46 mg Ga/kg
	Subcutaneous injecting	121 mg Ga/kg
Rabbits	Intravenous injection	43 mg Ga/kg
	Subcutaneous injection	97 mg Ga/kg

The distribution of gallium in animals receiving injected gallium lactate varies with time, the kidneys initially containing the greatest amount, followed by bone, liver, spleen, muscle, etc. The concentration of gallium falls off rapidly in all tissues except bone, in which the gallium

is fixed, and is given up slowly over a period of months. The symptoms resulting from lethal and near-lethal injections of gallium salts may include rapid loss of weight, hyperexcitability, and in some cases photophobia, blindness and terminal flaccid paralysis. NSA 3-217

STUDIES OF THE METABOLISM OF GALLIUM. Horace C. Dudley, George E. Maddox, and Herbert C. LaRue. Naval Medical Research Institute NM-011-013 Report No. 4. Jan. 25, 1949. 12p.

The excretion of gallium is predominantly via the urine, with 85 per cent or more of a near-toxic dose retained in the rabbit more than 10 days. Retention in the liver and kidneys of the rat is moderate for up to 30 days, while bone retains large concentrations of the element for 90 days and longer. Gallium is transported wholly by the plasma, the initial concentration dropping rapidly so that at the end of 24 hr a concentration of less than $1 \mu\text{g Ga/ml}$ is reached. Formed elements show no significant change. It is postulated that gallium may offer a new approach to the study of bone metabolism. Gallium seems to act as a neuromuscular poison. NSA 3-218

STUDIES ON THE TOXIC ACTION OF GALLIUM. H. C. Dudley, Katherine E. Henry, and B. F. Lindsley. J. Pharmacol. Exptl. Therap. 98, 409-17(1950) Apr.

In order that radiogallium studies may be properly evaluated, work on the toxicity of gallium, including the effects of injected gallium lactate on larger animals, the toxic action of gallium citrate on many different species of animals, and the changes in blood and urine of rabbits receiving toxic doses of gallium citrate was instituted. The experiments are briefly described and some of the results are tabulated, the authors conclude that: gallium lactate is much more toxic on a mg/kg basis for larger animals than for smaller ones, gallium citrate is more suitable as a means of administering soluble gallium to experimental animals than gallium lactate, gallium citrate is not absorbed by the gastrointestinal tract and produced no significant effect when fed to rats for 13 weeks, the toxicity in terms of LD_{50} in ten days of gallium citrate, expressed in mg/kg body weight, was found to be 600 for mice, 220 to 240 for small rats (50 to 100 g), 100 for larger rats (200 to 300 g), 45 for 2.0 to 2.5 kg rabbits, and 10 to 15 for goats and dogs, blood and urine analyses showed that toxic doses of gallium citrate in the rabbit induced marked kidney changes followed by albuminuria and glycosuria, an increase in blood urea nitrogen and nonprotein nitrogen, and an uncompensated acidosis with significant changes in the serum sodium and potassium levels. DEPOSITION OF RADIO GALLIUM (Ga^{72}) IN SKELETAL TISSUES. H. C. Dudley and G. E. Maddox. J. Pharmacol. and Exptl. Therap. 96, 224-7(1949) July (See also NSA 2-68).

The results of a radioautographic study of the distribution of Ga in the skeletal tissues of the rabbit and dog following injections of non-toxic doses of radio-gallium (Ga^{72}) are presented. The radio-gallium was injected as the lactate or citrate into the animals at a dosage level of 0.5 mc/kg of body weight, the animals were sacrificed 12 hr after the injections, and the bones were removed, cleaned of adhering tissue, mounted in dental stone, sectioned, and placed on emulsion x-ray film. The radioautographs show that in young animals the Ga is selectively deposited in the areas of greatest osteogenic activity (the epiphyseal line); in adult animals there is also a deposition in this general area, but it takes place in a more diffuse manner throughout the trabecular bone. The most significant finding is the rapidity of deposition of the Ga. NSA 3-1179

BONE CARBONATE TURNOVER. Donald L. Buchanan and Akira Nakao. Jan. 1952. 31p. (AECU-1867; UAC-499)

The effects of age, growth, body size, duration of exposure, and ambient CO_2 concentration on bone carbonate turnover were studied in mice and rats. Results indicate that the carbonate of new bone forming in infant mice arises wholly or largely by incorporation of soluble inorganic C into the precipitating bone salt, approximately 30% of the carbonate in the bone of fully grown animals exchanges quite rapidly with the soluble carbonate system whereas approximately 40% exchanges very slowly, turnover rates in the adult are largely determined by the physical and chemical properties of bone salt, growth of bone stimulates the turnover of bone carbonate out of all proportion to the net increase in bone mass, and long term retention of isotopic carbonate in the entire skeleton of mice is approximately proportional to the duration of the exposure regardless of the age of the animal when exposed. On the basis of the data presented it was concluded that adult or growing mammals can exist continuously and indefinitely in an atmosphere which contains as much as $49 \mu\text{c of } C^{14}O_2$ per cubic meter of air and yet never exceeds a radiation dose rate to bone of 0.3 repper per week. PERMEABILITY OF EXCISED MOUSE, RAT, AND HUMAN SKIN TO GASEOUS TRITIUM. Chester W. DeLong, Roy C. Thompson, and Harry A. Kornberg (General Electric Co., Richland, Wash.) Radiation Research 1, 214-17(1954) Apr.

The percutaneous absorption of tritium gas was studied using excised skin from mice, rats, and man. In terms of μc tritium absorbed/ $\text{cm}^2/\text{min}/\mu\text{c}$ tritium/ cm^3 atmospheres, absorption rates found were, for mice $(254 \pm 44) \times 10^{-4}$, for rats, $(207 \pm 26) \times 10^{-6}$, and for man, $(72 \pm 16) \times 10^{-6}$. Although there is considerable uncertainty as to the applicability of these figures to intact animals, the relative permeability of human, rat and mouse skins should be useful in the extrapolation of animal data to humans. Approximately 50% of ingested Zn^{65} is absorbed from the gastrointestinal tract of mature rats as judged from ratios of urinary to fecal excretion of the radioisotope during and following a period of chronic feeding. Tissues attaining the highest concentrations of Zn^{65} , during 200 days of chronic administration, were bone and dorso-lateral prostate. The MPC calculated for bone as critical organ was $1.4 \times 10^{-2} \mu\text{c}/\text{ml}$. Based on prostate as critical organ, the calculated MPC is $3 \times 10^{-3} \mu\text{c}/\text{ml}$. The 24-hr retention of Zn^{65} absorbed from the gastrointestinal tract of very young rats was as much as 5.5 times the adult level. (auth) NSA 14-468

DISTRIBUTION OF GALLIUM IN MAN, AUTOPSY EVIDENCE. Marshall Brucer. Paper presented at the American Society for Pharmacology and Experimental Therapeutics Fall Meeting, Boston, Nov. 13-15, 1950.

An abstract of this paper appeared in J. Pharmacol. Exptl. Therap. 101, 4-5(1951) Jan. and is reproduced here in its entirety.

One 14-yr-old patient with osteogenic sarcoma (primary removed) metastatic to the lungs was given 50 mc of Ga^{72} in 375 mg of stable Ga as a gallium citrate complex. It was administered intravenously in divided doses of 5 to 15 mc at 4-day intervals. At autopsy the distribution in 38 types of tissue was found relatively uniform. Only in kidney, liver, and bone was there increased retention of Ga^{72} . All metastatic nodules sampled showed greater activity per gram than did any normal organ. One 68-yr-old patient with multiple myeloma received intravenously 178 mc of Ga^{72} in 681 mg of stable Ga in the citrate complex. The doses of 4-day intervals ranged from 20 to 50 mc each. On autopsy, the marrow, cortical bone, liver, kidney, and spleen showed the greatest retention of Ga^{72} . There was no normal bone, but the greater relative distribution in areas of increasing myeloma activity was shown by autoradiograms.

THE USE OF RADIOISOTOPES OF COPPER AND MOLYBDENUM IN NUTRITIONAL STUDIES. C. L. Comar. In Copper Metabolism, A Symposium On Animal, Plant, and Soil Relationships. Wm. McElroy and D. Glass, eds. Baltimore. The Johns Hopkins Press, 1950. p.191-215.

After a discussion of availability of isotopes, methods of measuring radioactivity, and preparation of samples for solution measurement, the author gives a detailed summary of previously reported nutritional studies using Cu^{64} and Mo^{99} which have been performed by himself and others on animals. An over-all picture has been obtained of the behavior of Cu in the animal body. The high points are the poor absorption of ingested Cu, the entrance of Cu into the hematopoietic centers, the liver storage of this element, the nature of the equilibrium between red blood cell and plasma Cu, the mucosal accumulation of Cu, and the increased liver storage of Cu by very young individuals. Through the use of Cu^{64} , Mo^{99} , and P^{32} the physiological interrelationships of these elements have

been studied, certain possible mechanisms have been ruled out and others are suggested. NSA 5-3875

TIME AND SITE STUDY FOR OPTIMUM LYMPH NODE CONCENTRATION OF RADIOGOLD FOLLOWING INTRA-BRONCHIAL INJECTION. Harold F. Berg, William M. Christopherson, and J. Ray Bryant (Univ. of Louisville School of Medicine, Kentucky). Cancer Research 14, 775-9(1954) Dec.

Colloidal Au¹⁹⁸ was injected into the bronchial mucosa of dogs in an attempt to determine the rapidity of concentration within the regional lymph nodes and the site of injection for optimum concentration within the nodes. Specimens of the regional lymph nodes and viscera were measured for radioactivity. Histologic sections and autoradiographs were examined and compared with those from a group of animals receiving a similar dosage of Au¹⁹⁸ and sacrificed in from 1 to 5 weeks. Colloidal radiogold of this particle size concentrated within the regional lymph nodes well within the effective activity range of the isotope. Radioactivity was concentrated in the lymph nodes and was not distributed in any appreciable amount to other organs. The most effective site of injection within the bronchial tree was found to be the most dependent accessible site within the bronchus. Radiation necrosis within the lymph nodes had a patchy distribution when small doses of Au¹⁹⁸ were used. This distribution was confirmed by autoradiographs. (auth) NSA 9-1457

THE METABOLISM OF ¹³²TELLURIUM-IODINE MIXTURE IN MAMMALS. D. W. H. Barnes, G. B. Cook, G. E. Harrison, J. F. Loutit, and W. H. A. Raymond. J. Nuclear Energy 1, 218-30(1955) Feb.

Te¹³²-I¹³² has been given in 0.1N acid orally to guinea pigs and rats. The absorption from the gut is greater in the rat. The rat also retains more tellurium, in virtue of its concentration in the blood. In the rat, but not in the guinea pig, rabbit, or mouse, the red corpuscles take up tellurium and bind it to intracorpuseular protein, presumably hemoglobin. Thus tellurium may provide a useful marker for the red cells in physiological studies on the rat (auth) NSA 9-3754

IRON METABOLISM. UTILIZATION OF INTRAVENOUS RADIOACTIVE IRON. Clement A. Finch, John G. Gibson, Wendell C. Peacock, and Rex G. Fluharty. Blood 4, 905-27(1949) Aug.

Studies to determine the dynamic relationship between storage and circulating iron in normal subjects and in patients with a variety of hematologic disorders through the use of radiation iron (Fe⁵⁵ and Fe⁵⁹) are reported. When single tracer doses of radio-iron were given intravenously to human subjects, it was observed that the radio-iron rapidly entered the hemoglobin cycle and tagged erythrocytes began to appear in the circulation within 24 hours, the radioactivity of the circulating red cells continued to rise up to two weeks after the injections. Radio-iron Fe⁵⁵ was usually given and in sufficient concentration to produce 1,000,000 counts/min in each case, patients with Fe deficiency, hemochromatosis, refractory anemia, uremia, infections, hemolytic anemia, pernicious anemia, malaria, malignancies, hepatitis disease, endocrinological disease or polycythemia were the subjects chosen and the results were compared against those obtained from normal

subjects. The internal Fe metabolism was measured by determining the percentage utilization of the intravenously administered radio-iron for hemoglobin production over a period of two to three weeks. It was found that in Fe depletion cases more complete and rapid utilization of the radio-iron occurred, states of Fe excess, such as hemochromatosis displayed profound depression of radio-iron utilization. The rate of erythropoiesis was estimated by the slope of the utilization curve, and evidence of abnormal red cell destruction was found in cases showing an early and abrupt plateau of the utilization curve. A correlation is made between the radio-iron utilization and the clinical factors of the hematological disorders studied. 24 references. NSA 3-1325

BIOLOGICAL STUDIES WITH POLONIUM, PLUTONIUM, AND RADIUM. PART III, CHAPTER 1. TOXICITY OF POLONIUM, PLUTONIUM, AND RADIUM IN RATS. Edited by Robert M. Fink. Jan. 1, 1947. Decl. May 18, 1949. 132p. For publication in NNES. (AECD-2593)

Pilot studies on polonium, plutonium, and radium to determine the 20-day LD₅₀ were made. Polonium dosages ranged from 50 to 170 microcuries per kilogram, plutonium dosages ranged from 18.5 to 185 microcuries per kilogram, and radium dosages ranged from 17 to 8000 microcuries per kilogram. In general, there were two to three animals at each dosage level. The 20-day LD₅₀ dosage values in terms of microcuries per kilogram for polonium, plutonium, and purified radium (polonium at approximately 0.07% of equilibrium value) were found to be approximately 50, 130, and 4000 microcuries per kilogram, respectively. The microcurie toxicities relative to purified radium as defined by the ratio of the 20-day LD₅₀s were approximately 93 and 32 for polonium, and plutonium, respectively. A radium preparation estimated to contain about 2 microcuries of polonium per 1000 microcuries of radium appeared to be about two to four times as toxic as the above purified radium in the period of 40 to 100 days after injection. The weights seemed to be the best clinical criterion of the condition of the rat. In general, as the dosages increased the rate of weight loss increased. Pathology studies were made on some of the animals at death. Polonium produced changes in the hematopoietic system at all dosage levels used. These changes were marked atrophy of lymphoid elements in the spleen and lymph nodes and marked depression of cellular elements in the marrow. Visceral engorgement was a constant finding. Liver changes were unimpressive. The changes in the 50 microcuries per kilogram range suggest a lesser degree of toxicity than higher levels. The changes with 140 to 170 microcuries per kilogram were not quantitatively different. Visceral hyperemia was inconsistent with x-radiation effects. Radium caused changes in the hematopoietic system, liver, kidney, bowel, bone, testes, aorta, and coronary arteries. The changes in the hematopoietic system bone, testes, and bowel were compatible with x-radiation effects. Liver, renal, and vascular effects were unlike changes produced by x-radiation. Plutonium produced damage to the hematopoietic system, bone liver, testis, and kidney similar to x-radiation. Testes may be less sensitive in comparison with other tissues than it is in high voltage x-radiation experiments. 47 references. NSA 3-17

OBSERVATIONS ON THE FIXATION IN VITRO OF URANIUM TO SECTIONS OF BONE. R. Amprino. *Experientia* 9, 291-3(1953) Aug. 15. (In English).

Preliminary results are reported of an autoradiographic study of sections of whole fresh bone, bone fixed in ethanol or formalin, and bone freed of its organic components which had been treated with 0.1% uranyl nitrate in a 0.025N buffer of NaHCO₃. The distribution of U is qualitatively the same as that of Ca⁴⁵, but the differential uptake in recent as compared to old bone tissue is much greater for Ca⁴⁵ than for U. Removal of the organic components increases the ability of bone tissue to fix U. The U partially replaces Ca⁴⁵ previously fixed but causes no change in the relative distribution of Ca⁴⁵. Concurrent fixation of Ca⁴⁵ and U takes place, and sections treated with U can still fix a remarkable amount of Ca⁴⁵. Nearly all the U can be removed by treatment with 0.025N NaHCO₃ or Na₂CO₃, by glycol ashing or microincineration at 700°C, or by decalcification with dilute HNO₃. No removal of U occurs on treatment with 0.025N NaCl or Na phosphate solutions. (G. Y.) NSA 7-5911

INFLUENCE OF PARATHYROID EXTRACT, CORTISONE AND DIENESTROL DIACETATE ON METABOLISM OF CESIUM IN RATS. F. Mraz, Marie LeNoir, J. Pmajian, and H. Patrick (U. S. Atomic Energy Commission Agricultural Research Program, Oak Ridge, Tenn.). Arch. Biochem. Biophys. 63, 73-6(1956) July.

The effects of parathyroid extract, cortisone, and dienestrol diacetate on cesium extraction in rats, were studied. Parathyroid increases urine flow and decreases Cs excretion by the kidneys, 100 mg cortisone increases excretion but 50 mg decreases excretion. Dienestrol diacetate increases Cs retention by muscle, femur, liver, kidney, and spleen. (F. S.) NSA 10-9911

BIOLOGICAL STUDIES WITH POLONIUM, PLUTONIUM, AND RADIUM. PART III, CHAPTER 2. TOXICITY OF POLONIUM, PLUTONIUM, AND RADIUM IN RATS.

Edited by Robert M. Fink. Jan. 1, 1947. Decl. May 18, 1949. 172p. For publication in NNES. (AECD-2605)

Comparative lethal dosage studies of radium, plutonium, and polonium in rats were made to determine the relative toxicities of plutonium, polonium, and radium. Clinical observations, gross and microscopic pathological studies, and hematological studies were made. At death the rats were analyzed for total polonium and radium in their bodies. The retention of plutonium was not determined. NSA 3-15

Rats and mice were exposed to C¹⁴O₂ via a tracheal cannula attached to a 2-way valve permitting collection of

expired air samples. Both species clear over 50% of inhaled air of $C^{14}O_2$, suggesting that rapidly exchanging C compartment is composed of two portions of which only one is in direct equilibrium with alveolar air. Rate of loss is much slower than rate of uptake and rates are almost independent of CO_2 content of inhaled air.

THE EFFECTS OF URANIUM DIOXIDE POWDER APPLIED SUBCUTANEOUSLY THROUGH AN INCISION IN THE SKIN OF RABBITS. Roberta Allen. May 23, 1949. Decl. Oct. 4, 1949. 7p. (AECD-2709)

Insoluble UO_2 was applied in incisions made under the skin of 4 rabbits to determine its effect on wound healing and the extent, if any, of its systemic absorption. The animals, as compared with 3 controls (incision only), were observed for a month for local and systemic changes and finally, an analysis of the skin area was made to determine the amount of uranium remaining at the site of application. The normal course of wound healing was not altered by the administration of as much as 40 mg of UO_2 Powder to a 3 cm incision, nor was uranium absorbed to any significant degree from its site of application. THE DISTRIBUTION AND EXCRETION OF A SOLUBLE BERYLLIUM COMPOUND USING Be^7 AS A TRACER. Roberta Allen, Geraldine Bonner, and Arnold Sparks, William Neuman, James K. Scott, and George Kosel June 2, 1948, decl. July 9, 1948. 22p. For oral presentation; and will also be for publication in Journal of Pharmacology and Experimental Therapeutics. (AECD-2104, UR-35)

Beryllium sulphate containing Be^7 was administered to rats, rabbits, and guinea pigs by different routes. Later the animals were dissected and the beryllium content of the organs determined. Following intravenous administration approximately 30% was excreted in the urine, 30% was recovered from bone and 30% in liver. There were wide species variations in the distribution and excretion, and the amount of beryllium administered to the animal affected the distribution and excretion. NSA 1-606

INVESTIGATIONS ON THE PROBLEM OF RADIUM POISONING. V. RESULTS OF PHYSICAL MEASUREMENTS IN A CASE OF PROFESSIONAL RADIUM POISONING WITH A FATAL END. Hermann Muth and Hans-Helmut Roth. Strahlentherapie 80, 271-80(1949). (In German).

A chemist working in the radium industry died from continuous exposure to strong γ radiation over a period of 10 yr, he had handled approximately 15, 150 mg of radium (as radium salts) and about 7,200 mg of mesothorium (γ equivalent of radium). Physical measurements of 6 different parts of his body during his life time disclosed a deposit of 3 to 4 mg of radium, measurements taken from his suits and laundry revealed strong radiation. Measurements carried out post mortem determined the radioactive deposits present in 1 g of tissue from the lungs, liver, spleen, kidney, brain, skin,

skeletal muscle, and heart muscle, and the total activity for the different organs was established; the calculated values are shown in two tables. A special pathological difference found in this case as compared with others was the combined existence of aplastic anemia and fibrosis of the lungs. NSA 4-2585

THE EFFECT OF ADDED CARRIER ON THE DISTRIBUTION AND EXCRETION OF SOLUBLE Be^7 . R. R. Allen, G. Bonner, G. E. Kosel, W. F. Neuman, J. K. Scott, and A. F. Sparks. May 11, 1949. 22p. (AECU-294).

A soluble compound of Be^7 only and one to which $BeSO_4$ was added as carrier were administered intravenously to rabbits and rats. The distribution and excretion of the Be^7 was determined by tracer techniques. It was found that when the isotope only was given that the Be^7 was deposited in bone and excreted in the urine. When $BeSO_4$ was injected simultaneously with the isotope appreciable amounts of the Be^7 were found in the liver, spleen and bone marrow in addition to that deposited in the skeleton and excreted in the urine. The rate of clearance of Be^7 from the circulating blood was much more rapid when isotope only was given than when carrier was added to the isotope. The urinary excretion of Be^7 was more rapid when isotope only was injected than when carrier was added. Significant amounts of Be^7 were excreted in the feces when isotope plus carrier was administered. NSA 3-1049

Naval Medical Research Inst., Bethesda
THE URINARY EXCRETION OF GALLIUM. J. I. Munn and H. C. Dudley. Dec. 17, 1951. 20p. (NP-3731, R6279)

A method was devised for the quantitative estimation of Ga^{72} in urine, based on the colorimetric or fluorometric determination of the 8-hydroxyquinoline- Ga^{72} complex formed in a $CHCl_3$ solution containing Ga^{72} extracted from the urine with acidified diethyl ether. Intravenous injection of Ga^{72} -citrate in rabbits and dogs resulted in lower urinary excretion of Ga^{72} than when the animals were given the same doses subcutaneously. Urinary excretion of Ga^{72} during the first 24 hr subsequent to intravenous administration in humans varied from 4 to 78%. No correlation was observed between the clinical manifestations and the rate or amount of Ga^{72} excreted. The studies indicate that in both dogs and man the initial rate of urinary excretion of Ga^{72} is high and that it falls rapidly by 18 hr. Blood- Ga^{72} levels decline quickly after intravenous injection and reach low values within 6 hr. (Published in part in the J. Lab. Clin. Med. 37, 676(1951). (NRS abst.) NSA 6-5538

INCORPORATION OF TRITIUM INTO THE ORGANIC COMPONENTS OF VARIOUS TISSUES OF THE MOUSE. Ernest A. Pinson. Oct. 1952. 17p. (LA-1467)

Two groups of mice were given chronic and acute exposures, respectively, to tritium as HTO in body fluids. Both groups eliminated the tritium from body fluids with an initial half time of 1.6 to 2.0 days. After most of the tritium had been eliminated, the half time for elimination increased to about 12 days as the rate of growth of tritium out of the organic constituents of the body became the limiting factor in the elimination rate. Mice killed when the half time for elimination had lengthened to about 12 days showed a specific activity of tritium in the organic components of tissues which was many times the specific activity of tritium in body water. However, the radiation dose to the mice from the tritium incorporated in the organic constituents was small in comparison with the radiation dose from tritium in body water at levels necessary to induce the activity into the organic components either on chronic or acute exposure. It was concluded that the over-all radiation hazard due to incorporation of tritium into the organic constituents of mice is minor compared to the radiation hazard from tritium in body water. The same is probably true for man. (auth) NSA 7-1036

California. Univ., Los Angeles. Atomic Energy Project. THE DISCRIMINATION OF CALCIUM AND STRONTIUM BY THE KIDNEY. N. S. MacDonald, P. Noyes, and P. C. Lorick. May 31, 1956. 23p. Contract AT-04-1-GEN-12. (UCLA-369)

The skeletal retention and the excretion of Sr were directly compared with those of Ca, by injecting solutions containing both radioisotopes, Ca^{45} and Sr^{90} , into rats and rabbits. In normal animals, a greater fraction of the injected dose of Ca^{45} was retained in the skeleton than was observed for Sr^{90} . In complementary fashion, the fraction of the injected Sr^{90} which appeared in the urine was greater than the fraction of the dose of Ca^{45} which was excreted. However, in rats which were actively calcifying tibial fractures, this difference disappeared. The enhanced accumulation of radioactivity in deposits of new bone possessed the same ratio of Sr^{90} : Ca^{45} as the solution injected. Furthermore, when the functions of the kidneys of normal rabbits were impaired by poisoning with mercuric chloride or completely extinguished by nephrectomy, again the usual differences in Ca^{45} and Sr^{90} deposition in bone tissue disappeared. When plasma containing both Ca^{45} and Sr^{90} was shaken with powdered bone, both radioisotopes were extracted in equivalent amounts. It was concluded that the avidity of bone tissue, per se, for Sr ions is not discernibly different from that for Ca ions. The retention by the skeleton of a larger fraction of an injected quantity of Ca than of simultaneously administered Sr was attributed to a renal discrimination causing a greater relative loss of Sr to the urine. Atomic Energy Project, Univ. of Rochester
THERMAL BURNS FROM THE ATOMIC BOMB. Herman

E. Pearse and Harry D. Kingsley. Apr. 30, 1953. Decl. with deletions June 30, 1953. 43p. (AECD-3532, UR-254)

Primary thermal burns from the explosion of an atomic bomb are caused by brief exposure to intense radiant energy. Gross and microscopic evaluation of burn lesions produced by intense radiant energy from a carbon arc light and burning Mg have been carried out in the laboratory. Since the time of application, the intensity, and the spectrum of applied energy influence the character of the resultant lesion, it was necessary to compare the burns from an atomic bomb explosion to those produced in the laboratory. Experiments using anesthetized pigs and dogs were carried out at atomic bomb explosions and a range of thermal energies from 1.1 to 43 cal/cm² studied in respect to the skin effects. The time of burn production from various portions of the thermal pulse was determined by the use of various electrically operated shutters. The spectral effects of the bomb light were evaluated by the use of limiting filters over the exposed skin and also in front of calorimeters for measuring the energy causing the burns. Preliminary but inconclusive tests were made of the protective effects of certain fabrics. Some observations were obtained regarding the effects of combining ionizing radiation and burns. Sufficient data are obtained from the field to confirm and advance laboratory investigations of this type of burn. (auth) NSA 7-4702

PRELIMINARY STUDIES OF THE TOXICITY OF THORIUM. H. Ackerman, R. P. Allen, G. Bonner, W. L. Downs, H. C. Hodge, E. A. Maynard, W. F. Neuman, J. K. Scott, A. Sparks and H. E. Stokinger. February 26, 1948, decl. September 15, 1948. 44p. Informal disposition. Document for sale by AEC. (AECD-2283, UR-13)

Thorium Nitrate: Acute Toxicity in Rats. Adult albino rats were given various doses intraperitoneally of an aqueous solution of thorium nitrate. The LD50 in 24 hours is of the order of 1770 mg/kg. This represents a low order of toxicity. Toxicity Following Intratracheal Administration. The LD50 of thorium nitrate (24-hour kill) was found to be of the order of 85 mg/kg. A comparable value for thorium dioxide could not be determined, 1000 mg/kg were tolerated apparently without effect for at least four months. In surviving animals studies are underway in which mortality is recorded, periodic lung x-rays are made, and lung pathology is observed in sacrificed animals. No consistent lesions which could be attributed to the thorium compounds were found in any organs other than the lung. Thorium nitrate provoked a peculiar focal coalition of monocytes in the alveolar sacs. Thorium dioxide provoked minimal or no response. Short-Term Feeding Studies of Thorium Nitrate. In a pilot study a few young and two adult rats were fed diets containing very high percentages of thorium nitrate, viz., 10 and 20% for the weanlings, 10% for the adult rats. The weanlings fed 20% died promptly. The weanlings fed 10% grew very little but survived for 11 months. A small scale paired feeding study demonstrated clearly that the weight depression was only partly due to the decreased food consumption. Based on earlier experiments, larger groups of male and female rats were fed diets containing 0, .05, 1, and 10% thorium nitrate. Severe weight reductions and deaths were recorded on the highest dietary percentages. Weanling rats, in groups of 20 males and females each, were placed on diets containing 0, .05, 1.0, 3.0, 5.0, 8.0, and 10% thorium. In a 6-week period, a regular pattern of growth depression was established, with increasing effect observed in the rats fed higher amounts of thorium nitrate. Distribution and Excretion Studies. A natural radioisotope of thorium, UX_1 (Th-234) is available, having a half life of about 25 days, and emitting a hard

beta radiation. Small amounts of thorium marked with UX_1 were administered intravenously, intramuscularly, by stomach tube, and intratracheally to a number of animals including rats, rabbits, and guinea pigs. Administered intravenously, thorium is slowly lost from the blood and appears in major proportion in the liver. At 6 hours the balance is present in the spleen, intestine, and other organs, including bone and bone marrow. Fourteen days after an intravenous dose, the liver still contains a large fraction of the total amount given. About one-third of the dose is excreted in the feces, a much smaller percentage in the urine. Roughly, one-tenth of the dose is in the carcass, probably mostly in the bone and the bone marrow. The other organs still account at this late date for approximately 15% of the dose. Administered by other routes, the principal idea that emerges is that wherever thorium is placed, it tends to stay; for example, in rats given a soluble thorium compound intramuscularly, 91 to 94% of the dose has been recovered from the site four days later. Rats and guinea pigs given a solution of thorium nitrate by stomach tube excrete 67 to 100% in the feces, absorption is very limited, i.e., considerably less than 1%. A soluble thorium compound administered intratracheally either stays in the lung or is brought up by the ciliated epithelium and deposited in the gastrointestinal tract. Recoveries of 85 to 90% of an intratracheal dose have been found four days later in lung and gastrointestinal tract combined. NSA 1-1095

MECHANISMS IN SKELETAL ACCUMULATION OF IONS. Norman S. MacDonald, Ralph E. Nusbaum, Florita Ezmirlian, Richard C. Barbera, Patricia Spain, and Donald E. Rounds. Issued Sept. 11, 1952. 13p. (UCLA-222)

The deposition of Sr and of Pb in the femurs of rats as a function of parenteral dosage was studied. A single injection was administered and the content of metal ion determined after 24 hours. Dosages ranged from 0.10 to 75.00 mg of Sr^{++} per 200 g of body weight and from 0.03 to 10.00 mg per 200 g of body weight in the case of Pb^{++} . The uptake indicated that at least two modes of accumulation occurred. The dominant process at low doses was described satisfactorily by an equation of the same form as the Langmuir gas absorption isotherm. However, an abrupt discontinuity in the graph of the data appeared as the dose was increased. This departure from linearity was interpreted as the point where saturation of the initial mode of deposition was attained. The values of these saturation levels for Sr and Pb were 125 ppm and 60 ppm, respectively. The various compartments in which the cations might conceivably be found in bone were discussed. It was estimated that if the first stage saturation were the result of adsorption or ionic exchange at surfaces of bone salt crystals, the average burden would be approximately 32 atoms of Sr per crystal and 6 per crystal in the case of Pb. However, the combining power of the sulfate present in the organic matrix of bone could equally well account for the binding of the saturation levels of Sr and Pb. (auth) NSA 6-5971

CHANGES IN MEAN BLOOD LEVELS OF METALLURGICAL EMPLOYEES DURING THE FIRST YEAR OF EMPLOYMENT, AS RELATED TO WORKING CONDITIONS. N. Perlman and G. A. Sacher. June 1946, decl. June 3, 1948. 7p. (To be included in the NNES-MPTS). (AECD-2030, CH-3865)

Mean levels of several blood elements were investigated for a control group and for groups exposed to radiation and uranium toxicity hazards in the Metallurgical Laboratory at six months and one year after employment. No significant decrease in mean level was found for any blood element. Lymphocytes of the groups exposed to radiation hazards and those of the metal working groups increased significantly after employment. The increase of lymphocyte count in hazard groups in excess of a slight increase in the control group is on the borderline of significance ($p = 0.05$). Thus it is possible that working in the presence of radiation or metal hazards somehow brings about slight lymphocytosis. Individual daily monitoring indicates that the average measured exposure is less than 0.1 r per day for all individuals in these groups. NSA 1-13

RELATIVE BIOLOGICAL HAZARDS OF RADIATIONS EXPECTED IN HOMOGENEOUS REACTORS TBR AND HPR. E. D. Arnold and A. T. Gresky. Dec. 2, 1955. Decl. Mar. 12, 1957. 55p. Contract W-7405-eng-26. (ORNL-1982)

An evaluation of the relative health hazards of radioisotopes produced in nuclear reactors is reported. The most important hazards were indicated to be I^{131} , the Sr^{90} - Y^{90} chain, the Ce^{144} - Pr^{144} chain, Sr^{89} , the Ba^{140} - La^{140} chain, Y^{91} , the Zr^{96} - Nb^{96} chain, Pr^{143} , La^{140} , and Pa^{233} . The most critical body organs affected by air-borne contamination are the thyroid gland, the bone marrow, the lungs, and the gastrointestinal tract. Where possible, continuous daily removal of gaseous and solid fission products from the reactor environment can be shown to permit very significant reductions in the total hazards. Homogeneous reactors, such as the Thermal Breeder Reactor and the Homogeneous Plutonium Producer Reactor, specifically studied in this report, are designed with daily removal cycles and may be considered potentially safer than heterogeneous reactors. URINARY EXCRETION OF GALLIUM BY MAN AND ANIMALS. J. I. Munn, N. H. Walters, and H. C. Dudley. J. Lab. Clin. Med. 37, 676-82 (1951) May.

A method is described for the separation of Ga from urine by ether extraction of 6N HCl solution. Colorimetric or fluorimetric estimation of 8-hydroxyquinoline-Ga complex in chloroform is the basis for quantitative determination. In the rabbit and dog, intravenous injection promotes greater retention of parenterally administered Ga citrate, with lessened urinary excretion. The 24-hr urinary excretion of Ga by 22 patients varied widely. Studies of the rate of uranium excretion of Ga^{72} in man and dog indicate that in both the initial excretion rate is high and reaches a low level in less than 18 hr. Blood-Ga levels fall rapidly after intravenous injection and approach low constant values within 6 hr. (auth) NSA 5-3340

10365

THE DISTRIBUTION IN RABBIT TISSUES OF INTRAVENOUSLY INJECTED IODINE AS SHOWN BY THE RADIOISOTOPE, I-130. Walter Mann, William F. Bale, Harold C. Hodge and Stafford L. Warren. J. Pharmacol and Exptl. Therap. 95, 12-17 (1949) Jan.

The distribution of intravenously-administered I^{130} in rabbit thyroid, blood, muscle, kidney, lung, liver, spleen, and heart, up to 12 hours after injection, was measured. The total iodine present in these tissues was also determined chemically. The thyroid gland contained relatively high percentages of the injected dose. After 12 hours the I^{130} concentration was more than 1000 times that in other tissues. From this work and the data of others, it is concluded that to produce maximal concentrations of radioiodine in the thyroid gland, the total dose of iodine (I^{127}) should be kept as small as possible. DISTRIBUTION AND PATHOLOGY RESULTING FROM THE INTRACEREBRAL AND INTRAVENTRICULAR INJECTION OF RADIOACTIVE GOLD AND SILVER COATED RADIOGOLD COLLOIDS. C. C. McClure, Jr., E. L. Carothers, and P. F. Hahn (Meharry Medical Coll., Nashville, Tenn.). Am. J. Roentgenol. Radium Therapy Nuclear Med. 73, 81-7(1955) Jan.

Injection of radioactive gold colloids and silver coated radioactive gold colloids into the brain substance resulted in localization of the material roughly in proportion to the volume administered. When such colloids were injected into the lateral ventricle of the brain there was a diffuse parallel distribution of the colloid in both the right and left side with slight concentrations in some regions in the fore and hind part of the brain. There was a considerable concentration of the material in the choroid plexus but gross and histological examination of this structure did not show anything but minimal changes. The possibilities of the use of such inert colloids in treatment of malignant brain tumors and hydrocephalus are briefly discussed. (auth) NSA 9-1172

X-RAYS AND RADIUM IN THE TREATMENT OF DISEASES OF THE SKIN. George M. MacKee, Lea and Febiger, Publishers, Minneapolis, 1946. 668p.

Approximately the first half of this book is concerned with the essentials of physics and biology. The various forms of radiation, methods of measurement, dosages, control techniques, and the biological effects of the radiations on the organs and tissues of the body are fully discussed. The last part of the book discusses clinical uses and problems for the application of radiation therapy. Several chapters cover the methods of treating diseases caused by fungi or due to pyogenic organisms, eczema, psoriasis, lichen planus, pruritis, hypertrichosis, diseases of the hematopoietic system, diseases due to the tubercle bacillus, verrucous lesions, nevi, and benign and malignant new growths. The medico-legal aspects of x-ray and radium therapy are also discussed.

THE DISTRIBUTION AND RADIATION EFFECTS OF INTRAVENOUSLY ADMINISTERED COLLOIDAL Au^{198} IN

MAN. Samuel W. Root, Gould A. Andrews, Ralph M. Kniseley, and Malcolm P. Tyor (Oak Ridge Inst. of Nuclear Studies, Tenn.). *Cancer* 7, 856-66(1954) Sept.

Radioactive gold in colloidal form can be injected intravenously into the human being without immediate untoward reactions. The isotope rapidly leaves the blood stream and deposits largely in reticulo-endothelial organs. Neoplasma that replace reticulo-endothelial tissue in liver do not concentrate the isotope and these lesions contrast strikingly with surrounding tissue having high levels of activity. This information on a small number of cases suggests that intravenous colloids radiogold has no promise the treatment of discrete primary or metastatic lesions of the liver but does not rule out the possibility that very fine diffusion lesions could be treated advantageously. DEPOSITION AND REMOVAL OF RADIOISOTOPES FROM THE BODY. Quarterly Progress Report for April 1, 1958 - June 30, 1958. C. L. Comar and R. H. Wasserman. 17p. Contract DA-49-007-MD-897. (AD-200487)

In the living animal containing cesium-137 it has been shown there is a metabolic dissociation of the radioactive daughter barium-137m. This means that some tissues such as bone and plasma will have a significantly increased level of barium-137m as compared with that expected from the usual radio-assay measurements of cesium-137. The technique of peritoneal lavage was used to study metabolic processes involved in the removal of alkaline earths from bone. Methods have been established for studying the factors that govern the movement of alkaline earths from the digestive tract to the body. Special attention is being given to the ability of certain sugars to enhance gastrointestinal absorption. Lactose and xylose increased strontium absorption more than that of calcium. The enhancing effect of lactose occurred mainly in the small intestine, and there is a suggestion that an active transport process is involved. Lactose also tended to decrease the emptying rate of the stomach. (auth) NSA 13-3514

THE EFFECTS OF CALCIUM AND PHOSPHATE IN FOODS ON RADIOSTRONTIUM ACCUMULATION. N. S. MacDonald, Patricia C. Spain, Florita Ezmirlan, and Donald E. Rounds. Dec. 7, 1954. 20p. Contract AT-04-1-GEN-12. (UCLA-317)

Each of a series of common food materials, accompanied by a fixed dose of $\text{Sr}^{90}\text{-Y}^{90}$, was administered by gavage to rats. The femurs were removed forty-eight hours later and analyzed for radiostrontium activity. The Ca and PO_4 contents of each of the materials was also determined. There was a clearcut reduction of Sr^{90} bone burden with increase of ingested Ca. The reduction of Sr^{90} bone burden was even more pronounced if the PO_4 as well as the Ca dose was elevated. Milk powder was an exception. Accumulation of Sr^{90} was enhanced by the presence of milk even though the dose was rich in Ca and PO_4 . Some speculations concerning the inter-relationships of orally administered Ca and Sr^{90} are presented. Assuming that Sr^{90} acted as a 'tracer' for Ca, the results imply that the percentage of an oral dose of Ca which deposits in the skeleton decreases as the size of the dose increases. It is suggested that the potential hazards from ingestion of foods contaminated with radiostrontium are somewhat diminished in proportion to the Ca and PO_4 concentrations existing in the foods naturally or by enrichment. DISTRIBUTION OF RADIOACTIVITY IN RATS AND MAN. AFTER INTRAVENOUS ADMINISTRATION OF DIETHYL β -RADIOIODOETHYL AMINE HYDROCHLORIDE AND OF RADIOACTIVE SODIUM IODIDE. Alexander M. Ruthenburg, Orrie M. Friedman, and Arnold M. Seligman. *Cancer* 3, 336-41(1950) Mar.

A comparison of the rate of disappearance of radioactivity from the blood and tissues of Wistar rats following the intravenous injection of I^{131}NM (diethyl β -iodoethyl amine hydrochloride) and NaI^{131} indicated that most of the I^{131}NM rapidly cyclized to the ammonium ion with the loss of the iodide ion, but that a small fraction persisted in the blood, reached tissues intact, and penetrated the cells. The highest concentration of radioactivity due to I^{131}NM was noted in thyroid and blood. Lower concentrations were present in lung, kidney, Bagg lymphosarcoma, and spleen. A similar distribution study in a patient with reticulum-cell sarcoma of the tonsil revealed a higher concentration of radioactivity in tumor, blood, and muscle following the injection of mustard than following sodium iodide; the tumor had the highest concentration of radioactivity following injection of both I^{131}NM and NaI^{131} . Persistence of higher concentrations of I^{131}NM than of NaI^{131} in the blood of three patients was not observed. The distribution of radioactivity in the tissues of rats following injection of carrier-free radioactive iodide is described. 18 references. (auth) NSA 4-2969

THE ULTIMATE SITE OF SKELETAL DEPOSITION OF Sr AND Pb. N. S. MacDonald, Florita Ezmirlan, Patricia Spain, and Clare McArthur. Nov. 6, 1950. 25p. (UCLA-96)

X-ray diffraction studies were made on the bone ash of rats receiving repeated injections of SrCl_2 and of Pb acetate. Debye powder patterns showed no evidence of a second solid phase, even in bone samples containing as much as 8% Sr or 5% Pb. Determinations of the unit cell dimensions were made with a precision of 0.1% using a symmetrical focusing back reflection camera. These determinations showed definite distortions of the normal apatite-like lattice due to the presence of the foreign ions. It is concluded that when Sr or Pb are accumulated by skeletal tissue, some and perhaps most of the foreign cations ultimately become part of the crystalline structure of the bone salt. DISTRIBUTION OF RADIOIODINE IN ERYTHROCYTES AND PLASMA OF MAN. J. E. Rall, Marschelle H. Power, and A. Albert. *Proc. Soc. Exptl. Biol. Med.* 74, 460-1 (1950) June.

To venous blood drawn from normal individuals there was added various amounts of labeled sodium iodide (NaI^{131}). The ratio of chloride content of the erythrocytes to that of the plasma was found to be 0.59, and the corresponding ratio for radioiodide was 0.67. The data indicate that a portion of iodide added to human blood is not freely diffusible and may be bound in some manner within the erythrocytes. NSA 4-4790

STUDIES OF THE UNSATURATION OF PHOSPHOLIPID FATTY ACIDS OF THE LIVER, KIDNEY AND BLOOD OF URANIUM-POISONED RATS. R. S. Crossland, F. L. Haven and V. M. Edwards. Jan. 1946. Dec. 29, 1948. 46p. Proposed for publication in *Proc. Soc. Exptl. Biol. and Med.* (AECD-2428, M-1877)

The effect of uranium nitrate on the unsaturation of the phospholipid fatty acids of the liver, kidney and blood of rats has been studied. It was found that with an acute dose (5 mg/kg injected intraperitoneally) the iodine number of the liver was increased about 14 per cent. The iodine number of the kidney was decreased about 25 per cent. A limited number of determinations on the blood fatty acids showed an increase of 20 per cent. When repeated small doses (0.33 mg/kg) of uranium nitrate were given followed by an acute dose, the iodine numbers of both the liver and kidney of these tolerant animals were normal. Apparently the repeated small doses prevent the changes in unsaturation, which are caused by a single acute dose. Two series of rats, which had survived an acute dose of uranium nitrate showed normal average and low average iodine num-

bers, respectively, for liver. Those values showed the greatest variation of any series of liver, with a large percentage of the figures falling below normal. The iodine numbers for the kidney were, likewise, normal and low normal, respectively, for the two series. When rats were given a sub-acute dose of uranium nitrate (2.5 mg/kg) the iodine number for the liver was elevated about 11 per cent. The value for kidney, however, was a low normal. If any injury to the kidney had occurred, as was indicated by the ratio of kidney to body weight, such injury had been repaired, while the corresponding injury to the liver apparently persisted. TURNOVER OF P^{32} IN DIFFERENT TYPES OF NUCLEI FROM RABBIT LIVER. A. Marshak and Audrey Peck. *Proc. Soc. Exptl. Biol. Med.* 73, 479-80(1950) Mar.

Radioactive phosphorus, P^{32} , was administered intravenously to two rabbits as Na_2HPO_4 , and 3 hr later the livers were perfused, and the nuclei were isolated and separated into two groups, the spherical hepatic-cell type and the nonspherical type consisting of fibroblast, reticulo-endothelial, endothelial, and polymorphonuclear leukocyte nuclei. The specific activity of the spherical nuclei from the first animal was 34 per cent greater than that of the nonspherical nuclei, while with the second animal the difference was 23 per cent. The data indicated a higher rate of turnover of phosphorus in the spherical as compared with the nonspherical nuclei. It was previously shown that most of the P^{32} in liver nuclei was in nucleic acid and that it was re-concluded that nucleic acid turnover in the nuclei of hepatic cells is more rapid than that of nuclei of other cells in the liver. DISTRIBUTION OF COLLOIDAL RADIOACTIVE CHROMIC PHOSPHATE AFTER INTRACAVITARY ADMINISTRATION. Samuel W. Root, Malcolm P. Tyor, Gould A. Andrews, and Ralph M. Kniseley. (Oak Ridge Inst. of Nuclear Studies, Inc., Tenn). *Radiology* 63, 251-9(1954) Aug.

Preliminary studies indicate that the distribution of chromic phosphate after intracavitary injection is similar in most respects to that of colloidal radioactive gold. There is evidence, however, for some ionization of the chromic phosphate and this ionized portion follows the distribution expected for phosphate ion. From the point of view of distribution, chromic phosphate appears to be suitable for intracavitary therapeutic use. (auth). NSA 8-6076

TRANSPORT OF RADIOACTIVE COLLOIDAL GOLD BETWEEN SEROUS CAVITIES Irving L. Cowan, Roland S. Cron, Gordon F. Burgess, and Frank G. Kariotis (Milwaukee Hosp. and Marquette Univ., Wisconsin). *Surg. Gynecol. Obstet.* 98, 721-4(1954) June.

Following administration of a therapeutic dose of Au^{198} to a patient with a clinical diagnosis of ovarian carcinoma

with ascites and hydrothorax there was a rapid transport of radioactive colloidal gold from the peritoneal cavity to the pleural space. A maximum concentration was obtained within 2 hours. Radioactive gold was found in the abdominal cavity following right pleural space administration with a maximum concentration in 1 hour. The concentration of Au^{198} in the abdominal fluid decreased exponentially with time, the rate of decrease being typical of Au^{198} that is injected directly into the abdominal cavity. Little or no therapeutic effect on the development of ascites was obtained in the case of this patient. The pleural fluid reaccumulation seemed, however, to be slightly repressed. (auth) NSA 8-4490

RADIOACTIVITY DISTRIBUTION IN THE TISSUES OF MICE BEARING MELANOSARCOMA AFTER ADMINISTRATION OF DL-TYROSINE LABELED WITH RADIOACTIVE CARBON. James C. Reid and Hardin B. Jones. *Journal of Biological Chemistry* **174**, 427-437 (1948) June. (See also MDDC-1404)

The synthesis of DL-tyrosine labeled with C^{14} in the β -position. The distribution of radioactivity following intravenous administration of DL-radiotyrosine to mice bearing melanoma has been investigated. At 72 hours, about 30 per cent of the administered dose has appeared in the breath, about 40 per cent in the urine and feces, with 30 per cent remaining in the body. Radioactivity is found in every tissue of the body. The adrenals, thyroids, intestines, kidneys, liver, plasma, spleen, and tumor show the highest specific activities. Erythrocytes

are lowest, with bone next. In this species, the total activity in the body diminishes by half during the 60 hour period between the 12th and 72nd hour after administration of radiotyrosine. NSA 1-252

EFFECTS OF FEEDING URANIUM NITRATE HEXAHYDRATE IN THE DIETS OF BREEDING WHITE RATS Elliott A. Maynard, Challiss Randall, Harold C. Hodge, and James K. Scott. *J. Pharmacol. Exptl. Therap.* **95**, 421-8 (1949) Apr.

Two groups of 50 pairs of rats each were maintained for 7 months on a control diet and on a diet containing 2% of uranium nitrate hexahydrate, respectively. The growth rate of both male and female rats receiving the 2% uranium nitrate hexahydrate diet was notably depressed. An increased growth rate, insufficient to compensate entirely for the previous loss, occurred when the experimental rats were placed on the control diet 7 months after the start of the experiment. Uranium feeding sharply reduced the number of female rats having litters. In addition, the experimental rats had fewer young per litter. When the experimental rats were replaced on the stock diet the females having litters were more productive than the control rats. Females which failed to have litters on the experimental diet did not have litters later on the stock diet. Rats fed 2% uranium nitrate hexahydrate exhibited a slightly greater mortality during the 12-month period, 17% to 10% for the controls. Uranium nitrate hexahydrate feeding produced an irregularity of the oestrus cycle since only 19 of 44 experimental female rats had regular oestrus cycles and regular mating. Uranium, except in traces, does not cross the placental barrier since very little was found in the newly-born of the experimental females upon assay. 11 references. NSA 3-213

TWO-YEAR FEEDING TEST. URANYL FLUORIDE. Elliott A. Maynard, W. L. Downs, and Harold C. Hodge. *nd. Decl. Dec. 22, 1949. 35p.* (Proposed for publication in *NNES, Div. VI, Vol. 1. Chap. 20, Sec. 5, Part 3*). (AEC-D-2776)

Groups of male rats, for the most part 25 each, were fed diets containing 0, 0.01, 0.05, 0.10, 0.15, 0.25, and 0.50% of uranyl fluoride for two years. Groups of female rats, 15 to 25 per group, were fed diets containing 0, 0.01, 0.05, 0.25, and 0.50% uranyl fluoride for a period of two years. In the male rats and in the female rats the 0.05% diet did not depress body weight. In the male rats 0.1% uranyl fluoride was the lowest dietary percentage producing weight depression. Diets containing 0.15%

consistently depressed the body weights of male rats, and diets containing 0.25% produced depressed body weights in both male and female rats. The addition of 0.25% of uranyl fluoride shortened the life span of the male rat but not that of the female. The addition of 0.05% was without effect on the life span. Hematological observations showed a trend for red blood cell counts and hemoglobin values to be depressed in male rats with increasing percentages of uranyl fluoride. A tendency toward higher white blood cell counts in the rats on the higher doses of uranyl fluoride was also found. Urine analyses for sugar and protein was surprisingly free from evidence of a positive response to the administration of such amounts of uranium. Uranium content of the kidneys and of the femurs increased with increasing percentages of uranyl fluoride in the diets. The fluoride content of bones and teeth increased with increasing concentration of uranyl fluoride in the diet. Based on the amounts of uranium and amounts of fluoride found in the bone, it is probable that about 5000 times as much fluoride is absorbed as uranium. As a result of histological examinations, the addition of 0.10% or lower percentages of uranyl fluoride was described as producing no evidence of injury. Adding 0.15% produced minimal and inconsistent renal tubular changes, this level may be considered as the lowest producing just detectable change. Testicular atrophy was also described. There is no evidence that the frequency of spontaneous disease was affected by adding uranyl fluoride to the diets. (auth) NSA 4-1914

ONE-YEAR FEEDING EXPERIMENTS ON DOGS. Elliott A. Maynard and Harold C. Hodge (nd). Decl. Dec. 22, 1949. 38p. (AECD-2778)

A total of 30 dogs were fed various daily doses of five uranium compounds, i. e., UO_3 , UF_4 , $\text{UO}_2(\text{NO}_3)_2 \cdot 6\text{H}_2\text{O}$, UCl_4 , and UO_2F_2 at levels that were tolerated for

a period of one year. Sixteen control dogs were also studied. The daily dosage levels ranged from 0.0002 g/kg body weight of the soluble UO_2F_2 to 10 g/kg body weight of the insoluble UO_3 . At the end of the one-year feeding period the only dogs in which an adverse effect on growth was noted were those which received uranyl nitrate at a daily dosage of 0.2 g/kg body weight. A questionable effect was noted when UF_4 was fed daily at a level of 5 g/kg. When blood NPN (nonprotein nitrogen) and urea nitrogen values were used as criteria of toxicity it was apparent that in most of the dogs studied there was not produced a marked acute uranium poisoning. Some scattered abnormal urinary protein and sugar values were found. This was particularly noticeable in the dogs fed UCl_4 at a daily level of 0.05 g/kg body weight. Most of the recorded values did not deviate greatly from normal values. Histological studies disclosed that renal cortical tubular changes are the principal pathological effects of feeding uranium compounds to dogs. No marked abnormalities occurred in the hematological picture when observations were made on red cell counts, white cell counts, hemoglobin, and differential white cell counts at various intervals during the one-year feeding period. A limited number of uranium analyses were made of tissues from dogs fed uranyl nitrate hexahydrate and UCl_4 . The highest liver value reported was 2 $\mu\text{g/g}$ for a dog fed 0.05 g/kg. Kidney values mostly ranged below 1 $\mu\text{g/g}$. Bone values ranged from 1 to 5 $\mu\text{g/g}$. When blood fluoride determinations were made on the dogs which received daily doses of UF_4 for a period of 1 year it was evident that the dependence of the blood fluoride level on dietary intake of fluorine is essentially a linear function. Analyses of bone and tooth samples from these same dogs also demonstrated that the dependence of bone and tooth content of fluorine on the amount of fluorine ingested is nearly linear. NSA 4-1916

BONE METABOLISM. III. THE EFFECTS OF VARIOUS DIETS ON THE MOBILIZATION OF STRONTIUM FROM THE RAT SKELETON. Robert D. Ray, Dorothy E. Stedman, and Norvelle K. Wolff (Univ. of Washington School of Medicine, Seattle). J. Bone and Joint Surg. 38A, 637-54(1956) June.

A study has been carried out to determine the effect of various diets on body growth, histological structure of bone, and chemical composition and mobilization of Sr from the skeletons of young growing rats. Animals having from 5 to 6% of the mineral portion of their skeletons as Sr were maintained on a standard laboratory diet, a low-protein diet, a high-calcium and high-vitamin-D diet, a subminimal-phosphorus diet, a cereal rachitogenic diet, a cereal rachitogenic diet containing ammonium chloride, and a low-phosphorus diet. The low-phosphorus diet had the most profound effect on Sr mobilization and skeletal mineralization, while the standard diet and the low-protein diet has the least effect. (auth) NSA 10-9915

10408

TWO-YEAR FEEDING TEST. URANYL NITRATE HEXAHYDRATE. Elliott A. Maynard, W. L. Downs, and Harold C. Hodge. nd. Decl. Dec. 22, 1949. 30p. (Proposed for publications in NNS, Div. VI, Vol. 1, Chap. 20, Sec. 5, Part 4.) (AECD-2777)

Groups of 15 to 25 male and female rats were fed diets containing 0, 0.01, 0.05, 0.1, 0.5, 1.0, and 2.0% uranyl

nitrate hexahydrate for a period of two years. For the male rats, diets containing up to 0.05% uranyl nitrate hexahydrate produced no detectable depression in weight, female rats tolerated a diet containing 0.10% without effect on growth. The lowest percentage in the diet associated with detectable growth depression was 0.1 for the male rats, and 0.5 for the female rats. Even 2% of uranyl nitrate hexahydrate did not lessen the life span over a two-year period. The hematological observations were essentially negative for the male rats, but revealed a tendency for an anemia and a low-grade increase in white blood cell counts for the female rats fed the 1.0% and the 2.0% diets. Urine analyses for sugar and protein gave no evidence of a chronic or continuing uranium effect. On the contrary, there was an apparent trend toward a lessened positive response with increasing amounts of uranyl nitrate in the second year. Uranium contents of the kidneys and femurs of the rats increased with increasing uranium in the diet. On the basis of detailed histopathological examinations, the kidney has been found to be the only organ exhibiting significant changes. There was a clear-cut dependence of the degree of injury on the dosage. No histological change identified as uranium poisoning was found in the kidneys of rats fed the 0.01, 0.05, and 0.1% diets. The kidneys of the rats fed the 0.5% diets exhibited subtle, borderline changes, this percentage may be identified as a + or - zone of minimal response. In the rats fed the 1 and 2% diets the changes were typical and consistent. A number of male rats showed degenerative changes in the testes. The common pathological findings were seen, there was no evidence of a relation between the frequency of spontaneous disease and the feeding of uranyl nitrate hexahydrate in the diet. Evidence of tolerance to acute uranium poisoning was found in rats that had been ingesting diets containing uranyl nitrate for two years.

TWO-YEAR FEEDING TEST. URANIUM DIOXIDE. Elliott A. Maynard, W. L. Downs, and Harold C. Hodge. nd. Decl. Dec. 22, 1949. 21p. (Proposed for publication in NNES, Div. VI, Vol. 1, Chap. 20, Sec. 5, Part 1). (AECD-2774)

Groups of 50 male and 50 female rats were fed diets containing 0, 0.5, 2.0, and 20% UO_2 for a period of two years. There was no evidence of a depression of body weight in any of the groups. The mortality for each group compared favorably with the mortalities observed in control rats. There was no indication of a shortening of life span. Results of hematological observations were uniformly negative. Uranium analyses for sugar and for protein were essentially negative. Pathological examinations showed none of the changes characteristic of uranium poisoning. The usual scattering of incidental pathological changes was noted. The uranium content of the kidneys did not increase as the percentage of UO_2 increased in the diets. The uranium content of the femurs increased slightly with increase in UO_2 content of the diets. Metabolic Properties of Plutonium and Allied Materials. The localization of Ca^{45} , Sr^{90} , Pm^{147} , Am, and Pu in the skeletal tissue of rats has been investigated by radioautography of the costochondral junction. Photographs and radioautographs of histological sections through the junction are presented. The distribution of tracer Ca and Sr coincides exactly with that of bone salt and of Ca deposited in cartilage. None of the other three elements

examined were localized in this pattern. The evidence for Pm indicates that it is deposited both at calcified surfaces and in potentially osteogenetic tissues found free from any osseous component. It is also found in spotty deposits in the vascular or perivascular regions within bone. Americium is similar to Pm except for the absence of the spotty distribution. Plutonium is demonstrated only with difficulty in any cartilaginous tissue, whether perichondrium, noncalcified, or calcified cartilage. Nevertheless, the possibility of demonstrating it 1 hr after injection suggests that there is a transitory localization adjacent to calcium salts. Its main localization is limited to the bony part of the rib, where its clear occurrence on both aspects of the bone (inner and outer) and its presence in the periosteal extension beyond bone proper suggest that it localizes mainly in actively osteogenetic tissues. Tracer Studies on the Metabolism of the Fission Products. The metabolic fate of Ta^{182} has been studied in rats following intravenous and intramuscular administration as a citrate complex and as uncomplexed Ta salts. The metabolism of inhaled Ta aerosols formed by burning Ta metal containing Ta^{182} in an electric arc is also reported. Studies have been carried out on the organic binding of astatine to the thyroglobulin protein by the thyroid of rats and on the red cell/plasma At-concentration ratio. The Mechanism of Skeletal Deposition of Radioactive Strontium in Young, Adult, and Rachitic Rats. Young rachitic rats show the same rapid initial uptake of $\text{Sr}^{89,90}$ as do young normal animals, and the maximum uptake is as great, but this radiostrontium does not remain fixed in the skeleton and is lost rather rapidly. Less than $\frac{1}{2}$ of the dose present at 1 hr remains at the end of 24 hr. The rapid initial uptake may be associated with the potential bone growth and large amount of osteoid matrix present in these animals. The failure of the radiostrontium to remain fixed in the skeleton may be a result of the low phosphate level and failure of actual new bone-salt deposition in the rachitic rats. The rapid removal of radiostrontium in these rachitic animals suggests the possibility of important decontamination of radiostrontium deposited in the skeleton if similar conditions can be reproduced in normal animals. Role of Alkaline Phosphatase in Bone Metabolism, Inhibitory Effect of Phosphate in Vivo. The intraperitoneal injection of inorganic phosphate, even in low concentrations, into young rats lowers the blood phosphatase level. Effect of Zirconium Citrate on the Distribution and Excretion of Nb^{95} in Rats. The value of massive doses of Zr citrate as a decontaminant for Nb^{95} is demonstrated. The initial rapid drop in blood Nb^{95} level and the high urinary excretion rate are maintained by the Zr citrate action. Versene Acid as a Radio-yttrium Decontaminant. Data on the effectiveness of Ca versenate (ethylenediaminetetracetate) in removing Yt already deposited in the body are presented, and the toxicity of versene acid and Ca versenate to rats is determined. Astatine²¹¹ Studies. Effects on the Thyroid Autopsies on rats following 1.2 μc to 157 μc doses of At^{211} show that At has a highly selective destructive affinity for thyroid gland tissues. Photomicrographs of the thyroid tissues are given. Hematological studies are also reported. Radiochemistry. Improved methods are given for the production of mc amounts of At^{211} and for the recovery and analysis of At in tissues. The preparation of carrier-free $\text{Re}^{183,184}$ from Ta and from W, and carrier-free Os^{185} from W is reported. The Metabolism of the Lipoproteins. Studies are being made on the metabolism of cholesterol and the serum lipoproteins in the rabbit. Preliminary results are reported on the incorporation of tritium-labeled water into tissue cholesterol and on the rate of cholesterol turnover. The lipoproteins found in the blood of labeled-cholesterol-fed rabbits have been segregated

and the specific activities of the various fractions found to be comparable. Lipoproteins labeled by giving radioactive phosphate to rabbits are found to have varying specific activities. Disappearance rates of all lipoprotein fractions injected intravenously are comparable whether the recipient is normal, cholesterol-fed-hypercholesteremic, or atherosclerotic. Blood Lipids and Human Atherosclerosis. The presence of a class of lipid and lipoprotein molecules in the serum of the human and the cholesterol-fed rabbit associated with atherosclerosis in both species has been demonstrated. These molecules do not represent any part of the acute alimentary lipemia. The presence of these cholesterol-bearing lipid and lipoprotein molecules cannot be predicted from the analytical total serum cholesterol level. Partial dietary restriction of fat and cholesterol in the human results in a gradual decrease in the serum level of such molecules over a period of weeks to months. These molecules are present with a much higher frequency and at higher concentrations in patients who have survived a myocardial infarction than in corresponding individuals without known vascular disease. The presence of these molecules with increased frequency in other diseases associated with excessive atherosclerosis (diabetes mellitus, the nephrotic syndrome, hypothyroidism, hypertension, and coronary insufficiency) supports the hypothesis of their association with atherosclerosis

nd. Decl. Dec. 22, 1949. 12p (Proposed for publication in *ENES*, Div. VI, Vol. 1, Chap. 20, Sec. 5, Part 2).
(AEC-2775)

Groups of 50 male and female rats were fed diets containing 0, 0.5, 2.0, and 20 per cent of UF_4 for a period of two years. Only the groups fed a 20 per cent UF_4 diet exhibited a growth depression, but even in these rats the effect was not large. There was no indication that UF_4 even up to 20 per cent of the diets decreased the life span. In the hematological observations there was little or no indication of any change ascribable to the UF_4 . Urine analyses for sugar and protein were uniformly negative. Only in the kidneys were any changes found on histological examination that could be attributed to the administration of uranium; and in this organ mild tubular degeneration with typical and atypical regeneration were described only in the rats fed the 20 per cent diets. The usual nonspecific pathological changes were also found. The uranium content of the kidneys and femurs increased somewhat with increasing the percentage of UF_4 in the diet.

Rochester. Univ., New York.
ONE-YEAR FEEDING TEST SERIAL STUDY OF URANYL NITRATE. Elliott A. Maynard, T. B. Barnett, W. F. Downs, W. F. Neuman, and Harold Hodge. (nd). Decl. Dec. 22, 1949. 55p. (AEC-2773)

Groups of male and female rats have been maintained on diets containing 0 (a control group), 0.1, 0.5, and 2.0% uranyl nitrate hexahydrate, respectively, for various periods up to one year. In a large-scale, serial sacrifice study, rats were examined at daily intervals for the first 5 days, at weekly intervals for the first month, at intervals of 2 weeks for the first 6 months, and at the 30th, 38th, and 52nd weeks. The growth was notably depressed in rats maintained on a diet containing 2% uranyl nitrate hexahydrate. The addition of 0.1% produced a negligible, if any, effect on growth. The growth rates of rats on the 0.5% diets consistently averaged slightly below those for the control rats. Mortality data are available on 125 male

and female rats, respectively, at each of the dietary levels during the first week. Data are available on 100 of each sex during the first 14 weeks, on 75 of each sex during the first 36 weeks, and 50 of each sex during the balance of the year. An abnormally-high mortality was observed in the rats on the 2% diet, in contrast, the rats on the 0.5 and 0.1% diets exhibited the same order of mortality as did the control rats. The uranium content of the kidneys increased with increasing percentages of uranyl nitrate in the diet. The uranium content of the femurs of the rats on the 0.5% diet ultimately reached values of approximately 20 μg U/g, on the 2% diet the values became as great as 200 μg U/g. Based on a number of assumptions, it has been calculated that the rat absorbs about 0.1% of the uranium from the diet. From hematological observations it was concluded that long-continued administration of uranyl nitrate hexahydrate at a dietary level of 2% was accompanied by a low-grade anemia and a tendency toward a low-grade leukocytosis. Extensive histological examinations failed to reveal any renal abnormalities in rats maintained on the diet containing 0.1% of uranyl nitrate hexahydrate. In rats fed the 0.5% diet, mild tubular necrosis occurred during the first week, followed by epithelial regeneration, so that only slight traces of injury were present at the end of the experiment. The kidneys of rats maintained on the 2% diets showed moderately severe tubular necrosis initially, followed by regeneration. In these rats, however, pathological changes developed progressively, different from the initial injury and characterized by tubular atrophy, increase in stroma, and narrowing the cortex. The only other abnormalities appearing regularly were found in the testes of the male rats on the 2% diet. The origin of these changes is obscure.

Univ. of California Radiation Lab.
RADIOCALCIUM TURNOVER AND EXCRETION IN ADULT YOUNG, AND RACHITIC RATS. D. H. Copp and D. M. Thomson. July 1951. 1p. (UCRL-1401)

The report is reproduced here in its entirety. The bone turnover and urinary excretion of radiocalcium (Ca^{45}) was studied in mature female rats, in normal young animals 2 months old, and in rats of the same age made rachitic by restricting them to a synthetic low-phosphorus diet from weaning. They were sacrificed at intervals up to 16 days following IV injection of Ca^{45} . Initial bone uptake of Ca^{45} was rapid in both groups of young animals. In the normals, it remained fixed in the skeleton, in the rachitic rats it appeared "labile," and was rapidly removed. Uptake in adult bone was slower. Urinary excretion of radiocalcium was very high in the rachitic group, and the renal clearance of Ca^{45} was 10 to 15 times as great as in young or adult normal animals. This suggests a direct effect of low-phosphorus rickets on calcium excretion by the kidney. NSA 5-5035

THE BEHAVIOR OF RADIOIODINE IN THE BLOOD.
William M. McConahey, F. Raymond Keating, Jr., and Marschelle H. Power. *J. Clin. Invest.* 28, 191-8 (1949) Mar.

A study is reported of the behavior of I^{131} in blood after its oral administration, the comparison of the disappearance rates of I^{131} from the blood as determined directly and by urine sampling methods, and the appearance in the blood of organically bound I^{131} on 31 humans with various thyroid conditions. The patients received 150 cc of an aqueous solution of 100 μg of sodium iodide containing 100 μc of I^{131} . The method and controls are completely described, and a breakdown of the type of dose (therapeutic or tracer) and thyroid conditions of the subjects are given. Time

graphs up to 150 hr after injection are given for $I^{131}\%$ of dose per liter of serum, and a table of urine excretion is also included in the report. The results are extensively discussed, with special considerations of the inadequacy of the method used for making quantitative conclusions. The authors believe that the data indicate that the rate of disappearance of radioiodine from the blood reflects variations in thyroidal function, and the two methods of determining the rate of disappearance of radioiodine from blood do not give significantly different results. 15 references. DISTRIBUTION OF COLLOIDAL RADIOACTIVE CHROMIC PHOSPHATE AFTER INTRACAVITARY ADMINISTRATION IN THE RAT. John A. Cooper and Elinor M. Zorn. J. Lab. Clin. Med. 42, 867-7(1953) Dec.

The distribution and excretion of various preparations of radioactive colloidal chromic phosphate after intracavitary administration in the rat have been studied. Colloid with particle sizes of $0.2\ \mu$ was found in large amounts in the liver after intrapleural and intraperitoneal administration. With larger particle size a smaller fraction appeared in the liver. Urinary excretion was negligible in all animals studied. (auth) NSA 5-5035

THE ANEMIA OF INFECTION. XII. THE EFFECT OF TURPENTINE AND COLLOIDAL THORIUM DIOXIDE ON THE PLASMA IRON AND PLASMA COPPER OF DOGS.

George E. Cartwright, Clark J. Gubler, and Maxwell M. Wintrobe. J. Biol. Chem. 184, 579-87(1950) June.

The intramuscular injection of 5 ml of turpentine into each of 10 dogs resulted in an average decrease in plasma iron of 77 per cent within 24-48 hr. The intravenous injection of a single dose of colloidal thorium dioxide (2 ml/kg of body weight) into each of 13 dogs resulted in an average decrease in plasma iron of 29 per cent in 24 hr. The administration of three consecutive daily intravenous injections of colloidal thorium dioxide into each of 9 dogs resulted in an average increase in the plasma iron of 446 per cent within 3 to 7 days. The intramuscular injection of 5 ml of turpentine into each of 5 dogs previously given three consecutive daily intravenous injections of colloidal thorium dioxide resulted in an average decrease in plasma iron of only 18 per cent. These studies suggested, to the authors, the possibility that the hypoferrremia which follows the intramuscular injection of turpentine is the result of increased activity of the reticulo-endothelial system. 18 references. TOXICITY OF RADIOIODINE AND RADIOPHOSPHORUS IN RATS IN DOSES COMPARABLE TO THOSE USED CLINICALLY. Campbell Moses, Joseph B. Boatman, Robert S. George, and Agatha M. DeLacio. Proc. Soc. Exptl. Biol. Med. 79, 343-4(1952) Mar.

Radioactive phosphorus (P^{32}) was administered by intubation to young male rats in doses equivalent to 4.6 mc, 7.0 mc and 11.6 mc for a 70 kg man. Similar radioiodine doses of I^{131} equivalent to 14.0 mc, 42, and 420 mc were given. All animals were sacrificed 6 weeks after dosing. Except for a significant decrease in the testes/body weight ratio and a moderate lymphopenia at the time of autopsy no growth curve, organ weight or histologic evidence of damage was discerned in the animals receiving P^{32} . Although no changes in weight gain or histologic evidence of organ damage was observed following the administration of I^{131} , some variations in organ weight/body weight ratio were recorded. In the doses here employed, which were comparable to those used clinically no evidence of serious radiation damage was recorded. (auth) NSA 6-3939

UPTAKE OF RADIOACTIVE IODINE IN THE THYROID OF PATIENTS WITH IMPAIRED LIVER FUNCTION. Richard Mueller, Charles C. Brausch, Eugene Z. Hirsch, Richard S. Benua, and Brown M. Dobyns (Western Reserve Univ. School of Medicine, Cleveland, Ohio). *J. Clin. Endocrinol and Metabolism* 14, 1287-99(1954) Nov.

The I^{131} thyroidal uptake was 50 per cent or higher in 20 out of 50 patients with liver disease but no evidence of thyroid disease. Among the patients with liver disease, elevated I^{131} thyroidal uptakes were associated most frequently with spider angiomas, jaundice, and microscopic evidence of severe cellular damage of the liver. No correlation could be established between elevated I^{131} thyroid uptakes and either the presence of ascites or the results of any single test for liver function. In spite of the elevated I^{131} uptakes by the thyroid in some patients with liver disease, there was no evidence for increased production of thyroid hormone, either by clinical findings or by laboratory determinations of the basal metabolic rate, the serum protein-bound iodine level, or the height of thyroid cells. Although abnormal kidney function may be present in patients with cirrhosis, the normal urinary excretion of radioiodine found in sample patients in this series indicated that renal disturbance at the time of the tests was not the cause of the elevated I^{131} thyroidal uptakes. 10428

STUDIES OF THE KINETICS OF POTASSIUM EXCHANGE BETWEEN CELLS AND PLASMA OF CANINE BLOOD IN VITRO USING K^{42} . C. W. Sheppard and W. R. Martin. Aug. 12, 1948, decl. Aug. 26, 1948. 23p. From oral presentation before a meeting of the Society of General Physiologists to be held at Woods Hole, Massachusetts, September 8-10, 1948. (AECD-2249)

Freshly-drawn heparinized canine whole blood is equilibrated in vitro (paraffin lined vessels) at 38.1°C with a normal pulmonary atmosphere saturated with water vapor. It is then tagged by mixing with a small amount of plasma containing dextrose and radioactive KCl. The potassium content of the resulting plasma is thus raised by not more than 3% of the normal and the blood sugar to about 400 mg%. By this procedure cells are maintained in a healthy state for periods up to 10 hours as shown by minimal hemolysis, nearly constant hematocrit and minimal potassium leakage. In whole blood the activity of the plasma decreases initially at a rapid rate which is correlated with the appearance of activity in the cells (red cells, white cells, and platelets). The initial decrease follows an exponential curve to an elevated base line, half of this change being complete in about 50 minutes. However, if the white cells and platelets are previously removed by repeated differential centrifugation, the behavior is different. The plasma activity declines very slowly, at the rate of about 1% per hour. The initial

rapid decrease in plasma activity for whole blood is attributed to a rapid exchange of potassium in the fraction containing the white cells and platelets. A typical value for the amount of this easily exchangeable potassium is about 30% of the total potassium in the plasma. It is evident that studies of potassium exchange of erythrocytes must give equivocal results unless the white cells and platelets are removed in advance or otherwise taken into account. 10 references. Rochester, N. Y. Univ. Atomic Energy Project THE EARLY FATE OF POLONIUM²¹⁰ IN CATS. I. GASTROINTESTINAL ADMINISTRATION STUDIES II INTRAVENOUS ADMINISTRATION STUDIES. P. E. Morrow, Frank A. Smith, R. J. Della Rosa, Louis J. Casaretti, and J. N. Stannard. May 7, 1955. 25p. Contract W-7401-eng-49. (UR-396)

The absorption, distribution and excretion of polonium²¹⁰ citrate and neutralized polonium²¹⁰ chloride from isolated *in vivo* stomach pouches and intestinal segments and following intravenous administration to cats have been studied up to twelve hours. The experiments were designed to differentiate some of the effects of varying the dose, form, and absorption site of polonium by the use of tissue analyses, serial blood, bile, and uranium analyses, and autoradiography. Significant absorption of polonium from the cat stomach occurs irrespective of the chemical form of polonium administered. The rate of absorption of ionic polonium from the intestine exceeds that for polonium colloid by a factor of ten. In the dose range, 3-18 μ c polonium per kilogram cat body weight, the rate of polonium absorption from the stomach and the intestine is proportional to the dose. Quantitative differences in the polonium distribution among organs and in the urinary excretion are primarily related to the site of administration. In addition, autoradiography of the tissues indicates that the cellular location of polonium varies only quantitatively. The urinary excretion data confirm the view that the excretion of polonium is maximal after absorption from the gastrointestinal tract. The renal clearance of polonium varies between 0.005 and 0.03 ml of whole blood per minute according to the form and site of the administered polonium. (auth) NSA 9-5874

ISOTOPIC STUDIES OF POTASSIUM EXCHANGE RATES BETWEEN CELLULAR ELEMENTS AND PLASMA OF HUMAN AND CANINE BLOOD IN VITRO. C. W. Sheppard and W. R. Martin. nd. Decl. Jan. 5, 1949. 1p. See also AECD-2249. (AECD-2453)

This document is an abstract, it is reproduced below in its entirety. Fresh heparinized blood is maintained in an apparently viable state for eight to ten hours *in vitro*. Hemolysis is generally at, or below, the lower limit of visual detection. Hematocrits are routinely determined and lie within 2 1/2 per cent of the mean. There is some evidence of occasional systematic increases of potassium concentration in the plasma late in the experiments, the total change being about 15 per cent. In human blood the

concentration of isotope K^{42} in the plasma decreases fairly rapidly. Equal specific activities of cells and plasma are reached at about 18 hours. The curve is a smooth exponential with a single half value time corresponding to an exchange rate of about 10^{-13} millimol of potassium per hour per cell. In the dog, the curve shows an initial rapid exponential decline to an elevated base line, which slowly declines at about one per cent per hour. Removal of a fraction of the cells containing leukocytes, platelets and probably young erythrocytes, eliminates the rapid exponential phase. The slow decline is evidently characteristic of the exchange of potassium in mature canine erythrocytes, the rate being about 4×10^{-15} per hour cell. NSA 2-1018

STUDIES IN PERCUTANEOUS ABSORPTION OF RADIO-
IODINE. Otis B. Miller and W. A. Selle. J. Investigative
Dermatol. 12, 19-29(1949) Jan.

Methods demonstrating absorption of iodine from the skin with the use of I^{131} (aqueous sodium iodide) are presented. Studies on human subjects indicate that iodine applied to the skin remains in the skin for several days, gradually disappearing either by absorption or by evaporation and other surface loss. The application of radioiodine to the skin of a pregnant animal results in marked concentration of the iodine not only in the thyroid gland but also in the gastric fluid of the fetus; approximately 70 per cent of all the iodine present in the fetus is recoverable from the stomach. The distribution of radioactive iodine in various organs of the rabbit and guinea pig following percutaneous absorption is shown in a table. NSA 2-1298

10436

PRELIMINARY REPORT ON THE CHEMICAL USE OF
RADIOACTIVE IODINE (I^{131}). Earl R. Miller, Mayo H. Soley and Morris E. Dailey. Am. J. Roentgenol.
Radium Therapy 60, 45-50(1948) July.

This study was made to determine if possible the uptake of radioiodine in microcuries in the human thyroid in situ after oral administration of I^{131} . Patients with Graves' disease and thyroiditis were given iodine solution calibrated in microcuries per centimeter in 50 cc of water. Measurements were made during the following two days and then at one- or two-week intervals to the end of a month when the patients were clinically re-evaluated. A Geiger counter, with a lead shield to permit recording of harder radiation only, was used vertically 29 to 53 cm from the patient's thyroid for determining the number of microcuries in the thyroid. Readings were also taken over the thigh just above the knee. They were subtracted from the readings taken over the neck and thyroid to give the readings of the iodine in the thyroid only. Doses of I^{131} varied from 800 microcuries in a single dose to 250 microcuries per week for six weeks. Composite curves of the

results on metabolic rate and the protein-bound iodine show a fall at first, but this is soon followed by a return to normal. The amounts of iodine used were too small to be effective. NSA 1-847

10437

MOBILIZATION OF RADIOACTIVE SODIUM FROM THE
GASTROCNEMIUS MUSCLE OF THE DOG. Peter W. Stone and William B. Miller, Jr. Proc. Soc. Exptl. Biol. Med. 71, 529-34(1949) Aug.

The study reported here involve the use of radioactive sodium on dogs (1) to determine the role of the lymphatics in the mobilization and removal of intramuscularly injected radioactive sodium, and (2) as a means of qualitatively estimating the radioactive sodium in the blood draining from the injection site. In the lymphatic experiments a 0.1-0.2 cc solution of sodium chloride containing 5-20 μ c of Na^{24} was injected into one of the gastrocnemius muscles, dogs were injected with a saline solution containing 7-17 μ c in the capillary and venous system experiments. A determination of the sodium content of the thoracic duct indicated that the lymphatic system of the dog's hind extremity does not play a significant role in the mobilization of intramuscularly injected sodium, nor does the radioactive material diffuse along intramuscular planes beyond the region of the injection. A study of the collected blood and the Geiger counter readings from the injection site indicated that sodium can be quantitatively recovered from the femoral vein blood if the collateral venous system of the upper thigh is occluded, the rate of removal of the Na^{24} measured external to the injection site was the same as that determined directly from the blood draining from the muscle.

STUDIES ON THE VERY EARLY DISTRIBUTION OF
 ^{45}Ca IN THE TISSUES AND SKELETON OF THE MOUSE.
K. Dawson, E. O. Field, J. E. Gibbs, and M. M. Gwyther (Royal Cancer Hospital, London). 14p.
(A/CONF.15/P/93)

The distribution of calcium-45 in the body at short intervals after intravenous injection was investigated in mice by the low-temperature autoradiographic technique. To correct for effects due to different degrees of vascularization, a control series of mice was given sulfur-35 labeled thiosulfate. Although calcium and thiosulfate ions in general behave very similarly in their extra-skeletal distribution, the higher renal clearance rate of thiosulfate resulted in a relatively higher concentration of this material in the kidney. The rate of exchange with skeletal calcium was consistent with rates deduced from analyses of plasma clearance curves for a rapidly exchangeable bone fraction. (auth) NSA 13-6063

UPTAKE OF RADIOACTIVE IODINE BY THE THYROIDS
OF UNDERFED RATS. Joseph Meites and L. F. Wolterink. Science 111, 175-6(1950) Feb. 17.

The uptake of I^{131} by the thyroids of starved rats was compared with the uptake noted in control animals in order to determine whether thyroid activity in rats remains unchanged during starvation, when computed on a body-

weight basis. Fifty young female rats of the Sherman strain were divided into five groups of ten each and were fed ad libitum, 3/4, 1/2, 1/4, and no-feed regimens; the unfed group was sacrificed at the end of 7 days and the other groups at the end of 14 days, 8 hr previous to sacrifice, each rat was injected intraperitoneally with 0.2 ml of carrier-free ^{131}I (estimated to contain approximately $2\text{ }\mu\text{C}$). The thyroids were removed, weighed, dried, and counted and it was found that the weights of the thyroids of the underfed rats were decreased but remained relatively unchanged on the basis of 100 g/body weight . Underfeeding also did not affect the ability of thyroid tissue/ μg to concentrate the radioiodine, counts being similar for all the groups. It is concluded that the primary effect of underfeeding was that it did tend, however, to reduce the total thyroid activity. NSA 4-2264

THE METABOLIC FATE OF SYNTHETIC METAPHOSPHATES AND THEIR INFLUENCE ON URANIUM EXCRETION. Robert Megirian. (Atomic Energy Project, Univ. of Rochester). Sept. 17, 1953. 65p. Contract W-7405-eng-49. (UR-281)

Various polyphosphates were injected into rats simultaneously with sublethal amounts of uranyl nitrate given intraperitoneally. The cyclic polymers enhanced the excretion of U whereas the linear polymers depressed the excretion when given by the same route of administration as the uranyl nitrate. Evidence is presented to show that the polyphosphates are able to affect the excretion of U only during the first 24-hr period after the injection of the heavy metal. (auth) NSA 8-991

THE EFFECT OF CERTAIN GOITROGENIC DRUGS ON THE ABSORPTION OF RADIOACTIVE IODINE BY THE THYROID GLAND. PART II. COLLECTION OF RADIOIODINE BY THYROIDS OF RATS AND CHICKS FOLLOWING A SINGLE INJECTION OF THESE AGENTS. D. A. McGinty, R. W. Rawson, R. G. Fluhrty, Mary Wilson, Charlotte Riddell, and Hilda Yee. J. Pharmacol. Exptl. Therap. 92, 246-57(1948) June.

The antithyroid action of several goitrogenic compounds was studied quantitatively by comparing the effect and duration of effect of varying doses of these agents, when injected subcutaneously, on the collection of radioiodine by the thyroids of rats and chicks. The drugs studied included thiouracil, propylthiouracil, benzylthiouracil, methylthiouracil, 5-aminothiadiazole-2-thiol (TC-68), 3-(phenylaminomethyl)-thiazolidine-2-thione (TC-105), 2-aminothiazole and potassium thiocyanate. In the rat, it was observed that propyl and benzylthiouracil were ten times as effective as thiouracil and methylthiouracil in inhibiting the natural capacity of the thyroid to collect iodine. The duration of inhibitory action of minimal effective doses of these drugs was not materially different. In all cases at least partial escape from the drug effect occurred eight hours after administration. In the cockrel, the minimal effective inhibitory doses of all compounds were greater than in the rat. Benzylthiouracil was observed to be approximately ten times more effective than thiouracil, propylthiouracil and TC-68. TC-105 aminothiazole and potassium thiocyanate had about one-half the activity of thiouracil. The duration of action of minimal effective doses was six hours. With the exception of aminothiazole, in all instances escape from the block to iodine collection was complete 24 hours after injection of the drug. Certain fundamental differences between the iodine-blocking effect and the goitrogenic action of these agents are discussed. NSA 1-711

THE METABOLISM OF THE LANTHANONS IN THE RAT.

II. TIME STUDIES OF THE TISSUE DEPOSITION OF INTRAVENOUSLY ADMINISTERED RADIOISOTOPES. Patricia W. Durbin, C. Willey Asling, Muriel E. Johnston, Joseph G. Hamilton, and Marilyn H. Williams. Nov. 8, 1955. 23p. Contract W-7405-eng-48. (UCRL-3191)

Tracer studies have been performed to study the fate of citrate-complexed high-specific-activity Ce^{144} , Eu^{154} , Tb^{160} and Tm^{170} following intravenous administration. Preliminary investigations of the mode of transport of microgram amounts of these lanthanons complexed with sodium citrate are also described. At a mole ratio of 1000:1 citrate to lanthanon, the distribution is similar to that previously found following intramuscular administration. It is postulated that following the introduction of microgram amounts of lanthanon-citrate into the blood stream, the citrate complex is destroyed and the lanthanon recomplexed by one of the plasma proteins. The distribution studies at postinjection intervals from one minute to 24 hours showed that the rate of disappearance of intravenously administered lanthanons is dependent on the rate of circulation in the target organ, the greater skeletal deposition of the heavy lanthanons are apparent as early as 1 mm after intravenous injection, both the liver and the skeleton are capable of accumulating lanthanons against a rather large concentration gradient. The urinary excretion rate of the lanthanons is dependent on the plasma level, i. e., the kidney does not seem to be able to excrete lanthanons against a concentration gradient. (auth) NSA 10-1694

10446

PASSAGE OF SELENIUM THROUGH THE MAMMARY GLANDS OF THE WHITE RAT AND THE DISTRIBUTION OF SELENIUM IN THE MILK PROTEINS AFTER SUBCUTANEOUS INJECTION OF SODIUM SELENATE. Kenneth P. McConnell, J. Biol. Chem. 173, 653-57 (1948) April.

It has been demonstrated that after subtoxic subcutaneous injections of selenium (radioactive) as sodium selenate, selenium passes through the mammary gland into the milk of the white rat. Further, it has been found that administered inorganic selenium was converted into organoselenium in the protein fraction of milk because approximately 54 per cent of the selenium present in the milk was in the casein fraction, while smaller amounts, namely 40 and 7 per cent, were in the albumin and globulin fractions, respectively. NSA 1-383

10447

DISTRIBUTION OF SELENIUM IN SERUM PROTEINS AND RED BLOOD CELLS AFTER SUBCUTANEOUS INJECTION OF SODIUM SELENATE CONTAINING RADIOSELENIUM. Kenneth P. McConnell and Betty J. Cooper. J. Biol. Chem. 183, 459-66(1950) Apr.

Studies were made on the distribution of selenium in the blood, serum proteins, and red blood cells of the dog after subcutaneous injections of radioseelenium, Se^{75} , as sodium selenate. It was found 24 hr after the last of three injections that the whole blood activity in red blood cells for four dogs averaged 79%, while in plasma it averaged 22%, it was calculated that 2.0 to 3.9% of the selenium administered was present in the total circulating blood. The results obtained from serum protein fractionation revealed that selenium was present in albumin, globulin, euglobulin, and pseudoglobulin and that the amount of selenium in the various fractions when expressed as micrograms of selenium per gram of protein was similar, but not identical. Results from dialysis studies indicated

that there was a certain amount of selenium fixation in blood proteins which existed in a fairly stable protein-like combination. It has been shown that selenium is present in crystalline hemoglobin and hemin and in globin, the amounts of selenium in hemin, when calculated on the gram basis, are greater than in globin. SKELETAL EFFECTS OF RADIO-IODINE INDUCED THYROID DEFICIENCY IN MICE AS INFLUENCED BY SEX, AGE, AND STRAIN. Ruth Silberberg and Martin Silberberg (Snodgrass Lab. and Washington Univ. School Med., St. Louis, Mo.). *Am. J. Anat.* **95**, 263-89(1954) Sept.

In male and female mice of strains DBA and C57BL, thyroid deficiency induced by radioactive iodine, I^{131} , retarded growth and development of the tibia. The underlying histogenetic mechanisms consisted of delayed growth and ossification of the epiphyseal cartilage and of marked inhibition of resorption of cartilage and bone. These changes, in particular the inhibition of resorption, were more prominent in females than in males and more pronounced in strain DBA than in strain C57BL. The skeletal response to thyroid deficiency decreased with advancing age at the time of administration of the isotope. The possible relationship of strain and sex differences to the genetic hormonal make-up is discussed. It is suggested that the sex difference in skeletal response to thyroid deficiency induced by I^{131} are primarily due to the action of estrogenic hormone in the female and that the strain differences are related to strain differences in thyroid activity of mice of the two strains investigated. In addition, the strain differences in the skeletal response of females to the thyroid deficiency seem to be determined by the amount or relative potency of the endogenous estrogenic hormone produced. Univ. of Calif., Berkeley. Radiation Lab.
MEDICAL AND HEALTH PHYSICS QUARTERLY REPORT [FOR] OCTOBER, NOVEMBER, DECEMBER 1954. Feb. 28, 1955. 46p. Contract W-7405-eng-48. (UCRL-2881)

Results are reported from tracer studies in the rat employing either carrier-free or high-specific-activity radioisotopes of La, Pm, Gd, Tb, and Er. Data are tabulated from a series of tracer studies on the bone deposition of Ca^{45} and Sr^{90} - Y^{90} mixture in rats and monkeys. In the skeletons of rats sacrificed from 4 to 265 days after injection the Sr^{90} - Ca^{45} ratios were consistently less than unity and averaged approximately 0.65. A method is described for mounting uniform samples for radiometric analysis of α and soft- β emitters dissolved in salt solution. Propylthiouracil treatment increased the thyroidal accumulation of At^{211} in rats and the combination of this treatment with thyroxine and propylthiouracil decreased the thyroidal uptake of At^{211} . Preliminary results are discussed on the pathological effects of At^{211} on rats and monkeys. Preliminary results are reported in the *in vivo* determination of two isotopes simultaneously, human blood volume studies with Cr^{51} -labeled red cells, the relationship of age and sex to the early mixing of Na^{24} in humans, the incorporation of P^{32} into the deoxyribonucleic acid (DNA) of hypophysectomized rats, the total DNA content of livers and small intestine after whole-body x irradiation of mice, the relationship between serum lipoproteins, coronary atherosclerosis, and coronary disease, and early cardiovascular disturbances following thermal injury. THE DISTRIBUTION OF RADIOACTIVE IODINE IN MICE WITH AND WITHOUT TUMOR 15091A AFTER INJECTION OF RADIOACTIVE SODIUM IODIDE. Charles D. Stevens, Mary Ann Meinken, Patricia M. Quinlin, and Paul H. Stewart. *Cancer Research* **10**, 155-6(1950) Mar.

Measurements were made of the distribution of I^{131} among the tissues of 206 mice killed either 45 min or 25 hr after injection of labeled sodium iodide in quantities varying from 0.0013 to 1.3 μ g of iodine/g of mouse. Smaller quantities of I^{131} were found in the thyroid glands of mice with implants of tumor 15091a than in the thyroids of control mice, although the concentration of I^{131} in their blood were similar. Higher concentrations of I^{131} were found in the spleens of tumor mice than in their blood on some occasions. Compared to the concentrations of I^{131} in the sera, the livers and ear pinnae of mice contain lower concentrations of I^{131} , and their thymus glands contained higher concentrations than noted in the corresponding tissues in rats. Otherwise, the distribution of the injected iodide was similar in mice and rats. NSA 4-2968

10454

THE ACTION OF RADIOACTIVE RADIATIONS ON THE FUNCTIONAL STATE OF RETINA. G. G. Demirchoglyan, G. T. Adunts, and Ts. Avakyan. p.164-9 of **WORKS OF THE ALL-UNION CONFERENCE ON MEDICAL RADIOLOGY. EXPERIMENTAL MEDICAL RADIOLOGY.** Translated from a publication of the State Publication House of Medical Literature, Moscow, 1957. (AEC-tr-3661(Bk. 1))

Data are presented on the effects of phosphorus-32 on electric characteristics of the eye retina which reflect its functional state. It is concluded that in the clinical use of phosphorus-32 and of other radioactive isotopes it is necessary to take into account the possibility of effects of even very small amounts on the retina. EFFECT OF A SINGLE DOSE OF URANYL NITRATE. W. L. Downs, Elliott A. Maynard, and Harold C. Hodge. (nd). Decl. Dec. 22, 1949. 21p. (AEC-D-2772).

Fifty male and 50 female rats were given access to a diet containing 2% uranyl nitrate hexahydrate for a single 24-hour period and thereafter maintained for 10 months on the stock ration. Equal groups of control rats were observed during the same period. The rats were kept in pairs, 1 male and 1 female in each cage. The male rats were removed from the cage near the end of the gestation period. The litters were removed at birth and the rats remated. There was no interference in growth associated with the single dose of uranyl nitrate hexahydrate. A single 24-hour feeding of uranyl nitrate did not reduce the number of females bearing litters. The experimental female rats had a small reduction in the number of litters but a larger reduction in the total number of pups. It seems to be reasonable to conclude that, under the circumstances of this experiment, uranium administration adversely affected the reproductive functions in the absence of a severe derangement of nutrition. ABSORPTION OF METALLIC COBALT-60 FROM A SUBCUTANEOUS SITE. M. Nickson, L. F. Lamerton, and W. V. Mayneord. *Nature* **164**, 613(1949) Oct. 8 (letter to the editor)

In order to determine the behavior of subcutaneously administered cobalt, mature rats were implanted with active and inactive cobalt wire. The wire (0.01 in. diameter) was cut into lengths of about 1 in. and each radioactive length was estimated to contain $24 \mu\text{c}$ of cobalt-60. When the animals were sacrificed (4 to 14 days later) localized inflammatory reactions were found in all animals implanted with bare cobalt (active or inactive). When gold-covered cobalt wires were used the only tissue reactions were at the open ends of the tubes. Although no attempt was made in these experiments to determine the

quantity of cobalt absorbed, tissues which had been near the bare radioactive wire were found to be more active than tissues near the gold-covered cobalt. Similar inflammatory reactions were obtained in a group of rats implanted with active and inactive cobalt disks. It was also shown that bare metallic cobalt-60 can be absorbed from a subcutaneous site and may be found in the adjacent tissues, in the liver, kidneys, remaining parts of the body and excreta. It was concluded that neither cobalt-60 nor its alloys should be used parenterally without prior investigation of possible absorption. NSA 3-2049

Harvard School of Dental Medicine
SUMMARY REPORT ON STUDIES ON THE METABOLISM OF THE TEETH. Reidar F. Sognaes and James H. Shaw. Dec. 1, 1952. 16p. (AECU-2359)

A series of experiments on the interactions between saliva, enamel, dentin and the internal blood supply of the teeth has been conducted. The first problem to be explored has been conclusively answered to the effect that the enamel of P^{32} -injected monkeys attains its major radioactivity from a direct contact with salivary P^{32} per se. Two P^{32} gradients have been observed in the teeth of intact rhesus monkeys following intravenous P^{32} administrations: one increasing from the internal to the external enamel surface, the other increasing from the external to the internal dentin surface. The former gradient could be nearly completely abolished by avoiding contact between the enamel and the salivary P^{32} secretion, the latter by removal of the pulpal P^{32} supply to the teeth. The P^{32} uptake of enamel was greater in young than old teeth, lower in extracted than vital teeth, and was reduced in teeth exposed to radioactive saliva containing 20% sucrose. Observations on P^{32} , which forms an integral part of the tooth, have more recently been compared with the distribution of radioisotopes, such as radioiodine and tritiated water which give clues to processes of diffusion. Measurements of radioactivity have been made with procedures described in detail in published works. In addition, we have continued to refine the radioautograph technique, exploring the application of ultra-thin section. (auth) NSA 7-1600

CALCIUM EXCHANGE AS THE MECHANISM FOR ADSORPTION OF THE RADIOACTIVE ISOTOPE BY BONE. M. Falkenheim, E. E. Underwood, and H. C. Hodge. NNES Div. 6, Vol. 1, Pt. 4, p.1959-70 (J. Biol. Chem. 188, 805-17(1951).

In vitro experiments in which powdered bone ash was exposed to solutions of calcium chloride containing Ca^{45} have shown that bone exchanges calcium with the solution. The Ca^{45} concentration rises rapidly until it reaches a "quasi equilibrium." The exchangeable bone calcium represents at the most less than 20% of the total bone calcium, this fraction is of the same order of magnitude as that previously reported for the exchangeable bone phosphate. This reaction is reversible to the same "quasi equilibrium" point. 14 references. (auth) NSA 4-1923

THE UPTAKE OF RADIOACTIVE PHOSPHORUS IN NORMAL BREAST AND BREAST TUMORS. N. N. Das Gupta, K. L. Bhattachary, R. Dutt Choudhuri, A. Bose, and P. K. De. Acta Radiol. 45, 69-80(1956) Jan.

Radioactive phosphorus (P^{32}) was administered to 48 patients with breast tumors and the superficial beta activity over the tumor and over a corresponding site of normal breast measured. The relative activity in 85% of the histologically proved malignant tumors was found to range from 130 to 350% of the normal, while 82% of the benign tumors showed an uptake ratio ranging from 100 to 130% of the normal. In about 17% of the total number of cases, the probable diagnosis based on radioactivity measurement was at variance with the histologic report. It is suggested that the use of P^{32} in the diagnosis of malignancy can be a useful adjunct to the already existing pathologic test. (auth) NSA 10-6508

BIOLOGICAL STUDIES WITH ARSENIC⁷⁶. II. EXCRETION AND TISSUE LOCALIZATION. Howard S. Ducoff, William B. Neal, Robert L. Straube, Leon O. Jacobson and Austin M. Brues. *Proc. Soc. Exptl. Biol. and Med.* **69**, 548-554(1948) Dec.

Arsenic excretion was studied in man, rats, and rabbits. Less than 10% of the excreted arsenic is found in feces in any of these species, rats have by far the slowest rate of excretion. Data are given for arsenic distribution in various organs in man, the rat, the rabbit, and 2 strains of mouse. The degree of individual variation within each species was very great, in contrast to man and to other animals studied, the rat retains most of the injected dose in the blood for a considerable length of time. The ratio of arsenic concentration in kidney, liver, and spleen of healthy inbred mice was found to be fairly constant for a given time after administration, and this ratio is suggested as a criterion for effects of various types of treatment. Using this ratio as criterion, it was found that arsenic distribution is altered by the presence of transplanted tumors. Factors changing arsenic distribution are discussed in relation to effects on levels of sulfhydryl-containing substances. NSA 2-1026

RATE OF EXCRETION OF RADIOACTIVE SULFUR AND ITS CONCENTRATION IN SOME TISSUES OF THE RAT AFTER INTRAPERITONEAL ADMINISTRATION OF LABELED SODIUM SULFATE. Dominic D. Szwiatkowski. *J. Biol. Chem.* **178**, 197-202(1949) Mar.

The excretion by rats in urine and feces of S^{35} in the form of sodium sulfate appears to be rapid and accounts for the major portion of the S^{35} given. Approximately 95% was found to have been eliminated by these routes at the end of 120 hours. During that period the concentration of S^{35} in the blood, liver, and brain fell to relatively low levels. A similar concentration of S^{35} in the blood and liver was reached at 48 hours, and in the blood and brain at 72 hours. In contrast to the rapid fall observed in the liver and blood, the concentration of S^{35} was found to increase until about the 8th hour in bone and until the 24th hour in bone marrow. The subsequent fall in the S^{35} concentration of the bone and bone marrow was also slower than in blood, liver, and brain. NSA 2-1729

Argonne National Lab., III. THE DISTRIBUTION OF URANIUM IN TISSUES OF DOGS ADMINISTERED URANIUM METAL OR OXIDE (U_3O_8) BY ORAL OR PULMONARY ROUTES. J. J. Nickson, R. Ferretti, and S. T. Cantrell. May 1, 1948. Decl. October 22, 1948. 8p. (AECD-2356; ANL-4190)

A study was made of the distribution of uranium in the tissues of 5 dogs given talc, uranium oxide, or uranium metal either orally or by pulmonary insufflation over a period of several months. The animals were sacrificed about 3 years after the last dose was given. High concentrations of uranium were found in the adrenals of all dogs used in this study. All values reported have been corrected for fluorescence quenching. Oxide vs. metal by pulmonary insufflation: The dog given uranium oxide retained approxi-

mately 4 times the amount of uranium in the lung and kidney cortex than did the dog that received metal. The average concentration of uranium in the brain, liver, and spleen was slightly more in the dog that received the metal than in the oxide-treated animal. Oxide vs. metal by feeding: The concentration of uranium in the kidney cortex of the dog that received the metal was 6 times greater than that of the dog that received the oxide, and the concentration of uranium in the brain tended to be somewhat higher in the oxide-treated dog than in the dog receiving the metal. The concentration of uranium in the bone shaft and rib was much greater in the dog administered the metal than in the dog which received the oxide.

PRELIMINARY OBSERVATIONS OF URANIUM METAL ON WOUND HEALING WITH REFERENCE TO GAS FORMATION. W. F. Neuman, Roberta Allen and B. J. Mulryan. Jan. 13, 1949. Decl. Feb. 21, 1949. 5p. (AECD-2476, UR-50)

Small scale tests were conducted to determine whether uranium caused gas-formation when exposed to tissue fluid. In-vitro experiments and in-vivo experiments using rabbits were carried out. It is clear that uranium metal did not result in gas-formation when exposed to tissue fluids. The apparent absorption of gas in the in-vitro experiment probably resulted from the solution (as a bicarbonate complex) of some partially oxidized uranium. Clinically, if gas-formation is observed in wounds containing uranium metal, it appears justifiable to assume that bacterial contamination is responsible for the gas-formation.

THE EFFECTS OF SMALL AMOUNTS OF POLONIUM ON RATS. R. K. Davis, G. T. Stevenson, K. A. Busch, and D. S. Anthony. Aug. 1955. 25p. Contract AT-33-1-GEV-53. (MLM-1062)

Large groups of Sprague-Dawley rats were given either small single intravenous injections of 0.75, 0.5 or 0.25 microcurie of Po^{210} per kilogram body weight, or repeated doses designed to maintain a relatively constant polonium burden of 0.01 microcurie per kilogram body weight. Since the most sensitive criteria of polonium damage had been shown to be shortening of life span, or possibly increased tumor incidence, these two possible effects were given the most attention in observations continuing throughout the adult life of the animals. Definite shortening of life span occurred in male rats that had received the single doses of 0.75 or 0.5 microcurie per kilogram body weight. Life span shortening at the 0.25 microcurie level was not as definite, though probable. None of the groups of females receiving single doses showed significant life span shortening, possibly in part because of the greater variance of the female populations. A maintained polonium burden of 0.01 microcurie per kilogram body weight was completely without measurable effect. No effect on tumor incidence was observed in any of the single or multiple dose groups. However, the tumor incidence in all groups of old injected and control rats was very high. (auth)

THE DIPHASIC CHARACTER OF THYROIDAL I^{131} CLEARANCE. John H. Nodine, William H. Perloff, Danilo De

Albuquerque, Leon Perezek, and Bertram Channick (Temple Univ. School of Medicine and Philadelphia General Hospital, Philadelphia, Penna.). *J. Clin. Endocrinol. and Metabolism* **15**, 347-53 (1955) Mar.

The occurrence of a biphasic thyroidal radioiodide clearance in which the second phase is slower than the first phase, has been observed in 13 of 15 normal subjects. This shift in clearance rate has been correlated with changes in the rates of serum I^{131} disappearance and urinary I^{131} excretion. An apparatus has been constructed and tested, for use in correlating these findings with an initial phase of equilibrium and a final phase of hormonal synthesis. (auth) NSA 9-2603

PHARMACOLOGICAL STUDIES OF RADIOGERMANIUM (Ge^{71}). H. C. Dudley and E. J. Wallace. *Arch. Ind. Hyg. Occupational Med.* **6**, 263-7 (1952) Sept.

A method is presented by which the Ge in tissues and excreta may be determined by radiochemical counting of Ge^{71} . Studies of the distribution and excretion of radio-germanium oxide in the rabbit and the dog indicate that this compound is rapidly eliminated, chiefly by way of the urine. No selective tissue localization occurred. Studies of both stable and radioactive particulate Ge preparations indicate that the organism can easily dissolve finely divided elemental Ge and rapidly eliminate it, probably as the oxide. Ge oxide appears to be pharmacologically inactive. Because of the low energy (9 kv) of the radio-activity form Ge^{71} , the biological effectiveness of this isotope is not significant. AN AUTORADIOGRAPHIC STUDY WITH P^{32} OF THE RABBIT UTERUS. Erik Odeblad and Bjorn Westin. *Acta. Endocrinol.* **11**, 311-16 (1952) Dec.

The autoradiographic picture with P^{32} (mainly in nucleic acids) of the rabbit uterus was studied in castrates, after treatment with oestradiol monobenzoate and progesterone and in anoestrous animals. The epithelium contained larger amounts of P^{32} than the myometrium and the myometrium more than the endometrial stroma within each experimental group. Oestrogen increased the amount of P^{32} in all layers. Progesterone superimposed upon oestrogenic stimulation caused an additional increase, especially in the endometrial epithelium. The pictures of anoestrous animals resembled those of the castrates, and three days of oestrogen-withdrawal had no appreciable effect. (auth) NSA 7-2252

REPEATED INTRAPERITONEAL INJECTIONS OF URANYL NITRATE. Ann G. Dinse, T. B. Barnett, Harold C. Hodge, and Elliott A. Maynard. *nd. Decl. Dec. 22*, 1949. 29p. (NNS, Div. VI, Vol. 1, Pt. 3, Chap. 20, Sec. 1). (AECD-2770)

Groups of male and female rats were injected daily for one month with the same volumes (10 cc/kg) of various concentrations of uranyl nitrate hexahydrate in aqueous solution. In the first experiment weanling female rats were treated as follows: (1) control group, no treatment, (2) control group, injected with distilled water daily, (3) dose of 0.08 mg/kg daily, (4) dose of 0.40 mg/kg daily, (5) dose of 2.0 mg/kg daily. In the second experiment weanling male rats were treated as follows: (1) single dose of 1.0 mg/kg, (2) dose of 0.17 mg/kg daily, (3) dose of 0.67 mg/kg daily (4) dose of 1.0 mg/kg daily. None of the control rats and none of the rats receiving up to and including 0.40 mg/kg daily died. Of the remaining three groups, the mortalities were as follows: 0.67 mg/kg daily, 20%, 1.0 mg/kg daily, 60%, 2.0 mg/kg daily, 90%. During the one-month period of treatment of growth rates of the control rats, those receiving the single dose, and those receiving daily doses of 0.08 and 0.17 mg/kg, respectively, were all closely similar, specifically, the average body weights at the end of the month were within 10 grams of each other. Considerable growth depressions followed the daily injection of 0.40 to 2.0 mg/kg. At the time of autopsy, organ weights were recorded. In general, the rats had sacrificed body weight in order to maintain the vital organs. An exception was the liver which showed a loss of weight. When the daily doses are computed as cumulative doses the total amounts administered are found to be small, for example, a daily dose of 0.08 mg/kg gave a total dose of only 0.3 mg during the month, and the highest dose, 2.0 mg/kg, amounted to only 4.0 mg in the month. The anatomical diagnosis showed the following progressive increase in renal injury with dosage: 0.08 mg/kg, very slight changes, 0.17 mg/kg, slight changes, 0.40 mg/kg, mild to moderate injury, 0.67 mg/kg, moderate to moderately severe injury, 1.0 mg/kg, moderately severe injury. There were too few survivors to assess the relative damage following the administration of 2.0 mg/kg. These data provide the basis for indicating the relationship between percentages of uranyl nitrate mixed into the diets of rats and ingested for one month and the daily doses given intraperitoneally. Using mortality as a criterion, 1% of uranyl nitrate hexahydrate in the diet is roughly equivalent to 0.2 to 0.3 mg/kg intraperitoneally. Using weight depression as a criterion, 1% in the diet is roughly equivalent to 0.33 to 0.39 mg/kg intraperitoneally. Using the pathological changes as a criterion, 0.5% in the diet is compared with 0.17 mg/kg and 2.0% in the diet is compared with 0.67 mg/kg, therefore, 1% in the diet is intermediate between 0.17 and 0.67 mg/kg intraperitoneally. EFFECT OF RESORCINOL ON THE THYROID UPTAKE OF I^{131} IN RATS. I. Doniach and Russell Fraser. *Lancet* **1**, 855-856 (1950) May 6.

Adult rats weighing 150 to 250 g (mostly females of the hooded Lister strain) were injected intraperitoneally with 10 μ c of I^{131} along with 0.5 μ g of carrier potassium iodide and were sacrificed 1.0, 1.5, and 2 hr later, the radioactivity in the alkaline digest of the dissected thyroid glands was then determined. Radioautographs were made on other rats 2 hr after an intraperitoneal injection of 18 μ c of the isotope. The antithyroid effects of 4-methyl-2-thiouracil, sodium thiocyanate, and resorcinol were measured in separate experiments, a subcutaneous injection of the particular drug to be studied was made 10 to 30 min before the administration of the I^{131} , the injection sometimes being repeated 1 hr later; the results were compared with the thyroid uptake seen in controls. Resorcinol effects were found to be similar to those of methyl thiouracil in all respects tested, that is, the maximal depression of thyroid uptake of iodine which can be induced, the abolition of organic binding as evidence by radioautographs, and the enhancement of its antithyroid effect obtainable by the additional injection of thiocyanate but not of methyl thiouracil. RADIOIRON ABSORPTION IN ANEMIA DOGS. FLUCTUATIONS IN THE MUCOSAL BLOCK AND EVIDENCE FOR A GRADIENT OF ABSORPTION IN THE GASTROINTESTINAL TRACT. Wellington B. Stewart, Charles L. Yuile,

Herbert A. Claiborne, Richard T. Snowman, and George H. Whipple. *J. Exptl. Med.* **92**, 375-82 (1950) Oct. 1.

Radioiron, Fe^{55} , has been used to study the absorption of iron from the gastrointestinal tract of normal and anemic dogs. The control of iron absorption appears to reside in the mucosa of the gastrointestinal tract. The colon absorbs very little iron. The stomach and duodenum seem to be the most active in its absorption. This suggests the existence of a gradient in the capacity of the gastrointestinal tract to absorb iron. NSA 4-6319

THE EFFECT OF PHYTATE AND OTHER FOOD FACTORS ON IRON ABSORPTION. Leon M. Sharpe, Wendell C. Peacock, Richard Cooke, and Robert S. Harris. *J. Nutrition* **41**, 433-45 (1950) July 10.

The effect of 7 test meals upon the absorption of either reduced Fe^{55} or reduced Fe^{59} fed to adolescent boys was measured. The test meals considered of (I, VI) milk, rolled oats, tomato juice, white bread, and omelet, (II) milk, (III) milk and sodium phytate, (IV, VII) milk and rolled oats, and (V) water. Each meal contained approximately the same amount of iron. Meals I, VI, and VII contained the same level of natural phytate in rolled oats; meal III contained the same quantity of phytate, as the sodium salt; meal IV contained approximately half as much rolled oats and phytate as meal VII; phytate was absent from the meals II and V. The following percentages of radioactive iron were absorbed from these meals: (I) 4.43, (II) 17.4, (III) 1.74, (IV) 9.81, (V) 26.9, (VI) 5.76, and (VII) 8.84. Milk reduced the absorption of iron by one-third. This was not due to the action of phytates, as the milk contained none. Rolled oats and milk reduced the absorption of iron by two-thirds. Thus, rolled oats interfered no more than did milk. There was no correlation between the phytate content of rolled oats and the reduction in iron absorption. Sodium phytate reduced the absorption of iron by 15-fold, indicating that added soluble phytates can interfere with iron absorption. The absorption of iron from the breakfast was one-fifth that from the water meal. Medicinal iron should be more effective if administered between meals. Evidence is presented for the inverse correlation of iron absorption with the solids content of the test meals. 18 references. (auth) NSA 4-5143

BEHAVIOR OF THORIUM IN GRAVID AND NON-GRAVID RATS. A. Engels, W. Maurer, and A. Nikias. *Exptl. Med.* **115**, No. 5, 525-33 (1950). (In German)

In a previous paper (*Deut. med. Rundschau* **3**, 261 (1949)) the authors have shown that thorium injected into

animals was accumulated mainly in the liver, the spleen, and the bones. In the present work the same technique (intravenous introduction to thorium nitrate into a rat's tail, Th being labeled with UX_1) was applied to a study of differences in the distribution of Th in gravid and non-gravid rats. It was found that the above mentioned organs were chiefly involved in both cases, however, in gravid animals the Th concentrations were lower, and the decrease of Th content in blood proceeded more slowly than in nongravid individuals. It was also established that the volume of blood contained in the adrenals of a gravid rat is twice that found in those of a nongravid animal, the body weight being only slightly increased in the former case. COMPARATIVE BIOLOGICAL EFFECTS OF URANIUM²³³ AND URANIUM²³⁸ (NORMAL URANIUM); RENAL FUNCTION STUDIES. W. J. Eversole. Jan. 10, 1953. 25p. (LA-1333)

Renal function tests reveal that either U^{233} or normal uranium (U^{238}), in a dose of 1 mg/kg body weight causes severe damage to the kidneys. Following an initial period of equal impairment by U^{233} or U^{238} , kidney function in animals given U^{233} returns toward normal more slowly than in animals given U^{238} . Evidence presented indicates that the toxicity of U^{233} is a result of its chemical rather than its general radiation effects on the kidney.

BIOLOGICAL INJURY FROM PARTICLE INHALATION.

Falconer Smith, D. W. Boddy, and Marvin Goldman (National Inst. of Arthritis and Metabolic Diseases, Bethesda, Md.). June 18, 1952. Decl. with deletions Sept. 25, 1959. 55p. Project 2.7 (of) OPERATION JANGLE. (WT-396(Del. 2)) OTS.

Mongrel dogs and sheep were exposed at 2500, 5000, and 8000 feet from surface and underground zero. The purpose of the exposure was to assess the hazard due to inhalation of the dust associated with surface and underground atomic detonations, and to compare the internal and external doses obtained in the exposed test animals. Animals were sacrificed at from H + 10 to H + 24 hours, and at D + 2, D + 4, D + 9, and D + 70 days. Dry ashed homogenates of lung, liver, spleen, kidney, blood, bone, urine, and gut contents were assayed for radioactivity. Representative pieces of soft tissues were fixed by a freezing dehydration method for the preparation of autoradiographs. Samples of bone were wet ashed and assayed for their radioactivity. Radioactivity in tissues taken from animals exposed during the surface shot was extremely low and total body amounts of radioactive materials found at the time of sacrifice were estimated to range between 0.06 and 2.13 μ c. Total-body activity for animals exposed during the underground test ranged between 2.22 and 31.1 μ c. Integrated internal dosage due to β emission ranged from 0.10 to 0.43 rep. Dosage for dog lungs due to β emission ranged between 0.25 and 7.03 rep and between 0.19 and 8.83 rep for sheep lungs. Tissue radioactivity had fallen below limits of detection in all animals by D + 9 following the underground shot. Embryonic tissues and associated fluids contained just detectable activity. Three types of radioactive particles were detected in autoradiographs of lung tissue. One of these particles was a pure α emitter of 5 mev energy and was probably Pu^{239} . A second type of active particle emitter α and β particles while a third was a pure β emitter of indeterminate energy. Autoradiographs of soft tissue other than lungs showed no blackening. A few bone samples contained suf-

ficient activity to cause some blackening on Ilford plates after 29 days of exposure. No evidence of α activity could be detected in bone samples. Radiochemical analysis of the femurs strongly indicated that their activity was due to Ba^{140} and Sr^{90} . Amounts of activity taken up by the combined action of inhalation and ingestion in animals exposed to the dust associated with either type of detonation were not physiologically significant. The mixture of materials thus taken up was undetectable in tissues of animals sacrificed 4 days after the surface shot and 9 days after the underground shot. It is calculated that the underground detonation of a 20 KT weapon would not result in a short term inhalation and ingestion hazard to dogs and sheep exposed under conditions comparable with those prevailing during the JANGLE underground test. 10506

QUANTITATIVE STUDIES ON SKELETAL ACCRETION IN LABORATORY AND DOMESTIC ANIMALS. R. H. Wasserman (New York State Univ. Veterinary Coll., Ithaca). 16p. (A/CONF.15/P/816)

Prepared for the Second U. N. International Conference on the Peaceful Uses of Atomic Energy, 1958. In all animals there are two processes occurring simultaneously in the skeleton: bone accretion and bone resorption. The net increase in bone is equal to bone accretion minus bone resorption and can be determined by gross measurements of bone growth. Until the use of radiotracer techniques it was not possible to measure each process separately. There are two general methods whereby accretion and resorption data can be obtained. Both methods are initially worked out with the rat. The first procedure is based on a combination of balance and radiotracer techniques. The principle is, as follows: radiocalcium (Ca^{45}) is incorporated into the diet or drinking water of the experimental animal, and the intake of dietary calcium and Ca^{45} measured. After a short period on this labeled diet, the rat is killed and the retained skeletal Ca^{45} determined. Total bone growth, or accretion, is equivalent to the amount of Ca^{45} retained in the skeleton divided by the specific activity ($SA = Ca^{45}/Ca^{40}$) of the diet. When, under conditions of continuous Ca^{45} ingestion, the integrated, plasma specific activity curve and retained skeletal Ca^{45} were employed for this calculation, similar values were obtained. Bone resorption values are determined by difference between the calculated accretion values and net bone growth measured by conventional methods. In the second method, Ca^{45} is parenterally administered in a single dose, and bone accretion estimated from the Ca^{45} disappearance curve and retained Ca^{45} . Mathematical analysis of this kind of data has indicated that the movement of Ca^{45} into bone by accretion can be distinguished from that due to exchange reactions, accretion rates can thus be calculated. These methods have been used for preliminary calculations of bone accretion and bone resorption in domestic animals since such values are not available in the literature. NSA 12-14559

10507

DISTRIBUTION OF RADIOACTIVE GALLIUM IN THE TEETH AND JAWS OF EXPERIMENTAL ANIMALS. J. A. English and H. C. Dudley. (Naval Medical Research Institute). May 3, 1949. 14p. (NM-008-009-Report 1)

Radiogallium in the form of soluble Ga lactate (pH 7.0 - 7.4) was injected subcutaneously into rats and rabbits. The dosage was 0.2 to 0.4 mc of Ga^{112} per kg of body weight (6 mg/kg), which is well below the toxic level. The animals were killed six hours after injection and thin sections (50 - 100 μ) were made of the bone and teeth by cutting with high speed abrasive discs and grind-

ing to the desired thickness against an abrasive wheel. These thin sections were placed next to special x-ray film for 24-48 hr. The rays emanating from the radioactive isotope affected the film just as do the rays from an x-ray tube. The developed negatives were compared with transillumination photographs which were subsequently made from the ground sections. By this means it was determined that radiogallium is predominately deposited in endosteum, periosteum, tooth pulp, and peridontium. There appears to be a moderate deposition in cancellous bone. Cortical bone and the dentin of the root portion of teeth take a barely perceptible amount of radiogallium, whereas coronal dentin and enamel give no indication that any radiogallium is deposited. The main advantages of the autoradiographic method over methods using the electroscope or Geiger counter for determining the radioactivity are that fractional portions of teeth and bone are not required, and the visual localization is rapid and effective. The relative distribution of the radioactive substance in each anatomic area is apparent, however, quantitative measurements were not attempted in this study. 40 references. NSA 3-1180

THE BIOLOGICAL SIGNIFICANCE OF X-RAY DOSE. Holzknecht. Munch. Med. Wchnschr. 68, 1180(1921). (In German).

It is necessary to have a proper treatment method for each malady, not a single universal treatment method. One must use maximum dose for malignant tumors, minimally effective doses for benign conditions. Author cautions against use of maximum dose in all cases, citing ill effects in tbc. Disorders of hypophyseal function, testicular and ovarian irradiation are included among conditions treated by radiation therapy.

SIZE OF DOSE: ITS EFFECT ON DISTRIBUTION IN THE BODY. Herbert E. Stokinger. Nucleonics 11, No. 4, 24-7(1953) Apr.

Often substantial quantitative, and at times qualitative, differences in distribution and excretion of an element in the body follow upon the administration of different dosage levels. With certain elements these differences can be so great as to result in erroneous conclusions as to the tendency of an element to accumulate in certain organ sites. Current physiochemical theory and experimental results thus far available are used to furnish a reasonable explanation as to why certain of these differences in distribution with dose occur. This review develops the fact that there are at least three distinct mechanisms that regulate the distribution of an element in the body. 16 references. NSA 7-2985

Royal Veterinary Coll., Stockholm
METABOLISM OF STRONTIUM 90 IN LACTATING AND PREGNANT GOATS. Lars Ekam and Bertil Aberg. 12p. (A/CONF. 15/P/175)

Data are tabulated on the distribution of strontium-90 in lactating and pregnant goats, milk, and fetuses following the administration of single and multiple oral doses of strontium-90. Excretion and retention data are discussed. Strontium-90 was readily taken up in many tissues of the fetus, especially those containing calcium. Strontium-90 was found to accumulate in the udder before milk excretion started and thus affected the activity of first milk. NSA 13-6085

THYROID UPTAKE OF RADIOACTIVE IODINE IN THE DOG, EFFECT OF DIET, HYPOPHYSECTOMY, AND TSH. Donald S. Fredrickson, William F. Ganong, and David M. Hume (Harvard Medical School and Surgical Service, Peter Bent Brigham Hospital, Boston). Proc. Soc. Exptl. Biol. Med. 89, 416-19(1955) July.

A scintillation counter adapted to the determination of thyroid I¹³¹ uptakes in the unanesthetized dog is described. The dog was shown to have a relatively slow rate of accumulation of I¹³¹ by the thyroid, but a total uptake of the same order of magnitude as man and the rabbit if the dog was maintained on a dietary intake of 70 μ g of iodine or less per day. Hypophysectomy markedly depressed the thyroidal uptake and blood I¹³¹ clearance rate, and TSH administration elevated the rate of uptake and release. NSA 8-6175

THE ACTION OF SALTS OF ZIRCONIUM AND OTHER METALS ON PLUTONIUM AND YTTRIUM DISTRIBUTION AND EXCRETION. Marcia R. White and Jack Schubert. J. Pharmacol. Exptl. Therap. 104, 317-24(1952) Mar.

Treatment of rats with zirconium prior to injection of Pu²³⁹ and Y⁹¹ lowered the amount of Pu and Y subsequently deposited in the skeleton and increased the amount of Pu in the kidneys. The deposition of both Pu and Y in the bone was correlated with the length of time between pretreatment and their injection. Zr injected 24 hours after Pu and Y prevented further deposition of the radioelements in bone, but had no other observable effect on their organ distribution. In addition to Zr other hydrolyzable elements - manganese, iron, titanium, aluminum, and thorium - reduced bone deposition of Pu, but had various effects on the amounts deposited in other organs. Al and Th increased the Pu content of the liver and other soft tissues. Non-hydrolyzable magnesium had no significant effect on the distribution of either Pu or Y. The mechanism by which salts of Zr and other hydrolyzable elements may affect Pu and Y metabolism is discussed. This includes adsorption of the radioelement on colloidal aggregates in the circulation and the relation between particle size and the resulting distribution of the aggregate plus adsorbed radioelement NSA 6-3206

THE EXCRETION, RETENTION, DISTRIBUTION, AND CLINICAL EFFECTS OF STRONTIUM⁸⁹ IN THE DOG. PART II, STATISTICAL ANALYSIS OF EXCRETION AND

RETENTION OF STRONTIUM⁸⁹ FOR INDIVIDUAL DOGS. George Sacher. June 1946, decl. July 19, 1948. 18p. (AEC-2108; CH-3866)

Excretion data of 17 dogs injected with Sr⁸⁹ were analyzed. Excretion was assumed to conform to the function $\log E = b \log t$, where E_t is the excretion per day at time t , E_1 is the instantaneous excretion at the end of the first day, and b is the slope of the $\log E$ versus $\log t$ diagram. Values of E_1 and b were estimated for urinary and fecal excretion of individual dogs. Errors of estimate were also computed. A negative correlation ($r = -0.575$) was found between the urinary and fecal excretion slopes of adult dogs. Slopes and intercepts of urinary and fecal excretion lines of beagle pups were lower than those of adult dogs. In the urine-feces correlation and in dependence of excretion parameters on age, the Sr⁸⁹ results paralleled the results with plutonium. The total elimination, Q_∞ , was defined and estimated for individual adult dogs. It was found that on the average more than 90 per cent of the injected Sr⁸⁹ could be accounted for by extrapolation of the excretion line based on observed excretion in the first few weeks after injection. The calculated total elimination of pups, based on the observed excretion behavior, showed at least 40 per cent of the injected Sr⁸⁹ unaccounted for, presumably because of the increase of total-body strontium concomitant with bodily growth. 10523

THE EFFECT OF ADRENOCORTICOTROPHIC HORMONE ON TISSUE DISTRIBUTION AND TOXICITY OF BERYLLIUM. M. R. White, A. J. Finkel, and J. Schubert (Argonne National Lab.). May 1952. 5p. (AECU-2111, UAC-578)

Adrenocorticotrophic hormone (ACTH) had no striking effect on the distribution or retention of radioberyllium, injected into mice with and without carrier beryllium sulfate, although it caused a statistically questionable decrease in retention of carrier-free radioberyllium. It also had no effect on the survival of mice acutely poisoned with beryllium sulfate. NSA 6-4714

10524

REACTIONS WITH HEAVY METALS AND THEIR BEARING ON POISONING AND ANTIDOTE ACTION. James L. A. Webb, Iqbal Singh Bhatia, Alsoph H. Corwin, and Alvin G. Sharp. J. Am. Chem. Soc. 72, 91-5(1950) Jan.

Sulfhydryl compounds are essential for the growth of many, and probably all, cells. Recently a large group of enzymes has been shown to contain -SH groups essential for enzymatic activity. This activity is inhibited by mercury and arsenic compounds and is restored by glutathione. The poisoning thus results from metallic combination with essential sulfhydryl groups. Detoxicant action is a preliminary combination of a substance with the metallic poison in a compound so firm that the metal is not available for reaction with essential sulfhydryls. Antidote action is observed after combination has taken place with the essential sulfhydryls, but when the affinity of the antidote for the metal is greater than that of the essential sulfhydryls displacement takes place. Dithione, $C_6H_5N=NC(SH)=NNHC_6H_5$, will react with the mercury in mercurials of the types HgX_2 , $R'HgX$, R'_2Hg , $R'HgSr''$, and $(R'S)_2Hg$. Dithione will cleave C-Hg bonds to form S-Hg bonds. Alkyl and aryl mercuric dithizonates tested could be cleaved further to yield mercuric bisdithizonate. Mercury can exchange between different sulfur compounds. Mercuric bis-dithizonate and certain other material dithizonates are reversibly sensitive to light. NSA 4-2954

RATE OF ELIMINATION OF RADIOACTIVE CARBON ADMINISTERED AS CARBONATE FROM THE TISSUES AND TISSUE COMPONENTS OF MATURE AND GROWING

RATS. Jack Schubert and W. D. Armstrong. *J. Biol. Chem.* **177**, 521-527(1949) Feb.

Eight mature rats and 6 growing rats were given intraperitoneal injections of C^{14} -labeled sodium carbonate in order to study the change in C^{14} concentration of the soft and calcified tissues and derived components with time. The rats were killed in pairs at different time intervals from 8 to 30 days after the last of the injections. In general the specific activity of C^{14} in the tissues and tissue components of the growing rats greatly exceeded those of the mature animals. The overall retention of C^{14} , however, was greater in the mature rats. In the latter practically no change in the overall C^{14} retention was observed after the 15th day, while an appreciable decrease in overall retention of C^{14} was observed in the growing animals. Beyond the 8th day the biological half lives of the C^{14} in intact and inorganic bone were 12 to 15 days in the growing rats and 30 to 40 days in the mature rat. In the case of the serum proteins the specific activity of C^{14} and the rates of decrease in C^{14} content were about the same for the 2 groups of rats. The rate of decrease of C^{14} in the soft tissues of the mature rats had decreased appreciably by the 20th day. No significant turnover of C^{14} in the brain protein was observed in the young animals following its incorporation. NSA 2-1464

STRONTIUM⁸⁵ METABOLISM IN MAN AND EFFECT OF CALCIUM ON STRONTIUM EXCRETION. Herta Spencer, Milton Brothers, Eva Berger, H. E. Hart, and Daniel Laszlo (Montefiore Hospital, New York) *Proc. Soc. Exptl. Biol. Med.* **91**, 155-7(1956) Jan.

Radiostrontium metabolism following intravenous administration of tracer doses of Sr^{85} was studied in 4 human subjects. Plasma levels, and urinary and fecal Sr excretion were measured. The plasma levels declined rapidly. The main route of excretion is via the kidney.

Rate of Sr excretion seems to depend upon the state of bone metabolism. It was low in Paget's disease and high in senile osteoporosis. Simultaneous administration Ca gluconate significantly enhanced the Sr excretion. NSA 10-5506

URANIUM TOXICITY IN MICE. I. EXPERIMENTAL DESIGN AND RESULTS AT 30 DAYS. Miriam P. Finkel and Gertrude M. Hirsch. Oct. 1950. Decl. Jan. 22, 1951. 10p. (AECU-3045, ANL-4531)

The results of a study of the toxicity of U^{233} in CF-1 female mice are summarized for the first 30 days. The preinjection handling of the mice and the experimental routine were essentially the same as those employed in the long-term polonium mouse experiment (ANL-4401). U^{238} was used as a chemical control and U^{232} as a radiation control. Dosage of U^{233} , injected into a lateral tail vein in the form of $UO_2(NO_3)_2 \cdot 6H_2O$ solution, ranged from 0.0001 to 0.1 $\mu\text{c}/\text{g}$ (0.01 to 10 $\mu\text{g}/\text{g}$). The tentative LD_{50} 30-day dose is 0.027 to 0.031 $\mu\text{c}/\text{g}$. 5 figures. NSA 5-2364

Western Reserve Univ., Atomic Energy Project
THE MECHANISM OF POTENTIATED LETHAL ACTION OF CERTAIN RADIOISOTOPES IN RATS AND MICE.
Hymer L. Friedell, Paul R. Salerno, and Saul A. Rosenberg. Issued July 23, 1953. 22p. (NYO-4020)

A potentiated lethal action was observed in rats and mice when a bone-localizing internal emitter such as P³² or Sr⁸⁹ was administered in combination with colloidal Au¹⁹⁸. It was noted that the toxicity of colloidal Au¹⁹⁸ in rats and mice was not altered by splenectomy. However, the lethal action of the bone-seeking radioactive isotopes was found to be clearly more effective in splenectomized animals. This sensitizing action of splenectomy was found to be of the same order of magnitude as the degree of potentiation observed when P³² was combined with colloidal Au¹⁹⁸. Furthermore, the intensity of the combined lethal action of these two isotopes was found to be the same in both normal and splenectomized animals. Since the acute effects of relatively small doses of colloidal Au¹⁹⁸ are equivalent to splenectomy, the level of sensitivity of animals which receive Au¹⁹⁸ in combination with P³² or Sr⁸⁹ is reduced to that of splenectomized animals. Splenectomy did not greatly modify the sensitivity of either rats or mice to x rays. Apparently the total body dose in the lethal range severely injures the spleen. Since the bone marrow can partially recover independently, the injured spleen without its special protective function is not a major determinant in survival. It was noted that more than four times as much Sr⁸⁹ could be tolerated by mice with intact spleens as by splenectomized mice. As would be anticipated, it was found that when colloidal Au¹⁹⁸ was given in combination with Sr⁸⁹, the potentiation of the lethal effect was also increased approximately four-fold. This potentiation is much more striking in the mouse than in the rat, and these data suggest that the mouse may be unique with respect to the potentiality of the spleen in influencing survival following radiation injury to the bone marrow.

Brookhaven National Lab.
THE TURNOVER OF CARBON IN THE MOUSE AS STUDIED BY THE USE OF TAGGED CARBOHYDRATE.
Robert Steele. nd. 32p. (BNL-1222)

The excretion in respiratory CO₂, urine, and feces of carbon derived from ingested sucrose was measured during the 36-day period following the ingestion of uniformly tagged C¹⁴ sucrose by young adult C-57 black male mice. The retention of carbon derived from sucrose in each of 28 organs or tissues of the mice under these conditions was measured in ten animals sacrificed at various times during the 36-day period. The specific activity of the respiratory CO₂ of the mice under standard conditions of dosage with uniformly tagged C¹⁴ sucrose was ascertained and was expressed as an empirical mathematical function of time. It was deduced, after demonstrating that an application of the Zilversmit-Entenman-Fishler precursor-product relationship gives incongruous results for tissue carbon turnover that either (1) the interchange of carbon between the tissue constituents and the pool of CO₂-producing metabolites is less than expected on the basis of the previously observed turnover half times of individual tissue constituents or (2) that a physiological mechanism exists which reduces the movement of carbon from the small molecule metabolites to the tissue constituents when

exogenous carbohydrate is being metabolized. If possibility (1) above is correct the general concept of exogenous, as opposed to endogenous, metabolism cannot be attacked by citing the shortness of the turnover times of the major tissue constituents. If possibility (2) is correct there then exists an obvious demarcation of exogenous from endogenous metabolism.

10540

AN AUTORADIOGRAPHIC STUDY OF THE DISTRIBUTION OF POLONIUM IN THE RAT DURING 24 HOURS AFTER INTRAVENOUS INJECTION. John C. Gallimore, George A. Boyd (Oak Ridge Inst. of Nuclear Studies, Tenn.) and J. N. Stannard (Univ. of Rochester School of Medicine and Dentistry, N. Y.). Anat. Record 118, 253-67 (1954) Feb.

The distribution of polonium chloride in the liver, spleen, kidney, muscle, and blood of rats after intravenous administration has been studied autoradiographically and radiochemically. It was found that the polonium in the blood immediately after injection existed in two systems: a system of polonium aggregates characterized by sunbursts in the autoradiograms and a system of non-grouped singly dispersed atoms or molecules. The aggregates were removed from the blood stream over an approximate two-hour period and deposited in the liver and spleen. The non-particulate polonium was observed to concentrate in the proximal convoluted tubules of the kidney. No particulate polonium was observed to be deposited in this organ. The polyatomic groupings deposited in liver and spleen are seen to become diffuse and to gradually disintegrate beginning at about 10 hours after administration and continuing to the end of the observation period (24 hours). It is concluded that the aggregates are taken up by elements of the reticulo-endothelial system and inferred that distribution, excretion, and toxicity may be affected by the relative number of aggregated and dispersed atoms present under any given conditions.

RECOVERY-STIMULATING ACTIVITY OF BACTERIAL RIBONUCLEIC ACID POLYNUCLEOTIDE MATERIAL. G. E. Stapleton, D. H. Woodburg, and A. Hollaender. Radiation Research, 5, 597 (1956).

Authors describe an RNA polynucleotide fraction from E. coli β/r which stimulates recovery of irradiated organisms of the same strain if amino acids are also supplied. There is suggestive evidence that the compound may also be protective in mice.

10544

UPTAKE OF RADIOACTIVE SULFUR BY CHONDROSARCOMAS IN MAN. Raymond G. Gottschalk and Herbert C. Allan, Jr. Proc. Soc. Exptl. Biol. Med. 80, 334-9 (1952) June.

Two patients with chondrosarcomas received, respectively, 6.7 and 2.9 millicuries of S³⁵ as sodium sulfate. Tissue samples were obtained at operations and at necropsy several days after the injection and were analyzed for S³⁵ content. The highest concentrations of isotope were found in the chondrosarcomas. Progressively smaller amounts were found in other tissues in the sequence: cartilage, bone marrow, spleen, kidney, skin, liver, bone adipose

tissue, and muscle. Radioautographs indicated maximum concentration in the growing portions of the chondrosarcoma and in those containing abundant ground substance. The findings are discussed in relation to the possibility of diagnostic or therapeutic applications. NSA 6-5723

10545

LOCALIZATION OF RADIOACTIVE COLLOIDS IN LYMPH NODES. Leonard A. Walker. *J. Lab. Clin. Med.* **36**, 440-9(1950) Sept.

The quantitative uptake of radioactive colloids by lymph nodes when the colloids are introduced into the lymphatic channels has been studied. Unsuccessful attempts were made to cause colloids injected subcutaneously to enter the lymphatic vessels and localize in the regional nodes. Only P^{32} -labeled casein left the site of injection, but it did not localize in the regional nodes. A method for intralymphatic injections was developed, and quantitative studies were made on the irradiation of rabbit lymph nodes by means of two Y^{90} -labeled yttrium hydroxy-citrate colloids, called the C and E type colloids. The C type colloid has an average molecular weight of 20,000, whereas the molecular weight of the E type is much higher, possibly millions. The C type gives an average concentration of radiation in the most active node 284 times that in the most active tissue. The E type average ratio is 7900. Although variation of the volume of colloid injected over the values of 0.05, 0.10, and 0.20 ml resulted in some change in the percentage uptake by the nodes, these changes were not striking. It was found that previous intralymphatic injection of yttrium colloids caused an increase in the uptake by the nodes in subsequent injections. No explanation for this effect is offered. Iodinated bovine albumin incorporating radioactive iodine, I^{131} , when injected intralymphatically in the rabbit is not taken up by the nodes. This technique for specific irradiation of lymph nodes might be of use in Hodgkin's disease, in primary lymphosarcoma, or in irradiation of metastases to the nodes, as in cancer of the breast. THE EFFECTS OF HYPOPHYSECTOMY, GROWTH, AND ADRENOCORTICOTROPIC HORMONES ON THE INCORPORATION OF P^{32} INTO LIVER PHOSPHOLIPIDS. Irving I. Geschwind, Choh Hao Li, and Herbert M. Evans. *Endocrinology* **47**, 162-5(1950) Sept.

The uptake of phosphorus by rat liver phospholipids has been investigated by intraperitoneal injection of P^{32} -labeled Na_2HPO_4 solution. Ageing causes a decrease in the uptake of P^{32} by liver phospholipids. Hypophysectomy, with or without growth or adrenocorticotrophic hormone treatment, does not influence the concentration of phospholipids in liver, but does result in a decreased turnover of liver phospholipids. Growth hormone produces an increase in the turnover of liver phospholipids in normal or hypophysectomized rats. Treatment of the hypophy-

sectomized animal with ACTH results in an increased turnover of liver phospholipids. NSA 4-6542

MORPHOLOGICAL CHANGES IN THE TISSUES FOLLOWING INTRA-TISSUE INTRODUCTION OF RADIOGOLD (Au^{198}). M. I. Svetlakov and V. A. Odinkova (Moscow Regional Scientific Research Chemical Inst. and Central Inst. for Advanced Training for Physicians, Moscow). *Med. Radiol.* **4**, No. 4, 61-4(1959) Apr. (In Russian).

An investigation was made of the morphological changes which develop in tissues of patients with cancer of the larynx at the site of introduction of radiogold (20, 40, 108 mc). Analysis of 15 observations shows that the introduction of radiogold directly into the cancer tumor tissue provokes necrosis with subsequent development of focal sclerosis. In these tissues acute circulatory disorders and dystrophic changes occur, the degree and character of which is determined by the specificity of tissue structure and the dose of the preparation. SELECTIVE PLACENTAL TRANSMISSION OF RADIOACTIVE ALKALINE EARTHS AND PLUTONIUM. Paul N. Wilkinson and Frank E. Hoecker. (Kansas Univ.). *nd.* **33p.** (AECU-2400)

A series of experiments are described in which the placental transmission of several of the alkaline earth metals and Pu is investigated, and results are presented which demonstrate the existence of significant differences in the physiological activity of those elements. It was found that the arrangement of these compounds in order of the magnitude of transmission is $Ca^{46} > Ba^{140} > Pu^{239} > Ra^{226}$. A discussion of the possible significance of these results and the results obtained by other workers is presented. It was concluded that the placental transmission of the compound investigated is dependent upon the molecular weight of the cation and that analogies between the known properties of one member of the group and those of another member should be made with extreme caution. It was conjectured that the results were indicative of a fundamental difference in metabolic handling of these substances by the animal organism and that similar differences might exist in the mechanism of deposition of these elements in mammalian bone. THE LOCALIZATION OF RADIO-PHOSPHORUS IN SOFT TISSUES WITH RESULTING DESTRUCTION. B. Grad, C. E. Stevens, and C. P. Leblond. *Acta Unio Intern. contra Cancrum* **7**, 534-8(1952).

Male and female albino rats were injected with a single large dose of P^{32} and were sacrificed at various intervals from 5 minutes to 10 days later. The tissues were fixed in Orth fluid. Histological sections of the tissues were examined for radiation damage, and their P^{32} content was detected by the radioautographic technique. The destructive effects of P^{32} were intense only in some of the tissues with a high P^{32} content, e.g., hemopoietic tissues, intestinal crypts and ovarian follicles. In all organs and tissues with a low P^{32} content, little or no destructive effect occurred, e.g., pancreas, nervous tissue. However some tissues with a high P^{32} content showed no destructive action, e.g., liver and kidney NSA 6-3499

ISOTOPES IN HORMONAL AND NUTRITIONAL STUDIES IN ANIMALS. Lester F. Wolterik. p.122-54 "Conference on the Use of Isotopes in Plant and Animal Research." Apr. 1953. **33p.** (TID-5098)

General methods applicable to the use of radioactive isotopes as indicators when introduced into the metabolic

stream are reviewed. Specific techniques for turnover rate studies and space studies are described in detail. Hormone studies in general are discussed, and details of studies of normal I^{131} thyroid turnover, interrelations between the thyroid and the ovary, the effects of exogenous thyroxine upon the thyroid, techniques for use in studies of factors regulating the development and function of the mammary gland, and the effect of growth hormone on Ca^{45} uptake by bone are described in detail. Specific nutrition studies described include the effects of treatment with thyroxine, thiouracil, on estrogen on Ca^{45} exchange in the skeleton, and studies of the effects of vitamin B_{12} and penicillin on the absorption, deposition, and renal and hepatic blood clearance of Co^{60} . DISTRIBUTION OF RADIOACTIVE SILVER COLLOIDS IN TISSUES OF RODENTS FOLLOWING INJECTION BY VARIOUS ROUTES. James C. Gammill, Brownell Wheeler, E. L. Carothers, and P. F. Hahn. Proc. Soc. Exptl. Biol. Med. **74**, 691-5(1950) Aug.

Intramuscular injection of dextrin-protected Ag^{111} -radiosilver colloid results in a high concentration of the injected material at the site of injection. Intravenous injection of a dextrin-silver colloid into rats and intraperitoneal injection of a gelatin-silver colloid into mice result in deposition of the silver in highest concentration in the reticuloendothelial system. Considerable silver was eliminated through the intestines and feces. The possible causes of such elimination under the conditions of this experiment are discussed. A method of preparing tissues of small bulk for determining radiosilver activity with the G-M counter is described. NSA 4-6310

Michigan State College of Agriculture and Applied Science HORMONAL AND NUTRITIONAL FACTORS WHICH ALTER THE EFFECTIVE HALF-LIVES AND DIFFERENTIAL ABSORPTION RATIOS OF CALCIUM, MANGANESE, AND COBALT IN THE ANIMAL BODY, SEMI-ANNUAL REPORT. L. F. Wolterink and E. P. Reineke. Feb. 20, 1950. 14p. (AECU-1015)

In pair-fed rats as little as 10 μ g of thyroxine daily for two weeks, an amount only slightly in excess of their own secretion rate, increased the rate of calcium turnover in the liver and the retention of calcium by the femur. Thiouracil had the opposite effect. In addition, thiouracil made the animals extremely sensitive to the subcutaneous radio-calcium chloride injections, particularly if the animals were on a vitamin D assay diet. If shock occurred, there appeared to be a diversion of the calcium to the lungs and liver. Daily subcutaneous injections of 10 μ g of the dimethyl ether of stilbestrol had no effect on calcium turnover although this treatment usually depresses iodine turn-over in the thyroid. Vitamin B_{12} administration to deficient chicks and pigs usually increased iodine turnover in the thyroid. When administered to normal rats or mice, iodine uptake by the thyroid was reduced. The effect of vitamin B_{12} on calcium retention is currently being investigated in the light of its antithyrototoxic effects. Cobalt turnover will then be studied.

Rochester Univ., New York.
URANYL NITRATE, FOUR ONE-YEAR INHALATION TOXICITY STUDIES OF ANIMALS. Robert G. Yaeger. May 17, 1948. Dec. 1, 1948. 112p. NNS Div. 6, Vol. 1, Pt. 3, Chap. 21. (AECU-2129; UR-30)

A comparison of the effects of daily inhalation exposure of animals for one year to uranyl nitrate was made by 4 studies performed concurrently at concentrations of 0.08, 0.3, 0.5 and 4 mg/m^3 of air, respectively. Approximately 24 dogs and 200 rats were exposed to each level, 20 rabbits and 30 guinea pigs were added to the 2 highest levels 5 1/2 months after the start of exposure of dogs and rats. Neither the dog nor the rat exposed to concentrations below 0.5 mg/m^3 of dust (approximately 0.3 mg/m^3 at the end of a one-year period showed appreciable weight loss, significant biochemical change, or renal damage when compared with controls. Exposure at this level produced some degree of injury in almost all exposed dogs, in 50 per cent of the rabbits, but only in an occasional rat, and no changes whatsoever in the guinea pig. Associated with renal injury was biochemical evidence of blood NPN elevation, urinary protein and plasma carbon dioxide decrease. At the 4 mg level only one dog was free from renal injury of some degree from uranium. In this group of animals injury was marked in 1, moderate in 11 and mild in 3. Likewise all rabbits showed renal injury from extensive to slight and 2/3 of all rats showed varying degrees of renal injury from traces of acute injury to marked atrophy, the guinea pig kidney showed no changes at this level. The guinea pigs and the rabbits, however,

were exposed for only 6.5 months. Only at the highest level did appreciable accumulation of uranium occur in the tissues and this was confined chiefly to the hard tissues, minimal amounts of uranium were found in both bone and tooth at the 0.5 mg level. In the 4 studies comprising almost 1000 animals, only 1 dog and 22 rabbits died from causes attributable wholly or in part to uranium. Thus, exposure at concentrations below 0.5 mg uranyl nitrate/ m^3 for one year appears to be essentially noninjurious and constitutes safe exposures for dogs and rats. The level of 0.5 however, was moderately injurious to the majority of dogs and rabbits exposed, mildly so to rats, and completely nontoxic to guinea pigs. Four milligrams of uranium nitrate dust was almost uniformly injurious to dogs, rabbits, and rats, though less so to the rabbit species, and completely nontoxic to guinea pigs

DISTRIBUTION AND EFFECT OF COLLOIDAL RADIOACTIVE GOLD IN PERITONEAL FLUID CONTAINING FREE SARCOMA 37 CELLS. Horace Goldie and Paul F. Hahn. *Proc. Soc. Exptl. Biol. Med.* 74, 638-42(1950) July.

Two to five days after intraperitoneal inoculation of 10,000 (in one series, 50,000) free sarcoma 37 cells from peritoneal fluid, several series of CFW mice were treated with a single intraperitoneal injection of 0.2 to 0.44 mc of colloidal radioactive gold. Control mice remained untreated or were treated with inactive (decayed) gold preparations. On 3 consecutive days after treatment, specimens of peritoneal fluid were withdrawn by exploratory puncture from treated and control mice. Stained smears from these specimens revealed the absence of tumor cells or cytological abnormalities therein in gold treated mice, while in controls the tumor cells were numerous and showed high proportion of mitoses. The nonviability of morphologically altered cells was demonstrated by their inability to multiply or even to survive after their transfer into new mice. Ultramicroscopic colloidal gold particles mixed immediately after injection with the peritoneal fluid became condensed, after 24 to 48 hr, into dot-like particles in the cytoplasm of macrophages and during the following days into coarse clumps. The macrophages loaded with gold particles maintained their structural and functional integrity, lymphocytes and polymorphonuclears were partially and temporarily destroyed by radiation effect. It is concluded that in the cellular peritoneal exudate from mice inoculated intraperitoneally with S-37 cells, the tumor cells were highly sensitive to small amounts of radiation well tolerated by the mice themselves while macrophages showed very high resistance to the same agent. Thus, the complete destruction of free tumor cells in the peritoneal cavity of the mice may be described as a selective radiotherapeutic effect of radioactive colloidal gold. 12 references. MULTIPLICITY REACTIVATION OF BACTERIOPHAGE INACTIVATED BY IONIZING RADIATIONS. J. J. Weigle and G. Bertani. *Virology*, 2, 344-55(1956).

Studies on the "multiplicity reactivation" phenomenon in T_2 coliphage after ionizing irradiation indicate that radiosensitivity is greater when only one treated particle is present/host cell in the mixture of phage and bacteria. "Multiplicity infection" (more than one phage particle/bacterium) results in reactivation. This reactivation is seen after γ irradiation of isolated T_2 . When soft x-rays are used, however, sensitivity is changed only after irradiation of phage absorbed in host cells. Damage in the virus can be substituted for by another damaged particle, probably a genetic phenomenon like that after U-V. (Genetic substitution).

Univ. of Calif., Los Angeles, Atomic Energy Project THE AVAILABILITY OF RADIO-STROMTIUM TO MAMMALS BY WAY OF THE FOOD CHAIN. Warren J. Gross, Janice F. Taylor, Joshua A. Lee, and James C. Watson. Issued June 18, 1953. 26p. (UCLA-259)

Sr^{90} is selectively metabolized by rats when ingested in the form of barley or lettuce grown on $Sr^{90} + Y^{90}$ contaminated soil. Aggregation occurs in the tissues (mainly skeletal) when such doses are administered at the rate of 500 to 1000 dis/sec/day. Deposition from contaminated plant material is less than from equal doses of $Sr^{90} + Y^{90}$ in aqueous solution. The rate of deposition of Sr^{90} from equal daily oral doses of $Sr^{90} + Y^{90}$ decreases with time during a prolonged feeding experiment. Thus young rats fed daily $Sr^{90} + Y^{90}$ in solution over a seven-day period retained 7.9% total dose while young rats given daily doses of $Sr^{90} + Y^{90}$ over a seventeen-week period retained only 1.8% total dose. The amount of Sr^{90} deposited from oral doses is influenced little, if any, by the amount of stable Sr in the diet at the time of the Sr^{90} ingestion. Stable Sr, however, apparently effects the release of deposited Sr^{90} from the tissues when it is administered orally in massive doses ten days following the ingestion of Sr^{90} . This suggests stable Sr as a therapeutic agent. No radiation effects are identified in any of the experimental animals even in the extreme case where rats were given doses of $Sr^{90} + Y^{90}$ of 2783 dis/sec over a seventeen-week period. A method for predicting the maximum level of retention under a given set of conditions for any radioisotope of any physiological element is discussed. Rats fed $Sr^{90} + Y^{90}$ over a seventeen-week period with the daily dose of 2733 dis/sec for a cumulative dose of 431,000 dis/sec averaged a retention of 5976 dis/sec or sixty-six % of the calculated maximum. The observed retention after thirty daily doses of 688 dis/sec was 2293 dis/sec, also sixty-six % of the calculated maximum. (auth) NSA 7-4717

EFFECT OF SODIUM AND ZIRCONIUM CITRATES ON BLOOD LEVEL, DISTRIBUTION, AND EXCRETION OF INJECTED RADIOLEAD. Jack Schubert and Marcia R. White. Feb. 1951. 22p (AECU-1227, UAC-356)

The effects of Zr and Na citrates on the blood disappearance, tissue distribution, and excretion of soluble Pb salts injected intravenously into rats at two concentrations- carrier-free and with added carrier- have been studied. At the tracer level, Pb^{210} disappeared from the

blood (essentially the cellular fraction) with a half time of 30 hr. When injected with carrier Pb, the half time of disappearance of Pb^{210} from plasma was 42 min. Na or Zr citrate injected after carrier-free Pb^{210} did not affect the rate of disappearance of Pb^{210} from the blood, the tissue distribution, or the fraction excreted. In rats injected with carrier amounts of Pb labeled with Pb^{210} , Zr and Na citrate both caused some redistribution of Pb^{210} , but neither affected the immediate rate of disappearance of Pb^{210} from the blood. Zr citrate caused at least a threefold increase in the Pb^{210} excreted during the first 24 hr. The action of many drugs used to treat Pb poisoning is explained by the supposition that they slow down the rate of transfer of Pb from the tissues into the circulation, the ensuing natural rapid drop in the plasma Pb level relieves the symptoms of Pb poisoning. FUNCTIONAL AND MORPHOLOGICAL CHANGES OF THE THYROID GLAND IN THE RAT FOLLOWING THE ADMINISTRATION OF VARIOUS DOSES OF RADIOACTIVE IODINE I^{131} . M. Jovanovic, V. Pantic, et al. (*Univ. of Belgrade*). 16p. (*A/CONF.15/P/479*)

The rate of the basal metabolism in rats was measured for 80 days after the administration of radioiodine in doses of 20, 50, 100, and 300 μc in order to establish the degree of the injuries in thyroid gland and the intervals after which these injuries took place. The results obtained by examination of the oxygen consumption were compared

with the results obtained by the examination of the radioiodine fixation and with the morphological structure of the thyroid gland. Data indicate that the oxygen consumption rate is not a sufficiently sensitive indicator for establishing the lighter morphological and functional injuries in the thyroid gland. NSA 13-6116

THE BASAL METABOLISM OF RATS FOLLOWING THE INJECTION OF RADIOACTIVE IODIDE. C. L. Gemmill, K. R. Crispell, and K. M. Browning (Univ. of Virginia, Charlottesville, Va. School of Medicine). *Endocrinology* 59, 522-5 (1956) Nov.

Large doses of radioactive iodide were given to rats. Their basal metabolism was followed before and after this injection. For a period of several months following the injection cyclic changes were noted in their metabolic activity. These changes are interpreted as attempts on the part of the thyroid gland to recover. The final value of basal metabolism following radioactive iodide removal of the thyroid gland was comparable to the values obtained following surgical removal. For the testing of compounds for metabolic activity, rats may be used with their thyroid glands removed by radioactive iodide or by surgery interchangeably. NSA 11-842

IMMEDIATE AND DELAYED BIOCHEMICAL AND BIOLOGICAL EFFECTS OF IRRADIATION ON ANIMAL TISSUE. Hardin B. Jones and others. (Status Report No. 3, June-December, 1947). 1947. (TIP-U-547)

Adult rats were injected intraperitoneally with 14, 170, and 500 microcurie of I^{131} . Animals were sacrificed after injections. The I of the thyroid gland was fractionated into organic and inorganic, both chemical and radioactive measurements were made. The gland began to lose I rapidly 24 hours following injection of 500 microcurie of I^{131} . The effect of irradiation upon the thyroxine-I metabolism was insignificant up to dosages of 35,000 β -r equivalents. Thyroxine was formed as long as the cells were intact. The colloidal substance of the thyroid was particularly sensitive to irradiation. Its disappearance was one of the first changes noticed, but in spite of its absence synthesis of thyroxine took place. Methods for localizing radioactive compounds in the liver, spleen, and bone marrow are summarized. NSA 1-30

DETERMINATION OF THE INITIAL UPTAKE RATE OF RADIOIODINE BY THE THYROID BY MEANS OF TWO SCINTILLATION COUNTERS. G. Joyet. *Z. Med. Isotopenforsch.* 1, No. 1, 11-25 (1956) Nov. (In French).

With the aid of a statistics in 222 cases, it is shown, that the initial tangent T'_0 of the radioiodine uptake curve, after intravenous injection of radioactive iodine, is the determining element for the differentiation of normal and pathological thyroid behavior. A new instrument is described with two scintillation counters, which enables the correct determination of T'_0 on the reclining patient, after an injection of 10 to 20 microcuries of I^{131} . A main counter, properly suspended with an appropriate collimator and an optical adjustment for determining the distance, measures the activity of the thyroid and the neck. A second counter enables the determination of the correction for the extra-thyroidal activity, based on measurements on the thigh and around the thyroid. This correction is essential for obtaining an accurate determination of the initial uptake rate of the thyroid. NSA12-6427

URINARY EXCRETION OF RADIOACTIVE SULFUR. Paul Gyorgy. p.15-19 of TRANS. OF SEVENTH CONFERENCE ON LIVER INJURY HELD JAN. 15-16, 1948, AT NEW YORK CITY. F. W. Hoffbauer, ed. New York, Josiah Macey, Jr. Foundation, 95p.

The detection of S^{35} compounds in the urine by a "paperogram" method is described. The paperogram for rats which were fed methionine shows an S^{35} peak in the inorganic sulfate fraction. It was found that oral administration of radioactive methionine followed by injection of C_6H_6 gave a peak in the ethereal sulfate fraction. The ethereal peak was small and the inorganic sulfate peak was absent when C_6H_5OH and methionine were administered simultaneously and the oral administration of C_6H_5Br resulted in 2 peaks which were attributed to inorganic sulfate and mercaptic acid. From these preliminary experiments it is concluded that this method may be useful in the investigation of the metabolism of methionine in the urine NSA 2-2237

THE EFFECT OF BAL ON THE DISTRIBUTION AND METABOLISM OF P^{32} AND Sr^{90} . Walter E. Kiseleski and William P. Norris. *Apr.* 1951. 7p. (AECU-1368, 383)

The effectiveness of 2,3-dimercapto-1-propanol (British antilewisite, BAL) in increasing the elimination of injected P^{32} and Sr^{90} in mice was investigated. It is concluded that BAL is essentially without effect although, in the case of P^{32} , the rate of uptake in bone appears to be reduced during the first hour. No such difference could be demonstrated after 24 hr. NSA 5-4665

10579

ACTION OF IONIZING RADIATIONS ON THE COURSE OF PREGNANCY AND ON THE FETUS. V. V. Kholin. Translated from *Klin. Med.* (U. S. S. R.) 33, No. 6, 24-7 (1955). 4p. (AEC-tr-3603)

Results are summarized from a number of studies on the effects of ionizing radiations on the course of preg-

nancy and on the fetus. Disturbances of pregnancy during various stages are described. It was concluded that the occurrence of concrete anomalies of development under the influence of radiations is characteristic for various stages of the formation of the fetus. The doses which cause abnormalities of development during the period most characteristic for their occurrence differ with the anomalies. Results are included from a study of the tissue distribution of strontium-89 and plutonium in the developing fetus. Considerable concentration of strontium was found to occur in the fetus, where its accumulation was greater than in the mother. Plutonium was retained primarily in the mother. NSA 13-10789

EFFECTS OF RADIOACTIVE IODINE ON FREE SARCOMA 37 CELLS IN THE PERITONEAL FLUID OF THE MOUSE. Horace Goldie and Paul F. Hahn. *Proc. Soc. Exptl. Biol. Med.* 74, 634-8 (1950) July.

CFW mice of 25 g weight were inoculated intraperitoneally with requisite numbers (mostly 10,000) of S-37 cells and treated intraperitoneally with radioactive iodine (I^{131}) (0.2 or 0.4 mc). The fate of tumor cells was studied by repeated withdrawal and examination of peritoneal fluid in each mouse and compared with their fate in control animals (inoculated with the same dose of cells, but untreated or treated with decayed I^{131}). The examination of each specimen of peritoneal fluid consisted (a) in the microscopic assay of integrity and ability for multiplication (percentage of mitoses) of free tumor cells which multiplied in the peritoneal fluid before treatment, and (b) in the biological assay of viability of tumor cells, i. e., their ability to survive and multiply after transfer into new mice. The results indicate that with a single exception (tumor strain C isolated from a treated mouse) all tumor cells suffered loss of viability even after treatment with the minimal dose (0.2 mc) of I^{131} . In most mice this effect was detected only after the failure of tumor cells from treated animals to grow in the peritoneal fluid of new animals. In other animals, where higher dose of radiation was used, or, presumably, where nutrient environment was drastically changed, the tumor cells disintegrated in the body of the treated mouse. Rapid disappearance (after 24 to 48 hr) from the peritoneal fluid of injected radioactive preparation suggested the differentiation between its early and primary effect (which may be the production of a "lethal mutation") and its later secondary effect (cell disintegration) may be due to additional factors (higher dose of radioactivity), drastic changes in the biological medium. NSA 4-5369

Anesthesia Lab., Harvard Medical School and Biophysical Lab., Harvard Medical School
BRAIN POTASSIUM EXCHANGE IN NORMAL ADULT AND IMMATURE RATS (THESIS). Robert Katzman and P. Herbert Leiderman. 1953. 30p. (AECU-2677)

Sixty-eight normal adult male rats were injected intraperitoneally with radioactive K. The animals were sacrificed at intervals of 4, 16, 39, 54, and 72 hr by decapitation, and plasma and brain activity and total K were measured. The general exchange equation, $d(K^{42})_{br}/dt = k_1(K^{42})_{pl} - K_2(K^{42})_{br}$, was solved by graphical methods for the transport coefficients k_1 and k_2 and from these values the influx and outflux were calculated. Similar studies were done on animals 4, 15, and 35 days old and on animals more than 18 months old. The influx of K into the brain of normal adult rats was found to be 2.89 meq/kg/hr, the outflux rate 3.64 meq/kg/hr, and the influx/outflux ratio 0.80. Since a steady state obtains, the outflux must be equivalent to influx. Therefore 20 meq of K per kg of wet brain is not exchangeable with K^{42} . The influx in 4-day- and 15-day-old animals is 3.9 meq/kg/hr and in 35-

day animals the influx is 3.1 meq/kg/hr. All brain K was found to be exchangeable in 4-, 15-, and 35-day rats. Brain K exchange in older rats was found to be similar to that of normal young adults. NSA 7-6358

THE EFFECT OF IONIZING RADIATION ON THE INTERFERING PROPERTY OF INFLUENZA VIRUS. W. F. Powell and E. C. Pollard. *Virology*, 2, 321-36(1956).

The part of the influenza A virus that represents its interfering property (interfering with production of hemagglutinins, infective virus, and complement fixation antigen) is shown by irradiation studies to have a molecular weight of 1.6×10^6 .

10583

THE DISTRIBUTION OF I^{131} IN TISSUE OBTAINED AT NECROPSY OR AT SURGICAL OPERATION IN MAN. George S. Kurland and A. Stone Freedberg. *J. Clin. Endocrinol.* 11, 843-56(1951) Aug.

The distribution of I^{131} is reported in seven euthyroid patients given 300 to 850 μ c of I^{131} 4 to 168 hr before orchidectomy or oophorectomy and in six cases given 1.7 to 39.1 mc 1 to 8 days before death. Data indicate that the major portion of the radiation was to the thyroid gland. Other organs were shown to receive 1% or less of the radiation delivered to the thyroid. In order of decreasing I^{131} uptake per gram of tissue, these organs were lung, kidney, pituitary, liver, gonad, spleen, adrenal, and pancreas. NSA 5-6609

DISAPPEARANCE OF ISOTOPICALLY LABELED GOLD COLLOIDS FROM THE CIRCULATION OF THE DOG. C. W. Sheppard, Gilbert Jordan, and P. F. Hahn. *Am. J. Physiol.* 164, 345-50(1951) Feb. 1; (ORNL-689)

Immediately following injection of radioactively tagged colloidal gold particles in the dog the circulatory level drops exponentially with time, the half-value time being about 1 1/2 min. A very low residual level is reached in about 10 to 20 min showing occasional fluctuations. A high concentration of activity is then found in the buffy coat fraction, and if blood is withdrawn and transfused into a second animal the initial rapid rate of decline is not observed. The possibility is explored that the rate of the initial disappearance might be quantitatively related to the total blood flow rate to the liver. NSA 5-2104

10586

UPTAKE OF RADIOACTIVE IODINE AFTER INTRAVENOUS ADMINISTRATION OF TRACER DOSES. Joseph P. Kriss. *J. Clin. Endocrinol.* 11, 289-97(1951) Mar.

The thyroid uptake of I^{131} after intravenous administration has been studied in euthyroid subjects and in patients with various thyroid states. The uptake value 1 hr after administration of the tracer has been found to differentiate satisfactorily between the euthyroid and hyperthyroid state, and it exhibits excellent correlation with the degree of clinical toxicity. The method also offers advantages over the 24-hr oral method in rapidity and in diagnostic accuracy by reducing the overlap values between normal and hyperthyroid subjects. NSA 5-3339

NOTIONS ON SENSITIVITY OF CELLS TO RADIATION. O. A. Schjeide, J. F. Mead, and L. S. Myers. *Science*, 123, 1020-22(1956).

Authors propose that cellular radiation damage is the result of radiation-produced oxidants in the cell nucleus.

10588

THE EXPERIMENTAL APPLICATION OF RADIOACTIVE COLLOIDAL GOLD IN THE TREATMENT OF PELVIC CANCER. Alfred I. Sherman, James F. Nolan, and Willard M. Allen. *Am. J. Roentgenol. Radium Therapy* 64, 75-85(1950) July.

Radioactive gold (Au^{198}) suspended in pectin solution was used as an interstitial therapy method in the treatment of transplanted squamous cell carcinoma in mice. It was found that these tumors could be safely and completely cured, with high survival rates using this therapy. The optimum dose required for cure was found to be 200 to 300 μ c per cm^3 of tumor tissue. Radioactive gold in colloidal pectin suspension was injected into the paracervical tissue of rabbits. It was found that the gold entered the lymphatic system and reached the primary and secondary regional lymph nodes. There were definite irradiation effects noted in these areas. Radioactive gold when injected into the peritoneal space found its way into the retroperitoneal lymph nodes causing marked irradiation effects. Radioactive gold in pectin solution was introduced into the uterine horns of rabbits and left in situ. In the presence of this material the usual progestational response with rapid growth and mitosis resulting from stimulation with chorionic gonadotrophin was inhibited. The range of irradiation included the ovaries which also showed irradiation effects. The normal tissue responsiveness had not returned after 6 weeks. The gold was also found phagocytosed and carried to the lymphatics of the submucosal and subperitoneal tissues and to the immediate lymph nodes draining these areas. During the experiments with radioactive gold it became necessary to study and define tissue tolerance levels by this form of radiation therapy. The tissue selected for study was the parametrium of the rabbit. The results indicate that doses of radiogold at therapeutic levels are not injurious to normal structures. The results of these experiments in lower animals qualify the effectiveness and limitations of radioactive colloidal gold in pectin solution as a mode of treatment in carcinoma of the uterus. The physical characteristics of the material and its behavior in relation to biologic processes suggest its use as an adjunct to present methods of radiation therapy in this disease. 21 references. RADIOCALCIUM AS AN INDICATOR IN THE STUDY OF THE ACTION OF ESTRADIOL ON CALCIUM METABOLISM. J. Govaerts, M. J. Dallemagne, and J. Melon. *Endocrinology* 48, 443-52(1951) Apr. NSA 5-3871

The influence of estrogen on Ca metabolism in soft tissues and skeleton has been studied in pigeons by the use of Ca^{45} . Daily estrogen injections produce an increase of Ca metabolism to a higher degree than can be observed to occur by normal hormonal secretion. The excretion of Ca is decreased by estrogen injections and at the same time the over-all retention of Ca is increased, yielding a biological half life of Ca of about 75 days instead of the 45 days in the controls. The distribution of Ca in bone was also studied by the radioautographic technique. NSA 5-3871

BIOLOGIC EFFECTS OF RADIOACTIVE PHOSPHORUS POISONING IN RATS. Simon Koletsky and James H. Christie. *Am. J. Path.* **27**, 175-94 (1951) Mar.-Apr.

Lethal doses of P^{32} produced extensive morphologic lesions in rats. These were similar to previously described effects of radiation, from either external or internal source, in both animals and man. Similar changes result also from the nitrogen mustards. By virtue of its distribution, P^{32} acted as a powerful hemopoietic poison producing aplasia of the bone marrow and hypoplasia of the lymphoid tissues of the body, including spleen and thymus. This was reflected in the peripheral blood by rapidly developing leukopenia, thrombocytopenia, and anemia. In addition, the intestinal tract, especially the small bowel, and the gonads were sensitive to radiation. Organs such as liver, pancreas, adrenals, kidney, heart, and brain were radioresistant. Destruction of tissue occurred rapidly, being well developed from 6 to 12 hr after injection of the P^{32} . The principal mode of cell destruction was by karyorrhexis. Most of the resulting debris was removed by the 2nd or 3rd day. Involution of the hemopoietic organs was marked at the end of 24 hr and was then progressive over the next several days. During the period of necrosis and involution the animals usually were in good condition and asymptomatic. However, this latent interval was followed by progressive inanition, debility, and weight loss, terminating in death within 3 weeks after administration of the P^{32} . At the time of death there were aplasia of bone marrow, atrophy of lymphoid tissues, and persistent leukopenia, but the hemopoietic system often revealed beginning or even fairly substantial regeneration, the intestinal damage was largely repaired, whereas the injury to testes was progressive. In animals that recovered there was usually good repair of bone marrow and lymph nodes after a few months. Regeneration was less effective in spleen and thymus, and in the testis generally ranged from slight to negligible. One of the late effects of P^{32} poisoning was the development of malignant neoplasms. The mechanism of radiation death is not established. With massive doses of P^{32} , after

which death takes place within a few days, the outcome is usually attributed to a general toxemia resulting from extensive destruction of tissue. With LD_{50} doses of P^{32} , after which death occurs within a few weeks, the almost constant presence of infectious lesions suggests that bacterial toxemia may be significant. 30 references.

PRODUCTION OF MALIGNANT TUMORS IN RATS WITH RADIOACTIVE PHOSPHORUS. Simon Koletsky, Frederick J. Bonte, and Hymer L. Friedell. *Cancer Research* **10**, 129-38 (1950) Mar.

Adult white male rats of the Wistar strain, weighing about 150 g, were used in experiments in which the incidence of neoplasms was observed following either the injection of a LD_{50} dose of P^{32} (4.5 μ c/g of body weight) or repeated injections of P^{32} (1.5 μ c/g body weight every three weeks) for a total dose of 9 or 12 μ c/g, spontaneous bone tumors have not been observed among control animals of this strain. Complete autopsies were performed on all rats which died or were sacrificed, and in almost all the animals routine microscopic sections of the femur and vertebrae were taken. Of the 19 animals in the first group, 9 developed malignant neoplasms but were otherwise in good condition, except for the last few weeks of life. Of 15 rats in the second group, 4 were discarded, and of the remaining 11, 4 developed neoplasms. Of the total of 13 neoplasms, 3 were squamous-cell carcinoma involving the face and were associated with exophthalmos, 10 were osteogenic sarcomas, 4 of which were located in the jaw, 2 in the spine, 2 in the tibia, and 1 each in the femur and pelvis, 4 of these latter tumors metastasized to the lungs. The incidence of tumor development was about 40%. A typical proliferation of bone was usually found in the rats and the lesions, it is concluded, may have served as a precursor to malignant changes. Hanford Atomic Products Operation, Richland, Wash. GASTROINTESTINAL ABSORPTION, DISTRIBUTION, AND RETENTION OF PHOSPHORUS (P^{32}) BY RATS FOLLOWING FEEDING IN VARIOUS FORMS. B. Kavin and R. F. Palmer. June 21, 1956. 23p. Contract W-31-109-Eng-52. (HW-43836)

Following a single feeding of rats with either inorganic P^{32} , P^{32} incorporated in fish muscle, or P^{32} incorporated in plant leaves, no statistically significant differences in P^{32} distribution and excretion ascribable to the source of radioactivity were found over an experimental period of 40 days. About 25% of the P^{32} fed was not absorbed from the gastrointestinal tract and was rapidly excreted in the feces. The excretion of the absorbed fraction of P^{32} appeared to be distributed equally between urine and feces. There was no significant change in the quantity of radioactivity in the skeleton, which amounted to 13.5% of the fed dose of P^{32} , throughout the period covered by the experiment. The concentrations of P^{32} in the liver and other soft tissues were proportional to the P^{32} concentration of the blood. Studies of the distribution of inert and radioactive phosphorus in teeth and bones of the rat skeleton following intragastric administration showed a high concentration of inert phosphorus in teeth as compared to bone. The P^{32} was rapidly taken up and retained without loss by both bones and teeth. The P^{32} concentration was greatest in the incisors, less in the bones, and least in the molars. The femur was found to be a reliable measure of total skeletal P^{32} deposition, and the ratio, skeletal P^{32} to femur P^{32} , amounted to 24.6 ± 1.2 . Compared to those reported for humans, the calculated differential absorption coefficients were similar, but the P^{32} concentrations of the bones differed. NSA 11-1761

STATUS REPORT NO. 8 ON BODY RETENTION OF
CARBON-14 TO ATOMIC ENERGY COMMISSION, DIV-

ISION OF BIOLOGY AND MEDICINE, PROJECT NO. 121.
Oct. 9, 1950. 20p. (AECU-1014, Status Report No. 8)

A new series of long-term experiments designed to obtain information on the degree of radiation in the area of the bone shaft where $C^{14}O_2$ is laid down following a single exposure are underway. An experiment which entailed exposure of mice to a very active $BaC^{14}O_3$ aerosol followed by tissue-activity determinations, lung autoradiographs, and measurement of the exhaled CO_2 activity is described. Preliminary results indicate very rapid exchange of barium carbonate carbon with inactive carbonate ions in the lung as was to be expected. Studies on the effect of repeated injection of C^{14} -labeled formate (a rather specific precursor of nucleic acid moieties) on the pattern of leukemia in Ak-4 mice are underway. Monthly doses of $50 \mu c$ of C^{14} formate per mouse are being employed. Such a dose has been found to give tissue activities of $50 \mu c$ /mole of carbon, and nucleic acid purine activities of $1800 \mu c$ /mole of carbon at 6 hr after injection. The short-term distribution of formate carbon in tissues and organs has been investigated. Over-all distribution and excretion studies have been carried out with methyl-labeled nitrogen mustard and 2,6-diaminopurine labeled in the 2 position. NSA 5-513

THE METABOLISM OF SILVER IN THE RAT WITH RADIOSILVER USED AS AN INDICATOR. Kenneth G. Scott and Joseph G. Hamilton Univ. Calif. *Pubs. Pharmacol.* 2, 241-62(1950).

The preparation of carrier-free radiosilver from Pd and the biological methods used to study silver metabolism are described. The findings on the way in which rats handle small amounts of silver differ from the findings reported on argyria. After the administration of about 10^{13} atoms of silver, excretion is immediately and thoroughly accomplished, principally by the liver. Silver administered intragastrically was not absorbed within the limits of sensitivity of the method. The distribution of silver in the rat after intravenous injection is the same as that observed after intramuscular injection. When the dose of silver atoms per rat was increased from 10^{13} to 10^{18} , a concentration commonly used in therapy, a 10- to 100-fold increase in the concentration of silver was observed in such organs as liver, kidney, spleen, skin, bone, and muscle. The effect of liver damage and bile-duct ligation and the blood chemistry of tracer concentrations of silver are discussed. NSA 4-6072

RETENTION BY MICE OF TRITIUM ADMINISTERED AS THE OXIDE. R. C. Thompson. June 19, 1951. 14p. (HW-21494)

Tritium oxide was administered to mice by intraperitoneal injection. The retention of tritium activity in the body water and in the dry carcass was determined. The biological half life of body water in the mouse is approximately 1.1 days. The curve of tritium loss from the tissue-bound state can be fairly well resolved into components of 9-day and 90-day half lives. These components are thought to represent, respectively, groups of relatively dynamic body constituents, and of relatively stable body constituents. They are of comparable tritium binding capacity and under chronic exposure to tritium would accumulate about 17% as much activity as would be present in the body water. NSA 5-5455

PROGRESS REPORT, THE EXCRETION OF Sr⁸⁹ BY GOATS. p. 11-20 "Division of Biological and Medical Research Quarterly Report, May, June, July, 1950. S. A. Tyler and Joan Gurian. July 1950. 10p. (ANL-4488)

In an effort to investigate in greater detail the time distribution of Sr⁸⁹ excretions for goats, an analysis of the time course of excreted radiostrontium for individual goats from data of previous experiments was made, and the interrelationship between individual patterns was noted. Daily excretion (in per cent of the injected dose) were assumed to follow the empirical model $E_t = E_1 t^b$, where E_t is the per cent of the injected dose excreted during day t , t = time in days after injection, and E_1 and b are empirically determined constants. Thus the correspondence $Y - \log E_t$, $X - \log t$ was adopted as the rectifying transformation. The excretion data were corrected for decay on the assumption that all activity consisted of Sr⁸⁹ with a half-life of 55 days. The least-square parameters of the characterizing linear equation based on

daily excretion from day 2, $\log E_t = \log E_1 + b \log t$, are tabulated in three tables. The scatter diagram of paired slopes (urine versus feces) is presented, and the dependence of urinary excretion slope on age of animal is illustrated. NSA 5-2365

THE DEPOSITION OF Sr⁸⁹ IN RABBIT BONES FOLLOWING INTRAVENOUS INJECTION. Margaret Tutt, Barbara Kidman, Barbara Rayner, and Janet Vaughan. Brit. J. Exptl. Path. 33, 207-15(1952) Apr.

The uptake by the skeleton of a single dose of Sr⁸⁹ given by intravenous injection is extremely rapid, in young animals 70% of the injected Sr⁸⁹ is present in the bone within 4 hours, with a consequent rapid lowering of the blood level. The fall in skeletal Sr⁸⁹ follows a smooth curve for 9 days, reaching a figure of 55%. In older animals the uptake is equally rapid but reaches a lower maximum, and the curve for retention fall unevenly and to a greater extent in the first 9 days. In older animals retention is greater in the flat bones than in the long bones. This may be associated with the fact that in young animals there is red marrow throughout the shaft of the long bones, while in older animals there is more red marrow in the flat bones. There is no significant difference in retention in different long bones or different flat bones. In rabbits of 3 to 4 months the concentration of Sr⁸⁹ is at first greater in the epiphyseal plate and later in the metaphysis, this displacement is evidently due to subsequent bone growth. The localized concentration of radioactive strontium within the bone must be remembered in considering toxic hazards. NSA 6-5041

DISTRIBUTION OF INTRAVENOUSLY INJECTED COLLOIDAL RADIOACTIVE IRON IN IRON PROTEINS OF THE

NORMAL RABBIT AND OF RABBITS WITH TURPENTINE ABSCESS AND DIPHTHERIA TOXICOSIS. Ignazio Indovina. *Am. J. Physiol.* **165**, 348-51(1951) May 1.

Intravenously injected bivalent colloidal iron (Fe^{55} and Fe^{59}) is found in all the Fe-containing proteins of the rabbits. The ratio cpm/γ of Fe is increased more in the ferritin and in the cytochromes than in the other compounds. In the turpentine abscess and diphtheria toxicosis the Fe goes especially into the liver (where the preformed apoferritin is resident), and the radioactivity in the myoglobin and in the cytochromes is low. No alterations were noted in the formation of hemoglobin.

EXCRETION OF ADMINISTERED RADIOCALCIUM FOLLOWING THYROPARATHYROIDECTOMY, OR BILATERAL NEPHRECTOMY, AND THE INJECTION OF PARATHYROID EXTRACT. W. R. Tweedy, M. V. L'Heureux, and E. M. Zorn. *Endocrinology* **47**, 219-27 (1950) Oct.

The urinary and fecal excretion of administered radiocalcium, Ca^{45} , by rats during an 18-hr period was determined at intervals of 1 to 40 days after thyroparathyroidectomy. On an adequate diet, containing approximately 1.18% of calcium and 0.98% of phosphorus, the urinary excretion of administered Ca^{45} was unchanged but the fecal excretion was diminished and remained below the control level for several days. Administered Ca^{45} appeared to accumulate in the kidneys of thyroparathyroidectomized rats, injected with parathyroid extract, prior to the elevation of the serum calcium level, but the fractions of the Ca^{45} excreted in the urine and feces were not increased. Normal rats injected with toxic doses of parathyroid extract showed an increased urinary excretion of Ca^{45} concomitant with a decreased fecal excretion. Bilaterally nephrectomized rats excreted smaller amounts of Ca^{45} than their normal controls. The injection of parathyroid extract in nephrectomized rats did not increase the fecal excretion of Ca^{45} .

THE METABOLISM OF URANIUM²³³ IN MICE. Walter E. Kisieleski, William G. Faraghan, William P. Norris and James S. Arnold. *J. Pharmacol. Exptl. Therap.* **104**, 459-67 (1952) Apr.

A study was made of the retention and distribution of U^{233} given intravenously to mice at dose levels of 0.05 and 0.005 $\mu\text{c/g}$. Animals were sacrificed at intervals of from 30 minutes to 120 days and their body content and tissue concentrations of U^{233} were determined. Analysis of the data indicates that at both dose levels 60% of the injected dose is retained after 1 day and only 15% remains after 120 days. The U^{233} is chiefly deposited in bone and kidneys. A number of radioautographs are accompanied with a discussion of the cellular distribution of U^{233} .

THE RETENTION AND DISTRIBUTION OF U^{233} IN MICE. W. E. Kisieleski, W. G. Faraghan, and W. P. Norris. Nov. 1950. Dec. Feb. 2, 1951. 2p. (AECD-3057)

A study of the metabolism and organ distribution of U^{233} injected intravenously in mice is reported. The major portion of the injected material was rapidly excreted; about 50% was retained at 3 to 4 days and only about 20% at 6 days. The bone was the principal site of deposition.

RELATIVE EFFECTIVENESS OF VARIOUS AGENTS FOR PREVENTING THE INTERNAL DEPOSITION OF PLUTONIUM IN THE RAT. J. Katz, M. H. Weeks, and W. D. Oakley. Jan. 1, 1954. 12p. Contract W-31-109-Eng-52. (HW-30231)

The prompt administration of zirconium citrate was at least twice as effective as the prompt administration of the calcium disodium salt of ethylenediaminetetraacetic acid (CaEDTA) in preventing deposition of plutonium in the skeleton. On the other hand, CaEDTA was twice as effective as zirconium citrate in preventing the deposition of plutonium in soft tissues. The combined administration of zirconium citrate and CaEDTA was the most effective treatment for preventing the deposition of plutonium in the total rat. This combined treatment reduced by about two-thirds the plutonium retained after 30 days. Zirconium malate offered no advantage over zirconium citrate, and appeared to be somewhat more toxic. Three doses of the zirconium salts over a four-day period were no more effective than a single dose. All forms of therapy (single injection) initiated 30 days after plutonium administration were ineffective in removing the plutonium fixed in the body of the rat. Various skeletal segments were separately analyzed in both control and therapeutically treated rats and were shown to exhibit a comparable affinity for plutonium with the exception that bones of the skull were found to contain a lower concentration of plutonium by a factor of about two.

ROLE OF CALCIUM IN RADIATION INJURY. M. H. Toosy (Nishtar Medical Coll., Multan, West Pakistan). 19p. (A/CONF.15/P/1405)

Results are presented from a study on the effects of beta particles on the skin of mice. A 90-mc strontium-90 applicator was used as the radiation source. The influence of calcium content of the skin and the effects of various injected hormones on skin reaction were investigated. The hormones employed increased the calcium content of the epidermis significantly. An association was noted between calcium content and the reduced tendency of the irradiated epidermis to ulcerate. The relationship of irradiation, endocrines, and calcium metabolism is discussed.

ABSORPTION OF PLUTONIUM FED CHRONICALLY TO RATS. I. EFFECT OF SEX ON FRACTION ABSORBED AFTER HIGH DOSAGE LEVELS. J. Katz, C. W. DeLong, M. E. Getzendaner, A. C. Case, and Ester S. Miller. Mar. 13, 1951. 11p. (HW-20941(pt. 1))

Preliminary investigations undertaken to determine the percentage absorption from the rat's gastrointestinal tract of Pu administered chronically and to find whether

the sex of the animal plays a role in the rate of absorption are described. Five male and five female rats each received perorally an average of $5.9 \mu\text{g}$ of $\text{Pu}^{239} (+4)$ as the nitrate over a period of 90 days. Radiochemical analyses indicate that an average of 0.0095% of the administered dose was deposited in the total carcass. The pelt contained negligible amounts, but the gastrointestinal tract and contents retained considerable quantities of Pu even after a fast of 3 to 5 days. There was no evidence of any sex difference in Pu retention. NSA 5-6950

DYNAMICS OF CALCIUM METABOLISM. I. THE DISTRIBUTION OF INTRAVENOUSLY ADMINISTERED RADIO-CALCIUM. R. O. Thomas, T. A. Litovitz, M. I. Rubin, and C. F. Geschickter. 1951. 24p. (AECU-2457)

The disappearance from the blood, the uptake by the bones, and the excretion via the urine and feces of tracer radiocalcium have been investigated for groups of normal young and adult rabbits. Mathematical analysis of the blood disappearance curves obtained in this study indicated that four exponential terms are needed to represent the data. From the first two terms the rates of exchange of Ca between plasma and extravascular compartments were calculated and shown to be in good agreement with data previously obtained by others for other ions. Within the experimental accuracy these above rates were found to be the same in both young and adult rabbits. The third term in the blood disappearance equation has been correlated with the bone uptake of Ca. The bone uptake of radiocalcium in the young age group was greater than in the adult age group. Therefore, it has been shown that the third blood terms for the disappearance of Ca is a measure of bone activity. The fourth term from the equations expressing blood disappearance rates has been correlated with the excretion of Ca via the urine and feces. This excretory output has been found to be an inverse function of the bone uptake of Ca. From this study it was deduced that a mathematical analysis of blood disappearance data and excretion data for Ca can yield information regarding bone activity. NSA 7-3338

10628

THE TISSUE DISTRIBUTION AND EXCRETION OF RADIO-ACTIVE HAFNIUM¹⁸¹ MANDELATE IN THE RAT. C. Frederick Kittle, E. R. King, and Marshall Brucer. Paper presented at the American Society for Pharmacology and Experimental Therapeutics Fall Meeting, Boston, Nov. 13-15, 1950. An abstract of this paper has appeared in J. Pharmacol. Exptl. Therap. 101, 21(1951) Jan. and is reproduced here in its entirety.

The tissue distribution and excretion of Hf^{181} was determined in 17 rats sacrificed in groups of 3 at intervals of 1, 2, 3, 4, 8, and 16 days after intravenous administration of the mandelate salt. After pseudoashing the tissues with HNO_3 , radioactivity was measured utilizing a thin-walled, end-window, G-M counter. Seven per cent of the Hf was excreted in 16 days (5% urinary, 2% fecal) with 5% being eliminated within 4 days. The liver, skeletal, muscular, and integumentary systems, respectively, showed greatest retention calculated on an organ basis, while the spleen, liver, and bone were highest when expressed on an activity per gram basis. Slight but significant amounts were found in the adrenal glands and other parenchymatous organs. Results were correlated with tissue autoradiographs. The 10-day LD_{50} for stable Hf mandelate given in a single intravenous dose was of the order of 100 mg/kg, while with Hf gluconate administered

in successive daily intraperitoneal doses, the LD_{50} was 2 to 3 g/kg. NSA 5-2029

A STUDY OF THE METABOLISM OF RADIOACTIVE CALCIUM (Ca^{45}) IN YOUNG, ADULT, AND RACHITIC RATS. D. M. Thomson and D. Harold Copp. Oct. 24, 1950. 4p. (UCRL-960 (excerpt)).

In the adult rats, the relatively slow uptake of radio-calcium by the skeleton reflects ion exchange with the Ca in the bone salt, since there is little or no new bone formation in these animals. Initial rapid uptake in the normal and rachitic young rats is associated with the metabolically active tissue in these animals. However, while the Ca becomes fixed in the skeleton of the normal animals, it is rapidly lost from the rachitic skeleton, suggesting that it is initially taken up in a very labile form. High urinary excretion and renal serum clearance in the rats with low phosphorus rickets, despite a normal level of blood Ca, indicates that there is a direct effect of rickets on the Ca clearance by the kidney. This may be associated with the low level of blood phosphate in these animals. In the adult rats, the renal serum clearance is almost the same as in young normals, and the urinary excretion is low, but fecal excretion is relatively high. The loss of radiocalcium from the body in these animals is not due to the kidney, but to fecal excretion. NSA 5-1786

BIOCHEMICAL CONSIDERATION OF DISTRIBUTION. Granvil C. Kyker (Oak Ridge Inst. of Nuclear Studies, Tenn.). Am. J. Med. Sci. 227, 572-89(1954) May.

There are several well established factors known to influence prominently the metabolic pattern of distribution of internally administered radioisotopes. The potential value of most isotopes for internal use in therapy remains largely obscure. New ones will undoubtedly arouse interest and offer apparent advantages. Besides the many factors profoundly affecting their distribution, removal of internally administered radioisotopes is in general an unsolved problem. Extensive information and experience from a study of a radioisotope in animals prior to its medical use are therefore emphasized as measures of extreme importance. NSA 8-5120

BODY RETENTION OF CARBON 14. (STATUS REPORT NO. 9). Jan. 12, 1951. 18p. (ORO-41)

Preliminary results are reported on a new experiment having to do with long-term retention of C^{14} in bone and bone fractions. After a period of 4 months, the greatest part of the injected C^{14} can be found in the bone. The "active" volume of the bone shaft was receiving approximately 0.16 rep/day from 1 to 2 weeks after injection of $18 \mu\text{C}$ of $\text{NaHC}^{14}\text{O}_3$ and about 0.04 rep/day at from 5 to 6 months. In studies of the effect of C^{14} -formate on the pattern of deaths from spontaneous leukemia in Akm mice which have been under way about 4 1/2 months, experimental

animals have now received a total of 200 μc each. None of the mice in either the experimental or control groups has developed leukemia to date. Rather extensive studies have now been completed on the incorporation and turnover of C^{14} from sodium formate in normal and neoplastic mice. In mice with lymphoid Ak 4 leukemia, the thymus, spleen, and lymph nodes have been observed to incorporate C^{14} from formate much more rapidly than was the case in normal mice. Sarcoma 180 tissue picks up C^{14} rapidly when compared to most other tissues. Blood-smear autoradiograms have shown that C^{14} from formate is present in leukemic cells in relatively high levels at 1 hr after injection while normal lymphocytes, myelocytes, or erythrocytes are almost entirely inactive at this time. Univ. of Calif., Berkeley, Radiation Lab. THE EFFECTS OF CaEDTA UPON THE METABOLIC PATTERN OF PLUTONIUM IN RATS. Joseph G. Hamilton and Kenneth G. Scott. Aug. 11, 1952. 15p. (UCRL-1905)

Studies indicate that the oral administration to rats of the Ca salt of (ethylenediamine) tetraacetic acid did not produce a pronounced depletion of Pu in the soft tissues and apparently had very little effect upon the skeletal content of Pu. The parenteral administration of a small amount of CaEDTA likewise appeared to be productive of little effect. An increase of urinary excretion was noted after prolonged feeding but it was not of sufficient magnitude to influence sufficiently the content of either the skeleton or soft tissues. The parenteral administration of large amounts of CaEDTA was shown to decrease the skeletal content of Pu and to increase the absorption from intramuscular injection sites. In the rat the amounts of CaEDTA necessary to secure an appreciable increase of urinary excretion are in the toxic range. It is concluded that while the immediate use of large amounts of CaEDTA following the accidental entry of Pu into the body through cuts or abrasions may offer some promise, the use of CaEDTA for the treatment of chronic Pu poisoning is of very limited practical value. University of California, Radiation Laboratory THE METABOLIC PROPERTIES OF PLUTONIUM AND ALLIED MATERIALS, SECT. I OF MEDICAL AND HEALTH PHYSICS QUARTERLY REPORT, APRIL, MAY, AND JUNE 1950. J. G. Hamilton. July 26, 1950. Decl. Sept. 8, 1950. 42p. (AECD-2928(sect. 1))

Radioautography and Histology. Studies on the histopathology of astatine, At^{211} , have continued following two lines: (1) the toxicity of the element to body tissues in general, and (2) the points of localization and destruction of thyroid tissue. Tracer Studies in Rats with Radioactive Materials. Studies on the deposition of tantalum in rats using Ta^{182} as a radioactive tracer have been continued. In general, these studies show that tantalum is rather readily eliminated from the body. That which remains deposited in the body 64 days after administration is primarily found in liver and kidney, skeleton, skin, and the musculature. Carrier-free Re^{183} has been administered to rats intravenously and its fate studied for 1, 4, 24, and 48 hr. With the exception of a relatively large accumulation of this isotope by the thyroid, rhenium was not deposited to any great degree in any of the tissues studied. The fate of carrier-free Os^{185} has been studied in rats following intramuscular administration. One day following administration, relatively large amounts of osmium were found in kidney and in the intestinal contents, with lesser amounts being deposited in liver, blood and spleen. Chelating Experiments. Necessary characteristics of chelating agents for hastening excretion of radioactive material are discussed. In view of the importance of the

toxicology of beryllium, a number of chelating agents were screened *in vivo* for possible use for removing beryllium which has been deposited in the body. Numerous cations have been tested for reaction with ethylenediamine tetraacetic acid (EDTA) to form soluble chelates. A Preliminary Report on the Effect of Whole-body Radiation on Extra- and Intracellular Electrolytes. Experiments have been aimed at establishing the pattern in rats of fecal and urinary excretion of electrolytes in acute radiation injury. Na²² was injected subcutaneously in an amount of 2.0 μ c 36 hr before various irradiations. The reactions of the animals are described, and the change in Na²² concentration in tissues and excreta is presented. Decontamination and Bone-Metabolism Studies. A study was made of the curves for distribution in rats of Ce¹⁴⁴, Nb⁹⁵, Y⁹⁰, and Pu²³⁹ during the first hour following intravenous injection. An initial rapid fall in blood level during the first 10 min was followed by a much slower decline. Treatment with massive doses of zirconium citrate prolonged the initial rapid rate of urinary excretion and fall in blood level. After injection of Ca⁴⁵ into normal young rats, feeding a phosphorus-deficient diet resulted in an immediate and marked increase in the urinary excretion of radiocalcium, with accelerated removal from the skeleton. This procedure would appear to have possibilities for decontamination of radiostrontium. The Effect of Calcium-Versene Complex on the Excretion of Radiocalcium in the Rat. Calcium-versene complex injected 0 or 15 min after administration of Ca⁴⁵ resulted in a very significant increase in the urinary excretion of radiocalcium. This treatment also produced a small reduction in the amount of Ca⁴⁵ in bone. Radiochemistry. The 52.9-day Be⁷, produced by (d, 2p) reaction on lithium, was isolated by dissolving the target in water to give a solution of lithium hydroxide containing the Be⁷ as a radiocolloid which is removed by passing the solution through a sintered-glass filter. The long-lived radioisotopes of tantalum, Ta¹⁷⁸, ¹⁸², were prepared by α -particle bombardment of hafnium according to the reaction Hf(d, α p) Ta. A carrier-free procedure was developed for isolating the radiotantalum from the hafnium oxide target material and from the röntgenium concurrently produced by (α , xn) reaction. The shorter-lived radioisotopes of tantalum, Ta¹⁷⁶, ¹⁷⁷, were prepared by deuteron bombardment of HfO₂ according to the reaction Hf(d, xn) Ta. A more rapid procedure has been developed for the separation of At²¹¹ from bombarded bismuth foils. The bismuth is heated to 425°C in a stream of nitrogen carrier gas at a pressure of 10⁻² to 10⁻⁹ mm. The At²¹¹ is collected on a cold finger which is covered with a thin layer of ice. NSA 4-6703

THE DEPOSITION OF PLUTONIUM AND CERTAIN FISSION PRODUCTS IN BONE AS A DECONTAMINATION PROBLEM. Joseph G. Hamilton, D. H. Copp, D. M. Greenberg, M. J. Chace, L. Van Middlesworth and E. M. Cuthbertson. May 15, 1946. Decl. July 22, 1947. 98p. (AECD-2483; CH-3591)

Many of the radioactive elements concerned in nuclear fission are deposited in the skeleton, subjecting the cells of the bone marrow and bone to the chronic effects of toxic radiations. These studies have been concerned with the deposition in bone of plutonium and of the radioactive isotopes of strontium, yttrium, and cerium which are formed by fission. They were conducted with particular reference to the problem of decontamination. Although most treatments had little influence on the absorption of Sr from the gut, both age and dietary calcium did have a profound effect, and growing rats, on a diet low in calcium, absorbed over 25 times as much of a given dose as did adult rats receiving ample calcium in the diet. There was also a 4-fold difference in the retention of injected radioactive Br when these two extremes were compared, but no appreciable effect on the retention of radioactive Y, Ce, or Pu. Parathormone, massive doses of vitamin D, and "carrier" strontium were found to have little effect on the retention of radioactive Sr. The chronic elimination by the rat of radioactive Sr, Y, Ce, and Pu was followed for a period of several months. No appreciable decontamination was obtained by prolonged treatment with parathormone, ammonium chloride, sodium citrate, and other methods suggested for the treatment of chronic radium poisoning. The only effect observed was a small increase in the excretion of Sr. Experiments on healing bone fractures showed that the peak uptake of radioactive Pu and Y by the callus occurred several days before the commencement of active calcification and deposition of radioactive Sr. A diet very low in phosphorus was prepared with washed beef blood fibrin as the protein base. Rats weaned to this diet at three weeks of age showed severe signs of phosphorus deficiency within two weeks, including low inorganic blood phosphate, aphosphaturia, and extreme decalcification of the bones. There was a four-fold reduction in the retention of radioactive Sr by these animals,

but no significant difference in the retention of radioactive Pu, Y, and Ce. It was found that these effects of severe phosphorus deficiency, including resorption of bone salts, could be produced by adding aluminum sulfate or freshly precipitated aluminum hydroxide to a normal diet. Some demineralization of bone could be produced even in adult animals. In animals with severe phosphorus deficiency, large areas of the bone, particularly below the epiphysis, consisted of organic matrix free from bone salts. Radioautographs of undecalcified bone sections from such animals showed that the radioactive Sr was deposited only in the presence of bone salts while radioactive Pu, Y, Ce, and Zr were laid down in the uncalcified organic matrix. These, and the preceding metabolic studies, indicate that while Sr follows the path of calcium and is deposited in the mineral of bone, the metabolism of the other elements is unrelated to that of calcium and they may be laid down in the organic bone matrix. Radioautographs of undecalcified bone sections of adult rat demonstrated the superficial deposition of plutonium, and the relative immobility of these deposits. By this technique, it was shown that these plutonium deposits in the skeleton may be overlaid with newly formed non-radioactive bone, thus shielding the sensitive cells of bone marrow and bone from the short range alpha particles. This has been suggested as a possible means of reducing the chronic toxicity of plutonium in the skeleton. 24 references. NSA 2-1326

RADIOSTRONTIUM-CALCIUM RELATIONS IN PLANTS AND ANIMALS. H. A. Kornberg. 12p. (A/CONF.15/P/1029)

Prepared for the Second U. N. International Conference on the Peaceful Uses of Atomic Energy, 1958. In laboratory experiments the uptake in plants of Strontium-90 was measured as a function of calcium in the root environment. In general, the uptake of Sr^{90} was not found to decrease as a result of the calcium present. When rats were intraperitoneally injected or fed in single doses mixtures of Sr^{90} and calcium, the deposition of Sr^{90} on the skeleton was not found to be affected by the presence of

calcium in the administered dose. Groups of rats which were maintained on diets containing several levels of calcium along with Ca^{45} and Sr^{90} were found to deposit less Sr^{90} and Ca^{45} on their skeletons as the calcium in the diet was increased. However, the decrease of Sr^{90} deposition with increase in dietary calcium was less than that which would have occurred if the strontium had deposited in inverse proportion to the calcium in the diet. The data also showed that beyond 0.5% of dietary calcium there was no further decrease of Sr^{90} deposition with increase of calcium. Similar observations were made with lambs that were fed Sr^{90} and calcium gluconate in milk. The gluconate ion was found to account for a significant amount of the decreased Sr^{90} deposition observed. These experimental observations point to the need for measuring Sr^{90} contamination in absolute units and tend to support theoretical considerations of the effect of isotopic dilution. The movement and deposition of substances can occur by only four processes: flow, diffusion, adsorption, and chemical reaction. Each of these processes may be separately considered to determine the effect of the addition of one isotope on the movement or deposition of another isotope. For the processes of flow and simple diffusion, isotopic dilution is without effect. For the processes of adsorption and chemical reaction, isotopic dilution will be effective only under the condition that some acceptor material upon which the element deposits approaches saturation. Even under this condition the effect of one isotope on another need not be a linear inverse relationship. Experimental data involving radioactive and non-radioactive isotopes other than radiostrontium and calcium which also support these hypotheses are presented. NSA 12-14593

DISTRIBUTION OF ZINC IN NORMAL BLOOD AND ORGANS STUDIED BY MEANS OF Zn^{65} . Bert L. Vallee, Rex G. Fluharty, and John G. Gibson, 2nd. *Acta Unio Intern. contra Cancrum* 6, 869-73(1949).

Measurements of the zinc content of normal dogs demonstrated that zinc is present in all organs of the body, after the intravenous administration of Zn^{65} , the isotope was also found to be distributed to all the organs, and remained in the body up to six months later. There was no evidence of specific localization of the isotope in any organ studied, doses used resulted in irradiation of 0.001-0.06 r/day. The isotope was transmitted across the placental barrier in a pregnant dog and was found in each of its nine pups on parturition. The zinc content of erythrocytes and leucocytes was very low, with the leucocytes in dogs containing 100 times the concentration of the erythrocytes, human leucocyte concentrations of zinc were 25 times that of erythrocytes. The results of studies on zinc metabolism by the white and red blood cells suggest to the authors that zinc plays an important part in the metabolism of tissue and blood cells, and that the body has a mechanism for its conservation and reutilization. THE METABOLISM STUDIED BY MEANS OF THE RADIOACTIVE ISOTOPE Zn^{65} . Bert L. Vallee and Rex G. Fluharty. *J. Clin. Invest.* 26, 1199(1947) Nov.

External scanning with a gamma ray Geiger-Muller counter has shown that, following intravenous administration, Zn^{65} becomes widely distributed throughout the entire body of the normal dog. The normal range of zinc content of organs has been determined in normal dogs by an improved dithizone method. The ranges, in completely perfused organs, in gamma per gram (wet weight), are: heart and great vessels 15-20; respiratory organs 10-20, digestive organs 10-60, genito-urinary tract 20-50, muscle

40-50; cortical bone 40-50, C. N. S. (brain) 10-15, endocrines 20-100, lymph glands 15-100, liver 50-60; spleen 10-20; marrow 60-80, plasma 2-4 (per cc), whole blood 7-9. Simultaneous measurements of Zn^{65} and total zinc content have not shown selective localization of the element in any of the above organs. The complete separation of white cells from blood can be effected by flotation of heparinized whole blood on an isosmotic solution of bovine serum albumin of specific gravity of approximately 1.079. The normal zinc content of white cells is 1×10^{-2} gamma and of red cells 1×10^{-4} gamma per million cells, respectively. Following the intravenous injection of Zn^{65} the isotope becomes concentrated within the circulating white cells in amounts sufficient for accurate x-ray detection in the leucocyte mass separated from 15 cc of whole blood (1.0 to 2.0×10^8 whole blood cells). Blood, white cells, and tissue samples are dry ashed, and the zinc extracted with dithizone for colorimetry. The zinc is removed from the dithizonate with sulfuric acid and electroplated from an alkaline solution with added carrier zinc on a copper disk. The x-ray counting procedures are similar to those used to measure Fe^{55} . These procedures have opened the way to a study of overall zinc metabolism in addition to the physiology of leucocytes. EXCRETION BY THE RAT OF INTRAVENOUSLY INJECTED $Ga^{72}Cl_3$ AND Ga^{72} CITRATE. E. R. King, H. D. Bruner, J. D. Perkinson, and Joe Gray. Paper presented at the American Society for Pharmacology and Experimental Therapeutics Fall Meeting, Boston, Nov. 13-15, 1950. An abstract of this paper has appeared in J. Pharmacol. Exptl. Therap. 101, 21(1951) Jan. and is reproduced here in its entirety.

As a part of a general study of the biological significance of Ga, the excretion by the rat of a freely ionizing compound such as $GaCl_3$ was compared with that of a slowly ionizing compound, Ga citrate. $GaCl_3$ or Ga citrate tagged with Ga^{72} was administered intravenously in tracer doses to groups of 24 and 20 animals, respectively. Urine and feces were collected separately at 12-, 24-, 48-, 72-, and 96-hr intervals. The results expressed in terms of per cent of total dose excreted show the principal organ of excretion to be the kidney. About 35 per cent of the total dose of $GaCl_3$ was excreted during the first 12 hr, with 48, 52, 53, and 54 per cent cumulatively excreted at 24, 48, 72, and 96 hr. Of the citrate salt, 22 per cent was excreted during the first 12 hr while 52, 62, 72, and 72 per cent cumulatively was excreted during those 24-hr periods. The total fecal excretion at the end of 96 hr was 7.8 per cent for the $GaCl_3$ and 3.3 per cent for the Ga citrate. NSA 5-2097

IS THE BIOLOGICAL ROLE OF POTASSIUM RELATED TO ITS RADIOACTIVITY? Guillaume Valette and Charles Combescot. Compt. rend. soc. biol. 145, 1625-7(1951). Nov. (In French).

Tyrode's solution was prepared without K but with enough tracer K^{42} to produce the same specific radioactivity as a solution containing normal K. In this solution a fragment of rabbit ileum ceased to contract in 180 to 220 min, rat duodenum ceased to contract in 40 to 60 min, the "potassium paradox" could not be observed, and spontaneous contractions could not be induced after 7-days refrigeration. In Tyrode's solution prepared by substituting the same molarity of K^{42} as that of K in normal solution, thus having 50,000 to 100,000 times the specific activity, no difference in behavior of intestinal fragments was noted except a 50% reduction in the contraction amplitude. It is concluded that the radioactive properties of K have no preponderant effect on the element's biological action. NSA 6-3163

Kansas. Univ., Lawrence

THE METABOLISM OF Sr^{90} AND Y^{90} AND THE INFLUENCE OF LACTATION ON RETENTION. Frank E. Hoecker and Edward I. Shaw. 15p. (A/CONF. 15/P/1996)

Prepared for the Second U. N. International Conference on the Peaceful Uses of Atomic Energy, 1958. Detailed studies of the metabolic history of strontium 90 and yttrium-90 in terms of retention as influenced by gestation and lactation are reported for rats which received intraperitoneal injections either 52 days before parturition or within 24 hours after parturition. Retention periods ranging from 7 minutes to 100 days are covered for 11 body compartments including soft tissue, bones (excluding femurs), femurs, blood, mammary glands, kidneys, liver, muscle, testis, spleen, and litters. Data for Sr^{90} - Y^{90} in equilibrium are based on crystal detection of bremsstrahlung in which energy dependence errors are eliminated by spectrometric analysis and geometrical errors are avoided by digesting or homogenizing tissues. Y^{90} and Sr^{90} are studied separately by half-life measurements based on beta-particle detection. When compared with unbred controls the retention of Sr^{90} in the bones of rats injected 52 days prepartum is not significantly influenced by lactation, but that of animals injected at parturition is markedly affected. When the per cent of dose retained by the latter group is plotted versus time after injection, the depletion of calcium in the bones during gestation is reflected by increased Sr^{90} uptake for the first 5 hours after injection at which time the uptake in both the controls and in the postpartum group reaches a minimum of 42 percent. From this value the retention in both decreases with time although lactation in the postpartum group is responsible for a much greater rate of elimination of Sr^{90} during the first 18 days of lactation which results in a retention of only 5% of the dose at 100 days as compared with a retention of approximately 15% in the controls at that time. Data on soft tissue retention show approximately 80% in all groups at 7 minutes after injection. Greater avidity of the bones is again shown by a slightly lower soft tissue retention in the post partum group although this lower retention vanishes at 7 hours after injection, after which time the soft tissue content increases from 25% to reach a maximum of 37% in 24 hours. This increase in soft tissue retention coincides with the onset of lactation and reflects mobilization of calcium (and hence Sr^{90}) from the bones. It also coincides with the time of decreased bone retention referred to above. Sr^{90} concentration in the blood decreases by a factor of 7 during a period of 2 hours following injection. In the control group the blood content is essentially zero within 24 hours, while in the lactating group the Sr^{90} concentration reaches a minimum at 24 hours but undergoes an increase which coincides with the increase in soft tissue content resulting from the onset of lactation. EXCRETION OF GALLIUM BY THE RAT AND BY MAN. E. R. King, Jesse D. Perkinson, Jr., H. D. Bruner, and Joe Gray. Science 113, 555-7(1951) May 11.

A detailed comparison is made between excretion of Ga in the rat following intravenous administration of $GaCl_3$, a rapidly ionizing salt, and the slowly ionizing complex, gallium citrate. The rats received 200 to 300 μ c of Ga^{72} in 1.5 to 2 mg of stable Ga. About 73% of the Ga given as the citrate was excreted in the urine by the fourth day compared with 59% for the chloride salt. The

fecal excretion of the GaCl_3 was about twice that of the citrate. At 96 hr the urine/feces ratio was ~ 8 for the chloride salt and 19.3 for the citrate complex. A second comparison is made between excretion by the rat and by man of tracer and larger intravenous doses of gallium citrate. In man the chief route of excretion is also the urinary tract. In the rat studies the effective half life at the dose level used was 8.33 hr. For the larger doses in man it was ~ 12.5 hr. NSA 5-4355

10659

SOME PHARMACOLOGIC EFFECTS OF DIBORANE. Anne M. Kunkel, Edmund F. Murtha, Aili H. Oikemus, Dorothy E. Stable, J. Palmer Saunders, and J. Henry Willis. (Army Chemical Center, Md.). Arch. Ind. Health 13, 346-51(1956) April.

The primary effect in poisoning by diborane appears to be the production of pulmonary edema. The earliest sign observed in dogs and rabbits during exposure was respiratory embarrassment. This was followed by a slight fall in blood pressure, an increase in activity of the smooth muscle of the intestine, and an increase and subsequent diminution in cortical activity. The latter effects were possibly associated with anoxia. Bradycardia occurred late in poisoning and was followed terminally by ventricular fibrillation or complete disappearance of ventricular activity. It appears that none of the drugs tested prophylactically possesses any significant value in preventing diborane intoxication.

STUDY OF THE DEVELOPMENT IN ANIMALS OF BONE TUMORS ARISING UNDER THE INFLUENCE OF RADIOACTIVE SUBSTANCES. N. A. Krayevskii (Krayevskiy) and N. N. Litvinov. p.367-73 of WORKS OF THE ALL-UNION CONFERENCE ON MEDICAL RADIOLOGY, EXPERIMENTAL MEDICAL RADIOLOGY. Translated from a publication of the State Publishing House of Medical Literature, Moscow, 1957. (AEC-tr-3661 (Bk. 2))

A study was made of bone tissue changes in 100 rats into which strontium-90 had been introduced intraperitoneally at a dose of $0.4 \mu\text{C/g}$ of body weight. Changes in bone tissue are most pronounced in metaphyses of long tubular bones. They consist of a progressive disturbance of the processes of osteogenesis, with the formation of steadily more immature and primitive bone structures. These changes of a dysplastic nature terminate in a number of cases in malignant growth. At first, in the course thereof, during the 2nd and 3rd month following administration of radioactive strontium, disturbance of the processes of osteogenesis consist of a production of atypical, imperfect structures, mostly of osseous, fibrous, and amorphous nature. Later on, during the 4th month, in addition to atypical osseous, fibrous, and amorphous structures, there are formed extensive accumulations of osteogenic tissue consisting primarily of undifferentiated cell elements. During the 5th month a further distortion of processes of osteogenesis is observed. Extensive tissular proliferates are formed which consist of atypical osteogenic cells, and undergo propagation along the bone marrow cavity. By the end of the 5th and the beginning of the 6th month of the injury, there are formed among the growths of atypical osteogenic tissue, areas which have the appearance of tumors. They increase rapidly in size, fill the bone marrow cavity and extend outside of the bone. NSA 14-3336

PHYSIOLOGY AND TOXICOLOGY OF PLUTONIUM²³⁹.

Wright H. Langham. p. 256-75 "Proceedings of the Seventh Hot Laboratories and Equipment Conference." 1959. (AECU-4183)

When taken into the systemic circulation, Pu^{239} deposits predominantly in the skeleton where it may produce bone disease (including cancer) many years later. Its absorption rate from the gastrointestinal tract is only about 0.003 per cent. Absorption from the lung may be from 1 to 10 per cent of the inhaled dose, depending on particle size, solubility, etc. A small amount may be absorbed through the intact skin and through contaminated cuts and puncture wounds. Lung absorption is potentially the most important route of entry into the body and is largely responsible for the rigorous closed-systems and other industrial hygiene and engineering practices employed in plutonium processing. Once in the body, Pu^{239} is excreted extremely slowly (about 200 years being required to eliminate one-half the body burden). An individual who has reached the maximum permissible body burden, technically should be removed from further plutonium contact for the rest of his life. The maximum permissible body burden of Pu^{239} ($0.04 \mu\text{C}$) is established by comparison with Ra^{226} and is that amount which has the same improbability of producing harm to any person at any time during his natural life as does $0.1 \mu\text{C}$ of fixed Ra^{226} . Control of the industrial hazards of Pu^{239} processing is based on the premise that exposure of personnel should be as nearly zero as possible. This is not because less than the maximum permissible body burden is apt to do harm, but because it is sound industrial medical and economic practice. If presently recommended practices are maintained, there is little reason to feel that the health of a person working with Pu^{239} will be subject to any greater absolute risk than if he were engaged in any other chemical or industrial occupation. Rochester N. Y. Univ. Atomic Energy Project THE CHEMICAL TOXICITY OF THORIUM DIOXIDE FOLLOWING INHALATION BY LABORATORY ANIMALS.

H. C. Hodge, E. A. Maynard and L. J. Leach. Jan. 5, 1960. 33p. Contract W-7401-eng-49. (UR-562)

Short-term inhalation studies of thorium dusts, soluble or insoluble, inhaled by laboratory animals in high concentrations for short periods, gave practically no evidence of chemical toxicity. Because toxic effects unpredicted for short-term studies sometimes appear in protracted exposures, a one-year inhalation study of thorium dioxide at an atmospheric concentration of 5 mg Th/m^3 was conducted. This study confirmed the inertness of thorium in the body. The retention of thorium in the tissues was followed in serially sacrificed dogs and rats. The data indicate appre-

ciable accumulation of thorium in the lung. For example, for the dog and the rat the lung values averaged 183 and 121 $\mu\text{g Th/g}$ fresh lung, respectively, at the end of the one-year exposure. Of the tissues examined (lung, liver, kidney, spleen, and bone) only the lung showed an increased thorium content with increased exposure. This is demonstrated when the average lung values after one month exposure for the dog (28 $\mu\text{g Th/g}$) and the rat (31 $\mu\text{g Th/g}$) are compared with the one-year values. This 5-fold increase was not seen in any of the other tissues examined. NSA 14-7204

MULTIPLE MYELOMA: A STUDY OF 24 PATIENTS TREATED WITH RADIOACTIVE ISOTOPES (P^{32} AND Sr^{89}). John H. Lawrence and Louis R. Wasserman. *Ann. Internal Med.* 33, 41-55(1950) June.

Radioactive phosphorus and radioactive strontium have been used as therapeutic agents in multiple myeloma. Improvement was noted in some cases. The average length of life after the onset of the disease in this group of patients was approximately 3 years. These isotopes are valuable in producing whole body background irradiation which may in itself afford some relief. The combination of isotope therapy and x-ray or stilbamidine or urethane is suggested. 16 references. NSA 4-5123

10668

MECHANISM OF URANIUM POISONING. H. C. Hodge (Univ. of Rochester, N. Y.). *Arch. Ind. Health* 14, 43-7(1956) July.

More is known about the toxicity of uranium than about the toxicity of any other element. Uranium in the body is highly toxic, providentially, it is hard to absorb into the body. Once absorbed, uranium is carried partly as a protein complex and partly as a bicarbonate complex. In the bone uranium is deposited principally on the surface of the mineral crystals by exchange with calcium. The kidney is the sole site of the characteristic histological injury. Uranium kills cells by blocking carbohydrate metabolism, apparently inhibiting specifically hexokinase in the cell surface. Finally, a tribute should be paid to the vigilant medical supervision of the Manhattan Project and the Atomic Energy Commission. This supervision has

been so successful at all their installations that severe uranium poisoning has never occurred and mild uranium poisoning is so rare that it is practically unknown. NSA 10-9990

METABOLISM OF CALCIUM IN NORMAL, RACHITIC, AND VITAMIN D TREATED RATS AS EVIDENCED BY RADIOCALCIUM (Ca⁴⁵) STUDIES. H. Hodge, E. Underwood, and S. Fisch. *Jan. 15, 1951*. 13p. (UR-148).

In agreement with the current theory, the evidence presented favors the view that vitamin D increases the absorption of calcium from the gastrointestinal tract, aids in mobilizing inorganic phosphorus from organic sources, and locally accelerates the mineralization of bone. In addition, vitamin D increases the blood-calcium concentration. Active healing of rachitic bone, as shown by the deposition of Ca⁴⁵, begins between the 18th and 72nd hr after the administration of the vitamin.

BIOLOGICAL STUDIES ON STABLE AND RADIOACTIVE RARE EARTH COMPOUNDS. I. ON THE DISTRIBUTION OF LANTHANUM IN THE MAMMALIAN ORGANISM. Daniel Laszlo, Daniel M. Ekstein, Ruth Lewin, and Kurt G. Stern. *J. Natl. Cancer Inst.* 13, 559-73(1952) Oct.

The distribution of La in normal and tumor-bearing mice was studied as a function of time, dose, route of administration, and chemical state of the element. La chloride, injected intravenously, is taken up rapidly by various tissues and the concentration was found to be highest in liver and spleen, and low in the skeletal system. The concentration in the lung was very low until a critical dose-level was reached, whereupon it rose sharply. Minimal transport occurred when La chloride was injected intraperitoneally or subcutaneously. This suggests its intracavitary or intratumoral use. La complexes are distributed more homogeneously than the ionized forms. The implications for therapy of tumors with rare-earth radioisotopes are discussed. NSA 7-3

KINETICS OF OPEN SYSTEMS APPLIED IN RADIATION BIOLOGY. O. Hug and L. Wolf. p. 12 "Progress in Radiobiology." Springfield, Illinois. C. H. Thomas Pub. Co. 1956. 557p.

Authors consider living organisms to be "open systems," assuming, for purposes of the thesis, that production and degradation of a given substance are in equilibrium. Metabolic turnover of substances must be taken into account when irradiation time becomes comparable with turnover time of the substance in question. A formula is given for these two conditions and for recovery to equilibrium after exposure. Initial slope of recovery curve permits determination of "mean recovery time" which may be compared with "mean inactivation time" which in turn may be taken from the initial slope of the curve following irradiation. Theoretical concepts are compared with observed results in *Achromobacter fisheri* (light production). Dose rate and fractionation effects are evaluated.

A QUANTITATIVE STUDY OF PERCUTANEOUS ABSORPTION. IV. ABSORPTION OF MINUTE QUANTITIES OF RADIOSTRONTIUM CHLORIDE THROUGH BURNED RAT SKIN. (Technical Objective AW-6). R. Kenneth Loeffler, John W. Herron, and V. Thomas. Apr. 2, 1951. 25p. (AD-308(B))

The effect of thermal burns on percutaneous absorption of radiostrontium chloride has been studied. Burns were given both before and after contamination of intact and abraded rat skin with radiostrontium chloride. Intact skin with moderately severe or severe burns showed a tendency toward less absorption than unburned skin. This effect was noted when thermal energy was applied during the period from 24 hr preceding application of strontium chloride to 5 min following this contamination. No decrease in absorption was found following suberythermal energy doses. Absorption through abraded skin varied when thermal energy was applied 1 min after contamination. Specifically, in the suberythermal and first-degree burn range, absorption tended to increase. In the second- and third-degree burn range, absorption de-

creased. A much greater concentration of absorbed strontium was found in tissues surrounding the contaminated skin that was normal or mechanically damaged. This was noted even at an energy dosage slightly below that causing visible skin change. NSA 5-4995

QUARTERLY PROGRESS AND WORK ACCOMPLISHMENT REPORT FOR QUARTER ENDING JUNE 30, 1951, AGRICULTURAL RESEARCH PROGRAM. June 30, 1951. 13p. (ORO-43)

Administrative information and brief summaries of progress during this period are presented. No activity was detected in tissues of sheep given Ta^{182} labeled K tantalate orally, indicating less than $0.18 \times 10^{-1}\%$ of the dose per gram of tissue. Data on fecal excretion of orally administered La^{140} by a cow in the third month of lactation are given, no activity was detectable in blood or milk. Changes in serum and milk activity with time in a cow injected intravenously with 15 mc of Ca^{45} 3 weeks previous to parturition are listed. NSA 5-5460

A QUANTITATIVE STUDY OF PERCUTANEOUS ABSORPTION. III. EFFECT OF CONCENTRATION AND SOLUBILITY ON TRACER ABSORPTION OF Sr^{89} FROM INTACT AND ABRADED SKIN AND FROM MUSCLE IN THE RAT, VALIDITY OF SURFACE COUNTER TECHNIQUES. R. Kenneth Loeffler. Feb. 12, 1951. 18p. (AD-290(B))

Absorption into the body of $Sr^{89}Cl_2$ in isotonic and saturated solutions of carrier $SrCl_2$ from intact and abraded rat skin was shown to be essentially independent of the concentration of the applied solution. Very little radiostrontium was found in the body 1 hr after poorly soluble $Sr^{89}SO_4$ was applied to intact skin, abraded skin, and intramuscular lacerations. However, an appreciable amount was found to have been absorbed ten days after intramuscular application. Values for percutaneous absorption obtained by surface-counting technique were shown to correlate closely with those obtained by direct analysis of ashed tissues. NSA 5-3633

AGRICULTURAL RESEARCH PROGRAM. SEMI-ANNUAL PROGRESS REPORT FOR JULY 1, 1955 TO DECEMBER 31, 1955. May 1956. 129p. Contract AT-40-1-GEN-242. (ORO-150). NSA 10-3769

10693

A QUANTITATIVE STUDY OF PERCUTANEOUS ABSORPTION. II. TOXICITY AND EFFECT UPON ABSORPTION OF TWO DECONTAMINATING SOLUTIONS. R. Kenneth Loeffler and V. Thomas. (Naval Radiological Defense Laboratory). Oct. 2, 1950. 16p. (Technical Objective AW-06). (AD-254(B))

Two solutions which have previously been proposed for skin decontamination, each consisting of a complexing agent, a wetting agent, and a disinfectant, are investigated for toxicity in rats. Some systemic toxicity is demonstrated, even from local applications. The solutions are shown to be good skin decontaminants, but it is also shown that they tend to increase the percutaneous absorption of $Sr^{89}Cl_2$ under several conditions. Data are presented which are interpreted as showing that, immediately upon contact with normal intact rat skin, some material is irreversibly bound in a manner which causes it to be eventually absorbed into the system. TISSUE DISTRIBUTION OF BORON COMPOUNDS IN RELATION TO NEUTRON CAPTURE THERAPY OF CANCER.

Herbert B. Locksley and William H. Sweet. *Proc. Soc. Exptl. Biol. Med.* 86, 56-63(1954) May.

Recent application of the atomic pile to the neutron-capture therapy of human brain tumors has focussed attention on the biological behavior of boron compounds. Studies reported in mice and man indicate that borax and boric acid are rapidly absorbed and distributed throughout the body. Uptake by the various organs and tumor describes a family of similar curves such that the faster the rise in concentration, the higher and earlier is the peak. All tissues studied, except brain, reach a peak by 30 minutes. Borate is rapidly excreted by the kidneys as a "low-threshold substance" in a class with urea and sulfate, and clearance from the blood in mice proceeds with an exponential half time of approximately 65 minutes. Concentrations of borate in the tissues of normal mice are directly proportional to dosage for at least 2 hours after injection over a range of 18 to 700 $\mu\text{g/g}$ body weight. At equilibrium distribution, studied in nephrectomized mice, borate is uniformly distributed throughout the body water, with a 10 to 20% excess bound in the intracellular compartment. This excess is bound more tenaciously in brain than in other tissues and appears to be responsible for the toxicity of these compounds. Study of the factors determining the concentration ratio between neoplasm and surrounding normal tissues indicates that boron-neutron treatment offers little promise for malignant tumors other than those of the brain. NSA 8-5113

CONTRIBUTIONS TO THE STUDY OF THE METABOLISM OF CAESIUM, STRONTIUM AND A MIXTURE OF BETA-EMITTERS IN COWS. A. V. Lebedinski (Lebedinsky), ed. Translated from a publication of the Scientific Committee on Medical Radiology of the Ministry of Health, U.S.S.R., Moscow, 1956, 18p. (NP-tr-206)

The tissue distribution and excretion were measured for cows following the ingestion of strontium-89-90, cesium-137, and a mixture of beta-emitting radioisotopes containing niobium-95, zirconium-95, ruthenium-106, cesium-137, strontium-89-90, and an aggregate of rare-earth elements. Data are tabulated. Results of the investigation serve to emphasize the hazards of any large-scale use of radioactive fertilizers containing cesium, strontium, or other easily absorbed isotopes, and the danger of keeping animals on pastures or waters which are contaminated with radioactive substances.

ACUTE TOXICITY OF INHALED THORIUM COMPOUNDS. Robert H. Hall, Catherine A. Stroud, James K. Scott, Robert E. Root, Lucille T. Steadman, and Herbert E. Stokinger. Nov. 13, 1951. 25p. (UR-190)

The low toxicities of $\text{Th}(\text{NO}_3)_4 \cdot 4\text{H}_2\text{O}$, ThO_2 , ThF_4 , and Th oxalate have been demonstrated by a series of tests in which animals breathed atmospheres containing these as dusts. The species exposed were dogs, rabbits, guinea pigs, rats, mice, and hamsters. Negative findings were reported for mortality, urinary protein, blood NPN and urea, plasma fibrinogen, and serum protein. Growth depression was observed in rats exposed to ThO_2 .

Occasional vomiting was observed in the dogs exposed to the nitrate. A thorough histological examination revealed practically no pathological changes attributed to the treatment, the exceptions were minor lesions of uncertain etiology in the lungs. The only positive findings were changes in the hematological picture, especially in the white cells, and somewhat abnormal bone marrow. Spectrographic analyses of the Th content of lung, femur, liver, and spleen showed a tendency for increased Th content with increased exposure. NSA 6-528

ANIMAL DISTRIBUTION OF COLLOIDS OF Au^{198} , P^{32} , AND Y^{90} . AN IMPROVED METHOD OF TISSUE ASSAY FOR RADIOACTIVITY. T. N. Lahr, Robert Olsen, G. I. Gleason, and D. L. Tabern (Abbott Labs., North Chicago, Ill. and Oak Ridge, Tenn.). *J. Lab. Clin. Med.* 45, 66-80(1955) Jan.

A quantitative comparison is presented of three types of chromic phosphate colloids, and of several colloids prepared from Au^{198} and Y^{90} . The data indicate excellent cavity retention in the case of Type G CrPO_4 , and excellent retention of Y^{90} , as the phosphate. In view of the established clinical safety of Au^{198} colloid (Aurcoloid), several of these others are undergoing clinical evaluation by groups with experience in this field. Data regarding cavity distribution and clinical effectiveness can be secured only on suitable clinical material. Also presented

is a much simplified method for tissue assays, involving homogenization of whole organs, solution of aliquots at room temperature in Formamide, and either beta counting at infinite thickness, or, where possible, gamma counting in a suitable well-type scintillation unit.

AGRICULTURAL RESEARCH PROGRAM QUARTERLY RESEARCH PROGRESS REPORT FOR THE TWO QUARTERS ENDING MARCH 31, 1953 AND JUNE 30, 1953. July 20, 1953. 131p. (ORO-98)

The tissue distribution, excretion, and placental transfer of Y^{91} were studied after intravenous administration to cattle and intramuscular administration to rats. The "isotope-dilution" and "comparative-balance" methods for the determination of endogenous fecal Ca in cattle are compared. Irradiation of burros caused a decrease in body H_2O , but the significance of this is not fully determined. It was observed that a corn-cob meal ration red to chicks inhibited growth and caused the endocrine glands to remain infantile in size. The thyroid function in rats after total-body irradiation was studied by I^{131} tracer techniques. A case history is reported of an osteogenic sarcoma in a muskrat which fed on plants containing large amounts of radioactive Sr. The effects of total-body irradiation of burros on respiration and blood values are reported.

10711

New York Operations Office. Health and Safety Div., AEC PRELIMINARY STUDY OF Sr^{90} DISTRIBUTION AND UPTAKE FOLLOWING NUCLEAR DETONATIONS. Aug. 14, 1953. Decl. with deletions Apr. 28, 1959. 24p. (NYO-4528(Del.))

Samples of animal bone, soil, vegetation, and settled and airborne dust were analyzed for radioactive strontium. Because of the age of the majority of the material, Sr^{89} rather than Sr^{90} was the isotope found. The results showed widespread low-level activity and appreciable plant and animal uptake. Analyses of human bone for normal strontium content showed values in the range of 0.02% on the basis of bone ash. A critical evaluation of analytical methods for strontium showed that good recoveries were possible from bone ash, soil, and vege-

tation. The analysis of fall-out samples is not yet satisfactory, but the cause of the difficulty is known and can be eliminated. Determinations of Sr^{90} on human bone samples from victims of the Nagasaki burst were made. Sr^{90} was found, and the results are appended to this report.

MEDICAL AND HEALTH PHYSICS QUARTERLY REPORT, JULY, AUGUST, AND SEPTEMBER 1950. (Excerpt UCRL-960 appeared in NSA 5-1786). Nov. 8, 1950. Decl. Apr. 24, 1951. 75p. (AECD-3141; UCRL-960)

The Metabolic Properties of Plutonium and Allied Materials. Rats which had been subjected to a smoke chamber containing Pu were sacrificed 64 days after exposure, and histologic sections of their lungs were prepared. Representative radioautographs made from these sections are presented and discussed. The fate of terbium has been studied in rats. Pile-produced Tb^{160} was used as a tracer. Metabolism studies in rats of carrier-free Sc^{45} , Ta^{182} , Mn^{52} , Cr^{51} , and At^{211} also are summarized. The effect of whole-body irradiation on the extra- and intra-cellular distributions of Na^{22} and K has been studied. The effects of chelating agents in vivo on the excretion of Pu^{239} and Ce^{144} , and in vitro experiments on the chelation of Be are reported. Results of a metabolism study of Ca^{45} in young, adult, and rachitic rats are given, this study, by D. M. Thomson and D. Harold Copp, has been excerpted from this report and has appeared in Nuclear Science Abstracts as NSA 5-1786. Radiochemistry. Methods of preparation of carrier-free Cr^{51} , Sc^{46} , Bi^{204} , 206 , and Mn^{52} from V, Ti, Pb, and Cr, respectively, are summarized.

Biological Studies of Radiation Effects. Evidence of a Combined Target-Intermediate Action Mechanism of Radiation Effects. A parallelism is demonstrated between the so-called indirect mechanism of radiation effect and the target theory. The apparent contradiction in the two theories may be eliminated by using the "diffusion model" of radiation effects, which assumes the formation of intermediates by the ions of the primary radiation. The formulation of the diffusion model allows for variation in radiation sensitivity with substrates, state of cell division, water content, etc., it furnishes clues for study of the quantitative effects of externally applied cell poisons. The mechanism of inhibition of cell division by radiation may be quantitatively accounted for in haploid, diploid, and tetraploid yeast cells. 13 figures. 19 references. **Health Chemistry and Physics.** Activities in monitoring, transportation, decontamination, dispersal, and storage of radioactive materials and surveys of the radiation field of the 60-in. cyclotron and of the fast-neutron field produced by the synchrotron are summarized. THE METABOLIC PROPERTIES OF VARIOUS MATERIALS. Joseph G. Hamilton. p.4-47 of MEDICAL AND HEALTH PHYSICS QUARTERLY REPORT, JANUARY, FEBRUARY, AND MARCH, 1952. (AEC-3448; UCRL-1826)

Tissue distribution of fission products obtained from Oak Ridge were determined in rats and data are presented in tabular form. A decay curve and mass absorption curve for the fission products used are included. Studies on the effect of Ca ethylenediamine tetraacetic acid on the distribution of Pu in the rat indicate that the oral administration of CaEDTA is not a particularly efficient way of reducing the Pu content of the tissues, and large amounts of CaEDTA must be given parenterally during the time the Pu is in a relatively labile state in the body for increase of excretion to be marked. An ether extraction method is reported for the separation of U from mixed fission products. Studies on the products resulting from irradiation of aqueous solutions of acetic acid are reported. Design of a calorimeter for determination of the cyclotron He ion beam energy is described. A diagrammatic arrangement of the calorimeter assembly is included. Photographs and stripping-film radioautographs of rat lungs after exposure to a smoke containing Pu are presented. A technique is described for preparing radioautographs using a film similar to stripping film but consisting of emulsion and an inert layer of gelatin which allows staining of the tissue through the wet gelatin. This film, supplied for experimentation by Eastman Kodak Company, gave improved radioautographs. Possible applications of the method to additional studies of the fate of inhaled particulate matter are discussed. NSA 6-6291

MODIFICATION OF THE DISTRIBUTION AND EXCRETION OF RADIOISOTOPES BY CHELATING AGENTS. Hiram Hart and Daniel Laszlo. *Science* 118, 24-5(1953) July 3.

Modifications in the distribution and excretion of intravenously injected La¹⁴⁰ by the administration of Ca-ethylenediaminetetraacetate (EDTA) and La-EDTA are reported. Results are compared with results from previously reported decontamination studies using Fe⁵⁹ and Y⁹¹ and distribution studies using La-EDTA and La chloride. Since La removal by EDTA was found to decrease with time, it is suggested that EDTA may be used as an investigative tool as well as for removal of metals and radioisotopes from the body. NSA 7-5012

10729

Univ. of Calif. Radiation Lab.
MEDICAL AND HEALTH PHYSICS QUARTERLY REPORT, OCTOBER, NOVEMBER, AND DECEMBER 1950. Feb. 27, 1951. Decl. July 16, 1951. 61p. (AECD-3200; UCRL-1143)

In the tracer program, difficulties associated with the assay of astatine in biological material were solved. At²¹¹ was intravenously injected into rats and was injected into the anterior chamber of the eye of monkeys. Radioautographs are shown. Other experiments were conducted with carrier-free Bi²⁰⁶, carrier-free Mn⁵², carrier-free Mo^{93, 99}, Np²³⁷, Ta¹⁸² of a fair degree of specific activity, carrier-free Sc⁴⁶, and high specific activity Tm¹⁷⁰. Detailed data (14 tables) are given on deposition of these tracers in various body organs after intravenous or intramuscular injection and at varying time intervals after injection. Detailed data are given on experiments on the movement of Na and K in the tissues of the rat following acute radiation injury using Na²² and K^{42, 43} as tracers. Experiments are in progress on administration of a chelating agent to rats

carrying a body burden of Pu²³⁹, which results in increases in the urinary excretion of the radioelement. Descriptions are given of preparation of carrier-free, Pd¹⁰³ from Rh, Mo^{93, 99} from Zr, W¹⁸¹ from Ta, Ta^{177, 178, 182} from Hf. Studies on the effect of specific liver irradiation on the chromic phosphate disappearance constant in rabbits and mice are reported. The observed lowering of the disappearance constant is apparently due in part to a decrease in the efficiency of the liver phagocytes and in part to a depression of the liver blood flow. In regard to survival, either the rate at which the irradiation is given or more probably, the degree of localization in the liver and spleen seems to be important. NSA 5-4306

THE METABOLIC PROPERTIES OF VARIOUS MATERIALS. p. 4-31 Medical and Health Physics Quarterly Report; July, August, and September, 1951. Nov. 5, 1951. Decl. Apr. 25, 1952. 28p. (AECD-3354)

A study of radioautographs of liver from rats, injected with radiogold 1 day previously, showed 50% of the gold deposited; those injected 4 days previously showed 43% remaining. Careful dark-field examination at high magnification showed particulate matter of the order of 2 μ in size present in the Kupffer cells. These were of random distribution, and, wherever there was evidence of activity from the radiogold accumulated in the liver, there was present one of these small unidentified particles. However, only some of the particles were associated with the photographic evidence of the presence of radiogold, thus suggesting the radiogold was adsorbed on the particulate matter held by the reticulo-endothelial system. Tissue distribution studies are reported for rats administered W, Tl, Sc, Au, and Tm. Results are presented in tabular form. Preparation is reported of carrier-free Au^{196, 196, 198, 199}, W¹⁸¹, and Ir^{188, 190, 192}. Modifications are reported in the design of a centrifugal-pump target assembly for cyclotron irradiation of litter amounts of solution under controlled conditions. Irradiation-induced oxidation of the ferrous ammonium sulfate system was investigated using this assembly. Results are presented graphically. NSA 6-3156

PROGRESS IN BIOCHEMISTRY. Felix Haurowitz. New York, Interscience Publishers 1950. 405p.

This book was written mainly to inform students and teachers of science, medicine, and pharmacy about the results of biochemical research since 1939. The first chapter briefly reviews the structure of stable and radioactive isotopes, and outlines the use of such isotopes as tracers in metabolism studies. Subsequent chapters deal in detail with various metabolism problems and discuss the use to which radioactive and stable isotopes have been put in this connection. NSA 4-4535

Duke Univ. School of Medicine
THE USE OF RADIOPHOSPHORUS IN STUDIES OF THE GLOMERULAR PERMEABILITY OF PLASMA INORGANIC PHOSPHATE. Philip Handler and David V. Cohn. nd. 29p. (ORO-14)

When single tracer doses of P³² with or without carrier were intravenously injected into dogs, the specific activity of the urinary inorganic phosphate was found to be as much

as 32% above that of the specific activity of the corresponding plasma inorganic phosphate. This difference usually disappeared within 25 min. When the specific activity of the plasma inorganic phosphate was caused to rise, fall, or remain constant, the differences in specific activity between urine and plasma inorganic phosphate were markedly altered or entirely abolished. When a small amount of radioactive plasma from an apparently "equilibrated" dog was given to a second dog, differences in specific activity of urine and plasma inorganic phosphate were of the same order of magnitude as in animals receiving untreated P^{32} . It is concluded that the greatest part of these differences may be explained on the basis of a lag which exists between the time inorganic phosphate is filtered by the glomerulus and the time at which it reaches the bladder for collection. The evidence suggests that the majority of the inorganic phosphate of plasma exists in a simple, filterable state. 14 references. NSA 5-3332

DISTRIBUTION OF RADIOACTIVE COLLOIDAL GOLD IN THE ORGANISM. A. Herve and J. Closon. Schweiz. Med. Wochenschr. 82, 522-6(1952) May. (In French).

Intraperitoneal injection of 3 mc of colloidal Au^{198} , the particles of which had a diameter of ~ 70 A, was closely equivalent in the rabbit to intravenous injection and led to a very similar tissue distribution. Addition to the standard solution of an equal volume of a 10% gelatinous serum retarded absorption of the intraperitoneally injected colloid and diminished fixation in the organs. Elimination was negligible in all cases. The suspension tended to disseminate throughout the organism. Radiotherapy with this substance should be undertaken only in exceptional cases. NSA 6-4379

MICROSCOPIC DISTRIBUTION OF RADIOISOTOPES IN TISSUES. Margaret W. Holt and Shields Warren. 1953. 34p. (AECU-2515)

Autoradiographic techniques were used to demonstrate the distribution of injected P^{32} and S^{35} in mouse or rat ovary, placenta, and intestine. The techniques used were demonstrated to retain water-soluble diffusible substances *in situ*. P^{32} and S^{35} were shown to be distributed quite differently in these organs, apparently reflecting a difference in chemical metabolism of the two elements. Photographs of the radioautograms are included. NSA 7-2981

Union Carbide Nuclear Co. Y-12 Plant, Oak Ridge, Tenn. A URANIUM INHALATION EXPOSURE CASE HISTORY. nd. 4p. (AECU-4089)

Condensed version of Y-B94-54. A machinist in a U shop was found to have inhaled dust from his work. The exposure resulted from the worker's keeping his face close to the work thereby interfering with the exhaust provided. Also, at some time during the period some cleansing tissues were drawn into the exhaust duct and lodged there. An initial lung burden of 3 to 5 mg was found with no evidence of kidney loading. Excretion was primarily in the urine, 2.33 mg being detected in urinalyses for 2.54 mg being eliminated from the deposit. The employee suffered no deleterious effects, felt well, and had no complaints. NSA 13-11708

EXPERIMENTAL AND CLINICAL STUDIES WITH RADIO-ACTIVE COLLOIDAL GOLD IN THE THERAPY OF SEROUS EFFUSIONS ARISING FROM CANCER. Campbell Moses, Edward Kent, Joseph B. Boatman, R. D. Cole, Joseph H. Sunder, R. S. George, Clem Russ, W. B. Ford, and E. R. Kutz. (Univ. of Pittsburgh School of Medicine, Penna.). *Cancer* **8**, 417-23(1955) Mar.-Apr.

The distribution and toxicity of colloidal radiogold (Au^{198}) after its intrapleural and intraperitoneal instillation in rats have been studied. No significant complications were encountered with doses comparable to those used clinically. The Au^{198} , intrapleural, fifteen-day LD_{50} for rats was approximately 20 microcuries per gram body weight. The intrapleural administration of Au^{198} to mice with spontaneous lung tumors failed to produce any but the most superficial surface effects. In dogs the administration of a single dose of 5 mc per kg intrapleurally produced a mild leukopenia and local pleural reaction, but no sharply deleterious effects. The subcutaneous injection of 10 to 40 mc of Au^{198} about fresh surgical wounds increased the induration in the area but no wound separation occurred nor was there any delayed healing. Complete cessation or marked retardation of fluid formation followed the intracavitary injection of Au^{198} in approximately one half of 163 patients with metastatic carcinoma and pleural effusion or ascites. This response, together with the absence of serious toxic reactions, indicates that radiogold is a useful, but far from ideal, therapeutic weapon in the management of this problem.

REACTION OF THE BLOOD AND PATHOLOGICAL TISSUES UNDER THE INFLUENCE OF X-RAYS. C. Minouflet and P. Schrupf-Pierron. *Arch. Elect. Med.* **33**, 193-213 (1923). (In French).

Histological findings in heavily x-irradiated tissues included inflammation in first few post-exposure days, connective tissue proliferation and destruction of neoplastic cells after 2 weeks, followed by atrophy and changes in connective tissue. Radium produces primary necrosis of surface cells; less effect at 2 cm, no effect at 3 cm. Roentgen sickness is attributed to electrical change in patient, remediable by grounding, biological effects to altered cellular osmotic pressure and electrical potential.

10801

ARCHIVES OF THE ROENTGEN RAY. C. Mansell Morelline. *Brit. J. Radiol.* **4**, 28 (1899).

Discusses harmful effects observed and whether or not they are due to rays.

10817

TECHNICAL PROGRESS REPORT ON THE METABOLIC STUDIES OF FISSION PRODUCTS. J. G. Hamilton. April 1944. 2p. (CH-1572; A-2240; MDDC-1061)

Incomplete tracer studies with plutonium indicate that less than 0.05 per cent of this element is absorbed from the digestive tract in any of the three valence states. The behavior of plus 4 plutonium following intramuscular and intrapulmonary administration is very similar to that of zirconium. The metabolic properties of plus 3 and plus 6 plutonium are very similar to those of yttrium and plus 3 uranium.

10818

SUMMARY OF METABOLISM OF CARRIER-FREE FISSION PRODUCTS IN THE RAT. J. G. Hamilton. 1947. 1p. (CH-775). ADD-1; MDDC-1002.

The following carrier-free fission products were studied to determine their effect upon the metabolism of the rat: Sr^{85} , Y^{86} , Zr^{89} , Cb^{93} , Ru^{105} , I^{131} , Xe^{127} , Ba^{133} , La^{140} , Ce^{140} , and a raw fission mixture. The results are presented in chart form.

10819

METABOLISM OF FISSION PRODUCTS. J. G. Hamilton. *Radiology* **49**, 325-43 (1947).

All radioactive elements that accumulate in bone, with the exception of Sr, are not deposited in mineral structure of bone, but are localized in and adjacent to the osteoid matrix. The large fraction of La, Ce, Pr, Am and Cm deposited in liver was an unexpected finding and similar findings may be predicted for Nd, Sm and Eu.

10820

THE METABOLIC PROPERTIES OF THE FISSION PRODUCTS AND ACTINIDE ELEMENTS. J. G. Hamilton. *Rev. Med. Phys.* **20**, 718-28(1948). (ADD-1; AECD-2012)

An investigation of the assimilation, distribution, retention, and excretion of the fission products and actinide elements in the rat has been conducted at the Crocker Radiation Laboratory, University of California, Berkeley, California. These studies were initiated October 15, 1942, and are continuing at the present time. An extensive survey has been made of the metabolism of twenty-two different radioelements in the rat. Radioactive materials were administered by mouth and by injection. The fission products studied included the carrier-free radioactive isotopes of strontium, yttrium, zirconium, columbium, ruthenium, tellurium, iodine, xenon, cesium, barium, lanthanum, cerium, praseodymium, and element 61. In addition, the eight members of the actinide series which were subjected to metabolic experiments included actinium, thorium, protactinium, uranium, neptunium, plutonium, americium, and curium. The results of these studies indicated that most of the fission products and all of the heaviest elements are absorbed to a very small degree by way of the digestive tract, deposited primarily in the skeleton following parenteral administration, and eliminated very slowly from that organ. The fission products studied which are accumulated in the skeleton include strontium, barium, yttrium, lanthanum, cerium, praseodymium, element 61, zirconium, and columbium.

10821

STUDIES OF SYSTEMIC EFFECT OF ROENTGEN RAYS. I. BLOOD CHEMICAL CHANGES IN DOGS FOLLOWING EXPOSURE TO FILTERED ROENTGEN RAYS OF SHORT WAVE LENGTH. E. A. Pohle and E. L. Sevringhaus. *Am. J. Roentg.* **23**, 291-298(1930).

Authors observed trends in NPN, uric acid, NaCl, cholesterol and hemoglobin in blood of 14 dogs exposed to short wave length X-rays, 500 r in air, to anterior and posterior lower body, posterior part only, or posterior upper chest. 26 references.

10822

TRACER STUDIES ON FISSION PRODUCT METABOLISM. J. G. Hamilton. 1945. 7p. (CH-2673) ADD-1; MDDC-1062.

Radioactive isotopes, free from inert carrier, of Sr, Y, Zr, Nb, Ru, Te, Cs, Ba, La, Pr, Ce, and Np were administered to rats as chlorides in isotonic solutions of NaCl at pH ranging from 2.3 to 3.5. Iodine was given as NaI, and Xe was given by inhalation in an oxygen-gas mixture. Unseparated fission products, free from inert carrier and uranium, after 90 days cooling were administered in an isotonic solution of NaCl at pH 2.5. Adult rats received the various radioactive preparations in solution by oral, parenteral, and intrapulmonary administration. The most significant conclusions that can be derived in the survey of all of the work done with the long life fission products can be summarized in the following manner: the alkaline earths, rare earths, Zr, Nb, and Nb when introduced into the body are deposited primarily in the skeleton, where the

average degree of retention of the absorbed radioelement is approximately 50 per cent of the initial absorbed quantity. The retained fractions of these radioelements are eliminated at rates which are less than their rates of radioactive decay with the exception of the 340 day Ce and possibly Sr⁹⁰. The remaining five long-lived radioelements, Ru, Te, Xe, I, Cs do not show any significant degree of localization in the skeleton and in addition there is no very striking deposition in any other of the tissues with the exception of deposition of I in the thyroid. The rates of elimination for all of these four radioelements are much greater than their rates of radioactive decay, with the exception of I accumulated in the thyroid. In this particular case the release of accumulated I in the thyroid is many times slower than its rate of radioactive decay. The members of the long-lived fission product group which are absorbed by way of the digestive tract include the alkaline earths, tellurium, iodine, and cesium. A high degree of retention by the lungs has been observed following direct intrapulmonary administration of the rare earths, Zr, Nb, Ru and Np. The pulmonary retention observed for the alkaline earths, Te, I, and Cs is negligible under the conditions of the experiment.

In rabbits 820 r whole body X-irradiation appears to accelerate the rate and increase the efficiency of major mechanisms by which lungs clear insoluble foreign particles following acute inhalation exposure. Ciliary action and/or increased mucous secretion play a greater role than phagocytosis. Both mechanisms are more effective in X-irradiated animals than in non-irradiated controls. Indirect indices of phagocytic function of R-E system indicate LD₅₀ X-Ray doses (or larger) produce an initial depression (0-14 days) of phagocytosis by relatively resistant macrophages.

COMPREHENSIVE SUMMARY OF THE PHARMACOLOGY AND TOXICOLOGY OF URANIUM COMPOUNDS. CHAPTER XVI. STUDY ON HUMAN EXPOSURE TO URANIUM COMPOUNDS. J. W. Howland. 1946. 42p. (MDDC-260; M-3493)

This chapter is divided into five major parts: (1) A review of the literature is presented in which the clinical use of uranium as a drug in the treatment of disease in the years 1874 to 1930 is described, (2) An historical description is included next of the selection of 150 ugU/m³ as a temporary maximum allowable concentration, (3) Some of the factors known to be important in exposures to dusts are presented and their influence indicated, (4) Reports are made in considerable detail of two accidents in which workers were exposed to flood concentrations of uranium hexafluoride. Case reports are included, both of fatal and of non-fatal cases, (5) A careful outline is presented of the program of medical observations conducted by the medical branch on workers in laboratories and plants in which chronic exposures to uranium compounds were possible. The description included pre-employment examinations, periodic health check-ups with laboratory procedures. A special program of industrial hygiene was set up at four selected sites: (a) a large laboratory, (b) a small uranium processing plant, (c) a large ore and uranium processing plant, and (d) a large uranium processing plant. In addition, two programs of special examinations were carried out; one on 10 men working in a U₂F₆ plant, and the other on 31 men with possible exposures to UO₃, UO₄, and UCl₄.

PHOSPHATE EXCHANGE AS THE MECHANISM FOR ABSORPTION OF THE RADIOACTIVE ISOTOPE BY THE CALCIFIED TISSUES. M. Falkenheim, W. F. Neuman and H. C. Hodge. *J. Biol. Chem.* **169**, 713-722(1947).

The absorption by bone (I), dentine (II), enamel (III) and synthetic hydroxyapatite (IV) of Na_2HPO_4 containing P^{32} has been studied at 2×10^{-1} , 2×10^{-3} and 2×10^{-5} M Na_2HPO_4 up to 240 hours. Interpretation of the data indicates a diffusion process. I and IV absorb P more rapidly and to a greater extent than do II and III. Particle surface does not control the extent or rate of absorption. The specific surfaces of I, IV, II and III are respectively. 99.3, 51.1, 2.4 and 1.8 sq. m/g.

10873

TRACER STUDIES WITH INHALED 1.0 YEAR RUTHENIUM. M. Dailey, I. Wender, and R. Abrams. 23p. (MDDC-420)

This paper deals primarily with the fate of tracer quantities of airborne ruthenium after inhalation by rats. 1. In the course of the work it was necessary to have a simple, quantitative test for Ru, and a colorimetric test was developed which depends on the blue color formed with rubeanic acid. It was possible to detect 2 ug of Ru with 10 per cent accuracy. 2. In order to expose animals to RuO_4 vapor, a generator was needed which would supply RuO_4 at a continuous and more or less uniform rate. Of a number of oxidizing agents investigated for this purpose, potassium permanganate in sulfuric acid was best suited. 3. A rough determination was made of the chemical toxicity of Ru for mice. By intracardiac injection, doses in the range of 3 ug/g were acutely toxic. 4. Methods have been developed for assaying tissues for radioactive ruthenium. The hard β of the 1.0 year Ru - 30 sec Rh system was counted. To avoid volatility losses, small tissues were minced, dried at 110° , and counted. Larger tissues were muffled and a correction made for losses due to volatility. 5. Three types of Ru exposure were carried out--to RuO_4 vapor, dry " RuCl_3 " (in) aerosol, and " RuCl_3 " solution. In all cases the Ru was rapidly passed from the lungs and rapidly excreted via the urine and feces. The kidney tends to retain a considerably higher concentration than other tissues. The rapid excretion, approximately 90 per cent in 30 days, minimizes the hazard resulting from internally deposited Ru.

ACUTE RADIOTOXICITY OF $(\text{Ba-La})^{140}$ IN RATS AND MICE. PART I. PREPARATION AND ADMINISTRATION OF THE EMITTERS. R. Finkle, R. Snyder, and P. Tompkins. (1946). 11p. (MDDC-1248; CH-3828)

Barium¹⁴⁰ and its daughter, lanthanum¹⁴⁰, were obtained from uranium fission. The radiochemical composition of the different samples, as measured under absorption equivalent to 8 mg/cm² Al, fell within the following ranges: Ba¹⁴⁰ - 43 to 49 per cent, La¹⁴⁰ - 44 to 50 per cent, Sr(⁸⁸-⁹⁰) - 2 to 8 per cent, all others 1 per cent or less. The radioactive solutions were administered by intraperitoneal injection. The bottles were mounted behind lead shields and the personnel was rotated to reduce each individual's exposure to gamma rays. Three series of experiments were made using mice, and two series, using rats. One ml was the largest volume injected into a mouse, and six ml or less were injected into the rats. At intervals after the experiment was begun, samples of excreta were collected. Urine and feces were collected together from each group of mice, while the rats were kept in individual cages over funnels with glass bulb-type separators so that separate analyses of urine and feces were possible. An mg of inactive barium and lanthanum each was added to the collection containers to reduce loss by adsorption on the glass walls. Urine was diluted to a known volume and the radioactivity measured. This was untreated except for the addition of formalin as a preservative. Feces were digested with HNO_3 to dryness and then ashed. The ash was dissolved in dilute HCl and diluted to a known volume for measurement of radioactivity. After digestion and ashing, fairly large amounts of the fecal ash were insoluble in HCl. About half of the radioactivity was carried on this insoluble matter. For analyses, this material was sus-

pended and the activity of an aliquot of the suspension was measured. Tissues were dried and ashed at 700°, and the ash was dissolved in dilute acid. As a check on the accuracy of the analytical procedure, the total excreta and carcasses of several groups of mice and rats were measured. When results were corrected for decay from the time of injection, the over-all recovery in mice was found to be between 80 and 120 per cent with an average of 101 per cent. In the rats the average total recovery was 96 per cent.

10891

THE RADIUM CONTENT OF THE BODY FOR INDIVIDUALS WITH NO KNOWN OCCUPATIONAL EXPOSURE. J. B. Hursh and A. A. Gates (University of Rochester). Nucleonics 7, 46(1950).

Authors analyzed the total cremated ash of 25 adult humans with no known exposure to Ra. Most had been in the N. Y. area for some years and averaged 67 years of age. Average value was 1.18×10^{-10} gm Ra/body with 0.50×10^{-13} gm. Ra/gm. ash. Six stillborn infants had 0.32×10^{-13} gm Ra/gm ash. Analyses of Rochester water gave 6.2×10^{-17} gm Ra/ml which indicates about a 5%-7% retention of Ra. This is calculated for a 70 year old man drinking 2.5 liters of water/day at the above Ra conc. Authors conclude that Ra is not an etiological factor in osteogenic sarcoma at this level. The value for body content is $\sim 1/100$ that reported by Krebs for a corresponding study in Germany

10892

A CASE OF ANTRAL SINUSITIS COMPLICATED BY RADIUM POISONING. F. B. Flinn. The Laryngoscope, 3-11(1927).

Author describes case of Ra poisoning in a dial painter with severe necrosis of the jaw. Woman painted dials for 14 mo. in 1921-1922. She was examined by Flinn in June, 1926. Tests for Ra content were made using both emanation and gamma-ray techniques. The gamma-ray method gave a value of 100 μ g. (The details of measurement are not given.) Patient was given 5 gm. NH_4Cl /day and Flinn states her Ra burden was reduced to 86 μ g. A third

test in late October gave a value of 75 μ g. She died in January 1927.

SEMI-ANNUAL REPORT ON RADIOLOGICAL PHYSICS DIVISION. PART II. QUARTERLY REPORT ON BIOLOGICAL AND MEDICAL RESEARCH. Jan. 1955. (ANL-5378)

The experiment was done to determine the effect of an abrupt decrease in circulating white blood cells resulting from repeated injections of antiserum during the first day after exposure to radiation. It was reasoned that severe leucopenia induced in this way might activate primitive precursor cells that were still capable of responding to a physiological signal to blood formation,

but it might also enhance radiation injury by placing additional stress on the system. Results indicated that antiserum injections during the first hours after x-irradiation with 300 r diminished the magnitude and duration of radiation leucopenia and favored survival. Similar treatment after exposure to 400 r has been comparatively ineffective. (From authors' summary).

RADIOTOXICITY OF INJECTED Sr^{87} FOR RATS, MICE, AND RABBITS. PART I. INTRODUCTION; METHODS. D. Anthony, K. Lanthrop and R. Finkle. June 1, 1946. Decl. Oct. 9, 1947. 16p. Inclusion in the NNES (MPTS) for Part II see MDDC-1363, CH-3846. (MDDC-1363) 1540).

The toxic effects and metabolism of radiostrontium (Sr^{88} - Sr^{90}) were studied. Determinations were made of the acute lethal doses for rats, mice, and rabbits, and of the comparative toxicity and metabolism following intraperitoneal and intravenous administration. Distribution studies of radiostrontium in various organs were made. A method is described for handling and preparing radioactive strontium for administration to experimental animals. Procedures are given for preparing tissues and excreta for measurement of Sr^{88} - Sr^{90} with a Geiger-Muller counter, and for correcting these measurements for radioactive decay back to the time of injection.

10949

Univ. of Chicago Metallurgical Lab.
RADIOTOXICITY OF INJECTED Sr^{89} FOR RATS, MICE, AND RABBITS. PART II. METABOLISM AND ORGAN

DISTRIBUTION. D. Anthony, K. Lathrop and R. Finkle. June 1, 1946. Decl. Oct. 9, 1947. 36p. (MDDC-1363) 1363).

Mice, rats, and rabbits excreted Sr^{89} - Sr^{90} very rapidly following intraperitoneal or intravenous administration. The greatest part of the excretion took place during the first three days, and by 10-15 days virtually no more of the retained strontium was excreted. Average total excretion values were 54 per cent of the injected dose for the mouse, 40 per cent for the rat, and about 70 per cent for the rabbit. Average total retention values were 45 per cent of the injected dose for the mouse, 59 per cent for the rat, and 21 per cent for the rabbit. After three days almost all of the retained Sr^{89} - Sr^{90} was found in the skeleton. The concentration in bone was more than 100 times that in soft tissue. There does not appear to be any significant variation in retention of Sr^{89} on a per gram basis between different types of bone. The logarithm of the retention, the rate of excretion, and the blood concentration of radioactive strontium in each case was found to be a straight-line function of time.

URANIUM POISONING. S. Wexler and G. E. Boyd. July 9, 1942. 5p. (MDDC-1054; CC-16)

Poisoning from uranium may come about either through inhalation of uranium oxide dust (U_3O_8 , UO_2 , or UO_3) or through contact with the soluble salts. The pathological manifestation of uranium poisoning is nephritis, an inflammation of the kidney. The intensity of the anatomical and functional lesion is the result of the accumulation of the metal in the organ as a result of attempts at excretion. Protection of the body against uranium involves protection of the hands and care to avoid inhalation or ingestion. In the synthesis of uranyl nitrate, rubber gloves are recommended. Protection against ingestion depends solely upon the worker; care must be exercised to prevent the taking of any uranium by mouth during such operations as pipetting. A bibliography is included.

10966

CONCEPTS OF ULTRA STRUCTURE OF BONE THROUGH RADIOACTIVE DAUGHTER PRODUCTS BEHAVIOR OF Sr^{90} AND Ra^{226} . J. S. Arnold. Federation Proc. 14, 398(1955).

When Ra^{226} is skeletally fixed *in vivo*, the gas Rn^{222} readily escapes from areas of bone which were mature prior to Ra administration. Rn escape is much less from bone formed during or after Ra administration. The limiting path of diffusion within crystalline material is shorter in "old" bone, mother radium is deposited closer to the crystal surfaces in old than in newly forming bone. Sr^{90} was given to a 5 mo. old pup, which was killed 4 mo. later. At death the Y^{90} daughter was at complete radioactive

equilibrium (demonstrated by serial radioautographs and energy discriminatory beta ray counting). Since Rn escapes but the Y does not, these alkaline earths are close to the crystal surfaces but not at the surface.

ION EXCHANGE AND RECRYSTALLIZATION IN FIXATION OF Ca^{45} IN THE RABBIT'S SKELETON. J. S. Arnold and W. S. S. Jee. *Proc. Soc. Exper. Bio. and Med.* 85, 658-663(1954).

Undecalcified bone sections (rabbits) sacrificed at intervals between one hour and three weeks following calcium administration were treated in CaAc solutions to determine what portion of Ca^{45} remains on crystal surface of bone as a function of time following administration. Data presented indicate that recrystallization and crystallization remove Ca to non-exchangeable positions at extremely rapid rates. One hour following Ca^{45} administration, half of the isotope fixed in bone is no longer available to removal by ion exchange.

THE LOCALIZATION OF CERTAIN ALKALINE AND RARE EARTH ELEMENTS IN THE COSTOCHONDRAL JUNCTION OF THE RAT. C. W. Asling and J. G. Hamilton. *Anat. Rec.* 113, 285-300(1952).

Radioactive isotopes of calcium and strontium possessing a high degree of specific activity were administered by parenteral injection to adult rats. Radioautography showed that both elements localized in varying degrees both in the bony and the cartilaginous segment of the rib.

10980

LATE EFFECTS OF RADIUM AND PLUTONIUM ON BONE. M. A. Bloom and W. Bloom (Argonne National Labs., Division of Biological and Medical Research) *Quarterly Report.* (1948). (ANL-4227)

Effects on mice: (1) overgrowth of bone in femurs and vertebrae. In femur the overgrowth begins in distal metaphysis and is more extensive than in the epiphysis or shaft. (2) After exposure to Ra the bone is atypical, fibrous, much of it becomes devitalized. Cortical bone of shaft contained many empty lacunae (3) After Pu injection, newest bone is fibrous, but greatly thickened trabeculae of spongy bone become progressively more compact. Extremely irregular arrangement of lamellae and osteocytes distinguishes them from normal bone. Empty lacunae are fewer than with Ra. (4) Changes in vertebrae are essentially the same as those in femur.

Calif. Univ., Berkeley. Radiation Lab.
STUDY OF PLUTONIUM METABOLISM IN BONE. L. Van Middlesworth, (nd). Decl. June 6, 1947. 100p. (MDDC-1022; BP-69)

A method is described whereby Pu^{239} , Sr^{89} and Y^{88} may all be distinguished in the same animal by differences in their radiations. The chronic excretion of Pu^{239} , Sr^{89} and Y^{88} was followed for 11 weeks in rats injected simultaneously with these three elements. The very low rate of elimination of all three after the first month emphasizes the danger of chronic toxicity. Radioautographs of the tibia show radioactive strontium deposited throughout

the bone with a heavy concentration in the region of new bone growth and active calcification beneath the epiphysis. Plutonium was shown to localize superficially in the endosteal and periosteal surfaces of the bone with no apparent concentration in the zone of bone growth and calcification.

THE RESPONSE OF THE ANIMAL ORGANISM TO REPEATED INJECTIONS OF AN ACTIVE DEPOSIT OF RADIUM EMANATION. INTRAVENOUS INJECTIONS IN DOGS. Halsey J. Bagg. J. Cancer Res. 5, 301-19(1920).

Large intravenous doses of active deposits of Radium administered to dogs produced a considerable reduction in the number of WBC (up to 80% of their total following an initial dose) while the RBC showed a simultaneous reduction of 25%. Repeated doses produced a marked decrease in circulating lymphocytes. Digestive disturbances after large doses were associated with a considerable reduction in body weight. Metabolic changes included a decided increase in the total N of urine. The organs showed considerable congestion of the principal viscera on histological examination.

11003

THE OXYGEN EFFECT ON RADIATION INDUCED CHROMOSOME ABERRATIONS. BREAKAGE VS. RECOMBINATION HYPOTHESIS. Norman H. Giles. p.271 of SEVENTH ANNUAL RESEARCH CONFERENCE OF THE BIOLOGY DIVISION, OAK RIDGE NATIONAL LABORATORY AND THE DIVISION OF BIOLOGY AND MEDICINE, AEC, ON GENETIC RECOMBINATION HELD AT OAK RIDGE, TENNESSEE ON APRIL 19-21, 1954. J. Cellular Comp. Physiol. 35, Suppl. 2 (1951) May.

Oxygen affects aberration yield only when the oxygen is present during irradiation (Tradescantia). Treatment with oxygen before irradiation does not sensitize chromosomes to subsequent x-irradiation, but does sensitize them to subsequent infrared exposure. Oxygen itself did not affect the aberration yield or the recombination process. Temperature during irradiation has a marked effect on aberration yield.

INTRACAROTID INJECTION OF RADIOACTIVE COLLOIDAL

GOLD (30 μ PARTICLES) IN THE DOG. P. Benda, J. Constans, and M. David. C. Rend. Soc. Biol., 149 (3-4), 273-5(1955).

Most radioactivity is found in the lateral ventricle on the side of the injection, next most is in the diencephalon. Radioactivity tends to remain mostly unilateral. It is not significantly precipitated in blood vessels. Distribution also varies according to the circulatory system of the brain, being higher on the external surface of cortex. White matter has 10 times less radioactivity than grey matter. Author believes patterns of localization justify trials of colloidal gold as a therapeutic agent.

11030

X-RAYS ON DEHYDROGENASES, MECHANISM OF BIOLOGICAL EFFECTS. W. Seitz. Radiologica 2, 4-14(1938).

Irradiation with x-rays (in vitro) produced an increase in the activity of xanthine dehydrogenases, citric dehydrogenase, glutamic dehydrogenase and palmitic dehydrogenase. Observations are considered relative to their significance in biological effects of x-rays.

EVIDENCE ON THE MECHANISM OF THE OXYGEN EFFECT BY USE OF A RING CHROMOSOME. W. K. Baker and E. VonHalles. p.299-307 of 7TH ANNUAL RESEARCH CONFERENCE OF THE BIOLOGY DIVISION, OAK RIDGE NATIONAL LABORATORY AND THE DIVISION OF BIOLOGY AND MEDICINE, AEC, ON GENETIC RECOMBINATION HELD AT OAK RIDGE, TENNESSEE ON APRIL 19-21, 1954. J. Cellular Comp. Physiol. 35, Suppl. 2(1955) May.

Results of experiments using *D. melanogaster* favored the reunion hypothesis. The apparent oxygen effect with a ring chromosome observed by using the criterion of the x-o male frequency is not caused by loss of the ring, but by loss of the y+ marker at high doses.

BIOLOGICAL EFFECTS OF RADIOACTIVE MATERIALS. SUMMARY OF RESEARCH AND SERVICE PROGRAMS JAN. 1, 1948 TO DEC. 31, 1948. H. A. Blair, ed. p.102-5 of UNIVERSITY OF ROCHESTER ATOMIC ENERGY PROJECT REPORT. 1948. (UR-60)

11045

EVIDENCE OF RECOVERY FROM X-RAY DAMAGE IN CHLAMYDOMONAS. Baruch S. Jacobson. Radiation Res. 7, 394-406(1957).

When exposure of *Chlamydomonas reinhardtii*, and algal flagellate, to the x-ray beam is interrupted for about 15 min., survival after a given dose is increased, provided the cells are at a suitable temperature during treatment. Below 10°C. little or no increase occurs even after interrupting exposure for an hour. Under favorable conditions, the 2nd dose kills fewer cells than it would if given immediately after the first dose. When the number of cells killed by the first dose is accounted for, however, the fraction killed by the 2nd dose is at least as great as would be expected if the first dose had not been given. Two or three interruptions of the dose result in higher survival than a single interruption, but not enough to suggest that an irradiated cell population can tolerate more irradiation than a previously unirradiated population. NSA 12-2672

11048

FORMATION OF REDUCING SUBSTANCE FROM PEPTONE BY X-RAYS. W. Seitz. Z. Ges. Exptl. Med. 101, 641-7(1937).

A study was made to determine whether reducing substances can be produced by subjecting peptone to the x-ray. Sterile Witte peptone prepared in ampoules for inj. was used. Ampoules were subjected to radiation 2 times a wk. for 2 hrs. in darkness. No felt was used, and the tube was focused on the ampoules at 17 cm. Thus the min. exposure was

400 R. No reducing substances were demonstrated under 100,000 R. Above this level the radiated peptone decolorized methylene blue in vacuo. Exposure to air caused loss of this effect, so that no effect was shown, as was also the case in control ampoules not radiated. This reducing substance also reduced indicators with negative potentials such as indigo-disulphate, Janus green and cresyl-violet, but did not affect strong negative dyes such as phenol-safrann, rosindulin, or neutral red. This reducing body had the character of a sulph-hydril substance as shown by a strong vitro prusside reaction and its delayed effect caused by iodomon-acetate. Rapid oxidation of the substance on exposure to air was similar to that seen in other sulph-hydril substances. CA 32-4614

11049

ABSORPTION OF MANGANESE BY THE THYROID GLAND OF THE GUINEA PIG. L. J. Deysach and T. W. Roy. Proc. Soc. Exp. Biol. and Med., 71, 188-189(1949).

Subcutaneous injection of manganese chloride caused accumulation in all organs tested, but particularly in thyroid where it began to appear within 30 minutes after injection. Absorption was particularly rapid during first few hours (70% of total amount deposited in thyroid accumulated during first 6 hours) but continued for 24 hours. Elimination from the thyroid was likewise rapid - 70% of the 24 hrs. value disappeared within 48 hours after injection, 85% in 96 hours.

OSTEOMYELITIS OF THE MANDIBLE AND MAXILLA. T. Blum. Jour. Amer. Dental Assoc. 11, 802-805(1924)

During the fall of 1923, there came under my observation a case of osteomyelitis of the mandible and maxilla, somewhat similar to phosphorus necrosis, which however, was caused by some radioactive substance used in the manufacture of luminous dials for watches. The condition has been termed "radium jaw".

11052

DURATION OF SPERMATOGENESIS IN THE MOUSE. RELATION OF MATURATION TIME OF SPERM TO X-RADIATION OF SPERMATOGENIC EPITHELIUM. E. F. Oakberg. Nature 180, 1137-8(1957).

Doses as high as 1000 r had no retarding effect on meiosis or on spermiogenesis of cells irradiated as spermatids. Maturation of spermatids arising from cells irradiated as spermatocytes probably is retarded at high doses, but not by 100 r. Timing of maturation, based on observations after irradiation with 100 r, agreed with maturation time observed in experiments where doses were as low as 5 r of γ rays from Co^{60} . Author concludes that the estimated duration, 34.5 days, for spermatogenesis is not seriously biased. NSA 12-2623

PROGRAMS IN TOXICITY AND METABOLISM OF COMMONLY USED ISOTOPES. A. M. Brues. March 5, 1947. 1p. (MDDC-1601; ANL-AMB-33)

^{P32}. Since little difference is found between the chronic effects of radium and strontium, a comparable toxicity experiment as described in a declassified monograph was set up using ^{P32}. This is tremendously important since many patients are receiving relatively large doses of ^{P32} and not all of them may be suffering from a malignant disease, ^{C14}. Following the brief note published by Drs. Bloom, Curtis and McLean in *Science* (Feb., 1947), Drs. Bloom and McLean, in conjunction with Dr. Morris, are preparing an experiment along the same lines from which more quantitative information can be obtained on retention of ^{C14} by animals given the isotope. Dr. Morris is also in process of setting up an experiment to determine the overall carbon metabolism of animals breathing active CO₂ vapor. It is also planned to investigate the metabolism and toxicity of organic molecules containing ^{C14}. An experiment is being set up to determine retention by growing tissue. (The entire text of the report is reproduced here.)

CHRONIC EFFECT OF RADIUM SALTS ON AN ANIMAL ORGANISM. S. E. Manoilov, B. M. Graevskaia and K. B. Shimanovskaia. *Vest. rentg. No. 6*, 43-49(1955).

Parenteral administration of 10^{-4} c of RaBr_2 to rats caused radiation sickness and 100% mortality. A dose of 2×10^{-3} c caused no mortality. Sublethal and intermediate doses of RaBr_2 produced increased levels of glycogen in the liver and an initial decline in proteolytic activity of liver followed by an increase (to 150% of normal) 44 days after administration. Introduction of RaBr_2 (2×10^{-6} c) into the bone cavity of a rat gave inconclusive results, but in a rabbit, induced bone sarcoma with metastases in approximately 15 months. Administration of P^{32} to rats in doses of 1.75×10^6 c or greater caused 100% mortality in 9-15 days. Very high doses of P^{32} depressed liver proteolytic activity severely and abruptly, low doses of P^{32} had little effect. CA 50-51646

Argonne National Lab., Ill. A PRELIMINARY STUDY OF THE REMOVAL OF RADIO STRONTIUM Sr^{85} FROM THE BODY. D. M. Greenberg and N. Kaplan. 1947. 5p. (MDDC-1142E)

Preliminary experiments on removal of Sr^{85} from rats has indicated that sodium citrate, parathyroid hormone, ammonium chloride, and strontium chloride all apparently slightly enhance the removal of Sr^{85} . Massive doses of irradiated ergosterol has no such effect. This study must be repeated upon a much larger group of animals at varying periods after Sr^{85} administration before any quantitative appraisals as to the relative effect of these different agents may be made.

PRELIMINARY REPORT: EFFECT OF X-IRRADIATION ON ENZYMOGENESIS. T. N. Tahmisian and D. M. Adamson. (Argonne National Laboratory). 1951. 87p. (ANL-4713)

Grasshopper eggs were irradiated with x-ray doses of 2500, 25,000 or 50,000 r (200 KV, 15 ma, 1400r/min.) immediately after diapause, prior to secondary differentiation. Acetylcholine content of eggs was determined at 2 day intervals from the 6th day post-diapause to the day of hatching. The increment of acetylcholine in control eggs followed a sigmoid curve during embryonic development. After 25,000 - 50,000 r the acetylcholine remained constant, after 2500 r it was slightly increased above the control level.

COMBINATION OF PLUTONIUM WITH PLASMA PROTEINS (ELECTROPHORETIC AND CHEMICAL ANALYSIS). J. A. Muntz and E. S. G. Barron, Jan. 19, 1947. 23p. (MDDC-1268; CH-3757)

When the metal is injected into dogs either in the form of the nitrate or citrate it is carried with proteins present in the β globulin fraction. This was demonstrated by electrophoretic fractionation of dog sera and analysis of the fractions obtained. Plutonium poisoning in dogs results in an altered plasma protein pattern. Many of the changes are similar to those seen in dogs dying of X-ray injury and the alterations become most profound in the terminal period. Certain differences between the plasma protein pattern of plutonium poisoned dogs and X-ray injured dogs are pointed out.

11162

AUTORADIOGRAPHIC STUDIES OF THE DEPOSITION OF Sr^{89} IN BONE (RABBIT). B. Kidman, M. Tutt, B. Rayner, and J. Vaughan. Jour. Path. and Bact. 64, 453-59(1952).

Young animals concentrate Sr^{89} in areas of active bone growth; there is more diffuse distribution throughout mineralized bone as in older rats. Ionic surface exchange alone will not account for the uptake of these isotopes. As time goes on, localized areas of concentrated Sr are displaced by newly formed non-radiated bone and may be removed by normal process of resorption.

THE LONG TERM RETENTION OF CESIUM IN THE RAT FOLLOWING A SINGLE INTRAPERITONEAL INJECTION. J. E. Ballou and R. C. Thomson (General Electric Co. Hanford Atomic Products Operation, Richland, Wash.). Apr. 1, 1957. 16p. Contract W-31-109-Eng-52. (HW-46150)

Cesium¹³⁷ is absorbed rapidly and completely by the rat after intraperitoneal injection and is deposited almost entirely in the soft tissues. The largest total quantity and the highest concentration (subsequent to the first day) is found in muscle. Its retention in muscle over a period of 200 days, during which time its concentration is reduced by a factor of nearly 10^6 , may be most adequately described as a sum of two exponential components with biological half-lives of 8 and 16 days. In addition to these two components, most other tissues also exhibit a substantial shorter lived component with a half life of approximately two days. Thirty days after exposure about 10% of the injected Cs remains in the animal with 90% of this being present in muscle. For purposes of calculating permissible exposure limits, the rate of loss of Cs from muscle can be quite closely approximated by a single exponential function with a half life of 13 days. Consistent with this half life, the fraction of ingested Cs¹³⁷ deposited in muscle is 0.57. The maximum permissible concentration for Cs¹³⁷ in water, calculated from these parameters is 1.8×10^{-3} μ c/ml, which differs insignificantly from the presently accepted value of 2×10^{-3} μ c/ml. Attention is called to recent studies indicating a much longer biological half life in man than that observed in the rat.

SECRETION IN COW'S MILK OF INTRAVENOUSLY INJECTED RADIOACTIVE PHOSPHORUS P^{32} . M. Kleiber, A. H. Smith and N. P. Ralston. Proc. Soc. Exp. Biol. and Med. 62, 354-56(1948).

Two lactating Jersey cows were injected intravenously with 15 mc and 30 mc of P^{32} respectively. The cows secreted 9.5 and 8.7 liters of milk/day respectively. Maximum concentration of P^{32} in milk was reached 3-8 hours after injection (1.22% of injected dose/liter of milk). Average daily secretion of P^{32} in milk from 1-7 days after injection was 7.4, 4.9, 2.8, 2.1, 1.6 and 1.4% respectively. Organic P^{32} never exceeded 20% of the total. P appeared to be more labile than Ca, i.e. to have a faster exchange rate.

In the $(Ba-La)^{140}$ experiments, mice and rats were injected intraperitoneally with toxic doses of radio-barium. Hematological data indicated that in mice the threshold for effects on hemoglobin and red blood cell count must be above 1.9 uc/g; that at 1.9 uc/g the heterophil and lymphocyte counts diminished, and that a dose of 0.2 uc/g appeared to be just below threshold. In rats, a dose of 0.5 uc/g decreased the white cell count by about 30 per cent 8 days after injection.

Argonne National Lab., III. RADIOSTRONTIUM (Sr^{90}). I. L. Chaikoff, M. C. Fishler, and C. Entnman. (nd). Decl. July 14, 1947. 1p. (MDDC-1142-D)

Tracer Studies-- A continuation of this work with more complete data indicates that the retention of Sr^{90} by the skeleton was essentially as has been described in a previous report. The uptake of this material in the bones of the animals which received it by mouth was found to rise by almost a factor of two between the fourth and sixteenth days. Otherwise, there were no significant differences to be observed between the present more complete information and that which was given previously. The rate of excretion of Sr^{90} has now been followed for a period of thirty days, and after the fifteenth day its excretion is apparently

less than the rate of decay of that which is retained in the body.

11210

SOME OBSERVATIONS ON THE DEVELOPMENT OF PUPPIES BORN OF IRRADIATED DOGS. M. Ya. Chaikovskaya. Vestnik Rentgenol. i Radiol. 1955(4), 34-38 (1955).

Only one of the full-term puppies from mothers irradiated on the 28th day of pregnancy with 500 r developed normally. Signs of rickets and of disturbed cardiac function were observed in all puppies. Cardiac abnormalities included systolic and diastolic murmurs, asthma, changes in heart sounds and combined congenital cardiac defects. BA 32-15257

PARAMETRIAL INJECTION OF COLLOIDAL GOLD (Au198) IN THE MONKEY. J. F. Nolan, E. G. Jones and R. H. Neil. *Am. J. Roentg.* 69(5), 805-12(1953).

Limitations imposed by necrosis of local tissues rather than liver injury is the major factor governing choice of dose for treatment of humans by the technique described. It appears likely that 25-50 millicuries in 50cc of solution would be injected into each parametrium of humans without difficulty. This amount should diffuse uniformly throughout the parametria with enough fixing in local lymphatics and lymph nodes to cause sclerosis without extensive necrosis, and enough radiation to be cancericidal.

Argonne National Lab., Ill.
STUDIES ON METABOLISM AND TOXIC ACTION OF INJECTED Ra. W. P. Norris and H. B. Evans. 1948. 28p. (AECD-1965; CH-3852)

The most important period in defining the fate of radium in the animal body is that closely following administration, providing the material is readily available to the body fluids. This period is demonstrated in rats by the rapid disappearance of radium from the blood after intravenous injection and by the rapid uptake of radium from the peritoneal cavity as indicated by blood concentration curves following intraperitoneal administration. The excretion of intraperitoneally administered radium in rats and mice was very rapid and reached such a low value within 10 days that further excretion had a negligible function in determining the final retention. There exists a linear logarithmic dependence of per cent injected dose excreted per day (log E) on time (log T). More of the excreted radium was present in the feces than in the urine. The retention of radium, administered intraperitoneally to rats, mice, and rabbits, increased concomitantly with dose level. There exists a linear logarithmic dependence of per cent retention (log R) on dose level (log I).

METABOLISM OF FISSION PRODUCTS. A Progress Report. Roy Overstreet, L. O. Jacobson, H. Fisher and K. Scott. 1943. 49p. (MDDC-1011; CH-1049; A-1441)

Unseparated Fission Products. Unseparated fission products have been isolated from 18 pounds of neutron bombarded UO₂(NO₃)₂·6H₂O free from carrier and containing less than .03 micrograms of uranium per microcurie of activity. The final solution was assayed

for its content of strontium, yttrium, praseodymium, zirconium, columbium, ruthenium, tellurium, cesium, barium, cerium, and UX_1 . Tracer studies were done on a large group of rats which received the prepared solution by intramuscular, intraperitoneal, intrapulmonary, and oral routes of administration.

Radio-Ruthenium ($Ru >^{105}$). A carrier-free purified preparation of $Ru >^{105}$ (includes some other activities) has been isolated as a solution of $RuCl_4$ and tracer studies comparable to those for the fission mixture completed. $Ru >^{105}$ was found to be rather widely distributed throughout the body and the greatest degree of selective localization took place in the kidney which was considerably less than the degree of deposition and retention in bone for alkaline earths, zirconium, columbium, and the fission mixture. **Neptunium ($Np^{238}, ^{239}$).** A mixture of Np^{238} and Np^{239} , free from radioactive contaminants and inert hold-back carriers, was isolated from a uranium metal target which had been bombarded by 16 Mev deuterons. Tracer studies, which included the intraperitoneal, intrapulmonary, and oral routes of administration, were carried out over a period of 8 days. The metabolic behavior of neptunium was found to resemble that of yttrium more closely than any of the other fission products studied thus far. **Radio-Autographic Studies.** A large series of radio-autographs have been prepared from the lungs of the rats which had received the fission mixture, ruthenium, and neptunium by intrapulmonary administration. Photomicrographs of representative lung sections and their corresponding radio-autographs prepared no significant deposition was noted in the bronchi, lymphoid tissue, and blood vessels. In all of the radio-autographs it was found that the radioactivity was distributed widely throughout the alveolar structure of the lungs. Frequently a tendency for the alveolar pattern of the sections to be duplicated on the radio-autograph was observed.

11249

EFFECTS OF RADIOACTIVE P^{32} ON NORMAL TISSUES. W. R. Platt. Archives of Pathology 43, 1-14(1947)

Radioactive P produces changes, similar to those produced by other ionizing radiation, in many tissues. Types of changes include: cell death, abnormal mitoses resulting in giant, irregular nuclei, fibrosis, hyalinization of collagen and a vascular change characterized by thickening and hyalinization of small vessels. There is selective localization of P^{32} in tissues most often invaded by neoplastic cells of lymphomatosis and myelomatosis, i. e. marrow, spleen, liver, lymph nodes. Changes were also observed in lung, kidney, GI tract, ovaries and testes.

URANIUM [TOXICITY], p. 38-54 of QUARTERLY TECHNICAL REPORT, JANUARY 1, 1951, THROUGH MARCH 31, 1951. Henry A. Blair, Director (Atomic Energy Project, Univ. of Rochester). May 9, 1951. 17p. (UR-164)

The effects of particle size and purity on the toxic response, as measured by urinary protein, to inhaled UO₂ have been studied by exposing rabbits to suspensions of 0.5-μ massmedian particle diameter. The pH range was kept at 5.0 to 7.5, where uranyl ion and other oxidation products are low in concentration. Comparison with the results of Wilson et al. (*J. Ind. Hyg. Toxicol.* **30**, 319 (1948)) indicates that UO₂ itself is nontoxic, the observed chemical toxicity being due to uranyl ion or some complex. The different rates of alveolar deposition and of elimination of insoluble particulates were determined for each of the lobes of the rat lung following inhalation of U₃O₈ or UO₂

of different mass-median particle sizes. The nasal filtration cutoff point in mass-median diameters (MMD) was about 0.7 μ for the rat. Alveolar deposition was calculated to be but 0.9% for U₃O₈ of 2.6 μ MMD based on respired atmospheric concentration of particles of all sizes of this distribution, for UO₂ at MMD 0.45 μ, alveolar deposition was 8.3%. NSA 5-5529

Effects of citrate ion concentration, valence state and various other factors on the distribution and excretion of Pu following its intravenous administration to the rat are discussed.

11276

MEDICAL AND BIOLOGICAL RESEARCH ACTIVITIES OF THE LOS ALAMOS LABORATORY. W. Langham. (nd). Decl. Oct. 29, 1947. 20p. (MDDC-1439; LADC-449)

Emphasis is being placed on using carbon-14 to trace physiological processes in animals and to trace the activities of cells and their relation to their substrate or environment. A number of important compounds have been tagged with carbon-14, namely nicotinic and p-amino-benzoic acids. Tracer studies with these tagged vitamins may help to explain why body cells occasionally become cancerous when exposed to atomic radiations. Other growth promoting substances to be studied or in the process of study with carbon-14 are the hormones. A major part of the research is directed to the study of direct biological effects of atomic radiations. Radioactive phosphorus is being used to study the rate of breakdown of nucleoproteins and nucleic acids as a result of large doses of ionization radiations. The effects of the radiations on the weight and gross appearance of the spleen, kidneys, ovary, adrenal gland, intestinal tract, bone marrow and

peripheral blood are being studied. The effects of the radiations on the mitotic index (an indication of the rate of growth and replacement) of the various organs and tissues are being studied also. Other research activities include further studies of the effects of plutonium on the animal system and of health hazards created by this material and other materials peculiar to the Los Alamos Laboratory.

11283

UPTAKE AND DISTRIBUTION OF IODINE IN THE INTACT ANIMAL. C. P. Leblond. *Revue Canadienne de Biologie* **1**, 402-453(1942). (In French).

Author reviews the metabolism of iodine. It is rapidly eliminated via urine. In gastric secretion, I^- was present as the halogenated acid, HI, as is chloride. I^- was found in extracellular spaces of organs, as are other halides, and a small fraction was incorporated into cells, especially into liver cells. The thyroid fixed approximately 50% of physiologically available iodine as di- and tri-iodo-tyrosine. Excess I^- was stored as I^- or di-iodotyrosine in the follicular colloid.

11284

METABOLISM OF RADIOACTIVE IODINE IN THE THYROID OF RATS KEPT AT LOW TEMPERATURE. C. P. Leblond, J. Gross, W. C. Peacock, and R. D. Evans. *Fed. Proc.* **2**, 28-29(1943).

Metabolism of radioiodine in rat thyroids was 3 x normal after 26 days at 0°.

11287

IODINE METABOLISM IN THE THYROID GLAND AFTER SINGLE INJECTIONS OF 5 OR 500 MICROGRAMS OF RADIOACTIVE IODINE TO ADULT RATS. C. P. Leblond, W. C. Peacock, J. Gross and R. D. Evans. *Fed. Proc.*, **2**, 29(1943).

Uptake of I_2 by the thyroid from the smaller dose was progressive, increasing markedly with time, while that from the larger dose showed only a relatively slight increase with time. After 15 min. or 2 hr. most I_2 was present as inorganic iodine. After 30 hours, radioactivity was predominantly in the D fractions. This distribution was comparable for the 2 doses.

11288

STUDIES ON THE FIXATION OF RADIOACTIVE IODINE BY THE RABBIT THYROID. A. Lein. *Endocrinology* **32**, 429-432(1943).

The iodide-combining mechanism of the rabbit thyroid was saturated within 10 min. after intravenous administration of radioactive iodine. Saturation was partly dependent on quantity of I^{131} administered. Organic iodine appeared within 5 min. The total quantity of iodine in the acetone-insoluble fraction at the end of 12 hours was 4 or 5x greater than that originally fixed by the thyroid.

QUARTERLY PROGRESS REPORT OCTOBER 1- DECEMBER 31, 1953. (UNCLASSIFIED SECTION). (Brookhaven National Lab.). 66p. (BNL-270)

Abstracts of papers from the Physics, Chemistry, Biology, and Medical Depts. which have been submitted for journal publication are presented. Cosmotron operation and research studies are briefly summarized. The general layout of the electron analog for the proposed 25-bev alternating-gradient synchrotron is presented. Equipment is described for studying neutron-capture γ spectra, and

results are presented for V, Co, Cu, Ti, and Fe. The oblique attenuation of Na^{24} γ rays through lucite and steel was measured. Progress on radiation polymerization studies is reported. A polyethylene rod given 20,000,000-r γ irradiation showed improved corrosion resistance to $H_2O-NaNO_3$ solutions at 234°F. Heat-transfer data from the cross-flow of Hg in staggered-tube banks are presented. Degradation of γ radiation in a hole in the ground from a Co^{60} source suspended 100 ft above was measured. Time-of-flight circuits for the BNL fast chopper and the 18-in. cyclotron and a new high-speed linear amplifier are discussed. Ionization-chamber performance for monitoring complex radiation in the vicinity of the Cosmotron was evaluated. A summary of waste-disposal studies is presented. The maximum uptake of At^{210} or At^{211} in the rat thyroid takes place in 1 to 2 hr after administration compared to 18 hr for I^{131} . Triphenyltetrazolium chloride was shown to be a suitable indicator for dehydrogenase activity of irradiated bacteria cells. The use of A-CH₄ mixtures in the gas-phase counting of $C^{14}O_2$ is discussed. Equipment for the continuous sampling and counting of blood radioisotope activity has been built. Cardiac output, portal blood flow, pulmonary circulatory effects of hypoxemia, and the effects of inhalation of hypoxic mixtures has been studied in the dog. Effects of pulmonary embolism and small alterations in oxygen tensions on respiration in dogs was studied. Lithium chloride LD_{50} doses were determined for normal and anesthetized mice. The distribution of Mn^{50} in tissues and cells of rats was studied. NSA 8-3181

11296

QUARTERLY PROGRESS REPORT OCTOBER 1, - DECEMBER 31, 1955. (Brookhaven National Lab., Upton, N. Y.). 64p. Contract [AT-(30-2)-Gen-16]. (BNL-375).

Abstracts of papers submitted for journal publication are included. The operational efficiency of the Cosmotron continued high. Developmental work on accelerator design is reported. Services furnished to off-site users of the BNL reactor, irradiation facilities, and services are summarized. Isotope shipments made during the period are listed. Preliminary results in studies on solid-state radioinduced polymerization of styrene grafted to polyethylene and to teflon are reported. Heat-transfer and pressure-drop characteristics were determined for Hg flowing normal to a bank of staggered tubes. Calibration and minor design modifications in radiation detection and other instruments are reported. Brief summaries are presented of preliminary results from biochemical and physiological research studies in progress. Data are presented graphically from studies on B distribution among mouse brain, brain tumor, and muscle and the viability of mouse brain tumor following B^{10} -borax neutron capture irradiation.

EFFECTS OF RADIATION UPON A TRANSPLANTED MOUSE LYMPHOSARCOMA. Joanne Weikel and E. Lorenz. (Argonne National Lab.), p.17-20 of BIOLOGICAL AND MEDICAL DIVISIONS QUARTERLY REPORT. Nov. 1, 1948. (ANL-4227)

Tumor size at time of treatment effects the degree of regression after radon injection as it does after x-irradiation. Both regression and regrowth tend to be proportional to tumor size. Amount of tumor tissue destroyed does not affect the red cell or leukocyte count. Lymphocytes in the radon-injected animals studied appeared to return to normal levels more quickly than they did following x-irradiation.

DISTRIBUTION OF U^{233} IN TISSUES OF MICE FOLLOWING INJECTION OF U^{233} (+6) NITRATE. A. Tannenbaum. Sp. 1945. (MDDC-1280; MUC-RSS-563)

The purpose of this investigation was to study the distribution and excretion of U^{233} and to compare the results with those previously obtained with uranium (238) salts. The distribution of U^{233} is similar to that of uranium 238. U^{233} , therefore, may be used as a tracer for studies on uranium distribution and excretion. Both accumulate principally in the bone and kidneys, and it may be expected that chemical or radiation damage caused by ordinary uranium and the isotopes thereof would be mainly in these organs.

11321

THE EFFECTS OF RADIATION ON RESPIRATORY METABOLISM. E. J. Boell. Symposium on Physiol. Effects of Radiation at the Cellular Level. The Biol. Div. Oak Ridge National Lab. 19(1951) also; J. Cell and Comp. Physiol., 39(1). (1952).

Immediate effect of irradiation on the grasshopper embryo (*Melanoplus differentialis*) was a reduction of oxidase activity. Activity had returned to normal 2 days after exposure and subsequently exceeded the normal.

Irradiation *in vitro* had no effect on respiration. Other experiments demonstrated that certain enzymes are inactivated by irradiation *in vitro*. SH enzymes were found to be particularly radiosensitive. In general, however, *in vivo* and *in vitro* effects were markedly different. Authors suggest that in some cases, enzymes in the cell may be protected from radiation damage by the presence of non-enzymatic proteins.

11332

EFFECTS OF ACUTE EXPOSURE TO X-RADIATION ON THE PERIPHERAL BLOOD OF EXPERIMENTAL ANIMALS. M. Ingram and W. B. Mason. Biological Effects of External Radiation (NNES-VI-2) Henry A. Blair, ed. McGraw-Hill Book Co., Inc., New York(1954). p. 58-83.

Rats received doses ranging from 1500 to 5 r in single doses of x-radiation, monkeys doses from 2000-3000 r, dogs 300 r. Changes in routine blood studies after exposure to small doses can only be demonstrated by statistical methods. There was no consistent difference between leucocyte counts of survivors and non-survivors. There was an early depression of lymphocytes and reticulocytes. Depression of erythrocytes and hemoglobin occurred last. (from authors' summary.)

11333

THE EFFECTS OF INTRAPERITONEALLY INJECTED RADIUM CHLORIDE ON THE THYMUS OF THE ALBINO RAT. Ralph D. Comar and Paul G. Roefe. Kansas Acad. Sci. 56(2), 234-241(1953).

Authors observed a decrease in the number of small lymphocytes and found this to be the most sensitive index of effect. Reticular cells were least sensitive. Some animals in all the radium dosage groups showed involutional changes in the thymus. The affected lobules scarcely resembled thymic tissue. Mast cells and plasma cells invaded the sinusoids and small lymphocytes disappeared. No areas of ectopic myelopoiesis were observed, although eosinophils were present in all thymus tissues studied. BA 28-12880

11334

HEMANGIOENDOTHELIOMA OF LIVER FOLLOWING THORIUM DIOXIDE ADMINISTRATION. H. Tesluk and W. A. Nordin. A. M. A. Arch Path. 60(5), 493-501(1955).

11335

THE TOTAL DOSE RECEIVED BY A WORKER EXPOSED TO RADIATIONS. UTILIZATION OF FILM BADGES. J. Govaerts. J. Belge Radiol., 38, 387-93(1955).

Data obtained from film badges worn by African uranium miners, radiation therapy workers and diagnostic radiology workers are analyzed. Radiation therapy workers received the highest doses, exceeding "tolerance" dose by 10%.

11341

COMPARATIVE EFFECTS OF X-RAYS AND NEUTRONS IN INDUCING CHROMOSOMAL REARRANGEMENTS AND MUTATIONS, PRIMARILY IN *TRADESCANTIA*, MEASUREMENT OF NEUTRON DOSAGES AND INTENSITY OF NEUTRON RADIATION. N. H. Giles and R. F. Humphreys. Yearbook Am. Phil. Soc. 1942, 152-3(1943).

A linear relationship has been demonstrated between neutron dose and the frequencies of induced chromatid and chromosome aberrations.

11342

VIAL PLANTS FROM HYBRIDIZATION OF DEFECTIVE MUTANTS OF BARLEY. S. J. Kraevoi. Vestnik Gibrizatsii (Hybridization) No. 2, 103-5(1941).

Two x-ray mutants of *Hordeum sativum* var. *medicum* Korn were crossed. The F_1 plants were unlike either parent and practically normal, hardly different from the original variety which they equalled in stem length and productivity, although sterility up to 12.35% was observed.

11343

PATHOLOGIC HISTOLOGY OF RADIODERMATITIS. H. Montgomery. p.333-62 of X-RAYS AND RADIUM IN THE TREATMENT OF DISEASES OF THE SKIN. G. M. MacKee, ed. Philadelphia, Lea and Febiger. 1938.

11344

IMPLICATIONS FROM STUDIES WITH PHYSICAL CARCINOGENS. Paul S. Henshaw. J. Natl. Cancer Inst., 5, 419(1944).

11345

THE THERAPEUTIC USE OF BAL IN POLONIUM TOXICITY. I. THE EFFECT OF DITHIOL COMPOUNDS ON THE EXCRETION OF POLONIUM II. BLOOD AND TISSUE DISTRIBUTION OF POLONIUM AS AFFECTED BY BAL. III. SURVIVAL EXPERIMENTS ON POLONIUM INJECTED RATS AS AFFECTED BY BAL TREATMENT. John B. Hursh (University of Rochester, Rochester, N. Y.). 1949. 65p. (UR-83; AECD-2852)

11346

THE DISPERSION OF P^{32} AND OTHER TRACERS INJECTED INTO EMBRYONATED EGGS. R. M. Taylor and A. C. Saenz, J. Immunol. 63, 319-30(1949). NSA 4-366

11347

COMPARATIVE EXCHANGE OF CALCIUM, LEAD, AND RADIOACTIVE LEAD IN DOGS. J. A. Calhoun, R. McLean, J. C. Hudson and J. C. Aub. Arch. Indust. Hyg. Occup. Med. 9, 9-22(1954).

Radioactive Pb was toxic to dogs, and they developed uremia as a result of radioactivity since dogs poisoned with inert lead did not have these symptoms. Parathyroid hormone and high or low calcium diet had no effect on excretion of tagged lead.

11348

THE ACTION OF X-RAYS ON THE AMPHIBIAN EGG DEVELOPMENT. I. THE EFFECT OF OXYGEN ON THE RELATIVE SENSITIVITY OF EGGS AND SPERMATOZOA OF THE TOAD. Y. Nakao. Annot. Zool. Jap. 25, 187 (1952).

In the eggs of *Bufo vulgaris* irradiated with x-rays in air, H_2O_2 produced in the cytoplasm was an important factor in producing abnormalities. CA 48-47101

11349

CLARIFICATION OF DIFFERENCES IN RADIOSENSITIVITY OF TUMORS IRRADIATED *IN VITRO* AND *IN VIVO* ON BASIS OF EFFECT OF OXYGEN ON RADIOSENSITIVITY. B. V. Hall. Cancer Research, 12, 268(1952).

Radiosensitivity measurements of transplantable mouse carcinoma were made by measuring viability and growth of implants irradiated under standard conditions *in vitro* with x-rays. All observed radiosensitivities were consistent with assumed O_2 content of tumor fragments *in vitro* and intact tumors *in vivo*. Although other factors may be involved it appears possible to account for many of the peculiarities in radiosensitivity of tumors and tumor fragments on the basis of tissue O_2 .

11350

AUXIN BIOSYNTHESIS - A CYTOPLASMIC LOCUS OF RADIATION DAMAGE. S. A. Gordon. p.44 of PROGRESS IN RADIOBIOLOGY. Springfield, Ill., C. C. Thomas Co. 1956.

Auxin, by a still undefined mechanism, controls (as the limiting factor) cell division, expansion and individuation in plants. Low doses of ionizing radiation cause an immediate depression of free auxin levels. Data from the author's studies show: 1. auxin *per se* is not sensitive to irradiation *in vitro* or *in vivo*, 2. auxin has a rapid turnover rate in tissues, 3. auxin synthesis is highly radiosensitive, 4. sensitivity of auxin synthesis in a dynamic system is responsible for the immediate drop post-exposure. Sensitivity of auxin synthesis to radiation is mirrored by *in vivo* sensitivity of enzyme systems that degrade tryptophan to indoleacetic acid (IAA). Locus of radiation damage is the terminal enzyme of the enzyme sequence, i.e. the enzyme catalyzing IA aldehyde to IAA. In studies with mung beans, the author found that 10 r caused 20% inhibition of ability of cell-free extracts from irradiated plants to convert the aldehyde to acid. Inhibition was detectable immediately after irradiation. Site of effect in the cell was identified as being in the non-particulate fraction of cells, i.e. in solution in cytoplasm. Ultracentrifugation further showed the site to be in the heterogenous fraction of "soluble" protein.

11351

COMPARISON OF THE INACTIVATION OF THE ESTERASE AND PROTEASE ACTIVITIES OF α -CHYMOTRYPSIN SOLUTION WITH X-RAYS. D. L. Aronson, L. K. Mee, and C. L. Smith. p.61 of PROGRESS IN RADIOBIOLOGY. Springfield, Ill., C. C. Thomas Co. 1956.

Author studied the possibility that the radiosensitivity of enzymes with 2 or more modes of action might depend on the assay method used. If so, 2 modes of action might indicate 2 different target volumes. Solutions of crystalline α chymotrypsin (aqueous) were used in the experiments reported. It was found that for each enzyme concentration, esterase activity was more radiosensitive than protease activity of chymotrypsin. (The preparation used was shown not to be a mixture of 2 enzymes.)

11352

RECENT RESEARCH ON THE CHEMICAL PROTECTORS AND PARTICULARLY ON CYSTEAMINE-CYSTAMINE. Z. M. Bacq. p.160 of PROGRESS IN RADIOBIOLOGY. Springfield, Ill., C. C. Thomas Co. 1956.

Author presents a discussion, based on experiments and interpretations of various results obtained by a number of authorities, on the mechanism of the protective effect of cysteamine-cystamine and related agents against lethal and other effects of irradiation. Author feels that anoxia produced by the agents may be contributory, but that it is not an entirely satisfactory explanation of effect.

11353

A METHOD OF OXYGEN ASSAY APPLIED TO A STUDY OF THE REMOVAL OF DISSOLVED OXYGEN BY CYSTEINE AND CYSTEAMINE. L. H. Gray. p.267 of PROGRESS IN RADIOBIOLOGY. Springfield, Ill., C. C. Thomas Co. 1956.

Commercial cysteine added to water or buffer solution completely removed all dissolved oxygen in 10 minutes at pH 6.5.

PRIMARY BIOCHEMICAL EFFECTS IN THE X-IRRADIATED YOSHIDA ASCITES SARCOMA G. Hohne, H. A. Kunkel, H. Maass and G. H. Rathgen. Progress in Radiobiology (C. C. Thomas, Pub., Ill.). (1957).

In vitro x-irradiation of ascites tumor cells with x-ray doses of 25,000 r resulted in depression of glycolysis due to blockage of a link in the reaction chain which takes place beyond the triosephosphates. This cannot be attributed to inactivation of aldolase or to inhibition of lactic acid dehydrogenase. The most likely explanation appeared to be that x-irradiation inactivated phosphoglycerol dehydrogenase.

11356

ALKOXYGLYCEROL ESTERS IN IRRADIATION TREATMENT. A. Brohult. p.241 of PROGRESS IN RADIOBIOLOGY. Springfield, Ill., C. C. Thomas Co. 1957.

Compounds obtained from bone marrow and shark liver oil were studied as therapeutic agents in cases of radiation leukopenia and in thrombocytopenia. In one case, alkoglycerol esters were administered to a nurse who had been occupationally exposed to radium and had had a leukocyte count of about 2000/mm³ for more than one year. Three days of treatment (oral administration) increased the count to 3600 where it had been maintained for more than one year at the time of this report.

THE PROTECTIVE EFFECT OF THE REDUCTION OF THE BODY TEMPERATURE ON ADULT AND YOUNG MICE AFTER WHOLE-BODY IRRADIATION S. Hornsey. Progress in Radiobiology 248 (C. C. Thomas, Pub., Ill.). (1957). 557p.

Protection (young mice) against post-irradiation "intestinal death" (following 1800 r x-ray dose) conferred by anoxia (N₂ atmosphere) plus hypothermia was not greater than that from anoxia alone and was less than the protection against "hematopoietic death." Comparison of anoxic and cold young mice suggested that cold animals may simply tolerate greater anoxia than do those with higher temperatures.

THE BIOLOGIC DECAY RATES AND EXCRETION OF RADIOCESIUM, Cs¹³⁴ WITH EVALUATION AS A TRACER OF POTASSIUM IN DOGS. S. A. Threefoot, G. E. Burch, and C. T. Ray. J. of Lab. and Clin. Med 45, 313-322 (1955)

11361

URANIUM POISONING - REVIEW OF LITERATURE TO 1942. S. T. Cantrell and J. J. Nickson. December 15, 1942. 6p. (MDDC-1199)

This review is divided into three headings: pathology, symptomology, and uranium poisoning in man. On the whole, very little was found in the literature on uranium poisoning in man and even less dealing with chronic poisoning with which the authors are most concerned. It is well established that the element is toxic, but the routes of absorption of uranium in various forms are not well established. It is known that the kidneys suffer damage when uranium is absorbed, and the signs of this toxicity can be seen in the urine. The central nervous system has also been seen to be damaged. It is likely that other organs also suffer but no definite information is available. Experiments are underway to study chemical toxicity in the mouse, but no results are given in this report. A bibliography is appended.

INTRAPROSTATIC INJECTION OF RADIOACTIVE YTTRIUM CHLORIDE IN THE DOG. G. J. Bulkley, J. D. Cooper and V. J. O'Conor. Surg. Gynecol. Obstet. 100, 405-8(1955) Apr.

The excretion and distribution of radioactive yttrium chloride after intraprostatic injection in the dog have been studied. Approximately one-half of the injected radioactivity is excreted in the urine, the major portion during the first 48 hours. One-third of the radioactivity remaining in the body was found in the prostate with only small amounts in distant organs. Radiation effects observed in the prostate initially were characterized by hemorrhage and necrosis followed by healing with fibrous replacement of glandular tissue. Uniform distribution of the radioactive material through the parenchyma of the gland could not be achieved. High levels of radioactivity were found in the regional lymphatics and tissues of the pelvis in over half of the animals. NSA 9-3378

DEPOSITION OF REPRESENTATIVE RADIOACTIVE ALKALINE EARTH AND RARE EARTH ELEMENTS IN THE SKELETAL TISSUES OF THE RAT. C. W. Asling, Mrs. D. A. Heller, D. H. Copp and J. G. Hamilton. nd. 1p. (AECU-254)

This document is in abstract form, it is reproduced below in its entirety. Radioautographs of sections through the costochondral junction of young normal and phosphorus deficient rats were compared with undecalcified silver-stained sections to determine any differences which might exist in deposition of carrier-free radiostrontium (Sr⁹⁰) in bone, osteoid, hyaline cartilage, and calcified cartilage. The rats were sacrificed 1 and 72 hours after intraperitoneal administration of the radioelement. Radiostrontium was found in the compact bone of both normal and deficient rats as well as in the spongy bone of normal controls but not in the osteoid of the deficient animals. The distribution and degree of deposition was comparable at 1 and 72 hours. In both control and deficient rats radiostrontium was demonstrated in the calcified cartilage but not in the hyaline cartilage. The degree of deposition approached that of the cortical bone of the same sections. The distribution of promethium (element 61) in normal adult rats at 96 hours differs remarkably from that of strontium. The promethium was observed in the region of periosteum, endosteum, and perichondrium and not in cortical bone, hyaline cartilage, or calcified cartilage. NSA 3-524

11391

PREVENTIVE MEASURES FOR ATOMIC EXPLOSION. A. J. Bauer. *Delaware State Med. J.* 20, 121-123(1948) June.

All of the health measures now taken in cases of widespread disaster will have to be put into effect in an atom bombing. In addition there will be the problems caused by radioactivity and the treatment of much larger numbers of people. Important preparatory procedures are psychological preparation, large quantities of whole blood for the fantastic number of required blood transfusions, and training of laymen in blood typing and making blood counts, and the transfusion operation. Treatment may be divided into two broad categories, (1) those which are of proved value: good nursing care, blood transfusion, antibacterials, Vitamin C, intravenous glucose and saline, and (2) those of questionable value: vitamin B₆, toluidine blue, protamine sulfate, rutin, and adrenal cortical hormones. It is important that cities plan to handle the emergencies of their neighboring cities. The director of the emergency plan for one city must be a resident in some other community. NSA 2-698

11392

INTERNAL RADIATION HAZARDS IN INDUSTRY FROM THE USE OF POLONIUM IN STATIC ELIMINATOR DEVICES. Fred A. Bryan and Louis B. Silverman. Apr. 11, 1949. 16p. (AECU-343)

The use of radioactive materials as static eliminators has been described. Although polonium is an energetic alpha particle emitter and, therefore, an excellent static eliminator, it has many serious disadvantages. Such devices produce industrial inhalation hazards by contamination of the air with fine particles containing radioactive polonium. Also the ingestion of minute quantities of polonium may cause serious injury. The hazard here is primarily by contamination of the hands. Impure polonium containing radiolead (Pb²¹⁰) is even more injurious. Therefore, it is recommended that all plants, companies and individuals engaged in the production, investigation, and use of such radioactive substances and devices be made cognizant of the dangers from internal radiation injury. NSA 3-536

11393

RADIATION HAZARDS IN INDUSTRY. T. H. J. Burnett. *Am. Ind. Hyg. Assoc. Quart.* 9, 94-7(1948) Dec.

A general discussion of the protective measures necessary to control exposure to radiation is presented. The difference in permissible exposure doses established in various countries is pointed out. The current maximal exposure dosage in the U S is 0.1 r/day. The following steps are useful in the control of radiation exposure: limiting the length of time of exposure; increasing the distance from the source of radiation; using radiation shielding materials; facilitating adequate disposal of radioactive waste products; studying the

radiation strength of the material being used; employing various detection devices, such as film badges, and pocket ionization chambers; and using frequent blood counts to determine the effects of large exposures to radiation. NSA 3-223

11394

RADIOGRAPHIC EXAMINATIONS AND RADIATION DANGERS. J. Camerman. *J. belge radiol.* 39, No. 2, 165-78(1956). (In French).

A chart is given of roentgen-ray dose rates (skin and depth doses) the patient and the radiologist may receive during the different procedures of roentgen diagnosis. It shows that these investigations offer no harm for the patient provided special care is given in cases of abnormally long exposure time and perhaps in roentgen diagnosis of the pelvis in young women. Radiologists and assistants should be warned against secondary radiation which is more important than generally admitted. Skin and depth doses to the patient as well as secondary radiation to the radiologist are largely reduced by the hard radiation technique (100 to 130 kv) which therefore justifies its use. NSA 10-9975

11395

HAZARDS TO PHYSICIANS, PATIENTS, NURSES, AND OTHERS FROM USE OF RADIOACTIVE ISOTOPES. W. Edward Chamberlain, R. R. Newell, Lauriston Taylor, and Harold Wyckoff. *Am. J. Roentgenol. Radium Therapy* 61, 726-8(1949) May.

A discussion of the problem of radiation injury is presented. The authors stress the fact that there is no antidote for radiation injury, so particular caution must be practiced on the part of the operator to prevent injury to the patient and to himself. The various types of external and internal irradiation are also mentioned. Patients' hazards mostly arise from errors by the physicians in calculation intensity doses. Wet and dry isotopic-containing wastes have to be disposed of by collection and isolation (deep burial, etc.) rather than dilution and distribution, because of the ability of some algae and other plant forms for re-concentrating these materials. A table is included which lists the hazards from radioactive isotopes, which may be used as a guide for the adequate control of these materials by physicians. NSA 3-540

11396

THE DEVELOPMENT OF LINEAR ACCELERATORS IN SYNCHROTRONS FOR RADIOTHERAPY AND FOR RESEARCH IN PHYSICS. John Cockcroft. *Proc. Inst. Elec. Eng.* 96, Part I, 296-303(1949) Nov.

The article contains a simplified explanation of the operation of the synchrotron and of the linear accelerator, and a short discussion of their applications to radiotherapy. Details of the operation of several of these machines are described. The author concludes with a paragraph on the proton synchrotron and the synchrocyclotron. NSA 4-649

11398

THERAPEUTIC USES OF THORIUM. H. Corsi. *Lancet*, 2, 346-48(1943).

Thorium X (Ra²²⁴) is a short-lived radioactive metal of atomic weight 224, 99% of its emanation consists of alpha rays. It can be applied to the skin either as a suspension in amyl acetate or dissolved in n-propyl alcohol. The use of the metal in the treatment of certain groups of skin diseases is described and it is concluded that thorium X is a valuable therapeutic agent in psoriasis and alopecia

areata, and sometimes superior to X rays for amelioration of subacute and chronic dermatitis, particularly of the lichenified type. Encouraging results are also reported in the treatment of onychomycosis, sycosis and naevi of the purely capillary type. NSA 1-561

11399

A SURVEY OF SCATTERED RADIATION FROM FLUOROSCOPIC UNITS IN FIFTEEN INSTITUTIONS. Russell F. Cowing and Charles K. Spalding. *Radiology* 53, 569-74 (1949) Oct.

Experiments determining the minimum room size in which a fluoroscopic unit could function and have a low wall-scattering factor are reported; the most efficient location of the unit within the room was also determined. Measurements of the scattered radiation were taken under actual diagnostic conditions and for many types of examination; all the measurements were made with a Beckman beta-gamma survey meter. It was found that several installations presented radiation hazards which could be overcome by using a movable barrier; technicians assisting with the examinations in nearly every instance received more irradiation than the roentgenologist. Upright units were the most dangerous. It is concluded that for units employing tilt and stationary horizontal tables the minimum room size should be 12 by 14 ft; there should be at least 6 ft between the roentgenologist and the closest wall, regardless of the type of examination. APPROXIMATE THEORETICAL SOLUTION OF A PROBLEM OF SCATTERING OF SOFT X-RAYS (λ BETWEEN 0.25 AND 0.56 Å) AND ITS CONSEQUENCES IN MEDICAL RADIOLOGY. R. H. de Waard. *Brit. J. Radiology* 21, 454-63(1948) Sept.

Approximate solutions of the problem of the scattering of soft x-rays are applied to the discussion of superficial x-ray therapy in skin diseases, and to the evaluation of densities and contrasts in radiographs. NSA 4-1323

11403

ADMINISTRATION OF NUCLEAR SAFETY AT HANFORD. R. L. Dickeman (Hanford Atomic Products Operation, Richland, Wash.). Apr. 10, 1956. 12p. Contract W-31-109-Eng-52. (HW-42331)

Nuclear safety considerations arise in the Hanford Atomic Products Operation in the areas of fuel element fabrication, high power reactor design and operation, chemical processing plant operation, research reactor operations, and on occasion, in critical experiments. The nuclear safety aspect of all production operations at Hanford is the joint responsibility of the Engineering and Manufacturing Departments. These responsibilities are clearly delegated within the respective departments to the appropriate levels in the line organizations. NSA 10-3980

11404

STATUS AND DEVELOPMENT OF PROTECTION AGAINST

RADIATION. M. Dorneich and R. Jaeger. *Strahlentherapie* 78, 569-86(1949). (In German).

According to the author biological damage through radiation can be almost completely avoided if the proper precautions are observed. A complete list is given of the protective measures used in Germany, as listed by the German Norm Committee for x-ray and radium work, as of October, 1948. Pertinent information is furthermore summarized in a number of tables and graphs dealing with the ion density produced in tissue by various kinds of radiation, characteristic advantages and disadvantages of various protective measures, and safe dosages for continued work in the vicinity of sources of radiation. Finally a brief discussion is given of damage caused by the penetration of radioactive substances into the body, which cannot be determined by direct ionization measurements. NSA 4-1858

11405

MAXIMUM ALLOWABLE CONCENTRATIONS OF ATMOSPHERIC IMPURITIES. Philip Drinker and Warren A. Cook. *J. Ind. Hyg. Toxicol.* 31, 51-4(1949) Jan.

In a discussion of maximum allowable concentrations of air contaminants, the author considered the use of a zone of response method for classifying vapor concentrations. Toxic substances are broken up into six arbitrary groups in terms of the effective range, radon gas and other radioactive gases are placed in the sixth and most toxic group, having maximum allowable concentrations of below 0.1 ppm. THE EFFECT OF POLYVINYLPIRROLIDONE (PVP) AND INSULIN ON THE TISSUE DISTRIBUTION AND EXCRETION OF Pu^{239} . J. Schubert and M. R. White. (Argonne National Lab.). p.123 of BIOLOGICAL AND MEDICAL RESEARCH DIVISIONS QUARTERLY REPORT, AUGUST, SEPTEMBER, OCTOBER, 1951. (nd). 133p. (ANL-4713)

11408

PERSONNEL PROTECTION IN THE USE OF RADIOACTIVE ISOTOPES. G. Failla. *J. Clin. Invest.* 28, pt. 1, 1281-5(1949) Nov.

Some factors to be considered by personnel working with radioactive isotopes are presented. Among the factors stressed are the importance of maintaining constant and accurate monitoring of the possible areas of contamination; the mental attitude of the worker is important in that it determines the manner and method in which the worker makes use of the available precautionary measures and devices. The proper kind of measuring instrument known by actual test to be in good working order, and adequate isolation of the radioisotopes to prevent possible scattered radiation are essential, a β -ray source (such as P^{32}) is concluded to be especially dangerous because of greater possibility of radiation scattering. The long-range effects of overexposure from the radioisotopes are not in most cases immediately discernible, often manifesting themselves long after corrective measures can be taken, cancer, irreparable injury and death may occur. A table is included which presents the dosage rates at different perpendicular distances from the surfaces of two radioactive preparations. Other topics are briefly discussed and mention is made of the revised permissible limits of exposure to ionizing radiations; whole body exposure to x-rays or γ rays of up to 3,000,000 r is 0.3 r/week, measured in air; local exposure limited to the

hands is 1.5 r/week or 1.5 rep for β -ray exposure, measured at the basal layer of the epidermis. NSA 4-2147

THE PROBLEM OF EXCESSIVE RADIATION DURING ROUTINE INVESTIGATIONS OF THE HEART T. H. Hills and R. W. Stanford. *Brit. Heart J.* **12**, 45-53 (1950) Jan.

An account of the types of measurements made during routine cases of angiocardiology and cardiac catheterization is given. Details are provided concerning the possible amounts of excess radiation to which the patient and the technical personnel may be exposed during the routine investigations, suggestions are made as to means whereby the excess exposure to radiations can be avoided or reduced to a safe level. Distance, lead and rubber aprons and gloves, and other protective devices and measures are discussed as close proximity to the patient. Accurate monitoring and calculations of the radiation exposure experienced by the patient are also mentioned as safeguards. NSA 4-2532

11414

ROENTGEN RAY PROTECTION AND IRRADIATION HAZARDS DUE TO OVER-EXPOSURE. Thomas J. Ho. *X-Ray Technician* **20**, 353-5 (1949) May.

A short review of the subject of roentgen ray protection and irradiation hazards is presented. Some of the more important of the injuries are: dermatitis and carcinoma, which may be acute or chronic, the former developing into the latter in cases where skin damage is extensive, sterility, which occurs for about 4 months with a dose of 168 r delivered to the ovaries, and permanently with a dose of 210 r or more, anemia and leukemia, mutation changes, which increase when either of the parents has been irradiated, and, shortening of the life span. The maximum daily doses for the technician and other persons near the irradiated area are discussed. Protective measures, involving the location of the equipment, the alignment of the x-ray tube, protective screens, the determination of the exposure condition, and a search for possible injury are all included and discussed. Mention is also made of the lengthening of the prothrombin time as a means of detecting overexposure to the rays. NSA 3-224

THE PROTECTION OF PERSONNEL ENGAGED IN ROENTGENOLOGY AND RADIOLOGY. F. T. Hunter, O. E. Merrill, J. G. Trump, and L. L. Robbins. *New England J. Med.* **241**, 79-89 (1949) July 21.

An exposure film badge is described (which measures the exposure dose and the quality of the radiations) in connection with a preliminary report on the investigation of direct and indirect radiations to which radiologists are exposed. It was found that the scattered radiations during a fluoroscopic examination are much more penetrating than the direct beam, and, while greatly reduced in intensity, are still capable of penetrating the blood-forming organs of the examiner. The technique of manipulation of the film badge described here is presented, together with methods of processing the film and interpreting the exposure dose. The significance and importance of the physical data acquired from this investigation are discussed in detail, and graphs of the intensities of radiation under filtering conditions and voltage changes are included. A monitoring system for the x-ray personnel is also described, and consists of the uniform use of film badges and examination of the blood (hemoglobin determination, white-cell count, differential count and a description of the stained smear), the results of which are tabulated periodically and entered in individual health records. TREATMENT OF PLUTONIUM POISONING BY METAL DISPLACEMENT. J. Schubert. *Science* 105, 389-390(1947). (MDDC-595)

The effect of zirconium treatment on the urinary excretion of plutonium is tabulated. The administration of zirconium in those rats treated shortly after the injection of plutonium was followed by as much as a fifteen-fold increase in the amount of plutonium excreted in the urine over a 24 hour period. When the output of Pu had dropped, a re-injection of zirconium was followed by a second rise in the elimination rate. Actually, the re-injected rats excreted nearly as much plutonium on the fourth day following plutonium administration as the control rats eliminated during the first twenty four hours. Finally, the sustained therapeutic action was shown by the observation that the Pu excretion level remained about three times greater than that of the controls for several days after the cessation of zirconium therapy. From a study of the toxicity of zirconium and other metals, it was concluded that Zr was by far the safest metal to be used therapeutically.

Tri, tetra, and hexavalent Pu^{239} was not absorbed from the gastro-intestinal tract of the rat to any appreciable extent. No significant differences were observed in the metabolism after inj of the 3 valence states. Skeleton was the main site of deposition. Radioautographs demonstrated it in the region of the endosteum, periosteum, and the endosteal covering the trabecular bone.

11438

METABOLISM OF PLUTONIUM IN RATS. K. Scott, et al. 1944. 27p. (MDDC-1018)

The results of detailed metabolic studies of plutonium following oral, intramuscular, intravenous, subcutaneous, and intrapulmonary administration are presented. Plutonium is not adsorbed from the digestive tract. The skeleton is the chief organ of deposition for plutonium absorbed by the body following parenteral administration. The digestive tract is the principle channel of elimination and the degree of retention is very great. The rate of excretion is very slow and the half-period of retention of plutonium by the skeleton is estimated to exceed six months. No significant differences in the metabolic properties of plutonium absorbed by the body were observed for its three valence states. Considerable retention of plutonium by the lungs following intrapulmonary administration was observed and was found to be highest for the +4 state, less for +3 plutonium and least for +6 plutonium. A significant degree of absorption of plutonium from the lungs with subsequent deposition in the skeleton took place following the intrapulmonary administration of solutions of this element in its three valence states.

THE METABOLISM OF AM IN THE RAT. K. G. Scott, D. H. Copp, D. Axelrod and J. G. Hamilton. (1947) (AECD-1785; UCRL-22)

An investigation of the metabolism of americium (element 95) in the rat has been conducted following its administration by intramuscular injection and by stomach tube. Each animal received .3 micrograms of $AmCl_3$ in 1 cc of isotonic saline at pH 5. No appreciable absorption took place from the digestive tract. Within 24 hours after parenteral administration, 55 per cent of the total amount of americium absorbed from the site of injection was deposited in the liver and 20 per cent was accumulated by the skeleton. Excretion occurred primarily by way of the digestive tract and most of the americium eliminated appeared to come from the liver, which released this element at an almost exponential rate for 30 days with a half-time of 10 days. Thereafter, excretion became progressively slower. There was no significant change in the content of americium in the skeleton throughout the entire interval of the experiments, which extended for 256 days. The only other tissues studied that demonstrated any striking degree of accumulation of americium were the kidneys and spleen. The distribution of americium in the bone was studied by means of the radioautographic technique and it was observed that deposition of this element occurred in the region of the osteoid matrix and about the small blood vessels of the cortex.

THE METABOLISM OF CURIUM IN THE RAT. K. G. Scott, D. J. Axelrod and J. G. Hamilton. *J. Biol. Chem.* **177**(1), 325-335 (1949). BA 23-14386

11441

California. Univ., Berkeley. Radiation Lab. THE METABOLISM OF Cm IN THE RAT. K. G. Scott, D. Axelrod, and J. G. Hamilton. January 15, 1948. 13p. (AEC-1805; UCRL-35).

The fate of curium has been studied in the rat 1, 4, 16, 64, and 256 days after intramuscular administration. About 5/6 of the curium is absorbed in the first 16 days after injection from the site of administration. Upon entrance into the animal, curium is primarily deposited in the liver and skeleton. The curium present in the soft tissues of the body is eliminated, primarily via the gastro-intestinal tract. Curium is not absorbed from the gastro-intestinal tract. Radioautographic studies showed that curium is deposited in the periosteum, endosteum, and trabeculae of the skeleton. Curium is retained by the skeleton for a long period of time. The metabolism of curium and americium in the rat are very similar.

11442

California. Univ., Berkeley. Radiation Lab. THE METABOLISM OF CARRIER-FREE FISSION PRODUCTS IN THE RAT. K. G. Scott, et al. (nd). Dec. Sept. 3, 1947. 207p. (MDDC-1275)

The alkaline earths, rare earths, zirconium, and columbium when introduced into the body are deposited primarily in the skeleton, where the average degree of retention of the absorbed radioelements is approximately 50 per cent of the initially absorbed quantity. The retained fractions of these radioelements are eliminated at rates which are less than their rates of radioactive decay with the exception of the 340 day cerium and possibly Sr⁹⁰. The remaining five longlived radioelements, ruthenium, tellurium, xenon, iodine and cesium do not show any significant degree of localization in the skeleton and in addition, there is no very striking deposition in any other of the tissues with the exception of deposition of iodine in the thyroid. The rates of elimination for all of these four radioelements are much greater than their rates of radioactive decay, with the exception of iodine accumulated in the thyroid. In this particular case, the release of accumulated iodine in the thyroid is many times slower than its rate of radioactive decay. The members of the long-lived fission product group which are absorbed by way of the digestive tract include the alkaline earths, tellurium, iodine, and cesium.

11443

California. Univ., Berkeley. Radiation Lab. THE METABOLISM OF CARRIER-FREE RADIOACTIVE Ag IN THE RAT. K. G. Scott. January 1, 1948. 46p. (MDDC-1778; UCRL-36)

Silver atoms in concentrations of about 10¹³ atoms per cc of blood are combined primarily on blood proteins although measureable amounts are found on the red cell membrane and in the hemoglobin. The silver was not dialyzable through cellophane. The primary carrier of silver in the blood is the blood globulin fraction although some is carried on the albumin fraction. The relative distribution of silver on the various fractions of the blood is regulated by the blood itself, since purified globulin containing silver redistributes the silver to the other protein fractions of the blood in vitro when it is added to whole blood. Silver combined with globulin is rapidly taken from the globulin in the intact animal and excreted by the liver.

MONITORING OF CERTAIN PERSONNEL FOR INTERNAL PLUTONIUM CONTAMINATION. W. H. Langham, A. Murray, III, A. M. Perley, and R. W. Mattison (Los Alamos Scientific Lab., N. Mex.). Aug. 17, 1945. Changed from OFFICIAL USE ONLY with deletions Dec. 10, 1955. 25p. Contract W-7405-eng-36. (AECD-4075)

A detailed report is given of the method of determining body internal contamination with plutonium. This method consists of wet-ashing a 24-hour urine sample, extracting

the plutonium with cupferron, plating and counting the plate in a proportional alpha counter. Results are presented which were obtained by assaying urine samples from 76 members of the chemistry personnel. These results show that, to date, only the recovery step in processing plutonium has presented a serious health hazard. The results also show a qualitative correlation between the number of high nose counts recorded for an individual and the degree of internal contamination indicated by urine assay. When the individuals were classified in zero- or low-exposure, moderate-exposure and high-exposure groups the difference between the urine counts of those with moderate and high exposure was definitely significant. The difference between the values for the moderate- and low-exposure groups was of doubtful significance. NSA 10-7108

BIOPHYSICAL STUDIES ON BONE TISSUES. THE *IN VIVO* AND *IN VITRO* UPTAKE OF RADIOACTIVE ISOTOPES AND IONIC EXCHANGE REACTIONS IN BONE TISSUE. B. Engfeldt and O. Hjertquist. Acta. Path. et Microbiol. Scand. 35, 205-16(1954).

The *in vivo* and *in vitro* uptake of radioactive isotopes (P, Ca, S) in bone tissue, and the latter's capacity for ionic exchange reactions under varying conditions were studied. An autoradiographic procedure was employed for elucidating which structures in the bone tissue take up isotopes. The degree of mineralization of those areas was studied by means of microradiography. The *in vivo* and *in vitro* uptake of P³² Ca⁴⁵ and S³⁵ occurs in the same structures, namely, the newly laid down, poorly mineralized areas of bone tissue. P³² and Ca⁴⁵ both go to the inorganic phase of bone, while part of the S goes to the organic phase. All three show a capacity for ion exchange with the surrounding fluid. Ca⁴⁵ seems to be more fixed to the bone tissue than P³² and S³⁵. The hypothesis is propounded that certain structures take up isotopes *in vivo* and *in vitro* because of the smaller size of the crystallites in newly formed areas of bone tissue.

PHYSICAL METHODS OF ACHIEVING PROTECTION FOR HIGH ENERGY RADIATION AND RADIOACTIVE ISOTOPES. W. G. Marley. Proc. Roy. Soc. Med. 62, 927-34(1949). Nov.

In this summary of the physical methods necessary for the protection of personnel from ionizing radiations, the maximum permissible dose is defined, the methods of measuring the radiation intensity and dosage to the personnel, specific hazards, and the problems of waste disposal are all briefly covered. It is concluded that the more hazardous radiations encountered specifically in areas where the work is primarily on physics projects include hard γ rays, hard x-rays and fast neutrons, arising from cyclotrons, piles or Van de Graaf generators. The main problem in chemistry areas is the prevention of contamination of laboratory benches, fume hoods, floors, and the air, the provision of suitable monitors is essential to prevent the build-up of contamination. As far as is possible active material should be precipitated from solution and disposed of as an insoluble residue. Other measures are briefly outlined for the protection from radioactive compounds. THE LATERAL DISTRIBUTION OF IONS ACROSS THE TRACK OF AN IONIZING PARTICLE. PART I. THE PRESENT PICTURE AND ITS IMPLICATIONS. John Read. Brit. J. Radiology 22, 366-74(1949) July.

If Lea's (Brit. J. Radiology (Supplement 1), 59(1947)) picture of the lateral distributions of positive and negative ions across the track of an ionizing particle is correct, then the separation of charge must lead to a radical electric field. Expressions are deduced for this field, the corresponding potential differences, and the energy per ion pair stored in the field. Numerical values are obtained for an ion density of 1,000 ions per micron in water, hexane, and a chromosome thread. The field is of the order of 10^5 v/cm at relatively large distances from the axis of the track. An approximate expression is derived for the distribution of the positive and negative ions when in thermal equilibrium. Small ion densities can be in equilibrium with quite large separation of charge, but in the case of ion densities of 1,000 ions per micron Lea's distributions are far from equilibrium, and the electrons would return to the positive core unless captured. If, when an ionizing particle passes radially across a chromosome, this separation of charge occurs, and the electrons become attached to the fabric of the chromosome, then tensions of the order 10^5 dynes/cm² would be produced normal to circles of radius comparable with that of the chromosome. A tension wave would travel in both directions away from the point of intersection of track and chromosome. If the chromosome has weak points, e.g., between genes, breaks might be produced here, and the minute deletions might be due to the two tension waves each producing a break. Reference is made to the work of Jaffe (Ann. Phys. 42, 303(1913)). NSA 4-1328

EFFECT OF NUCLEAR EXPLOSIONS ON FROZEN FOODS. H. P. Schmitt (Food and Drug Administration, Washington, D. C. and Federal Civil Defense Administration, Battle Creek, Mich.). Mar. 1956. 17p. Project 32.5 [of] OPERATION TEAPOT. (WT-1215)

Samples of frozen foods representing major pack items and container types currently in use were exposed to the effects of a nuclear explosion. Exposure was made at close-in positions and in freezers located in homes. Recovered samples were found to be free of physical and thermal damage. Kinesthetic evaluation proved the retention of flavor, color, appearance, and texture. Scientific tests indicated the retention of vitamins, minerals, and proximate composition at all exposures well within ranges observed during good commercial manufacture. Samples from exposures in homes were recovered free of induced radiation. It is concluded that, under emergency conditions similar to this exposure, frozen foods may be used for both military and civilian feeding. NSA 11-3275

RADIOACTIVE WASTE DISPOSAL - HOW WILL IT AFFECT MAN'S ECONOMY? Kenneth G. Scott. Nucleonics 6, 18-25(1950) Jan.

The author describes the waste disposal problem faced by the growing number of public institutions, such as the University of California Medical Center for example, which use radioactive isotopes. Such wastes cannot be eliminated through sewage systems because of the high radioactive concentrations which would result in the sewage filter cake which is often used for fertilizer. The disposal methods recommended by the AEC are: dispersion in media such as air or water, confinement and dilution in materials such as concrete, or confinement in storage tanks after the volume of the waste has been reduced. These different methods are compared, and the disposal of wastes in the oceans is discussed in some detail. NSA 4-1857

RADIOISOTOPES IN PHARMACEUTICAL AND MEDICAL STUDIES. I. D. L. Tabern, J. D. Taylor, and G. I. Gleason. Nucleonics 7, No. 5, 3-23(1950) Nov.

Uses for radioisotopes in biology and medicine are indicated under three categories: tracer techniques, diagnosis assistance, and therapeutics. Uses of I^{131} in the therapy of thyroid diseases, P^{32} in the treatment of leukemia, polycythemia, and multiple myeloma, and uses of radioisotopes in tumor localization are outlined. Other diagnostic agents considered are radioactive iron-tagged red cells for determining red cell volume, I^{131} -tagged human serum albumin, Na^{24} for determining blood circulation time, S^{35} -tagged sodium sulfate, etc. Tumor therapy is discussed and cases and statistics of the use of radiotherapy are cited. EXPERIMENT ON THE EFFICIENCY OF ROENTGEN RADIATION OF DIFFERENT WAVE LENGTHS ON THE SPLEEN OF THE MOUSE IN EQUAL DOSES, MEASURED IN ROENTGEN UNITS. J. Piepenborn. Strahlentherapie, 33, 322-337(1929) (In German).

11509

IONIZING RADIATIONS. Rex H. Wilson. Ohio State Med. J. 45, 579-81(1949) June.

A general discussion of the types and dangers of ionizing radiations encountered in industry is presented. Such precautionary measures as the employment of dental x-ray films to detect exposure and the use of frequent medical examinations to detect abnormal blood counts are mentioned. Lowered white blood cell counts, especially those of the lymphocytic elements, are good indicators of destructive ionization. In conclusion, it is noted that the use of ionizing radiations is a problem which requires close scrutiny on the part of safety, industrial hygiene, and medical personnel. NSA 3-221

THE USE OF CHELATING AGENTS FOR ACCELERATING EXCRETION OF RADIOELEMENTS. Harry Foreman and Joseph G. Hamilton (Radiation Lab., Univ. of Calif.). June 14, 1951. Decl. Sept. 21, 1951. 18p. (AECD-3247)

The chelating action of (ethylenediamine) tetraacetic acid (EDTA) was investigated as a means of accelerating the excretion of radioelements which have become fixed in the animal skeleton. Rats injected with Y^{91} followed by the administration of Ca EDTA showed excretion of Y^{91} greatly increased when compared with controls which received Y^{91} alone. Rats receiving both Ce^{144} and Pu^{239} , followed by Ca EDTA showed an increase in urinary excretion of Ce when given during the first 24 hr following injection of the isotope. Ca EDTA enhanced urinary excretion of Pu to levels which were approximately 10 times greater than that of control animals. The effect lasted for several days after the cessation of treatment. Fecal excretion of Pu was not affected by the chelating agent except when Ca EDTA was administered during the first 24 hr, at which time there was a marked rise in Pu excretion. NSA 5-6043

DESIGN OF A PORK-IRRADIATION FACILITY USING GAMMA RAYS TO BREAK THE TRICHINOSIS CYCLE. H. J. Gomberg, S. E. Gould, J. V. Nehemias, and L. E. Brownell (Univ. of Michigan, Ann Arbor). NUCLEAR ENGINEERING, PART III, Chem. Eng. Progr. Symposium Ser. No. 13, 89-104(1954).

The use of ionizing radiation to break the trichinosis cycle has been discussed previously. The technical feasibility has been well established; economic feasibility is thus the major outstanding problem. Presented here are the results of a cost study of a meat-processing plant designed to irradiate hog carcasses, using Cs^{137} or waste fission

products as the radiation source. A radiation dose of 15,000 r will sterilize trichinae encysted within a hog carcass so that they cannot reproduce and cause infection. The irradiation level used in the cost study is 30,000 r to the surfaces of the carcass. Tests and calculations have shown that this radiation could produce a dose of 25,000 r at the center of a 14-in-thick carcass, using techniques which minimize attenuation due to geometry. The thickest sections of carcasses (the hams) are rarely more than 10-in. thick. Flavor tests with ground pork show no detectable taste changes with doses up to 60,000 r. This radiation can also destroy microorganisms. The pasteurization achieved by 60,000 r increases the refrigerator shelf-life of the meat by approximately 100%, 30,000 r increases shelf-life by almost 30%. Pasteurization with gamma radiation will be discussed in more detail in a separate study covering this effect in a number of products. The plant design outlined in this paper was evolved. NSA 9-493

Rochester. Univ., New York. THE TOXICITY OF U HEXAFLUORIDE FUME IN ANIMALS, EXPOSED ONE YEAR TO 0.05 and 0.2 mg U/m³. C. J. Spiegl. (1948) 65p. (AECD-1918; UR-4)

Exposure to UF₆ at 0.2 mg U/m³ produced slight but definite changes in the prothrombin clotting time and blood fibrinogen levels of dogs, rats, and rabbits, although no pathologic changes were found in the liver. Mild renal tubular injury was produced in 12 of 14 dogs within 10 days, and in 55 per cent of the rabbits and 16 per cent of the rats, respectively. Fluoride, but not uranium was found deposited in the bones of rats. Alveolar bone changes were pathognomonic of fluorosis although dental studies of incisors showed only slight pigmentary changes. Except for 2 of 17 dogs and 1 of 141 rats, there was no evidence that 0.05 mg U/m³ produced any morphologic changes.

METABOLIC EFFECTS OF MARKED SODIUM RESTRICTION IN HYPERTENSIVE PATIENTS. PART 2. EVIDENCE FOR A VARIABLE SODIUM POOL WITH CONSTANT DIETARY INTAKE. Lewis K. Dahl, Bernard G. Stall, III, and George C. Cotzias (Brookhaven National Lab. and Rockefeller Inst. for Medical Research Hospital, New York). (1954). 15p. (BNL-1843)

Measurements of total exchangeable Na (TENa) were made in a series of 16 patients with essential hypertension before and after marked sodium restriction. Changes in values for TENa have been compared with the net sodium balance according to estimates of intake and output of this ion. In 16 of the 44 periods included in this study, it was found that variation in TENa bore no apparent relationship to net balance calculations and, in fact, diverged significantly. It was suggested that changes in the availability of the reservoir of sodium in bone, and possibly in other tissues, accounted for the findings. NSA 8-4876

QUARTERLY PROGRESS AND WORK ACCOMPLISHMENT REPORT FOR QUARTER ENDING DECEMBER 31, 1952, AGRICULTURAL RESEARCH PROGRAM. (Tennessee Univ.). (nd) 152p. (ORO-90)

The work reported on Pa^{233} includes the purification for biological use from neutron-irradiated Th nitrate; radiochemical properties of importance in biological measurements, absorption, tissue distribution, retention and fetal transfer in rats, adsorption, behavior in blood, secretion in milk, and tissue distribution in dairy cattle, sheep, and pigs, and a discussion of data from these studies from the standpoint of ingestion of food products from animals exposed to Pa^{233} . Preliminary results from a study of the effects of estrogen on Ca behavior in blood and bone, Ca and P blood levels, and bone histology in cattle show that moderate levels of α estradiol caused bone and urinary Ca changes, while high levels caused decreased serum Ca with concomitant serum P increases. Procedures and results are presented for the determination of endogenous fecal Ca in cattle by a simple isotope-dilution method which allows estimation of the true digestibility of Ca. Results are presented from a study of the availability for plant uptake and the leaching from soil of Ca incorporated therein as Ca^{45} -labeled Ca silicate. The LD_{50/30} value for burros exposed to whole-body irradiation was recalculated and was determined to be 651 r for γ radiation from Ta^{182} sources and 784 r for γ radiation from Co^{60} sources. The LD_{50/30} for swine exposed to total-body γ radiation from Co^{60} sources was determined as 618r. The LD_{50/30} for rabbits exposed to total-body irradiation from Co^{60} sources was determined to be 1094 r. Detailed blood value changes

in the burro following irradiation and a statistical analysis of the data are included. NSA 7-2731

ON THE GENERAL EFFECT OF ROENTGEN AND RADIUM RAYS. G. Fromme. *Z. Geburtsh. u. Gynak.* 79, 579 (1916-17). (In German).

Author reviews effects of x-rays and radium rays on blood, hematopoietic tissue, liver, skin and gastrointestinal tract. Observations on frogs following injection of mesothorium are described including blood flow in capillaries of foot webs, lethal effects, effect on general circulation and histological changes in the heart. Observations on histological changes in the nervous system and muscles are described for young axolotls. The histological changes observed in guinea pigs and mice after exposure to large doses included heavy deposition of blood pigment in reticuloendothelial cells, capillary damage, splenic atrophy, vacuolated epithelial cells in spleen, testes and skin and a high incidence of infection.

NOTES ON THE ROENTGEN TREATMENT OF LEUKEMIA IN VIVO. SPLENIC LEUKEMIA. W. O. Upson. Am. J. Roentgenol. 7, 608(1920).

It would seem that the benefit desired from radiation in leukemia is due not alone to the destructive action on the

blood and blood forming organs, but to certain leukocytic substances that are in some manner produced by the treatment. By applying the treatment to the long bones first, there is a more gradual but more lasting reduction of the leukocytes with less toxic effect than when the treatment is applied to the spleen first. During the course of the x-ray treatment there is usually a slight initial rise of the leukocytes followed by a gradual reduction of the white count with an increase of red cells. Leukemia usually does not respond so readily to treatment after the first or second series.

BIOLOGICAL STUDIES ON STABLE AND RADIOACTIVE RARE EARTH COMPOUNDS. III. DISTRIBUTION OF RADIOACTIVE YTTRIUM IN NORMAL AND ASCITES-TUMOR-BEARING MICE, AND IN CANCER PATIENTS WITH SEROUS EFFUSIONS. Ruth Lewin and Hiram E. Hart (Coll. of the City of New York), Joseph Greenberg (National Cancer Inst., Bethesda, Md.), Herta Spencer, Kurt G. Stern and Daniel Laszlo (Montefiore Hospital, New York). J. Natl. Cancer Inst. 15, 131-44(1954) Aug.

The distribution of radio-yttrium, Y⁹⁰, following intracavitary administration in ionized form, has been studied in normal and Ehrlich ascites-tumor-bearing mice and in terminal cancer patients. The retention of the radioisotope in the injected cavity was markedly enhanced by the addition of stable yttrium; at low carrier levels significant amounts of Y⁹⁰ were found in tissues distant from the injected cavity, whereas relatively high carrier levels greatly reduced the leakage from the cavity. In view of these observations and of the favorable radiation characteristics of Y⁹⁰ which reduce safety hazards to patient and personnel, the potential usefulness of this isotope in the

palliative therapy of carcinomatous effusions was discussed. NSA 9-511

11646

PROBLEMS OF RADIATION PROTECTION ASSOCIATED WITH THE USE OF RADIOACTIVE ISOTOPES. Hermann Muth. *Strahlentherapie* 97, 246-58(1955) June. (In German).

The introduction into therapy of artificial radioisotopes has increased the scope of problems relating to the protection against the damaging influence of radiations. Obligatory values for the admissible doses of the various radiations emitted by radioisotopes, serve as a basis for speculations and calculations with respect to the protective measures. The author consolidates in tables and discusses the figures set up on a provisional basis on the occasion of the 1953 International Conference of Radiologists in Copenhagen. Particular reference is made to the new unit of dose, the rad, introduced during that conference. The amount of radiant energy acting on the critical organ is decisive for the estimation of the admissible quantities of radioisotopes to be introduced into the body. The figures, presently binding with respect to the most important radioisotopes used for therapeutical purposes, are indicated. The second part of the paper deals with the problems of practical protection against radiations. NSA 9-6582

BIOCHEMICAL STUDIES RELATING TO THE EFFECTS OF RADIATION AND METALS. Samuel Schwartz. January 11, 1947. Dec. August 4, 1948. 77p. (AECD-2198; CH-3820)

The biochemical detection of incipient damage resulting from exposure to radiations or to toxic materials has become increasingly important in recent years. This was especially true on the Manhattan Project because of the well known development of late insidious and "irreversible" changes such as anemia and malignancy in individuals with chronic radiation exposure. Unfortunately, however, the successful solution of this problem has been hampered by lack of basic information on the early toxic effects of these materials. Various biochemical effects of radiation have therefore been studied in 10 patients given total body X-ray in total doses of 75 to 310 r (skin), in 5 patients given 20 to 36 mc P³², and in 5 project personnel accidentally exposed to excessive doses of external radiations. Similar studies have also been made of several hundred Plutonium Project personnel exposed in most instances to relatively small amounts of uranium, lead, and other metals, and to chemicals and radioactive sources. These studies included

the investigation of liver function, of white blood cell chemistry, and of various urinary constituents such as coproporphyrin, uroporphyrin and other pigments, urobilinogen, "corticosteroid-like" substances, catalase, and uranium. Definitely excessive exposures resulted in various abnormalities in the above tests. With the exception of urinary uranium analysis, none of them were specific in indicating overexposure to either radiation, metals, or chemicals. When interpreted in the light of the exposure and medical history, however, they may aid in the clinical interpretation of relatively marked overexposure. In addition, they may afford further insight into the nature of radiation effects. The literature on the biochemical effects of radiation is reviewed briefly, and certain suggestions are offered regarding future investigations in this field. NSA 1-892

FALLOUT DOSAGES AT WASHINGTON, D. C. I. H. Blifford, Jr. and H. B. Rosenstock. (Naval Research Lab., Washington, D. C.). Oct. 6, 1955. 9p. Project NR-612-130. (NRL-4654)

The total infinity dosage at Washington, D. C., due to fallout of fission product debris from all atomic tests which took place between January 1951 and May 1955 has been estimated from the measured air concentration at ground level. Within order of magnitude accuracy, this dosage was found to be about 0.2 r. The Nevada tests contributed about 60% of this amount, and the Russian tests about 33%, with the remainder due to tests in the Pacific. Evidence for stratospheric holdup of activity from the thermonuclear tests of the spring of 1954 has been found. Fallout of this high altitude activity corresponds to an infinity dosage of about 0.0002 r. NSA 10-1704

CONFIRMATION OF RADIOACTIVITY IN THYROIDS OF VARIOUS ANIMALS. [REPORT FOR THE PERIOD] JULY 15 TO SEPTEMBER 10, 1954. Ralph L. Gunther and Hardin B. Jones (California. Univ., Berkeley. Radiation Lab., and California. Univ., Berkeley. Donner Lab.). Sept. 1954. Decl. May 3, 1955. 12p. Contract W-7405-eng-48. (UCRL-2689)

Appreciable quantities of radioactivity were found in the thyroid glands of cattle obtained from the School of Veterinary Medicine on the Davis Campus of the University of California. This activity followed an 8-day decay and was attributed to I^{131} resulting from the respiration of air containing radioactive material. Preliminary *in vivo* tests on human subjects from the same area show no activity above background in the vicinity of the thyroid.

METABOLISM OF HYDROGEN ISOTOPES BY RAPIDLY GROWING *CHLORELLA PYRENOIDOSA* CELLS. Daniel Weinberger and John W. Porter (General Electric Company, Richland, Washington). Arch. Biochem. and Biophys. 50, 160-8(1954) May.

Chlorella pyrenoidosa cells have been grown in the presence of deuterium and tritium oxide, and the quantity of each of these isotopes incorporated into the whole cells, methanol-insoluble, ether-soluble, and methanol-soluble, ether-insoluble fractions has been determined. The quantity present has been recorded in terms of the per cent expected on the assumption of no isotope effect. It has been found that the cells incorporate deuterium approximately 50% as rapidly as hydrogen, and that they incorporate tritium 90% as rapidly as deuterium. Further, the extent of incorporation of tritium or deuterium by the enzymes involved in hydrogen transfer in the synthesis of lipides is significantly higher than the extent of incorporation by enzymes involved in the transfer of hydrogen in the synthesis of proteins, nucleic acids, and starch (methanolinsoluble fraction). 11704

A SPECTROMETRIC METHOD FOR THE STUDY OF RADON PARTITION IN RADIUM-BURDENED ANIMALS. P. F. Gustafson and L. D. Marinelli (Argonne National Lab., Lemont, Ill. and Univ. of Chicago Medical School) Radiology 65, 90-5(1955) July.

The fraction of radon retained in a radium-burdened animal can be determined experimentally *in vivo* by measuring with scintillation spectrometers the relative intensities of the Ra^{226} and RaB gamma rays emitted by the animal and by comparing them to those obtained with properly de-emanated Ra sources placed in suitable phantoms. The soundness of the technic has been proved by experiment on rabbits and dogs. The possibility of its use in other

fields of investigation has been briefly discussed.

11711

STUDIES ON THE USE OF RADIOACTIVE ISOTOPES IN MEDICINE. A. Ignatyev, ed. Moscow, Medgiz, 1955. (2nd edition). (In Russian) (Book on display at Geneva Conference.)

The symposium comprises 28 papers on the use of radioactive isotopes in blood disease therapy, in determining the functional state of the thyroid gland, in microbiological, immunological, and virological investigations, in physiology, biochemistry, and toxicology. The book includes also a review on radiometry. NSA 9-7647

11712

THE MECHANISM OF THE EFFECT OF X RAYS AND ULTRAVIOLET RAYS ON AQUEOUS SOLUTION OF ALBUMIN AND THYMONUCLEIC ACID. N. Koyenuma. *Strahlen-therapie* 96, 599-617(1955) Apr. (In German).

The author used potentiometer and polarography for the purpose of investigating the reaction to roentgen and ultraviolet rays of watery solutions of protein, cystine and thymonucleic acid. He then compared the sensitivity of the different solutions to these radiations. The observed acidulation is due to the formation of H_2O_2 on the one side and the production of activated O_3 on the other. The ultraviolet light quanta are acting directly on the dissolved substance while the roentgen quanta are primarily and mainly attacking the dissolvent. NSA 9-5291

11713

VITAMINS AND ENZYMES IN MILK. EFFECT OF GAMMA-RADIATION ON ACTIVITY. Hung-Chun Kung, Elmer L. Gaden, Jr., and C. G. King (Columbia Univ., New York). *J. Agr. and Food Chem.* 1, 142-4(1953) Apr 15.

Interest in the use of radiations from fission products includes consideration of sterilizing biological products to accomplish stabilization. Tests were undertaken to measure vitamin and enzyme retention in milk and related products coincident with irradiation from cobalt-60. Vitamin A, tocopherols, and ascorbic acid were highly sensitive to destruction within the time period required for sterilization (at relatively low intensities). Carotenoids and riboflavin were moderately sensitive. The enzyme phosphatase, however, which is very sensitive to heat inactivation, was slightly changed during identical exposures. Tests with raw whole milk, pasteurized whole milk, evaporated milk, cream, margarine, Cheddar cheese, and cream cheese demonstrate that irradiation at 80,000 roentgen per hour induces severe losses in nutritive quality before sterilization is accomplished. Changes in enzyme activity, however, are sharply reversed in comparison with best effects on natural products. Protein denaturation apparently can be avoided, relatively, while accomplishing this type of sterilization. NSA 9-4919

11714

CHORIORETINITIS PRODUCED BY ATOMIC BOMB EXPLOSION. Jacques Landesberg (V. A. Regional Office, Brooklyn). *Arch. Ophthalmol.* 54, 539-40(1955) Oct.

The energy released from an atomic bomb blast has visible infrared and long ultraviolet rays, which are capable of producing thermal burns involving the choroid and retina. The pupillary diameter at the time of detonation is a very important factor. The pupillary and blink reflexes are too slow to prevent burning of the retina because sufficient energy for this arrives after the first 0.1 second. These reflexes take a longer time. The distance at which burns may be produced is much greater than that at which any other harmful effects of the atomic bomb occur, and at a given distance the burns on the retina are more severe than those of the skin. This is true because of the optical system of the eye. It seems apparent that in this case the right eye did not receive the rays because of the shielding effect of the bony structures of the nose. It is concluded that the necessity of covering the eyes during an atomic blast is of the utmost importance. NSA 9-7624

MEDICAL DIVISION QUARTERLY PROGRESS REPORT [FOR] JANUARY 1 - MARCH 31, 1954, SUPPLEMENT. TELETHERAPY DESIGN PROBLEMS III. Constitutes the minutes of the PROCEEDINGS OF THE THIRD INDUSTRIAL CONFERENCE ON TELETHERAPY. Marshall Brucer, J. H. Harmon, and Elizabeth B. Anderson, eds. (Oak Ridge Inst. of Nuclear Studies). 71p. Contract AT-40-1-Gen-33. (ORO-127(suppl.))

Topics discussed at this conference included: the cost of radiation in hospitals, current problems of Co^{60} production, problems of source strength, calibration and loading, the AEC allocation policy for teletherapy source units, data a manufacturer must supply the radiologist, shipping containers, instrumentation, new sources for teleradiation, the development of the atomic energy industry, and design of an irradiator containing a Tm source. NSA 8-5482

11720

X-RAY EXPOSURE IN MANUFACTURE AND OPERATION OF CERTAIN ELECTRONIC TUBES. A. F. Bush, H. T. Castberg, and D. G. Macpherson. *Public Health Reports* 59, 1045-1047(1944).

11721

PERSONNEL EXPOSURES ASSOCIATED WITH THE THERAPEUTIC USE OF RADIUM, RADON, AND COBALT-60. Egilda DeAmicis and Russell F. Cowing (New England Deaconess Hosp., Boston, Mass.). *New Eng. J. Med.* 251, 1-4(1954) July 1.

Various methods are described which are employed in keeping the exposure of personnel handling therapeutic doses of Ra, Rn, and Co^{60} below permissible exposure levels as defined by the National Bureau of Standards. NSA 8-6393

11722

PERCUTANEOUS ABSORPTION OF TRITIUM OXIDE. Chester W. DeLong, Roy C. Thompson, and Harry A. Kornberg (General Electric Co., Richland, Washington). *Am. J. Roentgenol. Radium Therapy Nuclear Med.* 71, 1038-45(1954) June.

The percutaneous absorption of tritium oxide-labeled water vapor was studied in mice, rats, and man. In terms of μg water absorbed/cm²/min from a saturated water vapor atmosphere, the rates found were: for mice (abdomen),

20 ± 5; rats (abdomen), 5.7 ± 1.1, man (forearm), 8.6 ± 1.7. A single total body exposure to a human at 70 per cent relative humidity gave a rate of 18 µg/cm²/min. The rate of water vapor absorption in the rat was found to be directly proportional to water vapor pressure. For a constant level of atmospheric tritium oxide, absorption of tritium oxide was independent of total water vapor pressure. It was shown that for humans the rate of percutaneous absorption of tritium from a tritium oxide-contaminated atmosphere is about the same as the rate of pulmonary absorption from the same atmosphere. NSA 8-5193

11723

TERATOGENIC ACTION OF X RAYS ON SEMINAL CELLS. C. Regaud and J. Blanc. C. R. Soc. de Biol. 158, 390 (1906). (In French).

The various maturation stages of spermatozoa vary in radiosensitivity. Moderate x-ray doses resulted in bizarre forms of sperm, abnormalities being observed in various parts of the cells, but especially in the nucleus. Changes included unequal distribution of chromatin in pre-spermatocytes, chromosomal aberrations and binucleate cells. Other changes are also described.

11724

EFFECTS OF X RAYS ON THE TESTICULAR EPITHELIAL ELEMENTS. C. Regaud and J. Blanc. C. R. Soc. de Biol. 158, 652(1906). (In French).

Authors' findings do not agree with those of other investigators who found syncytium of testes to be less radiosensitive than the rest of the tissue. These authors found the syncytium to be highly radiosensitive. Changes in various maturation stages of seminal epithelium are described. Cell stages vary in radiosensitivity. Mature sperm were found to be relatively radioresistant.

11725

EFFECT OF ROENTGEN IRRADIATION OF THE TESTES ON THE STRUCTURE OF THE SEMINAL EPITHELIUM AND EPIDIDYMES, ON FERTILITY AND SEXUAL VIGOR OF THE RABBIT. C. Regaud and G. Dubreuil. Lyon Medical 40, 457(1908). (In French).

11726

COMPENSATORY HYPERTROPHY OF THE INTESTINAL GLAND OF ANIMAL TESTICLES RESULTING FROM UNILATERAL CASTRATION FOLLOWING X RAY STERILIZATION. C. Regaud and Th. Nogier. C. R. Assoc. des Anat. 13, 293(1911). (In French).

11727

DISTURBANCES IN THE DEVELOPMENT OF RABBIT EGGS FERTILIZED BY SPERMATOZOA IN X IRRADIATED *IN VIVO*. C. Regaud and G. Dubreuil. C. R. Soc. de Biol. 64, 1014(1908). (In French).

11728

COMPLETE, DEFINITIVE STERILIZATION OF THE RAT TESTICLE WITHOUT SKIN LESIONS BY A SINGLE DOSE OF FILTERED X RAYS. C. Regaud and Th. Nogier. C. R. Acad. des Sciences 149, 1398(1909). (In French).

11729

STERILIZATION OF THE TESTICLE OF THE CAT BY X RAYS. X. TECHNIQUE. C. Regaud and Th. Nogier. C. R. Acad. des Sciences 70, 5(1911). (In French).

11730

EFFECT OF X RAYS ON THE DOG TESTES. CONDITIONS FOR COMPLETE STERILIZATION. C. Regaud and Th. Nogier. C. R. Soc. de Biol. 70, 50(1911). (In French).

11731

TOTAL, DEFINITIVE ROENTGEN STERILIZATION OF THE TESTES OF THE ADULT RAM. C. Regaud and Th. Nogier. C. R. Soc. de Biol. 70, 202(1911). (In French).

11743

THE PREPARATION OF RADIO-GOLD FOR MEDICAL USE (¹⁹⁸Au). F. Hudswell, B. J. Miles, B. R. Payne, and K. J. Taylor (Atomic Energy Research Establishment, Harwell, Berks, England) Jan. 22, 1954. 14p. (AERE-I/R-1341)

This report contains a description of the apparatus and methods used for the handling and production of colloidal and particulate radiogold for injection into human patients. A brief discussion of particle size and stability of the colloid is included. NSA 8-3231

11744

THE INFLUENCE OF RADIUM RADIATION ON COLLOID OF THE CELL OF PROTOZOA. M. Zuelzer and E. Philipp. Biol. Zentralbl., 45, 557-572(1924). (In German).

11745

RADIOLOGICAL HEALTH HANDBOOK. Simon Kinsman, comp. and ed. (Sanitary Engineering Center, Public Health Service). Apr. 1954. 340p. (NP-5239)

This edition of the handbook contains a large amount of readily available information of interest to anyone working in the field of radiation. Sections are included on physical, chemical, and mathematical data; radioassay and decay data, radiation protection data, a table of isotopes

which includes decay schemes; and a glossary.
NSA 8-5105

11746

THE EFFECT OF X RAYS IN PRODUCING SOMATIC GENOVARIATION OF A DEFINITE LOCUS IN DIFFERENT DIRECTIONS IN *DROSOPHILA MELANOGASTER*. N. W. Timofeeff-Ressovsky. Roux' s Arch. 124, 654(1931)

Male flies were mated immediately after x-irradiation or 3 weeks after irradiation. Mutation rate was 50-80% less when 3 weeks elapsed before mating the irradiated flies. In *Drosophila*, sperm are not killed by doses lethal for all mouse and human sperm. Mutability of various sperm stages may vary.

11747

IRRADIATION OF THE TESTICLES AND HEREDITY IN THE MOUSE. Dobrovolskaia - Zavadskaia. Arch. Inst. du Radium de L' Univ. de Paris 1, 359-94(1929). (In French).

Doses of radiation heavy enough to effect complete sterilization (temporary) did not produce any hereditary defects among 3000 descendants. Long introduction and literature review are included in this report. Experiments included both partial body and whole body irradiation.

11748

Ca EDTA AND THE EXCRETION OF PLUTONIUM. H. Foreman, T. T. Trujillo, O. Johnson, and C. Finnegan (Los Alamos Scientific Lab., N. Mex.). Proc. Soc. Exptl. Biol. Med. 89, 339-42(1955) July.

A comparison of Ca EDTA and Zr citrate for the therapy of acute Pu poisoning was made in which it was found that Ca EDTA brought forth greater Pu excretion than did the Zr citrate. The use of the latter agent resulted in lower Pu skeletal content than occurred in the Ca EDTA treated animals. Combined Ca EDTA and Zr citrate treatment produced the same results as Zr citrate alone. Ca EDTA administered long after Pu was deposited in bone did remove Pu from the skeleton but this is a slow process. A comparison of the regimen of Na EDTA and Ca EDTA with one using Ca EDTA alone in acute Pu exposures showed no advantage to either. Ca EDTA did not influence passage of Pu across the lung alveolar membrane. Ca EDTA did not influence the rate of mobilization of Pu from an intramuscular site. Ca EDTA did not influence the rate of absorption of Pu from the gastrointestinal tract.
NSA 9-6172

11749

SELECTIVE RADIATION OBTAINED BY THE INTRAVENOUS ADMINISTRATION OF COLLOIDAL RADIOACTIVE ISOTOPES IN DISEASES OF THE LYMPHOID SYSTEM. P. F. Hahn and C. W. Sheppard. South. M. J. 39, 558-562(1946).

Use of radioactive manganese in selective interval radiation therapy of lymphoid system. (Used as colloidal sols.)

11750

DUAL MORPHOLOGICAL REACTIONS OF RABBIT LYMPHOCYTES TO X-RAYS. R. Shrek. Arch. Pathol. 63, 252-59(1957).

Stability with eosin and cessation of cytoplasmic Brownian movement are criteria used in identifying lymphocytes killed by irradiation.

11751

RADIOLOGICAL SAFETY IN CATHODE-RAY STERILIZATION. Samuel Levin (Massachusetts Inst. of Tech., Cambridge). Nucleonics 12, No. 6, 54-7(1954) June.

Factors necessary in establishing an adequate radiological safety program for installations engaged in the radiation sterilization of food and drugs are reviewed.
NSA 8-4487

11752

THE SHOE-FITTING FLUOROSCOPE AS A RADIATION

HAZARD. Leon Lewis and Paul E. Caplan. Calif. Med. 72, 26-30(1950) Jan.

A series of tests on shoe-fitting fluoroscopes was run to determine the amounts of radiation to which patrons and salesmen are constantly exposed. Estimations of weekly exposure were made by placing film badges strategically on the personnel in close contact with the machines, direct measurements were made within the shoe-fitting chamber on 40 machines through the use of a dosimeter r-meter, the exposures being timed for 30 seconds. The beam intensities of the machines tested were 10-109 r/min, in most cases far in excess of standards proposed for safe use of the apparatus. It is stated that the principal potential danger from the machines is interference with bone growth in children as a result of careless use or uncontrolled dosages, some possibility also exists of excessive exposure of shoe salesmen in exceptional circumstances. NSA 4-1338

11753

RADIOAKTIVITETEN I RISØ OMRADET (RADIOACTIVITY IN THE RISØ DISTRICT.) K. Heydern, J. Lippert, and P. Theodorsson (Atomenergikommissionen, Denmark) Apr. 1, 1957. 87p. (NP-6672)

Various methods of determining total beta activity in natural materials are discussed. With these methods the activity was determined for the water of the Roskilde fjord and the earth and plants of the Risø district. Daily measurements were made of the air and rainwater, and fewer measurements were made on the Roskilde fjord, fresh water, and milk. The activity found was from naturally occurring radioactive background or from fall-out. For plants and rainwater the fall-out activity was the strongest. The variation of activity with time was determined. NSA 12-8270

11754

RADIOACTIVE CONTAMINATION OF THE ATMOSPHERE BY THE FALL-OUT FROM NUCLEAR EXPLOSIONS. L. Jurkiewicz. Nucleonika 2, 657-66(1957). (In Polish).

Fresh traces of radioactive contamination from U^{235} and Pu^{239} have been found, and the effects from the nuclear and thermonuclear explosions are discussed. Tables showing the recent data on the dose of ionizing radiation received by man in various conditions are presented, and the extreme importance of systematic monitoring of radioactivity in the atmosphere is stressed. NSA 12-6411

11755

RADIATION EXPOSURE OF STAFF IN DIAGNOSTIC PROCEDURES. II. RADIATION DOSES RECEIVED BY DIAGNOSTIC X-RAY WORKERS. S. B. Osborn, (Univ. Coll. Hospital, London). Brit. J. Radiol. 28, 650-4(1955) Dec.

A review of measurements of the radiation dose received by diagnostic x-ray workers led to the conclusion that such workers receive radiation doses well below the maximum permissible levels, but that they often approach these levels and occasionally exceed them.

NSA 10-1708

11756

EFFECT OF IONIZING RADIATIONS ON SOLUTIONS OF PROTEIN AND OF PROTEIN COMPLEXES. A. G. Pasynskii. p. 85-105 in Meetings of the Division of Biological Sciences. Session of the Academy of Sciences of the U. S. S. R. on the Peaceful Use of Atomic Energy. July 1-5, 1955. Moscow, Publishing House of the Academy of Sciences of the U. S. S. R. 1955. 339p. (In Russian).

The following are the results obtained from a study of the effect produced by roentgen rays on crystalline human serum albumin, on lipoproteins of blood serum, nucleoproteins (of the thymus) and blood serum, as well as by gamma rays, and neutron radiation upon human serum albumin. The threshold of action was determined either by the common methods, such as absorption spectra in the

infrared and ultraviolet, electrophoresis, viscosity, etc., or by means of the isotope method developed in this laboratory which is based on the increased binding of labeled methionine- S^{35} by proteins as caused by irradiation. The principal results are summarized in a table from which it appears that by means of the isotope method it is possible to detect molecular changes in the proteins and their complexes upon irradiation with doses (in thousands of r) 20 to 100 times less than those practiced previously for proteins, in particular, with biological doses of 400 to 500 r. This result disproves the conception of strictly localized changes of nucleic acids and of nucleoproteins in the primary processes elicited by irradiation. In fact, these primary changes may occur throughout the protein substance of the cell even with biological doses. As regards the nature of the primary molecular changes of proteins elicited by irradiation, it may be assumed from the evidence obtained that the chemical changes in the molecules of proteins and of their complexes (viz., rupture of the peptide bonds, splitting off of the components of the complexes, rupture of cyclic groups, desemination, etc.) should have no significance for the biological irradiation doses, except probably for partial oxidation of SH- groups. The changes in the ultraviolet absorption spectra elicited by irradiation, often considered in published works as an indication of chemical changes, were shown to disappear almost entirely upon elimination of the secondary aggregative changes (through addition of formamide, sodium caprylate, cysteine, etc.). Obviously of principal importance is the transition of the protein molecules to the excited or active state at the expense of the absorbed radiation energy. This is accompanied (as e. g., also upon heating) by structural changes of the type of rearrangement of part of the polypeptide chains which results in a decrease of solubility, increased aggregation of particles, increased binding of labeled methionine, etc. Although with biological doses these denaturing changes are rather slight, yet their accumulation in the multipartite and interrelated chains of the metabolic processes and the development of these chains of changes within the organism may become the cause of appreciable physiological disturbances and of high sensitivity of complex organisms to irradiation. NSA 9-7616

RADIATION OSTEITIS OF THE RIBS FOLLOWING TREATMENT FOR CANCER OF BREAST. L. W. Paul and E. A. Poble. *Radiology* **38**, 543(1942).

11758
AIR CONTAMINATION AND RESPIRATORY PROTECTION IN RADIOISOTOPE WORK. G. W. Morgan and C. R. Buchanan (Isotopes Div., Advisory Field Service Branch, AEC.) Jan. 19, 1953. 29p. (AECU-2821)

Air contamination associated with the use of radioactive isotopes in the laboratory is discussed. Positive control measures to prevent contamination are emphasized. The various forms of possible contamination and mechanisms influencing their stability in the air are discussed. Data are included on maximum permissible air contamination values, the pathway of inhaled contaminants once they enter the respiratory system, and the characteristic absorption, deposition, and pulmonary retention pattern of contaminants. The characteristics of various respiratory protective devices are discussed NSA 8-3654

11769
POLONIUM IN THE URINE OF MINERS EXPOSED TO RADON. Mary Sultzer and J. B. Hursh (Atomic Energy Project, Univ. of Rochester). Dec. 7, 1953. 28p. Contract W-7401-eng-49. (UR-266)

The urine of 19 miners working in the U mines of the Colorado Plateau and chronically exposed to high Rn concentration has been found to contain amounts of Po^{210} varying from 2 to 38 $\mu\mu\text{c}$ per liter, whereas no Po could be found in the urine of unexposed laboratory personnel. It is

proposed that urinary Po measurements may serve as a rough measure of cumulative lung exposure to Rn and its daughters since the daughters decay to Pb^{210} , a Pb isotope with a long effective half life in the body and a decay scheme producing Po^{210} . Calculations are presented to show that Po levels in the range of the experimental values obtained on miners' urine might be expected on general grounds and that a part of the body Pb^{210} content comes from the Rn accumulation in body fat NSA 8-1507

11774

AN EVALUATION OF THE PULMONARY RADIATION DOSAGE FROM RADON AND ITS DAUGHTER PRODUCTS. Jacob Shapiro (Atomic Energy Project, Univ. of Rochester). *Apr.* 9, 1954. 150p. Contract W-7401-eng-49. (UR-298).

The pulmonary radiation dosage from the radon-radon daughter product atmosphere was investigated in experiments in which measurements were made of the radioactivity deposited in the lungs of rats and dogs breathing in an exposure chamber containing 2×10^{-8} curies-liter radon. The chamber was 2' x 3' x 6'. The results of these experiments indicate that most of the radiation dosage to the lungs is produced by these daughter products, removed as particulates from the air, rather than by gaseous radon and the daughter products of the radon molecules decaying in the lungs. SOME PUBLIC HEALTH PROBLEMS IN NUCLEAR FISSION OPERATIONS. Arthur E. Gorman and Abel Wolman. Amer. Jour. Publ. Health 39(4), 443-53(1949).

Authors discuss problems of environmental and industrial sanitation existing in atomic energy industry with reference to water supply and waste disposal.

BA 24-6883

11793

PRECAUTIONS FOR WORKERS USING RADIOACTIVE ISOTOPES. G. H. Guest. Canadian Jour. Comp. Med. 12(12), 323-33(1948). BA 23-14176

11794

HISTORICAL SKETCH OF THE BIOLOGICAL APPLICATION OF TRACER ELEMENTS. G. Hevesy. Cold Spring Harbor Symposia on Quantitative Biology 13, 129-50(1948).

A brief history of early research and applications in isotopic elements is given. Biological investigations using natural and artificially produced isotopes and radioisotopes are cited. BA 23-23059

11795

THE CHARACTERISTIC RADIOACTIVITY OF HUMAN BLOOD AND ITS SIGNIFICANCE TO THE PROBLEM OF RADIUM POISONING. Adolf Krebs. Kolloid-Z 89, 309-10(1939).

By means of a special Geiger Counter, radioactivity of normal human blood was determined to be 10^{-12} to 10^{-13} gm of Ra equivalent per cc of fresh blood. Author demonstrates importance of this quantity in limiting dose of Ra therapy. Early diagnosis of Ra poisoning with this apparatus is discussed. BA 14-8138

11796

ADVANCES IN BIOLOGICAL AND MEDICAL PHYSICS. J. H. Lawrence and J. G. Hamilton. New York, Academic Press, Inc. 1951. Vol. 2. 348p.

Includes chapters on the biological effects of radiations, carcinogenic effects of radiations. These chapters are abstracted separately.

11797

RADIATION DOSES RECEIVED BY THE SKIN OF PATIENTS DURING ROUTINE DIAGNOSTIC X RAY EXAMINATIONS. J. H. Martin. Brit. J. of Radiology 20, 279-283(1947).

11798

EFFECT OF NITROGEN MUSTARD ON SERUM COMPLEMENT IN VITRO AND IN PATIENTS WITH NEOPLASTIC DISEASE. Chester M. Southam and Yvette Goldsmith. Proc. Soc. Exptl. Biol. Med. 76(3), 430-2(1951).

No depression of human complement titer were observed following clinical use of nitrogen mustard and x-rays in maximal dosage. Human complement was inactivated by high concentrations of nitrogen mustard in vitro, but not by concentrations in range which is achieved in clinical usage. BA 25-24297

11799

RADIATION-EXPOSURE SURVEY OF X-RAY AND ISOTOPE PERSONNEL. Charles K. Spalding, E. DeAmicis and R. F. Cowing. Nucleonics 5(6), 63-66(1949).

As estimated from standard dental film packs in film badge holders, the total body radiation dosages in x-ray department personnel were frequently in excess of recommended tolerance dose, among isotope laboratory workers, tolerance dose was rarely exceeded.

STRAY RADIATION MEASUREMENT ON X-RAY PERSONNEL AND IN THE X RAY ROOM WITH SERIES INVESTIGATIONS WITH THE USE OF X RAY PHOTOGRAPHY. RADIATION PROTECTIVE APPARATUS. Steffens. Fortschr. Geb. Roentgenstrahlen 61, 365-73(1940). (In German).

Considerable values for scattering found as far as 3 and 4.7 m from apparatus, which in an 8 hour working period would sometimes exceed tolerance dose. BA 23-15315

11802

ACTION OF HIGH INTENSITY ELECTRONS IN MICRO-ORGANISMS. I. INACTIVATION OF BACTERIA AND VIRUSES. AN ABSTRACT. Frederick B. Traub, Wolfgang Huber, Arno Brasch and Ulrich Friedemann. Fed. Proc. 10, 422(1951). BA 25-31188

11803

COMPARATIVE METABOLISM OF RADIUM, STRONTIUM AND CALCIUM. William P. Norris and Walter Kiseleski. Cold Spring Harbor Symposia on Quantitative Biology 13, 164-72(1948).

Intravenous injection of rats with either Ca^{45} , Sr^{89} , Sr^{90} or Ra results in rapid urinary and fecal excretion. There are quantitative but not qualitative differences in biological behavior of 3 elements. Retentions are in decreasing order: Ca, Sr, Ra. Intraperitoneal injection of Ra shows that retention is proportional to dose.

FORMATION OF HYDROXYLAMINE FROM AMINO-COMPOUNDS IN AQUEOUS SOLUTION BY IRRADIATION WITH X RAYS. George Scholes and J. Weiss. *Nature* 167 (4252), 693(1951).

Hydroxylamine (cell poison and catalase inhibitor) was produced by irradiation of adenine, guanine, cytosine or other amino compounds, nucleic acid gave little and hypoxanthine, uracil, uridine and ammonia gave none. Amino-group is apparently the source. BA 25-35843

11819

QUARTERLY TECHNICAL REPORT [FOR] JULY 1 THRU SEPTEMBER 30, 1953. (Atomic Energy Project, Univ. of Rochester). Nov. 10, 1953. 47p. Contract W-7401-eng-49. (UR-290)

Severe neurological dysfunction and multiple sub-arachnoid hemorrhage are described which were observed in a dog following exposure to 550 r x radiation. Factors affecting the preparation of tissue samples from the carcasses of large animals prior to the radiometric determination of Po are discussed. Preliminary experiments to determine the effect of Piromen on the phagocytosis-promoting effect on leukocytes showed that the

addition of Piromen to a mixture of heparinized whole blood and saccharated Fe did not increase the uptake of the Fe by human or dog leukocytes. Further evidence is presented for the in vivo incorporation of α -C¹⁴-acetate into the stroma of erythrocytes. An application of the findings to studies of defects in erythrocyte stroma in pernicious anemia is described. NSA 8-977

OUTLINE FOR COURSE IN HEALTH PHYSICS, 1948-1949. (University of Rochester). nd. 20p. (M-4460)

A course in health physics to be given as a one-year course is described. It consists of the following subjects, instrumentation and monitoring, industrial hygiene and toxicology, radiation biology, introduction to research, introduction to modern physics, introduction to nuclear physics, mathematics. A list of required texts and reference books is included. NSA 4-1632

11830

California, Univ., Berkeley. Radiation Lab. MEDICAL AND HEALTH PHYSICS QUARTERLY REPORT FOR JULY, AUGUST, SEPTEMBER 1956. Nov. 1, 1956. 21p. (UCRL-3573)

Progress is reported on the following studies: the effect of surgical and radiothyroidectomy--parathyroidectomy with I^{131} and At^{211} on breeding in the female rat; the tissue distribution of Sr^{90} in adult, young, and infant monkeys; the *in vivo* determination of whole-body retention of trace amounts of I^{131} in rats; the effect of thyroid-hormone therapy on health and longevity of rats receiving high levels of I^{131} ; the radiation-induced oxidation of acetic acid-oxygen solutions; the radiation-induced reduction of formic acid in oxygen-free solution; the growth of ultraviolet-induced autotrophs of yeast; and heat inactivation of yeast. Routine health chemistry activities for the period are summarized. NSA 11-4227

11831

California, Univ., Berkeley. Radiation Lab. BIOLOGY AND MEDICINE QUARTERLY REPORT FOR OCTOBER, NOVEMBER, DECEMBER 1956. Jan. 28, 1957. 51p. (UCRL-3653).

Data are presented from the following studies: the growth of osteogenic sarcoma transplants in rats; the effect of thyroid hormone therapy after large doses of I^{131} in rats; the radiation chemistry of formic acid solutions and systems; the radiation chemistry of pepsin solutions; tracer studies of iron metabolism in anemia; tracer studies of the life span of human erythrocytes; tracer studies on leukocyte life spans in normal, irradiated, and leukemic mice; tracer studies on carbon metabolism in diabetes; and lymphocyte response to low-level radiation exposure in man. Health chemistry and health physics activities for the period are summarized. A list of papers presented or published during the period is included. NSA 11-5136

RADIOACTIVE-WASTE DISPOSAL IN THE OCEAN. Natl. Bur. Standards (U.S.) Handbook 58, Aug. 1954. 31p.

Recommendations of the National Committee on Radiation Protection governing radioactive-waste disposal in the ocean are presented. Factors affecting safety and convenience are discussed. NSA 9-604

11836

REPORT ON BIOLOGICAL, MEDICAL, AND BIOPHYSICS PROGRAMS. PART I. SEMIANNUAL REPORT OF RADIOLOGICAL PHYSICS DIVISION. PART II. QUARTERLY REPORT OF BIOLOGICAL AND MEDICAL RESEARCH DIVISION. (Argonne National Lab., Lemont, Ill.). Jan. 1956. 224p. Contract W-31-109-eng-38.

Radiological Physics. Progress is reported on the following studies: the effect of gas pressure on the performance of ionization chambers, the efficiency of the twin scintillator method for measuring neutron fluxes to energies greater than 14 Mev, the effects of radiation on the optical and scintillation properties of various organic solvents, with and without added scintillator, Rn contamination in apparatus used for measurements of expired Rn from humans having natural body Ra, the use of butyl phosphates as extractants of Th from bone samples, the performance of scintillation counters in the detection of Rn, the bone deposition of Ca^{45} following injection in dogs as determined from the specific activity of the blood as a function of time, the feasibility of adding heavy metal-organic compounds to liquid scintillators to increase absorption of γ rays, the performance of a halogen detector, application of the low-level γ -ray facility to the measurement of the radioactive burden of humans due to both natural and acquired radioactivity, and instrument design for studies on the effect of weather elements upon the rate of atmospheric diffusion and the capacity of the atmosphere to dispose of contaminants. Biological and Medical Research. Results are presented from a survey of parasites infesting laboratory mice and the effectiveness of various control measures, the effects of ultraviolet light on the mating reaction in paramecium; the effect of β -emitting isotopes upon survival and upon the incidence of malignant bone tumors following injection in mice, calculations of the total radiation dose from body deposits of Ra, decay constants for radioisotopes, effects of x irradiation on plasma constituents in chicks, ascorbic acid and nucleic acid metabolism in guinea pigs, identification of *Escherichia Coli* enzymes, protein syntheses in the pancreas and liver of rats and in yeast, biochemical patterns in health and in the presence of malignant tumors, the morphology of connective tissue, radioinduced bacterial inactivation, the response of *Drosophila* to single and periodic x-ray exposure, the radiosensitivity of pigeons, radiation effects on nucleic acids in grasshopper eggs, factors affecting plant transport and radiodecomposition of C^{14} -labeled sugars, neutron dosimetry, biological effects of neutrons; factors affecting enzyme activity and synthesis, effects of x radiation on amoeba, the protective effects against radiation injuries in mice of cells perfused from hypoxic spleens, the establishment of a frozen ascites tumor bank, and the liquid scintillation counting of tritium-labeled water. NSA 10-3327

11837

ATOMIC ENERGY IN CLINICAL MEDICINE. II. PROTEC-

TION AGAINST RADIATION. *Ars Med.* 5, 358-71(1950) May. (In French).

This article reviews the inherent dangers in working at the various atomic energy installations in the United States and the precautionary measures taken to protect the workers. Some of the topics discussed are monitoring of the atmosphere, waste disposal, personnel and area monitoring, and plutonium and beryllium poisoning. NSA 4-4142

11838
INDUSTRIAL HYGIENISTS DISCUSS RADIATION HAZARDS. *Chem. and Eng. News* 26, 1074-76(1948) Apr. 12.

Among the papers presented at the ninth annual meeting of the American Industrial Hygiene Association in Boston in March were the following: "Protection Against Radiation Hazards and Maximum Allowable Exposure Values" - by K. Z. Morgan of the Oak Ridge National Laboratories, "Radiation Measurements in Health Physics" by J. W. Healy of the Hanford Engineer Works. NSA 1-85

11839
MAXIMUM PERMISSIBLE AMOUNTS OF RADIOISOTOPES. *Nucleonics* 8, No. 2, 70-5(1951) Feb.

The International Commission on Radiological Protection (ICRP) draws attention to the data on maximum permissible exposures to radioisotopes for occupational workers presently used in the United States, Canada, and the United Kingdom. The isotopes considered are Ra^{226} , Pu^{239} , Sr^{88} , Sr^{90} , Po^{210} , T , C^{14} , Na^{24} , P^{32} , Co^{60} , and I^{131} . NSA 5-1475

11842
HEALTH PHYSICS REPORT FOR APRIL, MAY, JUNE 1957. (Knolls Atomic Power Lab., Schenectady, N. Y.) 40p. Contract W-31-109-Eng-52.

Routine personnel, in-plant, and environmental radiation monitoring procedures engaged in during the period are summarized. NSA 12-4058

11843
HEALTH PHYSICS REPORT FOR OCTOBER, NOVEMBER, DECEMBER 1957. (Knolls Atomic Power Lab., Schenectady, N. Y.). 43p. Contract W-31-109-Eng-52. (KAPL-1914)

Personnel, in-plant, and environmental radiation monitoring procedures engaged in during the period are summarized. NSA 12-10323

11844
RECOMMENDATIONS OF THE INTERNATIONAL COMMISSION ON RADIOLOGICAL UNITS. *Radiology* 62, 106-9 (1954) Jan.

Recommendations of the International Commission on Radiological Units, as revised at the Seventh International Congress of Radiology, Copenhagen, July 1953, are presented. NSA 8-1968

11845
HEALTH PHYSICS REPORT FOR JULY, AUGUST, SEPTEMBER 1957. (Knolls Atomic Power Lab., Schenectady,

N. Y.). 43p. Contract W-31-109-Eng-52. (KAPL-1889).

Personnel, in-plant, and environmental radiation monitoring procedures engaged in during the period are summarized. NSA 12-4059

11846
CODE OF PRACTICE FOR THE PROTECTION OF PERSONS EXPOSED TO IONIZING RADIATIONS. PART A. USE OF X-RAYS FOR DIAGNOSIS, USE OF X-RAYS AND γ -RAY BEAM UNITS FOR THERAPY. PART B. USE OF RADIOACTIVE ISOTOPES. SUPPLEMENT; PROTECTION AGAINST IONIZING RADIATIONS - FUNDAMENTAL DATA. London, Her Majesty's Stationary Office, 1957. 86p. NSA 12-5865

11847
THE LOCAL EFFECT OF RADIATION ON BLOOD, BLOOD FORMING ORGANS, KIDNEYS AND TESTICLES. E. Peters. *Fortschr. Geb. Rontgenstr.* 16, 11, 16, 31(1910-1911). (In German).

11848
THE EFFECT OF RADIOACTIVE ISOTOPES IN PRODUCING LOCALIZED BIOLOGICAL EFFECTS. J. H. Muller. *Experientia* 1, 199(1945).

11849
ACTION OF X RAYS ON THE BLOOD AND BONE MARROW. C. Aubertin and E. Beaujard. *Folio Haematol.* 6, 31(1908). (In French).

Leucopenia after x-irradiation equivalent to therapeutic irradiation is not caused by decreased production of leukocytes by bone marrow, but by the formation of hyper-destructive macrophages in the spleen. Massive and repeated x-ray doses, however, will inhibit leukopoiesis.

11850
THE ACTION OF THE RADIATIONS EMITTED BY (1) RADIUM PLACQUES, (2) UNFILTERED AND FILTERED RADON SEEDS AND (3) INTRAVENOUS INJECTION OF RADON. A. Eidmow. *Brit. J. Radiol.* 13, 357(1940).

Lethal doses of Ra, applied (1) to the body surface, (2) by implantation of radon seeds subcutaneously or (3) as intravenously injected radon in solution in citrated blood caused identical histological and hematological changes in experimental animals. The author felt that leukopenia, which was proportional to radiation dose, could not be considered as a direct effect of radiation on leukocytes. Toxic and lethal actions of Ra or Rn were attributed to the hard β radiation which is "directly absorbed" by the blood stream causing lethality through its effects on endothelial cells and the induction of generalized toxemia.

11851
PROGRESS IN DEEP ROENTGEN THERAPY. Ernst Stark. *Strahlentherapie* 12, 1024(1923). (In German).

This paper includes a description of late effects of radiation and their causes. It is primarily a review of radiation therapy results in a variety of diseases including tuberculosis and many tumors.

11852
THE USE OF BLOOD COUNTS TO INDICATE THE EFFICIENCY OF X RAY AND RADIUM PROTECTION. J. C. Mottram. *Brit. Med. J.* , 269(1921).

11853
INTERPRETATION OF BLOOD COUNTS IN RADIUM AND X RAY WORKERS. J. C. Mottram. *Lancet* 1, 42(1931).

11854
TEMPORARY RADIATION AMENORRHEA AND HUMAN HEREDITY EPIDEMIOLOGICAL STUDY Hans Luxenburger. *Strahlentherapie* 45, 679(1932)

11855
THE GENETIC BASIS OF ROENTGEN MUTATIONS. Paula Hertwig. *Strahlentherapie* 45, 657-78(1932).

A review of effects on genes and chromosomes including observations on various organisms including *Drosophila*, *Triton* and *Habrobracon*.

11856

THE EFFECTS OF RADIATION ON GERM CELLS WITH SPECIAL REFERENCE TO MAN. J. B. S. Haldane. Brit. J. Radiol., Suppl. 1-3, 99 (1947-50).

This paper is introductory to the four papers following it. Author cautions that results of studies using experimental animals cannot be extrapolated to man.

11857

RADIUM NECROSIS OF THE INTESTINE. B. Fisher. Strahlentherapie 13, 333(1922). (In German).

A description of 3 (fatal) cases of necrosis of the intestine following the use of deep radiation therapy for abdominal tumors.

11858

ON THE EFFECT OF GRENZ RAYS ON LEUKOCYTE AND THE BLOOD PICTURE. P. Eckel. Strahlentherapie 45, 525-37(1932). (In German).

Rabbits were exposed to various doses of soft x-rays (Grenz rays) and blood picture described after exposure.

11859

OVARIAN HISTOLOGY WITH RESPECT TO THE QUESTION OF GERMINAL DAMAGE DUE TO ROENTGEN RAYS. Rudolf Dryoff. Strahlentherapie 45, 711(1932). (In German).

Author reports observations on pregnancies of irradiated mothers. Studies on drosophila ovaries and consideration of the significance of the observations to humans are also included.

11860

ACTION OF RADIATION ON AQUEOUS SOLUTIONS. EXPERIMENTAL WORK WITH ENZYMES IN SOLUTION. W. M. Dale. Brit. J. Radiol. Suppl. 1-3, 46(1947-50).

11861

OESTRUS, ONSET OF OVULATION AFTER TEMPORARY STERILIZATION BY ROENTGEN RAYS (EXPERIMENTAL ANIMALS). J. V. Khreninger-Guggenberger. Strahlentherapie 45, 747(1932). (In German).

11862

RADIATION INJURY OF MOUSE AND RAT SPERM. OBSERVATIONS ON FERTILIZED OVA. H. Brenneke. Strahlentherapie 60, 214(1937). (In German).

When a small (200 r) x ray dose was delivered to mouse testes, and normal female mated with the irradiated male, many fertilized ova died before completing development due to chromosome translocations in the sperm.

11863

TWO CASES OF LEUKAEMIA TREATED BY THE ROENTGEN RAYS. W. I. Bruce. Lancet 1, 211(1906).

11864

A STUDY OF THE RELATIVE TOXIC EFFECTS PRODUCED BY REGIONAL RADIATION. W. Denis and C. L. Martin-Aldrich. Amer. J. Med. Sci. 160, 555(1920).

Rabbits were exposed to x-rays from a Coolidge tube. Effects of partial body exposure (heart, lungs, thyroid, liver, kidney, stomach, spleen, intestines, thigh, anterior or posterior abdomen) to various doses are described.

11865

METHODS FOR THE CONTROLLED SELECTIVE LOCALIZATION OF RADIOISOTOPES OF ZIRCONIUM, COLOMBIUM AND YTTRIUM IN LIVER, SPLEEN AND BONE MARROW. E. Dobson, J. Gofman, H. Jones, L. Kelly and L. Walker. Proc. IV Intern. Cancer Research Congress (1947).

11866

PRELIMINARY OBSERVATIONS ON THE EFFECT OF RADIUM CHLORIDE INJECTIONS IN PATIENTS. Walter Altschul. Strahlentherapie 45, 579(1932). (In German).

11867

CHANGES IN THE BLOOD PICTURE DUE TO ROENTGEN IRRADIATION AND THEIR PROGNOSTIC SIGNIFICANCE. Hans Bosch. Strahlentherapie 45, 503-524(1932). (In German).

Author reports his observations on patients receiving therapy.

11868

General Electric Co. Hanford Atomic Products Operation, Richland, Wash.

BIOLOGICAL EFFECTS OF I^{131} CONTINUOUSLY ADMINISTERED TO SHEEP. L. K. Bustad, L. A. George, C. M. Barnes, S. Marks, D. E. Warner, K. E. Herde, and H. A. Kornberg. Radiation Research 6, 380(1957). 131p. (HW-30437)

Sheep received I^{131} orally each day over a period of 4 years. All animals showed diminished thyroid activity within 4 years and before clinical changes were evident. The study continues, using doses of 0.15, 0.5 and 1.5 $\mu\text{c}/\text{day}$.

11869

EFFECTS OF RADIATION ON THE EYES. Birch-Hirschfeld. Therapeutics Rundschau 34 (1908). Abstracted in Brit. J. Radiol. 13(1908).

Observations on the changes in the irradiated eyes of patients are described, including changes in the optic nerve, leading to atrophy, and changes in blood vessels. Role of changes induced in lecithin by irradiation is discussed.

11870

EFFECTS OF SMALL X RAY DOSES ON THE FERTILITY OF RATS AND MICE. H. Schafer. Z. Mikro. Anat. F., 46, 1(1939). (In German).

Author describes both physiological and histological effects.

11871

EFFECT OF TOTAL BODY X IRRADIATION ON THE SUSCEPTIBILITY OF MICE TO *E. COLI* ENDOTOXIN. J. P. Sanford and H. E. Noyes. Radiation Res. 7, 58(1957).

A dose of 400 r produced leukopenia and weight loss but no increase in susceptibility to endotoxin over a period of 21 days.

11872

PRODUCTION OF TRANSLOCATIONS AND MUTATIONS IN MICE BY MEANS OF X RAYS. G. D. Snell. Genetics 20, 545(1935).

Death in utero of mouse ova fertilized by sperm from low dose (approx. 200 r) local irradiation of mouse testes is due to chromosome translocations in the sperm. (Also describes fertility studies and histological studies in rats) Some offspring were semi-sterile after 800 r dose to testes, or 260 r to the ovaries

11873

ACTION OF RADIUM ON BLOOD. C. Aubertin and A. Delamore. C. R. Soc. Biol. 64, 437(1908). (In French).

11874

NOTE RELATIVE TO THE INFLUENCE OF X RAYS ON THE FERTILITY OF RABBITS. J. Bergonie and L. Tribondeau. C. R. Soc. Biol. 64, 478(1908).

Previous studies showed that x-rays affected various functions of rabbit sperm independently in that after receiving a sterilizing dose, sperm remained motile but did not fertilize ova of females. Study reported here was designed to determine whether various functions of ova were also affected independently. Ovaries were exposed surgically and exposed to various doses of x-ray, and 8 days and 15 days after exposure the females were inseminated by normal males. After small radiation doses, normal pregnancies resulted, after 60 min. irradiation, pregnancy terminated prematurely with delivery of small, non-viable fetuses. Macroscopically, ovaries showed little change, but on histological study it was observed that very few intact primordial follicles and Graafian follicles remained. "Dissociation of functions" of ova was not observed.

11875

ROENTGEN RAY INTOXICATION. II. A STUDY OF THE SEQUENCE OF CLINICAL, ANATOMICAL AND HISTOLOGICAL CHANGES FOLLOWING A UNIT DOSE OF X RAYS. S. L. Warren and G. H. Whipple. *J. Exp. Med.* 35, 203-211(1922).

Initial injury of small intestine is responsible for severe clinical reaction and lethal intoxication following total body exposure of dogs to large x-ray doses. Observations reported include: slight elevation of BUN, no clinical signs of intoxication, fragmentation of lymphocyte nuclei in spleen and lymph nodes during the 1st 24 hours; onset of clinical intoxication, severe injury of intestinal epithelium in 2nd 24 hrs., severe intoxication and anatomical changes in 3rd 24 hrs., increasing intoxication and decline into a moribund state during the 4th 24 hrs. after exposure. Lymphocytes in Peyer's Patches appeared to be much less sensitive than neighboring intestinal epithelium.

11876

ROENTGEN RAY INTOXICATION. III. SPEED OF AUTOLYSIS OF VARIOUS BODY TISSUES AFTER LETHAL X RAY EXPOSURES. THE REMARKABLE DISTURBANCE IN THE EPITHELIUM OF THE SMALL INTESTINE. S. L. Warren and G. H. Whipple. *J. Exp. Med.* 35, 213-24(1922).

Gastro-intestinal tract, spleen, liver, pancreas and kidneys were studied to determine pattern and rate of autolysis in normal and heavily x-irradiated dogs. In the intestine after x-irradiation, crypt epithelium autolyzes faster than does epithelium of tips of villi. The reverse relationship occurred in intestine of unirradiated dogs. Clinically, gastro-intestinal signs were maximal on 4th post-exposure day and death commonly occurred then. Dogs surviving the 4th day after irradiation recovered.

11877

A STUDY OF THE EFFECTS OF RADIUM ON NORMAL BRAIN TISSUE. C. S. Williamson, R. O. Brown and J. W. Butler. *Surg. Gynec. and Obst.* 31, 239(1920).

Consistent changes were observed in the blood vessels of irradiated dogs' brains.

11878

CANCER OF RADIOLOGISTS. Ledoux-Lebard. *Paris Med.* 12, 299-303(1922) (In French).

Chronic radiodermatitis, like all chronic irradiation, favors the development of cancer. Author believes malignant transformation occurs in 20-30% of cases of chronic radiodermatitis.

11879

A CASE OF DERMATITIS FROM ROENTGEN RAYS. H. R. Crocker. *Brit. Med. Jour.* 1, 8(1897).

One hour x ray exposure of a broad abdominal area resulted in a burn resembling sunburn. Hair of the area was not lost.

11880

IONIZATION AND ITS BEARING ON THE BIOLOGICAL EFFECTS OF RADIATION. G. Failla. Ch. III in: *Biological Effects of Radiation*, McGraw-Hill Book Co. B. M. Duggar, Editor. 1, 87-121(1936).

11881

DERMATITIS CAUSED BY ROENTGEN RAYS. H. C. Drury. *Brit. Med. J.* 2, 1377-8(1896).

Exposure to 2 doses (1 hr. and 1.5 hrs) of x rays for kidney stone studies resulted in nausea in the one case and in the second, nausea plus severe erythema progressing to lesion with discharge.

11889

HEMATOLOGICAL AND CHEMICAL OBSERVATIONS IN CASES OF SPLEEN-MEDULLARY LEUKEMIA UNDER X RAY TREATMENT. J. C. G. Ledingham. *Lancet* 1, 366-8(1906).

Author reports his studies on uric acid and leukocyte levels in patients receiving x-ray therapy for leukemia. Uric acid excretion increased during therapy but the increase could not be correlated with the leukopenia. The leukopenia was attributed to diminished leukocyte production rather than to increased destruction. Evidence is interpreted as favoring the view that x-rays have an inhibitory effect on hematopoiesis.

11890

THE EFFECTS OF RADIUM AND X RAYS ON EMBRYONIC DEVELOPMENT. E. G. Butler. p.389-410 of *BIOLOGICAL EFFECTS OF RADIATION*. B. M. Duggar, ed. New York. McGraw-Hill Book Co., 1936.

DECONTAMINATION CHART. *Nucleonics* 9, No. 5, C12-15(1951) Nov.

The results of extensive studies of methods of decontamination are presented in the form of a chart. For each type of surface listed--paint, asphalt, metal, concrete or

brick, tile, wood, and soil--several decontaminating materials are compared with respect to type of action, technique to be used, advantages, and disadvantages. Some of the decontaminating agents are water, steam, soapless detergents, complexing agents, trisodium phosphate, organic solvents, caustics, wet sandblasting, vacuum blasting, and vacuum cleaning. POST TREATMENT MODIFICATION OF X-RAY MUTA-

GENESIS IN PARAMECIUM. R. F. Kimball, N. Gaither and S. M. Wilson. Radiation Research 5, 485(1956).

Treatment of paramecia immediately after x-irradiation slowed subsequent cell division. To see whether the length of the interdivision interval was involved in the radiation effect, the animals were subjected to temp. of 6°C-37°C starting within one hour post-exposure and maintained at the selected temp. for 24 hours before being returned to 27°C. Lowering the temp. was found to decrease the number of radiation induced mutations slightly, the effect of low temp. being less marked when combined with exposure to H₂O₂. Appropriate doses of streptomycin immediately after or within 2 hrs. after irradiation caused an increase in mutations although streptomycin *per se* was not mutagenic. Streptomycin had no effect if it was added after the first post-exposure division. Authors concluded that an appreciable fraction of "mutational changes" are not irrevocably established in paramecia until at least 2 hrs. post-exposure provided that a division does not occur during that interval. (from authors' abstract).

11962

University of California Radiation Lab.
METABOLIC PROPERTIES OF PLUTONIUM AND ALLIED
MATERIALS. Med. and Health Physics Quarterly Report.
1950. 105p. (AECD-2901)

The localized ion of Ca^{45} , Sr^{90} , Pm^{147} , Am, and Pu
in the skeletal tissues of rats has been investigated by
radioautoradiography of costochondral junction. Photo-
graphs and radioautographs of histological sections through
the junction are presented. The distribution of tracer Ca
and Sr but none of the other 3 elements coincides exactly
with that of bone salts and Ca deposited in cartilage.

11963

11967

A PRELIMINARY REPORT ON THE EFFECTS OF ROENT-
GEN RAYS ON GASTRIC HYPERACIDITY. L. Bryan and
H. F. Dormody. *Amer. J. Roentgenol.* 8, 623(1920).

11968

INFLUENCE OF RADIUM ON CANCER TISSUES. J. Ewing.
Amer. J. Roentgenol. 5, 52(1918).

11969

THE ABSORPTION OF RADIUM RADIATIONS BY TISSUES
G. Failla. *Amer. J. Roentgenol.* 8, 215(1921).

11970

SOME ROENTGEN-RAY EVIDENCE RELATED TO THE
ETIOLOGY OF CARCINOMA. C. I. Martin. *Amer. J.*
Roentgenol. 6, 180(1919).

X-ray dose causes contraction of skin and rapid con-
nective tissue growth.

11971

ROENTGEN RAY TREATMENT OF ACNE VULGARIS.
J. M. Martin and C. L. Martin. *Amer. J. Roentgenol.* 8,
468(1920).

Authors review possible causes of acne and report
results of an experiment on guinea pigs to determine
x-ray effect on skin.

11972

SURGERY OF X-RAY LESIONS. L. L. McArthur. *Amer. J.*
Roentgenol. 4, 521(1917).

X-ray burns may result in carcinoma, therefore should
be excised surgically.

11973

A HISTOLOGICAL STUDY OF THE EFFECTS OF RADIUM
ON CARCINOMA OF THE CERVIX. C. C. Norris and
N. S. Rothschild. *Amer. J. Roentgenol.* 8, 604(1920).

11974

PRESENT STATUS OF ROENTGENOTHERAPY IN
LEUKEMIA. H. K. Pancoast. *Amer. J. Roentgenol.* 4,
611(1917).

11975

SOME EFFECTS OF ROENTGEN RAYS ON CERTAIN
BACTERIA. M. W. Perry. *Am. J. Roentgenol.* 6, 464
(1919).

Roentgen radiation, in doses up to twice the doses
used for radiation therapy of human diseases, does not
prevent growth of *B. typhosus* and *S. aureus* on inert
media, nor does it destroy the organisms of tuberculosis
lesions *in situ* or prevent development of glandular
tuberculosis. The radiation does tend to increase the
susceptibility of *B. typhosus* and *S. aureus* to killing by
heat.

11976

THE CAUSE AND PREVENTION OF THE CONSTITUTIONAL
EFFECTS ASSOCIATED WITH THE MASSIVE DOSES OF
DEEP ROENTGENOTHERAPY. G. E. Pfahler. *Amer. J.*
Roentgenol. 5, 5(1918).

11977

THE CAUSE OF CONSTITUTIONAL SYMPTOMS FOLLOW-
ING DEEP ROENTGENOTHERAPY - FROM THE VIEW-
POINT OF THE EXPERIMENTAL PHYSIOLOGISTS. P.
Roth. *Amer. J. Roentgenol.* 5, 33(1918).

From observation the author discounts gases as
cause. He suggests that deep x-ray in gastric region
triggers the reaction.

11978

THE CLASSIFICATION OF UTERINE CARCINOMA FOR
THE STUDY OF THE EFFICACY OF RADIUM THERAPY.
H. Schmitz. *Amer. J. Roentgenol.* 7, 383(1920).

11979

THE BLOOD IN CANCER UNDER ROENTGENOTHERAPY
(PRELIMINARY REPORT). R. H. Stevens. *Amer. J.*
Roentgenol. 4, 215(1917).

11980

X-RAY TREATMENT OF TONSILS AND ADENOIDS.
W. D. Witherbee. *Amer. J. Roentgenol.* 8, 25(1921)

The author suggests that massive x-ray dose where
operation is impossible will kill bacteria and cure infection.

11981

THE ABSENCE OF ONE KIDNEY ASSOCIATED WITH
HEREDITARY ABNORMALITIES IN THE DESCENDANTS
OF X-RAYED MICE. H. J. Bagg. *Proc. Soc. Exp. Biol.*
and Med. 21, 146-149(1923).

11982

THE ABSENCE OF BOTH KIDNEYS ASSOCIATED WITH
HEREDITARY ABNORMALITIES IN MICE. H. J. Bagg.
Proc. Soc. Exp. Biol. and Med. 21, 228-229(1924).

11983

HEREDITARY STRUCTURAL DEFECTS IN THE DESCENDANTS OF MICE EXPOSED TO ROENTGEN-RAY IRRADIATION. H. J. Bagg and C. C. Little. *Amer. Jour. Anat.* 33, 119-145(1924).

11984

EFFECTS OF IRRADIATION ON FETAL DEVELOPMENT. H. Bailey and H. J. Bagg. *Amer. Jour. Obstet. and Gynecol.* 5, 3-15(1923).

The authors review and discuss the effects of radium and x-radiation on animal development (rats, amphibians, drosophila, silkworms, rabbits) and present results of clinical studies showing effects of the radiations on human embryonic development.

11985

THE ARTIFICIAL PRODUCTION OF MONSTERS DEMONSTRATING LOCALIZED DEFECTS AS THE RESULT OF INJURY FROM X-RAYS. W. M. Baldwin. *Amer. Jour. Physiol.* 52, 296-303(1920).

11986

THE ARTIFICIAL PRODUCTION OF MONSTERS CONFORMING TO A DEFINITE TYPE BY MEANS OF X-RAYS. W. M. Baldwin. *Anat. Rec.* 17, 135-163(1919).

11987

THE ARTIFICIAL PRODUCTION OF SYRINGOMYELOCELE IN THE TADPOLE BY MEANS OF X-RAYS. W. M. Baldwin. *Anat. Rec.* 22, 305-309(1921).

11988

FURTHER STUDIES ON THE VARIATION IN SUSCEPTIBILITY OF AMPHIBIAN OVA TO THE X-RAYS AT DIFFERENT STAGES OF DEVELOPMENT. C. R. Bardeen. *Amer. Jour. Anat.* 11, 419-498(1911).

11989

VARIATIONS IN SUSCEPTIBILITY OF AMPHIBIAN OVA TO THE X-RAYS AT DIFFERENT STAGES OF DEVELOPMENT. C. R. Bardeen. *Anat. Rec.* 3, 163-165(1909).

11990

THE INHIBITIVE ACTION OF THE ROENTGEN RAYS ON REGENERATION IN PLANARIANS. C. R. Bardeen and F. H. Baetjer. *Jour. Exp. Zool.* 1, 191-195(1904).

11991

EFFECTS OF X-RAYS ON THE GALLBLADDER BY EXPERIMENTAL PRODUCTION OF CHOLECYSTITIS. J. Brahm and L. Darnbacher. *Radiology* 13, 103-108(1929).

Authors observed acute and chronic cholecystitis in dogs exposed to x-rays in doses similar to those used in x-ray therapy. Histological changes observed included hemorrhage, inflammatory edema, round cell infiltration, fibrous tissue hyperplasia and sometimes necrosis of the epithelium. The gall bladder was, relatively, more sensitive to irradiation than were the organs neighboring it.

11992

Argonne National Lab., Division of Biological and Medical Research

PROGRESS REPORT: MEDICAL ASPECTS OF THE RADIUM TOXICITY PROGRAM. W. B. Looney. Quarterly Report, Aug., Sept., Oct., 1951. (ANL-4713). NSA 6-2555

11993

EFFECT OF GAMMA IRRADIATION ON CELL DIVISION IN TISSUE CULTURE IN VITRO. R. G. Cantl and F. G. Spear. *Proc. Roy. Soc. Biol.* 102, 92-101(1927).

Authors studied the choroid of 6-7 day chick embryos, counting the number of mitoses at various times after exposure to various doses of γ rays. The number of mitoses decreased as dose increased, although the authors found that there was a critical dose and intensity below which no radiation effect was observed.

11994

THE OCCURRENCE OF HEPATIC LESIONS IN PATIENTS TREATED BY INTENSIVE DEEP ROENTGEN IRRADIATION.

J. T. Case and A. S. Warthin. *Amer. Jour. Roentg. and Rad. Ther.* 12, 27-46(1924).

11995

THE BIOLOGICAL EFFECT OF RADIUM. C. F. Charlton. *Radiology* 7, 137-139(1926).

Histological studies were performed serially during radium and x-ray therapy of tumors and observations are described. Both radium and x-rays showed a definite sequence of changes, *viz*: a latent period, swelling of malignant cells, keratinization and finally, disintegration. Excessive doses of radiation did not cause tumor regression, but hastened tumor growth.

11996

RADIUM IN GYNECOLOGY. J. G. Clark and C. C. Norris. J. B. Lippincott Company, Philadelphia (1927).

11997

THE ACTION OF REPEATED DOSES OF X-RAYS UPON THE DEVELOPING CHICK EMBRYO. H. A. Colwell, R. J. Gladstone, and C. P. G. Wakeley. *Jour. Anat.* 57, 1-11(1922).

11998

EFFECTS OF RADIUM ON LIVING SUBSTANCE. I. THE INFLUENCE OF RADIATIONS OF RADIUM UPON THE EMBRYONIC GROWTH OF THE POMACE-FLY DROSOPHILA AMPELOPHILA, AND UPON THE REGENERATION OF THE HYDROID TUBULARIA CROCEA. E. D. Congdon. *Bull. Mus. Comp. Zool.* 53, 345-358(1912).

11999

EFFECT OF INJECTION OF ACTIVE DEPOSIT OF RADIUM EMANATION ON RABBITS. H. J. Corper and L. Hektoen. *Jour. Infect. Dis.* 31, 305-312(1922).

Intravenous administration to rabbits of the active deposit of radium proved lethal when the dose administered was 8-10 millicuries. There was an initial leukocytosis, followed by leukopenia. It is suggested that non-lethal doses may depress the formation of a (leukocyte) lysin.

12000

SENSITIVITY TO X-RAYS OF CELLS IN VITRO. S. F. Cox. *Arch. Exp. Zellforsch.* 11, 121-131(1931).

Author describes his studies on x-ray effects on the choroid and sclera of chick embryos and on fibroblast cultures. Radiosensitivity was greatest when mitotic activity was greatest.

12001

SOME CONSIDERATIONS RELATIVE TO THE ACTION OF X-RAYS ON TISSUE CELLS. J. A. Crowther. *Proc. Roy. Soc., [London] B.* 96, 207-211(1924).

The effect of various single doses of x-rays on embryonic development in groups of chick and frog embryos was studied. Large doses inhibited development or were lethal, very small doses appeared to accelerate development

12002

STUDIES OF THE SYSTEMATIC EFFECT OF ROENTGEN RAYS. II. THE ACID BASE BALANCE AND THE SERUM PROTEINS OF DOGS BEFORE AND AFTER IRRADIATION. Leita Davy. *Amer. Jour. Roentg. and Rad. Ther.* 25, 255-265(1931).

The author describes changes in serum protein and in acid-base balance in dogs following a dose of 500 r delivered to: 1. total body, 2. dorsal chest, 3. dorsal aspects of lower body, or ventral or dorsal aspects of lower body. Serum protein changes were related to total x-ray dose rather than to part of body exposed. Blood changes in dogs irradiated over ventral and dorsal aspects of posterior body were not significantly different in dogs with generalized infection and in normal dogs similarly irradiated although irradiation proved lethal only to the infected animals.

12003

MORPHOLOGICAL CHANGES OF THE BLOOD FOLLOWING

IRRADIATION OF SPLENIC AREA WITH SO-CALLED STIMULATING DOSES. A. Dazi. *Radiol. Med.* 11, 552-561(1930).

12004
THE "TOLERANCE CONCENTRATION" OF RADON IN THE ATMOSPHERE. John Read and J. C. Mottram. *Brit. J. Radiol.* 12, 54(1939).

The authors give their reasons for suspecting that the leukopenia observed in Ra workers is due to inhalation of radon. The maximum permissible concentration of radon in air is calculated, the calculations being based on the MPE for x-rays at the time the paper was written (10^{-5} r per sec. for a 7 hr. work day). The estimated MPC for radon: 10^{-11} curies per cc of air. This concentration is compared with that found in the Joachimsthal mines. Observations on mice exposed to various concentrations of radon are described and compared with findings in x-irradiated mice.

12005
INFLUENCE OF TEMPERATURE UPON BIOLOGICAL ACTION OF X-RAYS. A. Dognon. *Arch. Physical Therapy* 9, 55-59(1928).

The author studied injury in *Ascaris* embryos following exposure to x-rays at various temperatures. Temperatures ranging from 5-20°C did not influence the response to x-irradiation but between 20° and 47° the number of embryos injured increased rapidly with increasing temperature. Author postulates that the biological reaction has two components: a photochemical process that is not temperature dependent and an ordinary chemical reaction which is markedly influenced by temperature. The photochemical reaction follows and is dependent on the temperature dependent reaction. CA 22-3458

12006
IMMEDIATE METABOLIC DISTURBANCES FOLLOWING DEEP ROENTGEN RAY THERAPY. H. P. Dorn, A. Bollinger and F. W. Hartman. *Amer. Jour. Roentg. and Rad. Ther.* 13, 54-63(1925).

12007
THE RELATIVE SENSITIVITY OF THE KIDNEY TO IRRADIATION. H. P. Dorn, A. Bollinger and F. W. Hartman. *Radiology* 8, 142-148(1927).

The authors found the kidney to be highly radiosensitive, as judged by both morphological and functional changes. They ranked intestine, stomach, pancreas, ovary, spleen lung, adrenal and liver in order of decreasing radiosensitivity, with kidney in the first rank. Radiation-induced nephritis and hypertension in patients and experimental animals are described.

12008
THE ACTION OF X-RAYS ON THE DEVELOPING CHICK. J. F. Gaskell. *Proc. Roy. Soc. [London] B* 83, 305-310 (1911).

Mitosis in growing tissues is inhibited by x-rays, the inhibition being reversible if injury is not too severe. The dose which is sufficient to preclude recovery decreases as the mitotic activity of tissue increases and decreases as development of the embryo advances.

12009
SOME EFFECTS OF THE ROENTGEN RAYS ON THE DEVELOPMENT OF EMBRYOS. P. K. Gilman and F. H. Baetjer. *Am. J. Physiol.* 10, 222-24(1904).

During the first 3-4 days of x-irradiation for 15 min. each day, development of fertilized *Amblystoma* eggs was accelerated, and acceleration persisted for as long as 10 days in a few cases, size being the major criterion of development during this stage. Continued daily exposure, after the 10th or 11th day, resulted in cessation of growth and various morphological anomalies. Animals receiving repeated exposures during only 1 day tended to recover and

develop normally, although more than half such *amblystoma* showed morphological anomalies of development. Similar results were observed when chick embryos were irradiated daily. Various types of developmental anomalies that were observed are described.

12010
FIRST OBSERVATIONS ON THE PHYSIOLOGICAL EFFECTS OF ROENTGEN RAYS ON THE HUMAN SKIN. O. Glasser. *Amer. Jour. Roentg. and Rad. Ther.* 28, 75-80(1932).

12011
ERYTHEMA AND TOLERANCE DOSES IN AMERICAN CLINICS. O. Glasser and U. V. Portmann. *Radiology* 14, 346-350(1930).

12012
THE PHYSICAL FOUNDATION OF GRENZ-RAY THERAPY. O. Glasser. *Radiology* 18, 713-726(1932).

Physical properties of grenz rays are discussed and problems in dosimetry are reviewed. The threshold erythema dose for this soft radiation was found to be approximately 250 r. Increase in skin effect with increasing dose was found to be less than with x-rays.

12013
THE EFFECTS OF THE RAYS OF RADIUM UPON PLANTS. C. S. Gager. *Mem. New York Bot. Gard.* 4, 1-278(1908).

12014
THE EFFECT OF RADIUM ON GROWTH AND DEVELOPMENT IN EGGS OF CREPIDULA AND PAGURUS. F. S. Hammett, Matie Green and Eleanor Davenport. *Proto-plasma* 15, 415-421(1932).

12015
THE ACTION OF SALTS OF RADIUM UPON GLOBULINS. W. B. Hardy. *Jour. Physiol* 29, *Proc. of Physiol. Soc.* May 16, 1903, XXIX-XXX(1903).

12016
THE SPECTRO-PHOTOMETER ANALYSIS OF THE COLOR OF SKIN FOLLOWING RADIATION BY ROENTGEN RAYS. M. Harris, E. T. Leddy and C. Sheard. *Radiology* 19, 233-256(1932).

12017
FUNCTIONAL STUDIES THROUGHOUT COURSES OF ROENTGEN RAY NEPHRITIS IN DOGS. M. Hartmann, A. Bolliger, and H. B. Doub. *J. Am. Med. Assoc.* 88, 130-145(1927).

Irradiation of the kidneys of dogs with penetrating x-rays produces a kidney lesion very similar to that of human chronic interstitial nephritis. Authors were unable to correlate serial changes in results of any one kidney function test with progressive pathological changes in the affected kidneys.

12018
EXPERIMENTAL NEPHRITIS PRODUCED BY IRRADIATION. M. Hartmann, A. Bolliger, and H. B. Doub. *Am. J. Med. Sci.* 172, 487-500(1926). *Bull. Johns Hopkins Hospital* 41(1), 36-61(1927).

The histological changes in x-ray-induced nephritis in dogs, and the course of pathological changes during the various stages of the nephritis are described.

12019
ON THE ACTION OF THE SECONDARY X-RAYS FROM COPPER ON THE DEVELOPMENT OF THE OVA OF *ASCARIS MEGALOCOPHALA*. S. Hastings. *Arch. Mid-dlex Hosp.* 27, 154-156(1912).

12020
A CONTRIBUTION TO THE STUDY OF THE EFFECTS OF RADIATION ON SILKWORMS. S. Hastings, H. Beckton, and B. H. Webb. *Arch. Middlesex Hosp.* 27, 128-153(1912).

12021
THE INFLUENCE OF THE X-RAY ON THE PRODUCTION OF ANTIBODIES. L. Hektoen. *Jour. Infect. Dis.* 17, 415-422(1915).

The production of hemolytic antibody by rats injected with sheep erythrocytes is not affected by x-irradiation immediately after injection unless the x-ray dose is great enough to be detrimental to the general health of the rats. Author interprets the results as indicating that antibodies are produced by spleen and lymphatic tissues and marrow (the most radiosensitive tissues).

12022
CHANGES IN SUSCEPTIBILITY OF DROSOPHILA EGGS TO ALPHA PARTICLES P. S. Henshaw and C. T. Henshaw. *Biol. Bull.* **64**, 348-357(1933).

Susceptibility to injury by α particles varies with the developmental stage of the embryo. Sensitivity increases during cleavage and blastulation, is maximal in early gastrulation. Sensitivity to x-rays and γ rays differed from sensitivity to α particles, and analysis of the various experimental results showed that the responses of the various stages to α particles could be accounted for by movement of cells into and out of the short penetration range of the α particles.

12023
SKIN TOLERATION DOSES IN ROENTGEN UNITS AND THEIR RELATION TO THE QUALITY OF RADIATION. P. M. Hickey and E. A. Pohle. *Radiology* **12**, 300-316(1929).

12024
THE EFFECT OF EXPOSURE TO ROENTGEN RAYS ON REPRODUCTION IN MALE RATS. D. R. Hooker. *Amer. Jour. Roentg. and Rad. Ther.* **14**, 327-336(1925).

12025
A REMARKABLE SEQUEL TO AN ATTEMPT TO DETERMINE THE X-RAY LETHAL DOSE FOR TISSUE CULTURES GROWING IN VITRO. F. L. Hopwood and M. Donaldson. *British Jour. Radiol.*, N. S. **3**, 69-75 (1930).

A previously reported effect of various doses of x-rays on cultures of chick choroid (death after various numbers of sub-cultures, the number of viable sub-cultures increasing with decreasing dose) is shown to have been an artefact.

12026
STUDIES ON THE EFFECTS OF ROENTGEN RAYS ON GLANDULAR ACTIVITY. EFFECT OF EXPOSURE OF ABDOMINAL AND THORACIC AREAS TO ROENTGEN RAYS ON GASTRIC SECRETIONS, ROENTGEN CACHEXIA. A. C. Ivy, J. E. McCarthy, and B. H. Orndorff. *J. Am. Med. Assoc.* **83**, 1977-1984(1924).

The authors' experimental studies on dogs demonstrate that the intestinal mucosa is more radiosensitive to x-radiation than is the mucosa of the fundus of the stomach. Effects of various doses on general condition, appetite and gastric secretion are described.

12027
CYTOLOGICAL AND PHYSIOLOGICAL CHANGES IN VICIA FABA IRRADIATED WITH ROENTGEN RAYS. H. Komuro. *Botan. Gaz.* **77**, 446-452(1924).

12028
THE DIRECT AND INDIRECT ACTION OF RADIATION ON CANCER TISSUES. A. Lacassagne. *Radiology* **11**, 393-401(1928).

The author considers the destruction of cells by radiation with respect to 1. a direct action, 2. a local direct action, and 3. an indirect, generalized action. The direct effect is manifest at the cellular level.

12029
ON RADIUM AS A STIMULUS OF CELL DIVISION. W. S. Lazarus-Barlow and H. Beckton. *Arch. Middlesex Hosp.* **30**, 47-71(1913).

12030
INVESTIGATION OF THYMUS STIMULATION BY ROENTGEN RAYS. M. Lenz. *Amer. Jour. Roentg. and Rad. Ther.* **13**, 226-234(1925).

The thymus glands of rabbits were exposed to x-rays and the glands were examined at autopsy of the animals 1, 4, 11 and 12 days post-exposure. (Observations on spleen and lymph nodes are also described.) Radiation accelerated thymic involution and this effect is compared with effects of involution due to aging. Radiation did not stimulate hypofunctioning thymus glands.

12031
PIGMENTARY REACTION IN RANA CLAMITANS LARVAE FOLLOWING TREATMENTS WITH X-RAYS. W. T. Levine. *Proc. Soc. Exp. Biol. and Med.* **28**, 594-596(1931).

12032
EFFECT OF IRRADIATION ON ELECTROPHORETIC VELOCITY, VIABILITY, AGGLUTINABILITY, LYSIS, AND pH OF ESCHERICHIA COLI. M. W. Lisse and R. P. Tittsler. *Penn. Agric. Exp. Sta. Tech. Bull.* **276**, 4-44 (1932).

12033
THE OCCURRENCE OF FOUR INHERITABLE MORPHOLOGICAL VARIATIONS IN MICE AND THEIR POSSIBLE RELATION TO TREATMENT WITH X-RAYS. C. C. Little and H. J. Bagg. *Jour. Exp. Zool.* **41**, 45-91(1924).

12034
PROBLEMS OF TRUE TISSUE REACTION AFTER ROENTGEN IRRADIATION. M. Magat. *Jour. Eksp. Biol. i. Med.* **11**(32), 243-251(1929).

12035
RELATIVE SUSCEPTIBILITY TO X-RAYS OF EGGS AND SPERM OF ARBACIA. J. W. Mavor and D. M. de Forest. *Proc. Soc. Exp. Biol. and Med.* **22**, 19-21(1924).

12036
THE TREATMENT OF INFECTIOUS DISEASES BY LEUCOCYTOLYSIS PRODUCED BY ROENTGENIZATION OF THE SPLEEN. I. I. Manoukhine. *Lancet* **200**, 685-687 (1921).

The author describes experimental studies on monkeys and guinea pigs infected with the tubercle bacillus and irradiated over the spleen with small doses of x-ray. Similar studies on tuberculous patients are also described. The beneficial effects of irradiating the spleen are attributed to the release of leukocytolysins from splenic leukocytes, and an increase in the level of circulating antibodies and related immunologically active substances. The author describes the preparation of curative sera (against dysentery and non-infectious diseases) from the blood of patients subjected to x-irradiation of the spleen.

12037
THE EFFECT OF IRRADIATION ON THE URETER. C. L. Martin and F. T. Rogers. *Amer. Jour. Roentg. and Rad. Ther.* **16**, 215-218(1926).

Ureteral stricture and hydronephrosis were produced in dogs by a 75 mg-hr dose of radium applied directly to the ureter. Smaller doses produced partial stricture.

12038
THE EFFECT OF ROENTGEN RAYS ON THE ADRENAL GLAND. C. L. Martin, F. T. Rogers, and N. F. Fisher. *Amer. Jour. Roentg. and Rad. Ther.* **12**, 466-471(1924).

Authors observed fibrosis of the adrenal gland following heavy x-irradiation subsequent to removal of the contralateral gland. Endocrine function was maintained. When the dose equal to that applied to the adrenal was delivered to an isolated loop of small intestine, cachexia and death ensued. Irradiation of the upper pole of one kidney produced fibrosis.

12039
REMARKS ON THE DELAYED OR REMOTE APPEARANCE OF X-RAY BURNS AFTER LONG PERIODS OF LATENCY. R. Matas. *Amer. Jour. Roentg. and Rad. Ther.* **13**, 37-40(1925).

The author describes late skin lesions that developed following therapeutic doses of x-ray for exophthalmic

goutre and epidermal carcinoma. Period of latency was 4 years in one case, 3 years in the other. Surgical treatment of the ulcerated lesions is described.

12040
ABNORMAL DEVELOPMENT OF FROG EMBRYOS AS A RESULT OF TREATMENT OF OVA AND SPERM WITH ROENTGEN RAYS. J. H. McGregor. *Science* 27, 445-446(1908).

12041
THE ALLANTOIC MEMBRANE OF THE CHICK EXPOSED TO BETA RADIATION. W. Moppett. *British Jour. Radiol.* N.S. 5, 342-348(1932).

12042
ON THE ACTION OF BETA AND GAMMA RAYS OF RADIUM ON THE CELL IN DIFFERENT STATES OF NUCLEAR DIVISION. J. C. Mottram. *Arch. Middlesex Hosp.* 30, 98-119(1913).

12043
HISTOLOGIC CHANGES IN LYMPHATIC GLANDS FOLLOWING EXPOSURE TO RADIUM. J. C. Mottram. *Amer. Jour. Med. Sci.* 165, 469-479(1923).

12044
EFFECTS OF RADIUM AND RADIUM IN COMBINATION WITH METALLIC SENSITIZERS ON ENDAMOEBIA DYSENTERIAE IN VITRO. Elizabeth C. Nasset and C. A. Kofoed. *Univ. California Publ. Zool.* 31, 387-416(1928).

12045
STUDIES OF EFFECTS OF X-RAYS ON GLANDULAR ACTIVITY. B. H. Orndorf, J. I. Farrell, and A. C. Ivy. *Jour. Radio.* 4, 189-199(1923).

12046
STUDIES ON THE EFFECT OF ROENTGEN RAYS ON GLANDULAR ACTIVITY - EXTERNAL PANCREATIC SECRETION. B. H. Orndorf, J. I. Farrell and A. C. Ivy. *Amer. Jour. Roentg. and Rad. Ther.* 16, 349-354(1926).

The amount of secretion from an irradiated segment of pancreas and the concentration of lipase and trypsin in the secretion were measured in dogs with chronic fistulae. The effects of three different doses were compared. The pancreas was found to be relatively radioresistant, in terms of its exocrine function, and to have great ability to recover from radiation injury.

12047
THE BIOLOGICAL EFFECTIVENESS OF HIGH VOLTAGE AND LOW VOLTAGE X-RAYS. C. Packard. *Amer. Jour. Cancer* 16, 1257-1274(1932).

Equal doses of x-rays of three different wave lengths (0.05, 0.08 and 1.70 Å produced at 500, 300 and 12 Kv) produced equal quantitatively measured effects on *Drosophila* eggs and on mouse tumor tissue. Doses were measured by means of ionization chambers. The results reported confirm conclusions based on earlier experiments using wave lengths of 0.20, 0.30, 0.50 and 0.70 Å, namely that the biological effectiveness in the systems studied is independent of wave length.

12048
THE SATURATION METHOD IN ROENTGENTHERAPY, AS APPLIED TO DEEP SEATED MALIGNANT DISEASE. G. E. Pfahler. *British Jour. Radiol.* 31, 45-54(1926).

12049
PATHOLOGY OF TOTAL BODY IRRADIATION IN THE MONKEY. H. G. Schlumberger and J. J. Vazquez. *Am. J. Pathol.* 30, 1013-48(1954).

The authors found the LD_{50/30} dose for total body x-ray exposure of the rhesus monkey to be approximately 550 r. Gross and microscopic pathology of the irradiated animals is described.

12050
STUDIES ON THE SUSPENSION STABILITY OF THE HUMAN BLOOD. THE CHANGES OF THE SEDIMENTATION

RATE OF THE ERYTHROCYTES IN VITRO AND IN VIVO AFTER X-RAY EXPOSURE. E. A. Pohle. *Radiology* 6, 55-58(1926).

12051
STUDIES OF THE ROENTGEN ERYTHEMA OF THE HUMAN SKIN. E. A. Pohle. *Radiology* 8, 185-194(1927).

12052
A STUDY OF THE EFFECT OF GRADED DOSES OF TWO DIFFERENT WAVE LENGTHS ON THE SKIN OF RATS. E. A. Pohle and C. H. Bunting. *Radiology* 15, 647-659(1930).

12053
STUDIES OF THE ROENTGEN ERYTHEMA OF THE HUMAN SKIN. E. A. Pohle and C. S. Wright. *Radiology* 14, 351-363(1930).

12054
THE SKIN ERYTHEMA DOSE WITH A COMBINATION OF TWO TYPES OF RADIATION. Edith Quimby. *Amer. Jour. Roentg. and Rad. Ther.* 17, 621-625(1927).

12055
THE BIOLOGICAL EFFECTS OF RADIUM. W. A. Pusey. *Science* 33, 1001-1005(1911).

12056
STUDIES ON THE SUSPENSION STABILITY OF HUMAN BLOOD. I. THE VELOCITY OF SEDIMENTATION OF ERYTHROCYTES IN X-RAY THERAPY CASES. E. A. Pohle. *Radiology* 5, 206-210(1925).

12057
THE SUSCEPTIBILITY OF CELLS TO RADIUM RADIATIONS. C. Packard. *Proc. Soc. Exp. Biol. and Med.* 20, 226-227(1923).

The radiosensitivity of paramecia and other protozoa is influenced by cellular temperature during irradiation and by the permeability of the cell membrane.

12058
THE EFFECT OF ROENTGEN RADIATION ON THE VELOCITY OF ERYTHROCYTE SEDIMENTATION. E. H. Rubin and O. Glasser. *Amer. Jour. Roentg.* 18, 520-527(1927).

The increased sedimentation rate of red cells in whole blood x-irradiated *in vitro* is shown to be due to the heat generated during irradiation with unfiltered x-rays. The change is thought to be due primarily to the temperature effects on cells.

12059
EXPERIMENTS ON X-RADIATION AS A CAUSE OF CHANGES IN PERMEABILITY. A. Richards. *Amer. Jour. Physiol.* 36, 400-419(1915).

12060
TEMPERATURE COEFFICIENT OF THE ACTION OF β RAYS UPON THE EGG OF NEREIS. A. C. Redfield and Elizabeth M. Bright. *Jour. Gen. Physiol.* 1, 255-259(1918).

12061
THE PHYSIOLOGICAL ACTION OF IONIZING RADIATIONS. I, II. A. C. Redfield and Elizabeth M. Bright. *Am. J. Physiol.* 68, 54-61, 62-69(1924).

The authors develop a theory based on the assumption that some constituent of protoplasm is ionized by β rays at a rate proportional to β ray intensity. The ions formed may 1. recombine or 2. combine with some other constituent in which as their number determines the value of the velocity coefficient of the reaction. An equation is developed which correctly describes results of experiments with *Nereis* eggs. The effect of temperature on the reaction rates is also considered theoretically and demonstrated by means of certain experimental results.

12062
THE PHYSIOLOGICAL ACTION OF IONIZING RADIATIONS. IV. THE COMPARISON OF β - AND X-RAYS. A. C.

Redfield and Jeanne Wertheimer. *Am. J. Physiol.* **68**, 368-378(1924).

The relative biological effectiveness of β and x-rays on *Nereis limbata* eggs is considered to depend on the degree to which the ions formed by them tend to recombine. When recombination is the same for β and x-rays, the physiological effects are also the same. The relationship between radiation intensity and physiological reaction rate are thought to be due to dense ion fields formed in paths of secondary particles. The temperature coefficient is 1:1 for the x-ray-induced physiological effect.

12063

THE SENSIBILITY OF BONY STRUCTURES TO RADIATIONS AND THE MECHANISM OF RADIO-NECROSIS OF BONES. C. Regaud. *Jour. Radiol. et Electrol.* **6**, 485-488(1922).

The author describes the effects of radiation on both normal and cancerous bone of patients receiving radiation therapy. Normal adult bone is considered to be more radiosensitive than skin if very short wave length radiation is used. The author emphasizes the importance of secondary radiation in bone (due to high Ca content). The secondary radiation is readily absorbed by connective tissue and blood vessels.

12064

EFFECT OF RADON ON CHLOROPHYLL CONTAINING CELLS. E. J. Rochlin-Gleichgewicht. *Vestnik Roentgen. i Radio.* **8**, 387-407(1930).

12065

THE EFFECT OF X-RAYS ON THE RATE OF CELL DIVISION IN THE EARLY CLEAVAGE OF PLANORBIS. A. Richards. *Biol. Bull.* **27**, 67-96(1914).

12066

EFFECT OF ROENTGEN RAYS ON THE TOBACCO, OR CIGARETTE, BEETLE AND THE RESULTS OF EXPERIMENTS WITH A NEW FORM OF ROENTGEN TUBE. G. A. Runner. *Jour. Agric. Res.* **6**, 383-388(1916).

12067

THE ACTION OF RADON "SEEDS" ON TUMOR AND LIVER CELLS OF THE RAT. S. Rues and G. M. Scott. *British Jour. Radiol.* **32**, 239-244(1927).

Jensen's rat sarcoma and rat liver exposed *in vivo* to radiation from radon "seeds" showed areas of destruction that tended to be proportional to radiation dose. Liver cells near blood vessels were more resistant than were cells more remote from them. Total dose rather than intensity determined the degree of damage observed.

12068

THE DIFFERENTIAL ACTION OF X-RAYS AND GAMMA RAYS UPON SOME LIVING TISSUES. S. Rues and G. M. Scott. *British Jour. Radiol.*, N S. **2**, 301-308(1920).

12069

RADIOACTIVE SUBSTANCES IN BODY FIVE YEARS AFTER DEATH. A. U. Saint George, A. O. Gettler, and R. H. Muller. *Archives of Pathol.* **7**, 397-405(1929).

12070

THE pH OF HUMAN MIXED SALIVA DURING IRRADIATION FROM INTRAORAL CARCINOMA. G. S. Sharp. *Amer. Jour. Roentg. and Rad. Ther.* **25**, 266-270(1931).

12071

BILE SALT METABOLISM. II. PROTEOSE AND X-RAY INTOXICATION. F. S. Smyth and G. H. Whipple. *Jour. Biol. Chem.* **59**, 637-659(1924).

An x-ray dose (1/3 minimum lethal dose) to the liver did not alter bile salt output in bile fistula dogs, but larger doses did result in decreased output. The effects of x-irradiation are compared with proteose intoxication and with effects of thyroxin.

12072

EFFECTS OF ULTRAVIOLET RAYS, RADIUM AND X-RAYS ON PROTEINS. Mona Spiegel-Adolf. *Arch. Path.* **12**, 533-542(1931).

The author placed crystals that fluoresce in the ultra-violet region when irradiated by Ra or x-rays in quartz tubes and immersed them in protein solutions. When these solutions were irradiated with x-rays or Ra, the protein coagulated, but they did not coagulate when similarly irradiated in the absence of the UV fluorescing crystal. Other observations on erythrocytes and paramecia are reported briefly.

12073

STUDY OF SKIN REACTIONS AFTER DIVIDED ROENTGEN RAY DOSAGE. W. Stenstrom and W. L. Mattick. *Amer. Jour. Roentg. and Rad. Ther.* **15**, 513-519(1926).

12074

CONCERNING THE VISIBILITY OF ROENTGEN RAYS. R. B. Taft. *Amer. Jour. Roentg. and Rad. Ther.* **28**, 245-248(1932).

12075

THE ACTION OF RADIUM UPON THE FORMATION OF BLOOD CAPILLARIES AND CONNECTIVE TISSUE. T. Takahashi. *British Jour. Radiol.*, N. S. **3**, 439-445(1930).

Injury and repair in young capillaries and fibroblasts (young rats) exposed to various doses of β and γ radiation from radium are described. No "stimulating" effect was observed.

12076

STUDIES ON X-RAY EFFECTS. II. STIMULATIVE ACTION ON THE LYMPHOCYTES. Marguerite Thomas, H. D. Taylor, and W. D. Wetherby. *Jour. Exp. Med.* **29**, 75-82(1919).

Changes in the lymphocyte counts of 9 rabbits exposed to low doses of x-rays from a Coolidge tube are described. Following an initial decrease, the counts were elevated 15-35 days after the smaller exposures only and this is considered to represent "stimulation."

12077

EFFECT OF HEAVY RADIATION ON PLEURA AND LUNGS. A. F. Tyler and J. R. Blackman. *Jour. Radiology* **3**, 469-475(1922).

12078

THE PREVENTION OF HYPERPLASIA OF THE THYROID IN THE OPOSSUM BY X-RAYS. O. M. Walters, B. J. Anson and A. C. Ivy. *Radiology* **18**, 583-591(1932).

The hyperplasia of the thyroid that occurs in opossums on a high protein diet was definitely decreased, but not entirely prevented, by the x-ray dosages used.

12079

INTESTINAL LESIONS AND ACUTE INTOXICATION PRODUCED BY RADIATION IN A VARIETY OF ANIMALS. S. L. Warren and G. H. Whipple. *J. Exptl. Med.* **38**, 741-752(1923).

Common laboratory animals are about equally sensitive to x-ray given over the abdomen. Clinical reaction following a minimum lethal dose is very similar and intestinal pathology identical. Rat and guinea pig are slightly more sensitive to x-ray than are dog, cat and rabbit. By contrast birds, frogs and reptiles are very resistant to x-ray and may tolerate 2 or 3 doses of radiation that would be lethal for dogs. The possibility that human intestinal tract is likewise sensitive to radiation must be considered in conditions where abdominal and pelvic radiation is being used.

12080

BACTERIAL INVASION OF THE BLOOD STREAM AS INFLUENCED BY X-RAY DESTRUCTION OF THE MUCOSAL EPITHELIUM OF THE SMALL INTESTINE. S. L. Warren and G. H. Whipple. *J. Exptl. Med.* **38**, 713-723(1923).

The authors describe their studies on dogs, showing that the x-ray has a specific effect upon the epithelium lining the crypts and covering the villi of the small intestine. A suitable dose of x-ray will destroy this epithe-

lumen in large measure, leaving empty crypts and naked villi exposed to swarms of bacteria in the intestine. Subsequently, an overwhelming invasion of the tissues, lymph and blood by intestinal bacteria does not occur. It is therefore suggested that the intestinal epithelium is not the all-important barrier which protects the tissues from invasion by intestinal bacteria.

12081

THE ACTION OF THE RAYS FROM RADIUM UPON SOME SIMPLE FORMS OF ANIMAL LIFE. E. G. Willcock. J. Physiol. 30, 449-454(1904).

Resistance to the lethal effect of radium rays varies with species (*Euglena irridis*, *Stentor irridis*, *Hydra irridis* and *Hydra fusca*). Chlorophyll-containing organisms tended to move away from the radiation.

12082

A SUMMARY OF THE EFFECTS OF REPEATED ROENTGEN RAY EXPOSURES UPON THE HUMAN SKIN, ANTECEDENT TO THE FORMATION OF CARCINOMA. S. B. Wolbach. Amer. Jour. Roentg. and Rad. Ther. 13, 139-143(1925).

12083

FURTHER STUDIES IN THE EFFECTIVENESS OF DIFFERENT WAVELENGTHS OF RADIATION. F. C. Wood. Radiology 5, 199-205(1924).

The author observed effects of radiation of different wave lengths on human skin, mouse and rat tumors and on *Drosophila* eggs and concluded that there is little or no difference between the action of short and long wave lengths of x-ray within the limits of ordinary practice.

12084

THE EFFECT ON TUMORS OF RADIATION OF DIFFERENT WAVELENGTHS. F. C. Wood. Amer. Jour. Roentgenol. 12, 474-481(1924).

12085

THE ACTION OF LIGHT, X-RAYS, AND RADIUM ON THE MOVEMENT OF CILLATED EPITHELIUM (A STUDY IN TISSUE CULTURE METHOD.) T. Umeda. (Japanese, English abstract.) Acta. Dermat. 10, 597-604(1927).

12086

THE EFFECT OF RADIUM RAYS ON THE PROTOPLASM OF A CELL. S. S. Wail and S. R. Frenkel. Ann. Roentg. et Radiol. 2, 140-143(1926).

In irradiated frog embryos, mitochondria and cytoplasmic granules are altered first, nuclear changes subsequently following exposure to radium rays.

12087

REVIEW OF THE THEORIES OF THE MECHANISM OF ACTION OF RADIATION IN THE TREATMENT OF CANCER. K. W. Steenstrom. Jour. Cancer Res. 9, 190-203(1925).

12088

LESIONS OF THE CORPUS STRIATUM BY RADIUM EMANATION AND THE ACCOMPANYING STRUCTURAL AND FUNCTIONAL CHANGES. D. J. Edwards and H. J. Bagg. Amer. Jour. Physiol. 65, 162-73(1923).

The authors produced lesions in the corpus striatum of dogs by means of buried radium emanation tubes. The gross and microscopic pathology of the well localized lesions are described. Neurological changes were observed when bilateral lesions were produced simultaneously. These included tremors and hypertonia immediately and, in animals maintained long enough (2-33 weeks), temporary dysphagia, dysarthria, conjunctivitis, clumsiness, tremor and hypertonia.

12089

INTRATHORACIC CHANGES INDUCED BY HEAVY RADIATION. W. A. Evans and T. Leucutia. Amer. Jour. Roentg. and Rad. Ther. 13, 203-220(1925).

Early and late clinical and roentgenographic changes in the chest following various therapeutic regimens (radiation therapy) are described and discussed.

12090

RADIUM THERAPY IN CANCER. J. Ewing. J. Am. Med. Assoc. 68, 1238-1247(1917).

PRECONCEPTION OVARIAN RADIUM IRRADIATION OF ALBINO RAT (*MUS NORVEGICUS ALBINUS*) A BIOLOGICAL STUDY. G. S. De Renyi, M. De Renyi, and D. P. Murphy. Am. J. Roentgenol. Radium Therapy 28, 764-83(1932).

12092

THE OCCURRENCE OF ROENTGEN PLEUROPNEUMONITIS IN TREATMENT OF BREAST CANCER. R. H. Fike. Am. J. Roentgenol. Radium Therapy 27, 509-512(1932).

12093

THE RELATION OF CHEMICAL, COLLOIDAL AND BIOLOGICAL EFFECTS OF ROENTGEN RAYS OF DIFFERENT WAVELENGTHS TO THE IONIZATION WHICH THEY PRODUCE IN AIR. II. ACTION OF ROENTGEN RAYS ON SOLUTIONS OF FERROSULPHATE. H. Fricke and S. Morse. Amer. Jour. Roentgenol. 18, 426-430(1927).

12094

BASIS FOR MAXIMUM PERMISSIBLE STANDARDS FOR INTERNAL EXPOSURE. R. S. Thompson, H. M. Parker, and H. A. Kornberg. Proc. of the International Conf. on the Peaceful Uses of Atomic Energy 13, 201(1956) United Nations, N. Y.

In order to establish MPC's for internal emitters in air or material that may be ingested, it is necessary to know: 1. permissible critical organ burden, 2. concentration of the radioisotope in air, water or material ingested and 3. limiting factors other than direct human ingestion, e. g. concentration along food chains. MPC values for P-239, Ru-106, I-131, P-32, Na-24 and H-3, are discussed critically.

12095

CHANGES IN THE PROTOPLASM OF NEREIS EGGS INDUCED BY β RADIATION. A. Forbes and Catharine Thacher. Amer. Jour. Physiol. 74, 567-578(1925).

12098

THE EFFECT OF α RAYS ON TISSUES IN CULTURE. H. C. Andersen and M. Fischer. Strahlentherapie 48, 500-507(1933). (In German).

12099

DEVELOPMENT OF THE EMBRYO AND BLASTODERM FROM X IRRADIATED EGGS. P. Ancel and P. Vintemberger. Compt. Rend. Soc. Biol. [Paris] 92, 172-174 (1925). (In French).

12100

EFFECT OF CELLULAR ACTIVITY ON THE MANIFESTATION OF X-RAY INDUCED LESIONS IN THE BLASTODERM OF THE IRRADIATED CHICKEN EGG. P. Ancel and P. Vintemberger. Compt. Rend. Soc. Biol. [Paris] 91, 1425-1428(1924). (In French).

12101

THE EFFECT OF X-RAYS ON EMBRYONIC DEVELOPMENT. DO THE RAYS HAVE AN ACCELERATING EFFECT? P. Ancel and P. Vintemberger. Arch. Biol. 35, 1-43(1925). (In French).

The authors describe effects observed in chick embryos and in fertilized frogs' eggs exposed to various doses of x-rays.

12102

EFFECT OF X-RAYS ON CLEAVAGE AND GASTRULA-

TION IN RANA FUSCA. P. Ancel and P. Vintemberger. Compt. Rend. Soc. Biol. [Paris] 91, 1267-1270 (1924). (In French).

12103

EFFECT OF ROENTGEN RAYS ON CELL DIVISION. W. Alberti and G. Politzer. Arch. Mikrosk. Anat. und Entwicklungsmech. (Roux) 103, 284-307 (1924). (In German).

Metaphase was found to be the most radiosensitive phase of the cell cycle in the studies reported on the cornea of salamander larvae.

12104

THE EFFECT OF α AND β RAYS ON PROTOPLASM. Nora Feichtinger. Protoplasma 14, 36-51 (1931). (In German).

Roots of Crepis virens were irradiated with α or β rays and the effects, when equal amounts of energy were absorbed, were compared. The effect was found to depend on the total number of ionizations produced and was the same for equal amounts of α and β radiation. Cytological changes observed in the irradiated cells are described.

12105

THE EFFECT OF ROENTGEN IRRADIATION ON CALCIUM AND POTASSIUM METABOLISM IN RABBITS. I. SERUM AND SKIN. K. Adler and O. Wiederhold. Strahlentherapie 44, 383-392 (1932). (In German).

12106

STUDIES ON THE CHANGES IN STRIATED MUSCLE DUE TO ROENTGEN IRRADIATION OF ANIMALS. L. Fedder and H. Hellner. Strahlentherapie 30, 682-705 (1928). (In German).

Irreparable damage to nuclei of myocardial muscle cells was observed.

12107

ANIMAL STUDIES ON THE CASTRATION DOSE OF RADIUM. K. Abe. Strahlentherapie 16, 554-559 (1924). (In German).

Unchanged primary follicles were found in both ovaries of rabbits after exposure to 1500 mg hrs. of radium placed over ovaries on the back. No intact primary follicles were formed after 2000 mg hrs. or more.

12108

EFFECT OF RADIUM SULFATE ON TOXINS. G. Fabre and E. Ostrovsky. Compt. Rend. Assoc. Franc. Av. Sci. 40, 122-123 (1911). (In French).

12109

ACTION OF RADIUM ON BACTERIAL TOXINS. G. Fabre and E. Ostrovsky. Compt. Rend. Assoc. Franc. Av. Sci. 40, 1004-1006 (1912). (In French).

12110

EFFECT OF RADIUM ON CULTURES OF PATHOGENIC PROTOZOA. R. Bruynoghe and A. Dubois. Compt. Rend. Soc. Biol. [Paris] 93, 840-850 (1925). (In French).

The authors studied pathogenicity and ability to multiply of certain Trypanosomes after x-irradiation in vitro. Irradiation can destroy infectivity (causing extreme retardation in cell division) after injection. This effect was observed in Leishmania tropica after 62 hours of exposure in vitro. Motility was maintained in spite of loss of ability to divide. T. inopinatum and T. ictero-hemorrhagiae were also studied. Cell division and pathogenicity could be affected separately.

12111

X-RAY EFFECTS ON CELL PERMEABILITY. K. Brummer. Strahlentherapie 21, 447-451 (1926). (In German).

Defibrinated blood of patients was irradiated with various x-ray doses and the permeability of cells to a dilute solution of methylene blue in isotonic saline was measured.

12112

A CASE OF PERNICIOUS ANEMIA DUE TO RADIUM.

Broule et Boulin. Bull. Mem. Soc. Med. Hospitaux Paris 12, 528 (1925). (In French).

12113

EFFECT OF ROENTGEN, RADIUM AND U-V RAYS ON THE COMPONENTS OF THE WASSERMAN REACTION. G. Brann. Zeitsch. Immunitätsf. und Exp. Ther. Orig. 44, 27-32 (1925). (In German).

12114

DOES HYPERSECRETION MODIFY THE RADIO SENSITIVITY OF THE SUBMAXILLARY GLAND? M. Brancovici. Compt. Rend. Soc. Biol. [Paris] 99, 757-758 (1928). (In French).

12115

EFFECT OF X RAY ON SILK WORM DEVELOPMENT. H. Bordier. Radium 2, 410 (1905). (In French).

12116

EFFECT OF X RAYS ON THE DEVELOPMENT OF THE CHICK EMBRYO. H. Bordier and J. Galimard. Arch. d'elec. Med. Exp. et Clin. 13, 491-494 (1905). (In French).

12117

ANTIBODIES AND ROENTGEN RAYS. M. Fiorini and A. Zironi. Arch. Electr. Med. 24, 113-116 (1914). (In French).

Roentgen irradiation did not affect the production of agglutinins or hemolysins by rabbits nor did it alter the agglutinability of typhoid bacilli in vitro.

12118

EFFECTS ON RADIUM ON FERTILIZED AND NON-FERTILIZED EGGS IN THE FIRST DEVELOPMENTAL STAGES. Georges Born. Compt. Rend. Acad. Sci. [Paris] 136, 1085-1086 (1903). (In French).

The radiation was lethal to spermatozoa, damaging the naked chromatin, but stimulated the chromatin of the egg, protected by protoplasm, to undergo parthenogenesis.

12119

ACTION OF RADIUM RAYS ON YEAST. A. Kotzareff and F. Chodat. Compt. Rend. Soc. Phys. et Hist. Nat. Geneve 40, 36-39 (1923). (In French).

12120

EFFECT OF ROENTGEN RAYS ON PLANTS. M. Kornicke. Handb. Ges. Anwend. Elektr. 3, Teil 3., Heft 3, (1922). (In German).

12121

MICROCHEMICAL AND CYTOLOGICAL STUDY ON THE EFFECT OF ROENTGEN RAYS ON PLANT TISSUES. H. Komuro. Fortsch. Geb. Roentgens. 41, 984-989 (1930). (In German).

The author describes studies concerning the staining reaction of Vicia faba root tips after irradiation.

12122

SIGNIFICANCE AND PREVENTION OF ROENTGEN CATARACTS. M. Cremer. Strahlentherapie 36, 732-735 (1930). (In German).

12123

ON DELAYED REACTIONS OF SKIN, MOUTH AND PHARYNX AFTER X-IRRADIATION. H. Coutard. Compt. Rend. Soc. Biol. [Paris] 86, 1140-1142 (1922). (In French).

Irradiation produces severe damage to skin and mucous membranes, but these heal apparently completely. Greater doses cause longer reaction and more pain.

12124

AN EFFECT OF ROENTGEN RAYS ON THE RABBIT OVARY. H. V. Klein. Strahlentherapie 25, 443-456 (1927). (In German).

A dose of 4 H units (0.2 mm Zn and 1 mm Al filtration) was delivered over the ovaries of nine-week old rabbits. An identical dose was delivered three weeks later and caused pronounced estrus and sexual hyperesthesia for several weeks. The results were interpreted as indicating that part of the germinal epithelium was injured and the

uninjured part underwent compensatory growth, resulting in increased exocrine and endocrine secretion by the ovary. A stronger dose would be required to obtain ovulation while preserving the interstitial gland tissue in the mature rabbit.

12125

EFFECT OF RADIATIONS ON VAGAL EXCITABILITY. P. Chailey-Bert and A. Zimmern. *Compt. Rend. Soc. Biol. [Paris]* 100, 719(1929). (In French).

Arterial blood pressure, pulse rate and amplitude and cardiac rhythm were used as criteria of radiation effect on the vagus nerve of dogs that had been irradiated (under anesthesia) over exposed vagus nerve in the neck. Effects of x-rays and ultraviolet were compared. Radiation (both x-ray and U-V) decreased the amplitude and increased the rate of the pulse, depressed the oculocardiac reflex (more with x-rays than with U-V) and modified the excitability of the vagus nerve.

12126

12130

THE EFFECT OF ROENTGEN RAYS ON WOUND HEALING. S. Fukase. *Strahlentherapie* 36, 102-115(1930). (In German).

Wound healing of surgical incisions on the abdomen of rabbits was studied. One half of each wound was x-irradiated, the other half being shielded with Pb. The x-irradiated half healed by primary intention, the shielded half developed granulation tissue first. The author interprets this as a repression of inflammation of x-rays.

12131

HISTOGENESIS OF REGENERATION IN THE PLANARIAN. O. Bartsch. *Arch. Mikrosk. Anat. und Entwicklungsmech.* (Roux) 99, 187-221(1923). (In German).

12132

ON THE PHYSIOLOGICAL EFFECT OF BEQUEREL RAYS. H. von Bayer. *Zeitschr. Allg. Physiol.* 4, 79-86(1904). (In German).

12133

BACTERICIDAL EFFECTS OF ROENTGEN RAYS. C. Fried. *Strahlentherapie* 21, 56-72(1926). (In German).

The bactericidal power of venous blood of various patients was increased after the patients had received x-ray exposures (therapeutic). Irradiation of blood or serum in vitro had no such effect.

12134

EFFECT OF X RAYS ON LYMPHOCYTOMA (CLINICAL AND HISTOLOGICAL STUDY.) J. Belot, L. Nahen and Cailhau. *Jour. Radiol.* 9, 305-315(1925). (In French).

12135

EXPERIMENTAL STUDIES ON THE RADIOSENSITIVITY OF THE ADRENAL GLAND. H. Frey. *Acad Radiologia* 9, 23-53(1928). (In German).

The author observed transient hyperemia and retardation of cell division in the adrenal after irradiation.

12136

VITAL STAINING OF RELICULOENDOTHELIAL ELEMENTS AFTER ROENTGEN IRRADIATION. E. Benassi. *Radiol. Med.* 16, 874-891(1929). (In Italian).

12137

THE EFFECT OF ROENTGEN RAYS ON HEMOLYTIC COMPLEMENT OF GUINEA PIGS. E. Frankel. *Berl. Klin. Wochenschr.* 49, 2030-2032(1912). (In German).

The level of hemolytic complement in x-irradiated guinea pigs is shown to vary independently of the leukocyte count, although in general, severe leukopenia was accompanied by poor complement fixation. Small doses (fractionated doses) applied over several weeks caused decreased complement level in only a few animals. Following a single exposure to 2-2.4 erythema doses, most animals were severely ill after about the 10th post-exposure day. In spite of this severe debilitation, there was no depression of complement titre. No clear relationship was demonstrated between dose and titre.

12138

EFFECT OF ROENTGEN RAYS ON AGGLUTININS. E. Frankel and K. Schilling. *Berl. Klin. Wochenschr.* 50, 1299-1301(1913). (In German).

12139

THE EFFECT OF THORIUM X INJECTIONS ON AGGLUTININS. E. Frankel and F. Gumpertz. *Berl. Klin. Wochenschr.* 51, 209-210(1914). (In German).

Injections had very little effect on production of typhoid agglutinin except when very large radiation doses were given.

12140

THE PHARMACOLOGICAL EFFECT OF RADIOACTIVITY. A. Benedicenti. *Soc. Ital. Biol. Sper.* 7, 363-424(1932). (In Italian). CA 26-5660

12141

ACTION OF X RAYS ON RABBIT RED BLOOD CELLS. J. L. Bergonie and Tribondeau. *Arch. Elect. Med.* 16, 597(1908). (In French).

12142

EFFECT OF RADIUM ON TISSUES IN VITRO. A. Fischer and M. Horowitz. *Strahlentherapie* 40, 465-469(1931). (In German).

Using chick embryo connective tissue cells, the authors observed a latent period between exposure to radium rays and manifestations of injury. Length of latent periods appeared to be independent of mitotic rate at the time of exposure.

12143

PHYSIOLOGICAL AND MORPHOLOGICAL CHANGES IN THE CHICK EMBRYOS EXPOSED TO RADIOACTIVE SUBSTANCES. U. Bisceglie and G. Bucciardi. *Arch. Exp. Zellforsch.* 7, 444-483(1929). (In Italian).

12144

HISTOLOGY OF ROENTGEN IRRADIATED SKIN. H. G. Bode. *Strahlentherapie* 40, 515-545(1931). (In German).

The author describes histological changes in the skin of guinea pigs following x-irradiation with and without local application of the sensitizing agents, 1. croton oil or 2. chrysarobin.

12145

HISTOLOGICAL CHANGES IN ROENTGEN IRRADIATED SKIN. H. G. Bode and E. Riecke. *Strahlentherapie* 35, 265-288(1930). (In German).

The authors describe the histological picture of the skin of guinea pigs and rabbits at various times after x-irradiation. Skin of some animals had local application of chrysarobin, croton oil or salvarsan prior to irradiation.

12146

EFFECT OF X-RAYS ON BLOOD CELLS IN VIVO AND IN

VITRO. G. Ollino. Clin. Med. Ital. 54, 373-79(1915). (In Italian).

12147

THE EFFECT OF PENETRATING RADIUM RAYS ON SERUM AND EGG ALBUMEN. A. Fernau. Biochem. Zeitsch. 167, 380-383(1926). (In German).

12148

ALTERATIONS IN PROTOPLASMIC VISCOSITY DUE TO RADIATION. Nora Feichtinger. Naturwissenschaften 21, 569-575, 589-591(1933). (In German).

12149

THE SIGNIFICANCE OF THE TIME FACTOR IN DECREASING THE RADIUM RADIATION EFFECT ON EUDORINA ELEGANS. A. Luntz. Strahlentherapie 41, 132-134(1931). (In German).

The effects of single fractionated dose and the effects of 2 dose fractions administered from 0-40 hours apart as well as effects of exposure at some earlier time were studied using the lethal effect of eudorina elegans as an end point.

12150

CHANGES IN THE LIVER DUE TO ROENTGEN IRRADIATION. M. Ludm. Strahlentherapie 19, 138-41(1925). (In German).

The author describes histological changes in livers of guinea pigs and rabbits exposed to various (large) doses of unfiltered x-rays. Changes included: hyperemia, chromatin abnormalities in parenchymal cells and lymphocytic infiltration of Ghisson's capsule.

12151

EXPERIMENTAL STUDIES ON THE QUESTION OF THE BIOLOGICAL EFFECT OF ROENTGEN RAYS. A. Low-Beer. Strahlentherapie 46, 469-516(1933). (In German).

Author describes results of his studies on the effects of x-irradiation on cholesterol in solution and on the cholesterol level in x-irradiated mice and humans.

12152

RADIUM IN BIOLOGY AND MEDICINE. E. S. London. Leipzig. Akadem. Verlagsgesellschaft. (1911). 197p. (In German).

12153

THE INCREASED RESISTANCE AND THE INCREASED ANTIBODY LEVEL DUE TO BONE MARROW IRRITANTS, THORIUM X AND ARSENICALS. H. Lippmann. Zeitsch. Exp. Path. Therap. 16, 124-140(1914). (In German).

Thorium x increases the production of erythrocytes and leukocytes, stimulates antibody production and the production of new agglutinins. It protects mice against death following injection of a fatal dose of pneumococci. Thorium x does not change a negative Wasserman test to a positive during sero-negative stage of infection as does salvarsan which acts directly on the spirochetes and destroys them, liberating fresh antigen into the circulation.

12154

ON THE SIGNIFICANCE OF BETA RAYS IN THE BIOLOGICAL EFFECT OF ROENTGEN RAYS. A. Liechtl. Acta. Radiol. 5, 385-394(1926). (In German).

The author studied the effects of secondary rays from bright and colloid metals on *B. prodigiosus* and on skin and testes of rabbits. The effect of 2° rays on the dose measurement in x-ray therapy is considered. Secondary β rays are considered to be of decisive importance in the biological effectiveness of x-rays. The author proposes that there is a "membrane effect" of x-rays and supports this by citing experiments in which the potential difference between oil and glass chains was increased by x-rays. Other experiments are also cited.

12155

THE EFFECT OF SECONDARY RAYS FROM METALS. A. Liechtl. Klin. Wochensh. 3, 825-828(1924). (In German).

A metal with an atomic number of 47-51 or 79-90 or the salt of such a metal, emits (under fixed operating conditions of the x-ray tube) secondary radiation which greatly increases the total radiation dose delivered to *B. prodigiosus*. The mechanism of the effect is discussed, the ultimate biological effectiveness being attributed to the production of secondary β rays in the bacteria.

12156

THE PHYSICO-CHEMICAL EFFECT OF ROENTGEN RAYS IN LIVING ORGANISMS. G. D. Lieber. Strahlentherapie 20, 93-102(1925). (In German).

The author describes results of histochemical studies of hair follicles of dogs, white rats and guinea pigs following x-irradiation.

12157

MICROSCOPIC STUDIES ON THE EFFECT OF RADIUM RAYS ON EMBRYONIC AND REGENERATIVE DEVELOPMENT. O. Levy. Arch. Entwicklungsmech. 21, 130-49 (1906). (In German).

12158

EXPERIMENTAL STUDIES ON THE REACTION OF THE ROENTGEN IRRADIATED ANIMAL TO BACTERIAL INFECTION WITH RESPECT TO PRODUCTION OF SPECIFIC ANTIBODIES. A. Lawen. Mitt. Grenzgeb. Med. Chir. 19, 141-186(1909). (In German).

12159

ON THE EFFECT OF ROENTGEN RAYS OF VARIOUS WAVE LENGTHS ON BIOLOGICAL OBJECTS. IV. H. Langendorff, M. Reuss and A. Reuss. Strahlentherapie 46, 655-662(1933). (In German).

The lethality curve for algae has the same shape for x-rays with wave lengths of 0.56 Å and 1.54 Å. The curve is of an entirely different shape than the lethality curve using UV radiation, however, The "time factor" is very small with algae, the dark shield exponent being at least 0.98-1.0.

12160

CHANGES IN SEMINAL EPITHELIUM PRODUCED BY THE RAYS OF URANIUM X. A. Lacassagne, J. Lattes, and G. Fournier. Compt. Rend. Soc. Biol. [Paris] 99, 1643(1928). (In French).

12161

EFFECT OF RADIATIONS ON BLOOD LEUKOCYTES STUDIED BY MEANS OF TISSUE CULTURES. A. Lacassagne and H. Gricouff. Jour. Radiol. et Elect. 11, 573-580 (1927). (In French).

The authors interpret their experimental studies of rabbit leukocytes irradiation in vitro with x-rays, α , β or γ rays and in vivo studies of irradiated animals as indicating that radiation leukopenia is due to injury of leukopoietic centers and decreased production of cells. Among criteria of x-ray effects in the in vitro studies were: cell survival, motility, migration, nuclear pyknosis, transformation to macrophages, epithelioid and giant cells.

12162

UNEQUAL ABSORPTION OF THE TWO TYPES OF RAYS FROM URANIUM X AS DEMONSTRATED BY THEIR DIFFERING BIOLOGICAL EFFECTS. A. Lacassagne, G. Fournier, and J. Lattes. Comp. Rend. Soc. Biol. [Paris] 99, 1641(1928). (In French).

Finely ground uranium and thorium fluoride were incorporated in paraffin, placed in small cylinders (trophs) and imbedded in the testes of adult dogs. Histo-pathological changes in testes at various distances from the source are described. The greatest effect was observed in the seminal epithelium.

12163

CYTOLOGICAL CHANGES IN PARAMECIA EXPOSED TO RADIATION OF MESOTHORIUM. E. Markowits. Arch. Zellforsch. 16, 238-248(1922). (In German).

Major changes observed in the irradiated paramecia were: 1. reduction in size and disintegration of macronuclei, 2. stickiness of macronuclei during division, 3. failure of micronuclear division, 4. liquefaction of plasma and withdrawal from the pellucida and 5. reduction in the size of the progeny.

12164

ROENTGEN RADIATION AND BLOOD CELL SEDIMENTATION RATE. F. von Mikulicz-Radecki. Zentralbl. Gynak. 47, 1075-1076(1928-1932). (In German).

An explanation of the different relationships after intense x-irradiation demonstrated, in the majority of the cases, a distinct fall in the "sinking slowness." The observed results, which are in contrast to the expected results, suggest that there is either a direct alteration of the electric charge of the red cells or an alteration of the fibrinogen due to the x-rays.

12165

EFFECT OF EMANATIONS OF RADIUM ON THE REPRODUCTIVE RHYTHM AND THE MORPHOLOGY OF COLPIDIUM COLPODA. G. Meldolei and G. Reverberi. Boll. Ist. Zool. R. Univ. Roma 8, 1-35(1930). (In Italian).

12166

THE COMBINED ACTION OF RADIUM AND CHEMICAL AGENTS ON PLANTS. G. Nadson and A. Jolkevitch. Ann. Roentgenol. et Radiol. 2, 11-39(1926). (In French).

Chemical agents such as iodine, potassium iodide, copper sulfate, chloral hydrate and eosin, introduced into *sinapis alba* either before or after exposure to radium irradiation enhanced the effects of the radiation. Development was more retarded and pathological changes were greater following exposure to the two types of agents than following exposure to only one. On the basis of such observations on *sinapis alba* and other organisms, the author proposes that the effect of radium and x-rays in man after the introduction of colloidal metals is not due to secondary rays but to the additional effects of the second agent. The implications with respect to radiation therapy are discussed.

12167

THE EFFECT OF RADIUM ON YEAST AND THE GENERAL EFFECTS OF RADIUM ON LIVING SYSTEMS. G. A. Nadson. Ann. Roentgenol. et Radiol., Leningrad 1, 47-96 (1922). (In German).

Effect of x-rays, and β and γ rays of radium in yeasts, molds and bacteria demonstrate that the radiations cause premature aging in the organisms and sometimes even death due to acceleration of vital processes.

12168

THE EFFECT OF IRRADIATED SPERM ON THE DEVELOPMENT OF THE SEA URCHIN EGG. O. Hertwig. Arch. Mikrosk. Anat. 82, 1-63(1913). (In German)

12169

EFFECT OF RADIUM RADIATION ON THE UNFERTILIZED FROG EGG AND ITS DEVELOPMENT AFTER FERTILIZATION WITH NORMAL SPERM. G. Hertwig. Arch. mikrosk. Anat. 77, 165-209(1911). (In German).

12170

RADIATION EFFECTS ON METABOLISM AND DEVELOPMENT IN: HANDBOOK OF RADIATION THERAPY, BIOLOGY, AND PATHOLOGY. VOL. 1. J. F. Bergmann. Munchen(1927).

12171

A LITERATURE SURVEY OF RADIUM EXPERIMENTS IN BIOLOGY. G. Hertwig. Strahlentherapie 11, 821-850 (1920). (In German).

12172

EFFECTS OF RADIUM RADIATIONS ON COLLOIDS, HEMOGLOBIN, ENZYMES AND RED BLOOD CELLS

V. Henri and A. Mayer. Compt. Rend. [Paris] 138, 521-524(1904). (In French).

12173

ROENTGEN RAY EFFECTS ON THE ERYTHROCYTES. E. Hayer. Strahlentherapie 33, 196-198(1929). (In German).

The author describes results of studies of the saponin-resistant central zone of red blood cells in agar plates when cellophane or aluminum filters are introduced between the cathode tube and the agar plates.

12174

EFFECTS OF CATHODE RAYS ON ERYTHROCYTES IN BLOOD AGAR PLATES. W. Hausmann and W. E. Pauli. Strahlentherapie 30, 350-58(1928). (In German).

Irradiation of blood agar plates with cathode rays resulted in a ring-shaped area of hemolysis, the central erythrocytes remaining unhemolyzed. These cells were also resistant to lysis by saponin.

12175

BIOLOGICAL EFFECTS OF RADIUM. W. Hausmann and W. Kerl. Strahlentherapie 11, 1027-1033(1920) (In German)

The authors describe the *in vitro* hemolysis of human erythrocytes by the γ rays of radium, and the intensification of this hemolysis by means of calcium tungstate.

12176

ROENTGEN RAY EFFECT ON VITAL STAINING OF TISSUES. L. Halberstadter and O. Wolfsberg. Fortsch. Geb. Roentgenstr. 29, 545-551(1922). (In German).

The rates and characteristics of vital staining of various tissues after irradiation of experimental animals with various doses are described. Lower doses were required to cause marked vital staining of parenchyma than were required for similar staining of connective tissue. The latent period between irradiation and staining is also shorter for parenchyma.

12177

STIMULATING AND DAMAGING EFFECTS OF ROENTGEN RAYS ON ANIMAL TISSUES STUDIED BY VITAL STAINING. L. Halberstadter and O. Wolfsberg. Zeitsch. Ges. Exp. Med. 32, 367-377(1923). (In German)

12178

HISTOLOGICAL STUDY OF X-RAY EFFECTS ON THE OVARY DURING OOGENESIS. G. Gricouloff. Arch. Inst. Radium, Univ. Paris. 2, 1-80(1930). (In French).

12179

THE EFFECT OF ROENTGEN RAYS OF VARIOUS WAVE LENGTHS ON BIOLOGICAL SYSTEMS. III. R. Glocker, H. Langenforff, and A. Reuss. Strahlentherapie 46, 517-528(1933). (In German).

The yeast, *Saccharomyces ellipsoideus*, gave different lethality curves after exposure to 0.56 Å and 1.54 Å x-rays. These are compared with lethality following exposure to α particles and interpreted with respect to the penetrating power of the radiations.

12180

THE EFFECT OF ROENTGEN RAYS OF VARIOUS WAVE LENGTHS ON BIOLOGICAL SYSTEMS. I. R. Glocker and A. Reuss. Strahlentherapie 46, 137-160(1933). (In German).

Lethality curves for beans after exposure to 0.18, 0.56 or 1.54 Å x-rays are interpreted in light of the hit theory and are compatible with it. The shape of the curve does not depend upon the time factor when the duration of radiation is short compared to the rate of growth and when the dark shield exponent is slightly different from one. The results of experiments with α particles are also reported.

12181

DIPHtheria TOXIN AND ROENTGEN RAYS. H. Gerhartz.

Berl. Klin. Wochenschr. 46, 1800-1802(1909). (In German).

12182

STUDIES ON SO-CALLED GRENZ RAYS. G. Gabriel. Strahlentherapie 26, 189-199(1927). (In German).

The author studied the production of erythema in the rabbit using low KVP x-rays.

12183

BIOLOGY OF ROENTGEN RAYS. K. Kovacs. Strahlentherapie 26, 313-328(1927). (In German).

Lethality of paramacia after irradiation in various chemical and biochemical solutions and solutions of hormones was determined.

12184

EFFECT OF X-RAYS ON PERMEABILITY OF THE CELL MEMBRANE. K. Kovacs. Strahlentherapie 30, 77-85(1928). (In German).

The author studied dye diffusion through frog heart after irradiation *in vivo* and *in vitro*.

12185

ROENTGEN RAY EFFECTS ON TISSUES. C. Koretz. Strahlentherapie 22, 319-321(1926). (In German).

In vivo and *in vitro* measurement of changes in permeability of frog leg skin to salt, sugar and dye after x-irradiation are reported. Other studies (infusion of normal saline and grape sugar solution into the peritoneal cavity of dogs and guinea pigs) were also performed to determine the effect of irradiation.

12186

CHANGES IN THE COMPOSITION OF THE BLOOD AFTER ROENTGEN IRRADIATION. C. Kroetz. Strahlentherapie 18, 545-555(1924). (In German).

The author studied acid-base equilibria in dogs and rabbits after x-irradiation.

12187

NEW DATA ON THE PHYSICO-CHEMICAL AND BIOLOGICAL PROPERTIES OF ROENTGEN RAYS. K. Kovacs. (Hungarian). Festsch. Bela Entz. 182-190(1928).

12188

ROENTGEN RAYS AND COMPLEMENT. A. Merlino. Giorn. Batt. Immunol. 4, 522-535(1929).

12189

INJURIOUS EFFECTS OF GRENZ RAYS. M. Monacelli. Strahlentherapie 35, 581-591(1930). (In German).

Late effects of irradiation in patients receiving radiation therapy for various skin conditions such as psoriasis and acne are described. Prominent and major late effects include: telangiectases, vascular spiders, atrophy and depigmentation. Histological sections of some lesions are shown.

12190

DIPHThERIA TOXIN AND ROENTGEN RAYS. J. Morgenroth. Berl. Klin. Wochenschr. 46, 1962(1909). (In German).

12191

EFFECT OF ROENTGEN RAYS ON BONES. W. Muller. Strahlentherapie 16, 1018-1019(1924). (In German).

Rabbits with fractures of radius were treated with small roentgen ray doses and healing was compared with healing unirradiated controls with similar fractures.

12192

EFFECT OF HIGH ENVIRONMENTAL TEMPERATURE AND ROENTGEN RAYS ON ANTIBODY PRODUCTION. P. T. Muller. Sitzungsber. K. Akad. Wiss. Wien. Math.-Nat. Kl. 114(3), 479-496(1905). (In German).

12193

RADIUM EMANATION AND MUSCLE IMBIBITION. P. Mascherpa and A. Sgro. Boll. Soc. Ital. Biol. Sper. 8, 479-484(1933). (In Italian).

Muscle preparations were exposed *in vitro* to solutions of radium emanation. During the first 8 hours of exposure, substances moved rapidly from the muscle into the water and muscle weight decreased. Large doses of emanation

produced muscle weight loss very soon after exposure. Electrical conductivity of the water in which control muscle preparations were immersed was always greater than that of the radioactive water.

12194

ALTERED CELL PERMEABILITY DUE TO ROENTGEN IRRADIATION, PHOSPHOROUS EXCRETION BY SURVIVING TUMOR AND LIVER SLICES. M. A. Magath. Zeitsch. Krebsforsch. 31, 95-104(1930). (In German).

12195

CHANGES IN RED CELL SEDIMENTATION RATE DUE TO ROENTGEN IRRADIATION. F. von Mikulicz-Radecki. Strahlentherapie 16, 222-231(1923-24). (In German).

12196

STUDIES ON THE RELATIONSHIPS BETWEEN ROENTGEN RAYS AND CALCIUM EFFECT ON TUMOR TISSUE. M. A. Magath and M. J. Kolomijetz. Zeitsch. Krebsforsch. 60, 457-472(1930). (In German).

12197

IRRADIATION AND ADRENAL AND PITUITARY FUNCTION. Z. M. Bacq, P. Martinovic, P. Fischer, M. Pavlovic and G. Sladic. p. 237. "Advances in Radiobiology." (Proc. of Fifth Internat. Conf. on Radiobiology, held in Stockholm, Aug. 15-19, 1956). J. S. Mitchell, B. E. Holmes and C. L. Smith, Editors. Springfield, Ill., Charles C. Thomas Co. U. S. Pub. 1956.

12198

CHANGES IN THE REACTIVITY OF THE ORGANISM UNDER THE INFLUENCE OF IONISING RADIATION. O. Bogomolets, A. Boico, G. Diadiucha, Z. Zekhova, V. Lavrick and G. Levitchouk. p. 231. "Advances in Radiobiology." (Proc. of Fifth Internat. Conf. on Radiobiology, held in Stockholm, Aug. 15-19, 1956). J. S. Mitchell, B. E. Holmes, and C. L. Smith, eds. Springfield, Ill., Charles C. Thomas Co., 1956.

Dogs, rats and rabbits were x-irradiated with large single doses and treated, after exposure, with antireticular cytotoxic serum. Observations included, opsonocytaphagic index, coefficient of a trypan blue skin test, cellular composition of wound exudate; changes in protein composition, cellular composition and oxygenation of blood, clinical observations of acute radiation syndrome and histopathological studies (marrow, spleen, connective tissue).

12199

MODIFICATION OF THE X-RAY REACTION IN THE SKIN OF MICE BY SHIELDING OF MINUTE AREAS OF THE SKIN. F. Devik. p. 226 "Advances in Radiobiology." (Proc. of Fifth Internat. Conf. on Radiobiology, held in Stockholm, Aug. 15-19, 1956). J. S. Mitchell, B. E. Holmes and C. L. Smith, eds. Springfield, Ill., Charles C. Thomas Co., 1956.

A flap of loose skin on mice from a hairless strain was exposed to 2700 r or 4000 r of 50 kv x-rays. Four platinum wires of 0.05 mm diameter were placed in contact with the skin and parallel to each other during exposure to provide a thin layer of shielded skin. Skin reactions were observed daily, biopsy specimens were taken from animals sacrificed 4-14 days post-exposure.

12200

STUDIES ON THE MECHANISM OF POST-IRRADIATION PROTECTION. E. L. Simmons, L. O. Jacobson and J. Denko. "Advances in Radiobiology." (Proc. of Fifth Internat. Conf. on Radiobiology, held in Stockholm, Aug. 15-19, 1956). J. S. Mitchell, B. E. Holmes and C. L. Smith, eds. Springfield, Ill., Charles C. Thomas Co., 1956.

Studies were done to investigate the nature of late alterations in immunity pattern on irradiated CF₁ mice that had recovered following marrow transplants from several

different donor strains. The CF₁ mouse is normally resistant to leukemia P-1534; DBA mice are susceptible. Irradiated mice surviving after treatment with cells from leukemia-susceptible donors retained their acquired susceptibility as late as 68 days after 750 r. Studies on irradiated rabbits protected with mouse cells are also reported briefly, as are chick embryo cell-protected mice studies.

12201

THE INFLUENCE OF IONISING RADIATION UPON THE NATURAL IMMUNITY. V. L. Troitsky, M. A. Tumanjan and A. J. Friedenstern. p. 221 "Advances in Radiobiology." (Proc. of Fifth Internat. Conf. on Radiobiology, held in Stockholm, Aug. 15-19, 1956). J. S. Mitchell, B. E. Holmes and C. L. Smith, eds. Springfield, Ill., Charles C. Thomas Co., 1956.

12202

CHANGES IN THE RABBIT TIBIA AND AN ESTIMATION OF THE DOSE RECEIVED BY THE BONE TISSUE FOLLOWING A SINGLE INJECTION OF STRONTIUM. M. Owen and J. Vaughan. p. 287 "Advances in Radiobiology." (Proc. of Fifth Internat. Conf. on Radiobiology, held in Stockholm, Aug. 15-19, 1956). J. S. Mitchell, B. E. Holmes and C. L. Smith, eds. Springfield, Ill., Charles C. Thomas Co., 1956.

12203

BONE AND RADIOSTRONTIUM - AN ATTEMPT TO EVALUATE THE DOSE DISTRIBUTION. F. Björnerstedt, C. J. Clemedson, A. Engstrom and A. Nelson. p. 294 "Advances in Radiobiology." (Proc. of Fifth Internat. Conf. on Radiobiology held in Stockholm, Aug. 15-19, 1956). J. S. Mitchell, B. E. Holmes and C. L. Smith, eds. Springfield, Ill., Charles C. Thomas Co., 1956.

12204

DECONTAMINATION STUDIES. (A SIMPLE *IN VITRO* SYSTEM TO STUDY THE INTERACTION OF RADIOACTIVE METALS WITH PROTEINS FROM BODY FLUIDS AND TISSUES.) R. Lewin, B. Rosoff, H. E. Hart, K. G. Stern and D. Laszlo. p. 29 "Advances in Radiobiology." (Proc. of Fifth Internat. Conf. on Radiobiology held in Stockholm, Aug. 15-19, 1956). J. S. Mitchell, B. E. Holmes, and C. L. Smith, eds. Springfield, Ill., Charles C. Thomas Co., 1956.

This is a report of an *in vitro* system using 3% solution of crystalline bovine albumin in saline, used in studying the interaction of body fluids with Y-90 at 2 pH levels. Two yttrium chelates were tested for their ability to keep the metal in a diffusible state.

12205

IODINATED TYROSINES AND RADIOSENSITIVITY IN THYROTOXICOSIS. J. D. Abbatt and H. E. A. Farran. p. 305 "Advances in Radiobiology." (Proc. of Fifth Internat. Conf. on Radiobiology held in Stockholm, Aug. 15-19, 1956). J. S. Mitchell, B. E. Holmes and C. L. Smith, eds. Springfield, Ill., Charles C. Thomas Co., 1956.

Authors describe studies on the blood of patients being treated with I-131 for thyrotoxicosis.

12206

THE RADIATION EXPOSURE OF THE ORGANISM BY INHALATION OF NATURALLY RADIOACTIVE AEROSOLS. W. Jacobi, K. Auran and A. Schraub. p. 310 "Advances in Radiobiology." (Proc. of Fifth Internat. Conf. on Radiobiology held in Stockholm, Aug. 15-19, 1956). J. S. Mitchell, B. E. Holmes and C. L. Smith, eds. Springfield, Ill., Charles C. Thomas Co., 1956.

12207

NUCLEIC ACIDS AND AMINO ACID INCORPORATION. E. F. Gale. p. 174 "Ionizing Radiations and Cell Metabolism." (Ciba Foundation London, England). G. E. W. Wolsten-

holme and C. M. O'Connor, eds. Boston, Mass. Little, Brown and Co., 1956.

Disrupted staphylococcal preparations exposed to x-ray doses of 50,000 r or 150,000 r showed no change in the ability of their RNA or DNA to promote glycine incorporation.

12208

EFFECTS OF LONG-TERM IRRADIATION ON LYSOGENIC BACTERIA. H. Marcovich and R. Latarjet. p. 281 "Advances in Radiobiology." (Proc. of Fifth Internat. Conf. on Radiobiology held in Stockholm, Aug. 15-19, 1956). J. S. Mitchell, B. E. Holmes and C. L. Smith, eds. Springfield, Ill., Charles C. Thomas Co., 1956.

The authors determined the percent of bacteria induced (lysogenic *E. coli*) as a function of x-ray dose over a wide range of doses.

12209

RESTORATION OF PRIMORDIAL FOLLICLES IN THE IRRADIATED OVARY. P. Dasaive. p. 274 "Advances in Radiobiology." (Proc. of Fifth Internat. Conf. on Radiobiology held in Stockholm, Aug. 15-19, 1956). J. S. Mitchell, B. E. Holmes and C. L. Smith, eds. Springfield, Ill., Charles C. Thomas Co., 1956.

A dose of 2500 r completely and permanently sterilizes the ovarian follicular apparatus in rabbits. A non-sterilizing dose of 1050 r is followed by restoration, eventual effects of which are more important than those following the same total dose in 5 fractions at 48 hour intervals. Results indicate an increased radiosensitivity of the primordial follicles on the days immediately following the first fractionated irradiation. This increase enhances the efficiency of succeeding dose fractions.

12210

STUDIES ON THE TIME-INTENSITY FACTOR AFTER WHOLE-BODY X-IRRADIATION. B. Rejewsky, K. Auran and I. Wolf. p. 267 "Advances in Radiobiology." (Proc. of Fifth Internat. Conf. on Radiobiology, held in Stockholm, Aug. 15-19, 1956). J. S. Mitchell, B. E. Holmes, and C. L. Smith, eds. Springfield, Ill., Charles C. Thomas Co., 1956.

The authors studied survival time, LD₅₀ as a function of dose rate (0-60 Kr/day), and mortality curves in male and female mice. The sexes respond differently to long continued radiation.

12211

EFFECTS OF RADIATION ON AGEING. H. J. Curtis and R. Healy. p. 261 "Advances in Radiobiology." (Proc. of Fifth Internat. Conf. on Radiobiology, held in Stockholm, Aug. 15-19, 1956). J. S. Mitchell, B. E. Holmes, and C. L. Smith, eds. Springfield, Ill., Charles C. Thomas Co., 1956.

The authors compared the effect of x-rays, typhoid infection and nitrogen mustard on life span of mice. They also studied the effect of treatment, after recovery from one exposure, with one of the three agents not used initially. An effort was made to evaluate the state of capillary circulation in treated and untreated animals.

12212

EFFECT OF WHOLE-BODY IRRADIATION AND VARIOUS DRUGS ON ERYTHROPOIETIC FUNCTION IN THE RAT. STUDIES WITH RADIOACTIVE IRON. L. F. Lamerton and E. H. Belcher. p. 321 "Advances in Radiobiology." (Proc. of Fifth Internat. Conf. on Radiobiology, held in Stockholm, Aug. 15-19, 1956). J. S. Mitchell, B. E. Holmes and C. L. Smith, eds. Springfield, Ill., Charles C. Thomas Co., 1956.

12213

IONIZING RADIATIONS AND CELL METABOLISM. p. 318 of CIBA FOUNDATION CONFERENCE HELD IN LONDON, ENGLAND ON MAR. 6-9, 1956. G. E. W.

Wolstenholm and C. M. O'Connor, eds. Boston, Mass., Little, Brown and Co., 1956.

12214

THE EFFECT OF REPEATED SMALL DOSES ON THE FERTILITY OF THE WHITE MOUSE. H. and M. Langendorff. p. 257 "Advances in Radiobiology" (Proc. of Fifth Internat. Conf. on Radiobiology, held in Stockholm, Aug. 15-19, 1956). J. S. Mitchell, B. E. Holmes and C. L. Smith, eds. Springfield, Ill., Charles C. Thomas Co., 1956.

Male mice were exposed to 2.5 r/day and mated to unirradiated females after various cumulative doses. Similar experiments were done with irradiated female mice, mating them with unirradiated males. The number of litters and offspring per litter were recorded. For comparison, other animals received single doses ranging from 50-450 r. Sterility curves for males and females differ.

12215

IN VIVO UPTAKE OF RADIOACTIVE IRON BY THE ERYTHROID CELLS OF RAT BONE MARROW. E. B. Harriss. p. 333 "Advances in Radiobiology." (Proc. of Fifth Internat. Conf. on Radiobiology held in Stockholm, Aug. 15-19, 1956). J. S. Mitchell, B. E. Holmes and C. L. Smith, eds. Springfield, Ill., Charles C. Thomas Co., 1956.

The authors determined the uptake of radioactive iron by various maturation stages of red cell precursors in the marrow of normal adult male rats as a function of time after intravenous injection. In this species (in contrast to rabbits and man) Fe is incorporated in all stages of developing rbc, even cells as late as reticulocytes

12216

THE RELATIVE IMPORTANCE OF DIRECT AND INDIRECT RADIOCHEMICAL PROCESSES IN RADIOBIOLOGY. P. Alexander. p. 8 "Advances in Radiobiology." (Proc. of Fifth Internat. Conf. on Radiobiology in Stockholm Aug. 15-19, 1956). J. S. Mitchell, B. E. Holmes and C. L. Smith, eds. Springfield, Ill., Charles C. Thomas Co., 1956.

Changes in temperature and oxygen concentration as well as added substances may influence radiation induced chemical changes in solids where the action must be "direct." This paper includes new data on effect of oxygen on (1) crosslinking of thin polyethylene films by 2 MeV electrons and (2) viscosity changes in irradiated polystyrene sulfonate.

12217

RADIATION SENSITIVITY OF MOLECULES IN INTACT CELLS. F. Hutchinson. p.3 of "Advances in Radiobiology." (Proc. of Fifth Internat. Conf. on Radiobiology in Stockholm, Aug. 15-19, 1956). Springfield, Ill., Charles C. Thomas Co., 1956.

The author studied inactivation of invertase, alcohol dehydrogenase and Co-A in yeast (wet and dry) by 4 MeV deuterons and 8 MeV α particles and interpreted results in relation to Zirkle and Tobias' "migration model" in which radiation dose and biological effect are related through a diffusion distance, P.

12218

THE PARTICIPATION OF THE PERIPHERAL NERVOUS SYSTEM IN THE REACTION TO IRRADIATION. V. Slouka. p. 76 "Advances in Radiobiology" (Proc. of Fifth Internat. Conf. on Radiobiology Stockholm, Aug. 15-19, 1956). J. S. Mitchell, B. E. Holmes and C. L. Smith, eds. Springfield, Ill., Charles C. Thomas Co., 1956.

In experiments with Wistar rats, the nervous system is shown to participate in the reaction of gluteal areas to localized exposure to 2000-3000 r of 60 Kv x-rays, 300 r/min. Reaction observed; erythema on 4-5th day, slight

serous exudate on 6-7th day, progression to peak reaction on 8-10th day after which it subsides. Experiments involved surgical denervation, novocaine blocks and drugs influencing the vegetative nervous system.

12219

THE EFFECTS OF LETHALLY DAMAGED CELLS UPON SURVIVORS IN X-IRRADIATED EXPERIMENTAL TUMORS. L. Revesz. "Advances in Radiobiology." (Proc. of Fifth Internat. Conf. on Radiobiology, Stockholm Aug. 15-19, 1956). J. S. Mitchell, B. E. Holmes and C. L. Smith, eds. Springfield, Ill., Charles C. Thomas Co., 1956.

Induced or spontaneous tumors of mice were used in their first transfer generation in their genotype of origin, and Ehrlich ascites tumor in heterozygous animals. Suspensions of known cell numbers were irradiated *in vitro* in N_2 atmosphere with a dose known to be supralethal for such cells. Irradiated cells were then mixed in various (known) proportions with unirradiated cells and inoculated into mice. Latency period before palpable tumors appeared and survival time were measured to determine the effect of lethally damaged cells on the growth of accompanying intact cells.

12220

INDUCTION OF CHROMOSOME BREAKS IN THE YOSHIDA SARCOMA ASCITES CELLS OF THE RAT BY X-RAYS AND FAST ELECTRONS AT DIFFERENT OXYGEN PARTIAL PRESSURES. W. Dittrich. p.86 of ADVANCES IN RADIOBIOLOGY. (Proc. of Fifth Internat. Conf. on Radiobiology held in Stockholm Aug. 15-19, 1956). J. S. Mitchell, B. E. Holmes, and C. L. Smith, eds. Springfield, Ill., C. C. Thomas Co. 1956.

12221

OBSERVATIONS ON BACTERIAL GROWTH AND MORPHOLOGY SHORTLY AFTER IRRADIATION AND SOME REMARKS ON THE OXYGEN EFFECT. T. Alper. p. 90 "Advances in Radiobiology." (Proc. of Fifth Internat. Conf. on Radiobiology Stockholm, Aug. 15-19, 1956). J. S. Mitchell, B. E. Holmes and C. L. Smith, eds. Springfield, Ill., Charles C. Thomas Co., 1956.

12222

THE "SHOOTING" OF BACTERIA ONE AT A TIME BY SINGLE ALPHA PARTICLES. R. J. Munson. p. 105 "Advances in Radiobiology." (Proc. of Fifth Internat. Conf. on Radiobiology, Stockholm, Aug. 15-19, 1956). J. S. Mitchell, B. E. Holmes, C. L. Smith, eds. Springfield, Ill., Charles C. Thomas Co., 1956.

This paper is a description of the procedure. No results are given, but the authors have in mind the use of the system described to study the relative radiosensitivities of parts of large bacteria.

12223

ALPHA IRRADIATION OF PARTS OF SINGLE METAPHASE CELLS IN CHICK TISSUE CULTURES. R. Munro. p. 108 "Advances in Radiobiology." (Proc. of Fifth Internat. Conf. on Radiobiology, Stockholm, Aug. 15-19, 1956) J. S. Mitchell, B. E. Holmes and C. L. Smith, eds. Springfield, Ill., Charles C. Thomas Co., 1956.

Chick embryo heart cells in tissue culture were subjected to partial-cell irradiation by Po α particles.

12224

THE IRRADIATION OF SINGLE CELLS AND PARTS OF SINGLE CELLS IN TISSUE CULTURE WITH MICROBEAMS OF ALPHA-PARTICLES. M. I. Davis, I. Simon-Reuss and C. L. Smith. p. 114 "Advances in Radiobiology." (Proc. of Fifth Internat. Conf. on Radiobiology held in Stockholm, Aug. 15-19, 1956). J. S. Mitchell, B. E. Holmes and C. L. Smith, eds. Springfield, Ill., Charles C. Thomas Co., 1956.

Authors report on results of their studies on clotting of peritoneal fluid in normal and irradiated hamsters.

12225

THE EFFECTS OF PRE- AND POST-TREATMENT ON THE RADIATION SENSITIVITY OF MICROORGANISMS. A. Hollaender. p. 123 "Advances in Radiobiology." (Proc. of Fifth Internat. Conf. on Radiobiology held in Stockholm, Aug. 15-19, 1956). J. S. Mitchell, B. E. Holmes and C. L. Smith, eds. Springfield, Ill., Charles C. Thomas Co., 1956.

Studies on mitosis in the grasshopper neuroblast after 3r of x-rays in isotonic and hypertonic solution and studies on the effect of protective compounds on recovery in bacteria are reported. The discussion of studies with bacteria considers the role of mutation in the recovery process and in response to protective compounds.

12226

THE PRESENT STATUS OF RADIATION PROTECTION BY CHEMICALS AND BIOLOGICAL AGENTS IN MAMMALS. J. A. Cohen, O. Vos and D. W. VanBekkum. p. 134 "Advances in Radiobiology." (Proc. of Fifth Internat. Conf. on Radiobiology held in Stockholm, Aug. 15-19, 1956). J. S. Mitchell, B. E. Holmes and C. L. Smith, eds. Springfield, Ill., Charles C. Thomas Co., 1956.

Authors review their recent studies on chemical protection and bone marrow therapy in radiation injury. Compounds tested include cysteamine and derivatives. Five figures and 2 tables provide a summary of effects of route of administration of marrow, genetic relationship of marrow donor, rate of appearance of cells from grafted cells in irradiated recipients, and of recipients own cells.

12227

THE BIOLOGICAL ACTION OF IONIZING RADIATIONS FROM THE POINT OF VIEW OF RADIATION CHEMISTRY. G. Stein and A. J. Swallow. p. 16. "Advances in Radiobiology." (Proc. of Fifth Internat. Conf. on Radiobiology in Stockholm, Aug. 15-19, 1956). J. S. Mitchell, B. E. Holmes and C. L. Smith, eds. Springfield, Ill., Charles C. Thomas Co., 1956.

Authors consider that indirect action by "ideal" x-rays can best be interpreted in terms of primary formation of solvated electrons and hydroxyl radicals, which may react with any substance present in excess to give organic free radicals which in turn react with other constituents. Hence, effects of radiation are concentrated in minor components of complex mixtures. Radiation of cells may damage them by causing disorganization, as well as by inactivating specific cell constituents.

12228

X-RAY INACTIVATION OF THE COMPONENTS OF THE SUCCINIC ACID DEHYDROGENASE-CYTOCHROME - CYTOCHROME OXIDASE- SYSTEM. B. G. Rajewsky, and H. Pauly. "Advances in Radiobiology." (Proc. of Fifth Internat. Conf. on Radiobiology in Stockholm, Aug. 15-19, 1956). J. S. Mitchell, B. E. Holmes and C. L. Smith, eds. Springfield, Ill., Charles C. Thomas Co., 1956.

12229

THE INCORPORATION OF P^{32} INTO LIVER PHOSPHOLIPIDS AND RNA MONONUCLEOTIDES OF IRRADIATED AND NON-IRRADIATED MICE. F. G. Sherman and A. B. Almeida. p. 49 "Advances in Radiobiology." (Proc. of Fifth Internat. Conf. on Radiobiology in Stockholm, Aug. 15-19, 1956). J. S. Mitchell, B. E. Holmes and C. L. Smith, eds. Springfield, Ill., Charles C. Thomas Co., 1956.

Authors report studies on P^{32} incorporation into phospholipids and RNA mononucleotides by livers of young male mice at 30, 60, 180 and 380 minutes after total body x irradiation with 500 rads of 200 KV x-rays, and compare results with those representing unirradiated mice.

12230

THE COMBINED ACTION OF X-RAYS AND CHEMICAL INHIBITORS ON IN VITRO KIDNEY TRANSPORT AND RESPIRATION. M. L. Mendelsohn. p. 38 "Advances in Radiobiology." (Proc. of Fifth Internat. Conf. on Radiobiology in Stockholm, Aug. 15-19, 1956). J. S. Mitchell, B. E. Holmes and C. L. Smith, eds. Springfield, Ill., Charles C. Thomas Co., 1956.

Respiration and ability to concentrate PAH were studied using kidney slices irradiated in vitro.

12231

CHEMICAL AND BIOLOGICAL ACTION OF PROTECTIVE SH-COMPOUNDS. U. Hagen. p. 187 "Advances in Radiobiology." (Proc. of Fifth Internat. Conf. on Radiobiology held in Stockholm, Aug. 15-19, 1956). J. S. Mitchell, B. E. Holmes, and C. L. Smith, eds. Springfield, Ill., Charles C. Thomas Co., 1956.

12232

THE DOSE REDUCTION FACTOR FOR CYSTEAMINE AND ISOTHIURONIUM IN THE CASE OF WHOLE BODY X-IRRADIATED MICE AND RATS. A. Catsch. p. 181 "Advances in Radiobiology." (Proc. of Fifth Internat. Conf. on Radiobiology held in Stockholm, Aug. 15-19, 1956). J. S. Mitchell, B. E. Holmes and C. L. Smith, eds. Springfield, Ill., Charles C. Thomas Co., 1956.

12233

A BACTERIOLOGICAL TEST FOR THE STUDY OF RADIO-PROTECTION PROBLEMS IN MAMMALS. H. Marcovich and J. F. Duplan. p. 192 "Advances in Radiobiology." (Proc. of Fifth Internat. Conf. on Radiobiology, held in Stockholm, Aug. 15-19, 1956). J. S. Mitchell, B. E. Holmes and C. L. Smith, eds. Springfield, Ill., Charles C. Thomas Co., 1956.

Irradiated rabbits treated with protective compounds were bled and their serum was tested for its ability to protect bacteria. Broth cultures of *E. coli* at the end of the exponential growth phase were irradiated in plasma or broth. Results are interpreted as showing that protection of bacteria, irradiated in plasma of cysteine-injected animal, is a direct consequence of anoxia. (Same conclusion for cysteine added in vitro.)

12234

STUDIES OF RADIATION CHIMAERAS BY THE USE OF CHROMOSOME MARKERS. C. E. Ford, J. L. Hamerton, D. W. H. Barnes and F. Loutit. p. 197 "Advances in Radiobiology." (Proc. of Fifth Internat. Conf. on Radiobiology, held in Stockholm, Aug. 15-19, 1956). J. S. Mitchell, B. E. Holmes and C. L. Smith, eds. Springfield, Ill., Charles C. Thomas Co., 1956.

Authors report studies on irradiated CBA/H mice injected, after exposure, with cell suspensions from spleens of baby mice heterozygous for T6 translocation and having a small chromosome useful as a "marker." Others received rat bone marrow. Once established, the grafted T6 cell strain persists, but rat cells may be progressively replaced by cells of the host from the 6th week onward.

12235

THE CELL FACTOR IN SPLEEN HOMOGENATES AFTER IRRADIATION. J. Soska, V. Drasil and Z. Karpfel. p. 204 in: "Advances in Radiobiology." (Proc. of Fifth Internat. Conf. on Radiobiology, held in Stockholm, Aug. 15-19, 1956). J. S. Mitchell, B. E. Holmes, and C. L. Smith, eds. Springfield, Ill., C. C. Thomas Co. 1956.

12236

SOME EXPERIMENTS IN FAVOR OF THE CELLULAR HYPOTHESIS FOR THE SPLEEN CURATIVE FACTOR. D. W. H. Barnes, M. P. Esnouf and L. A. Stocken. p. 211 "Advances in Radiobiology." (Proc. of Fifth Internat. Conf. on Radiobiology, held in Stockholm, Aug. 15-19,

1956). J. S. Mitchell, B. E. Holmes and C. L. Smith, eds. Springfield, Ill., Charles C. Thomas Co., 1956.

Results of studies of 30 day survival of CBA mice after lethal x-ray dose and intravenous injection of various spleen fractions (nuclear preparation and cell preparation) are reported.

12237

EFFECTS OF X-RAYS ON THE ACTIVITY OF ENZYMES. E. S. Guzman Barron, S. R. Dickman, T. P. Singer and J. A. Muntz. p.388 "Biological Effects of External X and Gamma Radiation. Part I." R. E. Zirkle, ed. New York. McGraw-Hill Book Co., 1954.

Results of *in vitro* x-irradiation on the activity of of phosphoglyceraldehyde dehydrogenase, adenosinetriphosphatase, yeast hexokinase, succinoxidase, trypsin, ribonuclease, lactic dehydrogenase and catalase are reported. The action of x-rays in moderate doses (0-500 r) resembles that of mild oxidizing agents (e.g. ferricyanide and iodosobenzoic acid) and is not limited to oxidation of SH groups. Enzyme inhibition by protein denaturation also occurred.

12238

AN ELECTROPHORETIC STUDY OF THE EFFECTS OF X-RAYS ON THE PLASMA PROTEIN PATTERN IN DOGS. John A. Muntz, E. S. Guzman Barron and C. L. Prosser. p.373 "Biological Effects of External X and Gamma Radiation. Part I." R. E. Zirkle, ed. New York, McGraw-Hill Book Co., 1954.

Tiselius electrophoresis patterns of plasma proteins were determined before and serially after exposure of dogs to a lethal total body dose of x-rays. The effects of injecting bovine albumin in an effort to correct the low serum albumin levels (and the apparently reciprocal increase in α_2 globulin) that developed during the terminal period, and the effect (on plasma protein picture) of lipid extraction prior to electrophoresis during the terminal period are reported.

12239

EFFECTS OF TOTAL-BODY X IRRADIATION ON A PREEXISTING INDUCED ANEMIA IN RABBITS III. HISTOPATHOLOGICAL STUDIES. Matthew H. Block, L. O. Jacobson, E. K. Marks and E. Gaston. p.339 "Biological Effects of External X and Gamma Radiation. Part I." R. E. Zirkle, ed. New York. McGraw-Hill Book Co., 1954.

Rabbits with pre-existing phenylhydrazine-induced anemias were exposed to 800 r, total body x-ray dose. Histopathological changes in the bone marrow and spleen at various times between 1 hour and 36 days after exposure are reported.

12240

HEPARINEMIA (?): AN ANTICOAGULANT IN THE BLOOD OF DOGS WITH HEMORRHAGIC TENDENCY AFTER TOTAL-BODY EXPOSURE TO ROENTGEN RAYS. J. Garrott Allen, M. Sanderson, M. Milham, A. Kirschen and L. O. Jacobson. p.372 "Biological Effects of External X and Gamma Radiation. Part I." R. E. Zirkle, ed. New York. McGraw-Hill Book Co., 1954.

A one-paragraph summary of observations on a circulating anticoagulant found during the hemorrhagic diathesis induced by whole body exposure to 450 r of x-rays suggests that the anticoagulant may be heparin.

12241

EFFECTS OF LONG-CONTINUED TOTAL-BODY GAMMA IRRADIATION ON MICE, GUINEA PIGS, AND RABBITS. VI. CONCLUSIONS AND APPLICABILITY OF RESULTS TO THE PROBLEM OF HUMAN PROTECTION Egon Lorenz. p.226 "Biological Effects of External X and Gamma Radiation." Part I. R. E. Zirkle, ed. New York. McGraw-Hill Book Co., 1954.

Results of long term exposures of the three species to 1, 2, 4, 8 or 16 r/day are considered in light of implications for man. Life span shortening, decreased fertility, tumor induction and hematopoietic injury are the major effects discussed.

12242

SYMPOSIUM ON RADIATION EFFECTS ON CELLS AND BACTERIA A. Kerner, W. D. Bellamy, G. E. Stapleton and M. R. Zelle. Bacteriol. Reviews 19-20, 22(1955-56).

12243

THE BIOLOGICAL EFFECTS OF COSMIC RAYS. M. Fry. N. Y. State J. Med. 54, 1208(1954).

A review, concerned especially with the relationship between cosmic rays and cancer.

12244

STUDIES ON THE COURSE OF TUBERCULOSIS IN GUINEA PIGS SUBJECTED TO REPEATED X-IRRADIATION AFTER INFECTION ARE DESCRIBED. Rodet and Bertin-Sans. Archives d'Electricite Medicale, Oct. 1898 Reported in Archive Roent. Ray 3, 56(1898-99)

12245

THE POSSIBLE ROLE OF PEROXIDES IN RADIATION AND CHEMICAL MUTAGENESIS IN *DROSOPHILA*. F. H. Sobels. p.449 in "ADVANCES IN RADIOBIOLOGY." (Proc. of Fifth Internat. Conf. on Radiobiology held in Stockholm, Sweden Aug. 15-19, 1956). J. S. Mitchell, B. E. Holmes, and C. L. Smith, eds. Springfield, Ill., Charles C. Thomas Co., 1956.

The hypothesis that peroxide formation may contribute to the mutagenic effect of formaldehyde was tested for *Drosophila* by means of catalase inhibition and by studying mutagenicity of dihydroxydimethyl peroxide which is formed by the reaction of formaldehyde and hydrogen peroxide. Cyanide was used as a catalase inhibitor (increasing rate of mutation induction).

12246

RECENT STUDIES ON CHROMOSOME BREAKAGE AND REJOINING. S. Wolff. p.463 "Advances in Radiobiology." (Proc. of Fifth Internat. Conf. on Radiobiology held in Stockholm, Aug. 15-19, 1956). J. S. Mitchell, B. E. Holmes and C. L. Smith, eds. Springfield, Ill., Charles C. Thomas Co., 1956.

12247

COMPARISON OF CHEMICALLY AND X-RAY INDUCED MUTATIONS IN *DROSOPHILA MELANOGASTER*. O. G. Fahmy and M. J. Fahmy. p.437 "Advances in Radiobiology." (Proc. of Fifth Internat. Conf. on Radiobiology held in Stockholm, Aug. 15-19, 1956). J. S. Mitchell, B. E. Holmes and C. L. Smith, eds. Springfield, Ill., Charles C. Thomas Co., 1956.

The mutagens included in this comparison are: x-ray, nitrogen mustards, dimethylalkanes, epoxides and polyethyleneimines. Mutations analyzed: dominant lethals (cytological and hatchability tests). Viable chromosome breaks were studied in F_1 larvae salivary gland chromosomes as were sex-linked recessives and lethals

12248

RATE OF DEVELOPMENT OF X-RAY INDUCED DETRIMENTALS AND THE INFLUENCE OF SELECTION PRESSURE. G. Bonnier. p.433 "Advances in Radiobiology." (Proc. of Fifth Internat. Conf. on Radiobiology held in Stockholm, Aug. 15-19, 1956). J. S. Mitchell, B. E. Holmes and C. L. Smith, eds. Springfield, Ill., Charles C. Thomas Co., 1956.

12249

THE INDUCTION OF DETRIMENTAL MUTATIONS IN *DROSOPHILA* BY X-RAYS K. G. Luning and S. Jonsson. p.425. "Advances in Radiobiology." (Proc. of Fifth Internat. Conf. on Radiobiology held in Stockholm, Aug. 15-19, 1956). J. S. Mitchell, B. E. Holmes and C. L. Smith, eds. Springfield, Ill., Charles C. Thomas Co., 1956.

Rates of induction of detrimental mutations in sperm chromosomes vary with the stage treated in a manner like that shown for visibles and recessive lethals. Weak detrimental mutations were 5 times as numerous as strong detrimental or recessive lethals. Recessive lethals are induced in unfertilized eggs slightly less frequently than in sperm.

12250

GENETIC IMPLICATIONS OF IRRADIATION IN MAN. T. C. Carter. p. 416 "Advances in Radiobiology." (Proc. of Fifth Internat. Conf. on Radiobiology held in Stockholm, Aug. 15-19, 1956). J. S. Mitchell, B. E. Holmes and C. L. Smith, eds. Springfield, Ill., Charles C. Thomas Co., 1956.

Human radiation genetics has developed from the descriptive study of human populations and experimental study of mutagenesis. Absolute system of measurement (induced mutations expressed as mutations per r per locus) is sometimes used with reference to man when the relative system (mutation rate doubling dose) would be more appropriate. Use of the inappropriate system may result in erroneous conclusions.

12251

PRINCIPLES OF BACK MUTATION AS OBSERVED IN DROSOPHILA AND OTHER ORGANISMS. H. J. Muller and I. I. Oster. p. 407 "Advances in Radiobiology." (Proc. of Fifth Internat. Conf. on Radiobiology held in Stockholm, Aug. 15-19, 1956). J. S. Mitchell, B. E. Holmes and C. L. Smith, eds. Springfield, Ill., Charles C. Thomas Co., 1956.

The authors report preliminary results of back mutation of forked locus in Drosophila and conclude that in Drosophila, as in Neurospora, mutations of the same general types that occur spontaneously may be induced by ionizing radiation. These mutations include chemical changes of the types that permit evolution.

12252

RADIATION INDUCED LEUKEMIA IN DENMARK. M. Faber. p. 397 "Advances in Radiobiology." (Proc. of Fifth Internat. Conf. on Radiobiology held in Stockholm, Aug. 15-19, 1956). J. S. Mitchell, B. E. Holmes and C. L. Smith, eds. Springfield, Ill., Charles C. Thomas Co., 1956.

12253

INDUCTION OF LEUKEMIA BY RADIATION. J. F. Loutit. p. 388 "Advances in Radiobiology." (Proc. of Fifth Internat. Conf. on Radiobiology held in Stockholm, Aug. 15-19, 1956). J. S. Mitchell, B. E. Holmes and C. L. Smith, eds. Springfield, Ill., Charles C. Thomas Co., 1956.

12254

THE IMMEDIATE EFFECTS OF LARGE DOSES OF RADIOACTIVE PHOSPHORUS ON THE PERIPHERAL BLOOD COMPARED WITH THOSE OF EXTERNAL IRRADIATION IN PATIENTS WITH MALIGNANT DISEASE. E. M. Ledlie. p. 382 "Advances in Radiobiology." (Proc. of Fifth Internat. Conf. on Radiobiology held in Stockholm, Aug. 15-19, 1956). J. S. Mitchell, B. E. Holmes and C. L. Smith, eds. Springfield, Ill., Charles C. Thomas Co., 1956.

12255

COMPARISON OF THE PHYSIOLOGICAL RESPONSE TO RADIATION AND RADIOMIMETIC CHEMICALS. PATTERNS OF BLOOD RESPONSE. L. A. Elson. p. 372. "Advances in Radiobiology." (Proc. of Fifth Internat. Conf. on Radiobiology held in Stockholm, Aug. 15-19, 1956). J. S. Mitchell, B. E. Holmes and C. L. Smith, eds. Springfield, Ill., Charles C. Thomas Co., 1956.

12256

READ-OFF METHODS IN RADIOHAEMATOLOGICAL

CONTROL. M. Helde. p. 361 "Advances in Radiobiology." (Proc. of Fifth Internat. Conf. on Radiobiology held in Stockholm, Aug. 15-19, 1956). J. S. Mitchell, B. E. Holmes and C. L. Smith, eds. Springfield, Ill., Charles C. Thomas Co., 1956.

Data from routine blood studies on radiation workers (hospital) and data from experiments previously reported by Langendorff using cats are presented. Conventional methods of plotting blood cell counts over a period of time are compared with plots on probit paper. Irradiation is shown to result in a double or multiple distribution of, for example, lymphocyte counts in probability diagrams in contrast to the normal picture which is a single distribution.

12257

THE LIFE SPAN OF RED CELLS OF THE RHESUS MONKEY FOLLOWING WHOLE-BODY X-RADIATION. C. W. Gilbert, E. Paterson and M. V. Haigh. p. 357. "Advances in Radiobiology." (Proc. of Fifth Internat. Conf. on Radiobiology held in Stockholm, Aug. 15-19, 1956). J. S. Mitchell, B. E. Holmes and C. L. Smith, eds. Springfield, Ill., Charles C. Thomas Co., 1956.

Using Fe^{59} as a red cell tag, the red cell life span was measured in monkeys after irradiation with 500 r and in unirradiated monkeys. The rbc life spans were found to be 101 days and 97 days respectively (one monkey each). Conclusion: irradiation does not appreciably shorten the life span of cells already in circulation.

12258

QUANTITATIVE CHANGES IN THE ERYTHROPOIETIC CELLS OF THE RAT BONE MARROW DURING THE FIRST FORTY-EIGHT HOURS AFTER WHOLE-BODY X-IRRADIATION. E. V. Hulse. p. 349 "Advances in Radiobiology." (Proc. of Fifth Internat. Conf. on Radiobiology held in Stockholm, Aug. 15-19, 1956). J. S. Mitchell, B. E. Holmes and C. L. Smith, eds. Springfield, Ill., Charles C. Thomas Co., 1956.

Absolute numbers of various maturation stages of erythrocyte precursors in all of the marrow in single femurs were determined in normal rats, 24 hours after exposure to x-ray doses of 25r-5000 r and from 2-48 hours after exposure to 100 r, 600 r and 5000 r. The times of disappearance and return of mitotic activity in the erythroid series are also reported.

12259

ERYTHROPOIETIC ACTIVITY IN IRRADIATED RATS INJECTED WITH HOMOLOGOUS AND HETEROLOGOUS BONE MARROW STUDY WITH Fe^{59} . H. Maisin, A. Dunjic, P. Maldague and J. Maisin. p. 341. "Advances in Radiobiology." (Proc. of Fifth Internat. Conf. on Radiobiology held in Stockholm, Aug. 15-19, 1956). J. S. Mitchell, B. E. Holmes and C. L. Smith, eds. Springfield, Ill., Charles C. Thomas Co., 1956.

Fe^{59} was injected 24 hours prior to killing rats 1, 2, 4, 7, 10, 13, 16 or 19 days after x-irradiation according to one of the following regimes: 1. whole body exposure to LD_{50} , 2. one leg shielded with Pb, the rest of the body exposed to LD_{50} , or 3. whole body exposure to LD_{50} followed immediately by intraperitoneal injection of 120 mg of homologous bone marrow suspended in 1 ml saline. Uptake of Fe^{59} by peripheral blood red cells, marrow, liver, spleen, omentum and pancreas was determined.

12260

RELATIVE BIOLOGICAL EFFECTIVENESS OF 100 kvp AND 250 kvp X-RADIATIONS IN THE DOG. D. M. Jones, E. L. Alpen and V. P. Bond. Radiation Research 5, 484 (1956).

RBE of 1.0 was obtained for x-rays in the range 250-2000 kvp, but not for lower energy radiation. With divided bilateral exposure to x-rays of 100 kvp (effective

energy = 30 kVp) and 250 kVp (effective energy = 90 kVp), the $LD_{50/30}$ (midline air dose) was 630 ± 65 r and 280 ± 9 r respectively. Expressed in terms of dose to the median sagittal plane, the values become 300 ± 30 r and 230 ± 7 r respectively.

12261

HOW RADIATION CHANGES THE GENETIC CONSTITUTION. H. J. Muller. p.387. Proc. of Internat. Conf. on Peaceful Uses of Atomic Energy held in Geneva, Aug. 8-20, 1955. Vol. 11. Biological Effects of Radiation, New York, United Nations, 1956.

12262

GENETICS AND IRRADIATED POPULATIONS. T. C. Carter. p.384. Proc. of Internat. Conf. on Peaceful Uses of Atomic Energy, held in Geneva Aug. 8-20, 1955. Vol. 11. Biological Effects of Radiation, New York, United Nations, 1956.

12263

GENETIC EFFECTS OF RADIATION IN MICE AND THEIR BEARING ON THE ESTIMATION OF HUMAN HAZARDS. W. L. Russell. p.382. Proc. of Internat. Conf. on Peaceful Uses of Atomic Energy held in Geneva, Aug. 8-20, 1955. Vol. 11. Biological Effects of Radiation, New York, United Nations, 1956.

12264

THE GENETIC STRUCTURE OF MENDELIAN POPULATIONS AND ITS BEARING ON RADIATION PROBLEMS. B. Wallace. p.377. Proc. of Internat. Conf. on Peaceful Uses of Atomic Energy held in Geneva, Aug. 8-20, 1955. Vol. 11. Biological Effects of Radiation, New York, United Nations, 1956.

12265

MEDICAL CARE OF WOUNDS CONTAMINATED WITH RADIOACTIVE MATERIALS. E. A. Hathaway and A. J. Finkel. p.362. Proc. of Internat. Conf. on Peaceful Uses of Atomic Energy held in Geneva, Aug. 8-20, 1955. Vol. 11. Biological Effects of Radiation, New York, United Nations, 1956.

12266

A STUDY OF RECOVERY FOLLOWING EXPOSURE OF PART OR THE WHOLE OF THE BODY TO IONIZING RADIATION. P. Lamarque and J. Gary-Bobo. p.351. Proc. of Internat. Conf. on Peaceful Uses of Atomic Energy held in Geneva, Aug. 8-20, 1955. Vol. 11. Biological Effects of Radiation, New York, United Nations, 1956.

Single or fractionated doses of x, γ or β radiation were delivered to 1. the eggs of Bombyx mori, 2. Bacillus rossii, 3. entire body or part of the body of guinea pigs and, 4. the skin of the internal aspect of the forearm of women. Criteria of effect were: hatchability of insect eggs, epilation of guinea pig skin, lethality in guinea pigs and erythema of human skin.

12267

RECOVERY FROM RADIATION INJURY. D. W. H. Barnes and J. F. Loutit. p.348. Internat. Conf. on Peaceful Uses of Atomic Energy held in Geneva Aug. 8-20, 1955. Vol. 11. Biological Effects of Radiation, New York, United Nations, 1956.

The authors review briefly the data and concepts pertinent to the nature of the protective effect conferred by injecting cells or cell fragments into irradiated hosts. Authors conclude that there is no incontrovertible evidence that the observed protection is not due to intact cells in all cases

12268

THE EFFECT OF NONCELLULAR PREPARATIONS ON SURVIVAL AFTER LETHAL DOSES OF X-RADIATION. E. Goldwasser and W. F. White. p.343. Proc. of Internat. Conf. on Peaceful Uses of Atomic Energy held in Geneva, Aug. 8-20, 1955. Vol. 11. Biological Effects of Radiation, New York, United Nations, 1956.

12269

CYSTEAMINE-CYSTAMINE: ON THE MECHANISM FOR THE PROTECTIVE ACTION AGAINST IONIZING RADIATION. L. Eldjarn, et al. p.335. Proc. of Internat. Conf. on Peaceful Uses of Atomic Energy held in Geneva, Aug. 8-20, 1955. Vol. 11. Biological Effects of Radiation, New York, United Nations, 1956.

The authors describe their studies on the in vitro irradiation of cysteamine and on in vitro and in vivo (mice) irradiated blood serum with and without the addition of cysteamine before irradiation. Cysteamine labeled with S-35 was found to be rapidly bound to serum proteins and to hemoglobin in vitro or in vivo. Inactivation of free radicals from irradiated water appeared not to be the major mechanism of its protective action. The protective effect was considered to be exerted in cells or on the surface of tissue constituents.

12270

POSSIBILITIES AND LIMITATIONS OF THE CHEMICAL PROTECTION OF MAN AND OTHER MAMMALS AGAINST IONIZING RADIATION. Z. M. Bacq. p.332. Proc. of Internat. Conf. on Peaceful Uses of Atomic Energy held in Geneva, Aug. 8-20, 1955. Vol. 11. Biological Effects of Radiation, New York, United Nations, 1956.

This is a short review of desirable properties of a protective agent and of observations from the author's laboratories demonstrating observed effects of protective agents (cystamine) in mice and rats.

12271

THE SCOPE OF CHEMICAL PROTECTION AGAINST IONIZING RADIATION IN MAMMALS. D. W. van Bekkum and J. A. Cohen. p.330. Proc. of Internat. Conf. on Peaceful Uses of Atomic Energy held in Geneva, Aug. 8-20, 1955. Vol. 11. Biological Effects of Radiation, New York, United Nations, 1956

This is a general discussion, reviewing studies by the author and others on the chemical radiation protective agents in mammals.

12272

CELLULAR AND HISTOLOGICAL RADIOLESIONS, THEIR CONSEQUENCES AND REPAIR. J. Maisin, et al. p.315. Proc. of Internat. Conf. on Peaceful Uses of Atomic Energy held in Geneva, Aug. 8-20, 1955. Vol. 11. Biological Effects of Radiation, New York, United Nations, 1956.

The authors report results of studies on rats, the major criteria of protection being survival after otherwise lethal x-ray doses, suppression of gastrointestinal and hematological phases of acute radiation injury and protection of embryos. A marked tendency towards development of cancer in long term survivors (protected animals) was observed.

12273

DOMINANT LETHAL FACTORS AND EMBRYONIC MORTALITY AFTER IRRADIATION AT 180 KV AND 31 MeV. H. Fritz-Niggli. p.179. Proc. of Internat. Conf. on Peaceful Uses of Atomic Energy held in Geneva, Aug. 8-20, 1955. Vol. 11. Biological Effects of Radiation, New York, United Nations, 1956.

Male *Drosophila* at various ages between 0-24 hours were exposed to 3000 r of 180 kv x-rays at 67r/min. Hatchability of eggs was measured as a function of 1. time after irradiation and 2. time in days between irradiation and insemination.

12274

COMPARATIVE BIOLOGICAL EFFECTS OF 1000 MeV PROTONS, 220 KVP AND 30 MeVp ROENTGEN RAYS AND 04 MeV GAMMA RAYS. K. C. Bora. p.303. Proc. of Internat. Conf. on Peaceful Uses of Atomic Energy held in Geneva Aug. 8-20, 1955. Vol. 11. Biological Effects of Radiation, New York, United Nations, 1956.

Chromosome breaks in *Tradescantia* and growth of pollen grains were studied in these experiments comparing biological effectiveness of the various radiations.

12275

INFLUENCE OF GAMMA RADIATION ON VARIOUS IMMUNITY FACTORS. G. Gaude and J. Coursaget. p. 169. Proc. of Internat. Conf. on Peaceful Uses of Atomic Energy held in Geneva Aug. 8-20, 1955. Vol. 11. Biological Effects of Radiation. New York, United Nations, 1956.

Rabbits and guinea pigs were exposed (total body) to various doses (single) of Co-60 γ rays and phagocytosis and antibody formation were studied. Phagocytosis studies utilized peritoneal exudate cells and starch particles. Antibody formation, but not *in vitro* phagocytosis of starch, was inhibited by large x-ray doses.

12276

GENETIC DIFFERENCES IN LONGEVITY AND DISEASE RESISTANCE IN ANIMALS UNDER IRRADIATION. J. W. Gowen. p.188. Proc. of Internat. Conf. on Peaceful Uses of Atomic Energy held in Geneva, Aug. 8-20, 1955. Vol. 11. Biological Effects of Radiation. New York, United Nations, 1956.

Hosts: 20 strains of mice each with known and characteristic resistance to *S. typhimurium*. Pathogen: 7 strains of *S. typhimurium* varying in virulence. Normal life span of the normal host strains were independent of their susceptibility to typhoid. Mortality when exposed to large x-ray doses only, to typhoid only and to both stresses was determined for various combinations of hosts and pathogens. Body weights, growth patterns, heart, kidney, liver, testes and spleen weights of WBC levels were also measured.

12277

EFFECT OF DAILY LOW DOSES OF X-RAYS ON SPERMATOGENESIS IN DOGS. G. W. Casarett and J. B. Hursh. p.184. Proc. of Internat. Conf. on Peaceful Uses of Atomic Energy held in Geneva, Aug. 8-20, 1955. Vol. 11. Biological Effects of Radiation. New York, United Nations, 1956.

Results of semen analysis are reported for 4 groups of male beagle dogs receiving 0.06, 0.12 or 0.6 r of x-rays 5 days a week for a period of 150 weeks (at the time of the report). In general, the two lower dose regimes had produced no effects, but the 0.6 r/day dosage produced a successive decline in sperm count and concomitant increases in abnormal sperm after 20-30 weeks of exposure.

12278

STUDIES ON HYPERFERREMIA FOLLOWING ACUTE WHOLE BODY X-IRRADIATION. T. J. Haley. p. 296. Proc. of Internat. Conf. on Peaceful Uses of Atomic Energy held in Geneva, Aug. 8-20, 1955. Vol. 11. Biological Effects of Radiation. New York, United Nations, 1956.

Studies on liberation of iron in x-irradiated rabbits are reported. X-ray doses: 800, 1200 or 1600 r, 250 Kv x-ray. Biological manipulations included: sterile abscesses produced by intramuscular terpine, reticuloendothelial blockage with intravenous colloidal thorium dioxide and localized radiation of 800 r to liver and spleen. Decreased marrow utilization of iron appears to be the major factor in irradiation hyperferremia.

12279

RADIATION EFFECTS ON CELLS: GENETICS OR PHYSIOLOGY? E. L. Powers and C. F. Ehret. Proc. of Conf. on Peaceful Uses of Atomic Energy held in Geneva, Aug. 8-20, 1955. Vol. 11. Biological Effects of Radiation. New York, United Nations, 1956.

Certain effects in cells of various types are considered in light of the question posed in the title, and

many illustrations of effects are taken from the author's extensive studies with *Paramecia*. Division delay, cell death and mutation induction are reviewed concisely with respect to possible cellular mechanisms.

12280

RELATIONSHIP BETWEEN ELECTROLYTES AND RADIATION EFFECTS ON CELL METABOLISM. W. J. Bair. p.292. Proc. of Internat. Conf. on Peaceful Uses of Atomic Energy held in Geneva, Aug. 8-20, 1955. Vol. 11. Biological Effects of Radiation. New York, United Nations, 1956.

Anaerobic CO₂ production and potassium leakage were studied in x-irradiated yeast subjected to normal culture conditions, starvation, Dowex-50 resin, culture medium with increased potassium content, or starvation.

12281

STUDIES ON THE MECHANISM OF PHYTOHORMONE DAMAGE BY IONIZING RADIATION. S. A. Gordon. p.283. Proc. of Internat. Conf. on Peaceful Uses of Atomic Energy held in Geneva, Aug. 8-20, 1955. Vol. 11. Biological Effects of Radiation. New York, United Nations, 1956.

Biological material studied included: mung bean plants, cabbage leaf discs, Avena and Cocklebur.

12282

COMPARATIVE STUDIES OF THE BIOLOGICAL EFFECTS OF IONIZING RADIATION AND OF RADIOMIMETIC CHEMICALS. A. Haddow. p.213. Proc. of Internat. Conf. on Peaceful Uses of Atomic Energy held in Geneva Aug. 8-20, 1955. Biological Effects of Radiation. Vol. 11. New York, United Nations, 1956.

Radiomimetic qualities of the chemicals are reviewed and considered with respect to: hair pigmentation, growth inhibition, carcinogenesis, mutagenesis, cytological changes, and effects on natural and synthetic macromolecules.

12283

BIOLOGICAL DAMAGE RESULTING FROM EXPOSURE TO IONIZING RADIATION. L. H. Gray. p.209. Proc. of Internat. Conf. on Peaceful Uses of Atomic Energy held in Geneva Aug. 8-20, 1955. Vol. 11. Biological Effects of Radiation. New York, United Nations, 1956.

12284

CYTOLOGICAL AND CYTOCHEMICAL EFFECTS OF RADIUM AND RADIOMIMETIC SUBSTANCE. A. R. Gopal-Ayengar. p.219. Proc. of Internat. Conf. on Peaceful Uses of Atomic Energy held in Geneva, Aug. 8-20, 1955. Vol. 11. Biological Effects of Radiation. New York, United Nations, 1956.

Cytological studies were carried out on mouse tumors irradiated *in vivo* or treated with dichloroethyl aminophenyl butyric acid by intraperitoneal injection. *V. faba* root tips, *Luzula* seedlings and Walker rat ascites tumor were also studied and results are summarized and illustrated.

12285

RELATIVE BIOLOGICAL EFFECTIVENESS. G. D. Adams, H. L. Kohn and R. S. Stone. p.260. Proc. of Internat. Conf. on Peaceful Uses of Atomic Energy held in Geneva, Aug. 8-20, 1955. Vol. 11. Biological Effects of Radiation. New York, United Nations, 1956.

Authors recommend the determination of Relative Biological Effectiveness values as precisely as possible. Standard biological test systems suggested are (1) LD₅₀ of adult mice, (2) LD₅₀ of 4 day old chick embryos, (3) LD₅₀ of haploid yeast, (4) weight loss of mouse testis 28 days after irradiation.

12286

STUDIES OF THE BIOLOGICAL BASIS OF RADIO-SENSITIVITY. T. N. Tahmisiian. p.256. Proc. of Internat. Conf. on Peaceful Uses of Atomic Energy held in Geneva,

Aug. 8-20, 1955. Vol. 11. Biological Effects of Radiation. New York, United Nations, 1956.

The degree of growth suppression in the grasshopper egg (diapause embryo) was studied in eggs exposed to oxygen, CO, CO₂:N₂ mixtures or KCN before, during or immediately after exposure to 25,000 r of 200 KV x-rays, the major interest being the relationship between radiation injury and oxidative metabolism.

12287

ON THE NATURE OF CHANGES IN METABOLISM UNDER IRRADIATION EFFECTS. N. M. Sissakian. p.248. Proc. of Internat. Conf. on Peaceful Uses of Atomic Energy held in Geneva, Aug. 8-20, 1955. Vol. 11. Biological Effects of Radiation. New York, United Nations, 1956.

Author compares effects of various x-ray doses on enzyme activity when enzymes were irradiated as pure enzymes or tissue extracts *in vitro*, in plant leucoplasts and chloroplasts *in vitro* and in the intact plants (rye seedlings of various ages).

12288

THE PROBLEM OF THE BIOLOGICAL ACTION OF LOW DOSES OF IONIZING RADIATION. M. H. Marcovich. p.244. Proc. of Internat. Conf. on Peaceful Uses of Atomic Energy held in Geneva Aug. 8-20, 1955. Vol. 11. Biological Effects of Radiation. New York, United Nations, 1956.

The author studied the induction of lysis in a lysogenic strain of *E. coli*. The frequency of inductions was found to be proportional to dose between 1 and 1000 r, the percentage induced varying from 0.01% to 10%. The linear relationship was confirmed by experiment, up to a dose of 0.3 r. Target size, based on these data, would be 90-100 μ . Induction rate was not altered by change in dose rate when a dose rate of 0.06 r/min. was compared with a dose rate of 60,000 r/min. Implications with respect to carcinogenesis are considered briefly.

12289

BIOLOGICAL EFFECT OF IONIZING RADIATIONS ON MICROORGANISMS. M. N. Meissel. p.227. Proc. of Internat. Conf. on Peaceful Uses of Atomic Energy held in Geneva Aug. 8-20, 1955. Vol. 11. Biological Effects of Radiation. New York, United Nations, 1956.

This paper is a review of extensive experimental studies on yeast by the author and his colleagues. The morphological, physiological, genetic and biochemical changes observed are summarized.

12290

PROGRESS IN RADIOBIOLOGY. A. Forssberg. C. C. Thomas Co., Springfield, Ill. 17, 557(1956).

Discussion: Synthesis of DNA by Ehrlich ascites tumor cells is promptly resumed after irradiation if DNA is added to the ascitic fluid of the mice post-exposure, regardless of the origin of the DNA or of its time of injection relative to irradiation. In a mixture of unlabelled living cells and C¹⁴ labelled cells irradiated with a uniformly lethal dose of 7000 r, the living, mitotic cells in some experiments took up as much as 25% of the activity from lysed irradiated cells. Results have important implications with respect to interpretation of tracer studies.

12291

PROGRESS IN RADIOBIOLOGY. A. Goldfeder. C. C. Thomas Co., Springfield, Ill., 69-70, 557(1956).

Discussion: Three strains of mice employed in a study of radiation injury and protective agents proved to have inherently different responses (mortality rate after 700 r) to x-irradiation. Males and females also differed in some strains not only in mortality rate but also in oxidation capacity of liver mitochondria and in P/O ratios of liver mitochondria. Histochemical studies of alkaline phosphatase in the liver, kidney, duodenum, spleen and mammary glands of irradiated (12,000 r) and control mice demonstrated that a lethal dose (or greater) of x-ray does not

inactivate this enzyme and that the tissues may contain protective agents for the enzymes.

12292

PROGRESS IN RADIOBIOLOGY. U. Hagen and R. Koch. C. C. Thomas Co., Springfield, Ill., U.S. Publishers. 257, 557(1956).

Discussion: Iodoacetate has been shown to sensitize animals to radiation and in itself can produce tissue changes very similar to those produced by radiation. It reacts quickly with -SH compounds that are protective against radiation.

12293

PROGRESS IN RADIOBIOLOGY. D. B. Cater. C. C. Thomas Co., Springfield, Ill., 276, 557(1956).

Discussion: In vivo measurements of tissue oxygen tension (by means of Pt electrodes) showed little decrease in oxygen tension after cysteine injection although the oxidation-reduction potential fell sharply. (Measured in lactating mammary gland.)

12294

THE HYDROGEN EFFECT IN THE STUDY OF RADIATION DAMAGE DUE TO RADICALS. M. Ebert and Alma Howard. p.324. "Progress in Radiobiology." (Proc. of Fourth Internat. Conf. on Radiobiology held in Cambridge, Aug. 14-17, 1955). J. S. Mitchell, B. E. Holmes and C. L. Smith, eds. Springfield, Ill., C. C. Thomas Co. 1956.

Growth rate (elongation) of *V. faba* root tips was measured and evaluated as a function of x-ray dose and gaseous atmosphere during irradiation.

12295

THE RADIATION-INDUCED REDUCTION OF DIPHOSPHOPYRIDINE NUCLEOTIDE AND ITS BEARING ON THE OXYGEN EFFECT IN RADIOBIOLOGY. A. J. Swallow. "Progress in Radiobiology." (Proc. of Fourth Internat. Conf. on Radiobiology held in Cambridge, Aug. 14-17, 1955). J. S. Mitchell, B. E. Holmes and C. L. Smith, eds. Springfield, Ill., C. C. Thomas Co. 1956.

12296

BLOOD DESTRUCTION AND IRON METABOLISM IN THE ACUTE SYNDROME OF RADIATION SICKNESS. N. A. Fedorov. "Progress in Radiobiology." (Proc. of Fourth Internat. Conf. on Radiobiology held in Cambridge, Aug. 14-17, 1955). J. S. Mitchell, B. E. Holmes and C. L. Smith, eds. Springfield, Ill., C. C. Thomas Co. 1956.

Dogs with ureter gall-bladder anastomoses were irradiated with x ray doses of 200 r-400 r, total body exposures. Studies of blood and hematopoietic tissues were supplemented by determinations of daily excretion of tetrapyrrobin. The existence of a hemolytic process during the acute radiation syndrome is confirmed.

12297

EFFECTS OF RADIATION ON ERYTHROPOIESIS IN THE RAT. TURNOVER STUDIES USING RADIOACTIVE IRON. E. H. Belcher, E. B. Harriess and L. F. Lamerton. p.303 of "Progress of Radiobiology." (Proc. of Fourth Internat. Conf. on Radiobiology held in Cambridge, Aug. 14-17, 1955). J. S. Mitchell, B. E. Holmes and C. L. Smith, eds. Springfield, Ill., Charles C. Thomas Co., 1956.

The uptake (percent of injected dose) of Fe⁵⁹ in hind leg, spleen, liver and blood as a function of time after injection is described in normal rats and in rats irradiated with 450 r or 200 r of x-ray to the total body or total body with one leg shielded.

12298

HAEMOPOIETIC REGENERATION IN SPLEEN GRAFTS AFTER IN VIVO AND IN VITRO IRRADIATION. E. H. Betz, G. Booz and J. Firket. p.297. "Progress in Radiobiology." (Proc. of Fourth Internat. Conf. on Radiobiology held in Cambridge, Aug. 14-17, 1955). J. S. Mitchell, B. E. Holmes and C. L. Smith, eds. Springfield, Ill., Charles C. Thomas Co., 1956.

Splenic tissue irradiated *in vivo* or *in vitro* with doses larger than those required to kill 100% of the animals is still able to regenerate myeloid tissue when transplanted to a normal host. Doses as high as 5000 r do not markedly impair the hematopoietic potentialities of the tissue. It appears that in whole body irradiation, general metabolic disturbances are at least as important as cellular destruction of splenic tissue *per se* in regulating hematopoiesis.

12299

IMMUNOLOGICAL AND HISTOLOGICAL RESPONSE FOLLOWING SPLEEN TREATMENT IN IRRADIATED MICE.

D. W. H. Barnes and J. F. Loutit. p.299. "Progress in Radiobiology." (Proc of Fourth Internat. Conf. on Radiobiology held in Cambridge, Aug. 14-17, 1955). J. S. Mitchell, B. E. Holmes and C. L. Smith, eds. Springfield, Ill., Charles C. Thomas Co., 1956.

Following therapy (for lethal x-ray dose) with a single dose of strain A spleen, irradiated CBA mice were studied to see whether they produced anti-A agglutinins. At time of autopsy (1, 3, 5, 8, 15, 22, 35 and 44 days after irradiation and spleen cell injection) spleen and thymus were weighed and histological sections prepared of spleen, thymus, lymph node, testes, liver, sternum and femur.

12300

COMPARISON OF THE PHYSIOLOGICAL RESPONSE TO RADIATION AND TO RADIOMIMETIC CHEMICALS - BONE MARROW EFFECTS. L. A. Elson, G. A. Galton, L. F. Lamerton and M. Till. p.285. "Progress in Radiobiology." (Proc. of Fourth Internat. Conf. on Radiobiology held in Cambridge, Aug. 14-17, 1955). J. S. Mitchell, B. E. Holmes and C. L. Smith, eds. Springfield, Ill., Charles C. Thomas Co., 1956.

Data comparing the effects of whole body exposure to an x-ray dose of 250 r with effects of the "radiomimetic" compounds, CB 1348 and myleran on the peripheral blood and hematopoietic tissues are tabulated.

12301

THE EFFECTS OF X-RAYS AND RADIOMIMETIC SUBSTANCES ON RAT LYMPHOCYTES. C. Biagini. p.281. "Progress in Radiobiology." (Proc. of Fourth Internat. Conf. on Radiobiology held in Cambridge, Aug. 14-17, 1955). J. S. Mitchell, B. E. Holmes and C. L. Smith, eds. Springfield, Ill., Charles C. Thomas Co., 1956.

The percent of pyknotic lymphocytes was determined for lymph node lymphocytes of rats treated with a second dose of x-rays or HN₂ after a previous treatment with one of the agents. Exposures to 100 r of x-rays were total body or anterior or posterior half of the body. Dose effect and time-effect curves are presented. If the interval between two exposures is not greater than 2-3 days, effects are partially cumulative. With longer intervals, they are not.

12302

PROTECTIVE EFFECT OF CYSTEAMINE ON MICE INJECTED WITH NITROGEN MUSTARD. A. J. Therkelsen. p.260 of PROGRESS IN RADIOBIOLOGY. (Proc. of Fourth Internat. Conf. held in Cambridge, Aug. 14-17, 1955). J. S. Mitchell, B. E. Holmes, and C. L. Smith, eds. Springfield, Ill., C. C. Thomas Co., 1956.

12303

ON THE MECHANISM OF CHEMICAL PROTECTION AGAINST IONISING RADIATION. THE INTERACTION OF CYSTEAMINE AND CYSTAMINE WITH PROTEINS. L. Eldjarn and A. Pihl. p.249 of PROGRESS IN RADIOBIOLOGY. (Proc. of Fourth Internat. Conf. on Radiobiology held in Cambridge, Aug. 14-17, 1955). J. S. Mitchell, B. E. Holmes, and C. L. Smith, eds. Springfield, Ill., C. C. Thomas Co., 1956.

The authors report on studies of *in vitro* exposure of blood proteins to labelled cysteamine and cystamine and on the fixation of the compounds by proteins. Cystamine, the disulfide form, is considered to be the immediate protective agent in the cell.

12304

DISCUSSION OF PAPER ON p.143 BY vanBekkum and DeGroot. R. Koch and U. Hagen. p.246-48 of PROGRESS IN RADIOBIOLOGY. (Progress of Fourth Internat. Conf. on Radiobiology held in Cambridge, Aug. 14-17, 1955). J. S. Mitchell, B. E. Holmes, and C. L. Smith, eds. Springfield, Ill., C. C. Thomas Co., 1956.

Discussion: Studies on series of compounds of the dithiocarbonate family demonstrated that the protective effect in lethally irradiated mice increased as toxicity increased and that the sulphhydryl group of the compounds is activated by the neighboring amino group to an increasing extent as the amino group is made "more strongly positive" by substitution. Simple idea of capture of radicals or non-specific reducing action does not adequately explain the protective effects.

12305

OBSERVATIONS ON CHEMICAL PROTECTION *IN VIVO* AND *IN VITRO*. D. W. vanBekkum and J. DeGroot. p.243 of PROGRESS IN RADIOBIOLOGY. (Proc. of Fourth Internat. Conf. on Radiobiology held in Cambridge, Aug. 14-17, 1955). J. S. Mitchell, B. E. Holmes, and C. L. Smith, eds. Springfield, Ill., C. C. Thomas Co., 1956.

Chemical protective agents were studied with respect to their ability 1. to protect mice against the lethal effects of radiation and 2. to protect rat thymocytes irradiated *in vitro*. Protective agents studied were: cysteine, glutathione, cysteamine, diethyldithiocarbamate, histamine, l-epinephrine, β phenylethylamine and cyanide.

12306

STUDY OF A POPULATION OF LYSOGENIC BACTERIA GROWING IN A CONSTANT FIELD OF γ -RADIATION. H. Marcovich. p.236 of PROGRESS IN RADIOBIOLOGY. (Proc. of Fourth Internat. Conf. on Radiobiology held in Cambridge, Aug. 14-17, 1955). J. S. Mitchell, B. E. Holmes, and C. L. Smith, eds. Springfield, Ill., C. C. Thomas Co., 1956.

12307

MUTATION TO DEFECTIVE LAMBDA LYSOGENY IN *E. COLI*. R. K. Appleyard. p.229 of PROGRESS IN RADIOBIOLOGY. (Proc. of Fourth Internat. Conf. on Radiobiology held in Cambridge, Aug. 14-17, 1955). J. S. Mitchell, B. E. Holmes, and C. L. Smith, eds. Springfield, Ill., C. C. Thomas, 1956.

12308

THE PRODUCTION OF MUTATIONS OF ECONOMIC VALUE IN CEREAL CROPS. R. N. H. Whitehouse. p.223 of PROGRESS IN RADIOBIOLOGY. (Proc. of Fourth Internat. Conf. on Radiobiology held in Cambridge, Aug. 14-17, 1955). J. S. Mitchell, B. E. Holmes, and C. L. Smith, eds. Springfield, Ill., C. C. Thomas Co., 1956.

Wheat and barley seeds were irradiated with various doses of fast neutrons and the types and numbers of mutations produced were observed.

12309

DIFFERENTIAL ULTRA-VIOLET IRRADIATION OF THE *HABROBRACON* EGG NUCLEUS. R. C. vonBorstel and H. Moser. p.211 of PROGRESS IN RADIOBIOLOGY. (Proc. of Fourth Internat. Conf. on Radiobiology held in Cambridge, Aug. 14-17, 1955). J. S. Mitchell, B. E. Holmes, and C. L. Smith, eds. Springfield, Ill., C. C. Thomas Co., 1956.

In nuclear killing, U-V as well as x-rays, α rays and nitrogen mustard kill most embryos before the eighth cleavage stage.

12310

CHEMICAL AND RADIATION MUTAGENESIS IN *DROSOPHILA MELANOGASTER*. O. G. Fahmy and Myrtle Fahmy. p.205 of PROGRESS IN RADIOBIOLOGY. (Proc. of Fourth Internat. Conf. on Radiobiology held in Cambridge, Aug. 14-17, 1955). J. S. Mitchell, B. E. Holmes, and C. L. Smith, eds. Springfield, Ill., C. C. Thomas Co., 1956.

Mustards, epoxides, amines and mesyloxyalkanes (all alkylating agents) were compared with x-rays as mutagenic agents. Effects measured; incidence of dominant lethals and of F_1 viable (eucentric) chromosomes rearrangements.

12311

X-RAY SENSITIVITY OF TWO WILD-TYPE STRAINS OF *DROSOPHILA MELANOGASTER*. O. Stromnes. p.196. "Progress in Radiobiology." (Proc. of Fourth Internat. Conf. on Radiobiology held in Cambridge, Aug. 14-17, 1955). J. S. Mitchell, B. E. Holmes and C. L. Smith, Editors. C. C. Thomas Co., Springfield, Ill., U. S. 1956.

Four day old males were irradiated and then mated to unirradiated females. Hatchability of eggs was used as criterion of effect (dominant lethal mutations).

12312

AN EXPERIMENTAL AND THEORETICAL INVESTIGATION OF THE LINEAR ABSORPTION COEFFICIENT IN WATER AND BONE FOR γ -RADIATION FROM 13 MeV to 24 MeV. T. Brustad and J. Baarli. p.178 of PROGRESS IN RADIOBIOLOGY. (Proc. of Fourth Internat. Conf. on Radiobiology held in Cambridge Aug. 14-17, 1955). J. S. Mitchell, B. E. Holmes, and C. L. Smith, eds. Springfield, Ill., C. C. Thomas Co., 1956.

12313

LINEAR ENERGY TRANSFER CALCULATIONS ALLOWING FOR DELTA TRACKS. P. R. J. Burch and P. M. Bird. "Progress in Radiobiology." (Proc. of Fourth Internat. Conf. on Radiobiology held in Cambridge, Aug. 14-17, 1955). J. S. Mitchell, B. E. Holmes and C. L. Smith, Editors. C. C. Thomas Co., Springfield, Ill., 1956.

12314

RELATIVE MUTAGENIC EFFICIENCY OF 4 MeV X-RAYS AS ASSESSED BY THE INDUCTION OF DOMINANT LETHALS IN *DROSOPHILA*. A. J. Bateman. p.144. "Progress in Radiobiology." (Proc. of Fourth Internat. Conf. on Radiobiology held in Cambridge, Aug. 14-17, 1955). J. S. Mitchell, B. E. Holmes and C. L. Smith, Editors. C. C. Thomas Co., Springfield, Ill., U. S. 1956.

12315

THE RELATIVE BIOLOGICAL EFFICIENCY OF 31 MeV BETATRON AND 175 keV X-RAY IRRADIATION AS MEASURED BY RECESSIVE SEX-LINKED LETHALS IN *DROSOPHILA MELANOGASTER*. Jeanne Mossige. p.137. "Progress in Radiobiology." (Proc. of Fourth Internat. Conf. on Radiobiology held in Cambridge, Aug. 14-17, 1955). J. S. Mitchell, B. E. Holmes and C. L. Smith, Editors. C. C. Thomas Co., Springfield, Ill., 1956.

12316

THE RELATIVE BIOLOGICAL EFFICIENCIES OF 31 MeV BETATRON RADIATION AND 175 keV X-RAYS AS MEASURED BY LETHAL EFFECTS ON 4-DAY CHICK EMBRYOS. P. Oftedal. p.131. "Progress in Radiobiology." (Proc. of Fourth Internat. Conf. on Radiobiology held in Cambridge, Aug. 14-17, 1955). J. S. Mitchell, B. E. Holmes and C. L. Smith, Editors. C. C. Thomas Co., Springfield, Ill., 1956.

12317

PRODUCTION OF "HIDDEN" BREAKS IN DNA BY THE DIRECT ACTION OF IONISING RADIATION. P. H. Alexander and K. A. Stacey. p.105. "Progress in Radiobiology." (Proc. of Fourth Internat. Conf. on Radiobiology held in Cambridge, Aug. 14-17, 1955). J. S. Mitchell, B. E. Holmes and C. L. Smith, Editors. C. C. Thomas Co., Springfield, Ill., 1956.

12318

DIFFERENCE IN RADIOSENSITIVITY OF VARIOUS ENZYMES IN TISSUE HOMOGENATE AND IN PURIFIED SOLUTION. H. A. Kunkel, G. Hohne, H. Maass and G. Schubert. p.52. "Progress in Radiobiology." (Proc. of Fourth Internat. Conf. on Radiobiology held in Cambridge, Aug. 14-17, 1955). J. S. Mitchell, B. E. Holmes and C. L. Smith, Editors. C. C. Thomas Co., Springfield, Ill., 1956.

Liver homogenates were irradiated and enzyme activity was determined in irradiated and unirradiated homogenates from the same liver. The observations that x-irradiation did not inactivate the major enzymes of carbohydrate metabolism suggest that the intracellular environment of enzymes provides effective protection against irradiation damage.

12319

THE EFFECT OF FRACTIONATED X-RAY DOSES ON DNA SYNTHESIS AND GROWTH OF *VICIA FABA* ROOTS. S. R. Pelc and A. Howard. p.8. "Progress in Radiobiology." (Proc. of Internat. Conf. (Fourth on Radiobiology held in Cambridge, Aug. 14-17, 1955). J. S. Mitchell, B. E. Holmes and C. L. Smith, Editors. C. C. Thomas Co., Springfield, Ill., U. S. 1956.

Growth rate during 10 days following x-irradiation and number of meristematic cells synthesizing DNA during a period of 12 hours post-exposure were measured in bean roots.

12320

RADIATION-INDUCED CHROMOSOME ABERRATIONS IN *TRADESCANTIA*. Norman H. Giles, Jr. p.713-761 of Vol. 1 of RADIATION BIOLOGY. Alexander Hollaender, ed. New York. McGraw-Hill Book Co., Inc. 1954.

Major sub headings are: aberration types and frequencies, experimental techniques, types of aberrations, symmetrical and asymmetrical exchanges, distribution of breaks in chromosomes, distribution of aberration types among nuclei, spontaneous aberrations, time of chromosome division, variations in radiosensitivity with the nuclear cycle, relation of aberration yield to dose and intensity, space factor in reunion, restitution, relative efficiencies of various radiations, effect of absorbed isotopes, modifying factors.

12321

IRRADIATION EFFECTS IN SOLIDS OF DIFFERENT WATER CONTENT. L. Ehrenberg. p.114. "Progress in Radiobiology." (Proc. of Fourth Internat. Conf. on Radiobiology held in Cambridge, Aug. 14-17, 1955). J. S. Mitchell, B. E. Holmes and C. L. Smith, Editors. C. C. Thomas Co., Springfield, Ill., 1956.

Results of studies on *in vitro* irradiation of starch indicate how biological radiation effects over a range of water contents (*in vivo*) must be explained. At least part of the energy conduction after irradiation is by diffusion of reactive intermediary compounds. At higher water contents, reactions of the kinds occurring in dilute water solutions become more important.

12322

X-RAY SIEVE THERAPY IN CANCER. B. Jolles. Lewis Co., London (1953).

12323

THE CONCEPT OF DOSAGE AND THE DEFINITION OF THE R UNIT. R. Glocker. *Radiology* 18, 93-8(1932).

12324

THE EXPERIMENTAL ANIMAL FOR STUDY OF THE BIOLOGICAL EFFECTS OF RADIATION. J. F. Loutit. p.3-6 of Vol. 11 of PROCEEDINGS OF INTERNATIONAL CONFERENCE ON PEACEFUL USES OF ATOMIC ENERGY, HELD IN GENEVA, AUG. 8-20, 1955. New York, United Nations. 1956.

12325

THE INFLUENCE OF IONIZING RADIATIONS ON ANIMAL ORGANISMS. A. V. Lebedinsky. p.7-24 of Vol. 11 of PROCEEDINGS OF THE INTERNATIONAL CONFERENCE ON PEACEFUL USES OF ATOMIC ENERGY, HELD IN GENEVA, AUG. 8-20, 1955. New York, United Nations. 1956.

The author reviews the role of the nervous system in the general response of animals to irradiation.

12326

BIOLOGICAL EFFECTS OF RADIATION. J. C. Bugher. p.45-8 of Vol. 11 of PROCEEDINGS OF THE INTERNATIONAL CONFERENCE ON PEACEFUL USES OF ATOMIC ENERGY, HELD IN GENEVA, AUG. 8-20, 1955. New York, United Nations. 1956.

12327

BIO-MEDICAL EFFECTS OF NUCLEAR ENERGY. M. Tsuzuki. p.65-7 of Vol. 11 of PROCEEDINGS OF THE INTERNATIONAL CONFERENCE ON PEACEFUL USES OF ATOMIC ENERGY, HELD IN GENEVA, AUG. 8-20, 1955. New York, United Nations. 1956.

12328

A COMMENTARY ON THE MODES OF RADIATION INJURY. A. M. Brues. p.71-5 of Vol. 11 of PROCEEDINGS OF THE INTERNATIONAL CONFERENCE ON PEACEFUL USES OF ATOMIC ENERGY, HELD IN GENEVA, AUG. 8-20, 1955. New York, United Nations. 1956.

12329

MODES OF RADIATION AND INJURY - MEDICAL ASPECTS. E. Rock Carling. p.76-9 of Vol. 11 of PROCEEDINGS OF THE INTERNATIONAL CONFERENCE ON PEACEFUL USES OF ATOMIC ENERGY, HELD IN GENEVA, AUG. 8-20, 1955. New York, United Nations. 1956.

12330

SOME ASPECTS OF THE IMMUNITY OF THE ORGANISM EXPOSED TO IONIZING RADIATION. I. A. Pigalyev. p.80-7 of Vol. 11 of PROCEEDINGS OF THE INTERNATIONAL CONFERENCE ON PEACEFUL USES OF ATOMIC ENERGY, HELD IN GENEVA, AUG. 8-20, 1955. New York, United Nations. 1956.

12331

MODES OF RADIATION INJURY. A. Zuppinger. p.88-92 of Vol. 11 of PROCEEDINGS OF THE INTERNATIONAL CONFERENCE ON PEACEFUL USES OF ATOMIC ENERGY, HELD IN GENEVA, AUG. 8-20, 1955. New York, United Nations. 1956.

12332

EFFECTS OF WHOLE BODY EXPOSURE TO NUCLEAR OR X-RAY ENERGY ON LIFE SPAN AND LIFE EFFICIENCY. J. W. Gowen. p.105-9 of Vol. 11 of PROCEEDINGS OF THE INTERNATIONAL CONFERENCE ON PEACEFUL USES OF ATOMIC ENERGY, HELD IN GENEVA, AUG. 8-20, 1955. New York, United Nations. 1956.

Ten inbred strains of mice were exposed to one of several doses of either x-rays or nuclear radiation and observed throughout their lifespan. Progeny were studied to determine rates of mutation-induction.

12333

BIOLOGICAL EFFECTS OF FAST NEUTRONS AND

GAMMA RAYS. J. W. Clark, et al. p.110-14 of Vol. 11 of PROCEEDINGS OF THE INTERNATIONAL CONFERENCE ON PEACEFUL USES OF ATOMIC ENERGY, HELD IN GENEVA, AUG. 8-20, 1955. New York, United Nations. 1956.

Lethality, mechanism of mortality (infection, spleen weight) and effects of streptomycin and cysteine pre-treatment were studied in CF₁ female mice following exposure to various single doses and dose rates of: 1. fission neutrons, 2. Co⁶⁰ γ rays or 3. mixtures of 1 and 2.

12334

A FORMULATION OF THE RELATION BETWEEN RADIATION DOSE AND SHORTENING OF LIFE SPAN. H. A. Blair. p.118-20 of Vol. 11 of PROCEEDINGS OF THE INTERNATIONAL CONFERENCE ON PEACEFUL USES OF ATOMIC ENERGY, HELD IN GENEVA, AUG. 8-20, 1955. New York, United Nations. 1956.

The author discusses the kinetics of radiation injury and presents a formulation of life span - radiation dose relationships.

12335

MODES OF ACUTE RADIATION DEATH. H. Quastler. p.121-24 of Vol. 11 of PROCEEDINGS OF THE INTERNATIONAL CONFERENCE ON PEACEFUL USES OF ATOMIC ENERGY, HELD IN GENEVA, AUG. 8-20, 1955. New York, United Nations. 1956.

12336

IRREVERSIBILITY OF DAMAGE PRODUCED BY ALPHA-EMITTERS. J. N. Stannard, H. A. Blair and R. C. Baxter. p.125-27 of Vol. 11 of PROCEEDINGS OF THE INTERNATIONAL CONFERENCE ON PEACEFUL USES OF ATOMIC ENERGY, HELD IN GENEVA, AUG. 8-20, 1955. New York, United Nations. 1956.

Studies on albino rats receiving injections of polonium chloride at several dosage levels in single or repeated injections are reported.

12337

EARLY EFFECTS OF RADIATION INJURY. M. Tsuzuki. p.128-29 of Vol. 11 of PROCEEDINGS OF THE INTERNATIONAL CONFERENCE ON PEACEFUL USES OF ATOMIC ENERGY, HELD IN GENEVA, AUG. 8-20, 1955. New York, United Nations. 1956.

The author presents a brief review of the acute illness as observed in Hiroshima and Nagasaki casualties.

12338

LATE EFFECTS OF RADIATION INJURY. M. Tsuzuki. p.130-31 of Vol. 11 of PROCEEDINGS OF THE INTERNATIONAL CONFERENCE ON PEACEFUL USES OF ATOMIC ENERGY, HELD IN GENEVA, AUG. 8-20, 1955. New York, United Nations. 1956.

Late effects of extremely high radiation doses are considered with respect to effects on the exposed persons and on their descendants. Effects: leukemia, cataracts, abortion and stillbirth, altered growth and development of children exposed in utero, nail bed capillary studies on survivors, general condition.

12339

RADIATION INJURY DUE TO RADIOACTIVE FALLOUT. M. Tsuzuki. p.132-33 of Vol. 11 of PROCEEDINGS OF THE INTERNATIONAL CONFERENCE ON PEACEFUL USES OF ATOMIC ENERGY, HELD IN GENEVA, AUG. 8-20, 1955. New York, United Nations. 1956.

A report of the clinical findings in 23 Japanese fishermen injured by radioactive fallout in March 1954 (Mixed fission product exposure).

12340

SIMILARITY OF EFFECTS PRODUCED BY ABSENCE OF VITAMINS AND BY EXPOSURE TO X-RAYS. W. Cramer, A. H. Drew and J. C. Mottram. *Lancet*, 963-4(1921).

Avitaminosis and starvation characteristically produce a marked reduction in size of lymphoid tissue (spleen, thymus, nodes, Peyer's patches, blood lymphocytes) in rats and mice. Exposure to radium and x-rays produces the same effect. The authors believe that both agents lead to inanition and have especially marked effects on lymphoid tissue, demonstrating its importance for life.

12341

CARCINOGENESIS BY IONIZING RADIATIONS. Jacob Furth and Egon Lorenz. p.1145-1201 of RADIATION BIOLOGY, VOL. 1. Alexander Hollaender, ed. New York. McGraw-Hill Book Co., Inc. 1954.

12342

HISTOLOGICAL CHANGES AFTER IRRADIATION. William Bloom and Margaret A. Bloom. p.1091-1143 of RADIATION BIOLOGY, VOL. 1. Alexander Hollaender, ed. New York. McGraw-Hill Book Co., Inc. 1954.

12343

THE PATHOLOGICAL PHYSIOLOGY OF RADIATION INJURY IN THE MAMMAL. II. SPECIFIC ASPECTS OF THE PHYSIOLOGY OF RADIATION INJURY. Harvey Patt and A. M. Brues. p.959-1028 of RADIATION BIOLOGY, VOL. 1. Alexander Hollaender, ed. New York. McGraw-Hill Book Co., Inc. 1954.

12344

THE EFFECTS OF RADIATION ON MAMMALIAN PRENATAL DEVELOPMENT. Liane Brauch Russell. p.861-918 of RADIATION BIOLOGY, VOL. 1. Alexander Hollaender, ed. New York. McGraw-Hill Book Co., Inc. 1954.

12345

GENETIC EFFECTS OF RADIATION IN MAMMALS. W. L. Russell. p.825-859 of RADIATION BIOLOGY, VOL. 1. Alexander Hollaender, ed. New York. McGraw-Hill Book Co., Inc. 1954.

12346

IMMEDIATE EFFECTS ON DIVISION, MORPHOLOGY AND VIABILITY OF THE CELL. J. Gordon Carlson. p.763-824 of RADIATION BIOLOGY, VOL. 1. Alexander Hollaender, ed. New York. McGraw-Hill Book Co., Inc. 1954.

Main subheadings: Ionizing radiation effects compared with U-V effects; mitotic effects (grasshopper neuroblasts, Arbacia eggs, various plant and animal tissues including tabulated data); morphological effects; cell viability effects.

12347

ANAEROBIC RECOVERY OF ASCARIS EGGS FROM X-IRRADIATION. G. Fahl and C. S. Bachofer. Biol. Bull. 112, 383-389(1957).

12348

THE X-IRRADIATION OF HAPLOID AND DIPLOID STRAINS OF YEAST AND ITS ACTION ON CELL DIVISION AND METABOLISM. E. L. Gonzales and E. S. G. Barron. Biochim. Biophys. Acta 19, 425-431(1956).

12349

NONIONIZING RADIANT ENERGY AS AN AGENT IN ALTERING THE INCIDENCE OF X-RAY-INDUCED CHROMATID ABERRATIONS. II. EFFECTS OF FAR-RED AND INFRA-RED RADIANT ENERGY ON TRADESCANTIA AND VICIA. R. B. Withrow and C. C. Moh. Radiation Research 6, 491-500(1957).

12350

EFFECTS OF IONIZING RADIATION ON THE IN VIVO INCORPORATION OF AMINO ACIDS INTO PROTEINS. J. A. V. Butler, P. Cohn and A. R. Crathorn. p.33 of PROGRESS IN RADIOBIOLOGY. Springfield, Ill., C. C. Thomas Co. 1957.

Rats (fasted) were irradiated (whole body) with a 500 r dose of x-rays and immediately after irradiation

injected intraperitoneally with C^{14} labelled phenylalanine. Livers were removed at selected times after exposure and the various subcellular constituents (nucleus, mitochondria, microsomes, fluid supernatant) were studied with respect to amino acid incorporation. Irradiation produced an increase in incorporation into tissue protein, the increase occurring first in the nuclear fraction, followed within an hour by the other fractions. This effect was not observed in fractions of kidney cells. Causes of the observed effects remained obscure.

12351

OBSERVATIONS ON RADIATION DAMAGE TO THE UPPER PORTION OF THE INTESTINE IN THE TREATMENT OF COLUMN CARCINOMA. K. Bock and W. Heyde. Zentralblatt für Gynäkologie 75, 642-50(1953). (In German).

Four human autopsy cases showed, in addition to damage in the sigmoid colon, severe damage in the small intestine and lower ileum. The changes in the small intestine were similar to those in the upper portion of the large intestine. Roentgenologically detected damage of the ileum that progressed to perforation is described.

12352

THE EFFECTS OF IONIZING RADIATIONS ON ENZYMES IN VITRO. W. M. Dale. p.25-37 of CIBA FOUNDATION SYMPOSIUM ON IONIZING RADIATION AND CELL METABOLISM. Boston. Little, Brown and Co. 1956.

A short review of radiation effects on enzymes in vitro in light of which the author proposes in vivo studies should be viewed.

12353

THE MORTALITY-REDUCING EFFECT OF POTENTIATED ANESTHESIA IN IRRADIATED GUINEA PIGS. R. L. Fonner and D. Laird. Compt. rend. 239, 832-34(1954).

The combined medications (a phenothiazine plus dimethylamino - 2 methyl - 2 ethyl - N- thiophenylamine hydrochloride or the ethyl ester of methyl - 11 phenyl - 4 piperidine-carboxylic acid) protected guinea pigs against lethal effects of a radiation dose that would have been lethal unless the animals were made hypothermic.

12354

EDUCATION AND TRAINING IN NUCLEAR SCIENCE AND ENGINEERING IN THE UNITED STATES. E. E. Anderson, F. C. Vonderlage, and R. T. Overman. p.463-70 of PROC. OF INTERNAT. CONF. ON PEACEFUL USES OF ATOMIC ENERGY, HELD IN GENEVA, AUG. 8-20, 1955, VOL. 1. New York, United Nations. 1956.

12355

THE EFFECT OF FILTERED RADIUM RAYS ON THE ENDOMETRIUM. W. Von Massenbach and H. Czech. Geburtsh. Frauenheilk. 14, 317-22(1954). (In German)

The beta particle of "filtered radium" cannot penetrate the full thickness of the human endometrium. Curettage must be carried out if this agent is used to irradiate the basal layer of the endometrium.

12356

EDUCATION AND TRAINING IN HEALTH AND MEDICAL USES OF ATOMIC ENERGY. World Health Organization. p.471-76 of PROC. OF INTERNAT. CONF. ON PEACEFUL USES OF ATOMIC ENERGY, HELD IN GENEVA, AUG. 8-20, 1955, VOL. 1. New York, United Nations. 1956.

12357

EARLIER MORPHOLOGIC CHANGES OF TISSUE CELLS CAUSED BY X-RAY IRRADIATION. (STUDIES WITH METHYL GREENPYRONIN). S. Nagai, H. Matsuda, K. Akita, and T. Kasue. Med. J. Osaka Univ. 5(4), 749-762 (1954). BA 30-494

12358

A STUDY OF RADIATION EFFECTS ON PRIMARY PHOSPHATE ESTERS IN AQUEOUS SOLUTION. R. W. Wilkinson and T. E. Williams. p.82 of PROGRESS IN RADIO-BIOLOGY. Springfield, Ill., C. C. Thomas Co. 1956.

12359

INCORPORATION OF CARBON¹⁴ INTO FAT AND GLYCOGEN OF THE LIVER OF IRRADIATED MICE AFTER RECEIVING AN INJECTION OF CARBON¹⁴-LABELED GLUCOSE. M. Loureau-Pitres. Arkiv. Kemi. 7, 211(1954). (In German).

12360

EFFECT OF HIGH SINGLE DOSES AND EFFECT OF FRACTIONATION OF THESE DOSES ON THE SKIN OF C57 BLACK STRAIN MICE. F. Kroning and R. Sigmund. Hautarzt 6, 127-29(1955). (In German).

12361

MORPHOLOGICAL CHANGES OF INTERCELLULAR STRUCTURES OF CONNECTIVE TISSUE AFTER ROENTGEN RAY EXPOSURE. A. Merli. Radioterap., radiobiol. e fis. med. 297-315(1954).

12362

CHRONOLOGICAL DEVELOPMENT OF VARIOUS HISTOCHEMICAL MODIFICATIONS OF THE SKIN IN THE REGION EXPOSED TO ROENTGEN IRRADIATION AS WELL AS IN ADJACENT AND DISTANT REGIONS. A. Romanini and S. Chippa. Boll. soc. ital. biol. sper. 30, 811-13(1954). (In Italian).

12363

INHIBITION OF THE ENZYME ACTIVITY OF ISOLATED MITOCHONDRIA BY SMALL X-RAY DOSES. H. Fritz-Niggli. Naturwissenschaften 42, 585(1955). (In German). BA 51-15, 677c

12364

X-IRRADIATION OF THE GIANT AMOEBA PELOMYXA ILLINOISENSIS. I. SURVIVAL AND CELL DIVISION FOLLOWING EXPOSURE. THERAPEUTIC EFFECTS OF WHOLE PROTOPLASM. E. W. Daniels. J. Exp. Zool. 130, 183-197(1955).

12365

SOME AFTER-EFFECTS IN FATS IRRADIATED WITH HIGH ENERGY ELECTRONS AND X-RAYS. R. S. Hannan and H. J. Shepherd. Trans. Faraday Soc. 49, 326(1953).

Irradiation of butter fat with large doses of 1.2 MeV cathode rays or 50 Kv x-rays produces organic peroxides, approximately equivalent in amount to the original O₂ content. Carotenoids and antioxidants are also destroyed. Similar changes are observed in fat extracted from beef perinephric tissue and to a greater extent in whole butter and intact perinephric tissue.

12366

INFLUENCE OF RADIATION ON THE METABOLISM OF ASCITES TUMOUR CELLS. A. Forssberg. p.212-24 of CIBA FOUNDATION SYMPOSIUM ON IONIZING RADIATIONS AND CELL METABOLISM. G.E.W. Wolstenholm and C. M. O'Connor, eds. Boston. Little, Brown and Co. 1956.

The author's studies on protein and nucleic acid synthesis in ascites tumor cells irradiated in vivo are reviewed.

12367

LIFE SPANS OF DIFFERENT STRAINS OF MICE AS AFFECTED BY ACUTE IRRADIATION WITH 1000 KVP X-RAYS. J. W. Gowen and J. Stadler. J. Exptl. Zool. 132, 133-55(1956).

12368

Brookhaven National Lab., Upton, N. Y. MUTATION. A REPORT OF SYMPOSIUM HELD JUNE 15 TO 17, 1955. Brookhaven Symposium in Biology No. 8. 240p. (BNL-350)

12369

Michigan State Univ., East Lansing. A CONFERENCE ON RADIOACTIVE ISOTOPES IN AGRICULTURE. HELD AT MICHIGAN STATE UNIVERSITY ON JANUARY 12, 13, AND 14, 1956. Jan. 1956. 420p. (TID-7512)

12370

THE EFFECTS OF EXTRANEIOUS AGENTS ON CELL METABOLISM. H. A. Krebs. p.92-105 of CIBA FOUNDATION SYMPOSIUM ON IONIZING RADIATIONS AND CELL METABOLISM. G. E. W. Wolstenholme and C. M. O'Connor, eds. Boston. Little, Brown and Co. 1956.

The cellular metabolic stages that are vulnerable to radiation are those controlling the rates of metabolic processes and are referred to as "pacemaker" reactions. In these systems, the amount of active enzymes is the critical factor modifying the metabolic process. Enzymes operating at other stages are present in excess of available substrate and partial enzyme destruction is incompatible with the normal rate of metabolism. Available evidence is considered to confirm the author's hypothesis that extraneous agents (e.g. radiation) more often than not interfere with pacemaker reactions.

12371

THE PROBLEM AND CONSTITUTION OF RADIATION-SENSITIZING AGENTS. R. Koch. p.170 of PROGRESS IN RADIOBIOLOGY. Springfield, Ill., C. C. Thomas Co. 1957.

Although α thiolamino acids are known to be radiation-protective substances, their analogues, the β thiolamino acids (β homocysteine and isocysteine) are shown to be radiation sensitizing agents in rats and mice.

12372

RADIOBIOLOGICAL INVESTIGATIONS ON THE HIBERNATING LOIR (GLIS GLIS). H. A. Kunkel, G. Hohne, and H. Maass. p.176 of PROGRESS IN RADIOBIOLOGY. Springfield, Ill., C. C. Thomas Co. 1957.

Hibernation at temperature of 4°C. resulted in delay of onset of symptoms of injury from a dose of 700 r x-ray in the dormouse until the animals returned to room temperature. Then, death rate at 30 days (subsequent to return to room temperature) was the same as that in non-hibernating irradiated animals. The hibernation period appeared only to delay radiation effects and did not appear to permit recovery. Cysteine protected the animals when administered 21 days after irradiation (when returned to room temperature). Apparently injury was not complete during hibernation.

12373

EFFECTS OF IRRADIATION ON DNA SYNTHESIS BY HUMAN BONE MARROW CELLS IN VITRO. L. G. Laytha, R. Oliver and F. Ellis. p.54 of PROGRESS IN RADIOBIOLOGY. Springfield, Ill., C. C. Thomas Co. 1957.

Small doses (150-300 rads) of x-irradiation inhibit DNA synthesis if delivered to cells prior to the beginning of DNA synthesis (cells in G₁ period) but have no inhibiting effect once synthesis has started. There appears to be a radiosensitive system in cells connected with the process of DNA synthesis. This process, however, is not identical with DNA synthesis.

12374

THE EFFECT OF X-IRRADIATION ON RAT THYMUS NUCLEIC ACIDS AT SHORT INTERVALS AFTER EXPOSURE IN VIVO. M. G. Ord and L. A. Stocken. p.65 of PROGRESS IN RADIOBIOLOGY. Springfield, Ill., C. C. Thomas Co. 1957.

A brief summary of previous physico-chemical studies on DNA from rat thymus glands irradiated in vitro is given. To check the results of in vitro irradiation, authors exposed rats (after injection with a labelling dose of P³²)

to 1000 r of x-rays. Other rats received the P^{32} immediately after irradiation. Nuclei were prepared as in the earlier *in vitro* studies and the incorporation of P^{32} into the nucleic acids was determined. Inhibition of P^{32} uptake was observed soon after exposure, by 24 hours had essentially ceased. Major effect is on DNA, much less on RNA. Failure to incorporate P^{32} probably is not due to altered DNA structure.

12375

RADIOBIOLOGY EMPLOYED IN PHYSIOLOGIC PATHOLOGY AND EXPERIMENTAL CANCER. J. Maisin, H. Maisin, A. Dunjic and P. Moldaque. *Bull. Schweiz. Akad. Med. Wiss.* 11, 247-273(1955).

12376

ACTION OF X-RAYS ON MAMMALIAN CELLS. II. SURVIVAL CURVES OF CELLS FROM NORMAL HUMAN TISSUES. T. T. Puck, D. Morkovin, P. I. Marcus, and S. J. Cieciura. *J. Exp. Med.* 106, 485-500(1957).

Dose-effect curves were determined for isolated cells in culture subjected to x-rays. Cells studied were HeLa cells, human embryonic lung cells and human fibroblasts from skin, spleen and ovary. The survival curve indicates at 2-hit mechanism of killing. Cytological aberrations are described.

12377

EVIDENCE FOR THE CELLULAR HYPOTHESIS IN RADIATION PROTECTION BY BONE MARROW CELLS. O. Vos, J. A. G. Davids, W. W. Weyzen and D. W. vanBekum. *Acta Physiol. et Pharmacol. Neerl.* 4, 482-486(1956).

12378

ENHANCED PRODUCTION OF ANTIBODIES BY LOCAL IRRADIATION. I. MEASUREMENT OF CIRCULATING ANTIBODIES. J. B. Graham, R. M. Graham, L. Neri and K. A. Wright. *J. Immunol.* 76, 103-109(1956).

Sheep erythrocytes were injected into the dermis of the lateral aspect of the proximal thigh of rabbits and the area was then irradiated with 1000 r, 30 minutes and again 1 week after antigen injection. This resulted in an elevated serum hemolysin response.

12379

CELL DIVISION AND NUCLEIC ACID SYNTHESIS IN THE REGENERATING LIVER OF THE RAT. D. B. Cater, B. E. Holmes and L. K. Mee. *Acta Radiol.* 46, 655-667(1956).

12380

EFFECTS OF X-RAYS ON *ACETABULARIA MEDITERRANEA*. Z. M. Bacq, F. Vanderhaeghe, I. Damblon, M. Ervare, and A. Herve. *Exptl. Cell. Res.* 12, 639-648(1957). (In French).

Survival of anucleate fragments of *A. mediterranea* is decreased below that of nucleate fragments following x-irradiation. Upon x-irradiation of the whole cell, cytoplasm furthest from the nucleus dies earliest and in a higher percentage of cases than that surrounding the nucleus, but the mortality rate of cells and fragments is not proportional to total dose. Growth and morphogenesis of surviving irradiated algae at all doses are equal to or better than in controls. Data on survival for as long as 20 days after 10^5 or 10^4 r are presented for stems, roots and anucleate fragments, also data on effect of partial shielding on survival following irradiation.

12381

INACTIVATION OF BACTERIA BY DECAY OF INCORPORATED RADIOACTIVE PHOSPHORUS. C. R. Faerst and G. S. Stent. *J. Gen. Physiol.* 40, 73-90(1956).

A thymineless strain of *E. coli*, differentially labelled with P-32 will not grow if the specific activity of the media is very high. Growth inhibition is due to P-32 disintegrations within the bacterial DNA. Thymine deprivation and P-32

effects appear to inactivate bacteria by a similar mechanism and their effects are additive. Growth characteristics of subcultures of thymineless and P-32 labeled cells are also described and discussed.

12382

HETEROPLASTIC TISSUE GRAFTING EFFECTED THROUGH ROENTGEN-RAY LYMPHOID DESTRUCTION.

J. B. Murphy. *J. Am. Med. Assoc.* 62, 1459(1914).

"Removal of the lymphoid barrier" by means of x-irradiation is shown to permit growth of heterologous tissues in rats, as predicted by the author on the basis of his earlier studies which showed that the lymphoid-deficient chick embryo accepts heterologous grafts but becomes resistant in the adult stage if supplied with a graft of adult chicken spleen or marrow.

12383

RADIOSENSITIVITY OF SALT UPTAKE IN PLANTS.

D. A. Barber, G. J. Neary and R. S. Russell. *Nature* 180, 556-557(1957).

12384

THE PROPERTIES OF X-RAY INACTIVATED BACTERIOPHAGE. II. INACTIVATION BY INDIRECT EFFECTS.

J. D. Watson. *J. Bacteriol.* 63, 473-485(1952).

12385

ACTION OF X-RAYS ON LIVING TISSUES *IN VITRO*. III. SUCCESSIVELY APPEARING MORPHOLOGICAL CHANGES IN X-IRRADIATED CULTURES. R. I. Gassoul. *Ann. Roentgenol. et Radiol. Leningrad* 2, 341-356(1926). (In French).

12386

IS IT POSSIBLE TO MODIFY THE RADIOSENSITIVITY OF VARIOUS CELLS? G. E. Meldolesi. *Arch. Radiol.* 29, 291-96(1954).

The metabolic state of individual cells influences their radiosensitivity. Emergence of a population of radioresistant cells from an irradiated population of cells of the same type but varying in radiosensitivity represents loss of the radiosensitive cells, not transformation.

12387

SYNTHESIS OF DEOXYRIBONUCLEIC ACID IN NORMAL AND IRRADIATED CELLS AND ITS REACTION TO CHROMOSOME BREAKAGE. A. Howard and S. R. Pelc. *Heredity, Suppl.* 6, 216(1953).

V. faba roots received neutron doses of 1.1, 2.4, or 4.9×10^3 ergs/gm. and the number of cells synthesizing DNA thereafter was determined by autoradiography of squash preparations after incubation in nutrient containing P-32 as NaH_2PO_4 . The number of cells in DNA synthesis 12 hours after irradiation was not dose-dependent. Division delay was, however, related to dose and the relation is discussed with respect to chromosome reproduction and times of maximum vulnerability of chromosomes to injury by x-rays and other agents.

12388

STUDIES ON THE MECHANISM OF PROTECTION AGAINST IONISING RADIATION BY COMPOUNDS OF THE CYSTEAMINE-CYSTEINE GROUP. A. Pihl and L. Eldjarn. p.147 of *PROGRESS IN RADIOBIOLOGY*. Springfield, Ill., C. C. Thomas Co. 1957.

The authors present data on the kinetics of thiol disulfide interactions, based on studies using S^{35} labeled cystamine, cysteamine and N, N'-diacetylcystamine with glutathione, cysteine, bovine serum albumin and a commercial preparation of cytochrome C. The compounds were incubated in oxygen-free phosphate buffer and reactions stopped by rapid acidification. Amounts of mixed disulfides in reaction products were measured by scanning paper chromatograms. The results are presented as (1) interactions of disulfides with biological thiols, (2) inter-

action of thiols with biological disulfides, (3) interaction of thiols with aldehydes and ketones. It is shown that when protective agents of the cysteamine-cysteine group are administered to animals, the compounds exist to a considerable extent as mixed disulfides (with tissue constituents). Qualitatively there is a correlation between the ability of various compounds to form mixed disulfides and their protective effectiveness.

12389

RADIATION CATARACT. A. Pirie. p.18 of PROGRESS IN RADIOBIOLOGY. Springfield, Ill., C. C. Thomas Co. 1956.

A review of the author's studies on experimentally produced cataract in rabbit eyes. Findings support observations of other investigators showing that the lens of the young animal is far more susceptible than that of older animal and secondly that the effect depends on the particular area of the lens irradiated. Only when the dividing cells are injured does cataract result (when they form defective lens fibres later). Glutathione decreases before cataract is present clinically. Possibly high energy PO_4 bonds also decrease early. Other enzymes decrease later. The GSH changes may be related to depressed protein synthesis and growth in irradiated lens, and to decreased RNA and DNA synthesis.

12390

BIBLIOGRAPHY OF X-RAY LITERATURE AND RESEARCH, 1896-97. Charles E. S. Phillips. ("The Electrician" Printing and Publishing Co., Ltd., London).

Such a work as this has become almost a necessity. The vast and scattered literature of the x-ray was already beyond the ken of even its most industrious student. (From a review in Archiv. Roentgen Ray 2, 33(1897-98)).

12391

THE BIOLOGICAL EFFECT OF X AND γ RAYS. Paul Reiss. Chez Vigot, France (1935).

12392

RELATIONSHIP OF THE CILIARY BODY TO RADIATION CATARACTS. I. Puntenney and D. Schoch. Trans. Am. Ophthalmol. Soc. 51, 285-300(1953).

The authors investigated the role of the ciliary body in radiation-induced cataracts. The ciliary body was found to be necessary for cataract production. Partial shielding of lens prevents formation of complete cataract even after 12,000 r.

12393

EFFECTS OF LARGE OXYGEN PRESSURES ON THE X-RAY SENSITIVITY OF THE BROAD BEAN ROOT. J. Read. Brit. J. Applied Phys. 2, 331(1951)

12394

PROLONGATION OF THE CLOTTING TIME OF PERITONEAL FLUID AFTER X-IRRADIATION. E. S. Smith and Y. S. Lewis. p.73 of PROGRESS IN RADIOBIOLOGY. G. C. deHevesy, A. G. Forssberg, and J. B. Abbatt, eds. Springfield, Ill., C. C. Thomas Co. 1957.

A clotting defect observed in peritoneal fluid of x-irradiated rats and hamsters appeared to be due to increased amounts of a heparin-like substance and could be corrected by adding protamine to the fluid. The impaired clotting coincided in time with the period of widespread disruption of mast cells in the serous membrane of the peritoneal cavity.

12395

RADIATION CHEMISTRY OF ORGANIC COMPOUNDS IN AQUEOUS SOLUTION. J. H. Baxendale and D. H. Smithies. Z. Physik. Chem. (Neue Folge) 7, 242(1956). (In German)

The authors studied the kinetics of oxidation of formic acid by x-rays in aqueous solution containing Cu^{++} and/or Fe^{+++} . Results of the studies are presented and analysed.

12396

FORMATION OF LABILE PHOSPHATE FROM SOME ORGANIC PHOSPHATE ESTERS BY IRRADIATION WITH X-RAYS IN AQUEOUS SOLUTION. G. Scholes and J. Wiess. p.93 of PROGRESS IN RADIOBIOLOGY. Springfield, Ill., C. C. Thomas Co. 1956.

The authors studied the formation of labile phosphate from irradiated aqueous solutions of monoethyl phosphate, 1- and 2- glycerophosphates, ribonucleotides and nucleic acids. The post-irradiation release of phosphate in RNA ("after-effect") is discussed. A true "after-effect" occurs in DNA only if molecular oxygen is present during irradiation.

12397

CHANGES IN BLOOD GLUCOSE LEVELS WHEN ADRENALS ARE IRRADIATED. Q. Vischia. Riv. de Rad. e Fisica Medica, 71(1930) Jan. (In French)

Hyperglycemia that occurs in rabbits immediately after irradiation of the adrenals is felt to be due to an effect of the irradiated adrenal on the vegetative nervous system.

12398

GENETIC VARIATION IN THE ACUTE LETHAL RESPONSE OF FOUR INBRED MOUSE STRAINS TO WHOLE BODY X-IRRADIATION. D. Grahn and K. R. Hamilton. Genetics 42, 189(1957).

12399

THE INFLUENCE OF THE EXPOSURE TO X-RAYS UPON THE FORMATION OF ANTIBODIES. J. P. Simonds and H. M. Jones. J. Med. Research 33, 183-196(1915).

Single large doses of killed typhoid bacilli were administered intraperitoneally to rabbits after the termination of a 3-week course of daily 10-15 min. x-ray exposures. Production of agglutinins, opsonins and bacteriolysins by these rabbits was compared with production by control rabbits and by benzol-treated rabbits receiving identical doses of killed typhoid bacilli. Only agglutinin production was affected by x-irradiation, and benzol caused a greater depression than did x-rays.

12400

THYROID CANCER AFTER IRRADIATION IN CHILDHOOD. p. 146. Proc. of Internat. Conf. on Peaceful Uses of Atomic Energy held in Geneva, Aug. 8-20, 1955. Vol. 11, Biological Effects of Radiation. New York, United Nations, 1956.

12401

THE EFFECT OF WHOLE BODY X-IRRADIATION ON THE MEGAKARYOCYTIC SYSTEM IN RAT FEMUR. B. Lindell and J. Zajicek. p. 376. "Advances in Radiobiology." (Proc. of Fifth Conf. on Radiobiology, Stockholm, 1956). C. C. Thomas Co., Springfield, Ill. Publishers (1956).

The total number of megakaryocytes in the femur of the rat was determined before and after total body exposure to 100 to 600 r of x-rays. Using a microdiver method for quantitative determination of cholinesterase activity in single cells, the authors demonstrate that the synthesis of this enzyme is not impaired in cells developing within 48 hours after a dose of 600 r.

12402

PHYSICAL PRINCIPLES UNDERLYING PHOTOCHEMICAL, RADIATION-CHEMICAL AND RADIOBIOLOGICAL REACTIONS. James Franck and Robert Platzman. p.191-253 of RADIATION BIOLOGY, VOL. 1. Alexander Hollaender, ed. New York. McGraw-Hill Book Co., Inc. 1954.

12403

BASIC RADIATION BIOCHEMISTRY. Walter M. Dale. p.255-281 of RADIATION BIOLOGY, VOL. 1. Alexander Hollaender, ed. New York. McGraw-Hill Book Co., Inc. 1954.

12404

THE RADIOBIOLOGICAL IMPORTANCE OF LINEAR ENERGY TRANSFER. Raymond E. Zirkle. p.315-350 of RADIATION BIOLOGY, VOL. 1. Alexander Hollaender, ed. New York. McGraw-Hill Book Co., Inc. 1954.

THE NATURE OF THE GENETIC EFFECTS PRODUCED BY RADIATION. H. J. Muller. p.351-473 of RADIATION BIOLOGY, VOL. 1. Alexander Hollaender, ed. New York. McGraw-Hill Book Co., Inc. 1954.

12406

THE MANNER OF PRODUCTION OF MUTATIONS BY RADIATION. H. J. Muller. p.475-626 of RADIATION BIOLOGY, VOL. 1. Alexander Hollaender, ed. New York. McGraw-Hill Book Co., Inc. 1954.

12407

LABORATORY STUDIES AND CLINICAL TRIALS OF SOME CHEMICAL RADIO-SENSITIZERS. J. S. Mitchell p. 170. "Radiobiology Symposium - 1954." (Proc. held at Liege, Aug.-Sept., 1954). Z. M. Bacq and P. Alexander, Editors. New York, Academic Press, Inc. 1955.

The author reviews his studies aimed at finding chemical agents that act as radiosensitizers for possible use in cancer chemotherapy. Basic compound is tetra Na 2 methyl - 1:4 naphthoquinone diphosphate (Synkavite). Related quinone compounds are also under study. Mitotic inhibition cytological effects and radiosensitization generally are studied in tissue cultures of chick fibroblasts. Low acute and chronic toxicity of Synkavite have been demonstrated for rats, mice and rabbits. Therapeutic trials in a large series of Walker rat carcinoma animals are described and clinical trials in progress are also described briefly.

12408

AUGMENTATION OF HEMOGLOBIN SYNTHESIS BY RETICULOCYTES IN VITRO AFTER IRRADIATION. A. Nizet and A. Herve. p. 194. "Radiobiology Symposium - 1954." (Proc. held at Liege, Aug. - Sept., 1954). Z. M. Bacq and P. Alexander, Editors. New York, Academic Press, Inc., 1955. (In French).

Data relative to incorporation of C¹⁴ labeled amino acids (glycine and phenylalanine) by reticulocytes in vitro from whole body x-irradiated dogs (dose: 500 r) and by reticulocytes irradiated in vitro (1500 r, 20,000 r or 100,000 r) are presented.

12409

PHOSPHORYLATING ACTIVITY OF MITOCHONDRIA AFTER TOTAL BODY IRRADIATION. D. W. van Bekkum. p. 201. "Radiobiology Symposium - 1954." (Proc. of Sym held at Liege Aug.-Sept., 1954). Z. M. Bacq and P. Alexander, Editors. New York, Academic Press Inc., 1955.

Mitochondria of rat spleen tissue or thymus 4 hrs or less after total body irradiation demonstrate greater depression of O₂ uptake than of phosphorylation. The minimal effective dose was 50 and 100 r for spleen and thymus respectively. Liver mitochondria were unaffected by a dose as high as 5000 r to the liver only. Spleen mitochondria were unaffected after in vitro spleen irradiation with 20,000 r. Possible role of ATPase as a mediator of the radiation effect is considered but the lesion is judged to be related to primary radiation injury.

12410

EFFECT OF SINGLE DOSE OF X-RAYS ON ACID SOLUBLE PHOSPHORUS FRACTIONS AND ON RESPIRATION OF THE SKIN OF THE RAT. P. Mandel, Ch. Gros and J. Rodesch. p. 210. "Radiobiology Symposium - 1954." (Proc. at Liege Aug.-Sept. 1954). Z. M. Bacq and P.

Alexander, Editors. New York Academic Press, Inc., 1955. (In French).

Wistar rats received total body exposure to 700 r, and at various times after irradiation, skin specimens were studied in vitro.

12411

DNA SYNTHESIS IN BONE MARROW STUDIED BY AUTORADIOGRAPHY. L. G. Lajtha, R. Oliver and F. Ellis. p. 216. "Radiobiology Symposium - 1954." (Proc. held at Liege, Aug.-Sept., 1954). Z. M. Bacq and P. Alexander, Editors. New York, Academic Press, Inc., 1955.

Human bone marrow cell suspensions were studied in an in vitro system using P³² or C¹⁴ labeled precursors to evaluate synthetic processes. Radiation doses of 5000 r in vitro markedly inhibited DNA synthesis, results indicating that cells in the period of DNA synthesis are immediately and completely prevented from synthesizing DNA. Results with x-ray were contrasted with those after treatment with aminopterin.

12412

THE INHIBITION OF DNA SYNTHESIS BY IRRADIATION WITH SPECIAL REFERENCE TO IRRADIATION IN THE EARLY STAGES OF LIVER REGENERATION. Barbara E. Holmes and L. K. Mee. p. 220. "Radiobiology Symposium - 1954." (Proc. held at Liege, Aug.-Sept., 1954). Z. M. Bacq and P. Alexander, Editors. New York, Academic Press, Inc., 1955.

Rate of DNA synthesis and mitotic index were studied in regenerating rat liver (after partial hepatectomy) following x-ray doses of 150 to 2200 r.

12413

INCORPORATION OF C¹⁴ INTO LIVER GLYCOGEN AFTER IRRADIATION. M. Louran-Pitres. p. 225. "Radiobiology Symposium - 1954." (Proc. held at Liege, Aug.-Sept., 1954). Z. M. Bacq and P. Alexander, Editors. New York, Academic Press, Inc., 1955.

Mice received a lethal x-ray dose (total body, 2000-2500 r) and studies were carried out within 24 hours after exposure, using C¹⁴ labeled glucose as a glycogen precursor.

12414

OBSERVATIONS MADE ON THE HUMAN RESPONSE TO A SINGLE DOSE OF X-RAYS - THE LATENT PERIOD. W. M. Court-Brown and J. D. Abbott. p. 229. "Radiobiology Symposium - 1954." (Proc. held at Liege, Aug.-Sept., 1954). Z. M. Bacq and P. Alexander, Editors. New York, Academic Press, Inc., 1955.

Authors present data on the length of the latent period prior to the onset of "radiation sickness" following single carefully measured doses of radiation (therapeutic) to various body regions of patients. Influence of body size and relationship between length of latent period and duration of acute symptoms suggest that symptoms are related to some circulating compound. Also supporting this is the longer latent period in patients with congestive failure.

12415

A NEW HYPOTHESIS FOR "CHROMATID" CHANGES. S. H. Revell. p. 243. "Radiobiology Symposium - 1954." (Proc. held at Liege, Aug.-Sept., 1954). Z. M. Bacq and P. Alexander, Editors. New York, Academic Press, Inc. 1955.

Author reviews critically the previously proposed explanations for chromatid changes induced in V. faba root tip cells by irradiation and chemicals, and suggests an explanation for the aberrations that characteristically occur in cells about to undergo mitosis (exchange hypothesis for chromatid changes).

12416

EFFECT OF OXYGEN TENSION ON THE PRODUCTION OF CHROMOSOME BREAKAGE BY IONIZING RADIATIONS:

AN INTERPRETATION. C. P. Swanson. p. 254. "Radiobiology Symposium - 1954." (Proc. held at Liege, Aug.-Sept., 1954). Z. M. Bacq and P. Alexander, Editors. New York, Academic Press Inc., 1955.

Chromosome breaks were counted in Tradescantia microspores after exposure to 50 Kvp, 100 Kvp, 250 Kvp x-rays or 1.1-3 MeV γ rays in (1) air, (2) N_2 , or (3) various mixtures of air/ N_2 .

12417

CHROMOSOME BREAKAGE BY DIEPOXIDE AND BY X-RAYS. G. Roy Lane. p. 265. "Radiobiology Symposium - 1954." (Proc. held at Liege, Aug.-Sept., 1954). Z. M. Bacq and P. Alexander, Eds. New York, Academic Press Inc., 1955.

Tradescantia roots in culture were exposed to an x-ray dose of 50r-100 r and fixed 6 hrs. - 4 days after exposure or treated with M/2000 diepoxide for 10, 20, 30 or 40 min. and fixed at intervals from 12-78 hours after treatment.

12418

STUDIES ON THE EXPERIMENTAL CONTROL OF THE MUTATION PROCESS. Ake Gustafsson. p. 282. "Radiobiology Symposium - 1954." (Proc. held at Liege, August - September 1954). Z. M. Bacq and P. Alexander, Eds. New York, Academic Press Inc., 1955.

Dormant or germinating seeds and pollen grains received single exposure to x-rays of varying hardness, fast and thermal neutrons, α rays or fission fragments. Living plants were irradiated over all or part of the vegetation period. This report is concerned with mutation process, the author pointing out that the problem of directed mutation is nearing solution in plants such as those included in the work presented.

12419

THE INFLUENCE OF POST-RADIATION FACTORS ON EFFECTS PRODUCED IN BARLEY. L. Ehrenberg. p. 285. "Radiobiology Symposium - 1954." (Proc. held at Liege, August - September 1954). Z. M. Bacq and P. Alexander, Editors. New York, Academic Press Inc., 1955.

Dormant barley seeds or seeds irradiated after the onset of germination were x-irradiated with one of several doses. The water content of seeds greatly influences radiosensitivity to sparsely ionizing rays (x-ray) but not to densely ionizing radiation, e.g. fast neutrons. Effect of germination temperature and of storage after irradiation were also evaluated.

12420

PATHOLOGY OF MICE IRRADIATED AFTER INJECTION OF CYSTEAMINE (β -MERCAPTOETHYLAMINE). M. A. Gerebtzoff and Z. M. Bacq. p. 290. "Radiobiology Symposium - 1954." (Proc. held at Liege, Aug.-Sept., 1954). Z. M. Bacq and P. Alexander, Editors. New York, Academic Press Inc., 1955.

Mice of C_{57} strain received a 700 r total body x-ray dose with or without injection of 3 mg of cysteamine just before exposure. Histological findings in spleen, thymus, intestine and liver of the animals are described briefly. Cysteamine is believed to exert its effect on some factors concerned with glycogen metabolism.

12421

SOME FACTORS CONTROLLING THE HAEMATOPOIETIC REGENERATION IN WHOLE BODY IRRADIATED RATS. E. H. Betz. p. 292. "Radiobiology Symposium - 1954." (Proc. held at Liege, Aug.-Sept. 1954). Z. M. Bacq and P. Alexander, Editors. New York, Academic Press Inc., 1955.

The author proposes that substances stimulating the anabolism of proteins are active in stimulating hematopoietic regeneration of rats exposed to single large whole-body x-ray doses. Adrenal hormones, growth hormone,

testosterone propionate and vitamin B_{12} tend to antagonize the anabolic effect.

12422

THE EFFECT OF CYSTEAMINE ON GRAFTED TUMORS IRRADIATED *IN LOCO*. S. Neukomm, Mme. L. Peguiron and A. Herve. p. 298. "Radiobiology Symposium - 1954." (Proceedings held at Liege, Aug.-Sept., 1954). Z. M. Bacq and P. Alexander, Editors. New York, Academic Press Inc., 1955. (In French).

Mice bearing a subcutaneously grafted mammary adenocarcinoma received local contact radiation therapy to the tumor and some animals received the protective agent intraperitoneally either before or after irradiation. Doses of x-ray were 1500 or 3000 r. Cysteamine proved protective for the tumor against x-ray doses, best effects being observed when the agent was given 1-2 hours before irradiation.

12423

HISTOLOGICAL STUDY OF INTESTINAL REPAIR PROCESSES IN RATS IRRADIATED UNDER DIVERSE "PROTECTIVE" CONDITIONS. H. Maisin and C. Fievez. p. 304. "Radiobiology Symposium - 1954." (Proc. held at Liege, Aug.-Sept., 1954). Z. M. Bacq and P. Alexander, Editors. New York, Academic Press Inc., 1955. (In French).

Rats were exposed to 700 r (total body) of x-rays with (1) no protection, (2) with lower abdominal lead shield or (3) after intraperitoneal injection of 7.5 mg of becapant per 100 g. body weight. Histological studies were done on animals sacrificed during the first 10 post exposure days.

12424

CYTOLOGICAL EFFECTS OF CHRONIC GAMMA IRRADIATION AND THE PROTECTIVE PROPERTY OF CERTAIN CHEMICALS AGAINST THE RADIATION INDUCED CHROMOSOME ABERRATIONS. Knut Mikaelson. p. 316. "Radiobiology Symposium-1954." (Proceedings held at Liege, Aug.-Sept. 1954). Z. M. Bacq and P. Alexander, Editors. New York, Academic Press Inc., 1955.

The author studied cuttings of Tradescantia in nutrient solution at time when they showed good primary roots. In one experiment plants received 12.5, 25, 50 or 100 r per dose. In a second experiment the same dose rates were applied during a 48 hour exposure (2x dose used in first experiment). Observed: chromosome aberrations and effect of various protective agents in nutrient solution.

12425

THE EFFECT OF RADIATION ON FROZEN TUMOR CELLS. Ilse Lasnitzki. p. 321. "Radiobiology Symposium - 1954." (Proceedings held at Liege, Aug.-Sept., 1954). Z. M. Bacq and P. Alexander, Editors. New York, Academic Press Inc., 1955.

Ehrlich ascites tumor was frozen and stored at -79° for 7 days prior to exposure in vitro to 1500 r of x-rays at 75 r/min. or to the same dose of γ rays prior to freezing. Growth after grafting was evaluated in terms of the mitotic index of the transplant and volume of tumor mass.

12426

MECHANISMS OF MUTATION PRODUCTION IN MICRO-ORGANISMS. Howard B. Newcombe. p. 326. "Radiobiology Symposium 1954." (Proceedings held at Liege, Aug.-Sept., 1954). Z. M. Bacq and P. Alexander, Editors. New York, Academic Press, Inc., 1955.

Induced mutations affecting colony morphology and color were studied in *Streptomyces* exposed one or more times to 8000 r. Results are interpreted in light of previous studies with U-V.

12427

THE EFFECT OF LARGE DOSES OF METHYL-BIS (2-

CHLOROETHYL) AMINE ON THE OVARY OF THE ADULT RABBIT WITH OR WITHOUT PRIOR TREATMENT WITH BETAMERCAPTOETHYLAMINE. Paul Desai. p. 340. "Radiobiology Symposium - 1954." (Proceedings held at Liege, Aug.-Sept. 1954). Z. M. Bacq and P. Alexander, Editors. New York, Academic Press Inc., 1955. (In French).

The toxicity of HN_2 on the ovary was studied histologically with particular attention to its radiomimetic effect.

12428
HISTOLOGICAL CHANGES IN MAN AND RABBITS AFTER PARENTERAL THORIUM ADMINISTRATION. Charles Johansen. p. 358. "Radiobiology Symposium - 1954." (Proceedings held at Liege, Aug.-Sept., 1954). Z. M. Bacq and P. Alexander, Editors. New York, Academic Press, Inc., 1955.

A series of 250 patients who had received colloidal thorium dioxide (0.5-5 μg radium-equivalent) suspension intravenously as a contrast medium is reviewed. Four patients died of blood diseases. There appeared to be no increase in non-hematopoietic tumors. Observation periods ranged from 3-16 years after injection.

12429
SOME ASPECTS OF RADIATION CHEMISTRY WHICH ARE RELEVANT TO SOME RADIOBIOLOGICAL PROBLEMS. F. S. Dainton. p. 19. "Advances in Radiobiology." (Proc. of Fourth Internat. Conf. on Radiobiology in Cambridge, 14-17 August, 1955). J. S. Mitchell, B. E. Holmes and C. L. Smith, Editors. C. C. Thomas Co., Springfield, Ill., U.S. Publishers 1956.

12430
THE EFFECT OF X-RADIATION ON METABOLISM AND ON ENZYMES. H. Pauly and B. Rajewsky. p. 32. "Advances in Radiobiology." (Proc. of Fourth Internat. Conf. on Radiobiology, Cambridge, 1955). J. S. Mitchell, B. E. Holmes and C. L. Smith, Editors. Charles C. Thomas Co., Springfield, Ill., U.S. 1956.

12431
COMPARISON OF THE INACTIVATION OF THE ESTERASE AND PROTEASE ACTIVITIES OF α -CHYMOTRYPSIN SOLUTION WITH X-RAYS. D. Aronson, Lorna Mee and C. L. Smith. p. 61. "Progress in Radiobiology." (Proc. of Fourth Internat. Conf. on Radiobiology held in Cambridge, Aug. 14-17, 1955). J. S. Mitchell, B. E. Holmes and C. L. Smith, Editors. C. C. Thomas Co., Springfield, Ill., 1956.

12432
THE EFFECT OF OXYGEN IN THE PRODUCTION OF CHROMOSOME ABERRATIONS BY CHEMICALS AND X-RAYS. B. A. Kihlman. p. 336. "Progress in Radiobiology." (Proc. of Fourth Internat. Conf. on Radiobiology held in Cambridge Aug. 14-17, 1955). J. S. Mitchell, B. E. Holmes and C. L. Smith, Editors. C. C. Thomas Co., Springfield, Ill., U.S. 1956.

The author compared the effectiveness of x-rays, 8-ethoxycaffeine and nitrogen mustard in producing chromosome aberration in *V. faba* root tip cells. The cytochrome oxidase inhibitor, sodium azide, was tested in one series of experiments. Production of aberrations by N mustard is independent of oxygen tension during exposure, in contrast to the marked oxygen effect when cells are exposed to EOC and x-rays. In contrast to x-rays, EOC has almost no effect in the absence of oxygen or in presence of cytochrome oxidase inhibitor.

12433
THE EFFECT OF ANOXIA ON THE RATES OF X-RAY-INDUCED MUTATIONS IN *DROSOPHILA MELANOGASTER*. K. G. Luning. p. 350. "Progress in Radiobiology." (Proc. of Fourth Internat. Conf. on Radiobiology held in Cambridge, Aug. 14-17, 1955). J. S. Mitchell, B. E. Holmes

and C. L. Smith, Editors. C. C. Thomas Co., Springfield, Ill., U.S. 1956.

Muller -5 male *Drosophila* 0-1 or 3-4 days old were irradiated with 3,240 r x-ray dose in air or in a nitrogen atmosphere and mated to normal females. The F_1 offspring were analyzed for yellow mutations and hyperploid males. Groups of F_1 females were tested for recessive lethals.

12434
THE DEPENDENCE OF THE OXYGEN EFFECT ON THE INTENSITY OF GAMMA IRRADIATION IN *VICIA FABA*. G. J. Neary. p. 355. "Progress in Radiobiology." (Proc. of Fourth Internat. Conf. on Radiobiology held in Cambridge, Aug. 14-17, 1955). J. S. Mitchell, B. E. Holmes and C. L. Smith, Editors. C. C. Thomas Co., Springfield, Ill., U.S. 1956.

12435
DEVELOPMENT OF A RADIO-RESISTANT STRAIN OF EHRLICH CARCINOMA IN MICE. W. Dittrich, G. Hohne and G. Schubert. p. 381. "Progress in Radiobiology." (Proc. of Fourth Internat. Conf. on Radiobiology held in Cambridge, Aug. 14-17, 1955). J. S. Mitchell, B. E. Holmes and C. L. Smith, Editors. C. C. Thomas Co., Springfield, Ill., U.S. 1956.

Ehrlich carcinoma cells were transplanted into each hind leg of mice and allowed to grow for 10 days. One of the implants was then irradiated and cells from both irradiated and shielded tumors were transplanted in the same fashion to the hind legs of another mouse. This was repeatedly done, irradiating always the same tumor. Increased radioresistance and glycolytic activity were observed in the serially irradiated tumors and may represent selection of resistant cells.

12436
EFFECTS OF IONISING RADIATIONS ON THE GROWTH OF THE MAMMALIAN REPAIR BLASTEMA (IN VIVO) STUDIES IN SANDISON-CLARK EAR CHAMBERS. H. A. S. van den Brenk. p. 386. "Progress in Radiobiology." (Proc. of Fourth Internat. Conf. on Radiobiology held in Cambridge, Aug. 14-17, 1955). J. S. Mitchell, B. E. Holmes and C. L. Smith, Editors. C. C. Thomas Co., Springfield, Ill., U.S. 1956.

12437
STUDIES ON DIFFUSIBLE FACTORS IN IRRADIATED SKIN WITH GRAFTING EXPERIMENTS. B. Jolles and S. G. Greening. p. 410. "Progress in Radiobiology." (Proc. of Fourth Internat. Conf. on Radiobiology held in Cambridge, Aug. 14-17, 1955). J. S. Mitchell, B. E. Holmes and C. L. Smith, Editors. C. C. Thomas Co., Springfield, Ill., U.S. 1956.

A dose of 1,200, 2,500 or 3,000 r was delivered to a 3 cm diameter area of the clipped skin on the flank of rabbits. Small grafts were taken from the center of the area and placed on normal (non-irradiated) graft site nearby. Normal skin was grafted to the center of the irradiated area. Other grafts of normal skin to normal skin areas on the animals flanks served as controls. Observations on normal grafts in the irradiated area support the idea of a centripetal diffusion of factors from the irradiated tissue.

12438
THE EFFECTS OF WHOLE BODY IRRADIATION ON THE MELANOPHORES OF THE COMMON FROG (*RANA TEMPORARIA*). Margaret Ashton. p. 419. "Progress in Radiobiology." (Proc. of Fourth Internat. Conf. on Radiobiology held in Cambridge, Aug. 14-17, 1955). J. S. Mitchell, B. E. Holmes and C. L. Smith, Editors. C. C. Thomas Co., Springfield, Ill., U.S. 1956.

12439
PRELIMINARY REPORT ON LESIONS IN THE SKELETON OF YOUNG RABBITS FOLLOWING A SINGLE INTRAVENOUS

INJECTION OF Sr^{90} (500-1,000 $\mu\text{c/kg.}$) J. Vaughan and J. Jowsey. p. 429. "Progress in Radiobiology." (Proc. of Fourth Internat. Conf. on Radiobiology held in Cambridge, Aug. 14-17, 1955). J. S. Mitchell, B. E. Holmes and C. L. Smith, Editors. C. C. Thomas Co., Springfield, Ill., U.S. 1956.

Observations include abnormal growth patterns and tumor formation.

12440

DEVELOPMENT OF TUMOURS IN ANIMALS UNDER THE INFLUENCE OF PENETRATING RADIATION M. N. Pobedinsky. p. 433. "Progress in Radiobiology." (Proc. of Fourth Internat. Conf. on Radiobiology held in Cambridge, Aug. 14-17, 1955). J. S. Mitchell, B. E. Holmes and C. L. Smith, Editors. C. C. Thomas Co., Springfield, Ill., U.S. 1956.

Abnormalities observed in rats injected with various doses of Sr^{90} include bone necrosis, fibrosis of marrow, atypical proliferation of marrow, dystrophic and proliferative changes in epiphyseal cartilage.

12441

EXPERIMENTAL STUDY OF THE EFFECT OF LOCAL IRRADIATION ON BONE GROWTH. H. A. Sissons. p. 436. "Progress in Radiobiology." (Proc. of Fourth Internat. Conf. on Radiobiology held in Cambridge, Aug. 14-17, 1955). J. S. Mitchell, B. E. Holmes and C. L. Smith, Editors. C. C. Thomas Co., Springfield, Ill., U.S. 1956.

Young male rats received 0, 400, 800, 1200 or 1600 r of x-rays to the growing region of the upper end of the right tibia. Bone growth was measured radiographically over a period of about 100 days. Some animals were killed for histological studies.

12442

THE USE OF THE GROWING MOUSE TAIL AS A TEST OBJECT IN RADIOBIOLOGY. E. A. Wright and P. Howard-Flanders. p. 449. "Progress in Radiobiology." (Proc. of Fourth Internat. Conf. on Radiobiology held in Cambridge, Aug. 14-17, 1955). J. S. Mitchell, B. E. Holmes and C. L. Smith, Editors. C. C. Thomas, Springfield, Ill., U.S. 1956.

Tails of 7 day old mice were irradiated and growth during the ensuing 3 weeks was measured. The entire tail or the midportion only was irradiated to evaluate possible effects of injury to proximal blood vessels on growth of tail distal to them. The effect of oxygen tension was evaluated by having mice breathe gas mixtures with various partial pressures of oxygen. Irradiation was either 190 KV x-rays or fast neutrons.

12443

PRODUCTION OF CANCERS IN RATS BY THE LOCAL APPLICATION OF β -RAYS AND OF CHEMICAL CARCINOGENS. J. W. Boag and A. Glucksmann. p. 476. "Progress in Radiobiology." (Proc. of Fourth Internat. Conf. on Radiobiology held in Cambridge, Aug. 14-17, 1955). J. S. Mitchell, B. E. Holmes and C. L. Smith, Editors. C. C. Thomas Co., Springfield, Ill., U.S. 1956.

Circumscribed areas of skin of black-hooded rats were irradiated with β rays from a Van de Graff generator, or treated with a weak or a potent chemical carcinogen, or both irradiated and treated with a carcinogen. Effects of irradiating multiple and single fields were compared. A non-carcinogenic dose of β rays was carcinogenic if 1:2 dibenzanthracene (itself not producing tumors) was applied.

12444

RESPONSE OF HUMAN BEINGS ACCIDENTALLY EXPOSED TO SIGNIFICANT FALL-OUT RADIATION (SUMMARY). R. A. Conrad. p. 491. "Progress in Radiobiology." (Proc.

of Fourth Internat. Conf. on Radiobiology held in Cambridge, Aug. 14-17, 1955). J. S. Mitchell, B. E. Holmes and C. L. Smith, Editors. C. C. Thomas Co., Springfield, Ill., U.S. Publishers, 1956.

The author summarizes blood count and skin changes in Marshallese islanders exposed to fall-out radiation following detonation of a thermonuclear device. (Observations during the year following exposure.)

12445

ACUTE LEUKEMIA AND OCCUPATIONAL RADIUM AND RADON EXPOSURE. J. D. Abbatt. p. 494. "Progress in Radiobiology." (Proc. of Fourth Internat. Conf. on Radiobiology held in Cambridge, Aug. 14-17, 1955). J. S. Mitchell, B. E. Holmes and C. L. Smith, Editors. C. C. Thomas Co., Springfield, Ill., U.S. Publishers 1956.

Clinical, hematological and post mortem findings on a 74 year old man with a 35+ year history of relatively high level occupational radiation exposure are presented briefly. Death was due to acute myeloid leukemia. Estimates of internally deposited radium are given.

12446

SOME OBSERVATIONS ON THE OCCURRENCE OF LEUKEMIA IN AN IRRADIATED HUMAN POPULATION. W. M. Court Brown. p. 501. "Progress in Radiobiology." (Proc. of Fourth Internat. Conf. on Radiobiology held in Cambridge, Aug. 14-17, 1955). J. S. Mitchell, B. E. Holmes and C. L. Smith, Editors. C. C. Thomas Co., Springfield, Ill., U.S. Publishers 1956.

12447

EFFECTS OF X-RAY IRRADIATION ON IRON METABOLISM IN HUMAN BONE MARROW. H. D. Suit, L. G. Laytha, F. Ellis and R. Oliver. p. 506. "Progress in Radiobiology." (Proc. of Fourth Internat. Conf. on Radiobiology held in Cambridge, Aug. 14-17, 1955). J. S. Mitchell, B. E. Holmes and C. L. Smith, Editors. C. C. Thomas Co., Springfield, Ill., U.S. Publishers 1956.

Uptake of Fe^{59} *in vitro* by nucleated red cells of marrow was not affected by 300-5000 r *in vitro* x-ray dose or by 1000 r locally to the manubrium sternum just prior to marrow aspiration or by 100 r total body irradiation 1-4 days before obtaining marrow. Tracer studies *in vivo* indicated that 25-50 r total body irradiation 24 hrs. before giving Fe^{59} did not delay appearance of the tracer in peripheral blood rbc, nor did 100 r total body dose if tracer was given 2 hrs. after irradiation. If given 24-72 hrs. post exposure, appearance of Fe^{59} in peripheral blood rbc's was delayed.

12448

PERIPHERAL BLOOD CHANGES FOLLOWING INTERNAL CONTAMINATION WITH RADIOACTIVE MATERIAL (COLLOIDAL THORIUM DIOXIDE). O. G. Backer. p. 519. "Progress in Radiobiology." (Proc. of Fourth Internat. Conf. on Radiobiology held in Cambridge, Aug. 14-17, 1955). J. S. Mitchell, B. E. Holmes and C. L. Smith, Editors. C. C. Thomas Co., Springfield, Ill., U.S. Publishers 1956.

A group of 222 patients who had received colloidal thorium dioxide for cerebral arteriography was compared with (1) patients with similar clinical conditions and medications but no angiography and (2) normal persons, with respect to peripheral blood picture.

12449

NEW COMPARATIVE DATA ON THE NORMAL RADIUM CONTENT OF THE HUMAN BODY. H. Muth, A. Schraub and K. Aurand. p. 525. "Progress in Radiobiology." (Proc. of Fourth Internat. Conf. on Radiobiology held in Cambridge, Aug. 14-17, 1955). J. S. Mitchell, B. E. Holmes and C. L. Smith, Editors. C. C. Thomas Co., Springfield, Ill., U.S. Publishers 1956.

Radium content of cremation ashes was measured for 10 human bodies. Results and implications of such studies are discussed briefly.

12450

INDUCTION OF DIFFERENTIATION IN CANCER CELLS WITH COBALT⁶⁰. S. Mitra and P. K. De. p.539. "Progress in Radiobiology." (Proc. of Fourth Internat. Conf. on Radiobiology held in Cambridge, Aug. 14-17, 1955). J. S. Mitchell, B. E. Holmes and C. L. Smith, Editors. C. C. Thomas Co., Springfield, Ill., U.S. Publishers 1956.

Histopathological studies were done on tissues from the growing edges of epidermoid carcinoma from 54 patients before and after 7000 γ r from Co⁶⁰, from 19 patients after 14000 γ r and from 10 patients after 21,000 γ r. Tissues were collected 7 days after 7000 γ r, 21 days after the second 7000 γ r and 3 months after the third. Results are considered in light of similar studies on patients treated with radium.

12451

THE PROTECTIVE ACTION OF PHENOLIC DERIVATIVES IN THE LETHALLY IRRADIATED MOUSE. A. Lacassagne, J. F. Duplan and N. P. Buu-Hoff. p.64. "Radiobiology Symposium - 1954." (Proceedings held at Liege, Aug.-Sept., 1954). Z. M. Bacq and P. Alexander, Eds. New York, Academic Press, Inc., 1955. (In French).

12452

INFLUENCE OF OXYGEN ON DAMAGE TO MICRO-ORGANISMS BY IONIZING IRRADIATION. H. Laser. p.68. "Radiobiology Symposium - 1954." (Proceedings held in Liege, Aug.-Sept., 1954). Z. M. Bacq and P. Alexander, Eds. New York, Academic Press, Inc., 1955.

Studies with bacteria and yeast exposed to several doses of x-rays demonstrate changes in O₂ uptake and CO₂ production, anaerobic and aerobic fermentation or acid production and utilization of H₂, and changes in growth rate. All growing cells showed an "O₂ effect" on irradiation. Respiratory inhibitors tended to abolish the oxygen effect.

12453

THE ACTION OF IONIZING RADIATION ON ENZYMES AND VIRUSES. Ernest Pollard. p.70. "Radiobiology Symposium - 1954." (Proceedings held at Liege Aug.-Sept., 1954). Z. M. Bacq and P. Alexander, Eds. New York, Academic Press, Inc., 1955.

The author presents a brief review of studies with enzymes, bacteria and viruses using high energy particles to produce effects in the biological systems.

12454

RADIOACTIVITY IN TERRESTRIAL ANIMALS NEAR AN ATOMIC ENERGY SITE. W. C. Hanson and H. A. Kornberg. p.385-88 of PROCEEDINGS OF THE INTERNATIONAL CONFERENCE ON PEACEFUL USES OF ATOMIC ENERGY, HELD IN GENEVA, AUG. 8-20, 1955. Vol. 13. New York, United Nations. 1956.

The authors present results of extensive analyses of terrestrial animals and waterfowl near Hanford Works. The environmental radioactive contaminants came from various reactors (radioactive byproducts) including river water used to cool the reactors. Amounts of P³² in various adult and young birds, their food, and the ratio of amounts in the birds relative to the amount in their foods are presented in tabular form. Transfer of radioactive contaminants from the environment to animals and selective concentration of some contaminants by animal tissues are discussed briefly and illustrated with data from the extensive studies. The authors emphasize the potential hazard implicit in the transfer of released radioactive wastes among various forms of terrestrial life.

12455

ON THE DISTRIBUTION OF RADIOACTIVITY IN THE

NORTH PACIFIC OCEAN IN 1954-1955. Yasuo Miyake. p.381-84 of PROCEEDINGS OF THE INTERNATIONAL CONFERENCE ON PEACEFUL USES OF ATOMIC ENERGY HELD IN GENEVA, AUG. 8-20, 1955. Vol. 13. New York, United Nations. 1956.

Radioactivity of the sea in the area around Bikini Atoll was measured several times during the year following a hydrogen-bomb test. Vertical and horizontal distribution of radioactivity is presented in charts showing relationship of radioactivity to the ocean currents.

12456

NUCLEAR SCIENCE AND OCEANOGRAPHY R. Revelle, T. R. Folsom, E. D. Goldberg and J. D. Isaacs. p.371-380 of PROCEEDINGS OF THE INTERNATIONAL CONFERENCE ON PEACEFUL USES OF ATOMIC ENERGY HELD IN GENEVA, AUG. 8-20, 1955. Vol. 13. New York, United Nations. 1956.

12457

BIOLOGICAL CYCLE OF FISSION PRODUCTS CONSIDERED FROM VIEWPOINT OF CONTAMINATION OF MARINE ORGANISMS. Yoshio Hiyama. p.368-70 of PROCEEDINGS OF THE INTERNATIONAL CONFERENCE ON PEACEFUL USES OF ATOMIC ENERGY, HELD IN GENEVA, AUG. 8-20, 1955. Vol. 13. New York, United Nations. 1956.

The amounts and distributions of radioactive fission products in the bodies of fish and various other forms of marine life taken from parts of the ocean contaminated by fallout from a hydrogen bomb test were determined in order to study the biological cycle of fission products.

12458

THE ACCUMULATION OF RADIOACTIVE SUBSTANCES IN AQUATIC FORMS. R. F. Foster and J. J. Davis. p.364-367 of PROCEEDINGS OF THE INTERNATIONAL CONFERENCE ON PEACEFUL USES OF ATOMIC ENERGY, HELD IN GENEVA, AUG. 8-20, 1955. Vol. 13. New York, United Nations. 1956.

The paper explains how aquatic forms become radioactive and describes conditions found in the Columbia River below the Hanford Reactors

12459

BIOLOGICAL CYCLES OF FISSION PRODUCTS IN AGRICULTURE IN JAPAN. R. Sasaki. p.357-59 of PROCEEDINGS OF THE INTERNATIONAL CONFERENCE ON PEACEFUL USES OF ATOMIC ENERGY, HELD IN GENEVA, AUG. 8-20, 1955. Vol. 13. New York, United Nations. 1956.

The author summarizes results of extensive surveys on radioactive contamination and its effects on rainwater, soil, cereals, vegetables, tea, fruits, silkworms, farm animals and their products

12460

THE BEHAVIOUR OF I¹³¹, Sr⁸⁹ AND Sr⁹⁰ IN CERTAIN AGRICULTURAL FOOD CHAINS. A. C. Chamberlain, J. F. Loutit, R. P. Martin, and R. S. Russell. p.360-363 of PROCEEDINGS OF THE INTERNATIONAL CONFERENCE ON PEACEFUL USES OF ATOMIC ENERGY, HELD IN GENEVA, AUG. 8-20, 1955. Vol. 13. New York, United Nations. 1956.

12461

THE RADIOACTIVE SURVEY OF THE AREA SURROUNDING AN ATOMIC ENERGY FACTORY. D. R. R. Fair and A. S. McLean. p.329-32 of PROCEEDINGS OF THE INTERNATIONAL CONFERENCE ON PEACEFUL USES OF ATOMIC ENERGY, HELD IN GENEVA, AUG. 8-20, 1955. Vol. 13. New York, United Nations. 1956.

Naturally occurring radioactivity was measured in the area surrounding the Windscale Works in England before radioactive operations commenced. Values for soil, roots and vegetation and for α and β airborne radioactivity are presented.

12462

HEALTH PROTECTION IN CHEMICAL PROCESSING PLANTS. H. M. Parker and J. M. Smith. p.324-28 of PROCEEDINGS OF THE INTERNATIONAL CONFERENCE ON PEACEFUL USES OF ATOMIC ENERGY, HELD IN GENEVA, AUG. 8-20, 1955. Vol. 13. New York, United Nations. 1956.

12463

THE DANGERS PRESENTED BY URANIUM IRRADIATED IN NUCLEAR REACTORS. H. Jammet and H. Joffre. p.319-23 of PROCEEDINGS OF THE INTERNATIONAL CONFERENCE ON PEACEFUL USES OF ATOMIC ENERGY, HELD IN GENEVA, AUG. 8-20, 1955. Vol. 13. New York, United Nations. 1956.

12464

SAFETY CRITERIA IN ATOMIC ENERGY. F. R. Farmer. p.315-18 of PROCEEDINGS OF THE INTERNATIONAL CONFERENCE ON PEACEFUL USES OF ATOMIC ENERGY, HELD IN GENEVA, AUG. 8-20, 1955. Vol. 13. New York, United Nations. 1956.

Major aspects of the control of radiation exposure in atomic energy operations are reviewed and examples of accumulated personnel exposure records are presented to show the feasibility of operating well within permissible exposure limits.

12465

THE CRITICALITY SAFETY OF CHEMICAL PLANT PRODUCING FISSILE MATERIALS. H. A. C. McKay and C. M. Nicholls. p.311-14 of PROCEEDINGS OF THE INTERNATIONAL CONFERENCE ON PEACEFUL USES OF ATOMIC ENERGY, HELD IN GENEVA, AUG. 8-20, 1955. Vol. 13. New York, United Nations. 1956.

12466

RADIATION EXPOSURE FROM ENVIRONMENTAL HAZARDS. H. M. Parker. p.305-10 of PROCEEDINGS OF THE INTERNATIONAL CONFERENCE ON PEACEFUL USES OF ATOMIC ENERGY, HELD IN GENEVA, AUG. 8-20, 1955. Vol. 13. New York, United Nations. 1956.

The author classifies and discusses briefly the potential radiation hazards beyond the confines of nuclear reactor installations and radiochemical processing plants.

12467

ENVIRONMENTAL ASPECTS OF THE ATOMIC ENERGY INDUSTRY. Arthur E. Gorman. p.298-304 of PROCEEDINGS OF THE INTERNATIONAL CONFERENCE ON PEACEFUL USES OF ATOMIC ENERGY, HELD IN GENEVA, AUG. 8-20, 1955. Vol. 13. New York, United Nations. 1956.

The author reviews the problems of disposing of toxic and radioactive waste from atomic industry, and some of the economic considerations related to these problems.

12468

APPROACHES TO TREATMENT OF POISONING BY BOTH RADIOACTIVE AND NONRADIOACTIVE ELEMENTS ENCOUNTERED IN ATOMIC ENERGY OPERATIONS. J. Schubert. p.274-297 of PROCEEDINGS OF THE INTERNATIONAL CONFERENCE ON PEACEFUL USES OF ATOMIC ENERGY, HELD IN GENEVA, AUG. 8-20, 1955. Vol. 13. New York, United Nations. 1956.

12469

CONTROL OF RADIATION HAZARDS IN THE OPERATION OF MEDIUM-POWERED EXPERIMENTAL REACTORS.

W. G. Marley and B. S. Smith. p.270-73 of PROCEEDINGS OF THE INTERNATIONAL CONFERENCE ON PEACEFUL USES OF ATOMIC ENERGY, HELD IN GENEVA, AUG. 8-20, 1955. Vol. 13. New York, United Nations. 1956.

12470

RADIATION EXPOSURE EXPERIENCE IN A MAJOR ATOMIC ENERGY FACILITY. H. M. Parker. p.266-269 of PROCEEDINGS OF THE INTERNATIONAL CONFERENCE ON PEACEFUL USES OF ATOMIC ENERGY, HELD IN GENEVA, AUG. 8-20, 1955. Vol. 13. New York, United Nations. 1956.

12471

HEALTH AND SAFETY ACTIVITIES IN REACTOR OPERATIONS AND CHEMICAL PROCESSING PLANTS. A. J. Cipriani. p.263-65 of PROCEEDINGS OF THE INTERNATIONAL CONFERENCE ON PEACEFUL USES OF ATOMIC ENERGY, HELD IN GENEVA, AUG. 8-20, 1955. Vol. 13. New York, United Nations. 1956.

12472

HEALTH PROTECTION OF URANIUM MINERS AND MILLERS. S. E. Miller, D. A. Holaday and H. N. Doyle. p.242-47 of PROCEEDINGS OF THE INTERNATIONAL CONFERENCE ON PEACEFUL USES OF ATOMIC ENERGY, HELD IN GENEVA, AUG. 8-20, 1955. Vol. 13. New York, United Nations. 1956.

12473

USE OF RADIOISOTOPES IN STUDIES OF HEALTH HAZARDS IN THE URANIUM MINING INDUSTRY. E. C. Tsvoglou. p.237-41 of PROCEEDINGS OF THE INTERNATIONAL CONFERENCE ON PEACEFUL USES OF ATOMIC ENERGY, HELD IN GENEVA, AUG. 8-20, 1955. Vol. 13. New York, United Nations. 1956.

The use of radioisotopes in a series of experiments designed to evaluate health hazards associated with the inhalation of atmospheric mixtures of radon and its daughters is described.

12474

RADIATION DOSAGE TO LUNGS FROM RADON AND ITS DAUGHTER PRODUCTS. W. F. Bale and J. V. Shapiro. p.233-36 of PROCEEDINGS OF THE INTERNATIONAL CONFERENCE ON PEACEFUL USES OF ATOMIC ENERGY, HELD IN GENEVA, AUG. 8-20, 1955. Vol. 13. New York, United Nations. 1956.

The authors present a brief review of the problem and summarize results of measurements and estimates of doses received by rats, dogs and humans.

12475

INDUSTRIAL HYGIENE OF URANIUM PROCESSING. M. Eisenbud and J. A. Quigley. p.222-28 of PROCEEDINGS OF THE INTERNATIONAL CONFERENCE ON PEACEFUL USES OF ATOMIC ENERGY, HELD IN GENEVA, AUG. 8-20, 1955. Vol. 13. New York, United Nations. 1956.

12476

THE PROBLEM OF RADON IN URANIUM MINES. H. Jammet and J. Pradel. p.219-221 of PROCEEDINGS OF THE INTERNATIONAL CONFERENCE ON PEACEFUL USES OF ATOMIC ENERGY, HELD IN GENEVA, AUG. 8-20, 1955. Vol. 13. New York, United Nations. 1956.

12477

THE PATHOPHYSIOLOGICAL MECHANISM OF DEATH IN LETHALLY X-IRRADIATED RATS. J. Maisin, H. Maisin and A. Dunjic. p.154. "Radiobiology Symposium - 1954." (Proc. held at Liege, August-September, 1954). Z. M. Bacq and P. Alexander, Editors. New York, Academic Press, Inc., 1955. (In French).

The effects of: 1. shielding various regions of the body, 2. injection pre-exposure with mercaptoethylamine and 3. treatment with marrow suspensions on lethality due to the gastrointestinal syndrome were studied in rats.

12478

A SKIN TEST IN RADIOBIOLOGICAL STUDIES. B. Jolles. p. 151. "Radiobiology Symposium - 1954." (Proc. of Sympos. held at Liege, Aug.-Sept., 1954). Z. M. Bacq and P. Alexander, editors. New York, Academic Press, Inc., 1955.

12479

EFFECT OF X-RAYS ON THE RESORPTION RATE OF INJECTED $\text{NaH}^{14}\text{CO}_3$ IN MICE. A. Forssberg and G. Hevesy. p. 148. "Radiobiology Symposium - 1954." (Proc. held at Liege, Aug.-Sept., 1954). Z. M. Bacq and P. Alexander, Editors. New York, Academic Press, Inc., 1955.

Mice receiving total body exposures to 2000 r show a depression of carbonate resorption immediately after exposure and slower exhalation of CO_2 from injected C^{14} labeled bicarbonate.

12480

THE MODIFICATION OF THE RADIATION RESPONSE BY SHIELDING PROCEDURES. L. F. Lamerton and E. H. Belcher. p. 136. "Radiobiology Symposium - 1954." (Proc. held at Liege, Aug.-Sept., 1954). Z. M. Bacq and P. Alexander, Editors. New York, Academic Press, Inc., 1955.

12481

SPLEEN PROTECTION: THE CELLULAR HYPOTHESIS. D. W. H. Barnes and J. F. Loutit. p. 134. "Radiobiology Symposium - 1954." (Proc. at Liege, Aug.-Sept. 1954). Z. M. Bacq and P. Alexander, Editors. New York, Academic Press, Inc., 1955.

Mice were irradiated (whole body) with 950 r and treated with heterologous spleen cells.

12482

OBSERVATIONS ON THE EFFECT OF SPLEEN-SHIELDING AND THE INJECTION OF CELL SUSPENSIONS ON SURVIVAL FOLLOWING IRRADIATION. L. O. Jacobson, E. K. Marks and E. O. Gaston. p. 122. "Radiobiology Symposium - 1954." (Proc. held at Liege, Aug.-Sept., 1954). Z. M. Bacq and P. Alexander, Editors. New York, Academic Press, Inc., 1955.

12483

RELATIVE BIOLOGICAL EFFICIENCY OF FAST NEUTRONS AND GAMMA RADIATION FOR CHRONIC IRRADIATION OF MICE. R. H. Mole, R. J. Munson and G. J. Neary. p. 104. "Radiobiology Symposium - 1954." (Proc. held at Liege, Aug.-Sept., 1954). Z. M. Bacq and P. Alexander, Eds. New York, Academic Press, Inc., 1955.

This is a one-paragraph report of studies carried out at Harwell. The biological effects mentioned are: sterilization of male and female mice and reduction of weight of testes.

12484

ACTION OF IONIZING RADIATIONS ON CELL CONSTITUENTS. Maurice Errera. p. 93. "Radiobiology Symposium - 1954." (Proc. held at Liege, Aug.-Sept., 1954). Z. M. Bacq and P. Alexander, Eds. New York, Academic Press, Inc., 1955.

The author reviews work (by many investigators) designed to study the immediate effects of ionizing radiation on cells and concludes that the only clearly apparent immediate effect is on DNA metabolism.

12485

RADIATION DEATH IN MAMMALS. B. Rajewsky. p. 81. "Radiobiology Symposium - 1954." (Proc. held at Liege, Aug.-Sept., 1954). Z. M. Bacq and P. Alexander, Eds. New York, Academic Press, Inc., 1955.

The author summarizes a large series of studies designed to indicate the nature of the lethal injury in heavily irradiated mice, guinea pigs, and rats with particular attention to the relative importance of various organ systems. Dosage range: 250-200,000 r.

12486

BACTERIOPHAGE INACTIVATION UNDER VARYING CONDITIONS OF IRRADIATION. Tikvah Alper. p. 39. "Radiobiology Symposium." (Proceedings held at Liege, Aug.-Sept., 1954). Z. M. Bacq and P. Alexander, editors. New York, Academic Press, Inc., 1955.

Studies on the inactivation of a bacteriophage by high dose rate irradiation under various gas treatments are reported. Results suggest that one mechanism by which oxygen may enhance radiation effects is by "storing" radicals which later become available for reaction with sensitive systems.

12487

HYDROGEN PEROXIDE PRODUCTION UNDER VARYING CONDITIONS OF IRRADIATION. M. Ebert. p. 30. "Radiobiology Symposium - 1954." (Proc. held at Liege, Aug.-Sept., 1954). Z. M. Bacq and P. Alexander, editors. New York, Academic Press, Inc., 1955.

12488

THE NATURE OF THE PEROXIDE-LIKE SUBSTANCES FORMED IN MICE BY X-RAYS. V. J. Horgan and J. St. L. Philpot. p. 26. "Radiobiology Symposium." (Proc. held at Liege, Aug.-Sept., 1954). Z. M. Bacq and P. Alexander, eds. New York, Academic Press, Inc., 1955.

Butanol extracts of lethally x-irradiated mice oxidize cuprous-catalyzed leuco-brilliant cresyl blue more readily than do extracts of control mice. Mean ionic yield is approximately 80. Authors suggest that the precursors of the oxidizing material in the extracts may be squalene and related metabolic compounds.

12489

X-RAY INACTIVATION OF THE PNEUMOCOCCUS TRANSFORMING AGENT. H. Ephrussi-Taylor and R. Latarjet. p. 79. "Radiobiology Symposium - 1954." (Proc. held at Liege, Aug.-Sept., 1954). Z. M. Bacq and P. Alexander, Eds. New York, Academic Press, Inc., 1955. (In French).

12490

IRRADIATION OF VIRUS. P. Bonet-Maury. p. 75. "Radiobiology Symposium - 1954." (Proc. held at Liege, Aug.-Sept., 1954). Z. M. Bacq and P. Alexander, Eds. New York, Academic Press, Inc., 1955. (In French).

12491

THE EFFECT OF CHOLINE AND ROENTGEN RAYS ON THE COURSE OF PREGNANCY. Dr. Fried von Neuman and Dr. Otfried O. Fellner. *Muenchener Med. Wochenschrift* 54, 1131-32(1907). (In German).

Pregnant rabbits were exposed to x-rays over the whole body, upper body or lower body and the course of pregnancy as well as the occurrence of fetal eye damage were observed. The paper is written in response to a paper by von Hippel and Pagenstecher comparing the effects of x-rays and choline.

12492

CROSS REACTIVATION OF GENETIC LOCI OF T2 BACTERIOPHAGE AFTER DECAY OF INCORPORATED RADIOACTIVE PHOSPHORUS. G. S. Stent. *Proc. Nat. Acad. Sci.* 39, 1234-1241(1953).

12493

A STUDY OF ANTIGEN LOCALIZATION AND DEGRADATION AND THE HISTOLOGIC REACTION IN THE SPLEEN OF NORMAL, X-IRRADIATED, AND SPLEEN-SHIELDED RATS. F. W. Fitch, P. Barker, K. H. Soules and R. W. Wissler. *J. Lab. Clin. Med.* 42, 598-620(1953).

12494

FACTORS EFFECTING X-RAY INHIBITION OF ANTIBODY

FORMATION. L. O. Jacobson and M. J. Robson. *J. Lab. Clin. Med.* **39**, 169-175(1952).

12495

FURTHER OBSERVATIONS ON THE EFFECTS OF ROENTGENIZATION AND SPLENECTOMY ON ANTIBODY-PRODUCTION. L. Hektoen. *J. Infectious Diseases* **27**, 23-30(1920).

12496

ANTIBODY PRODUCTION IN EXPERIMENTAL ROENTGEN RADIATION INJURY OF THE HEMATOPOIETIC SYSTEM. E. Benjamin and E. Sluka. *Wien. Klin. Wochschr.* **21**, 311-13(1908). (In German).

Precipitin titres were depressed and serum antibody disappearance was retarded in rabbits that had received several daily doses of x-rays shortly before the injection of bovine serum albumin. Non-irradiated rabbits and rabbits irradiated after injecting the antigen did not show these changes.

12497

ON THE ROLE OF LEUKOCYTES AND THE SPLEEN IN THE PRODUCTION OF ALEXIN, HEMOLYSINS, AGGLUTININS AND BACTERIOLYSINS. I. I. Manoukhine. *Compt. rend. soc. biol.* **74**, 1221-22(1913). (In French).

12498

ATTENUATION OF EXPERIMENTAL TUBERCULOSIS BY ROENTGEN RADIATION. L. Lortet and P. Genoud. *Franc. gazette hospital* **69**, 787-88(1896). (In French).

12499

EFFECT OF X-RAYS UPON HEMOLYSIN PRODUCTION IN THE RAT. H. I. Kohn. *J. Immunol.* **66**, 525-533(1951).

12500

THE TIMING OF ANTIGEN INJECTION RELATIVE TO WHOLE BODY X-IRRADIATION AND THE DEVELOPMENT OF CIRCULATING ANTIBODY AND THE SPLENIC HISTOLOGIC REACTION IN THE RAT. F. W. Fitch, R. W. Wissler, M. Lavia and P. Barker. *J. Immunol.* **76**, 151-160(1956).

12501

CHANGES IN DEOXYRIBOSIDE, DEOXYRIBOSIDE AND NUCLEIC ACID CONTENT OF RABBIT APPENDIX AND THYMUS AFTER X IRRADIATION. C. W. Bishop and J. N. Davidson. *Brit. J. Radiol.* **30**, 367-370(1957).

12502

NUCLEIC ACID METABOLISM IN REGENERATING LIVER. IV. THE EFFECT OF X-RADIATION OF THE WHOLE BODY ON NUCLEIC ACID SYNTHESIS *IN VIVO*. R. E. Beltz, J. van Lancker and V. R. Potter. *Cancer Research* **17**, 688-697(1957).

12503

CIRCULATING RAT PLATELETS IN LETHALLY X-RADIATED MICE GIVEN RAT BONE MARROW. L. H. Smith, T. Makinodan and C. C. Congdon. *Cancer Research* **17**, 367-369(1957).

12504

EFFECT OF HOMOLOGOUS BONE MARROW INJECTIONS IN X-IRRADIATED RABBITS. K. A. Porter. *Brit. J. Exp. Pathol.* **38**, 401-412(1957).

12505

FURTHER CYTOLOGICAL OBSERVATIONS ON RADIATION CHIMERAS. C. E. Ford, P. L. T. Ilbery and J. F. Loutit. *J. Cell. Comp. Physiol.* **50**, 109-121(suppl. 1, (1957)).

A chromosome marker was used to identify donor cells in the hematopoietic tissue of radiation chimeras (mice).

12506

PRESENCE OF HOMOLOGOUS CELLS IN THE MARROW OF MICE PROTECTED FROM THE EFFECTS OF IRRADIATION BY HOMOLOGOUS MARROW. R. M. Merwin and C. C. Congdon. *Federation Proc.* **15**, 129(1956).

12507

THE EFFECT OF HOMOLOGOUS BONE MARROW EMULSION ON RABBITS AFTER TOTAL-BODY IRRADIATION. M. F. Hilfinger, Jr., J. H. Ferguson and P. A. Riemschneider. *J. Lab. Clin. Med.* **42**, 581-91(1953).

12508

ENHANCED PRODUCTION OF ANTIBODIES BY LOCAL IRRADIATION. II MEASUREMENT OF LOCAL ANTIBODIES. J. B. Graham and S. Leskowitz. *J. Immunol.* **76**, 110-111(1956).

Diphtheria toxin was injected into the lateral surface of the thigh 45-60 min. after 1000 r local x-ray exposure to the area. Antitoxin level in the injected site and circulating antitoxin levels were elevated above levels in control animals 20 days later, and authors interpret this as representing a stimulating effect of x-rays on antibody-producing activity of cells.

12509

REACTIVATION OF IRRADIATED BACTERIOPHAGE BY TRANSFER OF SELF-REPRODUCING UNITS. S. E. Luria. *Proc. Nat. Acad. Sci. U. S.* **33**, 253-264(1947).

12510

THE RADIO-PHYSIOLOGICAL PARADOX. H. Zwaardemaker. *Compt. Rend. Soc. Biol.* **84**, 704(1921). (In French).

Changing the composition of a fluid used to perfuse an isolated frog heart from a solution containing thorium to one in which thorium is replaced by potassium, or vice versa, causes a 30-34 sec. cardiac arrest. This is believed to be due to the presence of equal amounts of α and β rays at the moment of change, the two radiations neutralizing one another.

12511

GENERALIZED ACTION OF X-RAYS. E. Woenckhaus and W. Munzel. *Arch. Exper. Path. u. Pharmacol.* **160**, 19-28(1931). (In German).

Blood cells and defibrinated blood of rats exposed to large x-ray doses cause changes in the blood of rats receiving them intravenously. The changes are similar to changes produced in irradiated animals (leukopenia). The effect is considered to represent (probably) results of severe destruction of blood cells in the irradiated donor animal and release of lytic substances.

12512

GENERALIZED ACTION OF X-RAYS. E. Woenckhaus and W. Munzel. *Arch. Exper. Path. u. Pharmacol.* **165**, 145-60(1932). (In German).

The blood of heavily irradiated rabbits injected into normal rabbits causes 1. a fall in lymphocyte count and 2. hypoglycemia. Defibrinated dog blood irradiated *in vitro* does not produce this effect. Guinea pigs were found to be extremely sensitive.

12513

THE CAUSE OF INHIBITION OF CELL DIVISION BY X-RAYS. Kurt Erdmann. *Pflug. Arch. ges. Physiol.* **235**, 470-85(1935). (In German).

Yeast cells were irradiated in media containing different ions and capable of inhibiting cell division. The laws governing the inhibition were similar to those relating the action of ions to swelling of proteins and the author concludes that growth inhibition results from a decrease in the swelling power of living tissue, a property necessary for growth.

12514

POSSIBLE BIOLOGICAL EFFECTS OF PENETRATING RADIATIONS. V. Ducceschi. *Arch. Fisiol.* **33**, 461-7(1934).

The activity of various animals in unshielded and partly shielded boxes (lead walls) was studied to determine whether γ rays and cosmic rays affect living processes.

Systems studied (yeast fermentation, movement of bees, ants and silkworms) were found not to vary after exposure.

12515

THE BIOLOGICAL EFFECT OF ROENTGEN RAYS ON HEALTHY AND DISEASED SKIN. G. A. Rost. *Strahlentherapie* 44, 521-40(1932). (In German).

12516

EARLY CYTOLOGICAL CHANGES IN THE LYMPHOCYTE AND MYELOID COMPONENTS OF MOUSE SPLEEN FOLLOWING X-RAY IRRADIATION. M. Praslicka and M. Hill. *Folia Biol. (Praha)* 3/1, 37-48(1957). (Russian Text with English Summary).

Mice were exposed to a 500 r x-ray dose, some animals being-anesthetized prior to exposure. Degeneration of lymphocytes and erythroblasts after irradiation are described as is the series of histological and cytological changes in the spleen. Anesthesia (several agents used) appeared to retard the appearance of the phenomena, which is interpreted as a change of neurohumoral reaction due to the effect on the central nervous system.

THE ACCIDENT TO THE N.R.X. REACTOR. PART II. D. G. Hurst. Oct. 23, 1953. 33p. (GPI-14; AECL-233).

Problems which faced the operating staff as a consequence of the NRX accident are discussed. These include containment of active water, cooling of broken rods, and assessment of damage. Information is given concerning the state of the fuel rod assemblies and calandria. It appears that the major damage followed boiling of cooling water. Explanations are presented of some of the observed phenomena, in particular a sudden rise of the gas-holder, and some details of fuel rod behavior.

DISTRIBUTION AND EXCRETION OF BERYLLIUM SULPHATE USING Be^7 AS A TRACER. James K. Scott and William Neuman. (U. Rochester, N. Y.). *Fed. Proc.* 8(1), 331(1949).

12555

THE ACTION OF RADIUM RAYS ON CANE SUGAR AND AGAR. A. Fernau. *Biochem. Z.* 102, 246-250(1920).

Inversion of cane sugar, after exposure to Ra rays, is probably a primary radiation effect, not secondary to H_2O_2 or O_2 formation. Radiation of 4 cc. of a 0.1% sugar solution for four days caused decreased viscosity and rendered the sugar capable of reducing Fehling's solution.

12556

STUDIES ON THE METABOLISM OF ZINC WITH THE AID OF ITS RADIOACTIVE ISOTOPES. G. E. Shelme, I. L. Chaikoff, H. B. Jones and M. L. Montgomery. *Journal of Biological Chemistry* 147, 409-414(1943).

12557

THE ACTION OF X-RAYS ON THYMUS NUCLEIC ACID. B. Taylor, J. P. Greenstein and A. Hollaender. *Cold Spring Harbor Symposia Quant. Biol.* 12, 237-246(1947).

The decrease in viscosity of sodium thymus nucleate (TNA) was proportional to x-ray dose up to 56,000 r and was independent of temperature. A progressive and presumably indirect effect occurred at higher temperatures but not at 0°C . The x-ray effect appeared not to involve breaks of primary leakages or rearrangement of the spatial configurations that render it susceptible to enzyme action.

12558

EFFECTS PRODUCED BY THE IRRADIATION OF PROTEINS AND AMINO ACIDS. L. E. Arnow. *Physiol. Rev.* 16, 671-685(1936).

Major subheadings in this review article are 1. Denaturation Process and 2. Physical Changes, including a review of changes in optical rotation and dispersion coefficients, in U-V absorption spectra and in viscosity. The action of radiations is compared with that of heat, alcohol, acetone and oxidizing agents.

THE EXISTENCE OF FREE ATOMS AND RADICALS IN WATER AND AQUEOUS SOLUTIONS SUBJECTED TO IONIZING RADIATION. F. S. Dainton. *J. Phys. and Colloid Chem.* 52 490-517 (1948). CA 42-4455

12600

THE EFFECT OF X RAYS ON ENZYMES. W. M. Dale. *Biochem. J.* 34 1367-1373 (1940).

The effect of x rays on crystalline carboxypeptidase and on partly purified polyphenoloxidase was determined. Per cent inactivation was a function of enzyme concentration for a given radiation dose. A given amount of radiation absorbed by carboxypeptidase corresponded to a constant amount of enzyme inactivated; inactivation dose decreasing with decreasing enzyme concentration to levels far lower than those used in radiotherapy. Effect of radiation of enzyme with and without substrate are described.

12601

EFFECT OF X RAYS ON AQUEOUS SOLUTIONS OF BIOLOGICALLY ACTIVE COMPOUNDS. W. M. Dale. *Brit. J. Radiol.* 16 338-9 (1943).

Radiosensitivity of a given substance depends on conditions under which it is irradiated. In solutions of carboxypeptidase, 50r of x rays inactivated 30% of a dilute solution while 100,000r were required to produce the same effect in a solution 345 times as concentrated. If the same enzyme is irradiated together with its substrate the radiosensitivity is decreased. Similar protection is provided by numerous substances, e.g., nucleic acids and sugars, varying according to the concentration of the protecting substance. Explanation proposed radiation acts primarily on the water, forming intermediate products which then react with the solute.

12602

SLOW-ELECTRON REACTIONS. J. D. Devins. (Natl. Research Council, Ottawa, Ont.). *Proc. Conf. Nuclear Chem., Chem. Inst. Canada (Ottawa)* 200-204(1947).

Chemical reactions induced by slow neutrons are discussed. The theoretical background and limitations of methods used are considered. Primary processes producing reactive ions or molecules by means of slow electrons, and secondary processes involving chemical reactions of these ions and molecules are reviewed. NSA 1-198

12607

ACTION OF X-RAY IRRADIATION ON THE NUCLEO-PROTEINS OF CELL NUCLEI. M. Errera. *Bull. Soc. Chem. Biol.* 28: 472-7 (1946).

Upon irradiation, nucleoproteins from chicken erythrocytes and carp sperm, normally in the form of stiff gels, undergo liquifaction whether treated before or after preparation of the nucleoproteins. Gels gradually liquified if the intact cells were first irradiated with 50,000r from W_0 anticathode, 200KV, and the nucleoproteins then extracted were in liquid form.

12608

INCIDENCE OF LEUKEMIA IN SURVIVORS OF THE ATOMIC BOMB IN HIROSHIMA AND NAGASAKI, JAPAN. J. H. Folley and others. *Am. J. Med.* 13 311-21 (1952).

12609

ACTION OF X-RAYS ON CATALASE AND ITS BIOLOGICAL SIGNIFICANCE. Arne Forssberg. *Arkiv. Kemi. Mineral Geol.* 21A (No. 7) 1-15 (1945).

Certain effects of ionizing radiation on living material, such as the frequent reversibility of action and deviations from the Bunsen-Roscoe law, may be explained by the action of x rays on catalase. CA 40-6509

12610

MECHANISM OF THE ACTION OF X RAYS ON ENZYMES IN WATER SOLUTION. A. Forssberg. *Nature* 159 308-9 (1947).

Pure crystalline catalase was irradiated in an aqueous solution, concentration 3.7×10^{-5} g/ml. The x ray dose was 12,400r. Inactivation of the enzyme when in pure solution and when various compounds were added to the solution was measured. Compounds evaluated for their protective effect succinic, malonic, pyruvic, levulinic, fumaric and maleic acids, oxidized and reduced glutathione and cysteine. A possible mechanism of x ray effect based on generation of H ions is discussed.

12611

DENATURATION OF PROTEINS BY X RAYS. H. Fricke. Cold Springs Harbor Symposium Quant. Bio. 6 164-70 (1938).

Radiation discussed includes x rays and α -, β -, and γ - from Ra. Chemical effects produced by β - and γ - rays, and the usual types of x-rays are determined solely by the absorbed energy, but this may not be true for α rays and very long x-rays. The most obvious effect of the radiations on proteins is flocculation. Activation of the aqueous phase may be an important factor in the action of radiation on living cells. Proteins investigated include: pepsin, trypsin, oxyhemoglobin, complement and egg albumin.

12612

EFFECTS OF X RAYS ON THYMUS NUCLEIC ACID. J. P. Greenstein et al. *Science* 105 263-4 (1942).

Authors irradiated dialysed solutions of 0.7% sodium thymus nucleate from calf thymus. After radiation, products were still acted upon by specific enzymes.

12613

MODIFICATION OF THE DEPTH DOSE CURVES OF VARIOUS RADIATIONS BY INTERPOSED BONE. L. L. Haas and G. H. Sandberg. *Brit. J. Radiol.* 30 19-26 (1957).

12614

EFFECTS OF X RAYS AND γ RAYS ON INDOPHENOL OXIDASE. R. E. Harvard. *Brit. J. Radiology* 7 296-304 (1934).

Mixed x rays (doses up to 10,000r) and γ rays (from 18,000 mg-hours of radium at a distance of about 1.5 cm) have no destructive effect on the activity of indophenol oxidase of yeast when irradiated at body temperature, at 0° C or at room temperature.

12615

12623

FURTHER STUDIES ON THE ANTIRACHITIC ACTIVATION OF SUBSTANCES BY CATHODE RAYS. A. Knudson. *Science* 66, 176-8(1927).

Commercial cholesterol exposed to cathode rays for 30 sec. is effective in healing rickets in rats in doses of 1-2 mgm. per day. Cholesterol purified by the dibromide method could not be rendered antirachitic by either cathode rays or ultraviolet radiation. Yeast, starch, and cottonseed oil were also activated by exposure to cathode rays. Dry yeast exposed for 30 sec. healed rickets in rats in doses of 1 mgm. daily. Extracting dried yeast with ether in a Soxhlet apparatus did not entirely remove the substance which is rendered antirachitic when irradiated. CA 21-3636⁶

APPLICATION OF MATHEMATICS TO THE EVALUATION OF BIOLOGICAL EFFECTS OF X RAYS. J. A. Reboul. Amer. J. Cancer 37: 273-287 (1939).

Summary. A theory is given of the action of x rays upon biological elements (populations, in general) taking into account the fact that in certain cases all the hits may not be effective. This leads to the introduction of a correction term into Crowther's formula. This correction term has been studied and curves are presented showing the importance it may have in certain cases. The few experimental works available fit the theory.

12687

EFFECT OF ROENTGEN AND RA RADIATION ON THE FE METABOLISM WITH SPECIAL REFERENCE TO THE BEHAVIOR OF ADENOCARCINOMA. J. Schuck. Arch. Gynakol. 172: 521-46 (1942).

Serum Fe level was 30% below the average for normal women in 44 patients with adenocarcinoma. Author suggest that low Fe levels may be due to migration of Fe into the R-E system and perhaps to increased Fe demand (demonstratable histochemically) of the growing tumor. A small rise in serum Fe usually occurred after Ra therapy and a marked rise to levels about 25% above the initial value, after x ray therapy. After 3 months of combined Ra and x ray therapy, serum Fe content was elevated above normal. Four rabbits also showed a rise in serum Fe after x irradiation.

THE ROLE OF MUTATION AND OF SELECTION IN THE FREQUENCY OF MUTANTS AMONG MICRO-ORGANISMS GROWN ON IRRADIATED SUBSTRATE. W. S. Stone et al. *Proc. Nat. Acad. Sci. U.S.* 34 (No. 4) 142 (1948).

Organism *Staphylococcus aureus*. Mutations mutants are penicillin resistant and streptomycin resistant from stock strain grown in irradiated broth.

12696

EDUCATION IN RADIATION PROTECTION. Lauriston S. Taylor. *Am. J. Roentgenol., Radium Therapy Nuclear Med.* 73 193-202 (1955).

12697

PRELIMINARY NOTES ON THE EFFECT OF RONTGEN RAYS ON THE SULFONIMIDES *IN VITRO*. I. C. C. Tchaperoff. *Radiology* 41, 61-3(1943).

Solutions of sulfanilamide and sulfathiazole (1 mg. in 10 ml. to 20 mg. in 10 ml. of water) were irradiated with x-rays of 200 kV without filtration. For the detn. of the sulfonamides the Marshal method was used. Both compounds were altered by irradiation in such a way that the pink color of the Marshal test was prevented to develop. The exact nature of the compounds produced by irradiation has not been elucidated according to the author. CA 37-5549⁸

STUDY OF THE NITROGEN NUTRITION AND METABOLISM OF PLANTS WITH THE USE OF N¹⁵ ISOTOPE. F. V. Turchin, M. A. Guminskaya, and E. G. Plyshevskaya. p. 145-54 of CONFERENCE OF THE ACAD. OF SCI., USSR ON THE PEACEFUL USES OF ATOMIC ENERGY, JULY 1-5 1955. SESSION OF THE DIVISION OF BIOLOGICAL SCIENCE (Translation). 10 p. (AEC-tr-2435 (Pt. 4))

12699

EFFECTS OF SOFT X-RAYS ON UREASE AND CATALASE. A. A. Tytell and H. Kersten. *Proc. Soc. Exptl. Biol. Med.* 48 521-5 (1941).

Effects of soft x-rays on crude urease, crystalline urease, crude catalase and crystalline catalase are described. Sensitivity of the enzymes to the irradiation is dependent upon purity and concentration. Results are given which are in accordance with the observations of Dale on the effects of hard x-rays on polyphenol and carboxypolypeptidase. CA 36-787⁹

RADIOBIOLOGICAL RESURVEY OF RONGELAP AND AILINGINAE ATOLLS, MARSHALL ISLANDS, OCTOBER-NOVEMBER 1955. (Washington. Univ., Seattle. Applied Fisheries Lab.). Dec. 30, 1955. 91 p. Contract AT(45-1)-540. (UWFL-43)

The radiobiological survey showed a great variability in the materials contributing to the radioactivity of various samples. In coconuts and marine animals, no traces of Sr^{90} have been found; in other land plants the Sr^{90} constituted 2 to 5% of total activity, and in the skeletal salts of land crabs up to 50%. Only small amounts of radioactive cesium were found in marine animals, but in some of the land plants it contributed up to 100% of the total activity; however, the marine animals contained more Ce^{144} than the land plants.
