DISTRIBUTION OF THIS DOCUMENT IS UNLIMITED

This report was prepared by the Energy Information Administration, the independent statistical and analytical agency within the Department of Energy. The information contained herein should not be construed as advocating or reflecting any policy position of the Department of Energy or any other organization.

Electronic Publishing System (EPUB)

User Instructions

EPUB is an electronic publishing system maintained by the Energy Information Administration of the U.S. Department of Energy. EPUB allows the general public to electronically access selected energy data from many of EIA's statistical reports. The system is a menu-driven, bulletin board type system with extensive online help capabilities that can be accessed free of charge 24 hours a day by using a terminal or PC with an asynchronous modem. (EPUB will be taken down briefly at midnight for backup.)

CONFIGURING YOUR PC SOFTWARE

PC users must provide the following information to their communications software in order to successfully access the EPUB system. Consult your communications software documentation for information on how to correctly configure your software.

Communications Parameters: BAUD RATE: 300 - 2400 bps

DATA BITS: 8 STOP BITS: 1 PARITY: NONE DUPLEX: FULL

TERMINAL TYPE: examples: ANSI, ANSI-BBS, VT100

ACCESS PHONE NUMBER

Once your communications software and/or hardware has been configured, you can access EPUB by dialing (202) 586-2557.

USING EPUB

When a connection to the system has been made, some users may find that the menu-driven instructions and the online help capabilities will provide enough information to effectively use EPUB. If needed, more extensive information may be found in the EPUB Users Guide, which is available online from the EPUB system or from:

National Energy Information Center, EI-231 Energy Information Administration Forrestal Building, Room 1F-048 Washington, DC 20585 (202) 586-8800

Hours: 8:00 a.m. to 5:00 p.m. Eastern Time, Monday through Friday

EPUB ASSISTANCE:

For communications or technical assistance, call (202) 586-8959, 8:00 a.m. to 5:00 p.m. Eastern Time, Monday through Friday.

For questions about the content of EPUB reports, call (202) 586-8800, 8:00 a.m. to 5:00 p.m. Eastern Time, Monday through Friday.

EPUB PROVIDES SELECTED DATA FROM THE FOLLOWING EIA PUBLICATIONS:

Weekly Petroleum Status Report, updated on Wednesdays (Thursdays in the event of a holiday) at 5:00 p.m.

Petroleum Supply Monthly, updated on the 20th of the month

Petroleum Marketing Monthly, updated on the 20th of the month

Heating Fuel Data, updated the 2nd week of the month

Natural Gas Monthly, updated on the 20th of the month

Weekly Coal Production, updated on Fridays at 5:00 p.m.

Quarterly Coal Report, updated 60 days after the end of the quarter

Electric Power Monthly, updated on the 1st of the month

Monthly Energy Review, updated the last week of the month

Short Term Energy Outlook, updated 60 days after the end of the quarter.

Preface

The Natural Gas Monthly (NGM) is prepared in the Data Operations Branch of the Reserves and Natural Gas Division, Office of Oil and Gas, Energy Information Administration (EIA), U.S. Department of Energy (DOE).

General questions and comments regarding the NGM may be referred to Kendrick E. Brown, Jr. (202) 586-6077, James M. Todaro, (202) 586-6305, or Eva M. Fleming, (202) 586-6113. Specific technical questions may be referred to the appropriate persons listed in Appendix E.

The NGM highlights activities, events, and analyses of interest to public and private sector organizations associated with the nat ral gas industry. Volume and price data are presented each month for natural gas production, distribution, consumption, and interstate pipeline activities. Producer-related activities and underground storage data are also reported. From time to time, the NGM features articles designed to assist readers in using and interpreting natural gas information.

The data in this publication are collected on surveys conducted by the EIA to fulfill its responsibilities for gathering and reporting energy data. Some of the data are collected under the authority of the Federal Energy Regulatory Commission (FERC), an independent commission within the DOE, which has jurisdiction primarily in the regulation of electric utilities and the interstate natural gas industry. Geographic coverage is the 50 States and the District of Columbia.

Explanatory Notes supplement the information found in tables of the report. A description of the data collection surveys that support the *NGM* is provided in the Data Sources section. A glossary of the terms used in this report is also provided to assist readers in understanding the data presented in this publication.

All natural gas volumes are reported at a pressure base of 14.73 pounds per square inch absolute (psia) and at 60 degrees Fahrenheit.

Background on the Natural Gas Industry

by Mary E. Carlson, Joan Heinkel, David F. Morehouse, William Trapmann, and Dana Van Wagener

Introduction

Real natural gas wellhead prices have declined to levels last seen in 1978 (Figure FE1). From 1984 through the first quarter of 1991, the average wellhead price of gas fell in nominal terms from \$2.66 to \$1.68 per thousand cubic feet (Mcf), and in constant 1990 dollars from \$3.25 to \$1.64 per Mcf. Recent spot market gas prices have been below \$1 per thousand cubic feet in some areas.

A surplus in wellhead deliverability is the major factor in the price decline. This surplus stems from expanding supplies without equivalent increases in demand. Natural gas demand generally declined between 1972 and 1986, as indicated by a 26-percent decrease in gas consumption (Figure FE2). Since 1986, this trend has generally reversed, with consumption increasing from 16.2 trillion cubic feet (Tcf) to 18.8 Tcf in 1989, before declining slightly to 18.7 Tcf in 1990. These higher levels

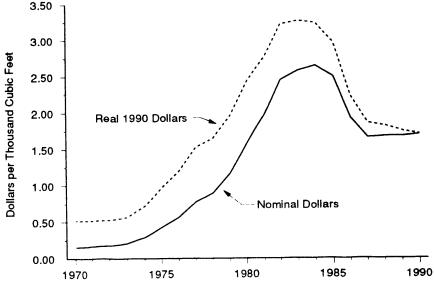

of consumption were not nearly enough to utilize the available wellhead supply fully however, especially considering the growth of imports.

Abundant supplies coupled with declining prices clearly benefit gas consumers in the short run. It is doubtful that the same holds true for the long run, as the implications of low gas prices are far reaching. The financial viability of some firms has been threatened in the short term, while in the long term, the ability of the industry to provide adequate supply may be seriously reduced. Exploration and development activities have declined as the current prices are widely believed to be below replacement cost. Abundant supply conditions are not expected to be sustainable at current price levels.

Many factors have contributed to the development of the current situation. Producers' unfulfilled demand and price expectations have resulted in a capacity to produce gas that substantially exceeds current demand.

The situation has been exacerbated by several events, all occurring roughly during the same time period. From 1987 through 1990 competitively priced imports increased by 54 percent; warmer than normal heating seasons limited natural gas consumption; and entirely new region-specific gas sources, such as coalbed methane developed. (These new sources partly resulted from favorable Federal tax treatments.) Other factors, such as the removal of Federal regulation of wellhead prices, the reduction of Federal regulation of interstate transportation (including gas sales), the industry's subsequent reactions to these events, and the rise and fall of competing fuel prices, especially petroleum liquids, also affect the industry.

Supply Side Developments

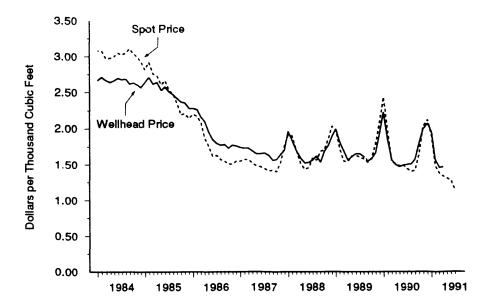

This section focuses on changes in the industry that pertain to natural gas supply. The current supply situation is the result of a set of diverse, and not necessarily complementary, influences. Over the last 2 decades, industry participants have experienced a transition from a highly regulated business environment, in which virtually all aspects were subject to governmental oversight and review, to a much less regulated position. Further, while the natural gas industry was moving toward a more competitive environment, the price of oil surged and fell with changes in the global market, leading to widely varying degrees of competition with petroleum products.

The fluctuations that have buffeted the natural gas industry, planned or unexpected, have changed the industry both on a short-term, cyclical basis and in the longer term. A shift from long-term contracts to spot transactions has led to wellhead prices that vary during the year to an unprecedented degree (Figure FE3). Competition within the industry has accentuated the seasonal nature of the market. Nonetheless, long-term changes affecting the industry are of greater significance and, hence, more interest in understanding the current state of the natural gas industry.

Legislative Changes

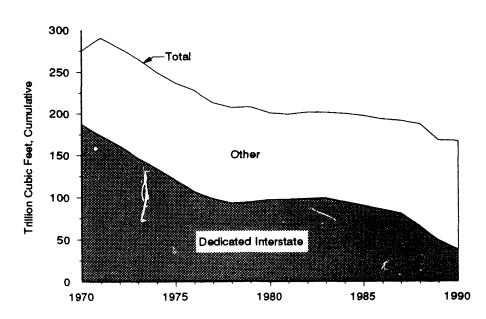

Market conditions in the 1970's provided the motivation for a movement to less regulation. During the 1970's the interstate market for natural gas experienced shortages largely attributed to the failure of Federally regulated wellhead prices to reflect changing market conditions. Interstate price ceilings set by the Federal Power Commission (predecessor to the current Federal Energy Regulatory Commission, or FERC) often constrained interstate prices to below market-clearing levels, encouraging consumption while discouraging investment directed toward supplying gas to the interstate market. Despite plentiful supplies in intrastate markets that were not subject to Federal price controls, shortages eventually appeared in States where supplies were obtained primarily from the interstate pipelines. The inability of interstate pipelines to compete for natural gas supplies is apparent in the drop in their dedicated reserve stocks (Figure FE4).

Figure FE3. Average Wellhead and Spot Natural Gas Prices, 1984 - July 1991

Figure FE4. Natural Gas Proyed Reserves, Beginning of Year 1970 - 1990

Sources: Energy Information Administration: Interstate: Gas Supplies of Interstate Natural Gas Pipeline Companies 1989. Total: *1970-1976: Annual Energy Review 1989. *1977-1990: U.S. Crude Oil, Natural Gas, and Natural Gas Liquids Reserves, Annual Reports 1977-1989.

Total U.S. natural gas reserves declined by about 83 trillion cubic feet between the beginning of 1971 and the end of 1978, the year of passage of the Natural Gas Policy Act (NGPA). Reserves dedicated to interstate pipeline companies, however, fell by 80 trillion cubic feet, which is almost 96 percent of the decline in total natural gas reserves. Dedicated interstate reserves constituted 45 percent of the total at the end of 1978 down from roughly 60 percent at the beginning of 1 71. Total proved reserves decreased 20 percent between 1979 and 1990, but most of this decline (60 percent) was the result of a massive negative revision reported for natural gas reserves on the Alaskan North Slope.

The Natural Gas Policy Act of 1978 sought to alleviate market imbalances by providing a gradual movement toward the deregulation of natural gas wellhead markets. The approach was to bring all natural gas wellhead sales, both inter- and intrastate, under a comprehensive multi-tiered pricing regime. Ceiling prices for most "old" gas would remain fixed in constant dollars. Some "old" gas, primarily intrastate, would be decontrolled as of certain dates.

The NGPA provided higher price ceilings and price growth rates for gas from newly drilled wells and for "high-cost" gas. "High-cost" gas included incremental production resulting from the production entrancement of old wells. Further, FERC decontrolled some categories of high-cost gas immediately under the NGPA. Gas within most categories of "new" wells was scheduled for eventual decontrol (beginning in 1985). The ever-higher price ceilings (in both nominal and constant dollars) were intended to stimulate additional supplies and to allow interstate pipeline companies to compete more effectively for the incremental supplies over time, thus reversing the downward trend in their dedicated reserves.

The retention of relatively low price ceilings for old gas and the schedule of gradual price increases and decontrol for other types of gas were intended to stimulate exploration and development of new supplies while protecting consumers from large price increases. The degree of success in meeting these goals may be arguable, however, as the actual course of subsequent events did not conform to anyone's expectations.

However, shortly after passage of the NGPA, the assumptions underlying the Act began to unravel. The price of imported oil soared from \$15 per barrel in November 1978, to \$39 per barrel in February 1981, destroying the underlying reasoning of the NGPA that intended to provide a smooth transition through the gradual removal of natural gas wellhead price ceilings. The surge in petroleum product prices led consumers to shift toward other, lower priced fuels, thus building

demand pressure in the natural gas market. Consequently, wellhead price ceilings even under the NGPA were binding, frustrating the intended loosening of regulatory constraints. Prices paid for the small amount of deregulated gas available at that time show the intensity of natural gas demand. They rose above \$10 per thousand cubic feet for a brief period, from 1980 through 1982, and even exceeded the equivalent price of residual fuel oil, the closest gas competitor.

Industry Response to the NGPA

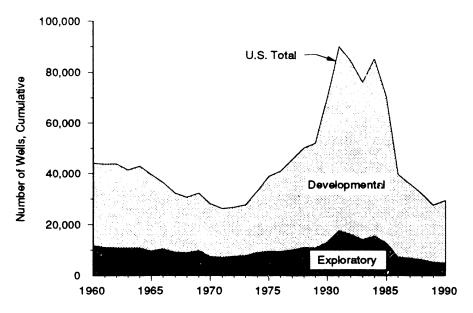

An unprecedented increase in drilling occurred shortly after passage of the NGPA. In general, this increase can be attributed both to higher prices allowed for natural gas under the NGPA and to increases in the price of crude oil on the world market.

Total annual well completions grew by 73 percent between 1979 and 1981 (Figure FE5)--the early years of partial decontrol of wellhead prices and rising crude oil prices. In 1981, drilling peaked at more than 90,000 wells, over three times the level observed just 10 years earlier. Gas wells accounted for about one in three successful wells. This increase in natural gas drilling activity occurred despite a drop in overall consumption of about 2 percent per year and constantly increasing per-well drilling costs.

The high level of drilling occurred when the prices of all types of energy, including natural gas, were expected to increase. Given the previous period of continued price growth, it seemed reasonable to assume that wellhead prices would rise more or less continuously into the future. The ceiling price paths for NGPA Section 102 (new reservoirs) ranged from \$3 to \$5 per thousand cubic feet during the 1980's. The set of legislated ceiling prices provided a framework that likely reflected or influenced the formation of the industry's price expectations. Realized average wellhead gas prices, however, diverged from the ceiling prices as consumption decreased (Figure FE6). The turnaround from increasing to decreasing average wellhead prices took place in 1984 and 1985. The optimistic outlook of producers regarding prices included the assumption that consumption, and thus sales of produced gas, would remain steady or increase. In fact, consumption weakened and subsequently declined through 1986.

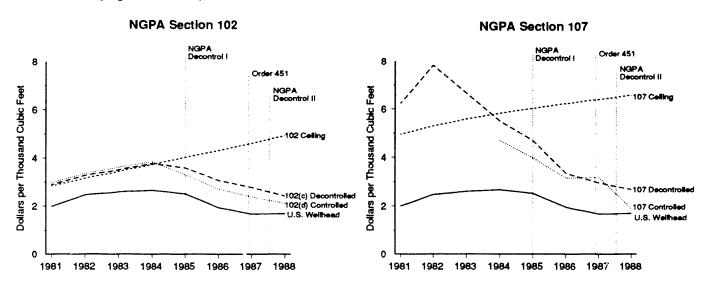

Two major changes concerning gas well drilling occurred from the late 1970's through the 1980's that are not apparent from the number of wells alone. The first change concerns industry practice and the intended targets of the additional gas wells. The second change is a shift in the returns to drilling.

Figure FE5. Annual Well Completions, Exploratory and Developmental, 1960 - 1990

Figure FE6. Average Interstate Prices for NGPA Section 102 (New Reservoir Gas) and Section 107 (High-Cost Gas), 1981 - 1988

Note: Actual prices include taxes, gathering and other allowable charges and therefore may exceed the ceiling price.

Sources: Energy Information Administration, Natural Gas Annual 1989; Federal Energy Regulatory Commission, Purchased Gas Adjustment Fillings.

The generally applied model of field development used until the mid 1970's was based on a standardized gas reservoir. This idealized model relied on the assumption of a homogeneous reservoir with uniform characteristics throughout. This model led to the engineering conclusion that a single well could drain extensive acreage. Over time, this concept was replaced with the idea that the effective radius of drainage for any well is more limited in many gas reservoirs because of the heterogeneity of reservoir characteristics. Thus, according to the new model, the introduction of additional wells into producing reservoirs (infill drilling) would increase overall recovery on average.

Gas well spacing prior to the late 1970's had been rather sparse, frequently with only one well in any 320 or even 640 acres. During the 1980's, regulators low-ered acreage per well restrictions as operators showed more interest in the infill development of already producing fields. This shift in policy and practice had significant consequences for the industry. The success of infill drilling programs in terms of additional recovery can be seen in the natural gas reserves statistics. Gas reserves have been remarkably stable throughout most of the 1980's despite a tremendous decrease in the number of exploratory gas completions. The stability may be attributed largely to net positive revisions to the proved reserves of old fields, which in turn were related to the success of infill drilling programs.

An important aspect of these infill programs concerns unit supply costs. The cost of producing gas from infill wells generally is substantially less than the cost of most other types of additional gas supplies. This is especially pertinent to old fields, where the costs of discovery have already been recovered and processing and gathering infrastructures already exist. Previously, sparse well spacing had created a large stock of relatively low cost gas awaiting development. This portion of the resource base began to be exploited during the period when other events also were acting to drive down the wellhead price of natural gas.

The second change concerning gas well drilling involves the productivity of the wells. As the number of exploratory gas wells (new field wildcats, new reservoir tests, and field extension tests) declined from the peak of 2,530 wells in 1981 to 550 wells in 1990, the quality of the discoveries being made improved in terms of reserves found per exploratory well. This is a common, expected phenomenon in both oil and gas exploratory drilling. Higher drilling levels typically yield discoveries of decreasing average reserve volumes per well, while falling drilling levels typically result in the discovery of higher reserve volumes per well. This happens as marginal prospects respectively become, or cease to be, economically attractive drilling targets.

Beyond the short-term changes in productivity related to drilling levels, improved exploration technology emerged, which served to increase returns to drilling. During the 1980's, new and improved technologies such as three dimensional seismic surveying and directional/horizontal drilling were increasingly applied both to the discovery of new fields and reservoirs, and to the design of field development programs. The impact of the combined economic response and technology factors can be seen in the data on average gas reserves discovered per exploratory gas well (Figure FE7). The average yield in discovered volumes generally decreased from 1977 through 1980, remained fairly constant through 1983, and then increased to much higher levels. The average discovered gas volume per gas exploratory well in 1990 was 240 percent of the 1977 level, and 330 percent of the 1980 to 1983 average value.

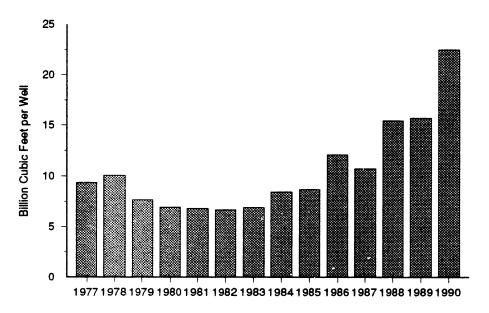

The number of producing wells from 1960 through 1990 (Figure FE8) provides a different perspective on the condition of the industry, as compared with well completions alone. Producing gas wells increased at a more or less constant and relatively low rate up to 1975 to 1976, when the Government began raising gas ceiling prices. Between 1976 and 1990 the number of producing gas wells increased by about 132,000. The bulk of these new wells were not of the same quality as their predecessors with respect to production flow rates, but the sheer number of additional wells drilled after 1975 offset the loss of productivity, leading to an excess wellhead deliverability that is only slowly diminishing (Figure FE9).

Tax incentives that subsidize the production of selected categories of gas also encouraged the development of additional natural gas supplies. An example of such a program is the tax subsidy for coalbed methane production. The provision of a special tax credit for nonconventional gas sources in Section 29 of the Crude Oil Windfall Profits Tax Act of 1980 was an important factor in the conversion of coalbed methane from a worthless substance vented from coal mines for safety reasons to an attractive gas resource. The credit was originally applicable to wells drilled after December 31, 1979, and before January 1, 1990. The qualification period has since been extended twice. Now, coalbed methane wells must be drilled by the end of 1992 to receive the tax credit through the end of 2002.

The significant economic incentive provided by the tax credit encouraged the industry's experimentation with drilling, completion, production, and water disposal methods related to coalbed methane resource exploitation. The significance of this provision is apparent in a comparison of the average price of natural gas in 1990, \$1.71 per thousand cubic feet (Mcf), and the tax credit, worth \$0.865 per Mcf, roughly half the price.

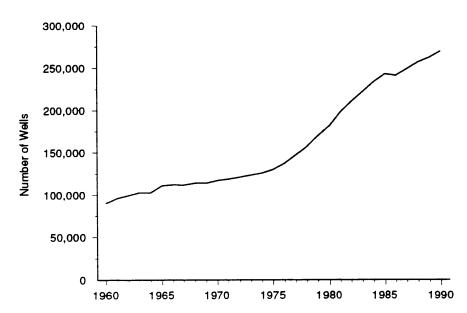

The Section 29 credits also apply to tight gas sands. Devonian shales, and other nonconventional, high-cost gas sources. Annual solutions of about 195 billion cubic test still are vented to remove gas from coal mines.

Figure FE9. Monthly Natural Gas Production and Capacity, 1986 - May 1990

Source: Energy Information Administration, Natural Gas Productive Capacity for the Lower 48 States 1980 through 1991, January 1991.

The tax credit for coalbed methane is adjusted for inflation.

Coalbed methane production increased over seven fold from 27 billion cubic feet (Bcf) in 1987 to 196 Bcf in 1990, when it accounted for 1.1 percent of total domestic gas production. Some portion of the production increase in 1990 must be attributed to the fact that companies expected the tax credit to expire at the end of 1990, initiating more drilling than otherwise would have been expected. More than half of all coalbed methane wells ever drilled (3,600 of 6,000) were drilled in 1990, although less than half of them have started producing. Most experts do not expect 1991 coalbed methane drilling to increase as much as it did in 1990 because of the present low spot gas prices and the extension of the qualification period through the end of 1992. Production, however, should increase appreciably as wells already drilled are completed for production.

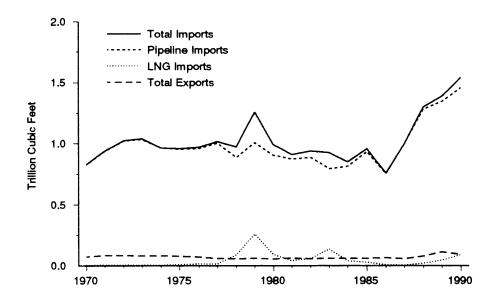

Imports

The increase in natural gas imports has also affected the current supply situation. From 1987 through 1990, gross imports, mostly from Canada, increased at an annual rate of 16 percent (Figure FE10). Net imports of 1.4 trillion cubic feet accounted for 7 percent of total U.S. natural gas supplies in 1990 and are expected to nearly double this share in the early part of the next century.

The current level of Canadian imports reflects the fact that in recent years, Canada has instituted regulatory reforms that have moved its industry toward marketbased pricing of natural gas. This is reflected in the 62-percent decline in Canadian import prices from a 1982 peak of \$4.97 per thousand cubic feet to \$1.91 per thousand cubic feet in 1990 (Figure FE11). During this period, gross imports from Canada increased by 85 percent, doubling their share of total U.S. consumption from 4 to 8 percent. The 1989 Free Trade Agreement with Canada provided assurance of reasonable access to Canadian supplies. Canadian imports now compete directly with domestic sources for core markets. At present, fully half of Canadian proved gas reserves are not connected to delivery systems because of the lack of markets, so competitive pressure from Canada will continue.

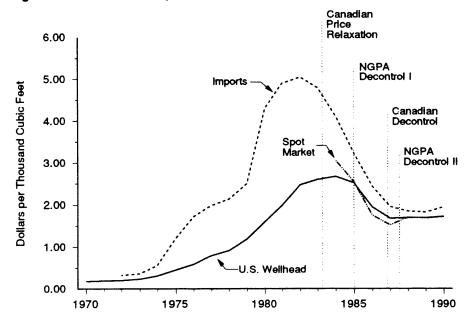

³Although coalbed methane comprises a relatively small portion of total U.S. domestic natural gas production, it may be quite significant regionally. Roughly 20 percent of overall gas production in the San Juan Basin, located mainly in northwest New Mexico, comes from coalbed methane.

Although still very small, (less than 1 percent of total consumption). LNG imports from Algeria roughly doubled from 42 billion cubic feet in 1989, to 84 billion cubic feet in 1990. While only two of the four U.S. LNG facilities were operating in 1990 (Everett, Massachusetts had reopened in 1988 and Lake Charles, Louisiana in 1989), plans call for the reopening of the other two facilities (Cove Point, Maryland and Elba Island, Georgia) in the mid-1990's. Low domestic natural gas prices may cast some doubt on these plans however.

Domestic Supply Summary

Abundant natural gas supplies have reduced prices generally below the replacement cost of reserves. Many producing firms appear to be in a loss-minimization position, in which they treat their past finding and development costs as sunk, and continue to produce from existing wells, as long as the variable costs of operating do not exceed generated revenue. This strategy to maintain cash flow and market share is not viable in the long term, but each firm hopes to survive the period of low prices.

Productive capacity eventually will equilibrate with demand, given either additional natural gas demand or the removal of the appropriate amount of supply. Supply contraction is occurring as current conditions in the industry eliminate economically marginal producing projects and limit exploratory drilling to only the best prospects. One would therefore expect, over the next few years, the evolution of a more concentrated producing industry, with fewer operators, built around fewer marginal properties.

Firms in the industry do not show evidence of optimism. A survey by Saloman Brothers, Inc., indicates that operators are backing off significantly in their plans for drilling expenditures. Overall, producers expect drilling expenditures to increase 2.1 percent for the year. This is down from expectations at the end of 1990 of a 5.5-percent increase in 1991. Independent producers are expecting to cut back even further. Current plans are for a 1.7-percent reduction in experditures from last year as compared with plans for a 6.6 percent increase as of the end of last year.

Gas price increases in the next few years are expected to be limited, because of

 Expected lack of demand growth, which may be attributed to a number of causes, including the current recession and consumer concerns about supply assurance.

- Ready availability of competitively priced imports, either via pipeline from Canada or via LNG tankers.
- Expected continued success of exploratory gas drilling and of infill drilling programs, which would combine to provide relatively low-cost supplies to the market.

Market Developments

While the production side of the market was responding to the price incentives provided by the NGPA, market expansion did not parallel the advances in productive capacity.

Natural gas consumption generally declined during much of the 1970's and 1980's, although substantial increases have been evident since 1986. Natural gas consumption decreased 27 percent from the peak of 22.1 trillion cubic feet (Tcf) in 1972, to 16.2 Tcf in 1986. Consumption levels recovered, increasing 16 percent from the 1986 level to reach 18.8 trillion cubic feet (Tcf) in 1989, before declining slightly to 18.7 Tcf in 1990. All sectors showed increased consumption between 1986 and 1989, while both the industrial and electric utility sectors increased again in 1990 (Figure FE12). Overall, the greatest increase came in the industrial sector, as the result of two factors: the increased use of natural gas by consumers with switchable fuelburning capacity, and the development of gas-fired cogeneration. The increases in total consumption were moderated by the relatively warm weather over the last few years. Weather during the heating seasons⁵ from the end of 1986 through the first quarter of 1990 was warmer than normal6 in virtually every region of the Lower 48 States.

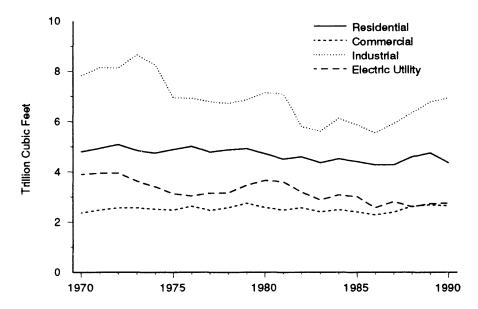

Steep declines in consumption in the early 1980's were related to the sharp growth in natural gas prices (Figure FE13) as well as the recession of 1982. Another factor in the decline was the Powerplant and Industrial Fuel Use Act of 1978 (PIFUA), which was designed to reduce the consumption of natural gas and petroleum products by electric utilities and large industrial boilers. While consumption increased about 1 trillion cubic feet in 1984, another decline occurred from 1985 to 1986. Additional pressure was put on natural gas markets, as crude oil prices collapsed, resulting in fuel switching from natural gas to other fuels. Most of the market contraction occurred in the industrial and electric utility sectors which have substantial fuel switching capability. Residential and commercial use have remained fairly level throughout the last 2 decades.

⁴ Natural Gas Week, July 1, 1991.

The measure of weather for each heating season is the summation of heating degree days for the entire season. October through March Heating degree days is the deviation between the mean temperature for the day and 65 degrees, all measured on the Fahrenheit scale.

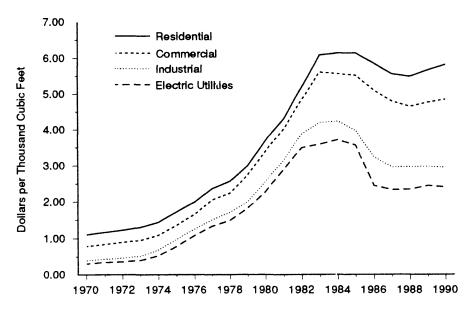

^{6 &}quot;Normal" in this context is determined as average heating degree days for the 10 years, 1976 through 1985

Figure FE13. Average Natural Gas Prices to Consumers, 1970 - 1990

Sources: Energy Information Administration: 1970-1989: Annual Energy Review 1989. 1990: Natural Gas Annual 1990.

During this period, natural gas use in the industrial sector contracted as the result of several factors. First, companies have become more energy efficient. Second, the remaining mix of manufacturing industries has changed so that they now have a greater propensity to use electricity rather than fossil fuels--whether gas, petroleum, or coal. Finally, among industrial consumers who could burn gas in their manufacturing processes, concern about gas supply and price influenced their decision to look elsewhere for fuel.

Industrial customers typically purchase natural gas under interruptible contracts, trading off reduced supply dependability for better price terms. Interruptible customers in many parts of the country routinely have natural gas supplies cut off during periods of peak demand, usually because of the need to satisfy residential and commercial heating requirements during the winter. While there are good reasons for industrial users to elect interruptible service, it remains that: (1) there is no realistic way for these users to stockpile natural gas because they have little or no access to storage; and (2) if interrupted, they must locate and acquire substitute fuel sources or shut down. Additionally, the price of natural gas to industrial customers, in both nominal and real terms, experienced double-digit annual rate increases from the mid-1970's through the early 1980's. The real rate of increase in the price of gas exceeded 20 percent in 7 of the 10 years from 1973 to 1982. In the late 1980's, natural gas prices to industrial users declined significantly. In 1990, the average price was \$2.93 per thousand cubic feet, 31 percent below the peak level of \$4.22 per thousand cubic feet in 1984. Recently, industrial consumption has increased.

Electric utilities are burning substantially less natural gas than in the early 1970's. During the 1970's and 1980's, as a result of PIFUA and rapidly increasing prices for both oil and natural gas, electric utilities placed increased emphasis on coal-fired power plants and the development of nuclear power. In 1970, electric utilities paid an average of 12 percent more for coal, on a Btu equivalent basis, than for natural gas; however, measured in constant dollars, gas prices to utilities increased at an annual average rate of 14 percent through 1982, while coal prices increased only 7 percent annually over the same period (Figure FE14). Since 1982,

natural gas prices have dropped dramatically, however, in 1990 electric utilities still paid 58 percent more per Btu for natural gas than for coal. Between 1972 and 1989, generation from coal-fired plants more than doubled while nuclear generation increased nearly 10-fold. Since the late 1970's, almost all baseload capacity construction has been either coal-fired or nuclear. Some expansion of the electric utility market for natural gas is expected over the next several years as utilities look to natural gas combined cycle plants to meet increasing generation requirements over the next decade.

Residential consumption has decreased by 14 percent from the 1972 peak, reflecting the countervailing effects of an increase in the size of the market being served on the one hand, and conservation efforts on the other. Because of concerns about their ability to secure sufficient supplies for their existing customer base, local distribution companies have not been aggressive in the past two decades in promoting natural gas for new communities, or in promoting conversions to natural gas from alternative fuels. New communities were developed without any access to gas lines. Some existing residential customers are confined to only partial use of natural gas and are prohibited from expanding their use. For instance, although a household may use natural gas for cooking, it may not be allowed to install a gas furnace.

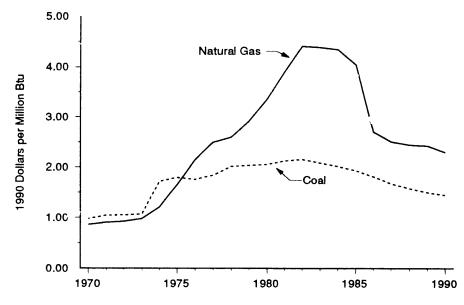

Still, the number of residential customers has increased by approximately 26 percent since 1972. On average, each customer is burning less gas than previously. As shown in Figure FE15, weather driven demand does not explain the shift." While there may be a slight increase in the proportion of customers who cook with gas but do not use it for home heating, it seems that the primary factor in the decline lies with conservation efforts. These range from cutting back the thermostat and replacing inefficient units with more efficient burners, to the greater energy efficiency if new homes. The incentives for these efforts are as varied as simply having to replace a unit because of age; the desire to take advantage of tax incentives for weatherization efforts; or a response to demand side management efforts by local distribution companies.

Figure FE15. Natural Gas Consumption per Residential Customer, 1970 - 1989

Sources: Energy Information Administration: Residential Demand per Household: Natural Gas Annual 1990. Expected from Weather Patterns: Office of Oil and Gas.

In summary, these factors together have resulted in 1990 consumption levels that are approximately 15 percent below the 22.1 trillion cubic feet of consumption in 1972. For 1991, natural gas consumption is expected to be about 18.8 trillion cubic feet. 10 Generally weak demand in the industrial and electric utility sectors is expected to offset some growth in residential and commercial use if normal weather patterns develop. With significant recovery in the industrial sector not expected until late this year, and with stable prices and plentiful supplies of fuel oil expected for the rest of 1991, industrial gas demand is not expected to show year-by-year improvement again until early to mid-1992. Total gas consumption in 1992 is projected to be 19.4 trillion cubic feet, which would be the highest annual level of gas use since 1981.

The longer term prospects for expansion of natural gas markets appear promising. During the course of this decade, consumption of natural gas is expected to return to levels seen in the early 1970's. This growth will be led by increases in the electric utility and industrial sectors. Electric utility use of natural gas is expected to reach historical highs by the end of the decade as utilities meet additional peaking and intermediate load requirements with the use of gas-fired, combined-cycl. and combustion turbine plants. An increase of from 200 to 600 billion cubic feet in natural gas consumption by industries is projected by the end of the decade. 11 However, industrial consumption is not expected to reach the previous peak seen in the early 1970's. Residential and commercial consumption of natural gas are expected to show little change throughout the decade. The increased use of natural gas appliances, both in existing units as well as in new commercial establishments and homes, is expected to be offset by improvements in appliance efficiencies.

Regulatory Developments

The continuing climb of natural gas prices in the carly 1980's, in the face of declining demand for natural gas and the supply surplus, highlighted some of the weaknesses of the regulatory structure then in place. In particular, the inflexibility of the system prevented companies from responding quickly to changing market conditions. Pipeline companies were locked into contractual arrangements with inflexible pricing terms that resulted in above market prices for their purchases of gas. These contract rigidities were in large part responsible for the continuing upward movement of prices in the early to mid-1980's in spite of declining demand.

Pipeline companies found it more difficult to sell their relatively high priced gas, and those with take-or-pay clauses in their contracts began to experience substantial liabilities. That is, they were obligated to pay producers for gas supplies regardless of whether or not they could market the gas. Some major pipeline companies invoked market-out clauses while others unilaterally lowered the rates they paid for gas that could not be resold at the contracted price. Producers also suffered from a lack of outlets for their production and a subsequent loss of revenue.

While the wellhead market was becoming more competitive, the regulatory structure of the transportation system was impeding the transmission of price signals. These market dislocations were the impetus for a sweeping program of reform of the regulatory structure that began when FERC issued Order 380 in 1984. Under this Order, pipeline companies were no longer allowed to require their customers to purchase or pay for predetermined levels of gas (minimum bills). The removal of such requirements relieved the local distribution companies (LDC's) of any obligation to purchase gas under these contracts and encouraged them to seek alternate supply sources (usually through other pipeline companies), adding to competitive pressures on wellhead prices. The pipeline companies were still faced with the obligation to be prepared to supply gas to these customers and did not receive any compensation for being unable to collect minimum bills. This situation served to increase pipeline company takeor-pay liabilities.

Some pipeline companies, operating within FERC guidelines, moved to expand off-system sales to new users and to offer incentives to retain existing customers through brokerage packages that became known as special marketing programs (SMP's). The intent was to enable pipeline companies to retain customers who otherwise might have switched to alternative fuels by providing access to less expensive, spot market supplies. FERC responded to this industry initiative by introducing blanket certificates for transportation, for both high-priority and nonpriority users of natural gas. Both programs restricted access to the market-priced wellhead gas to certain classes of customers. In 1985, the D.C. Circuit Court found that SMP's and blanket certificates illegally discriminated among customers and the programs were terminated (Maryland People's Counsel v. FERC F. 2nd, Nos. 84-1019 and 84-1090).

As a result of the Court's decision, FERC developed a more comprehensive program to provide LDC's and end users greater access to the increasingly deregulated, wellhead market. Over time, it became apparent that a key feature of a restructured natural gas market would have to be greater flexibility on the part of tra-

Table FE1. Major FERC Orders and Court Decisions

Item	Date	Features
Order 380	May 25, 1984	Prohibits most aspects of minimum bitls in natural gas contracts between jurisdictional pipeline companies and their customers.
Order 436	October 9, 1985	Allows nondiscriminatory, open access transportation.
AGD I Court Decision	June 23, 1987	Vacates and remands Order 436 primarily because it did not adequately address the take-or-pay issue.
Order 500	August 7, 1987	Interim order. (1) Repeats most aspects of Order 436, maintaining the contract demand (CD) conversion option, but prospectively eliminating the CD reduction option; (2) Provides an alternate mechanism for the recovery of take-or-pay settlement costs by open access pipeline companies, subject to a sunset date; (3) Provides a cross-crediting mechanism whereby certain gas transported for producers is credited towards a pipeline company's take-or-pay obligation with that producer; (4) Provides for a gas inventory charge for the prevention of future take-or-pay liabilities.
AGA I Court Decision	October 16, 1989	Remands interim Order 500 because of the "arbitrary and capricious" choice of a sunset date. Does not rule on any other issues because the order is not final. Requires FERC to issue a final rule within 60 days.
Order 500-H	December 13, 1989	Final order, issued in response to the AGA I court mandate. (FERC issued Order 500-I on February 12, 1990, granting in part and denying in part rehearing of Order 500-H. Order 500-I did not specifically affect the take-or-pay recovery mechanisms.)
AGD II Court Decision	December 28, 1989	Finds that the purchase deficiency methodology for allocating directly billed fixed charges among pipeline customers violates the Filed Rate Doctrine and therefore vacates this aspect of Order 500.
AGA II Court Decision	August 24, 1990	Approves almost all aspects of Orders 500-H/I. Defers judgment of the purchase deficiency methodology to the proceedings under AGD II.
Order 528	November 1, 1990	In response to AGD II and AGA II, stays collections of fixed charges for certain pipeline companies. Provides guidelines for companies that will submit alternate allocation methods for collecting the fixed charge.

Source: The Federal Energy Regulatory Commission orders and the D.C. Circuit Court decisions.

ditional sales customers of interstate pipeline companies in their selection of a natural gas supplier, and greater access to transportation capacity on the existing pipeline grid. After Order 380, the restructuring of the industry continued with the issuance of the following Orders (Table FE1):

Order 436/500 (Order 436 issued in 1985 and superseded by Order 500 in 1987) provided the mechanism for interstate pipeline companies to become "open access" transporters¹² for gas bought directly from producers, thereby separating the pipeline companies' merchant and transportation functions. The objective of Order 436 was to aid in the development of a fully competitive market by guaranteeing that consumers wishing to buy directly from producers could rely on transportation services from pipelines on a nondiscriminatory basis. Permitting these direct

sales also provided producers an outlet for gas the pipeline companies either could not or would not buy. Order 436 had the effect of increasing pipeline company transportation volumes and decreasing sales, further increasing their take-or-pay liabilities. Order 500 provided a mechanism whereby interstate pipeline companies could partially recover payments they had made to their producers in order to settle these liabilities.

 Order 451 (issued in 1986) provided a mechanism for increases in the price of old interstate gas subject to the lowest (below-market) NGPA ceiling prices. This Order eliminated price differences among various old-gas subcategories by setting an alternative maximum lawful price (MLP) equal to the highest previous ceiling for any old interstate gas. Acceptance of an alternative MLP, how-

¹²In accepting an "open access" transportation certificate from the Federal Energy Regulatory Commission, a pipeline company agrees to allow access to its transportation capacity to any customer on an open, nondiscriminatory basis. For example, the pipeline company cannot offer preferential transportation rates to its sales customers, because this would discriminate against third-party customers who purchase gas elsewhere and only use the pipeline company for transportation.

ever, depends on "good-faith negotiation" agreements between parties to the contract.

- Order 490 (issued in 1988) allowed sellers and purchasers to abandon automatically all first sales (i.e., producer sales) of natural gas under Section 7(b) of the Natural Gas Act. up..n 30 days' notice, when the underlying contract either had expired or had been terminated or modified by mutual agreement of the parties. This Order also promoted open access transportation by making possession of an Order 436/500 certificate a prerequisite for abandonment.
- Order 528 (issued in 1990) stayed the collection of fixed charges for take-or-pay settlement recovery for certain pipeline companies, because on December 28, 1989, the D.C. Circuit Court had found that the methodology for allocating those charges among a pipeline company's customers. as originally proposed in Order 500, violated the Filed Rate Doctrine (Associated Gas Distributors. et al. v. FERC. Nos. 88-1385 et al.).13 Certain companies were exempt from the stay because they and their customers had filed Stipulation and Agreements with FERC in which all parties agreed that the Order 500 fixed charge allocation mechanism would be used even if it was later modified by the Court. Order 528 also provided a means for those companies affected by the stay to file new fixed charges that reflect a new allocation methodology that will satisfy the Court. and made several suggestions for such a methodology.

Regulatory problems remain as the industry continues to evolve. Transportation customers seek guarantees that the transportation service they receive from interstate pipeline companies is no different from that offered by the companies to their remaining sales customers (the comparability of service issue). Also, the industry seeks the implementation of a rate structure that, while "fair" to both the regulated company and end users of gas, also more nearly reflects conditions in a competitive market. FERC, on July 31, 1991, issued a Notice of Proposed Rulemaking (NOPR) that addresses these issues.

The result of the recent regulatory initiatives is a natural gas market that is dramatically different from that of 10 years earlier. The traditional role of the pipeline company as the sole aggregator and marketer of interstate supply has been replaced by a substantially more complex market, with many more participants involved in the purchase and sale of the gas (Figure FE16). Prior to 1980, natural gas in the interstate market moved almost exclusively under long-term contracts with inflexible pricing arrangements. The long-term contract structure collapsed in the mid-1980's with in-

creasing amounts of gas flowing under short-term arrangements. Local distribution companies, large end users, and natural gas marketers have taken advantage of the increased access, with the result that the role of the pipeline companies has shifted to being principally transporters. In 1982, 20 major interstate pipeline companies owned 77 percent of the gas they delivered, but by 1989, they owned only 21 percent (Figure FE17).

While producers found greater access to buyers under the new market structure, they also were faced with intense gas-on-gas competition from other producers. The competitiveness of the wellhead market is reflected in the movement of spot market prices. With the advent of the spot market, natural gas prices began to reflect market conditions more accurately and respond to them. Unlike the traditional long-term contract, spot market contracts are generally short term, usually less than 2 months. Delivery is on a best-efforts basis. but not guaranteed. Bidding, which takes place during the last 10 days of the month, is for gas to be delivered 1 to 3 months in the future. While prices on the spot market generally declined in the early years of trading, a normal seasonal pattern began to develop around 1988 (Figure FE3). A concern to producers is the continuing slide in off-peak spot prices.

While the new regulatory structure appears to be increasing the efficiency of price signals, the costs of this transition have been significant. The most visible costs are the \$9 billion of take-or-pay settlements. Pass through of these costs, which were incurred in the 1980's, will continue well into the mid-1990's. It is important to note that these amounts reflect only the actual settlement amounts, which are only a portion of the total amount producers claimed under the take-or-pay clauses. Other hidden costs that are not easily quantifiable include:

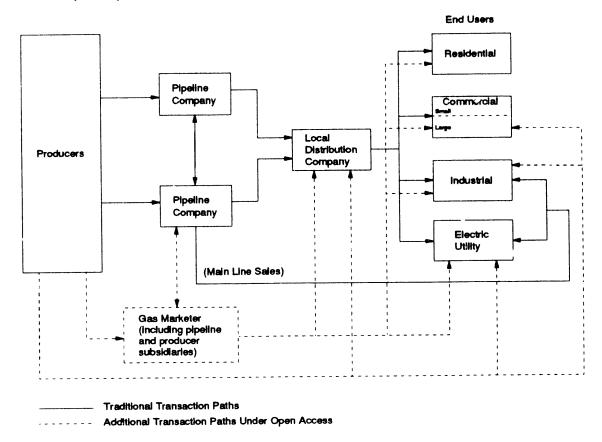

- Reduced reliability of the system resulting from the complexity of the transaction structure and lack of experience of market participants in negotiating these transactions
- Dislocations and uncertainty caused by lengthy regulatory and judicial review prompted by myriad challenges to nearly every aspect of the new structure.

Outlook for the Industry

The movement to a less regulated industry has opened numerous opportunities for industry participants. However, taking advantages of these opportunities requires major changes in operating practices and the development of innovative means of securing the as-

The Filed Rate Doctrine is a label attached by the courts and others to describe provisions in various regulatory. Acts of Congress that prescribe the procedures and substantive standards to be followed in setting rates and the conditions under which changes may be made to rates that have been filed or fixed under those Acts.

Figure FE16. Principal Buyer/Seller Transaction Paths for Natural Gas Marketing

Source: Energy Information Administration, Office of Oil and Gas.

sociated benefits. The increasing flexibility of the natural gas pipeline system engenders much greater competition in the marketplace and faster transmission of price signals. Services traditionally provided by the pipeline companies are now being provided by marketers and in some cases by the end users themselves. Transactions are becoming increasingly complex and the transaction costs associated with negotiation for gas deliveries can be significant.

Additionally, regulatory bodies must resolve certain issues affecting the industry. Impediments remain that restrict the functioning of the market in this era of open access. Comparability of service on pipeline systems and access to storage facilities are being addressed in the FERC NOPR. Producers generally have access to the pipeline system to negotiate deliveries directly with marketers and end users, but access remains limited. For example, access to natural gas storage facilities is controlled by the pipeline companies. Storage access could aid producers in maintaining relatively constant flows and deliveries into a market area. Access to secure firm transportation service could aid end users in ensuring adequate supplies of natural gas even during

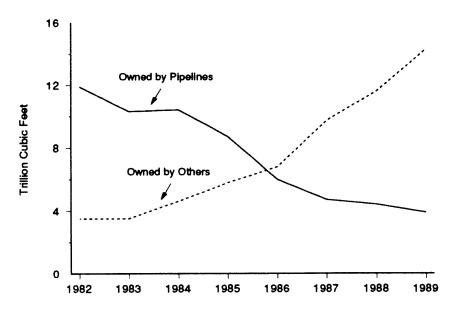

seasonal periods when curtailments under interruptible contracts normally occur. Lastly, changes to Federal regulation may be moot without complementary modification at the State level.

Over the next 2 years and perhaps longer, downward pressure on natural gas prices is likely to continue. This does not preclude some recovery in the overall annual price levels. However, intense competition among producers during off-season periods will probably constrain any large increases in price on an annual basis.

Some factors that could raise prices or generally improve conditions for producers over the short term include:

- Improvement in economic growth could increase demand for natural gas.
- Accelerated implementation of modified rate structures would allow higher utilization of pipeline capacity in the nonheating season, increasing the off-peak demand for natural gas.

Figure FE17. Annual Deliveries of Natural Gas by Twenty Major Interstate Pipeline Companies, 1982 - 1989

Source: Federal Energy Regulatory Commission, FERC Form 2, "Annual Report of Major Natural Gas Companies."

Increased use of long-term contracts could provide more stability to the market. This would provide for more certain and stable revenue streams to the producers. However, total reliance on long-term contracts might not be appropriate for the industry in general as the spot market is an important part of a prudent gas purchasing strategy.

Factors that will continue to depress natural gas prices include the following:

- Supplies available from pipeline and LNG imports as well as domestically, from the expected continued success of drilling programs and from taxcredited sources.
- Gas on gas competition resulting from continued deregulation and increased access to transportation and storage.
- Perceived lack of supply reliability that inhibits greater use of gas by end users.
- Lack of opportunities for further fuel switching, because substantial portions of the electric utility and industrial sector already are using natural gas in place of petroleum fuels.

In conclusion, relatively low prices and abundant gas volumes bestow substantial benefits on consumers. For the producers, however, the short-term outlook is one of continuing adjustment and financial difficulties for some firms.

Opportunities over the longer term for the industry are more positive. The recent Clean Air Act Amend-

ments (CAA) of 1990 require substantial reductions in sulfur dioxide emissions by the year 2000. Conversion to natural gas units is one option available to electric utilities to meet the CAA requirements. Other options are the installation of scrubbers or a switch to lower sulfur coal. One concern for utilities is the availability of fuel supplies at reasonably stable and predictable prices. In order to compete with coal to capture portions of this market, the natural gas industry must find a means of assuring long-term supplies at prices that are competitive with alternative fuels.

Long-term contracts have been an important aspect of the market throughout much of the development of the industry. Nonetheless, the use of long-term contracts has declined since the build-up of take-or-pay liabilities resulting, in part, from the inflexibilities of these contracts. A return to greater use of long-term contracts would play a significant role in providing market stability. Terms currently offered by producers provide supply security, but at a premium over current spot prices. Customers, such as local distribution companies and electric utilities, are uncertain of the response of State regulatory commissions to contracts that carry a premium over current market rates.

Reform of the Public Utility Holding Company Act (PUHCA) is widely viewed by the natural gas pipeline industry as providing additional opportunity for the expansion of the natural gas market. This reform would promote the development of independent power producers by exempting electric utility affiliates and other energy companies from PUHCA regulation. Currently, electric utility holding companies are restricted

under PUHCA so that in most instances they cannot own unregulated, independent power generation facilities. Many of these independent generators would use natural gas as a fuel. Advocates of bills now before Congress to repeal or modify PUHCA feel that allowing holding companies to own independent generators would not only increase the market for natural gas, but would increase competition in the electric utility industry as well. Those opposing these bills feel that such a move would reduce the overall reliability of the electric utility industry.

Another potential market for the industry is the use of compressed natural gas (CNG) in fleet vehicles. In some regions of the country, industry, local governments, and gas distributors are experimenting with prototype programs testing the general applicability of

this use of natural gas. More general application of CNG, however, will require the development of an infrastructure to service these vehicles.

While the opportunities appear to be substantial for the industry, there are obstacles also. The industry must:

- Structure marketing arrangements that will meet the needs of the industrial and electric utility sectors for predictable and stable prices
- Assure prospective users of natural gas that supplies are abundant and will be available at competitive prices.
- Support legislative and regulatory reforms that remove barriers to the use of natural gas.

Domestic Natural Gas Reserves and Production Dedicated to Interstate Pipeline Companies, 1990

By Norman Crabtree and Rosemary Jameson

A preliminary compilation of information reported by interstate natural gas pipeline companies to the Energy Information Administration (EIA) indicates that domestic natural gas reserves dedicated to the interstate market at the end of 1990 were 34.4 trillion cubic feet, a decrease of 9 percent from the 37.7 trillion cubic feet at the end of 1989 (Table FE2).

Dedicated domestic natural gas reserves are those economic and recoverable gas reserves committed to, controlled by, or owned by interstate pipeline companies, where both the seller and pipeline company have received all requisite certification authorizations from the Federal Energy Regulatory Commission (FERC) or its predecessor, the Federal Power Commission. Dedicated reserves include interstate pipeline-owned reserves, reserves controlled under contracts with independent producers, and intrastate supplies committed to the interstate market pursuant to the Natural Gas Policy Act of 1978 (NGPA). Coal gas, liquefied natural gas, synthetic natural gas, and gas supplies purchased under contracts with other interstate pipeline companies or foreign sources are not included as reserves. Information concerning 1989 reserves was extracted from Table 1 of Gas Supplies of Interstate Natural Gas Pipeline Companies 1989, DOE/EIA-0167(89).

Table FE2. Preliminary Year-End Dedicated Reserves and Production, 1990 (Billion Cubic

Feet)

Dedicated Reserves and Production	Volume
Dedicated Reserves - Dec 31, 1989	37,685
Dedicated Reserves - Dec 31, 1990	* 34,410
Change in Dedicated Reserves Net Change (Dec 31, 1990, minus Dec 31, 1989)	° -3,276
1990 Production from Dedicated Reserves	° 4,167
Gross Change	° 891

P Preliminary data Source: FERC Form 15, "Interstate Pipeline's Annual Report of Gas Supply."

Dedicated reserves decreased by 9 percent in 1990, which is less than the 23 percent decrease reported in 1989. The continuing decrease in reserves since 1982 reflects a move by many interstate pipeline companies to become primarily transporters of natural gas, indicating a basic shift in the structure of the natural gas industry. In past years, gas was traditionally sold by the producer to the pipeline company. The pipeline company then sold the gas to a local distribution company which in turn delivered it to the ultimate consumer. The increasing trend is for gas to be sold by the producer directly to the consumer. This results in less gas being dedicated to the interstate market. Pipeline companies in these cases provide transportation services only. Over the past decade, some pipeline companies have renegotiated their take-or-pay contracts resulting in dedicated reserves being returned to the producers. These reserves are then no longer dedicated and are available for spot market or short term contracts. For information concerning industry changes see Natural Gas Production Responses to a Changing Market Environment 1978-1988, DOE/ EIA-0532.

EIA's preliminary compilation indicates that the volume of natural gas produced from dedicated reserves in 1990 totaled 4.2 trillion cubic feet, a decrease of 14.1 percent from the 4.9 trillion cubic feet produced during 1989. Production from dedicated reserves includes production from interstate pipeline-owned reserves, volumes purchased from reserves dedicated under independent producer contracts, and volumes purchased from intrastate supplies, as authorized by the NGPA.

The 1990 dedicated domestic reserves were 34.4 trillion cubic feet. Of these reserves, 4.4 trillion cubic feet (12.8 percent) were interstate pipeline-owned reserves, 29.4 trillion cubic feet (85.5 percent) were dedicated under independent producer contracts, and 0.6 trillion cubic feet (1.7 percent) were committed to the interstate market from intrastate supplies. Production from interstate pipeline-owned reserves totaled 0.1 trillion cubic feet in 1990, or 3.1 percent of the total production. Production from reserves dedicated under contracts with independent producers totaled 3.8 trillion cubic feet, which is 90.7 percent of the total production. The remaining 0.3 trillion cubic feet, or 6.1 percent of the total production, is production from intrastate gas supplies (Table FE3).

¹ Major companies are those that reported in-the-ground dedicated domestic reserves of over 900 billion cubic feet in the year they initially filed a FERC Form 15 report.

Note: Totals may not equal sum of components due to independent rounding. Source: FERC Form 15, "Interstate Pipeline's Annual Report of Gas Supply."

The 23 major interstate pipeline companies owned or held under contract a reported 91.0 percent of the reserves and 91.0 percent of the production shown in Table FE3. For the purpose of this report, major companies are those that reported in-the-ground dedicated domestic reserves of over 900 billion cubic feet in the year they initially filed a report.

The gross change in reserves during 1990 was an increase of 0.9 trillion cubic feet compared to a decrease of 6.3 trillion cubic feet in 1989. Gross change represents the net effect of all additions and revisions to the year-end reserve estimates. It is computed as the difference between year-end 1990 and year-end 1989 reserves, plus 1990 production. Dedicated reserves dropped from 195,130 bcf in 1966 to 34,410 bcf in 1990. The reserves to production (R/P) ratio was 8.3 at the end of 1990, compared to the 7.8 ratio at the end of 1989. The K/P ratio, after dropping rapidly from 1963 to 1972, remained relatively stable through 1990 (Table FE4).

The data presented here are based upon computeredited, detailed reserves and production data reported by the interstate pipeline companies on Schedule II of FERC Form 15. The final data, to be published in the last quarter of calendar year 1991 in Gas Supplies of Interstate Natural Gas Pipeline Companies 1990, DOE/EIA-0167(90), are not expected to vary significantly from the data published in this report.

Sixty-eight interstate pipeline companies, subject to FERC jurisdiction during 1990, were required to report natural gas supply information. Of those, 13 obtained their entire supply of natural gas from other interstate pipeline companies and/or foreign suppliers. The data for the remaining 55 interstate pipeline companies (Table FE5) were edited, validated, and aggregated to develop the 1990 dedicated reserve and production data shown in this report. Thirteen interstate pipeline companies are no longer required to report because they do not buy or sell gas, they have sold their reserves, or the company no longer exists.

A decrease in reserves reported on FERC Form 15 does not necessarily indicate a decrease in the level of proved natural gas reserves for the United States as a whole. FERC Form 15 covers only those reserves dedicated to interstate pipeline companies, as described above. The EIA collects total proved reserves information on Form EIA-23, "Annual Report of Domestic Oil and Gas Reserves," and publishes the findings in U.S. Crude Oil, Natural Gas, and Natural Gas Liquids Reserves, DOE/EIA-0216.

² Includes recoverable natural gas in underground storage facilities at the end of the current report year.

Includes intrastate supplies contracted pursuant to Sections 311(b) and 312 of the Natural Gas Policy Act of 1978.

Overview

Natural Gas Reserves Up After 8-Year Decline

U.S. natural gas reserves increased in 1990 for the first time since 1981. According to the Energy Information Administration (EIA) report, U.S. Crude Oil, Natural Gas and Natural Gas Liquids Reserves 1990, the 1.3 percent increase brought dry gas reserves up to 169,346 billion cubic feet.

Proved gas reserves increased in both Alaska and the lower 48 States. Gas reserves for the lower 48 States

not only increased in 1990, but are higher now than they were in 1985. Higher estimates of future gas requirements on the North Slope caused some technically recoverable Alaskan gas to be reclassified as economically recoverable proved reserves.

Reserves in coalbed methane fields increased by 1,411 billion cubic feet in 1990 while production doubled. In 1990, three-quarters of the net growth of natural gas reserves in the lower 48 States came from the increases in reserves of coalbed methane. They have grown from negligible quantities to 5,087 billion cubic feet or 3 percent of the U.S. total. Large tax incentives

Includes operator reported corrections for the years 1980 and 1981. After 1981 operators included corrections with revisions.

² Revisions and adjustments = Col. 1 + Col. 2 - Col. 3.

Total discoveries = Col. 5 + Col. 6 + Col. 7.
Proved reserves = Col. 10 from prior year + Col. 4 + Col. 8 - Col. 9.

An unusally large revision decrease to North Slope dry natural gas reserves was made in 1988. It recognizes some 24.6 trillion cubic feet of downward revisions reported during prior years by operators because of economic and market conditions. EIA in previous years carried these reserves in the proved category.

Notes: o Old means discovered in a prior year. o New means discovered during the report year. o The production estimates in this table are based on data reported in Form EIA-23, "Annual Survey of Domestic Oil and Gas Reserves," and Form EIA-64A, "Annual Report of the Origin of Natural Gas Liquids Production." They may differ from the official Energy Information Administration production data for 1990 contained in the Natural Gas Annual 1990, DOE/EIA-0131(90).

Source: U.S. Crude Oil, Natural Gas, and Natural Gas Liquids Reserves, 1980 through 1990 annual reports, DOE/EIA-0216.

and an improved understanding of the underlying production technology caused the rapid growth.

U.S. total discoveries of dry gas reserves are those attributable to field extensions, new fields, and new reservoirs in old fields and result from drilling exploratory wells. These total discoveries were 12,368 billion cubic feet in 1990, a 23.3 percent increase. Large total discoveries in New Mexico, the Alabama State offshore, and the Louisiana Federal offshore areas made major contributions to the overall increase in proved reserves of natural gas.

Supply and Disposition

The Energy Information Administration (EIA) estimates that marketed production (gross withdrawals less gas used for repressuring, quantities vented and flared, and nonhydrocarbon gases removed in treating or processing operations) totaled 1,504 billion cubic feet in July (Table 1). This is a 1 percent increase from June's total of 1,489 billion cubic feet and slightly higher than in July 1990.

The total gas supply available for disposition in July was an estimated 1,479 billion cubic feet, 8 percent less than in July 1990 (Table 2). The July 1991 total includes 9 billion cubic feet of supplemental fuel supplies, 132 billion cubic feet of imported gas, and 46 billion cubic feet withdrawn from storage. Imports were 10 percent greater than in July 1990, indicating the continued strong level of Canadian import activity, which has increased every year since 1986.

On the disposition side, the consumption of 1,207 billion cubic feet was less than 1 percent greater than in June 1991 and 6 percent less than in July 1990 (Table 2). Total disposition included 266 billion cubic feet of gas injected into underground storage reservoirs and exports of 6 billion cubic feet.

Consumption

Data for the four major end-use sectors, as shown in Table 3, indicate that the total amount of gas delivered to all consumers decreased 11 percent to 1,057 billion cubic feet in June, from 1,192 billion cubic feet in May (Table 3). Consumption in the industrial sector decreased from 560 billion cubic feet in May 1991 to 532 billion cubic feet in June 1991, a decline of 5 percent.

The electric utility sector maintained its strong consumption level, using 260 billion cubic feet, 4 percent higher than May 1991, but 12 percent less than in June 1990.

The residential sector consumed 147 billion cubic feet in June 1991, and the commercial sector consumed 119 billion cubic feet. These totals are 8 percent and 4 percent less, respectively, than in June 1990.

Prices

In June 1991, major interstate pipeline companies paid an average of \$1.98 per thousand cubic feet for gas purchased from domestic producers, a 3 percent decrease from May's \$2.04 total, and a 9 percent decrease from the \$2.18 paid in June 1990. In June 1991, these pipeline companies paid \$2.05 per thousand cubic feet for imported gas. Distributors paid an average \$2.86 per thousand cubic feet for gas at the city gate in June. This is 3 percent more than these consumers paid in May 1991 but 5 percent less than they paid in June 1990. Residential consumers paid \$6.94 per thousand cubic feet in June, 11 percent more than the \$6.28 per thousand cubic feet paid in May, and 6 percent more than they paid in June 1990. Commercial consumers paid \$4.79 per thousand cubic feet in June, 2 percent greater than \$4.71 paid in May and an increase of 5 percent from the \$4.57 they paid in June 1990. Industrial consumers paid \$2.33 per thousand cubic feet in June, a 3 percent decrease from May's price of \$2.39 and an 8 percent reduction from June's total in 1990. Electric utilities paid an average of \$2.01 per thousand cubic feet in May. This is a decrease of 4 percent from the \$2.10 per thousand cubic feet they paid in April 1991.

Monthly and annual data for 1985 through 1989 include underground storage and liquefied natural gas storage. Data for January 1990 forward include underground storage only. See Appendix A, Explanatory Note 7 for discussion of computation procedures.

Notes: Data for 1985 through 1989 are final. All other data are preliminary unless otherwise indicated. Geographic coverage is the 50 States and the District of Columbia. Totals may not equal sum of components because of independent rounding.

Sources: •Total Dry Gas Production: EIA Natural Gas Annual 1989, 1985 through 1989; IOCC, MMS reporting, and EIA estimates, January 1990

Sources: *Total Dry Gas Production: EIA Natural Gas Annual 1999, 1985 through 1989; IOCC, MMS reporting, and EIA estimates, January 1990 through current month. See Explanatory Note 3 for estimation procedures and revision policy. *Withdrawals from and Additions to Storage: EIA Natural Gas Annual 1989, 1985 through 1989; Form FERC-8 and Form EIA-191, January 1990 through current month. See Explanatory Note 2 for discussion of computation procedures and revision policy. *Imports and Exports: Form FPC-14, 1985 through 1989; and EIA estimates, January 1990 through through through through through through through through through 1989; and EIA computations, January 1990 through through 1989; and EIA computations, January 1990 through current month. See Explanatory Note 4 for discussion of procedures and revision policy. *Consumption and Balancing Item: EIA Natural Gas Annual 1989, 1985 through 1989; and EIA computations, January 1990 through current month. See Explanatory Notes 5 and 11 for discussion of computation procedures and revision policy.

b Represents quantities lost and imbalances in data due to differences among data sources. See Appendix A, Explanatory Note 11 for full discussion.
c "Total" data for 1985 through 1989 do not equal equivalent data in Table 1 of the 1989 Natural Gas Annual due to the exclusion of intransit receipts

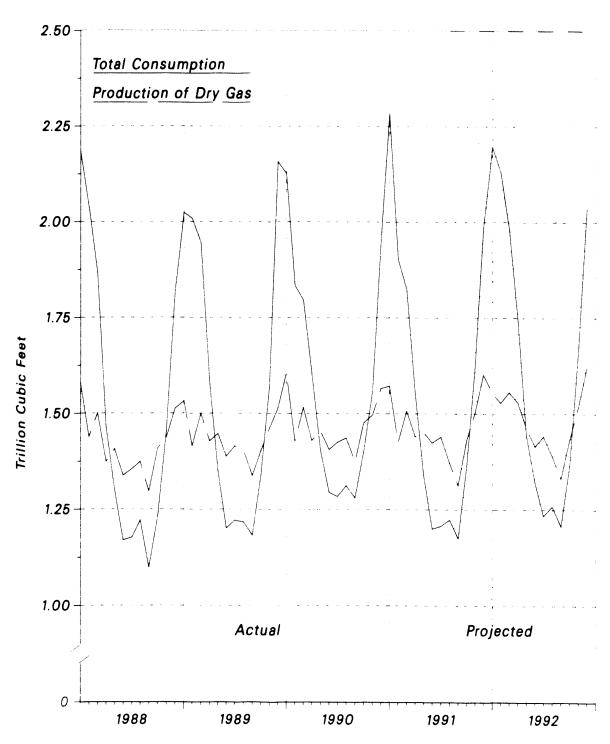

and deliveries in the NGM.

d Consists of pipeline fuel use, lease and plant fuel use, and deliveries to consuming sectors as shown in Table 3.

E = Estimated Data.

R = Revised Data.

See Appendix A, Explanatory Note 8 for discussion of wellhead price.

Notes: Data for 1985 through 1989 are final. All other data are preliminary unless otherwise indicated. Geographic coverage is the 50 States and the District of Columbia. Average prices for gas delivered to industrial consumers for 1985 through 1987 include imputed averages for volumes of gas delivered for the account of others. From 1988 on, average prices reflect on-system sales prices only. The change in series in 1987 affects the commercial and industrial averages.

Sources: •Average wellhead price: EIA Natural Gas Annual 1989, 1985 through 1989; and EIA estimates, January 1990 through current month. See Explanatory Note 8 for estimation procedures and revision policy. •Imports and Interstate Pipeline Company Purchases: Form FERC-11. •Average City Gate, Residential, Commercial and Industrial average prices for 1985 through current month from Form EIA-857. See Explanatory Note 5 for discussion of revision policy. •Earlier prices from EIA Natural Gas Annual 1989. Electric Utilities averages from Form FERC-423, "Monthly Report of Cost and Quality of Fuels for Electric Plants."

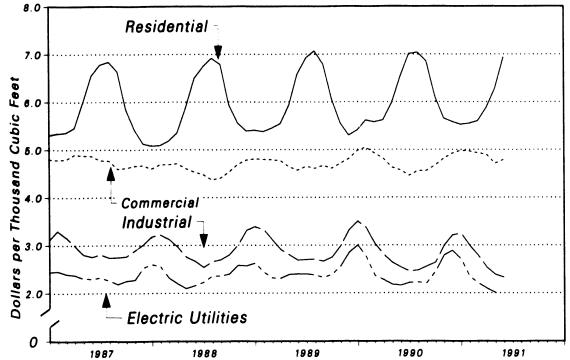

See Appendix A. Explanatory Note 9 for discussion of major interstate pipeline company data.

See Table Notes and Sources for explanation of break in series for consumer prices in 1987.

Includes all steam electric utility generating plants with a combined capacity of 50 megawatts or greater.

R = Revised Data.
NA = Not Available

Dedicated to interstate commerce.

Notes: See Explanatory Note 12 for discussion of purchased gas adjustment fillings. Totals may not equal sum of components because of independ-

Source: Purchased Gas Adjustment filings for interstate pipeline companies.

Existing intrastate contracts.

Rollover contracts.

Total of Sections 104, 105, and 106.

New natural gas and certain natural gas produced from the Outer Continental Shelf.

New onshore production wells.

Stripper well natural gas.

h Other categories of natural gas.

Total of Sections 102, 103, 108, and 109.

I High cost natural gas.

Natural gas not identified by category in Purchased Gas Adjustments (PGA) filing.

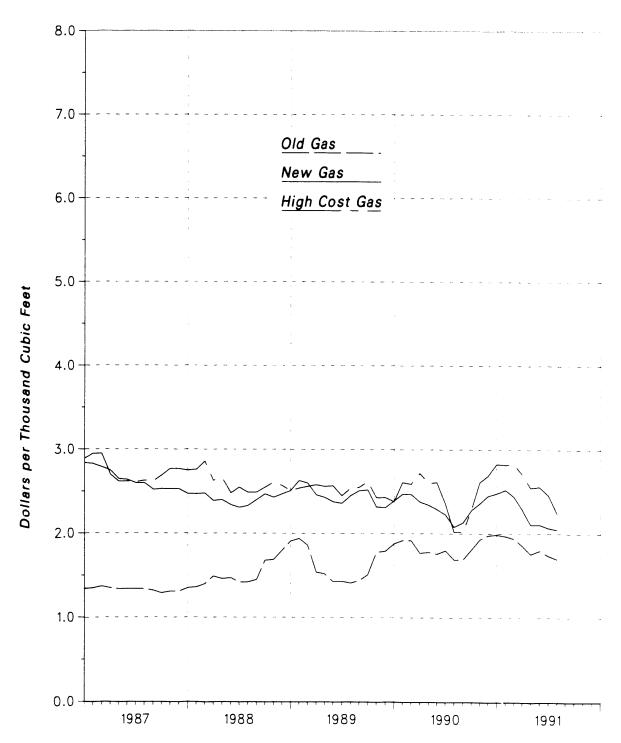

¹ Total of old gas, new gas, high cost gas, and miscellaneous

m All prices are weighted averages.

See Appendix A, Explanatory Note 12 for pipeline company list.

 ⁼ Not Applicable.
 = Volume is less than 500 million cubic feet.

[•] Includes Arizona, Illinois, Indiana, Kentucky, Maryland, Missouri, Nebraska, New York, Ohio, Oregon, Pennsylvania, South Dakota, Tennessee, and Virginia. The 1990 monthly values for these States are estimated.

• Total marketed production for Louisiana in October 1990 - May 1991 were estimated on the basis of production reported in January - December 1989

and 1990, seasonally adjusted.

E = Estimated Data.

Notes: Data for 1985 through 1989 are final. All other data are preliminary unless otherwise indicated. Totals may not equal sum of components because of independent rounding. See Explanatory Notes 1 and 3 for discussion of computation procedures and revision policy.

New natural gas and certain natural gas produced from the Outer Continental Shelf.

New onshore production wells.

High cost natural gas.

d Stripper well natural gas.

[•] Not all filings report estimated volumes. The "With Volumes" columns show number reporting volumes.

f Annual volumes are often estimated by producers prior to actual operations or based on short periods of operation. For this reason the accuracy of estimates may vary.

Notes: Data for the current month and the previous 2 months are preliminary. All other data are final. Dates shown indicate date received at the FERC. Data include affirmative determinations only. See Explanatory Note 10 for discussion of Title I of the Natural Gas Policy Act. Geographic coverage is the 50 States and the District of Columbia. Totals may not equal sum of components because of independent rounding. Source: Form FERC-121.

Note: Data shown are based on filings received at FERC during the month indicated by the table heading. Data include affirmative determinations only. See Explanatory Note 10 for discussion of Title I of the Natural Gas Policy Act. Geographic coverage is the 50 States and the District of Columbia. Totals may not equal sum of components because of independent rounding. Source: Form FERC-121.

Includes all filings reporting volume.
 Annual volumes are often estimated by producers prior to actual operations or based on short periods of operation. For this reason the accuracy of estimates may vary.

New natural gas and certain natural gas produced from the Outer Continental Shelf.

d New onshore production wells.

[·] High cost natural gas.

f Stripper well natural gas.

^{*} See Appendix A, Explanatory Note 10 for discussion of Title I of the Natural Gas Policy Act.

* Commencing January 1, 1985 and July 1, 1987, the price of some natural gas finally determined to be produced from a new, onshore production well under Section 103 is deregulated. Thus, for all months succeeding June 1987, publication of a maximum lawful price per MMBtu under NGPA Section 103(b)(2) is discontinued. New category as of January 1, 1985.

* Section 108(b) of the NGPA provides that for certain gas solid under an intrastate rollover contract, the maximum lawful price is the higher of the price paid.

under the expired contract adjusted for inflation, or an alternative Maximum Lawful Price specified in this table. This atternative Maximum Lawful Price for each month appears in this row.

[.] The price for interstate rollover gas is the higher of the price listed in this table or the just and reasonable price under the expired contract as adjusted for inflation.

Notes: Geographic coverage is the 50 States and the District of Columbia. A "small producer" is one with annual sales subject to FERC jurisdiction not in excess of 10 billion cubic feet. On November 16, 1984, the FERC issued Order No. 406 in Docket No. RM 84-14-000 providing for inclusion of maximum lawful prices under Sections 103(b)(2) and 105(b)(3) of the Natural Gas Policy Act. Order No. 406 became effective on January 1, 1985 Source: Federal Register, "Rules and Regulations."

All prices are computed weighted averages based on dollar and volume amounts reported, which may include or reflect out-of-period dollar or volume adjustments, restatements or revisions, or account reclassifications or provisions for ending regulatory adjustments. See Appendix A, Explanatory Note 9 for discussion of apparent anomalies.
 Not Applicable.

Notes: Two lines have been added to this table to explicitly differentiate transactions between major and nonmajor pipeline companies. Totals may not equal sum of components due to independent rounding and provisions for pending regulatory adjustments.

	.,,-				•— - ·			,		

Gas transported for other companies through the production, transmission, or distribution lines or compressor stations of the reporting pipelines.

Previously published manufactured gas is now summarized with liquefied natural gas, gasified coal, and synthetic gas production. Also, the summaries presented in this table are exclusive of transactions between major pipeline companies in the computation of total pipeline activities to eliminate double counting. See Explanatory Note 9 for discussion of major interstate pipeline companies. Totals may not equal sum of components because of independent rounding.

Source: Form FERC-11.

Sas transported for other companies through the production, or assistant of interest or compressor state.
 Mixture of hydrocarbons existing in gaseous phase or in solution with crude oil in natural underground reservoirs.
 Includes out-of-period adjustments to correct data in prior month.
 Revised Data.
 Not Available.

Includes out-of-period adjustments to correct data in pnor month.

Notes: Previously published manufactured gas is now summarized with liquefied natural gas, gasified coal, and synthetic gas production. Two lines have been added to this table that explicitly differentiate transactions between major and nonmajor pipeline companies. See Explanatory Note 9 for discussion of major interstate pipeline companies. Totals may not equal sum of components because of independent rounding.

[.] Total as of December 31.

Notes: Data for 1985 through 1989 are final. All other data are preliminary unless otherwise noted. See Explanatory Note 7 for discussion of revision policy. Gas in storage at the end of a reporting period may not equal the quantity derived by adding or subtracting net injections or withdrawals during the period to the quantity of gas in storage at the beginning of the period. This is due to changes in the quantities of native gas included in base gas and/or losses in base gas due to migration from storage reservoirs. Totals may not equal sum of components because of independent rounding. Geographic coverage is the 50 States and the District of Columbia.

Sources: Form EIA-191, Form FERC-8, and Form EIA-176.

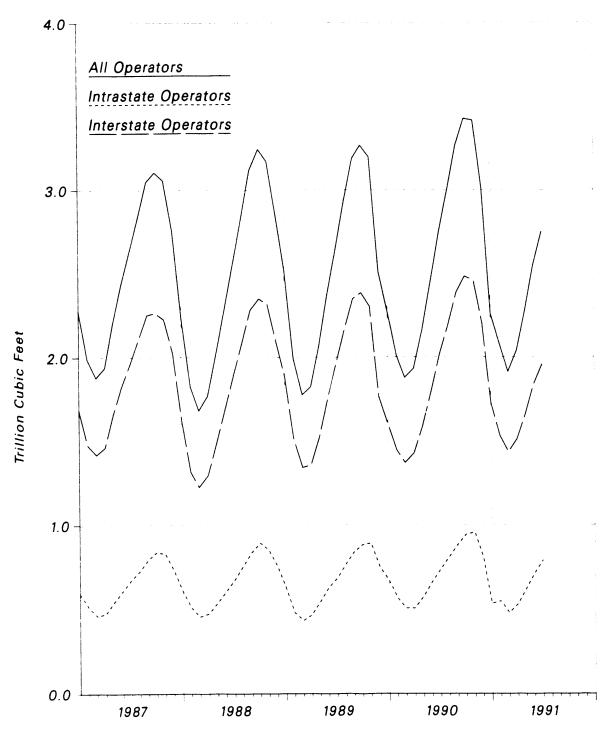

[•] Total underground storage capacity at the end of each calendar Year (in billion cubic feet): 1985 - 8,087; 1986 - 8,145; 1987, 1988, and 1989 - 8,124; and 1990 - 8,125.

e Positive numbers indicate the volume of injections in excess of withdrawals. Negative numbers indicate the volume of withdrawals in excess of injections.

⁼ Revised Data.

^{- =} Not Applicable.

R = Revised Data.

Notes: This table contains total net withdrawals for each State with natural gas storage facilities. Positive numbers indicate the volume of withdrawals in excess of injections. Negative values indicate the volume of injections in excess of withdrawals. All data are preliminary at this time and are not considered final until publication of the *Natural Gas Annual* for that year.

a Positive numbers indicate the volume of injections in excess of withdrawals. Negative numbers indicate the volume of withdrawals in excess of injec-

Notes: Gas in storage at the end of a reporting period may not equal the quantity derived by adding or subtracting net injections or withdrawals during the period to the quantity of gas in storage at the beginning of the period. This is due to changes in the quantities of native gas included in base gas and/or losses in base gas due to migration from storage reservoirs. Totals may not equal sum of components because of independent rounding. Geographic coverage is the 50 States and the District of Columbia.

R = Revised Data.

^{- =} Not Applicable.

Notes: Geographic coverage is the 50 States and the District of Columbia. Prices in this table represent the average price of natural gas by State at the point where the gas transferred from a pipeline to a local distribution company within the State. See Explanatory Note 5 for discussion of computations and revision policy. Source: Form EIA-857.

R = Revised Data.

Notes: Data for 1989 are final. All other data are preliminary unless otherwise indicated. Geographic coverage is the 50 States and the District of Columbia. Average prices for gas delivered to commercial consumers for 1988 forward reflect onsystem sales prices only. See Explanatory Note 5 for discussion of computations and revision policy. See Table 32 for data on onsystem sales expressed as a percentage of both total commercial and total industrial deliveries.

Source: Form EIA-857.

R = Revised Data.

⁼ Not Applicable.

Notes: Data for 1989 are final. All other data are preliminary unless otherwise indicated. Geographic coverage is the 50 States and the District of Columbia. Average prices for gas delivered to commercial consumers for 1988 forward reflect onsystem sales prices only. See Explanatory Note 5 for discussion of computations and revision policy. See Table 32 for data on onsystem sales expressed as a percentage of both total commercial and total industrial deliveries.

Source: Form EIA-857.

Includes all steam electric utility generating plants with a combined capacity of 50 megawatts or greater.

Average prices calculated from data reported on Form EIA-176.
 R = Revised Data.
 Not Applicable.

Notes: Data for 1989 are final. All other data are preliminary unless otherwise indicated. Geographic coverage is the 50 States and the District of Columbia. See Explanatory Note 5 for discussion of computations and revision policy. See Sources: Form FERC-423 and Form EIA-176.

Notes: Volumes of natural gas reported for the commercial and industrial sectors in this publication include data for both sales and deliveries for the account of others. This table shows the percent of the total State volume that represents natural gas sales to the commercial and industrial sectors. This information may be helpful in evaluating commercial and industrial price data which are based on sales data only. See Appendix C, Statistical Considerations, for a discussion of the computation of natural gas prices.

Appendix A

Explanatory Notes

Appendix A

Explanatory Notes

Note 1. Nonhydrocarbon Gases Removed

Annual Data

Data on nonhydrocarbon gases removed from marketed production--carbon dioxide, helium, hydrogen sulfide, and nitrogen--are reported by State agencies on the voluntary Form EIA-627. For 1989, of the 32 producing States, 22 reported data on nonhydrocarbon gases removed. The 22 States accounted for 57 percent of total 1989 gross withdrawals. Of the 22 States reporting nonhydrocarbon gases removed, 11 reported zero values: Alaska, Arizona, Arkansas, Illinois, Indiana, Maryland, Missouri, New York, Oregon, South Dakota, and Virginia. The nine States reporting volumes greater than zero are Alabama, California, Colorado, Florida, Mississippi, New Mexico, North Dakota, Texas, and Wyoming. Two States (Kentucky and Nebraska) reported quantities unknown but considered insignificant. In addition, Kansas, Louisiana, Montana, and Oklahoma, which together accounted for 38 percent of gross withdrawals, did not report nonhydrocarbon gases removed separately. However, their gross withdrawal data excluded all or most of the nonhydrocarbon gases removed on leases. No estimates are made for States not reporting nonhydrocarbon gases removed.

Preliminary Monthly Data

All monthly data are considered preliminary until after publication of the Natural Gas Annual for the year in which the report month falls. Three States report monthly data on nonhydrocarbon gases removed: Alabama, Texas, and Mississippi. Monthly data for California, Colorado, Florida, New Mexico, North Dakota, and Wyoming are estimated based on annual data reported on Form EIA-627. Nonhydrocarbon gases as an annual percentage of gross withdrawals reported by each of the six States is applied to each State's monthly gross withdrawal data to produce an estimate of nonhydrocarbon gases removed.

Final Monthly Data

Monthly data are revised after publication of the Natural Gas Annual by proportionally allocating the differences between annual data reported on the Form EIA-627 and the sum of monthly data (January-December).

Note 2. Supplemental Gaseous Fuels

Annual Data

Annual data are published from Form EIA-176.

Preliminary Monthly Data

All monthly data are considered preliminary until after the publication of the *Natural Gas Annual* for the year in which the report month falls. Monthly estimates are based on the annual ratio of supplemental gaseous fuels to the sum of dry gas production, net imports, and net withdrawals from storage. This ratio is applied to the monthly sum of these three elements to compute a monthly supplemental gaseous fuels figure.

Final Monthly Data

Monthly data are revised after publication of the *Natural Gas Annual*. Final monthly data are estimated based on the revised annual ratio of supplemental gaseous fuels to the sum of dry gas production, net imports, and net withdrawals from storage. This ratio is applied to the revised monthly sum of these three elements to compute final monthly data.

Note 3. Production

Annual Data

Natural gas production data are collected from 32 gasproducing States on Form EIA-627 which includes gross withdrawals, vented and flared, respressuring, nonydrocarbon gases removed, marketed production (wet), and extraction loss. The U.S. Minerals Management Service (MMS)also supplies data on the quantity and value of natural gas production on the Gulf of Mexico and Outer Continental Shelf. No adjustments are made to the data.

Estimated Monthly Data

State marketed production data for a particular month are estimated if data are unavailable at the time of publication. The data are estimated based on an average rate of change between the report month and the prior month over the previous 3 years. The rate-of-change percentage is applied to the data for the month prior to the report month to compute the estimate for the report month in the current year.

Estimates for total U.S. marketed production are based on the application of historical (latest 3 calendar years) month-to-month ratios of daily production rates to the latest preliminary reported monthly production data. State estimates for nonhydrocarbon gas removed, gas used for repressuring, and gas vented and flared are based on the ratio of the latest preliminary reported 3-month average of these categories to marketed production. These ratios are applied to the estimates of marketed production to calculate figures for nonhydrocarbon gases removed, gas used for repressuring, and gas vented and flared. Estimates for gross withdrawal data are the sum of the estimates calculated for nonhydrocarbon gases removed, gas used for repressuring, gas vented and flared, and marketed production.

Preliminary Monthly Data

All monthly data are considered preliminary until after publication of the *Natural Gas Annual* for the year in which the report month falls. Preliminary monthly data are published from reports from the Interstate Oil Compact Commission (IOCC) and the MMS. Volumetric data are converted, as necessary, to a standard 14.73 psia pressure base. Data are revised as Table 7 monthly data are updated.

Final Monthly Data

The differences between each State's annual production data reported on the annual Form EIA-627 and the sum of its monthly IOCC reports (January-December) are allocated proportionally to the monthly IOCC data.

Note 4. Imports and Exports

Annual Data and Final Monthly Data

Annual and final monthly data are published from the annual Form FPC-14, which requires data to be reported by month for the calendar year.

Preliminary Monthly Data - Imports

Preliminary monthly import data are based on data from the National Energy Board of Canada and responses to informal industry contacts and EIA estimates. Preliminary data are revised after the publication of the article "U.S. Imports and Exports of Natural Gas" for the calendar year.

Preliminary Monthly Data - Exports

Preliminary monthly export data are based on historical data from the Form FPC-14, informal industry contacts, and information gathered from natural gas industry trade publications. Preliminary monthly data are revised after publication of "U.S. Imports and Exports of Natural Gas" for the calendar year in which the report month falls.

Note 5. Consumption

All Annual Data

All consumption data except electric utility data are from the Form EIA-857 and Form EIA-176. No adjustments are made to the data. Electric utility data are reported on Form EIA-759.

Monthly Data

All monthly data are considered preliminary until after publication of the *Natural Gas Annual*.

Total Consumption

Preliminary Monthly Data

The most current month estimate is calculated based on the arithmetic average change from the previous month for the previous 3 years. The following month this estimate is revised by summing the components (pipeline fuel, lease and plant fuel, and deliveries to consumers).

Final Monthly Data

Monthly data are revised after publication of the Natural Gas Annual. Final monthly total consumption is obtained by summing its components.

Residential, Commercial, and Industrial Sector Consumption

Preliminary Monthly Data

Preliminary monthly residential, commercial, and industrial data are from Form EIA-857. See Appendix C, "Statistical Considerations," for a detailed explanation of sample selection and estimation procedures.

Price data are representative of prices for gas sold and delivered to residential, commercial, and industrial consumers. These prices do not reflect average prices of natural gas transported to consumers for the account of third parties or "spot-market" prices.

Final Monthly Data

Monthly data are revised after the publication of the *Natural Gas Annual*. Final monthly data are estimated by allocating annual consumption data from the Form EIA-176 to each month in proportion to monthly sales volumes reported in Form EIA-857.

Electric Utility Sector Consumption

All Monthly Data

Monthly data published are from Form EIA-759.

Pipeline Fuel Consumption

Preliminary Monthly Data

Preliminary data are estimated based on the pipeline fuel consumption as an annual percentage of total consumption from the previous year's Form EIA-176. This percentage is applied to each month's total consumption figure to compute the monthly estimate.

Final Monthly Data

Monthly data are revised after the publication of the Natural Gas Annual. Final monthly data are based on the revised annual ratio of pipeline fuel consumption to total consumption from the Form EIA-176. This ratio is applied to each month's revised total consumption figure to compute final monthly pipeline fuel consumption estimates.

Lease and Plant Fuel Consumption

Preliminary Monthly Data

Preliminary monthly data are estimated based on lease and plant fuel consumption as an annual percentage of marketed production (excluding nonhydrocarbon gases). This percentage is applied to each month's marketed production figure to compute estimated lease and plant fuel consumption.

Final Monthly Data

Monthly data are revised after publication of the *Natural Gas Annual*. Final monthly data are based on a revised annual ratio of lease and plant fuel consumption to marketed production (excluding nonhydrocarbon gases) from Form EIA-176. This ratio is applied to each month's revised marketed production figure to compute final monthly lease and plant fuel consumption estimates.

Note 6. Extraction Loss

Annual Data

Extraction loss data are calculated from filings of Form EIA-64A, "Annual Report of the Origin of Natural Gas Liquids Production." For a fuller discussion, see the *Natural Gas Annual 1989*.

Preliminary Monthly Data

Preliminary data are estimated based on extraction loss as an annual percentage of marketed production. This percentage is applied to each month's marketed production to estimate monthly extraction loss.

Final Monthly Data

Monthly data are revised after the publication of the *Natural Gas Annual*. Final monthly data are estimated by allocating annual extraction loss data to each month based on its total natural gas disposition.

Note 7. Natural Gas Storage

Underground Natural Gas Storage

All monthly data concerning underground storage are published from the essentially identical forms, FERC-8 and EIA-191. A new EIA-191 became effective in January 1991. Monthly data are revised after publication of "Underground Natural Gas Storage in the United States" for the heating year (April through March) in which the report month falls. In addition, injection and withdrawal data from the FERC-8/EIA-191 survey are adjusted to correspond to data from Form EIA-176 following publication of the Natural Gas Annual.

Underground and Liquefied Natural Gas Storage

The final monthly and annual storage and withdrawal data for 1985 through 1989 shown in Table 2 include both underground and liquefied natural gas (LNG) storage. Underground storage data are obtained from the FERC-8/EIA-191 and EIA-176 surveys in the manner described earlier. Annual data on LNG additions and withdrawals are taken from Form EIA-176. Monthly data are estimated by computing the ratio of each month's underground storage additions and withdrawals to annual underground storage additions and withdrawals and applying it to annual LNG data.

Note 8. Average Wellhead Value

Annual Data

Form EIA-627 requests State agencies to report the quantity and value of marketed production. When complete data are unavailable, the form instructs the State

agency to report the available value and the quantity of marketed production associated with this value. A number of States reported values of production and associated values for other than marketed production. In addition, information for several States which were unable to provide data was obtained from Form EIA-176. It should be noted that Form EIA-176 reports a fraction of State production. The imputed value of marketed production in each State is calculated by dividing the State's reported value by its associated well-head value. This unit price is then applied to the quantity of the State's marketed production to derive the imputed value of marketed production.

Preliminary Monthly Data

An estimate of the U.S. gas price is made each month based on monthly gas prices from four States: Mississippi, New Mexico, Oklahoma, and Texas.

Final Monthly Data

Preliminary monthly data are revised after the publication of the Natural Gas Annual. The weighted average 12-month prices for Texas, New Mexico, Oklahoma, and Mississippi are compared to the wellhead prices published for each of the four States in the Natural Gas Annual. The ratio derived from this comparison is then applied to each month's estimates for those States, and the monthly data are revised.

Note 9. Financial Data of Major Interstate Pipeline Companies

The prices in Table 4 for imports and purchases from producers, and industrial sales by major interstate pipeline companies, and all data in Tables 12 through 16 are derived from Form FERC-11. Form FERC-11 is filed monthly by the approximately 47 major interstate natural gas pipeline companies. A major pipeline company is defined as one "whose combined sales for resale, and gas transported interstate or stored for a fee exceeded 50 billion cubic feet in the previous calendar year."

Data reported by the major interstate pipeline companies on Form FERC-11 generally reflect the timing of data entry, revision, and/or reclassification of accounts in the companies' accounting records in accordance with the FERC regulations and regulatory filings. Certain data may also be estimated. Consequently, the data reported and shown in Tables 12 through 16 for any given month may include or reflect out-of-period dollar or volume adjustments, restatements or revisions, or account reclassifications. The dollar amounts reported as paid or received and volumes reported as delivered

or received may also include amounts paid, delivered, or received under contractual provisions such as prepayment, take-or-pay, minimum take, or minimum bill provisions. Unless otherwise footnoted, the individual data items, computed averages, and aggregated totals shown include the effect of any and all such adjustments, revisions, estimates, reclassifications, and/or contractual provisions. Average prices are not reported on the Form 11. The averages shown are computed by dividing the total dollars reported for the particular item by the total volume reported for the same item.

Final Monthly Data

Final revisions for the prior year's data are made upon receipt of the December data for the current survey year.

Note 10. Natural Gas Policy Act of 1978

Tables 5 and 8 through 11, in this publication contain data reported by the natural gas industry under Title I of the Natural Gas Policy Act of 1978 (NGPA).

Title I of the NGPA - Wellhead Prices

The NGPA signed into law on November 9, 1978, mandated a new framework for the regulation of most facets of the natural gas industry. Ceiling prices were established for all production of natural gas. For gas produced from both new and old (pre-NGPA) reserves, ceiling prices depend on contract provisions and the characteristics of the well. If a well qualifies under more than one provision in Title I of the NGPA, the highest maximum ceiling price is applicable. Further, all price ceilings are adjusted by a monthly inflation adjustment.

Natural gas dedicated to interstate commerce on or before the November 9, 1978 enactment of the NGPA has as a maximum lawful price the "just and reasonable" rate as established by the Federal Energy Regulatory Commission under Section 104.

The maximum lawful price of natural gas under old intrastate contracts (Section 105) is based on its contract price on November 9, 1978, and is, in general much higher than for comparable old interstate gas. Gas production under Sections 104, 105, and 106 (old contracts that have "rolled over") constitute what is referred to as "old gas."

Almost all development and extension wells begun after February 19, 1977, qualify as new onshore production (Section 103). In order to qualify for new gas sta-

tus under Section 102, an onshore well started after February 19, 1977, must produce from a new reservoir or be at least 2.5 miles from, or 1,000 feet deeper than, a "marker well" (a well producing in commercial quantities any time between January 1, 1970, and April 20, 1977). Offshore gas qualifies for Section 102 if production is from new leases (entered into on or after April 20, 1977) or reservoirs "discovered" on or after July 27, 1976.

Production from wells qualifying under Section 107 is given special treatment as "high-cost gas" and is defined as gas produced:

- from wells started after February 19, 1977, and completed to produce from a depth greater than 15,000 feet
- from geopressured brine
- from coal seams
- from Devonian shale
- under conditions determined by the Federal Energy Regulatory Commission to present extraordinary risks or costs.

On November 1, 1979, gas from the first four categories was deregulated. On August 15, 1980, natural gas produced from tight formations (geologic formation where tight packing of the reservoir rock causes low production rates) was defined as high-cost gas with a ceiling price set at 200 percent of the Section 103 price.

Under the NGPA, producers applying for price classification under Sections 102, 103, 107, or 108 must file Form FERC-121, with the applicable State jurisdictional agency. The forms are then sent to FERC for review. The filings are grouped according to the month received by FERC. Not all submissions contain estimated annual volumes or contract prices. Annual volumes are often estimated by producers prior to actual operations or based on short periods of operation. Price data from Form FERC-121 are not included in this publication, since submission dates vary and prices may have changed subsequent to submission.

On January 1, 1985, the following categories of gas were deregulated pursuant to NGPA Section 121:

- Section 102(c) "new natural gas"
- Section 103(c) "new onshore production wells" which were not committed or dedicated to interstate commerce on April 20, 1977, and which produce gas from a completion location deeper than 5,000 feet.
- Sections 105 and 106(b) "intrastate gas under contracts" where the price paid on December 31, 1984, is higher than \$1.00 per million Btu, provided that such price over \$1.00 was not established by operation of an indefinite escalator clause.

On July 1, 1987, the following category of gas was deregulated pursuant to NGPA Section 121:

• Section 103(b)(2) "new onshore production wells" which were not committed or dedicated to interstate commerce on April 20, 1977, and which produce gas from a completion location less than 5,000 feet deep.

On July 26, 1989, the President signed legislation to remove all remaining natural gas wellhead price controls by 1993.

Note 11. Balancing Item

The "balancing item" category represents the difference between the sum of the components of natural gas supply and the sum of the components of natural gas disposition. These differences may be due to quantities lost or to the effects of data reporting problems. Reporting problems include differences due to the net result of conversions of flow data metered at varying temperatures and pressure bases and converted to a standard temperature and pressure base; the effect of variations in company accounting and billing practices; differences between billing cycles and calendar periods; and imbalances resulting from the merger of data reporting systems, which vary in scope, format, definitions, and type of respondents.

Annual Data

Annual data are from the Natural Gas Annual. For an explanation of the methodology involved in calculating annual "balancing item" data, see the Natural Gas Annual 1989.

Preliminary Monthly Data

Preliminary monthly data in the "balancing item" category are calculated by subtracting dry gas production, withdrawals from storage, supplemental gaseous fuels, and imports from total supply/ disposition.

Final Monthly Data

Final monthly data in the "balancing item" category are calculated by subtracting dry gas production, withdrawals from storage, supplemental gaseous fuels, and imports from total supply/disposition.

Note 12. Purchased Gas Adjustments

The Purchased Gas Adjustment filings for selected interstate pipeline companies have been aggregated to present volume and price data by NGPA category as shown in Table 5. These filings represent over 85 percent of the wellhead purchases subject to the NGPA and dedicated to the interstate market.

Respondents file projections qua terly in an abbreviated format, and one detailed filing per year. The projected volume and price data are used for each month for which the filing is effective.

Appendix B

Data Sources

Appendix B

Data Sources

The data in this publication are taken from survey reports authorized by the U.S. Department of Energy (DOE), Energy Information Administration (EIA) and by the Federal Energy Regulatory Commission (FERC). The EIA is the independent statistical and analytical agency within the DOE. The FERC is an independent regulatory commission within the DOE which has jurisdiction primarily in the regulation of electric utilities and the interstate natural gas industry. The EIA conducts and processes some of the surveys authorized by the FERC.

Data are collected from two annual surveys and five monthly surveys. Filings with the FERC also provide sources of data for this publication.

The annual reports are the Form EIA-176, a mandatory survey of all companies that deliver natural gas to consumers or that transport gas across State lines, and the Form EIA-627, a voluntary survey completed by energy or conservation agencies in the gas-producing States.

The monthly reports include three surveys of the natural gas industry and two surveys of the electric utility industry. The natural gas industry surveys are the Forms FERC-8 and EIA-191 filed by companies that operate underground storage facilities, the Form FERC-11 filed by major interstate natural gas pipeline companies, and the Form EIA-857 filed by a sample of companies that deliver natural gas to consumers. The electric utility industry surveys are the Form EIA-759 filed by all generating electric utilities and the Form FERC-423 filed by fossil fueled plants. Responses to these five monthly surveys are mandatory.

Data in this publication are also taken from two types of reports that are filed with the FERC under its regulatory functions. One filing is the Form FERC-121, filed by natural gas producers who are the first seller of gas that qualified for an incentive price. The other filing is the "Purchased Gas Adjustment," which is filed by interstate pipeline companies to allow them to recover changes in their purchase prices for natural gas above the cost of service reflected in their current filings.

A description of the survey respondents, reporting requirements, and processing and editing of the data is given on the following pages for each of the surveys. Also shown are copies of the EIA and FERC survey forms that are sources of data for this publication.

Form EIA-176, "Annual Report of Natural and Supplemental Gas Supply and Disposition"

Survey Design

The original version of Form EIA-176 was approved in 1980 with a mandatory response requirement. Prior to 1980, published data were based on voluntary responses to Bureau of Mines, U.S. Department of the Interior predecessor Forms BOM-6-1340-A and BOM-6-1341-A of the same title. Beginning with 1990 data, the responses are not considered proprietary.

In 1982, the scope of the revised EIA-176 survey was expanded to collect the number of electric utility consumers in each State, volumes of gas transported to industrial and electric utility consumers, detailed information on volumes transported across State borders by the respondent for others and for the responding company, and detailed information on other disposition. These changes were incorporated to provide more complete survey information with a minimal change in respondent burden. The 1982 revision of the Form EIA-176 continues to be the basis of the current version of this form. On March 4, 1985, the Form EIA-176 was again approved by the Office of Management and Budget for use through report year 1986.

In 1988, the Form EIA-176 was revised to include data collection for deliveries of natural gas to commercial consumers for the account of others. The revised form was approved for use during report years 1987 through 1989. Response to the form continues to be mandatory.

A short version of Form EIA-176 was also approved in 1988. Companies engaged in purchase and delivery activities, but not in transportation and storage

acitivies, may file the short form. Usually, these companies are municipals handling small volumes of gas.

Survey Universe and Response Statistics

The Form EIA-176 is mailed to all identified interstate and intrastate natural gas pipeline companies, investor and municipally owned natural gas distributors, underground natural gas storage operators, synthetic natural gas plant operators, and field, well, or processing plant operators that deliver natural gas directly to consumers (including their own industrial facilities) and/or that transport gas to, across, or from a State border through field or gathering facilities.

Each company and its parent company or subsidiaries were required to file if they met the survey specifications. The original mailing in February 1990 for report year 1989 totaled 2.138 questionnaire packages. To this original mailing, 9 names were added and 2 were deleted as a result of the survey processing. Additions were the result of comparisons of the mailing list to other survey mailing lists. Deletions resulted from post office returns and determinations that companies were out of business, sold, or not within the scope of the survey. After all updates, the survey universe was 2.145 responses from approximately 1,800 companies.

Following the original mailing, second request mailing, and nonrespondents followup, 2,145 responses were entered into the data base, and there were no nonrespondents.

Summary of Form EIA-176 Data Reporting Requirements

The EIA-176 is a multiline schedule for reporting all supplies of natural gas and supplemental gaseous fuels and their disposition within the State indicated. Respondents file completed forms with EIA in Washington, DC. Data for the report year are due by April 1 of the following year. Extensions of the filing deadline for up to 45 days are granted to any respondent on request.

All natural gas and supplemental gaseous fuels volumes are reported on a physical custody basis in thousand cubic feet (Mcf), and dollar values are reported to the nearest whole dollar. All volumes are reported at 14.73 pounds per square inch absolute pressure (psia) and 60 degrees Fahrenheit.

Routine Form EIA-176 Edit Checks

A series of manual and computerized edit checks are used to screen the Form EIA-176. The edits performed include validity, arithmetic, and analytical checks.

The incoming forms are reviewed prior to keying. This prescan determines if the respondent identification (ID) number and the company name and address are correct, if the data on the form appear complete and reasonable, and if the certifying information is complete.

Manual checks on the data are also made. Each form is prescanned to determine that data were reported on the correct lines. The flow of gas through interstate pipelines is checked at the company level to ensure that each delivery from a State is matched with a corresponding receipt in an adjoining State.

After the data are keyed, computer edit procedures are performed. Edit programs verify the report year. State code, and arithmetic totals. Further tests are made to ensure that all necessary data elements are present and that the data are reasonable and internally consistent. The computerized edit system produces error listings with messages for each failed edit test. When problems occur, respondents are contacted by telephone and required to file amended forms with corrected data.

Other EIA Publications Referencing Form EIA-176

Data from Form EIA-176 are also published in the Natural Gas Annual.

Form EIA-176

U.S. DEPARTMENT OF ENERGY ENERGY INFORMATION ADMINISTRATION

Form Approved
OMB No. 19050175
Expires: 12/31/90

ANNUAL REPORT OF NATURAL AND SUPPLEMENTAL GAS SUPPLY AND DISPOSITION, 19

This report is mandatory under the Federal Energy Administration Act of 1974 (Public Law 93-275). Failure to report may result in criminal fines, civil penalities, and other senctions as provided by law. See Section VI of the instructions for confidentiality statement. Public reporting burden for this collection of information is estimated to everage 19.8 hours per response, including the time of reviewing instructions, searching existing data sources, gathering and maintaining the data needed, and completing and reviewing the collection of information. Send comments regarding this burden estimate or any other aspect of this collection of information, including suggestions for reducing this burden, to the Energy information Administration, Office of Statistical Standards E1-73, Mall Station 1H-023 Forrestal, 1000 Independence Ave SW, Washington DC 20585; and to the Office of Information and Regulatory Affairs, Office of Management and Budget, Washington DC 20503.

U.S. DEPARTMENT OF ENERGY ENERGY INFORMATION ADMINISTRATION

Form Approved OMB No. 19050175 Expires: 12/31/90

SHORT

ANNUAL REPORT OF NATURAL AND SUPPLEMENTAL GAS SUPPLY AND DISPOSITION, 19

This report is mandatory under the Federal Energy Administration Act of 1974 (Public Law 93.275). Failure to report may result in criminal fines, civil penalties, and other sanctions as provided by law. See Section VI of the instructions for confidentiality statement. Public reporting burden for this collection of information is estimated to average 2 hours per response, including the time of reviewing instructions, searching existing data sources, gathering and maintaining the data needed, and completing and reviewing the collection of information. Send comments regarding this burden estimate or any other aspect of this collection of information, including suggestions for reducing this burden, to the Energy Information Administration, Office of Statistical Standards El 73. Mail Station 1H-023 Forrestal, 1000 Independence Ave SW, Washington DC 20585, and to the Office of Information and Regulatory Affairs, Office of Management and Budget, Washington DC 20503.

Form EIA-627, "Annual Quantity and Value of Natural Gas Report"

Survey Design

Beginning with 1980, natural gas production data previously obtained on an informal basis from State conservation agencies were collected on Form EIA-627 (Figure D2). This form was designed by EIA to collect annual natural gas production data from the appropriate State agencies under a standard data reporting system within the limits imposed by the diversity of data collection systems of the various producing States. Data are not considered proprietary. It was also designed to avoid duplication, of effort in collecting production and value data by producing States and to avoid an unnecessary respondent burden on gas and oil well operators.

Survey Universe and Response Statistics

Form EIA-627 is mailed to energy or conservation agencies in all 32 natural gas producing States. All producing States participate voluntarily in the EIA-627 survey by filing the completed form or by responding to telephone contacts. For 1989, data on the quantities of nonhydrocarbon gases removed were reported by the appropriate agencies of 22 of the 32 States. These 22 States accounted for 57 percent of total 1989 gross withdrawals. In addition, gross withdrawal data from Kansas, Oklahoma, Louisiana, and Montana, which together accounted for 38 percent of total production, excluded all or most of the nonhydrocarbon gases removed on leases.

Summary of Form EIA-627 Data Reporting Requirements

Form EIA-627 is a multipart form that collects data on the production volume of natural gas (including gross withdrawals from both gas and oil wells); volumes returned to formation for repressuring, pressure maintenance, and cycling; quantities vented and flared; quantities of nonhydrocarbon gases removed; marketed production; the value of marketed production; and the number of producing gas wells.

Respondents are asked to report all volumes in million cubic feet at the State's standard pressure base and at 60 degrees Fahrenheit. All dollar values are reported in thousands.

Routine Form EIA-627 Edit Checks

Each filing of Form EIA-627 is manually checked for reasonableness and mathematical accuracy. Information on the forms is compared to totals of monthly data reported to the Interstate Oil Compact Commission (see Appendix B, "Data Sources"). Volumes are converted, as necessary, to a standard 14.73 psia pressure base. Reasonableness of data is assessed by comparing reported data to the previous year's data. State agencies are contacted by telephone to correct errors. Amended filings or resubmissions are not a requirement, since participation in the survey is voluntary.

Other EIA Publications Referencing Form EIA-627

Data from Form EIA-627 are also published in the EIA publication, *Natural Gas Annual*.

Interstate Oil Compact Commission Form "Monthly Report of Natural Gas Production"

Survey Design

The Interstate Oil Compact Commission (IOCC) is an organization comprised of 32 gas and oil producing States; the Governor of each State sits on the board of the IOCC. The IOCC form, "Monthly Report of Natural Gas Production," (Figure D3) is a voluntary report filed to the IOCC by most of the producing States. The IOCC forwards copies of these forms to the EIA. The purpose of the form is to standardize, to the extent possible, the reporting of natural gas data by the States. Data are not considered proprietary.

Survey Universe and Response Statistics

Most of the 32 States report data to the IOCC. Two exceptions are Florida, which submits its own form, and California, whose data are taken from the Conservation Committee of California Oil Producers publication. Reports on State production are forwarded to the EIA by the IOCC approximately 80 days after the end of the report month.

Form EIA-627 U.S. DEPARTMENT OF ENERGY Energy Information Administration

Form Approved OMB No. 19050175 Expires: 12/31/90

ANNUAL QUANTITY AND VALUE OF NATURAL GAS REPORT

This report is collected under P.L. 93-275, Federal Energy Administration Act of 1974. Your voluntary cooperation and response are urgently needed to provide comprehensive, accurate and timely energy information. Because the data collected on EIA-627 are already aggregated by state, no confidentiality pledges are required.

PART I: IDENTIFICATION DATA		
1. Name of State Reporting	2. Calendar Year Being Reported	
3. Name of Office/Agency		
4. Office Address (Street, City, State, Zip Code)		
5. Name of Contact Person	6. Phone Number of Contact Person	
PART II: NATURAL GAS VOLUMES		
7. Enter the pressure base at which all volumes are reporte	d (psia at 60°F)	
Gross withdrawals should represent full well stream gases, but excluding lease condensate. Also, include	UMES IN MILLIONS OF CUBIC FEET on volumes including all natural gas plant liquids and amounts delivered as royalty payments or consumed IMATE VIHEN GAS IS NOT METERED

Summary of Data Requirements

The IOCC form consists of three questions on one page, and requires volumetric information on gross production, quantities of gas vented or flared, and gas used for repressuring.

Routine Edit Checks

State data are checked for reasonableness and, in the event of problems, the appropriate State agency is called.

EIA-191 Survey, "Underground Natural Gas Storage Report"

Survey Design

Beginning in January 1991, the EIA-191. "Underground Natural Gas Storage Report," was revised. All prior data on the storage of natural gas was collected on a survey jointly implemented in 1975 by the Federal Power Commission (FPC), the Federal Energy Administration (FEA), and the Bureau of Mines (BOM) as the FPC-8/ FEA-G-318 system. The data received on both the FPC-8 and FEA-G-318 were computerized and aggregated by FPC. The new form will collect storage data by country, field, and reservoir of which there are approximately 400 operating reservoirs in the United States. Data are considered proprietary.

At the beginning of 1979, the EIA assumed responsibility for the collection, processing, and publication of the data gathered in the survey. Form FEA-G-318 was renewed on July 1, 1979, as Form EIA-191 and the survey was retitled the FPC-8/EIA-191 Survey (Figure D4 shows the EIA-191). Form FPC-8 was renewed in December 1985 and the survey retitled FERC-8/EIA-191 Survey. The forms were not merged because of FERC's stated desire to maintain the separate identity of the FERC-8 for administrative reasons. FERC jurisdictional firms will continue to file the FERC-8 in addition to the new EIA-191.

Survey Universe and Response Statistics

The same group of 91 companies that operate underground facilities will file the new Form EIA-191. Of these companies, 40 are subject to the jurisdiction of FERC and are required to report data on Form FERC-8.

The response rate as of the filing deadline is approximately 20 percent. Data from the remaining 80 percent of respondents are received in writing and/or by telephone within 3 to 4 days after the filing deadline. All data supplied by telephone are subsequently filed in writing, generally within 15 days of the filing deadline. The final response rate is 100 percent.

Summary of EIA-191 Data Reporting Requirements

The EIA-191 is a multipart form that reports the quantities of gas in storage, injections and withdrawals, and the location (including State and county, field, reservoirs) and capacity of underground storage reservoirs along with peak day send out during the reporting period. Information on co-owners of storage reservoirs is also required.

Collection of the survey is on a custody basis, although some respondent ownership data are required. Information requested must be provided within 10 days after the first day of each month. Twelve reports are required per calendar year. Respondents are required to indicate whether the data reported are actual or estimated. In the case of most estimated filings, the necessary revisions are reflected in subsequent scheduled filings or in a revised submission that provides actual data filed, although there is no specific requirement that the respondent do either. Actual data on natural gas injections and withdrawals from underground storage are based on metered quantities. Data on quantities of gas in storage and on storage capacity represent, in part, reservoir engineering evaluations. All volumes are reported at 14.73 psia and 60 degrees Fahrenheit.

Routine Form EIA-191 Edit Checks

Data received on Form EIA-191 are entered into the survey processing system. The survey's five principal data elements (total, base, and working gas in storage, injections, and withdrawals) receive a preliminary visual edit to eliminate and correct obvious errors or omissions. Respondents are required to refile reports containing any inconsistencies or errors.

Form FERC-11, "Natural Gas Pipeline Company Monthly Statement"

Survey Design

The collection of monthly data from major pipeline companies was begun in December 1964 by the Federal Power Commission (FPC). On October 1, 1977, FPC ceased to exist, and its functions and regulatory responsibilities were transferred to the Secretary of Energy and to the Federal Energy Regulatory Commission (FERC), an independent commission within the Department of Energy.

Information collected on Form FERC-11 (Figure D5) is used by FERC in carrying out its regulatory authority. Form FERC-11 is a monthly regulatory reporting form rather than one filed for statistical purposes. Data are not considered proprietary.

Survey Universe and Response Statistics

Form FERC-11 is filed by major interstate natural gas pipeline companies whose combined sales for resale and gas transported interstate or stored for a fee exceeded 50 billion cubic feet in the previous calendar year. Approximately 40 pipeline companies report data on Form FERC-11. Natural gas pipeline companies are monitored annually to determine whether each has met the requirements for classification as a major pipeline.

Information is collected monthly by mail. Historically, the response rate has been 100 percent.

Summary of Form FERC-11 Data Requirements

Form FERC-11 requires information on revenues, expenses, and sales data, as well as volumetric data on purchases and production.

Submission of Form FERC-11 is required no later than 40 days after the close of the report month. The form requires reporting of both preliminary data for the report month and final data for the same month in the previous year. All data are reported on an equity basis.

Routine Form FERC-11 Edit Checks

Data are collected on standard forms that initially are manually reviewed and coded. Reviews are made to ensure consistency in reporting within and among utilities in the presentation of current and 12-month financial and sales data. Also, receipts and disposition of gas are analyzed between domestic and foreign producers. Data are later sent for keying, which begins the automated processing. Data are keyed to tape or disk for data editing. Edit reports are produced and are reviewed manually.

Other EIA Publications Referencing Form FERC-11

The Energy Information Administration publication Monthly Energy Review contains data from Form FERC-11.

FERC-121, "Application for Determination of the Maximum Lawful Price Under the Natural Gas Policy Act"

Survey Design

Form FERC-121 (Figure D6) was designed by the Federal Energy Regulatory Commission (FERC) to carry out its authority to regulate natural gas prices under the Natural Gas Policy Act. Form FERC-121 is initially filed with the agency having jurisdiction over the lease on the land where the well is drilled, for example, State agencies or the Department of Interior. The agencies determine whether or not to grant the application. The application, support documentation, and decision are forwarded to FERC, which has 45 days to review the decision. Data are not considered proprietary.

Survey Universe and Response Statistics

Form FERC-121 must be filed by any natural gas producer who is the first seller of gas that qualifies for an incentive price. At the end of February 1988, FERC had 408,363 applications from 12,000 producers on file. Of the total applications, approximately 20 percent are reapplications requesting new price determinations on wells that have been producing under a previous application.

FERC FORM NO. 11 (REVISED 12-84)

18

Summary of Form FERC-121 Data Reporting Requirements

Form FERC-121 requires information on the location and API number of the well, the name and address of the applicant, the type of determination being sought, the estimated annual production, and the contract price.

In addition to Form FERC-121, each application must be submitted with support documentation; for example, a well completion report for Section 103 filings, and geological information on surrounding wells for Section 102 applications.

Routine Form FERC-121 Edit Checks

Upon receipt at FERC, forms are checked manually for completeness. In addition, a computerized edit program flags incomplete or incorrect data.

Purchased Gas Adjustment Filings

The purpose of the PGA is to allow interstate natural gas pipeline companies to recover changes in their purchase prices for natural gas above the cost of service reflected in their current tariff filings. To allow recov-

ery in a timely manner, the key data reported in the PGA are projections of purchases in the immediate future. In most cases, companies report both the NGPA Section number covering each contracted purchase and the date of the contract. These data make the PGA filings a unique source of information about the current state of the natural gas market. Data are not considered proprietary.

Description of Data

Fifty-eight interstate pipeline companies submit PGA filings. Pipeline companies that transport only intrastate supplies of natural gas do not submit filings, nor do companies that have no purchased gas adjustment clauses in their tariffs.

All PGA filings include projected purchases for a defined future period by NGPA category. Projected volumes and prices represent the company's best estimate of natural gas purchase volumes and costs during the subsequent effective tariff period. The figures are usually derived from those of similar past periods. Annual PGA filings also include "actual" volumes and prices for some past period. The two sets of figures cannot, in general, be used to check each other because the actual figures can cover periods other than past projections. To the extent that the two sets of figures can be compared, they appear to approximate but not to match each other.

APPLICATION FOR DETERMINATION OF THE MAXIMUM LAWFUL PRICE UNDER THE NATURAL GAS POLICY ACT (NGPA) (Sections 102, 103, 107 and 108)

GENERAL INSTRUCTIONS

Complete this form if you are applying for price classification under sections 102, 103, 107 or 108 of the NGPA

Complete each appropriate item on the reverse side of this page. The code numbers used in items 4 and 6 can be obtained from the Buyer/Seller Code Book. If there is more than one purchaser or contract, identify the additional information in the space below. Also enter any additional remarks in the space below. The data reported on this form are not considered to be confidential and will not be treated as such.

Submit the completed application to the appropriate Jurisdictional Agency as listed in title 18 of the CFR, part 274 501. If there are any questions, call (202) 357-8585.

FERC-121 (8-82)

Only projected figures for volumes and costs have been used. They are considered more generally useful and accurate than the reports of actual production for the following reasons:

- Companies file actual reports largely as a convenience to themselves. The data are not generally subjected to the same scrutiny as projections.
 Moreover, pipeline companies have considerable latitude as to which time they use in reporting actual figures.
- The costs reported as actual costs are costs derived from previous projections.
- As a general rule, neither projected nor actual volumes are audited. In the absence of such an audit, it is thought that actual volumes may be as subject to error as the projections.

The PGA filings contain a rough indication of the error due to using projections in the form of the surcharge adjustment. The surcharge adjustment is used to recover purchase costs beyond those expected or to repay costs below those expected. The surcharge adjustment cannot be applied directly to PGA filings because:

- It contains only a summary figure for all differences from projected levels. This includes costs of pipeline purchases and imports.
- No volumes are directly reported. A cost per thousand cubic feet figure is reported but is based on projected future purchases only.
- It covers time periods different from previous projections. Normally, the surcharge adjustment covers a period from 9 to 3 months prior to the beginning of a new projection period.

The PGA filings remain the only source of information for analyzing gas categories, however, and the data problems do not appear to be crippling for purposes of drawing general conclusions.

Interpretation of Data. The projected purchase cost for each contract volume represents the pipeline company's estimates of the purchase costs it will incur during the coverage period of the filing. These costs include:

- The average price to be paid to the producer
- · Gathering charges
- Transportation charges
- Taxes.

Royalty payments and payments for gas not received under take-or-pay clauses are among the costs not included.

Projected volumes reported in the PGA filings are generally based on actual volumes for a similar preceding period (though they are typically adjusted to fit current market conditions). A number of projected gas purchases reported in the PGA filings have not been considered because they would have resulted in significant double counting. They are:

- Purchases from other pipelines
- Imports
- Exchange gas.

In addition, cost-of-service gas (a company's own production from specific leaseholds of pre-NGPA gas) is not considered because it is not covered by the NGPA and because most companies do not include it in their PGA filings.

The table included in this publication is therefore designed to cover a specific part of the overall national gas market: wellhead purchases that are both subject to the NGPA and dedicated to the interstate market.

Form FPC-14, "Annual Report for Importers and Exporters of Natural Gas"

Survey Design

The collection of data covering natural gas imports and exports was begun in 1973 by the Federal Power Commission (FPC). On October 1977, FPC ceased to exist and its data collection functions were transferred to the Federal Energy Regulatory Commission (FERC) within the Department of Energy (DOE). Since 1979, the Energy Information Administration (EIA) has had the responsibility for collecting Form FPC-14. Data are not considered proprietary.

Survey Universe and Response Statistics

The Form FPC-14 is filed annually by each organization or individual having authorization to import and export natural gas regardless of whether any imports or exports took place during the reporting year. The authorization to import and export was originally granted by the FPC. In 1977, it was transerred to the Economic Regulatory Commission (ERA) and it now resides with the Office of Fuels Programs in the Office of Fossil Energy. In 1989, 205 companies met the reporting criteria, only 76 reported import or export of natural gas.

The respondent list for the Form FPC-14 is updated at the beginning of each year. All new respondents with authorization to import or export natural gas are added to the list and respondents whose licenses have expirted are deleted. Five copies of Form FPC-14 are mailed in February to all companies authorized to im-

port or export natural gas. The completed original and three copies are to be filed with the EIA on or before March 31 of each year, for the preceding calendar year. Companies that have not filed by March 31 are contacted.

Routine Form FPC-14 Edit Checks

Respondents are required to certify the accuracy of all data reported. The survey forms are checked at the EIA for responableness and accuracy. If errors are found the companies are required to file corrected data. The data are processed at the EIA and published as reported. All natural gas volumes in this report are expressed at a pressure base of 14.73 pounds per square inch absolute and temperature of 60 degrees Fahrenheit, except as noted. All prices are in U.S. dollars and import/export prices are those paid at the U.S. border (except exports of LNG are those prices paid at the point of sale and delivery in Yokohama, Japan).

"Quarterly Natural Gas Import and Export Sales and Price Report"

This report is prepared quarterly by the Office of Fuels Programs in the Office of Fossil Energy based on information submitted by all firms having authorization to import or export natural gas. All data on this report is considered preliminary until the annual data on the Form FPC-14 is final, usually in September of the following year.

Form ElA-857, "Monthly Report of Natural Gas Purchases and Deliveries to Consumers"

Survey Design

The original Form EIA-857 was approved for use in December 1984. Response to the Form EIA-857 is mandatory on a monthly basis. Data collected on the Form EIA-857 cover the 50 States and the District of Columbia and include both price and volume data. Data are considered proprietary.

Survey Universe and Response Statistics

A sample of 389 natural gas companies including interstate pipelines, intrastate pipelines, and local distribution companies report to the survey. The sample was selected independently for each of the 50 States and the District of Columbia. Each selected company is required to complete and file the Form EIA-857 on a monthly basis. Initial response statistics on a monthly basis are as follows: responses received by due date, approximately 90 percent, and responses received after follow-up, 100 percent.

The Form EIA-857 is a monthly sample survey of natural gas marketers, including interstate pipelines, intrastate pipelines, and local distribution companies. It provides data that are used to estimate monthly sales of natural gas (volume and price) by State and monthly deliveries of natural gas on behalf of others (volume) by State to three consumer sectors - residential, commercial, and industrial. (Monthly deliveries and prices of natural gas to electric utilities are reported on the Form FERC-423, "Monthly Report of Cost and Quality of Fuels for Electric Plants," and the Form EIA-759, "Monthly Power Plant Report.")

See Appendix C for a discussion of the sample design and estimation procedures.

Summary of Form EIA-857 Data Reporting Requirements

Data collected monthly on the Form EIA-857 on a State level include the volume and cost of purchased gas, the volume and cost of natural gas consumed by sector (residential, commercial, and industrial), and the average heat content of all gas consumed. Respondents file completed forms with EIA in Washington, DC on or before the 30th day after the end of the report month.

All natural gas volumes are reported in thousand cubic feet at 14.73 psia at 60 degrees Fahrenheit and dollar values are reported to the nearest whole dollar.

Routine Form EIA-857 Edit Checks

A series of manual and computerized edit checks are used to screen the Form EIA-857. The edits performed include validity and analytical checks.

FEDERAL ENERGY REGULATORY COMMISSION

Washington D.C. 20426

ANNUAL REPORT FOR IMPORTERS AND EXPORTERS OF NATURAL GAS

Poza Approved Q& Hamber: Expiration Date

1902-0027

GENERAL INSTRUCTIONS

- The completed original and 3 conformed copies of this report shall be filed with the Federal Energy Regulatory Commission, Washington, D.C. 20426 on or before March 31, of each year, for the preceding calendar year
- 2. The report will be filed by each person having authorization to import or export natural gas.
- 3. Use a separate schedule for each authorization, if one authorization involves more than one import or export point, a separate schedule must be filed for each point
- 4. All volumes reported in Mcf will be at 14.73 Psia and 60°F
- 5. Where transactions are based primarily on volumetric measurement, weighted average Btu data should be used to estimate total monthly Btu's.
- 6. Amounts paid or received and cost or receipts shall be reported in U.S. Dollars.
- 7. DEFINITIONS. Transporter-the party or parties, other than buyer or seller, owning the facilities by which gas or LNG is physically transferred between buyer and seller, Costs-all expenses incurred by importer up to the U.S. name of delivery for the reported quantity imported. Receipts all revenues received by exporter for the reported

quantity exported

MONTHLY REPORT OF NATURAL GAS PURCHASES AND DELIVERIES TO CONSUMERS

This report is mandatory under the Federal Energy Administration Act of 1974 (Public Law 275). Failure to report may result in criminal times, civil penalties, and other sanctions as provided by law. See section VL of the instructions for the confidentiality scatement. Public reporting burden for this collection of information is estimated to average 4 hours per response, including time of reviewing instructions, searching existing data sources, gathering and maintaining the data needed, and completing and reviewing the collection of information. Statistical Considerations

Appendix C

Statistical Considerations

The monthly sales (volume and price) and monthly deliveries (volume) of natural gas to residential, commercial and industrial consumers presented in this report by State are estimated from data reported on the Form EIA-857, "Monthly Report of Natural Gas Purchases and Deliveries to Consumers." (See Appendix B for a description of this Form.) These estimations must be made from the reported data since the Form EIA-857 is a sample survey. A description of the sample design and the estimation procedures is given below.

Sample Design

The Form EIA-857 is a monthly sample survey of companies delivering natural gas to consumers. It includes interstate pipeline companies, intrastate pipeline companies, producers, and local distribution companies. The survey provides data that are used each month to estimate the volume and price for onsystem sales of natural gas by State and the volume of natural gas delivered for the account of others, by State, to three consumer sectors--residential, commercial, and industrial. Monthly deliveries and prices of natural gas to electric utilities are reported on the Form EIA-759, "Monthly Power Plant Report," and the Form FERC-423, "Monthly Report of Costs and Quality of Fuels for Electric Plants."

Sample Universe. The sample currently in use was selected from a universe of 1,730 companies. These companies were respondents to the Form EIA-176, "Annual Report of Natural and Supplemental Gas Supply and Disposition," for reporting year 1989 who reported sales or deliveries to consumers in the residential, commercial or industrial sectors. (See Appendix B for a description of the Form EIA-176.)

Sampling Plan. The goal was a sample that would provide estimates of monthly natural gas consumption by the three consuming sectors within each State and the District of Columbia. A stratified sample using a single stage and systematic selection with probability proportional to size was designed. The measure of size was the volume of natural gas physically delivered in the

State to the three consuming sectors by the company in 1989. There were two strata--companies selected with certainty and companies selected under the systematic probability proportional to size design.

Initial calculations showed that a 25 percent sample of companies would yield reasonably accurate estimates. The sample was selected independently in each State, resulting in a national total of 392 respondent-companies. After adjustment for previously unrecorded mergers and acquisitions occuring since 1989 and reported as a result of the initial mail-out, the sample contains a national total of 389 respondent companies.

Certainty Stratum. Since estimates were needed for each of the 50 States and the District of Columbia, the strata were established independently within each State. In 16 States and the District of Columbia where sampling was not feasible due to small numbers of companies and/or small volumes of gas deliveries, all companies were selected. The 16 States were: Alaska. Connecticut, Delaware, Hawaii, Idaho, Maine, North Dakota, New Hampshire, New Jersey, Nevada, Oregon, Rhode Island, South Dakota, Utah, Vermont, and Washington.

For each of the remaining States, the total volumes of industrial sales and deliveries and of the combined residential/commercial sales and deliveries were determined. Companies with gas sales/deliveries to the industrial sector or to the combined residential/commercial sector above a certain level were selected with certainty. Since a few large companies often account for most of the natural gas delivered within a State, this ensures those companies' inclusion in the sample. The formula for determining certainty was applied independently in the two consumer sectors—the industrial and the combined residential/commercial. These selected companies, together with the companies in the jurisdictions discussed where sampling was not feasible, formed the certainty stratum.

All companies with gas sales/deliveries in sector j greater than the cut-off value (C_j) were included in the certainty stratum. The formula for C_j was:

$$C_{j} = \frac{X_{j}}{2n} \tag{1}$$

where:

 C_{ij} = cutoff value for consumer sector j.

n = target sample size to be selected for the State, 25 percent of the companies in the State,

 X_{ij} = the annual volume of gas sales/deliveries by company i to customers in consumer sector j.

 X_{i} = the sum within State of annual gas volumes for company i.

 X_{ij} = the sum within State of annual gas volumes in consumer sector j.

 X_{\perp} = the sum within State of annual gas volumes in all consumer sectors.

Noncertainty Stratum. All other companies formed the noncertainty stratum. They were systematically sampled with probability proportional to size. The measure of size for each company was the total volume of gas sales to all consumer sectors (X_t) . The number of companies to be selected from the noncertainty stratum was calculated for each State, with a minimum of 2.

The formula for selecting the number of noncertainty stratum companies was:

$$m = n \frac{X2}{X} \tag{2}$$

where:

m = the sample size for the noncertainty stratum within a State,

X2 = the sum within State of the X_i for all companies in the noncertainty stratum.

Companies were listed in ascending order according to their measure of size and then a cumulative measure of size in the stratum was calculated for each company. The cumulative measure of size was the sum of the measures of size for that company and all preceding companies on the list. An interval of width I for selecting the companies systematically was calculated using ($I = \frac{X^2}{m}$). A uniform random number R was selected between zero and I. The first sampled company was the first company on the list to have a cumulative measure of size greater than R. The second company selected was the first company on the list to have a cumulative measure of size greater than R + I, R + I was increased again by I to determine the third company to be selected. This procedure was repeated until the entire sample was drawn.

Subgroups. In eight States, the noncertainty stratum was divided into subgroups to ensure that gas in each consumer sector could be estimated. The systematic sample with probability proportional to size design described above was applied independently in each subgroup. The methods for determining the subgroup sample size and calculating the subgroup interval for sample selection were the same as the methods described above for the noncertainty stratum, except that X2 was the sum within State of the X_L for only those companies in the subgroup.

These subgroups were defined only for the purpose of sample selection. They are:

Illinois and West Virginia: companies handling any industrial gas and all other companies.

California, Kansas, and Louisiana: companies handling only industrial gas and all other companies.

Texas: companies handling only residential/commercial gas, companies handling only industrial gas, and all other companies (three subgroups).

Arkansas: companies handling 1 billion cubic feet or more of gas and companies handling less than 1 billion cubic feet of gas.

New York: companies handling 8 million cubic feet or more of gas and companies handling less than 8 million cubic feet of gas.

Estimation Procedures

Estimates of Volumes. A ratio estimator is applied to the volumes reported in each State by the sampled companies to estimate the total gas sales and deliveries for the State. Ratio estimators are calculated for each consumer—sector--residential, commercial, and industrial--in each State where companies are sampled. The following annual data are taken from the most recent 1989 submissions of Form EIA-176:

The formula for calculating the ratio estimator (E_{vj}) for the volume of gas in consumer sector j is:

$$E_{ij} = \frac{Y_{,j}}{Y_{,j}'} \tag{3}$$

where:

 Y_{ij} = the sum within State of annual gas volumes in consumer sector j for all companies,

 Y'_{j} = the sum within State of annual gas volumes in consumer sector j for those companies in the sample.

$$V_i = y_i + E_{vi} \tag{4}$$

where:

 V_j = the State estimate of monthly gas volumes in consumer sector j.

 y_j = the sum within State of reported monthly gas volumes in consumer sector j.

Estimates of Revenues. State revenues are estimated from monthly data reported by the sample companies in the same way as the volumes are estimated. Ratio estimators are calculated for each consumer sector based on annual sales revenue in each State where companies are sampled. The estimated revenues are subsequently used to calculate average prices.

The formula for calculating the ratio estimator for residential gas sales revenues in consumer sector j is:

$$E_{rj} = \frac{Z_{.j}}{Z_{.j}'}.$$

where:

 Z_{ij} = the sum within State of annual gas sales revenues in consumer sector j.

 $Z'_{.j}$ = the sum within State of annual gas sales revenues for those companies in the sample in consumer sector i.

The ratio estimator is applied as follows:

$$R_j = z_{.j} \times E_j$$

where:

 R_j = the monthly estimated revenue for gas sales in consumer sector j.

 z_j = the sum within State of reported monthly gas sales revenues in consumer sector j.

Computation of Natural Gas Prices. The natural gas volumes that are included in the computation of prices represent only those volumes associated with natural gas sales.

The average price of natural gas is calculated as follows:

$$P_{j}=\frac{R_{j}}{V_{j}}.$$

where:

 P_j = the average price of gas sales within a State in consumer sector j.

 V_j = the estimate of gas sales within a State in consumer sector j.

All average prices are weighted by their corresponding sales volume estimates when national average prices are computed.

The monthly average prices of natural gas are based on sales data only. Volumes of gas delivered for the account of others to these consumer sectors are not included in the State or national average prices.

Table 33 shows the percent of the total State volume that represents volumes from natural gas sales to the commercial and industrial sectors. This table may be helpful in evaluating commercial and industrial price data. Virtually all natural gas deliveries to the residential sector represent onsystem sales volumes only.

Estimation for Nonrespondents. A volume for each consumer category is imputed for companies that fail to respond. The imputation is based on the previous month's value reported by the non-responding company and the change from the previous month to the current month in volumes reported by other companies in the State. The imputed volumes are included in the State totals. To estimate prices for non-respondents, the unit price (dollars per thousand cubic feet) reported by the company in the previous month is used.

The formula for imputing volumes of gas sales for nonrespondents was:

$$F_t = F_{t-1} \times \frac{y_{,jt}}{y_{,j}t-1}$$
 (5)

where:

 F_t = imputed gas volume for current month t,

 F_{t-1} = gas volume for the company for the previous month.

 $y_{,jt}$ = gas volume reported by companies in the State stratum for report month t,

 $y_j t - 1 = \text{gas volume}$ in the previous month for companies in the State stratum that reported in month t.

Final Revisions

Adjusting Monthly Data to Annual Data. After the annual data reported on the Form EIA-176 have been submitted, edited, and prepared for publication in the Natural Gas Annual, revisions are made to monthly data. The revisions are made to the volumes and prices of natural gas delivered to consumers that have appeared in the Natural Gas Monthly to match them to the annual values appearing in the Natural Gas Annual. The revised monthly estimates allocate the difference between the sum of monthly estimates and the annual reports according to the distribution of the estimated values across the months.

Before the final revisions are made, changes or additions to submitted data received after publication of the monthly estimate and not sufficiently large to require a revision to be published in the *Natural Gas Monthly*, are used to derive an updated estimate of monthly consumption and revenues for each State's residential, commercial, or industrial natural gas consumption.

For each State, two numbers are revised, the estimated consumption and the estimated price per thousand cubic feet.

The formula for revising the estimated consumption is:

$$V_{jm}^{\bullet} = V_{jm} + \left[(V_{ja} - V'_{jm}) (\frac{V_{jm}}{V'_{jm}}) \right]$$
 (6)

where:

 V_{jm}^* = the final volume estimate for month m in consumer sector j,

 V_{jm} = the estimated volume for month m in consumer sector j,

 V_{ja} = the volume for the year reported on Form EIA-176,

 V'_{jm} = The annual sum of estimated monthly volumes.

The price is calculated as described above in the Estimation Procedures section, using the final revised consumption estimate and a revised revenue estimate.

The formula for revising the estimated revenue is:

$$R_{jm}^{\bullet} = R_{jm} + \left[(R_{ja} - R'_{jm})(\frac{R_{jm}}{R'_{jm}}) \right]$$
 (7)

where:

 R_{jm}^* = the final revenue estimate for month m in consumer sector j,

 R_{jm} = the estimated revenue for month m in consumer sector j,

 R_{ja} = the revenue for the year reported on Form EIA-176,

 R'_{jm} = The annual sum of estimated monthly revenues.

Revision of Volumes and Prices for Deliveries to Electric Utilities. Revisions to monthly electric utilities data are published throughout the year as they become available.

Reliability of Monthly Data

The monthly data published in this report are subject to two sources of error - nonsampling error and sampling error. Nonsampling errors occur in the collection and processing of the data. See the discussion of the Form EIA-857 in Appendix B for a description of nonsampling errors for monthly data.

Sampling error may be defined as the difference between the results obtained from a sample and the results that a complete enumeration would provide. The standard error statistic is a measurement of sampling error.

Standard Errors. A standard error of an estimate is a statistical measure that indicates how the estimate from the sample compares to the result from a complete enumeration. Standard errors are calculated based on statistical theory that refers to all possible samples of the same size and design.

The standard errors for monthly natural gas volume estimates by State are given in Table C2. Ninety-five percent of the time, the volume that would have been obtained from a complete enumeration will lie in the range between the estimated volume minus two standard errors and the estimated volume plus two standard errors.

Source: Energy Information Administration, Form EIA-857, "Monthly Report of Natural Gas Purchases and Deliveries to Consumers."

The standard error of the natural gas volume estimate is the square root of the variance of the estimate. The formula for calculating the variance of the volume estimate is.

$$V(\hat{Y}) = \sum_{h=1}^{H} \left[N_h^2 \frac{(1 - \frac{n_h}{N_h})}{n_h(n_h - 1)} (\sum_{i=1}^{L-1} (v_i - Tx_i)^2) \right]$$
(8)

where:

H = the total number of strata

 N_h = the total number of companies in stratum h

 n_h = the sample size in stratum h

 y_i = the reported monthly volume for company i

 x_i = the reported annual volume for company i

T = the ratio of the sum of the reported monthly volumes for sample companies to the sum of the reported annual volumes for the sample companies.

NGM Feature Articles

January 1989

Main Line Natural Gas Sales by Interstate Pipeline Companies, 1987

(Describes and analyzes direct sales to end users by interstate pipeline companies and SIC codes.)

Summary of An Examination of Domestic Gas Resource Estimates

(Provides an overview of the various natural gas resource estimates currently in use.)

May 1989

The Outlook for Natural Gas Supply in the 1990's

(Discusses recent conditions in the oil and gas producing industry.)

June 1989

Domestic Natural Gas Reserves and Production Dedicated to Interstate Pipeline Companies, 1988

(Provides preliminary data on natural gas reserves and production dedicated to the interstate market.)

August 1989

U.S. Natural Gas Imports and Exports - 1988

(Contains final 1988 data on all U.S. imports and exports of natural gas.)

September 1989

Natural Gas Production in the Post-NGPA Decade

(Presents data on the production of natural gas by categories defined under the Natural Gas Policy Act of 1978 (NGPA).)

November 1989

Natural Gas Wellhead Decontrol Act of 1989

(Describes the categories of natural gas most affected by the decontrol provisions and provides market data for these categories and the overall markets during the 1980's.)

March 1990

The Developing Natural Gas Futures Market and Its Potential Impact on Domestic Natural Gas Markets

(Discusses futures markets vs. physicals markets, which include spot markets.)

April 1990

The Outlook for Natural Gas

(Discusses projections of natural gas markets through the year 2010.)

May 1990

Domestic Natural Gas Reserves and Production Dedicated to Interstate Pipeline Companies, 1989

(Provides preliminary data on natural gas reserves and production dedicated to the interstate market.)

June 1990

U.S. Natural Gas Imports and Exports - 1989

(Contains final 1989 data on all U.S. imports and exports of natural gas.)

July 1990

Resurgence in Natural Gas Wellhead Productivity

(Explores the factors that contributed to the recent increases in natural gas wellhead production.)

October 1990

Update on U.S. Coalbed Methane Production

(Presents estimates of annual coalbed methane production through 1988 by basin and field.)

January 1991

Take-or-Pay Settlements

(Presents information on the resolutions of the takeor-pay issue.)

February 1991

Recent Trends and Regional Variability in Underground Storage Activities

(Discusses underground storage in the expansion of end-use markets.)

March 1991

Natural Gas Transportation Services: An Update

(Reassesses transportation market activities by examining data through 1989 for major interstate pipeline companies.)

April 1991

An Overview of Recent Developments in the Underground Storage Market

(Reviews the changing market for underground natural gas storage services in the United States.)

May 1991

Analysis of Long-Term Contracts for Imports of Canadian Natural Gas

(Focuses on the contractual provisions that will govern imports of natural gas from Canada through the 1990's and beyond.)

June 1991

Natural Gas Productive Capacity for the Lower 48 States, 1980 through 1991

(Summarizes the full report and contrasts the findings for two major producing regions: Texas and the Gulf of Mexico Outer Continental Shelf.)

July 1991

The Outlook for Natural Gas 1991

(Focuses upon the natural gas supply and market aspects of the forecasts contained in the *Annual Outlook* for Oil and Gas 1991.)

August 1991

U.S. Natural Gas Imports and Exports - 1990

(Contains final 1990 data on all U.S. imports and exports of natural gas.)

Glossary

Balancing Item: Represents the difference between the sum of the components of natural gas supply and the sum of the components of natural gas disposition. These differences may be due to quantities lost or to the effects of data reporting problems. Reporting problems include differences due to the net result of conversions of flow data metered at varying temperature and pressure bases and converted to a standard temperature and pressure base; the effect of variations in company accounting and billing practices; differences between billing cycle and calendar period time frames; and imbalances resulting from the merger of data reporting systems which vary in scope, format, definitions, and type of respondents.

Base (Cushion) Gas: The volume of gas needed as a permanent inventory to maintain adequate underground storage reservoir pressures and deliverability rates throughout the withdrawal season. All native gas is included in the base gas volume.

British Thermal Unit (Btu): The heat required to raise the termperature of one pound of water by one degree Fahrenheit at or near 39.2 degrees Fahrenheit.

City-gate: A point or measuring station at which a gas distribution company receives gas from a pipeline company or transmission system.

Commercial Consumption: Gas used by nonmanufacturing organizations such as hotels, restaurants, retail stores, laundries, and other service enterprises, and gas used by local. State, and Federal agencies engaged in nonmanufacturing activities.

Depletion: The loss in service value incurred in connection with the exhaustion of the natural gas reserves in the course of service.

Depreciation: The loss in service value not restored by current maintenance, incurred in connection with the consumption or respective retirement of a gas

plant in the course of service from causes that are known to be in current operation and against which the utility is not protected by insurance; for example, wear and tear, decay, obsolescence, changes in demand and requirements of public authorities, and the exhaustion of natural resources.

Dry Natural Gas Production: Marketed production less extraction loss.

Electric Utility Consumption: Gas used as fuel in electric utility plants.

Exports: Natural gas deliveries out of the Continental United States (including Alaska) to foreign countries.

Extraction Loss: The reduction in volume of natural gas resulting from the removal of natural gas liquid constituents at natural gas processing plants.

Flared: The volume of gas burned in flares on the base site or at gas processing plants.

Gross Withdrawals: Full well stream volume, including all natural gas plant liquid and nonhydrocarbon gases, but excluding lease condensate. Also includes amounts delivered as royalty payments or consumed in field operations.

Hinshaw Pipeline: A pipeline or local distribution company that has received exemption, (by Section 1 (c) of the Natural Gas Act), from regulations pursuant to the Natural Gas Act. These companies transport interstate natural gas not subject to regulations under NGA.

Imports: Natural gas received in the Continental United States (including Alaska) from a foreign country.

Independent Producers: Any person who is engaged in the production or gathering of natural gas and who sells natural gas in interstate commerce for resale but who is not engaged in the transportation of natural gas (other than gathering) by pipeline in interstate commerce.

Industrial Consumption: Natural gas used by manufacturing and mining establishments for heat, power, and chemical feedstock.

Interstate Companies: Natural gas pipeline companies subject to FERC jurisdiction.

Intransit Deliveries: Redeliveries to a foreign country of foreign gas received for transportation across U.S. territory and deliveries of U.S. gas to a foreign country for transportation across its territory and redelivery to the United States.

Intransit Receipts: Receipts of foreign gas for transportation across U.S. territory and redelivery to a foreign country and redeliveries to the United States of U.S. gas transported across foreign territory.

Intrastate Companies: Companies not subject to FERC jurisdiction.

Lease and Plant Fuel: Natural gas used in well, field, lease operations and as fuel in natural gas processing plants.

Liquefied Natural Gas (LNG): Natural gas that has been liquefied by reducing its temperature to minus 260 degrees Fahrenheit at atmospheric pressure.

Major Interstate Pipeline Company: A company whose combined sales for resale, and gas transported interstate or stored for a fee, exceeded 50 million thousand cubic feet in the previous year.

Marketed Production: Gross withdrawals less gas used for repressuring, quantities vented and flared, and nonhydrocarbon gases removed in treating or processing operations. Includes all quantities of gas used in field and processing operations. See Explanatory Note 1 for discussion of coverage of data concerning nonhydrocarbon gases removed.

Native Gas: Gas in place at the time that a reservoir was converted to use as an underground storage reservoir as in contrast to injected gas volumes.

Natural Gas: A mixture of hydrocarbon compounds and small quantities of various nonhydrocarbons existing in the gaseous phase or solution with oil in natural underground reservoirs at reservoir conditions.

Natural Gas Policy Act of 1978 (NGPA): Signed into law on November 9, 1978, the NGPA is a framework for the regulation of most facets of the natural gas industry. See Explanatory Note 10 for a full discussion.

Nonhydrocarbon Gases: Typical nonhydrocarbon gases that may be present in reservoir natural gas are carbon dioxide, helium, hydrogen sulfide, and nitrogen.

Onsystem Sales: Sales to customers where the delivery point is a point on, or directly interconnected with, a transportation, storage, and/or distribution system operated by the reporting company.

Pipeline Fuel: Gas consumed in the operation of pipelines, primarily in compressors.

Repressuring: The injection of gas into oil or gas formations to effect greater ultimate recovery.

Residential Consumption: Gas used in private dwellings, including apartments, for heating, cooking, water heating, and other household uses.

Storage Additions: The volume of gas injected or otherwise added to underground natural gas or liquefied natural gas storage during the applicable reporting period.

Storage Withdrawals: Total volume of gas withdrawn from underground storage or liquefied natural gas storage during the applicable reporting period.

Supplemental Gaseous Fuels Supplies: Synthetic natural gas, propane-air, refinery gas, biomass gas, air injected for stabilization of heating content, and manufactured gas commingled and distributed with natural gas.

Synthetic Natural Gas (SNG): A manufactured product chemically similar in most respects to natural gas, that results from the conversion or reforming of petroleum hydorcarbons and may easily be substituted for or interchanged with pipeline quality natural gas.

Therm: One-hundred thousand British thermal units.

Underground Gas Storage Reservoir Capacity: Interstate company reservoir capacities are those certificated by FERC. Independent producer and intrastate company reservoir capacities are reported as developed capacity.

Vented Gas: Gas released into the air on the base site or at processing plants.

Wellhead Price: Represents the wellhead sales price, including charges for natural gas plant liquids subsequently removed from the gas, gathering and compression charges, and State production, severance, and/or similar charges.

Working (Top Storage) Gas: The volume of gas in an underground storage reservoir above the designed level of the base. It may or may not be completely withdrawn during any particular withdrawal season. Conditions permitting, the total working capacity could be used more than once during any season.
