DOE EPIDEMIOLOGIC RESEARCH PROGRAM

SELECTED BIBLIOGRAPHY

U.S. Department of Energy
Office of Epidemiology and Health Surveillance
Washington, D.C. 20545

PREPARED BY THE HEALTH COMMUNICATION AND COORDINATION DIVISION

JANUARY 1991

MASTER

DISTRIBUTION OF THIS DOCUMENT IS UNLIMITED

FOREWORD TO THE SECOND EDITION

The objective of the Department of Energy (DOE) Epidemiologic Research Program is to determine the human health effects resulting from the generation and use of energy, and from the operation of DOE facilities.

The program has been divided into seven general areas of activity: the Radiation Effects Research Foundation (RERF) which supports studies of survivors of the atomic weapons in Hiroshima and Nagasaki, mortality and morbidity studies of DOE workers, studies on internally deposited alpha emitters, medical/histologic studies, studies on the genetic aspects of radiation damage, community health surveillance studies, and the development of computational techniques and of databases to make the results as widely useful as possible.

Excluding the extensive literature from the RERF, the program has produced 380 publications in scientific journals, contributing significantly to improving the understanding of the health effects of ionizing radiation exposure. In addition, a large number of public presentations were made and are documented elsewhere in published proceedings or in books.

The purpose of this bibliography is to present a guide to the research results obtained by scientists supported by the program. The bibliography, which includes doctoral theses, is classified by national laboratory and by year. Multi-authored studies are indicated only once, according to the main supporting laboratory.

Robert Goldsmith, Ph.D.
Acting Director
Office of Epidemiology and
Health Surveillance
