1. Introduction

This quarterly basin activities report is a summation of three months drilling and testing activities in the four primary study areas of the WGSP. This report details information in each study area for the months of October, November and December, 1979. Refer to Figure 1-1 for the location of study areas in the WGSP.

Figure 1-1 Map of Western United States, Showing Areas of Interest

The monitoring of basin activities is an important part of resource assessment and promotes cooperation between industry and government. This is especially evident in the core program. Certain areas in each study area have been recommended by the USGS for obtaining core. Operators active in these specific areas are located by monitoring new activity in each area and contacted by CER Corporation to negotiate contracts for joint industry/government coring operations.

The summary of information on each study area is divided into two sections. The core program section identifies industry activity within the preferred core areas and relates the status of WGSP core acquisition developments. The second section details drilling and testing operations of interest and tabulates production figures from horizons of interest. Newly staked and active wells, and completed wells are listed and located on a map with red and blue numbers, respectively.

The drilling information used in this report was compiled primarily from *The Rocky Mountain Region Report*, published daily by Petroleum Information Corporation. Additional sources used were the *Montana Oil and Gas Journal*, *The Oil and Gas Journal* and the *Western Oil Reporter*.

The following is an excerpt from the *Western Oil Reporter*, December 1979, and is of interest to the WGSP.

*Operators Are Extending Mancos "B" and Dakota Production
East and West of the Douglas Creek Arch
by Douglas Gill*

Several operators are extending Mancos B and Dakota production both east and west from the Douglas Creek Arch.

About 10 miles to the east of the Douglas Creek Arch in the Piceance Basin, Dallas independent David Munson drilled five producing wells to the Mancos B and Dakota Formations from 9,000 to 12,000 ft. In November, Cities Service Gas Company and Pacific Gas Transmission Supply Company were working to the south and north of the Munson wells with the same objective in mind.

To the west of the arch in the southeast corner of the Uinta Basin, Coseka Resources USA, Ltd. found the first significant production in seven townships in the tight formation area by drilling down as deep as 10,000 ft with a 20-well program.

There is significant exploration away from the Douglas Creek Arch area. The new work is much further away from the Northwest Pipeline mainline that runs up the arch, and is 5,000 to 6,000 ft deeper than previous Douglas Creek Arch drilling. The older Wasatch Formation fields that hooked up to the mainline in the 1960s, are mostly in the 3,000 to 6,000 ft range.

Munson established about 7.5 MMCFD in deliverability among his five wells, but believes he could have done better if he knew what he does now about completion and subsurface fracturing in the area. The wells were drilled on his Sagebrush Hills II Unit on the west flank of the Piceance Basin.

Munson says he's hoping for 15 to 20 MMCFD in deliverability from his next five wells, but as of early November he was still looking for a sponsor to finance them.

Financing its own effort in the Piceance Basin, Cities Service is seeking to provide more gas for its pipeline system, either by trades involving the Northwest line or through a future direct connection with Cities' new line to Rawlins, Wyoming.

The company has taken an option to earn part of Chancellor Exploration's large Rio Blanco Exploration Unit by drilling six wells to evaluate the Mancos B and Dakota on the western flank of the basin, in the vicinity of Munson's wells. Results from the two wells now finished or being tested will guide the company's decision whether to finish the series.

Pacific Gas Transmission Supply (PGT), the producing arm of Pacific Gas & Electric Company, has a significant exploratory program in both the Uinta and Piceance Basins. It is part of an effort to justify a Uinta lateral off its proposed new line from the Overthrust Belt near Kemmerer, Wyoming, to southeast California. PGT is doing its own drilling in the Piceance Basin and is in partnership with Coseka Resources in the southeast corner of the Uinta Basin.

Coseka Resources has had success in searching for production in the Mancos B and Dakota Formations in the southeastern part of the Uinta Basin, where strata begin to slope upwards toward the Douglas Creek Arch.

Of the 20 wells drilled or drilling so far in the Uinta Basin, Coseka has or will successfully complete 19, and would have completed the twentieth except for an unexpected casing collapse. Ten of the wells are Mancos completions.

At an average 2 MMCFD from the Dakota and 200 MCFD from the Mancos, Coseka has established some 20 MMCFD of production in seven sparsely drilled previously unproductive Uinta Basin townships. There were a dozen wells which pioneered the effort in the seven townships. All were drilled in large exploratory units, very useful in tight gas sand drilling where the operator knows he will drill a number of wells over a large area.

A fracture treatment can be avoided whenever a natural flow is encountered due to better than usual permeabilities or natural fissure networks. Deliverabilities in that case can average 1 to 3 MMCFD. Coseka tries not to augment good natural flow with a fracture job.

Coseka's drilling plan typically calls for conventional mud drilling through the lowest water-bearing zone, usually the Castlegate—sometimes called the Mancos A. Casing is set to that point, then air is used to drill through the Mancos to the Dakota. If completion is not possible there, the well is plugged back and completed in the Mancos. Using air and no mud, the Mancos is not damaged while continuing on to the deeper objective.

Background and geologic information about the WGSP can be obtained from the Quarterly Basin Activities Reports, dated January 1, 1978 (NVO/0655-03), April 1, 1978 (NVO/0655-05), and July 21, 1978 (NVO/0655-06). Included in these reports are stratigraphic correlation charts, cross sections and a brief account of the geology of each area and information relating to the USGS recommended coring locations. For information on the core

program, refer to the *WGSP Core Program, January 12, 1978*. These reports may be obtained from the Technical Information Center (TIC), Post Office Box 62, Oak Ridge, Tennessee, 37830, except the Core Program document, which is available from CER Corporation, 4220 South Maryland Parkway, Suite 801, Las Vegas, Nevada, 89109.

2. Northern Great Plains Province

2.1 CORE PROGRAM

Specific areas within Montana were selected by the USGS for the initiation of the WGSP core program. These areas include:

- Powder River County — T5S, R52E to T53E.
- Custer and Prairie Counties — T10N to T11N, R48E to R49E.
- Valley County — T29N to T30N, R35E to R37E.
- Phillips County — T29N to T30N, R26E to R27E.

The four areas (refer to Figure 2-2 for location) were chosen for the following reason:

- They are removed from productive fields and little data is available in the areas.
- There are two or more potential reservoir intervals and adjacent source beds in the areas.
- The combination of these areas will test several different reservoir types, including sections with fine-grained carbonates, such as chalk, and fractured reservoirs found along lineament zones.

The objectives are Cretaceous horizons ranging from the Judith River Formation through the older Mowry Formation. Figure 2-1 is a correlation chart of Cretaceous rocks in the Northern Great Plains Province. Drilling depths to reach these objectives are shallower in the Province (2,000 to 4,000 ft) than in the basins of Wyoming, Colorado and Utah. Therefore, costs for recovering core and obtaining complete log data should be less than in basins where the objectives are deeper.

There was not much activity in the designated core areas. Dome Petroleum has two wildcat tests near Core Area B in Custer County. Falcon-Colorado Exploration had two development completions near Core Area C in Valley County. Coring was to take place for the Midlands Gas No. 2-2670 Federal in Phillips County, but was postponed until early spring.

Table 2-1 lists the wells of interest to the USGS designated core areas and Figure 2-2 shows their locations.

2.2 DRILLING ACTIVITY

Exploration of the shallow gas sands of interest to the WGSP continued to increase. Colorado Interstate Gas Exploration's program continued in Carter, Custer, Fallon and Garfield Counties, Montana, and included some Niobrara tests. Sugar Creek Resources had three Fallon County Eagle tests with one completed D&A. Other activity in the province included Joseph J. C. Paine's Eagle program in Bowman County, North Dakota, with significant production from a number of the wells. Other activity included Jerry McCutchin's Shannon wells in Harding County, South Dakota, and Odessa Natural's two Greenhorn tests in Carson County, South Dakota, which were completed D&A.

There was activity in new areas of the province, with one of the most interesting being the Niobrara field discovery in Phillips County, Montana (XENO No. 16-15 Wagner, Sec. 15, T32N, R28E). The pay zone perforated at 1,539 to 1,552 ft, and although its initial potential was only 34 MCFD, this new field in a different stratigraphic horizon is significant. The well was fractured, but no information about the fracture job was available.

Other new areas of shallow gas exploration included a Muddy test to 2,469 ft (D&A) by South Ranch Oil in Fergus County, Montana. Gulf Oil had a 2,050 ft Eagle test (D&A), with two additional tests planned, all in Garfield County, Montana; this illustrates that major companies are also showing interest in these shallow sands. Hilton Engineering & Geological Services currently has a 2,000 ft Mowry test in Stillwater County, Montana, which is just outside the province boundary. P&M Management drilled a D&A Parkman (Judith River) test to 4,461 ft in Powder River County, Montana. This test, however, indicated that the Parkman was probably in the higher permeability part of that facies.

Montana-Dakota Utilities is drilling an Eagle test in the area of the J. J. C. Paine program in North Dakota. South Dakota is also getting new activity: Lario Oil & Gas plans to drill three Niobrara tests and two Shannon tests in Butte County. These tests are probably designed to extend production out from the same trend that J. McCutchin established to the northwest. Drilling depth will vary from 1,000 ft (Shannon) to 2,000 ft (Niobrara).

There were 96 newly-staked locations in the fourth quarter: 68 development and 28 wildcat wells. A summary of active and newly staked wells is in Table 2-2 and Figure 2-3 shows the locations of the wells.

Table 2-3 is a summary of the WGSP drilling activities. These figures have been revised to the fourth quarter, 1978, and revision will continue in future quarters as statistics become available. Drilling summaries for all four primary areas of interest are being updated.

A number of wells in the province have natural production. If fractured, the treatment is usually 8,000 to 15,000 gal fluid and 40,000 lb sand. The largest fracture treatment reported during the quarter, was performed on J. J. C. Paine No. 2-23 Lowe well, Sec. 23, T129N, R106W, Bowman County, North Dakota. The well, which was fractured with 20,025 gal of fluid and 50,000 lb sand, yielded 120 MCFD from the Eagle Formation.

Figure 2-3 Wells Staked and Completed, USGS Designated Core Areas, Northern Great Plains Province (refer to Tables 2-2 and 2-4)

Operator had 10 additional completions in locale reported this quarter.	494
SP: 8-28-79 CP: 9-1-79	Texas Oil & Gas	1-S Leonard A Miller	8	swsw 20/34N/17E Wildcat Field Hill Cnty, MT	Eagle 1,700	1,700		WF, D&A. Operator had 1 additional wildcat D&A in same locale.	

In the Northern Great Plains Province, 122 wells were reported as completions: 68 development wells were producers and 25 were D&A; 9 wildcat wells were reported as discoveries and 20 were D&A. Potential new gas totaled 33,030 MCFD. Producing horizons included the Eagle (which usually contributes the most gas in the NGPP), Phillips, Bow Island, Shannon, Bowdoin, Greenhorn and Niobrara. Table 2-4 is a summary of completed wells and Figure 2-3 shows their locations.

3. Greater Green River Basin

3.1 CORE PROGRAM

To assist in assessing the resource potential within the Greater Green River Basin, the USGS recommended core acquisition in the following areas (see Figure 3-3):

Area A

The crest of the Wamsutter Arch in Sweetwater and Carbon Counties, the Northern edge bordering on the Red Desert Basin and the southern edge occupying part of the Washakie Basin, T17N to T21N, and R91W to R97W. The section below the commercial Almond and Ericson (Mesaverde) is of primary interest in this area;

Area B

The area east of the Big Piney/LaBarge Field in Sweetwater and Sublette Counties, running north and south through the Pinedale area, and to the northern edge of the Green River Basin. These areas skirt the edge of the Wind River Range. Production here is primarily Frontier, with some contribution from the Mesaverde and Fort Union.

Area B has been divided into four subdivisions which are:

B₁ West of R104W to R109W and from T22N, north to T28N;

B₂ R106W to R111W and from T27N to T31N;

B₃ R108W to R112W but not including development drilling, and T30N to T35N;
and

B₄ North edge of Green River Basin into the Hoback Basin, R112W to R114W and T36N to T39N.

The core sites contain thick sections of tight, but generally untested, gas sands in Upper Cretaceous and Tertiary formations.

During the quarter, two DOE coring jobs took place in the Greater Green River Basin. Coring began November 9 on the Pacific Transmission Supply No. 3-10A Federal well, Sec. 10, T22N, R94W, Sweetwater County, Wyoming. Approximately 165 ft of 4 in. core was recovered and WGSP coring operations were finished on November 13. H. E. Newman, S. R. Anderson and J. M. Gromer (CER Corporation) were on site for the WGSP coring segment. Coring began at the top of the Almond Formation (of the Mesaverde Group), which was the only horizon cored. Table 3-1 has detailed core information.

*Table 3-1 Core Description for Pacific Transmission Supply
No. 3-10A Federal Well, Greater Green River Basin*

Core No.	Interval Cored	Ft Recovered	Percent Recovered	Feet	General Lithologic Description
1	11,436-11,496	53.9	90	.5	Shale: black; silty; carbonaceous, non-calcareous
				18.0	Siltstone: fine grain; ranging from shaley to sandy; lt. grey; massive bedding; non calcareous
				35.4	Sandstone: lt. grey; fine to very fine grained, massive bedding, salt and pepper, non-calcareous
2	11,496-11,553	51.2	90	4.0	Siltstone: shaley; lt. grey; very fine grain; silty shale laminations
				47.2	Shale: ranging from less than 10% silt to very silty; from non-calcareous to locally calcareous; light and dark laminations; carbonaceous
3	11,553-11,605	46.2	89	2.0	Sandstone: lt. grey; silty; very fine grain, massive bedding
				6.5	Shale: black; silty; some coaly black laminations
				37.7	Siltstone: shaley; grey, some coaly carbonaceous inclusions; shaley laminations
4	11,605-11,623	15.4	86	7.0	Siltstone: grey; laminated w/black silty shale layers; 1-2 in. coaly seam; slightly calcareous
				8.4	Shale: silty; black; scattered carb. laminations

Samples were sent to Bartlesville Energy Technology Center (BETC), Lawrence Livermore Laboratory (LLL), Los Alamos Scientific Laboratory (LASL) and Core Laboratories (Casper, Wyoming).

Logging operations commenced November 16 and were completed November 17. G. C. Kukal (CER Corporation) assisted. Table 3-2 is a list of logs run on the well.

Coring of Rainbow Resources No. 1-3 Pacific Creek Federal well, Sec. 3, T26N, R103W, Sweetwater County, commenced during the quarter (December 29). By December 31, two Mesaverde cores were cut from 12,398 to 12,497 ft, with full recovery. The operator resumed normal drilling at that point. Coring will resume below 12,600 ft after the first of the year.

Figures 3-1 and 3-2 depict some of the activities related to coring operations of the Rainbow Resources No. 1-3 well. The first picture is Parker Drilling Company roughnecks pulling out the inner core barrel. The second photograph is H. E. Newman (CER Corporation staff geologist) taking core from the rig floor to the "doghouse" for description.

Table 3-3 is a summary of wells located in the USGS designated core areas and Figure 3-3 shows their locations.

3.2 DRILLING ACTIVITY

Most activity in the Greater Green River Basin was in the same general areas as the third quarter: east of the Rock Springs Uplift in and on the flanks of the Washakie and Red Desert Sub-basins. Koch and Colorado Interstate Gas Exploration are expanding their drilling programs in the same general area of the Waskakie Sub-basin, Sweetwater County. CIGE has planned three Mesaverde tests to 17,000 ft in their Haystack Unit area. Koch will drill two 18,300 ft Mesaverde wildcat tests to the northwest. Cotton Petroleum has a five well wildcat program planned in this general area. Cotton Petroleum's Shallow Creek Unit wells are all planned to 12,600 ft (Mesaverde).

The most common objective in Sweetwater County is the Mesaverde Group. The Frontier Formation is the usual target in the Lincoln and Uinta Counties (to the west of the Rock Springs Uplift area).

The Green River Basin proper (Sublette County and western Sweetwater County) has not been particularly active in WGSP horizons of interest. However, Belco Petroleum is the most active in Sublette County with the Frontier horizon as the main objective. In western Sweetwater County, Bruff gas field also has quite a bit of Frontier activity. Figure 3-4 is a stratigraphic correlation chart, showing the formations of the Greater Green River, Piceance and Uinta Basins.

During the quarter, 64 new wells were staked: 52 development and 12 wildcat wells. Most of the new wildcat wells are located in the Red Desert Sub-basin. One notable exception is Forest Oil No. 1 Jonas Gulch wildcat well, Sec. 9, T26N, R107W, Sweetwater County, Wyoming (Green River Basin proper), which is planned to 10,000 ft (Mesaverde).

The largest fracture treatment reported this quarter was performed on Amoco Production's No. 1 Champlin 222 Amoco-E well, Sec. 21, T19N, R93W, Carbon County, Wyoming. The well was acidized with 1,200 gal and fractured with 395,850 gal gel, 268,296 gal water and 1,397,500 lb sand. This Almond Formation completion produced 700 MCFD.

Seventy-eight wells were reported complete this quarter with a total potential of 76,072 MCFD new gas. Of the reported completions, 48 development wells were producers, 10 wildcat wells were discoveries, and 7 development and 13 wildcat wells were D&A.

Contributing horizons included the Fort Union, Wasatch, Lewis, Almond, Ericson, Mesaverde (undifferentiated), Frontier, Lewis/Ericson (commingled), Frontier/Muddy (commingled) and Frontier/Bear River (commingled). The producing horizons and a summary of drilling activities are listed in Table 3-4. (The figures are revised up to fourth quarter, 1978, and revision will continue in future quarters.)

4. Uinta Basin

4.1 CORE PROGRAM

The Uinta Basin is located in northeastern Utah and has potential production from "tight gas sands" in a thick section of Upper Cretaceous through Tertiary sediments. Cretaceous tight horizons include the Castlegate and Sego sandstones and the Blackhawk, Price River, Neslen and Farrer Formations. Tertiary tight gas sands are found in the Tuscher, North Horn, Wasatch and Green River Formations.

Areas recommended by the USGS for the acquisition of core for the WGSP core program are listed below (See Figure 4-1).

Area A

Wasatch and Duchesne Counties — T4S to T7S, R5W to R11W; in Wasatch County, T9S to T11S, R7E to R9E; in Carbon County, T11S and T12S, R7E to R13E.

Area B

Duchesne and Uintah Counties — T3S to T4S, R2E to R2W and parts of T8S, R16N to R18W.

Area C

Uintah County — T8S to T9S and R23E to R25E.

Area D

Uintah and Grand Counties — T10S, R18E, T11S to T16S, R18E to R25E; and T17S to T19S, R21E and R22E.

These areas were selected due to the lack of core and well data, and location being outside the main productive fields of the Uinta Basin. Within the core areas, newly staked locations are monitored so that operators can be contacted concerning participation in the WGSP core program.

During the fourth quarter 1979, discussions with Mapco, Inc., resulted in the coring of selected Wasatch and Mesaverde intervals from their No. 11-17F River Bend Unit, Sec. 17, T10S, R20E, Uintah County. This was the first coring agreement reached in the Uinta Basin as part of the WGSP Core Program.

The coring operation commenced November 13 in the lower portion of the Wasatch Formation, locally named the Uteland Buttes Unit by Mapco. D. C. Bleakly, W. J. Brown and J. Baltes (CER Corporation) were present to process the core on location for the WGSP. By the end of the operation on November 27, seven cores had been cut, two in the Wasatch and five in the upper 1,000 ft of the Mesaverde. (See Table 4-1).

Whole core samples were sent to BETC and LASL. Chip samples, taken every foot through the sands, were sent to Sandia Laboratories. All remaining core was sent to Core Laboratories for additional analysis.

Logging operations commenced November 29 and were completed on December 1 for the Mapco No. 11-17F well. G. C. Kukal and S. R. Anderson (CER Corporation) were on location to assist. Table 4-2 is a list of logs run for the well.

Table 4-3 is a summary of Uinta Basin core area wells and Figure 4-1 shows their locations and the WGSP designated core areas.

4.2 DRILLING ACTIVITY

The focal point of the Uinta Basin activity is the Natural Buttes area, T8S to T11S, R19E to R24E. Belco Development Corporation, Colorado Interstate Gas Exploration/Gas Producing Enterprises were very active during the quarter staking new locations, drilling and completing wells. Other operators active in the Natural Buttes and surrounding areas were Conoco, Enserch, Pacific Transmission Supply, Mapco and Cotton Petroleum.

The Wasatch Formation is the principal pay horizon in the Natural Buttes area but there are indications that interest is increasing in the Mesaverde horizon. Gas production from the two horizons was commingled in some wells. Fracture treatments are standard completion procedures, with the size of the treatments during the quarter varying from 25,000 to 500,000 lbs of sand.

The largest fracture treatment reported during the quarter was performed on Enserch Exploration No. 1-14 White River-Federal, Sec. 14, T10S, R23E, Uintah County, Utah. The well yielded 2,300 MCFD from the Mesaverde Group (undifferentiated) after being fractured with 260,000 gal gel and 480,000 lb sand.

In other areas of the Uinta Basin, operators continued to be active in the oil-productive regions around Red Wash and Altamont fields where the Tertiary, Green River and Wasatch Formations are the primary pays.

In the southern portion of the basin, there has been an increase in drilling for gas in the Cisco Dome area. However, objectives lie below horizons of interest to the WGSP, with drilling depths to these objectives shallow (1,000 to 5,000 ft), because the Upper Cretaceous-Tertiary section has been partially or totally removed.

Amoco Production spudded a 13,000 ft Cretaceous test on the western edge of the basin in a little-drilled area of Utah County (see Table 4-5). This wildcat test, located in Sec. 7, T9S, R6E, is in the same section as a Mountain Fuel Supply D&A wildcat drilled to 8,207 ft.

Figure 4-1 USGS Designated Core Areas and Wells of Interest, Uinta Basin (refer to Table 4-3)

Elsewhere in the Uinta Basin, there was little activity of note during the fourth quarter, 1979. The high level of activity in and around the Natural Buttes Unit is expected to continue with further infill drilling and gradual enlargement of the Wasatch-Mesaverde productive area.

Table 4-4 is a summary of drilling activities in the basin. Up to the fourth quarter, 1978, the figures have been revised, and revision will continue in future quarters.

Fifteen development wells were reported complete during the quarter and 9 wildcat wells were reported D&A. Potential new gas totaled 12,201 MCFD with the Mesaverde undifferentiated contributing the most new gas. Twenty-six developments and 3 wildcat wells were staked during the quarter. Tables 4-5 and 4-6 are summaries of active wells and new locations, and completed wells, respectively. Figure 4-2 shows the location of these wells.

5. Piceance Basin

5.1 CORE PROGRAM

The Piceance Basin has numerous tight Upper Cretaceous and Tertiary gas sands. Within the Mancos Formation, the Castlegate (Rollins) and the Mancos B sands are the principal objectives. The Iles Formation of the Mesaverde Group contains the Corcoran, Cozzette, Sego and Trout Creek sand units which have gas potential. Within the continental portion of the Mesaverde Group (Williams Fork Formation) and the continental Fort Union and Wasatch Formations, potential is present in both lenticular and blanket sand deposits. Most of these units are productive somewhere within the Piceance Basin. Actively producing gas fields include the Cathedral, Piceance Creek, Trail Canyon, Thunder, Dragon Trail, and Texas Mountain. However, in areas removed from productive fields, or in horizons below known producing zones, very little information is available. For example, in the Piceance Creek Field, very few wells have penetrated below the commercial Wasatch and therefore data is limited.

In an effort to better understand areas or horizons with minimal control, the USGS has recommended several key areas from which cores should be obtained. Within the Piceance Basin these areas are (see Figure 5-1):

Area A

East of Rangely Field in Rio Blanco County, T1S to T2N, R98W to R99W;

Area B

Piceance Creek Field area, Rio Blanco County, T2S, R96W and R97W (below the Wasatch;

Area C

Garfield and Mesa Counties, T5S to T8S, R95W in the north tapering down to R98W to R99W on the southern part of the area; and

Area D

Garfield and Mesa Counties, T8S to T10S, R92W to R94W (this area is flanked on the northwest and southeast by the Grand Mesa National Forest).

As new locations are staked in areas of interest to the WGSP Core Program, operators are contacted to discuss possible joint coring operations. No new ventures were discussed with operators during the fourth quarter. However, the second stage of a coring program continued at Pacific Transmission Supply No. 22-12 Federal Barcus Creek well, Sec. 12, T1N, R99W, Rio Blanco County, Colorado.

The initial stage of the effort, as reported in the third quarter, commenced in mid-August. Approximately 280 ft of Mesaverde (Williams Fork Formation) core was cut in seven runs with 98 percent recovery. The second stage commenced October 1. Two 60-ft cores were cut in the deltaic Mancos B sand beginning at 11,669 ft. Background gas readings of 750 to 1,000 units were recorded by the mudlogger throughout the interval. Table 5-1 gives a summary of core data for the well.

Core was processed on location by CER personnel D. C. Bleakly, S. R. Anderson and J. M. Gromer. Limited samples were sent to BETC and LLL, with the remaining core being sent to Core Laboratories in Casper, Wyoming, for routine analysis. WGSP coring was completed on October 3, although PTS obtained additional Mancos B core later in the month.

Logging operations, covering the Mesaverde and Mancos interval, commenced October 17 and were completed on October 19. G. C. Kukal (CER Corporation) was on location during that period. Table 5-2 outlines the logging for the well.

Table 5-3 is a sample of Piceance Basin wells located in the WGSP designated core areas; Figure 5-1 shows their locations.

5.2 DRILLING ACTIVITY

During the quarter, 52 new wells were staked in the Piceance Basin: 42 development and 10 wildcat wells. Two areas continued to attract most of the drilling activity. Along the western margin in the Douglas Creek Arch area, the Mancos B (Emery equivalent) sand has been the primary objective, found at shallow depths ranging from 2,000 to 6,000 ft. In the southern portion of the basin, east of Grand Junction and principally south of the Colorado River, operators are drilling wells to tap the Mesaverde-Mancos transition sands. Such sands include the Rollins (Castlegate equivalent), Corcoran and Cozzette, found at depths ranging from 3,000 to 8,000 ft.

Wells in both areas are usually fractured and sometimes the Mancos B is acidized to improve production. Fracture treatments during the quarter were moderate to large in size, ranging from 90,000 to 600,000 lbs of sand. The largest treatment reported during the quarter was performed on Adolph Coors No. 1-31 Acco-Nichols et al well, Sec. 31, T10S, R95W, Mesa County, Colorado. The well produced 850 MCFD of gas after being fractured three times with a total of 344,440 gal fluid and 652,000 lb sand.

The Mancos accounted for 53 percent of the new gas production reported during the fourth quarter. The majority of this production was from the Douglas Creek Arch area, but operators are in the process of extending the Mancos play eastward into the Piceance Basin proper.

Among the significant Mancos wells reported during the quarter were two Teton Energy wildcat wells drilled in Sec. 8, T1S, R98W and Sec. 14, T1S, R99W. Both were reported testing Mancos B during the quarter at approximately 11,200 ft. Although they are "tight-holed", it is thought that both are productive. To the south, CSG Exploration was also testing the Mancos B at approximately 11,500 ft in the Sulphur Creek Field (see Table 5-5).

Figure 5-1 USGS Designated Core Areas and Wells of Interest, Piceance Basin (refer to Table 5-3)

Amoco Production staked a noteable location, Sec. 15, T12S, R91W, Delta County, in the southern most portion of the basin (see Table 5-5). The No. 1 Bowie Unit is located in an undrilled township approximately 24 mi south of the producing Divide Creek Field. The well is expected to test Corcoran and Cozzette potential in that unexplored area.

Twelve miles north of Divide Creek, operations were suspended for the winter months on another interesting Mesaverde test in a previously undrilled township. Rio Colorado & Gas set casing at 4,393 ft on No. 1 Cactus 23-6-70, Sec. 23, T6S, R90W, Garfield County. This location, which is situated on the eastern edge of the basin, is over the Basin Axis, a trend which has had few tests penetrating the Mesaverde interval.

By the quarter's end, 45 wells were reported complete. Thirty-three development wells were reported as producers and 7 wildcat wells were reported as discoveries. Two development and 3 wildcat wells were D&A. The Mancos B/Emery horizons contributed the most potential new gas (8,751 MCFD). Other contributors included Mancos (undifferentiated), Mesaverde (undifferentiated), Corcoran and Wasatch. Commingled potential included Rollins/Corcoran, Corcoran/Cozzette and Rollins/Corcoran/Cozzette. Total potential new gas was 17,434 MCFD.

Table 5-4 shows the drilling activity of the WGSP since monitoring began. The figures are in the process of being updated. Tables 5-5 and 5-6 give a sample of active wells and new locations, and completed wells, respectively. Figure 5-2 shows the locations of these wells.
