LIQUID METAL FAST BREEDER REACTORS

A Bibliography

ABOUT THE TECHNICAL INFORMATION CENTER

The Technical Information Center, as the national information center for the Department of Energy, manages, publishes, and disseminates scientific, technical, and practical energy information acquired from worldwide sources. It builds and maintains energy information data bases used to prepare abstracting journals, bibliographies, and literature searches. The data bases are also searchable via the Department's on-line retrieval system, DOE/RECON. This information is provided to DOE program offices; contractors; scientists; engineers; educational, commercial, and industrial communities; and the general public. The Technical Information Center conducts an active announcement and marketing program. It establishes policy and administers control of a DOE-publications inventory and registry. TIC also develops and evaluates new and effective information systems and services as required by scientific and technical management within the Department of Energy.

About This Bibliography

The Liquid Metal Fast Breeder Reactor (LMFBR) has been under development for more than 30 years as a potential source of electric power production. Since breeder reactors utilize uranium 60 to 70 times more efficiently than light water reactors, they can extend the use of available uranium resources for centuries. Breeders are viewed by many as essential to ensure that nuclear fission will remain a long-term energy source and to reduce dependence on dwindling supplies of fossil fuels. The large number of publications on LMFBR technology attests to the importance placed on its potential for commercial power production.

This bibliography includes 5465 selected citations on LMFBR development. The citations were compiled from the DOE Energy Data Base covering the period January 1978 (EDB File No. 78R1087) through August 1980 (EDB File No. 80C79142). The references are to reports from the Department of Energy and its contractors, reports from other government or private organizations, and journal articles, books, conference papers, and monographs from U.S. originators. These citations and hundreds of additional citations on this subject are available for on-line searching and retrieval from the Technical Information Center's Energy Data Base using the DOE/RECON interactive system.

Report citations are arranged alphanumerically by report number; nonreport literature citations are arranged chronologically. Corporate, Personal Author, Subject, and Report Number Indexes are provided.

ABSTRACTS

The principal elements of abstract entries for a typical research and development report and a typical technical journal article are illustrated below.

	Report number	Title	Availability
Date of publication	Author(s)	Contract number	
1187	(TID-27639)	Gamma heated subassembly for sodium boiling experiments.	Artus, S.C. (Washington Univ., Seattle (USA)). 1975. Contract EY-76-S-05-3363. 79p. Dep. NTIS, PC A05/MF A01.

Thesis.

The design of a system to boil sodium in an LMFBR is examined. This design should be regarded as a first step in a series of boiling experiments. The reactor chosen for the design of the boiling apparatus is the Experimental Breeder Reactor-II (EBR-II), located at the National Reactor Testing Station in Idaho. Criteria broadly classified as design objectives and design requirements are discussed.

	Date of publication	Author(s)	Title	Journal citation
13569		Braun, C.	Perceptions of risks and timing in breeder development decisions.	(Electr. Power Res. Inst., Palo Alto, Calif.). <i>Am. Soc. Mech. Eng., [Pap.]</i> : No. 79-JPGC-NE-4, 1-13 (1979).

This paper considers the role of the breeder from an electric utility point of view. FBRs will be required as a capacity option, in order to maintain flexibility in the choice of the future generation mix. The uncertainties in electric demand growth rate and the availability of other power technologies indicate that foreclosing the breeder option now would not represent a prudent generation planning policy. Three conclusions are evident: There exists a need now to proceed with a well focused breeder R&D program, so that this technology is available when required. The upside risk of not having the FBR option ready on time far outweighs the downside risk of accelerated rather than reduced FBR development effort. Even with active pursuit of the FBR program, there exists sufficient time to develop and improve the institutional arrangements required to safeguard this electric generation option. 20 refs.

INDEXES

Four indexes are provided for approaching the contents of this bibliography. Each index is preceded by an introduction that details the organization of the index and the principles by which it was compiled. The reader is referred to these introductions for information not found in the index examples that follow.

•Corporate Index

Technical report literature is indexed using the name of the organization or institution responsible for the issuance of the report.

The first report cited above is indexed as:

Washington Univ., Seattle (USA)

Gamma heated subassembly for sodium boiling experiments. 1187 (TID 27639)

•Author Index

Each author's name is indexed in the form appearing on the document abstracted, with the exception that given names are reduced to initials:

Arnold, C. Jr., Preliminary evaluation of organics as coolants for LMFBR spent-fuel shipping, 1663

Artus, S.C., Gamma heated subassembly for sodium boiling experiments, 1187 (TID- 27639)

Arwas, E.B., See Smalley, A J , 964

•Subject Index

The subject index consisting of entries naming specific materials, objects, and processes is arranged alphabetically. Document titles, informative phrases, or both specific to these entries are arranged alphabetically under the entries.

EBR-2 REACTOR/REACTOR CORES

Observation of a 12-Hz effect in the upper plenum of EBR-II, 1330

EBR-2 REACTOR/REACTOR EXPERIMENTAL FACILITIES

Gamma heated subassembly for sodium boiling experiments, 1187 (TID-27639)

Physics design of an EBR-II fast-transient facility, 1594

EBR-2 REACTOR/REACTOR INSTRUMENTATION

Preliminary results of the upper-plenum acoustic experiment at EBR-II, 1635

•Report Number Index

Technical report literature is also indexed using report numbers. This index includes information on where individual reports may be obtained. Patents and conference papers are indexed here as a matter of convenience.

ABSTRACTS

- 1 (AD-A--047410) SWELLING AND ALLOY STABILITY OF POTENTIAL FAST-BREEDER-REACTOR STRUCTURAL ALLOYS IRRADIATED IN NRL EXPERIMENT H-5. INTERIM REPORT. Reed, J.R.; Smidt, F.A. Jr. (Naval Research Lab., Washington, DC (USA)). 15 Sep 1977. Contract AT(49-5)-2110. 24p. (NRL--8130). NTIS PC A02/MF A01.
Seven commercial alloys of potential interest for fast-breeder-reactor structural alloys have been irradiated in the EBR-II to a fluence of 1.6×10^{22} n/sq cm, $E > 0.1$ MeV, at 455 C (850 F) and subsequently examined and analyzed using transmission electron microscopy. Irradiated were Inconel 718, Incoloy 800, Inconel 600, Inconel 625, PE-16, Sandvik 12R72HV, and Inconel 744. The experiment was designed to examine the alloy stability during irradiation and to measure swelling resistance. Inconel 718 and PE-16 exhibited the best swelling resistance, and Sandvik 12R72HV and Incoloy 800 had the poorest resistance to swelling. Inconel 744, an experimental superplastic alloy with a duplex microstructure, exhibited one of the highest swelling rates known for the austenite phase but showed no swelling for the ferrite phase. Inconel 625, Inconel 600, and Incoloy 800 showed extensive precipitation of phases not present prior to irradiation.

- 2 (AED-Conf--77-498-087) FUEL CYCLES OF D_2O -FAST BREEDER AND HIGH TEMPERATURE REACTORS. Zech, H.J. (Kernforschungszentrum Karlsruhe (Germany, F.R.). Abt. fuer Angewandte Systemanalyse). (International Atomic Energy Agency, Vienna (Austria)). 1977. 28p. (CONF-7709147--50). Dep. NTIS (US Sales Only), PC A03/MF A01.
From Meeting on construction and operation management of a nuclear power plant; Karlsruhe, F.R. Germany (5 Sep 1977).
Heavy water reactors (e.g. CANDU, MZFR) show marked differences in fuelling compared to the common LWR-types. So do HTGR and FBR. This lecture summarizes the main features of these differences, and discusses their consequences. The emphasis is on heavy water reactors for power production. This survey is intended to convey general background information on fuelling, to recollect material of previous courses, and to indicate new developments in this field.

- 6 (AEEW-M--1471) WATER MODELLING STUDIES OF THE HYDRODYNAMIC CHARACTERISTICS OF IMPERMEABLE BLOCKAGES IN AN 11-PIN GEOMETRY. Robinson, D.P.; Smith, R.A.K. (UKAEA Reactor Group, Winfrith. Atomic Energy Establishment). Mar 1977. 49p. Dep. NTIS (US Sales Only), PC A03/MF A01.
A linear array of 11 pins, representing a radial slice through a 325 pin bundle, has been used to investigate the flow distribution caused by an impermeable local blockage in water. The wake geometry, which was visualised by the injection of air, is shown to be controlled by the channel flowrate and the presence of grids downstream of the blockage. From a comparison between the 11 pin results and previous investigations, the length of the wake, non-dimensionalised by a suitable blockage length scale, is shown to be consistent with measurements made with edge blockages in gridded geometries. SABRE 1 predictions, in which the 11-pin geometry is represented by a 23 subchannel model, are in excellent agreement with the measured wake lengths.

- 7 (AEEW-M--1484) WATER MODELLING STUDIES OF BLOCKAGE WITH DISCRETE PERMEABILITIES IN AN 11 PIN GEOMETRY. Robinson, D.P. (UKAEA Reactor Group, Winfrith. Atomic Energy Establishment). Jun 1977. 43p. Dep. NTIS (US Sales Only), PC A03/MF A01.

A linear array of 11 pins, representing a radial section through a 325 pin bundle, has been used to investigate the effect of discrete permeabilities on the wake geometry behind a local blockage in water. Three series of experiments were performed in each of which a different position of the permeability was considered. The complex wake geometries, visualised by the injection of air, are shown to be controlled by the position of, and flowrate through the permeability. Good agreement is shown between the experimental flow patterns and predictions by SABRE 1.

- 8 (AEEW-R--1140) TRANSMISSION OF SOUND WAVES THROUGH WATER IN A PFR SUBASSEMBLY WRAPPER. Antonopoulos Domis, M.; Butterfield, M.H. (UKAEA Atomic Energy Establishment, Winfrith). Mar 1978. 18p. Dep. NTIS (US Sales Only), PC A02/MF A01.

A theoretical model is developed which analyses the reduction of the velocity of longitudinal waves in flexible tubes of arbitrary cross section. The model is in good agreement with an experiment involving a PFR subassembly wrapper immersed in a water tank.

- 9 (AEEW-R--1168) ACOUSTIC RESONANCES AS A MEANS OF BLOCKAGE DETECTION IN SODIUM-COOLED FAST REACTORS. Domis, M.A. (Brussels Univ. (Belgium)). Mar 1978. 50p. Dep. NTIS (US Sales Only), PC A03/MF A01.

A system is described which gives early warning of the presence and build up of a local blockage in sodium cooled fast reactor sub-assemblies. The method uses acoustic resonances and reports on the analysis of signals recorded during special experiments on the Dounreay Fast Reactor. These tests proved the detectability of the standing waves and showed theoretical predictions of their frequency and shift in the presence of a blockage to be in good agreement with measurements.

- 10 (AEEW-R--1183) ZERO-POWER BAISS OF FAST REACTOR DOSIMETRY. Sanders, J.E. (UKAEA Atomic Energy Establishment, Winfrith). Jun 1978. 18p. Dep. NTIS (US Sales Only), PC A02/MF A01.

Predictions of reaction rates, atomic displacements, and gamma-ray energy deposition in the prototype Fast Reactor are based on cross-section data and calculation methods validated against the results of zero-power experiments. The paper reviews work in Zebra relevant to this dosimetry, including neutron spectrometry, power mapping, foil activations within core heterogeneities, and measurements with thermoluminescent detectors. Comparisons of experiment and calculation are discussed in relation to the accuracies required to meet materials testing objectives.

- 11 (AERE-M--2992) BEHAVIOR OF DISSOLVED FISSION GASES PRIOR TO TRANSIENT TESTING OF FUEL PINS. Wood, M.H.; Matthews, J.R. (UKAEA Atomic Energy Research Establishment, Harwell). Oct 1978. 16p. Dep. NTIS (US Sales Only), PC A02/MF A01.

Work performed under United States--UKAEA Fast Reactor Exchange Program.

The TREAT and CABRI series of reactor safety experiments on irradiated fuel require the

transfer of fuel pins from the reactor in which the fuel has achieved some burn-up to the test facility. Subsequently, the fuel is restored to power in the test facility for some time before transient heating is initiated. Such pre-test maneuvers, where the fuel is subjected to changes in the fission rate and temperature, may have important consequences for the fission gas behavior during the transient experiment. The results of rate theory calculations are used to assess these effects.

- 12 (AERE-R--8020) CONTINUOUS METHOD OF DETERMINING THE THERMODYNAMIC ACTIVITY OF CARBON IN SODIUM. Asher, R.C.; Kirstein, T.B.A.; Tolchard, A.C. (UKAEA Research Group, Harwell. Atomic Energy Research Establishment). Jan 1977. 12p. Dep. NTIS (US Sales Only), PC A02/MF A01.

The Harwell Carbon Meter (HCM) provides a continuous indication of the thermodynamic carbon activity in liquid sodium. This information is important with respect to the carburization and decarburization of steel components of the sodium circuits of sodium cooled Fast Reactors. A description of the HCM is given. It has been shown to respond rapidly to changes in carbon activity, to give an output which is in satisfactory agreement with spot calibrations using nickel 'tabs' and to operate reliably without failure for long periods.

- 13 (AERE-TP--692) BEHAVIOUR OF MATERIALS IN FAST REACTORS. Matthews, J.R. (UKAEA Atomic Energy Research Establishment, Harwell). Dec 1976. 46p. Dep. NTIS (US Sales Only), PC A03/MF A01.

Fast neutron damage in fast reactors can limit the life of structural components through the growth of voids. The main features of the current theory of point defect production and condensation are surveyed. The role of metallurgical structures and radiation produced extended defects is outlined and used to demonstrate the development of volume swelling and radiation hardening. Mechanisms of radiation creep are described in the context of the preceding treatment of point defect behavior. Finally future trends in the field are briefly explored.

- 14 (AERE-TP--719) ANALYSIS OF CRACK PATTERNS IN FAST REACTOR FUEL PELLETS. Guha, R.M.; Head, J.L.; Matthews, J.R. (Imperial Coll. of Science and Technology, London (UK). Dept. of Mechanical Engineering; UKAEA Atomic Energy Research Establishment, Harwell). [nd]. 26p. Dep. NTIS (US Sales Only), PC A03/MF A01.

Two dimensional (r-theta) finite element analysis is used to calculate the thermal stress in complete fast reactor fuel pellets, completely cracked pellet segments and partially cracked pellet segments. The residual stress levels are used to assess whether further cracking is probable and linear-elastic fracture mechanics used to study crack propagation. The results of the analyses show that propagation of cracks with a circumferential component becomes increasingly probable as the pellet cracks into segments with smaller angles. By making simplifying assumptions for the degree of relaxation of stress and crack healing in pellets after prolonged irradiation, the number and orientation of cooling cracks is predicted. Included are cross sections of irradiated hollow and solid fuel pellets, subjected to different rating levels.

- 15 (AERE-TP--782) MODELLING THE TRANSIENT BEHAVIOUR OF FISSION GAS. Matthews, J.R.; Wood, M.H. (UKAEA Atomic Energy Research Establishment, Harwell). Feb 1979. 31p. Dep. NTIS (US Sales Only), PC A03/MF A01.

Work performed under United States-UKAEA Fast Reactor Exchange Program.

To gain an understanding of the behavior of fuel during hypothetical accident situations rapid heating experiments are in progress in pulsed reactors such as TREAT and in out-of-pile facilities. The role of the fission gases is particularly important in such accident situations and it is their behavior which is investigated. The behavior of intragranular gas during transient situations is discussed. A simple model is constructed of this which accounts for bubble movement in a temperature gradient, bubble growth through the capture of single gas atoms and coalescence among the bubble population, and the non-equilibrium character of the bubbles. The release of gas to the grain boundaries and intragranular swelling is determined. The model has been incorporated into the fuel behavior code, FRUMP, and has been applied both to out-of-pile heating experiments and the in-pile TREAT test H3.

- 16 (AERE-TP--793) COMPARISON OF EXPERIMENT AND NEFIG MODEL CALCULATIONS OF TRANSIENT FISSION GAS BEHAVIOR. Wood, M.H.; Matthews, J.R.; Matthews, H.R. (UKAEA Atomic Energy Research Establishment, Harwell). Jun 1979. 29p. Dep. NTIS (US Sales Only), PC A03/MF A01.

Work performed under United States-UKAEA Fast Reactor Exchange Program.

Calculations have been performed, using the NEFIG model of transient gas behavior, of rapid external heating experiments performed on pre-irradiated mixed oxide fuel. The calculations predict fission gas release, intragranular bubble sizes and swelling in good agreement with experiment.

- 17 (AERE-TP--796) FAST REACTOR FUEL PIN BEHAVIOUR MODELLING IN THE UK. Matthews, J.R.; Hughes, H. (UKAEA Atomic Energy Research Establishment, Harwell). May 1979. 23p. Dep. NTIS, PC A02/MF A01.

Work performed under United States-UKAEA Fast Reactor Exchange Program.

Two fuel behavior codes have been applied extensively to fast reactor problems; SLEUTH developed at Springfields Nuclear Laboratory and FRUMP at AERE Harwell. Other UKAEA Establishments and those of the CEGB have contributed work which has been important in model development. The codes themselves are available for use by the various organizations concerned with fast reactors.

- 18 (AI-DOE--13208) SODIUM TECHNOLOGY AND COVER GAS SEAL DEVELOPMENT PROGRAMS. QUARTERLY TECHNICAL PROGRESS REPORT, JULY--SEPTEMBER 1977. (Atoms International Div., Canoga Park, CA (USA)). 10 Nov 1977. Contract EY-76-C-03-0824. 64p. AT.

Progress is summarized in studies related to LMFBR-FFTF cover gas seals development and testing and in sodium removal and decontamination of LMFBR components. (DG)

- 19 (AI-DOE--13209) FAST REACTOR FLUENCE DOSIMETRY. TECHNICAL PROGRESS REPORT, JUNE--DECEMBER 1977. (Atoms International Div., Canoga Park, CA (USA)). 31 Mar 1978. Contract EY-76-C-03-0824-027. 30p. Dep. NTIS, PC A03/MF A01.

The objectives of this task are to develop and demonstrate the use of ^{10}B and ^6Li helium accumulation fluence monitors (HAFM's) as a reliable and accurate method of measuring reactor neutron fluence, develop and apply an expanded set of HAFM's that will provide fluence responses in different but overlapping neutron energy ranges, and identify, through the precise measurement of spectrum-integrated helium production cross sections, those elements producing significant helium when used individually or as components of advanced alloys in FTR and breeder reactor neutron environments, so that their use might be eliminated, minimized, or controlled.

- 20 (AI-DOE--13210) LMFBR SAFETY PROGRAM. ANNUAL TECHNICAL PROGRESS REPORT. GOVERNMENT FISCAL YEAR, 1977. (Atoms International Div., Canoga Park, CA (USA)). 15 Dec 1977. Contract EY-76-C-03-0824-010. 40p. Dep. NTIS, PC A03/MF A01.

Information is presented concerning the development of the SOMIX-1 computer code for sodium drop burning analysis; experimental analysis of burning sodium drops; aerosol leakage from containment buildings; high-temperature-concentration aerosols; aerosol source term from vaporized fuel; properties of high-temperature fuel mixtures; and development of the COMRADEX computer code for analysis of radiological doses in the environment from LMFBR accidents.

- 21 (AI-DOE--13211) SODIUM-TO-GAS LEAK DETECTION. ANNUAL TECHNICAL PROGRESS REPORT, GOVERNMENT FISCAL YEAR 1977. (Atoms International Div., Canoga Park, CA (USA)). 18 Nov 1977. Contract EY-76-C-03-0824-012. 12p. AT.

The objectives of the program are to: (1) demonstrate the sensitivity, reliability and operability of liquid metal-to-gas leak detection instrumentation, and (2) provide information that can be used to establish criteria to guide the design of detection systems for use in LMFBR plants. During the report period, this project continued to provide data that are of use to the Clinch River Breeder Reactor Plant (CRBRP), Fast flux Test Facility (FFTF) and the American Society of Mechanical Engineers (ASME) working group on inservice inspection. These data were derived from: (1) small insulated pipe (test chamber atmosphere natural circulation) sodium leak tests, and (2) long-term performance tests of aerosol detectors at EBR-II. Preparations were made for tests to verify the performance of selected aerosol detectors in simulated LMFBR environments. Testing was postponed in deference to urgent experimental efforts essential to FFTF leak detection system design.

- 22 (AI-DOE--13212) LMFBR FLEXIBLE PIPE JOINT DEVELOPMENT PROGRAM. ANNUAL TECHNICAL PROGRESS REPORT, GOVERNMENT FISCAL YEAR 1977. (Atoms International Div., Canoga Park, CA (USA)). 15 Feb 1978. Contract EY-76-C-03-0824-019. 131p. Dep. NTIS, PC A07/MF A01.

Currently, the ASME Boiler and Pressure Vessel Code does not allow the use of flexible pipe joints (bellows) in Section III, Class 1 reactor primary piping systems. Studies have shown that the primary piping loops of LMFBR's could be simplified by using these joints. This simplification translates directly into shorter primary piping runs and reduced costs for the primary piping system. Further cost savings result through reduced vault sizes and reduced containment building diameter. In addition, the use of flexible joints localizes the motions

from thermally-induced piping growth into components which are specifically designed to accommodate this motion. This reduces the stress levels in the piping system and its components. It is thus economically and structurally important that flexible piping joints be available to the LMFBR designer. The overall objective of the Flexible Joint Program is to provide this availability. This will be accomplished through the development of ASME rules which allow the appropriate use of such joints in Section III, Class 1 piping systems and through the development and demonstration of construction methods which satisfy these rules. The rule development includes analytic and testing methodology formulations which will be supported by subscale bellows testing. The construction development and demonstration encompass the design, fabrication, and in-sodium testing of prototypical LMFBR plant-size flexible pipe joints which meet all ASME rule requirements. The satisfactory completion of these developmental goals will result in an approved flexible pipe joint design for the LMFBR. Progress is summarized in the following efforts undertaken during 1977 to accomplish these goals: (1) code case support, (2) engineering and design, (3) material development, (4) testing, and (5) manufacturing development.

- 23 (AI-DOE--13214) HIGH-TEMPERATURE PIPING DESIGN TECHNOLOGY. QUARTERLY TECHNICAL PROGRESS REPORT, JULY--SEPTEMBER 1977. Jetter, R.L.; Naugle, F.V. (Atomics International Div., Canoga Park, CA (USA)). 14 Dec 1977. Contract EY-76-C-03-0824-021. 49p. Dep. NTIS, PC A03/MF A01.

Progress is reported in the following LMFBR piping design studies: collection of sodium piping failure data, analysis of piping systems with prior successful operating history, evaluation of sensitivity of piping design margins to variability in materials and geometry, and high-cycle fatigue behavior at elevated temperature.

- 24 (AI-DOE--13216) EVALUATIONS OF THE PIPING SYSTEM INELASTIC ANALYSIS COMPUTER PROGRAM PIRAX2. Rodabaugh, E.C. (Atomics International Div., Canoga Park, CA (USA)). 24 Oct 1977. Contract EY-76-C-03-0824. 75p. Dep. NTIS, PC A04/MF A01.

The report contains two sets of comparisons of inelastic test data with PIRAX2-theory; i.e., ORNL beam tests and ORNL elbow tests. The purpose of these comparisons is to evaluate the accuracy of the simplified analytical techniques used in PIRAX2. The test data are on structures that are much simpler than piping systems but provide a fundamental basis for comparison. The report includes an analysis of a 3-anchor piping system to illustrate the relative simplicity of PIRAX2 input/output data and relatively small computer running time. Some areas of needed improvements in PIRAX2 are discussed.

- 25 (AI-DOE--13218) DECONTAMINATION OF LMFBR COMPONENTS. Hill, E.F. (Atomics International Div., Canoga Park, CA (USA)). 31 Jan 1978. Contract EY-76-C-03-0824. 124p. AT.

A decontamination process specification for use on Type 304 stainless steel hot leg components of an LMFBR system has been issued. It is based on the use of 2.5 percent glycolic--2.5 percent citric acids at a temperature of 70°C. The criteria used for selecting this system are described, along with the supporting metal removal and metallurgical data. The

results of decontamination tests using radioactive specimens from two different loops are presented. The reagent selected exhibits superior decontaminating capability with acceptable metal damage.

- 26 (AI-DOE--13220) QUARTERLY TECHNICAL PROGRESS REPORT. SODIUM TECHNOLOGY AND COVER GAS SEAL DEVELOPMENT PROGRAMS. OCTOBER--DECEMBER 1977. (Rockwell International Corp., Canoga Park, CA (USA). Rocketdyne Div.). 15 Feb 1978. Contract EY-76-C-03-0824-027. 21p. AT.

Progress is summarized in FFTF-LMFBR cover gas seals testing and design and in sodium removal and decontamination techniques. (DG)

- 27 (AI-DOE--13221) QUARTERLY TECHNICAL PROGRESS REPORT COVER GAS SEAL COMPONENTS AND SODIUM COMPONENT DEVELOPMENT PROGRAMS. OCTOBER--DECEMBER 1977. (Rockwell International Corp., Canoga Park, CA (USA). Rocketdyne Div.). 30 Jan 1978. Contract EY-76-C-03-0824-026. 20p. AT.

Progress is summarized in LMFBR cover gas seals development and testing and in studies of sodium wetting of fuel handling subcomponents. (DG)

- 28 (AI-DOE--13222) HIGH-TEMPERATURE PIPING DESIGN TECHNOLOGY. QUARTERLY TECHNICAL PROGRESS REPORT, OCTOBER--DECEMBER 1977. (Rockwell International Corp., Canoga Park, CA (USA). Rocketdyne Div.). 15 Feb 1978. Contract EY-76-C-03-0824-026. 11p. AT.

Progress is summarized in the following LMFBR piping design studies: collection of sodium piping failure data, analysis of piping systems with prior successful operating history, evaluation of sensitivity of piping design margins to variability in materials and geometry, and high cycle fatigue behavior at elevated temperature. (DG)

- 29 (AI-DOE--13223) REACTOR SAFETY. QUARTERLY TECHNICAL PROGRESS REPORT, OCTOBER--DECEMBER 1977. (Atomics International Div., Canoga Park, CA (USA)). 21 Mar 1978. Contract EY-76-C-03-0824-028. 27p. Dep. NTIS, PC A02/MF A01.

The objectives of the program are to conduct tests that will characterize the behavior of sodium oxide, fuel, fission product, and other aerosols as they might be generated by various postulated LMFBR accidents; determine by analysis and confirm by experiment the generation and transport of these aerosols with respect to source (location, type, and configuration), for the entire course of events associated with real and hypothetical accident conditions; and conduct tests that will determine the effect of molten fuel on reactor structural or sacrificial material.

- 30 (AI-DOE--13225) SODIUM PIPING SURVEY TO JULY 1977. Novacek, P.F. (Atomics International Div., Canoga Park, CA (USA)). 22 Feb 1978. Contract EY-76-C-03-0824. 112p. AT.

This document presents a survey of high-temperature sodium piping experience through July 1, 1977. This survey was developed from reported data and from personal contacts with people familiar with specific installations. The survey provides information on piping that had no failures as well as piping that did. Twenty-six failures were identified in > or = to 1-in. diameter piping with only one being directly related to piping design.

- 31 (AI-DOE--13226) PERFORMANCE TESTS OF SODIUM DIP SEALS. Shimazaki, T.T. (Atoms International Div., Canoga Park, CA (USA)). 28 Feb 1978. Contract EY-76-C-03-0824. 110p. AT.

Tests made on the CRBR sodium dip seal show that it meets all its capability requirements, provided the 400°F dip seal walls are wetted. It was demonstrated that the dip seal walls can be wetted at 400°F by either initially tin-plating the surface at room temperature by the brush electroplating process or by subjecting the submerged 400°F surface to ultrasonic energy. Data were also obtained on argon convection and sodium frost deposition in the upper annulus, corrosion of SA508 Class II steel in sodium, mass transfer coefficient for O₂ in sodium, and effect of solids buildup in dip seal on plug rotational binding.

- 32 (AI-DOE--13227) SELECTION OF A SODIUM-AND RADIATION-RESISTANT SEALANT FOR LMFBR EQUIPMENT CELL PENETRATIONS. Humphrey, L.H.; Horton, P.H. (Atoms International Div., Canoga Park, CA (USA)). 31 Jan 1978. Contract EY-76-C-03-0824-001. 44p. AT.
- The test program is described which selected a sealant for LMFBR equipment cell penetrations capable of withstanding 1000°F sodium for 2 h after being exposed to 10⁶ rads of gamma radiation. The selected material is Dow-Corning 93-104.

- 33 (AI-DOE--13228) CRBRP ADVANCED FUEL RELOAD CORE DESIGN STUDIES. SUMMARY REPORT. Vitti, J.A.; Galluzzo, N.G.; Brittingham, J.C.; Ostermier, B.J.; von Arx, A.V.; Moldenhauer, J. (Atoms International Div., Canoga Park, CA (USA)). 15 May 1978. Contract EY-76-C-03-0824. 288p. AT.

Trade studies were performed based on the identified constraints, ground rules, and assumptions, to establish preferred preconceptual CRBRP core designs using advanced fuel. These designs were subdivided into Level I and Level II categories. The Level I concepts primarily involved a switch of fuel and blanket subassemblies only, compared to the reference (U-Pu)O₂ homogeneous and heterogeneous cores. The Level II designs not only used advanced fuel but also involved cost- and performance-effective modifications of components not normally removed at refueling. Two Level I and three Level II designs were selected. These core designs are denoted by the acronyms RC1S, AC1N, RC2S, AC2N, and AC2S, which are explained in Table 2.1. Of these designs, the tightly-coupled heterogeneous AC2N concept is recommended as the conceptual core design for the CRBRP when fueled with (U-Pu)C. The AC2N core design offers a high breeding ratio, low doubling time, reasonably low inventory, and good economics, while maintaining a low sodium void worth. It is, therefore, an attractive alternative for use as a CRBRP reload core.

- 34 (AI-DOE--13231) SODIUM TECHNOLOGY AND COVER GAS SEAL DEVELOPMENT PROGRAMS. QUARTERLY TECHNICAL PROGRESS REPORT, JANUARY--MARCH 1978. (Atoms International Div., Canoga Park, CA (USA)). 30 Apr 1978. Contract EY-76-C-03-0824-025. 41p. AT.

Progress is reported in the following study areas: sodium evaporation process development, decontamination studies, advanced seal materials, and gamma irradiation effects on seal materials. Some of the studies were aimed specifically at FFTF or CRBR component development.

- 35 (AI-DOE--13232) COVER GAS SEAL COMPONENTS AND SODIUM COMPONENT DEVELOPMENT PROGRAMS. QUARTERLY TECHNICAL PROGRESS REPORT, JANUARY--MARCH 1978. (Atoms International Div., Canoga Park, CA (USA)). 30 Apr 1978. Contract EY-76-C-03-0824-011. 18p. AT.

Progress is reported in the following study areas: CRBRP inflatable seal vendor qualification, static inflatable seal development, high-temperature seal degradation, and sodium wetting tests on specimen materials.

- 36 (AI-DOE--13233) HIGH-TEMPERATURE PIPING DESIGN TECHNOLOGY. QUARTERLY TECHNICAL PROGRESS REPORT, JANUARY--MARCH 1978. (Atoms International Div., Canoga Park, CA (USA)). 30 May 1978. Contract EY-76-C-03-0824-026. 24p. AT.

Progress is summarized in the following LMFBR piping design studies: (1) collection of piping failure and construction defect data; (2) analysis of systems with prior successful operating history; (3) evaluation of sensitivity of piping design margins to variability in materials, loading, temperature, and geometry; (4) high cycle fatigue behavior at elevated temperature; and (5) piping component testing. (DG)

- 37 (AI-DOE--13234) REACTOR SAFETY QUARTERLY TECHNICAL PROGRESS REPORT, JANUARY--MARCH 1978. (Atoms International Div., Canoga Park, CA (USA)). 31 May 1978. Contract EY-76-C-03-0824-028. 19p. Dep. NTIS, PC A02/MF A01.

Progress is summarized in LMFBR safety studies related to accident debris behavior. Included are sections on aerosol leakage, large scale molten fuel tests, and coordination of LMFBR risk analysis and safety studies. (DG)

- 38 (AI-DOE--13236) FAST REACTOR FLUENCE DOSIMETRY TECHNICAL PROGRESS REPORT FOR PERIOD JANUARY--MARCH 1978. (Atoms International Div., Canoga Park, CA (USA)). 18 May 1978. Contract EY-76-C-03-0824-027. 38p. Dep. NTIS (US Sales Only), PC A03/MF A01.

Progress is summarized in studies and tests related to the development and demonstration of ¹⁰B and ⁶Li helium accumulation fluence monitors as a reliable and accurate method of measuring LMFBR neutron fluence. (DG)

- 39 (AI-DOE--13238) SELECTION OF BEARING MATERIALS FOR COMMERCIAL LMFBR FLEXIBLE JOINT APPLICATIONS. Kuster, C.A.; Sarraf, R.J.; Tsang, S. (Atoms International Div., Canoga Park, CA (USA)). 7 Jul 1978. Contract EY-76-C-03-0824-019. 73p. AT.

Results of the verification and test program conducted for selecting a bearing couple for hinge assemblies of the angular flexible joint for use in primary LMFBR piping are reported. Initial screening phase friction and wear tests and thermal cycling tests were performed on 13 bearing material combinations in a nitrogen environment. These bearing combinations, selected from a wide range of bearing materials and combinations studied in a literature survey, were considered to be the most promising to meet the requirements of the system. Final friction and wear testing of the best four bearing combinations were conducted in both nitrogen and air environments. Two bearing combinations, K162B/K162B and Tribaloy 700/Colmonoy 6, are recommended for further evaluation in prototypic testing.

- 40 (AI-ERDA--13198) FAST REACTOR FLUENCE DOSIMETRY. TECHNICAL PROGRESS REPORT, DECEMBER 1976--MAY 1977. (Atomics International Div., Canoga Park, CA (USA)). 31 Aug 1977. Contract EY-76-C-03-0824-002. 26p. AT.
Progress is summarized in studies and tests related to the development and demonstration of ^{10}B and ^6Li helium accumulation fluence monitors as a reliable and accurate method of measuring LMFBR neutron fluence. (DG)

- 41 (AI-ERDA--13204) SODIUM TECHNOLOGY AND COVER GAS SEAL DEVELOPMENT PROGRAMS. QUARTERLY TECHNICAL PROGRESS REPORT, APRIL--JUNE 1977. (Atomics International Div., Canoga Park, CA (USA)). 29 Jul 1977. Contract EY-76-C-03-0824-001. 53p. AT.
Progress is summarized in LMFBR-FFTF seals testing, cover gas seal components development, and sodium removal and component decontamination techniques. (DG)

- 42 (AI-ERDA--13205) LMFBR SAFETY PROGRAM. QUARTERLY TECHNICAL PROGRESS REPORT, APRIL--JUNE 1977. Heisler, M.P.; Johnson, R.P.; Nelson, C.T.; Vaughan, E.U.; Guderjohn, C. (Atomics International Div., Canoga Park, CA (USA)). 31 Aug 1977. Contract EY-76-C-03-0824-019. 24p. Dep. NTIS, PC A02/MF A01.
Progress is summarized in LMFBR safety studies related to the characterization of sodium fires and fission products. Included are sections on sodium jet dispersal, aerosol leakage, high temperature-concentration aerosols, characteristics of released aerosols, and SOMIX code development. (DG)

- 43 (AI-ERDA--13206) HIGH-TEMPERATURE PIPING DESIGN TECHNOLOGY. QUARTERLY TECHNICAL PROGRESS REPORT, APRIL--JUNE 1977. Jetter, R.I.; Naugle, F.V. (Atomics International Div., Canoga Park, CA (USA)). 15 Aug 1977. Contract EY-76-C-03-0824-021. 23p. Dep. NTIS, PC A02/MF A01.
Progress is summarized in the following LMFBR piping design studies: long-range program planning, collection of piping failure and construction defect data, analysis of systems with prior successful operating history, and compilation of fatigue data for 2-1/4 Cr-1 Mo and type 316 stainless steels. (DG)

- 44 (AI-ERDA--13207) WATER TESTING OF THE INDUCER PUMP. Dunn, C.; Hoshide, R.K. (Atomics International Div., Canoga Park, CA (USA)). 15 Sep 1977. Contract EY-76-C-03-0824-024. 100p. Dep. NTIS, PC A05/MF A01.
The inducer pump, designed and fabricated as a test article to evaluate the inducer/impeller pump concept for providing improved suction performance of large sodium pumps, met or exceeded all performance goals. The inducer stage in front of the centrifugal impeller dramatically reduces the size of pumps. It was demonstrated that the inducer can operate at suction specific speeds in excess of 35,000, whereas conventional centrifugal pumps have demonstrated capability to only 12,000. The inducer pump employs several components of the 2000 and 4000 gpm NaK pumps from the Connecticut Aircraft Nuclear Engine Laboratory (CANEL) Programs. Use of the volute, thermal barrier and shaft oil seal from the CANEL pumps allowed acceleration and cost reduction of the Inducer Pump Program.

- 45 (AI/FBR--77-1) PLBR CORE SELECTION FOR

LOW CDA ENERGETICS: LIQUID METAL FAST BREEDER REACTOR DESIGN PROJECT. (Atomics International Div., Canoga Park, CA (USA)). 1 Feb 1977. Contract EY-76-C-03-1142. 306p. AT.

A study made to determine the feasibility of providing a PLBR core which has inherently nonenergetic CDA characteristics is presented. If such a core can be provided, it is expected that containment of large CDA energetics would not be required for licensing. The five major stages of this effort were: (1) Establishment of design requirements and configuration selection criteria; (2) Performance of extensive nuclear design and reactor system-related safety parametric studies, to provide a basis for choosing designs (i.e., bullseye and spoiled regular configurations) representative of the basic "nonenergetic" core concepts; (3) Selection and detailed characterization of the reference bullseye and spoiled regular core configurations; (4) Comparison of the reference designs against the selection criteria; and (5) Selection of the core configuration to be recommended for PLBR. Also included in the study was the determination of characteristics of a regular core. This provided a baseline against which to compare the performance and safety features of the candidate low-energy cores. Details of the approach followed, and results obtained, are presented.

- 46 (ANL--75-41) RESPONSE OF EBR-II TO REACTIVITY INSERTION. Dean, E.M.; Sackett, J.I. (Argonne National Lab., IL (USA)). Mar 1978. Contract W-31-109-ENG-38. 45p. AT.

The report presents the results of a parametric study to determine how variations in important reactor parameters affect the EBR-II dynamic response to reactivity change. The purpose of the study was to (1) define the inherent capabilities of the plant protection system (PPS), (2) identify essential trip parameters and their range of applicability, and (3) identify reactor parameters or conditions which, if changed, would affect the performance of the PPS. As a result of this study, the bases for reactivity-related limits in EBR-II were developed.

- 47 (ANL--76-34) FINAL SAFETY ANALYSIS ADDENDA TO HAZARDS SUMMARY REPORT, EXPERIMENTAL BREEDER REACTOR II (EBR-II): UPGRADING OF PLANT PROTECTION SYSTEM. VOLUME I. Sackett, J.I.; Gale, N.L. (comps.). (Argonne National Lab., IL (USA)). Aug 1977. Contract W-31-109-ENG-38. 174p. AT.

This report is a compilation of the formal Final Safety Analysis Addenda (FSAA's) to the EBR-II Hazard Summary Report and Addendum that have been prepared in support of certain modifications to the reactor-shutdown-system portion of the EBR-II plant protection system. Each major section is an edited version of the original FSAA for a particular modification and provides a description of the pre- and post-modification system, the rationale for the modification, and required supporting safety analysis.

- 48 (ANL--76-44) EXAMINATION AND EVALUATION OF IN-REACTOR FRACTURE OF SHROUD TUBES IN MIXED-OXIDE-FUEL EXPERIMENT X159. Flinn, J.E.; Cook, J.H.; Koenig, J.F.; Williamson, M.H. (Argonne National Lab., IL (USA)). Jun 1977. Contract W-31-109-ENG-38. 43p. AT.

During disassembly and subsequent visual examinations of X159 (a Mark A-19A type of EBR-2 subassembly containing mixed-oxide fuel), 11 of 19 shroud tubes were found fully or partially severed. Several of the capsules

within their shroud tubes were distinctly kinked at axial locations near those at which the shroud tubes were severed. The examination also disclosed that the shroud-tube fractures occurred during reactor operation. The unirradiated shroud-tube material and some of the fracture areas of the irradiated material were structurally examined and evaluated. The surface appearances of the two materials suggested that the shroud-tube failures were produced by stress corrosion. The conditions for promoting stress corrosion could have easily been present in the subassembly. Possible stress-producing mechanisms associated with the reactor environment were analyzed. These mechanisms predicted conditions that did not correlate with the observations. It was concluded that kinks in several of the fuel-element capsules were the more logical candidates for producing the shroud-tube fractures. What produced the kinks was not resolved.

- 49 (ANL--76-78) DESIGN AND FABRICATION OF THE EBR-II ENVIRONMENTAL INSTRUMENTED SUBASSEMBLY: TEST XX07. Gillette, J.L.; Poloncsik, J.; Smaardyk, A.; Walker, D.E.; Filewicz, E.C.; Longnecker, A.A.; Murphy, W.A.; Wendte, J.C. (Argonne National Lab., IL (USA)). Nov 1977. Contract W-31-109-ENG-38. 65p. AT.

The EBR-II environmental instrumented subassembly (EISA), or Test XX07, was designed, fabricated, and irradiated to provide in-core measurements of irradiation conditions. This subassembly contained 57 elements with uranium metal-5 wt % fissium fuel and four nonfueled elements. It was instrumented with two permanent-magnet flowmeters, 13 coolant thermocouples at various axial and radial locations, 10 fuel-centerline thermocouples, and two self-powered detectors. The subassembly was irradiated in EBR-II for about 11,600 MWd (approximately 186 days), reaching a peak burnup of about 2.9 at. %. During its residence in the reactor, XX07 provided in-core measurements of flow, temperature, and flux levels under both steady-state and dynamic conditions. This report discusses the detailed design of XX07 and the various techniques used in its fabrication and assembly. The many component parts of XX07, as well as the final, completed subassembly, are described.

- 50 (ANL--76-94) EFFICACY OF THE EBR-II FERD SYSTEM AS AN AUTOMATIC TRIP DEVICE. Fryer, R.M.; Dean, E.M.; Lambert, J.D.B.; Reyes, L.A. (Argonne National Lab., IL (USA)). Aug 1977. Contract W-31-109-ENG-38. 72p. AT.

The effectiveness of the EBR-II fuel-element-rupture-detector (FERD) system which detects delayed-neutron-emitting fission products is discussed. It is demonstrated that FERD provides no reactor or public protection for loss-of-flow or transient-overpower fault events that affect the whole core; such protection is provided by other systems. For single-element faults (cladding breaches), protection is not required, because the failures are nonpropagative. For intermediate fault events, for example, flow blockage to a single subassembly, the element cladding, sodium coolant, and hexagonal subassembly duct provide effective barriers to potential failure propagation. The FERD system provides beneficial diagnostic information about such events, but is ineffective in preventing either the original event or potential subsequent rapid propagative events when used as an automatic trip device.

- 51 (ANL--77-11) DATA AND ANALYSES FOR INCONEL X750 SPRINGS IRRADIATED IN SURV-1, -3, -4, -5, AND -6. Walters, L.C.; Ruther, W.E. (Argonne National Lab., IL (USA)). Feb 1978. Contract W-31-109-ENG-38. 42p. AT.

In 1965, eight surveillance subassemblies were placed in row 12 of EBR-II, where the irradiation temperature would be near the sodium-inlet temperature of 371°C. At the same time, two other surveillance subassemblies were placed in the primary-tank storage basket, which receives minimal neutron exposure but is immersed in primary sodium and experiences a temperature of 371°C. Each subassembly contained 18 preloaded springs made of Inconel X750. Springs from four of the in-core subassemblies and from one subassembly in the storage basket have been evaluated to determine rates of irradiation-enhanced deformation at neutron exposures of up to 4.2 dpa. The creep coefficient derived from the stress-relaxation measurements on the springs was 1.0×10^{-12} (Pa · dpa)⁻¹ for neutron exposures of 4.2 dpa (3751 days) at an in-reactor temperature of 371°C. The relaxation behavior was adequately described by a creep equation that was linear in neutron fluence and applied stress. Springs encapsulated in helium showed in-reactor relaxation rates identical to those of springs exposed to the flowing primary sodium. The creep coefficient derived from this work in Inconel X750 springs was almost the same as the creep coefficients determined for various austenitic stainless steel alloys.

- 52 (ANL--77-15) TH13D-1: A COMPUTER PROGRAM FOR STEADY-STATE THERMAL-HYDRAULIC MULTICHANNEL ANALYSIS. Sha, W.T.; Schmitt, R.C.; Lin, E.I.H. (Argonne National Lab., IL (USA)). Jul 1977. Contract W-31-109-ENG-38. 107p. AT.

TH13D-1 is an improved version of the TH13D computer program for steady-state, single-phase, thermal-hydraulic multichannel analysis. The program accounts for conservation of mass, energy, and momentum subject to pressure-drop boundary conditions, and leads to a nonlinear multipoint boundary-value problem. Turbulent interchange, radial thermal conduction, and forced flow due to wire wraps or grids between channels are explicitly taken into account. Temperature distributions in the coolant, cladding, fuel, and duct wall and the size of the central void of the oxide fuel after thermal restructuring are computed. Three different thermal-hydraulic channel arrangements (square, hexagonal, and triangular) can be treated. Multipin analysis with transverse interactions or multiassembly calculations without transverse interactions between the channels can be performed. In addition, (1) a new wire-wrap model has been developed that accounts for most measured mixing data in a wire-wrapped rod bundle; (2) bypass fluid of a fuel assembly is accounted for; (3) an implicit option for the energy equation is provided (this option is necessary for low Reynolds number flow); and (4) an improved transverse-momentum equation is incorporated. Also included are program-input description and format, and a sample problem reflecting these improvements.

- 53 (ANL--77-20) BUBBLE DYNAMICS IN A SUPERHEATED LIQUID. Sha, W.T.; Shah, V.L. (Argonne National Lab., IL (USA)). Sep 1977. Contract W-31-109-ENG-38. 55p. (NUREG--0333). Dep. NTIS, PC A04/MF A01.

The report presents an extensive literature survey on bubble dynamics. Growth of a single spherical bubble moving in a uniformly superheated liquid is considered. Equations of

motion and energy are presented in the forms that take into consideration the interaction between the motion and the growth. The fourth-order Runge-Kutta method is used to obtain a simultaneous solution of equations of motion and growth rate, and the solution is compared with available experimental results. Results for liquid sodium are presented for a range of pressures and Jakob numbers.

- 54 (ANL--77-25) FINAL REPORT OF FUEL DYNAMICS TEST E7. Doerner, R.C.; Murphy, W.F.; Stanford, G.S.; Froehle, P.H. (Argonne National Lab., IL (USA)). Apr 1977. Contract W-31-109-ENG-38. 150p. Dep. NTIS, PC A08/MF A01.

Test data from an in-pile failure experiment of high-power LMFBF-type fuel pins in a simulated \$3/s transient-overpower (TOP) accident are reported and analyzed. Major conclusions are that (1) a series of cladding ruptures during the 100-ms period preceding fuel release injected small bursts of fission gas into the flow stream; (2) gas release influenced subsequent cladding melting and fuel release [there were no measurable FCI's (fuel-coolant interactions), and all fuel motion observed by the hodoscope was very slow]; (3) the predominant postfailure fuel motion appears to be radial swelling that left a spongy fuel crust on the holder wall; (4) less than 4 to 6 percent of the fuel moved axially out of the original fuel zone, and most of this froze within a 10-cm region above the original top of the fuel zone to form the outlet blockage. An inlet blockage approximately 1 cm long was formed and consisted of large interconnected void regions. Both blockages began just beyond the ends of the fuel pellets.

- 55 (ANL--77-27) PHYSICS CALCULATIONS FOR THE CLINCH RIVER BREEDER REACTOR. Kalimullah, Kier, P.H.; Hummel, H.H. (Argonne National Lab., IL (USA)). Jun 1977. Contract W-31-109-ENG-38. 176p. Dep. NTIS, PC A09/MF A01.

Calculations of distributions of power and sodium void reactivity, unvoided and voided Doppler coefficients and steel and fuel worths have been performed using diffusion theory and first-order perturbation theory for the LWR discharge Pu-fueled CRBR at BOL, the FFTF-grade Pu-fueled CRBR at BOL and for the beginning and end of equilibrium cycle of the LWR-Pu-fueled CRBR. The results of the burnup and breeding ratio calculations performed for obtaining the reactor compositions during the equilibrium cycle are also reported. Effects of sodium and steel contents on the distributions of sodium void reactivity and steel worth have also been studied. Errors and uncertainties in the reactivity coefficients due to cross-sections and the two-dimensional geometric representations of the reactor used in the calculations have also been estimated. Comparisons of the results with those in the CRBR PSAR are also discussed.

- 56 (ANL--77-40) SUMMARY AND EVALUATION OF TRANSIENT TEST DATA ON EXTENDED FUEL MOTION RESULTING FROM UNPROTECTED LOSS OF FLOW. Dickerman, C.E. (Argonne National Lab., IL (USA)). Jun 1977. Contract W-31-109-ENG-38. 38p. Dep. NTIS, PC A03/MF A01.

Experimental data on fuel failure and its consequences are used to provide predictions of the extended fuel motion that would occur after a hypothetical core-disruptive loss-of-flow accident without scram in the Fast Test Reactor. These data indicate the existence of fuel-dispersal mechanisms, slow collapse of fresh fuel, resistance to collapse of

irradiated fuel, the absence of accelerated collapse mechanisms (such as cladding-coolant vapor "explosions"), and the fact that real LMFBF conditions inhibit rapid sodium-vaporization events. These data indicate that severely damaged subassemblies will not be coolable in situ by returning sodium after the accident, because of steel and fuel blockages, and suggest that the severely damaged, melted fuel will eventually disperse upward under the influence of vapor generated by decay heating.

- 57 (ANL--77-43) VAPOR-EXPLOSION EXPERIMENTS WITH SUBCOOLED FREON. Henry, R.E.; McUmber, L.M. (Argonne National Lab., IL (USA)). Jun 1977. Contract W-31-109-ENG-38. 32p. Dep. NTIS, PC A03/MF A01.

Vapor-explosion experiments were conducted in a well-wetted Freon-22 and mineral-oil system in which the initial temperature of both the Freon and the mineral oil were varied over a wide range. These experiments were specifically conducted to investigate the importance of interface temperature in determining the explosive behavior of a given system. The results clearly demonstrate that the interface temperature developed upon intimate liquid-liquid contact is a valid characterization of the explosive potential of a given system.

- 58 (ANL--77-44) SUMMARY AND EVALUATION OF FUEL DYNAMICS TRANSIENT-OVERPOWER EXPERIMENTS: STATUS 1974. Deitrich, L.W.; Doerner, R.C.; Hughes, T.H.; Wright, A.E. (Argonne National Lab., IL (USA)). Jun 1977. Contract W-31-109-ENG-38. 128p. Dep. NTIS, PC A07/MF A01.

The report summarizes and evaluates experiments conducted in the Transient Reactor Test Facility (TREAT) using the Mark-II loop facility. The tests discussed are of the E and H series. Detailed descriptions of test conditions and test results as of February 1974 are presented. Since all data have not been acquired on all experiments, this report must be considered interim in nature. Particular emphasis is placed on data relevant to Fast Test Reactor (FTR) safety-analysis efforts.

- 59 (ANL--77-46) FIRST MECHANIZED IN-SERVICE INSPECTION OF EBR-II STEAM GENERATOR. Longua, K.J.; Whitham, G.K.; Reimann, K.J. (Argonne National Lab., IL (USA)). Sep 1977. Contract W-31-109-ENG-38. 39p. AT.

A mechanized ultrasonic test system was developed and built at Southwest Research Institute (SwRI) to conduct the first in-service inspection of the 2 1/4, Cr-1 Mo steel duplex tubing in the EBR-II steam-generator system. This inspection required tube inspection from the bore side, complete volumetric examination, wall-thickness measurement, and evaluation of the braze condition. The test equipment was thoroughly checked and routinely calibrated, using a standard containing artificial flaws. Artificial flaws as small as 1.6 mm long by 0.25 mm deep were readily detected. Forty-eight of 73 tubes were inspected, and 15 of them were rescanned for verification of indications. Calculations showed that the largest indication, 5 mm long by 0.25 mm deep, would not grow to sufficient size before the next scheduled inspection to cause concern. The second indication was classified as a small dent. Before this inspection, an exploratory manual ultrasonic testing examination was conducted on EV-702, but inherent limitations made this test unsuitable for definition of the duplex-tube condition. This test was useful, however, in specifying the requirements for the

mechanized ultrasonic test system. Finally, parallel laboratory studies were conducted to examine effects of flaw size and orientation on ultrasonic indications. While the results of these studies were not directly used for the in-service inspection, they do form a basis for (1) understanding the ultrasonic test signals in duplex 2 1/4 Cr-1 Mo steel tubes and (2) possible future refinements of the mechanized ultrasonic test system built by SwRI.

- 60 (ANL--77-48) PHYSICS OF REACTOR SAFETY. QUARTERLY REPORT, JANUARY--MARCH 1977. (Argonne National Lab., IL (USA)). Jun 1977. Contract W-31-109-ENG-38. 57p. Dep. NTIS, PC A04/MF A01.

This report summarizes work done on reactor safety, Monte Carlo analysis of safety-related critical assembly experiments, and planning of DEMI safety-related critical experiments. Work on reactor core thermal-hydraulics is also included.

- 61 (ANL--77-52) APPLICATION OF THE PULSED-NEUTRON ACTIVATION TECHNIQUE FOR FLOW MEASUREMENT AT EBR-II. Price, C.C.; Sackett, J.I.; Curran, R.N.; Livengood, C.L.; Kehler, P.; Forster, G.A. (Argonne National Lab., IL (USA)). Nov 1977. Contract W-31-109-ENG-38. 69p. AT.

The pulsed-neutron-activation (PNA) flow-measuring technique as applied to in situ fluid-flow measurements at EBR-II is described. Analytic relationships are derived for modeling the process and estimating the uncertainty in the measurement. Results from measurements of both water flow and secondary-sodium flow are presented. Results from PNA measurements on the water side of the EBR-II steam system have led to better definition of plant parameters. Results from sodium-flow measurements are used to provide a correlation for in situ calibration of the electromagnetic sodium flowmeter in the secondary system.

- 62 (ANL--77-53) APPARATUS FOR TESTING SMOOTH AND RIBBED TUBING WITH PULSED EDDY CURRENTS. Sather, A. (Argonne National Lab., IL (USA)). May 1978. Contract W-31-109-ENG-38. 26p. Dep. NTIS, PC A03/MF A01.

The use of outside diameter ribs on nuclear reactor tubing presents severe problems to nondestructive testing of this tubing. A pulsed eddy-current apparatus for inspecting the integrity of smooth and ribbed tubing has been developed at Argonne National Laboratory. Test results for this apparatus and analysis and circuit block diagrams are presented. In addition, transducer and preamplifier features, scanning procedures, and theory of operation are discussed. To date, this apparatus has provided the best solution to the ribbed tubing problem because of its capability to time-sample data.

- 63 (ANL--77-54) FINAL REPORT ON TREAT TEST R3, A SINGLE-PIN LOSS-OF-FLOW EXPERIMENT. Holtz, R.E.; Grohmes, M.A.; Spencer, B.W.; Miller, C.E.; Kramer, N.A.; Testa, F.J.; Murphy, W.F. (Argonne National Lab., IL (USA)). Jul 1977. Contract W-31-109-ENG-38. 57p. Dep. NTIS, PC A04/MF A01.

Test R3 was the first of the R-series fuel-element meltdown tests performed to support modeling and code development for analysis of hypothetical, whole-core accidents in LMFBR's. Test R3 served as a proof test for the subsequent R4--R8 sequence of seven-pin tests examining coolant, cladding, and fuel behavior under thermal and hydraulic conditions

representative of a hypothetical loss-of-coolant flow (LOF) with failure to scram in FFTF. The high heat loss radiated from the single test fuel element run at full power prevented representative prototypicality of the test events. However, the test was significant as a prelude to subsequent seven-pin tests, and also from the standpoint of materials interactions and fuel-motion detection by the hodoscope. Coolant voiding began when the inlet flow rate was down to about 1.7 m/s (approximately 22% of initial flow rate). Upon melting, most of the cladding moved downward, eventually solidifying in the bottom of the test region, forming an inlet blockage. For the conditions of this single-pin test, molten-cladding flooding and upper blockage formation were not found. Subsequent fuel melting was relatively minor; pellets at the top and bottom of the active fuel showed no melting, while about 43% area melting occurred at the hot spot. At no time during the meltdown sequence was there any sodium reentry or significant pressurization events.

- 64 (ANL--77-66) STATISTICAL STUDY OF EBR-II FUEL ELEMENTS MANUFACTURED BY THE COLD LINE AT ARGONNE-WEST AND BY ATOMICS INTERNATIONAL. Harkness, A.L. (Argonne National Lab., IL (USA)). Sep 1977. Contract W-31-109-ENG-38. 24p. Dep. NTIS, PC A02/MF A01.

Nine elements from each batch of fuel elements manufactured for the EBR-II reactor have been analyzed for ²³⁵U content by NDA methods. These values, together with those of the manufacturer, are used to estimate the product variance and the variances of the two measuring methods. These variances are compared with the variances computed from the stipulations of the contract. A method is derived for resolving the several variances into their within-batch and between-batch components. Some of these variance components have also been estimated by independent and more familiar conventional methods for comparison.

- 65 (ANL--77-69) PHYSICS OF REACTOR SAFETY. QUARTERLY REPORT, APRIL--JUNE 1977. (Argonne National Lab., IL (USA)). Sep 1977. Contract W-31-109-ENG-38. 47p. Dep. NTIS, PC A03/MF A01.

The work in the Applied Physics Division includes reports on reactor safety program by members of the Reactor Safety Appraisals Group, Monte Carlo analysis of safety-related critical assembly experiments by members of the Theoretical Fast Reactor Physics Group, and planning of safety-related critical experiments by members of the Zero Power Reactor (ZPR) Planning and Experiments Group. Work on Reactor core thermal-hydraulic code development performed in the Components Technology Division is also included in the report.

- 66 (ANL--77-70) ALTERNATIVE FUEL CYCLE OPTIONS: PERFORMANCE CHARACTERISTICS AND IMPACT ON NUCLEAR POWER GROWTH POTENTIAL. Chang, Y.I.; Till, C.E.; Rudolph, R.R.; Deen, J.R.; King, M.J. (Argonne National Lab., IL (USA)). Sep 1977. Contract W-31-109-ENG-38. 43p. Dep. NTIS, PC A03/MF A01.

The fuel utilization characteristics for LWR, SSCR, CANDU and LMFBR reactor concepts are quantified for various fuel cycle options, including once-through cycles, thorium cycles, and denatured cycles. The implications of various alternative reactor deployment strategies on the long-term nuclear power growth potential are then quantified in terms of the maximum nuclear capacity that can be

achieved and the growth pattern over time, subject to the constraint of a fixed uranium-resource base. The overall objective of this study is to shed light on any large differences in the long-term potential that exist between various alternative reactor/fuel cycle deployment strategies.

- 67 (ANL--77-72) CYCLIC-DEFORMATION RESISTANCE OF WELD-DEPOSITED TYPE 16-8-2 STAINLESS STEEL AT 593°C. Raske, D.T. (Argonne National Lab., IL (USA)). Aug 1977. Contract W-31-109-ENG-38. 37p. AT.

The creep fatigue and cyclic-deformation behavior of Type 16-8-2 (16 percent Cr-8 percent Ni-2 percent Mo) stainless steel weld metal is discussed. Tests were conducted in air at 593°C and a strain rate of $4 \times 10^{-3} \text{ s}^{-1}$. Comparisons with data for Type 316 stainless steel base metal indicate that the weld metal has significantly longer fatigue lives for 360-, 1.8×10^3 -, and 1.8×10^4 -s tension hold-time tests. This longer life is attributed to the fine duplex microstructure of the weld metal that inhibits the growth rate of cracks. Additional studies on the cyclic-deformation behavior of the weld metal indicate that this material is strain-history dependent; therefore, a unique cyclic stress-strain curve does not exist. Monotonic tension tests after cyclic straining result in a different stress-strain curve from that obtained from companion fatigue tests at various completely reversed constant strain ranges. A comparison of the fracture morphology of creep-fatigue and creep-rupture specimens indicates that differences resulting from these tests can be attributed to different failure mechanisms. 32 figures, 5 tables.

- 68 (ANL--77-73) MODEL FOR TURBULENT MOMENTUM AND HEAT TRANSPORT IN LARGE ROD BUNDLES. Sha, W.T.; Launder, B.E. (Argonne National Lab., IL (USA)). Jan 1979. Contract W-31-109-ENG-38. 32p. AT.

A quasi-continuum model for turbulent momentum and heat transport in large rod bundles has been developed. This model has been derived from a subchannel analysis and adapted to a quasi-continuum form by introducing concepts of porosity and distributed resistance. The effects of turbulent kinetic energy generation due to shear, viscosity, diffusion, geometric effects, buoyancy, and Reynolds number are explicitly included. The proposed model of turbulence is relatively simple, yet it is believed to provide a framework for taking account of important turbulent mechanisms in rod bundles.

- 69 (ANL--77-74) BILINEAR CYCLIC STRESS-STRAIN ANALYSIS FOR INCOLOY 800. Maiya, P.S. (Argonne National Lab., IL (USA)). Nov 1977. Contract W-31-109-ENG-38. 27p. AT.

This report describes the bilinear stress-strain analysis under cyclic loading conditions for the alloy Incoloy 800. Although the method for determining the bilinear stress-strain parameters is based on a procedure proposed in the RDT Standard F9-1 for inelastic analysis of Fast Flux Test Facility (FFTF) components, the accuracy and consistency of results have been improved by an analytical technique, which also resulted in certain simplifications. The bilinear stress-strain parameters of solution-annealed Incoloy 800 (Heat HH7058A) under cyclic loading conditions at a strain rate ($\epsilon/\text{sub } t$) of $8.6 \times 10^{-5} \text{ s}^{-1}$, total strain range ($\Delta\epsilon/\text{sub } t$) of 0.2 to 0.8 percent, and temperatures of room temperature to 593°C (1100°F) have been determined. The

dependence of bilinear parameters on temperature and strain is discussed. The cyclic-hardening characteristics based on correlation of yield parameter k with accumulated plastic strain are also presented.

- 70 (ANL--77-76) ANALYSIS OF EBR-II LOW-POWER DOSIMETRY RUN 78C. Franklin, F.C.; Ebersole, E.R.; Heinrich, R.R. (Argonne National Lab., IL (USA)). Dec 1977. Contract W-31-109-ENG-38. 49p. AT.

This report compares calculated reaction rates based on neutron-transport calculations in RZ and XY geometries with measured values from a low-power dosimetry test in EBR-II. Axial distributions of ^{235}U and ^{238}U fission rates and ^{238}U capture rate are given for various radial locations along the length of the core and the axial reflectors, and along the length of the radial steel reflectors. Reaction rates, primarily at the reactor midplane, are given for a number of fission and capture reactions. The analytical RZ- and XY-geometry models used for the neutronics calculations are described.

- 71 (ANL--77-77) PLANE-STRAIN STRESS INTENSITY FACTORS FOR CRACKED HEXAGONAL SUBASSEMBLY DUCTS. Petroski, H.J.; Glazik, J.L.; Achenbach, J.D. (Argonne National Lab., IL (USA)). Oct 1977. Contract W-31-109-ENG-38. 44p. Dep. NTIS, PC A03/MF A01.

Plane-strain stress intensity factors for a pressurized hexagonal subassembly duct with a crack in a corner or midflat are presented in convenient graphical form for representative LMFBR hexcan dimensions. Corner-crack calibrations based on several different models of the round hexcan corner are determined first in order to bound the stress intensity factor. A subsequent finite-element analysis of a uniformly pressurized hexcan with a corner crack gives accurate data for the stress intensity factor from which a weight function for this geometry may be constructed. The effects of different numbers of cracks, different locations for cracks, and different loading modes are discussed briefly, and some comments are made on the application of linear elastic fracture mechanics to cracked hexagonal ducts that have suffered a high degree of irradiation embrittlement.

- 72 (ANL--77-82) COMPUTATION OF THE WEIGHT FUNCTION FROM A STRESS INTENSITY FACTOR. Petroski, H.J.; Achenbach, J.D. (Argonne National Lab., IL (USA)). Oct 1977. Contract W-31-109-ENG-38. 28p. Dep. NTIS (US Sales Only), PC A03/MF A01.

A simple representation for the crack-face displacement is used to compute a weight function solely from stress intensity factors for a reference loading configuration. Crack-face displacements given by the representation are shown to be in good agreement with analytical results for cracked tensile strips, and stress intensity factors computed from the weight function agree well with those for edge cracks in half-planes, radial cracks from circular holes, and radially cracked rings. The technique involves only simple quadrature, and its efficacy is demonstrated by the example computations. The weight function for a corner crack in an LMFBR hexagonal subassembly duct is constructed from stress-intensity-factor results for the uniformly overpressurized case, and it is shown how this may be used to determine the stress intensity factors for other loading cases.

- 73 (ANL--77-86) INVESTIGATIONS OF MATERIALS COMPATIBILITY RELEVANT TO THE EBR-II SYSTEM: FY 1977 AND THE TRANSITION PERIOD. Longua, K.J.; Ruther, W.E.; Shields, J.A.; Olson, W.H.; Clark, A.F. (Argonne National Lab., IL (USA)). Feb 1978. Contract W-31-109-ENG-38. 30p. AT.

The failure of newly designed thermocouple assemblies in the steam system was caused by severe corrosion due to residual brazing flux left inside the protective tube. Examination of a failed bellows-and-pivot-rod assembly inside the turbine initial-pressure-regulation assembly revealed intergranular cracking in the heat-affected zone at the root convolution of the welded bellows. The annual inspection of the steam plant included an in-service type of inspection. Burst tests of fuel-element tubes were performed in irradiated and unirradiated defected hexagonal subassembly ducts, using both single and multiple defected tubes to simulate fuel-element failure. A fabric to be used in an enclosure to protect the EBR-II fuel transfer arm was tested successfully in sodium at 135 to 200°C. Thermal-shock testing of stainless steel-clad thermocouples at rates of 2600°C/s confirmed their capability to withstand sudden changes in temperature. Out-of-reactor experiments indicated that graphite and reticulated vitreous carbon will trap ^{137}Cs and are compatible with 371°C sodium. Experiments were performed with thermal-expansion-difference temperature monitors to determine the extent of stress relaxation during calibration.

- 74 (ANL--77-87) SUMMARY, ANALYSIS, AND COMPARISON OF DATA FROM EXPERIMENTS WITH THE EBR-II MARK IIB OSCILLATOR ROD. Larson, H.A.; Dean, E.M. (Argonne National Lab., IL (USA)). Apr 1978. Contract W-31-109-ENG-38. 51p. AT.

The Mark IIB oscillator rod was used in EBR-II runs 48-55. Data were collected, digitized, and processed by on-line computer analysis, and Fourier analysis was used to obtain frequency-response functions. Feedback frequency-response functions are compared with those obtained by rod-drop experiments and are qualitatively identical. Experimental results are also compared with the EBR-II dynamic-simulation computer program, EROS. Through use of basic neutronic and heat-transfer principles, this program is shown to adequately represent the reactor feedback frequency-response function. The experimental data from EBR-II runs 48-55 are presented in both tabular and graphic form.

- 75 (ANL--77-88) APPROXIMATIONS OF GAMMA CROSS SECTIONS FOR FAST NUCLEAR REACTORS. Grimm, K.N.; Meneghetti, D. (Argonne National Lab., IL (USA)). Mar 1978. Contract W-31-109-ENG-38. 24p. Dep. NTIS, PC A02/MF A01.

The report shows a method to approximate a P_1 scattering solution for the flux in a fast reactor, using an isotropic, but not a diagonal-transport-approximation scattering matrix. Presented are flux errors relative to a P_1 solution for different levels of transport approximation in an EBR-II type of core surrounded by a stainless steel reflector. Problems associated with the use of the method are also presented.

- 76 (ANL--77-91) COUPLED HYDRODYNAMIC-STRUCTURAL RESPONSE ANALYSIS OF PIPING SYSTEMS. A-Moneim, M.T. (Argonne National Lab., IL (USA)). Feb 1978. Contract W-31-109-ENG-38. 88p. AT.

The report describes in detail the expansion of the ICEPEL code for the coupled hydrodynamic-

structural response analysis of pipe-elbow loops to general piping systems. A generalized piping-component model, a branching tee junction, and a surge-tank model are introduced and coupled with the pipe-elbow loop model so that a general piping system under the effect of internally traveling pressure pulses can be analyzed hydrodynamically, as well as structurally. Optional capabilities are included in the generalized piping-component model so that it can be used in modeling pipe-flow area changes, valves, and heat exchangers. The options are: nine different axisymmetric exterior wall configurations, elastic-plastic exterior walls, interior rigid-wall simulation, and heat-exchanger tube-bundle model. The Implicit Continuous-Fluid Eulerian (ICE) differencing technique is used in the hydrodynamic part of the analysis; the Waves in Hysteretic Arbitrary Media (WHAM) finite-element scheme is used in the structural response part of the analysis. Sample problems that demonstrate the capabilities and limitations of the method are presented. The results are discussed and conclusions are made in connection with further development of the method. Detailed input-output instructions for the ICEPEL code use are also presented.

- 77 (ANL--77-92) PHYSICS OF REACTOR SAFETY. QUARTERLY REPORT, JULY--SEPTEMBER 1977. (Argonne National Lab., IL (USA)). Dec 1977. Contract W-31-109-ENG-38. 40p. Dep. NTIS, PC A03/MF A01.

The work in the Applied Physics Division includes reports on reactor safety program by members of the Reactor Safety Appraisals Group, Monte Carlo analysis of safety-related critical assembly experiments by members of the Theoretical Fast Reactor Physics Group, and planning of safety-related (ZPR) Planning and Experiments Group. Work on reactor core thermal-hydraulic code development performed in the Components Technology Division is also included.

- 78 (ANL--77-93) TRANSIENT-OVERPOWER TEST E8 ON FFTF-TYPE LOW-POWER-IRRADIATED FUEL. Simms, R.; Lo, R.K.; Murphy, W.F.; Stanford, G.S.; Rothman, A.B. (Argonne National Lab., IL (USA)). Dec 1977. Contract W-31-109-ENG-38. 124p. Dep. NTIS, PC A06/MF A01.

Test E8 simulated a hypothetical \$3/s transient overpower accident in an LMFBR using seven (Pu, U)O₂ fuel elements of the FTR type. The test elements were preirradiated in the PNL-10 assembly in EBR-II to 5 at. % burnup at 30 kW/m. The preirradiation in EBR-II caused a fuel-restructuring range characteristic of a low-to-moderate power microstructure for FTR. Failure predictions indicated that fuel with this microstructural characteristic would fail at a lower energy deposition than fuel irradiated at higher power. Data from test-vehicle sensors, hodoscope, and postmortem examinations were used to construct the sequence of events occurring within the test zone. The sequence occurred incoherently across the test cluster, the initial event occurring abruptly at about 29 times nominal power level at an estimated stored energy of about 925 kJ/kg with 50% of the fuel above the solidus at the suspected failure site. After the initial failure, about 2% of the total mass of test fuel was ejected above the original top of the active fuel column. Sodium voiding occurred rapidly. A fuel-debris blockage also apparently prevented further fuel dispersal. Inherent test-vehicle limitations, loss of flow-tube geometry, and nontypical power generation after failure may have caused a departure from the fuel motion predicted for FTR conditions. No

violent fuel-coolant interaction or associated work-energy conversion to the coolant was observed.

- 79 (ANL--77-94) TEST E3 ON HIGH-ENERGY TRANSIENT MELTDOWN OF IRRADIATED UO_2 IN A TREAT MARK-II LOOP. Deitrich, L.W.; Dickerman, C.E.; Willis, F.L. (Argonne National Lab., IL (USA)). Dec 1977. Contract W-31-109-ENG-38. 53p. Dep. NTIS, PC A04/MF A61.

Three "gassy" irradiated UO_2 pins were run past failure in a 35-ms natural TREAT transient in TREAT loop Test E3 to guide in choosing between two modeling assumptions regarding energy conversion from sodium vaporization in an irradiated-oxide-fuel/coolant interaction (FCI): (1) The trapped fission gas enhances fuel fragmentation upon failure, accelerates fuel-coolant mixing, and thus promotes an energetic FCI, or, conversely, (2) the trapped fission gas blankets the fuel and reduces the rate of heat transfer to sodium, preventing an energetic FCI. The sample pins were run in the Materials Testing Reactor (MTR) to burnup levels of 4.8, 4.8, and 6.3 at. percent. Gas retention of 77 percent was estimated, based on sibling-pin data. Each pin consisted of a short fuel stack about 145 mm (5.7 in.) long, clad with a 4.42-mm (0.174-in.)-OD, annealed Type 304 stainless steel jacket, 0.23 mm (0.009 in.) thick. Failure occurred before coolant boiling at a fuel energy input in the highest energy location of the hottest pin of 857 kJ/kg within 5 ms of inception of melting. Failure was marked by sharp pressure pulses and sodium ejection. The maximum growth rate of void volume was about $9.5 \times 10^{-3} \text{ m}^3/\text{s}$ the largest recorded in a TREAT loop test. The initial pressure pulses recorded at inlet and outlet were 5.9 and 3.3 MPa, respectively. Although the work was the highest for all the TREAT loop tests, it was only about 4 kJ/kg, of which about half could be accounted for by expansion of fission gas. There was no evidence for an energetic FCI of the type that could be calculated on the basis of rapid fuel-coolant mixing and heat transfer.

- 80 (ANL--77-95) CLADDING FAILURE BY LOCAL PLASTIC INSTABILITY. Kramer, J.M.; Deitrich, L.W. (Argonne National Lab., IL (USA)). Dec 1977. Contract W-31-109-ENG-38. 36p. Dep. NTIS, PC A03/MF A01.

Cladding failure is one of the major considerations in analysis of fuel-pin behavior during hypothetical accident transients since time, location, and nature of failure govern the early postfailure material motion and reactivity feedback. Out-of-pile thermal transient tests of both irradiated and unirradiated fast-reactor cladding show that local plastic instability, or bulging, often precedes rupture and that the extent of local instability limits the initial rip length. To investigate the details of bulge formation and growth, a perturbation analysis of the equations governing large deformation of a cylindrical shell has been developed, resulting in a set of linear differential equations for the bulge geometry. These equations have been solved along with appropriate constitutive equations and various constraints on the ends of the cladding. Sources for bulge formation that have been considered include initial geometric imperfections and thermal perturbations due to either eccentric fuel pellets or nonsymmetric cooling. Of these, only the first is relevant to out-of-pile burst tests. Here it has been found that the most likely imperfection that will grow unstably to failure leads to a bulge around half the circumference with an axial length 1.1 times

the deformed diameter. This is in general agreement with burst-test results. For the case of in-reactor fuel pins, it has been found that thermal perturbations can significantly affect local instability, particularly if the deformation process is thermally activated with a high activation energy.

- 81 (ANL--77-XX-62, pp 24-27) INTERNATIONAL FAST BREEDER REACTOR DEVELOPMENT. Yevick, J.G. 1977.

From 16. nuclear engineering education conference on international nuclear engineering - development and planning; Argonne, IL, USA (28 Feb 1977).

The LMFBR development programs in the U.S., France, German Federal Republic, Italy, Japan, U.K., and the U.S.S.R. are reviewed.

- 82 (ANL--78-4) PTAC: A COMPUTER PROGRAM FOR PRESSURE-TRANSIENT ANALYSIS, INCLUDING THE EFFECTS OF CAVITATION. Kot, C.A.; Youngdahl, C.K. (Argonne National Lab., IL (USA)). Sep 1978. Contract W-31-109-ENG-38. 95p. AT.

PTAC was developed to predict pressure transients in nuclear-power-plant piping systems in which the possibility of cavitation must be considered. The program performs linear or nonlinear fluid-hammer calculations, using a fixed-grid method-of-characteristics solution procedure. In addition to pipe friction and elasticity, the program can treat a variety of flow components, pipe junctions, and boundary conditions, including arbitrary pressure sources and a sodium/water reactor. Essential features of transient cavitation are modeled by a modified column-separation technique. Comparisons of calculated results with available experimental data, for a simple piping arrangement, show good agreement and provide validation of the computational cavitation model. Calculations for a variety of piping networks, containing either liquid sodium or water, demonstrate the versatility of PTAC and clearly show that neglecting cavitation leads to erroneous predictions of pressure-time histories.

- 83 (ANL--78-9) EBR-II ENVIRONMENTAL INSTRUMENTED SUBASSEMBLY XX08: ENGINEERING AND ASSEMBLY. Smaardyk, A.; Filewicz, E.C.; Longnecker, A.A.; Poloncsik, J.; Tokar, J.V.; Walker, D.E.; Wendte, J.C. (Argonne National Lab., IL (USA)). May 1978. Contract W-31-109-ENG-38. 72p. AT.

Subassembly XX08 is a fueled and instrumented subassembly designed primarily for an ongoing program to investigate the thermal-hydraulic core environment within EBR-II under normal and off-normal plant operating conditions. The Mark-II fuel is expected to provide XX08 with an irradiation lifetime three times as great as that attained with XX07, i.e., 9 versus 2.9 at. percent burnup. A burnup of 9 at. percent is equivalent to about 29,000 Mwt days of EBR-II reactor operation, which corresponds to 11 reactor runs at 2700 Mwd per run. Instrumentation within XX08 includes 16 spacer-wire coolant thermocouples with junctions at various axial and radial locations within the fuel-element bundle, six top-of-core-elevation fuel-pin thermocouples, two subassembly-outlet-coolant thermocouples, two permanent-magnet flowmeters for measuring subassembly flow, and two rhodium self-powered detectors for neutron-flux determinations. Signals from the instrumentation are processed and recorded using the EBR-II digital data-acquisition system (DAS). This report provides detailed information on engineering, design, and assembly of XX08.

- 84 (ANL--78-10, pp 192-201) STATUS OF THE POST ACCIDENT HEAT REMOVAL PROGRAM AT GFK FOR FAST BREEDER REACTORS. Hofmann, F.; Alsmeyer, H.; Hame, W.; Perinic, D.; Schulz, B. (Gesellschaft fuer Kernforschung, Karlsruhe, Ger.). 1977.

From 3. post-accident heat removal information exchange; Argonne, IL, USA (2 Nov 1977).

Long term coolability and stable containment of irradiated core material with internal decay heat generation must be possible under quite a number of circumstances of various accident conditions in a LMFBR. The post accident heat removal (PAHR) assessment has to assure coolability for situations after both local and global core disruptions. In-vessel and on a higher level of defense even ex-vessel coolability of core material has to be established. The present state of post accident heat removal R&D activities at GfK is summarized.

- 85 (ANL--78-10, pp 5-8) ROLE OF MECHANISTIC ANALYSIS IN PROVIDING PAHR INITIAL CONDITIONS. Jackson, J.F. (Los Alamos Scientific Lab., NM). 1977.

From 3. post-accident heat removal information exchange; Argonne, IL, USA (2 Nov 1977).

The objective of this paper is to discuss how Postaccident Heat Removal (PAHR) calculations interface with the earlier accident phases in overall mechanistic accident analyses, to briefly review the evolution of the transition phase as an important path in LMFBR core disruptive accidents, and to assess the impact of the transition phase on PAHR analyses.

- 86 (ANL--78-10, pp 9-14) VIEWS ON POST-ACCIDENT HEAT REMOVAL. Marchese, A.R. (Nuclear Regulatory Commission, Washington, DC). 1977.

From 3. post-accident heat removal information exchange; Argonne, IL, USA (2 Nov 1977).

Some thoughts on the technical needs, fundamental direction, and relative emphasis that should be characteristic of studies on post-accident heat removal are presented.

- 87 (ANL--78-10, pp 26-34) CURRENT STATE OF ANALYSIS OF RECRITICALITY UNDER PAHR CONDITIONS. Abramson, P.B. (Argonne National Lab., IL). 1977.

From 3. post-accident heat removal information exchange; Argonne, IL, USA (2 Nov 1977).

In the highly unlikely event of failure to scram following a loss of coolant flow in an LMFBR, fuel pins would melt and fuel, cladding, and coolant would be redistributed. The redistribution of materials is generically the most difficult of the reactor safety analysis problems. Since as materials relocate, their hydrodynamic and thermodynamic interactions are altered, any error in the calculation of the relocations is rapidly compounded to a point that what is calculated may have very little resemblance to reality. Attempts to deterministically calculate these material interactions and motions have taken on a parametric nature in an effort to provide a reasonable set of bounds on the macroscopic accident consequences (such as the potential challenge to the containment). Unfortunately, while some efforts have been fruitful, many of these parametric attempts have resulted in sets

of bounds which are so wide as to provide no useful information. Because each material in the reactor has specific effects upon the neutronic behavior, and because a typical LMFBR contains so much fissionable material that a relatively small fraction of the original core can itself cause a prompt critical configuration, and because the effects of a neutronic prompt critical excursion are felt neither hydrodynamically nor thermodynamically until the configuration is reached, we do not have the ability to rule out by deterministic analysis the occurrence of second prompt critical excursion (recriticality). The current state of analytical efforts to understand recriticality is reviewed.

- 88 (ANL--78-10, pp 35-46) SECONDARY CRITICALITY EVALUATIONS OF POSTULATED CORE MELT-DOWN ACCIDENTS IN EARLY-SIZED LMFBR'S. Harless, W.H.; Talwar, B.; Gluekler, E.L. (General Electric Co., Sunnyvale, CA). 1977.

From 3. post-accident heat removal information exchange; Argonne, IL, USA (2 Nov 1977).

Secondary criticality analyses have been performed for an early-sized LMFBR. The results indicate that recriticality will occur only as a result of extremely unlikely combinations of failures which lead to melt-down of a large portion of the reactor core, subsequent formation of a relatively pure fuel layer, and/or substantial vessel deformation. Design features were identified that could be used to eliminate recriticality or mitigate its effects if needed to meet safety requirements. The presently existing large uncertainties in the containment response and radiological consequences of single or multiple recriticalities may be reduced with the aid of dynamic analyses that couple neutronic, thermal, and hydrodynamic methods.

- 89 (ANL--78-10, pp 49-60) PRELIMINARY RESULTS FROM INITIAL IN-PILE DEBRIS BED EXPERIMENTS. Rivard, J.B. (Sandia Labs., Albuquerque, NM). 1977.

From 3. post-accident heat removal information exchange; Argonne, IL, USA (2 Nov 1977).

The initial series of three experiments in the ACPR, designated D-1, D-2, and D-3, was designed to provide basic data on the cooling capacity of representative debris beds under typical accident conditions. Important issues addressed include: (1) whether or not bed depth is an influencing parameter on cooling capacity; (2) what the influence of sodium subcooling is; and (3) how the results correlate with the results of nonreactor experiments and with analytical treatments. Besides providing this frame of reference for safety assessment, it was expected that an initial understanding of bed phenomena would be gained, the details of which could be determined in future experiments. This paper reports preliminary results from the D-series of three experiments.

- 90 (ANL--78-10, pp 62-72) EFFECT OF PARTICLE SIZE DISTRIBUTION AND NON-HEATED CONSTITUENTS ON DEBRIS BED DRY-OUT. Dhir, V.K.; Catton, I. (Univ. of California, Los Angeles). 1977.

From 3. post-accident heat removal information exchange; Argonne, IL, USA (2 Nov 1977).

Past studies of debris bed dry-out have been made using beds of a single particle size (UCLA) or a particle size distribution that attempted simulation of TREAT tests or ANL experiments (ANL, SANDIA). A systematic

variation of the particle size distribution has not yet been made. It is the purpose of this work to report on a study of the effect of particle size distribution on debris bed dry-out. Another aspect of this work considered the effect of mixtures of unheated and heated constituents on dry-out. Measurements were also made of segregated beds. The dry-out heat flux data are compared with models based on semi-theoretical correlations developed earlier for deep beds.

- 91 (ANL--78-10, pp 74-80) PARTICULATE BED FORMATION AND PHENOMENA. Gabor, J.D.; Sowa, E.S.; Pavlik, J.R.; Cassulo, J.C. (Argonne National Lab., IL). 1977.

From 3. post-accident heat removal information exchange; Argonne, IL, USA (2 Nov 1977).

The mechanics of particulate debris formation by interaction of molten-core material and sodium and the subsequent phenomena of sodium boiling within the interstices of the particulate debris are important elements in Post-accident Heat Removal analyses. Recent large-scale particulate-bed-formation tests and investigations on channel formation and hydraulic phenomenon associated with heat removal from fragmented core debris are reported here.

- 92 (ANL--78-10, pp 81-87) EXPERIMENTAL STUDIES OF A HEAT GENERATING POROUS BED. Lee, D.O.; Nilson, R.H. (Sandia Labs., Albuquerque, NM). 1977.

From 3. post-accident heat removal information exchange; Argonne, IL, USA (2 Nov 1977).

The paper describes experimental observations and qualitative interpretations of flow patterns and temperature distributions for a series of steady state bench experiments in which fission product decay is simulated by Joule heating of the liquid phase. Both single-phase and two-phase boiling phenomena are examined. Particular emphasis is given to the influence of subcooling at the upper surface of a boiling bed. In addition, a brief discussion of similitude parameters and experimental scaling is presented. These considerations suggest a good degree of similarity between the D2 series of in pile experiments at Sandia and the supportive simulant experiments which are reported here.

- 93 (ANL--78-10, pp 92-98) CORE DEBRIS DEPOSITION IN THE PRIMARY HEAT TRANSPORT SYSTEM PIPING OF LMFBRs. Tsai, S.S. (Brookhaven National Lab., Upton, NY). 1977.

From 3. post-accident heat removal information exchange; Argonne, IL, USA (2 Nov 1977).

A hypothetical core disruptive accident may lead to the upward ejection of core fuel into the upper sodium plenum of a liquid metal fast breeder reactor (LMFBR). Subsequently, the fuel will quench and fragment in the subcooled sodium. Due to the gravitational force, some of the core debris may settle onto horizontal surfaces in the vessel, and the remainder of the debris will be swept out of the reactor vessel into the primary heat transport system piping. Depending on the sodium flow rate in the primary system piping, the debris will either remain suspended or settle out of the sodium stream. It is assumed that the three primary loops are intact and sodium flow is maintained by the pony motors. Due to the low pony-motor-driven sodium flow rate, the core debris is expected to settle out of the sodium

stream and deposit on the bottom walls of the primary piping. It is the purpose of this study to investigate the possibility of forming a debris bed on the piping walls and to assess the coolability of such a bed.

- 94 (ANL--78-10, pp 205-214) EXPERIMENTAL AND THEORETICAL STUDIES ON WATER AND GAS RELEASE FROM HEATED CONCRETE. McCormack, J.D.; Postma, A.K. (Hanford Engineering Development Lab., Richland, WA). 1977.

From 3. post-accident heat removal information exchange; Argonne, IL, USA (2 Nov 1977).

Procedures currently used in licensing of nuclear facilities require analysis of postulated accidents which are more severe than "design basis" events. For breeder program reactors, some accidents in this severe category involve spillage of sodium coolant onto concrete protected by a steel liner. Heat transfer through the liner heats the concrete, causing a part of the mixing water and other gases to be driven off. These gases would add to pressure in the containment atmosphere, and the water vapor can form hydrogen if it contacts sodium. Evaluations of containment integrity for such postulated accidents will be aided by knowledge of how much water and other gases are released from heated concrete. Results are presented of a research effort at Hanford Engineering Development Laboratory designed to improve understanding of the release of water and gases from heated concrete.

- 95 (ANL--78-10, pp 223-232) CORE DEBRIS PENETRATION INTO CONCRETE. Baker, L. Jr.; Cheung, F.B.; Bingle, J.D. (Argonne National Lab., IL). 1977.

From 3. post-accident heat removal information exchange; Argonne, IL, USA (2 Nov 1977).

Analyses of the behavior of core debris following an HCDA require a thorough understanding of the interactions of core debris with concrete. The nature of the attack of core debris on the concrete below the reactor cavity is important because it involves the final line of defense against violation of the containment. One of the most important factors to be determined is the ratio of sideward to downward growth of molten core debris pools in concrete. Such a determination requires evaluations of both the "concrete-side" heat transfer and gas release behavior and the "pool-side" heat transfer behavior as well as of the coupling between the two. This paper describes an empirical approach to evaluate the "concrete-side" conditions and outlines a preliminary pool-growth model (GROWS II) which uses this approach. Two sets of representative "pool-side" conditions were used for illustrative purposes. No coupling effects such as the changes in pool heat transfer caused by the gases released from the concrete were considered in these preliminary calculations.

- 96 (ANL--78-10, pp 233-242) CONCRETE FAILURE MODES AT ELEVATED TEMPERATURES. Gluekier, E.L. (General Electric Co., Sunnyvale, CA); Dayan, A. 1977.

From 3. post-accident heat removal information exchange; Argonne, IL, USA (2 Nov 1977).

Local failure modes of concrete at high surface temperatures have been determined based on microstructural investigation and failure surface calculations. Preliminary results indicate that concrete crushing does not occur

and spallation would occur only under extreme conditions.

- 97 (ANL--78-10, pp 243-249) LARGE SCALE SODIUM TEST FACILITY AT SANDIA LABORATORIES. King, D.L.; Smaardyk, J.E.; Sutherland, H.J.; Sallach, R.A. (Sandia Labs., Albuquerque, NM). 1977.

From 3. post-accident heat removal information exchange; Argonne, IL, USA (2 Nov 1977).

The large scale sodium test facility in use at Sandia Laboratories was designed to be used for a wide range of sodium interaction experiments. Of initial concern is the interaction of hot sodium with concrete under conditions similar to accident conditions in any sodium cooled reactor. The tests to be run cover the cases of sodium spills and sprays on bare concrete and on cells with defective steel liners. The initial series of tests in progress at the facility involves rapidly dropping from 20 kg to 225 kg of sodium at temperatures from 550°C to 850°C into concrete crucibles that are representative of the concrete to be used at the Clinch River Breeder Reactor Plant (CRBRP). Specific objectives are to obtain sufficient information to completely describe the sodium/concrete interaction including: reaction rate, heat of reaction, gas evolution and flow, movement of the reaction front, reaction product formation, and the effects of variation of drop temperature and reaction area geometries.

- 98 (ANL--78-10, pp 250-257) LARGE SCALE SODIUM INTERACTIONS WITH LIMESTONE CONCRETE. Sallach, R.A.; Smaardyk, J.E.; Sutherland, H.J.; King, D.L.; Dahlgren, D.A. (Sandia Labs., Albuquerque, NM). 1977.

From 3. post-accident heat removal information exchange; Argonne, IL, USA (2 Nov 1977).

For sodium cooled reactors, knowledge of the interaction of hot sodium with cell liners and, given either a failed liner or a core disruptive accident, the interaction of hot sodium with concrete are necessary for a safety assessment. To better understand what happens when hot sodium contacts concrete, a series of tests is being carried out under conditions which are similar to postulated reactor accident conditions. Specific objectives are to obtain a complete description of the sodium/concrete interaction including heat balance, gas evolution and flow, movement of and heat generation in the reaction zone, reaction product formation, and the layering and movement of the reaction products. The experimental results of the initial three tests of the test series are presented. These tests were "uninstrumented" in that the full array of instrumentation had not yet been installed. The test results do include thermal data from thermocouples immersed in the sodium pool, post-test measurements of penetration depths, and post-test chemical analyses of the reaction products.

- 99 (ANL--78-10, pp 258-266) INTERMEDIATE SCALE SODIUM-CONCRETE REACTION TESTS. Hassberger, J.A. (Hanford Engineering Development Lab., Richland, WA). 1977.

From 3. post-accident heat removal information exchange; Argonne, IL, USA (2 Nov 1977).

Twelve intermediate scale, sodium-concrete reaction tests have been completed. These tests involved spilling hot (1250 to 1600°F, 677 to 871°C) sodium onto 1 ft³ (.028 m³) specimens of magnetite of limestone concretes. The resulting

reactions were allowed to continue for from 2 to 24 hours, at which time the sodium was decanted from the test article. Included are discussions of the observed penetration depths, chemical analyses of the reaction products, characterization of the evolved gases and a brief summary of laboratory scale experiments performed earlier.

- 100 (ANL--78-10, pp 267-272) HYDROGEN JET RECOMBINATION UNDER POSTULATED BREEDER REACTOR ACCIDENT CONDITIONS. Wierman, R.W. (Hanford Engineering Development Lab., Richland, WA). 1977.

From 3. post-accident heat removal information exchange; Argonne, IL, USA (2 Nov 1977).

Certain conditions may be postulated in breeder reactor risk assessments for which the potential of hydrogen release to the reactor containment building needs to be evaluated. One of these conditions is a postulated core melt-through accident followed by cavity liner failure allowing sodium to react with the structural concrete resulting in the release of free hydrogen. If the hydrogen-sodium vapor mixtures in the reactor cavity were to jet into the containment building and inherently self-ignite at the source where they enter the reactor containment building, no immediate hydrogen accumulation would occur. However, as the oxygen in the sealed containment building is consumed by hydrogen and sodium, the oxygen concentration may decrease to a point at which the hydrogen may cease burning. The self-ignition and extinguishment characteristics of hydrogen-sodium jets need to be understood for complete breeder reactor safety analysis. Therefore, experiments have been conducted investigating hydrogen jet burning characteristics under conditions similar to those postulated for core melt-through accidents. The data presented below describe the conditions for jet self-ignition and extinguishment using a small-scale apparatus.

- 101 (ANL--78-10, pp 275-285) HEAT TRANSFER BY NATURAL CONVECTION IN CONFINED MEDIUM. Grand, D.; Martin, R.; Tenchine, D. (CEN, Grenoble, France). 1977.

From 3. post-accident heat removal information exchange; Argonne, IL, USA (2 Nov 1977).

In order to estimate the performances of a core-catcher located inside the main vessel of a pool type reactor, one needs to know the heat transfer coefficient between the core-catcher and the surrounding sodium and also the thermal resistance of the large volumes of sodium between the heat source and the outer ultimate cooling circuit. The development of natural convection in the different volumes of sodium separated by metal walls is also of interest.

- 102 (ANL--78-10, pp 286-296) METHOD FOR ESTIMATING THE PERFORMANCES OF AN INTERNAL CORE-CATCHER IN A POOL-TYPE LMFBR. Kayser, G.; LeRigoleur, C. (Centre d'Etudes Nucleaires, Cadarache, France). 1977.

From 3. post-accident heat removal information exchange; Argonne, IL, USA (2 Nov 1977).

A large pool-type fast reactor presents two important advantages in concern with PAHR: an important sodium volume with a high heat capacity; and a large diameter allowing the retainment of molten fuel in a very thin layer. The objective of this study is to show the practical interest of these advantages and the possible performances of an internal core catcher.

- 103 (ANL--78-10, pp 303-308) DYNAMIC BEHAVIOR OF SNR-300 CORE RETENTION DEVICE AND EXPERIMENTAL SUPPORT OF THE DESIGN CONCEPT. Friedrich, H.J. (Internationale Atomreaktorbau GmbH, Bergisch Gladbach, Ger.). 1977.

From 3. post-accident heat removal information exchange; Argonne, IL, USA (2 Nov 1977).

Methods and results are presented of temperature course investigations relating to the large Na-pool underneath the reactor vessel after a hypothetical meltthrough of the core debris. Temperature behavior of this pool controls the thermal load of the containment, steam release, aerosol production, and the thermal load of the core catcher components themselves. The SNR-300 Primary System is designed to withstand the consequences of a HDCA without major leakage of sodium. Since there is a good chance to remove the decay heat either by natural convection through the three primary loops or by the six especially protected emergency coolers, no serious rise of the mean sodium temperature can occur.

- 104 (ANL--78-10, pp 309-316) INVESTIGATION OF MARGINS IN FFTF CONTAINMENT DESIGN. Stepniewski, D.D.; Simpson, D.E.; Peak, R.D. (Hanford Engineering Development Lab., Richland, WA). 1977.

From 3. post-accident heat removal information exchange; Argonne, IL, USA (2 Nov 1977).

Analyses are presented of predicted phenomena and containment building transients for postulated failures of post-accident heat removal (PAHR) that follow a hypothetical core disruptive accident (HCDA) in the Fast Flux Test Facility (FFTF). The results are included of two cases which typify two classes of failure modes of in-vessel PAHR for FFTF. As previously discussed, a disrupted core would be predicted to remain within the reactor vessel, coolable as a debris bed by the primary HTS loops. There are three independent primary loops; any one loop has sufficient capability to cool the core. If, however, all three loops failed, then the sodium coolant would heat up, reach its boiling point, and eventually boil away into the Reactor Containment Building (RCB). This scenario forms the basis for the 'in-vessel' cases treated in subsequent sections of the paper. On the other hand, if for any reason HCDA core debris were to assume a noncoolable configuration, the fuel could melt its way through successive barriers consisting of the core shield-orifice assemblies, core basket region, and lower dome of the core support structure. If a coolable configuration did not develop in the reactor vessel inlet plenum, the lower vessel head would be penetrated, with molten material release to the guard vessel. It is probable that fuel fragmentation would occur in the guard vessel, resulting in a coolable configuration, a conclusion supported by the ANL M-5 test. If further progression occurred, with penetration of the guard vessel, sodium and core materials would then be released to the reactor cavity floor. This scenario is the basis for 'ex-vessel' cases treated in this paper.

- 105 (ANL--78-10, pp 317-326) EVALUATIONS OF CRBRP THERMAL MARGIN BEYOND THE DESIGN BASE. Schornhorst, J.R.; Strawbridge, L.E.; Bradbury, P. (Westinghouse Advanced Reactors Div., Madison, PA). 1977.

From 3. post-accident heat removal

information exchange; Argonne, IL, USA (2 Nov 1977).

This paper assesses the Thermal Margin Beyond the Design Base (TMBDB). Specifically, the consequences of a whole core melt, resulting in penetration of the reactor vessel and guard vessel are assessed. The plant features provide thermal margin such that containment integrity can be maintained for not less than 24 hours after initiation of the event as required by the Nuclear Regulatory Commission. The design features that provide the thermal margin beyond the design base described are illustrated. Some of these features are provided specifically for TMBDB while other features have augmented capabilities to provide TMBDB.

- 106 (ANL--78-10, pp 327-334) EX-VESSEL CONTAINMENT RESPONSE TO A CORE MELTDOWN. Pyun, J.J.; Gasser, R.D.; Pratt, W.T.; Bari, R.A. (Brookhaven National Lab., Upton, NY). 1977.

From 3. post-accident heat removal information exchange; Argonne, IL, USA (2 Nov 1977).

The Third Level Thermal Margin (TLM) design analysis for the Clinch River Breeder Reactor (CRBR) assumes (in the extremely unlikely event of a hypothetical core disruptive accident) that melt-through of the reactor vessel and guard vessel will occur 1000 seconds after shutdown. All of the active core and lower axial blanket together with 4.5×10^6 gm of steel is then distributed over the 1219.2 cm diameter reactor cavity floor. Approximately 544×10^6 gm of sodium at 1050°F is also released into the cavity, and it is assumed that the fuel and steel form a sodium-flooded, self-leveling debris bed. As a consequence of this assumption, all of the decay heat is transferred to the sodium. It is also assumed that the steel liner on the reactor cavity floor fails and is followed by a reaction of sodium with concrete. The purpose of the present investigation is to consider the possibility that a molten fuel and steel pool may exist rather than a sodium-flooded debris bed.

- 107 (ANL--78-10, pp 335-342) REVIEW OF CONTAINMENT TRANSIENTS IN A 2500 MW/SUB T/ SODIUM COOLED BREEDER REACTOR FOLLOWING POSTULATED CORE DISRUPTIVE ACCIDENTS. Armstrong, G.R.; Seeman, S.E. (Hanford Engineering Development Lab., Richland, WA). 1977.

From 3. post-accident heat removal information exchange; Argonne, IL, USA (2 Nov 1977).

Three types of containment configurations for breeder reactors of the 2500 MW(t) class were compared to determine the typical responses associated with each type to selected hypothetical accident conditions. The study was conducted for ERDA-RDD by HEDL to provide insight as to the sensitivity of accident consequences to various design and phenomenological assumptions, and thereby provide potentially useful input to guidance of R and D activities. The types of containment systems investigated in the study were the single, double and containment-confinement designs. Two types of hypothetical accidents were arbitrarily assumed as bases for the initial conditions in the evaluation--the energetic core disruptive accident and the whole core melt-through accident. More than 20 separate cases were analyzed in which selected design and phenomenological assumptions were varied. The primary computer codes used in the study were CACECO, HAA, and COMRADEX.

- 108 (ANL--78-10, pp 353-360) HEAT TRANSFER IN VOLUMETRICALLY-HEATED POOLS WITH GAS INJECTION AT THE BOUNDARIES. Abdel-Khalik, S.I.; Felde, D.K. (Univ. of Wisconsin, Madison). 1977.

From 3. post-accident heat removal information exchange; Argonne, IL, USA (2 Nov 1977).

A volumetrically-heated pool with noncondensable gas injection at the boundaries is used to simulate the heat transfer processes taking place in molten core debris/concrete systems. Measurements of the upward, downward, and sideward heat transfer rates have been made over wide ranges of internal Rayleigh number ($6.0 \times 10^5 < Ra < 2.7 \times 10^9$), superficial gas velocity ($0 < V_g < 2.5$ cm/min), and pool aspect ratio ($1.32 < W/L < 5.16$). Pools with either an isothermal solid upper boundary or a free surface have been examined. Detailed measurements of the temperature distribution within the pool have also been made. The results indicate that the downward heat transfer rates are significantly increased while the sideward heat transfer rates are slightly affected by gas injection. The heat transfer rates at the pool boundaries are sensitive to the upper surface boundary condition.

- 109 (ANL--78-10, pp 361-368) BUBBLE-INDUCED HEAT TRANSFER IN A HEAT GENERATING LIQUID LAYER. Bergholz, R.F.; Bjorge, R. (Argonne National Lab., IL). 1977.

From 3. post-accident heat removal information exchange; Argonne, IL, USA (2 Nov 1977).

The purpose of this investigation is to study the heat transfer behavior of a volumetrically heated liquid layer with gas bubbling from a horizontal, porous, lower boundary. The experimental data obtained are used to develop a correlation for the interfacial heat transfer coefficient for use in PAHR pool growth models. The experimental results also provide information on the upward heat loss due to gas and vapor flow through the liquid layer. Finally, the characteristics of bubble-induced heat transfer at a porous surface are compared with those found in experiments on nucleate boiling.

- 110 (ANL--78-10, pp 369-376) THERMO-FLUID MECHANICS OF VOLUME-HEATED BOILING POOLS. Greene, G.A.; Jones, D.C. Jr.; Schwarz, C.E. (Brookhaven National Lab., Upton, NY). 1977.

From 3. post-accident heat removal information exchange; Argonne, IL, USA (2 Nov 1977).

A program to study the behavior of volume-heated boiling pools has been undertaken at BNL in order to provide meaningful estimates of heat transfer mechanisms in such systems. Emphasis has been placed on developing appropriate scaling parameters to allow results to be applied to prototypical, hypothetical accident conditions in an LMFBR. It has been determined that, within experimental accuracy, a boiling pool seems to exhibit behavior much like a single-phase natural convection system with a much extended laminar film regime to local Rayleigh numbers approximately 10^{12} .

- 111 (ANL--78-10, pp 389-397) SANDIA IN-CORE MOLTEN FUEL POOL EXPERIMENT PRELIMINARY RESULTS. Plein, H.G.; Carlson, G.A. (Sandia Labs., Albuquerque, NM). 1977.

From 3. post-accident heat removal information exchange; Argonne, IL, USA (2 Nov

1977).

The PAHR Molten Fuel Pool experimental program is concerned with the interaction of very hot fuel with reactor structural or sacrificial materials. The approach is to use fission heated fuel to obtain sustained, intrinsic heating which rather closely approximates the decay heated case. This experimental method also allows the fuel to interact with real structural and core retention materials at the actual temperatures of interest. The development of an advanced temperature diagnostic, ultrasonic thermometry, for the molten pool experiments; a materials compatibility study which defined the materials used for containment and insulation for the in-core experiments; and the results of the first three in-core molten pool experiments, two with UO_2 -only, and one containing both UO_2 and steel are presented. Plans for future molten pool studies are also discussed.

- 112 (ANL--78-10, pp 408-414) MOLTEN CORE DEBRIS INTERACTIONS WITH CORE CONTAINMENT MATERIALS. Swanson, D.G. (Ivan A. Getting Labs., El Segundo, CA); Zehms, E.H.; Ang, C.Y.; van Paassen, H.L.L. 1977.

From 3. post-accident heat removal information exchange; Argonne, IL, USA (2 Nov 1977).

A series of experiments have been performed to study the interactions expected in a hypothetical core meltdown accident between molten core debris and materials that might be used for core containment. The core debris would contain UO_2 and substantial quantities of stainless steel from the fuel cladding and support structures. Many sacrificial-bed concepts have been proposed for core containment in which materials are used that have been identified as having desirable thermal, chemical, and mechanical properties. In the experiments described here, the interactions between molten UO_2 and steel and various materials that might be employed have been investigated on a small scale. Molten UO_2 interactions with MgO brick, low-carbon steel plate, and stainless-steel plate have been studied, and interactions between molten stainless steel and MgO brick and low-carbon steel plate were also examined.

- 113 (ANL--78-10, pp 415-423) INTERACTIONS OF UO_2 WITH REACTOR MATERIALS. Fink, J.K.; Heiberger, J.J.; Leibowitz, L. (Argonne National Lab., IL). 1977.

From 3. post-accident heat removal information exchange; Argonne, IL, USA (2 Nov 1977).

Two sets of in-progress small-scale interaction experiments are discussed. The interaction of UO_2 -graphite and stainless steel is being studied from 1894 to 2760 K for varied amounts of stainless steel (0 to 75%). Results of these experiments indicate that, below 2223 K, CO production is inhibited by the presence of stainless steel. Between 2223 K and 2760 K, the rate of CO evolution is significantly increased by the presence of stainless steel. The reaction rate increases with temperature. The interactions of Na_2O - Na_2CO_3 with UO_2 , mixtures of UO_2 and stainless steel, and ThO_2 at 1255 K are discussed. Na_2O - Na_2CO_3 interacts with UO_2 forming sodium uranates. Stainless steel particles dissolve in the Na_2O - Na_2CO_3 - UO_2 mixture to a limited extent. No reaction was observed between Na_2O - Na_2CO_3 and ThO_2 .

- 114 (ANL--78-10, pp 425-432) MEASUREMENT OF THE PENETRATION OF MOLTEN CORE MATERIALS INTO CONCRETE USING AN ACOUSTIC TECHNIQUE.

Sutherland, H.J. (Sandia Labs., Albuquerque, NM). 1977.

From 3. post-accident heat removal information exchange; Argonne, IL, USA (2 Nov 1977).

In a recent article, Sutherland and Kent described a pulse-echo ultrasonic technique which measures the motion, as a function of time, of the interface of two dissimilar materials. They illustrated the technique by monitoring the motion of an ice/flame interface and a concrete/plasma jet interface, and they suggested that this technique could be used to monitor the motion of a molten pool/concrete interface. The technique, with some modifications, has now been used in this second configuration. These modifications and some preliminary results are reported.

- 115 (ANL--78-10, pp 433-440) SUSTAINED MOLTEN STEEL/CONCRETE INTERACTIONS TESTS. Powers, D.A. (Sandia Labs., Albuquerque, NM). 1977.

From 3. post-accident heat removal information exchange; Argonne, IL, USA (2 Nov 1977).

Four tests of the sustained interaction between high-temperature steel melts and two varieties of concrete are described. Inductive heating was used to keep the 200 Kg stainless steel melts liquid for periods of up to 20 min. A cover assembly over the melt-concrete system controlled emissions produced by the interactions so that quantification of phenomena produced in the tests could be attempted. Measurements of the gas composition, gas temperature, gas generation rate, aerosol emissions, upward heat-flux from the melt, and melt-temperature were made. Gases liberated from the concrete were found to be chemically reduced principally to carbon monoxide and hydrogen as they passed through the melt. The tests provided some evidence that stainless steel may also catalyze the hydrogenation of carbon monoxide to yield hydrocarbons such as methane, ethene, and ethane in the gas stream.

- 116 (ANL--78-17) ANALYTICAL STUDY OF THE FEASIBILITY OF IRRADIATING $^{233}\text{U}/^{232}\text{Th}$ METAL FUEL EXPERIMENTS IN EBR-II. Foltman, A.J.; Meneghetti, D. (Argonne National Lab., IL (USA)). Apr 1978. Contract W-31-109-ENG-38. 34p. AT.

Recent concerns about proliferation and diversion of plutonium have led to reconsideration of $^{233}\text{U}/^{232}\text{Th}$ fuel cycles. Although thorium fuels have been studied earlier, much of that work is incomplete; consequently, additional irradiation studies will be necessary. Experimental Breeder Reactor II (EBR-II) has the capability to perform many of these studies. Two broad types of irradiation experiments using $^{233}\text{U}/^{232}\text{Th}$ metal fuel are investigated: (1) full-core and/or blanket loadings and (2) individual experimental subassemblies loaded into current EBR-II cores. Calculations indicate that current EBR-II core dimensions give rise to ^{233}U enrichments as high as 48% and even higher for full-core loadings using $^{235}\text{U}/^{232}\text{Th}$ fuel. Because the uranium content in thorium is metallurgically restricted to 20 wt %, these enrichments are impractical. On the other hand, calculations show that it is feasible to irradiate up to six $^{233}\text{U}/^{232}\text{Th}$ metal-fueled subassemblies containing as much as 20 wt % uranium in thorium. Each experimental subassembly would be located in a row-7 "corner" of EBR-II's core. The local environment of the experiment would be tailored by surrounding the experiment with three subassemblies containing beryllium in row 8 and

three subassemblies containing half beryllium and half fueled driver elements in rows 6 and 7. Linear heat-generation rates of 40.4 to 53.1 kW/m are obtainable while heating in nearby rows increases less than 15%. Burnup should be about 2.9 to 3.6 at. % per year. Little degradation of the remaining core environment occurs, and the experiments would have only a modest impact on EBR-II's current irradiation program.

- 117 (ANL--78-23) PHYSICS OF REACTOR SAFETY. QUARTERLY REPORT, OCTOBER--DECEMBER 1977. (Argonne National Lab., IL (USA)). Mar 1978. Contract W-31-109-ENG-38. 32p. Dep. NTIS, PC A03/MF A01.

Work on the reactor safety program includes Monte Carlo analysis of safety-related critical assembly experiments by members of the Theoretical Fast Reactor Physics Group, and Planning of Safety-Related (ZPR) Planning and Experiments Group. Work on reactor core thermal-hydraulic code development performed in the Components Technology Division is also included.

- 118 (ANL--78-24) LOSS-OF-FLOW TEST L5 ON FFTF-TYPE IRRADIATED FUEL. Simms, R.; Gehl, S.M.; Lo, R.K.; Rothman, A.B. (Argonne National Lab., IL (USA)). Mar 1978. Contract W-31-109-ENG-38. 139p. Dep. NTIS, PC A07/MF A01.

Test L5 simulated a hypothetical loss-of-flow accident in an LMFBR using three (Pu, U) O_2 fuel elements of the FTR type. The test elements were irradiated before TREAT Test L5 in the General Electric Test Reactor to 8 at. % burnup at about 40 kW/m. The preirradiation in GETR caused a fuel-restructuring range characteristic of moderate-power structure relative to the FTR. The test transient was devised so that a power burst would be initiated at incipient cladding melting after the loss of flow. The test simulation corresponds to a scenario for FTR in which fuel in high-power-structure subassemblies slump, resulting in a power excursion. The remaining subassemblies are subjected to this power burst. Test L5 addressed the fuel-motion behavior of the subassemblies in this latter category. Data from test-vehicle sensors, hodoscope, and post-mortem examinations were used to construct the sequence of events within the test zone. From these observations, the fuel underwent a predominantly dispersive event just after reaching a peak power six times nominal at, or after, scram. The fuel motion was apparently driven by the release of entrained fission-product gases, since fuel vapor pressure was deliberately kept below significant levels for the transient. The test remains show a wide range of microstructural evolution, depending on the extent of heat deposition along the active fuel column. Extensive fuel swelling was also observed as a result of the lack of the cladding restraint. The results of the thermal-hydraulic calculations with the SAS3A code agreed qualitatively with the postmortem results with respect to the extent of the melting and the dispersal of cladding and fuel. However, the calculated times of certain events did not agree with the observed times.

- 119 (ANL--78-28) VISCOSITY OF MOLTEN ALUMINA. Blomquist, R.A.; Fink, J.K.; Leibowitz, L. (Argonne National Lab., IL (USA)). Mar 1978. Contract W-31-109-ENG-38. 18p. Dep. NTIS, PC A02/MF A01.

In the analysis of LMFBR core-containment and heat-removal problems associated with

- hypothetical core-disruptive accidents, viscosity data on molten ceramics are needed to help analyze the convective heat transfer and flow patterns within liquid pools. An oscillating cup viscometer has been used to measure the viscosity of molten alumina in the temperature range from 2400 to 2750°K. The data are represented by the equation: $\log \eta = 11448/T - 8.2734$ where the viscosity, η , is given in pascal seconds and the temperature, T , is in kelvins.
- 120 (ANL--78-30) TRITIUM METERS FOR USE IN LMFBF SODIUM COOLANT. Skladzien, S.B.; Renner, T.A.; Raue, D.J.; McPheeters, C.C. (Argonne National Lab., IL (USA)). Jun 1978. Contract W-31-109-ENG-38. 21p. AT.
- Tritium meters for continuously measuring tritium concentrations in the liquid metal coolant of fast breeder reactors have been designed, built, and tested. The tritium meters operate by diffusion of tritium from the sodium through a nickel membrane into a sweep-gas stream. The sweep gas flows to a gas-proportional-counting tube in which the tritium activity is measured. Tests on the Apparatus for Monitoring and Purifying sodium (AMPS) at ANL have shown excellent agreement between calculated and observed count rates under various conditions of sweep-gas flow rate and membrane temperature.
- 121 (ANL--78-31) STUDY OF THE TRANSIENT CORRECTION FACTOR USED IN TREAT REACTOR IN-PILE EXPERIMENTS. Graff, D.L. (Argonne National Lab., IL (USA)). Mar 1978. Contract W-31-109-ENG-38. 57p. Dep. NTIS, PC A04/MF A01.
- The transient correction factor (TCF) is used in TREAT reactor experiments to predict the power calibration coefficient (PC) for prototype LMFBF fuel pins at transient conditions without subjecting the pins to a reactor transient. The TCF is defined as the fissions in a monitor wire per MW of reactor power at transient conditions divided by the fissions in a monitor wire per MW of reactor power at low power conditions. The power calibration factor is the power in the target fuel per gram of ^{235}U per MW reactor power. The purpose of this study was to reduce the uncertainties concerning the transient correction factor by examining the nature and applicability of the TCF method. ANISN, a discrete-ordinates transport code, was used to simulate two TREAT reactor tests.
- 122 (ANL--78-34) TRANSIENT ENERGY TRANSFER BY CONDUCTION AND RADIATION FOR A SUDDEN CONTACT BETWEEN MOLTEN UO_2 AND SODIUM. Cho, D.H.; Chan, S.H. (Argonne National Lab., IL (USA)). Mar 1978. Contract W-31-109-ENG-38. 18p. Dep. NTIS, PC A02/MF A01.
- The transient energy transfer following a sudden contact between molten UO_2 and sodium has been investigated, taking into consideration both conduction and internal thermal radiation in UO_2 . Analytical expressions for the contact-interface temperature valid for small times are derived. Illustrative calculations indicate that on a time scale relevant to fuel-coolant interactions, internal radiation of molten UO_2 should have an insignificant effect on the contact-interface temperature between molten UO_2 and sodium. It thus appears that for the purpose of assessing the potential for an explosive fuel-coolant interaction, the contact-interface temperature may be adequately determined based on consideration of pure conduction.
- 123 (ANL--78-36) ROLE OF BUBBLE-SIZE EQUILIBRATION IN THE TRANSIENT BEHAVIOR OF FISSION GAS. Gruber, E.E. (Argonne National Lab., IL (USA)). Apr 1978. Contract W-31-109-ENG-38. 32p. Dep. NTIS, PC A03/MF A01.
- An explicit analysis of bubble-size equilibration by volume diffusion has been derived and incorporated into the FRAS2 code. This code was developed for mechanistic analysis of transient fission-gas behavior in LMFBF fuel, but had been limited by the approximation that the time required for bubble-size adjustment, following coalescence or changes in temperature or pressure, was negligible. The equilibration phenomenon is illustrated by several idealized examples. If the fuel temperature rises linearly with time, an isolated bubble will expand rapidly toward its equilibrium size only after the temperature reaches a critical value that depends on both bubble size and heating rate. Conversely, if the temperature is reduced uniformly, an isolated bubble will shrink only until diffusion becomes too slow for further size change. The final size that is "frozen in" may be significantly larger than the final equilibrium size. Finally, isothermal equilibration following coalescence of two equal bubbles can be described conveniently in terms of relaxation times, which depend on bubble size and temperature. However, a complete picture of the role of equilibration in transient fission-gas behavior can only be gained through an investigation of the bubble-size distribution and its evolution. Such an investigation is carried out with the FRAS2 code, in which the explicit equilibration model is implemented. Since nonequilibrium bubbles in a thermal transient are generally overpressured, the gas represents a source of energy that can conceivably disrupt the fuel. This "dispersive potential" is also calculated in the FRAS2 code.
- 124 (ANL--78-38) EXPERIMENTAL VALIDATION OF PTA-1 COMPUTER CODE FOR PRESSURE-TRANSIENT ANALYSIS INCLUDING THE EFFECT OF PIPE PLASTICITY. Youngdahl, C.K.; Kot, C.A.; Valentin, R.A. (Argonne National Lab., IL (USA)). Jul 1978. Contract W-31-109-ENG-38. 59p. AT.
- The PTA-1 code for computing pressure transients in piping networks includes a computational model to treat the significant effect of plastic deformation of the piping on pulse propagation. Stanford Research Institute has completed an experimental program on the response of piping systems to internal pressure pulses which plastically deform portions of the piping. This report makes extensive comparisons between PTA-1 computations and these experimental results. The excellent agreement obtained for both pressure histories and strain histories for all the experiments indicates that the PTA-1 computational model for pipe plasticity effects is accurate. The computation-experiment comparisons also permit a number of observations and conclusions to be made on other aspects of computational modeling of pressure transients, particularly with respect to pulse propagation around elbows.
- 125 (ANL--78-41) COMPARISONS OF SODIUM VOID AND DOPPLER REACTIVITIES IN LARGE OXIDE AND CARBIDE LMFBRS. Su, S.F. (Argonne National Lab., IL (USA)). Mar 1978. Contract W-31-109-ENG-38. 64p. Dep. NTIS, PC A04/MF A01.
- Sodium void and Doppler reactivities in two full scale (3000 MWth) LMFBRS are analyzed; one is fueled with UO_2 - PuO_2 and the other is fueled with UC - PuC . These two reactors are

analyzed for beginning of life as well as for beginning and end of equilibrium cycle conditions, and the variations of these two safety parameters with burnup are explained. A series of comparative analyses of these two and several hypothetical reactors are carried out to determine how differences in fuel type, sodium content, and heavy metal concentration between an oxide and a carbide reactor affect their sodium void and Doppler reactivities. The effect of the presence of control poison on sodium void reactivity is also addressed.

- 126 (ANL--78-50) F1 PHENOMENOLOGICAL TEST ON FUEL MOTION: FINAL REPORT. Palm, R.G.; Gehl, S.M.; Fink, C.L.; Dever, D.J.; Rothman, A.B. (Argonne National Lab., IL (USA)). May 1978. Contract W-31-109-ENG-38. 95p. Dep. NTIS, PC A05/MF A01.

TREAT F-series tests are being conducted to provide data on fuel motion in an LMFBR during a hypothetical loss-of-flow accident. Fuel and fuel-boundary conditions in an LMFBR subassembly following sodium voiding and dryout under loss-of-flow conditions are simulated in each F-series test. Simulation is achieved with a single fuel element surrounded by an annular nuclear-heated wall in a dry (no sodium) test capsule. The area inside the heated wall was selected to represent the area inside the perimeter of an LMFBR coolant channel. Test F1 was conducted with an irradiated fuel element to investigate the effect of fission gas on fuel motion at design power levels following cladding melting and drainage. The principal conclusion from Test F1 is that fission products retarded, but did not prevent, eventual fuel collapse. The collapse was retarded by a fuel/fission-product froth that prevented fuel collapse until the fission products separated from the partially molten fuel. The fuel motion observed in F1 represents a particular type of fuel (burnup of 2.35 at.%, power rating of 394 W/cm) transient heated at design power rating.

- 127 (ANL--78-51) NODAL METHOD FOR SOLVING TRANSIENT FEWGROUP NEUTRON DIFFUSION EQUATIONS. Shober, R.A. (Argonne National Lab., IL (USA)). Jun 1978. Contract W-31-109-ENG-38. 82p. AT.

A nodal method for multidimensional light water reactor (LWR) static and transient analysis is presented. This method efficiently solves one- or two-group diffusion equations using an analytic solution procedure. The report details significant improvements made to those aspects of the method previously reported in the literature. Eigenvalues and power distributions are presented for several static benchmark problems. Time-dependent results for a difficult two-dimensional BWR kinetics benchmark problem are presented. A reference solution for this benchmark problem is also presented. The results presented in the report are summarized, and suggestions are made as to appropriate ways to extend this work to multigroup fast breeder reactor analysis.

- 128 (ANL--78-56) PROSA-1: A PROBABILISTIC RESPONSE-SURFACE ANALYSIS CODE. Vaurio, J.K.; Mueller, C. (Argonne National Lab., IL (USA)). Jun 1978. Contract W-31-109-ENG-38. 157p. Dep. NTIS, PC A08/MF A01.

Techniques for probabilistic response-surface analysis have been developed to obtain the probability distributions of the consequences of postulated nuclear-reactor accidents. The uncertainties of the consequences are caused by the variability of the system and model input parameters used in

the accident analysis. Probability distributions are assigned to the input parameters, and parameter values are systematically chosen from these distributions. These input parameters are then used in deterministic consequence analyses performed by mechanistic accident-analysis codes. The results of these deterministic consequence analyses are used to generate the coefficients for analytical functions that approximate the consequences in terms of the selected input parameters. These approximating functions are used to generate the probability distributions of the consequences with random sampling being used to obtain values for the accident parameters from their distributions. A computer code PROSA has been developed for implementing the probabilistic response-surface technique. Special features of the code generate or treat sensitivities, statistical moments of the input and output variables, regionwise response surfaces, correlated input parameters, and conditional distributions. The code can also be used for calculating important distributions of the input parameters. The use of the code is illustrated in conjunction with the fast-running accident-analysis code SACO to provide probability studies of LMFBR hypothetical core-disruptive accidents. However, the methods and the programming are general and not limited to such applications.

- 129 (ANL--78-58) EBR-II FISSION-PRODUCT-SOURCE TEST NO. 1. EBR-II PROJECT. Strain, R.V.; Fogle, G.L.; Thresh, H.R.; Heinrich, R.R.; Fryer, R.M.; So, B.Y.C.; Lambert, J.D.B. (Argonne National Lab., IL (USA)). Aug 1978. Contract W-31-109-ENG-38. 42p. AT.

A fission-product source (FPS) was irradiated in EBR-II to provide data for calibrating the facility's fuel-element rupture detector (FERD), which is a delayed-neutron monitor, and germanium-lithium argon-scanning system (GLASS), a fission-gas-activity monitor. A metal alloy source, Ni-3.2 wt % U, provided quantitative recoil release of the fission-product nuclides. The source alloy, in tubular form, was irradiated as core-region segments of 18 capsules in the FPS subassembly. The irradiation showed that the response of the FERD was linear with increasing reactor power. The magnitude of the FERD signal was dependent on the local fission rate for the FPS and the flow path of the sodium carrying the delayed-neutron emitters. The relatively high fission-gas activity released by the FPS allowed accurate calibration of the GLASS under several modes of operation and provided data for verifying a gas-release model for the reactor.

- 130 (ANL--78-59) CREEP-FATIGUE LIFE PREDICTION FOR DIFFERENT HEATS OF TYPE 304 STAINLESS STEEL BY LINEAR-DAMAGE RULE, STRAIN-RANGE PARTITIONING METHOD, AND DAMAGE-RATE APPROACH. Maiya, P.S. (Argonne National Lab., IL (USA)). Jul 1978. Contract W-31-109-ENG-38. 22p. Dep. NTIS, PC A02/MF A01.

The creep-fatigue life results for five different heats of Type 304 stainless steel at 593°C (1100°F), generated under push-pull conditions in the axial strain-control mode, are presented. The life predictions for the various heats based on the linear-damage rule, strain-range partitioning method, and damage-rate approach are discussed. The appropriate material properties required for computation of fatigue life are also included.

- 131 (ANL--78-64) TRITIUM AND HYDROGEN TRANSPORT IN LMFBR SYSTEMS: EBR-II, CRBR, AND FFTF. Renner, T.A.; McPheeters, C.C.

(Argonne National Lab., IL (USA)). Sep 1978. Contract W-31-109-ENG-38. 37p. AT.

A tritium and hydrogen transport model has been employed to simulate concentration profiles, tritium losses to auxiliary containment systems, and cold trap burdens for EBR-II, CRBR, and FFTF. Experimental data from EBR-II were found to correlate well with calculated tritium and hydrogen profiles. A major change relative to previous transport models, namely, the inhibiting effect of oxide coatings on tritium permeation through reactor structural surfaces, has been incorporated into the current model. Tritium release rates to auxiliary systems where oxide barrier effects were included were predicted to be approximately two orders of magnitude lower than those for the reference case where structural surfaces were assumed to be totally oxide-free. Tritium releases during operation of large LMFBRs are expected to present essentially no hazard to the environment.

- 132 (ANL--78-69) COMBINED MOTION OF FUEL AND COOLANT DUE TO FUEL-COOLANT INTERACTIONS UNDER HIGH RAMP RATE REACTIVITY INSERTION. Chang, K.I.; Cho, D.H. (Argonne National Lab., IL (USA)). Jul 1978. Contract W-31-109-ENG-38. 52p. AT.

An analysis has been made of the combined motion of fuel and coolant due to fuel-coolant interactions following a massive fuel failure in a high-ramp overpower transient. The motion of fuel and coolant was described using a two-fluid model formulation in which the mixture of sodium liquid and vapor and of fission gas, on the one hand, and the fuel particles, on the other, were treated as two superimposed continua. The method of solution employed was a numerical procedure called the ACE method, a modified version of the IMF technique. Illustrative calculations were made for a fuel rupture length of 60 cm in the FFTF geometry. Three different modes of fragmentation were considered. First, upon pin failure, molten fuel is completely fragmented and uniformly distributed in the coolant (uniform fragmentation). Second, fragmentation is initiated at the bottom of the mixing zone and propagates upward (bottom-initiated progressive fragmentation). Third, fragmentation is initiated at the top of the mixing zone and propagates downward (top-initiated progressive fragmentation).

- 133 (ANL--78-70, pp 74-88) LMFBR AND GCFR SUPPORT WORK. Aug 1978.

Chemical Engineering Division research highlights, 1977.

Information is presented concerning reactor safety and physical property studies; sodium technology; and fuels and materials chemistry.

- 134 (ANL--78-70) CHEMICAL ENGINEERING DIVISION RESEARCH HIGHLIGHTS, 1977. (Argonne National Lab., IL (USA)). Aug 1978. Contract W-31-109-ENG-38. 185p. Dep. NTIS, PC A09/MF A01.

Separate abstracts are included for sections with information on lithium/metal sulfide batteries; electrochemical energy development; advanced fuel cell development; utilization of coal; magnetohydrodynamics technology; LMFBR and GCFR support work; fuel cycle studies; fusion reactor research; solar energy development; and basic energy science.

- 135 (ANL--78-73) FAILURE OF A HIGH-POWER PIN IN A SIMULATED $\$3/S$ TOP ACCIDENT: TEST E6 FINAL REPORT. Doerner, R.C.; Murphy, W.F.;

Stahl, D.; Stanford, G.S. (Argonne National Lab., IL (USA)). Aug 1978. Contract W-31-109-ENG-38. 147p. AT.

This report describes the Fuel Dynamics Test E6 and analyzes the test data. A cluster of six fresh FTR-type fuel pins surrounding a previously irradiated pin was tested to failure in a simulated $\$3/S$ FFTF accident. It is shown that: (1) the central 34.3-cm-long test pin is thermodynamically equivalent to a one-third scale model of the 91.4-cm-long FFTF pins; (2) failure occurred 70 ms earlier than predicted in the PSAR; (3) postfailure fuel motion was principally upward in direction and from the center of the cluster, with no more than 10 g of total fuel loss; (4) the outlet blockage was formed in stages; (5) the irradiated fuel is more mobile than fresh fuel; (6) there were no significant fuel-coolant interactions; and (7) the lower one-third of the test pin suffered only minor cladding damage and no inlet blockage was formed. It is concluded that the mechanisms that led to initial failure can be reliably applied to the FTR. Characterization of the initial fuel release in amount, location, structure (solid, liquid or foam), and rate were reasonably prototypic. Postfailure coolant dynamics, however, were not very prototypic. Although the amount of fuel swept out is probably realistic, the formation of an outlet blockage and its impact on adjacent channel hydraulics is clearly nonprototypic.

- 136 (ANL--78-74) METALLOGRAPHIC AND FRACTOGRAPHIC OBSERVATIONS OF POSTTEST CREEP-FATIGUE SPECIMENS OF WELD-DEPOSITED TYPE 308 CRE STAINLESS STEEL. Williams, M.W. (Argonne National Lab., IL (USA)). Aug 1978. Contract W-31-109-ENG-38. 19p. AT.

Type 308 CRE stainless steel weld specimens were subjected to metallographic and fractographic analysis after failure in elevated-temperature (593°C) creep-fatigue tests. The failure mode for specimens tested under continuous-cycle fatigue conditions was predominantly transgranular. When the test cycle was modified to include a hold time at the maximum tensile strain, the failure mode became predominantly interphase. Sigma phase was observed within the delta-ferrite regions in the weld. However, the presence of sigma phase did not appear to affect the failure mode.

- 137 (ANL--78-84) ULTRASONIC SCANNER FOR STAINLESS STEEL WELD INSPECTIONS. Kupperman, D.S.; Reimann, K.J. (Argonne National Lab., IL (USA)). Sep 1978. Contract W-31-109-ENG-38. 34p. AT.

The large grain size and anisotropic nature of stainless steel weld metal make conventional ultrasonic testing very difficult. A technique is evaluated for minimizing the coherent ultrasonic noise in stainless steel weld metal. The method involves digitizing conventional "A-scan" traces and averaging them with a minicomputer. Results are presented for an ultrasonic scanner which interrogates a small volume of the weld metal while averaging the coherent ultrasonic noise.

- 138 (ANL--78-86) SECOND MECHANIZED INSERVICE INSPECTION OF EBR-II STEAM GENERATOR. Longua, K.J.; Whitham, G.K.; Allen, C.C.; Larson, H.A. (Argonne National Lab., IL (USA)). Nov 1978. Contract W-31-109-ENG-38. 18p. AT.

The second mechanized ultrasonic inspection of evaporator EV-702, part of the EBR-II steam-generator system, was completed in March 1978.

The 2 1/4 Cr-1 Mo duplex tubes were inspected from the bore (water) side for flaws and changes in wall thickness and for evaluating the condition of the braze between the tubes. An addition to this second inspection was the use of an ultrasonic probe to search for circumferential flaws. The inspection equipment was thoroughly checked and routinely calibrated, using a reference standard containing electrical-discharge-machined notches. Notches as small as 1.6 mm long by 0.25 mm deep were readily detected.

- 139 (ANL--78-87) DISPOSAL OF RADIOACTIVE SODIUM WASTE. McPheeters, C.C.; Wolson, R.D. (Argonne National Lab., IL (USA)). Sep 1978. Contract W-31-109-ENG-38. 25p. AT.

Operation of liquid-metal-cooled fast breeder reactors (LMFBRs) will result in production of various quantities of radioactive sodium waste. Two methods have been developed and tested on a small scale for converting this sodium waste to inert compounds suitable for disposal. The first method is direct oxidation of the sodium after dispersal in a silica matrix. The sodium is mixed with silica and oxidized in a rotary drum reactor. The product is suitable for making glass when other stabilizing compounds are added. The second method is reaction of elemental sodium with molten NaOH at 450°C and subsequent injection of steam into the melt to convert the reaction products (Na_2O and NaH) to additional NaOH. The reactions are smooth and easily controlled with little danger of runaway reactions. The end product is molten NaOH which can be cast into drums for further treatment or disposal. The advantages of these two methods over more conventional aqueous processes are the elimination of aqueous wastes and the elimination or minimization of gaseous effluents. 9 figures, 3 tables.

- 140 (ANL--78-89) FINAL SAFETY ANALYSIS ADDENDUM TO HAZARD SUMMARY REPORT, EXPERIMENTAL BREEDER REACTOR NO. II (EBR-II): THE EBR-II COVER-GAS CLEANUP SYSTEM. Fryer, R.M.; Monson, L.R.; Price, C.C.; Hooker, D.W. (Argonne National Lab., IL (USA)). Apr 1979. Contract W-31-109-ENG-38. 91p. AT.

This report evaluates abnormal and accident conditions postulated for the EBR-II cover-gas cleanup system (CGCS). Major considerations include loss of CGCS function with a high level of cover-gas activity, loss of the liquid-nitrogen coolant required for removing fission products from the cover gas, contamination of the cover gas from sources other than the reactor, and loss of system pressure boundary. Calculated exposures resulting from the maximum hypothetical accident (MHA) are less than 2% of the 25-Rem limit stipulated in U.S. Regulation 10 CFR 100; i.e., a person standing at any point on an exclusion boundary (area radius of 600 m) for 2 h following onset of the postulated release would receive less than 0.45 Rem whole-body dose. The on-site whole-body dose (10 m from the source) would be less than 16 Rem.

- 141 (ANL--78-92) LIQUID-LIQUID CONTACT IN VAPOR EXPLOSION. Segev, A. (Argonne National Lab., IL (USA)). Aug 1978. Contract W-31-109-ENG-38. 188p. Dep. NTIS, PC A09/MF A01.

The contact of two liquid materials, one of which is at a temperature substantially above the boiling point of the other, can lead to fast energy conversion and a subsequent shock wave. This phenomenon is called a vapor explosion. One method of producing intimate,

liquid-liquid contact (which is known to be a necessary condition for vapor explosion) is a shock tube configuration. Such experiments in which water was impacted upon molten aluminum showed that very high pressures, even larger than the thermodynamic critical pressure, could occur. The mechanism by which such sharp pressure pulses are generated is not yet clear. The report describes experiments in which cold liquids (Freon-11, Freon-22, water, or butanol) were impacted upon various hot materials (mineral oil, silicone oil, water, mercury, molten Wood's metal or molten salt mixture).

- 142 (ANL--78-97) FX2-TH: A TWO-DIMENSIONAL NUCLEAR REACTOR KINETICS CODE WITH THERMAL-HYDRAULIC FEEDBACK. Shober, R.A.; Daly, T.A.; Ferguson, D.R. (Argonne National Lab., IL (USA)). Oct 1978. Contract W-31-109-ENG-38. 380p. Dep. NTIS, PC A17/MF A01.

FX2-TH is a two-dimensional, time-dependent nuclear reactor kinetics program with thermal and hydraulic feedback. The neutronics model used is multigroup neutron diffusion theory. The following geometry options are available: x, r, x-y, r-z, theta-r, and triangular. FX2-TH contains two basic thermal and hydraulic models: a simple adiabatic fuel temperature calculation, and a more detailed model consisting of an explicit representation of a fuel pin, gap, clad, and coolant. FX2-TH allows feedback effects from both fuel temperature (Doppler) and coolant temperature (density) changes. FX2-TH will calculate a consistent set of steady state conditions by iterating between the neutronics and thermal-hydraulics until convergence is reached. The time-dependent calculation is performed by the use of the improved quasistatic method. A disk editing capability is available. FX2-TH is operational on IBM system 360 or 370 computers and on the CDC 7600.

- 143 (ANL--78-99) RESULTS OF UO_2 DIAGNOSTIC TESTS FOR RUN BEYOND CLADDING BREACH IN EBR-II. Strain, R.V.; Lambert, J.D.B. (Argonne National Lab., IL (USA)). Feb 1979. Contract W-31-109-ENG-38. 36p. AT.

Predefected UO_2 fuel elements were irradiated in EBR-II to determine the response of the fission-product-monitoring systems. In particular, the tests were performed to indicated whether the amount of oxide fuel exposed to the primary sodium could be estimated by monitoring, with the fuel-element-rupture detector (FERD), delayed neutrons (DN's) emitted from bromine and iodine isotopes in the sodium. Elements with defect areas of 0.005 and 0.20 cm^2 were irradiated consecutively in April and June 1977. The smaller defect produced no measurable DN signal, and the larger defect produced a DN signal of approx. 55 counts per second (cps) while irradiated at 11.3 kW/ft (3.44 kW/m) and 70 cps at 14.3 kW/ft (4.35 kW/m). The signal of 55 cps was about 20 times the signal that would be expected if the release from the defect had been solely by recoil from the exposed fuel. Postirradiation examination of the elements showed that an unexpectedly large amount of UO_2 /sodium chemical reaction occurred in the element with the 0.20- cm^2 defect.

- 144 (ANL--78-100) THEORY AND APPLICATION OF A QUASI-EULERIAN FLUID ELEMENT FOR THE STRAW CODE. Kennedy, J.M.; Belytschko, T.B. (Argonne National Lab., IL (USA)). Oct 1978. Contract W-31-109-ENG-38. 51p. Dep. NTIS, PC A04/MF A01.

Two-dimensional finite-element models for the treatment of the nonlinear, transient

response of fluids and structures are described. The fluid description is quasi-Eulerian, so that the mesh can move independently of the material, and it includes a new finite-element upwinding scheme. The structural description is based on a corotational formulation in which the coordinate system is embedded in the elements, which is applicable to arbitrarily large rotations. The interface between the fluid and structure permits relative sliding, but because of the description of the quasi-Eulerian fluid, the nodes of the fluid and structure can be allowed to remain contiguous. Modeling procedures for treating the various aspects of subassemblies, such as the narrow fluid channels, the fuel bundles which are immersed in the coolant, and the axial flow are developed. Calculations are made for a symmetric 7-subassembly cluster and compared to experimental results. In addition, the application to a 19-subassembly cluster is described.

- 145 (ANL--78-102) FLUCTUATION ANALYSIS OF FAST REACTOR SAFETY EXPERIMENTS IN TREAT. Doerner, R.C.; Meek, C.C.; Hurt, R.F.; Pekarsky, M.I. (Argonne National Lab., IL (USA)). Nov 1978. Contract W-31-109-ENG-38. 71p. AT.

Statistical fluctuations of measured signals about their mean are related to physical processes in fuel-failure experiments. Signal variance, correlation, and spectral density are shown to be sensitive measures of instrument response characteristics, of flow-blockage formation, and of boiling phenomena. This sensitivity is demonstrated by a series of examples that use test data from the E6, E7, and L5 experiments. A mathematical model of the Mark-II loop is developed to predict both the mean and the fluctuation behavior of measured test parameters. The analysis is extended to include signal forecasting by the ARIMA time-series model. Techniques that are used to identify the model and to estimate the model parameters are discussed in detail. It is shown that departure of real-time data from the on-line forecasts is a powerful tool for the rapid detection of off-normal conditions. A description of the experiments and the data-reduction process is given.

- 146 (ANL--78-103) ANALYSIS OF NONLINEAR FLUID STRUCTURE INTERACTION TRANSIENT IN FAST REACTORS. Wang, C.Y. (Argonne National Lab., IL (USA)). Nov 1978. Contract W-31-109-ENG-38. 60p. Dep. NTIS, PC A04/MF A01.

A generalized Eulerian method is described for analyzing the fluid transients and the structural response in nuclear reactors under the postulated accident conditions. The phenomena considered are the wave propagation, slug impact, sodium spillage, bubble migration, and the fluid-structure interaction. The basic equations and numerical formulation are presented in detail. Sample calculations are given to illustrate the analysis. It is shown from the results that the implicit, iterative method used is unconditionally stable and is especially suitable for problems involving large material distortions.

- 147 (ANL--78-104) INVESTIGATIONS OF MATERIALS COMPATIBILITY RELEVANT TO THE EBR-II SYSTEM, FY 1978. Longue, K.J.; Shields, J.A.; Ruther, W.E.; Olson, W.H. (Argonne National Lab., IL (USA)). Jan 1979. Contract W-31-109-ENG-48. 23p. AT.

Thermocouple assemblies used to monitor sodium piping failed in FY 1977. The

examination in FY 1978 showed that these corrosion failures of the thermocouples have not caused any degradation of the sodium piping. Evaporator EV-702 was ultrasonically inspected for the second annual inspection. The in-service inspection of the steam system and the secondary sodium system did not reveal any evidence of material degradation or defects in any pipe welds. An EBR-II periscope used to examine reactor internals became inoperative owing to deposition of sodium aerosol on its faceplate. A method was devised for preventing such deposition. Various illumination sources for the periscope were evaluated, and a GE sealed-beam lamp was recommended. Notch tensile tests did not detect any difference in notch sensitivity between 12% cold-worked AISI 316 and annealed AISI 304 stainless steels after irradiation.

- 148 (ANL--78-105) ICEPEL ANALYSIS OF AND COMPARISON WITH SIMPLE ELASTIC--PLASTIC PIPING EXPERIMENTS. A-Moneim, M.T. (Argonne National Lab., IL (USA)). Dec 1978. Contract W-31-109-ENG-38. 60p. Applied Technology.

The results of simple elastic--plastic piping experiments for straight pipes and single-elbow loop systems are interpreted and evaluated. The experiments are also analyzed by the ICEPEL piping code, and the analytical results are compared against the experimental data. Good agreement is obtained in predicting both pressure and circumferential strain histories along the pipe systems. Inside the elbow, however, the analysis showed radial pressure variation while the experiments showed no radial pressure variation. Consequently, the ICEPEL elbow model was modified to resolve this discrepancy. The new model agreed with the experiments in showing no radial pressure variation.

- 149 (ANL--79-7) DEVELOPMENT OF A MK-II LOOP TO SIMULATE REACTOR HYDRAULIC CONDITIONS. Page, R.J.; Robinson, L.E. (Argonne National Lab., IL (USA)). Jan 1979. Contract W-31-109-ENG-38. 35p. AT.

The Mk-II Integral Loop was modified to provide an in-pile experimental apparatus that would simulate the subassembly coolant flow rate and inlet pressure head of the Fast Test Reactor (FTR). There were two main design changes. First, the safety dump tanks were removed from the Mk-II loop and replaced by a second annular linear induction pump (ALIP). Second, a flow-restricting orifice was sized so that the hydraulic requirements of prototypical test-section coolant velocity (670 cm/s) and pressure head (0.74 MPa) would be achieved. In support of this effort, out-of-pile experiments were conducted to determine the frictional pressure drop across a seven-pin fuel bundle; determine the pumping characteristics of the dual ALIP system; determine the calibration characteristics of several sharp-edge orifices; and improve the test-section outlet flowmeter sensitivity. The resulting redesigned loop was used for the in-pile TREAT transient over-power Test H6, which investigated fuel sweepout and coolability following fuel-pin failure under hydraulic conditions typical of the FTR.

- 150 (ANL--79-13) SUMMARY OF TREAT EXPERIMENTS ON OXIDE CORE-DISRUPTIVE ACCIDENTS. Dickerman, C.E.; Rothman, A.B.; Klickman, A.E.; Spencer, B.W.; DeVolpi, A. (Argonne National Lab., IL (USA)). Feb 1979. Contract W-31-109-ENG-38. 59p. Dep. NTIS, PC A04/MF A01.

A program of transient in-reactor experiments is being conducted by Argonne

National Laboratory in the Transient Reactor Test (TREAT) facility to guide and support analyses of hypothetical core-disruptive accidents (HCDA) in liquid-metal fast breeder reactors (LMFBR). Test results provide data needed to establish the response of LMFBR cores to hypothetical accidents producing fuel failure, coolant boiling, and the movement of coolant, molten fuel, and molten cladding. These data include margins to fuel failure, the modes of failure and movements, and evidence for identification of the mechanisms which determine the failure and movements. A key element in the program is the fast-neutron hodoscope, which detects fuel movement as a function of time during experiments.

- 151 (ANL--79-14) WASTE PRODUCTION AND MANAGEMENT AT EBR-II. Witbeck, L.C.; Fryer, R.M. (Argonne National Lab., IL (USA)). Apr 1979. Contract W-31-109-ENG-38. 43p. AT.

This report surveys waste production rates and disposal practices at EBR-II, a small-scale liquid-metal fast breeder reactor, for the past decade. Normal airborne wastes have been reduced by switching to low-sulfur fuel oil in auxiliary boilers and by converting to use of reactor steam for part of the plant space heating. Atmospheric releases of gaseous radioactive wastes initially increased during the implementation of programs for testing reactor fuels to and beyond cladding breach; but the effluent rates have now been reduced to far below permissible limits by use of a cryogenic distillation column. EBR-II's small production of liquid radioactive waste is handled by evaporation, followed by disposal of the evaporator sludge as solid waste. Liquid-waste releases meet all applicable state and federal standards. Solid wastes are sent to two storage/disposal areas - one of which is reserved primarily for storage of materials containing sodium, pending development of a facility for disposal of the sodium. In overall waste emission, EBR-II compares very favorably with commercial light-water reactors.

- 152 (ANL--79-26) FISSION-PRODUCT RELEASES TO THE PRIMARY SYSTEM OF EBR-II FROM APRIL 1975 TO MARCH 1977. So, B.Y.C.; Lambert, J.D.B.; Kirn, F.S.; Armstrong, J.R.; Ebersole, E.R.; Laug, M.T. (Argonne National Lab., IL (USA)). May 1979. Contract W-31-109-ENG-38. 59p. AT.

This report describes the 14 releases of fission products that occurred in EBR-II from April 1975 to March 1977. Each release was readily detected, and all but one (in a driver-fuel subassembly) was identified with a particular subassembly. Xenon tagging was the primary method of identification, although other methods were used where appropriate. Methods of monitoring and identifying fission-product sources are discussed, and each release and identification is described. Effects of breached elements on plant availability were minimal in this period. From all evidence, cladding breaching on elements in EBR-II continues to be a benign process.

- 153 (ANL--79-27) FISSION-PRODUCT RELEASES TO THE PRIMARY SYSTEM OF EBR-II FROM APRIL 1977 TO MAY 1978. So, B.Y.C.; Gross, K.C.; Lambert, J.D.B.; Kirn, F.S.; Ebersole, E.R.; Laug, M.T. (Argonne National Lab., IL (USA)). Jul 1979. Contract W-31-109-ENG-38. 27p. AT.

Suspected fission-product releases from 18 subassemblies between April 1977 and May 1978 are described. Postirradiation examinations on 15 of the suspect subassemblies confirmed that

all contained one or more breached elements. Except for two untagged subassemblies, xenon tagging was the primary method of identification, although other methods were used where appropriate. Methods to monitor and identify fission-product sources are discussed. Problems encountered with multiple-element breaches are described. Overall, the effects of breached elements on plant availability were minimal during this reporting period. From all evidence, cladding breaching on elements in EBR-II continues to be a benign process.

- 154 (ANL--79-57) DEVELOPMENT OF A METHODOLOGY FOR ANALYSIS OF DELAYED-NEUTRON SIGNALS. Gross, K.C.; Strain, R.V.; Fryer, R.M. (Argonne National Lab., IL (USA)). Feb 1980. Contract W-31-109-ENG-38. 84p. NTIS, PC A05/MF A01.

Experimental and analytical techniques have been developed for analysis and characterization of delayed-neutron (DN) signals that can provide diagnostic information to augment data from cover-gas analyses in the detection and identification of breached elements in an LMFBR. Eleven flow-reduction tests have been run in EBR-II to provide base data support for predicting DN signal characteristics during exposed-fuel operation. Results from the tests demonstrate the feasibility and practicability of response-analysis techniques for determining (a) the transit time, $T_{\text{sub tr}}$, for DN emitters traveling from the core to the detector and (b) the isotropic holdup time, $T_{\text{sub h}}$, of DN precursors in the fuel element.

- 155 (ANL--79-63) MECHANICAL PROPERTIES TEST PROGRAM ON STRUCTURAL MATERIALS IN A SODIUM ENVIRONMENT. Natesan, K.; Chopra, D.K.; Kassner, T.F. (Argonne National Lab., IL (USA)). Oct 1979. Contract W-31-109-ENG-38. 20p. Dep. NTIS, PC A02/MF A01.

This document describes in detail the ongoing and planned US Test program on the mechanical properties of sodium-exposed Type 316 austenitic stainless and Fe-2 1/4 Cr-1 Mo ferritic steels. The test program is based on the Development Requirement Specifications (DRS) established by the DOE/Clinch River Breeder Reactor Project (CRBRP) Program Office, the general need for the development of LMFBR structural-design criteria established by the Nuclear Systems Materials Handbook, and the need for a fundamental understanding of materials behavior in a sodium environment, which is generic to LMFBR systems. The planned test program is an extension of work based on current knowledge of sodium chemistry and the influence of sodium purity on the mechanical properties of structural materials.

- 156 (ANL--79-70) NUMERICAL METHOD FOR SOLUTION OF TRANSIENT, HOMOGENEOUS, EQUILIBRIUM, TWO-PHASE FLOWS IN ONE SPACE DIMENSION. Shin, Y.W.; Wiedermann, A.H. (Argonne National Lab., IL (USA)). Oct 1979. Contract W-31-109-ENG-38. 28p. Dep. NTIS, PC A03/MF A01.

A solution method is presented for transient, homogeneous, equilibrium, two-phase flows of a single-component fluid in one space dimension. The method combines a direct finite-difference procedure and the method of characteristics. The finite-difference procedure solves the interior points of the computing domain; the boundary information is provided by a separate procedure based on the characteristics theory. The solution procedure for boundary points requires information in addition to the physical boundary conditions.

This additional information is obtained by a new procedure involving integration of characteristics in the hodograph plane. Sample problems involving various combinations of basic boundary types are calculated for two-phase water/steam mixtures and single-phase nitrogen gas, and compared with independent method-of-characteristics solutions using very fine characteristic mesh. In all cases, excellent agreement is demonstrated.

- 157 (ANL--79-72) ALICE: A HYBRID LAGRANGIAN-EULERIAN CODE FOR CALCULATING FLUID-STRUCTURE INTERACTION TRANSIENTS IN FAST-REACTOR CONTAINMENT. Chu, H.Y. (Argonne National Lab., IL (USA)). Aug 1979. Contract W-31-109-ENG-38. 59p. Dep. NTIS, PC A04/MF A01.

This report describes a reactor-containment code, ALICE, which uses an arbitrary Lagrangian-Eulerian method to describe the coolant motion, together with a Lagrangian method to analyze the response of the containment vessel and other solid media inside a reactor containment. The finite-difference formulation used to approximate the governing equations for the motion of the coolant can be solved in either an explicit or an implicit scheme; the finite-element formulation used to approximate the governing equations for the containment vessel and other solid media can be performed only in the explicit scheme. Thus, the ALICE code can perform two types of coupling calculations for the fluid and structure (implicit-explicit and explicit-explicit). The code is generalized so that it can apply to problems either in a two-dimensional Cartesian or in a two-dimensional cylindrical-coordinate system.

- 158 (ANL--79-73) MULTICHANNEL CLAD-RELOCATION MODEL FOR FAST-REACTOR LOSS-OF-FLOW ACCIDENTS. Ishii, M.; Chen, W.L.; Grohmes, M.A. (Argonne National Lab., IL (USA)). Aug 1979. Contract W-31-109-ENG-38. 62p. Dep. NTIS, PC A04/MF A01.

During an unprotected undercooling accident in a liquid-metal fast breeder reactor, the motion and relocation of the molten cladding can be important because of its potentially significant effect on reactivity, blockage formation, and subsequent fuel motion. The present study analyzes the clad relocation problem based on a multichannel film-flow model. The important aspects considered in the analysis are the non-uniform transverse clad-melting pattern and diversions of sodium-vapor flow within a subassembly. It has been shown that the motion of molten clad and subsequent blockage formations can be significantly influenced by this interconnected channel effect. Several sample calculations have been made in order to demonstrate these points.

- 159 (ANL--79-86) LASER MICROSAMPLING METHOD FOR DETERMINATION OF RETAINED FISSION GAS IN IRRADIATED NUCLEAR FUELS. Graczyk, D.G.; Bandyopadhyay, G.; Gehl, S.M.; Hughes, J.P.; Goodspeed, H.T. (Argonne National Lab., IL (USA)). Oct 1979. Contract W-31-109-ENG-38. 41p. Dep. NTIS, PC A03/MF A01.

A small ruby laser adapted to fire through a microscope is used to release fission gases from specific sites on a plane surface of an irradiated fuel specimen. Interaction of the focused laser pulse with the specimen surface results in a conical crater from which sampled material has been vaporized; the crater is surrounded by a heat-affected zone in which intergranular fracture and grain separation allow release of grain-boundary gases. Procedures for measuring the amount of krypton-

85 released by laser heating and the volume of material from which the release occurred are presented. The data obtained may be used to obtain local krypton fission-gas concentrations and the intragranular/intergranular distribution.

- 160 (ANL--79-89) QUASI-EULERIAN METHOD FOR ANALYZING SLUG IMPACT AND COOLANT SPILLAGE IN A FAST-REACTOR ACCIDENT. Chu, H.Y. (Argonne National Lab., IL (USA)). Dec 1979. Contract W-31-109-ENG-38. 31p. Dep. NTIS, PC A03/MF A01.

This report describes a quasi-Eulerian method which has been incorporated into the ICECO code to study slug impact and coolant spillage problems in a fast-reactor accident. The quasi-Eulerian cells used in this method are located on the tops of the regular cells. The axial size of the quasi-Eulerian cells varies according to the gap generated at the reactor head-wall junction. Penetration holes on the cover head are modeled on the top center of the quasi-Eulerian cells. Fluid variables in these quasi-Eulerian cells also satisfy all the conservation equations. Since the boundary pressures above the quasi-Eulerian cells are determined by the movement of the moving grid, the velocity of the cover head is also included in the pressure iteration. Several examples are given to compare the results obtained by this quasi-Eulerian method with the existing experimental excursion data, as well as with the analytical and the other code solutions.

- 161 (ANL--79-91) LIMBO COMPUTER CODE FOR ANALYZING COOLANT-VOIDING DYNAMICS IN LMFBR SAFETY TESTS. Bordner, G.L. (Argonne National Lab., IL (USA)). Oct 1979. Contract W-31-109-ENG-38. 34p. Dep. NTIS, PC A03/MF A01.

The LIMBO (liquid metal boiling) code for the analysis of two-phase flow phenomena in an LMFBR reactor coolant channel is presented. The code uses a nonequilibrium, annular, two-phase flow model, which allows for slip between the phases. Furthermore, the model is intended to be valid for both quasi-steady boiling and rapid coolant voiding of the channel. The code was developed primarily for the prediction of, and the posttest analysis of, coolant-voiding behavior in the SLSF P-series in-pile safety test experiments. The program was conceived to be simple, efficient, and easy to use. It is particularly suited for parametric studies requiring many computer runs and for the evaluation of the effects of model or correlation changes that require modification of the computer program. The LIMBO code, of course, lacks the sophistication and model detail of the reactor safety codes, such as SAS, and is therefore intended to compliment these safety codes.

- 162 (ANL--79-104) FINITE-ELEMENT METHOD FOR ABOVE-CORE STRUCTURES. Kennedy, J.M.; Belytschko, T.B. (Argonne National Lab., IL (USA)). Dec 1979. Contract W-31-109-ENG-38. 50p. Dep. NTIS, PC A03/MF A01.

Three-dimensional finite-element models for the treatment of the nonlinear, transient response of a fast breeder reactor's above-core structures are described. For purposes of treating arbitrarily large rotations, node orientations are described by unit vectors and the deformable elements are treated by a corotational formulation in which the coordinate system is embedded in the elements. Deformable elements may be connected either to nodes directly or through rigid bodies. The time integration is carried out by the Newmark

β method. These features have been incorporated to form the finite-element program SAFE/RAS (Safety Analysis by Finite Elements/Reactor Analysis and Safety Division). Computations are presented for semianalytical comparisons, simple scoping studies, and Stanford Research Institute (SRI) test comparisons.

- 163 (ANL--80-31) ACCURATE NUMERICAL SOLUTIONS FOR ELASTIC-PLASTIC MODELS. Schreyer, H.L.; Kulak, R.F.; Kramer, J.M. (Argonne National Lab., IL (USA)). Mar 1980. Contract W-31-109-ENG-38. 26p. NTIS, PC A03/MF A01.

The accuracy of two integration algorithms is studied for the common engineering condition of a von Mises, isotropic hardening model under plane stress. Errors in stress predictions for given total strain increments are expressed with contour plots of two parameters: an angle in the π plane and the difference between the exact and computed yield-surface radii. The two methods are the tangent-predictor/radial-return approach and the elastic-predictor/radial-corrector algorithm originally developed by Mendelson. The accuracy of a combined tangent-predictor/radial-corrector algorithm is also investigated.

- 164 (ANL--7542(Add.C)) CATALOG OF ROD-DROP DATA FROM EBR-II RUNS 67-87. Foltman, A.J. (Argonne National Lab., IL (USA)). Sep 1977. Contract W-31-109-ENG-38. 40p. AT.

Kinetics studies using the rod-drop procedure have been conducted in EBR-II for runs 67 to 87. Most of the studies were routine measurements of the prompt power coefficient. However, additional tests aided in determining limitations and errors of the rod-drop method that in turn helped lead to a full-power calibration procedure. The number of drops necessary for acceptable accuracy was studied as well; five drops per test was suggested for EBR-II. An additional test permitted us to determine that at least 24 hours are needed to allow the core to reach thermal and mechanical equilibrium in terms of reactivity effects.

- 165 (ANL--7721) ARC SYSTEM FUEL CYCLE ANALYSIS CAPABILITY, REBUS-2. Hosteny, R.P. (Argonne National Lab., IL (USA)). Oct 1978. Contract W-31-109-ENG-38. 409p. Dep. NTIS, PC A18/MF A01.

A detailed description is given of the ARC System fuel cycle modules FCI001, FCC001, FCC002, and FCC003 which form the fuel cycle analysis modules of the ARC System. These modules, in conjunction with certain other modules of the ARC System previously described in documents of this series, form the fuel cycle analysis system called REBUS-2. The physical model upon which the REBUS-2 fuel cycle modules are based and the calculational approach used in solving this model are discussed in detail. The REBUS-2 system either solves for the infinite time (i.e., equilibrium) operating conditions of a fuel recycle system under fixed fuel management conditions, or solves for the operating conditions during each of a series of explicitly specified (i.e., nonequilibrium) sequence of burn cycles. The code has the capability to adjust the fuel enrichment, the burn time, and the control poison requirements in order to satisfy user specified constraints on criticality, discharge fuel burnup, or to give the desired multiplication constant at some specified time during the reactor operation.

- 166 (ANL/A--78-3) STUDY OF BASIC APPROACHES TO THE DESIGN OF THE PRIMARY SYSTEM OF LOOP-TYPE LMFBRs. Amorosi, A.; Ahmed, H.; Hutter, E. (Argonne National Lab., IL (USA)). Mar 1978. Contract W-31-109-ENG-38. 250p. Dep. NTIS, PC A11/MF A01.

The report describes the results of a study conducted by an informal "Primary System Study Group" formed at ANL to review from a systems point of view the many possible approaches available to the design of the primary heat transport system for large-size (roughly, 1200 MWe), loop-type LMFBRs. The study is based on examination of the various design options which have been used or proposed to date in the principal loop-type projects and design studies in this country and abroad. The objective of the report is to provide an overview of the approaches which have been considered over the years, to identify and discuss some of their advantages and disadvantages, and, where possible, to indicate which approaches appear to warrant further consideration. The approaches discussed in the report differ principally in: the use of different sizes of reactor vessel--small, with external piping downcomers, or large, with internal downcomers; use of different pump locations--hot leg or cold leg; and, use of different methods for accommodation of system thermal expansion--pipe and elbow loops, special expansion accommodators, free-end pipes, free component movement, and others. The important characteristics, from the systems standpoint, and some particularly pertinent design considerations of the major primary system components are also examined, with emphasis on reactor vessel, pump, and intermediate heat exchanger.

- 167 (ANL-AFP--2) ADVANCED FUELS PROGRAM. QUARTERLY PROGRESS REPORT FOR THE PERIOD, JULY--SEPTEMBER 1974. Kittel, J.H. (comp.). (Argonne National Lab., IL (USA)). 1974. Contract W-31-109-ENG-38. 136p. AT.

Progress is summarized in the following LMFBR mixed carbide and mixed nitride fuel development tasks: (1) fuel system design studies; (2) fuel element modelling; (3) steady state irradiations; (4) off-normal irradiations; (5) fuel properties; (6) reprocessing; and (7) safety.

- 168 (ANL-AFP--22) APPARATUS TO SIMULATE NUCLEAR HEATING IN ADVANCED FUELS. Wrona, B.J.; Galvin, T.M.; Johanson, E. (Argonne National Lab., IL (USA)). Oct 1976. Contract W-31-109-ENG-38. 20p. Dep. NTIS, PC A02/MF A01.

A direct-electrical-heating apparatus has been built to simulate in-reactor temperature gradients and heating conditions in both the mixed nitrides and carbides of uranium and plutonium. The apparatus has the capability for the investigation and direct observation of fuel-behavior phenomena that should significantly enlarge the data base on mixed carbides and nitrides at temperatures near and above their melting points. In addition to heating UC, results of proof tests showed that the apparatus has the capability to heat graphite, 30 vol % ZrC in graphite, B₄C control-rod pellets, and stainless steel.

- 169 (ANL-AFP--28) ADVANCED FUELS PROGRAM. QUARTERLY PROGRESS REPORT, JANUARY--MARCH 1976. Kittel, J.H. (comp.). (Argonne National Lab., IL (USA)). 1976. Contract W-31-109-ENG-38. 271p. AT.

Progress in studies on advanced LMFBR fuels is reported in the following areas: steady-

state irradiation tests, off-normal irradiation tests, performance modeling, design studies for FTR and CRBR, design studies for large plants, fuel properties, fuel chemical stability, environmental assessments, and safety.

- 170 (ANL-AFP--29) ADVANCED FUELS PROGRAM. QUARTERLY PROGRESS REPORT, APRIL--JUNE 1976. Kittel, J.H. (comp.). (Argonne National Lab., IL (USA)). 1976. Contract W-31-109-ENG-38. 245p. AT.

Progress in studies on advanced LMFBR fuels is reported in the following areas: steady-state irradiation tests, performance modeling, design studies for FTR and CRBR, design studies for large plants, fuel properties, fuel chemical stability, environmental assessments, and safety.

- 171 (ANL-AFP--30) BREEDING PERFORMANCE OF CARBIDE AND NITRIDE FUELS IN 2000 MWE LMFBRs: A PRELIMINARY REPORT. PART I. ASSUMPTIONS, CONSTRAINTS AND METHODOLOGY. Barthold, W.P. (Argonne National Lab., IL (USA)). Sep 1976. Contract W-31-109-ENG-38. 57p. Dep. NTIS, PC A04/MF A01.

The assumptions, constraints, and methodology used in the design and analysis of 2000 MWE LMFBRs using carbide and nitride fuel are presented. The assumptions used in the nuclear, thermal and mechanical designs are discussed together with geometry constraints, operational constraints, performance constraints, constraints coming from fabrication consideration and fuel bundle-duct interaction constraints. The basic calculational flow for system design studies is described, and the computer codes used in the analyses are briefly reviewed.

- 172 (ANL-AFP--31) BREEDING PERFORMANCE OF CARBIDE AND NITRIDE FUELS IN 2000 MWE LMFBRs. PART IV: IMPACT OF A PRESSURE DROP CONSTRAINT ON BREEDING PERFORMANCE AND PIN DIAMETER OPTIMIZATION IN 5000 MWT LMFBRs USING SODIUM BONDED CARBIDE FUELS. Lam, P.S. (Argonne National Lab., IL (USA)). Jul 1976. Contract W-31-109-ENG-38. 42p. Dep. NTIS, PC A03/MF A01.

Impact on pin diameter optimization and breeding performance from either a constant coolant velocity (25 ft/sec) constraint or a constant fuel bundle pressure drop (40 psi) constraint has been evaluated, and comparisons of these results are given. The 40 psi fuel bundle pressure drop was chosen not to imply a limit of pump technology, but because it corresponds to acceptable coolant velocities in the range of 25 ft/sec to 35 ft/sec for various pin diameters and linear heat ratings.

- 173 (ANL-AFP--32) SENSITIVITY OF POWER PEAKING ANALYSIS TO LARGE REACTOR CORE MODELING. King, M.J. (Argonne National Lab., IL (USA)). Oct 1976. Contract W-31-109-ENG-38. 47p. Dep. NTIS, PC A03/MF A01.

Various models of large LMFBRs, based on cylindrical and hexagonal geometries, are examined in regard to application to nuclear power peaking analysis. It is shown that the general behavior of power distributions during burnup in these large reactors implies that power shaping by control rod movement is desirable for minimizing the peaking factor. Due to current limitations of available three-dimensional computer codes, one- and two-dimensional models were used to test general assumptions of power shaping. However, it is demonstrated that these models are not appropriate for more accurate power peaking

analysis. Comparison of results for nuclear power peaking factors in cylindrical and hexagonal geometries shows that the use of annular rings of control poison in the cylindrical models does not provide a realistic representation of banks of control rod assemblies.

- 174 (ANL-AFP--33) ADVANCED FUELS PROGRAM. QUARTERLY PROGRESS REPORT, JULY--SEPTEMBER 1976. Kittel, J.H. (comp.). (Argonne National Lab., IL (USA)). 1976. Contract W-31-109-ENG-38. 199p. AT.

Progress in studies on advanced LMFBR fuels is reported in the following areas: steady-state irradiation tests, off-normal irradiation tests, performance modeling, design studies for FTR and CRBR, design studies for large plants, fuel properties, fuel chemical stability, environmental assessments, and safety.

- 175 (ANL-AFP--34) ADVANCED FUELS PROGRAM. QUARTERLY PROGRESS REPORT, OCTOBER--DECEMBER 1977. Kittel, J.H. (comp.). (Argonne National Lab., IL (USA)). 1977. Contract W-31-109-ENG-38. 196p. AT.

Progress is summarized in the following LMFBR mixed carbide and mixed nitride fuel development tasks: (1) design, surveillance, and evaluation of steady-state irradiation tests; (2) off-normal irradiation testing; (3) performance modeling; (4) design studies for FTF and CRBR; (5) design studies for large LMFBR plants; (6) fuel properties; (7) design of irradiation tests in FTF; (8) fuel chemical stability; and (9) safety studies. (DG)

- 176 (ANL-AFP--35) ADVANCED FUELS PROGRAM. QUARTERLY PROGRESS REPORT, JANUARY--MARCH 1977. Kittel, J.H. (comp.). (Argonne National Lab., IL (USA)). 1977. Contract W-31-109-ENG-38. 239p. AT.

Progress is summarized in the following LMFBR mixed carbide and mixed nitride fuel development tasks: (1) design, surveillance, and evaluation of steady-state irradiation tests; (2) off-normal irradiation testing; (3) performance modeling; (4) design studies for FTF and CRBR; (5) design studies for large LMFBR plants; (6) fuel properties; (7) design of irradiation tests in FTF; (8) fuel chemical stability; and (9) safety studies. (DG)

- 177 (ANL-AFP--36) RESPONSE MATRIX METHOD FOR LARGE LMFBR ANALYSIS. King, M.J. (Argonne National Lab., IL (USA)). Jun 1977. Contract W-31-109-ENG-38. 68p. Dep. NTIS, PC A04/MF A01.

The feasibility of using response matrix techniques for computational models of large LMFBRs is examined. Since finite-difference methods based on diffusion theory have generally found a place in fast-reactor codes, a brief review of their general matrix foundation is given first in order to contrast it to the general strategy of response matrix methods. Then, in order to present the general method of response matrix technique, two illustrative examples are given. Matrix algorithms arising in the application to large LMFBRs are discussed, and the potential of the response matrix method is explored for a variety of computational problems. Principal properties of the matrices involved are derived with a view to application of numerical methods of solution. The Jacobi iterative method as applied to the current-balance eigenvalue problem is discussed.

- 178 (ANL-AFP--37) CORE RESTRAINT PERFORMANCE OF LARGE HETEROGENEOUS REFERENCE CORES. de Paz, J.F.; Madell, J.T. (Argonne National Lab., IL (USA)). Jun 1978. Contract W-31-109-ENG-38. 77p. Dep. NTIS, PC A05/MF A01.

A preliminary study of the core restraint performance of heterogeneous cores was performed as part of the Large Heterogeneous Reference Core Study (LHRCS). The performance is based on satisfying four functional requirements: (1) to provide assembly alignment for control rod insertion and fuel handling; (2) to permit fuel handling within allowable insertion and withdrawal forces; (3) to maintain the core reactivity (from radial motion) within specified limits during normal and off-normal conditions; and (4) to prevent extensive duct-to-duct contact throughout the core. Six generic cases were selected to represent the range of core arrangements whose features greatly influence core restraint performance. Case 1 is a reference homogeneous core with temperature gradients only near the fuel-blanket interface. Case 2 is also a reference homogeneous core, but has fictitious opposing temperature gradients within the fuel region. Cases 3 and 4 are tightly-coupled heterogeneous cores with fuel and blanket in the center region, respectively. Cases 5 and 6 are loosely-coupled heterogeneous cores with fuel (Case 5) and blanket (Case 6) in the center region. The most important relative difference in the performance of homogeneous and heterogeneous cores is the extent of duct-to-duct contact in the core region. Three of the four heterogeneous cores have substantial duct-to-duct contact while neither of the homogeneous cores do. This performance characteristic of heterogeneous cores appear to be inherent in their design and not amenable to change by core modifications, etc. The features producing duct-to-duct contact should be kept in mind in the initial stages of laying out heterogeneous cores, and detailed core restraint analysis (i.e., 3-D) should be employed to investigate their core restraint performance in preliminary design studies.

Contract W-31-109-ENG-38. 45p. Dep. NTIS, PC A03/MF A01.

The consequences of carbide=fuel-coolant interactions (CFCI) resulting from overpower transients have been investigated with the PLUTO code (PLUTO1 version). The predictions are based on direct extrapolation from oxide-developed phenomenology. In addition the carbide results are compared to an "equivalent" oxide=fuel-coolant interaction (OFCI). The initial conditions for the fuel-coolant-interactions are based on predictions from whole core accident studies. The detailed calculations indicate that under these assumptions, using the oxide results as a standard of measure, the CFCI can be characterized by the following: (1) higher sodium temperatures and thus higher sodium vapor pressure in the interaction zone, (2) more rapid insertion of sodium voiding reactivity, (3) higher degree of z-symmetry (with respect to the rupture location) in the ejected fuel distribution, (4) more rapid growth of the interaction zone, and (5) an indication of the temporary shutting off of fuel ejection during the early stage of the interaction.

- 182 (ANL-AFP--46) ENGINEERING ANALYSIS OF MIXED CARBIDE FUELS FOR LARGE BREEDER REACTORS. de Paz, J.F.; Madell, J.T. (Argonne National Lab., IL (USA)). Jan 1978. Contract W-31-109-ENG-38. 51p. Dep. NTIS, PC A04/MF A01.

The results of several parametric studies of the performance of sodium-bonded carbide fuel assemblies are presented. The thermal hydraulic impact of changes in coolant velocity, core height, coolant temperature rise, spacer type and duct material is considered. An evaluation of the effect of these changes on the transient behavior, core restraint performance, flow-induced vibrations, and cladding lifetime is also given. The cladding thickness, inlet coolant temperature and spacer type are identified as the design features whose optimization appears most promising as a means of achieving an improved fuel performance.

- 179 (ANL-AFP--39) ADVANCED FUELS PROGRAM. QUARTERLY PROGRESS REPORT FOR THE PERIOD APRIL--JUNE 1977. Kittel, J.H. (comp.). (Argonne National Lab., IL (USA)). 1977. Contract W-31-109-ENG-38. 245p. AT.

Progress in the development of carbide/nitride LMFBR fuels is reported under the following headings: steady-state irradiation tests, off-normal irradiation tests, performance modeling, design studies for FTR and CRBR, design studies for large plants, fuel properties, design of irradiation tests in FTR, fuel chemical stability, and safety studies.

- 183 (ANL-AFP--47) ADVANCED FUELS DEVELOPMENT PROGRAM. QUARTERLY PROGRESS REPORT, OCTOBER--DECEMBER 1977. Kittel, J.H. (comp.). (Argonne National Lab., IL (USA)). 1978. Contract W-31-109-ENG-38. 223p. AT.

Progress is summarized in the following tasks related to development of LMFBR mixed carbide and mixed nitride fuels: (1) steady-state irradiation performance, (2) transient irradiation performance, (3) fabrication, (4) design and modelling, (5) fuels properties, (6) safety, and (7) environmental assessment. (DG)

- 180 (ANL-AFP--40) ADVANCED CARBIDE/NITRIDE FUELS PROGRAM. QUARTERLY PROGRESS REPORT FOR THE PERIOD JULY--SEPTEMBER 1977. Kittel, J.H. (comp.). (Argonne National Lab., IL (USA)). 1977. Contract W-31-109-ENG-38. 211p. AT.

Progress in the development of carbide/nitride LMFBR fuels is reported under the following headings: steady-state irradiation tests, off-normal irradiation tests, performance modeling, design studies for FTR and CRBR, design studies for large plants, fuel properties, design of irradiation tests in FTR, fuel chemical stability, and safety studies.

- 184 (ANL-AFP--51) ADVANCED FUELS DEVELOPMENT PROGRAM. QUARTERLY PROGRESS REPORT, JANUARY--MARCH 1978. Kittel, J.H. (comp.). (Argonne National Lab., IL (USA)). 1978. Contract W-31-109-ENG-38. 252p. AT.

Progress is summarized in the following tasks on mixed carbide and nitride fuel development for LMFBRs: steady-state irradiation performance, transient irradiation performance, fabrication, design and modeling, fuels properties, safety, and environmental assessments for mining and milling.

- 181 (ANL-AFP--41) COMPARISON OF CARBIDE AND OXIDE FUEL-COOLANT INTERACTIONS RESULTING FROM OVERPOWER TRANSIENTS. Mync, L.; Trease, H. (Argonne National Lab., IL (USA)). Dec 1977.

- 185 (ANL-AFP--55) ADVANCED FUELS DEVELOPMENT PROGRAM. QUARTERLY PROGRESS REPORT, APRIL--JUNE 1978. Kittel, J.H. (comp.). (Argonne National Lab., IL (USA)). 1978. Contract W-31-109-ENG-38. 240p. AT.

Progress is summarized in the following

- LMFBR mixed carbide and mixed nitride fuel development tasks: steady-state irradiation performance, transient irradiation performance, fabrication, design and modeling, fuels properties, safety, and environmental assessment.
- 186 (ANL-AFP--59) ADVANCED FUELS DEVELOPMENT PROGRAM. QUARTERLY PROGRESS REPORT, JULY-SEPTEMBER 1978. Kittel, J.H. (comp.). (Argonne National Lab., IL (USA)). 1978. Contract W-31-109-ENG-38. 216p. AT. Progress is summarized in the following mixed carbide and mixed nitride fuel development tasks: steady-state irradiation performance, transient irradiation performance, fabrication, design and modeling, fuels properties, and safety.
- 187 (ANL-AFP--63) ADVANCED FUELS DEVELOPMENT PROGRAM. QUARTERLY PROGRESS REPORT, OCTOBER-DECEMBER 1978. Kittel, J.H. (comp.). (Argonne National Lab., IL (USA)). 1978. Contract W-31-109-ENG-38. 248p. AT. Progress is summarized in the following LMFBR mixed carbide and mixed nitride fuel development tasks: (1) steady-state irradiation performance; (2) transient irradiation performance; (3) fabrication; (4) design and modeling; (5) fuel properties; (6) safety; and (7) environmental assessment.
- 188 (ANL-CT--77-6) HIGH-TEMPERATURE SHEAR-MODE TRANSDUCERS FOR LMFBR ULTRASONIC FLOWMETERS. Karplus, H.B. (Argonne National Lab., IL (USA)). Aug 1977. Contract W-31-109-ENG-38. 80p. AT. The design of an ultrasonic transducer for measuring sodium flow to 500°C in an LMFBR features a shear mode X-cut lithium niobate piezoelectric crystal mounted on a laminated coupling wedge. Acoustic transmission from the lithium niobate is effected by accurate surface flatness to 250 nm, an annealed platinum foil, and applied contact pressure of about 15 MPa (2000 psi). The pressure is applied through a stack of stainless steel foils which offer sufficient attenuation to the back-radiated energy to make its ultimate reflection and interference with the main pulse negligible. Sound energy is radiated into the liquid through mode conversion at the oblique interface at the inside surface of the pipe. The wedge shape of the coupling block eliminates standing waves in this block. This effect, combined with the close impedance match between lithium niobate and the steel wedge, yield very wide band widths (0.8-4 MHz). The response to a 100-ns pulse is one cycle of a distorted sine wave. Reverberation in the wedge due to residual reflection at the solid-liquid interface and grain boundary scattering is controlled by laminating the wedge, and forcing the stray interface reflection to traverse the laminations by machining the third wedge surface at a 60° angle. A piezoelectric element backed by a tuned tungsten carbide plate yielded a resonant transducer with a Q of 5. This unit was substituted for the low-temperature plastic wedge transducer supplied with a commercial clamp-on ultrasonic flowmeter. Preliminary measurements in a water loop have confirmed operation of the ANL developed high-temperature resonant transducer with commercial flowmeter electronics, requiring only a scale adjustment. Measurements of water flow using the highly damped transducer in conjunction with laboratory pulsers and timers, and special gates and trigger circuits yielded data needed for flowmeter design.
- 189 (ANL-CT--77-23) FINITE ELEMENT METHOD IN NONLINEAR DYNAMIC ANALYSIS OF AXISYMMETRIC SHELLS: THEORY AND COMPUTER PROGRAM. Hsieh, B.J. (Argonne National Lab., IL (USA)). Sep 1978. Contract W-31-109-ENG-38. 99p. TIC. Portions of document are illegible. The necessary equations for the equivalent nodal forces and the conditions necessary to simplify some of these equations are presented. A computer program is written in FORTRAN language that can treat uniformly distributed loadings. The modifications that are needed to treat other loadings are presented. This program is written in a nondimensional form so that any consistent units used for the input produces consistent units in the output.
- 190 (ANL-CT--77-25) MEASUREMENT OF LIQUID SODIUM FLOW IN THE SECONDARY SYSTEM OF THE EBR-II BY A NEUTRON ACTIVATION TECHNIQUE. Kehler, P.; Forster, G.A.; Price, C.C.; Sackett, J.I.; Curran, R.N. (Argonne National Lab., IL (USA)). Jun 1977. Contract W-31-109-ENG-38. 108p. AT. The liquid sodium flow velocity in the secondary system of the EBR-II was measured by a neutron activation technique. This test has verified the computer program used for the modeling of flow measurements by neutron activation techniques, has proven the feasibility of neutron activation methods for the in-situ calibration of flowmeters measuring liquid sodium flow through 30 cm pipes, and has provided calibration data for the EBR-II secondary system sodium flow instrumentation.
- 191 (ANL-CT--77-29) MEASUREMENT OF THE ACOUSTIC NOISE BACKGROUND IN THE EXPERIMENTAL BREEDER REACTOR II, UPPER PLENUM. Carey, W.M.; Bobis, J.P.; Gavin, A.P. (Argonne National Lab., IL (USA)). Dec 1977. Contract W-31-109-ENG-48. 199p. AT. Measurements of the acoustic background of an operating Liquid Metal Fast Breeder Reactor (LMFBR) have been performed over a seventeen month period in 1976 and 1977 at the Experimental Breeder Reactor II (EBR-II) in Idaho. These data are presented in terms of linear average spectra, autocorrelation and cross power spectral density for 0.2 to 5 kHz and 4 to 50 kHz analysis ranges. These data are shown to be weakly stationary. The data below 5 kHz were shown to be dominated by pump-induced structural vibrations and the excitation of acoustic resonances. The data above 5 kHz were shown to be the result of flow noise and the response of the reactor geometry to this flow noise. Acoustic resonances in the 4 to 50 kHz frequency region were closely spaced and produced a smeared response. The higher frequency data were also shown to be influenced by local flow effects and sensor mounting characteristics. A strong correlation of high frequency data with flow is presented, indicating that an appreciable portion of the high frequency data could be due to the action of each fuel subassembly acting as a subsonic jet. These measurements provide a basis for the acoustic surveillance of LMFBRs.
- 192 (ANL-CT--77-31) THERMAL BUOYANCY PHENOMENA IN A HORIZONTAL PIPE DURING A FLOW COAST-DOWN THERMAL-HYDRAULIC TRANSIENT (SCOPING STUDIES). Kasza, K.E.; Schmitt, R.C.; Sha, W.T. (Argonne National Lab., IL (USA)). Sep 1977. Contract W-31-109-ENG-38. 32p. AT. Initial problem scoping studies on thermal stratification effects in horizontal LMFBR piping during a pump coast-down cooling

- transient have been performed using the ANL COMMAX computer code. It is found that thermal buoyancy forces can create appreciable secondary flow and thermal effects. For the problem studied, donut shaped flow patterns develop in the pipe circular cross sections symmetrically on both sides of the pipe vertical symmetry plane; the patterns, for the case of a pipe inlet cooling transient, are produced by the sinking to the bottom of the pipe of the cooler fluid entering the pipe. In addition, a large longitudinal recirculation loop is established which convects warmer downstream fluid upstream in the pipe and greatly increases the pipe top-bottom temperature difference as well as causing the thermal-stratification-effects front to move faster through the pipe than would be indicated by the pipe inlet mean velocity. A pipe top-bottom stratification temperature difference in excess of 100°F (55.6°C) occurred which amounted to nearly 60% of the pipe-inlet-flow-transient temperature decline. This result contradicts the usual isothermal-front assumption employed in LMFBR system analysis codes. In general results are obtained which suggest that additional studies (both experimental and analytical) be undertaken to obtain information which can be directly applied to both design of LMFBR piping and assessment of thermal stratification effects under conditions of pump coast-down and natural circulation. Recommendations are also made as to the directions and focus of further research efforts.
- 193 (ANL-CT--77-33) ELECTROCHEMICAL OXYGEN METERS: STATE-OF-THE-ART, MARCH 1977. Epstein, L.F.; McKee, J.M. (Argonne National Lab., IL (USA)). Oct 1977. Contract W-31-109-ENG-38. 76p. AT.
- The present state-of-the-art of fabricating electrochemical oxygen meters, in the U.S. and abroad, for use in sodium-cooled reactor systems, particularly the LMFBR is summarized. It is concluded that there is a need for substantial improvement over the currently available meters, and that instruments that are more reliable and dependable can be developed and will be required in future advanced reactors.
- 194 (ANL-CT--77-34) NUBOW-2D INELASTIC: A FORTRAN PROGRAM FOR STATIC TWO-DIMENSIONAL STRUCTURAL ANALYSIS OF BOWED REACTOR CORES, INCLUDING EFFECTS OF IRRADIATION CREEP AND SWELLING. Cha, B.K.; McLennan, G.A.; Fulford, P.J. (Argonne National Lab., IL (USA)). Jun 1977. Contract W-31-109-ENG-38. 107p. AT.
- NUBOW-2D Inelastic is an extensive modification of the two-dimensional core-restraint analysis code NUBOW. Subroutines have been added to calculate time histories of inelastic changes in bowing shapes and forces induced by creep and swelling in reactor fuel assemblies (ducts). Based on the conventional beam theory assumption that plane sections remain plane, and using supplied radial and axial fluxes and temperatures, and creep and swelling correlations, the code calculates creep and swelling strains at axial and peripheral locations for each duct. These strains are numerically integrated to give corresponding bow shapes which are used as input pre-bow shapes for structural analysis by NUBOW. This procedure is performed on a time-incremental basis, giving a history of two-dimensional forces, displacements and strains for the ducts, and reactivity changes in the core.
- 195 (ANL-CT--77-35) VALIDATION OF THE COMPUTER PROGRAM PTA-1-RD. Hsieh, B.J. (Argonne National Lab., IL (USA)). Sep 1978. Contract W-31-109-ENG-38. 35p. AT.
- Experimental data on rupture discs generated by General Electric is used to validate the PTA-1-RD computer program. The experimental data was obtained by dropping a weight into a water filled pipe which was connected to a rupture disc at one end. Pressure transducers were located along the pipe to record the pressure produced as the resultant pulse moved through the system. One of the recorded pressure histories is used as the input disturbance to the PTA-1-RD program. The computed pressure histories from this program are then compared with the experimental data at other locations.
- 196 (ANL-CT--77-37) RESULTS FROM THE TESTING OF A TCE DC-14B AND THE ORNL FC-3 FISSION COUNTER-CHAMBERS IN THE EBR-II NITF AT TEMPERATURES UP TO 546°C. EBR-II RUN 82 (MAY 1976)--RUN 89 (AUGUST 1977). Taboas, A.L.; Yingling, G.E. (Argonne National Lab., IL (USA)). 14 Sep 1977. Contract W-31-109-ENG-38. 47p. AT.
- The performance of two high temperature fission counter-chambers in an LMFBR environment is evaluated and reported. The test results indicate that using current-sensitive preamplifiers, the ORNL FC-3 detector can be successfully operated as a long term LLFM at temperatures up to approximately 400°C, while the TCE DC-14B, S/N 7304-69 detector can be successfully operated as a long term, fixed position, wide range neutron flux monitor at temperatures up to approximately 565°C, in a gamma flux of 186 mC/Kg.s and a neutron flux greater than 1.1×10^{11} nv.
- 197 (ANL-CT--77-38) SUMMARY OF TEST RESULTS FROM THE TESTING OF A WESTINGHOUSE MODEL WX-30950 COMPENSATED IONIZATION CHAMBER IN THE EBR-II NITF J-1 THIMBLE AT TEMPERATURES UP TO 370°C (EXPERIMENT NI-3). Popper, G.F.; Elsbergas, V.J.; Yingling, G.E. (Argonne National Lab., IL (USA)). Sep 1977. Contract W-31-109-ENG-38. 39p. AT.
- A summary of the results obtained from the performance testing of a high temperature gamma compensated ionization chamber-cable assembly in a typical Liquid Metal Fast Breeder Reactor (LMFBR) nuclear environment at temperatures up to 370°C is presented. A brief description of the detector packaging used for installation into the reactor, the test equipment used and the data collection system is also included. Based upon the results contained in this report, the WX-30950 compensated ionization chamber tested could be used as a linear dc channel detector in an uncooled, fixed position LMFBR environment at temperatures up to 370°C.
- 198 (ANL-CT--78-1) CHF=INDUCED THERMAL OSCILLATIONS MEASURED IN AN LMFBR STEAM GENERATOR TUBE WALL. France, D.M.; Carlson, R.D.; Chiang, T.; Priemer, R. (Argonne National Lab., IL (USA)). Oct 1977. Contract W-31-109-ENG-38. 125p. AT.
- Thermal oscillations induced in a sodium heated steam generator tube wall as a consequence of critical heat flux (CHF) were experimentally measured. The tube was prototypical of the Clinch River Breeder Reactor (CRBR) plant design for the steam generator evaporator: length = 13.1 m, I.D. = 10.1 mm, O.D. = 15.9 mm. The tube was vertically orientated in the ANL Steam Generator Test Facility (SGTF) with water flowing vertically upwards inside and sodium flowing countercurrent in a surrounding

annulus. The SGTF test section and data analysis methods are presented in detail. The measured and calculated results of thermal fluctuation amplitude and thermal stress are presented showing the effects of sodium temperature and water pressure separately on the severity of the fluctuations.

- 199 (ANL-CT--78-2) CHARACTERIZATION OF THE TEMPERATURE FLUCTUATIONS GENERATED IN A THERMAL MIXING TEE (SODIUM VERSUS WATER BEHAVIOR). Kasza, K.F.; Colwell, W.S. (Argonne National Lab., IL (USA)). Nov 1977. Contract W-31-109-ENG-38. 88p. AT.

The temperature fluctuations occurring in 180° inlet-leg angle pipe tee thermal mixers with and without inlet reducer pipes are characterized. Sodium and water data from different sized tees have allowed delineation of the size and fluid medium modeling laws required for the extrapolation of reduced-scale water model temperature fluctuation data to prototype sodium mixers. The information presented is vital to the design of thermal-fatigue-free mixers and much of it has not been previously available to designers. The presented information on temperature fluctuations in pipe tees, in addition to furnishing much needed design information, also establishes that water testing of thermal mixers, with respect to modeling thermal-fatigue producing temperature fluctuations in prototype sodium mixers, has a built in conservativeness (i.e., $\Delta T_{\text{sub Na}} / \Delta T_{\text{sub H}_2\text{O}} < 1$). Finally, it is shown that thermal buoyancy effects can alter a thermal mixer's performance and that buoyancy must be correctly modeled in thermal mixing experiments.

- 200 (ANL-CT--78-3) NUMERICAL RESULTS OBTAINED FROM THE THREE DIMENSIONAL TRANSIENT SINGLE PHASE VERSION OF THE COMMIX COMPUTER CODE. Domanus, H.M.; Schmitt, R.C.; Sha, W.T. (Argonne National Lab., IL (USA)). Oct 1977. Contract W-31-109-ENG-38. 103p. (NUREG--0355). Dep. NTIS, PC A06/MF A01.

Results from the first three applications of the three-dimensional, transient, single-phase version of the thermal-hydraulics computer code, COMMIX, are presented. The applications include an LMFBR outlet plenum, a horizontal pipe, and a 19-pin LMFBR hexagonal fuel assembly. Each case is described and the results presented. All three applications use liquid sodium as the fluid. The plenum and pipe analyses are transient, while the fuel assembly involves a steady-state analysis.

- 201 (ANL-CT--78-5) MEASUREMENT OF THE SOUND PRODUCED DURING STEAM INJECTIONS INTO SODIUM. Claytor, T.N.; Carey, W.M.; Doolittle, R.D.; Fitzgerald, J.W. (Argonne National Lab., IL (USA)). Sep 1977. Contract W-31-109-ENG-38. 86p. AT.

The acoustic signature of a steam-into-sodium leak has been investigated. Characterization of the acoustic signal from a leak of steam into sodium is of interest because a steam leak in a liquid metal steam generator module has potential for dire economic consequences if allowed to grow into a larger-size leak by self-wastage and impingement damage. Passive acoustic monitoring of the steam generator module may have the capability to rapidly detect a steam-to-sodium leak in a liquid metal fast breeder reactor steam generator module. Data contained in the report clearly show that at higher frequencies (> 20 kHz) a larger signal-to-noise ratio was obtained than at frequencies below 10 kHz under conditions of half the maximum sodium flowrate

for a prototypic liquid metal steam generator. Characteristic of the steam-to-sodium leak was a form of acoustic energy release which occurs in intense bursts with frequency components of up to 100 kHz. This feature of the sodium-to-steam injection may enable detection of leaks with simplified instrumentation or improved response time by using steam leak signals in the frequency range above 20 kHz. At lower frequencies, the acoustic energy released was probably due to hydrogen bubble oscillation, thus substantiating previous suggestions that hydrogen bubble oscillation is the dominant source of sound at low frequencies (2 kHz).

- 202 (ANL-CT--78-6) GE/CRBRP/IHTS MIXING TEE MODEL PERFORATED PLATE VIBRATION TEST (IN SUPPORT OF GE/CRBRP:DRS 51.32). FINAL REPORT. Chung, H.; Hallie, H. (Argonne National Lab., IL (USA)). Sep 1977. Contract W-31-109-ENG-38. 71p. AT.

A series of vibration tests were performed on a quarter-scale model of CRBRP/IHTS mixing tee proposed by GE-FBRD to assess the vibration characteristics and the potential for flow-induced vibrations. The flow test conditions include simulated prototypic conditions using room-temperature water. The test results show that the fundamental natural frequency of the perforated plates is about 740 Hz in water and their displacements were less than 0.0025 mm (0.1 mils) RMS at the prototypic flowrate and at lower flowrates. The perforated plate response spectra were characterized by distinct, lightly damped resonances at all flowrates with high loop system static pressure. However, as the system pressure level was lowered the response spectra became less distinct, possibly due to the cavitation-type phenomena.

- 203 (ANL-CT--78-7) FINAL REPORT AND DESIGN GUIDE FOR CAVITATION-FREE LMFBR HYDRAULIC COMPONENTS. Cha, Y.S.; Huebotter, P.R. (Argonne National Lab., IL (USA)). Oct 1977. Contract W-31-109-ENG-38. 95p. AT.

A survey of experimental data on cavitation tests of various hydraulic components in water and sodium indicated that, for practical engineering applications, there is no significant difference between cavitation inception in water at room temperature and that in sodium at temperatures within the interest range of LMFBRs. It is concluded that water at room temperature can be used as a testing fluid to determine the cavitation inception threshold for sodium provided no deliberate action is taken to reduce the gas content in the test loop. Cavitation damage tests using venturis in water and sodium indicate that sodium is much more damaging than water under similar geometric and dynamic conditions. Under a typical loop-type LMFBR environment, cavitation damage is more severe in the cold leg than in the hot leg. Acoustic data from the cavitation tests of the FFTF primary sodium pump indicates that cavitation exists at NPSH values much greater than that corresponding to the 3% head-drop point.

- 204 (ANL-CT--78-8) INFLUENCE OF HETEROGENEOUS CORE GEOMETRY UPON OUTLET PLENUM MIXING. Howard, P.A. (Argonne National Lab., IL (USA)). Nov 1977. Contract W-31-109-ENG-38. 49p. AT.

LMFBR outlet plenum temperatures were simulated and recorded for three different heterogeneous core configurations. Core geometry included the CRBR Alternate Fuel Management Scheme (AFMS) case 9' and two modifications of the central assemblies.

Experiments were conducted at $1/10$ -scale where water was used as a test fluid. A total of 367 assemblies were simulated including fuel, inner blanket, outer blanket, and control assemblies. A scale model of the CRBR UIS was used in all tests and conditions close to Start-of-Cycle 1 were simulated. The steady-state temperatures and oscillations were recorded for 80 locations throughout the outlet plenum. Particular emphasis was placed upon chimney temperatures and leakage temperatures.

- 205 (ANL-CT--78-9) SODIUM FLOW CALIBRATION USING A PULSED NEUTRON ACTIVATION TECHNIQUE ON A 400MM (16 INCH) PIPE AT LMEC. Forster, G.A.; Kehler, P. (Argonne National Lab., IL (USA)). Nov 1977. Contract W-31-109-ENG-38. 33p. AT.

The velocity of liquid sodium in pipes can be measured by the pulsed neutron activation (PNA) technique without disturbing the pipe or removing insulation. A collimated beam of 14 MeV neutrons is directed against the sodium filled pipe. The resulting gamma activity is detected a suitable distance downstream. The velocity is determined from the spacing of source and detector, and the transit time of the activated sodium weighted for gamma decay. Data were taken on the 400 mm sodium system at LMEC at temperatures of 200, 400, and 560°C. The resulting velocities come within the 2 percent predicted uncertainty limit for the higher flow ranges when compared to the system's Venturi reference flowmeter. A low velocity measuring capability (.05 m/s) was also demonstrated.

- 206 (ANL-CT--78-10) CRITICAL HEAT FLUX TESTS AT LOW WATER FLOW AND 7.3 MPa: INTERIM REPORT. France, D.M.; Chiang, T.; Carlson, R.D. (Argonne National Lab., IL (USA)). Oct 1977. Contract W-31-109-ENG-38. 82p. AT.

Low flow critical heat flux (CHF) tests were performed in the ANL Steam Generator Test Facility (SGTF) employing sodium to boil water in a straight, vertically mounted, water tube under forced convection operation. The $2\frac{1}{4}$ Cr-1 Mo steel tube dimensions were: 13.1 m length, 10.1 mm I.D. and 15.4 mm O.D. Results of nine tests at 7.3 MPa water pressure and mass fluxes of 550, 270 and 140 kg/m² . s covering a broad range of critical heat flux, were selected for presentation in order to supply data on the earliest possible schedule. Parametric conditions at CHF are given including heat flux and quality. Measured and analyzed tube wall, thermal fluctuation data and thermal stresses are presented for each test. Only one test at the highest heat flux of 0.76 MW/m² and 270 kg/m² . s mass flux exhibited cyclic thermal stresses in the marginal range for meeting ASME requirements for 30 years lifetime. All other tests showed considerably lower stresses.

- 207 (ANL-CT--78-11) VIBRO-IMPACT RESPONSES OF A TUBE WITH TUBE--BAFFLE INTERACTION. Shin, Y.S.; Sass, D.E.; Jendrzeczyk, J.A. (Argonne National Lab., IL (USA)). Jan 1978. Contract W-31-109-ENG-38. 75p. Dep. NTIS, PC A04/MF A01.

The relatively small, inherent tube-to-baffle hole clearances associated with manufacturing tolerances in heat exchangers affect the vibrational characteristics and the response of the tube. Numerical studies were made to predict the vibro-impact response of a tube with tube-baffle interaction. The finite element method has been employed with a non-linear elastic contact spring-dashpot to model the effect of the relative approach between the tube and the baffle plate. The coupled

equations of motion are directly integrated with a proportional system damping represented by a linear combination of mass and stiffness. Lumped mass approach with explicit time integration scheme was found to be a suitable choice for tube-baffle impacting analysis. Fourier analyses indicate that the higher mode contributions to the tube response are significant for strong tube-baffle impacting. The contact damping forces are negligible compared with the contact spring forces. The numerical analysis results are in reasonably good agreement with those of the experiments.

- 208 (ANL-CT--78-12) TEMPERATURE-SENSITIVE ORIFICE: A PRE-TEST REPORT. Flynt, W.S.; Howard, P.A.; Carlson, R.D. (Argonne National Lab., IL (USA)). Nov 1977. Contract W-31-109-ENG-38. 31p. AT.

A device which is capable of maintaining a nearly constant blanket assembly exit temperature over several LMFBR fuel cycles is currently being investigated by the Components Technology Division of Argonne National Laboratory. This orifice will develop a pressure drop inversely proportional to temperature with the absence of any moving parts. Design and fabrication of a temperature-sensitive orifice scaled for the High Temperature Simulation Loop (HTSL) has also been completed. The proposed location of a prototypic orifice would be in the upper region of a LMFBR blanket assembly. This location is compatible with current LMFBR design.

- 209 (ANL-CT--78-13) COMPARISON AND VERIFICATION OF THE CORE RESTRAINT CODES NUBOW-2D, NUBOW-3D, AND PARABOW: LEVEL II. McLennan, G.A.; Moran, T.J.; Cha, B.K. (Argonne National Lab., IL (USA)). Nov 1977. Contract W-31-109-ENG-38. 108p. AT.

A series of ten problems was solved by each of the core restraint codes NUBOW-2D, PARABOW, and NUBOW-3D for purposes of verifying the calculational capabilities of the codes and comparing the solutions. The physical system modeled was the 121 assembly configuration of the Core Restraint Test Facility located at W-ARD. Problems with moving yokes and with varying temperatures were considered. The resulting calculated displacements of the individual assemblies and the contact forces between assemblies are reported. It is concluded that the codes accurately calculate the equilibrium forces and displacements as modeled, but that three dimensional effects cause significant difficulties in the equilibrium states for the different code models.

- 210 (ANL-CT--78-14) NEUTRON INDUCED CURRENT PULSES IN FISSION CHAMBERS. Taboas, A.L.; Buck, W.L. (Argonne National Lab., IL (USA)). Jan 1978. Contract W-31-109-ENG-38. 28p. Dep. NTIS, PC A03/MF A01.

The mechanism of neutron induced current pulse generation in fission chambers is discussed. By application of the calculated detector transfer function to proposed detector current pulse shapes, and by comparison with actually observed detector output voltage pulses, a credible, semi-empirical, trapezoidal pulse shape of chamber current is obtained.

- 211 (ANL-CT--78-15) MEASUREMENT AND CORRELATION OF CRITICAL HEAT FLUX IN A SODIUM HEATED STEAM GENERATOR TUBE. France, D.M.; Chiang, T.; Carlson, R.D.; Minkowycz, W.J. (Argonne National Lab., IL (USA)). Jan 1978. Contract W-31-109-ENG-38. 67p. AT.

Critical heat flux (CHF) experiments were performed in the Steam Generator Test Facility (SGTF) at Argonne National Laboratory (ANL) for application to Liquid Metal Fast Breeder Reactor (LMFBR) steam generators. A single, straight, vertical, full scale LMFBR steam generator tube was tested with water flow boiling upwards inside the tube heated by sodium flowing countercurrent in a surrounding annulus. The test section tube parameters were: inside diameter = 10 mm, outside diameter = 15.8 mm, material = $2\frac{1}{4}$ Cr - 1 Mo steel, and heated length = 13.1 m. Experiments were performed in the water pressure range of 7.0 to 15.3 MPa and the water mass flux range of 720 to 3200 kg/m² . s. The data exhibited two trends: heat flux independent and heat flux dependent. The CHF data from 398 tests in the SGTF are presented in summary along with an empirical correlation having a root mean square deviation of 14.7% from the data. The correlation is compared to other CHF data in the same parameter range.

- 212 (ANL-CT--78-16) PLENUM-2: A TWO-REGION OUTLET PLENUM MODEL. Howard, P.A.; Carbaño, J.J. (Argonne National Lab., IL (USA)). Mar 1978. Contract W-31-109-ENG-38. 93p. AT.

An experimental study to address the transient behavior of a generalized outlet plenum after a scram in a LMFBR has been conducted. Different conditions of flowrate, temperature, and geometries were used for three-exit loop-type reactor systems. Water was used as a fluid and a small-scale model plenum was used to simulate the various generalized configurations. Thermocouples were used to monitor the temperatures at 48 locations within the outlet plenum. The thermo-hydraulic behavior has been studied in detail and has been simplified as having four consecutive discrete stages. A computer model following these experimentally observed stages has been developed and calculations and results are compared.

- 213 (ANL-CT--78-19) NUBOW-3D (INELASTIC): A FORTRAN PROGRAM FOR THE STATIC THREE-DIMENSIONAL STRUCTURAL ANALYSIS OF BOWED REACTOR CORES INCLUDING THE EFFECTS OF IRRADIATION CREEP AND SWELLING. McLennan, G.A. (Argonne National Lab., IL (USA)). Mar 1978. Contract W-31-109-ENG-38. 176p. AT.

NUBOW-3D is a special purpose FORTRAN computer program for the three-dimensional static structural time history analysis of symmetric sectors of LMFBR core systems, subjected to thermal and/or mechanical bowing and time (fluence) dependent effects of irradiation-induced swelling and irradiation-enhanced creep. The program calculates the mechanical equilibrium forces and displacements of the core system treating the individual assemblies as conventional beam members. Time increments of creep and swelling strains are calculated for each assembly using specified material creep and swelling correlations and input values for assembly flux and temperature distributions. These strains are numerically integrated over each assembly to give inelastic beam curvatures and bowed shapes. Assembly dilation and contact forces in the core region are calculated for each time step. Detailed strain and fluence histories, contact forces and displacements are calculated and stored for each time step in the history. Using input reactivity worth values for individual assemblies, the structural reactivity changes for the reactor system are calculated for each time step. The NUBOW-3D structural model allows for axial variations in assembly geometry and different types of assemblies in the system.

Local flexibility and clearance gap may occur at all contact points. Contact stiffness is modeled as a single linear compression spring, acting after gap closure. Forces are assumed to act normal to contacting surfaces, so that friction and torsional effects are not included in the analysis.

- 214 (ANL-CT--78-20) RELEASE OF BUBBLES FROM SMALL LEAKS AT STEAM GENERATOR TUBESHEET WELDS. Skladzien, S.B.; McKee, J.M. (Argonne National Lab., IL (USA)). Mar 1978. Contract W-31-109-ENG-38. 19p. AT.

Helium was injected into a water-filled Lucite mockup of the CRBR steam generator tubesheet region to simulate the hydrogen bubbles formed by a small steam leak into sodium at a tube-to-tubesheet weld. With the tubesheet horizontal (lower tubesheet orientation), the bubbles escaped upward through the $\frac{1}{16}$ " (1.6 mm) annulus between the tubes and the 3" (76 mm) thick thermal baffle with no significant delay. With the tubesheet vertical (upper tubesheet orientation) the bubbles again escaped from the annulus and rose vertically through the gap between thermal baffle and tubesheet with minimal delay. The smallest leak that typically remains open, 10 mg H₂O/s, is expected to generate ample hydrogen to form a vigorous rising stream of bubbles. The total travel of these bubbles before dissolving is expected to be ample at the lower tubesheet and probably adequate at the upper (hotter) tubesheet to carry a local current of sodium rich in steam reaction products to the nearest leak detector. It is concluded that the thermal baffles and spacers will not significantly impede the prompt chemical detection of small steam leaks at tube-to-tubesheet welds in the CRBR hockey stick steam generator.

- 215 (ANL-CT--78-21) USER'S MANUAL FOR FINITE-ELEMENT COMPUTER CODE, CREEP-PLAST. Yang, C.I.; Zawadzki, S. (Argonne National Lab., IL (USA)). Jan 1978. Contract W-31-109-ENG-38. 55p. Dep. NTIS, PC A04/MF A01.

CREEP-PLAST is a finite element computer code developed for high temperature structural design of LMFBR vessels, components and core structures. It performs creep and plasticity calculation in two dimensional form under plane stress, plane strain or axisymmetric assumptions. The original code has been extensively modified to improve its efficiency.

- 216 (ANL-CT--78-22) FINITE-ELEMENT SOLUTION OF ADDED MASS AND DAMPING OF OSCILLATING RODS IN VISCOUS FLUIDS. Yang, C.I.; Moran, T.J. (Argonne National Lab., IL (USA)). Feb 1978. Contract W-31-109-ENG-38. 26p. Dep. NTIS, PC A02/MF A01.

A finite element analysis is presented for the cylindrical rods oscillating periodically in an incompressible viscous fluid. A system of discretized equation is obtained from the appropriate Navier-Stokes and continuity equations through Galerkin's process. The basic unknowns are velocity and pressure. A mixed interpolation method is used. The added mass and viscous damping coefficients which characterize the fluid reaction force due to the rods oscillation can be obtained through a line integration of stress and pressure around the circumference of the rods. For the special case of a cylindrical rod oscillating in a viscous fluid enclosed by a rigid, concentric cylindrical shell, the finite element solution agrees well with the analytical closed form solution, which, in turn, has been verified experimentally.

- 217 (ANL-CT--78-23) INTERIM ULTRASONIC SODIUM FLOW MEASUREMENTS ON THE EBR-II SECONDARY SYSTEM. Karplus, H.B.; Forster, G.A. (Argonne National Lab., IL (USA)). Mar 1978. Contract W-31-109-ENG-38. 45p. AT.

The ultrasonic flowmeter measures the flow in a pipe by determining the times of flight of an ultrasonic pulse travelling through the fluid in a diametral plane at an angle of about 55° to the pipe axis. The difference of the time of flight of a pulse travelling in the direction of the flow and a pulse travelling in the opposite direction yields a measure of the flow velocity. The average flight time of the two pulses is a function of the temperature from which a correction for pipe expansion and sound velocity may be derived. Flight times were measured with laboratory instruments and flow-rates calculated with a hand calculator to yield data for implementing a complete flowmeter using a microprocessor to give flow output directly. The differences between observed and calculated total ultrasonic flight times are well within experimental error. Absolute ultrasonic flow measurements are within the error band of other measuring systems.

- 218 (ANL-CT--78-24) PRESSURE TRANSIENT ANALYSIS IN PIPING SYSTEMS INCLUDING THE EFFECTS OF PLASTIC DEFORMATION AND CAVITATION. Youngdahl, C.K.; Kot, C.A.; Valentin, R.A. (Argonne National Lab., IL (USA)). Mar 1978. Contract W-31-109-ENG-38. 40p. Dep. NTIS, PC A03/MF A01.

Computational methods for analyzing pressure transients in the intermediate heat transport system of a sodium-cooled breeder reactor are being developed at Argonne National Laboratory. Because these systems typically operate at low pressures, thin-walled piping is used. Consequently, the pressure pulses produced by a sodium/water reaction in a steam generator or a pipe break may plastically deform sections of the piping, and rarefaction waves, because of the low operating pressure, may produce cavitation in the system. Both these phenomena have a large effect on the pressure pulses traversing the pipe network and, consequently, on the transient loading on major components. The computer program PTA-1, which includes the effect of plastic deformation of piping, and the computer program PTAC, which includes the effect of cavitation, have previously been validated using available experimental data. A new program, PTA-2, is being developed which combines the capabilities of PTA-1 and PTAC. Comparisons will be shown between PTA-2 predictions and the results of several experiments performed at Stanford Research Institute. In each of these experiments, a pressure pulse caused plastic deformation of a thin-walled pipe, producing a rarefaction wave which then produced a cavitating region in another pipe.

- 219 (ANL-CT--78-26) FTMOC-2D: A COMPUTER PROGRAM FOR TWO-DIMENSIONAL FLUID-TRANSIENT ANALYSIS BY THE METHOD OF CHARACTERISTICS. Shin, Y.W. (Argonne National Lab., IL (USA)). Mar 1978. Contract W-31-109-ENG-38. 133p. Dep. NTIS, MF A01.

Portions of document are illegible.

The computer program FTMOC-2D is a basic two-dimensional fluid-transient code that offers flexibility for application to a wide variety of problems. The flexibility is attained by requiring the user to provide a small part of the code to define the problem he wishes to solve. The basic numerical technique used is a

two-step explicit procedure based on the method of characteristics. Use of four linearized bicharacteristic relations yields an efficient computational procedure for both the Cartesian and axisymmetric two-dimensional problems. The basic scheme is suitable for a fluid-structure interaction problem. The program structure is described in detail. Ease in use of the program is demonstrated by a sample problem calculation. Graphical display capability is also developed by which the calculated result is easily visualized.

- 220 (ANL-CT--78-27) CRITICAL HEAT FLUX DATA WITH STRESS CALCULATIONS IN AN LMFBR STEAM GENERATOR TUBE. France, D.M.; Chiang, T.; Carlson, R.D.; Priemer, R.; Minkowycz, W.J. (Argonne National Lab., IL (USA)). Apr 1978. Contract W-31-109-ENG-38. 52p. AT.

Measured and calculated results of critical heat flux tests are presented from 406 experiments conducted in the ANL Steam Generator Test Facility. A full scale LMFBR steam generator tube was employed as the test section with an inside diameter = 10 mm, heated length = 13.1 m, and material = 2 1/2% Cr-1 Mo steel. Water was circulated vertically upwards through the tube and was heated by sodium flowing counter-current in a surrounding annulus. Complete parametric results are presented for all tests, and additional measured and calculated results are included for thermal fluctuations and thermal stresses in the tube wall adjacent to the transition boiling region for 139 of the tests.

- 221 (ANL-CT--78-30) OUTLET PLENUM MIXING FOR TRANSIENT OVERPOWER CONDITIONS OF A ONE-EXIT NOZZLE LMFBR. Howard, P.A. (Argonne National Lab., IL (USA)). Apr 1978. Contract W-31-109-ENG-38. 70p. Dep. NTIS, PC A04/MF A01.

Two types of transient tests were employed to model a one-exit nozzle LMFBR outlet plenum. Water was used as a test fluid in the simulation of constant flowrates, Transient Overpower (TOP) conditions. In the first test, simulated fuel flow was 85% and blanket flow was 15%, whereas in the second test, the fuel flow was 100%. This allowed the assessment of the mitigating effects of blanket flow upon the exit nozzle temperature transient. The flow field was clearly three-dimensional, and a less active, though not stagnant, region was observed diametrically opposite the exit nozzle. During steady state, oscillations above the fuel-blanket interface were found to be small. This is attributed to the existence above the reactor core of a recirculating flow field, which served as an effective mixing agent. A simple lumped-parameter model, EXITI, was developed to simulate TOP transient conditions for the test with both fuel and blanket flows. The predicted temperature profiles for various regions in the plenum were in good agreement with the experimental profiles, except for the region immediately above the reactor blanket. In devising the computer model, the temperature in this region was assumed to remain constant throughout the transient. However, this constant temperature did not prevail owing to the mixing that occurred in this region as a result of the recirculating flow field above the reactor core. The computer model can be readily modified to take into account the mixing due to this recirculation. In the test without blanket flow, good agreement between predictions and data was again obtained. In comparing results of the two tests, it was found that the blanket flow had only a small mitigating influence on the transient at the exit nozzle. The computer

model can easily be extrapolated to reactor conditions.

- 222 (ANL-CT--78-32) PTA-1-RD: A COMPUTER PROGRAM FOR ANALYSIS OF PRESSURE TRANSIENTS IN HYDRAULIC NETWORKS INCLUDING THE EFFECTS OF NONINSTANTANEOUS RUPTURE DISCS. Hsieh, B.J. (Argonne National Lab., IL (USA)). Sep 1978. Contract W-31-109-ENG-38. 73p. AT.

The one dimensional method of characteristics pressure transient analysis computer program, PTA-1 can treat complex piping networks and includes a variety of junction types and boundary nodes. Among these boundary nodes is a rupture disc representation. However, the disc is assumed to fail instantaneously when subjected to a pressure preceding some prespecified value, usually the static buckling pressure of the disc. A nonlinear finite element method is applied to compute the transient response of the disc. The disc's response is then fed back to the PTA-1 program by using the Newton-Raphson iteration technique. The resulting new computer program, PTA-1-RD, retains all the capabilities of the PTA-1 code and, in addition, treats the noninstantaneous rupture disc.

- 223 (ANL-CT--78-33) THERMODYNAMIC THEORY OF CAVITATION NUCLEI IN DILUTE LIQUID-GAS SOLUTIONS. Cha, Y.S. (Argonne National Lab., IL (USA)). Jun 1978. Contract W-31-109-ENG-38. 39p. Dep. NTIS, PC A03/MF A01.

The stability of a spherical bubble in a two-component two-phase system is examined by employing the thermodynamic theory of dilute solutions. It is shown that a bubble can remain in a state of stable equilibrium provided that the ratio of the total number of moles of the solute to the total number of moles of the solvent in the system is not extremely small and that the system pressure falls between an upper bound (dissolution limit) and a lower bound (cavitation limit). The results of the analysis provide a theoretical basis for the persistence of microbubbles in a saturated liquid gas solution. Thus to a certain extent, the results also help to resolve the dilemma that exists in the field of cavitation due to (1) the necessity of postulating the existence of microbubbles; and (2) the lack of theoretical justification for the persistence of such bubbles in a liquid.

- 224 (ANL-CT--78-34) COUPLED SHELL-SIDE AND TUBE-SIDE HEAT TRANSFER MODEL FOR HEAT EXCHANGERS. Oras, J.J.; Sha, W.T.; Kao, T.T.; Chou, S.L.; Cho, S.M. (Argonne National Lab., IL (USA)). May 1978. Contract W-31-109-ENG-38. 23p. AT.

A heat transfer model coupling the heat transfer of the shell- and tube-side fluids of a sodium-to-sodium heat exchanger is developed. In addition, a difference scheme is suggested for use in computer simulations. Nonuniform tube-side flow distribution is incorporated in the model. Future extension of the model to steam generator applications is made possible by the use of energy equations written in terms of enthalpy.

- 225 (ANL-CT--78-39) CRITICAL HEAT FLUX MEASUREMENTS WITH SODIUM HEATING AND LOW WATER FLOWRATE. France, D.M.; Chiang, T.; Carlson, R.D.; Minkowicz, W.J.; Priemer, R. (Argonne National Lab., IL (USA)). Jul 1978. Contract W-31-109-ENG-38. 37p. AT.

Seventy critical heat flux (CHF) experiments were performed in the Steam Generator Test

Facility (SGTF) employing a straight vertical steam tube of 13.1 m length, 10 mm inside diameter, heated by flowing sodium. The water mass flux was relatively low ranging from 0.1 to 0.6 Mg/m².s, and the majority of the data were obtained at a water pressure of 7.3 MPa. The data are presented in measured and reduced form for each test. The critical quality and thermal stress in the tube wall at CHF are compared to extrapolations of previously derived empirical correlation equations.

- 226 (ANL-CT--78-40) UK/USA CORE RESTRAINT EXCHANGE STUDY NUBOW-3D RESULTS. McLennan, G.A. (Argonne National Lab., IL (USA)). Jul 1978. Contract W-31-109-ENG-38. 73p. AT.

Core restraint structural analyses were performed for a model of the National Core Restraint Test Facility (NCRTF) for a series of loading conditions. These calculations were performed using the computer code NUBOW-3D, to form a basis for comparison with results to be obtained through a cooperative agreement with the United Kingdom, from the UK code CRAMP. This UK core restraint code includes a friction capability and the results of this comparison will be used to assess the effects of friction on US core restraint analysis and design. The report summarizes the NUBOW-3D modeling of the NCRTF to be compatible with the UK code and presents the (frictionless) NUBOW-3D results for a series of selected loadings, including compaction by movable yokes at the above-core-load-plane, and an assumed thermal rise to power for a specified temperature distribution.

- 227 (ANL-CT--78-42) FINITE-ELEMENT CODE FOR COMPUTING ADDED MASS COEFFICIENTS. Yang, C.I. (Argonne National Lab., IL (USA)). Sep 1978. Contract W-31-109-ENG-38. 21p. AT.

In this report, the effect of the surrounding fluid which is termed as added mass upon the accelerating structural components is outlined. If the surrounding fluid is assumed to be inviscid, the governing equation can be expressed in terms of pressure and reduced to elliptic type. A numerical approximation of the solution based on a previous report has been formulated. For a special case, such as a set of concentric cylinder with fluid in the gap, the results agree well with the analytical solution. This computer code was also used to compute the matrix of added mass coefficients of an array of hexagonal cans surrounded by inviscid fluid.

- 228 (ANL-CT--78-43) HYDRODYNAMIC FORCES ON A GROUP OF TUBES SUBJECTED TO CROSSFLOW. Chen, S.S.; Lin, W.H. (Argonne National Lab., IL (USA)). Jul 1978. Contract W-31-109-ENG-38. 63p. AT.

A complete solution to the problem of crossflow-induced vibrations of tube banks is still unattainable. The major task is the characterization of flow noises and motion-dependent forces. This includes the understanding of formation of organized vortex systems, unsteady fluid forces acting on the tubes, turbulence characteristics within tube arrays, and interaction of tube motion and fluid field. The objective of this report is to present a two-dimensional, potential-flow solution for the fluid inertia force, hydrodynamic damping force, and fluidelastic force of tube arrays arranged in an arbitrary pattern. Based on the result, a mathematical model for crossflow induced of tube banks is presented.

- 229 (ANL-CT--78-44) EXPERIMENTS ON

FLUIDELASTIC INSTABILITY IN TUBE BANKS SUBJECT TO LIQUID CROSS FLOW. PART I. RECTANGULAR ARRAYS. Chen, S.S.; Jendrzejczyk, J.A.; Lin, W.H. (Argonne National Lab., IL (USA)). Jul 1978. Contract W-31-109-ENG-38. 256p. AT.

The objective of the work reported is to provide an experimentally validated mathematical model for design evaluation of curved tube banks to avoid detrimental flow-induced vibrations. An extensive test program is being carried out to establish the critical flow velocity as a function of various system parameters. The test program is divided into two phases: (1) rectangular tube arrays and (2) triangular and mixed tube arrays. Testing of the rectangular tube arrays has been completed; the report presents the results for the first-phase tests. Critical flow velocities for six tube arrays with different spacing, mass ratio, damping, and detuning are established. Based on the experimental data, a stability map is prepared; this is useful in design to avoid detrimental fluidelastic instability. Based on the results, several general conclusions are drawn: (1) the generally accepted correlation does not correlate the data well, (2) detuning has beneficial effects on tube stability, (3) in the parameter ranges tested, tube spacings in the transverse and longitudinal directions do not have a significant effect on tube stability, (4) the instability modes are predominantly associated with the lift-direction motions, (5) there are multiple values of critical flow velocities associated with different modes of instability, (6) fluidelastic mechanism interacts with vortex shedding in some cases, and (7) damping stabilizes tube arrays and affects the on-set of instability.

230 (ANL-CT--78-47) INITIAL CONSIDERATIONS ON THE INFLUENCE OF THERMAL BUOYANCY ON HEAT EXCHANGER PERFORMANCE (RELEVANT GEOMETRIC, OPERATIONAL, THERMAL-HYDRAULIC PHENOMENA AND MODELLING CONSIDERATIONS). Kasza, K.E. (Argonne National Lab., IL (USA)). Aug 1978. Contract W-31-109-ENG-38. 130p. AT.

An initial study of the propensity for thermal buoyancy to alter the performance of the current generation of LMFBR intermediate heat exchangers under low flow operation has been performed. The thermal buoyancy related phenomena which can possibly occur in the various geometric subregions of the IHX and the appropriate modelling parameters for many of these phenomena have been delineated. The extent of the knowledge available pertaining to the various phenomena has been determined through a quite extensive literature review. In general there is a weakness in the general understanding of thermal buoyancy effects in complex flow and heat transfer equipment.

231 (ANL-CT--79-1) MIXING STUDIES FOR GEOMETRIC VARIATIONS OF THE CRBR OUTLET PLENUM. Howard, P.A.; Carbajo, J.J. (Argonne National Lab., IL (USA)). Oct 1978. Contract W-31-109-ENG-38. 59p. AT.

A set of eight transient mixing tests was performed with five geometric variations of the CRBR outlet plenum. These results are compared to data from an earlier study where the prototypic CRBR outlet plenum was modeled. Water was used as a test fluid and similitude was based upon the Richardson number at 1/10 scale. A model of the CRBR reference core with both fuel and blanket assemblies was utilized throughout. The results of two different scram transients for similar geometry are compared, and the question of simulation accuracy is addressed. In addition, experimental results are compared to predictions from the PLENUM-2

computer code which provided good agreement with the representative results.

232 (ANL-CT--79-3) FLUID FORCES ON RODS VIBRATING IN FINITE LENGTH ANNULAR REGIONS. Mulcahy, T.M. (Argonne National Lab., IL (USA)). Jun 1978. Contract W-31-109-ENG-38. 37p. AT.

Approximate expressions for the fluid forces acting on a central, rigid rod translating periodically in a finite length annular region of confined fluid are derived from the Navier Stokes equations for a range of geometric and fluid parameters where viscous damping is significant. Based on the derived forces, lumped added mass and linear dashpot modeling of an annular gap support typically found in nuclear reactors are employed to predict the fundamental frequency and modal damping of a single beam. Test methods and results for the same beam are presented which indicate the force expressions are applicable for small fluid motions.

233 (ANL-CT--79-4) THERMAL-HYDRAULICS DESIGN GUIDE FOR AN ADVANCED DESIGN THERMAL MIXER (INCLUDING DEVELOPMENT/TESTING DETAILS). Kasza, K.E.; Bobis, J.P. (Argonne National Lab., IL (USA)). Oct 1978. Contract W-31-109-ENG-38. 88p. AT.

An Advanced Design Thermal Mixer concept has been developed and performance tested. The mixer combines two fluid streams by utilizing a coaxial perforated pipe insert which allows flow from an outer annular region to jet radially into an inner pipe through a large number of holes and combine with the second stream. Detailed mixer performance information (both experimental and analytical) has been generated on temperature fluctuation peak-to-peak amplitude, associated temperature fluctuation frequency, and pressure changes. The dependence of the preceding measures of mixer performance on thermal-hydraulic conditions and mixer geometry has been delineated. The peak-to-peak temperature fluctuation amplitudes ($\Delta T/\text{sub FLUCT/}$) occurring at the mixer primary pressure boundary pipe possess a maximum which is a function of geometry and thermal-hydraulic conditions. A general correlation in terms of three basic mixing mechanisms has been developed which relates $\Delta T/\text{sub FLUCT/}$ to all pertinent parameters. The mixer concept is shown to be capable of achieving rapid thermal mixing for which $\Delta T/\text{sub FLUCT/}$ is less than 20% of the inlet-leg two stream temperature difference. In contrast conventional pipe tee mixers previously tested readily experienced $\Delta T/\text{sub FLUCT/}$ of order 90% of the inlet-leg temperature difference. The low level of $\Delta T/\text{sub FLUCT/}$ achievable in the subject mixer design qualifies it as thermal-fatigue free mixer from LMFBR service.

234 (ANL-CT--79-5) PRELIMINARY TEST PLAN FOR SEISMIC FEATURE TESTS. Moran, T.J. (Argonne National Lab., IL (USA)). Oct 1978. Contract W-31-109-ENG-38. 11p. AT.

The purpose of this document is to describe a series of seismic feature tests to be conducted by the Components Technology Division of Argonne National Laboratory for the Reactor Research and Technology Division of the U.S. Department of Energy. This experiment is part of the National Core Mechanics and Configuration Performance Plan Seismic development program under Task C, Feature Tests. In particular, Phase I address tasks C.1.1, gap impact phenomena tests, C.1.2, impact parameter variations, and C.2, inertial

coupling, damping and effective mass effects. Later phases of the test series may address tasks C.1.3, impact damage tests and C.3, dynamic friction effects. This series of tests is intended to qualify mathematical models of fluid/structure interaction and structures impacting in fluid for systems analogous to those occurring in fast reactor core seismic response. The seismic analysis of fast reactor core structures is a complex problem involving fluid structural coupling and impact in a three-dimensional structure; it requires extensive simplifying assumptions to obtain a solvable mathematical model. Seismic testing of reactor core models is also a complex and expensive effort. The seismic feature tests provide the intermediate step of experimental verification of the analysis tools and assumptions in simplified models representative of various features of core seismic response.

- 235 (ANL-CT--79-06) DYNAMIC RESPONSE OF CIRCULAR TUBES SUBJECTED TO LIQUID CROSS FLOW. Chen, S.S.; Jendrzeczyk, J.A.; Wambsganss, M.W. (Argonne National Lab., IL (USA)). Oct 1978. Contract W-31-109-ENG-38. 77p. AT.

The work reported herein was performed as part of the base technology activity under Flow Induced Vibration Program (189a No. CA054) sponsored by DOE/RRT. The overall objective of the activity is to develop new and/or improved, experimentally-validated analytical methods and guidelines for designing breeder reactor components to avoid detrimental flow induced vibration. This report describes three series of experimental investigations of circular tubes subjected to liquid cross flow: (1) a single tube; (2) a pair of tubes with one in the wake of the other; and (3) two tubes in a plane normal to the flow stream. The tube response characteristics, including natural frequencies, dampings, displacements, and vibration orbits are studied in detail. The results of this study provide some additional insight into the response characteristics of circular tubes in liquid flow, such as flow-velocity dependent damping and "lock-in" region of tube motion in the drag direction.

- 236 (ANL-CT--79-11) SOFTWARE DEVELOPMENT FOR THE MIXING COMPONENTS TEST FACILITY. Bobis, J.P.; Colwell, W.S. (Argonne National Lab., IL (USA)). Nov 1978. Contract W-31-109-ENG-38. 71p. AT.

The first set of software was developed and performance tested for the 16 bit minicomputer system at the Mixing Components Test Facility. The software developed for the analog/digital converter allows 32 channels of analog signals to be scanned in less than 4 ms with a minimum scan interval of 20 ms. For the analysis of the data in the time domain additional software was developed that calculated the mean, rms, maximum and minimum signal levels, and listed instantaneous values of chosen signals. To assist in determining the frequency associated with a temperature fluctuation, software was generated and tested successfully to measure the signal power spectral density and autocorrelation. For two temperature signals that can be related by a time delay the autocorrelation software was extended to operate in a cross correlation mode. The time and frequency domain analysis was supplemented with analysis in the amplitude domain when software was completed for determining signal probability density histograms. All software was evaluated and proven to be correct with the use of benchmark analytic functions and by measuring the analog signal with hardware that included rms-mean voltmeters, storage oscilloscopes, and spectrum analyzers.

- 237 (ANL-CT--79-14) POST-CHF HEAT TRANSFER AND TRANSITION BOILING CHARACTERISTICS IN AN LMFBR STEAM GENERATOR TUBE. Chiang, T.; France, D.M.; Carlson, R.D. (Argonne National Lab., IL (USA)). Dec 1978. Contract W-31-109-ENG-38. 139p. AT.

One hundred thirty-five post-critical heat flux (post-CHF) experiments were performed in the Steam Generator Test Facility (SGTF) employing a straight, vertical steam tube of 13.1 m length and 19 mm inside diameter that was heated by flowing sodium. The water pressure ranged from 7.0 to 15.3 MPa, and the water mass flux ranged from 0.72 to 3.2 Mg/m².s. The data and a correlation equation are presented. Also presented are the results of analyses of transition boiling region characterization which show that the previously observed heat flux dependent and heat flux independent trends of critical heat flux data are a consequence of a change of the hydrodynamic structure of the two-phase flow.

- 238 (ANL-CT--79-16) REVIEW ON FLUID FORCES ON CIRCULAR CYLINDERS IN CROSS FLOW. Nahavandi, A.N.; Chen, S.S. (Argonne National Lab., IL (USA)). Jan 1979. Contract W-31-109-ENG-38. 68p. AT.

The objective of the study is to recommend the most promising numerical digital-computer-oriented methods for the computation of fluid forces on a single rigid cylinder or an array of rigid cylinders. The scope of the work specifically includes: (1) performing an extensive literature search on the analytical, numerical and other solution techniques applicable to this problem; (2) comparing the advantages and disadvantages of the available solution techniques; and (3) recommending the most promising numerical techniques and computer codes for the computation of hydrodynamic loading on cylinders in cross flow.

- 239 (ANL-CT--79-17) PLENUM=2A: A PROGRAM FOR TRANSIENT ANALYSIS OF LMFBR OUTLET PLENUMS. Howard, P.A.; Carbajo, J.J. (Argonne National Lab., IL (USA)). Feb 1979. Contract W-31-109-ENG-38. 52p. AT.

An improved version of the PLENUM=2 code, PLENUM=2A, has been developed to predict the thermal conditions in an LMFBR outlet plenum after a reactor scram. Both the old and the improved versions divide the transient into three consecutive stages and consider only two mixing regions within the outlet plenum. Modifications of the code as reported here include elimination of the three second delay between Stage 1 and Stage 2, a simplification of the transition stage which occurs between complete mixing and the stratification phase, and an improved hot-cold interface rise-rate correlation. In most cases, PLENUM=2A has better agreement with available data than does PLENUM=2.

- 240 (ANL-CT--79-18) TESTING OF STEAM GENERATOR LEAK DETECTORS ON THE HIGH PRESSURE TEST LOOP: INTERIM REPORT. Koehl, E.R.; Smith, F.A.; McKee, J.M. (Argonne National Lab., IL (USA)). Jul 1979. Contract W-31-109-ENG-38. 63p. AT.

A small pumped loop was built and is being used to test LMFBR steam generator leak detectors and calibration equipment in sodium at 925°F and 180 psi, with excursions to 325 psi (planned CRBR operating conditions). Six hydrogen meters, four oxygen meters and a hydrogen injection coil have completed a year of operation in sodium with no mechanical

failures. The calibration stability of the hydrogen meters has not been as good as expected and is the subject of continuing investigation. The hydrogen injection coil was found to be correctly sized for its intended function, on-line calibration of hydrogen meters in leak detector modules. Sodium hydroxide injections are being used to calibrate both hydrogen and oxygen meters. Essentially all of the hydrogen and oxygen in the hydroxide is promptly detectable at 925°F. Two nickel membrane designs and two ion-pump cathode materials are being tested on the six hydrogen meters.

- 241 (ANL-CT--79-32) ACOUSTIC RADIATION AND SCATTERING FROM A GROUP OF CIRCULAR CYLINDERS. Lin, W.H.; Chen, S.S. (Argonne National Lab., IL (USA)). Apr 1979. Contract W-31-109-ENG-38. 76p. AT.

Acoustic waves caused by the motion of a group of circular cylinders in an infinite compressible fluid medium have been investigated. The linear two-dimensional acoustic wave equation is solved in terms of a series of cylindrical wave functions associated with the circular coordinates of each cylinder. To satisfy the boundary condition at a particular cylinder, all cylindrical wave functions are transformed to the local coordinates of that cylinder. The resulting equations are a system of linear algebraic equations for the undetermined constants, which are solved numerically by a digital computer. The velocity potential, pressure, and force acting on each cylinder are then obtained in terms of these constants.

- 242 (ANL-CT--79-35) SWAAM PREDICTION OF LLTR SERIES-II A-1A TEST. Shin, Y.W.; Lin, H.C.; Eichler, T.V.; Hsieh, B.J. (Argonne National Lab., IL (USA)). May 1979. Contract W-31-109-ENG-38. 59p. AT.

This report describes the pre-test prediction of the nonreactive nitrogen injection Test A-1a of the LLTR Series-II Test sequence. The test conditions resemble the reactive Test A-2 subcooled water injection at 1700 psia except that the tube-side pressure is increased to 2000 psia to insure activation of the relief system. The relief system activates when the rupture disk fails.

- 243 (ANL-CT--79-36) MIXING IN A POOL-TYPE PLBR AFTER A SCRAM. Howard, P.A.; Haried, J.A. (Argonne National Lab., IL (USA)). Jun 1979. Contract W-31-109-ENG-38. 116p. AT.

Transient flow patterns were simulated for eleven geometric variations of a pool-type PLBR. The effects of coolant density changes due to a reactor scram were simulated using water in a 1/15-scale model of the hot and cold pools. The influence of Intermediate Heat Exchanger (IHx) inlet height, gap beneath the Upper Internal Structure (UIS), and UIS exit height on coolant flow were studied in the hot pool. Transients with and without pump trips were included in this study. Dye injection allowed visual observation of the flow patterns within the hot pool. The results for the hot pool were compared to an existing computer model, Plenum-2A. In addition, the cold pool was analyzed during simulated upshock transients with various primary pump inlet heights.

- 244 (ANL-CT--79-40) SCALE MODELING OF FINITE LENGTH FLUID ANNULAR GAPS FOR FLOW-INDUCED VIBRATION TESTING. Mulcahy, T.M.; Miskevics, A.J. (Argonne National Lab., IL

(USA)). Jun 1979. Contract W-31-109-ENG-38. 30p. AT.

Possible scale model distortions for structural vibration testing are discussed. Conditions for which fluid energy dissipation is expected to be larger in a reduced scale model than in the prototype are defined. This unconservative and sometimes undesirable distortion is confirmed by testing of a vibrating rod surrounded by a finite length fluid filled annulus. A theory for estimating the magnitude of the distortion is presented.

- 245 (ANL-CT--79-45) EXPERIMENTS ON FLUIDELASTIC INSTABILITY IN TUBE BANKS SUBJECT TO LIQUID CROSS FLOW. PART II. MIXED ARRAYS. Chen, S.S.; Jendrzejczyk, J.A.; Lin, W.H. (Argonne National Lab., IL (USA)). Jul 1979. Contract W-31-109-ENG-38. 298p. AT.

The work reported was performed as part of the design method development activity for curved tube banks under the Flow Induced Vibration Program included in US DOE/RRT Work Package: Engineered System and Components; Task: General Engineering Support (Task No. 00305). The objective is to provide an experimentally validated mathematical model for design evaluation of curved tube banks to avoid detrimental flow-induced vibrations. An extensive test program was carried out to establish the critical flow velocity as a function of various system parameters. The test program was divided into two phases: (1) rectangular tube arrays; and (2) mixed tube arrays. The results from the second-phase tests are presented.

- 246 (ANL-CT--79-46) FIC: A FINITE ELEMENT CODE FOR CALCULATING ADDED MASS AND DAMPING COEFFICIENTS. USER'S MANUAL. Batill, S.M. (Argonne National Lab., IL (USA)). Jul 1979. Contract W-31-109-ENG-38. 60p. AT.

The purpose of this report is to provide a user's manual for a finite element code, written by C. I. Yang of ANL. The code is capable of calculating the hydrodynamic reactions on multiple interacting bodies undergoing simple harmonic motion. This report will document input requirements and discuss the program output. A sample data set and program listing are also included. It should be noted that the program has not been prepared for production applications but is intended for use as a research tool.

- 247 (ANL-CT--79-47) PRELIMINARY STUDY OF FLUID EFFECTS ON REACTOR CORE SEISMIC RESPONSE. Batill, S.M. (Argonne National Lab., IL (USA)). Jul 1979. Contract W-31-109-ENG-38. 34p. AT.

The dynamic response during a seismic event of a liquid metal fast breeder reactor core may be influenced significantly by the fluid contained between the fuel assemblies. This report documents a preliminary study designed to highlight the dominant fluid effects on the dynamic response of a related idealized model. The model consists of a simple two-dimensional rectangular channel which contains five rigid blocks with square cross-sections. Fluid added mass and damping coefficients were calculated using a finite element model of the fluid region. These effects were incorporated into the SCRAP computer code and position-time histories due to simple harmonic base motion were calculated for the idealized core.

- 248 (ANL-CT--79-48) SCRAP: INPUT, OUTPUT, AND SOURCE LISTINGS. Moran, T.J. (Argonne National Lab., IL (USA)). Jul 1979.

Contract W-31-109-ENG-38. 108p. AT.

This report describes the FORTRAN IV computer code, SCRAP, written to aid the analysis of the seismic response of fast reactor core structures. Flow diagrams for the code are given, the code input is described and examples listed, and the source listing is given. Comparison reports describe the theoretical basis of the SCRAP code and provide guidance in modeling fast reactor core structures with the code. SCRAP is a research tool and changes to the code are expected so this report should be considered interim.

- 249 (ANL-CT--79-49) SCRAP: THEORY AND MODELING CONSIDERATIONS. Moran, T.J. (Argonne National Lab., IL (USA)). Jul 1979. Contract W-31-109-ENG-38. 28p. AT.

The theoretical basis for the FORTRAN IV computer code SCRAP is presented. Guidance for modeling fast reactor core structures with the code is included. Companion reports describe the FORTRAN source and input format and the theoretical basis for the fluid modeling used by the code. SCRAP is a research tool, not a production code, and this report should not be considered a user's manual.

- 250 (ANL-CT--79-51) ADDED MASS AND DAMPING COEFFICIENTS FOR HEXAGONAL TUBE ARRAYS. Wilson, D.E. (Argonne National Lab., Evanston, IL (USA)). Aug 1979. Contract W-31-109-ENG-38. 24p. Dep. NTIS, PC A02/MF A01.

An analytical investigation of the fluid coupling effects from an array of hexagonal cylindrical ducts undergoing harmonic oscillations is presented. A closed form solution for the velocity and pressure is obtained under a thin gap approximation for the case of moderate frequencies. From this solution, the usual viscous and inertial fluid coupling coefficients are easily obtained. These analytically derived coefficients indicate a strong dependence upon gap spacing and oscillating Reynolds number.

- 251 (ANL-CT--80-1) COMPARATIVE TRANSIENT ANALYSIS OF METAL AND OXIDE FUELED LMFBR. Saphier, D.; Madell, J.T. (Argonne National Lab., IL (USA)). Sep 1979. Contract W-31-109-ENG-38. 125p. Dep. NTIS, PC A06/MF A01.

The neutronics and thermodynamics of an LMFBR primary system have been simulated using the DSNP simulation language. A detailed fuel pin and its subchannel model were developed and included in the DSNP library. This permits the reactor core to be simulated with any number of pins having any number of radial and axial nodes. The metal fueled core transients were compared to transients of an oxide fueled core, the conclusion being that for the same perturbations the temperature transients are faster in the metal core. A comparison between pool-type and loop-type reactors was also performed, leading to a conclusion that the transients in the upper plenum temperatures are much slower in the pool-type reactor than in the loop-type reactor.

- 252 (ANL/CT/DA--1666) EVALUATION AND INTERPRETATION OF THE ANL-MICROPHONE DATA FROM THE CAVITATION TESTS OF THE FFTF PRIMARY PUMP AT LMEC--SPTF. Cha, Y.S.; Bobis, J.P.; Carey, W.M.; Huebotter, P.R. (Argonne National Lab., IL (USA)). Jun 1977. Contract W-31-109-ENG-38. 27p. AT.

Acoustic data from the cavitation tests of the FFTF pump were analyzed. It was found that the high frequency (> 10 kHz) noise provides a

better means of detecting light and moderate pump cavitation conditions as compared with low frequency cavitation noise that was not easily distinguished from the background noise. It was observed that relatively intense cavitation occurred at an NPSH value corresponding to that when the head began to decrease. A qualitative conclusion is that, under the design conditions, short-term damage is unlikely to occur for the FFTF pump. However, the possibility of long-term (30 years) damage cannot be ruled out.

- 253 (ANL/EBR--063) DATA-PROCESSING SYSTEM FOR INSTRUMENT MAINTENANCE AND CALIBRATION AT EBR-II. Moriarty, K.J.; Ringquist, J.M. (Argonne National Lab., Idaho Falls, ID (USA); Argonne National Lab., IL (USA)). Jun 1972. Contract W-31-109-ENG-38. 47p. Dep. NTIS, PC A03/MF A01.

Early in the operation of EBR-II, it was recognized that a computer program was required for the periodic calibration and maintenance of the more than 1600 instruments in service. Computer Program No. I, set up in 1964, evolved into Computer Program No. II by addition of updated scheduling, history cards, and a new computer to execute the program. Computer Program II, combined with the required procedures, has been operative for about one year. This report describes that program and its operation.

- 254 (ANL/EBR--071) COMPUTERIZED PREVENTIVE-MAINTENANCE PROGRAM FOR EBR-II REACTOR-ASSOCIATED MECHANICAL AND POWER-ELECTRICAL COMPONENTS. Doe, C.B.; Leman, J.D.; Jacob, D.F.; Ringquist, R.M. (Argonne National Lab., Idaho Falls, ID (USA); Argonne National Lab., IL (USA)). Feb 1973. Contract W-31-109-ENG-38. 32p. Dep. NTIS, PC A03/MF A01.

This report describes the computer program that has been set up to assist in meeting the preventive-maintenance requirements of the EBR-II reactor-associated mechanical and power-electrical components. The program can provide several types of listings, including all equipment covered by the program, all equipment due for maintenance, and all equipment due for maintenance under specified plant conditions. This report also describes some other areas of the preventive-maintenance program that are not computerized. Possibilities for expansion of the computer program are briefly indicated.

- 255 (ANL/EBR--100) COOLING OF A SIMULATED EBR-II SUBASSEMBLY WITH AIR AND ARGON. Buchanan, T.N. (Argonne National Lab., IL (USA)). Jul 1978. Contract W-31-109-ENG-38. 102p. AT.

To gain more accurate knowledge of the heat-transfer characteristics of irradiated EBR-II subassemblies and to provide a broader data base for use in developing analytical models for postirradiation decay cooling, a 61-element electrically heated subassembly was constructed and instrumented so that axial and radial temperature profiles across it could be obtained. To obtain the broad data base that would be needed to fit a test to a condition that might arise, a number of tests were run under differing conditions of heat input and cooling. Cooling was done in both argon and air atmospheres and under conditions representing loss-of-flow events as well as normal cooling.

- 256 (ANL/EBR--101) COMPILED OF DATA FROM EBR-II NATURAL-CIRCULATION-TEST PROCEDURE EX-140, SECTION IV, ADDENDUM 1A. Gillette, J.L.; Sullivan, J.E.; Tokar, J.V.; Singer, R.M.

(Argonne National Lab., Idaho Falls, ID (USA)).
May 1978. Contract W-31-109-ENG-38. 257p.
AT.

Data from the XX08 natural-circulation Test 1A in EBR-II are presented herein. This test consisted of four separate coastdowns of primary-system flow initiated from approximately 5.5 percent of normal full flow (the flow provided by the auxiliary electromagnetic pump in the reactor outlet pipe of EBR-II). Each coastdown was conducted with a different flow rate of secondary sodium through the intermediate heat exchanger (IHX). Data were obtained with the EBR-II data-acquisition system (DAS) from the normal plant instrumentation, from the INCOT YY07D experiment, and from instrumented subassembly XX08, which had been installed in the reactor just before the test. The necessary corrections for offsets in the raw data collected through the DAS are discussed. The corrected data are graphically presented for each phase of the test.

257 (ANL/EBR--102) COMPILATION OF DATA FROM EBR-II NATURAL-CIRCULATION-TEST PROCEDURE EX-140, SECTION IV, ADDENDUM 1E. Gillette, J.L.; Sullivan, J.E.; Tokar, J.V.; Singer, R.M. (Argonne National Lab., IL (USA); Argonne National Lab., Idaho Falls, ID (USA)). Sep 1978. Contract W-31-7405-ENG-48. 328p. AT.

Data from the XX08 natural-circulation Test 1E are presented. This test was similar to an earlier test, XX08 Test 1A, except that instrumented subassembly XX08 had undergone irradiation before Test 1E, but not before Test 1A. Four separate coastdown transients were conducted. Each was initiated by tripping the power supply to the auxiliary electromagnetic pump, thereby causing the flow rate in the primary system to coast down to the natural-circulation flow. Each coastdown was initiated with a different flow rate in the secondary system. Data were obtained with the EBR-II data-acquisition system (DAS) from the normal plant instrumentation, from the INCOT YY07E experiment, and from instrumented subassembly XX08. The necessary corrections for offsets in the raw data collected through the DAS are discussed. The corrected data are graphically presented for each of the four phases of the test.

258 (ANL/EBR--103) RELIABILITY ANALYSIS APPLIED TO THE SRM EARTHQUAKE SHUTDOWN SYSTEM (ESS). Clay, H.W.; Lehto, W.K. (Argonne National Lab., Idaho Falls, ID (USA); Argonne National Lab., IL (USA)). Dec 1978. Contract W-31-109-ENG-38. 63p. AT.

The EBR-II Safety Research Modification (SRM) was designed to convert the EBR-II from a steady-state irradiation facility to a more versatile safety-test reactor with pulse capability. Part of this modification was to provide an upgraded shutdown system of which the ESS is a part. The fundamentals are presented of event and fault tree analysis as applied to the ESS and establishes the system reliability based on individual component failure rates and reactor-cycle operating times. As a result of this analysis, several improvements were suggested, the methodology was established for the other shutdown systems, and the reliability of the ESS was shown to be satisfactory.

259 (ANL/EBR--104) COMPILATION OF DATA FROM EBR-II NATURAL-CIRCULATION-TEST PROCEDURE EX-140, SECTION IV, ADDENDUM 7A. Gillette, J.L.; Sullivan, J.E.; Singer, R.M.; Tokar, J.V.;

Dean, E.M. (Argonne National Lab., IL (USA)). Apr 1979. Contract W-31-109-ENG-38. 167p. AT.

The transition from forced primary-coolant flow to natural-circulation flow following the loss of primary pumping power with concomitant reactor scram has been investigated in Experimental Breeder Reactor II. Before the loss-of-flow transient, the reactor was operated at 17.1 MWt (28.5% of the normal full-power value) and at 33% of normal full flow. All electrical power to the primary pumping system was terminated, causing the flow rate of the primary-system coolant to coast down. As the flow rate coasted down, the low-flow trip setting caused the reactor to scram. The transition from forced to natural-circulation flow was observed to be smooth, and the coolant temperatures throughout the reactor were observed to remain lower than the corresponding values at full-power operating conditions. The corrected test data are presented graphically.

260 (ANL/EBR--106) BIBLIOGRAPHY OF PUBLICATIONS ON EXPERIMENTAL BREEDER REACTOR NO. II (EBR-II). 1955-JULY 1979. Berg, D.B. (comp.). (Argonne National Lab., IL (USA)). Aug 1979. Contract W-31-109-ENG-38. 112p. Dep. NTIS, PC A06/MF A01.

This bibliography is divided into 15 broad areas, or categories, of interest. The same publication is listed in more than one category if its content applies to several areas of interest. Under each category, the publications are listed (1) by calendar year of publication and (2) then alphabetically by last name of the first author given. Publications that have no evident author (or compiler or editor) are listed alphabetically by title at the end of the listing for the calendar year in which they were published. Only open literature (that which can be obtained through libraries and other sources available to the public) are listed.

261 (ANL/ENG--79-05) SLSF LOOP HANDLING SYSTEM. VOLUME I. STRUCTURAL ANALYSIS. Ahmed, H.; Cowie, A.; Ma, D. (Argonne National Lab., IL (USA)). Oct 1978. Contract W-31-109-ENG-38. 453p. Dep. NTIS, PC A20/MF A01.

SLSF loop handling system was analyzed for deadweight and postulated dynamic loading conditions, identified in Chapters II and III in Volume I of this report, using a linear elastic static equivalent method of stress analysis. Stress analysis of the loop handling machine is presented in Volume I of this report. Chapter VII in Volume I of this report is a contribution by EG and G Co., who performed the work under ANL supervision.

262 (ANL/ENG--79-06) SLSF LOOP HANDLING SYSTEM. VOLUME II. CRADLE ANALYSIS FOR NORMAL AND ACCIDENTAL LOADING. Ahmed, H.; Cowie, A.; Ma, D.; Malek, R.A. (Argonne National Lab., IL (USA)). Oct 1978. Contract W-31-109-ENG-38. 400p. Dep. NTIS, PC A17/MF A01.

SLSF loop handling system was analyzed for deadweight and postulated dynamic loading conditions. Computer modeling of LHM-Cradle-transporter system is presented.

263 (ANL/ENG--79-07) SLSF LOOP HANDLING SYSTEM. VOLUME III. AISC CODE EVALUATIONS AND ANALYSIS OF CRITICAL ATTACHMENTS. Ahmed, H.; Cowie, A.; Malek, R.A.; Rafer, A.; Ma, D.; Tebo, F. (Argonne National Lab., IL (USA)). Oct 1978. Contract W-31-109-ENG-38. 263p.

- Dep. NTIS, PC A12/MF A01.
- SLSF loop handling system was analyzed for deadweight and postulated dynamic loading conditions using a linear elastic static equivalent method of stress analysis. Stress computations of Cradle and critical attachments per AISC Code guidelines are presented. HFEF is credited with in-depth review of initial phase of work.
- 264 (ANL/ENG--79-08) SLSF LOOP HANDLING SYSTEM. VOLUME IV. ANALYSIS VERIFICATIONS AND SUPPORTING APPENDICES. Ahmed, H.; Malek, R.A.; Rafer, A.; Ma, D.; D'Souza, F.; Leonard, J.W. (Argonne National Lab., IL (USA)). Oct 1978. Contract W-31-109-ENG-38. 407p. Dep. NTIS, PC A18/MF A01.
- SLSF loop handling system was analyzed for deadweight and postulated dynamic loading conditions. Some relevant backup appendices for the report are included.
- 265 (ANL/ENG--80-02) STUDY OF PIPING CONFIGURATIONS. Pan, Y.; Rafer, A.; Ahmed, H. (Argonne National Lab., IL (USA)). Jan 1980. Contract W-31-109-ENG-38. 34p. Dep. NTIS, PC A03/MF A01.
- A study of piping and elbow flexibility is performed using an analytical approach and piping analysis computer programs ADLPIPE and MARC. The study focuses on pipe loop configurations commonly used to accommodate thermal expansion in such applications as Liquid Metal Fast Breeder Reactors.
- 266 (ANL/K72--2655-1) CHARACTERIZATION OF AN ENERGY SOURCE FOR MODELING HYPOTHETICAL CORE DISRUPTIVE ACCIDENTS IN NUCLEAR REACTORS. FIRST INTERIM REPORT. Cagliostro, D.J.; Florence, A.L. (Stanford Research Inst., Menlo Park, CA (USA)). Oct 1972. Contract W-31-109-ENG-38. 110p. Dep. NTIS, PC A06/MF A01.
- The expansion characteristics of the detonation products of a high-explosive energy source used to simulate the pressure-volume change relationships for sodium-vapor expansions during hypothetical core disruptive accidents in a Fast Test Reactor were determined experimentally. Rigid cylinder-piston experiments performed at two scales (ratio 3:3) were undertaken to determine a pressure-volume relationship as a function of source mass and expansion environment. Some of these measurements were compared with code calculations for the source.
- 267 (ANL/K76--2655-5) EXPERIMENTS ON THE RESPONSE OF RIGID AND FLEXIBLE REACTOR VESSEL MODELS TO A SIMULATED HYPOTHETICAL CORE DISRUPTIVE ACCIDENT. Cagliostro, D.J.; Romander, C.M. (Stanford Research Inst., Menlo Park, CA (USA)). Nov 1976. Contract W-31-109-ENG-38. 104p. (SRI-PYD--1966). Dep. NTIS, PC A06/MF A01.
- A simulated HCDA loading was applied in simple, thick-walled and thin-walled, 1/30-scale models of a fast breeder reactor vessel. The loading and resulting vessel response were measured to verify the modeling techniques used in the REXCO computer code. The sodium coolant is simulated by water, and the HCDA load is simulated by the expansion of the detonation products of a low-density explosive detonated in the vessel core. The detonation products expand from an initial pressure of 3700 psi down to 360 psi for a volume change of 410 cm³, equal to the cover gas volume. The expansion produces 2.87 kW-sec of gas work up to slug impact on the vessel cover. From the strain measurements and the posttest deformation profiles of the vessel, the strain energy absorbed by the vessel before and after slug impact is calculated.
- 268 (ANL/MSD--78-3) COMPILATION OF FATIGUE DATA FOR INCOLOY 800 ALLOYS. Majumdar, S. (Argonne National Lab., IL (USA)). Mar 1978. Contract W-31-109-ENG-38. 34p. Dep. NTIS, PC A03/MF A01.
- The present report is a compilation of all room- and elevated-temperature, low-cycle fatigue data for Incoloy alloys 800 and 800H that are available in the literature in the United States. The compilation represents 482 data points that include strain-controlled, stress-controlled, and rotating-beam tests.
- 269 (ANL-RDP--61) REACTOR DEVELOPMENT PROGRAM PROGRESS REPORT, MAY--JUNE 1977. (Argonne National Lab., IL (USA)). 11 Aug 1977. Contract W-31-109-ENG-38. vp. AT.
- Progress is summarized in the following research and development areas: Experimental Breeder Reactor No. II (EBR-II), LMFBR Design Support, Instrumentation and Control, Fuels and Materials Development, Reactor Physics, Reactor Safety, and Gas Cooled Fast Breeder Reactors.
- 270 (ANL-RDP--62) REACTOR DEVELOPMENT PROGRAM PROGRESS REPORT, JULY--AUGUST 1977. Sachs, R.G.; Kyger, J.A. (Argonne National Lab., IL (USA)). 5 Oct 1977. Contract W-31-109-ENG-38. vp. AT.
- Progress is summarized in the following research and development areas: Experimental Breeder Reactor No. II (EBR-II), LMFBR Design Support, Instrumentation and Control, Reactor Physics, Reactor Safety, and Other Fast Breeder Reactors.
- 271 (ANL-RDP--63) REACTOR DEVELOPMENT PROGRAM. PROGRESS REPORT, SEPTEMBER 1977. (Argonne National Lab., IL (USA)). 1977. Contract W-31-109-ENG-38. 170p. AT.
- This progress report summarizes work performed during September 1977 in the following research and development areas: Experimental Breeder Reactor No. II (EBR-II), LMFBR Design Support, Instrumentation and Control, Reactor Physics, and Reactor Safety.
- 272 (ANL-RDP--64) REACTOR DEVELOPMENT PROGRAM. PROGRESS REPORT. (Argonne National Lab., IL (USA)). Oct 1977. Contract W-31-109-ENG-38. 169p. AT.
- The report summarizes work performed in the following research and development areas: Experimental Breeder Reactor No. II (EBR-II), LMFBR design support, instrumentation and control, reactor physics, and reactor safety.
- 273 (ANL-RDP--65) REACTOR DEVELOPMENT PROGRAM. PROGRESS REPORT, NOVEMBER 1977. Sachs, R.G.; Kyger, J.A. (Argonne National Lab., IL (USA)). 24 Jan 1978. Contract W-31-109-ENG-38. 166p. AT.
- Progress is summarized on work performed during November 1977 in the following research and development areas: Experimental Breeder Reactor No. II (EBR-II), LMFBR design support, instrumentation and control, reactor physics, reactor safety, and GCFR type reactors.
- 274 (ANL-RDP--66) REACTOR DEVELOPMENT PROGRAM PROGRESS REPORT, DECEMBER 1977. Sachs, R.G.; Kyger, J.S. (Argonne National

Lab., IL (USA)). 17 Feb 1978. Contract W-31-109-ENG-38. 163p. AT.

Progress is summarized on work performed during December 1977 in the following research and development areas: experimental breeder reactor No. II (EBR-II), breeder-reactor design support, instrumentation and control, reactor physics, reactor safety, and other fast breeder reactors.

- 275 (ANL-RDP--67) REACTOR DEVELOPMENT PROGRAM PROGRESS REPORT, JAN 1978. Sachs, R.G.; Kyger, J.A. (Argonne National Lab., IL (USA)). Jan 1978. Contract W-31-109-ENG-38. 100p. AT.

This progress report summarizes the Argonne National Laboratory work performed for the Reactor Development Program during January 1978 in the following research and development areas: Experimental Breeder Reactor No. II, Breeder-reactor Design Support, Instrumentation and Control, Fuels and Materials Development, Reactor Physics, Reactor Safety, and Gas Cooled Fast Breeder Reactors.

- 276 (ANL-RDP--68) REACTOR DEVELOPMENT PROGRAM PROGRESS REPORT, FEBRUARY 1978. (Argonne National Lab., IL (USA)). 7 Apr 1978. Contract W-31-109-ENG-38. 173p. AT.

Progress is summarized in the following research and development areas: Experimental Breeder Reactor No. II (EBR-II), Breeder-reactor Design Support, Instrumentation and Control, Reactor Physics, Reactor Safety, and Other Fast Breeder Reactors.

- 277 (ANL-RDP--69) REACTOR DEVELOPMENT PROGRAM PROGRESS REPORT, MARCH 1978. (Argonne National Lab., IL (USA)). 1978. Contract W-31-109-ENG-38. 156p. AT.

This progress report summarizes the Argonne National Laboratory work performed for the Reactor Development Program during March 1978 in the following research and development areas: Experimental Breeder Reactor No. II (EBR-II), Breeder-reactor Design Support, Instrumentation and Control, Fuels and Materials Development, Reactor Physics, Reactor Safety, and Other Fast Breeder Reactors.

- 278 (ANL-RDP--70) REACTOR DEVELOPMENT PROGRAM. PROGRESS REPORT, APRIL 1978. (Argonne National Lab., IL (USA)). 16 Jun 1978. Contract W-31-109-ENG-38. 186p. AT.

The report summarizes work in the following research and development areas: Experimental Breeder Reactor No. II (EBR-II), Breeder-reactor Design Support, Instrumentation and Control, Reactor Physics, Reactor Safety, and GCFR Type Reactors.

- 279 (ANL-RDP--71) REACTOR DEVELOPMENT PROGRAM. PROGRESS REPORT, MAY 1978. Sachs, R.G.; Kyger, J.A. (Argonne National Lab., IL (USA)). 12 Jul 1978. Contract W-31-109-ENG-38. 165p. AT.

Progress is summarized in the following research and development areas: Experimental Breeder Reactor No. II (EBR-II), breeder-reactor design support, instrumentation and control, reactor physics, reactor safety, energy and environmental systems, and gas-cooled fast breeder reactors.

- 280 (ANL-RDP--72) REACTOR DEVELOPMENT PROGRAM. PROGRESS REPORT, JUNE 1978. (Argonne National Lab., IL (USA)). 11 Aug 1978. Contract W-31-109-ENG-38. 200p. AT.

The report summarizes work performed in the following research and development areas: Experimental Breeder Reactor No. II (EBR-II), Breeder-Reactor Design Support, Instrumentation and Control, Reactor Physics, Reactor Safety, and Gas Cooled Fast Breeder Reactors.

- 281 (ANL-RDP--73) REACTOR DEVELOPMENT PROGRAM PROGRESS REPORT, JULY 1978. (Argonne National Lab., IL (USA)). 1978. Contract W-31-109-ENG-38. 119p. AT.

Progress is summarized in the following research and development areas: Experimental Breeder Reactor No. II (EBR-II), Breeder-reactor Design Support, Instrumentation and Control, Reactor Physics, Reactor Safety, and Gas Cooled Fast Breeder Reactors.

- 282 (ANL-RDP--74) REACTOR DEVELOPMENT PROGRAM PROGRESS REPORT, AUGUST 1978. (Argonne National Lab., IL (USA)). 18 Oct 1978. Contract W-31-109-ENG-38. 150p. AT.

Progress is summarized in the following research and development areas: Experimental Breeder Reactor No. II (EBR-II), Breeder-reactor Design Support, Instrumentation and Control, Reactor Physics, Reactor Safety, and Gas Cooled Fast Breeder Reactors.

- 283 (ANL-RDP--75) REACTOR DEVELOPMENT PROGRAM. PROGRESS REPORT. (Argonne National Lab., IL (USA)). Sep 1978. Contract W-31-109-ENG-38. 181p. AT.

Progress is summarized in the following research and development areas: Experimental Breeder Reactor No. II (EBR-II), Breeder-reactor Design Support, Instrumentation and Control, Reactor Physics, Reactor Safety, and Gas Cooled Fast Breeder Reactors.

- 284 (ANL-RDP--76) REACTOR DEVELOPMENT PROGRAM. PROGRESS REPORT, OCTOBER 1978. Sachs, R.G.; Kyger, J.A. (Argonne National Lab., IL (USA)). 15 Dec 1978. Contract W-31-109-ENG-38. 131p. AT.

Progress is summarized in the following research and development areas: Experimental Breeder Reactor No. II (EBR-II), Breeder-reactor Design Support, Instrumentation and Control, Fuels and Materials Development, Reactor Physics, and Reactor Safety.

- 285 (ANL-RDP--77) REACTOR DEVELOPMENT PROGRAM PROGRESS REPORT, NOVEMBER 1978. Sachs, R.G.; Kyger, J.A. (Argonne National Lab., IL (USA)). 16 Jan 1979. Contract W-31-109-ENG-38. 116p. AT.

Progress is summarized in the following research and development areas: Experimental Breeder Reactor No. II (EBR-II), breeder-reactor design support, instrumentation and control, reactor physics, and reactor safety.

- 286 (ANL-RDP--78) REACTOR DEVELOPMENT PROGRAM. PROGRESS REPORT, DECEMBER 1978. (Argonne National Lab., IL (USA)). 20 Feb 1979. Contract W-31-109-ENG-38. 129p. AT.

Progress is summarized in the following research and development areas: Experimental Breeder Reactor No. II (EBR-II), Breeder Reactor Design Support, Instrumentation and Control, Reactor Physics, Reactor Safety, and Other Fast Breeder Reactors.

- 287 (ANL-RDP--79) REACTOR DEVELOPMENT PROGRAM. PROGRESS REPORT. (Argonne National Lab., IL (USA)). Jan 1979. Contract W-31-

109-ENG-38. 136p. AT.

Progress is summarized in the following research and development areas: Experimental Breeder Reactor No. II (EBR-II) breeder-reactor design support, engineered systems and components, reactor physics, reactor safety, and other fast breeder reactors.

288 (ANL-RDP--80) REACTOR DEVELOPMENT PROGRAM. PROGRESS REPORT, FEBRUARY 1979. (Argonne National Lab., IL (USA)). 19 Apr 1979. Contract W-31-109-ENG-38. 116p. AT.

Progress is summarized in the following research and development areas: Safety, Engineered Systems and Components, Physics, Gas Cooled Breeder Reactor, and Test Facilities.

289 (ANL-RDP--81) REACTOR DEVELOPMENT PROGRAM. PROGRESS REPORT, MARCH 1979. (Argonne National Lab., IL (USA)). 16 May 1979. Contract W-31-109-ENG-38. 121p. AT.

This progress report summarizes the Argonne National Laboratory work performed for the Reactor Development Program during March 1979 in the following research and development areas: Safety, Engineered Systems and Components, Physics, Gas Cooled Breeder Reactor, Test Facilities - ANL, and EBR-II Fuel Fabrication Costs Inventory Account.

290 (ANL-RDP--82) REACTOR DEVELOPMENT PROGRAM. PROGRESS REPORT. (Argonne National Lab., IL (USA)). Apr 1979. Contract W-31-109-ENG-38. 181p. AT.

This progress report summarizes the Argonne National Laboratory work performed for the Reactor Development Program during April 1979 in the following research and development areas: safety, engineered systems and components, physics, gas cooled breeder reactor, and test facilities - ANL.

291 (ANL-RDP--83) REACTOR DEVELOPMENT PROGRAM. PROGRESS REPORT. (Argonne National Lab., IL (USA)). May 1979. Contract W-31-109-ENG-38. 119p. AT.

This progress report summarizes the Argonne National Laboratory work performed for the Reactor Development Program during May 1979 in the following research and development areas: safety, physics, fuel and absorber development, test facilities - ANL, and EBR-II fuel fabrication costs inventory account.

292 (ANL-RDP--84) REACTOR DEVELOPMENT PROGRAM. PROGRESS REPORT. (Argonne National Lab., IL (USA)). Jun 1979. Contract W-31-109-ENG-38. 182p. AT.

This progress report summarizes the Argonne National Laboratory work performed for the Reactor Development Program during June 1979 in the following research and development areas: Safety, Engineered Systems and Components, Physics, Gas Cooled Breeder Reactor, and Test Facilities - ANL.

293 (ANL-RDP--85) REACTOR DEVELOPMENT PROGRAM. PROGRESS REPORT, JULY 1979. (Argonne National Lab., IL (USA)). Jul 1979. Contract W-31-109-ENG-38. 109p. AT.

This progress report summarizes the Argonne National Laboratory work performed for the Reactor Development Program during July 1979 in the following research and development areas: Safety, Engineered Systems and Components, Physics, Fuel and Absorber Development, Test Facilities - ANL, and EBR-II Fuel Fabrication Costs Inventory Account.

294 (ANL-RDP--86) REACTOR DEVELOPMENT PROGRAM. PROGRESS REPORT, AUGUST 1979. Massey, W.E.; Kyger, J.A. (Argonne National Lab., IL (USA)). 15 Oct 1979. Contract W-31-109-ENG-38. 86p. AT.

Progress is summarized in the following research and development areas: Safety, Physics, Gas Cooled Breeder Reactor, and Test Facilities.

295 (AWRE--49/91/87) COMPUTER CODE FOR SEURBNUK-2 FOR FAST REACTOR EXPLOSION CONTAINMENT SAFETY STUDIES. Cameron, I.G.; Hankin, B.C.; Warham, A.G.P.; Benuzzi, A.; Yerkes, A. (UKAEA Weapons Group, Aldermaston. Atomic Weapons Research Establishment; Commission of the European Communities, Ispra (Italy). Joint Research Centre). May 1977. 26p. (TRG-Report--3006(R/X); JRC-ISPRA-ET--02/77). Dep. NTIS (US Sales Only), PC A03/MF A01.

The SEURBNUK-2 code has been developed jointly by JRC, Ispra and AWRE, Aldermaston for use in containment analysis for fast reactor safety studies. It is a major extension of the SEURBNUK code developed earlier by Belgonucleaire and Aldermaston, which, in turn, was based on the Marker and Cell (MAC) code. In the Marker and Cell method the motion of a two-dimensional incompressible fluid, which may have a free surface, is solved using an Eulerian approach whereby the fluid moves through a fixed grid of mesh lines with velocity and pressure as the basic variables. Massless particles are distributed throughout the fluid and move with it, but their sole use is to determine which cells contain fluid. The numerical procedures adopted in SEURBNUK to solve the basic hydrodynamic equations are similar to the ICE procedure which itself is an extension of the MAC method. In this the non-linear partial differential equations are solved by an implicit finite difference technique which advances the solution in a series of time steps. SEURBNUK-2 has a full thin shell treatment for tanks of arbitrary shape and includes the effects of compressibility of the fluid. A feature of SEURBNUK is that the equations of motion for the thin shells are solved quite separately from those for the fluid and the time step for the fluid flow calculation is an integral multiple of that for calculating the shell motion. The interaction of the shell with the fluid is then considered as a modification to the coefficients in the implicit pressure equations, the modification naturally depending on the behavior of the thin shell section within the fluid cell.

296 (BLG--515) ANNUAL SCIENTIFIC REPORT 1975. Billiau, R.; Bobin, K.; Michiels, G.; Proost, J. (eds.). (Centre d'Etude de l'Energie Nucleaire, Mol (Belgium)). 1976. 236p. Dep. NTIS (US Sales Only), PC A02/MF A01.

The main activities of SCK/CEN during 1975 are reported in individual summaries. Field of research are the following: sodium cooled fast reactors, gas cooled reactors, light water reactors, applied nuclear research (including waste disposal, safeguards and fusion research), basic and exploratory research (including materials science, nuclear physics and radiobiology). The BR2 Materials testing reactor and associated facilities are described. The technical and administrative support activities are also presented. A list of publications issued by the SCK/CEN Scientific staff is given.

- 297 (BLG--520) ANNUAL SCIENTIFIC REPORT 1976. Billiau, R.; Kirk, F.; Proost, J. (eds.). (Centre d'Etude de l'Energie Nucleaire, Mcl (Belgium)). 1977. vp. Dep. NTIS (US Sales Only), PC A09/MF A01.

This report of the Centre d'Etude de l'Energie Nucleaire - Studiecentrum voor Kernenergie gives a survey of the scientific and technical work done in 1976. The research areas were as follows: 1. The sodium-cooled fast reactors and, in particular, mixed oxide fuels, carbide fuel, materials development, reprocessing, fast reactor physics, safety and instrumentation, and sodium technology. 2. The gas-cooled reactors as gas-cooled fast and high-temperature reactors. 3. The light water reactors, in particular, the BR3 reactor, light-water reactor fuels and plutonium recycling. 4. Applied nuclear research, waste processing and disposal: safeguards, fusion research and lithium technology. 5. Basic and exploratory research in materials science and nuclear physics. 6. Non-nuclear research and development such as in air pollution, pollution abatement and waste handling, fuel cells and applied electrochemistry.

- 298 (BLG--524) ANNUAL SCIENTIFIC REPORT 1977. Proost, J.; Billiau, R.; Kirk, F. (eds.). (Centre d'Etude de l'Energie Nucleaire, Mcl (Belgium)). 1978. vp. Dep. NTIS (US Sales Only), PC A09/MF A01.

This report of the Centre d'Etude de l'Energie Nucleaire - Studiecentrum voor Kernenergie gives a survey of the scientific and technical work done in 1977. The research areas are: 1. The sodium cooled fast reactors and namely the mixed oxide fuels, the carbide fuel, the materials development, the reprocessing, the fast reactor physics, the safety and instrumentation and the sodium technology. 2. The gas cooled reactors as gas cooled fast and high temperature reactors. 3. The light water reactors namely the BR3 reactor, the light water reactor fuels and the plutonium recycling. 4. The applied nuclear research, waste conditioning and disposal as the safeguards, the fusion research and the lithium technology. 5. The basic and exploratory research namely the materials science and the nuclear physics and finally 6. Non-nuclear research and development such as the air pollution, the pollution abatement and waste handling, the fuel cells and applied electrochemistry.

- 299 (BMI-NUREG--1983) AEROSOL MEASUREMENTS AND MODELING FOR FAST REACTOR SAFETY.

QUARTERLY PROGRESS REPORT, APRIL 1--JUNE 30, 1977. TASK 7. Gieseke, J.A.; Jordan, H.; Schmidt, E.W.; Lee, K.W.; Vaishnavi, B.; Reed, L.D. (Battelle Columbus Labs., OH (USA)). 28 Oct 1977. 24p. NTIS, PC A03/MF A01.

Technical efforts were concentrated on improving the HAARM-2 code primarily by adding the results of the sodium oxide agglomerate measurements, on formulating the mathematical basis for reference code development, on investigating the possibilities for using polynomials to express particle size distributions in the reference code, and on evaluating the use of a laser Doppler interferometry system to measure sodium oxide agglomerate sizes. Details of efforts performed and progress made on tasks in these several general areas are discussed.

- 300 (BMI-NUREG--1987) AEROSOL MEASUREMENTS AND MODELING FOR FAST REACTOR SAFETY: TASK 7.

ANNUAL REPORT FOR FY 1977. Gieseke, J.A.; Jordan, H.; Lee, K.W.; Vaishnavi, B.; Reed, L.D. (Battelle Columbus Labs., OH (USA)). 23 Dec 1977. 114p. Dep. NTIS, PC A06/MF A03.

Progress is summarized in the following areas: (1) measurements of agglomerate characteristics and thermophoretic forces for sodium oxide aerosols, (2) revision of HAARM-2 computer code, (3) comparison of HAARM-2 and HAARM-3 calculations, (4) evaluation of BAM code capabilities, (5) development of a reference code, and (6) experiments to characterize fuel material aerosol properties. A compilation of experimental data is presented. (DG)

- 301 (BMI-NUREG--1991) HAARM-3 USERS MANUAL.

Gieseke, J.A.; Lee, K.W.; Reed, L.D. (Battelle Columbus Labs., OH (USA)). 5 Jan 1978. 73p. NTIS, PC A04/MF A01.

Various models have been developed to describe aerosol behavior under postulated LMFBR accident conditions. Each of the codes has its own advantages and limitations regarding the accuracy of the physically realistic model of the actual aerosol behavior. The present computer code designated HAARM-3 (Heterogeneous Aerosol Agglomeration Revised Model-3) is a new version of the previous HAARM-2 and HAARM-1 models. One of the main advantages of these codes is their relatively short computing times. Therefore, these codes have been widely used for nuclear reactor safety analyses. The numerical methods employed in the present codes are based on the previous HAA-3B code which was originally developed at Atomics International. By assuming that the time dependent particle size distribution is lognormal, the integro-differential equation describing the concentration decay of aerosol is converted into three first-order differential equations. These equations with several additional first order differential equations for the generation of other desired information are integrated using a standard library subroutine. The model described in the report differs from the previous models in that all of the aerosol agglomeration and deposition mechanisms which are dependent upon the morphological properties of agglomerates are corrected using a more recent experimental density correction factor. The effects of non-spherical shape of the agglomerates on settling velocity and collision rate may also be accounted for at the user's discretion. In addition, aerosol agglomeration due to turbulence which was not included before has been added.

- 302 (BN--7612-04) RESULTS OF THE POST-IRRADIATION EXAMINATIONS OF THE RAPSODIE I EXPERIMENT FUEL PINS. Haas, V.; Gaube, M.; van de Velde, J.; Ketels, J.; van Loon, C. (Societe Belge pour l'Industrie Nucleaire, Brussels). 1976. 25p. Dep. NTIS (US Sales Only), PC A02/MF A01.

An experiment sponsored by GfK, BELGONUCLEAIRE and INTERATOM has been carried out in the French reactor Rapsodie from February 1971 to September 1972, in the frame of the R and D program for the fast breeder prototype reactor SNR. This experiment consisted in the irradiation of two bundles of 34 mixed oxide pins each, with spacer grids and tie-rods, up to a peak burn-up of 19.6 a/o and a peak total neutron fluence of $8 \times 10^{20} \text{ mm}^{-2}$, corresponding to a peak fast fluence ($E > 0.111 \text{ MeV}$) of $6.4 \times 10^{20} \text{ mm}^{-2}$. The post-irradiation examinations showed that the cold-worked WNr. 1.4970 cladding stainless steel has a lower irradiation induced swelling than the solution-

annealed WNr. 1.4988. Important inelastic deformations of both types of claddings have been observed; the largest part of these deformations can be explained by the in-pile creep. A mechanical interaction between the fuel and the cladding is not excluded in the case of the pins with the cladding steel WNr. 1.4970. The destructive examinations emphasized the influence of the pellets initial stoichiometry on the fission products migration, on the plutonium radial distribution and on the fuel-cladding chemical interaction. An interaction between the fuel and the blanket pellets due to the cesium migration and to the formation of cesium uranates, leading to local cladding strains, has been noticed. These phenomena, as well as the chemical interaction between the fuel and the cladding, have been investigated by extensive microprobe analysis. Finally, the fuel restructuration has been analysed and interpreted as a function of the fuel characteristics, irradiation conditions and cladding deformations.

- 303 (BNL--50831-4) DESIGN GUIDE FOR CATEGORY IV REACTORS: LIQUID METAL REACTORS. Brynda, W.J.; Karol, R.C.; Lobner, P.R.; Powell, R.W.; Straker, E.A. (Brookhaven National Lab., Upton, NY (USA)). Jul 1979. Contract EY-76-C-02-0016. 243p. Dep. NTIS, PC A11/MF A01.

The purpose of this Design Guide is to provide additional guidance to aid the DOE facility contractor in meeting the requirement that the siting, design, construction, modification, operation, maintenance, and decommissioning of DOE-owned reactors be in accordance with generally uniform standards, guides, and codes which are comparable to those applied to similar reactors licensed by the Nuclear Regulatory Commission (NRC). This Design Guide deals principally with the design and functional requirements of liquid metal cooled fast reactor (Category IV reactor) structures, components, and systems.

- 304 (BNL--50992, pp 287-295) REACTOR APPLICATION OF ACTINIDE CROSS SECTION DATA. Bearan, S.L.; Cowan, C.L. (General Electric Co., Sunnyvale, CA). May 1979.

From Conference on the nuclear data of higher plutonium and americium isotopes for reactor applications; Upton, NY, USA (20 Nov 1978).

Uncertainties in the cross section data for the higher plutonium and americium isotopes have been investigated to determine their impact on the important LMFBR design parameters. The results of this investigation have indicated that the design calculations are sensitive to the uncertainties in the capture and fission data for ^{240}Pu and ^{241}Pu , and for long-term design applications these uncertainties should be reduced to less than about 10%. The uncertainties in the data for ^{242}Pu and for the americium isotopes have only a small impact on the fast reactor design studies but may be important in the development of schemes for the management of actinide waste discharge and for plutonium burnout.

- 305 (BNL-NUREG--23113) SIMULATION OF OPERATIONAL AND SAFETY TRANSIENTS IN LMFBR SYSTEMS. Agrawal, A.K.; Guppy, J.G. (Brookhaven National Lab., Upton, NY (USA)). 1978. Contract EY-76-C-02-0016. 6p. (CONF-780407--1). Dep. NTIS, PC A02/MF A01.

From Symposium on design, construction and operating experience of demonstration liquid metal fast breeder reactors; Bologna, Italy (10 Apr 1978).

A new, advanced thermohydraulic simulation code for LMFBRs is described. This code, designated as the Super System Code (SSC), simulates operational and safety transients that may be initiated anywhere in the system. The SSC code provides for the simulation of all essential components in the primary and intermediate heat transport systems. The steam generating circuit along with the turbine and condenser are also included. The usefulness of this code in future LMFBR plant designs is demonstrated by its application to the Clinch River Breeder Reactor-type plant. Several design and operational transients such as normal scram, control rod withdrawal, after-heat removal by natural convection and load follow-up are analyzed. A pipe rupture accident in the primary heat transport system is also discussed.

- 306 (BNL-NUREG--24043) REVIEW OF THE FFTF NATURAL CIRCULATION TEST PLANS. Perkins, K.R.; Bari, R.A.; Chen, L. (Brookhaven National Lab., Upton, NY (USA)). Feb 1978. Contract EY-76-C-02-0016. 47p. Dep. NTIS, PC A03/MF A01.

A review of the FFTF Natural Circulation test plans has been conducted in order to evaluate their relationship to the safety of the facility and to verification of analytical methods. It is concluded that: in general, the bases for the test acceptance criteria are incomplete and do not achieve the desired objective of assuring adequate natural circulation decay heat removal for "worst case" conditions; and the behavioral gap between the 5 percent and 75 percent power transients is too wide to assure the safety of the facility (without extensive uncertainty analyses which apparently have not been performed). Recommendations are presented.

- 307 (BNL-NUREG--24141-R) CONTAINMENT RESPONSE TO POSTULATED CORE MELTDOWN ACCIDENTS IN THE FAST FLUX TEST FACILITY. Gasser, R.D.; Pratt, W.T. (Brookhaven National Lab., Upton, NY (USA)). Aug 1978. Contract EY-76-C-02-0016. 100p. Dep. NTIS, PC A05/MF A01.

An assessment of the containment margin available in the Fast Flux Test Facility to mitigate the consequences of a postulated failure on in-vessel post-accident heat removal following a hypothetical core-disruptive accident (HCDA) has been completed. Two general meltdown configurations (termed in-vessel and ex-vessel) have been considered, and it is concluded that: (1) For the in-vessel meltdown scenario, the quantity of sodium assumed ejected from the vessel into the cavity during the HCDA is crucial to the subsequent reactor containment building (RCB) pressurization. If the reactor cavity liner is also assumed to fail, then the containment integrity could be challenged within 10 hours. (2) For the ex-vessel meltdown scenario, the collapse of the reactor cavity floor, which allows sodium to contact the unlined subcavity, is crucial to the subsequent RCB pressurization. Predictions of cavity floor penetration vary between 2 to 60 hours depending on the initial assumptions made; however, after floor collapse occurs overpressurization of the RCB occurs rapidly within several hours.

- 308 (BNL-NUREG--24162) RELIABILITY OF THE CRBRP SHUTDOWN HEAT REMOVAL SYSTEM. Buslik, A.J.; Papazoglou, I.A.; Bari, R.A. (Brookhaven National Lab., Upton, NY (USA); Massachusetts Inst. of Tech., Cambridge (USA)). 1978. Contract EY-76-C-02-0016. 12p. (CONF-780507--13). Dep. NTIS, PC A02/MF A01.

From Probabilistic analysis of nuclear reactor safety; Los Angeles, CA, USA (8 May 1978).

The failure probability per year of the shutdown heat removal system (SHRS) of the Clinch River Breeder Reactor Plant is calculated for the loss of off-site power (LOSP) initiator. Only the case in which reactor operation is not permitted on less than 3 loops is considered. The design studied includes the capability of operating pony motors on the pumps in one primary and associated intermediate loop from a battery, and includes a Direct Heat Removal Service which under certain circumstances can lead to successful decay heat removal even if heat transport through the main heat transport system is cut off at the intermediate heat exchangers. The calculated failure probability per year of the SHRS due to LOSP ranges from $3 \times 10^{-6}/\text{yr}$ to $4 \times 10^{-6}/\text{yr}$, depending on the diesel generator failure probabilities used, the assumptions concerning adequacy of natural circulation in main heat transport system sodium loops, the requirements for auxiliary feedwater system mission success, and the probability that off-site power is not restored in two hours.

- 309 (BNL-NUREG--24946) ASSESSMENT OF THE LOSS-OF-HEAT-SINK ACCIDENT WITH SCRAM IN THE LMFBR. Bari, R.A.; Ludewig, H.; Pratt, W.T.; Sun, Y.H. (Brookhaven National Lab., Upton, NY (USA)). 1978. Contract EY-76-C-02-0016. 12p. (CONF-781022--37). Dep. NTIS, PC A02/MF A01.

From Meeting on nuclear power reactor safety; Brussels, Belgium (16 Oct 1978).

A description of a slow core meltdown in a liquid metal fast breeder reactor is presented for the conditions of loss-of-heat-sink following neutronic shutdown. Simple models are developed for the prediction of phase changes and/or relocation of the core materials including fuel, clad, ducts, control rod absorber material (B₄C), and plenum gases. The sequence of events is accounted for and the accident progression is described up to the point of recriticality. The neutronic behavior of the disrupted core is analyzed in R-Z geometry with a static transport theory code. For most scenarios assessed, the reactor is expected to become recritical although large ramp rates are not anticipated.

- 310 (BNL-NUREG--24984) VOLUME-HEATED BOILING POOL FLOW BEHAVIOR AND APPLICATION TO TRANSITION PHASE ACCIDENT CONDITIONS. Ginsberg, T.; Jones, D.C. Jr.; Chen, J.C. (Brookhaven National Lab., Upton, NY (USA)); Lehigh Univ., Bethlehem, PA (USA). Dept. of Mechanical Engineering and Mechanics). 1978. Contract EY-76-C-02-0016. 20p. (CONF-781022--39). Dep. NTIS, PC A02/MF A01.

From Meeting on nuclear power reactor safety; Brussels, Belgium (16 Oct 1978).

Observations of two-phase flow fields in volume-heated boiling pools are reported. Photographic observations, together with pool-average void fraction measurements are presented. Flow regime transition criteria derived from the measurements are discussed. The churn-turbulent flow regime was the dominant regime for superficial vapor velocities up to nearly five times the Kutateladze dispersal velocity. Within this range of conditions, a churn-turbulent drift flux model provides a reasonable prediction of the pool-average void fraction data. The results of the experiment and analyses are extrapolated to transition phase conditions. It is shown that intense pool boil-up could occur

where the pool-average void fraction would be greater than 0.6 for steel vaporization rates equivalent to power levels greater than one percent of nominal LMFBR power density.

- 311 (BNL-NUREG--24988) CONFIRMATORY SIMULATION OF SAFETY AND OPERATIONAL TRANSIENTS IN LMFBR SYSTEMS. Guppy, J.G.; Agrawal, A.K. (Brookhaven National Lab., Upton, NY (USA)). 1978. Contract EY-76-C-02-0016. 12p. (CONF-781022--40). Dep. NTIS, PC A02/MF A01.

From Meeting on nuclear power reactor safety; Brussels, Belgium (16 Oct 1978).

Operational and safety transients (anticipated, unlikely, or extremely unlikely) that may originate anywhere in a liquid-metal fast breeder reactor (LMFBR) system must be adequately simulated to assist in safety evaluation and plant design efforts. An advanced thermohydraulic transient code, the Super System Code (SSC), is described that may be used for confirmatory safety evaluations of plant-wide events, such as assurance of adequate decay heat removal capability under natural circulation conditions. Results obtained with SSC illustrating the degree of modeling detail present in the code as well as the computing efficiency are presented. A version of the SSC code, SSC-L, applicable to any loop-type LMFBR design, has been developed at Brookhaven. The scope of SSC-L is to enable the simulation of all plant-wide transients covered by Plant Protection System (PPS) action, including sodium pipe rupture and coastdown to natural circulation conditions. The computations are stopped when loss of core integrity (i.e., clad melting temperature exceeded) is indicated.

- 312 (BNL-NUREG--25140) STATE-OF-THE-ART REVIEW OF SODIUM FIRE ANALYSIS AND CURRENT NOTIONS FOR IMPROVEMENTS. Tasi, S.S. (Brookhaven National Lab., Upton, NY (USA)). 1978. Contract EY-76-C-02-0016. 13p. (CONF-781173--1). Dep. NTIS, PC A02/MF A01.

From Specialists' meeting on sodium fires and prevention; Aix-en-Provence, France (20 Nov 1978).

Sodium releases from postulated pipe ruptures, as well as failures of sodium handling equipment in liquid metal fast breeder reactors, may lead to substantial pressure-temperature transients in the sodium system cells, as well as in the reactor containment building. Sodium fire analyses are currently performed with analytical tools, such as the SPRAY, SOMIX, SPOOL-FIRE and SOFIRE-II codes. A review and evaluation of the state-of-the-art in sodium fire analysis is presented, and suggestions for further improvements are made. This work is based, in part, on studies made at Brookhaven National Laboratory during the past several years in the areas of model development and improvement associated with the accident analyses of LMFBRs.

- 313 (BNL-NUREG--25297) FLOW DYNAMICS OF VOLUME-HEATED BOILING POOLS. Ginsberg, T.; Jones, D.C.; Chen, J.C. (Brookhaven National Lab., Upton, NY (USA)); Lehigh Univ., Bethlehem, PA (USA). Dept. of Mechanical Engineering and Mechanics). 1979. Contract EY-76-C-02-0016. 13p. (CONF-790808--2). Dep. NTIS, PC A02/MF A01.

From 18. ASME national heat transfer conference; San Diego, CA, USA (Aug 1979).

Safety analyses of fast breeder reactors require understanding of the two-phase fluid dynamic and heat transfer characteristics of volume-heated boiling pool systems. Design of direct contact three-phase boilers, of

practical interest in the chemical industries also requires understanding of the fundamental two-phase flow and heat transfer behavior of volume boiling systems. Several experiments have been recently reported relevant to the boundary heat-loss mechanisms of boiling pool systems. Considerably less is known about the two-phase fluid dynamic behavior of such systems. This paper describes an experimental investigation of the steady-state flow dynamics of volume-heated boiling pool systems.

- 314 (BNL-NUREG--25421) APPLICABILITY OF MICROWAVE HEATING TO THE SIMULATION OF THE LMFBR MELTDOWN PROCESS. Makowitz, H.; Ginsberg, T. (Brookhaven National Lab., Upton, NY (USA)). Dec 1978. Contract EY-76-C-02-0016. 7p. (CONF-790602--11). Dep. NTIS, PC A02/MF A01.

From ANS annual meeting; Atlanta, GA, USA (3 Jun 1979).

In the analysis of post accident heat removal (PAHR) following a hypothetical core-disruptive accident (HCDA) in an LMFBR one is faced with the problem of simulating a boiling pool of a fissile fuel, steel mixture. Previous work at Argonne National Laboratory has recommended that a small scale simulation study of melt-through by microwave heating would be useful on the basis of scoping studies which indicate that the internal heating is quite uniform. In the present work, the effects of droplet size, temperature, dielectric properties and wavelength on the absorption efficiency are investigated and the appropriate materials for obtaining near equal volume heating over a range of droplet sizes of 5.0 x 10⁻⁴ cm to 10 cm in radius are suggested for a suitable wavelength.

- 315 (BNL-NUREG--25492) COMBUSTION OF LARGE SODIUM POOLS. Tsai, S.S.; Bari, R.A. (Brookhaven National Lab., Upton, NY (USA)). 1979. Contract EY-76-C-02-0016. 11p. (CONF-790816--7). Dep. NTIS, PC A02/MF A01.

From International meeting on fast reactor safety technology; Seattle, WA, USA (19 Aug 1979).

Concern over potential spillages of sodium in liquid metal fast breeder reactors has prompted several experimental and theoretical investigations of sodium pool fires in recent years. Newman has measured the burning rates of sodium pool fires and proposed a correlation for the burning rates based on an analogy between mass transfer and heat transfer. In his theory, only oxygen transport to the pool surface is considered and, therefore, experimental data on the flame temperature is needed to compute the pool burning rate. The determination of the flame structure and the pool burning rate are analyzed. The present theory considers not only the oxygen transport to the flame but also the thermal interactions between the flame and the pool surface and between the flame and the ambient. This makes the determination of the flame temperature and position possible.

- 316 (BNL-NUREG--25493) ANALYSIS OF THE FFTF PRIMARY PIPE RUPTURE TRANSIENTS. Perkins, K.R.; Bari, R.A.; Chen, L.C.; Albright, D.C. (Brookhaven National Lab., Upton, NY (USA)). 1979. Contract EY-76-C-02-0016. 26p. (CONF-790816--6). Dep. NTIS, PC A03/MF A01.

From International meeting on fast reactor safety technology; Seattle, WA, USA (19 Aug 1979).

The response of the Fast Flux Test Facility (FFTF) to hypothetical ruptures of the high pressure primary piping has been analyzed using

two LMFBR plant systems codes, namely IANUS and DEMO. Comparisons of the average channel temperatures predicted by the two codes show good agreement for identical transients. However, the hot channel temperatures predicted by DEMO are about 60K higher than the corresponding IANUS predictions for severe transients. This difference is attributed to the dynamic hot channel factors employed in DEMO which discount the thermal inertia of the duct walls for rapid transients. DEMO also predicts more severe transients for hot-leg ruptures in FFTF than previously reported analyses for the CRBR.

- 317 (BNL-NUREG--25497) FEEDBACK CONTROL SYSTEMS FOR NON-LINEAR SIMULATION OF OPERATIONAL TRANSIENTS IN LMFBRs. Khatib-Rahbar, M.; Agrawal, A.K.; Srinivasan, E.S. (Brookhaven National Lab., Upton, NY (USA)). [nd]. Contract EY-76-C-02-0016. 9p. Dep. NTIS, PC A02/MF A01.

Adequate modeling of Plant Control Systems (PCS) for the study of Anticipated Transients Without Scram (ATWS) is of considerable significance in the design, operation and safety evaluation of Liquid-Metal-Cooled Fast Breeder Reactor (LMFBR) systems. To assess the system response to high frequency, low consequence events, the plant needs to be dynamically simulated. The description of analytical and numerical models for PCS that have been developed and incorporated into the loop version of the Super System Code (SSC=L) are described. The importance of detailed modeling of control systems is discussed. Sample transient results obtained for a 20% ramp change of load in 40 s in the Clinch River Breeder Reactor Plant (CRBRP) are also shown.

- 318 (BNL-NUREG--25498) SINGLE-PHASE SODIUM PUMP MODEL FOR LMFBR THERMAL-HYDRAULIC ANALYSIS. Madni, I.K.; Cazzoli, E.G.; Agrawal, A.K. (Brookhaven National Lab., Upton, NY (USA)). 1979. Contract EY-76-C-02-0016. 28p. (CONF-790816--10). Dep. NTIS, PC A03/MF A01.

From International meeting on fast reactor safety technology; Seattle, WA, USA (19 Aug 1979).

A single-phase, homologous pump model has been developed for simulation of safety-related transients in LMFBR systems. Pump characteristics are modeled by homologous head and torque relations encompassing all regimes of operation. These relations were derived from independent model test results with a centrifugal pump of specific speed equal to 35 (SI units) or 1800 (gpm units), and are used to analyze the steady-state and transient behavior of sodium pumps in a number of LMFBR plants. Characteristic coefficients for the polynomials in all operational regimes are provided in a tabular form. The speed and flow dependence of head is included through solutions of the impeller and coolant dynamic equations. Results show the model to yield excellent agreement with experimental data in sodium for the FFTF prototype pump, and with vendor calculations for the CRBR pump. A sample pipe rupture calculation is also performed to demonstrate the necessity for modeling the complete pump characteristics.

- 319 (BNL-NUREG--25506) SURVEY AND EVALUATION OF FFTF INSTRUMENTATION FOR SYSTEMS CODE VALIDATION. Majumdar, D.; Ludwig, H.; Cerbone, R.J. (Brookhaven National Lab., Upton, NY (USA)). 1979. Contract EY-76-C-02-0016. 14p. (CONF-790816--9). Dep. NTIS, PC A02/MF A01.

From International meeting on fast reactor safety technology; Seattle, WA, USA (19 Aug 1979).

FFTF instrumentation and preoperational tests are examined here to determine whether the proposed tests and associated instrumentation can provide relevant information needed for verification of systems codes such as SSC. Details of both the in-core and out-of-core instrumentations are studied and their accuracy examined. From a series of multichannel core calculations, the temperatures in instrumented subassemblies were correlated with temperatures in uninstrumented subassemblies. It is found that FFTF can furnish relevant steady-state data at different core conditions for use in systems code validation. The two FOTA channels will provide the most valuable in-core data. However, the FFTF natural circulation tests should be considered as only one of a series of experiments necessary to validate a large systems code.

- 320 (BNL-NUREG--25519) APPLICATION OF MULTIPLE TIMESTEP INTEGRATION METHOD IN SSC. Guppy, J.G. (Brookhaven National Lab., Upton, NY (USA)). 1979. Contract EY-76-C-02-0016. 5p. (CONF-790816--4). Dep. NTIS, PC A02/MF A01.

From International meeting on fast reactor safety technology; Seattle, WA, USA (19 Aug 1979).

The thermohydraulic transient simulation of an entire LMFBR system is, by its very nature, complex. Physically, the entire plant consists of many subsystems which are coupled by various processes and/or components. The characteristic integration timesteps for these processes/components can vary over a wide range. To improve computing efficiency, a multiple timestep scheme (MTS) approach has been used in the development of the Super System Code (SSC). In this paper: (1) the partitioning of the system and the timestep control are described, and (2) results are presented showing a savings in computer running time using the MTS of as much as five times the time required using a single timestep scheme.

- 321 (BNL-NUREG--25521) PHENOMENA AND SCENARIOS RELATED TO A LOSS-OF-HEAT-SINK ACCIDENT (WITH SCRAM) IN AN LMFBR. Bari, R.A.; Pratt, W.T.; Meyer, J.F. (Brookhaven National Lab., Upton, NY (USA); Nuclear Regulatory Commission, Washington, DC (USA)). 1978. Contract EY-76-C-02-0016. 10p. Dep. NTIS, PC A02/MF A01.

Several key phenomena and alternative scenarios which may follow a loss-of-heat-sink event, with scram, in an LMFBR are discussed. An event tree procedure is used to highlight the major branching points as they relate to controlling phenomena in the accident progression. For each of these branching points, a discussion of results of analyses carried out at BNL is presented. These discussions focus on the inherent safety capability features of the LMFBR concept as well as on particular design features of the Clinch River Breeder Reactor and of the Fast Flux Test Facility.

- 322 (BNL-NUREG--25522) CONTAINMENT RESPONSE TO POSTULATED EX-VESSEL CORE MELTDOWN ACCIDENTS IN THE FAST FLUX TEST FACILITY. Pratt, W.T.; Gasser, R.D.; Marchese, A.R. (Brookhaven National Lab., Upton, NY (USA); Nuclear Regulatory Commission, Washington, DC (USA). Div. of Project Management). 1979. Contract EY-76-C-02-0016. 12p. (CONF-790816--1).

Dep. NTIS, PC A02/MF A01.

From International meeting on fast reactor safety technology; Seattle, WA, USA (19 Aug 1979).

An evaluation of the containment response to ex-vessel core meltdown accidents in the Fast Flux Test Facility is discussed. Particular attention is given to the possibility of the molten fuel/steel mixture remaining in a molten form after entering the reactor cavity. For the molten pool configurations considered, significant H₂ concentrations were reached in the RCB before the reactor cavity floor was penetrated. The melt-front impacts the pressure transient, not through gas generation, but through penetration into the unlined subcavity resulting in an enhanced sodium-concrete reaction. Hence, if H₂ recombination is neglected, then steps would have to be taken to decrease the H₂ concentration before the RCB design pressure is reached.

- 323 (BNL-NUREG--25535) ONE-DIMENSIONAL MODEL FOR TRANSIENT BOILUP OF VOLUME-HEATED POOLS FOR LMFBR TRANSITION PHASE ANALYSIS. Ginsberg, T.; Chen, J.C. (Brookhaven National Lab., Upton, NY (USA); Lehigh Univ., Bethlehem, PA (USA). Dept. of Mechanical Engineering and Mechanics). 1979. Contract EY-76-C-02-0016. 14p. (CONF-790816--8). Dep. NTIS, PC A02/MF A01.

From International meeting on fast reactor safety technology; Seattle, WA, USA (19 Aug 1979).

An analytical model is presented which describes the transient dispersion characteristics of fuel-steel boiling pool systems under decay heating conditions, with boundary heat losses. The spatial distribution of steel vapor (void fraction) and molten fluid is computed, together with the pressure-temperature histories of boiling pool systems. Local heat losses and sensible heating are included in the model for the vapor generation rate in the material balance equations. Model calculations are presented. Results indicate that while only a fraction of the decay heat source is useful for steel vaporization and dispersal, the potential nevertheless exists for dispersal of UO₂-steel pools to the limits of the available volume under decay heating conditions. Mild pressurization rates of 0.1 atm/s are computed for transition phase, closed-pool accident conditions.

- 324 (BNL-NUREG--25575) MICROWAVE HEATING SIMULATIONS OF FISSION ENERGY GENERATION IN VOLUME-BOILING POOL SYSTEMS. Makowitz, H.; Ginsberg, T. (Brookhaven National Lab., Upton, NY (USA)). 1979. Contract EY-76-C-02-0016. 8p. (CONF-790602--4). Dep. NTIS, PC A02/MF A01.

From ANS annual meeting; Atlanta, GA, USA (3 Jun 1979).

The transition phase of the (hypothetical) loss-of-flow accident in LMFBR's may be characterized by the temporary entrapment of boiling pools of molten fuel and steel within the original core boundaries. Experiments to investigate the multiphase flow and heat transfer characteristics of such systems have been performed and are planned in which simulant fluids are volume-heated by microwave electromagnetic radiation. It has been assumed that the microwave radiation provides a spatially uniform energy source per unit volume of liquid in multiphase flow geometries. It is known, however, that energy absorption by dielectrics in a microwave electromagnetic field is a function of geometry, dielectric properties, and wavelength of the radiation. At high power density, volume-heated boiling pools

exhibit a complex two-phase, liquid-vapor, geometric structure. Dispersed droplets, with diameters less than 1 mm, in a vapor continuum may coexist with continuous liquid structures of centimeter scale or greater. This study was performed to: (i) investigate the uniformity of microwave heating in boiling pool systems as a function of liquid geometry; and (ii) design an experimental system employing microwave heating in which the heat generation rate per unit volume of liquid is independent of geometric structure. The results of the study are presented.

- 325 (BNL-NUREG--25618) DYNAMIC SIMULATION OF LMFBR PLANT UNDER NATURAL CIRCULATION. Agrawal, A.K.; Guppy, J.G.; Madni, I.K.; Weaver, W.L. III. (Brookhaven National Lab., Upton, NY (USA)). 1979. Contract EY-76-C-02-0016. 42p. (CONF-790808--8). Dep. NTIS, PC A03/MF A01.

From 18. ASME national heat transfer conference; San Diego, CA, USA (Aug 1979).

An adequate dissipation of after-heat via natural circulation can be demonstrated by dynamic simulation of the entire LMFBR plant. Models needed to accomplish this task are briefly described in the paper. The resulting computer code, SSC-L, is then applied to simulate the response of the Clinch River Breeder Reactor Plant for a loss-of-electric power transient. Entire simulation is performed for 1800 seconds of the transient time. The decay heat removal via natural circulation is shown. The effect of internal flow redistribution in the reactor core is also demonstrated.

- 326 (BNL-NUREG--25714) COMPARISON OF MEASURED AND CALCULATED AVERAGE VOID FRACTION IN VOLUME-BOILING POOLS WITH INCLINED BOUNDARIES. Greene, G.A.; Jones, D.C. Jr.; Abuaf, N.; Schwarz, C.E. (Brookhaven National Lab., Upton, NY (USA)). 1979. Contract EY-76-C-02-0016. 9p. (CONF-790602--5). Dep. NTIS, PC A02/MF A01.

From ANS annual meeting; Atlanta, GA, USA (3 Jun 1979).

Accident analysis of an HCDA in an LMFBR often involves consideration and calculation of thermal hydraulic events related to boiling pools of fuel and steel mixtures in the disrupted core, as well as the subsequent motion of these two-phase mixtures out of the core. In many cases, the thermal-hydraulic state of the boiling fuel-steel or fuel pool may determine the initial or boundary conditions for subsequent calculations. Calculations of boundary heat losses are directly dependent on knowledge of the local and pool-averaged void fraction, and assessment of models to predict the average void fraction depends on the availability of these experimental data. Experiments have been performed to determine the distribution of boundary heat losses from volume-heated boiling pools and the pool-averaged void fraction.

- 327 (BNL-NUREG--26083) HEAT REMOVAL CHARACTERISTICS OF VOLUME-HEATED BOILING POOLS WITH INCLINED BOUNDARIES IN BUBBLY FLOW REGIME. Greene, G.A.; Jones, D.C. Jr.; Abuaf, N.; Schwarz, C.E. (Brookhaven National Lab., Upton, NY (USA)). 1979. Contract EY-76-C-02-0016. 10p. (CONF-790808--7). Dep. NTIS, PC A02/MF A01.

From 18. ASME national heat transfer conference; San Diego, CA, USA (Aug 1979).

The heat transfer characteristics of volume-heated boiling pools are of importance in the safety analysis of hypothetical core disruptive

accidents in liquid metal fast breeder reactors. Investigations into the heat transfer and hydrodynamic behavior of such volume-heated boiling pools have been few. The existing work in boiling pool heat transfer is reviewed, and current modeling efforts are described. The current experiment is discussed in detail, and significant improvements in experimental techniques are described. The data for local convective boundary heat transfer coefficient and pool-averaged void fraction are presented for the bubbly flow regime over a range of dimensionless power, $j/\text{sub } g^{00}/U_{00}$, up to unity, and wall angles of 90° (vertical), 75°, and 60°. The data are compared to existing correlations for local heat transfer and to a one-dimensional drift flux model for local and average void fraction. It is shown that the drift flux model predicted the experimental data for average void fraction in the bubbly flow regime well when based upon the net boiling power. However, it was demonstrated that the existing correlations for local and average boundary heat flux (based on Gustavson's data) underpredicted the present data by as much as a factor of 2 or more.

- 328 (BNL-NUREG--26131) IN-VESSEL NATURAL CIRCULATION DURING A HYPOTHETICAL LOSS-OF-HEAT-SINK ACCIDENT IN THE FAST FLUX TEST FACILITY. Perkins, K.R.; Bari, R.A.; Pratt, W.T. (Brookhaven National Lab., Upton, NY (USA)). May 1979. Contract EY-76-C-02-0016. 27p. (CONF-791205--13). Dep. NTIS, PC A02/MF A01.

From ASME winter annual meeting; New York, NY, USA (2 Dec 1979).

The capability to remove decay heat from the FFTF core via in-vessel natural circulation has been analyzed for the preboiling phase using a lumped parameter model. The results indicate that boiling will occur in the average fuel assembly for a wide spectrum of initial conditions which appear to be representative of the hypothetical loss-of-heat-sink accident. Two-phase pressure drop calculations indicate that, once the saturation temperature is reached, coolability can only be assured for decay heat levels which are less than 0.5% of the operating power. A review of the limited sodium boiling data indicates that boiling-induced natural circulation may support up to 4% of the operating power, but geometric atypicalities and a large degree of inlet subcooling for the existing data limit the applicability to the loss-of-heat-sink accident in FFTF.

- 329 (BNL-NUREG--26572) FEEDBACK CONTROL SYSTEMS FOR NON-LINEAR SIMULATION OF OPERATIONAL TRANSIENTS IN LMFBRs. Khatib-Rahbar, M.; Agrawal, A.K.; Srinivasan, C.S. (Brookhaven National Lab., Upton, NY (USA)). 1979. Contract EY-76-C-02-0016. 14p. (CONF-790816--48). Dep. NTIS, PC A02/MF A01.

From International meeting on fast reactor safety technology; Seattle, WA, USA (19 Aug 1979).

Feedback control systems for non-linear simulation of operational transients in LMFBRs are developed. The models include (1) the reactor power control and rod drive mechanism, (2) sodium flow control and pump drive system, (3) steam generator flow control and valve actuator dynamics, and (4) the supervisory control. These models have been incorporated into the SSC code using a flexible approach, in order to accommodate some design dependent variations. The impact of system nonlinearity on the control dynamics is shown to be significant for severe perturbations. Representative result for a 10 cent and 25 cent step insertion of reactivity and a 10% ramp

change in load in 40 seconds demonstrate the suitability of this model for study of operational transients without scram in LMFBRs.

- 330 (BNL-NUREG--50603) POST-ACCIDENT FUEL RELOCATION AND HEAT REMOVAL IN THE LMFBR. Kazimi, M.S.; Tsai, S.S.; Gasser, R.D. (Brookhaven National Lab., Upton, NY (USA)). Aug 1976. Contract EY-76-C-02-0016. 116p. Dep. NTIS, PC A06/MF A01.

Assessment of the dynamics of post-accident fuel relocation and heat removal is an important aspect of the evaluation of the consequences of a hypothetical accident in an LMFBR. Such an assessment is of particular importance in the evaluation of the post-accident radiological doses around the reactor site. In the present evaluation particular attention is given to the design features of the Clinch River Breeder Reactor Plant (CRBR). Fuel relocation and heat removal, assuming certain conditions have resulted in core disruption, are discussed. The discussion of events and phenomena involved in the relocation processes is centered around the resulting patterns of heat source distribution. The factors influencing fuel relocation and distribution in the inlet and outlet plena of the reactor vessel are discussed. The current technology of in-vessel heat removal is applied to the design of the CRBR reactor. Both fuel debris cooling limits and overall coolant flow in the reactor under natural convection conditions are explored. Some of the uncertainties in ex-vessel fuel behavior are addressed. In particular, the effect of melting the cavity bed on the rate of growth of a molten fuel pool is investigated.

- 331 (BNL-NUREG--50759) THERMO-FLUID MECHANICS OF VOLUME-HEATED BOILING POOLS. Greene, G.A.; Jones, O.C. Jr.; Schwarz, C.E. (Brookhaven National Lab., Upton, NY (USA)). Dec 1977. Contract EY-76-C-02-0016. 12p. Dep. NTIS (US Sales Only), PC A02/MF A01.

A program to study the behavior of volume-heated boiling pools has been undertaken at BNL in order to provide meaningful estimates of heat transfer mechanisms in such systems. Emphasis has been placed on developing appropriate scaling parameters to allow results to be applied to prototypical, hypothetical accident conditions in an LMFBR. It has been determined that, within experimental accuracy, a boiling pool seems to exhibit behavior much like a single-phase natural convection system with a much extended laminar film regime to local Rayleigh numbers approximately 10^{12} .

- 332 (BNL-NUREG--50773) ADVANCED THERMOHYDRAULIC SIMULATION CODE FOR TRANSIENTS IN LMFBRs (SSC-L CODE). Agrawal, A.K. (Brookhaven National Lab., Upton, NY (USA)). Feb 1978. Contract EY-76-C-02-0016. 331p. Dep. NTIS, PC A15/MF A02.

Physical models for various processes that are encountered in preaccident and transient simulation of thermohydraulic transients in the entire liquid metal fast breeder reactor (LMFBR) plant are described in this report. A computer code, SSC-L, was written as a part of the Super System Code (SSC) development project for the "loop"-type designs of LMFBRs. This code has the self-starting capability, i.e., preaccident or steady-state calculations are performed internally. These results then serve as the starting point for the transient simulation.

RESEARCH PROGRAMS. QUARTERLY PROGRESS REPORT, OCTOBER 1--DECEMBER 31, 1977. Romano, A.J. (comp.). (Brookhaven National Lab., Upton, NY (USA)). Jan 1978. Contract EY-76-C-02-0016. 214p. Dep. NTIS, PC A10/MF A01.

HTGR safety evaluation included studies on fission product release; materials, chemistry, and instrumentation; structural evaluation; and analytical safety evaluation. LMFBR safety evaluation included studies on accident sequences, technical coordination of structural integrity, and SSC code development and validation. LWR safety studies included thermal/hydraulic accident analysis, THOR code development, and stress corrosion cracking of PWR steam generator tubing.

- 334 (BNL-NUREG--50820) REACTOR SAFETY RESEARCH PROGRAMS. QUARTERLY PROGRESS REPORT, JANUARY 1--MARCH 31, 1978. Romano, A.J. (comp.). (Brookhaven National Lab., Upton, NY (USA)). Apr 1978. Contract EY-76-C-02-0016. 171p. Dep. NTIS, PC A09/MF A01.

Progress is summarized in the following areas: (1) gas reactor safety evaluation, (2) THOR code development, (3) foreign code review, (4) SSC code development, (5) LMFBR and LWR safety experiments, (6) fast reactor safety code validation, (7) stress corrosion cracking of PWR steam generator tubing, and (8) technical coordination of structural integrity.

- 335 (BNWL--510) DESIGN AND DEVELOPMENT QUALITY ASSURANCE REQUIREMENTS FOR THE FFTF. Albert, W.G. (Battelle Pacific Northwest Labs., Richland, WA (USA)). 23 Oct 1968. Contract EY-76-C-06-1830. 55p. Dep. NTIS, PC A04/MF A01.

The document is presented to provide general management requirements for Pacific Northwest Laboratory (PNL) and contractor design and development quality assurance programs to assure the required quality level of the various items required for the FFTF. The document is applicable as imposed by the contract to FFTF contractors and subcontractors. The document is also applicable to PNL design and development activities related to the FFTF.

- 336 (BNWL--2216) INVESTIGATION OF COMBINED FREE AND FORCED CONVECTION IN A 2 X 6 ROD BUNDLE. Quigley, M.S.; McMonagle, C.L.; Bates, J.M. (Battelle Pacific Northwest Labs., Richland, WA (USA)). Jul 1977. Contract EY-76-C-06-1830. 116p. Dep. NTIS, PC A06/MF A01.

The report documents a study designed to provide velocity and temperature data in a rod bundle geometry with low Reynolds number flows and severe radial power gradients. The data were then used to verify predictions by the COBRA computer program in the combined free and forced convection flow regime. Comparable flow conditions may occur in the radial blanket of a Liquid Metal Fast Breeder Reactor (LMFBR), in which radial power gradients up to 4 : 1 may exist across an assembly. Under low flow rate conditions the power gradient may cause significant buoyancy forces potentially resulting in flow redistribution within the radial assemblies. Consequently, there is a need to evaluate whether available thermal-hydraulic design codes can accurately predict the corresponding temperature and velocity profiles.

- 337 (BNWL-CC--2500) TECHNICAL BASES: FFTF FUEL/CLADDING DAMAGE CRITERIA. Hanson, J.E.; Ballard, E.O.; Bard, F.E. Jr.; Bullington, D.C.;

- 333 (BNL-NUREG--50785) REACTOR SAFETY

- Leggett, R.D. (Battelle Pacific Northwest Labs., Richland, WA (USA)). Feb 1970. Contract EY-76-C-06-1830. 271p. Dep. NTIS, PC A50/MF A01.
- Specification of fuel damage criteria is important in evaluating and verifying the adequacy of safety margins for the FFTF. These margins are provided to meet the established safety objectives for the facility. The purpose of this report is to review the parameter limits specified as preliminary design data in the FFTF design safety criteria, and to identify the bases for each of these limit values. These bases provide a logical framework for discussion of the uncertainties involved as well as emphasize the more promising options for maximizing the return on investment of development funds.
- 338 (BR-E--180(Vol.1)) PLBR PHASE II: (FOLLOW-ON) REPORTS. (Burns and Roe, Inc., Oradell, NJ (USA)). 30 Sep 1977. Contract EY-76-C-03-1145. 408p. AT.
- Included are sections dealing with PLBR component seismic response characteristics and the response of the reactor cavity and primary heat transport system to the consequences of sodium pipe breaks. (DG)
- 339 (BR-E--180(Vol.2)) PLBR PHASE II: (FOLLOW-ON) REPORTS. VOLUME II. Byoun, T.; Celnik, J.; Babel, P.J. (Burns and Roe, Inc., Oradell, NJ (USA)). 30 Sep 1977. Contract EY-76-C-03-1145. 204p. AT.
- The following PLBR design projects are described: (1) radiation shielding analysis for the reactor cooling system, (2) primary heat transport system cell layout and model, (3) steam cycle design basis, and (4) reactor support ledge and pipe penetration cooling. (DG)
- 340 (BR-E--180(Vol.2)) PLBR PHASE II: (FOLLOW-ON) REPORTS. (Burns and Roe, Inc., Oradell, NJ (USA)). 30 Sep 1977. Contract EY-76-C-03-1145. 203p. AT.
- Engineering program objectives include work in the following areas: labyrinth shielding of primary piping; HTS cell layout; steam cycle design basis; reactor cavity structure gamma heating; and reactor support ledge and pipe penetration cooling.
- 341 (CE-FBR--77-26) EFFECT OF OPERATING TEMPERATURE ON LMFBR CORE PERFORMANCE. Noyes, R.C.; Bergeron, R.J.; di Lauro, G.F.; Kulwich, M.R.; Stuteville, D.W. (Combustion Engineering, Inc., Windsor, CT (USA)). 11 Apr 1977. Contract EY-76-C-02-2426-001. 165p. Dep. NTIS, PC A08/MF A01.
- The purpose of the study is to provide an engineering evaluation of high and low temperature LMFBR core designs. The study was conducted by C-E supported by HEDL expertise in the areas of materials behavior, fuel performance and fabrication/fuel cycle cost. The evaluation is based primarily on designs and analyses prepared by AI, GE and WARD during Phase I of the PLBR studies.
- 342 (CEA-BIB--226) CORROSION BY LIQUID METALS - APPLICATION TO LIQUID SODIUM. Lavielle, L. (CEA Centre d'Etudes Nucleaires de Cadarache, 13 - Saint-Paul-les-Durance (France). Dept. des Reacteurs a Neutrons Rapides). Oct 1978. 72p. (In French). Dep. NTIS (US Sales Only), PC A05/MF A01.
- In this bibliographic review on the corrosion by liquid metals, the first part is

devoted to the theoretical aspects of the problem and the second part concerns the corrosion of steels by liquid sodium, as example. Obvious the numerous works now published, the mechanisms are still leaving bad known.

- 343 (CEA-CONF--3749) SEISMIC ANALYSIS FOR THE SUPER-PHENIX REACTOR. Lefevre, J.C.; Livolant, M.; Lucenet, G. (CEA Centre d'Etudes Nucleaires de Saclay, 91 - Gif-sur-Yvette (France). Dept. des Etudes Mecaniques et Thermiques). 1976. 11p. (CONF-761006--46). Dep. NTIS (US Sales Only), PC A02/MF A01.
- From Nuclear science, scintillation and semiconductor counter symposium; New Orleans, LA, USA (20 Oct 1976).
- The seismic analysis performed for SUPER-PHENIX is presented. The analysis consists essentially of: selecting reference ground motions based on the seismic risks at the site; establishing general earthquake safety criteria; studying the response of buildings, systems and components, using the most appropriate methods; establishing design and acceptance criteria in order to verify the validity of the conception and the reliability of the equipment.
- 344 (CEA-CONF--3834(Pt.2)) TRIPOLI 01, A THREE-DIMENSIONAL POLYKINETIC MONTE CARLO PROGRAM. PT.2. CONSTANT DATA INPUT AND RESULTS OBTAINED FOR A COMPLEX BENCH-MARK EXAMPLE. Baur, A.; Bourdet, L.; Gonnord, J.; Nimal, J.C.; Vergnaud, T. (CEA Centre d'Etudes Nucleaires de Cadarache, 13 - Saint-Paul-les-Durance (France). Dept. des Reacteurs a Eau). Jan 1977. 165p. (In French). (CONF-7610162--P2). Dep. NTIS (US Sales Only), PC A08/MF A01.
- From Seminar workshop on the Monte Carlo code TRIPOLI; Las Vegas, NV, USA (17 Oct 1976).
- Some properties of the sub-routines included in TRIPOLI for the constant data input are briefly reviewed. The bench-mark example then proposed is a problem of the contour lines of a neutron-opaque shield. The example is derived from activation calculations for the secondary sodium in a fast reactor provided with an integrated shield of Phenix type. The dimensions have been reduced so as the geometry to be simplified, and the constant data load reduced. Besides the rate of ^{24}Na formation by capture in the exchanger region, the attenuation of various detector responses all along the neutron trajectory was taken into account. The detectors chiefly used were: ^{103}Rh activation from (n,n') reactions for fast neutron detection, the activation Mn detectors, either bare or under cadmium, for detecting thermal and epithermal neutrons respectively.
- 345 (CEA-CONF--3848) KEY SAFETY ISSUES FOR FAST BREEDER REACTORS. Tanguy, P.; Petit, J.; Justin, F. (CEA Centre d'Etudes Nucleaires de Saclay, 91 - Gif-sur-Yvette (France). Dept. de Surete Nucleaire). 1976. 8p. (CONF-761001--). Dep. NTIS (US Sales Only), PC A02/MF A01.
- From International meeting on fast reactor safety and related physics; Chicago, IL, USA (5 Oct 1976).
- Safety evaluations made on the commercial 1200 Mwe Creys-Malville LMFBR have shown a number of key safety issues: fuel cladding integrity, core stability, core coolability, core monitoring, shutdown systems, core disruptive accident and containment. Not one of them seems unsolvable, but studies and tests appear still necessary, especially if it is thought in simplifying the system of increasing

the unit size of the plant.

- 346 (CEA-CONF--3849) SAFETY TEST FACILITIES. NEEDS AND CONCEPTS. A FRENCH EVALUATION. Tretiakoff, O.; Bailly, J. (CEA Centre d'Etudes Nucleaires de Saclay, 91 - Gif-sur-Yvette (France). Dept. de Surete Nucleaire). 1976. 7p. (CONF-761001--). Dep. NTIS (US Sales Only), PC A02/MF A51.

From International meeting on fast reactor safety and related physics; Chicago, IL, USA (5 Oct 1976).

The fuel behaviour of LMFBRs in the event of an accident has been tested in-pile in the SCARABEE program (local blockage, sudden flow reduction and pump coast-down at constant power). These tests will be carried on in the framework of an international cooperation on irradiated fuels: this is the purpose of the CABRI and SCARABEE N programs. All those studies should enable to assess safety margins between accident conditions and the technical specifications of the reactor. The paper explains how a logical set of simple observations has led to the present state of the Cadarache in-pile experimental safety program and how it may help to find the way in a dense forest of both technical and psychological difficulties.

- 347 (CEA-CONF--3890) NUCLEAR SAFETY RESEARCH IN FRANCE. Tanguy, P. (CEA Centre d'Etudes Nucleaires de Saclay, 91 - Gif-sur-Yvette (France). Dept. de Surete Nucleaire). 1976. 22p. (CONF-761254--1). Dep. NTIS (US Sales Only), PC A02/MF A01.

From Seminar on nuclear safety; Tokyo, Japan (17 Dec 1976).

As a consequence of the decision of choosing light water reactors (PWR) for the French nuclear plants of the next ten years, a large safety program has been launched referring to three physical barriers against fission product release: the fuel element cladding, main primary system boundary and the containment. The parallel development of French-designed fast breeder reactors involved safety studies on: sodium boiling, accidental fuel behavior, molten fuel-sodium interaction, core accident and protection, and external containment. The rapid development of nuclear energy resulted in a corresponding development of safety studies relating to nuclear fuel facilities. French regulations also required a special program to be developed for the realistic evaluation of the consequences of external aggressions, the French cooperation to multinational safety research being also intensive.

- 348 (CEA-CONF--3987) METALLURGICAL ASPECTS OF THE WELDABILITY OF CR-MO STABILIZED FERRITIC STEELS. Colombe, G.; Petrequin, P.; Debriez, S.; Donati, J.R.; Zacharie, C. (CEA Centre d'Etudes Nucleaires de Saclay, 91 - Gif-sur-Yvette (France). Dept. de Physique Nucleaire). 1977. 16p. (CONF-770545--4). Dep. NTIS (US Sales Only), PC A02/MF A01.

From British Nuclear Energy Society conference on ferritic steels for fast reactor steam generators; London, UK (30 May 1977).

Results of tests performed to compare the tendency of 2.25 Cr-Mo and 9 Cr-2 Mo steels stabilised with niobium and niobium + vanadium, to different cracking phenomena susceptible to occur during welding, stress-relieving and service in the conditions of fast breeder reactors are presented.

- 349 (CEA-CONF--3994) HOW LOCAL SODIUM BOILING IN ROD BUNDLES UNDER REALLY STEADY

STATE BOUNDARY CONDITIONS IS ACHIEVED ON THE CFNA LOOP. Menant, B. (CEA Centre d'Etudes Nucleaires de Grenoble, 38 (France). Dept. de Transfert et Conversion d'Energie). 1977. 10p. (CONF-770640--6). Dep. NTIS (US Sales Only), PC A02/MF A01.

From 7. liquid metal boiling working group meeting; Petten, Netherlands (1 Jun 1977).

A good knowledge on sodium boiling under steady state boundary conditions is a necessary basis for the analysis of sodium boiling in the area of the fast reactor safety. The laps of time necessary to establish permanent local boiling in rod bundles is sometimes longer than a few seconds. Therefore steady state boundary conditions (power, flow rate, inlet temperature, outlet pressure) can be maintained as long as desired on the CFNA loop. Several cycles of measurements are performed during each run in order to make sure that a permanent thermohydraulic regime is reached everywhere in the test section.

- 350 (CEA-CONF--3995) NUCLEATION, DRY-OUT AND BOILING BEHIND A SODIUM-TIGHT LOCAL BLOCKAGE IN A 9-PIN BUNDLE WITH HELICAL WIRE SPACERS. Menant, B. (CEA Centre d'Etudes Nucleaires de Grenoble, 38 (France). Dept. de Transfert et Conversion d'Energie). 1977. 15p. (CONF-770640--4). Dep. NTIS (US Sales Only), PC A02/MF A01.

From 7. liquid metal boiling working group meeting; Petten, Netherlands (1 Jun 1977).

Permanent sodium boiling tests were performed with a 19 wire-wrapped pin bundle in which the 12 central subchannels were sodium-tightly blocked. No risk of boiling was evidenced with nominal cooling and power, but the boiling which occurred when the flow rate was sufficiently restricted was very damagable. Indeed dry-out occurred before any evidence of vapor bubbles in the flow could be obtained with classical means of investigation (i.e. electromagnetic flowmeters and pressure transducers). The interpretation, leading to a model of nucleation and dry-out around hot spots in the wake of the blockage, is corroborated by the analysis of thermal and acoustical noise.

- 351 (CEA-CONF--3996) SODIUM VOIDING IN AN ANNULAR CHANNEL HEATED BY A SINGLE PIN IN OVERPOWER ACCIDENT SIMULATIONS. Seiler, J.M. (CEA Centre d'Etudes Nucleaires de Grenoble, 38 (France). Dept. de Transfert et Conversion d'Energie). 1977. 8p. (CONF-770640--5). Dep. NTIS (US Sales Only), PC A02/MF A01.

From 7. liquid metal boiling working group meeting; Petten, Netherlands (1 Jun 1977).

In a simulation of overpower accidents affecting a fast breeder core, experiments on sodium boiling were performed in a single vertical channel of annular cross section (10.65 mm I.D.) indirectly heated by a high flux heater pin (8.65 mm O.D.). Measurements were made with a high speed acquisition system. The experimental conditions were: Pressure of cover gas: 1 kg/cm² abs, Mass Flow rate of sodium: 25 g/s, Inlet temperature: 400°C, Steady state outlet temperature: 800°C, Transient power supply: 90 KW up to 250 KW. For the first expulsion, the results revealed two important points: variable initial superheat with corresponding pressure pulse, and after superheat resorption, thermal conditions prevail and the boiling process followed equilibrium conditions. After heating cut off, rewetting pressure pulses were observed.

- 352 (CEA-CONF--4013) EFFECT OF STRUCTURE AND ALLOYING ELEMENTS ON VOID FORMATION IN

AUSTENITIC STEELS AND NICKEL ALLOYS. Levy, V.; Azam, N.; Le Naour, L.; Didout, G.; Delaplace, J. (CEA Centre d'Etudes Nucleaires de Saclay, 91 - Gif-sur-Yvette (France). Dept. de Technologie). 1977. 19p. (CONF-770641--). Dep. NTIS (US Sales Only), PC A02/MF A01.

From Conference on radiation effects in breeder reactor structural materials; Scottsdale, AZ, USA (19 Jun 1977).

In the development of the fast breeder reactors the phenomenon of metal swelling due to the formation of radiation induced voids is a large problem. In the complex alloys small fluctuations in composition can have a considerable effect on swelling and a great deal of investigation on the effect of both major and minor alloying elements is needed to be able to predict swelling. To provide more insight a research program involving irradiation of both commercial or specially cast alloys by 500 keV Ni⁺ ions or 1 MeV electrons has been developed. The major results are presented.

353 (CEA-CONF--4014) FUNDAMENTAL ASPECTS OF THE EVOLUTION OF, AND PHASE CHANGES IN, METALS AND ALLOYS UNDER IRRADIATION. Martin, Georges; Bocquet, J.-L.; Barbu, Alain; Adda, Yves. (CEA Centre d'Etudes Nucleaires de Saclay, 91 - Gif-sur-Yvette (France). Dept. de Technologie). 6 Jun 1977. 16p. Dep. NTIS (US Sales Only), PC A02/MF A01.

From International conference on radiation effects in breeder reactor structural materials; Scottsdale, AR, USA (19 Jun 1977).

The quantitative prediction and the simulation of irradiation damage present a considerable interest for the technology of fast neutron and fusion reactors. However, at present time, even qualitative predictions are not always possible when the dose rate varies over a relatively large range; for example the formation of vacancy loops takes place instead of that of voids, precipitation occurs in under-saturated solid solutions etc... Therefore, in addition to a microscopic description of the phenomena, it seems important to elaborate an irradiation damage phenomenology. The results of a systematic experimental study of dose rate effects for radiation induced precipitation in Ni Si solid solution alloys are reported. The existence of dose rate thresholds for this phenomenon is clearly established. The composition dependence of this thresholds permits the definition of a solubility limit under irradiation which is both temperature and dose rate dependent. Finally, the various theoretical approaches to radiation induced precipitation are discussed.

354 (CEA-CONF--4192) UTILIZATION OF THE EXPERIMENTAL REACTOR OSIRIS FOR THE STUDY AND THE DEVELOPMENT OF FUELS OF THE FAST NEUTRON REACTOR TYPE. Marcon, M.; Faugere, J.L.; Genthon, J.P.; Maillot, R. (CEA Centre d'Etudes Nucleaires de Saclay, 91 - Gif-sur-Yvette (France). Services des Piles). 1977. 21p. (In French). (CONF-771189--5). Dep. NTIS (US Sales Only), PC A03/MF A01.

From Symposium on the future of research reactors; Grenoble, France (Nov 1977).

Nuclear fuel tests for the fast neutron reactor type have been carried out at the Osiris reactor: thermal study of (U,Pu)₂O₃ oxide by measurement with thermocouples in the core of the fuel pellet; study of the effects of power cycling on nuclear fuel; study of the mechanical interactions between oxide and cladding by measurement of the cladding deformation during irradiation.

355 (CEA-CONF--4212) BREEDER REACTORS. Gollion, H.; Lucenet. (CEA Centre d'Etudes Nucleaires de Cadarache, 13 - Saint-Paul-les-Durance (France). Dept. des Reacteurs a Neutrons Rapides). 1977. 52p. (In French). (CONF-7703127--1). Dep. NTIS (US Sales Only), PC A04/MF A01.

From One-day information meeting on nuclear power plants; Grenoble, France (9 Mar 1977).

The reasons for the development of fast reactors are briefly reviewed (a propitious neutron balance oriented towards a maximum uranium burnup) and its special requirements (cooling, fissile material density and reprocessing) discussed. The three stages in the French program of fast reactor development are outlined with Rapsodie at Cadarache, Phenix at Marcoule, and Super Phenix at Creys-Malville. The more specific features of the program of research and development are emphasized: kinetics and the core, the fuel and the components.

356 (CEA-CONF--4339) NUMERICAL METHOD FOR A TRANSIENT TWO-FLUID MODEL. Le Coq, G.; Libmann, M. (CEA Centre d'Etudes Nucleaires de Cadarache, 13 - Saint-Paul-les-Durance (France). Dept. des Reacteurs a Eau). 1978. 15p. (CONF-7805170--2). Dep. NTIS (US Sales Only), PC A02/MF A01.

From 2. Phase Flow Group meeting; Stockholm, Sweden (28 May 1978).

The transient boiling two-phase flow is studied. In nuclear reactors, the driving conditions for the transient boiling are a pump power decay or/and an increase in heating power. The physical model adopted for the two-phase flow is the two fluid model with the assumption that the vapor remains at saturation. The numerical method for solving the thermohydraulics problems is a shooting method, this method is highly implicit. A particular problem exists at the boiling and condensation front. A computer code using this numerical method allow the calculation of a transient boiling initiated by a steady state for a PWR or for a LMFBF.

357 (CEA-CONF--4384) CALCULATION OF STRUCTURES BY A METHOD OF SUBSTRUCTURES DEFINED BY THEIR EIGENMODES. LINEAR AND NONLINEAR APPLICATIONS. TRISTANA CODE. Jeanpierre, F.; Livolant, M. (CEA Centre d'Etudes Nucleaires de Saclay, 91 - Gif-sur-Yvette (France). Dept. des Etudes Mecaniques et Thermiques). 1978. 26p. (In French). (CONF-7806167--3). Dep. NTIS (US Sales Only), PC A03/MF A01.

From Summer meeting: shocks and vibrations; Lyon, France (13 Jun 1978).

An efficient method for complex structures dynamical analysis is the method of independent substructures connected by mechanical links, the movement of the substructures being defined on their natural modes basis. This method allows the calculation of non linear links like shocks or fretting. Studied in CEA/DEMT it has been introduced in the TRISTANA code. Some applications are presented in this report: tests of the method or application to nuclear reactor internals vibrational calculations.

358 (CEA-CR--13, pp vp) EFFECTS OF LOAD FOLLOWING ON THE CORE AND THE COMPONENTS OF THE SUPER PHENIX SODIUM CIRCUITS. Acket (Compagnie d'Ingenierie pour les Reacteurs au Sodium (CIRNA), Centre d'Etudes Nucleaires de Saclay, 91 - Gif-sur-Yvette (France)); Decuyper; Reynaud (Societe Centrale Nucleaire Europeenne a Neutrons Rapides (NERSA), 69 - Lyon (France)); Quinton (CEA Centre d'Etudes Nucleaires de Cadarache, 13 - Saint-Paul-les-Durance

(France). Dept. des Reacteurs a Neutrons Rapides). [nd]. (In French).

Nuclear power plant control problems associated with loads following and network transients.

After describing the installation, a description is given of the objectives for the load following of the Creys-Malville power station, as well as of the execution, study means and tests.

- 359 (CEA-N--2075) EXPERIMENTAL TESTS ON BUCKLING OF ELLIPSOIDAL VESSEL HEADS UNDER INTERNAL PRESSURE. Alix, M.; Roche, R. (CEA Centre d'Etudes Nucleaires de Saclay, 91 - Gif-sur-Yvette (France). Dept. des Etudes Mecaniques et Thermiques). Jan 1979. 117p. (In French). Dep. NTIS (US Sales Only), PC A06/MF A01.

Seventeen heads made out of metal sheets -by cold working- were tested. Three different metals were used - carbon steel, austenitic steel, and aluminium alloy. Nominal dimensions were: diameter D 500 mm height H 50 and 100 mm thickness to diameter ratio t/D in the range 0.001-0.005. The heads had a good axisymmetric shape, but that the thickness was varying along the ellipse. Material characteristic of each head was given by a tensile test (strain-stress curve). The obtained results are mainly the pressure deflexion recordings, strain measurements and visual observations of the geometrical changes. For thin heads, buckling is a very fast event and the first folding occurs suddenly, with a strong perturbation on the pressure-deflexion curve. For the thickest heads, circular waves are slowly forming. In all of these tests, yielding occurred before buckling and it was possible to increase the pressure beyond the first buckling pressure without failure. The experimental results agree very well ($\pm 5\%$ except one head) with the empirical formula $P_{sub}(c) = 70000 \cdot (\sigma_y + \sigma_u / 2) \cdot (t/D)^{5/3} \cdot ((D/H)^2 - 8)^{2/3}$. The following notations being used: $P_{sub}(c)$: critical buckling pressure; σ_y : yield strength; σ_u : ultimate stress (same unit); t: knuckle thickness; D: mean diameter; H: height (same unit).

- 360 (CEA-R--4881) MANUFACTURE OF THE SECOND CORE OF RAPSODIE - TYPE 2 A - FORTISSIMO VERSION. Mandicourt, L. (CEA Centre d'Etudes Nucleaires de Cadarache, 13 - Saint-Paul-les-Durance (France). Dept. de Developpement des Elements Combustibles). Nov 1977. 88p. (In French). Dep. NTIS (US Sales Only), PC A05/MF A01.

This report concerns the fuel manufacturing of the second core of RAPSODIE reactor 2 A type, FORTISSIMO version. This fuel is a mixed oxide of Plutonium and highly enriched Uranium. The manufacturing facility which is used, started in 1969, is essentially designed for the production of fuels with high percentage of fissile material. It includes devices used to produce the first RAPSODIE fuel and new machines resulting from technological improvements obtained during previous manufactures. The manufacturing process is described after a recall fuel physical characteristics. A final quantitative balance for the whole fabrication is presented. The results obtained on fuel pellets and pins are discussed with starting from the fabrication process and the changes which may have occurred or arose from the use of different devices. A more theoretical approach of some particular problems is presented: the multiphasage, the amount of oxygen and the porosities. A general conclusion is given on the main theoretical and technical problems met on the manufacture of

nuclear fuel of this type.

- 361 (CEA-R--4905) STUDY OF THE Na-C-O AND Na-H-O TERNARY SYSTEMS IN THE SODIUM RICH CORNER. Maupre, J.-P. (CEA Centre d'Etudes Nucleaires de Cadarache, 13 - Saint-Paul-les-Durance (France). Dept. des Reacteurs a Neutrons Rapides; Aix-Marseille-1 Univ., 13 - Marseille (France)). Feb 1978. 367p. (In French). Dep. NTIS (US Sales Only), PC A15/MF A01.

Thesis.

The purpose of this study is to provide a contribution to the understanding of the sodium - carbon - oxygen and sodium - hydrogen - oxygen ternary systems in the sodium rich corner. In order to do this the Na-NaH-Na₂O-NaOH phase diagram was completed and the Na-Na₂O-Na₂CO₃-C phase diagram was outlined. This work is made up of two parts. The first is devoted to a critical literature survey essential to establish correct phase diagrams. The second is an experimental study followed by a discussion collating our finding to the literary data. The basic experimental technique used is differential thermal analysis (DTA) but it has been completed by quenching, X-ray and chemical analysis methods. The proposed phase diagrams imply that Na-NaH-Na₂O-NaOH and Na-Na₂O-Na₂CO₃-C systems are reciprocal ternary systems. Temperatures of stable pairs reversal are respectively 410 and 690°C. The stable pairs are Na-NaOH and Na-Na₂CO₃ at elevated temperature, Na₂O-NaH and Na₂O-C at low temperature.

- 362 (CEA-R--4911) FAST NEUTRON REACTOR CORE RESEARCH AT THE C.E.A. Chaudat, J.P. (CEA Centre d'Etudes Nucleaires de Cadarache, 13 - Saint-Paul-les-Durance (France). Dept. des Reacteurs a Neutrons Rapides). May 1978. 121p. (In French). Dep. NTIS (US Sales Only), PC A06/MF A01.

This report covers all physical studies of fast neutron reactors carried out by the C.E.A., to provide basic data (multi-group cross sections) and computer methods which may be used to calculate nuclear power plant neutron properties with the precision required by the project. The approach adopted to establish the basic data used in all core calculations is described in greater detail: choice of a reference procedure for basic mode calculations (CARNAVAL set), choice of particular experimental programs to reduce uncertainties in connection with the formula set, adjustment of cross sections on integral parameters measured on critical experiments. The development of the formula set is closely connected with the project requirements; hence the set is modified with respect to the core characteristics of the power plant studied. Following an explanation of how the CARNAVAL III and IV formula sets -used for PHENIX and SUPER-PHENIX respectively- were derived, current studies for heterogeneous cores are described.

- 363 (CEGB-RD/B/N--3414) FRODA - A PROGRAM FOR THE ANALYSIS OF FREQUENCY DYNAMICS EXPERIMENTS. Emmett, J.C.A. (Central Electricity Generating Board, Berkeley (UK). Berkeley Nuclear Labs.). May 1976. 40p. Dep. NTIS (US Sales Only), PC A03/MF A01.

The FRODA program has been produced for the analysis of dynamics experiments in the frequency domain. Its two main functions are the processing of experimental frequency responses and the fitting of theoretical frequency responses from various simple mathematical models to experimental plant. Two

types of model can be used: (i) empirical models of which there are three different formulations of the standard polo-zero type of model and (ii) physics models which consist of a set of linearized algebraic and first order differential equations. The FRODA calculation is divided into separate tasks which may be performed singly or in any feasible combination. These tasks have all been used successfully in a simulated analysis of the P.F.R. Oscillator Experiment and it is intended to use FRODA to analyse the real experimental data when it becomes available. FRODA has been written in a general form for use for evaluation and fitting of a wide variety of simple plant models in the frequency domain. Other nuclear applications have been the analysis of noise measurements on a Magnox reactor and the setting up of a simple AGR core model for simulating a dynamic experiment to measure reactivity coefficients. A general description of FRODA and instructions on how to use the program is given.

- 364 (CEGB-RD/B/N--3666) RECENT ADVANCES IN UNDERSTANDING LARGE SCALE VAPOUR EXPLOSIONS. Board, S.J.; Hall, R.W. (Central Electricity Generating Board, Berkeley (UK). Berkeley Nuclear Labs.). Apr 1977. 32p. (CONF-760328--7). Dep. NTIS (US Sales Only), PC A03/MF A01.

From 3. specialists' meeting on sodium fuel interaction; Tokyo, Japan (Mar 1976).

Recent advances in the description of large scale efficiency vapour explosions indicate that three stages must be considered: setting up a quasi-stable initial configuration; triggering of this configuration; and propagation of the explosion. Each of these stages is considered in turn, the relevant experimental information and theory being reviewed to see to what the extent the requirement for energetic explosions and the physical processes satisfying the requirements are understood. Recent models for large scale explosions have helped to achieve an improved understanding, particularly of the propagation phase. Particular attention is paid to a suggested criterion for explosivity that the contact temperature should exceed the temperature of spontaneous nucleation of the coolant, for this criterion sodium and UO₂ in particular, are not explosive.

- 365 (CEGB-RD/B/N--3810) LOCAL BLOCKAGE STUDIES IN A HEATED MULTIPHASE WATER EXPERIMENT WITH FAST REACTOR GEOMETRY. Clare, A.J. (Central Electricity Generating Board, Berkeley (UK). Berkeley Nuclear Labs.). May 1977. 40p. Dep. NTIS (US Sales Only), PC A03/MF A01.

An important stage in studying the effects of local blockages in LMFBR subassemblies concerns the prediction of the elevated coolant temperatures in the downstream recirculating wake, and in particular the size of blockage which would cause boiling of the coolant. The development of both sophisticated models of the flow and heat transfer in the wake (such as the UK code SABRE), and simpler empirical methods, requires adequate experimental support including measurements of wake temperature patterns in large cluster experiments. Results are reported of a detailed study of wake temperature distributions produced in single-phase flow by blockages in a 283 pin (91 heated) water experiment. Two central blockages (7.2% and 12.8% of total flow area blocked) and two corner blockages (5.4% and 8.7% blocked) have been studied.

- 366 (CEGB-RD/B/N--3982) MEASUREMENTS OF TEMPERATURE FLUCTUATIONS IN THE MIXING OF HOT AND COLD AIR JETS. Sumner, V.W. (Central Electricity Generating Board, Berkeley (UK). Berkeley Nuclear Labs.). Mar 1977. 41p. Dep. NTIS (US Sales Only), PC A03/MF A01.

In order to assess the effect of the mixing of 'hot' and 'cold' jets of sodium on structures in the above-core region of the fast reactor, temperature fluctuations have been measured in an experiment consisting of a heated jet of air surrounded by six unheated jets. Temperature spectra obtained from the experiment showed no strong peaks or bands. In considering the effect of thermal cycling of the above-core structures, it is the higher strain values at low frequencies which will be more limiting than the smaller values at high frequencies, due to the nature of strain-lifetime curves. Thus the spectra have been summarised using a low-frequency level and a cut-off frequency at which this level has fallen by an order of magnitude. Attenuation of temperature fluctuations due to the high thermal conductivity of sodium or by boundary layer effects has been considered; however, in the low-frequency, high-energy region of the spectra, little attenuation can be expected.

- 367 (CEGB-RD/B/N--4029) TECHNIQUE FOR MEASURING HYDROGEN AND WATER IN INERT GASES AND THE HYDROGEN CONCENTRATION IN LIQUID SODIUM. Smith, C.A. (Central Electricity Generating Board, Berkeley (UK). Berkeley Nuclear Labs.). Apr 1978. 26p. Dep. NTIS (US Sales Only), PC A03/MF A01.

A method is described of measuring the hydrogen and water content of an inert gas. It is based upon the use of an electrochemical oxygen cell and has a high sensitivity at low hydrogen and water levels. The following possible applications of the method are described together with supporting experimental measurements: improving the sensitivity and range of the present PFR secondary circuit hydrogen detection instruments; the measurement of hydrogen diffusion coefficients in steels; the measurement of waterside corrosion rates of boiler steels; on-line monitoring of waterside boiler corrosion. Attention is given to the characteristics of diffusion barriers in relation to the first and last of these.

- 368 (CEGB-RD/B/N--4194) FISSION GAS BUBBLE DISTRIBUTION IN A MIXED OXIDE FAST REACTOR FUEL PIN. Baker, C. (Central Electricity Generating Board, Berkeley (UK). Berkeley Nuclear Labs.). Dec 1977. 11p. Dep. NTIS (US Sales Only), PC A02/MF A01.

The fission gas bubble distribution has been studied in a mixed oxide fast reactor fuel pin irradiated in DIDO MTR to 2.8% burn-up at centre and surface temperatures of 2000 and 1000°C. The intragranular fission gas bubbles are very small (< 6 mm diameter) and this is a consequence of the high re-solution rate at fast reactor ratings. The bubbles nucleate heterogeneously and linear arrays of bubbles, due to nucleation on fission tracks, are observed up to irradiation temperatures of 1900°C. At 1980°C approximately equal to 4% of the fission gas produced is present in intragranular bubbles. There is no definite evidence for gas bubble mobility or coalescence. Apart from any effects of columnar grain growth, fission gas release in fast reactor fuel pins seems to occur predominantly by the diffusion of single gas atoms, at least up to irradiation temperatures of 2000°C.

- 369 (CEGB/RD/B/N--4219) CREEP IN SODIUM: A REVIEW. Charnock, W.; Cordwell, J.E. (Central Electricity Generating Board, Berkeley (UK). Berkeley Nuclear Labs.). Mar 1978. 33p. (FRDC/MWP/P--(78)752; FRDC/MWP/MPSG/P--(78)172). Dep. NTIS (US Sales Only), PC A03/MF A01.

The available information on the creep of austenitic, ferritic, and Alloy-800 type steels in liquid sodium is critically reviewed. The creep properties of stainless steels can be affected by element transfer and corrosion. At reactor structural component temperatures environmental effects are likely to be less important than changes due to thermal ageing. At high clad temperatures (700°C) decarburization may cause the loss of strength and ductility in unstabilized steels while cavity formation may cause embrittlement in stabilized steels. In some experiments Alloy 800 properties are found to deteriorate while in others they are enhanced. Low alloy ferritic steels tend to decarburize in sodium at temperatures greater than approx. 500°C and this leads to loss of strength and an increase in ductility. High alloy ferritics are immune to this effect and appear to be able to tolerate a degree of carburization. Although in general the incidence of intergranular cracking may be enhanced in liquid sodium the mechanical consequences are not significant and the evidence for the existence of an embrittlement effect not associated with element transfer or corrosion is weak. Stress and strain may enhance element transfer at crack tips. However, in real cracks the gettering or supply action of the crack faces conditions the chemistry of the crack sodium and protects the crack tip from element transfer. Thus creep crack extension rates should be independent of changes in bulk coolant chemistry.

- 370 (CEGB/RD/B/N--4241) TERTIARY CREEP OF SOLUTION TREATED AISI 316 STAINLESS STEEL IN AIR AND IN SODIUM AT 550°C. Cordwell, J.E. (Central Electricity Generating Board, Berkeley (UK). Berkeley Nuclear Labs.). Feb 1978. 21p. Dep. NTIS (US Sales Only), PC A02/MF A01.

Reported observations of tertiary creep embrittlement in short term tests on AISI 304 stainless steel at 550°C in sodium led to the present series of short duration creep tests on AISI 316 stainless steel at the same temperature. Neither the duration of tertiary creep nor the strain associated with it appeared to be systematically affected by the environment. However, both these quantities were small making any embrittling effect difficult to detect. Differences in the strains produced on initial loading may have been responsible for increased creep life in the sodium exposed specimens.

- 371 (CEGB/RD/B/N--4334) REMOVAL OF RADIOACTIVE PRODUCTS FROM LIQUID METAL COOLANTS OF LMFBRs UNDER NORMAL OPERATION. Hooper, A.J. (Central Electricity Generating Board, Berkeley (UK). Berkeley Nuclear Labs.). Aug 1978. 22p. Dep. NTIS (US Sales Only), PC A02/MF A01.

The levels of activity which will accumulate on components in the primary circuit of a liquid metal cooled fast breeder reactor as a result of deposition of activated corrosion products, fission products, and fuel particles from the liquid metal coolant must be minimized to facilitate maintenance and decontamination procedures. The information available in the open literature up to the end of 1977 relating to removal of radioactive products from the liquid metal coolants of LMFBRs and to the

mechanisms of deposition of these species is reviewed. Particular emphasis is placed on information emanating from operating LMFBRs.

- 372 (CEGB/RD/B/N--4338) EFFECT OF VARIATIONS IN CARBON ACTIVITY ON THE CARBURIZATION OF AUSTENITIC STEELS IN SODIUM. EXPLORATORY TESTS. Gwyther, J.R.; Hobdell, M.R.; Hooper, A.J. (Central Electricity Generating Board, Berkeley (UK). Berkeley Nuclear Labs.). Jul 1978. 23p. Dep. NTIS (US Sales Only), PC A03/MF A01.

Experience has shown that the liquid sodium coolant of fast breeder reactors is an effective carbon-transport medium; the resulting carburization of thin austenitic stainless steel components (eg IHX and fuel cladding) could adversely affect their mechanical integrity. The degree and nature of steel carburization depend, inter alia, on the carbon activity of the sodium environment. Exploratory tests are described in which specimens of austenitic stainless steel were carburized in sodium, the carbon activity of which was continuously monitored by a BNL electrochemical carbon meter. The sodium carbon activity was initially high, but decreased with time, simulating conditions equivalent to plant start-up or coolant clean-up following accidental oil ingress. The extent and nature of steel carburization was identified by metallography, electron microscopy, X-ray crystallography and chemical analysis.

- 373 (CENC--1397) POOL TYPE IHX STUDY FOR THE LARGE COMPONENT DEVELOPMENT PROGRAM. Sowers, M.G.; DeFur, D.D. (Combustion Engineering, Inc., Chattanooga, TN (USA). Nuclear Components Dept.). 30 Sep 1979. Contract W-31-109-ENG-38. 129p. AT.

Pool type IHX designs for both 430 MWt and 645 MWt ratings should be feasible and practical with careful engineering studies of potential problems. C-E drawings show preferred configurations. The principle areas of concern are uncertainties associated with design latitude, flow distribution and seismic response. These and other less significant concerns are functions of IHX size; therefore, there is a higher degree of confidence for the smaller units. It is recommended that development programs be carried out to reduce the design uncertainties.

- 374 (CONF-681093-- pp 8.1-8.9) SEFOR: THE MOST PROMISING CONCEPT. Kerns, R.E. (Oklahoma Gas and Electric Co., Oklahoma City). 1968.

From Frontiers of power technology conference; Stillwater, OK, USA (28 Oct 1968). A brief survey is given of the planning and construction of the SEFOR reactor. Fuel element design and core configuration are examined. (DG)

- 375 (CONF-681093-- pp 9.1-9.51) UNIQUE FEATURES OF A SODIUM-COOLED FAST-BREEDER REACTOR. Ash, E.B. (North American Rockwell Corp., Canoga Park, CA). 1968.

From Frontiers of power technology conference; Stillwater, OK, USA (28 Oct 1968). The paper describes the characteristics of the liquid-metal cooled fast-breeder reactor (LMFBR). It is rapidly emerging as one of the major future energy sources throughout the world. The paper discusses the design features of this concept and describes the unique features which distinguish it from the more familiar light-water reactor (LWR). It highlights these features from a utility

viewpoint and emphasizes some significant advantages.

- 376 (CONF-760673-- pp 253-289) NEUTRON SWELLING OBSERVATIONS ON AUSTENITIC STAINLESS STEELS IRRADIATED IN EBR-II. Flinn, J.E. (Argonne National Lab., Idaho Falls, IA); Kenfield, T.A. 1976.

From Workshop on correlation of neutron and charged particle damage; Oak Ridge, TN, USA (8 Jun 1976).

Recent neutron swelling results on annealed types 304L, 304, and 316 stainless steels are presented. The results consist of percent volume changes as a function of irradiation temperature and fast fluence. The respective swelling data bases for each steel are not sufficient to provide a quantitative comparison between the three stainless steels. The most pronounced difference observed is their peak swelling temperatures, where 304 exhibits the lowest temperature (approximately 450°C) and 316 the highest (approximately 600°C). Influence due to cold-worked conditions on 304 and 316 stainless steels are examined. The 30% cold-worked condition for the two alloys showed a definitive decrease in swelling when compared to the respective annealed materials. Some preliminary results on enhanced swelling (possible stress effects) and irradiation history or memory effects on 304L stainless steel driver fuel cladding are also given.

- 377 (CONF-760673-- pp 291-311) APPLICATIONS OF SIMULATION EXPERIMENTS IN LMFBR CORE MATERIALS TECHNOLOGY. Appleby, W.K. (General Electric Co., Sunnyvale, CA). 1976.

From Workshop on correlation of neutron and charged particle damage; Oak Ridge, TN, USA (8 Jun 1976).

The development of charged particle bombardment experiments to simulate neutron irradiation induced swelling in austenitic alloys is briefly described. The applications of these techniques in LMFBR core materials technology are discussed. It is shown that use of the techniques to study the behavior of cold-worked Type-316 was instrumental in demonstrating at an early date the need for advanced materials. The simulation techniques then were used to identify alloying elements which can markedly decrease swelling and thus a focused reactor irradiation program is now in place to allow the future use of a lower swelling alloy for LMFBR core components.

- 378 (CONF-760735--1) LEAK DETECTION SYSTEM DESIGN AND OPERATING CONSIDERATIONS FOR THE US-CRBRP. Kruger, G.B.; Eng, K.Y.; Kelly, W.L. (General Electric Co., Sunnyvale, CA (USA); Energy Research and Development Administration, Washington, DC (USA)). 1976. Contract EY-76-C-15-2395. 23p. Dep. NTIS, PC A02/MF A01.

From US/USSR steam generator seminar; Dimitrovgrad, USSR (26 Jul 1976).

Diffusion membrane type hydrogen detectors are provided for monitoring the sodium exiting each evaporator and superheater in the Clinch River Breeder Reactor Plant. These detectors allow detection of small water to sodium leaks and provide the plant operator with an early warning signal. Hydrogen detectors are located at the exit sodium streams of each steam generator module, the vent from the module semi-stagnant region, the cold leg piping, and in an intermediate system sodium expansion tank cover gas region. In addition, an electrochemical oxygen detector is located in the cold leg piping. The leak detection system is capable of detecting the presence of steam/water leaks on the order of 0.45×10^{-5} kg/sec or larger and

of signaling within one to three minutes upon initiation of a leak, during normal operation. Operator action is taken upon receipt of a leak signal to shutdown the affected system, by closing steam/water isolation valves and depressurizing the affected unit.

- 379 (CONF-760735--2) DESIGN OF THE US-CRBRP SODIUM/WATER REACTION PRESSURE RELIEF SYSTEM. Kruger, G.B.; Murdock, T.B.; Rodwell, E.; Sane, J.D. (General Electric Co., Sunnyvale, CA (USA); Westinghouse Electric Corp., Pittsburgh, PA (USA)). 1976. Contract EY-76-C-15-2395. 24p. Dep. NTIS, PC A02/MF A01.

From US/USSR steam generator seminar; Dimitrovgrad, USSR (26 Jul 1976).

Protection against intermediate sodium system overpressure from the sodium/water reaction associated with large leaks within the CRBRP Steam Generators is provided by the sodium/water reaction pressure relief system (SWRPRS). This system consists of rupture disks connected to the intermediate sodium piping adjacent to the inlet to the superheater and outlet from the evaporator modules. The rupture discs relieve into piping that leads to reaction produce separator tanks, which in turn are vented to a centrifugal separator and flare stack arranged to burn hydrogen gas exhausting into the atmosphere. Analyses have been conducted using the TRANSWRAP Computer Code to predict the system pressures and flow rates during the large leak event. Experimental tests to be conducted in the large leak test rig (LLTR) will be used to confirm the analysis techniques used in the design.

- 380 (CONF-761001--3, pp 1047-1056) SAFETY PROBLEMS RELATED TO MICROHETEROGENEITIES IN PHYSICALLY MIXED OXIDE FUELS. Renard, A.; Evrard, G.; Vanhellemont, G. (Belgonucleaire SA, Brussels). 1976.

From International meeting on fast reactor safety and related physics; Chicago, IL, USA (5 Oct 1976).

The safety aspects of microheterogeneities in LMFBR mixed oxide fuel are reviewed from the point of view of the pin behaviour dynamic study, the fabrication and the quality control. The paper emphasizes some significant parameters in transient conditions, the prevention means in the fabrication process and the analysis methods for the control.

- 381 (CONF-761001--P1, pp 2-13) KEY ISSUES ON SAFETY DESIGN BASIS SELECTION AND SAFETY ASSESSMENT. An, E.; Togo, Y. (Tokyo Univ.). 1976.

From International meeting on fast reactor safety and related physics; Chicago, IL, USA (5 Oct 1976).

In current fast reactor design in Japan, four design accident conditions and four design seismic conditions are adopted as the design base classifications. These are classified by the considerations on both likelihood of occurrence and the severeness of the consequences. There are several major problem areas in safety design consideration such as core accident problems which include fuel sodium interaction, fuel failure propagation and residual decay heat removal, and decay heat removal systems problems which is more or less the problem of selection of appropriate system and of assurance of high reliability of the system. In view of licensing, two kinds of accidents are postulated in evaluating the adequacy of a reactor site. The one is the 'major accident' which is the accident to give most severe radiation hazard to the public from technical point of view. The other is the

"hypothetical accident", induced public accident of which is severer than that of major accident. While the concept of the former is rather unique to Japanese licensing, the latter is almost equivalent to design base hypothetical accident of the US practice. In this paper, design bases selections, key safety issues and some of the licensing considerations in Japan are described.

- 382 (CONF-761001--P1, pp 14-23) LICENSING ASPECTS IN THE VERIFICATION OF THE SNR 300 DESIGN CONCEPT AGAINST HYPOTHETICAL ACCIDENTS. Kugler, E.; Wiesner, S. (Ministerium fuer Arbeit, Gesundheit und Soziales des Landes Nordrhein-Westfalen, Duesseldorf). 1976.

From International meeting on fast reactor safety and related physics; Chicago, IL, USA (5 Oct 1976).

The German prototype of a fast breeder reactor, the SNR 300, is being built near Kalkar on the Lower Rhine. It is a loop-type fast sodium-cooled reactor, designed and constructed by Interatom, Bensberg. Experiences gained from the first phase of construction are described. The report is restricted to the aspects of the SNR 300 design against a core disruptive accident (CDA) and its consequences and to the difficulties having arisen in the verification of the design concept so far. Some examples of the detailed design are described and discussed from the licensing authority's point of view showing that the difficulties have been typical for a prototype reactor subjected to a regular licensing procedure.

- 383 (CONF-761001--P1, pp 24-32) KEY SAFETY ISSUES FOR FAST BREEDER REACTORS. Tanguy, P.; Petit, J.; Justin, F. (Commissariat a l'Energie Atomique, Saclay, France). 1976.

From International meeting on fast reactor safety and related physics; Chicago, IL, USA (5 Oct 1976).

Safety evaluations made on a commercial LMFBR have shown a number of key safety issues. Not one of them seems unsolvable, but studies and tests are still necessary, especially if it is thought desirable to simplify the system or increase the unit size of the power plant.

- 384 (CONF-761001--P1, pp 33-43) SAFETY ISSUES IN LICENSING COMMERCIAL LMFBR'S. Hannaford, J.; Fryer, D.R.H. (Nuclear Installations Inspectorate, London). 1976.

From International meeting on fast reactor safety and related physics; Chicago, IL, USA (5 Oct 1976).

The paper describes briefly the role of the Nuclear Installations Inspectorate of the Health and Safety Executive as the independent licensing body within the United Kingdom and explains the part they play in the pre-licensing phases of commercial fast reactors. The whole core accident (WCA) is examined in some detail and from this examination the major safety issues are highlighted. The Inspectorate believes that all necessary safeguards should be provided to prevent the occurrence of WCAs, that the objective should be to maintain the core in a state which may be described by analytical models and for which appropriate data is available. Nevertheless, in view of the nature of whole-core accidents and of residual uncertainties associated with LMFBRs, it is considered necessary for designs to include suitable provisions for coping with WCAs. The importance is stressed of recognising that decisions made for the first commercial fast reactors will tend to commit the designs for subsequent power programs. Consideration must be given now, therefore, to ways of reducing

the yield from whole core accidents and of providing containments which can cope with upper bound yields. While research results may subsequently permit a reduction in the level of conservatism currently applied, safety decisions made now must be justifiable in the light of present knowledge.

- 385 (CONF-761001--P1, pp 44-51) SOME THOUGHTS ON FAST REACTOR SAFETY. Okrent, D. (Univ. of California, Los Angeles). 1976.

From International meeting on fast reactor safety and related physics; Chicago, IL, USA (5 Oct 1976).

This paper has been divided into five related sections: (1) ACRS recommendations on LMFBR safety; (2) Some historical perspectives on LWR safety, particularly as they relate to core melt; (3) Some speculation on societal approaches to low probability, high consequence accidents; (4) Hazards from LWR's and LMFBR's; and (5) Some personal thoughts on LMFBR safety.

- 386 (CONF-761001--P1, pp 61-75) SAFETY CONCLUSIONS FROM START-UP TESTS AND FROM THE ANALYSIS OF THE CORE BEHAVIOUR OF PHENIX. Caluzon, P.P. (Centre d'Etudes Nucleaires de Cadarache, Saint-Paul-Lex-Durance, France); Coulon, P.; Meyer-Heine, A.; Penet, F. 1976.

From International meeting on fast reactor safety and related physics; Chicago, IL, USA (5 Oct 1976).

The start-up tests of PHENIX and the analysis of the core behavior for more than 2 years of operation have provided substantial information for the safety analysis of similar reactors. The validity of neutronic basic data and codes is confirmed by the good prediction of the main core physical characteristics, including the neutronic feedbacks which are more specifically involved in the accident consequence evaluation. Furthermore, sodium natural convection build-up has been proved experimentally, thus improving the knowledge on its essential influence on all loss of electric supply type accidents.

- 387 (CONF-761001--P1, pp 76-83) OPERATING EXPERIENCE WITH THE PHENIX NUCLEAR POWER STATION FROM THE POINT OF VIEW OF SAFETY. Goddet, J. (Phenix Plant, Bagnols-sur-Ceze, France). 1976.

From International meeting on fast reactor safety and related physics; Chicago, IL, USA (5 Oct 1976).

Three years after the PHENIX first criticality, and after more than 3 billion kWh production, it is useful to present operating experience results regarding safety and protection. The main result concerns the sodium circuits radioactivity. It shows that where there is a risk of sodium leak or sodium-water reaction, there is no radioactivity. Radioactive and sodium risks are then separately examined. Waste in solid, liquid or gaseous form are specially described. Last is reported the behavior of some reactor components, the reliability of which has a direct influence on safety analysis.

- 388 (CONF-761001--P1, pp 84-98) SAFETY DESIGN OF SNR-300. Traube, K. (Interatom, Bensberg, France). 1976.

From International meeting on fast reactor safety and related physics; Chicago, IL, USA (5 Oct 1976).

The joint German-Belgian-Dutch loop-type 300 MW(e) LMFBR prototype is being constructed at Kalkar on the lower Rhine in Germany. Among the many arguments put forward in defense of SNR-

300, that of acquiring licensing experience has proven to be of major importance to the international breeder scene. The severity of the licensing procedures and of the safety standards imposed are unique in several respects, including timing: generally growing scepticism towards nuclear power increased severity of the licensing practice; organizational features: the procedure and criteria developed for commercial light water reactors have been applied without exemptions. This relates to the commercial-type contract under which SNR-300 is being built for private utilities by a private company; and German nuclear safety standards, known worldwide to be most stringent. The following three important areas are discussed in which SNR-300 decidedly deviates from its forerunners: protection against the hypothetical core disruptive accident (HCDA), protection against external events, and provisions for in-service inspection.

- 389 (CONF-761001--P1, pp 99-111) SAFETY-RELATED DESIGN OF MONJU. Kawashima, K.; Suzuki, Y. (Power Reactor and Nuclear Fuel Development Corp., Tokyo). 1976.

From International meeting on fast reactor safety and related physics; Chicago, IL, USA (5 Oct 1976).

MONJU is a prototype reactor of 300 MWe. Construction of MONJU is scheduled to start in 1978, and it is now in the stage of preparing for license applications. Some of the safety design features of MONJU are: elevated main coolant pipes, guard vessels for reactor vessel, IHX's and pumps, three decay heat removal systems branched from IHX's, two independent safety rods, and cylindrical steel shell container. These designs are based on the safety design guidelines specified by PNC (Power Reactor and Nuclear Fuel Development Corp.). The guideline includes four design accident categories and four earthquake conditions. Core disruptive accident is chosen as the "hypothetical accident" for siting evaluation. In this paper, safety design guidelines and safety design features of MONJU are described.

- 390 (CONF-761001--P1, pp 112-128) SAFETY-RELATED DESIGN CONSIDERATIONS FOR THE CLINCH RIVER BREEDER REACTOR PLANT. Slember, R.J. (Westinghouse Electric Corp., Oak Ridge, TN). 1976.

From International meeting on fast reactor safety and related physics; Chicago, IL, USA (5 Oct 1976).

In this paper the engineered safety features and margins which have been incorporated into the design of the plant are described. The features emphasized are those to prevent accidents which could lead to core disruption, and to accommodate certain design requirements such as the site suitability source term. Also, described are the specific design margins and features which have the capability to mitigate the consequences of accidents beyond those included in the plant design basis, to provide additional assurance that the health and safety of the public are adequately protected.

- 391 (CONF-761001--P1, pp 164-179) MAIN SAFETY FEATURES OF THE SUPER-PHENIX PROJECT. Robert, E. (EDF/NERSA, Lyon); Lucet, G.; Chalot, A.; Leduc, J. 1976.

From International meeting on fast reactor safety and related physics; Chicago, IL, USA (5 Oct 1976).

The construction of the CREYS-MALVILLE Fast Neutron Breeder Reactor (SUPER-PHENIX) started

in 1976 and industrial operation is scheduled for 1982. From the standpoint of safety the Plant presents some interesting features. For although the Plant repeats logically the same major options laid down for PHENIX, the international nature of the project, the size of the reactor (3000 MW thermal power), the new French licensing procedure to which it was subjected, have led the designers to provide a coherent aggregate of measures and/or devices aimed at ensuring the maximum intrinsic safety of the facilities. The purpose of this report is to describe and stress some of these features.

- 392 (CONF-761001--P1, pp 180-192) SEISMIC ANALYSIS FOR THE SUPER-PHENIX REACTOR. Lefevre, J.C. (CIRNA-PROJET SUPER-PHENIX, Gif-sur-Yvette, France); Livolant, M.; Lucet, G. 1976.

From International meeting on fast reactor safety and related physics; Chicago, IL, USA (5 Oct 1976).

The seismic analysis performed for SUPER-PHENIX is presented in this paper. The analysis consists essentially of: selecting reference ground motions based on the seismic risks at the site; establishing general earthquake safety criteria; studying the response of buildings, systems and components, using the most appropriate methods; and establishing design and acceptance criteria in order to verify the validity of the conception and the reliability of the equipment.

- 393 (CONF-761001--P1, pp 193-208) SAFETY ANALYSIS ASPECTS OF A 2000 MWE LMFR CORE. Struwe, D. (Kernforschungszentrum, Karlsruhe, Ger.); Huebel, H.; Maschek, W.; Heusener, G.; Kieflhaber, E.; Kleefeldt, K. 1976.

From International meeting on fast reactor safety and related physics; Chicago, IL, USA (5 Oct 1976).

To identify areas of constraint possibly limiting the maximum allowable power of single plants safety analysis has been carried out for a 2000 MWe reactor core. Design characteristics of the SNR-2000 reactor are presented. Core disruptive accident analysis has been performed for transient overpower and loss of flow accidents. No basic difficulties have been found, in demonstrating that TOP cases are likely to lead to relatively mild excursions. Reference case evaluations of LOF accidents also showed no energetic power bursts. Due to uncertainties with regard to fuel and clad movement a parametric investigation of LOF initiated disassembly phases has been found to be necessary. Results demonstrated, that it is essential to limit the possibility of high positive reactivity ramp generation as long as mechanical restraints or thermal inertia of fuel are effective. Modifications of conventionally designed reactor cores are discussed. Despite the fact that uncertainties have been identified the study strongly supports that in principal conventionally designed large liquid metal fast breeder reactors may withstand consequences of core disruptive accidents.

- 394 (CONF-761001--P1, pp 209-223) SAFETY RELATED DESIGN CONSIDERATIONS FOR LARGE FAST BREEDER PLANTS. Griffith, J.D. (Energy Research and Development Administration, Washington, DC); Graham, J.; Greebler, P.; Lancet, R.T. 1976.

From International meeting on fast reactor safety and related physics; Chicago, IL, USA (5 Oct 1976).

The safety and licensing philosophy for

large U.S. fast breeder plants is presented and the implementation of the safety approach in design is discussed. Highlighted in addition to the influence of the U.S. licensing process is the evolving use of risk analysis to provide a needed framework for systematically securing and organizing the information needed to make safety-related design decisions. The supporting safety development program is also discussed.

395 (CONF-761001--P1, pp 232-245)

CONSIDERATIONS ON A PAHR TEST FACILITY.

Boenisch, G.; Groetzbach, G.; Heinzel, V.; Kleeefeld, K.; Kuechle, M.; Mueller, R.A.; Roysl, P.; Schramm, K.; Smidt, D.; Werle, H. (Kernforschungszentrum, Karlsruhe, Ger.). 1976.

From International meeting on fast reactor safety and related physics; Chicago, IL, USA (5 Oct 1976).

On the basis of a hypothetical core disruptive accident (HCDA) analysis the phenomena of the post accident phase are first identified which require experimental investigations and can only be studied in pile. Then the experimental requests for both debris bed and molten fuel pool studies are specified and grouped into three categories. For two of the categories the requests can be satisfied with loop experiments in thermal reactors. For the third category a 70 cm diameter test bed is needed and here the proposal is to use a flat core fast reactor with the test bed located below the core heated by axial leakage neutrons. Finally a conceptual design for such a reactor is presented where the test bed is loaded into an ex-vessel device and is removable on a carriage to a hot cell building. Maintenance and safety problems are briefly discussed and alternative solutions are mentioned.

396 (CONF-761001--P1, pp 246-261) THE SAREF PROGRAM. Avery, R. (Argonne National Laboratory, IL); Millunzi, A.C.; Grolmes, M.A.; Rose, D. 1976.

From International meeting on fast reactor safety and related physics; Chicago, IL, USA (5 Oct 1976).

The current proposed SAREF program for acquiring the necessary facilities and performing the in-pile experiments required to resolve the key issues in fast reactor safety are reviewed. The facility acquisition plans involve both modification of existing facilities, TREAT and EBR-II, and the acquisition of a major new facility, the Safety Test Facility (STF). The proposed characteristics of the facilities are discussed, as are the considerations that led to the decisions made on facility selection.

397 (CONF-761001--P1, pp 262-269) SAFETY TEST FACILITIES. NEEDS AND CONCEPTS. A FRENCH EVALUATION. Tretjakoff, O.; Bailly, J. (Commissariat a l'Energie Atomique, Saclay, France). 1976.

From International meeting on fast reactor safety and related physics; Chicago, IL, USA (5 Oct 1976).

The fuel behavior of LMFBRs in the event of an accident has been tested in-pile in the SCARABEE program. These tests will be carried on in the framework of an international cooperation on irradiated fuels: this is the purpose of the CABRI and SCARABEE N programs. All those studies should enable to assess safety margins between accident conditions and the technical specifications of the reactor. The purpose of this paper is to explain how a logical set of simple observations has led us

to the present state of the Cadarache in-pile experimental safety program and how it may help us to find our way in a dense forest of both technical and psychological difficulties.

398 (CONF-761001--P2, pp 512-520) EXTRAPOLATION OF ZPR SODIUM VOID MEASUREMENTS TO THE POWER REACTOR. Beck, C.L.; Collins, P.J.; Lineberry, M.J.; Grasseschi, G.L. (Argonne National Lab., Idaho Falls, ID). 1976.

From International meeting on fast reactor safety and related physics; Chicago, IL, USA (5 Oct 1976).

Sodium-voiding measurements of ZPPR assemblies 2 and 6 are analyzed with ENDF/B Version IV data. Computations include directional diffusion coefficients to account for streaming effects resulting from the plate structure of the critical assembly. Bias factors for extrapolating critical assembly data to the CRBR design are derived from the results of this analysis.

399 (CONF-761001--P2, pp 555-564) SAFETY ASPECTS IN NUCLEAR CORE DESIGN OF LMFBRs. Wehmann, U. (INTERATOM, Bensberg, Ger.). 1976.

From International meeting on fast reactor safety and related physics; Chicago, IL, USA (5 Oct 1976).

Nuclear investigations were performed in view of an improvement of the safety characteristics of SNR 2. The Doppler effect, the sodium void effect and burnup behaviour of cores with a heterogeneous arrangement of fuel and blanket elements together with the effect of moderation of both element types were investigated. Numerical results of parametric studies and of detailed calculations on some selected systems are presented.

400 (CONF-761001--P2, pp 565-574) LOW SODIUM VOID COEFFICIENT LMFBR CORES. Sehgal, B.R.; Lin, C.; Naser, J.; Loewenstein, W.B. (Electric Power Research Inst., Palo Alto, CA). 1976.

From International meeting on fast reactor safety and related physics; Chicago, IL, USA (5 Oct 1976).

A major safety concern in the design of commercial-sized LMFBR's has been the addition of positive reactivity with coolant voiding. Two different approaches to alleviate this problem are discussed. The first is a core design using modular assemblies with $\text{PuO}_2\text{-UO}_2$ fuel. Neutronic and fuel cycle calculations show that the positive coolant voiding Δk may be decreased substantially without incurring significant penalties in the fissile doubling time or the Doppler coefficient. This design does require a larger initial fissile inventory. The second approach is to use thorium-based fuels in uniform cores. Neutronic and fuel cycle analyses show that thorium metal alloys may be attractive candidates for LMFBR fuels. They appear to provide higher breeding gains, lower positive coolant void reactivity changes, higher negative Doppler coefficients, slightly lower fissile inventories and longer fuel cycle lengths than the reference $\text{PuO}_2\text{-UO}_2$ fuel. The $\text{PuO}_2\text{-ThO}_2$ fuel also shows favorable safety parameters compared to the reference core.

401 (CONF-761001--P2, pp 575-583) SAFETY AND BREEDING: RELATED ASPECTS OF FAST REACTOR CORES HAVING INTERNAL BLANKETS. Driscoll, M.J.; Ducat, G.A.; Pinnock, R.A.; Aldrich, D.C. (Massachusetts Inst. of Tech., Cambridge).

1976.

From International meeting on fast reactor safety and related physics; Chicago, IL, USA (5 Oct 1976).

The safety characteristics and breeding performance of fast reactor cores having internal axial blankets are examined. Worthwhile improvements and tolerable penalties are identified in both areas based on comparisons with conventional core designs having identical external and fuel assembly dimensions. Internally-blanketed cores have smaller sodium void reactivity contributions and, if properly designed, higher breeding gains and shorter fissile inventory doubling times than conventional cores. The potential for additional improvements in breeding gain is also identified for internally-blanketed cores which are optimized to exploit the inherently lower neutron fluence and fluence/power/temperature gradients characteristic of these cores.

402 (CONF-761001--P2, pp 584-593)

SIMULATION OF AN HCDA SEQUENCE ON THE ZPPR CRITICAL FACILITY. Kaiser, R.E.; Beck, C.L.; Lineberry, M.J. (Argonne National Lab., Idaho Falls, ID). 1976.

From International meeting on fast reactor safety and related physics; Chicago, IL, USA (5 Oct 1976).

ZPPR Assembly 5 was used to simulate successive stages in a loss-of-flow initiated Hypothetical Core Disruptive Accident: sodium-voiding, clad redistributions, and fuel redistribution. Each stage was subdivided into steps corresponding to the anticipated accident sequence. The reactivity change in each step was measured, and reaction rate and small-sample reactivity distributions were measured in each of the three accident stages. The measurements were adequately predicted using diffusion theory, with some transport and streaming corrections.

403 (CONF-761001--P2, pp 594-601) ANALYSIS OF SIMULATED HCDA EXPERIMENTS IN ZPPR.

Stewart, S.L.; Lee, B.W.; Hitchcock, J.T.; Crick, S.C. (General Electric Co., Sunnyvale, CA). 1976.

From International meeting on fast reactor safety and related physics; Chicago, IL, USA (5 Oct 1976).

An experimental program was run in the ZPPR critical facility in order to evaluate the design methods used to provide the nuclear feedback information for the hypothetical core disassembly accident analysis. A series of "snapshot" views of a progressing accident was mocked up in the reactor and measurements were made of the resulting reactivity. The accident scenario consisted of voiding sodium, followed by slumping 30 percent of the steel, followed by slumping fuel both toward and away from the core center. Analysis of these experiments indicates that corrections for neutron streaming are necessary to properly analyze data from plate critical facilities. However, if measured worths are adjusted to convert them to equivalent pin data, perturbation theory is an adequate tool for predicting the reactivity effect of sodium voiding and steel redistribution. Diffusion theory was found to be inadequate for accurately predicting the reactivity worth of extreme conditions of fuel redistribution.

404 (CONF-761001--P2, pp 605-614) SAFETY PHILOSOPHY IN UPGRADING THE EBR-II PLANT PROTECTION SYSTEM. Sackett, J.I. (Argonne National Lab., Idaho Falls, ID). 1976.

From International meeting on fast reactor safety and related physics; Chicago, IL, USA (5 Oct 1976).

The EBR-II plant protection system (PPS) has been substantially modified, upgrading its performance to more fully comply with modern safety philosophy and criteria. The upgrading effort required that the total reactor system be evaluated for possible faults and that a PPS be designed to accommodate them. The result was deletion of a number of existing trip functions and upgrading of others. Particular attention was given to loss of primary pumping power and reactivity insertion events. The design and performance criteria for the PPS has been more firmly established, understanding of the PPS function has been improved and the reactor has been subjected to fewer spurious trips, improving operational reliability.

405 (CONF-761001--P2, pp 615-624) SAFETY RELATED CONSIDERATIONS FOR OPERATION WITH DEFECTED ELEMENTS IN EBR-II. Fryer, R.M.; Sackett, J.I.; Lambert, J.D.B. (Argonne National Lab., Idaho Falls, ID). 1976.

From International meeting on fast reactor safety and related physics; Chicago, IL, USA (5 Oct 1976).

Traditionally, EBR-II has employed the 'shutdown and remove' philosophy when breached fuel elements are encountered. This mode of operation maintained in-plant inventories of fission products at low levels and allowed certain fission product detection systems to be employed as automatic plant shutdown devices. Information from fuel failure propagation studies and fast reactor operation indicates that shutdown under these conditions is unwarranted. Analytical studies, as well as fast reactor experience, further indicate that failure propagation, if it occurs at all, will not cross adjacent subassembly boundaries. Therefore, the 'shutdown and remove' philosophy can be liberalized to allow the demonstration of safety during a run-beyond-clad-breach mode of operation. This mode of operation is essential to the demonstration of the economics of commercial LMFBR systems.

406 (CONF-761001--P2, pp 625-634) DETECTION OF COOLANT BLOCKAGES: PROBLEMS AND POSSIBILITIES. Greef, C.P.; Clare, A.J.; Board, S.J.; Hall, R.S. (Central Electricity Generating Board, Berkeley, Eng.). 1976.

From International meeting on fast reactor safety and related physics; Chicago, IL, USA (5 Oct 1976).

A semi-empirical model is developed correlating a wide range of experimental data on peak wake temperatures for subassembly blockages; it is predicted that boiling could be produced at a corner blockage of 10 percent flow area in a 325 pin subassembly. An assessment of the possible consequences of local boiling suggests that the margin to propagation may be small, particularly in the presence of fission gas release, leading to a requirement for early detection systems. A continuing theoretical and experimental programme to investigate the temperature noise technique for blockage detection is reported. It is concluded that blockages appreciably smaller than those predicted to produce boiling should be detectable against a background noise level due to subassembly power tilts; considerable statistical certainty would be obtained with a 5 second detection time, giving protection against rapidly developing incidents. The use of wire wrapped fuel pins would raise the detection threshold by a factor approximately 2 to 3 in blockage area.

- 407 (CONF-761001--P2, pp 635-645) DESIGNS FOR IN-REACTOR SODIUM BOILING DETECTION AND GENERATION. Wright, S.A. (Sandia Labs., Albuquerque, NM); Albrecht, R.W.; Artus, S.C.; Crowe, R.D.; Dodd, L.R. 1976.

From International meeting on fast reactor safety and related physics; Chicago, IL, USA (5 Oct 1976).

Design of a detection system and sodium boiling generation devices is presented. It is shown that if the probability of a sodium boiling incident is sufficiently high, then a detection system is economically feasible. It is also shown that safe and reliable sodium boiling generation devices can be operated in EBR-II.

- 408 (CONF-761001--P2, pp 658-664) LMFBR: SUBASSEMBLY FAULT DETECTION AND IDENTIFICATION BY TEMPERATURE NOISE ANALYSIS. Ohlmer, E.; Schwalm, D. (EURATOM, Ispra, Italy). 1976.

From International meeting on fast reactor safety and related physics; Chicago, IL, USA (5 Oct 1976).

The aim of these investigations is to check if it would be possible in principle to detect and to identify a malfunction in a LMFBR-subassembly (e.g. blockages) by analysing the temperature noise measured downstream from the bundle exit. Temperature noise measurements have been performed in different test sections simulating the thermohydraulic conditions downstream from the fuel bundle exit using water as a simulant fluid. As a result it was found by analysing the amplitude distribution of the temperature fluctuations that it is possible to identify the size of different simulated blockages. However, in practice the analyzing techniques developed can be applied successfully only if the scale of turbulence is sufficiently large and if no mixer will destroy the relevant information in the zone between the bundle exit and the temperature fluctuation detector.

- 409 (CONF-761001--P2, pp 665-672) INDICATION OF A COOLANT BLOCKAGE IN A FUEL ELEMENT OF A SODIUM-COOLED REACTOR BY TEMPERATURE FLUCTUATION MEASUREMENTS WITH STEEL-SODIUM THERMOCOUPLES. Krebs, L.; Weinkoetz, G. (Kernforschungszentrum, Karlsruhe, Ger.). 1976.

From International meeting on fast reactor safety and related physics; Chicago, IL, USA (5 Oct 1976).

The knowledge of the coolant temperature fluctuations measured at the outlet of a subassembly is an important indicator for the control and safety of sodium cooled reactors. For this reason measurements were carried out at the fuel element outlet of the KNK I reactor and on an electrically heated 28-rod bundle. This bundle has a 60 degree segment geometry and a blocked section of 68, 5 percent. On both test facilities the root mean square (RMS) and power spectral density (PSD) of temperature signals from intrinsic steel-sodium thermocouples were analyzed. Moreover the influence of a flow mixer was investigated on the 28-rod bundle. The results of these measurements show that the PSD and the RMS analyses seem to be significant sizes to detect flow blockages in reactors, possibly behind flow mixers.

- 410 (CONF-761001--P2, pp 683-695) HYDRAULICALLY SUPPORTED ABSORBER BALLS SHUTDOWN SYSTEM FOR INHERENTLY SAFE LMFBR'S. Specht, E.R.; Paschall, R.K.; Marquette, M.; Jackola, A. (Atoms International, Canoga Park, CA).

1976.

From International meeting on fast reactor safety and related physics; Chicago, IL, USA (5 Oct 1976).

A diverse, inherently-actuated control system would be very valuable for Advanced LMFBR's since its use may preclude the consideration of a "hypothetical core disruptive accident" as a design basis. An Inherent Shutdown System (ISS) which uses a number of subassemblies, each containing a column of hydraulically supported tantalum balls, is being studied. This system appears to be capable of successfully protecting the public (and the reactor) from low-probability high-consequence events, such as a loss-of-flow or transient-over-power incident with failure of the normal control system (or systems) to scram. A number of columns of small (about 1/4 in. OD) tantalum balls are held above the active core region of a reactor by the reactor coolant flow. These columns automatically fall into the core and shut the reactor down if the coolant flow of the reactor is interrupted by a loss-of-flow event. A thermally-actuated valve within each ISS subassembly enables this system to shut down the reactor during a transient-over-power event. This control system is extremely diverse since it can operate in a severely distorted core and is independent of top shield rotation. Also, it is basically very simple and should be extremely reliable after it is developed.

- 411 (CONF-761001--P2, pp 709-718) SAFETY EVALUATION OF THE MONJU STEAM GENERATOR. Hori, M.; Kawashima, K.; Sato, M.; Saito, T.; Kanegae, N.; Hiroi, H. (Power Reactor and Nuclear Fuel Development Corp., Tokyo). 1976.

From International meeting on fast reactor safety and related physics; Chicago, IL, USA (5 Oct 1976).

For the design and safety evaluation of MONJU steam generator, the safety design guides are determined and the models and input data for the sodium-water reaction analysis are specified. These guides and specification are being updated and verified with the progress of the design, analysis and tests. Safety evaluation at the current stage of MONJU design shows that the steam generator and the secondary circuit components could withstand, with sufficient margin, the pressure effect of the maximum conceivable leak.

- 412 (CONF-761001--P2, pp 721-727) RELIABILITY MODELS FOR PLANT PROTECTION SYSTEMS. Hockenbury, R.W.; Yeater, M.L. (Rensselaer Polytechnic Inst., Troy, NY). 1976.

From International meeting on fast reactor safety and related physics; Chicago, IL, USA (5 Oct 1976).

Methods to calculate system reliability and the confidence levels of such calculations are being evaluated and modified on the basis of their usefulness in operating plants, and the CRBR in particular. Model development from this viewpoint includes study of approximate methods and the determination of their accuracy by comparison with benchmark calculations and Monte Carlo simulation. As a part of this approach to operational failure prediction and maintenance scheduling, the role of sensor and channel response in the partial failure regime is considered.

- 413 (CONF-761001--P2, pp 748-756) ACCIDENT TREES: A FRAMEWORK FOR ACCIDENT EVALUATION. Bradfute, J.D.; Gilchrist, A.R.; Mott, J.E. (General Electric Co., Sunnyvale, CA). 1976.

From International meeting on fast reactor safety and related physics; Chicago, IL, USA (5 Oct 1976).

The event tree formalism is used in a data base system for LMFBR safety-related information. The central part of this system is a quantified data base explicitly dependent upon individual event tree branch points. A formalism for including the effects of proposed experiments, test facilities or design options is developed. The output of the system is sets of data which form input for decision analyses. The feasibility of the approach is demonstrated by applying simplified data from previous studies of safety research facility informational needs, costs, and benefits. We conclude that such a system has wide application to organizing, clarifying and forming decision bases for LMFBR safety-related information.

- 414 (CONF-761001--P2, pp 757-764) COMPREHENSIVE METHOD OF COMMON-MODE FAILURE ANALYSIS FOR LMFBR SAFETY SYSTEMS. Unione, A.J.; Ritzman, R.L.; Erdmann, R.C. (Science Applications, Inc., Palo Alto, CA). 1976.

From International meeting on fast reactor safety and related physics; Chicago, IL, USA (5 Oct 1976).

A technique is demonstrated which allows the systematic treatment of common-mode failures of safety system performance. The technique uses log analysis in the form of fault and success trees to qualitatively assess the sources of common-mode failure and quantitatively estimate the contribution to the overall risk of system failure. The analysis is applied to the secondary control rod system of an early sized LMFBR.

- 415 (CONF-761001--P2, pp 787-796) IN-PILE EXPERIMENTS AND TEST FACILITIES PROPOSED FOR FAST REACTOR SAFETY. Grohmes, M.A.; Avery, R.; Goldman, A.J.; Fauske, H.K.; Marchaterre, J.F.; Rose, D.; Wright, A.E. (Argonne National Lab., IL). 1976.

From International meeting on fast reactor safety and related physics; Chicago, IL, USA (5 Oct 1976).

The role of in-pile experiments in support of the resolution of fast breeder reactor safety and licensing issues has been re-examined, with emphasis on key safety issues. Experiment needs have been related to the specific characteristics of these safety issues and to realistic requirements for additional test facility capabilities which can be achieved and utilized within the next ten years. It is found that those safety issues related to the energetics of core disruptive accidents have the largest impact on new facility requirements. However, utilization of existing facilities with modifications can provide for a continuing increase in experiment capability and experiment results on a timely basis. Emphasis has been placed upon maximum utilization of existing facilities and minimum requirements for new facilities. This evaluation has concluded that a new Safety Test Facility, STF, along with major modifications to the EBR II facility, improvement in TREAT capabilities, the existing Sodium Loop Safety Facility and corresponding Support Facilities provide the essential elements of the Safety Research Experiment Facilities (SAREF) required for resolution of key issues.

- 416 (CONF-761001--P2, pp 846-855) FUEL AND CLADDING MOTION SURVEILLANCE. De Volpi, A. (Argonne National Lab., IL). 1976.

From International meeting on fast reactor

safety and related physics; Chicago, IL, USA (5 Oct 1976).

The central role of fuel and clad motion is examined from the viewpoint of diagnostic instrumentation. Direct surveillance of material motion during tests conducted in safety test facilities is necessary to provide various postulated models with realistic chronological data. Other roles for such surveillance are identified. The fast neutron hodoscope at TREAT has demonstrated its ability to satisfy experiment requirements, and some results are highlighted. Improvements and extensions of surveillance are described, and plans to fulfill a multi-facility program for new or modified safety facilities are discussed, with emphasis on the need for adequate sensitivity to material motion in large test sections.

- 417 (CONF-761001--P2, pp 864-873) CODED APERTURE IMAGING METHODS FOR FUEL MOTION MEASUREMENT. Kelly, J.G.; Stalker, K.T. (Sandia Labs., Albuquerque, NM). 1976.

From International meeting on fast reactor safety and related physics; Chicago, IL, USA (5 Oct 1976).

Coded aperture imaging techniques are being applied to fuel motion detection in core disruptive safety experiments in the LMFBR. Its potential for time resolved broad source X-radiography is being investigated, and for the Sandia Annular Core Pulse Reactor (ACPR) a system is being developed to image moving fuel with approximately 1 mm spatial resolution at about 10^4 frames/sec. Thus far in the investigations of these systems a number of feasibility milestones have been reached. (1) A fuel pin shaped object has been imaged with 2 mm resolution using a large area 10 MeV electron bremsstrahlung spectrum and coded source X-radiography. (2) An extended ^{252}Cf fission gamma ray source has been imaged with film through 1.27 cm of steel (simulating reactor containment). (3) The ^{252}Cf extended source has been imaged through 1.27 cm of steel with X-ray image intensifier amplification. (4) Collimation and shielding tests indicate that at ACPR it should be possible to obtain adequate signal to noise at the detector when the fuel is observed through a slot in the core.

- 418 (CONF-761001--P2, pp 492-501) RECENT IMPROVEMENTS IN THE PREDICTION OF REACTIVITY COEFFICIENTS RELEVANT TO LMFBR ACCIDENT ANALYSIS. Fischer, E.A.; Helm, F. (Kernforschungszentrum, Karlsruhe, Ger.). 1976.

From International meeting on fast reactor safety and related physics; Chicago, IL, USA (5 Oct 1976).

The results of measurements of the effective delayed neutron fraction β_{eff} are given for various assemblies built in the fast critical facility SNEAK. They are in good agreement with a recent evaluation of delayed neutron data by Tuttle. β_{eff} values derived from the Tuttle data also give an improved agreement between measurements and calculations for the material worths of fissile isotopes. Further, measurements and calculations of the sodium void effect in assembly 9C of SNEAK are described in detail. While the agreement for oxide compositions using standard SNEAK fuel is satisfactory, the effect of introducing higher Pu-isotopes and of using carbide instead of oxide composition causes calculational difficulties.

- 419 (CONF-761001--P2, pp 728-737)

APPLICABILITY OF THE REACTOR SAFETY STUDY (WASH-1400) TO LMFBR RISK ASSESSMENTS. El-Sheikh, K.A. (General Electric Co., Sunnyvale, CA); Feller, K.G.; Fleischer, L.; Greebler, P.; McDonald, A.; Sultan, P.; Temme, M.I.; Fullwood, R.R. 1976.

From International meeting on fast reactor safety and related physics; Chicago, IL, USA (5 Oct 1976).

The feasibility of applying the WASH-1400 methods and data to LMFBR risk assessment is evaluated using the following approach for a selected LMFBR: (1) Structuring the LMFBR risk assessment problem in a modular form similar to WASH-1400; (2) Comparing the predictive tools applicable to each module; (3) Comparing the dependencies among the various modules. It is concluded that the WASH-1400 applicability is limited due to LWR-LMFBR differences in operating environments and accident phenomena. WASH-1400 and LMFBR specific methods applicable to LMFBR risk assessments are indicated.

- 420 (CONF-761001--P2, pp 369-387) LMFBR ACCIDENT ENERGETICS AND THEIR ROLE IN LICENSING. Speis, T.P. (Nuclear Regulatory Commission, Washington, DC); Denise, R.P.; Starostek, R.W.; Lois, L.; Meyer, J.F.; Theofanous, T.G. 1976.

From International meeting on fast reactor safety and related physics; Chicago, IL, USA (5 Oct 1976).

The role of core disruptive accidents in the licensing of LMFBR's is addressed, in particular as it relates to the Clinch River Breeder Reactor. The evolution of the Nuclear Regulatory Commission's containment design requirements is discussed and the technical basis for its present position reviewed. The initiators considered for energetic core disruption are loss-of-flow (LOF) and transient overpower (TOP) both without scram. In addition to considering the immediate mechanical disassembly potential from these initiators, the potential for recriticality during meltdown phases is also assessed. The loss-of-flow cases are given particular attention because of the apparent potential for significant energetics.

- 421 (CONF-761001--P2, pp 400-410) RESOLUTION OF KEY SAFETY-RELATED ISSUES IN FFTF REGULATORY REVIEW. Simpson, D.E. (Westinghouse Hanford Co., Richland, WA). 1976.

From International meeting on fast reactor safety and related physics; Chicago, IL, USA (5 Oct 1976).

The FFTF is an ERDA facility which does not require licensing, but a technical review by NRC is required by ERDA policy. Safety issues which were not fully resolved in the course of the review for construction authorization have been the subject of continuing review since mid-1973. These issues included HCDA energetics, design fallback provisions for additional safety margins, piping integrity, and natural circulation core cooling.

- 422 (CONF-761001--P2, pp 411-419) DEVELOPMENT OF TECHNICAL SPECIFICATIONS FOR EBR-II: SOME CONSIDERATIONS FOR APPLICATION TO COMMERCIAL LMFBR'S. Sackett, J.I.; Gale, N.L. (Argonne National Lab., IL). 1976.

From International meeting on fast reactor safety and related physics; Chicago, IL, USA (5 Oct 1976).

Considerations made in development of Technical Specifications for EBR-II identified operational-safety concerns unique to LMFBR's and applicable to both major reactor test facilities and prototype commercial plants.

This effort highlighted the fact that to be useful, such documents must be prepared with a clear understanding of purpose and application. The necessary difference in purpose of these documents for different reactor applications is not widely recognized. For commercial reactors, the form and application of these documents has gone through significant evaluation. The Technical Specifications developed for EBR-II define the safe operating envelope while at the same time providing the flexibility to accommodate a wide range of tests relevant to fast reactor safety. This required, in many cases, definition of performance criteria rather than specific operating limits. Much consideration was given to differentiating between items truly relevant to personnel safety and those relevant only to reactor availability.

- 423 (CONF-761001--P2, pp 420-430) DESIGNING FOR SAFETY IN FAST REACTORS IN THE PRESENCE OF UNCERTAINTIES. Cave, L.; Ilberg, D.; Okrent, D. (Univ. of California, Los Angeles). 1976.

From International meeting on fast reactor safety and related physics; Chicago, IL, USA (5 Oct 1976).

Topics discussed include safety requirements for fast reactors, sources of uncertainty in the demonstration of high reliability requirement in reactor systems, and possible means of limiting the risk from pressure-driven core disassembly accidents.

- 424 (CONF-761001--P2, pp 442-451) DECAY HEAT REMOVAL PLAN OF THE SNR-300: A LICENSED CONCEPT. Morgenstern, F.H.; Gyr, W.; Stoetzel, H.; Vossebrecker, H. (INTERATOM, Bensberg, Ger.). 1976.

From International meeting on fast reactor safety and related physics; Chicago, IL, USA (5 Oct 1976).

The report describes how the decay heat removal plan of the SNR-300 has been established in 3 essential licensing steps, thus giving a very significant example for the slow but steady progress in the overall licensing process of the plant. (1) Introduction of an ECCS in addition to the 3 main heat transfer chains as a back-up for rather unlikely and undefined occurrences, 1970; (2) Experimental and computational demonstration of a reliable functioning of the in-vessel natural convection of the fluid flow, 1974; and (3) Proof of fulfilling the general safety and specific reliability criteria for the overall decay heat removal plan; i.e., the 3 main heat transfer chains with specific installations on the steam/water system side and the ECCS, 1976. Some special problem areas, for instance the cavity concept provided for the pipe fracture accident, have still to be licensed, but they do not contribute considerably to the overall risk.

- 425 (CONF-761001--P2, pp 452-459) DESIGN REQUIREMENTS FOR THE SNR-300 CONTAINMENT SYSTEM. Deynhausen, H.; Morgenstern, F.; Scholle, U.; Lange, L.; Waldhoer, G. (INTERATOM, Bensberg, Ger.). 1976.

From International meeting on fast reactor safety and related physics; Chicago, IL, USA (5 Oct 1976).

The essential design data of the SNR-300 containment system were derived from the results of analyses of the Bethe-Tait-Accident (hypothetical core disruption). The thermodynamic loads to be expected after a Bethe-Tait-excursion are carried by the inner containment. The confinement of the activity

released following a Bethe-Tait-excursion is achieved by use of a reventing system in the outer containment. The essential results of the thermodynamic analysis are given as well as the design data of the system. The results of the aerosol-physical analysis are discussed with regard to their importance for the safety of the auxiliary equipment. The radiological considerations following an accident place special requirements upon the containment design. The radiological safety of the equipment is shown, even in the extreme case when active heat sinks are neglected.

- 426 (CONF-761001--P2, pp 463-472) COMPARISON OF NEUTRONICS CALCULATIONS IN A LOSS-OF-FLOW ACCIDENT. Schaefer, R.W. (Argonne National Lab., IL). 1976.

From International meeting on fast reactor safety and related physics; Chicago, IL, USA (5 Oct 1976).

Results of a study of the accuracy of point kinetics reactivity predictions for loss-of-flow transients in a CRBR model are presented. Neutronics calculations were driven by realistic material and temperature histories representative of the thermal-hydraulic feedback which occurs in this type of transient. Reactivity solutions from 3 point kinetics variations and the quasistatic method are compared. One variation is found to be superior to the others for these transients; its prediction at power burst conditions is low by approximately \$0.35. Accurate quasistatic neutronics calculations are found to have small CPU requirements relative to the time required for thermal-hydraulic calculations with SAS.

- 427 (CONF-761001--P2, pp 473-481) ASSESSMENT OF TRANSPORT EFFECTS IN LMFBR SAFETY NEUTRONICS. Cahalan, J.E. (Purdue Univ., Lafayette, IN); Ott, K.O.; Ferguson, D.R. 1976.

From International meeting on fast reactor safety and related physics; Chicago, IL, USA (5 Oct 1976).

A qualitative and quantitative assessment of the significance of neutron transport effects in LMFBR core disruptive accident analysis is presented. Material relocations which might cause important neutron transport behavior are identified. A quantitative measure of the error in the neutron flux is obtained from a consistent numerical comparison of transport and diffusion theory eigenvalue solutions for models of disrupted cores. A numerical technique for the prediction of transport eigenvalues and eigenvectors is formulated and applied. The technique is based on a modified diffusion theory which is fully capable of reproducing transport theory solutions.

- 428 (CONF-761001--P2, pp 482-491) NEUTRONIC COUPLING OF FEEDBACK EFFECTS. Malloy, D.J.; Ott, K.O. (Purdue Univ., Lafayette, IN). 1976.

From International meeting on fast reactor safety and related physics; Chicago, IL, USA (5 Oct 1976).

The currently applied feedback methodology has been extended by explicitly treating the coupling effect which exists between the various feedback components and by improving the description of the temperature dependence of the Doppler feedback. The Doppler and sodium void feedback and coupling coefficients are presented as a first comparison of the improved and the currently applied methods. Further, the energy release which results from hypothetical disassembly accidents is simulated with a special response surface (based upon VENUS-II

results) in the parametric safety evaluation code PARSEC. Additionally, the probability distribution for available work-energy, which results from the statistical uncertainty of the Doppler coefficient, is calculated. The improved feedback methodology yields about a 16 percent higher average value for the work-energy. A substantially larger increase is found on the high-yield end of the spectrum: the probability for work-energy above 500 MJ is increased by about a factor of ten.

- 429 (CONF-761001--P3, pp 885-894) METHOD FOR ASSESSING CORE-WIDE INCOHERENCY EFFECTS ON LMFBR WHOLE-CORE ACCIDENT EVOLUTION. Massey, J.V.; Lois, L.; Speis, T.P.; Theofanous, T.G. (Purdue Univ., Lafayette, IN). 1976.

From International meeting on fast reactor safety and related physics; Chicago, IL, USA (5 Oct 1976).

A technique for the evaluation of the effects of core-wide incoherencies on the CRBRP unprotected Loss-of-Flow accident scenario has been presented. It appears that core-wide incoherencies result in increased core voiding and hence less sodium reactivity inventory, at the inception of LOP=d-TOP conditions. The approach to this condition is also governed by substantially lower ramp rates. Finally the post failure phenomena when treated with the degree of incoherency physically present, yield substantially milder super prompt critical conditions.

- 430 (CONF-761001--P3, pp 1037-1046) BEHAVIOR OF CARBIDE FUEL IN LOCAL AND WHOLE CORE ACCIDENTS. Siegmann, E.R.; Bergeron, R.J.; Nickerson, G.M. (Combustion Engineering, Inc., Windsor, CT). 1976.

From International meeting on fast reactor safety and related physics; Chicago, IL, USA (5 Oct 1976).

This paper evaluated the likelihood of carbide fuel pin failure propagation and describes the behavior of carbide fuel during whole core accident sequences, such as transient overpower (TOP) and transient undercooling (TUC). Applicable methodology is used to assess the possibility that postulated local accidents will result in the propagation of pin failure across a carbide subassembly. Of the three propagation mechanisms considered, local blockages, fuel coolant interaction (FCI), and fission gas release, only FCI is judged to have more than a remote possibility of causing propagation. Comparison is made between oxide and carbide fuel pins during both TOP and TUC. Results indicate that the sequence of events can vary with fuel type. Sodium bonding is found to influence the onset of cladding motion.

- 431 (CONF-761001--P3, pp 877-884) CEC ACTIVITIES IN THE FIELD OF LMFBR SAFETY. Balz, W.; Finzi, S.; Klersy, R. (Joint Research Centre, Ispra, Italy). 1976.

From International meeting on fast reactor safety and related physics; Chicago, IL, USA (5 Oct 1976).

The aim of the ECC is to reach a common LMFBR Safety strategy in Europe. To this end the Commission promotes collaboration between the different fast reactor projects in the Community through working groups and collaborative arrangements and contributes with a research activity executed in its Joint Research Centre Ispra. A short description is given of the activity in the working groups and of the Ispra programme on LMFBR Safety. This programme covers: LMFBR thermohydraulics, fuel coolant interactions, dynamic structure loading

and response, safety related material properties and whole core accident code development.

- 432 (CONF-761001--P3, pp 905-914) ASSESSMENT OF FUEL FAILURE PROPAGATION IN LMFBRs. Fauske, H.K.; Grolmes, M.A.; Chan, S.H. (Argonne National Lab., IL). 1976.
- From International meeting on fast reactor safety and related physics; Chicago, IL, USA (5 Oct 1976).
- The potential for subassembly disruption as well as the consequences thereof have been examined for an oxide-fueled liquid metal cooled fast breeder reactor. Based upon credible initiators, it has not been possible to identify any sequence of events which could result in subassembly disruption prior to detection and shutdown of the reactor. The principal reasons for this conclusion are: (1) local faults have been previously shown to be isolated events and; (2) slow blockage propagation appears non-mechanistic. Furthermore, even if subassembly meltdown is postulated to occur in the absence of scram, it was concluded that significant damage beyond the incident subassembly also appears unlikely. Finally, even if extensive whole-core involvement is postulated, the level of accident energetics is assessed to be insufficient to breach the primary containment. The principal reasons for the "benign" character of the consequences following postulated fuel disruption are attributed to the inherent dispersive nature of the heat generating fuel and the lack of satisfying the necessary requirements for large mass vapor explosions with the oxide-fuel-sodium system. These characteristics can be used in a general way to rule out early mechanical damage to the core and significant propagation beyond the incident subassembly due to radial meltthrough, as well as prompt critical conditions due to sodium voiding and recriticality events.

- 433 (CONF-761001--P3, pp 926-935) COMPUTATIONAL ANALYSIS OF FUEL--SODIUM INTERACTIONS WITH AN IMPROVED METHOD. Jacobs, H. (Kernforschungszentrum, Karlsruhe, Ger.). 1976.
- From International meeting on fast reactor safety and related physics; Chicago, IL, USA (5 Oct 1976).
- A new fuel-sodium interaction model programmed as the MURTI code is presented. Owing to a more rigorous treatment of the heat fluxes within fuel and sodium in connection with a space and time-dependent description of the coolant state, it is more generally applicable than the models used so far. Furthermore in this model the region of interaction may be subdivided which enables a very flexible description of thermal interactions. It is demonstrated that most of the presently used models adequately describe only interactions with strong intermixing of fuel and sodium. In a case with only poor intermixing MURTI predicts early vaporization and the formation of a vaporous layer at the fuel surface while the remaining coolant acts as a heat sink only. Furthermore the MURTI code is applied to study thermal detonations as hypothesized by Board and Hall. It is found that an interaction with pressures far below the level of stable propagation can escalate by itself, if appropriate conditions are encountered.

- 434 (CONF-761001--P3, pp 947-957) EFFECT OF FAILURE INCOHERENCE IN A LMFBR HYPOTHETICAL OVERPOWER ACCIDENT. Royl, P.; Kuczera, B.

(Kernforschungszentrum, Karlsruhe, Ger.). 1976.

From International meeting on fast reactor safety and related physics; Chicago, IL, USA (5 Oct 1976).

Incoherency effects due to the statistical nature of fuel rod failure have been assessed for transient overpower (TOP) accidents with different initiating ramp rates. Characteristic single subassembly feedbacks from sodium voiding, fuel injection, and fuel sweep out after failure were calculated and superimposed incoherently. Effective feedback functions were thus generated for characteristic subassembly groups (channels) and used as tabular reactivity input to corresponding multi-channel whole core TOP simulations using the HOPE computer model. Analyses were performed for the SNR-300 MARK 1A end of life (EOL) core with initiating ramp rates of 0.15, 0.5 and 5 \$/sec. The results are compared with those from a calculation with coherent subassembly behavior in each channel. It is concluded for the mild transient: Irrespective of the assumed axial failure location, negative fuel sweep out reactivity from early failed subassemblies will prevent the accident from reaching a prompt critical stage and lead to a gradual shut down, if the assessed failure incoherencies are applied. For the higher ramp rates (greater than or equal to 0.5 \$/sec) the assessed incoherencies will not always lead to an early shut down, but they can considerably reduce the potential to accumulate high ramp rates in the initiating phase of TOP accidents.

- 435 (CONF-761001--P3, pp 958-968) ANALYSIS OF LMFBR OVERPOWER ACCIDENTS, INCLUDING FISSION GAS EFFECTS IN THE PREDISASSEMBLY AND DISASSEMBLY PHASE. Bogenberger, H.G.; Fischer, E.A.; Royl, P.; Arnecke, G. (Kernforschungszentrum, Karlsruhe, Ger.). 1976.

From International meeting on fast reactor safety and related physics; Chicago, IL, USA (5 Oct 1976).

The analysis of unprotected TOP accidents for an irradiated LMFBR core with the codes HOPE and KADIS was improved in two different ways: First, an existing fission gas behavior model was further developed to include a simulation of transient gas release. This model was used to check, and to improve the analysis of the gas behavior during steady state, and also in the predisassembly and disassembly phase of the accident. The effect of transient gas release before melting, which is predicted for a mild TOP, has been simulated in HOPE by adjusting the corresponding gas release parameters. In KADIS, a new equation of state, including fission gas effects, was introduced. Case studies were carried out for the LOL core of the SNR300. For accidents with different ramp rates, pin failure was assumed to occur in the axial peak node, at the onset of unrestructured fuel melting. These cases all lead to energetic core disassemblies and demonstrate the shutdown potential of the fission gas pressure under rather pessimistic conditions. In addition, the influence of transient gas release below the solidus was studied, in connection with a mechanical failure criterion. With this more realistic criterion, the accident is much milder. Gas release below the solidus did not greatly change the overall accident sequence; especially, it did not lead to more coherent failure of the channels, which would be associated with higher energy release.

- 436 (CONF-761001--P3, pp 979-987) EPIC: A COMPUTER PROGRAM FOR FUEL-COOLANT INTERACTIONS.

Pizzica, P.A.; Abramson, P.B. (Argonne National Lab., IL). 1976.

From International meeting on fast reactor safety and related physics; Chicago, IL, USA (5 Oct 1976).

EPIC models fuel and coolant motions which result from internal fuel pin pressure (from fission gas or fuel vapor) and/or from the generation of sodium vapor pressures in the coolant channel subsequent to pin failure in an LMFBR. The modeling includes the ejection of molten fuel from the pin into a coolant channel with any amount of voiding through a clad rip which may be of any length or may expand with time. One-dimensional Eulerian hydrodynamics is used to model both the motion of fuel and fission gas inside a molten fuel cavity and the mixture of two-phase sodium and fission gas in the channel. Motion of molten fuel particles in the coolant channel is tracked with a particle-in-cell technique.

- 437 (CONF-761001--P3, pp 1027-1036) SAFETY ISSUES FOR ADVANCED-FUELED LMFBRs. Rose, D.; Deltrich, L.W.; Groimes, M.A.; Ferguson, D.R. (Argonne National Lab., IL). 1976.

From International meeting on fast reactor safety and related physics; Chicago, IL, USA (5 Oct 1976).

The safety issues for LMFBRs fueled with the candidate advanced-fuels, particularly for commercial size reactors, are reviewed and comparisons drawn with oxide-fueled fast reactors. The extent to which the definition and resolution of safety issues for advanced-fueled reactors draws on the current level of understanding for oxide-fueled reactors is highlighted. Areas of technology in which work is required and underway to resolve the safety issues are also highlighted.

- 438 (CONF-761001--P3, pp 1057-1066) CENTRAL COMPUTERIZED DATA BASE FOR LIQUID METAL FAST BREEDER REACTOR SAFETY CODES. Alter, H. (Energy Research and Development Administration, Washington, DC); Flanagan, G.F.; Greene, N.M. 1976.

From International meeting on fast reactor safety and related physics; Chicago, IL, USA (5 Oct 1976).

The majority of safety computer codes used in the Liquid Metal Fast Breeder Reactor (LMFBR) safety studies have been developed with funds provided by the Energy Research and Development Administration (ERDA). Currently, the data used by these codes are collected by each user who must transcribe it for use in his study. This procedure, unfortunately, involves redundant effort and many times requires the user to "evaluate" physical property data, even though he has no expertise in this area. The Safety Analysis Computerized Reactor Data (SACRD) effort has been initiated to alleviate many of the difficulties cited above.

- 439 (CONF-761001--P3, pp 1069-1080) INFLUENCE OF FUEL-COOLANT-INTERACTIONS ON LOSS OF FLOW TYPE CORE DISRUPTIVE ACCIDENTS FOR THE SNR=300. Essig, C.; Froehlich, R.; Schmuck, P. (Kernforschungszentrum, Karlsruhe, Ger.). 1976.

From International meeting on fast reactor safety and related physics; Chicago, IL, USA (5 Oct 1976).

The influence of fuel-coolant-interactions (FCIs) on loss of flow type core disruptive accidents has been studied for the fresh and irradiated (end of third cycle) SNR=300 Mark 1A cores. For the fresh core two accident simulations (without and with axial expansion reactivity feedback) have been considered. For

these simulations it has been shown that FCIs must only be considered for the disassembly phase of the accident and these FCIs do not lead to dangerous implosive effects. The highest energy releases are obtained if FCIs are neglected. For the irradiated core the accident has been simulated without axial expansion reactivity feedback. FCIs during the disassembly phase do not lead to dangerous implosive effects. Unfortunately, for an irradiated core, pin failures and FCIs cannot be excluded during the predisassembly phase of the accident. These phenomena are discussed and several reasons are given which lead to the conclusion that these failures and FCIs during the predisassembly phase have rather limited consequences for the irradiated SNR=300 core considered.

- 440 (CONF-761001--P3, pp 1081-1090) UNPROTECTED LOSS-OF-FLOW TRANSIENTS IN LARGE LMFBRs. Tzaros, C.P.; Barthold, W.P.; van Erp, J.B. (Argonne National Lab., IL). 1976.

From International meeting on fast reactor safety and related physics; Chicago, IL, USA (5 Oct 1976).

The dependence of the time to reach sodium boiling in an unprotected loss-of-flow transient in large LMFBRs on sodium density reactivity, radial thermal core expansion, and flow decay characteristics has been investigated. From the results obtained it appears to be possible to avoid sodium boiling completely if the following features, achievable within practical design limits, are incorporated (a) extended flow coastdown, (b) enhanced negative reactivity feedbacks due to radial thermal core expansion, (c) reduced positive reactivity feedbacks due to sodium density changes and the Doppler effect, (d) enhanced coolant flow due to natural circulation.

- 441 (CONF-761001--P3, pp 1091-1100) TREATMENT OF INCOHERENCIES AND UNCERTAINTIES IN LMFBR LOF ACCIDENT ANALYSIS WITH PARSEC. Burns, R.D. III; Ott, K.O. (Purdue Univ., Lafayette, IN). 1976.

From International meeting on fast reactor safety and related physics; Chicago, IL, USA (5 Oct 1976).

As basis for an investigation of the parameter and model uncertainties as well as of inter-subassembly incoherency effects, a computer program, PARSEC (Parametric Safety Evaluation Code) is being developed at Purdue University. The basic features of the first version, PARSEC-1, are described and some typical results are presented. Results of the investigations presented here show the importance of treating incoherency and uncertainty effects in analyzing severe LMFBR accidents. In contrast, the more benign accidents appear to be quite insensitive to incoherency effects. In addition, spectra of accident consequences are calculated by varying impact parameters within their range of uncertainty. This yields more detailed risk assessment information than single best-estimate and worst-case runs.

- 442 (CONF-761001--P3, pp 1101-1110) PIPE RUPTURE STUDIES FOR THE CRBR USING DEMO AND SAS. Hummel, H.H.; Kalimullah. (Argonne National Lab., IL). 1976.

From International meeting on fast reactor safety and related physics; Chicago, IL, USA (5 Oct 1976).

It was found, in agreement with previous calculations, that the hot channel of the DEMO

code model of the CRBR is well into the boiling range for a double-ended primary pipe rupture at the inlet nozzle, and boiling is just about attained for the peak channel. The situation improves rapidly as the break moves away from the inlet nozzle because inertial and static pressures maintain inlet plenum pressure long enough to permit stored pin heat to be removed. The most important hot channel factor in producing boiling conditions is the one applied to pin power, with factors affecting fuel-clad gap conductance and coolant flow contributing important but smaller effects. Calculations of maximum coolant temperatures with DEMO and with SAS using the same power and flow histories are in surprisingly close agreement considering the coarseness of the mesh in the DEMO pin heat transfer calculation.

- 443 (CONF-761001--P3, pp 1111-1118) ANALYSIS OF POSTULATED FFTF PIPE RUPTURES. Markowski, F.J.; McCall, T.B.; Strawbridge, L.E. (Westinghouse Electric Corp., Madison, PA). 1976.

From International meeting on fast reactor safety and related physics; Chicago, IL, USA (5 Oct 1976).

A detailed assessment of the FFTF Primary Heat Transport System (PHTS) piping has led to the conclusion that the integrity of the piping is assured such that there is no realistic potential for a rupture. Nevertheless, consistent with the practice of showing design margins even for hypothetical events, a spectrum of postulated PHTS ruptures has been analyzed. The analyses showed that upstream of the reactor vessel inlet downcomer, rupture areas of any size including a double-ended rupture could be tolerated with no core coolant boiling. At the most limiting location, the reactor inlet nozzle, rupture areas of 75 in.² and 55 in.² could be tolerated for three-loop and two-loop operation, respectively. This paper will present the following: (1) the criterion with which consequences of postulated pipe ruptures are compared; (2) the general transient response of the FFTF to postulated ruptures; and (3) the acceptable rupture sizes for the FFTF primary loop for a variety of conditions.

- 444 (CONF-761001--P3, pp 1121-1133) WORK-ENERGY CHARACTERIZATION FOR CORE-DISRUPTIVE ACCIDENTS. Marchaterre, J. (Argonne National Lab., IL); Marciniak, T.; Bratis, J.; Fauske, H.; Jackson, J. 1976.

From International meeting on fast reactor safety and related physics; Chicago, IL, USA (5 Oct 1976).

The key result sought after in the analysis of core-disruptive accidents (CDAs) in fast reactors, is the potential damage that a given accident can impart to the system. A primary source of damage is the expansion of vapor from materials that have been severely overheated by a prompt-critical excursion. As the high temperature vapors expand, they can do work on the structures that comprise the primary system of the reactor. Thus, the terms "work potential", and "work-energy" are often used to characterize damage potential. Current practice in analyzing damage in fast reactor systems is to develop a pressure-volume relationship for the expanding materials and then explicitly calculate the work done on various structural components in the primary system using a coupled hydrodynamics/structural response code. Although this provides a rather direct analysis of the damage, various techniques have been used to calculate the required pressure volume relationships. Further, it is not always practical to carry

out such detailed analysis, and a variety of damage potential estimates have been, and continue to be used. This has often led to confusion as to what the actual damage potential for a given accident would be and how the various results reported in the literature are related to each other. The objective of this paper is to define the main techniques that have been used, and present a set of consistent calculations that compare the most important of these techniques for a range of reactor sizes and excursion severities.

- 445 (CONF-761001--P3, pp 1152-1161) CRITICAL CONFIGURATIONS AND SECONDARY EXCURSIONS FOR HIGH TEMPERATURE FUEL/STEEL MIXTURES. Pena, J.; Froehlich, R.; Schmuck, P. (Kernforschungszentrum, Karlsruhe, Ger.). 1976.

From International meeting on fast reactor safety and related physics; Chicago, IL, USA (5 Oct 1976).

The amount of fuel necessary for obtaining neutronically critical configurations is studied. Critical spheres of fuel or of fuel/steel mixtures embedded in sodium are considered and the necessary amount of fuel is determined as function of Pu-enrichment, void fraction, and steel content. It is found that rather large fuel masses are necessary, especially for high void fractions (low smeared densities) or relatively high steel content. The calculations have been done by applying transport and diffusion theory by using the 26 group KFK-INR cross section set. Secondary excursions are analysed for high temperature fuel masses by using a two partner model, where one mass is resting on depleted UO₂ and the other mass is falling on top of the first one. High and low density systems are studied. Free fall, fall in sodium, and in addition a rather slow fall are considered. For high density masses large reactivity ramps, high pressure pulses, but very low thermal energy releases are encountered. For low density systems relatively low reactivity ramps, relatively low pressures, but high thermal energy releases are obtained. The calculations have been performed by using the neutronic-hydrodynamics program KADIS and by starting from rather pessimistic assumptions. For the SNR=300 it can be concluded that secondary excursions in the external core retention device can be contained from a thermal and very likely also from a mechanical point of view if reasonable assumptions are made.

- 446 (CONF-761001--P3, pp 1172-1182) ROLE OF WALL HEAT TRANSFER AND OTHER SYSTEM VARIABLES ON FUEL COMPACTION AND RECRITICALITY. Dhir, V.K.; Castle, J.N.; Catton, I.; Kastenbergh, W.E.; Doshi, J.B. (Univ. of California, Los Angeles). 1976.

From International meeting on fast reactor safety and related physics; Chicago, IL, USA (5 Oct 1976).

The assessment of the molten fuel gaining recriticality after a hypothetical core disruptive accident in a fast reactor is an important safety consideration. Recriticality of the disrupted core can be envisioned to occur, if the fuel rearranges itself into a denser configuration either due to gravity slumping of the molten fuel or due to pressure or heat transfer driven compaction of the earlier dispersed fuel. In this paper the role played by wall heat transfer, internal radiation and the bottle pressure on the physical state of the molten fuel pool is discussed. It is suggested that in the absence of a solid crust the heat transfer process from the molten fuel to the surrounding steel will

be very efficient because of melting and buoyancy driven removal of less dense steel through the pool of heavier UO_2 . The internal radiation at the high fuel temperature significantly increase the effective thermal conductivity of the molten fuel and lead to increased heat transfer in situations where a solid crust of UO_2 exists between molten UO_2 and molten steel. IN a boiled-up bottled pool, the pool pressure is shown to increase very rapidly with time and thus necessitate higher fission heating of the fuel to maintain it in a certain boiled up state. Finally, the results of the above discussion are applied to study the recriticality of a fuel pool formed during a hypothetical core disrupted accident in a fast reactor.

- 447 (CONF-761001--P3, pp 1216-1224) LARGE-SCALE DETERMINISTIC COMPUTER CODE SYSTEMS AND LMFBR SAFETY: A PERSPECTIVE. Wider, H.U.; Bohl, W.R.; Dunn, F.E.; Ferguson, D.R. (Argonne National Lab., IL). 1976.

From International meeting on fast reactor safety and related physics; Chicago, IL, USA (5 Oct 1976).

The development and application of large-scale deterministic computer code systems in the LMFBR safety field involves a set of complex and many-faceted issues. This paper discusses a number of these issues. Motivations cited for developing these code systems are the desire to predict more realistic accident sequences and the need to isolate and identify key phenomena which require further experimental and analytical investigation. Code development difficulties which are discussed include those arising from the limited capabilities of current computer systems, the sometimes limited understanding of relevant phenomena and the need to provide some experimental verification of code models. The interaction required among code developers, experimentalists and phenomenological modelers is explored. In addition, the roles that such safety code systems can play in LMFBR design and in the actual licensing process are discussed.

- 448 (CONF-761001--P3, pp 1225-1235) SAS4A LMFBR ACCIDENT ANALYSIS CODE SYSTEM: A PROGRESS REPORT. Ferguson, D.R.; Bohl, W.R.; Bowers, C.H.; Cahalan, J.E.; Dunn, F.E.; Heames, T.J.; Kyser, J.M.; Wang, W.L.; Wider, H.U. (Argonne National Lab., IL). 1976.

From International meeting on fast reactor safety and related physics; Chicago, IL, USA (5 Oct 1976).

The SAS4A LMFBR accident analysis code system, which is currently under development at Argonne National Laboratory as the successor to the SAS3A code system, is discussed. Significant experience gained in the application of SAS3A to the study of hypothetical core disruptive accidents in a variety of LMFBR designs which has motivated the overall approach taken in SAS4A is cited. The structure and organization of SAS4A is presented, followed by a description of the new general code modules and phenomenological modules that are being developed for SAS4A.

- 449 (CONF-761001--P3, pp 1244-1252) MULTI-FIELD HYDRODYNAMIC DISASSEMBLY CALCULATIONS WITH SPACE-TIME KINETICS: FX2/VENUS-III. Weber, D.P.; Ganapol, B.D. (Argonne National Lab., IL). 1976.

From International meeting on fast reactor safety and related physics; Chicago, IL, USA (5 Oct 1976).

The development of computer codes which

analyze the hydrodynamics, neutronics, and thermodynamics of hypothetical LMFBR disassembly starting with the Lagrangian 2-D hydrodynamics code VENUS and extending to the Eulerian hydrodynamics code FX2/VENUS-III RM which includes treatment of multi-field motions as well as space-time kinetics are reviewed. The physical assumptions that form their basis are indicated and the differences in solution technique are illustrated. Primary emphasis is given to the description of the Eulerian code development with indications of the capabilities of implicit differencing, the necessity of tracking generic fuel types, the effect of relative motion, and the role of space-time kinetics. Several examples and comparisons of codes are given for FTR and 1000 MW(e) designs.

- 450 (CONF-761001--P3, pp 1253-1260) CORE DISRUPTIVE ACCIDENT AND RECRITICALITY ANALYSIS WITH FX2-POOL. Abramson, P.B. (Argonne National Lab., IL). 1976.

From International meeting on fast reactor safety and related physics; Chicago, IL, USA (5 Oct 1976).

The current state of development of FX2-POOL, a two-dimensional hydrodynamic, thermodynamic and neutronic scoping model for Hypothetical Core Disruptive Accident analysis is described. Checkout comparisons to VENUS for prompt burst conditions were good. Use of FX2-POOL to examine the importance of fuel to steel heat transfer during a prompt burst indicates that heat transfer plays no important role on that time scale. Scoping studies of material thermohydrodynamics for about 20 to 30 milliseconds following the prompt burst indicate that heat transfer is important on the time scale necessary for the CDA bubble to grow to the size of the original core. Preliminary results are presented for energetics of boiling fuel steel pools which are forced recritical by local surface pressurization.

- 451 (CONF-761001--P3, pp 1269-1279) PROBABILISTIC/DETERMINISTIC PROCEDURE FOR ANALYZING LMFBR CORE DISRUPTIVE ACCIDENTS. Vaurio, J.K.; Mueller, C. (Argonne National Lab., IL). 1976.

From International meeting on fast reactor safety and related physics; Chicago, IL, USA (5 Oct 1976).

A general procedure is presented for obtaining the probability distributions of selected consequences of an LMFBR hypothetical core disruptive accident. The uncertainties of the consequences are considered as a variability of the system and model input parameters used in the accident analysis. Probability distributions are assigned to these input parameters and parameter values are systematically chosen from these distributions. These input are then used in deterministic consequence analyses which are performed by fast-running analogues of the comprehensive mechanistic accident analysis codes. The results of these deterministic consequence analysis are used to generate the coefficients for multivariate polynomials which approximate the consequences in terms of the selected input parameters. These approximating polynomials are then used to generate the probability distributions of the consequences with random sampling being used to obtain the accident parameters from their distributions. The use of the procedure is illustrated by an application to a postulated loss of flow transient with failure to scram in the CRBR.

- 452 (CONF-761001--P3, pp 1285-1294)

GENERALIZED EULERIAN METHOD IN REACTOR CONTAINMENT ANALYSIS AND ITS COMPARISON WITH OTHER NUMERICAL METHODS. Chu, H.Y.; Wang, C.Y.; Gvildys, J.; Chang, Y.W. (Argonne National Lab., IL). 1976.

From International meeting on fast reactor safety and related physics; Chicago, IL, USA (5 Oct 1976).

The implicit continuous-fluid Eulerian method has been extended to include the treatment of the irregular cell which contains a moving wall boundary and the treatment of the special cell which has an out-flow boundary condition where the opening of the out-flow boundary is smaller than the side of the Eulerian cell. The extended method has been applied to a number of problems of interest in fast reactor containment analysis. Numerical results of sample calculations are presented. Comparisons with other numerical solutions and experimental measurements are also given.

- 453 (CONF-761001--P3, pp 1295-1303) EVALUATION OF EXPLICIT FINITE-DIFFERENCE TECHNIQUES FOR LMFBR SAFETY ANALYSIS. Bernstein, D.; Golden, R.D.; Gross, M.B.; Hofmann, R. (Science Applications, Inc., Oakland, CA). 1976.

From International meeting on fast reactor safety and related physics; Chicago, IL, USA (5 Oct 1976).

In the past few years, the use of explicit finite-difference (EFD) and finite-element computer programs for reactor safety calculations has steadily increased. One of the major areas of application has been for the analysis of hypothetical core disruptive accidents in liquid metal fast breeder reactors. Most of these EFD codes were derived to varying degrees from the same roots, but the codes are large and have progressed rapidly, so there may be substantial differences among them in spite of a common ancestry. When this fact is coupled with the complexity of HCDA calculations, it is not possible to assure that independent calculations of an HCDA will produce substantially the same results. Given the extreme importance of nuclear safety, it is essential to be sure that HCDA analyses are correct, and additional code validation is therefore desirable. A comparative evaluation of HCDA computational techniques is being performed under an ERDA-sponsored program called APRICOT (Analysis of Primary Containment Transients). The philosophy, calculations, and preliminary results from this program are described in this paper.

- 454 (CONF-761001--P3, pp 1314-1323) SIMULATION OF HYPOTHETICAL CORE DISRUPTIVE ACCIDENTS IN VESSEL MODELS. Egleme, M. (Belgonucleaire, Brussels); Brahy, N.; Fabry, J.P.; Lamotte, H.; Stievenart, M.; Holtbecker, H.; Actis-Dato, P. 1976.

From International meeting on fast reactor safety and related physics; Chicago, IL, USA (5 Oct 1976).

Explosion experiments have been performed with a pyrotechnic compound in overstrong vessels, without internals or with a perforated plate, and in yielding vessels. Thanks to these tests the charge characteristics have been determined, the pressure-flow characteristics of a perforated plate attached to the roof have been established and the validity of the SURBOUM-II code has been checked for various geometries of yielding vessels.

- 455 (CONF-761001--P3, pp 1324-1333) COMPARISON OF ANL CONTAINMENT CODES WITH SNR-300 SIMULATION EXPERIMENTS. Marchertas, A.H.;

Wang, C.Y.; Fistedis, S.H. (Argonne National Lab., IL). 1976.

From International meeting on fast reactor safety and related physics; Chicago, IL, USA (5 Oct 1976).

A comparison of REXCO and ICECO code predictions is made with data obtained from experiments of LMFBR excursion models. The comparisons are based on published results of tests conducted for the safety analysis of the SNR-300 fast breeder. The test configurations consist of a centrally located spherical source immersed in a pool of water which is encased in a cylindrical container. The cylindrical walls of the container are prestressed by hold-down bolts which span the two rigid ends. The space above the surface of the water within the container is occupied by air. Although certain aspects of the tests could not be simulated by the analytical models exactly, the comparison of results shows quite close agreement. The fact that the REXCO and ICECO codes involve different analytical formulations, their own close correspondence of results lends added credence to the value of analytical predictions.

- 456 (CONF-761001--P3, pp 1334-1343) SAFETY ANALYSIS OF THE PRIMARY HEAT TRANSPORT SYSTEMS OF LMFBRs. A-Moneim, M.T.; Chang, Y.W. (Argonne National Lab., IL). 1976.

From International meeting on fast reactor safety and related physics; Chicago, IL, USA (5 Oct 1976).

A two-dimensional Implicit Continuous-Fluid Eulerian Code designed for the safety analysis of the primary heat transport systems of LMFBRs is described. The code includes a separate model for all the components of the system, except the primary pump. These models are coupled together hydrodynamically to form a loop that can be subjected to two simultaneous pressure pulses. The structural response of the external walls of all the pipes and components is coupled with the hydrodynamics so that the fluid transients and the structural response of the system can be analyzed. Only the elbow walls are limited to be rigid.

- 457 (CONF-761001--P3, pp 1344-1353) SOME ASPECTS OF THE STRUCTURAL RESPONSE OF POOL-TYPE LMFBR SYSTEMS TO HCDA AND SEISMIC EVENTS. Marciniak, T.J.; Seidensticker, R.W.; Kulak, R.F.; Kennedy, J.M.; Fistedis, S.H. (Argonne National Lab., IL). 1976.

From International meeting on fast reactor safety and related physics; Chicago, IL, USA (5 Oct 1976).

Of the geometries possible in configuring an LMFBR system, there are essentially two which have been given the greatest amount of study throughout the world. These are the loop system and the pool system. This study addresses the safety related questions of the pool-type system to response energetic HCDAs and seismic events. Using representative reactor configurations of commercial size LMFBRs, it is shown that it is possible to design pool-type systems to accommodate HCDA and seismic loads despite the fact that the primary tank is a large diameter, thin walled structure and that the shield deck could be vulnerable to such loads.

- 458 (CONF-761001--P3, pp 1354-1362) MITIGATING EFFECT OF COOLANT CAVITATION IN THE RESPONSE OF LMFBR CONTAINMENT TO A WHOLE-CORE ACCIDENT. Jones, A.V. (Joint Research Centre, Ispra, Italy). 1976.

From International meeting on fast reactor safety and related physics; Chicago, IL, USA (5 Oct 1976).

Oct 1976).

The deformation and damage to LMFBR containment consequent upon a whole-core accident is the result of the transmission of energy in the form of pressure waves from core region to containment structures by the coolant. If a mechanism can be invoked which dissipates some fraction of the energy of these pressure waves within the coolant itself the cost and other benefits in designing and constructing a containment for a given whole-core accident are obvious. This paper presents evidence that cavitation in the coolant is such a mechanism, recounts the theoretical developments made in modelling coolant behaviour and estimates the effect of cavitation in reducing loads to containment both in model experiments using water and in the real reactor. Plans for further theoretical and experimental investigations are also discussed.

- 459 (CONF-761001--P3, pp 1365-1375) FUEL-CLAD STRESS--STRAIN STATE AT THE BEGINNING OF A TRANSIENT. Sun, Y.H.; Ukrent, D. (Univ. of California, Los Angeles). 1976.

From International meeting on fast reactor safety and related physics; Chicago, IL, USA (5 Oct 1976).

This paper deals with KRASS (Kwick-Running Analysis for Stress and Strain), a simplified, fast-running, axis-symmetric computer code intended to predict fuel element conditions after long term steady state operation in an LMFBR. KRASS assumes restructuring has already occurred and divides the fuel pellet into two zones, an inner, highly plastic, hot region and an outer, cooler region which, together with the cladding, can undergo creep. The code allows for fission gas pressure, fuel swelling, and hot pressing with simple models, and it includes alternative correlations for stainless steel swelling. Fuel cracking is not included. The output of KRASS includes the radial and axial distribution of stress and strain on fuel and clad as a function of burnup. KRASS takes eleven hundred machine unit seconds on the UCLA IBM-360-91 to calculate fuel element behavior to 15 percent burnup with seven axial sections in the fuel column. The results indicate that the axial variation of fuel-clad mechanical interaction depends strongly on the fluence-to-burnup ratio, as well as the applicable stainless steel swelling correlation, and that transient fuel element behavior studies of pre-irradiated fuel need to allow for such differences. The position of maximum fuel-clad mechanical interaction frequently is found to occur in the lower third of the fuel element during steady state irradiation; at high fluence-to-burnup ratios the central axial nodes generally exhibit gap-reopening tendencies.

- 460 (CONF-761001--P3, pp 1376-1384) PREDICTION OF HIGH STRAIN-RATE DEFORMATION OF LMFBR CLADDING DURING REACTOR TRANSIENTS. Chow, L.S.H.; Shack, W.J. (Argonne National Lab., IL). 1976.

From International meeting on fast reactor safety and related physics; Chicago, IL, USA (5 Oct 1976).

A time-independent plasticity model is proposed. The model is incorporated into the LIFE code to predict the high strain-rate cladding deformation. A benchmark problem was solved using the modified code. The results are in good agreement with an analytical solution and a finite-element solution for the same problem. The modified code is also used to predict cladding deformation in simulated over-power transient experiments. In this case,

adequate agreement can only be obtained using a strain-rate-dependent yield stress.

- 461 (CONF-761001--P3, pp 1385-1392) RESPONSE OF SINGLE SUBASSEMBLY HEXCAN WRAPPERS TO PRESSURE LOADS. Ash, J.E. (Argonne National Lab., IL); Marciniak, T.J.; Romander, C.M.; Cagliostro, D.J. 1976.

From International meeting on fast reactor safety and related physics; Chicago, IL, USA (5 Oct 1976).

The Liquid Metal Fast Breeder Reactor (LMFBR) core structure consists of a matrix of hexagonal subassembly ducts. Evaluation of the safety aspects of the core structure requires that reliable computational procedures be available to predict the deformation response of the subassembly configuration to postulated local energy releases. Finite-element computer codes have been developed to calculate deflections and strains of a hexcan subassembly wrapper subjected to internal and external dynamic pressure loadings. A series of experiments on simple out-of-pile hexcan sections has been performed to validate the computer codes. Particular attention has been directed towards the determination of the influence of the mechanical properties of the steel upon the hexcan response.

- 462 (CONF-761001--P3, pp 1399-1408) ANALYTIC STUDIES OF SUBASSEMBLY FAILURE PROPAGATION. Belytschko, T. (Univ. of Illinois, Chicago); Kennedy, J.M. 1976.

From International meeting on fast reactor safety and related physics; Chicago, IL, USA (5 Oct 1976).

The prediction of subassembly response to energy sources and failure propagation is a three dimensional problem involving a fluid coupled with a structure. Because of the large expense involved in solving such three dimensional problems, a simplified, quasi-three dimensional treatment, in which the axial flow within the subassembly is treated by a one dimensional model coupled to a two dimensional model which represents the behavior in the cross section of the energy source has been developed in STRAW. For purposes of studying the validity and limitations of this model, a more complex computational approach which retains more of the three dimensional character was used and compared to STRAW predictions. It is shown that the results obtained by the quasi-three dimensional model are on the whole satisfactory; its predictions differ from the three dimensional solutions by about 10 percent or less in most cases.

- 463 (CONF-761001--P3, pp 1409-1418) STRESS INTENSITY FACTORS FOR CORNER-CRACKED SUBASSEMBLY DUCTS. Petroski, H.J. (Argonne National Lab., IL); Achenbach, J.D. 1976.

From International meeting on fast reactor safety and related physics; Chicago, IL, USA (5 Oct 1976).

Plane strain stress intensity factors for cracks along the inside corners of internally pressurized hexagonal subassembly ducts have been calculated by various methods and compared.

- 464 (CONF-761001--P3, pp 1419-1426) EXPLOSION TESTS ON LMFBR-CORE MODELS; AN EVALUATION FOR REACTOR SAFETY. Will, H. (Institut fuer Reaktorentwicklung Gesellschaft fuer Kernforschung mbH, Karlsruhe, Ger.). 1976.

From International meeting on fast reactor safety and related physics; Chicago, IL, USA (5 Oct 1976).

Oct 1976).

With regard to a certain, serious, unprobable reactor fault, explosion tests on core models for the SNR 300 are being carried out. The aim of the experiments is, to prove, that the deformation resulting from such a fault does not influence the reactor to be shut down. Until now, the six experiments that have been done show, that even in the case of conservative essentials with respect to the pressure loading of the postulated local fault, no power excursion can be expected. The deformations remain in the row of subassemblies next to the incident wrapper. The main experimental results are presented.

- 465 (CONF-761001--P3, pp 1427-1435) FINITE ELEMENT SOLUTION OF TRANSIENT FLUID-STRUCTURE PROBLEMS IN LAGRANGIAN COORDINATES. Donea, J.; Fasoli-Stella, P.; Giuliani, S. (EURATOM, Ispra, Italy). 1976.

From International meeting on fast reactor safety and related physics; Chicago, IL, USA (5 Oct 1976).

A finite element method of analysis is described for the transient dynamic response of fluid-structure configurations. Hydrodynamic elements with linear and quadratic local velocity fields are considered. The structural elements are treated by a corotational formulation which accounts for large-displacement effects and nonlinear material behaviour. A lumped-explicit scheme is used for time integration of the equations of motion. Representative results are given for a Lagrangian frame of reference.

- 466 (CONF-761001--P4, pp 1587-1595) MODEL FOR PREDICTING TEMPERATURE FLUCTUATION CHARACTERISTICS BEYOND THE EXIT OF LMFBR SUBASSEMBLIES WITH FAULTS. Eifler, I.W.; Nijssing, I.R. (Commission of the European Communities, Ispra, Italy). 1976.

From International meeting on fast reactor safety and related physics; Chicago, IL, USA (5 Oct 1976).

A model based on the theory of turbulent diffusion and including the effect of the coolant conductivity is described, which relates the main characteristics of the fluctuating temperature field in the plenum to those of the time average temperature profile at the bundle outlet, which is distorted as a consequence of a flow blockage. With the aim to show the potential of an early failure detection method based on temperature fluctuation measurements in the coolant plenum, the model has been applied to a number of practical situations. The applications concern the signal optimisation, "background" temperature fluctuations and signals caused by typical cooling anomalies.

- 467 (CONF-761001--P4, pp 2077-2086) EXPERIMENTAL INVESTIGATIONS ON THE COMPATIBILITY OF A SNR-TYPE CORIUM WITH GRAPHITE. Peehs, M. (Kraftwerk Union AG, Erlangen, Ger.); Friedrich, H.J.; Heuvel, H.J. 1976.

From International meeting on fast reactor safety and related physics; Chicago, IL, USA (5 Oct 1976).

Tests on the compatibility between UO_2 -pellets, UO_2 /stainless steel mixtures (70 w/o UO_2 , 30 w/o SS) and graphite were carried out at 1600, 2000, and 2400°C. The test duration was 0.5 h. UO_2 -pellets are only completely converted to carbides at 2400°C, when liquid U-carbide phases occur. In the presence of SS the liquefaction temperature was lowered to 2000°C. The conversion rates in the case of UO_2 -

liquefaction as indicated by the corresponding CO-generation are high. The interactions are completed within a quarter of an hour. Apart from the release of O in the form of CO, the pick-up of C and the evaporation losses at the highest temperatures no significant changes in the chemical composition could be found. Post melting analyses by microsections, microprobe and X-ray investigations detected $UFeC_2$ -phases and carbides from the M_7C_3 -type together with austenite. A thermodynamic evaluation revealed that the C-activity of the melts after UO_2 -liquefaction is nearly 1.

- 468 (CONF-761001--P4, pp 1605-1614) LMFBR PROMPT BURST EXCURSION (PBE) EXPERIMENTS IN THE ANNULAR CORE PULSE REACTOR (ACPR). Schmidt, T.R. (Sandia Labs., Albuquerque, NM). 1976.

From International meeting on fast reactor safety and related physics; Chicago, IL, USA (5 Oct 1976).

A series of in-pile experiments has been initiated to provide information on the energetics of LMFBR cores subjected to hypothetical superprompt-critical excursions. In these experiments, a single fuel pin in an instrumented piston-loaded autoclave is pulse heated into partial vaporization by the ACPR with initial reactor periods as low as 1.4 msec. Nine experiments have been performed with fresh unstructured UO_2 fuel pins. The first three were conducted without sodium coolant. In the dry experiments, energy depositions up to 3200 J/gm were obtained resulting in low pressure histories, negligible energy conversion ratios, and large upward axial fuel motions within the cladding. With sodium, the energy depositions also ranged up to 3200 J/gm resulting in large sharp pressure events (60 MPa), very low energy conversion ratios (2.1×10^{-4}), and within-cladding axial fuel motions comparable to the dry capsule experiments.

- 469 (CONF-761001--P4, pp 1615-1624) LOSS-OF-COOLING EXPERIMENTS WITH SINGLE FUEL PINS. Kwast, H. (Netherlands Energy Research Foundation ECN, Petten). 1976.

From International meeting on fast reactor safety and related physics; Chicago, IL, USA (5 Oct 1976).

Some results are presented of three series of loss-of-cooling experiments, namely with (1) fresh fuel pins, (2) pre-pressurized fresh fuel pins, and (3) pre-irradiated fuel pins. These pins were tested in sodium filled capsules. Furthermore the Loss of Cooling (LOC) time and the type of the shroud tube (closed or with slots), were used as parameter. The results indicate that considerable clad melting can occur without leading to fuel failure. In cases fuel failure occurred this happened very gently. Preliminary results indicate that in case of equal energy input the extent of pin failure decreases by using a slotted shroud tube and pre-irradiated fuel pins. Considerable gas blanketing can occur if fuel pins with high internal pressure are subjected to a Loss of Cooling condition. The occurrence of a pressure pulse in case of an experiment with a low pressure, low burn-up fuel pin is most likely attributable to an FSI. So far no significant deformations of the capsule construction have been observed, so it can be concluded that the fuel failures were of a benign nature.

- 470 (CONF-761001--P4, pp 1625-1646) RESULTS OF RECENT TOP AND LOF EXPERIMENTS IN TREAT. Rothman, A.B.; Dickerman, C.E.; Lo, R.K.; Palm, R.G.; Semenza, L.A.; Simms, R.; Wider, H.U. (Argonne National Lab., IL). 1976.

From International meeting on fast reactor

safety and related physics; Chicago, IL, USA (5 Oct 1976).

Tests E8, L6, F1 and F2 were recent experiments performed at TREAT as a part of the LMFBR Safety Test Program. Test E8 employed seven pins with fuel which had an axial variation of its fuel microstructure more like FTR than in previous tests. Test E8 was the first overpower experiment with clear indication of an initial postfailure fuel dispersal. An analysis made with the PLUTO code indicates that the driving force for fuel expulsion to the coolant channel was fission gas. The subsequent fuel dispersal could be explained by fission-gas expansion and a very mild fuel-coolant interaction.

- 471 (CONF-761001--P4, pp 1647-1657) SUMMARY AND EVALUATION OF R-SERIES LOSS-OF-FLOW SAFETY TESTS IN TREAT. Spencer, B.W.; Grohmes, M.A.; Holtz, R.E.; Testa, F.J.; Kramer, N.A. (Argonne National Lab., IL). 1976.

From International meeting on fast reactor safety and related physics; Chicago, IL, USA (5 Oct 1976).

A series of in-pile tests has been performed in which 7-pin bundles of FTR fuel pins (fresh UO_2) have been subjected to transient undercooling conditions representative of a hypothetical unprotected loss-of-flow (LOF) accident in FTR. The tests were undertaken to evaluate SAS modeling and code predictions of coolant voiding, molten cladding motion, and cladding blockage formations. Agreement with SAS predictions was found to be remarkably good. The absence of sodium superheat, sodium reentry, and fuel-sodium interactions was confirmed. Flooding of molten cladding by sodium vapor streaming was confirmed to result in an upper cladding blockage prior to subsequent formation of the lower blockage. The tests also revealed two areas where improvements in modeling were needed (1) to handle the additional effects upon coolant and cladding motion caused by plenum gas release, and (2) to improve the description of upward cladding motion and blockage formation which was found to be less substantial than predicted.

- 472 (CONF-761001--P4, pp 1658-1662) SIMULATION OF LOF ACCIDENTS WITH DIRECTLY ELECTRICAL HEATED UO_2 PINS. Alexas, A. (Kernforschungszentrum, Karlsruhe, Ger.). 1976.

From International meeting on fast reactor safety and related physics; Chicago, IL, USA (5 Oct 1976).

The behavior of directly electrical heated UO_2 pins has been investigated under loss of coolant conditions. Two types of hypothetical accidents have been simulated, first, a LOF accident without power excursion (LOF accident) and second, a LOF accident with subsequent power excursion (LOF+TDP accident). A high-speed film shows the sequence of events for two characteristic experiments. In consequence of the high-speed film analysis as well as the metallographical evaluation statements are given in respect to the cladding meltdown process, the fuel melt fraction and the energy input from the beginning of a power transient to the beginning of the molten fuel ejections.

- 473 (CONF-761001--P4, pp 1679-1688) CLADDING FAILURE IN TREAT OVERPOWER EXPERIMENTS: A MECHANISTIC INTERPRETATION AND ITS IMPLICATIONS FOR LMFBR SAFETY ANALYSIS. Atcheson, D.B.; Sherry, R.R.; Shimane, K.J. (General Electric Co., Sunnyvale, Ca). 1976.

From International meeting on fast reactor

safety and related physics; Chicago, IL, USA (5 Oct 1976).

Eleven TREAT overpower experiments have been analyzed using the BEHAVE-SST fuel rod mechanics program. The results suggest that mechanistic prediction of cladding failure under hypothetical overpower conditions is feasible. Differential fuel-cladding thermal expansion and fuel expansion upon melting appear to be the dominant loading mechanisms in the experiments analyzed. It was necessary to postulate a fission gas loading mechanism in only one experiment to account for the observed behavior. These results suggest that failure noncoherence under overpower conditions will depend primarily on rod-to-rod variations in fuel strength, cladding strength and the distribution of available volume within the fuel.

- 474 (CONF-761001--P4, pp 1691-1696) CLADDING RELOCATION EXPERIMENTS. Henry, R.E.; Jeans, W.C.; Quinn, D.J.; Spieha, E.A. (Argonne National Lab., IL). 1976.

From International meeting on fast reactor safety and related physics; Chicago, IL, USA (5 Oct 1976).

When analyzing the consequences of a hypothetical core meltdown accident in an LMFBR, the movement of molten clad material must be well understood for two reasons; (1) it has the potential for plugging the system as it leaves the core region, and (2) it is directly coupled to the neutronics of the system. To provide a detailed insight into this motion, small-scale single and ten pin tests have been conducted using Wood's metal to simulate the cladding material. In addition, a full length (FFTF) 28-pin triangular bundle experiment has been fabricated and is currently being calibrated. The objective of these experiments is to study the behavior of molten cladding within a voided subassembly where sodium vapor streaming tends to counteract the drainage due to gravity.

- 475 (CONF-761002--P4, pp 1697-1706) CLAD RELOCATION DYNAMICS: THE PHYSICS AND ACCIDENT EVOLUTION IMPLICATIONS. Theofarous, T.G.; Prather, W.; Chen, M.; Speis, T.P.; Lois, L. (Purdue Univ., Lafayette, IN). 1976.

From International meeting on fast reactor safety and related physics; Chicago, IL, USA (5 Oct 1976).

Even under transient flow conditions the value $J^*/\text{sub } g/ = 1$ represents the threshold for upward film relocation. However, the two-phase frictional pressure drop multiplier is found to be substantially smaller than that predicted by the classical steady-state correlations for annular flow. Based on the values determined here new flow regime maps for clad relocation in LMFBR bundles under axial and radial melting incoherencies are presented. For large values of $J^*/\text{sub } g/$ upward relocation is usually accompanied by separation from the advancing film front and entrainment. The entrained mass proceeds at much higher velocities. Based on these findings and the calculated (by SAS) core pressure drop substantial clad relocation would be expected under LDFA conditions.

- 476 (CONF-761001--P4, pp 1707-1714) FUEL DISPERSAL EXPERIMENTS WITH SIMULANT FLUIDS. Farahat, M.; Henry, R.E.; Santori, J. (Argonne National Lab., IL). 1976.

From International meeting on fast reactor safety and related physics; Chicago, IL, USA (5 Oct 1976).

Boiling pool stability experiments have been

conducted for open and "bottled up" systems to ascertain the dispersive characteristics of such systems. These studies were performed in a microwave oven with water as the boiling liquid. High speed movies demonstrate that open pools are dispersive at very low vapor production rates and that "bottled up" pools, as a result of upward heat sinks created by the pressurization, are also dispersive at vapor production rates equivalent to 2 percent of nominal reactor power.

- 477 (CONF-761001--P4, pp 1725-1734)
TRANSIENT UNDERCOOLING ANALYSIS OF THE DISPERSAL MECHANISM TEST. Mync, L.; Bowers, C.H.; Heineman, J.B. (Argonne National Lab., IL). 1976.

From International meeting on fast reactor safety and related physics; Chicago, IL, USA (5 Oct 1976).

The initiating phase response of the proposed Dispersal Mechanism Test to an unprotected loss-of-flow initiator is studied with the SAS3A accident analysis code. This is done in order to study the question of whether or not the initiating phase would have a high probability of evolving into the gradual core meltdown/boilup transition phase scenario which this proposed test is intended to examine. It is found that the initiating phase could well terminate with a power burst driven by the slumping of fresh fuel. This has led to a search for core design changes which would tend to mitigate any such burst.

- 478 (CONF-761001--P4, pp 1735-1743)
EXPERIMENTS ON PRESSURE-DRIVEN FUEL COMPACTION WITH REACTOR MATERIALS. Henry, R.E.; Erickson, E.G.; Goldfuss, G.T.; Heiberger, J.J.; Quinn, D.J.; Roth, R.L.; Spieha, E.A.; Winsch, I.O. (Argonne National Lab., IL). 1976.

From International meeting on fast reactor safety and related physics; Chicago, IL, USA (5 Oct 1976).

Pressure driven, fuel-recompaction experiments have been conducted with reactor materials in 37-pin wire wrapped bundles. The experiments have been performed with the bundle full, half full, and empty of sodium coolant. Measurements and post-test examination of the bundles show that the sodium coolant had no significant effect on the final disposition of the fuel. Consequently, no fuel recompaction forces were observed.

- 479 (CONF-761001--P4, pp 1744-1753)
EQUATIONS OF STATE FOR LMFBR MATERIALS. Barnes, J.F.; DeVault, G.P. (Los Alamos Scientific Lab., NM). 1976.

From International meeting on fast reactor safety and related physics; Chicago, IL, USA (5 Oct 1976).

Tabular equations of state are constructed for use by the SIMMER code in its investigations of LMFBR safety in hypothetical core disruptive accidents. A correction to a sodium equation of state reported earlier is described. The revised tabular data are presented. Need for further work on the melting transition is suggested.

- 480 (CONF-761001--P4, pp 1757-1766) STUDY OF FUEL FREEZING AND CHANNEL PLUGGING DURING HYPOTHETICAL OVERPOWER TRANSIENTS. Wong, K.W.; Dhir, V.K.; Kastenber, W.E. (Univ. of California, Los Angeles). 1976.

From International meeting on fast reactor safety and related physics; Chicago, IL, USA (5 Oct 1976).

A mechanistic approach has been used to

determine the events following pin failure which may lead to fuel freezing and channel plugging. The location of the impact of the fuel particle with a wire wrap and the induced impact stresses in the particle are determined. A fuel particle is assumed to plate out at the impact location, if the induced impact stress exceeds the maximum fracture or yield stress. Knowing the distribution of the particles around the failure location, the amount and axial distance from the point of failure are determined. The effect on fuel plate-out of such variables as the rate and amount of fuel injection, fuel particle size, fission heating rate and presence of fission gas has been studied parametrically. The above modelling is applied to determine the amount and location of fuel plate out in CRBR under hypothetical slow and fast transients.

- 481 (CONF-761001--P4, pp 1767-1777)
HYDRODYNAMIC MODEL FOR TREATING TRANSIENT FREEZING IN PIN BUNDLES. Hakim, S.J.; Henninger, R.J. (Argonne National Lab., IL). 1976.

From International meeting on fast reactor safety and related physics; Chicago, IL, USA (5 Oct 1976).

A one-dimensional treatment of incompressible two-component flow in pin bundles is presented. The model monitors the temporal evolution of the pin geometry due to ablation, crust formation, and growth at every axial position along the flow channel. Heat conduction and generation in the pin structure are included. The model is used to extract the dependence of the penetration distance of the fluid up to the freezing temperature on inlet pressure, inlet temperature, initial pin temperature, pin diameter, and the hydraulic diameter of the flow. Comparison with available experimental results is made. The model was used to calculate the penetration distance of molten core material in the axial blankets of a liquid metal fast breeder reactor during a hypothetical core disruptive accident.

- 482 (CONF-761001--P4, pp 1788-1798)
ANALYTICAL AND EXPERIMENTAL STUDIES OF TRANSIENT FUEL FREEZING. Epstein, M.; Henry, R.E.; Grohmes, M.A.; Fauske, H.K.; Goldfuss, G.T.; Quinn, D.J.; Roth, R.L. (Argonne National Lab., IL). 1976.

From International meeting on fast reactor safety and related physics; Chicago, IL, USA (5 Oct 1976).

The freezing of a molten ceramic fuel-metal mixture in a single steel tube and in a seven-pin bundle has been studied experimentally. The freezing data in the single-tube experiment compare well with a simple transient heat-conduction model. It was found that the extent of penetration of a molten fuel-metal mixture into a seven-pin rod bundle is considerably greater than that predicted by existing models based on bulk freezing concepts. A tentative explanation for the observed penetration behavior is that, while melting of the steel channel structure rapidly leads to a fuel freezing in a bulk manner, complete occlusion of the pin bundle channels is ultimately controlled by conduction within the melted steel.

- 483 (CONF-761001--P4, pp 1808-1818)
DYNAMICS OF SOLIDIFICATION OF FLOWING FLUIDS WITH APPLICATIONS TO LMFBR POST-ACCIDENT FUEL RELOCATION. Chun, M.H.; Gasser, R.D.; Kazimi, M.S.; Ginsberg, T.; Jones, O.C. Jr. (Brookhaven National Lab., Upton, NY). 1976.

From International meeting on fast reactor

safety and related physics; Chicago, IL, USA (5 Oct 1976).

The process of solidification of a flowing fluid has been studied both analytically and experimentally. A series of tests was performed, using paraffin wax and Wood's metal as flowing hot fluids, to verify the model as well as to investigate experimentally the effects of various parameters on the process of transient flowing and freezing through a vertical channel. Preliminary experimental results for plugging times and the total mass of molten fluid displaced through the channel before plugging are presented. Effects of important parameters on the transient freezing process have been examined experimentally. A preliminary evaluation of the model is made based on comparison with the experimental results.

- 484 (CONF-761001--P4, pp 1833-1842) MECHANISMS OF VAPOR EXPLOSIONS. Bankoff, S.G.; Jo, J.H.; Ganguli, A. (Northwestern Univ., Evanston, IL). 1976.

From International meeting on fast reactor safety and related physics; Chicago, IL, USA (5 Oct 1976).

A recalculation is presented of the Board-Hall theory of thermal detonation waves, taking into account the fuel-coolant mass ratio in determining the velocity equilibration time constant. The required peak pressure is now approximately 10^5 bar, so that fast droplet breakup by Taylor instability cannot be visualized. Crust breakup times of approximately 10^{-3} to 10^{-4} sec are calculated for a fuel drop entering the sodium coolant due to bubble growth and collapse, followed by jet penetration of the crust. Coarse premixing of the fuel and coolant is therefore difficult to attain. Taken together, these calculations imply that the probability of an efficient fuel-sodium explosion is very small. 26 references.

- 485 (CONF-761001--P4, pp 1843-1851) LIQUID--LIQUID CONTACT IN VAPOR EXPLOSIONS. Ochiai, M.; Bankoff, S.G. (Northwestern Univ., Evanston, IL). 1976.

From International meeting on fast reactor safety and related physics; Chicago, IL, USA (5 Oct 1976).

A self-mixing theory for initiation and early propagation of vapor explosions is presented. Random contacts are postulated to cause local regions of high pressure at the contact interface, which result in annular jets tending to mix the fluids. The criterion for successful initiation depends upon the minimum Weber number for coalescence being exceeded over an area at least equal to the original contact area. Experimental free-fall droplet data are presented from which the minimum Weber number correlation is determined.

- 486 (CONF-761001--P4, pp 1852-1861) SOME ASPECTS OF MIXING IN LARGE-MASS, ENERGETIC FUEL-COOLANT INTERACTIONS. Cho, D.H.; Fauske, H.K.; Grolmes, M.A. (Argonne National Lab., IL). 1976.

From International meeting on fast reactor safety and related physics; Chicago, IL, USA (5 Oct 1976).

Certain aspects of mixing involved in large-mass fuel-coolant interactions are examined, considering the energy required as well as the dynamics of mixing. It is observed that: (1) an energetic, coherent interaction involving large masses of molten fuel appears extremely unlikely, unless the molten fuel is coarsely premixed with liquid coolant prior to the interaction and the interaction propagates

rapidly throughout the entire system, (2) the premixing that is likely to produce an energetic interaction is one in which molten fuel is initially separated from liquid coolant by a vapor layer, and (3) while details of the fine-scale intermixing leading to an energetic interaction are not fully understood, it would appear to be a one-step process. The observations along with consideration of accident situations seem to suggest that the possibility of a large-mass, energetic interaction is extremely remote in oxide-fueled LMFBR systems.

- 487 (CONF-761001--P4, pp 1862-1869) VAPOR EXPLOSION EXPERIMENTS WITH SIMULANT FLUIDS. Henry, R.E.; Fauske, H.K.; McUmber, L.M. (Argonne National Lab., IL). 1976.

From International meeting on fast reactor safety and related physics; Chicago, IL, USA (5 Oct 1976).

Several simulant fluid vapor explosion experiments have been performed to test the predictions of the interface temperature, spontaneous nucleation model. All experiments conducted to date have been in agreement with the model.

- 488 (CONF-761001--P4, pp 1870-1878) HEAT TRANSFER AND PRESSURE GENERATION DUE TO A TEMPERATURE DISCONTINUITY AT A LIQUID--LIQUID INTERFACE. Cooper, F.M. (Los Alamos Scientific Lab., NM). 1976.

From International meeting on fast reactor safety and related physics; Chicago, IL, USA (5 Oct 1976).

In the absence of a phase transition, the solution is presented for the time evolution of the temperature and pressure fields for fuel and coolant in both planar and spherical geometries assuming an initial temperature discontinuity. The problem is solved analytically using Laplace transforms. In spherical geometry the temperature of a sphere in a medium relaxes to the temperature of the medium in a time approximately R^2/α where R is the radius and α the thermal diffusivity of the sphere. For a sphere of fuel in coolant or coolant in fuel, with the fuel freezing, the time-dependent temperature distributions are determined and the motion of the freeze front is solved by using a boundary layer approximation.

- 489 (CONF-761001--P4, pp 1879-1888) A MODEL FOR FUEL FRAGMENTATION DURING MOLTEN FUEL/COOLANT THERMAL INTERACTIONS. Vaughan, G.J. (Culham Lab., Abingdon, Eng.); Caldarola, L.; Todreas, N.E. 1976.

From International meeting on fast reactor safety and related physics; Chicago, IL, USA (5 Oct 1976).

Various physical models have been proposed to explain fuel/coolant interactions (FCI) and many sets of experimental data have been published. Some of the significant results are presented for a restricted class of FCIs. The experiments discussed are restricted to those in which one substance is dropped into the other as this mode of contact is the most quiescent. The model which is considered is a cyclic theory of bubble growth followed by collapse. The collapse, being asymmetric, forms a jet of coolant which can penetrate the fuel and vaporize forming another bubble and disrupting the fuel surface. 46 references.

- 490 (CONF-761001--P4, pp 1889-1895) THEORETICAL AND EXPERIMENTAL INVESTIGATION OF FUEL-COOLANT INTERACTIONS IN A SHOCK TUBE

CONFIGURATION. Goldammer, H.; Kottowski, H.M. (Commission of the European Communities, Ispra, Italy). 1976.

From International meeting on fast reactor safety and related physics; Chicago, IL, USA (5 Oct 1976).

Experiments in a shock tube configuration were performed using molten stainless steel and UO_2 in combination with water, respectively sodium. The following data were measured as a function of time: (a) reaction force acting on the interaction crucible; (b) pressure of the vapor in the interaction space; (c) growth of vapor volume; and (d) ejection velocity. The experiments demonstrated that the process of "vapor explosion" in constrained configurations is dominated by successive ejection and reentry cycles. A physical model and a corresponding calculation code has been developed in order to simulate FCI in shock tubes.

- 491 (CONF-761001--P4, pp 1896-1904) EFFECTS OF FUEL-SODIUM INTERACTION IN TOP TESTS WITH ELECTRICALLY HEATED FUEL PINS. Bojarsky, E.; Deckers, H.; Drexler, H.; Gross, S.; Lehning, H.; Piel, D.; Reiser, H. (Kernforschungszentrum, Karlsruhe, Ger.). 1976.

From International meeting on fast reactor safety and related physics; Chicago, IL, USA (5 Oct 1976).

To simulate TOP accidents experiments are performed in an out-of-pile sodium loop using electrically operated UO_2 fuel pins. A single pin or a seven-pin bundle is heated from steady-state operation in a power transient of 300 to 400 ms duration so that up to 50 g of molten UO_2 penetrate into the cooling channel. Immediately after the pin has become defective narrow pressure pulses occur with amplitudes up to about 70 bar. They seem to be produced by collapsing of sodium vapor bubbles. Gas overpressures of about 2 to 3 bar in the fuel pin yield the highest amplitudes. Another type of pressure profile was observed, above all at a very low gas pressure in the fuel pin. It might be caused by evaporation of sodium penetrating into the defective zone. There is relatively small mechanical work done at the coolant during these events. A strong blockage of the cooling channel was observed within the damaged zone.

- 492 (CONF-761001--P4, pp 1907-1914) STATE OF THE ART IN AEROSOL MODELLING FOR LMFBR SAFETY ANALYSIS. Schikowski, W.O. (Kernforschungszentrum, Karlsruhe, Ger.). 1976.

From International meeting on fast reactor safety and related physics; Chicago, IL, USA (5 Oct 1976).

The problems of aerosol formation, aerosol transport behavior, aerosol retention systems and (eventually) release to the environment from core disassembly accidents and other sources are of high significance in LMFBR safety. Beginning with the early models developed in the mid 60's much work has been done since to improve understanding of aerosol behavior in LMFBR containments. Present modelling theories comprise essentially the US code HARM-2 and the German code PARADISEKO-3. The status of aerosol modelling, the verification by experimental programs and the remaining uncertainties are discussed.

- 493 (CONF-761001--P4, pp 1915-1923) DEPOSITION OF AEROSOLS FORMED BY HCDA DUE TO DECAV HEAT TRANSPORT IN LMFBR INNER CONTAINMENT ATMOSPHERES. van de Vate, J.F.; Plomp, A.; de

Jong, C.; Smit, H.C.D. (Netherlands Energy Research Foundation ECN, Petten). 1976.

From International meeting on fast reactor safety and related physics; Chicago, IL, USA (5 Oct 1976).

The role of heat transfer related processes governing aerosol behavior after core melt down in LMFBR containments is discussed. Useful and experimentally supported equations for calculation of aerosol decay due to thermophoresis or condensation coupled settling are given. The important aspect of spatially homogeneous distribution of aerosol in the containment space is treated. Comments are made about existing computer models for safety evaluation of nuclear aerosols.

- 494 (CONF-761001--P4, pp 1924-1929) FUEL PARTICLE AND FISSION PRODUCT RELEASE FROM LMFBR-CORE CATCHER. Jordan, S.; Ozawa, Y. (Kernforschungszentrum, Karlsruhe, Ger.). 1976.

From International meeting on fast reactor safety and related physics; Chicago, IL, USA (5 Oct 1976).

During a postulated severe incident with core rupture at a sodium cooled fast reactor major quantities of fuel particles may be suspended in the liquid sodium contained in the core catcher. The release of fuel and sodium from a contaminated pool at 500 and 900°C was investigated by laboratory and technical experiments. Sodium vapor was released from a boiling sodium pool into nitrogen atmosphere with a rate of 85 kg Na/m².h. Decontamination factors for uranium release from sodium pools were measured between 10³ and 10⁴ for sodium containing 1 weight percent UO_2 powder. The effect was found to be not strong dependent on temperature between 500 and 900°C.

- 495 (CONF-761001--P4, pp 1937-1944) SOME POTENTIAL REDUCTIONS IN THE RELEASE OF RADIOACTIVITY UNDER LMFBR ACCIDENT CONDITIONS. Nelson, G.T.; Johnson, R.P.; Vaughan, E.U.; Guderjahn, C.A.; Morewitz, H.A. (Atomic International, Canoga Park, CA). 1976.

From International meeting on fast reactor safety and related physics; Chicago, IL, USA (5 Oct 1976).

The reactor system and containment of a LMFBR can be expected to be very effective in preventing the spread of radioactivity following an accident. With current leak data measurement technology, a reactor containment building must be considered to have 0.1 v/o leakage/day. Since this is the limit of sensitivity, this much gas leakage can be accommodated by flow through a single, short length hole having an equivalent diameter of about 1 mm. Recent tests at Atomic International have shown that holes this small in diameter are quickly plugged if aerosols are present to any extent. Since, in addition, radioactive volatiles will be mostly trapped in the sodium pool, there is little release of dose producing radioactivity.

- 496 (CONF-761001--P4, pp 1945-1954) SODIUM FIRE STUDIES IN FRANCE SAFETY TESTS AND APPLICATIONS ON AN LMFBR. Fruchard, Y.; Colome, J.; Malet, J.C.; Berlin, M.; de Cuy, G.D.; Justin, J.; Duco, J.; Fourest, B. (Centre d'Etudes Nucleaires de Cadarache, France). 1976.

From International meeting on fast reactor safety and related physics; Chicago, IL, USA (5 Oct 1976).

The risk of sodium fires in an LMFBR requires thorough analysis, and the possible consequences of an accidental fire must be

accurately determined. Not only must means of prevention and detection be perfected, but techniques must be developed to limit the damage caused by a fire: extinguishment, aerosol containment, protection of reactor structures. The program currently undertaken by the SEA's Nuclear Safety Department covering these problems is described. The major results obtained as well as their application to the SUPER-PHENIX reactor are included.

from the primary system due to the system boundary failure, and (3) a characterization of events within the primary system that may affect the spatial distribution of radionuclides. The model is under development and has been applied to selected reactor designs and accidents. These applications provide insight into the reliability of the primary system to retain core debris, the range of accident outcomes, and the accident risks.

- 497 (CONF-761001--P4, pp 1955-1961) RELEASE OF FISSION PRODUCTS FROM CONTAMINATED SODIUM FIRMS. Jordan, S. (Kernforschungszentrum, Karlsruhe, Ger.). 1976.

From International meeting on fast reactor safety and related physics; Chicago, IL, USA (5 Oct 1976).

Leaks in the primary coolant system of a LMFBR and also serious incidents with tank rupture may entail the escape of fission products into the containment of the reactor. For incident analysis it is important to know the retention capability of sodium for the different fission products. The release of cesium and strontium from pools contaminated with 10 to 1000 ppm was investigated by experiments. The cesium content of airborne aerosols depends on oxygen concentration: at 2 percent oxygen concentration the Cs content of sodium-oxide aerosols is 3 times and at 6.5 percent 15 times as high as the initial Cs concentration in the pool. Strontium content of aerosols over burning contaminated sodium pools is 10^3 times smaller than the strontium pool concentration.

- 498 (CONF-761001--P4, pp 1972-1981) SODIUM SPRAY RELEASE ACCIDENT ANALYSIS FOR FAST REACTOR SAFETY STUDIES. Shire, P.R. (Westinghouse Hanford Co., Richland, WA). 1976.

From International meeting on fast reactor safety and related physics; Chicago, IL, USA (5 Oct 1976).

A computer code has been developed to model the effects of postulated sodium spray release from LMFBR piping, although this is an event of extremely low probability. The calculation method utilizes gas convection and droplet combustion theory to calculate the pressure and temperature effects in a range of 0 to 21 mole percent oxygen with humidity. Droplet motion and large aggregate sodium surface area result in rapid release of combustion and sensible heat causing a nearly adiabatic pressure rise which peaks in several seconds. This analytical tool has indicated reasonable agreement with prototypic test data for a range of oxygen and water vapor concentrations, cell volumes and droplet sizes.

- 499 (CONF-761001--P4, pp 1985-1994) MODEL FOR EVALUATING PROBABILITIES OF PRIMARY SYSTEM RETENTION OF CORE DEBRIS AND TIME OF RELEASE IN LMFBR RISK ASSESSMENTS. Fleischer, L.S.; Feller, K.G.; El-Sheikh, K.A.; Medley, J.R. (General Electric Co., Sunnyvale, CA). 1976.

From International meeting on fast reactor safety and related physics; Chicago, IL, USA (5 Oct 1976).

An analytical model is presented that can probabilistically analyze the capability of the primary coolant system to retain core debris after a core disruption accident. For a given set of conditions at the termination of a core disruption, the model provides (1) the probability of a failure of the reactor vessel and the primary system piping resulting from non-coolable core debris, (2) the probability distribution of the time of major fuel releases

- 500 (CONF-761001--P4, pp 1995-2004) CONSIDERATIONS OF THE THIRD LINE OF ASSURANCE: POST-ACCIDENT HEAT REMOVAL AND CORE RETENTION IN CONTAINMENT. Glueckler, E.L.; Dayan, A. (General Electric Co., Sunnyvale, CA). 1976.

From International meeting on fast reactor safety and related physics; Chicago, IL, USA (5 Oct 1976).

LMFBR safety through defense in depth is provided by four lines of assurance (LOA 1 to 4). Primary emphasis in design is on LOA-1 or prevention of accidents, but the LMFBR can also be shown to possess inherent safety characteristics in the second, third and fourth lines. These lines would limit core damage, retain radioactive materials in the primary system cells and mitigate the consequences of very low probability events. The main concern of this paper is with LOA3. Functional requirements and pertinent considerations of core retention and decay heat removal are given. The scenario of a postulated accident is described from the stage of core debris dispersion to the final stage of debris settling in either the reactor vessel or at the bottom of the reactor cell. Parametric studies for conservative scenarios which assume liner failure and subsequent chemical reactions have been performed for early-sized LMFBRs. The containment response appears to be highly dependent on the structural integrity of the reactor cell liner and concrete dehydration rates in the case the liner has failed. Radiological assessments indicate that 10CFR100 guidelines can be met for all considered cases.

- 501 (CONF-761001--P4, pp 2026-2035) PREDICTION OF DRYOUT HEAT FLUXES IN BEDS OF VOLUMETRICALLY HEATED PARTICLES. Dhir, V.K.; Catton, I. (Univ. of California, Los Angeles). 1976.

From International meeting on fast reactor safety and related physics; Chicago, IL, USA (5 Oct 1976).

New data for dryout heat fluxes in volumetrically heated shallow beds are reported. The shallow bed data are correlated with a semi-theoretical correlation based on maximum possible vapor volume flux through the vapor jets overlying the bed. The transition from deep to shallow beds is determined by using the present shallow bed correlation and the deep bed correlation suggested earlier. It is found that the transition height is significantly dependent on the particle size, and the initial bed porosity. The results of the present study are applied to a hypothetical core disruptive accident in a liquid metal fast breeder reactor. The maximum possible coolable depths of the core debris as a function of the particle size, bed porosity and decay heat have been predicted.

- 502 (CONF-761001--P4, pp 2036-2044) STUDIES OF THE FORMATION AND COOLING OF PARTICULATE FUEL DEBRIS BEDS IN SODIUM. Sowa, E.S.; Gabor, J.D.; Baker, L. Jr.; Pavlik, J.R.; Cassulo, J.C.; Holloway, W. (Argonne National Lab., IL). 1976.

From International meeting on fast reactor

safety and related physics; Chicago, IL, USA (5 Oct 1976).

Particulate debris-bed formation and heat transfer experiments have been conducted to provide information needed for postaccident heat removal analysis of sodium-cooled reactors. The particulate debris bed formation experiment, designated M-5, employed molten UO_2 generated by a thermite-type chemical reaction. The molten UO_2 flowed into a dry steel container that simulated the cavity below a reactor. Sodium flow into the cavity followed the fuel flow by about 0.2 s. Examination of the residue indicated that the molten UO_2 was completely fragmented by interaction with sodium to form a particulate bed. Particle distributions down to the submicron size range are reported. Bed heat transfer experiments were performed with metallic particulates in water. Three experimental techniques were used with the same particulate material, including (1) induction heating of the particulate, (2) Joule heating of the aqueous phase (made conducting by the addition of salts), and (3) bottom heating.

- 503 (CONF-761001--P4, pp 2047-2055) EXPERIMENTAL INVESTIGATIONS OF HEAT TRANSFER CHARACTERISTICS IN LIQUID LAYERS WITH INTERNAL HEAT SOURCES. Fieg, G. (Kernforschungszentrum, Karlsruhe, Ger.). 1976.

From International meeting on fast reactor safety and related physics; Chicago, IL, USA (5 Oct 1976).

Stationary natural convective heat transport from internally heated horizontal fluid layers is studied. As compared to previous measurements the spectrum of boundary conditions has been extended to cover the range from adiabatic lower to adiabatic upper wall, including the special case of equal temperatures at the upper and lower wall. In addition the heat transport from an internally heated fluid layer which is superposed by a second, not internally heated and nonmiscible fluid layer, has been studied. Moreover, heat transfer measurements have been done in internally heated liquid layers through which gas bubbles are rising from the bottom.

- 504 (CONF-761001--P4, pp 2056-2065) HEAT REMOVAL FROM MOLTEN FUEL POOLS. Baker, L. Jr.; Chasanov, M.G.; Gabor, J.D.; Gunther, W.H.; Cassulo, J.C.; Bingle, J.D.; Mansoori, G.A. (Argonne National Lab., IL). 1976.

From International meeting on fast reactor safety and related physics; Chicago, IL, USA (5 Oct 1976).

Two experiments were conducted to study the distribution of internally generated heat in nonboiling pools of rectangular cross-section. In one experiment, the heated fluid was an aqueous solution, and in the other the fluid was molten uranium dioxide. Heat was generated by the passage of AC current through the pools. Analysis of the heat flux data from the water experiments led to an empirical model of pool heat transfer. The model takes account of the interactions of the vertical heat fluxes with the horizontal heat fluxes. The empirical model, when applied to the conditions of the molten UO_2 experiments, predicted significantly smaller downward heat fluxes than were observed. The increased downward heat fluxes in the molten UO_2 could possibly be caused by effects of partial transparency within the molten UO_2 .

- 505 (CONF-761001--P4, pp 2066-2076) HEAT TRANSFER AND FLUID DYNAMICS IN A VOLUME-HEATED

BOILING POOL. Gustavson, W.R.; Kazimi, M.S.; Chen, J.C. (Brookhaven National Lab., Upton, NY). 1976.

From International meeting on fast reactor safety and related physics; Chicago, IL, USA (5 Oct 1976).

An analytical and experimental investigation of the horizontal heat transfer from an internally heated boiling pool to a vertical wall has been conducted. A model is presented for the heat transfer based on combined modes of natural and forced convection flow in the liquid boundary layer at the vertical wall. The experimental results, using Joule heating of a $ZnSO_4$ - H_2O solution, indicate that the pool may develop a low-density 'foam-like' regime as well as a dense 'turbulent' regime. The analytic model compares favorably to the results in the 'dense' regime which show that the highest heat flux will develop near the upper edge of the pool. Application of the model to a boiling pool of UO_2 with a low level of boiling power (decay-heat level) suggests that the sideward heat transfer rates will limit the thickness of any fuel crust that may develop between the pool and the surrounding steel structure to a few millimeters. The stability and strength of such a crust have not been investigated.

- 506 (CONF-761001--P4, pp 2105-2114) INTERACTIONS OF LMFBR CORE DEBRIS WITH CONCRETE. Baker, L. Jr.; Cheung, F.B.; Chasanov, M.G.; Sowa, E.S.; Bingle, J.D.; Staahl, G.; Pavlik, J.R.; Holloway, W. (Argonne National Lab., IL). 1976.

From International meeting on fast reactor safety and related physics; Chicago, IL, USA (5 Oct 1976).

Experiments were conducted to study each of the four processes of importance in the analyses of the interactions of LMFBR core debris with concrete, including: (1) concrete dehydration, (2) interaction with molten stainless steel, (3) interaction with molten UO_2 , and (4) interaction with liquid sodium. The dehydration experiments, performed with one type of limestone concrete, indicated that as a result of dehydration and moisture migration within the concrete, the effective thermal diffusivity at higher temperatures is several times that at room temperature. Based on the observed rate of thermal diffusion in concrete, a preliminary model of heat transfer in concrete has been developed.

- 507 (CONF-761001--P4, pp 2115-2121) ACOUSTIC DIAGNOSTIC TECHNIQUES FOR POST-ACCIDENT HEAT REMOVAL EXPERIMENTS. Sutherland, H.J.; Carlson, G.A.; Kent, L.A. (Sandia Labs., Albuquerque, NM). 1976.

From International meeting on fast reactor safety and related physics; Chicago, IL, USA (5 Oct 1976).

Two acoustic techniques which have applications to reactor safety studies are described here. Both techniques are adaptations of the pulse-echo ultrasonic method. The first technique uses acoustic waves to measure temperature. It will be used to monitor the temperature of UO_2 from 2000°K to above the UO_2 melting point (3130°K). The second technique uses acoustic waves to measure erosion rates and its use is illustrated by monitoring the erosion of a concrete interface by a plasma jet.

- 508 (CONF-761001--P4) FAST REACTOR SAFETY AND RELATED PHYSICS. VOLUME IV. PHENOMENOLOGY. (American Nuclear Society, Chicago, IL; European Nuclear Society, Petit-

- Lancy (Switzerland)). 1976. Contract W-31-109-ENG-38. 705p. Dep. NTIS, PC A99/MF A01. From International meeting on fast reactor safety and related physics; Chicago, IL, USA (5 Oct 1976).
Separate abstracts are included for 58 papers concerning single-phase flow and sodium boiling; sodium boiling and subassembly flow blockages; transient-overpower and loss-of-flow experiments; fuel and cladding behavior and relocation; fuel and cladding freezing; molten-fuel-coolant interaction; aerosols and fission product release, and post-accident heat removal. Thirteen papers have been previously abstracted and included in ERA.
- 509 (CONF-761001--P4, pp 1439-1447) MULTICHANNEL ANALYSIS FOR PREDICTING TEMPERATURES AND BOILING INITIATION IN LMFBR SUBASSEMBLIES DURING A FLOW TRANSIENT. Nijssing, R.; Eifler, W. (EURATOM, Ispra, Italy). 1976.
From International meeting on fast reactor safety and related physics; Chicago, IL, USA (5 Oct 1976).
The transient thermo-hydraulic subchannel behaviour of LMFBR subassemblies subjected to loss-of-coolant-flow conditions, is analyzed. The temperature behaviour in the stage prior to boiling inception is described. The model applied is based on the description of a significant number of subchannels and associated fuel rods and takes account of transverse mixing between adjacent subchannels. An analytical approach is used for solving the energy equations pertaining to both the coolant and the solid material region. Illustrative results are given for various rod bundle configuration subjected to a prescribed flow decay.
- 510 (CONF-761001--P4, pp 1457-1466) INTEGRAL BOILING PHENOMENA UNDER RADIAL TEMPERATURE GRADIENTS IN A TWELVE ROD BUNDLE OF LMFBR GEOMETRY. Boswinkel, H.H.; Maarleveld, J.R.C.; Turkcan, E. (Netherlands Energy Research Foundation ECN, Petten). 1976.
From International meeting on fast reactor safety and related physics; Chicago, IL, USA (5 Oct 1976).
Steady boiling patterns obtained from a partly heated twelve rod bundle are discussed. A comparison with existing boiling models gives preference to the two-phase flow patterns which are usually applied in calculations for water cooled reactors. An attempt is made to apply the results obtained to the core of a fast breeder reactor under loss of flow conditions.
- 511 (CONF-761001--P4, pp 1467-1476) NUMERICAL SIMULATION OF THE TWO-DIMENSIONAL BOILING (VOIDING) IN LMFBR SUBASSEMBLIES. Miao, C.; Theofanous, T.G. (Purdue Univ., Lafayette, IN). 1976.
From International meeting on fast reactor safety and related physics; Chicago, IL, USA (5 Oct 1976).
Preliminary estimates of the two-dimensional voiding effects indicate that they are not likely to be very significant in affecting the time to flow reversal.
- 512 (CONF-761001--P4, pp 1477-1487) AN INVESTIGATION OF FORCED CONVECTION BOILING OF SODIUM AT LOW HEAT FLUXES IN ELECTRICALLY HEATED SEVEN PIN BUNDLES. Eisenhower, S.W.; Albrecht, R.W. (Univ. of Washington, Seattle). 1976.
From International meeting on fast reactor safety and related physics; Chicago, IL, USA (5 Oct 1976).
Sodium boiling at low flow and heat fluxes can be expected in a gamma-heated, in-reactor experiment. The results of experiments under these conditions (10-40 W/cm², 10-50 gm/s) in electrically heated seven pin rod bundles are described. The type of boiling is seen to depend upon the amount of superheat, the degree of inlet throttling and several system dependent parameters. The possible forms of acoustic and neutronic signals from an in-core experiment are discussed in terms of the underlying thermalhydraulics and the experimental findings.
- 513 (CONF-761001--P4, pp 1488-1493) TRANSIENT SODIUM BOILING CHARACTERISTICS AT PUMP RUN DOWN. Kottowski, H.M.; Savatteri, C.; Mol, M. (Commission of the European Communities, Ispra, Italy). 1976.
From International meeting on fast reactor safety and related physics; Chicago, IL, USA (5 Oct 1976).
The transient pattern of boiling in simple channel geometry for loss of coolant conditions was investigated at various heat flux levels and mass flow rates. Heat flux densities of up to 900 W/cm were chosen for the individual experiments and were kept constant during the whole run-down until dry-out was reached. The rate of change of flow during the run-down was determined by the pump control circuit.
- 514 (CONF-761001--P4, pp 1494-1501) STEADY STATE LIQUID METAL BOILING PRESSURE DROP CHARACTERISTICS. Kottowski, H.M. (Commission of the European Communities, Ispra, Italy); Mol, M.; Savatteri, C.; Costa, J. 1976.
From International meeting on fast reactor safety and related physics; Chicago, IL, USA (5 Oct 1976).
Steady state Na-boiling experiments were performed in order to measure the boiling characteristics (pressure drop). These experiments were executed at various heat fluxes and mass flow rates up to dry-out. For the analysis of the experiments a steady state boiling computation code (ESSD) was developed. In a first approach a parametric study has been made using the various two-phase flow-models and friction multipliers proposed by Lockhart-Martinelli, Chen, Kalish and Peppier. A validation of the code with the experimental results was made.
- 515 (CONF-761001--P4, pp 1502-1510) INFLUENCE OF THE AXIAL DISTRIBUTION OF HEAT FLUX ON SODIUM BOILING IN FORCED CONVECTION. Meneghello, S.; Pezzilli, M.; Scarano, G. (Comitato Nazionale Energia Nucleare, Casaccia, Italy). 1976.
From International meeting on fast reactor safety and related physics; Chicago, IL, USA (5 Oct 1976).
The axial distribution of heat flux and single phase transient influence on incipient boiling superheat and sodium boiling dynamics have been studied by two test series in forced convection. These experiments were carried out in the same conditions of velocity, pressure, inlet temperature and mean heat flux on two wire wrapped single pin test-sections, geometrically similar, having respectively flat and sinusoidal ($\phi/\text{sub max}/\phi/\text{sub min} = 1.7$) axial distribution of heat flux. Moreover the influence of the bundle geometry on sodium boiling is carried out on the basis of the preliminary experiments on sodium boiling in seven pins bundle.

- 516 (CONF-761001--P4, pp 1523-1531) SODIUM BOILING EXPERIMENTS IN A 19 PIN BUNDLE: TWO PHASE COOLANT DYNAMICS. Costa, J.; Menant, B. (Commissariat a l'Energie Atomique, Turis). 1976.

From International meeting on fast reactor safety and related physics; Chicago, IL, USA (5 Oct 1976).

Permanent sodium boiling experiments have been performed in a 19 wire-wrapped pin bundle on the forced convection loop CFNa II of the Service des Transferts Thermiques at the Grenoble Nuclear Research Center. These experiments have shown that subcooled boiling, highly sensitive to the multidimensional aspects of bundles, is very noticeable: the singular coolant dynamics during subcooled boiling could lead to consequences such as burn-out and pin failure. Nevertheless, the behaviour of the sub-assembly during saturated boiling becomes grossly analogous to the behaviour of a monodimensional channel, and the pressure drops which develop in the adiabatic parts of the subassembly may be of primordial influence on subsequent events.

- 517 (CONF-761001--P4, pp 1532-1540) TEMPERATURE DISTRIBUTION AND LOCAL BOILING BEHIND A CENTRAL BLOCKAGE IN A SIMULATED FBR SUBASSEMBLY. Brook, A.J.; Huber, F.; Peppler, W. (Gesellschaft fuer Kernforschung mbH., Karlsruhe, Ger.). 1976.

From International meeting on fast reactor safety and related physics; Chicago, IL, USA (5 Oct 1976).

A series of experiments has been carried out to investigate the effects of localised disturbance to the normal coolant flow in a fast reactor fuel element. The tests involved an electrically heated bundle of 169 pins, with a centrally located blockage extending over 49% of the flow area. Test section geometry corresponded to the SNR 300 Mk Ia fuel element. Measured temperature distributions behind the blockage agreed well with those measured in corresponding water experiments. The observed features of local boiling are discussed, and it is shown that a continued capability for cooling the blockage region is preserved, even with intensive local boiling.

- 518 (CONF-761001--P4, pp 1541-1549) THERMAL-HYDRAULIC CORRELATIONS OF A SIX-CHANNEL BLOCKAGE IN A SODIUM-COOLED SIMULATED LMFBR FUEL ASSEMBLY. Han, J.T.; Fontana, M.H.; Wantland, J.L.; Gnadt, P.A.; Smith, C.M. (Oak Ridge National Lab., TN). 1976.

From International meeting on fast reactor safety and related physics; Chicago, IL, USA (5 Oct 1976).

The temperature measurements in the wake behind a six-channel internal blockage in a simulated CRBR fuel assembly have been studied and analyzed. The coolant residence time in the wake and the mass exchange rate between the wake and the adjacent free stream are calculated using a simple physical model. Correlations are obtained for the average coolant temperature rise in the wake, the maximum coolant temperature rise in the wake, the maximum (inner) cladding temperature and the mean Nusselt number in the wake with Reynolds numbers in the range of 10^4 less than or equal to Re less than or equal to 10^5 and the power per pin in the range of 16 to 33 kW/m. The results can be easily applied to predict the temperature rises in the wake behind a six-channel blockage located anywhere in the fuel assemblies of the CRBR and the FFTF, providing the blockage is located two rows or more away from the duct wall and has a negligible heat

generation rate. Furthermore, it should be pointed out that no sodium boiling nor pin failure occurred in the tests and therefore, the reactor can still be operated safely under this kind of blockage condition.

- 519 (CONF-761001--P4, pp 1560-1567) RECENT RESULTS OF A LOCAL BLOCKAGE EXPERIMENT IN A SODIUM COOLED ELECTRICALLY HEATED BUNDLE. de Vries, J.F. (Netherlands Energy Research Foundation ECN, Petten); Hoebe, J.C.; Dorr, B. 1976.

From International meeting on fast reactor safety and related physics; Chicago, IL, USA (5 Oct 1976).

The test section represents a 60-degree section of a SNR-300 fuel element having a 70% flat type central blockage. Experiments have been performed under single-phase and local boiling conditions. A parameter study of the wake temperatures has been carried out. It has been found that the normalized vortex temperatures depend on the Reynolds number. Apart from the temperature maximum in the vortex another relative temperature maximum has been found downstream the vortex. The boiling experiments showed that stable single-bubble boiling was dominating and the cooling capacity in the vortex enough to avoid dryout in this region.

- 520 (CONF-761001--P4, pp 1568-1577) LOCAL BOILING OF SODIUM IN DOWNSTREAM OF LOCAL FLOW BLOCKAGE IN A SIMULATED LMFBR FUEL SUBASSEMBLY. Kikuchi, Y.; Daigo, Y.; Ohtsubo, A. (Power Reactor and Nuclear Fuel Development Corp., Ibaraki, Japan). 1976.

From International meeting on fast reactor safety and related physics; Chicago, IL, USA (5 Oct 1976).

Local sodium boiling in the downstream of a six-subchannel blockage in an electrically heated LMFBR fuel subassembly mockup is described. The first series of experiments were conducted to measure temperature distributions in the downstream of the blockage under non-boiling conditions. The measured temperature rise due to the blockage agreed fairly well with the calculation by the LOCK code. When the experimental results are extrapolated to reactor conditions, the temperature rise due to the six-subchannel blockage is estimated to be less than 250°C. The second series of experiments were performed to investigate local boiling phenomena. In the local boiling region, no flow instability was observed since the subchannels near the wrapper wall were filled with subcooled liquid. In the nearly bulk boiling region, however, considerable upstream voiding occurred and then the inlet flow was reduced, leading to final dryout.

- 521 (CONF-761001--P4, pp 1578-1586) DECAY HEAT REMOVAL FROM A PIN BUNDLE. Kaiser, A.; Peppler, W.; Straka, M. (Gesellschaft fuer Kernforschung mbH., Karlsruhe, Ger.). 1976.

From International meeting on fast reactor safety and related physics; Chicago, IL, USA (5 Oct 1976).

A number of sodium experiments have been carried out using an electrically heated seven pin bundle to investigate steady-state heat dissipation capability of a LMFBR fuel element under complete inlet blockage conditions. Test have been performed in a 37 pin bundle to assess the amount of heat which can be removed under natural convection conditions in a system consisting of tests section, by-pass and cold leg. The results of several test runs are reported. The results of the complete inlet blockage tests are compared with those of a

simple theoretical model. Because of the influence of the honeycomb grids, the capability for steady state heat dissipation is markedly reduced. Amounts of heat which can be transferred by boiling under natural convection conditions correspond broadly to reactor decay heat levels.

- 522 (CONF-761107--27) HEAT TRANSFER IN TUBE BUNDLES OF HEAT EXCHANGERS WITH FLOW BAFFLES INDUCED FORCED MIXING. AbuRomia, M.M.; Chu, A.W.; Cho, S.M. (Foster Wheeler Energy Corp., Livingston, NJ (USA)). 1976. Contract EY-76-C-15-2395; EY-76-C-03-0972. 22p. Dep. NTIS, PC A02/MF A01.

From Annual meeting of the American Society of Mechanical Engineers; New York, NY, USA (29 Nov 1976).

Thermal analysis of shell-and-tube heat exchangers is being investigated through geometric modeling of the unit configuration in addition to considering the heat transfer processes taking place within the tube bundle. The governing equations that characterize the heat transfer from the shell side fluid to the tube side fluid across the heat transfer tubewalls are indicated. The equations account for the heat transfer due to molecular conduction, turbulent thermal diffusion, and forced fluid mixing among various shell side fluid channels. The analysis, though general in principle, is being applied to the Clinch River Breeder Reactor Plant-Intermediate Heat Exchanger, which utilizes flow baffles appropriately designed for induced forced fluid mixing in the tube bundle. The results of the analysis are presented in terms of the fluid and tube wall temperature distributions of a non-baffled and baffled tube bundle geometry. The former case yields axial flow in the main bundle region while the latter is associated with axial/cross flow in the bundle. The radial components of the axial/cross flow yield the necessary fluid mixing that results in reducing the thermal unbalance among the heat transfer to the allowable limits. The effect of flow maldistribution, present on the tube or shell sides of the heat exchangers, in altering the temperature field of tube bundles is also noted.

- 523 (CONF-761107--28) ECONOMICAL REMOVAL OF SODIUM WATER REACTION PRODUCTS (SWRP) FROM AN LMFBR INTERMEDIATE HEAT TRANSPORT SYSTEM (IHTS). Anand, R.K.; Reynolds, R.G. (American Society of Mechanical Engineers, New York). 1976. 6p. American Society of Mechanical Engineers, New York.

From Annual meeting of the American Society of Mechanical Engineers; New York, NY, USA (29 Nov 1976).

The system study concludes that, after a sodium-water reaction in an LMFBR power plant, the hot sodium circulation process is an economical and practical method of removing the SWRP from the IHTS. It is proposed that the impure sodium produced by the hot sodium circulation process be purified by a special fast cleanup cold trap design which is shown herein. The hot sodium circulation process, using the special fast cleanup cold trap, is shown to save a significant amount of downtime during the life of each LMFBR plant. A development program for the recommended process is included.

- 524 (CONF-770401--29) SUMMARY OF THE ORNL SHIELD DESIGN SUPPORTING ANALYSIS FOR THE FFTF. Engle, W.W. Jr.; Mynatt, F.R.; Emmett, M.B. (Oak Ridge National Lab., TN (USA)). 1977. Contract W-7405-ENG-26. 9p. Dep. NTIS, PC

A02/MF A01.

From 5. international conference on reactor shielding; Knoxville, TN, USA (18 Apr 1977).

From 1969 through early 1976, Oak Ridge National Laboratory was requested by the Westinghouse Advanced Reactors Division (WARD) to analyze various shields WARD designed for the Fast Flux Test Facility (FFTF). To develop the proper methodology for such a large and complex system, it was necessary to improve the basic cross-section data sets for sodium and iron and to devise calculational techniques which would allow some regions to be treated in detail and would also allow the analyses to be carried out in steps that could be coupled to each other. These requirements necessitated the performance of two types of experiments: measurements of radiation transport through bulk samples (simple geometry) of important FFTF materials; and measurements of radiation transport through mock-ups of specific geometric regions of the FFTF. The successful analyses of these experiments allowed the application of the derived data sets and various combinations and adaptations of the DOT discrete ordinates and MORSE Monte Carlo transport codes to the FFTF system itself. The first series of calculations for the full system revealed that a cavity surrounding the reactor vessel provided a pathway for neutrons to stream up to the head compartment. Also, fissions in fuel elements stored in the outer region of the reactor vessel were found to contribute significantly to the cavity streaming. As a result, the major ORNL effort was expended on analyzing various designs of a concrete shield to be added in the upper region of the reactor cavity. With the inclusion of the shield and modifications to the reactor vessel support system, the dose rates above the closure head were reduced by a factor of approximately 10^4 .

- 525 (CONF-770545--2) DEVELOPMENT OF A 9 CR STEEL WITH IMPROVED STRENGTH AND TOUGHNESS. Bodine, G.C. Jr.; Chakravarti, B.; Harkness, S.D.; Owens, C.M.; Roberts, B.; Vandergriff, R.; Ward, C.T. (Combustion Engineering, Inc., Chattanooga, TN (USA)). 1977. Contract W-7405-ENG-26. 5p. Dep. NTIS, PC A02/MF A01.

From British Nuclear Energy Society conference on ferritic steels for fast reactor steam generators; London, UK (30 May 1977).

A development program was initiated to provide an alternate code-approved advanced ferritic alloy for LMFBR use. Approximately 30 laboratory heats were made of the type 9Cr-1Mo-2Nb-0.05V-0.02W. In elevated-temperature properties the experimental alloys are superior to code-approved and candidate commercial steels. Improvements realized in weldability, toughness, and elevated-temperature strength and stability are discussed.

- 526 (CONF-770545--3) MATERIALS DATA REQUIREMENTS FOR THE HIGH-TEMPERATURE STRUCTURAL DESIGN OF 2 1/4 CR-1 MO STEEL COMPONENTS. Corum, J.M.; Dalcher, A.W. (Oak Ridge National Lab., TN (USA); General Electric Co., Sunnyvale, CA (USA). Fast Breeder Reactor Dept.). 1977. Contract W-7405-ENG-26. 5p. Dep. NTIS, PC A02/MF A01.

From British Nuclear Energy Society conference on ferritic steels for fast reactor steam generators; London, UK (30 May 1977).

The materials data needs that can arise when a structural alloy is used for the first time in liquid-metal fast-breeder reactor system components are discussed from the standpoint of the high-temperature structural designer. Recent experience with 2 1/4 Cr-1 Mo steel is used as an example. A common structural

problem, involving repeated thermal transient loadings, is discussed, and the current high-temperature structural design methods and criteria used to design for such loadings are outlined. It is shown that the limiting design consideration for 2 1/4 Cr-1 Mo steel is likely to be the accumulation of creep-rupture damage during the relaxation of residual stresses arising from thermal transient loadings. It is concluded that although many data needs for a new alloy are readily apparent, others are unique to each particular material and are often identified only as the material is employed in actual design.

- 527 (CONF-770611--31) SENSITIVITY OF THE POWER DISTRIBUTION IN LARGE HETEROGENEOUS LMFBR DESIGNS. Tzanos, C.P.; Barthold, W.P. (Argonne National Lab., IL (USA)). 1977. Contract W-31-109-ENG-38. 7p. Dep. NTIS, PC A02/MF A01.

From American Nuclear Society annual meeting; New York, NY, USA (12 Jun 1977).

In heterogeneous LMFBR designs consisting of consecutive core and blanket zones, the power distribution is very sensitive to enrichment distribution changes in the core zones. The purpose of the paper is to analyze this sensitivity in heterogeneous LMFBR designs of different degrees of coupling among the core zones.

- 528 (CONF-770611--34) NEUTRON AND GAMMA TRANSPORT EFFECTS BY HETEROGENEOUS CORE DESIGNS. Lam, S.K. (Argonne National Lab., IL (USA)). 1977. Contract W-31-109-ENG-38. 6p. Dep. NTIS, PC A02/MF A01.

From American Nuclear Society annual meeting; New York, NY, USA (12 Jun 1977).

The use of diffusion theory for the prediction of power production near a reactor core-blanket interface and the assumption that gammas are absorbed in situ can lead to substantial errors. This is primarily due to the breakdown of Fick's law for neutron diffusion near the core-blanket boundary, and the gamma leakage from the core into the blanket. These considerations are more pronounced in a situation where a large number of internal blanket assemblies are present, such as in the large heterogeneous core designs. The power distribution is studied for both fission and gamma heating in a large heterogeneous LMFBR with 3 core zones separated by 2 internal blanket zones. Comparisons are made between diffusion and transport theory for neutron calculations, and between in-situ absorption and rigorous transport theory calculation for gamma heating.

- 529 (CONF-770611--35) POTENTIAL AND LIMITATION OF THE HETEROGENEOUS REACTOR CONCEPT. Barthold, W.P.; Beitel, J.; Khan, E.; Tzanos, C. (Argonne National Lab., IL (USA)). 1977. Contract W-7405-ENG-48. 7p. Dep. NTIS, PC A02/MF A01.

From American Nuclear Society annual meeting; New York, NY, USA (12 Jun 1977).

Characteristics of LMFBR type reactors with heterogeneous cores are described. Reactor kinetic and safety aspects of heterogeneous and homogeneous cores are compared.

- 530 (CONF-770611--36) SYSTEMATIC APPROACH FOR CONSTRUCTING LOW SODIUM VOID HETEROGENEOUS CORES. Tzanos, C.P.; Barthold, W.P. (Argonne National Lab., IL (USA)). 1977. Contract W-31-109-ENG-38. 7p. Dep. NTIS, PC A02/MF A01.

From American Nuclear Society annual meeting;

New York, NY, USA (12 Jun 1977).

In unprotected loss-of-flow transients in large LMFBRs sodium voiding may result in high ramp rates of positive reactivity addition leading to rates of energy release that may exceed the design limits of the containment. Therefore, there is an incentive in designing reactors of low sodium void reactivity to reduce the positive reactivity ramp rates arising from sodium voiding. A systematic way of constructing heterogeneous configurations that have a near zero value of sodium void reactivity is presented.

- 531 (CONF-770611--37) PIN DIAMETER OPTIMIZATION IN 1200 MWE HETEROGENEOUS VS. HOMOGENEOUS LMFBRs. Orzechwa, Y.; Turski, R.B.; King, M.J. (Argonne National Lab., IL (USA)). 1977. Contract W-31-109-ENG-38. 6p. Dep. NTIS, PC A02/MF A01.

From American Nuclear Society annual meeting; New York, NY, USA (12 Jun 1977).

LMFBRs with internal blankets (heterogeneous reactors) are known for reducing the sodium void reactivity and increasing the breeding ratio. As for homogeneous reactors, the optimization of the fuel pin diameter for heterogeneous reactors is of great interest. The optimum pin diameter is obtained by changing the fuel pin diameter until the homogenized fuel volume fraction is the same as the optimum fuel volume fraction of the homogeneous core. The optimization of the fuel pin diameter with respect to doubling time for a loosely coupled 1200 MWe oxide heterogeneous reactor is described. The results are compared with those of a homogeneous reactor.

- 532 (CONF-770611--38) FLOW ORIFICING OF LARGE LMFBR CORES WITH INTERASSEMBLY HEAT TRANSFER. Khan, E.U.; Barthold, W.P. (Argonne National Lab., IL (USA)). 1977. Contract W-31-109-ENG-48. 7p. Dep. NTIS, PC A02/MF A01.

From American Nuclear Society annual meeting; New York, NY, USA (12 Jun 1977).

Core flow orificing is important because fuel lifetime (or burnup) is strongly dependent upon the peak cladding temperature. The peak cladding temperature in different assemblies can be made nearly equal by properly allocating the flow to each assembly through flow orificing. In the method described each orifice zone has the same peak cladding temperature at some time in life. This method is especially important for large heterogeneous LMFBR (parfait) cores where interassembly heat transfer effects become more important than for the corresponding homogeneous LMFBR. The method was applied to orifice the flow in both homogeneous and heterogeneous cores.

- 533 (CONF-770735--4) SELF-WELDING EVALUATION OF STELLITE 6 AND STELLITE 56 IN FLOWING SODIUM. Chang, J.Y.; Schrock, S.L.; Johnson, R.V. (Westinghouse Electric Corp., Madison, PA (USA). Advanced Reactors Div.). 1977. Contract EY-76-C-62-345-001. 31p. Dep. NTIS, PC A03/MF A01.

From International Metallographic Society annual meeting; Houston, TX, USA (19 Jul 1977).

The self-welding behavior of two similar materials, Stellite 6 and Stellite 56, in sodium are discussed. The materials were tested at temperatures from 850 to 1400°F for time periods up to six-months while immersed in flowing sodium. Contact stresses ranged from 6000 psi to 16,000 psi on contact areas from 0.35 to 0.47 square inches. All separation tests to determine the extent of self-welding

were conducted in a tensile mode. The surface morphologies of the samples before and after each test were measured. At temperatures of 1150°F and above, almost all the Stellite 6 specimens indicated a significant tendency toward self-welding within a relatively short period of time (one week). Stellite 56 couples also developed a strong self-weld bond at 1160°F after six-month exposure.

time varying loading is becoming more and more important. However, notorious discrepancy has been observed between various analytical predications and experimental results for the buckling of shells. Various theories have been proposed to explain these discrepancies. Most of these theories are concerned with two aspects: initial imperfections and asymmetric responses. Both theories do narrow the gap between theoretical and experimental results; however, the remaining discrepancy is still not small. Other possible causes of this discrepancy have to be studied; among them, the boundary conditions. It has been pointed out that the slip at the boundary may have noticeable effect on the transient behavior of a plate. In this paper, the effect of various boundary conditions on the dynamic instability of axisymmetric shells is studied using the numerical discretization technique--convective finite element method.

- 534 (CONF-770807--1, pp vp) COMPOSITE CONTAINMENT FOR NUCLEAR POWER. 1977. From 4. international conference on structural mechanics in reactor technology; San Francisco, CA, USA (15 Aug 1977).

A new concept is described in which a steel liner is employed which carries much of the primary membrane loads. This type of structure is similar in some aspects to the previously described system: a mat, lined with a thin plate on its top surface, is similar to concrete containment; a cylinder and hemispherical dome, made up of steel plate and concrete, is about 2.5 feet thick (the minimum required for radiation shielding). The governing equations have been derived accounting for the fact that the stresses in the steel liner are calculated in accordance with the shell equations for hoop and meridional strains and temperature and the fact that the reinforcing bars respond as linear members. Because of composite behavior hoop and meridional membrane strain compatibility is maintained between the steel liner and the reinforcing bars.

- 537 (CONF-770807--35) SUBASSEMBLY BOWING EXPERIENCE IN EBR-II. Bottcher, J.H.; Hoffman, G.L. (Argonne National Lab., IL (USA)). 1977. Contract W-31-109-ENG-38. 12p. Dep. NTIS, PC A02/MF A01.

From 4. international conference on structural mechanics in reactor technology; San Francisco, CA, USA (15 Aug 1977).

In reactor bowing of subassemblies has caused some handling difficulties at EBR-II, the extent of the problem increasing with the subassembly stiffness. Analysis of four particular bowed subassemblies with respect to their core environment and structural design has indicated that residual bow is primarily the result of radiation-enhanced creep during irradiation.

- 535 (CONF-770807--27) SOME TRENDS IN CONSTITUTIVE EQUATION MODEL DEVELOPMENT FOR HIGH-TEMPERATURE BEHAVIOR OF FAST-REACTOR STRUCTURAL ALLOYS. Pugh, C.E.; Robinson, D.N. (Oak Ridge National Lab., TN (USA)). 1977. Contract W-7405-ENG-26. 25p. Dep. NTIS, PC A02/MF A01.

From 4. international conference on structural mechanics in reactor technology; San Francisco, CA, USA (15 Aug 1977).

The paper addresses some important features of the inelastic behavior of 2 1/4Cr-1Mo steel and indicates a mathematical framework that is capable of representing these types of response. While the constitutive model discussed embraces capabilities beyond those of equations presently used in design analyses; their implementation into practicable analysis methods (such as finite-element programs) is more demanding. For example, in the case of slow time-dependent deformations, the equations governing accumulation of the inelastic strain components and the evolution of the tensorial state variable α are intimately coupled. A part of recommending any such model for use in design must be a quantitative assessment of the economic feasibility of implementation.

- 538 (CONF-770807--37) STRUCTURAL DYNAMICS IN LMFBR CONTAINMENT ANALYSIS: A BRIEF SURVEY OF COMPUTATIONAL METHODS AND CODES. Chang, Y.W.; Gvildys, J. (Argonne National Lab., IL (USA)). 1977. Contract W-31-109-ENG-38. 19p. Dep. NTIS, PC A02/MF A01.

From 4. international conference on structural mechanics in reactor technology; San Francisco, CA, USA (15 Aug 1977).

In recent years, the use of computer codes to study the response of primary containment of large, liquid-metal fast breeder reactors (LMFBR) under postulated accident conditions has been adopted by most fast reactor projects. Since the first introduction of REXCO-H containment code in 1969, a number of containment codes have evolved and been reported in the literature. The paper briefly summarizes the various numerical methods commonly used in containment analysis in computer programs. They are compared on the basis of truncation errors resulting in the numerical approximation, the method of integration, the resolution of the computed results, and the ease of programming in computer codes. The aim of the paper is to provide enough information to an analyst so that he can suitably define his choice of method, and hence his choice of programs.

- 536 (CONF-770807--34) DYNAMIC INSTABILITY ANALYSIS OF AXISYMMETRIC SHELLS BY FINITE ELEMENT METHOD WITH CONNECTED COORDINATES. Hsieh, B.J. (Argonne National Lab., IL (USA)). 1977. Contract W-31-109-ENG-38. 12p. Dep. NTIS, PC A02/MF A01.

From 4. international conference on structural mechanics in reactor technology; San Francisco, CA, USA (15 Aug 1977).

The instability of axisymmetric shells has been used in engineering fields as a safety device such as the rupture discs used in the LMFBR (Liquid Metal Fast Breeder Reactor) design to relieve the excessive pressure caused by the water and sodium reaction when there is a leak in the piping system. Hence, the analysis of the instability of shells under

- 539 (CONF-770807--39) PARAMETRIC INVESTIGATION OF FRACTURE OF EBR-II DUCTS. Chopra, P.S.; Moustakakis, B. (Argonne National Lab., IL (USA)). 1977. Contract W-31-109-ENG-38. 23p. Dep. NTIS, PC A02/MF A01.

From 4. international conference on structural mechanics in reactor technology; San Francisco, CA, USA (15 Aug 1977).

Results of preliminary static and dynamic finite element fracture mechanics analyses that

were conducted to analytically simulate the dynamic fracture behavior of EBR-II ducts are presented. The loads considered are those that may arise because of rapid release of fission gases from a failed fuel element inside a duct, obtained from some previous tests and a recent analytical model. In spite of the motivation for the present work, the analytical procedures described may have a wider general application in the fail-safe design of structures.

- 540 (CONF-770807--39) EFFECT OF HIGH EXTERNAL THERMAL LOADING ON LMFBR SUBASSEMBLY INTEGRITY. Smith, J.L.; Helenberg, H.W.; Kilsdonk, D.J.; Pedersen, D.R.; Pierce, R.D.; Wilson, R.E.; Ariman, T. (Argonne National Lab., IL (USA)). 1977. Contract W-31-109-ENG-38. 17p. Dep. NTIS, PC A02/MF A01.

From 4. international conference on structural mechanics in reactor technology; San Francisco, CA, USA (15 Aug 1977).

One of the postulated accidents to be considered in the evaluation of the safety and integrity of a Liquid Metal Fast Breeder Reactor (LMFBR) is a complete meltdown (loss-of-cooling) of a subassembly without reactor shutdown. One barrier to further propagation is the ducts of the adjacent subassemblies. The meltdown of a subassembly can result in a pressure loading and/or a thermal loading of the adjacent subassembly ducts. There are four potential failure modes of the adjacent duct: (1) failure as a result of coolant boiling inside the adjacent duct followed by melting of the duct, (2) cracking of the duct as a result of thermal stress, (3) deformation of the duct as a result of thermal stress followed by coolant boiling and melt through, and (4) weakening of the duct as a result of high temperature allowing pressure loading to cause duct failure. The purpose of this paper is to discuss the experimental investigation of the thermal loading of the adjacent subassembly ducts as a result of application of fuel to one flat.

- 541 (CONF-770807--40) THERMAL AND STRESS ANALYSES OF MELTDOWN CUPS FOR LMFBR SAFETY EXPERIMENTS USING SLSF IN-REACTOR LOOPS. Blomquist, C.A.; Ariman, T.; Pierce, R.D.; Pedersen, D.R. (Argonne National Lab., IL (USA)). 1977. Contract W-31-109-ENG-38. 21p. Dep. NTIS, PC A02/MF A01.

From 4. international conference on structural mechanics in reactor technology; San Francisco, CA, USA (15 Aug 1977).

A description of a meltdown cup to be used in the SLSF in-reactor experiments is presented. Thermal analyses have shown that the cup is capable of containing and cooling the postulated quantities of molten fuel and steel. The basic loadings for stress analyses were defined and failure modes were determined. It was shown that both the maximum bending stress and maximum tangential stress in the Inconel vessel are below the material yield stress. Additionally, the axial stress in the Inconel vessel was found to be negligible. The shear stress in the wire-formed retaining ring is much below the maximum shear stress. Therefore, the meltdown cup is capable of performing its required function.

- 542 (CONF-770807--41) DEVELOPMENT OF A FINITE-STRAIN FUEL-ELEMENT MODEL. Jankus, V.Z.; Shack, W.J. (Argonne National Lab., IL (USA)). 1977. Contract W-31-109-ENG-38. 11p. Dep. NTIS, PC A02/MF A01.

From 4. international conference on structural mechanics in reactor technology; San Francisco, CA, USA (15 Aug 1977).

The LIFE-III computer code was developed to calculate the thermal and mechanical response of mixed-oxide fuel elements in a fast-reactor environment. It incorporates a one-dimensional, steady-state heat-transfer analysis and a structural analysis based on generalized plane strain. Temperature, stress, and strain can be calculated for any specified history of reactor power cycling. Up to seven axial segments are permitted to account for axial variations in power and coolant temperature. Fuel restructuring, migration of fabricated porosity, fuel and cladding swelling and creep, fission-gas release, and fuel cracking, crack healing, and hot pressing are included in the analysis. The mechanical analysis in the original version of the code was based on the assumption that the strains in the fuel and cladding could be considered infinitesimal. However, this assumption is grossly violated in the vicinity of the central void of the fuel, since the opening and closing of the void involves displacements of the order of the void radius. To provide a more accurate description of the mechanical behavior of the fuel element, a finite-strain fuel-element model has been developed. The finite-strain calculations in the modified code are based on an incremental analysis. The deformation history of the fuel element is analyzed in discrete time steps, and the basic geometry of the element is updated after each time step. To perform the calculation for nonlinear materials, each axial segment is divided into a number (less than or equal to 20) of concentric cylindrical shells. The analysis maintains the overall force equilibrium of each ring and enforces geometric compatibility between the shells, and the boundary pressures and displacement increments at the inner and outer surfaces of a shell are related to the stresses and the strain increments within the shell in a novel manner.

- 543 (CONF-770807--43) MECHANICAL RESPONSE OF FFTF REFERENCE AND P1 CLADDING TUBES UNDER TRANSIENT HEATING. Youngahl, C.A.; Ariman, T.; Lepacek, B.E. (Argonne National Lab., IL (USA)). 1977. Contract W-31-109-ENG-38. 13p. Dep. NTIS, PC A02/MF A01.

From 4. international conference on structural mechanics in reactor technology; San Francisco, CA, USA (15 Aug 1977).

Burst tests of Type 316 stainless steel cladding tube samples subjected to increasing temperature and relatively constant internal pressure were conducted to assist in the pretest analysis of the P1 experiment performed in the Sodium Loop Safety Facility. This paper reports and analyzes the burst test results and those of subsequent transient heating work. The use of a modified extensometer in obtaining mechanical response data for stainless steel in the high temperature range is illustrated, some of such data is provided, and the potential of further experiments and analysis is indicated. Tubing of the same design as Fast Flux Test Facility (FFTF) cladding (20% cold worked, 0.230 in. OD, 15 mil wall) was tested as-received and after annealing or electrolytic thinning. P1 tubing (38% cold worked, 0.230 in. OD, 10 mil wall) was tested before and after aging under conditions anticipated in the P1 reactor experiment. The P1 cladding was designed to simulate FFTF tubing that had experienced irradiation embrittlement and attack by cesium oxide and sodium impurities.

- 544 (CONF-770807--44) PROOF TESTS OF IRRADIATED AND UNIRRADIATED EBR-II SUBASSEMBLY DUCTS. Ruther, W.E.; Chopra, P.S.; Lambert, J.D.B. (Argonne National Lab., IL (USA)). 1977. Contract W-31-109-ENG-38. 15p. Dep.

NTIS, PC A02/MF A01.

From 4. international conference on structural mechanics in reactor technology; San Francisco, CA, USA (15 Aug 1977).

A series of dynamic pressure tests have been conducted within EBR-II subassembly ducts. The tests were designed to simulate bursting of a driver-fuel element in a cluster of such elements at their burnup limit during off-normal conditions in EBR-II. The major objective of the tests was to assure that such failure, which might cause rapid release of stored fission gas, would not deform or otherwise damage subassembly ducts in a way that would hinder movement of a control rod. The test results are described.

- 545 (CONF-770807--45) COMPUTER SIMULATION OF LMFBR PIPING SYSTEMS. A-Moneim, M.T.; Chang, Y.W.; Fistedis, S.H. (Argonne National Lab., IL (USA)). 1977. Contract W-31-109-ENG-38. 10p. Dep. NTIS, PC A02/MF A01.

From 4. international conference on structural mechanics in reactor technology; San Francisco, CA, USA (15 Aug 1977).

Integrity of piping systems is one of the main concerns of the safety issues of Liquid Metal Fast Breeder Reactors (LMFBR). Hypothetical core disruptive accidents (HCDA) and water-sodium interaction are two examples of sources of high pressure pulses that endanger the integrity of the heat transport piping systems of LMFBRs. Although plastic wall deformation attenuates pressure peaks so that only pressures slightly higher than the pipe yield pressure propagate along the system, the interaction of these pulses with the different components of the system, such as elbows, valves, heat exchangers, etc.; and with one another produce a complex system of pressure pulses that cause more plastic deformation and perhaps damage to components. A generalized piping component and a tee branching model are described. An optional tube bundle and interior rigid wall simulation model makes such a generalized component model suited for modelling of valves, reducers, expansions, and heat exchangers. The generalized component and the tee branching junction models are combined with the pipe-elbow loop model so that a more general piping system can be analyzed both hydrodynamically and structurally under the effect of simultaneous pressure pulses.

- 546 (CONF-770807--46) RESPONSE OF SUBASSEMBLY MODEL WITH INTERNALS. Kennedy, J.M.; Belytschko, T. (Argonne National Lab., IL (USA)). 1977. Contract W-31-109-ENG-38. 23p. Dep. NTIS, PC A02/MF A01.

From 4. international conference on structural mechanics in reactor technology; San Francisco, CA, USA (15 Aug 1977).

Analytical tools have been developed and validated by controlled sets of experiments to understand the response of an accident and/or single subassembly in an LMFBR reasonably well. They have been subjected to a variety of loadings and boundary environments. Some large subassembly cluster experiments have been performed, however little analytical work has accompanied them because of the lack of suitable analytical tools. Reported are analytical approaches to: (1) development of more sophisticated models for the subassembly internals, that is, the fuel pins and coolant; (2) development of models for representing three dimensional effects in subassemblies adjacent to the accident subassembly. These analytical developments will provide feasible capabilities for doing economical three-dimensional analysis not previously available.

- 547 (CONF-770807--47) STRUCTURAL RESPONSE OF LARGE LMFBR HEAD CLOSURES TO HYPOTHETICAL CORE DISRUPTIVE ACCIDENTS. Kulak, R.F.; Marciniak, T.J.; Belytschko, T.B. (Argonne National Lab., IL (USA)). 1977. Contract W-31-109-ENG-38. 18p. Dep. NTIS, PC A02/MF A01.

From 4. international conference on structural mechanics in reactor technology; San Francisco, CA, USA (15 Aug 1977).

A preliminary study of the dynamic response of a large (1200 MWe) pool-type deck structure to an energetic core disassembly accident was performed. The analysis proceeded as two independent, decoupled calculations: containment calculations and deck response calculations. The containment calculations were performed mainly to derive a loading pressure history for the deck structure. In part of the study, the deck was considered rigid so the derived loading pressures were conservative. In the second part of the study a set of independent deck response calculations were performed using the derived loading pressure history as input. A finite-element model that incorporated the main structural components of the deck was constructed. A preliminary study of the dynamic response of the deck was performed using this model. Also, the effect that different types of boundary conditions have on the dynamic response of the deck was studied. Based on the above preliminary studies, it is concluded that the deck structure can maintain its structural integrity under the given energy release.

- 548 (CONF-770807--49) EXTENSION OF HCDA SAFETY ANALYSIS TO LARGE PCRV CONTAINMENT STRUCTURES. Marchertas, A.H.; Fistedis, S.H.; Bazant, A.P.; Belytschko, T. (Argonne National Lab., IL (USA)). 1977. Contract W-31-109-ENG-38. 29p. Dep. NTIS, PC A03/MF A01.

From 4. international conference on structural mechanics in reactor technology; San Francisco, CA, USA (15 Aug 1977).

The introduction of PCRV as part of LMFBR containment also brings in the need for dynamic analysis. The conventional design would not be adequate for designing PCRVs subject to highly transient loading. The PCRV models described provide a valuable illustration of the design arrived at by conventional means and loaded dynamically by means of the transient computer code. In particular the value of the computer code is realized in the case of the loop-type model. The original pressure-volume source used for the illustrative examples corresponds to a total available energy of 2720 MW-s, if the expansion were continued down to one bar. Thus the energy source is considerably larger than the energy releases utilized in the currently prevailing LMFBR safety evaluations. Although the resultant pressure acting on the walls of the PCRV varies with the particular design, the two sample cases indicate that no apparent difficulty is encountered in designing the PCRV to sustain those higher loads. The computer code is established as a valuable tool to study the PCRV response. It serves as a means to locate critical areas of the particular design. Parameter- or sensitivity studies could thus be made with great efficiency. As an example, one interesting and somewhat unexpected result of the illustrations presented is the occurrence of circumferential cracks through the walls of the PCRV.

- 549 (CONF-770807--50) FINITE-ELEMENT FORMULATIONS FOR THE THERMAL STRESS ANALYSIS OF TWO- AND THREE-DIMENSIONAL THIN REACTOR

STRUCTURES. Kulak, R.F.; Kennedy, J.M.; Belytschko, T.B.; Schoeberle, D.F. (Argonne National Lab., IL (USA)). 1977. Contract W-31-109-ENG-38. 22p. Dep. NTIS, PC A02/MF A01.

From 4. international conference on structural mechanics in reactor technology; San Francisco, CA, USA (15 Aug 1977).

In several postulated LMFBR subassembly-to-subassembly failure propagation events, it is hypothesized that the duct wall of an accident subassembly fails and deposits molten fuel on the outer wall of an adjacent subassembly. It is therefore necessary to determine if the deposited fuel will fail the adjacent wall and thus propagate the event. This entails a thermal stress analysis, and since at times the adjacent subassembly is internally pressurized, thermomechanical analysis are also of value. Solutions are presented for several elastic plastic thermal problems. Some of these examples are compared to available analytic solutions. In addition, the hypothetical accident of molten fuel deposition on the adjacent hexcan is addressed. Combinations of pressure and thermal loading are considered. It is shown that the principal feature of the response is a large in-plane compressive stress which would undoubtedly cause buckling.

550 (CONF-770807--51) EFFECT OF TUBE-SUPPORT INTERACTION ON THE DYNAMIC RESPONSES OF HEAT EXCHANGER TUBES. Shin, Y.S.; Jendzejczyk, J.A.; Wambagans, M.W. (Argonne National Lab., IL (USA)). 1977. Contract W-31-109-ENG-38. 15p. Dep. NTIS, PC A02/MF A01.

From 4. international conference on structural mechanics in reactor technology; San Francisco, CA, USA (15 Aug 1977).

Operating heat exchangers have experienced tube damages due to excessive flow-induced vibration. The relatively small inherent tube-to-baffle hole clearances associated with manufacturing tolerances in heat exchangers affect the tube vibrational characteristics. In attempting a theoretical analysis, questions arise as to the effects of tube-baffle impacting on dynamic responses. Experiments were performed to determine the effects of tube-baffle impacting in vertical/horizontal tube orientation, and in air/water medium on the vibrational characteristics (resonant frequencies, mode shapes, and damping) and displacement response amplitudes of a seven-span tube model. The tube and support conditions were prototypic, and overall length approximately one-third that of a straight tube segment of the steam generator designed for the CRBR. The test results were compared with the analytical results based on the multispan beam with 'knife-edge' supports.

551 (CONF-770807--52) SIMULATION OF LMFBR EXCURSION MODELS BY MEANS OF ICECO. Marchertas, A.H.; Wang, Y.C.; Fistedis, S.H. (Argonne National Lab., IL (USA)). 1977. Contract W-31-109-ENG-38. 13p. Dep. NTIS, PC A02/MF A01.

From 4. international conference on structural mechanics in reactor technology; San Francisco, CA, USA (15 Aug 1977).

Test data from experiments dealing with LMFBR containment studies are compared with containment code solutions. The features of fluid spillage, which is a subject of some concern in experiments, is modeled in the ICECO code and is stressed. Several variations of spillage solution were arrived at gaining more insight to this problem and thus serve in reducing some of the uncertainties connected with fluid spillage. Other features of the

analytical models are utilized and described.

552 (CONF-770807--53) ANALYSIS OF LMFBR CONTAINMENT RESPONSE TO AN HCDA USING A MULTIFIELD EULERIAN CODE. Chu, H.Y.; Chang, Y.W. (Argonne National Lab., IL (USA)). 1977. Contract W-31-109-ENG-38. 13p. Dep. NTIS, PC A02/MF A01.

From 4. international conference on structural mechanics in reactor technology; San Francisco, CA, USA (15 Aug 1977).

During a hypothetical core disruptive accident (HCDA), a core meltdown may cause the fuel cladding to rupture and the fuel fragments to penetrate into the sodium coolant. The heat in the molten fuel may cause the liquid sodium to boil, changing its phase. The interactions between materials are so complicated that a single-material model with homogenized material properties is not adequate. In order to analyze the above phenomena more realistically, a Multifield Implicit Continuous-Fluid Eulerian containment code (MICE) is being developed at Argonne National Laboratory (ANL) to solve the multifield fluid-flow problems in which the interpenetrations of materials, heat transfer, and phase changes are considered in the analysis. The hydrodynamics of the MICE code is based upon the implicit multifield (IMF) method developed by Harlow and Amsden. A partial donor-cell formulation is used for the calculation of the convective fluxes to minimize the truncation errors, while the Newton-Raphson method is used for the numerical iterations. An implicit treatment of the mass convection together with the equation of state for each material enables the method to be applicable to both compressible and incompressible flows. A partial implicit treatment of the momentum-exchange functions allows the coupling drag forces between two material fields to range from very weak to those strong enough to tie the fields completely. The differential equations and exchange functions used in the MICE code, and the treatment of the fluid and structure interactions as well as the numerical procedure are described. Two sample calculations are given to illustrate the present capability of the MICE code.

553 (CONF-770807--54) EULERIAN ALGORITHM FOR ANALYZING FLUID-STRUCTURE INTERACTION IN THE FAST REACTOR CONTAINMENT. Wang, C.Y.; Chang, Y.W.; Fistedis, S.H. (Argonne National Lab., IL (USA)). 1977. Contract W-31-109-ENG-38. 18p. Dep. NTIS, PC A02/MF A01.

From 4. international conference on structural mechanics in reactor technology; San Francisco, CA, USA (15 Aug 1977).

The Eulerian algorithm described is capable of analyzing two-dimensionally the fluid-structure interaction in a typical LMFBR containment consisting of various structure components. The algorithm has several special features. First, it employs the Eulerian coordinates in the formulation and enables the technique to be applicable to excursions involving large material distortions. Second, it provides rigorous hydrodynamic analyses at the fluid-structure interface and at the geometrical discontinuities, which is very important in the study of wave-transmission and -diffraction problems. Third, the algorithm incorporates a well-developed finite-element structural program that can account for both material and geometrical nonlinearities. The application of this Eulerian algorithm is not limited to fast reactor containment. It can also be applied to the major piping components, such as valve and IHX, where internal baffle plates may play an important role in the wave propagation. Moreover, the treatment of the

time-dependent irregular cell can be integrated with the IMF² Method and structural dynamics program for investigating the coupled fluid-structure problems involving two-phase flows.

- 554 (CONF-770807--55) PTA-1 COMPUTER PROGRAM FOR TREATING PRESSURE TRANSIENTS IN HYDRAULIC NETWORKS INCLUDING THE EFFECT OF PIPE PLASTICITY. Youngdahl, C.K.; Kot, C.A. (Argonne National Lab., IL (USA)). 1977. Contract W-31-109-ENG-38. 20p. Dep. NTIS, PC A02/MF A01.

From 4. international conference on structural mechanics in reactor technology; San Francisco, CA, USA (15 Aug 1977).

Pressure pulses in the intermediate sodium system of a liquid-metal-cooled fast breeder reactor, such as may originate from a sodium/water reaction in a steam generator, are propagated through the complex sodium piping network to system components such as the pump and intermediate heat exchanger. To assess the effects of such pulses on continued reliable operation of these components and to contribute to system designs which result in the mitigation of these effects, Pressure Transient Analysis (PTA) computer codes are being developed for accurately computing the transmission of pressure pulses through a complicated fluid transport system, consisting of piping, fittings and junctions, and components. PTA-1 provides an extension of the well-accepted and verified fluid hammer formulation for computing hydraulic transients in elastic or rigid piping systems to include plastic deformation effects. The accuracy of the modeling of pipe plasticity effects on transient propagation has been validated using results from two sets of Stanford Research Institute experiments. Validation of PTA-1 using the latter set of experiments is described briefly. The comparisons of PTA-1 computations with experiments show that (1) elastic-plastic deformation of LMFBR-type piping can have a significant qualitative and quantitative effect on pressure pulse propagation, even in simple systems; (2) classical fluid-hammer theory gives erroneous results when applied to situations where piping deforms plastically; and (3) the computational model incorporated in PTA-1 for predicting plastic deformation and its effect on transient propagation is accurate.

- 557 (CONF-770807--Pt.E, pp vp) ACOUSTIC WAVE MEASUREMENTS IN REACTOR-GRADE CONCRETES. 1977.

From 4. international conference on structural mechanics in reactor technology; San

Francisco, CA, USA (15 Aug 1977).

In this paper, five reactor grade concretes were investigated during their initial cure period to gather information which is a suitable data base for interpreting the results of confirmatory reactor safety research programs. In particular, the concretes studied were the concrete proposed for the Clinch River Breeder Reactor (CRBR), which is a limestone mix with flyash, and two other limestone-aggregate mixes and two basaltic-aggregate mixes. The curing process in these concretes was followed with strength tests and with acoustic-wave velocity measurements. The choice of the latter technique was based on the successful programs of several investigators who used acoustic waves to follow the curing process in concrete and this information was also required for instrumentation techniques that are proposed for accident simulation studies. The technique used to measure the sound velocities of concrete is a modified version of the pulse transmission technique introduced by Mattaboni and which conforms to ASTM Standard C597-71 for the measurement of the sound velocity in concrete. This technique uses an electronic technique to measure the transit time of an acoustic wave through a sample and, thus, its acoustic velocity. The results of the CRBR concrete program illustrate that the water retention stabilizes after 10 days of cure with a net loss of 0.4%; the addition of flyash to the mix stabilizes it and slows down the initial curing process from 33 to 90 days; the addition of the admixtures to the mix reduces its sound velocity from 5.74 km/s to 5.64 km/s and its strength from 51.6 MPa (7590 psi) to 42.1 MPa (6190 psi); and the sound velocity in this concrete stabilized after 75 days of cure.

- 558 (CONF-770807--Pt.E, pp vp) FINITE-ELEMENT FORMULATIONS FOR THE THERMAL STRESS ANALYSIS OF TWO- AND THREE-DIMENSIONAL THIN REACTOR STRUCTURES. 1977.

From 4. international conference on structural mechanics in reactor technology; San Francisco, CA, USA (15 Aug 1977).

This paper describes finite-element formulations for the thermal stress analysis of LMFBR structures. The first formulation is applicable to large displacement rotation problems in which the strains are small. For this formulation, a general temperature-dependent constitutive relationship is derived from a Gibbs potential function and a temperature dependent yield surface. The temperature dependency of the yield surface is based upon a temperature-dependent, material-hardening model. The model uses a temperature-equivalent stress-plastic strain diagram which is generated from isothermal uniaxial stress-strain data. A second formulation is presented for problems characterized by both large displacement-rotations and large strains. Here a set of large strain hypoelastic-plastic relationships are developed to linearly relate the rate of stress to the rate of deformation. The temperature field is described through time-dependent values at mesh node points; the temperature fields in each element are then obtained by interpolation formulas. Hence, problems with both spatial and temporal dependent temperature fields can easily be treated. The above developments were incorporated into two ANL developed finite-element computer codes: the implicit version of STRAW and the 3D Implicit Structural Analysis Code. STRAW is a two-dimensional code with a plane stress/plane strain beam element. The 3D Implicit code has a triangular flat plate element which is capable of sustaining both membrane and bending loads. To insure numerical

stability both codes are based on an iterative-incremental solution procedure with equilibrium checks based on an error in energy.

559 (CONF-770807--Pt.E, pp vp) COMPUTER SIMULATION OF LMFBR PIPING SYSTEMS. 1977.

From 4. international conference on structural mechanics in reactor technology; San Francisco, CA, USA (15 Aug 1977).

A two-dimensional coupled hydrodynamic-structural response analysis of piping systems is described. Implicit Continuous-Fluid Eulerian (ICE) technique is utilized in the hydrodynamics while a finite-element technique is used in the structural analysis. Different piping components such as elbows, valves, reducers, expansions, heat exchangers, and tees are modelled and coupled with the straight pipe model. An axisymmetric general component model that can be used in modelling valves, reducers, expansions, and heat exchangers is described. At the inlet and outlet region of such component the cross-sectional area may change suddenly or gradually, or may not change at all. Among the options available in this model are deformable exterior walls, interior rigid wall simulation, and tube bundle effect. Exterior walls of pipes and components are treated as thin axisymmetric shell. A convected coordinate explicit finite-element scheme for large displacement small strain, elastic-plastic material behavior in which membrane and bending strengths are accounted for is employed. The strains are linearly related to the displacement of the element relative to its convective coordinates, and similarly, the nodal forces are linearly related to the elements stresses. The coupling of the hydrodynamics and structural problems is done in such a way that the hydrodynamics supplies the structure with a pressure loading and the structure supplying the hydrodynamics with a moving boundary condition. Because of the difficulties of handling interior walls that may occupy partial zones, the walls are assumed rigid and limited in their orientation to be parallel to the radial or axial directions, their position to zone boundaries, and their thickness to zero.

560 (CONF-770807--Pt.E, pp vp) MATERIAL PROBLEMS IN ACCIDENT ANALYSIS OF PRESTRESSED CONCRETE REACTOR VESSELS. 1977.

From 4. international conference on structural mechanics in reactor technology; San Francisco, CA, USA (15 Aug 1977).

One problem investigated is the nonlinear constitutive behavior and failure criteria for concrete. Previously, a comprehensive theory, called endochronic theory, has been shown to satisfy all basic currently known features of test data. Nevertheless uncertainty still exists with regard to non-proportional loading paths, for which good test data are lacking at present. An extension of the endochronic theory which correlates best with general experimental evidence and includes fracturing terms is given, and a comparison with vertex-type hardening in plasticity is made. Finally, application in a finite element analysis of compression failure of a wall due to localized strain-softening bands is discussed. A second problem which must be analysed in accident situations is the high temperature shock on the concrete walls (due to liquid sodium, up to 850°C). Refining a previous crude formulation a rational model for calculating moisture and heat transfer and pore pressures in concrete subjected to thermal shock is presented. It employs full thermodynamic properties of water, considers dehydration of concrete, changes in porosity and in sorption isotherms, as well as

heat convection and thermal moisture flux. The model is calibrated by means of test data. For the purpose of failure analysis of the vessel, creep at high temperature, including the transitional thermal creep must be considered. Finally, a model in which the formulations for heat and moisture transport, for creep and for nonlinear stress-strain behavior are combined to calculate compression failure due to a thermal shock, is outlined. The ultimate purpose is the prediction of spalling, possibly the explosive spalling, of the wall.

562 (CONF-770807--Pt.E, pp vp) RESPONSE OF SIMPLE, SCALE MODEL REACTOR VESSELS TO A SIMULATED HCDA LOADING. 1977.

From 4. international conference on structural mechanics in reactor technology; San Francisco, CA, USA (15 Aug 1977).

The work described here was performed to verify modeling techniques used in two-dimensional axisymmetric fluid-structure-interaction codes. A well-defined energy source was applied in simple reactor models having well-defined material properties, dimensions with precision tolerances, and simple boundary conditions, and the loading, strain, and deformations were measured. The experiments were performed in thick-walled and thin-walled vessels that are approximately 1/30-scale of the Clinch River Breeder Reactor (CRBR). The sodium coolant is simulated by water, and the HCDA load is simulated by the expansion of the detonation products of a low-density explosive detonated in the vessel core barrel. The detonation products expand from an initial pressure of 3700 psi down to 360 psi for a volume change of 410 cm³, equal to the cover gas volume. The expansion produces 2.87 kW-sec of gas work up to slug impact on the vessel cover. Piezoelectric quartz pressure transducers measure the loading pressure in the core and on the core support platform, the vessel wall, and the cover. Foil strain gages measure circumferential and axial strains on the vessel wall. The plastic work absorbed by the vessel before and after slug impact is calculated from the strain measurements and the post-test deformation profiles. In the thick-walled vessel, the peak pressures are 3000 psi on the core support platform, 6000 psi on the vessel wall, and 14,000 psi on the cover. The cover pressure rapidly drops to 7000 psi corresponding to slug impact pressure. In the thin-walled vessel, the platform and wall pressures are 50% lower and the cover pressure is only 7% lower.

563 (CONF-770807--Pt.E, pp vp) CHARGE DEVELOPMENT AND ANALYSIS OF RECENT UK EXPERIMENTS IN THE COVA MODEL TEST PROGRAMME. 1977.

From 4. international conference on structural mechanics in reactor technology; San Francisco, CA, USA (15 Aug 1977).

The COVA programme of small scale experiments consists of a two pronged attack on the provision of high quality accurate data for validating explosion containment codes. This paper examines some effects arising from the inclusion in the model geometries of either

thin or over strong outer tanks, of hemispherical or right cylindrical bases or of simple internals. The main energy source for the COVA programme is a low pressure high explosive which has been especially developed by the UK for use in model test series. The paper describes the characterisation of this low density explosive which is based on a PETN/polystyrene mix expanded, under strictly controlled heating, to form self supporting charges of various sizes. This characterization, involving the analysis of cylinder tests and under-water firings of bare spheres, shows that the explosive performs in a reproducible manner in both dry and wet environments. The development of a JWL equation of state will be illustrated and discussed. The explosion containment codes being developed within the UK are the 2-D Lagrangian code ASTARTE-3 and the 2-D Eulerian code SEURBNUK-2, the latter being currently developed jointly with JRC, Ispra. Both codes are able to deal with transient compressible flow in deformable primary containment tanks, with various geometries of internal components, depending upon the limitations of Lagrangian or Eulerian concepts and the current state of the development of both codes. For the bare tank experiments the ASTARTE code can be used to predict the entire history of impulse loading due to the fluid flow and some typical comparisons are given for experiments with thin outer tanks.

564 (CONF-770807--Pt.E, pp vp) STRUCTURAL DYNAMICS IN LMFBR CONTAINMENT ANALYSIS. A BRIEF SURVEY OF COMPUTATIONAL METHODS AND CODES. 1977.

From 4. international conference on structural mechanics in reactor technology; San Francisco, CA, USA (15 Aug 1977).

This paper gives a brief survey of the computational methods and codes available for LMFBR containment analysis. The various numerical methods commonly used in the computer codes are compared. It provides the reactor engineers to up-to-date information on the development of structural dynamics in LMFBR containment analysis. It can also be used as a basis for the selection of the numerical method in the future code development. First, the commonly used finite-difference expressions in the Lagrangian codes will be compared. Sample calculations will be used as a basis for discussing and comparing the accuracy of the various finite-difference representations. The distortion of the meshes will also be compared; the techniques used for eliminating the numerical instabilities will be discussed and compared using examples. Next, the numerical methods used in the Eulerian formulation will be compared, first among themselves and then with the Lagrangian formulations. Special emphasis is placed on the effect of mass diffusion of the Eulerian calculation on the propagation of discontinuities. Implicit and explicit numerical integrations will be discussed and results obtained from these two techniques will be compared. Then, the finite-element methods are compared with the finite-difference methods. The advantages and disadvantages of the two methods will be discussed in detail, together with the versatility and ease of application of the method to containment analysis having complex geometries. It will also be shown that the finite-element equations for a constant-pressure fluid element is identical to the finite-difference equations using contour integrations. Finally, conclusions based on this study will be given.

565 (CONF-770807--Pt.E, pp vp) MODELING OF REACTOR INTERNALS IN THE HCDA ANALYSIS. 1977.

From 4. international conference on structural mechanics in reactor technology; San Francisco, CA, USA (15 Aug 1977).

This paper deals with the modeling of the reactor internals in the HCDA analysis. Internals which must be included in the analysis are core blankets, shields, fission-gas plenum, core barrel and core support structure. This is because they are placed so close to the reactor core that the expansion of the reactor core is strongly influenced by the presence of these internals. The general approach to the mathematical model is to incorporate, to the extent possible, the actual geometries and the correct material properties. In the HCDA analysis, the mechanism for producing mechanical damage to the primary containment is the expansion of the reactor core. Therefore, it is very important to model the core gas properly. The inertia of the core gas must be included. Four to six zones are needed for a proper representation of the core. The core blankets and shields can also be represented by zones. If they are segmented, they must be modeled as solid materials with no circumferential strength. Modeling of the core blankets and shields as hydrodynamic materials can lead to underestimation of the slug impact loading on the reactor head as well as the upper vessel wall deformation. Sliding lines must be provided at both sides of the core blankets and shields. The fission-gas plenum can be treated as a group of mixed materials containing gases, liquids and solids. Core barrels must be modeled as thin shells. If the core barrel is to be treated as continuum solid material, the thickness of the core barrel will have to be divided into at least three to five zones. The core support structure can be modeled either as a lattice of shell elements similar to the actual structure or as an elastic-plastic solid continuum material with overall bending stiffness equivalent to the actual structure.

567 (CONF-770807--Pt.E, pp vp) ANALYSIS OF LMFBR CONTAINMENT RESPONSE TO AN HCDA USING A MULTIFIELD EULERIAN CODE. 1977.

From 4. international conference on structural mechanics in reactor technology; San Francisco, CA, USA (15 Aug 1977).

This paper describes a computer code, MICE (Multifield Implicit Continuous-fluid Eulerian Containment Code), which is being developed at Argonne National Laboratory (ANL) for the analysis of containment response to a hypothetical core disruptive accident (HCDA). The code is applicable to multifield flow problems where material fields are allowed to have penetrations. Reactor structures are treated as axisymmetrical shells and solved by the large-displacement and small-strain theory. The numerical technique used for the solution of the multifield fluid flow code consists of two principal steps. In the first step, the material fields in each cell are treated independently; coupling effects are evaluated by binary interactions between fields. In the second step, a pressure equilibration is performed among all fields in each cell; volume fractions are also adjusted in this step. A

partial donor-cell form is adopted for calculating the convective fluxes to minimize the truncation errors; a Newton-Raphson formula is used for the numerical iteration. Implicit treatment of the mass transport and state equations allows the flow speeds to range from far subsonic (incompressible flow) to supersonic. The coupling drag forces between fluids can vary from very weak to those strong enough to tie the fields together completely. Phase transition and heat transfer between fields are also considered into calculation. Two sample problems have been performed using the NICE code. The first illustrates the relative motions of the material fields after the initiation of a core disassembly accident. Core support structure and core barrel are modelled as rigid obstacles. The second demonstrates the interactions between fluid and structures.

- 568 (CONF-770807--Pt.E, pp vp) TRANSIENT RESPONSE OF FAST-REACTOR CORE SUBASSEMBLIES TO PRESSURE LOADS: A COMBINED ANALYTICAL AND EXPERIMENTAL APPROACH. 1977.

From 4. international conference on structural mechanics in reactor technology; San Francisco, CA, USA (15 Aug 1977).

The intent of the paper is to describe a combined analytical-experimental programme that is being performed at J.R.C. Ispra in the field of subassembly deformation. From the numerical side, 2D and 3D non-linear dynamic finite element codes are being developed for coupled hydrodynamics structures situations. The structural part of these codes is based on the use of flexural elements in which non-linearities arising from elastic-plastic behavior and from large-displacement effects are accounted for. As far as the fluid flow phase is concerned, a Lagrangian code is used, since, due to the particular configuration of the subassemblies, the fluid distortions can be assumed to be relatively small. Nevertheless special hybrid elements are used on the interfaces between the liquid and the hexcan walls. In parallel with the analytical work experiments are performed in steps of increasing complexity to that each component of the computer codes can be adequately tested. The experimental series starts with single internally loaded hexcans in which the pressures, strains and displacements are measured as a function of time. The programme continues by explosively loading hexcans surrounded by one or two rows of water filled subassemblies which are held together by a rigid heavy ring. This configuration has well defined boundary conditions, which are necessary for code validation purposes. Experiments are also planned in which the fuel element pins and their spacers will be modelled. Comparisons between experimental and analytical results will be presented for a single internally loaded subassembly and possibly for a subassembly surrounded by a first row of water filled hexcans.

- 569 (CONF-770807--Pt.E, pp vp) ANALYSIS OF MECHANICAL HCDA CONSEQUENCES IN THE COOLANT LOOPS FOR DEMONSTRATION OF PRIMARY CONTAINMENT INTEGRITY IN SNR 300. 1977.

From 4. international conference on structural mechanics in reactor technology; San Francisco, CA, USA (15 Aug 1977).

The demonstration of the accommodation of the mechanical consequences of a hypothetical core disruptive accident (HCDA) within the primary system is an essential objective in the safety assessment for SNR-300. For this purpose a mathematical model has been developed, in which the pressure pulse propagation in fluid-filled

piping systems is calculated. This model takes into account the compressibility of the fluid as well as the elastic-plastic deformation of the pipe walls. It is the special aim of this work to estimate the attenuation of pressure peaks by elastic-plastic response of the pipe walls and to calculate the remaining strains. The basic system of partial differential equations includes the conservation laws for mass and momentum and the equations of state for the fluid and the pipe wall material. Additionally, the equation of motion for the pipe wall is provided, which considers the inertia of structure response after the pressure loading. The stress is described in a one-dimensional way. Axial stresses and strains are neglected. The numerical solution of the differential equations is carried out by an explicit extended Lax-Wendroff difference-scheme with the help of an intermediate step. The accuracy of the implemented calculation models is examined using the results of experiments. First of all, pressure wave experiments are taken, where the rising pressure pulse is so chosen, that the response of the pipe wall material lies exclusively within the elastic region of the diagram. These investigations have been carried out by INTERATOM. The comparison between measured and calculated values shows an excellent agreement of experiment and calculation.

- 570 (CONF-770807--Pt.E, pp vp) LMFBR TYPICAL IMPULSIVE LOADING CHARACTERIZATION AND ITS APPLICATION TO SIMPLIFIED STRUCTURAL MODELS. 1977.

From 4. international conference on structural mechanics in reactor technology; San Francisco, CA, USA (15 Aug 1977).

The aim of this paper is a discussion of the analytical methods which have been used for the dimensioning of the support structure of a LMFBR tank to cope with the explosive accident. Particular reference is given to fast but comprehensive methods developed in order to assist the designer in the preliminary stage of the design. The three main steps necessary to define a general arrangement of the structure can be described as follows: (1) simplified equivalent characterization of the impulsive loading, (2) characterization of the elastic plastic behavior of simple structural elements, (3) parametric absorption of plastic energy with comparison with allowable strains. Each step has been extensively studied and the main results obtained in terms of the analytical methods developed and typical applications are presented and discussed. The paper is divided into two sections: analytical tools and applications.

- 571 (CONF-770807--Pt.E, pp vp) MAIN ASPECTS OF THE DESIGN OF A SUPPORT STRUCTURE OF A LMFBR WITH PARTICULAR REFERENCE TO THE EXPLOSIVE ACCIDENT CONSEQUENCES. 1977.

From 4. international conference on structural mechanics in reactor technology; San Francisco, CA, USA (15 Aug 1977).

The aim of this paper is a review of the main aspects of the design of a support structure of a LMFBR tank, with particular reference to the analysis of the non-linear dynamic behavior of the structure in the plastic range under the effect of an explosive accident within the tank. The structure is composed by a L-shaped flange, which supports the tank, connected by means of nine square beams to a rigid box-type ring, fixed to the concrete. The plug of the tank is connected to the L-shaped flange by means of a group of SS bars. The non-linear dynamic analysis of the explosive accident has been carried out on a

lumped mass model, with elastic-plastic elements which simulate main components of the support structure and tank. The impulsive load connected to the explosive accident has been modelled (on the basis of extensive comparative studies carried out) as two triangular pressure impulses has been the object of a parametric evaluation. The dynamic transient on the support structure during and after the explosive accident for each couple of pressure impulses has been analyzed by means of modified version of the NON SAP code running on a CDC 7600 computer. A large amount of results, which describe displacements, velocities and accelerations of the plug, of the tank, and of the support structure, together with the forces and stresses acting on the main structural components are presented and discussed, with particular reference to the influence of the various parameters involved in the analysis.

572 (CONF-770807--Pt.E, pp vp) CIRCUMFERENTIAL WAVE PROPAGATION EFFECTS IN THIN CYLINDRICAL VESSELS. 1977.

From 4. international conference on structural mechanics in reactor technology; San Francisco, CA, USA (15 Aug 1977).

This paper presents and comments results obtained from the study of an infinitely long thin cylindrical shell ($t/R=5\%$) impulsively loaded over one sixth of its perimeter. This problem is a first approach to deal with the asymmetric loading of the outer containment due to rupture of the inner vessel. A finite element approach has been adopted using the computer system EURDYN. EURDYN deals with dynamic elasto-plastic problems. Large displacements and rotations can be accounted for since a convective coordinate formulation is used. Marching in time is achieved by an explicit scheme particularly suited to the problem treated. Different material properties have been assumed: elastic-perfectly plastic and elasto-plastic with or without Bauschinger effect. In the present case simulation of the cylindrical structure is achieved by means of plane strain beam elements. In this context it is shown in details how to implement the material properties, starting from the general elasto-plastic incremental stress-strain relation for isotropic hardening. Kinematic hardening is obtained by the use of an overlay model. Although, of course, a membrane wave exists in the problem treated, a flexural wave appears; the stress amplitude of the flexural wave is about an order of magnitude above the stress amplitude of the membrane wave. This indicates that safety analysis based on axisymmetric conditions is probably not sufficient and that 3-D calculations have to be considered. Plots of the stress histories at various points are given. The analysis of the results shows that classical properties of the waves are well represented by the numerical solutions.

573 (CONF-770807--Pt.E, pp vp) RESPONSE OF SUBASSEMBLY MODEL WITH INTERNALS. 1977.

From 4. international conference on structural mechanics in reactor technology; San Francisco, CA, USA (15 Aug 1977).

For the purpose of predicting the structural response in such accident environments, a program STRAW has been developed. This is a finite element program which can treat the structure-fluid system consisting of the coolant and the subassembly walls. Both material nonlinearities due to elastic-plastic response and geometric nonlinearities due to large displacements can be treated. The energy source can be represented either by a pressure-time history or an equation of state. Because

of the lack of any simplifying symmetry in the geometry of the subassembly the program uses a quasi-three dimensional model. The cross section of the accident hexcan and the adjacent hexcan are modelled by a two-dimensional finite element mesh which represents the hexcan walls by flexural element and the internals by two-dimensional continuum elements. This mesh is coupled to a series of one-dimensional elements which represent the axial flow of the coolant and the longitudinal stiffness of the fuel pins and hexcan. The latter is of importance in the adjacent hexcan, for its lateral displacement is resisted entirely by this flexural behavior and its inertia. The adequacy of such quasi-three dimensional models has been examined by comparing the STRAW results against almost complete three-dimensional analysis performed with the REXCAT program. In this program, the accident hexcan is represented in a true three-dimensional sense by plate-shell elements, whereas the internals are represented as axisymmetric. These comparisons indicate that the quasi-three-dimensional approach employed in STRAW is valid for a large range of pressure time histories; the fidelity of this model suffers primarily when pressure reaches a peak over a very short time, such as 5-10 microseconds.

575 (CONF-770807--Pt.E, pp vp) SIMULATION OF LMFBR EXCURSION MODELS BY MEANS OF ICECO. 1977.

From 4. international conference on structural mechanics in reactor technology; San Francisco, CA, USA (15 Aug 1977).

Some comparisons of transient fluid-structure tests with results from the ICECO containment code have already been published. The test data used before referred to simplified structural models dealing with the safety aspect of the SNR-300 fast breeder. Thus, the comparison of these more complex models with the ICECO results is the subject of this paper. The experimental data used herein pertain to test models composed of a spherical source within a cylindrical pool water. The rigid ends of the container are connected by holddown bolts and cylindrical boundaries are made of one or two concentric deformable shells. The space above the surface of the water is occupied by air which may vent during the course of the experiment. The dimensions of the model, the transient stress-strain data of the shells, which had been derived in separate experiments, and the pressure-volume relationship are known. Although the boundary conditions of the vessel are also known, they could not be simulated by the analytical models. Initially the outside shell is prestressed by the holddown bolts through the two rigid lids with rubber seals set between the ends of the shell and the lids. This rather complex boundary condition was analytically simulated in the following way: at the bottom the shells were assumed free to deform radially, but were fixed axially; at the top the shell was assumed to have no constraints at all. The analytical results show that the cylindrical vessel closest to the source begins to deform first, followed by the bottom portion of the vessel. The top vessel portion deforms only later when the fluid surface reaches the

top cover and the developed fluid pressure imparts radial vessel deformation.

576 (CONF-770807--Pt.E, pp vp) EXTENSION OF HCDA SAFETY ANALYSIS TO LARGE PCRV CONTAINMENT STRUCTURES. 1977.

From 4. international conference on structural mechanics in reactor technology; San Francisco, CA, USA (15 Aug 1977).

The prestressed concrete reactor vessel (PCRV) has thus far been applied for nuclear reactor containments involving steady-state loading. This paper, on the other hand, considers the PCRV for the LMFBR containment which must sustain dynamic effects stemming from the Hypothetical Core Disruptive Accident (HCDA). To perform a feasibility study of such a PCRV, a specialized formulation for transient analysis of such structures was developed. The analytical model of a PCRV is represented in a finite element computer code involving an explicit time-integration procedure. The formulation is particularized for the axisymmetric geometry and includes simulations of tensile cracking of concrete, reinforcement and prestressing capability. The tensile cracking of concrete and concrete reinforcement are both modeled in a single subroutine describing the element constitutive relations. The stresses in the reinforcement and concrete stresses are computed separately and combined to give an overall stress state of the composite material. The reinforcement is assumed to be elastic-plastic; the concrete is taken to be elastic in tension with a tensile stress limit. Cracking of concrete is based on the principal stress-when the tensile criterion is exceeded, a crack is assumed to form normal to the direction of the maximum principal stress. The stress component in the direction normal to the crack is then set to zero. This procedure of cracking within an element is continued until three cracks have formed, at which time the material is assumed to have lost all its tensile carrying capacity. An existing crack is also permitted to close. This option is introduced so that a compressive load can still be sustained by the material subsequent to crack formation if compressive strains develop.

577 (CONF-770807--Pt.E, pp vp) EXPERIMENTS ON THE RESPONSE OF HEXAGONAL SUBASSEMBLY DUCTS TO INTERNAL PRESSURE PULSES. 1977.

From 4. international conference on structural mechanics in reactor technology; San Francisco, CA, USA (15 Aug 1977).

The safety of Liquid Metal Fast Breeder Reactors depends in part on the ability of the hexagonal subassembly ducts (hexcans) to withstand accidental internal radial loads so that damaged hexcans can be removed from the reactor core. These internal loads could be caused by fission gas release and fuel- or steel-coolant interactions resulting from fuel-pin-cladding failure inside the hexcans. To predict deformations and strains in hexcans subjected to these internal loads and in hexcans surrounding the damaged hexcan, Argonne National Laboratory has developed the finite-element, two-dimensional structure code STRAW (Structural Transient Response of Assembly Wrappers). The experiments described here were performed to verify the modeling techniques used in STRAW and to determine the effects of material properties on hexcan response. Pressure pulses were applied in 12-inch-long hexcans of annealed, 20% CW, and 50% CW 316 stainless steel. The ends of the hexcans were fixed to ensure plane-strain response at the midsection of the hexcans. At the midsection, piezoelectric quartz pressure transducers

measured loading pressure, light-emitting-diode displacement gages measured mid-flat radial deflections, and foil strain gages measured midflat circumferential and axial strains.

578 (CONF-770807--Pt.E, pp vp) REPONSE OF WATER-FILLED PIPES TO PRESSURE PULSES. 1977.

From 4. international conference on structural mechanics in reactor technology; San Francisco, CA, USA (15 Aug 1977).

During a hypothetical core disruptive accident (HCDA) in a fast breeder reactor, fuel meltdown in the reactor core results in high pressure molten fuel and sodium vapor expansions. These expansions accelerate the above-core sodium pool upward to impact against the vessel cover causing a large reflected pressure pulse. The pressure pulse travels downward through the sodium pool and past the outlet nozzles that lead to the primary piping loop. The pressure pulse entering the primary piping may be strong enough to plastically deform the piping and damage the intermediate heat exchanger, a part of the primary containment of the reactor. Argonne National Laboratory has developed two-dimensional, axisymmetric fluid-structure-interaction codes to predict the pressures and strains in the primary piping loop caused by HCDA-generated pressure pulses. Verification of these codes requires simple, well-defined experiments in which scale models of the primary piping are loaded with pressure pulses and the pressures, strains, and deformation in the pipe are measured. This paper presents the results of such an experimental program. Experiments were performed on 5-foot-long (3 inch OD, 0.065 inch wall) Ni 200 pipe sections filled with water. Pressure pulses from an explosively driven pulse gun had a peak pressure of about 2200 psi and a rise time of 0.125 msec and were propagated along two piping systems fixed at each pipe flange to a concrete test pad. Each piping system consisted of a pulse gun connected to a 10-foot-long, thick-walled stainless steel pipe joined rigidly to a 5-foot-long Ni 200 pipe. The Ni 200 pipe in the first piping system was terminated with a thick-walled blind flange. The Ni 200 pipe in the second piping system was joined rigidly to a second Ni 200 pipe by a thick-walled 90° elbow and was terminated by a blind flange.

579 (CONF-770807--Pt.E, pp vp) INITIAL PRESSURE SPIKE AND ITS PROPAGATION PHENOMENA IN SODIUM-WATER REACTION TESTS FOR MONJU STEAM GENERATORS. 1977.

From 4. international conference on structural mechanics in reactor technology; San Francisco, CA, USA (15 Aug 1977).

With the objective of demonstrating the safe design of steam generators for prototype LMFBR MONJU against the postulated large-leak accident, a number of large-leak sodium-water reaction tests have been conducted using the SWAT-1 and SWAT-3 rigs. Investigation of the potential effects of pressure load on the system is one of the major concerns in these tests. This paper reports the behavior of initial pressure spike in the reaction vessel, its propagation phenomena to the simulated secondary cooling system, and the comparisons with the computer code for one-dimensional pressure wave propagation problems. Both rigs used are the scaled-down models of the helically coiled steam generators of MONJU. The SWAT-1 rig is a simplified model and consists of a reaction vessel (1/8 scale of MONJU evaporator with 0.4 m dia. and 2.5 m height) and a pressure relief system i.e., a pressure relief line and a reaction products tank. On the other hand, the SWAT-3 rig is a 1/2.5 scale

of MONJU SG system and consists of an evaporator (reaction vessel with 1.3 m dia. and 6.35 m height), a superheater, an intermediate heat exchanger (IHX), a piping system simulating the secondary cooling circuit and a pressure relief system. The both water injection systems consist of a water injection line with a rupture disk installed in front of injection hole and an electrically heated water tank. Choice of water injection rates in the scaled-down models is made based on the method of iso-velocity modeling. Test results indicated that the characteristics of the initial pressure spike are dominated by those of initial water injection which are controlled by the conditions of water heater and the size of water injection hole, etc.

- 582 (CONF-770807--Pt.E, pp vp) EULERIAN ALGORITHM FOR ANALYZING FLUID-STRUCTURE INTERACTION IN THE FAST REACTOR CONTAINMENT. 1977.

From 4. international conference on structural mechanics in reactor technology; San Francisco, CA, USA (15 Aug 1977).

This paper presents an algorithm for analyzing the coupled fluid-structure problems in the LMFBR consisting of various internals and primary vessel. The aim is at the development of a generalized Eulerian hydrodynamic scheme, which can be used to link together the ICE technique with the finite-element structural dynamics method to provide sliding capability at interface, modeling of perforated structure, and analyses of fluid motions at the geometry discontinuity. Since the finite-element method has been already well developed, the work described herein thus will concentrate on the fluid-structure interaction. The algorithm uses the Eulerian description in the hydrodynamic formulation principally because it has the deciding advantage of treating excessive distortion. It employs the implicit temporal integration scheme to solve the nonlinear, time-dependent equations of fluid mechanics. This scheme not only ensures computational stability, but also eases the Courant condition on the time step. Furthermore, the implicit treatment of pressure and velocity fields allows the presence of all flow-speed regimes. Hence, the algorithm is applicable to any degree of excursion. Two sample problems are given, concerning wave propagation in a typical LMFBR which consists of radial shield, core barrel, core-support structure, and the primary vessel. The first problem computes the deformation histories of various structure components. The second problem examines the influence of core-support

structure openings on the pressure loading in the reactor lower plenum. Results reveal that this algorithm can offer a stable and accurate solution, and is particularly suitable for the coupled fluid-structure problems possessing strong material distortion.

- 583 (CONF-770807--Pt.E, pp vp) PARAMETRIC STUDY OF THE NONLINEAR BEHAVIOR OF COMPLETE LMFBR SUBASSEMBLIES USING THE CORTAN COMPUTER CODE. 1977.

From 4. international conference on structural mechanics in reactor technology; San Francisco, CA, USA (15 Aug 1977).

The paper emphasizes the computational aspects of combined analytical-experimental investigations concerning dynamic elastoplastic deformation of a single fuel subassembly under transverse pressure loading. To simulate the situation within a fast reactor core during a postulated local vapor explosion the cushioning effect of the thin sodium layers between subassemblies has to be included. Therefore a new computer code CORTAN was developed which combines both a one-dimensional axial squeeze flow model as well as a variable cross-section Timoshenko beam model. The paper outlines the salient features of these computational schemes. In particular, different types of dynamic plastic material behavior formulations like the implementation of various hardening rules (e.g. isotropic, kinematic) and a newly proposed catastrophe-theoretic interpretation of strain-rate dependent dynamic unloading are discussed. As applications to fast reactor safety analysis typical results of parametric studies which show the influence of some relevant energy sources (load histories), fluid support conditions or material data on structural damage are compared with experimental findings.

- 584 (CONF-770807--Pt.F, pp vp) FROM PHENIX TO SUPER PHENIX: MECHANICAL STRUCTURES ASSURING REACTOR VESSEL TIGHTNESS AT MAIN SODIUM PUMP PENETRATIONS. 1977.

From 4. international conference on structural mechanics in reactor technology; San Francisco, CA, USA (15 Aug 1977).

Even though the components of SUPER PHENIX are larger than those of PHENIX, there is no corresponding increase in available vessel height. Furthermore the SUPER PHENIX vessel does not possess a roof. For these reasons, original and patented solutions, which, nevertheless, take advantage of the experimental results and operating experience acquired with PHENIX, were sought. The most important parameters are: weights and sizes of various components; stresses transmitted to the structures differential displacements between the top and bottom positions of components; inclinations due to deformation of the deck; preservation of containment at places where components penetrate the deck. In the solution finally adopted, an elastic torus shaped ring, which forms a ball-and-socket type joint is used. A thin shell structure connects the bottom to the reactor internals in such a way as to permit both vertical and rotational displacements. The upper joint consists of: a bolted double flange system; flanged component; a torus with a gear tooth shape profile made of elastic material; leaktight bellows attached to both flanges. Studies and calculations have been completed with the realization of a 1/5 scale model of the upper torus ring. Displacement, and angular and axial stiffness measurements have confirmed the validity of the hypotheses. Moreover, even though the lower part is an extrapolation of PHENIX, full scale experimental tests have been carried out in

sodium, reproducing the real displacements and forces that will be experienced in the reactor. Finally, the pumps will be tested with water; the suspension will be studied (investigation of relevant mechanical parameters, measurement of leaktightness with respect to the outside).

From 4. international conference on structural mechanics in reactor technology; San Francisco, CA, USA (15 Aug 1977).

An analytical technique, such as the damage-function analysis, must be used to extrapolate from harder spectra data. This technique has been used to analyze the grid-support structure in the Experimental Breeder Reactor-II. The damage-function analysis has two requirements: the availability of an energy-dependent displacement cross section set for the material being investigated and the applicable neutron-energy spectra. Other investigators have developed cross sections for 18-8 stainless steels (e.g., Type 304) and the neutron-energy spectrum in EBR-II has been well characterized as a function of position during the twelve years of operation at various power levels and in different configurations. Tensile data, including yield and ultimate strengths and elongation, and swelling data are available for archive EBR-II Type 304 stainless steel irradiated for long times at moderate dose rates. Damage-function analysis was used to convert the units of neutron fluence to displacements per atom (dpa). To date, trends have been identified for residual ductility (total elongation) and swelling at the EBR-II coolant inlet temperature of 371°C. The total elongation decreases linearly with exposure from an unirradiated value of approximately 50% to approximately 28% at 2.5 dpa. Above 5 dpa, total elongation is constant at approximately 3%. Forthcoming data at 4 dpa should prove valuable in obtaining a more accurate determination of the elongation decrease with dose. Swelling of Type 304 stainless steel has been found to be almost linear with dose and independent of dose rate over the range of dose rates available. The expected doses to the EBR-II grid-support structure have been calculated as 1.5 dpa for 1976 and 3.5 dpa for 1985.

STAINLESS STEELS. 1977.

From 4. international conference on structural mechanics in reactor technology; San Francisco, CA, USA (15 Aug 1977).

The present work considers load relaxation data reported by Conway, Stentz and Berling, for 304 and 316 stainless steels during cyclic deformation with various hold times. The experiments were conducted at 650 and 538°C, temperatures sufficiently high so that recovery is likely to occur during the experiment. The experimental data are analyzed to determine if a power law suggested as an equation of state can represent the observed behavior. In 304 at 650°C short hold times and large cyclic strain amplitudes inhibit recovery. Conversely, long hold times and small cyclic strains promote recovery. At 538°C for 304 no evidence of recovery was found. Likewise in 316 at 650°C no recovery was found. These observations can be explained on the basis of thermal and strain induced recovery of the microstructure developed by cyclic deformation. When recovery occurs, stress relaxation no longer prescribes the loci of rate dependent behavior at a constant state; rather the material passes through a continuous succession of states. The results of this analysis indicate that the power law may provide an equation of states for the stainless steels.

- 590 (CONF-770817--2) OVERVIEW OF CORE DISRUPTIVE ACCIDENTS. Marchaterre, J.F. (Argonne National Lab., IL (USA)). 1977. Contract W-31-109-ENG-38. 9p. Dep. NTIS, PC A02/MF A01.

From International seminar on containment of fast breeder reactors; San Francisco, CA, USA (22 Aug 1977).

An overview of the analysis of core-disruptive accidents is given. These analyses are for the purpose of understanding and predicting fast reactor behavior in severe low probability accident conditions, to establish the consequences of such conditions and to provide a basis for evaluating consequence limiting design features. The methods are used to analyze core-disruptive accidents from initiating event to complete core disruption, the effects of the accident on reactor structures and the resulting radiological consequences are described.

- 591 (CONF-770817--3) ASSESSMENT OF ACCIDENT ENERGETICS IN LMFBR CORE-DISRUPTIVE ACCIDENTS. Fauske, H.K. (Argonne National Lab., IL (USA)). 1977. Contract W-31-109-ENG-38. 12p. Dep. NTIS, PC A02/MF A01.

From International seminar on containment of fast breeder reactors; San Francisco, CA, USA (22 Aug 1977).

An assessment of accident energetics in LMFBR core-disruptive accidents is given with emphasis on the generic issues of energetic recriticality and energetic fuel-coolant interaction events. Application of a few general behavior principles to the oxide-fueled system suggests that such events are highly unlikely following a postulated core meltdown event.

- 592 (CONF-770817--4) APPLICATION OF CONTAINMENT CODES TO LMFBRs IN THE UNITED STATES. Chang, Y.W. (Argonne National Lab., IL (USA)). 1977. Contract W-31-109-ENG-38. 16p. Dep. NTIS, PC A02/MF A01.

From International seminar on containment of fast breeder reactors; San Francisco, CA, USA (22 Aug 1977).

The application of containment codes to predict the response of the fast reactor containment and the primary piping loops to HCDAs is described. Five sample problems are given to illustrate their applications. The first problem deals with the response of the primary containment to an HCDA. The second problem deals with the coolant flow in the reactor lower plenum. The third problem concerns sodium spillage and slug impact. The fourth problem deals with the response of a piping loop. The fifth problem analyzes the response of a reactor head closure. Application of codes in parametric studies and comparison of code predictions with experiments are also discussed.

- 593 (CONF-770817--5) CORE DEBRIS BEHAVIOR AND INTERACTIONS WITH CONCRETE. Baker, L. Jr. (Argonne National Lab., IL (USA)). 1977. Contract W-31-109-ENG-38. 16p. Dep. NTIS, PC A02/MF A01.

From International seminar on containment of fast breeder reactors; San Francisco, CA, USA (22 Aug 1977).

Post-HCDA, core-debris behavior is considered in three locations: (1) within the reactor vessel, (2) within the cavity below the reactor vessel, and (3) within the concrete below the reactor cavity. In-vessel behavior is dominated by considerations of the fragmentation of molten fuel and steel on quenching in an excess of sodium to form particulate debris beds. In-vessel coolability depends primarily on the availability of sufficient horizontal surface area so that the particulate bed depth is not excessive and on the requirement that removal of small quantities of heat from the reactor vessel continues. Core debris behavior in the reactor cavity can be controlled in several different ways. An uncooled cavity liner could maintain its integrity for many days while the decay heat is absorbed by sodium boiloff from the cavity. An engineered cooling system in the cavity could result in the permanent coolability of core debris in the cavity. Such a system could be based on one of four general concepts, including (1) the cooled crucible concept, (2) the sacrificial barrier concept, (3) the stable barrier concept, and (4) the catch tray concept. Each concept has a different set of advantages and disadvantages. However, each would appear to be a viable approach to core retention.

- 594 (CONF-770822--5) OPERATING LIMITS FOR SUBASSEMBLY DEFORMATION IN EBR-II. Bottcher, J.H. (Argonne National Lab., IL (USA)). 1977. Contract W-31-109-ENG-38. 10p. Dep. NTIS, PC A02/MF A01.

From American Nuclear Society meeting; Chattanooga, TN, USA (8 Aug 1977).

The deformation of a subassembly in response to the core environment is frequently the life limiting factor for that component in an LMFBR. Deformation can occur as diametral and axial growth or bowing of the subassembly. Such deformation has caused several handling problems in both the core and the storage basket of EBR-II and may also have contributed to reactivity anomalies during reactor operation. These problems generally affect plant availability but the reactivity anomalies

could lead to a potential safety hazard. Because of these effects the deformation mechanisms must be understood and modeled. Diametral and axial growth of subassembly ducts in EBR-II is due to swelling and creep and is a function of temperature, neutron fluence and stress. The source of stress in a duct is the hydraulic pressure difference across the wall. By coupling the calculated subassembly growth rate to the available clearance in the core or storage basket a limiting neutron fluence, or exposure, can be established.

- 595 (CONF-770822--6) EBR-II OPERATING EXPERIENCE. Smith, R.N.; Cissel, D.W.; Smith, R.R. (Argonne National Lab., IL (USA)). 1977. Contract W-31-109-ENG-38. 52p. Dep. NTIS, PC A04/MF A01.

From American Nuclear Society meeting; Chattanooga, TN, USA (8 Aug 1977).

As originally designed and operated, EBR-II successfully demonstrated the concept of a sodium-cooled fast breeder power plant with a closed fuel reprocessing cycle (mini-nuclear park). Subsequent operation has been as an irradiation facility, a role which will continue into the foreseeable future. Since the beginning of operation in 1961, operating experience of EBR-II has been very satisfactory. Most of the components and systems have performed well. In particular, the mechanical performance of heat-removal systems has been excellent. A review of the operating experience reveals that all the original design objectives have been successfully demonstrated. To date, no failures or incidents resulting in serious in-core or out-of-core consequences have occurred. No water-to-sodium leaks have been detected over the life of the plant. At the present time, the facility is operating very well and continuously except for short shutdowns required by maintenance, refueling, modification, and minor repair. A plant factor of 76.9% was achieved for the calendar year 1976.

From American Nuclear Society meeting; Chattanooga, TN, USA (8 Aug 1977).

Portions of document are illegible.

Information is presented concerning the operation and maintenance of the Phenix Reactor.

- 597 (CONF-770933--1) CRBRP FLOW INDUCED VIBRATION PROGRAM. Novendstern, E.H.; Grochowski, F.A.; Yang, T.M.; Ryan, J.A.; Mulcahy, T.M. (Westinghouse Electric Corp., Madison, PA (USA). Advanced Reactors Div.; General Electric Co., Sunnyvale, CA (USA). Energy Systems and Technology Div.; Hanford Engineering Development Lab., Richland, WA (USA); Argonne National Lab., IL (USA)). 1977. Contract EY-76-C-15-2395. 57p. Dep. NTIS, PC A04/MF A01.

From International Atomic Energy Agency, international working group on fast reactors; Argonne, IL, USA (20 Sep 1977).

The program to assure the structural adequacy of CRBRP components during its planned 30 years of operation is described. The program includes (1) an assessment of reactor components relative to their susceptibility to FIV, (2) designing to minimize component excitation due to FIV, (3) scale model tests to

measure structural response during simulated operating conditions and (4) preoperational tests. An overview of the CRBRP test program is described. Additionally, details of scale model testing of reactor internals and the steam generator is described in more detail.

- 598 (CONF-770939--2) PLANT CONTROL SYSTEM DESIGN FOR THE CLINCH RIVER BREEDER REACTOR PLANT. DeMore, L.A.; Bapna, B.H.; Matta, J.V. (Westinghouse Electric Corp., Madison, PA (USA). Advanced Reactors Div.). 1977. Contract EY-76-C-15-2395. 22p. Dep. NTIS, PC A02/MF A01.

From 3. power plant dynamics, control and testing symposium; Knoxville, TN, USA (7 Sep 1977).

The design of the plant control system for the CRBR is described. The description covers both the process servos and the supervisory control system.

- 599 (CONF-770973--1) PERSPECTIVE ON LONG-RANGE NUCLEAR ENERGY OPTIONS. Harms, W.O. (Oak Ridge National Lab., TN (USA)). 1977. Contract W-7405-ENG-26. 25p. Dep. NTIS, PC A02/MF A01.

From 5. annual energy conference on energy policy options; Chicago, IL, USA (28 Sep 1977).

The study group whose effort is presented here concluded that the United States urgently needs to have a breeder option available for possible deployment before the year 2000 primarily because of uncertainties in the availability of fossil fuels and uranium supplies. It was recommended that the U/Pu LMFBR program proceed as planned, including prompt construction of the CRBRP and its associated fuel cycle facilities. Alternative cycle studies should be pursued, but without significantly delaying the current program. There are technological choices which, in suitable political contexts, may somewhat reduce proliferation risks; of these, only those that employ breeders preserve the breeder option (and the nuclear option in the long term. These alternatives must be coupled with political agreements to have any significant effect on proliferation potential internationally. These same political agreements should suffice to control the U/Pu breeder cycle; there is only a difference in degree between the U/Pu and the denatured Th/U-233 cycles.

- 600 (CONF-771008--5) RADIOLOGICAL ENVIRONMENTAL ASSESSMENT OF THE RECYCLE OF LMFBR ADVANCED FUELS. Tennery, V.J.; Bomar, E.S.; Till, J.E.; Morse, L.E.; Pobereskin, M.; Madia, W.J. (Oak Ridge National Lab., TN (USA); Battelle Columbus Labs., OH (USA)). 1977. Contract W-7405-ENG-26. 21p. Dep. NTIS, PC A02/MF A01.

From International meeting on advanced LMFBR fuels; Tucson, AZ, USA (10 Oct 1977).

The environmental impact resulting from the release of radioactive material during reprocessing and refabrication of spent LMFBR advanced fuels was compared with that from similar treatment of reference oxide fuel. Candidate advanced fuels include carbide [(U,Pu)C] in addition to nitride [(U,Pu)N] with selected concentrations of ^{15}N . Several techniques for preparing enriched ^{15}N were reviewed and estimates were made of the cost of preparing nitrogen enriched to greater than 99 percent by each method. Core neutronics, fuel management, and designs appropriate for each fuel were used with the DRIGEN code to calculate the compositions of spent core and

blanket fuel. The mass of fuel recycled annually was that providing 50 GW(e)-years of energy at the burnup attained by each fuel. Confinement factors for each isotope were identified for reprocessing and refabrication operations and were used to calculate source terms describing isotopic release rates. These source terms were used in the AIRDOS-II code to estimate the 50-year dose to the maximally exposed individual and to both the local and world populations. Total body dose commitments to the maximally exposed individual for oxide and carbide fuels are about 2.8 millirem, while nitride fuel would result in a range of 59 to 3.4 millirem as the ^{14}N content in fresh fuel is varied from 99.64 percent to zero.

- 601 (CONF-771023--13) ASSESSMENT OF THE PERFORMANCE OF A CONCEPTUAL ACOUSTIC SURVEILLANCE SYSTEM FOR ANOMALOUS EVENTS IN LMFBRs. Doolittle, R.D.; Carey, W.M. (Argonne National Lab., IL (USA)). 1977. Contract W-31-109-ENG-38. 5p. Dep. NTIS, PC A02/MF A01.

From Nuclear science symposium; San Francisco, CA, USA (19 Oct 1977).

A method is developed for calculating the detectability of anomalous acoustic events. The example used is the sodium vapor bubble collapse in the subcooled regions of a Liquid Metal Fast Breeder Reactor (LMFBR). This method provides a range of estimates for detection and false alarm probabilities in acoustic surveillance systems for sodium boiling and voiding detection, as well as any other impulsive events such as loose-parts monitoring. The signal excess at the receiver array from an impulsive source is computed by an extension of methods introduced by W. Carey. Assuming an exponential pulse form for the signal (or its envelope) the equivalent source level is determined from the energy flux spectral density for inclusion in the sonar equation. The signal excess (SE) is then given by the source level (SL) minus the noise level (NL) minus the transmission loss (TL) minus the detection threshold (DT) plus the receiving array gain (AG).

- 602 (CONF-771023--22) ACOUSTIC MEASUREMENTS OF THE BOILING STABILITY TESTS ON THORS SODIUM LOOP. Sheen, S.H.; Bobis, J.P.; Carey, W.M. (Argonne National Lab., IL (USA)). 1977. Contract W-31-109-ENG-38. 6p. Dep. NTIS, PC A02/MF A01.

From Nuclear science symposium; San Francisco, CA, USA (19 Oct 1977).

Acoustic data of boiling stability tests on the THORS (Thermal-Hydraulic Out-of-Reactor Safety) facility were obtained using three sodium-immersible high temperature microphones. The data was analyzed in both the time and frequency domains and provides the following information: (1) the acoustic signal due to sodium boiling was clearly observed; (2) the signal level and the repetition rate of boiling pulses are directly proportional to the applied heat flux; (3) a typical boiling pulse consists of a high frequency signal due mainly to the bubble collapses and a low frequency void oscillation; (4) the frequency spectra of the boiling and background pulses can be mostly assigned to various acoustic resonance frequencies of the THORS loop.

- 603 (CONF-771023--23) SIGNAL ANALYSIS METHOD USING CROSS-CORRELATION OF TURBULENCE FLOW SIGNALS TO DETERMINE CALIBRATION OF PERMANENT MAGNET SODIUM FLOWMETERS. Raptis, A.C.; Forster, G.A. (Argonne National Lab., IL (USA)). 1977. Contract W-31-109-ENG-38.

6p. Dep. NTIS, PC A02/MF A01.

From Nuclear science symposium; San Francisco, CA, USA (19 Oct 1977).

Permanent magnet flowmeters are used to measure flow in sodium cooled power plants both in the core and in plant piping. In this paper the cross-correlation technique and in particular the transfer function method is used to process the flow turbulence signals from electrodes spaced along the pipe in the vicinity of the magnetic field. Results from a loop flowmeter the EBR-II secondary flowmeter and a 400 mm diameter flowmeter are presented.

604 (CONF-771036--2) DOSIMETER SAMPLE PREPARATION, QUALITY ASSURANCE, AND MATERIALS DEVELOPMENT FOR THE ILRR, FRMDC, AND FFTF DOSIMETRY PROGRAMS. Adair, H.L.; Kobisk, E.H.; Setaro, J.A.; Quinby, T.C.; Dailey, J.M. (Oak Ridge National Lab., TN (USA)). 1977. Contract W-7405-ENG-26. 19p. Dep. NTIS, PC A02/MF A01.

From 2. ASTM-EURATOM symposium on reactor dosimetry: dosimetry methods for fuels, cladding and structural materials; Palo Alto, CA, USA (2 Oct 1977).

Since the IRML dosimeter program began in 1971, approximately 1900 vanadium encapsulated dosimeters and approximately 100 aluminum encapsulated metal fission foils have been prepared to meet TLRR, FRMDC, and FFTF requirements. Development efforts have focused on cost reduction in fabrication as well as characterization of both pure and dilute materials to meet the desired accuracy goals of ± 0.5 and ± 1.0 percent (2 sigma), respectively. One important requirement of the dosimeter program is that the dosimeter materials be encapsulated in high purity vanadium. To meet this requirement over the next ten years, an adequate supply of vanadium must be maintained. Efforts were begun to locate and characterize batches of high purity vanadium to meet this requirement. In addition, efforts were initiated to obtain the necessary vanadium capsules, to be fabricated from ILRR material, on a competitive bid basis from a commercial supplier. Quality assurance procedures were established to maintain homogeneity among the various batches of dosimeters produced. Procedures developed for producing the 1.270-mm diameter capsules were adapted to the loading of the more recently required 0.889-mm diameter capsules. Vanadium capsules are to be used in neutron energy spectra, flux and fluence characterization studies during start-up and run phases of the FFTF.

605 (CONF-771052--1) MATERIAL PROPERTIES REQUIREMENTS FOR LMFBR STRUCTURAL DESIGN: GENERAL CONSIDERATIONS AND DATA NEEDS. Pugh, C.E.; Purdy, C.M. (Oak Ridge National Lab., TN (USA)); Energy Research and Development Administration, Washington, DC (USA)). 1977. Contract W-7405-ENG-26. 46p. Dep. NTIS, PC A03/MF A01.

From International working group on fast reactors (IAEA/IWGFR) specialists meeting; Bensburg, F.R. Germany (17 Oct 1977).

A statement is given of material properties information needed in connection with the structural design technology for liquid-metal fast breeder reactor (LMFBR) primary circuit components. Implementation of current analysis methods and criteria is considered with an emphasis on data and data correlations for performing elastic-plastic and creep analyses, for establishing allowable stress limits, and for computing creep-fatigue damage. Further development of the technology is discussed in relation to properties information. Emphasis is

placed on improved constitutive equations for representing inelastic material behavior, on procedures for treating time-dependent fatigue, and on criteria for creep rupture. The properties are generally discussed without regard to specific alloys, since most categories of information are needed for each major structural material. Some sample experimental results are given for type 304 stainless steel and 2 1/4 Cr-1 Mo steel.

606 (CONF-771052--2) OVERVIEW OF THE U.S. PROGRAMS ON PROPERTIES OF PRIMARY CIRCUIT MATERIALS. Brinkman, C.R.; Sikka, V.K.; Booker, M.K. (Oak Ridge National Lab., TN (USA)). 1977. Contract W-7405-ENG-26. 31p. Dep. NTIS, PC A03/MF A01.

From International working group on fast reactors (IAEA/IWGFR) specialists meeting; Bensburg, F.R. Germany (17 Oct 1977).

The objective of U.S. Breeder Reactor Programs associated with primary circuit structural materials is to develop the design data base and associated design technology on existing commercially available materials as well as new alloys. This will permit economic operation of components at acceptable levels of plant availability and at up to 40-year lifetimes for inaccessible components. Long-term component reliability, elevated-temperature service within the creep range, and resistance to sodium attack and irradiation damage, along with design in compliance with ASME Codes and RDT Specifications, have required that the U.S. programs be directed toward contributing knowledge in a number of areas. These areas, relating to material deformation, failure modes, compatibility, fabrication, long-term behavior, irradiation damage, and availability will be discussed. The U.S. Structural Material Programs concerned with primary-circuit components will be reviewed, and their current and future contributions to knowledge of these areas will be explained.

607 (CONF-771052--3) EFFECT OF SODIUM ENVIRONMENT ON THE CREEP=RUPTURE AND LOW-CYCLE FATIGUE BEHAVIOR OF AUSTENITIC STAINLESS STEELS. Natesan, K.; Chopra, J.K.; Zeman, G.J.; Smith, D.L.; Kassner, T.F. (Argonne National Lab., IL (USA)). Sep 1977. Contract W-31-109-ENG-38. 34p. Dep. NTIS, PC A03/MF A01.

From International working group on fast reactors (IAEA/IWGFR) specialists meeting; Bensburg, F.R. Germany (17 Oct 1977).

Austenitic stainless steels used for in-core structural components, piping, valves, and the intermediate heat exchanger in Liquid-Metal Fast-Breeder Reactors (LMFBRs) are subjected to sodium at elevated temperatures and to complex stress conditions. As a result, the materials can undergo compositional and microstructural changes as well as mechanical deformation by creep and cyclic fatigue processes. Information is presented on the creep-rupture and low-cycle fatigue behavior of Types 304 and 316 stainless steel in the solution-annealed condition and after long-term exposure to flowing sodium. The nonmetallic impurity-element concentrations in the sodium were controlled at levels similar to those in EBR-II primary sodium. Strain-time relationships developed from the experimental creep data were used to generate isochronous stress-creep strain curves as functions of sodium-exposure time and temperature. The low-cycle fatigue data were used to obtain relationships between plastic strain range and cycles-to-failure based on the Coffin-Manson formalism and a damage-rate approach developed at ANL. An analysis of the cyclic stress-strain

- behavior of the materials showed that the strain-hardening rates for the sodium-exposed steels were larger than those for the annealed material. However, the sodium-exposed specimens showed significant softening, as evidenced by the lower stress at half the fatigue life. Microstructural information obtained from the different specimens suggests that crack initiation is more difficult in the long-term sodium-exposed specimens when compared with the solution-annealed material. Based on the expected carbon concentrations in LMFBR primary system sodium, moderate carburization of the austenitic stainless steels will not degrade the mechanical properties to a significant extent, and therefore, will not limit the performance of out-of-core components.
- 608 (CONF-771108--3) EVALUATIONS OF CRBRP THERMAL MARGIN BEYOND THE DESIGN BASE. Schornhorst, J.R.; Strawbridge, L.E.; Bradbury, P. (Westinghouse Electric Corp., Madison, PA (USA). Advanced Reactors Div.). 1977. Contract EY-76-C-15-2395. 10p. Dep. NTIS, PC A02/MF A01.
From Post accident heat removal information exchange meeting; Chicago, IL, USA (2 Nov 1977).
The thermal loads and radiological consequences that could result from a hypothetical core disruptive accident with whole core involvement were evaluated. Since the in-vessel margins may not prevent melt-through of the reactor vessel and guard vessel, emphasis has been placed on providing margins external to the reactor vessel and guard vessel to mitigate the radiological consequences of an HCDA. To evaluate the plant thermal and radiological margins, the release of the entire core, blankets and primary sodium into the reactor cavity was considered. Design requirements have been placed on plant components and structures to assure that containment integrity can be maintained without venting for at least 24 hours. Features are also included to provide long term mitigation of HCDA consequences. Based on the thermal and radiological evaluations considering the CRBRP features it is concluded that the radiological consequences of a hypothetical core disruptive accident would be enveloped by those for light water reactors for events beyond the design base.
- 609 (CONF-771109--49) SUPPORT FOR A NUCLEAR FUTURE: STUDENT RESPONSE TO THE CRBRP. Bremseth, M.D.; Clelland, D.A. (Tennessee Univ., Knoxville (USA). Dept. of Sociology). 1977. Contract EY-76-C-15-1200. 5p. Dep. NTIS, PC A02/MF A01.
From ANS winter meeting; San Francisco, CA, USA (27 Nov 1977).
Results are presented of a multiple regression analysis of questionnaire data from two random samples of University of Tennessee seniors. Data were collected from 94 students with science/engineering majors (the 'Tech' sample), and 91 students with non-science/engineering majors (the 'Mass' sample--which represents the majority of the students). The purpose of the analysis was to isolate factors which independently explain student response to the CRBRP and to breeder reactors in general.
- 610 (CONF-771109--52) CONCEPTS OF REMOTE SIGNAL TRANSMISSION FOR LIQUID-METAL FAST BREEDER REACTORS. De Lorenzo, J.T.; Burns, R.S.; Valentine, K.H. (Oak Ridge National Lab., TN (USA)). 1977. Contract W-7405-ENG-26. 4p. Dep. NTIS, PC A02/MF A01.
From ANS winter meeting; San Francisco, CA, USA (27 Nov 1977).
Sensors and remote signal transmission techniques suitable for LMFBR conditions are discussed. Some of the major problems which must be addressed during further development of sensors and techniques are listed.
- 611 (CONF-771109--77) DYNAMIC BOILING TESTS IN A 19-PIN SIMULATED LMFBR FUEL ASSEMBLY. Wantland, J.L.; Clapp, N.E.; Fontana, M.H.; Gnadt, P.A.; Hanus, N. (Oak Ridge National Lab., TN (USA)). 1977. Contract W-7405-ENG-26. 22p. Dep. NTIS, PC A02/MF A01.
From ANS winter meeting; San Francisco, CA, USA (27 Nov 1977).
A series of quasi-steady state tests were made to study dynamic boiling and to determine a boiling region which would not lead to immediate dryout and pin failure in the Thermal-Hydraulic Out-of-Reactor Safety (THORS) Facility (previously the Fuel Failure Mockup), an engineering-scale sodium loop for testing simulated LMFBR fuel assemblies at normal and off-normal operating conditions. These tests were made on an assembly consisting of 19 electrically heated pins of the same configuration as FFTF fuel. Approximately 50 flow transients were so conducted to boiling or near boiling over a range of flows and powers. Dryout occurred at three test conditions.
- 612 (CONF-771109--78) MAXIMUM WAKE TEMPERATURE AND NUSSELT NUMBER BEHIND BLOCKAGES IN SODIUM-COOLED BUNDLES. Han, J.T.; Fontana, M.H.; Wantland, J.L. (Oak Ridge National Lab., TN (USA)). 1977. Contract W-7405-ENG-26. 5p. Dep. NTIS, PC A02/MF A01.
From ANS winter meeting; San Francisco, CA, USA (27 Nov 1977).
Two important correlations have been obtained to calculate the maximum coolant temperature and the Nusselt number in the wake (the flow recirculating zone) downstream of blockages in 19-pin sodium-cooled bundles. These correlations can be applied to predict the maximum temperature rise and the average heat transfer coefficient behind small non-heat-generating blockages in the fuel assemblies of the FFTF and the CRBR for the wide range of flow and power conditions. Experiments with partial blockages in simulated LMFBR fuel assemblies have been performed at the THORS facility (formerly called FFM) of the Oak Ridge National Laboratory. Nineteen-pin sodium-cooled bundles were used, which had the same pin diameter and pitch as the CRBR and the FFTF fuel assemblies.
- 613 (CONF-771109--86) DESIGN AND DEVELOPMENT OF THE CRBRP EX-VESSEL TRANSFER MACHINE. Jones, C.E. Jr. (Atomic International Div., Canoga Park, CA (USA)). 1977. 24p. Dep. NTIS, PC A03/MF A01.
From ANS winter meeting; San Francisco, CA, USA (27 Nov 1977).
The Reactor Refueling System (RRS) for the Clinch River Breeder Reactor Project (CRBRP) uses the Ex-Vessel Transfer Machine (EVTM) for transferring core assemblies outside the reactor vessel. The design of the Ex-Vessel Transfer Machine (EVTM) and its gantry-trolley for the CRBRP is discussed. The development tests required for the design are presented, in conjunction with the impact of the test results on the design. The impact of the increased seismic requirements on the design are also presented.
- 614 (CONF-771120--8) EDGE BLOCKAGE IN A 19-PIN SODIUM-COOLED BUNDLE. Han, J.T.; Gnadt,

P.A.; Fontana, M.H.; Wantland, J.L. (Oak Ridge National Lab., TN (USA)). 1977. Contract W-7405-ENG-26. 9p. Dep. NTIS, PC A02/MF A01.

From Winter annual meeting of the American Society of Mechanical Engineers; Atlanta, GA, USA (27 Nov 1977).

To assess the effect of partial flow blockages on the local temperature distributions in LMFBR fuel assemblies, several experiments have been carried out at the Thermal-Hydraulic Out-of-Reactor Safety (THORS) Facility at the Oak Ridge National Laboratory. Two kinds of flow blockages have been investigated: (1) six-channel internal blockage for which the blocked channels are not adjacent to the duct wall, and (2) 14-channel edge blockage for which some of the blocked channels are adjacent to the wall. The larger edge blockage is generally more severe than the internal blockage due to higher temperature rises in the wake behind the blockage. The experimental results on the edge blockage are analyzed and presented.

- 615 (CONF-771120--14) BLOCKAGES IN LMFBR FUEL ASSEMBLIES: A REVIEW. Han, J.T.; Fontana, M.H. (Oak Ridge National Lab., TN (USA)). 1977. Contract W-7405-ENG-26. 73p. Dep. NTIS, PC A03/MF A01.

From Winter annual meeting of the American Society of Mechanical Engineers; Atlanta, GA, USA (27 Nov 1977).

Experimental and analytical investigations performed in the United States, Germany, Great Britain, and Japan on the effects of partial flow blockages in liquid-metal fast breeder reactor fuel assemblies are reviewed and the results presented. Generalized models are developed from experimental data obtained for blockages of various sizes, shapes, and porosity, with and without pins, utilizing water and sodium as the coolant. Generally, the recirculating flow in the wake behind a blockage is a relatively effective heat transfer mechanism. Experiments where sodium boiling was made to occur behind the blockages indicate that boiling is stable for the configurations tested; these results are predicted by analytical models. Blockages at the inlet of fuel assemblies tend to have insignificant effects in the fuel assembly unless flow is reduced grossly and therefore would be detectable. Blockages in the heat generating zone have to be quite large to cause sodium boiling under normal reactor operating conditions.

- 616 (CONF-771120--20) COMPUTING THE EFFECT OF PLASTIC DEFORMATION OF PIPING ON PRESSURE TRANSIENT PROPAGATION. Youngdahl, C.K.; Kot, C.A. (Argonne National Lab., IL (USA)). 1977. Contract W-31-109-ENG-38. 15p. Dep. NTIS, PC A02/MF A01.

From Winter annual meeting of the American Society of Mechanical Engineers; Atlanta, GA, USA (27 Nov 1977).

The computer program PTA-1 performs pressure-transient analysis of large piping networks using the one-dimensional method of characteristics applied to a fluid-hammer formulation. The effect of elastic-plastic deformation of piping on pulse propagation is included in the computation. Each pipe is modeled as a series of rings, neglecting axial effects, bending moments, and inertia. The fluid wave speed is a function of pipe deformation and, consequently, of position and time. Comparison with existing experimental data indicate that this simple fluid-structure interaction model gives surprisingly accurate results for both pressure histories in the

fluid and strain histories in the piping.

- 617 (CONF-771120--22) LIQUID METAL FAST BREEDER REACTOR SAFETY: AN OVERVIEW INCLUDING IMPLICATIONS OF ALTERNATE FUEL CYCLES. Fauske, H.K. (Argonne National Lab., IL (USA)). 1977. Contract W-31-109-ENG-38. 33p. Dep. NTIS, PC A03/MF A01.

From Winter annual meeting of the American Society of Mechanical Engineers; Atlanta, GA, USA (27 Nov 1977).

Key issues concerning LMFBR safety are reviewed. A brief discussion of alternate fuel cycles for preventing diversion of fissionable materials is included.

- 618 (CONF-771120--23) EULERIAN METHOD FOR LARGE-DISPLACEMENT FLUID-STRUCTURE INTERACTION IN REACTOR CONTAINMENTS. Chang, Y.W.; Wang, C.Y. (Argonne National Lab., IL (USA)). 1977. Contract W-31-109-ENG-38. 17p. Dep. NTIS, PC A02/MF A01.

From Winter annual meeting of the American Society of Mechanical Engineers; Atlanta, GA, USA (27 Nov 1977).

An Eulerian method for analyzing large-displacement fluid-structure interaction in reactor containments is presented. The emphasis is on the development of a generalized hydrodynamic scheme to treat the irregular cells created by the movement of the structure with respect to the fixed Eulerian coordinates. A relaxation equation is derived from the boundary condition at the fluid-structure interface for the solution of the pressure at the interface. By combining this with the Poisson equation a sufficient set of equations is obtained for the determination of the advanced-time pressures in the fluid region and at the fluid-structure interfaces. Sample problems are given to illustrate the analysis.

- 619 (CONF-771123--1) ENGINEERING ASPECTS OF HETEROGENEOUS AND HOMOGENEOUS REACTORS. Dickson, P.W. Jr. (Westinghouse Electric Corp., Madison, PA (USA). Advanced Reactors Div.). 1977. Contract EY-76-C-15-2395. 27p. Dep. NTIS, PC A03/MF A01.

From BNES conference on optimization of sodium cooled fast reactors; London, UK (28 Nov 1977).

The core arrangement in an LMFBR can potentially affect the lower internals, upper internals, radial shielding, vessel, hot leg transients, head access area and control systems as well as breeding ratio, doubling time and core inventory. This paper describes the results of a study of the impact on these components and parameters that would result if the Clinch River Breeder Reactor were to incorporate a heterogeneous core.

- 620 (CONF-771123--2) POTENTIAL OF LARGE HETEROGENEOUS REACTORS. Barthold, W.P.; Tzanos, C.P.; Beitel, J.C. (Argonne National Lab., IL (USA)). 1977. Contract W-31-109-ENG-38. 24p. Dep. NTIS, PC A02/MF A01.

From BNES conference on optimization of sodium cooled fast reactors; London, UK (28 Nov 1977).

Different 1200 MWe heterogeneous core configurations have been evaluated and compared with a homogeneous 1200 MWe LMFBR design. This study discusses the neutronic coupling concept which was employed to discriminate between different heterogeneous core designs. Reactivity control, breeding performance, safety parameters, fuel pin optimization, transient behavior and thermal performance were investigated in detail and results of these

analyses are presented.

Contract EY-76-C-15-1200. 20p. Dep. NTIS, PC A02/MF A01.
From Seminar on LMFBR components; Canoga Park, CA, USA (5 Dec 1977).
The fuel handling system and reactor rotating plugs for the Clinch River Breeder Reactor Plant (CRBRP) are based primarily on existing technology and, in many respects, follow the concept developed for the Fast Flux Test Facility (FFTF). The equipment and the development programs initiated to verify its performance are described. Test results obtained from the development program, and the extent to which these results verified original design selections, or suggested potential improvements, are discussed.
- 635 (CONF-771217--2) FFTF AND CRBRP INTERMEDIATE HEAT EXCHANGER DESIGN, TESTING, AND FABRICATION. Devlin, R.W.; Bresnahan, J.D. (Westinghouse Electric Corp., Madison, PA (USA). Advanced Reactors Div.). 1977.
Contract EY-76-C-02-3045-022. 34p. Dep. NTIS, PC A03/MF A01.
From Seminar on LMFBR components; Canoga Park, CA, USA (5 Dec 1977).

The Heat Transport Systems of the Fast Flux Test Facility (FFTF) and the Clinch River Breeder Reactor Plant (CRBRP) include Intermediate Heat Exchangers (IHxs) to form barriers between the primary radioactive and secondary non-radioactive sodium coolant loops. The design, development and fabrication of the IHX for the FFTF has been completed and the units installed in the facility. The design and development of the IHX for the CRBRP has progressed through the performance sizing stage and flow testing of critical areas into early fabrication. The design evolution of these two heat exchangers may be considered a continuous development because the design and fabrication organizations have been the same for both units. Structural considerations to meet ASME Code requirements, support testing experience and manufacturing experience from the FFTF program have been factored into the CRBRP program. This paper outlines the similarities and differences between the FFTF and CRBRP designs. Special attention has been given to utilization of flow distribution devices and associated hydraulic testing, tube bundle and tube-to-tubesheet joint configurations, and fabrication differences.

- 636 (CONF-771217--3) CLINCH RIVER BREEDER REACTOR SECONDARY CONTROL ROD SYSTEM. McKeehan, E.R.; Sim, R.G. (Energy, Inc., Idaho Falls, ID (USA)). 14 Sep 1977. Contract EY-76-C-02-3045-002. 19p. Dep. NTIS, MF A01.

From Seminar on LMFBR components; Canoga Park, CA, USA (5 Dec 1977).

Portions of document are illegible.

The shutdown system for the Clinch River Breeder Reactor (CRBR) includes two independent systems--a primary and a secondary system. The Secondary Control Rod System (SCRS) is a new design which is being developed by General Electric to be independent from the primary system in order to improve overall shutdown reliability by eliminating potential common-mode failures. The paper describes the status of the SCRS design and fabrication and testing activities. Design verification testing on the component level is largely complete. These component tests are covered with emphasis on design impact results. A prototype unit has been manufactured and system level tests in sodium have been initiated.

- 637 (CONF-771217--4) CRBRP SODIUM CIRCULATING PUMP DESIGN EVALUATION. Marrujo, F.; Cook, M.; Manners, L.; Cothran, H. (Clinch River Breeder Reactor Plant Project Office, Oak Ridge, TN (USA)). Dec 1977. Contract EY-76-C-02-3045-014. 26p. Dep. NTIS, PC A03/MF A01.

From Seminar on LMFBR components; Canoga Park, CA, USA (5 Dec 1977).

The following topics are discussed: (1) primary sodium pump design concept; (2) pump level control system; (3) resolution of design problems in stress analysis, dynamics analysis, and mechanical design; (4) model testing; (5) planned performance tests; and (6) fabrication status. (DG)

- 638 (CONF-771217--5) REVIEW OF FFTF AND CRBRP CONTROL ROD SYSTEMS DESIGNS. Pitterle, T.A.; Legally, H.O. (Clinch River Breeder Reactor Plant Project Office, Oak Ridge, TN (USA)). 4 Oct 1977. Contract EY-76-C-02-3045-002. 30p. Dep. NTIS, PC A02/MF A01.

From Seminar on LMFBR components; Canoga Park, CA, USA (5 Dec 1977).

The evolution of the primary control rod system design for FFTF and CRBR, beginning with

the initial choice of the basic concepts, is described. The significant component and systems tests are reviewed together with the test results which referenced the development of the CRBR primary control rod system design. Modifications to the concepts and detail designs of the FFTF control rod system were required principally to satisfy the requirements of CRBR, and at the same time incorporating design refinements shown desirable by the tests.

- 639 (CONF-771217--6) CRBRP DECAY HEAT REMOVAL SYSTEMS. Hottel, R.Z.; Louison, R.; Boardman, C.E.; Kiley, M.J. (Westinghouse Electric Corp., Madison, PA (USA). Advanced Reactors Div.; General Electric Co., Sunnyvale, CA (USA). Fast Breeder Reactor Dept.; Atomics International Div., Canoga Park, CA (USA)). 1977. Contract EY-76-C-02-3045. 31p. Dep. NTIS, PC A03/MF A01.

From Seminar on LMFBR components; Canoga Park, CA, USA (5 Dec 1977).

The Decay Heat Removal Systems for the Clinch River Breeder Reactor Plant (CRBRP) are designed to adequately remove sensible and decay heat from the reactor following normal shutdown, operational occurrences, and postulated accidents on both a short term and a long term basis. The Decay Heat Removal Systems are composed of the Main Heat Transport System, the Main Condenser and Feedwater System, the Steam Generator Auxiliary Heat Removal System (SGAHS), and the Direct Heat Removal Service (DHRS). The overall design of the CRBRP Decay Heat Removal Systems and the operation under normal and off-normal conditions is examined. The redundancies of the system design, such as the four decay heat removal paths, the emergency diesel power supplies, and the auxiliary feedwater pumps, and the diversities of the design such as forced circulation/natural circulation and AC Power/DC Power are presented. In addition to overall design and system capabilities, the detailed designs for the Protected Air Cooled Condensers (PACC) and the Air Blast Heat Exchangers (ABHX) are presented.

- 640 (CONF-771217--7) DESIGN OF THE CORE SUPPORT AND RESTRAINT STRUCTURES FOR FFTF AND CRBRP. Sutton, H.G.; Rylatt, J.A. (Westinghouse Electric Corp., Madison, PA (USA). Advanced Reactors Div.). Dec 1977. Contract EY-76-C-02-3045-005. 25p. Dep. NTIS, PC A02/MF A01.

From Seminar on LMFBR components; Canoga Park, CA, USA (5 Dec 1977).

This paper presents and compares the design and fabrication of the FFTF and CRBRP reactor structures which support and restrain the reactor core assemblies. The fabrication of the core support structure (CSS) for the FFTF reactor was completed October 1972 and this paper discusses how the fabrication problems encountered with the FFTF were avoided in the subsequent design of the CRBR CSS. The radial core restraint structure of the FFTF was designed and fabricated such that an active system could replace the present passive system which is segmented and relies on the CSS core barrel for total structure integrity to maintain core geometry. The CRBR core restraint structure is designed for passive restraint only, and this paper discusses how the combined strengths of the restraint structure former rings and the CSS core barrel are utilized to maintain core geometry. Whereas the CSS for the FFTF interfaces directly with the reactor core assemblies, the CRBR CSS does not. A comparison is made on how intermediate structures in CRBR (inlet modules) provide the necessary design

interfaces for supporting and providing flow distribution to the reactor core assemblies. A discussion is given on how the CRBR CSS satisfied the design requirements of the Equipment Specification, including thermal transient, dynamic and seismic loadings, and results of flow distribution testing that supported the CRBR design effort. The approach taken to simplify fabrication of the CRBR components, and a novel 20 inch deep narrow gap weld joint in the CSS are described.

- 641 (CONF-771217--8) DESIGN OF THE UPPER INTERNALS STRUCTURE FOR THE CLINCH RIVER BREEDER REACTOR PLANT. Thompson, D.C.; Novendstern, E.H. (Westinghouse Electric Corp., Madison, PA (USA). Advanced Reactors Div.). 1977. Contract EY-76-C-02-3045. 30p. Dep. NTIS, PC A03/MF A01.

From Seminar on LMFBR components; Canoga Park, CA, USA (5 Dec 1977).

The Upper Internals Structure (UIS) is located above the core and is supported from the head at four locations. It is designed to perform the following primary functions: provide secondary core holddown in the event of a malfunction of the core hydraulic holddown system; provide support for routing all in-vessel instrumentation to core assemblies; maintain alignment between the core assemblies, the UIS and the closure head; provide guidance and crossflow protection for the control rod drivelines; and mix/duct flow to the upper region of the vessel outlet plenum to minimize rapid temperature changes to components during a reactor trip transient. In accomplishing these functions, the UIS will experience a sodium environment with temperatures up to 1200°F (649°C), and as many as 7×10^6 cycles of fluid temperature fluctuations up to 250°F (121°C) at full power operation. It must be designed to survive these conditions in combination with seismic and flow-induced vibration loadings for its 30 year design life. The design program of designing to controlled functional requirements and design conditions is discussed. Included is a description of the significant parts of the design and the approach used to balance the requirement of tight joints. The thermal and hydraulic environment including the results of a comprehensive test program are discussed. The test program results establish the basis of the thermal boundary used in the structural evaluation, and the UIS vibration characteristics. A summary of the areas which have required design changes is included with a summary of the structural evaluation of these changes.

- 642 (CONF-771217--9) FFTF AND CRBRP REACTOR VESSELS. Morgan, R.E. (Westinghouse Electric Corp., Madison, PA (USA). Advanced Reactors Div.). 1977. Contract EY-76-C-02-3045-002. 12p. Dep. NTIS, PC A02/MF A01.

From Seminar on LMFBR components; Canoga Park, CA, USA (5 Dec 1977).

The Fast Flux Test Facility (FFTF) reactor vessel and the Clinch River Breeder Reactor Plant (CRBRP) reactor vessel each serve to enclose a fast spectrum reactor core, contain the sodium coolant, and provide support and positioning for the closure head and internal structure. Each vessel is located in its reactor cavity and is protected by a guard vessel which would ensure continued decay heat removal capability should a major system leak develop. Although the two plants have significantly different thermal power ratings, 400 megawatts for FFTF and 975 megawatts for CRBRP, the two reactor vessels are comparable in size, the CRBRP vessel being approximately

28% longer than the FFTF vessel. The FFTF vessel diameter was controlled by the space required for the three individual In-Vessel Handling Machines and Instrument Trees. Utilization of the triple rotating plug scheme for CRBRP refueling enables packaging of the larger CRBRP core in a vessel the same diameter as the FFTF vessel.

- 643 (CONF-780203--9) U.S. PROGRAM FOR LARGE SODIUM/WATER REACTION TESTS. Whipple, J.C.; Amos, J.C.; DeBear, W.S.; Neely, H.H.; Hopenfeld, J. (General Electric Co., Sunnyvale, CA (USA). Fast Breeder Reactor Dept.). [nd]. Contract EY-76-C-03-0189; EY-76-C-03-0701. 26p. Dep. NTIS, PC A03/MF A01.

From 1. joint U.S./Japan LMFBR steam generator seminar; Tokyo, Japan (13 Feb 1978).

An extensive large leak test program is underway in the United States to investigate the effects of large sodium-water reaction events in LMFBR steam generators. The general objectives of the program are to provide data for validating analytical codes, provide information on the extent of secondary tube failures, provide data on relief system performance and provide data on cleanup and recovery needs. Tests are conducted in the Large Leak Test Rig located at the Liquid Metal Engineering Center. The program is divided into two phases, Series I and Series II, for the purpose of satisfying near-term and long-term needs. The Series I testing, utilizing the Atomics International modular steam generator as the test article, commenced in July 1976 with six tests completed by November 1977. The test article for the Series II tests (the Large Leak Test Vessel/Large Leak Test Internals) has been fabricated. Upon completion of Large Leak Test Rig modification, test article installation, and system checkout Series II testing will begin in the Spring of 1979. The overall program plan is defined, the test articles and test facility are described, and the experimental approach is discussed for both Series I and II programs. The Series I test experience and results of intertest examinations are also presented.

- 644 (CONF-780215--2) NEEDS FOR DEVELOPMENT IN NONDESTRUCTIVE TESTING FOR ADVANCED REACTOR SYSTEMS. McClung, R.W. (Oak Ridge National Lab., TN (USA)). 1978. Contract W-7405-ENG-26. 23p. Dep. NTIS, PC A02/MF A01.

From Conference on NDE in the nuclear industry; Salt Lake City, UT, USA (13 Feb 1978).

The needs for development of nondestructive testing (NDT) techniques and equipment were surveyed and analyzed relative to problem areas for the Liquid-Metal Fast Breeder Reactor, the Molten-Salt Breeder Reactor, and the Advanced Gas-Cooled Reactor. The paper first discusses the developmental needs that are broad-based requirements in nondestructive testing, and the respective methods applicable, in general, to all components and reactor systems. Next, the requirements of generic materials and components that are common to all advanced reactor systems are examined. Generally, nondestructive techniques should be improved to provide better reliability and quantitativeness, improved flaw characterization, and more efficient data processing. Specific recommendations relative to such methods as ultrasonics, eddy currents, acoustic emission, radiography, etc., are made. NDT needs common to all reactors include those related to materials properties and degradation, welds, fuels, piping, steam

generators, etc. The scope of applicability ranges from initial design and material development stages through process control and manufacturing inspection to in-service examination.

- 645 (CONF-780232--1) EBR-II EXPERIENCE WITH SODIUM CLEANING AND RADIOACTIVITY DECONTAMINATION. Ruther, W.E.; Smith, C.R.F. (Argonne National Lab., IL (USA)). 1978. Contract W-31-109-ENG-38. 27p. Dep. NTIS, PC A03/MF A01.

From IAEA meeting on sodium removal and decontamination; Richland, WA, USA (14 Feb 1978).

The EBR-2 is now in its 13th year of operation. During that period more than 2400 subassemblies have been cleaned of sodium without a serious incident of any kind by a two-step process developed at Argonne. Sodium cleaning and decontamination of other reactor components has been performed only on the relatively few occasions in which a repair or replacement has been required. A summary of the EBR-2 experience will be presented. A new facility will be described for the improved cleaning and maintenance of sodium-wetted primary components.

- 646 (CONF-780251--P2) PROCEEDINGS OF THE U.S./U.S.S.R. SEMINAR ON PROBLEMS OF DESIGN, DEVELOPMENT, FABRICATION, AND TEST OF BREEDER REACTOR COMPONENTS. (Department of Energy, Washington, DC (USA). Div. of Reactor Research and Technology). Aug 1978. 387p. AT.

From US/USSR seminar on problems of design, development, fabrication, and test of breeder reactor components; Los Angeles, CA, USA (6 Feb 1978).

Each paper has been separately processed for the Energy Information Data Base.

- 647 (CONF-780251--P2, pp 1.1-1.12) FFTF AND CRBRP REACTOR VESSELS. Morgan, R.E. Aug 1978.

From US/USSR seminar on problems of design, development, fabrication, and test of breeder reactor components; Los Angeles, CA, USA (6 Feb 1978).

Included are design specifications, descriptions, and detailed illustrations of FFTF and CRBRP reactor vessels and associated structures.

- 648 (CONF-780251--P2, pp 2.13-2.36) DESIGN OF THE CORE SUPPORT AND RESTRAINT STRUCTURES FOR FFTF AND CRBRP. Sutton, H.G.; Rylatt, J.A. Aug 1978.

From US/USSR seminar on problems of design, development, fabrication, and test of breeder reactor components; Los Angeles, CA, USA (6 Feb 1978).

The paper presents and compares the design and fabrication of the FFTF and CRBRP reactor structures which support and restrain the reactor core assemblies. The fabrication of the core support structure (CSS) for the FFTF reactor was completed October 1972 and the paper discusses how the fabrication problems encountered with the FFTF were avoided in the subsequent design of the CRBR CSS. The radial core restraint structure of the FFTF was designed and fabricated such that an active system could replace the present passive system which is segmented and relies on the CSS core barrel for total structure integrity to maintain core geometry. The CRBR core restraint structure is designed for passive restraint only, and the paper discusses how the combined strengths of the restraint structure former

rings and the CSS core barrel are utilized to maintain core geometry. Whereas the CSS for the FFTF interfaces directly with the reactor core assemblies, the CRBR CSS does not. A comparison is made on how intermediate structures in CRBR (inlet modules) provide the necessary design interfaces for supporting and providing flow distribution to the reactor core assemblies. A discussion is given on how the CRBR CSS satisfied the design requirements of the Equipment Specification, including thermal transient, dynamic and seismic loadings, and results of flow distribution testing that supported the CRBR design effort. The approach taken to simplify fabrication of the CRBR components, and a novel 20 inch deep narrow gap weld joint in the CSS are described.

- 649 (CONF-780251--P2, pp 3.37-3.56) CRBRP DESIGN AND TEST RESULTS FOR FUEL HANDLING SYSTEMS, PLUGS, AND SEALS. Berg, G.E. Aug 1978.

From US/USSR seminar on problems of design, development, fabrication, and test of breeder reactor components; Los Angeles, CA, USA (6 Feb 1978).

The fuel handling system and reactor rotating plugs for the Clinch River Breeder Reactor Plant (CRBRP) are based primarily on existing technology and, in many respects, follow the concept developed for the Fast Flux Test Facility (FFTF). However, several requirements are considerably more stringent and demand more advanced or larger equipment. The paper first briefly describes the equipment, and then concentrates on the development programs initiated to verify its performance. Tests results obtained from the development program, and the extent to which these results verified original design selections, or suggested potential improvements, are discussed. Among the designs (and tests) included are the In-Vessel Transfer Machine (component and full-size prototype tests), Reactor Rotating Plugs (dynamic inflatable seal, sodium dip seal, and functional test), Ex-Vessel Transfer Machine (heat transfer and component tests), Ancillary Components (core component pot siphon and rotating guide tube tests), and Fuel Handling Cell (component operability and operator training).

- 650 (CONF-780251--P2, pp 4.57-4.85) DESIGN OF THE UPPER INTERNALS STRUCTURE FOR THE CLINCH RIVER BREEDER REACTOR PLANT. Thompson, D.C.; Novendstern, E.H. Aug 1978.

From US/USSR seminar on problems of design, development, fabrication, and test of breeder reactor components; Los Angeles, CA, USA (6 Feb 1978).

The Upper Internals Structure (UIS) is located above the core and is supported from the head at four locations. It is designed to perform the following primary functions: provide secondary core holddown in the event of a malfunction of the core hydraulic holddown system; provide support for routing all in-vessel instrumentation to core assemblies; maintain alignment between the core assemblies, the UIS and the closure head; provide guidance and crossflow protection for the control rod drive lines; and mix/duct flow to the upper region of the vessel outlet plenum to minimize rapid temperature changes to components during a reactor trip transient. In accomplishing these functions, the UIS will experience a sodium environment with temperatures up to 1200°F (649°C), and as many as 7×10^6 cycles of fluid temperature fluctuations up to 250°F (121°C) at full power operation. It must be designed to survive these conditions in

combination with seismic and flow-induced vibration loadings for its 30 year design life. The paper reflects the design progress of designing to controlled functional requirements and design conditions. Included is a description of the significant parts of the design and the approach used to balance the requirement of tight joints. The paper includes a discussion of the thermal and hydraulic environment including the results of a comprehensive test program. The test program results establish the basis of the thermal boundary used in the structural evaluation, and the UIS vibration characteristics. A summary of the areas which have required design changes is included with a summary of the structural evaluation of these changes.

- 651 (CONF-780251--P2, pp 5.87-5.106) DESIGN AND OPERATING EXPERIENCE OF EBR-II INTERMEDIATE HEAT EXCHANGER (IHX). Buschman, H.W.; Koenig, J.F.; Stone, C.C. Aug 1978.

From US/USSR seminar on problems of design, development, fabrication, and test of breeder reactor components; Los Angeles, CA, USA (6 Feb 1978).

The IHX assembly consists of three basic sections: (a) the well casing, (b) the tube bundle, and (c) the shield plug. The well casing is permanently installed within the primary tank, being welded to the tank cover and reactor outlet piping. The casing contains a neutron shield which reduces the activation of the secondary sodium that flows through the tube bundle. The shield plug and tube bundle are an integral assembly that is removable at the operating floor. The tube bundle is unbaffled and is of conventional straight tube and tubesheet design, having 3,026 tubes of Type 304 stainless steel with 5/8-in. (15.9-mm) outside diameter X 0.052-in. (1.24-mm) wall thickness. Primary sodium flows downward on the shell side, and secondary sodium flows upward through the tubes. There are no provisions to compensate for differences in thermal expansion between tubes or the tubes and the center pipe. The IHX was installed in the EBR-II primary tank in November 1962. Operating conditions varied since 1963 as operating power was gradually increased to the design level of 62.5 MWT in September 1970. Since that time, operation has been at 62.5 MWT except for shutdown periods. By December 1977, the accumulated service will be approximately 3.5 million MWh. Except for a minor problem in November 1970, when a permanently installed evacuation tube came loose and was vibrating, service has been trouble-free. The evacuation tube was removed with the IHX in place with little difficulty and little loss of plant time.

- 652 (CONF-780251--P2, pp 8.199-8.230) CRBRP DECAY HEAT REMOVAL SYSTEMS. Hottel, R.E.; Louison, R.; Boardman, C.E.; Kiley, M.J. Aug 1978.

From US/USSR seminar on problems of design, development, fabrication, and test of breeder reactor components; Los Angeles, CA, USA (6 Feb 1978).

The Decay Heat Removal Systems for the Clinch River Breeder Reactor Plant (CRBRP) are designed to adequately remove sensible and decay heat from the reactor following normal shutdown, operational occurrences, and postulated accidents on both a short term and a long term basis. The Decay Heat Removal Systems are composed of the Main Heat Transport System, the Main Condenser and Feedwater System, the Steam Generator Auxiliary Heat Removal System (SGAHR), and the Direct Heat Removal Service (DHRS). The paper examines the overall design

of the CRBRP Decay Heat Removal Systems and the operation under normal and off-normal conditions and presents the redundancies of the system design, such as the four decay heat removal paths, the emergency diesel power supplies, and the auxiliary feedwater pumps; and the diversities of the design such as forced circulation/natural circulation and ac power/dc Power. In addition to overall design and system capabilities, the detailed designs for the Protected Air Cooled Condensers (PACC) and the Air Blast Heat Exchangers (ABHX) are presented.

- 653 (CONF-780251--P2, pp 10.289-10.314)

CRBRP SODIUM CIRCULATING PUMP DESIGN EVALUATION. Marrujo, F.; Cook, M.; Manners, L.; Cothran, H. Aug 1978.

From US/USSR seminar on problems of design, development, fabrication, and test of breeder reactor components; Los Angeles, CA, USA (6 Feb 1978).

One sodium pump is provided in the hot leg of each primary loop. Each of the pumps is nominally rated at 33,700 gpm (2.12 m³/sec), 458 ft (139.6m) total dynamic head. The pumps are driven by conventional squirrel-cage induction motors rated at 5,000 horsepower at 1,116 rpm. A pony motor rated at 75 horsepower is coupled to each pump motor by a reduction gear and overrunning clutch to drive the pump system at about 7-1/2 percent speed during standby operation, refueling, and decay heat removal periods. Each pump drive motor is powered by a commercial motor-generator set with fluid coupling. Drive speed turndown ratio is 4:5:1. The design of the sodium pumps is based on the free-surface centrifugal pump concept as successfully operated in EBR-II, EFBR, SRE, and HNPF. In this concept, the drive motor is located above the shield deck, the pump drive shaft penetrates the shield, and a buffer gas is contained between the sodium free surface and the final atmosphere seal at the pump shaft and containment boundary.

- 654 (CONF-780251--P2, pp 12.343-12.383)

ADVANCED WORK ON PUMPS AND HEAT EXCHANGERS. Jaross, R.; Anderson, R.; Brown, G.; Cox, J.; Brunsvold, A.; Nixon, D.; DeStefano, J. Aug 1978.

From US/USSR seminar on problems of design, development, fabrication, and test of breeder reactor components; Los Angeles, CA, USA (6 Feb 1978).

Model testing of an inducer for a centrifugal sodium pump plus test results is discussed. Hot and cold leg pump studies for liquid metal breeder reactor plants are summarized, including the operating parameters such as capacities from 77,000 gpm to 127,000 gpm, in addition to the key features of the conceptual designs and the needed supporting development work. A description of the ongoing program of the large sodium pump design for a primary hot leg and a secondary cold leg pump plus specification requirements and schedules is given. The feasibility study of a scale-up of the CRBRP IHX to commercial size, plus later low and high pressure drop commercial size conceptual studies is summarized. An advanced program for study of IHX maintainability including a tube plug placement device design, mock-up and testing, plus tube buckling analysis is outlined. A review of specific existing IHX designs, design criteria, and evaluation results is summarized.

- 655 (CONF-780251--P2, pp 11.315-11.342)

REVIEW OF FFTF AND CRBRP: CONTROL ROD SYSTEMS DESIGNS. Pitterle, T.A.; Lagally, H.D. Aug

1978.

From US/USSR seminar on problems of design, development, fabrication, and test of breeder reactor components; Los Angeles, CA, USA (6 Feb 1978).

Much of the design experience for the Clinch River Breeder Reactor (CRBR) design was developed in the design of the Fast Flux Test Facility (FFTF). CRBR designers were able to review the concepts developed for FFTF, integrate the current test data, and modify the designs and concepts as necessary to meet CRBR requirements. The primary control rod system design for CRBR progressed by the same evolutionary process, starting from the FFTF design concepts and integrating the considerable test data available and the specific requirements of CRBR. The paper describes the evolution of the primary control rod system design for FFTF and CRBR, beginning with the initial choice of the basic concepts. The significant component and systems tests are reviewed together with the test results which referenced the development of the CRBR primary control rod system design. Modifications to the concepts and detail designs of the FFTF control rod system were required principally to satisfy the requirements of CRBR, and at the same time incorporating design refinements shown desirable by the tests. The present status of the CRBR control rod system design is the inception of the systems and component test program to verify performance of the CRBR primary control rod system. The planned tests reflect the emphasis on reliability, and address the potential failure modes which the design experience has shown to be significant. It is expected that the experience from the current design experience and tests will contribute to future control rod systems designs as the FFTF experience contributed to CRBR.

656 (CONF-780251--P2, pp 6.107-6.139) FFTF AND CRBRP INTERMEDIATE HEAT EXCHANGER DESIGN, TESTING AND FABRICATION. Devlin, R.W.; Breshahan, J.D. Aug 1978.

From US/USSR seminar on problems of design, development, fabrication, and test of breeder reactor components; Los Angeles, CA, USA (6 Feb 1978).

The Heat Transport Systems of the Fast Flux Test Facility (FFTF) and the Clinch River Breeder Reactor Plant (CRBRP) include Intermediate Heat Exchangers (IHxs) to form barriers between the primary radioactive and secondary non-radioactive sodium coolant loops. The design, development and fabrication of the IHX for the FFTF has been completed and the units installed in the facility. The design and development of the IHX for the CRBRP has progressed through the performance sizing stage and flow testing of critical areas into early fabrication. The design evolution of these two heat exchangers may be considered a continuous development because the design and fabrication organizations have been the same for both units. Structural considerations to meet ASME Code requirements, support testing experience and manufacturing experience from the FFTF program has been factored into the CRBRP program. The paper outlines the similarities and differences between the FFTF and CRBRP designs. Special attention has been given to utilization of flow distribution devices and associated hydraulic testing, tube bundle and tube-to-tubesheet joint configurations, and fabrication differences.

657 (CONF-780251--P2, pp 7.141-7.197) FFTF DUMP HEAT EXCHANGER DESIGN AND DEVELOPMENT. Jansen, W.D.; Mahaffey, M.K.; Seber, E.C.;

Mancuso, R.A. Aug 1978.

From US/USSR seminar on problems of design, development, fabrication, and test of breeder reactor components; Los Angeles, CA, USA (6 Feb 1978).

The report is a brief summary of the history of procurement of the Dump Heat Exchangers for FFTF; it outlines the various organizations and respective roles. A description of the design basis and features of the large main heat transport system dump heat exchangers is included. Design evolution is discussed and testing performed as part of the design process, including finned tube qualification, header hydraulic tests, air-pressure drop tests, insulated panel tests and friction/wear testing, is summarized. Manufacturing experience, including development of an integral finned tube, development of welding procedures for joining the finned tubes, and header fabrication is also presented. Testing results obtained with the prototype unit are described, as are additional feature model tests that were performed to define possible methods of improving heat transfer performance for the plant units. The paper concludes with a summary of construction experience, status of plant modifications and a description of expected plant operation, including decay heat removal.

658 (CONF-780251--P2, pp 9.231-9.288) DESIGN EVOLUTION OF FFTF HEAT TRANSPORT SYSTEM PUMPS. Young, M.W.; Nixon, D.R.; Absher, K.R. Aug 1978.

From US/USSR seminar on problems of design, development, fabrication, and test of breeder reactor components; Los Angeles, CA, USA (6 Feb 1978).

The Fast Flux Test Facility (FFTF) Heat Transport System (HTS) pumps have been completed and are installed. The basic designs for the prototype, primary, and secondary pumps are described in the report. The descriptions include changes based on design reviews, high temperature and thermal transient considerations, sub-component development testing, and pump testing. Emphasis has been placed on changes resulting from pump tests in water and sodium test loops. Prototype and plant unit configurations are compared to show applicability of sodium test data to the plant units. The pump bearing failure experienced during thermal transient testing is also described, along with the changes required to prevent recurrence. Special prototype pump modifications were made to obtain data verifying adequacy of the design changes to the hydrostatic bearing. These changes are significant to future development programs, as are potential design improvements intended to reduce sensitivity to long-term dimensional instability and severe thermal transients.

659 (CONF-780374--1) ULTRASONIC INSPECTION FOR WASTAGE IN THE LMFBR STEAM GENERATOR DUE TO SODIUM-WATER REACTIONS. Neely, H.H.; Renger, L. (Atomics International Div., Richland, WA (USA). Rockwell Hanford Operations). 1977. Contract EY-76-C-04-3533. 10p. Dep. NTIS, PC A02/MF A01.

From Conference of the American Society for Nondestructive Testing; Phoenix, AZ, USA (28 Mar 1978).

As part of a program to study the results of large sodium-water reactions in the LMFBR Steam Generator, a boreside ultrasonic inspection device was developed to measure the wall thickness and diameter of the 2-1/4Cr-1 Mo, 0.397 in. I.D. steam tubes. The reaction was created in a near prototype steam generator by guillotine-type rupture of a steam tube, while

the generator was at operating conditions. Wastage occurred on the surrounding tubes due to the high temperature reaction. The UT test instrument was designed to operate with a 15 MHz transducer in the pulse-echo shear-wave mode, with a sampling rate of 10⁶/sec. System outputs are diameter, wall thickness, attitude and axial position of the transducer. All are displayed digitally and may be recorded. Measurements are fed into a computer for later retrieval, and/or cascaded outputs into an x-y recorded displaying either out-of-limit or thickness data. The UT data taken in this experiment were consistent with physical measurements on a tube which was removed from the generator after the test. A machined flat 1/8-inch long and 0.002-inch deep could readily be detected.

- 660 (CONF-780401-- , pp 191-206) USE OF INTEGRAL DATA IN THE DEVELOPMENT OF DESIGN METHODS FOR FAST REACTORS. Doncals, R.A.; Lake, J.A.; Paik, N.C. (Westinghouse Electric Corp., Madison, PA). Jun 1978.

From Topical meeting on advances in reactor physics; Gatlinburg, TN, USA (9 Apr 1978).

The paper describes an LMFB nuclear design methodology which has been strongly influenced by the availability of integral data, by the expansion of the differential nuclear data base, by improvements in large nuclear design computer codes, and by the specific reactor under consideration. The accuracy of the nuclear data base has been improved as the result of detailed differential measurements as well as extensive integral testing in the ZPR and ZPPR criticals. Due to the increased interest in radial parfait designs, the applicability of the design data and methods to the analysis of heterogeneous LMFB systems have been explored. The ability of the design data and methods to predict integral parameters in ZPPR is also discussed.

- 661 (CONF-780401-- , pp 479-492) PRESENT STATUS OF SODIUM VOID REACTIVITY PREDICTIONS IN CONVENTIONAL AND NONCONVENTIONAL FAST REACTOR CORE DESIGNS. Kuesters, H.; Ganesan, S. (Kernforschungszentrum, Karlsruhe, Ger.). Jun 1978.

From Topical meeting on advances in reactor physics; Gatlinburg, TN, USA (9 Apr 1978).

A review is given on the present status of the prediction of sodium void reactivity effects in conventional and nonconventional fast reactor core designs. First problems arising in the assessment of fast reactor safety are outlined and are discussed in relation to reactor physics aspects. Target accuracies for the sodium void effect are estimated. Nuclear data and calculational uncertainties are discussed, and the present accuracy achieved in various laboratories of the world is summarized. Some cases, for which the calculated void effects were rather far off the respective experimental results, were re-examined, resulting in significant improvements.

- 662 (CONF-780401-- , pp 517-525) CRITICALITY STUDIES ON PARTIALLY INSERTED ROD CONFIGURATIONS. Lee, B.W.; Indreboe, L.L.; Stewart, S.L. (General Electric Co., Sunnyvale, CA). Jun 1978.

From Topical meeting on advances in reactor physics; Gatlinburg, TN, USA (9 Apr 1978).

Criticality measurements were performed in Assembly 6 of ZPPR which included four core conditions. A bank of control rods was inserted various distances into the core for each configuration to simulate the first fuel cycle

of an LMFB. Analysis of criticality included both two-dimensional (X,Y) and three-dimensional (X,Y,Z) diffusion calculations. The core midplane compositions and the buckling values deduced from the axial leakage through the midplane were input to the (X,Y) calculation. The sensitivity of the axial leakage treatment in the (X,Y) calculations was analyzed. In addition, midplane neutron reaction rates were computed to provide diagnostic studies. It is concluded that the (X,Y) calculations using axial buckling deduced from the midplane axial leakage produce the best agreement with the 3-D calculations and provide a consistent prediction of criticality over a wide range of partially inserted configurations.

- 663 (CONF-780401-- , pp 527-538) NUCLEAR CHARACTERISTICS OF LARGE LMFB'S: HOMOGENEOUS AND HETEROGENEOUS DESIGNS. Lu, Y.S.; Cowan, C.L.; Bailey, H.S. (General Electric Co., Sunnyvale, CA). Jun 1978.

From Topical meeting on advances in reactor physics; Gatlinburg, TN, USA (9 Apr 1978).

GE-FBRD has carried out physics developments in the design of large size LMFBs using oxide fuel. A variety of designs have been investigated. Among those are the homogeneous (Pu,U)O₂ core, the heterogeneous (Pu,U)O₂ core, the homogeneous (²³³U,Th)O₂ core, and the heterogeneous (²³³U,Th)O₂ core. The nuclear characteristics of these cores are presented. The design data and core layout for each design are described. A discussion on the performance of these designs is given. It appears that the heterogeneous (Pu,U)O₂ core design possesses the potential of offering low sodium void worth advantage without significant economic impact and that the sodium voiding may not be an issue for the (²³³U,Th)O₂ cores.

- 664 (CONF-780401-- , pp 539-547) PERFORMANCE POTENTIAL OF (TH,U) CARBIDE AND (TH,U) NITRIDE FUEL IN 1200 MWE LMFB'S. Caspersson, S.A.; Kulwich, M.R. (Combustion Engineering, Inc., Windsor, CT). Jun 1978.

From Topical meeting on advances in reactor physics; Gatlinburg, TN, USA (9 Apr 1978).

An evaluation of the performance potential of thorium-uranium carbide and nitride fuel in 1200 MWE homogeneous and heterogeneous LMFB's has been completed. Comparisons were done with 9.40 mm outer diameter, 0.38 mm cladding fuel pins at a selected peak (3 sigma) linear power of 98.4 kW/m for all cores. Breeding ratios for the homogeneous (Th,U)C and (Th,U)N cores are 1.12 and 1.16, respectively. In the heterogeneous cores the breeding ratios are 0.08 to 0.09 greater. A comparative breeding ratio of 1.48 results for a sodium-bonded (U,Pu)C homogeneous LMFB with similar design criteria. Compound inventory doubling times for the homogeneous and heterogeneous (Th,U)C cores are 82 and 53 years, respectively. The enriched nitride cores, with a higher fuel density, show a large improvement in doubling time for the two core concepts, 53 and 46 years. The (U,Pu)C homogeneous core has a 10 year doubling time. Additional performance parameters have also been compared, including sodium void worths, specific inventories, fissile material gains, and equilibrium cycle reactivity losses.

- 665 (CONF-780401-- , pp 549-563) ALTERNATIVE FUEL CYCLES FOR BREEDER REACTORS. Bartine, D.E. (Oak Ridge National Lab., TN); Burns, T.J.; White, J.R.; Kallfelz, J.M.; Rowland, D.M. Jun 1978.

From Topical meeting on advances in reactor physics; Gatlinburg, TN, USA (9 Apr 1978).

The primary rationale for considering alternative fuel cycles is two-fold: possible reduced nuclear proliferation risk relative to the reference Pu/U cycle and the projected capital cost differential between fast and thermal reactor systems. One proposed alternate nuclear system has most reactors operating on a "denatured" fuel cycle, with fresh fuel containing ^{233}U mixed with sufficient ^{238}U so that it is unsuitable for weapons use; these reactors also contain fertile ^{232}Th for ^{233}U breeding. Any "plutonium burner" reactors would be inside a controlled safeguards area, and their primary goal would be to produce ^{233}U . The performance characteristics of various LMFBRs (both "classical" and "heterogeneous" configurations) are examined for each of the above roles. Calculations for denatured fuel show that in a heterogeneous design, which has mixed annuli of fertile and fissile elements, the ratio of ^{233}U production to plutonium production can be considerably increased over that for a classical LMFBR. The calculations have been performed primarily with the CITATION code, using ENDF/B-IV cross section data. For the designs considered, various significant design and performance parameters, such as the fissile production per cycle, are reported. Symbiotic system characteristics of various thermal/fast and fast/fast reactor combinations are discussed.

666 (CONF-780401-- pp 505-515) PURDUE UNIVERSITY FAST BREEDER BLANKET FACILITY. Ott, K.O.; Clikeman, F.M.; Fulford, P.J.; Borg, R.C.; Johnson, R.H.; Gailar, O.H. (Purdue Univ., Lafayette, IN). Jun 1978.

From Topical meeting on advances in reactor physics; Gatlinburg, TN, USA (9 Apr 1978).

The Purdue University fast breeder blanket facility has recently been completed. Neutrons for this subcritical facility are provided by a large ^{252}Cf source; cylindrical geometry is used. Transformer regions surround the source and are designed to match the spectrum of neutrons leaking from these regions with the spectrum of neutrons leaking from the core of a commercial fast breeder reactor. A radial blanket region surrounds the transformer regions; blanket loadings can be varied allowing a number of mock-ups of the radial blankets of proposed fast reactors. A variety of reaction rates and neutron energy spectra will be measured as a function of position in the blanket. These measurements will be compared with calculated spectra and reaction rates obtained using the same computational methods and cross sections which are currently being used to analyze proposed fast reactors. Measurements of gamma-ray heating rates in the blanket will be compared with transport calculations. Experiments using the Purdue facility will serve as integral tests of fast reactor blanket design techniques.

667 (CONF-780401--11) ASSESSMENT OF NUCLEAR DATA FILES VIA BENCHMARK CALCULATIONS: A REPORT ON THE NEACRP/IAEA INTERNATIONAL COMPARISON CALCULATION OF A LARGE LMFBR. LeSage, L.G.; Wade, D.C.; McKnight, R.D.; Freese, K.E. (Argonne National Lab., IL (USA)). 1978. Contract W-31-109-ENG-38. 19p. Dep. NTIS, MF A01.

From Topical meeting on advances in reactor physics; Gatlinburg, TN, USA (9 Apr 1978).

Portions of document are illegible.

The results of an international comparison calculation of a large (1250 MWe) LMFBR benchmark model are presented and discussed. Eight reactor configurations were calculated. Parameters included with the comparison were: eigenvalue, $k_{\text{sub infinity}}$, neutron balance

data, breeding reaction rate ratios, reactivity worths, central control rod worth, regional sodium void reactivity, core Doppler and effective delayed neutron fraction. Ten countries participated in the comparison, and fourteen solutions were contributed. The discussion focuses on the variation in parameter values, the degree of consistency among the various parameters and solutions, and the identification of unexpected results. The results are displayed and discussed both by individual participant and by groupings of participants (e.g., results from adjusted data sets versus non-adjusted data sets). Unexpected large variations among results were observed for radial reaction rate and worth distributions and for the central control rod worth.

668 (CONF-780401--12) CONCLUSIONS DRAWN FROM SUBCRITICAL MULTIPLICATION RESULTS IN ZPPR. Carpenter, S.G.; McFarlane, H.F.; Lineberry, M.J.; Beck, C.L. (Argonne National Lab., IL (USA)). 1978. Contract W-31-109-ENG-38. 13p. Dep. NTIS, PC A02/MF A01.

From Topical meeting on advances in reactor physics; Gatlinburg, TN, USA (9 Apr 1978).

Modified source multiplication (MSM) has been investigated as a measurement technique for several LMFBR designs in the 1000 MWt class. This investigation has been based on the results of hundreds of measurements in ZPPR as well as on detailed analysis of some of the components of the method. The results of this study have special significance for critical-experiment planning and for the use of ex-vessel detectors in operating LMFBRs. The calculated factors that are applied in the MSM technique for ex-core detectors were found to be particularly insensitive to the calculational method. This apparently resulted from two facts: (1) the calculated factors are ratios of ratios, which reduce the sensitivity to first order corrections, and (2) most neutrons which cause reactions in an ex-core detector originate in the small volume of core nearest to the detector. Maps of key parameters in the MSM technique have been generated to promote a general understanding of the method and to assure its proper application.

669 (CONF-780401--13) PHYSICS ASPECTS IN THE DESIGN OF HETEROGENEOUS CORES. Barthold, W.P.; Beitel, J.C. (Argonne National Lab., IL (USA)). 1978. Contract W-31-109-ENG-38. 15p. Dep. NTIS (US Sales Only), PC A02/MF A01.

From Topical meeting on advances in reactor physics; Gatlinburg, TN, USA (9 Apr 1978).

In unprotected loss-of-flow transients in large LMFBRs the reactor may become super-prompt critical on sodium voiding alone. To preclude an energetic disassembly the subsequent fuel motion must be monotonically dispersive. It is difficult if not impossible to resolve details of fuel motion under super-prompt critical conditions at very high power levels. However, if the sodium void reactivity is reduced to zero or near zero values, the sensitivity of the energetics to details of fuel motion can be greatly reduced and even under pessimistic accident scenarios less energetic termination of the transient is expected. Therefore, there is a strong incentive for designing reactors that have a near zero value of sodium void reactivity. Among such designs, the heterogeneous configurations that consist of successive radial core and blanket zones are most promising. The enhancement of neutron leakage from the core zones into the internal blanket zones results in a low sodium void reactivity

because of the increase in the leakage component and decrease in the spectral component of the void reactivity.

Results for conventional and heterogeneous LMFBR designs are compared in some detail.

- 670 (CONF-780401--15) NUCLEAR DATA SENSITIVITY COEFFICIENTS FOR A (^{233}U - ^{232}Th) FUELED LMFBR. Turski, R.B.; McKnight, R.D. (Argonne National Lab., IL (USA)). 1978. Contract W-31-109-ENG-38. 13p. Dep. NTIS, PC A02/MF A01.

From Topical meeting on advances in reactor physics; Gatlinburg, TN, USA (9 Apr 1978).

Sensitivity coefficients for the nuclear data of the principal constituents of a representative ^{233}U - ^{232}Th fueled LMFBR have been generated. Generalized perturbation coefficients for several reactor parameters were computed with the VARI code and ENDF/B Version 4 data for a homogeneous one-dimensional spherical model. The following ten reactor parameters were studied: eigenvalue; breeding ratio; inner core conversion ratio; outer core conversion ratio; central reaction rate ratios of f^{02} , c^{23} , and c^{02} relative to f^{23} ; and the central material reactivity worths of ^{233}U , ^{232}Th , and ^{23}Na . Total (energy-integrated) and energy-dependent sensitivity coefficients were obtained for each of these parameters to each of the following nuclear data: sigma/sub f/ for ^{233}U , ^{234}U , ^{232}Th , and ^{233}Pa ; sigma/sub c/ for ^{233}U , ^{234}U , ^{232}Th , ^{233}Pa , ^{23}Na , SS316 , and fission products; anti ν for ^{233}U and ^{232}Th ; and sigma/sub inel/ for ^{232}Th . These data are combined with estimated data uncertainties and with observed large differences in recent data evaluations to project the impact on integral parameters calculated for a ^{233}U - ^{232}Th fueled LMFBR.

- 671 (CONF-780401--16) UNCERTAINTIES IN THE BREEDING RATIO OF A LARGE LMFBR. Marable, J.H.; Weisbin, C.R. (Oak Ridge National Lab., TN (USA)). 1978. Contract W-7405-ENG-26. 13p. Dep. NTIS, PC A02/MF A01.

From Topical meeting on advances in reactor physics; Gatlinburg, TN, USA (9 Apr 1978).

An uncertainty analysis for eight fast integral benchmark experiments was performed to find the most consistent set of values for both the integral and differential data as well as their associated covariances. Extensive covariance data including inelastic scattering for ^{238}U and uncertainties in the fission spectrum temperature were used in the adjustment. The resulting covariance for the adjusted data was folded with calculated performance parameter sensitivities for a two-dimensional model of a conventional homogeneous plutonium-oxide fueled fast breeder reactor. Based on the estimated covariance files it was found that the inclusion of integral experiment data reduced the uncertainty in the static breeding ratio to the design goal of two percent. Some apparent inconsistencies in the data were alleviated by including in an approximate way the effect of methods, uncertainties, and other possible systematic errors.

- 672 (CONF-780401--20) COMPARISON BETWEEN PHYSICS PARAMETERS IN CONVENTIONAL AND HETEROGENEOUS LMFBRs USING RESULTS FROM ZPPR. Collins, P.J.; Beck, C.L.; McFarlane, H.F.; Lineberry, M.J.; Carpenter, S.G. (Argonne National Lab., IL (USA)). 1978. Contract W-31-109-ENG-38. 12p. Dep. NTIS, PC A12/MF A01.

From Topical meeting on advances in reactor physics; Gatlinburg, TN, USA (9 Apr 1978).

The analysis of several ZPPR experiments has been made using consistent methods and data.

- 673 (CONF-780407--6) FAST REACTOR OPERATION IN THE UNITED STATES. Smith, R.R.; Cissel, D.W. (Argonne National Lab., Idaho Falls, ID (USA)). 1978. Contract W-31-109-ENG-38. 33p. Dep. NTIS, PC A03/MF A01.

From Symposium on design, construction and operating experience of demonstration liquid metal fast breeder reactors; Bologna, Italy (10 Apr 1978).

Of the many American facilities dedicated to fast reactor technology, six qualify as liquid-metal-cooled fast reactors. All of these satisfy the following criteria: an unmoderated neutron spectrum, highly enriched fuel material, substantial heat production, and the use of a liquid metal coolant. These include the following: EBR-I Clementine, LAMPRE, EBR-II, EFFBR, and SEFOR. Collectively, these facilities encompassed all of the more important features of liquid-metal-cooled fast reactor technology. Coolant types ranged from mercury in Clementine, to NaK in EBR-I, and sodium in the others. Fuels included enriched-uranium metallic alloys in EBR-I, EBR-II, and EFFBR; metallic plutonium in Clementine; molten plutonium alloy in LAMPRE; and a mixed UO_2 - PuO_2 ceramic in SEFOR. Heat removal techniques ranged from air-blast cooling in LAMPRE and SEFOR; steam-electrical generation in EBR-I, EBR-II, and EFFBR; to a mercury-to-water heat dump in Clementine. Operational experience with such diverse systems has contributed heavily to the U.S. Each of the six systems is described from the viewpoints of purpose, history, design, and operation. Attempts are made to limit descriptive material to the most important features and to refer the reader to a few select references if additional information is needed.

- 674 (CONF-780407--7) EBR-II COVER-GAS CLEANUP SYSTEM. Monson, L.R.; McDaniel, M.J.; Knox, A.E.; Rice, R.E. (Argonne National Lab., IL (USA)). 1978. Contract W-31-109-ENG-38. 16p. Dep. NTIS (US Sales Only), PC A02/MF A01.

From Symposium on design, construction and operating experience of demonstration liquid metal fast breeder reactors; Bologna, Italy (10 Apr 1978).

Operation of EBR-II with breached elements results in the continuous release of fission gases to the argon cover gas. To control activity in the reactor, a cover-gas cleanup system (CGCS) was installed to remove xenon and krypton from the cover gas by cryogenic distillation. Although only one breached fuel element will, by intention, be in-core during the early stages of the run-beyond-cladding-breach (RBCB) program now under way, the CGCS is designed to handle the activity released by up to 12 mixed-oxide elements.

- 675 (CONF-780440--1) ROLE AND PROGRESS OF THE CLINCH RIVER BREEDER REACTOR PLANT. Nolan, J.E.; Goesser, D.K. (Westinghouse Electric Corp., Oak Ridge, TN (USA). Advanced Reactors Div.). 1978. Contract EY-76-C-15-2395; EY-76-C-15-0003. 12p. Dep. NTIS, PC A02/MF A01.

From American power conference; Chicago, IL, USA (Apr 1978).

The Clinch River Breeder Reactor Plant plays a vital role in the development of an LMFBR industry by demonstrating the technical performance, reliability, maintainability, safety, environmental acceptability and economic feasibility of an LMFBR central

station power plant in a utility environment and confirms the value of the LMFBR in conserving natural resources. Activities already completed on the CRBRP Project have supported the attainment of these objectives in fulfilling the role of the CRBRP. In particular, the licensing interactions with the NRC leading to the issuance of a favorable or environmental acceptability (FES), the development of an industrial base of qualified component suppliers, and the completion of system and component designs, have all shown the ability of the CRBRP to meet its objectives. The most striking achievements on the CRBRP to date have been the completion of component designs and the considerable progress in component fabrication. Many of the major components are 50% or more through the fabrication process. The capability of the Project to maintain cost and schedule in these component procurements has been a major achievement and provides a solid basis for establishing the commercial viability of the LMFBR.

a systematic and disciplined evaluation of the plant design to search for and identify potential accident scenarios and to provide additional early assurance that important safety considerations have been identified. Results of the study indicate that CRBRP operational risks are small when compared with other societal risks and are comparable to those associated with current-generation Light Water Reactors (LWRs).

- 676 (CONF-780469--1) SOME RESULTS FROM THE TESTING OF A HIGH TEMPERATURE FISSION COUNTER-CHAMBER IN THE EBR-II J-2 THIMBLE OF THE NUCLEAR INSTRUMENT TEST FACILITIES (NITF). Yingling, G.E.; Taboas, A.L.; Popper, G.F.; Lipinski, W.C. (Argonne National Lab., IL (USA)). 1978. Contract W-31-109-ENG-38. 14p. Dep. NTIS, PC A02/MF A01.

From IAEA symposium on nuclear power plant control and instrumentation; Cannes, France (24 Apr 1978).

A summary of test results from the life testing of a Twentieth Century Electronics (TCE) Model DC-14B fission counter-chamber at temperatures up to approximately 560°C in a typical Liquid Metal Fast Breeder Reactor (LMFBR) nuclear environment. The test results, after approximately 2.5 years of testing in the Experimental Breeder Reactor-II (EBR-II) J-2 thimble of the Nuclear Instrument Test Facilities (NITF), indicate that this type of detector, when attached to a current sensitive type preamplifier can be successfully utilized for long term, fixed position, low level and/or wide range neutron flux monitoring applications in thermal equivalent neutron fluxes of greater than 10^{11} nv. Brief descriptions of the test program, electronic test instruments used and the reactor facility are also included.

- 677 (CONF-780507--15) CLINCH RIVER BREEDER REACTOR PLANT SAFETY STUDY: SUMMARY AND RESULTS. Wood, P.J.; Leaver, D.W.W.; Piper, H.B.; Buhl, A.R.; Crump, R.J.; Hale, J.P.; Ferguson, D.R.; Griffin, C.W. (Clinch River Breeder Reactor Plant Project Office, Oak Ridge, TN (USA)). 1978. Contract EY-76-C-15-1200. 20p. Dep. NTIS, PC A02/MF A01.

From Probabilistic analysis of nuclear reactor safety; Los Angeles, CA, USA (8 May 1978).

The Clinch River Breeder Reactor Plant (CRBRP) Safety Study is an assessment of risks to the public associated with the operation of a 380-MW(e) liquid-metal fast breeder reactor (LMFBR) of the type to be built on the Clinch River site in Oak Ridge, Tennessee. The objectives of the study were to provide a realistic assessment of accident risks associated with the CRBRP, to place them in perspective in relation to other societal risks, and to aid in determining whether accident risks from the CRBRP are comparable to those for previously licensed reactors. Although this study was necessarily not completed with the depth or precision possible for operating reactors, its timing has allowed

- 678 (CONF-780622--15) VIBRATION STUDIES OF PERFORATED PLATES ON CRBRP MIXING TEE MODEL. Chung, H.; Halle, H. (Argonne National Lab., IL (USA)). 1978. Contract W-31-109-ENG-38. 5p. Dep. NTIS, PC A02/MF A01.

From ANS annual meeting; San Diego, CA, USA (18 Jun 1978).

Results are reported for a series of vibration tests on a quarter scale model of a mixing tee for the CRBR intermediate heat transport system. The tests consisted of free vibration tests and flow tests on the perforated plates in the tee.

- 679 (CONF-780622--37) SIMPLE TRANSIENT ANALYSIS OF THE THORS BUNDLE 6A BOILING TEST RESULTS. Garrison, P.W. (Oak Ridge National Lab., TN (USA)). 1978. Contract W-7405-ENG-26. 2p. Dep. NTIS, PC A02/MF A01.

From ANS annual meeting; San Diego, CA, USA (18 Jun 1978).

A simple one-dimensional boiling model has been developed to investigate the effect of bundle insulation degradation on the results of boiling stability tests conducted in the Thermal Hydraulic Out-of-Reactor Safety (THORS) Facility at ORNL. Significant periods (20 to 90s) of stable boiling without dryout were observed during a series of flow coastdown initiated boiling tests of a 19-pin simulated LMFBR fuel subassembly at power levels of 1.0 to 5.2 kW/ft.

- 680 (CONF-780622--42) SAS3A SIMULATIONS FOR A 19-PIN DRYOUT EXPERIMENT. Han, J.T.; Tomlinson, E.T. (Oak Ridge National Lab., TN (USA)). 1978. Contract W-7405-ENG-26. 6p. Dep. NTIS, PC A02/MF A01.

From ANS annual meeting; San Diego, CA, USA (18 Jun 1978).

Three preliminary calculations using the one-dimensional SAS3A code have been performed to simulate a dryout experiment obtained in a 19-pin sodium-cooled bundle. Different values of the structure thermal inertia were used in SAS to account for the boiling incoherency in the test caused mainly by the wall heat loss. It was found that the larger the value used in SAS, the further the delay of boiling and dryout inception. In order to predict these events closely, two SAS calculations were required using different structure thermal inertias.

- 681 (CONF-780622--43) SENSITIVITY ANALYSES OF FAST REACTOR SYSTEMS INCLUDING THORIUM AND URANIUM. Marable, J.H.; Weisbin, C.R. (Oak Ridge National Lab., TN (USA)). 1978. Contract W-7405-ENG-26. 4p. Dep. NTIS, PC A02/MF A01.

From ANS annual meeting; San Diego, CA, USA (18 Jun 1978).

The Cross Section Evaluation Working Group (CSEWG) has, in conjunction with the development of the fifth version of ENDF/B, assembled new evaluations for ^{232}Th and ^{233}U . It is the purpose of this paper to describe briefly some of the more important features of these evaluations relative to ENDF/B-4 to

project the change in reactor performance based upon the newer evaluated files and sensitivity coefficients for interesting design problems, and to indicate preliminary results from ongoing uncertainty analyses.

682 (CONF-780622--67) DESIGN APPLICATIONS OF IRRADIATION CREEP AND SWELLING DATA.

Boltax, A.; Foster, J.P.; Kalinowski, J.E.; Swenson, D.V. (Westinghouse Electric Corp., Madison, PA (USA). Advanced Reactors Div.). 1978. Contract EY-76-C-02-3045-007. 20p. Dep. NTIS, PC A02/MF A01.

From ANS annual meeting; San Diego, CA, USA (18 Jun 1978).

Recently, high dose irradiation creep and swelling data have been reported for a variety of stainless steels. However, the data base is still not sufficiently large for any one material to permit unambiguous determination of the functional dependencies of irradiation creep and swelling on dose, temperature, and stress. The purpose of the paper is to present an assessment of irradiation creep and swelling relative to various design applications and, in particular, to illustrate the sensitivity of uncertainties in the available data when applied to design calculations where irradiation creep and swelling act in opposition.

683 (CONF-780819--13) AGGLOMERATION CHARACTERISTICS OF FAST REACTOR HCDA AEROSOLS.

Parker, G.W.; Creek, G.E.; Sutton, A.L. Jr. (Oak Ridge National Lab., TN (USA)). 1978. Contract W-7405-ENG-26. 26p. Dep. NTIS, PC A03/MF A01.

From 15. nuclear air cleaning conference; Boston, MA, USA (Aug 1978).

The behavior of vaporized mixed oxide fuel aerosols postulated to result from fast reactor core disruptive accidents is a subject which is intensely evaluated in fast reactor safety analysis, containment design, and site selection licensing procedure. In this program, surrogate uranium oxide aerosols produced by vapor condensation of super-heated liquid UO_2 have been produced in a variety of ways and have been intercompared with respect to particle morphology, number concentration, deposition behavior, surface area, oxygen content, and diffusion, sedimentation, and agglomeration rates. It has been established that, within a relatively narrow range, the primary particles are nearly identical when examined for initial shape, and size distribution, and effective density. However, primary particles in those aerosols produced by the most rapid heating methods followed by nearly instantaneous cooling are smaller in size and generally spherical, while those produced by slower processes in combination with delayed cooling give rise to a large proportion of crystalline particles which result in more tightly bound agglomerates. Deposition behavior is not significantly affected by this difference. Stokes diameters, which can be rather accurately calculated from the rate of settling, compare favorably with aerodynamic mean diameters measured with inertial devices. Agglomerate sizes appear to follow the cube root of the maximum initial concentration. The HAARM-2 version of the HAA-3 aerosol code has been used to obtain detailed time-dependent predicted behavior on a reference closed volume. The interrelations observed suggest that, in a given system, many of the characteristics can be calculated after only a few cases have been experimentally measured.

684 (CONF-780819--P1, pp 195-207) STUDY ON THE TRITIUM REMOVAL FROM THE SODIUM IN LMFB. Hata, K.; Nishizawa, Y.; Osawa, Y. (Mitsubishi Atomic Power Industries, Inc., Omiya, Japan). Feb 1979.

From 15. nuclear air cleaning conference; Boston, MA, USA (Aug 1978).

Removal of tritium in the sodium coolant of LMFB, is important for achieving the release of radioactivities as low as reasonably achievable. It is well known that cold trap should be an effective method for controlling tritium in sodium. To develop an effective tritium trapping system with reactive getter (chemical trap), in-sodium hydrogen absorption behavior has been studied. The absorption experiment was conducted by dipping some test materials into sodium on which cover gas was composed of an $Ar-H_2$ mixture. Hydrogen analysis and metallographic examination for the test materials were made after the experiment. From these experiments, it was concluded that Yttrium canned with Nickel or Niobium was the most suitable as reactive getter. Further investigation to develop the chemical trap made from these materials for practical application has been in progress.

685 (CONF-780819--P1, pp 257-265) STUDY OF THE CONTAINMENT SYSTEM OF THE PLANNED SNR-2 FAST BREEDER REACTOR. Bunz, H. (Kernforschungszentrum Karlsruhe GmbH, Germany); Scholle, U. Feb 1979.

From 15. nuclear air cleaning conference; Boston, MA, USA (Aug 1978).

Research is presented concerning the behaviour of four possible containment concepts for the planned Fast Breeder Reactor SNR-2 under the conditions of a HCDA. Detailed descriptions and calculations are given dealing with the acceptable leakages and the filter loads reached. The transport of the aerosol-type as well as the gaseous activity through the different compartments into the environment is calculated and from this the resulting accident doses. To cover the uncertainties of the accident course a wide range of accident parameters is examined.

686 (CONF-780819--P2, pp 764-791) SODIUM OXIDE/HYDROXIDE AEROSOL PROPERTIES AND BEHAVIOR IN A LARGE VESSEL. Hilliard, R.K.; McCormack, J.D.; Hassberger, J.A.; Postma, K.A. (Westinghouse Hanford Co., Richland, WA). Feb 1979.

From 15. nuclear air cleaning conference; Boston, MA, USA (Aug 1978).

Two large-scale aerosol behavior tests were performed in the Containment Systems Test Facility (CSTF) using sodium pool fires as the aerosol source. The purpose was to characterize the properties and behavior of sodium aerosol particles formed and aged in a large containment vessel. The results will be used as baseline data for comparison with follow-on air cleaning tests. The 20-m high, 850-m³ CSTF containment vessel is approximately half scale of a commercial reactor containment building for parameters which affect agglomeration and gravitational settling. Thus, the test air cleaning systems will be challenged with an aerosol closely representative of that postulated for LMFB accidents. The results of these tests also offer an excellent opportunity to evaluate computer models which have been developed for the purpose of predicting aerosol behavior during hypothetical accidents in sodium cooled reactor containment spaces. The two tests differed only in that steam was injected in the second test to simulate the release of water vapor from heated concrete. The aerosol in the first test was a dry mixture

of sodium peroxide, sodium hydroxide and sodium carbonate. In the second test it was predominantly wet sodium hydroxide. The addition of water vapor caused more rapid fallout during the aerosol release period, but lower settling rates afterward. The net results was a 25% lower potential for aerosol leakage in the wet test. Detailed analyses of computer model comparisons have not yet been performed, but preliminary HAA-3B code predictions were in good agreement with suspended mass concentration and the ratio of mass settled to plated on walls.

- 687 (CONF-780819--P2, pp 792-804)
ATTENUATION OF PARTICLES THROUGH LEAK PATHS.
Nelson, C.; Johnson, R. (Atomics International Div., Canoga Park, CA). Feb 1979.

From 15. nuclear air cleaning conference; Boston, MA, USA (Aug 1978).

Particulates of sodium oxide were passed through narrow leak passages. The particulates impacted on the walls and built up plugs which eventually stopped the flow. Conditions under which plugging occurs were determined. Material which did pass through the leaks was increased in size because of agglomeration on the wall followed by detachment. The data shows that radioactive particulates escaping through leaks following a hypothetical FBR accident will tend to plug the leaks in both the reactor vessel and the containment building. Also, the particulates will generally increase in size so as to be nonrespirable.

- 688 (CONF-780819--P2, pp 1044-1057)
PERFORMANCE OF A WET CELL WASHER FOR SODIUM FIRE AEROSOLS. Hinds, W.; Price, J.; First, M.W. (Harvard Air Cleaning Lab., Boston, MA). Feb 1979.

From 15. nuclear air cleaning conference; Boston, MA, USA (Aug 1978).

The suitability of 6 packing materials for removal of sodium fire aerosols in a wet cell scrubber was evaluated experimentally by measuring the efficiency and flow resistance of two 10.2 cm deep cells in series at air face velocities of 185 and 289 cm/sec, water flow rates of 0.210 and 0.387 cm³/sec/cm², with and without aerosol prehumidification. The most satisfactory material was found to be 50 µm diameter stainless steel fibers at a packing density of 30 kg/m³ (porosity = 0.99). Two 10.2 cm deep cells in series gave a removal efficiency of 85% for typical sodium fire aerosols at a face velocity of 289 cm/sec. Measurement of efficiency as a function of particle size indicated a reduction in efficiency in the 0.4 to 1.1 µm size range for all packing materials.

- 689 (CONF-780922--2) MAINTENANCE OF CLINCH RIVER BREEDER REACTOR NUCLEAR ISLAND SYSTEMS. Ehrman, C.S.; Burgess, D.S. (Burns and Roe, Inc., Oradell, NJ (USA); Atomics International Div., Canoga Park, CA (USA)). 1978. Contract EN-77-C-03-1547. 18p. Dep. NTIS, PC A02/MF A01.

From ASME conference on power generation; Dallas, TX, USA (10 Sep 1978).

The Clinch River Breeder Reactor Plant is being designed to be maintained so that a high plant availability goal can be achieved. The plant is being designed so that equipment disassembly, cleaning, repair, reassembly, and return to service can be conducted in an expeditious manner. The layout of the plant and of individual cells provides adequate accessibility, work clearance, laydown areas, removal paths, and handling areas. Wherever

possible, the plant systems have been designed to provide capability for hands-on inspection and maintenance without undue hazard to maintenance personnel. Major sodium system components are removed by special transfer and bag-out techniques and placed in shielded casks when required. Systems and facilities have been provided for removal of sodium and decontamination of components, supported by Radwaste Systems which provide for control and disposition of radioactive wastes generated or released during maintenance.

- 690 (CONF-780963--1) EBR-II: SUMMARY OF OPERATING EXPERIENCE. Perry, W.H.; Leman, J.D.; Lentz, G.L.; Longus, K.J.; Olson, W.H.; Shields, J.A.; Wolz, G.C. (Argonne National Lab., Idaho Falls, ID (USA)). 1978. Contract W-31-109-ENG-38. 78p. Dep. NTIS, PC A05/MF A01.

From Seminar on plant engineering; Mito, Japan (20 Sep 1978).

Experimental Breeder Reactor II (EBR-II) is an unmoderated, sodium-cooled reactor with a design power of 62.5 Mwt. The primary cooling system is a submerged-pool type. The early operation of the reactor successfully demonstrated the feasibility of a sodium-cooled fast breeder reactor operating as an integrated reactor, power plant, and fuel-processing facility. In 1967, the role of EBR-II was reoriented from a demonstration plant to an irradiation facility. Many changes have been made and are continuing to be made to increase the usefulness of EBR-II for irradiation and safety tests. A review of EBR-II's operating history reveals a plant that has demonstrated high availability, stable and safe operating characteristics, and excellent performance of sodium components. Levels of radiation exposure to the operating and maintenance workers have been low; and fission-gas releases to the atmosphere have been minimal. Driver-fuel performance has been excellent. The repairability of radioactive sodium components has been successfully demonstrated a number of times. Recent highlights include installation and successful operation of (1) the hydrogen-meter leak detectors for the steam generators, (2) the cover-gas-cleanup system and (3) the cesium trap in the primary sodium. Irradiations now being conducted in EBR-II include the run-beyond-cladding breach fuel tests for mixed-oxide and carbide elements. Studies are in progress to determine EBR-II's capability for conducting important 'operational safety' tests. These tests would extend the need and usefulness of EBR-II into the 1980's.

- 691 (CONF-780963--2) TRAINING EXPERIENCE AT EXPERIMENTAL BREEDER REACTOR II. Driscoll, J.W.; McCormick, R.P.; McCreery, H.I. (Argonne National Lab., Idaho Falls, ID (USA)). 1978. Contract W-31-109-ENG-38. 72p. Dep. NTIS, PC A04/MF A01.

From Seminar on plant engineering; Mito, Japan (20 Sep 1978).

The EBR-II Training Group develops, maintains, and oversees training programs and activities associated with the EBR-II Project. The group originally spent all its time on EBR-II plant-operations training, but has gradually spread its work into other areas. These other areas of training now include mechanical maintenance, fuel manufacturing facility, instrumentation and control, fissile fuel handling, and emergency activities. This report describes each of the programs and gives a statistical breakdown of the time spent by the Training Group for each program. The major training programs for the EBR-II Project are presented by multimedia methods at a pace

controlled by the student. The Training Group has much experience in the use of audio-visual techniques and equipment, including video-tapes, 35 mm slides, Super 8 and 16 mm film, models, and filmstrips. The effectiveness of these techniques is evaluated in this report.

- 692 (CONF-781001--P1) THIRD US/USSR LMFBF STEAM GENERATOR SEMINAR. VOLUME 1. US PAPERS. (General Electric Co., Sunnyvale, CA (USA). Advanced Reactor Systems Dept.). 1978. Contract EY-76-C-03-0893-010. 356p. AT.
From 3. US-USSR LMFBF steam generator seminar; Tampa, FL, USA (Oct 1978).
Separate abstracts were prepared for the individual papers presented at the meeting.

- 693 (CONF-781001--P1, pp 1.1-1.30) DESIGN, MANUFACTURING, AND TEST STATUS OF THE CRBRP HOCKEY STICK STEAM GENERATORS. Lillie, A.F.; Bashford, A.L. 1978.
From 3. US-USSR LMFBF steam generator seminar; Tampa, FL, USA (Oct 1978).
The history of the development of the hockey stick steam generator, currently being designed and fabricated for use in the CRBRP, is traced back to its inception in the late 1960's. Additional supporting development, which has formed the basis for the current CRBRP design, is presented. The design requirements for the CRBRP steam generators is outlined and the basic design, which has been evolved to meet those requirements, is described. Of particular interest to the designer are the design analysis problem areas which have been encountered and the method of attack which has been employed to resolve these problems. Finally, the current status of the prototype and CRBRP steam generator plant unit production effort is described. Tube-tubesheet welding and welding of shell sections is discussed.

- 694 (CONF-781001--P1, pp 2.1-2.12) FABRICATION AND INSPECTION OF TUBING, TUBESHEETS, AND TUBE-TO-TUBESHEET WELDS FOR THE CRBRP STEAM GENERATORS. Spalaris, C.N.; Durand, R.E.; McClung, R.W.; Wright, E.A. 1978.
From 3. US-USSR LMFBF steam generator seminar; Tampa, FL, USA (Oct 1978).
The rationale for the technical details leading to the selection of tubing and tubesheet specifications and inspection techniques was based upon the desire to optimize the chances of success for the CRBRP steam generators. Fabrication processes, especially welding for the tube-to-tubesheet joints were recognized as critical. Thus, heavy emphasis was placed upon the development of reliable welding techniques as well as inspection methods using the most accurate and sensitive tools available. Accomplishments to date include: (a) the procurement of the tubing and tubesheets, to the desired specifications; (b) validation that the design base properties of wrought products are well within code acceptable levels; and (c) development of welding and tube-to-tubesheet inspection methods to provide satisfactory levels of quality.

- 695 (CONF-781001--P1, pp 3.1-3.34) DESIGN APPROACHES AND PROGRAMS FOR DEVELOPMENT OF STEAM GENERATORS FOR U.S. LMFBF PLANTS BEYOND CRBRP. Stone, C.C. (Argonne National Lab., IL); Ford, J.A.; McDonald, J.S.; Lohmeier, A.; Grant, G. 1978.
From 3. US-USSR LMFBF steam generator seminar; Tampa, FL, USA (Oct 1978).
The advanced steam generator program in the

U.S. for LMFBF Plants consists of base technology and development of three large-scale steam generator design concepts. A feasibility scale-up of the CRBRP hockey stick design steam generator for application in the Prototype Large Breeder Reactor (PLBR) has been performed by the Atomic International Division of Rockwell International. A single-wall helical-coil steam generator is being developed by Babcock and Wilcox Company and a double-wall straight-tube concept is being developed by the Tampa Division of the Westinghouse Electric Corporation. This paper gives a description of each of the three concepts, basis for selection and the main factors considered. The development that has been completed in support of the hockey stick design is described and the planned development and testing programs to support the double-wall and helical-coil designs are outlined. Two alternate steam cycles are being considered and a 70 MWt prototype for both the double-wall and helical-coil concepts is planned to be designed, fabricated and tested after selection of a single reference steam cycle for each of the concepts.

- 696 (CONF-781001--P1, pp 4.1-4.12) DECARBURIZATION OF 2-1/4CR-1MO IN FLOWING SODIUM. Roy, P.; Hampton, L.V.; Spalaris, C.N. 1978.
From 3. US-USSR LMFBF steam generator seminar; Tampa, FL, USA (Oct 1978).
The Intermediate System Mock-up Sodium Loop (ISML) was designed to model a bi-metallic (austenitic stainless and 2-1/4Cr-1Mo ferritic steel) LMFBF intermediate heat transport system. The objective of the loop is to establish decarburization kinetics of 2-1/4Cr-1Mo as well as carburization rates for Types 304 and 316 stainless, operative in an intermediate heat transport sodium loop. It is intended to verify design basis assumptions made for the CRBRP regarding carbon transport in the secondary system. This loop has operated for about 11,000 hours. The specimens tested include prototypical materials used for the fabrication of CRBRP steam generators, as well as experimental heats controlled to test the effects of remelt refining processes. Activation energies have been obtained for decarburization rates for electroslag remelt (ESR) and vacuum arc remelt (VAR) materials produced from the same air melted ingot. Geometry effects of test samples have been investigated and time dependence was established for the decarburization constants. Carburization rates in this loop for Type 304 stainless were found to be lower than the previous data band.

- 697 (CONF-781001--P1, pp 5.1-5.32) CORROSION AND IMPURITIES DEPOSITION EFFECTS UNDER DNB CONDITIONS. Rush, D.J.; Hampton, L.V.; Spalaris, C.N.; Schmidt, D.K.; Padden, T.R. 1978.
From 3. US-USSR LMFBF steam generator seminar; Tampa, FL, USA (Oct 1978).
A summary of two separate steam generator model test programs, including a description of the test models, test systems, control and monitoring of water chemistry, in situ nondestructive examination methods and results, post-test destructive examination methods and results, are presented. The test programs described are: the DNB Corrosion Effects test program conducted by General Electric which comprised a sodium-heated single-wall-tube test model with a single-wall heat transfer tube prototypic of the CRBRP steam generator tubing; and the Small Steam Generator Model corrosion test program conducted by Westinghouse which

comprised a sodium-heated double-wall tube. The objectives of these tests were to determine whether accelerated or localized damage would occur as a result of DNB operation. The two parameters varied were caustic level and heat transfer. The GE, or prototypic, test was conducted at an extreme condition of the plant specifications: 9 ± 3 ppb Na and thermal conditions corresponding to 64% plant power where the heat flux and tube wall temperature oscillations are maximum. The Westinghouse test was conducted at a 30 ppb sodium ion content to simulate worst-case conditions under which the CRBR might be operated with the thermal conditions corresponding to the less severe 100% power condition.

- 698 (CONF-781001--P1, pp 6.1-6.22) TUBE/SPACE PLATE INTERACTIONS IN SODIUM COOLED FAST BREEDER STEAM GENERATORS. Wilson, W.L.; Galioto, R.A.; Ring, P.J.; Page, J.P. 1978.

From 3. US-USSR LMFBR steam generator seminar; Tampa, FL, USA (Oct 1978).

The friction, wear, and self-welding behavior of 2-1/4Cr-1Mo steam generator tubing interacting with tube space plates has been investigated under prototypic LMFBR steam generator service conditions. Dynamic friction and self-welding characteristics were investigated. Subsequent testing involved tube/tube space plate model tests utilizing actual steam generator tubing and spacer plate materials and configurations. Conditions of contact load, stroke, velocity, rubbing distance, sodium temperature, and intermittent dwell periods were investigated. In addition, the behavior of alternate spacer plate materials was evaluated. Dynamic coefficients of friction and breakaway friction coefficients were measured in sodium. Inconel 718 spacer plate material was found to result in a marked reduction in tube wear under all test conditions as compared to the reference 2-1/4Cr-1Mo and alternate spacer plate materials which were evaluated.

- 699 (CONF-781001--P1, pp 7.1-7.30) HEAT TRANSFER WITH HOCKEY-STICK STEAM GENERATOR. Moody, E.; Gabler, M.J. 1978.

From 3. US-USSR LMFBR steam generator seminar; Tampa, FL, USA (Oct 1978).

The hockey-stick modular design concept is a good answer to future needs for reliable, economic LMFBR steam generators. The concept was successfully demonstrated in the 30 MWt MSG test unit; scaled up versions are currently in fabrication for CRBRP usage, and further scaling has been accomplished for PLBR applications. Design and performance characteristics are presented for the three generations of hockey-stick steam generators. The key features of the design are presented based on extensive analytical effort backed up by extensive ancillary test data. The bases for and actual performance evaluations are presented with emphasis on the CRBRP design. The design effort on these units has resulted in the development of analytical techniques that are directly applicable to steam generators for any LMFBR application. In conclusion, the hockey-stick steam generator concept has been proven to perform both thermally and hydraulically as predicted. The heat transfer characteristics are well defined, and proven analytical techniques are available as are personnel experienced in their use.

- 700 (CONF-781001--P1, pp 8.1-8.28) THERMAL-HYDRAULICS IN A HELICAL COIL TUBE STEAM GENERATOR. Kakarala, C.R. 1978.

From 3. US-USSR LMFBR steam generator

seminar; Tampa, FL, USA (Oct 1978).

Thermal-hydraulic considerations play an important part in all stages of the design and development of a steam generator with a high degree of reliability and safety, ease of maintenance, and reasonable first cost. With this perspective, the subject of this paper is presented in three parts: (1) thermal-hydraulic considerations in the selection of the B and W helical coil tube once-through steam generator configuration and other important design parameters; (2) heat transfer and pressure drop correlations and the supporting experimental and theoretical basis; and (3) design and analysis methods for sizing, steady-state and dynamic performance evaluation. The present thermal-hydraulic design and analyses methods and back-up test data provide a sound basis for the design. Additional test programs, analytical model developments, building and testing a prototype, as described in a separate paper, will provide further assurance regarding the reliability of the design. These development programs will also allow further design optimization.

- 701 (CONF-781001--P1, pp 9.1-9.26) HEAT TRANSFER WITH DOUBLE WALL STEAM GENERATOR. Efferding, L.E.; Waszink, R.P.; Hwang, J.Y. 1978.

From 3. US-USSR LMFBR steam generator seminar; Tampa, FL, USA (Oct 1978).

Experimental/analytical studies performed to date on the double-wall tube heat transfer-hydraulic development have been addressed to single-tube sodium-heated experience and analysis support. These programs and results are summarized in this paper. Results demonstrate that thermal resistance behavior of the interface clearance of an annealed double-wall tube without grooves is predictable. References tubes employing grooves for leak detection reflect predictable interface thermal resistance behavior within 10% of experimental results derived from a sodium-heated test model. Flow boiling critical heat flux (CHF) data is shown to be unaffected by the behavior of the double-wall variable conductance interface. Use of a gas mixture in the interface of a double-wall tube test model demonstrated the versatility of this concept as a heat-flux-limiting feature without introducing a significant sizing penalty in other regions exposed to lower heat flux. Plans are described for future effort which applies these earlier findings to large steam generator tube bundles and describes the areas where future development is required. These areas of future effort entail thermal/hydraulic stability investigations of a large matrix of flow-boiling circuits, long-term test exposure of prototypic tubing at elevated-temperature, shell-side flow distribution of sodium through a baffled tube bundle reflecting two-dimensional (axisymmetric) and three-dimensional effects experiencing forced- and natural-circulation mechanisms.

- 702 (CONF-781001--P1, pp 10.1-10.20) RECENT EXPERIMENTAL RESULTS ON SMALL LEAK BEHAVIOR AND INTERPRETATION FOR LEAK DETECTION. Greene, D.A.; Gudahl, J.A.; Magee, P.M. 1978.

From 3. US-USSR LMFBR steam generator seminar; Tampa, FL, USA (Oct 1978).

A small leak of water into sodium in an LMFBR steam generator can cause damage to adjacent tubes, a phenomenon termed impingement wastage. The available impingement wastage data are analyzed by considering the sodium-water reaction to be a simple combustion process. This approach permits correlation of data from different facilities and integrates and

explains experimental observations. Water leaking into sodium also causes self-enlargement of the defect, or self-wastage. Results of recent experimental tests on the growth patterns of very small leaks are summarized and used to provide estimates of the magnitude of self-wastage phenomena. Steam generator leak protection is strongly influenced by the wastage results. Significant differences in protection exist between evaporators and superheaters due principally to their differences in sodium temperature. Two types of tube defect plugging have been studied: (1) plugging prior to steam generator service due to magnetic formation or the presence of foreign matter; and (2) plugging due to sodium-water reaction products. It is shown that a cleaning solution will open both types of plugs. Experimental studies on pool fire (diffusion flame) damage at sodium surfaces are briefly reviewed.

- 703 (CONF-781001--P1, pp 11.1-11.14) DEVELOPMENT OF LEAK DETECTION SYSTEMS FOR LMFBR STEAM GENERATORS IN THE U.S. Magee, P.M.; Gerrels, E.E.; Greene, D.A.; McKee, J. 1978.

From 3. US-USSR LMFBR steam generator seminar; Tampa, FL, USA (Oct 1978).

Leak detection for Liquid Metal Fast Breeder Reactor steam generators is an important economic factor in the shutdown, repair and restart of a plant. The paper summarizes U.S. progress in three key technology areas involved in leak detection development: (1) chemical (H_2 and O_2) leak detection meters; (2) acoustic leak detection/location techniques; and (3) data management for plant operations. The status, design aspects, and applications of leak detector technology for LMFBR plants are discussed.

- 704 (CONF-781001--P1, pp 12.1-12.30) U.S. PROGRAM FOR LARGE SODIUM/WATER REACTION TESTS. Whipple, J.C.; Amos, J.C.; DeBear, W.S.; Neely, H.H. 1978.

From 3. US-USSR LMFBR steam generator seminar; Tampa, FL, USA (Oct 1978).

An extensive large leak test program is underway in the United States to investigate the effects of large sodium-reaction events in LMFBR steam generators. The general objectives of the program are to provide data for validating analytical codes, provide information on the extent of secondary tube failures, provide data on relief system performance and provide data on cleanup and recovery needs. Tests are conducted in the Large Leak Test Rig located at the Energy Technology Engineering Center. The program is divided into two phases, Series I and Series II, for the purpose of satisfying near-term and long-term needs. The test article for the Series II tests (the Large Leak Test Vessel/Large Leak Test Internals) has been fabricated. Upon completion of Large Leak Test Rig modification, test article installation, and system checkout Series II testing will begin. The overall program plan is defined, the test articles and test facility are described, and the experimental approach is discussed for both Series I and Series II programs. The Series I test experience and results of intertest examinations are also presented.

- 705 (CONF-781001--P2) THIRD US/USSR LMFBR STEAM GENERATOR SEMINAR. VOLUME 2. USSR PAPERS. (General Electric Co., Sunnyvale, CA (USA). Advanced Reactor Systems Dept.). 1978. 356p. AT.

From 3. US-USSR LMFBR steam generator seminar; Tampa, FL, USA (Oct 1978).

Separate abstracts were prepared for the individual papers presented at the meeting.

- 706 (CONF-781001--P2, pp 1.1-1.20) STATUS OF DEVELOPMENT AND MANUFACTURE OF A STEAM GENERATOR FOR THE BN-600 NUCLEAR POWER REACTORS. Titov, V.F.; Lukasevich, B.I. 1978.

From 3. US-USSR LMFBR steam generator seminar; Tampa, FL, USA (Oct 1978).

The basic results are presented from studies performed in the stage of development of the plan for a concurrent, multi-section steam generator for the BN-600 nuclear powerplant. Thermal and hydrodynamic, strength and vibration, heat-corrosion and operating-life testing of models of the steam generator have confirmed the plan assignments of specification parameters for the steam generator. One section of the PG-2 steam generator, the prototype of the actual steam generator of the BN-600, the manufacture of which has assisted in developing the technological cycle for production of the BN-600 steam generator, has been installed on the BOR-60 steam generator, has been installed on the BOR-60 experimental installation for long-term combined testing.

- 707 (CONF-781001--P2, pp 2.2-2.10) SOME ESTIMATES OF THE PROSPECTS FOR DUAL-WALL SODIUM-WATER STEAM GENERATORS. Kokorev, P.V.; Turchin, N.M. 1978.

From 3. US-USSR LMFBR steam generator seminar; Tampa, FL, USA (Oct 1978).

Steam generators with double tubes practically eliminate the probability of interaction of sodium and water in case of a leak. However, the opinion is still heard that these steam generators are significantly larger and heavier, and higher in initial cost than single-wall generators. Calculated estimates of the variation in heat-exchange surface as a function of thermal resistance of the zone of contact for steam generators with the parameters of the BN-600 installation have shown that the use of double tubes would not lead to an excessive increase in cost. Development of the design of double tubes, allowing easy repair of defective tubes, will make it desirable to manufacture steam generators of large unit power. These designs can be the equal of modular single-wall apparatus.

- 708 (CONF-781001--P2, pp 3.1-3.16) SOME RESULTS OF THE STUDY OF VIBRATIONS AND WEAR IN MODELS OF THE STEAM GENERATOR OF THE BN-600. Titov, V.F.; Fedorov, V.G. 1978.

From 3. US-USSR LMFBR steam generator seminar; Tampa, FL, USA (Oct 1978).

Results are discussed from testing models of the tubes of steam generators for fretting. The parameters of vibration in the models are selected from the results of measurement of vibrations of a multitube steam generator at nominal water flow rates. During the fretting tests, the amplitudes of tube acceleration, compressive forces of the tubes against the spacing grid and water flow rates were varied. A description is presented of the models, the testing methods and methods of processing the results. A comparison of the results produced with data produced earlier is performed and the results are used to estimate the operating life of steam generators.

- 709 (CONF-781001--P2, pp 4.1-4.10) RESULTS OF STUDY OF AMERICAN SPECIMENS OF WELDED JOINTS BETWEEN TUBES AND TUBESHEETS. Gubanov, V.M.; Sobolev, E.N.; Sokolov, A.S.; Titov, V.F.

1978.

From 3. US-USSR LMFBR steam generator seminar; Tampa, FL, USA (Oct 1978).

Results are presented from laboratory testing of specimens of welded joints between tubes and tubesheets provided by the American side. The tests were conducted in the USSR in accordance with the cooperative plan.

- 710 (CONF-781001--P2, pp 6.1-6.22) MODEL THERMAL CORROSION TESTING OF THE BN-600 STEAM GENERATOR. Titov, V.F.; Gubanov, V.M.; Sobolev, E.N.; Sokolov, A.S.; Lukasevich, B.I. 1978.

From 3. US-USSR LMFBR steam generator seminar; Tampa, FL, USA (Oct 1978).

Results are presented from thermal corrosion testing of models of the steam generator of the BN-600, operating life up to 12,000 hours, as well as information on the design of the models, the experimental test stand, the methods of conduct of the tests and of processing of the experimental results. Based on the experimental studies, it is shown that the 12KH2M steel used for the model evaporator and the KH18N9 steel used for the steam generator, under the planned operating conditions, can provide reliable operation of the steam generator for the assigned operating life.

- 711 (CONF-781001--P2, pp 9.1-9.22) PROBLEMS OF HEAT EXCHANGE AND HYDRODYNAMICS OF SODIUM-WATER STEAM GENERATORS FOR FAST-NEUTRON REACTORS. Kirillov, P.L.; Ushakov, P.A.; Grachev, N.S. 1978.

From 3. US-USSR LMFBR steam generator seminar; Tampa, FL, USA (Oct 1978).

This report contains a review of the problems and tasks related to the heat exchange and hydrodynamics of sodium-water steam generators, as related to the program of development of fast-neutron reactors. The hydrodynamics of these steam generators on the sodium side are significantly more important than has been thought up to now. Examples are presented of hydrodynamic effects. A general description of heat transfer from the sodium is discussed without reference to any specific design of steam generator. The characteristics of heat transfer on the water side and in the steam-water mixture are analyzed as applicable to the design of a steam generator with straight tubes. Information on heat-exchange crisis in a two-phase flow under various conditions, and the phenomena accompanying it are discussed separately, and problems of heat exchange in the supercritical zone of a steam generator are also discussed. A number of other phenomena are mentioned, related to deposits in steam generators, corrosion, plugging of tubes and other problems, which must be considered during design.

- 712 (CONF-781001--P2, pp 11.1-11.30) SMALL LEAKS OF WATER INTO SODIUM AND THEIR DETECTION BY CONCENTRATION METHODS. Kozlov, F.A.; Sergeyev, G.P.; Poplavskii, V.M.; Sednev, A.R.; Borisov, V.V.; Makarov, V.M. 1978.

From 3. US-USSR LMFBR steam generator seminar; Tampa, FL, USA (Oct 1978).

Reports are presented from studies of the spontaneous development of small leaks of water into the sodium, and methods of their recording on the basis of the hydrogen concentration in the sodium and in the protective gas are discussed. Based on a calculation model, an estimate is presented of the coefficient of hydrogen leakage into the gas space of a steam generator upon appearance of leaks of water into the sodium. The calculation results are

compared with the values of leakage coefficient determined experimentally. Possibilities of detecting leaks using hydrogen detectors are analyzed as applicable to the conditions of the BN-350 and BN-600 installations.

- 713 (CONF-781001--P2, pp 12.1-12.18) EXPERIMENTAL STUDY OF ABNORMAL PROCESSES WITH SMALL LEAKS OF WATER INTO SODIUM IN MODELS OF STEAM GENERATORS OF REVERSE DESIGN. Poplavskii, V.M.; Bagdasarov, Yu.E.; Kozlov, F.A.; Sergeyev, G.P.; Borisov, V.V.; Sednev, A.R. 1978.

From 3. US-USSR LMFBR steam generator seminar; Tampa, FL, USA (Oct 1978).

This report describes the basic peculiarities of reverse type steam generators, the advantages and disadvantages of the design. A description is presented of experimental devices used to study abnormal processes, and the research method is outlined. Based on the experimental results produced, conclusions are drawn concerning possible advantages of reverse steam generator design for sodium-water steam generators, from the stand-point of decreasing abnormal effects resulting from contact between the two media.

- 714 (CONF-781001--P2, pp 13.1-13.26) INFLUENCE OF HEAT EXCHANGE BETWEEN REACTION PRODUCTS OF THE INTERACTION OF SODIUM WITH WATER AND STRUCTURAL ELEMENTS OF THE STEAM GENERATOR ON THE PARAMETERS OF THE LARGE LEAK EMERGENCY MODE. Poplavskii, V.M.; Leonchuk, V.N. 1978.

From 3. US-USSR LMFBR steam generator seminar; Tampa, FL, USA (Oct 1978).

In this work, an attempt is made to analyze the temperature state of the material of the wall of a heat-transmitting tube in a steam generator in the area of a large leak of water into the sodium, considering its cooling by the steam-water flow, in order to predict the possibility of secondary ruptures. Physical and mathematical models of the process of heat exchange between the reaction products and the tube bundle of the steam generator in the large leak mode are suggested. The calculated results are compared with experimental results. The possibility of secondary ruptures is analyzed for the case of an instantaneous large leak of water into the sodium under the conditions found in a full-scale steam generator.

- 715 (CONF-781001--P2, pp 15.1-15.28) EXPERIENCE OF THE OPERATION OF LEAK-TESTING SYSTEMS OF SODIUM-WATER STEAM GENERATORS OF THE BN-350 INSTALLATION. Kozlov, F.A.; Kuznetsov, E.K.; Kozub, P.S.; Demin, A.A.; Samarkin, A.A.; Shvedenko, I.M.; Grebenshchikov, Yu.E. 1978.

From 3. US-USSR LMFBR steam generator seminar; Tampa, FL, USA (Oct 1978).

This report presents materials on the experience of operation of the leak detection system in the steam generators, used to test the hydrogen content in the protective gas and the sodium of the BN-350 installation. The selection of the system and its parameters are described, and examples are presented of the detection of leaks during operation of the steam generators. In the system which tests for leaks by hydrogen analysis in the protective gas, sodium vapor is trapped by a special filter. The use of a conductometric analyzer allows the detection of changes in hydrogen concentration in the protective gas of about 0.005 vol. %. It has been found that in some evaporators, the quantity of sodium contained in the flow of gas being analyzed is many times the calculated quantity. Results are presented from start-up and adjustment operations of the

system for testing of the hydrogen content of sodium, which uses a thick nickel membrane, as well as a test system with a thin nickel membrane in combination with a magnetic-discharge pump.

- 716 (CONF-781001--P2, pp 17.1-17.18) MAIN RESULTS OF EXPERIMENTS WITH A MAJOR LEAK OF WATER INTO SODIUM CONDUCTED IN NINETEEN-TUBE MODELS. 1978.

From 3. US-USSR LMFBR steam generator seminar; Tampa, FL, USA (Oct 1978).

The present report presents the main results of studies of effects that accompany major leaks of water into sodium under the conditions of 19-tube models in 1964--1967. The organization of the experiments and the methods of research are described. The dynamic and temperature phenomena in the sodium circuit and the vulnerability to damage of the tube bundle are discussed.

- 717 (CONF-781001--P2, pp 18.1-18.28) ACOUSTICAL METHODS OF LEAK DETECTION IN SODIUM-WATER STEAM GENERATORS (A SURVEY PAPER). Afanas'ev, V.A.; Sokolov, V.M. 1978.

From 3. US-USSR LMFBR steam generator seminar; Tampa, FL, USA (Oct 1978).

The results of preliminary studies aimed at determining the feasibility of leak detection in a sodium-water steam generator by the acoustical method are presented. Results of studies of noise generation aimed at substantiating the selection of the frequencies used in the leak detection device are discussed. A qualitative analysis is given of the mechanisms of noise generation in a gas jet, and some experimental findings are presented.

- 718 (CONF-781001--P2, pp 19.1-19.14) REPORT ON THE RESULTS OF ANALYSIS OF EMERGENCY LARGE LEAK MODES IN THE STEAM GENERATORS OF THE BN-350 INSTALLATION. 1978.

From 3. US-USSR LMFBR steam generator seminar; Tampa, FL, USA (Oct 1978).

This report briefly outlines basic results of analysis of emergency processes in the steam generator of the BN-350 reactor, resulting from large leaks of water into the sodium loop. A description is presented of the steam generator of the BN-350, and the characteristics of its emergency protection system are described.

- 719 (CONF-781001--P2, pp 20.1-20.6) RESEARCH PROGRAM ON AN ACOUSTICAL METHOD OF LEAK DETECTION IN SODIUM-WATER STEAM GENERATORS FOR 1978--1979. 1978.

From 3. US-USSR LMFBR steam generator seminar; Tampa, FL, USA (Oct 1978).

Bench tests on the characteristics of acoustic noise during a steam and gas leak into sodium are described. Tests using a model of the BN-600 steam generator are also described. Tests planned for the BOR-60 modular steam generator are mentioned.

- 720 (CONF-781001--P2, pp 5.1-5.22) STUDY OF THE ONCE-THROUGH SERPENTINE STEAM GENERATOR IN THE BOR-60 EXPERIMENTAL NUCLEAR POWERPLANT. Kondrat'ev, V.I.; Titov, V.F.; Bai, V.F. 1978.

From 3. US-USSR LMFBR steam generator seminar; Tampa, FL, USA (Oct 1978).

Results are presented from testing of a once-through serpentine steam generator which had operated under load for 18,000 hours in the BOR-60 installation. Its basic operational, steady-state, transient and emergency modes are

described, as well as the water chemistry determined in the process of testing. The results of corrosion-mechanical studies of the coils of the steam generator, made of 1Kh2M steel, are presented for testing after 4,000, 6,200, 8,400 and 18,000 hours of reactor operation. The nature, composition and thickness of corrosion products in the evaporated and steam-superheating sections are indicated. The degree of damage to the tubes of the coils resulting from pitting corrosion, decarburization and changes in the mechanical properties of the steel in the process of use is estimated.

- 721 (CONF-781001--P2, pp 14.1-14.18) SIMULATED AND EXPERIMENTAL STUDIES OF LARGE LEAKS IN MICROMODULAR STEAM GENERATORS. Chernobrovkin, Iu.V.; Kondrat'ev, V.I.; Smirnov, A.M.; Bukhteev, I.S.; Tomesh, V.; Matal, D. 1978.

From 3. US-USSR LMFBR steam generator seminar; Tampa, FL, USA (Oct 1978).

A program of experimental work is presented for the study of small and large leaks of water into the sodium in the micromodular steam generator of the BOR-60 reactor. Requirements are established as to the volume of information collected during experiments and the measurement systems required. The basic prerequisites for the method and programs for simulation of large-leak emergency are presented, with some results of leak simulation involving bursting of the entire cross section of one tube in the micromodular steam generator of the BOR-60.

- 722 (CONF-781001--P2, pp 7.1-7.18) STUDY OF DECARBURIZATION CONSTANTS OF PEARLITIC STEELS TYPE 2.25CR--1MO AND CARBURIZATION OF 12KH18N9 AND 304 STEELS. Starkov, O.V.; Kononov, E.S.; Kononyuk, M.Kh.; Umyashkin, E.V.; Kozlova, N.A. 1978.

From 3. US-USSR LMFBR steam generator seminar; Tampa, FL, USA (Oct 1978).

This report presents the results of investigation of the transfer of carbon from austenitic steels to pearlitic steels of Soviet and American manufacture. The tests were performed under isothermal conditions and in a nonisothermal stream of sodium in the 500 to 700°C temperature interval. Equilibrium concentrations of carbon in the steels 10Kh2M and 2.25CR--1Mo and decarburization constants were achieved. A study is made of the influence of carbon on the mechanical properties of pearlitic and austenitic steels, and this influence is evaluated for the specific usage conditions.

- 723 (CONF-781001--P2, pp 8.1-8.26) COMPARATIVE MATERIAL STUDIES OF SPECIMENS OF STEELS TYPE 2.25CR--1MO AND 18-8 OF SOVIET AND AMERICAN MANUFACTURE FOLLOWING CONTACT WITH SODIUM. Starkov, O.V.; Golubenkova, S.M.; Kondratenko, S.N.; Kononyuk, M.Kh.; Filin, M.P. 1978.

From 3. US-USSR LMFBR steam generator seminar; Tampa, FL, USA (Oct 1978).

This report presents the results of comparative studies of steels type 2.25Cr--1Mo and 18-8 of Soviet and American manufacture before and after testing in a nonisothermal sodium loop at $T = 510^\circ\text{C}$ for test times of up to 4550 hours and in a convection flow of sodium with a high content of oxygen and sodium hydroxide in the 450 to 730°C temperature interval.

- 724 (CONF-781001--P3) THIRD US/USSR LMFBR

STEAM GENERATOR SEMINAR. (General Electric Co., Sunnyvale, CA (USA). Advanced Reactor Systems Dept.). Oct 1978. Contract EY-76-C-03-0893-010. 70p. AT.

From 3. US-USSR LMFBR steam generator seminar; Tampa, FL, USA (Oct 1978).

The development of liquid metal heated steam generators for use in an LMFBR is a major technological undertaking which can be assisted by international exchanges. The United States and Russian governments have negotiated an agreement which encourages technical interchanges of LMFBR data. The seminar held in Tampa in October was the 3rd such meeting to interchange information and views and discuss recent liquid metal steam generator technology developments. The document contains the Memorandum and Record of the seminar.

- 725 (CONF-781022--25) GENERIC CONSIDERATIONS OF LMFBR HYPOTHETICAL ACCIDENT ENERGETICS. Fauske, H.K.; Cho, D.H.; Epstein, M.; Grolmes, M.A.; Henry, R.E. (Argonne National Lab., IL (USA)). 1978. Contract W-31-109-ENG-38. 14p. Dep. NTIS, PC A02/MF A01.

From Meeting on nuclear power reactor safety; Brussels, Belgium (16 Oct 1978).

The paper provides a preliminary assessment of generic accident energetics issues associated with alternatives relative to the reference (U,Pu) oxide fuel in liquid metal fast breeder reactors. The alternatives considered include thorium- and uranium-based oxide, carbide and metal fuel types. This assessment is made within the context of low probability, but potentially large consequence accidents, e.g., core-disruptive accidents.

- 726 (CONF-781022--27) STRUCTURAL AND CONTAINMENT RESPONSE TO LMFBR ACCIDENTS. Marchaterre, J.F.; Fistedis, S.H.; Baker, L. Jr.; Stepniewski, D.D.; Peak, R.D.; Glueckler, E.L. (Argonne National Lab., IL (USA); Hanford Engineering Development Lab., Richland, WA (USA); General Electric Co., Sunnyvale, CA (USA)). 1978. Contract W-31-109-ENG-38. 15p. Dep. NTIS, PC A02/MF A01.

From Meeting on nuclear power reactor safety; Brussels, Belgium (16 Oct 1978).

The adequacy of the containment of fast reactors has been traditionally evaluated by analyzing the response of the containment to a spectrum of core disruptive accidents. The current approach in the U.S. is to consider fast reactor response to accidents in terms of four lines of assurance (LOAs). Thus, LOA-1 is to prevent accidents, LOA-2 is to limit core damage, LOA-3 is to control accident progression and LOA-4 is to attenuate radiological consequences. Thus, the programs on the adequacy of containment response fall into LOA-3. Significant programs to evaluate the response of the containment to core disruptive accidents and, thereby, to assure control of accident progression are in progress. These include evaluating the mechanical response of the primary system to core disruptive accidents and evaluating the thermal response of the reactor structures to core melting, including the effects this causes on the secondary containment. The analysis of structural response employs calculated pressure-volume-time loading functions. The results of the analyses establish the response of the containment to the prescribed loadings. The analysis of thermal response requires an assessment of the distribution and state of the fuel, fission products and activated materials from accident initiation to final disposition in a stable configuration.

- 727 (CONF-781022--28) CRITICAL EXPERIMENTAL STUDY OF INTEGRAL PHYSICS PARAMETERS IN SIMULATED LMFBR MELTDOWN CORES. Bhattacharyya, S.K.; Wade, D.C.; Bucher, R.G.; Smith, D.M.; LeSage, L.G. (Argonne National Lab., IL (USA)). 1978. Contract W-31-109-ENG-38. 10p. Dep. NTIS, PC A02/MF A01.

From Meeting on nuclear power reactor safety; Brussels, Belgium (16 Oct 1978).

A program of measurements designed to provide experimental data for the validation of analytical methods used in the neutronics part of LMFBR accident analyses has recently been completed at Argonne National Laboratory. A considerable volume of critical experimental data already exists for normal, undamaged LMFBR cores, and the size of the calculational and cross-section data errors is well established. However, this knowledge cannot be easily extrapolated to severely distorted accident configurations because of the large changes in neutron spectrum and system leakage properties (including streaming in large cavities) which are induced by redistribution of materials. The available experimental data on the physics of damaged LMFBR cores are inadequate for use in the systematic validation of calculational methods for a variety of reasons. The present program provides a clean, benchmark set of experiments with large reactivity changes (involving approximately 18.5% core volume distortions) for use in the methods validation. The reference configuration for the measurements consisted of a single core zone with a typical LMFBR composition. A sequence of idealized configurations was designed to follow from this reference to simulate, in a static or "snap-shot" sense, the sequence of configurations that might result from a loss-of-flow transient.

- 728 (CONF-781022--30) LMFBR OPERATIONAL SAFETY: THE EBR-II EXPERIENCE. Sackett, J.I.; Allen, N.L.; Dean, E.M.; Fryer, R.M.; Larson, H.A.; Lehto, W.K. (Argonne National Lab., Idaho Falls, ID (USA)). 1978. Contract W-31-109-ENG-38. 14p. Dep. NTIS, PC A02/MF A01.

From Meeting on nuclear power reactor safety; Brussels, Belgium (16 Oct 1978).

The mission of the Experimental Breeder Reactor II (EBR-II) has evolved from that of a small LMFBR demonstration plant to a major irradiation-test facility. Because of that evolution, many operational-safety issues have been encountered. The paper describes the EBR-II operational-safety experience in four areas: protection-system design, safety-document preparation, tests of off-normal reactor conditions, and tests of elements with breached cladding.

- 729 (CONF-781022--31) ANALYSIS OF HYPOTHETICAL LMFBR WHOLE-CORE ACCIDENTS IN THE USA. Ferguson, D.R.; Dettrich, L.W.; Brown, N.W.; Walter, A.E. (Argonne National Lab., IL (USA); General Electric Co., Sunnyvale, CA (USA); Hanford Engineering Development Lab., Richland, WA (USA)). 1978. Contract W-31-109-ENG-38. 14p. Dep. NTIS, PC A02/MF A01.

From Meeting on nuclear power reactor safety; Brussels, Belgium (16 Oct 1978).

The issue of hypothetical whole-core accidents continues to play a significant role in assessment of the potential risk to the public associated with LMFBR operation in the USA. The paper briefly characterizes the changing nature of this role, with emphasis on the current risk-oriented perspective. It then describes the models and codes used for accident analysis in the USA which have been developed under DOE sponsorship and summarizes

some specific applications of the codes to the current generation of fast reactors. An assessment of future trends in this area concludes the paper.

- 730 (CONF-781022--32) LOW SODIUM VOID CORES. Barthold, W.P.; Beitel, J.C.; Lam, P.S.K.; Orehwa, Y.; Su, S.F.; Turski, R.B. (Argonne National Lab., IL (USA)). 1978. Contract W-31-109-ENG-38. 12p. Dep. NTIS, PC A02/MF A01.

From Meeting on nuclear power reactor safety; Brussels, Belgium (16 Oct 1978).

To avoid high energy releases in LMFBR TUC accidents which are accompanied by a failure to scram with a regular shutdown system, various devices have been proposed which would add negative reactivity to the core by either bringing poison material into the core or by creating negative reactivity feedbacks coming from the thermal expansion of the core. While inherent shutdown systems (ISSs) show promise for enhancing safety by adding poison to the reactor, the trigger mechanism and the geometry of the poison are critical design issues. But by postulating an "unprotected" accident, an emergency shutdown capability is denied by definition and the core has to rely solely on inherent safety features. Thermal expansion of core components can lead to the addition of negative reactivity to the core, however, depending on the core restraint system this reactivity margin is usually small and does not prevent sodium boiling. Another approach to enhance the safety of the core is to modify the core design such that the removal of sodium from the core would add only a small amount of positive reactivity or even a negative reactivity. There exists no firm and quantified design goal for the maximum allowable sodium void reactivity. In a simplistic approach, a sodium void reactivity of approximately \$2 or less would be desirable to compensate for roughly \$1 in Doppler reactivity and \$1 as the margin to the prompt-critical stage. But voiding incoherence and fuel motion patterns certainly affect this target value. At this stage of knowledge, it is also not clear if all fuel types would require the same reduction in sodium void reactivity to assure a benign transition phase leading to the termination of a TUC event. A discussion is presented of low sodium void core options which concentrates on the means of lowering sodium void reactivity in general and the oxide fuel form of the uranium-plutonium cycle in particular rather than the carbide, nitride and metal fuel forms.

- 731 (CONF-781022--41) LMFBR SAFETY AND SODIUM BOILING. Hinkle, W.D.; Tschamper, P.M.; Fontana, M.H.; Henry, R.E.; Padilla, A. Jr. (Oak Ridge National Lab., TN (USA); Massachusetts Inst. of Tech., Cambridge (USA); General Electric Co., Sunnyvale, CA (USA); Argonne National Lab., IL (USA); Hanford Engineering Development Lab., Richland, WA (USA)). 1978. Contract W-7405-ENG-26. 13p. Dep. NTIS, PC A02/MF A01.

From Meeting on nuclear power reactor safety; Brussels, Belgium (16 Oct 1978).

Within the U.S. Fast Breeder Reactor Safety R and D Work Breakdown Structure for Line of Assurance 2, Limit Core Damage, the influence of sodium boiling upon the progression and termination of accidents is being studied in loss of flow, transient overpower, loss of piping integrity, loss of shutdown heat removal system and local fault situations. The pertinent analytical and experimental results of this research to date are surveyed and compared with the requirements for demonstrating the effectiveness of this line of

assurance. A discussion of specific technical issues concerned with sodium boiling and the need for future development work is also presented.

- 732 (CONF-781033--9) HODOSCOPE PERFORMANCE TESTS ON A 91-PIN FUEL BUNDLE AT PARKA. Fink, C.L.; DeVolpi, A.; Rhoades, E.A.; Evans, A.L. (Argonne National Lab., IL (USA); Los Alamos Scientific Lab., NM (USA)). 1978. Contract W-31-109-ENG-38. 6p. Dep. NTIS, PC A02/MF A01.

From IEEE nuclear science symposium; Washington, DC, USA (18 Oct 1978).

Joint LASL/ANL studies of the fuel motion performance capability of a fast-neutron hodoscope have been performed on a 91-pin fuel bundle. Optimization of the neutron detectors used in the hodoscope was also investigated. The neutron detectors tested were a Hornyak button and a stilbene detector with pulse shape discrimination. These studies show that a hodoscope can provide useful fuel motion detection capability for large bundles and that the amount of information provided is greatly increased by the use of neutron detectors with high neutron thresholds and high detection efficiency. These measurements indicate that the TREAT hodoscope can be upgraded to meet most of the fuel motion diagnostic requirements of new safety facilities.

- 733 (CONF-781042--2) STRATEGY FOR THE PRACTICAL UTILIZATION OF THORIUM FUEL CYCLES. Kasten, P.R. (Oak Ridge National Lab., TN (USA)). 1978. Contract W-7405-ENG-26. 23p. Dep. NTIS, PC A02/MF A01.

From 5. conference on energy; Rolla, MO, USA (Oct 1978).

There has been increasing interest in the utilization of thorium fuel cycles in nuclear power reactors for the past few years. This is due to a number of factors, the chief being the recent emphasis given to increasing the proliferation resistance of reactor fuel cycles and the thorium cycle characteristic that bred ^{233}U can be denatured with ^{238}U (further, a high radioactivity is associated with recycle ^{233}U , which increases fuel diversion resistance). Another important factor influencing interest in thorium fuel cycles is the increasing cost of U_3O_8 ores leading to more emphasis being placed on obtaining higher fuel conversion ratios in thermal reactor systems, and the fact that thorium fuel cycles have higher fuel conversion ratios in thermal reactors than do uranium fuel cycles. Finally, there is increasing information which indicates that fast breeder reactors have significantly higher capital costs than do thermal reactors, such that there is an economic advantage in the long term to have combinations of fast breeder reactors and high-conversion thermal reactors operating together. Overall, it appears that the practical, early utilization of thorium fuel cycles in power reactors requires commercialization of HTGRs operating first on stowaway fuel cycles, followed by thorium fuel recycle. In the longer term, thorium utilization involves use of thorium blankets in fast breeder reactors, in combination with recycling the bred ^{233}U to HTGRs (preferably), or to other thermal reactors.

- 734 (CONF-781079--4) TRANSIENT HEAT TRANSFER IN CONCRETE. Baker, L. Jr.; Cheung, F.B.; Bingle, J.D. (Argonne National Lab., IL (USA)). 1978. Contract W-31-109-ENG-38. 12p. Dep. NTIS, PC A02/MF A01.

From Postaccident heat removal information exchange; Ispra, Italy (10 Oct 1978).

The experimental method to study transient heat transfer in concrete has been applied to three concretes of very different compositions. The similarity curves obtained for the three concretes were very much alike. Thermodynamic analysis was used to derive values of the effective volumetric specific heats. The analysis involved the development of idealized compositions to represent the concrete constituents in an approximate way. These were used in conjunction with experimental similarity curves to derive values of effective thermal conductivity for the three concretes which take into account the thermal effects of moisture migration. The results indicated that limestone and magnetite concretes are significantly more conductive at low temperatures than basalt concrete, although all three have values near 1 W/m·K at 700°C.

- 735 (CONF-781105--8) IMPROVED METHOD FOR CONDUCTING FAILED FUEL EXPERIMENTS IN LWR'S. Thomas, R.W.; Klingler, W.B. (EG and G Idaho, Inc., Idaho Falls (USA)). 1978. Contract EY-76-C-07-1570. 5p. Dep. NTIS, PC A02/MF A01. From ANS meeting; Washington, DC, USA (12 Nov 1978).

In conduct of the Sodium Loop Safety Facility (SLSF) experiment program in the Engineering Test Reactor (ETR), destructive tests are performed with up to 37 full length (0.914m fuel zone) LMFBR type fuel pins in a sodium environment. Operation of such experiments in a light water reactor like the ETR requires careful attention to safety. A major problem is how to run destructive experiment transients of sufficient duration to satisfy sponsors needs without jeopardizing the reactor. The paper discusses the way in which EG and G has minimized the difference between nominal and design basis transients, thereby allowing destructive tests of maximum safe duration.

- 736 (CONF-781105--20) FREEZING AND MELTING PHENOMENA IN FINITE-MEDIA, WITH APPLICATION TO MOLTEN FUEL CONTAINMENT FOR SLSF EXPERIMENTS. El-Genk, M.S.; Cronenberg, A.W.; Moore, R.L. (New Mexico Univ., Albuquerque (USA)); EG and G Idaho, Inc., Idaho Falls (USA)). 1978. Contract EY-76-C-07-1570. 12p. Dep. NTIS, PC A02/MF A01.

From ANS meeting; Washington, DC, USA (12 Nov 1978).

The Sodium Loop Safety Facility (SLSF) experiments are being conducted to furnish information concerning the behavior of fast reactor fuel elements under postulated off-normal or hypothesized loss-of-flow accident conditions. Such experiments involve measurements and observations that will permit an assessment of the location and time of sodium void initiation, the nature of sodium expulsion and reentry, the time and nature of cladding failure and motion, the nature of molten fuel motion, and the extent of plugging at the axial extremities of the subassembly. Because such high energy experiments are to be conducted in-pile within the Experimental Test Reactor (ETR) Facility, extensive pretest analysis is required to insure loop integrity. One aspect of this problem is an assessment of molten fuel freezing phenomena on the walls of SLSF to insure the containment capability of the loop, which is the subject of the paper.

- 737 (CONF-781105--57) LOCATION DEPENDENT COMMON CAUSE ANALYSIS WITH AN APPLICATION TO FIRES. Leaver, D.; vonHerrmann, J.; Olmos, J.; Boardman, R. (Science Applications, Inc., Palo Alto, CA (USA)). 1978. Contract EY-77-

C-15-0005. 6p. Dep. NTIS, PC A02/MF A01.

From ANS meeting; Washington, DC, USA (12 Nov 1978).

Portions of document are illegible.

The purpose of the work described is to develop a methodology by which the public risk arising from localized common cause events (e.g., fires) in nuclear plants can be assessed. Attention was paid to maximizing both the completeness and efficiency of the analysis. This methodology was then applied to the analysis of fire events in the Clinch River Breeder Reactor Plant (CRBRP).

- 738 (CONF-781105--58) CONDENSATION FROM A LARGE HCDA VAPOR-GAS BUBBLE ONTO STRUCTURES. Geziak, M.N.; Kress, T.S.; White, J.S. (Oak Ridge National Lab., TN (USA)). 1978. Contract W-7405-ENG-26. 6p. Dep. NTIS, PC A02/MF A01.

From ANS meeting; Washington, DC, USA (12 Nov 1978).

A mechanistic assessment of the consequences of a Hypothetical Core Disruptive Accident (HCDA) for a sodium-cooled breeder reactor will require analyses that determine the quantity of fuel released from the primary containment. This release is due to fuel melting, vaporization, and movement through the sodium pool and leakage through the assumed damaged vessel head closure. According to some views, this fuel may move through the cooler sodium pool as a large fuel vapor bubble containing non-condensable fission gases. There is potential for removal of the radionuclide source during this transport by condensation onto structural material (i.e., instrument carriers, control rod drives, support structures, etc.) as well as at the bubble interface. Previous analyses have estimated the condensation rates at the bubble interface. The work described extends a previous model to condensation on structural surfaces in the bubble path. The results of the analysis show that the condensation model for thick steel structures yields similar results as the previous model for condensation on the bubble interface. Due to the high thermal conductivities of both sodium and steel, the mass transfer on the vapor side becomes the controlling factor for condensation. In the case of thin steel structures, the interface temperature rise becomes significant (melting temperatures may be reached) due to the limited heat sink provided by the structure.

- 739 (CONF-781105--66) SLSF DELAYED NEUTRON DETECTION WITH THE ON-LINE SODIUM SAMPLING SYSTEM. Heiberger, W.F.; Holzworth, R.E.; Shire, P.R. (Idaho National Engineering Lab., Idaho Falls (USA)). 1978. Contract EY-76-C-07-1570. 5p. Dep. NTIS, PC A02/MF A01.

From ANS meeting; Washington, DC, USA (12 Nov 1978).

An on-line sodium sampling system (OLSS) is being installed in the Sodium Loop Safety Facility (SLSF) at INEL. The OLSS will provide real time detection of failed fuel pins via fission products deposited in the sodium. The SLSF, now in its fourth test in the Engineering Test Reactor (ETR), permits failed fuel testing under simulated LMFBR transient conditions. The OLSS loop will withdraw a sample stream from the SLSF test loop, and transport it through a delayed neutron monitor (DNM). The oxide control and indication system is provided as a subloop of OLSS to purify the OLSS/SLSF sodium.

- 740 (CONF-781108--), pp 274-295) ANALYSIS OF PROPOSED TRANSIENT OVERPOWER EXPERIMENTS. Campbell, K. (Los Alamos Scientific Lab., NM);

Hurd, D. Jul 1979.

From 4. DOE statistical symposium; Albuquerque, NM, USA (1 Nov 1978).

This problem presentation arose from a project to demonstrate a new approach to the assessment of risk associated with core-disruptive accidents in a liquid metal fast breeder reactor. The project is intended to anticipate problems that may arise when the results of a planned series of experiments are used in this context. A possible model and some simulated test results are presented.

- 741 (CONF-781117--2) U.S. INTEGRAL AND BENCHMARK EXPERIMENTS. Maienschein, F.C. (Oak Ridge National Lab., TN (USA)). 1978. Contract W-7405-ENG-26. 21p. Dep. NTIS, PC A02/MF A01.

From FBR shielding seminar; Obninsk, USSR (13 Nov 1978).

Verification of methods for analysis of radiation-transport (shielding) problems in Liquid-Metal Fast Breeder Reactors has required a series of experiments that can be classified as benchmark, parametric, or design-confirmation experiments. These experiments, performed at the Oak Ridge Tower Shielding Facility, have included measurements of neutron transport in bulk shields of sodium, steel, and inconel and in configurations that simulate lower axial shields, pipe chases, and top-head shields. They have also included measurements of the effects of fuel stored within the reactor vessel and of gamma-ray energy deposition (heating). The paper consists of brief comments on these experiments, and also on a recent experiment in which neutron streaming problems in a Gas-Cooled Fast Breeder Reactor were studied. The need for additional experiments for a few areas of LMFBR shielding is also cited.

- 742 (CONF-781117--3) METHODS FOR U.S. SHIELDING CALCULATIONS: APPLICATIONS TO FFTF AND CRBR DESIGNS. Engle, W.W. Jr.; Mynatt, F.R.; Disney, R.K. (Oak Ridge National Lab., TN (USA)). 1978. Contract W-7405-ENG-26. 16p. Dep. NTIS, PC A02/MF A01.

From FBR shielding seminar; Obninsk, USSR (13 Nov 1978).

The primary components of the U.S. reactor shielding methodology consist of: (1) computer code systems based on discrete ordinates or Monte Carlo radiation transport calculational methods; (2) a data base of neutron and gamma-ray interaction and gamma-ray-production cross sections used as input in the codes; (3) a capability for processing the cross sections into multigroup or point energy formats as required by the codes; (4) large-scale integral shielding experiments designed to test cross-section data or techniques utilized in the calculations; and (5) a "sensitivity" analysis capability that can identify the most important interactions in a transport calculation and assign uncertainties to the calculated result that are based on uncertainties in all of the input data. The required accuracy for the methodology is to within 5 to 10% for responses at locations near the core to within a factor of 2 for responses at distant locations. Under these criteria, the methodology has proved to be adequate for in-vessel LMFBR calculations of neutron transport through deep sodium and thick iron and stainless steel shields, of neutron streaming through lower axial coolant channels and primary pipe chaseways, and of the effects of fuel stored within the reactor vessel. For ex-vessel LMFBR problems, the methodology requires considerable improvement, the areas of concern including neutron streaming through heating and

ventilation ducts, through the cavity surrounding the reactor vessel, and through gaps around rotating plugs in the reactor heat, as well as gamma-ray streaming through plant shield penetrations.

- 743 (CONF-781117--4) SHIELDING EXPERIMENTAL METHODS. Maienschein, F.C.; Muckenthaler, F.J. (Oak Ridge National Lab., TN (USA)). Nov 1978. Contract W-7405-ENG-26. 13p. Dep. NTIS, PC A02/MF A01.

From FBR shielding seminar; Obninsk, USSR (13 Nov 1978).

Benchmark, parametric, and design-confirmation shielding measurements are made at the Tower Shielding Facility (TSF) in Oak Ridge. A powerful reactor (to 1 MW thermal) is used with spectral modifiers to provide neutron spectra close to those associated with the various parts of an LMFBR. The source strength allows measurements through shields of full reactor thickness using sensitive detectors. The detectors include spectrometers and dosimeters for both neutrons and gamma rays. A large exclusion area provides much flexibility in arranging shield assemblies to be studied.

- 744 (CONF-781117--5) NUCLEAR DATA NEEDS FOR FAST BREEDER REACTOR SHIELDING. Oblow, E.M.; Perey, F.G. (Oak Ridge National Lab., TN (USA)). Nov 1978. Contract W-7405-ENG-26. 16p. Dep. NTIS, PC A02/MF A01.

From FBR shielding seminar; Obninsk, USSR (13 Nov 1978).

A review of neutron and gamma-ray cross section data needs for fast reactor shielding is presented in light of the recent advances made in assessing these needs through sensitivity studies. Total and partial cross sections and energy and angular distribution data for neutrons are surveyed as well as gamma-ray production cross sections. The strengths and deficiencies of currently available benchmark-quality integral experiments are also discussed with respect to their use in creating adjusted cross section libraries for design work. The availability of first round covariance data in ENDF/B-IV and plans for ENDF/B-V are also reviewed. This latter information makes it possible to quantitatively assess the quality of current cross section data libraries and also puts adjustment and data assessment procedures on a firmer basis.

- 745 (CONF-781117--6) INVESTIGATION OF STEEL-SODIUM-IRON SHIELDS. Oblow, E.M.; Maerker, R.E. (Oak Ridge National Lab., TN (USA)). 1978. Contract W-7405-ENG-26. 15p. Dep. NTIS, PC A02/MF A01.

From FBR shielding seminar; Obninsk, USSR (13 Nov 1978).

An analysis of experimental data from 21 fast reactor shield configurations containing steel, sodium, and iron were made as part of a study of the upper axial shielding needs of the Clinch River Breeder Reactor. The measured data were analyzed using both one- and two-dimensional discrete ordinates transport codes and several cross section libraries based on ENDF/B-IV data with group structures of 51 and 171 neutron groups. One-dimensional sensitivity studies using the 171 group library and ENDF/B-IV covariance files for sodium and iron data were used to determine the sensitivities of the measured data to multigroup cross sections and to estimate uncertainties in the calculated results. Results indicate that the standard 51-group design cross section library could be expected to predict the measurements to within 30% over 12 decades of attenuation although a few of the deepest penetration configurations

showed disagreements as large as a factor of three. The sensitivity results revealed very high sensitivity of the measurements to total cross section minima and cross sections from 5 to 10 MeV in sodium and iron in the deep penetration configurations. As a result, large uncertainties in the calculated results arose from small uncertainties in the cross section data. These results indicate the need for better measurements of the total cross section minima in sodium, especially around 300 keV.

- 746 (CONF-781117--7) DESIGN EXPERIENCE: CRBRP RADIATION SHIELDING. Disney, R.K.; Chan, T.C.; Gallo, F.G.; Hedgecock, L.R.; McGinnis, C.A.; Wrights, G.N. (Westinghouse Electric Corp., Madison, PA (USA). Advanced Reactors Div.). Nov 1978. Contract EY-76-C-15-2395. 27p. Dep. NTIS, PC A03/MF A01.

From FBR shielding seminar; Obninsk, USSR (13 Nov 1978).

The Clinch River Breeder Reactor Plant (CRBRP) is being designed as a fast breeder demonstration project in the U.S. Liquid Metal Fast Breeder Reactor (LMFBR) program. Radiation shielding design of the facility consists of a comprehensive design approach to assure compliance with design and government regulatory requirements. Studies conducted during the CRBRP design process involved the aspects of radiation shielding dealing with protection of components, systems, and personnel from radiation exposure. Achievement of feasible designs, while considering the mechanical, structural, nuclear, and thermal performance of the component or system, has required judicious trade-offs in radiation shielding performance. Specific design problems which have been addressed are in-vessel radial shielding to protect permanent core support structures, flux monitor system shielding to isolate flux monitoring systems for extraneous background sources, reactor vessel support shielding to allow personnel access to the closure head during full power operation, and primary heat transport system pipe chaseway shielding to limit intermediate heat transport system sodium system coolant activation. The shielding design solutions to these problems defined a need for prototypic or benchmark experiments to provide assurance of the predicted shielding performance of selected design solutions and the verification of design methodology. Design activities of CRBRP plant components and systems, which have the potential for radiation exposure of plant personnel during operation or maintenance, are controlled by a design review process related to radiation shielding. The program implements design objectives, design requirements, and cost/benefit guidelines to assure that radiation exposures will be "as low as reasonably achievable" (ALARA).

- 747 (CONF-781181--2) PREDICTION OF THERMAL CONSEQUENCES OF PLENUM FISSION GAS RELEASE IN AN LMFBR FUEL ASSEMBLY. Kadambi, N.P. (Westinghouse Electric Corp., Madison, PA (USA). Advanced Reactors Div.). 1978. Contract EY-76-C-15-2395. 5p. Dep. NTIS, PC A02/MF A01.

From American Nuclear Society meeting; San Francisco, CA, USA (12 Nov 1978).

One of the types of hypothetical accidents important in the safety analysis of Liquid Metal Fast Breeder Reactors is that in which fission gas release is postulated to occur from the plena of fuel pins at such a rate that significant perturbation to coolant flow occurs. Past consideration of such events has employed highly conservative calculations in the interest of simplicity and expediency. This

paper describes a method developed to predict more accurately the thermal consequences of such fission gas release events.

- 748 (CONF-781202--25) EFFECTS OF NOTCHES ON ELEVATED-TEMPERATURE, LOW-CYCLE FATIGUE BEHAVIOR OF TYPE 304 STAINLESS STEEL. Raske, D.T.; Maiya, P.S. (Argonne National Lab., IL (USA)). Dec 1978. Contract W-31-109-ENG-38. 23p. Dep. NTIS, PC A02/MF A01.

From ASME meeting; San Francisco, CA, USA (10 Dec 1978).

The results of an investigation into the effects of geometric stress concentrations on the elevated-temperature low-cycle fatigue behavior of Type 304 stainless steel are presented. The objective of this study was to develop a data base that could be used to verify the ASME Code Case 1592-8 design method for predicting the creep-fatigue behavior of structural components which contain discontinuities. In continuous-cycling tests, the local strains at the notch root determined from the Code Case procedure result in fatigue-life estimates that are conservative when compared to the experimental values. For tests containing a hold time at the peak tensile strain, the Code Case procedure results in local strains that are nearly identical to the experimentally obtained local strains, if the local stress is assumed to relax to the nominal value during the hold time.

- 749 (CONF-781202--26) ACOUSTICS AND VOIDING DYNAMICS DURING SLSF SIMULATIONS OF LMFBR UNDERCOOLING TRANSIENTS. Anderson, T.T.; Kuzay, T.M.; Marr, W.W.; Miles, K.J.; Pedersen, D.R.; Thompson, D.H.; Wilson, R.E. (Argonne National Lab., IL (USA)). 1978. Contract W-31-109-ENG-38. 26p. Dep. NTIS, PC A03/MF A01.

From ASME meeting; San Francisco, CA, USA (10 Dec 1978).

The SLSF is the largest U.S. in-reactor test vehicle for steady-state and transient experiments in an environment typical of a LMFBR core. The SLSF experiment program, sponsored by the Department of Energy, contributes to the LMFBR safety assurance program by providing data on key phenomena that occur during postulated reactor accidents. This paper describes completed SLSF experiments, in-core instrumentation used, and methods of data interpretation to determine sodium boiling and voiding dynamics. Boiling inception is shown to be identifiable from several types of in-core instruments. Location of the boiling front and void growth derived from experimental data are compared with analytical predictions. These and other data form the basis to improve understanding of accidents and to validate or guide the development of accident analysis methods.

- 750 (CONF-781219--1) TENSILE, CREEP, AND CREEP--RUPTURE STUDIES ON 2 1/4 CR--1 MO STEEL. Klueh, R.L. (Oak Ridge National Lab., TN (USA)). 1978. Contract W-7405-ENG-26. 17p. Dep. NTIS, PC A02/MF A01.

From US/UKAEA specialists meeting on mechanical properties; Oak Ridge, TN, USA (4 Dec 1978).

Tensile, creep, and creep-rupture studies were made on annealed or isothermally annealed air-melted 2 1/4 Cr--1 Mo steel. Creep strength is the result of the interaction of solid solution hardening and dispersion strengthening. Microstructure is primarily proeutectoid ferrite. (FS)

- 751 (CONF-781219--4) JOINING TECHNOLOGY DEVELOPMENT SUMMARY, 189A OH024. Edmonds, D.P. (Oak Ridge National Lab., TN (USA)). 1978. Contract W-7405-ENG-26. 34p. Dep. NTIS, PC A03/MF A01.
From US/UKAEA specialists meeting on mechanical properties; Oak Ridge, TN, USA (4 Dec 1978).
Joining technology is discussed for Breeder Reactor technology including welding development and mechanical properties of weldments for austenitic stainless steels, high-temperature structural design data for austenitic stainless steel weldments and advanced transition joints is discussed. Technology developed in this program is briefly reviewed. (FS)
- 752 (CONF-781219--5) OVERVIEW OF U.S. EFFORTS DIRECTED TOWARDS DEVELOPMENT OF MECHANICAL PROPERTIES DATA IN SUPPORT OF FBR DEVELOPMENT. Brinkman, C.R. (Oak Ridge National Lab., TN (USA)). 1978. Contract W-7405-ENG-26. 14p. Dep. NTIS, PC A02/MF A01.
From US/UKAEA specialists meeting on mechanical properties; Oak Ridge, TN, USA (4 Dec 1978).
The object of U.S. Breeder Reactor Program associated with primary and secondary circuit structural materials is to develop a design data base and associated design technology on commercially available material as well as new alloys. The commercially available materials include ASIA 316 and 304. Chromium--molybdenum steels and alloy 800H. (FS)
- 753 (CONF-790202-- , pp 9-11) CLINCH RIVER BREEDER REACTOR. Baron, S. Jul 1979.
From 6. annual energy conference and exhibition energy and the public; Knoxville, TN, USA (21 Feb 1979).
Mr. Baron says the administration's effort to terminate the Clinch River Breeder Reactor (CRBR) project is symptomatic; they have also placed restrictions on fusion, coal, solar, and other areas of energy development in which technological advances are held back in order to force conservation. Because the breeder reactor, unlike solar and fusion energy, is both economically and technically feasible, a demonstration plant is needed. The contentions that the CRBR design is obsolete, that its proposed size is inappropriate, or that plutonium can be diverted for weapons proliferation are argued to be invalid. Failure to complete the CRBR will have both economic and national security repercussions.
- 754 (CONF-790236-- , pp 32-40) LIQUID-METAL FAST BREEDER REACTOR STRUCTURAL MATERIALS DESIGN CONSIDERATIONS. Huddleston, R.L. (Oak Ridge National Lab., TN). Jun 1979.
From Workshop on time-dependent fracture of materials; Germantown, MD, USA (15 Feb 1979).
This paper gives a brief overview of the LMFBR, to describe its key components, addresses two key structural problems, reviews high-temperature materials utilized, and places bounds on expected operating conditions. The current status of materials utilization in the LMFBR is summarized as follows: with the exception of the reactor upper internals, design needs for the LMFBR can be met with currently approved Code materials; Inconel 718 can potentially solve the thermal striping problems in the reactor upper internals; temperature, stress-strain levels, and design lifetime of the LMFBR push currently approved Code materials toward their limits of usefulness.
- 755 (CONF-790236--1) LIQUID METAL FAST BREEDER REACTOR STRUCTURAL MATERIALS DESIGN CONSIDERATIONS. Huddleston, R.L. (Oak Ridge National Lab., TN (USA)). 1979. Contract W-7405-ENG-26. 18p. Dep. NTIS, PC A02/MF A01.
From Workshop on time-dependent fracture of materials; Germantown, MD, USA (15 Feb 1979).
In summary, this paper has attempted to give a brief overview of the LMFBR, to describe its key components, to address two key structural problems, to review high-temperature materials utilized, and finally, to attempt to place bounds on expected operating conditions. The current status of materials utilization in the LMFBR might be summarized as follows: (1) With the exception of the reactor upper internals, design needs for the LMFBR can be met with currently approved Code materials. (2) Inconel 718 can potentially solve the thermal striping problems in the reactor upper internals. (3) Temperature, stress-strain levels, and design lifetime of the LMFBR push currently approved Code materials toward their limits of usefulness.
- 756 (CONF-790239--1) COMPARISON OF NUMERICAL RESULTS WITH EXPERIMENTAL DATA FOR SINGLE-PHASE NATURAL CONVECTION IN AN EXPERIMENTAL SODIUM LOOP. Ribando, R.J. (Oak Ridge National Lab., TN (USA)). 1979. Contract W-7405-ENG-26. 45p. Dep. NTIS, PC A03/MF A01.
From Specialists' meeting on decay heat removal and natural convection in FBRs; Upton, Long Island, NY, USA (28 Feb 1979).
A comparison is made between computed results and experimental data for a single-phase natural convection test in an experimental sodium loop. The test was conducted in the Thermal-Hydraulic Out-of-Reactor Safety (THORS) facility, an engineering-scale high temperature sodium loop at the Oak Ridge National Laboratory (ORNL) used for thermal-hydraulic testing of simulated Liquid Metal Fast Breeder Reactor (LMFBR) subassemblies at normal and off-normal operating conditions. Heat generation in the 19 pin assembly during the test was typical of decay heat levels. The test chosen for analysis in this paper was one of seven natural convection runs conducted in the facility using a variety of initial conditions and testing parameters. Specifically, in this test the bypass line was open to simulate a parallel heated assembly and the test was begun with a pump coastdown from a small initial forced flow. The computer program used to analyze the test, LONAC (LOW flow and NATural Convection) is an ORNL-developed, fast-running, one-dimensional, single-phase, finite-difference model used for simulating forced and free convection transients in the THORS loop.
- 757 (CONF-790306--5) PERFORMANCE OF EBR-II MARK-II METALLIC DRIVER FUEL UP TO 6750°C. Einziger, R.E. (Argonne National Lab., IL (USA)). Mar 1979. Contract W-31-109-ENG-38. 17p. Dep. NTIS, PC A02/MF A01.
From International conference on fast breeder reactor performance; Monterey, CA, USA (5 Mar 1979).
The performance of EBR-2 Mark-II fuel at 6750°C is significantly different from that at 5900°C. Despite the differences, the elements were all successfully irradiated to 8 at. % burnup before being removed from the reactor unbreached. Some of the more significant differences in performance at the higher temperatures are (1) The fuel-element cladding showed a double-peaking strain profile, with enhanced swelling and creep due to extensive

carbide precipitation, an FCCI enhanced fission gas stress, or FCMI. (2) The FCCI zone in the fuel was cracked and represented 25% of the cladding thickness. This zone was substantially larger than observed at 590°C. (3) The fuel pin lifted 12 mm to the restrainer dimple, so some type of restrainer may be necessary in future designs. A restrainer had previously been deemed unnecessary based on irradiations at 590°C. (4) The fission-gas release is less at a fuel-centerline temperature of 720°C compared at 650°C. This difference is primarily due to the upper third of the element having very little open porosity. Owing to the lack of bond sodium infiltration into the fuel at the higher temperature, the fission gas pressure is the same at both temperatures.

- 758 (CONF-790306--16) PERFORMANCE OF U--PU--ZR METAL FUEL IN 1000 MWE LMFBRs. Lam, P.S.K.; Turski, R.B.; Barthold, W.P. (Argonne National Lab., IL (USA)). 1979. Contract W-31-109-ENG-38. 15p. Dep. NTIS, PC A02/MF A01.

From International conference on fast breeder reactor performance; Monterey, CA, USA (5 Mar 1979).

The present analyses indicate that very conservatively designed U--Pu--Zr metal-fueled 1000 MW(e) LMFBRs have CSDT in the range of 9 to 10 years, with corresponding specific inventories ranging from 2.5 to 3.5 kg/MWe. Doubling times in the range of 8 years are achievable with only minor changes in the fuel pin design or operating conditions.

- 759 (CONF-790361--1) FUEL AND COOLANT MOTIONS FOLLOWING PIN FAILURE: EPIC MODELS AND THE PBE-5S EXPERIMENT. Garner, P.L.; Abramson, P.B. (Argonne National Lab., IL (USA)). 1979. Contract W-31-109-ENG-38. 14p. Dep. NTIS, PC A02/MF A01.

From LMFBR workshop; Albuquerque, NM, USA (12 Mar 1979).

The EPIC computer code has been used to analyze the post-fuel-pin-failure behavior in the PBE-5S experiment performed at Sandia Laboratories. The effects of modeling uncertainties on the calculation are examined. The calculations indicate that the majority of the piston motion observed in the test is due to the initial pressurization of the coolant channel by fuel vapor at cladding failure. A more definitive analysis requires improvements in calculational capabilities and experiment diagnostics.

- 760 (CONF-790363--1) OVERVIEW OF US EFFORTS TO VALIDATE ANALYSIS METHODS AND DESIGN CRITERIA. Corum, J.M. (Oak Ridge National Lab., TN (USA)). 1979. Contract W-7405-ENG-26. 39p. Dep. NTIS, PC A03/MF A01.

From US Japan specialist meeting on high temperature piping design and analysis; Pittsburgh, PA, USA (26 Mar 1979).

As a part of its basic breeder reactor technology activities, the United States has a High-Temperature Structural Design Program aimed at establishing, and transferring to designers a rationally sound and experimentally validated structural design technology that will assure freedom from structural failures. Both development and validation efforts are centered on three main ingredients of the technology: (1) mathematical descriptions (constitutive equations) of the deformation behavior of the alloys of interest, (2) time-dependent rupture, or cracking, models, again for the alloys of interest, and (3) detailed design analysis methods and failure criteria based on these inputs. The objective of this

presentation is to provide a brief overview of the status of efforts to experimentally assess and validate each of these three technology ingredients. In the case of deformation and rupture models, the current procedures and rules are outlined, and their significant features are assessed through comparisons with results from uniaxial and multiaxial material behavior tests. Design analysis methods and failure criteria are, on the other hand, discussed relative to the results of experimental benchmark structural tests. Although several significant needs and problem areas remain, data generated to date tend to provide limited validation of key aspects of the existing technology. Current constitutive equations represent many of the observed behavioral features; limited available data support current time-dependent rupture criteria reasonably well; and it is observed that structural analysis predictions capture most of the experimentally observed features of inelastic structural behavior.

- 761 (CONF-790363--2) EVALUATION OF THE INFLUENCE OF SEISMIC RESTRAINT CHARACTERISTICS ON LMFBR PIPING. Mallett, R.H. (Westinghouse Electric Corp., Madison, PA (USA). Advanced Reactors Div.). 1979. Contract EY-76-C-15-2395. 21p. Dep. NTIS, PC A02/MF A01.

From US Japan specialist meeting on high temperature piping design and analysis; Pittsburgh, PA, USA (26 Mar 1979).

For the Clinch River Breeder Reactor Plant (CRBRP) heat transport system piping within the reactor containment building, dynamic analyses of the piping loops have been performed to study the effect of restraint stiffness on the dynamic behavior of the piping, i.e., changes in frequencies, mode shapes, loads, stresses, and displacements. In addition, analysis and testing of typical CRBRP restraint system components have been performed for the purpose of quantifying and verifying the basic characteristics of the restraints used in the piping system dynamic analysis. The results are presented of the analysis and testing described above. In particular, it is shown that piping restraint effects on breeder reactor piping response are important considerations in the design/analysis process.

- 762 (CONF-790363--3) LOAD-TIME HISTOGRAM AND ELASTIC ANALYSIS OF CRBRP HEAT TRANSPORT SYSTEM PIPING. Mello, R.M. (Westinghouse Electric Corp., Madison, PA (USA). Advanced Reactors Div.). 1979. Contract EY-76-C-15-2395. 21p. Dep. NTIS, PC A02/MF A01.

From US Japan specialist meeting on high temperature piping design and analysis; Pittsburgh, PA, USA (26 Mar 1979).

The CRBRP heat transport system piping was designed and analyzed for the operating and load conditions as specified in the Piping Design Specification. The various types of design loading conditions have been categorized into design, normal, upset, emergency and faulted conditions, and organized into a load histogram. Using the thermal transient defined for each condition and the histogram, a set of load cycles was constructed using the 863 startup-shutdown conditions. The stress analysis of the piping was performed on the basis of the thermal transients and loadings resulting from the loading categories and the histogram. The ELTEMP computer program was used to perform the elastic ASME Code compliance analysis. The input required to perform the Code evaluation included the pipe cross-section geometry, component type (elbow, tee, straight, etc.), the forces and moments output data from

the flexibility analyses, average temperature, linear temperature gradients, non-linear temperature gradients, pressure, etc.

- 763 (CONF-790363--4) APPLICATION OF ASME CODE CASE N-47 CONCEPTS TO CRBRP PRIMARY PIPING. Mallett, R.H. (Westinghouse Electric Corp., Madison, PA (USA). Advanced Reactors Div.). 1979. Contract EY-76-C-15-2395. 22p. Dep. NTIS, PC A02/MF A01.

From US Japan specialist meeting on high temperature piping design and analysis; Pittsburgh, PA, USA (26 Mar 1979).

Portions of document are illegible.

Section III of the ASME Code provides rules in Subsection NB-3600 which greatly simplify the structural evaluation of piping. The key to this simplification is in the use of stress analysis formulas based upon stress indices. These formulas are applicable in the evaluation of compliance with limits on elastically calculated quantities. At present, Code Case N-47 permits, but does not specify, the use of analyses based upon piping stress indices. This paper describes a set of formulas for piping analysis using stress indices. Specifically, stress intensities needed for evaluation of compliance with Code Case N-47 limits on elastically calculated are given using piping stress indices. The specified formulas are examined by comparison with related ANSI B31.1 rules and test data.

- 764 (CONF-790363--5) DESIGN CONSIDERATIONS FOR CRBRP PRIMARY PIPING SYSTEM OPERATING AT ELEVATED TEMPERATURES. Mello, R.M. (Westinghouse Electric Corp., Madison, PA (USA). Advanced Reactors Div.). 1979. Contract EY-76-C-15-2395. 18p. AT.

From US Japan specialist meeting on high temperature piping design and analysis; Pittsburgh, PA, USA (26 Mar 1979).

The heat transport system sodium piping for the Clinch River Breeder Reactor Plant (CRBRP) within the reactor containment building must withstand high temperatures for long periods of time. Each phase of the mechanical design process of the piping system is influenced by elevated temperature considerations which include material thermal creep effects, ratchetting caused by rapid temperature transients and stress relaxation, and material degradation effects. This requires that careful attention be given to through-wall temperature gradients and time-dependent material behavior in the design and analysis process. The description of the structural design philosophy and approaches taken to design the CRBRP piping operating in a high temperature environment are presented. In addition, the resulting design of the heat transport system piping is discussed along with the special features that resulted from the elevated temperature considerations.

- 765 (CONF-790370--1) STUDY OF STRUCTURAL ATTACHMENTS OF A POOL TYPE LMFBR VESSEL THROUGH SEISMIC ANALYSIS OF A SIMPLIFIED THREE DIMENSIONAL FINITE ELEMENT MODEL. Ahmed, H.; Ma, D. (Argonne National Lab., IL (USA)). 1979. Contract W-31-109-ENG-38. 15p. Dep. NTIS, PC A02/MF A01.

From 5. international conference on structural mechanics in reactor technology; Berlin, F.R. Germany (20 Mar 1979).

A simplified three dimensional finite element model of a pool type LMFBR in conjunction with the computer program ANSYS is developed and scoping results of seismic analysis are produced. Through this study various structural attachments of a pool type LMFBR like the reactor vessel skirt support,

the pump support and reactor shell-support structure interfaces are studied. This study also provides some useful results on equivalent viscous damping approach and some improvements to the treatment of equivalent viscous damping are recommended. This study also sets forth pertinent guidelines for detailed three dimensional finite element seismic analysis of pool type LMFBR (to be published in a separate paper).

- 766 (CONF-790374--1) RADIOACTIVE WASTE MANAGEMENT AT A LIQUID METAL FAST BREEDER REACTOR. Abrams, C.S.; Fryer, R.H.; Witbeck, L.C. (Argonne National Lab., IL (USA)). 1979. Contract W-31-109-ENG-38. 17p. Dep. NTIS, PC A02/MF A01.

From AECD-IAEA symposium on the on-site management of power reactor; Zurich, Switzerland (26 Mar 1979).

This paper presents the radioactive waste production and management at a Liquid Metal Fast Breeder Reactor-II (EBR-II), which is operated for the US Department of Energy by the Argonne National Laboratory at the Idaho National Engineering Laboratory (INEL). Since this facility, in addition to supplying power has been used to demonstrate the breeder, fuel cycling, and recently operations with defective fuel elements, various categories of waste have been handled safely over some 14 years of operation. Liquid wastes are processed such that the resulting effluent can be discharged to an uncontrolled area. Solid wastes up to 10,000 R/hr are packaged and shipped contamination-free to a disposal site or interim storage with exposures to personnel approximately 10 mrem. Gaseous waste discharges are low such as 143 Ci of noble gases in 1978 and do not have a significant effect on the environment even with operations with breached fuel.

- 767 (CONF-790402--16) ELASTIC-PLASTIC-CREEP ANALYSIS OF SHELLS. Pai, D.H. (Foster Wheeler Corp., Livingston, NJ (USA)). 1979. Contract EW-76-C-2395. 23p. Dep. NTIS, PC A02/MF A01.

From Computational methods in nuclear engineering; Williamsburg, VA, USA (23 Apr 1979).

This paper presents the recent experience of a designer/fabricator of nuclear heat transport components in the area of elastic-plastic-creep analysis of shell-like structures. A brief historical perspective is first given to highlight the evolution leading to the present industry practice. The ASME elevated temperature design criteria will be discussed followed by examples of actual computations performed to support the design/analysis and fabrication of a breeder reactor component in which a substantial amount of elastic-plastic-creep analysis was performed. Mathematical challenges encountered by the design analyst in these problems will be highlighted. Developmental needs and future trends will then be given.

- 768 (CONF-790402--18) VENUS-III TWO-DIMENSIONAL MULTI-COMPONENT THERMAL HYDRAULIC TECHNIQUES. Weber, D.P. (Argonne National Lab., IL (USA)). 1979. Contract W-31-109-ENG-38. 19p. Dep. NTIS, PC A02/MF A01.

From Computational methods in nuclear engineering; Williamsburg, VA, USA (23 Apr 1979).

In recent analyses of the initiating phase in LMFBR core disruptive accidents the energy deposition rate may not be nearly so high as originally thought and the development of

material motion and interaction may take place on a time scale considerably larger than the classic disassembly time scale of milliseconds. This introduces a considerably different twist to the problem and it becomes apparent that processes heretofore ignored, such as differential motion and heat exchange, may become important. In addition, time scales may become long enough that substantial core material motion may take place and since rearrangement in more critical configurations cannot be absolutely precluded, capability for extended motion analysis, not easily performed with Lagrangian techniques in multi-dimensions, become desirable. Such considerations provided the motivation for developing a hydrodynamic algorithm to resolve these questions, and an Eulerian rather than Lagrangian frame of reference was chosen, primarily to handle extended motion and interpenetration. The results of the study are described.

- 769 (CONF-790402--19) NODAL METHOD FOR FAST REACTOR ANALYSIS. Shober, R.A. (Argonne National Lab., IL (USA)). 1979. Contract W-31-109-ENG-38. 16p. Dep. NTIS, PC A02/MF A01.

From Computational methods in nuclear engineering; Williamsburg, VA, USA (23 Apr 1979).

In this paper, a nodal method applicable to fast reactor diffusion theory analysis has been developed. This method has been shown to be accurate and efficient in comparison to highly optimized finite difference techniques. The use of an analytic solution to the diffusion equation as a means of determining accurate coupling relationships between nodes has been shown to be highly accurate and efficient in specific two-group applications, as well as in the current multigroup method.

- 770 (CONF-790402--20) APPLICATION OF AN LP MODEL TO BREEDER STRATEGY STUDIES. Till, C.E.; Chang, Y.I. (Argonne National Lab., IL (USA)). 1979. Contract W-31-109-ENG-38. 17p. Dep. NTIS, PC A02/MF A01.

From Computational methods in nuclear engineering; Williamsburg, VA, USA (23 Apr 1979).

The paper discusses the relationships between the capital cost differential (FBR--LWR) allowable for economic breeder introduction and energy demand, resource availability (through price--quantity schedule), and economic environment for a range of future projections. The ALPS linear programming reactor systems analysis code, developed by Hanford Engineering Development Laboratory, was used for economic optimizations where they were done, and where they were not it provided a useful tool to compute the discounted total system power cost over the planning horizon for a given set of reactor mix and cost parameters.

- 771 (CONF-790404--), pp 145-170) FFTF IMPLEMENTATION OF TRAINING REQUIREMENTS FOR GOVERNMENT AND COMMERCIALY OWNED FACILITIES. Gaden, A.D. (Hanford Engineering Development Lab., Richland, WA); Izatt, R.D.; Wiborg, J.C. Apr 1979.

From 3. symposium on the training on nuclear facility personnel; Gatlinburg, TN, USA (29 Apr 1979).

The FFTF Training Program is a specific example of how training guidelines provided by NRC can be implemented in principle in a DOE owned reactor. The DOE requirements for government owned facilities and the NRC requirements for commercially owned facilities

are compared to components of the FFTF Training program. These components will be described, actual status provided and evaluated as to meeting requirements. Cold Plant Qualification (equivalent to NRC Cold Plant Licensing) is the next major milestone for FFTF Operator training. Additional requirements or constraints such as operator time utilization, recruiting and turnover, plant availability and startup testing greatly affect the ability to meet this milestone. These constraints and requirements and the resulting compromises will be evaluated relative to meeting DOE requirements.

- 772 (CONF-790408--3) STRENGTH PROPERTIES OF CONCRETE AT ELEVATED TEMPERATURES. Freskakis, G.N.; Burrow, R.C.; Debbas, E.B. (Burns and Roe, Inc., Oradell, NJ (USA)). 1979. Contract EY-76-C-03-1145. 30p. Dep. NTIS, PC A03/MF A01.

From 3. ASCE specialty conference on the structural design of nuclear plant facilities; Boston, MA, USA (2 Apr 1979).

A study is presented concerning the compressive strength, modulus of elasticity, and stress-strain relationships of concrete at elevated temperatures. A review of published results provides information for the development of upper and lower bound relationships for compressive strength and the modulus of elasticity and establishes exposure conditions for a lower bound thermal response. The relationships developed from the literature review are confirmed by the results of a verification test program. The strength and elasticity relationships provide a basis for the development of design stress-strain curves for concrete exposed to elevated temperatures.

- 773 (CONF-790602--36) WHOLE-CORE THERMAL-HYDRAULIC TRANSIENT CODE DEVELOPMENT AND VERIFICATION FOR LMFBR ANALYSIS. Spencer, D.R. (Westinghouse Electric Corp., Madison, PA (USA). Advanced Reactors Div.). Apr 1979. Contract EW-76-C-15-2395. 5p. Dep. NTIS, PC A02/MF A01.

From ANS annual meeting; Atlanta, GA, USA (3 Jun 1979).

Predicted performance during both steady state and transient reactor operation determines the steady state operating limits on LMFBRs. Unnecessary conservatism in performance predictions will not contribute to safety, but will restrict the reactor to more conservative, less economical steady state operation. The most general method for reducing analytical conservatism in LMFBR's without compromising safety is to develop, validate and apply more sophisticated computer models to the limiting performance analyses. The purpose of the on-going Natural Circulation Verification Program (NCVP) is to develop and validate computer codes to analyze natural circulation transients in LMFBRs, and thus, replace unnecessary analytical conservatism with demonstrated calculational capability.

- 774 (CONF-790602--52) THEORETICAL EVALUATION OF EX-VESSEL MONITORING FOR INITIAL FUEL LOADING OF A LIQUID METAL FAST BREEDER REACTOR. Mihalcz, J.T.; Selby, D.L.; Knee, H.E. (Oak Ridge National Lab., TN (USA)). 1979. Contract W-7405-ENG-26. 7p. Dep. NTIS, PC A02/MF A01.

From ANS annual meeting; Atlanta, GA, USA (3 Jun 1979).

Transport theory calculations were used to determine the feasibility of monitoring the fuel loading to initial criticality of the Clinch River Breeder Reactor (CRBR) with a

detector in a cavity outside the reactor vessel. Such monitoring of the CRBR with an ex-vessel detector will be different from monitoring of previous LMFBRs, where in-vessel detectors were used. The feasibility of ex-vessel monitoring will depend mainly on two criteria: (1) sensitivity - will there be enough counts to obtain adequate counting statistics; and (2) interpretability - will the count rate obtained during the initial fuel loading sequence be sufficient to determine the neutron multiplication or reactivity. Satisfying these criteria will assure that the reactor can be loaded safely to initial criticality. The sensitivity criterion can be satisfied by inserting an additional neutron source (one much more intense than the inherent neutron source of the fuel subassemblies) into the core center and using ex-vessel detectors with high sensitivity, such as multiple BF₃ counters mounted in a graphite moderator block. These calculations were used to determine the intensity of the additional source required to produce adequate counting rates at the ex-vessel detectors.

- 775 (CONF-790602--59) DETERMINATION OF CURRENT WEIGHTED TOTAL CROSS SECTIONS IN THE UNRESOLVED ENERGY REGION. Barhen, J.; Cacuci, D.G. (Oak Ridge National Lab., TN (USA)). 1979. Contract W-7405-ENG-26. 7p. Dep. NTIS, PC A02/MF A01.

From ANS annual meeting; Atlanta, GA, USA (3 Jun 1979).

As part of the preliminary ENDF/B-5 data testing, recommendations were made to reassess the computation of the effective point-wise current-weighted cross sections in the unresolved energy region. No previously published work has taken fully into account such important effects as interference scattering and within-sequence overlap. In addition, the extension of the unresolved region to higher energies in ENDF/B-5, in order to include competitive widths, increases the computational complexity. Because of the potential cost penalties associated with design uncertainties in large LMFBR's, it was necessary to develop a procedure which takes these effects fully into account. The new methodology presented here is to be used in the generation of multigroup libraries based on the final version of ENDF/B-5. 1 table. (RWR)

- 776 (CONF-790602--60) INTERLABORATORY COMPUTATIONAL COMPARISONS OF CRITICAL FAST TEST REACTOR PIN LATTICES. Mincey, J.F.; Kerr, H.T.; Durst, B.M. (Oak Ridge National Lab., TN (USA)); Battelle Pacific Northwest Labs., Richland, WA (USA)). 1979. Contract W-7405-ENG-26. 8p. Dep. NTIS, PC A02/MF A01.

From ANS annual meeting; Atlanta, GA, USA (3 Jun 1979).

An objective of the Consolidated Fuel Reprocessing Program's (CFRP) nuclear engineering group at Oak Ridge National Laboratory (ORNL) is to ensure that chemical equipment components designed for the reprocessing of spent LMFBR fuel (among other fuel types) are safe from a criticality standpoint. As existing data are inadequate for the general validation of computational models describing mixed plutonium-uranium oxide systems with isotopic compositions typical of LMFBR fuel, a program of critical experiments has been initiated at the Battelle Pacific Northwest Laboratories (PNL). The first series of benchmark experiments consisted of five square-pitched lattices of unirradiated Fast Test Reactor (FTR) fuel moderated and reflected by light water. Calculations of these five experiments have been conducted by both ORNL/

CFRP and PNL personnel with the purpose of exploring how accurately various computational models will predict $k_{\text{sub eff}}$ values for such neutronic systems and if differences between $k_{\text{sub eff}}$ values obtained with these different models are significant.

- 777 (CONF-790602--61) INFLUENCE OF FISSION SPECTRA UNCERTAINTIES ON CALCULATED FAST REACTOR PARAMETERS. Lucius, J.L.; Marable, J.H. (Oak Ridge National Lab., TN (USA)). 1979. Contract W-7405-ENG-26. 6p. Dep. NTIS, PC A02/MF A01.

From ANS annual meeting; Atlanta, GA, USA (3 Jun 1979).

The effect of fission spectra uncertainties on calculated fast reactor parameters is studied by (1) considering the sensitivities to fission spectrum parameters of four performance parameters in the fast reactor benchmark ZPR-6/7, (2) estimating the uncertainties in these calculated performance parameters due to uncertainties in the fission spectra, (3) reporting the change in ZPR-6/7 calculated performance parameters due to fission spectra changes going from ENDF/B-IV to proposed ENDF/B-VP, and (4) determining what fast benchmark integral experiments are trying to tell us about ENDF/B-IV fission spectrum parameters as variables in a least squares adjustment procedure.

- 778 (CONF-790602--62) SODIUM COMPONENT RELIABILITY DATA COLLECTION AT CREDO. Bott, T.F.; Haas, P.M.; Manning, J.J. (Oak Ridge National Lab., TN (USA)). 1979. Contract W-7405-ENG-26. 6p. Dep. NTIS, PC A02/MF A01.

From ANS annual meeting; Atlanta, GA, USA (3 Jun 1979).

The Centralized Reliability Data Organization (CREDO) has been established at Oak Ridge National Laboratory (ORNL) by the Department of Energy to provide a national center for collection, evaluation and dissemination of reliability data for advanced reactors. While the system is being developed and continuous data collection at the two U.S. reactor sites (EBR-II and FFTF) is being established, data on advanced reactor components which have been in use at U.S. test loops and experimental reactors have been collected and analyzed. Engineering, operating and event data on sodium valves, pumps, flow meters, rupture discs, heat exchangers and cold traps have been collected from more than a dozen sites. The results of analyses of the data performed to date are presented.

- 779 (CONF-790602--63) COMPARISON OF THE HAARM-3 FALLOUT MODEL WITH NUCLEAR SAFETY PILOT PLANT (NSPP) DATA. Han, J.T.; Kress, T.S.; Adams, R.E. (Oak Ridge National Lab., TN (USA)). 1979. Contract W-7405-ENG-26. 6p. Dep. NTIS, PC A02/MF A01.

From ANS annual meeting; Atlanta, GA, USA (3 Jun 1979).

Sodium-oxide aerosols have been generated in the Nuclear Safety Pilot Plant (NSPP) experiment under vessel conditions appropriate for the LMFBR secondary containment following an HCDA. The primary goal of the NSPP program is to provide experimental validation for the HAARM-3 aerosol behavioral code. Validation can be determined by direct comparison of code predictions and integral test results using the same initial and boundary conditions. In addition, separate physical models within the code (e.g., for agglomeration, plate-out, and gravitational fallout) may be validated by a comparison of predicted values with measured instantaneous values. A comparison is presented

for the gravitational fallout rate which is considered to be the primary depletion mechanism under prototypic secondary containment conditions.

- 780 (CONF-790602--65) EVALUATION OF STOCHASTIC VOID MODELS FOR BUBBLE WORTH CALCULATIONS. Vaughan, E.U.; Hoffman, T.J. (Rockwell International Corp., Canoga Park, CA (USA). Energy Systems Group; Oak Ridge National Lab., TN (USA)). 1979. Contract W-7405-ENG-26. 7p. Dep. NTIS, PC A02/MF A01.

From ANS annual meeting; Atlanta, GA, USA (3 Jun 1979).

The reactivity due to the collapse of a large number of small bubbles in a reactor core has been analyzed with Behrens' method, Benoist's method, and the probability table method. Each analysis has used a different stochastic model for the bubble distribution within the reactor core: the Nicholson--Goldsmith calculations have employed a closely-spaced holes model; the Gelbard--Lell calculations have employed a random cube model; the Hoffman--Petric calculations have employed a nuclear model. However, any of the models can be used with any of the methods. In this paper, the three void models are evaluated. Based on this analysis, the closely-spaced holes model is recommended as the most suitable for analysis of bubble collapse in a molten, LMFBR core.

- 781 (CONF-790602--87) ANALYTICAL METHOD TO ACCURATELY PREDICT LMFBR CORE FLOW DISTRIBUTION. Carelli, M.D.; Willis, J.M. (Westinghouse Electric Corp., Madison, PA (USA). Advanced Reactors Div.). 1979. Contract EY-76-C-15-2395. 10p. Dep. NTIS, PC A02/MF A01.

From ANS annual meeting; Atlanta, GA, USA (3 Jun 1979).

An accurate and detailed representation of the flow distribution in LMFBR cores is very important as the starting point and basis of the thermal and structural core design. Previous experience indicated that the steady state and transient core design is as good as the core orificing; thus, a new orificing philosophy satisfying a priori all design constraints was developed. However, optimized orificing is a necessary, but not sufficient condition for achieving the optimum core flow distribution, which is affected by the hydraulic characteristics of the remainder of the primary system. Consequently, an analytical model of the overall primary system was developed, resulting in the CATFISH computer code, which, even though specifically written for LMFBRs, can be used for any reactor employing ducted assemblies.

- 782 (CONF-790615--11) STRUCTURAL ANALYSIS OF THE UPPER INTERNALS STRUCTURE FOR THE CLINCH RIVER BREEDER REACTOR PLANT. Houtman, J.L. (Westinghouse Electric Corp., Madison, PA (USA). Advanced Reactors Div.). 1979. Contract EW-76-C-15-2395. 54p. Dep. NTIS, PC A04/MF A01.

From 3. US national congress on pressure vessels and piping; San Francisco, CA, USA (25 Jun 1979).

The Upper Internals Structure (UIS) of the Clinch River Breeder Reactor Plant (CRBRP) provides control of core outlet flow to prevent severe thermal transients from occurring at the reactor vessel and primary heat transport outlet piping, provides instrumentation to monitor core performance, provides support for the control rod drivelines, and provides secondary holddown of the core. All of the

structural analysis aspects of assuring the UIS is structurally adequate are presented including simplified and rigorous inelastic analysis methods, elevated temperature criteria, environmental effects on material properties, design techniques, and manufacturing constraints.

- 783 (CONF-790615--13) EVALUATION OF THE INFLUENCE OF SEISMIC RESTRAINT CHARACTERISTICS ON BREEDER REACTOR PIPING SYSTEMS. Mello, R.M.; Pollono, L.P. (Westinghouse Electric Corp., Madison, PA (USA). Advanced Reactors Div.). 1979. Contract EW-76-C-15-2395. 19p. Dep. NTIS, PC A02/MF A01.

From 3. US national congress on pressure vessels and piping; San Francisco, CA, USA (25 Jun 1979).

For the Clinch River Breeder Reactor Plant (CRBRP) heat transport system piping within the reactor containment building, dynamic analyses of the piping loops have been performed to study the effect of restraint stiffness on the dynamic behavior of the piping. In addition, analysis and testing of typical CRBRP restraint system components have been performed for the purpose of quantifying and verifying the basic characteristics of the restraints used in the piping system dynamic analysis.

- 784 (CONF-790615--16) DESIGN CONSIDERATIONS FOR CRBRP HEAT TRANSPORT SYSTEM PIPING OPERATING AT ELEVATED TEMPERATURES. Pollono, L.P.; Mello, R.M. (Westinghouse Electric Corp., Madison, PA (USA). Advanced Reactors Div.). 1979. Contract EY-76-C-15-2395. 27p. Dep. NTIS, PC A03/MF A01.

From 3. US national congress on pressure vessels and piping; San Francisco, CA, USA (25 Jun 1979).

The heat transport system sodium piping for the Clinch River Breeder Reactor Plant (CRBRP) within the reactor containment building must withstand high temperatures for long periods of time. Each phase of the mechanical design process of the piping system is influenced by elevated temperature considerations which include material thermal creep effects, ratchetting caused by rapid temperature transients and stress relaxation, and material degradation effects. The structural design philosophy taken to design the CRBRP piping operating in a high temperature environment is described. The resulting design of the heat transport system piping is presented along with a discussion of special features that resulted from the elevated temperature considerations.

- 785 (CONF-790731--1) CHARGED PARTICLE IRRADIATIONS IN THE UNITED STATES BREEDER REACTOR PROGRAM. Rowcliffe, A.F.; Lee, E.H.; Sklad, P.S. (Oak Ridge National Lab., TN (USA)). 1979. Contract W-7405-ENG-26. 24p. Dep. NTIS, PC A02/MF A01.

From US/USSR breeder reactor core materials information exchange meeting; Richland, WA, USA (Jul 1979).

Charged particle irradiations used as a means of studying radiation damage in materials of interest in the US Breeder Reactor Program are reviewed.

- 786 (CONF-790802--48) THERMAL AND THERMAL STRESS ANALYSIS OF A POOL TYPE LMFBR DECK STRUCTURE. Stephenson, M.; Ahmed, H.; Ma, D. (Argonne National Lab., IL (USA)). 1979. Contract W-31-109-ENG-38. 17p. Dep. NTIS, PC A02/MF A01.

From International conference on structural mechanics in reactor technology; Berlin, F.R.

Germany (13 Aug 1979).

The thermal capabilities of the ANSYS code were used to construct a thermal model of a pool type LMFBR system. This model included the primary tank of hot sodium covered by the concrete deck. Included in the geometry were the pump, heat exchanger, and control rod penetrations, and the metallic insulation underneath the concrete. The model included radiation and conduction of heat from the hot sodium to the concrete deck, and the cooling of the concrete via water pipes embedded in it. Thermal stresses are calculated within the code for the various plate and shell steel elements used in the code to represent different parts of the structure. This study provides a basis for studying the effect of insulation and coolant in the design of the deck structure.

- 787 (CONF-790802--49) COMPARISON OF TRANSIENT PCRV MODEL TEST RESULTS WITH ANALYSIS. Marchertas, A.H.; Belytschko, T.B. (Argonne National Lab., IL (USA)). 1979. Contract W-31-109-ENG-38. 19p. Dep. NTIS, PC A02/MF A01.

From International conference on structural mechanics in reactor technology; Berlin, F.R. Germany (13 Aug 1979).

Comparisons are made of transient data derived from simple models of a reactor containment vessel with analytical solutions. This effort is a part of the ongoing process of development and testing of the DYNAPCON computer code. The test results used in these comparisons were obtained from scaled models of the British sodium cooled fast breeder program. The test structure is a scaled model of a cylindrically shaped reactor containment vessel made of concrete. This concrete vessel is prestressed axially by holddown bolts spanning the top and bottom slabs along the cylindrical walls, and is also prestressed circumferentially by a number of cables wrapped around the vessel. For test purposes this containment vessel is partially filled with water, which comes in direct contact with the vessel walls. The explosive charge is immersed in the pool of water and is centrally suspended from the top of the vessel. The load history was obtained from an ICECO analysis, using the equations of state for the source and the water. A detailed check of this solution was made to assure that the derived loading did provide the correct input. The DYNAPCON code was then used for the analysis of the prestressed concrete containment model. This analysis required the simulation of prestressing and the response of the model to the applied transient load. The calculations correctly predict the magnitudes of displacements of the PCRV model. In addition, the displacement time histories obtained from the calculations reproduce the general features of the experimental records: the period elongation and amplitude increase as compared to an elastic solution, and also the absence of permanent displacement. However, the period still underestimates the experiment, while the amplitude is generally somewhat large.

- 788 (CONF-790802--50) DYNAMIC RESPONSE OF CRACKED HEXAGONAL SUBASSEMBLY DUCTS. Glazik, J.L.; Petroski, H.J. (Argonne National Lab., IL (USA)). 1979. Contract W-31-109-ENG-38. 17p. Dep. NTIS, PC A02/MF A01.

From International conference on structural mechanics in reactor technology; Berlin, F.R. Germany (13 Aug 1979).

The hexagonal subassembly ducts (hexcans) of current Liquid Metal Fast Breeder Reactor (LMFBR) designs are typically made of 20% coldworked Type 316 stainless steel. Prolonged

exposure of this initially tough and ductile material to a fast neutron flux at high temperatures can result in severe embrittlement. Under these conditions, the unstable crack propagation of flaws, which may have been introduced during fabrication or transportation of the hexcans, is a problem of interest in LMFBR safety analysis. The abnormal overpressurization resulting from certain interactions within a subassembly, or the rupture of one or more fuel pins, may be sufficient to overload an otherwise subcritical crack in an embrittled hexcan. This paper examines the dynamic elastic response of flawed and unflawed fast reactor subassembly ducts. A plane-strain finite element analysis was performed for ducts containing internal corner cracks, as well as external midflat cracks. Two worst case loading situations were considered: rapid uniform internal pressurization and suddenly applied point loads at opposite midflats. The finite-element code CHILES, which can accommodate the stress singularities that occur at crack tips, was given dynamic capabilities through the inclusion of a consistent mass matrix and step-by-step time integration scheme. The SAP IV code was also employed for eigenvalue analysis and modal response. Although this code does not contain singular elements in its element library, dynamic stress intensity factors were calculated by a technique requiring only ordinary isoparametric quadrilaterals.

- 789 (CONF-790802--51) FRACTURE EXPERIMENTS WITH CRACKED AND EMBRITTLED HEXCAN SECTIONS. Petroski, H.J.; Yamada, H. (Argonne National Lab., IL (USA)). 1979. Contract W-31-109-ENG-38. 15p. Dep. NTIS, PC A02/MF A01.

From International conference on structural mechanics in reactor technology; Berlin, F.R. Germany (13 Aug 1979).

Crack-like flaws that might exist in hexagonal subassembly ducts are not generally expected to initiate brittle fracture, but there is reason to be concerned about the integrity of cracked hexcans that have been severely embrittled by fast-neutron irradiation. In order to check the applicability of linear elastic fracture mechanisms analysis to such ducts, a program of experiments with deliberately cracked and embrittled hexcan sections has been undertaken. Type 446 stainless steel was used for the test sections because this material may be heat treated to alter its room-temperature mechanical properties to such an extent that they simulate those of irradiated 20% cold-worked Type 316 stainless steel at reactor operating temperature. Although these different materials are not metallurgically comparable in their fracture properties, the structural response of hexcan sections fabricated from Type 446 may be assumed similar to that of irradiated Type 316 stainless steel hexcans. A series of experiments involving several different crack depths at either the corners or midflats of hexcan sections has been begun. After heat treatment and fatigue-sharpening of the cracks, the duct sections were loaded at two opposite midflats, and the load vs crack opening displacement was recorded for each test. Earlier analytical work provides stress intensity factor calibrations for the test conditions, and these calibrations enable one to predict analytically the load at which brittle fracture could occur. In this paper, a comparison of these analytical predictions and experimental results will be made and discussed.

- 790 (CONF-790802--52) THREE-DIMENSIONAL

FINITE-ELEMENT COMPUTATIONS OF THE TRANSIENT RESPONSE OF COMPONENTS TYPICAL OF A REACTOR STRUCTURE. Ash, J.E.; Kulak, R.F.; Marchertas, A.H. (Argonne National Lab., IL (USA)). 1979. Contract W-31-109-ENG-38. 17p. Dep. NTIS, PC A02/MF A01.

From International conference on structural mechanics in reactor technology; Berlin, F.R. Germany (13 Aug 1979).

A structural analysis, finite-element code SADCAT has been developed to compute the elastoplastic response of thin-walled structural members undergoing rapid, large displacements in three-dimensional space. A convected-coordinate technique permits a simplified description of large displacements and rotations. The computational procedure consists of a lumped-mass, explicit numerical scheme suited to the nonlinear path-dependent material behavior. Code predictions have been compared with analytical calculations and published experimental data, and the correlations validate the capability of the code to provide reliable predictions for three-dimensional shell-type structure.

791 (CONF-790802--55) EVALUATION OF LAGRANGIAN, EULERIAN, AND ARBITRARY LAGRANGIAN-EULERIAN METHODS FOR FLUID-STRUCTURE INTERACTION PROBLEMS IN HCDA ANALYSIS. Chang, Y.W.; Chu, H.Y.; Gvildys, J.; Wang, C.Y. (Argonne National Lab., IL (USA)). 1979. Contract W-31-109-ENG-38. 17p. Dep. NTIS, PC A02/MF A01.

From International conference on structural mechanics in reactor technology; Berlin, F.R. Germany (13 Aug 1979).

The analysis of fluid-structure interaction involves the calculation of both fluid transient and structure dynamics. In the structural analysis, Lagrangian meshes have been used exclusively, whereas for the fluid transient, Lagrangian, Eulerian, and arbitrary Lagrangian-Eulerian (quasi-Eulerian) meshes have been used. This paper performs an evaluation on these three types of meshes. The emphasis is placed on the applicability of the method in analyzing fluid-structure interaction problems in HCDA analysis.

792 (CONF-790802--56) COMPARISONS OF REXCO CODE PREDICTIONS WITH SRI SM-2 EXPERIMENTAL RESULTS. Chang, Y.W.; Gvildys, J. (Argonne National Lab., IL (USA)). 1979. Contract W-31-109-ENG-38. 19p. Dep. NTIS, PC A02/MF A01.

From International conference on structural mechanics in reactor technology; Berlin, F.R. Germany (13 Aug 1979).

SRI International has performed a series of simple model (SM) experiments for the Clinch River Breeder Reactor Project (CRBR). The SM tests consisted of five experiments. The energy source used to simulate the core-disassembly accident loads was a PETN-microsphere mixture, which was well calibrated. These experiments were well instrumented and performed under carefully controlled conditions. The experimental data can be used as reliable test data for validation of computer codes, as well as the modeling technique used in the computer analysis. This paper deals with the REXCO-HEP code predictions of the SRI SM-2 test, which was a dynamic test performed on 1/20th scale model of the CRBR. Two calculations have been performed: one used the pressure history $P(t)$ of the core detonation products as input, and the other the pressure-volume relation ($P=V$) of the detonation products as input. The pressure loadings and wall deformations obtained with the $P(t)$ calculations are in better agreement with the experimental measurements than those

obtained with the $P=V$ calculations. This is because the $P=V$ relations used in the code calculation were derived from the pressure gauge readings of the core gas, the measured surface motions of the slug and the calculated compressibility of the coolant; they may become less accurate at low pressures. Therefore, in performing code validation calculations, the pressure history of the core gas should be used in the analysis to describe the behavior of the core gas, if the $P(t)$ values are available from the experimental data.

793 (CONF-790802--59) EFFECTS OF GAP SIZES ON STRESSES AND DEFLECTIONS OF A FUEL ELEMENT. Wu, T.S. (Argonne National Lab., IL (USA)). 1979. Contract W-31-109-ENG-38. 14p. Dep. NTIS, PC A02/MF A01.

From International conference on structural mechanics in reactor technology; Berlin, F.R. Germany (13 Aug 1979).

Based on the simple beam theory and the principle of superposition, the elastic lateral deflection and flexural stress of wire-wrapped fuel elements were studied. In wire-wrapped fuel elements, the space wire provides potential contact points for neighboring fuel elements. The actual points of contact, however, depend on the deflection of the fuel element. The model used in this investigation consists of a cantilever beam with intermediate stops located at a distance g from the axis of the beam, where g is the gap size. Three values of $g = 0, 0.051 \text{ mm}$ (2 mil), and 0.127 mm (5 mil) were used in this investigation. Results from two wire-wrapped fuel elements under their respective transverse thermal gradients show that both the number of contact points and the magnitude of the maximum reaction force are reduced as the value of g increases. In all cases considered, the maximum reaction force is acting at the stop farthest from the fixed end, and the maximum deflection occurs in the vicinity where thermal gradient had its peak value. Another expected result is that the maximum lateral deflection increases with the gap size. The largest deflection for all cases studied, however, is still much smaller than the radius of a typical space wire. This suggests that, under the conditions such as the ones considered here, direct contact between a fuel element and its adjacent member is very unlikely. The maximum flexural stresses with and without gap differ only slightly, and the relation between the stress and the gap size is not monotonic. Since a larger gap will only reduce stress slightly, but will cause larger deflection and therefore more positive thermal-hydraulic feedback, a smaller gap that is able to keep the maximum stress within the design limit should be favorably considered.

794 (CONF-790802--61) COUPLED HYDRODYNAMIC-STRUCTURAL ANALYSIS OF AN INTEGRAL FLOWING SODIUM TEST LOOP IN THE TREAT REACTOR. Zeuch, W.R.; A-Moneim, M.T. (Argonne National Lab., IL (USA)). 1979. Contract W-31-109-ENG-38. 16p. Dep. NTIS, PC A02/MF A01.

From International conference on structural mechanics in reactor technology; Berlin, F.R. Germany (13 Aug 1979).

A hydrodynamic-structural response analysis of the Mark-IIICB loop was performed for the TREAT (Transient Reactor Test Facility) test AX-1. Test AX-1 is intended to provide information concerning the potential for a vapor explosion in an advanced-fueled LMFBR. The test will be conducted in TREAT with unirradiated uranium-carbide fuel pins in the Mark-IIICB integral flowing sodium loop. Our analysis addressed the ability of the experimental hardware to maintain its containment integrity during the

reference accident postulated for the test. Based on a thermal-hydraulics analysis and assumptions for fuel-coolant interaction in the test section, a pressure pulse of 144 MPa maximum pressure and pulse width of 1.32 ms has been calculated as the reference accident. The response of the test loop to the pressure transient was obtained with the ICEPEL and STRAW codes. Modelling of the test section was completed with STRAW and the remainder of the loop was modelled by ICEPEL.

- 795 (CONF-790802--62) THERMOHYDRAULIC AND THERMAL STRESS ASPECTS OF A POROUS BLOCKAGE IN AN LMFBR FUEL ASSEMBLY. Kuzay, T.M.; Marr, W.W.; Helenberg, H.W.; Ariman, T.; Wilson, R.E.; Pedersen, D.R. (Argonne National Lab., IL (USA)). 1979. Contract W-31-109-ENG-38. 15p. Dep. NTIS, PC A02/MF A01.

From International conference on structural mechanics in reactor technology; Berlin, F.R. Germany (13 Aug 1979).

The current safety scenarios of Liquid Metal Fast Breeder Reactors (LMFBR) under local fault propagation include the study of a hypothetical accident initiated by the formation of an external debris porous blockage in a fuel subassembly. In this preliminary experimental and analytical investigation, a non-heat-generating porous blockage was postulated to cover 18 flow channels of a 37 pin Fast Test Reactor (FTR) type fuel subassembly. The axial extent of the blockage is 50 mm. The blockage material is stainless steel (SS 316) with 30 percent average porosity (percent void volume). The blockage and the pins were modeled with a finite element technique and the thermal field in the blockage was predicted. This thermal field was utilized to do a planar thermal stress analysis of the postulated blockage. To verify the analytical model and also to better understand the thermal-hydraulics of such a porous blockage out-of-pile tests were conducted in a sodium loop. Data from the out-of-pile tests was utilized to calibrate and improve the analytical model.

- 796 (CONF-790802--63) STUDY OF STRUCTURAL ATTACHMENTS OF A POOL TYPE LMFBR VESSEL THROUGH SEISMIC ANALYSIS OF A SIMPLIFIED THREE DIMENSIONAL FINITE ELEMENT MODEL. Ahmed, H.; Ma, D. (Argonne National Lab., IL (USA)). 1979. Contract W-31-109-ENG-38. 15p. Dep. NTIS, PC A02/MF A01.

From International conference on structural mechanics in reactor technology; Berlin, F.R. Germany (13 Aug 1979).

A simplified three dimensional finite element model of a pool type LMFBR in conjunction with the computer program ANSYS is developed and scoping results of seismic analysis are produced. Through this study various structural attachments of a pool type LMFBR like the reactor vessel skirt support, the pump support and reactor shell-support structure interfaces are studied. This study also provides some useful results on equivalent viscous damping approach and some improvements to the treatment of equivalent viscous damping are recommended. This study also sets forth pertinent guidelines for detailed three dimensional finite element seismic analysis of pool type LMFBR.

- 797 (CONF-790802--65) THREE-DIMENSIONAL FINITE ELEMENT FORMULATION FOR FLUID-STRUCTURE INTERACTION. Kulak, R.F. (Argonne National Lab., IL (USA)). 1979. Contract W-31-109-ENG-38. 14p. Dep. NTIS, PC A02/MF A01.

From International conference on structural mechanics in reactor technology; Berlin, F.R.

Germany (13 Aug 1979).

The safety evaluation of fast reactors often involves the modeling of various types of structural components which interact with surrounding fluid in three-dimensional space. In this paper, several key areas for performing three-dimensional fluid-structure interaction calculations are discussed. A new development is presented for a three-dimensional hexahedral hydrodynamic finite-element based upon a Quasi-Eulerian approach. By using trilinear shape functions and assuming a constant pressure field within the element, simple relations are obtained for internal nodal forces. The forms developed are easily coded and computationally efficient. Because the formulation is based upon a rate approach it is applicable to problems involving large displacements. Only adiabatic processes are considered. The difficult tasks (1) of input data preparation and checking and (2) the displaying of computed results are discussed. The use of automatic mesh generators, input data error analysis, and graphical display of the finite element meshes used to model reactor components are shown to ease the input task. In the final section, the formulation is applied to the three-dimensional fluid-structure interactions involved in a current reactor safety problem.

- 798 (CONF-790802--67) THREE-DIMENSIONAL FLUID-STRUCTURE INTERACTION DYNAMICS OF A POOL-REACTOR IN-TANK COMPONENT. Kulak, R.F. (Argonne National Lab., IL (USA)). 1979. Contract W-31-109-ENG-38. 16p. Dep. NTIS, PC A02/MF A01.

From International conference on structural mechanics in reactor technology; Berlin, F.R. Germany (13 Aug 1979).

The safety evaluation of reactor-components often involves the analysis of various types of fluid/structural components interacting in three-dimensional space. For example, in the design of a pool-type reactor several vital in-tank components such as the primary pumps and the intermediate heat exchangers are contained within the primary tank. Typically, these components are suspended from the deck structure and largely submersed in the sodium pool. Because of this positioning these components are vulnerable to structural damage due to pressure wave propagation in the tank during a CDA. In order to assess the structural integrity of these components it is necessary to perform a dynamic analysis in three-dimensional space which accounts for the fluid-structure coupling. A model is developed which has many of the salient features of this fluid-structural component system.

- 799 (CONF-790802--68) STRUCTURAL FORMULATION FOR UPPER INTERNALS OF LMFBR. Kennedy, J.M.; Belytschko, T. (Argonne National Lab., IL (USA)). 1979. Contract W-31-109-ENG-38. 16p. Dep. NTIS, PC A02/MF A01.

From International conference on structural mechanics in reactor technology; Berlin, F.R. Germany (13 Aug 1979).

The upper internal structures which are located above the core and below the head cover may play a significant role in the hydrodynamics of an energy excursion such as a hypothetical core disruptive accident (HCDA) by mitigating the slug impact on the head. For purposes of studying these effects, a structural model was developed for the upper internals and the support columns which connect them to the head of the reactor vessel. This structural model can be used either by itself or in an interactive mode with one of the hydrodynamics codes developed at Argonne, such

as ICECO or REXCO.

- 800 (CONF-790802--69) CUMULATIVE DAMAGE FRACTION DESIGN APPROACH FOR LMFBR METALLIC FUEL ELEMENTS. Johnson, D.L.; Einziger, R.E.; Huchman, G.D. (Argonne National Lab., IL (USA)). 1979. Contract W-31-109-ENG-38. 14p. Dep. NTIS, PC A02/MF A01.

From International conference on structural mechanics in reactor technology; Berlin, F.R. Germany (13 Aug 1979).

The cumulative damage fraction (CDF) analytical technique is currently being used to analyze the performance of metallic fuel elements for proliferation-resistant LMFBRs. In this technique, the fraction of the total time to rupture of the cladding is calculated as a function of the thermal, stress, and neutronic history. Cladding breach or rupture is implied by $CDF = 1$. Cladding wastage, caused by interactions with both the fuel and sodium coolant, is assumed to be uniformly thin the cladding wall. The irradiation experience of the EBR-II Mark-II driver fuel with solution-annealed Type 316 stainless steel cladding provides an excellent data base for testing the applicability of the CDF technique to metallic fuel. The advanced metal fuels being considered for use in LMFBRs are U-15-Pu-10Zr, Th-20Pu and Th-20U (compositions are given in weight percent). The two cladding alloys being considered are Type 316 stainless steel and a titanium-stabilized Type 316 stainless steel. Both are in the cold-worked condition. The CDF technique was applied to these fuels and claddings under the assumed steady-state operating conditions.

- 801 (CONF-790802--70) FLUID-STRUCTURE INTERACTION ANALYSIS OF A DECK STRUCTURE DURING A HCDA. Kulak, R.F. (Argonne National Lab., IL (USA)). 1979. Contract W-31-109-ENG-38. 19p. Dep. NTIS, PC A02/MF A01.

From International conference on structural mechanics in reactor technology; Berlin, F.R. Germany (13 Aug 1979).

Presented is an assessment of the structural integrity of the deck structure of a pool-type LMFBR during a Hypothetical Core Disruptive Accident (HCDA). During this accident the sodium above the core is propelled upward until it impacts against the deck structure. This hydrodynamic loading could produce (1) significant structural damage and (2) sodium leak paths. A finite-element model is used to study the deck dynamics during slug impact. By using the symmetry of the system, a sector model which accounts for the salient features of the system is developed. The main radial I-beam, component support I-beam and bottom annular plate are modeled using triangular plate elements. The concrete fill is modeled using hexahedral continuum elements. Using the above finite-element model the dynamics of the deck during a HCDA are investigated.

- 802 (CONF-790802--73) TRANSIENT ANALYSIS OF LMFBR REINFORCED/PRESTRESSED CONCRETE CONTAINMENT. Marchertas, A.H.; Belytschko, T.B.; Bazant, Z.P. (Argonne National Lab., IL (USA)). 1979. Contract W-31-109-ENG-38. 16p. Dep. NTIS, PC A02.

From International conference on structural mechanics in reactor technology; Berlin, F.R. Germany (13 Aug 1979).

The use of prestressed concrete reactor vessels (PCRVs) for LMFBR containment creates a need for analytical methods for treating the transient response of such structures, for LMFBR containment must be capable of sustaining the dynamic effects which arise in a

hypothetical core disruptive accident (HCDA). These analyses require several unique features: a model of concrete which includes tensile cracking, a methodology for representing the prestressing tendons and for simulating the prestressing operation, and an efficient computational tool for treating the transient response. For the purpose of treating the transient response, a finite element program with explicit time integration was chosen. For the purpose of illustrating the applicability of these techniques and the validity of the models for concrete and the prestressing tendons, several example solutions are presented and compared with experimental results.

- 803 (CONF-790808--1) TESTING OF THE CRBRP DIRECT HEAT REMOVAL SERVICE IN A 1/21 SCALE MODEL. Novendstern, E.H.; Marinkovich, P.S. (Westinghouse Electric Corp., Madison, PA (USA). Advanced Reactors Div.). Aug 1979. Contract EY-76-C-15-2395. 17p. Dep. NTIS, PC A02/MF A01.

From 18. ASME national heat transfer conference; San Diego, CA, USA (Aug 1979).

The Direct Heat Removal Service (DHRS) of the Clinch River Breeder Reactor Plant provides an alternative means of cooling of the core in the extremely unlikely event that both the normal and auxiliary heat paths are not available. The hot sodium is taken from the outlet plenum, cooled and returned into the outlet plenum at a different location; this sodium is mixed in the outlet plenum and pumped through the primary loops into the reactor core to remove the decay heat. The hydraulic performance of the outlet plenum was evaluated with a test using a 1/21 scale outlet plenum feature model. The model hydraulically simulated the Upper Internals Structure and the sodium within the reactor vessel. The hydraulic characteristics were studied to determine the amount of mixing which occurs in the outlet plenum.

- 804 (CONF-790808--13) COMPARISON OF NUMERICAL RESULTS WITH EXPERIMENTAL DATA FOR SINGLE-PHASE NATURAL CONVECTION IN AN EXPERIMENTAL SODIUM LOOP. Ribando, R.J. (Oak Ridge National Lab., TN (USA)). 1979. Contract W-7405-ENG-26. 53p. Dep. NTIS, PC A04/MF A01.

From 18. ASME national heat transfer conference; San Diego, CA, USA (Aug 1979).

A comparison is made between computed results and experimental data for single-phase natural convection in an experimental sodium loop. The tests were conducted in the Thermal-Hydraulic Out-of-Reactor Safety (THORS) Facility, an engineering-scale high temperature sodium facility at the Oak Ridge National Laboratory used for thermal-hydraulic testing of simulated LMFBR subassemblies at normal and off-normal operating conditions. Heat generation in the 19 pin assembly during these tests was typical of decay heat levels. Tests were conducted both with zero initial forced flow and with a small initial forced flow. The bypass line was closed in most tests, but open in one. The computer code used to analyze these tests [LONAC (Low flow and Natural Convection)] is an ORNL-developed, fast running, one-dimensional, single-phase finite difference model for simulating forced and free convection transients in the THORS loop.

- 805 (CONF-790808--18) EXPERIMENTAL STUDY OF THE TRANSITION FROM FORCED TO NATURAL CIRCULATION IN EBR-II AT LOW POWER AND FLOW. Gillette, J.L.; Singer, R.M.; Tokar, J.V.;

- Sullivan, J.E. (Argonne National Lab., IL (USA)). 1979. Contract W-31-109-ENG-38. 9p. Dep. NTIS, PC A02/MF A01.
- From 18. ASME national heat transfer conference; San Diego, CA, USA (Aug 1979).
- A series of tests have been conducted in EBR-II which studied the dynamics of the transition from forced to natural circulation flow in a liquid-metal-cooled fast breeder reactor (LMFBR). Each test was initiated by abruptly tripping an electromagnetic pump which supplies 5 to 6% of the normal full operational primary flow rate. The ensuing flow coast-down reached a minimum value after which the flow increased as natural circulation was established. The effects of secondary system flow through the intermediate heat exchanger and reactor decay power level on the minimum in-core flow rates and maximum in-core temperatures were examined.
- 806 (CONF-790808--19) TEMPERATURES OF EBR-II SUBASSEMBLIES IN AIR OR ARGON WITHOUT FORCED COOLING. Koenig, J.F.; Buchanan, T.N. (Argonne National Lab., IL (USA)). 1979. Contract W-31-109-ENG-38. 12p. Dep. NTIS, PC A02/MF A01.
- From 18. ASME national heat transfer conference; San Diego, CA, USA (Aug 1979).
- Test were conducted to determine the maximum temperatures in a electrically heated tube bundle not subject to forced cooling. While natural convection cooling through the bundle was allowed, it was found that the majority of the heat was removed by radial conduction and radiation to the surrounding hex container. Overall heat transfer coefficients are reported for the combined heat removal.
- 807 (CONF-790816--2) OPTIMIZATION AND COMMON CAUSE ANALYSIS OF A PROTOTYPE LARGE BREEDER REACTOR SAFETY SYSTEM. Rasmuson, D.M.; Wilson, J.R.; Burdick, G.R. (Idaho National Engineering Lab., Idaho Falls (USA)). 1979. Contract EY-76-C-07-1570. 5p. Dep. NTIS, PC A02/MF A01.
- From International meeting on fast reactor safety technology; Seattle, WA, USA (19 Aug 1979).
- The prototype large breeder reactor (PLBR) is a 1000 MWe sodium cooled fast breeder reactor designed to succeed the Clinch Breeder Reactor and verify scaling laws. Several conceptual PLBR designs have been presented for consideration. A procedure is needed for the conceptualization of, evaluation of, and selection between such designs. This paper presents a method that can be effectively used to: (1) allocate optimal component redundancy, (2) evaluate design trade-offs, and (3) help in design finalization. The procedure is applied to three diverse design options for a shutdown heat removal system (SHRS). The selected configuration is analyzed for potential common cause failures.
- 808 (CONF-790816--12) DUAL CHANGE-OF-PHASE IN FORCED FLOW ON A FINITE WALL, WITH APPLICATION TO SLSF SAFETY ANALYSIS. El-Genk, M.S.; Moore, R.L. (Idaho National Engineering Lab., Idaho Falls (USA)). 1979. Contract EY-76-C-07-1570. 11p. Dep. NTIS, PC A02/MF A01.
- From International meeting on fast reactor safety technology; Seattle, WA, USA (19 Aug 1979).
- An important study related to the safety analysis of Liquid Metal Fast Breeder Reactors (LMFBRs) is to understand the phenomena of molten fuel relocation and refreezing on the core cold structures following a hypothesized loss-of-flow accident (LOFA). An assessment of molten fuel containment capability for the Sodium Loop Safety Facility (SLSF) in-pile experiments following a postulated LOFA is presented, considering the conditions of molten fuel flow, simultaneous melting in the outer duct wall, and convective cooling at the outer surface of the wall due to sodium coolant bypass flow.
- 809 (CONF-790816--18) BEHAVIOR OF SODIUM--OXIDE AND URANIUM--OXIDE AEROSOLS IN A LARGE VESSEL. Adams, R.E.; Kress, T.S.; Han, J.T.; Parsly, L.F. Jr. (Oak Ridge National Lab., TN (USA)). 1979. Contract W-7405-ENG-26. 6p. Dep. NTIS, PC A02/MF A01.
- From International meeting on fast reactor safety technology; Seattle, WA, USA (19 Aug 1979).
- Results are reported for experiments on the behavior of sodium--oxide aerosols, uranium--oxide aerosols, and various mixtures of these in the Nuclear Safety Pilot Plant (NSPP) vessel at Oak Ridge. The NSPP Program, sponsored by the Nuclear Regulatory Commission, is to provide experimental qualification of the HAARM-3 aerosol behavioral code being independently developed at Battelle-Columbus Laboratories. The results from ten single-component and two mixed component aerosol experiments are presented along with selected comparisons with the code predictions.
- 810 (CONF-790816--19) ANALYSIS OF SODIUM VALVE RELIABILITY DATA AT CREDO. Bott, T.F.; Haas, P.M. (Oak Ridge National Lab., TN (USA)). 1979. Contract W-7405-ENG-26. 13p. Dep. NTIS, PC A02/MF A01.
- From International meeting on fast reactor safety technology; Seattle, WA, USA (19 Aug 1979).
- The Centralized Reliability Data Organization (CREDO) has been established at Oak Ridge National Laboratory (ORNL) by the Department of Energy to provide a centralized source of data for reliability/maintainability analysis of advanced reactor systems. The current schedule calls for development of the data system at a moderate pace, with the first major distribution of data in late FY-1980. Continuous long-term collection of engineering, operating, and event data has been initiated at EBR-II and FFTF.
- 811 (CONF-790816--20) NATURAL CONVECTION BOILING OF SODIUM IN A SIMULATED FBR FUEL ASSEMBLY SUBCHANNEL. Garrison, P.W.; Morris, R.H.; Montgomery, B.H. (Oak Ridge National Lab., TN (USA)). 1979. Contract W-7405-ENG-26. 12p. Dep. NTIS, PC A02/MF A01.
- From International meeting on fast reactor safety technology; Seattle, WA, USA (19 Aug 1979).
- A series of single channel sodium boiling experiments were conducted in the Sodium Boiling Test (SBT) Facility at the Oak Ridge National Laboratory. The objective of these tests was to determine the maximum power that can be transferred to the coolant in a fuel assembly subchannel when the flow is driven by natural convection. Stable boiling was achieved for test times approaching one hour in duration for powers below the critical level. The power corresponding to dryout in these tests compares well with predictions from an earlier water simulation of fuel assembly voiding behavior.
- 812 (CONF-790816--21) EFFECTS OF SCATTERING ON RADIATIVE COOLING OF A LARGE HCDA-PRODUCED VAPOR BUBBLE. Oezisik, M.N.; White, J.S.; Kress, T.S. (Oak Ridge National Lab., TN

(USA)). 1979. Contract W-7405-ENG-26. 9p. Dep. NTIS, PC A02/MF A01.

From International meeting on fast reactor safety technology; Seattle, WA, USA (19 Aug 1979).

Previous investigations have shown that radiation is potentially a significant mode of energy transfer for the cooling of a large HCDA-produced vapor bubble. The radiative cooling capability could be significantly reduced by the presence of small particles or droplets due to local condensation or fog formation. The purpose of this work is to demonstrate the separate effect of scattering on the radiative heat flux in order to determine the relative importance to conductive and convective heat transfer.

- 813 (CONF-790816--22) EVALUATION OF COBRA III-C AND SABRE-I (WIRE WRAP VERSION) COMPUTATIONAL RESULTS BY COMPARISON WITH STEADY-STATE DATA FROM A 19-PIN INTERNALLY GUARD HEATED SODIUM COOLED BUNDLE WITH A SIX-CHANNEL CENTRAL BLOCKAGE (THORS BUNDLE 3C). Dearing, J.F.; Rose, S.D.; Nelson, W.R. (Oak Ridge National Lab., TN (USA)). 1979. Contract W-7405-ENG-26. 17p. Dep. NTIS, PC A02/MF A01.

From International meeting on fast reactor safety technology; Seattle, WA, USA (19 Aug 1979).

The predicted computational results of two well-known sub-channel analysis codes, COBRA-III-C and SABRE-I (wire wrap version), have been evaluated by comparison with steady state temperature data from the THORS Facility at ORNL. Both codes give good predictions of transverse and axial temperatures when compared with wire wrap thermocouple data. The crossflow velocity profiles predicted by these codes are similar which is encouraging since the wire wrap models are based on different assumptions.

- 814 (CONF-790816--24) THORS: A HIGH-TEMPERATURE SODIUM TEST FACILITY RATED AT 2.0 MW. Gnadt, P.A.; Anderson, A.H.; Clapp, N.E.; Montgomery, B.H.; Collins, C.W.; Stulting, R.D. (Oak Ridge National Lab., TN (USA); Union Carbide Corp., Oak Ridge, TN (USA). Nuclear Div.). 1979. Contract W-7405-ENG-26. 12p. Dep. NTIS, PC A02/MF A01.

From International meeting on fast reactor safety technology; Seattle, WA, USA (19 Aug 1979).

The Thermal-Hydraulic Out-of-Reactor Safety (THORS) facility at Oak Ridge National Laboratory (ORNL) is a high-temperature sodium test facility operated for the United States Breeder Reactor Safety Program. The facility is primarily used for testing large simulated Liquid-Metal Fast Breeder Reactor (LMFBR) fuel subassemblies. The facility has recently been upgraded to provide a 2.0-MW test bundle power input and heat removal capability. A new test section, which will be capable of operating at 980°C and which will accommodate a 217-pin bundle, has also been added. A 61-pin bundle is currently under test in the facility. A description of the test facility is presented, along with a brief summary of the 8-year operating history of this safety-related test facility.

- 815 (CONF-790816--28) DESIGN OPTIMIZATION OF A PROTOTYPE LARGE BREEDER REACTOR SAFETY SYSTEM. Rasmuson, D.M.; Wilson, J.R.; Burdick, G.R. (Idaho National Engineering Lab., Idaho Falls (USA)). 1979. Contract EY-76-C-07-1579. 12p. Dep. NTIS, PC A02/MF A01.

From International meeting on fast reactor safety technology; Seattle, WA, USA (19 Aug

1979).

A procedure is presented that can be used in the conceptualization of, evaluation of, and selection among several conceptual liquid metal fast breeder reactor (LMFBR) designs. The method can be effectively used to: (a) allocate optimal component redundancy, (b) evaluate design trade-offs, and (c) help in design finalization. The procedure is applied to three diverse design options for a shutdown heat removal system. The selected configuration is analyzed for potential common cause failures.

- 816 (CONF-790816--29) APPLICATION OF GENERALIZED PERTURBATION THEORY TO FAST REACTOR SAFETY SENSITIVITY STUDIES. Parks, C.V.; Tomlinson, E.T.; Oblo, E.M. (Oak Ridge National Lab., TN (USA)). 1979. Contract W-7405-ENG-26. 11p. Dep. NTIS, PC A02/MF A01.

From International meeting on fast reactor safety technology; Seattle, WA, USA (19 Aug 1979).

A new sensitivity analysis method based on generalized perturbation theory is applied to a typical fast reactor safety code. The adjoint equations are provided for the coupled, nonlinear, conduction-convection equations as they are implemented in MELT-IIIA. An expression for the sensitivity of any temperature to problem input data is presented. In this initial application of the new methodology, two simple transient problems for the Fast Flux Test Facility are considered. Sensitivity results for various temperature responses to all thermal input data are presented. Conclusions are drawn about the practicality and advantages of developing this new sensitivity methodology. Comparisons of perturbation theory with response surface methodologies are also made throughout the paper.

- 817 (CONF-790816--30) ANALYSIS OF THE HEAT AND MASS TRANSFER PROCESSES OF UO_2 BUBBLE IN SODIUM. Tobias, M.L. (Oak Ridge National Lab., TN (USA)). 1979. Contract W-7405-ENG-26. 6p. Dep. NTIS, PC A02/MF A01.

From International meeting on fast reactor safety technology; Seattle, WA, USA (19 Aug 1979).

The anticipated behavior of uranium oxide vapor bubbles produced by the capacitor discharge vaporization (CDV) method in the Fuel Aerosol Simulant Test (FAST) Facility is discussed on the basis of relatively simple physical models. Results of calculations for the rate of bubble rise and for heat and mass transfer rates are presented. Parametric studies indicate that future analysis efforts should emphasize the diffusion condensation process and the loss of heat from the bubble by radiation. Transfer of heat in the surrounding sodium is rapid enough that simplified models should be adequate. No important effects were noted in connection with bubble depth, initial quantity of UO_2 , or initial superheat.

- 818 (CONF-790816--31) SAS3A ANALYSIS OF NATURAL CONVECTION BOILING BEHAVIOR IN THE SODIUM BOILING TEST FACILITY. Klein, G.A. (Oak Ridge National Lab., TN (USA)). 1979. Contract W-7405-ENG-26. 8p. Dep. NTIS, PC A02/MF A01.

From International meeting on fast reactor safety technology; Seattle, WA, USA (19 Aug 1979).

An analysis of natural convection boiling behavior in the Sodium Boiling Test (SBT) Facility has been performed using the SAS3A computer code. The predictions from this analysis indicate that stable boiling can be

achieved for extensive periods of time for channel powers less than 1.4 kW and indicate intermittent dryout at higher powers up to at least 1.7 kW. The results of this analysis are in reasonable agreement with the SBT Facility test results.

- 819 (CONF-790816--32) SODIUM BOILING INCOHERENCE IN A 19-PIN WIRE-WRAPPED BUNDLE. Wantland, J.L.; Garrison, P.W.; Nelson, W.R.; Dearing, J.F.; Gnadt, P.A.; Ribando, R.J.; Fontana, M.H. (Oak Ridge National Lab., TN (USA)). 1979. Contract W-7405-ENG-26. 9p. Dep. NTIS, PC A02/MF A01.

From International meeting on fast reactor safety technology; Seattle, WA, USA (19 Aug 1979).

During various flow transients in a sodium-cooled reactor, localized boiling can occur. If this boiling does not result in dryout, significant reactor core damage is not likely. A full-length electrically heated 19-pin bundle was used to determine the extent to which dynamic boiling can be sustained before dryout occurs. Over 30 boiling runs were made with runs at three flow-power conditions culminating in dryout. Continuous boiling for time periods exceeding 20 sec was observed. Preliminary data analysis suggested that thermal inertia of the duct walls, which were backed with thermal insulation, was higher than designed and was contributing to boiling incoherence. Posttest examination confirmed that the insulation annulus had become permeated with sodium, resulting in a significantly increased thermal inertia. Detailed comparisons of experimental results with the results of several different analytical techniques indicate that incoherent boiling caused by bundle thermal inertia was responsible for the long time periods between boiling inception and dryout. This suggests that thermal inertia designed into the reactor core could prevent or delay core damage during various flow-power mismatch transients.

- 820 (CONF-790816--37) CRBRP STRUCTURAL AND THERMAL MARGIN BEYOND THE DESIGN BASE. Strawbridge, L.E. (Westinghouse Electric Corp., Madison, PA (USA)). Advanced Reactors Div.). 1979. Contract EY-76-C-15-2395. 13p. Dep. NTIS, PC A02/MF A01.

From International meeting on fast reactor safety technology; Seattle, WA, USA (19 Aug 1979).

Although Hypothetical Core Disruptive Accidents (HCDAs) are not Design Basis Accidents for the Clinch River Breeder Reactor Plant, extensive assessments of HCDA consequences have been made. Prudent margins beyond the design base have been included in the design to further reduce the risk to the public from highly improbable occurrences. These margins include Structural Margin Beyond the Design Base to address the energetics aspects and Thermal Margin Beyond the Design Base to address the longer term thermal and radiological consequences. The assessments that led to the specification of these margins are described, along with the experimental support for those assessments.

- 821 (CONF-790816--39) COMPARISON OF COBRA III-C AND SABRE-1 (WIRE-WRAP VERSION) COMPUTATIONAL RESULTS WITH STEADY-STATE DATA FROM A 19-PIN INTERNALLY GUARD HEATED SODIUM-COOLED BUNDLE WITH A SIX-CHANNEL CENTRAL BLOCKAGE (THORS BUNDLE 3C). Dearing, J.F.; Nelson, W.R.; Rose, S.D. (Oak Ridge National Lab., TN (USA)). 1979. Contract W-7405-ENG-26. 11p. Dep. NTIS, PC A02/MF A01.

From International meeting on fast reactor

safety technology; Seattle, WA, USA (19 Aug 1979).

Computational thermal-hydraulic models of a 19-pin, electrically heated, wire-wrap liquid-metal fast breeder reactor test bundle were developed using two well-known subchannel analysis codes, COBRA III-C and SABRE-1 (wire-wrap version). These two codes use similar subchannel control volumes for the finite difference conservation equations but vary markedly in solution strategy and modeling capability. In particular, the empirical wire-wrap-forced diversion crossflow models are different. Surprisingly, however, crossflow velocity predictions of the two codes are very similar. Both codes show generally good agreement with experimental temperature data from a test in which a large radial temperature gradient was imposed. Differences between data and code results are probably caused by experimental pin bowing, which is presently the limiting factor in validating coded empirical models.

- 822 (CONF-790816--55) OPERATIONAL- SAFETY- TESTING EXPERIENCE AT EBR-II. Sackett, J.I.; Dean, E.M.; Fryer, R.M.; Golden, G.H.; Lambert, J.D.B.; Lehto, W.K.; Singer, R.M. (Argonne National Lab., IL (USA)). 1979. Contract W-31-109-ENG-38. 10p. Dep. NTIS, PC A02/MF A01.

From International meeting on fast reactor safety technology; Seattle, WA, USA (19 Aug 1979).

Operation of EBR-II has required that issues of safety and reliability be continually addressed. This has been necessary not only to support routine operation, but also to support test programs that bear upon safety. Major issues are: (1) operability of fuel elements with breached cladding (local fault prevention); (2) assurance of adequate convective cooling upon loss of pumping power (decay heat removal); and (3) demonstration of benign response of fuel-elements and subassemblies to protected overpower transients (shutdown system margin and reliability). Test programs to address these issues at EBR-II are described. Particular emphasis is given to the potential capability at EBR-II for mild transient testing, consistent with its role in addressing LOA-1 (line of assurance one) safety issues.

- 823 (CONF-790816--57) STUDIES RELATED TO EMERGENCY DECAY HEAT REMOVAL IN EBR-II. Singer, R.M.; Gillette, J.L.; Mohr, D.; Tokar, J.V.; Sullivan, J.E.; Dean, E.M. (Argonne National Lab., IL (USA)). 1979. Contract W-31-109-ENG-38. 10p. Dep. NTIS, PC A02/MF A01.

From International meeting on fast reactor safety technology; Seattle, WA, USA (19 Aug 1979).

Experimental and analytical studies related to emergency decay heat removal by natural circulation in the EBR-II heat transport circuits are described. Three general categories of natural circulation plant transients are discussed and the resultant reactor flow and temperature response to these events are presented. These categories include the following: (1) loss of forced flow from decay power and low initial flow rates; (2) reactor scram with a delayed loss of forced flow; and (3) loss of forced flow with a plant protective system activated scram. In all cases, the transition from forced to natural convective flow was smooth and the peak in-core temperature rises were small to moderate. Comparisons between experimental measurements in EBR-II and analytical predictions of the NATDEMO code are included.

- 824 (CONF-790816--58) EBR-II BREACHED FUEL TEST FACILITY. Lehto, W.K.; Koenig, J.F.; Seim, O.S.; Olp, R.H.; Strain, R.V.; Colburn, R.P. (Argonne National Lab., IL (USA)). 1979. Contract W-31-109-ENG-38. 13p. Dep. NTIS, PC A02/MF A01.

From International meeting on fast reactor safety technology; Seattle, WA, USA (19 Aug 1979).

The Breached Fuel Test Facility (BFTF) is a multipurpose experimental facility, designed to provide the capability to conduct and monitor safety and fuel behavior experiments under more severe conditions than previously allowed in EBR-II. The facility consists of an outer thimble assembly with an internal instrument stalk which extends from the reactor floor through the primary tank cover to the top of the core. Coolant from a breached element test is directed upward to the instrument train above the core. The BFTF has the capability to measure flow, temperature, particle size distribution and deposition, and delayed neutron levels for breach site characterization. This paper describes the design, the instrumentation, the operational safety concerns and the initial experiments.

- 825 (CONF-790816--59) MOLTEN CORE DEBRIS-SODIUM INTERACTIONS: M-SERIES EXPERIMENTS. Sowa, E.S.; Gabor, J.D.; Pavlik, J.R.; Cassulo, J.C.; Cook, C.J.; Baker, L. Jr. (Argonne National Lab., IL (USA)). 1979. Contract W-31-109-ENG-38. 11p. Dep. NTIS, PC A02/MF A01.

From International meeting on fast reactor safety technology; Seattle, WA, USA (19 Aug 1979).

Five new kilogram-scale experiments have been carried out. Four of the experiments simulated the situation where molten core debris flows from a breached reactor vessel into a dry reactor cavity and is followed by a flow of sodium (Ex-vessel case) and one experiment simulated the flow of core debris into an existing pool of sodium (In-vessel case). The core debris was closely simulated by a thermite reaction which produced a molten mixture of UO_2 , ZrO_2 , and stainless steel. There was efficient fragmentation of the debris in all experiments with no explosive interactions observed.

- 826 (CONF-790816--60) SAFETY APPROACH TO THE SELECTION OF DESIGN CRITERIA FOR THE CRBRP REACTOR REFUELING SYSTEM. Meisl, C.J.; Berg, G.E.; Sharkey, N.F. (Rockwell International Corp., Canoga Park, CA (USA). Energy Systems Group). 1979. Contract EY-76-C-03-0824-027. 12p. Dep. NTIS, PC A02/MF A01.

From International meeting on fast reactor safety technology; Seattle, WA, USA (19 Aug 1979).

The selection of safety design criteria for Liquid Metal Fast Breeder Reactor (LMFBR) refueling systems required the extrapolation of regulations and guidelines intended for Light Water Reactor refueling systems and was encumbered by the lack of benefit from a commercially licensed predecessor other than Fermi. The overall approach and underlying logic are described for developing safety design criteria for the reactor refueling system (RRS) of the Clinch River Breeder Reactor Plant (CRBRP). The complete selection process used to establish the criteria is presented, from the definition of safety functions to the finalization of safety design criteria in the appropriate documents. The process steps are illustrated by examples.

- 827 (CONF-790816--61) THERMAL INTERACTIONS OF A MOLTEN CORE DEBRIS POOL WITH SURROUNDING STRUCTURAL MATERIALS. Baker, L. Jr.; Cheung, F.B.; Farhadieh, R.; Stein, R.P.; Gabor, J.D.; Bingle, J.D. (Argonne National Lab., IL (USA)). 1979. Contract W-31-109-ENG-38. 12p. Dep. NTIS, PC A02/MF A01.

From International meeting on fast reactor safety technology; Seattle, WA, USA (19 Aug 1979).

Analytical and experimental results on individual aspects of the overall problem of the interaction of a large mass of LMFBR core debris with concrete or other materials are reviewed. Results of recent heat transfer experiments with molten UO_2 have indicated the importance of internal thermal radiation and methods to take account of this are developed. Effects of gas release and density difference are considered. The GROWS-2 Code is used to illustrate the effects of various assumptions.

- 828 (CONF-790884--2) DEVELOPMENT OF LIFE4-CN: A COMBINED CODE FOR STEADY-STATE AND TRANSIENT ANALYSES OF ADVANCED LMFBR FUELS. Liu, Y.Y.; Zawadzki, S.; Billone, M.C.; Nayak, U.P.; Roth, T. (Argonne National Lab., IL (USA); Northwestern Univ., Evanston, IL (USA); Westinghouse Electric Corp., Madison, PA (USA). Advanced Reactors Div.). 1979. Contract W-31-109-ENG-38. 28p. Dep. NTIS, PC A02/MF A01.

From Post-SMIRT5 second international seminar on mathematical/mechanical modeling of reactor fuel elements; Berlin, F.R. Germany (26 Aug 1979).

The methodology used to develop the LMFBR carbide/nitride fuels code, LIFE4-CN, is described in detail along with some subtleties encountered in code development. Fuel primary and steady-state thermal creep have been used as an example to illustrate the need for physical modeling and the need to recognize the importance of the materials characteristics. A self-consistent strategy for LIFE4-CN verification against irradiation data has been outlined with emphasis on the establishment of the gross uncertainty bands. These gross uncertainty bands can be used as an objective measure to gauge the overall success of the code predictions. Preliminary code predictions for sample steady-state and transient cases are given.

- 829 (CONF-790902--3) IMPACT OF ADVANCED SYSTEMS ON LMFBR ACCIDENT ANALYSIS CODE DEVELOPMENT. Dunn, F.E.; Kyser, J.M. (Argonne National Lab., IL (USA)). 1979. Contract W-31-109-ENG-38. 12p. Dep. NTIS, PC A02/MF A01.

From Impact of advanced systems on scientific computations; Livermore, CA, USA (12 Sep 1979).

In order to investigate the ability of an advanced computer, using currently available software, to handle large LMFBR accident analysis codes, the SAS3D code has been run on the NCAR CRAY-1. SAS3D is a large code (56,000 Fortran cards) using many different physical models and numerical algorithms, no one of which dominates the computing time. Even though SAS3D was developed on IBM computers, remarkably little effort was required to run it on the CRAY-1. Making limited use of the CRAY-1 vector capabilities, it runs a factor of 2.5 to 4 times faster on the NCAR CRAY-1 than on the ANL IBM 370-195. With minor modifications, an additional 20 to 30% speed improvement on the CRAY-1 is achieved. In the current process of completely re-writing SAS3D to make SAS4A, much

of the coding is being vectorized for the CRAY=1 without sacrificing IBM, CDC 7600, or UNIVAC performance and portability. An initial SAS4A test case runs a factor of 7.1 faster on the CRAY-1 than on the IBM 370-195.

- 830 (CONF-790905--1) RE-EVALUATING YOUR NUCLEAR PROGRAM NEEDS: HOW TO BENEFIT FROM YOUR VENDOR'S Q.A. PROGRAM. Cocoros, A.E. (Westinghouse Electric Corp., Madison, PA (USA). Advanced Reactors Div.). 1979. Contract EY-76-C-15-2395. 22p. Dep. NTIS, PC A02/MF A01.

From American Society for Quality Control conference; Las Vegas, NV, USA (24 Sep 1979).

The quality assurance component control and verification program to be presented provides a cost effective approach to monitoring and controlling the implementation of the design, fabrication, inspection and shipping plans of a supplier. It attempts to coordinate and integrate quality control and verification effort of a supplier with the control and verification effort of the purchaser to obtain a composite which accomplishes a total need. Based on the competency and capabilities of the supplier the purchaser can either maximize the effort the supplier performs or he must maximize his effort to obtain an optimum mix. The ultimate goal is to utilize the supplier's quality assurance program to the greatest benefit in assuring maximum quality.

- 831 (CONF-790934--1) ANALYTICAL MODELING OF CORE HYDRAULICS AND FLOW MANAGEMENT IN BREEDER REACTORS. Carelli, M.D.; Willis, J.M. (Westinghouse Electric Corp., Madison, PA (USA). Advanced Reactors Div.). 1979. Contract EY-76-C-15-2395. 7p. Dep. NTIS, PC A02/MF A01.

From 18. congress of International Association for Hydraulic Research; Cagliari, Italy (10 Sep 1979).

An analytical model representing the hydraulic behavior of the primary system of fast breeder nuclear reactors is discussed. A computer code capable of detailing the core flow distribution and characterizing the flow and pressure drop in each reactor component is presented. Application of this method to the reactor core thermal-hydraulic design has allowed optimization of the flow management with consequent upgrading in performance, reduction of unnecessary conservatism and very substantial cost savings. Typical quantitative examples are presented.

- 832 (CONF-791008--5) ULTRASONIC DYNAMIC IMAGING (UDI) SYSTEM TO DETERMINE THE SIZE AND VELOCITY OF LARGE SPHERICAL SIMULATED BUBBLES IN LIQUIDS. Lattimer, J.; Fitting, D.W.; Adler, L. (Oak Ridge National Lab., TN (USA)). 1979. Contract W-7405-ENG-26. 4p. Dep. NTIS, PC A02/MF A01.

From ASNT fall conference; St Louis, MO, USA (15 Oct 1979).

As part of the nuclear safety program it is desirable to fully characterize the dynamics of a vapor bubble formed in liquid sodium. The bubble would be formed during the hypothetical case of partial core vaporization in a liquid-metal reactor. A real-time ultrasonic imaging system was developed which provides simultaneous measurement of the rise velocity and radius of large spherical bubbles. The range of applicability of the UDI system has been determined in model experiments.

- 833 (CONF-791051--16) ANALYSIS OF EBR-II BLANKET DOSIMETRY. Meneghetti, D.; Ebersole,

E.R.; Kucera, D.A.; Rempert, R.H. (Argonne National Lab., IL (USA)). 1979. Contract W-31-109-ENG-38. 11p. Dep. NTIS, PC A02/MF A01.

From 3. ASTM-EURATOM symposium on reactor dosimetry; Ispra, Italy (1 Oct 1979).

Comparisons of reaction-rate calculations with absolute dosimetry measurements in the EBR-II blanket are made for $^{235}\text{U}/\text{sub f/}$, $^{239}\text{Pu}/\text{sub f/}$, and $^{238}\text{U}/\text{sub c/}$ reactions.

- 834 (CONF-791058--26) CROSS SECTION ADJUSTMENT APPLIED TO ESTIMATION OF UNCERTAINTY IN THE BREEDING RATIO OF AN LMFB. Marable, J.H.; Weisbin, C.R.; de Saussure, G. (Oak Ridge National Lab., TN (USA)). 1979. Contract W-7405-ENG-26. 5p. Dep. NTIS, PC A02/MF A01.

From International conference on nuclear cross sections for technology; Knoxville, TN, USA (22 Oct 1979).

Eleven fast-reactor benchmark experiments and two neutron-field benchmark experiments were applied to a least-squares adjustment of a 26-group cross section library based primarily on ENDF/B-IV. The covariance data include correlations between cross sections for different energies, reactions, and materials, and between integral experiments, and covariances of calculational bias factors due to specific modeling and calculational procedures. The results of the adjustment are applied to the determination of the uncertainties in the multiplication factor and in the breeding ratio of a large LMFB design model fixed by the Large Core Code Evaluation Working Group (LCCEWG).

- 835 (CONF-791058--34) VITAMIN E: A MULTIPURPOSE ENDF/B-V COUPLED NEUTRON-GAMMA CROSS SECTION LIBRARY. Barhen, J.; Cacuci, D.G.; Ford, W.E. III; Roussin, R.W.; Wagschal, J.J.; Weisbin, C.R.; White, J.E.; Wright, R.Q. (Oak Ridge National Lab., TN (USA)). 1979. Contract W-7405-ENG-26. 5p. Dep. NTIS, PC A02/MF A01.

From International conference on nuclear cross sections for technology; Knoxville, TN, USA (22 Oct 1979).

The US Department of Energy Office of Fusion Energy and the Division of Reactor Research and Technology jointly sponsored the development of a coupled fine-group cross section library (VITAMIN-C). The experience gained in the generation, validation, and utilization of the VITAMIN-C library along with its broad range of applicability has led to the request for updating this data set using ENDF/B-V. Additional support in this regard has been provided by the Defense Nuclear Agency (DNA) and by EPRI in support of weapons analyses and light water reactor shielding and dosimetry problems, respectively. The rationale for developing the multipurpose ENDF/B-V-based VITAMIN-E library is presented, with special emphasis on new models used in the data generation algorithms. The library specifications and testing procedures are also discussed in detail. The distribution of the VITAMIN-E library is currently subject to the same restrictions as the distribution of the ENDF/B-V data. 2 tables.

- 836 (CONF-791103--7(Summ)) METHODOLOGY FOR STATISTICAL DETERMINATION OF FUEL INTRA-ASSEMBLY FLOW MIXING UNCERTAINTY. Tang, Y.S.; Friedland, A.J.; Markley, R.A. (Westinghouse Electric Corp., Madison, PA (USA). Advanced Reactors Div.). 1979. Contract EY-76-C-15-2395. 6p. Dep. NTIS, PC A02/MF A01.

From American Nuclear Society meeting; San

Francisco, CA, USA (12 Nov 1979).

To account for calculational and experimental uncertainties in reactor thermal-hydraulic analyses, hot channel/spot factors are usually used. This paper presents the methodology used to determine calculational uncertainty in the prediction of flow distribution between subchannels of LMFBR core assemblies. The flow distribution uncertainty may be caused by fabrication tolerance, distorted elements or inter-channel mixing.

- 837 (CONF-791103--25) MOLTEN FUEL CONTAINMENT ANALYSIS FOR SLSF EXPERIMENTS. El Genk, M.S.; Moore, R.L. (Idaho National Engineering Lab., Idaho Falls (USA)). 1979. Contract EY-76-C-07-1570. 5p. Dep. NTIS, PC A02/MF A01.

From American Nuclear Society meeting; San Francisco, CA, USA (12 Nov 1979).

The Sodium Loop Safety Facility (SLSF) experiments are being conducted in the Engineering Test Reactor (ETR) at the Idaho National Engineering Laboratory to furnish information concerning the behavior of fast reactor fuel elements under a hypothesized loss-of-flow accident conditions. These experiments involve measurements and observations that will permit an assessment of the location and time of sodium void initiation, the nature of sodium expulsion and reentry, the time and nature of cladding failure and motion, the molten fuel motion, and the extent of flow plugging by molten fuel freezing at the axial extremities of the subassembly. Because such high energy experiments are being conducted in-pile within the ETR facility, extensive pretest analysis was required to ensure loop integrity. One aspect of this analysis, which is the subject of this paper, was the assessment of molten fuel relocation and refreezing on the wall of the SLSF.

- 838 (CONF-791103--92) SAS3D ANALYSIS OF NATURAL CONVECTION BOILING BEHAVIOR IN THE SODIUM BOILING TEST FACILITY. Klein, G.; Dunn, F. (Oak Ridge National Lab., TN (USA); Argonne National Lab., IL (USA)). 1979. Contract W-7405-ENG-26. 6p. Dep. NTIS, PC A02/MF A01.

From American Nuclear Society meeting; San Francisco, CA, USA (12 Nov 1979).

The objective of the initial phase of testing in the Sodium Boiling Test (SBT) Facility, at the Oak Ridge National Laboratory, was to determine the maximum power that could be transferred by a simulated breeder reactor coolant subchannel when the coolant flow is driven by natural convection. In order to aid in the evaluation of the experimental data and to help understand the flow regimes present at the various power levels examined during this test program, a SAS3D computer model of the SBT Facility was developed.

- 839 (CONF-791103--99) DEVELOPMENT OF THE CENTRALIZED RELIABILITY DATA ORGANIZATION (CREDO). Haas, P.M.; Bott, T.F.; Knee, H.E.; Manning, J.J.; Hudson, S.D.; Greene, N.M.; Woodside, M.A. (Oak Ridge National Lab., TN (USA)). 1979. Contract W-7405-ENG-26. 7p. Dep. NTIS, PC A02/MF A01.

From American Nuclear Society meeting; San Francisco, CA, USA (12 Nov 1979).

CREDO has been established to meet the needs of the US Breeder Reactor Program and the advanced reactor community for a centralized source of accurate reliability/maintainability data and data-related services. The center provides for a comprehensive program of collection, evaluation, and dissemination of

data and for necessary user services. A steering committee of nationally recognized experts has been formed to guide CREDO development and operation. Historic data have been collected, analyzed, and published. Routine, continuous data collection and processing has been initiated at US sites. Interfaces with existing data bases have been established. Special user services are under development.

- 840 (CONF-791103--105) EFFECTIVENESS OF THREE REBALANCE METHODS IN DEEP PENETRATION PROBLEMS. Rhoades, W.A.; Tomlinson, E.T. (Oak Ridge National Lab., TN (USA); Union Carbide Corp., Oak Ridge, TN (USA); Nuclear Div.). 1979. Contract W-7405-ENG-26. 22p. Dep. NTIS, PC A02/MF A01.

From American Nuclear Society meeting; San Francisco, CA, USA (12 Nov 1979).

The space-rebalance method brought important new capability to discrete-ordinates calculations by using an easily-solved procedure. Later, diffusion synthetic acceleration used the diffusion equation as the auxiliary equation. Application of this new approach has been slow, partially due to concomitant restrictions. Aull et al showed a reformulation which brought compatibility with weighted-difference and negative-fixup schemes. Miller showed that the differential forms of the conventional space rebalance (CRB) and the newer methods could be derived from a common framework. This paper will, similarly, cast the difference form of Aull's consistent diffusion acceleration (CDA) into the same form as CRB and will indicate a third approach suggested by this comparison. Variations of these methods will be tested on deep-penetration problems.

- 841 (CONF-791108--21) MODEL TO SIMULATE THE FISSION-PRODUCT TRANSPORT PROCESS IN THE EXPERIMENTAL BREEDER REACTOR II. So, B.Y.C. (Argonne National Lab., IL (USA)). 1979. Contract W-31-109-ENG-38. 11p. Dep. NTIS, PC A02/MF A01.

From 72. AICHE meeting; San Francisco, CA, USA (25 Nov 1979).

When fission products are released from a cladding breach in EBR-II, they mix turbulently with the sodium in the core, in the upper plenum and in the intermediate heat exchanger. Eventually the fission products are discharged 12 to 13 s later into the primary tank. Fission gases migrate upward through a 9-ft layer of sodium and enter the cover gas. Loss of fission gas is due to decay, leakage of cover gas, cold trapping of iodine and bromine parents. Depending on the reactor operation requirement, it may purge with fresh argon. The assumptions made and differential equations used to develop a model for such transport are presented.

- 842 (CONF-791117--3) SYSTEM FOR NONDESTRUCTIVE ASSAY OF SPENT FUEL SUBASSEMBLIES: COMPARISON OF CALCULATIONS AND MEASUREMENTS. Ragan, G.L.; Ricker, C.W.; Chiles, M.M.; Ingersoll, D.T.; Slaughter, G.G.; Williams, L.R. (Oak Ridge National Lab., TN (USA)). 1979. Contract W-7405-ENG-26. 13p. Dep. NTIS, PC A02/MF A01.

From ANS topical conference; Kiawah Island, SC, USA (26 Nov 1979).

A nondestructive assay system was developed for determining the total fissile content of spent fuel subassemblies at the head end of a reprocessing plant. The system can perform an assay in 20 min with an uncertainty of <5%. Antimony-beryllium neutrons interrogate the subassemblies, and proton recoil counters detect the resulting fission neutrons. Pulse-

height discrimination differentiates between the low-energy interrogation neutrons and the higher-energy fission neutrons. Calculated and measured results were compared for (1) interrogation-neutron penetrability, (2) fission-neutron detectability, (3) radial variation of assay sensitivity, (4) axial variation of assay sensitivity, and (5) the variation of detector count rate as a function of the number of fuel rods in a special 61-rod, LMFBR-type subassembly.

- 843 (CONF-791204--29) STUDIES RELATED TO PROTECTED LOSS OF FLOW ACCIDENTS IN A FAST BREEDER REACTOR. Singer, R.M.; Gillette, J.L.; Mohr, D. (Argonne National Lab., IL (USA)). 1979. Contract W-31-109-ENG-38. 12p. Dep. NTIS, PC A02/MF A01.

From 2. Miami international conference on alternative energy sources; Miami Beach, FL, USA (10 Dec 1979).

Intrinsic to the design of liquid-metal-cooled fast-breeder-reactors (LMFBR) are a number of physical processes which inherently contribute to the safe operation and shutdown of the plant. Natural circulation cooling of the plant following a complete loss of all on-site electrical power is analyzed. The calculations which are presented demonstrate that the reactor core is adequately and stably cooled by natural circulation for a wide range of postulated initial operating conditions and plant design parameters.

- 844 (CONF-791204--34) CONCEPT EVALUATION OF NUCLEAR FUSION DRIVEN SYMBIOTIC ENERGY SYSTEMS. Renier, J.P.; Hoffman, T.J. (Oak Ridge National Lab., TN (USA)). 1979. Contract W-7405-ENG-26. 32p. Dep. NTIS, PC A03/MF A01.

From 2. Miami international conference on alternative energy sources; Miami Beach, FL, USA (10 Dec 1979).

This paper analyzes systems based on D-T and semi-catalyzed D-D fusion-powered U233 breeders. Two different blanket types were used: metallic thorium pebble-bed blankets with a batch reprocessing mode and a molten salt blanket with on-line continuous or batch reprocessing. All fusion-driven blankets are assumed to have spherical geometries, with a 85% closure. Neutronics depletion calculations were performed with a revised version of the discrete ordinates code XSDRN-PM, using multigroup (100 neutron, 21 gamma-ray groups) coupled cross-section libraries. These neutronics calculations are coupled with a scenario optimization and cost analysis code. Also, the fusion burn was shaped so as to keep the blanket maximum power density below a preset value, and to improve the performance of the fusion-driven systems. The fusion-driven symbiotes are compared with LMFBR-driven energy systems. The nuclear fission breeders that were used as drivers have parameters characteristic of heterogeneous, oxide LMFBRs. They are net plutonium users - the plutonium is obtained from the discharges of LWRs - and U233 is bred in the fission breeder thorium blankets. The analyses of the symbiotic energy systems were performed at equilibrium, at maximum rate of grid expansion, and for a given nuclear power demand.

- 845 (CONF-791205--2) EXPERIMENTAL STUDIES OF FLOW DISTRIBUTION IN A WIRE WRAPPED LMFBR BLANKET ASSEMBLY. Patch, L.; Rojdt, R.M.; Carelli, M.D.; Markley, R.A. (Westinghouse Research and Development Center, Pittsburgh, PA (USA); Westinghouse Electric Corp., Madison, PA (USA). Advanced Reactors Div.). 1979. Contract EY-76-C-15-2395. 39p. Dep. NTIS,

PC A03/MF A01.

From ASME winter annual meeting; New York, NY, USA (2 Dec 1979).

An experimental investigation of the flow characteristics in a model of an LMFBR wire wrapped blanket assembly is presented. A 5:1 scale model of a Clinch River Breeder Reactor Plant blanket assembly was tested in an unheated airflow facility under Reynolds number simulation conditions. Pressure gradients, subchannel gap crossflows and local axial velocities were measured in the interior, side and corner subchannels, thus providing a complete, self-consistent set of data. The bulk of the experiments were performed for a Reynolds number of 22,000, representative of blanket full flow conditions. Additional data were calculated at intermediate ($Re = 11,800$) and low ($Re = 4,300$) flow conditions. Very detailed mappings of the axial velocity distribution in the subchannels and of the crossflow velocities in representative gaps were performed.

- 846 (CONF-791205--3) TECHNIQUES FOR THE THERMAL/HYDRAULIC ANALYSIS OF LMFBR CHECK VALVES. Cho, S.M.; Kane, R.S. (Foster Wheeler Energy Corp., Livingston, NJ (USA); Manhattan Coll., Riverdale, NY (USA). Dept. of Mechanical Engineering). 1979. Contract EY-76-C-15-2395. 25p. Dep. NTIS, PC A02/MF A01.

From ASME winter annual meeting; New York, NY, USA (2 Dec 1979).

A thermal/hydraulic analysis of the check valves in liquid sodium service for LMFBR plants is required to provide temperature data for thermal stress analysis of the valves for specified transient conditions. Because of the complex three-dimensional flow pattern within the valve, the heat transfer analysis techniques for less complicated shapes could not be used. This paper discusses the thermal analysis techniques used to assure that the valve stress analysis is conservative. These techniques include a method for evaluating the recirculating flow patterns and for selecting appropriately conservative heat transfer correlations in various regions of the valve.

- 847 (CONF-791205--18) DESIGN AND OPERATING EXPERIENCE OF EBR-II INTERMEDIATE HEAT EXCHANGER. Buschman, H.W.; Koenig, J.F.; Stone, C.C. (Argonne National Lab., Idaho Falls, ID (USA); Argonne National Lab., IL (USA)). 1979. Contract W-31-109-ENG-38. 23p. Dep. NTIS, PC A02/MF A01.

From ASME winter annual meeting; New York, NY, USA (2 Dec 1979).

Experimental Breeder Reactor II (EBR-II) has operated for over 15 years at the Idaho National Engineering Laboratory near Idaho Falls. EBR-II has served the nation in providing information on fuels, materials, and components under conditions approaching those expected for commercial power plants. In addition, EBR-II is a power plant generating electricity with an availability of about 70%. A key component, the Intermediate Heat Exchanger (IHX), of any Liquid Metal Fast Breeder Reactor (LMFBR) must perform with a high degree of reliability for successful commercialization. The design and operating experience gained from EBR-II demonstrates that the IHX can be built and operated with confidence that its performance and reliability will be satisfactory.

- 848 (CONF-791205--23) HEAT-TRANSFER IN A PARTIALLY-BLOCKED SODIUM-COOLED ROD BUNDLE. Han, J.T. (Oak Ridge National Lab., TN

(USA)). 1979. Contract W-7405-ENG-26. 6p. NTIS, PC A02/MF A01.

From ASME winter annual meeting; New York, NY, USA (2 Dec 1979).

Heat transfer coefficients were experimentally determined for 31-rod sodium-cooled bundle with a 6-subchannel central blockage. The Nusselt number is presented as a function of the Peclet number for both the free flow region undisturbed by the blockage and the wake region immediately downstream of the blockage. Results are compared with the existing correlations for liquid metals. The heat transfer coefficient was generally higher in the unblocked free flow region than in the wake region. A leak at the blockage improved the heat transfer coefficient in the wake region.

849 (CONF-800226--1) BUOYANCY INDUCED FLOW AND HEAT REDISTRIBUTION DURING LMFBR CORE DECAY HEAT REMOVAL. Coffield R.D. Jr.; Tang, Y.S.; Killimayer, J.S.; Markley, R.A. (Westinghouse Electric Corp., Madison, PA (USA)). 1980. Contract AC15-76CL02395. 14p. Dep. NTIS, PC A02/MF A01.

From Specialists meeting on decay heat removal and natural circulation in FBR's; Upton, NY, USA (28 Feb 1980).

Natural convection cooling of the core exhibits one of the few core design transients where low power/high temperature conditions exist. Core inter-assembly and intra-assembly flow/heat redistribution: (a) become significant with regard to accurately predicting temperatures; and (b) decrease the maximum hot element temperatures. A technique is described herein for linking dynamic core-wide transient effects as predicted by COBRA-WC to the localized hot element temperatures calculated with FORE-2M. These latter temperatures are used in evaluations with regard to core design adequacy.

850 (CONF-800226--6) RESPONSE OF EBR-II TO A COMPLETE LOSS OF PRIMARY FORCED FLOW DURING POWER OPERATION. Singer, R.M.; Gillette, J.L.; Mohr, D.; Tokar, J.V.; Sullivan, J.E.; Dean, E.M. (Argonne National Lab., IL (USA)). 1980. Contract W-31-109-ENG-38. 14p. Dep. NTIS, PC A02/MF A01.

From Specialists meeting on decay heat removal and natural circulation in FBR's; Upton, NY, USA (28 Feb 1980).

Detailed measurements of the thermal, hydraulic, and neutronic response of EBR-II to a complete loss of primary forced flow followed by a PPS-activated scram are presented. The experimental results clearly indicate a smooth transition to natural convective flow with a quite modest incore temperature transient. The accompanying calculations using the NATDEMO code agree quite well with the measured temperatures and flow rates throughout the primary system. The only region of the plant where a significant discrepancy between the measurements and calculations occurred was in the IHX. The reasons for this result could not be definitively determined, but it is speculated that the one-dimensional assumptions used in the modeling may not be valid in the IHX during buoyancy driven flows.

851 (CONF-800334--7) DEVELOPMENTS IN EFFLUENT CONTROL FOR BREEDER REPROCESSING FACILITIES. Yarbrow, G.O.; Sears, M.B. (Oak Ridge National Lab., TN (USA)). 1980. Contract W-7405-ENG-26. 8p. Dep. NTIS, PC A02/MF A01.

From 2. DOE environmental control symposium; Reston, VA, USA (17 Mar 1980).

10 CFR 20 and 40 CFR 190 impose tight restrictions on the releases of radioactive materials from the fuel cycle. Retention factors needed in the LMFBR and LWR fuel cycles to meet the 40 CFR 190 release limits of ^{85}Kr , ^{129}I , and ^{239}Pu are listed. Technologies for the control of I, ^{85}Kr , and tritium are discussed. Advanced effluent control systems will be demonstrated in the Hot Experimental Facility. (DLC)

852 (CONF-800401--5) EMISSIVITY OF SODIUM WETTED AND OXIDIZED TYPE 304 STAINLESS STEEL. Haines, N.L.; Craig, R.E.; Forsyth, D.R.; Novendstern, E.H. (Westinghouse Electric Corp., Madison, PA (USA). Advanced Reactors Div.). 1980. Contract AC15-76CL02395. 7p. Dep. NTIS, PC A02/MF A01.

From 2. international conference of liquid metal technology for energy systems; Richland, WA, USA (20 Apr 1980).

The emissivity of sodium wetted and oxidized Type 304 stainless steel was determined to provide data for calculating the heat flow through Liquid Metal Fast Breeder Reactor (LMFBR) reflector plates, located above the sodium pool, to the reactor closure head. An emissivity experiment using a Type 304 stainless steel specimen was performed in an inerted glovebox. Relatively high oxygen concentrations of 10,000 and 50 vppm were used in the argon/oxygen mixtures to reduce reaction time. Following wetting and oxidation, the specimen was heated to a maximum temperature of 450°C and the emissivity of the oxidized coating was calculated. Results indicate that the emissivity of the coating ranged from 0.55 to 0.92.

853 (CONF-800434--2) ORNL EXPERIMENTS TO CHARACTERIZE FUEL RELEASE FROM THE REACTOR PRIMARY CONTAINMENT IN SEVERE LMFBR ACCIDENTS. Wright, A.L.; Kress, T.S.; Smith, A.M. (Oak Ridge National Lab., TN (USA)). 1980. Contract W-7405-ENG-26. 16p. Dep. NTIS, PC A02/MF A01.

From CSNI specialist meeting on nuclear aerosols in reactor safety; Gatlinburg, TN, USA (15 Apr 1980).

This paper presents results from aerosol source term experiments performed in the ORNL Aerosol Release and Transport (ART) Program sponsored by the US NRC. The tests described were performed to provide information on fuel release from an LMFBR primary containment as a result of a hypothetical core-disruptive accident (HCDA). The release path investigated in these tests assumes that a fuel/sodium bubble is formed after disassembly that transports fuel and fission products through the sodium coolant and cover gas to be released into the reactor secondary containment. Due to the excellent heat transfer characteristics of the sodium, there is potential for large attenuation of the maximum release.

854 (CONF-800434--3) BEHAVIOR OF SODIUM OXIDE, URANIUM OXIDE AND MIXED SODIUM OXIDE-URANIUM OXIDE AEROSOLS IN A LARGE VESSEL. Adams, R.E.; Han, J.T.; Kress, T.S.; Silberberg, M. (Oak Ridge National Lab., TN (USA)). 1980. Contract W-7405-ENG-26. 20p. Dep. NTIS, PC A02/MF A01.

From CSNI specialist meeting on nuclear aerosols in reactor safety; Gatlinburg, TN, USA (15 Apr 1980).

Results are reported for experiments on the behavior of sodium oxide aerosols, uranium oxide aerosols, and various mixtures of these in the Nuclear Safety Pilot Plant (NSPP) vessel at Oak Ridge National Laboratory. The NSPP

program, sponsored by the Nuclear Regulatory Commission, is to provide experimental qualification of the HAARM-3 aerosol behavioral code being independently developed at Battelle-Columbus Laboratories. The results of fourteen single-component and six mixed-component aerosol experiments are presented along with selected comparisons with code predictions.

- 855 (CONF-800607--5) INFLUENCE OF CONTROL ROD WORTH INTERACTIONS ON LMFBR CONTROL SYSTEMS DESIGN. Lake, J.A.; Rittenberger, R.V.; Rathbun, R.W. (Westinghouse Electric Corp., Pittsburgh, PA (USA). Advanced Reactors Div.). 1980. Contract AC15-76CL02395. 5p. Dep. NTIS, PC A02/MF A01.

From American Nuclear Society annual meeting; Las Vegas, NV, USA (8 Jun 1980).

These design criteria are interpreted to define the reactivity worth requirements for the primary and secondary control systems in terms of the minimum control systems capability under faulted conditions which will assure that the reactor can be safely shut down. The faulted conditions are postulated to occur upon the simultaneous failure of one of the redundant safety control systems to scram, a stuck rod in the scrambling system, and a reactivity insertion resulting from the uncontrolled withdrawal of the highest worth control rod inserted in the reactor. The resulting positive reactivity insertion from the rod runout envelopes other postulated operational faults and is imposed on the shutdown requirements of both the primary and secondary control systems. In order to determine the minimum shutdown capability, an evaluation is made of the worst combination of control rod runout (reactivity fault) and stuck rod worth.

- 856 (CONF-800607--28) IRRADIATED TYPE 304 SS BEND TEST DUCTILITY. Garkisch, H.D. (Westinghouse Electric Corp., Madison, PA (USA). Advanced Reactors Div.). 1980. Contract AC15-76CL02395. 6p. Dep. NTIS, PC A02/MF A01.

From American Nuclear Society annual meeting; Las Vegas, NV, USA (8 Jun 1980).

A series of tests were performed to determine the available bending deformation capability and ductility of preirradiated Type 304 stainless steel (SS) for core applications. This material was tested under conditions at which it exhibits less ductility than Type 316 SS or other stainless steels currently under considerations for core applications. Tensile testing of Type 304 SS with specimens from EBR-II ducts which were irradiated to fluences between 5 to 10 x 10²² n/cm² (E > 0.1 MeV) revealed a significant reduction of uniform elongation (UE) and total elongation (TE), but smaller decreases in reduction of area (RA). These specimens fail with significant but very localized necking. The ductility of this material decreases with decreasing strain rate if the test temperature is above the irradiation temperature. A large reduction in ductility is caused by a change from a transgranular to an intergranular fracture mode.

- 857 (CONF-800607--29) BLANKET DESIGN CONSIDERATIONS FOR FAST REACTOR OXIDE FUEL SYSTEMS BASED ON CRBRP EXPERIENCE. Garkisch, H.D. (Westinghouse Electric Corp., Madison, PA (USA). Advanced Reactors Div.). 1980. Contract AC15-76CL02395. 6p. Dep. NTIS, PC A02/MF A01.

From American Nuclear Society annual meeting; Las Vegas, NV, USA (8 Jun 1980).

The blanket assemblies are of prime importance in achieving the performance goals of fast reactor fuel systems to conserve uranium ore and to minimize fuel cycle costs. The purpose of past blanket design efforts in the US was to meet these goals with designs of optimum fuel and thermal performance. Only the Clinch River Breeder Reactor Plant (CRBRP) blanket design has evolved beyond the conceptual stage. The CRBRP blanket assembly design is based on conservatively predicted environments and criteria which are being confirmed by a design oriented development program. The results of the ongoing program obtained to date have not indicated any need for assembly design changes. However, since the irradiation testing of blanket rods is not completed, the ultimate performance capability of the blanket is presently not known. Therefore, conservative blanket assembly design criteria and predicted environments must be utilized for performance predictions at the present time.

- 858 (CONF-800607--33) FINAL DESIGN ANALYSES OF CRBRP FUEL ROD. Bishop, B.A.; Vijuk, R.M. (Westinghouse Electric Corp., Madison, PA (USA). Advanced Reactors Div.). 1980. Contract AC15-76CL02395; EY-76-C-15-0003. 6p. NTIS, PC A02/MF A01.

From American Nuclear Society annual meeting; Las Vegas, NV, USA (8 Jun 1980).

The key results are presented of the CRBRP fuel rod analyses performed in support of the CRBRP fuel assembly final design review in December, 1977. For the CRBRP fuel rod design environment, it is shown that the life limiting criteria on ductility limited strain (DLS) and cumulative damage function (CDF) are satisfied. The conservatism in these analyses is demonstrated by comparison to the upset enthalpy based failure potential criteria derived from cladding breach experience for TREAT simulated untempered rapid reactivity insertion transients.

- 859 (CONF-7706129--), pp 8p, Paper 1) CLINCH RIVER BREEDER REACTOR AND ENERGY INDEPENDENCE. Anderson, J.C. (Oak Ridge Associated Universities, TN). 1977.

From AIPE annual convention proceedings; Atlanta, GA, USA (20 Jun 1977).

Nuclear energy with special emphasis on the Clinch River Breeder Reactor (CRBRP) program is discussed. The CRBRP is an important demonstration project in that it will produce electricity and make fuel. For every twelve atoms of fuel utilized to produce heat/electricity, twelve new atoms of fuel will be manufactured. This demonstration will point toward a method of "manufacturing" fuel at a time when naturally-occurring fossil fuels and uranium-235 are being depleted by an ever increasing number of countries each year. Both fossil and uranium-235 fuels are limited. As these finite fuel supplies vanish, it is important that additional energy sources be developed.

- 860 (CONF-7706130--), pp 12p, Session 2, Paper 1) FUTURE OF THE BREEDER IN THE U.S. Iacobellis, S.F. (Atomics International Div., Canoga Park, CA). 1977.

From Conference on U.S. options for long term energy supply; Denver, CO, USA (19 Jun 1977).

The current political and social forces affecting the U.S. LMFBR program are discussed. The need for timely LMFBR development is emphasized.

- 861 (CONF-7706130--), pp 17p, Session 2, Paper 2) LMFBRs: WHERE DO WE GO FROM HERE. Beckjord, E.S. (Energy Research and Development Administration, Washington, DC). 1977.

From Conference on U.S. options for long term energy supply; Denver, CO, USA (19 Jun 1977).

The mission and current status of the U.S. LMFBR program are discussed. Changes in the program made by the Carter administration are described, and the direction and pace of future activities are discussed.

- 862 (CONF-7706130--), pp 23p, Session 1, Paper 3) ALTERNATE PERSPECTIVE ON LONG-RANGE ENERGY OPTIONS. Culler, F.L. (Oak Ridge National Lab., TN). 1977.

From Conference on U.S. options for long term energy supply; Denver, CO, USA (19 Jun 1977).

The author emphasizes that, in his opinion and that of the industrial segment of the economic establishment, nuclear energy will be needed to replace in part the rapidly diminishing supplies of oil and gas. To maintain the nuclear option, breeders are necessary, he continues. With uranium of recoverable grade in limited supply Mr. Culler says that prudent planning should include the demonstration of the breeder option, which must also provide efficient and safe reprocessing, fuel recycle, and radioactive waste disposal. (MCW)

- 863 (CONF-7711121--), PROCEEDINGS OF THE INDO-GERMAN SEMINAR ON RADIATION DAMAGE. (Reactor Research Centre, Kalpakkam (India)). 1977. 521p. Dep. NTIS (US Sales Only), PC A22/MF A01.

From Indo-German seminar on radiation damage; Kalpakkam, India (14 Nov 1977).

Information is presented concerning fundamental aspects of radiation damage; voids, creep, and other mechanical properties; applications to reactor materials; and irradiation studies and facilities. (FS)

- 864 (CONF-7810133--5) ENVIRONMENTALLY IMPORTANT RADIONUCLIDES IN NONPROLIFERATIVE FUEL CYCLES. Kaye, S.V.; Till, J.E. (Oak Ridge National Lab., TN (USA)). 1978. Contract W-7405-ENG-26. 22p. Dep. NTIS, PC A02/MF A01.

From 12. annual symposium of the German Health Physics Society--radioactivity and the environment; Norderney, F.R. Germany (2 Oct 1978).

Our analyses indicate that more in-depth research should be done on ^3H , ^{14}C , ^{99}Tc , and ^{232}U , especially because of their presence in nonproliferative fuel cycles. For increased ^3H production by fast reactors, we can only speculate that such research could show that environmental releases might be significantly greater than for LWRs. Carbon-14 will likely not be a problem if a suitable decontamination factor can be agreed upon for reprocessing facilities and if a satisfactory regulatory limit can be established for global populations. Additional experimental research is urgently needed to determine the uptake of low levels of ^{99}Tc by plants. These data are essential before an accurate assessment of ^{99}Tc releases can be made. Finally, we recommend that investigators take a closer look at the potential problems associated with ^{232}U and daughters. This radionuclide could contribute a significant portion of the dose in both environmental and occupational exposures from

the nonproliferative fuels.

- 865 (CONF-7910112--2) CURRENT STATUS OF FAST REACTOR PHYSICS. Hummel, H.H. (Argonne National Lab., IL (USA)). 1979. Contract W-31-109-ENG-38. 46p. Dep. NTIS, PC A03/MF A01.

From NEACRP meeting; Paris, France (1 Oct 1979).

The subject of calculation of reactivity coefficients for fast reactors is developed, starting with a discussion of the status of relevant nuclear data and proceeding to the subjects of group cross section generation and of methods of obtaining reactivity coefficients from group cross sections. Reactivity coefficients measured in critical experiments are compared with calculated values. Dependence of reactivity coefficients on reactor design is discussed. Finally, results of the recent international comparison of calculated reactivity coefficients are presented.

- 866 (COO--2172-29) MECHANICAL PROPERTIES OF CRYSTALLINE SOLIDS. PROGRESS REPORT, DECEMBER 1, 1978-NOVEMBER 30, 1979. Li, C.; Hart, E.W. (Cornell Univ., Ithaca, NY (USA). Dept. of Materials Science and Engineering). 1 Sep 1979. Contract EY-76-S-02-2172. 60p. Dep. NTIS, PC A04/MF A01.

The work performed during the past fiscal year included: the development and preliminary experimental verification of a second generation deformation model based on state variables, which more correctly represents transient deformation; the establishment of experimental capabilities for investigating grain boundary anelasticity and the development of unified phenomenological models for grain boundary anelasticity and grain boundary sliding; the continued investigation of grain boundary cavitation processes in the Zircalloys; and the theoretical modeling of stress relaxation in thin films.

- 867 (COO--2245-17TR(Rev.1)) INPUT PARAMETERS TO CODES WHICH ANALYZE LMFBR WIRE WRAPPED BUNDLES. REVISION 1. Wang, S.F.; Todreas, N.E. (Massachusetts Inst. of Tech., Cambridge (USA)). May 1979. Contract EY-76-S-02-2245. 57p. Dep. NTIS, PC A04/MF A01.

This report provides a current summary of recommended values of key input parameters required for ENERGY code analysis of LMFBR wire wrapped bundles. This data is based on the interpretation of experimental results from the MIT and other available laboratory programs.

- 868 (COO--2245-27TR(Rev.1)) FABRICATION DETAILS FOR WIRE WRAPPED FUEL ASSEMBLY COMPONENTS. Bosy, B.J. (Massachusetts Inst. of Tech., Cambridge (USA). Dept. of Nuclear Engineering). Sep 1978. Contract EY-76-S-02-2245. 64p. Dep. NTIS, PC A04/MF A01.

Revised by H. Khan.

Extensive hydraulic testing of simulated LMFBR blanket and fuel assemblies is being carried out under this MIT program. The fabrication of these test assemblies has involved development of manufacturing procedures involving the wire wrapped pins and the flow housing. The procedures are described in detail in the report.

- 869 (COO--2245-35TR) ANALYSIS OF THE FEASIBILITY OF IMPLEMENTING AN IMPLICIT TEMPORAL DIFFERENCING SCHEME IN THE SUPERENERGY CODE. Masterson, R.; Todreas, N. (Massachusetts Inst. of Tech., Cambridge (USA)).

Dept. of Nuclear Engineering). Feb 1977.
Contract EY-76-S-02-2245. 34p. Dep. NTIS,
PC A03/MF A01.

In order to assess the optimum approach for extending the SUPERENERGY code to transient LMFBR analysis, it is necessary to consider the advantages and disadvantages of the various temporal differencing schemes that can be applied to the energy equation used by the code. These differencing schemes can be fully implicit or fully explicit, although differencing schemes consisting of a combination of temporally implicit and explicit parts may also be used. It is well recognized that temporally implicit differencing schemes tend to be more stable, but that this stability can be offset in practice by factors such as greater computer storage requirements and considerably longer running times.

- 870 (COO--2245-36TR) COLLECTION AND EVALUATION OF SALT MIXING DATA WITH THE REAL TIME DATA ACQUISITION SYSTEM. Glazer, S.; Chiu, C.; Todreas, N.E. (Massachusetts Inst. of Tech., Cambridge (USA)). Dept. of Nuclear Engineering). Sep 1977. Contract EY-76-S-02-2245. 331p. Dep. NTIS, MF A01.

Portions of document are illegible.

A minicomputer based real time data acquisition system was designed and built to facilitate data collection during salt mixing tests in mock ups of LMFBR rod bundles. The system represents an expansion of data collection capabilities over previous equipment. It performs steady state and transient monitoring and recording of up to 512 individual electrical resistance probes. Extensive real time software was written to govern all phases of the data collection procedure, including probe definition, probe calibration, salt mixing test data acquisition and storage, and data editing. Offline software was also written to permit data examination and reduction to dimensionless salt concentration maps. Finally, the computer program SUPERENERGY was modified to permit rapid extraction of parameters from dimensionless salt concentration maps. The document describes the computer system, and includes circuit diagrams of all custom built components. It also includes descriptions and listings of all software written, as well as extensive user instructions.

- 871 (COO--2245-37TR) APPROXIMATE METHOD FOR PREDICTING TEMPERATURE DISTRIBUTION IN WIRE WRAPPED FUEL ASSEMBLIES OF A LMFBR. Mikic, B.; Khan, E.U.; Todreas, N.E. (Massachusetts Inst. of Tech., Cambridge (USA)). Dept. of Nuclear Engineering). Apr 1977. Contract EY-76-S-02-2245. 31p. Dep. NTIS, PC A03/MF A01.

In Liquid Metal Fast Breeder Reactors (LMFBR) the fuel and blanket assemblies are subject to radial gradients in the rate of heat generations and have a wide range of flow conditions. An approximate method is presented for predicting temperature distributions in wire wrapped fuel assemblies based on a porous body model which was previously formulated by Khan. Numerical techniques were used for the solution of the equation set. However it was indicated that an analytical solution is possible for the case where the bundle is operating in forced convection only (negligible free convection). An analytical method is presented which, when combined with a very simple graphical construction, provides an engineering estimate of the temperature distribution in wire wrapped fuel rod assemblies.

- 872 (COO--2245-40TR) WARD BLANKET ASSEMBLY PRE-TEST PREDICTIONS BY SUPERENERGY. Chiu, C.; Todreas, N.E. (Massachusetts Inst. of Tech., Cambridge (USA)). Dept. of Nuclear Engineering). May 1977. Contract EY-76-S-02-2245. 67p. Dep. NTIS, PC A04/MF A01.

A heated LMFBR blanket assembly is under test at WARD to determine its thermal-hydraulic characteristics. Predictions of part of the WARD test results using the SUPERENERGY code with the aid of existing flow split and salt mixing data are presented. A significant part of this effort is the detailed consideration of the uncertainties introduced in temperature field predictions due to as-built bundle tolerances.

- 873 (COO--2245-41TR) FLOW SPLIT MEASUREMENTS IN LMFBR BLANKET ASSEMBLIES. Chiu, C.; Todreas, N.E.; Rohsenow, W.M. (Massachusetts Inst. of Tech., Cambridge (USA)). Apr 1978. Contract EY-76-S-02-2245. 136p. Dep. NTIS (US Sales Only), PC A07/MF A01.

Individual subchannel flow rates are isokinetically measured for all the edge and interior subchannels (at a series of Reynolds numbers ranging from laminar to turbulent) in two different LMFBR blanket assemblies. The specific goals of this task are to obtain the average subchannel flow rates for both interior and edge subchannels in the bundle ($P/D = 1.067$, $H/D = 8.0$) which is geometrically similar to the blanket assemblies ($P/D = 1.077$, $H/D = 7.7$) used in the Clinch River Breeder Reactor and to obtain the information of the lead length effect on the average subchannel flow rates through the subchannel flow rate measurement in the bundle which has $P/D = 1.067$ and $H/D = 4.0$.

- 874 (COO--2245-42TR) PRESSURE DROP MEASUREMENTS IN LMFBR WIRE WRAPPED BLANKET ASSEMBLIES. Chiu, C.; Hawley, J.; Rohsenow, W.M.; Todreas, N.E. (Massachusetts Inst. of Tech., Cambridge (USA)). Jul 1977. Contract EY-76-S-02-2245. 77p. Dep. NTIS, PC A05/MF A01.

In this experiment, measurements of subchannel static pressure for an interior and edge subchannel were taken at two elevations in two wire-wrapped 61-pin bundles. One of the bundles has geometric characteristics of $P/D = 1.067$ and $H/D = 8.0$ (4 inch lead length and 0.501 inch rod diameter) and the other bundle has geometric characteristics of $P/D = 1.067$ and $H/D = 4.0$ (2 inch lead length and 0.501 inch rod diameter). The bundle average friction factors as well as the local subchannel friction factors for both interior and edge subchannels were determined from the experimental static pressure data. The average subchannel flow rates for both edge and interior subchannels were determined in a separate experiment. Results show that two correlations suggested by Rehme and Novendstern for the bundle average friction factor cannot predict the data within the range of experimental error. The bundle average friction factors for both bundles under test were underestimated by Rehme's correlation and overestimated by Novendstern's correlation. The results of the local subchannel friction factors indicate the effect of the wire lead length is more pronounced in the interior subchannel friction factor than in the edge subchannel friction factor. As the wire wrap lead length decreases, both interior and edge subchannel friction factors increase.

875 (COO--2245-43TR) MIXING EXPERIMENTS IN LMFBR WIRE WRAPPED BLANKET ASSEMBLIES. Chib, C.; Rohsenow, W.M.; Todreas, N.E. (Massachusetts Inst. of Tech., Cambridge (USA)). Apr 1978. Contract EY-76-S-02-2245. 173p. Dep. NTIS (US Sales Only), PC A08/MF A01.

The saline water injection technique is used to obtain the salt concentration maps at the exits of two LMFBR 61-pin blanket assemblies. The intersubchannel mixing parameter ϵ_{sub}/l and the swirl flow parameter C_{sub}/l which are inputs to the SUPERENERGY (or ENERGY) computer code are reduced from the exit salt concentration maps. Results show that both parameters are independent of the bundle Reynolds number under the high turbulent flow conditions and decrease as the Reynolds number decreases into the laminar flow regime. Both parameters for the four inch lead bundles are less than those for the two inch lead bundle by a factor of 1.8.

876 (COO--2245-44TR) COOLANT MIXING IN THE LMFBR OUTLET PLENUM. Chen, Y.B.; Golay, M.W. (Massachusetts Inst. of Tech., Cambridge (USA)). Dept. of Nuclear Engineering. Jun 1977. Contract EY-76-S-02-2245. 224p. Dep. NTIS, PC A10/MF A01.

Small scale experiments involving water flows are used to provide mean flow and turbulence field data for LMFBR outlet plenum flows. Measurements are performed at Reynolds Number (Re) values of 33000 and 70000 in a 1/15-scale FFTF geometry and at Re = 35000 in a 3/80-scale CRBR geometry. The experimental behavior is predicted using two different turbulence model computer programs, TEACH-T and VARR-II. It is found that the qualitative nature of the flow field within the plenum depends strongly upon the distribution of the mean inlet velocity field, upon the degree of inlet turbulence, and upon the turbulence momentum exchange model used in the calculations. It is found in the FFTF geometry that the TEACH-T predictions are better than that of VARR-II, and in the CRBR geometry neither code provides a good prediction of the observed behavior. From the sensitivity analysis, it is found that the production and dissipation of turbulence are the dominant terms in the transport equations for turbulent kinetic energy and turbulent energy dissipation rate, and the diffusion terms are relatively small. From the same study a new set of empirical constants for the turbulence model is evolved for the prediction of plenum flows.

877 (COO--2245-45TR) TURBULENT INTERCHANGE IN TRIANGULAR ARRAY BARE ROD BUNDLES. Kelly, J.M.; Todreas, N. (Massachusetts Inst. of Tech., Cambridge (USA)). Dept. of Nuclear Engineering. Jul 1977. Contract EY-76-S-02-2245. 227p. Dep. NTIS, PC A11/MF A01.

Bulk mixing coefficients were measured for single plane water flow in a simulated rod bundle with a pitch to diameter ratio of 1.10. A tracer technique employing Rhodamine B as the tracer and measuring fluorescence was used. Isokinetic sampling was achieved by using a pressure balance method. The results were corrected for both entrance effects and diversion crossflows. The results showed a change in Reynolds number behavior as the laminar sublayer began to "choke" the turbulent mixing. This, and a review of other mixing experiments, suggested that secondary flows do not compensate for laminarization and that turbulent mixing decreases as the pitch to diameter ratio decreases for values of P/D less than 1.05 in a manner similar to that predicted by Ramm et al. Concentration profiles were

measured through the clearance gap and the values of the gradient were used to calculate the gap averaged circumferential eddy diffusivity for mass. A discussion of the eddy diffusivity concept and its applicability to turbulent mixing is presented.

878 (COO--2245-46TR) ASSESSMENT OF THE NEED TO INCORPORATE THE VARIABLE SWIRL MODEL IN THE ENERGY CODE. Basehore, K.L.; Todreas, N.E. (Massachusetts Inst. of Tech., Cambridge (USA)). Dept. of Nuclear Engineering. Jul 1977. Contract EY-76-S-02-2245. 74p. Dep. NTIS, MF A01.

Portions of document are illegible.

At present the ENERGY model contains a correlated swirl flow that is circumferentially and axially constant. This report evaluates the need to include a variable swirl flow forcing function in this model. A suitable function for testing the variable swirl flow effects is obtained by reducing the existing world transverse flow experimental data, relying heavily on the MIT laser doppler anemometer data. A comparison of the existing constant swirl model with the variable swirl model using the resulting forcing function is made with the help of a few sample problems.

879 (COO--2245-47TR) ANALYSIS OF THE THERMAL-HYDRAULIC BEHAVIOR IN THE CRBR SECONDARY CONTROL ASSEMBLY, INCLUDING INTERASSEMBLY HEAT TRANSFER EFFECTS. Basehore, K.L.; Todreas, N.E. (Massachusetts Inst. of Tech., Cambridge (USA)). Dept. of Nuclear Engineering. Jul 1977. Contract EY-76-S-02-2245. 173p. Dep. NTIS, PC A08/MF A01.

Portions of document are illegible.

A first effort is presented at modeling the thermal hydraulic behavior of the CRBR secondary control assembly (SCA). For modeling purposes, the SCA is broken into two sections, the counterflow section and the poison control section, which contains the control bundle. The coolant temperature distribution in the counterflow section is evaluated by using a semi-analytical solution technique. The distribution in the poison control section is found by using forward differenced numerical techniques. The wire wrap sweeping in the control bundle is represented by an empirical enhanced eddy diffusion of heat as in the ENERGY model.

880 (COO--2245-48TR) HYDRODYNAMIC BEHAVIOR OF A BARE ROD BUNDLE. Bartzis, J.G.; Todreas, N.E. (Massachusetts Inst. of Tech., Cambridge (USA)). Dept. of Nuclear Engineering. Jun 1977. Contract EY-76-S-02-2245. 370p. Dep. NTIS, PC A16/MF A01.

Thesis. Submitted by J.G. Bartzis.

Portions of document are illegible.

The temperature distribution within the rod bundle of a nuclear reactor is of major importance in nuclear reactor design. However temperature information presupposes knowledge of the hydrodynamic behavior of the coolant which is the most difficult part of the problem due to complexity of the turbulence phenomena. In the present work a 2-equation turbulence model--a strong candidate for analyzing actual three dimensional turbulent flows--has been used to predict fully developed flow of infinite bare rod bundle of various aspect ratios (P/D). The model has been modified to take into account anisotropic effects of eddy viscosity. Secondary flow calculations have been also performed although the model seems to be too rough to predict the secondary flow correctly. Heat transfer calculations have been

performed to confirm the importance of anisotropic viscosity in temperature predictions. All numerical calculations for flow and heat have been performed by two computer codes based on the TEACH code. Experimental measurements of the distribution of axial velocity, turbulent axial velocity, turbulent kinetic energy and radial Reynolds stresses were performed in the developing and fully developed regions. A 2-channel Laser Doppler Anemometer working on the Reference mode with forward scattering was used to perform the measurements in a simulated interior subchannel of a triangular rod array with $P/D = 1.124$. Comparisons between the analytical results and the results of this experiment as well as other experimental data in rod bundle array available in literature are presented. The predictions are in good agreement with the results for the high Reynolds numbers.

- 881 (COO--2245-49TR) MEASUREMENT AND ANALYSIS OF FLOW WALL SHEAR STRESS IN AN INTERIOR SUBCHANNEL OF TRIANGULAR ARRAY RODS. Fakori-Monazah, M.R.; Todreas, N.E. (Massachusetts Inst. of Tech., Cambridge (USA). Dept. of Nuclear Engineering). Aug 1977. Contract EY-76-S-02-2245. 206p. Dep. NTIS, PC A10/MF A01.

Thesis.

A simulated model of triangular array rods with pitch to diameter ratio of 1.10 (as a test section) and air as the fluid flow was used to study the LMFBR hydraulic parameters. The wall shear stress distribution around the rod periphery, friction factors, static pressure distributions and turbulence intensity corresponding to various Reynolds numbers ranging from 4140 to 36170 in the central subchannel were measured. Various approaches for measurement of wall shear stress were compared. The measurement was performed using the Preston tube technique with the probe outside diameter equal to 0.014 in.

- 882 (COO--2245-50) COOLANT MIXING IN LMFBR ROD BUNDLES AND OUTLET PLENUM MIXING TRANSIENTS. PROGRESS REPORT, MARCH 1, 1977--MAY 31, 1977. Todreas, N.E.; Golay, M.W.; Wolf, L. (Massachusetts Inst. of Tech., Cambridge (USA). Dept. of Nuclear Engineering). 1977. Contract EY-76-S-02-2245. 100p. Dep. NTIS, PC A05/MF A01.

Progress is summarized in the following tasks: (1) bundle flow studies (wrapped and bare rods); (2) subchannel flow studies (bare rods); (3) LMFBR outlet plenum flow mixing; and (4) theoretical determination of local temperature fields in LMFBR fuel rod bundles. (DG)

- 883 (COO--2245-51TR) FLUID MIXING STUDIES IN A HEXAGONAL 61-PIN, WIRE-WRAPPED ROD BUNDLE. Hanson, A.S.; Todreas, N. (Massachusetts Inst. of Tech., Cambridge (USA). Dept. of Nuclear Engineering). Aug 1977. Contract EY-76-S-02-2245. 568p. Dep. NTIS, PC A14/MF A01.

Two wire-wrapped rod bundles with different leads (6 in. and 12 in.) were constructed with geometric parameters similar to proposed LMFBR fuel assemblies. Rod diameter was 0.25 in. and pitch-to-diameter ratio was 1.26. These two bundles were tested in a flow loop which was designed and built for mixing experiments. Fluid mixing was studied by means of salt tracer dispersion. Salt was injected at various radial and axial locations in the bundle via injection rods, and then the dispersed distribution was measured at the bundle exit by

means of 126 specially designed electrical conductivity probes inserted into the bundle subchannels. The data collected showed a strong swirl flow around the bundle circumference and periodic variation with axial injection location. Data from turbulent runs was generally good with mass balances averaging 90% and having a spread of $\pm 25\%$. The laminar data collected was generally poor because of a "striping" phenomena and injection instabilities. Data were compared with calculations using the ENERGY computer code. The comparison between ENERGY calculations and the data was not good for laminar flow and was only fair in the turbulent cases. It was found that turbulent data could be best characterized by the ENERGY parameters $C_1 = 0.19$ and $\epsilon_{1,*} = 0.025$ when the lead was 6 inches; for a 12-inch lead the parameters were $C_1 = 0.16$ and $\epsilon_{1,*} = 0.012$. Pressure drop data was also taken from the two bundles and it too showed a periodic variation with axial location. Friction factors derived from the data were generally higher than predicted by available correlations. These data suggested that traditional flow split calculations could be in error and that the laminar-turbulent transition occurs over a broad Reynolds number range in wire-wrapped rod bundles.

- 884 (COO--2245-53) COOLANT MIXING IN LMFBR ROD BUNDLES AND OUTLET PLENUM MIXING TRANSIENTS. PROGRESS REPORT, JUNE 1, 1977--AUGUST 31, 1977. Todreas, N.E.; Golay, M.W.; Wolf, L. (Massachusetts Inst. of Tech., Cambridge (USA). Dept. of Nuclear Engineering). 1977. Contract EY-76-S-02-2245. 32p. Dep. NTIS, MF A01.

Portions of document are illegible.

Information is presented concerning coolant mixing in bundle geometries of wrapped and bare rods, mixing in subchannel geometry of bare rods, and LMFBR outlet plenum flow mixing.

- 885 (COO--2245-54TR) MIXING EXPERIMENTS IN AN ALTERNATING WIRE WRAPPED ASSEMBLY. Chiu, C.; Todreas, N.E.; Rohsenow, W.M. (Massachusetts Inst. of Tech., Cambridge (USA)). Dec 1977. Contract EY-76-S-02-2245. 201p. Dep. NTIS, PC A10/MF A01.

The salt injection experiment was performed in an alternating wire-wrapped, triangular-array bundle to study the coolant mixing behavior pertaining to alternating wrapped wires. Results show that the coolant mixing is much enhanced in the subchannels for this type of bundle compared to the in-phase wire-wrapped bundle currently used in the LMFBR design. A strong interaction between the coolants in the edge and the interior subchannels at four assembly faces (where the alternating wires give 180° out-of-phase configuration) has also been observed. After calibrating the input parameters for the sweeping flow of the COBRA-IIIC/MIT code against this experimental data, the code is employed to predict the coolant temperatures for a skew-powered alternating wire-wrapped blanket assembly. Comparing the code results with the SUPERENERGY code predicted coolant temperature data for an in-phase wrapped assembly under identical operating conditions, it is observed that the hot spot temperature for the alternating wire-wrapped assembly is less than that for the in-phase wire-wrapped bundle by 5 percent (normalized to the hot spot axial temperature rise).

- 886 (COO--2245-55TR) TURBULENT SWEEPING FLOW MIXING MODEL FOR WIRE WRAPPED LMFBR ASSEMBLIES. Chiu, C.; Rohsenow, W.M.;

Todreas, N.E. (Massachusetts Inst. of Tech., Cambridge (USA)). Apr 1978. Contract EY-76-S-02-2245. 69p. Dep. NTIS (US Sales Only), PC A04/MF A01.

A physical model is proposed to derive the sweeping flow for LMFBR triangular array wire-wrapped assemblies under the turbulent flow condition. Two correlations are suggested for the sweeping flow through two different types of gaps between subchannels, the gap between the interior subchannels and the gap between the wall subchannels. These two sweeping flow correlations are evolved by calibrating the constants in the proposed model against the available experimental data. Agreement between the correlations and all the experimental data of ± 35 percent is obtained over the assembly design range of 1.315 greater than P/D greater than 1.067 and 52 greater than H/D greater than 4 . Based on these correlations, flow sweeping input parameters for two popular computer codes, i.e., COBRA and SUPERENERGY, are recommended.

TRANSFER ANALYSIS OF COUPLED COOLANT CELLS IN FINITE LMFBR BUNDLES. Wong, C.N.; Wolf, L. (Massachusetts Inst. of Tech., Cambridge (USA)). Dept. of Nuclear Engineering). Feb 1978. Contract EY-76-S-02-2245. 327p. Dep. NTIS, PC A15/MF A01.

A three-dimensional single region slug flow heat transfer analysis for finite LMFBR rod bundles using a classical analytical solution method has been performed. According to the isolated single cell analysis, the results show that the peripheral clad temperature variation as well as the thermal entrance length are strongly dependent upon the degree of irregularity displayed by various coolant geometries. Since under the present LMFBR conditions, fully-developed temperature fields may hardly be established in such characteristic rod bundle regions, a 3-D heat transfer analysis seems to be mandatory. This implies that the results of fully developed heat transfer analyses are by far too conservative.

887 (COO--2245-55TR(Rev.1)) TURBULENT SWEEPING FLOW MIXING MODEL FOR WIRE WRAPPED LMFBR ASSEMBLIES. Chiu, C.; Rohsenow, W.M.; Todreas, N.E. (Massachusetts Inst. of Tech., Cambridge (USA)). Dept. of Nuclear Engineering). Oct 1978. Contract EY-76-S-02-2245. 69p. Dep. NTIS, PC A04/MF A01.

A physical model is proposed to derive the sweeping flow for LMFBR triangular array wire-wrapped assemblies under the turbulent flow condition. Two correlations are suggested for the sweeping flow through two different types of gaps between subchannels, the gap between the interior subchannels and the gap between the wall subchannels. These two sweeping flow correlations are evolved by calibrating the constants in the proposed model against the available experimental data. Agreement between the correlations and all the experimental data of $\pm 35\%$ is obtained over the assembly design range of $1.315 > P/D > 1.067$ and $52 > H/D > 4$. Based on these correlations, flow sweeping input parameters for two popular computer codes, i.e., COBRA and SUPERENERGY, are recommended.

888 (COO--2245-56TR) FLOW SPLIT MODEL FOR LMFBR WIRE WRAPPED ASSEMBLIES. Chiu, C.; Rohsenow, W.M.; Todreas, N.E. (Massachusetts Inst. of Tech., Cambridge (USA)). Apr 1978. Contract EY-76-S-02-2245. 49p. Dep. NTIS (US Sales Only), PC A03/MF A01.

A physical model is proposed to describe the subchannel pressure drop and in turn to derive two correlations for the interior subchannel and edge subchannel average flow rates in wire wrapped LMFBR assemblies. This model takes into account the effects of both the form drag induced by the wires and the skin friction pressure drop induced by the secondary flow in the determination of the interior and edge average subchannel flow rates. As a result, good agreement ($\pm 4\%$) between the predicted and the experimental subchannel flow rates is obtained for the bundles having the geometric characteristics ranging from $P/D=1.067$ and $H/D=4.0$ to $P/D=1.25$ and $H/D=52$ over the Reynolds number range $5000 < Re < 73,000$. The corner subchannel flow rates are not predicted by the proposed model because experimental data is lacking on the transverse and axial flow in the corner subchannels. However, when this information is available, the proposed model can be expanded to predict the corner subchannel flow rate.

890 (COO--2245-59TR) TWO DIMENSIONAL STRUCTURAL ANALYSIS OF REACTOR FUEL ELEMENT CLADDINGS DUE TO LOCAL EFFECTS. Karimi, R.; Wolf, L. (Massachusetts Inst. of Tech., Cambridge (USA)). Dept. of Nuclear Engineering). Apr 1978. Contract EY-76-C-02-2245. 431p. Dep. NTIS, MF A01.

Portions of document are illegible.

Two dimensional thermoelastic and inelastic stresses and deformation of typical LWR (PWR) and LMFBR (CRBR) claddings are evaluated by utilizing the following codes, for (1) Thermoelastic analysis (a) STRESS Code (b) SEPIPE Code (2) Thermoelastic analysis (a) Modified version of the GOGD code (b) One dimensional GRO-II code. The primary objective of this study is to analyze the effect of various local perturbations in the clad temperature field, namely eccentrically mounted fuel pellet, clad ovality, power tilt across the fuel and clad-coolant heat transfer variation on the cladding stress and deformation. In view of the fact that the thermoelastic analysis is always the first logical choice entering the structural field, it was decided to start the analysis with the two dimensional codes such as STRESS and SEPIPE. Later, in order to assess the validity and compare the thermoelastic results to those obtained for actual reactor conditions, a two dimensional code, namely a modified version of the GOGD code, was used to account for inelastic effects such as irradiation and thermal creep and swelling in the evaluation. The comparison of thermoelastic and inelastic results shows that the former can be used effectively to analyze LWR fuel pin over 350 hours of lifetime under the most adverse condition and 500 hours of lifetime for an LMFBR fuel pin. Beyond that the inelastic solution must be used. The impact of the individual thermal perturbation and combinations thereof upon the structural quantity is also shown. Finally, the effect of rod displacement on the two dimensional thermal and structural quantities of the LMFBR fuel pin cladding is analyzed.

891 (COO--2245-60) COOLANT MIXING IN LMFBR ROD BUNDLES AND OUTLET PLENUM MIXING TRANSIENTS. PROGRESS REPORT, SEPTEMBER 1, 1977--NOVEMBER 30, 1977. Todreas, N.E.; Golay, M.W.; Wolf, L. (Massachusetts Inst. of Tech., Cambridge (USA)). Dept. of Nuclear Engineering). 1977. Contract EY-76-S-02-2245. 53p. Dep. NTIS, PC A04/MF A01.

Progress in studies on LMFBR hydrodynamics is summarized under the following task headings:

889 (COO--2245-58TR) 3-D SLUG FLOW HEAT

bundle geometry (wrapped and bare rods), subchannel geometry (bare rods) outlet plenum flow mixing, and theoretical determination of local temperature fields in fuel rod bundles.

- 892 (COO--2245-61TR) MEASUREMENT OF HEAT AND MOMENTUM EDDY DIFFUSIVITIES IN RECIRCULATING LMFBR OUTLET PLENUM FLOWS. Manno, V.P.; Golay, M.W. (Massachusetts Inst. of Tech., Cambridge (USA). Dept. of Nuclear Engineering). Jun 1978. Contract EY-76-S-02-2245. 308p. Dep. NTIS, PC A14/MF A01.

An optical technique has been developed for the measurement of the eddy diffusivity of heat in a transparent flowing medium. The method uses a combination of two established measurement tools: a Mach-Zehnder interferometer for the monitoring of turbulently fluctuating temperature and a Laser Doppler Anemometer (LDA) for the measurement of turbulent velocity fluctuations. The technique is applied to the investigation of flow fields characteristic of the LMFBR outlet plenum. The study is accomplished using air as the working fluid in a small scale Plexiglas test section. Flows are introduced into both the $1/15$ scale FFTF outlet plenum and the $3/80$ scale CRBR geometry plenum at inlet Reynolds numbers of 22,000. Measurements of the eddy diffusivity of heat and the eddy diffusivity of momentum are performed at a total of 11 measurement stations. Significant differences of the turbulence parameters are found between the two geometries, and the higher chimney structure of the CRBR case is found to be the major cause of the distinction. Spectral intensity studies of the fluctuating electronic analog signals of velocity and temperature are also performed. Error analysis of the overall technique indicates an experimental error of 10% in the determination of the eddy diffusivity of heat and 6% in the evaluation of turbulent momentum viscosity. In general it is seen that the turbulence in the cases observed is not isotropic, and use of isotropic turbulent heat and momentum diffusivities in transport modelling would not be a valid procedure.

- 893 (COO--2245-62TR) LABORATORY MANUAL FOR SALT MIXING TEST IN ROD BUNDLES. Khan, H.U.R.; Chiu, C.; Todreas, N. (Massachusetts Inst. of Tech., Cambridge (USA)). Oct 1978. Contract EY-76-S-02-2245. 37p. Dep. NTIS, PC A03/MF A01.

This report is a Laboratory Manual dealing with the procedure employed during Salt Tracer Experiments, which are used for evaluating the hydraulic characteristics of a rod bundle. A description of the standard equipment used is given together with details of manufacture of non-standard items i.e., probes used for detecting the salt-concentration. Details of bundle construction have not been included as they are available in the references cited. An attempt has also been made to point out potential trouble areas and procedures.

- 894 (COO--2245-63) COOLANT MIXING IN LMFBR ROD BUNDLES AND OUTLET PLENUM MIXING TRANSIENTS. PROGRESS REPORT, DECEMBER 1, 1977--FEBRUARY 28, 1978. Todreas, N.E.; Golay, M.W.; Wolf, L. (Massachusetts Inst. of Tech., Cambridge (USA). Dept. of Nuclear Engineering). 1978. Contract EY-76-S-02-2245. 46p. Dep. NTIS, PC A03/MF A01.

Progress is reported for the following tasks: bundle geometry (wrapped and bare rods), subchannel geometry (bare rods), velocity and temperature fields in outlet plenum flow mixing, and theoretical determination of local temperature fields in fuel rod bundles.

- 895 (COO--2245-64) COOLANT MIXING IN LMFBR ROD BUNDLES AND OUTLET PLENUM MIXING TRANSIENTS. PROGRESS REPORT, MARCH 1, 1978--MAY 31, 1978. Todreas, N.E.; Golay, M.W.; Wolf, L. (Massachusetts Inst. of Tech., Cambridge (USA). Dept. of Nuclear Engineering). 1978. Contract EY-76-S-02-2245. 37p. Dep. NTIS, PC A03/MF A01.

- 896 (COO--2245-65) COOLANT MIXING IN LMFBR ROD BUNDLES AND OUTLET PLENUM MIXING TRANSIENTS. PROGRESS REPORT, JUNE 1, 1978--AUGUST 31, 1978. Todreas, N.E.; Golay, M.W.; Wolf, L. (Massachusetts Inst. of Tech., Cambridge (USA). Dept. of Nuclear Engineering). 1978. Contract EY-76-S-02-2245. 29p. Dep. NTIS, PC A03/MF A01.

Information is presented concerning coolant mixing in LMFBR fuel rods in wrapped and bare bundle geometry; LMFBR outlet plenum flow mixing; and theoretical determination of local temperature fields in LMFBR fuel rod bundles.

- 897 (COO--2245-66) COOLANT MIXING IN LMFBR ROD BUNDLES AND OUTLET PLENUM MIXING TRANSIENTS. PROGRESS REPORT, SEPTEMBER 1, 1978--NOVEMBER 30, 1978. Todreas, N.E.; Golay, M.W.; Wolf, L. (Massachusetts Inst. of Tech., Cambridge (USA). Dept. of Nuclear Engineering). 1978. Contract EY-76-S-02-2245. 31p. Dep. NTIS, PC A02/MF A01.

Information is presented concerning coolant mixing in LMFBR fuel rods in wrapped and bare bundle geometry; LMFBR outlet plenum flow mixing; and theoretical determination of local temperature fields in LMFBR fuel rod bundles.

- 898 (COO--2245-68TR) MULTICELL SLUG FLOW HEAT TRANSFER ANALYSIS OF FINITE LMFBR BUNDLES. Yeung, M.K.; Wolf, L. (Massachusetts Inst. of Tech., Cambridge (USA). Dept. of Nuclear Engineering). Dec 1978. Contract EY-76-S-02-2245. 51p. Dep. NTIS, PC A22/MF A01.

An analytical two-dimensional, multi-region, multi-cell technique has been developed for the thermal analysis of LMFBR rod bundles. Local temperature fields of various unit cells were obtained for 7, 19, and 37-rod bundles of different geometries and power distributions. The validity of the technique has been verified by its excellent agreement with the THTB calculational result. By comparing the calculated fully-developed circumferential clad temperature distribution with those of the experimental measurements, an axial correction factor has been derived to account for the entrance effect for practical considerations. Moreover, the knowledge of the local temperature field of the rod bundle leads to the determination of the effective mixing lengths $L_{sub ij}$ for adjacent subchannels of various geometries. It was shown that the

implementation of the accurately determined L/sub i/ into COBRA-IIIC calculations has fairly significant effects on intersubchannel mixing. In addition, a scheme has been proposed to couple the 2-D distributed and lumped parameter calculation by COBRA-IIIC such that the entrance effect can be implanted into the distributed parameter analysis. The technique has demonstrated its applicability for a 7-rod bundle and the results of calculation were compared to those of three-dimensional analyses and experimental measurements.

- 899 (COO--2245-69) COOLANT MIXING IN LMFBR ROD BUNDLES AND OUTLET PLENUM MIXING TRANSIENTS. PROGRESS REPORT, DECEMBER 1, 1978--FEBRUARY 28, 1979. Todreas, N.E.; Golay, M.W.; Wolf, L. (Massachusetts Inst. of Tech., Cambridge (USA). Dept. of Nuclear Engineering). 1979. Contract EY-76-S-02-2245. 35p. Dep. NTIS, PC A03/MF A01.

Information is presented concerning coolant mixing in bundle geometry and subchannel geometry; outlet plenum flow mixing; and theoretical determination of local temperature fields in LMFBR fuel rod bundles.

- 900 (COO--2245-70) COOLANT MIXING IN LMFBR ROD BUNDLES AND OUTLET PLENUM MIXING TRANSIENTS. PROGRESS REPORT, MARCH 1-MAY 31, 1979. Todreas, N.E.; Golay, M.W.; Wolf, L. (Massachusetts Inst. of Tech., Cambridge (USA). Dept. of Nuclear Engineering). 1979. Contract EY-76-S-02-2245. 68p. Dep. NTIS, PC A04/MF A01.

Progress is summarized concerning liquid flow in bundle geometry (wrapped and bare rods) and LMFBR outlet plenum flow mixing.

- 901 (COO--2250-28) MIT LMFBR BLANKET PHYSICS PROJECT PROGRESS REPORT NO. 7, JULY 1, 1975--SEPTEMBER 30, 1976. Driscoll, M.J. (ed.). (Massachusetts Inst. of Tech., Cambridge (USA). Dept. of Nuclear Engineering). 30 Sep 1976. Contract EY-76-S-02-2250. 186p. (MITNE--211). Dep. NTIS, PC A09/MF A01.

Work during the period was devoted primarily to a range of analytical/numerical investigations, including evaluation of means to improve external blanket designs, beneficial attributes of the use of internal blankets, improved methods for the calculation of heterogeneous self-shielding and parametric studies of calculated spectral indices. Experimental work included measurements of the ratio of U-238 captures to U-235 fissions in a standard blanket mockup, and completion of development work on the radiophotoluminescent readout of LIF thermoluminescent detectors. The most significant findings were that there is very little prospect for substantial improvement in the breeding performance of external blankets, but internal blankets continue to show promise, particularly if they are used in such a way as to increase the volume fraction of fuel inside the core envelope. An improved equivalence theorem was developed which may allow use of fast reactor methods to calculate heterogeneously self-shielded cross sections in both fast and thermal reactors.

- 902 (COO--2250-29) MIT LMFBR BLANKET RESEARCH PROJECT. QUARTERLY PROGRESS REPORT, APRIL 1, 1977--JUNE 30, 1977. Driscoll, M.J. (Massachusetts Inst. of Tech., Cambridge (USA). Dept. of Nuclear Engineering). 1977. Contract EY-76-S-02-2250. 13p. Dep. NTIS, PC A02/MF A01.

Axial power shaping calculations for the radial blanket of an LMFBR type reactor are presented.

- 903 (COO--2250-30) MIT LMFBR BLANKET RESEARCH PROJECT. QUARTERLY PROGRESS REPORT, JULY 1, 1977--SEPTEMBER 30, 1977. Driscoll, M.J. (Massachusetts Inst. of Tech., Cambridge (USA). Dept. of Nuclear Engineering). 1977. Contract EY-76-S-02-2250. 16p. Dep. NTIS, PC A02/MF A01.

Irradiation experiments on Mockup 5B have been completed. A series of comparative calculations are underway on internal blanket variations. Preliminary results are presented. A final workup of the T/sub i/(n,p) Sc⁴⁸ and N/sub i/(n,p) Co⁵⁸ threshold traverses in Blanket Mockup 5B has been completed.

- 904 (COO--2250-31) MIT LMFBR BLANKET RESEARCH PROJECT. QUARTERLY PROGRESS REPORT, OCTOBER 1, 1977--DECEMBER 31, 1977. Driscoll, M.J. (Massachusetts Inst. of Tech., Cambridge (USA). Dept. of Nuclear Engineering). 1977. Contract EY-76-S-02-2250. 16p. Dep. NTIS, PC A02/MF A01.

Research progress on LMFBR breeding blanket is reported for the following: threshold foil traverses in blanket/reflector Mockup 5B, Mockup No. 6 assemblies, and LCCEWG benchmark problems.

- 905 (COO--2250-32) MIT LMFBR BLANKET RESEARCH PROJECT. QUARTERLY PROGRESS REPORT, JANUARY 1, 1978--MARCH 31, 1978. Driscoll, M.J. (Massachusetts Inst. of Tech., Cambridge (USA). Dept. of Nuclear Engineering). 1978. Contract EY-76-S-02-2250. 15p. Dep. NTIS, PC A02/MF A01.

Progress in the development of LMFBR breeding blanket design parameters is reported under the following headings: thorium utilization, reflector fast neutron penetration, and interface measurement and calculations.

- 906 (COO--2250-34) MIT LMFBR BLANKET RESEARCH PROJECT. QUARTERLY PROGRESS REPORT, JULY 1, 1978--SEPTEMBER 30, 1978. Driscoll, M.J. (Massachusetts Inst. of Tech., Cambridge (USA). Dept. of Nuclear Engineering). 20 Oct 1978. Contract EY-76-S-02-2250. 9p. Dep. NTIS, PC A02/MF A01.

Progress in the development of LMFBR breeding blanket design parameters is reported under the following headings: an improved Dancoff factor prescription and breed/burn blanket management.

- 907 (COO--2250-36) MIT LMFBR BLANKET RESEARCH PROJECT. QUARTERLY PROGRESS REPORT, JANUARY 1, 1979--MARCH 31, 1979. Driscoll, M.J. (Massachusetts Inst. of Tech., Cambridge (USA). Dept. of Nuclear Engineering). 20 Apr 1979. Contract EY-76-S-02-2250. 14p. Dep. NTIS, PC A02/MF A01.

Progress is summarized in the following areas: fissile build-up in internal blankets, reference cores, and power peaking.

- 908 (COO--2250-37) INTERFACIAL EFFECTS IN FAST REACTORS. Saidi, M.S.; Driscoll, M.J. (Massachusetts Inst. of Tech., Cambridge (USA). Dept. of Nuclear Engineering). May 1979. Contract EY-76-S-02-2250. 196p. Dep. NTIS, PC A09/MF A01.

The problem of increased resonance capture rates near zone interfaces in fast reactor

media has been examined both theoretically and experimentally. An interface traversing assembly was designed, constructed and employed to measure U-238 capture rates near the blanket-reflector interface in the MIT Blanket Test Facility. Prior MIT experiments on a thorium-uranium interface in a blanket assembly were also reanalyzed. Extremely localized fertile capture rate increases of on the order of 50% were measured immediately at the interfaces relative to extrapolation of asymptotic interior traverses, and relative to state-of-the-art (LIB-IV, SPHINX, ANISN/2DB) calculations which employ infinite-medium self-shielding throughout a given zone. A method was developed to compute a spatially varying background scattering cross section per absorber nucleus which takes into account both homogeneous and heterogeneous effects on the interface flux transient.

- 909 (COO--2250-38) MIT LMFBR BLANKET RESEARCH PROJECT. QUARTERLY PROGRESS REPORT, APRIL 1-JUNE 30, 1979. Driscoll, M.J. (Massachusetts Inst. of Tech., Cambridge (USA). Dept. of Nuclear Engineering). 25 Jul 1979. Contract EY-76-S-02-2250. 16p. Dep. NTIS, PC A02/MF A01.

In designing a plutonium-uranium core with thorium internal blankets there are several parameters that must be investigated to identify the design with the best performance. Choices include: the amount of moderation in the blanket, whether moderation is incorporated from the outset or added after an assembly is shuffled to the external blanket, and the cycle length both for the core and internal blanket assemblies. To investigate the effect of these parameters several core and blanket burnup analyses were performed.

- 910 (COO--2426-101) SYSTEM DESIGN OF CARBIDE FUEL. QUARTERLY PROGRESS REPORT, APRIL--JUNE 1977. Noyes, R.C. (Combustion Engineering, Inc., Windsor, CT (USA)). 1977. Contract EY-76-C-02-2426. 76p. (CE-FBR--77-339). AT.

The expected costs and benefits of introducing carbide fueled assemblies into Liquid Metal Fast Breeder Reactors are studied. Associated with this overall objective are the parallel objectives of identifying the important characteristics of optimum commercial carbide fueled LMFBR designs and the comparison of such designs with designs of oxide fueled LMFBR's. Determination of efficient and acceptable means of testing carbide and other advanced fuels in FTR and CRBR, including detailed design and analysis of experimental FTR driver fuel assemblies, is a major objective of this work.

- 911 (COO--2426-133) PERFORMANCE POTENTIAL OF (TH,U) CARBIDE AND (TH,U) NITRIDE FUEL IN 1200 MWE LMFBR'S. Caspersson, S.A.; Kulwich, M.R. (Combustion Engineering, Inc., Windsor, CT (USA)). Apr 1978. Contract EY-76-C-02-2426-001. 10p. Dep. NTIS, PC A02/MF A01.
- An evaluation of the performance potential of thorium-uranium carbide and nitride fuel in 1200 MW(e) homogeneous and heterogeneous LMFBR's has been completed. Comparisons were done with 9.40 mm outer diameter, 0.38 mm cladding fuel pins at a selected peak (3 sigma) linear power of 98.4 kW/m for all cores. Breeding ratios for the homogeneous (Th,U)C and (Th,U)N cores are 1.12 and 1.16, respectively. In the heterogeneous cores the breeding ratios are 0.08 to 0.09 greater. A comparative breeding ratio of 1.48 results for a sodium-bonded (U,Pu)C homogeneous LMFBR with similar

design criteria. Compound inventory doubling times for the homogeneous and heterogeneous (Th,U)C cores are 82 and 53 years, respectively. Additional performance parameters have also been compared, including sodium void worths, specific inventories, fissile material gains, and equilibrium cycle reactivity losses.

- 912 (COO--2426-136) SYSTEM DESIGN OF CARBIDE FUEL. QUARTERLY PROGRESS REPORT, JANUARY--MARCH 1978. (Combustion Engineering, Inc., Windsor, CT (USA)). 1978. Contract EY-76-C-02-2426. 30p. (CE-FBR--7878). AT.
- Portions of document are illegible.
- Progress is summarized in design studies and performance testing of advanced carbide fuels for LMFBR reactors. (DG)

- 913 (COO--2458-22) SIMPLE REPRESENTATIONS OF SPECTRUM AVERAGED CROSS SECTIONS IN LMFBR BLANKETS. Badruzzaman, A.; Wiley, R.; Becker, M. (Rensselaer Polytechnic Inst., Troy, NY (USA). Dept. of Nuclear Engineering). 1978. Contract EY-76-S-02-2458. 7p. (CONF-781105-101). Dep. NTIS, PC A02/MF A01.
- From ANS meeting; Washington, DC, USA (12 Nov 1978).

The setting up of correlations to represent spectrum averaged cross sections in the core-blanket interface and blanket region of LMFBRs is described. Analytical representations of concentrations as functions of position are used. Sample calculations using a CRBR core composition are presented.

- 914 (COO--2458-23) ANALYSIS OF EXPOSURE DEPENDENT HETEROGENEOUS FBR SPECTRA USING CONTINUOUS SLOWING DOWN-INTEGRAL TRANSPORT CONCEPTS. Badruzzaman, A.; Badruzzaman, T.; Becker, M. (Rensselaer Polytechnic Inst., Troy, NY (USA). Dept. of Nuclear Engineering). 1979. Contract EY-76-S-02-2458. 7p. (CONF-790602--44). Dep. NTIS, PC A02/MF A01.
- From ANS annual meeting; Atlanta, GA, USA (3 Jun 1979).

Generalized continuous slowing down (CSD) theory coupled with integral transport concepts has been shown to give accurate prediction of the spatial variation of exposure dependent spectra at the core-blanket interface and in the blanket region of the homogeneous design fast reactor. The spectrum and the spectrum-averaged cross sections (SAXS) exhibited a strong space dependence as one proceeded from the outer core into the blanket. However, at any given location these varied rather weakly with exposure. In the paper the authors have extended the procedure to analyse the heterogeneous LMFBR spectra with depletion. Briefly, one solves a matrix differential equation of the zonal slowing down densities; the equation being a generalization of slowing down equations of the Greuling--Goertzel type with a source term. One then uses a multiregion analogue of the usual expressions of flux in terms of slowing down densities, either of the Greuling--Goertzel or Wigner form. The formalism has been applied to an infinite array of alternating core and blanket zones in slab geometry. The properties of these zones are based on Clinch River Breeder Reactor (CRBR) parameters and calculations were performed with the 29 group FTR-300 data set.

- 915 (COO--2458-24) SIMPLE PROCEDURE FOR DETERMINING IMPLICATIONS OF DESIGN CHANGES ON FAST REACTOR FUEL CYCLE COST AND BREEDING PERFORMANCE. Badruzzaman, A.; Becker, M. (Rensselaer Polytechnic Inst., Troy, NY (USA). Dept. of Nuclear Engineering). 1979.

Contract EY-76-S-02-2458. 6p. (CONF-790602--18). Dep. NTIS, PC A02/MF A01.

From ANS annual meeting; Atlanta, GA, USA (3 Jun 1979).

Recently, analytical sensitivity methods has been applied to obtain fuel cycle cost implications of data uncertainties. To perform exposure dependent sensitivity analysis without repeating expensive spectrum calculations, simple correlations of the spectrum averaged cross sections (SAXS) were constructed. The correlation coefficients were obtained by fitting the SAXS calculated by direct methods over a wide range of LMFBR core designs. In this paper the procedure has been extended to study sensitivity of fuel cycle cost and breeding ratio to design variation. The method involves using the correlations to construct both the SAXS and the sensitivity coefficients. Composition dependent correlations have been found to be accurate for the core while both composition and position have to be included in analysing the blanket.

- 916 (COO--2509-4) MECHANISMS OF FAST NEUTRON PENETRATION IN THICK LAYERS OF SODIUM. Huang, L.Y. (Columbia Univ., New York (USA). Div. of Nuclear Science and Engineering). 1975. Contract EY-76-S-02-2509. 219p. Dep. NTIS, PC A10/MF A01.

Thesis.

A series of computer experiments was carried out to elucidate the penetration mechanisms of fast neutrons through thick layers of sodium such as occur in LMFBR designs. As a one-dimensional approximation of the actual situation, the calculations concentrated mainly on the flux 5 meters from a plane isotropic fission source in an infinite sodium medium. Most of the transport calculations were made with the moments-method code BMT with a 496-energy point grid. Previously developed methods for reconstructing the flux from the spatial moments were used, except that a set of biorthogonal polynomials was constructed suitable for expansion of the flux in terms of a Gaussian weight function. The moments-method technique lends itself to easy and economical changes of the input cross section data. A large number of such modified cross section sets, built around the ENDF/B-III set, were used in separate calculations designed variously to emphasize or eliminate one or more particular transport processes. It was shown that, as the energy decreases below 190 keV, the flux spectrum at 5 m is increasingly dominated by an age-diffusion process that is quantitatively close to conventional age theory if the age is suitably chosen. Conclusions from this picture of neutron penetration in sodium are made as to the types of transport calculations that can be successfully made in shield design, and the accuracies needed in future cross section measurements. 37 figures, 30 tables.

- 917 (COO--2554-6) SIMULATION OF BOILING POOLS WITH INTERNAL HEAT SOURCES BY GAS INJECTION. Luk, A.C.H.; Ganguli, A.; Bankoff, S.G. (Northwestern Univ., Evanston, IL (USA). Dept. of Chemical Engineering). 29 Jul 1977. Contract EY-76-S-02-2554. 32p. Dep. NTIS, PC A03/MF A01.

Heat transfer from the sides and bottom of an open non-boiling liquid pool with spatially uniform internal gas injection was studied experimentally, both in transient and in steady state. The results were compared with experimental data for a boiling pool without permanent gas injection undertaken at Argonne National Laboratory. Typical Nusselt number versus Reynolds number plots showed that heat

transfer rates were much higher in the gassy pool due to more efficient circulation. A correction was applied to estimate the surface evaporation effect under boiling conditions. Bubble size and distribution effects controlled the heat transfer rates. Vertical void fraction profiles were inferred from local static pressure measurements. A modified Grashof number, in terms of the average void fraction, was also used to correlate the data for horizontal heat flow. The bottom and side heat loss rates were about equal, which would indicate that the pool might retain its shape as it sinks into the support material.

- 918 (COO--2571-9) IMPROVEMENT AND VERIFICATION OF FAST REACTOR SAFETY ANALYSIS TECHNIQUES. PROGRESS REPORT, APRIL 1, 1977--JUNE 30, 1977. Barker, D.H.; Wheeler, P.A. (Brigham Young Univ., Provo, UT (USA). Dept. of Chemical Engineering). 1977. Contract EY-76-S-02-2571. 17p. Dep. NTIS, PC A02/MF A01.

An energy balance was made to determine the effect of the latent heat of vaporization of fuel and steel on temperature changes of the fuel and steel. Calorimeter runs were made on the reaction of DMSO with acetyl chloride to determine the effects of concentration and injection speed on the power of the reaction. Within a limited range, the power is proportional to both the concentration and injection rate. A plot of void fraction as a function of concentration was made. The concentration at which the reaction suddenly produces a large void fraction is between 3 and 4 molar.

- 919 (COO--2571-10) IMPROVEMENT AND VERIFICATION OF FAST REACTOR SAFETY ANALYSIS TECHNIQUES. PROGRESS REPORT, 1 JULY 1977--30 SEPTEMBER 1977. Barker, D.H.; Wheeler, P.A. (Brigham Young Univ., Provo, UT (USA). Dept. of Chemical Engineering). 1977. Contract EY-76-S-02-2571. 30p. Dep. NTIS, PC A02/MF A01.

A calorimeter was designed and built to measure reaction power in the range where liquid is boiling. Measurements made with the new calorimeter at a concentration just lower than what would produce boiling (3m) was about 10% lower than those measured using the Precision Calorimeter. A heat loss of about 40% due to a non-adiabatic vessel was determined by comparing the reaction power in solution of the reaction vessel to that of the calorimeter. A closed reaction vessel was designed to observe the effects of pressure (up to 3 atm) on the dispersion height. A preliminary calculation of the theoretical critical superficial vapor velocity was 0.0432 m/sec.

- 920 (COO--2571-11) IMPROVEMENT AND VERIFICATION OF FAST REACTOR SAFETY ANALYSIS TECHNIQUES. PROGRESS REPORT, OCTOBER 1, 1977--DECEMBER 31, 1977. Barker, D.H.; Wheeler, P.A. (Brigham Young Univ., Provo, UT (USA). Dept. of Chemical Engineering). 1977. Contract EY-76-S-02-2571. 38p. Dep. NTIS, PC A02/MF A01.

The critical superficial vapor velocity was measured for an open vessel system with chemically produced internal heat. The measured value was within experimental error of the value predicted by the Kutateladze stability criterion. The greatest error induced was in the measurement of the energy generation rate. The effects of mixtures were taken into account. Further work suggestions are also presented.

- 921 (COO--2571-12) IMPROVEMENT AND

VERIFICATION OF FAST REACTOR SAFETY ANALYSIS TECHNIQUES. PROGRESS REPORT, JANUARY 1, 1978--MARCH 31, 1978. Barker, D.H.; Wheeler, P.A. (Brigham Young Univ., Provo, UT (USA). Dept. of Chemical Engineering). 1978. Contract EY-76-S-02-2571. 11p. Dep. NTIS, PC A02/MF A01.

A stainless steel vessel was used to perform preliminary fuel simulant, closed system experiments. The reaction of DMSO in acetyl chloride was carried out within the closed vessel. Temperatures and pressure in the vessel were measured as a function of time for several solution concentrations. These experiments are the first of a series designed to investigate the properties of fuel dispersion in a closed system.

- 922 (COO--2571-14) IMPROVEMENT AND VERIFICATION OF FAST REACTOR SAFETY ANALYSIS TECHNIQUES. PROGRESS REPORT, JULY 1, 1978--SEPTEMBER 30, 1978. Barker, D.H.; Wheeler, P.; Bybee, D.J. (Brigham Young Univ., Provo, UT (USA). Dept. of Chemical Engineering). 1978. Contract EY-76-S-02-2571. 169p. Dep. NTIS, PC A08/MF A01.

This report deals with the simulation of a HCDA in a LMFBR using chemical heating. The chemicals used were acetyl chloride and dimethyl sulfoxide in a benzene base. In our last report, it was shown that for high concentrations of the two chemicals, vapor velocities above 8 cm/sec and void fractions above 50% were obtained in a closed system. However, at lower concentrations, such as 4 M, no void fraction was obtained. During this period of work, a closed system with a cooling coil was used to provide a larger heat sink. It was shown that for the 4 M concentration void fractions above 50% was obtained and for the 9 M concentration the void fraction was higher and stayed dispersed much longer than without the cooling coil.

- 923 (COO--2571-15) IMPROVEMENT AND VERIFICATION OF FAST REACTOR SAFETY ANALYSIS TECHNIQUES. PROGRESS REPORT, OCTOBER 1, 1978--DECEMBER 31, 1978. Barker, D.H.; Wiberg, D.V. (Brigham Young Univ., Provo, UT (USA). Dept. of Chemical Engineering). 1978. Contract EY-76-S-02-2571. 11p. Dep. NTIS, PC A02/MF A01.

The effect of using Acetone, Benzene, or Toluene as a solvent material in a 4M, Acetyl Chloride-Dimethyl Sulfoxide reaction system was investigated. Maximum void fraction and length of time with void greater than 50% were compared. The Acetone system produced the largest maximum void and longest time above 50% void followed by Benzene and Toluene in descending order. Seventeen waxes were tested and compared to determine a material suitable to simulate reactor containment materials (e.g., steel, concrete). Waxes were compared on the basis of solubility in the reaction materials, melting point and structural integrity.

- 924 (COO--2571-17) IMPROVEMENT AND VERIFICATION OF FAST REACTOR SAFETY ANALYSIS TECHNIQUES. PROGRESS REPORT, APRIL 1, 1979--JUNE 30, 1979. Barker, D.H.; Wiberg, D.V. (Brigham Young Univ., Provo, UT (USA). Dept. of Chemical Engineering). 1979. Contract EY-76-S-02-2571. 36p. Dep. NTIS, PC A03/MF A01.

This report details a mathematical model for the dissipation of heat from an internally heated liquid pool which is contained in a hollow cylinder of finite inside and outside diameter. The model includes a temperature profile for the previously described cylinder, empirical correlations for Nusselt numbers at the walls of the container and a film theory

correction of the heat transfer coefficients for mass transfer. Also included in this report is a description of the experimental work conducted as a preliminary step to verification or rejection of the proposed mathematical model. This experimental work consisted of reacting Dimethyl Sulfoxide (DMSO) with Acetyl Chloride (AC), using Acetone as a solvent, in a hollow wax cylinder and observing the geometry and dimensions of the melt.

- 925 (COO--2571-19) IMPROVEMENT AND VERIFICATION OF FAST REACTOR SAFETY ANALYSIS TECHNIQUES. PROGRESS REPORT, OCTOBER 1, 1979--MARCH 31, 1980. Barker, D.H.; Wiberg, D.V. (Brigham Young Univ., Provo, UT (USA). Dept. of Chemical Engineering). 1980. Contract AC02-76ET37205. 7p. NTIS, PC A02/MF A01.

Several of the time dependent properties of the dimethyl sulfoxide-acetyl chloride reaction system were determined. The volume of a wax cylinder melted by conducting a dimethyl sulfoxide-acetyl chloride reaction in the vessel was compared with the melted volume calculated using several different heat transfer correlations. It was found that a laminar flow at the wall model provided the most accurate calculation of the observed melted volume.

- 926 (COO--2781-12TR) HEAT TRANSFER AND FLUID FLOW ASPECTS OF FUEL--COOLANT INTERACTIONS. Corradini, M.L. (Massachusetts Inst. of Tech., Cambridge (USA). Dept. of Nuclear Engineering). Sep 1978. Contract EY-76-S-02-2781. 530p. Dep. NTIS, PC A23/MF A01.

A major portion of the safety analysis effort for the LMFBR is involved in assessing the consequences of a Hypothetical Core Disruptive Accident (HCDA). The thermal interaction of the hot fuel and the sodium coolant during the HCDA is investigated in two areas. A postulated loss of flow transient may produce a two-phase fuel at high pressures. The thermal interaction phenomena between fuel and coolant as the fuel is ejected into the upper plenum are investigated. A postulated transient overpower accident may produce molten fuel being released into sodium coolant in the core region. An energetic coolant vapor explosion for these reactor materials does not seem likely. However, experiments using other materials (e.g., Freon/water, tin/water) have demonstrated the possibility of this phenomenon.

- 927 (COO--2781-13) FUEL COOLANT THERMAL INTERACTION PROJECT UC 79P. QUARTERLY PROGRESS REPORT NO. 7. (Massachusetts Inst. of Tech., Cambridge (USA)). Jul 1977. Contract EY-76-S-02-2781. 20p. Dep. NTIS, PC A02/MF A01.

The objective of the continued work on this project is to experimentally and analytically study the dominant mechanisms in fuel-coolant thermal interactions which could lead to vapor explosions. The exploration of mechanisms is focused in two areas: (1) investigations in dynamics of liquid-liquid film boiling; and (2) possible mechanisms of energy dissipation due to heat transfer during the HCDA expansion. Work being performed simultaneously in these areas is briefly described.

- 928 (COO--2781-14) FUEL--COOLANT THERMAL INTERACTION PROJECT. PROGRESS REPORT NO. 8. Todreas, N.E. (Massachusetts Inst. of Tech., Cambridge (USA)). 1978. Contract EY-76-S-02-2781. 24p. Dep. NTIS, PC A02/MF A01.

Progress is reported in the areas of: (a) Analysis of the experimental results of a fundamental Taylor Instability Experiment; (b) Development of simple models for liquid entrainment and liquid-vapor heat transfer occurring in the transient expansion of a gaseous high pressure zone; and (c) Application of these models experiments to assess the model's adequacy.

- 929 (COO--2781-15FR) FINAL REPORT ON MIT CONTRACT ON FUEL-COOLANT INTERACTIONS. Todreas, N.E. (Massachusetts Inst. of Tech., Cambridge (USA). Dept. of Nuclear Engineering). Oct 1978. Contract EY-76-S-02-2781. 20p. Dep. NTIS, PC A02/MF A01.

The work of this contract has yielded results in three areas which can be summarized as follows. The existing body of molten metal/water interaction data appears consistent with the criteria of the spontaneous nucleation theory. The observed fragmentation of UO_2 can be satisfactorily predicted using the proposed thermal stress initiated fracture model. The work potential of a hypothetical fuel vapor source acting on a sodium slug can be reduced by about a factor of two by considering entrainment due to Taylor instabilities at the vapor-liquid interface.

- 930 (COO--2801-7) ACOUSTIC AND TURBULENT AGGLOMERATION OF SODIUM AEROSOLS. PROGRESS REPORT, JANUARY 1, 1977--DECEMBER 31, 1977. Hinds, W.C. (Harvard Univ., Boston, MA (USA). School of Public Health). Sep 1977. Contract EY-76-S-02-2801. 8p. Dep. NTIS, PC A02/MF A01.

Freshly formed and aged sodium aerosols generated by burning metallic sodium in air were decontaminated in wet cell washers of experimental design. Two wetted cells in series packed with curly glass fibers 35 μ m in diameter gave removal efficiencies in excess of 90%. More efficient cell packings and a larger number of cells in series can be used to raise collection efficiency above 99%.

- 931 (COO--2801-8) ACOUSTIC AND TURBULENT AGGLOMERATION OF SODIUM AEROSOLS. QUARTERLY PROGRESS REPORT, OCTOBER 1, 1977--DECEMBER 31, 1977. Hinds, W.C. (Harvard Univ., Boston, MA (USA). School of Public Health). Jan 1978. Contract EY-76-S-02-2801. 11p. Dep. NTIS, PC A02/MF A01.

Design of a wet cell washer and test system for air cleaning of sodium fire aerosols is described. The test aerosol was produced by continuous burning of metallic sodium in a 90 m^3 chamber to maintain a concentration of 1.14 ± 0.05 g/ m^3 for as long as 65 minutes. The sodium fire aerosol was drawn through the wet cell washer test loop at a constant flow rate of 9 m^3 /min. The wet cell washer consisted of two cells in series, the first, two off-set layers of perforated metal screen, and the second, a 4" thick filter stage packed with curly glass fibers 35 μ m in diameter. The wet cells were washed by solid cone water spray at 16.7 lpm at 30 psig. Sodium removal efficiencies ranged from 87 to 94%. Curly glass fibers were found to deteriorate after a six hour exposure to sodium aerosols.

- 932 (COO--2801-9) ACOUSTIC AND TURBULENT AGGLOMERATION OF SODIUM AEROSOLS. FINAL REPORT, OCTOBER 1, 1975--JULY 31, 1978. Hinds, W.; Price, J.; First, M.W. (Harvard Univ., Boston, MA (USA). School of Public Health). Nov 1978. Contract EY-76-S-02-2801. 15p. Dep. NTIS, PC A02/MF A01.

A suitability of 6 packing materials for removal of sodium fire aerosols in a wet cell scrubber was evaluated experimentally by measuring the efficiency and flow resistance of two 10.2 cm deep cells in series at air face velocities of 185 and 289 cm/sec, water flow rates of 0.210 and 0.387 $cm^3/sec/cm^2$, with and without aerosol prehumidification. The most satisfactory material was found to be 50 μ m diameter stainless steel fibers at a packing density of 30 kg/ m^3 (porosity = 0.99). Two 10.2 cm deep cells in series gave a removal efficiency of 85% for typical sodium fire aerosols at a face velocity of 289 cm/sec. Measurement of efficiency as a function of particle size indicated a reduction in efficiency in the 0.4 to 1.1 μ m size range for all packing materials.

- 933 (COO--2826-4) FAST BREEDER BLANKET FACILITY (FBBF). QUARTERLY PROGRESS REPORT, APRIL 1, 1977--JUNE 30, 1977. Ott, K.O. (ed.). (Purdue Univ., Lafayette, IN (USA)). Jun 1977. Contract EY-76-S-02-2826. 51p. (PNE--77-119). Dep. NTIS, PC A04/MF A01.

The work performed in the reporting period was primarily concerned with aspects of the preanalysis and the corresponding safety investigations of the Fast Breeder Blanket Facility (FBBF). Progress on the loading of the first configuration, testing experimental equipment, and performing check-out tests is also summarized. It is necessary that a neutron poison (B_4C) be placed in the converter regions in order to hold the value of k_{sub} eff/ for a hypothetical flooded FBBF of future loadings below the licensed limit of 0.75. It appears that this limit on k_{sub} eff/ can be attained for all loadings if one of the 180° configurations consists of stainless steel double clad natural uranium rods. The safety of one of the most reactive configurations is investigated and the need for B_4C verified. In addition, the safety of other FBBF loadings is investigated.

- 934 (COO--2826-5) FAST BREEDER BLANKET FACILITY (FBBF). QUARTERLY PROGRESS REPORT, JULY 1, 1977--SEPTEMBER 30, 1977. PNE-77-120. Ott, K.O. (ed.). (Purdue Univ., Lafayette, IN (USA). School of Nuclear Engineering). Sep 1977. Contract EY-76-S-02-2826. 60p. Dep. NTIS, PC A04/MF A01.

The work performed in the reporting period was primarily concerned with the detailed preanalysis of the first experimental loading sequence. Progress on testing experimental equipment and performing checkout test is also summarized. Preanalysis calculations of important reaction rates have been completed. Two-dimensional diffusion calculations were made to obtain the neutron flux. A program was written to obtain reaction rates at any spatial mesh point using the calculated flux. Preanalysis calculations for gamma-ray heating rates have also been completed. Coupled neutron-gamma-ray calculations were performed using a one-dimensional transport code to obtain the gamma-ray flux. Heating rates in several materials were then calculated using kerma factors. These preanalysis calculations of reaction rates and gamma-ray heating rates will be used in the detailed planning of the experiments.

- 935 (COO--2826-7) FAST BREEDER BLANKET FACILITY (FBBF). ANNUAL REPORT, JANUARY 31, 1976--DECEMBER 31, 1977. Ott, K.O. (ed.). (Purdue Univ., Lafayette, IN (USA). School of Nuclear Engineering). Jan 1978. Contract EY-76-S-02-2826. 85p. (PNE--78-127). Dep.

NTIS, PC A05/MF A01.

The work performed in the reporting period was primarily concerned with the construction of the Fast Breeder Blanket Facility (FBBF), acquisition of experimental equipment, outlining the experimental program, preanalysis of the initial loading configuration and investigation of the safety of the initial loading and advanced loadings. The detailed physical description of the FBBF, operational procedures and controls, radiation shielding and experimental equipment are presented. The ability of the FBBF to simulate the blanket spectrum of a large fast breeder reactor is illustrated by comparison of spectra. The source axial distribution, reaction rate comparisons, breeding of plutonium and gamma-ray energy deposition rates are also discussed. Some of the safety aspects of the initial loading and advanced loadings are described. Experimental capabilities of the facility are outlined.

- 936 (COO--2826-8) FAST BREEDER BLANKET FACILITY. QUARTERLY PROGRESS REPORT, JANUARY 1, 1978--MARCH 31, 1978. Clikeman, F.M. (ed.). (Purdue Univ., Lafayette, IN (USA). School of Nuclear Engineering). Mar 1978. Contract EY-76-S-02-2826. 39p. (PNE--78-128). Dep. NTIS, PC A03/MF A01.

The work performed in the reporting period was primarily concerned with the continued preanalysis of the first experimental sequence (Task B) and the loading of the first blanket (Task C). Progress on testing experimental equipment and performing checkout tests is also summarized. A comparison of calculated spectra for the original FBBF design, the "as-built" facility, and a large LMFBR is reported. A description of the one- and two-dimensional models used for reaction rate and spectrum calculations are summarized together with a comparison of the results.

- 937 (COO--2826-9) FAST BREEDER BLANKET FACILITY. QUARTERLY PROGRESS REPORT, APRIL 1, 1978--JUNE 30, 1978. Clikeman, F.M. (ed.). (Purdue Univ., Lafayette, IN (USA). School of Nuclear Engineering). Jun 1978. Contract EY-76-S-02-2826. 51p. (PNE--78-132). Dep. NTIS, PC A04/MF A01.

The work performed in the reporting period was primarily concerned with the initial measurements and checkout of the Purdue Fast Breeder Blanket Facility (TASK C). The safety calculations for the "as built" are also presented and compared with the initial safety calculations (TASK B). Safety calculations on the FBBF facility have been completed for a variety of new flooded-dry combinations. Specifically the effect of adding boron carbide to the transformer regions was investigated. The investigation showed the stabilizing effect of the boron carbide in the flooded cases while the effect in the dry cases is minimal. Measurements of the $k_{\text{sub eff}}$ of the FBBF facility, of the effectiveness of the shielding, and of the radiation levels in the rooms surrounding the laboratory have been completed and compare well with the calculations presented in the license application.

- 938 (COO--3027-27) EXPERIMENTAL HIGH TEMPERATURE COEFFICIENTS OF COMPRESSIBILITY AND EXPANSIVITY OF LIQUID SODIUM AND OTHER RELATED PROPERTIES. Das Gupta, S. (Columbia Univ., New York (USA)). 1977. Contract EY-76-S-02-3027. 172p. Dep. NTIS, MF A01.

Portions of document are illegible.

The subcooled compressibility of liquid

sodium was directly measured up to 200 atm between 900 K and 1867 K, utilizing a new multi-property apparatus which was previously tested with water. The experimental data were correlated by a 6-term equation with a standard deviation of 9.2 percent. The equation can be used to estimate the subcooled compressibilities and densities of liquid sodium up to 2300 K and 500 ata. The thermal expansion of liquid sodium was also measured along the isobars 1 ata, 28.9 ata and 69 ata. Densities within 1 percent of those obtained from the compressibilities were obtained. The above compressibility data were used to calculate the thermal pressure coefficient of saturated liquid sodium. Also, Bhise and Bonilla's correlations for the vapor pressure and the saturated liquid density of sodium were improved by including more data in the analysis. The critical temperature and density were thus reestimated as 2508.7 K and 0.2141 g/cc. Furthermore, a new correlation was developed to determine the heat of vaporization of sodium up to the critical point, which was then used to estimate the internal energy and the entropy of vaporization and the saturated vapor density of sodium up to the critical point.

- 939 (COO--3027-37) HIGH TEMPERATURE PROPERTIES OF NUCLEAR REACTOR COOLANTS AND THERMODYNAMIC POWER CYCLE WORKING FLUIDS. TECHNICAL PROGRESS REPORT, DECEMBER 1, 1977--NOVEMBER 30, 1978. Bonilla, C.F.; Holder, G.P. (Columbia Univ., New York (USA). Liquid Metals Research Lab.). Sep 1978. Contract EY-76-S-02-3027. 39p. Dep. NTIS, PC A03/MF A01.

The program to determine the surface tension of sodium to high temperatures has been soundly commenced with the completion and calibration of a new all-molybdenum maximum-bubble-pressure apparatus suitable to some 1900°K. This property bears on boiling, condensing and two-phase flow phenomena, also related to LMFBR analysis. This same apparatus will be useful with lithium, of interest in fusion reactor cooling. Reduction of prior maximum bubble pressure results on potassium by the Schroedinger method has been repeated by the more precise but time-consuming Sugden procedure, which has increased the resulting surface tension values by an average of 0.27%. Thus the Sugden method will be employed to reduce the data for sodium and lithium.

- 940 (COO--3536-13) SEPARATION OF KRYPTON AND XENON FROM REACTOR ATMOSPHERES BY SELECTIVE PERMEATION. FINAL REPORT. Stern, S.A.; Leone, S.M.; Onorato, F.J.; Wang, S.C. (Syracuse Univ., NY (USA). Dept. of Chemical Engineering and Materials Science). Mar 1978. Contract EY-76-S-02-3536. 110p. Dep. NTIS, PC A06/MF A01.

The removal of krypton and xenon from nuclear reactor atmospheres by permeation through silicone rubber capillaries has been studied theoretically and experimentally. Permeator modules resembling shell-and-tube heat exchangers have been constructed and tested. Permeation cascades were designed for the removal of krypton and xenon from the following nuclear atmospheres: (a) the atmosphere of a reactor containment building after a nuclear accident; (b) the off-gas of a nuclear fuel reprocessing plant; and (c) the cover gas of a liquid-metal-cooled fast breeder reactor. Design criteria are presented for the separation of multicomponent mixtures with large separation factors. The performance of "ideal" cascades, in which the concentrations of a key component are matched in mixing

interstage streams, is compared with that of cascades with constant stage cuts. The removal of krypton and xenon from reactor atmospheres in permeation cascades with silicone rubber capillaries is a potentially attractive process because of its safety and reliability. Permeator modules are compact and sturdy and a permeation plant could be easily transported to the scene of a nuclear accident.

- 941 (COO--4040-3) SURFACE RADIATION PROPERTIES BETWEEN NUCLEAR REACTOR MATERIALS IN CONTACT. Chan, S.H.; Tseng, H.H. (Wisconsin Univ., Milwaukee (USA). Dept. of Energetics). 18 Oct 1978. Contract EY-76-S-02-4040. 42p. Dep. NTIS, PC A03/MF A01.

This technical report summarizes a portion of the results on surface radiation properties of reactor materials, which is part of the program on Attenuation of Radiological Consequences From Core Disruptive Accidents by Radiative Transfer. In analyzing radiant energy exchange between the fuel and coolant, it is necessary to know the reflection absorption, and emission characteristics of the fuel and its interface with coolant. Because of unavailability and great uncertainty of those radiation properties, they are calculated from the electromagnetic theory of optics and results are presented here. Depending on the contacting medium, six types of surfaces received consideration. They are the interfaces between uranium dioxide and sodium, uranium dioxide and steel, uranium dioxide and a gas, water and a gas, steel and a gas as well as sodium and a gas. The spectral interface reflectance as well as the spectral absorptance from one side of the medium to the other side is evaluated for all wavelengths. Those spectral properties are further integrated to yield the total hemispherical properties for a black body source over a temperature range of 1200°K to 6000°K. Comparisons are made with available experimental data or calculated values and the general agreement is found generally good.

- 942 (COO--4116-2) INVESTIGATION OF ACCURACY AND COMPUTATION TIME OF A HIERARCHY OF GROWTH RATE DEFINITIONS. Maudlin, P.J.; Borg, R.C.; Ott, K.O. (Purdue Univ., Lafayette, IN (USA). School of Nuclear Engineering). Jul 1977. Contract EY-76-S-02-4116. 21p. Dep. NTIS, PC A02/MF A01.

A numerical illustration of the hierarchy of four logically different procedures for the calculation of the asymptotic growth of fast breeder fuel is presented. Each hierarchy level is analyzed in terms of accuracy and computational effort. Using the first procedure as reference, the fourth procedure, which incorporates the isotopic breeding worths, w vector*, requires a minimum amount of effort with a negligible decrease in accuracy.

- 943 (COO--4116-3) INVESTIGATION OF THE GROWTH RATE FOR JOINT FAST BREEDER REACTOR AND LIGHT WATER REACTOR OPERATION. Hanan, N.A.; Borg, C.R.; Ott, K.O. (Purdue Univ., Lafayette, IN (USA). School of Nuclear Engineering). Jul 1977. Contract EY-76-S-02-4116. 24p. Dep. NTIS, PC A02/MF A01.

An investigation of fuel consumption and breeding characteristics of FBR-LWR joint operation is presented. The FBR operates in a closed cycle with joint-reprocessing of core and blanket material. The LWR-portion that runs on FBR plutonium operates in an open cycle. The growth rate of the system is defined based upon the fact that the discharge from the system will make up a fraction of an identical system;

the system growth rate is found to have an almost linear dependence on the fraction of the LWR fed by plutonium from the FBR. The LWR growth rate, which is negative, is a constant and represents the fraction of the fuel burnt in the LWR=fraction that runs on FBR plutonium per year.

- 944 (COO--4171-3) HEAT TRANSFER CHARACTERISTICS OF A NON-BOILING POOL WITH SPATIALLY UNIFORM GAS INJECTION. Ganguli, A.; Luk, A.; Bankoff, S.G. (Northwestern Univ., Evanston, IL (USA). Dept. of Chemical Engineering). Dec 1978. Contract EN-77-S-02-4171. 36p. Dep. NTIS, PC A03/MF A01.

It is possible to encounter molten fuel pools in the course of events during a hypothetical Liquid Metal Fast Breeder Reactor accident. In such cases it may be important to estimate correctly the rate of melting of the pool walls and bottom, which are governed by the rate of heat transfer to those materials. The heat transfer characteristics of internally heated two-phase pools are thus of interest. Heat transfer measurements were made in the horizontal and downward directions both in transient and in steady state. The transient study involved slow cooling or heating of the pool liquid, while in the steady state case heat was provided by electrical immersion heaters. A permanent gas was injected from a distributed hypodermic tubing network with two hole sizes. Void fraction measurements were also made by static pressure probes. The data is reported as plots of Nusselts number versus Reynolds number and surface evaporation and entrainment effects for a boiling pool were estimated for comparison purposes.

- 945 (COO--4197-T1) SODIUM ION LEAK DETECTOR. QUARTERLY TECHNICAL PROGRESS REPORT, JANUARY 1-APRIL 1, 1978. Hrizo, J.; Bauerle, J.E.; Witkowski, R.E. (Westinghouse Research and Development Center, Pittsburgh, PA (USA)). 5 May 1978. Contract EN-77-C-02-4197. 9p. AT.

This program involves a basic technology development effort for the Westinghouse Sodium Ionization Detector (SID). The study consists of four task areas that will be performed over a two-year period. This effort will establish an in-situ operational testing/calibration method for the SID. It will test the performance/reliability characteristics of aged filaments and evaluate potential chemical interference effects. Quarterly and annual reports will be submitted detailing the work accomplished during the current period, problems encountered, and their resolutions.

- 948 (COO--4261-4) GROWTH OF MOLTEN CORE DEBRIS POOLS IN CONCRETE. PROGRESS REPORT, MARCH 1, 1977--NOVEMBER 30, 1977. Abdel-Khalik, S.I. (Wisconsin Univ., Madison (USA)). Dept. of Nuclear Engineering). Nov 1977. Contract EN-77-S-02-4261. 24p. Dep. NTIS, PC A02/MF A01.

Experiments have been conducted using a volumetrically-heated pool with noncondensable gas injection at the boundaries to simulate the heat transfer processes taking place in molten core debris/concrete systems. Measurements of the upward, downward, and sideward heat transfer rates have been made over wide ranges of internal Rayleigh number ($6.0 \times 10^5 < Ra < 2.7 \times 10^9$), superficial gas velocity ($0 < V_{sub} g / < 2.5 \text{ cm/min}$), and pool aspect ratio ($1.32 < W/L < 5.16$). Pools with either an isothermal solid upper boundary or a free surface have been examined. Detailed measurements of the temperature distribution within the pools have also been made. The results indicate that the downward heat transfer rates are significantly increased while the sideward heat transfer rates are slightly affected by gas injection. The heat transfer rates at the pool boundaries are sensitive to the upper surface boundary condition. Efforts are continuing on the second part of the present study where the phase-change and gas evolution processes are combined.

- 949 (COO--4261-8) CONVECTIVE HEAT TRANSFER CORRELATIONS FOR MOLTEN CORE DEBRIS POOLS GROWING IN CONCRETE. Felde, D.K.; Kim, H.S.; Abdel-Khalik, S.I. (Wisconsin Univ., Madison (USA)). Dept. of Nuclear Engineering). [nd]. Contract EN-77-S-02-4261. 5p. Dep. NTIS, PC A02/MF A01.

The heat and mass transfer processes taking place in volumetrically-heated pools are of interest because of their relevance in post accident heat removal analyses for fast reactors. Earlier studies on volumetrically-heated pools have focused on natural convection phenomena. These, however, do not apply for molten core debris pools growing in concrete since large amounts of gas will be released by the concrete. These gases will vigorously mix the pool. Knowledge of the heat transfer rates at the pool boundaries is necessary in order to assess the passive core retention capability of the concrete support structure below the reactor vessel. Hence, the main objectives of this investigation have been to experimentally simulate the gas evolution process at the pool boundaries and determine the effect of gas release on the heat transfer rates along the boundaries. Nusselt-type correlations have been obtained for the downward, sideward, and upward

- 950 (COO--4261-9) EFFECT OF OVERLAYING STEEL LAYERS ON THE GROWTH OF MOLTEN CORE DEBRIS POOLS IN CONCRETE. Paik, I.K.; Felde, D.K.; Abdel-Khalik, S.I. (Wisconsin Univ., Madison (USA)). Dept. of Nuclear Engineering). [nd]. Contract EN-77-S-02-4261. 5p. Dep. NTIS, PC A02/MF A01.

Following a hypothetical core disruptive accident (HCDA) in a fast reactor, the core debris may be in the form of a molten pool which is volumetrically heated by the radioactive decay of the dissolved fission products. The debris pool may be retained in the concrete support structure below the reactor vessel. It grows continually by melting the concrete which readily dissolves in the pool. The purpose of this research is to simulate the heat and mass transfer processes taking place in the molten steel/core debris/concrete system. The effects of the initially-lighter steel layer atop the pool and the subsequent inversion process on the transient radial and downward growth rates of the pool are investigated.

- 951 (COO--4261-10) RETENTION OF MOLTEN CORE DEBRIS POOLS IN COMPOSITE SACRIFICIAL BEDS. Paik, I.K.; Abdel-Khalik, S.I. (Wisconsin Univ., Madison (USA)). Dept. of Nuclear Engineering). [nd]. Contract EN-77-S-02-4261. 5p. Dep. NTIS, PC A02/MF A01.

Passive core catchers have been proposed as a means for retaining the core debris following a hypothetical core disruptive accident in a fast reactor. The core debris which may be in the form of a molten pool is passively retained in a sacrificial bed of high melting temperature material placed inside or outside the reactor vessel. Recently, it has been suggested that composite sacrificial beds with a low-melting-temperature zone inside the main high-melting-temperature bed may be more effective in retaining the pool than simple beds. It was argued that the inner zone would quickly melt and dilute the pool so that further growth into the main bed would be slowed. Hence, the main objective of this work has been to examine the composite bed concept to ascertain its efficacy vis-a-vis simple sacrificial beds.

- 952 (COO--4261-11) SIMULATION OF HEAT AND MASS TRANSFER PROCESSES IN MOLTEN CORE DEBRIS-CONCRETE SYSTEMS. Felde, D.K. (Wisconsin Univ., Madison (USA)). 1979. Contract EN-77-S-02-4261. 116p. Dep. NTIS, PC A06/MF A01.

Thesis.

The heat and mass transport phenomena taking place in volumetrically-heated fluids have become of interest in recent years due to their significance in assessments of fast reactor safety and post-accident heat removal (PAHR). Following a hypothetical core disruptive accident (HCDA), the core and reactor internals may melt down. The core debris melting through the reactor vessel and guard vessel may eventually contact the concrete of the reactor cell floor. The interaction of the core debris with the concrete as well as the melting of the debris pool into the concrete will significantly affect efforts to prevent breaching of the containment and the resultant release of radioactive effluents to the environment.

- 953 (COO--4261-12) GROWTH OF MOLTEN CORE DEBRIS POOLS IN CONCRETE. PROGRESS REPORT, APRIL 1--JUNE 30, 1979. Abdel-Khalik, S.I.

(Wisconsin Univ., Madison (USA). Dept. of Nuclear Engineering). 1 Jul 1979. Contract EN-77-S-02-4261. 48p. Dep. NTIS, PC A03/MF A01.

The heat and mass transfer processes taking place in molten core debris/concrete systems have been experimentally investigated. Two types of experiments have been conducted. The first experiment simulates the growth of a molten debris pool in a composite sacrificial bed. This experiment models debris pool growth in an inner, low-melting point, sacrificial material zone followed by a melting attack on the concrete bed. The purpose of the inner zone is to quickly melt and dilute the debris pool so that its subsequent downward growth in the concrete may be slowed. In the second experiment a two-layer immiscible liquid system is volumetrically heated and allowed to melt into a low-density gas-releasing solid bed which is miscible in the initially-higher-density bottom liquid. The solid melts, mixes with, and dilutes the bottom liquid pool until its density is lower than that of the top liquid. At this time pool inversion occurs and the immiscible liquid sinks to the bottom of the pool displacing the now lighter fuel-concrete simulant.

954 (COO--4261-14) GROWTH OF MOLTEN CORE DEBRIS POOLS IN CONCRETE. PART II. A. POOL GROWTH IN COMPOSITE BEDS; B. EFFECT OF OVERLAYING STEEL LAYERS. FINAL REPORT, MARCH 1, 1978-SEPTEMBER 30, 1979. Abdel-Khalik, S.I. (Wisconsin Univ., Madison (USA). Dept. of Nuclear Engineering). 26 Dec 1979. Contract EN-77-S-02-4261. 47p. Dep. NTIS, PC A03/MF A01.

The heat and mass transfer processes taking place in molten core debris/concrete systems have been experimentally investigated. Two types of experiments have been conducted. The first experiment simulates the growth of a molten debris pool in a composite sacrificial bed. This experiment models debris pool growth in an inner, low-melting point, sacrificial material zone followed by a melting attack on the concrete bed. The purpose of the inner zone is to quickly melt and dilute the debris pool so that its subsequent downward growth in the concrete may be slowed. In the second experiment a two-layer immiscible liquid system is volumetrically heated and allowed to melt into a low-density gas releasing solid bed which is miscible in the initially-higher-density bottom liquid. The solid melts, mixes with, and dilutes the bottom liquid pool until its density is lower than that of the top liquid.

955 (COO--4932.M001-2) ANALYSIS OF FLOW IMPEDANCE PHENOMENA. FINAL REPORT, JUNE 1, 1978-JULY 31, 1979. Bishop, A.A. (Pittsburgh Univ., PA (USA)). Dec 1979. Contract ET-78-S-02-4932. 102p. Dep. NTIS, PC A06/MF A01.

Pressure drop data obtained during testing of the MARK I, II and IIA fuel assemblies in the Argonne National Laboratory liquid metal core component loop (CCTL) were analyzed. It is concluded that the previously unexplained pressure drop increase measured across the MARK II and MARK IIA assemblies was caused by metallic particulate fouling; the source was mechanical-chemical wear of the loops pump journal shaft. The implication to liquid metal breeder reactor (LMFBR) operation is that if a continuous source of metallic particles exists upstream of the core, a pressure drop increase can be expected. The size of the deposited particles should be larger than the thickness of laminar sublayer on a fuel rod. It is also

concluded that the most probable source of metallic particulates will come from component failure and not from normal corrosion products. A small amount of deposited particulates can produce a relatively high pressure drop increase.

956 (COO--4954-1(Vol.1)) ENERGY ECONOMIC DATA BASE (EEDB) PROGRAM: PHASE I, VOLUME I. FINAL REPORT. (United Engineers and Constructors, Inc., Philadelphia, PA (USA)). Dec 1979. Contract EN-78-C02-4954. 306p. (UE/C-DOE--790930(Vol.1)). Dep. NTIS, PC A14/MF A01.

The Energy Economic Data Base Program, which deals with the development of cost data for nuclear and comparison electric power generating stations, provides periodic updates of technical and cost (capital, fuel, and operating and maintenance) information of significance to DOE. The information allows for evaluation and monitoring of US civilian nuclear power programs and provides a consistent means of evaluation the nuclear option against alternatives. Currently, the EEDB contains 6 nuclear electrical generating plant technical models and 5 comparison coal-fired electrical generating plant technical models. Each of these technical plant models is a complete conceptual design for a single unit, steam electric power generating station located on a standard, hypothetical Middletown site. A description of the site is provided in Appendix A-1 (Volume 2) for nuclear plants, and Appendix A-2 (Volume 2) for coal-fired plants. The EEDB also includes a conceptual design of a coal liquefaction plant for comparison purposes. Volume 1 provides a description of the current Data Base, as of September 30, 1978: gives assumptions and ground rules for the initial-cost update; summarizes the initial cost update, with cost results tabulated; details the initial update of the technical conceptual design, the capital cost, the quantities of commodities and their unit costs, and craft labor man hours and costs for each EEDB program model; and details the fuel-cycle-cost initial update and the operating- and maintenance-cost initial update. Finally, an extensive list of references and a glossary are presented.

957 (COO--4954-1(Vol.2)) ENERGY ECONOMIC DATA BASE (EEDB) PROGRAM: PHASE I, VOLUME II. FINAL REPORT. (United Engineers and Constructors, Inc., Philadelphia, PA (USA)). Dec 1979. Contract EN-78-C-02-4954. 386p. (UE/C-DOE--790930(Vol.2)). Dep. NTIS, PC A14/MF A01.

This Volume II of Phase I of the Energy Economic Data Base Program contains appendices. Appendix A-1 provides the site and environmental data, derived from Appendix A of Guide for Economic Evaluation of Nuclear Reactor Plant Designs, USAEC Report NUS-531, modified to reflect current requirements. These data form the bases of the criteria used for designing the facility and for evaluating the routine and accidental release of radioactive liquids and gases to the environment. Appendix A-2 provides the site and environmental data as derived from Appendix A of NUS-531, and modified to reflect coal-plant siting, forming the bases of the criteria used for designing the facility and for evaluating the release of liquids and gases to the environment. A description of the topography of the hypothetical city, Middletown, is given. Appendix B provides an overall summary of the conclusions of NUS' work on all NUS tasks in support of the nuclear fuel-cycle work in Phase I. Appendix C-1 introduces the concepts involved and addresses methods of calculation

of fixed charges applicable to investor-owned utilities, as used in the EEDB. Appendix C-2 consists of review and revision of each plant's fuel cycle and operating and maintenance costs in accordance with the EEDB update procedures. In Appendix D, NSSS Capital Costs for a Mature LMFBR Industry, much information is provided on plant description, cost estimate, comparison and discussion, drawings, and equipment list. (MCW)

- 958 (COO/4116--1) IMPACT OF DELAYS IN PLUTONIUM USE ON THE STATIONARY GROWTH RATE OF FAST BREEDER REACTOR FUEL. Borg, R.C.; Ott, K.O. (Purdue Univ., Lafayette, IN (USA). School of Nuclear Engineering). Jul 1977. Contract EY-76-S-02-4116. 55p. Dep. NTIS, PC A04/MF A01.

The hierarchy of the four growth rate expressions originally derived from an instantaneous reuse scheme is expanded to account for finite burnup in the core and blanket, β -decay of ^{241}Pu , core and blanket loading schemes, reuse delays due to reprocessing and fabricating fuel and external fuel cycle losses. The most general growth rate expression, obtained from the asymptotic slope of the accumulating fuel material in an expanding park of breeder reactors, is formally the same in both cases. Formulation of the growth rate based on the condensation of the detailed information of the equilibrium fuel cycle for a single reactor, is more complicated than without delays due to the composition difference between the average residing and excess discharge material. The third growth rate expression results from a slightly more complicated fuel-cycle eigenvalue problem than without delays. The last definition employs isotopic breeding worth factors obtained from the adjoint fuel cycle eigenvalue problem.

- 959 (COO/4171--1) FORMATION AND STABILITY OF CRUST IN MOLTEN POOLS. TECHNICAL PROGRESS REPORT, FEBRUARY 1, 1977--OCTOBER 1, 1977. Bankoff, S.G.; Ganguli, A. (Northwestern Univ., Evanston, IL (USA). Dept. of Chemical Engineering). 1977. Contract EN-77-S-02-4171. 43p. Dep. NTIS, PC A03/MF A01.

The objective of the research is to study the formation and stability of a freezing-melting process under well-defined hydrodynamic and thermal boundary conditions simulating LMFBR HCDA phenomena. A hot liquid, such as molten UO_2 , comes into contact with a cold solid, such as stainless steel forming a solid crust at the interface, possibly accompanied by the simultaneous formation of a melt layer. The stability and rate of growth of the crust and underlying melt layer are thus of concern. A steady flowpast an initially flat slab of the cold solid is considered. The experimental apparatus consists of a horizontal rectangular test section in which a frozen slab of n-decane 18-in. long and 4-in. wide, supported on a refrigerated copper block, is exposed to a flowing stream of cold water. Temperature profiles in the decane will be measured, as well as the rate of liquid decane collection, and the ice crust and melt layer profiles, if stable. These will be compared with theoretical predictions, following an integral boundary layer method. Current efforts are focussed on improving the mold release properties and other debugging operations.

- 960 (CRBRP--1(Vol.1)) CRBRP SAFETY STUDY: AN ASSESSMENT OF ACCIDENT RISKS IN THE CRBRP. VOLUME I. MAIN REPORT. (Clinch River Breeder Reactor Plant Project Office, Oak Ridge, TN (USA)). Mar 1977. Contract EY-76-C-15-1200.

222p. Dep. NTIS, PC A10/MF A01.

The objective of the CRBRP risk assessment is to provide a realistic evaluation of the risk to the public from the Clinch River Breeder Reactor Plant, to place that risk in perspective relative to other societal risks, and to provide a basis for assessing the comparability of the risk from the CRBRP with risks associated with previously licensed reactors. The assessment formally and systematically evaluated the CRBRP risk and showed that (1) the risk associated with postulated accidents of the CRBRP is negligible when compared with non-nuclear risks to which the local population is already exposed, (2) CRBRP risks are comparable to those from light-water reactors (LWRs) of the current generation as characterized in the Reactor Safety Study (RSS), and (3) the results of this study and those presented in the RSS reveal that the societal risk from currently defined nuclear power systems (both LWRs and the CRBRP) is extremely small.

- 961 (CRBRP--1(Vol.2)) ASSESSMENT OF ACCIDENT RISKS IN THE CRBRP. VOLUME 2. APPENDICES. (Clinch River Breeder Reactor Plant Project Office, Oak Ridge, TN (USA)). Mar 1977. Contract EY-76-C-15-1200. 750p. Dep. NTIS, PC A19/MF A01.

Appendices to Volume I include core-related accident=sequence definition, CRBRP risk=assessment sequence=probability determinations, failure=probability data, accident scenario evaluation, radioactive material release analysis, ex-core accident analysis, safety philosophy and design features, calculation of reactor accident consequences, sensitivity study, and risk from fires.

- 962 (CRBRP-ARD--0119) CLINCH RIVER BREEDER REACTOR PLANT. PRELIMINARY ANALYSIS OF HEAT GENERATING BLOCKAGES IN CRBRP FUEL AND RADIAL BLANKET ASSEMBLIES TO DETERMINE DETECTION REQUIREMENTS. Brown, R.G. (Westinghouse Electric Corp., Madison, PA (USA). Advanced Reactors Div.). Dec 1977. Contract EY-76-C-15-0003; EY-76-C-15-2395. 64p. AT.

Heat generating blockages in CRBR fuel and radial blanket assemblies during steady state operation have been analyzed. Blockages of both a single subchannel and six subchannels completely encircling one pin have been investigated. The blockage porosity and particle size have been treated parametrically. The results itemized in Tables IV through IX have been provided to assist in determining the sensitivity requirements of the delayed neutron monitoring system. For purposes of blockage detectability by the delayed neutron monitors, the total surface area of all particles within the blockage which are exposed to the sodium is the important parameter. Conclusions of this study are discussed.

- 963 (CRBRP-ARD--0132) CLINCH RIVER BREEDER REACTOR PLANT. A PRELIMINARY EVALUATION OF THE CRBRP NATURAL CIRCULATION DECAY HEAT REMOVAL CAPABILITY. Lowrie, R.R.; Severson, W.J. (Westinghouse Electric Corp., Madison, PA (USA). Advanced Reactors Div.). Nov 1977. Contract EY-76-C-15-2395; EY-76-C-15-0003. 291p. AT.

Using the "LMFBR Demonstration Plant Simulation Model (DEMO)" a preliminary evaluation of the Clinch River Breeder Reactor Plant decay heat removal capability by natural circulation has been made. This assessment was made in response to the design requirement that, although the plant is a forced circulation plant, emergency cooling shall be

based on natural circulation in all main heat transport loops. Based on this evaluation, the preliminary conclusions are: (1) The arrangement of components within the plant (i.e., the relative elevations of the IHX with respect to the core, the steam generator modules with respect to the IHX and the steam drum with respect to the evaporator modules) will provide thermal driving heads necessary to promote adequate flows in the natural circulation mode. (2) The specified pump coastdown characteristics satisfy the minimum flow decay requirements immediately following a plant trip. (3) While the CRBRP is a forced circulation plant, its heat transport and steam generator systems will provide a desirable margin in decay heat removal by their natural circulation capability.

- 964 (CRBRP-ARD--0147) CLINCH RIVER BREEDER REACTOR PLANT. INTERNAL/EXTERNAL CLADDING DEGRADATION. Travis, M.L. (Westinghouse Electric Corp., Madison, PA (USA). Advanced Reactors Div.). Oct 1977. Contract EY-76-C-15-1200;EY-76-C-15-2395. 63p. AT.

Cladding degradation of CRBRP fuel cans due to sodium-cladding interactions, fuel-cladding interactions, and fretting wear is discussed.

- 965 (CRBRP-ARD--0149) CLINCH RIVER BREEDER REACTOR PLANT. WIRE WRAP CLADDING INTERACTION IN LMFBR FUEL RODS. Schwegler, E.C. (Westinghouse Electric Corp., Madison, PA (USA). Advanced Reactors Div.). Dec 1977. Contract EY-76-C-15-2395;EY-76-C-15-0003. 107p. AT.

Most of the currently accepted designs of the fuel and blankets for the LMFBR utilize helically wound wires for spacing the individual rods within a rod bundle. The fuel assembly design for the CRBRP also utilizes a wire wrap as a rod spacer/support system. The purposes of this report are to delineate the functional objectives of the wire-wrap design, to describe the methods applied for evaluating the performance adequacy of the wire wrap system for the CRBRP fuel assembly design, and to present current experimental results concerning wire wrap performance.

- 966 (CRBRP-ARD--0168) CLINCH RIVER BREEDER REACTOR PLANT. IMPACT OF FUEL DENSIFICATION ON CRBRP FUEL PERFORMANCE. Bishop, B.A. (Westinghouse Electric Corp., Madison, PA (USA). Advanced Reactors Div.). Jun 1977. Contract EY-76-C-14-2395. 63p. TIC.

A review of both LWR and LMFBR mixed-oxide fuel literature shows that fuel densification mechanisms are similar. The primary factor is unirradiated porosity and the associated fuel microstructure. If fuel densification were to become a problem in CRBRP, there is substantial evidence in the literature that densification could be controlled by changes in the fuel manufacturing process. Based upon low burnup FFTF vendor fuel data, which is CRBRP prototypic, and high burnup nonprototypic data, which overpredicts CRBRP densification, from the EBR-II Reference Fuels Irradiation Program, a conservative design bases for CRBRP fuel densification was derived. The maximum CRBRP fuel pellet length decrease was set at 0.4 to 1.1% at 15 to 21 MWd/Kg local fuel burnup. These values were shown to envelop or exceed the values in the published literature. The maximum column shortening in the peak power fuel rod was 0.352 inches while the core average value is 0.220 inches.

- 967 (CRBRP-ARD--0173) CLINCH RIVER BREEDER

REACTOR PLANT. PLAN FOR INSERVICE INSPECTION. Blinn, H.O.; Chase, W.L. (Westinghouse Electric Corp., Madison, PA (USA). Advanced Reactors Div.). Sep 1977. Contract EY-76-C-15-2395;EY-76-C-15-0003. 45p. AT.

The plan describes the approach to be followed in specifying the type, extent, and frequency of inservice inspections to be performed on the Clinch River Breeder Reactor Plant (CRBRP). The plan also gives the basis for the approach and specifies requirements for inspection. In addition, a preliminary listing of examinations to be performed on components and systems which make up the coolant boundary is included. The inservice inspection requirements given are based on protection of public health and safety.

- 968 (CRBRP-ARD--0175) CLINCH RIVER BREEDER REACTOR PLANT. MAXPRES-2: COMPUTER CODE VERIFICATION. Ranatza, S. (Westinghouse Electric Corp., Madison, PA (USA). Advanced Reactors Div.). Jul 1977. Contract EY-76-C-15-2395;EY-76-C-15-1200;EY-76-C-15-0003. 31p. AT.

During an energetic LMFBR Hypothetical Core Disruptive Accident (HCDA), the rapid expansion of the HCDA bubble would accelerate the slug of sodium above the core. As the sodium rises, the argon cover gas would be compressed. After the sodium slug impacts the reactor vessel closure head, the sodium would penetrate the spaces within the head structure and the head-mounted component annuli. The argon cover gas in the annuli would be further compressed by the penetrating sodium. The MAXPRES-2 code analyzes the argon and sodium flow in the annuli to determine maximum annuli pressures and, ultimately, the capability of various seals and annuli geometries for mitigation of HCDA consequences. During the development of the code, various comparisons and checks were made to verify that the code programming and formulation accurately represented the mathematical model. Two of these comparisons and checks which were made to the key parts of the code are described in detail. A comparison was made between a separately programmed simplified computer calculation (MPCK) and MAXPRES-2 to check the integration subroutine and the momentum equation subroutine. A separately programmed simplified calculation (AFLOCK) of gas flow equations was made to check the MAXPRES-2 AFLO subroutine.

- 969 (CRBRP-ARD--0183) CLINCH RIVER BREEDER REACTOR PLANT. CRBRP PIPING INTEGRITY: AN EVALUATION OF POSTULATED SUPPORT FAILURES. Mallett, R.H.; Nair, B.R.; Mello, R.M. (Westinghouse Electric Corp., Madison, PA (USA). Advanced Reactors Div.). Sep 1977. Contract EY-76-C-15-1200;EY-76-C-15-2395. 78p. AT.

The CRBRP Project position on piping integrity is that the probability of a gross failure of the heat transport system piping within containment is low enough to preclude such an event from being considered a design basis event. As part of the overall effort to establish this position, a special evaluation of postulated support failures in the primary heat transport system piping was performed even though such failures are not included in the Plant Duty Cycle. The results of the preliminary evaluation, which was focused on the primary cold leg between the intermediate heat exchanger and the reactor vessel inlet, are presented in the report. It is concluded that the integrity of the primary cold leg piping will be preserved even in the unlikely event of the failure of a snubber or pipe hanger.

970 (CRBRP-ARD--0184) CLINCH RIVER BREEDER REACTOR PLANT. NUMERICAL EVALUATION OF AN ELBOW ELEMENT FOR INELASTIC FLEXIBILITY ANALYSIS OF PIPING. Scheller, J.D.; Mallett, R.H.; Nair, B.R. (Westinghouse Electric Corp., Madison, PA (USA). Advanced Reactors Div.). Sep 1977. Contract EY-76-C-15-2395. 109p. AT.

The PIRAX computer program embodies a simplified model for predicting inelastic behavior of piping elbows at elevated temperature. This model is evaluated for use in inelastic flexibility analysis of LMFBR piping by comparing results obtained using PIRAX with results obtained from more complex analytical models and tests. Isolated piping elbows are examined under in-plane and out-of-plane loading. Plasticity, thermal creep under load-controlled loading and relaxation by thermal creep under deformation-controlled loading are considered. The load versus deformation behavior obtained using the simplified model for piping elbows is judged to be a useable approximation. Based upon this evaluation, it is concluded that the inelastic flexibility analysis capability of the PIRAX computer program should be useful for detecting elastic followup in LMFBR piping systems and for classifying forces induced in LMFBR piping systems into load-controlled and deformation-controlled categories.

971 (CRBRP-ARD--0185(Vol.1)) CLINCH RIVER BREEDER REACTOR PLANT. INTEGRITY OF PRIMARY AND INTERMEDIATE HEAT TRANSPORT SYSTEM PIPING IN CONTAINMENT. Mallett, R.H.; Nair, B.R. (Westinghouse Electric Corp., Madison, PA (USA). Advanced Reactors Div.). Oct 1977. Contract EY-76-C-15-1200;EY-76-C-15-2395. 330p. AT.

A comprehensive and detailed assessment of the primary and intermediate Heat Transport System (HTS) piping in containment has led to the conclusion that the integrity of this HTS piping is assured such that there is a negligible likelihood of a large break. This conclusion is based upon the following: (1) The overall system design incorporates many features which prevent the occurrence, and limit the consequences, of leaks in this HTS piping; (2) The highest quality engineering standards are applied by the HTS Piping Design Specification which provides a complete basis for construction including the materials, design, fabrication, examination, testing, inspection and certification; (3) A comprehensive quality assurance program assures that the specified engineering standards are met throughout the construction, installation, operation and maintenance of this HTS piping; (4) A compilation of operating experience with liquid metal piping governed by various quality standards has shown that, although fatigue crack leakage incidents have occurred, no large breaks have occurred in liquid metal piping; (5) A detailed structural design analysis has shown that the piping will comply with all of the Design Specifications and ASME Code requirements for Class 1 piping; (6) A detailed fracture mechanics evaluation has shown that significant fatigue crack propagation will not occur during the entire plant lifetime even if an initial defect much larger than quality standards allow is postulated; and (7) A comprehensive technology program has shown that even if a defect did grow significantly, it would penetrate the pipe wall and result in detectable leakage without risk of a large break in this HTS piping.

972 (CRBRP-ARD--0185(Vol.2)) CLINCH RIVER BREEDER REACTOR PLANT. INTEGRITY OF PRIMARY AND INTERMEDIATE HEAT TRANSPORT SYSTEM PIPING IN CONTAINMENT. (Westinghouse Electric Corp., Madison, PA (USA). Advanced Reactors Div.). Oct 1977. Contract EY-76-C-15-1200;EY-76-C-15-2395. 180p. AT.

Appendix titles include the development program for ultrasonic examination of primary piping, the development program for review of sodium piping experience, the development program for long term thermal aging effects on welds, the development program for sodium leak detection verification, aerosol and radiation monitor sensitivity and response time calculations, an evaluation of postulated support failures, and sodium effects on long term material properties.

973 (CRBRP-ARD--0186) CLINCH RIVER BREEDER REACTOR PLANT. PRELIMINARY TESTING OF THE DIRECT HEAT REMOVAL SERVICE IN A 1/21 SCALE MODEL. Marinkovich, P.S. (Westinghouse Electric Corp., Madison, PA (USA). Advanced Reactors Div.). Oct 1977. Contract EY-76-C-15-1200;EY-76-C-15-2395. 31p. AT.

A Direct Heat Removal Service (DHRS) test was performed in the ARD 1/21 scale Outlet Plenum Feature Model (OPFM) to determine the amount of cold make-up flow which will flow directly from the make-up nozzle to the DHRS overflow nozzle. This flow is termed short circuit flow and it is assumed that it does not contribute to cooling of the primary heat transport coolant. The results show that five to six percent of the make-up flow will short circuit at prototypic DHRS operating conditions; this is concluded to be a conservative confirmation of the design since an allowance of twenty percent has been used in sizing the DHRS.

974 (CRBRP-ARD--0188) CLINCH RIVER BREEDER REACTOR PLANT. EFFECTS OF THERMAL AGING ON CRBRP PRIMARY PIPING. Leasure, R.A. (Westinghouse Electric Corp., Madison, PA (USA). Advanced Reactors Div.). Oct 1977. Contract EY-76-C-15-1200;EY-76-C-15-2395. 60p. AT.

The primary piping systems of Liquid Metal Fast Breeder Reactors (LMFBR's) are designed for many years of safe and maintenance free, high temperature operation. The materials being used to construct these systems are primarily the austenitic stainless steels which are selected for their good high temperature mechanical properties and compatibility with the liquid sodium environment. For the Clinch River Breeder Reactor Plant (CRBRP), which is a demonstration plant in the LMFBR program with a thirty year design life, the proposed primary piping materials include Type 304 and Type 316 stainless steels. As in any system that has to operate safely and without maintenance for many years, it is necessary to examine the effects of long term service on the properties of the materials in the CRBRP piping. This report examines the effects of the major factor contributing to changes in material properties of the primary piping over the thirty year service life, i.e., thermal aging. Included in this examination are the effects of thermal aging on microstructure, tensile properties, creep, fatigue and the fracture toughness of both base metal and weldments.

975 (CRBRP-ARD--0192) CLINCH RIVER BREEDER REACTOR PLANT. CRACK GROWTH CALCULATIONS FOR PRIMARY PIPING OF CRBRP. Wilson, W.K. (Westinghouse Electric Corp., Madison, PA (USA). Advanced Reactors Div.). Dec 1977.

Contract EY-76-C-15-2395;EY-76-C-15-0003.
35p. AT.

The growth patterns under cyclic loading of surface cracks which are postulated to exist in the primary piping of the Clinch River Breeder Reactor Plant (CRBRP) are investigated. An analytical model which can be used to calculate the crack growth history of surface cracks is presented. The model is based upon the fracture mechanics approach for calculating crack growth rates. The applicability of the model is checked in part by comparing calculated data with experimentally measured data. Using the model, crack growth calculations are made under the expected duty cycles for the primary piping of the CRBRP. Special emphasis is placed on calculating the crack length at the time of wall penetration.

976 (CRBRP-ARD--0211) CLINCH RIVER BREEDER REACTOR PLANT PROJECT. 1977 TECHNICAL PROGRESS REPORT. (Westinghouse Electric Corp., Madison, PA (USA). Advanced Reactors Div.). 1977. Contract EY-76-C-15-2395;EY-76-C-15-0003. 368p. AT.

In this report period, much of the basic design and documentation were completed and refined. Analysis and testing methods were improved and applied to many components. Much design and analysis effort was applied to the alternate fuel management scheme, which is an arrangement of fuel and blanket assemblies that could improve the breeding ratio, reduce peak neutron flux levels, and reduce the number of fuel and control assemblies required as compared with the original fuel management scheme. Fabrication of many components is well along. The reactor vessel, for example, was more than half completed by the end of the report period. Fabrication and checkout were completed for the first prototype of the secondary control rod system, and testing was initiated.

977 (CRBRP-ARD--0230) CLINCH RIVER BREEDER REACTOR PLANT PROJECT. 1978 TECHNICAL PROGRESS REPORT. (Westinghouse Electric Corp., Madison, PA (USA). Advanced Reactors Div.). 1978. Contract EW-76-C-15-2395;EW-76-C-15-0003. 379p. AT.

This technical progress report on the Clinch River Breeder Reactor Plant Project describes the objectives, design decisions, and major accomplishments achieved in the planning, organizing, design, and licensing of the Clinch River Breeder Reactor Plant (CRBRP). In this report period, fabrication of components continued. Several components were completed, the most significant being the cold-leg check valves. Fabrication of the reactor vessel passed the 80-percent completion stage. All licensing action remains suspended until decisions regarding the Project have been made by the Administration and Congress.

978 (CRBRP-GEFR--00025) ANALYSIS OF THE ZPPR-7 CRITICAL EXPERIMENTS. (Clinch River Breeder Reactor Plant Project Office, Oak Ridge, TN (USA)). Jul 1977. Contract EY-76-C-15-2395. 99p. AT.

Calculations of the ZPPR-7 critical experiments have provided estimates of design bias factors and uncertainties for standard nuclear design tools used in the analysis of radial heterogeneous cores. The analysis concentrated on calculations of criticality, neutron reaction rate distributions, sodium void worths, small sample reactivity worths, and control and refueling worths. Differences were observed in the accuracy of the predicted nuclear performance of heterogeneous cores

relative to conventional designs. However, nothing was found which would impact the viability of using standard design techniques for radial heterogeneous designs since the calculated differences were generally found to be in a conservative direction.

979 (CRBRP-GEFR--00100) CLINCH RIVER BREEDER REACTOR PLANT. DNB EFFECTS TEST PROGRAM. FINAL REPORT. Stephens, P.B.; Rodgers, D.N.; Valente, C.G.; Hampton, L.V.; Wolf, S.; Holmes, D.H.; Rush, D.J. (General Electric Co., Sunnyvale, CA (USA). Fast Breeder Reactor Dept.). Jun 1977. Contract EY-76-C-15-2395. 110p. AT.

The CRBR Plant evaporators will operate with departure from nucleate boiling (DNB) in the tubes over the power range of approximately 60 to 100%. When the 2:1 recirculation ratio was selected for the plant evaporators in 1974, potential damage mechanisms associated with DNB were identified as increased local corrosion in the DNB zone due to thermal strain cycling-induced exfoliation of the protective oxide layer and/or attack by soluble corrodents concentrated in the water. Thus, the DNB Effects Test Program was conducted to verify that excessive damage to the evaporator tubes would not be produced by operation with DNB or liquid film dryout. A sodium-heated single-tube test section with a 16-foot (4.9 m) active heat transfer length was designed, fabricated, and operated under test conditions to simulate "worst case" thermal and water chemistry conditions expected for the plant evaporators. Operation under these endurance conditions established the nucleate boiling and DNB regions, and the initial part of the post-DNB boiling region of the plant evaporator within the test section. The test section was operated for a total of 4181 hours of steaming test time, of which 2820 hours of steaming were with DNB held within a 24-inch (61 cm) test zone. The principal findings after post-test examination were: (1) no localized damage or accelerated corrosion, (2) long-term life, in the order of 30 years, is predicted based on extrapolation of the test data, and (3) deposition (fouling) on the tube wall was minimal.

980 (CRBRP-GEFR--00103) ANALYSIS OF HYPOTHETICAL CORE DISRUPTIVE EVENTS IN THE CLINCH RIVER BREEDER REACTOR PLANT. McElroy, J.L.; Switick, D.M.; Brown, N.W.; Chou, F.M.; Damerow, W.P.; Rodgers, F.C. (General Electric Co., Sunnyvale, CA (USA). Fast Breeder Reactor Dept.). Apr 1978. Contract EY-76-C-15-2395. 551p. AT.

The results of hypothetical core disruptive event analyses for the Clinch River Breeder Reactor Plant performed during the period of January 1975 to January 1977 (with the SAS3A and VENUS II computer codes) are reported. The analytical results cover a large number of parametric cases including variations in design parameters, initiating conditions and phenomenological assumptions. Reactor core configurations at the beginning and end of an equilibrium cycle are evaluated. Accident progression branch points leading to either hydraulic pressure (within fuel assembly duct structural capacity) or hydrodynamic pressure (exceeding fuel assembly duct structural capacity) fuel disruption modes are evaluated. The phenomenological processes of molten fuel pools are described and the consequences of energetic recriticality, including Behrens' effects, are examined. The energetic consequences are evaluated based upon both fuel expansion thermodynamic work potential and a relative probability assignment. It is

concluded that the structural loads which result from 101 megajoules of available expansion work at sodium slug impact on the reactor closure head (equivalent to 661 megajoules of fuel expansion work to one atmosphere) is an adequate energetic consequence envelope for use in specifying the Structural Margins Beyond the Design Basis.

- 981 (CRBRP-GEFR--00323) ANALYSIS OF ZPPR-6 CRITICAL EXPERIMENTS. Lee, B.W.; Stewart, S.L. (General Electric Co., Sunnyvale, CA (USA). Fast Breeder Reactor Dept.). Jan 1978. Contract EY-76-C-15-2395. 143p. AT.

This report presents analysis of critical experiments performed in the Zero Power Plutonium Reactor (ZPPR) in support of the Clinch River Breeder Reactor Project (CRBRP) initial core critical, power distribution, and neutron and gamma flux distribution. The major emphasis is on analysis of the CRBRP Engineering Mockup Critical (EMC) Experiment Phase 2A also identified as ZPPR Assembly 6.

- 982 (CRBRP-GEFR--06465) HISTORY OF THE WATER CHEMISTRY FOR THE FEW TUBE TEST MODEL. Moss, S.A.; Simpson, J.L. (General Electric Co., San Jose, CA (USA). Advanced Reactor Systems Dept.). Sep 1979. Contract EY-76-C-03-0189-061. 42p. Dep. NTIS, PC A03/MF A01.

The water chemistry activities carried out in support of the Few Tube Test are described. This test was conducted to provide design confirmation data for the Clinch River Breeder Reactor Project (CRBRP) steam generators. Proposed CRBRP chemistry was followed; all volatile treatment (AVT) of water was carried out with on-line monitoring capability.

- 983 (CRBRP-GEFR-SP--036) EVALUATION OF STRAIN CYCLING EFFECTS IN THE DNB ZONE OF A SODIUM-HEATED STEAM GENERATOR. Roberts, J.M.; Chu, C.L.; Wolf, S.; Magee, P.M. (General Electric Co., Sunnyvale, CA (USA). Fast Breeder Reactor Dept.). Nov 1977. Contract EY-76-C-0893-027. 23p. (CONF-780203--8). TIC \$4.00.

From 1. joint U.S./Japan LMFBR steam generator seminar; Tokyo, Japan (13 Feb 1978).

Two sources of strain cycling in LMFBR steam generator tubing are identified as resulting from departure from nucleate boiling (DNB); namely, alternate transposition of rivulets and dry areas in the DNB zone itself and gross movement of the entire DNB zone due to system parameters disturbances originating in the controllers for the system. Experimental evidence and observations are used to support the analytical development of a finite element rivulet model which is used to calculate tube fatigue life. The gross movement is analytically represented by a finite element type trapezoidal wave front model. Results of the study show that lifetime operation (30 years) of the plant at the worst case plant power level (64%) for tube fatigue is safe. This assessment is shown to be conservative both from the standpoint of analysis assumptions and plant operations.

- 984 (CRBRP-GEFR-SP--040) DEVELOPMENT OF LEAK DETECTION SYSTEMS FOR LMFBR STEAM GENERATORS IN THE U.S. Magee, P.M.; Gerrels, E.E.; Greene, D.A. (General Electric Co., Sunnyvale, CA (USA). Fast Breeder Reactor Dept.). Nov 1977. Contract EY-76-C-03-0893-027. 23p. (CONF-780203--7). AT.

From 1. joint U.S./Japan LMFBR steam generator seminar; Tokyo, Japan (13 Feb

1978).

Leak detection for Liquid Metal Fast Breeder Reactor steam generators is an important economic factor in the shutdown, repair and restart of a plant. The paper summarizes U.S. progress in three key technology areas involved in leak detection development: (1) chemical (H_2 and O_2) leak detection meters; (2) acoustic leak detection/location techniques, and (3) data management for plant operations. The status, design aspects, and applications of leak detector technology for LMFBR plants are discussed.

- 985 (CRBRP-GEFR-SP--139) INTERNAL FLUID FLOW MANAGEMENT ANALYSIS FOR CLINCH RIVER BREEDER REACTOR PLANT SODIUM PUMPS. Cho, S.M.; Zury, H.L.; Cook, M.E.; Fair, C.E. (General Electric Co., Sunnyvale, CA (USA). Advanced Reactor Systems Dept.). Dec 1978. Contract EY-76-C-03-0893-001. 27p. (CONF-781202--4). Dep. NTIS, PC A03/MF A03.

From ASME meeting; San Francisco, CA, USA (10 Dec 1978).

The Clinch River Breeder Reactor Plant (CRBRP) sodium pumps are currently being designed and the prototype unit is being fabricated. In the design of these large-scale pumps for elevated temperature Liquid Metal Fast Breeder Reactor (LMFBR) service, one major design consideration is the response of the critical parts to severe thermal transients. A detailed internal fluid flow distribution analysis has been performed using a computer code HAFMAT, which solves a network of fluid flow paths. The results of the analytical approach are then compared to the test data obtained on a half-scale pump model which was tested in water. The details are presented of pump internal hydraulic analysis, and test and evaluation of the half-scale model test results.

- 986 (CRBRP-GEFR-SP--176) CLINCH RIVER BREEDER REACTOR PLANT STEAM GENERATOR: FEW TUBE TEST MODEL POST TEST EXAMINATION. Impellezzeri, J.R.; Camaret, T.L. (General Electric Co., Sunnyvale, CA (USA). Advanced Reactor Systems Dept.). 13 Sep 1979. Contract EY-76-C-03-0189-061. 8p. (CONF-800401--10). NTIS, PC A02/MF A01.

From 2. international conference of liquid metal technology for energy systems; Richland, WA, USA (20 Apr 1980).

The Steam Generator Few Tube Test (FTT) is part of an extensive testing program being carried out in support of the Clinch River Breeder Reactor Plant (CRBRP) steam generator design. The testing of full-length seven-tube evaporator and three-tube superheater models of the CRBRP design was conducted to provide steady-state thermal/hydraulic performance data to full power per tube and to verify the absence of multi-year endurance problems. The problems encountered with the mechanical features of the FTT model design which led to premature test termination and the results of the post-test examination are described.

- 987 (CRBRP-GEFR-SP--00043) COMPARISON OF RESULTS FROM LARGE-LEAK SODIUM/WATER TESTS AT LLTR WITH ANALYSIS. Meyer, R.A.; Bradfute, J.O.; Lee, L.S.; Regimbal, J.J. (General Electric Co., Sunnyvale, CA (USA). Fast Breeder Reactor Dept.). Feb 1978. Contract EY-76-C-03-0893. 27p. (CONF-780203--6). AT.

From 1. joint U.S./Japan LMFBR steam generator seminar; Tokyo, Japan (13 Feb 1978).

Pre-test analyses performed for the Series I Large Leak Test Rig (LLTR) tests using the

TRANSWRAP II computer code are described. These pre-test predictions are compared to the test data and significant differences between the pre-test analyses and the data are evaluated. These evaluations include three major areas: the source term, acoustic transmission of pressure disturbances, and the response of the LLTR sodium-water reaction relief system. The degree of conservatism in the analytical predictions is assessed and some possible areas for reducing conservatism in the analysis are identified.

- 988 (CRBRP-PMC--77-04) CLINCH RIVER BREEDER REACTOR PLANT. TECHNICAL REVIEW, FALL 1977. (Clinch River Breeder Reactor Plant Project Office, Oak Ridge, TN (USA)). 1 Oct 1977. Contract EY-76-C-15-1200. 47p. AT.

Included are sections dealing with seismic design of cantilever cylindrical shells, uniaxial compressive strengths of concrete for temperatures reaching 1033K, and practical aspects of probabilistic structural reliability analyses. (DG)

- 989 (CRBRP-PMC--78-01) CLINCH RIVER BREEDER REACTOR PLANT. TECHNICAL REVIEW, WINTER 1978. (Clinch River Breeder Reactor Plant Project Office, Oak Ridge, TN (USA)). 1 Jan 1978. Contract EY-76-C-15-1200. 66p. AT.

Information on the Clinch River Breeder Reactor is presented concerning accident analysis and safety studies; design and development of the ex-vessel transfer machine; and design and fabrication considerations for the ex-vessel storage tank.

- 990 (CRBRP-PMC--79-01) TECHNICAL REVIEW. (Project Management Corp., Oak Ridge, TN (USA)). Win 1979. Contract EY-76-C-15-1200. 55p. AT.

This quarter the Project continued the major tasks of plant design, component procurement and fabrication. As of December 30, 1978, the design was over 66% complete, research and development borne by the Project 79.7% complete and component fabrication about 37% complete. Information is presented concerning the need for the CRBRP Reactor and alternate core designs and fuels for the CRBRP Reactor.

- 991 (CRBRP-PS--01) OVERVIEW OF THE CRBRP SAFETY STUDY. Piper, H.B.; Conrad, L.L.; Buhl, A.R.; Wood, P.J.; Leaver, D.E.W. (Clinch River Breeder Reactor Plant Project Office, Oak Ridge, TN (USA); Energy Research and Development Administration, Oak Ridge, TN (USA); Oak Ridge Operations Office; Westinghouse Electric Corp., Madison, PA (USA); Advanced Reactors Div.; Science Applications, Inc., Palo Alto, CA (USA)). Jun 1977. Contract EY-76-C-15-2395. 31p. (CONF-77061--16). Dep. NTIS, PC A03/MF A01.

From American Nuclear Society annual meeting; New York, NY, USA (12 Jun 1977).

A Safety Study has been conducted for the Clinch River Breeder Reactor Plant (CRBRP). This paper presents a review and discussion of objectives, methods, techniques, and results of that study. The CRBRP Safety Study was conducted to: (1) provide a realistic assessment of accident risks associated with operation of the CRBRP, (2) place those identified risks in perspective with other societal risks, and (3) aid in determining whether accident risks from the CRBRP are comparable to those of previously licensed reactors. Achievement of the objectives of this study has required identification of significant contributors to risk in a logical

and orderly manner. Consideration of a comprehensive set of accident initiators, inclusion of experience data with a conservative bias, reliance upon proven methods and techniques, evaluation of a wide range of radionuclide releases and associated health effects, and utilization of experienced risk analysts are the salient elements employed in the systematic approach to this study. This together with heavy reliance on experience gained during years of Light Water Reactor (LWR) design, licensing, and operation provides reasonable assurance that the study objectives have been achieved. Results of the CRBRP Safety Study indicate that the risk arising from the operation of CRBRP is small in comparison to other local societal risks, and that CRBRP risk is comparable to the risk from previously licensed nuclear power plants as identified in the Reactor Safety Study.

- 992 (CS-INIS--199) ACCIDENT OF SODIUM STEAM GENERATOR ELEMENT - LEWISA PROGRAM. Korinek, J.; Stehlik, J.; Ricany, J.; Simerka, I.; Bucko, S.; Krchnakova, M. (Vyskumny Ustav Energeticky, Bratislava (Czechoslovakia)). 22 Dec 1975. 30p. (In Czech). Vyskumny Ustav Energeticky, Bratislava, Czechoslovakia.

The equation of the liquid motion in an unbranched tube and its numerical solution for the motion of a sodium and water column during an accident of a modular sodium steam generator is given. The LEWISA computer code mathematically modelling this accident, the input data of an exemplary accident and calculated values acquired by means of the code are described.

- 993 (CS-INIS--201) ANALYSIS OF FUEL-COOLANT INTERACTION IN THE INITIATION AND POSTEXPLOSIVE STAGES OF FAST REACTOR CREDIBLE ACCIDENTS. Suchomel, J.; Adamik, V.; Misak, J.; Zajic, A.; Simerka, I.; Sprusanska, M.; Polakova, Z.; Bazikova, V.; Stehlikova, Z. (Vyskumny Ustav Energeticky, Bratislava (Czechoslovakia)). 27 Feb 1976. 40p. (In Czech). Vyskumny Ustav Energeticky, Bratislava, Czechoslovakia.

The results of molten fuel-sodium interaction analysis are presented. The INTER code points out the heat transfer, the CEFRA code the influence on the process of structure dynamics. During the liquid expansion phase of MFCI in a tough tube, a pressure pulse of 1000 bar shorter than 1 ms is generated; the two-phase mixture subsequently expands from hundreds to units of bars. Due to the elasticity of the tube wall, pressure oscillations in the liquid phase arise with a lower amplitude. Thermal to mechanical energy conversion in the postexplosive MFCI in an RER-600 project was calculated for the determination of its vessel and cover loading.

- 994 (CS-INIS--212, pp 86-100) CONSTITUTION AND PROPERTIES OF CRMONB STEELS FOR STEAM GENERATOR COMPONENTS OF SODIUM-COOLED NUCLEAR REACTORS. Walder, V.; Gottwald, M. (Vyzkumny Ustav Hutnictvi Zeleza, Dobru (Czechoslovakia)). [nd].

From 5. international symposium on heat-resistant metal materials; Vsetin, Czechoslovakia (13 Sep 1976).

$NbC_{sub}(x)N_{sub}(y)$ ($x+y=1$) where x and y are functions of the chemical composition of steel and of precipitation temperature is the main precipitating phase in CrMoNb steel. A brief description is given of precipitation phase behaviour. Heat treatment affects mechanical properties dependent mainly on the size and distribution of precipitating particles. The amount of insoluble precipitates is affected by

austenitization temperature and time. Melt containing 1.11% Nb was less sensitive to austenitization temperature increase. The cooling rate also affects mechanical properties. In steels with excess of Nb malleabilizing is accompanied with Fe₂Nb precipitation increasing the precipitation strengthening of material at low malleabilizing temperatures. At a precipitation temperature of 750 degC or above coarse ferritic grains were observed.

- 995 (CSNI-R--14, pp Paper 12) INSERVICE INSPECTION OF PFR SECONDARY HEAT EXCHANGERS. Hudgell, R.J. (UKAEA, Risley. Nuclear Power Development Labs.). 1978.

From Specialists meeting on the ultrasonic inspection of reactor components; Daresbury, UK (27 Sep 1976).

In-service inspection of PFR secondary heat exchangers requires, for each tube bundle, systems capable of detecting defects in both the bore and outer surface of the tubes; specifically, pitting and cracking in the bore surface and fretting and thinning on the outer. Full 100% inspection of bends and straight portions is desirable together with an examination of the tube plate and in particular the tube/tube plate weld region. The current state of development to meet these requirements is described. An ultrasonic method of inspecting the tube plate for cracks which might extend into the tube plate is described, and also an eddy current method for detecting surface breaking cracks in the bores of the tube plate holes.(UK).

- 996 (CSNI-R--14, pp Paper 2) REVIEW OF THE PROCEEDINGS OF THE 8TH WORLD NDT CONFERENCE, ANNES, SEPTEMBER 1976. Hudgell, R.J. (UKAEA, Risley. Nuclear Power Development Labs.). 1978.

From Specialists meeting on the ultrasonic inspection of reactor components; Daresbury, UK (27 Sep 1976).

Among the papers given at the 8th World NDT Conference, which are reviewed, were several on light water reactors. One covered the development of equipment for in-service inspection, another discussed advances in electronics, transducer design, mechanical scanning, data presentation and evaluation of results in NDT, especially for nuclear vessels, and a third described an electronic system for ultrasonic inspection of reactor vessels and primary components. Of the remaining papers several dealt with acoustic emission related to nuclear inspection problems. One paper, only concerned inspection of heavy water reactors. It described an ultrasonic system for testing zirconium alloy pressure tubes using plate waves. Inspection of Rapsodie following the release of fluorine from concrete blocks surrounding the vessel was the only paper on in-service inspection of fast-reactors. Reference is made to several other topics which were discussed at the conference, including inspection of anisotropic material, twin crystal probes and their use for testing stainless steel welds.

- 997 (CSNI-R--14, pp Paper 10) ULTRASONIC INSPECTION DEVELOPMENT AT HEDL. Day, C.K.; Mech, S.J.; Michaels, T.E.; Dixon, N.E. (Hanford Engineering Development Lab., Richland, WA (USA)). 1978.

From Specialists meeting on the ultrasonic inspection of reactor components; Daresbury, UK (27 Sep 1976).

Ultrasonic testing methods and equipment are being developed to support preservice and in-

service inspection of selected FFTF welds. A digital computer system is employed in the analysis of both simulated FFTF pipe sections and plate specimens containing fatigue cracks. It is anticipated that test evaluation standards containing fatigue cracks will partially eliminate questions formerly associated with weld test calibration producers by providing natural cracks which follow grain boundaries and stress patterns resembling piping situ conditions. Studies have revealed that commercial transducers may satisfy LMFBF ultrasonic pipe inspection applications.

- 998 (CSNI-R--32(Vol.2), pp 23.1-23.11) ELASTOPLASTIC FRACTURE MECHANICS APPROACH FOR LMFBF. Fortmann, M.; Link, F.; Zeibig, H. (Internationale Atomreaktorbau G.m.b.H. (INTERATOM), Bergisch Gladbach (Germany, F.R.)). 1978.

From Safety of nuclear installations specialist meeting on elastoplastic fracture mechanics; Daresbury, UK (22 May 1978).

The structural materials used for LMFBF are austenitic steels from Type AISI 304, 316, or steels which are similar. Investigations show that a leak-before-break concept can be established for LMFBF piping systems and components, due to the ductile behaviour of these steels and operating conditions. A major element of this concept is the knowledge of fatigue crack growth patterns. The experiments which were carried out show that initial flaws will only grow slowly during the lifetime. The investigations should be extended into the plastic range. A test facility is under construction, where components such as nozzles, elbows and bellows can be tested under operational conditions with specified flaws in stress concentration areas.

- 999 (CURL--53) SYSTEM MODELING FOR TRANSIENT ANALYSIS OF LOOP-TYPE LIQUID-METAL-COOLED FAST BREEDER REACTORS. Khatib-Rahbar, M. (Cornell Univ., Ithaca, NY (USA). Nuclear Reactor Lab.). May 1978. 388p. Cornell Univ., Ithaca, NY.

Thesis.

A digital computer simulation model for the dynamic analysis of multiloop liquid-metal-cooled fast breeder reactor plants is developed. The model is capable of simulating operational transients, anticipated incidents, postulated accidents which do not disturb the system geometry, and a major pipe rupture accident in the primary heat transport system. The mathematical model includes: point reactor kinetics, reactivity feedback, and reactor power control; primary, secondary, and tertiary thermal and coolant dynamics governed by forced and natural circulation; and plant protection and control systems. A method is incorporated which calculates the negative inverse of the diagonal elements of the Jacobian matrix as the characteristic times for the 489 state variables modeling the entire system, and compares them with the preset integration timestep. A Runge-Kutta algorithm is applied to those state variables with slow and moderate time response, and a quasi-static approximation is applied to those with rapid response; i.e., the "stiff" equations. This assures numerical stability and is shown to greatly reduce the computation time requirements without much sacrifice in accuracy. The quasi-static equations are also utilized to determine the pre-transient steady state conditions. The system response to several transients has been calculated and compared to parallel calculations using the FORE-II and DEMO simulation models; these include: a seismic induced reactivity insertion, a spurious pump

trip, and a complete loss-of-forced-cooling leading to buoyancy induced natural circulation.

- 1000 (DOE/ER--0025-D) NUCLEAR STRATEGY OF THE DEPARTMENT OF ENERGY. (Department of Energy, Washington, DC (USA). Office of Energy Research). Apr 1979. 92p. Dep. NTIS, PC A05/MF A01.

An analysis of the important technical and economic parameters related to the timing and future deployment of nuclear power in the US is presented. The analysis is used first to form the basis of a set of alternative nuclear strategies and then to assist in a critical evaluation of these strategies. The strategies involve major decisions on breeder commercialization, fuel cycle development, and strengthening the nuclear option in the US. DOE energy projections indicate that nuclear power must play a substantial role in meeting future US energy needs, even under assumptions that are optimistic with respect to energy conservation and the increased use of coal-fired generating plants. Also, estimates indicate that nuclear power can have a substantial cost advantage in certain areas of the US. However, these estimates involve significant uncertainties, such as the relative environmental impact of the nuclear and coal cycles and the costs of meeting new environmental performance standards. There are three main elements in the fission portfolio: programs which extend the uranium resource base or which add to the efficiency of its use; breeder programs; and enabling programs.

- 1001 (DOE/ER--0054) PRELIMINARY COMPARATIVE ASSESSMENT OF LAND USE FOR THE SATELLITE POWER SYSTEM (SPS) AND ALTERNATIVE ELECTRIC ENERGY TECHNOLOGIES. Newsom, D.E.; Wolsko, T.D. (Argonne National Lab., IL (USA)). Apr 1980. Contract W-31-109-ENG-38. 26p. Dep. NTIS, PC A03/MF A01.

A preliminary comparative assessment of land use for the satellite power system (SPS), other solar technologies, and alternative electric energy technologies has been conducted. The alternative technologies are coal-gasification/combined-cycle, coal fluidized-bed combustion (FBC), light water reactor (LWR), liquid metal fast breeder reactor (LMFBR), terrestrial photovoltaics (TPV), solar thermal electric (STE), and ocean thermal energy conversion (OTEC). Fusion was not included in this preliminary work but will be a part of the final evaluation based on available research, to identify a suitable assessment methodology, and to identify data deficiencies. The major issues of a land use assessment are the quantity, purpose, duration, location, and costs of the required land use. The phased methodology described treats the first four issues, but not the costs. Several past efforts at comparative or single-technology assessment are reviewed briefly. The current state of knowledge about land use is described for each technology. Conclusions are drawn regarding deficiencies in the data on comparative land use and needs for further research. (WHK)

- 1002 (DOE/ET--0009) COMPENDIUM OF COMPUTER CODES FOR THE SAFETY ANALYSIS OF FAST BREEDER REACTORS. (Department of Energy, Washington, DC (USA). Div. of Reactor Research and Development). Oct 1977. 432p. Dep. NTIS, PC A14/MF A01.

The objective of the compendium is to provide the reader with a guide which briefly describes many of the computer codes used for liquid metal fast breeder reactor safety

analyses, since it is for this system that most of the codes have been developed. The compendium is designed to address the following frequently asked questions from individuals in licensing and research and development activities: (1) What does the code do. (2) To what safety problems has it been applied. (3) What are the code's limitations. (4) What is being done to remove these limitations. (5) How does the code compare with experimental observations and other code predictions. (6) What reference documents are available.

- 1003 (DOE/ET--0050/1) PERFORMANCE MEASUREMENT SYSTEM: SYSTEM DESCRIPTION. (Department of Energy, Washington, DC (USA). Div. of Reactor Research and Technology). 28 Jan 1977. 27p. (RDD/PMS--1). Dep. NTIS, PC A03/MF A01.

The summary description describes the Performance Measurement System (PMS) and Mini-Performance Measurement System (Mini-PMS) used by the Reactor Development and Demonstration Division (RDD) on selected contracts within Division projects. The intent of the pamphlet is to provide a summary description of the two systems and their operation for the benefit of ERDA and industry personnel. As its name implies, Mini-PMS is a derivative of PMS. Basically, PMS and Mini-PMS differ only in that Mini-PMS is a less rigid version of PMS. The general differences between PMS and Mini-PMS in the areas of their application, implementation, and operation are listed and discussed.

- 1004 (DOE/ET--0050/2) PERFORMANCE MEASUREMENT SYSTEM IMPLEMENTATION GUIDE. RRT MANAGEMENT CONTROL SYSTEM. (Department of Energy, Washington, DC (USA). Div. of Reactor Research and Technology). Apr 1978. 113p. (RDD/PMS--2). Dep. NTIS, PC A06/MF A01.

Revision of February 4, 1978.

The document provides uniform guidance for the Reactor Development and Demonstration Division (RDD) and other Energy Research and Development Administration (ERDA) organizations responsible for reviewing and monitoring contractor systems complying with the criteria for cost and schedule control systems of the RDD Performance Measurement System (PMS). Detailed PMS surveillance guidance is provided in RDD/PMS-5, Performance Management System Surveillance Guide. Specific PMS responsibilities of RDD and other participating organizations are stated in RDD Policy and Procedural Guide No. 26, Application and Implementation of PMS. For the purpose of this guide the term 'criteria' is synonymous with the PMS criteria for cost and schedule control systems. The term 'performance' is intended to mean 'cost/schedule performance.'

- 1005 (DOE/ET--0050/3(Rev.)) PERFORMANCE MEASUREMENT SYSTEM: CONTRACTOR REPORTING INSTRUCTIONS. (Department of Energy, Washington, DC (USA). Div. of Reactor Research and Technology). 14 Jan 1977. 55p. (RDD/PMS--3(Rev.)). Dep. NTIS, PC A04/MF A01.

The document provides guidance which has been approved by the Director of the Reactor Development and Demonstration Division (D/RDD) for use in preparation of the Management Control System Description, the Summary System Description, the Work Breakdown Structure Dictionary, the Cost Performance Report (CPR), the Cost/Schedule Status Report (C/SSR), the Schedule Status Report (SSR), and the Contract Funds Status Report (CFSR) of the Performance Measurement System (PMS) and the Mini-PMS.

1006 (DOE/ET--0050/4) PERFORMANCE MEASUREMENT SYSTEM: DATA ANALYSIS GUIDE. (Department of Energy, Washington, DC (USA). Div. of Reactor Research and Technology). 30 Mar 1976. 80p. (RDD/PMS--4). Dep. NTIS, PC A05/MF A01.

This guide provides a framework for using data generated by a management control system that complies with the requirements of the RDD Performance Measurement System (PMS). It was developed to assist ERDA Managers in their roles as decision makers. It presents: (1) types of data that are available, (2) various data analysis techniques applicable, (3) depiction of the data, and (4) benefits from use of the data.

1007 (DOE/ET--0050/5) PERFORMANCE MEASUREMENT SYSTEM: SURVEILLANCE GUIDE. (Department of Energy, Washington, DC (USA). Div. of Reactor Research and Technology). 30 Mar 1976. 58p. (RDD/PMS--5). Dep. NTIS, PC A04/MF A01.

The guide provides uniform guidance for the Reactor Development and Demonstration Division (RDD) and other Energy Research and Development Administration (ERDA) organizations responsible for surveillance of the RDD Performance Measurement System (PMS) criteria for cost and schedule control systems. Guidance for implementation of the PMS criteria and acceptance of a contractor's management control system is provided in RDD/PMS-2, PMS Implementation Guide. The procedural guidance contained in the guide should be adapted to specific organizational structures and to specific situations as they arise. Details concerning the PMS surveillance of each contractor's management control system should be developed by the Cognizant Contracting Office (CCO), coordinated with the Cognizant Federal Auditor (CFA), and agreed upon by RDD Project Management. Any procedures employed should be consistent with the guidance contained herein and in the PMS Implementation Guide. The guidance furnished will provide assistance to: (1) RDD Project Management in formulating surveillance plans and determining resource requirements; (2) RDD surveillance personnel in accomplishing their surveillance functions; and (3) contractors in understanding the requirements of the surveillance program and responding to them.

1008 (DOE/ET--0050/6) PERFORMANCE MEASUREMENT SYSTEM: WORK BREAKDOWN STRUCTURE (WBS) GUIDE. (Department of Energy, Washington, DC (USA). Div. of Reactor Research and Technology). Apr 1978. vp. (RDD/PMS--6).

The guide provides guidance on the use of the Work Breakdown Structure (WBS) technique to Reactor Development and Demonstration Division (RDD) managers responsible for projects supporting the LMFBR Program. The guide covers the types of WBSs, how and by whom they are prepared, and how they should be used by RDD and contractors for effective management and control.

1009 (DOE/ET--0050/7) PERFORMANCE MEASUREMENT SYSTEM: MINI-PMS GUIDE. (Department of Energy, Washington, DC (USA). Div. of Reactor Research and Technology). 14 Jan 1977. 72p. (RDD/PMS--7). Dep. NTIS, PC A04/MF A01.

This guide provides guidance to Reactor Development and Demonstration Project Management and contractors on the use of the Mini-Performance Measurement System (Mini-PMS) as a contract management tool. As its name

implies, Mini-PMS is a derivative of the RDD Performance Measurement System (PMS) applied to selected contracts/subcontracts within major RDD projects. Mini-PMS differs from PMS in that Mini-PMS does not require that contractors' management control systems comply with a set of criteria for such systems and offers a more flexible approach to contract performance reporting. Mini-PMS is applied to contracts which require visibility and control in order to meet the contract and related project objectives. In addition, contractors should consider applying Mini-PMS to their subcontracts. Mini-PMS supports the Project Management functions through a series of interrelated RDD/contractor activities that include: (1) development and use of work breakdown structures (WBSs) that define and organize the project/contract work; (2) use of contractor management control systems that facilitate performance measurement within the WBS framework; and (3) use of a reporting system based on Mini-PMS data elements to report contract status. When combined, these activities provide the means for correlating the contract's cost, schedule, and technical accomplishments.

1010 (DOE/ET--0050/8) PERFORMANCE MEASUREMENT SYSTEM REVIEW TEAM HANDBOOK. RRT MANAGEMENT CONTROL SYSTEM. (Department of Energy, Washington, DC (USA). Div. of Reactor Research and Technology). 30 Mar 1977. 116p. (RDD/PMS--8). Dep. NTIS, PC A06/MF A01.

The purpose of the handbook is to provide guidance and reference material for personnel selected to participate in PMS/Mini-PMS implementation activities. It includes procedures and evaluation techniques which have been developed to assist in timely and effective evaluation of a contractor's implementation of the RDD contract performance measurement requirements.

1011 (DOE/ET/37203--1) EXPERIMENTAL EVALUATION OF ACOUSTIC AGGLOMERATORS AS AN AIR CLEANING SYSTEM CONCEPT FOR EMERGENCY USE IN LMFBR PLANTS. FINAL REPORT. Shaw, D.T.; Wegrzyn, J. (State Univ. of New York, Buffalo (USA). Lab. for Power and Environmental Studies). Nov 1979. Contract EN-77-S-02-4260. 52p. Dep. NTIS, PC A04/MF A01.

In the development of the Liquid Metal Fast Breeder Reactor, a major safety problem concerns the suppression of the sodium oxides aerosol particles produced during a hypothetical core disruptive accident. Some theoretical calculations are presented concerning sonic agglomeration rates of such a system in terms of acoustic frequency, intensity and particles. The information is useful in providing some guidelines for the evaluation and design of sonic systems for LMFBR emergency applications.

1012 (DOE/ET/37205--T1) CHEMICAL SIMULATION MODELING OF HEAT TRANSFER IN LMFBRs. Wiberg, D.V. (Brigham Young Univ., Provo, UT (USA). Dept. of Chemical Engineering). Apr 1980. Contract AC02-76ET37205. 126p. NTIS, PC A07/MF A01.

Thesis.

A chemical reaction conducted in a wax cylinder was used in this study to simulate a CDA occurring in a reactor. The exothermic reaction of dimethyl sulfoxide (DMSO) with acetyl chloride (AC) was used as the chemical reaction to simulate the internally heated liquid pool. SUN-3420 wax was used to construct the cylindrical reaction vessel to simulate

cladding and containment.

- 1013 (DOE/EV--0046(Vol.2), pp 111-142) COMBUSTION OF SODIUM IN THE OPEN ATMOSPHERE. Morewitz, H.A.; Johnson, R.P.; Nelson, C.T.; Otter, J.M. (Rockwell Hanford Operations, Richland, WA). Sep 1979.

From Environmental control symposium; Washington, DC, USA (28 Nov 1978).

A series of sodium fire tests has been conducted in ambient air at a meteorological test site. This test series was designed to simulate hypothetical accidents which might occur in the heat transport system of an LMFBR. Measurements of concentration, agglomeration, fallout, and chemical species of sodium combustion products were made as a function of downwind distance. In each of the first two tests, approx. 23 kg of 540°C sodium was sprayed as a fan of 250-μm sodium drops across the wind, from heights of 5 or 6 m. Each release took a few minutes. Two additional tests were performed by releasing sodium through 9.5-mm diameter jets at a height of 30 m. In each test, the sodium jet was aimed horizontally across the wind, and followed a downward parabolic trajectory, releasing burning sodium drops along its track. In a third type of test, sodium was burned for 60 min as a pool in a 1.5 m² burn pan at 9 m/s wind velocity. Approximately 30% of the combustion products became airborne. Large agglomerates fell out as they moved downward, depositing 2 kg/m² at 1 m downwind from the edge of the pan.

- 1014 (DOE/NE--0001(Vol.6)) NUCLEAR PROLIFERATION AND CIVILIAN NUCLEAR POWER: REPORT OF THE NONPROLIFERATION ALTERNATIVE SYSTEMS ASSESSMENT PROGRAM. VOLUME VI. SAFETY AND ENVIRONMENTAL CONSIDERATIONS FOR LICENSING. (Department of Energy, Washington, DC (USA)). Dec 1979. 139p. Dep. NTIS, PC A07/MF A01.

Volume 6 of the Nonproliferation Alternative Systems Assessment Program report addresses safety and environmental considerations in licensing the principal alternative nuclear reactors and fuel cycles in the United States for large-scale commercial nuclear power plants. In addition, this volume examines the safety and environmental considerations for licensing fuel service centers. These centers, which have been proposed for controlling sensitive fuel-cycle facilities and special nuclear materials, would contain a combination of such facilities as reprocessing plants, fabrication plants, and reactors. For this analysis, two fuel service center concepts were selected - one with power-generating capability and one without. This volume also provides estimates of the time required for development of large-scale commercial reactor systems to reach the construction permit application stage and for fuel-cycle facilities to reach the operating license application stage, which is a measure of the relative technical status of alternative nuclear systems.

- 1015 (DOE/NE--0003/6) LIQUID-METAL FAST-BREEDER REACTORS: PRELIMINARY SAFETY AND ENVIRONMENTAL INFORMATION DOCUMENT. VOLUME VI. (Department of Energy, Washington, DC (USA)). Jan 1980. 175p. Dep. NTIS, PC A08/MF A01.

Information is presented concerning LMFBR design characteristics; uranium-plutonium/uranium recycle homogeneous core; uranium-plutonium/uranium spiked recycle heterogeneous core; uranium-plutonium/uranium spiked recycle homogeneous core; uranium-plutonium/thorium

spiked recycle heterogeneous core; uranium-plutonium/thorium spiked recycle homogeneous core; thorium-plutonium/thorium spiked recycle homogeneous core; denatured uranium-233/thorium cycle homogeneous core; safety consideration for the LMFBR; and environmental considerations.

- 1016 (DOE/TIC--10063) STRUCTURAL RESPONSE OF 1/20-SCALE MODELS OF THE CLINCH RIVER BREEDER REACTOR TO A SIMULATED HYPOTHETICAL CORE DISRUPTIVE ACCIDENT. TECHNICAL REPORT 4. Romander, C.M.; Cagliostro, D.J. (SRI International, Menlo Park, CA (USA)). Oct 1978. Contract EY-76-C-03-0115-097. 266p. Dep. NTIS, PC A12/MF A01.

Five experiments were performed to help evaluate the structural integrity of the reactor vessel and head design and to verify code predictions. In the first experiment (SM 1), a detailed model of the head was loaded statically to determine its stiffness. In the remaining four experiments (SM 2 to SM 5), models of the vessel and head were loaded dynamically under a simulated 661 MW=sec hypothetical core disruptive accident (HCDA). Models SM 2 to SM 4, each of increasing complexity, systematically showed the effects of upper internals structures, a thermal liner, core support platform, and torospherical bottom on vessel response. Model SM 5, identical to SM 4 but more heavily instrumented, demonstrated experimental reproducibility and provided more comprehensive data. The models consisted of a Ni 200 vessel and core barrel, a head with shielding and simulated component masses, an upper internals structure (UIS), and, in the more complex models SM 4 and SM 5, a Vi 200 thermal liner and core support structure. Water simulated the liquid sodium coolant and a low-density explosive simulated the HCDA loads.

- 1017 (DOE/TIC--10099) FRESS PIN FAILURE MODEL AND ITS APPLICATION TO E-8 TREAT TEST. Kalimullah. (Argonne National Lab., IL (USA)). 1979. Contract W-31-109-ENG-38. 19p. Dep. NTIS, PC A02/MF A01.

FRESS is a cladding rupture prediction model for an irradiated mixed-oxide LMFBR fuel pin during transient heating based only on the internal pressurization of the cladding by the fission gas released from fuel grains during the transient. The model is applied to the analysis of the hottest PNL-10-53 pin in the 7-pin E-8 TREAT test which simulates a \$3/sec transient overpower. Although the uncertainties of the inputs to the temperature calculation done with the COBRA code have not been included, the uncertain input parameters to FRESS have been varied over their estimated uncertainties. The cladding rupture predictions are a few tens of milliseconds late compared to the most probable failure time detected in the test. However, these calculations seem to indicate that fission gas pressure is a significant mechanism for causing clad rupture in this test.

- 1018 (DOE/TIC--10100) ANALYSIS OF A PROTOTYPIC AND A SIMULANT-EXPERIMENT RELATED TO FREEZING IN FLOW CHANNELS. Hakim, S.J. (Argonne National Lab., IL (USA)). 1979. Contract W-31-109-ENG-38. 23p. Dep. NTIS, PC A02/MF A01.

An analysis is presented of two experiments, one involving simulant materials, and a second more prototypic experiment, related to freezing of molten LMFBR core material in flow channels. Good agreement is obtained between predictions and experimental results for both experiments. It is argued that simulant experiments could

provide a reasonable vehicle for validation of isolated phenomena related to the freezing process while prototypic experiments provide a more realistic view of the integrated behavior of molten core material during the accident.

- 1019 (DOE/TIC--10101) ANALYSIS OF TREAT TRANSIENT OVERPOWER EXPERIMENTS USING THE PLUTO2 CODES. Wider, H.U.; Semenza, L.A. (Argonne National Lab., IL (USA)). 1979. Contract W-31-109-ENG-38. 12p. Dep. NTIS, PC A02/MF A01.

Pre- and post-test computer analyses of TREAT transient overpower test H6 are presented and compared with an earlier analysis of E8. The computer models used were the PLUTO code and its successor, the PLUTO2 code. A good agreement with several events could be achieved in the post test simulations, which supports the basic modeling in the codes used. The pre-test analyses suffered from the uncertainty in the pin failure sequence. Fission-gas pressures in the pins at failure time were on the order of 15-30 MPa in both tests. Plenum fission-gas release may have played an important role in both tests.

- 1020 (DOE/TIC--10102) ANALYSIS OF TREAT TESTS L7 AND L8 WITH SAS3D, LEVITATE AND PLUTO2. Bowers, C.H.; Tentner, A.M.; Wider, H.U. (Argonne National Lab., IL (USA)). 1979. Contract W-31-109-ENG-38. 17p. Dep. NTIS, PC A02/MF A01.

Fuel motion in TREAT Tests L7 and L8 is analyzed with the SAS3D, LEVITATE, and PLUTO2 computer codes. These results are compared with fuel motion data obtained from the fast neutron hodoscope. It is concluded that fission gas acts to disperse fuel during the early stages of fuel motion.

- 1021 (DOE/TIC--10187) FABRICATION DATA FOR THE US/UK SAFETY TEST PROGRAM L01 CALIBRATION FUEL PINS. Steffen, J.M.; Manuel, J.L. (comps.). (Hanford Engineering Development Lab., Richland, WA (USA)). Sep 1979. Contract EY-76-C-14-2176. 36p. AT.

Data are presented that relate to the fabrication of fuel pins for the LMFBR safety test program.

- 1022 (DOE/TIC--10188) DATA FOR PNC FUEL PINS FOR HEDL P-E01 TEST. Steffen, J.M.; Manuel, J.L. (comps.). (Hanford Engineering Development Lab., Richland, WA (USA)). Sep 1979. Contract EY-76-C-14-2176. 37p. AT.

Fabrication and quality assurance data are presented for the LMFBR test fuel pins.

- 1023 (DOE/TIC--10224) LARGE LIQUID METAL FAST BREEDER REACTOR INTERMEDIATE HEAT EXCHANGER MAINTENANCE STUDY REPORT. Johnson, R.H. (Foster Wheeler Corp., Livingston, NJ (USA)). 8 Dec 1977. Contract W-31-109-ENG-38. 38p. AT.

Current designs for Intermediate Heat Exchangers (IHX) planned for use in Commercial LMFBR systems call for a straight tube configuration without a central downcomer. The maintenance of such a unit involves three (3) major operations: detection of leaking tubes; location of defective tubes; and plugging of leaking tubes. Two of the main objectives of this study were to investigate IHX maintainability in the areas of tube leak detection and tube plugging.

- 1024 (DOE/TIC--10240, pp 24p, Attachment 2)

APPLICATION OF ALLOY 718 IN THE UPPER INTERNALS STRUCTURE OF THE CLINCH RIVER BREEDER REACTOR. Schmidt, J.E. (Westinghouse Electric Corp., Madison, PA). 1975.

Status of technology of Alloy 718 for nuclear applications. Minutes of meeting, October 30, 1975.

After a description of the Clinch River Breeder Reactor, the utilization of Inconel 718 is described and research needed is explained. (FS)

- 1025 (DOE/TIC--10240) STATUS OF TECHNOLOGY OF ALLOY 718 FOR NUCLEAR APPLICATIONS. MINUTES OF MEETING, OCTOBER 30, 1975. Roche, T.K.; Brinkman, C.R. (comps.). (Oak Ridge National Lab., TN (USA)). 1975. Contract W-7405-ENG-26. 302p. Dep. NTIS, PC A14/MF A01.

The objective of the Alloy 718 meeting held at ORNL on October 30, 1975 were to evaluate the status of the technology of the alloy. Subjects presented included melting, fabrication, heat treatments, welding techniques, weldment properties, product from availability, use in the nuclear industry, design data, code requirements, and mechanical and physical properties. Each paper was processed separately for the Energy Data Base. (FS)

- 1026 (DOE/TIC--10240, pp 100p, Attachment 3) EVALUATION OF THE ADDITIONAL MATERIALS DATA NEEDED TO SUPPORT THE USE OF ALLOY 718 IN NON-WELDED NUCLEAR REACTOR APPLICATIONS. Snow, A. (Westinghouse Electric Corp., Madison, PA). 1975.

Status of technology of Alloy 718 for nuclear applications. Minutes of meeting, October 30, 1975.

An evaluation is made of data needed to support the use of Alloy 718 in nonwelded nuclear reactor applications. Included are low and elevated temperature tensile and fatigue data and test results, physical property information, and plasticity and aging effects. (FS)

- 1027 (DOE/TIC--10240, pp 10p, Attachment 4) MATERIAL PROPERTIES REQUIREMENTS AND PRIORITIES MATRIX FOR CRBRP. Bitner, J.L. (Westinghouse Electric Corp., Madison, PA). 1975.

Status of technology of Alloy 718 for nuclear applications. Minutes of meeting, October 30, 1975.

The latest material properties requirements, and priorities matrix for CRBR are tabulated. Properties include strength, residual ductility, physical properties, fatigue, creep, fracture, radiation effects, aging and corrosion. (FS)

- 1028 (DOE/TIC--10240, pp 11p, Attachment 6) ALLOY 718 UTILIZATION IN THE FAST FLUX TEST FACILITY; ALLOY 718 DESIGN DATA CURRENTLY IN NUCLEAR SYSTEMS MATERIALS HANDBOOK; GENERAL AND SPECIFIC DESIGN DATA NEEDS FOR ALLOY 718; ALLOY 718 FOR CODE CASE 1592-4 APPLICATIONS (BOLTING); GUIDELINES FOR REQUIRED DATA ON NEW MATERIALS FOR SECTION III, ELEVATED TEMPERATURE NUCLEAR CONSTRUCTION. Moen, R.A. (Westinghouse Hanford Co., Richland, WA). 1975.

Status of technology of Alloy 718 for nuclear applications. Minutes of meeting, October 30, 1975.

Information is presented concerning Inconel 718 utilization in the Fast Flux Test Facility, design data currently in Nuclear Systems Materials Handbook, general and specific design

data needs,, bolting applications and guidelines for required data. (FS)

- 1029 (DOE/TIC--11038) SODIUM HYDRIDE PRECIPITATION IN SODIUM COLD TRAPS. McPheeters, C.C.; Raue, D.J. (Argonne National Lab., IL (USA)). Oct 1979. Contract W-31-109-ENG-38. 29p. Dep. NTIS, PC A03/MF A01.

A series of experiments have been performed to test a calculational model for precipitation of NaH in sodium cold traps. The calculational model, called ACTMODEL, is a computer simulation that uses the system geometry and operating conditions as input to calculate a mass transfer coefficient and the distribution of NaH in a cold trap. The ACTMODEL was tested using an analytical cold trap (ACT) that is simple and essentially one-dimensional. The ACT flow and temperature profile may be controlled at any desired condition. The ACT was analyzed destructively after each test to measure the actual NaH distribution. Excellent agreement was obtained between the ACTMODEL simulations and the experiments.

- 1030 (DOE/TIC--11039) EXPERIMENTS ON COLD TRAP REGENERATION BY NAH DECOMPOSITION. McPheeters, C.C.; Skladzien, S.B.; Raue, D.J. (Argonne National Lab., IL (USA)). Oct 1979. Contract W-31-109-ENG-38. 23p. Dep. NTIS, PC A02/MF A01.

Cold trap regeneration may be very important in future LMFBRs because of the expected high hydrogen source from the steam generators. This hydrogen precipitates as NaH in the cold trap and may fill the trap within one year of operation. Several methods of cold trap regeneration were considered, but the simplest and least expensive appears to be decomposition of NaH under vacuum at elevated temperatures. Experiments were done to assess the feasibility of this method for cold trap regeneration. Small-scale simulated cold traps (SCT) were located with NaH and NaH plus Na₂O, and were heated both under vacuum and under a sweep gas at 100 kPa. The evolved hydrogen was converted to water by a CuO bed and collected in a weighting tube.

- 1031 (DOE/TIC--11040) COLD TRAP REQUIREMENTS FOR PHTS AND IHTS SODIUM PURIFICATION. Sletten, H.L. (Atomics International Div., Canoga Park, CA (USA)). 31 May 1974. Contract EY-76-C-03-0824-025. 76p. (TI--099-811-013). Dep. NTIS, PC A05/MF A01.

Cold trap requirements for the Primary Heat Transfer System (PHTS) and the Intermediate Heat Transfer System (IHTS) are defined. The bases for these requirements are (1) maintaining concentrations of oxygen and hydrogen within given limits, (2) controlling the transport of tritium by coprecipitating it in cold traps together with hydrogen, and (3) providing the necessary volume capacity for collecting impurities. It is concluded that the 60 gpm, FFTF Type I, NaK cooled, cold trap will satisfy the PHTS requirements. For each of the IHTS loops a single, 60 gpm, cold trap is required; and an aircooled trap similar to the FFTF Type I design except for a 3-foot longer crystallizer section has been chosen for this service.

- 1032 (DOE/TIC--11041) THERMAL AND HYDRAULIC ANALYSES OF THE SYSTEM 81 COLD TRAPS. Kim, K. (Atomics International Div., Canoga Park, CA (USA)). 15 Jun 1977. Contract EY-76-C-03-0824-025. 174p. Dep. NTIS, PC A08/MF A01.

Portions of document are illegible.

Thermal and hydraulic analyses of the System 81 Type I and II cold traps were completed except for thermal transients analysis. Results are evaluated, discussed, and reported. Analytical models were developed to determine the physical dimensions of the cold traps and to predict the performance. The FFTF cold trap crystallizer performances were simulated using the thermal model. This simulation shows that the analytical model developed predicts reasonably conservative temperatures. Pressure drop and sodium residence time calculations indicate that the present design will meet the requirements specified in the E-Specification. Steady state temperature data for the critical regions were generated to assess the magnitude of the thermal stress.

- 1033 (DOE/TIC--11042) COMPUTERIZED FUEL MEASUREMENT FROM X-RAY RADIOGRAPHY. Green, D.R.; Karnesky, R.A.; Bromley, C. (Hanford Engineering Development Lab., Richland, WA (USA)). Nov 1979. Contract EY-76-C-14-2170. 11p. Dep. NTIS, PC A02/MF A01.

Techniques have recently been developed which allow nondestructive dimensional characterization of fuel pellets within fuel pins. Fuel pellet diameters can be measured with an accuracy of ± 0.0005 inch (0.0012 cm) using standard vendor-supplied radiography, or with an accuracy of ± 0.0002 inch (0.0005 cm) using x-ray radiography produced by a special HEDL developed technique. These data are needed for the detailed evaluation of the effects of irradiation on fuel behavior. The radiographs to be analyzed are transformed into a digital form using a computer controlled x-y scanning microdensitometer. The digital image is then recorded on a magnetic tape which is then sent to the central computer (CDC 6600) for analysis with FORTRAN IV software. Pellet diameters are determined, statistically analyzed, and the results are tabulated with a high speed line printer. These reports are also placed on magnetic tape storage for future computerized comparison and evaluation.

- 1034 (DOE/TIC--11060) SIEX DESIGN PREDICTIONS FOR THE PNC FUEL PINS IN THE HEDL P-E01 POWER-TO-MELT TEST. (Hanford Engineering Development Lab., Richland, WA (USA)). 1979. Contract EY-76-C-14-2170. 13p. Dep. NTIS, PC A02/MF A01.

During the design phase of the HEDL P-E01 power-to-melt test, a series of design predictions were generated for the three PNC pins using the SIEX fuel pin modeling code. This document tabulates a series of selected PNC pin design predictions as requested by M. Shinohara during his visit to HEDL (October 8-19, 1979).

- 1035 (DOE/TIC--11087) FFTF DRIVER FUEL PELLETS: TYPICAL PELLETT LOT DATA. (Babcock and Wilcox Co., Apollo, PA (USA). Nuclear Materials and Mfg. Div.). [nd]. Contract EY-76-C-02-3109. 13p. Dep. NTIS, PC A02/MF A01.

Quality assurance data for FFTF reactor fuel pellets are presented.

- 1036 (DOE/TIC--11088) FFTF DRIVER FUEL PELLETS: TYPICAL PELLETT LOT DATA. (Kerr-McGee Corp., Oklahoma City, OK (USA)). [nd]. 12p. Dep. NTIS, PC A02/MF A01.

Quality assurance data are presented for FFTF driver fuel pellets.

1037 (DOE/TIC--11114) LIQUID METAL ENGINEERING CENTER (LMCE) ANNUAL TECHNICAL PROGRESS REPORT, JANUARY-DECEMBER 1975. (Liquid Metal Engineering Center, Canoga Park, CA (USA)). 30 Apr 1976. Contract EY-76-C-03-0700. 22p. Dep. NTIS, PC A02/MF A01.

Portions of document are illegible.

During operation of the prototype FFTF sodium pump, it is necessary to know the position of the pump shaft relative to the sodium-lubricated hydrostatic bearing journals. Performance of the Kaman proximity measurement system was known to be affected by the type of media between the gap to be measured. Since Kaman Sciences Corp. did not have liquid sodium testing capabilities, LMCE was requested to evaluate a spare prototype system. Determination of the sodium performance characteristics of the Kaman proximity systems was a necessary requisite for use of four prototype systems in the FFTF prototype pump test program.

1038 (DOE/TIC--11115) THERMAL INSULATION SYSTEM DESIGN AND FABRICATION SPECIFICATION (NUCLEAR) FOR THE CLINCH RIVER BREEDER REACTOR PLANT. (Westinghouse Electric Corp., Oak Ridge, TN (USA). Advanced Reactors Div.). 21 Jul 1978. Contract EY-76-C-15-2395. 67p. Dep. NTIS, PC A04/MF A01.

This specification defines the design, analysis, fabrication, testing, shipping, and quality requirements of the Insulation System for the Clinch River Breeder Reactor Plant (CRBRP), near Oak Ridge, Tennessee. The Insulation System includes all supports, convection barriers, jacketing, insulation, penetrations, fasteners, or other insulation support material or devices required to insulate the piping and equipment cryogenic and other special applications excluded. Site storage, handling and installation of the Insulation System are under the cognizance of the Purchaser.

1039 (DOE/TIC--11116) CLINCH RIVER BREEDER REACTOR PLANT NUCLEAR INSULATION SYSTEM MATERIAL SELECTION REPORT. (Westinghouse Electric Corp., Pittsburgh, PA (USA). Advanced Energy Systems Div.). Oct 1977. Contract EY-76-C-15-2395. 40p. Dep. NTIS, PC A03/MF A01.

This insulation system material selection report presents a comparative evaluation of candidate insulation materials for use with the nuclear Steam Supply System (NSSS) of the Clinch River Breeder Reactor Plant (CRBRP). This evaluation takes a comprehensive view of the quantitative as well as qualitative characteristics of candidate insulation and protective covering materials.

1040 (DOE/TIC--11162) EBR-II OPERATING EXPERIENCE. Smith, C.R.F. (Argonne National Lab., IL (USA)). Jul 1978. Contract W-31-109-ENG-38. 220p. Dep. NTIS, PC A10/MF A01.

Operation of the EBR-2 reactor is presented concerning the performance of the heat removal system; reactor materials; fuel handling system; sodium purification and sampling system; cover-gas purification; plant diagnostics and instrumentation; recent improvements in identifying fission product sources in EBR-2; and EBR-2 safety.

1041 (DOE/TIC--11163) EBR-II PROJECT: RUN 100, MARCH 4 1979-APRIL 15, 1979. (Argonne National Lab., IL (USA)). 1979. Contract W-31-109-ENG-38. 44p. Dep. NTIS, PC A03/MF A01.

Run 100 started on March 4 and ended on April 15, 1979, following 2139 Mwd of reactor operation. Reactor-operate interlocks and reactor-startup check sheets were completed on March 4. Criticality was reached at 2337 on March 4. The control rods were calibrated, and reactor power was increased, reaching 62.5 MWt at 0850 on March 5. Run 100A was to be a 48-hr irradiation of the flow-blockage-simulation experiment (X343). The FERD signal increased linearly with power and reached about 280 counts/s at 62.5 MWt.

1042 (DOE/TIC--11164) EBR-II PROJECT: RUN 99, JANUARY 3, 1979-FEBRUARY 22, 1979. (Argonne National Lab., IL (USA)). 1979. Contract W-31-109-ENG-38. 49p. Dep. NTIS, PC A03/MF A01.

Run 99 was started on Jan. 9, 1979, and ended on Feb. 22, 1979, following 2344 Mwd of operation. The run was conducted in five segments because of fission-product releases. There were two scrams; one was caused by instrument malfunctions and one was a manual scram due to high FERD counts.

1043 (DOE/TIC--11165) EBR-II PROJECT: RUN 104, OCTOBER 7, 1979-DECEMBER 3, 1979. (Argonne National Lab., IL (USA)). 1979. Contract W-31-109-ENG-38. 33p. Dep. NTIS, PC A03/MF A01.

Run 104 started on October 7, 1979, and ended on December 3, 1979, after 3106 Mwd of operation. Authorized power level was reduced from 62.5 MWt to 57-1/4 MWt as part of the Operational Safety Testing Program. The run was conducted in two segments because of a fission-product release. Two reactor scrams occurred during the run: one caused by failure of the latch clutch for control rod No. 1, and one caused by a low-flow trip for reactor coolant outlet.

1044 (DOE/TIC--11166) EBR-II PROJECT: RUN 101, APRIL 16, 1979-JUNE 25, 1979. (Argonne National Lab., IL (USA)). 1979. Contract W-31-109-ENG-38. 53p. Dep. NTIS, PC A04/MF A01.

Run 101 started on April 18 and ended on June 25, 1979, after 2436 Mwd of operation. The run was conducted in two segments because of a fission-product release. There was one manual scram at the beginning of the run, before full power, because of high FERD count. Between the completion of run 100 on April 16 and the beginning of run 101, annual long-shutdown maintenance and scheduled plant modifications were in progress.

1045 (DOE/TIC--11167) EBR-II PROJECT: RUN 102, JUNE 25, 1979-AUGUST 20, 1979. (Argonne National Lab., IL (USA)). 1979. Contract W-31-109-ENG-38. 38p. Dep. NTIS, PC A03/MF A01.

Run 102 started on July 4 and ended on August 20, 1979, following 2513 Mwd of reactor operation.

1046 (DOE/TIC--11168) EBR-II PROJECT: RUN 103, AUGUST 20, 1979-OCTOBER 6, 1979. (Argonne National Lab., IL (USA)). 1979. Contract W-31-109-ENG-38. 36p. Dep. NTIS, PC A03/MF A01.

Run 103 was started on August 27, 1979, and ended on October 6, 1979, following 2277 Mwd of operation. The run was conducted in two segments. There were no scrams.

1047 (DOUNREAY=TRANS--813) KALKAR NUCLEAR POWER STATION (SNR 300). (UKAEA Dounreay Nuclear Power Development Establishment). Aug 1978. 23p. British Library Lending Division, Boston Spa, Wetherby, West Yorkshire, England.

The report falls under the following headings: summary of the most important events in the first quarter of 1978; state of the planning (nuclear steam generating system; conventional sector); state of the safety technology and building regulation work (licensing processes); building progress report; deadline situation.

1048 (ECN--21) TRANSIENT TUBE BURST TESTS ON FAST REACTOR FUEL CLADDING. Kwast, H. (Stichting Energieonderzoek Centrum Nederland, Petten). Jul 1977. 80p. Dep. NTIS (US Sales Only), PC A05/MF A01.

Experimental results of transient tube burst tests on tubing of three different austenitic stainless steels, Werkstoff no. 1.4970 (Sandvik 12R72HV), 1.4981 and 1.4988 (DIN classification), are reported. The tubing geometry is representative for the canning of the sodium cooled fast reactor SNR-300. The internal tube pressure ranged from 30 to 120 Kg/cm². The heating rate was varied from 27 to 110degC/sec. Up to a heating rate of about 70degC/sec the failure temperatures can be reasonable well predicted by a secondary creep relation. The failure temperature of 1.4970 tubing is strongly influenced by the heating rate. This is much less the case for 1.4981 and 1.4988 tubing. The failure strains of the three tubings depend largely on failure temperature and except for material 1.4981, also on heating rate. Three different failure modes have been observed.

1049 (ECN--22) FAST REACTOR PROGRAMME. FIRST QUARTER 1977 PROGRESS REPORT. Hoekstra, E.K. (Stichting Energieonderzoek Centrum Nederland, Petten). Jul 1977. 50p. Dep. NTIS (US Sales Only), PC A03/MF A01.

Results of central reactivity worth measurements on various fission product nuclides performed in STEK at Petten are compared with results of integral activation measurements performed on same in CFRMF at Idaho. Post-irradiation examination results are given of a burst fuel pin (R54-F36) fitted with a stainless steel DIN 1.4981 canning, and loss-of-cooling experiment R63-L14. The outcome of several thermal diffusivity measurements on 14 pellets of U(C,N) is reported. Results of low-cycle fatigue experiments on creep-conditioned specimens of stainless steel DIN 1.4948 are discussed. A study on the leakage of aerosol particles through cracks and ducts in a reactor containment wall is proposed. In the field of heat transfer and hydraulics, reports are given on a singlephase experiment using a thin-walled heater NANCY-054, Laser Doppler Anemometer measurements on water flowing through a square channel, temperature noise measurements, and a study of local boiling behind a flow blockage in a 28-rod bundle.

1050 (ECN--34) FAST REACTOR PROGRAM. COMBINED SECOND AND THIRD QUARTERS 1977 PROGRESS REPORT. Hoekstra, E.K. (Stichting Energieonderzoek Centrum Nederland, Petten). Jan 1978. 62p. Dep. NTIS (US Sales Only), PC A04/MF A01.

Average capture cross sections and their standard deviations of a number of fission product nuclides in an SNR-300 flux spectrum, derived from the integral data from STEK and CFRMF, are given. The HFR-TOP facility for

transient overpower experiments on fuel pins being irradiated in the pool-side facility for transient overpower experiments on fuel pins being irradiated in the pool-side facility of the HFR is described. The outcome of the thermal diffusivity measurements on U(C,N) pellets of different oxygen content is reported. Results of destructive tests on samples of stainless steel DIN 1.4948 used in the SNR-300 reactor vessel are discussed. Data on the floor of the SAUNA vessel to the covering sodium aerosol are given. Heat transfer and temperature noise analyses of the single and two-phase experiments performed behind a flow blockage in an electrically heated 28-rod bundle in a sodium coolant are reported.

1051 (ECN--41) FAST REACTOR PROGRAMME. FOURTH QUARTER 1977 PROGRESS REPORT. Hoekstra, E.K. (Stichting Energieonderzoek Centrum Nederland, Petten). May 1978. 67p. Dep. NTIS (US Sales Only), PC A04/MF A01.

Fast neutron capture cross section data of natural Mo are presented; a feasibility study on integral neutron spectrum measurements in the low-energy region of large LMFBR's is discussed. The post-irradiation examination results of the fuel pin of loss-of-cooling experiment R63-L18 and the progress made with preparations for the HFR-TOP transient overpower experiments on fuel pins under irradiation in the pool-side facility of the HFR are reported on. An exact determination of the thermochemical properties of uranyl halides is discussed. Results of mechanical tests on stainless steel DIN 1.4948 specimens are given. Aerosol leakages through blocks of concrete are determined. In the field of heat transfer and hydraulics, data on fully-developed turbulent flows in rod bundles have been obtained using the code VITESSE, results of Laser Doppler Anemometer measurements performed on water flowing through a square channel are given and progress is reported on the study of local boiling occurring behind a flow blockage in a 28-rod bundle.

1052 (ECN--48) FAST REACTOR PROGRAMME. FIRST QUARTER 1978 PROGRESS REPORT. Hoekstra, E.K. (Stichting Energieonderzoek Centrum Nederland, Petten). Sep 1978. 52p. Dep. NTIS (US Sales Only), PC A04/MF A01.

Recently evaluated neutron capture cross section data of ¹⁴²Nd, ¹⁴³Nd, ¹⁴⁴Nd, ¹⁴⁵Nd, ¹⁴⁶Nd, natural Nd and Mo as well as adjustment of the capture cross sections of ¹⁵²Sm and ¹⁵⁴Sm to fit integral data measured in STEK and CFRMF are discussed. The progress made with preparations for the HFR-TOP transient overpower experiments on fuel pins under irradiation in the pool-side facility of the HFR is reported on. Results are given of tensile tests on irradiated as well as on heat-treated stainless steel DIN 1.4948 specimens subjected to varying numbers of fatigue cycles. In the field of aerosol research, measured gas flow rates and pressure drops in stainless steel capillaries of various dimensions are compared with theory; the gas flow and aerosol penetration in cracks, artificially introduced in concrete test specimens, have been determined. Criteria in selecting the right light-scattering particles for use in Laser Doppler Anemometer measurements are given; the results of single and two-phase experiments with the second 28-rod bundle and the hydrodynamics during single-bubble boiling in the first bundle are discussed.

1053 (ECN--50) EFFECTS OF NEUTRON

IRRADIATION AND FATIGUE ON DUCTILITY OF STAINLESS STEEL DIN 1.4948. de Vries, M.I.; van der Schaaf, B.; Staal, H.U.; Elen, J.D. (Stichting Energieonderzoek Centrum Nederland, Petten). Oct 1978. 22p. (CONF-780722--25). Dep. NTIS (US Sales Only), PC A03/MF A01.

From 9. symposium on effects of radiation in structural materials; Richland, WA, USA (10 Jul 1978).

Test specimens of stainless steel DIN 1.4948, which is similar to AISI type 304, have been irradiated at 723 K and 823 K up to fluences of 1.10^{23} neutrons (n).m⁻² and 5.10^{24} n.m⁻² ($E > 0.1$ MeV). These are representative conditions for the SNR-300 reactor vessel and inner components after 16 years of operation. High temperature (723 K to 1023 K) tensile tests at strain rates (depsilon/dt) from 10^{-7} s⁻¹ to 10 s⁻¹ show a considerable decrease of tensile ductility. The extent depends on helium content, test temperature and strain rate. The atomic helium fractions of 3.10^{-7} and 7.10^{-6} result from the reactions of thermal neutrons with the 14 ppm boron, present in the steel. Helium embrittlement sets in at strain rates below 1 s⁻¹ to 10 s⁻¹ (the range of interest for Bethe-Tait accident analyses). A minimum total elongation value of 6% is shown at 923 K. The post-irradiation fatigue life is reduced by up to about 50% due to intergranular cracking. The combination of irradiation and fatigue causes a decrease of ductility after a smaller number of prior fatigue cycles than in the case of unirradiated material.

1054 (ECN--52) PSEUDO FISSION-PRODUCT CROSS SECTIONS FOR A 1300 MWE FAST BREEDER REACTOR (STATUS JULY 1978). Heijboer, R.J. (Stichting Energieonderzoek Centrum Nederland, Petten). Nov 1978. 26p. Dep. NTIS (US Sales Only), PC A03/MF A01.

Zero-dimensional burn-up calculations have been performed for a reactor with an average core composition representative of a 1300 MWE LMFBR to obtain its fission product inventory at various time steps. In these calculations 162 fission-product nuclides have been taken into account. The fission yields used were taken from a preliminary version of ENDF/B-V. The adopted cross section set for the fission products was the adjusted RCN=2A group constant set for 37 important nuclides, supplemented with group constants calculated from other libraries, mainly from ENDF/B-IV. The adjustments in the capture cross sections are based upon integral data from STEK and CFRMF. In the calculations the complete fission-product mixture was separated into five mixtures of fission-products originating from the fissionable nuclides ²³⁵U, ²³⁸U, ²³⁹Pu, ²⁴⁰Pu and ²⁴¹Pu. For each of these heavy nuclides a 26-group set of pseudo fission-product cross sections was derived at each of the 9 time steps. Tables of the capture group constants of the 5 pseudo products are given at a burn-up stage of 41 MWd/kg. Comparisons are made with results of previous calculations (1976) in which other fission yields, capture cross sections and group weighting functions were used. On the average, the difference between the present and previous results is about +3%. The calculated capture cross sections of the pseudo products depend at present for about 82% on adjusted capture cross section data of individual fission-product nuclides (RCN=2A set). The uncertainty in the average pseudo fission-product capture cross section in a LMFBR, as calculated with the present data, is estimated at 6 to 9%.

1055 (ECN--59) FAST REACTOR PROGRAMME.

COMBINED SECOND AND THIRD QUARTERS 1978 PROGRESS REPORT. Hoekstra, E.K. (Stichting Energieonderzoek Centrum Nederland, Petten). Apr 1979. 62p. Dep. NTIS (US Sales Only), PC A04/MF A01.

Results of capture cross section adjustments of the Nd isotopes and ¹⁴⁷Pm are reviewed. Results of the in-pile canning failure experiment R54-F37 are compared with those of R54-F26 and R54-F42; progress is reported on the preparations being made for the HFR-TOP transient overpower experiments on irradiated fuel pins. Recently commenced thermo-chemical investigations on the intermetallic compounds URu₃, URh₃ and UPd₃ are discussed. The residual high-rate tensile ductility of stainless steel DIN 1.4948 measured after having applied various creep and fatigue damage fractions and results of tensile tests on post-low-cycle fatigue treated irradiated and non-irradiated DIN 1.4948 are given. Results of gas leak rate and aerosol penetration measurements on concrete specimens with artificially made cracks are reported on. Development of hydraulic computer codes, heat transfer measurements in the vicinity of grid-type spacers, planned Laser Doppler Anemometer measurements in a four-rod bundle and results of boiling experiments and temperature noise measurements behind a 34% blockage of a 28-rod bundle are discussed.

1056 (ECN--61) EFFECT OF NEUTRON IRRADIATION ON CREEP PROPERTIES OF 18CR-11NI (DIN 1.4948) STAINLESS STEEL PLATE AND WELDED JOINTS AT 823 K. van der Schaaf, B.; de Vries, M.I.; Elen, J.D. (Stichting Energieonderzoek Centrum Nederland, Petten). May 1979. 192p. Dep. NTIS (US Sales Only), PC A10/MF A01.

Design and safety analysis of permanent structures such as reactor vessel and shield tank of the loop type fast breeder reactor SNR-300 require post-irradiation creep data on the structural steel DIN 1.4948, which is equivalent to type AISI 304. Specimens from plate and weldments were irradiated at 823 K to thermal neutron fluences of about 5×10^{22} n.m⁻² and 2×10^{24} n.m⁻², (fast neutron fluences of 10^{23} n.m⁻² and 5×10^{24} ($E > 0.1$ MeV) respectively), followed by creep testing up to 10,000 h. The most important effect of irradiation is the diminished ductility of both plate and welded joints. As a result the creep strength of plate is reduced by 50 MPa which means a reduction in creep life by a factor of about 10. Welded joints fracture in unirradiated condition along the dendrite boundaries in the weld at a creep stress 20 MPa lower than parent metal. After irradiation the grain boundaries in the parent metal adjacent to the weld are weaker, causing a further reduction of creep strength of 30 MPa. The irradiation embrittlement is attributed to the formation of helium by thermal neutron reaction with the ¹⁰B isotope. The boron is mainly precipitated on the grain boundaries. In applying post irradiation creep-rupture data of type 304 ss for design and analysis of reactor components, thermal fluence limits rather than fast fluence limits should be set for life reduction factors and creep strains.

1057 (ECN--73) TENSILE PROPERTIES OF IRRADIATED AND FATIGUE EXPOSED STAINLESS STEEL DIN X 6 CRNI 1811 (SIMILAR TO AISI TYPE 304) PLATE AND WELDED JOINTS. de Vries, M.I.; van der Schaaf, B.; Elen, J.D. (Stichting Energieonderzoek Centrum Nederland, Petten). Oct 1979. 49p. Dep. NTIS (US Sales Only), PC A04/MF A01.

Test specimens of plate metal and welded

joints of stainless steel DIN 1.4948, which is similar to AISI type 304, have been irradiated at 723°K and 823°K up to fluences of 1.10^{23} n.m⁻² and 5.16^{24} n.m⁻² ($E > 0.1$ MeV). These are representative conditions for the SNR-300 reactor vessel and inner components after 16 years of operation. High-rate (depsilon/dt = 1 s^{-1}) tensile tests were performed after fatigue exposure up to various fractions of fatigue life (D) ranging from 5% to 95% at the same temperatures as the nominal temperatures of the irradiation series.

- 1058 (ECN--74) EFFECT OF NEUTRON IRRADIATION ON SEQUENTIAL CREEP-FATIGUE INTERACTION OF 18CR-11NI (DIN 1.4948) STAINLESS STEEL PLATE AND WELDED JOINTS AT 823 K. van der Schaaf, B.; de Vries, M.I.; Elen, J.D. (Stichting Energieonderzoek Centrum Nederland, Petten). Oct 1979. 162p. Dep. NTIS (US Sales Only), PC A06/MF A01.

The effect of irradiation on sequential creep-fatigue interaction was studied for plate and welded joints of 18Cr-11Ni stainless steel DIN 1.4948, equivalent to AISI type 304. Irradiation and test temperature were 823 K, the neutron fluence amounted to 10^{23} n.m⁻² ($E > 0.1$ MeV). Creep exposures lasted up to 4100 h. Low cycle fatigue testing was carried out with a total strain range of 0.6% and a strain rate of $3 \times 10^{-3} \text{ s}^{-1}$. The data are required for design and safety analysis of permanent structure such as: reactor vessel and shielded tank of the fast breeder reactor SNR-300.

- 1059 (EMD--76-13) EVALUATION OF THE STATUS OF THE FAST FLUX TEST FACILITY PROGRAM. (General Accounting Office, Washington, DC (USA)). 15 Nov 1976. 45p. General Accounting Office, Washington, DC.

Report to the Congress by the Comptroller General of the United States.

The report presents the current status of and problems associated with the construction and testing capabilities of the FFTF. Included are sections dealing with program cost experience, program schedule experience, and status of problems with major heat transport system components. (DG)

- 1060 (EMD--77-5) CONSIDERATIONS FOR COMMERCIALIZING THE LIQUID METAL FAST BREEDER REACTOR. (General Accounting Office, Washington, DC (USA)). 29 Nov 1976. 74p. General Accounting Office, Washington, DC.

Report to the Congress by the Comptroller General of the United States.

The report presents a picture of the commitment and effort necessary if the LMFBF and needed support technologies are ultimately to be commercialized. Emphasis is placed on the need for coordination of the planning and timing of the separate components required. Included are sections dealing with characteristics of a commercial LMFBF industry, schedule requirements for commercialization, alternative futures for commercialization of LMFBF technologies, constraints on commercialization, and conclusions and recommendations. (DG)

- 1061 (EMD--79-15) NUCLEAR REACTOR OPTIONS TO REDUCE THE RISK OF PROLIFERATION AND TO SUCCEED CURRENT LIGHT WATER REACTOR TECHNOLOGY. COMPTROLLER GENERAL'S REPORT TO THE CONGRESS. (General Accounting Office, Washington, DC (USA)). 23 May 1979. 54p. U.S. General Accounting Office, 441 G Street, N.W., Washington, DC.

In response to a request from the Vice

Chairman of the Joint Economic Committee and widespread interest by other Members of the Congress, GAO compared a number of alternative reactor technologies, a number of modifications to the reprocessing technology, and the thorium fuel cycle. GAO found that there is no proliferation-proof reactor technology, nor is there any technology which is clearly superior when compared in terms of resource utilization, licensability, environmental acceptability, cost, commercialization schedule, proliferation resistance, safeguardability, and economics. Therefore, GAO believes that Congress should not preclude the liquid metal fast breeder reactor option, at least at this time.

- 1062 (ENICO--1028) FAST REACTOR FISSION YIELDS FOR ²³³U AND ²³⁵U IRRADIATED IN ROW 4 OF EBR-II. Maeck, W.J.; Erikson, A.L.; Tromp, R.L. (Exxon Nuclear Idaho Co., Inc., Idaho Falls (USA)). Feb 1980. Contract AC07-79ID01675. 32p. Dep. NTIS, PC A03/MF A01.

Absolute ²³³U and ²³⁵U fast reactor fission yields are given for the stable and long-lived isotopes of krypton, rubidium, strontium, zirconium, molybdenum, xenon, cesium, barium, lanthanum, cerium, neodymium, and samarium, for samples irradiated in Row 4 of the Experimental Breeder Reactor II. The principal measurement technique for the fission product isotopes was isotope dilution mass spectrometry. The number of fissions was established by summing the number of fission product atoms in the heavy mass peak.

- 1063 (EPRI-AF--664(Vol.1)) COMPARATIVE STUDY AND EVALUATION OF ADVANCED-CYCLE SYSTEMS. FINAL REPORT. Pomeroy, B.D.; Fleck, J.J.; Marsh, W.D.; Brown, D.H.; Shah, R.P. (General Electric Co., Schenectady, NY (USA)). Feb 1978. 139p. Dep. NTIS, PC A07/MF A01.

A number of advanced energy-conversion concepts are now being proposed to supplement or supersede conventional power-generation technology. They are being proposed by individuals and organizations with widely varied backgrounds, using a diversity of approaches and assumptions for predicting performance, cost, and development requirements. The work reported here was undertaken to assist EPRI in planning R and D for the utility industry by analyzing 19 of the advanced concepts on a common basis using uniform technical and economic assumptions. The concepts range from a steam cycle with an atmospheric fluidized-bed furnace to longer-term options such as magnetohydrodynamic systems. The primary purpose of this study is to define techniques for assessing the worth of these concepts to the utility industry and the nation as a whole. Three methods have been developed: levelized cost of electricity; direct-weighting method; and net-present-worth method. These measure not only the life-cycle costs associated with each power plant concept, but also the intangible attributes such as development risk and reliability. They assess the relative importance of costs and intangibles in the context of utility goals.

- 1064 (EPRI-AF--664(Vol.2)(Pt.1)) COMPARATIVE STUDY AND EVALUATION OF ADVANCED-CYCLE SYSTEMS. FINAL REPORT. Pomeroy, B.D.; Fleck, J.J.; Marsh, W.D.; Brown, D.H.; Shah, R.P. (General Electric Co., Schenectady, NY (USA)). Feb 1978. 183p. Dep. NTIS, PC A09/MF A01.

This volume presents 3 appendices (A, B, and C) containing data dealing with the advanced power cycles evaluated. They are: Phase 1 Power Cycles Data Tabulation; Phase 2 Power Cycles--

Conceptual Designs; and Summary of Power Cycle Data and Development Plans from the Energy Conversion Alternatives Study. The 19 advanced cycles and their fuels evaluated in Phase 1 and two reference cycles (last two) are: advanced steam, atmospheric fluidized-bed furnace, coal; advanced steam, conventional furnace, No. 6 oil; advanced steam, high-temperature gas-cooled reactor, nuclear; advanced steam, liquid metal fast breeder reactor, nuclear; advanced open-cycle gas turbine, recuperative, air-cooled, high Btu gas derived from coal; advanced open-cycle gas turbine, recuperative, air-cooled, No. 6 oil; advanced open-cycle gas turbine, combined-cycle, air-cooled, low-Btu gas derived from coal; advanced open-cycle gas turbine, combined-cycle, water-cooled, low-Btu gas derived from coal; advanced open-cycle gas turbine combined-cycle, water-cooled, liquid semiclean fuel derived from coal; closed-cycle gas turbine, supercritical carbon dioxide, atmospheric fluidized-bed, coal; closed-cycle gas turbine, helium atmospheric fluidized-bed, coal; closed-cycle gas turbine, helium, high-temperature gas-cooled reactor, nuclear; open-cycle plasma MHD, coal; closed-cycle plasma MHD, conventional furnace, coal; liquid-metal MHD, atmospheric fluidized-bed, coal; metal-vapor turbine, atmospheric fluidized-bed, coal; thermionic, conventional furnace, coal; fuel-cell, low-temperature, hydrogen derived from coal; fuel-cell, low-temperature, No. 6 oil; conventional steam with stack gas scrubbing (reference case for base load and midrange), coal; and simple-cycle gas turbine (reference case for peaking), high-Btu gas derived from coal. (MCW)

- 1065 (EPRI-AF--664(Vol.2)(Pt.2)) COMPARATIVE STUDY AND EVALUATION OF ADVANCED-CYCLE SYSTEMS. FINAL REPORT. Pomeroy, B.D.; Fleck, J.J.; Marsh, W.D.; Brown, D.H.; Shah, R.P. (General Electric Co., Schenectady, NY (USA)). Feb 1978. 231p. Dep. NTIS, PC A11/MF A01.

Appendices D through H are included in this volume dealing with data compiled from the advanced cycle systems studies. They are: Details of Net Present Worth Approach; Net Present Worth With Discrete Annual Payments; Output of Net Present Worth Programs; Direct Weighting Method Power Cycle Ratings; and Direct Weighting Method: Utility Objectives and Impacts of Evaluation Criteria. (MCW)

- 1066 (EPRI-NP--645-SY(Vol.1)) ENGINEERING ASPECTS OF THE POOL TYPE LMFBR, 1000 MWE. FINAL REPORT. McDonald, J.S.; Golan, S. (Atoms International Div., Canoga Park, CA (USA); Bechtel Corp., San Francisco, CA (USA)). Apr 1978. 57p. Dep. NTIS (US Sale Only), MF A01.

The diverse directions of LMFBR development in the national programs here and abroad have established that both the loop-type and the pool-type of primary coolant systems should be considered to be viable options for an LMFBR power plant of practical size. Recognizing that the U.S. technological base for the pool-type plant was significantly smaller than that for the loop-type, this study of a 1000 MWe pool-type plant was concentrated on the areas of the plant unique to the pool concept to establish a more adequate basis for reassessment of the pool concept. The work concluded to date indicates that the pool concept is feasible with respect to design, construction and licensing practice in the United States. Volume 1 summarizes the work to date.

ASPECTS OF THE POOL TYPE LMFBR, 1000 MWE. FINAL REPORT. McDonald, J.S.; Golan, S. (Atoms International Div., Canoga Park, CA (USA); Bechtel Corp., San Francisco, CA (USA)). Apr 1978. 515p. Dep. NTIS (US Sale Only), MF A01.

Portions of document are illegible.

This volume presents the conceptual design and performance characteristics of a 1000-MWe pool-type Liquid Metal Fast Breeder Reactor (LMFBR) electric generating power plant.

- 1068 (EPRI-NP--645(Vol.2)(App.)) ENGINEERING ASPECTS OF THE POOL TYPE LMFBR, 1000 MWE. FINAL REPORT. McDonald, J.S.; Golan, S. (Atoms International Div., Canoga Park, CA (USA); Bechtel Corp., San Francisco, CA (USA)). Apr 1978. 262p. Dep. NTIS (US Sales Only), PC A12/MF A01.

Appendices to Volume 2 include detailed information under the following headings: NSSS system and equipment data sheets, deck trade study, rotatable plug and seal study, reflective insulation experience, fuel handling and storage, seismic design criteria, major component maintenance approach, radiation protection philosophy and criteria, NSSS design criteria, alternate to IHTS piping concepts, and safety licensing evaluation of IHTS and DDHRS containment isolation requirements.

- 1069 (EPRI-NP--645(Vol.3)) ENGINEERING ASPECTS OF THE POOL TYPE LMFBR, 1000 MWE. FINAL REPORT. Golan, S. (Bechtel Corp., San Francisco, CA (USA)). Apr 1978. 259p. Dep. NTIS (US Sale Only) MF A01.

Portions of document are illegible.

This volume reports the results of the balance-of-plant (BOP) work carried out under Phase A of the Prototype Large Breeder Reactor (PLBR) program sponsored by EPRI. The primary objective of BOP work for Phase A was to develop an integrated NSSS/BOP conceptual design under U.S. conditions for a 1000 MWe pool LMFBR utilizing a saturated steam cycle. The conceptual design was to be carried to sufficient depth to establish the technical feasibility of the major structures and systems unique to the pool concept and to investigate their practicality. This report describes the overall arrangement, major structures and systems, and provides engineering evaluations for key pool-related areas. Features affecting constructibility of a pool-type plant are also evaluated and areas requiring further study and resolution are identified. A detailed comparison between the pool and the loop was not performed; however, a number of general observations are noted.

- 1070 (EPRI-NP--646-SY) POOL-TYPE LMFBR PLANT, 1000 MWE PHASE A DESIGN. EXECUTIVE SUMMARY. Davies, S.M.; Golan, S.J. (General Electric Co., Sunnyvale, CA (USA); Bechtel Corp., San Francisco, CA (USA)). Apr 1978. 55p. Dep. NTIS, PC A04/MF A01.

The diverse directions of LMFBR development in the national programs here and abroad have established that both the loop-type and the pool-type of primary coolant systems should be considered to be viable options for an LMFBR power plant of practical size. Recognizing that the U.S. technological base for the pool-type plant was significantly smaller than that for the loop-type, this study of a 1000 MWe-type plant was concentrated on the areas of the plant unique to the pool concept to establish a more adequate basis for reassessment of the pool concept. The work concluded to date indicates that the pool concept is feasible with respect to design, construction and

The results of a detailed design study on the reactor assembly and core for a 1000 MW(e) pool-type LMFBF are presented.

- 1075 (EPRI-NP--646(Vol.5)) POOL-TYPE LMFBF PLANT 1000 MWE PHASE A DESIGN. PART IV. APPENDIX, FINAL REPORT. (General Electric Co., Sunnyvale, CA (USA)). Fast Breeder Reactor Dept.). Apr 1978. 90p. Dep. NTIS, PC A05/MF A01.

The results of an engineering study of the design, fabrication, construction, and testing of the major structural components of a pool-type 1000 MW(e) LMFBF are presented.

- 1076 (EPRI-NP--646(Vol.6)) POOL-TYPE LMFBF PLANT 1000 MWE PHASE A DESIGN. PART V. AUXILIARY SYSTEMS. PART VI. RESEARCH AND DEVELOPMENT NEEDS, FINAL REPORT. (General Electric Co., Sunnyvale, CA (USA)). Fast Breeder Reactor Dept.). Apr 1978. 239p. Dep. NTIS, PC A11/MF A01.

The results of an engineering study of auxiliary systems design and of additional research and development needs for a 1000 MW(e) pool-type LMFBF are presented.

- 1077 (EPRI-NP--646(Vol.7)) POOL-TYPE LMFBF PLANT 1000 MWE PHASE A DESIGN. PART VII. BALANCE-OF-PLANT FINAL REPORT. (Bechtel Corp., San Francisco, CA (USA)). Apr 1978. 455p. Dep. NTIS, PC A16/MFA01.

The results of an engineering study of the balance-of-plant design for a 1000 MW(e) pool-type LMFBF are presented.

- 1078 (EPRI-NP--646(Vol.8)) POOL-TYPE LMFBF PLANT 1000 MWE PHASE A DESIGN. PART VI. APPENDIXES, FINAL REPORT. (Bechtel Corp., San Francisco, CA (USA)). Apr 1978. 187p. Dep. NTIS, PC A09/MF A01.

Equipment lists, piping class sheets, plant drawings, and a Q-list (items subject to quality assurance program) for a 1000 MW(e) pool-type LMFBF are presented.

- 1079 (EPRI-NP--646(Vol.9)) POOL-TYPE LMFBF PLANT 1000 MWE PHASE A DESIGN. APPENDIX: INNOVATIVE DESIGN FEATURES, FINAL REPORT. (General Electric Co., Sunnyvale, CA (USA)). Fast Breeder Reactor Dept.). Apr 1978. 42p. Dep. NTIS, PC A03/MF A01.

The results of a study of innovative design features for a 1000 MW(e) pool type LMFBF are presented.

- 1080 (EPRI-NP--846) SELF-ACTUATED SHUTDOWN SYSTEM FOR A COMMERCIAL SIZE LMFBF. FINAL REPORT. Dupen, C.F.G. (Combustion Engineering, Inc., Windsor, CT (USA)). Aug 1978. 155p. Dep. NTIS, PC A08/MF A01.

A Self-Actuated Shutdown System (SASS) is defined as a reactor shutdown system in which sensors, release mechanisms and neutron absorbers are contained entirely within the reactor core structure, where they respond inherently to abnormal local process conditions, by shutting down the reactor, independently of the plant protection system (PPS). It is argued that a SASS, having a response time similar to that of the PPS, would so reduce the already very low probability of a failure-to-scrum event that costly design features, derived from core disruptive accident analysis, could be eliminated. However, the thrust of the report is the feasibility and reliability of the in-core SASS hardware to achieve sufficiently rapid shutdown. A number of transient overpower and transient undercooling-responsive systems were investigated leading to the selection of a primary candidate and a backup concept. During a transient undercooling event, the recommended device is triggered by the associated rate of change of pressure, whereas the alternate concept responds to the reduction in core pressure drop and requires calibration and adjustment by the operators to accommodate changes in reactor power.

- 1081 (EPRI-NP--847) CCB, A TWO-DIMENSIONAL DIFFUSION THEORY CONTINUOUS CROSS-SECTION BURNUP CODE FOR FAST REACTOR ANALYSIS. FINAL REPORT. Borg, R.C.; Ott, K.O. (Purdue Univ., Lafayette, IN (USA)). School of Nuclear Engineering). Aug 1978. 219p. Dep. NTIS, PC A10/MF A01.

The burnup calculational procedures for fast breeder reactors are briefly reviewed; disadvantages of the procedures are discussed and several improvements are outlined and implemented. Microscopic group constants, which are usually considered time independent over each burnup interval, are replaced by time dependent expressions. These time dependencies are evaluated in terms of polynomials of the actinide number densities with predetermined coefficients. The burnup equations are then solved with time-dependent instead of the usual time-dependent one-group cross sections. Then, one-group flux calculations can replace most of the multigroup flux calculations for updating the power distribution. Use of these improvements reduces the computation time by more than a factor of two for a six-group problem, with very little inaccuracy in the predicted material inventory. A user's manual

for CCB is included. CCB is a two-dimensional, multigroup diffusion code for use in fast reactor burnup analysis. All group fluxes are in fast memory during the spatial calculation. The code includes techniques that have the primary goal of minimizing the number of outer iterations.

- 1082 (EPRI-NP--881-SY(Vol.1)) FURTHER EXAMINATION OF THE POOL TYPE 1000 MWE LMFBR. VOLUME 1. EXECUTIVE SUMMARY. McDonald, J.S.; Golan, S. (Atoms International Div., Canoga Park, CA (USA). Energy Systems Group; Bechtel National, Inc., San Francisco, CA (USA)). Aug 1978. 22p. Dep. NTIS, PC A02/MF A01.

A study of a 1000-MWe pool-type plant was initiated, concentrating on the areas of the plant unique to the pool concept. This four-volume interim report is the second presentation of results in this continuing study. Special emphasis is given to: (1) seismic requirements and related design impacts, (2) safety criteria and methodology to support U.S. licensing, (3) site fabrication and construction requirements and approaches, and (4) refinements in the design of the reactor tanks and supports, reactor cover, reactor internals, intermediate heat exchangers, pumps, head access area, and fuel handling system. The additional work supports the previous indication that the pool concept is feasible with respect to design, construction, and licensing practice in the United States.

- 1083 (EPRI-NP--881(Vol.2)) FURTHER EXAMINATION OF THE POOL TYPE 1000 MWE LMFBR. VOLUME 2. EXAMINATION OF NSSS CONCEPTS. INTERIM REPORT. (Atoms International Div., Canoga Park, CA (USA). Energy Systems Group). Aug 1978. 488p. Dep. NTIS, PC A21/MF A01.

The diverse directions of LMFBR development in the national programs, here and abroad, have established that both the loop-type and the pool-type of primary coolant systems should be considered to be viable options for an LMFBR power plant of practical size. Recognizing that the U.S. technological base for the pool-type plant was significantly smaller than that for the loop-type, a study of a 1000-MWe pool-type plant was initiated, concentrating on the areas of the plant unique to the pool concept. A four-volume interim report is the second presentation of results in this continuing study. Volume 2 deals with (1) nuclear steam supply system characteristics, (2) fabricability and constructibility, and (3) key pool-related design characteristics.

- 1084 (EPRI-NP--881(Vol.3)) FURTHER EXAMINATION OF THE POOL TYPE 1000 MWE LMFBR. VOLUME 3. EXAMINATION OF NSSS CONCEPTS (CONTINUED). INTERIM REPORT. (Atoms International Div., Canoga Park, CA (USA). Energy Systems Group). Aug 1978. 433p. Dep. NTIS, PC A19/MF A01.

The diverse directions of LMFBR development in the national programs, here and abroad, have established that both the loop-type and the pool-type of primary coolant systems should be considered to be viable options for an LMFBR power plant of practical size. Recognizing that the U.S. technological base for the pool-type plant was significantly smaller than that for the loop-type, a study of a 1000-MWe pool-type plant was initiated, concentrating on the areas of the plant unique to the pool concept. A four-volume interim report is the second presentation of results in this continuing study. Volume 3 deals with (1) plant performance; (2) safety and licensing; (3)

availability-maintainability, inspectability, reliability, and operability; and (4) development and test requirements.

- 1085 (EPRI-NP--881(Vol.4)) FURTHER EXAMINATION OF THE POOL TYPE 1000 MWE LMFBR. VOLUME 4. EXAMINATION OF BALANCE OF PLANT. INTERIM REPORT. (Bechtel National, Inc., San Francisco, CA (USA)). Aug 1978. 177p. Dep. NTIS, PC A09/MF A01.

The diverse directions of LMFBR development in the national programs, here and abroad, have established that both the loop-type and the pool-type of primary coolant systems should be considered to be viable options for an LMFBR power plant of practical size. Recognizing that the U.S. technological base for the pool-type plant was significantly smaller than that for the loop-type, a study of a 1000-MWe pool-type plant was initiated, concentrating on the areas of the plant unique to the pool concept. A four-volume interim report is the second presentation of results in this continuing study. Volume 4 contains the results of balance-of-plant (BOP) work performed by Bechtel under Phase A extension of the program. Although a conceptual BOP design for the pool was previously developed during Phase A, certain specific areas were selected for further study in order to more completely define design details and further develop the reference pool concept. A summary of the results of this work is presented. Five specific tasks were identified jointly with AI/CE. The scope of these tasks is described, and the task results are discussed. In addition, several modifications to the BOP arrangement were identified in order to improve structural design and constructibility aspects, and these are described. As a result of this work, the reference pool design drawings were updated and are contained in the appendix.

- 1086 (EPRI-NP--882-SY(Vol.1)) POOL-TYPE LMFBR PLANT 1000 MWE PHASE A-EXTENSION-1 DESIGN. PART I. EXECUTIVE SUMMARY. INTERIM REPORT. (General Electric Co., Sunnyvale, CA (USA); Bechtel National, Inc., San Francisco, CA (USA)). Sep 1978. 64p. Dep. NTIS, PC A04/MF A01.

A 900 MWe pool-type plant has been developed, to approximately the same level as current U.S. loop-type LMFBR plant designs, in a conceptual design study sponsored by EPRI. Concentrating on areas of the plant unique or especially important to the pool concept, this report covers the reactor deck; the design of internal structures, seismic response and construction of the reactor assembly; the thermal behavior of the plant during part-power operation and during transients; the auxiliary heat transport systems; the instrumentation and control systems; and the Balance of Plant. The main conclusion arising from this work is that the large pool-type LMFBR is a viable concept suitable for use in the United States.

- 1087 (EPRI-NP--882(Vol.2A)) POOL-TYPE LMFBR PLANT 1000 MWE PHASE A-EXTENSION-1 DESIGN. PART II. REACTOR ASSEMBLY: STRUCTURES. SECTIONS 1-6. INTERIM REPORT. Davies, S.M. (General Electric Co., Sunnyvale, CA (USA). Advanced Reactor Systems Dept.). Sep 1978. 234p. Dep. NTIS, PC A11/MF A01.

The Phase A effort produced an initial description of the overall plant, structures and systems. During Phase A, General Electric developed the overall nuclear steam supply system (NSSS) conceptual design. It defined specific design approaches for selected NSSS components and subsystems after analyzing

various design alternatives. Bechtel assumed responsibility for the intermediate sodium piping arrangement, the access area above the reactor deck and the Balance of Plant (BOP). The resulting integrated plant design provided the necessary seismic data for both the NSSS and BOP.

- 1088 (EPRI-NP--882(Vol.2B)) POOL-TYPE LMFBR PLANT 1000 MWE PHASE A-EXTENSION-1 DESIGN. PART II. REACTOR ASSEMBLY: STRUCTURES. SECTIONS 7-11. INTERIM REPORT. Davies, S.M. (General Electric Co., Sunnyvale, CA (USA). Advanced Reactor Systems Dept.). Sep 1978. 245p. Dep. NTIS, PC A11/MF A01.

The Phase A effort produced an initial description of the overall plant, structures and systems. - 1089 (EPRI-NP--882(Vol.3)) POOL-TYPE LMFBR PLANT 1000 MWE PHASE A-EXTENSION-1 DESIGN. PART III: REACTOR ASSEMBLY - DECK. PART IV: REACTOR ASSEMBLY - FABRICATION. Davies, S.M. (General Electric Co., Sunnyvale, CA (USA). Advanced Reactor Systems Dept.). Sep 1978. 254p. Dep. NTIS, PC A12/MF A01.

This report describes Phase A Extension 1 work performed between February 8 and July 31, 1978 on the design of a large pool-type LMFBR power plant. The work is the result of a team effort by Bechtel Corporation and General Electric Company which was sponsored and guided by the Electric Power Research Institute (EPRI). The objective of the work was to refine certain areas of design and bring them into better focus than had been provided by Phase A work performed between April 4 and December 30, 1977. Information is presented concerning the reactor assembly deck and fabrication of the reactor.

- 1090 (EPRI-NP--882(Vol.4)) POOL-TYPE LMFBR PLANT 1000 MWE PHASE A-EXTENSION-1 DESIGN. PART V. HEAT TRANSFER SYSTEM COMPONENTS. INTERIM REPORT. Davies, S.M. (General Electric Co., Sunnyvale, CA (USA). Advanced Reactor Systems Dept.). Sep 1978. 445p. Dep. NTIS, PC A19/MF A01.

This report describes Phase A Extension 1 work performed between February 8 and July 31, 1978 on the design of a large pool-type LMFBR power plant. The work is the result of a team effort by Bechtel Corporation and General Electric Company which was sponsored and guided by the Electric Power Research Institute (EPRI). The objective of the work was to refine certain areas of design and bring them into better focus than had been provided by Phase A work performed between April 4 and December 30, 1977. Information is presented concerning the balance of plant systems.

- 1093 (EPRI-NP--883-SY) LARGE POOL LMFBR DESIGN. EXECUTIVE SUMMARY. Wett, J.F.; Churchill, J.R. (Westinghouse Electric Corp., Madison, PA (USA). Advanced Reactors Div.; Stone and Webster Engineering Corp., Boston, MA (USA)). Aug 1978. 71p. Dep. NTIS, PC A04/MF A01.

The design effort reported and performed by ARD in the period February--July 1978, and by S and W from mid-March to July, 1978 concentrates on those parts of the nuclear island unique to a commercial size pool type LMFBR. In particular, the work covers the reactor vessel, deck, rotating plugs, upper and lower internals, internal plenum separator system, IHX, pumps, cold traps, intermediate system layout, containment/confinement system, plot plan, and residual heat removal systems. Preliminary thermal, hydraulic, stress and system analyses are also presented.

- 1094 (EPRI-NP--883(Vol.1)) LARGE POOL LMFBR DESIGN. FINAL REPORT. VOLUME 1. REACTOR. Wett, J.F. (Westinghouse Electric Corp., Madison, PA (USA). Advanced Reactors Div.). Aug 1978. 193p. Dep. NTIS, PC A09/MF A01.

- 1097 (EPRI-NP--883(Vol.3)) LARGE POOL LMFBR DESIGN. VOLUME 3. APPENDIXES. FINAL REPORT. Wett, J.F. (Westinghouse Electric Corp., Madison, PA (USA). Advanced Reactors Div.). Aug 1978. 493p. Dep. NTIS, PC A21/MF A01.
- Detailed studies are presented on: structural analysis, deck cooling analysis, vessel cooling and intermediate plenum analyses, radiation analysis, performance analysis, RHR system design, primary system flow and neutron flux measurements, alternate design considerations, selection of reference pump concept, intermediate heat exchanger design, passive RHR system, guidelines for EPRI LMFBR pool design, inert gas container for liquid metal containing pipe, insulation and support for LPR deck and rotatable plugs, selection of air as a deck coolant, two plena core inlets, reactor upper internals structure removal, inspection of in-vessel components, and upper internals/refueling chute interference.
- 1098 (EPRI-NP--883(Vol.4)) LARGE POOL LMFBR DESIGN. VOLUME 4. BALANCE OF PLANT. FINAL REPORT. (Stone and Webster Engineering Corp., Boston, MA (USA)). Aug 1978. 260p. Dep. NTIS, PC A12/MF A01.
- The primary objective of the balance-of-plant technical effort during Phase A Extension was to perform design work for a 1000 MWe (gross) pool type LMFBR to obtain an integrated plant design with emphasis of pool related structures and systems that differ from a loop type LMFBR or are of special concern. This report describes the general arrangement of major structures and equipment that are supported on a common foundation mat and the containment auxiliary systems that are unique or essential for the pool concept. Installation of major pool components during construction and containment design features that permit removal of major pool-related equipment are also described.
- 1099 (EPRI-NP--915) CRITIQUE OF THE PLBR
- PHASE A GUIDELINES. FINAL REPORT. Drechwa, Y.; Su, S.F.; Barthold, W.P. (Argonne National Lab., IL (USA)). Oct 1978. Contract W-31-109-ENG-38. 59p. Dep. NTIS, PC A04/MF A01.
- A critical analysis of the core/blanket complex as defined in the Phase A LMFBR Pool Guidelines was performed with respect to consistency and feasibility of the nuclear, thermal and mechanical design assumptions. Recommendations were made for changes in fuel assembly and blanket assembly design, core configuration and orificing.
- 1100 (EPRI-NP--948) RADIATION SOURCE TERMS IN LWR AND LMFBR SPENT FUEL. FINAL REPORT. Stamatelatos, M.G.; Huszar, L. (Science Applications, Inc., La Jolla, CA (USA)). Dec 1978. 149p. Dep. NTIS, PC A07/MF A01.
- The Electric Power Research Institute has sponsored an evaluation of the fission product gamma ray source terms for use in estimating radiation levels in the vicinity of spent nuclear fuel. This information is intended primarily for EPRI use in assessing how diversion-resistant LWR and LMFBR spent fuel will be during either long-term storage or various fuel reprocessing steps. Utility personnel engaged in the calculation of radiation levels around spent fuel pools and during refueling operations may find this report of use in their work.
- 1101 (EPRI-NP--1000(Vol.1)) OPTIMIZATION OF RADIALLY HETEROGENEOUS 1000-MW(E) LMFBR CORE CONFIGURATIONS. DESIGN AND PERFORMANCE OF REFERENCE CORES. RESEARCH PROJECT 620-25. Barthold, W.P.; Drechwa, Y.; Su, S.F.; Hutter, E.; Batch, R.V.; Beitel, J.C.; Turski, R.B.; Lam, P.S.K. (Argonne National Lab., IL (USA)). Nov 1979. Contract W-31-109-ENG-38. 164p. Dep. NTIS, PC A08/MF A01.
- A parameter study was conducted to determine the interrelated effects of: loosely or tightly coupled fuel regions separated by internal blanket assemblies, number of fuel regions, core height, number and arrangement of internal blanket subassemblies, number and size of fuel pins in a subassembly, etc. The effects of these parameters on sodium void reactivity, Doppler, incoherence, breeding gain, and thermohydraulics were of prime interest. Trends were established and ground work laid for optimization of a large, radially-heterogeneous, LMFBR core that will have low energetics in an HCDA and will have good thermal and breeding performance.

- 1105 (EPRI-NP--1001) EPRI--CURL DYNAMIC ANALYSIS OF LOOP TYPE LMFBRs. FINAL REPORT. Cady, K.B.; Pavlenko, G.F.; Raber, J.R.; Khatib-Rahbar, M. (Cornell Univ., Ithaca, NY (USA)). May 1979. 516p. Dep. NTIS, PC A22/MF A01.

A computer-aided simulation is developed to analyze the transient behavior of loop type liquid metal-cooled fast breeder reactor plants. A set of nuclear, heat transfer, sodium dynamics, steam/water thermodynamics and control models for the multi-loop plant is developed to simulate operational, incident and accident transients. The major important features of the model include: (1) a multi-loop simulation, consisting of a single loop and the remaining lumped loops; (2) a method to calculate the characteristic times for every differential equation, and apply the Runge-Kutta algorithm to variables with slow and moderate time responses as compared to the integration time step and evaluate the variables with fast responses from a prompt approximation to assure numerical stability and reduce the computation time; and (3) a pre-accident initialization method by forcing most variables into their prompt approximation. The analytical submodels of the EPRI--CURL Code simulates: (a) the dynamics of sodium flows in the primary and secondary systems governed by forced and natural circulation; (b) reactor

heat transfer; (c) neutron kinetics, reactivity feedbacks, and reactor power control; (d) intermediate heat exchanger heat transfer; (e) sodium transport delays in the primary and secondary systems; (f) steam/water thermodynamics, normal feed water flow and auxiliary feed water flow control; and (g) turbine header, throttle, steam bypass and relief flow control. There is a total of 489 first order ordinary differential equations modelling the entire plant. The EPRI--CURL systems analysis computer code for loop-type liquid metal cooled fast breeder reactors is used to model the plant response of a typical LMFBR to several transient conditions.

- 1106 (EPRI-NP--1014-SY(Vol.1)) POOL-TYPE LMFBR PLANT 1000 MWE PHASE A-EXTENSION-2 DESIGN. PART I: EXECUTIVE SUMMARY. FINAL REPORT. Golan, S.; Davies, S.M. (General Electric Co., Sunnyvale, CA (USA). Advanced Reactor Systems Dept.; Bechtel National, Inc., San Francisco, CA (USA)). Jun 1979. 49p. Dep. NTIS, PC A03/MF A01.

A 9000 MWe (net) pool-type LMFBR plant has been developed, to approximately the same level as current US loop-type LMFBR plant designs, in a conceptual design study sponsored by EPRI. A major guideline specified the plant to have an 875°F reactor outlet temperature and 550°F, 1000 psi steam with the design effort concentrating on areas of the plant unique or especially important to the pool concept. These areas include the reactor deck; the reactor assembly and its internal structures, the thermal behavior of the plant during steady state and transients; the auxiliary heat transport systems; the primary sodium pumps; the intermediate heat exchangers; the plant seismic response; maintenance and inspection; and the Balance of Plant. The main conclusion arising from this work is that the large pool-type LMFBR is a viable concept suitable for use in the United States.

- 1107 (EPRI-NP--1014(Vol.2)) POOL-TYPE LMFBR PLANT 1000 MWE PHASE A-EXTENSION-2 DESIGN. PART II: PLANT SUMMARY DESCRIPTION. FINAL REPORT. (General Electric Co., Sunnyvale, CA (USA). Advanced Reactor Systems Dept.). Jun 1979. 214p. Dep. NTIS, PC A16/MF A01.

This plant summary description volume covers the integrated Phase A plant conceptual design as it exists at the completion of Extension 2 work. In most cases the designs described are the reference arrived at after due consideration of reasonable alternatives. For a few specific design features, however, the lack of system and component development test data obscures the choice between alternatives. For these features certain alternate options remain under active interest. Examples of design features in this category are the upper internals structure, the pool thermal barriers and thermal insulation, the IHX flow distribution, and the hot pool thermal-hydraulic design in general.

- 1108 (EPRI-NP--1014(Vol.3)) POOL-TYPE LMFBR PLANT 1000 MWE PHASE A-EXTENSION-2 DESIGN. PART III: REACTOR ASSEMBLY, SEC. 1--2.5. FINAL REPORT. (General Electric Co., Sunnyvale, CA (USA). Advanced Reactor Systems Dept.). Jun 1979. 300p. Dep. NTIS, PC A13/MF A01.

The basic general arrangement of the reactor assembly for the General Electric Company's concept of a large pool type LMFBR plant was established in Phase A. EPRI design guidelines issued early in that phase specified fundamental plant features and requirements.

New arrangement drawings were prepared for Phase A Extension 1 and are contained in the Extension 1 report. The overall size and basic configuration of the reactor assembly is unchanged from Phase A. The Phase A Extension 2 work on the general arrangement is a progression from Extension 1. Prominent modifications are shown and described, and design uncertainties defined.

- 1109 (EPRI-NP--1014(Vol.4)) POOL-TYPE LMFBR PLANT 1000 MWE PHASE A-EXTENSION-2 DESIGN. PART III: REACTOR ASSEMBLY, SEC. 2-6--APPENDIX IIB. FINAL REPORT. (General Electric Co., Sunnyvale, CA (USA)). Advanced Reactor Systems Dept.). Jun 1979. 484p. Dep. NTIS, PC A21/MF A01.

The response to thermal striping and shock was determined for the upper internals structure. The components analyzed are identified and include (1) PRACS, (2) Fuel Transfer Tube, (3) Cold Trap, (4) Reactor Thermal Barrier, (5) Pump Thermal Barrier, (6) Horizontal Thermal Barrier, (7) IHX Upper Flow Shroud, (8) IHX Flow Shroud Inlet Region, (9) IHX External Cylinder, (10) Pump Inlet Nozzle, (11) Pump Exhaust Pipe, (12) Vessel Bottom Head, (13) Lower Core Support Structure, (14) Redundant Core Support, (15) Thermal Barrier Exits, and (16) Neutron Monitor Guide Tube.

- 1110 (EPRI-NP--1014(Vol.5)) POOL-TYPE LMFBR PLANT 1000 MWE PHASE A-EXTENSION-2 DESIGN. PART IV: REACTOR DECK. FINAL REPORT. (General Electric Co., Sunnyvale, CA (USA)). Advanced Reactor Systems Dept.). Jun 1979. 349p. Dep. NTIS, PC A15/MF A01.

The reactor roof or deck is a dominating structure in the pool reactor configuration; in addition to closing off the top of the reactor and providing access to the core for refueling (as it does also in the loop configuration) it also encloses and supports the entire primary coolant system including all major components such as pumps, IHXs, cold traps and instrumentation. Because of the absence of a suitable existing design basis in the United States for a large pool-concept design, the objective of the design effort was to establish feasibility through an intensive review of the many possible structural, insulation, cooling and shielding arrangements. The design effort considered construction, in-service inspection, response to non-routine conditions and influence on the pump and IHX configurations.

- 1111 (EPRI-NP--1014(Vol.6)) POOL-TYPE LMFBR PLANT 1000 MWE PHASE A-EXTENSION-2 DESIGN. PART V: HEAT TRANSPORT SYSTEMS. FINAL REPORT. (General Electric Co., Sunnyvale, CA (USA)). Advanced Reactor Systems Dept.). Jun 1979. 524p. Dep. NTIS, PC A22/MF A01.

The heat transport systems carry heat from the reactor to the IHXs and from the IHXs to the steam generators. The major components in the primary heat transport system are the primary sodium pumps and IHXs, and the major components in the intermediate heat transport system are the intermediate sodium pumps and steam generators. The history and evolution of the pool reactor heat transport systems and components during previous study phases are summarized. In addition, highlights of the current study are summarized.

- 1112 (EPRI-NP--1014(Vol.7)) POOL-TYPE LMFBR PLANT 1000 MWE PHASE A-EXTENSION-2 DESIGN. PART VI: AUXILIARY SYSTEMS; PART VII: PLANT CONTROL AND INSTRUMENTATION; PART VIII: SEISMIC ANALYSIS. FINAL REPORT. (General

Electric Co., Sunnyvale, CA (USA)). Advanced Reactor Systems Dept.). Jun 1979. 364p. Dep. NTIS, PC A16/MF A01.

Several key NSSS auxiliary systems are needed to support the reactor and main heat transport systems. These auxiliary systems include fuel handling and storage, reactor auxiliary cooling, sodium purification, and cover gas processing and control. Work has been performed on each of these systems, either to develop appropriate system conceptual designs or to investigate problem areas and identify solutions. For the fuel handling and storage system, the reactor auxiliary cooling system (RACS), and the primary sodium purification system overall system designs have been generated. Conceptual and/or preliminary designs of major components have been generated. For the cover gas system, two key aspects have been studied. The cover gas pressure control performance requirements have been defined and a suitable control system identified. In addition gas leakage through the component-to-deck seals has been analyzed. Recommended seal types and configurations have been established.

- 1113 (EPRI-NP--1014(Vol.8)) POOL-TYPE LMFBR PLANT 1000 MWE PHASE A-EXTENSION-2 DESIGN. PART IX: CONSTRUCTABILITY AND FABRICABILITY; PART X: MAINTAINABILITY AND INSPECTABILITY; PART XI: SAFETY. FINAL REPORT. (General Electric Co., Sunnyvale, CA (USA)). Advanced Reactor Systems Dept.). Jun 1979. 330p. Dep. NTIS, PC A15/MF A01.

Information is presented concerning the construction and fabrication of the upper internals structure and thermal barriers, maintainability and inspectability of reactor components, and design basis accidents.

- 1114 (EPRI-NP--1014(Vol.9)) POOL-TYPE LMFBR PLANT 1000 MWE PHASE A-EXTENSION-2 DESIGN. PART XII: BALANCE OF PLANT--PLANT DESCRIPTION. FINAL REPORT. (Bechtel, Inc., San Francisco, CA (USA)). Jun 1979. 262p. Dep. NTIS, PC A12/MF A01.

The Bechtel-developed BOP conceptual design, which combines the work of Phase A and its extensions, is described. The overall plant, structures, and systems of a 1000 MWe (gross) LMFBR utilizing the pool concept and the saturated steam cycle adopted in Phase II, are described. Particular attention is directed to the description of features unique to the pool concept, and to incorporating the results of the special studies done in Phase A and Extensions 1 and 2.

- 1115 (EPRI-NP--1014(Vol.10)) POOL-TYPE LMFBR PLANT 1000 MWE PHASE A-EXTENSION-2 DESIGN. PART XII: APPENDICES. FINAL REPORT. (Bechtel, Inc., San Francisco, CA (USA)). Jun 1979. 331p. Dep. NTIS, PC A15/MF A01.

Information presented includes system listing; an equipment list; piping class sheets; and a list of drawings.

- 1116 (EPRI-NP--1014(Vol.11)) POOL-TYPE LMFBR PLANT 1000 MWE PHASE A-EXTENSION-2 DESIGN. PART XIII: BALANCE OF PLANT - EVALUATION OF POOL-RELATED AREAS. FINAL REPORT. (Bechtel, Inc., San Francisco, CA (USA)). Jun 1979. 525p. Dep. NTIS, PC A22/MF A01.

The supportive studies carried out in Phase A and its extensions investigated specific areas where practical solutions or procedures are considered essential prerequisites for subsequent design. Those areas identified for

each phase of the work are summarized and described in detail along with significant conclusions reached.

- 1117 (EPRI-NP--1014(Vol.12)) POOL-TYPE LMFBR PLANT 1000 MWE PHASE A-EXTENSION=2 DESIGN. FINAL REPORT. (Bechtel National, Inc., San Francisco, CA (USA)). Jun 1979. 109p. Dep. NTIS, PC A06/MF A01.

Drawings are presented concerning the reactor head compartment; equipment removal, reactor, and steam generator buildings; IHTS/IRACS piping enclosure; motor control layouts; maintenance and Na storage buildings; rectangular plant arrangement alternate 1; and general arrangement and reactor support buildings.

- 1118 (EPRI-NP--1015(SY)(Vol.1)) LMFBR POOL PLANT: 1000 MWE. VOLUME 1. EXECUTIVE SUMMARY. FINAL REPORT. McDonald, J.S.; Golan, S. (Rockwell International Corp., Canoga Park, CA (USA). Energy Systems Group; Bechtel National, Inc., San Francisco, CA (USA)). Feb 1979. 53p. Dep. NTIS, PC A04/MF A01.

Information is presented concerning reactor design features; steam supply system; safety; and reactor licensing.

- 1119 (EPRI-NP--1015(Vol.2)) LMFBR POOL PLANT: 1000 MWE. VOLUME 2. NSSS PLANT DESCRIPTION. FINAL REPORT. McDonald, J.S. (Rockwell International Corp., Canoga Park, CA (USA). Energy Systems Group). Feb 1979. 416p. Dep. NTIS, PC A18/MF A01.

The report summarizes the design of the nuclear steam system; plant construction; plant performance; safety and licensing; and reactor availability.

- 1120 (EPRI-NP--1015(Vol.3)) LMFBR POOL PLANT: 1000 MWE. VOLUME 3. POOL REACTOR ENGINEERING, NSSS. FINAL REPORT. McDonald, J.S. (Rockwell International Corp., Canoga Park, CA (USA). Energy Systems Group). Feb 1979. 401p. Dep. NTIS, PC A18/MF A01.

The report summarizes the safety criteria and methodology to support US licensing; plant performance; primary coolant circuit components; plant performance characteristics; and supporting test program.

- 1121 (EPRI-NP--1015(Vol.3)(App.)) LMFBR POOL PLANT: 1000 MWE. VOLUME 3. APPENDICES. FINAL REPORT. McDonald, J.S. (Rockwell International Corp., Canoga Park, CA (USA). Energy Systems Group). Feb 1979. 337p. Dep. NTIS, PC A15/MF A01.

Appendices are presented concerning the structural design of reactor components, seismic effects, and operating procedures.

- 1122 (EPRI-NP--1015(Vol.4)) LMFBR POOL PLANT: 1000 MWE. VOLUME 4. BALANCE OF PLANT. FINAL REPORT. Golan, S. (Bechtel National, Inc., San Francisco, CA (USA)). Feb 1979. 177p. Dep. NTIS, PC A09/MF A01.

The report summarizes the refinements in the design of the reactor tanks and supports, reactor cover, reactor internals, intermediate heat exchangers, pumps, head access area, and fuel handling systems. The results of the work show that the pool concept is feasible with respect to design, construction, and licensing practice in the United States.

- 1123 (EPRI-NP--1016-SY) LARGE POOL LMFBR DESIGN: EXECUTIVE SUMMARY. Wett, J.F. (Westinghouse Electric Corp., Madison, PA (USA). Advanced Reactors Div.; Stone and Webster Engineering Corp., Boston, MA (USA)). Mar 1979. 100p. Dep. NTIS, PC A05/MF A01.

The design effort reported is an extension of past design effort and continuous concentration on those parts of the nuclear island unique to a commercial size pool type LMFBR. In particular, the work covers the reactor vessel, deck, rotating plugs, upper and lower internals, internal plenum separator system, IHX, pumps, cold traps, intermediate system layout, containment/confinement system, plot plan, and residual heat removal systems. Preliminary thermal, hydraulic, stress and system analyses are also presented.

- 1124 (EPRI-NP--1016(Vol.1)) LARGE POOL LMFBR DESIGN. FINAL REPORT. Wett, J.F.; Churchill, J.R. (Westinghouse Electric Corp., Madison, PA (USA). Advanced Reactors Div.; Stone and Webster Engineering Corp., Boston, MA (USA)). Mar 1979. 380p. Dep. NTIS, PC A17/MF A01.

The design effort reported is an extension on past design effort and continuous concentration on those parts of the nuclear island unique to a commercial size pool type LMFBR. In particular, the work covers the reactor vessel, deck, rotating plugs, upper and lower internals, internal plenum separator system, IHX, pumps, cold traps, intermediate system layout, containment/confinement system, plot plan, and residual heat removal systems. Preliminary thermal, hydraulic, stress, and system analyses are also presented.

- 1125 (EPRI-NP--1016(Vol.2)) LARGE POOL LMFBR DESIGN. VOLUME 2. BALANCE OF PLANT. FINAL REPORT. (Stone and Webster Engineering Corp., Boston, MA (USA)). Mar 1979. 282p. Dep. NTIS, PC A13/MF A01.

The work performed during this Phase A, Extension 2 is, in part, an extension of the conceptual design work for a 1000 Mwe (gross) large pool LMFBR initiated under Phase A, Extension 1 of the Phase A contract. This volume describes the general arrangement of the overall plant with emphasis on the nuclear island complex and facilities for maintenance of sodium heat transport system components. Auxiliary systems unique or essential for the pool concept were studied in more detail. A summary level construction schedule was developed for major activities of the nuclear island. The schedule and sequence for installing the large pool reactor primary heat transfer system components are presented in detail. Results are presented of the seismic evaluation of the nuclear island buildings and structural considerations that are of special concern to the pool type LMFBR.

- 1126 (EPRI-NP--1016(Vol.3)(Pt.1)) LARGE POOL LMFBR DESIGN. APPENDICES A-K. FINAL REPORT. Wett, J.F.; Churchill, J.R. (Westinghouse Electric Corp., Madison, PA (USA). Advanced Reactors Div.; Stone and Webster Engineering Corp., Boston, MA (USA)). Mar 1979. 401p. Dep. NTIS, PC A18/MF A01.

Appendices are presented which describe component development, stress analysis, shielding calculations, and transient analysis.

- 1127 (EPRI-NP--1016(Vol.3)(Pt.2)) LARGE POOL LMFBR DESIGN. VOLUME 3, PART 2. APPENDICES L-CC. FINAL REPORT. Wett, J.F. (Westinghouse Electric Corp., Pittsburgh, PA

(USA). Advanced Reactors Div.; Stone and Webster Engineering Corp., Boston, MA (USA)). Mar 1979. 406p. Dep. NTIS, PC A18/MF A01.

These appendices contain information concerning design specifications for various reactor components and structures, reactor materials, and cost data.

- 1128 (EPRI-NP--1190-SR) EVAP USERS MANUAL. Heising, C.D.; James, J. Jr. (Massachusetts Inst. of Tech., Cambridge (USA)). Dept. of Nuclear Engineering; Electric Power Research Inst., Palo Alto, CA (USA)). Aug 1979. 47p. Dep. NTIS, PC A03/MF A01.

The computer code EVAP calculates the national economic value of an advanced electric power system - in particular, the liquid metal fast breeder reactor - under conditions of uncertainty in electricity demand and availability of technologies. On the basis of this calculation and assumptions about the effects of various reprocessing decisions on the availability of the advanced system, the code can also calculate the value of alternative reprocessing decisions. Uncertainties in the data are treated explicitly through the construction and evaluation of a Bayesian decision-analysis economic model (a decision tree). EVAP is short (400 lines of FORTRAN) and quick running (3 seconds of processing time on the Electric Power Research Institute's [EPRI's] PRIME-450 minicomputer).

- 1129 (EPRI-NP--1219) PRELIMINARY DESIGN: DUPLEX TUBE LOW-PRESSURE SATURATED STEAM GENERATOR FOR LARGE LMFBR PLANT. FINAL REPORT. Dawson, B.E. (Foster Wheeler Energy Corp., Livingston, NJ (USA)). Oct 1979. 253p. Dep. NTIS, PC A12/MF A01.

A preliminary design was completed for a steam generator which is applicable to a four loop LMFBR plant of 1000 MWe gross output employing dry and saturated steam conditions. Two steam generators of 364 Mwt thermal capacity would be in each loop. The steam generator is a straight, duplex tube design with a shell bellows for thermal expansion and a single tubesheet with an integral leak detection system. The report outlines a proposed series of development tasks to provide additional design data for the duplex tube and to demonstrate the steam generator design with test modules. The design can be adapted readily as either the evaporator or the superheater for a superheated steam cycle with temperatures up to at least 430°C (800°F), which is below the creep range for the 2 1/4 Cr-1 Mo material.

- 1130 (EPRI-NP--1265) ELECTROMAGNETIC PUMPS FOR LARGE POOL-CONCEPT LMFBR. Cage, J.F. Jr. (General Electric Co., Sunnyvale, CA (USA)). Dec 1979. 106p. Dep. NTIS, PC A06/MF A01.

A study was performed to evaluate application of Linear Induction Electromagnetic (EM) sodium pumps to the heat transport systems of a 1000 MW(e) pool-type sodium-cooled fast breeder reactor power plant. Characteristics of EM pumps were examined to evaluate their size and effect on plant efficiency, the arrangement of the primary heat transport system, and their potential advantage in mitigation of SCRAM temperature transients. Both gas-cooled pumps and pumps using high temperature insulation and cooled by the pumped sodium were studied. The parameters that establish size limitations were identified and several scoping arrangements designs were made. It was concluded that electromagnetic pumps are smaller and lighter than equivalent mechanical pumps, and that these features can be utilized to minimize the

size and complexity of the primary heat transport system.

- 1131 (EQL-Memo--8) URANIUM AVAILABILITY AND THE BREEDER DECISION. Holdren, J.P. (California Inst. of Tech., Pasadena (USA)). Environmental Quality Lab.). Jan 1974. 54p. California Inst. of Tech., Environmental Quality Lab., Pasadena.

The high priority assigned by the Federal government to the early development and commercial deployment of the Liquid Metal Fast Breeder Reactor (LMFBR) is attributed by some to the supposition that, without the breeder, a supply-price squeeze on uranium will soon materialize. This supposition is examined by considering the technology and economics of uranium utilization in nonbreeder reactors, in the context of available information about uranium resources at various prices and projections of the growth of nuclear power through 2020. Reactor characteristics, cost sensitivities, and estimates of uranium resources used are based largely on publications of the U.S. Atomic Energy Commission. The results show that existing reactor technologies--light-water reactors (LWRs), high temperature gas reactors (HTGRs), or a mix of these--could meet even the most enthusiastic projections of the expansion of nuclear generation through 2020 from presently known domestic uranium supplies, exploitable at \$50 per pound of U₃O₈ or less. The increment in electricity costs that arises from increasing uranium prices in the absence of commercial breeder reactors is about 1 mill/kwhe in 2000 and about 2 mills/kwhe in 2020 in the worst case (very high growth, no HTGRs), and significantly less in more plausible cases. Briefer attention is given to potential difficulties with rapid expansion of uranium mining operations, with enrichment capacity, and with environmental impact of mining low grade ores. Timely action in the first two areas would be required to meet high growth projections, but no fundamental obstacles are apparent. The environmental issue needs more study, but on present evidence does not constitute a persuasive case for an early commitment to the LMFBR. It is concluded that the urgency often ascribed to early deployment of LMFBRs on grounds of uranium availability is, in fact, illusory.

- 1132 (ERDA--77-56) LIFE: III FUEL-ELEMENT PERFORMANCE CODE. (Argonne National Lab., IL (USA)). 15 Jul 1977. Contract W-31-109-ENG-38. 96p. AT.

The LIFE-III computer code was developed to calculate the thermal and mechanical response of mixed-oxide fuel elements in a fast-reactor heat-transfer analysis and a finite-strain-theory structural analysis based on generalized plane strain and the method of successive elastic solutions. An incremental approach is used so that temperatures, stresses, and strains can be calculated during any specified history of reactor power cycling. Fuel-cladding and sodium-cladding chemical attack is treated by a cladding wastage model. Up to six axial sections are allowed to account for axial variations in power and coolant temperature. Fuel restructuring; migration of fabricated and swelling porosities; fuel and cladding thermal expansion, elasticity, swelling, and creep; fission-gas release; and fuel cracking, crack heating, and hot pressing are included in the analysis.

- 1133 (ESG-DOE--13239) SODIUM TECHNOLOGY AND COVER GAS SEAL DEVELOPMENT PROGRAMS.

QUARTERLY TECHNICAL PROGRESS REPORT, APRIL--JUNE 1978. Welch, F.H.; Steele, D.P. III; Hill, E.F. (Atomics International Div., Canoga Park, CA (USA)). 15 Aug 1978. Contract EY-76-C-03-0824-001. 30p. AT.

Progress is reported in the LMFBR seal test program and in sodium removal and decontamination of components.

1134 (ESG-DOE--13240) COVER GAS SEAL COMPONENTS. QUARTERLY TECHNICAL PROGRESS REPORT, APRIL--JUNE 1978. (Atomics International Div., Canoga Park, CA (USA). Energy Systems Group). 21 Aug 1978. Contract EY-76-C-03-0824. 23p. AT.

Progress is summarized in the program to develop and demonstrate the performance of commercial and custom-designed head region cavity seals for LMFBR reactors, to develop and evaluate advanced seal concepts capable of achieving improvement in radioactive gas containment and seal temperature-life capabilities, and to establish operational safety margins for head region seals for nominal and extraordinary LMFBR plant conditions. The CRBRP sodium dip seal configuration performance characteristics have been determined and the seal demonstrated to meet system requirements. Current activities include verifying the acceptability of CRBRP head region inflatable elastomer seal manufacturers, developing the technology to improve static inflatable seal design, and determining the ultimate temperature capabilities of several elastomer seal materials.

1135 (ESG-DOE--13241) HIGH-TEMPERATURE PIPING DESIGN TECHNOLOGY. QUARTERLY TECHNICAL PROGRESS REPORT, APRIL--JUNE 1978. (Atomics International Div., Canoga Park, CA (USA)). 30 Aug 1978. Contract EY-76-C-03-0824-026. 21p. AT.

The overall objectives of the High-Temperature Piping Design Technology progress is summarized in studies designed to: (1) provide design methodology for elevated-temperature piping systems, based on experiences with FFTF, STEC, and CRBRP designs and on operating high-temperature piping systems; (2) assess the validity of using current high-temperature Code Case 1592 design rules on piping systems; (3) investigate critical piping system design problems from the design criteria viewpoint; and (4) increase the confidence level in high-temperature design rules for piping by demonstrating the conservativeness of these rules.

1136 (ESG-DOE--13242) QUARTERLY TECHNICAL PROGRESS REPORT. REACTOR SAFETY, APRIL--JUNE 1978. (Rockwell International Corp., Canoga Park, CA (USA)). 30 Sep 1978. Contract EY-76-C-03-0824-028. 24p. Dep. NTIS, PC A02/MF A01.

Progress is summarized in LMFBR safety studies related to the characterization of sodium fires and fission products. Included are sections on high temperature-concentration aerosols, large-scale molten fuel tests, characterization of released sodium particles, and risk analysis. (DG)

1137 (ESG-DOE--13243) HIGH CYCLE FATIGUE OF 2-1/4 CR--1 MO STEEL AT TEMPERATURES TO 538°C (1000°F). Jaske, C.E.; Utah, D.A.; Frey, N.D. (Rockwell International Corp., Canoga Park, CA (USA)). 31 Jul 1978. Contract EY-76-C-03-0824. 43p. AT.

Long-life (greater than 10^5 cycles to

failure) fatigue experiments have been conducted on isothermally annealed 2-1/4 Cr--1 Mo steel in air at temperatures up to 538°C (1000°F). Strain was cycled continuously at rates equal to or greater than 4×10^{-3} sec⁻¹. Baseline experiments were for constant amplitude, fully reversed (zero mean stress) cycling. Exploratory experiments were conducted with tensile mean stress. Fatigue data for temperatures up to 427°C (800°F) were represented adequately by a single curve relating total strain range to fatigue life between 10^2 and 10^6 cycles to failure. A similar type of curve was developed for data at 538°C (1000°F). Tensile mean stress showed no reduction in fatigue resistance at 316°C (600°F), only a small reduction at 427°C (800°F), and a significant reduction at 538°C (1000°F). The degrading effect of mean stress at 427 and 538°C (800 and 1000°F) could not be accounted for by using a linear time-fraction plus cycle-fraction damage rule for creep-fatigue damage assessment. This result indicates that the effect of tensile mean stress must be taken into account by other means. It was found that both the Goodman approach and a stress-strain parameter method provided conservative and quite similar estimates of the effect of tensile mean stress on fatigue resistance. Two design fatigue curves from 10^2 to 10^6 cycles were developed for continuing cycling of 2-1/4 Cr--1 Mo steel in air and at strain rates equal to or greater than 4×10^{-3} sec⁻¹. One curve was for temperatures equal to or less than 427°C (800°F) and the other was for 538°C (1000°F). The maximum effect of mean stress was included in these curves using calculations based on the stress-strain parameter method.

1138 (ESG-DOE--13244) PRECONCEPTUAL STUDY OF 1000-MWE CARBIDE-FUELED LMFBR DESIGNS. Vitti, J.A.; Felten, L.D.; Brittingham, J.C.; Galluzzo, N.G.; Ostermier, B.J.; von Arx, A.V. (Atomics International Div., Canoga Park, CA (USA). Energy Systems Group). 30 Sep 1978. Contract EY-76-C-03-0824-018. 268p. AT.

A preconceptual study on the design of heterogeneous carbide-fueled LMFBR cores is summarized. The study was part of a broader effort on the design of proliferation-resistant LMFBR's. The study included (Pu-Th)c drivers with ThC blankets and (Pu-U)C drivers with UC or ThC blankets. It covered core configuration, nuclear analysis, thermal-hydraulic analysis, mechanical analysis, and economic evaluation.

1139 (ESG-DOE--13245) LMFBR COVER GAS SEALS DESIGN GUIDE ADDENDUM AND SEAL TECHNOLOGY SUMMARY. Dewart, N.A.; Welch, F.H.; Horton, P.H. (Atomics International Div., Canoga Park, CA (USA)). 30 Sep 1978. Contract EY-76-C-03-0824-011. 99p. AT.

Elastomer seals, metallic-elastomer seals, and a magnetic fluid seal were evaluated to LMFBR conditions. Basic permeation measurements and compression set resistance measurements were made. Some irradiation data were generated. Several new geometries and materials were disqualified for reactor use. In general, no new seal gave exemplary performance. Two metallic spring seal configurations with elastomeric jackets demonstrated potential worthiness under these test conditions, as did a magnetic fluid seal.

1140 (ESG-DOE--13246) ECEL THORIUM ASSEMBLY DESCRIPTIONS AND DATA SUMMARIES. Fiscella, J.M.; Specht, E.R. (Rockwell International Corp., Canoga Park, CA (USA)). 6 Oct 1978. Contract EY-76-C-03-0824-013. 250p. AT.

The Atomic International ECEL thorium-uranium-223 critical experiments covered a wide range of median fission energies (<0.1 eV to 0.4 MeV) and were used to measure a number of important reactor design parameters (fission ratios, reactivity worths, Doppler coefficients, etc.). The report describes ECEL assemblies 1 through 13 and summarizes the measured data that were obtained for the assemblies. The assemblies were constructed in pseudo-spherical configurations, with various combinations of thorium, uranium-233, uranium-238, moderator (carbon or beryllium) and aluminum (to mockup sodium coolant in the central test region.) This central test region was surrounded by a thorium decoupler and a thermal driver (uranium-235 and polyethylene.) Fission rate measurements (relative to uranium-235) were performed for uranium-233, -234, -236, and -238 as well as thorium-232, plutonium-239, and neptunium-237. Central reactivity worth measurements were made with 52 samples, including uranium-233, uranium-235, uranium-238, thorium-232, plutonium-239, sodium, aluminum, beryllium, carbon, boron, and stainless steel. Doppler measurements were made for uranium-235, uranium-238, thorium-232, and tantalum.

- 1141 (ESG-DOE--13247) SODIUM TECHNOLOGY PROGRAM QUARTERLY TECHNICAL PROGRESS REPORT, JULY--SEPTEMBER 1978. (Atomic International Div., Canoga Park, CA (USA)). 30 Oct 1978. Contract EY-76-C-03-0824-001. 17p. AT.
Progress is summarized in studies aimed at developing and evaluating techniques for sodium removal from LMFBR components and decontamination of LMFBR components.

- 1142 (ESG-DOE--13248) COVER GAS SEAL COMPONENTS. QUARTERLY TECHNICAL PROGRESS REPORT, JULY--SEPTEMBER 1978. (Atomic International Div., Canoga Park, CA (USA). Energy Systems Group). 10 Nov 1978. Contract EY-76-C-03-0824. 29p. AT.
Progress is summarized in the program to develop and demonstrate the performance of commercial and custom-designed head region cavity seals for LMFBR reactors, to develop and evaluate advanced seal concepts capable of achieving improvement in radioactive gas containment and seal temperature and life capabilities, and to establish operational safety margins for head region seals for nominal and extraordinary LMFBR plant conditions. The CRBRP sodium dip seal configuration performance characteristics have been determined, and the seal was demonstrated to meet system requirements. Current activities include verifying the acceptability of CRBRP head region inflatable elastomer seal manufacturers, developing the technology to improve static inflatable seal design, and determining the ultimate temperature capabilities of several elastomer seal materials. A new activity was initiated to design and analyze a flexing metal seal as an alternate concept to the inflatable elastomer seals.

- 1143 (ESG-DOE--13249) HIGH-TEMPERATURE PIPING DESIGN TECHNOLOGY. QUARTERLY TECHNICAL PROGRESS REPORT, JULY--SEPTEMBER 1978. (Rockwell International Corp., Canoga Park, CA (USA)). 10 Nov 1978. Contract EY-76-C-03-0824. 32p. TIC.

The overall objectives of the High-Temperature Piping Design Technology Program are: to provide design methodology for elevated-temperature piping systems, based on experiences with FFTF, ETEC, and CRBRP designs

and on operating high-temperature piping systems; to assess the validity of using current high-temperature Code Case 1592 design rules on piping systems; to investigate critical piping system design problems from the design criteria viewpoint; and to increase the confidence level in high-temperature design rules for piping by demonstrating the conservativeness of these rules.

- 1144 (ESG-DOE--13252) INTERMEDIATE-SIZE INDUCER PUMP PROGRAM. ANNUAL TECHNICAL PROGRESS REPORT, GOVERNMENT FISCAL YEAR 1978. (Atomic International Div., Canoga Park, CA (USA)). 26 Mar 1979. Contract EY-76-C-03-0824-020. 90p. AT.

The objective of the ISIP Development Program is to demonstrate the practical applicability of the Rockwell International inducer to large sodium pumps designed for reactor coolant service. The development of inducer pumps at Rockwell International started in the Rocketdyne Division with the development of high speed turbopumps for rocket engines. Since then inducer pumps have been applied successfully in the commercial area to water-jet propulsion systems for large high speed hydrofoil vessels. These commercial units require considerably greater life expectancy than those for space vehicles.

- 1145 (ESG-DOE--13254) ANNUAL TECHNICAL PROGRESS REPORT: REACTOR SAFETY, GOVERNMENT FISCAL YEAR 1978. (Atomic International Div., Canoga Park, CA (USA)). 31 Dec 1978. Contract EY-76-C-03-0824-028. 45p. Dep. NTIS, PC A03/MF A01.

Progress in LMFBR safety studies on accident debris behavior is reported under the following subtask titles: high-temperature-concentration aerosols, large-scale molten fuel tests, sodium release tests, and risk analysis.

- 1146 (ESG-DOE--13257) USE OF STRESS INDICES FOR PIPING UNDER ASME CODE CASE N-47. Rodabaugh, E.C. (Atomic International Div., Canoga Park, CA (USA)). 30 Sep 1978. Contract EY-76-C-03-0824. 83p. AT.

At the present time, rules for design of piping for nuclear power, elevated-temperature service are contained in the ASME Boiler Code Case N-47(-12). A Task Group under the Code Working Group on Piping Design (WGPD) has prepared a proposed addition on piping for a future revision of Code Case N-47. The WGPD proposed addition includes specific equations, using stress indices from NB-3600 of the Code, to implement the elastic analysis approach in Appendix T of Code Case N-47. The WGPD proposal was prepared when Code Case N-47(-7) was current; subsequent modifications to Code Case N-47 require modifications to the WGPD proposal; those modifications are shown in the report. A review of Appendix T of Code Case N-47 and the WGPD rules is presented, with the conclusion that the WGPD proposals are appropriate for use with the elastic analysis methods of the Code Case. Comparisons are made with the stress limits of ANSI B31.1, with the conclusion that for the particular conditions considered, Code Case N-47/WGPD limits are very conservative with respect to the limits of ANSI B31.1. Comparisons are also made with available test data. These comparisons also indicate that Code Case N-47/WGPD is conservative.

- 1147 (ESG-DOE--13261) SODIUM TECHNOLOGY PROGRAM. QUARTERLY TECHNICAL PROGRESS REPORT, OCTOBER--DECEMBER 1978. (Atomic International Div., Canoga Park, CA (USA)).

Energy Systems Group). 31 Jan 1979.

Contract EY-76-C-03-0824-001. 8p. AT.

Progress is the development of techniques for decontamination and sodium removal from LMFBR components is summarized.

- 1148 (ESG-DOE--13262) COVER GAS SEAL COMPONENTS AND REACTOR COMPONENTS: FUEL HANDLING. QUARTERLY TECHNICAL PROGRESS REPORT, OCTOBER--DECEMBER 1978. Steele, O.P. III; Horton, P.H. (Rockwell International Corp., Canoga Park, CA (USA)). 1 Feb 1979. Contract EY-76-C-03-0824-011. 15p. AT.

Progress is summarized in work to develop and demonstrate the performance of commercial and custom-designed head region cavity seals for LMFBR reactors, to develop and evaluate advanced seal concepts capable of achieving improvement in radioactive gas containment and seal temperature-life capabilities, and to establish operational safety margins for head region seals for nominal and extraordinary LMFBR plant conditions. During FY 1979, the major effort will be directed toward fabricating and performance testing two concepts for flexing metal dynamic seals as alternate concepts to inflatable elastomer seals.

- 1149 (ESG-DOE--13263) ACOUSTIC LEAK DETECTION-LOCATION. QUARTERLY TECHNICAL PROGRESS REPORT, OCTOBER--DECEMBER 1978. (Atomics International Div., Canoga Park, CA (USA). Energy Systems Group). 31 Jan 1979. Contract EY-76-C-03-0824-012. 8p. AT.

Progress in the development of acoustic emission techniques for detection of steam generator leaks in LMFBRs is summarized.

- 1150 (ESG-DOE--13264) REACTOR SAFETY. QUARTERLY TECHNICAL PROGRESS REPORT, OCTOBER--DECEMBER 1978. (Atomics International Div., Canoga Park, CA (USA)). 8 Jun 1979. Contract EY-76-C-03-0824. 44p. Dep. NTIS, PC A03/MF A01.

Progress is summarized in LMFBR safety studies related to the characterization of sodium fires and fission products. Included are sections on SOMIX Code development, sodium splash dispersal, aerosol leakage, aerosol model improvement, characterization of aerosol source term, large scale molten fuel tests, fuel and fission product release from burning sodium, and iodine attenuation.

- 1151 (ESG-DOE--13267) SIMPLIFIED DESIGN METHODS FOR BELLOWES. Jaquay, K.R.; Becht, C. IV. (Atomics International Div., Canoga Park, CA (USA). Energy Systems Group). 15 Feb 1979. Contract EY-76-C-03-0824-026. 227p. AT.

Over the past 3 years, the Energy Systems Group of Rockwell International has been working on a Department of Energy funded program to develop flexible piping joints for Class 1, nuclear piping systems. An important part of this program has been the design of gimbaled expansion joints to be used in a large-scale breeder reactor (LSBR) primary loop reactor outlet line. To support this activity, several design tools have been developed to simplify the analysis efforts. This report describes these design tools in sufficient detail to allow their use by other design organizations. Example problems are provided to clarify the procedures and to serve as check cases for method verification. The simplified design methods covered by this report are: (1) a program providing closed form stress calculations for angulated bellows (SCAB), (2) two finite element mesh generation programs for

U-shaped bellows convolutions (CONGEN/28 and CONGEN/15), and (3) elastic analysis-based bounding techniques for calculating creep ratchetting strains in bellows.

- 1152 (ESG-DOE--13268) RESEARCH AND DEVELOPMENT NEEDS TO DEVELOP DESIGN TOOLS FOR PREDICTION OF CREEP INSTABILITY OF FLEXIBLE PIPING JOINTS. (Rockwell International Corp., Canoga Park, CA (USA)). 15 Feb 1979. Contract EY-76-C-03-0824-019. 90p. AT.

A study was undertaken to define and plan a research program to develop design tools for the prediction of flexible piping joint (bellows) instability when operating in the creep regime. Currently, bellows instability is predicted by classical elastic beam column theory. This theory has sufficed for many years for the design of expansion joints for non-nuclear applications, however, such theory is not completely adequate for minimum risk design of expansion joints for 40 years service at elevated temperature. Design criteria that address instability with inelastic (creep or plastic) material behavior are necessary.

- 1153 (ESG-DOE--13271) STUDIES IN THE REDUCTION OF SODIUM CARRYOVER. Horton, P.H.; Oliva, R.M. (Rockwell International Corp., Canoga Park, CA (USA). Energy Systems Group). 20 Jul 1979. Contract EY-76-C-03-0824. 71p. AT.

This study was undertaken to better define the mechanisms causing excessive carryover of sodium into the Clinch River Breeder Reactor Plant (CRBRP) - Ex-Vessel Transfer Machine (EVTM) chain hoist drive system. At the test temperature of 400°F, classical wetting of steels does not occur, but during development testing of the chain hoist drive system, apparent wetting was observed on the chain and other steel surfaces. Full scale and laboratory scale tests were used to study the wetting mechanism with emphasis on the influence of oxygen and moisture in the argon cover gas atmosphere. It was demonstrated that moisture enrichment of the atmosphere (tests were conducted at 50 ppm moisture) encourages adherence of sodium to the metal surfaces while oxygen enrichment showed no such effect.

- 1154 (ESG-DOE--13272) SODIUM TECHNOLOGY PROGRAM. QUARTERLY TECHNICAL PROGRESS REPORT, JANUARY--MARCH 1979. (Atomics International Div., Richland, WA (USA). Rockwell Hanford Operations). 31 May 1979. Contract EY-76-C-03-0824-027. 18p. AT.

Progress in sodium evaporation process development and decontamination studies applicable to the FFTF, CRBRP, and LMFBR target plant programs is reported.

- 1155 (ESG-DOE--13273) COVER GAS SEAL COMPONENTS AND REACTOR COMPONENTS: FUEL HANDLING. QUARTERLY TECHNICAL PROGRESS REPORT, JANUARY--MARCH 1979. (Atomics International Div., Canoga Park, CA (USA)). 15 Jun 1979. Contract EY-76-C-03-0824-011. 28p. AT.

The objectives of the Cover Gas Seal Component test program are to develop and demonstrate the performance of commercial and custom-design head region cavity seals for LMFBR reactors, to develop and evaluate advanced seal concepts capable of achieving improvement in radioactive gas containment and seal temperature-life capabilities, and to establish operational safety margins for head region seals for nominal and extraordinary LMFBR plant conditions. During FY 1979, the

major effort will be directed toward fabricating and performance testing two concepts for flexing metal dynamic seals as alternate concepts to inflatable elastomer seals. The objectives of the Fuel Handling Subcomponent development program are to verify that wetting of the chain will reduce sodium carryover into the EVTM drive components and determine whether or not the chain will remain wetted throughout the EVTM life cycle.

- 1156 (ESG-DOE--13274) HIGH-TEMPERATURE PIPING DESIGN TECHNOLOGY. SEMI-ANNUAL TECHNICAL PROGRESS REPORT, OCTOBER 1978--MARCH 1979. (Atomics International Div., Richland, WA (USA). Rockwell Hanford Operations). 1 Jun 1979. Contract EY-76-C-03-0824-026. 18p. AT.

Progress is reported in the following LMFBR piping design subtasks: (1) evaluation of sensitivity of piping design margins to variability in materials and geometry, (2) high-cycle fatigue at elevated temperature, and (3) piping component tests.

- 1157 (ESG-DOE--13275) ACOUSTIC LEAK DETECTION-LOCATION. QUARTERLY TECHNICAL PROGRESS REPORT, JANUARY--MARCH 1979. (Rockwell International Corp., Canoga Park, CA (USA). Energy Systems Group). 20 Jun 1979. Contract EY-76-C-03-0824-012. 8p. AT.

The objective of this program is to develop a multidimensional detection-location system for steam generator tube leaks. Verification of the detection method will be made by injecting pressurized gas into water in the Hydraulic Test Model at General Electric. Typical background patterns from an operating steam generator will be monitored and recorded using a steam generator at EBR-II. Using data from these and other sources, hard- and software will be developed which can be used for the detection-location of steam generator leaks.

- 1158 (ESG-DOE--13278) SODIUM TECHNOLOGY PROGRAM. QUARTERLY TECHNICAL PROGRESS REPORT, APRIL-JUNE 1979. (Rockwell International Corp., Canoga Park, CA (USA). Energy Systems Group). 24 Aug 1979. Contract EY-76-C-03-0824-001. 13p. AT.

Progress is reported for the following LMFBR-CRBR related activities: (1) sodium removal process development, and (2) decontamination studies.

- 1159 (ESG-DOE--13279) COVER GAS SEAL COMPONENTS. QUARTERLY TECHNICAL PROGRESS REPORT, APRIL--JUNE 1979. (Rockwell International Corp., Canoga Park, CA (USA)). 24 Aug 1979. Contract EY-76-C-03-0824-011. 13p. AT.

Progress is summarized in efforts to develop and demonstrate the performance of commercial and custom-designed head region cavity seals for LMFBR reactors, to develop and evaluate advanced seal concepts capable of achieving improvement in radioactive gas containment and seal temperature-life capabilities, and to establish operational safety margins for head region seals for nominal and extraordinary LMFBR plant conditions. During FY 1979, the major effort has been directed toward designing and analyzing concepts for flexing metal dynamic seals as alternate concepts to inflatable elastomer seals. In June, the program was redirected to concentrate on improving and simplifying fabrication techniques and designs of inflatable elastomer seals.

- 1160 (ESG-DOE--13280) ACOUSTIC LEAK DETECTION-LOCATION. QUARTERLY TECHNICAL PROGRESS REPORT, APRIL-JUNE 1979. Thiele, A.W. (Rockwell International Corp., Canoga Park, CA (USA). Energy Systems Group). 31 Aug 1979. Contract EY-76-C-03-0824-012. 20p. AT.

Research in developing a multidimensional location system for steam generator tube leaks is reported. Measurements of the acoustic background were made at EBR-2 during flow calibration. The background signals were proportional to flow, but were not dependent upon power level. (FS)

- 1161 (ESG-DOE--13281) REACTOR SAFETY. QUARTERLY TECHNICAL PROGRESS REPORT, JANUARY-MARCH 1979. (Rockwell International Corp., Canoga Park, CA (USA). Energy Systems Group). 28 Sep 1979. Contract AT03-76SF74028. 32p. Dep. NTIS, PC A03/MF A01.

Progress in LMFBR safety studies is briefly summarized.

- 1162 (ESG-DOE--13284) REACTOR SAFETY. QUARTERLY TECHNICAL PROGRESS REPORT, APRIL-JUNE 1979. (Rockwell International Corp., Canoga Park, CA (USA). Energy Systems Group). 15 Oct 1979. Contract W-31-109-ENG-38. 25p. Dep. NTIS, PC A02/MF A01.

Progress in LMFBR safety studies is briefly summarized.

- 1163 (ESG-DOE--13285) CRBRP SODIUM FIRE TESTS. TECHNICAL PROGRESS REPORT, MAY-JUNE 1979. (Rockwell International Corp., Richland, WA (USA). Rockwell Hanford Operations). 15 Oct 1979. Contract W-31-109-ENG-38. 11p. Dep. NTIS, PC A02/MF A01.

Progress in small-scale fire suppression tests and spray maximization tests related to sodium fires in the Clinch River Breeder Reactor is reported.

- 1164 (ESG-DOE--13290) SODIUM TECHNOLOGY PROGRAM. QUARTERLY TECHNICAL PROGRESS REPORT, JULY-SEPTEMBER 1979. (Rockwell International Corp., Canoga Park, CA (USA). Energy Systems Group). 24 Oct 1979. Contract A103-76SF70027. 19p. AT.

Progress is reported for the following LMFBR-CRBR related activities: (1) sodium evaporation process development and (2) decontamination studies.

- 1165 (ESG-DOE--13294) REACTOR SAFETY. ANNUAL TECHNICAL PROGRESS REPORT, GOVERNMENT FISCAL YEAR 1979. (Rockwell International Corp., Canoga Park, CA (USA). Energy Systems Group). 15 Apr 1980. Contract AT03-76SF74028. 46p. Dep. NTIS, PC A03/MF A01.

Information is presented on LMFBR reactor safety concerning the energetics effects of sodium spray fires; sodium drop and spray burning; core debris accommodation; attenuation in containment; and attenuation in the environment.

- 1166 (ESG-DOE--13310) FAST REACTOR FLUENCE DOSIMETRY. TECHNICAL PROGRESS REPORT, OCTOBER 1978-MARCH 1979. Oliver, B.M.; Bradley, J.G.; Farrar, H. IV. (Rockwell International Corp., Canoga Park, CA (USA). Energy Systems Group). 15 Feb 1980. Contract AT03-76SF75028. 64p. Dep. NTIS, PC A04/MF A01.

Information is presented concerning the development and performance testing of helium

accumulation fluence monitors and the measurement of helium distribution in irradiated unfueled Type 316 stainless steel fuel cans.

- 1167 (ESG-DOE--13312) CRBRP SODIUM FIRE TESTS. QUARTERLY TECHNICAL PROGRESS REPORT, OCTOBER-DECEMBER 1979. (Rockwell International Corp., Canoga Park, CA (USA). Energy Systems Group). 29 Feb 1980. Contract AM03-76SF00824. 13p. Dep. NTIS, PC A02/MF A01.

The objective of the small-scale group of tests is to demonstrate that sodium will drain from the surface of the fire suppression deck into the catch pan without interference during a spill event, and to demonstrate that burning is terminated following the spill event by the accumulation of combustion products inside the drain pipes. The results of this series of tests will be used to validate the catch pan fire suppression deck design concept based on the criteria that sodium will drain freely from the surface of the fire suppression deck and that burning is terminated in an acceptably short time (less than or equal to 36 h). The objective of the large-scale group of tests is to provide experimental data on the consequences of sodium spills using prototypic leak rates and to demonstrate the effectiveness of a large-scale fire suppression Q-deck assembly.

- 1168 (ESG-DOE--13313) FAST REACTOR FLUENCE DOSIMETRY. TECHNICAL PROGRESS REPORT, APRIL-SEPTEMBER 1979. Bradley, J.G.; Oliver, B.M.; Farrar, H. IV. (Rockwell International Corp., Canoga Park, CA (USA). Energy Systems Group). 31 Mar 1980. Contract AT03-76SF74028. 51p. Dep. NTIS, PC A04/MF A01.

Information is presented concerning the development and performance testing of helium accumulation fluence monitors.

- 1169 (ETEC--78-9) SODIUM--WATER REACTION PRODUCT DEPOSITION AND POST-TEST CLEANING OF THE MODULAR STEAM GENERATOR. Neely, H.H.; McCollum, W.A.; Shepard, R.C.; Stearns, J.D. (Energy Technology Engineering Center, Canoga Park, CA (USA)). 1 Dec 1978. Contract EY-76-C-03-0700. 50p. AT.

Six sodium--water reaction tests have been completed in the Atomics International Modular Steam Generator at prototypic LMFBR plant conditions. Tests were run in preprogrammed regions of the generator and resulted in reaction product deposition that was appreciably different for each of the three test locations. Deposition is shown to be unique to test location. Major deposition that can impede sodium flow in a generator is generated from a leak above the lower relief line, which results in a pool reaction. After testing, the steam generator was satisfactorily cleaned with Dowanol for post-test destructive examination. Dowanol and sodium--water reaction products were shown to generate water during the cleaning process, which, in turn, appreciably enhanced the reaction rate of available metallic sodium.

- 1170 (ETEC--78-10) SODIUM--WATER REACTION TEST IN LLTR. SERIES I. FINAL REPORT. Eichelberger, R.L. (Energy Technology Engineering Center, Canoga Park, CA (USA)). 15 Jul 1978. Contract EY-76-C-03-0700. 247p. TIC.

Portions of document are illegible. Extensive large-leak testing is being conducted to investigate effects of sodium-

water reaction events in LMFBR steam generators. The general objectives of the program are to provide data for validating analytical design methods, to provide data on secondary failures, and to provide performance data on ancillary and cleanup systems. The first test series, utilizing the Atomics International Modular Steam Generator as the test article, has been successfully completed and is reported. For this series, two double-ended guillotine (DEG) tests were conducted in the vertical section of the steam generator and four DEG tests were conducted in the horizontal (hockey-stick) region. The first five tests were DEG ruptures of a standard steam generator tube. The sixth test rupture tube had a flow area equivalent to three standard tubes. Results from these six tests have indicated that analytical methods are conservative (i.e., predict higher reaction temperatures and pressures than measured). Salient test results are presented as well as comparisons between the six tests performed. The inspection activity was successful in identifying the consequences of a major sodium-water reaction event. Among the notable observations were: secondary tube wastage, secondary tube bowing, reaction product deposition, and rupture relief characteristics.

- 1171 (ETEC--78-11) METALLURGICAL EVALUATION OF AN FFTF PPS PRESSURE TRANSDUCER INTERFACE SEAL ASSEMBLY AFTER LIQUID SODIUM SERVICE. Thompson, E.G. (Rockwell International Corp., Canoga Park, CA (USA)). 30 Sep 1978. Contract EY-76-C-03-0700. 39p. AT.

The interface seal assembly of an RDT C 6-1T pressure transducer system, Model S 63-4, Serial No. 1, manufactured by Statham Instruments (now Gould, Inc. Measurement System Division) was destructively examined after approximately 23,000 h of liquid sodium service. The purpose of examination was to determine if service degradation had taken place in this bellows-type assembly.

- 1172 (ETEC--78-12) METALLURGICAL EVALUATION OF THE MODULAR STEAM GENERATOR (MSG) AFTER LLTR TESTING. Stearns, J.D. (Energy Technology Engineering Center, Canoga Park, CA (USA)). 30 Sep 1978. Contract EY-76-C-03-0700. 49p. AT.

The AI LMFBR modular steam generator was subjected to a thorough metallurgical examination during final disassembly. No major anomalies were found. Tube deformation and localized wastage were found near the programmed leak sites. No wastage greater than 0.048 cm (0.019 in.) was found, and at most locations was much less. Less than 10 kg (22 lb) of residual metallic sodium and sodium reaction products were found. The residual sodium was found at locations where flow was restricted during organic solvent circulation.

- 1173 (ETEC--78-15) FUEL CLADDING: WIRE WRAP WEAR IN SODIUM. Droher, J.J.; Hoffman, N.J.; Stearns, J.D. (Energy Technology Engineering Center, Canoga Park, CA (USA)). 30 Sep 1978. Contract EY-76-C-03-0700. 59p. Dep. NTIS, PC A04/MF A01.

Tests involving longitudinal-motion and transverse-motion rubbing of fuel cladding by wire wrap were performed in ambient air and in elevated temperature sodium to determine the type and magnitude of wear of the fuel cladding. Adhesive wear was encountered in tests in sodium at 900° to 1300°F (480 to 705°C), while abrasive wear was encountered in tests in sodium at 450°F (205°C) and in ambient air. The wear scar generally did not exceed 2

or 3 mils (0.05 or 0.08 mm). In all of the tests, there was not a high degree of correlation of depth of wear scar with such test parameters as sodium temperature, contact load, wire wrap pitch or angle, stroke length, rubbing cycle, or mode of rubbing. In addition to the metal removed, a layer of disturbed metal was found under some of the wear scars.

- 1174 (ETEC--78-16) SODIUM AEROSOL AND HYDROGEN GENERATION TESTS. Davis, K.A. (Energy Technology Engineering Center, Canoga Park, CA (USA)). 15 Nov 1978. Contract EY-76-C-03-0700. 245p. AT.

Results are reported on a testing program designed to evaluate the factors which influence sodium aerosol and hydrogen generation from a sodium leak. The factors identified for evaluation included leak rate, temperature, moisture and oxygen concentration, and leak surface geometry and orientation. The range of parameters was selected to provide data pertinent to leak detection in the FFTF inerted cells. Fifty-four tests were performed. Details of the test method and results of each test are presented. Photographs are presented to show the effect of test parameter variation on the behavior of the leaking sodium. Graphs showing the effects of each parameter on aerosol and hydrogen generation are presented.

- 1175 (ETEC--78-18) SODIUM IONIZATION DETECTOR RESPONSE TO EXTRANEOUS MATERIALS. Davis, K.A.; Klee, J.A.; Douglas, R.E. (Energy Technology Engineering Center, Canoga Park, CA (USA)). 31 Oct 1978. Contract EY-76-C-03-0700. 70p. AT.

Results are reported on a series of tests to determine what materials commonly existing in a nuclear reactor sodium heat transport system may form an aerosol to which a Westinghouse sodium ionization detector may respond. Thirty-five materials were tested. The results showed a relatively high response to several of these indicating the possibility that a false indication of a sodium leak could be presented. A ranking of the materials is presented to show the relative sensitivity of the detector to these materials.

- 1176 (ETEC--79-1) ENERGY TECHNOLOGY ENGINEERING CENTER (ETEC). ANNUAL TECHNICAL PROGRESS REPORT, JANUARY--DECEMBER 1978. (Energy Technology Engineering Center, Canoga Park, CA (USA)). 30 Apr 1979. Contract EY-76-C-03-0700. 382p. AT.

Progress is reported for the following LMFBR-related activities: sodium-water reaction testing, subscale inducer pump test, hydraulically supported absorber ball shutdown assembly, articulated control assembly, pipe clamp test program, CRBR small sodium valve testing, gate valve testing, sodium flowmeter testing, pressure transducer testing, sodium-to-gas leak detection, sodium level measurement system testing, electrical resistance heater tests, proximity transducers, strain measurement, development of percussion welding applications, and friction and wear in sodium. (JWR)

- 1177 (ETEC-TDR--78-13) ALIP/FLOWMETER CALIBRATION. De Vita, V. (Energy Technology Engineering Center, Canoga Park, CA (USA)). 8 Sep 1978. Contract EY-76-C-03-0700. 58p. AT.

This report describes the calibration of an Annular Linear Induction Pump (ALIP), a one-inch electromagnetic (EM) flowmeter, and a one-inch permanent magnet (PM) flowmeter. The three

items, incorporated into one test article, were calibrated at 600, 700, and 800°F (315.5, 371.1, 426.7°C) over a liquid sodium flow range from 1 to 10 gpm (6.3 to 63 x 10⁻⁵m³/sec) and for pump differential pressures from 5 to 25 psi (34.5 to 172.5 kPa). The test articles were supplied by HEDL, Richland, Washington in support of the Mark II=C Loop Test Program which is part of the National LMFBR Mixed Oxide Fuel Transient Performance program. The reference flow for this calibration was determined by forcing sodium from one supply tank to a receiver tank. By measuring the change in the sodium free surface level in the supply tank as a function of time, the volumetric flow rate was computed.

- 1178 (ETEC-TDR--79-4) ENDURANCE TESTING OF PROTOTYPIC SUBSCALE INDUCER PUMP AT SCTL. Baker, R.S. (Energy Technology Engineering Center, Canoga Park, CA (USA)). 26 Jul 1979. Contract EY-76-C-03-0700. 45p. AT.

A series of tests have been conducted in sodium on a prototypic subscale inducer pump designed by Atomics International. Pump operation has been successful. Testing consisted of three intervals totaling 2000-h.

- 1179 (ETEC-TDR--79-6) EVALUATION OF SPTF LIQUID RHEOSTAT FOR ISIP TEST PROGRAM. Baker, R.S. (Energy Technology Engineering Center, Canoga Park, CA (USA)). 22 Aug 1979. Contract EY-76-C-03-0700. 8p. AT.

This report is an evaluation of the performance of the liquid rheostat installed at SPTF for sodium pump speed control.

- 1180 (ETEC-TDR--79-7) STRESSCOAT TEST OF 6-INCH PIPE CLAMP IN TTF: ARTICLE B. Rollins, C.T. (Energy Technology Engineering Center, Canoga Park, CA (USA)). 4 May 1979. Contract EY-76-C-03-0700. 49p. AT.

The Stresscoat evaluation is presented for the stress distribution in the clamp and adjacent pipe when subjected to clamp bolt load, tensile and compressive load on the clamp normal to the pipe. The Stresscoat evaluation was effective in determining the approximate stress distributions and the maximum stress locations for each type of loading. Based on these results detailed strain gage locations for subsequent testing were selected and presented.

- 1181 (ETEC-TDR--79-10) DYNAMIC TESTING OF A PROTOTYPICAL FFTF PIPING SYSTEM. Stearns, J.D.; Onesto, A.T.; Hunter, R.G. (Rockwell International Corp., Canoga Park, CA (USA). Energy Technology Engineering Center). 28 Sep 1979. Contract EY-76-C-03-0700. 257p. AT.

Dynamic tests were conducted on a fully insulated one-inch diameter prototypal FFTF pipe system to study the behavior of the pipe system and support structure during vibrational loading. Tests were conducted with both rigid struts for reference and mechanical snubbers. Test setup and sine sweep tests, simulated seismic tests, and a sine dwell to failure are described. Selected data are included in the Appendices.

- 1182 (ETEC-TDR--79-11) HEAD-FLOW MAPPING AND LOW NPSH TESTING OF A PROTOTYPIC SUBSCALE INDUCER PUMP AT SCTL. Haroldsen, D.D. (Energy Technology Engineering Center, Canoga Park, CA (USA)). 25 Sep 1979. Contract EY-76-C-03-0700. 180p. AT.

A series of tests have been conducted in sodium on a prototypic subscale inducer pump

designed by the Atomic International Division of Energy Systems Group. The tests, consisting of head-flow mapping and low NPSH operation were successful. The pump was removed from the SCTL test system and returned to Atomic International for inspection and preparation for future testing.

- 1183 (EUR--5598) EFFECTS OF FAST BREEDERS' CHARACTERISTICS ON CONSUMPTIONS AND EXPENDITURES RELATED TO ELECTRIC POWER GENERATION. AN ASSESSMENT FOR THE EUROPEAN COMMUNITY. Graziani, G.; Zanantoni, C. (Commission of the European Communities, Ispra (Italy). Joint Research Centre). Dec 1976. 36p. Dep. NTIS (US Sales Only), PC A03/MF A01.

The effects of the physical characteristics of the FBR (breeding ratio, inventory) and of the associated fuel cycle (out-of-pile time) on the results of strategy calculations performed for an electric power system are discussed. Attention is focused on the penetration of FBR, on the demand of uranium and separative work and on the economical performance of the breeders. It is pointed out that uncertainties about the out-of-pile time are as important as those concerning FBR breeding ratio and inventory.

- 1184 (EUR--5599) ROLE OF THE DEMAND-DURATION CURVE IN THE EVALUATION OF POWER STATION INSTALLATION POLICIES. REMARKS ON ITS EFFECTS ON STATIONS' UTILIZATION, GENERATING CAPACITY, LOAD FACTOR HISTORY AND CONSUMPTIONS. Graziani, G.; Maineri, M.; Zanantoni, C. (Commission of the European Communities, Ispra (Italy). Joint Research Centre). Dec 1976. 38p. Dep. NTIS (US Sales Only), PC A03/MF A01.

The role of the load-duration curve in determining the installation policy for an electric power system, is examined. The effect of the priority order for the allocation of the power stations in the load-diagram is also discussed: in the model used here (program TOTEM) this priority is given as a function of type and age of the station. The significance of the load factor history for a power station as a function of its age is also discussed. It is suggested that such a curve be deduced as a result of strategy calculations made with TOTEM rather than assuming it as input data.

- 1185 (EUR--5667(Pt.1), pp 455-475) FISSION-RATE MEASUREMENTS BY ACTIVATION TECHNIQUES: METHODS, ACCURACIES AND APPLICATIONS. Dudev, N.D.; Heinrich, R.R. (Argonne National Lab., Ill. (USA)). 1977.

From 1. ASTM-Euratom symposium on reactor dosimetry; developments and standardization; Petten, Netherlands (22 Sep 1975).

The U.S. reactor development programs have established the need for developing a capability to measure fission rates to an absolute accuracy of $\pm 2\%$. To achieve this goal, a national program is operative to develop and apply the necessary methodology. The approach is to use gamma-active fission product monitors to define fission rates for ^{235}U , ^{238}U , ^{237}Np and ^{239}Pu . Emphasis is upon redundant tests of the critical steps including mass assay, gamma counting, and fission yield determinations via a multiple laboratory approach. The methods are developed and tested in benchmark-type neutron fields, usually of low intensity ($<10^{12}$ n/cm²-sec) and applications of fission-rate measurements include EBR-II, fast critical assemblies, and CTR irradiation facilities. The most general approach, using conventional fission yields, is

capable of $\pm 3.5\%$ accuracy, whereas under certain specific conditions, accuracies of 2-2.5% are possible.

- 1186 (EUR--5667(Pt.1), pp 52-62) PREDICTION OF RADIATION DAMAGE IN STRUCTURAL MATERIALS OUTSIDE THE REACTOR CORE. Hehn, G.; Stiller, P. (Stuttgart Univ. (TH) (Germany, F.R.). Inst. fuer Kernenergetik und Energiesysteme). 1977.

From 1. ASTM-Euratom symposium on reactor dosimetry; developments and standardization; Petten, Netherlands (22 Sep 1975).

Computer studies were done to improve the prediction of radiation damage outside the reactor core for a PWR and a fast reactor. The aim was to show, how measurements of the neutron fluence and calculations of the energy spectra could be combined best. Outside the core there is a strong local variation of the neutron fluence accompanied by appreciable changes in neutron energy spectrum. With one- and two dimensional $S_{\text{sub}}(N)$ calculations the correlation was determined between surveillance samples at accelerated positions near the core and the expected damage in the pressure vessel. Displacement cross sections were calculated for the important nuclides in steel from ENDF/BIV data. The neutron flux spectra were weighted appropriately to get the displacement rates as a function of neutron energy. With this spectral quantity correlations are shown and possible uncertainties are discussed for both reactor types. Our results show, that calculations of displacement cross section and neutron flux spectra need high computational effort, if errors of 30% in the displacement rate sh.

- 1187 (EUR--5667(Pt.1), pp 375-413) CALCULATION OF ATOMIC DISPLACEMENT DOSE IN FAST REACTORS. Etherington, E.W. 1977.

From 1. ASTM-Euratom symposium on reactor dosimetry; developments and standardization; Petten, Netherlands (22 Sep 1975).

In the UKAEA neutron induced damage in metals is estimated in terms of atomic displacements. In the fast reactor environment this parameter is calculated from the fluxes obtained from multi-group neutron diffusion theory calculations and the Half-Nelson atomic displacement model. It is found that these calculated atomic displacements are sufficiently reliable in and near to the cores of fast reactors and it is not necessary to make regular experimental checks of the flux. An assessment has been made of the uncertainties in atomic displacements which arise from the atomic displacement model, the neutron cross sections of the material being damaged, the neutron spectrum, the relative total neutron flux, and the reactor power. These uncertainties have been compared with the requirement of the materials testing programme and of fast power reactor operation and it is judged that the present accuracy of the calculations meets these requirements. Some experiments which have a bearing on atomic displacement dose but which are being done primarily for other reasons are planned for the PFR. These measurements are reviewed.

- 1188 (EUR--5667(Pt.1), pp 99-116) NEUTRON SPECTROMETRY DATA IN LMFBR BENCHMARK AND STANDARD NEUTRON FIELDS. de Leeuw-Gierts, G.; de Leeuw, S. (Centre d'Etude de l'Energie Nucleaire, Mol (Belgium)); Helmick, H.H.; Roger, J.W. 1977.

From 1. ASTM-Euratom symposium on reactor dosimetry; developments and standardization; Petten, Netherlands (22 Sep 1975).

The test of cross section data of dosimetry

materials, the study of the integral consistency of cross section files, as well as the determination of nuclear parameters, related to the development of fast reactors, and of material damage functions require a good spectral characterization of the neutron field. To reach the accuracy compatible with the requirements on the parameter to be deduced from integral measurements only theoretical treatment of the neutron field is inadequate and one experimental approach is by far insufficient. Sufficiently accurate neutron spectrum measurements as well as calculations can only be performed in clean assemblies. The assemblies suitable for these purposes are gathered in the family of benchmarks in which the neutron spectral characterization is in study. In Mol-II, Bigten and CFRMF the spectrum was among others determined by means of the ^6Li technique by the authors. Through these spectral measurements the link established between the German-Dutch-Belgian and the US Interlaboratory Reaction Rate (ILRR) programme in the field of fast reactor physics is enlarged.

- 1189 (EUR--5667(Pt.2), pp 46-60) DAMAGE ANALYSIS: DAMAGE FUNCTION DEVELOPMENT AND APPLICATION. Simons, R.L. (Westinghouse Hanford Co., Richland, Wash. (USA)); Odette, G.R. (California Univ., Santa Barbara (USA)). 1977.

From 1. ASTM-Euratom symposium on reactor dosimetry; developments and standardization; Petten, Netherlands (22 Sep 1975).

Material behavior observed under irradiation conditions in test reactors is not always directly applicable to the design of reactor components because of differences in the damage effectiveness of test reactor and service spectra. The interpolation and, under some conditions, extrapolation of material property change data to different neutron spectra from those in which the data were obtained can be performed using semi-empirical damage functions. The derivation and application of damage functions, including recent development, for the U.S. LMFBR and CTR programs, is reviewed. A primary application of damage functions is in predicting component life expectancies; i.e., the fluence required in a service spectrum to attain a specified design property change. An important part of the analysis is the estimation of the uncertainty in such fluence limit predictions. Additional uses of damage functions include improving the correlation of irradiation effects data, contributing to the understanding of irradiation effects mechanisms, and selecting future locations programs. The status of standardizing the procedures for the derivation and application of damage functions is discussed. Improvements in several areas of damage function development are needed before standardization can be completed. These include increasing the quantity and quality of the data used in the analysis, determining the limitations of the analysis due to the presence of multiple damage mechanisms, and finally, testing of damage function predictions against data obtained from material surveillance programs in operating thermal and fast reactors.

- 1190 (EUR--5667(Pt.2), pp 112-130) REACTOR DOSIMETRY INTEGRAL REACTION RATE DATA IN LMFBR BENCHMARK AND STANDARD NEUTRON FIELDS: STATUS, ACCURACY AND IMPLICATIONS. - 1191 (EUR--5667(Suppl.), pp 23-89) REACTOR DOSIMETRY INTEGRAL REACTION RATE DATA IN LMFBR BENCHMARK AND STANDARD NEUTRON FIELDS: STATUS, ACCURACY AND IMPLICATIONS. Fabry, A.; Ceulemans, H.; Vandeplas, P. (Centre d'Etude de l'Energie Nucleaire, Mol (Belgium)); McElroy, W.N.; Lippincott, E.P. (Hanford Engineering Development Lab., Richland, WA (USA)). 1977.

From 1. ASTM-Euratom symposium on reactor dosimetry; developments and standardization; Petten, Netherlands (22 Sep 1975).

This paper provides conclusions that may be drawn regarding the consistency and accuracy of dosimetry cross-section files on the basis of integral reaction rate data measured in U.S. and European benchmark and standard neutron fields. In a discussion of the major experimental facilities CFRMF (Idaho Falls), BIGTEN (Los Alamos), $\Sigma\Sigma$ (Mol, Bucharest), NISUS (London), TAPIRO (Roma), FISSION SPECTRA (NBS, Mol, PTB), attention is paid to quantifying the sensitivity of computed integral data relative to the presently evaluated accuracy of the various neutron spectral distributions. The status of available integral data is reviewed and the assigned uncertainties are appraised, including experience gained by interlaboratory comparisons. For all reactions studied and for the various neutron fields, the measured integral data are compared to the ones computed from the ENDF/B-IV and the SAND-II dosimetry cross-section libraries as well as to some other differential data in relevant cases. This comparison, together with the proposed sensitivity and accuracy assessments, is used, whenever possible, to establish how well the best cross-sections evaluated on the basis of differential measurements (category I dosimetry reactions) are reliable in terms of integral reaction rates prediction and, for those reactions for which discrepancies are indicated, in which energy range it is presumed that additional differential measurements might help. For the other reactions (category II), the inconsistencies and trends are examined. The need for further integral measurements and interlaboratory comparisons is also considered.

- 1192 (EUR--5682) INTERPRETATION AND EXPERIMENT ON THE NEUTRON FLUX IN THE COOLING PIPES OF FAST REACTORS (A COMBINED METHOD SN-MONTE CARLO-ALBEDO FOR A RATIONAL CALCULATION OF THE RUPTURE). Bader, S. (Commission of the European Communities, Luxembourg). 1977. 104p. (In German). Dep. NTIS (US Sales Only), PC A06/MF A01.

The problems involved in the special case of SNR reactor are due to the structural dimensions, penetrations and tridimensional neutron transport through number of cavities. The previously available neutron codes separately dealt with the problems of penetrations and propagation in the event of rupture, but TIMOC cannot ensure precise computation and DLS/ALBEMO suffers a lack of reliability. A trial for a better approximation was performed; SN seems convenient for solving penetration problems and Monte Carlo for solving rupture. The thermal column was shown to play an important role (moderator plus reflector) and if it is not taken into account the epithermal flux obtained is not good. A group representation of iron cross sections is of importance for the flux spectrum after

filtering. In the rupture zone, the isotropy of the flux permits the albedo concept to give analytical representation but the relative dimensions geometry detectors does not allow analogy estimate in the spectra computation and, when the point of measurement is near the impact shock points: the method of estimate used caused some problems to arise. Results obtained show that the model such developed allow the experiments to be calculated in the limit of error, whilst the neglecting of the thermal column with TIMOC entailed bad results.

- 1193 (EUR--5813) REXCO-EUR CODE - USER'S MANUAL. Benuzzi, A.; Fasoli Stella, P. (Commission of the European Communities, Ispra (Italy). Joint Research Centre). 1978. 34p. Dep. NTIS (US Sales Only), PC A03/MF A01.

This report is the user's manual of a version (produced by the JRC and called REXCO-EUR) of the hydrodynamic-elastoplastic code REXCO-H release 2 developed by the ANL III.H USA. The REXCO-H code was designed for containment analysis of LMFBR during a high-energy excursion. The equations of mass, momentum and energy conservation in lagrangian coordinates for compressible fluid flow and the equations of state describing fluid materials are associated to the thin shell equations to calculate the dynamic response of a LMFBR to a core disruptive accident. The REXCO-EUR capabilities are described with the basic numerical techniques of the original code REXCO-H.

- 1194 (EUR--5854) SODIUM=FUEL INTERACTION: DROPPING EXPERIMENTS AND SUBASSEMBLY TEST. Holtbecker, H.; Schins, H.; Jorzik, E.; Klein, K. (Commission of the European Communities, Luxembourg). 1978. 58p. Dep. NTIS (US Sales Only), PC A04/MF A01.

Nine dropping tests, which bring together 2 to 4 kg of molten UO_2 with 150 l sodium, showed the incoherency and non-violence of these thermal interactions. The pressures can be described by sodium incipient boiling and bubble collapse; the UO_2 fragmentation by thermal stress and bubble collapse impact forces. The mildness of the interaction is principally due to the slowness and incoherency of UO_2 fragmentation. This means that parametric models which assume instantaneous mixing and fragmentation are of no use for the interpretation of dropping experiments. One parametric model, the Caldarola Fuel Coolant Interaction Variable Mass model, is being coupled to the two dimensional time dependent hydrodynamic REXCO-H code. In a first step the coupling is applicated to a monodimensional geometry. A subassembly test is proposed to validate the model. In this test rapid mixing between UO_2 and sodium has to be obtained. Dispersed molten UO_2 fuel is obtained by flashing injected sodium drops inside a UO_2 melt. This flashing is theoretically explained and modelled as a superheat limited explosion. The measured sodium drop dwell times of two experiments are compared to results obtained from the mentioned theory, which is the basis of the Press 2 Code.

- 1195 (EUR--5897, pp 221-231) STUDIES ON RECYCLING OF ACTINIDES OTHER THAN U AND PU. Bouchard, J.; Darrouzet, M.; Giacometti, A. (CEA Centre d'Etudes Nucleaires de Cadarache, 13 - Saint-Paul-les-Durance (France). Dept. des Reacteurs a Neutrons Rapides). 1978. (In French).

From 1. technical meeting on the nuclear transmutation of actinides; Ispra, Italy (16 Apr 1977).

The destruction of actinides formed during the fuel cycle in electronuclear reactors is most effectively carried out by a recycling process in fast neutron reactors. This conclusion from a preliminary study has led to detailed calculations for americium, curium and neptunium. These computations were made on a twenty year operation time basis of a Super Phenix type fast reactor in which actinides associated with plutonium used as fuel were reintroduced. This experiment has shown that all these three elements can completely disappear without building up a great mass inventory in the reactor, without producing high quantities of heavier elements and with very limited reactor perturbations. Although the data required for these calculations are not well known yet and although experimental confirmations are needed, trends are sufficiently evident to give way to precise studies on possible cycles, including technological consequences, particularly on fuel fabrication and reprocessing.

- 1196 (EUR--5897, pp 13-50) REACTOR PHYSICS ASPECTS OF BURNING ACTINIDES IN A NUCLEAR REACTOR. Hage, W.; Schmidt, E. (Commission of the European Communities, Ispra (Italy). Joint Research Centre). 1978.

From 1. technical meeting on the nuclear transmutation of actinides; Ispra, Italy (16 Apr 1977).

A short review of the different recycling strategies of actinides other than fuel treated in the literature, is given along with nuclear data requirements for actinide build-up and transmutation studies. The effects of recycling actinides in a nuclear reactor on the flux distribution, the infinite neutron multiplication factor, the reactivity control system, the reactivity coefficients and the delayed neutron fraction are discussed considering a notional LWR or LMFBR as an Actinide Transmutation Reactor. Some operational problems of Actinide Transmutation reactors are mentioned, which are caused by the α -decay heat and the neutron sources of Actinide Target Elements.

- 1197 (EUR--5897, pp 193-212) SOME PRELIMINARY INVESTIGATIONS OF THE INCINERATION OF ACTINIDE WASTE FROM THE UK AND EUROPEAN NUCLEAR POWER PROGRAMMES. Harte, G.A.; Nair, S. (Central Electricity Generating Board, Berkeley (UK). Berkeley Nuclear Labs.). 1978.

From 1. technical meeting on the nuclear transmutation of actinides; Ispra, Italy (16 Apr 1977).

The reactor inventory codes FISP /RICE and HYACINTH have been used to predict waste arisings from the operation of various reactor types, and an investigation has been carried out to determine the effect on the long-term hazards of these wastes of the removal and nuclear incineration of the elements neptunium, americium and curium.

- 1198 (EUR--5946) COMPARATIVE ANALYSIS OF A HYPOTHETICAL COOLANT LOSS ACCIDENT IN AN LMFBR REACTOR WITH THE USE OF VARIOUS CALCULATION MODELS FOR A COMMON REFERENCE PROBLEM. Royl, P. (Commission of the European Communities, Brussels (Belgium)). 1979. 202p. (In French). Dep. NTIS (US Sales Only), PC A06/MF A01.

The results of a comparative analysis of the initial and dismantling stages of a hypothetical loss of flow accident in an LMFBR reactor are presented. The analyses were made for a common reference problem with four different calculation models (CARMEN/KADIS,

SURDYN, CAPRI/KADIS and FRAX). The reference core is described specifically, as are the differences in its geometrical disposition in the models, the static and transient conditions before and after the start of boiling and during dismantling. The differences in the models used for simulating the boiling and the dismantling are compared. The structure of the core, as well as the calculation conditions and hypotheses, were intentionally designed so that the accident would culminate, in all cases, in an energetic hydrodynamic dismantling stage.

- 1199 (EUR--6108, pp 53-58) MEASUREMENTS AND CALCULATIONS OF INTEGRAL CAPTURE CROSS-SECTIONS OF STRUCTURAL MATERIALS IN FAST REACTOR SPECTRA. Seth, S.; Brunson, G.; Gmuier, K.; Jermann, M.; McCombie, C.; Richmond, R.; Schmocker, U. (Eidgenössisches Inst. fuer Reaktorforschung, Wuerenlingen (Switzerland)). 1979.

From Meeting on neutron data of structural materials; Geel, Belgium (5 Dec 1977).

This paper relates the checking of integral data of steel and iron in fast reactor lattices. The fully-rodged GCFR benchmark lattice of the zero-energy reactor PROTEUS was successively modified by replacing the $\text{PuO}_2\text{-UO}_2$ fuel rods by steel-18/8 or steel-37 (iron) rods. The neutron spectra of the modified lattices in fact have median energies close to that of a typical LMFBR. The replacement of fuel by the structural material of interest was such that in each case the value of $k(\infty)$ was reduced to near-unity. This allowed the measurement of the lattice- $k(\infty)$ by the null-reactivity technique. In addition, the principal reaction rates (namely U238 capture and fission, relative to Pu239 fission) and the neutron spectrum were measured. These directly measured integral data which are particularly sensitive to the steel cross-sections can be used for the checking and systematic adjustment of data sets. The results may also be analysed so as to derive specific values for the integral capture cross-sections of steel and iron. Neutron balance equations were set-up for each of the lattices using the measured $k(\infty)$ and reaction rates.

- 1200 (EUR--6108, pp 105-117) BENCHMARK TESTS OF JENDL-1 FOR STRUCTURAL MATERIALS. Otake, I. (Power Reactor and Nuclear Fuel Development Corp., Tokyo (Japan)). 1979.

From Meeting on neutron data of structural materials; Geel, Belgium (5 Dec 1977).

In order to examine the reliability of JENDL-1 for its use of FBR core design, various benchmark tests were performed on the basis of selected integral measurements. Total of 21 assemblies were selected and sample worths were calculated for ^{10}B , Cr, Fe, Ni, C, Na, Al and Mo. The adjustment technique was applied for the cross sections to fit the experimental values. Besides, fast neutron spectra in Fe were calculated and then compared with the measurements at KURRI to evaluate the JENDL-1 data for structural materials.

- 1201 (EURFNR--1454) SODIUM BOILING EXPERIMENTS IN AN ANNULAR TEST SECTION UNDER FLOW RUNDOWN CONDITIONS. Kaiser, A.; Pepler, W. (Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Inst. fuer Reaktorentwicklung). Mar 1977. 44p. (KFK--2389). Dep. NTIS (US Sales Only), PC A03/MF A01.

Work performed under United States--Euratom Fast Reactor Exchange Program.

Experiments have been carried out using sodium in an annular test section geometry to

simulate boiling development in a fast reactor core under the somewhat improbable conditions of primary circulator pump run-down with coincidental failure of the reactor trip system. Induction heating of the outer tube was used, the axial heat flux distribution being linear. Boiling was achieved by means of a steady reduction of the coolant flow from normal steady state values, heat fluxes being appropriate to reactor conditions. Boiling was allowed to continue until indications of permanent dryout of the heated tube were received, at which stage power was terminated to prevent damage to the test section. The results obtained provide useful information on the transient development of boiling, the axial distribution of void within the channel, initial superheat, liquid film thickness, dryout and rewetting. The experiments thus provide a source of data against which computer codes such as BLOW3 based on theoretical models of boiling may be validated.

- 1202 (EURFNR--1457) PHYSICS INVESTIGATIONS OF SODIUM-COOLED FAST REACTORS: SNEAK-ASSEMBLY 9C. Scholtyssek, W. (comp.). (Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Inst. fuer Neutronenphysik und Reaktortechnik). Apr 1977. 81p. (KFK--2361). Dep. NTIS (US Sales Only), PC A05/MF A01.

Work performed under United States--Euratom Fast Reactor Exchange Program.

The assemblies 9C completed the SNEAK 9 series of SNR specific criticals. A detailed description is presented of the SNEAK 9C-assemblies and of experiments related to core physics and to neutron physics parameters of the compositions used. The results of the experiments are compared to calculations carried out mainly with Karlsruhe code systems and the KFKINR cross section set. Only in some cases other cross sections were used.

- 1203 (EURFNR--1460) THERMODYNAMIC STATE, SPECIFIC HEAT, AND ENTHALPY FUNCTION OF SATURATED UO_2 VAPOR BETWEEN 3000 K AND 5000 K. Karow, H.U. (Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Inst. fuer Neutronenphysik und Reaktortechnik). Feb 1977. 40p. (KFK--2390). Dep. NTIS (US Sales Only), PC A03/MF A01.

Work performed under United States--Euratom Fast Reactor Exchange Program.

Reactor safety analysis requires knowledge of the thermophysical properties of molten oxide fuel and of the thermal equation-of-state of oxide fuel in thermodynamic liquid-vapor equilibrium far above 3000°K. The thermodynamic state of saturated UO_2 fuel vapor, its internal energy $U(T)$, specific heats $C_{\text{sub}} v(T)$ and $C_{\text{sub}} p(T)$, and enthalpy functions $H^0(H)$ and $H^0(T)-H^0_0$ have been determined by means of statistical mechanics in the temperature range 3000 to 5000°K. The discussion of the thermodynamic state includes the evaluation of the plasma state and its contribution to the caloric variables-of-state of saturated oxide fuel vapor. The resulting enthalpy functions and specific heats for saturated UO_2 vapor of equilibrium composition and that for pure UO_2 gas are compared with the enthalpy and specific heat data of gaseous UO_2 at lower temperatures known from literature. Tentatively also experimental enthalpy data of the condensed phases of UO_2 have been converted into the vapor phase using the Clausius-Clapeyron equation. However, the correlation based on the Clausius-Clapeyron equation turns out to fail because this equation is not applicable to the chemically reactive oxide fuel system.

1204 (EURFNR--1464) ANALYSIS OF EXPERIMENTAL FISSION GAS BEHAVIOR DATA IN FAST REACTOR FUEL UNDER STEADY STATE AND TRANSIENT CONDITIONS. Fischer, E.A. (Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Inst. fuer Neutronenphysik und Reaktortechnik). Jun 1977. 35p. (KFK--2370). Dep. NTIS (US Sales Only), PC A03/MF A01.

Work performed under United States--Euratom Fast Reactor Exchange Program.

To assess the utility of the computer programs LANGZEIT and KURZZEIT for the prediction of the fission gas behavior in LMFBR accident analysis, the input parameters were reassessed, a systematic comparison of the results with experimental data was carried out, and the model was further developed to include the diffusion of gas bubbles in a thermal gradient. The empirical relation by Duit was used for a comparison of the predicted gas release with experimental data. In addition, a comparison with data obtained in the fuel irradiation program of the Debenelux Fast Breeder Project was also carried out. The LANGZEIT results obtained using the new input parameters are consistent with experimental data for burn up values above 20,000 MWd/to. For lower burn up, LANGZEIT overestimates the gas release, because it considers the gas at grain boundaries as released. (An improved model is now available.) The program KURZZEIT was used to analyze transient gas release laboratory experiments carried out at HEDL. For this purpose, the effect of bubble diffusion in a thermal gradient had to be included in the model, because it plays an important role in those experiments. If reasonable values for the bubble diffusion coefficient are used, the model predicts correctly the time needed until complete gas release in the HEDL experiment, but not the details of the release history.

1205 (EURFNR--1465) IMPORTANCE AND STATUS OF (n,α) -CROSS SECTIONS FOR A RELIABLE PREDICTION OF RADIATION DAMAGE IN STAINLESS STEEL. Goel, B. (Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Inst. fuer Neutronenphysik und Reaktortechnik). Jun 1977. 29p. (KFK--2473). Dep. NTIS (US Sales Only), PC A03/MF A01.

Work performed under United States--Euratom Fast Reactor Exchange Program.

It is well established that helium formed in stainless steel by various (n,α) processes has a pronounced effect on its mechanical and dimensional properties. There has been strong discrepancy between the helium contents measured in irradiated stainless steel and that calculated on the basis of known (n,α) cross sections on the stable constituents of stainless steel. This discrepancy seems to be resolved by attributing the excessive helium to the two-step process $^{58}\text{Ni}(n,\gamma)^{59}\text{Ni}(n,\alpha)^{56}\text{Fe}$. However, a large discrepancy exists between the value of the thermal cross section for the $^{59}\text{Ni}(n,\alpha)^{56}\text{Fe}$ process used to calculate the helium production data and that obtained from the direct measurements of this cross section. The role of the (n,α) cross section on the irradiation-induced swelling is investigated. It is shown that insoluble gases like helium do influence swelling by way of nucleating and stabilizing voids. It is further shown that helium produced via ^{59}Ni constitutes a substantial amount of helium produced in stainless steel under thermal as well as under fast reactor conditions. In fast reactors helium produced via ^{59}Ni gains its importance at high neutron fluences. A linear extrapolation of helium production data measured at low fluences to the fluences of the

order of 1.5×10^{23} n/cm² is not justified. It is shown that the usual practice to relate helium production data to thermal and fast neutron fluence is inadequate. The details of neutron spectrum are necessary to predict helium production rate reliably. A measurement of $^{59}(n,\alpha)^{56}\text{Fe}$ cross section in keV range is recommended. 8 figures, 4 tables.

1206 (FBR--77-4) PLBR PHASE II FOLLOW-ON RESOLUTION OF KEY ISSUES. (Atomics International Div., Canoga Park, CA (USA)). Sep 1977. Contract EV-76-C-03-1142. 407p. AT.

Results of the effort to resolve principal outstanding engineering problems and issues arising in incompleting areas of systems conceptual design during Phase II of the Prototype Large Breeder Reactor (PLBR) Design Project are presented. Tasks covered under this effort included steam cycle comparison, in-vessel primary pipe inspection and maintenance, reactor cover, vessel and internals seismic response, primary system piping arrangement and analysis, in-vessel flow distribution, fuel handling system, intermediate piping system, reactor upper internals, EVST and cooling system, and plant control.

1207 (FBR--77-4) PLBR PHASE II FOLLOW-ON STUDIES: RESOLUTION OF KEY ISSUES. (Atomics International Div., Canoga Park, CA (USA)). Sep 1977. Contract EV-76-C-03-1142. 369p. AT.

Results of the effort by Atomics International to resolve principal outstanding engineering problems and issues arising in incompleting areas of systems conceptual design of Phase 2 of the Prototype Large Breeder Reactor Design Project are presented. Tasks covered include: steam cycle comparison; in-vessel primary pipe inspection and maintenance; reactor cover; vessel and internals seismic response; primary system piping arrangement and analysis; in-vessel flow distribution; fuel handling system; intermediate piping system; reactor upper internals; EVST and cooling system; and plant control.

1208 (FEI--536) HIGH-TEMPERATURE ACOUSTIC TRANSDUCERS OF SOUND PRESSURE BASED ON LITHIUM NIOBATE PIEZOELEMENTS. Masagutov, R.F.; Krivtsov, V.A. (Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Obninsk. Fiziko-Ehnergeticheskij Inst.). 1975. 22p. (In Russian). Dep. NTIS (US Sales Only), PC A02/MF A01.

Reviewed are wide-band piezoelectric sensors of sound pressure for measuring characteristics of sound fields in a liquid-metal coolant at temperatures up to 800 deg C. Materials used provide the possibility of using the sensors in the ionizing radiation fields. Two types of the sensors, i.e. asymmetric, are described. Their electrical, mechanical and acoustic parameters are presented. Thermal stability of the sensors is tackled. Estimations show that a higher temperature does not affect largely sensor characteristics, except for electric resistance which drops down to $10^6\Omega\text{cm}$ as the temperature goes up to 600 deg C.

1209 (FEI--556) EXPERIMENTAL STUDY ON INTERCHANNEL INTERACTION OF COOLANT IN ROD LATTICES WITH WIRE-WRAP SPACERS. Zhukov, A.V.; Kotovskij, N.A.; Matyukhin, N.M.; Sviridenko, E.Ya.; Sorokin, A.P.; Ushakov, P.A. (Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Obninsk. Fiziko-Ehnergeticheskij Inst.). 1975. 26p. (In

Russian). Dep. NTIS (US Sales Only), PC A03/MF A01.

Experimental study results for interchannel mixing in rod assemblies with wire spacers are presented. Particular attention is given to the analysis of interchannel interaction local processes found by measuring temperature profiles along the assembly length. The results of experimental study are compared with precomputed data on the basis of local and effective interchannel mixing models. A systematization is provided of data on the effective mixing coefficients for the rod assemblies in the liquid metal flows. Relations for local and effective mixing coefficients are recommended.

- 1210 (FEI--563) DESCRIPTION OF DESIGNS, FABRICATION AND TEST DATA OF PIEZOELECTRIC PICK-UPS BASED ON LITHIUM NIOBATES. Masagutov, R.F.; Krivtsov, V.A. (Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Obninsk. Fiziko-Ehnergeticheskij Inst.). 1975. 14p. (In Russian). Dep. NTIS (US Sales Only), PC A02/MF A01.

Piezoelectric sensors of sound pressure are discussed. These are designs on the basis of piezoelements of lithium niobate and intended for application in power units, in particular, in the fast nuclear reactor core. Two types of the sensors, i.e. asymmetric and symmetric, are described. Problems of sensor manufacture, assembly and their preliminary treatment are considered, which ensures their reliability. Results of sensor tests in the air furnace and in the unit with a forced circulation of Na-K alloy show that the sensors provide a reliable output signal at temperatures up to 700 deg C.

- 1211 (FEI--566) EXPERIMENTAL-CALCULATION STUDIES ON EFFICIENCY OF EUROPIUM OXIDE RODS OF THE BFS-29 ASSEMBLY. Gorbato, N.E.; Matveev, V.I.; Tyutyunnikov, P.L.; Efimenko, E.M.; Efimov, E.P.; Ivanov, A.P.; Melamed, V.E.; Abagyan, L.P.; Zakharova, S.M. (Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Obninsk. Fiziko-Ehnergeticheskij Inst.). 1977. 17p. (In Russian). Dep. NTIS (US Sales Only), PC A02/MF A01.

Experimental results of measurements of the efficiency of the rods made of natural boron carbide and europium oxide taken on one of the models of the BN-600-reactor - BFS-29 assembly are presented. The experimental data are compared with the results of calculations. It is shown that the experimental data agree (within 10%) with the calculated results. The analysis of the obtained results shows that the efficiency of the identical rods made of natural boron carbide and europium oxide is approximately equal in the fast power reactors, type BN-600.

- 1212 (FEI--597) APPROXIMATE SIMULATION TECHNIQUE FOR THERMAL AND HYDRAULIC PARAMETERS OF A REACTOR CORE. Gorchakov, M.K.; Kolmakov, A.P.; Yur'ev, Yu.S. (Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Obninsk. Fiziko-Ehnergeticheskij Inst.). 1975. 19p. (In Russian). Dep. NTIS (US Sales Only), PC A03/MF A01.

Differential equations are given of liquid motion and heat transfer in the core as in a porous body in case of natural and forced convection. Conditions of macrodistribution similarity of liquid pressure, velocity and temperature are determined. An example is shown simulating quasistationary processes in the liquid-metal reactor with a hydromodel.

- 1213 (FEI--607) EFFECT OF THE FAST BREEDER CONCEPT ON THE REACTOR MAIN CHARACTERISTICS AND STEAM GENERATION PARAMETERS. Rinejskii, A.A.; Pashicheva, M.I.; Chushkin, V.N. (Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Obninsk. Fiziko-Ehnergeticheskij Inst.). 1975. 29p. (In Russian). Dep. NTIS (US Sales Only), PC A03/MF A01.

To solve a fuel problem for a particular country fast breeders should have definite physical characteristics (reproduction coefficient, duplication time). If this condition is taken as a basic one for manufacture of a fast reactor, it causes a number of specific requirements for the reactor, thermomechanical and power-steam equipment. The above problems are discussed.

- 1214 (FEI--622) ANALYTICAL SOLUTION OF SOME PROBLEMS RELATED WITH ELECTROMAGNETIC METHOD OF VELOCITY MEASUREMENT IN COMPLEX CHANNELS. Mikhin, V.I.; Zhukov, A.V. (Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Obninsk. Fiziko-Ehnergeticheskij Inst.). 1975. 20p. (In Russian). Dep. NTIS (US Sales Only), PC A02/MF A01.

The objective of the work is to study a process of measuring the velocity of liquid-metal coolant by an electromagnetic method. The operation of electromagnetic sensors, which principle lies in a EMF effect caused in a rotating magnetic field of a conductor, has been analytically studied. The examination of two types of the electromagnetic sensor, one with and the other without a copper ring, is aimed at determining the effect of channel geometry and location of electrodes on the sensor signal. The analysis is performed for the case of a flat flow of the coolant. The formulas are recommended describing the effect of adjacent walls of various configurations on the signal of the sensor. The following conclusions have been drawn: in case of a flat flow of the coolant the effect of the adjacent walls of the channel on the sensor signal is largely governed by a size of the magnet, the use of a copper ring in the electromagnetic sensor makes it possible to diminish the effect of the adjacent walls of the channel upon the sensor signal, application of small-size magnets improves considerably the characteristics of electromagnetic sensors.

- 1215 (FEI--624) ABOUT SOME EFFECTS ON THE COOLANT TEMPERATURE FIELD IN FUEL ASSEMBLIES WITH WIRE SPACERS. Zhukov, A.V.; Sorokin, A.P.; Titov, P.A.; Ushakov, P.A. (Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Obninsk. Fiziko-Ehnergeticheskij Inst.). 1975. 21p. (In Russian). Dep. NTIS (US Sales Only), PC A02/MF A01.

The effect of several factors - displacement of fuel elements, excess energy output from central and peripheral fuel elements, spacing of spacer coils, etc. - on the temperature field of fast reactor fuel assemblies was examined. Methodology for calculating the heat field of reactor BN-600 with consideration of interchannel interdisplacement is presented. Analysis of the calculation results showed that variations in the fuel element lattice of fast reactors from the normal geometry, within permissible limits, on the assembly and also excess (up to 50%) energy release from individual fuel elements shows up somewhat in average coolant heating along the channels. The effects increase significantly with displacement of the peripheral fuel elements. Placement of detectors in the cell channel

significantly affect the distribution of the coolant heating. Dispersion of the coolant heating along the cell radius is shown graphically as a function of the factors studied.

- 1216 (FEI--711) TEMPERATURE CONTROL OF ACTIVE CORE ASSEMBLIES IN A FAST REACTOR IN ACCIDENTS. Buksha, Yu.K.; Bagdasarov, Yu.E.; Kuznetsov, I.A. (Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Obninsk. Fiziko-Ehnergeticheskij Inst.). 1976. 24p. (In Russian). Dep. NTIS (US Sales Only), PC A03/MF A01.

A mathematical model of nonstationary two-dimensional temperature field in a fast reactor active core, when the coolant flow rate change in the separate fuel assemblies takes place. On the base of calculations the correction factors for indications of thermocouple located at fuel assembly output have been obtained. Effectiveness of using in reactor protective system thermocouples with various constants of time and flowmeters controlling each fuel assembly state has been investigated. Specific calculation results are related to BN-600-type reactor.

- 1217 (FEI--739) WAYS OF SOLVING SOME ENGINEERING PROBLEMS IN ARRANGEMENT OF INTEGRAL AND LOOP TYPE FAST REACTORS. Rineiskii, A.A.; Baklushin, R.P.; Ivanenko, V.N.; Klimov, S.A.; Mel'nikov, N.P.; Matveev, G.V.; Sobolevskii, R.G.; Tkachenko, S.B.; Ustinov, G.G. (Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Obninsk. Fiziko-Ehnergeticheskij Inst.). 1977. 21p. (In Russian). Dep. NTIS (US Sales Only), PC A03/MF A01.

A comparative analysis of currently-in-use and feasible arrangements of loop and integral LMFBR type reactors is given. The discussion is based on the designs of "in operation", "under construction" and "projected" reactors all over the world. The effects of the outlet coolant temperature, reactor unit power, maintainability and costs on the choice of the arrangement type are considered. Considered in greater details are the hydraulic schemes and problems of the integral reactor vessel attachment as well as problems of ensuring strength of pipe-to-vessel connections and localizing coolant leaks in the loop type reactors. There is no general consent over the superiority of one of the designs up to now. There are different opinions on the account in different countries, since both designs have its merits and shortcomings.

- 1218 (FEI--850) PHYSICAL ASPECTS OF CHOOSING FUEL FOR A RESEARCH FAST REACTOR. Antonova, V.N.; Lantsov, M.N.; Markelov, I.P.; Orehov, V.I.; Chufikov, M.I. (Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Obninsk. Fiziko-Ehnergeticheskij Inst.). 1978. 10p. (In Russian). Dep. NTIS (US Sales Only), PC A02/MF A01.

Comparative evaluations of research sodium cooled fast reactors fueled with plutonium or uranium carbides have been made. The core represents a homogeneous mixture of major constituents - fuel, sodium and steel. The physical calculations have been fulfilled in terms of the 26-group P_1 -approximation in the spherical geometry within the wide range of core volumes (20-1000 l). The plutonium fuel is concluded to be superior to the uranium one from the standpoint of the reactor "quality" (ratio of the maximum neutron flux to the reactor power), fuel concentration in the critical volume of the core and the neutron

spectrum hardness.

- 1219 (FRNC-TH--709) STUDY OF SODIUM COMBUSTION AND FIRE EXTINCTION BY PULVERIZED SUBSTANCES. ROLE OF ADDITIVES. Reuillon, M. (Orleans Univ., 45 (France)). 1976. 153p. (In French). Dep. NTIS (US Sales Only), PC A10/MF A01.

Thesis.

A study is presented on inflammation and combustion of liquid sodium, extinction of the metal fires by comburant concentration reducing and cooling, liquid covering, powder smothering. The role of the additives is discussed. The setting up and the experimental process are given. The sodium combustion residues are analyzed. Various powder mixtures based on alkaline carbonates, $\text{NaCl}-\text{Na}_2\text{CO}_3$, $\text{NaCl}-\text{Na}_2\text{CO}_3, \text{H}_2\text{O}$ etc... are studied. An attempt of interpretation on sodium fire extinction is presented.

- 1220 (FRNC-TH--765) STUDY OF SODIUM BOILING DURING A POWER TRANSIENT IN A HEATING DUCT. INVESTIGATION CARRIED OUT WITHIN THE SCOPE OF A STUDY ON THE SAFETY OF FAST NEUTRON REACTORS. Seiler, J.M. (Grenoble-1 Univ., 38 (France); Institut National Polytechnique, 38 - Grenoble (France)). 1977. vp. (In French). Dep. NTIS (US Sales Only), PC A10/MF A01.

Thesis.

This work comprises an experimental study and a physical and theoretical interpretation of sodium boiling during a power transient in conditions simulating a power excursion accident in a breeder reactor. The experimental study was performed on an 'out of pile' system with forced sodium convection. It enabled a detailed study to be made of the draining of the heating duct representing a part of a reactor assembly (expansion of the double-phase area on the heating part of the pin). The physical and theoretical interpretation rests on a very simple calculation model solely describing the heat transfers in the duct, assuming that the fluid stays liquid. The extension of the boiling is governed by the initial overheating and the boiling conditioned by thermal inertias of the walls. The extent of the overheating appears to depend on the degree of initial under-saturation. In the absence of overheating, the rate at which the double-phase front moves is controlled by the saturated boiling. This front is well localised when the central temperature gradient is significant. The draining rate is then directly proportional to the growth rate of the temperature in the liquid. The model employed in the CASPAR code for describing power excursion experiments in single liquid phase is described. This code makes it possible to calculate the heat transfers occurring in a forced system by a heating part, a coolant in movement and possibly a part representing an outer cover.

- 1221 (FRNC-TH--783) STUDY OF TRANSIENT AND PERMANENT FLOW IN THE EVENT OF NATURAL CONVECTION IN A CONFINED ENVIRONMENT. Tenchine, D. (Lyon-1 Univ., 69 (France)). 1978. vp. (In French). Dep. NTIS (US Sales Only), PC A11/MF A01.

These (D. Ing.).

This report deals with natural convection in a confined environment, in connection with the studies on the safety of nuclear reactors of the sodium cooled breeder type (possibilities of removing the residual power of the fuel by natural convection in the liquid sodium). These natural convection exchanges develop in a confined environment between various sodium volumes separated by metallic structures. The

study covered a cavity heated by the roof or by the bottom and cooled laterally. The results are compared with those achieved along heating plates, vertical or horizontal, in an infinite medium and the effect of the thermal limit conditions are highlighted by comparison with the case of bottom heated and roof cooled cavities. Placed in a bidimensional geometry situation, with water as fluid, this leads to tackling the problems of similarity between water and sodium flows. A digital code has been developed in plane bidimensional geometry with a laminar and permanent flow. A description is given of the 'BIDIM' experimental rig as well as the measuring and display devices. A permanent flow study of the two previously mentioned configurations produces references for the analysis of transient flows, particularly in the case of bottom heating (field of medium temperatures and medium exchange coefficient). The turbulence intensity and frequency distribution determinations of the temperature changes are given. Then the determinations in transient flow are dealt with in the case of bottom heating. The cavity being initially cold, a power rise is initiated in the heating plates and the establishment and growth of natural convection and the change in the field of medium temperatures and exchange coefficient are studied.

- 1222 (FWC/FWEC/ND--75-70) 360° FLOW MODEL PRIMARY INLET FLOW DISTRIBUTION TEST REPORT. Dietz, D. (Foster Wheeler Energy Corp., Livingston, NJ (USA)). 15 Dec 1975. Contract EY-76-C-15-0003. 146p. Dep. NTIS, PC A07/MF A01.

In this test, an appropriate hole pattern in the distribution shroud was obtained so as to achieve uniform shellside sodium flow at a full load condition. The flow distribution through the distribution shroud was measured at lower flow rates after the final hole pattern was determined. The velocity profile inside the nozzle and in the inlet plenum was also measured over a range of flow rates. The pressure drops upstream of the distribution shroud and across the distribution shroud were also measured. A visual study to obtain a clear picture of the flow patterns in the inlet plenum completed the test program.

- 1223 (FWC/FWEC/ND--76/49) INTERMEDIATE FLOW MODEL TEST REPORT. Dietz, D. (Foster Wheeler Energy Corp., Livingston, NJ (USA)). 27 Sep 1976. Contract EY-76-C-15-0003. 91p. Dep. NTIS, PC A05/MF A01.

The intermediate flow enters the top of the Clinch River Breeder Reactor Intermediate Heat Exchanger (CRBRP-IXH), passes downward through the downcomer pipe and turns 180° in the plenum formed by the intermediate hemi-head and the tubesheet. The flow then passes through the tube bundle and exits the heat exchanger. Due to the geometry of the plenum, the flow tends to be strongest in the tubes along the outer perimeter of the tube bundle. The tests determined the geometry of an annular ring baffle secured to the wall of the hemispherical head which deflects the tubeside flow evenly into the entrance region of the tube bundle, and the length of the downcomer extension.

- 1224 (FWC/FWEC/ND--76/59) CRBRP-IXH: 30° MODEL FLOW DISTRIBUTION, PRESSURE DROP AND TUBE VIBRATION TEST REPORT. Jaisingh, G. (Foster Wheeler Energy Corp., Livingston, NJ (USA)). 1 Mar 1977. Contract EY-76-C-15-0003. 133p. Dep. NTIS, PC A07/MF A01.

The objective of this test program was to study the flow of shell side sodium and tube

vibration caused by it. This was achieved by simulating sodium flow by water at 170°F. (Additional tests were performed with 100°F water at lower flow rates.)

- 1225 (GEAP--13923-16) SAFETY ENGINEERING SIXTEENTH QUARTERLY REPORT, MAY--JULY 1976. (General Electric Co., Sunnyvale, CA (USA)). Fast Breeder Reactor Dept.). Aug 1976. Contract E(04-3)-0893-TAS-2. 57p. AT.

Progress is summarized in the following LMFBR safety studies: experiment analysis and code validation, evaluation and adaptation of existing codes, fuel performance code development, and parametric accident analysis. (DG)

- 1226 (GEFR--00027(L)) INTERIM EVALUATION OF SODIUM--WATER REACTION TEST NO. 1 DATA AND COMPARISON WITH TRANSWRAP ANALYSES: SERIES I LARGE LEAK TEST PROGRAM. Amos, J.C.; McClelland, S.D.; Regimbal, J.J. (General Electric Co., Sunnyvale, CA (USA)). Fast Breeder Reactor Dept.). 28 Feb 1977. Contract EY-76-C-03-0893-010. 65p. AT.

The report presents an interim evaluation and analytical comparison of the test data and intertest examination results for Sodium Water Reaction (SWR) Test No. 1 (SWR No. 1) conducted in the Large Leak Test Rig (LLTR) at the Liquid Metal Engineering Center (LMEC). Efforts to achieve a more detailed evaluation of SWR No. 1 are underway. Comparisons with the experimental findings of subsequent tests in the series, similar to this evaluation, are planned. A final Series I evaluation report will be prepared following completion of the Series I test program. The test was the first of the Series I large leak tests utilizing the MSG test article. The test consisted of a programmed double-ended guillotine rupture of a centrally located steam generator tube at a location 4'10³/' above the MSG lower tubesheet. Pretest conditions for both water and sodium in the test article were representative of CRBRP evaporator operating conditions. Dynamic H₂O flow conditions were established in the rupture tube, with static (uniform) steam pressure in the remaining steam generator tubes. A representative 225° linear temperature gradient was established over the length of the shell.

- 1227 (GEFR--00037(L)) LLTR SERIES I: ANALYSIS IN SUPPORT OF SWRPS DESIGN AND SWR CLEANUP AND RECOVERY. Reynolds, R.G. (General Electric Co., Sunnyvale, CA (USA)). Fast Breeder Reactor Dept.). Apr 1977. Contract EY-76-C-03-0893-010. 29p. AT.

Documentation and analysis is made of the Series I Large Leak Test data pertinent to the CRBR Sodium-Water Reaction Pressure Relief System (SWRPS) and the Sodium-Water Reaction (SWR) Cleanup and Recovery Programs. This is an interim report and it will be updated when all the results from SWR-2 and SWR-3 are available. Preliminary data reveal no CRBRP rupture disc design flaws. The long vent lines in the LLTR are effective in reducing the amount of sodium compound aerosols released to the atmosphere so there is no incentive to test a centrifugal separator in Subsequent Series II tests. Enough reaction products were deposited in the steam generator during the test to present a significant clean-up problem. Reaction products were not observed to stick to relief system lines.

- 1228 (GEFR--00041) PROBABILISTIC LEAK ANALYSIS FOR LMFBR PRIMARY COOLANT PIPING.

Derby, S.L.; Hackford, N.E. (General Electric Co., Sunnyvale, CA (USA). Fast Breeder Reactor Dept.). Jul 1977. Contract EY-76-C-03-0893 013. 32p. AT.

The development of a probabilistic analysis for a leak in the primary coolant piping in an LMFBR is described. In a detailed example, the analysis is used to evaluate a point estimate of the conditional probability of pipe wall penetration as a function of initial crack depth for the inlet elbow in the reactor primary coolant system of the Fast Flux Test Facility (FFTF). The result is used to demonstrate an approach for specifying a probabilistic criterion for the crack inspection of piping to meet an overall safety objective.

1229 (GEFR--00051(L)=1) SELF-WASTAGE PHENOMENA. VOLUME I. STATE-OF-THE-ART DATA REVIEW AND EVALUATION. Greene, D.A. (General Electric Co., Sunnyvale, CA (USA). Fast Breeder Reactor Dept.). Sep 1977. Contract EY-76-C-03-0893-010. 86p. AT.

The report discusses general trends and conclusions which can be drawn from self-wastage data, and supports the evaluation with hypotheses and mechanisms on self-wastage and defect plugging phenomena. The data base is used to provide preliminary estimates of the magnitude of self-wastage phenomena, their impact on leak detection criteria, and possible criteria and guidelines for the plant operator. Chemical leak detectors were evaluated against the self-wastage data. They provide significant, but limited, protection against defects in the steam generators. Such detectors will indicate the presence of defects which have an initial size in the range 0.025 to 0.10 mm equivalent hydraulic diameter (0.001 in. to 0.004 in.). If the defect is initially smaller than 0.025 mm diameter and in the superheater (460°C), it is probable that the defect will grow into a hole of approximately 3 mm diameter prior to unit shutdown following detection and operator action. All defects with initial size below 0.2 mm (0.008 in.) in the evaporator (340°C) will probably be detected with time to take action. Acoustic leak detectors were also evaluated. They appear to have the potential for increased detection range compared to chemical detectors, but are in an early stage of development. Acoustic detectors have the potential added capability of location of the defect.

1230 (GEFR--00051(L)=2) SELF-WASTAGE PHENOMENA. VOLUME II. EXPERIMENTAL DATA FROM GE TEST FACILITIES. Gudahl, J.A.; Greene, D.A.; Hunsicker, J.C.; Ulpindo, C.Q. (General Electric Co., Sunnyvale, CA (USA). Fast Breeder Reactor Dept.). Feb 1977. Contract EY-76-C-03-0893-010. 179p. AT.

A study on self-wastage phenomena in LMFBR steam generators is described. Experimental data on preliminary scoping tests and the Phase I test series are included. The report also contains descriptions of the test facilities in which the tests were made and a description of the techniques used to obtain the data.

1231 (GEFR--00061(L)) SOME ASPECTS OF CORROSION OF 2 1/4 CR--1 MO EVAPORATORS BY PROTOTYPIC CRBRP WATER CHEMISTRY. Rodgers, D.N.; Dutina, D. (General Electric Co., Sunnyvale, CA (USA). Fast Breeder Reactor Dept.). Mar 1977. Contract EY-76-C-03-0893-010. 10p. AT.

The steam/water tubes in the Clinch River Breeder Reactor (CRBR) evaporators will experience Departure from Nucleate Boiling

(DNB) in which the liquid film in the nucleate boiling region evaporates and breaks up into rivulets and dry spots. A number of potential damage mechanisms have been postulated as a result of this. For example, a major concern has been that tube life would be reduced by fatigue failure due to thermally induced stresses. Such stresses arise from oscillation in the tube wall temperature caused by the repeated wetting and drying within the DNB zone and the change from nucleate to film boiling as the DNB zone moves along the tube. Recent sophisticated modeling work coupled with experimental data has virtually eliminated this concern. It is now accepted that the CRBR design provides adequate margin against fatigue failure for the design life at the worst operating condition (64 percent power). A second possible damage mechanism was that corrosive species, particularly sodium hydroxide, would concentrate in the dry-out region and cause local corrosion damage. This paper emphasizes the work carried out to minimize this potential problem and to test its severity.

1232 (GEFR--00062) SWELLING OF TYPES-304, -316, AND -321 STAINLESS STEELS AT HIGH FLUENCES IN EBR-II. Kenfield, T.A.; Appleby, W.K.; Bell, W.L.; Busboom, H.J.; McClellan, G.C. (General Electric Co., Sunnyvale, CA (USA). Fast Breeder Reactor Dept.). Mar 1977. Contract EY-76-C-03-0893-003. 56p. AT.

Swelling determinations on unstressed cladding tubes have revealed peak swellings of 14% and 18%, respectively, for solution-annealed Types-304 and -316 after irradiation to 14×10^{22} n/cm² ($E > 0.1$ MeV). The swelling peaks occurred at approx. 500°C and approx. 580°C. The 20% cold-worked Type-316 showed a slight reduction in swelling (15%) relative to solution-annealed material, although the temperature dependence of swelling remained essentially the same (peaking at approx. 580°C). The peak steady-state swelling rate for 20% cold-worked Type-316 stainless steel, the reference cladding and duct material for FFTF and CRBRP, is approx. $2.1\% \Delta V/V/\text{sub f}/\text{per } 10^{22}$ n/cm². Neutron irradiation of Type-321 stainless steel to a fluence level of 9.0×10^{22} n/cm², $E > 0.1$ MeV, shows swelling similar to that for Type-304 with a peak swelling temperature in the vicinity of 450°C. Cold working is more effective in reducing swelling in Type-316 than in Type-304 or Type-321.

1233 (GEFR--00067-2) PROGRAM FOR THE DEVELOPMENT OF DESIGN DATA: LMFBR STEAM GENERATOR MATERIALS. (General Electric Co., Sunnyvale, CA (USA). Fast Breeder Reactor Dept.). 7 Jun 1978. Contract EY-76-C-03-0893-030. 241p. AT.

A program to characterize materials, mainly 2 1/4 Cr-1 Mo steel and austenitic stainless steels, to assure that satisfactory materials compatibility is achieved with LMFBR steam generator environments is reported, along with a program for steam generator materials qualification. The objectives of the second program are to develop and qualify materials specifications, to develop fabrication procedures and processes, to purchase tubing and tubesheet material for development programs, to develop and apply nondestructive examination techniques for the Intermediate Heat Transport System of the CRBRP, to coordinate design of the steam generators in the area of water chemistry, to provide technical management to wear and friction testing of IHTS material, and to develop the design and fabrication procedures for the austenitic stainless to ferritic steel

transition joints of the CRBR. (GHT)

- 1234 (GEFR--00067-3) PROGRAM FOR THE DEVELOPMENT OF DESIGN DATA LMFBR STEAM GENERATOR MATERIALS. (General Electric Co., Sunnyvale, CA (USA). Advanced Reactor Systems Dept.). Jun 1979. Contract EY-76-C-03-0893-030. 140p. AT.

Progress in steam generator materials development and qualification for LMFBRs and the Clinch River Breeder Reactor is reported.

- 1235 (GEFR--00076) REFERENCE FUEL STUDIES. ANNUAL REPORT, FEBRUARY 1976--JANUARY 1977. (General Electric Co., Sunnyvale, CA (USA). Fast Breeder Reactor Dept.). Feb 1977. Contract EY-76-C-03-0893-003. 236p. AT.

Research progress is reported for the following subtasks: fuel pin testing and analysis; in-reactor behavior of reference structural materials; and fuel pin chemistry and thermodynamics.

- 1236 (GEFR--00101) NATIONAL CORE RESTRAINT PROGRAM CODE VERIFICATION/COMPARISON STUDY, PROBLEM LEVEL I=D. Fox, J.N. (General Electric Co., Sunnyvale, CA (USA). Fast Breeder Reactor Dept.). Apr 1977. Contract EY-76-C-03-0893-023. 37p. AT.

The CORTAC computer code calculates the short term steady-state and transient response of the core restraint system. This requires the simultaneous analysis of the coupled effects of reactor core thermal-hydraulics, reactor kinetics, and component structural deflections. The structural portion of CORTAC is being verified along with the other core restraint codes PARABOW, NUBOW-2D and NUBOW-3D, under Problem Levels I-A, I-C, IV-A, and IV-B. However, CORTAC is the only core restraint code that treats reactor thermal hydraulics and reactor kinetics. Thus, the Level I=D Problems are unique in that they only apply to CORTAC. The Level I=D Problems are directed primarily to the reactor kinetics related and the transient portions of CORTAC. The CORTAC core-side steady-state radial heat transfer model will be verified under Problem Levels I-B and II-B, in which the CORTAC results will be compared directly to the WARD TRITON code which rigorously treats 3-D steady-state heat transfer. There are three types of problems under Level I=D: feedback reactivity, kinetics response, and transient heat transfer response. Each of these problems is sufficiently important so that it is essential to examine the results individually without the influence of any other effects. The report describes the feedback reactivity problem in which the inlet temperature is increased by 10°F at a zero power condition and hand calculations of the CORTAC results. The description and results of the point kinetics equations are provided with and without reactivity feedback. Each kinetics problem is subject to a step change in input reactivity. Two transient heat transfer response problems are considered: axial convection and fuel-to-coolant radial heat transfer.

- 1237 (GEFR--00108) ANALYSIS OF THE ZPPR-4 CRITICAL EXPERIMENTS, PHASES 3 AND 4. Hartman, A.K.; Hitchcock, J.T. (General Electric Co., Sunnyvale, CA (USA). Fast Breeder Reactor Dept.). Aug 1977. Contract EY-76-C-03-0893-005. 149p. AT.

Assembly 4 of ZPPR was a systematic study of the nuclear performance of a demonstration plant sized LMFBR. Its primary purpose was to provide a benchmark study of the radial

blanket. Specifically, the objective of ZPPR-4 was to investigate plutonium buildup and breeding performance, and to provide a data base on the family of effects related to fuel burnup. The program was also used to provide pre-Engineering Mockup Critical data to be applied to the Clinch River Breeder Reactor design. The ZPPR-4 program was divided into four experimental phases in order to investigate the separate and combined influence of control and plutonium buildup. The purpose of Phases 3 and 4 was to investigate the neutronic characteristics of a simulated equilibrium core and to study the effects of blanket fissile buildup on core and blanket performance. The analysis of the ZPPR-4 measurements was directed toward the evaluation and calibration of standard design techniques as they are applied in LMFBR design. An attempt was made to lower and quantify the nuclear design uncertainties. Where possible, the standard design methods were calibrated against the experimental data. Where normal design methods failed or were inadequate. The necessary analytical effort to adequately analyze the experimental data was identified. The primary calculational tool was few group two-dimensional diffusion theory. The cross section data base was ENDF/B Version III.

- 1238 (GEFR--00109) ANALYSIS OF THE ZPPR-5 CRITICAL EXPERIMENTS: SIMULATING HYPOTHETICAL CORE DISRUPTIVE ACCIDENTS. Lee, B.W.; Crick, S.C. (General Electric Co., Sunnyvale, CA (USA). Fast Breeder Reactor Dept.). Jul 1977. Contract EY-76-C-03-095. 172p. AT.

An experimental program was performed in the ZPPR critical facility in order to evaluate the design methods used to provide the nuclear feedback information for the hypothetical core disruptive accident analysis. A series of "snapshot" views of a progressing accident was mocked up in the reactor and measurements were made of the resulting reactivity. The accident scenario consisted of voiding sodium, followed by slumping 30 percent of the steel, followed by slumping fuel both toward and away from the core center. The ZPPR-5 measurement program has been broken into two phases, A and B. In Phase A, control rods were parked in the upper axial blanket and sodium-filled control rod channels were located in the core and lower axial blanket to simulate an initial core at end-of-cycle. Phase B, simulated beginning-of-cycle condition, was created from Phase A by inserting seven control rods from parked position in the upper axial blanket into the core region. The analytical emphasis was on the evaluation and calibration of standard design techniques. An attempt was made to lower and quantify the nuclear design uncertainties. The primary calculational tool was twenty-one group, two-dimensional diffusion theory in R,Z geometry. Both perturbation worths and eigenvalue differences were generated and compared with measurements. The cross section data base was ENDF/B Version III.

- 1239 (GEFR--00114(L)) EVALUATION OF HYDRAULIC TEST MODEL (HTM) FLOW DISTRIBUTION TEST RESULTS. Lee, Y.J. (General Electric Co., Sunnyvale, CA (USA). Fast Breeder Reactor Dept.). May 1977. 37p. AT.

The CRBR steam generator Hydraulic Test Model (HTM) flow distribution test results have been evaluated, and it is found that the performance degradation due to the flow nonuniformity observed in the HTM test is negligible; 0.06% for the evaporator and nil for the superheater. Also, the fact that ambient temperature water was used in the test instead of hot sodium with temperature

gradients does not introduce significant errors in applying the HTM test results for the tested flow rate range to the CRBR steam generator flow pattern.

- 1240 (GEFR--00152) PROCEDURES FOR MEASURING BOWING/EXPANSION REACTIVITY EFFECTS. Fox, J.N. (General Electric Co., Sunnyvale, CA (USA). Fast Breeder Reactor Dept.). Nov 1977. Contract EY-76-C-03-0893-023. 31p. AT.

Detailed analyses of CRBRP beginning-of-cycle first core were performed with the computer code CORTAC. The objective was to provide a sound technical basis for development of suitable reactivity measurement procedures. The resulting recommended procedures provide for the separate measurement of core restraint reactivity-related quantities during reactor startup and rise-to-power, radial reactivity feedback based on a transient which suppresses the Doppler and axial feedback contributions, and Doppler plus axial reactivity feedbacks based on a transient designed to suppress the radial reactivity feedback. For the model used, it was found that the transient reactivity feedbacks of coolant density, structural density, and cladding density were negligible compared with the fuel-related and radial reactivity feedbacks. The coolant density reactivity feedback was found to be less than 2% of the total, the structural density contribution essentially zero, and the cladding density reactivity feedback less than 1% of the total. During the startup and rise-to-power phase, the sodium density contribution is a little higher (< 3%) while the structural and cladding density reactivities remain about the same as in the transient case. Hence, the only components of reactivity feedback that are important relative to the reactivity measuring procedures contained herein are Doppler, axial, and radial feedback. In addition to providing total reactivity feedback as a function of power, the recommended reactivity measurement procedure during the startup and rise-to-power sequence provides for two key core restraint quantities that can be implied through the total reactivity measurements. The first quantity is the onset of the structurally determinate region; the second is the power level at which the Above-Core Load Plane (ACLP) gaps are effectively closed.

- 1241 (GEFR--00156) CORE RESTRAINT SYSTEM SEISMIC MODELING CAPABILITIES. Fakhari, M.; Fox, J.N. (General Electric Co., Sunnyvale, CA (USA). Fast Breeder Reactor Dept.). Nov 1977. Contract EY-76-C-03-0893-023. 249p. AT.

Due to the lack of adequate analytical tools and supporting test data, seismic response is the most difficult design area of core restraint. The primary concerns of seismic response are: the reactivity changes associated with both horizontal and vertical motions of the core assemblies; the structural integrity of the core assembly load pads and duct walls under the influence of seismic loading; and the horizontal displacements of the upper ends of the core assemblies which could potentially interfere with control rod insertion. The information herein addresses both analytical modeling and testing; however, this information is preliminary since it represents less than 20% of the overall effort required to adequately evaluate core restraint system seismic response.

- 1242 (GEFR--00232) INSTRUMENT DEVELOPMENT: ADVANCED SIGNAL TRANSMISSION SYSTEMS. FINAL SUMMARY REPORT, OCTOBER 1976-JUNE 1977.

Imhoff, D.H.; Craig, C.N. (General Electric Co., Sunnyvale, CA (USA). Fast Breeder Reactor Dept.). Aug 1977. Contract EY-76-C-03-0893-009. 26p. AT.

The Instrumentation Development Program was initiated in January 1972 with the objective of developing in-core and in-vessel instrumentation for application to LMFRs. The objective of the subtask reported is to develop methods of monitoring reactor conditions and signal transmission to reduce in number and to simplify or eliminate vessel head penetrations for in-vessel instrumentation. Feasibility studies continued on methods of monitoring temperatures and transmitting acoustic energy via waveguides. Fluidic switching and sampling system work was completed. Feasibility of acoustic methods in application to subcriticality monitoring for the Clinch River Breeder Reactor was investigated and one technique found suitable for further development.

- 1243 (GEFR--00239) NATIONAL CORE RESTRAINT DEVELOPMENT PROGRAM CODE VERIFICATION/COMPARISON STUDY, PROBLEM LEVEL I-B. Fox, J.N. (General Electric Co., Sunnyvale, CA (USA). Fast Breeder Reactor Dept.). Aug 1977. Contract EY-76-C-03-0893. 23p. AT.

The CORTAC computer code calculates the steady-state and short-term transient response of the core restraint system. This requires the simultaneous analysis of the coupled effects of reactor core thermal-hydraulics, reactor kinetics, and component structural deflections. The structural portion of CORTAC is being verified along with the other core restraint codes PARABOW, NUBOW-2D and NUBOW-3D, under Problem Levels I-A, I-C, IV-A, and IV-B. However, CORTAC is the only core restraint code that treats reactor kinetics and thermal-hydraulics. Thus, the verification problems associated with reactor kinetics (Problem Level I-D) and thermal-hydraulics (Problem Levels I-B and II-B) are unique in that they only apply to CORTAC. The Level I-D Problems, already completed, were directed primarily to the reactor kinetics-related and transient portions of CORTAC. The CORTAC core-wide steady-state radial heat transfer model is verified under Problem Levels I-B and II-B in which the duct wall temperatures are compared directly to the WARD TRITON code results which rigorously treat 3-D steady-state heat transfer. The Level I-B Problem, the subject of the document, is the verification of CORTAC for a seven-assembly cluster.

- 1244 (GEFR--00255) LMFR REFUELING FORCE LIMITS CRITERIA, TESTING AND EVALUATION. Fox, J.N. (General Electric Co., Sunnyvale, CA (USA). Fast Breeder Reactor Dept.). Sep 1977. Contract EY-76-C-03-0893-031. 54p. AT.

This report develops criteria for refueling force limits by means of analysis and testing. These criteria are applied to a CRBRP refueling model to assess the practicality of the criteria and to provide an example application of their usage. It was determined that refueling force limits should be based on not exceeding core component damaging lateral loads with the axial structural limits and the refueling equipment designed to meet or exceed the corresponding refueling force limits. A damaging lateral load is defined as a lateral load that would result in load pad galling, duct wall galling, transfer of metal to the nosepiece liner or permanent distortion of the receptacle liner. The corresponding lateral load limits have been established for prototypical materials and geometries.

- 1245 (GEFR--00256) PECS-III: PROBABILISTIC EVALUATION OF CLADDING LIFETIME IN LMFBR FUEL PINS. Lovejoy, W.S.; Patel, M.R.; Hoover, D.G.; Krommenhock, F.J. (General Electric Co., Sunnyvale, CA (USA). Fast Breeder Reactor Dept.). Oct 1977. Contract EY-76-C-03-0893-011. 220p. AT.

Theoretical basis, user instructions, a sample whole-core analysis and program listing for the probabilistic FBR fuel pin structural analysis code PECS-III (Probabilistic Evaluation of Cladding Lifetime) are described. Monte Carlo simulation is used to generate probability distributions for time to failure, cumulative damage fraction and other significant parameters in fuel pin cladding subjected to the fission gas pressure and fuel-cladding mechanical interaction loads under normal operating conditions. Importance sampling is used to reduce the number of Monte Carlo samples required for adequate estimate of the low probability of failures. A multiple regression analysis capability in the code permits correlation between selected input parameters and PECS-generated response parameters. The code is operational on the Honeywell-6000 and CDC-7600 computers.

- 1246 (GEFR--00257) INHALATION DOSE CONVERSION FACTORS FOR VARIOUS RADIONUCLIDES ASSOCIATED WITH LIQUID METAL FAST BREEDER REACTORS. PART 2. Teresi, J.D. (General Electric Co., Sunnyvale, CA (USA). Fast Breeder Reactor Dept.). Sep 1977. Contract EY-76-C-03-0893-015. 27p. AT.

This report presents the values of the inhalation dose conversion factors (F-factors) in Rem per curie inhaled for 30 important LMFBR radionuclides. In addition, an example of a parametric analysis is presented in the calculation of ^{90}Mo F-factors for seven particle sizes and three clearance classes for each particle size.

- 1247 (GEFR--00258) REFERENCE FUEL STUDIES SEMI-ANNUAL REPORT, FEBRUARY--JULY 1977. (General Electric Co., Sunnyvale, CA (USA). Fast Breeder Reactor Dept.). Oct 1977. Contract EY-76-C-03-0893-003. 128p. AT.

Research progress is reported for the following LMFBR-related subtasks: (1) fuel pin chemistry and thermodynamics, and (2) fuel pin testing and analysis.

- 1248 (GEFR--00260) PROTOTYPE LARGE BREEDER REACTOR. PHASE II. EXTENSION STUDIES. PART 2. REACTOR ASSEMBLY. Davies, S.M. (General Electric Co., Sunnyvale, CA (USA). Fast Breeder Reactor Dept.). Sep 1977. Contract EY-76-C-03-1143. 206p. AT.

Information is presented concerning the seismic analysis of the PLBR loop design; limiting temperature conditions for the reactor vessel roof structures; reactor vessel support and roof thermal/structural analysis; and reactor vessel closure (rotating plugs).

- 1249 (GEFR--00260) PROTOTYPE LARGE BREEDER REACTOR. PHASE II. EXTENSION STUDIES. PART II. REACTOR ASSEMBLY. (General Electric Co., Sunnyvale, CA (USA). Fast Breeder Reactor Dept.). Sep 1977. Contract EY-76-C-03-1143. 203p. TIC.

Portions of document are illegible. The seismic analysis of the PLBR loop reactor design was accomplished with two distinct finite element models in order to obtain a complete picture of the stresses in the reactor assembly. Although only one model

is discussed in detail, this summary discusses the results of both the models. The axisymmetric model and the stick model were subjected to the same input seismic excitation. Two conservative approximations of the complete PLBR response spectrum were used. They were the spectra for horizontal excitation specified by: (1) the USAEC Regulatory Guide 1.60 and (2) the Bechtel Corporation based on a preliminary analysis of the PLBR structure. Two-thirds of each of the horizontal spectra were applied to the models in the vertical direction in order to investigate the reactor response to vertical motion.

- 1250 (GEFR--00260(Pt.1)(Summ.)) PROTOTYPE LARGE BREEDER REACTOR. PHASE II EXTENSION STUDIES. PART I. SUMMARY. (General Electric Co., Sunnyvale, CA (USA). Fast Breeder Reactor Dept.). Sep 1977. Contract EY-76-C-03-1143. 24p. AT.

The Prototype Large Breeder Reactor design project has been performed in two distinct work phases. During the Phase I the plant characteristics and design criteria were established during a period of tradeoff studies. The major features established during Phase I were: power, temperature, steam cycle, number of loops, component and system features, refueling schemes, and research and development needs. During Phase II an overall conceptual design for PLBR was established and the initial plant design essentially completed in the following areas: core, components, systems, structures, research and development needs, and project schedule. The reactor assembly and heat transport systems are described.

- 1251 (GEFR--00260(Pt.3)) PROTOTYPE LARGE BREEDER REACTOR. PHASE II. EXTENSION STUDIES. PART III. HEAT TRANSPORT SYSTEMS. (General Electric Co., Sunnyvale, CA (USA). Fast Breeder Reactor Dept.). Sep 1977. Contract EY-76-C-03-1143. 360p. AT.

The transient analysis during PLBR Phase II Extension was broken into four specific areas. These are (1) to determine the sensitivity of the reactor scram transient for both the saturated and superheat cycle designs to a range of possible decay heat and initial power levels, (2) to investigate the potential for improving the reactor scram transient for the superheat cycle design (3) to evaluate selected transients during single-loop component failures without a reactor scram for the saturated cycle design and (4) to evaluate the drum vent failure transient followed by a reactor scram for the saturated cycle design.

- 1252 (GEFR--00260(Summ.)) PROTOTYPE LARGE BREEDER REACTOR. PHASE II EXTENSION STUDIES. PART 1. SUMMARY. (General Electric Co., Sunnyvale, CA (USA). Fast Breeder Reactor Dept.). Sep 1977. Contract EY-76-C-03-1143. 24p. AT.

Information is presented concerning the reactor vessel seismic analysis, roof structure, support, and closure; and heat transport systems including steam generator, sodium pump design, and plant transient analysis.

- 1253 (GEFR--00274(L)) PLUGGING/UNPLUGGING OF DEFECTS IN LMFBR STEAM GENERATOR TUBING. Fellow, H.C. (General Electric Co., Sunnyvale, CA (USA). Fast Breeder Reactor Dept.). Sep 1977. Contract EY-76-C-03-0893-010. 30p. AT.

An investigation was made to (1) determine the plugging tendency of small leaks/defects in

steam generator tubing material when exposed to simulated manufacturing and testing techniques, and (2) determine the ability of a candidate plant cleaning solution to dissolve the plug and open the leak. Nine series of four leaks each (leak sizes ranging in equivalent steam flow rate from 1.34×10^{-5} to 1.2×10^{-1} grams/sec) were exposed to: humid storage with VPI addition, die lubricant, heat treatment, hydrotest, dye penetrant examination, sodium exposure, centerless grinding lubricant and sodium-water reaction products. Severe reduction in leak flow in almost all cases resulted from exposure to the various processes, with complete plugging of about $\frac{1}{3}$ of the leaks. Cleaning of the defects with a 4% citric acid solution containing 0.1% Rodine 33, at a pH of 3.0 to 4.0 and a temperature of 160°F (71°C) resulted in the opening of all the leaks tested (including those completely plugged) to the same order of magnitude as the large leaks in the series. The use of such a cleaning solution following tube fabrication, before operation of a steam generator, and/or after a leak has been detected but subsequently plugged, appears to be feasible. Additional work in this area is recommended to provide the operational techniques required.

- 1254 (GEFR--00279(L)) PRELIMINARY SELF WASTAGE TEST RESULTS FROM CRACKPOT FACILITY. Gudahl, J.A.; Hunsicker, J.C.; Gerrels, E.E. (General Electric Co., Sunnyvale, CA (USA). Fast Breeder Reactor Dept.). Sep 1977. Contract EY-76-C-03-0893-010. 38p. AT.

This preliminary report presents results of the microdefect self-wastage tests conducted in the new CRACKPOT facilities as of September 1977. Twelve tests were completed; three additional tests are in progress. Complete self-wastage penetration of the tube wall (e.g., defect enlargement) occurred in three cases at 900°F (482°C), three at 650°F (343°C), and one at 580°F (304°C). In three tests at 580°F and one test at 650°F, the leak rate remained below the initial rate during the entire test. Complete penetration was not achieved in one test at 650°F prior to test termination. All three of the continuing microdefect tests, at 650°F, are in a plugged condition.

- 1255 (GEFR--00291) VENTED ASSEMBLY CORE DEVELOPMENT PROGRAM, FY-77. Dubberley, A.E. (General Electric Co., Sunnyvale, CA (USA). Fast Breeder Reactor Dept.). Sep 1977. Contract EY-76-C-03-0893-020. 186p. AT.

Information on LMFBR vented assembly cores is presented concerning thermal-hydraulic performance, vent flow uncertainties, load pad mechanical performance, and core economic performance.

- 1256 (GEFR--00293) SUMMARY OF THE CORTAC VERIFICATION ACTIVITY AND THE EVALUATION OF 3-D EFFECTS. Fox, J.N.; Wei, J.P. (General Electric Co., Sunnyvale, CA (USA). Fast Breeder Reactor Dept.). Sep 1977. 23p. AT.

The report documents the results of the FY-77 Core Restraint Transient Analysis Subtask C effort. The objectives of this subtask are to complete the verification of the CORTAC computer code and to perform an evaluation of 3-D effects relative to the current capability of the code. The CORTAC computer code calculates the short-term steady-state and transient response of the core restraint system. This requires the simultaneous analysis of the coupled effects of reactor core thermal-hydraulics, reactor kinetics, and component structural deflections. The structural portion of CORTAC is being verified along with the

other core restraint codes NUBOW-2D, PARABOW, and NUBOW-3D, under verification problem levels I-A, I-C, IV-A, and IV-B. However, CORTAC is the only core restraint code that treats reactor thermal-hydraulics and reactor kinetics. Thus, the level I-D problem is unique in that it only applies to CORTAC. The level I-D problem is directed primarily to the reactor kinetics related and the transient portions of CORTAC. The CORTAC core under steady-state radial heat transfer model is verified under problem levels I-B and II-B, in which the CORTAC results are compared directly to the WARD TRITON code which rigorously treats 3-D steady-state heat transfer. The results of this verification study demonstrated the need to develop 3-D models for the eventual inclusion into a 3-D version of CORTAC. The report summarizes the CORTAC verification activity, identifies essential 3-D effects, and provides a CORTAC-3D development plan.

- 1257 (GEFR--00295) DATA-BASED EVALUATION OF THERMAL PERFORMANCE MECHANISMS IN MIXED-OXIDE FUEL PINS. Vaidyanathan, S.; McCarthy, W.H.; Hilbert, R.F. (General Electric Co., Sunnyvale, CA (USA). Fast Breeder Reactor Dept.). Sep 1977. Contract EY-76-C-03-0893-031. 75p. AT.

Evaluations of data from GE F-20 experiment indicate that the thermal performance of mixed oxide fuel can be broadly classified into two regimes: early life thermal performance and high burnup thermal performance. During early life operation (less than 1% burnup) the power to incipient melt of fresh fuel is greatly increased by the processes of fuel restructuring and fuel cladding gap closure. The power to melt of fresh fuel immediately after startup is in the range of 16--17 kW/ft. Subsequent to restructuring and gap closure processes which happen within 1% burnup provided the power level is sufficiently high, the power to melt increases to 20--22 kW/ft. If, however, the operating power levels are low (less than approximately 10 kW/ft) this increase does not take place. At high burnup (>5%), the F-20 data indicate a loss of thermal performance. Pins that operated at high power levels and underwent early life restructuring values exhibit incipient power to melt values in the 15--16 kW/ft range at high burnup. The power to melt of pins that operated at low powers and which did not undergo early life restructuring is decreased to 12.5--14 kW/ft. This decrease in power to melt is thought to arise as a result of decreased fuel thermal conductivity at high burnup. Thermal performance maps have been generated for each of these regimes. Based on preliminary evaluations that suggest the fuel conductivity at high burnup to be a function of initial fuel density, it is recommended that pins be designed with the highest practical fuel density. With the aid of the high burnup thermal performance map, confirming evidence for the proposed models has been obtained from experimental irradiations that were not specifically designed to be power to melt experiments.

- 1258 (GEFR--00303) FATIGUE CRACK GROWTH PROPERTIES OF TYPE-316 PLATE AND 16-8-2 STAINLESS STEEL WELDS IN AIR AND HIGH CARBON LIQUID SODIUM. Copeland, J.F.; Yuen, J.L. (General Electric Co., Sunnyvale, CA (USA). Fast Breeder Reactor Dept.). Sep 1977. Contract EY-76-C-03-0893-031. 119p. TIC \$6.50.

The fatigue crack growth rates of Type 316 stainless steel and 16-8-2 GTA welds were measured in air and high-carbon liquid sodium

at 513°C (950°F) for secondary sodium loop LMFBR applications. Loading variables such as low frequency, load ratio, and hold-time at peak load were studied. Crevice experiments were performed, and a diffusion model for carburization in a crack was developed. The results show that carburization of crack faces occurs prior to any crack tip carburization for up to 5 to 15% of a 2.1×10^5 hr. service life, with practical crack sizes and load frequencies. Thus, a carburization effect on da/dN is not shown for the relatively short-term tests of this study. Low AK, ultra-low frequency tests to simulate service would be required to show this effect. These tests appear to be very time consuming. It is recommended that Nuclear Systems Materials Handbook (NSMH) crack growth curves for austenitic stainless steels in air, with appropriate frequency and load ratio corrections, should be conservative for design against crack extension in high-carbon sodium, for base metal and welds. Verification of this recommendation by possible ultra-low frequency testing and long-time exposure of surveillance crevice specimens under service conditions is also recommended.

- 1259 (GEFR--00305) IRRADIATION AND POST-IRRADIATION EXAMINATION DATA FROM SELECTED F9 AND F5 TEST PINS. Gatus, L.A.; Hilbert, R.F. (General Electric Co., Sunnyvale, CA (USA). Fast Breeder Reactor Dept.). Nov 1977. Contract EY-76-C-03-0893-031. 121p. AT.

This document presents the design, operating parameters, and post-irradiation examination results from four mixed oxide fuel pins from the GE F9 and F5 test series that were irradiated in EBR-II. Examination of pins from the F9 series, which cover burnups up to 19 atom %, continuing at LASL. This report covers the F9 and F5 pins for which post-irradiation data became available for reporting during FY 1977.

- 1260 (GEFR--00320(Vol.1)) CLINCH RIVER RELOAD CORE DESIGN STUDY. VOLUME I. TRADE-OFF STUDY AND DESIGN RECOMMENDATIONS. Deane, N.A. (comp.). (General Electric Co., Sunnyvale, CA (USA). Fast Breeder Reactor Dept.). Feb 1978. Contract EY-76-C-03-0893-031. 252p. AT.

This is the final report of the General Electric portion of a year-long study to conceptually design advanced reload replacement cores for the CRBR. General Electric was to examine the potential of advanced oxide fuel replacement cores using advanced design concepts and advanced materials. Two objectives were established at the outset for the study. They were: to study the potential for improvements in compound system doubling time (CSDT) for future core reloads; and to study the potential for increases in thermal power output for future core reloads. General Electric analyzed in detail a minimum CSDT core and a high power (20 to 30 percent greater than the current design) core in order to understand the total performance potential for CRBR. A 40-year CSDT core which represents a 15-year improvement over the reference core was also analyzed during the trade-off studies.

- 1261 (GEFR--00320(vol.2)) CLINCH RIVER RELOAD CORE DESIGN STUDY. VOLUME II: RECOMMENDED CORE DESIGN EVALUATION. Deane, N.A. (General Electric Co., Sunnyvale, CA (USA). Fast Breeder Reactor Dept.). Feb 1978. Contract EY-76-C-03-0893-031. 334p. \$12.00.
Information on the Clinch River Breeder Reactor reload core design is presented

concerning neutronic performance evaluations, recommended core thermal-hydraulic performance, mechanical performance, CRBR constraints, and economic impact of the recommended core designs.

- 1262 (GEFR--00321) TERMINAL EXAMINATION OF THE F9E AND F9F EBR-II GRID-SPACED FUEL ASSEMBLIES. (General Electric Co., Sunnyvale, CA (USA). Fast Breeder Reactor Dept.). Feb 1978. Contract EY-76-C-03-0893-031. 71p. AT.

The F9E assembly of 37 pins was loaded into EBR-II in July 1972 and completed its burnup after 17,000 hours of reactor operation in February 1975. The F9E experiment achieved a burnup of 11.8 atom % peak in the lead pin. The F9E experiment was designed to simulate high fluence mechanical interaction between fuel pin and grid spacer. The F9E accomplished its objective by using annealed Type-316 stainless steel rather than cold-worked stainless steel for fabrication of the duct, fuel pin cladding, and grid spacers. This allowed the experiment to obtain high relative pin-to-grid swelling on a shortened low fluence time scale. The F9E fuel pins were supported by two types of grid spacers: (a) the main support of six "full" grids at 6-inch intervals and (b) three "staggered" grids at 3-inch intervals. Three months after insertion of the F9E experiment, in October 1972, the 37-pin F9F experiment was placed in EBR-II. The F9F experiment achieved a burnup of 12 atom % in the lead pin after approximately 20,000 hours of EBR-II operation. The F9F experiment was designed to simulate high fluence mechanical interaction between the fuel pin bundle and the duct. To achieve the desired bundle-to-duct interaction, an increased spacing was used between the edge fuel pins and the duct wall. The increased edge distance resulted in an overcooled duct relative to the fuel pins and grids. In this way, high beam-to-duct and pin-to-duct relative growths were obtained. The structural material used for the fuel pins, grid spacers, and the duct was 20% cold-worked Type-316 stainless steel. The staggered grid concept was used almost exclusively in the F9F experiment but for two full grids and a single tabless grid placed near the top of the fuel pins. The success of these experiments provide a high level of confidence that the planned grid-spaced experiments in FFTF will be successful, and that burnups in excess of 100,000 MWD/Te are achievable.

- 1263 (GEFR--00322) FRICTION, WEAR, AND FRETTING: CLINCH RIVER BREEDER REACTOR STEAM GENERATORS. Hartle, R.T.; Ring, P.J. (General Electric Co., Sunnyvale, CA (USA). Fast Breeder Reactor Dept.). Apr 1978. Contract EY-76-C-03-0893-030. 66p. AT.

Steam generator tubing is subject to fretting, wear and galling due to movement of the tubing relative to the spacer plates. Testing was performed to determine the degree of wear likely for 2 1/4%Cr-1Mo under Clinch River Breeder Reactor Steam Generator conditions.

- 1264 (GEFR--00324) SOURCE TERM MODEL NEEDS AND DEVELOPMENTS. McDonald, J.W.; Huang, T.C.; Kriebel, A.R.; Stitt, R.K.; Teresi, J.D. (General Electric Co., Sunnyvale, CA (USA). Fast Breeder Reactor Dept.). Feb 1978. Contract EY-76-C-03-0893-032. 47p. AT.

This report summarizes source-term model developments from the beginning of this base program, Radiological Assessment, through September 1977. The summary is intended to show

the scope, status, and needs of radiological source-term technology. The approach to model development has been to divide HCDA accident scenarios into phases and to work on those phases which offer the most potential benefit. The work covers energetic and melt-through HCDA scenarios, and is directed to demonstrating for extremely low probability accidents that public safety is assured.

- 1265 (GEFR--00340) ACOUSTIC LEAK DETECTION SYSTEM CONCEPT DESIGN. Greene, D.A. (General Electric Co., Sunnyvale, CA (USA). Fast Breeder Reactor Dept.). Jan 1978. Contract EY-76-C-03-0893-030. 101p. AT.

Design criteria are developed for acoustic monitoring of small sodium-water reactions in an LMFBR steam generator. From these criteria a concept design of an acoustic leak detection system has been prepared. The system description includes discussions of predicted system costs, expected system performance, mode of operation, and reactor manufacturers target cost criteria for leak protection systems. It is concluded that an acoustic system is feasible for LMFBR steam generators.

- 1266 (GEFR--00347) UPDATED ANALYSIS OF THE ZPPR-7 CRITICAL EXPERIMENTS: PHASES A, B, AND C. Hartman, A.K.; Kujawski, E. (General Electric Co., Sunnyvale, CA (USA). Fast Breeder Reactor Dept.). Feb 1978. Contract EY-76-C-03-0789-031. 87p. AT.

The ZPPR-7 experimental program involved a study of several tightly coupled heterogeneous cores at various points in life. One of the objectives of the program was to evaluate the accuracy of analytical methods for predicting the nuclear behavior of heterogeneous cores. In the present work a number of measurements taken in Phases A, B, and C were reanalyzed using ENDF/B-IV data, and the emphasis was on investigating the sensitivity of the predictions to the nuclear data, data processing and neutronics methods. Calculations for criticality, neutron reaction rate distributions, control rod worth, and sodium void worth are reported. Changes in data and data processing were found to be important and to impact differently on homogeneous and heterogeneous cores. Transport corrections are important for criticality and control rod worth predictions in heterogeneous cores. Mesh effects are especially significant for control rod worth calculated with diffusion theory. Criticality is generally underpredicted by 1.0 to 1.5%. Transport corrections for Phase B are 0.43% $\Delta k/k$. The average (C/E) for the control rod worth in Phases B and C using four meshes per drawer and transport theory is 0.96, while using one mesh per drawer and diffusion theory the average (C/E) for the control worth is 0.91. The present analysis indicates the need for accurate cross sections and refined neutronics methods when analyzing heterogeneous cores. The general conclusion is that the nuclear performance of heterogeneous cores can be predicted with an accuracy consistent with homogeneous cores when due care is given to the analysis. The calculated parameters for Phase C, however, are in better agreement with the measurements than those for Phase B, which is indicative of the greater difficulties in accurately predicting heterogeneous cores. Remaining discrepancies appear to be consistent with the uncertainty in the nuclear data.

- 1267 (GEFR--00348) HEAT TREATMENT FOR 2-1/4Cr-1Mo FOR APPLICATION TO SODIUM HEATED STEAM GENERATORS. Spalaris, C.N.; Roy, P.; Ring, P.J.; Pizzo, P.P.; Hampton, L.V. (General

Electric Co., Sunnyvale, CA (USA). Fast Breeder Reactor Dept.). Feb 1978. Contract EY-76-C-03-0893-031. 17p. AT.

The reason is summarized for selecting the isothermal and full anneal heat treatments for 2-1/4Cr-1Mo. Supportive data which have been accumulating as a result of DOE-sponsored base development programs, foreign experiments, as well as recent wrought product fabrication by commercial vendors, indicate that decisions made in mid-1974 regarding heat treatment selection were justified.

- 1268 (GEFR--00349) HYDRAULIC TESTING PROGRAM ON VENTED ASSEMBLY CORE DESIGN. Wang, J.C.F. (General Electric Co., Sunnyvale, CA (USA). Fast Breeder Reactor Dept.). Mar 1978. Contract EY-76-C-03-0893-031. 73p. AT.

Early LMFBR vented core hydraulic studies demonstrated that vent and interstitial flows are primarily governed by the vent and load pad plane flow resistances. The methods used to evaluate the magnitude of these resistances were very simplified and thus lead to large uncertainties in the vent and interstitial flow patterns. To reduce the largest of these uncertainties, an analytical and test program was initiated in FY-77 to provide better flow resistance correlations with empirical verifications for (1) flow through vents, (2) flow past load pads, and (3) radial flow between assemblies. This program was completed by the end of FY-77 and the report completes the documentation.

- 1269 (GEFR--00351) LOCALIZED DUCT WALL CYCLIC THERMAL STRESSES IN VENTED ASSEMBLY LMFBR CORES. Dubberley, A.E. (General Electric Co., Sunnyvale, CA (USA). Fast Breeder Reactor Dept.). Dec 1977. Contract EY-76-C-03-0893-031. 85p. AT.

A vented assembly differs from a standard assembly only by having one or more vents machined into the duct wall at positions above the active core. The vents below the Above Core Load Pads (ACLP's) allow coolant to leave the assembly and pressurize the interstitial spaces between the assemblies before flowing up past the load pads and exiting to the upper plenum. Additional vents above the ACLP's further reduce the assembly pressure drop. Two primary benefits are anticipated from a core composed of vented assemblies. First, a pressurized interstitial space reduces the pressure across the assembly duct wall, reducing duct stress and deflection and allowing either longer dilation life or a thinner duct wall. The second benefit is a reduced pressure drop between the reactor inlet and outlet plenum for the same core coolant mass flow rate. The flow exiting from the assemblies at the vents and following a "parallel" hydraulic path through the interstitial region to the outlet plenum reduces the mass flow rate and thus the pressure drop in the upper portion of the assemblies. The greater the bypass flow leaving the vents, the greater the reduction in assembly pressure drop will be.

- 1270 (GEFR--00352) MICROLEAK WASTAGE TEST RESULTS. Gudahl, J.A.; Magee, P.M. (General Electric Co., Sunnyvale, CA (USA). Fast Breeder Reactor Dept.). Mar 1978. Contract EY-76-C-03-0893-030. 83p. AT.

The report presents results of, and conclusions drawn from, the microdefect self-wastage tests conducted on 2-1/4Cr-1Mo tubing samples in the new sodium filled Crackpot facilities. A total of fifteen sodium-water reaction tests were run at three temperature levels: 580°F (304°C), 650°F (343°C) and 900°F

(428°C). In seven tests, complete self-wastage penetration of the tube wall occurred under constant temperature conditions. In three tests at 580°F and one at 650°F, the leak rate remained below the initial leak rate during the entire test. Four tests at 650°F plugged completely and remained plugged for the duration of the tests, in three cases for more than two months. These three plugged specimens were then thermally cycled; only one reopened. All steam leaks (650°F and 900°F) initially less than 10^{-5} lb/sec (4.5×10^{-3} gm/sec) completely plugged for at least some period of testing. Conversely, only one leak initially greater than 10^{-5} lb/sec decreased as much as one decade in leak rate. Water leaks (580°F) showed less tendency to plug and, if plugging occurred, greater tendency to reopen than the steam leaks, although the latter were at higher temperatures. It was determined that the enlargement growth rate is slow enough at 580 to 650°F that the CRBRP evaporator tubesheet regions are fully protected against microdefects initially so small as to be undetectable by the chemical leak detection system. However, because self-wastage damage rates are considerably faster at higher temperatures, there is a significantly probability that growth of an initially undetectable microleak in a CRBRP superheater will result in impingement wastage damage and possible failure of adjacent tubes before leak detection and unit shutdown.

1271 (GEFR--00353) CHARACTERIZATION OF CRBRP STEAM GENERATOR SHELL PLATE. Offer, H.P.; Ring, P.J. (General Electric Co., Sunnyvale, CA (USA). Fast Breeder Reactor Dept.). Mar 1978. Contract EY-76-C-03-0893 030. 58p. AT.

A section of CRBR steam generator shell plate was evaluated in the fully annealed and annealed plus post weld heat treatment (PWHT) conditions. The microstructural features were determined to provide a more complete understanding of the influence of the structure on the mechanical properties which were subsequently characterized. The results of these mechanical property tests have been compared to the mechanical property guidelines used for design purposes, which in most cases were based on data from material with nonprototypic anneals and without PWHT. The results of this evaluation are presented.

1272 (GEFR--00354) COMPARISON OF SEMI-STATISTICAL HOT CHANNEL FACTOR AND MONTE CARLO ANALYSES OF FUEL ASSEMBLY COOLANT TEMPERATURE UNCERTAINTIES. Chen, K.H. (General Electric Co., Sunnyvale, CA (USA). Fast Breeder Reactor Dept.). Jun 1978. Contract EY-76-C-03-0893 034. 52p. AT.

A comparison between the semi-statistical hot channel factor and Monte Carlo analyses of the effects of uncertainties on the prediction of coolant temperature in a typical LMFBR fuel assembly was carried out under equivalent start of life design conditions. The design data base for major random and direct uncertainty parameters relevant to a thermal hydraulic analysis of an LMFBR fuel assembly was established from available reports and documents. The random, systematic and combined uncertainty effects were analytically and numerically investigated.

1273 (GEFR--00355(Rev.1)) BACKGROUND NOISE MEASUREMENTS ON PROTOTYPE OF SNR-300 STEAM GENERATOR IN THE 50 MW TEST FACILITY AT HENGEL, THE NETHERLANDS. Greene, D.A.; Ahlgren, F.F. (General Electric Co.,

Sunnyvale, CA (USA). Fast Breeder Reactor Dept.). Nov 1978. Contract EY-76-C-03-0893-030. 179p. AT.

Acoustic noise amplitudes were measured in a 50 MW helical coil prototype of a steam generator mounted in the Hengelo test facility in a joint technical program between GE/DOE and TNO/NERATOOM. Background acoustic noise measurements were completed with test conditions ranging from quiescent (with no sodium or water flow) to high thermal power transfer from the sodium circuit to the water circuit. The acoustic noise pressure on the vessel wall was measured using externally mounted accelerometers. Data were obtained for the effect of sodium flow rate on the acoustic noise amplitude. A preliminary correlation is derived for the acoustic noise generated by nucleate boiling of the water. Results indicate that acoustic leak detection/location is feasible for LMFBR steam generators.

1274 (GEFR--00357) CORE RESTRAINT SEISMIC TEST PLAN. Yang, T.M. (General Electric Co., Sunnyvale, CA (USA). Fast Breeder Reactor Dept.). Mar 1978. Contract EY-76-C-03-0893-031. 18p. AT.

This test plan responds to Task 5 (Seismic Testing Plan) of the GE-FBRD plan for the evaluation of core restraint seismic response. The test plan has been developed with the assumption that the testing can be performed utilizing the FFTF Hydraulic Core Mockup (HCM) located at HEDL. The level of detail contained in this document is sufficient for HEDL to make cost and schedule estimates for the testing. This document also serves as a vehicle to obtain comments on the proposed seismic tests from the core restraint/seismic communities.

1275 (GEFR--00361) DEVELOPMENT OF SODIUM-WATER REACTION PRESSURE RELEASE RUPTURE DISCS FOR THE CLINCH RIVER BREEDER REACTOR PLANT. Reynolds, R.G. (General Electric Co., Sunnyvale, CA (USA). Advanced Reactor Systems Dept.). Jul 1978. Contract EY-76-C-03-0893-030. 91p. AT.

The report documents the requirements for the development of the CRBRP main duplex rupture disc assemblies, to describe how design and testing of the assemblies met the requirements and to list those future activities necessary to completely fulfill the requirements. Included in the report is a description of the rupture disc manufacturing process. Results from single rupture disc tests run to data are interpreted to estimate the performance of the duplex discs to be used in CRBRP.

1276 (GEFR--00366) INTERIM EVALUATION OF DATA FROM SODIUM-WATER REACTION TESTS SWR-3, SWR-4, AND SWR-5 AND COMPARISON WITH TRANSWRAP ANALYSES. SERIES I: LARGE-LEAK TEST PROGRAM. Regimbal, J.J.; Bradfute, J.D.; Rauch, T.; Sane, J.D. (General Electric Co., Sunnyvale, CA (USA). Advanced Reactor Systems Dept.). Jun 1978. Contract EY-76-C-03-0893-030. 159p. AT.

This evaluation treats the experimental results and analyses of performance of three additional sodium water reaction tests performed in the Large Leak Test Rig (LLTR) by ETEC (formerly LMEC). A series of six tests were conducted in the LLTR over the past few years. This report combines the evaluation of SWR-3, SWR-4, and SWR-5 in the continuing effort to provide a basis for validating the TRANSWRAP computer code. All three of the tests were DEG ruptures of a tube in the hockey stick region of the MSG with the same break location,

1.75 inches from the sodium face of the upper tube sheet. In SWR-3 the rupture tube was filled with a two phase mixture of steam and water; in SWR-4 the water side fluid was superheated steam and in SWR-5 nitrogen was used as the working fluid. The water side pressure was nominally 1900 psia for all three tests. These three tests, taken collectively, were intended to provide an experimental basis for an interpretation of the role of the pressurizing fluid vis-a-vis the products of the sodium/water reaction in producing the initial bubble pressure transient, since appreciably different flow rates of the liquid and vapor were delivered in SWR-3 and SWR-4 and non-reactive nitrogen was the pressurizing gas for SWR-5.

- 1277 (GEFR--00367) MICROSTRUCTURAL RESULTS FROM F20 POWER-TO-MELT EXPERIMENT. McCarthy, W.H.; Jedlovac, D.R. (General Electric Co., Sunnyvale, CA (USA). Fast Breeder Reactor Dept.). May 1978. Contract EY-76-C-02-0893-031. 172p. AT.

Data are provided on operating conditions, plenum gas, retained gas, and 113 microstructural specimens obtained from the GE-F20 power-to-melt experiment. The report extends the range of fuel and irradiation parameters that were contained in earlier reports on F20 Experiment results.

- 1278 (GEFR--00370) EXPERIMENTAL EVALUATION OF THE OXIDATION BEHAVIOR OF Nb, V, AND Ti AS CANDIDATE FCCI INHIBITORS. Caputi, R.W.; Adamson, M.G. (General Electric Co., Sunnyvale, CA (USA). Fast Breeder Reactor Dept.). May 1978. Contract EY-76-C-03-0893-031. 19p. AT.

Out-of-pile measurements of the rates of surface oxidation of the candidate cladding attack inhibitors Nb, V and Ti under typical operating fuel pin conditions, viz., low oxygen potential (Δ anti G/sub O₂/sup 750°C/ = -80 to -100 kcal/mol), temperatures in the range 600 to 900°C, presence and absence of low levels of cesium are described. The measurements were performed on clean metal foils in an automatic recording electrobalance system using flowing He-H₂-H₂O mixtures as the oxidizing atmosphere. To provide a basis for comparison, oxidation rate measurements were also performed on an annealed Type-316 stainless steel specimen. At 750°C the measured oxidation rates fall in the order V > Nb > Ti > 316 SS, but at 600°C the order is Nb > V > Ti. The linearized rates for Nb, V and Ti also compare favorably with values estimated from rates measured at higher oxygen pressures. The effect of Cs(v) vapor on the oxidation rates was studied. With p/sub Cs/ approximately 10⁻³ atms the catalytic effects proved to be relatively modest (30% increase for Ti, 70% increase for Nb, and 100% increase for V); however, as expected, Type 316 SS showed a dramatic increase in oxidation rate (13-fold increase). An attempt is made to explain the catalytic influence of cesium in terms of its reactivity with the various oxides of Nb, V, Ti and Cr.

- 1279 (GEFR--00373) INTERMEDIATE SYSTEM MOCKUP LOOP (ISML) OPERATION. Hampton, L.V.; Kanoh, S. (General Electric Co., Sunnyvale, CA (USA). Fast Breeder Reactor Dept.). Jun 1978. Contract EY-76-C-03-0893-031. 53p. AT.

The Intermediate heat Transport System (IHTS) of the Clinch River Breeder Reactor (CRBR) will experience carbon transport from the low alloy ferritic to the stainless steels. Loss of carbon will weaken the low alloy steel

and the resulting carburization may embrittle the stainless steel. The ISML test facility was constructed to model the carbon transport that will occur during the 30-year CRBR lifetime. The ISML simulates the materials, temperatures and surface area ratios of the CRBR. The objective of the tests performed is to provide the data base needed to design and predict the performance of components and piping associated with the CRBR Intermediate Heat Transport System. This report describes the ISML history to over 11,000 hours operating time.

- 1280 (GEFR--00375) CORROSION FATIGUE OF 2-1/4 CR--1 MO STEEL IN CAUSTIC AT 316°C. McIlree, A.R.; Pizzo, P.P.; Indig, M.E. (General Electric Co., Sunnyvale, CA (USA). Fast Breeder Reactor Dept.). Jun 1978. Contract EY-76-C-03-0893-031. 33p. AT.

The equipment developed to perform full reversed push-pull fatigue tests in a high temperature (316°C) aqueous environment (5% NaOH), and the effects of this environment on the fatigue life and failure mode of 2 1/4 Cr-1 Mo steel are described. The safety factor of the design allowable fatigue curve for 2 1/4 Cr-1 Mo steel adequately accounts for the possible degradation of properties in 5% NaOH at 316°C over the strain range investigated. The fracture morphology of 2 1/4 Cr-1 Mo steel at 316°C (500°F) is branching and transgranular in both air and 5% NaOH. Further high cycle (>10⁶) fatigue tests in 5% NaOH will be necessary to quantitatively establish the caustic influence. Equipment changes have been identified which will improve the strain measuring capability of the corrosion fatigue facility.

- 1281 (GEFR--00378) FINAL SUMMARY REPORT ON CHARACTERIZATION OF CRBRP STEAM GENERATOR TUBING. Offer, H.P.; Busboom, H.J.; Ring, P.J. (General Electric Co., Sunnyvale, CA (USA). Fast Breeder Reactor Dept.). Jun 1978. Contract EY-76-C-03-0893-030. 36p. AT.

A previous report (GEFR-00243-L) characterized the chemical composition, microstructural features, physical dimensions, and short term mechanical properties of a representative sampling of the initial lots of CRBRP steam generator tubing. This report summarizes these previous results, and gives the results of full wall thickness hydrostatic burst tests at room temperature. Also presented here are the results of reduced wall thickness stress-rupture tests at 510C (950F) in argon. The results of these additional tests are similar from lot to lot indicating (in agreement with previous testing) little variation in chemical composition and final heat treatment.

- 1282 (GEFR--00379) FINAL REPORT ON VACUUM ARC REMELTED TUBESHEET FORGING PROPERTIES FOR CRBRP STEAM GENERATORS. Offer, H.P.; Ring, P.J. (General Electric Co., Sunnyvale, CA (USA). Fast Breeder Reactor Dept.). Jul 1978. Contract EY-76-C-03-0893-030. 67p. AT.

The evaluation is presented of vacuum arc remelted (VAR) tubesheet material for CRBRP steam generators. The properties reported initially in General Electric Report GEFR-00245(L) are summarized. The additional work reported includes J-integral fracture toughness testing, tensile testing of tubesheet material reannealed by the tubesheet vendor, and creep-rupture testing results not previously available. Also reported are a limited number of tubesheet properties determined by the tubesheet vendor on material both before and after vendor reannealing.

- 1283 (GEFR--00384) TESTS AND ANALYSIS IN SUPPORT OF AN ACOUSTIC LEAK DETECTION/LOCATION SYSTEM (PROGRESS REPORT). Greene, D.A.; Gudahl, J.; Chronert, S.; Clark, E.J.; Ahlgren, F.F.; Scott, P.; Czechoski, J. (General Electric Co., Sunnyvale, CA (USA). Advanced Reactor Systems Dept.). Sep 1978. Contract EY-76-C-03-0893-030. 179p. AT.

General Electric, under Department of Energy sponsorship, has been developing a leak detection system based on detecting the acoustic noise produced by a small sodium/water reaction. The reaction noise is marked by background noise and is detected using an array of transducers. This interim progress report documents analytical and experimental investigations made in support of the detector development. A comprehensive investigation of array processing suggests that the current linear array approach is optimum for steam generator leak detection. Signal attenuation and delay between the source and transducer have been measured experimentally, and a computer code is available to predict the signal attenuation. Accelerometer choice and attachment techniques are outlined, with experimental validation. Basic electronic noise levels which can be achieved with commercial equipment have been measured.

- 1284 (GEFR--00386) VENTED ASSEMBLY CORE DEVELOPMENT PROGRAM, FY-78. Dubberley, A.E. (General Electric Co., Sunnyvale, CA (USA). Advanced Reactor Systems Dept.). Sep 1978. Contract EY-76-C-03-0893-031. 273p. AT.

The purpose of the Advanced LMFBR Core Design Program is to identify and evaluate core design trade-off issues for commercial-sized LMFBRs and to determine specific mechanical design options which lead to improved economic and nuclear performance. Scoping studies are used to define high priority advanced core design options. Detailed assessments of the high priority options covering economic, neutronic, thermal/hydraulic and mechanical performance then quantify attractive cost/benefit opportunities and identify significant potential problems. The objective of the FY-77, 78 and 79 vented core activities is the detailed assessment of vented core characteristics.

- 1285 (GEFR--00390) FUEL PIN FISSION GAS PLENUM LOCATION STUDY. Dubberley, A.E. (General Electric Co., Sunnyvale, CA (USA). Advanced Reactor Systems Dept.). Sep 1978. Contract EY-76-C-03-0893-031. 201p. AT.

The purpose of this study is to evaluate the interrelated effects of plenum design changes and the tradeoffs that are possible at the reactor system level: the reactor system economics, the core mechanics, and the reactor system safety. Reactor system economics are addressed by comparative evaluations of COROPT optimized 900 MWe loop LMFBR designs with upper plenum, lower plenum, and split plenum (both upper and lower, simultaneously). To evaluate the effects of advanced core design features on the plenum tradeoff issues, advanced (partial wireless) wire-wrapped bundles, staggered grid spaced bundles, vented assemblies and advanced material (D57) assemblies are also considered along with the reference, straight-start, wire-wrapped bundle in unvented assemblies. Brief descriptions of these advanced features are included.

- 1286 (GEFR--00392) PRECONCEPTUAL DESIGN STUDY OF PROLIFERATION-RESISTANT HOMOGENEOUS OXIDE LMFBR CORES. Taiwar, B. (General

Electric Co., Sunnyvale, CA (USA). Advanced Reactor Systems Dept.). Nov 1978. Contract EY-76-C-03-0893-031. 265p. AT.

The preconceptual design and performance of four 1000 MW(e) homogeneous oxide LMFBR cores are described. GE-ARSD developed the core designs as part of the Proliferation Resistance LMFBR Core Design Study (PRLCDS). The first design is the reference, using (PuU)O₂ fuel in the core and UO₂ in the axial and radial blankets. The second design is identical to the first, except that ThO₂ replaces UO₂ in the blankets. The third design is optimized for the use of (PuTh)O₂ in the core and ThO₂ in the blankets. Both of the second and third reactors produce the fissile isotope ²³³U and are referred to as transmuters. Either transmuter can form a symbiotic reactor system with the fourth reactor, which uses proliferation-resistant denatured (²³³U=²³⁸U)O₂ fuel with a fissile enrichment below 12%. The blankets of the denatured reactor contain ThO₂. All the designs were developed under a uniform set of ground rules. The performance evaluations consist of nuclear, thermal/hydraulic, mechanical, resource utilization, and preliminary safety evaluations. The PRLCDS thermal/hydraulic and mechanical performance cross-cutting study is also included.

- 1287 (GEFR--00393) ANALYSIS OF ADVANCED FUELS CRITICAL EXPERIMENTS. Zadworski, Z.F.; Indreboe, L.L. (General Electric Co., Sunnyvale, CA (USA)). Aug 1978. Contract EY-76-C-03-0893-031. 102p. AT.

Analysis of the Advanced Fuels Critical Experiments in ZPR-9 has been completed. The experimental program, jointly planned by ANL and GE, contained three critical configurations identified as the Carbide Benchmark, Carbide Zone, and Advanced Oxide Zone Assemblies. These experiments provided data to examine the relative breeding, core performance, and safety parameters of advanced fuel materials. Analysis using normal LMFBR design techniques shows that carbide and oxide fueled cores can be evaluated with equivalent accuracy. Generally good agreement between calculated and measured parameters is observed.

- 1288 (GEFR--00394) OPTIMIZED SPENT FUEL STORAGE AND SHIPPING SYSTEMS. Davis, C.R. (General Electric Co., Sunnyvale, CA (USA)). Aug 1978. Contract EY-76-C-03-0893-030. 138p. AT.

This report describes the development of optimum, integrated, Liquid-Metal Cooled Reactor (LMCR) spent fuel storage and shipping systems. The requirements are described for facility interfaces and major component design features in order to have efficient, effective, minimum cost spent fuel storage and shipping systems. Due consideration is given to various refueling intervals, reload batch sizes, and recycle times, since the out-of-core fuel inventory has a pronounced influence on fuel cycle costs.

- 1289 (GEFR--00395) STUDY OF TRANSIENT SODIUM BOILING IN LMFBR FUEL BUNDLES. Shih, T.A. (General Electric Co., Sunnyvale, CA (USA). Advanced Reactor Systems Dept.). Apr 1979. Contract EY-76-C-03-0893-032. 78p. AT.

An assessment of the dynamics of sodium boiling in LMFBR fuel bundles undergoing transient undercooling events has been performed and is reported. Since there is no suitable two-dimensional analytical tool available for such evaluation, the analysis was conducted using special overlays of existing

computer codes and approximation methods. An attempt was also made to develop a simple multi-channel model which is capable of predicting axial and radial boiling progression and the time of inlet flow reversal. Analytical predictions obtained with this model were compared with available experimental results and were judged satisfactory for use in near-term safety test design engineering.

- 1290 (GEFR--00396) DEVELOPMENT AND PRELIMINARY VERIFICATION OF CORTAC-3D. Fox, J.N.; Wei, J.P. (General Electric Co., Sunnyvale, CA (USA). Advanced Reactor Systems Dept.). Sep 1978. Contract EY-76-C-03-0893-031. 283p. AT.

The report documents the development and preliminary verification effort associated with the CORTAC-3D computer code. CORTAC-3D is a three-dimensional version of the two-dimensional CORTAC computer code which was made available for general use in mid-1976. The CORTAC family of computer codes calculates the short-term steady-state and transient response of an LMFBR core restraint system. This requires the simultaneous analysis of the coupled effects of reactor core thermal-hydraulics, component structural deflections, and reactor kinetics. In spite of the demonstrated general usefulness of the two-dimensional version of CORTAC, several significant 3-D effects were identified in FY-77 which provided the incentive to develop a 3-D version of the code. These effects included: (1) thermal-hydraulic modeling shortcomings, numerical difficulties, verification concerns, and exclusion of important subchannel thermal-hydraulic details; (2) "averaged" rather than discrete thermal bowed shapes and load pad forces; (3) regional rather than row-wise Doppler, axial expansion and material densities reactivity feedback calculations. Since 3-D reactivity feedbacks are a simple extension of those employed in CORTAC (the point kinetic model will be identical) and 3-D structural modeling is available with NUBOW-3D, the major 3-D development item is clearly the thermal-hydraulic model. Hence, the majority of the FY-78 effort was directed toward the development and verification of the thermal-hydraulic portion of CORTAC-3D.

- 1291 (GEFR--00397) DEVELOPMENT OF BACKUP REFUELING METHODS. Fox, J.N. (General Electric Co., Sunnyvale, CA (USA). Advanced Reactor Systems Dept.). Sep 1978. Contract EY-76-C-03-0893-031. 16p. AT.

The influence of long-term irradiation-induced material property effects, coupled with the complexity of analyzing a three-dimensional array of parallel core assemblies with small gaps at the load pad planes, make it extremely difficult to predict accurately the load pad normal forces and ultimately the force required to withdraw or insert an LMFBR core assembly at refueling. The accuracy of such load predictions is also subject to the uncertainties in the operational environment (flux and temperature distribution), creep and swelling correlations, and the uncertainties of pad-to-pad and nozzle-to-receptacle friction coefficients. Hence, it is not unreasonable to expect that actual withdrawal loads will exceed core assembly withdrawal force design limits. Therefore it is important to develop backup refueling method that can reduce core assembly withdrawal or insertion loads to acceptable levels during the refueling process. These methods provide a secondary or backup means for completing assembly refueling without damage to neighboring assemblies or the core assembly receptacles. The backup refueling methods

activity has included proof-of-principle testing, development of backup refueling devices, and the development of backup refueling procedures. Each of these efforts is described in the report.

- 1292 (GEFR--00398) CARBON MIGRATION IN TRANSITION JOINT WELDS. Mitchell, M.D.; Offer, H.P.; Ring, P.J. (General Electric Co., Sunnyvale, CA (USA). Advanced Reactor Systems Dept.). Sep 1978. Contract EY-76-C-03-0893-30. 97p. AT.

Diffusion and mixing are known to occur at the fusion boundary of transition weld joints, particularly in certain austenitic/ferritic material combinations where the weld and base metal have different carbon diffusivities and carbon activities. Heat from the welding process and post weld heat treatment accelerates carbon diffusion, generating adjacent carburized and decarburized bands. A program was conducted to quantify the effects of weld metal dilution, time, and temperature on the carbon migration at the fusion zone of the 2 1/4 Cr-1Mo steel/Inconel 82 weld interface in a CRBRP prototypic transition joint. The electron microprobe was used to measure chemical gradients, particularly the carbon gradient, across the weld interface. The major emphasis of the study was placed on establishing a time-temperature relationship which could predict the extent of carbon migration under service conditions from short time, high temperature tests. Based on the similarity of carbon profiles obtained from samples treated at 510C (950F) for 1000 hours and 677C (1250F) for 10 hours, a Larson-Miller type equivalency was employed to establish the time-temperature relationship.

- 1293 (GEFR--00399) POSTIRRADIATION EXAMINATION RESULTS FROM EXPERIMENT F11A (EBR-II SUBASSEMBLIES X141 AND X141A). Rosa, J.M. (General Electric Co., Sunnyvale, CA (USA). Advanced Reactor Systems Dept.). Sep 1978. Contract EY-76-C-03-0893-031. 69p. AT.

The F11A experiment has achieved a peak burnup of 7 atom % in subassemblies X141, X141A, and X141B. Two fuel pins, operating at peak cladding temperatures in excess of 1350°F, experienced cladding breach. The first of these was the first breach of an unencapsulated fuel element in a GE experiment. Post-irradiation examination data is reported on five fuel pins irradiated in subassemblies X141 and X141A, including the initial breach. The cladding breach is a thermal creep rupture probably caused by local intergranular fuel-cladding chemical interaction (FCCI). Alteration of cladding morphology (precipitation of intergranular sigma phase) is evident near the breach. Metallographic examination of companion pins which operated at lower cladding temperatures show sound cladding with insignificant FCCI.

- 1294 (GEFR--00400) INTERIM REPORT: LEAK DETECTION TEST ACTIVITIES ON THE GENERAL ELECTRIC STEAM GENERATOR TEST RIG (SGTR). Stehling, S.G.; Magee, P.M. (General Electric Co., Sunnyvale, CA (USA). Advanced Reactor Systems Dept.). Sep 1978. Contract EY-76-C-03-0893-030. 71p. AT.

Leak detection equipment and their associated control and instrumentation systems have been developed under Base Development Program SG027, Subtask X1, to detect the reaction products which evolve from the reaction of sodium with small quantities of water in LMFBR steam generators. The prototype leak detector characterization tests which have

been initiated in the General Electric Steam Generator Test Rig (SGTR), in conjunction with the Few Tube Test (FTT) Program, are the first in a series of tests designed to assure the adequacy of the system design for commercial LMFBR plant utilization. The SGTR tests are the first time the prototype Clinch River Breeder Reactor (CRBR) design leak detectors are tested, and the primary emphasis of the tests is on system operation and procedure checkout, with secondary emphasis placed on obtaining signal resolution and transit time data.

- 1295 (GEFR--00402(Vol.1)) PRE-IRRADIATION CONCEPT DESCRIPTION AND COST ASSESSMENT. Pflasterer, G.R.; Deane, N.A. (comps.). (General Electric Co., Sunnyvale, CA (USA). Advanced Reactor Systems Dept.). Sep 1978. Contract EY-76-C-03-0893-031. 35p. AT.

The objective of this study is to develop a Pre-Irradiation Facility (PIF) design concept, and a preliminary capital and operating cost assessment for this facility, for the purpose of estimating the effect of pre-irradiation on the LMFBR energy cost.

- 1296 (GEFR--00402(Vol.2)) PRE-IRRADIATION CONCEPT DESCRIPTION AND COST ASSESSMENT. Pflasterer, G.R.; Deane, N.A. (comps.). (General Electric Co., Sunnyvale, CA (USA). Advanced Reactor Systems Dept.). Sep 1978. Contract EY-76-C-03-0893-031. 276p. AT.

A concept evaluation and cost assessment for a water-cooled reactor facility for the pre-irradiation of LMFBR fuel assemblies is described. This study is part of the LMFBR advanced core design program aimed at PLBR development. Volume II contains chapters on the reactor description, plant description, cost assessment, impact of pre-irradiation on LMFBR capital cost, impact of pre-irradiation on LMFBR total energy costs, and demonstration of pre-irradiation concept progress.

- 1297 (GEFR--00402(Vol.3)) PRE-IRRADIATION CONCEPT DESCRIPTION AND COST ASSESSMENT. Pflasterer, G.R.; Deane, N.A. (comps.). (General Electric Co., Sunnyvale, CA (USA). Advanced Reactor Systems Dept.). Sep 1978. Contract EY-76-C-03-0893-031. 455p. AT.

The various appendices cited in Volumes I and II are included in this volume.

- 1298 (GEFR--00403) C-1 IRRADIATION CREEP IN BENDING EXPERIMENT: SUMMARY DESCRIPTION AND RESULTS OF THE FIRST TWO INTERIM EXAMINATIONS. McSherry, A.J.; Marshall, J.; Patel, M.; Ring, P.J.; Konze, G.K.; Appleby, W.K. (General Electric Co., Sunnyvale, CA (USA). Advanced Reactor Systems Dept.). Sep 1978. Contract EY-76-C-03-0893-031. 77p. AT.

The design constraints and a description of the final design of an irradiation experiment to measure irradiation creep in bending of 20% cold worked AISI 316 stainless steel is presented along with the results of the first two interim examinations. Analysis of this low fluence data indicates that irradiation creep in bending has a larger transient creep component than observed in biaxially stressed specimens, but the secondary (steady state) creep rates appear similar and will be quantified by subsequent higher fluence measurements.

- 1299 (GEFR--00404) CLADDING COMPONENT CHEMICAL TRANSPORT IN MIXED-OXIDE FAST REACTOR FUEL PINS: AN ADDITIONAL (HIGH BURNUP) MECHANISM FOR FUEL CLADDING CHEMICAL

INTERACTION. Adamson, M.G.; Aitken, E.A. (General Electric Co., Sunnyvale, CA (USA). Advanced Reactor Systems Dept.). 19 Sep 1978. Contract EY-76-C-03-0893-031. 52p. AT.

Transport of the principal metallic components of Fe-Cr-Ni austenitic cladding alloys into the fuel phase of irradiated oxide fuel pin has been reported periodically since the inception of fuel pin testing in the Fast Reactor Development Program, however, thus far, an adequate explanation for this phenomenon has been lacking. In this document we review available in-pile evidence for cladding component transport in oxide pins, delineate the major variables that appear to be responsible for its occurrence, outline the development of a working physicochemical model for cladding component chemical transport (CCCT) at moderate to high burnups, and describe how such a model may be applied in the calculation of cladding wastage due to component transport. The basis of the CCCT mechanism for FCCI is a liquid Cs,Te fission product medium in the fuel-cladding gap in which Fe, Cr, Ni, Mn, etc., can dissolve and undergo transport up the steep (radial) temperature gradient. Special requirements on the quantities of Te (and Cs) fission products present in the gap explain why CCCT is generally observed only at moderate to high burnups, and characteristic morphological features of CCCT are consistent with a dissolution-type mechanism. The thermodynamic basis of the CCCT model is also treated in some detail, and it is shown, for example, how oxygen activity influences the equilibria between tellurium and dissolved cladding components in the Cs,Te fission product melt. A preliminary quantitative analysis of recent in-pile data is performed and the results used to derive coefficients for some of the key parameters in the rate model. Finally, the model is applied to a long, commercial LMFBR-type fuel pin to illustrate the expected important contribution of CCCT to FCCI-induced cladding inner surface wastage at high burnup.

- 1300 (GEFR--00405(Vol.1)) IMPROVEMENTS TO THE MAINTAINABILITY AND INSPECTION OF LIQUID METAL SYSTEMS. VOLUME 1. OVERALL STUDY RESULTS. Sciacca, F.W.; Scott, W.B. (General Electric Co., Sunnyvale, CA (USA). Advanced Reactor Systems Dept.). Sep 1978. Contract EY-76-C-03-0893-030. 567p. AT.

The Systems Maintainability and Inspection Improvements Study was a subtask of the Liquid Metal Systems Development Studies (DOE Contract EY-76-C-03-0893, 189a SG066). This subtask had the objective of identifying and evaluating improvements to the maintenance and inspection of the reactor, heat transport, and steam generation systems of loop-type liquid metal cooled reactor (LMCR) plants. More specifically, the aim of the effort was to identify concepts and ideas to accomplish the following: reduce the time for maintenance and inspection; improve the quality of maintenance and inspection; reduce personnel exposure; increase plant availability; improve plant constructability; and reduce total energy costs.

- 1301 (GEFR--00405(Vol.2)) IMPROVEMENTS TO THE MAINTAINABILITY AND INSPECTION OF LIQUID METAL SYSTEMS. VOLUME 2. PLANT LAYOUT IMPROVEMENTS. Golan, S. (General Electric Co., Sunnyvale, CA (USA). Advanced Reactor Systems Dept.; Bechtel National, Inc., San Francisco, CA (USA)). Sep 1978. Contract EY-76-C-03-0893-030. 137p. AT.

A study has been performed for General Electric to determine the technical feasibility

and cost of arranging loop-type LMFBR primary heat transport cells to incorporate features that facilitate in-service inspection and maintainability. Specific areas requested to be examined were: primary heat transport system (HTS) piping layouts; HTS cell configurations; a shield floor; routing of auxiliary services in the HTS cell; maintenance equipment space requirements; effect on plant cost and construction schedule of alternative layout; and effect on plant constructability of alternative layout. A study was also performed to investigate the feasibility of primary HTS modularization as a means to improve plant constructability and maintainability.

- 1302 (GEFR--00406) CORE PERFORMANCE EVALUATION OF ADVANCED CLAD/DUCT ALLOYS. Branlund, B.J. (General Electric Co., Sunnyvale, CA (USA). Advanced Reactor Systems Dept.). 1 Sep 1978. Contract EY-76-C-03-0893-031. 139p. AT.

The objective of the LMFBR core materials performance evaluation was to provide rankings to the Clad/Duct Working Group to assist their screening of the candidate alloys (D9, D11, M813, PE16, D21, D25, D66, INC706, D68, HT9, and D57). The working group was attempting to reduce the number of candidate alloys to six. The six most attractive alloys are D9, PE16, D66, D68, HT9 and D57 based on the overall core cost rankings provided by COROPT optimization studies. For 40% of the cases considered, five of these six alloys were no more than 10% more expensive than the top ranked alloy; all other alloys fell within the 10% range in less than 15% of the cases.

- 1303 (GEFR--00407) IRRADIATION AND POST-IRRADIATION EXAMINATION DATA FROM SELECTED F9E FUEL PINS. Plumlee, D.E. (General Electric Co., Sunnyvale, CA (USA). Advanced Reactor Systems Dept.). Sep 1978. Contract EY-76-C-03-0893-031. 90p. AT.

The design, operating parameters, and post-irradiation examination results are presented from five mixed-oxide fuel pins (F9E02, F9E04, F9E23, F9E41, and F9E42) irradiated in the General Electric F9E experiment. The F9E experiment was designed as a diagnostic test to assess subassembly performance for fuel pins spaced using several candidate grid spacer designs. The companion F9 tests (F9A, B, C, and D) containing pins spaced by wire wrapping provided the reference base for judging grid spaced fuel pin performance. Subassembly and grid spacer performance have been previously reported.

- 1304 (GEFR--00409) EVALUATION OF PROTOTYPICAL CRBRP STEAM GENERATOR TUBE/TUBESHEET WELDS. Offer, H.P.; Ring, P.J. (General Electric Co., Sunnyvale, CA (USA). Advanced Reactor Systems Dept.). Sep 1978. Contract EY-76-C-03-0893-030. 43p. AT.

The CRBRP tube/tubesheet welds are being evaluated for quality and uniformity of properties. This evaluation is proceeding on a continuing basis throughout the fabrication cycle of the CRBRP steam generators. The weld evaluation includes bend tests to identify susceptibility to brittleness, hardness tests to determine the effectiveness of post weld heat treatments in reducing the weld strength, stress corrosion cracking tests to evaluate caustic stress corrosion susceptibility under faulted conditions, flexural fatigue tests (to characterize the effects of the weld geometry, metallurgical structure and allowable porosity), and stress rupture and burst tests to evaluate the weld mechanical efficiency

under biaxial stress, relative to the tubing strength. Metallography and nondestructive testing techniques are also used to help in interpretation of the mechanical test results and to aid in verifying the weld quality and uniformity.

- 1305 (GEFR--00411) COMPENDIUM OF CORE DEBRIS RETENTION TECHNOLOGY. Gluekler, E.L. (General Electric Co., Sunnyvale, CA (USA). Advanced Reactor Systems Dept.). 29 Sep 1978. Contract EY-76-C-03-0893-032. 108p. AT.

A summary is presented of core debris retention technology pertinent to demonstration of successful control of accident progression for postulated core melting events in liquid metal fast breeder reactors. Data and models in key areas of in-vessel and ex-vessel debris retention are reviewed, including decay heating rates, heat source distribution, potential for secondary criticality, debris fragmentation and settling characteristics, coolability of particle beds, molten layers and boiling layers, primary system integrity, ex-vessel material interactions, debris penetration into concrete, and containment responses. Some concepts applied to early liquid metal fast breeder reactors for consequence mitigation are described, and recommendations are made for future work needed to support demonstration of successful debris retention.

- 1306 (GEFR--00413) USSR STEAM GENERATOR MATERIALS EXAMINATION OF TEST SPECIMENS. Hampton, L.V.; Roy, P. (General Electric Co., Sunnyvale, CA (USA). Advanced Reactor Systems Dept.). Jan 1979. Contract EY-76-C-03-0893-031. 54p. AT.

Metallography, radiography, chemical analysis and electron-microprobe analysis were used to characterize samples of USSR steam generator materials and sodium loop specimens. The samples were analyzed with regard to steam side corrosion and deposition, decarburization, structure, composition and weld integrity. The lack of suitable archive materials and precise operating conditions limits the number of firm conclusions which can be drawn as a result of the examination. An attached Appendix lists all the available initial data and the type of specimens examined.

- 1307 (GEFR--00414) BASELINE INSPECTION OF THREE TRANSITION JOINT LIFE TEST ARTICLES. Day, R.A. (General Electric Co., Sunnyvale, CA (USA)). Dec 1978. Contract EY-76-C-03-0893-030. 48p. AT.

Ultrasonic inspection was accomplished on the Transition Joint Life Test (TJLT) articles using a semiautomatic computer controlled pipe scanner. Tests were capable of reliable detection of ten and five percent notch in the Alloy 800 and 316 stainless steel parent materials and at least a three percent notch in the 2-1/4Cr--1Mo parent metal. The detection of notches in the weld metal has not been established, but ten percent notches were detectable above weld metal noise in the 316 parent metal by insomifying the 16-8-2 weld metal from the Alloy 800 parent metal. The TJLT joints will be reinspected at intervals at the Energy Technology Engineering Center (ETEC) in Los Angeles to detect creep fatigue cracks in the 2-1/4Cr--1Mo HAZ. The same equipment will be used with some improvements to do the in-service inspections.

- 1308 (GEFR--00415) IN-VESSEL CORE DEBRIS COOLABILITY FOR LARGE BREEDER REACTORS. Yang, H.K.; Gluekler, E.L. (General Electric Co.,

Sunnyvale, CA (USA). Advanced Reactor Systems Dept.). 31 Oct 1978. Contract EY-76-C-03-0893-032. 64p. AT.

Work is in progress to evaluate the ability of inherent structural barriers and natural processes to mitigate the consequences of extremely low probability events which could involve meltdown of a portion of the reactor core. In this report, an assessment of the coolability of core debris within the primary system boundary of large breeder reactors is presented. Since the state and configuration of fuel after neutronic shutdown by relocation from the core region is uncertain, the coolability limits were determined for debris in the form of small fragmented particles, as well as solid or molten layers. To assess the coolability of fragmented particles, it was necessary to extend existing analytical models for particle bed dryout to include the effects of heat removal from the bottom of the particle layer, and sodium subcooling. At 1000 seconds after neutronic shutdown, the maximum volume fraction of core fuel that can be cooled as fragmented particles was predicted to be on the order of 5%. A flat retention plate located underneath the core support structure would improve the particle coolability limit to volume fractions between 50 and 100% depending on the design configuration. The analysis of solid and molten layers indicated that dryout and remelting of debris particle layers do not necessarily lead to debris penetration through the primary system boundary, if the following conditions are met: (a) heat must be removed from the lower surface of the structure retaining the debris by sodium natural convection, or (b) the structure must be able to withstand surface temperatures close to its melting point. Otherwise, the coolability limit for solid and liquid layers was found to be on the order of 0.25 to 0.7% of the core volume, depending on the final debris configuration and the boundary conditions assumed.

- 1309 (GEFR--00417) PACT 2: PROBABILISTIC ANALYSIS OF COOLANT AND CLADDING TEMPERATURES. Chen, K.H.; Hoover, D.G. (General Electric Co., St. Petersburg, FL (USA). Pinellas Peninsula Plant). Jun 1978. Contract EY-76-C-03-0893-031. 239p. AT.

The PACT 2 code computes the probability distributions of the coolant and cladding temperatures throughout a single LMFBR fuel assembly during steady state operation at start of life. The PACT 2 code is an improved version of PACT. It uses a mathematical model that considers both thermal-hydraulics in coolant subchannels and Monte Carlo sampling of the thermal-hydraulic calculation. The coolant temperature in each nodalized coolant subchannel is defined as a function of enthalpy, flowrate, crossflow between adjacent subchannels, heat flux, and position. The mathematical model neglects the redistribution of subchannel coolant flow; therefore, it is limited to fuel pin assemblies in which there is no flow blockage. The equations of the mathematical model for the thermal-hydraulic calculation are solved by using a forward marching finite difference scheme.

- 1310 (GEFR--00419) PRELIMINARY MODELS FOR EVALUATING RADIOLOGICAL SOURCE TERMS. Huang, T.C.; Dayan, A.; McDonald, J.W.; Teresi, J.D. (General Electric Co., Sunnyvale, CA (USA). Advanced Reactor Systems Dept.). 17 Nov 1978. Contract EY-76-C-03-0893-032. 48p. AT.

The purpose of the safety work described herein is to develop the technology for evaluating mechanisms that attenuate radiological consequences. This report presents model

developments from October 1977 through September 1978 (FY 1978) and indicates experimental needs regarding model development and verification. The work covers modeling of extremely low-probability accident scenarios resulting in fuel vaporization and discharge of sodium and core debris to the containment building, the generation of melt-through source terms by sparging and vaporization, and the attenuation of energetics and melt-through source terms.

- 1311 (GEFR--00422) TRANSITION JOINT WELDING: LIFE TEST ARTICLE FABRICATION. Hartle, R.T.; Busboom, H.J.; Ring, P.J. (General Electric Co., Sunnyvale, CA (USA). Advanced Reactor Systems Dept.). Dec 1978. Contract EY-76-C-03-0893-030. 90p. AT.

This work is in support of the Clinch River Breeder Reactor (CRBR), a demonstration plant funded jointly by the Department of Energy and the Project Management Corporation. The objective of this task was to improve the conventional transition joint design and develop welding fabrication techniques for these improved joints. The joints for CRBR form the sodium side transitions between ferritic and austenitic stainless steel piping within the Intermediate Heat Transfer System (IHTS). These joints vary in size from 1 inch, Schedule 80 up to 26.0 inches, and are required to perform successfully throughout a design life of 30 years (approx. 263,000 hours).

- 1312 (GEFR--00423) CORE RESTRAINT SYSTEM DESIGN GUIDELINES. Fox, J.N. (General Electric Co., Sunnyvale, CA (USA). Advanced Reactor Systems Dept.). Jan 1979. Contract EY-76-C-03-0893-031. 64p. AT.

Guidelines contained herein were developed by examining the fundamental core restraint functional criteria which require that the core restraint system: (1) establish and control the radial and azimuthal position of the reactor core assemblies such that reactivity variations from radial and azimuthal motion will not limit safe reactor operation under all credible conditions; (2) maintain critical alignments between in-core and above-core components; and (3) permit refueling within specified load limits. While these functional criteria are important, they do not provide sufficient guidance to the individual designer (contractor) to develop detailed design criteria that are generally acceptable to the LMFBR community. This is due primarily to the complex behavior of the core restraint system, its many interfacing systems, and the individual interpretation of safe reactor operation. Hence a set of comprehensive core restraint system design guidelines are necessary that not only address the functional criteria, but reflect design and safety philosophies that are consistent with current core restraint engineering technology. These design guidelines, once endorsed by the CM and CP working group will allow each core restraint system designer to develop consistent and well-based detailed design criteria.

- 1313 (GEFR--00424) PHYSICOCHEMICAL MODEL FOR PREDICTING SODIUM REACTION SWELLING IN BREACHED LMFBR FUEL AND BREEDER ELEMENTS. Caputi, R.W.; Adamson, M.G.; Evans, S.K. (General Electric Co., Sunnyvale, CA (USA). Advanced Reactor Systems Dept.). Mar 1979. Contract EY-76-C-03-0893-031. 48p. AT.

The use of sodium as a coolant for the Liquid Metal Fast Breeder Reactor (LMFBR) necessitates study of the properties of the coolant and chemical interactions it may

undergo with the reactor fuel. If a defect or breach develops in the cladding of an irradiated fuel pin, sodium is likely to enter the pin and react chemically with the fuel. This reaction results in formation of a sodium-fuel reaction product which, since it has a lower density than the fuel, can cause the fuel pin to swell. An investigation is presented for the reaction of sodium with the mixed-oxide fuel following a breach of the cladding. Predictive correlations are presented for swelling with time in breach fuel rods that will be helpful to those concerned with performance of breached driver fuel pins and blanket rods in an LMFBR and plant-related consequences.

1314 (GEFR--00426-1) HYDRAULIC TESTING PROGRAM ON VENTED ASSEMBLY CORE DESIGN, FY-78. VOLUME 1: VENT HYDRAULICS TESTING. Edelfelt, I.H. (General Electric Co., Sunnyvale, CA (USA). Advanced Reactor Systems Dept.). Jan 1979. Contract EY-76-C-03-0893-031. 22p. AT.

During FY-77 a combined theoretical and experimental program was conducted for the purpose of determining the key parameters for the vent hole design in an actual LMFBR. The theoretical work was based on the pipe break flow analysis as modeled by Quan. This analysis predicted two types of flow regimes; free jet and confined flows, with the particular classification depending upon the relative area of the vent hole to that of the channel gap. The vent area is the cross-sectional area of the vent hole, while the gap area is the area resulting by multiplying the vent perimeter by the duct-to-duct (interstitial) spacing. In the case of a small vent-hole-to-gap area ratio such that the vent flow is limited by the hole area, a free jet model was used. On the other hand, if the channel gap area is smaller than that of the vent area, a confined flow model was used. The FY-78 effort which is being reported here included two vent flow pressure drop tests, both performed with a constant 1.5-inch diameter vent size. The first consisted of rotating the test channel in the test rig by 60 degrees so that the vent holes would be opposite one another. This configuration was tested over the same range of variables as was used in the FY-77 tests. The second set of tests employed a reverse, or inflow, configuration wherein the channel was in its standard orientation with the vents not opposite one another but with flow out of the interstitial space into the tube bundle.

1315 (GEFR--00426-2) HYDRAULIC TESTING PROGRAM ON VENTED ASSEMBLY CORE DESIGN, FY-78. VOLUME 2: PIN VIBRATION TESTING. Edelfelt, I.H. (General Electric Co., Sunnyvale, CA (USA). Advanced Reactor Systems Dept.). Jan 1979. Contract EY-76-C-03-0893-031. 224p. AT.

One problem which could conceivably exist in any reactor assembly and which, therefore, must be investigated is flow induced vibration of the fuel pins. It is to the evaluation of this possible source of trouble that the work reported here was addressed. During FY-77, a combined theoretical and experimental program was conducted for the purpose of determining the flow and pressure drop characteristics for the vent hole design in an actual LMFBR. During the 1977 program, a flow loop was constructed incorporating a test model. The fuel pin vibration study reported herein makes use of this test model and flow loop. The model consists of a single channel containing a tube bundle. Surrounding this channel was another hexagonal channel which duplicated the adjacent

walls of the six channels which would normally surround any interior channel in a complete fuel assembly. The spacing between the two channels thus corresponded to the interstitial gap. A biaxial accelerometer was installed in each of eight tubes, or pins as they are referred to in an actual reactor unit; four adjacent to vents, two adjacent to nonvented walls and two near the center. In all cases, the accelerometers were located in the plane of the three vent holes. Data were recorded from the accelerometers for the no flow case, for reference purposes, and with inlet flows of 240 GPM, 320 GPM and 400 GPM with vent flow from 0 to 30% of the inlet flow. The results were processed by a Fourier analyzer to yield plots of g loading versus frequency. The resulting plots are given in this report along with a discussion of the results.

1316 (GEFR--00431) INFLUENCE OF DECARBURIZATION ON THE 510°C (950°F) TENSILE AND CREEP PROPERTIES OF THIN SECTION 2-1/4CR--1MO STEEL WELDMENTS. Mandurrango, G.L.; Pizzo, P.P. (General Electric Co., Sunnyvale, CA (USA). Advanced Reactor Systems Dept.). Feb 1979. Contract EY-76-C-03-0893-031. 42p. AT.

The short-term tensile and creep properties of severely decarburized 2-1/4Cr--1Mo steel autogenous weldments at 510°C were determined by the properties of the base material. Limited deformation occurs within the autogenous weld region. Base metal properties will provide conservative design rules for CRBR. Microstructural damage, such as grain boundary void growth and/or triple point cracking, was not observed in either the Weld, HAZ, or Base Metal regions for conditions scoped in this study. Abnormal grain growth occurred within weld regions for the more extreme decarburization conditions. Abnormal grain growth was similarly observed in normalize and tempered (NT) specimens. Isothermal anneal and post weld heat treatment (IA + PWHT) specimens did not exhibit abnormal grain growth. Based on the limited kinetics data available, initiation of abnormal grain growth in decarburized regions will not occur in a design life of 30 years for temperature lower than 520°C (968°F).

1317 (GEFR--00432) MATERIALS CHARACTERIZATION: STUDY OF DECARBURIZATION INFLUENCE ON MECHANICAL PROPERTIES OF CRBR STEAM GENERATOR TUBING. Pizzo, P.P. (General Electric Co., Sunnyvale, CA (USA). Advanced Reactor Systems Dept.). Feb 1979. Contract EY-76-C-03-0893-031. 45p. AT.

Tensile characterization tests at 510°C confirm that the thin section coupon specimens selected for the decarburization study exhibit analogous data trends to CRBR steam generator tubing. A real secondary size/geometry factor must be applied in interpreting steam generator tube properties from coupon data. Tensile ductility and ultimate tensile strength values require adjustment. Baseline creep data for tubular specimens selected for decarburization study correlate well with the Nuclear Systems Materials Handbook (NSMH) time-to-rupture and minimum creep rate correlations for annealed 2-1/4 Cr--1Mo steel. Thermal aging 1000 hours at 510°C reduces the tensile strength of 2-1/4 Cr--1Mo steel by approximately 17%. The effect is intrinsic. Further data are required to assess implications with respect to design. Scoping tests indicate that cold work enhances creep resistance of 2-1/4 Cr--1Mo steel while maintaining creep ductility. Fabrication induced cold work has significant impact on creep behavior, and a pretest stress relieving treatment must be incorporated in the

decarburation study. Use of UTS as a correlation parameter for creep behavior is not supported by data. Although 510°C thermal aging reduces the UTS of 2-1/4 Cr-1Mo steel 17%, the creep properties before and after 510°C thermal aging are equivalent. Mechanical properties variations noted could not be correlated with carbide size and distribution. Thin film transmission electron microscopy techniques are required to provide structure/property correlation. Creep cavitation was observed at 510°C and at a stress of 130 MPa. Rupture time and minimum creep rate values were 11,253 hours and $1.6 \times 10^{-3}\%$ per hour. Further data are required to determine the nature of the cavities and to assess the impact of cavity formation on the resultant creep behavior.

- 1318 (GEFR--00436) FULMIX-II: A COMPUTER PROGRAM FOR STEADY-STATE THERMAL-HYDRAULIC ANALYSIS OF WIRE WRAPPED ROD BUNDLES. Wei, J.P. (General Electric Co., Sunnyvale, CA (USA). Advanced Reactor Systems Dept.). 1 Mar 1979. Contract EY-76-C-03-0893-031. 250p. AT.

This report provides a description of the FULMIX-II computer program, detailed instructions for its use, and a brief discussion of the features of the program. FULMIX-II is a modified version of FULMIX [I]. FULMIX-II is designed specially to determine single-phase, steady-state coolant flow and temperature distributions in a wire wrapped assembly with reference wire wrap design (straight starts) and other wire wrap configurations (staggered starts, wireless rods, locked wrap, etc.). The code can be used for hexagonally arranged assemblies with 7 to 271 fuel rods. The code performs the steady-state calculation of average temperatures for each fuel rod and coolant flow subchannel in the assembly at an arbitrary number of axial planes. The thermal-hydraulic analyses presented in this report are based on application of the subchannel concept in association with the use of bulk parameters for coolant velocity and coolant temperature within a subchannel. The interactions between subchannels are due to turbulent interchange, pressure-induced crossflow, directed sweeping crossflow induced by the helical wire wrap, and transverse thermal conduction. Flow field in the pin bundle is solved first using an iterative method in a finite difference scheme. Once the flow field is determined, the energy equation is decoupled, and the temperature distribution is calculated accordingly.

- 1319 (GEFR--00439) BUNDLE TO DUCT INTERACTION COMPRESSION TESTS USING LARGE DIAMETER PINS. Kaplan, S. (General Electric Co., Sunnyvale, CA (USA). Advanced Reactor Systems Dept.). 19 Mar 1979. Contract EY-76-C-03-0893-031. 88p. AT.

Bundle compression testing was recently performed on large diameter pin bundles to expand the bundle compression test data base previously obtained using small diameter (0.230 inch) pins. The large diameter pin bundles used the carbide fuel pin size (0.370-inch diameter) and CRBR radial blanket pin size (0.506-inch diameter). The recent testing included pin ovaling measurements, data not obtained during the smaller diameter pin tests. This report summarizes the compression testing performed on pin bundles using the large diameter pins.

- 1320 (GEFR--00441) FLOW-INDUCED VIBRATION AND HYDRAULIC TEST OF THE FTR 00-00-00/WIRELESS ADVANCED WIRE-WRAP FUEL BUNDLE ASSEMBLY. Lee, K.L. (General Electric Co., Sunnyvale, CA

(USA). Advanced Reactor Systems Dept.). Mar 1979. Contract EY-76-C-03-0893-031. 133p. AT.

A series of vibration and hydraulic tests were performed on a mock-up Fast Test Reactor (FTR) fuel assembly for the Fast Flux Test Facility (FFTF) to assess the vibrational and hydraulic characteristics under simulated flow conditions. The 217-pin advance wire wrap (00-00-00/Wireless) fuel assembly was tested under simulated reactor flow conditions using demineralized water to simulate the primary sodium coolant. An adjustable (across-flats) duct was used to vary the bundle-duct assembly clearance (porosity). The tests were required because of the difficulty in performing accurate analytical predictions of the fuel assembly performance due to the turbulent flow conditions and highly complex structural boundary conditions. The test results confirmed that the fuel pins met the FTR design criteria for vibrations. The fuel pin displacements were less than 2 mils (rms). The vibration behavior was similar to wire wrapped assemblies. The fuel pin response spectra were characterized by distinct, highly damped resonances at low flow rates. As the flow rate increased, the fluid-forced response dominated until at high flow rates the resonant response was almost completely masked by broad band fluid forces. Vibrations were relatively independent on bundle porosity but flow friction losses were definitely dependent on bundle porosity.

- 1321 (GEFR--00442) TWOD-2: TWO-DIMENSIONAL FINITE ELEMENT FUEL PIN ANALYSIS CODE. Patel, M.R. (General Electric Co., Sunnyvale, CA (USA). Advanced Reactor Systems Dept.). 23 Mar 1979. Contract EY-76-C-03-0893-031. 79p. AT.

TWOD-2 is a two-dimensional finite element code developed specifically for thermostructural analysis of Fast Breeder Reactor (FBR) fuel pins subjected to normal operation and design basis transients. It enables evaluation of effects of geometrical and environmental asymmetries and thus complements the LIFE system of one-dimensional codes being developed as the reference methods for evaluating the performance of FBR fuel pins. The code permits analysis of heat transfer, and elastic-plastic-creep-swelling and thermal deformations in isotropic solids deforming in plane stress, plane strain and axisymmetric modes. Fuel-cracking, crack-healing, fuel-cladding gap closure and friction at the fuel-cladding interface are modeled by permitting orthotropic elasticity and conductivity in the elements. The current version models (U,Pu) O₂ - 26CW316SS behavior.

- 1322 (GEFR--00444) TRANSWRAP-II ANALYSES OF THE STANFORD RESEARCH INSTITUTE IHTS/RELIEF SYSTEM SIMULATION TESTS. Wolfe, C.F. Jr. (General Electric Co., Sunnyvale, CA (USA). Advanced Reactor Systems Dept.). Apr 1979. Contract EY-76-C-03-0893-030. 254p. AT.

Tests were performed by the Stanford Research Institute (SRI), Menlo Park, California, in which the time histories of acoustical pressure pulses were measured at various locations in a water loop that simulated a LMFBR intermediate heat transport and pressure relief system. This report focuses on the computer simulation of these experiments, and the comparison of the analytical results to corresponding measured values. The report shows that TRANSWRAP has the capability to predict adequately the pressure response of the SRI scale model of an LMFBR IHTS. Fluid velocities in the relief line are shown to be

conservatively predicted.

- 1323 (GEFR--00445) ANALYSIS OF THE ZPPR-8 CRITICAL EXPERIMENTS. Lu, Y.S.; Crick, S.C. (General Electric Co., Sunnyvale, CA (USA). Advanced Reactor Systems Dept.). Mar 1979. Contract EY-76-C-03-0893-031. 83p. AT.

The purpose of this report is to present the analysis of a series of experiments performed in the Zero Power Plutonium Reactor (ZPPR), identified as ZPPR Assembly 8. This assembly simulates a clean condition of the demonstration-reactor class LMFBR core with a heterogeneous (radial parfait) reference configuration which uses thorium in the internal blanket regions. The experimental program in ZPPR-8 was specified to provide a benchmark study of the neutronic behavior of a heterogeneous LMFBR core with an emphasis on the impact of a thorium blanket. A thorium blanket was loaded at different locations for various phases of ZPPR Assembly 8. This report presents details on the experimental program, criticality, core midplane reaction rate distributions, sodium void and subassembly worth measurements, control worth measurements and loading error simulations, and finally the conclusions.

- 1324 (GEFR--00446) EFFECTS OF THERMAL AGING ON THE MECHANICAL PROPERTIES OF A 2-1/4 CR-1MO STEEL/INCONEL 82 TRANSITION JOINT FUSION ZONE. Mitchell, M.D.; Offer, H.P. (General Electric Co., Sunnyvale, CA (USA). Advanced Reactor Systems Dept.). Apr 1979. Contract EY-76-C-03-0893-030. 90p. AT.

Transition joint weldments between austenitic and ferritic materials are required in the CRBRP Project piping systems. Annealed 2-1/4Cr-1Mo steel welded with ERNiCr-3 (Inconel 82) to Incoloy 800H using the hot wire automatic gas tungsten arc process will be used for a number of these joints. This effort provides a scoping study of the mechanical properties at the 2-1/4Cr-1Mo steel/Inconel 82 fusion zone of these joints to provide actual material properties for the TJLT inelastic analysis and to provide a better understanding of the probably degradation of properties due to thermal aging and carbon migration as a function of the time at temperature. Elevated temperature, tensile, stress rupture, strain controlled fatigue, and fatigue crack growth tests were performed. Thermal aging at 677°C (1250°F) for ten hours (equivalent to approximately 1000 hours at 510°C (950°C), the nominal service temperature), was found to reduce the tensile and stress rupture properties of the weldment at the fusion zone. The fatigue crack growth rate and continuous fatigue life at the fusion zone were not affected by the thermal aging; however, this zone was shown to crack more readily than either the annealed 2-1/4Cr-1Mo steel or the Inconel 82 weld deposit.

- 1325 (GEFR--00449) FOULING AND CHEMICAL CLEANING STUDIES: CRBRP EVAPORATORS. PART II. Hampton, L.V. (General Electric Co., Sunnyvale, CA (USA). Advanced Reactor Systems Dept.). May 1979. Contract EY-76-C-03-0893-030. 39p. AT.

Tests were conducted to study the chemical descaling process of removing fouling deposits from the waterside surfaces of sodium-heated 2-1/4Cr-1Mo steel evaporator tubes. Test solutions were ammoniated EDTA (ethylenediamine tetraacetic acid), ammoniated citric acid and ammoniated EDTA + citric acid. The fouling product layers were characterized by both energy dispersive x-ray and electron microprobe

techniques. Tests were conducted at approximately 80°C (176°F) and at 25.2 cm³/sec (0.4 GPM) and 252 cm³/sec (4.0 GPM). The base metal corrosion rates during cleaning were determined. Ammoniated EDTA + citric acid solutions yielded the most acceptable results.

- 1326 (GEFR--00463) STATE-OF-THE-ART WATER CHEMISTRY OF STEAM GENERATORS WITH EMPHASIS ON CRBRP SPECIFICATIONS. Simpson, J.L.; Dutina, D.; Robles, M.N.; Spalaris, C.N. (General Electric Co., Sunnyvale, CA (USA). Advanced Reactor Systems Dept.). Jun 1979. Contract EY-76-C-03-0893-030. 62p. AT.

This report is an Addendum to Reference 1, presenting an update of the CRBRP water chemistry specifications, as well as the supporting data and discussion for the changes made. Experimental data are presented from three tests conducted by General Electric. A resolution was obtained to relate water chemistry and the occurrence of DNB in the evaporator tubes for exposures up to 8,000 hours. Verification of on-line sodium ion measurement in the sub-ppm range was provided by experiments which were necessary to solidify the CRBRP chemistry specifications. CRBRP water specifications were demonstrated in a prototypical experiment.

- 1327 (GEFR--00466) FEASIBILITY OF ACOUSTIC LEAK LOCATION FOR WTD DUPLEX-TUBE STEAM GENERATORS. Gaubatz, D.C.; Greene, D.A.; Magee, P.M.; McMurtrie, K.R. (General Electric Co., Sunnyvale, CA (USA). Advanced Reactor Systems Dept.). Jul 1979. Contract EY-76-C-03-0893-030. 115p. AT.

It has been demonstrated that leak localization is feasible at all locations within the two Westinghouse Tampa Division (WTD) duplex-tube steam generator designs. All of the WTD requirements for leak location can be achieved. The primary WTD design requirement is that a small leak of helium gas into the shell-side sodium be located to within a cluster of seven tubes in less than four hours after hot standby conditions are achieved. This requirement can be met or exceeded everywhere in the steam generator, provided the acoustic sensors (accelerometers) are pre-mounted on the steam generator vessel. It was found to be necessary to simulate experimentally those regions of the WTD steam generator which differ significantly from the vessel wall-sodium annulus-shroud configuration of the Clinch River steam generators. Of particular concern were the convoluted bellows section and the inlet/outlet regions. Feasibility of leak location was experimentally demonstrated for both regions. The feasibility study summarized in this report consisted of twelve tasks: six areas of analysis and six experimental investigations of geometric regions, or problems, associated with the specific WTD Steam Generator designs.

- 1328 (GEFR--00468) GE-LOA-2 TASKS. 1979 ANNUAL REPORT, OCTOBER 1978-JUNE 1979. (General Electric Co., Sunnyvale, CA (USA). Advanced Reactor Systems Dept.). Jul 1979. Contract EY-76-C-03-0893-007. 130p. AT.

Progress in studies on safe shutdown reliability for large LMFBR type reactors is summarized under the following subtask headings: inherently safe core design, fuel pin accident transients, and fuel pin behavior modeling for TOP conditions.

- 1329 (GEFR--10028-62) CORE ENGINEERING SIXTY-SECOND QUARTERLY REPORT, FEBRUARY--APRIL

1977. (General Electric Co., Sunnyvale, CA (USA). Fast Breeder Reactor Dept.). May 1977. Contract EY-76-C-03-0893-011. 52p. AT.
Progress is summarized in the areas of LMFBR fuel assembly engineering and core component design analysis. (DG)
- 1330 (GEFR--10028-63) CORE ENGINEERING. SIXTY-THIRD QUARTERLY REPORT, MAY--JULY 1977. (General Electric Co., Sunnyvale, CA (USA). Fast Breeder Reactor Dept.). Aug 1977. Contract EY-76-C-03-0893-011. 41p. AT.
Progress is summarized in LMFBR fuel assembly engineering and core component design analysis. (DG)
- 1331 (GEFR--10028-64) CORE ENGINEERING. SIXTY-FOURTH QUARTERLY REPORT, AUGUST--OCTOBER 1977. (General Electric Co., Sunnyvale, CA (USA). Fast Breeder Reactor Dept.). Nov 1977. 45p. AT.
Information is presented concerning LMFBR fuel assembly engineering and core component design analysis.
- 1332 (GEFR--10028-65) CORE ENGINEERING. SIXTY-FIFTH QUARTERLY REPORT, NOVEMBER 1977--JANUARY 1978. (General Electric Co., Sunnyvale, CA (USA). Fast Breeder Reactor Dept.). Feb 1978. Contract EY-76-C-03-0893-031. 27p. AT.
Progress is described. Effective October 1, 1976, the Grid-Spacer Driver Assembly and Wire-Wrap Assembly Engineering Programs were combined into a single task entitled "Fuel Assembly Engineering." Similarly, the Core Component Structural Design Criteria and Probabilistic Design Criteria were combined into a single program entitled "Core Component Design and Analysis."
- 1333 (GEFR--10028-66) CORE ENGINEERING. SIXTY-SIXTH QUARTERLY REPORT, FEBRUARY 1978--APRIL 1978. (General Electric Co., Sunnyvale, CA (USA). Fast Breeder Reactor Dept.). May 1978. Contract EY-76-C-03-0893-031. 30p. AT.
Information is presented concerning the fabrication of grid spacers and test assemblies, and classification of core components.
- 1334 (GEFR--10028-67) CORE ENGINEERING. SIXTY-SEVENTH QUARTERLY REPORT, MAY-JULY 1978. (General Electric Co., Sunnyvale, CA (USA)). Aug 1978. Contract EY-76-C-03-0893-031. 28p. AT.
Progress is described for tasks related to the grid-spaced drive assembly, wire-wrap assembly engineering, and core component design analysis.
- 1335 (GEFR--10028-68) CORE ENGINEERING. SIXTY-EIGHTH QUARTERLY REPORT, AUGUST--OCTOBER 1978. (General Electric Co., Sunnyvale, CA (USA). Advanced Reactor Systems Dept.). Nov 1978. Contract EY-76-C-03-0893-031. 47p. AT.
Progress is summarized in LMFBR fuel assembly engineering and core component design analysis.
- 1336 (GEFR--10028-69) CORE ENGINEERING. SIXTY-NINTH QUARTERLY REPORT, NOVEMBER 1978--JANUARY 1979. (General Electric Co., Sunnyvale, CA (USA). Advanced Reactor Systems Dept.). Feb 1979. Contract EY-76-C-03-0893-
031. 42p. AT.
Progress in LMFBR core engineering is reported under the following headings: fuel assembly engineering, and core component design analysis.
- 1337 (GEFR--13771-22) CRITICAL EXPERIMENTS AND ANALYSIS TWENTY-SECOND QUARTERLY REPORT, JANUARY--MARCH 1977. (General Electric Co., Sunnyvale, CA (USA). Fast Breeder Reactor Dept.). Apr 1977. Contract EY-76-C-03-0893-005. 77p. AT.
Current activities and technical progress for the period January through March 1977 are reported for two subtasks. Subtask A covers the technical direction for critical experiments and analysis as applicable to LMFBR commercial plants and the Clinch River Breeder Reactor Plant Benchmark Critical Experiments in ZPPR Assembly 4 and the CRBRP EMC. Subtask B is directed towards the analysis of advanced fuels critical experiments that can provide a consistent data base for testing the computational tools, nuclear analysis techniques and basic nuclear data which are used in the LMFBR design effort, and for evaluating the nuclear performance and safety characteristics of advanced fuel materials.
- 1338 (GEFR--13771-23) CRITICAL EXPERIMENTS AND ANALYSIS. TWENTY-THIRD QUARTERLY REPORT, APRIL--JUNE 1977. (General Electric Co., Sunnyvale, CA (USA). Fast Breeder Reactor Dept.). Jul 1977. Contract EY-76-C-03-0893-005. 74p. AT.
Subtask A covers the technical direction for critical experiments and analysis as applicable to LMFBR commercial plants and the Clinch River Breeder Reactor Plant Benchmark Critical Experiments in ZPPR Assembly 4 and the CRBRP EMC. Subtask B is directed towards the analysis of advanced fuels critical experiments that can provide a consistent data base for testing the computational tools, nuclear analysis techniques and basic nuclear data which are used in the LMFBR design effort, and for evaluating the nuclear performance and safety characteristics of advanced fuel materials.
- 1339 (GEFR--13771-24) CRITICAL EXPERIMENTS AND ANALYSIS TWENTY-FOURTH QUARTERLY REPORT, JULY--SEPTEMBER 1977. (General Electric Co., Sunnyvale, CA (USA). Fast Breeder Reactor Dept.). Oct 1977. Contract EY-76-C-03-0893-005. 132p. AT.
Current activities and technical progress for the period July through September 1977 are reported for two subtasks. Subtask A covers the technical direction for critical experiments and analysis as applicable to LMFBR commercial plants and the Clinch River Breeder Reactor Plant Benchmark Critical Experiments in ZPPR Assembly 4 and the CRBRP EMC. Subtask B is directed towards the analysis of advanced fuels critical experiments that can provide a consistent data base for testing the computational tools, nuclear analysis techniques and basic nuclear data which are used in the LMFBR design effort, and for evaluating the nuclear performance and safety characteristics of advanced fuel materials.
- 1340 (GEFR--13771-25) CRITICAL EXPERIMENTS AND ANALYSIS. (General Electric Co., Sunnyvale, CA (USA). Fast Breeder Reactor Dept.). 1977. Contract EY-76-C-03-0893-031. 64p. AT.
Current activities and technical progress are reported for two subtasks. Subtask A covers the technical direction for critical

experiments and analysis as applicable to LMFBR commercial plants and the Clinch River Breeder Reactor Plant Benchmark Critical Experiments in ZPPR Assembly 4 and the CRBRP EMC. Subtask B is directed towards the analysis of advanced fuels critical experiments that can provide a consistent data base for testing the computational tools, nuclear analysis techniques and basic nuclear data which are used in the LMFBR design effort, and for evaluating the nuclear performance and safety characteristics of advanced fuel materials.

- 1341 (GEFR--13771-26) CRITICAL EXPERIMENTS AND ANALYSIS. TWENTY-SIXTH QUARTERLY REPORT, JANUARY--MARCH 1978. (General Electric Co., Sunnyvale, CA (USA). Fast Breeder Reactor Dept.). Apr 1978. Contract EY-76-C-03-0893-031. 56p. Dep. NTIS, PC A04/MF A01.

Current activities and technical progress are reported for two subtasks. Subtask A covers the technical direction for critical experiments and analysis as applicable to LMFBR commercial plants and the Clinch River Breeder Reactor Plant Benchmark Critical Experiments in ZPPR Assembly 4 and the CRBRP EMC. Subtask B is directed towards the analysis of advanced fuels critical experiments that can provide a consistent data base for testing the computational tools, nuclear analysis techniques, and basic nuclear data which are used in the LMFBR design effort, and for evaluating the nuclear performance and safety characteristics of advanced fuel materials.

- 1342 (GEFR--13771-27) CRITICAL EXPERIMENTS AND ANALYSIS. TWENTY-SEVENTH QUARTERLY REPORT, APRIL--JUNE 1978. (General Electric Co., Sunnyvale, CA (USA). Fast Breeder Reactor Dept.). Jul 1978. Contract EY-76-C-03-0893-031. 61p. AT.

Current activities and technical progress for the period April through June 1978 are reported for two subtasks. Subtask A covers the technical direction for critical experiments and analysis as applicable to LMFBR commercial plants and the Clinch River Breeder Reactor Plant Benchmark Critical Experiments in ZPPR Assembly 4 and the CRBRP EMC. Subtask B is directed towards the analysis of advanced fuels critical experiments that can provide a consistent data base for testing the computational tools, nuclear analysis techniques and basic nuclear data which are used in the LMFBR design effort, and for evaluating the nuclear performance and safety characteristics of advanced fuel materials.

- 1343 (GEFR--13771-28) CRITICAL EXPERIMENTS AND ANALYSIS. TWENTY-EIGHTH QUARTERLY REPORT, JULY--SEPTEMBER 1978. (General Electric Co., Sunnyvale, CA (USA)). Oct 1978. Contract EY-76-C-03-0893-031. 84p. AT.

Current activities and technical progress are reported for the technical direction for critical experiments and analysis as applicable to LMFBR commercial plants and the Clinch River Breeder Reactor Plant Benchmark Critical Experiments in ZPPR Assembly 4 and the CRBRP EMC.

- 1344 (GEFR--13771-29) CRITICAL EXPERIMENTS AND ANALYSIS. TWENTY-NINTH QUARTERLY REPORT, OCTOBER--DECEMBER 1978. (General Electric Co., Sunnyvale, CA (USA). Advanced Reactor Systems Dept.). Jan 1979. Contract EY-76-C-03-0893-031. 63p. AT.

Current activities and technical progress for the period October through December 1978 are reported. This report covers the technical

direction for critical experiments and analysis as applicable to LMFBR commercial plants and the Clinch River Breeder Reactor Plant Benchmark Critical Experiments in ZPPR Assembly 4 and the CRBRP EMC.

- 1345 (GEFR--13771-30) CRITICAL EXPERIMENTS AND ANALYSIS. THIRTIETH QUARTERLY REPORT, JANUARY--MARCH 1979. (General Electric Co., Sunnyvale, CA (USA). Advanced Reactor Systems Dept.). Apr 1979. Contract EY-76-C-03-0893-031. 57p. AT.

This report is the thirtieth in a series of quarterly reports published under the LMFBR Critical Experiments and Analysis Program. Current activities and technical progress for the period January through March 1979 are reported herein. This report covers the technical direction for critical experiments and analysis as applicable to LMFBR commercial plants and the Clinch River Breeder Reactor Plant.

- 1346 (GEFR--13771-31) CRITICAL EXPERIMENTS AND ANALYSIS. THIRTY-FIRST QUARTERLY REPORT, APRIL-JUNE 1979. (General Electric Co., Sunnyvale, CA (USA). Advanced Reactor Systems Dept.). Jul 1979. Contract EY-76-C-03-0893-031. 43p. Dep. NTIS, PC A02/MF A01.

Current activities and technical progress for the period April through June 1979 are reported herein. This report covers the technical direction for critical experiments and analysis as applicable to LMFBR commercial plants and the Clinch River Breeder Reactor Plant.

- 1347 (GEFR--13825-20-22) INSTRUMENTATION DEVELOPMENT TWENTY-SECOND QUARTERLY REPORT, OCTOBER 1976--JUNE 1977. Imhoff, D.H.; Craig, C.N. (General Electric Co., Sunnyvale, CA (USA). Fast Breeder Reactor Dept.). Jul 1977. Contract EY-76-C-03-0893-009. 14p. AT.

The report summarizes progress in the development of instrumentation for surveillance of the core and in-vessel components of liquid metal cooled fast breeder reactors. Current development efforts focus on high temperature neutron detectors and advanced signal transmission methods.

- 1348 (GEFR--13923-19) FUEL ROD MECHANICS AND FAILURE ANALYSIS. NINETEENTH QUARTERLY REPORT, FEBRUARY--APRIL 1977. (General Electric Co., Sunnyvale, CA (USA). Fast Breeder Reactor Dept.). May 1977. Contract EY-76-C-03-0893-002. 46p. AT.

The objective of the work reported under this program is to model fuel rod performance and cladding failure under hypothetical transient conditions, and to validate these models using data from both integral fuel rod experiments and differential in-reactor and out-of-reactor experiments. Progress is reported under the following headings: experimental analysis and code validation, FTR and CRBR supporting analyses, and evaluation-adaptation of existing codes.

- 1349 (GEFR--13923-20) FUEL ROD MECHANICS AND FAILURE ANALYSIS. TWENTIETH QUARTERLY REPORT, MAY--JULY 1977. (General Electric Co., Sunnyvale, CA (USA). Fast Breeder Reactor Dept.). Aug 1977. Contract EY-76-C-0893-002. 61p. AT.

The objective of the work reported under this program is to model fuel rod performance and cladding failure under hypothetical transient conditions, and to validate these

models using data from both integral fuel rod experiments and differential in-reactor and out-of-reactor experiments.

- 1350 (GEFR--13923-21) FUEL ROD MECHANICS AND FAILURE ANALYSIS. TWENTY-FIRST QUARTERLY REPORT, AUGUST--OCTOBER 1977. Horst, K.M.; Craig, C.N. (General Electric Co., Sunnyvale, CA (USA). Fast Breeder Reactor Dept.). Nov 1977. Contract EY-76-C-03-0893-002. 52p. AT.

The objective of the work reported under this program is to model fuel rod performance and cladding failure under hypothetical transient conditions, and to validate these models using data from both integral fuel rod experiments and differential in-reactor and out-of-reactor experiments. Progress is reported under the following headings: experiment analysis and code validation, FTR and CRBR supporting analysis, evaluation-adaptation of existing codes, fuel performance code development, code standardization and documentation, and technical management.

- 1351 (GEFR--13923-22) FUEL ROD MECHANICS AND FAILURE ANALYSIS TWENTY-SECOND QUARTERLY REPORT, NOVEMBER 1977--JANUARY 1978. (General Electric Co., Sunnyvale, CA (USA). Fast Breeder Reactor Dept.). Feb 1978. Contract EY-76-C-03-0893-032. 30p. AT.

The objective of the work reported under this program is to model fuel rod performance and cladding failure under hypothetical transient conditions, and to validate these models using data from both integral fuel rod experiments and differential in-reactor and out-of-reactor experiments. Progress during November and December 1977, and January 1978 is described.

- 1352 (GEFR--13923-23) FUEL ROD MECHANICS AND FAILURE ANALYSIS. TWENTY-THIRD QUARTERLY REPORT, FEBRUARY 1978--APRIL 1978. (General Electric Co., Sunnyvale, CA (USA). Fast Breeder Reactor Dept.). May 1978. Contract EY-76-C-03-0893-032. 30p. AT.

This report is the twenty-third in a series of quarterly progress reports published under this program. The program title for the first sixteen reports was "Safety Engineering". The present title reflects more accurately the nature of the work that has been performed in the past and the work that is expected to be emphasized in the future. The objective of the work reported under this program is to model fuel rod performance and cladding failure under hypothetical transient conditions, and to validate these models using data from both integral fuel rod experiments and differential in-reactor and out-of-reactor experiments. Progress is summarized under the following headings: experiment analysis and code validation, fuel performance code development, parametric accident analysis, FTR and CRBR supporting analysis, and LOA-2 reliability assessment.

- 1353 (GEFR--13923-24) FUEL ROD MECHANICS AND FAILURE ANALYSIS. TWENTY-FOURTH QUARTERLY REPORT, MAY--JULY 1978. (General Electric Co., Sunnyvale, CA (USA). Advanced Reactor Systems Dept.). Aug 1978. Contract EY-76-C-03-0893-032. 43p. AT.

The objective of the work reported is to model fuel rod performance and cladding failure under hypothetical transient conditions, and to validate these models using data from both integral fuel rod experiments and differential in-reactor and out-of-reactor experiments.

Tensile data are presented for 20% CW, type-316 stainless steel.

- 1354 (GEFR--14023-4) RISK ANALYSIS METHODS DEVELOPMENT. FOURTH QUARTERLY REPORT, OCTOBER--DECEMBER 1977. (General Electric Co., Sunnyvale, CA (USA). Fast Breeder Reactor Dept.). Jan 1978. Contract EY-76-C-03-0893-032. 17p. AT.

The pilot study to identify R and D needs for energetics control during the initiating phase of a whole-core disruption accident was completed. The study showed that the LOA3 conditional failure probability goal of 0.01 given LOA2 failure is not met based on available information. R and D programs with quantitative objectives satisfying the LOA3 goal were identified, thus demonstrating the value of the LOA strategy in producing measurable objectives. Work on the LOA Integration Plan was initiated. Objectives and scope of the plan were defined. The scope of the LOA supporting analysis for this fiscal year was defined. The analysis will focus on one Level 2 product for each LOA and will use the procedure developed for the pilot study on energetics control with appropriate modifications. Objectives and scope for the LOA Integration Task Level 2 products of Risk Assessment, Cost-Benefit Analysis, and State-of-Technology Documentation were defined. The draft of the Procedural Manual for Breeder Reactor Risk Assessment, GEFR-00259(DR), was completed.

- 1355 (GEFR--14023-5) RISK ANALYSIS METHODS DEVELOPMENT. FIFTH QUARTERLY REPORT, JANUARY--MARCH 1978. (General Electric Co., Sunnyvale, CA (USA). Fast Breeder Reactor Dept.). Apr 1978. Contract EY-76-C-03-0893-032. 27p. AT.

The structure of two procedures for guiding R and D planning using the line-of-assurance (LOA) approach is presented. The first procedure (LOA Integration Procedure) identifies failure dependencies between the LOAs and evaluates their effect on the LOA success probability. The second procedure (Cost-Benefit Analysis Procedure) identifies the optimum R and D choice and ranks R and D options in terms of their expected net benefit. The relationship of these procedures to the R and D planning process is also presented. The LOA Integration Procedure takes as input individual LOA definitions (given in terms of the challenge envelope for which the LOA is designed), LOA success paths, and success probability and develops corresponding event trees with consideration of challenges beyond the challenge envelope. The resulting event trees are then linked for analysis of failure dependencies resulting from causes beyond the challenge envelope, random causes within the challenge envelope, and uncertainty in the predictive tools used for evaluating the LOA performance. Probability models for LOA failure with consideration of these dependencies are presented for the four LOAs. The Cost-Benefit Analysis Procedure defines R and D program options in terms of factors describing the R and D program success criterion, test design, and test facility characterization. The procedure confines itself to economic benefits only and leaves it to the decision-maker to compare various benefits based on his own non-economic values. Separation of economic and non-economic values was accomplished by designing the procedure to provide a ranking of test facility characterization options based on the R and D program and test design which gives the maximum expected net economic benefit. Procedures for defining the R and D success

criterion and evaluating probability of the R and D program success are illustrated by examples. Cost and benefit functions are also described.

- 1356 (GEFR--14023-6/7) RISK ANALYSIS METHODS DEVELOPMENT. SIXTH--SEVENTH QUARTERLY REPORTS, APRIL--SEPTEMBER 1978. (General Electric Co., Sunnyvale, CA (USA). Advanced Reactor Systems Dept.). Oct 1978. Contract EY-76-C-03-0893-032. 48p. AT.

Progress is reported for the following subtasks in risk analysis methods development for LMFBRs: Lines-of-Assurance (LOA) supporting analysis, consultation with LOA working groups, and methods and procedures development.

- 1357 (GEFR--14023-8) RISK ANALYSIS METHODS DEVELOPMENT. EIGHTH QUARTERLY REPORT, OCTOBER--DECEMBER 1978. (General Electric Co., Sunnyvale, CA (USA). Advanced Reactor Systems Dept.). Jan 1979. Contract EY-76-C-03-0893-032. 28p. AT.

The objectives of the program are: (1) to develop and apply methods for R and D planning in support of the Lines-of-Assurance (LOA) strategy and (2) to establish a credible Breeder Reactor (BR) risk assessment basis for evaluating R and D overall risk goal accomplishments. The report describes work on the Procedural Manual for Breeder Reactor Risk Assessment and development of a consistent probability model for single plant risk assessment.

- 1358 (GEFR--14023-9) RISK ANALYSIS METHODS DEVELOPMENT. NINTH QUARTERLY REPORT, JANUARY--MARCH 1979. (General Electric Co., Sunnyvale, CA (USA). Advanced Reactor Systems Dept.). Apr 1979. Contract EY-76-C-03-0893-032. 51p. AT.

Progress in LMFBR risk analysis methods development is reported under the following headings: (1) task planning, management and liaison; (2) Lines-of-Assurance (LOA) supporting analysis; (3) consultation with LOA working groups; and (4) methods and procedures development.

- 1359 (GEFR--14023-10) RISK ANALYSIS METHODS DEVELOPMENT. TENTH QUARTERLY REPORT, APRIL--JUNE 1979. (General Electric Co., Sunnyvale, CA (USA). Advanced Reactor Systems Dept.). Jul 1979. Contract EY-76-C-03-0893-032. 32p. Participants in the LMFBR Program. Others request from TIC.

Progress in LMFBR risk analysis methods development is reported for the following subtasks: task planning, management and liaison; risk analysis applications; LOA (Lines of Assurance) supporting analysis; consultation with LOA working groups; and methods and procedures development.

- 1360 (GEFR--14029-12) STEAM GENERATOR MATERIALS ENGINEERING TWELFTH QUARTERLY REPORT, APRIL--JUNE 1977. Challenger, K.D. (General Electric Co., Sunnyvale, CA (USA). Fast Breeder Reactor Dept.). Jul 1977. Contract EY-76-C-03-0893-018. 42p. AT.

The primary objective of the work reported here is to characterize materials, mainly 2 1/4 Cr-1 Mo and stainless steels, to assure that satisfactory materials compatibility is achieved with expected LMFBR steam generator environments. Data are presented on decarburization phenomena, steam corrosion, and fracture properties.

- 1361 (GEFR--14029-13) STEAM GENERATOR MATERIALS ENGINEERING THIRTEENTH QUARTERLY REPORT, JULY--SEPTEMBER 1977. (General Electric Co., Sunnyvale, CA (USA). Fast Breeder Reactor Dept.). Oct 1977. Contract EY-76-C-03-0893-018. 35p. AT.

The primary objective of the work reported is to characterize materials, mainly 2 1/4 Cr-1 Mo and stainless steels, to assure that satisfactory materials compatibility is achieved with expected LMFBR steam generator environments.

- 1362 (GEFR--14031-9) CORE RESTRAINT ENGINEERING. NINTH QUARTERLY REPORT, AUGUST--OCTOBER 1976. Horst, K.M.; Cragi, C.N. (General Electric Co., Sunnyvale, CA (USA). Fast Breeder Reactor Dept.). Nov 1976. Contract EY-76-C-03-0893-023. 14p. AT.

Progress is described for subtasks related to refueling force evaluation and test, instrumented simulated fuel assemblies, core restraint transient analysis, in-reactor monitoring, advanced core restraint studies, and seismic evaluation.

- 1363 (GEFR--14031-10) CORE RESTRAINT ENGINEERING. TENTH QUARTERLY REPORT, NOVEMBER--DECEMBER 1976 AND JANUARY 1977. (General Electric Co., Sunnyvale, CA (USA). Fast Breeder Reactor Dept.). Feb 1977. Contract EY-76-C-03-0893-023. 17p. AT.

The design guidelines and the corresponding technology required to design LMFBR core restraint systems and to support applicable licensing processes are discussed. Progress is described for subtasks related to refueling force evaluation and test, instrumented simulated fuel assemblies, core restraint transient analysis, in-reactor monitoring, advanced core restraint studies, and seismic evaluation.

- 1364 (GEFR--14031-11) CORE RESTRAINT ENGINEERING. ELEVENTH QUARTERLY REPORT, FEBRUARY--APRIL 1977. (General Electric Co., Sunnyvale, CA (USA). Fast Breeder Reactor Dept.). May 1977. Contract EY-76-C-03-0893-023. 35p. Dep. NTIS, PC A03/MF A01.

The objective of the work reported is to develop, in conjunction with other members of the National Core Restraint Development Program, the design guidelines and the corresponding technology required to design LMFBR core restraint systems and to support applicable licensing processes. Progress during the reporting period is described for subtasks related to refueling force evaluation and test, instrumented simulated fuel assemblies, core restraint transient analysis, in-reactor monitoring, advanced core restraint studies, and seismic evaluation.

- 1365 (GEFR--14031-12) CORE RESTRAINT ENGINEERING. TWELFTH QUARTERLY REPORT, MAY--JUNE 1977. (General Electric Co., Sunnyvale, CA (USA). Fast Breeder Reactor Dept.). Aug 1977. Contract EY-76-C-03-0893-023. 25p. AT.

The design guidelines and the corresponding technology required to design LMFBR core restraint systems and to support applicable licensing processes are discussed. Progress is described for subtasks related to refueling force evaluation and test, instrumented simulated fuel assemblies, core restraint transient analysis, in-reactor monitoring, advanced core restraint studies, and seismic evaluation.

1366 (GEFR--14031-13) CORE RESTRAINT ENGINEERING. THIRTEENTH QUARTERLY REPORT, AUGUST--OCTOBER 1977. Horst, K.M.; Craig, C.N. (General Electric Co., Sunnyvale, CA (USA). Fast Breeder Reactor Dept.). Nov 1977. Contract EY-76-C-03-0893-023. 24p. AT.

Progress is described for subtasks related to refueling force evaluation and test, instrumented simulated fuel assemblies, core restraint transient analysis, in-reactor monitoring, advanced core restraint studies, and seismic evaluation.

1367 (GEFR--14031-14) CORE RESTRAINT ENGINEERING. FOURTEENTH QUARTERLY REPORT, NOVEMBER 1977--JANUARY 1978. (General Electric Co., Sunnyvale, CA (USA). Fast Breeder Reactor Dept.). Feb 1978. Contract EY-76-C-03-0893-031. 17p. AT.

The objective of the work reported is to develop, in conjunction with other members of the National Core Restraint Development Program, the design guidelines and the corresponding technology acquired to design LMFBR core restraint systems and to support applicable licensing processes. Progress during the reporting period is described for subtasks related to refueling force evaluation and test, instrumented simulated fuel assemblies, core restraint transient analysis, in-reactor monitoring, advanced core restraint studies, and seismic evaluation.

1368 (GEFR--14031-15) CORE RESTRAINT ENGINEERING. FIFTEENTH QUARTERLY REPORT, FEBRUARY--APRIL 1978. (General Electric Co., Sunnyvale, CA (USA). Fast Breeder Reactor Dept.). May 1978. Contract EY-76-C-03-0893-031. 19p. AT.

Progress is summarized in the following areas: (1) National Core Restraint Development Program activities, (2) refueling force evaluation and test, (3) core restraint transient analysis, (4) in-reactor monitoring, (5) seismic evaluation, and (6) core restraint system design guidelines. (DG)

1369 (GEFR--14031-16) CORE RESTRAINT ENGINEERING. SIXTEENTH QUARTERLY REPORT, MAY--JULY 1978. Horst, K.M.; Craig, C.N. (General Electric Co., Sunnyvale, CA (USA). Advanced Reactor Systems Dept.). Aug 1978. Contract EY-76-C-03-0893-031. 20p. AT.

Progress during the reporting period is described for core mechanics and configuration behavior.

1370 (GEFR--14031-17) CORE RESTRAINT ENGINEERING. SEVENTEENTH QUARTERLY REPORT, AUGUST--OCTOBER 1978. (General Electric Co., Sunnyvale, CA (USA). Advanced Reactor Systems Dept.). Nov 1978. Contract EY-76-C-03-0893-031. 37p. AT.

The overall objective of the program is to develop, in conjunction with other members of the National Core Mechanics and Configuration Performance Program, the design guidelines and the corresponding technology required to design LMFBR core restraint systems and to support applicable licensing processes.

1371 (GEFR--14034-11) RADIOLOGICAL ASSESSMENT MODELS. ELEVENTH QUARTERLY REPORT, MARCH--MAY 1977. (General Electric Co., Sunnyvale, CA (USA). Fast Breeder Reactor Dept.). Jun 1977. Contract EY-76-C-03-0893-015. 54p. AT.

The objectives of the program are to develop models based on analyses and experiments to determine: (1) the amount and the characteristics of radiological materials discharged energetically from the core, transported to the cover-gas space and available for leakage from the reactor vessel, and (2) the long-term radiological source resulting from a core melt-through as a result of hypothetical core disruptive accidents in liquid metal fast breeder reactors. During this reporting period, the experiments to simulate and examine the characteristics of rapidly expanding saturated fuel by rapidly expanding mixtures of hot saturated water and steam have been completed. The test data have been compared with analytical results. The fuel-vapor transport model (BUBBLE I), which was reported in the tenth quarterly report, was extended to account for fuel solidification during cool down and to include a scheme to treat condensation of fuel as an aerosol source and evaluate its size distribution. A parametric study was made to determine the effects of the number of bubbles and the bubble surface emissivity on the bubble characteristics and mass of fuel transported to the cover-gas space.

1372 (GEFR--14034-13) RADIOLOGICAL ASSESSMENT MODELS. THIRTEENTH QUARTERLY REPORT, SEPTEMBER--NOVEMBER 1977. (General Electric Co., Sunnyvale, CA (USA). Fast Breeder Reactor Dept.). Dec 1977. Contract EY-76-C-03-0893-015. 33p. AT.

The objective of the program is to develop models based upon analysis and experiment for determining: (a) the radiological source term resulting from the energetic phase of a hypothetical core disruptive accident, (b) the long duration radiological source term resulting from a core melt-through, and (c) the attenuation of radiological source terms within secondary containment. The discharge of fuel into a sodium pool as a result of an HCDA depends largely upon fuel pressure, heat transfer to structure and flow rates through channels. During this quarter, equations of state for fuel were examined and a theory was developed for evaluating choked flow rates. The theory compared favorably with test data. The BUBBLES code developed to calculate the collapse of vapor bubbles containing noncondensable gas was used to examine the effects of variations in the amount of gas. The code was improved and calculations were continued in order to determine bubble heat transfer parameters.

1373 (GEFR--14034-14) RADIOLOGICAL ASSESSMENT MODELS FOURTEENTH QUARTERLY REPORT, DECEMBER 1977--FEBRUARY 1978. (General Electric Co., Sunnyvale, CA (USA). Fast Breeder Reactor Dept.). Mar 1978. Contract EY-76-C-03-0893-032. 16p. AT.

The report documents work performed to develop models based on analyses and experiments which determine: (a) radiological source terms resulting from hypothetical, energetic and melt-through core disruptive accident scenarios, and (b) radiological source term attenuation within containment. The BUBBLES code being developed to evaluate potential radiological source terms resulting from energetic hypothetical core disruptive accidents has been used to calculate the collapse of water vapor bubbles containing noncondensable gas. The results have been compared with test data to evaluate heat transfer parameters. Compared with the test data, the BUBBLES code provides conservative results over the range of test Peclet numbers.

Similar results are expected for sodium vapor bubbles.

- 1374 (GEFR--14034-15) RADIOLOGICAL ASSESSMENT MODELS. FIFTEENTH QUARTERLY REPORT, MARCH--MAY 1978. (General Electric Co., Sunnyvale, CA (USA). Fast Breeder Reactor Dept.). Jun 1978. Contract EY-76-C-03-0893-032. 21p. AT.

The objective of the program is to develop models based on analyses and experiments which determine: (a) radiological source terms resulting from hypothetical, energetic and melt-through core disruptive accident scenarios, and (b) radiological source term attenuation within containment. The BUBBLES code being developed to evaluate attenuation of potential radiological sources resulting from energetic hypothetical core disruptive accidents was extended to treat condensation of sodium vapor bubbles. Parametric calculations were performed for a representative hypothetical accident in order to evaluate the effects of noncondensable gas and surface area (number of bubbles) on condensation rates. The results indicate that for dispersed discharge from the core there is a large potential for source term attenuation even when large amounts of noncondensable gas are present.

- 1375 (GEFR--14034-16) RADIOLOGICAL ASSESSMENT MODELS. SIXTEENTH QUARTERLY REPORT, JUNE--AUGUST 1978. (General Electric Co., Sunnyvale, CA (USA). Advanced Reactor Systems Dept.). Sep 1978. Contract EY-76-C-03-0893-032. 25p. AT.

This report, the sixteenth in a series of quarterly reports published under the Radiological Assessments program, documents work performed from June 1978 to August 1978. The objective of the program is to develop models based on analyses and experiments which determine: (a) radiological source terms resulting from hypothetical, energetic and melt-through core disruptive accident scenarios, and (b) radiological source term attenuation within containment. Test data pertaining to fuel and fission product release from burning and boiling sodium pools were examined to determine the mechanisms which control such releases. The data were found to be inadequate to determine conclusively the processes involved. A theoretical investigation is in progress to identify controlling parameters, develop correlations between them, and define experiments. Sensitivity studies over the range of uncertainty in decontamination factors indicate the risk is acceptable for the extremely low probability accidents considered in lines of assurance three and four. It is expected the risk could be significantly reduced if more test data were available.

- 1376 (GEFR--14038-11) ADVANCED SAFETY ANALYSIS. ELEVENTH QUARTERLY REPORT, MARCH--MAY 1977. (General Electric Co., Sunnyvale, CA (USA). Fast Breeder Reactor Dept.). Jun 1977. Contract EY-76-C-03-0893-019. 126p. AT.

Information on LMFBR safety is presented concerning engineering analysis of post-accident heat removal; inherently safe core design; fuel pin accident transients; safe shutdown reliability for large LMFBR; and experimental fuel rod fabrication.

- 1377 (GEFR--14038-12) ADVANCED SAFETY ANALYSIS. TWELFTH QUARTERLY REPORT, JUNE--AUGUST 1977. (General Electric Co., Sunnyvale, CA (USA). Fast Breeder Reactor

Dept.). Sep 1977. Contract EY-76-C-03-0893-019. 104p. AT.

Progress is summarized in the following study areas: engineering analysis of post-accident heat removal, inherently safe core design, fuel-pin accident transients, safe shutdown reliability for large LMFBRs, and experimental fuel rod fabrication.

- 1378 (GEFR--14038-13) ADVANCED SAFETY ANALYSIS THIRTEENTH QUARTERLY REPORT, SEPTEMBER--NOVEMBER 1977. (General Electric Co., Sunnyvale, CA (USA). Fast Breeder Reactor Dept.). Dec 1977. Contract EY-76-C-03-0893-032. 101p. AT.

Progress is summarized in the following study areas: accident debris analysis, inherently safe core design, fuel pin accident transients, safe shutdown reliability for large breeder reactors, and experimental fuel rod fabrication.

- 1379 (GEFR--14038-15) ADVANCED SAFETY ANALYSIS. FIFTEENTH QUARTERLY REPORT, MARCH--MAY 1978. (General Electric Co., San Jose, CA (USA). Boiling Water Reactor Systems Dept.). Jun 1978. Contract EY-76-C-03-0893-032. 59p. AT.

Progress is summarized in the following areas of LMFBR safety research: accident debris analysis, inherently safe core design, fuel pin accident transients program, safe shutdown reliability for large breeder reactors, and experimental fuel rod fabrication.

- 1380 (GEFR--14073-3) NUCLEAR DATA AND METHODS DEVELOPMENT AND APPLICATION TO LMFBRs. THIRD ANNUAL PROGRESS REPORT, FISCAL YEAR 1977. (General Electric Co., Sunnyvale, CA (USA). Fast Breeder Reactor Dept.). 1977. Contract EY-76-C-03-0893-021. 49p. AT.

This report is the third in a series of progress reports published under the Cooperative Nuclear Data and Methods Development Program. The objective of the work reported under this program is to support cooperative evaluations of nuclear data and analytical design tools, to expedite implementation of these in-reactor design applications, and to perform specific analytical physics tasks required to support the Fast Breeder Reactor Program.

- 1381 (GEFR--14073-4) NUCLEAR DATA AND METHODS DEVELOPMENT AND APPLICATION TO LMFBRs. FOURTH ANNUAL PROGRESS REPORT, FISCAL YEAR 1978. (General Electric Co., Sunnyvale, CA (USA). Advanced Reactor Systems Dept.). 1978. Contract EY-76-C-03-0893-031. 48p. AT.

The fast critical assemblies ZPR-6-7 and ZPR-9-31 were analyzed as part of Phase II testing of the preliminary Version V of ENDF/B. The analysis of the large core sodium-voiding benchmark has been completed. The conclusions based on these studies are reported. The radiological hazards from the actinide wastes discharged from a number of alternate fast reactor systems have been determined. It is recommended that further actinide recycle efforts include the investigation of a special purpose actinide-burner reactor. A systematic analysis of neutronics methods for large heterogeneous cores is being carried out.

- 1382 (GEFR--14074-5) COOPERATIVE NUCLEAR DATA AND METHODS DEVELOPMENT FIFTH QUARTERLY REPORT, OCTOBER--DECEMBER 1976. (General Electric Co., Sunnyvale, CA (USA). Fast Breeder Reactor Dept.). Jan 1977. Contract EY-76-C-

03-0893-021. 32p. AT.

Progress is reported in the cooperative evaluation of nuclear data and analytical design tools for LMFBRs.

- 1383 (GEFR--14074-6) COOPERATIVE NUCLEAR DATA AND METHODS DEVELOPMENT SIXTH QUARTERLY REPORT, JANUARY--MARCH 1977. (Analysis and Computer Systems, Inc., Burlington, MA (USA)). Apr 1977. Contract EY-76-C-03-0893-021. 31p. AT.

Progress is reported in the cooperative evaluation of nuclear data and analytical design tools for LMFBRs.

- 1384 (GEFR--14074-7) COOPERATIVE NUCLEAR DATA AND METHODS DEVELOPMENT SEVENTH QUARTERLY REPORT, APRIL--JUNE 1977. Horst, K.M.; Craig, C.N. (General Electric Co., Sunnyvale, CA (USA). Fast Breeder Reactor Dept.). Jul 1977. Contract EY-76-C-03-0893-021. 38p. AT.

The report presented in the seventh in a series of quarterly reports published under the Cooperative Nuclear Data and Methods Development Program. The objective of the work reported under this program is to support cooperative evaluations of nuclear data and analytical design tools, to expedite implementation of these in-reactor design applications, and to perform specific analytical physics tasks required to support the Fast Breeder Reactor Program including an evaluation of the nuclear feasibility of significantly impacting the waste disposal problem by utilizing actinide recycle.

- 1385 (GEFR--14074-8) COOPERATIVE NUCLEAR DATA AND METHODS DEVELOPMENT. EIGHTH QUARTERLY REPORT, OCTOBER--DECEMBER 1977. (General Electric Co., Sunnyvale, CA (USA). Fast Breeder Reactor Dept.). Jan 1978. Contract EY-76-C-03-0893-031. 44p. AT.

The Phase I Reviews of U-238, Cf-249, Cf-250 and Cf-251 as evaluated for Version V of ENDF/B have been completed. The recommended Pu-239 data for ENDF/B-V has been tested for a fast critical assembly to determine the effects of the changes with respect to ENDF/B-IV. Calculations for several fast CSEWG benchmarks have been performed using ENDF/B-IV data and the latest version of the data processing code TDOWN. The second LCCEWG benchmark, which is the sodium voiding of a large homogeneous fast reactor, has been analyzed. The results for the 21- and 4-energy group calculations are reported. A survey of the literature on actinide partitioning and actinide burnup has been carried out.

- 1386 (GEFR--14074-9) COOPERATIVE NUCLEAR DATA AND METHODS DEVELOPMENT. NINTH QUARTERLY REPORT, JANUARY--MARCH 1978. (General Electric Co., Sunnyvale, CA (USA). Fast Breeder Reactor Dept.). Apr 1978. Contract EY-76-C-03-0893-031. 47p. AT.

The objective of the work reported is to support cooperative evaluations of nuclear data and analytical design tools to expedite their implementation in reactor design applications and to perform specific analytical physics tasks required in the fast breeder reactor program. These tasks include an evaluation of the nuclear feasibility of significantly impacting the waste disposal problem by utilizing actinide recycle.

- 1387 (GEFR--14074-10) COOPERATIVE NUCLEAR DATA AND METHODS DEVELOPMENT. TENTH QUARTERLY REPORT, APRIL--JUNE 1978. (General Electric

Co., Sunnyvale, CA (USA). Fast Breeder Reactor Dept.). Jul 1978. Contract EY-76-C-03-0893-031. 39p. AT.

The objective of the work reported is to support cooperative evaluations of nuclear data and analytical design tools to expedite their implementation in reactor design applications and to perform specific analytical physics tasks required in the fast breeder reactor program. These tasks include an evaluation of the nuclear feasibility of significantly impacting the waste disposal problem by utilizing actinide recycle.

- 1388 (GEFR--14074-11) COOPERATIVE NUCLEAR DATA AND METHODS DEVELOPMENT. ELEVENTH QUARTERLY REPORT, JULY--DECEMBER 1978. (General Electric Co., Sunnyvale, CA (USA). Advanced Reactor Systems Dept.). Jan 1979. Contract EY-76-C-03-0893-031. 53p. AT.

The ^{239}Pu to ^{235}U fission cross section ratios were reevaluated in the energy range 0.2 to 12 MeV. The reevaluated ^{239}Pu to ^{235}U fission cross section ratios were used to obtain the ^{239}Pu fission cross sections for ENDF/B-V. To conform with DOE requirements on the release of computer codes, an effort is underway to convert TDOWN-III to the CCC standard interface format for input/output processing. A more accurate and efficient method for generating the transport kernels used in TDOWN has been developed. It is based on the exact solution of the transport equation in slab geometry, consistent with a flat source assumption. The solution is extended to cylindrical geometry using a slicing technique. Uncertainties in the cross section data for the higher plutonium and americium isotopes were investigated to determine their impact on the important LMFBR design parameters. The results of this investigation indicated that the design calculations are sensitive to the uncertainties in the capture and fission data for ^{240}Pu and ^{241}Pu , and for long-term design applications these uncertainties should be reduced to less than about 10%. The uncertainties in the data for ^{242}Pu and for the americium isotopes have only a small impact on the fast reactor design studies but may be important in the development of schemes for the management of actinide waste discharge and for plutonium burnout. The treatment of control rod heterogeneity effects with two-dimensional modeling was investigated. The results indicate that reasonable k-effectives can be computed for various control in/control out configurations in (X,Y) geometry using axial bucklings obtained from a single (R,Z) problem with central control rod in and with control out annuli representing the remaining control rod positions.

- 1389 (GEFR--14074-12) COOPERATIVE NUCLEAR DATA AND METHODS DEVELOPMENT. TWELFTH QUARTERLY REPORT, JANUARY--MARCH 1979. (General Electric Co., Sunnyvale, CA (USA). Advanced Reactor Systems Dept.). Apr 1979. Contract EY-76-C-03-0893-031. 38p. AT.

The GE-ARSD requirements for an ENDF/B-V multigroup library were specified and forwarded to ORNL. An effort is underway to convert TDOWN-III to the CCC standard interface format for input/output processing. A more accurate and efficient method for generating transport kernels was incorporated into TDOWN-III. The test calculations verified that excellent results are obtained at a reduced cost. Two actinide burner reactors were analyzed by use of one-dimensional diffusion theory and the point burnup code ORIGEN. These include a liquid-fuel spherical reactor with a high actinide burnup rate and an actinide-fueled fast reactor similar to an LMFBR. Reasonable k-

effectives can be computed with diffusion theory for various control-in/control-out/control partially configurations in (X,Y) geometry by use of axial bucklings obtained from (R,Z) problems with the central control fully or partially inserted and with control-out annuli representing the remaining control rod positions. These conclusions were verified by three-dimensional calculations. However, differences between (R,Z) and (X,Y) transport theory calculations were larger than expected for the same procedures. These differences may be due to the ray-effect in (X,Y) geometry, requiring the use of higher order $S_{\text{sub } n}$. An investigation of the transient behavior of homogeneous and heterogeneous LMFBR designs using the two-dimensional space-kinetics code FX2-TM was begun. 5 figures, 10 tables.

- 1390 (GEFR--14074-13) COOPERATIVE NUCLEAR DATA AND METHODS DEVELOPMENT. THIRTEENTH QUARTERLY REPORT, APRIL-JUNE, 1979. Protsik, R. (General Electric Co., Sunnyvale, CA (USA). Advanced Reactor Systems Dept.). Jul 1979. Contract EY-76-C-03-0893-031. 21p. AT.

The objective of the Cooperative Nuclear Data and Methods Program is the development and working implementation of nuclear data and methods relevant to the design and analysis of fast breeder reactors. The specific objectives of the four individual subtasks are summarized as follows: Cooperative Nuclear Data Development - To participate in the activities of the Cross Section Evaluation Working Group (CSEWG) to evaluate the nuclear data which is relevant to the design of fast breeder reactors. Cooperative Methods Development - To participate in the development of nuclear design methods including code validation in the functional areas of data processing, the analysis of critical experiments, and the design of large power reactors. Actinide Recycle Analysis - To evaluate actinide recycle in LMFBRs and the eventual use of Pu-burners as a waste management option. Full Scale LMFBR Analysis - To evaluate methods and quantify approximations for use in the analysis of heterogeneous cores.

- 1391 (GEFR-SP--010) OUT-OF-PILE EXPERIMENTS PERFORMED IN THE U.S. FUEL CLADDING CHEMICAL INTERACTION (FCCI) PROGRAM. Adamson, M.G. (General Electric Co., Pleasanton, CA (USA). Vallecitos Nuclear Center). 1977. Contract EY-76-C-03-0893-014. 69p. (CONF-770215--2). Dep. NTIS, PC A04/MF A01.

From Technical committee meeting on fuel and cladding interaction; Tokyo, Japan (21 Feb 1977).

Since 1972 a variety of out-of-pile experiments have been performed as part of the US National Fuel-Cladding Chemical Interaction (FCCI) Program. In the present paper results from these experiments are presented together with descriptions of many of the experimental techniques employed to obtain them. Although the main emphasis of the paper is on experiments designed to characterize FCCI with Type-316SS cladding, considerable attention is also paid to the following FCCI-related topics: thermodynamics of and phase equilibria in mixed oxide fuel and fission product compounds, fission product and cladding component thermo-transport, and chemical behavior of candidate oxygen-absorber materials (buffer/getters). Detailed interpretations of these results in terms of FCCI mechanisms are presented in a companion paper.

CLADDING CHEMICAL INTERACTION: US INTERPRETATION. Adamson, M.G. (General Electric Co., Pleasanton, CA (USA). Vallecitos Nuclear Center). 1977. Contract EY-76-C-03-0893-014. 47p. (CONF-770215--1). Dep. NTIS, PC A03/MF A01.

From Technical committee meeting on fuel and cladding interaction; Tokyo, Japan (21 Feb 1977).

Proposed mechanisms of fuel-cladding chemical interaction (FCCI) in LMFBR fuel pins are reviewed and examined in terms of in-pile and out-of-pile data. From this examination several factors are identified which may govern the occurrence of localized deep intergranular penetrations of Type-316SS cladding. Using a plausible mechanistic hypothesis for FCCI, first steps have been taken towards developing a quantitative, physically-meaningful, mathematical method of predicting cladding wastage in operating fuel pins. Both kinetic and thermodynamic aspects of FCCI are considered in the development of this prediction method, together with a fuel chemistry model that describes the evolution of thermochemical conditions at the fuel-cladding gap. On the basis of results from recent fuel pin and laboratory tests a thermal transport mechanism has been proposed to explain the thermal gradient-induced migration of Fe, Cr, and Ni from cladding into the fuel. This mechanism involves chemical transport of the metallic cladding components (as tellurides) in liquid Cs--Fe.

- 1393 (GEFR-SP--023) POST-ACCIDENT HEAT REMOVAL IN LMFBRs. Glueckler, E.L.; Baker, L. Jr. (General Electric Co., Sunnyvale, CA (USA). Fast Breeder Reactor Dept.). Jun 1977. Contract EY-76-C-03-0893-019. 62p. (CONF-771120--13). Dep. NTIS, PC A04/MF A01.

From Winter annual meeting of the American Society of Mechanical Engineers; Atlanta, GA, USA (27 Nov 1977).

For safety assessments of early sodium cooled fast breeder reactors (LMFBRs), extremely unlikely events such as unprotected loss of flow and transient overpower sequences have been evaluated. The prediction of the consequences of these postulated events involves investigations of decay heat dissipation and core retention. In general, these problem areas are referred to collectively as post-accident heat removal (PAHR). This paper reviews data on heat transfer, fluid mechanics, nuclear stability and material interactions associated with PAHR. Some concepts applied in early LMFBRs for consequence mitigation are also described.

- 1394 (GEFR-SP--027) RISK ALLOCATION APPROACH TO REACTOR SAFETY DESIGN AND EVALUATION. Gokcek, D.; Temme, M.I.; Derby, S.L. (General Electric Co., Sunnyvale, CA (USA). Fast Breeder Reactor Dept.). 23 Aug 1977. Contract EY-76-C-03-0893-019. 7p. (CONF-780507--20). Dep. NTIS, PC A02/MF A01.

From Probabilistic analysis of nuclear reactor safety; Los Angeles, CA, USA (8 May 1978).

The techniques of probabilistic risk assessment and risk allocation are viable and valuable tools for establishing safety reliability goals for nuclear power plants. These methods allow quantitative design goals to be derived from a risk acceptance constraint. The basic concept described in this paper can be applied to other type power generating plants with minor modifications.

EVALUATIONS OF POSTULATED CORE MELT-DOWN ACCIDENTS IN EARLY-SIZED LMFBR'S. Harless, W.H.; Talwar, B.; Glueckler, E.L. (General Electric Co., Sunnyvale, CA (USA). Fast Breeder Reactor Dept.). 26 Oct 1977. Contract EY-76-C-03-0893-019. 13p. (CONF-771108--6). Dep. NTIS, PC A02/MF A01.

From Post accident heat removal information exchange meeting; Chicago, IL, USA (2 Nov 1977).

Secondary criticality analyses have been performed for an early-sized LMFBR. The results indicate that recriticality will occur only as a result of extremely unlikely combinations of failures which lead to meltdown of a large portion of the reactor core, subsequent formation of a relatively pure fuel layer, and/or substantial vessel deformation. Design features were identified that could be used to eliminate recriticality or mitigate its effects if needed to meet safety requirements. The presently existing large uncertainties in the containment response and radiological consequences of single or multiple recriticalities may be reduced with the aid of dynamic analyses that couple neutronic, thermal, and hydrodynamic methods.

1396 (GEFR-SP--042) DESIGN, MANUFACTURING, AND TEST STATUS OF THE CRBRP HOCKEY STICK STEAM GENERATORS. Little, A.F.; Bashford, A.L. (General Electric Co., Sunnyvale, CA (USA). Fast Breeder Reactor Dept.). Nov 1977. Contract EY-76-C-03-1142; EY-76-C-03-1143. 41p. (CONF-780203--3). Dep. NTIS, PC A03/MF A01.

From 1. joint U.S./Japan LMFBR steam generator seminar; Tokyo, Japan (13 Feb 1978).

Portions of document are illegible.

The history of the development of the hockey stick steam generator, currently being designed and fabricated for use in the CRBRP, is traced back to its inception in the late 1960's. Additional supporting development, which has formed the basis for the current CRBR design, is presented. The design requirements for the CRBR steam generators are outlined and the basic design, which has been evolved to meet those requirements, is described. Of particular interest to the designer are the design analysis problem areas which have been encountered and the method of attack which has been employed to resolve these problems. In particular, the method of handling the creep characteristics of 2 1/4 Cr--1 Mo, as developed by the material properties program at ORNL, is presented. Finally, the current status of the prototype and CRBRP steam generator plant unit production effort is described. The critical tube-tubesheet welding and automated MIG welding of shell sections--developed especially for the CRBRP steam generators--is discussed.

1397 (GEFR-SP--044) SELECTION OF THE DESIGN BASIS LEAK FOR LMFBR STEAM GENERATORS. Meyer, R.A.; Pfefferlen, H.C.; Roberts, J.M.; Sane, J.O. (General Electric Co., Sunnyvale, CA (USA). Fast Breeder Reactor Dept.). Nov 1977. Contract EY-76-C-03-0893. 17p. (CONF-780203--2). Dep. NTIS, PC A02/MF A01.

From 1. joint U.S./Japan LMFBR steam generator seminar; Tokyo, Japan (13 Feb 1978).

Steam generator tube failure mechanisms that have been observed in experiments or that have been postulated are discussed. The DBL for CRBRP and a proposed DBL for future large LMFBR steam generators are described. Safety considerations and philosophy in selection of Design Basis Leaks (DBL) are presented. A discussion of the Large Leak Test Rig (LLTR)

Series II program support of the DBL selection for future large LMFBR steam generators is included.

1398 (GEFR-SP--045) CORROSION AND IMPURITIES DEPOSITION EFFECTS UNDER DNB CONDITIONS. Rush, D.J.; Hampton, L.V.; Spalaris, C.N.; Schmidt, D.K.; Padden, T.R. (General Electric Co., Sunnyvale, CA (USA). Fast Breeder Reactor Dept.). Nov 1977. Contract EY-76-C-03-0962. 21p. (CONF-780203--4). Dep. NTIS, PC A02/MF A01.

From 1. joint U.S./Japan LMFBR steam generator seminar; Tokyo, Japan (13 Feb 1978).

A summary of two separate steam generator model test programs, including a description of the test models, test systems, control and monitoring of water chemistry, in situ nondestructive examination methods and results, post-test destructive examination methods and results, are presented. The test programs described are: the DNB Corrosion Effects test program conducted by General Electric which comprised a sodium-heated single-wall-tube test model with a 4.9 m (16 feet) active heat transfer length and a single-wall heat transfer tube with 10.1 mm inside diameter prototypic of the CRBR steam generator tubing; and the Small Steam Generator Model corrosion test program conducted by Westinghouse which comprised a sodium-heated double-wall tube with 14.5 mm inside diameter and 18.6 m (60.9 feet) sodium heated length. The objectives of these tests were to determine whether accelerated or localized damage would occur as a result of DNB operation. The two parameters varied were caustic level and heat transfer. The GE, or 'prototypic,' test was conducted at an extreme condition of the plant specifications: 9 +/- 3 ppB Na and thermal conditions corresponding to 64% plant power where the heat flux and tube wall temperature oscillations are maximum at 1.26×10^6 W/m² (0.4×10^6 Btu/hr-ft²) and 56.7°C (102°F), respectively. The Westinghouse test was conducted at a 30 ppB sodium ion content to simulate worst-case conditions under which the CRBR might be operated with the thermal conditions corresponding to the less severe 100% power condition where the heat flux is about 0.75×10^6 W/m² (0.24×10^6 Btu/hr-ft²).

1399 (GEFR-SP--046) FABRICATION INSPECTION OF TUBING, TUBESHEETS, AND TUBE-TO-TUBESHEET WELDS FOR THE CRBRP STEAM GENERATORS. Spalaris, C.N.; Durand, R.E.; McClung, R.W.; Wright, E.A. (General Electric Co., Sunnyvale, CA (USA). Fast Breeder Reactor Dept.). Nov 1977. Contract EY-76-C-03-0893. 33p. (CONF-780203--5). Dep. NTIS, PC A03/MF A01.

From 1. joint U.S./Japan LMFBR steam generator seminar; Tokyo, Japan (13 Feb 1978).

The rationale for the technical details leading to the selection of tubing and tubesheet specifications and inspection techniques was based upon the desire to optimize the chances of success for the CRBRP steam generators. Fabrication processes, especially welding for the tube-to-tubesheet joints were recognized as critical. Thus, heavy emphasis was placed upon the development of reliable welding techniques as well as inspection methods using the most accurate and sensitive tools available. Accomplishments to date include: a) the procurement of the tubing and tubesheets, to the desired specifications; b) validation that the design base properties of VAR and ESR wrought products are well within the Code acceptable levels; and c) development

of welding and tube-to-tubesheet inspection methods to provide satisfactory levels of quality.

- 1400 (GEFR-SP--053) CRBR PUMP DESIGN CONCEPTS AND RESULTANT DESIGN EVOLUTION. Manners, L. (General Electric Co., Sunnyvale, CA (USA)). 1977. Contract EY-76-C-03-0893-001. 16p. AT.

US-JRDA/Japanese-PNC seminar on LMFBF components, December 1977. Portions of document are illegible.

The design, model testing, and fabrication status of the primary sodium pumps for the Clinch River Breeder Reactor are discussed.

- 1401 (GEFR-SP--062) CLINCH RIVER BREEDER REACTOR: SECONDARY CONTROL ROD SYSTEM. McKeehan, E.R.; Sim, R.G. (General Electric Co., Sunnyvale, CA (USA)). Fast Breeder Reactor Dept.). 14 Sep 1977. Contract EY-76-C-03-1143. 19p. AT.

The shutdown system for the Clinch River Breeder Reactor (CRBR) includes two independent systems, a primary and a secondary system. The secondary control rod system (SCRS) is a new design which is being developed by General Electric to be diverse from the primary in order to improve overall shutdown reliability by eliminating potential common-mode failures. The status of the SCRS design, fabrication and testing activities are described. Design verification testing on the component level is largely complete. These component tests will be covered with emphasis on design impact results.

- 1402 (GEFR-SP--064) LARGE ELECTROMAGNETIC PUMPS. Kilman, G.B. (General Electric Co., Sunnyvale, CA (USA)). Fast Breeder Reactor Dept.). 1976. Contract EY-76-C-03-0893-017. 24p. Dep. NTIS, PC A02/MF A01.

The development of large electromagnetic pumps for the liquid metal heat transfer systems of fission reactors has progressed for a number of years. Such pumps are now planned for fusion reactors and solar plants as well. The Einstein-Szilard (annular) pump has been selected as the preferred configuration. Some of the reasons that electromagnetic pumps may be preferred over mechanical pumps and why the annular configuration was selected are discussed. A detailed electromagnetic analysis of the annular pump, based on slug flow, is presented. The analysis is then used to explore the implications of large size and power on considerations of electromagnetic skin effect, geometric skin effect and the cylindrical geometry.

- 1403 (GEFR-SP--065) LMFBF VENTED ASSEMBLY HYDRAULIC MODELING AND TESTING. Wang, J.C.F.; Dubberley, A.E. (General Electric Co., Sunnyvale, CA (USA)). Fast Breeder Reactor Dept.). 1978. Contract EY-C-03-J893-031. 7p. (CONF-780622--34). Dep. NTIS, PC A02/MF A01.

From ANS annual meeting; San Diego, CA, USA (18 Jun 1978).

A fundamental uncertainty in designing or evaluating the performance of an LMFBF core composed of vented assemblies is the flow pattern of the coolant through the vents and spaces between the assemblies, as controlled by the vent hydraulic characteristics. The principal difference between a conventional and vented assembly is that a vented assembly has holes cut in the duct wall at locations above the active core region below the above-core load pads. The purpose of the venting is (i) to extend assembly life by pressurizing the core

interstitial region (spaces between the assemblies) to reduce duct stress and radial growth, and (2) to reduce the reactor coolant pressure drop by providing an additional bypass flow path to the upper plenum for the coolant after it cools the active core. The paper presents analytical and test results evaluating the vent flow discharge coefficient with respect to the system flow rates and vent geometry.

- 1404 (GEFR-SP--070) HEAT TRANSFER WITH HOCKEY-STICK STEAM GENERATOR. Moody, E.; Gabler, M.J. (General Electric Co., Sunnyvale, CA (USA)). Fast Breeder Reactor Dept.). Nov 1977. Contract EY-76-C-03-1142; EY-76-C-03-1143. 29p. (CONF-780203--1). Dep. NTIS, PC A03/MF A01.

From 1. joint U.S./Japan LMFBF steam generator seminar; Tokyo, Japan (13 Feb 1978).

The hockey-stick modular design concept is a good answer to future needs for reliable, economic LMFBF steam generators. The concept was successfully demonstrated in the 3t Mwt MSG test unit; scaled up versions are currently in fabrication for CRBRP usage, and further scaling has been accomplished for PLBR applications. Design and performance characteristics are presented for the three generations of hockey-stick steam generators. The key features of the design are presented based on extensive analytical effort backed up by extensive ancillary test data. The bases for and actual performance evaluations are presented with emphasis on the CRBRP design. The design effort on these units has resulted in the development of analytical techniques that are directly applicable to steam generators for any LMFBF application. In conclusion, the hockey-stick steam generator concept has been proven to perform both thermally and hydraulically as predicted. The heat transfer characteristics are well defined, and proven analytical techniques are available as are personnel experienced in their use.

- 1405 (GEFR-SP--130) MINIMIZING UNBALANCE RESPONSE OF THE CRBRP SODIUM PUMPS. Gupta, V.K.; Marrujo, F.G. (General Electric Co., Sunnyvale, CA (USA)). Advanced Reactor Systems Dept.). Apr 1979. Contract EY-76-C-15-0003. 32p. (CONF-790802--17). Dep. NTIS, PC A03/MF A01.

From International conference on structural mechanics in reactor technology; Berlin, F.R. Germany (13 Aug 1979).

The unbalance response characteristics of the vertical pumps for the Clinch River Breeder Reactor Plant are investigated. Finite-element shell and beam models representative of the pump-motor structure including the rotating assembly are developed to assess structural stiffnesses of dominant joints as well as the foundation support stiffness so as to exclude the danger of resonant excitation during normal operation. Less than four mils peak-to-peak vibration amplitude at the pump tank discharge nozzle results from just 10% frequency separation between the first rocking mode and the maximum operating speed of 1116 RPM, based on 0.5% modal damping ratio and balance quality grade of ISO/ANSI G2.5 for the rotating components: motor rotor, pump shaft, Bendix diaphragm-type flexible coupling, and centrifugal double-suction impeller. Several design options are explored for raising shaft critical speed beyond 125% of maximum operating speed.

- 1406 (GEFR-SP--133) CRITERIA FOR TOP OR

LOPI TERMINATION IN A LMFBR. Cantrell, R.T.; Peck, C.B. (General Electric Co., Sunnyvale, CA (USA). Advanced Reactor Systems Dept.). 12 Jan 1979. Contract EY-76-C-03-0893-032. 11p. (CONF-790816--25). Dep. NTIS, PC A02/MF A01.

From International meeting on fast reactor safety technology; Seattle, WA, USA (19 Aug 1979).

Conservative criteria are presented which relate safety test data to successful termination of Transient Overpower (TOP) and Loss of Piping Integrity (LOPI) accidents in a LMFBR. Simulated sets of test data were generated and applied to these criteria in order to predict whether real tests will establish LOA-2 success for these events.

1407 (GEFR-SP--135) EVENT TREE ANALYSIS OF CORE DISRUPTIVE ACCIDENT CONSEQUENCES SAFETY R AND D PLANNING. Peck, C.B.; Feller, K.G. (General Electric Co., Sunnyvale, CA (USA). Advanced Reactor Systems Dept.). 12 Jan 1979. Contract EY-76-C-03-0893-032. 11p. (CONF-790816--25). Dep. NTIS, PC A02/MF A01.

From International meeting on fast reactor safety technology; Seattle, WA, USA (19 Aug 1979).

These results provide a basis for planning research and development to support breeder reactor safety Line-of-Assurance 3. Consequences were calculated for different combinations of reactor containment design features and accident events assumed to occur with a 2500 MW(t) liquid metal fast breeder reactor hypothetical core meltdown. The consequences provide a figure of merit for evaluating both containment system concepts, and research which demonstrates favorable natural processes, and limits on unfavorable processes in the release of radionuclides in the environment.

1408 (GEFR-SP--136) LOADING ERROR SIMULATIONS AND CONTROL WORTH MEASUREMENTS IN A ZPPR CRITICAL ASSEMBLY OF HETEROGENEOUS CONFIGURATION. Lu, Y.S.; Crick, S.C.; Stewart, S.L. (General Electric Co., Sunnyvale, CA (USA). Advanced Reactor Systems Dept.). 1979. Contract EY-76-C-03-0893. 15p. (CONF-790602--47). Dep. NTIS, PC A02/MF A01.

From ANS annual meeting; Atlanta, GA, USA (3 Jun 1979).

A series of loading error simulations and control worth measurements were performed in ZPPR-8, Phase F, which was a part of the benchmark study of a demonstration-reactor-sized heterogeneous (radial parfait) LMFBR core. The results are presented of both experiments and analyses, and the significance of the observation on neutron flux redistribution due to control insertion in a heterogeneous core is analyzed.

1409 (GEFR-SP--140) PREDICTION OF COOLANT MIXING AND PERIPHERAL FLOW IN WIRE WRAPPED ROD BUNDLES. Wei, J.P. (General Electric Co., Sunnyvale, CA (USA). Advanced Reactor Systems Dept.). 1979. Contract EY-76-C-03-0893. 9p. (CONF-791103--14). Dep. NTIS, PC A02/MF A01.

From American Nuclear Society meeting; San Francisco, CA, USA (12 Nov 1979).

Thermal-hydraulic behavior in LMFBR wire-wrapped rod bundles was studied using the FULMIX-II code and the results compared with experimental data from the French 19-pin water flow tests.

1410 (GEFR-SP--149) APPLICATION OF CORE STRUCTURAL DESIGN GUIDELINES IN CONCEPTUAL FUEL PIN DESIGN. Patel, M.R.; Stephen, J.D. (General Electric Co., Sunnyvale, CA (USA)). 14 Mar 1979. Contract EY-76-C-03-0893-031. 10p. (CONF-790615--6). Dep. NTIS, PC A02/MF A01.

From 3. US national congress on pressure vessels and piping; San Francisco, CA, USA (25 Jun 1979).

The paper describes an application of the Draft RDT Standards F9-7, -8, and -9 to conceptual design of Fast Breeder Reactor (FBR) fuel pins. The Standards are being developed to provide guidelines for structural analysis and design of the FBR core components which have limited ductility at high fluences and are not addressed by the prevalent codes. The development is guided by a national working group sponsored by the Division of Reactor Research and Technology of the Department of Energy. The development program summarized in the paper includes establishment of design margins consistent with the test data and component performance requirements, and application of the design rules in various design activities. The application program insures that the quantities required for proper application of the design rules are available from the analysis methods and test data, and that the use of the same design rules in different analysis tools used at different stages of a component design produces consistent results. This is illustrated in the paper by application of the design rules in the analysis methods developed for conceptual and more detailed designs of an FBR fuel pin.

1411 (GEFR-SP--151) WELDING FOR THE CRBRP STEAM GENERATORS. Spalaris, C.N.; Ring, P.J.; Durand, R.E.; Wright, E.A. (General Electric Co., Sunnyvale, CA (USA); Atomic International Div., Canoga Park, CA (USA); Clinch River Breeder Reactor Plant Project Office, Oak Ridge, TN (USA)). 1979. Contract EW-76-C-15-2395;EW-76-C-15-0003. 9p. (CONF-790426--2). Dep. NTIS, PC A02/MF A01.

From International conference on welding and fabrication in the nuclear industry; London, UK (2 Apr 1979).

The rationale for selecting weld design, welding procedures and inspection methods was based upon the desire to obtain the highest reliability welds for the CRBRP steam generators. To assure the highest weld reliability, heavy emphasis was placed on the control of material cleanliness and composition substantially exceeding the requirements of the ASME Code for 2-1/4Cr-1Mo. The high tube/tubesheet weld quality was achieved through close material control, an extensive weld development program and the selection of high reliability welding equipment. Shell and nozzle weld fabrication using TIG, MIG, and submerged arc procedures are also being controlled through precise specifications, including preheat and postheat programs, together with radiography and ultrasonic inspection to ascertain the weld quality desired. Details of the tube/tubesheet welding and shell welding are described and results from the weld testing program are discussed.

1412 (GEFR-SP--159) INTERACTIONS BETWEEN THERMAL AND STRUCTURAL BEHAVIOR IN FBR FUEL PINS. Harbourn, B.L.; Patel, M.R.; Stephen, J.D. (General Electric Co., Sunnyvale, CA (USA). Advanced Reactor Systems Dept.). 23 Apr 1979. Contract EY-76-C-03-0893-031. 16p. (CONF-790802--38). Dep. NTIS, PC A02/MF A01.

From International conference on structural

mechanics in reactor technology; Berlin, F.R. Germany (13 Aug 1979).

The one-dimensional LIFE4 and the multidimensional TWOD codes form part of a system of design methods used for FBR core design. The primary purpose of LIFE4 and TWOD is to determine the capability of FBR fuel pins to attain target operating conditions and exposures while remaining within prescribed thermal and structural design limits. The codes utilize fundamentally-based models for fuel behavior with the capability to account for the interactions between phenomena.

1413 (GEFR-SP--164) METHOD OF ASSESSING THE IMPACT OF METALLURGICAL NOISE AND ITS REDUCTION IN ULTRASONIC TESTING OF AUSTENITIC WELDS.

Day, R.A. (General Electric Co., Sunnyvale, CA (USA). Advanced Reactor Systems Dept.). Aug 1979. Contract EY-76-C-03-0893. 23p. (CONF-790868--1). Dep. NTIS, PC A02/MF A01.

From IEEE ultrasonics symposium; New Orleans, LA, USA (Aug 1979).

A method of reducing the ultrasonic noise, or spurious echos, often present in austenitic metals has been developed. The method has been used on specimens of Type 316 stainless steel, Alloy 800, 16-8-2 weld metal, and Inco-82 type weld metal. The method has been applied to shear wave tests and is applicable to longitudinal wave tests. Noise in these materials has been subsequently reduced relative to saw cut notches in welded samples. Signal-to-noise improvements of 8Db have been achieved in 16-8-2 weld metal, and order of magnitude improvement is obtained in the probability of large noise signals per inspection. Experiments with 1 and 1/2 megahertz inspection indicate that the improvement attributed to longitudinal wave inspection may be due to the difference in wavelength rather than wave mode.

1414 (GEFR-SP--165) ANALYSIS OF THE U.S. LARGE LEAK TEST PROGRAM SERIES I SODIUM--WATER REACTION TEST RESULTS. Sane, J.O.; Regimbal, J.J.; Fairbairn, J.A.; Meyer, R.A. (General Electric Co., Sunnyvale, CA (USA)). 1979.

Contract EY-76-C-03-0893-010. 11p. (CONF-790816--11). Dep. NTIS, PC A02/MF A01.

From International meeting on fast reactor safety technology; Seattle, WA, USA (19 Aug 1979).

A computer code for modeling Liquid Metal Fast Breeder Reactor (LMFBR) Steam Generator (SG) leaks has been partially validated. This was accomplished by comparing code results with data from large leak Sodium/Water Reaction (SWR) tests conducted at the Energy Technology Engineering Center (ETEC). In each of six tests, a Double-Ended Guillotine (DEG) rupture of an SG tube was produced in a sodium-filled SG at typical operating conditions. The primary purpose of these tests was to provide data for validation of the TRANSWRAP (Transient Sodium Water Reaction Analysis Program) code. Primary areas of concern are the leaksite pressure history, pressures at various locations throughout the system, and expulsion of reaction products through the relief system. Agreement with TRANSWRAP results was found to be remarkably good.

1415 (GEFR-SP--171) RESPONSE OF SECONDARY CONTAINMENT TO PRESENCE OF SODIUM AND HYDROGEN. Gleikler, E.L.; Huang, T.C. (General Electric Co., Sunnyvale, CA (USA). Advanced Reactor Systems Dept.). Jul 1979. Contract EY-76-C-03-0893. 15p. (CONF-790810--2). Dep. NTIS, PC A02/MF A01.

From 2. international seminar on containment

of fast breeder reactors; Berlin, F.R. Germany (9 Aug 1979).

As part of an effort to demonstrate that the risk to the public from extremely low probability events in liquid metal fast breeder reactors is bound within an acceptable envelope, containment pressurization by sodium and hydrogen was evaluated. Temperature and pressure histories are presented for typical sodium spray and pool fires and sodium vapor reactions. A review of mechanisms for hydrogen generation and recombination as well as limit for flammability and autocatalytic recombination is provided, and general containment design options to reduce risk are discussed.

1416 (GEFR-SP--172) CARBON TRANSPORT IN A BIMETALLIC SODIUM LOOP SIMULATING THE INTERMEDIATE HEAT TRANSPORT SYSTEM OF A LIQUID METAL FAST BREEDER REACTOR. Hampton, L.V.; Spalaris, C.N.; Roy, P. (General Electric Co., Sunnyvale, CA (USA). Advanced Reactor Systems Dept.). Apr 1980. Contract EY-76-C-03-0893-031. 20p. (CONF-800401--7). Dep. NTIS, PC A02/MF A01.

From 2. international conference of liquid metal technology for energy systems; Richland, WA, USA (20 Apr 1980).

Carbon transport data from a bimetallic sodium loop simulating the intermediate heat transport system of a Liquid Metal Fast Breeder Reactor are discussed. The results of bulk carbon analyses after 15,000 hours' exposure indicate a pattern of carburization of Type 304 stainless steel foils which is independent of loop sodium temperature. A model based on carbon activity gradients accounting for this behavior is proposed. Data also indicate that carburization of Type 304 stainless steel is a diffusion-controlled process; however, decarburization of the ferritic 2 1/4 Cr-1Mo steel is not. It is proposed that the decarburization of the ferritic steel is controlled by the dissolution of carbides in the steel matrix. The differences in the sodium decarburization behavior of electroslog remelted and vacuum-arc remelted 2 1/4 Cr-1Mo steel are also highlighted.

1417 (GEFR-SP--177) RELIABILITY OF LIQUID METAL BREEDER REACTOR COOLING SYSTEMS. Crellin, G.L.; Bazovsky, I. Sr. (General Electric Co., Sunnyvale, CA (USA). Advanced Reactor Systems Dept.). 21 Sep 1979.

Contract EY-76-C-03-0893-032. 29p. (CONF-800103--2). Dep. NTIS, PC A03/MF A01.

From Reliability and maintainability symposium; San Francisco, CA, USA (22 Jan 1980).

The reliability of the cooling systems employed during shutdown of Liquid Metal Fast Breeder Reactor is discussed. A commercial-sized breeder reactor was selected as an example for the reliability modeling of the cooling system. Markov models in the form of state transition diagrams are used to exploit the effect of repairs on system reliability. The actual calculations were performed by a reliability computer program developed by General Electric.

1418 (GEFR-SP--180) OPTIMUM FEW-GROUP CROSS SECTION SET FOR HCDAS IN HETEROGENEOUS LMFBRs. Choong, P.T.; Kujawski, E. (General Electric Co., Sunnyvale, CA (USA). Advanced Reactor Systems Dept.). 6 Nov 1979. Contract AM03-76SF00893. 6p. (CONF-800607--32). Dep. NTIS, PC A02/MF A01.

From American Nuclear Society annual meeting; Las Vegas, NV, USA (8 Jun 1980).

The loss of sodium in a hypothetical transient with failure to scram proceeds sequentially. In heterogeneous cores, the high power-to-flow fuel regions during the accident will boil first and voiding will propagate to the internal blankets with some time lag. Ideally the multigroup cross sections should take this into account. It would be unrealistic to attempt to generate different multigroup cross sections for each phase of the transient. The objective is to present a simple to implement and yet quite accurate scheme for generating an optimal multigroup cross section set for use in hypothetical core disruptive accidents (HCDA) analysis of heterogeneous LMFBRs. Based on present and the past design procedures, five sets of multigroup cross section sets have been generated for calculating flowing sodium void reactivities of heterogeneous cores.

- 1419 (GEFR-SP--191) CORROSION ISSUES IN STEAM GENERATORS OF THE FAST BREEDER REACTOR SYSTEMS. Spalaris, C.N. (General Electric Co., Sunnyvale, CA (USA). Advanced Reactor Systems Dept.). Dec 1979. Contract AT03-76SF7G030. 16p. (CONF-800204--5). Dep. NTIS, PC A02/MF A01.

From Energy-sources technology conference; New Orleans, LA, USA (3 Feb 1980).

Reliability of sodium-heated steam generators is the key element to successful demonstration of Liquid Metal Fast Breeder Reactor. Corrosion resistance of the alloy selected for constructing the steam generators is paramount to high component reliability. A program was undertaken in the US to study the corrosion resistance of 2 1/4Cr-1Mo alloy, the reference construction material for the sodium heated steam generators. Test conditions selected for the experiments represent a wide spectrum of normal and faulted chemistry environments. The results obtained were used to establish (a) the basis for corrosion allowance in design, and (b) an understanding of temperature regimes, metallurgical condition and concentration of impurities that must be avoided in order to achieve high reliability of components. Experimental details, major findings, and significance of these to component reliability are reviewed in this paper.

- 1420 (GEFR-SP--196) PROGRESS OF LMFBR STEAM GENERATOR TESTING IN THE US. Tippets, F.E.; Ford, J.A.; Wright, E.A.; Buschman, H.W. (General Electric Co., Sunnyvale, CA (USA). Advanced Reactor Systems Dept.). 1980. Contract FY-76-C-03-0893-010. 24p. (CONF-800401--13). NTIS, PC A02/MF A01.

From 2. international conference of liquid metal technology for energy systems; Richland, WA, USA (20 Apr 1980).

In order to improve assurance of reliable performance, a concerted program of steam generator testing has been underway in the US since the early 1970's, performing both work oriented to the Clinch River Breeder Reactor Plant and work applicable to future plant steam generators. The approach in this program comprises a combination of small-scale and large-scale tests, special feature tests and integral proof tests, and materials tests. This paper describes the overall US program, summarizes some of the main results obtained, and outlines the efforts underway for succeeding phases.

- 1421 (GEFR-SP--198) MEASUREMENT OF IRRADIATION CREEP IN BENDING. McSherry, A.J.; Marshall, J.; Patel, M.R. (General Electric

Co., Sunnyvale, CA (USA). Advanced Reactor Systems Dept.). 31 Jan 1980. Contract AT03-76SF71031. 6p. (CONF-800607--25). Dep. NTIS, PC A02/MF A01.

From American Nuclear Society annual meeting; Las Vegas, NV, USA (8 Jun 1980).

The major deformation modes in LMFBR fuel channels are bowing caused by neutron flux and temperature gradients and dilation due to stresses imposed by the flowing sodium. In both cases, the stress state of interest is bending. The bulk of irradiation creep data has been generated by simply loaded specimens such as tensile or biaxial pressurized tubes but it is questionable whether this data can be used to predict creep in bending. An irradiation creep experiment using beams loaded in primary bending has been designed to investigate this premise.

- 1422 (GEFR-SP--202) EXPERIMENTAL DETERMINATION OF PLUTONIA AND URANIA SOLUBILITY IN LIQUID METAL. Caputi, R.W.; Adamson, M.G. (General Electric Co., Sunnyvale, CA (USA). Advanced Reactor Systems Dept.). Apr 1980. Contract EY-76-C-03-0893-029. 9p. (CONF-800401--8). Dep. NTIS, PC A02/MF A01.

From 2. international conference of liquid metal technology for energy systems; Richland, WA, USA (20 Apr 1980).

Available data pertaining to the solubilities of uranium and plutonium in liquid sodium at typical reactor coolant temperatures is reviewed. The recurring problem of separating true solubility from micro-spallation/mechanical dispersal effects is discussed and was considered in the experimental design. Descriptions of the filter capsules and analytical techniques that were used are provided. Derived solubility data for both $UO_2(Na_3UO_4)$ and $PuO_2/sub 2-x/(Na_3PuO_4)$ from a powder blended mixed oxide chip (75% UO_2 /25% PuO_2 , initial O:M = 2.00) are given for temperatures in the range 575 to 810°C. Significant levels of both dissolved oxide and micro-particulate were present in the sodium at higher temperatures (700 and 800°C).

- 1423 (GEFR-SP--210) BACKGROUND NOISE MEASUREMENTS ON PROTOTYPE OF SNR 300 STEAM GENERATOR AT HENGLO. Greene, D.A.; Meyer, G.J.A.M.; Ahlgren, F.F.; Van Westerbrugge, J.K. (General Electric Co., Sunnyvale, CA (USA). Advanced Reactor Systems Dept.). 1980. Contract EY-76-C-03-0893-031. 10p. (CONF-800401--2). Dep. NTIS, PC A02/MF A01.

From 2. international conference of liquid metal technology for energy systems; Richland, WA, USA (20 Apr 1980).

Acoustic noise amplitudes were measured in a 50 MW helical coil prototype of a steam generator mounted in the Hengelo test facility in a joint technical program between GE/DOE and TNO/NERATOOM. Background noise measurements were completed with test conditions ranging from quiescent (with no sodium or water flow) to high thermal power transfer from the sodium circuit to the water circuit. The acoustic noise pressure on the vessel wall was measured using externally mounted accelerometers. Data were obtained for the effect of sodium flow rate on the acoustic noise amplitude. A preliminary correlation was derived for the acoustic noise generated by nucleate boiling. Leak detection and location were demonstrated.

- 1424 (GEFR-SP--212) ACOUSTIC LEAK DETECTION/LOCATION SYSTEM FOR SODIUM HEATED STEAM GENERATORS. Greene, D.A.; Meneely, D.; Ahlgren, F.F. (General Electric Co., Sunnyvale, CA (USA). Advanced Reactor Systems

Dept.). 1980. Contract EY-76-C-03-0893-031. 12p. (CONF-800401--3). Dep. NTIS, PC A02/MF A01.

From 2. international conference of liquid metal technology for energy systems; Richland, WA, USA (20 Apr 1980).

The design of an acoustic leak detection system to monitor for sodium-water reactions in a LMFBR steam generator is described. The detector is based on similar techniques to passive SONAR. It relies on the only absolute parameters associated with a sodium-water reaction: the leak is stationary in space and generates noise. By forming an array from externally mounted sensors and using statistical processing techniques, signals masked by the general background noise can be recovered. Supporting experimental and analytical investigations are also described. Predictions are made of the detection sensitivity of an acoustic leak detection system for an LMFBR.

1425 (GEFR-SP--213) LEAK LOCATION IN A DOUBLE WALL TUBE STEAM GENERATOR. Greene, D.A.; McMurtrie, K.R.; Gaubatz, D.C. (General Electric Co., Sunnyvale, CA (USA). Advanced Reactor Systems Dept.). 1980. Contract EY-76-C-03-0893-031. 8p. (CONF-800401--4). Dep. NTIS, PC A02/MF A01.

From 2. international conference of liquid metal technology for energy systems; Richland, WA, USA (20 Apr 1980).

An experimental and analytical study was made of an acoustic location system for use with double wall tube steam generators. A conceptual design of an acoustic leak location system was developed. This system has the potential for detecting the third fluid gas escaping from the annulus between the double walled tubes into the sodium. The acoustic system uses an array of accelerometers mounted onto the outside of the steam generator vessel. Electronic circuitry selects a number of accelerometers, forms them into an array which focuses within the vessel. The volume of the vessel is sequentially scanned for anomalous acoustic energy.

1426 (GEFR-SP--00183) INFLUENCE OF THE MAIN CONDENSER ON SHRS RELIABILITY. Elerath, J.G. (General Electric Co., Sunnyvale, CA (USA). Advanced Reactor Systems Dept.). 21 Dec 1979. Contract EY-76-C-03-0893-032. 6p. (CONF-800607--4). Dep. NTIS, PC A02/MF A01.

From American Nuclear Society annual meeting; Las Vegas, NV, USA (8 Jun 1980).

Upon shutdown of a Large Breeder Reactor, decay and latent heat must be removed to keep core temperatures below specified design limits. Usually this function will be performed using the plant's main condenser as the heat sink. If it is not available, however, heat can be removed by an auxiliary Shutdown Heat Removal System (SHRS). In support of the DOE/ RRT Safe Shutdown Reliability Program, quantitative reliability studies were performed to investigate the relationships among various auxiliary SHRS configurations and the main condenser. The results of these studies show that the relative reliabilities achieved are a strong function of the auxiliary configurations selected; also that credit for the main condenser has significant reliability benefits in certain cases.

1427 (GRS-F--63) REPORT ON THE RESEARCH PROJECTS IN THE FIELD OF REACTOR SAFETY SPONSORED BY THE FEDERAL MINISTRY FOR RESEARCH AND TECHNOLOGY. PERIOD UNDER REPORT: JANUARY 1 - MARCH 31, 1978. (Gesellschaft fuer

Reaktorsicherheit m.b.H. (GRS), Koeln (Germany, F.R.)). Sep 1978. 520p. (In German). Dep. NTIS (US Sales Only), PC A23/MF A01.

Investigations on the safety of Light Water Reactors (LWR) being performed in the framework of the Research Program Reactor Safety (RS - Projects) are sponsored by the BMFT (Federal Minister for Research and Technology), Bundesminister fuer Forschung und Technologie. Objective of this program is to investigate in greater detail the safety margins of nuclear power plants and their systems and the further development of safety technology. Besides the investigations of LWR tasks first projects on the safety of FBR type reactors are sponsored by the BMFT. The GRS (Reactor Safety Association), Gesellschaft fuer Reaktorsicherheit mbH, by order of the BMFT, informs continuously of the status of such investigations by means of quarterly and annually publication of progress reports within the series GRS - F - Fortschrittsberichte (GRS - F - Progress Reports). Each progress report represents a compilation of individual reports about objectives, the work performed, the results, the next steps of the work etc. The individual reports are prepared in a standard form by the contractors themselves as a documentation of their progress in work. The individual reports are arranged according to the amended LWR Safety Research Program of the BMFT. Another table contents uses the same classification system as applied in the Nuclear Safety Index of the CEC Communities and the OECD. (orig./HP) 891 HP.

- 1432 (HEDL--77-106) SUMMARY REPORT OF FFTF PROTOTYPE PRIMARY PUMP SODIUM TEST PROGRAM. Buonamici, R. (Hanford Engineering Development Lab., Richland, WA (USA)). Oct 1977. Contract EY-76-C-14-2170. 84p. AT.

A summary of the high temperature in-sodium testing and test results of the full-size Fast Flux Test Facility (FFTF) prototype primary pump in the Sodium Pump Test Facility (SPTF) at the Liquid Metal Engineering Center (LMEC) is presented. The overall objectives of the test program, which spanned the period from July 1975 to April 1977, were to demonstrate the highest confidence in and the integrity of the design of the pump prior to its actual operation in the FFTF. Design modifications made to the pump following the hydrostatic bearing seizure during the initial thermal transient test program were successfully validated by extensive testing.

- 1433 (HEDL--6232) PROGRAM OUTLINE UNDER-SODIUM VIEWING. Holtink, N.C. (Hanford Engineering Development Lab., Richland, WA (USA)). Mar 1977. Contract EY-76-C-14-2170. 8p. AT.

An outline is presented of a program with the following objectives: (1) provide technical management and required basic development for completing the design, fabrication, and Composite Reactor Component Test Activity (CRCTA) testing of a prototype Under-Sodium Viewing (USV) system and complete all necessary modifications to the prototype system and make available for FFTF use; (2) identify the under-sodium viewing and ranging requirements for the Clinch River Breeder Reactor (CRBR) and develop the special ultrasonic concepts, techniques, and equipment needed to satisfy these requirements; and (3) develop transducers, electronics, and mechanisms to improve reactor inservice inspection capabilities. Specific

improvements include image enhancement, in-vessel storage of future USV systems and real time imaging. Advanced systems will provide capability for inservice inspection and surveillance.

- 1434 (HEDL--6297) US--UK TECHNICAL EXCHANGE BREEDER REACTOR FUELS: FUEL PIN CHEMISTRY. Woodley, R.E. (Hanford Engineering Development Lab., Richland, WA (USA)). 14 Oct 1977. Contract EY-76-C-14-2170. vp. AT.

Included are thermochemical data for use in analysis of mixed-oxide fuel chemical behavior and data on in-core behavior of materials to control fuel-cladding chemical interaction. (DG)

- 1435 (HEDL--6313) SODIUM IMPURITY MONITORING. Barton, G.B.; McCown, J.J.; Keough, R.F. (Hanford Engineering Development Lab., Richland, WA (USA)). 1977. Contract EY-76-C-07-1375. 5p. AT.

Two basic impurity monitoring methods are in use in the U.S. Breeder Reactor Program. The first involves instrumentation which performs measurements in-situ with real time data output from on-line sensors. The second involves obtaining some type of sample which is removed from the system and analyzed in a chemistry lab with the data obtained representing the impurity level as it was one or more days previously. These methods are reviewed and planned research is described.

- 1436 (HEDL--6314) MASS AND ACTIVITY TRANSPORT. Anantatmula, R.P.; Brehm, W.F.; Chulos, L.E.; McGuire, J.C. (Hanford Engineering Development Lab., Richland, WA (USA)). 1977. Contract EY-76-C-07-1375. 7p. AT.

LMFBR-related work accomplished in two programs, the Radioactivity Control Technology (RCT) Program, and the Advanced Alloy Sodium Compatibility Program, is described. The objective of the RCT Program is to develop and demonstrate methods for reducing the transport of radioactive species to maintenance zones in primary heat transport systems. Both corrosion and fission products are considered. The Compatibility Program is designed to test and qualify cladding and duct alloys.

- 1437 (HEDL--6557) NONDESTRUCTIVE TESTING METHODS AND EQUIPMENT: SECTION 3.0. SEMIANNUAL REPORT TO OAK RIDGE NATIONAL LABORATORY, OCTOBER 1978--MARCH 1979. ADVANCE COPY. Michaels, T.E.; Horn, J.E.; Boehmer, W.D.; Trantow, R.L. (Hanford Engineering Development Lab., Richland, WA (USA)). May 1979. Contract EY-76-C-14-2170. 15p. Dep. NTIS, PC A02/MF A01.

A system configuration has been determined for scan control, data acquisition, and real-time analysis for ultrasonic inspection of a weld in the secondary loop at FFTF. This system will significantly decrease time requirements for inspection and reduce data storage by utilizing a host computer to coordinate activities of dedicated stations. Acceptance testing of the Ultrasonic Scanning Mechanism (USM) was successfully completed. Results indicate that the USM is a well designed and well built mechanism. All motions met or exceeded specifications and operated smoothly without mechanical binding or interferences. Elevated temperature tests of USM components were completed. Stepping motors, encoders, limit switches, and cooling fans were shown to be capable of intermittent operation over

extended time periods at temperatures as high as 93°C (200°F). An improved transducer configuration has been determined for faster and more accurate ultrasonic scanning. Individual elements are being characterized in the laboratory for this multi-element transducer. Transducer work at Argonne National Laboratory is planned to develop a wedge suitable for the FFTF inspection.

- 1438 (HEDL--6583) EXPERIMENTAL IRRADIATION OF FRACTURE MECHANICS SPECIMENS IN FAST REACTORS. (Westinghouse Hanford Co., Richland, WA (USA)). 1979. Contract EY-76-C-14-2170. 22p. Dep. NTIS, PC A02/MF A01.

Two LMFBR irradiation facilities are, or will be, providing the great majority of irradiation space in support of fracture mechanics characterization efforts: the Experimental Breeder Reactor-II (EBR-II), and the Fast Flux Test Facility (FFTF). Current plans call for the EBR-II, which has been operating for a number of years, to be directed to other testing programs sometime after the startup of FFTF, presently scheduled for late 1979. However, since there may be a period of time during which both facilities are operating and available for specimen irradiation, features and characteristics of both will be discussed herein, although the emphasis will be on the FFTF. The purpose of this report is to provide the necessary background for considering possible collaborative programs on fracture toughness and crack growth of irradiated materials between USDOE and UKAEA, to be conducted under appropriate exchange agreements.

- 1439 (HEDL--6617) COMPUTERIZED INTERFERENCE ELIMINATION REPORT: FFTF CELLS 489, 422E, 529A, AND 529B. (Hanford Engineering Development Lab., Richland, WA (USA)). 1979. Contract EY-76-C-14-2170. 258p. Dep. NTIS, PC A12/MF A01.

Design information is presented concerning the possible piping interferences in FFTF cells 489, 422E, 529A, and 529B.

- 1440 (HEDL--6629) FFTF PREPRODUCTION MECHANICAL SNUBBER QUALIFICATION TEST PROGRAM FOR WESTINGHOUSE/HANFORD. (Hanford Engineering Development Lab., Richland, WA (USA)). 10 Nov 1978. Contract EY-76-C-14-2170. 384p. AT.

Performance testing data are presented for FFTF reactor seismic restraints.

- 1441 (HEDL--SA-1595-FP) BOILUP THRESHOLD FOR THE BOTTLED-UP TRANSITION PHASE POOL. Martin, F.J. (Hanford Engineering Development Lab., Richland, WA (USA)). Oct 1978. Contract EY-76-C-14-2170. 7p. (CONF-781105--95). Dep. NTIS, PC A02/MF A01.

From ANS meeting; Washington, DC, USA (12 Nov 1978).

Since the inception of the hypothesized transition phase, for the late stages of a postulated LMFBR accident, there has been a continual effort to characterize the anticipated conditions of such a hypothetical state. To date, several techniques and methods have been employed to analyze the potential for energetic criticality. As part of this effort, an arbitrary criterion of monotonic dispersiveness has been employed as the measure of diminished recriticality potential. The various attempts to demonstrate monotonic dispersiveness have included experimental demonstrations, theoretical approaches, and integrated analysis using both. As part of this

treatment, flow regime maps have been devised as a convenient method for inferring the state of dispersiveness. They included bubbly, churn turbulent, foam and drop fluidized regimes. Of these, foam and drop fluidized regimes were considered the most dispersive. The main thrust of the analysis to date, including flow regime maps, relates primarily to the open pool configuration. However, the bottled configuration may be the pertinent geometry. To date, no reliable escape path has been demonstrated for the advanced stages of core disruption, although strong potential escape mechanisms have been identified and are currently being analyzed. The bottled pool is examined in this paper.

- 1442 (HEDL-BR--5853-C-4(Rev.1)) FFTF REPORT: DRILLED-IN EXPANSION BOLTS UNDER STATIC AND ALTERNATING LOAD. Tsang, H.S. (Bechtel Power Corp., San Francisco, CA (USA)). 1 Oct 1976. Contract EY-76-C-14-2170. 92p. Dep. NTIS, PC A05/MF A01.

The objective of this investigation was to establish the allowable design loads (tension, shear, and combined load) for expansion bolts to be installed in regular 4000 psi mix concrete, Magnetite 5000 psi mix concrete, and Steel Shot 5000 psi mix concrete at the Fast Flux Test Facility. The test loads included Static Loads and Alternating Loads which simulate the dynamic loads of vibratory equipment and dynamic earthquake loads.

- 1443 (HEDL-S/A--1552-FP) FISSION GAS BEHAVIOR IN MIXED-OXIDE FUEL DURING OVERPOWER AND THERMAL TRANSIENT TESTS. Randklev, E.H.; Hinman, C.A. (Hanford Engineering Development Lab., Richland, WA (USA)). 1 Nov 1978. Contract EY-76-C-14-2170. 25p. (CONF-790306--24). Dep. NTIS, PC A02/MF A01.

From International conference on fast breeder reactor performance; Monterey, CA, USA (5 Mar 1979).

Results are presented from two complementary Hanford Engineering Development Laboratory (HEDL) programs which are investigating fission gas behavior in irradiated mixed-oxide fuel. The combined purpose of these programs is to define steady-state and transient fission gas behavior at axial fuel pin positions as a function temperature, radial and microstructural position and mechanisms of transient gas release. The following discussion, unless otherwise noted, applies to fuel irradiated at powers from approx. 20 kW/m to approx. 40 kW/m and for burnups of approx. 40 to approx. 60 MWd/kg.

- 1444 (HEDL-SA--135-3) FFTF DUMP HEAT EXCHANGER DESIGN AND DEVELOPMENT. Seber, E.C.; Mancuso, R.A.; Jansen, W.D.; Mahaffey, M.K. (Hanford Engineering Development Lab., Richland, WA (USA)). [nd]. Contract EY-76-C-14-2170. 55p. AT.

A brief summary of the history of procurement of the Dump Heat Exchangers for FFTF is presented. It outlines the various organizations and respective roles. A description of the design basis and features of the large main heat transport system dump heat exchangers is included. Design evolution is discussed and testing performed as part of the design process, including finned tube qualification, header hydraulic tests, air-pressure drop tests, insulated panel tests and friction/wear testing, is summarized. Manufacturing experience, including development of an integral finned tube, development of welding procedures for joining the finned tubes, and header fabrication is also

presented. Testing results obtained with the prototype unit are described, as are additional feature model tests that were performed to define possible methods of improving heat transfer performance for the plant units. A summary of construction experience, status of plant modifications and a description of expected plant operation including decay heat removal is included.

- 1445 (HEDL-SA--464) LINEAR HEAT RATING FOR INCIPIENT FUEL MELTING IN UO_2 -- PuO_2 FUEL. Leggett, R.D.; Ballard, E.O.; Baker, R.B.; Horn, G.R.; Dutt, D.S. (Hanford Engineering Development Lab., Richland, WA (USA)). 1974. Contract EY-76-C-14-2170. 6p. (CONF-741116--2). Dep. NTIS, PC A02/MF A01.

From ANS winter meeting; Washington, DC, USA (Nov 1974).

Results are presented for an experiment (HEDL-P-19) conducted in EBR-II to determine the effect of the initial, cold, diametral fuel-cladding gap size (3.2 to 10.0 mils) on the linear heat rating to incipient fuel melting, $Q'/\text{sub m}$, in mixed oxide (75% UO_2 --25% PuO_2) fuel pins under very rapid LMFBR startup conditions. Eight 0.250 in. OD X 0.016 in. wall and eight 0.230 in. OD X 0.015 in. wall, He bonded pins clad with type 316 stainless steel (20% CW) were irradiated in an encapsulated pin subassembly in Row 2 of the EBR-II. Each fuel pellet was measured to ± 0.2 mil, weighed and its position in the 13 1/2 in. long fuel column recorded. Most of the pellets were centerless ground to a predetermined size. Four pins--two of each size--contained pellets that were sintered to size. The fuel density and O/M of the 0.230 in. OD pins were 90.75% TD and 1.96, respectively. The 0.250 in. OD pins contained fuel with a density of 92.40% and an O/M of 1.97. This test was conducted to verify that no fuel melting will occur in the FTR at 115% of the 400 MW rating.

- 1446 (HEDL-SA--737) INFLUENCE OF BURNUP ON HEAT-RATING-TO-MELTING FOR UO_2 -- PuO_2 FUEL. Leggett, R.D.; Baker, R.B.; Dutt, D.S.; Chastain, S.A. (Westinghouse Hanford Co., Richland, WA (USA)). 1974. Contract EY-76-C-14-2170. 7p. (CONF-741116--1). Dep. NTIS, PC A02/MF A01.

From ANS winter meeting; Washington, DC, USA (Nov 1974).

This paper summarizes the results of an irradiation test (HEDL-P-20) conducted to evaluate the influence of burnup on the linear heat rating to incipient fuel melting, $Q'/\text{sub m}$, for 75% UO_2 --25% PuO_2 fuel. The very short term irradiation was conducted in Row 1 of the EBR-II to simulate 115% of FTR full power using an irradiation history similar to that used for the HEDL-P-19 test. Prototypic FTR fuel pins (0.230 in. O.D., type 316, 20% cw stainless steel) were included that were preirradiated to 0% BU, 0.3% BU, 0.7% BU, and 1% BU at a simulated 100% FTR power. One 0.250 in. O.D. pin (PNL-2-5) clad with type 304 stainless steel was also included that was preirradiated to approx. 7% BU. Fuel-cladding diametral gap sizes were varied from 3.5 to 7.5 mils (the FTR range) by centerless grinding the pellets to different diameters, helium and 80He + 20 Xe fill gases were used, and as-built fuel microstructure was also a test variable. The preirradiation of the 0.230 in. O.D. pins was done in Row 3 of the EBR-II for one reactor cycle and one-half reactor cycle, respectively. All seven of the 0.230 in. O.D., 'fresh', pins had extensive fuel melting, but fuel melting was indicated in only one of the preirradiated pins. This pin was fabricated with a 3.5 mil gap and preirradiated to approx.

0.3% BU. Similar pins preirradiated to 0.7% BU and 1% BU showed no melting. The high burnup PNL-2-5 pin (0.250 in. O.D.) also had fuel melting, but this is believed to be due to the 20% higher heat generation rate in this larger pin, rather than to a reduction in thermal performance at very high burnup.

- 1447 (HEDL-SA--838) DOCUMENT CONTROL AND INFORMATION RETRIEVAL SYSTEM FOR THE FAST FLUX TEST FACILITY (FFTF). Theo, M.G. (Westinghouse Hanford Co., Richland, WA (USA)). 1 Mar 1976. Contract EY-76-C-14-2170. 26p. (CONF-7606165--1). Dep. NTIS, PC A03/MF A01. From Special Libraries Association; Denver, CO, USA (7 Jun 1976).

A description is given of the FFTF Document Control and Information Retrieval System. The system utilizes a mini-computer along with various microfilm equipment and is designed to accommodate an anticipated 50 million pages of text and 750,000 drawings. The system is simple, uncluttered, eliminates duplication, and provides quick retrievability of documents for all technical and administrative personnel.

- 1448 (HEDL-SA--859(FP)) IN-REACTOR CORROSION BEHAVIOR OF STAINLESS STEEL CLADDING IN HIGH TEMPERATURE SODIUM. Weber, J.W. (Hanford Engineering Development Lab., Richland, WA (USA)). Apr 1976. Contract EY-76-C-14-2170. 9p. (CONF-760503--20). Dep. NTIS, PC A02/MF A01.

From International conference on liquid metal technology in energy production; Champion, PA, USA (3 May 1976).

Sodium-cladding chemical interaction has been studied on fuel pins clad with 20% cold worked type 316 stainless steel and irradiated in the EBR-II at temperatures up to 705°C and for exposures to 5300 hours. The measured corrosion rate of the cladding surface immediately above the top of the fuel column was 12.5 μm per year at 690°C. The loss of Ni at 700°C resulted in the formation of a ferrite layer approximately 5 μm thick. A zone depleted in Ni and Cr extends into the austenite from the ferrite-austenite interface an additional distance of approximately 15 μm . No large changes in volumetric average carbon or nitrogen were observed.

- 1449 (HEDL-SA--897) BUNDLE-DUCT CLEARANCE OF HEDL MIXED OXIDE SUBASSEMBLIES. Hill, R.G.; Jackson, R.J. (Hanford Engineering Development Lab., Richland, WA (USA)). 1976. Contract EY-76-C-14-2170. 17p. (CONF-761103--31). Dep. NTIS, PC A02/MF A01.

From ANS winter meeting; Washington, DC, USA (15 Nov 1976).

One parameter of interest bearing upon LMFBR fuel pin performance is the "clearance" between the fuel pin bundle and its associated duct. This clearance is determined by calculating the distance between a theoretically tight bundle and the inner surface of the duct wall. Because the individual fuel pins have varying amounts of bending and bowing, the pin bundle is a springy array which expands to fill the duct. Therefore, the calculated clearance exists as a somewhat randomly distributed porosity throughout the pin bundle. A computer code is described which calculates the amount of clearance which is distributed. This computer code, POROSITY, considers the mechanisms of thermal expansion, neutron induced swelling, and creep. These mechanisms each cause a dimensional change in the fuel pin bundle and duct.

- 1450 (HEDL-SA--1082) FFTF CORE AND PRIMARY SODIUM CIRCUIT INSTRUMENTATION. Day, C.K. (Hanford Engineering Development Lab., Richland, WA (USA)). Dec 1975. Contract EY-76-C-14-2170. 41p. (CONF-760137--3). Dep. NTIS, MF A01.

From International Atomic Energy Agency working party; Risley, UK (27 Jan 1976).

Portions of document are illegible.

This paper presents plans, engineering parameters, and some test results for several FFTF core and primary sodium circuit instrument systems. Systems to be discussed include temperature, flow, pressure, leak detectors, level sensors, fuel failure monitoring, sodium impurity analysis and cover gas monitors. Results of recent demonstration tests of the FFTF Under-Sodium Viewing and Ranging system are also presented.

- 1451 (HEDL-SA--1154) GAS TAGGING FOR FUEL FAILURE LOCATION USING XENON AND KRYPTON. Goheen, M.W.; Plucinski, C.E. (Hanford Engineering Development Lab., Richland, WA (USA)). 1977. Contract EY-76-C-14-2170. 14p. (CONF-770687--1). Dep. NTIS, PC A02/MF A01.

From The American Society of Mass Spectrometry; Washington, DC, USA (2 Jun 1977).

The FFTF (Fast Flux Test Facility) nearing completion at the Hanford Engineering Development Laboratory near Richland, Washington, under the direction of The Westinghouse Hanford Co., is designed to test components and materials for the development of Liquid Metal Fast Breeder Reactors. During the initial stages of operation, the FFTF will be shut down when a fuel or control pin has a detectable cladding leak. To achieve maximum reactor operating time, monitoring methods for detecting and locating leaking pins were developed. Monitoring techniques to signal a leak are based on changes of specific activity levels of individual xenon and krypton fission product isotopes. Gas tagging is the method used to locate the failed pin. Isotopically differing tags of a gas or gases can be used as a fingerprint technique for sealed assemblies such as fuel or control pins with mass spectrometer detection to locate a specific leaker. 104 unique tags were blended for the 80 fuel assemblies and 24 control assemblies.

- 1452 (HEDL-SA--1164FP) TRITIUM RELEASE FROM FAST NEUTRON IRRADIATED BORON CARBIDE. Hollenberg, G.W. (Westinghouse Hanford Co., Richland, WA (USA)). 1977. Contract EY-76-C-14-2170. 17p. (CONF-770416--6). Dep. NTIS, PC A03/MF A01.

From 79. annual meeting of American Ceramic Society; Chicago, IL, USA (23 Apr 1977).

A high-energy neutron reaction with boron produces tritium. In the LMFBR control material, B₄C, most of the tritium that is generated remains in the pellets. Potential retention mechanisms are discussed. 5 figures.

- 1453 (HEDL-SA--1167) STRESS-AFFECTED MICROSTRUCTURAL DEVELOPMENT AND CREEP-SWELLING INTERRELATIONSHIP. Brager, H.R.; Garner, F.A.; Gilbert, E.R.; Flinn, J.E.; Wolfer, W.G. (Hanford Engineering Development Lab., Richland, WA (USA)). May 1977. Contract EY-76-C-14-2170. 48p. (CONF-770641--12). Dep. NTIS, PC A03/MF A01.

From Conference on radiation effects in breeder reactor structural materials; Scottsdale, AZ, USA (19 Jun 1977).

Macroscopic measurement of the deformations

arising from swelling and creep during neutron irradiation indicate that both processes are dependent on the magnitude and possibly the sign of the applied stress state. Current modeling efforts also indicate that a strong interaction exists between swelling and creep through the stress state. Because the macroscopic distortions arise from the integrated microscopic strains associated with specific microstructural elements, the effect of applied stress on microstructural development has been studied.

- 1454 (HEDL-SA--1171-FP) MICROSTRUCTURE CHARACTERIZATION OF ADVANCED OXIDE FUEL. Rasmussen, D.E.; Gerber, E.W.; McCord, R.B. (Hanford Engineering Development Lab., Richland, WA (USA)). 1977. Contract EY-76-C-14-2170. 65p. (CONF-770416--7). Dep. NTIS, PC A04/MF A01.

From 79. annual meeting of American Ceramic Society; Chicago, IL, USA (23 Apr 1977).

Preirradiation porosity, grain size, and microcomposition characteristics are presented for selected advanced oxide ($\text{PuO}_2\text{-UO}_2$) LMFBR developmental fuels fabricated for irradiation testing in EBR-II. Quantitative microscopy, electron microprobe analysis, and a recently developed quantitative autoradiographic technique are utilized to relate microstructure characteristics to fabrication parameters.

- 1455 (HEDL-SA--1175) U. S. PROGRAMS ON REFERENCE AND ADVANCED CLADDING/DUCT MATERIALS. Bennett, J.W.; Holmes, J.J.; Laidler, J.J. (Hanford Engineering Development Lab., Richland, WA (USA)). May 1977. Contract EY-76-C-14-2170. 21p. (CONF-770641--13). Dep. NTIS, PC A02/MF A01.

From Conference on radiation effects in breeder reactor structural materials; Scottsdale, AZ, USA (19 Jun 1977).

Two coordinated national programs are presently in place in the United States for development of reference and advanced cladding and duct alloys for near-term and long-term LMFBR applications. A number of government, industrial and university laboratories are active participants in these two ERDA-sponsored programs. The programs are administered by ERDA through a task group organization, with each task group representing a particular technical activity and the membership of the task group drawn from among the laboratories with active involvement in that activity. Technical coordination of the two programs is provided by the Hanford Engineering Development Laboratory. The National Reference Cladding and Duct Program is charged with the responsibility for development of the required technology to permit full utilization of the reference material, 20 percent cold-worked Type 316 stainless steel, in early LMFBR core applications. The current schedule calls for full evaluation of FFTF-related design base data prior to full-power operation of FFTF in early 1980, followed by a confirmation in early 1983 of reference material performance capabilities for initial-core CRBRP applications. Comprehensive evaluation of reference material performance to commercial plant goal fluence levels will be complete by 1985. The National Advanced Alloy Development Program was instituted in 1974 with the objective to develop, by 1986, advanced cladding and duct materials compatible with advanced fuel systems having peak burnup capabilities up to 150 MWD/kg and doubling times of 15 years or less. Screening of a large number of potential alloys was completed in mid-1975, and there are presently 16 candidate alloys under active investigation.

- 1456 (HEDL-SA--1177-FP) ABSORBER MATERIALS FOR FAST REACTOR CONTROL APPLICATIONS. Birney, K.R.; Pitner, A.L.; Bourquin, R.D. (Hanford Engineering Development Lab., Richland, WA (USA)). Mar 1977. Contract EY-76-C-14-2170. 20p. (CONF-770611--29). Dep. NTIS, PC A02/MF A01.

From American Nuclear Society annual meeting; New York, NY, USA (12 Jun 1977).

This paper provides a brief description of design requirements for LMFBR absorber materials, and addresses some of the more important material property and performance considerations. The relative merits and disadvantages of the various candidates are compared with respect to these parameters, and the present status of the LMFBR absorber development program is addressed.

- 1457 (HEDL-SA--1189-FP) CORRELATION FOR BORON CARBIDE HELIUM RELEASE IN FAST REACTORS. Basmajian, J.A.; Pitner, A.L. (Hanford Engineering Development Lab., Richland, WA (USA)). Apr 1977. Contract EY-76-C-14-2170. 14p. (CONF-770622--7). Dep. NTIS, PC A02/MF A01.

From Air Pollution Control Association meeting; Toronto, Canada (19 Jun 1977).

An empirical helium correlation for the helium release from boron carbide has been developed. The correlation provides a good fit to the experimental data in the temperature range from 800 to 1350°K, and burnup levels up to 80×10^{20} captures/cm³. The correlation has the capability of extrapolation to 2200°K (3500°F) and 200×10^{20} captures/cm³. In this range the helium release rate will not exceed the generation rate.

- 1458 (HEDL-SA--1190FP) HYDROGEN JET RECOMBINATION UNDER POSTULATED LMFBR ACCIDENT CONDITIONS. Wierman, R.W. (Hanford Engineering Development Lab., Richland, WA (USA)). 1977. Contract EY-76-C-14-2170. 11p. (CONF-770611--27). Dep. NTIS, PC A02/MF A01.

From American Nuclear Society annual meeting; New York, NY, USA (12 Jun 1977).

Certain conditions may be postulated in LMFBR risk assessments for which the potential of hydrogen release to the reactor containment building needs to be evaluated. The inherent self-ignition characteristics of hydrogen jets entering the air atmosphere of the reactor containment building should be understood for such analyses. If hydrogen jets were to self-ignite (recombine) at the source where they enter the reactor containment building, then undesirable hydrogen accumulation would not occur. Therefore, experiments have been conducted investigating the phenomena associated with the recombination of hydrogen jets under conditions similar to those postulated for LMFBR studies. The data presented define the conditions required for self-ignition of the hydrogen jets.

- 1459 (HEDL-SA--1191(Rev.)) TRIBOLOGY: RESEARCH AND DEVELOPMENT NEEDS IN ADVANCED ENERGY TECHNOLOGY. Johnson, R.N. (Hanford Engineering Development Lab., Richland, WA (USA)). 1977. Contract EY-76-C-14-2170. 30p. (CONF-770237--1). Dep. NTIS, PC A03/MF A01.

From Workshop on tribology in energy technology; Washington, DC, USA (7 Feb 1977).

Poorly controlled wear and friction affects energy conservation, material conservation, and the reliability and safety of mechanical

systems, and is estimated to cost U.S. industries \$16 billion/yr. ERDA's National Friction, Wear, and Self-Welding Program and its accomplishments are described. This program includes studies of wear and friction problems in high temperature and unusual environments, e.g., as experienced by LMFBR components, and common to much technology involving energy conversion using fossil-fuel, geothermal, nuclear, and solar resources. Program activities for tribology information handling and wear and friction testing are discussed. (LCL)

- 1460 (HEDL-SA--1205) CORE DESIGN METHODS FOR ADVANCED LMFBRs. Chandler, J.C.; Marr, D.R.; McCurry, D.C.; Cantley, D.A. (Hanford Engineering Development Lab., Richland, WA (USA)). May 1977. Contract EY-76-C-14-2170. 17p. (CONF-770611--28). Dep. NTIS, PC A02/MF A01.

From American Nuclear Society annual meeting; New York, NY, USA (12 Jun 1977).

The multidiscipline approach to advanced LMFBR core design requires an iterative design procedure to obtain a closely-coupled design. HEDL's philosophy requires that the designs should be coupled to the extent that the design limiting fuel pin, the design limiting duct and the core reactivity lifetime should all be equal and should equal the fuel residence time. The design procedure consists of an iterative loop involving three stages of the design sequence. Stage 1 consists of general mechanical design and reactor physics scoping calculations to arrive at an initial core layout. Stage 2 consists of detailed reactor physics calculations for the core configuration arrived at in Stage 1. Based upon the detailed reactor physics results, a decision is made either to alter the design (Stage 1) or go to Stage 3. Stage 3 consists of core orificing and detailed component mechanical design calculations. At this point, an assessment is made regarding design adequacy. If the design is inadequate the entire procedure is repeated until the design is acceptable.

- 1461 (HEDL-SA--1216(Rev.)) FAST FLUX TEST FACILITY STARTUP PLAN. Carlisle, C.S.; Noordhoff, B.H. (Hanford Engineering Development Lab., Richland, WA (USA)). 1977. Contract EY-76-C-14-2170. 37p. (CONF-770822--7). Dep. NTIS, PC A03/MF A01.

From American Nuclear Society meeting; Chattanooga, TN, USA (8 Aug 1977).

The principal features of the FFTF startup plan are described and the startup schedule is discussed. The present status of startup testing is summarized.

- 1462 (HEDL-SA--1220) EFFECT OF SUPPORT CLAMPS ON ELEVATED TEMPERATURE PIPING. Hyde, L.L. (Hanford Engineering Development Lab., Richland, WA (USA)). 1977. Contract EY-76-C-14-2170. 28p. (CONF-770807--58). Dep. NTIS, PC A03/MF A01.

From 4. international conference on structural mechanics in reactor technology; San Francisco, CA, USA (15 Aug 1977).

Two finite-element models were used to analyze the effects of local support clamp loads in the FFTF piping systems. The results indicate that clamp influences on pipe stresses and strains may be significant.

- 1463 (HEDL-SA--1221) SEMI-AUTOMATED URANIUM ANALYSIS BY A MODIFIED DAVIES--GRAY PROCEDURE. Swanson, G.C. (Hanford Engineering Development Lab., Richland, WA (USA)). 1977.

Contract EY-76-C-14-2170. 16p. (CONF-7706109--1). Dep. NTIS, PC A02/MF A01.

From Northwest regional meeting; Portland, OR, USA (15 Jun 1977).

To rapidly and reliably determine uranium in fuel materials a semi-automated implementation of the Davies-Gray uranium titration was developed. The Davies-Gray method is essentially a three step procedure. First uranium is reduced quantitatively from +6 valence to +4 valence by excess of iron (II) in strong phosphoric acid in the absence of nitrite. Prior to the uranium reduction nitrite is destroyed by addition of sulfamic acid. In the second step iron (II) is selectively oxidized to iron (III) by nitric acid in the presence of Mo (VI) catalyst. Finally after dilution to reduce phosphate concentration, the uranium is titrated to U (VI) by standard dichromate. The original sluggish colorimetric endpoint determination used by Davies and Gray is seldom used since New Brunswick Laboratory discovered that addition of vanadium (IV) just prior to titration sufficiently improves reaction rate to allow a potentiometric endpoint determination. One of the advantages of the Davies-Gray uranium titration is that it is quite specific for uranium, most common impurity elements do not interfere with the analysis, and specifically high levels of Pu, Th, and Fe are tolerated.

- 1464 (HEDL-SA--1225FP(Rev.)) MICROSTRUCTURAL CHARACTERIZATION OF ADVANCED FERROUS ALLOYS EXPOSED TO LIQUID SODIUM. Anantatmula, R.P.; Mayhan, S.J.; White, P.A. (Hanford Engineering Development Lab., Richland, WA (USA)). Jul 1977. Contract EY-76-C-14-2170. 10p. (CONF-770739--1). Dep. NTIS, PC A02/MF A01.

From 10. annual technical meeting of the International Metallographic Society; Houston, TX, USA (19 Jul 1977).

The property requirements for breeder reactor fuel cladding materials are extremely stringent. Alloys with low sodium corrosion rates are required to avoid loss of strength from wall thinning at reactor operating temperatures. Data obtained on the following alloys are described: A-286, Inconel 706, Nimonic PE16, AISI 316, M-813 (sintered), Inconel 718, AISI 310, and Alloy 330. Tests were carried out at 700°C for 2000 hours at a sodium velocity of 6 m/s and an oxygen content in sodium of 1 ppm. Corrosion rates and major elements depleted are tabulated. It is concluded that A-286, Inconel 706, and Nimonic PE16 are highly promising commercial alloys for cladding purposes on the basis of corrosion resistance. 5 figures, 1 table. (RWR)

- 1465 (HEDL-SA--1230-S) FFTF GAS PROCESSING SYSTEMS. Halverson, T.G. (Hanford Engineering Development Lab., Richland, WA (USA)). 1977. Contract EY-76-C-14-2170. 21p. (CONF-770512--22). Dep. NTIS, PC A02/MF A01.

From Symposium on management of low level radioactive waste; Atlanta, GA, USA (23 May 1977).

The design and operation of the two radioactive gas processing systems at the Fast Flux Test Facility (FFTF) exemplifies the concept that will be used in the first generation of Liquid Metal Fast Breeder Reactors (LMFBR's). The two systems, the Radioactive Argon Processing System (RAPS) and the Cell Atmosphere Processing System (CAPS), process the argon and nitrogen used in the FFTF for cover gas on liquid metal systems and as inert atmospheres in steel lined cells housing sodium equipment. The RAPS specifically

processes the argon cover gas from the reactor coolant system, providing for decontamination and eventual reuse. The CAPS processes radioactive gases from inerted cells and other liquid metal cover gas systems, providing for decontamination and ultimate discharge to the atmosphere. The cryogenic processing of waste gas by both systems is described.

- 1466 (HEDL-SA--1241) LMFBR ACCIDENT CONSEQUENCES ASSESSMENT. Simpson, D.E. (Hanford Engineering Development Lab., Richland, WA (USA)). 1977. Contract EY-76-C-14-2170. 39p. (CONF-770625--6). Dep. NTIS, PC A03/MF A01.

From International conference on nuclear systems reliability engineering and risk assessment; Gatlinburg, TN, USA (20 Jun 1977).

Deterministic analyses of hypothetical LMFBR accidents have been applied in safety evaluations of FFTF and CRBRP. These analyses involve the application of complex inter-related computational techniques to assess a wide range of circumstances more extreme than any which are realistically foreseen. Such analyses are well suited to be employed in combination with probabilistic techniques for risk assessment.

- 1467 (HEDL-SA--1268) IN-REACTOR BEHAVIOR OF MATERIALS USED TO CONTROL FUEL-CLADDING CHEMICAL INTERACTION. Wilson, C.N.; Gibby, R.L.; Lawrence, L.A.; Weber, E.T. (Hanford Engineering Development Lab., Richland, WA (USA)). 22 Aug 1977. Contract EY-76-C-14-2170. 27p. (CONF-770958--1). Dep. NTIS, PC A03/MF A01.

From American Ceramic Society fall meeting; Hyannis, MA, USA (26 Sep 1977).

Niobium, vanadium, chromium and titanium metals were irradiation tested in various configurations as candidate oxygen buffer/getter materials in LMFBR fuel pins. Test results indicate in-situ oxidation of buffer/getter materials with specific materials and configurations preventing cladding attack. Some placement configurations were ineffective due to low oxygen mobility. A relative preference for buffer/getter reaction with fission product cesium was also noted.

- 1468 (HEDL-SA--1286) CLADDING DEVELOPMENT AND CHARACTERIZATION IN THE UNITED STATES. Lobsinger, R.J. (Hanford Engineering Development Lab., Richland, WA (USA)). 1977. Contract EY-76-C-14-2170. 27p. (CONF-770694--1). Dep. NTIS, PC A03/MF A01.

From U.S. Japan exchange meeting; Sunnyvale, CA, USA (27 Jun 1977).

During the past decade, an extensive program of cladding development has been carried out at HEDL in support of the FFTF/Breeder Reactor Program. This activity has resulted in the establishment of specification, fabrication, and characterization requirements for breeder reactor fuel cladding. In establishing these requirements, input has been derived from vendor development programs, evaluation studies, and reviews with other national laboratories. The major fabrication requirements of the current specification as derived from the development program and the testing required to assure product conformance and characterize cladding behavior are described.

- 1469 (HEDL-SA--1288) SAFETY ASPECTS OF FAST REACTOR FUELS. Hanson, J.E. (Hanford Engineering Development Lab., Richland, WA

(USA)). 1977. Contract EY-76-C-14-2170. 85p. Dep. NTIS, PC A05/MF A01.

Design requirements and performance characteristics of fuel pins for LMFBR reactors under accident conditions are discussed.

- 1470 (HEDL-SA--1292-S) EFFECTS OF STOICHIOMETRY ON CLADDING ATTACK IN MIXED-OXIDE FUELS TO approx. = 3.6 AT% BURNUP. Hata, D.C.; Lawrence, L.A.; Weber, J.W. (Hanford Engineering Development Lab., Richland, WA (USA)). 26 May 1977. Contract EY-76-C-14-2170. 14p. (CONF-771109--99). Dep. NTIS, PC A02/MF A01.

From ANS winter meeting; San Francisco, CA, USA (27 Nov 1977).

Effects of initial stoichiometry on the character and extent of fuel-cladding chemical interaction (FCCI) were established for mixed-oxide fuels irradiated to peak burnups of approximately 3.6 at.%. The present LMFBR design basis considers an initial reduction of 50 microns (2 mils) in cladding thickness to compensate for possible FCCI. This thickness loss represents a significant part of the total cladding wastage allowance for the LMFBR reference fuels design. The reduction or elimination of FCCI would allow a corresponding reduction in cladding thickness resulting in an improvement in the breeding ratio and a reduction in system doubling time.

- 1471 (HEDL-SA--1294S) ANALYSIS OF FUEL-CLADDING CHEMICAL INTERACTION AT HIGH BURNUP. Lawrence, L.A.; Weber, J.W.; Devary, J.L. (Hanford Engineering Development Lab., Richland, WA (USA)). 26 May 1977. Contract EY-76-C-14-2170. 6p. (CONF-771109--101). Dep. NTIS, PC A02/MF A01.

From ANS winter meeting; San Francisco, CA, USA (27 Nov 1977).

The HEDL fuel-cladding chemical interaction (FCCI) wastage correlation has been revised to incorporate additional data from the HEDL P-23 high temperature test series at peak fuel pin burnups of approximately 90.0 MWd/kgM. The previous HEDL correlation was developed from a data base of fuel pins with peak burnups of approximately 50.0 MWd/kgM. Therefore, in order to predict the amount of cladding thickness loss to be expected at current anticipated fuel pin lifetimes in the range of 90 to 100 MWd/kgM a major extrapolation of the actual irradiation experience was necessary. To provide the needed data for the extension of the correlation to high burnups the irradiation of the HEDL P-23A subassembly in EBR-II was extended to a peak fuel pin burnup of approximately 90.0 MWd/kgM. An advanced matrix type reaction was observed in the high burnup fuel pin. The character and extent of the interaction made it possible to estimate the location of the original cladding inner surface to determine cladding thickness loss due to FCCI by measuring the depth of penetration. Therefore, it was necessary to measure total cladding thickness for the high burnup pin. In order to place the entire data set on the same basis, cladding thickness was also measured for the lower burnup pins. Cladding thickness was measured on 225X photographs of the polished cladding at 16 equally spaced locations on the circumference of each sample. From these measurements an average cladding thickness was calculated.

- 1472 (HEDL-SA--1298) FFTF SCALE-MODEL CHARACTERIZATION OF FLOW-INDUCED VIBRATIONAL RESPONSE OF REACTOR INTERNALS. Ryan, J.A.; Julyk, L.J. (Hanford Engineering Development Lab., Richland, WA (USA)). 1977. Contract EY-76-C-14-2170. 98p. (CONF-770933--2).

Dep. NTIS, PC A05/MF A01.

From International Atomic Energy Agency, International working group on fast reactors; Argonne, IL, USA (20 Sep 1977).

As an integral part of the Fast Test Reactor Vibration Program for Reactor Internals, the flow-induced vibrational characteristics of scaled Fast Test Reactor core internal and peripheral components were assessed under scaled and simulated prototype flow conditions in the Hydraulic Core Mockup. The Hydraulic Core Mockup, a 0.285 geometric scale model, was designed to model the vibrational and hydraulic characteristics of the Fast Test Reactor. Model component vibrational characteristics were measured and determined over a range of 36 percent to 111 percent of the scaled prototype design flow. Selected model and prototype components were shaker tested to establish modal characteristics. The dynamic response of the Hydraulic Core Mockup components exhibited no anomalous flow-rate dependent or modal characteristics, and prototype response predictions were adjudged acceptable.

1473 (HEDL-SA--1299-S) CLADDING BREACHES IN MIXED OXIDE FUEL PINS. Weber, J.W.; Almasy, M.Y. (Hanford Engineering Development Lab., Richland, WA (USA)). May 1977. Contract EY-76-C-14-2170. 6p. (CONF-771109--104).

Dep. NTIS, PC A02/MF A01.

From ANS winter meeting; San Francisco, CA, USA (27 Nov 1977).

Breaches of the cladding have occurred on eleven fuel pins from the HEDL mixed oxide (75 w/o UO_2 - 25 w/o PuO_2) irradiation tests in EBR-II. These pins were in 19 or 37 pin subassemblies being irradiated as part of the HEDL Steady State and Run-to-Cladding Breach activities for the FFTF Reference Fuel Program. The linear powers and temperatures of these tests were within the FFTF Steady State design envelopes. Cladding materials included solution-annealed type 304 and 20 percent or 30 percent cold-worked type 316 stainless steel. All pins were fabricated to the reference specifications current at the time for the FFTF driver fuel, except for those with the 30 percent cold-worked cladding. The objectives of the studies and examinations of the breached pins are to: (1) establish the burnup capability for reference fuel, (2) identify cladding breach mechanisms, (3) determine the effects of cladding breach on neighboring fuel pins, (4) evaluate the effects of short term postbreach residence in reactor on fuel-coolant interaction, and (5) provide data for failure criteria. Examination and characterization have been completed on nine of the eleven breached pins, with two pins currently being examined. In addition, 46 neighbors to the breached pins have been evaluated for possible effects as a consequence of the breach.

1474 (HEDL-SA--1300FP) INTERSUBASSEMBLY INCOHERENCIES AND GROUPING TECHNIQUES IN LMFBR HYPOTHETICAL OVERPOWER ACCIDENT. Wilburn, N.P. (Hanford Engineering Development Lab., Richland, WA (USA)). Oct 1977. Contract EY-76-C-14-2170. 39p. (CONF-771109--97).

Dep. NTIS, PC A03/MF A01.

From ANS winter meeting; San Francisco, CA, USA (27 Nov 1977).

A detailed analysis was made of the FTR core using the 100-channel MELT-IIIA code. Results were studied for the transient overpower accident (where 0.5\$/sec and 1\$/sec ramps) and in which the Damage Parameter and the Failure Potential criteria were used. Using the information obtained from these series of runs, a new method of grouping the subassemblies into channels has been developed. Also, it was

demonstrated that a 7-channel representation of the FTR core using this method does an adequate job of representing the behavior during a hypothetical disruptive transient overpower core accident. It has been shown that this new 7-channel grouping method does a better job than an earlier 20-channel grouping. It has also been demonstrated that the incoherency effects between subassemblies as shown during the 76-channel representation of the reactor can be adequately modeled by 7-channels, provided the 7-channels are selected according to the criteria stated in the report. The overall results of power and net reactivity were shown to be only slightly different in the two cases of the 7-channel and the 76-channel runs. Therefore, it can be concluded that any intersubassembly incoherencies can be modeled adequately by a small number of channels, provided the subassemblies making up these channels are selected according to the criteria stated.

1475 (HEDL-SA--1306S) EFFECTS OF LOCAL CESIUM CONCENTRATIONS ON MIXED-OXIDE FUEL BEHAVIOR. Karnesky, R.A. (Hanford Engineering Development Lab., Richland, WA (USA)). 1977. Contract EY-76-C-14-2170. 6p. (CONF-771109--106). Dep. NTIS, PC A02/MF A01.

From ANS winter meeting; San Francisco, CA, USA (27 Nov 1977).

Local peaks in cesium concentrations were found to influence the thermal-mechanical behavior of mixed-oxide fuel pins at high burnup. A prototypic fuel pin was irradiated in EBR-II at a peak linear power of approximately 400 W/cm (12 kW/ft) with peak cladding temperatures of approximately 540°C (1000°F) to a peak burnup of approximately 8.7 at. %. The mixed-oxide pellet fuel (75 wt % UO_2 , 25% PuO_2) had an initial oxygen-to-metal ratio of 1.956 and a planar smeared density of 90% of theoretical. The pin was clad with .041 cm (0.016 in.) thick, .635 cm (0.250 in.) diameter, solution-annealed type 316 stainless steel. In the region of the upper UO_2 insulator the high cesium concentration and attendant cesium-uranium reaction zone are found to be restricted to a narrow region on the circumference of the first insulator pellet. This reaction zone resulted in extensive fragmentation of the insulator pellet approximately .24 cm (.1 in.) above the fuel-insulator interface. Densification of the insulator pellet fragment adjacent to the fuel column appears to have occurred and may be due to increased temperatures resulting from the increased thermal resistance of the crack. The cesium-uranium reaction region appears to consist of two zones, a high density area where the uranium insulator pellet has undergone grain boundary attack and dissolution and a lower density zone with a more porous cesium-uranium reaction product.

1476 (HEDL-SA--1316) UNCERTAINTIES IN FAST BREEDER REACTOR FUEL PIN CLADDING STRESS AND STRAIN CALCULATIONS. Sutherland, W.H. (Hanford Engineering Development Lab., Richland, WA (USA)). [nd]. Contract EY-76-C-14-2170. 27p. (CONF-780609--18). Dep. NTIS, PC A03/MF A01.

From ASME/CSME pressure vessels and piping conference; Montreal, Canada (25 Jun 1978).

Two LMFBR material response phenomena, irradiation creep and swelling, make the prediction of cladding stress and strain uncertain. Temperature gradients through the cladding wall result in high predicted swelling gradients because of the extreme sensitivity of swelling to temperature. If the

phenomenological material model for irradiation swelling does not assume a stress effect, then large stresses are calculated due to the large swelling gradients. Detailed analyses have been performed on selected fuel pins where the loading on the cladding has been restricted to fission gas pressure, temperature gradients, and swelling gradients. Various combinations of phenomenological material models for irradiation creep and swelling were used. Large variations in calculated cladding stresses and strains result from the above combination of material models. Resolution of the correct material model for irradiation creep and swelling could be achieved if the residual stress distribution and swelling distribution through the cladding thickness were known. Experimental investigations are underway to develop a procedure for measuring the residual stress and swelling distribution through the cladding wall.

- 1477 (HEDL-SA--1321) DESIGN AND ECONOMICS OF LARGE LMFBRs. Omberg, R.P.; Cantley, D.A.; Last, G.A.; Squire, A.; Lowery, V.W. (Hanford Engineering Development Lab., Richland, WA (USA); Energy Research and Development Administration, Washington, DC (USA). Div. of Reactor Development and Demonstration). Jun 1977. Contract EY-76-C-142-2170. 31p. (CONF-771123--3). Dep. NTIS, PC A03/MF A01. From BNES conference on optimization of sodium cooled fast reactors; London, UK (28 Nov 1977).

The design of an LMFBR core is a complex process which is strongly dependent upon design philosophy, design criteria, material properties, and the calculational procedure involved. The development of a core design with optimum characteristics, whether it be a minimum doubling time, a minimum power cost, or a minimum sodium void worth, requires a close coupling of the disciplines of reactor physics, thermohydraulics, mechanical design, and fuel pin performance. This is true regardless of whether the fuel is oxide, carbide, nitride, or metal, and regardless of whether the fuel cycle is Pu/U or U-233/Th.

- 1478 (HEDL-SA--1324-F) GROUND TEMPERATURES SURROUNDING A MOLTEN FUEL POOL. Peak, R.D. (Hanford Engineering Development Lab., Richland, WA (USA)). 22 Jun 1977. Contract EY-76-C-14-2170. 3p. (CONF-771109--96). Dep. NTIS, PC A02/MF A01.

From ANS winter meeting; San Francisco, CA, USA (27 Nov 1977).

In the analysis of the consequences of a hypothetical meltdown accident in an LMFBR, it is important to estimate the final location of the molten fuel pool in the concrete and ground underlying the reactor vessel. The GROWS program and the AYER program have been developed to calculate the final location of the molten fuel pool as the culmination of the transient analysis of this unusual Stefan problem but these programs require extensive computational resources. The solution is provided to the concrete and ground temperatures surrounding the stationary fuel pool and the related heat flux from the pool to the ground surface outside the containment building. This solution can be used to estimate the final location of the fuel pool and to check the end results of the sophisticated programs.

- 1479 (HEDL-SA--1325) DESIGN CONFIGURATIONS FOR CONTROLLING SODIUM VOID WORTH IN LARGE FBR CORES. Chandler, J.C.; Marr, D.R. (Hanford Engineering Development Lab., Richland, WA

(USA)). Sep 1977. Contract EY-76-C-14-2170. 25p. (CONF-771109--105). Dep. NTIS (US Sales Only), PC A02/MF A01.

From ANS winter meeting; San Francisco, CA, USA (27 Nov 1977).

Analyses of sodium voiding in small fast reactors with plutonium-uranium fuel--such as FFTF--indicate that a relatively small positive reactivity effect will result. Similar analyses for large fast breeder reactors (FBRs) in the 1200 MWe range, however, indicate that a much larger positive reactivity effect will occur. It is important, therefore, to develop design configurations and methods of defining those configurations so as to minimize the sodium void effect without adversely affecting the breeding and economic performance. A set of design configurations with these characteristics is presented in the paper. Since no practical experience is available for defining an acceptable value for sodium void worth, the voiding criterion was chosen to be whole-core sodium void worth roughly equivalent to that of CRBR, which is on the order of three dollars. This value was chosen on the assumption that CRBR could be licensed with such a void worth. Four reactor systems were evaluated for sodium void worth. The systems represented a direct scale up of the FFTF subassembly to 1200 MWe, a homogeneous core utilizing the FTR reference fuel pin in an optimized subassembly, a heterogeneous core utilizing the same fuel pin, and an alternate fueled design based on the thermal characteristics of the CRBR assembly. The designs are compared in terms of breeding and economic performance and sodium void worth.

- 1480 (HEDL-SA--1326) TRITIUM PERMEATION THROUGH OXIDIZED 304 AND 316 STAINLESS STEEL. McGuire, J.C. (Hanford Engineering Development Lab., Richland, WA (USA)). Jan 1978. Contract EY-76-C-14-2170. 27p. (CONF-780213--10). Dep. NTIS, PC A03/MF A01. From 107. AIME meeting; Denver, CO, USA (26 Feb 1978).

This work was completed during the course of a cooperative program on Tritium Transport in Liquid Metal Cooled Reactors. This work considers conditions encountered in operating reactors. It involves hydrogen, deuterium and tritium permeation measurements on "clean" and oxidized surfaces. The tritium measurements were restricted to permeation rates from sodium and through the test membrane at concentrations typical of EBR-II reactor experience. The hydrogen and deuterium work measured permeation rates at gas pressures from 13-1300 Pa (0.1 to 10 Torr). Permeation rates were measured for tritium permeation through oxidized 304 and 316 stainless steel. The tritium was injected into hot flowing sodium at concentrations near present sodium cooled reactor operating levels. Permeation data are presented as a function of temperature, oxidation time and tritium activity level in the sodium. Permeation rates were determined at 590, 540 and 480°C and at tritium concentrations varying from 1 to 40 x 10⁻⁹ CiT₂/gmNa (3.4 x 10⁻⁸ to 1 x 10⁻⁶ ppm). At 540°C tritium diffusion rates for both oxidized steels were in the range 1-2 x 10⁻⁴ cc-mm/hr-cm²-atm^{1/2}. Response at this concentration varied as the square root of pressure. However hydrogen (H₂) and deuterium permeation tests at 1300 to 13 Pa (10 to 0.1 Torr.) showed linear response to changes in this higher pressure range.

- 1481 (HEDL-SA--1327-FP) PERFORMANCE OF THORIUM FUELED FAST BREEDERS. Marr, D.R.; Cantley, D.A.; Chandler, J.C.; McCurry, D.C.; Omberg, R.P. (Hanford Engineering Development

Lab., Richland, WA (USA)). Oct 1977. Contract EY-76-C-14-2170. 38p. (CONF-771109--103). Dep. NTIS, PC A03/MF A01.

From ANS winter meeting; San Francisco, CA, USA (27 Nov 1977).

Three studies were performed to evaluate the breeding ratio of fast breeders containing thorium. In a study of a small breeder, thorium metal and thorium oxide core designs were found to have similar breeding ratios. The slight advantage exhibited by the metal design was not considered significant since the design was based on a limited amount of thorium metal swelling data. In a study of a 1200 MWe plant, a plutonium-uranium oxide design was compared to a uranium-thorium design. The uranium-thorium design had a lower breeder ratio, but also had a negative sodium void effect. In the third study, the effect of replacing thorium oxide radial blankets with thorium metal radial blankets was evaluated. This was found to have little effect on the breeding ratio.

1482 (HEDL-SA--1327-S) PERFORMANCE OF THORIUM FUELED FAST BREEDERS. Marr, D.R.; Cantley, D.A.; Chandler, J.C.; McCurry, D.C.; Haffner, D.R. (Hanford Engineering Development Lab., Richland, WA (USA)). Jun 1977. Contract EY-76-C-14-2170. 7p. (CONF-771109--102). Dep. NTIS, PC A02/MF A01.

From ANS winter meeting; San Francisco, CA, USA (27 Nov 1977).

Three studies were made of the performance characteristics of thorium-containing reactors. The first of these compared two small breeder designs, one using thorium oxide, the other using thorium metal, both with ^{233}U enrichment. The second compared a plutonium-uranium oxide 1200 MWe design to a uranium-thorium 1200 MWe design. The third compared the performances of thorium metal and thorium oxide radial blankets for three large breeders using uranium or thorium oxide cores and axial blankets. Results are presented and discussed.

1483 (HEDL-SA--1329) REACTOR PHYSICS PARAMETERS OF ALTERNATE FUELED FBR CORE DESIGNS. Haffner, D.R.; Hardie, R.W. (Hanford Engineering Development Lab., Richland, WA (USA)). Dec 1977. Contract EY-76-C-14-2170. 31p. (CONF-771109--112). Dep. NTIS, PC A03/MF A01.

From ANS winter meeting; San Francisco, CA, USA (27 Nov 1977).

Nuclear non-proliferation considerations have resulted in renewed interest in the thorium fuel cycle. Reactor physics parameters of a typical 1200-MW(e) Fast Breeder Reactor (FBR) design were compared when U-233 is substituted for Pu as a fissile fuel and when Th-232 is substituted for U-238 as a fertile fuel. When the U-238 in the blanket is replaced with Th-232, the reactor physics parameters are relatively unchanged. However, replacing U-238 in the core with Th-232 increases the critical mass by 11 to 15% and decreases the breeding ratio by 0.13 to 0.16. In addition, replacing the Pu in the core with U-233 decreases the critical mass by 4 to 6% and decreases the breeding ratio by 0.13 to 0.16. Both of the changes in the core make the sodium void coefficient more negative.

1484 (HEDL-SA--1333) TESTING OF FFTF FUEL HANDLING EQUIPMENT. Coleman, D.W.; Grazzini, E.D.; Hill, L.F. (Energy Research and Development Administration, Washington, DC (USA); Westinghouse Hanford Co., Richland, WA (USA)). Jul 1977. Contract EY-76-C-14-2170. 43p. (CONF-771120--24). Dep. NTIS, PC A03/MF A01.

From Winter annual meeting of the American Society of Mechanical Engineers; Atlanta, GA, USA (27 Nov 1977).

The Fast Flux Test Facility has several manual/computer controlled fuel handling machines which are exposed to severe environments during plant operation but still must operate reliably when called upon for reactor refueling. The test programs for two such machines--the Closed Loop Ex-Vessel Machine and the In-Vessel Handling Machine--are described. The discussion centers on those areas where design corrections or equipment repairs substantiated the benefits of a test program prior to plant operation.

1485 (HEDL-SA--1343) PULSED MAGNETIC WELDING OF BREEDER REACTOR FUEL PIN END CLOSURES. Brown, W.F.; Bendas, J.; Olson, N.T. (Hanford Engineering Development Lab., Richland, WA (USA); Maxwell Labs., Inc., San Diego, CA (USA)). [nd]. Contract EY-76-C-14-2170. 14p. (CONF-780406--4). Dep. NTIS, PC A02/MF A01.

From 59. AWS annual meeting; New Orleans, LA, USA (3 Apr 1978).

High-frequency, high-intensity pulsed magnetic fields were used in an experimental program to produce leak proof fuel pin end closures on stainless steel and nickel base alloys. Metallographic examination of these solid state welds between thin walled fuel pin cladding tubes and end plugs showed a wavy or rippled appearance which is characteristic of high velocity impact bonding. Leak tests and mechanical tests showed that the end closure welds were leak proof and stronger than the cladding tube material.

1486 (HEDL-SA--1348) DEVELOPMENT OF ULTRASONIC EXAMINATION METHODS FOR AUSTENITIC STAINLESS STEEL WELD INSPECTION. Mech, S.J.; Michaels, T.E.; Emmons, J.S.; Sugiyama, M.M. (Hanford Engineering Development Lab., Richland, WA (USA)). Aug 1977. Contract EY-76-C-14-2170. 29p. Dep. NTIS, PC A03/MF A01.

Signal acquisition and analysis techniques were developed to permit locating notches placed in an austenitic stainless steel pipe weld. Ultrasonic techniques presented here utilized refracted longitudinal and shear inspection beams with a dual element, pitch-catch transducer. Sources of grain noise and the metallurgical implications of inspecting austenitic stainless steel welds are reviewed. Data were analyzed in both time and frequency domains, and a simple frequency moment algorithm was developed which is sensitive to defect signal and somewhat insensitive to grain noise. Data were also used to train an adaptive learning network (ALN) and the results obtained demonstrate only slight sensitivity to grain noise.

1487 (HEDL-SA--1350) NONDESTRUCTIVE ANALYSIS OF IRRADIATED FUELS. Dudey, N.D.; Frick, D.C. (Exxon Nuclear Co., Inc., Richland, WA (USA); Westinghouse Hanford Co., Richland, WA (USA)). 1977. Contract EY-76-C-14-2170. 20p. (CONF-771036--14). Dep. NTIS, PC A02/MF A01.

From 2. ASTM-EURATOM symposium on reactor dosimetry: dosimetry methods for fuels, cladding and structural materials; Palo Alto, CA, USA (2 Oct 1977).

The principal nondestructive examination techniques presently used to assess the physical integrity of reactor fuels and cladding materials include gamma-scanning, profilometry, eddy current, visual inspection,

rod-to-rod spacing, and neutron radiography. LWR fuels are generally examined during annual refueling outages, and are conducted underwater in the spent fuel pool. FBR fuels are primarily examined in hot cells after fuel discharge. Although the NDE techniques are identical, LWR fuel examinations emphasize tests to demonstrate adherence to technical specification and reliable fuel performance; whereas, FBR fuel examinations emphasize aspects more related to the relative performance of different types of fuel and cladding materials subjected to variable irradiation conditions.

- 1488 (HEDL-SA--1351) FFTF REACTOR CHARACTERIZATION PROGRAM. Daughtry, J.W.; Bennett, R.A.; Bunch, W.L.; McElroy, W.N.; King, T.L. (Hanford Engineering Development Lab., Richland, WA (USA)). 1977. Contract EY-76-C-14-2170. 16p. (CONF-771036--10). Dep. NTIS, PC A02/MF A01.

From 2. ASTM-EURATOM symposium on reactor dosimetry: dosimetry methods for fuels, cladding and structural materials; Palo Alto, CA, USA (2 Oct 1977).

Preparations are under way for the initial startup and testing of the Fast Flux Test Facility (FFTF). The FFTF Reactor Characterization Program is that part of the startup test plan that deals with the determination of the neutron, gamma ray and thermal hydraulic characteristics of the reactor. This program encompasses measurements and calculations of: neutron spectra, flux and fluence; gamma-ray spectra, dose and heating; fission rate distributions; capture rate distributions; other reaction rates of interest; fission product yields; and thermal hydraulic data. Measurements of these parameters will be made in the reactor core and reflectors, will extend vertically downward to the vicinity of the core support structure and upward to the top of the sodium pool, and will extend radially outward to include in-vessel fuel storage locations and the cavity between the reactor vessel and the concrete wall.

- 1489 (HEDL-SA--1354-FP) INELASTIC ANALYSIS OF PIPELINE IN FFTF HEAT TRANSPORT SYSTEM. Chen, W.L.; Weiner, E.O. (Hanford Engineering Development Lab., Richland, WA (USA)). Dec 1977. Contract EY-76-C-14-2170. 27p. (CONF-780609--15). Dep. NTIS, PC A03/MF A01.

From ASME/CSME pressure vessels and piping conference; Montreal, Canada (25 Jun 1978).

The detailed inelastic (elastic-plastic-creep) analysis is presented for the Primary Crossover Pipe Line in the Fast Flux Test Facility (FFTF), subjected to the combined deadweight and thermal loads. It demonstrates the inelastic structural responses of the complete pipe run and satisfaction of ASME Code requirements at elevated temperatures. The analytical tool used for this analysis is the general purpose nonlinear finite element program, MARCCDC. The pipe line is modeled using the combinations of closed section beam elements and 3-node elbow elements. Results of creep relaxation under multiaxial loading of the piping systems are compared with those of uniaxial loading in a simple two-bar model. Creep-fatigue damage evaluations are calculated by following the procedures of ASME Code Case 1331-5.

- 1490 (HEDL-SA--13638) US--UK TECHNICAL EXCHANGE BREEDER REACTOR FUELS. FUEL PIN CHEMISTRY (SUPPORTING INFORMATION). (Hanford Engineering Development Lab., Richland, WA (USA)). 14 Oct 1977. Contract EY-76-C-14-

2170. 55p. (CONF-7710139--1). Dep. NTIS, PC A04/MF A01.

From US-UK technical exchange; Sunnyvale, CA, USA (14 Oct 1977).

The following information covering the two topic areas of fuel pin chemistry; fuel-cladding chemical interaction and cesium behavior will not be formally exchanged with the UK representatives prior to the October 14, 1977, meeting at GE in Sunnyvale, California. This information will only be presented to the UK representatives at the exchange meeting if they offer new information of comparable technical value. Data are presented on irradiation behavior and performance of mixed oxide LMFBR fuels. (DG)

- 1491 (HEDL-SA--1368) DESIGN EVOLUTION OF FFTF HEAT TRANSPORT SYSTEM PUMPS. Young, M.W.; Nixon, D.R.; Absher, K.R. (Hanford Engineering Development Lab., Richland, WA (USA)). Oct 1977. Contract EY-76-C-14-2170. 61p. AT.

The Fast Flux Test Facility (FFTF) Heat Transport System (HTS) pumps have been completed and are installed. The basic designs for the prototype, primary, and secondary pumps are described in this report. The descriptions include changes based on design reviews, high temperature and thermal transient considerations, sub-component development testing, and pump testing. Emphasis has been placed on changes resulting from pump tests in water and sodium test loops. Prototype and plant unit configurations are compared to show applicability of sodium test data to the plant units. The pump bearing failure experienced during thermal transient testing is also described, along with the changes required to prevent recurrence. Special prototype pump modifications were made to obtain data verifying adequacy of the design changes to the hydrostatic bearing. These changes are significant to future development programs, as are potential design improvements intended to reduce sensitivity to long-term dimensional instability and severe thermal transients.

- 1492 (HEDL-SA--1369) FFTF FUEL HANDLING SYSTEM, PORT CLOSURES AND SEALS: FEATURES AND EXPERIENCE. Hornberger, D.W. (Hanford Engineering Development Lab., Richland, WA (USA)). 1977. Contract EY-76-C-14-2170. 41p. AT.

A brief description of the FFTF Fuel Handling System is presented, with emphasis on the ex-reactor to in-reactor vessel handling machines and techniques. The description includes the Closed Loop Ex-Vessel Machine, In-Vessel Handling Machine, Floor Valve, In-Vessel Storage Module, and Fuel Transfer Port and its Floor Valve Adapter. Each item of equipment is reviewed with regard to design features which are important to the functional operation both when acting alone and in combination with the interfacing component. Where applicable, the different requirements imposed on the component during reactor operation and refueling are identified, including the expected response to off-normal events. In addition, the results of some of the test work which has been done on the fuel handling equipment relative to the operational requirements are described and results of purge techniques, measurements of inflatable seal leakages, an evaluation of long term diffusion of sodium vapor into annular spaces, and identification of potential design improvements in the machine operations are included.

- 1493 (HEDL-SA--1370) FFTF INSTRUMENT TREE

DESIGN AND DEVELOPMENT. Packard, R.B. (Hanford Engineering Development Lab., Richland, WA (USA)). Sep 1977. Contract EY-76-C-14-2170. 31p. AT.

A general description of the instrument tree is presented along with a discussion of its function in the FFTF. This includes the relationship of the instrument tree to the overall operation of the reactor. This is followed by a description of the design criteria used to develop the unit. The areas covered include flow and temperature monitoring of the core, secondary holddown of the core components, support for the control rod system, radiation, thermal and major structural requirements. Following each area is a discussion of the design features used to satisfy the requirements. A discussion of the instrumentation used to monitor the sodium flow and temperature of the core is presented. The instrumentation required to operate and monitor the instrument tree itself is covered. Fabrication of the prototype and installed units is covered with emphasis on areas such as the welding of the in-reactor portion which is essentially an 18,000 pound (8172 Kg), 32 foot (9.75 meters) long solid stainless steel weldment. The extensive testing performed on the prototype unit in air and sodium and the design changes required for the plant units are covered.

1494 (HEDL-SA--1371) FFTF EM SERVICE PUMP DESIGN, APPLICATION, AND TESTING. Jacobson, G.; Carter, E.H.; Hallinan, G.J.; Eichelberger, R.L. (Hanford Engineering Development Lab., Richland, WA (USA)). 1977. Contract EX-76-C-14-2170. 25p. (CONF-771217--10). Dep. NTIS, PC A02/MF A01.

From Seminar on LMFBR components; Canoga Park, CA, USA (5 Dec 1977).

Portions of this document are illegible.

During 1975, HEDL selected Atomic International to review the design of three classes of EM Pumps (L-30, L-100, L-200) and to fabricate a total of fifteen pumps. One of the L-100 pumps was shipped to the liquid Metal Engineering Center (LMEC) for sodium testing in the small components test loop (SCTL). The paper presents the HEDL design criteria, discusses the resulting design, and reviews the test results against the predictions.

1495 (HEDL-SA--1374) STANDARDIZATION OF DOSIMETRY AND DAMAGE ANALYSIS WORK FOR U.S. LWR, FBR, AND MFR DEVELOPMENT PROGRAM. McElroy, W.N.; Doran, D.G.; Gold, R.; Morgan, W.C.; Grundl, J.A.; McGarry, E.D.; Kam, F.B.K.; Swank, J.H.; Odette, G.R. (Hanford Engineering Development Lab., Richland, WA (USA)). Jan 1978. Contract EY-76-C-14-2170. 46p. (CONF-771036--11). Dep. NTIS, PC A03/MF A01.

From 2. ASTM-EURATOM symposium on reactor dosimetry: dosimetry methods for fuels, cladding and structural materials; Palo Alto, CA, USA (2 Oct 1977).

The accuracy requirements for various measured/calculated exposure and correlation parameters associated with current dosimetry and damage analysis procedures and practices depend on the accuracy needs of reactor development efforts in testing, design, safety, operations, and surveillance programs. Present state-of-the-art accuracies are estimated to be in the range of ± 2 to 30 percent (1 sigma), depending on the particular parameter. There now appears to be international agreement, at least for the long term, that most reactor fuels and materials programs will not be able to accept an uncertainty greater than about ± 5 percent (1 sigma). The current status of

dosimetry and damage analysis standardization work within the U.S. for LWR, FBR and MFR is reviewed in this paper.

1496 (HEDL-SA--1375) EBR-II VALIDATED, KEY FISSION PRODUCT YIELDS FOR FAST REACTOR APPLICATION. Kellogg, L.S.; Davis, A.I.; Lippincott, E.P.; Ruggles, J.M. (Hanford Engineering Development Lab., Richland, WA (USA)). 1978. Contract EY-76-C-14-2170. 15p. (CONF-781002--1). Dep. NTIS (US Sales Only), PC A02/MF A01.

Relative fission yields were measured for three different locations in the row 4 "Test Region" of the EBR-II reactor. Correlation of the relative fission yields to the measured average energy (anti E) and the measured ^{137}Cs $^{238}\text{U}/^{235}\text{U}$ spectral indices have been made. The measured relative fission yields for selected fission products from ^{235}U , ^{238}U , ^{239}Pu and ^{237}Np have been compared with those values reported by the Interlaboratory Reaction Rate (ILRR) program, EBR-II fast reactor yields from destructive analysis and summation, and the March 1977 version of ENDF/B-V.

1497 (HEDL-SA--1380) EXPERIMENTAL AND THEORETICAL STUDIES ON WATER AND GAS RELEASE FROM HEATED CONCRETE. McCormack, J.D.; Postma, A.K. (Hanford Engineering Development Lab., Richland, WA (USA)). 1977. Contract EY-76-C-14-2170. 11p. (CONF-771108--8). Dep. NTIS, PC A02/MF A01.

From Post accident heat removal information exchange meeting; Chicago, IL, USA (2 Nov 1977).

Procedures currently used in licensing of nuclear facilities require analysis of postulated accidents which are more severe than "design basis" events. For breeder program reactors, some accidents in this severe category involve spillage of sodium coolant onto concrete protected by a steel liner. Heat transfer through the liner heats the concrete, causing a part of the mixing water and other gases to be driven off. These gases would add to pressure in the containment atmosphere, and the water vapor can form hydrogen if it contacts sodium. Evaluations of containment integrity for such postulated accidents will be aided by knowledge of how much water and other gases are released from heated concrete. The report presents results of a research effort at Hanford Engineering Development Laboratory designed to improve understanding of the release of water and gases from heated concrete.

1498 (HEDL-SA--1381) PRELIMINARY RESULTS OF CSTF AEROSOL BEHAVIOR TEST, AB-1. Hilliard, R.K.; McCormack, J.D.; Hassberger, J.A.; Muhlestein, L.D. (Hanford Engineering Development Lab., Richland, WA (USA)). Oct 1977. Contract EY-76-C-14-2170. 36p. (CONF-7710102--1). Dep. NTIS, PC A03/MF A01.

From Aerosol transport and release review meeting; Silver Springs, MD, USA (27 Oct 1977).

A large-scale aerosol behavior test (AB-1) was performed in the Containment Systems Test Facility (CSTF) containment vessel using sodium oxide aerosol generated by a pool of sodium burning in air. The purpose was to characterize the aerosol properties and compare the experimental results with computer code predictions. The 20-meter high CSTF vessel is by far the largest ever used in aerosol agglomeration studies and is approximately half-scale of large commercial reactor containment buildings for the parameters affecting particle agglomeration and settling.

- 1499 (HEDL-SA--1382-FP) THERMALLY INDUCED STRESSES AND FRACTURES IN BORON CARBIDE PELLETS. Hollenberg, G.W. (Hanford Engineering Development Lab., Richland, WA (USA)). 1978. Contract EY-76-C-14-2170. 23p. (CONF-780545--5). Dep. NTIS (US Sales Only), PC A02/MF A01.

From Meeting of the American Ceramic Society; Detroit, MI, USA (6 May 1978).

Neutron absorber materials are used for the control of power levels in fast breeder reactors. In these applications, boron carbide has emerged as the best overall absorber material. Absorber pins in the Fast Test Reactor (FTR) consist of stacks of hot-pressed boron carbide pellets encapsulated in stainless steel tubes. The tubes are arranged in a triangular array inside a hexagonal duct. Experience has dictated the use of stoichiometric boron carbide with a nominal density of 92% of theoretical. Due to the internal heating which results from neutron captures in the pellets, radial temperature gradients and their accompanying thermal stress fields are established in the pellets. In evaluating the acceptability of advanced designs utilizing boron carbide, thermal stress levels in pellets under irradiation have been predicted. Laboratory experimentation and fracture mechanics analysis have been used to characterize the type of fracture behavior to be anticipated.

- 1500 (HEDL-SA--1387) CLEANING, DISASSEMBLY, AND REQUALIFICATION OF THE FFTF IN VESSEL HANDLING MACHINE. Coops, W.J. (Hanford Engineering Development Lab., Richland, WA (USA)). Oct 1977. Contract EY-76-C-14-2170. 26p. (CONF-7710126--1). Dep. NTIS, PC A03/MF A01.

From American power conference; Chicago, IL, USA (Oct 1977).

The Engineering Model In Vessel Handling Machine (IVHM) was successfully removed, cleaned, disassembled, inspected, reassembled and reinstalled into the sodium test vessel at Richland, Washington. This was the first time in the United States a full size operational sodium wetted machine has been cleaned by the water vapor nitrogen process and requalified for operation. The work utilized an atmospheric control system during removal, a tank type water vapor nitrogen cleaning system and an open "hands on" disassembly and assembly stand. Results of the work indicate the tools, process and equipment are adequate for the non-radioactive maintenance sequence. Additionally, the work proves that a machine of this complexity can be successfully cleaned, maintained and re-used without the need to replace a large percentage of the sodium wetted parts.

- 1501 (HEDL-SA--1388) FAST FLUX TEST FACILITY PRIMARY SODIUM VALVES. Rabe, G.B.; Ezra, B.C. (Foster Wheeler Energy Corp., Livingston, NJ (USA)). 1977. Contract EY-76-C-14-2170. 42p. (CONF-771237--1). Dep. NTIS, PC A03/MF A01.

From 1. joint US/Japan seminar on breeder reactor plant components; Los Angeles, CA, USA (5 Dec 1977).

The design and development of the valves used in the primary sodium coolant loop of the Fast Flux Test Facility is described. One tilting-disk check valve is used in the cold leg of the coolant loop. It is designed to limit flow reversal in the loop while maintaining a low pressure drop during forward flow. Two isolation valves are used in each

coolant loop--one in the cold leg and one in the hot leg. They are of the motor-operated swinging-gate type. The design, analysis, and testing programs undertaken to develop and qualify these valves are described.

- 1502 (HEDL-SA--1391) FRICTION, WEAR, AND CORROSION OF LAVES-HARDENED NICKEL ALLOY HARDSURFACING IN SODIUM. Johnson, R.N.; Farwick, D.G. (Hanford Engineering Development Lab., Richland, WA (USA)). 1978. Contract EY-76-C-14-2170. 23p. (CONF-780430--6). Dep. NTIS, PC A02/MF A01.

From Conference on metallurgical coatings; San Francisco, CA, USA (3 Apr 1978).

This paper represents the results of friction, wear, and corrosion tests on Tribaloy 700 specimens. The Tribaloy alloys are a family of materials typically consisting of a hard, intermetallic Laves phase dispersed in a cobalt or nickel eutectic or solid solution matrix. Only one alloy of the Tribaloy series, Tribaloy 700, is a cobalt-free nickel-base alloy. Tribaloy 700 is therefore of interest for nuclear reactor applications, where cobalt must be restricted. Tribaloy 700 rubbing against itself in sodium exhibited among the lowest friction coefficients measured for metallic materials at high temperature. Detonation-gun coatings had lower friction and lower corrosion rates than plasma coatings, in general. The wear rate of Tribaloy 700 was negligible. Surface damage resistance was good, especially when in contact with itself or other hard materials. The material also exhibited low corrosion rates in sodium.

- 1503 (HEDL-SA--1393) BIASES FOR CURRENT FFTF CALCULATIONAL METHODS. Ombrellaro, P.A.; Bennett, R.A.; Daughtry, J.W.; Dobbin, K.D.; Harris, R.A.; Nelson, J.V.; Peterson, R.E.; Rothrock, R.B. (Hanford Engineering Development Lab., Richland, WA (USA)). 1978. Contract EY-76-C-14-2170. 9p. (CONF-780401--9). Dep. NTIS, PC A02/MF A01.

From Topical meeting on advances in reactor physics; Gatlinburg, TN, USA (9 Apr 1978).

Uncertainties in nuclear data and approximate calculational methods used in safety design, and operational support of a reactor yield biased as well as uncertain results. Experimentally based biases for use in Fast Flux Test Facility (FFTF) core calculations have been evaluated and are presented together with a description of calculational methods. Experimental data for these evaluations were obtained from an Engineering Mockup Critical (EMC) of the FFTF core built at the Argonne National Laboratory (ANL). The experiments were conceived and planned by the Hanford Engineering Development Laboratory (HEDL) in cooperation with the Westinghouse Advanced Reactors Division (WARD) and ANL personnel, and carried out by the ANL staff. All experiments were designed specifically to provide data for evaluation of current FFTF core calculational methods. These comprehensive experiments were designed to allow simultaneous evaluations of biases and uncertainties in calculated reactivities, fuel sub-assembly and material reactivity worths, small sample worths, absorber rod worths, spatial fission rate distributions, power tilting effects and spatial neutron spectra. Modified source multiplication and reactivity anomaly methods have also been evaluated. Uncertainties in the biases have been established and are sufficiently small to attain a high degree of confidence in the design, safety and operational aspects of the FFTF core.

- 1504 (HEDL-SA--1399-FP) FABRICATION OF ThO_2 , UO_2 , AND PuO_2 - UO_2 PELLETS. Rasmussen, D.E.; Jentzen, W.R.; McCord, R.B. (Hanford Engineering Development Lab., Richland, WA (USA)). 1978. Contract EY-76-C-14-2170. 22p. (CONF-780545--10). Dep. NTIS, PC A02/MF A01.

From Meeting of the American Ceramic Society; Detroit, MI, USA (6 May 1978).

Portions of document are illegible.

Fabrication of ThO pellets for EBR-II irradiation testing and fabrication of UO_2 and PuO_2 - UO_2 pellets for United Kingdom Prototype Fast Reactor (PFR) irradiation testing is discussed. Effect of process parameters on density and microstructure of pellets fabricated by the cold press and sinter technique is reviewed.

- 1505 (HEDL-SA--1402) HIGH TEMPERATURE IN-REACTOR CREEP OF 20% COLD WORKED FTR CLADDING. Gilbert, E.R.; Lovell, A.J.; Chin, B.A. (Hanford Engineering Development Lab., Richland, WA (USA)). Dec 1977. Contract EY-76-C-14-2170. 15p. (CONF-780722--24). Dep. NTIS, PC A02/MF A01.

From 9. symposium on effects of radiation in structural materials; Richland, WA, USA (10 Jul 1978).

Portions of document are illegible.

The in-reactor creep behavior of 20% cold worked Type 316 stainless steel tubing was investigated at temperatures ranging from 410 to 720°C for neutron fluences up to 5×10^{22} n/cm² ($E > 0.1$ MeV) in the experimental breeder reactor (EBR-II). The irradiation environment was found to either retard or enhance creep rates depending upon the irradiation conditions. When compared to thermal control tests on unirradiated specimens, irradiation enhanced creep rates were observed for temperatures below 620°C. Above 620°C, however, some specimens exhibited less in-reactor creep than thermal creep of unirradiated specimens. This irradiation hardening was observed for strain rates exceeding $5 \times 10^{-4}\%$ per hour. In-reactor and thermal creep rates were found to be similar at lower strain rates. To fully describe the experimentally observed in-reactor creep behavior with an empirical expression, a commutative equation was developed. The development was based as much as possible on existing equations for thermal creep and irradiation creep. The thermal creep description is comprised of a slow transient, rapid transient, and a tertiary creep term. The tertiary creep term which becomes important for strain rates greater than $5 \times 10^{-4}\%$ per hour has been modified to predict the irradiation hardening phenomena. Similarly, the irradiation-enhanced contributions to in-reactor creep are comprised of a primary irradiation-enhanced creep term, steady-state irradiation enhanced creep term, and a tertiary irradiation enhanced creep term.

- 1506 (HEDL-SA--1405) COMPARISON OF FUEL PIN DEFORMATIONS WITH PRESSURIZED TUBE CREEP TESTS. Taylor, J.P.; Gilbert, E.R.; Lovell, A.J. (Hanford Engineering Development Lab., Richland, WA (USA)). Jun 1978. Contract EY-76-C-14-2170. 27p. (CONF-780722--7). Dep. NTIS (US Sales Only), PC A03/MF A01.

From 9. symposium on effects of radiation in structural materials; Richland, WA, USA (10 Jul 1978).

Fuel pins are a key component in the Fast Breeder Reactor; and the economical performance of the reactor depends upon the behavior and life of fuel pin assemblies. One of the limiting phenomena in fuel pin and assembly

performance is deformation. A thermo-mechanical performance code 'SIFAIL' is being used at HEDL to predict fuel cladding deformation. SIFAIL utilizes empirical descriptions of cladding strain as a function of temperature, stress and neutron fluence to predict fuel pin profiles. The equations are derived primarily from in-reactor tests on tubes pressurized with an inert gas and irradiated under conditions of constant temperature and stress. These equations were modified in SIFAIL to account for the variations in temperature and stress with time which occur in fuel pins. It is the purpose of these investigations to develop analytical methods which can be used to design fuel pins with optimum long life performance. Equations were developed to describe the in-reactor creep behavior for two different classes of AISI 316 stainless steel tubing; a developmental class for the FTR and the FTR first code tubing. The behavior of these two tubing classes were sufficiently different that two distinctly separate equations were required to describe their in-reactor creep behaviors.

- 1507 (HEDL-SA--1407) OUT-OF-REACTOR TRANSIENT FISSION GAS RELEASE STUDIES. Hinman, C.A.; Slagle, O.D. (Hanford Engineering Development Lab., Richland, WA (USA)). 1978. Contract EY-76-C-14-2170. 19p. (CONF-780545--7). Dep. NTIS, PC A02/MF A01.

From Meeting of the American Ceramic Society; Detroit, MI, USA (6 May 1978).

The work described is a series of six laboratory thermal transient tests using fast neutron irradiated mixed oxide fuel material. These tests, called FGR tests for Fission Gas Release, were all performed on fuel sections cut from the fuel pin PNL-2-4, which had been irradiated in EBR-II. This pin was irradiated to an average burnup of 3.6 atom percent at 250 watts/cm. The objective of the tests was to determine the transient interactions of the fuel and retained fission gas under thermal conditions resembling a loss of sodium coolant flow type of hypothetical accident in a fast reactor. These data help provide the experimental base for the development of computer codes for modeling hypothetical reactor accidents.

- 1508 (HEDL-SA--1420) EFFECT OF SODIUM ENVIRONMENT ON BREEDER REACTOR COMPONENTS. Eichelberger, R.L.; Brehm, W.F. (Liquid Metal Engineering Center, Canoga Park, CA (USA); Hanford Engineering Development Lab., Richland, WA (USA)). 1978. Contract EY-76-C-14-2170. 39p. (CONF-780308--8). Dep. NTIS, PC A03/MF A01.

From NACE meeting on corrosion; Houston, TX, USA (6 Mar 1978).

This paper reviews the interaction phenomena between sodium and reactor materials, and the application to reactor design and operation. Both corrosion and deposition are considered. Sodium removal and decontamination is briefly mentioned, together with some recent developments that are still in the experimental stage. No new theories of sodium-material interaction behavior are offered. 56 references.

- 1509 (HEDL-SA--1423) FUEL PIN BUNDLE AND HEXAGONAL DUCT MECHANICAL INTERACTION. Chan, D.P.; Jackson, R.J. (Westinghouse Hanford Co., Richland, WA (USA)). 1978. Contract EY-76-C-14-2170. 24p. (CONF-780609--13). Dep. NTIS, PC A02/MF A01.

From ASME/CSME pressure vessels and piping conference; Montreal, Canada (25 Jun 1978).

Cause and effect of the fuel pin bundle and the hexagonal duct mechanical interaction are discussed. An analytical method for calculating the bundle compressive stiffness and the pin-to-pin clearance is introduced. Analytical results for bundles of different sizes are compared to the available experimental values. It is concluded that (1) the bundle/duct interactive force and reduction in pin-to-pin clearance can vary over wide ranges due to tolerances on wire tension and wire pitch, (2) the maximum contact force and the maximum reduction in pin-to-pin clearance are more likely to occur near the edge pin than in the interior of a bundle, and (3) FFTF pin bundle will not experience adverse effects of bundle duct mechanical interaction.

- 1510 (HEDL-SA--1425) FLOW IMPEDANCE TEST RESULTS AT HEDL: CHEMICAL BASIS. Yunker, W. (Hanford Engineering Development Lab., Richland, WA (USA)). Mar 1978. Contract EY-76-C-14-2170. 23p. (CONF-780677--6). Dep. NTIS, PC A02/MF A01.

From U.S. Japanese information exchange; Richland, WA, USA (Jun 1978).

In stainless steel liquid sodium heat transfer systems, the steel constituents undergo mass transfer. Transported material collects on the heat transfer surfaces in the form of films or crystals. The deposits usually are found in the cooler regions of the system where the temperature may be too low for significant diffusion of these elements into the base steel. Deposits which break free can add to the particulate inventory of the system. Materials reported included α -Fe, NaCrO_2 , M_2C_3 , Cr_2C_6 , Mn and Cr_2C . The loss of material from the high temperature regions can result in a permanently roughened surface after extended periods of time, especially if the oxygen activity in the sodium has been high. The element silicon (1 w/o in stainless steel) has been ignored generally as being significant in mass transfer and sodium impurity control. The tests described show that, quite to the contrary, silicon is the cause of a number of flow, heat transfer and operational problems in such systems. Sodium tests have been run at HEDL to determine the cause of an apparent increase in friction factor which was observed during the testing of a 217-pin bundle in a 590°C isothermal sodium system.

- 1511 (HEDL-SA--1429FP) SUMMARY OF SODIUM REMOVAL AND DECONTAMINATION PROGRAMS IN THE U.S.A. Steele, D.P. III; Brehm, W.F. (Hanford Engineering Development Lab., Richland, WA (USA)). Feb 1978. Contract EY-76-C-14-2170. 8p. (CONF-780232--3). Dep. NTIS, PC A02/MF A01.

From IAEA meeting on sodium removal and decontamination; Richland, WA, USA (14 Feb 1978).

The goals of the United States Department of Energy sodium removal and decontamination programs are (1) to identify plant requirements and develop safe effective processes for sodium removal, both for experimental facilities and for reactor components, (2) to develop effective decontamination processes for removing deposited radioactivity, (3) to establish and put into use a set of workable criteria for requalification and return to service of components after sodium removal and decontamination, (4) to design, build and operate facilities in which to perform the sodium removal and decontamination operations. The paper gives a summary of progress toward each of these goals. Three basic processes for sodium removal have been investigated extensively: the use of water vapor in an inert carrier gas, the use of alcohol-type reagent,

and evaporation. The process development work on the first two processes has been essentially completed. The evaporative process is still under development, but preliminary parameters have been established.

- 1512 (HEDL-SA--1432) SODIUM SAMPLING AND IMPURITY MONITORING SYSTEMS IN U.S. BREEDER REACTORS. McCown, J.J.; Olson, W.H. (Hanford Engineering Development Lab., Richland, WA (USA)). 1978. Contract EY-76-C-14-2170. 30p. (CONF-780677--4). Dep. NTIS, PC A03/MF A01.

From U.S. Japanese information exchange; Richland, WA, USA (Jun 1978).

In the U.S. Breeder Reactor Program, sodium samplers and on-line impurity monitoring devices are used to provide complete sodium characterization data. The EBR-II has had such a program in place for over 10 years following the behavior of all detectable metals, non-metals and radionuclides. FFTF will be equipped with samplers and monitors which will be used to characterize all its sodium systems. This program will start in the summer of 1978 during sodium fill operations and continue for the life of the plant.

- 1513 (HEDL-SA--1433) FUEL FAILURE MONITORING SYSTEMS IN U.S. BREEDER REACTORS. McCown, J.J.; Lambert, J.D.B. (Hanford Engineering Development Lab., Richland, WA (USA)). 1978. Contract EY-76-C-14-2170. 30p. (CONF-780677--3). Dep. NTIS, PC A03/MF A01.

From U.S. Japanese information exchange; Richland, WA, USA (Jun 1978).

In the U.S. Breeder Reactor Program, sodium cooled test reactors are equipped with systems for detecting, characterizing and locating fuel cladding breaches. Gas releases and sodium-fuel contact events are analyzed on EBR-II by continuous on-line cover gas and sodium monitoring techniques and by the laboratory analysis of periodic samples. On FFTF hardware, electronics and computer software required for FFM have been developed, designed and tested and are in place awaiting plant startup.

- 1514 (HEDL-SA--1439) HELIUM PRODUCTION IN FBR OUT-OF-CORE STRUCTURAL COMPONENTS. Simons, R.L. (Hanford Engineering Development Lab., Richland, WA (USA)). 1978. Contract EY-76-C-14-2170. 22p. (CONF-780722--14). Dep. NTIS, PC A02/MF A01.

From 9. symposium on effects of radiation in structural materials; Richland, WA, USA (10 Jul 1978).

The major sources of helium production in stainless steel irradiated in a fast reactor are (n, α) reactions in nickel, iron, chromium, and impurities such as nitrogen and boron. The corresponding reaction cross sections are generally of the threshold type with threshold energies above one MeV. Two important exceptions are the cross sections for the two-stage nickel reaction and the boron 10 reaction. Although lifetime helium concentrations are low, these concentrations may be an important consideration when applying material property change data obtained from the EBR-II core to high temperature out-of-core EBR structural components. The ratio of appm helium to displacements per atom is larger for the soft out-of-core spectra than for the harder in-core spectra in which most irradiation data are obtained. These differences should be kept in mind when applying data obtained in EBR-II to FBR out-of-core components.

1515 (HEDL-SA--1440) DELAYED NEUTRON PARAMETERS FOR THE FFTF. Daughtry, J.W.; Dobbin, K.D. (Westinghouse Hanford Co., Richland, WA (USA)). 1978. Contract EY-76-C-14-2170. 13p. (CONF-780622--48). Dep. NTIS (US Sales Only), PC A02/MF A01.

From ANS annual meeting; San Diego, CA, USA (18 Jun 1978).

Delayed neutron parameters have been calculated for the Fast Test Reactor (FTR) and for the FTR Engineering Mockup Critical (EMC) assembly, using the most recent available evaluations of delayed neutron data. Using ENDF/B Version 4 delayed neutron parameters, β /sub eff/ is about 4% larger than the previously accepted value and the inhour-to-percent $\Delta k/k$ conversion factor is about 4% smaller. For beginning-of-life conditions, ^{235}U , ^{240}Pu , and ^{241}Pu contribute less than 10% to the total β /sub eff/ for the FTR and EMC, and, therefore, uncertainties in their delayed neutron data are relatively unimportant. Kinetics parameters calculated with a two-dimensional model of the FTR are less than a percent different from those obtained with a three-dimensional calculation. Thus the less expensive two-dimensional calculations are adequate.

1516 (HEDL-SA--1441) HANDLING OF SODIUM FOR THE FFTF. Ballif, J.L.; Meadows, G.E. (Hanford Engineering Development Lab., Richland, WA (USA)). Jun 1978. Contract EY-76-C-06-1830. 15p. Dep. NTIS, MF A01.

Portions of document are illegible.

Based on the High Temperature Sodium Facility (HTSF) experience and the extensive design efforts for FFTF, procedures are in place for the unloading of the tank cars and for the fill of the FFTF reactor. Special precautions have been taken to provide safe handling and to accommodate contingencies in operation. These contingencies include special protective suits allowing personnel to enter and correct conditions arising from fill operations in the course of moving 7.71×10^5 kg (1.7×10^6 lbs) of sodium from the tank cars into the reactor vessel and its loop system.

1517 (HEDL-SA--1442) LIQUID METAL LEVEL MEASUREMENT SYSTEMS FOR REACTOR SERVICE. Cota, L.; Connell, J.W. (Hanford Engineering Development Lab., Richland, WA (USA)). 1978. Contract EY-76-C-14-2170. 56p. (CONF-780677--1). Dep. NTIS, PC A04/MF A01.

From U.S. Japanese information exchange; Richland, WA, USA (Jun 1978).

A program was initiated by the U.S. Government in 1971 to test the available liquid metal level instruments on the market to determine which ones could be used in the Liquid Metal Breeder Reactor Program. The testing agency purchased the available level instruments on the market and started a testing program. The test results from that testing program are included in the report. The testing program is continuing.

1518 (HEDL-SA--1444) WATER VAPOR NITROGEN PROCESS FOR REMOVING SODIUM FROM LMFBR COMPONENTS. Crippen, M.D.; Funk, C.W.; Lutton, J.M. (Hanford Engineering Development Lab., Richland, WA (USA)). Jan 1978. Contract EY-76-C-14-2170. 8p. (CONF-780232--2). Dep. NTIS (US Sales Only), PC A02/MF A01.

From IAEA meeting on sodium removal and decontamination; Richland, WA, USA (14 Feb 1978).

Application and operation of the Water Vapor-Nitrogen Process for removing sodium from LMFBR components is reviewed. Emphasis is placed on recent efforts to verify the technological

bases of the process, to refine the values of process parameters, and to ensure the utility of the process for cleaning and requalifying components.

1519 (HEDL-SA--1446) RECENT WORK ON SODIUM-COOLED REACTOR PURIFICATION SYSTEMS. Bloom, G.R.; McPheeters, C.C. (Hanford Engineering Development Lab., Richland, WA (USA); Argonne National Lab., IL (USA)). Feb 1978. Contract EY-76-C-14-2170. 46p. (CONF-780677--2). Dep. NTIS, PC A03/MF A01.

From U.S. Japanese information exchange; Richland, WA, USA (Jun 1978).

Fast Flux Test Facility (FFTF) cold traps, including the Reactor Primary Cold Trap, the Reactor Secondary Cold Trap and the Closed Loop Cold Trap were fabricated and their thermal performances measured on sodium test systems. The cold traps all met reactor requirements after necessary economizer modifications. Mercury tests were performed to study the effect of woven wire packing on the flow of a liquid metal adjacent to a heated vertical wall as occurs in the cold trap crystallizer. The mesh was observed to alter the velocity distribution in the natural convection flow region. Cold trapping experiments have been done to determine the interaction of hydrogen and tritium isotopes during precipitation. It was determined that the hydrogen removal rate is of primary importance in tritium removal from sodium. Isotopic exchange plays a negligible role in cold trapping tritium. A one-dimensional computer model has been developed to predict hydride and oxide precipitation patterns. Experiments have been done using an essentially one-dimensional (long, thin) tube to compare results with the model.

1520 (HEDL-SA--1447-8) FUEL COLUMN STABILITY IN IRRADIATED MIXED-OXIDE FUEL. Melde, G.F.; Weber, J.W.; Dutt, D.S. (Hanford Engineering Development Lab., Richland, WA (USA)). Jan 1978. Contract EY-76-C-14-2170. 7p. (CONF-780622--58). Dep. NTIS, PC A02/MF A01.

From ANS annual meeting; San Diego, CA, USA (18 Jun 1978).

The dimensional stability of the fuel columns of 250 mixed uranium-plutonium-oxide fuel pins irradiated in EBR-II was evaluated including length and fuel-to-cladding gap size changes. Fuels with spherical porosity and fuel with nonspherical porosity were included in the study. Sufficient insight into the basic processes responsible for fuel behavior has been gained from this study to allow evaluation of expected behavior of fuel in advance of irradiation. All evidence indicates that mixed-oxide fuel columns for fast reactor applications are dimensionally stable and should present no problem to reactor operations.

1521 (HEDL-SA--1448) MASS AND ACTIVITY TRANSPORT IN FLOWING SODIUM SYSTEMS. Brehm, W.F.; Colburn, R.P.; McGuire, J.C.; Anantamula, R.P.; Chulos, L.E.; Maffei, H.P.; White, P.A. (Hanford Engineering Development Lab., Richland, WA (USA)). 1978. Contract EY-76-C-14-2170. 14p. (CONF-780493--1). Dep. NTIS, PC A02/MF A01.

From U.S. Japanese specialists meeting; Argonne, IL, USA (17 Apr 1978).

The objective of the studies described is to develop and demonstrate methods for reducing the transport of radioactive species from breeder reactor core regions to maintenance zones adjacent to primary heat transport system (PHTS) piping and equipment. Both corrosion

products (^{54}Mn , ^{60}Co) and fission products (^{137}Cs , $^{140}\text{Ba-La}$, tritium) are considered.

- 1522 (HEDL-SA--1449) CALCULATION OF RESONANT REACTION RATES NEAR REGION INTERFACES IN THE FFTF. Rothrock, R.B. (Hanford Engineering Development Lab., Richland, WA (USA)). 1978. Contract EY-76-C-14-2170. 13p. (CONF-780622--57). Dep. NTIS, PC A02/MF A01.

From ANS annual meeting; San Diego, CA, USA (18 Jun 1978).

Proper prediction of the local Pu-239 production, power generation, and temperatures reached in experimental U-238 blanket assemblies represents a problem in the calculation of spatial resonant reaction rate distributions not addressed in the course of FFTF nuclear design. These experimental assemblies generally have a common boundary with the FTR axial reflector region and may also, depending on their desired irradiation position in the core, be located adjacent to the FTR radial reflector. At these interfaces, the reflected neutron current from the axial or radial reflectors can cause a significant local increase in the capture rate. This is an effect not accounted for in the standard FTR multigroup diffusion theory calculations using the shielding factor method for preparation of broad group cross sections for resonant isotopes. Consequently, a calculational procedure was developed to treat explicitly the local variations in U-238 capture rate in these situations.

- 1523 (HEDL-SA--1452) CHARACTERIZATION OF CORROSION PRODUCT DEPOSITS IN SODIUM SYSTEMS. Colburn, R.P. (Hanford Engineering Development Lab., Richland, WA (USA)). Feb 1978. Contract EY-76-C-14-2170. 17p. (CONF-780232--4). Dep. NTIS, PC A02/MF A01.

From IAEA meeting on sodium removal and decontamination; Richland, WA, USA (14 Feb 1978).

Portions of document are illegible.

The characterization of mass transfer deposits on the containment surface of sodium systems is an essential step in the development of LMFBR decontamination processes. The surfaces of a sodium test facility used to study radioactive mass transport were examined to determine the chemical and physical nature of the deposits. The examination showed two fundamentally different problems will occur in the hot and cold leg regions of an LMFBR heat transport system. In the hot leg ^{60}Co , ^{54}Mn and ^{59}Fe will diffuse into the base metal and decontamination may require the removal of several microns of the base metal. In the cold leg ^{54}Mn will be the dominant radionuclide. It will be largely incorporated in nickel-manganese rich particles, a few microns in diameter, scattered on the surface as a semiaherent deposit with very shallow penetration into the base metal. For this region a process should be developed which selectively attacks the deposit phase with minimal attack on the base metal.

- 1524 (HEDL-SA--1453) THREE-DIMENSIONAL INELASTIC ANALYSIS OF A SMALL LIQUID SODIUM VALVE. Weiner, E.O. (Hanford Engineering Development Lab., Richland, WA (USA)). 1978. Contract EY-76-C-14-2170. 29p. (CONF-780609--10). Dep. NTIS, PC A03/MF A01.

From ASME/CSME pressure vessels and piping conference; Montreal, Canada (25 Jun 1978).

A three-dimensional inelastic analysis of a small liquid sodium valve for the Fast Flux Test Facility was conducted to assess

ratcheting and creep damage at temperatures to 1200°F using the MARC-CDC finite element program. A single mesh of twenty-node solid elements, representing the Y-type cylinder intersection, is used for both the heat transfer and mechanical computer runs. Material behavior is governed by kinematic and creep strain hardening, and the loading consists of steady mechanical loads with cyclic fluid thermal transients. The resulting creep damage is significantly smaller than that of a corresponding axisymmetric analysis, and plastic strains are confined to a single region.

- 1525 (HEDL-SA--1455) EFFECTS OF IRRADIATION CREEP ON EX-REACTOR MECHANICAL PROPERTIES. Duncan, D.R. (Hanford Engineering Development Lab., Richland, WA (USA)). May 1978. Contract EY-76-C-14-2170. 23p. (CONF-780722--6). Dep. NTIS (US Sales Only), PC A02/MF A01.

From 9. symposium on effects of radiation in structural materials; Richland, WA, USA (10 Jul 1978).

Irradiation creep of reactor components is usually considered nondamaging. This nondamaging concept has had no experimental verification; therefore, confidence in its application to reactor design is reduced. The damaging nature of irradiation creep was tested in the work described. Material used was SS-316 cladding of FFTF geometry, 5.84 mm x 5.08 mm, which had been irradiated under stress to provide significant amounts of irradiation creep. Specimens with no irradiation or stress exposure and specimens with zero stress irradiation exposure were used as controls. The actual test mode was a transient test, which imposes a constant internal stress on a closed piece of tubing and superimposes an increasing constant-rate temperature ramp on the tubing. The tests were conducted until failure occurred by tubing breach. Measured parameters were failure temperature and strain at failure. The effect of irradiation creep was monitored by comparing failure temperature and strain of specimens that had irradiation creep with failure parameters of specimens that had no irradiation creep. Results showed that specimens with irradiation creep failed at temperatures similar to those without irradiation creep. Strain results were less clear, but no major strain reductions were seen; thus, irradiation creep to the magnitudes investigated is nondamaging.

- 1526 (HEDL-SA--1458) PLANNED NATURAL CIRCULATION TESTING IN THE FAST FLUX TEST FACILITY. Bouchey, G.D.; Additon, S.L.; Parziale, E.A. (Hanford Engineering Development Lab., Richland, WA (USA)). Jun 1978. Contract EY-76-C-14-2170. 31p. (CONF-780622--51). Dep. NTIS, PC A03/MF A01.

From ANS annual meeting; San Diego, CA, USA (18 Jun 1978).

The natural circulation testing of FFTF is planned during three distinct periods in the Plant Acceptance Testing Program: secondary loop testing; low power (<5%) testing in the primary and secondary loops; and, high power (greater than or equal to 5%) transient testing. Planned testing during each of these periods and some typical test predictions that have been completed to-date will be discussed in more detail below.

- 1527 (HEDL-SA--1459) FFTF HOT LEG RUPTURES AND LOSS OF FLOW EVENTS. Additon, S.L.; Chien, Y.M. (Hanford Engineering Development Lab., Richland, WA (USA)). Jun 1978.

Contract EY-76-C-14-2170. 52p. (CONF-780622-46). Dep. NTIS, PC A04/MF A01.

From ANS annual meeting; San Diego, CA, USA (18 Jun 1978).

Two examples of recent FFTF design studies are discussed to illustrate the level of analytic complexity required to resolve design questions and the importance of system simulation. The first example is a study of postulated breaks in the primary hot leg piping. The second example is a study of the performance of the Plant Protection Systems during loss-of-flow events. Adequate safety margins were determined in both studies.

1528 (HEDL-SA--1462) TENSILE PROPERTY CORRELATIONS FOR HIGHLY IRRADIATED 20% C.W. TYPE 316 STAINLESS STEEL. Fish, R.L.; Cannon, N.S.; Wire, G.L. (Hanford Engineering Development Lab., Richland, WA (USA)). 11 May 1978. Contract EY-76-C-14-2170. 26p. (CONF-780722--3). Dep. NTIS, PC A03/MF A01.

From 9. symposium on effects of radiation in structural materials; Richland, WA, USA (10 Jul 1978).

Experiments on developmental FFTF cladding (20% C.W. Type 316 stainless steel) extended the data base to a fast neutron fluence of 8.4×10^{22} n/cm² ($E > 0.1$ MeV). The specimens were irradiated at temperatures ranging from 371° to 816°C, although peak fluence levels were attained on specimens irradiated near 371°C and 649°C. Tension tests were performed at 232°C, near the irradiation temperature, and in some cases, above the irradiation temperature. Test specimen strain rates ranged from 4×10^{-5} /s to 4×10^{-2} /s. Data generated on cladding irradiated near 371°C established that the low temperature strength and ductility are fluence independent beyond about 5×10^{22} n/cm² ($E > 0.1$ MeV). Strength behavior of the irradiated cladding at 538°, 593°, and 649°C is essentially the same as exhibited by thermally aged developmental cladding at the same temperatures and times. Up to a fluence of approximately 5×10^{22} n/cm² ($E > 0.1$ MeV), the 538°C ductility values remain relatively fluence independent after an initial decrease. Higher temperature (593°C and 649°C) ductilities decrease continually with increasing fluence. Tensile parameter correlations were developed for the prediction of irradiation effects on the tensile properties of 20% C.W. Type 316 stainless steel. These correlations are based on unirradiated tensile property correlations developed using Hart's equation of state. The condition of plastic deformation of materials such as 316 stainless steel, can be characterized by a structure parameter (σ^*) which describes the material's "hardness." Irradiation effects can be incorporated into this formulation by parameterizing the changes in σ^* with irradiation temperature and fluence. Correlations provide a description of strength and ductility over the temperature range of 371°C to 871°C and strain rates of 10^{-5} to 10^1 /s.

1529 (HEDL-SA--1463FP) EFFECT OF POWER SKEW ON THE FTR TOP. Yung, S.C.; Wilburn, N.P. (Hanford Engineering Development Lab., Richland, WA (USA)). Mar 1978. Contract EY-76-C-14-2170. 36p. (CONF-780622--55). Dep. NTIS, PC A03/MF A01.

From ANS annual meeting; San Diego, CA, USA (18 Jun 1978).

An enduring program of studies, both experimentally and analytically, on the unprotected Transient Overpower Hypothetical Core Disruptive Accident (TOP-HCDA) of the Liquid Metal Fast Breeder Reactor (LMFBR) has

been in progress for a decade or so. The data available from the experiments and the computational methodology improvements have made the recent TOP safety assessments more realistic. The evidences from the in-pile tests in the TREAT facility, such as the axial location of fuel pins' failure towards the upper portion of the pin, and the rather benign nature of Molten Fuel and Coolant Interactions (MFCI) have unambiguously clarified some key issues of earlier TOP accident assessments. However, on the other hand, there is no conclusive assertion that can be made on the post-failure scenarios. No complete sweepout of molten fuel has ever been observed in all TREAT TOP tests performed to date to warrant the complete sweepout assumption in the TOP analysis. As a matter of fact, the fuel blockage has occurred in almost all TREAT TOP tests, at least partial blockage, in the coolant flow paths in the testing apparatus. Arguments on the validity of these TREAT TOP experiments to Fast Test Reactors (FTR) have been raised because of the low coolant flow velocity and low coolant pressure drops in the testing section in their hydraulic simulations and gross power overdriving after fuel pin failure. For the non-prototypicality of hydraulic simulation, it argues that the higher coolant velocity will increase the likelihood of hydraulic fuel sweepout and the higher the system hydraulic pressure will reduce the likelihood of coolant flow reverse. A scrutiny of the hydraulic consequences may reveal that this hydraulic non-prototypicality does not necessarily yield a favorable conclusion to the formation of blockage in the FTR.

1530 (HEDL-SA--1469) FATIGUE-CRACK PROPAGATION ANALYSIS OF LMFBR PIPING. James, L.A. (Westinghouse Hanford Co., Richland, WA (USA)). 1978. Contract EY-76-C-14-2170. 15p. (CONF-780609--11). Dep. NTIS, PC A02/MF A01.

From ASME/CSME pressure vessels and piping conference; Montreal, Canada (25 Jun 1978).

The techniques of linear-elastic fracture mechanics were employed to estimate the in-service extension of hypothetical flaws in two LMFBR primary piping elbows. The paper describes the technical basis for the conclusion that very little crack growth will occur in these components due to either the anticipated normal, upset, and emergency events, as well as some unlikely "abnormal" events. The two examples treated include a hot leg elbow and a cold leg elbow. The assumptions and approximations concerning stress and loading conditions, the expected in-service operational environment, and material property behavior are discussed in detail. Based upon the analyses, it is concluded that significant crack extension is very unlikely under these LMFBR primary piping conditions.

1531 (HEDL-SA--1470-S) EFFECTS OF STOICHIOMETRY ON CLADDING REACTION IN MIXED-OXIDE FUEL AT HIGH BURNUP. Lawrence, L.A.; Weber, J.W.; Devary, J.L. (Hanford Engineering Development Lab., Richland, WA (USA)). Jan 1978. Contract EY-76-C-14-2170. 7p. (CONF-780622--76). Dep. NTIS, PC A02/MF A01.

From ANS annual meeting; San Diego, CA, USA (18 Jun 1978).

The effects of initial stoichiometry on the character and extent of fuel-cladding chemical interaction (FCCI) for mixed-oxide fuels at O/M's of 1.984 and 1.966 irradiated in EBR-2 to peak burnup are described. The strong effect of initial O/M character and extent of FCCI persists to high burnup. Wastage correlations

for mixed-oxide fuel based on data from higher O/M fuel must be reduced accordingly to account for the lower O/M levels typical of current LMFBR fuel designs. (FS)

- 1532 (HEDL-SA--1477) FBR CORE DESIGN WITH THE COMPOSITE FUEL ASSEMBLY. Cappiello, M.W. (Hanford Engineering Development Lab., Richland, WA (USA)). [nd]. Contract EY-76-C-14-2170. 18p. (CONF-780622--62). Dep. NTIS, PC A02/MF A01.
From ANS annual meeting; San Diego, CA, USA (18 Jun 1978).

Although calculations are preliminary, overall feasibility of an FBR core design with the composite fuel assembly has been demonstrated. The advantaged over the heterogeneous design is that large variances in assembly mixed mean outlet temperatures are eliminated. Also, the effective enrichment of an assembly may easily be adjusted by varying the number of fertile pins per assembly, thus making it possible to flatten the core radial power profile. The use of the composite fuel assembly may in the future offer a significant alternative to heterogeneous FBR core design.

- 1533 (HEDL-SA--1485) IRRADIATION TEST PROGRAM FOR FFTF. Corrigan, D.C.; Last, G.A. (Hanford Engineering Development Lab., Richland, WA (USA)). [nd]. Contract EY-76-C-14-2170. 10p. (CONF-780622--63). Dep. NTIS, PC A02/MF A01.
From ANS annual meeting; San Diego, CA, USA (18 Jun 1978).

Four unique design features are described which make the Fast Flux Test Facility eminently suitable for irradiation test programs. These features are a fast flux level of 7×10^{15} neutrons/cm²/sec, a 36-inch reference (breeder reactor) core height, test volumes suitable for testing of statistical quantities of materials, and the capability for direct (contact) or indirect (proximity) instrumentation of active core experiments.

- 1534 (HEDL-SA--1489-FP) APPLICABILITY OF TREAT TOP EXPERIMENTS TO POST-FAILURE DYNAMICS. Padilla, A. Jr.; Smith, D.E. (Hanford Engineering Development Lab., Richland, WA (USA)). May 1978. Contract EY-76-C-14-2170. 23p. (CONF-780622--69). Dep. NTIS, PC A02/MF A01.
From ANS annual meeting; San Diego, CA, USA (18 Jun 1978).

Recent TREAT transient overpower experiments have provided valid data to evaluate the post-failure phenomenology associated with LMFBR transient overpower accidents. Some comments are made on the role of the TREAT experiments and the experiment analysis.

- 1535 (HEDL-SA--1490) FFTF AND THE ASME CODE. Tobin, J.C. (Hanford Engineering Development Lab., Richland, WA (USA)). 1978. Contract WY-76-C-14-2170. 37p. (CONF-780240--1). Dep. NTIS, PC A03/MF A01.
From Meeting of Washington state boiler inspectors; Seattle, WA, USA (27 Feb 1978).
Photographs are presented of the FFTF reactor facility, components, and some materials.

- 1536 (HEDL-SA--1494) EXPERIMENTAL EVALUATION OF CELL LINERS. Wierman, R.W.; Simmons, L.D.; Muhlestein, L.D. (Hanford Engineering Development Lab., Richland, WA (USA)). [nd]. Contract EY-76-C-14-2170. 28p. Dep. NTIS, PC A03/MF A01.

Cell liners may be used in breeder reactor sodium pipe ways, sodium cells, and lower cavity region to provide a leak-tight cell and to protect the concrete from sodium in the unlikely event of a sodium spill. The objectives of the HEDL liner verification test program are to evaluate the integrity of liner concepts under postulated accident conditions and to develop the experimental data base which will demonstrate that liners will not fail. Two specific tests are reported; a high temperature liner feature test, and a large-scale liner sodium spill test. In both tests no failures of the liners or tendencies toward failure were detected. The discussed liner designs appeared to be conservative, and the liner strength appeared to be more than adequate.

- 1537 (HEDL-SA--1496) EXPERIENCE IN THE DESIGN, CONSTRUCTION, AND TESTING OF THE FFTF HEAT TRANSPORT SYSTEM. Dowling, R.J.; Ferguson, R.L.; Weber, S.A. (Department of Energy, Washington, DC (USA); Department of Energy, Richland, WA (USA). Richland Operations Office; Westinghouse Hanford Co., Richland, WA (USA)). 1978. Contract EY-76-C-14-2170. 9p. (CONF-780407--3; IAEA-SM--225/22). Dep. NTIS, PC A02/MF A01.

From Symposium on design, construction and operating experience of demonstration liquid metal fast breeder reactors; Bologna, Italy (10 Apr 1978).

The Fast Flux Test Facility (FFTF) at Richland Washington, U.S.A., is an integrated plant complex that will provide the testing capability essential to the diverse needs of the breeder reactor program. The design, development and testing of the heat transport system components are described. This includes the sodium pumps, intermediate heat exchangers and dump heat exchangers for both the main plant and also for the closed loops. Using models and prototypes, each component has been multi-phase tested, modified when necessary, and then retested before plant installation. Simplified stress analysis methods for piping operating over 800°F (425°C) are noted. Plant construction is essentially complete and the preoperational tests are well underway. A description of the irradiation services for the FFTF is included.

- 1538 (HEDL-SA--1499) APPLICATION OF QUALITY ASSURANCE TO THE DESIGN, PROCUREMENT, AND CONSTRUCTION OF THE FAST FLUX TEST FACILITY. Garland, D.L.; Glasscock, R.B.; Pressesky, A.J. (Westinghouse Hanford Co., Richland, WA (USA); Department of Energy, Richland, WA (USA). Richland Operations Office; Department of Energy, Washington, DC (USA)). 1978. Contract EY-76-C-14-2170. 8p. (CONF-780407--3). Dep. NTIS, PC A02/MF A01.

From Symposium on design, construction and operating experience of demonstration liquid metal fast breeder reactors; Bologna, Italy (10 Apr 1978).

Experience has clearly demonstrated the need for effective quality assurance programs throughout the design, procurement and construction phases of FFTF. Formal quality assurance programs for FFTF have contributed significantly to the achievement of project objectives thus far in a safe, reliable and predictable manner. Quality assurance programs employed by major FFTF Project participants are based in the requirements of RDT Standard F 2-2, one of the first and most comprehensive standards of its kind. RDT F 2-2 is similar in its basic requirements to ANSI N45.2 and other quality assurance program standards but differs in its degree of specificity, particularly in its coverage of development activities. RDT F 2-

2 is widely applied to a variety of large and small nuclear energy development projects and technology programs. Full implementation of RDT F 2-2 across the FFTF Project has had its problems and rewards. Problems have been encountered involving misinterpretation or overapplication of requirements. In some instances the problems pointed to the need for more specific requirements, and so the standard was amended to rectify the shortcomings. One valuable lesson learned is that feedback of use experience is essential to the development of a living, viable standard which can be beneficially applied to other projects. Benefits and cost savings have accrued from the preventive aspects of RDT F 2-2. Some examples of experiences and resulting amendments to RDT F 2-2, and their favorable impact on facility costs and schedule, are discussed in this paper.

- 1539 (HEDL-SA--1500-FP) FUEL PINS AND CORE RESPONSE UNDER LMFBR TOP ACCIDENT CONDITIONS. Wilburn, N.P.; Smith, D.E.; Baars, R.E.; Atcheson, D.B.; Spencer, B.W. (Hanford Engineering Development Lab., Richland, WA (USA); General Electric Co., Sunnyvale, CA (USA); Argonne National Lab., IL (USA)). 1978. Contract EY-76-C-14-2170. 18p. (CONF-781022--38). Dep. NTIS, PC A02/MF A01.

From Meeting on nuclear power reactor safety; Brussels, Belgium (16 Oct 1978).

Out-of-reactor experiments are currently being performed at Argonne National Laboratory to examine fuel sweepout and related post-failure phenomena under hypothetical TOP accident conditions. These tests are supplementing the TREAT MARK-II loop data base by keying on effects of important parameter variations such as system hydraulics and intrabundle coherency. In these tests, molten UO_2 , generated by a thermite reaction at 3470°K, is injected over approximately 40 msec into flowing sodium in a bundle of simulated LMFBR-type fuel pins. Hydraulic conditions in the bundle are selected to match conditions in either the MARK-II loop (HUMP-series) or the current design LMFBR subassembly (CAMEL-series). To date, four tests have been performed in both single-pin and seven-pin configurations representing coherent and incoherent subassembly power-to-flow cases, respectively. Details of the fuel motion were observed using a flash x-ray cine system. A compilation of significant findings from the four sweepout tests is presented.

- 1540 (HEDL-SA--1501-FP) HIGH TEMPERATURE PENETRANT PROCEDURE FOR LIQUID METAL PIPE WELDS. Hubbard, S.K.; Proudfoot, E.A. (Hanford Engineering Development Lab., Richland, WA (USA)). 9 May 1978. Contract EY-76-C-14-2170. 24p. (CONF-781008--4). Dep. NTIS, PC A02/MF A01.

From ASNT fall conference; Denver, CO, USA (2 Oct 1978).

A high temperature penetrant test developed for in-service inspection at the FFTF reactor can be performed at 400°F (205°C) achieving equal sensitivity to a standard test at ambient room temperature. However, the procedural control such as dwell time, cleaning, and development must be tightly controlled to achieve this result. The personnel performing the test must be well trained in the penetrant process and will require further special training in the high temperature technique.

- 1541 (HEDL-SA--1504-FP) EXPERIMENTAL CONFIRMATION OF THE DESIGN TO MINIMIZE VIBRATION AND WEAR IN 61-PIN WIRE-SPACED EBR-II

SUBASSEMBLIES. Fukuda, S.K. (Hanford Engineering Development Lab., Richland, WA (USA)). May 1978. Contract EY-76-C-14-2170. 5p. (CONF-780622--71). Dep. NTIS, PC A02/MF A01.

From ANS annual meeting; San Diego, CA, USA (18 Jun 1978).

Examinations of HEDL 61-pin subassemblies comprised of 5.84 mm (0.230) inch diameter mixed-oxide fuel pins with 1.02 mm (0.040") diameter spacer wire (PNL-9, -10, -11, HEDL-N-E, -N-F), showed severe cladding and spacer wire wear after irradiation in EBR-II. A comparison of a large number of design, fabrication, and irradiation parameters for all of the HEDL subassemblies indicated that the porosity per ring of fuel pins correlated significantly with the occurrence of wear on the fuel pins. The porosity per ring is the clearance between the flat-to-flat pin bundle dimension and the inner hex can dimension divided by the number of hexagonal fuel pin rings in the subassembly. The porosity per ring for PNL-9, -10, -11 and HEDL-N-E was 0.15 mm/ring (6 mils/ring) and 0.18 mm/ring (7 mils/ring) for the HEDL-N-F subassembly. Since the original FTR subassembly design had a porosity/ring spread of 0.04 mm/ring to 0.16 mm/ring (1.67 to 6.11 mils/ring) an additional series of irradiation tests was conducted to confirm that a tighter fuel pin bundle would eliminate the wear.

- 1542 (HEDL-SA--1505) OPTIMIZED FFTF ACCEPTANCE TEST PROGRAM COVERING PHASES III, IV, AND V. Wykoff, W.R.; Jones, D.H. (Hanford Engineering Development Lab., Richland, WA (USA)). Mar 1977. Contract EY-76-C-14-2170. 84p. Dep. NTIS, PC A05/MF A01.

A detailed review of Phases III, IV, and V of the FFTF Acceptance Test Program has been completed. The purpose of this review was to formulate that test sequence which not only meets requirements for safe, reliable and useful operation of the plant, but also results in the earliest prudent demonstration of full-power performance. A test sequence based on the underlying assumption that sodium flows into the secondary sodium storage tank (T-44) no later than August 31, 1978, is described in detail. A time-scale which allows extra time to put systems and equipment into operation the first time, debugging, and learning how to operate most effectively has been superimposed on the test sequence. Time is not included for major equipment malfunctions. This test plan provides the basis for coordinating the many and varied activities and interfaces necessary for successful and timely execution of the FFTF Acceptance Test Program. In this report, the need dates have been identified for presently scheduled test articles and standard core components.

- 1543 (HEDL-SA--1506) DESIGN OF SODIUM COOLED REACTOR SYSTEMS AND COMPONENTS FOR MAINTAINABILITY. Carr, R.W.; Charnock, H.O.; McBride, J.P. (Hanford Engineering Development Lab., Richland, WA (USA)). Sep 1978. Contract EY-76-C-14-2170. 43p. (CONF-7809124--1). Dep. NTIS, PC A03/MF A01.

From 1978 joint power generation conference; Dallas, TX, USA (Sep 1978).

Special maintainability problems associated with the design and operation of sodium cooled reactor plants are discussed. Some examples of both good and bad design practice are introduced from the design of the FFTF plant and other plants. Subjects include design for drainage, cleaning, decontamination, access, component removal, component disassembly and

reassembly, remote tooling, jigs, fixtures, and design for minimizing radiation exposure of maintenance personnel. Check lists are included.

- 1544 (HEDL-SA--1514) NEUTRON RADIOGRAPHY FACILITY AT THE HANFORD ENGINEERING DEVELOPMENT LABORATORY. Jackson, C.N. Jr.; Barton, J.P.; Proudfoot, E.A. (Hanford Engineering Development Lab., Richland, WA (USA)). 1978. Contract EY-76-C-14-2170. 25p. (CONF-781008--2). Dep. NTIS, PC A02/MF A01.

From ASNT fall conference; Denver, CO, USA (2 Oct 1978).

A 250 kW TRIGA reactor has recently been installed at the Hanford Engineering Development Laboratory (HEDL) to provide a neutron radiography facility for examinations of LMFBR fuel and other core components. The facility includes a vertical neutron beam for unirradiated materials and provisions for a horizontal beam which will be used for irradiated materials. Design of the horizontal beam is still being developed, whereas the vertical collimator equipment has been installed and is being applied and evaluated. Before the HEDL neutron radiography facility became available, a total of (1700) unirradiated driver fuel pins had been sent to the General Electric-Vallecitos Center for neutron radiography. The ability to provide valuable information concerning central voids within the fuel, inclusions between fuel pellet and clad, and fissile density variations caused by chemical reactions during manufacture, was demonstrated. These examinations served as a control on quality and also provided baseline data for future evaluations after FFTF irradiation. The paper describes the TRIGA reactor and gives details of the collimator and ancillary components installed for inspection of unirradiated fuel. Results of a testing program to determine neutron beam characteristics and identify radiographic quality of the images are discussed. Examples of production radiography and possible future applications are presented.

- 1545 (HEDL-SA--1516) ELECTRO-OPTICAL FUEL PIN IDENTIFICATION SYSTEM. Kirchner, T.L. (Hanford Engineering Development Lab., Richland, WA (USA)). Sep 1978. Contract EY-76-C-14-2170. 13p. (CONF-780958--3). Dep. NTIS, PC A02/MF A01.

From 10. electro optics laser conference; Boston, MA, USA (19 Sep 1978).

A prototype Electro-Optical Fuel Pin Identification System referred to as the Fuel Pin Identification System (FPIS) has been developed by the Hanford Engineering Development Laboratory (HEDL) in support of the Fast Flux Test Facility (FFTF) presently under construction at HEDL. The system is designed to remotely read an alpha-numeric identification number that is roll stamped on the top of the fuel pin end cap. The prototype FPIS consists of four major subassemblies: optical read head, digital compression electronics, video display, and line printer.

- 1546 (HEDL-SA--1517) SODIUM VAPOR DEPOSITS OBSERVED AT HEDL ON LARGE COMPONENTS. Funk, C.W.; Eichelberger, R.L. (Hanford Engineering Development Lab., Richland, WA (USA); Atomic International Div., Canoga Park, CA (USA)). [nd]. Contract EY-76-C-14-2170. 18p. (CONF-780677--5). Dep. NTIS, PC A02/MF A01.

From U.S. Japanese information exchange; Richland, WA, USA (Jun 1978).

Testing of the Fast Flux Test Facility (FFTF) components in the High Temperature

Sodium Facility (HTSF) has provided operating experience with sodium vapor deposits prior to reactor operation. Large component testing in liquid sodium at temperatures up to 1100°F (593°C) has simulated the thermal operating conditions of the FFTF including the evaporation rate of sodium from the surfaces of high temperature sodium. Testing of several plant scale components with various reactor head plug gap configurations has made it possible to evaluate the influence of annuli gap clearance on sodium vapor deposits. The dimensions of the annuli are described, followed by details of the operating conditions of their exposure to sodium vapor and observations of the amount and character of vapor deposits.

- 1547 (HEDL-SA--1518) EXPERIMENTAL FUEL ASSEMBLY IRRADIATION EXPERIENCE IN EBR II. Jackson, R.J.; Kaplan, S.; Schwaile, A. (Hanford Engineering Development Lab., Richland, WA (USA)). Nov 1978. Contract EY-76-C-14-2170. 19p. (CONF-790306--8). Dep. NTIS, PC A02/MF A01.

From International conference on fast breeder reactor performance; Monterey, CA, USA (5 Mar 1979).

Irradiation and laboratory tests at EBR-2 of fuel assembly bundles having features prototypic of fast breeder fuel assembly design are described. Much of the work was on fuel bundles design for FFTF.

- 1548 (HEDL-SA--1521) RECENT ADVANCES IN FEATURE EXTRACTION TECHNIQUES BEING DEVELOPED FOR ULTRASONIC EXAMINATION OF AUSTENITIC STAINLESS STEEL WELDS. Mech, S.J.; Emmons, J.S.; Michaels, T.E. (Hanford Engineering Development Lab., Richland, WA (USA)). Aug 1978. Contract EY-76-C-14-2170. 10p. (CONF-780829--1). Dep. NTIS, PC A02/MF A01.

From 22. symposium and instrument display; San Diego, CA, USA (28 Aug 1978).

Techniques are described which are being developed to characterize the features found during ultrasonic examination of stainless steel welds which are indicative of defects. Ultrasonic waveforms obtained from both defects and grain boundaries have similar time-domain characteristics. This phenomenon, together with variable signal attenuation and dispersion, is commonly encountered. The problem is to develop feature extraction techniques which will enable the examiner to discriminate reliably between weld defect signals and the other noise. Techniques presented use both time and frequency domain algorithms. The use of these techniques has demonstrated significantly better discrimination than conventional ultrasonic methods.

- 1549 (HEDL-SA--1522) OXYGEN TRANSPORT LIMITATIONS IN USING GETTERS TO CONTROL FUEL CLADDING CHEMICAL INTERACTION. Wilson, C.N. (Hanford Engineering Development Lab., Richland, WA (USA)). 17 Nov 1978. Contract EY-76-C-14-2170. 15p. (CONF-790111--3). Dep. NTIS, PC A02/MF A01.

From International symposium on thermodynamics of nuclear materials; Julich, F.R. Germany (29 Jan 1979).

A series of stainless steel clad $\text{Pu}_{0.25}\text{U}_{0.75}\text{O}/\text{sub 2-x/}$ fuel pins was irradiated in EBR-II to assess placement and oxygen transport limitations using oxygen buffer/getter materials (getters) in LMFBR fuel pins to inhibit fuel-cladding chemical interaction (FCCI). Effective FCCI inhibition required adequate axial dispersal of the getter over the fuel column length. The limiting factor in

getter placement was axial oxygen transport from the fuel to axially-isolated getters. The primary axial oxygen transport mode was concluded to be diffusion of oxygen through the fuel. Gas phase axial oxygen transport is most likely not significant at Δ anti GO_2 values less than the threshold for cladding oxidation.

- 1550 (HEDL-SA--1523-FP) LMFBR PLUTONIUM FUEL DEVELOPMENT AND FABRICATION. Heer, W.F. (Babcock and Wilcox Co., Apollo, PA (USA). Nuclear Materials Div.). 1978. Contract EY-76-C-14 2170. 8p. (CONF-781004--8). Dep. NTIS, PC A02/MF A01.

From Nuclear meeting; Basel, Switzerland (3 Oct 1978).

The history, development, and fabrication of Fast Flux Test Reactor driver fuel pins at the Babcock and Wilcox Company's Parks Township Fabrication Facility in Western Pennsylvania are summarized. The basic process steps are described with emphasis placed on the development efforts which led to the specific production practices used today. Typical conventional production equipment is shown to highlight the standardization which has taken place. Years of continuous production operation have enabled testing and refinement of techniques and equipment systems to the extent that manufacture of LMFBR fuel is now performed routinely within the constraints of all regulatory safety and safeguards criteria, including ALARA (As Low As Reasonably Achievable) control philosophy.

- 1551 (HEDL-SA--1525-FP) DISPLAY OF THE PREDICTIONS OF LARGE FAST REACTOR SAFETY ANALYSIS CODES VIA COMPUTER-GENERATED MOVIES. Lewis, C.H. (Hanford Engineering Development Lab., Richland, WA (USA)). May 1978. Contract EY-76-C-14-2170. 9p. (CONF-780698--1). Dep. NTIS, PC A02/MF A01.

From Northwest computer conference; Victoria, Canada (15 Jun 1978).

A number of computer codes have been written to attempt to predict the consequences of hypothetical accidents. These codes all have one thing in common: they produce reams of paper containing vast quantities of numbers. In an effort to make these numbers more comprehensible, certain graphical techniques have been employed; one of the most successful is the computer-generated movie. The elements necessary for the creation of a plot are presented.

- 1552 (HEDL-SA--1526-FP) EARLY-IN-LIFE THERMAL PERFORMANCE OF UO_2 - PuO_2 FAST REACTOR FUEL. Baker, R.B.; Leggett, R.D. (Hanford Engineering Development Lab., Richland, WA (USA)). 1979. Contract EY-76-C-14-2170. 11p. (CONF-790306--7). Dep. NTIS, PC A02/MF A01.

From International conference on fast breeder reactor performance; Monterey, CA, USA (5 Mar 1979).

Results from the combined analyses of two thermal performance tests, HEDL P-19 and HEDL P-20 are described. The tests were designed to provide data on the power required to cause incipient fuel melting early in life under conditions prototypic of FFTF driver fuel pins and similar FBR fuel systems.

- 1553 (HEDL-SA--1527-FP) FUEL-CLADDING CHEMICAL INTERACTION IN MIXED-OXIDE FUELS. Lawrence, L.A.; Weber, J.W.; Devary, J.L. (Hanford Engineering Development Lab., Richland, WA (USA)). Oct 1978. Contract EY-76-C-14 2170. 14p. (CONF-790306--13).

Dep. NTIS, PC A02/MF A01.

From International conference on fast breeder reactor performance; Monterey, CA, USA (5 Mar 1979).

The character and extent of fuel-cladding chemical interaction (FCCI) was established for UO_2 -25 wt% PuO_2 clad with 20% cold worked Type 316 stainless steel irradiated at high cladding temperatures to peak burnups greater than 8 atom %. The data base consists of 153 data sets from fuel pins irradiated in EBR-II with peak burnups to 9.5 atom %, local cladding inner surface temperatures to 725°C, and exposure times to 415 equivalent full power days. As-fabricated oxygen-to-metal ratios (O/M) ranged from 1.938 to 1.984 with the bulk of the data in the range 1.96 to 1.98. HEDL P-15 pins provided data at low heat rates, approx. 200 W/cm, and P-23 series pins provided data at higher heat rates, approx. 400 W/cm. A design practice for breeder reactors is to consider an initial reduction of 50 microns in cladding thickness to compensate for possible FCCI. This approach was considered to be a conservative approximation in the absence of a comprehensive design correlation for extent of interaction. This work provides to the designer a statistically based correlation for depth of FCCI which reflects the influences of the major fuel and operating parameters on FCCI.

- 1554 (HEDL-SA--1530) OVERVIEW OF U.S. FAST REACTOR IRRADIATION TEST VEHICLES. Claudson, T.T.; Grover, J.M.; McCord, R.B.; Rice, L.H.; Thornton, J.W. (Hanford Engineering Development Lab., Richland, WA (USA)). 25 Apr 1978. Contract EY-76-C-4-2170. 23p. (CONF-7805110--4). Dep. NTIS, PC A02/MF A01.

From Working group on irradiation devices; Petten, Netherlands (18 May 1978).

The United States has conducted extensive irradiation testing on fuels, structural, and absorber materials as a part of the breeder reactor program. Tests have been directed toward basic technology related to fuels and materials, confirmation of material and design selections, and reactor safety analyses. The test reactors used most extensively have been the EBR-II, TReAT, and ETR reactors. The FFTF will be available in the near future and will provide flux levels and test capabilities not previously available in the U.S. The FFTF and EBR-II, sodium-cooled fast reactors rates at 400 and 63 Mwth respectively, are used for steady state irradiations. TReAT and ETR are thermal reactors with provisions for conducting transient tests in special sodium loops. An overview of the design and fabrication of various irradiation test vehicles used in the U.S. Breeder Reactor Program is presented. The test vehicles described have been selected to demonstrate the variety of irradiation tests conducted.

- 1555 (HEDL-SA--1535-FP) HEDL MIXED OXIDE FUEL PIN BREACH EXPERIENCE IN EBR-II. Weber, J.W.; Almassy, M.Y.; Karnesky, R.A. (Hanford Engineering Development Lab., Richland, WA (USA)). Oct 1978. Contract EY-76-C-14-2170. 14p. (CONF-790306--12). Dep. NTIS, PC A02/MF A01.

From International conference on fast breeder reactor performance; Monterey, CA, USA (5 Mar 1979).

Mixed plutonium-uranium oxide fuel pins clad with stainless steel are being irradiated to cladding breach in the EBR-II for the Hanford Engineering Development Laboratory's (HEDL) Run-to-Cladding-Breach (RTCB) program. The objectives of these tests are to: (1) establish the burnup capability of mixed oxide fuel pins, (2) identify and characterize

cladding breach mechanisms, (3) determine the effects of cladding breach on neighboring fuel pins and (4) provide data for developing fuel pin failure criteria. Breaches have occurred in 16 HEDL fuel pins in the RTCB program. Examination and characterization has been completed on 13, with the remaining three in some phase of detailed examination. Characterization, includes identification and classification of the probable cause of each breach. The breaches evaluated have been classified as being due to: local cladding overtemperature, subassembly coolant overtemperature, and cladding and wire wrap wear. The cause for one breach has not been conclusively established. The paper reviews characteristics and discusses the probable mechanisms and causes.

1556 (HEDL-SA--1536-FP) MIXED OXIDE RUN-BEYOND-CLADDING-BREACH TESTS IN EBR-II. Washburn, D.F.; Almasy, M.Y.; Langstaff, D.C.; Lambert, J.D.B.; Strain, R.V. (Hanford Engineering Development Lab., Richland, WA (USA); Westinghouse Hanford Co., Richland, WA (USA); Argonne National Lab., IL (USA)). 26 Sep 1978. Contract EY-C-14-2170. 14p. (CONF-790306--9). Dep. NTIS, PC A02/MF A01.

From International conference on fast breeder reactor performance; Monterey, CA, USA (5 Mar 1979).

Fuel pin and subassembly design and quality control during fabrication are intended to ensure that fuel pins can reach goal exposure without cladding breach. However, premature random cladding breaches cannot be precluded. Economic commercial operation of sodium-cooled Fast Breeder Reactors may require operation with breached fuel pins in the core. The alternative to this mode of operation is to remove subassemblies with breached fuel pins at the first indication of cladding breach which is both time consuming and costly. An objective of the U.S. Run-Beyond-Cladding-Breach (RBCB) program is to understand the behavior of mixed oxide fuel during continued irradiation in the post-breach condition. The paper presents the results from the initial RBCB tests of mixed-oxide fuels which were conducted in the Experimental Breeder Reactor-II (EBR-II). Tests conducted to calibrate the EBR-II fission product monitors are also briefly described.

1557 (HEDL-SA--1537-FP) RECORDS MANAGEMENT AT WESTINGHOUSE HANFORD COMPANY. Humason, T.G. (Hanford Engineering Development Lab., Richland, WA (USA)). 23 Aug 1978. Contract EY-76-C-14-2170. 24p. (CONF-7810168--1). Dep. NTIS, PC A02/MF A01.

From Association of records managers and administrators annual conference; Washington, DC, USA (8 Oct 1978).

A program for the acquisition, dissemination, storage, and retrieval of documentation associated with the FFTF project is described.

1558 (HEDL-SA--1540-FP) RADIONUCLIDE TRAP FOR LIQUID METAL COOLED REACTORS. McGuire, J.C.; Brehm, W.F. (Hanford Engineering Development Lab., Richland, WA (USA)). Oct 1978. Contract EY-76-C-14-2170. 25p. (CONF-781105--80). Dep. NTIS, PC A02/MF A01. From ANS meeting; Washington, DC, USA (12 Nov 1978).

At liquid metal cooled reactor operating temperatures, radioactive corrosion product transport and deposition in the primary system will be sufficiently high to limit access time for maintenance of system components. A radionuclide trap has been developed to aid in

controlling radioactivity transport. This is a device which is located above the reactor core and which acts as a getter, physically immobilizing radioactive corrosion products, particularly ^{54}Mn . Nickel is the getter material used. It is most effective at temperatures above 450°C and effectiveness increases with increasing temperature. Prototype traps have been tested in sodium loops for 40,000 hours at reactor primary temperatures and sodium velocities. Several possible in-reactor trap sites were considered but a location within the top of each driver assembly was chosen as the most convenient and effective. In this position the trap is changed each time fuel is changed.

1559 (HEDL-SA--1543-FP) CESIUM MIGRATION IN LMFBR FUEL PINS. Karnesky, R.A.; Jost, J.W.; Stone, I.Z. (Hanford Engineering Development Lab., Richland, WA (USA)). Oct 1978. Contract EY-76-C-14-2170. 11p. (CONF-790306--10). Dep. NTIS, PC A02/MF A01.

From International conference on fast breeder reactor performance; Monterey, CA, USA (5 Mar 1979).

The factors affecting the axial migration of cesium in mixed oxide fuel pins and the effects of cesium migration on fuel pin performance are examined. The development and application of a correlated model which will predict the occurrence of cesium migration in a mixed oxide (75 w/o UO_2 + 25 w/o PuO_2) fuel pins over a wide range of fabrication and irradiation conditions are described.

1560 (HEDL-SA--1546) ULTRASONIC TECHNIQUES FOR IN-SERVICE INSPECTION OF AUSTENITIC STAINLESS STEEL WELDS AT 200°C . Mech, S.J.; Emmons, J.S.; Michaels, T.E. (Hanford Engineering Development Lab., Richland, WA (USA)). 1978. Contract EY-76-C-14-2170. 37p. (CONF-781008--6). Dep. NTIS, PC A03/MF A01.

From ASNT fall conference; Denver, CO, USA (2 Oct 1978).

Ultrasonic testing (UT) continues to be one of the most viable nondestructive testing (NDT) methods for preservice and inservice inspection of heat transport systems in the nuclear industry. In liquid metal-cooled reactors, these inspections must be conducted at high temperatures (200°C). Consequently, an important objective is to develop methods and equipment to examine austenitic stainless steel weldments at 200°C .

1561 (HEDL-SA--1551-FP) FAST REACTOR FUEL PIN PERFORMANCE REQUIREMENTS FOR OFF-NORMAL EVENTS. Baars, R.E.; Hikido, T.; Hanson, J.E. (Hanford Engineering Development Lab., Richland, WA (USA)). 1979. Contract EY-76-C-14-2170. 8p. (CONF-790306--19). Dep. NTIS, MF A01.

From International conference on fast breeder reactor performance; Monterey, CA, USA (5 Mar 1979).

Portions of document are illegible.

HEDL is conducting an experimental transient testing program to evaluate the performance of prototypic Fast Flux Test Facility (FFTF) fuel pins up to the cladding integrity limit. The relationship is described of the HEDL/TREAT transient overpower test program to the confirmation of FFTF fuel pin design bases via the FFTF fuel pin design procedure.

1562 (HEDL-SA--1553) FABRICATION AND IRRADIATION PERFORMANCE OF $\text{Pu}_{0.25}\text{U}_{0.75}\text{O}_2$ LOW O/M FUEL. Wilson, C.N. (Hanford Engineering

Development Lab., Richland, WA (USA)). 14 Sep 1978. Contract EY-76-C-14-2170. 18p. (CONF-7810143--3). Dep. NTIS, PC A02/MF A01. From 31. pacific coast meeting of American Ceramic Society; San Diego, CA, USA (25 Oct 1978).

Two very low O/M (1.91) stainless steel clad mixed oxide fuel pins were irradiated to 5 atom % burnup in EBR-II. Low O/M fuel is used to control fuel cladding chemical interaction. Fuel O/M reduction procedures and postirradiation examination data are presented.

1563 (HEDL-SA--1554-FP) B₄C ABSORBER PIN IN-REACTOR RUPTURE TEST. Pitner, A.L.; Hollenberg, G.W.; Jackson, J.L.; Basmajian, J.A. (Hanford Engineering Development Lab., Richland, WA (USA)). Jun 1978. Contract EY-76-C-14-2170. 15p. (CONF-781105--89). Dep. NTIS, PC A02/MF A01.

From ANS meeting; Washington, DC, USA (12 Nov 1978).

Portions of document are illegible.

The results of rupture tests on prototypic FFTF B₄C absorber pins are presented. The test in EBR-2 involved an instrumented reference pin and a sealed pin. The observed behavior was compared with calculations by several computer models.

1564 (HEDL-SA--1555-S) ADVANCED ABSORBER ASSEMBLY DESIGN FOR BREEDER REACTORS. SUMMARY. Birney, K.R.; Pitner, A.L.; Hollenberg, G.W. (Hanford Engineering Development Lab., Richland, WA (USA)). May 1978. Contract EY-76-C-14-2170. 6p. (CONF-781105--90). Dep. NTIS, PC A02/MF A01.

From ANS meeting; Washington, DC, USA (12 Nov 1978).

The purpose of this work is to develop an improved breeder reactor absorber assembly design that provides economic and performance benefits relative to the reference FTR absorber assembly design.

1565 (HEDL-SA--1559) MATERIALS COMPATIBILITY IN LIQUID SODIUM. Brehm, W.F. (Hanford Engineering Development Lab., Richland, WA (USA)). Aug 1978. Contract EY-76-C-14-2170. 38p. (CONF-781071--2). Dep. NTIS, PC A03/MF A01.

From NACE south central conference; Denver, CO, USA (3 Oct 1978).

A review of published literature on sodium technology shows that a great deal is known about the interaction of sodium with the materials and components of liquid-metal-cooled reactors. The transfer of science to technology is rapid. The present generation of sodium-cooled reactors are being built with confidence in the soundness of the sodium systems and a long in-sodium life for components. Materials selection and component design are based on firm, if somewhat conservative, criteria. Continuing work is needed, however, to refine the technological base in such areas as in-reactor measurement of corrosion, effect of prolonged sodium exposure on mechanical properties of metals, and the chemistry of impurities in sodium. This latter topic includes the measurement and control of interstitial elements and radioactive species. Sodium is essentially a benign and easily handled heat transfer medium. The science and technology of liquid metal systems had advanced rapidly. Without a doubt the use of liquid metal heat transfer systems in energy-conversion systems other than nuclear fission reactors will increase as the success of present systems continues to be demonstrated.

1566 (HEDL-SA--1562-FP) THERMOCHEMICAL DATA AND ITS USE IN MODELING CHEMICAL BEHAVIOR IN MIXED-OXIDE FUEL PINS. Gibby, R.L.; Woodley, R.E.; Adamson, M.G.; Johnson, C.E. (Hanford Engineering Development Lab., Richland, WA (USA)). 1979. Contract EY-76-C-14-2170. 15p. (CONF-790306--22). Dep. NTIS, PC A02/MF A01.

From International conference on fast breeder reactor performance; Monterey, CA, USA (5 Mar 1979).

The status of US activities to obtain fuel chemistry data is reviewed. Analytical expressions addressing basic needs of all fuel chemistry models are presented. Fission product concentrations during irradiation, oxygen-to-metal (O/M) at beginning-of-life and at burnup, and the potential in fuel-cladding gap at burnup are described. (FS)

1567 (HEDL-SA--1564) IN-CORE GAS RELEASE CAPSULE DEVELOPMENT. Kolowith, R.; Miller, W.C. (Hanford Engineering Development Lab., Richland, WA (USA)). 29 Sep 1978. Contract EY-76-C-14-2170. 28p. (CONF-781105--81). Dep. NTIS, PC A03/MF A01.

From ANS meeting; Washington, DC, USA (12 Nov 1978).

Portions of document are illegible.

Tests were performed on several candidate fusible plug materials and geometries to demonstrate the feasibility of the fusible plug as a reliable, low-cost gas release mechanism for the Fast Flux Test Facility (FFTF) Fuel Failure Monitoring System In-Core Gas Release Test. The three materials recommended for use in the gas release capsules are eutectic solder, lead and tin. Several plug fabrication methods were investigated. The recommended fabrication method includes using high purity materials, casting the plugs in a nickel tube, electropolishing the nickel tubing and making the plugs in an inert atmosphere glovebox. Sodium exposure tests were conducted and protective coatings were developed.

1568 (HEDL-SA--1564-S) IN-CORE GAS RELEASE CAPSULE DEVELOPMENT. Kolowith, R.; Miller, W.C. (Hanford Engineering Development Lab., Richland, WA (USA)). 1978. Contract EY-76-C-14-2170. 5p. (CONF-781105--98). Dep. NTIS, PC A02/MF A01.

From ANS meeting; Washington, DC, USA (12 Nov 1978).

Acceptance tests of the FFTF Fuel Failure Monitoring System will use gas releases in a non-critical reactor core to simulate actual fuel failures. The development tests which demonstrate the feasibility of a fusible plug concept as a predictable and reliable in-core gas release mechanism are described.

1569 (HEDL-SA--1574) MECHANICAL PROPERTIES OF TRANSIENT-TESTED IRRADIATED FAST-REACTOR CLADDING. Johnson, G.D.; Hunter, C.W. (Westinghouse Hanford Co., Richland, WA (USA)). 9 Aug 1978. Contract EY-76-C-14-2170. 5p. (CONF-781105--94). Dep. NTIS, PC A02/MF A01.

From ANS meeting; Washington, DC, USA (12 Nov 1978).

Results are presented for three high burnup PNL-11 fuel pins irradiated to goal FFTF exposure levels in testing cladding stress and strain on fast reactor fuel pins subjected to simulated power transient conditions. The mixed oxide fuel with Type 316 SS clad were tested at heating rates of 5.5 k/s and 200 k/s with internal gas pressures of 17.2 to 98.6 MPa. Mechanical property data were obtained. Under short-term transient heating, neutron

volumetric swelling does not change. Cladding strength does not exhibit a continuous degradation with increased neutron fluence, but does show saturation behavior or slight increase at higher fluences. (FS)

- 1570 (HEDL-SA--1575) STRESS ANALYSIS FOR THE DESIGN OF LIQUID METAL PIPING IN THE FAST FLUX TEST FACILITY. Sampson, R.C.; Jagels, R.E. (Hanford Engineering Development Lab., Richland, WA (USA)). 1978. Contract EY-76-C-14-2170. 9p. (CONF-780609--14). Dep. NTIS, MF A01.

From ASME/CSME pressure vessels and piping conference; Montreal, Canada (25 Jun 1978). Portions of document are illegible.

The fast Flux Test Facility (FFTF) is a 400 MWt nuclear facility designed for the exclusive purpose of testing equipment, materials and processes for liquid metal fast breeder reactor power plants. High temperature, low pressure, and severe thermal transient effects are the distinguishing features of the FFTF piping load history. Consequently, a large proportion of the Class 1 piping was designed to comply with ASME Code Case 1331-5 rules for elevated temperature, supplemented by Appendix T of Code Case 1592-3 and RDT-F9-4 for ratchet behavior. This paper outlines the procedures whereby elastic methods for stress analysis were first integrated with the piping design process and then subsequently used to evaluate compliance with Code criteria for extended service at elevated temperature.

- 1571 (HEDL-SA--1576) DESIGN OF THE FMEF AND MATERIAL HANDLING SYSTEMS. Doman, D.R.; Rogers, G.J.; Trego, A.L.; Barker, R.E.; Clark, H.E.; Peschel, W.P. (Hanford Engineering Development Lab., Richland, WA (USA)). 1978. Contract EY-76-C-14-2170. 36p. (CONF-781105--83). Dep. NTIS, PC A03/MF A01.

From ANS meeting; Washington, DC, USA (12 Nov 1978).

Final design is over half complete on the Fuels and Materials Examination Facility (FMEF), the hot cell facility for destructive and nondestructive examination of irradiated fuels and materials tested in the Fast Flux Test Facility (FFTF). The overall facility is generally described with detailed information given on systems for transferring fuels and materials for examinations, for solid and liquid radioactive waste, and for equipment maintenance and repair.

- 1572 (HEDL-SA--1579) IN-REACTOR PERFORMANCE OF METHODS TO CONTROL FUEL-CLADDING CHEMICAL INTERACTION. Weber, E.T.; Gibby, R.L.; Wilson, C.N.; Lawrence, L.A.; Adamson, M.G. (Hanford Engineering Development Lab., Richland, WA (USA); General Electric Co., Vallejos, NM (USA)). 1979. Contract EY-76-C-14-2170. 15p. (CONF-790306--15). Dep. NTIS, PC A02/MF A01.

From International conference on fast breeder reactor performance; Monterey, CA, USA (5 Mar 1979).

Inner surface corrosion of austenitic stainless steel cladding by oxygen and reactive fission product elements requires a 50 μ m wastage allowance in current FBR reference oxide fuel pin design. Elimination or reduction of this wastage allowance could result in better reactor efficiency and economics through improvements in fuel pin performance and reliability. Reduction in cladding thickness and replacement of equivalent volume with fuel result in improved breeding capability. Of the factors affecting fuel-cladding chemical interaction (FCCI), oxygen activity within the

fuel pin can be most readily controlled and/or manipulated without degrading fuel pin performance or significantly increasing fuel fabrication costs. There are two major approaches to control oxygen activity within an oxide fuel pin: (1) control of total oxygen inventory and chemical activity (Δ anti GO_2) by use of low oxygen-to-metal ratio (O/M) fuel; and (2) incorporation of a material within the fuel pin to provide in-situ control of oxygen activity (Δ anti GO_2) and fixation of excess oxygen prior to, or in preference to reaction with the cladding. The paper describes irradiation tests which were conducted in EBR-II and GETR incorporating oxygen buffer/getter materials and very low O/M fuel to control oxygen activity in sealed fuel pins.

- 1573 (HEDL-SA--1587) PREHEAT OPERATING EXPERIENCES AT THE FFTF. Tucker, W.R. (Hanford Engineering Development Lab., Richland, WA (USA)). 17 Aug 1978. Contract EY-76-C-14-2170. 22p. (CONF-7809110--2). Dep. NTIS, PC A02/MF A01.

From Plant experience working group meeting; Ibaraki-Ken, Japan (Sep 1978).

The rather extensive test program performed on the FFTF preheat control system resulted in successful sodium fill of one secondary heat transport loop on July 2, 1978. The data obtained during testing and the attendant operating experience gained resulted in some design changes and provided the information necessary to fully characterize system performance. Temperature excursions and deviations from preset limits of only a minor nature were encountered during preheat for sodium fill. The addition of the rate alarm feature was beneficial to operation of the preheat system and allowed early detection and correction of impending excursions.

- 1574 (HEDL-SA--1588) INITIAL ACCEPTANCE TEST EXPERIENCE WITH FFTF PLANT EQUIPMENT. Brown, R.K.; Coleman, K.A.; Mahaffey, M.K.; McCargar, C.G.; Young, M.W. (Hanford Engineering Development Lab., Richland, WA (USA)). Sep 1978. Contract EY-76-C-14-2170. 35p. (CONF-7809110--3). Dep. NTIS, PC A03/MF A01.

From Plant experience working group meeting; Ibaraki-Ken, Japan (Sep 1978).

The purpose of this paper is to examine the initial acceptance test experience of certain pieces of auxiliary equipment of the Fast Flux Test Facility (FFTF). The scope focuses on the DHX blowers and drive train, inert gas blowers, H and V containment isolation valves, and the Surveillance and In-service Inspection (SISI) transporter and trolley. For each type of equipment, the discussion includes a summary of the design and system function, installation history, preoperational acceptance testing procedures and results, and unusual events and resolutions.

- 1575 (HEDL-SA--1589-6) INTEGRATED LEAK RATE TESTING OF THE FAST FLUX TEST FACILITY REACTOR CONTAINMENT BUILDING. James, E.B.; Farabee, O.A.; Bliss, R.J. (Hanford Engineering Development Lab., Richland, WA (USA)). 1978. Contract EY-76-C-14-2170. 18p. (CONF-781105--92). Dep. NTIS, PC A02/MF A01.

From ANS meeting; Washington, DC, USA (12 Nov 1978).

Portions of document are illegible. The initial Integrated Leak Rate Test (ILRT) of the Fast Flux Test Facility containment building was performed from May 27 to June 2, 1978. The test was conducted in air with systems vented and with the containment

recirculating coolers in operation. 10 psig and 5 psig tests were run using the absolute pressure test method. The measured leakage rates were .033% Vol/24 hr. and -.0015% Vol/24 hrs. respectively. Subsequent verification tests at both 10 psig and 5 psig proved that the test equipment was operating properly and it was sensitive enough to detect leaks at low pressures. This ILRT was performed at a lower pressure than any previous ILRT on a reactor containment structure in the United States. While the initial design requirements for ice condenser containments called for a part pressure test at 6 psig, the tests were waived due to the apparent statistical problems of data analysis and the repeatability of the data itself at such low pressure. In contrast to this belief, both the 5 and 10 psig ILRT's were performed in a successful manner at FFTF.

- 1576 (HEDL-SA--1593-FP) INSPECTION TECHNIQUES AND PROCESSES FOR CONTROLLING FFTF FUEL QUALITY. Powers, H.G.; Kirchner, T.L.; McLemore, D.R.; Gottschalk, G.P. (Hanford Engineering Development Lab., Richland, WA (USA)). 18 Oct 1978. Contract EY-76-C-14-2170. 20p. (CONF-781105--82). Dep. NTIS, PC A02/MF A01.

From ANS meeting; Washington, DC, USA (12 Nov 1978).

Reliable performance of fuels for the Fast Flux Test Facility (FFTF) is of paramount importance for the FFTF program. Improved inspection techniques and processes are essential for controlling the quality of such fuels. Several considerations necessitated the development and application of improved inspection techniques and processes. These include fuel design, throughput rate, and pre-irradiation characterization requirements. Some of the more significant advances are in the areas of fuel pellet dimensional and weight measurements, fuel pin diameter measurements, and on-line, computerized quality status tracking. Advances in each of these areas are discussed.

- 1577 (HEDL-SA--1598-FP) EFFECTS OF MULTIPLE TRANSIENTS ON FAST REACTOR FUEL PIN CLADDING MECHANICAL PROPERTIES. Duncan, D.R.; Johnson, G.D.; Hunter, C.W. (Hanford Engineering Development Lab., Richland, WA (USA)). 1978. Contract EY-76-C-14-2170. 7p. (CONF-781105--97). Dep. NTIS, PC A02/MF A01.

From ANS meeting; Washington, DC, USA (12 Nov 1978).

The effects of various TREAT and simulated transient events on subsequent burst strength of 20% cold worked AISI 316 irradiated fast reactor fuel pin cladding were evaluated. Cladding strength after transient exposure was compared to strength prior to transient exposure, using a HEDL correlation of failure temperatures with irradiation and test parameters. The simulated transients and post-transient strength tests were performed in the Fuel Cladding Transient Tester (FCTT), which was developed at HEDL to simulate cladding conditions during in-reactor transient events by pressurizing tubing specimens under transient heating conditions.

- 1578 (HEDL-SA--1604-FP) ALTERNATIVE OXIDE FUEL PELLET FABRICATION FOR IRRADIATION TESTING. Rasmussen, D.E.; Jentzen, W.R.; McCord, R.B. (Hanford Engineering Development Lab., Richland, WA (USA)). 27 Oct 1978. Contract EY-76-C-14-2170. 24p. (CONF-7810143--5). Dep. NTIS, PC A02/MF A01.

From 31. pacific coast meeting of American Ceramic Society; San Diego, CA, USA (25 Oct

1978).

Portions of document are illegible.

Fabrication of experimental breeder reactor fuel pellets by the common cold-press-and-sinter technique for irradiation testing in EBR-II is discussed. Fuel types include mixed thorium-plutonium, UO_2 enriched with 22 weight percent ^{233}U in U , UO_2 enriched with thirty-four weight percent ^{235}U in U , and mixed uranium-plutonium.

- 1579 (HEDL-SA--1605-FP) CLOSED LOOP IN-REACTOR ASSEMBLY (CLIRA): A FAST FLUX TEST FACILITY TEST VEHICLE. Oakley, D.J. (Hanford Engineering Development Lab., Richland, WA (USA)). 12 Sep 1978. Contract EY-76-C-14-2170. 28p. (CONF-781202--42). Dep. NTIS, PC A03/MF A01.

From ASME meeting; San Francisco, CA, USA (10 Dec 1978).

The Closed Loop In-Reactor Assembly (CLIRA) is a test vehicle for in-core material and fuel experiments in the Fast Flux Test Facility (FFTF). The FFTF is a fast flux nuclear test reactor operated for the Department of Energy (DOE) by Westinghouse Hanford Company in Richland, Washington. The CLIRA is a removable/replaceable part of the Closed Loop System (CLS) which is a sodium coolant system providing flow and temperature control independent of the reactor coolant system. The primary purpose of the CLIRA is to provide a test vehicle which will permit testing of nuclear fuels and materials at conditions more severe than exist in the FTR core, and to isolate these materials from the reactor core.

- 1580 (HEDL-SA--1606) FAST FLUX TEST FACILITY ACCEPTANCE TEST PROGRAM AND EARLY RESULTS. Bliss, R.J.; Peckinpaugh, C.L.; Waldo, J.B.; James, E.B. (Hanford Engineering Development Lab., Richland, WA (USA)). 1978. Contract EY-76-C-14-2170. 31p. (CONF-7809110--1). Dep. NTIS, PC A03/MF A01.

From Plant experience working group meeting; Ibaraki-Ken, Japan (Sep 1978).

Portions of document are illegible.

At the present time, approximately 65% of the Phase 1 and 2 tests have been completed. The major systems which have been tested and are now operational to support sodium fill are summarized. On July 2, 1978 the first secondary loop was filled with sodium and pony motor flow initiated on July 3. Sodium sampling and cold trapping procedures were started immediately thereafter and are proceeding well. The preoperational Integrated Leak Rate Test of the containment building was satisfactorily completed on June 2, 1978. Presently, major emphasis is being placed on completing those test activities which are prerequisites for sodium fill of the remaining two secondary loops and the primary system. In particular, emphasis is being placed on dry refueling system tests and inerted primary cell leak rate testing since these two efforts present the major workloads remaining in the prerequisites to sodium fill of the primary system.

- 1581 (HEDL-SA--1609) FUEL ADJACENCY EFFECTS ON FAST REACTOR CLADDING MECHANICAL PROPERTIES. Hunter, C.W.; Johnson, G.D. (Hanford Engineering Development Lab., Richland, WA (USA)). 6 Dec 1978. Contract EY-76-C-14-2170. 12p. (CONF-790306--21). Dep. NTIS, PC A02/MF A01.

From International conference on fast breeder reactor performance; Monterey, CA, USA (5 Mar 1979).

Simulated transient tests were conducted on 234 cladding specimens from EBR-II irradiated

mixed oxide fuel pins; approximately 75% of the specimens were from the fuel column region, with the remainder from the plenum and below the fuel column. The cladding specimens were taken from the N-E, N-F, PNL-9, PNL-10, PNL-11, P-23A, P-23B, P-23C, and WSA-3 fuel pins irradiated at 15.2 to 37 KW/cm to burnup levels from 11 to 110 MWd/Kg. All the fuel pins used 20% cold worked Type 316 stainless steel cladding. Irradiation temperatures ranged from 370 to 725°C with a peak fluence of 10^{23} n/cm² (E > 0.1 MeV).

- 1582 (HEDL-SA--1625) CONTROL OF RADIONUCLIDE TRANSPORT IN SODIUM-COOLED REACTOR PRIMARY CIRCUITS. Brehm, W.F. (Hanford Engineering Development Lab., Richland, WA (USA)). Oct 1978. Contract EY-76-C-14-2170. 18p. (CONF-781109--20). Dep. NTIS, PC A02/MF A01.

From Environmental control symposium; Washington, DC, USA (28 Nov 1978).

In order to be economically viable, sodium-cooled reactors must operate at fairly high temperatures (500°C) and with long, uninterrupted fuel cycles. These conditions increase the potential for radioactive corrosion product transport; achieving the goal of long uninterrupted fuel cycles means that release and transport of fission products from breached fuel pins will undoubtedly have to be controlled. This paper shows that control of radioactive material transport is an achievable goal.

- 1583 (HEDL-SA--1630) PMS: WHAT ARE YOU GETTING FOR YOUR MONEY.. Rigney, R.A.; Campbell, R.H. (Hanford Engineering Development Lab., Richland, WA (USA); Department of Energy, Washington, DC (USA). Office of Nuclear Waste Management). 27 Sep 1978. Contract EY-76-C-14-2170. 12p. (CONF-7810120--1). Dep. NTIS, MF A01.

From PMI seminar/symposium; Anaheim, CA, USA (7 Oct 1978).

Portions of document are illegible.

The development and effectiveness of a Performance Measurement System (PMS) for contractors at Hanford Engineering Development Laboratory are discussed. The system was developed in particular for the FFTF project but has been extended to other areas.

- 1584 (HEDL-SA--1631-FP) FUEL CRACK VOLUME PREDICTIONS AND MEASUREMENTS. Fox, G.L.; Randklev, E.H. (Hanford Engineering Development Lab., Richland, WA (USA)). Jan 1979. Contract EY-76-C-14-2170. 13p. (CONF-790310--5). Dep. NTIS, PC A02/MF A01.

From Specialists workshop on predictive analysis of material dynamics in LMFBR safety expts; Los Alamos, NM, USA (13 Mar 1979).

Void volume within an LMFBR fuel pin has a substantial effect on calculations of cladding strain and lifetime for transient overpower accident analyses. A substantial fraction of this void volume is contained within startup cracks that are still present during fuel irradiation. The paper discusses a crack prediction method and crack measurement techniques, compares predictions with measurements, and includes a sufficient crack fraction data base to be of use to other fuel pin behavior analysts.

- 1585 (HEDL-SA--1634) DESIGN EXPERIENCE: FFTF SHIELDING. Bunch, W.L.; Rathbun, J.L.; Swenson, L.D. (Hanford Engineering Development Lab., Richland, WA (USA); Westinghouse Electric Corp., Madison, PA (USA).

Advanced Reactors Div.). Nov 1978. Contract EY-76-C-14-2170. 17p. (CONF-781117--18). Dep. NTIS, PC A02/MF A01.

From FBK shielding seminar; Obninsk, USSR (13 Nov 1978).

The Fast Flux Test Facility is being built to serve as the primary test facility in the United States for the development of liquid-metal-cooled fast breeder reactors. Shield design philosophy for the reactor was to protect permanent structural members with removable or replaceable components. Significant studies were undertaken to establish the shield design in the reactor support area, to protect the core support structure, and to prevent excessive activation of secondary sodium. Equipment associated with each of the three heat transport system loops are contained in separate shielded cells to permit individual shutdown and isolation maintenance. Design-basis source strengths were calculated and dose rate criteria were established based on anticipated access requirements to provide a basis for the design of plant shields. High density concretes were employed in some walls because of physical constraints established by the limited size of the containment building. Extensive shield acceptance tests are planned to establish the radiation environment throughout the reactor and plant to assure satisfactory performance and for subsequent comparison with design values.

- 1586 (HEDL-SA--1640) LOAD RATING AND DESIGN CRITERIA FOR PIPE SNUBBERS WITH EXTENSION STRUTS. Entz, R.D.; Anderson, M.J. (Hanford Engineering Development Lab., Richland, WA (USA)). Feb 1979. Contract EY-76-C-14-2170. 7p. (CONF-790615--25). Dep. NTIS, PC A02/MF A01.

From 3. US national congress on pressure vessels and piping; San Francisco, CA, USA (25 Jun 1979).

Snubbing devices are used extensively in nuclear power plant piping to prevent seismic shock forces from causing damaging pipe motions. Most seismic snubbers are designed and load rated by the manufacturer without consideration of attaching structure, unless specifically requested to do so by the purchaser. This paper discusses the additional design constraints imposed by the use of extension struts with the seismic snubbers. The constraints evaluated include load rating reduction as a function of strut length, and strut length limitations to prevent dynamic instability.

- 1587 (HEDL-SA--1641) INELASTIC ANALYSIS OF TWO PIPELINES IN THE FAST FLUX TEST FACILITY. Huang, S.N. (Hanford Engineering Development Lab., Richland, WA (USA)). Jan 1979. Contract EY-76-C-14-2170. 18p. (CONF-790615--24). Dep. NTIS, PC A02/MF A01.

From 3. US national congress on pressure vessels and piping; San Francisco, CA, USA (25 Jun 1979).

Several complex pipelines of the Fast Flux Test Facility (FFTF) were evaluated using detailed inelastic analysis because they did not satisfactorily comply with the ASME elastic analysis rules. The purpose of the inelastic analysis is to demonstrate that the piping systems, which operate at elevated temperatures, comply with ASME Code requirements under the loading conditions specified in the Design Specification of each pipeline, using inelastic analysis rules. Two pipelines are discussed, the 8-inch Secondary Hot Leg in the Heat Transport System and the 3-inch/4-inch Primary Hot Leg (Ex-module) in the Closed Loop

System. The former is made from type 304SS, operating at 9650F (518.3°C) and designed for a 20 year life; the latter is made from type 316SS, operating at 12000F (648.9°C) and designed for a 10 year life. The MARC general finite element computer program was utilized in the analyses. The pipelines were idealized using the combinations of thin-walled circular closed section beam elements and constant bending 3-node elbow elements. Discussions on the load histograms used, the inelastic strain accumulated, and the effects of creep and fatigue on the lines are given.

- 1588 (HEDL-SA--1642-FP) METHODS OF ASSURING DESIGN ADEQUACY OF SEISMIC III/I SUPPORTS. Summers, G.D. (Hanford Engineering Development Lab., Richland, WA (USA)). Jan 1979. Contract EY-76-C-14-2170. 11p. (CONF-790802--78). Dep. NTIS, PC A02/MF A01.

From International conference on structural mechanics in reactor technology; Berlin, F.R. Germany (13 Aug 1979).

After construction of the FFTF plant was virtually complete, special walkdown teams were sent to every cell containing SC I items. These teams, using specially derived zone of influence curves, identified those SC III items which could, if they or their support fail, impact the SC I items. A set of generic criteria was prepared for use by the walkdown teams in the field qualifying the SC III items. These items are referred to as III/I (SC III over SC I). The generic criteria include energy based relationships that can be used to determine whether a SC III item (the missile) has sufficient potential energy to damage a SC I item (the target) even if it does fall on it. Generic criteria were developed to qualify III/I conduct, lights, ducting, piping, pipe supports, and other items. Those items which can't be field qualified with the generic criteria are given detailed analysis. In cases where numerous SC III items threaten a single SC I item or a closely grouped set of SC I items, the SC I item is sometimes protected by providing a barrier between the missile and the target. A description of the analytical basis for the generic criteria is provided in the paper. Examples from FFTF are provided.

- 1589 (HEDL-SA--1643) SHIELDING MATERIALS. Bunch, W.L.; Blackburn, L.D. (Hanford Engineering Development Lab., Richland, WA (USA)). Nov 1978. Contract EY-76-C-14-2170. 11p. (CONF-781117--19). Dep. NTIS, PC A02/MF A01.

From FBR shielding seminar; Obninsk, USSR (13 Nov 1978).

The higher neutron flux levels associated with fast reactors, when compared to thermal reactors of the same power, dictate the use of structural steels in the primary reactor shields and the need to design replaceable shield components. The loop-type reactor design being developed in the United States eliminates the need for graphite or other moderating material within the reactor vessel. Sufficient reactor shielding is employed to assure that permanent structural members retain mechanical characteristics comparable to unirradiated material. Removable or replaceable components are designed to retain specific required physical characteristics until replaced. The concretes and compensatory shields used throughout the fast reactor plant are quite similar to those employed in thermal reactor systems. High density concretes containing metallic ores and iron are used where space limitations dictate. Selection of compensatory shield materials is complicated by the diversity of the problems that exist and by the

limited knowledge of the long-term behavior of some materials.

- 1590 (HEDL-SA--1658-S) ANALYSIS OF INTERNAL FUEL MOTION DURING PINEX-2 EXPERIMENT. Padilla, A. Jr.; Baars, R.E.; Porten, D.R.; Randklev, E.H. (Hanford Engineering Development Lab., Richland, WA (USA)). Sep 1978. Contract EY-76-C-14-2170. 14p. (CONF-790310--6). Dep. NTIS, PC A02/MF A01.

From Specialists workshop on predictive analysis of material dynamics in LMFBR safety expts; Los Alamos, NM, USA (13 Mar 1979).

This paper describes the analyses performed for the PINEX-2 experiment to calculate the ejection of molten fuel into the reflector and fission gas plenum for an internally-vented fuel pin during a simulated 5s/s transient overpower excursion. The LAFM code was used to predict the transient fuel melting and fission gas release, and the HOTPIM and FUMO-I codes were used to predict the fuel ejection. The analytical results were compared with initial data from both the Pinhole-TV Imaging System and the fast-neutron hodoscope, as well as post-transient examinations of the fuel pin.

- 1591 (HEDL-SA--1665) ATTENUATION OF AIRBORNE DEBRIS FROM LMFBR ACCIDENTS. Morewitz, H.A.; Johnson, R.P.; Nelson, C.T.; Vaughan, E.U.; Guderjahn, C.A.; Hilliard, R.K.; McCormack, J.D.; Postma, A.K. (Rockwell International Corp., Canoga Park, CA (USA). Energy Systems Group; Hanford Engineering Development Lab., Richland, WA (USA)). 1978. Contract EY-76-C-14-2170. 15p. (CONF-781022--128). Dep. NTIS, PC A02/MF A01.

From Meeting on nuclear power reactor safety; Brussels, Belgium (16 Oct 1978).

Experimental and theoretical studies have been performed to characterize the behavior of airborne particulates (aerosols) expected to be produced by hypothetical core disassembly accidents (HCDA's) in liquid metal fast breeder reactors (LMFBR's). These aerosol studies include work on aerosol transport in a 20-m high, 850-m³ closed vessel at moderate concentrations; aerosol transport in a small vessel under conditions of high concentration (approx. 1000 g/m³), high turbulence, and high temperature (approx. 2000°C); and aerosol transport through various leak paths. These studies have shown that little, if any, airborne debris from LMFBR HCDA's would reach the atmosphere exterior to an intact reactor containment building.

- 1592 (HEDL-SA--1669) SUMMARY OF HEDL SODIUM FIRE TESTS. Hillard, R.K. (Hanford Engineering Development Lab., Richland, WA (USA)). Oct 1978. Contract EY-76-C-14-2170. 69p. (CONF-7811137--1). Dep. NTIS, PC A04/MF A01.

From IAEA/INWGER specialists meeting; Cadarache, France (20 Nov 1978).

The sodium fire test program and related studies at the Hanford Engineering Development Laboratory (HEDL) are described. The program is analytical and experimental in scope, with computer code development and experimental verification. Tests have ranged in size from gram quantity laboratory tests to 1600-kg sodium spills. The experimental work is performed in two facilities: the Large Sodium Fire Facility (LSFF) and the Containment Systems Test Facility (CSTF). Sodium fire extinguishment tests which verified the Fast Flux Test Facility (FFTF) secondary sodium fire protection system are described and related information on sodium burning rates and smoke release rates are correlated. The burning rates

are compared to theoretical predictions based on heat and mass transfer analogy, with good agreement. Comparisons with the SOFIRE-II code are also made. Sodium combustion aerosol properties are defined as to chemical and physical nature, settling in closed vessels and effect of added water vapor. The HAA-SB aerosol behavior computer code is compared to tests in the 850 m³ CSTF containment vessel. Sodium spray tests in the CSTF are compared with the SPRAY computer code. An air cleaning program is described, which has the objective of removing high mass concentration sodium combustion aerosols from vented cells and containment buildings. The aerosol mass holding capacity of commercial filters was measured and an aqueous scrubber system is described. The effects of sodium spills on cell structures were investigated, including water release from heated concrete, the reaction of sodium with concrete, the formation and spontaneous recombination of hydrogen, and the ability of steel cell liners to withstand large spills of high temperature sodium without leaking.

- 1593 (HEDL-SA--1671) STATUS OF FFTF STARTUP PROGRAM AND FUTURE FFTF UTILIZATION. Hard, E.N.; Bliss, R.J.; Olson, O.L. (Hanford Engineering Development Lab., Richland, WA (USA)). Oct 1978. Contract EY-76-C-14-2170. 52p. (CONF-781014--1). Dep. NTIS, PC A04/MF A01.

From Meeting of Japan section of the American Nuclear Society; Tokyo, Japan (25 Oct 1978).

Portions of document are illegible.

A brief FFTF project description is provided which includes general plant siting information, general layout, plant design parameters, description of principal systems and components, and description of support facilities. The current status of the FFTF project is provided, including status of plant construction, overall status of the plant checkout and test program, status of operating authorization and plant operating procedures and personnel, and status of reactor core components and experiments. Specific information on the acceptance test program and early program results is discussed. The role of FFTF in the future breeder program is described, including its objectives for verification of plant system and components designs and operability and use as an irradiation test facility.

- 1594 (HEDL-SA--1676) PRACTICAL CONSIDERATIONS FROM CONSTRUCTION OF THE FFTF PIPE SUPPORT SYSTEM. Hartsell, J.O. (Hanford Engineering Development Lab., Richland, WA (USA)). Apr 1979. Contract EY-76-C-14-2170. 30p. (CONF-790488--7). Dep. NTIS, PC A03/MF A01.

From 2. PEWG specialists - meeting; Richland, WA, USA (23 Apr 1979).

Late this year the FFTF is scheduled to initiate criticality and power operation, an event signifying complete resolution of construction problems and compliance with applicable requirements. One of the tasks accomplished to achieve this position was the conduct of cell completion walkthroughs, problem identification, and resolution. Heavily oriented toward the final verification of pipe supports, the cell completion process identified and resolved a series of problems not readily apparent during the detailed design phases of plant construction. It is the objective of this presentation to establish a degree of awareness of these types of problems and of the FFTF techniques employed in resolution. All of the problems depicted herein

have been solved and the installations corrected.

- 1595 (HEDL-SA--1677) ANALYTICAL STUDY OF THE DILATION OF FAST REACTOR FUEL ASSEMBLY DUCTS. Chan, D.P.; Jackson, R.J. (Hanford Engineering Development Lab., Richland, WA (USA)). 15 Nov 1978. Contract EY-76-C-14-2170. 21p. (CONF-790802--75). Dep. NTIS, PC A02/MF A01.

From international conference on structural mechanics in reactor technology; Berlin, F.R. Germany (13 Aug 1979).

An analytic method is presented for determining the dilation of fast reactor fuel assembly ducts. For temperatures where creep is linearly dependent on stress, the method is rigorous in satisfying equilibrium, compatibility and stress-strain equations. Solutions are presented for two cases: (1) a duct with constant pressure differential, (2) a duct with varying pressure differential. Results are in close agreement with finite element results of the MARC-CDC program. The method is used to predict the dilation of the Fast Test Reactor (FTR) ducts under different operating conditions. Presented are the stress, strain and dilation predictions along the duct wall, and the duct dilation variations with its geometric and loading parameters.

- 1596 (HEDL-SA--1678-FP) HOT PRESSING OF EUB. Hollenberg, G.W.; Beutler, P.S. (Hanford Engineering Development Lab., Richland, WA (USA)). Feb 1979. Contract EY-76-C-14-2170. 26p. (CONF-790420--14). Dep. NTIS, PC A03/MF A01.

From International symposium on ceramics in nuclear waste management; Cincinnati, OH, USA (30 Apr 1979).

Europium boride pellets with 92% of theoretical density were prepared by hot-pressing. By ball milling the starting powder, hot-pressing temperature could be reduced to 1700°C. The lower hot-pressing temperature provided better control over final density and gave a more desirable microstructure.

- 1597 (HEDL-SA--1679) FFTF IMPLEMENTATION OF TRAINING REQUIREMENTS FOR GOVERNMENT OWNED FACILITIES. Gadeken, A.D.; Izatt, R.D.; Wiborg, J.C. (Hanford Engineering Development Lab., Richland, WA (USA)). 1978. Contract EY-76-C-14-2170. 26p. (CONF-7804149--1). Dep. NTIS, PC A03/MF A01.

From 3 symposium on the training of nuclear facility personnel; Gatlinburg, TN, USA (29 Apr 1978).

The Fast Flux Facility (FFTF) is a liquid metal cooled, fast flux reactor plant. It is owned by the Department of Energy (DOE) and is operated by the Hanford Engineering Development Laboratory (HEDL) under a DOE contract with Westinghouse Hanford Company. The FFTF is presently undergoing acceptance testing of sodium systems in preparation for initial criticality in August 1979. It will be used to test fuels and materials, to develop associated components and to gain operating experience for future LMFBR's. The FFTF Training Program is a specific example of how training guidelines provided by NRC can be implemented in principle in a DOE owned reactor. The DOE requirements for government owned facilities and the NRC requirements for commercially owned facilities are compared to components of the FFTF Training program. These components will be described, actual status provided and evaluated as to meeting requirements. Cold Plant Qualification (equivalent to NRC Col Plant Licensing) is the next major milestone for FFTF Operator

training. Additional requirements or constraints such as operator time utilization, recruiting and turnover, plant availability and startup testing greatly affect the ability to meet this milestone. These constraints and requirements and the resulting compromises will be evaluated relative to meeting DOE requirements.

- 1598 (HEDL-SA--1683-FP) STEADY STATE IRRADIATION BEHAVIOR OF MIXED OXIDE FUEL PINS IRRADIATED IN EBR-II. Leggett, R.D.; Heck, E.N.; Levine, P.J.; Hilbert, R.F. (Hanford Engineering Development Lab., Richland, WA (USA)). Oct 1978. Contract EY-76-C-14-2170. 24p. (CONF-790306--11). Dep. NTIS, PC A02/MF A01.

From International conference on fast breeder reactor performance; Monterey, CA, USA (5 Mar 1979).

Results are presented from the steady state fuel irradiation program in EBR-II, which is intended to provide the technology and engineering test data in near-term support of the design and operation of the Fast Flux Test Facility (FFTF) and Fast Breeder Reactors (FBR's) utilizing the reference fuel system - UO_2 - PuO_2 mixed oxide with 25 +/- 5 w/o PuO_2 and 20% CW Type 316 stainless steel cladding. This program is also intended to develop the base for longer term innovative improvements and design changes required for FBR's and develop design criteria and associated computer-based design codes for accurately predicting fuel performance.

- 1599 (HEDL-SA--1686) RECENT AEROSOL TESTS IN THE CONTAINMENT SYSTEMS TEST FACILITY. McCormack, J.D.; Hilliard, R.K.; Postma, A.K. (Hanford Engineering Development Lab., Richland, WA (USA)). Oct 1978. Contract EY-76-C-14-2170. 21p. Dep. NTIS, PC A02/MF A01.

The Containment Systems Test Facility (CSTF) is a 20-meter high, 850m³ model containment vessel in which various sodium fire aerosol air cleaning tests are studied for purposes of developing and proof testing air cleaning techniques. The first series of tests was designed to study the properties of sodium fire aerosols without any air cleaning and to provide a data base for model verification using large-scale experiments. To date, three such tests (two pool fire and one spray fire) have been completed and are being analyzed. These tests will be discussed, as will plans for the air cleaning tests to follow.

- 1600 (HEDL-SA--1688) W-1 SLSF EXPERIMENT. Simpson, D.E. (Hanford Engineering Development Lab., Richland, WA (USA)). 1 Dec 1978. Contract EY-76-C-14-2170. 33p. (CONF-781144--18). Dep. NTIS, PC A03/MF A01.

From 2. US-Japan seminar on HTGR safety technology; Fuji, Japan (24 Nov 1978).

The Sodium Loop Safety Facility (SLSF) is a doubly-contained, closed sodium loop designed to test full length fast breeder reactor (FBR) fuel pins under simulated hypothetical fast reactor accident conditions. The W-1 experiment has two distinct and separate objectives. The primary objective is to evaluate fuel pin heat release characteristics during loss-of-piping integrity (LOPI) accident flow and power conditions. The Clinch River Breeder Reactor (CRBR) conditions during this accident are being used as representative of FBR's. A progression of four LOPI tests will be conducted to collect data at different fuel pin conditions. These four tests will be performed on fuel pins with (a) fresh, unrestructured

fuel, (b) fresh, restructured fuel, (c) irradiated, uncracked fuel (after steady-state irradiation), and (d) irradiated, cracked fuel (after shutdown and startup). The second objective of the W-1 experiment is to determine stable boiling and recovery limits (boiling window) as a function of fuel pin power.

- 1601 (HEDL-SA--1690-FP) FAST REACTOR NEUTRON ABSORBER MATERIALS. Mahagin, D.E. (Hanford Engineering Development Lab., Richland, WA (USA)). Apr 1979. Contract EY-76-C-14-2170. 17p. (CONF-790420--16). Dep. NTIS, PC A02/MF A01.

From International symposium on ceramics in nuclear waste management; Cincinnati, OH, USA (30 Apr 1979).

In a fast reactor, nuclear properties limit the number of materials that can be considered for use as neutron absorbers. On a worldwide basis the leading candidates are boron carbide, europium sesquioxide, and europium hexaboride. The performance of these materials is discussed with regard to current and future requirements.

- 1602 (HEDL-SA--1695-FP) PROBABILISTIC METHODS FOR LMFBR APPLICATION. Dutt, D.S.; Chen, K.H.; Stephen, J.D.; O'Reilly, D.B. (Hanford Engineering Development Lab., Richland, WA (USA); General Electric Co., Sunnyvale, CA (USA). Advanced Reactor Systems Dept.; Rockwell International Corp., Palo Alto, CA (USA). Energy Systems Group). 1979. Contract EY-76-C-14-2170. 12p. (CONF-790306--20). Dep. NTIS, PC A02/MF A01.

From International conference on fast breeder reactor performance; Monterey, CA, USA (5 Mar 1979).

The field of statistics and probability, as applied to physical phenomena, is a natural extension of engineering in which reality is modeled. Random variations and their combined effect on system response occur. The paper summarizes the activities at three DOE sponsored laboratories to establish accepted methods to evaluate these random variations, their impact on system performance and to provide assistance in establishing meaningful and quantified product specifications and operating limits. Continued development and refinement of methods to perform probabilistic analysis is required in order for these techniques to become accepted design methods.

- 1603 (HEDL-SA--1703-FP) ANALYSIS OF FFTF RESPONSE TO HYPOTHETICAL EARTHQUAKE WITH POSTULATED PRIMARY PIPING LEAK AND COOLING BY NATURAL CIRCULATION. McCall, T.B.; Franz, G.R. (Hanford Engineering Development Lab., Richland, WA (USA)). Jul 1979. Contract EY-76-C-14-2170. 11p. (CONF-790816--66). Dep. NTIS, PC A02/MF A01.

From International meeting on fast reactor safety technology; Seattle, WA, USA (19 Aug 1979).

The predicted response of the FFTF to a hypothetical earthquake plus a postulated primary pipe leak with subsequent reliance on natural circulation cooling to demonstrate the independence of the primary loops under these conditions is studied. The most pessimistic leak location was selected on the basis of consideration of a sodium spray to maximize the cell gas pressure. The analyses show that the cell gas could not reach the reactor inlet plenum and that the cell pressurization would not interfere with core cooling by the HTS loops. The statistical hot channel coolant temperature would remain below the sodium saturation temperature. Therefore, core coolable geometry would be maintained.

- 1604 (HEDL-SA--1712-FP) HYDROGEN IGNITION AND RECOMBINATION FOLLOWING POSTULATED BREEDER REACTOR ACCIDENTS. Wierman, R.W.; Muhlestein, L.D. (Hanford Engineering Development Lab., Richland, WA (USA)). 1979. Contract EY-76-C-14-2170. 9p. (CONF-790816--77). Dep. NTIS, PC A02/MF A01.

From International meeting on fast reactor safety technology; Seattle, WA, USA (19 Aug 1979).

Understanding the inherent response of breeder reactors to hydrogen generated during a major accident is important to reactor safety analyses and in evaluating means of controlling hydrogen to safe levels. Experiments have been conducted at the Hanford Engineering Development Laboratory investigating the ignition, burning, and extinguishment of hydrogen jets under conditions similar to those of postulated reactor accidents. Two extensive series of small-scale tests and two large-scale tests have been performed which indicate the conditions necessary for hydrogen jet ignition and extinguishment. The results and conclusions of the test programs are included.

- 1605 (HEDL-SA--1713-FP) CONTAINMENT AIR CLEANING FOR LMFBRs. Hilliard, R.K.; McCormack, J.D.; Postma, A.K.; Owen, R.K. (Hanford Engineering Development Lab., Richland, WA (USA)). 1979. Contract EY-76-C-14-2170. 11p. (CONF-790816--56). Dep. NTIS, PC A02/MF A01.

From International meeting on fast reactor safety technology; Seattle, WA, USA (19 Aug 1979).

A variety of air cleaning concepts was evaluated for potential use in future sodium-cooled breeder reactors. A 3-stage aqueous scrubber system was selected for large-scale demonstration testing under conditions similar to those postulated for containment venting and purging during reactor melt-through accidents. Two tests were performed in the Containment Systems Test Facility using a quench tank, a jet venturi scrubber and a high efficiency fibrous scrubber in series. The results of two tests with Na_2O_2 and NaOH aerosol and NaI vapor are presented showing >99.9% removal of Na_2O_2 and NaOH and >99.7% for NaI .

- 1606 (HEDL-SA--1714-FP) AEROSOL BEHAVIOR DURING SODIUM SPRAY FIRES AND COMPARISON WITH COMPUTER CODES. McCormack, J.D.; Hilliard, R.K.; Postma, A.K.; Owen, R.K. (Hanford Engineering Development Lab., Richland, WA (USA)). Jul 1979. Contract EY-76-C-14-2170. 9p. (CONF-790816--79). Dep. NTIS, PC A02/MF A01.

From International meeting on fast reactor safety technology; Seattle, WA, USA (19 Aug 1979).

The results of sodium spray fires in air in the 850-m³ CSTF vessel are discussed. During these tests, sodium at 600°C was sprayed downward through commercial nozzles located 16 m above the floor. Test AB3 released 48 kg of sodium spray in 140 seconds with 670- μm MMD drop size and produced a maximum pressure increase of 0.041 MPa and 30 g/m³ of airborne sodium compounds. Test NT-1 sprayed 82 kg of sodium at 320 μm MMD drop size over 4.7 hours. In both tests, large stable temperature gradients, not predicted by pre-test SPRAY computer code calculations, were observed. Also, post-test estimations of pressure and aerosol concentration made using SPRAY and HAA-3B codes exceeded actual values measured. Thus, the codes conservatively over-predicted the aerosol leakage potential. The experimental

data and the SPRAY and HAA-3B code calculations are compared and discussed.

- 1607 (HEDL-SA--1716-FP) SODIUM CONCRETE REACTIONS. Colburn, R.P.; Muhlestein, L.D.; Hassberger, J.A.; Mahncke, A.J. (Hanford Engineering Development Lab., Richland, WA (USA)). 1979. Contract EY-76-C-14-2170. 11p. (CONF-790816--78). Dep. NTIS, PC A02/MF A01.

From International meeting on fast reactor safety technology; Seattle, WA, USA (19 Aug 1979).

The data from an extensive series of sodium/concrete reaction tests are presented and mechanisms by which the reactions proceed are analyzed. The results indicate water transport and the resulting sodium/water reaction dominate both the chemical energy release and H_2 generation. A mechanism which explains the limited penetration of concrete observed in most of these tests is proposed.

- 1608 (HEDL-SA--1724) QUALITY ASSURANCE FOR BREEDER REACTOR FUEL FABRICATION. Marx, E.R. (Hanford Engineering Development Lab., Richland, WA (USA)). 29 Dec 1978. Contract EY-76-C-14-2170. 24p. (CONF-790420--12). Dep. NTIS, PC A02/MF A01.

From International symposium on ceramics in nuclear waste management; Cincinnati, OH, USA (30 Apr 1979).

Fuel performance in the Fast Flux Test Facility (FFTF) depends on fabrication of fuel to rigorous quality standards. The quality program including Management, Procurement, Fabrication, Inspection, Records, and Audits is discussed as well as unique mixed oxide fuel inspections such as homogeneity inspection, analytical chemistry, and nondestructive fissile assay.

- 1609 (HEDL-SA--1725-FP) COMPARISON OF A FISSION-GAS EFFECTS IN A TRANSIENT OVERPOWER TEST (HUT 5-7A) TO FRAS3 CODE PREDICTIONS. Gruber, E.E.; Randklev, E.H. (Argonne National Lab., IL (USA); Hanford Engineering Development Lab., Richland, WA (USA)). 1979. Contract EY-76-C-14-2170. 9p. (CONF-790816--67). Dep. NTIS, PC A02/MF A01.

From International meeting on fast reactor safety technology; Seattle, WA, USA (19 Aug 1979).

Fission gas has an important bearing on fuel dynamics during reactor transients. Fission-gas bubble sizes and densities, both within grains and on grain boundaries, are characterized as functions of radial location at the axial midplane in studies of PNL-9 fuel microstructures before and after the HUT 5-7A (PNL 9-25) TREAT test. The FRAS3 code, being developed to model fission-gas effects in reactor transients, is applied to analyze the results of the HUT 5-7A test are presented to illustrate the observed phenomena and the validity of the modeling approach.

- 1610 (HEDL-SA--1727-FP) REMOTE FABRICATION OF PELLET FUELS FOR UNITED STATES BREEDER REACTORS. Dahl, R.E.; Nyman, D.H.; Yatabe, J.M. (Hanford Engineering Development Lab., Richland, WA (USA)). Apr 1979. Contract EY-76-C-14-2170. 12p. (CONF-790602--90). Dep. NTIS, PC A02/MF A01.

From ANS annual meeting; Atlanta, GA, USA (3 Jun 1979).

Goal of the program is to demonstrate the feasibility of fabricating breeder fuel in a remotely operated and maintained mode by 1985. Development for pellet fuel fabrication is in

the engineering stage with much of the equipment for ceramic unit operations in final design or currently under testing. Results to date confirm that remote fabrication of pellet fuels is feasible. Several of the processes and equipment items are described in this report.

- 1611 (HEDL-SA--1728-FP) NEUTRON SOURCE STRENGTH IN FFTF FUEL AS A FUNCTION OF IRRADIATION. Ombrellaro, P.A.; Petrowicz, N.E. (Hanford Engineering Development Lab., Richland, WA (USA)). Apr 1979. Contract EY-76-C-14-2170. 20p. (CONF-790602--74). Dep. NTIS, PC A02/MF A01.

From ANS annual meeting; Atlanta, GA, USA (3 Jun 1979).

The neutron source strength associated with fuel irradiated in the FFTF reactor is important in determining the reactivity of the core when it is shut down or being refueled. The monitoring of subcritical reactivity for FFTF will be done with the Modified Source Multiplication (MSM) technique which requires an accurate knowledge of the neutron source strength in high exposure fuel elements replaced with fresh fuel elements in a shut down reactor. As a means of obtaining the most accurate source evaluations possible with existing nuclear data for FFTF irradiated fuel, a technique for generating one-group actinide cross sections for use in isotopic buildup and depletion codes was developed. A further objective of the work was to use the cross sections and recently evaluated spontaneous fission and (α, n) reaction neutron yield data to calculate the neutron source strength in typical compositions of FFTF-type fuel as a function of flux level and irradiation time and then to compare the results with those of a previous study to assess the differences in the nuclear data. This paper will highlight the important aspects of this study and present some results.

- 1612 (HEDL-SA--1729-FP) NUCLEAR STARTUP, TESTING AND CORE MANAGEMENT OF THE FTR. Bennett, R.A.; Daughtry, J.V.; Harris, R.A.; Jones, D.H.; Nelson, J.W.; Rawlins, J.A.; Rothrock, R.B.; Sevenich, R.A.; Zimmerman, B.D. (Hanford Engineering Development Lab., Richland, WA (USA)). Aug 1979. Contract EY-76-C-14-2170. 18p. (CONF-790933--3). Dep. NTIS, PC A02/MF A01.

From IAEA international symposium on fast reactor physics; Aix-en-Provence, France (24 Sep 1979).

The Fast Test Reactor (FTR) is a sodium-cooled, mixed-oxide-fueled, 400 MW(Th) fast reactor designed for irradiation testing of FB fuels and materials. The reactor is located near Richland, Washington, and is operated by the Westinghouse Hanford Company for the US Department of Energy. The FTR is presently undergoing nonnuclear startup tests, in preparation for the initial fuel loading. The reactor is provided with special irradiation facilities to enhance its experimental capabilities.

- 1613 (HEDL-SA--1731-FP) MEASUREMENT OF CLADDING STRAIN DURING SIMULATED TRANSIENT TESTS. Duncan, D.R.; Johnson, G.D.; Hunter, C.W.; Hanson, J.E. (Hanford Engineering Development Lab., Richland, WA (USA)). 20 Jul 1979. Contract EY-76-C-14-2170. 13p. (CONF-790816--73). Dep. NTIS, PC A02/MF A01.

From International meeting on fast reactor safety technology; Seattle, WA, USA (19 Aug 1979).

A diametral extensometer was developed and employed during temperature ramp tests with the

Fuel Cladding Transient Tester (FCTT). Plastic strain measurements were performed using unirradiated 20X cold-worked AISI 316 stainless steel tubing ramped at 5.6 and 111°C/s with internal pressures from 3.4 to 93.1 MPa. Results demonstrated that plastic deformation can occur at stresses well below the conventional 0.2% yield strength and that most deformation in such tests occurs in the final 50°C before failure. Postirradiation tests were performed on fuel pin cladding irradiated to 5.8×10^{22} n/cm ($E > 0.1$ MeV) with irradiation temperatures to 540°C. The tests showed that, for test pressures of 17.2 MPa or less, the stress-strain behavior was unchanged from unirradiated material behavior although the strains at failure were greatly decreased.

- 1614 (HEDL-SA--1735-FP) SAFETY ANALYSIS OF EXPERIMENTS PROPOSED FOR IRRADIATION IN FFTF. Stepniewski, D.D.; Van Keuren, J.C. (Hanford Engineering Development Lab., Richland, WA (USA)). Jan 1979. Contract EY-76-C-14-2170. 8p. (CONF-790816--71). Dep. NTIS, PC A02/MF A01.

From International meeting on fast reactor safety technology; Seattle, WA, USA (19 Aug 1979).

A safety analysis of all experiments to be irradiated in FFTF is required to demonstrate that the experiment does not constitute a hazard to the reactor or the public. This paper summarizes the review procedure, the scope of the analysis and safety acceptance criteria.

- 1615 (HEDL-SA--1736-FP) FFTF CONTAINMENT OF HYPOTHETICAL ACCIDENTS. Peak, R.D.; Martin, H.C.; Jensen, R.L.; Stepniewski, D.D.; Hale, J.P. (Hanford Engineering Development Lab., Richland, WA (USA)). Aug 1979. Contract EY-76-C-14-2170. 18p. (CONF-790816--70). Dep. NTIS, PC A02/MF A01.

From International meeting on fast reactor safety technology; Seattle, WA, USA (19 Aug 1979).

The FFTF facility was evaluated for the consequences of an HCDA followed by failure of in-vessel post-accident heat removal, reactor vessel melt-through, and release of core debris and sodium coolant to the reactor cavity. Two cases are presented based on parameters considered to represent upper limits for rates of chemical and thermal attack of the reactor cavity concrete containment structure. The reactor containment building temperature, pressure, and leak rate histories were computed with the CACECO code which provided input into the HAA-3C code for prediction of aerosol behavior, and to the COMRADEX-H code for prediction of radioactivity dispersion. The resultant 30-day doses at the site boundary were judged to be acceptable considering the conservatism in the analysis and the low probability of the event.

- 1616 (HEDL-SA--1737-FP) PINEX-2 EXPERIMENT: CONCEPT VERIFICATION OF AN INHERENT SHUTDOWN MECHANISM FOR HCDA'S. Porten, D.R.; Padilla, A. Jr.; Baars, R.E. (Hanford Engineering Development Lab., Richland, WA (USA)). Jul 1979. Contract EY-76-C-14-2170. 13p. (CONF-790816--68). Dep. NTIS, PC A02/MF A01.

From International meeting on fast reactor safety technology; Seattle, WA, USA (19 Aug 1979).

PINEX-2 was a dual-objective experiment to continue development of the Pinhole Imaging (PINEX) system for monitoring fuel motion, and to further demonstrate the feasibility of internal fuel motion as a mechanism for mitigating the consequences of hypothetical

LMFBR accidents. A special fuel pin with a pre-fabricated central hole in the fuel, insulator, and reflector was pre-irradiated in the General Electric Test Reactor and subjected to a simulated 5\$/sec transient overpower excursion in the Transient Reactor Test (TREAT) facility. Approximately 10 grams of molten fuel were ejected upward from the fuel region into the reflector and fission gas plenum.

- 1617 (HEDL-SA--1741-FP) APPLICATION OF OPTIMAL ESTIMATION TECHNIQUES TO FFTF DECAY HEAT REMOVAL ANALYSIS. Nutt, W.T.; Additon, S.L.; Parziale, E.A. (Hanford Engineering Development Lab., Richland, WA (USA)). 20 Jul 1979. Contract EY-76-C-14-2170. 11p. (CONF-790816--69). Dep. NTIS, PC A02/MF A01.

From International meeting on fast reactor safety technology; Seattle, WA, USA (19 Aug 1979).

The verification and adjustment of plant models for decay heat removal analysis using a mix of engineering judgment and formal techniques from control theory are discussed. The formal techniques facilitate dealing with typical test data which are noisy, redundant and do not measure all of the plant model state variables directly. Two pretest examples are presented.

- 1618 (HEDL-SA--1743-FP) RESPONSE OF FFTF CORE TO PROTECTED REACTIVITY ADDITION TRANSIENTS. Yee, A.K.; Baars, R.E.; Stepnewski, D.D. (Hanford Engineering Development Lab., Richland, WA (USA)). Aug 1979. Contract EY-76-C-14-2170. 16p. (CONF-790816--62). Dep. NTIS, PC A02/MF A01.

From International meeting on fast reactor safety technology; Seattle, WA, USA (19 Aug 1979).

The response of the FFTF core to protected reactivity insertion events was evaluated. Reactivity addition transients ranging from .05 cents/s to 3\$/s have been considered. The evaluation method is based on a calculational model which predicts cladding strain from modified fuel-cladding differential thermal expansion. The results show that for all ramp rates considered, the Plant Protection System (PPS) controls consequences to required limits. Comparisons made between predicted fuel damage and results of TREAT transient tests support the conservatism of the results.

- 1619 (HEDL-SA--1744-FP) FFTF REGULATORY REVIEW FOR OPERATING AUTHORIZATION. Schade, A.R.; Simpson, D.E. (Hanford Engineering Development Lab., Richland, WA (USA)). 1979. Contract EY-76-C-14-2170. 7p. (CONF-790816--63). Dep. NTIS, PC A02/MF A01.

From International meeting on fast reactor safety technology; Seattle, WA, USA (19 Aug 1979).

The Project has undertaken design studies of concepts capable of providing added containment safety margins. Since the events, for which these features provide consequence reductions, are beyond the design basis accident classification, the conceptual designs would not be designed as Engineered Safety Features. A final decision has not been made by the Department of Energy as to the disposition of this advice. It is the Project's plan to develop sufficient design details for these features that construction schedules and cost estimates can be formulated. This information supplemented by the continuing analytical and experimental program to assess the adequacy of FFTF containment margins will enable a decision to be made as to additional features to be added to FFTF and their schedule for

implementation.

- 1620 (HEDL-SA--1747-FD) FISSION GAS BEHAVIOR IN MIXED-OXIDE FUEL DURING TRANSIENT OVERPOWER. Randklev, E.H.; Treibs, H.A.; Mastel, B.; Baldwin, D.L. (Hanford Engineering Development Lab., Richland, WA (USA)). 1979. Contract EY-76-C-14-2170. 13p. (CONF-790816--86). Dep. NTIS, PC A02/MF A01.

From International meeting on fast reactor safety technology; Seattle, WA, USA (19 Aug 1979).

Fission gas behavior can be important in determining fuel pin and core performance during a reactor transient. The results are presented of examinations characterizing the changes in microstructural distribution and retention of fission gas in fuel for a series of transient overpower (50 cents/s) tested mixed-oxide fuel pins and their steady state siblings.

- 1621 (HEDL-SA--1749-FP) EFFECTS OF STOICHIOMETRY ON CLADDING REACTION IN MIXED-OXIDE FUEL. Lawrence, L.A. (Hanford Engineering Development Lab., Richland, WA (USA)). Apr 1979. Contract EY-76-C-14-2170. 21p. (CONF-790602--75). Dep. NTIS, PC A02/MF A01.

From ANS annual meeting; Atlanta, GA, USA (3 Jun 1979).

Initial fuel stoichiometry (oxygen-to-metal ratio, O/M) has been established as one of the major parameters influencing the character and extent of fuel-cladding chemical interaction (FCCI) in UD_2 --25 wt% PuO_2 fuels clad with 20X cold worked type 316 stainless steel. How the character of the interaction changes with initial O/M and the O/M dependence that has been established for the depth of interaction are discussed. The data base for this analysis consists of 134 data sets from P-23 series fuel pins irradiated in EBR-II. As-fabricated O/M's ranged from 1.938 to 1.984 with the bulk of the data in the range 1.96 to 1.98. Fuel pins operated to 9.5 atom %, with local cladding inner surface temperatures to 725°C, for exposure times to 415 equivalent full power days at heat rates of approx. 400 W/cm.

- 1622 (HEDL-SA--1750) FATIGUE-CRACK PROPAGATION RESPONSE OF TWO NICKEL-BASE ALLOYS IN A LIQUID SODIUM ENVIRONMENT. Mills, W.J.; James, L.A. (Hanford Engineering Development Lab., Richland, WA (USA)). 23 Jan 1979. Contract EY-76-C-14-2170. 31p. (CONF-790615--20). Dep. NTIS, PC A03/MF A01.

From 3. US national congress on pressure vessels and piping; San Francisco, CA, USA (25 Jun 1979).

The elevated temperature fatigue-crack propagation response of Inconel 600 and Inconel 718 was characterized within a linear-elastic fracture mechanics framework in air and low-oxygen liquid sodium environments. The crack growth rates of both nickel-base alloys tested in liquid sodium were found to be considerably lower than those obtained in air. This enhanced fatigue resistance in sodium was attributed to the very low oxygen content in the inert sodium environment. Electron fractographic examination of the Inconel 600 and Inconel 718 fatigue fracture surfaces revealed that operative crack growth mechanisms were dependent on the prevailing stress intensity level. Under low growth rate conditions, Inconel 600 and Inconel 718 fracture surfaces exhibited a faceted, crystallographic morphology in both air and sodium environments. In the higher growth rate regime, fatigue striations were observed;

however, striations formed in sodium were rather ill-defined. These indistinct striations were attributed to the absence of oxygen in the liquid sodium environment. Striation spacing measurements were found to be in excellent agreement with macroscopic growth rates in both environments.

- 1623 (HEDL-SA--1751) SEISMIC DESIGN AND DEVELOPMENT FOR FAST REACTORS: A DESIGN-APPLICATION PERSPECTIVE WITH DIRECTIONS FOR IMPROVEMENT. Severud, L.K. (Hanford Engineering Development Lab., Richland, WA (USA)). 19 Jul 1979. Contract EY-76-C-14-2170. 29p. (CONF-790816--64). Dep. NTIS, PC A93/MF A01.

From International meeting on fast reactor safety technology; Seattle, WA, USA (19 Aug 1979).

Applications of seismic design criteria and qualification methods to the US breeder reactor projects have developed new findings, improvements in design methods, and identified areas for further development. Discussions are presented regarding site free field motion, soil-structure interaction, equipment response spectra, piping, snubbers and support design analyses, dynamic decoupling, seismic qualification testing, and protection of Seismic Category I components from Non-Category I equipment failures.

- 1624 (HEDL-SA--1752-FP) SURVIVAL OF PERIPHERAL PINS DURING A TOP-HCDA. Yung, S.C.; Wilburn, N.P. (Hanford Engineering Development Lab., Richland, WA (USA)). Jul 1979. Contract EY-76-C-14-2170. 19p. (CONF-790816--65). Dep. NTIS, PC A02/MF A01.

From International meeting on fast reactor safety technology; Seattle, WA, USA (19 Aug 1979).

This study addresses the survival of peripheral pins within an LMFBR subassembly during an unprotected transient overpower (TOP) Hypothetical Core Disruptive Accident (HCDA) by consideration of intrasubassembly incoherencies. A continuous analysis was made vs time from the initiation of the accident up to the point where the power decreases to a quasi-steady state for a Beginning-of-Cycle-4 (BOC-4) core of Fast Test Reactor (FTR), 0.5\$/sec ramp case. Blockage was assumed to be formed after fuel pin's failure and effects due to blockages were examined. The study concludes that most peripheral pins within an LMFBR subassembly indeed will survive.

- 1625 (HEDL-SA--1753-S(Rev.)) OBSERVATIONS OF IN-REACTOR ENDURANCE AND RUPTURE LIFE FOR FUELED AND UNFUELED FTR CLADDING. Lovell, A.J.; Christensen, B.Y.; Chin, B.A. (Hanford Engineering Development Lab., Richland, WA (USA)). 1979. Contract EY-76-C-14-2170. 21p. (CONF-790602--81(Rev.)). 02.

From ANS annual meeting; Atlanta, GA, USA (3 Jun 1979).

Reactor component endurance limits are important to nuclear experimenters and operators. This paper investigates endurance limits of 316 CW fuel pin cladding. The objective of this paper is to compare and analyze two different sets of FTR fuel pin cladding data. The first data set is from unfueled pressurized cladding irradiated in the Experimental Breeder Reactor No. II (EBR-II). This data set was generated in an assembly in which the temperature was monitored and controlled. The second data set contains observations of breached and unbreached EBR-II test fuel pins covering a large range of temperature, power and burnup conditions.

- 1626 (HEDL-SA--1754-FP) OBSERVATIONS OF IN-REACTOR STRAIN FOR FUELED AND UNFUELED FTR CLADDING. Gilbert, E.R.; Makenas, B.J.; Wilson, D.R. (Hanford Engineering Development Lab., Richland, WA (USA)). Jan 1979. Contract EY-76-C-14-2170. 15p. (CONF-790602--83). Dep. NTIS, PC A02/MF A01.

From ANS annual meeting; Atlanta, GA, USA (3 Jun 1979).

It has been demonstrated that equations derived from in-reactor creep and swelling in unfueled pressurized tubes of 20% CW AISI 316 stainless steel can be used to predict strains in prototypic FTR mixed-oxide (UO_2 -- PuO_2) fuel pins. For fast neutron fluences below $6 \times 10^{22}n/cm^2$ the strains were small (less than one percent) and good agreement was found (within 0.1 percent diametral strain) between the equations and the fuel pin strains. This paper describes an extension of the earlier study to fast neutron fluences up to $11 \times 10^{22}n/cm^2$.

- 1627 (HEDL-SA--1755-FP) COMPARISON OF IN-REACTOR AND OUT-OF-REACTOR FUEL PIN CLADDING STRAIN UNDER TRANSIENT LOADING. Duncan, D.R.; Hunter, C.W.; Thielges, J.R.; Hikido, T.; Hanson, J.E. (Hanford Engineering Development Lab., Richland, WA (USA)). 1979. Contract EY-76-C-14-2170. 9p. (CONF-790602--76). Dep. NTIS, PC A02/MF A01.

From ANS annual meeting; Atlanta, GA, USA (3 Jun 1979).

Results of two recent fuel pin transient tests performed in Mark II-C sodium loops in the TREAT reactor are compared with out-of-reactor transient test results. The TREAT pins were irradiated in EBR-II in the WSA-3 experiment; steady-state irradiation and TREAT test parameters are presented. Out-of-reactor transient tests in the Fuel Cladding Transient Tester (FCTT) measured the deformation and failure behavior of unirradiated specimens and irradiated fuel pin cladding specimens under constant internal gas pressure loading and transient temperature conditions. All fuel pins were 20% cold-worked AISI 316 stainless steel.

- 1628 (HEDL-SA--1756-5) LONG-TERM IN-REACTOR CORROSION OF STAINLESS STEEL CLADDING IN LIQUID SODIUM. Jensen, B.W.; Weber, J.W.; Jost, J.W. (Hanford Engineering Development Lab., Richland, WA (USA)). 1979. Contract EY-76-C-14-2170. 6p. (CONF-790602--82(Summ.)). Dep. NTIS, PC A02/MF A01.

From ANS annual meeting; Atlanta, GA, USA (3 Jun 1979).

In-reactor sodium corrosion of 20% cold-worked 316 stainless steel cladding was previously reported on HEDL P-23 series mixed-oxide fuel pins exposed in EBR-II for up to 4608 hours. This report extends those studies to 11,424 hours. Data from three HEDL subassemblies, P23A, P23B, and P23C, are included in this study. Nominal sodium velocities were 1.95 m/sec, 1.83 m/sec, and 2.18 m/sec, respectively. These 5.84 mm diameter fuel pins contained 25% PuO_2 - 75% UO_2 mixed-oxide fuel operating at a peak power of 440 W/cm. Time-averaged cladding outer surface temperature ranged from 400 to 712°C. Axial temperature gradients were approximately 960°C/m for the P23A and P23B subassemblies and 755°C/m for the P23C subassembly. Oxygen concentration in the sodium was approximately 1 ppm.

- 1629 (HEDL-SA--1759-FP) EFFECT OF A TIME VARYING POWER LEVEL IN EBR-II ON MIXED-OXIDE FUEL BURNUP. Stone, I.Z.; Jost, J.W.; Baker,

- R.B. (Hanford Engineering Development Lab., Richland, WA (USA)). 1979. Contract EY-76-C-14-2170. 7p. (CONF-790602--80). Dep. NTIS, PC A02/MF A01.
From ANS annual meeting; Atlanta, GA, USA (3 Jun 1979).
A refined prediction of burnup of mixed-oxide fuel in EBR-2 is compared with measured data. The calculation utilizes a time-varying power factor and results in a general improvement to previous calculations.
- 1630 (HEDL-SA--1760-FP) INFLUENCE OF OXYGEN-METAL RATIO ON MIXED-OXIDE FUEL PERFORMANCE. Lawrence, L.A.; Leggett, R.D. (Hanford Engineering Development Lab., Richland, WA (USA)). Apr 1979. Contract EY-76-C-14-2170. 21p. (CONF-790602--79). Dep. NTIS, PC A02/MF A01.
From ANS annual meeting; Atlanta, GA, USA (3 Jun 1979).
The fuel oxygen-to-metal ratio (O/M) is recognized as an important consideration for performance of uranium-plutonium oxide fuels. An overview of the effects of differing O/M's on the irradiation performance of reference design mixed-oxide fuel in the areas of chemical and mechanical behavior, thermal performance, and fission gas behavior is presented. The pellet fuel has a nominal composition of 75 wt% UO_2 + 25 wt% PuO_2 at a pellet density of approx. 90% TD. for nominal conditions this results in a smeared density of approx. 85%. The cladding in all cases is 20% CW type 316 stainless steel with an outer diameter of 5.84 to 6.35 mm. O/M has been found to significantly influence fuel pin chemistry, mainly FCCI and fission product and fuel migration. It has little effect on thermal performance and overall mechanical behavior or fission gas release. The effects of O/M (ranging from 1.938 to 1.984) in the areas of fuel pin chemistry, to date, have not resulted in any reduction in fuel pin performance capability to goal burnups of approx. 8 atom% or more.
- 1631 (HEDL-SA--1766) STRESS ANALYSIS OF CONICAL FLUED HEADS FOR FFTF LIQUID METAL PIPING ANCHORS. Sampson, R.C. (Hanford Engineering Development Lab., Richland, WA (USA)). Mar 1979. Contract EY-76-C-14-2170. 33p. (CONF-790615--17). Dep. NTIS, PC A03/MF A01.
From 3. US national congress on pressure vessels and piping; San Francisco, CA, USA (25 Jun 1979).
Flued heads for liquid metal piping were designed to function as structural anchors for liquid metal piping and as atmospheric seals between compartments. Their design was complicated by the need to provide high strength and rigidity as piping anchors, yet to have the flexibility needed to accommodate severe thermal differential temperature gradients under both steady state and transient conditions. Conical flued head design configurations in sizes from 1" to 28" were evolved by the repeated application of detailed thermal and stress analysis methods. Stress indices characterizing the response to each basic load type, were derived from the finite element analyses, followed by evaluations of performance by the elevated temperature ASME Code rules for elastic analysis and by the simplified one-dimensional analysis under the rules for inelastic analyses. Based upon this work, slight modifications of the design were made before authorizing production in order to enhance the resistance to creep damage. It was later demonstrated that the most critically stressed flued heads under the most extreme operating conditions complied with the Code rules for detailed inelastic stress analysis.
- 1632 (HEDL-SA--1769) ANALYSIS OF PIPING SYSTEMS WITH NONLINEAR SUPPORTS SUBJECTED TO SEISMIC LOADING. Barta, D.A. (Hanford Engineering Development Lab., Richland, WA (USA)). Mar 1979. Contract EY-76-C-14-2170. 23p. (CONF-790615--18). Dep. NTIS, PC A02/MF A01.
From 3. US national congress on pressure vessels and piping; San Francisco, CA, USA (25 Jun 1979).
An analytical study of effects of nonlinearities in piping supports on response to seismic excitation is presented. Response calculations for simplified single degree of freedom nonlinear models are used to illustrate sensitivity to stiffness variations, lost motion and impact damping. Seismic responses of typical spans of various sizes of piping supported by both linear and nonlinear constraints are compared to assess the support load magnifications due to impacting. The idealized nonlinear piping support models are integrated with a finite element model of a large piping system. Time domain seismic responses of the nonlinear piping system are compared to loads determined by a standard linearized seismic response spectra technique.
- 1633 (HEDL-SA--1770) RADIOLOGICAL ANALYSIS OF HYPOTHETICAL ACCIDENTS BY COMPUTER. Martin, H.C.; Hale, J.P. (Hanford Engineering Development Lab., Richland, WA (USA)). Jan 1979. Contract EY-76-C-14-2170. 14p. (CONF-790816--74). Dep. NTIS, PC A02/MF A01.
From International meeting on fast reactor safety technology; Seattle, WA, USA (19 Aug 1979).
The radiological analyses of extreme hypothetical accidents were performed almost wholly by computer techniques. Major analytical codes used were RIBD, CACECO, SPRAY, HAA, and COMRADEX. This paper describes the analyses, the modeling techniques, and transition programs that edited data output from one code into a form suitable for input to another. Although not sacrificing a conservative stance, the degree of realism afforded by these analyses shows that the projected consequences could be acceptable. Furthermore the techniques which have been developed are applicable to most LMFBR accident analyses.
- 1634 (HEDL-SA--1771) DESIGN ANALYSIS OF LIQUID METAL PIPE SUPPORTS. Margolin, L.L.; LaSalle, F.R. (Hanford Engineering Development Lab., Richland, WA (USA)). Feb 1979. Contract EY-76-C-14-2170. 15p. (CONF-790615--19). Dep. NTIS, PC A02/MF A01.
From 3. US national congress on pressure vessels and piping; San Francisco, CA, USA (25 Jun 1979).
Design guidelines pertinent to liquid metal pipe supports are presented. The numerous complex conditions affecting the support stiffness and strength are addressed in detail. Topics covered include modeling of supports for natural frequency and stiffness calculations, support hardware components, formulas for deflection due to torsion, plate bending, and out-of-plane flexibility. A sample analysis and a discussion on stress analysis of supports are included. Also presented are recommendations for design improvements for increasing the stiffness of pipe supports and which were utilized in the FFTF system.
- 1635 (HEDL-SA--1772) INSTRUMENT CALIBRATION

PROGRAM FOR STARTUP ON FFTF. Swanson, C.D. (Hanford Engineering Development Lab., Richland, WA (USA)). Jun 1979. Contract EY-76-C-14-2170. 27p. (CONF-790807--2). Dep. NTIS, PC A03/MF A01.

From Topical conference on reactor operating experience; Arlington, TX, USA (5 Aug 1979).

Calibration of plant instruments and control equipment is a key plant startup activity. Clearly defined calibration requirements are needed to effectively guide this activity. A master-loop/sub-loop concept developed for use at the FFTF to help solve this problem is described. Startup testing methods related to the calibration activity are also described and critiqued.

1636 (HEDL-SA--1773) EXPERIENCE WITH SIMPLIFIED INELASTIC ANALYSIS OF FFTF TEST ASSEMBLIES. Winkel, B.V. (Hanford Engineering Development Lab., Richland, WA (USA)). Feb 1979. Contract EY-76-C-14-2170. 18p. (CONF-790615--22). Dep. NTIS, PC A02/MF A01.

From 3. US national congress on pressure vessels and piping; San Francisco, CA, USA (25 Jun 1979).

Included in the more recent design activities for the Fast Flux Test Facility (FFTF) are a series of test assemblies which will contain experiments in the FFTF reactor. Due to high operating temperatures and severe thermal transients, inelastic analysis is generally required to demonstrate structural adequacy. Based upon previous FFTF experience, a number of simplifications have been made to reduce the inelastic analysis effort. Significant time and cost savings have resulted.

1637 (HEDL-SA--1787-FP) FAILURE LOCATION ANALYSIS FOR TAGGED REACTOR ASSEMBLIES. Figg, J.A. (Hanford Engineering Development Lab., Richland, WA (USA)). Mar 1979. Contract EY-76-C-14-2170. 12p. (CONF-790698--2). Dep. NTIS, PC A02/MF A01.

From Society of Women Engineers national student conference; San Francisco, CA, USA (27 Jun 1979).

The location of defective LMFBR fuel pins by the determination of gas tag isotopic ratios is discussed. The application of this method to the FFTF Reactor briefly described.

1638 (HEDL-SA--1794) EXPERIENCE IN THE USE OF FBR CORE COMPONENT STRUCTURAL DESIGN CRITERIA AS APPLIED TO FFTF. Hecht, S.L. (Hanford Engineering Development Lab., Richland, WA (USA)). 1979. Contract EY-76-C-14-2170. 10p. (CONF-790615--23). Dep. NTIS, PC A02/MF A01.

From 3. US national congress on pressure vessels and piping; San Francisco, CA, USA (25 Jun 1979).

User gained experience resulting from trial applications of proposed structural design guidelines for Fast Breeder Reactor (FBR) core components is presented. This work was done supporting the design analyses process for consumable core components for the Fast Test Reactor (FTR) of the Fast Flux Test Facility (FFTF). The proposed guidelines were found to be more comprehensive and generally easier to apply than those methods previously used. Component evaluation required a minimum amount of detailed inelastic analysis, primarily through the use of simplified inelastic analysis methods, as given in the guidelines. A major shortcoming of this draft criteria/guidelines is a lack of supporting irradiated material properties. Some areas of guidance

given seems ambiguous and may be non-conservative, particularly those related to stress classification unique to FBR environments. Further verification of these areas appears to be in order.

1639 (HEDL-SA--1795) FFTF STATUS AND TEST RESULTS. Noordhoff, B.H. (Hanford Engineering Development Lab., Richland, WA (USA)). Apr 1979. Contract EY-76-C-14-2170. 219p. (CONF-7904117--1). Dep. NTIS, PC A10/MF A01.

From American Nuclear Society meeting; Los Angeles, CA, USA (19 Apr 1979).

Portions of document illegible.

A general description of the FFTF is presented concerning the construction progress; status of startup and selected startup test results; and planned experiment program during and subsequent to the startup testing program. The FFTF is a 400 MWt, sodium cooled test reactor plant consisting of a fast-neutron reactor fueled by mixed plutonium oxide-uranium oxide fuel elements, three independent heat transport loops, extensive instrumentation, fuel handling equipment, and auxiliary systems which support the main reactor and cooling systems. The FFTF contains no steam generators, electrical generating equipment, or breeding blankets. Heat generated in the reactor is released to the ambient atmosphere by twelve large sodium-to-air heat exchangers.

1640 (HEDL-SA--1828) TITANIUM OXIDE CESIUM GETTERS FOR LOW O/M FBR FUEL PINS. Wilson, C.N.; Gibby, R.L.; Weber, E.T. (Hanford Engineering Development Lab., Richland, WA (USA)). 15 Aug 1979. Contract EY-76-C-14-21790. 15p. (CONF-791045--7). Dep. NTIS, PC A02/MF A01.

From American Ceramic Society conference; New Orleans, LA, USA (14 Oct 1979).

Fission product cesium may contribute to cladding strain in low oxygen-to-metal ratio (O/M) FBR fuel pins through localized reaction with fuel or UO_2 blanket pellets. Titanium oxide pellets were laboratory irradiation tested as candidate cesium getters for FBR fuel pins. Results indicate satisfactory performance.

1641 (HEDL-SA--1835) CONFIDENCE LEVEL IN THE CALCULATIONS OF HCDA CONSEQUENCES USING LARGE CODES. Nguyen, D.H.; Wilburn, N.P. (Hanford Engineering Development Lab., Richland, WA (USA)). 20 Apr 1979. Contract EY-76-C-14-2170. 7p. (CONF-791103--61). Dep. NTIS, PC A02/MF A01.

From American Nuclear Society meeting; San Francisco, CA, USA (12 Nov 1979).

The probabilistic approach to nuclear reactor safety is playing an increasingly significant role. For the liquid-metal fast breeder reactor (LMFBR) in particular, the ultimate application of this approach could be to determine the probability of achieving the goal of a specific line-of-assurance (LOA). Meanwhile a more pressing problem is one of quantifying the uncertainty in a calculated consequence for hypothetical core disruptive accident (HCDA) using large codes. Such uncertainty arises from imperfect modeling of phenomenology and/or from inaccuracy in input data. A method is presented to determine the confidence level in consequences calculated by a large computer code due to the known uncertainties in input invariables. A particular application was made to the initial time of pin failure in a transient overpower HCDA calculated by the code MELT-IIIA in order to demonstrate the method. A probability

distribution function (pdf) for the time of failure was first constructed, then the confidence level for predicting this failure parameter within a desired range was determined.

- 1642 (HEDL-SA--1838-FP) CORA: TRANSIENT ANALYSIS CODE FOR A CLUSTER OF REACTOR CORE ASSEMBLIES. Johnson, H.G. (Hanford Engineering Development Lab., Richland, WA (USA)). 25 Apr 1979. Contract EY-76-C-14-2170. 29p. (CONF-790602--78). Dep. NTIS, PC A03/MF A01.

From ANS annual meeting; Atlanta, GA, USA (3 Jun 1979).

The CORA code is a steady state/transient, core thermal hydraulics code for the FFTF Reactor. A brief overview of the code development and use is presented.

- 1643 (HEDL-SA--1839) THERMAL BOWING OF WIRE-WRAPPED FUEL PINS IN FAST REACTORS. Chan, D.P.; Jackson, R.J. (Hanford Engineering Development Lab., Richland, WA (USA)). 1979. Contract EY-76-C-14-2170. 24p. (CONF-791103--68). Dep. NTIS, PC A02/MF A01.

From American Nuclear Society meeting; San Francisco, CA, USA (12 Nov 1979).

The mechanism of thermal bowing of fuel pins is discussed. Finite element models for thermal bowing analysis using MARC-CDC and BEAMCREEP programs are presented. Analytical results are in reasonably close agreement with each other. Thermal bowings of edge fuel pins in various FTR core positions are predicted. Conservative predictions indicate that the reference edge pins with 30.48 cm (12 in.) axial pitch may touch the duct wall in as little as 1000 h or irradiation. The results further indicate that the axial stress induced in the cladding by thermal bowing is 4 times as much as that due to fission gas release. However, the combined axial stress level is still below that to cause stress rupture in the design life of the pin.

- 1644 (HEDL-SA--1846) FFTF MATERIALS OF CONSTRUCTION AND SURVEILLANCE PLANS. Shober, F.R. (Hanford Engineering Development Lab., Richland, WA (USA)). 4 May 1979. Contract EY-76-C-14-2170. 35p. Dep. NTIS, PC A03/MF A01.

Portions of document are illegible.

FFTF REACTOR; REACTOR MATERIALS; REACTOR COMPONENTS; CONSTRUCTION; SPECIFICATIONS; INSPECTION; MATERIALS TESTING

- 1645 (HEDL-SA--1850) DESIGN AND CONSTRUCTION OF THE FUELS AND MATERIALS EXAMINATION FACILITY. Burgess, C.A. (Hanford Engineering Development Lab., Richland, WA (USA)). 15 Nov 1979. Contract EY-76-C-14-2170. 32p. (CONF-791103--59). Dep. NTIS, PC A03/MF A01.

From American Nuclear Society meeting; San Francisco, CA, USA (12 Nov 1979).

Final design is more than 85 percent complete on the Fuels and Materials Examination Facility, the facility for post-irradiation examination of the fuels and materials tests irradiated in the FFTF and for fuel process development, experimental test pin fabrication and supporting storage, assay, and analytical chemistry functions. The overall facility is generally described with specific information given on some of the design features. Construction has been initiated and more than 10% of the construction contracts have been awarded on a fixed price basis.

- 1646 (HEDL-SA--1854FP) INTEGRATED QUALITY STATUS AND INVENTORY TRACKING SYSTEM FOR FFTF DRIVER FUEL PINS. Gottschalk, G.P. (Hanford Engineering Development Lab., Richland, WA (USA)). Nov 1979. Contract EY-76-C-14-2170. 14p. (CONF-791117--18). Dep. NTIS, PC A02/MF A01.

From ANS topical conference; Kiawah Island, SC, USA (26 Nov 1979).

An integrated system for quality status and inventory tracking of Fast Flux Test Facility (FFTF) driver fuel pins has been developed. Automated fuel pin identification systems, a distributed computer network, and a data base are used to implement the tracking system.

- 1647 (HEDL-SA--1860) CREEP RELAXATION OF FUEL PIN BENDING AND OVALING STRESSES. Chan, D.P.; Jackson, R.J. (Hanford Engineering Development Lab., Richland, WA (USA)). Jun 1979. Contract EY-76-C-14-2170. 27p. (CONF-791205--16). Dep. NTIS, PC A03/MF A01.

From ASME winter annual meeting; New York, NY, USA (2 Dec 1979).

Analytical methods for calculating fuel pin cladding bending and ovaling stresses due to pin bundle-duct mechanical interaction taking into account nonlinear creep are presented. Calculated results are in close agreement with finite element results by MARC-CDC program. The methods are used to investigate the effect of creep on the FTR fuel cladding bending and ovaling stresses. It is concluded that the cladding of 316 SS 20% CW and reference design has high creep rates in the FTR core region to keep the bending and ovaling stresses to low levels.

- 1648 (HEDL-SA--1868) EFFECTS OF TRANSIENT POWER HISTORIES ON THE INTRASUBASSEMBLY FAILURE INCOHERENCIES. Yung, S.C. (Hanford Engineering Development Lab., Richland, WA (USA)). Sep 1979. Contract EY-76-C-14-2170. 51p. (CONF-791103--64). Dep. NTIS, PC A04/MF A01.

From American Nuclear Society meeting; San Francisco, CA, USA (12 Nov 1979).

The effects of different transient power histories on the intrasubassembly failure incoherencies in an unprotected Transient Overpower (TOP) Hypothetical Core Disruptive Accident (HCDA) are analyzed. The computational tool and other relevant points of present analysis are described. The computational results from the analysis are also discussed. The summary of the present study is stated.

- 1649 (HEDL-SA--1881-FP) DEVELOPMENT OF AN INSTRUMENTED MATERIALS IRRADIATION TEST FOR FFTF. Grover, J.M.; Kaulitz, D.C.; Krogness, J.C. (Hanford Engineering Development Lab., Richland, WA (USA)). 1979. Contract EY-76-C-14-2170. 4p. (CONF-791103--63). Dep. NTIS, PC A02/MF A01.

From American Nuclear Society meeting; San Francisco, CA, USA (12 Nov 1979).

The development of an advanced test assembly for use in the Fast Flux Test Facility is described. The facility will be used to characterize alloys for in reactor use. (FS)

- 1650 (HEDL-SA--1895-FP) FABRICATION OF C.5-INCH DIAMETER FBR MIXED OXIDE FUEL PELLETS. Rasmussen, D.E.; Benecke, M.W.; McCord, R.B. (Hanford Engineering Development Lab., Richland, WA (USA)). 12 Sep 1979. Contract EY-76-C-14-2170. 43p. (CONF-791045--4). Dep. NTIS, PC A03/MF A01.

From American Ceramic Society conference; New Orleans, LA, USA (14 Oct 1979).

Large diameter (0.535 inch) mixed oxide fuel pellets for Fast Breeder Reactor application were successfully fabricated by the cold-press-and-sinter technique. Enriched UO_2 , $PuO_2=UO_2$, and PuO_2-ThO_2 compositions were fabricated into nominally 90% theoretical density pellets for the UO_2 and $PuO_2=UO_2$ compositions, and 88% and 93% T.D. for the PuO_2-ThO_2 compositions. Some processing adjustments were required to achieve satisfactory pellet quality and density. Furnace heating rate was reduced from 200 to 50°C/h for the organic binder burnout cycle for the large, 0.535-inch diameter pellets to eliminate pellet cracking during sintering. Additional preslugging steps and die wall lubrication during pressing were used to eliminate pressing cracks in the PuO_2-ThO_2 pellets.

- 1651 (HEDL-SA--1903-FP) HIGH VOLTAGE INSTRUMENT CABLES FOR 650°C IN-VESEL BREEDER REACTOR SERVICE. Cannon, C.P. (Hanford Engineering Development Lab., Richland, WA (USA)). Jul 1979. Contract EY-76-C-14-2170. 16p. (CONF-791037--5). Dep. NTIS, PC A02/MF A01.

From IEEE nuclear science symposium; San Francisco, CA, USA (17 Oct 1979).

MgO insulated nuclear instrument cables have been developed for use in the Fast Flux Test Facility (FFTF) and breeder reactor in-vessel environments. Prototype cables have been successfully fabricated and tested: voltage Breakdown Pulse Noise (BPN) thresholds in excess of 800 Vdc and cable resistivities in excess of $10^8 \Omega \cdot ft$ were achieved at temperatures to 650°C. Factors demonstrated to strongly affect breakdown phenomena and insulation resistance in bulk cable were insulation and backfill gas purity (especially as affected by fabrication processing), compaction density, and high temperature annealing. Substitution of copper electrical conductors did not adversely affect cable performance if fabrication parameters were appropriately adjusted. Preliminary gamma irradiation tests on bulk MgO cable indicate that the gamma flux decreases insulation resistance by an order of magnitude to $5 \times 10^9 \Omega \cdot ft$ at 450°C.

- 1652 (HEDL-SA--1919-FP) FFTF PRIMARY SYSTEM TRANSITION TO NATURAL CIRCULATION FROM LOW REACTOR POWER. Bouchey, G.D.; Additon, S.L.; Nutt, W.T. (Department of Energy, Richland, WA (USA). Richland Operations Office; Hanford Engineering Development Lab., Richland, WA (USA)). Jan 1980. Contract EY-76-C-14-2170. 18p. (CONF-800226--4). Dep. NTIS, PC A02/MF A01.

From Specialists meeting on decay heat removal and natural circulation in FBR's; Upton, NY, USA (28 Feb 1980).

Plans for reactor and primary loop natural circulation testing in the Fast Flux Test Facility (FFTF) are summarized. Detailed pretest planning with an emphasis on understanding the implications of process noise and model uncertainties for model verification and test acceptance are discussed for a transition to natural circulation in the reactor core and primary heat transport loops from initial conditions of 5% of rated reactor power and 75% of full flow.

- 1653 (HEDL-SA--1920S) COMPUTER SIMULATION OF NATURAL CIRCULATION IN FFTF SECONDARY LOOPS. Beaver, T.R.; Turner, D.M.; Additon, S.L. (Hanford Engineering Development Lab., Richland, WA (USA)). Jul 1979. Contract EY-76-C-14-2170. 10p. (CONF-800226--2). Dep.

NTIS, PC A02/MF A01.

From Specialists meeting on decay heat removal and natural circulation in FBR's; Upton, NY, USA (28 Feb 1980).

A thermal/hydraulic model of the FFTF secondary heat transport loop has been calibrated against transient natural circulation test data collected March to May 1979. The tests verified that the transition to natural convective flow could be effected from near isothermal conditions without excessive cooling at the air dump heat exchangers. Key empirical parameters of pressure drop and heat loss were found to be at 88% and 81% of pretest estimates, respectively. Pretest piping thermal transport and flow calculational models required no further revision to produce good agreement with test data.

- 1654 (HEDL-SA--1921-FP) POST TEST EVALUATION OF NATURAL CIRCULATION IN FFTF SECONDARY LOOPS. Beaver, T.R.; Turner, D.M.; Additon, S.L. (Hanford Engineering Development Lab., Richland, WA (USA)). Feb 1980. Contract EY-76-C-14-2170. 19p. (CONF-800226--5). Dep. NTIS, PC A02/MF A01.

From Specialists meeting on decay heat removal and natural circulation in FBR's; Upton, NY, USA (28 Feb 1980).

Two transient tests in one of the FFTF secondary heat transport loops were performed (March to May 1979) in order to verify that the transition to natural convective flow could be effected from near isothermal refueling conditions without excessive cooling at the air dump heat exchangers. Following the tests, the best estimate computer model was calibrated against the data, yielding in the process insights about the loop parameters and the probable suitability of the model structure. Key empirical parameters of pressure drop and heat loss were found to be at 62% and 81% of the pretest safety evaluation model parameter values, respectively. Pretest piping thermal transport and flow calculational models required no further revision to produce good agreement with the test data. Additional detail in the air dump heat exchanger heat loss model, accounting for long structural thermal time constants, was found to be necessary to obtain model agreement with transient outlet temperature data. The pretest model had conservatively employed steady state heat losses for transient calculations.

- 1655 (HEDL-SA--1931) DISSOLUTION OF FFTF VENDOR FUEL. Lerch, R.E. (Hanford Engineering Development Lab., Richland, WA (USA)). Aug 1979. Contract EY-76-C-14-2170. 26p. (CONF-791086--2). Dep. NTIS, PC A03/MF A01.

From US/United Kingdom information exchange on dissolution of nuclear fuel; Windscale, UK (16 Oct 1979).

Dissolution experiments were performed on FFTF vendor fuel (both mechanically mixed and coprecipitated) during 1974, 1975, and 1976. A marked improvement was noted in the completeness of fuel dissolution from 1974 to 1976. The reason for this is unknown but may have been attributable to slight changes in fuel fabrication conditions. In general, the bulk of the fuel pellets tested dissolved to greater than 99.9% in nitric acid alone.

- 1656 (HEDL-SA--1932) EQUIPMENT FOR INSPECTION OF AUSTENITIC STAINLESS STEEL PIPE WELDS. Boehmer, W.D.; Horn, J.E. (Hanford Engineering Development Lab., Richland, WA (USA)). 20 Aug 1979. Contract EY-76-C-14-2170. 4p. (CONF-791008--4). Dep. NTIS, PC

A02/MF A01.

From ASNT fall conference; St Louis, MO, USA (15 Oct 1979).

A computer controlled ultrasonic scanning system and a data acquisition and analysis system have been developed to perform the in-service inspection of welds in stainless steel sodium piping in the Fast Flux Test Facility. The scanning equipment consists of a six axis motion mechanism and control system which allows full articulation of an ultrasonic transducer as it follows the circumferential pipe welds. The data acquisition and analysis system consists of high speed ultrasonic waveform digitizing equipment, dedicated processors to perform on-line analysis, and data storage and display equipment.

- 1657 (HEDL-SA--1935) DISSOLUTION OF MIXED OXIDE FUEL AS A FUNCTION OF FABRICATION VARIABLES. Lerch, R.E. (Hanford Engineering Development Lab., Richland, WA (USA)). Aug 1979. Contract EY-76-C-14-2170. 54p. (CONF-791086--3). Dep. NTIS, PC A04/MF A01.

From US/United Kingdom information exchange on dissolution of nuclear fuel; Windscale, UK (16 Oct 1979).

Dissolution properties of mechanically blended mixed oxide fuel were very dependent on the six fuel fabrication variables studied. Fuel sintering temperature, source of PuO_2 and PuO_2 content of the fuel had major effects: (1) as the sintering temperature was increased from 1400 to 1700°C, pellet dissolution was more complete; (2) pellets made from burned metal derived PuO_2 were more completely dissolved than pellets made from calcined nitrate derived PuO_2 which in turn were more completely dissolved than pellets made from calcined nitrate derived PuO_2 ; (3) as the PuO_2 content decreased from 25 to 15 wt % PuO_2 , pellet dissolution was more complete. Preferential dissolution of uranium occurred in all the mechanically blended mixed oxide. Unirradiated mixed oxide fuel pellets made by the Sol Gel process were generally quite soluble in nitric acid. Unirradiated mixed oxide fuel pellets made by the coprecipitation process dissolved completely and rapidly in nitric acid. Fuel made by the coprecipitation process was more completely dissolved than fuel made by the Sol Gel process which, in turn, was more completely dissolved than fuel made by mechanically blending UO_2 and PuO_2 as shown below. Addition of uncomplexed fluoride to nitric acid during fuel dissolution generally rendered all fuel samples completely dissolvable. In boiling 12M nitric acid, 95 to 99% of the plutonium which was going to dissolve did so in the first hour. Irradiated mechanically blended mixed oxide fuel with known fuel fabrication conditions was also subjected to fuel dissolution tests. While irradiation was shown to increase completeness of plutonium dissolution, poor dissolubility due to adverse fabrication conditions (e.g., low sintering temperature) remained after irradiation.

- 1658 (HEDL-SA--1945) NATURAL CIRCULATION IN FFTF. Addison, S.L.; Bouchey, G.D. (Hanford Engineering Development Lab., Richland, WA (USA)). Oct 1979. Contract EY-76-C-14-2170. 40p. (CONF-791074--1). Dep. NTIS, PC A03/MF A01.

From US/USSR exchange meeting on fast reactor safety; Moscow, USSR (8 Oct 1979).

This paper provides a review of the evaluation of natural circulation in the Fast Flux Test Facility (FFTF), a loop type reactor plant. The emphasis is on the role of natural circulation in decay heat removal; however, free convection during either operation at

power or normal shutdown does influence some aspects of the design and these are mentioned. In treating decay heat removal the topics discussed include steady state loop performance and transient dynamics for conditions immediately after scram and for the longer term which involves different considerations. The review summarizes complex dynamics, specific to the FFTF design evaluation, which particularly illustrate large available margins for decay heat removal (possibly involving coolant boiling). Also addressed are modelling considerations and the status of experimental programs. To date, design adequacy has been assessed largely by a combination of component tests and system analyses, with design margins increased to accommodate uncertainties. Presently planned tests, when completed, will provide an empirical base for characterizing system dynamic behavior in the range most relevant to current LMFBR designs and will demonstrate FFTF decay heat removal capability directly.

- 1659 (HEDL-SA--1948) RADIOACTIVE CORROSION PRODUCT RELEASE POTENTIAL IN SODIUM-COOLED REACTORS. Colburn, R.P.; Taylor, G.R. (Hanford Engineering Development Lab., Richland, WA (USA); Westinghouse Electric Corp., Pittsburgh, PA (USA). Advanced Reactors Div.). Sep 1979. Contract EY-76-C-14-2170. 23p. Dep. NTIS, PC A02/MF A01.

A mathematical analysis of the rate of release and deposition of radioactive corrosion products from the core of liquid sodium cooled reactors is outlined and numerical results presented as a function of reactor design parameters for a number of reactors. It is shown that the activity release potential of advanced sodium-cooled reactors (FFTF and CRBRP) is about two orders of magnitude larger than that of older reactors such as EBR-II, and RAPSODIE. Radiation levels up to 6 R/hr are predicted for FFTF and CRBRP primary system components after 20 years of operation. The model can be used to predict the sensitivity of activated corrosion product release to changes in operating parameters for various existing and planned reactors.

- 1660 (HEDL-SA--1950=FP) CARBON IN SODIUM: A STATUS REVIEW OF THE USA R AND D WORK. McCown, J.J.; Bagnall, C. (Hanford Engineering Development Lab., Richland, WA (USA)). 1979. Contract EY-76-C-14-2170. 42p. (CONF-791149--1). Dep. NTIS, PC A03/MF A01.

From IWGFR specialists meeting on carbon in sodium; Harwell, UK (26 Nov 1979).

A review is presented concerning R and D work on carbon in sodium with reference to LMFBR primary coolant circuits. The chemistry of carbon in sodium, analysis and monitoring of carbon in sodium, carbon meters, and problems of carbon in sodium are described. 31 references. (FS)

- 1661 (HEDL-SA--1958) FFTF SAFETY REVIEW. Simpson, D.E. (Hanford Engineering Development Lab., Richland, WA (USA)). Oct 1979. Contract EY-76-C-14-2170. 6p. Dep. NTIS, PC A02/MF A01.

Key features of the FFTF design related to safety are described. The independent safety review process is also discussed.

- 1662 (HEDL-SA--1959) FFTF FUEL STORY. Claudson, T.T.; Bardsley, R.E. (Hanford Engineering Development Lab., Richland, WA (USA)). 1979. Contract EY-76-C-14-2170.

9p. Dep. NTIS, PC A02/MF A01.

The development and irradiation testing of FFTF fuel is reviewed.

- 1663 (HEDL-SA--1973-FP) FFTF PURIFICATION SYSTEM PERFORMANCE DURING FILL AND INITIAL TEMPERATURE ASCENSION. Bloom, G.R. (Hanford Engineering Development Lab., Richland, WA (USA)). Oct 1979. Contract EY-76-C-14-2170. 24p. Dep. NTIS, PC A02/MF A01.

Design parameters of the sodium purification systems on the Fast Flux Test Facility are given. Sodium and argon cover gas impurity changes observed during initial sodium fill and initial reactor heatup to 800°F are discussed. Sodium Purification System operation during these critical sodium impurity control periods is described.

- 1664 (HEDL-SA--1983, pp 20-40) EBR-II AND FFTF IRRADIATION EXPERIMENTS. Gilbert, E.R.; Paxton, M.M. 1979.

From Seminar on fast reactor cladding materials; Richland, WA, USA (12 Nov 1979).

Structural materials experiments were conducted in EBR-II using several different types of capsules. Subcapsule containing specimens were immersed in static sodium. The subcapsules are insulated from the outer capsule by a gas annulus which determines the irradiation temperature. A second type of noninstrumented capsule utilizes heat pipes for high temperature tests (650 to 750°C) where temperature fluctuations must be minimized. These heat pipes provide compensatory control to minimize effects of power fluctuation on temperature. In addition, instrumented vehicles using thermocouples and temperature controllers have been used for high temperature creep tests requiring accurate temperature measurement. These experimental methods were used to investigate the effects of temperature, temperature change, stress, and fluence dependence of in-reactor creep. Special tests have also yielded data on the effects of stress on swelling.

- 1665 (HEDL-SA--1983, pp 62-76) MICROSTRUCTURAL OBSERVATIONS OF AISI 316 STAINLESS STEEL FROM HIGH BURNUP FUEL PINS. Brager, H.R.; Berting, F.M.; Garner, F.A. 1979.

From Seminar on fast reactor cladding materials; Richland, WA, USA (12 Nov 1979).

Microstructural data were obtained from three fuel pins clad with 20% cold worked drawn tubing made from 316 stainless steel. The cladding was irradiated at a temperature in the range 370 to 600°C to a peak neutron fluence of 10×10^{22} n/cm² ($E > 0.1$ MeV) in the EBR-II. Additionally, cladding from a fuel pin utilizing a steel identical to that used to clad FFTF first core fuel pins was examined after irradiation at comparable temperatures to a peak neutron fluence of 6×10^{22} n/cm² ($E > 0.1$ MeV). The microstructure from the mid-wall regions of the cladding specimens has been compared with that from specimens made from the same tubing but irradiated in non-fueled experiments. The comparison shows that the microstructural development is not significantly influenced by the presence of the fuel but rather is dependent on irradiation temperature and neutron fluence. The microstructure of the fuel pin cladding shows that void nucleation and growth and that Frank loop nucleation are temperature dependent. The microstructures support the concept of an interaction model for unfaulting of Frank loops, exhibit a temperature-independent saturation density of dislocation networks, and

illustrate that void nucleation occurs heterogeneously. It would appear that nucleation of voids and swelling rate increases are associated with the emergence of nickel-rich precipitate phases including γ' (Ni₃Si). Type 316 stainless steel under irradiation tends to evolve towards a final saturation microstructure in which dislocation and Frank loop concentrations are independent of the starting microstructure.

- 1666 (HEDL-SA--1983, pp 169-186) CREEP BEHAVIOR OF OX16H15M3B STEEL AND COMPARISON WITH AISI 316. Gilbert, E.R.; Chin, B.A. (Hanford Engineering Development Lab., Richland, WA). 1979.

From Seminar on fast reactor cladding materials; Richland, WA, USA (12 Nov 1979).

Pressurized tube creep specimens were manufactured from OX16H15M3B tubing supplied by the USSR. These specimens are currently being irradiated in Experimental Breeder Reactor II (EBR-II). Four specimens (0, 33, 66 and 132 MPa) are being irradiated at 425°C in Capsule B-217b of the AA-IIa experiment while five specimens (0, 7.5, 18.9, 32 and 64 MPa) are being irradiated at 650°C in Capsule B-279a of the AA-IIc experiment. The 650°C specimens were discharged from the reactor after EBR-II Run 99 at a fast fluence ($E > 0.1$ MeV) of 4.2×10^{22} n/cm². These specimens were measured and re-encapsulated for reirradiation beginning with Run 10 (May 1979). The 425°C specimens were discharged after EBR-II Run 100 at a fast fluence ($E > 0.1$ MeV) of 2.8×10^{22} n/cm². These specimens were measured and re-encapsulated for reirradiation which began in Run 102 (July 1979). This paper reviews the results of the measurements and compares them with creep data generated in the BOR-60 fast reactor on hexagonal channels and US design equations developed from results on AISI 316 pressurized tube specimens.

- 1667 (HEDL-SA--2014) ULTRASONIC OFF-NORMAL IMAGING TECHNIQUES FOR UNDER SODIUM VIEWING. Michaels, T.E.; Horn, J.E. (Hanford Engineering Development Lab., Richland, WA (USA)). 6 Dec 1979. Contract EY-76-C-14-2170. 18p. (CONF-800231--1). Dep. NTIS, PC A02/MF A01.

From 3. international conference on nondestructive evaluation in the nuclear industry; Salt Lake City, UT, USA (11 Feb 1980).

Advanced imaging methods have been evaluated for the purpose of constructing images of objects from ultrasonic data. Feasibility of imaging surfaces which are off-normal to the sound beam has been established. Laboratory results are presented which show a complete image of a typical core component. Using the previous system developed for under sodium viewing (USV), only normal surfaces of this object could be imaged. Using advanced methods, surfaces up to 60 degrees off-normal have been imaged. Details of equipment and procedures used for this image construction are described. Additional work on high temperature transducers, electronics, and signal analysis is required in order to adapt the off-normal viewing process described here to an eventual USV application.

- 1668 (HEDL-SA--2022) DATA SYSTEMS IN FFTF AND EBR-II. Warrick, R.P.; Ritter, W.M. (Hanford Engineering Development Lab., Richland, WA (USA)). Feb 1980. Contract EY-76-C-14-2170. 25p. (CONF-800366--2). NTIS, PC A02/MF A01.

From Specialists' meeting on LMFBR

instrumentation and control; Tokyo, Japan (31 Mar 1980).

This paper describes the Data System used to monitor operation and collect experimental data in FFTF. This data system has evolved since initial inception from a relatively simple, single computer system monitoring a relatively few (approx. 1000) instrument channels important for operation to one which has increased capability to support the long-range testing needs in FFTF. The system, while still relatively simple, now contains multiple computers which normally perform independent functions. The computers, however, provide backup processing for certain simple tasks. Operator interfacing is provided through CRT's. The output capabilities of the system are described. A description of the Data System in EBR-II is also included.

- 1669 (HEDL-SA--2023) NUCLEAR INSTRUMENTATION SYSTEM DESIGN IN FFTF AND CRBRP. Warrick, R.P. (Hanford Engineering Development Lab., Richland, WA (USA)). Feb 1980. Contract EY-76-C-14-2170. 30p. (CONF-800366--1). NTIS, PC A03/MF A01.

From Specialists' meeting on LMFBR instrumentation and control; Tokyo, Japan (31 Mar 1980).

The Nuclear Instrumentation System installed in the Fast Flux Test Facility (FFTF) is described. The Nuclear Instrumentation System includes equipment for monitoring neutron flux levels from shutdown to full power. Detector location and mounting provisions are described. The design basis for equipment design is provided. Detailed discussion of startup testing in FFTF follows a brief discussion of pre-delivery development work and testing. Finally, a description of the Nuclear Instrumentation System planned for the Clinch River Breeder Reactor Plant is provided.

- 1670 (HEDL-SA--2066-FP) THERMOELASTIC BUCKLING OF PLATES IN A CYLINDRICAL GEOMETRY AGAINST AN ELASTIC BACK SUPPORT. Simmons, L.D.; Wierman, R.W. (Hanford Engineering Development Lab., Richland, WA (USA)). 1980. Contract EY-76-C-14-2170. 16p. (CONF-800360--1). NTIS, PC A02/MF A01.

From International conference on thermal stresses in materials and structures in severe thermal environments; Blacksburg, VA, USA (19 Mar 1980).

A plate which is fixed at its edges to a strong edge support structure will develop large compressive stresses when heated from ambient temperature more rapidly than the support structure. Determining the response of the plate to this situation requires stability analysis to ascertain whether the plate might buckle, or whether the constrained thermal expansion will lead to compressive stresses exceeding the yield point because it did not buckle. A special case is considered here, both analytically and experimentally, in which the plate is curved slightly into a cylindrical shape and the convex face of the plate is against a supporting surface. This case is more complex because the buckling mode will be a harmonic rather than the fundamental mode which is usually encountered.

- 1671 (HEDL-TC--517) SUMMARY STRESS RESULTS FOR THE HEAT TRANSPORT SYSTEM PIPING AND COMPONENTS. Bartholf, L.W.; Edwards, P.A.; Ketchum, H.B. (Westinghouse Electric Corp., Madison, PA (USA). Advanced Reactors Div.). May 1976. Contract EY-76-C-14-2170. 375p. Dep. NTIS, PC A16/MF A01.

Portions of document are illegible.

FFTF REACTOR; REACTOR COOLING SYSTEMS; PIPES; HEAT EXCHANGERS; STRESS ANALYSIS; PUMPS; VALVES

- 1672 (HEDL-TC--572 (Rev.1)) ANALYSIS OF FFTF REACTOR CAVITY LINERS UNDER EX-VESSEL PAHR CONDITIONS. Polentz, L.M. (Hanford Engineering Development Lab., Richland, WA (USA)). Jun 1976. Contract EY-76-C-14-2170. 175p. AT.

Portions of document are illegible.

A detailed analysis is presented of the effects of a hot-sodium spill caused by a hypothetical reactor-vessel melt-through on the steel liner plates in the FFTF reactor cavity. The effects of steam pressurization, thermal shock, and thermal stress are analyzed. In order to evaluate the effects of the steam pressure, a steam venting concept is included in the analysis. Complete flow and stress analyses are given including the effects of biaxial strain. It is concluded that the steel liner panels would yield plastically a small amount, but that there would be no danger of gross failure provided that the steam could escape from calculated margin of safety is greater than 1.6.

- 1673 (HEDL-TC--807) CRITICALITY ANALYSIS FOR FFTF FUEL ASSEMBLIES AND FUEL PINS. Morford, R.J.; Marr, D.R. (Hanford Engineering Development Lab., Richland, WA (USA)). Mar 1977. Contract EY-76-C-14-2170. 37p. Dep. NTIS, PC A03/MFA01.

A series of calculations is presented assessing the criticality aspects of specific configurations of FTR fuel. Results for regularly spaced arrangements of fuel pins or fuel assemblies as a function of spacing in each of four media (water, Mobiltherm, sodium, or air) are given. This information is intended to be of a broad general nature conservatively applicable both to normal fuel configurations likely to be encountered in the operation of the FFTF and to accident condition configurations postulated for criticality review purposes.

- 1674 (HEDL-TC--902-1) HEDL CONTRIBUTION TO SRL FUEL RECYCLE PROGRAM. QUARTERLY REPORT, JANUARY--MARCH 1977. Fletcher, J.F. (Hanford Engineering Development Lab., Richland, WA (USA)). Aug 1977. Contract EY-76-C-14-2170. 44p. Dep. NTIS, PC A03/MF A01.

Research on LWR fuel cycle is being done in the following categories: economic studies (sensitivity analysis of LMFBR fuel fabrication costs), spent fuel receipt and storage (failure of PWR and BWR fuel assemblies), fuel materials preparation or finishing processes, reduction of TRU waste generation, and environmental impacts. 12 tables. (DLC)

- 1675 (HEDL-TC--902-2) HEDL CONTRIBUTION TO SRL FUEL RECYCLE PROGRAM. QUARTERLY REPORT FOR APRIL, MAY, AND JUNE 1977. Fletcher, J.F. (comp.). (Hanford Engineering Development Lab., Richland, WA (USA)). Jul 1977. Contract EY-76-C-14-2170. 42p. Dep. NTIS, PC A03/MF A01.

Work is being done in five LWR categories: economic studies (capital cost of 1 MT/day LMFBR fuel fabrication facility); spent fuel receipt and storage (fuel failure, radioactivity releases); fuel materials preparation (review of safeguards and standards); reduce generation of TRU waste (treatment of HEPA filters); and environmental effects (hydrologic data for WTRAN code and modifications to DOSE code). (DLC)

- 1676 (HEDL-TI--1022) NATURAL CIRCULATION HEAT TRANSFER TESTING WITH A SIMULATED FULL-SCALE LMFB 217-PIN ELECTRICALLY HEATED FUEL ASSEMBLY: TEST DATA. Millburg, M.L.; Hassberger, J.A.; Boasso, C.J. (Hanford Engineering Development Lab., Richland, WA (USA)). Aug 1978. Contract EY-76-C-14-2170. 240p. AT.
- The heat transfer characteristics of a Clinch River Breeder Reactor Plant (CRBRP) nearly prototypic fuel assembly in a liquid sodium environment were investigated under low flow conditions indicative of natural circulation. The facilities, test plan and tests themselves were described in detail and discussed in an earlier report, "Natural Circulation Heat Transfer Testing with a Simulated Full-Scale LMFB 217-Pin Electrically Heated Fuel Assembly", HEDL-TME 77-3, June 1977. The report presented provides the data obtained during the test activities. These data were developed to supplement analytical predictions of assembly heat transfer and flow redistribution within this range of reactor operation.
- 1677 (HEDL-TI--45-LMB-009) EXPERIMENTAL RESULTS OF SODIUM-WATER REACTION TEST NO. 3 IN LLTR. Miller, A.E.; Neely, H.H. (Liquid Metal Engineering Center, Canoga Park, CA (USA)). 1 Aug 1977. Contract EY-76-C-03-0700. 569p. TIC \$16.25.
- Computer-generated plots of the transient data obtained during the third sodium-water reaction test (SWR-3) and observations made after the test are presented. Similar to the first two tests of Series I, a double-ended guillotine rupture was produced in a water tube of the Atomics International Modular Steam Generator (AI-MSG). Prior to tube rupture, the temperature distribution in the vertical AI-MSG was linear from 600°F at the bottom to 800°F at the top. The rupture was located in the horizontal section 1.75 in. from the upper tubesheet. Peak pressures generated in this test were somewhat lower than the 400 psi and 500 psi measured in the prior tests; while peak temperatures, about 1600°F, were higher than were measured previously. The interest examinations revealed no structural damage, material wastage, stress corrosion cracking, or dimensional changes. Additional reaction products have been accumulated in the bottom of the AI-MSG up to Spacer 3, so that the flow path in the AI-MSG to both the lower relief line and the drain line is restricted. The relief lines are relatively clear.
- 1678 (HEDL-TI--45-LME-006) EXPERIMENTAL RESULTS OF SODIUM-WATER REACTION TEST NO. 1 IN LLTR. Leppard, J.A.; Neely, H.H. (Liquid Metal Engineering Center, Canoga Park, CA (USA)). 15 Dec 1976. Contract EY-76-C-03-0700. 540p. AT.
- Sodium-Water Reaction Test No. 1 (SWR-1), the first test conducted in the Large-Leak Test Rig (LLTR), is described. The test consisted of intentionally producing a double-ended guillotine rupture of a tube in the Atomics International Modular Steam Generator, which had been modified for large-leak testing subsequent to performance tests in the Sodium Components Test installation. Results of post-test inspections of the test steam generator are discussed. Graphical displays of test data, which are to be used to validate or modify analytical techniques for predicting large-leak effects, are presented.
- 1679 (HEDL-TI--45-LME-007) EXPERIMENTAL RESULTS OF SODIUM-WATER REACTION TEST NO. 2 IN LLTR. Adler, K.L.; Neely, H.H. (Liquid Metal Engineering Center, Canoga Park, CA (USA)). 10 May 1977. Contract EY-76-C-03-0700. 538p. TIC \$15.50.
- The second sodium-water reaction test, SWR-2, in Series I of the Large Leak Test Rig (LLTR) program is described. Like the first test, SWR-1, this test consisted of intentionally producing a double-ended guillotine rupture of a single tube in the Atomics International-Modular Steam Generator (AI-MSG). The location of the SWR-2 rupture was higher and radially nearer the center-line of the steam generator than the SWR-1 rupture. Pressures and temperatures produced in SWR-2 were similar to those in SWR-1. This report includes results of post-test inspections of the test article and graphical presentations of the test data.
- 1680 (HEDL-TI--75001-9) REVISIONS TO FFTF FSAR. SUPPLEMENT 9, PARTS 1, 2, 3, 4, AND 5. (Hanford Engineering Development Lab., Richland, WA (USA)). 10 Apr 1978. Contract EY-76-C-14-2170. 63p. AT.
- Supplementary information is presented for incorporation into the FFTF Final Safety Analysis Report. (DG)
- 1681 (HEDL-TI--75001-10) FSAR Q₁ RESPONSES. (Hanford Engineering Development Lab., Richland, WA (USA)). Jul 1977. Contract EY-76-C-14-2170. 67p. AT.
- Supplementary information related to the FFTF final Safety Analysis Report is presented. (DG)
- 1682 (HEDL-TI--75001-11) FSAR Q₁ RESPONSES. SUPPLEMENT 11. (Hanford Engineering Development Lab., Richland, WA (USA)). Jul 1977. Contract EY-76-C-14-2170. 82p. AT.
- Additional information is presented on analytical methods and data used in the FFTF Final Safety Analysis Report. (DG)
- 1683 (HEDL-TI--75001-12-1) FSAR Q₁ RESPONSES SUPPLEMENT 12. PART 1. (Hanford Engineering Development Lab., Richland, WA (USA)). 1977. Contract EY-76-C-14-2170. 90p. AT.
- Information is presented concerning the performance characteristics of FFTF fuel pins.
- 1684 (HEDL-TI--75001-12.2) FSAR SUPPLEMENT 12, PART 2, RESPONSES TO NRC Q₁-SET 7; AMENDMENT 13. (Hanford Engineering Development Lab., Richland, WA (USA)). Dec 1977. Contract EY-76-C-14-2170. 147p. AT.
- Requested additional information on the FFTF reactor is presented concerning fuel pin performance limits and cladding failure.
- 1685 (HEDL-TI--75001-13.1) FSAR SUPPLEMENT 13. PART I. RESPONSES TO NRC Q₁ SET 8. (Hanford Engineering Development Lab., Richland, WA (USA)). Dec 1977. Contract EY-76-C-14-2170. 65p. AT.
- Requested additional information on the FFTF reactor is presented concerning reactor characteristics following control rod withdrawal accidents, loss of power, and loss of flow accidents.
- 1686 (HEDL-TI--75001-14) FSAR SUPPLEMENT 14: RESPONSE TO NRC Q₁ SET 9. Schade, A.R.

(Hanford Engineering Development Lab., Richland, WA (USA)). Dec 1977. Contract EY-76-C-14-2170. 19p. AT.

Requested additional information on the FFTF reactor is presented concerning personnel qualifications and staffing requirements.

- 1687 (HEDL-TI--75001-15) RESPONSES TO NRC Q₂ SET 3 QUALITY ASSURANCE. FSAR SUPPLEMENT 15. (Hanford Engineering Development Lab., Richland, WA (USA)). Oct 1977. Contract EY-76-C-14-2170. 40p. AT.

Responses to NRC questions regarding the quality assurance program for the FFTF reactor are presented.

- 1688 (HEDL-TI--75001-16.1) DISTRIBUTION OF REVISIONS TO FFTF FSAR. (Hanford Engineering Development Lab., Richland, WA (USA)). 24 Feb 1978. Contract EY-76-C-14-2170. 23p. AT.

Supplementary information is presented for incorporation into the FFTF Final Safety Analysis Report. The supplement deals with estimation of the maximum atmospheric particulate concentrations and particulate size distribution during periods of extreme atmospheric dust loadings in the site area. (DG)

- 1689 (HEDL-TI--75001-16.2) FSAR SUPPLEMENT 16. PART 2. RESPONSE TO NRC Q₂ SET 2. (Hanford Engineering Development Lab., Richland, WA (USA)). Dec 1977. Contract EY-76-C-14-2170. 28p. AT.

Requested additional information on the FFTF reactor is presented concerning personnel qualifications and testing of diesel generators, instrumentation, and sodium leak detection system.

- 1690 (HEDL-TI--75001-17) FSAR SUPPLEMENT 17: RESPONSES TO NRC Q₁ SET 10. (Hanford Engineering Development Lab., Richland, WA (USA)). Nov 1977. Contract EY-76-C-14-2170. 84p. AT.

Requested additional information on the FFTF reactor is presented concerning the effects of thermal stresses on the steel vessel liner.

- 1691 (HEDL-TI--75001-18) FSAR SUPPLEMENT 18: RESPONSES TO NRC Q₁ SET 6. Schade, A.R. (Hanford Engineering Development Lab., Richland, WA (USA)). Nov 1977. Contract EY-76-C-14-2170. 137p. AT.

Requested additional information on the FFTF reactor is presented concerning electrical equipment, instrumentation, and reactor protection systems.

- 1692 (HEDL-TI--75001-19) FSAR SUPPLEMENT 19: RESPONSE TO NRC Q₂ SET 3. Schade, A.R. (Hanford Engineering Development Lab., Richland, WA (USA)). Dec 1977. Contract EY-76-C-14-2170. 72p. AT.

Requested additional information on the FFTF reactor is presented concerning stress analysis of piping systems and core restraint system.

- 1693 (HEDL-TI--75001-20) FSAR SUPPLEMENT 20, RESPONSE TO NRC Q₂ SET 4. Schade, A.R. (Hanford Engineering Development Lab., Richland, WA (USA)). Dec 1977. Contract EY-76-C-14-2170. 70p. AT.

Additional information concerning the FFTF Final Safety Analysis Report is presented in response to NRC questions. The information covers accidental radioactivity release and

exposure data.

- 1694 (HEDL-TI--75001-21) FSAR SUPPLEMENT 21: RESPONSE TO NRC Q₂ SET 5. (Hanford Engineering Development Lab., Richland, WA (USA)). Dec 1977. Contract EY-76-C-14-2170. 47p. AT.

Requested additional information on the FFTF reactor is presented concerning seismic effects on structures and stress analysis of buildings and structural materials.

- 1695 (HEDL-TI--75001-22) FSAR SUPPLEMENT 22: RESPONSES TO NRC Q₂ SET 6. Schade, A.R. (Hanford Engineering Development Lab., Richland, WA (USA)). Dec 1977. Contract EY-76-C-14-2170. 27p. AT.

Requested additional information on the FFTF reactor is presented concerning containment leak testing and specifications for containment system valves.

- 1696 (HEDL-TI--75001-23) FSAR SUPPLEMENT 23: RESPONSES TO NRC Q₂ SET 7. Schade, A.R. (Hanford Engineering Development Lab., Richland, WA (USA)). Dec 1977. Contract EY-76-C-14-2170. 66p. AT.

Requested additional information on the FFTF reactor is presented concerning reactor materials monitoring; inspection of components and welded joints; and sodium leak detectors.

- 1697 (HEDL-TI--75001-24) RESPONSE TO NRC Q₂ SET 8. FSAR SUPPLEMENT 24. (Hanford Engineering Development Lab., Richland, WA (USA)). Dec 1977. Contract EY-76-C-14-2170. 12p. AT.

Responses to NRC questions concerning the SPRAY Code described in the FFTF FSAR are presented.

- 1698 (HEDL-TI--75001-25) DISTRIBUTION OF REVISIONS TO FFTF FSAR. Schade, A.R. (Hanford Engineering Development Lab., Richland, WA (USA)). 16 Dec 1977. Contract EY-76-C-14-2170. 30p. AT.

Supplementary information related to FFTF primary and secondary isolation valve control power sources is presented for incorporation into the FFTF Final Safety Analysis Report. (DG)

- 1699 (HEDL-TI--75001-26) FSAR SUPPLEMENT 26: RESPONSE TO NRC Q₂ SET 11. (Hanford Engineering Development Lab., Richland, WA (USA)). 9 Mar 1978. Contract EY-76-C-14-2170. 54p. AT.

Supplementary information is provided for incorporation in the FFTF Final Safety Analysis Report. (DG)

- 1700 (HEDL-TI--75001-27) FSAR SUPPLEMENT 27: RESPONSE TO NRC Q₂ SET 12. (Hanford Engineering Development Lab., Richland, WA (USA)). 9 Mar 1978. Contract EY-76-C-14-2170. 25p. AT.

Supplementary information is presented for incorporation in the FFTF Final Safety Analysis Report.

- 1701 (HEDL-TI--75001-28) FSAR SUPPLEMENT 28: RESPONSE TO NRC Q₂ SET 13. (Hanford Engineering Development Lab., Richland, WA (USA)). 9 Mar 1978. Contract EY-76-C-14-2170. 19p. AT.

Supplementary information is provided for

- incorporation in the FFTF Final Safety Analysis Report. (DG)
- 1702 (HEDL-TI--75001-29) FSAR SUPPLEMENT 29: RESPONSE TO NRC Q₂ SET 14. (Hanford Engineering Development Lab., Richland, WA (USA)). [nd]. Contract EY-76-C-14-2170. 31p. AT.
Responses to questions concerning the FFTF safety analysis are presented.
- 1703 (HEDL-TI--75001-30) FSAR SUPPLEMENT 30. (Hanford Engineering Development Lab., Richland, WA (USA)). 9 Oct 1978. Contract EY-76-C-14-2170. 63p. AT.
Information on the FFTF reactor is presented concerning instrumentation, reactor protection systems, and performance of engineered safety systems.
- 1704 (HEDL-TI--75002-5) FSAR AMENDMENT 5, REVISIONS TO SUPPLEMENT 6. (Hanford Engineering Development Lab., Richland, WA (USA)). May 1977. Contract EY-76-C-14-2170. 16p. AT.
Information on the FFTF Reactor is presented concerning the performance of structures under tornado and seismic stresses, securing of reactor internals, and reactor kinetics.
- 1705 (HEDL-TI--75002-8) FSAR AMENDMENT 8. (Hanford Engineering Development Lab., Richland, WA (USA)). Aug 1977. Contract EY-76-C-14-2170. 91p. AT.
Revisions to the FFTF Final Safety Analysis Report are presented. (DG)
- 1706 (HEDL-TI--75002-9) FFTF EMERGENCY PLAN, FSAR AMENDMENT 9. (Hanford Engineering Development Lab., Richland, WA (USA)). 10 Apr 1978. Contract EY-76-C-14-2170. 147p. AT.
The emergency plan for the FFTF reactor is presented.
- 1707 (HEDL-TI--75002-10) FSAR AMENDMENT 10. (Hanford Engineering Development Lab., Richland, WA (USA)). Sep 1977. Contract EY-76-C-14-2170. 87p. AT.
Supplementary information is provided on the FFTF Final Safety Analysis Report. (DG)
- 1708 (HEDL-TI--75002-11) FSAR AMENDMENT 11: CHANGES TO REFLECT SUPPLEMENT 13, PART 1. Schade, A.R. (Hanford Engineering Development Lab., Richland, WA (USA)). Dec 1977. Contract EY-76-C-14-2170. 12p. AT.
Revised information is presented concerning FFTF reactor operating procedures.
- 1709 (HEDL-TI--75002-12) DISTRIBUTION OF REVISIONS TO FFTF FSAR. Schade, A.R. (Hanford Engineering Development Lab., Richland, WA (USA)). 9 Jan 1978. Contract EY-76-C-14-2170. 50p. AT.
Supplementary information for incorporation into the FFTF final Safety Analysis Report is presented. (DG)
- 1710 (HEDL-TI--75002-14) FSAR AMENDMENT 14, FSAR REVISIONS: RESPONSE TO NRC Q₂ SET 1, QUALITY ASSURANCE. (Hanford Engineering Development Lab., Richland, WA (USA)). Oct 1977. Contract EY-76-C-14-2170. 32p. AT.
An amended Quality Assurance Chapter is presented for the FFTF Final Safety Analysis
- Report. (DG)
- 1711 (HEDL-TI--75002-15) FSAR AMENDMENT 15: MISCELLANEOUS CHANGES. (Hanford Engineering Development Lab., Richland, WA (USA)). Dec 1977. Contract EY-76-C-14-2170. 75p. AT.
Requested additional information on the FFTF reactor is presented concerning the health physics program and radiation protection equipment and procedures.
- 1712 (HEDL-TI--75002-16) FSAR AMENDMENT 16. (Hanford Engineering Development Lab., Richland, WA (USA)). Dec 1977. Contract EY-76-C-14-2170. 21p. AT.
Revisions to the FFTF Final Safety Analysis Report are presented. The revisions concern sodium release in secondary systems, engineered safety feature instrumentation, and containment isolation valves.
- 1713 (HEDL-TI--75002-17) FSAR AMENDMENT 17. (Hanford Engineering Development Lab., Richland, WA (USA)). Dec 1977. Contract EY-76-C-14-2170. 15p. AT.
Revised data concerning load combinations and allowable stresses on containment structures are presented for addition to the FFTF Final Safety Analysis Report.
- 1714 (HEDL-TI--75002-18) DISTRIBUTION OF REVISIONS TO FFTF FSAR. Schade, A.R. (Hanford Engineering Development Lab., Richland, WA (USA)). 16 Dec 1977. Contract EY-76-C-14-2170. 16p. AT.
Requested additional information on the FFTF reactor is presented concerning containment system valves.
- 1715 (HEDL-TI--75002-19) DISTRIBUTION OF REVISIONS TO FFTF FSAR. Schade, A.R. (Hanford Engineering Development Lab., Richland, WA (USA)). 9 Jan 1978. Contract EY-76-C-15-2170. 15p. AT.
Supplementary information for incorporation into the FFTF Final Safety Analysis Report is presented. The amendment deals specifically with seismic qualification of safety-related valves. (DG)
- 1716 (HEDL-TI--75002-20) DISTRIBUTION OF REVISIONS TO FFTF FSAR. Schade, A.R. (Hanford Engineering Development Lab., Richland, WA (USA)). 9 Jan 1978. Contract EY-76-C-14-2170. 32p. AT.
Supplementary information for incorporation into the FFTF Final Safety Evaluation Report is presented. The amendment deals specifically with fire protection changes. (DG)
- 1717 (HEDL-TI--75002-21) FFTF FSAR, AMENDMENT 21. (Hanford Engineering Development Lab., Richland, WA (USA)). 8 Mar 1978. Contract EY-76-C-14-2170. 33p. AT.
Miscellaneous revisions to the FFTF Final Safety Analysis Report are presented.
- 1718 (HEDL-TI--75002-22) FSAR AMENDMENT 22. ADDITION OF RESPONSE Q130.57 TO SUPPLEMENT 21. (Hanford Engineering Development Lab., Richland, WA (USA)). Feb 1978. Contract EY-76-C-14-2170. 14p. AT.
Additional data on the seismic analysis of FFTF structure is presented in response to an NRC request.

1719 (HEDL-TI--75002-23) FSAR AMENDMENT 23: (CHANGE TO CHAPTER 17, AS MADE BY FSAR SUPPLEMENT 26). (Hanford Engineering Development Lab., Richland, WA (USA)). 9 Mar 1978. Contract EY-76-C-14-2170. 13p. AT. Supplementary information is provided for incorporation in the FFTF Final Safety Analysis Report. (DG)

1720 (HEDL-TI--75002-24) FSAR AMENDMENT 24: ADDITION TO SUPPLEMENT 13, Q211.33, NRC Q₁, SET 8. (Hanford Engineering Development Lab., Richland, WA (USA)). 9 Mar 1978. Contract EY-76-C-14-2170. 25p. AT. Supplementary information is provided for incorporation in the FFTF Final Safety Analysis Report. (DG)

1721 (HEDL-TI--75002-25) FSAR AMENDMENT 25: MISCELLANEOUS REVISIONS. (Hanford Engineering Development Lab., Richland, WA (USA)). Mar 1978. Contract EY-76-C-14-2170. 129p. AT. Supplementary information is presented for incorporation in the FFTF Final Safety Analysis Report. (DG)

1722 (HEDL-TI--75002-26) DISTRIBUTION OF REVISIONS TO FFTF FSAR. (Hanford Engineering Development Lab., Richland, WA (USA)). 1 Sep 1978. Contract EY-76-C-14-2170. 53p. AT. Supplementary information is presented for inclusion in the FFTF Final Safety Analysis Report.

1723 (HEDL-TI--75002-28) FSAR AMENDMENT 28. (Hanford Engineering Development Lab., Richland, WA (USA)). 9 Oct 1978. Contract EY-76-C-14-2170. 24p. AT. Revised information on the FFTF reactor is presented concerning instrumentation, reactor protection systems, and engineered safety systems.

1724 (HEDL-TI--75002-29) FSAR AMENDMENT 29: MISCELLANEOUS CHANGES. (Hanford Engineering Development Lab., Richland, WA (USA)). Jan 1979. Contract EY-76-C-14-2170. 265p. AT. Portions of document are illegible. Revised and additional information is presented concerning the reactor control system; containment isolation system; plant protection systems; electrical systems; plant fire protection; in-vessel handling machine; and safety limit settings for engineered safeguards.

1725 (HEDL-TI--75002-30) REVISION OF FFTF FSAR TECHNICAL SPECIFICATIONS. (Hanford Engineering Development Lab., Richland, WA (USA)). Mar 1979. Contract EY-76-C-06-1830. 266p. AT. Revised technical specifications are presented for three-loop operation of the FFTF at 680°F inlet conditions with cores 1 and 2 and without closed-loop experiments in the reactor.

1726 (HEDL-TI--75002-31) FSAR AMENDMENT 31: CHANGES TO SECTION 3.10. Schade, A.R. (Hanford Engineering Development Lab., Richland, WA (USA)). Mar 1979. Contract EY-76-C-14-2170. 75p. AT. Revisions to Section 3.10 (Environmental Design of Mechanical and Electrical Equipment) of the FFTF Final Safety Analysis Report are presented.

1727 (HEDL-TI--75002-32) FSAR AMENDMENT 32: MISCELLANEOUS CHANGES. Schade, A.R. (Hanford Engineering Development Lab., Richland, WA (USA)). Apr 1979. Contract EY-76-C-14-2170. 87p. AT. FFTF REACTOR; REACTOR SAFETY; DOCUMENTATION

1728 (HEDL-TI--75002-33) DISTRIBUTION OF REVISIONS TO FFTF FSAR. (Hanford Engineering Development Lab., Richland, WA (USA)). 12 Mar 1979. Contract EY-76-C-14-2170. 56p. AT. Requested additional information is presented concerning the reactor protection systems and auxiliary equipment.

1729 (HEDL-TI--75002-34) FSAR AMENDMENT 34: ENVIRONMENTAL TECHNICAL SPECIFICATIONS FOR THE FAST FLUX TEST FACILITY (CHAPTER 18). Schade, A.R. (Hanford Engineering Development Lab., Richland, WA (USA)). Mar 1979. Contract EY-76-C-14-2170. 67p. AT. Requested additional information is presented concerning environmental surveillance procedures.

1730 (HEDL-TI--75002-35) FFTF FSAR AMENDMENT 35. REVISIONS TO EMERGENCY PLAN. (Hanford Engineering Development Lab., Richland, WA (USA)). 18 Apr 1979. Contract EY-76-C-14-2170. 53p. AT. Supplementary information is presented for inclusion in the FFTF Final Safety Analysis Report.

1731 (HEDL-TI--76002) SODIUM. (Westinghouse Hanford Co., Richland, WA (USA)). [nd]. Contract EY-76-C-14-2170. 4p. Dep. NTIS, PC A02/MF A01. The physical properties of sodium are described and the use of sodium as the coolant in liquid metal fast breeder reactors is discussed. Sodium technology facilities at HEDL for research and testing support of the Fast Flux Test Facility are described.

1732 (HEDL-TI-LME--012) EXPERIMENTAL RESULTS OF SODIUM--WATER REACTION TESTS NOS. 4 AND 5 IN LLTR. Miller, A.E.; Neely, H.H. (Liquid Metal Engineering Center, Canoga Park, CA (USA)). 10 Nov 1977. Contract EY-76-C-03-0700. 815p. AT. Computer-generated plots of transient data obtained during the fourth and fifth (SWR-4 and -5) sodium-water reaction tests and observations made following the tests are presented. As in previous tests of Series I, double-ended guillotine ruptures were produced in a water tube of the Atomics International Modular Steam Generator (AI-MSG). Tube rupture was located in the horizontal section 1.75 in. from the upper tube-sheet for each test. Superheated steam at approximately 700°F and 1900 psig was supplied for injection at tube rupture in SWR-4; whereas, high-pressure nitrogen was injected in SWR-5. Comparison of peak pressure data from the two tests shows similarity that may indicate system water pressure determines peak pressure.

1733 (HEDL-TME--72-86) EFFECT OF LIQUID SODIUM ON FFTF IHX TUBE-TO-TUBESHEET WELD RESIDUE DEPOSITS. Yunker, W.H. (Hanford Engineering Development Lab., Richland, WA (USA)). Jun 1972. Contract EY-76-C-14-2170. 24p. Dep. NTIS, PC A02/MF A01. Black deposits, about 20 mil diameter and 5

mil thick, formed during tube-to-tubesheet weld qualification tests for the FFTF Intermediate Heat Exchanger. The behavior of these spots in liquid sodium has been studied in the temperature range 400°F to 800°F in flowing and in stagnant sodium. The results show that the spot-like deposits disintegrate in a few hours into many smaller pieces and do not come loose from the metal as single pieces. The dissolution/disintegration can be assumed to continue after the fragments are released into the sodium. The total mass of material released is estimated to increase the impurity level in the FFTF primary sodium by 0.004 wppm.

- 1734 (HEDL-TME--72-95) LENGTH CHANGES IN FTR PROTOTYPIC CLADDING IRRADIATED IN EBR-II TO 1×10^{22} N/CM², $E > 0.1$ MEV (PIN B-65)(RM-24). Straalsund, J.L.; Guthrie, G.L.; Larson, T.J. (Hanford Engineering Development Lab., Richland, WA (USA)). Jul 1972. Contract EY-76-C-14-2170. 50p. Dep. NTIS, PC A04/MF A01.

Swelling in prototypic FTR cladding and duct specimens is being determined from a series of three irradiations designed to cover a range of temperatures approximately 800 to 1500°F and peak fluences of approximately 1×10^{22} , 6×10^{22} , and 1×10^{23} N/cm². The length change measurements for the low fluence irradiation have been completed and are summarized in this report. No swelling, only shrinkage, was found in the 20 percent cold worked Type 316 stainless steel cladding specimens. This shrinkage is of the same magnitude and has the same temperature dependency as unirradiated, control samples. Annealed specimens did swell slightly. Details of the experiment and analysis are given.

- 1735 (HEDL-TME--75-85) TEMP: A COMPUTER CODE TO CALCULATE FUEL PIN TEMPERATURES DURING A TRANSIENT. Bard, F.E.; Christensen, B.Y.; Gneiting, B.C. (Hanford Engineering Development Lab., Richland, WA (USA)). Apr 1980. Contract EY-76-C-14-2170. 293p. NTIS, PC A13/MF A01.

The computer code TEMP calculates fuel pin temperatures during a transient. It was developed to accommodate temperature calculations in any system of axis-symmetric concentric cylinders. When used to calculate fuel pin temperatures, the code will handle a fuel pin as simple as a solid cylinder or as complex as a central void surrounded by fuel that is broken into three regions by two circumferential cracks. Any fuel situation between these two extremes can be analyzed along with additional cladding, heat sink, coolant or capsule regions surrounding the fuel. The one-region version of the code accurately calculates the solution to two problems having closed-form solutions. The code uses an implicit method, an explicit method and a Crank-Nicolson (implicit-explicit) method.

- 1736 (HEDL-TME--75-96) FTR HCM SCALE-MODEL FLOW-INDUCED VIBRATION TESTS, PHASES I AND II. FINAL REPORT. Ryan, J.A.; Mahoney, J.J. (Hanford Engineering Development Lab., Richland, WA (USA)). Jun 1979. Contract EY-76-C-14-2170. 116p. AT.

The flow-induced vibrational characteristics of scaled Fast Flux Test Facility (FFTF) Fast Test Reactor (FTR) core internal and peripheral components were assessed under scaled and simulated FTR flow conditions in the Hydraulic Core Mockup (HCM). The HCM was an 0.285 geometric scale model of the FTR internals and, as such, was designed to model the vibrational and hydraulic characteristics of the FTR.

Vibration tests were conducted with water simulating the coolant over the range of 36 to 110% scaled FTR design flow rates. Selected model internals were instrumented with accelerometers and their vibrational characteristics were measured and established for the range of flow rates. The measured dynamic response of the scaled FTR components exhibited neither abnormal nor anomalous flow rate dependent response. Component vibrational characteristics were adjudged acceptable in terms of FTR response.

- 1737 (HEDL-TME--76-1) SCALE-MODEL CHARACTERIZATION OF FLOW-INDUCED VIBRATIONAL RESPONSE OF FTR INTERNALS: SUMMARY REPORT. Ryan, J.A.; Julyk, L.J. (Hanford Engineering Development Lab., Richland, WA (USA)). Oct 1977. Contract EY-76-C-14-2170. 70p. AT.

As an integral part of the Fast Test Reactor (FTR) Vibration Program for Reactor Internals, the flow-induced vibrational characteristics of scaled FTR core internal and peripheral components were assessed under scaled and simulated prototype flow conditions in the Hydraulic Core Mockup (HCM). The HCM, a 0.285 geometric scale (water) model, was designed to simulate the vibrational and hydraulic characteristics of the FTR. Model component vibrational characteristics were measured and determined over a range of 36 to 110% of the scaled prototype design flow. Selected model and prototype components were shaker tested to establish modal characteristics. The dynamic response of the HCM components exhibited no anomalous flow rate dependent or modal characteristics, and prototype response predictions were adjudged acceptable.

- 1738 (HEDL-TME--76-3) COVER GAS ENTRAINMENT TESTS IN FFTF HYDRAULIC CORE MOCKUP. Dickinson, D.R. (Hanford Engineering Development Lab., Richland, WA (USA)). Apr 1978. Contract EY-76-C-14-2170. 54p. AT.

Tests were performed in a 0.285-scale model to determine the rate of cover gas entrainment that might be expected in the outlet plenum of the Fast Flux Test Facility due to upward flow from the reactor core. Water was used to model sodium. The major source of entrainment was the gap surrounding a large vertical column where it penetrated the horizontal suppressor plate below the liquid surface. Modifications of this gap were tested to support redesign to reduce entrainment. The void fraction in the outlet pipes was measured by recording the attenuation of an ultrasonic pulse transmitted across the pipe, the system was calibrated in place by measured gas flow. The outlet void fraction for the final modification was 6×10^{-4} at Weber number modeling, which gives an upper bound on FFTF performance. The outlet void fraction was zero at Froude number modeling.

- 1739 (HEDL-TME--76-4) LIQUID VELOCITY MEASUREMENTS IN OUTLET PLENUM OF FFTF HYDRAULIC CORE MOCKUP. Dickinson, D.R. (Hanford Engineering Development Lab., Richland, WA (USA)). Jun 1977. Contract EY-76-C-14-2170. 87p. AT.

Liquid velocities were measured in the outlet plenum of the Hydraulic Core Mockup, which is a 0.285-scale hydraulic water model of the Fast Test Reactor, using three-dimensional pitot probes. Velocities (at FTR conditions) were 6 to 13 ft/sec upward over the core, 1 to 2 ft/sec radially outward below the vortex suppression plate, and 1 to 3 ft/sec downward along the vessel wall.

- 1740 (HEDL-TME--76-5) TESTS OF FLUID MIXING IN INLET AND OUTLET PLENUMS OF FFTF HYDRAULIC CORE MOCKUP. Dickinson, D.R. (Hanford Engineering Development Lab., Richland, WA (USA)). May 1979. Contract EY-76-C-14-2170. 142p. AT.

Mixing sodium streams of different temperatures in the inlet and outlet plenums of the Fast Flux Test Facility reactor was evaluated by tests in water in a 0.285-scale hydraulic model of the reactor vessel. Flow streams of water were tagged by injecting concentrated electrolyte to model hot or cool sodium streams. The resulting concentration changes and concentration fluctuations were measured by 162 small probes which sense local electrical conductivity. Measurements were made for mixing in the inlet plenum following stepwise concentration increase in one of the inlet pipes, and also for mixing in the outlet plenum following stepwise concentration increase in core positions within a single orifice zone. The inlet plenum was found to be well mixed; the outlet plenum less so. Data are presented which can be used to predict reactor steady-state temperatures, temperature transients, and temperature fluctuations.

- 1741 (HEDL-TME--76-10) ACTIVATED CORROSION PRODUCT RADIATION LEVELS IN THE FFTF HEAT TRANSPORT SYSTEM CELLS AND CLOSED LOOP SYSTEM MODULES. Kuhn, W.L. (Hanford Engineering Development Lab., Richland, WA (USA)). Sep 1977. Contract EY-76-C-14-2170. 115p. AT.

Radiation levels due to activated corrosion products in an FFTF Heat Transport System (HTS) cell and in a Closed Loop System (CLS) module are estimated for various maintenance locations. ^{54}Mn is found to be the dominant radionuclide. While control of ^{54}Mn release or transport would substantially reduce radiation levels, ^{54}Mn , ^{60}Co , and ^{59}Co must all be controlled to permit unshielded maintenance for the FFTF rated operating condition. Radiation levels are found to be relatively insensitive to sodium oxygen concentration but very sensitive to operating temperature. The average radiation level in an HTS cell is predicted to rapidly exceed 0.2 R/hr and eventually reach 4 R/hr at the FFTF rated core outlet temperature of 1100°F. At the 980°F, 0.7 R/hr is interpolated. The predicted radiation levels would preclude unshielded maintenance operations in an HTS cell. Radiation levels near a CLS module are predicted 0.2 to 2 R/hr, depending on the assumed operating temperature.

- 1742 (HEDL-TME--76-28) SODIUM ENGINEERING AND TECHNOLOGY TECHNICAL PROGRESS REPORT, OCTOBER, NOVEMBER, DECEMBER 1976. Atwood, J.M. (Hanford Engineering Development Lab., Richland, WA (USA)). Jun 1977. Contract EY-76-C-14-2170. 112p. AT.

Progress in LMFBF-related sodium technology studies is reported in the areas of radioactivity control technology, sodium systems technology, and hydraulics and mechanics studies.

- 1743 (HEDL-TME--76-45) FFTF DEVELOPMENT TESTING TECHNICAL PROGRESS REPORT, JANUARY, FEBRUARY, MARCH 1976. Berg, J.D.; Bliss, R.J.; Duncan, H.C.; Worth, G.A.; Duckett, A.J. (Hanford Engineering Development Lab., Richland, WA (USA)). Jul 1977. Contract EY-76-C-14-2170. 24p. AT.

Information is presented concerning refueling and plant equipment testing, mechanical equipment testing, reactor components testing, and control and data systems.

- 1744 (HEDL-TME--76-46) FFTF DEVELOPMENT TESTING TECHNICAL PROGRESS REPORT, APRIL--JUNE 1977. Berg, J.D.; Bliss, R.J.; Duckett, A.J.; Duncan, H.C.; Worth, G.A. (Hanford Engineering Development Lab., Richland, WA (USA)). Sep 1977. Contract EY-76-C-14-2170. 50p. AT.

Progress in FFTF component development is presented for the following: refueling and plant equipment testing, mechanical equipment testing, reactor components testing, and control and data systems.

- 1745 (HEDL-TME--76-47) FFTF DEVELOPMENT TESTING. TECHNICAL PROGRESS REPORT, JULY--SEPTEMBER 1976. Bliss, R.J. (Hanford Engineering Development Lab., Richland, WA (USA)). 1976. Contract EY-76-C-14-2170. 32p. AT.

Progress is summarized in the following areas: (1) refueling and plant equipment testing, (2) mechanical equipment testing, and (3) control and data systems. (DG)

- 1746 (HEDL-TME--76-48) FFTF DEVELOPMENT TESTING TECHNICAL PROGRESS REPORT, OCTOBER--DECEMBER 1976. Berg, J.D.; Bliss, R.J.; Duckett, A.J.; Duncan, H.C.; Worth, G.A. (Hanford Engineering Development Lab., Richland, WA (USA)). Oct 1977. Contract EY-76-C-14-2170. 30p. AT.

Progress in FFTF development testing is presented for the following: refueling and plant equipment testing, mechanical equipment testing, control and data systems, and reactor components testing.

- 1747 (HEDL-TME--76-65) FFTF TORNADO MISSILE BARRIER REPORT. Shang, K.D. (Hanford Engineering Development Lab., Richland, WA (USA)). Oct 1977. 36p. AT.

An evaluation is presented of the series of tests that was performed by the Sandia Corporation to determine the sufficiency of several systems that are candidates for barriers against tornado generated missiles for FFTF structures. Several objects representative of tornado missiles were impact tested against single and multiple layers of chain link fence and a concrete block wall. The barrier systems are being considered as alternatives to steel plate tornado hardening of the FFTF Dump Heat Exchangers and the containment airlocks.

- 1748 (HEDL-TME--77-13) DECAY HEAT FOR THE FAST TEST REACTOR (FTR). Schmittroth, F. (Hanford Engineering Development Lab., Richland, WA (USA)). May 1978. Contract EY-76-C-14-2170. 50p. Dep. NTIS, PC A03/MF A01.

The decay heat for the Fast Test Reactor (FTR) is reevaluated for cooling times up to 30 years. Decay heat from both fission-products and actinides is included. Fission-product decay data used in this evaluation are taken from ENDF/B version IV. Consideration is given to the effects of fuel cycles and loadings and to the importance of fissions in the minor fuels such as ^{235}U , ^{240}Pu , and ^{241}Pu , as well as in the major fuels, ^{238}U and ^{239}Pu . Decay-heat uncertainties are evaluated and are typically less than 5 percent for cooling times beyond 50 seconds. The effective energy release per fission for FTR is also reevaluated.

- 1749 (HEDL-TME--77-20) THERMAL PERFORMANCE TESTS OF THE FFTF CLOSED LOOP COLD TRAP.

Blair, C.K.; Bloom, G.R. (Hanford Engineering Development Lab., Richland, WA (USA)). Aug 1977. Contract EY-76-C-14-2170. 100p. AT.

The three gpm FFTF Closed Loop Cold Trap was tested to demonstrate thermal performance of the economizer and gas cooled crystallizer. Sodium and gas stream temperature profiles were measured and confirmed with heat balance calculations over the expected operating range. The trace heat system design adequacy was also tested.

Results of the effluent releases from the HEDL Fuel Fabrication Demonstration building are given; also presented are effluent measurements from a joint program with Babcock and Wilcox at the Fuel Fabrication Facility at Leechburg, PA. Attenuation measurements of flexible shielding materials designated 'Lamipore' are given and the neutron and gamma radiation levels from FFTF subassemblies and strip layers are recorded. A specific use of a Stabilized Assay Meter (SAM-2) for detecting plutonium in a waste dissolver is recorded.

1750 (HEDL-TME--77-23) INTEGRAL HEAT RATE-TO-INCIPENT MELTING IN UO_2 - PuO_2 FAST REACTOR FUEL. Baker, R.B. (Hanford Engineering Development Lab., Richland, WA (USA)). May 1978. Contract EY-76-C-14-2170. 132p. Dep. NTIS, PC A07/MF A01.

Analyses of integral power-to-melt tests, HELD P-19 and P-20, are presented. These tests contained mixed-oxide, UO_2 - PuO_2 , fuel prototypic of fuel to be used in the driver fuel assemblies of the Fast Flux Test Facility, FFTF, which could be used in initial Fast Breeder Reactors, FBR's. The experiments were irradiated in the Experimental Breeder Reactor No. 2, EBR-II, for the Hanford Engineering Development Laboratory, HELD. The primary test variables are fabricated fuel-to-cladding gap size and accumulated fuel burnup to 1.1 at.%. The observed improved thermal performance at higher burnup is analyzed based on results and conclusions drawn from sibling pins irradiated during the preconditioning phases of the P-20 test. These pins were not included in the overpower phase of the P-20 test. The primary cause of the improved thermal performance was found to be maturing fuel restructuring and rapid fuel-to-cladding gap closure. The favorable impact of these observations on the design and operation of FFTF and future FBR's is also reviewed.

1751 (HEDL-TME--77-25) IMPROVED SUBASSEMBLY GROUPING FOR MULTI-CHANNEL TOP HCDA SAFETY ANALYSIS. Wilburn, N.P. (Hanford Engineering Development Lab., Richland, WA (USA)). Jul 1977. Contract EY-76-C-14-2170. 50p. AT.

The behavior of two FTR cores, the BOC-4 and EOC-4, is investigated for TOP HCDA's using the 100-channel MELT-IIIA code. Each of the 76-driver subassemblies is assigned a channel. Using the results from the 76-channel runs, a more effective method to group subassemblies into a lesser number of channels is developed. The results of a 7-channel grouping using this method are compared to results from a former method and the 76-channel runs.

1752 (HEDL-TME--77-29) ROD SCANNER ASSAY OF FFTF FUEL. Goris, P. (Hanford Engineering Development Lab., Richland, WA (USA)). Jan 1978. Contract EY-76-C-14-2170. 29p. Dep. NTIS, PC A03/MF A01.

Rod scanner results for over 40,000 FFTF Cores 1 and 2 fuel pins are summarized. An improved rod scanner calibration technique for FFTF Cores 3 and 4 fuel pins is described. Data are compared with chemical assay measurements. 5 fig., 5 tables.

1753 (HEDL-TME--77-30) RADIATION AND EFFLUENT CONTROL TECHNOLOGY SEMI-ANNUAL PROGRESS REPORT, JANUARY--JUNE 1976. Smith, R.C.; Strode, J.N.; Bradley, J.G.; Richardson, G.L.; Brackenbush, L.W.; Faust, L.G.; Mishima, J. (Hanford Engineering Development Lab., Richland, WA (USA)). Jul 1977. Contract EY-76-C-14-2171. 46p. AT.

1754 (HEDL-TME--77-33) LMFBR REFERENCE CONTROL MATERIALS. SEMI-ANNUAL REPORT, JULY--DECEMBER 1976. Roake, W.E.; Claudson, T.T. (Hanford Engineering Development Lab., Richland, WA (USA)). Aug 1977. Contract EY-76-C-14-2170. 67p. AT.

Information is presented concerning improved absorber concepts, design and performance analysis, materials testing and characterization, neutron absorber performance monitoring, and fabrication development.

1755 (HEDL-TME--77-34(Vol.2), pp HEDL.60-HEDL.65) MODIFICATION OF THE NBS DOUBLE FISSION CHAMBER FOR IN-CORE OPERATION IN THE FAST TEST REACTOR. Fuller, J.L. May 1978. Interlaboratory Reaction Rate program. 11th progress report, November 1975--October 1976.

The results of studies undertaken to determine the design changes required to the National Bureau of Standards double fission chamber for use in FTR are provided. The detector design environment parameters are long-term operation at 400°F, γ -field to 1×10^7 R/h, 1 g vibration amplitude from 10 to 500 Hz, and neutron flux to 7×10^{12} cm⁻² s⁻¹. The status of efforts to implement the necessary modifications is also briefly discussed. 2 figures.

1756 (HEDL-TME--77-34(Vol.2), pp HEDL.27-HEDL.44) EBR-II DERIVED FISSION YIELDS FROM VANADIUM ENCAPSULATED FISSION MONITORS. Kellogg, L.S.; Davis, A.I.; Lippincott, E.P.; Ruggles, J.M. May 1978. Interlaboratory Reaction Rate program. 11th progress report, November 1975--October 1976.

Relative fission yield measurements were made for selected fission products obtained from irradiation of encapsulated ²³⁵U, ²³⁸U, ²³⁹Pu, and ²³⁷Np dosimeters in Row 4 'Test Region' of the EBR-II reactor. Replicate dosimeter sets were positioned in three separate locations to determine consistency of analysis, validity of fission yields recommended by the ILRR Program and elsewhere for use in FFTF and EBR-II, and to obtain data on possible spectral/energy dependence of the fission product yields. Selection of the fission products reported was based on those products routinely used for dosimetry foil and burnup analysis. Consistency of within-group radiometric analysis, with few exceptions, is quite good and well within the accuracy estimates of the individual analysis. Tabulations of individual yield to ¹³⁷Cs ratios are made. Comparison of fission product/¹³⁷Cs ratios with ratio values derived from ILRR consensus fission yield values agree within 2.5% with the exception of ⁹⁵Zr/²³⁷Np=6.6%, ¹⁰³Ru/²³⁸U=4.7%, and ¹⁰³Ru/²³⁷Np=3.4%. An apparent consistent trend in the ¹⁰³Ru ratios from ²³⁵U would suggest an energy dependence, but the comparative data are not statistically significant for confirmation.

- 1757 (HEDL-TME--77-36) SODIUM ENGINEERING AND TECHNOLOGY. QUARTERLY PROGRESS REPORT, JANUARY, FEBRUARY, MARCH 1977. Atwood, J.M. (Hanford Engineering Development Lab., Richland, WA (USA)). Sep 1977. Contract EY-76-C-14-2170. 107p. AT.

Progress is reported in the areas of: radioactivity control technology, sodium systems technology, sodium systems development, and hydraulics and mechanics. (GHT)

- 1758 (HEDL-TME--77-37) SODIUM ENGINEERING AND TECHNOLOGY. TECHNICAL PROGRESS REPORT, APRIL, MAY, JUNE 1977. Atwood, J.M. (Hanford Engineering Development Lab., Richland, WA (USA)). Nov 1977. Contract EY-76-C-14-2170. 142p. AT.

Progress in LMFBR-related sodium technology studies is reported in the areas of radioactivity control technology, sodium systems technology, safety systems development, and the hydraulics and mechanics program.

- 1759 (HEDL-TME--77-38) SODIUM ENGINEERING AND TECHNOLOGY. TECHNICAL PROGRESS REPORT, JULY, AUGUST, SEPTEMBER 1977. Atwood, J.M. (Hanford Engineering Development Lab., Richland, WA (USA)). Dec 1977. Contract EY-76-C-14-2170. 102p. AT.

Progress in LMFBR-related sodium technology studies is reported in the areas of radioactivity control, sodium systems, hydraulics and mechanics, and safety systems.

- 1760 (HEDL-TME--77-39) SODIUM ENGINEERING AND TECHNOLOGY. TECHNICAL PROGRESS REPORT, OCTOBER, NOVEMBER, DECEMBER 1977. Atwood, J.M. (comp.). (Hanford Engineering Development Lab., Richland, WA (USA)). May 1978. Contract EY-76-C-14-2170. 101p. AT.

This report represents a quarterly summary of progress made at Westinghouse Hanford Company in the areas of radioactivity control technology, sodium systems technology, hydraulics and mechanics, and safety systems development.

- 1761 (HEDL-TME--77-43) OPERATING EXPERIENCES AND ANALYSIS OF FFTF AND HTSF COLD TRAP ECONOMIZERS. Hassberger, J.A. (Hanford Engineering Development Lab., Richland, WA (USA)). Jun 1977. Contract EY-76-C-14-2170. 73p. AT.

Operating experience with the Type-I and Type-III cold traps in the High-Temperature Sodium Facility demonstrated that the sodium regenerative heat exchangers (economizers) did not meet design specifications. Initial operating data from the Type-I economizer pointed to a major problem in tube-side flow maldistribution. Hydraulic tests on the Type-III economizer verified that the severity of flow maldistribution could be minimized through the use of tube orifices. Subsequent in-sodium heat transfer tests, however, showed that other significant problems existed, such as shell-side flow maldistribution and annulus free convection. The performances of the various economizers, both as-built and modified or projected, are described. Primary emphasis was placed on correcting tube-side deficiencies. Alternate mechanisms contributing to degraded performance are also discussed.

- 1762 (HEDL-TME--77-44) HIGH ^{240}Pu FTR/EMC EXPERIMENTS AND ANALYSIS: CARBIDE FUEL AND UO_2 BLANKET SUBASSEMBLY WORTHS. Ombrellaro, P.A.

(Hanford Engineering Development Lab., Richland, WA (USA)). Jun 1977. Contract EY-76-C-14-2170. 40p. Dep. NTIS, PC A03/MF A01.

Carbide-plutonium fuel and UO_2 blanket subassembly worth measurements performed at ANL in the EMC/LWR were analyzed. Composition exchange worth calculations were performed for: (a) the replacement of high- ^{240}Pu fuel composition for low- ^{240}Pu fuel composition and carbide-plutonium fuel composition, successively, in the center subassembly of the core; (b) the replacement of low- ^{240}Pu fuel composition for carbide-plutonium fuel composition in one outer driver subassembly; and (c) the replacement of the radial reflector composition with UO_2 blanket composition in one subassembly of the radial reflector. The composition exchange worth calculations were performed in two-dimensional x,y geometry, using diffusion theory and perturbation theory. Each method produces about the same calculated-to-experimental bias factors.

- 1763 (HEDL-TME--77-47) CORE ENGINEERING TECHNICAL PROGRESS REPORT, APRIL--JUNE 1977. Peterson, R.E. (Hanford Engineering Development Lab., Richland, WA (USA)). Sep 1977. Contract EY-76-C-14-2170. 64p. AT.

Progress in FFTF core development is presented for the following study areas: core physics, radiation and shield analysis, and core design.

- 1764 (HEDL-TME--77-48) CORE ENGINEERING TECHNICAL PROGRESS REPORT, JULY--SEPTEMBER 1977. Peterson, R.E. (Hanford Engineering Development Lab., Richland, WA (USA)). Dec 1977. Contract EY-76-C-14-2170. 93p. AT.

Progress in FFTF core development is presented for the following study areas: core physics, radiation and shield analysis, and core design.

- 1765 (HEDL-TME--77-49) CORE ENGINEERING TECHNICAL PROGRESS REPORT, OCTOBER--DECEMBER 1977. Peterson, R.E. (Hanford Engineering Development Lab., Richland, WA (USA)). Apr 1978. Contract EY-76-C-14-2170. 79p. Dep. NTIS, PC A05/MF A01.

Progress in FFTF core development is presented for the following study areas: (1) core physics and (2) radiation and shield analysis.

- 1766 (HEDL-TME--77-53) ENERGY 1A: A MODIFIED VERSION OF THE ENERGY 1 THERMAL-HYDRAULIC COMPUTER CODE FOR LMFBR WIRE WRAP SPACER FUEL ASSEMBLIES. Shearer, D.M. (Hanford Engineering Development Lab., Richland, WA (USA)). Aug 1977. Contract EY-76-C-14-2170. 42p. AT.

ENERGY 1A is a modification of the ENERGY 1 thermal-hydraulic computer program developed at MIT. ENERGY 1A is useful for thermal-hydraulic sensitivity studies of large liquid metal fast breeder reactor fuel pin assemblies. The program is simple, easy to use, fast running, and readily accommodates large fuel pin assemblies with a minimum of input data. Calibration of ENERGY 1A is easily accomplished with experimental results or thermal-hydraulic results from a more rigorous computer program. For a flow solution given by a few input variables and input values for fuel pin energy generation ENERGY 1A predicts coolant and cladding midwall temperatures throughout the fuel pin assembly.

- 1767 (HEDL-TME--77-55) O/M STABILITY IN MIXED OXIDE FUEL PINS. Gottschalk, G. (Hanford Engineering Development Lab., Richland, WA (USA)). Aug 1977. Contract EY-76-C-14-2170. 23p. Dep. NTIS, PC A02/MF A01.

Mixed Oxide fuel pellets have been analyzed for change in oxygen to metal ratio following extended storage in FFTF fuel pins.

- 1768 (HEDL-TME--77-58) BREEDER REACTOR REFERENCE CONTROL MATERIALS. SEMIANNUAL REPORT, JANUARY--JUNE 1977. Roake, W.E.; Claudson, T.T. (Hanford Engineering Development Lab., Richland, WA (USA)). Oct 1977. Contract EY-76-C-14-2170. 61p. AT.

Progress on neutron absorber development activities from January 1977 through June 1977 is presented. Included in the report are descriptions of activities related to performance analysis, development testing, and fabrication technology.

- 1769 (HEDL-TME--77-59) CALCULATION OF PASSIVE SENSOR PERTURBATIONS IN FFTF. Rawlins, J.A. (Hanford Engineering Development Lab., Richland, WA (USA)). Nov 1977. Contract EY-76-C-14-2170. 38p. AT.

The integral transport theory code RABBLE has been used to calculate resonance region broad-group capture and fission cross sections for ^{235}U , ^{238}U , ^{239}Pu , ^{240}Pu , and ^{241}Pu inside an inner driver FTR fuel pellet and inside a dosimeter container at two fuel temperatures, corresponding to FFTF operation at low power and at 400 MW. These resonance region cross sections are merged with the 42-group 300S set of cross sections processed through 1DX. The resulting composite 42-group cross section set is used to calculate fluxes and reaction rates in a pin cell model using the two dimensional S/sub n/ transport theory code DOT-IIW, using S-4 quadrature. Calculations are made for prototypical and nonprototypical conditions (temperature and material); perturbations to capture, fission, and other reaction rates are then calculated as a function of temperature and material conditions. The calculated perturbations are less than ± 4 percent for all the U and Pu isotopes considered. The calculations, therefore, indicate no overwhelming reason for performing the capture and fission rate measurements under any particular set of reactor conditions. Several reactions to be used in passive spectrum measurement are also considered, and some of the perturbations calculated for these reactions are larger than those of the fuel isotopes. It may be possible to measure a few spectral set reaction rate perturbations.

- 1770 (HEDL-TME--77-60) ANALYSIS OF MIXED OXIDE FUEL IRRADIATED IN EBR-II: MEASURED VS. PREDICTED BURNUP. Scott, L.D.; Dutt, D.S.; Wilson, D.R. (Hanford Engineering Development Lab., Richland, WA (USA)). May 1978. Contract EY-76-C-14-2170. 19p. Dep. NTIS, PC A02/MF A01.

The calculation of burnup in mixed-oxide fuel pins irradiated in EBR-II is shown to agree with burnup measured by postirradiation radiochemical analysis. The mean percent deviation is 0.12% with a variance of 2.49%. This gives a high level of confidence that HIST, which uses 91% of the nominal EBR-II power, provides an accurate estimate of burnup.

- 1771 (HEDL-TME--77-61) CORROSION OF IRRADIATED STAINLESS STEEL IN HOT-TRAPPED SODIUM. Brehm, W.F.; Anantatmula, R.P.

(Hanford Engineering Development Lab., Richland, WA (USA)). Aug 1977. Contract EY-76-C-14-2170. 40p. AT.

Corrosion and radionuclide release from irradiated stainless steel into hot-trapped sodium at 1120°F (604°C) were quantitatively determined. The oxygen content of the sodium was maintained at less than 0.01 parts per million. The results show that corrosion and radionuclide release were not reduced below values observed in tests at 0.5 and 2.5 parts per million oxygen in sodium. The significance of this result is that development of hot traps or soluble getters for purification system of sodium-cooled reactors is not warranted. 14 figures, 7 tables.

- 1772 (HEDL-TME--77-62) SELECTION OF PROCESS PARAMETERS FOR SODIUM REMOVAL VIA THE WATER VAPOR NITROGEN PROCESS. Crippen, M. (Hanford Engineering Development Lab., Richland, WA (USA)). Nov 1977. Contract EY-76-C-14-2170. 39p. AT.

This report reviews the water vapor nitrogen (WVN) process for removing sodium from stainless steel equipment, with emphasis on the basis for selecting final operating parameters. The process includes vapor treatment with 5% water at 160°F to 190°F, hot water rinsing, and hot gas drying.

- 1773 (HEDL-TME--77-63) REMOVAL OF SODIUM FROM THE IVHM ORIENTATION PLUG. Crippen, M.D. (Hanford Engineering Development Lab., Richland, WA (USA)). Aug 1977. Contract EY-76-C-14-2170. 16p. AT.

A replica of the FFTF In-Vessel Handling Machine--Engineering Model (IVHM-EM) orientation plug was cleaned of sodium. It was demonstrated that cleaning time could be substantially reduced by either raising the moisture content of the water vapor-nitrogen gas or pressure cycling the reacting gas or both. The plug was repeatedly cleaned without damage.

- 1774 (HEDL-TME--77-66) FAST REACTOR SAFETY TECHNICAL PROGRESS REPORT, JANUARY--MARCH 1977. Simpson, D.E. (Hanford Engineering Development Lab., Richland, WA (USA)). Dec 1977. Contract EY-76-C-14-2170. 162p. AT.

The report presented describes technical progress made during the reporting period, by Westinghouse-Hanford Company and supporting contractors, on fast reactor safety programs. These programs summarized include reactor safety activities supportive of the Fast Flux Test Facility and associated with development of base LMFBR technology.

- 1775 (HEDL-TME--77-67) FAST REACTOR SAFETY TECHNICAL PROGRESS REPORT, APRIL--JUNE 1977. Simpson, D.E. (Hanford Engineering Development Lab., Richland, WA (USA)). Mar 1978. Contract EY-76-C-14-2170. 150p. Dep. NTIS (US Sales Only), PC A07/MF A01.

Progress is reported in the following studies related to FFTF and LMFBR safety: (1) reactor kinetics, (2) reactor safety, (3) system safety analysis, (4) safety development, (5) FSAR preparation and review, (6) safety test engineering, (7) fabrication development, and (8) safety systems development. (DG)

- 1776 (HEDL-TME--77-68) FAST REACTOR SAFETY. QUARTERLY TECHNICAL PROGRESS REPORT, JULY--SEPTEMBER 1977. Simpson, D.E. (Hanford Engineering Development Lab., Richland, WA (USA)). Nov 1978. Contract EY-76-C-14-2170.

175p. AT.

The report describes technical progress on fast reactor safety programs. These programs include reactor safety activities (a) supportive of the Fast Flux Test Facility and (b) associated with development of base FBR technology.

- 1777 (HEDL-TME--77-70) IRRADIATED EBR-II DUCT IMPACT TESTS. Fish, R.L.; Steichen, J.M.; Duncan, D.R. (Hanford Engineering Development Lab., Richland, WA (USA)). Aug 1977. Contract EY-76-C-14-2170. 47p. AT.

Experimental Breeder Reactor-II (EBR-II) duct components (annealed Type 304 SS) were impact-tested under loading and temperature conditions simulating fast reactor scrams. The ducts received a peak fluence of 9.8×10^{22} n/cm² (E greater than 0.1 MeV) during exposure in the EBR-II. The impact tests, performed on full duct components (45-in. long), used weights up to 13.6 kg (30 lb) which were dropped onto the upper end of the vertically-oriented components. These tests were conducted at 589°K and 811°K (600°F and 1000°F). To provide support stress-strain data for use in the analysis of duct impact test results, tensile tests were performed on specimens sectioned from a duct of equivalent fluence. Examinations of the duct components revealed no evidence of failure initiation or cracking due to the impact loads. Scanning electron fractography of tensile fracture surfaces showed no indication of low ductility "brittle" failure under the impact conditions simulated.

- 1778 (HEDL-TME--77-77) DIMENSIONAL ANALYSIS OF FFTF DRIVER FUEL ASSEMBLIES. Bunker, M.S.; Carlson, R.L. (Hanford Engineering Development Lab., Richland, WA (USA)). Sep 1977. Contract EY-76-C-14-2170. vp. AT.

Dimensional analysis is performed on Fast Flux Test Facility (FFTF) driver fuel assemblies using a computer program called DUCT. The program takes dial indicator readings from a dimensional gage, models a hexagonal column in three dimensions; and compares the resultant model against acceptance criteria for twist, offset, and centerline alignment, or bow. The document describes the mathematical derivation of the DUCT calculations, the benchmark tests conducted prior to implementation, the techniques governing measurement, and the acceptance procedure.

- 1779 (HEDL-TME--77-78) THERMAL SHOCK CONSIDERATIONS PERTAINING TO INITIAL FTR CORE LOADING AND REFUELING. Lacko, R.E. (Hanford Engineering Development Lab., Richland, WA (USA)). Aug 1977. Contract EY-76-C-14-2170. 33p. AT.

The results are presented of an analysis to determine the maximum allowable temperature differential between an FFTF fuel assembly and the reactor sodium pool that can be tolerated from the standpoint of thermal shock during initial core loading and subsequent refueling conditions. The analysis is based on a simplified and conservative one-dimensional thermal/inelastic stress model of an FFTF fuel assembly. The analysis shows that a fuel assembly must be preheated in the Core Component Conditioning Station (CCCS) to at least 280°F before loading into the reactor sodium pool, if the latter is assumed to be at 400°F refueling conditions.

- 1780 (HEDL-TME--77-79) EFFECT OF THERMAL CYCLING DURING IN-VESSEL STORAGE (IVS) OF FFTF

CORE COMPONENTS. Lacko, R.E. (Hanford Engineering Development Lab., Richland, WA (USA)). Aug 1977. Contract EY-76-C-14-2170. 41p. AT.

The results are presented of an analysis that addresses the effects of thermal cycling of FFTF core components while stored in the In-Vessel Storage (IVS) location of the FTR. The analysis incorporates the latest IVS temperature fluctuations measured during the FFTF Outlet Feature Model Tests performed at HEDL. The results show that thermal fatigue surface cracking is possible on the surface of an FFTF core component handling socket. Linear elastic fracture mechanics theory was used to evaluate the crack propagation from an initial assumed crack depth. The maximum depth of crack penetration is not sufficient to cause failure of the handling socket during removal of a core component assembly from the FFTF reactor during refueling operations.

- 1781 (HEDL-TME--77-80) ALLOWABLE COOLANT OUTLET TEMPERATURE DIFFERENTIALS FOR FTR TEST ASSEMBLIES IN DRIVER POSITIONS. Lacko, R.E. (Hanford Engineering Development Lab., Richland, WA (USA)). Aug 1977. Contract EY-76-C-14-2170. 20p. AT.

Results are reported of an analysis to establish allowable coolant outlet temperature differentials for driver position test assemblies relative to their surrounding assemblies in the Fast Test Reactor (FTR). The allowable coolant temperature differentials for driver position test assemblies supplement those previously established for an Open Test Assembly (OTA) and the surrounding assemblies. Both lower and upper bounds of a driver position test assembly coolant temperature differential relative to surrounding assemblies have been established for a range of FFTF core inlet coolant temperatures between 600°F and 680°F. The fuel assembly duct tube was found to be the critical structural member that limits the allowable sodium coolant temperature differential.

- 1782 (HEDL-TME--77-83) EX-REACTOR TRANSIENT FISSION GAS RELEASE STUDIES, FUEL PIN PNL-2-4. Hinman, C.A.; Slagle, D.D. (Hanford Engineering Development Lab., Richland, WA (USA)). May 1978. Contract EY-76-C-14-2170. 258p. AT.

Fast neutron irradiated UO₂--PuO₂ was rapidly heated at approximately 200°C/sec in a laboratory furnace. Transient gas release and fuel physical behavior were monitored during the rapid heating. Extensive microstructural examinations were conducted on the fuel which had been heated to various peak temperatures (less than melting). It was found that fission gas release behavior from PNL-2 fuel closely resembled earlier measured release rates from PNL-5 fuel. A gross-swelling temperature threshold exists for PNL-2 fuel between 2400°C and 2700°C. Neither grain boundary shattering nor thermal gradient induced diffusion of gas bubbles was observed. However, a high degree of nonequilibrium of gas bubble pressure and fuel surface tension was encountered. The evidence gathered in this work can be explained by a stress gradient directed forced diffusion mechanism.

- 1783 (HEDL-TME--77-85) PROGRESS IN RADIONUCLIDE TRAP DEVELOPMENT. McGuire, J.C.; Brehm, W.F. (Hanford Engineering Development Lab., Richland, WA (USA)). Dec 1977. Contract EY-76-C-14-2170. 28p. AT.

The report describes a radionuclide trap being developed to remove gamma-emitting

irradiation products from primary sodium in a liquid metal breeder reactor. The radionuclides, principally ^{54}Mn and ^{60}Co , are removed from sodium in the core area of the reactor to prevent their deposition in the heat exchanger. Prototype traps have been evaluated for the past three years and a full-scale version is now in test in EBR-II.

- 1784 (HEDL-TME--77-86) CALIBRATION OF A FUEL-TO-CLADDING GAP CONDUCTANCE MODEL FOR FAST REACTOR FUEL PINS. Baker, R.B. (Hanford Engineering Development Lab., Richland, WA (USA)). May 1978. Contract EY-76-C-14-2170. 132p. Dep. NTIS, PC A07/MF A01.

The report presents refined methods for calculation of fuel temperatures in $\text{PuO}_2\text{-UO}_2$ fuel in Fast Breeder Reactor (FBR) fuel pins. Of primary concern is the calculation of the temperature changes across the fuel-to-cladding gap of pins with fuel burnups that range from 60 to 10,900 Mwd/MTM (0.006 to 1.12 at.%). Described in particular are: (1) a proposed set of heat transfer formulations and corresponding material properties for modeling radial heat transfer through the fuel and cladding; and (2) the calibration of a fuel-to-cladding gap conductance model, as part of a thermal performance computer code (SIEX-M1) which incorporates the proposed heat transfer expressions, using integral thermal performance data from two unique in-reactor experiments. The test data used are from the HEDL P-19 and P-20 experiments which were irradiated in the Experimental Breeder Reactor Number Two (EBR-II), for the Hanford Engineering Development Laboratory (HEDL).

- 1785 (HEDL-TME--77-89) SWAB TEST: A METHOD TO DETERMINE SURFACE CONTAMINATION OF STAINLESS STEEL REACTOR COMPONENTS BY CHLORIDE AND FLUORIDE. Stromatt, R.W.; Lambert, M.C. (Hanford Engineering Development Lab., Richland, WA (USA)). Oct 1977. Contract EY-76-C-14-2170. 35p. AT.

A method--the swab test--to determine the surface contamination of stainless steel components of the Fast Flux Test Facility by chloride and fluoride is described. The Auger electron spectroscopy and analytical chemistry experiments to establish credibility for the procedure are presented.

- 1786 (HEDL-TME--77-91) THREE-DIMENSIONAL INELASTIC ANALYSIS OF A SMALL LIQUID SODIUM VALVE. Weiner, E.O. (Hanford Engineering Development Lab., Richland, WA (USA)). Feb 1978. Contract EY-76-C-14-2170. 198p. AT.

Portions of document are illegible.

A three-dimensional inelastic analysis of a small liquid sodium valve for the Fast Flux Test Facility was conducted to assess ratcheting and creep damage at temperatures to 1200°F using the MARC-CDC finite element program. A single mesh of twenty-node solid elements, representing the Y-type cylinder intersection is used for both the heat transfer and mechanical computer runs. Material behavior is governed by kinematic and creep strain hardening, and the loading consists of steady mechanical loads with cyclic fluid thermal transients. The resulting creep damage is significantly smaller than that of a corresponding axisymmetric analysis, and plastic strains are confined to a single region.

- 1787 (HEDL-TME--77-94) HEDL MIXED OXIDE FUELS FABRICATION DEVELOPMENT. QUARTERLY PROGRESS REPORT, JANUARY--MARCH 1977.

Bardsley, R.E. (comp.). (Hanford Engineering Development Lab., Richland, WA (USA)). Sep 1977. Contract EY-76-C-14-2170. 25p. Dep. NTIS, PC A02/MF A01.

Progress in LMFBR fuel fabrication development is described under the following headings: fuel characterization and attribute engineering, test fuel and pin fabrication, ANL/SLSF and IPE safety development pin fabrication, tag gas capsule fabrication, fuel assembly fabrication, and FFTF test articles.

- 1788 (HEDL-TME--77-95) LMFBR MIXED OXIDE FUELS FABRICATION DEVELOPMENT SEMIANNUAL, JANUARY--JUNE 1977. Bardsley, R.E. (comp.). (Hanford Engineering Development Lab., Richland, WA (USA)). Sep 1977. Contract EY-76-C-14-2170. 30p. AT.

Work is reported on the following: fuel characterization and attribute engineering, high-performance oxide fabrication studies, ANL/SLSF and IPE safety development fuel pin fabrication, test fuel and pin fabrication, tag gas capsule fabrication, fuel assembly fabrication development, fuel assembly, and FFTF test articles. (DLC)

- 1789 (HEDL-TME--77-96) COUPLE M: A COMPUTER PROGRAM WHICH MODELS THERMAL-HYDRAULIC AND DIMENSIONAL CHANGE BEHAVIOR OF A MULTI-PIN FBR FUEL ASSEMBLY. Shearer, D.M. (Hanford Engineering Development Lab., Richland, WA (USA)). Nov 1977. Contract EY-76-C-14-2170. 58p. AT.

The COUPLE M computer program is presented. COUPLE M models both the thermal-hydraulic and dimensional change behavior of Fast Breeder Reactor fuel assembly during irradiation. The program is described and input instructions and variables are given. A program listing and sample problem are provided in the appendix.

- 1790 (HEDL-TME--77-98) MGO INSULATED COAXIAL INSTRUMENT CABLE DEVELOPMENT FOR FFTF IN-VESSEL TEMPERATURE AND VOLTAGE CONDITIONS. Chan, A.I.Y.; Cannon, C.P. (Hanford Engineering Development Lab., Richland, WA (USA)). Oct 1978. Contract EY-76-C-14-2170. 33p. Dep. NTIS, PC A03/MF A01.

MgO insulated nuclear instrument cable designed for use in the Fast Flux Test Facility or breeder reactor in-vessel service environments were successfully tested to temperatures to 650°C. Breakdown Pulse Noise (BPN) thresholds in excess of 800 Vdc at 650°C were achieved on the bulk cable; cable resistivities at 650°C were 10⁶ ft. The effect of 1000°C annealing was a minimal reduction of cable resistivity with no observed effect on BPN threshold. No differences in insulation resistance and BPN thresholds were detected between cables containing copper electrical conductors and cables containing Inconel 600 conductors. Thus a copper conductor cable type was established to be suitable for both signal transmission and high voltage bias applications. The tested bulk cables exceeded final cable development program objectives: no BPN at 650°C, 800 Vdc continuous, and 10⁶ ft resistivity at 550°C in copper conductor MgO insulated bulk cables.

- 1791 (HEDL-TME--77-99) INTERMEDIATE SCALE SODIUM-CONCRETE REACTION TESTS. Hassberger, J.A. (Hanford Engineering Development Lab., Richland, WA (USA)). Mar 1978. Contract EY-76-C-14-2170. 160p. AT.

Twelve intermediate scale, sodium-concrete reaction tests have been completed. These tests involve spilling hot (1250 to 1600°F, 677 to

871°C) sodium onto 1 ft³ (0.028 m³) specimens of magnetite or limestone concretes. The resulting reactions were allowed to continue for from 2 to 24 hours, at which time the sodium was decanted from the test article. Included are discussions of the observed penetration depths, chemical analyses of the reaction products, characterization of the evolved gasses and a brief summary of laboratory scale experiments performed earlier.

- 1792 (HEDL-TME--77-100) EXPERIENCE IN THE ANALYSIS OF NUCLEAR-GRADE BORON CARBIDE. Stromatt, R.W.; Delvin, W.L. (Hanford Engineering Development Lab., Richland, WA (USA)). Apr 1978. Contract EY-76-C-14-2170. 197p. Dep. NTIS (US Sales Only), PC A09/MF A01.

A review of the analytical chemistry methods used at the Hanford Engineering Development Laboratory (HEDL) for the analysis of boron carbide and a summary of results obtained from the analysis of the boron carbide during fabrication of control rods for the Fast Flux Test Facility (FFTF) are presented. A brief review of the qualification and control program that governed the analytical chemistry laboratories during production of pellets for use with FFTF cores I and II is included. Detailed HEDL analytical chemistry methods are given in the Appendix.

- 1793 (HEDL-TME--77-102) HIGH TEMPERATURE LINER FEATURE TEST, FT-3. Simmons, L.D.; Wierman, R.W.; Jensen, R.L. (Hanford Engineering Development Lab., Richland, WA (USA)). Feb 1978. Contract EY-76-C-14-2170. 76p. AT.

The High Temperature Liner Feature Test, FT-3, was designed to test the adequacy of one wall design for breeder reactor cavity or equipment cell liners to sustain the rapid heating from an accidental liquid metal coolant spill without failure or leakage. A segment of a cylindrical wall, with steel liner plate welded to steel structure embedded in the structural concrete, was heated rapidly by radiant heaters. The liner plate buckled early in the test so that stresses in the liner were limited to the magnitude required to cause buckling, and no liner or structural failure occurred. The rapid heating caused extensive shallow fracturing in the concrete directly behind the liner plate, but this was judged to have no adverse consequences and did not affect the integrity of the liner.

- 1794 (HEDL-TME--77-105) EVALUATION OF ROD DROP STABILITY TESTS IN FFTF. Harris, R.A.; Sevenich, R.A. (Hanford Engineering Development Lab., Richland, WA (USA)). Jan 1978. Contract EY-76-C-14-2170. 55p. AT.

An evaluation of the adequacy of rod drop-type experiments to verify the stability margin in the FFTF is presented. This evaluation is based on simulations using models with the expected characteristics of the reactor. The assumed driving function for the experiments is the scrambling of a nearly fully inserted secondary control rod. It is shown that an adequate stability margin can be assured from the inferred Nyquist diagrams of the open-loop transfer function. The experiments cannot resolve the magnitude of the individual feedback mechanisms; therefore, predictions of the stability margins at reactor states other than the measurement state must rely on extrapolations of feedback mechanism magnitudes estimated from other corollary experiments or the wide stability margin expected in the FFTF. Positioning of the drop rod will result in a

major perturbation on the spatial power density in the reactor and thus will have a significant impact on nearby irradiation test subassemblies during the actual testing period.

- 1795 (HEDL-TME--77-107) DETECTION OF FEEDBACK RESONANCES IN FFTF USING ROD DROP STABILITY TESTS. Harris, R.A. (Hanford Engineering Development Lab., Richland, WA (USA)). Feb 1978. Contract EY-76-C-14-2170. 24p. AT.

An analysis is presented of simulated rod drop experiments in the Fast Flux Test Facility using reactor models with unanticipated resonant behavior. The analysis shows that a narrow resonance in the reactor transfer function should be detected if it resulted in an increase in the frequency response function gain of 26% over the gains at nearby frequencies. This detection level assumes no prior knowledge of the resonance and no attempt to model it in the analysis. Changes in the total reactor frequency response function gain of approximately 13% are shown to be detectable if consistent experimental data before and after the change are available.

- 1796 (HEDL-TME--77-108) REACTIVITY SURVEILLANCE PROCEDURES FOR ANOMALY DETECTION. Harris, R.A. (Hanford Engineering Development Lab., Richland, WA (USA)). Jan 1978. Contract EY-76-C-14-2170. 76p. AT.

The procedures for detecting unexpected reactivity changes in the FFTF are presented. These procedures are implemented on the Digital Data Handling and Display System (DDH and DS) and thus provide rapid indication of abnormal conditions within the core. The algorithms which use the thermal-hydraulic, the control rod position and the neutron flux sensor information to predict the reactivity state of the core are described and are shown to be adequate for the currently planned mode of operation of the reactor. Sufficient flexibility exists to revise these algorithms to reflect observed reactivity state characteristics by using calibration procedures. These procedures are also discussed. The expected uncertainties in the procedures due to uncertainties in both the sensors and algorithms are presented. These show that for acceptable false alarm rates, the alarm limit must be set fairly high (approximately 20 cents after calibration of the procedures) during major power changes. The limit may ultimately be reduced to approximately ± 2 cents for steady power operation.

- 1797 (HEDL-TME--77-109) BREEDER REACTOR REFERENCE CONTROL MATERIALS. SEMIANNUAL REPORT, JULY--DECEMBER 1977. Roake, W.E. (Hanford Engineering Development Lab., Richland, WA (USA)). Aug 1978. Contract EY-76-C-14-2170. 43p. AT.

Progress on neutron absorber development activities from July 1977 through December 1977 is presented. Included in the report are descriptions of activities related to performance analyses, development testing and fabrication technology.

- 1798 (HEDL-TME--78-1) LARGE HETEROGENEOUS REFERENCE FUEL DESIGN STUDY. FINAL REPORT. Chandler, J.C.; Marr, D.R.; McCurry, D.C.; Cantley, D.A.; Omberg, R.P. (Hanford Engineering Development Lab., Richland, WA (USA)). Jul 1978. Contract EY-76-C-14-2170. 121p. Dep. NTIS, PC A06/MF A01.

The fuel pin geometry used in the Fast Test

Reactor (FTR) and considered for use in a prototypic small breeder installation has been evaluated through a comprehensive development program during recent years so that an extensive data base exists for extrapolation of the FTR fuel pin and geometry to larger installations. The objectives of the Large Heterogeneous Reference Fuel Design Study (LHRFDS) were to evaluate the performance capabilities of the reference FTR fuel pin in a 1200 MWe reactor plant installation and to identify a corresponding optimum core design. For purposes of the study, a reference fuel assembly was defined, corresponding to the FTR fuel pin with axial blankets placed in a 217-pin assembly. The reference assembly was used to define a reference core, which approximated FTR technology extrapolated to prototypic small breeder conditions. Performance indices of the reference core were provided by ARD during the study.

- 1799 (HEDL-TME--78-10) FFTF VIBRATION OPEN TEST ASSEMBLY (VOTA) ENGINEERING MODEL CALIBRATION PROGRAM. White, R.G.; Simmons, M.D. (Hanford Engineering Development Lab., Richland, WA (USA)). Jun 1978. 70p. AT. Natural frequencies, mode shapes, and damping values were experimentally determined for an engineering model of the Fast Flux Test Facility (FFTF) vibration open test assembly (VOTA), and optimum accelerometer locations were determined for the VOTA plant unit. Testing was conducted at ambient temperature in air and quiescent water. The VOTA was installed in a closed-loop in-reactor assembly (CLIRA) spoolpiece and a prototypic inlet nozzle receptacle and liner. During the application of random excitation, dynamic response data were acquired for each of a variety of constraints applied to the VOTA top load pad and above-core load pad.

- 1800 (HEDL-TME--78-11) TIME STEP MOTA THERMOSTAT SIMULATION. Guthrie, G.L. (Hanford Engineering Development Lab., Richland, WA (USA)). Sep 1978. Contract EY-76-C-14-2170. 29p. Dep. NTIS, PC A03/MF A01.

The report details the logic, program layout, and operating procedures for the time-step MOTA (Materials Open Test Assembly) thermostat simulation program known as GYRD. It will enable prospective users to understand the operation of the program, run it, and interpret the results. The time-step simulation analysis was the approach chosen to determine the maximum value gain that could be used to minimize steady temperature offset without risking undamped thermal oscillations. The advantage of the GYRD program is that it directly shows hunting, ringing phenomenon, and similar events. Programs BITT and CYLB are faster, but do not directly show ringing time.

- 1801 (HEDL-TME--78-12) SMALL THERMAL OSCILLATION ANALYSIS OF THE MOTA. Guthrie, G.L. (Hanford Engineering Development Lab., Richland, WA (USA)). Sep 1978. Contract EY-76-C-14-2170. 57p. Dep. NTIS, PC A04/MF A01.

The MOTA (Materials Open Test Assembly) was designed to achieve a degree of thermal regulation compatible with the generation of useful materials property data obtained by irradiation of candidate reactor structural materials in the FFTF. Attaining a high degree of regulation is limited by the necessity to avoid undamped thermal oscillations. The report documents some of the analyses used to select useable configurations and determine effects of

parameter choices, and investigates limitations on allowable gains of the sensor-control-valve assembly. The main purpose of the document is to make the methods available to others, rather than to give a tabulation of specific numerical results.

- 1802 (HEDL-TME--78-13) MECHANICAL BEHAVIOR OF FAST REACTOR FUEL PIN CLADDING SUBJECTED TO SIMULATED OVERPOWER TRANSIENTS. Johnson, G.D.; Hunter, C.W. (Hanford Engineering Development Lab., Richland, WA (USA)). Jun 1978. Contract EY-76-C-14-2170. 195p. Dep. NTIS, PC A09/MF A01.

Cladding mechanical property data for analysis and prediction of fuel pin transient behavior were obtained under experimental conditions in which the temperature ramps of reactor transients were simulated. All cladding specimens were 20% CW Type 316 stainless steel and were cut from EBR-II irradiated fuel pins. It was determined that irradiation degraded the cladding ductility and failure strength. Specimens that had been adjacent to the fuel exhibited the poorest properties. Correlations were developed to describe the effect of neutron fluence on the mechanical behavior of the cladding. Metallographic examinations were conducted to characterize the failure mode and to establish the nature of internal and external surface corrosion. Various mechanisms for the fuel adjacency effect were examined and results for helium concentration profiles were presented. Results from the simulated transient tests were compared with TREAT test results.

- 1803 (HEDL-TME--78-14) GAS TAG LOCATION SYSTEMS FOR FFTF AND CRBRP FAILED ASSEMBLIES. Figg, J.A.; McCormick, N.J.; Schenter, R.E.; Schmittroth, F.; DeClue, J.F.; Holt, F.E. (Hanford Engineering Development Lab., Richland, WA (USA)). Jul 1978. Contract EY-76-C-14-2170. 136p. AT.

The report is directed at the computational aspects associated with the gas tag location system. The analytical techniques used to select the isotopic composition of the gases and the computer program to prescribe the blending of the gas mixtures during fabrication are described, and the computer program for identifying a failed assembly using the measured ratios is discussed. The tag compositions for the FFTF and CRBRP reactors also are presented along with sample calculations for the identification of failed assemblies using postulated tag gas releases.

- 1804 (HEDL-TME--78-18) FFTF PREOPERATIONAL ENVIRONMENTAL SURVEY PROGRAM. Horning, T.W. (Hanford Engineering Development Lab., Richland, WA (USA)). Mar 1978. Contract EY-76-C-14-2170. 35p. AT.

The Preoperational Environmental Survey Program establishes a pre-startup (initial criticality) background data base which is essential for comparative evaluation of routine monitoring information. Type, frequency, and location of specific surveys are consistent with those required by the Environmental Technical Specifications for the Fast Flux Test Facility (FFTF FSAR Chapter 18). The objective of the radiological monitoring program is to quantify concentrations of radioactive materials and direct radiation levels in the environs in order to verify that as a result of plant operations, persons in unrestricted areas do not receive radiation doses greater than those specified in 10 CFR 50 Appendix I. In addition, measurements will provide assurance that off-site doses resulting from radioactive materials in plant effluents are as low as

practicable. These goals should be accomplished by the environmental monitoring program outlined. It is emphasized that the FFTF is one of several facilities on the Hanford site. The environmental impact to unrestricted areas attributable to FFTF operations will be evaluated as part of the overall determination of the impact due to all Hanford facilities. However, only programs which are directly applicable to measurement of the environmental effects of the FFTF are discussed as part of the FFTF Routine Environmental Monitoring Program.

- 1805 (HEDL-TME--78-20) SODIUM ENGINEERING AND TECHNOLOGY TECHNICAL PROGRESS REPORT, JANUARY, FEBRUARY, MARCH 1978. Atwood, J.M. (comp.). (Hanford Engineering Development Lab., Richland, WA (USA)). Aug 1978. Contract EY-76-C-14-2170. 102p. AT.

The report presents a quarterly summary of progress made at Westinghouse Hanford Company in the areas of radioactivity control technology, sodium systems technology, hydraulics and mechanics, and safety systems development.

- 1806 (HEDL-TME--78-21) SODIUM ENGINEERING AND TECHNOLOGY. TECHNICAL PROGRESS REPORT, APRIL, MAY, JUNE 1978. Atwood, J.M. (Hanford Engineering Development Lab., Richland, WA (USA)). Nov 1978. Contract EY-76-C-14-2170. 147p. AT.

Progress in LMFR-related research is reported under the following headings: radioactivity control technology, sodium systems technology, safety systems development, hydraulics, and mechanics.

- 1807 (HEDL-TME--78-21) SODIUM ENGINEERING AND TECHNOLOGY. TECHNICAL PROGRESS REPORT, APRIL, MAY, JUNE 1978. Atwood, J.M. (comp.). (Hanford Engineering Development Lab., Richland, WA (USA)). Nov 1978. Contract EY-76-C-14-2170. 146p. AT.

This report presents a quarterly summary of progress made at Westinghouse Hanford Company in the areas of radioactivity control technology, sodium systems technology, safety systems development, and hydraulics and mechanics.

- 1808 (HEDL-TME--78-23) SODIUM VAPOR DEPOSIT TECHNOLOGY. Funk, C.W. (Hanford Engineering Development Lab., Richland, WA (USA)). Sep 1979. Contract EY-76-C-14-2170. 93p. AT.

This report reviews available technology of sodium vapor deposits in sodium cooled reactors; describes operational problems attributed to such deposits; and discusses processes for deposit formation, removal, and prevention. The document presents data concerning the amount, appearance, condition, and effect of deposits on performance of Fast Flux Test Facility (FFTF) components exposed to high-temperature sodium vapor during testing. Components examined include various reactor plugs, the in-vessel handling machine, and the instrument tree.

- 1809 (HEDL-TME--78-28) OPERATIONAL EXPERIENCE WITH A MODIFIED LIQUID METAL OXYGEN METER. Chulos, L.E.; Rake, R.R. (Hanford Engineering Development Lab., Richland, WA (USA)). May 1978. Contract EY-76-C-14-2170. 19p. AT.

A commercially available air reference electrode liquid metal oxygen activity meter was modified for use in a flowing sodium

system. The unmodified air reference electrode meter requires a layer of vapor-deposited platinum on the ceramic electrolyte to complete electrical contact. Failure of this meter would release platinum to the loop sodium, which would interfere with analysis of mass transfer deposits. The modified meter eliminates the platinum and exhibits better conductivity for faster response to changes in oxygen concentration. It is also more rugged, which contributes to longer meter life.

- 1810 (HEDL-TME--78-35) COMPARISON OF CONTAINMENT SYSTEMS FOR LARGE SODIUM-COOLED BREEDER REACTORS. Seeman, S.E.; Armstrong, G.R. (Hanford Engineering Development Lab., Richland, WA (USA)). Apr 1978. Contract EY-76-C-14-2170. 199p. Dep. NTIS, PC A09/MF A01.

Three types of containment configurations for large breeder reactors (1000 MWe/2500 MWt) were compared to determine characteristic responses of each type to selected hypothetical accident conditions. The three types of system configurations were the single, double and containment-confinement designs. Two types of postulated hypothetical accidents were applied as a basis for evaluation--the energetic core disassembly accident and the whole core melt-through accident. More than 20 separate cases were analyzed in which design and accident assumptions were varied. Based on this study the containment-confinement configuration is shown to be the most promising for limiting off-site radiation doses for large sodium-cooled breeder reactors given the specific assumptions on the initial accident conditions.

- 1811 (HEDL-TME--78-36) FRICTION, WEAR, CORROSION, AND SELF-WELDING OF TRIBALOG 700 HARDSURFACING IN SODIUM. Johnson, R.N.; Farwick, D.G. (Hanford Engineering Development Lab., Richland, WA (USA)). Jul 1978. Contract EY-76-C-14-2170. 83p. AT.

Tribalog 700 is a nickel-base hardsurfacing alloy that exhibits low friction, excellent wear resistance, and low corrosion rates in sodium; as such, it is well suited for use in high temperature liquid metal environments. Its freedom from cobalt makes it particularly attractive for nuclear applications. Tribalog 700, rubbing against itself in sodium, exhibits among the lowest friction coefficients measured for metallic materials at high temperatures. In thermal cycling tests in sodium, detonation-gun coatings were unaffected by 120 cycles while all plasma coatings, except a special duplex coating, cracked or spalled within 30 cycles. Tribalog 700 showed good resistance to self-welding at temperatures up to 540°C (1000°F) in sodium and at temperatures up to 315°C (600°F) in argon and sodium vapor. The physical properties of Tribalog 700 are also described.

- 1812 (HEDL-TME--78-38) NATIONAL FRICTION, WEAR, AND SELF-WELDING PROGRAM STATUS AND PLANS. Johnson, R.N. (Hanford Engineering Development Lab., Richland, WA (USA)). Jul 1978. Contract EY-76-C-14-2170. 95p. AT.

This report documents the status and plans of the National Friction, Wear, and Self-Welding Program. The primary objective of this program is to qualify materials for tribological applications through selection, development, and testing activities. The long-term goal is to develop a base list of well-characterized, wear-resistant materials, practical and economical fabrication process, and qualified sources of supply. The report reviews the status of testing and development activities, identifies program needs, and

recommends courses of action and priorities for future testing and development.

- 1813 (HEDL-TME--78-38) NATIONAL FRICTION, WEAR, AND SELF-WELDING PROGRAM STATUS AND PLANS. Johnson, R.N. (Hanford Engineering Development Lab., Richland, WA (USA)). Jul 1978. Contract EY-76-C-14-2170. 92p. AT.

The report documents the status and plans of the National Friction, Wear, and Self-Welding Program. The primary objective of this program is to qualify materials for tribological applications through selection, development, and testing activities. The long-term goal is to develop a base list of well-characterized, wear-resistant materials, practical and economical fabrication process, and qualified sources of supply. The report reviews the status of testing and development activities, identifies program needs, and recommends courses of action and priorities for future testing and development.

- 1814 (HEDL-TME--78-39) SUBCRITICAL REACTIVITY MONITORING: NEUTRON YIELDS FROM SPONTANEOUS (α, n) REACTIONS IN FFTF FUEL. Ombrellaro, P.A.; Johnson, D.L. (Hanford Engineering Development Lab., Richland, WA (USA)). Jun 1978. Contract EY-76-C-14-2170. 37p. Dep. NTIS (US Sales Only), PC A03/MF A01.

Neutron yields resulting from the reaction of alpha particles emitted by heavy metal isotopes with isotopes of oxygen are evaluated. The yields are evaluated for various alpha-decaying isotopes that are initially present or built up during irradiation in FFTF fuels. Calculations are performed using a sum of probabilities for $^{17}\text{O}(\alpha, n)^{20}\text{Ne}$ and $^{18}\text{O}(\alpha, n)^{21}\text{Ne}$ reactions in fuels which have been evaluated using basic nuclear data. The calculated yields are in agreement with those found in the literature except for the ^{242}Cm and ^{244}Cm isotopes of curium where the discrepancy is approximately one order of magnitude. The curium isotopes are present only in irradiated fuel and build up with increased irradiation. However, for ^{244}Cm the predominant contribution of neutrons to the total neutron source results from spontaneous fission rather than the (α, n) reactions of the alpha particles emitted by ^{244}Cm with oxygen. For ^{242}Cm , the discrepancy is more significant since previous evaluations of the (α, n) yield showed it to be comparable to the spontaneous fission yield. The method used for the calculation of the (α, n) reaction yields provide the most accurate neutron yield evaluation currently available with existing nuclear data.

- 1815 (HEDL-TME--78-42) CORE ENGINEERING TECHNICAL PROGRESS REPORT, JANUARY, FEBRUARY, MARCH 1978. Peterson, R.E. (Hanford Engineering Development Lab., Richland, WA (USA)). Jun 1978. Contract EY-76-C-14-2170. 116p. Dep. NTIS, PC A06/MF A01.

Progress in FFTF core development is summarized for the following study areas: reactor kinetics, radiation and shield analysis, and core design. (DG)

- 1816 (HEDL-TME--78-43) CORE ENGINEERING TECHNICAL PROGRESS REPORT, APRIL, MAY, JUNE 1978. Peterson, R.E. (Hanford Engineering Development Lab., Richland, WA (USA)). Nov 1978. Contract EY-76-C-14-2170. 102p. AT.

Progress is summarized in the following FFTF core development areas: core physics, radiation and shield analysis, and core design. (DG)

- 1817 (HEDL-TME--78-46) SODIUM FLOW DISTRIBUTION IN TEST FUEL ASSEMBLY P-23B. Taylor, J.P.S. (Hanford Engineering Development Lab., Richland, WA (USA)). Aug 1978. Contract EY-76-C-14-2170. 83p. Dep. NTIS, PC A05/MF A01.

Relatively large cladding diametral increases in the exterior fuel pins of HEDL's test fuel subassembly P-23B were successfully explained by a thermal-hydraulic/solid mechanics analysis. This analysis indicates that while at power, the subassembly flow was less than planned and that the fuel pins were considerably displaced and bowed from their nominal position. In accomplishing this analysis, a method was developed to estimate the sodium flow distribution and pin distortions in a fuel subassembly at power.

- 1818 (HEDL-TME--78-51) DUCTILITY AND STRENGTH OF FFTF/CRBRP STRUCTURAL MATERIALS IRRADIATED IN VARIOUS SPECTRA. INTERIM REPORT. Ward, A.L.; Blackburn, L.D. (Hanford Engineering Development Lab., Richland, WA (USA)). Aug 1978. Contract EY-76-C-14-2170. 76p. AT.

Tension test results have been obtained for the initial half of the FFTF/CRBRP Structural Materials Irradiation Experiment which was designed to investigate in EBR-II the relatively low temperature (659 to 676°K) effects of neutron fluence (to $6.4 \times 10^{22} \text{ n/cm}^2$) interpretation of behavioral and spectrum (average neutron energies from 0.19 to 0.77 MeV) on the strength and ductility of 304 SS, 316 SS, weld-deposited 308L SS and Alloy 718. An interim (fluence of $1.9 \times 10^{22} \text{ n/cm}^2$) interpretation of behavioral trends in these materials as they relate to fluence limits for out-of-core FBR component applications indicates that, by comparison, the energy-independent fluence limits for 0.10 residual tensile elongation currently in use for CRBRP are conservative for the stainless steel materials.

- 1819 (HEDL-TME--78-52) ASSESSMENT OF THE HEDL P-23 SPECIAL PINS TEST. METHODS TO CONTROL FUEL-CLADDING CHEMICAL INTERACTION. Wilson, C.W. (Hanford Engineering Development Lab., Richland, WA (USA)). Oct 1978. Contract EY-76-C-14-2170. 130p. AT.

An irradiation experiment was conducted in Experimental Breeder Reactor-II (EBR-II) to evaluate placement of chromium, niobium, titanium, and vanadium into Liquid Metal Fast Breeder Reactor (LMFBR) fuel pins for the purpose of controlling fuel-cladding chemical interaction (FCCI). Effective FCCI inhibition was dependent on adequate axial dispersal of absorber materials and was achieved with Nb and V fuel coatings. Nondestructive examination data from 21 fuel pins and destructive examination data from 11 fuel pins are assessed.

- 1820 (HEDL-TME--78-57) USER'S MANUAL HEATUP CLOSED CELL H AND V FAILURE TRANSIENT ANALYSIS CODE. Chandler, J.C. (Hanford Engineering Development Lab., Richland, WA (USA)). Jun 1978. Contract EY-76-C-14-2170. 128p. Dep. NTIS, MF A01.

Portions of document are illegible. HEATUP, a closed cell cooling system failure transient analysis code for Liquid Metal Fast Breeder Reactor (LMFBR) licensing analyses is described. The code replaces a modified version of SOFIRE-II formerly used for cooling failure analyses on the Fast Flux Test Facility (FFTF). HEATUP calculates heat transfer rates within

the cell structure and produces temperature and pressure histories based on input-controlled process sodium conditions. The output is designed to be readily usable for emergency load sequencing and structural analyses.

- 1821 (HEDL-TME--78-66) ANALYSIS OF FUEL-CLADDING CHEMICAL INTERACTION IN MIXED-OXIDE FUEL AT HIGH BURNUP. Lawrence, L.A.; Weber, J.W.; Devary, J.L. (Hanford Engineering Development Lab., Richland, WA (USA)). Jul 1978. Contract EY-76-C-14-2170. 52p. Dep. NTIS, PC A04/MF A01.

The character and extent of fuel-cladding chemical interaction (FCGI) were established for mixed uranium-plutonium oxide fuels at an initial oxygen-to-metal ratio of 1.984 irradiated in EBR-II to a peak burnup of approximately 90.0 MWd/kgM. Depths of interaction were correlated with fuel pin operating conditions, i.e., burnup and temperature, and results discussed in terms of a change in reaction kinetics.

- 1822 (HEDL-TME--78-69) BREEDER REACTOR REFERENCE CONTROL MATERIALS. SEMIANNUAL STATUS NEWSLETTER, JANUARY--JUNE 1978. Roake, W.E. (Hanford Engineering Development Lab., Richland, WA (USA)). Dec 1978. Contract EY-76-C-14-2170. 70p. AT.

Progress on neutron absorber development activities from January 1978 through June 1978 is presented. Included in the report are descriptions of activities related to performance analyses, development testing and fabrication technology.

- 1823 (HEDL-TME--78-78) GAS COOLING TEST WITH A FULL-SCALE 217-PIN BUNDLE ASSEMBLY. Boasso, C.J.; Madson, A.A. (Hanford Engineering Development Lab., Richland, WA (USA)). Nov 1978. Contract EY-76-C-14-2170. 203p. AT.

In forced-convection argon gas, the heat-transfer characteristics of a modified, electrically-heated, 217-pin Fast Flux Test Facility (FFTF) fuel bundle are investigated. Test data is presented to supplement analytical productions of heat transfer in a forced argon convection mode for expended FFTF and Clinch River Breeder Reactor fuel assemblies. The test assembly is described in detail, with attention focused on the 217-pin electrically-heated fuel bundle. Test variables, including assembly power, argon flow rate, and fuel assembly pressure drop are presented and discussed.

- 1824 (HEDL-TME--78-80) EXPERIMENTAL STUDY OF HYDROGEN JET IGNITION AND JET EXTINGUISHMENT. Wierman, R.W. (Hanford Engineering Development Lab., Richland, WA (USA)). Apr 1979. Contract EY-76-C-14-2170. 114p. Dep. NTIS, PC A06/MF A01.

Two phases are described of an experimental study that investigated: (1) the ignition characteristics of hydrogen--sodium jets, (2) the formation of hydrogen in sodium--humid air atmospheres, and (3) the extinguishment characteristics of burning hydrogen--sodium jets. Test conditions were similar to those postulated for highly-improbable breeder reactor core melt-through accidents and included: jet temperature, jet velocity, jet hydrogen concentration, jet sodium concentration, atmospheric oxygen concentration, and atmospheric water vapor concentration.

- CAPTURE OF CONDENSIBLE AIRBORNE CONTAMINANTS IN AN AQUEOUS SCRUBBING SYSTEM. Postma, A.K.; Hilliard, R.K. (Hanford Engineering Development Lab., Richland, WA (USA)). Sep 1978. Contract EY-76-C-14-2170. 84p. Dep. NTIS, PC A05/MF A01.

The fate of condensible contaminants in an aqueous scrubbing system was evaluated. Knowledge of the behavior of volatile fission product compounds is important in evaluating the effectiveness of emergency air cleaning systems proposed for use in containment systems of breeder reactor plants. When a high temperature air stream passes through a spray quench chamber, very large cooling rates occur in the drop boundary layers. These large cooling rates cause large supersaturations in airborne concentrations of condensible contaminants, and one predicts that most condensation would take place through homogeneous nucleation. The very small particles formed would agglomerate, and attach to sodium aerosol particles which would be present. In the study the overall removal efficiency of volatile fission product species (typified by NaI, SeO₂, and Sb₂O₃) in an air cleaning train (quench chamber, venturi scrubber, and fibrous bed) was theoretically evaluated. The overall removal efficiency of condensible materials was found to be lower than that for sodium compound aerosols because the freshly condensed particles would be smaller in size. For a base case, a removal efficiency of 99.97 percent was predicted for condensible materials. The fibrous bed scrubber exhibited superior particle removal characteristics for small particles compared to the quench chamber and venturi scrubber. Its removal efficiency exceeded 97 percent for even the most penetrating particle size (about 0.4 micron aerodynamic diameter). Therefore, all condensible fission products would be removed with efficiencies exceeding 97 percent.

- 1826 (HEDL-TME--78-84) EBR-II SPECTRAL PARAMETERS, RUN 75D. Long, C.L.; Uiseth, J.A.; Lippincott, E.P.; Graves, N.J. (Hanford Engineering Development Lab., Richland, WA (USA)). Mar 1979. Contract EY-76-C-14-2170. 77p. Dep. NTIS, PC A05/MF A01.

A dosimetry flux mapping experiment was performed in the EBR-II reactor during Run 75D. Fission and reaction rate data were analyzed from 54 flux spectral sets, containing up to 18 dosimeters and numerous interspersed Fe gradient wires, located in six subassemblies from Row 2 out through Row 8. The dosimeters were located axially from 70 cm below to 75 cm above reactor midplane. The fission and reaction rate data were used to generate neutron spectra from which r, z matrices of nuclear parameters were generated. The report includes parameter matrices for total flux, flux with $E > 0.1$ MeV, neutron average energy (E_{bar}), and atom displacement cross section values for stainless steel.

- 1827 (HEDL-TME--78-89) SPENT THERMAL REACTOR FUEL ASSEMBLY CHARACTERIZATION WITH SOLID STATE TRACK RECORDERS. Gold, R.; Ruddy, F.H.; Lippincott, E.P.; McElroy, W.N.; Roberts, J.H. (Hanford Engineering Development Lab., Richland, WA (USA)). Jun 1979. Contract EY-76-C-14-2170. 35p. Dep. NTIS, PC A03/MF A01.

A scoping experiment to characterize the neutron field generated from a Light Water Reactor spent fuel assembly has been successfully completed. Solid State Track Recorder (SSTR) neutron dosimeters were exposed at the surface of a spent fuel assembly from a Pressurized Water Reactor. Acceptable track

- 1825 (HEDL-TME--78-82) NUCLEATION AND

densities were obtained. From these SSTR neutron dosimetry measurements, an absolute neutron flux of about 8×10^3 n/cm² sec was determined at the surface of the spent fuel assembly deduced neutron energy flux, with a mean neutron energy of about 1.3 MeV, is intimately dependent upon the actinide content of the spent fuel.

1828 (HEDL-TME--78-90) SODIUM TECHNOLOGY PROGRESS REPORT, JANUARY--MARCH 1978. Atwood, J.M. (comp.). (Hanford Engineering Development Lab., Richland, WA (USA)). Jan 1979. Contract EY-76-C-14-2170. 65p. AT.
This report presents a quarterly summary of progress made at Westinghouse Hanford Company in the areas of LMFBR-related radioactivity control technology and sodium systems technology.

1829 (HEDL-TME--78-91) SODIUM TECHNOLOGY. PROGRESS REPORT, APRIL--JUNE 1978. Atwood, J.M. (comp.). (Hanford Engineering Development Lab., Richland, WA (USA)). Jan 1979. Contract EY-76-C-14-2170. 81p. AT.
The report presents a quarterly summary of progress made at Westinghouse Hanford Company in the areas of radioactivity control technology and sodium systems technology.

1830 (HEDL-TME--78-92) SODIUM TECHNOLOGY PROGRESS REPORT, JULY--SEPTEMBER 1978. Atwood, J.M. (comp.). (Hanford Engineering Development Lab., Richland, WA (USA)). Jan 1979. Contract EY-76-C-14-2170. 57p. AT.
The report presents a quarterly summary of progress made at Westinghouse Hanford Company in the areas of radioactivity control technology and sodium systems technology.

1831 (HEDL-TME--78-93) SODIUM TECHNOLOGY PROGRESS REPORT, OCTOBER--DECEMBER 1978. Atwood, J.M. (comp.). (Hanford Engineering Development Lab., Richland, WA (USA)). Mar 1979. Contract EY-76-C-14-2170. 67p. AT.
This report presents a quarterly summary of progress made at Westinghouse Hanford Company in the areas of radioactivity control technology and sodium systems technology.

1832 (HEDL-TME--78-99) SPECIMEN SIZE CONSIDERATIONS IN FATIGUE--CRACK GROWTH RATE TESTING. James, L.A. (Hanford Engineering Development Lab., Richland, WA (USA)). Dec 1978. Contract EY-76-C-14-2170. 34p. Dep. NTIS, PC A03/MF A01.

The effect of specimen size upon the fatigue-crack growth behavior of annealed AISI Type 304 stainless steel was studied at two stress ratios at an elevated temperature. The resulting data were examined in the light of the present ASTM size criterion (based upon monotonic yield strength) as well as a proposed criterion based upon the material flow strength. The flow stress criterion is considerably less restrictive than the present ASTM Criterion, and the results of this study indicate that the flow stress criterion is entirely appropriate for strain-hardening materials such as the austenitic stainless steels.

1833 (HEDL-TME--78-101) ELEVATED TEMPERATURE J/SUB IC/ FRACTURE TOUGHNESS BEHAVIOR OF TYPE 304 STAINLESS STEEL AND TYPE 308 STAINLESS STEEL WELDMENT. INTERIM REPORT. Mills, M.J. (Hanford Engineering Development Lab., Richland, WA (USA)). Jun 1979.

Contract EY-76-C-14-2170. 26p. AT.

The elastic-plastic J/sub IC/ fracture toughness response of FFTF reactor vessel Type 304 stainless steel base metal and Type 308 stainless steel weldment was evaluated at 800°F (427°C) by the multi-specimen R-curve technique. The Type 304 base metal exhibited a high value of J/sub IC/, 3095 in.-lb/in.² (542 kJ/m²), indicating that this austenitic stainless steel possesses very high fracture resistance under elevated temperature conditions. The J/sub IC/ response of the reactor vessel weldment at 800°F (427°C) was slightly less than one-half that exhibited by the base metal. Although the ductile fracture toughness of the weldment was considerably lower than that of the base metal, its fracture resistance was still relatively high compared to those of most structural alloys. Both materials are extremely resistant to unstable fracture even at J levels well above J/sub IC/. This study indicates that a 1-inch (2.5-cm) thick specimen will meet the proposed ASTM size criterion for establishing a valid J/sub IC/ value for the Type 308 weldment at 800°F (427°C), but that a 1.5- to 2-inch (3.8- to 5.1-cm) thick specimen of Type 304 base metal would be required to satisfy the proposed size criterion.

1834 (HEDL-TME--78-104) SODIUM EROSION OF BORON CARBIDE FROM BREACHED ABSORBER PINS. Baker, D.E.; Basmajian, J.A. (Hanford Engineering Development Lab., Richland, WA (USA)). Jan 1979. Contract EY-76-C-14-2170. 50p. AT.

The erosion of irradiated boron carbide by flowing sodium was investigated in an out-of-reactor loop test and in an irradiation test conducted in EBR-II. Sodium flow velocity over the intentionally breached absorber pins was 5 ft/sec. Important parameters investigated in the irradiation test were boron carbide burnup, temperature and defect type (hole or slit). Similar erosion behavior was observed for the irradiation test and the loop test. Erosion was not enhanced by the reactor radiation environment. Erosion was confined to the defect area and was influenced by boron-10 burnup in the boron carbide pellets and by temperature.

1835 (HEDL-TME--78-107) CALCULATION OF NEUTRON SOURCE STRENGTH IN FFTF FUEL AS A FUNCTION OF IRRADIATION. (Hanford Engineering Development Lab., Richland, WA (USA)). 1978. Contract EY-76-C-14-2170. 62p. AT.

Isotope buildup and depletion in reactor fuel as a function of irradiation were evaluated with the ORIGEN and ALCHEMY codes using updated libraries of effective cross sections and half-lives. More accurate evaluations of isotopic density changes in fuel than previously possible were made at the Hanford Engineering Development Laboratory using the Evaluated Nuclear Data File/B, Version V (ENDF/B-V) cross sections. Libraries of one-energy-group effective cross sections for capture, fission and (n,2n) reactions were developed by spectrum-averaging 12 energy group multigroup cross sections with typical 12-energy-group spectra in the inner and outer driver regions of FFTF Cores 1 and 2 at the beginning of life (BOL), the beginning of cycle 4 (BOC-4), and end of cycle 4 (EOC-4). The calculational results of isotope depletion and buildup for inner driver and outer driver fuel were used with recently evaluated neutron yields for spontaneous fission and (α,n) reactions. These provide the most accurate neutron source level evaluation currently obtainable with existing nuclear data.

- 1836 (HEDL-TME--78-108) MELT-IIIB: AN UPDATED VERSION OF THE MELT CODE. Tabb, K.K.; Lewis, C.H.; O'Dell, L.D.; Padilla, A. Jr.; Smith, D.E.; Wilburn, N.P. (Hanford Engineering Development Lab., Richland, WA (USA)). Apr 1979. Contract EY-76-C-14-2170. 104p. Dep. NTIS, PC A06/MF A01.

The MELT series is a reactor modeling code designed to investigate a wide variety of hypothetical accident conditions, particularly the transient overpower sequence. MELT-IIIB is the latest in the series.

- 1837 (HEDL-TME--78-111) DECAY HEAT DUE TO ACTIVATION OF CORE COMPONENTS. Luksic, A.T. (Hanford Engineering Development Lab., Richland, WA (USA)). Feb 1979. Contract EY-76-C-14-2170. 58p. AT.

The activation of the Fast Flux Test Facility reactor core components and the decay heat due to activation products were calculated to provide a basis for handling and storing these materials. The inventory and distribution of radionuclides produced by activation of core components are presented. Activating neutron fluxes were taken from earlier three-dimensional diffusion theory calculations, whereas activation cross-sections are predominantly from the FTR-300S set.

- 1838 (HEDL-TME--78-115) BREEDER REACTOR REFERENCE CONTROL MATERIALS. SEMIANNUAL STATUS NEWSLETTER, JUNE--DECEMBER 1978. Roake, W.E. (Hanford Engineering Development Lab., Richland, WA (USA)). May 1979. Contract EY-76-C-14-2170. 49p. AT.

Progress in the development of LMFBR reference core materials is reported under the following heading: improved absorber concepts, design and performance analysis, materials testing and characterization, feature testing, neutron absorber performance monitoring, and fabrication and procurement.

- 1839 (HEDL-TME--79-1) REAL-TIME ANALYSIS OF FFTF FUEL PIN INSPECTION DATA AT THE ²⁵²Cf ASSAY STATION. Gottschalk, G.P. (Hanford Engineering Development Lab., Richland, WA (USA)). Apr 1979. Contract EY-76-C-14-2170. 222p. AT.

The ²⁵²Cf Assay System used at the Hanford Engineering Development Laboratory (HEDL) has been upgraded to provide computerized data acquisition and analysis of total fissile content measurement and fuel column uniformity data. A laser measurement system has been incorporated for automated acquisition of fuel pin diameter data.

- 1840 (HEDL-TME--79-2) ANALYTICAL VALIDATION OF THE CACECO CONTAINMENT ANALYSIS CODE. Peak, R.D. (Hanford Engineering Development Lab., Richland, WA (USA)). Aug 1979. Contract EY-76-C-14-2170. 193p. Dep. NTIS PC E05/MF E05.

The CACECO containment analysis code was developed to predict the thermodynamic responses of LMFBR containment facilities to a variety of accidents. This report covers the verification of the CACECO code by problems that can be solved by hand calculations or by reference to textbook and literature examples. The verification concentrates on the accuracy of the material and energy balances maintained by the code and on the independence of the four cells analyzed by the code so that the user can be assured that the code analyses are numerically correct and independent of the organization of the input data submitted to the

code.

- 1841 (HEDL-TME--79-4) IRRADIATION EFFECTS IN FFTF RADIAL REFLECTOR MATERIALS. Ward, A.L.; Blackburn, L.D. (Hanford Engineering Development Lab., Richland, WA (USA)). Feb 1979. Contract EY-76-C-14-2170. 44p. AT.

Postirradiation tension tests and swelling measurements were performed on actual FFTF radial reflector materials (316 SS and Alloy 600) irradiated in EBR-II to a total fluence of 2.7×10^{22} n/cm² at temperatures of 514, 566, and 691°C. Ductility results for 316 SS indicate that the portion of reflector lifetime associated with reaching a uniform elongation level of 10% was estimated conservatively by a factor of 2 to 3 in the design. Swelling results at this relatively low fluence were generally consistent with correlations used for reflector design. Data from higher exposure irradiation tests are needed for final verification of reflector design lifetime predictions.

- 1842 (HEDL-TME--79-9) TEST DATA AND POST-TEST ANALYSES OF THREE PROTOTYPIC-LENGTH FFTF FUEL PINS TRANSIENT TESTED IN FLOWING SODIUM (HUT-L2). Bard, F.E.; Gneiting, B.C.; Horn, W.P.; Houser, T.R.; Manthos, E.J.; Randlek, E.H. (Hanford Engineering Development Lab., Richland, WA (USA)). Apr 1979. Contract EY-76-C-14-2170. 180p. AT.

The post-test measurements and the thermal, mechanical, and design procedure analyses of the HUT-L2 transient test are presented. This test was a loop experiment conducted in the TREAT facility. The HEDL MARK-IIC integral sodium loop test vehicle was used to simultaneously test three prototypic-length fresh fuel pins in a simulated FFTF environment. The objectives of the experiment were to obtain measurable cladding deformation and fuel melting for all three fuel pins. Fuel melting occurred in each fuel pin but measurable deformation occurred only in the high smeared density HUT-L2-4 fuel pin.

- 1843 (HEDL-TME--79-17) LIQUID METALS FIRE CONTROL ENGINEERING HANDBOOK. Ballif, J.L. (comp.). (Ford, Bacon and Davis Utah, Inc., Salt Lake City (USA)). Feb 1979. Contract EY-76-C-14-2170. 159p. Dep. NTIS, PC A08/MF A01.

This handbook reviews the basic requirements of the use of liquid metals with emphasis on sodium which has the greatest current usage. It delineates the concepts necessary to design facilities both radioactive and nonradioactive for use with liquid metals. It further reviews the state-of-the-art in fire extinguishers and leak detection equipment and comments on their application and sensitivity. It also provides details on some engineering features of value to the designer of liquid metal facilities.

- 1844 (HEDL-TME--79-19) DUCTILITY AND STRENGTH OF FFTF/CRBRP STRUCTURAL MATERIALS IRRADIATED IN VARIOUS SPECTRA. SECOND INTERIM REPORT. Ward, A.L.; Blackburn, L.D. (Hanford Engineering Development Lab., Richland, WA (USA)). Jul 1979. Contract EY-76-C-14-2170. 55p. AT.

Experimental description of the fluence and spectrum dependence of strength and ductility in 304SS, 316SS, weld-deposited 308L SS and Alloy 718 irradiated at low temperatures (644 to 699K) was extended to a total fluence of 3.7×10^{26} n/m². Tension test results for the stainless steel materials from the FFTF/CRBRP Structural Materials Irradiation Experiment

continued to verify earlier indications of significant spectral effects. Application of simple scaling procedures yielded relative damage cross sections which were found to incorporate separable spectrum and temperature dependencies. When normalized to a single temperature (658K) and multiplied by the total fluence, the cross sections provide an excellent correlation parameter for the irradiation damage. Energy-dependent fluence limits for 10% total elongation in the stainless steel materials were determined using the spectral and temperature dependencies of this study coupled with data variability evaluated in a larger data base. Irradiation effects in Alloy 718 were small relative to those observed in the stainless steels and spectral effects could not be defined quantitatively in detail. Estimates of fluence limits for 10% total elongation were determined for moderately soft spectra.

- 1845 (HEDL-TME--79-22) USERS' GUIDE TO CACECO CONTAINMENT ANALYSIS CODE. Peak, R.D. (Hanford Engineering Development Lab., Richland, WA (USA)). Jun 1979. Contract EY-76-C-14-2170. 216p. Dep. NTIS, PC A10/MF A01.

The CACECO containment analysis code was developed to predict the thermodynamic responses of LMFBR containment facilities to a variety of accidents. The code is included in the National Energy Software Center Library at Argonne National Laboratory as Program No. 762. This users' guide describes the CACECO code and its data input requirements. The code description covers the many mathematical models used and the approximations used in their solution. The descriptions are detailed to the extent that the user can modify the code to suit his unique needs, and, indeed, the reader is urged to consider code modification acceptable.

- 1846 (HEDL-TME--79-23) RESULTS FROM THE RUN-BEYOND-CLADDING-BREACH IRRADIATION OF A PREDEFECTED FUEL PIN (RBCB-6). Langstaff, D.C.; Almasy, M.Y.; Washburn, D.F. (Hanford Engineering Development Lab., Richland, WA (USA)). Aug 1979. Contract EY-76-C-14-2170. 61p. Dep. NTIS, PC A04/MF A01.

A slit was machined through the cladding of an irradiated fuel pin and irradiation in the Experimental Breeder Reactor-II (EBR-II) was resumed. The condition of the fuel pin was continuously followed with delayed neutron (DN) monitors. When the DN signal increased to a previously established administrative limit, the test was terminated. Postirradiation examination showed the sodium-fuel reaction caused fuel swelling and extension of the machined slit. There was no evidence of fuel loss nor was there any indication of impending pin-to-pin failure propagation. This test supports an increase in DN signal for subsequent run-beyond-cladding-breach (RBCB) tests.

- 1847 (HEDL-TME--79-24) SODIUM TECHNOLOGY PROGRESS REPORT, JANUARY--MARCH 1979. Atwood, J.M. (comp.). (Hanford Engineering Development Lab., Richland, WA (USA)). Jun 1979. Contract EY-76-C-14-2170. 54p. AT.

This report presents a quarterly summary of progress made at Westinghouse Hanford Company in the areas of radioactivity control technology and sodium systems technology.

- 1848 (HEDL-TME--79-25) SODIUM TECHNOLOGY. PROGRESS REPORT, APRIL-JUNE 1979. Atwood,

J.M. (comp.). (Hanford Engineering Development Lab., Richland, WA (USA)). Sep 1979. Contract EY-76-C-14-2170. 55p. AT.

This report presents a quarterly summary of progress made at Westinghouse Hanford Company in the areas of radioactivity control technology and sodium systems technology.

- 1849 (HEDL-TME--79-28) AEROSOL BEHAVIOR DURING SODIUM POOL FIRES IN A LARGE VESSEL: CSTF TESTS AB1 AND AB2. Hilliard, R.K.; McCormack, J.D.; Postma, A.K. (Hanford Engineering Development Lab., Richland, WA (USA)). Jun 1979. Contract EY-76-C-14-2170. 160p. Dep. NTIS, PC A08/MF A01.

Two large-scale aerosol behavior tests, using sodium pool fires as the aerosol source, were performed in the Containment Systems Test Facility (CSTF). The tests were conducted to characterize the properties and behavior of sodium aerosol particles formed and aged in a large containment vessel. The 20-m high, 850-m³ CSTF containment building in regard to parameters that affect agglomeration and gravitational settling. In both tests, sodium burned for one hour in a 4.38-m² pool, and the only difference between them was that steam was injected during the second test, simulating the release of water vapor from heated concrete.

- 1850 (HEDL-TME--79-30) PIPELINES SUPPORTED BY NONLINEAR LOAD-RESISTING MECHANICAL SNUBBERS. Barta, D.A. (Hanford Engineering Development Lab., Richland, WA (USA)). Jul 1979. Contract EY-76-C-14-2170. 48p. AT.

An analytical study of effects of nonlinearities in piping supports on response to seismic excitation is presented. Response calculations for simplified single degree of freedom nonlinear models are used to illustrate sensitivity to stiffness variations, lost motion, and impact damping. Seismic responses of typical spans of various sizes of piping supported by both linear and nonlinear constraints are compared to assess the support load magnifications due to impacting. The idealized nonlinear piping support models are integrated with a finite element model of a large piping system. Time domain seismic responses of the nonlinear piping system are compared to loads determined by a standard linearized seismic response spectra technique.

- 1851 (HEDL-TME--79-34) SIFAIL: A SUBPROGRAM TO CALCULATE CLADDING DEFORMATION AND DAMAGE FOR FAST REACTOR FUEL PINS. Wilson, D.R.; Dutt, D.S. (Hanford Engineering Development Lab., Richland, WA (USA)). May 1979. Contract EY-76-C-14-2170. 137p. Dep. NTIS, PC A07/MF A01.

SIFAIL is a series of subroutines used in conjunction with the thermal performance models of SIEX to assist in the evaluation of mechanical performance of mixed uranium plutonium oxide fuel pins. Cladding deformations due to swelling and creep are calculated. These have been compared to post-irradiation data from fuel pin tests in EBR-II. Several fuel pin cladding failure criteria (cumulative damage, total strain, and thermal creep strain) are evaluated to provide the fuel pin designer with a basis to select design parameters. SIFAIL allows the user many property options for cladding material. Code input is limited to geometric and environmental parameters, with a consistent set of material properties provided by the code. The simplified, yet adequate, thin wall stress-strain calculations provide a reliable estimate of fuel pin mechanical performance, while requiring a small amount of core storage and

computer running time.

- 1852 (HEDL-TME--79-39) INTERIM REPORT FOR THE PINEX-2 TRANSIENT TEST. Porten, D.R.; Padilla, A. Jr.; Randlev, E.H. (Hanford Engineering Development Lab., Richland, WA (USA)). Sep 1979. Contract EY-76-C-14-2170. 174p. AT.

PINEX-2, the first international benchmark test performed as part of the TREAT/CABRI Exchange, was a dual-objective experiment to continue development of the Pinhole Imaging (PINEX) system for monitoring fuel motion, and to demonstrate the feasibility of internal fuel motion as a mechanism for mitigating the consequences of hypothetical LMFBR accidents. A special fuel pin with a pre-fabricated central hole in the fuel, insulator, and reflector was pre-irradiated in the General Electric Test Reactor and subjected to a \$5/sec transient overpower excursion in the Transient Reactor Test (TREAT) Facility. Approximately 10 grams of molten fuel were ejected upward from the fuel region into the reflector and fission gas plenum.

- 1853 (HEDL-TME--79-42) UNCERTAINTY ANALYSIS OF CONSEQUENCES CALCULATED BY LARGE COMPUTER CODES. Nguyen, D.H. (Hanford Engineering Development Lab., Richland, WA (USA)). Sep 1979. Contract EY-76-C-14-2170. 59p. AT.

A methodology has been constructed to assess the uncertainty in an output consequence calculated by a large code, due to the uncertainties in input data. An application was made to the computer code MELT-IIIA to determine the confidence level in predicting the time of initial pin failure during a TOP accident in the FTR.

- 1854 (HEDL-TME--79-62) RESULTS FROM THE RUN-BEYOND-CLADDING BREACH IRRADIATION OF A PREDEFECTED FUEL PIN (RBCB-7). Langstaff, D.C.; Almasy, M.Y.; Washburn, D.F. (Hanford Engineering Development Lab., Richland, WA (USA)). Feb 1980. Contract EY-76-C-14-2170. 82p. Dep. NTIS, PC A05/MF A01.

A slit was machined through the cladding of an irradiated fuel pin and irradiation in the Experimental Breeder Reactor-II (EBR-II) was resumed. The condition of the fuel pin was continuously followed with delayed neutron (DN) monitors. When the DN signal increased to a previously established administrative limit of 800 counts per second, the test was terminated. Postirradiation examination showed the sodium-fuel reaction caused fuel pin swelling and extension of the machined slit. There was no evidence of fuel washout nor was there any indication of impending pin-to-pin failure propagation. This test supports an increase in DN signal for subsequent run-beyond-cladding-breach (RBCB) tests.

- 1855 (HEDL-TME--79-72) DILATE: A 2-D STRUCTURAL PROGRAM FOR THE DILATION RESPONSE OF HEXAGONAL DUCTS. Chan, D.P. (Hanford Engineering Development Lab., Richland, WA (USA)). Feb 1980. Contract EY-76-C-14-2170. 48p. Dep. NTIS, PC A03/MF A01.

An analytical method is introduced for determining the dilation of hexagonal ducts in fast reactors. The method, which is valid for temperatures where creep is linearly dependent on stress, was implemented in a fast-running computer called DILATE. A bench-mark program is presented, which shows the results of the DILATE program in close agreement with the results of the finite element program MARC-CDC. User instructions for the DILATE program are

described in detail and a listing of the program is included.

- 1856 (HEDL-TME--1480(FP)) DOSIMETER BASED ADJUSTMENTS OF FAST NEUTRON SPECTRA. Schmittle, F.; Rawlins, J.A. (Hanford Engineering Development Lab., Richland, WA (USA)). 1978. Contract EY-76-C-14-2170. 20p. (CONF-780622--47). Dep. NTIS, PC A02/MF A01.

From ANS annual meeting; San Diego, CA, USA (18 Jun 1978).

The task of using integral measurements to adjust or evaluate differential data is a long-standing problem in undetermined problems, as in the adjustment of multigroup neutron spectra based on dosimeter measurements. A general method for solving this problem is described, and its use in realistic problems is illustrated. Many approaches have been used to deal with a variety of well-known difficulties in this area. In particular, modern methods of generalized linear least-squares that include complete data covariance matrices have proved especially useful. The method described is based on an extension of these ideas. 6 figures, 1 table. (RWR)

- 1857 (HWS--1880(Rev.2)(Add.1)) FORCED CIRCULATION COLD TRAP ASSEMBLIES FOR REMOVAL OF SODIUM IMPURITIES FROM FFTF CLOSED LOOP SYSTEMS. Kios, D.B. (Hanford Engineering Development Lab., Richland, WA (USA)). 1975. Contract EY-76-C-14-2170. 124p. AT.

Revised specifications are presented for the FFTF closed loop forced circulation cold trap assemblies.

- 1858 (HWS--2160) FIRST ARTICLE TEST REPORT FOR FFTF HEATER SUPPORTS. (Westinghouse Electric Corp., Pittsburgh, PA (USA)). Astronuclear Lab.). 23 Dec 1974. Contract EY-76-C-14-2170. 137p. Dep. NTIS, PC A07/MF A01.

Test articles of 1-in. and 28-in. diameter have been assembled, tested in accordance with HWS-2160 and the FAT Plan, Revision 1, and disassembled and evaluated in the presence of a Bechtel representative. Observations and conclusions are presented.

- 1859 (IAE--2842) INTERFERENCE OF NEUTRON-ABSORBING CONTROL RODS IN A LARGE POWER FAST REACTOR. Karpov, V.A.; Matveev, V.I.; Protzenko, A.N. (Gosudarstvennyy Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Moscow, Inst. Atomnoj Ehnergii). 1977. 13p. (In Russian). Dep. NTIS (US Sales Only), PC A02/MF A01.

A numerical experiment investigating interference of absorbing rods in a BN-600-type reactor using the BFS-24-16 critical assembly is considered. The experiment was carried out with two-dimensional KENT program based on the grid solution technique of the two-group diffusion equation in hexagonal geometry. It is shown that in case of the optimum location of rods the gain up to 20% can be obtained in the system effectiveness. Using an example of internal and external rings of the absorbing rods it is shown that the methodical error of pairing interference is equal to 10% of the interference effect.

- 1860 (IAEA--207, pp 353-357) SOME REQUIREMENTS AS REGARDS THE ACCURACY OF CONSTANTS FOR FAST POWER REACTOR SHIELDING CALCULATIONS. Bakumenko, O.D.; Kulakovsky, M.Ya.; Savitsky, V.I. 1978.

From Specialists meeting on nuclear data requirements for shielding; Vienna, Austria (8 Oct 1976).

The intrinsic activity of sodium coolant, determined by the sodium activation components resulting from the reactions $^{23}\text{Na}(n,\gamma)^{24}\text{Na}$ and $^{23}\text{Na}(n,2n)^{22}\text{Na}$, was determined when the BN-350 reactor started up. Another series of experiments in the BN-350 reactor was carried out for the purpose of determining the activity of the steel components resulting from reactions $^{50}\text{Cr}(n,\gamma)^{51}\text{Cr}$, $^{58}\text{Fe}(n,\gamma)^{59}\text{Fe}$, $^{58}\text{Ni}(n,p)^{58}\text{Co}$, $^{54}\text{Fe}(n,p)^{54}\text{Mn}$ and $^{59}\text{Co}(n,\gamma)^{60}\text{Co}$. Comparison of calculated and experimental values are made. Some discrepancies are pointed out.

1861 (IAEA--207, pp 245-259) SENSIBILITY STUDIES OF THE EQUIVALENT THERMAL NEUTRON FLUX ON THE HEAT EXCHANGER OF A SODIUM COOLED FAST REACTOR. (1. PT.). Boioli, A.; Fiorini, L. (NIRA); Moreau, J.; Suntinger, G. (CEA Centre d'Etudes Nucleaires de Cadarache, 13 - Saint-Paul-les-Durance (France)). 1978. (In French).

From Specialists meeting on nuclear data requirements for shielding; Vienna, Austria (8 Oct 1976).

This paper reports on sensibility studies of the equivalent thermal neutron flux on the heat exchanger for a sodium cooled fast reactor. Graphs and diagrams of the neutron flux in function of the reactor geometry, contribution of the fission sources in the core and the blanket of the reactor are given.

1862 (IAEA--207, pp 431-463) RESULTS OF NEUTRON-PROPAGATION EXPERIMENTS PERFORMED IN IRON-SODIUM MIXTURES USING THE SOURCE REACTOR HARMONIE AND TAPIRO. Bouteau, F.; Calamand, D.; Ocerasies, Y.; Vienot, R. (CEA Centre d'Etudes Nucleaires de Cadarache, 13 - Saint-Paul-les-Durance (France)); Antonini, D.; Bozzi, L.; Martini, M.; Moio, P. (Comitato Nazionale per l'Energia Nucleare, Casaccia (Italy). Centro di Studi Nucleari). 1978. (In French).

From Specialists meeting on nuclear data requirements for shielding; Vienna, Austria (8 Oct 1976).

The results of neutron-propagation experiments performed in iron-sodium mixtures, using the source reactor HARMONIE and TAPIRO are presented: with HARMONIE: five media were studied: pure sodium and pure iron, and mixtures of iron and sodium (30 V/o, 50 V/o, 70 V/o); with TAPIRO the presently available results concern a pure sodium medium; two types of results are given: first, the raw results; then, the correction factors for heterogeneity and leakage to convert the raw results into the ideal homogeneous and spherical model used in the calculations. Finally, a comparison is made between results obtained with HARMONIE and TAPIRO for the pure sodium; the aim of this comparison is to verify that the differences in geometry and source spectra are properly accounted for the calculations.

1863 (IAEA--207, pp 465-504) ANALYSIS OF NEUTRON PROPAGATION EXPERIMENTS IN IRON-SODIUM MIXTURES WITH THE PROPANE CALCULATIONAL SCHEME FOR FAST REACTORS. Estiot, J.C.; Trapp, J.P. (CEA Centre d'Etudes Nucleaires de Cadarache, 13 - Saint-Paul-les-Durance (France)); Salvatore, M.; Palmiotti, G. (Comitato Nazionale per l'Energia Nucleare, Casaccia (Italy). Centro di Studi Nucleari). 1978. (In French).

From Specialists meeting on nuclear data requirements for shielding; Vienna, Austria (8

Oct 1976).

PROPANE is a calculational scheme for neutron propagation in the shield of fast reactors. PROPANE 0 is the first, non adjusted version of this scheme. Results of integral neutron propagation experiments obtained in pure iron, pure sodium, and iron-sodium mixtures (HARMONIE-TAPIRO and ASPEX experiments) are interpreted using PROPANE 0. Experimental results are, when necessary, corrected for heterogeneity and leakage and converted into a simple homogeneous one dimensional model before comparison with calculations. For HARMONIE and TAPIRO, the calculations consist of propagating a given surface source at the entry of the assemblies. The spectrum of this source is adjusted using proton-recoil and spectral indices measurements. The present version of PROPANE 0 is assessed. Possible source of discrepancies are discussed using essentially the results of sensitivity studies.

1864 (IAEA--207, pp 505-530) TWO-DIMENSIONAL SHIELDING BENCHMARKS FOR IRON AT YAYOI (I). Oka, Y.; An, S.; Kasai, S.; Yoshii, R.; Hashikura, H.; Akiyama, M. (Tokyo Univ. (Japan)); Miyasaka, S.; Koyama, K. (Japan Atomic Energy Research Inst., Tokai, Ibaraki. Tokai Research Establishment); Hyodo, T. (Kyoto Univ. (Japan)). 1978.

From Specialists meeting on nuclear data requirements for shielding; Vienna, Austria (8 Oct 1976).

The aim of this work is to assess the collapsed neutron and gamma multigroup cross sections for two dimensional discrete ordinate transport code. Two dimensional distributions of neutron flux and gamma ray dose through a 70cm thick and 94cm square iron shield were measured at the fast neutron source reactor "YAYOI". The iron shield was placed over the lead reflector in the vertical experimental column surrounded by heavy concrete wall. The detectors used in this experiment were threshold detectors In, Ni, Al, Mg, Fe and Zn, sandwich resonance detectors Au, W and Co, activation foils Au for neutrons and thermoluminescence detectors for gamma ray dose. The experimental results were compared with the calculated ones by the discrete ordinate transport code ANISN and TWOTRAN. The region-wise, coupled neutron-gamma multigroup cross sections (100n+20gamma, EURLIB structure) were generated from ENDF/B-IV library for neutrons and POPOP4 library for gamma ray production cross sections by using the code system RADHEAT. The effective microscopic neutron cross sections were obtained from the infinite dilution values applying ABBN type self-shielding factors. The gamma ray production multigroup cross sections were calculated from these effective microscopic neutron cross sections. For two-dimensional calculations the group constants were collapsed into 10 neutron groups and 3 gamma groups by using ANISN.

1865 (IAEA--207, pp 221-241) BENCHMARK PROBLEMS FOR THE SHIELDINGS OF A FAST NEUTRON REACTORS. Estiot, J.C.; Trapp, J.P. (CEA Centre d'Etudes Nucleaires de Cadarache, 13 - Saint-Paul-les-Durance (France)). 1978. (In French).

From Specialists meeting on nuclear data requirements for shielding; Vienna, Austria (8 Oct 1976).

The BENCHMARK calculations are performed using the calculational scheme (formulaire) for fast reactor shielding PROPANE 0, i.e.: 26 groups, P₁, S₁; the spatial meshes recommended in the BENCHMARK specifications: non adjusted

cross sections, derived from the 100g DLC2 cross sections set (ENDF/BII); the source is the surface anisotropic source given in the BENCHMARK specifications condensed to 26 groups; the calculated integral responses are those of the BENCHMARK specifications, i.e.: Total flux, equivalent thermal flux, flux above 800 and 111 Kev, damage rate in steel, capture rate of sodium, Sulphur and Rhodium responses, Manganese and Sodium responses, U235 fission rate and ^{59}Co capture rate.

- 1866 (IAEA--208(Vol.1), pp 147-181)
SPECTRAL CHARACTERIZATION BY COMBINING NEUTRON SPECTROSCOPY, ANALYTICAL CALCULATIONS, AND INTEGRAL MEASUREMENTS. McElroy, W.N.; Gold, R.; Lippincott, E.P. (Hanford Engineering Development Lab., Richland, Wash. (USA)); Fabry, A. (Centre d'Etude de l'Energie Nucleaire, Mol (Belgium)); Roberts, J.H. (Macalester Coll., Saint Paul, Minn. (USA)). 1978.

From Consultants meeting on integral cross section measurements in standard neutron fields; Vienna, Austria (15 Nov 1976).

Status and trends of differential spectrometry, calculations, and integral measurements for characterizing neutron spectra are assessed. Emphasis is placed upon the state-of-the-art accuracy that has actually been attained in standard, reference, and controlled-environment benchmark neutron fields. The utility of SAND-II unfolding is stressed for the comparison of differential spectrometry, integral measurements and calculations. Selective adjustments of both spectra and cross sections are still necessary, even for the most advanced benchmark fields and best known cross sections.

- 1867 (IAEA--208(Vol.2), pp 191-208)
INTERCOMPARISON OF THE INTERMEDIATE-ENERGY STANDARD NEUTRON FIELDS AT THE NISUS AND MOL-ΣΣ FACILITIES BY MEANS OF ABSOLUTE FISSION CHAMBERS. Fabry, A. (Centre d'Etude de l'Energie Nucleaire, Mol (Belgium)); Williams, J.G.; Hannan, A.H.M.A. (London Univ. (UK)). Sunninghill Reactor Centre; Azimi-Garakanl, D. (Teheran Univ. (Iran)). Inst. of Nuclear Science and Technology). 1978.

From Consultants meeting on integral cross section measurements in standard neutron fields; Vienna, Austria (15 Nov 1976).

Intermediate-energy standard neutron fields simulating core neutron spectra of fast breeder reactors are in operation at the Mol-ΣΣ (Belgium), ITN-ΣΣ (Rumania) and NISUS (Great Britain) facilities. These three assemblies are implemented within 50cm diameter spherical cavities hollowed out from conventional graphite thermal columns; the standard configuration consists of an approximately 5cm thick natural uranium spherical source, approximately 25cm outer diameter, surrounding a concentric natural boron carbide shell at the centre of which the standard neutron field is generated. Measurements of absolute fission rates and ratios have been performed in NISUS by means of NBS-type, double gas-flow ionization fission chambers previously exposed in Mol-ΣΣ and ITN-ΣΣ. Leakage of subcadmium neutrons through the access hole into the NISUS standard field has been detected and eliminated. Expected, small neutronic differences between the ΣΣ and NISUS assemblies have been assessed by transport theory computations for comparison with experimental data. The unperturbed fission cross section ratios measured at NISUS centre are (1.000: 1.175 ± 0.027: 0.0568 ± 0.0015: 0.383 ± 0.011) for ^{235}U : ^{239}Pu : ^{238}U : ^{237}Np respectively; they agree with similar data

obtained at the centre of the Mol-ΣΣ and ITN-ΣΣ facilities.

- 1868 (IAEA-AG--63-1) TECHNIQUES FOR SHEARING AND DISSOLVING LMFBR FUELS. Burch, W.D.; Watson, C.D.; Unger, W.E. (International Atomic Energy Agency, Vienna (Austria)). May 1976. 35p. (CONF-760576--32). Dep. NTIS (US Sales Only), PC A03/MF A01.

From IAEA meeting on LMFBR fuel reprocessing; Leningrad, USSR (17 May 1976).

The present paper describes development efforts and the present status of the head-end steps of fuel-element cleaning, shearing, sodium deactivation, and dissolution.

- 1869 (IAEA-AG--63-3) REVIEW OF UNITED STATES PROGRAM IN LMFBR FUEL REPROCESSING. McVey, W.H. (International Atomic Energy Agency, Vienna (Austria)). May 1976. 3p. (CONF-760576--25). Dep. NTIS (US Sales Only), PC A02/MF A01.

From IAEA meeting on LMFBR fuel reprocessing; Leningrad, USSR (17 May 1976).

The overall objective of the LMFBR program is to develop a broad technological and engineering base for a competitive commercial breeder industry as a means for meeting national energy needs in the 1990s and beyond. The review briefly considers the different aspects (industrial capability, public acceptance etc.) that have to be taken into consideration in connection with this. The work required to accomplish the LMFBR program has been divided into seven technology areas (components, materials, physics, chemistry, safety, fuels and fuel recycle) comprising the LMFBR Base Program, and a closely related Project part covering design, construction and operation of major reactor facilities for the LMFBR program. The LMFBR fuel reprocessing developmental plan, as a support effort in the Base Program, is considered more in detail. The objective of this plan is to develop and demonstrate reprocessing systems that accommodate all candidate fuels and allow for the rapid fuel recovery and turnaround times necessary to ensure doubling times of 10 to 15 years.

- 1870 (IAEA-AG--63-4) FAST REACTOR FUEL REPROCESSING IN THE UNITED KINGDOM. Pugh, O. (International Atomic Energy Agency, Vienna (Austria)). May 1976. 7p. (CONF-760576--28). Dep. NTIS (US Sales Only), PC A02/MF A01.

From IAEA meeting on LMFBR fuel reprocessing; Leningrad, USSR (17 May 1976).

The reprocessing activities at Dounreay in the United Kingdom is presented. In 1958 a plant was built to permit recycling of unburnt ^{235}U from the U/Mo metallic fuel element used in the Dounreay Fast Reactor (DFR). The decision to reprocess the irradiated Pu/U oxide fuel from PFR at Dounreay to provide data for the construction of larger reprocessing plants required for commercial fast reactor exploitation, has required considerable modification of the present DFR plant. The modifications include fuel handling, containment and waste management. Special attention is also paid to problems connected with solvent extraction. A brief description of the practical measures taken to carry out the modifications is given.

- 1871 (IAEA-AG--63-5) REPROCESSING OF 'FAST' FUEL IN FRANCE. Sauteron, J.; Boudry, J.C.; Bourgeois, M.; Le Bouhellec, J.;

Miquel, P. (International Atomic Energy Agency, Vienna (Austria)). May 1976. 18p. (In French). Dep. NTIS (US Sales Only), PC A03/MF A01.

The results of laboratory studies as well as pilot testing (AT-I La Hague, Marcoule, Fontenay-aux-Roses) in reprocessing of fast breeder reactor fuels are described. The paper covers all steps: head end, aqueous and fluoride volatility processes, and waste treatment. In conclusion, it is demonstrated why it is still too early to define a strategy of industrial reprocessing for this reactor type.

- 1872 (IAEA-AG--63-6) DEVELOPMENT AND STATUS OF LMFBR FUEL REPROCESSING IN THE FEDERAL REPUBLIC OF GERMANY. Baumgaertner, F.; Ochsenfeld, W. (International Atomic Energy Agency, Vienna (Austria)). May 1976. 28p. (CONF-760576--19). Dep. NTIS (US Sales Only), PC A03/MF A01.

From IAEA meeting on LMFBR fuel reprocessing; Leningrad, USSR (17 May 1976).

The problems associated with reprocessing oxide LMFBR fuel elements result from the higher plutonium content, the higher fission product content and the higher level of thermal decay power; their consequences on the Purex process are well recognizable. Reprocessing LMFBR elements by the conventional Purex process technique is considered to be feasible. If the cooling time of LMFBR fuel elements amount to one year or more, it is only the higher plutonium content which determines the process flowsheet. The necessary chemical steps for reprocessing co-precipitated oxides have been developed at Karlsruhe for this case. The mechanical head end still needs to be developed on a technical scale, as does the management of safety against criticality. If reprocessing is to follow a cooling time of less than 200 days, as envisaged in the original planning for LMFBR fuel elements, the efficiency of offgas treatment and the reliable operation of fast contactors in the first extraction cycle still have to be tested.

- 1873 (IAEA-AG--63-7) CONSIDERATIONS ON THE GAMMA ACTIVITY OF THE PU PRODUCT ARISING FROM LMFBR'S FUEL REPROCESSING. Moccia, A. (International Atomic Energy Agency, Vienna (Austria)). May 1976. 5p. (CONF-760576--26). Dep. NTIS (US Sales Only), PC A02/MF A01.

From IAEA meeting on LMFBR fuel reprocessing; Leningrad, USSR (17 May 1976).

The composition of Pu product and its gamma activity and gamma power were theoretically calculated with reference to the fuel to be recovered from the PEC fast experimental reactor. Preliminary evaluation derived from this calculation allows some conclusions to be drawn related to the extent of the purification from fission products required in the reprocessing step.

- 1874 (IAEA-AG--63-8) HEAD-END AND NUCLEAR GAS PURIFICATION RESEARCH ON LMFBR FUEL REPROCESSING IN BELGIUM. Baetsle, L.H. (International Atomic Energy Agency, Vienna (Austria)). May 1976. 11p. (CONF-760576--18). Dep. NTIS (US Sales Only), PC A02/MF A01.

From IAEA meeting on LMFBR fuel reprocessing; Leningrad, USSR (17 May 1976).

In the framework of the international DEBENELUX project on fast reactor development considerable attention was devoted to the reprocessing problems. The report describes the specific Belgian contributions which were

focused on experimental and conceptual studies of de-activation and transportation, on dissolution of high burn-up MOX fuel, and on technological development of gas purification methods applicable to LMFBR fuel.

- 1875 (IAEA-AG--63-12) PERSPECTIVES OF THE NUCLEAR POWER DEVELOPMENT IN THE USSR AND THE STRATEGY OF FUEL REPROCESSING. Dergachev, N.P. (International Atomic Energy Agency, Vienna (Austria)). May 1976. 10p. (In Russian). (CONF-760576--34). Dep. NTIS (US Sales Only), PC A02/MF A01.

From IAEA meeting on LMFBR fuel reprocessing; Leningrad, USSR (17 May 1976).

The forecast of the USSR program for nuclear power development, the role of fast reactors, the time of their introduction and their effect on fuel cycles are treated in the paper together with the consideration of technical characteristics of different fast reactors and their effect on uranium demand. The basic principles of development of reprocessing capacity is also described.

- 1876 (IAEA-AG--63-13) PHYSICAL CHARACTERISTICS OF SPENT LMFBR FUEL. Bakumenko, O.D.; Ikhlov, E.M.; Kulakovskij, M.Ya.; Troyanov, M.F.; Tsikunov, A.G. (International Atomic Energy Agency, Vienna (Austria)). May 1976. 11p. (In Russian). (CONF-760576--30). Dep. NTIS (US Sales Only), PC A02/MF A01.

From IAEA meeting on LMFBR fuel reprocessing; Leningrad, USSR (17 May 1976).

The present paper describes physical characteristics of fast breeder reactor fuels and analyses calculated isotope composition of spent fuel and dependance of fission product activity on cooling time. Requirements for a decontamination factor from fission product is considered in connection with the re-fabrication of fuel.

- 1877 (IAEA-AG--63-14) SOME ASPECTS OF CLEANING AND TRANSPORT OF SPENT FAST REACTOR FUELS. Shirin, V.M.; Karpov, A.V. (International Atomic Energy Agency, Vienna (Austria)). May 1976. 4p. (In Russian). (CONF-760576--38). Dep. NTIS (US Sales Only), PC A01/MF A01.

From IAEA meeting on LMFBR fuel reprocessing; Leningrad, USSR (17 May 1976).

Cleaning and transport of spent fast reactor fuels and utilization of lead for this purposes are considered in this paper.

- 1878 (IAEA-AG--63-15) FAST REACTOR SPENT FUELS TRANSPORTATION PROBLEMS. Burlakov, V.A.; Kosarev, Yu.A.; Markovin, A.P. (International Atomic Energy Agency, Vienna (Austria)). May 1976. 6p. (In Russian). (CONF-760576--33). Dep. NTIS (US Sales Only), PC A02/MF A01.

From IAEA meeting on LMFBR fuel reprocessing; Leningrad, USSR (17 May 1976).

In this paper transportation problems of spent fuels from fast reactors BN-350, BN-600 and BN-1500 to reprocessing plant are discussed. It was calculated that 6-10 fuel assemblies can be inserted in one transport cask, the weight of which is 50-60t. Noble gas or water can be used for the BN-350 fuel cask; sodium, lead and special alloys for the BN-1500. Transportation problems of angermetized fuel are also considered in this paper.

- 1879 (IAEA-AG--63-16) THERMAL DECLADDING OF BOR-60 FUEL ELEMENTS. Bibikov, S.E.;

Vasil'ev, G.I.; Ivanov, P.M.; Novoselov, G.P.; Serov, A.V.; Skiba, O.V.; Barkov, V.A. (International Atomic Energy Agency, Vienna (Austria)). May 1976. 20p. (In Russian). (CONF-760576--31). Dep. NTIS (US Sales Only), PC A02/MF A01.

From IAEA meeting on LMFBR fuel reprocessing; Leningrad, USSR (17 May 1976).

Experimental results on thermal decladding of reactor BOR-60 fuel elements irradiated to >10% and cooling time - 6 and 3 months - are discussed. The direct yield of fuel is 99.9%; content of steel in fuel <5.4%; data on fission products distribution are also given.

1880 (IAEA-AG--63-17) STORAGE OF FAST REACTOR SPENT FUEL AT THE REACTOR SITE AND IN REPROCESSING PLANTS. Burlakov, V.A.; Kruglikov, G.V.; Saaginskii, B.N. (International Atomic Energy Agency, Vienna (Austria)). May 1976. 5p. (In Russian). (CONF-760576--36). Dep. NTIS (US Sales Only), PC A02/MF A01.

From IAEA meeting on LMFBR fuel reprocessing; Leningrad, USSR (17 May 1976).

The paper considers the following problems: in-vessel spent fuel storage, intermediate storage in sodium, sodium removal and decontamination, utilization of special hermetically sealed containers to avoid release of radioactivity to the storage facility.

1881 (IAEA-AG--63-21) PILOT PLANT REPROCESSING OF THE BOR-60 SPENT URANIUM FUEL BY USING FLUORIDE VOLUTILITY METHOD. Kikoin, I.K.; Dem'yanovich, M.A.; Ivanov, P.M.; Prusakov, V.N.; Serov, A.V.; Skiba, O.V.; Barkov, V.A. (International Atomic Energy Agency, Vienna (Austria)). May 1976. 17p. (In Russian). (CONF-760576--24). Dep. NTIS (US Sales Only), PC A02/MF A01.

From IAEA meeting on LMFBR fuel reprocessing; Leningrad, USSR (17 May 1976).

Reactor BOR-60 spent fuels with burn-up approximately 10% and cooling time 3 and 6 months were successfully processed by the fluoride volatility method, followed up by sorption purification from fission products. The decontamination factor from gamma-radioactivity was >10⁴, fuel losses 0.4-0.5%. The main quantity (85%) of fission products is accumulated in an apparatus for fluorination as a waste; radioactive gas release is less than 10⁻⁵%.

1882 (IAEA-AG--63-27) REPORT OF THE IAEA ADVISORY GROUP MEETING ON LMFBR FUEL REPROCESSING. (International Atomic Energy Agency, Vienna (Austria)). May 1976. 31p. (CONF-760576--23). Dep. NTIS (US Sales Only), PC A03/MF A01.

From IAEA meeting on LMFBR fuel reprocessing; Leningrad, USSR (17 May 1976).

A summary of the papers and discussions of the meeting is presented, reviewing the status of development in LMFBR fuel reprocessing and focusing attention on important problem areas. The following topics are discussed: Transport, storage and removal of sodium; decladding and shearing; dissolution; Purex process; fluoride volatility method; off-gas purification; waste disposal. Status reports of national programmes of Belgium, France, Federal Republic of Germany, Italy, Japan, United Kingdom, USSR and USA are included.

1883 (IAEA-SM--225/24) DESIGN OF THE CLINCH RIVER BREEDER REACTOR STEAM GENERATORS. Lillie, A.F. (Atomics International Div., Canoga Park, CA (USA)). 1978. Contract EY-

76-C-03-1142. 20p. (CONF-780407--2). Dep. NTIS, PC A02/MF A01.

From Symposium on design, construction and operating experience of demonstration liquid metal fast breeder reactors; Bologna, Italy (10 Apr 1978).

The design features of the U.S. Clinch River Breeder Reactor Steam Generators are presented. The steam generator system arrangement and the design requirements for the units themselves are discussed. Special design features are discussed in some detail, and a summary of the supporting developments tests which have confirmed the steam generator design is presented.

1884 (IAEA-SM--244/66) CORE DESIGN AND OPTIMIZATION OF HIGH PERFORMANCE LOW SODIUM VOID 1000 MWE HETEROGENEOUS OXIDE LMFBR CORES. Barthold, W.P.; Orzechwa, Y.; Su, S.F.; Beitel, J.C.; Turski, R.; Lam, P.S.K.; Fuller, E.L. (Argonne National Lab., IL (USA); Electric Power Research Inst., Palo Alto, CA (USA)). 1979. Contract W-31-109-ENG-38. 38p. (CONF-790933--5). Dep. NTIS, PC A03/MF A01.

From IAEA international symposium on fast reactor physics; Aix-en-Provence, France (24 Sep 1979).

Radially heterogeneous core configurations are effective means to reduce sodium void reactivity. In general, radially heterogeneous cores can be designed as tightly or loosely coupled cores with center core or center blanket arrangements. Core height, number of core regions and number of fuel pins per assembly are additional variables in an optimization of basic heterogeneous core configurations. An extensive study was carried out to optimize the core configurations for 1000 MWe LMFBRs. All cores were subject to a common set of nuclear, mechanical, and thermal-hydraulic design assumptions. They were restrained by an upper sodium void reactivity limit of \$2.50 and a doubling time of approximately 15 to 18 years. The screening and optimization procedures employed lead to two core layouts which were both tightly coupled. A complete nuclear analysis of these two cores (derived from a loosely coupled configuration/derived from a tightly coupled configuration) determined the fissile inventories (4268.4/4213.4 kg at EOEC), burnups (83.90/100.7 Mwd/t peak), reactivity swings (0.49/1.8% Δk total), power and flux distributions for different control insertion patterns, the breeding performance (15.7/15.3 yrs CSDT), the safety parameters, such as sodium void reactivity (\$2.38/\$2.23 at EOEC), isothermal Doppler coefficients for both sodium-in (45.6/46.1 T dk/dT x 10⁻⁴ core at EOEC) and sodium-out conditions (28.6/28.2 T dk/dT x 10⁻⁴ core at EOEC), and the transient behavior which shows very little space-dependence during a 60 cent reactivity step insertion.

1885 (ICP--1050-4) FAST REACTOR FISSION YIELDS FOR ²⁴⁰Pu AND ²⁴²Pu. Maeck, W.J.; Eggleston, R.L.; Erikson, A.L.; Tromp, R.L. (Allied Chemical Corp., Idaho Falls, ID (USA). Idaho Chemical Programs - Operations Office). Feb 1979. Contract EY-76-C-07-1540. 57p. Dep. NTIS, PC A04/MF A01.

Absolute fast reactor fission yield data are presented for ²⁴⁰Pu and ²⁴²Pu irradiated in EBR-II. The measurement technique was isotope dilution mass spectrometry for over 40 mass numbers.

1886 (ICP--1050-11) FAST REACTOR FISSION YIELDS FOR ²³⁹Pu AND ²⁴¹Pu. Maeck, W.J. (Idaho National Engineering Lab., Idaho Falls

- (USA)). Aug 1977. Contract EY-76-C-07-1540. 58p. Dep. NTIS, PC A03/MF A01.
- Fast fission yield data are presented for ^{239}Pu and ^{241}Pu irradiated in EBR-II. The measurement technique was isotope dilution mass spectrometry. The neutron environment for the irradiation is defined, and chemical separation and mass spectrometric procedures are briefly described. Recommendations and suggestions for the selection of burnup monitors are given.
- 1887 (ICP--1168) SECOND ELECTROLYTIC DISSOLUTION CAMPAIGN OF EBR-II FUEL AT ICPP. Mortimer, S.R. (Allied Chemical Corp., Idaho Falls, ID (USA). Idaho Chemical Programs - Operations Office). Dec 1978. Contract EY-76-C-07-1540. 35p. Dep. NTIS, PC A03/MF A01.
- The second fuel reprocessing campaign using the electrolytic dissolution facility at the Idaho Chemical Processing Plant (ICPP) took place from February 1975 to November 1976. Several forms of EBR-II fuel, and various scrap fuels containing highly-enriched uranium, were dissolved in nitric acid in the dissolver's electric field. Gadolinium was used as a soluble nuclear poison to guarantee nuclear safety in the headend processing equipment. 9 figures, 5 tables.
- 1888 (IDO--1570-T31) INVESTIGATION OF OPTIMAL REDUNDANCY FOR A SPECIFIC SYSTEM OBJECTIVE. Griffith, J.M.; Rasmuson, D.M. (EG and G Idaho, Inc., Idaho Falls (USA)). 1979. Contract EY-76-C-07-1570. 23p. Dep. NTIS, PC A02/MF A01.
- Component redundancy is an effective technique for reducing system unavailability. However, the mathematical models relating redundancy and unavailability are generally complex, and casual inspection does not reveal which components should be made redundant to reduce unavailability. This paper develops a method for determining which components are made redundant with the greatest concomitant unavailability reduction. The method was used to study three system designs. For each design it was possible to identify several components which could be made redundant with an associated reduction in unavailability. However, the method also demonstrated that making most components redundant does not reduce unavailability, and in one case a component redundancy actually increased unavailability. Application of the present method helps the designer develop insight concerning the role of component redundancy in a system design without complex calculations and interpretations. 6 figures, 1 table.
- 1889 (IKE--4-87) BENCHMARK CALCULATIONS FOR A FAST SODIUM-COOLED BREEDER REACTOR ACCORDING TO THE METHOD OF FINITE ELEMENTS. Arnold, C.; Schmidt, F. (Stuttgart Univ. (TH) (Germany, F.R.). Inst. fuer Kernenergetik und Energiesysteme). Feb 1979. 30p. (In German). Dep. NTIS (US Sales Only), PC A03/MF A01.
- For a fast sodium-cooled breeder reactor a benchmark problem is calculated two- and three-dimensional according to the method of finite elements. The results are valued and compared with results obtained according to the method of finite differences. For the two-dimensional case good agreement is obtained. For the upper half of the core the results differ by .02%, for the lower half by .009%. For the three-dimensional case they differ by .07%. Also good agreement is obtained for flux comparison. The results are obtained with a smaller consumption of computing time.
- 1890 (IKE--5-202) COMPUTATION OF TEMPERATURE AND VELOCITY FIELDS IN FUEL ELEMENTS OF FAST SODIUM-COOLED BREEDERS PASSED BY A PARALLEL FLOW. Straub, G. (Stuttgart Univ. (TH) (Germany, F.R.). Inst. fuer Kernenergetik und Energiesysteme). Oct 1976. 93p. (In German). Dep. NTIS (US Sales Only), PC A05/MF A01.
- Thesis.
- A factor of decisive importance for the safe operation of nuclear reactors is the knowledge of the precise temperature distribution in the fuel elements. This study is to improve the computation of velocity and temperature fields in hexagonal fuel elements passed by a sodium flow. For this purpose, the turbulent transport phenomena in the turbulent bundle flow and their repercussions on the velocity and temperature fields had to be investigated. The ARTIS computer program was developed for calculation of the velocity and temperature fields; its results are compared with four different experiments.
- 1891 (IKE--5-203) DESIGN AND OPTIMIZATION OF THE ELECTROMAGNETICALLY ENERGIZED LIQUID METAL DIRECT CURRENT CONDUCTION PUMPS. Steiner, D. (Stuttgart Univ. (TH) (Germany, F.R.). Inst. fuer Kernenergetik und Energiesysteme). Dec 1976. 152p. (In German). Dep. NTIS (US Sales Only), PC A08/MF A01.
- Thesis.
- For direct-current conduction pumps with electromagnetic field-energizing an optimization method is developed accounting for the effects of electrical geometrical and materials specific quantities in the form of dimensionless power products. With fixed pump geometry the conditions for the maximum efficiency, including Joule's losses in the transformer channel, in the field windings, and in the electric power supplies are first set up. In the case of series excitation, minimizing Joule's losses in the power supplies and field windings have the effect of tending towards a design for small currents. With the aid of dimensionless geometry parameters the effects of variable pump dimensions are superimposed upon the electrical design. The optimum design can be represented as an envelope of a multi-parameter set of curves in a mass-efficiency diagram.

- 1894 (INIS-mf--4054, pp 182-192) RESULTS OF RESEARCH INTO NUCLEAR POWER PLANT SAFETY. Polak, V.; Hladky, E.; Moravek, J.; Suchomel, J.; Stehlik, J. Sep 1976. (In Slovak).

From 25. anniversary of the Power Research Institute; Prague, Czechoslovakia (30 Sep 1976).

A survey is given of computer programmes for the safety analysis of nuclear power plants with WWR type reactors and with fast breeder reactors. The programmes solve accidents in the core, the primary circuit and the containment. A comparison is made of Czechoslovak and foreign computer programmes and their agreement proved. Also studied is the problem of radiation safety of nuclear power plants with regard to the leakage of radioactive isotopes and their detection.

- 1895 (INIS-mf--4280, pp 163-166) PROGRESS IN LIQUID METALS HEAT TRANSFER. Pfann, J. 1976. (In Czech).

From Scientific and technical conference commemorating the 20. anniversary of the Nuclear Research Institute's foundation; Rez, Czechoslovakia (10 Jun 1975).

A mathematical model was drafted for heat transfer in liquid metals in turbulent flow. It was shown that the relation $Nu=Nu(Re, K_1, \dots, K_{sub}(n))$ applies for the flow region with negligible turbulent heat transfer for the practically most important case of heat transfer in channels with a coolant with $Pr \ll 1$ at fully developed velocity and temperature profiles. In the relation, K_1 to $K_{sub}(n)$ represent dimensionless geometric and physical parameters. In the region with an increased effect of turbulent heat transfer the relation $Nu=Nu(Pr, Re, K_1, \dots, K_{sub}(n))$ applies while for the region with a prevalent effect of turbulent heat transfer the relation $Nu=Nu(Pr, K_1, \dots, K_{sub}(n))$ applies. On the basis of the above model generally valid conclusions were formulated for heat transfer by liquid metals in a longitudinally by-passed bundle of fuel rods forming a regular triangular lattice.

- 1896 (INIS-mf--4280, pp 69-73) CALCULATIONS OF PHYSICS CHARACTERISTICS OF THE FAST REACTOR CORE. Cermak, J.; Tinka, I.; Tinkova, E. 1976. (In Czech).

From Scientific and technical conference commemorating the 20. anniversary of the Nuclear Research Institute's foundation; Rez, Czechoslovakia (10 Jun 1975).

Programmes have been written for fast reactors for the calculation of criticality, neutron flux spatial distribution in the core and the reflectors including other core characteristics, such as the distribution of heat generation and reactor output, reactivity coefficients, the effectivity of regulating and compensating elements, reactivity changes, and others. The programmes using a 26-group system in one-dimensional and two-dimensional geometry are based on the Galerkin variation method. Programmes have also been written based on the finite element method. The programmes have been tested in the calculation of two variants of the BN 350 fast power reactor and of the BN 600 reactor. In both cases, following the fundamental calculation of criticality and neutron fields the reactivity coefficients and some other physics parameters have been determined.

- 1897 (INIS-mf--4280, pp 137-144) EFFICIENT CALCULATION METHODS OF FAST REACTOR AND FUEL CYCLE THEREOF. Kujal, J.; Kujal, B. 1976.

(In Czech).

From Scientific and technical conference commemorating the 20. anniversary of the Nuclear Research Institute's foundation; Rez, Czechoslovakia (10 Jun 1975).

The ZELVA programme is briefly described for the calculation of a fast reactor and its fuel cycle. The programme includes a neutron-physics calculation and consequent thermal-hydraulic and strength calculations. The neutron calculation includes the determination of 26-group microscopic cross sections, the calculation of criticality and neutron flux distribution. The physics calculation is carried out one-dimensionally in a 26-group approximation. The thermal-hydraulic calculation determines the basic heat technology characteristics of the fuel element and fuel assembly and is performed for maximally loaded fuel assemblies in the core and in the breeding blanket. The maximal temperatures of the fuel pin cladding and the maximal fuel temperature are determined from the calculated values of thermal power density provided the input and output coolant temperatures are given. Also determined are friction losses, losses due to location, to spacing elements and other local losses. The strength calculation includes the determination of strength, deformation and function criteria characterizing the fuel pin and the fuel assembly claddings. It is estimated that the cladding is strained by a time-variable overpressure of fission products and a time-variable heat stress. The calculation is performed for the maximally loaded fuel pin and fuel assembly in the core and in the breeding blanket. The programme was tested by calculating a cylindrical reactor with a thermal output of 1,470 MW and a fast converter with a thermal output of 1,000 MW. Input data were taken over from projected reactors similar to the Soviet-made BN-600 and BN-350 reactors.

- 1898 (INIS-mf--4280, pp 167-169) NEUTRON TRANSPORT BY SODIUM PIPES GOING THROUGH FAST REACTOR SHIELDING 20. Burian, J.; Rataj, J. 1976. (In Czech).

From Scientific and technical conference commemorating the 20. anniversary of the Nuclear Research Institute's foundation; Rez, Czechoslovakia (10 Jun 1975).

On the WWR-S reactor, neutron transport was studied through a straight cylindrical sodium conduit 400 mm in diameter as was neutron transport through a conduit with elbows, and the effects were investigated of gaps and insulation materials on neutron transport with the purpose of determining the neutron transport through the sodium conduit in the fast reactor shielding. 7 different types of detectors were used for neutron detection, the neutron flux distribution in complex geometry was studied by the three-dimensional Boltzmann transport equation using the Monte Carlo method by means of an IBM 370/135 computer. When sodium is surrounded by a thick iron layer, neutron transport through sodium is decisive for long distance transport. If there is a gap or insulation around the conduit, neutrons passing through this medium also affect the neutron spectrum in sodium.

- 1899 (INIS-mf--4280, pp 182-189) PROGRESS IN THE CONSTRUCTION OF EXPERIMENTAL SODIUM LOOP SMT-1. Paryzek, R.; Rezac, J.; Pasek, M. 1976. (In Czech).

From Scientific and technical conference commemorating the 20. anniversary of the Nuclear Research Institute's foundation; Rez, Czechoslovakia (10 Jun 1975).

Experimental sodium loop SMT-1 being built

in the Nuclear Research Institute is designed for heat technology research of fast reactor fuel assemblies and for research and development of sodium technology. In addition to the sodium circuit proper, the equipment will consist of sodium preliminary cleaning and disposal stations, a measuring and a control unit, a 1000 kVA power supply and a ventilation system. The sodium circuit is divided into two branches operating at temperatures of 500 and 600 degC, respectively. For this purpose, an air cooler is inserted in the circuit and a contactless ejector-type heat exchanger. The circuit will also be equipped with 7 electromagnetic flowmeters without iron core, a contactless sodium level indicator and with a system of sodium leak indication.

INSTITUTE'S RESEARCH INTO THERMAL PARAMETERS OF FAST REACTOR FUEL ASSEMBLIES. Sulc, V.; Pasek, M.; Hrehor, M.; Masek, V.; Nechvatal, J. 1976. (In Czech).

From Scientific and technical conference commemorating the 20. anniversary of the Nuclear Research Institute's foundation; Rez, Czechoslovakia (10 Jun 1975).

Temperature fields in fuel assemblies modelling the BN-600 reactor assemblies for the case of deflection of the side rod from the nominal position in the direction normal to the assembly wall were studied using the experimental sodium loop S III permitting operation at sodium coolant temperature of 400 degC. The experimental assembly consisted of 16 rods, temperatures were measured with thermocouples placed on a measuring rod in a regular helical configuration with a pitch of 856 mm. The first thermocouple was placed 5 mm from the beginning of the heated length, the last at a distance of 775 mm. This configuration made it possible to measure the temperature field both along the periphery and along the length of the heating rod. The temperature profiles along the periphery of the measuring rod showed along the entire length of the rod temperature maxima in two contact places, this for all heated rods.

HYDRODYNAMICS OF EMERGENCY COOLING OF A SODIUM-COOLED FAST REACTOR. Macek, J.; Pfann, J. 1976. (In Czech).

From Scientific and technical conference commemorating the 20. anniversary of the Nuclear Research Institute's foundation; Rez, Czechoslovakia (10 Jun 1975).

A mathematical model is described permitting the quantitative study of transients in the primary coolant circuit and in the core of a sodium-cooled fast reactor in a loop configuration. The possibility of sodium boiling is not considered. The circuit is described using a system of nonlinear differential equations, the initial conditions for the solution of the system are based on the steady nominal state. The analytical solution is described of the outage of all pumps and simplifications facilitating the solution are given. A modified Runge-Kutta method permitting the automatic adjustment of the integration step length thus considerably accelerating the whole calculation, proved suitable for the integration of the nonlinear system of differential equations. The model is applicable not only for emergency after-cooling but also for other transients provided the steam phase is not formed in the coolant. The derived analytical relations facilitate good orientation in the changes in the flow rate and the pump run-out.

HYDRODYNAMICAL EXPERIMENTS ON AN ENLARGED MODEL OF A FAST REACTOR FUEL ASSEMBLY. Mantlik, F.; Hejna, J.; Cervenka, J. 1976. (In Czech).

From Scientific and technical conference commemorating the 20. anniversary of the Nuclear Research Institute's foundation; Rez, Czechoslovakia (10 Jun 1975).

The HEM-1 equipment in the Nuclear Research Institute is designed for the hydrodynamic research of fuel assemblies of fast power reactors of the BN-600 type, intended for obtaining information on hydrodynamic conditions in an infinite rod bundle with a local geometrical failure. The model consists of 19 aluminium tubes with a relative spacing of 1.17 enclosed in a hexagonal containment whose walls are in contact with the side tubes. The outer tube diameter is 120 mm, the total model length is 6 m. The central tube may be deflected towards one or two neighbouring tubes to contact. Static pressure is measured by two probes on each of four measuring rods and by 27 probes spaced evenly along the channel length by 250 mm. Static pressure measurement shows that the pressure gradient may be considered to be constant starting at a distance of 2000 mm from the inlet, i.e., about 40 hydraulic channel diameters.

- 1904 (INIS-mf--4316, pp 43-47) BINARY CYCLE WITH POTASSIUM AND N_2O_4 VAPORS FOR NPP WITH A FAST SODIUM REACTOR. Popyrin, L.S.; Starostenko, V.I.; Starostenko, N.N. 1977. (In Russian).

Dissociating gases as coolants and working fluids in power plants. 3. Pt. . Collection of papers (1972-1975).

Possible ways have been investigated to increase the efficiency of NPP with fast sodium reactors. Using a binary cycle with potassium and N_2O_4 as working fluids may be one of the promising means of improving NPP characteristics. Such an approach allows the substitution of intermediate circuit with potassium for that with sodium in a three-circuit scheme. In this case, the heat-exchangers used will be much more compact as compared to water heat-exchangers. The developed mathematical model of NPP with potassium and N_2O_4 as working fluids has allowed engineering and economic investigations and a complex optimization of the plant parameters to be performed. The results obtained show that it is promising realize the above-mentioned plant and to seek for the ways of a further increase in its efficiency.

Diploma thesis.

In order to find out how a fluid flow streaming off as a film depends on the gas phase being in counterflow, two experimental apparatuses were designed and built, and measurements were made. For this purpose, the flow conditions occurring in a SNR breeder element completely blocked and boiled empty were simulated by a 31-rod bundle. A relation derived for the steady-state equilibrium between film and gas flow was used for the evaluation of the measured results. In the experiments, limiting curves could be established showing the maximum film rate flowing off as a function of the superposed gas flow rate. In addition the equilibrium parameters gas velocity, film velocity, and film thickness were determined for the material combination water/air. The influence of the spacers on the film flow was also accounted for the series of the measurements carried out. It appeared that by mounting a honeycomb spacer in the test sections the maximum film rate flowing off is drastically reduced by about 75 to 85% for the same flow rate. Mounting a second spacer, however, had no further influence on the film flowing off. It was possible to explain this phenomenon by means of the course of the experiments.

- 1907 (INIS-mf--4426, pp VII.1-20) SHORT TERMS EXPERIMENTS IN BR2 TOWARDS A BETTER FAST FUEL PERFORMANCE ANALYSIS. van Vliet, J.; Pay, A. (Societe Belge pour l'Industrie Nucleaire, Brussels). 1978.

From BR2 reactor review meeting; Mol, Belgium (1 Jun 1978).

The FARFADET experimental program to be performed in the BR2 reactor is aimed to study the begin-of-life fuel temperature with short experiments on well characterized fuel pins for LMFBR type reactors. The article reviews some aspects of the fuel physical restructuring and its chemical effects at begin-of-life, like porosity redistribution, in-pile sintering, fission gas bubble swelling, grain growth, oxygen and actinide redistribution. The planned experiments in the BR2 reactor are presented.

- 1908 (INIS-mf--4426, pp VIII.1-15) CHEMICAL INTERACTION AT THE FBR CLADDING FUEL INTERFACES. Delbrassine, A.; Retels, J.; Dirven, P. (Centre d'Etude de l'Energie Nucleaire, Mol (Belgium)). 1978.

From BR2 reactor review meeting; Mol, Belgium (1 Jun 1978).

Pins containing UO_2 -30 wt.%PuO₂ and/or cesium and/or tellurium as doping elements have been irradiated for about 40 days in the BR2 reactor. The effects of two Cs/Te ratios, namely 1.3 and 4 and a wide range of D/M ratios on the inner corrosion of the clad have been investigated. The influence of Tellurium on the attack of the cladding has been pointed out. It may be responsible for the Chromium NS Nickel depletion in the grain boundaries of the steel. It is necessary to measure the effective Ts/Te ratio associated with the local corrosion layers. This local Cs/Te ratio should be more useful than the initial mean Cs/Te ratio in a pin for understanding the corrosion phenomena.

- 1909 (INIS-mf--4426, pp I.1-13) POSSIBILITIES OF APPLICATION OF EXPERIMENTAL KFK RESULTS FROM BR2 ON SNR DESIGNS. Karsten, G.; Elbel, K.; Dienst, W.; Schaefer, L. (Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Inst. fuer Reaktorentwicklung). 1978.

From BR2 reactor review meeting; Mol, Belgium (1 Jun 1978).

A review is given of the relevant results of the technological application for the SNR300 reactor, since the BR2 reactor has been used as a test facility for the material development. Special emphasis has been laid on the fuel pin behavior under the aspect of chemical and mechanical fuel-clad interaction and on the specification of the cladding in terms of high temperature mechanical behavior in the SNR 300 reactor. A systematic analysis of urgent research topics in BR2 test facility reactor is presented.

- 1910 (INIS-mf--4426, pp II.1-13) IN-PILE INVESTIGATION OF LOCAL COOLING DISTURBANCE IN LMFBR'S (MOL 7C). Kramer, W. (Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Inst. fuer Reaktorentwicklung); Vanmassenhove, G. (Centre d'Etude de l'Energie Nucleaire, Mol (Belgium)). 1978.

From BR2 reactor review meeting; Mol, Belgium (1 Jun 1978).

The main results of the MOL7C investigation program aimed at determination of consequences of local cooling disturbances in fuel pin bundles up to pin destruction are presented. The objectives of the program, the description of the test facility, a special sodium loop in the BR2-reactor, the performance of the experiments and the conclusions are described.

- 1911 (INIS-mf--4470, pp vp) MODELING OF LMFBR FUEL CLADDING MECHANICAL BEHAVIOR UNDER TRANSIENT CONDITIONS. 1977.

From 4. international conference on structural mechanics in reactor technology; San Francisco, CA, USA (15 Aug 1977).

Analytic methods must address the complexity of modeling fuel cladding response in situations where temperature, temperature gradient, strain rate, and stress are changing rapidly with time. Fuel cladding modeling is not a simple extension of the experimental and interpretative methods used in classical mechanics. New concepts are needed to describe materials in a reactor environment. Some aspects of continuum physics used to develop these new constitutive equations for fuel cladding are presented in this report. The theory of internal state variable, whose evolution is governed by ordinary differential equations, has been introduced into continuum mechanics. The components of the internal or hidden state variable vector may be scalars, components of vectors, components of second order tensors, etc. Irradiation, hardening, grain size, chemical reaction, etc., are scalar internal variables. Internal strain, dislocation loop density, etc., are all examples of second order tensors whose components are internal state variables. The internal state variables of this report are irradiation PHI which satisfies the neutron density conservation law, and hardening.

- 1912 (INIS-mf--4470, pp vp) EFFECTS OF STRESS ON SWELLING IN REACTOR FUEL CLADDING. 1977.

From 4. international conference on structural mechanics in reactor technology; San Francisco, CA, USA (15 Aug 1977).

The purpose of this report is to describe the effect of stress on swelling in both annealed and 20% cold worked 316 stainless steel. An effect of stress on swelling in irradiated metals has been postulated for some time. Low fluence data confirmed that indeed a tensile stress can increase swelling in irradiated annealed 316 stainless steel and

that the maximum swelling occurs at an intermediate stress level which is approximately equal to the proportional elastic limit of the material. The specimens discussed above were examined by transmission electron microscopy and an effect of stress on the microstructure of the annealed and 20% cold worked 316 specimens has been observed. However, as yet, copious swelling had not occurred in the 20% cold worked material. Specimens of 20% cold worked 316 fabricated from the same heat of material as those described above have now been irradiated to sufficiently high neutron fluences that swelling has occurred in both the annealed and cold worked conditions. The specimens were 2.5 cm long, biaxially pressurized tubes, with an OD of 0.58 cm and ID of 0.51 cm. Stress levels ranged from 0 to approximately 400 MPa. Specimens were irradiated in EBR-II to maximum fluences approximately 53 dpa. Swelling in the specimens was evaluated by pre- and post-irradiation immersion density measurements.

- 1916 (INIS-mf--4470, pp vp) CLADDING FAILURE BY LOCAL PLASTIC INSTABILITY. 1977.

From 4. international conference on structural mechanics in reactor technology; San Francisco, CA, USA (15 Aug 1977).

Cladding failure is one of the major considerations in analysis of fast-reactor fuel pin behavior during hypothetical accident transients since time, location, and nature of failure govern the early post-failure material motion and reactivity feedback. Out-of-Pile transient burst tests of both irradiated and unirradiated fast-reactor cladding show that local plastic instability, or bulging, often precedes rupture. The time and location of failure is then determined by conditions favorable to bulge formation. Furthermore, the extent of the local instability limits the initial rip length and the initial area available for motion of fuel and fission products from the pin. To investigate the details of cladding bulging, a perturbation analysis of the equations governing the large deformation of a cylindrical shell has been

developed. The overall deformation history is assumed to consist of a small perturbation of the radial displacement superimposed on large axisymmetric displacements. Computations have been carried out using high temperature properties of stainless steel in conjunction with various constitutive theories, including a generalization of the Endochronic Theory of Plasticity in which both time- and time-dependent plastic strains are modeled.

- 1917 (INIS-mf--4470, pp vp) LMFBR-FUEL CLADDING THERMAL CREEP STRAIN UNDER LINEARLY INCREASING INTERNAL PRESSURE. 1977.

From 4. international conference on structural mechanics in reactor technology; San Francisco, CA, USA (15 Aug 1977).

This paper describes an apparatus designed to simulate the continuously increasing internal pressure due to the accumulation of fission product gas. There is also an examination of the effects of increasing pressure on the thermal creep rate of cladding. Test specimens are 20% C.W. type 316 stainless steel tubes with 6.5 mm OD, 5.6 mm ID and 200 mm length. Increasing pressure creep tests were performed at 700°C, the hoop stress was increased in steps with 3 incremental rates of 0.15, 0.075 and 0.0375 kg/mm²h. Constant pressure creep tests were also performed at the same temperature for comparison. As mentioned above, calculations of creep behavior under increasing stress are normally made using the stationary creep rate obtained from constant pressure tests. Thus, it is important to know these creep rates agree with creep rates directly measured from strain-time plot under increasing pressure. The results show that the creep rates obtained from creep curves under increasing pressure are several times as high as the stationary creep rates measured under the same constant pressure. Creep strain rate under increasing pressure, due to the accumulation of gaseous fission products in the actual fuel cladding, is approximately 2 to 5 times that of the constant pressure creep rates, although the creep rate magnification depends on the stress and the stress-increase rate. Based on so-called time hardening theory and strain hardening theory, creep strain rate under increasing pressure is calculated using the strain-time plot under constant pressure.

- 1918 (INIS-mf--4470, pp vp) CHARACTERIZATION OF RESIDUAL STRESS PROFILES IN IRRADIATED FUEL PIN CLADDING. 1977.

From 4. international conference on structural mechanics in reactor technology; San Francisco, CA, USA (15 Aug 1977).

Two specific applications for characterizing the residual stress in irradiated fuel pin cladding with limited, discrete data are developed in the paper. One represents a minimum effort approach and requires only four pairs of data. The end product is a 'curve' consisting of four linear segments that approximates the residual stress profile of the cladding specimen. The second technique is a semi-analytical technique for statistically fitting an assumed curve form to the data. The deformation of fueled cladding irradiation is a complex phenomenon. Modelling the deformation mechanism fuel pin cladding cannot provide detailed information fuel pin behavior without corroborative experimental data. The ability to determine the actual residual stress profile through the wall of a cladding specimen represents a new and powerful tool for evaluating cladding behavior.

- 1919 (INIS-mf--4470, pp vp) PROBABILISTIC

DESIGN METHOD FOR LMFBR FUEL RODS. 1977.

From 4. international conference on structural mechanics in reactor technology; San Francisco, CA, USA (15 Aug 1977).

Fuel rod performance analyses for design purposes are dependent upon material properties, dimensions, and loads that are statistical in nature. Conventional design practice accounts for the uncertainties in relevant parameters by designing to a 'safety factor', set so as to assure safe operation. Arbitrary assignment of these safety factors, based upon a number of 'worst case' assumptions, may result in costly over-design. Probabilistic design methods provide a systematic way to reflect the uncertainties in design parameters. PECS-III is a computer code which employs Monte Carlo techniques to generate the probability density and distribution functions for time-to-failure and cumulative damage for sealed plenum LMFBR fuel rods on a single rod or whole core basis.

1920 (INIS-mf--4470, pp vp) STATISTICAL MECHANICAL ANALYSIS OF LMFBR FUEL CLADDING TUBES. 1977.

From 4. international conference on structural mechanics in reactor technology; San Francisco, CA, USA (15 Aug 1977).

The most important design requirement on fuel pin cladding for LMFBR's is its mechanical integrity. Disruptive factors include internal pressure from mixed oxide fuel fission gas release, thermal stresses and high temperature creep, neutron-induced differential void-swelling as a source of stress in the cladding and irradiation creep of stainless steel material, corrosion by fission products. Under irradiation these load-restraining mechanisms are accentuated by stainless steel embrittlement and strength alterations. To account for the numerous uncertainties involved in the analysis by theoretical models and computer codes statistical tools are unavoidably requested, i.e. Monte Carlo simulation methods. Thanks to these techniques, uncertainties in nominal characteristics, material properties and environmental conditions can be linked up in a correct way and used for a more accurate conceptual design. First, a thermal creep damage index is set up through a sufficiently sophisticated clad physical analysis including arbitrary time dependence of power and neutron flux as well as effects of sodium temperature, burnup and steel mechanical behavior. Although this strain limit approach implies a more general but time consuming model., on the counterpart the net output is improved and e.g. clad temperature, stress and strain maxima may be easily assessed. A full spectrum of variables are statistically treated to account for their probability distributions. Creep damage probability may be obtained and can contribute to a quantitative fuel probability estimation.

1922 (INIS-mf--4470, pp vp) EXPERIMENTAL AND THEORETICAL EVALUATION OF DEFECT GROWTH OF FUEL PIN CLADDING BY CHEMICAL FUEL-SODIUM

INTERACTION. 1977.

From 4. international conference on structural mechanics in reactor technology; San Francisco, CA, USA (15 Aug 1977).

In the system fuel=sodium+oxygen a reaction product (Na_2MO_4), where $\text{M}=\text{U}+\text{Pu}$, is formed after attaining an equilibrium oxygen concentration in the sodium. The reaction product is characterized by a low density (e.g. 5.5 g/cm^3) and a low thermal conductivity (about $2/10$ of that of the fuel). The melting point is about 1420°C . The reaction was predicted previously by thermodynamic assessment for UO_2 and for mixed oxide. First estimates were made for O-diffusion through the fuel to the defect after falling below the equilibrium O concentration in sodium. Because of the small diffusion coefficient, the calculated diffusion time was large and the swelling rate of the defected pin was relatively low. There are now available some results of German irradiation experiments with defected pins in sodium. The measured swelling rates are much higher than the former predicted values.

1923 (INIS-mf--4470, pp vp) 2-D THERMOELASTIC ANALYSIS OF LMFBR FUEL ROD CLADDINGS. 1977.

From 4. international conference on structural mechanics in reactor technology; San Francisco, CA, USA (15 Aug 1977).

The primary purpose of this study is twofold. Firstly, unique 2-D and 3-D temperature fields for bare finite rod bundles are presented which result from detailed distributed-parameter analyses using the slug flow model. Secondly, these results together with azimuthally varying inside and outside pressure fields are used to derive thermoelastic stress and displacement fields. The 2-D temperature fields are obtained by an iterative multicell, multiregion technique. Multicell calculations are especially important for studying the pronounced asymmetry effects induced by the coolant cells which are bounded by the bundle wall. The solution takes into account an arbitrary flow split between wall and internal subchannels as well as different heat source densities in the pins. Results indicate that the adiabatic single cell calculation is not conservative under all circumstances as has been previously assumed.

1926 (INIS-mf--4492, pp v) INELASTIC RESPONSE OF METALLIC IMPACT LIMITERS. 1977.

From 4. international conference on structural mechanics in reactor technology; San Francisco, CA, USA (15 Aug 1977).

Energy mitigators on some light water reactor (LWR) spent fuel shipping casks and conceptual designs for liquid metal fast breeder reactor (LMFBR) spent fuel shipping casks rely on the inelastic behavior of metallic plate-like structures. A program was undertaken to investigate the response of mitigators to hypothetical shipping accidents with parallel experimental and theoretical studies. The theoretical studies consist of performing large deformation three dimensional transient dynamic analysis on several metal fin designs and correlating the results with the experimental results. The newly developed computer program WULFF was used. WULFF is capable of predicting the dynamic response of solids with elastic-plastic material properties. The finite element displacement formulation with the eight isoparametric elements is used with the innovation of calculating stress components at the nodes of the model. Testing of scale model fin specimens was performed at SLA's drop table facility. The test specimens are mounted on a force transducer and this assembly is bolted to the stationary bottom table. Extra weights are added to the drop table so that the total energy at impact is sufficient to cause large plastic deformation in the specimens. Accelerometers mounted on the drop table and the data from the force transducer are used to compute the energy absorbed during the test. Also framing camera coverage was used to observe the specimen deformation as it develops.

1927 (INIS-mf--4498, pp v) PARAMETRIC INVESTIGATION OF DYNAMIC FRACTURE. 1977.
From 4. international conference on structural mechanics in reactor technology; San Francisco, CA, USA (15 Aug 1977).

This paper presents results of parametric finite element fracture mechanics analyses conducted to develop an analytical model for simulating dynamic brittle fracture. Although this work may have wider general application, the dynamic loads considered here are those that may arise due to rapid release of fission gases from a failed fuel element inside a subassembly duct in an LMFBR. The analyses were conducted on an edge-cracked panel with various configurations of primary and secondary flaws similar to those investigated for quasi-static fracture earlier by Chopra, et al. The dynamic loading was in the form of a triangular pressure pulse which reached a peak value of 1000 psi in 0.1 msec and decayed to zero in 2.0 msec. The finite element mesh employed was identical to that used for previous quasi-static fracture investigations so that the dynamic and quasi-static results could be compared. For the fracture configurations analyzed, the peak dynamic crack opening stresses (COS) in the vicinity of the crack tip exceeded the static values by factor of approximately 1.5. The displacement between two opposing nodes behind the crack tip, called the crack opening displacement (COD), also was investigated. The dynamic COD was found to be approximately 1.3 times greater than the corresponding static value. This difference may be due to the different locations at which the quantities are computed.

1929 (INIS-mf--4498, pp v) LMFBR FUEL ASSEMBLY CHANNEL WALL CROSS SECTION OPTIMIZATION. 1977.

From 4. international conference on structural mechanics in reactor technology; San Francisco, CA, USA (15 Aug 1977).

An LMFBR fuel assembly channel is a hexagonal thin-walled tube surrounding the fuel pin bundle to facilitate fuel handling and to control the flow of coolant through the core. The channel is subject to the internal pressure of the high temperature sodium coolant and also to a high flux of fast neutrons. This environment results in a ballooning of the channel from its original hexagonal shape due to irradiation swelling, thermal and irradiation enhanced creep, and the elastic pressure deformation of the channel material. The cross-sectional shape of the hexagonal channel is limited primarily by the principal stress and the total channel radial growth. It is presently considered preferable that adjacent channels do not touch from channel ballooning due to concerns about safety and refueling considerations. A computer program, WALLOP, has been developed as described in this paper to derive the wall shape of such an optimum channel, given realistic design and material constraints. Within WALLOP, an initial cross-sectional shape is chosen and a beam model of the wall is used to determine the elastic deflection. By assuming any changes in the axial direction along the assembly length to be gradual, a transverse slice of one wall may be reduced to a variable thickness, plain-strain, fixed-end beam with a non-planar centroidal surface and subject to transverse loading (internal coolant pressure) and axial loading (hoop force constraining the internal pressure). The deflection is combined with swelling and creep rate data on the chosen wall material and with core geometric parameters to evaluate the time for channel-to-channel contact. The computer program then sequentially perturb the wall cross section and repeats the process until channel life is maximized. This sequential search optimization process is similar to the 'Rosenbrock' algorithm.

1930 (INIS-mf--4498, pp v) COMPUTER ANALYSIS OF THE INFLUENCE OF DESIGN PARAMETERS, MATERIALS PROPERTIES AND OPERATION CONDITIONS ON THE IRRADIATION BEHAVIOR OF FAST BREEDER FUEL RODS WITH OXIDE FUEL. 1977.

From 4. international conference on structural mechanics in reactor technology; San Francisco, CA, USA (15 Aug 1977).

Irradiation experiments have shown that clad deformations due to contact pressure have occurred starting at a certain burnup value. This threshold is determined by two processes: time to gap closure and succeeding stabilization of the outer fuel region by crack healing. Irradiation experiments and modeling analyses have revealed that the gap volume is exhausted faster than expected due to fuel swelling only. Reasons for this effect are: formation of fission gas bubbles and their migration towards the central hole with simultaneous dislocation of the fuel pellet towards the clad and/or relocation of the cracked fuel pellet, e.g. due to power changes during reactor operation. It is known, moreover, from experiments and modeling analyses that high contact pressures and resulting clad deformations occur at non-steady-state operation. Necessary conditions are: residual gap width smaller than the difference

between the thermal expansion of fuel and clad, sufficient degree of crack healing, and increase of the local rod power above the level maintained a certain time. Contact pressure and clad deformation are determined by following parameters: start and end level of the rod power, the power ramp, the mechanical stability of the fuel which is influenced by its density and crack structure and volume, and creep and/or plastic properties of fuel and clad which are governed by temperature and rod power. SATURNE-1 calculations have shown that the load onto the clad expected at power ramps depends heavily on three factors: thermal expansion of the fuel pellet (dependency on O/Me ratio, actual temperature level) healing of the peripheral radial cracks, and mechanical properties of the outer fuel region.

1931 (INIS-mf--4498, pp v) THREE-DIMENSIONAL ANALYSIS FOR FUEL PIN DEFORMATIONS IN AN LMFBR ASSEMBLY. 1977.

From 4. international conference on structural mechanics in reactor technology; San Francisco, CA, USA (15 Aug 1977).

Based on this method, a new computational code, the Subchannel Deformation Analysis Code for Wire-Wrapped Assemblies (SHADOW), has been developed, which can be applied to seven kinds of wire-wrapped fuel assemblies with a number of fuel pins ranging from 7 to 169. This code calculates subchannel flow areas, wetted perimeters, gaps between fuel pins and distances between the outermost pins and wrapper tube wall, coupled with a thermal hydraulic code in order to get the temperature distributions of coolant and cladding in the deformed flow channels. SHADOW also calculates the magnitudes, positions and directions of contact forces loaded by the adjacent fuel pins or wrapper tube. SHADOW was utilized for analyzing the deformation due to thermal bowing of 169 fuel pins in a prototype fast breeder reactor. Conclusions derived from the present study are summarized as follows: the bowing deformations are significant throughout the overall length of the outer fuel pins and in the upper part of the gas plenum region of the inner fuel pins. These phenomena cause the axial variations of the flow areas, especially, in the outer channels and requires iterative estimations of the temperature distribution in the deformed channels. In the case of the outer fuel pins, the major contact forces are loaded near the top of each fuel pin, and in the case of the inner ones, the loads are mainly applied near the center parts of the gas plenum and core regions. These forces are not large enough to deform the cross section of the cladding.

1932 (INIS-mf--4498, pp v) RESPONSE OF A GRID SPACED FUEL ASSEMBLY TO SHIPPING ENVIRONMENT. 1977.

From 4. international conference on structural mechanics in reactor technology; San Francisco, CA, USA (15 Aug 1977).

This paper presents a dynamic analysis approach for design verification of the GSA under conditions of shipping and handling using prototypical test examples of transportation by truck. Analytical response results were obtained using representative trailer bed acceleration time histories which had been recorded earlier under simulated shipping by truck transport environment. Important parameters affecting response are identified. Recognizing that the analytical estimate of the fundamental periods of the GSA cannot be very accurate owing to the complex geometry, upper bounds on acceleration responses were established using the standard response spectrum technique. Finally, the GSA design was

verified by laboratory tests—both static and dynamic. Static tests were used to calibrate displacement response of the grid spacer tabs relative to the fuel rods. Prototypical dynamic shaking table test were next employed in which the response of the GSA was determined in sinusoidal sweep type of excitation. Handling loads were represented by shock tests consisting of one-cycle impulses at various levels of acceleration. The results of laboratory testing were seen to reinforce credence of design verification by analysis of the GSA subjected to shipping and handling environment.

1933 (INIS-mf--4498, pp v) STRESS-INTENSITY FACTORS FOR IRRADIATION-EMBRITTLED HEXAGONAL SUBASSEMBLY DUCTS. 1977.

From 4. international conference on structural mechanics in reactor technology; San Francisco, CA, USA (15 Aug 1977).

The results of a finite-element analysis of the same problem are reported, and they support the applicability of beam theory to the hexcan problem. In particular, modelling the hexcan corner as a cracked strip whose crack faces are loaded with the hexcan stress distribution has been found to give very good results for the particular hexcan studied. The finite-element results for uniformly pressurized hexcans have been used as the basis for computing stress intensity factors for cracks in non-uniformly loaded hexcans, under loading conditions that might simulate those of fission gas released from failed fuel pins or other non-uniform accident loading conditions. The weight function technique employed can be used to study a variety of conditions in a quick and efficient manner, for all that is required is knowledge of the stress intensity factor of the reference problem of the uniformly-loaded hexcan and the stress distribution through the thickness of an unflawed hexcan. This information is used in conjunction with a simple representation for the crack shape, and it is shown how one may thereby compute stress intensity factors for other loading conditions by the evaluation of simple integrals. The technique is illustrated by the problem of a hexcan loaded by concentrated forces at opposite midflats. A finite-element analysis also has been carried out for the cracked hexcan loaded by midflat forces. The results of the different techniques are compared, and the simple model of a cracked strip loaded with the hexcan stress distribution is found again to agree closely with the finite-element results for the hexcan considered. However, the weight function technique is expected to apply to geometries for which the strip model is inadequate and to hold over a wider range of crack sizes.

1934 (INIS-mf--4498, pp v) MODEL FOR PRESSURE IN AN LMFBR DUCT DUE TO DISCHARGE OF GAS FROM A FAILED FUEL PIN. 1977.

From 4. international conference on structural mechanics in reactor technology; San Francisco, CA, USA (15 Aug 1977).

In this paper an analytical model for the calculation of pressure pulses in hexagonal ducts due to discharge of gas from a failed fuel pin is developed. The analysis yields the time history of the pressure pulse which can be used in the calculation of permanent deformation of the duct or in the assessment of the susceptibility of the duct to fracture. The real physical situation of gas discharging through a pin in a duct filled with liquid is complex to model. Here the phenomenon is modeled based on some reasonable assumptions. In this model the analysis is divided into two

stages. In the first stage the gas expands as a spherical bubble, but the influence of the duct wall is taken into account. At the end of the first stage the spherical shape of the bubble is assumed to be lost and the gas is assumed to expand axially as a column. The analysis involves solving the continuity and momentum equations for the liquid along with the energy balance equation for the gas.

1935 (INIS-mf--4498, pp v) ANALYSIS OF BOWED REACTOR CORES USING THE FIAT-PROGRAM. 1977.

From 4. international conference on structural mechanics in reactor technology; San Francisco, CA, USA (15 Aug 1977).

FIAT is based on the NUBOW code of ANL. FIAT calculates the force equilibrium configuration of elements in a spoke, treating the ducts as beam members. The iteration technique, which is taken from NUBOW, is used in FIAT to calculate the gap distribution between the pads of the elements in the considered spoke. Knowing the gap distribution a direct solution of the unknown mechanical displacements and forces in the load planes can be given. As the gap distribution hardly changes during the burn-up history, the use of the iteration part is not required very often. The computer running times of the combined method are about 10 times less than the strict iteration technique as used in NUBOW. The computer running time reduction is improving with increasing numbers of load planes between the elements. Other improvements of FIAT over NUBOW are bowing of elements due to neutron induced swelling and creep effects, and the growth of duct width due to pressure drop and creep (bulging). In small time steps (approximately 4d) the additional amounts of swell bowing, creep bowing and growth of duct width are calculated. The equilibrium configuration is calculated after every time step to minimize the error produced by calculating at discrete time points. The calculation of the bowing reactivity of a burned core can be performed for any desired time in reactor history. The shut-down situation (low temperature level, no temperature gradients but bowed elements due to neutron fluence) can also be calculated at any time. At these time points a management of fuel elements can be prescribed, e.g. insertion of fresh elements or reshuffling of burned elements. With FIAT, the mechanical configuration of a reactor core can be calculated for the whole reactor history.

1936 (INIS-mf--4498, pp v) URANUS, A COMPUTER CODE FOR THE THERMAL AND MECHANICAL ANALYSIS OF FUEL ROD BEHAVIOR. 1977.

From 4. international conference on structural mechanics in reactor technology; San Francisco, CA, USA (15 Aug 1977).

The URANUS-code follows a first line: a quasi 2d thermal and mechanical integral fuel rod analysis is combined with highly complex material behavior. The quasi 2d solution has been compared with a 2d-finite element solution. An excellent agreement in the axial friction force distribution was found. The mechanical description takes seven components of strains into account: elastic, time-independent plastic, creep, thermal and strains due to swelling, cracking and densification. Models for temperature distributions, heat generation, gap closure, pellet cracking, crack healing, fission gas release, corrosion, D/H distribution and Pu-redistribution are included. The URANUS-code is an advanced fuel rod design code with a variable multizone concept. Geometric nonlinearity (large displacements) are involved, the loads

(pressure or temperature) are considered as steady state or transient loads. The crack structure and the axial friction forces are calculated by means of an axial loop. The URANUS code is applicable to every fuel rod type (LWR, LMFBR, HWR). Geometric details as well as material properties are regarded as input parameters. In the paper the new basic mechanical concept, which is a superposition of id-radial solution and a id-axial solution is given as well as all basic equations. The mechanical concept determines the code structure, which also is shown in detail. Example analysis and comparisons to experiments and results from other codes are given. The result of the present work is the URANUS-code works extremely fast as calculations up to now show.

1937 (INIS-mf--4498, pp v) SUBASSEMBLY BOWING EXPERIENCE IN EBR-II. 1977.

From 4. international conference on structural mechanics in reactor technology; San Francisco, CA, USA (15 Aug 1977).

Subassembly bowing in an LMFBR can affect core neutronics, subassembly handling, and possibly create a potential safety hazard if the phenomenon can not be characterized and predicted. Bowing may be induced by thermal gradients, differential swelling, and/or intersubassembly loading. Neutronic variations, such as long or short term power-reactivity decrement (PRD) variations, can be indicators of a bowing problem. But, because of other influences on the PRD it is very difficult to isolate the effect of bowing. As a result, subassembly bowing was not considered a problem in EBR-II until subassembly handling problems occurred. A typical handling problem, caused by top end deflection of the bowed subassembly, is centering of the subassembly removal mechanism over the subassembly. Another problem is excess loads of up to 375 kg that have been required to remove bowed subassemblies from their grid position. This latter problem is due in part, to the magnitude of bow and subassembly stiffness in addition to the overall subassembly cluster tightness caused by duct swelling and/or the occurrence of multiple bowing. Observed interferences in storing a bowed subassembly in the storage basket can be used as a qualitative gauge for bowing magnitude. In EBR-II a storage basket tube can accommodate a subassembly bow of 2.3 to 3.1 mm depending on the position in the basket. All of the bowed type 304 stainless steel subassemblies that created handling difficulties were given a post-irradiation examination. Damage that may have been caused by interference loading was found to be limited to surface scratches. The measured bow of these subassemblies range from 1.9 mm for a fueled subassembly to 5.7 mm for a neutron-source-rod thimble.

1938 (INIS-mf--4498, pp v) STRUCTURAL ANALYSIS OF EXPERIMENTAL CARBIDE FUELED DRIVER ASSEMBLY FLOW DUCT FOR TESTING IN THE FFTF. 1977.

From 4. international conference on structural mechanics in reactor technology; San Francisco, CA, USA (15 Aug 1977).

Mixed carbide fueled driver assembly experiments will be tested in FFTF fuel driver positions as part of the National Advanced Fuel Program. The design of the experimental flow ducts must assure conformance to FFTF functional requirements in addition to service as a test vehicle for the carbide fuel irradiations. Test goals of damage fluence, burnup, and fluence to burnup ratio exceed those of the standard oxide fueled drivers. As

a consequence, the 20% cold worked type 316 stainless steel material of construction will experience significant irradiation induced creep and swelling. Additionally, the flow duct design must withstand the enhanced thermal transients produced by the action of carbide fuel during reactor scrams. A major FFTF functional requirement is that adjacent flow ducts do not touch each other except at the load pads. This requires a realistic analysis of the creep and swelling deformation of the flow duct during an experiment lifetime. Flow duct dilation, i.e., diametrical growth of the hexagonal cross section, was investigated by the MARC-CDC finite element program. Subroutines for irradiation creep and swelling were incorporated into the program. The model for the 2-D duct dilation analysis was a transverse slice through one-half of one hexagonal cross section flat (midflat to corner). The ends were free to slide outward. Generalized plane strain modelling was required to satisfy boundary conditions and high stress gradients in the corner.

1939 (INIS-mf--4498, pp v) PROOF TESTS OF IRRADIATED EBR-II DUCTS. 1977.

From 4. international conference on structural mechanics in reactor technology; San Francisco, CA, USA (15 Aug 1977).

Permanent deformation and fracture of subassembly ducts due to potential pressure pulses generated by the discharge of fission gas from fuel elements are important considerations in determining the burnup limit of fuels in LMFBR's. This paper discusses the results of a series of dynamic pressure tests that were conducted on intentionally defected irradiated EBR-II subassembly ducts. The tests were designed to simulate failure of a fuel element in a cluster of such elements. The major objective of the tests was to provide complete assurance that cladding failure of a driver-fuel element, which might conceivably cause rapid release of stored fission gas, would not deform or otherwise damage subassembly ducts in a way that would hinder movement of a control rod. Although rapid failure of a driver-fuel element in its plenum region to cause a pressure pulse is an extremely remote event, even for loss-of-flow conditions in EBR-II, the occurrence of such an event cannot be adequately disproved analytically in discussions of reactor safety. An experimental approach was therefore adopted to show -if possible- that such failure would not result in significant damage to irradiated ducts. Hindrance of movement of a control rod could then be precluded.

1940 (INIS-mf--4498, pp v) TRANSIENT NON-BOILING HEAT TRANSFER IN A FUEL ROD BUNDLE DURING ACCIDENTAL POWER EXCURSIONS. 1977.

From 4. international conference on structural mechanics in reactor technology; San Francisco, CA, USA (15 Aug 1977).

The physical problem studied is the transient non-boiling heat transfer of a cylindrical fuel rod consisting of fuel, gap, and cladding to a steady, fully developed turbulent flow. The fuel pin is assumed to be located in the interior region of a subassembly with regular triangular or square arrangements. The turbulent velocity field as well as turbulent transport properties are specified as functions of the coordinates normal to the axial flow direction. The heat generation within the fuel may be specified as an arbitrary function of the three spatial coordinates and time. A digital computer program has been developed. On the basis of finite-difference techniques, to solve the

governing partial differential equations with their associated subsidiary conditions. Results have been obtained for a series of exponential power transients of interest to safety of liquid-metal and water cooled nuclear reactors. The general physical features of transient convective heat transfer as explored by previous investigators have qualitatively been substantiated by the present analysis. Emphasis has been devoted to investigate the differences of heat-transfer (coefficient) results from multi-region analysis including a realistic fuel rod model and single-region analysis for the coolant region only. A comparison with the engineering relationships for turbulent liquid-metal cooling by Stein, which are an extension of the heat transfer coefficient concept to account for transient heat fluxes, clearly demonstrates that, at the parameters studied, Stein's approach tends to largely overestimate the convective heat transfer at early times.

1941 (INIS-mf--4498, pp vp) DEVELOPMENT OF A FINITE-STRAIN FUEL-ELEMENT MODEL. 1977.

From 4. international conference on structural mechanics in reactor technology; San Francisco, CA, USA (15 Aug 1977).

The LIFE-III computer code has been developed to describe the steady-state performance of LMFBR fuel rods. The mechanical analysis in the original version of the code was based on the assumption that the strains in the fuel and the cladding could be considered as infinitesimal. However, this assumption is grossly violated in the vicinity of the central void, since the opening and closing of the void involves displacements of the order of the void radius. To provide a more accurate description of the mathematical behavior of the fuel element, a finite-strain fuel-element model was developed. The finite-strain calculations in the modified code are based on an incremental analysis. The deformations are assumed to be axisymmetric. The fuel element is divided into a number (≤ 10) of axial segments. Each segment is assumed to be in a state of generalized plane strain. The deformation history of the fuel element is analyzed in discrete time steps, and the basic geometry of the element is updated after each time step.

1942 (INIS-mf--4498, pp vp) DDT-A 3-DIMENSIONAL PROGRAM FOR THE ANALYSIS OF BOWED REACTOR CORES. 1977.

From 4. international conference on structural mechanics in reactor technology; San Francisco, CA, USA (15 Aug 1977).

A 3-dimensional code was developed, to allow a good description of the whole core bowing behavior. Each single hexagonal element is described by a simple beam with 6 springs in horizontal planes where contact with other elements is possible. Each force is divided in x- and y-directions of the coordinate system. The contact forces must be in equilibrium with the mechanical displacements in both directions. Because friction forces are not included in this analysis, all forces are assumed to act normal to contacting surfaces. Gaps may open and close and contact forces may only be compressive. Because of these nonlinearities, standard mathematical techniques for solving linear structural problems are not directly applicable. So an iterative procedure is applied to achieve the equilibrium force configuration. Each iteration step corrects the largest force discrepancy between neighbouring elements. This technique requires a long computer running time to converge, but the locations of gaps and contacts normally do not change if a rough equilibrium is found. This gap distribution is

used to formulate a set of linear equations which can be solved directly. The solution is checked against the start-up gap distribution. The code can handle 300, 600, 1200 sectors of complete reactor cores. The system boundaries are symmetrically. The next step of the development is to take the friction forces into consideration which originate from the different directions of element movements. Results for a 120° sector of the KNK II reactor and for a 30°-sector of SNR 300 are available.

1943 (INIS-mf--4506, pp vp) ELASTIC AND ELASTIC-PLASTIC BUCKLING OF VESSEL HEADS COMPUTATION BY THE CEASEMT SYSTEM. 1977.

From 4. international conference on structural mechanics in reactor technology; San Francisco, CA, USA (15 Aug 1977).

In Liquid Metal Fast Breeder Reactors of integrated type, the sodium pressure is low, but the dimensions are large. The thickness-diameter ratios are rather smaller than in other type of nuclear pressure vessels. Therefore buckling must be considered as a potential mode of failure. For instance, the bottom head of the main vessel is loaded by internal hydrostatic pressure and dead weights, and there is a need for buckling analysis. It must be pointed out that in practical cases buckling occurs after plastic deformation. Due to the effect of initial imperfections elastic buckling is rather difficult to analyse. Moreover, elastic-plastic buckling theory is not a very clear theory and consideration must be given to finite deflexions (and perhaps to initial stresses). So the choice of a suitable mathematical model is a matter of good engineering judgment. In the CEASEMT system of structural analysis by finite element method, a special program has been developed for that purpose. The model chosen (MOTAN) is near a tangent modulus model, because it seems a better approximation of the real behavior of mechanical structures. The buckling load of shells of any shape can be predicted. The method is now operational but a validation program is still in progress. Validation is especially based on buckling of vessel heads under internal pressure. Available results are given for ellipsoidal or torispherical heads. When it is possible comparison is made with known experiment.

1944 (INIS-mf--4506, pp vp) THERMAL ELASTO-PLASTIC ANALYSIS IN REACTOR VESSEL NOZZLES. 1977.

From 4. international conference on structural mechanics in reactor technology; San Francisco, CA, USA (15 Aug 1977).

In a sodium cooled nuclear fast reactor the thermal analysis has a particular importance as a consequence of the rapid transients and the high sodium conductivity. The aim of this work is to estimate the value of transient thermal stresses in elastic and plastic fields. In the first part, the loading conditions for different steady and transient operations are examined. A number of tests was planned to simulate in a mock-up the temperature changes in the upper part of the vessel for different thermal transients considered most dangerous: scram to full power, electric supply fault in a pump with reactor scram, pump seizure with reactor scram. A mock-up in scale 1 : 4 simulating the vessel area above the core was built-up. The heat transfer is simulated with a mass transfer; with this simulation it is not considered that the heat conduction in the sodium and the thermal gradients measured are higher than in the reactor. The temperature transients have been obtained with a different salt concentration: the water simulates the hot

sodium and the water salted represents the cold sodium. In the second part of the work is considered the thermo-elastic structural response using the FEM analysis. The elastic approach has had two functions: the first is to find a simplified structure in two dimensions that has the same behavior as the 3-D nozzle; the second is to follow the thermal transient to look for the time of maximum stress. For different geometry, in a previous paper, the stress distribution and the influence of some characteristic parameters have been examined. As a result of this part an axisymmetric geometry has been chosen and also the time of maxim.

1946 (INIS-mf--4506, pp vp) THERMAL RATCHETTING IN PRESSURE VESSELS. 1977.

From 4. international conference on structural mechanics in reactor technology; San Francisco, CA, USA (15 Aug 1977).

During its lifetime a nuclear power plant undergoes cyclic thermal loadings, i.e. time variations of temperature spatial distribution; these thermal cycles, combined with mechanical loads (pressure), can produce dimensional changes for creep, plastic cycling and/or ratchetting. This problem is in special way important for a Liquid Metal Fast Breeder Reactor (LMFBR) because temperatures in it are high (about 500°C) and change either in radial direction or in axial direction. While the plastic behavior of a structure subjected to mechanical loads and/or mechanical cyclic loads can be well studied with the by Finite Element analyses and several different computer programs, the thermal plastic behavior was studied for simplified conditions only. Actually, the Bree, Miller, Burgreen model considers a thin cylindrical shell with a radial thermal gradient and in uniaxial stress state while Kainins, Updike extend this model to a biaxial stress state. To obtain numerical results of the thermo-plastic behavior of cylindrical shells, a mathematical model was developed and the special purpose computer program PLAST was implemented.

1948 (INIS-mf--4513) ANNUAL REPORT 1977. (Stichting Energieonderzoek Centrum Nederland, The Hague). Jun 1978. 92p. (In Dutch). Dep. NTIS (US Sales Only), PC A05/MF A01.

The change of statute made in 1976 has been followed by a shift of emphasis towards non-nuclear subjects in the ECN Research Centre. A performance testing of experimental wind

turbines to be installed at the Petten site, is done in the framework of the national energy R and D programmes. An effort on technical superconductors and superconducting coils became the subject of a cooperation with the Netherlands Applied Research Organisation TNO and some industrial companies. Programmes on magnetohydrodynamic conversion and on energy storage in flywheels are in advanced preparation. A large experimental effort is devoted to the fast reactor development programme of Germany, Belgium and the Netherlands. Complete is the estimation of the reactivity effects of fission products in the prototype fast reactor under construction at Kalkar. The HFR will also be used in a new series of transient overpower experiments on fast reactor fuel pins. ECN activities in the nuclear fuel cycle are concentrated on the disposal of radioactive work in salt domes.

- 1952 (INIS-mf--4541, pp vp) SIMPLE STEEL/WATER MODEL FOR PRELIMINARY STUDIES OF ACOUSTIC VIBRATION IN LMFBR. 1977.

From 4. international conference on structural mechanics in reactor technology; San Francisco, CA, USA (15 Aug 1977).

One source of vibration excitation in Liquid Metal Fast Breeder Reactors is the acoustic energy which is generated by the circulating pump and transmitted through the fluid to various structural components. Since most of the energy occurs at fairly low frequencies, that of low harmonics of blade passing frequency, only the very large components have resonant frequencies such that they are significantly excited. To gain some preliminary understanding of the extent and magnitude of vibration in fast reactors therefore, a simple model has been constructed in which only the major components are represented. The modelling theory is discussed and it is shown that adequate representation of the steel/sodium

reactor materials can be obtained in the model based on the use of steel/water. The model represents a pool design with a primary tank of 3 1/4 metres diameter and typical components scaled in proportion; however, it does not necessarily relate to any specific reactor design. The pump acoustic source is represented by an underwater loudspeaker system and vibration amplitudes are scaled according to typical pressures generated by reactor circulators. Results from the model include calibration data for the acoustic source and measurements of acoustic pressure throughout the primary flow circuit and the inner and outer pools. Stresses are measured on structural components over a frequency range scaled from reactor frequencies and compensated for the characteristics of the acoustic source. Appreciable stresses are found on all the components in the primary circuit, not necessarily only those close to the simulated pump source. After scaling them to reactor size and allowing for the source calibration, it is found that stresses are unlikely to be sufficiently high to cause damage.

From 4. international conference on structural mechanics in reactor technology; San Francisco, CA, USA (15 Aug 1977).

In order to perform structural analyses of the CRBRP steam generators (hydraulic transients) detailed thermal profiles must be developed and transmitted to the stress analyst in a usable form. A unique, semi-automated computer system has been developed to optimally accomplish this task. The transient data are given in the specification in the form of sodium and water (steam) flow, temperature and pressure at the inlet of the steam generator as a function of time. The steam generator is divided into fourteen distinct zones each consisting of several subzones. Masses of thermal data must be generated to provide temperature distributions in each subzone as a function of time. A simplified nodal model of the entire steam generator is used to translate

the specification transient data into boundary conditions for the detailed subzone models. This is accomplished by the SETS (Superheater-Evaporator Transient Simulation) program. A one-to-one correlation between the stress and thermal models has been set up to enhance accuracy and simplify data transmittal. The stress analyst develops a finite element model to the degree of detail required by the MARC computer code. Nodes are added to this model and the thermal model development is accomplished using STAMP (Stress to Thermal Adaption Model Program). Thermal analysis is accomplished using a finite difference code - TAP (Thermal Analyzer Program). The SETS tape is used to provide the boundary conditions. Significant temperatures and temperature differences are output, isotherms are also output TEMPOS (Temperature Postprocessor) is then used to extract the thermal data and present the results in such a manner that the maximum stress intensity range may be calculated.

From 4. international conference on structural mechanics in reactor technology; San Francisco, CA, USA (15 Aug 1977).

As a part of ANL's Flow-Induced Vibration Program in support of the Clinch River Breeder Reactor Plant (CRBRP) steam generator design activity, tube/support interaction experiments are being performed not only to gain the insight into the dynamic behavior of CRBRP steam generator tubes, but also to provide the basis for developing design guidance. In the experiment, the tube and supports are prototypic, the tube spans nearly prototypic, and overall length approximately one-third that of a straight tube segment of the CRBRP steam generator. The test model features a 15.88 mm dia. x 3.18 mm thick x 5.08 m long tube (2-1/4% Cr - 1% Mo) surrounded by water, a 101.60 mm thick tubesheet, seven 25.44 mm thick stainless steel supports with 0.254 mm tube-to-support hole clearances and two closely-spaced supports adjacent to the excitation span. The tube is excited by electromagnetic coils simulating crossflow excitation; two displacement transducers, orthogonal to one another, are positioned at the center of each span. Tube response of the midspan locations were measured as a function of various input excitation levels and frequencies. Results were compared with analytical results based on multi-span tube with 'knife-edge' supports at the support locations. Test results show that the resonant frequencies are close to those of the analytical results; experimental modes are in good agreement with analytical predictions or the tube/support configuration tested, peak displacement amplitudes are always lower than those of analytical results; closely-spaced double supports do not effectively dampen out the vibration responses of the adjacent spans and significant orbital motions exist in the spans away from the excitation. It is concluded that a mathematical model assuming a multi-span beam fixed at the tubesheet with intermediate

'knife-edge' supports satisfactorily predicts natural frequencies and mode shapes for the tube/support configuration studied.

1959 (INIS-mf--4543, pp vp) THIN CIRCULAR CYLINDER UNDER AXISYMMETRICAL THERMAL AND MECHANICAL LOADING. 1977.

From 4. international conference on structural mechanics in reactor technology; San Francisco, CA, USA (15 Aug 1977).

To assess structural integrity of components subjected to cyclic thermal loadings one must look at thermal ratchetting as a possible failure mode. Considering a thin circular cylinder subjected to constant internal pressure and cyclically varying thermal gradient through the thickness Bree, J. Strain Analysis 2 (1967) No.3, obtained a diagram that serves as a foundation for many design rules (e.g.: ASME code). The upper part of the french LMFBR main vessel is subjected to an axisymmetrical axial thermal loading and an axial load (own weight). Operation of the reactor leads to cyclic variations of the axial thermal loading. The question that arises is whether or not the Bree diagram is realistic for such loading conditions. A special purpose computer code (Ratch) was developed to analyse a thin circular cylinder subjected to axisymmetrical mechanical and thermal loadings. The Mendelson's approach of this problem is followed. Classical Kirchhoff-Love hypothesis of thin shells is used and a state of plane stress is assumed. Space integrations are performed by Gaussian quadrature in the axial direction and by Simpson's one third rule throughout the thickness. Thermoelastic-plastic constitutive equations are solved with an implicit scheme (Nguyen). Thermovisco-plastic constitutive equations are solved with an explicit time integration scheme (Treanor's algorithm especially fitted). A Bree type diagram is obtained for an axial step of temperature which varies cyclically and a sustained constant axial load. The material behavior is assumed perfectly plastic and creep effect is not considered. Results show that the domain where no ratchetting occurs is reduced when compared with the domain predicted by the Bree diagram.

1960 (INIS-mf--4543, pp vp) PLASTIC CREEP BEHAVIOR ANALYSIS OF AN ELBOW PIPE. 1977.

From 4. international conference on structural mechanics in reactor technology; San Francisco, CA, USA (15 Aug 1977).

High temperature components are liable to strong creep effects, in LMFBR for example. This phenomenon is analyzed here for an elbow pipe. Comparisons are performed between experiments and computations using CEASEMT codes, particularly piping-system analysis code TEDEL. The reference is an experiment from Batelle's Columbus Laboratories and concerns a 4 in-sh 10 elbow pipe assembly made of type 304 stainless steel at room temperature and then at 593°C (1100°F) during more than 300 hours. The assembly is loaded by inplane moment; displacements, temperatures and strain measurements are picked up. Computations are first performed using the finite element codes developed by CEA. For creep analysis iterative processes referring to the normality principle of HILL are used: during steps of iterations, equilibrium and yield criterion are always met.

1961 (INIS-mf--4543, pp vp) CREEP-FATIGUE DESIGN CRITERIA FOR APPLICATION TO A 2 1/4 CR.-1 MO LMFBR STEAM GENERATOR. 1977.

From 4. international conference on structural mechanics in reactor technology; San Francisco, CA, USA (15 Aug 1977).

A study was undertaken to evaluate alternate criteria for creep fatigue evaluation of LMFBR steam generators constructed of 2 1/4 Cr.-1 Mo alloy steel. A review was conducted of the ASME Criteria for Design of Elevated Temperature Class 1 Components and the existing data available for 2 1/4 Cr.-1 Mo alloy steel. The current method in the Code for calculating creep-fatigue interaction damage using linear summation of fatigue damage and creep damage was employed on the existing test data. Alternately, the strain range partitioning method was considered. It was determined that the Code method is generally conservative for predicting life of the 2 1/4 Cr.-1 Mo test specimens, and the strain range partitioning method, as originally proposed, appeared to be unconservative when extrapolated to the low strain range long hold time service required by the design. A series of creep relaxation analyses employing the linear time fraction creep damage rule to evaluate the effect of plant thermal transients on the predicted design life and sensitivity of calculated creep damage to various material behavior parameters was conducted. Several creep equations and the effect of biaxiality were studied to determine their effect on stress relaxation and calculated creep damage. Calculated stress relaxation results from various creep equations were compared to measured relaxation from structural tests to aid in selecting an appropriate creep equation. In order to explore the sensitivity of calculated creep-fatigue damage to primary stress intensity, an infinite thick-cylinder was analyzed for variable pressure conditions using elastic-plastic-creep finite element techniques. In order to evaluate the effect of potential elastic follow-up effects on calculated creep damage, a built-in cylinder was also analyzed by finite element techniques.

1963 (INIS-mf--4543, pp vp) INSTABILITY ANALYSIS OF ELBOWS IN THE PLASTIC RANGE. 1977.

From 4. international conference on structural mechanics in reactor technology; San Francisco, CA, USA (15 Aug 1977).

This work presents some basic considerations underlying the instability in the plastic range of typical LMFBR elbows (radius-to-thickness ratio $r/t=20-50$), and the impact of these considerations on the practical aspects of solution by computer methods. The elbows are made from a strain hardening material and they are loaded by in-plane closing or opening bending moments. A simplified method of computer analysis is used and the particular type of instability considered is that of geometric buckling into a mode that is characterized by significant ovalization of the cross section and by a relatively gradual variation in shape along the length of the elbow. Emphasis is placed on the effects of including geometric nonlinearities (large displacement terms) in the inelastic (time-independent) analysis. Numerical results are presented for a typical LMFBR elbow. A general discussion of the basic concepts and definition of the instability of structures made from

strain hardening or from elastic materials is given. Such a discussion is needed to facilitate a complete understanding of the present numerical results and to avoid possible misinterpretations in a comparison of these and previous results. The major conclusions of this investigation are as follows: (1) Geometric nonlinear effects are significant, (2) The inclusion of such effects in an analysis of an elbow subjected to either a closing or an opening moment reveals that the buckling load is lower for the case of a closing moment. The buckling load for this case corresponds to a maximum point (zero slope) in a typical load-displacement curve, and (3) the omission of geometric nonlinear effects in the inelastic analysis leads to a load-displacement curve in which the load monotonically increases with displacement.

1964 (INIS-mf--4543, pp vp) CREEP BUCKLING OF SHELLS. 1977.

From 4. international conference on structural mechanics in reactor technology; San Francisco, CA, USA (15 Aug 1977).

Because of the characteristics of LMFBR primary piping components (thin-walled, low pressure, high temperature), the designer must guard against creep buckling as a potential failure mode for certain critical regions, such as elbows, where structural flexibility and inelastic response may combine to concentrate deformation and cause instability. The ASME Boiler and Pressure Vessel Code, through its elevated temperature Code Case 1592 (Section III, Division 1) provides design rules for Class 1 components aimed at preventing creep buckling during the design life. A similar set of rules is being developed for Class 2 and 3 components at this time. One of the original concepts behind the creep buckling rules was that the variability in creep properties (especially due to the effects of prior heat treatment), the uncertainty about initial imperfections, and the lack of confirmed accuracy of design analysis meant that conservatism would be difficult to assure. As a result, a factor of ten on service life was required (i.e. analysis must show that, under service conditions that extrapolate the life of the component by ten times, creep buckling does not occur). Two obvious problems with this approach are that: first, the creep behavior must also be extrapolated (since most creep experiments are terminated at a small fraction of the design life, extrapolation of creep data is already an issue, irrespective of the creep buckling question); second the nonlinear creep analysis, which is very nearly prohibitively expensive for design life histograms, becomes even more costly. Analytical results for an aluminum cylindrical shell subjected to axial loads at elevated temperatures are used to examine the supposed equivalence of two types of time-dependent buckling safety factors - a factor of ten on service life and a factor of 1.5 on loading.

1965 (INIS-mf--4543, pp vp) ANALYSIS OF PIPING SYSTEMS FOR CREEP. 1977.

From 4. international conference on structural mechanics in reactor technology; San Francisco, CA, USA (15 Aug 1977).

The purpose of this paper is to provide a survey of the current situation and to attempt to explain and clarify a number of misconceptions which have arisen in connection with approximative techniques. Recently there have become available several Finite Element computer codes for the analysis of vessel type structures which can deal with any geometry, loading condition and material behavior.

However, a finite element analysis of a large diameter complex piping system for high temperature reactor service is simply not feasible economically to the detail and accuracy of a pressure vessel analysis; in any case, the aim is to produce a flexible system. Even those simplified finite element methods which have been designed to cope principally with piping are not practical for the initial stages of design for elevated temperature. Ideally, a simple flexibility beam approach, similar to those classically used in elastic analysis, would be desirable. Such an approach has so far only been achieved using simplifications to the creep response. The two simplified methods which are primarily used are known generally as Kachanov's Method and the Method of Superposition of States. In this paper the reliability of these approximations is examined for simple piping components under combined loading; these also serve to clarify a number of misconceptions which have arisen over the methods. It is then discussed not only how these simplified methods can be adapted to the analysis of piping systems but also how a more general beam type approach could be constructed, and what sort of information would be necessary for their successful implementation.

1966 (INIS-mf==4543, pp vp) EVALUATION OF INELASTIC ANALYSIS METHODS. 1977.

From 4. international conference on structural mechanics in reactor technology; San Francisco, CA, USA (15 Aug 1977).

The purpose of this presentation is to explore this question relative to interim inelastic analysis guidelines that have been recommended for use in the design of liquid-metal-cooled reactor system components. Interim constitutive equations have been developed for describing the inelastic behaviors of types 304 and 316 stainless steel and 2 1/4 Cr-1 Mo steel. Although differing in detail, the recommended constitutive equations for these three materials are basically of the same form. They rest on the fundamental assumption that an increment of total strain consists of four additive contributions: thermal, elastic, plastic, and creep. The specification of the plastic and creep strains follows from the concepts of classical kinematic hardening plasticity theory and strain-hardening creep theory. These concepts are augmented, however, with ad hoc rules to account for such things as cyclic hardening and/or softening, aging, and the effects of prior inelastic straining on subsequent plastic and creep deformations. Uniaxial and multiaxial exploratory tests were used to identify the essential inelastic behavioral features of significance, and these features, in turn, provided the basis for choosing the interim constitutive equations. Typical exploratory test results are presented to support the basic constitutive equation framework and to illustrate how the ad hoc rules were developed, evaluated, and improved. To assess the validity of the constitutive equations and analysis methods for high-temperature design, benchmark structural tests were conducted under time-varying loadings at elevated temperatures, and the results were compared to inelastic analysis predictions. Representative test results for beam and plate structures and for a pipe subjected to repeated thermal shocks are presented and compared to predictions.

1968 (INIS-mf==4543, pp vp) FATIGUE DAMAGE ANALYSIS PROCEDURE FOR THERMAL LINERS SUBJECTED TO RANDOM THERMAL FLUCTUATIONS. 1977.

From 4. international conference on structural mechanics in reactor technology; San Francisco, CA, USA (15 Aug 1977).

Of particular concern in this paper is the structural analysis of thermal shock liners in liquid sodium systems subjected to sinusoidal and random thermal fluctuations produced by mixing of hot and cold fluid streams. The development of the response function, relating thermally induced surface stresses to both low and high frequency sinusoidal surface temperature fluctuations, enables one to develop a method of determining fatigue damage of the structural components by conventional random vibration analysis techniques. Having the response function for the thermal shock liners enables one to predict the fatigue damage due to thermal fluctuation having either wide-band or narrow-band spectral characteristics. Although results are presented for a particular analysis - the analytical procedures can be easily adapted to consider other thermal environments.

1969 (INIS-mf==4543, pp vp) SOME COMMENTS ON THERMOMECHANICAL CONSTITUTIVE EQUATIONS FOR INELASTIC ANALYSIS OF LMFBR COMPONENTS. 1977.

From 4. international conference on structural mechanics in reactor technology; San Francisco, CA, USA (15 Aug 1977).

The safety analysis of the primary and secondary circuits of sodium-cooled fast breeder reactors (LMFBR) requires systematic methods to predict the inelastic behaviors of metal structures under complex thermomechanical loading conditions. To provide those methods, constitutive equations have been recommended for interim use. This paper is concerned with the physical evidence and consistency of these constitutive equations. In particular, shortcomings of the recommended constitutive theories may result from the bilinear approximation of the stress-strain-curve, the kinematic linear hardening rule and the very special kind of the proposed creep laws. Moreover, the elastic-plastic and creep equations are formulated independently: except for hardening due to prior creep strains, possible interactions between viscoelastic and plastic material behaviors are neglected. Finally, the temperature appears as a given parameter, that means. The recommended constitutive assumptions do not allow for any coupling effects between the deformation and temperature field. A consistent set of constitutive equations should be based on a correct evaluation of the second law of thermodynamics. Looking at the specific mathematical form of the recommended constitutive theories, one can generalize the classical elastic-plastic and creep equations. However, in a more systematic approach to the problem of inelastic analysis, general results of the modern theories of non-linear material behavior should be utilized. These results provide systematic methods to establish constitutive equations which are thermomechanically consistent as well as experimentally practicable.

1970 (INIS-mf==4592) DYNAMIC RESPONSE OF

SINGLE HEXAGONAL LMFBR CORE SUBASSEMBLY WRAPPERS. Jaeger, T.A.; Boley, B.A. (comps.). (Commission of the European Communities, Brussels (Belgium)). 1977. vp. (CONF-770807--(Pt.E)).

From 4. international conference on structural mechanics in reactor technology; San Francisco, CA, USA (15 Aug 1977).

To analyze the dynamic structural response of the LMFBR core subassembly hexagonal wrappers to postulated local energy releases and the sensitivity of the response to variations in both the pressure loading and the material properties of the stainless steel, a finite-element computer code STRAW has been developed. A series of experiments was performed to study the effects of variations in material properties. The amount of coldworking to which the Type 316 stainless steel is subjected has a strong influence upon the ductility and the elastic yield point. The usual fabrication process produced a nominally 20% coldworking with a yield point of about 680 MPa. By designing a special set of dies for the drawing process, a very low ductility hexcan was produced for which the yield point was raised to 820 MPa. Conversely, the yield point was lowered to 170 MPa by a solution annealing process producing a highly ductile test hexcan. A metallurgical study was conducted to find a representative brittle simulant material for the irradiated end-of-life steel properties. An aging treatment for Type 446 stainless steel was developed which reproduced the expected tensile-flow behavior of the in-pile subassembly. Further study is underway to investigate the fracture properties of the simulant material. The pressure pulses were generated by the controlled expansion of high-pressure detonation products from low-density explosives detonated inside a vented steel canister. The orifice configuration of the canister and the charge mixture ratio were designed to produce two specified pulse shapes. A charge containing 37.7 g PETN mixed with 35 wt % inert, hollow-glass microballoons developed a pressure pulse peak of 9.5 MPa at 1.0 ms. Increasing the PETN to 41 g resulted in a 14.6 MPa peak pressure, and increasing the explosive concentration to 90 wt % in the mixture increased the burning rate and the pulse risetime, so that the peak occurred at 0.6 ms.

1971 (INIS-mf--4592) DYNAMIC LOADINGS OF SODIUM-WATER REACTIONS IN LMFBR AND FUSION POWER DESIGNS. Jaeger, T.A.; Boley, B.A. (comps.). (Commission of the European Communities, Brussels (Belgium)). 1977. vp. (CONF-770807--(Pt.E)).

From 4. international conference on structural mechanics in reactor technology; San Francisco, CA, USA (15 Aug 1977).

In liquid metal fast breeder reactor and lithium cooled fusion reactor, a sodium loop is being proposed to transfer heat from the primary coolant loop to the steam turbine cycle. Although by careful design and quality assurance programs, the probability for steam generator tube failure can be minimized, failure will still occur. The direct contact of sodium and water would cause a chemical reaction where hydrogen and sodium compounds are produced. This paper presents an evaluation of the potential hazards as a result of such a reaction. An analytical method is developed to investigate the extent of the reaction zone and the propagation of the pressure wave in the sodium system. In the calculation, the chemical reaction is assumed to be instantaneous, governed by the equation $2\text{Na}(l) + \text{H}_2\text{O}(l) \rightarrow \text{Na}_2\text{O}(l) + \text{H}_2(g) + 31.4 \text{ K cal/gm. mole}$. Both the temperature and pressure rise in

the reaction zone can be established from the energy balance and the equation of state for the gaseous product. As a consequence of the energy released, the chemical products suddenly expand with a high velocity. The expansion also generates a shock wave in both the water and the sodium systems. Results indicate that the reaction zone can expand in a rate of 1500 ft/sec and a shock wave with initial strength of 2300 atmospheres propagates with a speed of 8000 ft/sec into the sodium system. The propagating characteristics of the shock wave are obtained by solving the basic fluid equations. The shock wave decays rapidly, in the neighborhood of milliseconds, as soon as the reaction zone stops to expand. The decrease in the reaction zone pressure allows more water to react with the sodium and a second pulse is generated.

1974 (INIS-mf--4592, pp vp) ANALYSES OF HYDRODYNAMIC EFFECTS OF LARGE SODIUM-WATER REACTIONS. 1977.

From 4. international conference on structural mechanics in reactor technology; San Francisco, CA, USA (15 Aug 1977).

Large leak sodium-water reactions that would occur in a steam generator of LMFBR causes abrupt changes of pressure and velocity of fluid in a secondary sodium system and relief system. This paper describes SOWACS-III together with its model and method. Results of analyses are also given, the comparison with experimental results of initial pressure spike being included. SOWACS-III treats the system which consists of the steam generator, vessel, valve, pump and pipe, and uses the following models and methods. (1) Components are assumed to be one-dimensional. (2) Pressure wave propagation near a reaction zone, where hydrogen is generated, is analyzed with the spherical co-ordinate (sphere-cylinder model). (3) A moving boundary is formed by contact of sodium with other fluid such as hydrogen and nitrogen. The boundary travels without mixing of sodium and another fluid through the boundary (boundary tracking model). The boundary can be treated not to move from the original place (fixed boundary model). (4) Pressure wave propagation is analyzed by the explicit method of characteristics in one-dimensional Eulerian co-ordinate. (5) Flow-induced force is analyzed by momentum balance. (6) The lateral motion of relief piping caused by the force is analyzed by NASTRAN code. Analyses were carried out for large sodium-water reaction experiments in SWAT-3 rig of PNC by using the sphere-cylinder model. The calculated pressure spike in the reaction vessel was compared with the measured one for a

few milliseconds after water injection. The calculated value and measured one were 6.4 ata and 6.7 ata for peak pressure and 0.6 ms and 2.8 ms for rising time, respectively.
