INTRODUCTION

GEOTHERM, a computerized information system now off-line, was used to maintain data on the geology, geochemistry and hydrology of geothermal sites primarily within the United States. The system was proposed at the First Geothermal Implementation Conference in New Zealand in 1974 (Swanson, 1977) and was active until 1983. The primary mission was to provide a broad informational framework for the Geothermal Research Program (Duffield and Guffanti, 1981). GEOTHERM was used to support national geothermal assessments--in 1978 (Muffler, 1979) and 1982 (Reed, 1983). It was however a public system and provided data to both public and private sectors. A detailed discussion on databases in GEOTHERM and a general scheme of how the information system operated can be found in Bliss and Rapport (1983).

This report on Texas is one of a series intended to preserve the data collected for GEOTHERM and make the data available to the public. States with significant geochemical data for geothermal fluids will be covered in individual reports such as this. A report will also be issued to cover miscellaneous data collected for sites in the central and eastern United States. The data presented in this series is also available as a data file on the internationally-available General Electric Mark III service, a timeshare network. Those interested in accessing that system should contact the Energy Resource Center, University of Oklahoma, Norman, Oklahoma 73070. It is anticipated that a portion of the data will also be available on magnetic tape from the National Technical Information Service, U. S. Department of Commerce, Springfield, VA 22161. It will not be available until after the completion of the open-file series.

GEOTHERM INDEXES

Two computer-generated indexes are found in appendices A, and B of this report. The indexes give one line summaries of each GEOTHERM record in the sample file for Texas. Each index is sorted by different variables to assist the user in locating geothermal records describing specific sites.

Appendix A (p. 380-400) is sorted by the county name and the name of the source. Also given are latitude, longitude (in decimal minutes), well depth, GEOTHERM record identifier, and temperature (°C). The well depth is the total depth drilled and need not necessarily indicate the depth of the producing horizon. In conducting a search of Appendix A, site names are quite useful for locating springs or wells for which a specific name is commonly used, but sites which do not have specific names are more difficult to locate. In the case of Texas, names of wells give the name of the driller/operator, followed by the owner or lessor (city, etc.) In some cases, the descriptive text found as part of the site name and the site coordinates should be used to assist in determining location.

Appendix B (p. 401-423) is first sorted into one-degree blocks by latitude, and longitude, and then by name of source. Adjacent one-degree blocks which are published as a 1:250,000 map are combined under the appropriate map name. Since degrees of longitude include figures below and above 100 degrees, the the sort order may will be confusing. Therefore, the order of the two-degree sheet names is also given below:

1) Brownsville	12) San Antonio	23) Palestine
2) McAllen	13) Sonora	24) Waco
3) Corpus Christi	14) Ft. Stockton	25) Brownwood
4) Laredo	15) Marfa	26) Big Spring
5) Beeville	16) Lake Charles	27) Hobbs
6) Crystal City	17) Beaumont	28) Tyler
7) Del Rio	18) Austin	29) Dallas
8) Emory Peak	19) Llano	30) Abilene
9) Presidio	20) Pecos	31) Texarkana
10) Houston	21) Van Horn	32) Sherman
11) Seguin	22) El Paso	33) Plainview
		34) Amarillo

Also given are GEOTHERM record identifier, and temperature (°C). Records missing items used for sorting will be listed first. Numbers with a blank in the same position as zero will be given first.

GEOTHERM SAMPLE FILE

GEOTHERM sample file contains 1121 records for Texas (Table 1). Most of the data was a late addition to GEOTHERM and was not subject to extensive review and correction. Records may be present which are duplicates. About 97% of the records describe wells. A record may contain data on location, sample description, analysis type (water, condensate, or gas), collection condition, flow rates, and the chemical and physical properties of the fluid. Stable and radioactive isotopic data are occasionally available. Some records may contain only location and temperature. When sufficient chemical data was available, the charge balance (percentage of difference in anion- and cation-milliequivalents) was computed and added to the record. Many of the numeric fields in the sample file can be directly qualified. The qualifier code precedes the number when appropriate. The codes and their meaning are given in Table 1.

Each thermal spring or well usually is represented by several records. This may document temporal changes in the geothermal fluids. Judgement on what constituted acceptable data was extremely complicated and the primary attempt was to insure that each GEOTHERM record faithfully reproduced the published data. On occasion, glaring inconsistencies or data clearly of poor quality were excluded. Regrettably, no database can be constructed or supported without the introduction of errors. The user, therefore, is advised to check with the published literature whenever possible. Users should carefully and critically evaluate the records they use.

This compilation should identify all locations as potential sources of geothermal fluids in Texas available as of December, 1981. However, no claim is made for completeness, and published sources have probably been missed. About 27% of the records in this list contains information which was unpublished at the time of data entry. A critically evaluated and corrected list of over 2000 records for the United States was extracted from the sample file and issued as a reference document for the national low-temperature geothermal resource assessment (Reed and others, 1983). However, most of the data for Texas were added to GEOTHERM after completion of the assessment and have not been subject to critical review. Be forewarned that some records will not met some users criteria as geothermal springs or wells. A list of geothermal springs by Berry and others (1980) may be helpful to some users.

GEOTHERM BIBLIOGRAPHY

A bibliography is given in Appendix C (p. 424-431). The abbreviated form of the reference (called code) is identified as the record source in the full record list and is used to sort the entries in this appendix. Codes with a leading "*" identify records based on information which was unpublished at the time the record was prepared.

ACKNOWLEDGMENTS

Contributions and support to GEOTHERM have been made by many in both federal and state agencies. This includes the U.S. Department of Energy (and associated contractors), and U.S. National Oceanic and Atmospheric Administration. Data-entry forms for sites in Texas were prepared by the staff of the U.S. Geological Survey. The Texas Bureau of Economic Geology, University of Texas at Austin provided a magnetic tape with 98% of the records given in this report.

TABLE 1

State of Texas: computer-generated listing of records describing geothermal-fluid samples. [A few records may be for cold springs or wells--this was to provide ground-water references for some studies.]

ORGANIZATION: Records are sorted by county and then by the name of the spring or well. Order is the same in Appendix A.

QUALIFICATION CODES: All numeric attributes may be qualified. The codes and their meaning:

L = less than

G = greater than

E = estimated

T = trace (no numeric value reported)

N = not detected (not followed by number)

Q = qualified (other data in qualification field)

R = midpoint of range (actual range in qualification field)

REFERENCE: An expanded citation of the reference is found in Appendix C. The abbreviated form used in this table is called "CODE" in the appendix. Unpublished sources are preceded with "*".

APPENDIX B

Index to GEOTHERM sample file for the state of Texas sorted into one-degree blocks by latitude and longitude. Records are sorted by name of source within each one-degree block. Adjacent one-degree blocks which are published as a 1:250,000 map are combined under the appropriate map name. See page Table 1 for explanation of alphabetic qualifiers preceding temperature. I.D. - GEOTHERM record identifier
Temp. - temperature °C.
