Berlin, C.; Jarretou, H.; Rulleau, A. (CEA Centre d'Etudes Nucleaires de Cadarache, 13 - Saint-Paul-les-Durance (France)); Coulon, P. (CEA Centre de Marcoule, 30 - Bagnols-sur-CEze (France). Service de la Centrale Phenix); Pazlaud, A. (Novatome Industries, 92 - Le Plessis-Robinson (France)). pp 425-445 of Nuclear power plant control and instrumentation, 1978. Vol. 1. Vienna, Austria; International Atomic Energy Agency (1978). (In French)

From IAEA symposium on nuclear power plant control and instrumentation; Cannes, France (24 Apr 1978).

The failed-fuel detection systems for Rapsodie, Phenix and Super-Phenix are described in terms of their respective differences and design evolution. The technological problems encountered during design studies and construction are discussed. After considering in-service operating problems with failed-fuel detection and localization systems, the paper presents an account of results obtained in the detection of failed fuel.

4197 GASEOUS FISSION-PRODUCT DETECTOR FOR LMFBR FAILED-FUEL DETECTION.

Miyazawa, T.; Ashibe, K.; Takamatsu, S. (Tokyo Shibaura Electric Co. Ltd., Kawasaki, Kanagawa (Japan). Research and Development Center); Mimoto, Y. (Power Reactor and Nuclear Fuel Development Corp., Tokyo (Japan)). pp 351-364 of Nuclear power plant control and instrumentation, 1978. Vol. 1. Vienna, Austria; International Atomic Energy Agency (1978).

From IAEA symposium on nuclear power plant control and instrumentation; Cannes, France (24 Apr 1978).

A new gaseous FP (fission products) detection apparatus has been developed for an LMFBR (liquid-metal fast-breeder reactor) failed-fuel detection system. Major components are three cylindrical chambers with fixed central wires, valves, control circuits with alarm units and radiation measuring circuits.

Each of the chambers is designed to have two functions - precipitation by electrostatic force to daughter nuclides of gaseous FP, and detection of the daughter nuclides by changing only the polarity of applied potential. The adoption of chambers can avoid problems with moving-wire type precipitators. In the development work, the apparatus was trial-fabricated and tested with a small sodium in-pile loop. Major performances obtained by the tests were a collection efficiency of 65 $\pm$ 15%; a detection efficiency of 73 $\pm$ 3%; major collected nuclides on wire surfaces were ^{86}Rb , ^{87}Rb and ^{137}Cs ; at about 100 V precipitation voltage, the collection efficiency was roughly saturated; the collection efficiency dependence on sampling gas flow-rate and on soaking time proved to agree well with the expected tendency at design stage; an accumulation of long-lived daughter nuclides was not found in the experimental period; and each component worked well, and few improvements have been indicated. In conclusion, it is quite possible, with a few improvements, for the developed apparatus to be practicable for a failed-fuel detection system.

- 4198 COMMISSIONING OF PROTOTYPE FAST-REACTOR CONTROLS. Collins, G.B. (UKAEA, Winfrith. Atomic Energy Establishment); Caney, V. (UKAEA, Risley, UK); Humphreys, P.D. (UKAEA, Dounreay. Nuclear Power Development Establishment); Thomsson, R.K. (Nuclear Power Co. (Risley) Ltd. (UK)). pp 109-125 of Nuclear power plant control and instrumentation, 1978. Vol. 1. Vienna, Austria; International Atomic Energy Agency (1978).

From IAEA symposium on nuclear power plant control and instrumentation; Cannes, France (24 Apr 1978).

The UKAEA Prototype Fast Reactor (PFR) and its control systems are described. System commissioning procedures were devised; their extent and use are examined in the context of several essential steam generator plant control loops. Feedwater regulation at low power is satisfactory, but problems have arisen during automatic change-over from 7% to 100% duty valves. At higher powers the regulator performance is only adequate for small or slow power perturbations. The problems of coping adequately with a rapid load manoeuvre, such as a turbine trip, are examined. Related problems with the turbine-driven feed pump were also observed, and these are shown to be mainly due to deficiencies in the electro-hydraulic servo-amplifier which controls the turbine steam admission valves. Finally, the requirements and design of an automatic controlled power setback system are described. This is designed to minimize shock to various plant components owing to rapid temperature changes when the turbo-alternator is tripped. Extensive use is made of dynamic models of the PFR, not only for control system design, but equally for commissioning and performance assessment.

- 4199 WELDING THE CORE SUPPORT PLATE FOR THE CLINCH RIVER BREEDER REACTOR PLANT, USA. Canary, W.W.; Franco-Ferreira, E.A. (Allis-Chalmers Corp., York, Pa. (USA)). pp 373-378 of Advances in welding processes. Cambridge, England; Welding Institute (1978).

From 4. national conference on advances in welding processes; Harrogate, UK (9 May 1978).

The core support structure for the USA's Clinch River breeder reactor plant consists of a 51mm thick cylindrical barrel welded to a 610mm thick core support plate, both in Type 304 stainless steel. The reactor plant will operate at temperatures in excess of 427°C and hence the design of the core support structure is not covered by the ASME code. One of the

more difficult weldments in the support structure was associated with the fabrication of the 610mm thick core support plate. It was made from two forgings comprising a 3.5m diameter forged disc placed inside a 4.5m diameter forged ring which were joined by a circular, 530mm thick, full penetration weld. A narrow gap submerged-arc welding process was successfully developed for this application.

- 4200 STUDY OF MECHANICAL CHARACTERISTICS OF STRUCTURAL MATERIALS FOR THE SNR PLANT. Scheibe, W.; Schmitt, R.; Di Primio, J.C.; Anderko, K. (Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Inst. fuer Material- und Festkoerperforschung). KFK Nachr.; 10: No. 3/4, 37-40(1978). (In German).

The present paper deals with studies on the austenitic steel X6CrNi 1811 in the unirradiated and the irradiated state, problems like monotonous hardening behavior, cyclic hardening and fatigue behavior as well as combined creep and fatigue stress being investigated.

- 4201 TRIBOLOGICAL STUDIES IN SODIUM. Wild, E.; Mack, K.J. (Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Inst. fuer Reaktorbauelemente). KFK Nachr.; 10: No. 3: 4, 43-45(1978). (In German).

After the determination of pairs of materials with the highest resistance to wear and the best antifriction properties parameter studies are performed varying the following quantities: speed of causing friction, pressure per unit of area, geometry of specimens, sodium temperature, surface corrosion, and kind of motion.

- 4202 GAMMA HEATING MEASUREMENTS IN LMFBR SHIELDS WITH THERMOLUMINESCENT DOSIMETERS. Yoon, W.Y. Knoxville, TN; Univ. of Tennessee (1978). 211p. University Microfilms Order No. 79-03,486.

Thesis (Ph. D.).

An important and relatively new application for the thermoluminescent dosimeter (TLD) is the direct and simultaneous measurement of gamma-ray energy deposition distributions in heavy metal shields typical to fast breeder reactors. This dissertation describes the development of a TLD dosimetry system capable of measuring gamma-ray energy deposition in a mixed (neutron and gamma-ray) radiation field to within $\pm 3\%$ on an absolute basis. This work includes a detailed evaluation of the experimental techniques normally employed in TLD dosimetry, the verification of the gamma-ray spectral correction factor used to relate the energy deposition in the TLD to that occurring in the sleeve material, and the development of new neutron dose correction factors for both $\text{CaF}_2:\text{Mn}$ and ^7LiF thermoluminescent materials.

- 4203 FEATURES OF OPERATING CALCULATIONS OF PERMISSIBLE POWER FOR CHANNEL REACTORS AT BELOYARSKAYA ATOMIC ELECTRIC POWER PLANT. Sheinkman, A.G.; Petrov, V.A.; Kozyrev, V.D. (Izv Akad Nauk, USSR). Power Eng. (Engl. Transl.); 16: No. 6, 12-17(1978).

The classification is given and basic problems indicated for operational thermophysical calculations of permissible power for the channel reactors at the Beloyarskaya Atomic Power Plant (BAPP). The method is described and a flowchart given for a program to compute the permissible power of a BAPP reactor. The computational method used at the BAPP and the regulations for reactor-

parameter monitoring provide an adequate margin below the critical heat-transfer region in normal operation.

- 4204 (RISLEY-Trans--4010) BN-350 REACTOR. DEVELOPMENT, CONSTRUCTION AND OPERATING EXPERIENCE. Troyanov, M.F. Translated from Kernenergie; 21: No. 5, 775-787(1978). 15p. British Library Lending Division, Boston Spa, Wetherby, West Yorkshire, England.

The author analyses the experience gained with the BR-1, BR-2, BR-5 and BOR-60 reactors, which has served as the basis for the development of the BN-350 reactor with a thermal power of 1,000 MW and operating on ^{235}U . The most important design solutions for this reactor are discussed, together with the problems that arose during commissioning. Operating experience since then is described.

- 4205 MATHEMATICAL MODEL FOR AN INTEGRATED NUCLEAR POWER SYSTEM. Pavelescu, M. (Institutul de Reactori Nucleari Energetici, Pitesti (Romania)). Stud. Cercet. Fiz.; 30: No. 9, 899-928(1978). (In Romanian).

A mathematical model associated to an integrated nuclear power system constituted by two sub-systems, namely: a first one represented by PHWRs and LMFBRs, and a second one represented by PWRs and the same LMFBRs is presented. It is assumed that both sub-systems are developing in a first stage only in thermal variants, and in a second stage in an integrated (mixed) thermal-fast variant. The development of a fast reactor is allowed by the amounts of Pu reprocessed in the nuclear system. The independent variables of the model are the development periods of the sub-systems and the time variable, while the dependent variables are the produced year energy amounts and year energy specific cost prices. The paper is illustrated by numerous numerical results obtained by application of the integrated nuclear power system mathematical model, which allow a lot of different conclusions.

- 4206 OUTLOOK OF THE FAST BREEDER REACTOR DEVELOPMENT IN U.S.S.R. Krasnolarov, N. (Nauchno-Issledovatel'skij Inst. Atomnykh Reaktorov, Dimitrovgrad (USSR)). Gensan Nenji Taikai Gijiroku; No. 11, 113-118, 148-153(1978). (In Japanese).

From 11. annual conference of the Japan Atomic Industrial Forum; Tokyo, Japan (14 - 16 Mar 1978).

In USSR, following on the experimental fast reactor BOR-60, the large fast reactor BN-350 started operation in 1973. Its electric output is 120 MW, and its desalination capacity is 70,000 m³ per day. This is of loop type. On the other hand, a pool type fast reactor, BN-600, is now under construction and completion of the main part is expected in 1979. With the operation of this type, therefore, USSR will have experiences of both loop and pool types. These two should lead to future commercial power generation. The next step in the FBR development program is BN-1600. It will have the largest electric output, using two turbines of 800 MW each. It is the pool type, and it has the specification parameters similar to those of BN-600.

- 4207 PROJECT OF DEVELOPING FAST BREEDER REACTORS IN JAPAN. Oyama, A. (Power Reactor and Nuclear Fuel Development Corp., Tokyo (Japan)). Gensan Nenji Taikai Gijiroku; No. 11, 124-128, 156-159(1978). (In Japanese).

From 11. annual conference of the Japan Atomic Industrial Forum; Tokyo, Japan (14 -

16 Mar 1978).

The government decided "The policy concerning the development of power reactors" in 1968, and 10 years have elapsed since the development of fast breeder reactors has become one of the national projects in Japan. Since the oil crisis in 1973, the expectation to nuclear power generation grew larger and larger in view of the stable securing of energy in Japan. Recently, various discussions on the utilization of plutonium and the development of fast breeder reactors are made on the basis of the nuclear non-proliferation policy of USA, but breeder reactors are indispensable for Japan, which depends on import for around 90% of energy resources, therefore largest effort to put the breeder reactors into practical use must be exerted. The personnel of the PNC engaging in this project is 550 and the budget is 24 billion yen in 1978. The fast experimental reactor "Joyo" attained the criticality in April, 1977, and the measurement and test reactor performance were carried out in low power output operation. Now the reactor is stopped for the inspection. The design of the fast breeder prototype reactor "Monju" is almost finished, and the construction will begin in near future. The reasons for having selected the type and power output of the prototype "Monju" are explained. The international cooperation with USA, UK and FRG and the road to the practical use hereafter are described.

- 4208 Les surregenerateurs. (BREEDERS). Palaiseau, France; Societe Francaise d'Editions et d'Informations Regionales (1978). 72p. (In French).

The interest lying in the nuclear energy as a source of electric power is recalled with a view to the consumption of primary energy and electric power; the position of France is particularly discussed. The fast breeder reactor is presented and the state of development of this type of reactor in France is discussed with the planning of the Creys-Malville power plant. The problems successively examined are concerned with: fuel cycle, radioactivity and effluents, breeder safety, licensing procedures, sodium coolant, plutonium, fuel reprocessing, environmental impact and waste management.

- 4209 DEVELOPMENT WORK ON CORE PROTECTIVE INSTRUMENTATION. Jacobi, S.; Rohrbacher, H.A.; Schleisiek, K. (Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Inst. fuer Reaktorentwicklung); Edelmann, M.; Ehrhardt, J. (Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Inst. fuer Neutronenphysik und Reaktortechnik); Heckert, K. (Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Inst. fuer Material- und Festkoerperforschung); Krebs, L.; Mueller, S. (Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Inst. fuer Reaktorbauelemente); Voges, U. (Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Inst. fuer Datenverarbeitung in der Technik); Stieglitz, L. (Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Inst. fuer Heisse Chemie). KFK Nachr.; 10: No. 3-4, 109-115(1978). (In German).

For the SNR 300 there is provided, according to the present design stage, a detection method by means of delayed neutrons (DND system) and the measurement of the fuel outlet temperature for monitoring the fuel subassemblies. These two methods therefore also form the keypoint of the development work for the nuclear instrumentation that is reported in this paper.

- 4210 INFLUENCE OF THE SODIUM COOLANT ON THE MATERIALS CHARACTERISTICS. Borgstedt, H.U.; Frees, G. (Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Inst. fuer Material- und Festkoerperforschung). KFK Nachr.; 10: No. 3-4, 41-42(1978). (In German).

In the present paper the following problems are discussed: effect of sodium compared to the effects of other coolants; sodium influence in the coolant loop; phenomena of sodium corrosion; and effects on the mechanical properties of reactor components.

- 4211 THERMOHYDRAULICS OF THE CORE OF FAST NEUTRON REACTORS. Khairallah, A.; Lapparent, D. de; Jallade, M. (CEA Centre d'Etudes Nucleaires de Cadarache, 13 - Saint-Paul-les-Durance (France). Service d'Etude et de Developpement des Coeurs); Mouney, H.; Martin, J. (Electricite de France, 75 - Paris. Direction des Etudes et Recherches). Entropie; No. 83, 4-10(1978). (In French).

This article describes the main problems involved in cooling the core of fast-neutron reactors. The applications concern SUPER PHENIX 1 or PHENIX. After a brief description of SUPER PHENIX 1, the following problems are dealt with: the thermohydraulics of the fuel pencil bundles, taking into consideration deformations of the assemblies by exposure to radiations; the thermohydraulics of the core, i.e. the distribution of the flow throughout the core and the control of the flow per assembly; the estimations of the maximum temperature of the cladding; the thermohydraulics of the immediate environment of the core, i.e. the grid upstream and the space between the core and the core cover downstream. Finally, special operating characteristics are mentioned, such as the failure of normal power outlet circuits and boiling due to a cooling fault.

- 4212 SODIUM-WATER REACTIONS IN THE STEAM GENERATORS OF FAST NEUTRON NUCLEAR POWER STATIONS. Lions, N. (CEA Centre d'Etudes Nucleaires de Cadarache, 13 - Saint-Paul-les-Durance (France). Dept. des Reacteurs a Neutrons Rapides); Quinet, J.-L. (Electricite de France, 75 - Paris. Direction des Etudes et Recherches). Entropie; No. 83, 41-49(1978). (In French).

This very great chemical affinity of sodium for water could have important consequences for the availability of fast-neutron nuclear power stations, if there were a leak in the heat exchange wall of the steam generators. In this article, after a brief description of the different types of leak, the chemical reaction is described and then the calculation codes developed by the EDP and the CEA to determine the effects on the secondary circuit of a sodium-water reaction. The results of these theoretical and experimental studies are being used by the principal manufacturer (NOVATOME-NIRA) of the SUPER PHENIX boiler to ensure that the plant is safe.

- 4213 RECENT KFK WORK ON IRRADIATION TECHNIQUES FOR FAST REACTORS. Bojarsky, E.; Haefner, H.E.; Mueller, K.; Schmidt, L. (Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Inst. fuer Material- und Festkoerperforschung). KFK Nachr.; 10: No. 3-4, 27-28(1978). (In German).

In the not too distant future there may be used with KNK-2 the first German power reactor with a fast core for irradiation experiments. The test zone, offering a central fuel element position and six rim positions, is of special interest because of its relatively high fast

neutron flux. But also in the driver zone respectively near the reflector there are planned irradiation experiments. The central position being directly accessible from above through the closure head, there may be performed here preferably such experiments requiring supplies of pipes and cables to the test insert for instrumentation, control etc., as e.g. fuel element boiling experiments, accident experiments as well as investigations on cladding and structural material.

- 4214 ANALYSIS OF SEVERE HYPOTHETICAL ACCIDENTS. Froehlich, R.; Maschek, W.; Schmuck, P. (Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Inst. fuer Neutronenphysik und Reaktortechnik); Royl, P.; Struwe, D. (Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Inst. fuer Reaktorentwicklung). KFK Nachr.; 10: No. 3-4, 66-71(1978). (In German).

A loss-of-coolant-flow accident for the Kalkar nuclear power plant is not energetic, i.e. there will result a negligible mechanical stress on the reactor coolant system. In addition there can be shown that the masses of core material, which will temporarily melt, can be permanently cooled within the reactor tank. This rather satisfactory confirmation of the expected accident development is a main result of the R and D program of the last years. In order to be able to qualify this progress it has to be considered that such hypothetical accidents are very complex phenomena, the prediction of which has certainly been improved but which are still subject to some uncertainties. For the Kalkar nuclear power plant, in order to cover these uncertainties, there were simulated so-called energetic limiting cases besides the expected accident development. Also for these limiting cases there will result a radiation exposure for the environment not exceeding the limits of the Radiation Protection Ordinance.

- 4215 FACILITY FOR NUCLEAR AEROSOL EXPERIMENTS. Alexas, A.; Hoffmann, G.; Jordan, S.; Kind, J.; Lindner, W. (Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Lab. fuer Aerosolphysik und Filtertechnik 1). KFK Nachr.; 10: No. 3-4, 119-120(1978). (In German).

FAUNA is a plant that was designed for large-scale investigations on sodium spray and areal fires, on aerosol behavior in the closed containment, and on the development of aerosol separators, and that was taken into operation at the end of 1978. In the present paper there is described the plant with its safety systems and its instrumentations. Moreover the experimental program of FAUNA is presented.

- 4216 EXPERIMENTAL AND THEORETICAL STUDIES ON THE PRESSURE BUILD-UP OF CORE MATERIALS IN HYPOTHETICAL ACCIDENTS. Bober, M.; Fischer, E.A.; Karow, H.U.; Thurnay, K. (Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Inst. fuer Neutronenphysik und Reaktortechnik). KFK Nachr.; 10: No. 3-4, 92-96(1978). (In German).

The present paper is treating the following classes of problems: theoretical extrapolations of the equations of state for pure oxide fuel; experimental determination of the vapor pressure diagram of pure oxide fuel up to 5000 K; and contribution of the fission products to the pressure build-up in the fuel, thermodynamic variables of state for sodium.

- 4217 RESULTS OF THE IN-PILE EXPERIMENTAL

PROGRAMM SCARABEE. Bottoni, M.; Struwe, D. (Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Inst. fuer Reaktorentwicklung); Billiaux, M. (Societe Belge pour l'Industrie Nucleaire, Brussels); Eibel, H. (Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Inst. fuer Material- und Festkoerperforschung); Jacobs, H. (Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Inst. fuer Neutronenphysik und Reaktortechnik). KFK Nachr.; 10: No. 3-4, 75-78(1978). (In German).

Description of the in-pile program SCARABEE having been performed in the CABRI reactor is presented. The aim of it was to investigate the effects of cooling disturbances on the fuel rod behavior including failure. The special features of the test facility and the results of the theoretical interpretation of the transient thermal-hydraulic behavior are presented.

- 4218 STUDIES ON AEROSOL BEHAVIOR UNDER ACCIDENT CONDITIONS.** Bunz, H.; Jordan, S.; Schikarski, W.; Schuetz, W. (Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Lab. fuer Aerosolphysik und Filtertechnik I). KFK Nachr.; 10: No. 3-4, 116-118(1978). (In German).

Studies are presented on aerosol formation by sodium evaporation and condensation, on activity release from the bottom cooling unit, on aerosol formation by sodium fires and on the behavior of gasborne aerosols in the containment.

- 4219 THEORETICAL INVESTIGATIONS OF FUEL-COOLANT INTERACTION.** Caldarola, L.; Ladisch, R. (Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Inst. fuer Reaktorentwicklung); Jacobs, H. (Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Inst. fuer Neutronenphysik und Reaktortechnik). KFK Nachr.; 10: No. 3-4, 79-80(1978). (In German).

In the present paper there are discussed the reaction mechanisms of the system Na-UD_2 and the influence of the temperature on the development of the reactions. Many experiments indicate that a temperature criterion must be fulfilled for an explosive interaction to take place.

- 4220 EXPERIMENTS ON FUEL-COOLANT INTERACTION UNDER TRANSIENT CONDITIONS.** Deckers, H.; Lehning, H.; Piel, D.; Reiser, H. (Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Inst. fuer Material- und Festkoerperforschung); Gross, S. (Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Projekt Schneller Brueter). KFK Nachr.; 10: No. 3-4, 81-82(1978). (In German).

In no one of the experiments carried out an energetic reaction with shock waves and a high energy conversion factor was measured, as it may occur e.g. between different molten metals and water. Though there were produced pressure pulses with amplitudes up to about 70 bar their width and number is too small to cause serious loads on a reactor structure. The same is true for the conversion of thermal energy of the fuel into mechanical energy of the coolant.

- 4221 EXPERIMENTAL STRESS ANALYSIS IN FAST NUCLEAR REACTOR SAFETY.** Curioni, S.; Trombetti, T. pp 483-485 of 7th congress on materials testing. Vol. 2. Budapest, Hungary; OMKDK-Techninform (1978).
From 7. congress on materials testing;

Budapest, Hungary (9 Oct 1978).

In the primary containment design of a liquid metal fast breeder reactor (LMFBR) the possibility of a sudden energy release in the core (hypothetical core disruptive accident) must be considered. This paper discusses some simple vessel tests which have been carried out to verify the general pattern of structural response. 7 refs.

- 4222 SAFETY SYSTEMS RELATIVE TO THE CREYS-MALVILLE POWER STATION.** Noel, H.; Freslon, H. (Novatome Industries, 92 - Le Plessis-Robinson (France)); Lucenet, G. (Societe Centrale Nucleaire Europeenne a Neutrons Rapides (NERSA), 69 - Lyon (France)). Bull. Inf. Sci. Tech. (Paris); No. 227, 81-98(1978). (In French).

At Creys Malville, as in all nuclear power stations, public protection against any accidental discharge of radioactive products and its potential consequences is based on the setting up in series of barriers of specified tightness. The safety of the station therefore rests on the effectiveness of each of these barriers and its correct behaviour under the different working conditions of the station. Part one will analyse the various barriers in turn distinguishing for each on the three basic progressive stages of safety: prevention, supervision and the attendant safety action. The analysis of the different working conditions of the station given in part two will enable role and behaviour of each barrier for these various conditions to be represented as a whole.

- 4223 THERMOHYDRAULICS OF STEAM GENERATORS.** Ginier, R. (CEA Centre d'Etudes Nucleaires de Cadarache, 13 - Saint-Paul-les-Durance (France). Dept. des Reacteurs a Neutrons Rapides); Robin, M.G. (CEA Centre d'Etudes Nucleaires de Saclay, 91 - Gif-sur-Yvette (France). Service d'Etude et de Developpement de la Technologie des Reacteurs a Sodium); Gonnet, B. (Societe Franco-Americaine de Constructions Atomiques (FRAMATOME), 92 - Courbevoie (France)); de Montardy, A. (Electricite de France, 75 - Paris). Entropie; No. 83, 33-40(1978). (In French).

This article deals with the thermohydraulics of steam generators in pressurized-water or fast-neutron reactors built in France. A list is given of the theoretical or experimental methods used to analyse either the behaviour of the steam generator as a whole or phenomena occurring in more localised areas of the exchange surface. Details are given of the amount of precision of the methods used, and the fields where research is still needed are pointed out. The methods used have made an extensive study of these appliances possible, but research on certain point is still necessary: knowledge of two-phase flow and its models must be improved, in particular to get away from one-dimensional schematization. Great efforts must be developed to the study of complying between flow structures, phenomena of mass transfer at the wall, and the corrosion which this may lead to.

- 4224 POWER FLATTENING BY ENRICHMENT ZONING IN A FAST POWER REACTOR.** Lee, S.M.; John, T.M.; Singh, R.S. (Reactor Research Centre, Kalpakkam (India)). pp 392-395 of Reactor physics. Bombay, India; Department of Atomic Energy (1978).

From Symposium on reactor physics; Bombay, India (1 Mar 1976).

The use of two enrichment zones for radial power flattening in a Pu-U oxide fuelled large

LMFBR has been studied. Besides the choice of zone enrichments, optimization of the relative volumes of the two core zones has been made from the point of view of minimum radial form factor, maximum power per unit fissile mass and minimum flux gradients. It was found that an inner zone to outer zone volume ratio of 55/45 is optimum with a corresponding zone enrichments ratio of 0.68 for a 3000 litre core.

- 4225 NEUTRONIC CONSIDERATIONS IN THE DESIGN OF A FUEL PIN FOR A FAST POWER REACTOR. Lee, S.M.; John, T.M.; Singh, R.S. (Reactor Research Centre, Kalpakkam (India)). pp 396-399 of Reactor physics. Bombay, India; Department of Atomic Energy (1978).

From Symposium on reactor physics; Bombay, India (1 Mar 1976).

Results of neutronic calculations, performed in connection with the design of a helium bonded mixed plutonium-uranium oxide fuel pin for a large LMFBR, are reported. Some of the design features of such a pin affecting the core neutronic performance are the pellet diameter, the fuel smear density, the clad thickness, the active pin length and the axial blanket configuration. Optimisation of the pin diameter on the basis of the doubling time, assuming a reactor thermal power of 1500MW, average linear pin power of 290 W/cm and using currently available sodium pumping powers gave an optimum pellet diameter in the range 7.5 mm to 8 mm. The relative changes in doubling time due to variations in the smear density and the clad thickness have been also calculated. A study of the penalty paid in fissile inventory on flattening the core due to sodium pumping power limitations indicated a recommended minimum H/D ratio of 0.4 thus fixing the active pin length to be around 100 cms. The effect on the axial breeding contribution due to the use of integrated or separate blanket pins was estimated and resulted in the recommendation of having at least the bottom blanket pins integrated.

- 4226 CRACK PROPAGATION INVESTIGATION RELATED TO THE LEAK-BEFORE-BREAK CONCEPT FOR LMFBR PIPING. Begley, J.A. (Ohio State Univ., Columbus (USA)); Wilson, W.K.; Sheinker, A.A. pp 215-224 of Tolerance of flaws in pressurized components. London, England; Mechanical Engineering Pub. Ltd. for the Institution of Mechanical Engineers (1978).

From Conference on tolerance of flaws in pressurized components; London, UK (16 May 1978).

Results are presented from a study to evaluate leak-before-break conditions in LMFBR (Liquid Metal Fast Breeder Reactor) piping systems. Emphasis is placed on piping elbows, but most conclusions are also applicable to straight cylindrical sections. Critical crack sizes in pressurized elbows are experimentally measured and shown to agree well with predictions made using a plastic instability model. Also, surface crack fatigue growth patterns are determined. This information is combined to demonstrate a leak-before-break rationale.

- 4227 ULTRASONIC FLOW-METER TEST IN SODIUM. Ishii, Y.; Uno, O.; Kamei, M. (Power Reactor and Nuclear Fuel Development Corp., Oarai, Ibaraki (Japan). Oarai Engineering Center). pp 439-453 of Nuclear power plant control and instrumentation 1978. Vol. 2. Vienna, Austria; International Atomic Energy Agency (1978).

From IAEA symposium on nuclear power plant

control and instrumentation; Cannes, France (24 Apr 1978).

As a part of the R and D programme for the prototype fast breeder reactor MONJU, an ultrasonic flow-meter (USFM) test is being carried out in sodium in the O-Arai Engineering Center of PNC. Prior to the present test, an in-water test was done at the manufacturer's as a preliminary investigation. The results reported here are the results up to the present. Calibration tests using the actual fluid were conducted on a 12-inch ultrasonic flow-meter with guide rods fabricated for sodium flow measurement.

- 4228 LOW-AMPLITUDE STEADY STATES IN A SODIUM HEATED STEAM GENERATOR. Llory, M. (Electricite de France, 78 - Chatou. Direction des Etudes et Recherches). pp 337-352 of Phenomenes thermiques et hydrauliques nonstationnaires. Paris, France; Eyrolles (1978). (In French)

Indicial analysis tests of the Super Phenix 45 MW nominal power experimental steam generator were carried out in 1973 on the sodium heated steam generator test system of Electricite de France at the Renardieres. The numerical study of the dynamic behavior of this apparatus was made by means of a non-linear thermo-hydraulic calculation programme developed by EDF for simulating thermal or nuclear units (SICLE code). After touching on the simulation method and the main calculation hypotheses associated therewith, the calculation results achieved are commented, comparing them with the experimental results. The peculiarities of the modelisation of steam generators with helically wound tubes are also dealt with, as are the correlations adopted for determining the friction and thermal transmission coefficients.

- 4229 EFFECTS OF RADIATION ON STRUCTURAL MATERIALS: PROCEEDINGS OF THE INTERNATIONAL SYMPOSIUM, 9TH, 1978. Sprague, J.A.; Kramer, G. (eds.). (US Nav Res Lab, Washington, DC). Am. Soc. Test. Mater., Spec. Tech. Publ.; No. 683, 1-684(1978).

From 9. international symposium on the effects of radiation on structural materials; Richland, Washington, USA (11 Jul 1978).

This symposium contains 42 papers, all of which are indexed separately. The papers cover the broad area of radiation damage of materials. They are divided into six subject areas: microstructure, fracture of thermal reactor materials, primary damage production and irradiation creep simulation, dosimetry and damage function analysis, mechanical properties, and creep.

- 4230 HIGH-INTEGRITY THERMOCOUPLES FOR IN-PILE APPLICATIONS. Thomson, A.; Evans, R.A. (UKAEA Risley Nuclear Power Development Labs.). pp 401-419 of Nuclear power plant control and instrumentation, 1978. Vol. 2. Vienna, Austria; International Atomic Energy Agency (1978).

From IAEA symposium on nuclear power plant control and instrumentation; Cannes, France (24 Apr 1978).

Temperature measurements in the coolant of an LMFBR are usually made with metal-sheathed, mineral insulant thermocouples. When considerations of speed of response or available space require the cable to be immersed in the coolant, or its diameter to be small, the desired reliability may not be attained with conventional thermocouples. It is shown how a coaxial design can reduce the risk of failure caused by sodium penetration of the

sheath or metallurgical deterioration of the conductor. A 1.0 mm diameter co-axial thermocouple is described, which has a thermal response time of about 50 ms, a much higher reliability than the conventional mineral-insulated (MI) thermocouple and is incapable of sustaining an undisclosed operational fault.

- 4231 LOW-CYCLE FATIGUE OF THREE IRRADIATED AND UNIRRADIATED VANSTAR ALLOYS. Korth, G.E.; Schmunk, R.E. (Edgerton, Germeshausen and Grier Idaho, Inc, Idaho Falls). Am. Soc. Test. Mater., Spec. Tech. Publ.; No. 683, 466-476(1978).

From 9. international symposium on the effects of radiation on structural materials; Richland, WA, USA (11 Jul 1978).

Results are reported for strain-controlled low-cycle fatigue measurements on Vanstar-7, 8, and 9 in both the irradiated and unirradiated conditions, conducted at 400°C. Specimens were irradiated in the experimental breeder reactor II (EBR-II) to fluences of 0.18 to 6.37*10²⁵ neutrons (n)/m² (E>0.1 MeV) at 410 to 450°C. The results indicate that neutron irradiation had little or no effect on the fatigue life of any of the alloys. Comparison with data for Types 304 and 316 austenitic stainless steels tested at 400°C shows that on the basis of strain range the irradiated Vanstar alloys are inferior or equivalent to the stainless steels below 10,000 cycles-to-failure but become superior above that point. Proportional limit and yield-strength information have been extracted from the fatigue data, where possible. 8 refs.

- 4232 IN-REACTOR DEFORMATION AND FRACTURE OF AUSTENITIC STAINLESS STEELS. Bloom, E.E.; Wolfer, W.G. (Oak Ridge Natl Lab, Tenn). Am. Soc. Test. Mater., Spec. Tech. Publ.; No. 683, 656-672(1978).

From 9. international symposium on the effects of radiation on structural materials; Richland, WA, USA (11 Jul 1978).

An experimental technique for determining in-reactor fracture strain was developed and demonstrated. Differential swelling between a specimen holder and a test specimen with a lower swelling rate produced uniaxial deformation in 304 and cold-worked 316 stainless steel specimens. In-reactor deformations of 0.7 to 2.1 percent were achieved in Type 304 stainless steel previously irradiated to fluences up to 8.8x10²⁴ neutrons (n)/m² without fracture. These strains are significantly higher than found in postirradiation creep-rupture tests on similar specimens. From the measured strain values and published irradiation creep data and correlations, the stress levels during the irradiation were calculated. 9 refs.

- 4233 CONTROL SYSTEM ADOPTED FOR SUPER-PHENIX. REASONS FOR CHOICE AND EVALUATION OF PERFORMANCE. Decuyper, J.; Skull, G. (Societe Centrale Nucleaire Europeenne a Neutrons Rapides (NERSA), 69 - Lyon (France)); Hery, M.; Hennebicq, J.P. (Electricite de France, 75 - Paris); Acket, C. (Novatome Industries, 92 - Le Plessis-Robinson (France)). pp 129-141 of Nuclear power plant control and instrumentation, 1978. Vol. 2. Vienna, Austria; International Atomic Energy Agency (1978). (In French)

From IAEA symposium on nuclear power plant control and instrumentation; Cannes, France (24 Apr 1978).

The paper reviews all the research done in working out the control system for the fast-neutron Super-Phenix power station, which is

now under construction at Creys-Malville, France. The purpose of the system is to provide a balance between the power produced by the reactor and that taken by the electricity-generating plant. After an introductory section on the structure of the power station and the operating conditions imposed, the following main stages in design work are described: development of the system simulation model and corroboration on the basis of test results; specification of possible control system layouts (i.e. the various possible connections between regulating variables and regulated variables), optimization of control coefficients of each layout, comparison of performance and choice of layout; detailed study of the layout chosen. Special reference is made to the following typical aspects of Super-Phenix operating technology: response of the power station to primary frequency control; stability of steam generators operating in parallel; establishment of the sodium temperature value. The final part is a summary of the research carried out and a description of the performance of the computer codes.

- 4234 EVOLUTION OF THE CORE SURVEILLANCE AND PROTECTION SYSTEM IN FAST REACTORS. Gourdon, J.; Barbier, G.; Peirano, F. (CEA Centre d'Etudes Nucleaires de Cadarache, 13 - Saint-Paul-les-Durance (France)); Jeannot, A.; Le Bourhis, A. (Novatome Industries, 92 - Le Plessis-Robinson (France)). pp 23-40 of Nuclear power plant control and instrumentation, 1978. Vol. 2. Vienna, Austria; International Atomic Energy Agency (1978). (In French)

From IAEA symposium on nuclear power plant control and instrumentation; Cannes, France (24 Apr 1978).

The evolution of the core surveillance and protection system in French fast reactors from Rapsodie to Super-Phenix is described. The main trends in neutron flux measurements, core temperature surveillance, fuel failure detection and the control rod system are indicated and developments now under way are reviewed.

- 4235 DATA PROCESSING AND DATA COLLECTION IN SUPER-PHENIX. Josue, M. (Novatome Industries, 92 - Le Plessis-Robinson (France)); Thegner, G. (Sodeteg-TAI, Buc, France); Skull, G. (Societe Centrale Nucleaire Europeenne a Neutrons Rapides (NERSA), 69 - Lyon (France)). pp 143-158 of Nuclear power plant control and instrumentation, 1978. Vol. 2. Vienna, Austria; International Atomic Energy Agency (1978). (In French)

From IAEA symposium on nuclear power plant control and instrumentation; Cannes, France (24 Apr 1978).

The data processing systems for the Super-Phenix power station have been developed from Phenix systems, the various tasks being specified on the basis of the origin of information (specific to the boiler or common to the whole power station) and of its nature, i.e. depending on whether it is used for protection or for operational purposes or whether it provides personnel with a better understanding of phenomena related to the reactor. The data processing systems specific to the boiler are as follows: (a) the core temperature processing system (TRTC) with which fuel assembly temperatures can be monitored and any abnormally high value discovered, in which case it can cause a trip to shut down the reactor. To this extent it can be seen as part of the station safety equipment. In the interest of channel separation and satisfactory availability, the system is made up of two

identical units based on the use of mini-computers, some of which (for analog acquisition) are decentralized and placed near the measuring points in the dome; and (b) the core fault detection and diagnosis system (DDDC), which is a necessary complement to the TRTC in that it fulfils certain boiler operation tasks and supplies information if incidents occur. It is made up of three subsystems (acquisition and retrieval, reactivity comparison, noise analysis). Among the systems applicable to the overall operation of the station, there is: (c) the complementary information processing system (TCI) which provides overall control and is based on a large quantity of information connected with the facility as a whole.

- 4236 PRACTICAL POWER-REACTOR REACTIVITY METER. Peterson, B.R.; Larson, H.A. (Argonne National Lab., Idaho Falls, ID (USA)). pp 483-499 of Nuclear power plant control and instrumentation, 1978. Vol. 2. Vienna, Austria; International Atomic Energy Agency (1978).

From IAEA symposium on nuclear power plant control and instrumentation; Cannes, France (24 Apr 1978).

An on-line reactivity and anomalous reactivity meter has been designed and constructed at EBR-II. The meter is capable of identifying unknown reactivity perturbations associated with single subassembly events, sensing an unscheduled loss-of-pumping-power with sensitivity equal to the flow-meter, recording reactivity data during reactor experiments, and calibrating the control rods at start-of-run. The meter is based upon a minicomputer which senses power level via a fission and calculates reactivity and anomalous reactivity by using inverse kinetics. It operates over a wide range of power, from six dollars subcritical through 125% of full power.

- 4237 COLLECTION AND TRANSMISSION OF MILLI-VOLT-LEVEL DATA ON A LIQUID-METAL FAST-BREEDER REACTOR. Robinson, C. (Nuclear Power Co. (Risley) Ltd. (UK)); Thoburn, R. (Reyrolle Parsons Automation Ltd., Gateshead, Durham, United Kingdom). pp 65-79 of Nuclear power plant control and instrumentation, 1978. Vol. 2. Vienna, Austria; International Atomic Energy Agency (1978).

From IAEA symposium on nuclear power plant control and instrumentation; Cannes, France (24 Apr 1978).

The paper describes a high integrity data multiplexing system which caters for up to 252 input elements with remote measuring facilities, using a 12-core flexible cable. Tests carried out on a prototype unit and recommendations for effecting improvements are described. The system was developed following the identification of the problem of having to handle a large number of cables on the top of the Commercial Demonstration Fast Reactor. It has high reliability, a relatively small and conventional cable installation and is applicable to situations outside the nuclear field.

- 4238 PROTECTION OF THE SODIUM-COOLED FAST REACTOR DURING CORE MELT-DOWN. Efimov, I.A.; Lopatin, Yu.V.; Mameev, L.I.; Rysev, A.M.; Stabrovskij, S.A.; Ushakov, V.M.; Filonov, V.S. (Nauchno-Issledovatel'skij Inst. Priborostroeniya, Moscow (USSR)). pp 55-62 of Nuclear power plant control and instrumentation, 1978. Vol. 2. Vienna, Austria; International Atomic Energy Agency (1978). (In Russian)

From IAEA symposium on nuclear power plant control and instrumentation; Cannes, France (24 Apr 1978).

The paper describes a system based on delayed neutron detection which is designed to give protection against serious accidents involving core melt-down in a fast reactor. The system automatically normalizes delayed neutron data to reactor power with correction for neutron detection time. The alarm signal is generated if the normalized value of the readings rises above a threshold equivalent to the geometric area of the fuel in the fuel element and if the growth rate of the process is too rapid for operator analysis.

- 4239 REASSESSMENT OF THE ROLE OF STRESS IN DEVELOPMENT OF RADIATION-INDUCED MICROSTRUCTURE. Garner, F.A.; Wolfer, W.G.; Brager, H.R. (Westinghouse Hanford Co, Richland, Wash). Am. Soc. Test. Mater., Spec. Tech. Publ.; No. 683, 160-183(1978).

From 9. international symposium on the effects of radiation on structural materials; Richland, WA, USA (11 Jul 1978).

Data are now accumulating which clearly demonstrate that the stress state plays a strong role in the development of void and dislocation microstructure in metals during neutron irradiation. In these experiments the application of a tensile biaxial stress state at constant fluence and temperature has been found to lead to a progressively decreasing metal density with increasing stress. The effect of stress on the concurrent development of voids, Frank interstitial loops. Whereas a previous analysis of these data invoked as the dominant process an effect of stress on the rate of thermal re-emission of vacancies by voids, this process has been found to be too slow at the temperature at which the experiments were conducted to account for the magnitude of the observed perturbation. The current model employs as the dominant process the effect of stress on changing the capture efficiency of voids for interstitials. 28 refs.

- 4240 HELIUM PRODUCTION IN FAST BREEDER REACTOR OUT-OF-CORE STRUCTURAL COMPONENTS. Simons, R.L. (Westinghouse Hanford Co, Richland, Wash). Am. Soc. Test. Mater., Spec. Tech. Publ.; No. 683, 365-379(1978).

From 9. international symposium on the effects of radiation on structural materials; Richland, WA, USA (11 Jul 1978).

The major sources of helium production in stainless steel irradiated in a fast reactor are (n, α) reactions in nickel, iron, chromium, and impurities such as nitrogen and boron. The corresponding reaction cross sections are generally of the threshold type with threshold energies about 1 MeV. Two important exceptions are the cross sections for the two-stage nickel reaction and the boron-10 reaction. Although lifetime helium concentrations are low, they may be an important consideration, when applying material property change data obtained from the experimental breeder reactor II (EBR-II) core to high-temperature out-of-core spectra than for the harder in-core spectra in which most irradiation data are obtained. 11 refs.

- 4241 TENSILE PROPERTY CORRELATIONS FOR HIGHLY IRRADIATED 20 PERCENT COLD-WORKED TYPE 316 STAINLESS STEEL. Fish, R.L.; Cannon, N.S.; Wire, G.L. (Westinghouse Hanford Co, Richland, Wash). Am. Soc. Test. Mater., Spec. Tech. Publ.; No. 683, 450-465(1978).

From 9. international symposium on the effects of radiation on structural materials;

Richland, WA, USA (11 Jul 1978).

Recent experiments on developmental fast-flux test facility (FFTF) cladding (20 percent cold-worked Type 316 stainless steel) have extended the data base to a fast neutron fluence of 8.4×10^{22} neutrons (n)/cm² ($E > 0.1$ MeV). The specimens were irradiated in the experimental breeder reactor-II (EBR-II) at temperatures ranging from 371 to 816°C, although peak fluence levels were attained on specimens irradiated near 371 and 649°C only. Tension tests were performed at 232°C, near the irradiation temperature, and, in some cases, above the irradiation temperature. Test specimen strain rates ranged from 4×10^{-2} /s to 4×10^{-3} /s. The data generated on cladding irradiated near 371°C established that the low-temperature strength and ductility are fluence independent beyond about 5×10^{22} n/cm² ($E > 0.1$ MeV). The resulting correlations provide a description of strength and ductility over the temperature range of 371 to 871°C and strain rates of 10^{-6} to 10^1 /s. 11 refs.

- 4242 EFFECTS OF NEUTRON IRRADIATION AND FATIGUE ON DUCTILITY OF STAINLESS STEEL DIN-1-4948. de Vries, M.I.; van der Schaaf, B.; Staal, H.U.; Elen, J.D. (ECN, Petten, Neth.). Am. Soc. Test. Mater., Spec. Tech. Publ.; No. 683, 477-489(1978).

From 9. international symposium on the effects of radiation on structural materials; Richland, WA, USA (11 Jul 1978).

Test specimens of stainless steel DIN 1.4948, which is similar to AISI Type 304, have been irradiated at 723 and 823 K up to fluences of 1×10^{23} and 2×10^{23} neutrons (n)/cm² ($E > 0.1$ MeV). These are representative conditions for the reactor vessel and inner components of the liquid metal fast breeder reactor SNR-300 after 16 years of operation. High-temperature (723 to 1023 K) tension tests at strain rates ($\dot{\epsilon}$) from 10^{-5} to 10^{-1} /s show a considerable decrease of tensile ductility. The extent depends on helium content, test temperature, and strain rate. The atomic helium fractions of 3×10^{-4} and 7×10^{-4} result from the reactions of thermal neutrons with the 14 ppm boron present in the steel. Helium embrittlement sets in at strain rates below 1 to 10^{-4} /s (the range of interest for Bethe-Tait accident analyses). A minimum total elongation value of 6 percent is shown at 923 K. The postirradiation fatigue life is reduced by up to about 50 percent due to intergranular cracking. The combination of irradiation and fatigue causes a decrease of ductility after a smaller number of prior fatigue cycles than in the case of unirradiated material. 8 refs.

- 4243 ESTIMATES OF TIME-DEPENDENT FATIGUE BEHAVIOR OF TYPE 316 STAINLESS STEEL SUBJECT TO IRRADIATION DAMAGE IN FAST BREEDER AND FUSION POWER REACTOR SYSTEMS. Brinkman, C.R.; Liu, K.C.; Grossbeck, M.L. (Oak Ridge Natl Lab, Tenn.). Am. Soc. Test. Mater., Spec. Tech. Publ.; No. 683, 490-510(1978).

From 9. international symposium on the effects of radiation on structural materials; Richland, WA, USA (11 Jul 1978).

Cyclic lives obtained from strain-controlled fatigue tests at 593°C of specimens irradiated in the experimental breeder reactor II (EBR-II) to a fluence of 1 to 2.63×10^{26} neutrons (n)/cm² ($E > 0.1$ MeV) were compared with predictions based on the method of strain-range partitioning. It was demonstrated that, when appropriate tensile and creep-rupture ductilities were employed, reasonably good estimates of the influence of hold periods and irradiation damage on the fully reversed

fatigue life of Type 316 stainless steel could be made. After applicability of this method was demonstrated, ductility values for 20 percent cold-worked Type 316 stainless steel specimens irradiated in a mixed-spectrum fission reactor were used to estimate fusion reactor first-wall lifetime. The ductility values used were from irradiations that simulate the environment of the first wall of a fusion reactor. Neutron wall loadings ranging from 2 to 5 MW/m² were used. 27 refs.

- 4244 FRACTURE TOUGHNESS OF IRRADIATED AISI 304 AND 316L STAINLESS STEELS. Dufresne, J.; Henry, B.; Larsson, H. (CEA, Fontenay-Aux-Roses, Fr.). Am. Soc. Test. Mater., Spec. Tech. Publ.; No. 683, 511-528(1978).

From 9. international symposium on the effects of radiation on structural materials; Richland, WA, USA (11 Jul 1978).

The fracture toughness of AISI 304 and 316L stainless steels and their welds irradiated to 7×10^{25} neutrons (n)/m² (50 percent of this was at $E > 0.1$ MeV) was investigated on 10- and 20-mm-thick three-point bend specimens. Measurements of critical values of the J-integral, $J_{sub c}$, and the crack-opening displacement, $\Delta_{sub c}$, defined at the onset of stable crack growth, were performed at 23 and 400°C. The electric potential method was adapted to hot-cell operation for the detection of the initiation point. Drastic reductions of fracture toughness occur when combining welding, irradiation, and high temperature. As an example, the value $\Delta_{sub c}/0.51$ mm of base-material nonirradiated specimens tested at 20°C drops to 0.011 mm for welded irradiated specimens tested at 400°C. The consequences on liquid metal fast breeder reactor (LMFBR) structural design are illustrated in the case of the French LMFBR Super Phenix. 8 refs.

- 4245 EFFECTS OF IRRADIATION TEMPERATURE, FLUENCE, AND HEATING RATE ON POSTIRRADIATION FLOW PROPERTIES OF CLADDING UNDER SIMULATED TEMPERATURE TRANSIENT HEATING AND DEFORMATION CONDITIONS. Cannon, N.S.; Duncan, D.R. (Westinghouse Hanford Co, Richland, Wash.). Am. Soc. Test. Mater., Spec. Tech. Publ.; No. 683, 557-566(1978).

From 9. international symposium on the effects of radiation on structural materials; Richland, WA, USA (11 Jul 1978).

Irradiation temperature, fluence, and heating rate effects on plastic flow and failure properties of fast reactor cladding were investigated by heating internally pressurized specimens until failure occurred. Specimens tested were from 20 percent cold-worked Type 316 stainless steel cladding, irradiated in the experimental breeder reactor II (EBR-II) at temperatures to 720°C and fluences to 10^{23} neutrons (n)/cm² ($E > 0.1$ MeV). A decrease of transient failure temperature with increasing irradiation temperature was observed at the "standard" heating rate of 5.6 °C/s. This effect became more pronounced for irradiation temperatures above 600°C. Transient failure temperatures also generally decreased with increasing fluence for tests performed at the standard heating rate. 5 refs.

- 4246 EFFECTS OF IRRADIATION CREEP ON EX-REACTOR MECHANICAL PROPERTIES. Duncan, D.R. (Westinghouse Hanford Co, Richland, Wash.). Am. Soc. Test. Mater., Spec. Tech. Publ.; No. 683, 567-577(1978).

From 9. international symposium on the effects of radiation on structural materials; Richland, WA, USA (11 Jul 1978).

Irradiation creep of reactor core components

is usually considered nondamaging. This concept has had no experimental verification, reducing confidence in its application reactor design. The work reported herein was intended to test the damaging nature of irradiation creep. Material used was 20 percent cold-worked AISI 316 stainless steel tubing of 5.84-mm outside diameter and 5.08-mm inside diameter. The tubing specimens has been irradiated with stress and with zero stress to provide varying amounts of irradiation creep. A transient burst test was used to assess creep effects. This test imposes a constant stress and an increasing constant rate temperature ramp on a tubular specimen until rupture occurs. 12 refs.

- 4247 IRRADIATION CREEP IN BENDING OF COLD-WORKED AISI 316 STAINLESS STEEL AT LOW NEUTRON FLUENCE. McSherry, A.J.; Patel, M.R.; Marshall, J.; Appleby, W.K. (GE, Sunnyvale, Calif.). Am. Soc. Test. Mater., Spec. Tech. Publ.; No. 683, 598-607(1978).

From 9. international symposium on the effects of radiation on structural materials; Richland, WA, USA (11 Jul 1978).

The results from the first and second interim examinations of a test to measure irradiation creep in bending of 20 percent cold-worked AISI 316 stainless steel are presented. These low-fluence results indicate that irradiation creep in bending exhibits a larger primary creep component of the total strain as compared with creep in biaxial pressurized tubes of the same heat of material, but the secondary creep rates in the two cases appear to be similar. The data also indicate that the bending strains have a linear fluence and stress dependency, and strains measured on beams fabricated parallel to and transverse to the direction of cold work are similar, indicating that material texture anisotropy does not effect irradiation creep in bending. 6 refs.

- 4248 COMPARISON OF FUEL PIN DEFORMATIONS WITH PRESSURIZED TUBE CREEP TESTS. Taylor, J.P.; Gilbert, E.R.; Lovell, A.J. (Westinghouse Hanford Co, Richland, Wash.). Am. Soc. Test. Mater., Spec. Tech. Publ.; No. 683, 608-623(1978).

From 9. international symposium on the effects of radiation on structural materials; Richland, WA, USA (11 Jul 1978).

Fuel pins are a key component in the fast breeder reactor (FBR), and the economical performance of the reactor depends upon the behavior and life of fuel pin assemblies. One of the limiting phenomena in fuel pin and assembly performance is deformation. A thermomechanical performance code "SIFAIL" is being used at the Hanford Engineering Development Laboratory (HEDL) to predict fuel cladding deformation. SIFAIL utilizes empirical descriptions of cladding strain as a function of temperature, stress, and neutron fluence to predict fuel pin profiles. The equations are derived primarily from in-reactor tests on tubes pressurized with an inert gas and irradiated under conditions of constant temperature and stress. These equations were modified in SIFAIL to account for the variations in temperature and stress with time which occur in fuel pins. It is the purpose of these investigations to develop analytical methods which can be used to design fuel pins with optimum long-life performance. Equations were developed to describe the in-reactor creep behavior for two different classes of AISI 316 stainless steel tubing, a developmental class for the fast test reactor (FTR) and the FTR first-core tubing. The behavior of these two tubing classes was sufficiently different that

two distinctly separate equations were required to describe their in-reactor creep behaviors. 13 refs.

- 4249 PYROCHEMICAL PROCESSING OF LWR AND LMFBF FUELS BY THE SALT TRANSPORT METHOD. Knighton, J.B. (Rockwell International Corp., Golden, CO (USA). Rocky Flats Plant). Radiochim. Acta; 25: No. 3/4, 181-190(1978).

The salt transport pyrochemical process is being evaluated for coprocessing uranium and plutonium in spent LWR and LMFBF oxide fuel. The main objective is to develop a proliferation resistant process for recycle of uranium and plutonium. Diversion and proliferation resistance against weapons is enhanced by leaving part of the fission product elements with the uranium-plutonium product. The cladding (zircaloy or stainless) is removed from the oxide fuel by dissolution in molten zinc. The fuel oxides are then reduced by calcium metal in the presence of a Cu-Mg alloy and a $\text{CaCl}_2\text{-CaF}_2$ salt. The subsequent fission product separations from uranium and plutonium are achieved by a series of molten salt-metal equilibrations. Vacuum distillation is used to recover the volatile solvent metals for recycle. The uranium and plutonium product with residual fission products is subsequently converted to oxide fuel. The chemistry of the salt transport step is described. The integration of the salt transport step into a conceptual flow sheet is described.

- 4250 IMPACT OF PFR REPROCESSING AT DOUNREAY NUCLEAR DEVELOPMENT ESTABLISHMENT. Lillyman, E. (UKAEA Dounreay Nuclear Power Development Establishment). pp 117-126 of Radiation protection in nuclear power plants and the fuel cycle. Vol. 2. London; British Nuclear Energy Society (1978).

From Conference on radiation protection in nuclear power plants and the fuel cycle; Bristol, UK (27 Nov 1978).

This paper examines some of the consequences of changing over from an enriched uranium to a plutonium fuel cycle. It is concerned mainly with the irradiated fuel reprocessing plant which has been reconstructed to meet the standards required for a plutonium fuel cycle. The modifications have covered containment, shielding, ventilation, HEPA filtration and active posting systems.

- 4251 RADIOLOGICAL PROTECTION IN THE PROTOTYPE FAST REACTOR, DOUNREAY, SCOTLAND. Adam, E.R.; Howard, R.S.; McDonald, W. (UKAEA Dounreay Nuclear Power Development Establishment). pp 213-218 of Radiation protection in nuclear power plants and the fuel cycle. Vol. 1. London; British Nuclear Energy Society (1978).

From Conference on radiation protection in nuclear power plants and the fuel cycle; Bristol, UK (27 Nov 1978).

The Prototype Fast Reactor (PFR) at Dounreay is the largest power plant (250 MWe, 600 MW(th)) operated by the United Kingdom Atomic Energy Authority. The reactor was first taken critical in March 1974 and experience has since been obtained in the various aspects of radiological protection during almost 30,000 hours of operation at power levels up to and including the design thermal power of 600 MW. Radiation and contamination control has been highly satisfactory with personnel exposure levels extremely low and restrictions on personnel access applying to only a few limited areas. The paper gives a brief description of the reactor design shielding, describes the methods and facilities available for handling active components and discusses the

effectiveness of the radiation and contamination control policy being operated.

4252 NUCLEAR REACTOR WITH SEVERAL CORES.

Swars, H. (to Internationale Atomreaktorbau G.m.b.H. (INTERATOM), Bergisch Gladbach (Germany, F.R.); Deutsches Patentamt, Muenchen (Germany, F.R.)). German (FRG) Patent 2,628,782/A/. 29 Dec 1977. 11p. (In German).

Several sodium-cooled cores in separate vessels with removable closures are placed in a common reactor tank. Each individual vessel is protected against the consequences of an accident in the relevant core. Maintenance devices and inlet and outlet pipes for the coolant are also arranged within the reactor tank. The individual vessels are all enclosed by coolant in a way that in case of emergency cooling or refuelling each core can be continued to be cooled by means of the coolant loops of the other cores.

4253 IMPROVEMENTS IN OR RELATING TO THE BLOCKING OF MICROPORES IN A STRUCTURE.

Hailestead, W.D. (to Central Electricity Generating Board, London (UK)). British Patent 1,495,561/A/. 21 Dec 1977. 6p.

A method is described for blocking micropores that may occur during the manufacture of a sodium-water heat exchanger. Such pores may be so fine, say 10⁻²mm diameter or less, that they escape detection during testing. One face of the members to be treated is exposed to vapour phase Ni carbonyl, oxide, or hydroxide, whilst the other face is exposed to a suitable reactant that causes deposition of Ni or an oxide thereof in the micropores. If an oxide is deposited this is subsequently reduced to Ni by passing a reducing gas over the face that is to be exposed to Na.

4254 HEAT EXCHANGERS. Hayden, O.; Willby, C.R. (to UKAEA London Office). British Patent 1,495,654/A/. 21 Dec 1977. 4p.

Reference is made to "tube-in-shell" heat exchangers. Hitherto it has been the practice to seal the tubes to a tube sheet by welding, but frequently the welds fail, probably as a result of stress corrosion, and repair is a very difficult operation because there are so many closely spaced tubes. In the arrangement described welding is avoided by employing what are known as compression pipe couplings, the construction of which is described. The arrangement is particularly applicable to liquid metal cooled reactors.

4255 NUCLEAR REACTOR CORE SERVICING APPARATUS.

Andrea, C. (to Combustion Engineering, Inc.). US Patent 4,064,000. 20 Dec 1977. Filed date 29 Sep 1975. 26p.

Disclosed is an improved core servicing apparatus for a nuclear reactor of the type having a reactor vessel, a vessel head having a head penetration therethrough, a removable plug adapted to fit in the head penetration, and a core of the type having an array of elongated assemblies. The improved core servicing apparatus comprises a plurality of support columns suspended from the removable plug and extending downward toward the nuclear core, rigid support means carried by each of the support columns, and a plurality of servicing means for each of the support columns for servicing a plurality of assemblies. Each of the plurality of servicing means for each of the support columns is fixedly supported in a fixed array from the rigid support means. Means are provided for rotating the rigid support

means and servicing means between condensed and expanded positions. When in the condensed position, the rigid support means and servicing means lie completely within the coextensive boundaries of the plug, and when in the expanded position, some of the rigid support means and servicing means lie without the coextensive boundaries of the plug.

4256 RUPTURE DISC. Newton, R.G. (to Energy Research and Development Administration). US Patent 4,064,003. 20 Dec 1977. Filed date 29 Mar 1976. 6p. PAT-APPL-671,912.

The intermediate heat transport system for a sodium-cooled fast breeder reactor includes a device for rapidly draining the sodium therefrom should a sodium-water reaction occur within the system. This device includes a rupturable member in a drain line in the system and means for cutting a large opening therein and for positively removing the sheared-out portion from the opening cut in the rupturable member. According to the preferred embodiment of the invention the rupturable member includes a solid head seated in the end of the drain line having a rim extending peripherally therearound, the rim being clamped against the end of the drain line by a clamp ring having an interior shearing edge, the bottom of the rupturable member being convex and extending into the drain line. Means are provided to draw the rupturable member away from the drain line against the shearing edge to clear the drain line for outflow of sodium therethrough.

4257 IDENTIFICATION OF FAILED FUEL ELEMENT.

Fryer, R.M.; Matlock, R.G. (to Energy Research and Development Administration, Washington, DC (USA)). Canadian Patent 1,023,065/A/. 20 Dec 1977. 7p.

The invention relates to an improvement in the Experimental Breeder Reactor No. 2 (EBR-II) whereby existing fuel handling equipment can be used to interrogate each subassembly in turn to determine whether a failed fuel element is present therein.

4258 NUCLEAR CORE DEBRIS COLLECTING TRAY.

Broadley, D. (to United Kingdom Atomic Energy Authority). US Patent 4,062,724. 13 Dec 1977. Priority date 5 Apr 1974, United Kingdom of Great Britain and Northern Ireland (UK), 4p.

Disclosed is a nuclear reactor construction comprising a fast reactor core submerged in a pool of liquid sodium in a primary vessel. A collecting tray for core debris is submerged in the pool below the core. The collecting tray comprises a base plate constituting a plane tube sheet while the wall of the tray constitutes an annular tube sheet. Coolant conducting tubes are end received in the tube sheets. An internal skirt of the primary vessel overlaps the wall of the tray. 2 claims, 2 figures.

4259 NUCLEAR REACTORS. Jackson, G.O. (to United Kingdom Atomic Energy Authority). US Patent 4,061,534. 6 Dec 1977. Filed date 6 Oct 1971. 6p.

Disclosed is a nuclear reactor cooled by a freezable liquid has a vessel for containing said liquid and comprising a structure shaped as a container, and cooling means in the region of the surface of said structure for effecting freezing of said liquid coolant at and for a finite distance from said surface for providing a layer of frozen coolant on and supported by said surface for containing said liquid

coolant. In a specific example, where the reactor is sodium-cooled, the said structure is a metal-lined concrete vault, cooling is effected by closed cooling loops containing NaK, the loops extending over the lined surface of the concrete vault with outward and reverse pipe runs of each loop separated by thermal insulation, and air is flowed through cooling pipes embedded in the concrete behind the metal lining. 7 claims, 3 figures.

- 4260 METHOD FOR COOLING A BREEDER REACTOR AND BREEDER REACTOR FOR APPLYING THE METHOD. Gast, K. (to Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.)); Deutsches Patentamt, Muenchen (Germany, F.R.)). German (FRG) Patent 1,940,014/C/. 1 Dec 1977. 4p. (In German).

The fuel assemblies of the fission zone and the breeder subassemblies in the radial breeding blanket are supported on a double bottom. The coolant gets into the interspace of the double bottom below the blanket. This part of the space is separated from the interspace of the double bottom below the fission zone. Each breeder subassembly consists of a twin tube. The coolant enters the inner tube, flows through it upwards in axial direction, is then deflected on the upper end, and afterwards, in the annulus of the twin tube, flows down again in axial direction into the inlet region, below the double bottom. From there on it flows upwards through the fuel assemblies of the fission zone from below. Thereby a uniformly high coolant outlet temperature is obtained.

- 4261 CREEP FAILURE TIME OF 20% COLD-WORKED TYPE 316 STAINLESS STEEL. Chakrapani, B. (Duke Power Co., Charlotte, N.C. (USA)). Nucl. Eng. Des.; 44: No. 3, 421-432 (Dec 1977).

The Robinson failure criterion is examined for its accuracy to predict the creep failure time of 20% cold-worked type 316 stainless steel under uniaxial and multiaxial stresses. Observed changes of slope in the log-log plots of maximum tensile stress versus isothermal rupture life are neglected, and large errors in prediction of creep failure time are found. A failure criterion that best explains the experimental behavior of 20% cold-worked type 316 stainless steel in uniaxial and multiaxial creep conditions is developed by incorporating the effective stress responsible for crack initiation and the maximum tensile stress responsible for crack propagation into the creep failure time equation.

- 4262 LARGE ELECTRO-MAGNETIC PUMP FOR HIGH TEMPERATURE LMFBR APPLICATIONS. Yang, C.C.; Kraus, S. (General Electric Co., Sunnyvale, Calif. (USA)). Fast Breeder Reactor Dept.). Nucl. Eng. Des.; 44: No. 3, 383-395 (Dec 1977).

A 14 500 gal/min (3300 m³/hr) electro-magnetic (EM) axial annular linear induction pump with center return (ALIP-CR) was designed to satisfy the requirements of Section III and Code Case 1592 of the ASME Boiler and Pressure Vessel Code. One of the important features of this EM pump is that there are no moving parts. Every significant loading condition was considered in the stress analysis of this pump for a liquid metal (Na) fast breeder reactor (LMFBR) application. An axisymmetric overall stress model (finite element) was first set up to analyze the stress state within the pump duct which has a pressure boundary with the conventional pressure vessel features. Axisymmetric loading such as pressure and thermal loads as well as non-axisymmetric loading such as seismic and vibration loads were taken into account. Local analyses were

then performed for specific critical areas to supplement the overall model and to substantiate the adequacy of the design. Analytical results show that the EM pump is an acceptable and attractive design for high temperature LMFBR applications.

- 4263 (ANL-Trans--1114) DEVICE FOR SUPPORTING THE CORE OF A FAST NEUTRON REACTOR. Lleres, J.; Martin, J.P.; Perona, M.; Venot, R. Dec 1977. Translation of French Patent No. 7,336,035 9p. Dep. NTIS, PC A02/MF A01.

The object of the invention is a supporting device for the core of a fast reactor cooled by a molten sodium circulation comprising a tank, a flooring mounted to this tank, a grid equipped with studs for the entry of the fuel elements, the grid which is supported by said flooring, a large number of tubes feeding the heat-transferring liquid sodium to the grid, characterized by the fact that said flooring consists of a rigid annular structure equipped with a plane annular bearing, that said grid includes a plane annular supporting bearing, seating of the grid on the flooring being assured by the support of said annular bearing of the grid on said annular supporting bearing of the flooring, and that the tubes opening into the grid to feed molten heat-transferring sodium are each connected to a structure connected to the flooring by means of an expansion bellows.

- 4264 (ANL-Trans--1113) INSTALLATION FOR PURIFYING THE LIQUID METAL USED FOR COOLING THE CORE OF A FAST NEUTRON REACTOR. Abramson, R.; Delisle, J.P.; Elie, X. Dec 1977. Translation of French Patent No. 7,335,377 12p. Dep. NTIS, PC A02/MF A01.

The invention deals with a purification installation for liquid metal and particularly sodium used to provide for cooling of the fuel assemblies of a fast-neutron reactor.

- 4265 (ANL-Trans--1112) TURNSTILE DEVICE FOR FUEL UNLOADING OF NUCLEAR REACTORS. Allain, A.; Mulot, P.; Filloleau, E. Dec 1977. Translation of French Patent No. 7,412,839 13p. Dep. NTIS, PC A02/MF A01.

The invention deals with a turnstile transfer device for handling the fuel assemblies of a nuclear reactor, in particular of the fast neutron type cooled by circulating molten metal, generally sodium.

- 4266 (ANL-Trans--1111) PROCESS FOR THE CONTINUOUS CONTROL OF THE SEAL AND STRENGTH OF THE CONTAINMENT OF A REACTOR UTILIZING SAID PROCESS. Cachera, P.C. Dec 1977. Translation of French Patent No. 7,332,374 7p. Dep. NTIS, PC A02/MF A01.

The object of the invention is a process for the continuous monitoring of the seal and mechanical strength of the containment of a sodium-cooled fast reactor and the application of said process.

- 4267 RADIATION RISKS FROM PLUTONIUM RECYCLE. Cuddihy, R.G. (Lovelace Biomedical and Environmental Research Inst., Albuquerque, NM); McClellan, R.O.; Hoover, M.D.; Dugan, V.L.; Chapman, L.D.; Wayland, J.R. Environ. Sci. Technol.; 11: No. 13, 1160-1164 (Dec 1977).

A computer simulation method was used to estimate the health risks associated with alpha-emitting radionuclides that could be released to the environment from a nuclear reactor program with plutonium recycle and from burning low-sulfur, Western U.S. coal. Many of the base

assumptions for the model were taken from the LMFBR Environmental Impact Statement (EIS). The probabilities and consequences of severe nuclear accidents were projected to be low, and health risks to the general public over a long period of time were projected to result primarily from releases of actinide radionuclides during normal operations. No assumptions concerning the environmental transport of transuranic radionuclides or their deposition in human tissues were identified as having sufficient uncertainty to cause more than a factor of two or three changes in the overall projected health effects. The most significant remaining needs are for better information on the physical and chemical nature of released material, environmental weathering of particles, the physical size of particles resuspended from ground surfaces, uptake of radionuclides by plants and the validity of low-dose health-risk extrapolations from high-level biological dose-response studies. In estimating the potential health effects of burning coal, bone tumors and genetic defects were projected to be the major health impact rather than lung tumors, as in the LMFBR simulation. This was the result of the increased importance of the ingestion pathway, although this is probably the most uncertain aspect of the composite model. Still, even the projection for lung tumors was 400 times greater for operation of a coal-fired plant compared to that of an equivalent size LMFBR. This evaluation is limited in scope compared to all the hazards associated with either the total nuclear or coal fuel cycle. It applies the same criteria, degree of conservatism and scientific base of information in making this one health risk comparison.

- 4268 DIFFERENCES IN THE ^{103}Ru AND ^{106}Ru AXIAL DISTRIBUTIONS IN $(\text{U,Pu})\text{O}_2$ FUEL PINS. Phillips, J.R.; Marshall, T.K. (Los Alamos Scientific Lab., NM). Nucl. Technol.; 36: No. 2, 222-228 (Dec 1977).

A precision gamma-scanning system was applied to the nondestructive determination of the isotopic distributions of ^{103}Ru and ^{106}Ru in two failed $(\text{U,Pu})\text{O}_2$ fuel pins irradiated in the Experimental Breeder Reactor II. Significant differences in the two distributions were measured that were related to the half-lives of the two ruthenium isotopes. The two distributions can be used to determine the relative times at which the ruthenium deposits were formed within the fuel material. This information may be used to determine nondestructively the changes within the central void region over a period of several irradiation cycles.

- 4269 INTRUSION OF MOLTEN STEEL INTO CRACKS IN SOLID FUEL IN A TRANSIENT-UNDERCOOLING ACCIDENT IN A LIQUID-METAL FAST BREEDER REACTOR. Ostensen, R.W.; Murphy, W.F.; Wrona, B.J.; Deitrich, L.W.; Florek, J.C. (Argonne National Lab., IL). Nucl. Technol.; 36: No. 2, 200-214 (Dec 1977).

In a transient-undercooling accident in a liquid-metal fast breeder reactor with a small sodium void coefficient, steel cladding melts prior to disruption of the oxide fuel pellets. If molten steel could wet the fuel and penetrate into the interior of the fuel pin through the surface cracks, steel vapor pressure could cause an early breakup and possibly a dispersal of the fuel. The wetting and capillary properties of molten steel in contact with solid oxide fuel have been examined. Based on available indirect in-pile and out-of-pile experimental results, the known surface properties of steel and UO_2 , the

behavior of similar materials, and direct experiments on steel- UO_2 wetting properties, it is concluded that in an accident situation, molten Type 316 stainless steel will not wet oxide fuel at temperatures below the point of disruption of the fuel. Steel intrusions in the fuel will have no significant impact on the accident sequence.

- 4270 DESIGN CONSIDERATIONS FOR LARGE HETEROGENEOUS LIQUID-METAL FAST BREEDER REACTORS. Tzanos, C.P.; Barthold, W.P. (Argonne National Lab., IL). Nucl. Technol.; 36: No. 3, 262-274 (Dec 1977).

A systematic method for designing heterogeneous configurations having a near-zero value of sodium void reactivity is presented. It is based on the following principles: (a) the thickness of the internal blanket zones should be such that the reactivity change resulting from voiding any core zone is practically independent of any further increase in the thickness of these zones, and (b) the sodium void reactivity of each core zone must have a near-zero value. Neutronic coupling among the core zones of heterogeneous configurations decreases as the thickness of the internal blanket zones increases. To quantify coupling, Avery's coupling coefficients are used. Reduced coupling among the core zones of a heterogeneous design, compared to a homogeneous design, results in (a) increased sensitivity of the power distribution to enrichment distribution perturbations, (b) reduced reactivity worth of local perturbations, and (c) higher cladding temperatures during operational transients initiated by local perturbations. Heterogeneous designs compared to equivalent homogeneous designs have (a) lower core Doppler coefficient values, (b) larger fuel compaction reactivities, and (c) higher maximum cladding temperatures.

- 4271 STRESS-FREE SWELLING IN TYPE 304 STAINLESS STEEL AT HIGH FLUENCES. Kenfield, T.A.; Appleby, W.K.; Busboom, H.J. (General Electric Co., Sunnyvale, CA). Nucl. Technol.; 36: No. 3, 347-352 (Dec 1977).

Type 304 stainless steel has been irradiated to a fluence of 1.4×10^{27} n/m², $E > 0.1$ MeV, in the solution-annealed and 10, 20, and 30% cold-worked conditions. Cold working does not impart a continuous reduction in swelling for this alloy. Indeed, in the temperature range from 475 to 550°C (748 to 823 K), the 10 and 20% cold-worked specimens showed more swelling than the alloy in the solution-annealed condition. This behavior appears to be a consequence of differing temperature dependences of swelling. Peak swelling in the cold-worked materials occurs somewhere between 475 and 550°C (748 and 823 K), while the solution-annealed condition peaks at a lower temperature.

- 4272 CREEP-RUPTURE PROPERTIES OF A WELD-OVERLAID TYPE 304 STAINLESS-STEEL FORGING. Klueh, R.L.; Canonico, D.A. (Oak Ridge National Lab., TN). Nucl. Technol.; 36: No. 3, 353-367 (Dec 1977).

The creep-rupture properties of a cylindrical Type 304 stainless-steel forging weld overlaid with Type 308 stainless-steel weld metal were evaluated. Tests were made at 755, 811, and 866 K on tangential and radial (relative to the axis of the forging cylinder) specimens taken from the weld metal, from the forging as forged, and the forging adjacent to the weld metal/forging interface. Two types of axial specimens were also tested: specimens

taken from the unaffected forging and specimens taken across the fusion line. These latter specimens contained both weld metal and forging in the specimen gauge section. At all temperatures, the rupture strength of the forging immediately adjacent to the fusion line was greater than that of the forging specimens taken at a distance from the fusion line. All forging specimens were stronger than the Type 308 stainless steel of the overlay weld metal. The only effect of orientation was found for the overlay weld metal, where the tangential specimens had a slightly greater rupture life than the radial specimens. (The minimum creep rates for the two orientations were similar.) At 811 and 866 K, the ductilities of the overlay weld metal continuously decreased with increased rupture life. A minimum was found for the ductility-rupture life relationship of the Type 304 stainless-steel forging specimens at 866 K, while at 811 K, the ductility continuously decreased with increased rupture life.

- 4273 COMPUTATION STUDIES OF CLADDING RELOCATION DYNAMICS DURING LIQUID-METAL FAST BREEDER REACTOR TRANSIENT UNDERCOOLING ACCIDENTS. Angerer, G. (Kernforschungszentrum, Karlsruhe, Ger.). Nucl. Technol.; 36: No. 3, 305-313 (Dec 1977).

Cladding relocation upon melting has major consequences on the sequence of events in a transient undercooling accident in a liquid-metal fast breeder reactor (LMFBR). The CMOT code developed at the Karlsruhe Nuclear Research Center is used to simulate, by computation, cladding melt-off and blockage formation without and with the possibility of sodium vapor flow diversion. The latter phenomenon is of interest in case of incoherent cladding melt-off within an LMFBR subassembly. It turns out that large waves are generated on the liquid cladding film that quickly slide over a relatively thin slowly moving film. The motion of the waves contributes considerably to the mass transport of cladding film material and to the formation of blockages. The dynamics of these waves is a very important phenomenon of the cladding relocation process. The computed results indicate that cladding blockages in the upper and lower parts of the coolant channel will be established.

- 4274 DYNAMIC INSTABILITIES IN TUBES OF A LARGE CAPACITY, STRAIGHT-TUBE, ONCE-THROUGH SODIUM HEATED STEAM GENERATOR. Unal, H.C.; Gasselt, M.L.G.van (Nijverheidsorganisatie TNO, Apeldoorn-Zuid (Netherlands). Centraal Technisch Instituut TNO); Ludwig, P.W.P.H. (Neratoom N.V., The Hague (Netherlands)). Int. J. Heat Mass Transfer; 20: No. 12, 1389-1399 (Dec 1977).

Density-wave type dynamic instabilities were detected in the tubes of a large-capacity sodium heated steam generator. The peak-to-peak amplitudes of these oscillations varied between 9 to 60 K and the periods between 4 and 7.6s. Experimental data for the periods and the inception conditions of the dynamic instabilities, and the data found in literature obtained for a tube and a rectangular channel across which pressure drop is constant, have been correlated with simple equations for the following range of conditions: pressure: 4.1 to 17 MN/m²; exit quality: 0.27 to 1.59; inlet subcooling: 3 to 111 K; ratio of heated length to hydraulic diameter: 153 to 1921; hydraulic diameter: 0.0045 to 0.0126 m; enthalpy rise in the channel: 582 to 2130 kJ/kg; mass velocity: 353 to 2088 kg/m²s; average heat flux 0.1 to 3.25 MW/m²; period: 0.35 to 7.6s. At the start of dynamic instabilities the steam quality (or

the enthalpy of the steam or steam/water mixture) at the outlet of the boiling channel is constant for a given subcooling, pressure and geometry in the low subcooling range, and for a given pressure and geometry for the range of medium and high subcoolings. The period of the dynamic instabilities is a function of the transit time of a fluid particle in the boiling region of a channel, the Froude number, and the ratio of the length of the boiling region to the total heated length. A hot channel factor has also been established which relates the operating conditions in the tube in which the dynamic instabilities occur first, to the average operating conditions in the steam generator.

- 4275 ARE LMFBR PERMITS UNCONSTITUTIONAL. Wagner, H.; Ziegler, E. Atomwirtsch., Atomtech.; 22: No. 12, 622-627 (Dec 1977). (In German).

The August 18, 1977 decision by the Muenster Higher Administrative Court to have the Federal Constitutional Court investigate the constitutionality of permits granted for fast breeder power plants has aroused much attention, both in the FRG and in other countries. This is the first time that the German Atomic Energy Act is being questioned with respect to the separation of powers between legislative and executive authorities and also with respect to the principle of a constitutional state. As a result of their analysis of the first information available about the court decision the authors have some doubts as to whether the views held by the court about the consequences of the development of fast breeder reactors and of the permit granted for the SNR 300 demonstration nuclear power station are essentially correct. In view of the wording of and the official comments on the incriminated Section 7 of the Atomic Energy Act and the large number of subsequent leading decisions by the Federal Diet about fast breeder reactors also the concern about the constitutionality of that reactor line appears to be unfounded.

- 4276 DISCUSSION OF THE ERDA BREEDER PROGRAM IN THE USA. CRITICAL SURVEY OF THE RELATED PROLIFERATION PROBLEMS. Kessler, G. (Kernforschungszentrum Karlsruhe (Germany, F.R.). Projekt Schneller Bruester). Atomwirtsch., Atomtech.; 22: No. 12, 643-648 (Dec 1977). (In German).

The ERDA breeder program in the United States has been drastically cut back by the Carter Administration. Because of its large reserves of uranium and coal the U.S. feels it is able to postpone considerably the development of commercial fast breeder power plants. This policy is also very much a consequence of the proliferation threat emphasized by the Carter Administration in connection with reprocessing and a plutonium economy. For the same reason, also the other industrialized nations have been requested to rearrange their fast breeder activities accordingly. However, the situation with respect to reserves of primary energy in the German Federal Republic, in the whole of Western Europe and also in Japan compels these countries to make provision for reprocessing spent nuclear fuels, using plutonium as a nuclear fuel and last but not least, the determined development of commercial LMFBR power plants. In addition, an argument used against the new American nuclear policy, both in the United States and in other industrialized countries, is the contention that there is no such thing as an absolutely proliferation-proof fuel cycle and that this

objective could not even be attained by a halt to fast breeder development.

- 4277 SORPTION ON METAL SURFACES OF RADIONUCLIDES FROM SODIUM. Stamm, H.H. (Kernforschungszentrum Karlsruhe (Germany, F.R.). Inst. fuer Radiochemie). Atomwirtsch., Atomtech.; 22: No. 12, 639-640 (Dec 1977). (In German).

ALLOYS; BARIUM 140; CHEMISORPTION; CHROMIUM 52; COBALT 60; GETTERING; IMPURITIES; LIQUID METALS; MANGANESE 54; METALS; PRIMARY COOLANT CIRCUITS; PURIFICATION; SODIUM; LMFBTR TYPE REACTORS; COOLANT CLEANUP SYSTEMS; TANTALUM 182; ZINC 65

- 4278 NOTICE OF A PUBLICATION ACCORDING TO ARTICLE 17, PARAGRAPH 1, IN CONNECTION WITH ARTICLE 4, PARAGRAPH 1, OF THE RULES OF PROCEDURE IN NUCLEAR LAW. DATED 15TH DECEMBER 1977. Bundesanzeiger; No. 243, 8 (Dec 1977). (In German).

- 4279 CONSTITUTIONAL QUESTIONS OF THE DECISION OF THE OVG MÜNSTER CONCERNING THE KALKAR PROCEEDINGS. Backhaus, L. (Münster Univ. (Germany, F.R.). Rechtswissenschaftliches Seminar). Energiewirtsch. Tagesfragen; 27: No. 12, 801-802 (Dec 1977). (In German).

The likely main points of the expected debate are briefly described: 1. The decision relevance within the meaning of art. 100 Basic Law; 2. the substantive-constitutional argumentation of the OVG (Higher Administrative Court), section 7 of the Atomic Energy Act would be a breach of the principle of power sharing (art. 20, section 2, sentence 2 Basic Law).

- 4280 CREEP AND HOT DUCTILITY PROPERTIES OF ALLOY 800 FOR STEAM GENERATOR PIPES OF SURREGENERATORS. Mathern, G.; Seraphin, L.; Tricot, R. (Ugine Aciers, 73 (France)). Rev. Metall. (Paris); 74: No. 12, 717-723 (Dec 1977). (In French).

From 16. Meeting on special steels; Belfort, France (11 - 13 May 1977).

A study was carried out on three castings placed under near-real conditions in the steam generator of the Super Phenix reactor. Measurement of the toughness after holding between 550 and 650°C, creep properties and grain size, and hardness measurement are discussed. The results of electron microscope investigation are given.

- 4281 CAUSTIC STRESS CORROSION OF FE--CR--NI AUSTENITIC ALLOYS. Berge, P.; Donati, J.R.; Prieux, B.; Villard, D. Corrosion; 33: No. 12, 425-435 (Dec 1977).

From 6. international congress on metallic corrosion; Sydney, Australia (Dec 1975).

The susceptibility to stress corrosion cracking (SCC) in caustic solutions of austenitic materials for steam generator tubing, both for liquid metal fast breeders and pressurized water reactors (Type 316, and Alloys 600 and 800) has been compared as a function of: (1) The concentration of the sodium hydroxide solution; (2) the stress level (the actual stress levels for different types of specimens have been carefully evaluated and discussed); and (3) the composition and structure of the metal (in particular, the grain boundary precipitation in high nickel alloys has been characterized by different techniques). It has been shown that the first two factors have a strong influence on the

classification of the alloys, which can be completely reversed when the stress and the caustic concentration change. The possible cracking of Alloy 600 for very low caustic concentrations (4 g/l) suggested the hypothesis that cracking in pure water could be the same phenomenon as caustic cracking. Thermal treatments (such as 16 hours at 700°C) can significantly improve the behavior of Alloy 600 in caustic solutions.

- 4282 STUDY OF MIST FORMATION IN A CONVECTIVE FIELD. EFFECT OF TURBULENT FLUCTUATION ON THE MECHANISM OF MIST FORMATION. Hayashi, Y.; Takimoto, A. (Kanazawa Univ. (Japan). Faculty of Technology); Kanbe, M. Nippon Kikai Gakkai Rombunshu; 43: No. 376, 4598-4607 (Dec 1977). (In Japanese).

Observations were made on the mist formation in natural convective turbulent flow along a vertical plane. The aim of the observations was to clarify the mechanism of mist formation by the critical supersaturation model (CSM) in a turbulent field. Noaphthalene vapor was condensed in the air with sufficient external kernels. Theoretical analysis was also made on the effect of the turbulent fluctuation on the condition of mist formation. The observed experimental results are compared with the results of theoretical analysis in which the fluctuating component is taken into account, and some conclusions are drawn based on the comparison.

- 4283 INELASTIC STRESS ANALYSIS OF STEAM GENERATOR'S TUBE SHEET FOR FAST BREEDER REACTOR. Ishizaki, T.; Maruyama, T. (Babcock Hitachi K.K., Tokyo (Japan)). Karyoku Genshiryoku Hatsuden; 28: No. 12, 1167-1172 (Dec 1977). (In Japanese).

As FBRs and HTGRs are operated in high temperature range where the effect of creep appears conspicuously, the evaluation of ratchet and accumulating inelastic strain taking creep in account is required in the design of equipments, and inelastic stress analysis is required. Babcock Hitachi Ltd. carried out the inelastic stress analysis on the tube plates of steam generators for FBRs. The constructions of a steam generator and the steam exit are shown. For the analysis, the two-dimensional, axis-symmetric, thermo-elasto-plastic creep analysis program, TEPICC-4, was used. This program can make plastic calculation according to tangent rigidity method by the use of four nodes quadrilateral isoparametric elements, the yielding conditions by von Mises, and isotropic hardening law. Besides, the creep calculation is based on initial strain method. The axis-symmetric model of the tube plate part, the division into elements, the conditions of temperature and internal pressure, material constants, and the procedure of calculation are shown. As the result, creep ratchet occurred at the steam side corner of the joint of a tube plate and a shell. At the argon gas side corner, plastic deformation is larger than creep deformation, however, inelastic strain does not come into question because of shakedown. Accumulating inelastic strain satisfied the design standard.

- 4284 SAFETY OF FAST SODIUM-COOLED REACTORS. Bagdasarov, Yu.E.; Kochetkov, L.A.; Matveev, V.I.; Kulakovskij, M.Ya.; Kuznetsov, I.A.; Pomerantsev, G.B.; Krasnoyarov, N.V. At. Energ. (USSR); 43: No. 6, 464-472 (Dec 1977). (In Russian).

On the basis of the analysis of operating experience of fast liquid-metal-cooled reactors considered are the specific features of the

reactor safety and measures of its ensuring, in particular, the application of the emergency cooling systems, designated for significant coolant rates, and the use of specific kinds of electronics for the scram rod control system. The main directions of further developments in engineered safety systems even for the case of unlikely accidents are considered as well. It is shown, that such features of the fast liquid metal-cooled reactors as a great margin before boiling temperature and capability to transfer noninertially the heat from the reactor to other components and heat-exchangers under natural circulation conditions permit to hope, that the risk level for future serial NPPs with fast reactors will not exceed the risk level for the thermal reactor nuclear stations.

- 4285 PRESSURE AND TEMPERATURE STRAINING OF LIQUID SODIUM HEATED SECTIONAL STEAM GENERATORS IN ACCIDENT SITUATIONS. Matel, O. (Vyzkumny Ustav Zavodu Energetického Strojírenství, Brno-Slatina (Czechoslovakia)); Andel, J. (První Brněnská Strojírna (Czechoslovakia)). Jad. Energ.; 23: No. 12, 452-456 (Dec 1977). (In Czech).

The results are presented and discussed of the calculation of the pressure and temperature strain on a sectional steam generator fuelled by liquid sodium and having an output of 30 MW(th). In all sections of the steam generator is the ratio of section length to diameter much greater than 1. In the superheater sections this ratio is 63, in the evaporator and economizer it is 45. The flow rate, pressure, temperature and specific weight of the sodium are taken as constant. For a major leak of water into the sodium in case of a total failure of the heat transfer pipe a typical course is given of the temperature of water/sodium reaction products, the course of wall temperature along the section length filled with reaction products, and the course of the pressure load on the sections and on the steam generator at given parameters (sodium: inlet temperature 445 degC, outlet temperature 292 degC, mean pressure 0.2 MPa; water, steam: inlet temperature 190 degC, outlet temperature 435 degC, mean pressure 8.5 MPa) where the maximum weight flow of water into sodium is $m_{sub(max)} = 3.2 \text{ kg/s}$. An evaluation is made with regard to the project design and the design of the steam generator.

- 4286 REACTOR FUEL CHARGING EQUIPMENT. Wade, E. (to Westinghouse Electric Corp., Pittsburgh, PA (USA)). French Patent 2,373,858/A/. 30 Nov 1977. Priority date 7 Dec 1976, United States of America (USA), 17p. (In French).

In many types of reactor fuel charging equipment, tongs or a grab, attached to a trolley, housed in a guide duct, can be used for withdrawing from the core a selected spent fuel assembly or to place a new fuel assembly in the core. In these facilities, the trolley may have wheels that roll on rails in the guide duct. This ensures the correct alignment of the grab, the trolley and fuel assembly when this fuel assembly is being moved. By raising or lowering such a fuel assembly, the trolley can be immersed in the coolant bath of the reactor, whereas at other times it can be at a certain level above the upper surface of the coolant bath. The main object of the invention is to create a fuel handling apparatus for a sodium cooled reactor with bearings lubricated by the sodium coolant and in which the contamination of these bearings is prevented.

- 4287 REACTOR TECHNOLOGY. ATOMIC STRUCTURE.

Erdoes, P. Tech. Rundsch.; 69: No. 48, 9, 11, 13 (29 Nov 1977). (In German).

This is one of a series of articles discussing aspects of nuclear engineering ranging from a survey of various reactor types for static and mobile use to mention of atomic thermo-electric batteries of atomic thermo-electric batteries for cardiac pacemakers. Various statistics are presented on power generation in Europe and U.S.A. and economics are discussed in some detail. Molten salt reactors and research machines are also described.

- 4288 NUCLEAR POWER PLANT WITH IMPROVED ARRANGEMENTS FOR THE REMOVAL OF POST FISSION AND EMERGENCY HEATING. Buescher, E.; Vinzens, K. (to Internationale Atomreaktorbau G.m.b.H. (INTERATOM), Bergisch Gladbach (Germany, F.R.)); Deutsches Patentamt, Muenchen (Germany, F.R.)). German (FRG) Patent 2,621,256/A/. 24 Nov 1977. 11p. (In German).

This is concerned with additional equipment for emergency heat removal in a sodium cooled reactor, which operates on failure of the post fission heat removal system. The space for pressure relieving spaces and concrete masses as heat sinks within the reactor cell is no longer required. In this nuclear power plant, a heat exchanger chain transmits heat and power: There is a first sodium circuit between pressure vessel and the first heat exchanger, a second one between the first and second heat exchangers, and a third (Steam) circuit with turbine, condenser and return pump. A fourth circuit connects the secondary side of the condenser with a cooling tower. There is a three component heat exchanger in the primary circuit after the first heat exchanger, which is built around the first heat exchanger, and is sealed into an unloading space. This space is situated next to the reactor cell and is above the operating level of the sodium in the pressure vessel. It is connected to the cell by an upper duct, normally closed by a bursting disc, and by a lower duct. In the three component heat exchanger, a liquid lead-bismuth eutectic mixture transmits the heat from sodium pipes to water pipes. In normal operation it is used for steam superheating or feedwater preheating. The three component heat exchanger bridges the first and second heat exchangers as an emergency heat exchanger. If in such a case the post fission heat removal has failed, the sodium evaporating in the pressure vessel flows into the unloading space and condenses on the ribs of the emergency heat exchanger. The post fission heat is fed by the water secondary medium directly into the tertiary circuit. The sodium condensate flows back from the unloading space via the lower duct into the reactor cell and maintains the emergency level there. (RW) 891 RW.

- 4289 INDIRECT HEAT TRANSFER BETWEEN REACTIVE FLUIDS AND DETECTION OF LEAKS INDUCING A MIXTURE BETWEEN THESE FLUIDS. Dickinson, R. (to Babcock and Wilcox Co., New York (USA)). French Patent 2,371,655/A/. 15 Nov 1977. Priority date 17 Nov 1976, United States of America (USA), 10p. (In French).

The invention concerns heat exchangers for indirectly transferring heat between chemically reactive substances or, more generally, mutually incompatible ones (sodium-water exchangers of nuclear reactors). The intermediate capacity formed between the co-axial tubes offers an annular space to a heat conducting substance that is not reactive with the reactive fluids, this intermediate substance serving either as diluent for the fluids arriving in the intermediate capacity

through a leak, or as leak indicator. According to the fluids employed, the presence of a leak can be shown by various physical or chemical occurrences, for instance a change of pressure, temperature, viscosity, colour, odour or electric conductivity.

- 4290 IMPROVEMENTS IN OR RELATING TO SENSORS FOR MONITORING THE ELECTRICAL CONDUCTIVITY OF ELECTRICALLY CONDUCTIVE FLUIDS. McCann, J.D.; Poole, M.J. (to UKAEA). British Patent 1,491,207/A/. 9 Nov 1977. 12p.

A sensor is described that is suitable for monitoring the temperature of the coolant of a liquid metal cooled nuclear reactor or at least variations of the temperature of such a coolant from a predetermined value before it leaves the confines of a fuel sub-assembly and mixes with the outlet streams of other sub-assemblies. The sensor may also be used to detect fluctuations in the flow rate of the coolant. The basis of its action is changes of the electrical conductivity of the coolant with temperature. Constructional details are given. It is pointed out that random mixing of a number of coolant streams at slightly different temperatures produces temperature fluctuations about a mean value and this gives rise to a fluctuating signal sometimes referred to as 'fuel temperature noise', and it is believed that blockage of one coolant stream has a greater relative effect on this fluctuating signal than one on the mean outlet temperature of the coolant stream. Advantages of this type of sensor over conventional thermocouples are stated.

- 4291 NUCLEAR REACTOR FUEL ELEMENT SUB-ASSEMBLIES. Lunt, A.R. (to United Kingdom Atomic Energy Authority). US Patent 4,057,468. 8 Nov 1977. Priority date 3 Mar 1975, United Kingdom of Great Britain and Northern Ireland (UK), 4p.

An elongate fuel element sub-assembly for use in a liquid metal cooled fast breeder nuclear reactor is adapted at a base end region for plugging into core support means and at the upper free end there is inertia damping means to prevent excessive vibration.

- 4292 NUCLEAR REACTOR. Bittermann, D.; Goetzmann, C.; Hassmann, K.; Preuss, H.J.; Rau, P.; Schatz, M. (to Siemens A.G., Berlin (Germany, F.R.)); Siemens A.G., Muenchen (Germany, F.R.)). German(FRG) Patent 2,234,782/B/. 3 Nov 1977. 5p. (In German).

The object of the invention is to ensure a sufficient removal of heat in the case of an accident involving a core melt of a nuclear reactor - in particular a breeder reactor. A cooled tank to catch the melted core is inside the containment under the reactor core. According to the invention, there is a coolant pipeline from this tank to the containment serving as heat exchanger. The cooling of the containment (of metal) used as heat exchanger is further improved upon by a series of measures. 12 subclaims.

- 4293 SECONDARY HEAT TRANSFER CIRCUITS FOR NUCLEAR REACTOR PLANT. Robin, M. (to Commissariat a l'Energie Atomique). US Patent 4,056,439. 1 Nov 1977. Priority date 22 Aug 1975, France, 6p.

A secondary heat transfer circuit for a nuclear reactor comprises a steam generator module, an intermediate heat exchanger, and a pump which circulates a heat transfer liquid, e.g., liquid sodium, between the heat exchanger

and steam generator module. The steam generator module includes a central return duct for cold heat transfer liquid and the pump intake is directly connected to the central duct. In a modification, a plurality of steam generator modules are connected to a single duct.

- 4294 LIQUID SODIUM COOLED FAST REACTOR. Gama, J.M.; Lallement, J.; Pugnet, L. (to Commissariat a l'Energie Atomique). US Patent 4,056,438. 1 Nov 1977. Priority date 18 Oct 1973, France, 6p.

A set of cylindrical shells is interposed between the main vessel wall of an integrated sodium-cooled fast reactor and the primary core containment vessel so as to form a siphon having two downwardly directed branches. One branch opens into the intervessel zone which is separated from the primary vessel by a shell. The other branch which is nearest the main vessel wall is supplied with part of the cold sodium which has been withdrawn from the intervessel zone by means of pumps and reinjected into the bottom of the reactor core.

- 4295 PRODUCTION OF MOLTEN UO_2 POOLS BY INTERNAL HEATING: APPARATUS AND PRELIMINARY EXPERIMENTAL HEAT TRANSFER RESULTS. Chasanov, M.G.; Gunther, W.H.; Baker, L. Jr. (Argonne National Lab., IL). Nucl. Technol.; 36: No. 1, 120-128(Nov 1977).

The capability for removal of heat from a pool of molten fuel under postaccident conditions is an important consideration in liquid-metal fast breeder reactor safety analysis. No experimental data for pool heat transfer from molten UO_2 under conditions simulating internal heat generation by fission product decay have been reported previously in the literature. An apparatus to provide such data was developed and used to investigate heat transfer from pools containing up to 7.5 kg of UO_2 ; the internal heat generation rates and pool depths attained cover most of the ranges of interest for postaccident heat removal analysis. It was also observed in these studies that the presence of simulated fission products corresponding to approximately 150,000 kW-day/kg burnup had no significant effect on the observed heat transfer.

- 4296 SIMULATION OF FAST BREEDER REACTOR PIN BEHAVIOR USING UO_2 PINS WITH DIRECT ELECTRICAL HEATING. Alexas, A. (Kernforschungszentrum, Karlsruhe, Ger.). Nucl. Technol.; 36: No. 1, 129-138(Nov 1977).

In the electrical pin burst facility of the GfK, out-of-pile experiments are performed to simulate the in-pile behavior of fuel pins under SNR-300 accident conditions. Preliminary results of the first experimental series indicate that failure phenomena such as cladding meltdown, fuel melting, and fuel motion, and failure times can be studied by the method of the direct electrical heated UO_2 pin in a satisfactory and reproducible manner. Theory and experimental results will be compared at a later time with the computer program VESUV.

- 4297 CALCULATION OF THE FRAGMENTATION OF UO_2 BY CAPACITOR DISCHARGE: NONEQUILIBRIUM MODEL. Alsmiller, R.G. Jr.; Perez, R.B.; Barish, J. (Oak Ridge National Lab., TN). Nucl. Technol.; 36: No. 1, 139-147(Nov 1977).

A model based on phase-space considerations is developed to describe the fragmentation of UO_2 by capacitor discharge, i.e., to predict such quantities as the amount of gas and liquid produced, the number of liquid fragments, the

number distribution of the molecules in the liquid fragments, the kinetic-energy distribution of the gas and liquid fragments, etc. This model cannot give a unique numerical prediction of all of these quantities based only on the initial-state specification, but it does enable all of these quantities to be expressed in terms of the average internal energy of a gas molecule in the final state, the average binding energy of a UO_2 molecule in a liquid fragment in the final state, and the average number of molecules in a liquid fragment in the final state.

- 4298 SOME ASPECTS OF MODELING POWER PLANT THERMAL HYDRAULIC TRANSIENTS. Bein, M.; Yahalom, R. (General Electric Co., Sunnyvale, Calif. (USA); Fast Breeder Reactor Dept.). Nucl. Eng. Des.; 44: No. 2, 187-192(Nov 1977).

This paper deals with power plant thermal hydraulic modeling, covering the departure from nucleate boiling (DNB), the momentum equation, and the thermal effect of the pipe wall on the fluid heat transport. Two DNB correlations are compared, and the effect of neglecting the change in heat transfer coefficient due to DNB is estimated. The effect of the pipe wall on the thermal dynamics of the flow is analysed.

- 4299 PROBABILISTIC EVALUATION OF CORE-INTERNAL COOLANT FLOW DISTRIBUTION WITH CORRELATION AMONG FUEL SUBASSEMBLIES. Sakai, K.; Hishida, H. (Mitsubishi Atomic Power Industries, Inc., Omiya, Saitama (Japan). Engineering and Development Div.). Nucl. Eng. Des.; 44: No. 2, 235-246(Nov 1977).

The effect of local and global uncertainties in properties and tolerances on the probabilistic variation in coolant flow rate of the hottest channel in a prototype FBR core is discussed in terms of the coolant flow correlation among all the core-internal coolant channels. Sample calculations of the probabilistic deviations in subassembly flow rate for a prototype FBR were about 30% smaller than those conventionally calculated.

- 4300 EXPERIMENTAL STUDY OF WHOLE CORE THERMAL-HYDRAULIC PHENOMENA IN EBR-II. Singer, R.M.; Gillette, J.L. (Argonne National Lab., Ill. (USA)). Nucl. Eng. Des.; 44: No. 2, 177-186(Nov 1977).

In the analysis of core-wide temperature distributions in a liquid-metal-cooled fast breeder reactor (LMFBR) under both normal and abnormal operating conditions, it is commonly assumed that there is little, if any, thermal interaction between adjacent subassemblies. Since intersubassembly heat transfer tends to reduce the transverse temperature gradients in a reactor, thereby ameliorating the effects of local overheating, this assumption is conservative. In order to assess the importance of this effect as well as of flow redistribution in a reactor core, an experimental study was conducted in EBR-II covering a wide range of operating power and flow conditions, including both forced and natural convection. The results of this study indicate that radial heat transfer and flow redistribution are important mechanisms in the thermal-hydraulics of LMFBR cores, especially at low flow rates.

- 4301 INTERNAL PRESSURIZATION IN SOLID MIXED-OXIDE FUEL DUE TO TRANSIENT FISSION GAS RELEASE. Hofmann, J.R.; Meek, C.C. (Argonne National Lab., Ill.). Nucl. Sci. Eng.; 64: No. 3, 713-723(Nov 1977).

A model employing Darcy's law has been

developed to describe the transient pressure field within interconnected porosity of mixed-oxide liquid-metal fast breeder reactor fuel during hypothetical reactor accidents. Pressure increases are due both to fission gas released from fuel grains and fill gas originally present within fuel pores. Calculations utilizing the model have been performed for an out-of-pile test prior to fuel melting with both clad and unclad conditions being treated. Redistribution of gas from the source region in the relatively high-porosity unstructured fuel to a low-porosity restructured fuel was shown to exist in all cases considered. Even for the unclad case, significant internal pressurization was predicted by the model, which could prove important in subsequent fuel breakup and motion.

- 4302 SCALING UP THE FAST BREEDER. Nucl. Eng. Int.; 22: No. 264, 68-69(Nov 1977).

A brief description is given of the British experience in operating the PFR at Dounreay and plans for scaling up the prototype to a commercial demonstration fast reactor (CDFR). Major components performed extremely well in Na. Experience with leaks in steam generators and superheaters has results in some design changes for CDFR. Comparison of main parameters shows that the larger output of CDFR is provided by a greater number of components so that extrapolation in component size is generally kept small. Lower temperature will reduce thermal stress problems, and will also allow the use of 9% Cr steel superheaters. Primary containment will be prestressed concrete. The problem of security in relation to transportation of Pu is discussed.

- 4303 MAINTAINING AN EFFECTIVE BREEDER REACTOR PROGRAMME. Beckford, E.S. (Dept. Energy, (US) Division of Reactor Development). Nucl. Eng. Int.; 22: No. 264, 55-57(Nov 1977).

The near-term and long-term objectives of the US advanced nuclear programme are summarised and the Non-Proliferation Alternative System Assessment Program (NASAP) is discussed. US work on the sodium breeder is being restructured to examine alternate fuel cycles which minimise or eliminate the use of Pu. The test facilities and areas of technology involved are considered.

- 4304 SEISMIC DESIGN STUDY ON CANTILEVER CYLINDRICAL SHELLS. Wu, J.N.C.; Cory, J.E. Jr. (Babcock P Wilcox Co, Akron, Ohio). J. Pressure Vessel Technol.; 99: No. 4, 600-604(Nov 1977).

Paper No. 77-PVP-14.

- 4305 IN-REACTOR STRESS RELAXATION OF INCONEL X750 SPRINGS. Walters, L.C.; Ruther, W.E. (Argonne National Lab., Idaho Falls, Idaho (USA)). J. Nucl. Mater.; 68: No. 3, 324-333(Nov 1977).

In 1965 eight surveillance subassemblies were placed in row 12 of the EBR-II sodium-cooled fast breeder reactor with an irradiation temperature near the sodium-inlet temperature of 371°C. At the same time, two other surveillance subassemblies were placed in the primary storage basket, which receives minimal neutron exposure but is immersed in primary sodium and experiences a temperature of 371°C. Each of the subassemblies contained 18 preloaded springs made of Inconel X750. Springs from four of the in-core subassemblies and one subassembly from the storage basket have been evaluated to determine irradiation-enhanced deformation rates to neutron exposures of 4.2

dpa. It was found that the creep coefficient derived from the stress relaxation measurements on Inconel X750 springs was 1.0×10^{-12} (Pa-dpa)⁻¹ for springs irradiated up to 4.2 dpa (3751 d) at an in-reactor temperature of 371°C. The relaxation behavior was adequately described by a creep law that was linear in neutron fluence and applied stress. Springs encapsulated in helium showed identical in-reactor relaxation rates to springs exposed to the flowing primary sodium. The creep coefficient derived from the present work on Inconel X750 springs was shown to be the same as the creep coefficients determined from various austenitic steel alloys.

4306 BEHAVIOR OF ALLOY 800 IN SODIUM

CONTAMINATED BY SODA. Cappelaere, M.; Dixmier, J.; Sannier, J.; Coriou, H. (CEA, Cent d'Etud Nucl de Fontenay-aux-Roses, Fr). Mem. Sci. Rev. Metall.; 74: No. 11, 719-730 (Nov 1977). (In French).

A water leak in one of the steam generators in a nuclear plant cooled with sodium may lead to formation of soda (in addition to other compounds). The harmful effect of soda on the austenitic Fe-32Ni-21Cr alloy, called alloy 800, used in the steam generators of the Superphoenix reactor was therefore investigated. Stress corrosion tests showed that with high soda contents of 8% and more, the risk of stress corrosion cracking is real. With 16% soda under a stress of 130 N/mm² sup 2s the specimen fractured in 20 hr. With small amounts of soda (of about 1%) under the same stress, no fracture was observed after 100 hr.

4307 NUCLEAR POWER PLANTS OF THE SOVIET

UNION. Ermakov, G.V. (State Comm for Sci and Tech, USSR). Teploenergetika (Moscow); No. 11, 47-53 (Nov 1977). (In Russian).

Detailed description and design diagrams of several types of Soviet reactors are given, e.g., the uranium-graphite channel reactors with aqueous heat carrier installed at the Beloyarskaya nuclear power plant; its successor, the water-graphite boiling reactors of the channel type (RBMK-1000), installed at the Leningrad nuclear power plant; its further development, the RBMK-1500 presently being installed at the Ignalinskaya nuclear power plant; the uranium-graphite reactors with boiling water heat removal of the EGP-6 type installed at the Bilibinskaya nuclear heat-and-power plant (Magadan region); pressurized light water reactors of the VVER type, installed at the Novovoronezhskaya nuclear power plant, etc. Steam generators for power plants with VVER-440 and VVER-1000 reactors are described. The fast neutron breeder reactor, BN-350, installed at the city of Shevchenko in 1973 is briefly described and its design diagrams are given.

4308 DEVELOPMENT OF NUCLEAR POWER ENGINEERING

IN THE USSR. Karelin, E.P.; Sukhov, A.B. Teploenergetika (Moscow); No. 11, 54-59 (Nov 1977). (In Russian).

Brief characteristics of the first commercial Soviet nuclear power plants are presented. In particular, descriptions of the power units at the Novovoronezhskaya, Beloyarskaya, Armenian, and Shevchenko nuclear power plants are given. It is stated that, in the long run, nuclear power plants will mainly be built in the unified power systems of the North East, Center, South, and Middle Volga of the European part of the USSR. Specific costs of nuclear power plants have been reduced to 200-210 roubles/kW, which is by about 45% higher than the costs of ordinary steam power plants of the same capacity. Prime costs of

electric power produced by them are lower, however. A table of the existing nuclear power plants in the USSR is given.

4309 LOCAL SODIUM BOILING BEHIND LOCAL FLOW BLOCKAGE IN SIMULATED LMFBR FUEL SUBASSEMBLY.

Kikuchi, Y.; Daigo, Y.; Ohtsubo, A. (Power React and Nucl Fuel Dev Corp, Ibaraki-ken, Jpn). J. Nucl. Sci. Technol. (Tokyo); 14: No. 11, 774-790 (Nov 1977).
The paper deals with local sodium boiling in the downstream of a six-subchannel blockage in an electrically heated LMFBR fuel subassembly mock-up. The first series of experiments were conducted to measure temperature distributions in the downstream of the blockage under nonboiling conditions. The measured temperature rise due to the blockage agreed fairly well with the calculation by the LOCK code. The second series of experiments were performed to investigate local boiling phenomena. In the local boiling region, no flow instability was observed since the subchannels near the wrapper wall were still filled with subcooled liquids. The boiling caused a considerable increase in acoustic noise intensity. The frequency (2.9 and 20.2 sec/sup -1s) of bubble formation decreased with the increase of the bubble size at its point of maximum development. The product of the bubble frequency and the equivalent diameter was found to be constant. 7 refs.

4310 (JAPFNR--296) TEST ON "MONJU" FUEL SUBASSEMBLIES (THE FIRST AND THE SECOND TEST FABRICATIONS).

Kamimura, K.; Uematsu, K.; Sato, K. (Power Reactor and Nuclear Fuel Development Corp., Tokyo (Japan)). Nov 1977. Translation of N--241-77-32, December 1976 137p. Dep. NTIS (US Sales Only), PC A07/MF A01.

Work performed under United States--Japanese Fast Reactor Exchange Program.
This report covers the details of "the first and the second test fabrications of MONJU fuel subassemblies," "water flow test," "sodium flow test," and "post sodium flow examination."

4311 THERMO-HYDRODYNAMIC INSTABILITY TEST FOR 0.3 MWT SODIUM-HEATED STEAM GENERATOR.

Harada, T.; Tomita, Y.; Yano, T. (Ishikawajima-Harima Heavy Industries Co. Ltd., Tokyo (Japan)). Ishikawajima-Harima Giho; 17: No. 6, 558-565 (Nov 1977). (In Japanese).
In order to obtain information respecting the water-side instability in sodium-heated steam generators, the conditions to induce the instability were investigated on a 0.3 Mwt test model. Firstly, the model was confirmed to be entirely stable for the range of normal operating conditions. Secondly, it was judged from the oscillation characteristics of the flow instability that the instability was due to density wave oscillation. Thirdly, through a series of experiments where the flow instability was forcibly induced by throwing open the inlet orificing valve widely, the data for the steady-state static heat transfer just before the onset of instability and the data for the stability/instability threshold were obtained. Further, a computer program to predict the static performances was developed, and the heat input data thereunder computed were fed to the DYNAM Code to analyze the dynamic stability. As a result of the comparison with the experimental data for the stable operation, the DYNAM Code proved to have a fair amount of safety margin.

- 4312 LOCAL SODIUM BOILING BEHIND LOCAL FLOW BLOCKAGE IN SIMULATED LMFBF FUEL SUBASSEMBLY. Kikuchi, Y.; Daigo, Y.; Ohtsubo, A. (Power Reactor and Nuclear Fuel Development Corp., Darai, Ibaraki (Japan)). Darai Engineering Center). J. Nucl. Sci. Technol. (Tokyo); 14: No. 11, 774-790 (Nov 1977).

This paper deals with local sodium boiling in the downstream of a six-subchannel blockage in an electrically heated LMFBF fuel subassembly mock-up. The first series of experiments were conducted to measure temperature distributions in the downstream of the blockage under non-boiling conditions. The measured temperature rise due to the blockage agreed fairly well with the calculation by the LOCK code. The second series of experiments were performed to investigate local boiling phenomena. In the local boiling region, no flow instability was observed since the subchannels near the wrapper wall were still filled with subcooled liquid. In the nearly bulk boiling region, however, considerable upstream voiding occurred and then the inlet flow decreased, leading to final dryout. The boiling caused a considerable increase in acoustic noise intensity. The root-mean-square (RMS) noise level of approximately 20 mbar obtained in the present local boiling experiments with sodium was much higher than that (approximately 0.5 mbar) in the ordinary nucleate boiling experiments with water. The peak observed in the hertz ranges was due to the repetition of bubble formation and collapse. In the kilohertz ranges, however, resonance peaks were superposed on a smooth curve with a broad peak at approximately 7 kHz. The frequency (2.9 and 20.2 sec⁻¹) of bubble formation decreased with the increase of the bubble size at its point of maximum development. The product of the bubble frequency and the equivalent diameter was found to be constant.

- 4313 STATUS OF THE RESEARCH AND DEVELOPMENT PROGRAM ON FAST REACTORS IN THE USSR. Kazachkovskii, O.D.; Meshkov, A.G.; Mitenkov, F.M. . At. Energ. (USSR); 43: No. 5, 343-351 (Nov 1977). (In Russian).

The development of LMFBF type reactors in the USSR is shortly reviewed beginning with the BR-10 reactor. Operating experience of the BR-10 MW(th), BOR-60 MW(th), and BN-350 MW(e) reactors is summed up. Basic technical characteristics of the reactors as well as of the BN-600 MW(e) reactor (under construction) and the BN-1600 MW(e) reactor (planned) are compared. The designs of the BN-1600 reactor with a 'vertical' and 'horizontal' scheme integrating the core and the primary cooling system equipment within a single tank are discussed at greater length. The performance of circulating sodium pumps and sodium-water heat exchanges in the operating reactors is given. Oxide fuels are treated as the basic variant to pursue, but carbide, nitride and metallic fuels are also considered as likely candidates. Shortening of the fuel recycle duration is considered as one of the vital problems to tackle. It is pointed out that apart LMFBF type reactors other fast breeder reactors with He and dissociating gaseous N₂O₄ coolants are under investigation.

- 4314 ELECTROMAGNETIC PUMP FOR FAST BREEDER REACTOR. Nanba, M.; Mukaida, H.; Miyagi, T. (Tokyo Shibaura Electric Co. Ltd., Kawasaki, Kanagawa (Japan)). Ryutai Kogaku; 13: No. 11, 666-673 (Nov 1977). (In Japanese).
As for the circulating pumps for fast breeder reactors, mechanical pumps are employed for large flow rate, and electromagnetic pumps for small flow rate. The electromagnetic pumps

are inferior in pumping efficiency, but superior in safety and reliability to the mechanical pumps. The electromagnetic pumps are classified into two types: the conduction type to electrify the fluid directly from the exterior and the induction type to induce current in the fluid with a moving magnetic field. The induction type is more reliable as compared with the conduction type because of its simple duct construction. The simple theory for the induction type pumps is described, and three models with different constructions and features are explained, namely flat linear induction pump, annular linear induction pump, and helical induction pump. For putting fast breeder reactors to practical use, the electromagnetic pumps are required to realize the improvement of safety and reliability, high performance, compactness and light weight, the improvement of operation control, and easier installation and maintenance. The electromagnetic pumps may be adopted as the main circulating pumps for fast breeder reactors if the higher efficiency including thermal input is realized. For this purpose, the annular linear induction pumps are promising.

- 4315 ECONOMIC ASPECTS OF THE DEVELOPMENT OF NUCLEAR POWER AND FUEL CYCLE INDUSTRY IN THE USSR. Dergachev, N.P.; Kruglov, A.K.; Sedov, V.M.; Shuklin, S.V. . At. Energ. (USSR); 43: No. 5, 365-369 (Nov 1977). (In Russian).

The likely growth rate and technological structure of nuclear power generating capacities in the USSR have been investigated as well as the distribution of capital investments into NPP's and nuclear fuel cycle industries. The added NPP capacities are assumed to consist entirely of NPP's with the WWR -1000 MW(e), 1000 MW(e) LWGR type and BN-1600 MW(e) reactors. Basic formulas are given to calculate the projected growth rate of total nuclear capacity and NPP's with breeder reactors. The plutonium supply in the near 20-25 years is concluded to hardly restrain the development of NPP's with breeder reactors which would reduce the natural uranium demand by about 25%. The major flow of capital is required to construct NPP's and only about 20% of the total is invested into the fuel cycle industry. Hence, reduction of NPP capital costs is the most desired and effective undertaking. Uranium ore mining and milling account for as much as half of fuel cycle costs. Therefore, introduction of uranium and plutonium recycle and reduction of tails assay at enrichment plants are concluded to be the most efficient means to cut fuel costs.

- 4316 EFFECT OF FAST NEUTRON IRRADIATION ON THE STRUCTURE OF BORON CARBIDE. Hollenberg, G.W.; Cummings, W.V. (Westinghouse-Hanford Co., Richland, WA). J. Am. Ceram. Soc.; 60: No. 11-12, 520-525 (Nov 1977).

The leading LMFBF control rod material, B₄C, was examined by SEM, TEM, and X-ray diffraction after irradiation up to 80 x 10²⁰ captures/cm³ between 500° and 920°C. Bulk swelling was found to be the result of elastic and plastic strains, rather than dilation of the unit cell. Microcracking was observed and explained in terms of anisotropic swelling.

- 4317 ANALYTICAL METHOD OF FUEL PIN DEFORMATIONS IN LMFBF ASSEMBLY. Miki, K. (Hitachi Ltd., Kawasaki, Kanagawa (Japan)). Atomic Energy Research Lab.). J. Nucl. Sci. Technol. (Tokyo); 14: No. 11, 791-804 (Nov 1977).

A new analytical method is presented for

analyzing, in three dimensions, the mechanical response of fuel pins with wire spacers, to their thermal and neutronic environment in a fuel assembly of a LMFBR. It analyzes the mechanical interactions between fuel pins in the assembly in each of three directions, which form an angle of $\pi/3$ radians with one another, based on the mathematical relationship between the displacements at the contact points and the associated contact forces with respect to all fuel pins forming a line in one of the three directions. Based on this method, a new computational code, the Subchannel Deformation Analysis Code for Wire-Wrap Assemblies (SHADOW) has been developed, and is applied to a fuel assembly of a prototype fast breeder reactor in order to analyze the deformation of 169 fuel pins due to thermal bowing. Conclusions drawn from the study confirm that the SHADOW code can be an effective tool for analyzing or evaluating thermal and structural designs of a LMFBR fuel assembly.

- 4318 ELEVATED-TEMPERATURE LOW-CYCLE FATIGUE BEHAVIOR OF DIFFERENT HEATS OF TYPE 304 STAINLESS STEEL. Maiya, P.S.; Majumdar, S. (Argonne National Lab., IL). Metall. Trans., A; 8: 1651-1660 (Nov 1977).

The low-cycle fatigue results of three heats of Type 304 stainless steel have been obtained at 593°C under selected cyclic-loading conditions. The results are compared with those generated for a reference heat of steel for which extensive low-cycle fatigue data are available. Observation of the microstructures of specimens in the pretest condition after a given heat treatment and examination of fatigue fracture surfaces were conducted by means of optical and scanning electron microscopy and X-ray analysis. The three heats of stainless steel, which exhibit different microstructural features, show approximately the same continuous-cycling low-cycle fatigue behavior as that of the reference heat. However, the three materials show improved fatigue strength during tensile hold-time conditions where significant creep occurs. The fatigue properties determined in the present study for the different heats of steel are consistent with the observed microstructural features. Finally, the creep-fatigue properties of the heats as well as the microstructural observations are discussed in terms of a damage-rate approach recently developed by the authors.

- 4319 (DOE-tr--69) TESTING OF A GRAPHITE-BASED EXTINGUISHING POWDER FOR USE ON LIQUID METAL FIRES. Menzenauer, P.; Ochs, G.; Peppler, W. (Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Inst. fuer Neutronenphysik und Reaktortechnik). Nov 1977. Translation of KFK--2525 20p. Dep. NTIS (US Sales Only), PC A02/MF A01.

Work performed under United States--W. Germany Fast Reactor Exchange Program.

A graphite-based extinguishing powder, newly developed by a French firm (CECA S.A.--Le Carbone Lorraine) for use on liquid metal fires has been tested on a sodium fire in a pan with a surface area of 0.96 m² using 60 kg of sodium. The behavior and extinguishing power are reported and compared with those of other materials tested in earlier experiments. The new powder has excellent efficiency in dealing with sodium pool fires. Application is simple. The amount required is more than one order of magnitude less than that of currently available alternatives. The powder is not corrosive.

- PLANT. Doryokuro Giho; No. 24, 72-98 (Nov 1977). (In Japanese).

The design of the prototype fast breeder reactor "Monju" has been in progress since 1968. "Monju" is a 300 MWe, loop type plant with fuel of mixed oxides of plutonium and uranium. The core is divided into two zones with different plutonium enrichment, and composed of hexagon-shaped fuel subassemblies. The coolant temperatures at reactor inlet and outlet are 397 deg. C and 529 deg. C, respectively. The expected average fuel burn-up for some early stage of operational period is 55,000 MWd/t. Heat is removed from the reactor core and blanket by the primary sodium coolant, transferred to the secondary sodium coolant in three parallel intermediate heat exchangers, and finally transferred to water and steam in three once-through type steam generators composed of helical coil tubes, and generates superheated steam of 487 deg. C at 132 kg/cm² g which is used for a turbine. Decay heat removal is normally accomplished by means of three parallel auxiliary core cooling systems. The plant uses a top-supported reactor vessel of 7.1 meter in diameter and 17.8 meter in height, which is closed at the top with a shield plug. The reactor is equipped with 19 control rods, and B₄C is used as the neutron absorber. The fuel handling machine is a fixed arm type. The reactor containment consists of the primary and secondary boundaries to isolate the radioactivity released in a hypothetical accident. For the reactor building and the auxiliary service building, high reliability and integrity are required from seismic standpoint. The reactor building is located at the center of the single solid foundation which also supports the auxiliary service building surrounding the reactor building.

- 4321 BEHAVIOR OF ALLOY 800 IN SODIUM CONTAMINATED BY SODIUM HYDROXIDE. Cappelaere, M.; Dixmier, J.; Sannier, J.; Coriou, H. (CEA Centre d'Etudes Nucleaires de Fontenay-aux-Roses, 92 (France). Div. de Chimie). Mem. Sci. Rev. Metall.; 74: No. 11, 719-730 (Nov 1977). (In French).

From 16. Meeting on special steels; Belfort, France (11 - 13 May 1977).

The behavior of various metallic materials in NaOH-contaminated sodium was studied in the temperature range 475-550°C. It was observed that the presence of NaOH in sodium induced a generalized corrosion of ferritic steels while austenitic material were subjected to intergranular penetrations even without stress. In a second part, alloy 800 was specially investigated, since it was chosen as a standard material for Superphenix steam generators. Parametric tests were carried out under tensile stress to study susceptibility to cracking of this alloy. A device for introducing NaOH into sodium at the experiment temperature was specially designed. The results show that, for high concentration of NaOH (8 weight % and more), there is a real risk of stress cracking. So ruptures are observed in samples which show or not welded areas after 20 hours with 16% of NaOH under 130 N.mm⁻² stress. On the other hand, for low initial concentrations (about 1%) and with the same stress conditions, no cracking occurs after 100 hours. Finally surface condition of material has an effect on the formation of the oxidized surface layer but this parameter has no significant influence on the sample life-time.

- 4322 DEVICE FOR THERMAL INSULATION OF A VESSEL WALL. Lemerrier, G. (to Commissariat a l'Energie Atomique). US Patent 4,055,465. 25 Oct 1977. Priority

date 24 Jul 1975, France, 6p.

A thermal insulation structure mounted within the annular space between the primary vessel and the inner vessel of a liquid metal cooled fast reactor is constituted by a plurality of heat-insulating elements extending circumferentially around the common axis of the two vessels and consisting of half-casings each formed by two interengaged L-section members packed with flexible and compressible heat-insulating material.

- 4323 LIQUID METAL COOLED REACTOR AND PROCESS FOR PROTECTING THE CHANNELS AGAINST A BLOCKING. (to UKAEA London Office). French Patent 2,368,119/A/. 17 Oct 1977. Priority date 18 Oct 1976, United Kingdom of Great Britain and Northern Ireland (UK), 12p. (In French).

This invention concerns the nuclear fuel for liquid metal cooled nuclear reactors comprising a bundle of parallel nuclear fuel pins, very close together encased in an annular cladding. Under the invention, a liquid cooled nuclear reactor includes a core with a channel in which the coolant flows along subsidiary channels fitted between parallel fuel pins to extract the heat from them and a transducer sensitive to a medium temperature at the end of the channel outlet to monitor the correct cooling of the fluid. A certain number of heat transmission pipes open at the ends are distributed along the flow section of the channel to extract the heat from any localised area of the coolant flowing in the subsidiary channels, the resulting temperature rise of which is not communicated in any other manner to the transducer by the coolant flowing in the subsidiary channels in contact with the fuel pins. The above mentioned localised areas are those in which the coolant is locally detached from the main current flowing in the channel. The invention also concerns a process for monitoring a channel reserved for a liquid coolant in the above mentioned manner, as well as a nuclear, cooled by a liquid metal, fitted with the above mentioned device making it possible to detect the temperature prevailing in a coolant channel.

- 4324 LIQUID METAL COOLED NUCLEAR REACTORS. Barnes, S.; Fothergill, J.R. (to UKAEA). British Patent 1,488,478/A/. 12 Oct 1977. 6p.

Reference is made to liquid metal cooled nuclear reactors of the 'pool' type. In such reactors the core, the heat exchangers, and the coolant circulating pumps are submerged in a pool of liquid metal. In operation of the reactor it is necessary to be able to locate and identify components submerged in the pool, and before moving rotating shields in the roof of the pool-containing vault it is necessary to ensure that all the normally suspended absorber rods have been inserted in the core and released from their suspensions. Television cameras are unsuitable for use in the opaque liquid metal but ultrasound in the megahertz range has been used to give a television screen kind of display. There is some difficulty, however, in transmitting ultrasound signals from a transducer into the pool of coolant because the transducer must be protected from the high temperature environment of the coolant. This difficulty has been partially overcome, however, by transmitting the signals by way of a wave guide extending from the transducer into the coolant pool. Such a wave guide may comprise a column of liquid metal within a dip tube. The column of liquid coolant is uninterrupted by a supporting diaphragm. Such a system is here described.

- 4325 (DOE-tr--70) FR2-LOOP EXPERIMENTAL SERIES 5, IRRADIATION, POST-IRRADIATION EXAMINATION, AND ANALYSIS OF THE FCMI. Mueller-Lyda, I. (Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Inst. fuer Material- und Festkoerperforschung). 10 Oct 1977. Translation of KFK--2523 54p. Dep. NTIS (US Sales Only), PC A04/MF A01.

Work performed under United States--W. Germany Fast Reactor Exchange Program.

In the FR2-Loop experimental series 5, the plastic cladding tube diametral strain of UD_2 -- PuO_2 test rods was examined after alternating load operation. The pin design was different from the SNR-300 specification with respect to a strong FCMI (Fuel-Cladding Mechanical Interaction). The irradiation was carried out in a high number of single cycles (300 to 500 W/cm linear power, 1 to 600 h duration) with a subsequent diameter measurement. It turned out that within the attained burnup range (< 2%) no considerable diameter increases occurred, even with very rough cycling, except one case with a very special power and temperature history.

- 4326 METHOD AND APPARATUS FOR LOCATING A DEFECTIVE TUBE OF A LIQUID METAL-TO-WATER TUBE TYPE HEAT EXCHANGER. Schrock, S.L.; Mangus, J.D. (to Westinghouse Electric Corp.). US Patent 7963,003. 4 Oct 1977. Filed date 12 Apr 1976. 4p.

Disclosed is a method and apparatus for detecting a specific leaking tube or tubes and for detecting the position of a defect within a tube in a liquid metal-to-water tube type heat exchanger, generally used in a sodium cooled nuclear reactor. Subsequent to draining of the heat exchanger a solid reaction product of the liquid metal and water forms at a leak location. Introducing an inert gas to the exterior of the tubes, creating a pressure differential across the tube wherein the interior pressure is less than the exterior pressure, and heating the tube, provide dissociation and isolation of the reaction product, which, when analyzed for chemical content, indicates which tube or tubes is defective. A heat probe apparatus which traverses the interior of the tubes may be used in the heating step, which, as a result of the speed of the dissociation process at high temperatures provides a means for detecting the specific leak location within the tube. A heat apparatus which traverses the exterior of bayonet type tubes may be used in another embodiment.

- 4327 GENERALIZED PARAMETRIC MODEL FOR TRANSIENT GAS RELEASE AND SWELLING IN OXIDE FUELS. Gruber, E.E. (Argonne National Lab., IL). Nucl. Technol.; 35: No. 3, 617-634 (Oct 1977).

The need for a capability to predict transient fission gas behavior arises because of the complexity of fission gas response to transient conditions, the importance of fission gas to fuel mechanical response, and the prevalent limitations on experimental information relevant to the problem. A detailed mechanistic analysis of intragranular swelling and release of gas from grains to grain boundaries, both as they result from transient heating, has been developed and incorporated in a fission gas release and swelling code (FRAS). A generalized parametric model to approximate the results that would be obtained from the more detailed calculations has also been developed. The need for this model arises from the necessity to consider the fission gas effects in more general multinode accident-analysis and pin-mechanics codes. For such

calculations, the FRAS code is prohibitive in its demands on computer storage and execution time, while the parametric FRAS (PFRAS) code reduces these demands by an order of magnitude. Transient calculations have been carried out with both codes, both to illustrate the sensitivity of the results to the parameters and to indicate the level of confidence that can reasonably be ascribed to PFRAS results. The parameters considered include initial gas concentration, grain size, heating rate, thermal gradient, and pressure. The PFRAS model gives a satisfactory approximation to FRAS results for the broad range of parameters surveyed.

been introduced to provide greater flexibility. The details of a direct-coupled-ray (DCR) + P_0 conversion technique have been developed but not yet implemented. The DCR method, as implemented in the TRANS3 code, has been used in a number of liquid-metal fast breeder reactor shielding applications. These included a one-dimensional deep penetration configuration and one-, two-, and three dimensional representations of the lower axial shield of the Clinch River Breeder Reactor. Comparisons with ANISN and DOT-III solutions indicated good to excellent agreement in most situations.

- 4328 INTERACTIONS OF REFRACTORIES AND REACTOR MATERIALS WITH SODIUM. Fink, J.K.; Heiberger, J.J.; Kumar, R.; Blomquist, R.A. (Argonne National Lab., IL). Nucl. Technol.; 35: No. 3, 656-662(Oct 1977).

As part of a program at Argonne National Laboratory (ANL) to investigate the compatibility of high-temperature sodium with materials being considered for core retention systems in liquid-metal fast breeder reactors, various commercial refractories and samples of reactor control materials were exposed to static sodium at 850°C for 5 h. The refractories tested were samples of magnesia, alumina, zirconia, mixed ceramic oxides, and graphite; the reactor control materials were boron carbide and tantalum. Samples of graphite, zirconia, and the refractories with high alumina or magnesia contents, but with low silica and chromic oxide contents, were found to be compatible with high-temperature sodium. Sample compatibility with sodium decreased with an increase in the silica content of the sample. Samples with large silica content failed completely. These results are in good agreement with results of other experiments, performed at ANL and at the Westinghouse Advanced Reactors Division, in which these materials were exposed to boiling sodium.

- 4329 ELASTIC--PLASTIC ANALYSIS OF PRESSURIZED DUCTS WITH ROUNDED CORNERS. Petroski, H.J. (Argonne National Lab., IL). Nucl. Technol.; 35: No. 3, 671-676(Oct 1977).

The strength of a reactor subassembly duct depends on its cross section and its material properties. Straight- and curved-beam theories have been used to analyze ducts with elastic-perfectly-plastic material behavior, and this analysis has been found to be suitable and convenient for parametric studies. The strengths of hexagons with different corner radii have been compared, and the stiffening effect of increasing radius has been quantified. The relative strengths of different duct cross sections have also been determined.

- 4330 DIRECT-COUPLED-RAY METHOD FOR DESIGN-ORIENTED THREE-DIMENSIONAL TRANSPORT ANALYSIS. Bucholz, J.A. (Oak Ridge National Lab., TN); Poncellet, C.G. Nucl. Sci. Eng.; 64: No. 2, 356-372(Oct 1977).

A fast three-dimensional design-oriented transport method has been developed for the solution of both neutron and gamma transport problems. It combines a nodal approach with analytic integral transport to achieve relative speed and accuracy. An analytic solution is obtained for the angular flux in each of the 14 directions defined by the six faces and eight corners of a cubic mesh block. The scheme used to accommodate high-order anisotropic scattering is based on the formulation of ray-to-ray scattering probabilities in an integral sense. A variable mesh approximation has also

- 4331 OPTIMIZED ITERATION STRATEGIES AND DATA MANAGEMENT CONSIDERATIONS FOR FAST REACTOR FINITE DIFFERENCE DIFFUSION THEORY CODES. Ferguson, D.R.; Derstine, K.L. (Argonne National Lab., IL). Nucl. Sci. Eng.; 64: No. 2, 593-604(Oct 1977).

Optimized iteration methods for the solution of large-scale fast reactor finite difference diffusion theory calculations are presented, along with their theoretical basis. The computational and data management considerations that went into their formulation are discussed. The methods utilized include a variant of the Chebyshev acceleration technique applied to the outer fission source iterations and an optimized block successive overrelaxation method for the within-group iterations. The performance of a computer code employing these methods is compared with that of several existing production diffusion theory codes for a range of typical problems.

- 4332 (ANL-Trans--1106) AUTONOMOUS DEVICE FOR AFTER-HEAT REMOVAL FROM A SODIUM COOLED FAST NEUTRON REACTOR. Oct 1977. Translation of French Patent Application No. 7,335,223 11p. Dep. NTIS, PC A02/MF A01.

An autonomous device is described for removal of the after-heat in a sodium-cooled fast reactor of the type in which each cooling loop comprises the primary sodium circuit exchanging its heat with the sodium of a secondary circuit through an intermediate exchanger, characterized by the fact that each cooling loop in parallel with the secondary sodium circuit contains an auxiliary secondary circuit in which a chemically inert gas draws heat from the primary circuit, said auxiliary secondary circuit comprising at least one gas turbine fed by said inert gas and operating in an energy-generating closed cycle.

- 4333 PHYSICS OF LIQUID METAL FAST BREEDER REACTOR SAFETY. Wilson, R. (Department of Physics, Harvard University, Cambridge, Massachusetts 02138). Rev. Mod. Phys.; 49: No. 4, 893-924(Oct 1977).

The main physical features of LMFBR safety are summarized with particular reference to the maximum possible mechanical energy release in a hypothetical core disruption accident. It is likely that such a postulated fuel melting accident would lead to a nonenergetic disassembly of the core. With pessimistic estimates of reactivity increases, but not derived from any mechanistic point of view, mechanical energy impacts on the reactor vessel of 100 MJ have been calculated for the Clinch River Breeder Reactor. These are containable with the present design, and the increase should vary only linearly with increased power for future designs of similar concept. Various possible steps are discussed to increase the certainty of these conclusions.

- 4334 MATHEMATICAL AND COMPUTATIONAL TECHNIQUES EMPLOYED IN THE DETERMINISTIC APPROACH TO LIQUID-METAL FAST BREEDER REACTOR SAFETY. Walter, A.E. (Univ. of Virginia, Charlottesville); Padilla, A. Jr. Nucl. Sci. Eng.; 64: No. 2, 418-451 (Oct 1977).

The paper reviews major computer code packages presently utilized or under active development in the U.S. for deterministic liquid-metal fast breeder reactor safety analysis. Although the review covers the very large accident domain from intact predisassembly geometry through radiological consequences, an attempt was made to categorize code systems according to the physical problems solved to provide a working orientation for those not intimately involved in the field. Mathematical and computational aspects were given particular focus in the hope of stimulating development of more efficient numerical approaches in those areas of greatest need.

- 4335 PROBABILISTIC FAST REACTOR ACCIDENT ANALYSIS. Ott, K.O. (Purdue Univ., West Lafayette, IN). Nucl. Sci. Eng.; 64: No. 2, 452-464 (Oct 1977).

An approach for the description and evaluation of the uncertainties in the predicted consequences of fast breeder reactor accidents is outlined. All uncertainties are viewed as uncertainties of parameters, either of physical parameters or of quantities that appear in the parameterization of phenomenological models. By the incorporation of parameter uncertainties in the simulation of the accident progression, single accident-path scenarios assume the character of "accident spectra." The progression of accident spectra is found by combining deterministically calculated accident-path results with the probability of the respective set of input parameters. The substantial method development needed for the implementation of the approach is discussed, and the status of the development is briefly reviewed. Typical results are presented for illustration purposes. The possible eventual significance of the approach is indicated.

- 4336 NUMERICAL MODEL OF REACTOR FUEL AND COOLANT MOTIONS FOLLOWING PIN FAILURE. Pizzica, P.A.; Abramson, P.B. (Argonne National Lab., IL). Nucl. Sci. Eng.; 64: No. 2, 465-479 (Oct 1977).

From Proceedings of the international meeting on fast reactor safety and related physics; Chicago, IL, USA (Oct 1976).

The computer code EPIC models fuel and coolant motion that results from internal fuel pin pressure (from fission gas or fuel vapor) and/or from the generation of sodium vapor pressures in the coolant channel subsequent to pin failure in a liquid-metal fast breeder reactor. The modeling includes the ejection of molten fuel from the pin into a coolant channel with any amount of voiding through a clad rip which may be of any length or which may expand with time. One-dimensional Eulerian hydrodynamics is used to model both the motion of fuel and fission gas inside a molten fuel cavity and the mixture of two-phase sodium and fission gas in the channel. Motion of molten fuel particles in the coolant channel is tracked with a particle-in-cell technique.

- 4337 SIMULATION OF TRANSIENTS IN LIQUID-METAL FAST BREEDER REACTOR SYSTEMS. Agrawal, A.K.; Guppy, J.G.; Madni, I.K.; Quan, V.; Weaver, W.L. III; Yang, J.W. (Brookhaven National Lab., Upton, NY). Nucl. Sci. Eng.; 64: No.

2, 480-491 (Oct 1977).

The transient simulation of a liquid-metal fast breeder reactor (LMFBR) plant requires (a) modeling of all processes that may be encountered and (b) the development of numerical methods to solve them. All models needed for the thermohydraulic simulation of the whole plant are formulated. Numerical techniques required to solve the governing equations, which are hyperbolic and parabolic partial-differential equations and ordinary differential equations, are examined. It appears that the implicit (or partially implicit) scheme is most suitable to meet both the stability and accuracy requirements. A new approach, labeled as the multistep scheme, to efficiently solve the entire system is then presented and illustrated through an example. For a simplified test problem, the multistep scheme has been found to be more efficient (by a factor of 2 to 3) than the commonly used single-step methods. This effort has resulted in the creation of a system transient simulation code, called SSC, for LMFBRs.

- 4338 (ANL-Trans--1108) DEVICE FOR COOLING THE UPPER PART OF THE VESSEL OF A LIQUID SODIUM COOLED REACTOR. Gama, J.M.; Lallement, J.; Pugnot, L. Oct 1977. Translation of French Patent application No. 7,337,232 13p. Dep. NTIS, PC A02/MF A01.

The invention deals with a device for cooling the main vessel of a nuclear reactor in which the primary cooling circuit is located completely within the main reactor vessel.

- 4339 (ANL-Trans--1109) DEVICE FOR CONNECTING TWO TUBULAR DUCTS MOUNTED END-TO-END. Bentz, A.; Deplierre, Y.; Venobre, H. Oct 1977. Translation of French Patent application No. 7,331,539 12p. Dep. NTIS, PC A02/MF A01.

The invention concerns a device for connecting two tubular ducts, particularly two pipelines traversed by a liquid under pressure, this device allowing a relative displacement of these ducts in any direction, either along the direction of their common axis or in a plane perpendicular to this direction, or in any direction combining one and the other of these two displacements, while assuring free flow of the liquid from one duct to the other. The invention applies particularly, although not exclusively, when the ducts consist of pipelines installed in the interior of a sodium-cooled fast nuclear reactor, the device assuring connection of the outlet diffuser duct of a primary pump forming the sodium circulation in the tank through the core and heat exchangers, and of a large-diameter pipeline conducting the sodium thus delivered by the pump under the core support slab.

- 4340 US BREEDER REACTOR PROGRAMME. Beckjord, E.S. (Energy Research and Development Administration, Washington, D.C. (USA). Div. of Reactor Development and Demonstration). J. Br. Nucl. Energy Soc.; 16: No. 4, 323-326 (Oct 1977).

Lecture given at the joint meeting of the Risley Nuclear Engineering Society.

Changes in the US breeder reactor programme, as a result of recent nuclear power policy guidelines, are discussed. The activities and recommendations of the Steering Committee established by ERDA for its review of LMFBRs and the Clinch River Breeder Reactor, in particular, are described. Based on majority and minority reports of its members, the summary report of the Committee provided input for the National Energy Plan announced to

Congress in April 1977. Many of the plans new proposals are based on concern over proliferation and especially plutonium-based fuel cycles. The effect of the proposed policies both on LWRs and on the LMFBR programme are examined. Finally an outline is given of the objectives and probable future activities relating to fast breeder reactors in the U.S.A.

- 4341 **STRESS EFFECT ON THE VOID SWELLING INCUBATION PERIOD.** Weiner, R.A.; Boltax, A. (Westinghouse Electric Corp., Madison, Pa. (USA). Advanced Reactors Div.). J. Nucl. Mater.; 68: No. 2, 141-147 (Oct 1977).

The dose dependence of the swelling of solution-annealed Type 316 stainless steel irradiated as fuel pin cladding is compared with the behavior of irradiated stress-free samples. It is found that the onset of steady-state swelling occurs at a considerably lower fluence level for fuel pin cladding and a stress effect on the swelling incubation period is postulated to explain this result. A constitutive equation for this stress effect is formulated and a technique for using this constitutive equation with time-dependent stress histories is described. The stress effect on the incubation period is used in the calculation of the axial swelling profile of a fuel pin with 20% cold-worked Type 316 stainless steel cladding and good agreement with the measured swelling profile is obtained.

- 4342 **SODIUM TEST RIGS FOR BRITAIN'S COMMERCIAL REACTOR.** Masters, R. Nucl. Eng. Int.; 22: No. 263, 33-34 (Oct 1977).

Two new sodium rigs which are undergoing dry commissioning at Nuclear Power Development Laboratories, Risley, are described. The high temperature sodium loop and the sodium components test rig are designed for testing, in sodium, large scale models and components for use in the Commercial Fast Reactor. Workshop and control facilities are also described.

- 4343 **EQUIPMENT FOR THE NONDESTRUCTIVE TESTING OF 2-1/4 CR-1 MO DUPLEX LMFBR STEAM GENERATOR TUBING.** Longua, K.J.; Whitham, G.K.; McElroy, J.T. (Argonne Natl Lab, Idaho Falls). Mater. Eval.; 35: No. 10, 54-59 (Oct 1977).

The development of a nondestructive testing method was required for examination of the duplex tubing in the evaporator of the steam generator in the Experimental Breeder Reactor No. II (EBR-II). Ultrasonic testing was the only viable means of testing the steam generator tubing because the tubing material (2 1/4% Cr, 1 Mo) is a ferritic steel. The equipment designed to perform this inspection consisted of an ultrasonic inspection probe, a drive unit to rotate and move the probe, and a standard that contained electrical-discharged-machined (EDM) notches to be used to estimate flaw depth. The equipment is capable of inspecting either single wall or bonded duplex tubing with relative ease and reasonably fast. 1 ref.

- 4344 **WHAT WILL THE FAST BREEDER BRING US. AS AN IMPORTANT INTERLUDE, NUCLEAR POWER UTILIZATION MAY BE PROLONGED BY FAST BREEDERS: BUT IT MAY ALSO END AS A CATASTROPHE.** Urban, M. Sulzer Tech. Rev.; No. 226, 8 (Oct 1977). (In German).

This newspaper article gives a survey of the problems in connection with the fast breeder which are now under public discussion.

- 4345 **DECISION ON 'FAST BREEDER' PASSED ON TO FEDERAL CONSTITUTIONAL COURT.** Buedenbender, U. Energiewirtsch. Tagesfragen; 27: No. 10, 705-712 (Oct 1977). (In German).

The decision of the Higher Administrative Court at Muenster dated 18th August 1977 - VII A 338/74 - has been passed on to those concerned. The wording is as follows: 'The proceedings are suspended. A decision by the Federal Constitutional Court will be obtained as to whether section 7 of the Act on the peaceful uses of nuclear energy and the protection against its hazards of December 23rd, 1959, BGBI I 814, in the version of the publication of October 31st, 1976, BGBI I 3053, as far as it enables the licensing of nuclear power plants of the fast breeder type, is within the Basic Law.' The main grounds upon which the decision is based with comments are given.

- 4346 **FAST REACTOR INSTRUMENTATION DEVELOPMENT IS AIMED AT A COMMERCIAL PLANT.** Hughes, G.; Hayes, D.J.; Hobdell, M.R. (Central Electricity Generating Board, Berkeley (UK). Berkeley Nuclear Labs.). Nucl. Eng. Int.; 22: No. 263, 45-50 (Oct 1977).

Problems and present work relating to the provision of suitable instrumentation for commercial fast reactors are reviewed. The areas involved are: safety instrumentation, which includes development for improving the sensitivity and speed of response of sensors for measurement of temperature, flow, and pressure, and detection for boilers and for sodium systems; meters for monitoring impurities in sodium and in cover gas regions; and finally monitoring and inspection of reactor components.

- 4347 **REVIEW OF THE POTENTIAL USE OF NUCLEAR REACTORS FOR HYDROGEN PRODUCTION.** Worley, N.G. (Babcock and Wilcox (Ops) Ltd, London, Engl.). Gas Eng. Manage.; 17: No. 10, 371-383 (Oct 1977).

Except for marine propulsion, nuclear power, up to now, has only been used for electricity generation. The paper reviews the types of nuclear reactors available, the characteristics of the electricity industry and the way that nuclear power could supplement the supplies of gas when these become less abundant early in the twenty-first century. The route using high temperature reactors appears basically less attractive than electrolysis particularly when the increasing need for nuclear reactors which can 'breed' new fuel is taken into consideration. Some general comments on electrolysis plant are made together with some indications of the type of problem involved in their integration into the electricity/gas structure. 8 refs.

- 4348 **CHARACTERISTICS OF THE COMBINED OPERATION OF THERMAL AND FAST POWER REACTORS.** Litkin, V.B.; Kagramanyan, V.S. J. Br. Nucl. Energy Soc.; 16: No. 4, 335-339 (Oct 1977).

From Operating experience with nuclear power stations and routes of future development of atomic power conference; Obninsk, USSR (25 - 27 Jun 1974).

Thermal reactors have several deficiencies, in particular, their low efficiency in the use of national uranium resources. The advantages of joint use of thermal and fast reactors in a nuclear power system are indicated. Current fast reactors assessments however, show higher specific capital costs than for thermal reactors. To determine the combination of both types for which the economic effect is a

maximum, optimization calculations are necessary including optimization of reactor characteristics. Some of the problems involved are examined. Analysis of the results shows that in the period of mass introduction of fast reactors, thermal reactors of high plutonium production are required in the early stages and that the significance of expenditure on the initial fuel inventory in the cycle increases sharply in comparison with that for established fast reactors.

- 4349 NUCLEAR FUEL CYCLE. PT. 4. THE REACTORS. Farmer, A.A. (UKAEA Reactor Group, Risley). Arch. Energiewirtschaft.; 31: No. 10, 843-858(Oct 1977). (In German).

The basic concepts of the reactor types now in commercial operation or to be realized before 1990 are described in the form of a survey. In the framework of a description of special features and differences, the typical parameters of the reactors are listed for comparison.

- 4350 PERFORMANCE OF AN ELECTROMAGNETIC TEMPERATURE SENSOR IN LIQUID SODIUM. Farrington, B.J.; Hughes, G. (Central Electricity Generating Board, Berkeley (UK). Berkeley Nuclear Labs.). J. Br. Nucl. Energy Soc.; 16: No. 4, 347-352(Oct 1977).

An electromagnetic temperature sensor has been evaluated in flowing sodium. Temperature fluctuations, produced by the injection of a hot stream of sodium into the main sodium flow, have been measured with the sensor and compared with the indications of a small-diameter thermocouple. These comparisons show that a directly immersed sensor is capable of detecting 0.1 degC root-mean-square temperature oscillations with a 20 db signal-to-noise ratio, and enable the temperature sensitivity of the sensor to be determined. The sensor has also been operated from within a stainless steel pocket at reduced sensitivity (approximately 40% of the directly immersed value). In this operational mode the measured sensitivity agrees closely with that predicted by a developed theoretical analysis technique.

- 4351 SAFETY AND RELIABILITY: ANALYSES OF A BREEDER REACTOR. Fussell, J.B.; Cate, C.L.; Wagner, D.P. (Univ. of Tennessee, Knoxville). Simulation; 29: No. 4, 121-124(Oct 1977).

A University of Tennessee independent study of the safety and reliability of the Clinch River Breeder Reactor Plant in Oak Ridge, Tennessee is described. The study uses several kinds of models, and analytical computer programs, one of which (BACFIRE) is briefly described and illustrated.

- 4352 INVESTIGATION OF MEASURING ACCURACY OF PLUGGING INDICATORS. Yamamoto, H.; Murase, M.; Izumi, S.; Sagawa, N. (Hitachi Ltd, At Energy Res Lab, Ozenji, Kawasaki-shi, Jpn). J. Nucl. Sci. Technol. (Tokyo); 14: No. 10, 689-694(Oct 1977).

In order to improve the measuring accuracy of plugging indicators, the effects of operating conditions such as the sodium flow rate and the cooling air flow rate on the measuring error are analyzed. By this investigation, the measuring error can be evaluated as a function of the Reynolds and Stanton numbers, and suitable conditions which minimize the measuring error are obtained. 6 refs.

- 4353 SWORD OF DAMOCLES, OR: THE FAST BREEDER

IN KALKAR AND THE HIGHER ADMINISTRATIVE COURT AT MUENSTER. Dreistern. Energie; 29: No. 10, 307-309(Oct 1977). (In German).

A decision of the OVG Muenster of August 18th, 1977 has made the headlines. The judges of Muenster have put the question to the Federal Administrative Court, whether section 7 of the Atomic Energy Act is in agreement with the constitution as far as the licensing of fast breeders is concerned. A technician comments on the explanations of the OVG judges in a press conference as regards their decision.

- 4354 STRAIN RATE EFFECTS ON THE ELEVATED-TEMPERATURE TENSILE BEHAVIOR OF A BAINITIC 2 1/4 CR-1 MO STEEL. Klueh, R.L. (Oak Ridge National Lab., TN); Oakes, R.E. Jr. J. Eng. Mater. Technol.; 99: No. 4, 350-358(Oct 1977).

The tensile properties of a normalized-and-tempered 2-1/4 Cr-1 Mo steel were determined from 25 to 566°C and the strain rate 2.67 x 10⁻⁴ to 144/s. The specimens were taken from a 1-in. thick plate and had a microstructure that was essentially 100 percent bainite. Except at 25 and 566°C, the 0.2 percent yield stress was little affected by strain rate; at 25 and 566°C, the yield stress increased with increasing strain rate. At a constant strain rate, the yield stress decreased with increasing temperature. The effect of strain rate and temperature on the ultimate tensile strength was more complicated. A strength peak that resulted from dynamic strain aging was observed in the ultimate tensile strength-temperature relationship. The position of these peaks moved to higher temperatures with increasing strain rate. Total elongation and reduction of area were relatively constant over the range of test variables, except at 566°C, where they increased with decreasing strain rate. However, uniform elongation decreased with decreasing strain rate at 510 and 566°C, dropping to 1 and 0.6 percent, respectively.

- 4355 REPRESENTATION OF ELEVATED-TEMPERATURE TENSILE BEHAVIOR OF TYPE 304 STAINLESS STEEL IN A SODIUM ENVIRONMENT. Chopra, O.K.; Natesan, K. (Argonne National Lab., IL). J. Eng. Mater. Technol.; 99: No. 4, 366-371(Oct 1977).

An analysis of tensile behavior of Type 304 stainless steel was conducted for specimens in the solution-annealed condition and after exposure to a sodium environment. The Voce equation was used to describe tensile flow curves for plastic strains above 0.005 at temperatures between 550 and 700°C and strain rates of 3.81 x 10⁻⁶ to 1.90 x 10⁻³ s⁻¹. The results show that, when compared with solution-annealed specimens, the tensile flow behavior of the sodium-exposed specimens is characterized by a higher strain-hardening rate, which decreases rapidly with an increase in flow stress. The values of the saturation stress for uniform elongation predicted from the Voce model are higher for the sodium-exposed specimens than for those in the solution-annealed condition at strain rates < or approximately 5 x 10⁻⁵ s⁻¹ and lower for strain rates > or approximately 5 x 10⁻⁵ s⁻¹. Metallographic examination of the fracture surfaces shows a transition from a complete ductile fracture to a partial intergranular failure as the strain rate decreases. Carburization of the specimens appears to inhibit the intergranular failure.

- 4358 STUDIES OF THERMAL-HYDRODYNAMIC FLOW INSTABILITY, 2. EFFECTS OF HEATING CONDITION OF THERMAL-HYDRODYNAMIC FLOW INSTABILITY. Suzuki, A. (Osaka Univ. (Japan)). Bull. JSME (Jpn. Soc. Mech. Eng.); 20: No. 148, 1291-1298(Oct 1977).
For reliable prediction of flow stability in sodium-heated steam generators, a dynamic model was proposed for boiling flow oscillation in parallel channel systems, and an analysis code was developed. The model contains a description of a sodium flow exchanging heat with a water flow in counter-current fashion. The code was applied to three representative flow systems whose heating conditions differed from each other, whereby their flow stabilities were compared with a focus on the effects of heating condition. Eigenvalues and flow impedances of the oscillation determined for each system reveal that: (1) Two fundamental systems for the steam generator, parallel tube system in an evaporator and steam generator modules arranged in parallel, have different stabilities under low frequency oscillation. (2) Existing analysis model conditioned on constant heat flux gives different results on stability from those of either steam generator model under low frequency oscillation.
- 4359 THEORETICAL MODEL OF AN EDDY-CURRENT FLOWSENSOR. Hirayama, M. (Toshiba Res and Dev Cent, Ukishimacho, Kanagawa, Jpn). IEEE Trans. Nucl. Sci.; NS-24: No. 5, 2021-2030(Oct 1977).
A theoretical model of an eddy-current flowsensor has been derived to determine its optimum design for sensitivity. The validity of the model has been confirmed by experiments using a moving aluminum cylinder as a fluid. 8 refs.
- 4360 ACCIDENT ALARM IN STEAM GENERATORS OF SODIUM COOLED FAST REACTOR POWER PLANTS. I. TESTING THE FUNCTION OF AN ION PUMP PH-METER ON SIMULATED WATER PENETRATION IN LIQUID SODIUM. Pitak, O. (Chemoprojekt, Prague (Czechoslovakia)); Fresl, M. (Statni Vyzkumny Ustav Ochrany Materialu G.V. Akimova, Prague (Czechoslovakia)); Matal, O.; Martoch, J. (Vyzkumny Ustav Zavodu Energetického Strojirenstvi, Brno-Slatina (Czechoslovakia)). Jad. Energ.; 23: No. 10, 369-372(Oct 1977). (In Czech).
An experimental loop was used for modelling water penetration into liquid sodium. The experiment aimed at testing the suitability of a pH-meter using the principle of hydrogen diffusion in sodium. Sodium was pumped by an ion pump. Hydrogen concentration in sodium was considerably high; sodium was hydrogen-saturated. It was shown that water penetration could also be measured at high hydrogen concentration albeit with reduced sensitivity. The maximum pH-meter sensitivity under the given conditions corresponded to 5% change in the initial concentration. The response rate of the pH-meter with a probe having a membrane wall thickness of 2 mm and effective area of 130 cm² ranged between 30 and 45 s.
- 4361 PROCESS AND DEVICE FOR THERMAL ENERGY PRODUCTION. Mangus, J.D. (to Westinghouse Electric Corp., Pittsburgh, PA (USA)). French Patent 2,366,444/A/. 29 Sep 1977. Priority date 30 Sep 1976, United States of America (USA), 15p. (In French).
The main aim of the invention is to create a heating cycle arrangement, for the energy production facilities as from liquid metal cooled nuclear reactors, that will stand up to the temperature changes of the heated steam at least as from the high pressure turbine. This arrangement includes a first system in which flows a liquid metal coolant between a heat source, a steam generator and a utilisation system on which flows a vaporisable fluid from this generator, passing through a first turbine, a heater, at least a second turbine and a condenser. The steam heated in the heater is heated by the liquid metal coolant. A preheater is located in the heated steam system upstream of the heater. This preheater is connected so as to heat the steam to a preset, practically constant value, before this steam to be heated enters the heater heated by the liquid metal. This arrangement reduces the thermal transitions in the superheater and the heater during load changes. In a preferential design mode, the steam from the steam generator is sent to a moisture extraction drum and the heater is exposed to the steam in this drum.
- 4362 HEAT-INSULATED DEVICE, FOR INSULATING THE TOP PART OF THE ANNULAR SPACE BETWEEN THE MAIN VESSEL AND THE SAFETY VESSEL OF A FAST-NEUTRON REACTOR. Lemerrier, G. (to Commissariat a l'Energie Atomique). US Patent 4,050,988. 27 Sep 1977. Priority date 30 Aug 1974, France, 4p.
The invention relates to a device for heat-insulating the top part of the annular space separating the main vessel from the safety vessel from a fast-neutron nuclear reactor, the two vessels having a common vertical axis and being open at their top part and covered by a horizontal slab in which the ends are fitted so as to be suspended by the slab. According to the invention a substantially cylindrical heat-insulating ring is mounted under the slab and cooperates with the slab and with the facing walls of the vessel to bound the region to be insulated. The ring extends through the annular space in a horizontal plane and is carried by the slab by means of tie-rods, and a top insulating ring divided into two coaxial elements rests on the bottom ring and is secured to the walls of the two vessels respectively by an assembly of spacing springs disposed radially and bearing against the two elements. 8 claims, 3 figures.
- 4363 NUCLEAR REACTOR. Yant, H.W.; Stinebiser, K.W.; Anzur, G.C. (to Westinghouse Electric Corp.). US Patent 4,050,985. 27 Sep 1977. Filed date 13 Sep 1974. 16p.
Disclosed is a liquid-metal breeder reactor whose upper internals include outlet modules for channeling the liquid-metal coolant from selected areas of the outlet of the core vertically to the outlet plenum. The modules are composed of a highly-refractory, high corrosion-resistant alloy, for example, INCO-NEL-718. Each module is disposed to confine and channel generally vertically the coolant emitted from a subplurality of core-component assemblies. Each module has a grid with openings, each opening disposed to receive the

coolant from an assembly of the subplurality. The grid in addition serves as a holdown for the assemblies of the corresponding subplurality preventing their excessive ejection upwardly from the core. In the region directly over the core the outlet modules are of such peripheral form that they nest forming a continuum over the core-component assemblies whose outlet coolant they confine. Each subassembly includes a chimney which confines the coolant emitted by its corresponding subassemblies to generally vertical flow between the outlet of the core and the outlet plenum. Each subplurality of assemblies whose emitted coolant is confined by an outlet module includes assemblies which emit lower-temperature coolant, for example, a control-rod assembly, or fertile assemblies, and assemblies which emit coolant of substantially higher temperature, for example, fuel-rod assemblies. The coolants of different temperatures are mixed in the chimneys reducing the effect of stripping (hot-cold temperature fluctuations) on the remainder of the upper internals which are composed typically of AISI-304 or AISI-316 stainless steel. 7 claims, 28 figures.

- 4364 ROTATING PLUG BEARING AND SEAL. Wade, E.E. (to Westinghouse Electric Corp.). US Patent 4,050,987. 27 Sep 1977. Filed date 30 Dec 1974. 6p.

Disclosed is a bearing and seal structure for nuclear reactors utilizing rotating plugs above the nuclear reactor vessel. The structure permits lubrication of bearings and seals of the rotating plugs without risk of the lubricant draining into the reactor vessel below. The structure permits lubrication by utilizing a rotating outer race bearing. 19 claims, 3 figures.

- 4365 (BNWL-tr--265) RESULTS ON AN IRRADIATION EXPERIMENT ON ABSORBER MATERIALS FOR FAST SODIUM-COOLED REACTORS. Hoerle, M.; Enderlein, H.; Pejisa, R.; Duennen, P. (Battelle Pacific Northwest Labs., Richland, WA (USA)). 20 Sep 1977. Translation of AED-Conf--1976-013-195 (CONF-760359--6). 8p. Dep. NTIS, PC A02/MF A01.

From Reactor meeting; Duesseldorf, F.R. Germany (30 Mar 1976).

Some results concerning helium release, dimensional stability, swelling, density change, and cladding compatibility of irradiated LMFBR absorber materials are presented. The materials included B_4C , Eu_2O_3 , and EuB_6 .

- 4366 STRUCTURAL DESIGN OPTIMIZATION OF ONCE-THROUGH TYPE HEAT EXCHANGERS. Chiang, C.C. (Combust Eng, Inc, Windsor, Conn). Am. Soc. Mech. Eng., [Pap.]; No. 77-JPGC-NE-3, vp(18 Sep 1977).

This paper provides a general solution for the structural design of once-through type heat exchangers. From this solution, detailed equations are developed for optimizing the design of once-through units. In the analysis, use of the functions of the stiffness of the shell expansion joint and the size factor of the unperforated annular ring of the tube sheet greatly increases the design flexibility and provides a more direct solution for the structural design of once-through type heat exchangers. Two sample units, one a fixed-shell model and the other a floating-shell model, are analyzed to demonstrate that by using the proposed method an optimum design can be achieved. 4 refs.

- 4367 PROGRAM TO ESTABLISH LMFBR COMMERCIALIZATION. Richards, R.B.; Palmer, R.S. (GE, Sunnyvale, Calif). Am. Soc. Mech. Eng., [Pap.]; No. 77-JPGC-NE-23, vp(18 Sep 1977).

Some of the lessons of LWR commercialization are identified and examined; from these, a unique program for the commercialization of the LMFBR is proposed and a schedule for its accomplishment is presented and discussed. The proposed program features a standardized plant design reducing development effort while promoting reliable operation, high plant availability, and a standard licensing procedure. The result of this program would be increased utility confidence in the LMFBR, and greater public acceptance of this important energy source.

- 4368 CORROSION TESTING UNDER DEPARTURE FROM NUCLEATE BOILING CONDITIONS MODELING THE CLINCH RIVER BREEDER REACTOR PLANT STEAM GENERATOR. Rodgers, D.N.; Dutina, D.; Rush, D.J.; Stephens, P.B.; Valente, C.G. (GE, San Jose, Calif). Am. Soc. Mech. Eng., [Pap.]; No. 77-JPGC-NE-8, vp(18 Sep 1977).

Evaporators of a CRBR plant experience departure from nucleate boiling in the tubes under normal power conditions. Potential damage mechanisms associated with DNB include thermal strain cycling which may lead to exfoliation of the protective oxide layer on the steam side of the evaporator tube and water impurity concentration at DNB which may lead to increased local corrosion. After 2820 hr of testing under expected "worst case" thermal and water chemistry conditions in a sodium-heated single-tube model evaporator, non-destructive examination shows that the postulated accelerated corrosion resulting from these mechanisms has not occurred. The test loop, test model, and test operation designed to simulate the thermal hydraulic and water chemistry conditions expected for the plant evaporators and establish nucleate boiling and DNB regimes in the test model are described. 5 refs.

- 4369 EXPERIMENTAL EVALUATION OF DUPLEX TUBE HEAT TRANSFER CHARACTERISTICS SIMULATING STEAM GENERATOR EXTERNAL HEATING. Efferding, L.E.; Hwang, J.Y. (Westinghouse Electr Corp, Tampa, Fla). Am. Soc. Mech. Eng., [Pap.]; No. 77-JPGC-NE-9, vp(18 Sep 1977).

An experimental heat transfer evaluation of archived EBR-II 2-1/4Cr-1Mo steam generator double-wall (duplex) tubes in both the as-fabricated prestressed and annealed conditions has been completed which has resulted in the determination of thermal performance of the interface clearance behavior under heating conditions simulating that of a sodium-heated steam generator. The conclusions drawn from the EBR-II tube evaluation contribute to the establishment of design criteria and analyses techniques for duplex tubes in a steam generator application. Tests performed on various sample tubes reflected annealed and prestressed conditions with clean, oxygen, and moisture-contaminated interfaces and various initial interface clearances. Unique testing techniques and data analysis evaluation methods were devised which results in a direct resolution of the interface thermal resistance behavior. 13 refs.

- 4370 INVESTIGATIONS INTO THE SODIUM-STEAM SURFACE INTERACTION ON A STAGNANT POOL. Stehling, S.G.; Hunsicker, J.C. (GE, Sunnyvale, Calif). Am. Soc. Mech. Eng., [Pap.]; No. 77-JPGC-NE-11, vp(18 Sep 1977).

Experimental investigations into the interface reaction between a steam atmosphere and a stagnant sodium pool have been conducted at the General Electric San Jose Test Facility. The objectives of the tests were to create worst case accident situations and evaluate the consequences with respect to the design of sodium heated steam generators. The most important results of these investigations were the creation and actual photographing of a "pool fire" and the determination that damage mechanism associated with it is of a corrosive nature rather than thermal weakening as previously suspected. 1 ref.

- 4371 OPERATING EXPERIENCE AND SODIUM-WATER REACTION TESTING IN THE LARGE LEAK TEST RIG. DeBear, W.S.; Neely, H.H. (Liq Met Eng Cent, Canoga Park, Calif). Am. Soc. Mech. Eng., [Pap.]; No. 77-JPGC-NE-6, vp(18 Sep 1977).

The Large Leak Test Rig (LLTR) and its role in providing information on the consequences of large sodium-water reactions in sodium-heated steam generators is described. Facility startup problems and subsequent operating experiences are discussed. Instrumentation and data acquisition methods are identified and typical data from initial tests using the 30-MWt Modular Steam Generator (hockey-stick steam generator) as a test article are presented. Information also is included on post-test inspection methods, equipment, and results. 4 refs.

- 4372 DEVELOPMENT TESTING OF LEAK INJECTION DEVICES FOR USE IN TESTING SODIUM-WATER LEAK DETECTION MODULES. Stehling, S.G.; Hunsicker, J.C.; Sperberg, R.T. (GE, Sunnyvale, Calif). Am. Soc. Mech. Eng., [Pap.]; No. 77-JPGC-NE-7, vp(18 Sep 1977).

A leak detection device has been designed and tested. Small quantities of water or hydrogen are injected into a steam generator in order to test the sensitivity and calibration of the leak detectors. The outstanding feature of this device is that it may be mounted inside the tube bundle of a steam generator, because water injections made with the device produce negligible wastage of the tubes. This report describes the tests utilized to verify the design of leak injectors to be installed in the Few Tube Test Model, located in General Electric's Steam Test Rig, San Jose, California. The most significant result of this program was that it was demonstrated that a safe, dependable design for a Leak Injection Device has been achieved. 3 refs.

- 4373 FAST NUCLEAR REACTOR. Kovin, V.M.; Mitenkov, F.M.; Ovechkin, A.V. US Patent 4,048,011. 13 Sep 1977. Filed date 13 Sep 1974. 6p.

The proposed fast nuclear reactor comprises a vessel, a liquid metal coolant filling said vessel, the side wall of which is cylindrical in shape and has its axis disposed in a horizontal plane. The vessel accommodates a core and heat exchangers with said liquid-metal coolant being passed therethrough by means of forced circulation thereof. The space above the coolant level is occupied by an inert gaseous medium, with the coolant contacting said medium in pipe branches penetrating the side wall of the vessel. 5 claims, 4 figures.

- 4374 WALL PENETRATION OF A PIPE OPERATED AT HIGH TEMPERATURES, ESPECIALLY LINER PENETRATION. Kappauf, H. (to Internationale Atomreaktorbau G.m.b.H. (INTERATOM), Bergisch Gladbach (Germany, F.R.)). German (FRG) Patent

2,609,088/A/. 8 Sep 1977. 9p. (In German).

In order to counter the difficulties occurring due to thermal stresses when a pipe in which a hot medium (e.g. sodium at 500° C) is flowing is lead through a wall it is proposed to introduce a spring element between wall and pipe. This spring element absorbs the positional changes and prevents the build-up of high stresses. Details of the design are described.

- 4375 EDDY CURRENT POSITION INDICATING APPARATUS FOR MEASURING DISPLACEMENTS OF CORE COMPONENTS OF A LIQUID METAL NUCLEAR REACTOR. Day, C.K.; Stringer, J.L. (to Westinghouse Electric Corp.). US Patent 4,047,103. 6 Sep 1977. Filed date 4 Feb 1975. 6p.

Apparatus for measuring displacements of core components of a liquid metal fast breeder reactor by means of an eddy current probe is described. The active portion of the probe is located within a dry thimble which is supported on a stationary portion of the reactor core support structure. Split rings of metal, having a resistivity significantly different than sodium, are fixedly mounted on the core component to be monitored. The split rings are slidably positioned around, concentric with the probe and symmetrically situated along the axis of the probe so that motion of the ring along the axis of the probe produces a proportional change in the probe's electrical output. 11 claims, 3 figures.

- 4376 NUCLEAR REACTORS. Durston, J.G.; Hind, J.R. (to United Kingdom Atomic Energy Authority). US Patent 4,046,629. 6 Sep 1977. Priority date 7 Jul 1975, United Kingdom of Great Britain and Northern Ireland (UK), 4p.

Thermal insulation for a core tank of a fast breeder nuclear reactor comprises a plurality of spaced membranes defining a series of concentric chambers lining the tank. Liquid metal is pumped from the cooler regions of a pool of coolant into the first chamber from which it flows successively through the remaining chambers towards the reactor core. 2 claims, 3 figures.

- 4377 PIPE SUPPORT FOR USE IN A NUCLEAR SYSTEM. Pollono, L.P.; Mello, R.M. (to Energy Research and Development Administration). US Patent 4,046,169. 6 Sep 1977. Filed date 9 Jul 1975. 10p. PAT-APPL-594,477.

Disclosed is a pipe support for high temperature, thin-walled vertical piping runs used in a nuclear system. A cylindrical pipe transition member, having the same inside diameter as the thin-walled piping, replaces a portion of the piping where support is desired. The outside diameter of the pipe transition member varies axially along its vertical dimension. For a section of the axial length adjacent the upper and lower terminations of the pipe transition member, the outside diameter is the same as the outside diameter of the thin-walled piping to which it is affixed. Intermediate of the termination sections, the outside diameter increases from the top of the member to the bottom. Adjacent the lower termination section, the diameter abruptly becomes the same as the piping. Thus, the cylindrical transition member is formed to have a generally triangular shaped cross-section along the axial dimension. Load-bearing insulation is installed next to the periphery of the member and is kept in place by an outer ring clamp. The outer ring clamp is connected

to pipe hangers, which provide the desired support for the vertical thin-walled piping runs.

- 4378 WHY THE BREEDER REACTOR IS INEVITABLE. Alexander, T. Fortune; 122-130(Sep 1977).

The introduction of the liquid metal fast breeder reactor in the United States is necessary if nuclear energy is to supply a significant portion of future energy needs. The political, technical, and management problems associated with breeder development in the U.S. are reviewed. Political and management aspects are seen as the major obstacles to overcome as the technical problems have been largely solved in both domestic and foreign development programs.

- 4379 BENCHMARK CALCULATIONS FOR A SODIUM-COOLED BREEDER REACTOR BY TWO- AND THREE-DIMENSIONAL DIFFUSION METHODS. Buckel, G.; Kuefner, K.; Stehle, B. (Kernforschungszentrum Karlsruhe, Ger.). Nucl. Sci. Eng.; 64: No. 1, 75-89(Sep 1977).

This investigation concentrates on the numerical solution of the multigroup neutron diffusion equations by computer codes. For a realistic model liquid-metal fast breeder reactor, several benchmark problems in two and three space dimensions were derived and calculations were performed by eight different computer programs. The effect on k_{eff} and the neutron fluxes of the refinement of the discretization mesh is studied. Very good agreement (approximately 0.05%) of the results was found in those cases where the computer programs use the same discretization scheme of mesh-edged discretization formulas, although the codes employ different methods of solution. On the other hand, minor discrepancies remain between results obtained by codes using mesh-edged and mesh-centered discretization formulas, even for fine-mesh grids. The reasons are not understood in every detail. Fortunately, these discrepancies are very small and more of theoretical than practical interest. The effect of a simple group condensation scheme of k_{eff} was also investigated by considering several different energy group structures. Spatial mesh refinements and resolution of the energy range were found to be well decoupled. As the main result, one may take the fact that spatial and energetic mesh refinements may influence the results rather strongly, unless the mesh step is comparable to the minimum diffusion length and unless enough energy groups are used.

- 4380 BENCHMARK ANALYSIS OF LIQUID-METAL FAST BREEDER REACTOR NUCLEAR DESIGN METHODS. Kujawski, E.; Bailey, H.S. (General Electric Co., Sunnyvale, CA). Nucl. Sci. Eng.; 64: No. 1, 90-94(Sep 1977).

The Large Core Code Evaluation Working Group has been organized for the prime aim of testing and validating neutronics codes and methods for use in the analysis of large fast reactors. For the initial problem, static neutronics calculations were performed on a "representative" 1200-MW(e) liquid-metal fast breeder reactor in a two-dimensional radial geometry. The initial results representing the cooperative effort of the participants are summarized. Various codes and methods using few-group diffusion theory are intercompared. The calculational methods are in substantial agreement provided the same multigroup constants are used. This effort is to be further pursued and broadened to investigate such specific effects as sodium voiding.

- 4381 THREE-DIMENSIONAL THERMAL-HYDRAULIC ANALYSIS OF WIRE-WAPPED RODS IN LIQUID-METAL FAST BREEDER REACTOR CORE ASSEMBLIES. Chuang, M.C. (Westinghouse Research Labs., Pittsburgh); Carelli, M.D.; Bach, C.W.; Killmayer, J.S. Nucl. Sci. Eng.; 64: No. 1, 244-257(Sep 1977).

A study is presented to determine the detailed coolant velocity and temperature profile around the entire rod circumference in liquid-metal fast breeder reactor (LMFBR) core assemblies as well as the detailed radial and circumferential temperature profile in the rod. The digital computer code FATHOM-360 developed to perform the above calculations is described. Fuel, radial blanket, and control assembly rods (both wire-trapped and bare) can be analyzed. Coolant, cladding, and fuel (or absorber) temperature profiles are calculated for uniform and nonuniform heat generation (i.e., accounting for power skew across the pellet) in the rod. Temperature distributions can be calculated for both concentric and eccentric positions of the pellet with respect to the fuel rod cladding. Typical examples of the calculational capabilities of the code are presented. Such capabilities are needed for a reliable design of LMFBR core assemblies and rods to provide detailed cladding temperature profiles and accurately calculate the cladding strain on which the fuel rod lifetime and allowable burnup depend. Overall, a more realistic core thermofluids design is possible by implementing the study presented here.

- 4382 CROSS SECTIONS, ANGULAR DISTRIBUTIONS, AND MAGNETIC SUBSTATE POPULATIONS IN THE $^{23}\text{Na}(n,n'\gamma)$ REACTION. Donati, D.R.; Mathur, S.C.; Sheldon, E.; Barnes, B.K.; Beghian, L.E.; Harihar, P.; Kegel, G.H.R.; Schier, W.A. (Department of Physics and Applied Physics, University of Lowell, Lowell, Massachusetts 01854). Phys. Rev., C; 16: No. 3, 939-957(Sep 1977).

Neutron inelastic scattering cross sections have been determined for six levels in ^{23}Na over the incident neutron energy range 0.52 to 4.23 MeV by measuring the γ -ray production cross sections for 10 deexcitation γ transitions in the $^{23}\text{Na}(n,n'\gamma)$ reaction. γ -ray angular distributions from the first two excited levels were obtained at various incident neutron energies. From these, the magnetic substate populations were evaluated for the 0.440-MeV ($5/2^+$) first excited level and the 2.078-MeV ($7/2^+$) second excited level in ^{23}Na . Comparisons have been made between the distributions and magnetic substate populations calculated from compound-nuclear and direct-interaction theory, the former yielding better agreement in the interpretation of experimental results.

- 4383 TASKS OF AND METHODS FOR IMPURITY CONTROL IN SODIUM LOOPS. Ullmann, H. (Zentralinstitut fuer Kernforschung, Rossendorf bei Dresden (German Democratic Republic)). Kernenergie; 20: No. 9, 269-274(Sep 1977). (In German).

The tasks of impurity control of sodium and inert gas in coolant circuits of sodium-cooled reactors are formulated. From this, the requirements to be met by the measuring methods are derived. The current status of the methods of measurement and analysis are evaluated. Fundamental directions of further development are discussed.

- 4384 DOE TO SPEED REACTOR LICENSING. Power (N.Y.); 121: No. 9, 53-56(Sep 1977).

Deferment of the Clinch River Breeder Reactor development has awakened enthusiasm for alternative nuclear power systems. Most promising are the molten salt reactor developed in Oak Ridge; the HTGR pioneered by General Atomic; and the light-water thorium breeder sponsored by Admiral Hyman Rickover. The Nuclear Regulatory Commission is criticized for its slowness in approving new nuclear plants, thus contributing to 10-year lead times for them. Floating offshore nuclear plants seem to have the best chance of being approved; their lead times are expected to be about six years.

- 4385 INVESTIGATION OF THE PERFORMANCE OF URANIUM-PLUTONIUM MIXED OXIDE FUEL PINS FOR THE REACTOR BN-600. Golovnin, I.S.; Menshikova, T.S.; Bibilashvili, J.K. (Vsesoyuznyi Nauchno-Issledovatel'skiy Inst. Neorganicheskikh Materialov, Moscow (USSR)); Davydov, E.F.; Grjazev, V.M.; Sjuzev, V.N. (Nauchno-Issledovatel'skiy Inst. Atomnykh Reaktorov, Dimitrograd (USSR)). Atomwirtsch., Atomtech.; 22: No. 9, 469-470 (Sep 1977).

A subassembly of experimental fuel pins of the type to be used in BN-600 and using uranium-plutonium mixed oxide fuel had been irradiated up to burnup of 11% heavy atoms and an integrated neutron dose of 6.6×10^{22} n/cm² ($E > 0.1$ MeV) at a maximum clad temperature of 680°C. The most important results were as follows: 1) The dimensional change of the hexagonal wrapper tube (steel 0Ch18N10T) can be attributed to irradiation induced steel swelling of 7.6 vol.% at the neutron dose given above. 2) On an average the diameter of the fuel pins increased by 2% with a maximum of 3%. This diameter increase is essentially due to steel swelling. The diametral cladding deformation caused by radiation creep did not exceed 0.3%. 3) The maximum swelling of the clad material (solution treated steel 0Ch16N15M3B) was found to be 7.3% at about 500°C and at a neutron dose of 6.6×10^{22} n/cm² ($E > 0.1$ MeV). 4) The corrosive interaction between the mixed oxide fuel, the initial O/M-ratio of which was 1.97 to 1.98, and the steel clad was negligible and had no influence on the performance capability of the fuel clad. 5) Strength and plasticity of the clad were reduced due to the irradiation, especially in the high temperature region, but the clad kept its function. 6) The fraction of released fission gas is independent from the initial fuel density and was here found to be approx. 80%. 7) The fuel pins of the BN-600 type with U-Pu-mixed oxide (0.85 UO₂ - 0.15 PuO₂) proved to perform satisfactorily up to a burnup of 11%.

- 4386 STATUS OF FAST BREEDER DEVELOPMENT. Brandstetter, A. (Internationale Atomreaktorbau G.m.b.H. (INTERATOM), Bergisch Gladbach (Germany, F.R.); Internationale Natrium-Brutreaktor-Bau G.m.b.H., Bergisch Gladbach (Germany, F.R.)). Atomwirtsch., Atomtech.; 22: No. 9, 477-483 (Sep 1977). (In German).

From European conference on particle physics; Budapest, Hungary (4 - 9 Jul 1977). 6 figs.; 2 tabs..

The development of the fast breeder reactor, which has been severely handicapped by the Carter Administration's recent decision, is a must for most other industrialized countries which want to put their energy supply on a firm basis. This development has been pursued with great perseverance and has consumed large amounts of government funds since the early sixties in the United States, the Soviet Union, France, the United Kingdom, Japan and the Federal Republic of Germany. Three prototype reactors are already in operation, four others

in an advanced stage of construction. These many years of development have given fast breeder reactors their high safety standard. However, the main argument in favor of continuing the development of LMFBR's is the need for their commercial introduction in the early nineties. This deadline will perhaps not apply in the United States, which has very large uranium reserves of its own. For the Federal Republic and the developed countries with similar problems in ensuring the continuity of their power supplies, the system encompassing light water reactors as the first generation and sodium cooled fast breeders as the second generation represents a complete and logical energy supply concept. It is the only concept which, based on the present state of the art, permits a specific technology to be adopted for a specific strategy to guarantee the long term continuity of energy supply.

- 4387 FAST BREEDER LICENSING: IS IT UNCONSTITUTIONAL. FULL TEXT OF THE PRESS STATEMENT BY THE UPPER ADMINISTRATIVE COURT AT MÜNSTER. Atomwirtsch., Atomtech.; 22: No. 9, 454 (Sep 1977). (In German).

The statement on the decision to wait for a decision of the Federal Constitutional Court on whether paragraph 7 of the Atomic Energy Act is compatible with the Basic Law is discussed.

- 4388 EXPERIMENTAL INVESTIGATION OF THE FORMATION OF CRITICAL BOILING NUCLEI IN SUPERHEATED SODIUM. Riethmüller, R. (Karlsruhe Univ. (TH) (Germany, F.R.)). Inst. fuer Reaktortechnik. Nucl. Eng. Des.; 43: No. 2, 295-309 (Sep 1977).

This work deals with the problem of boiling nuclei growth up to the critical size in superheated sodium. The sodium was superheated to a certain degree without initiating the onset of boiling. The lifetime of the superheated state - defined as the waiting time - was measured. The experiments were performed with stagnant sodium in a gas-free apparatus. The sodium temperature and superheat were up to 960°C and 360°C, respectively. Waiting times of up to some hours were measured with large scattering of values. Cold trap purifications influenced the waiting time irreversibly. Natural boiling nuclei were unstable. An artificial boiling nucleus (small cylindrical cavity) was inactive. The existence of many cavities in the test chamber surface was demonstrated by a scanning electron microscope. Experimental results are compared with theoretical predictions from known nucleation models. The dynamic model of the formation of collective heterogeneous boiling nuclei agreed qualitatively.

- 4389 DAMPING OF THE TRANSVERSE IMPULSIVE MOTION OF A TIMOSHENKO BEAM RESTING ON A THIN FLUID LAYER. Zehlein, H. (Gesellschaft fuer Kernforschung m.b.H., Karlsruhe (Germany, F.R.)). Nucl. Eng. Des.; 43: No. 2, 373-379 (Sep 1977).

A discrete model for the one-dimensional incompressible transient axial squeeze potential flow within the thin fluid layer between two adjacent LMFBR sub-assemblies caused by the impulsive transverse bending of these beam-type core components is described. The numerical schemes used to determine the time- and space-dependent velocity and pressure fields are outlined. Emphasis is placed on the combined Lagrangian particle/Euler cell approach newly proposed here. In particular two different notions of Lagrangian particles, the convected Lagrangian particle (CLP) and the displaced Lagrangian particle (DLP) are

introduced and evaluated. Some remarks on the coupling technique for the fluid-structure interaction are also given. Preliminary results recommend the DLP because of its higher computational efficiency.

- 4390 TRANSIENT DEFORMATION OF LMFBR CORES DUE TO LOCAL FAILURE: EXPERIMENTAL AND THEORETICAL INVESTIGATION. Beutel, H.; Liebe, R.; Will, H.; Zehlein, H. (Gesellschaft fuer Kernforschung m.b.H., Karlsruhe (Germany, F.R.)); Rees, N.J.M.; Warren, G.R. (UKAEA Weapons Group, Foulness Atomic Weapons Research Establishment). Nucl. Eng. Des.; 43: No. 2, 381-410 (Sep 1977).

This paper describes an effort to predict the mechanical core deformation caused by local failure within an LMFBR core. These activities are intended to cover all the potential core damage possibilities currently under discussion and analysis. In particular it is shown that the reactor can be scrammed in time under pessimistic-realistic pressure transients and that the damage does not exceed tolerable limits. A special gas generator technique to simulate a fuel coolant explosion has been developed at AWRE Foulness. This has been used to perform the explosion tests needed to demonstrate the safety of the SNR 300 core. A molten fuel-coolant interaction (MFCI) experimental facility, and a drop tower to carry out sub-assembly crushing tests are described. Theoretical studies are presented which use mass-spring-dashpot, lumped parameter-hinge or micro-rigid-lumped-mass models. They simulate the crushing and bending of a single sub-assembly interacting with the coolant as well as the behaviour of a multirow 'spoke' model. For the core analysis only preliminary computational results are presently available which can be compared with the full scale tests in which the fluid pressure did not exceed a 'threshold' of about 100 bar. Parameter studies show the influence of pulse shape, material properties as well as the time integrator. Some of the unanswered questions concern the hydrodynamic feedback of the deformations on the pressure distribution in space and time. Also the behaviour of the highly irradiation-embrittled cores is poorly understood today. Finally, an enhanced energy release package to describe the MFCI must still be added to the reactivity calculation module of a future fast reactor dynamics code.

- 4391 FLOW RUNDOWN EXPERIMENTS IN A SEVEN PIN BUNDLE. Brook, A.J. (UKAEA Reactor Group, Risley); Kaiser, A.; Peppier, W. (Gesellschaft fuer Kernforschung m.b.H., Karlsruhe (Germany, F.R.)). Nucl. Eng. Des.; 43: No. 2, 273-283 (Sep 1977).

A series of experiments has been carried out using an electrically heated seven pin bundle to simulate the conditions under which boiling of the sodium coolant could occur in the event of the loss of power to the circulator pump of a fast reactor, coincident with a failure of the reactor to trip. Although it was not possible to represent the condition of the reactor exactly, nor to continue the tests far into dryout, the results nevertheless give valuable qualitative information on the course of boiling development as well as useful quantitative information against which the predictions of computer codes can be checked. In particular, data have been obtained relating to the incidence of superheat, the location and time to dryout of the residual liquid films, the void fraction within the boiling region, and the types of flow regimes which may be expected within different parts of the boiling region at various stages of the transient.

- 4392 SODIUM BOILING EXPERIMENTS IN A SEVEN-PIN BUNDLE: FLOW PATTERNS AND TWO-PHASE PRESSURE DROP. Kaiser, A.; Peppier, W. (Gesellschaft fuer Kernforschung m.b.H., Karlsruhe (Germany, F.R.)). Nucl. Eng. Des.; 43: No. 2, 285-293 (Sep 1977).

Two series of quasi-steady state sodium boiling experiments have been carried out in an electrically heated seven-pin bundle. The power levels (130-170 and 30-40 W/cm²) and other test conditions were selected to correspond to the core and radial breeder zones of a typical LMFBR. The test procedures involved the gradual reduction of mass flow rate through the bundle in a simulation of the consequences of a slowly growing blockage in the lower part of a reactor subassembly. By this means it was possible to study the development of quasi-steady state boiling up to the onset of permanent dryout. The results obtained provide information of flow regimes in the two-phase region, vapour qualities and flow rates at which cooling of the bundle can be effectively maintained, and the ultimate incidence of dryout. A relation for the two-phase pressure drop multiplier obtained from adiabatic pressure drop measurements in this geometry is given and compared with earlier results from single-channel geometry tests.

- 4393 SODIUM BOILING EXPERIMENTS IN A 7-PIN BUNDLE: INVESTIGATIONS INTO SOME SAFETY ASPECTS OF THE KNK II DRIVER ZONE. Kaiser, A.; Peppier, W.; Straka, M. (Gesellschaft fuer Kernforschung m.b.H., Karlsruhe (Germany, F.R.)). Nucl. Eng. Des.; 43: No. 2, 411-417 (Sep 1977).

A series of sodium boiling experiments, in which the thermohydraulic characteristics of KNK II driver subassemblies were simulated, has been carried out for the purpose of studying the effects of two types of cooling disturbances: rapid flow interruption and those flow reductions which develop rather gradually. Information about the spatial and temporal development of boiling, voidage and dryout was obtained. Furthermore the feasibility of individual subassembly temperature monitoring has been investigated as well as that of two integral boiling detection methods based on acoustic noise and reactivity measurements.

- 4394 ANALYSIS OF HYPOTHETICAL OVERPOWER ACCIDENTS IN THE SNR-300 MARK 1A CORE WITH MODELING OF FAILURE INCOHERENCE. Royl, P.; Kuczera, B. (Gesellschaft fuer Kernforschung m.b.H., Karlsruhe (Germany, F.R.)). Nucl. Eng. Des.; 43: No. 2, 239-248 (Sep 1977).

Incoherency effects due to the statistical nature of fuel rod failure have been assessed for transient overpower (TOP) accidents with different initiating ramp rates. Characteristic single subassembly feedbacks from sodium voiding, fuel injection, and fuel sweep-out after failure were calculated and superimposed incoherently. Effective feedback functions were thus generated for characteristic subassembly groups (channels) and used as tabular reactivity input to corresponding multi-channel whole core TOP simulations using the HOPE computer model. Analyses were performed for the SNR-300 Mark 1A end of life (EOL) core with initiating ramp rates of 0.15, 0.5 and 5 S/sec. The results are compared with those from a calculation with coherent subassembly behavior in each channel. It is concluded for the mild transient that irrespective of the assumed axial failure location, negative fuel sweep-out reactivity from early failed subassemblies will prevent the accident from reaching a prompt

critical stage and lead to a gradual shutdown if the assessed failure incoherencies are applied. For the higher ramp rates (>0.5 S/sec) the assessed incoherencies will not always lead to an early shutdown, but they can considerably reduce the potential to accumulate high ramp rates in the initiating phase of TOP accidents.

- 4395 IN-PILE SODIUM LOOP FOR INVESTIGATION OF LOCAL COOLING DISTURBANCES IN LMFBR'S. Kramer, W.; Schlesiak, K.; Schmidt, L. (Gesellschaft fuer Kernforschung m.b.H., Karlsruhe (Germany, F.R.)); Vanmassenhove, G.; Verwimp, A. (Centre d'Etude de l'Energie Nucleaire, Mol (Belgium)). Nucl. Eng. Des.; 43: No. 2, 343-351 (Sep 1977).

In the safety analysis of Liquid Metal Fast Breeder Reactors, investigations of the fuel element behavior under local off-normal cooling conditions and the possible failure propagation are of special interest. In a common program, called 'Mol 7C' the Gesellschaft fuer Kernforschung, Karlsruhe, and the Centre de l'Etude de l'Energie Nucleaire/Studiecentrum voor Kernenergie, Mol, are performing related in-pile experiments in a sodium loop in the BR 2-reactor. The test section contains a 37-rod bundle of fresh UO_2 -fuel. A local blockage within the fuel bundle will initiate a certain local damage to a few rods. The experiments are expected to obtain important informations with respect to the problems of pin to pin propagation and the long term behaviour of a fuel bundle with defect pins. The in-pile part of the loop contains the fully integrated primary sodium circuit. Total heat removal capacity is about 700 kW. The equipment for the first experiment is nearly manufactured. The first experiment will start in the beginning of 1977. At first three experiments are planned.

- 4396 THEORETICAL INTERPRETATION OF SCARABEE SINGLE PIN IN-PILE BOILING EXPERIMENTS. Struwe, D.; Bottoni, M.; Fries, W.; Elbel, H.; Angerer, G. (Gesellschaft fuer Kernforschung m.b.H., Karlsruhe (Germany, F.R.)). Nucl. Eng. Des.; 43: No. 2, 259-271 (Sep 1977).

In the framework of LMFBR safety analysis a theoretical interpretation of some of the most representative of the single pin experiments of the in-pile SCARABEE project has been performed from both viewpoints of thermohydraulic and fuel behaviour using the computer codes CAPRI-2 and SATURN-1. The analysis is aimed at investigating the pin behavior from the preirradiation history, through the observed sequence of events following a coolant mass flow reduction from boiling inception up to pin breakdown. A comparison of theoretical results with experimentally recorded data has allowed a deeper insight into the peculiar features of the experiments and enabled a valuable code verification.

- 4397 STEELS FOR THE PRIMARY CIRCUITS OF THE SODIUM COOLED BREEDER REACTOR. Weisz, M.; Berge, P.; Rabbe, P. (Cent d'Etud Nucl, Sclay, Fr.). Mater. Tech.; No. 9-10, 477-491 (Sep-Oct 1977). (In French and English).

Certain factors that must be taken into account in determining the allowable stresses in austenitic stainless steels for use in the primary circuits of sodium-cooled breeder reactors are reviewed. These include the effects of heat-to-heat variations on stress values determined from tensile and creep tests, the effect of the sodium medium on the creep and fatigue properties of the steels, including the intrinsic effects due to the presence of a very pure liquid metal and the effects due to

the transfer of alloying elements, particularly carbon. Also discussed are the effects of long holdings at high temperatures on the impact strength and intergranular corrosion sensitivity of the steels. Finally, the risks of cracking in the heat affected zones during welding and in service are assessed. 18 refs.

- 4398 SELECTION OF STEAM GENERATOR MATERIALS FOR SODIUM COOLED BREEDER REACTORS. Berge, P. (Electr de Fr). Mater. Tech.; No. 9-10, 493-510 (Sep-Oct 1977). (In French and English).

This paper deals with the determination of the permissible stresses for steels considered for fast breeder steam generator tubes. The mechanical properties of the tubes at elevated temperatures are discussed, as well as research on their fatigue resistance, the influence of sodium on their mechanical properties, and the effect of heat treatment on their sensitivity to intergranular corrosion. Also discussed are the weldability of the steels employed and the weld properties, the decarburization of ferritic steels, and corrosion in the water-steam circuit under normal operating conditions and during accidents. 45 refs.

- 4399 NOTCH DUCTILITY OF ALLOY 800 FOR THE STEAM GENERATORS OF BREEDER REACTORS. Cozar, R.; Rouby, M.; Lagadec, H.; Julien, M. (Creusot-Loire, Fr.). Mater. Tech.; No. 9-10, 511-524 (Sep-Oct 1977). (In French and English).

The aim of this study was to define the notch ductility at elevated temperature of Alloy 800 as specified for the Superphenix steam generator tube. The materials investigated, which are representative of the tube, were processed in various ways. It was found that homogeneous precipitation of the γ' phase improves their creep strength but reduces their ductility. The formation of this phase is governed by chemical composition, and in particular by the Ti+Al sum content. The limiting value of 0.65 to 0.70% for this content seems to be the threshold for noticeable effects of the γ' phase. The results of this study indicate that materials that show no trace of this homogeneous precipitation of the γ' phase are immune to the notch effect. Alloys having a Ti+Al sum content of between 0.40 and 0.65% are in this category. The ductility of these materials remains satisfactory even in the 10% and 15% cold worked state, after tests at 550°C. In comparison, a material with a Ti+Al sum content of 0.94% is very susceptible to the notch effect at 550°C; notched creep specimens fractured after 650 hr, whereas unnotched specimens resist periods of 2500 hr under a stress of 250 N/mm². 10 refs.

- 4400 UTILIZATION PROPERTIES OF SOME SPECIAL STEELS FOR SODIUM COOLED BREEDER REACTORS. Mathern, G.; Crolet, J.L.; Seraphin, L.; Tricot, R. (Pechiney Ugine Kuhlmann, Fr.). Mater. Tech.; No. 9-10, 525-542 (Sep-Oct 1977). (In French and English).

It is shown that 2.25% Cr-1% Mo low-alloy steels stabilized by niobium or by niobium/vanadium offer good resistance to corrosion by water and liquid sodium. Their mechanical properties can be adjusted by varying the heat treatment. The creep properties of niobium/vanadium stabilized steel are higher than those of steel stabilized with niobium alone if the quenching treatment is sufficiently severe to obtain an entirely bainitic structure. The behavior of niobium-vanadium stabilized ferritic steels with 9-12% chromium content is similar to that of steels of the previous

category. They withstand oxidation by steam up to higher temperatures; their hardenability is greater than that of low alloy steels. 18-10 or 18-12 Mo austenitic steels offer poor resistance to stress-corrosion in water and can, therefore, only be used in dry steam. However, their resistance to liquid sodium is good. Their creep properties can be optimized by adding boron and by controlling the Ti/C stabilizing ratio for steels containing titanium. They are very easy to weld providing certain precautions are taken to prevent hot cracking. The stress-corrosion resistance of Incoloy 800 is quite superior to that of the previous steels, which means that it can be used in water or wet steam. The alloy can be rendered immune to intergranular corrosion by suitable heat treatment. 20 refs.

- 4401 PRODUCTION AND CONTROL OF STAINLESS STEEL CLADDING TUBES FOR BREEDER REACTORS. Jackson, M.; Spriet, B. (Soc. Vallourec, Fr). Mater. Tech.; No. 9-10, 595-603 (Sep-Oct 1977). (In French and English).

A description is given of the manufacture and inspection of tubes for the cladding of fuel elements used in fast reactors. Particular attention is paid to nondestructive testing of the cladding tubes by eddy-current and ultrasonic inspection, and also by metrological inspection of the outside diameter and wall thickness. 3 refs.

- 4402 EFFECTIVE METHOD FOR ESTIMATING MULTIPLE CONTROL ROD WORTHS IN LARGE FAST REACTORS. Mitani, H. (Jpn At Energy Res Inst, Tokai-mura, Ibaraki-ken). J. Nucl. Sci. Technol. (Tokyo); 14: No. 9, 640-651 (Sep 1977).

A method for estimating the multiple control rod worth in large fast reactors has been developed using the higher order perturbation technique. With this method, physical significance of the interaction effect between multiple control rods can be understood by decomposing it into independent components with different physical processes. Furthermore, a new technique is proposed, whereby the interaction effect between multiple control rods can be estimated from a combination of the interaction effects between two or three control rods depending on the strength of the effect. The results show that the interaction effect between multiple control rods in prototype fast reactors can be estimated from a combination of the effects between 2 control rods with a good accuracy. The numerical examinations for a 1,000 MWe fast reactor showed that the interaction effect is too large to apply the present method for large fast reactors. To overcome this difficulty, a new concept of 'quasi-control-rod' is introduced in the method. With this improved method, the worths of 19 and 18 control rods in the 1,000 MWe fast reactor are estimated with accuracies of $\pm 2\%$. 18 refs.

- 4403 DISSOLUTION RATIO OF HYDROGEN GENERATED BY SMALL-LEAK SODIUM-WATER REACTION. Nei, H. (Power React and Nucl Fuel Dev Corp, Oarai Eng Cent, Ibaraki-ken, Jpn). J. Nucl. Sci. Technol. (Tokyo); 14: No. 9, 652-660 (Sep 1977).

A study, both theoretical and experimental, was undertaken on the hydrogen dissolution ratio in liquid sodium, with the view of estimating the quantity of hydrogen that dissolves into sodium before reaching the free surface, following the occurrence of sodium-water reaction in a steam generator. Superheated steam was injected into the sodium in a reaction vessel of configuration

simulating the steam generator. The hydrogen dissolution ratio was determined from analysis of the responses obtained on a hydrogen detector installed downstream of the reaction vessel. A theoretical model was assumed for estimating the hydrogen dissolution ratio, which yield results in good agreement with the experimental data, in respect of the rising tendency of the dissolution ratio with decreasing leak rate and with rising sodium temperature. 14 refs.

- 4404 SPLITTING METHOD FOR COMPUTING COUPLED HYDRODYNAMIC AND STRUCTURAL RESPONSE. Ash, J.E. (Argonne National Lab., IL). Appl. Math. Model.; 1: No. 6, 333-338 (Sep 1977).

A numerical method is developed for application to unsteady fluid dynamics problems, in particular to the mechanics following a sudden release of high energy. Solution of the initial compressible flow phase provides input to a power-series method for the incompressible fluid motions. The system is split into spatial and time domains which lead to the convergent computation of a sequence of elliptic equations. Two sample problems are solved, the first involves an underwater explosion and the second the response of a nuclear reactor containment shell structure to a hypothetical core accident. The solutions are correlated with experimental data.

- 4405 SUBASSEMBLY EXPERIMENTS AND A COMPUTER CODE TO ANALYZE THE DYNAMIC CORE DEFORMATION DURING LOCAL FAILURE PROPAGATION. Liebe, R. (Gesellschaft fuer Kernforschung m.b.H., Karlsruhe (Germany, F.R.)). Nucl. Eng. Des.; 43: No. 2, 353-371 (Sep 1977).

Safety investigations for LMFBRs have to consider local failure situations in one fuel element which may escalate to a hypothetical CDA. Such initiating events could produce high pressure pulses in a single subassembly which may expand and rupture the wrapper as well as load adjacent elements impulsively. The associated nonlinear dynamic core deformation problem is treated in this paper. In particular the multirow structural dynamics code COERE-1 and underlying mechanical models are described. Each subassembly is simulated by an equivalent system of point masses and nonlinear coupling springs. The motion of the coolant layer between the elements is treated by an incompressible, non-stationary frictional flow model. In order to obtain realistic code input four types of static single subassembly deformation experiments are described which provided strongly nonlinear load deformation characteristics.

- 4406 MODEL FOR FORMATION AND GROWTH OF LOCAL BLOCKAGES IN GRID SPACED FAST SODIUM COOLED BREEDER FUEL ELEMENTS. Schultheiss, G.F. (Karlsruhe Univ. (TH) (Germany, F.R.)). Inst. fuer Reaktortechnik. Nucl. Eng. Des.; 43: No. 2, 329-341 (Sep 1977).

The studies of the formation of local cooling flow disturbances in fast sodium breeder reactors are intended to furnish information, which can be used for safety assessments, about the attainable extent of blockages and the time required for their growth. The formation of major local blockages in normal fuel element geometries will mainly be caused by fuel expelled after a cladding tube failure. A model of the screening process is developed considering the results of in-pile experiments, thermohydraulic studies and simulation experiments of the growth of blockages. The model is limited to the initial phase in which the largest free cross sections

in a subchannel with a spacer grid geometry must be plugged up to constitute a so-called 'fundamental blockage'. Parameter studies on the model show that events constituting the formation of a blockage occur slowly.

- 4407 EFFECT OF THE BR-5 REACTOR OPERATING CONDITIONS ON THE DEVELOPMENT OF VACANCY POROSITY IN THE 1KH18N9T STEEL. Porollo, S.I.; Shcherbak, V.I.; Aristarkhov, N.N.; Bykov, V.N.; Dmitriev, V.D.; Mamaev, L.I. At. Energ. (USSR); 43: No. 3, 206-207 (Sep 1977). (In Russian).

- 4408 DEVELOPMENT OF A NEW TUBE-TO-TUBESHEET WELDING TYPE FOR FBR'S HEAT EXCHANGERS. Mase, N.; Kawara, M.; Shibato, E.; Kashiwakura, K. (Hitachi Ltd., Ibaraki (Japan). Hitachi Works). Hitachi Hyoron; 59: No. 9, 747-752 (Sep 1977). (In Japanese).

The intermediate heat exchanger for exchanging heat between primary and secondary sodium and the steam generator are required to guarantee the performance and the reliability of construction over long term under the environment of high temperature sodium peculiar to a FBR. With the increase of power output of FBR plants, the number of heating tubes and the size of tube plates of the intermediate heat exchangers of shell and tube type increase. In order to improve the reliability and the production process of the tube to tube plate welding, a new method was developed, according to which heating tubes are inserted into tube plate holes by about their thickness, and the welding of perfect penetration is carried out internally with an automatic TIG welder. At the same time, in order to confirm the reliability of the welded joints by this method, the tests for evaluating the strength for short time and long term were carried out. It was confirmed that the satisfactory performance of the welded joints was able to be obtained, and the method would be applicable to actual heat exchangers. As for the nondestructive inspection of welded joints, the radiographic method was established, and ultrasonic and eddy current flaw detection methods are being developed now.

- 4409 DISSOLUTION RATIO OF HYDROGEN GENERATED BY SMALL-LEAK SODIUM-WATER REACTION. Nei, H. (Power Reactor and Nuclear Fuel Development Corp., Oarai, Ibaraki (Japan). Oarai Engineering Center). J. Nucl. Sci. Technol. (Tokyo); 14: No. 9, 652-660 (Sep 1977).

A study, both theoretical and experimental, was undertaken on the hydrogen dissolution ratio in liquid sodium, with the view of estimating the quantity of hydrogen that dissolves into sodium before reaching the free surface, following the occurrence of sodium-water reaction in a steam generator. Superheated steam was injected into the sodium in a reaction vessel of configuration simulating the steam generator. The hydrogen dissolution ratio was determined from analysis of the responses obtained on a hydrogen detector installed downstream of the reaction vessel. The hydrogen dissolution ratio was found to vary from 5 to 15% over a leak rate ranging of 3 -- 10 g/sec, as determined both from the transient response data given by the hydrogen detector and from the corresponding data obtained from tests on changes in hydrogen concentration upon complete mixture with the

entire sodium inventory. A theoretical model was assumed for estimating the hydrogen dissolution ratio, which yield results in good agreement with the experimental data, in respect of the rising tendency of the dissolution ratio with decreasing leak rate and with rising sodium temperature.

- 4410 NOTCH DUCTILITY OF ALLOY 800 FOR LIQUID METAL FAST BREEDER REACTOR STEAM GENERATOR. Cozar, R.; Rouby, M. (Societe Creusot-Loire, 75 - Paris (France)); Lagade, H.; Julien, M. (Fives-Cail-Babcock, 75 - Paris (France)). Mater. Tech.; No. 9, 511-524 (Sep-Oct 1977). (In French and English).

From 2. Colloquium on special steels and nuclear energy; Paris, France (14 - 15 Dec 1976).

The grade selected for the manufacture of heat-exchange tubes for fast breeder reactor steam generators is an Ni Fe Cr alloy (2 4 NC 33.21). This choice is vindicated by the operating characteristics of this material. Are in particular studied: the alloy mechanical properties (low temperature creep - 500 to 600°C), the internal stress relaxation, the determination of the alloy ductility at low and medium temperatures, the precipitation of intermetallic phases, the structure to product thermomechanical history relationship.

- 4411 PRODUCTION AND CONTROL OF STAINLESS STEEL CLADDING TUBES FOR BREEDER REACTORS. Jacson, M. (Vallourec, 75 - Paris (France)); Spriet, B. (CEA Centre d'Etudes Nucleaires de Cadarache, 13 - Saint-Paul-les-Durance (France). Dept. de Developpement des Elements Combustibles). Mater. Tech.; No. 9, 595-603 (Sep-Oct 1977). (In French, English).

From 2. Colloquium on special steels and nuclear energy; Paris, France (14 - 15 Dec 1976).

The reliability of a cladding tube in a LMFBR depends, for the most part, on its capability of keeping its original shape, even under extremely heavy duty conditions. A tremendous effort has been conducted in two different ways, to attain this purpose: definition of the metallurgical characteristics of the cladding tube material according to its mechanical properties in high temperature conditions and its properties under neutronic action; an improved quality of the tubes by methodical and controlled processing conducted at Vallourec's plant in Montbard in a specially developed workshop for this type of tubes. The raw material controls, the tubes production scheduling in hot and cold conditions, together with the non-destructive and destructive tests are defined both by Vallourec and the C.E.A.

- 4412 UTILIZATION PROPERTIES OF SOME SPECIAL STEELS FOR SODIUM COOLED BREEDER REACTORS. Mathern, G.; Crolet, J.L.; Seraphin, L.; Tricot, R. (Ugine Aciers, 73 (France)). Mater. Tech.; No. 9, 525-542 (Sep-Oct 1977). (In French and English).

From 2. Colloquium on special steels and nuclear energy; Paris, France (14 - 15 Dec 1976).

Among the liquid metals, sodium constitutes a particularly effective coolant for removing large amounts of heat produced in the core of fast neutron breeder reactors. The following is examined: the mechanisms of corrosion and decarburization by liquid sodium in movement; the interest of stabilized ferritic steels used in mixed circuits or in homogeneous circuits; the respective positions of austenitic stainless steels from the viewpoint of utilization and working properties, such as

corrosion resistance and creep strength.

- 4413 STEELS FOR THE PRIMARY CIRCUITS OF THE SODIUM COOLED BREEDER REACTOR. Weisz, M. (CEA Centre d'Etudes Nucleaires de Saclay, 91 - Gif-sur-Yvette (France). Service de Recherches Metallurgiques Appliquees); Berge, P. (Electricite de France, 77 - Ecuellles. Dept. Etudes des Materiaux); Rabbe, P. (Societe Creusot-Loire, 42 - Unieux (France)). Mater. Tech.; No. 9, 477-491 (Sep-Oct 1977). (In French and English).

From 2. Colloquium on special steels and nuclear energy; Paris, France (14 - 15 Dec 1976).

This paper describes the effort made in the working group E.D.F.-C.E.A.-Industry, on the molybdenum austenitic steels in order to evaluate the best compromise between the various properties, considering the temperature conditions (350 - 550°C) and the mechanical working conditions: creep resistance, especially in the low strain range (0,1%); modification of toughness due to long holding time at high temperature; satisfactory resistance to intergranular corrosion; weldability; properties of the metal deposited in the heat affected zones; absence of cracking at high temperature.

- 4414 EXPERIMENTS WITH SLIDING SUSPENSION IN LIQUID SODIUM. Matul, O. (Vyzkumny Ustav Zavodu Energetického Strojirenstvi, Brno-Slatina (Czechoslovakia)). Strojirenstvi; 27: No. 9, 565-569 (Sep 1977). (In Czech).

Selected sliding pairs were tested as a model of sliding assembly on a model equipment in liquid sodium. The sliding pair consisted of a pellet 20 mm in diameter and a thickness of 8 mm with a ring 60 mm in diameter and a hole 45 mm in diameter and a width of 25 mm which was mounted on a rotating shaft. The peripheral velocity of the rings was 1.25 m/s. The pellets were pressed to the rings by an intermittent force of 1 to 1.7 kp at a frequency of intermittence 4 Hz. The sliding pairs were manufactured by the flame deposition of materials of the type Cr-Ni-B-Si, Cr-Ni-B-Si-WC, WC-Ni, WC-Co, Ti-steel on a steel semi-finished product (Czechoslovak Standard 17 246). The surface of the sliding pairs was studied using x-ray spectral microanalysis, electron microscopy and metallography. The short-term tests of sliding pairs in liquid sodium showed small wear, a good compactness of the deposited layer with the base material before exposure and after exposure in liquid sodium and resistance to corrosion by sodium. Only materials of the type WC-Co and WC-Ni did not show the expected properties.

- 4415 CONSTRUCTION OF SOVIET FAST REACTOR BN-600. Suransky, F. Jad. Energ.; 23: No. 9, 352-357 (Sep 1977). (In Czech).

A sectional view is shown of the integral configuration of the 3rd unit reactor in the Beloyarsk nuclear power plant. The reactor vessel is a cylinder 12.8 m in diameter and 12.6 m in height. In view of overpressure in the vessel (40 kPa) the wall thickness is 30 to 40 mm. The reactor core contains 370 hexagonal fuel elements. Each element consists of 127 pins of an outer diameter of 6.9 mm. 27 positions are taken by regulating and scram rods. The fuel reserve in the core and the efficiency of reactivity control permits reactor operation for about 150 days such that one third of the fuel elements is exchanged during refuelling. A block diagram is shown of the power plant heat generating system. Core cooling is ensured by three circuits, i.e., the

sodium primary and secondary circuits and one water and steam circuit. The progress of the power plant construction is briefly indicated.

- 4416 CORROSION OF REFRACTORY BORIDES IN FUSED SODIUM. Arabei, B.G.; Glukhov, V.A.; Markov, Y. (All-Union Sci-Res Inst of Aviat Mater, USSR). Prot. Met. (Engl. Transl.); 13: No. 5, 492-494 (Sep-Oct 1977).

Corrosion of chromium, tantalum, and hafnium diborides, samarium, gadolinium, and europium hexaborides, and composites of europium hexaboride with diborides of these metals was tested. As in the case of the diboride structure, no appreciable changes were detected in the structure of the $\text{MeB}_2\text{-EuB}_6$ composites. These composite materials can be recommended for use with sodium up to 800°C for periods of up to 5000 h.

- 4417 CORROSION RESISTANCE OF ALLOYS OF THE NIOBIUM-ZIRCONIUM-OXYGEN SYSTEM IN MOLTEN LITHIUM. Arakelov, A.G.; Vavilova, V.V.; Gekov, A.G.; Zel'tser, A.M. (Acad of Sci of the USSR, A.A. Baikov Inst of Metall, Moscow). Sov. Mater. Sci. (Engl. Transl.); 13: No. 5, 503-506 (Sep-Oct 1977).

Investigations were directed toward studying the effect of the phase composition, ratio of zirconium and oxygen in niobium-base alloys, and the heat treatment of alloys of the Nb-Zr-O system on corrosion resistance in molten lithium. The investigation of the interaction of alloys of the Nb-Zr-O system with lithium was conducted at 400°C by the method of full immersion of the specimen in a niobium ampul with lithium previously heated to this temperature. The method of microstructural analysis was used in studying the alloys, along with measurements of microhardness and resistivity, x-ray crystallographic analysis, and ion analysis. A comparison of the results of studies of the behavior of alloys of the binary system niobium-oxygen and the ternary system of niobium-zirconium-oxygen shows that the character of lithium damage to alloys with oxygen in the ternary system is less sharp, although, as with the binary system there is a reduction in microhardness and an increase in resistivity for alloys held in lithium. It must be noted that even in the section Nb-ZrO₂ corrosion takes place after annealing at 1500°C. However, the corrosion is considerably less despite the fact that a ratio Zr:O=1:2 is observed in the alloys. 14 refs.

- 4418 SELECTION OF STEAM GENERATOR MATERIALS FOR SODIUM COOLED FAST BREEDERS. Berge, P. (Electricite de France, 77 - Ecuellles. Dept. Etudes des Materiaux). Mater. Tech.; No. Special No. 9, 493-510 (Sep-Oct 1977). (In French and English).

From 2. Colloquium on special steels and nuclear energy; Paris, France (14 - 15 Dec 1976).

The sodium water heat exchangers are now considered as the stumbling block in the development of liquid metal cooled fast breeders, due to the risk of sodium-water reactions. The selection of the materials for these tube-bundles has been very broad, for the different existing, or in-project, reactors in the world: low alloy 2 1/4 Cr - 1 Mo steels (unstabilized or stabilized); 9 Cr - 1 Mo ferritic steel; 18 Cr - 10 Ni austenitic stainless steels; alloy 800. One can also add other ferritic steels, as 9 Cr - 2 Mo stabilized, which are studied for this application. In the framework of the E.D.F.-C.E.A. working group a major effort was undertaken to study the characteristics of

these various materials with respect to the main criteria governing construction of the tube bundles and their performance in service: mechanical characteristics at high temperature; fabrication and welding; behavior with respect to mass transfer in sodium; carburization and decarburization; corrosion resistance. The main lines and results of this program are described.

- 4419 CONTROL ROD AND/OR INSTRUMENT TREE ASSEMBLY. Noyes, R.C.; Dupen, C.F.G.; Barrus, D.M.; Siegel, E.A. (to Combustion Engineering, Inc.). US Patent 4,045,283. 30 Aug 1977. Filed date 30 Dec 1974. 14p.

Disclosed is an improved core servicing apparatus for a nuclear reactor having a vessel, a head for the vessel, one or more penetration openings in the head and a core within the vessel of the type having an array of fuel assemblies and including apertures in the array for neutron absorbers. The servicing apparatus includes a support column adapted to be supported by and depend from the head in registry with a penetration opening; a plurality of core servicing elements which may include neutron absorber actuating means and/or instrument packages are supported by the support column; and means are provided for laterally displacing at least some of the servicing elements relative to the support column between a laterally compact and a laterally expanded configuration. In one embodiment, instruments may be located at the lower end of long resilient cables and are longitudinally movable within and beyond guide channels supported by the support column. The guide channels are directed outward at their lower ends to direct a descending instrument and cable outwardly. 9 claims, 18 figures.

- 4420 MAINTENANCE SYSTEM FOR IMMersed SEALS, SPECIFICALLY FOR NUCLEAR REACTORS. Poindexter, A.M.; Ricks, H.E. (to Westinghouse Electric Corp., Pittsburgh, PA (USA)). French Patent 2,363,862/A/. 30 Aug 1977. Priority date 31 Aug 1976, United States of America (USA), 22p. (In French).

The invention concerns the immersed seals of nuclear reactors and specifically a maintenance system for the immersed seals of the revolving closing plugs of liquid metal breeder nuclear reactors. A liquid sodium immersed joint may be located at a given place or be surrounded by heating elements so that the sodium stays liquid whilst the reactor is working. In other cases, the sodium in the immersed seal is allowed to solidify whilst the reactor is working, thereby increasing the efficiency of the seal. At all events, the sodium must be in a liquid state during reloading with fuel to enable the plug to turn. The invention consists in fitting an ultrasonic transducer to the closure head of the reactor vessel so that the vibration emitting surface directs these vibrations towards the immersed seals so as to detach the deposits of impurities on them and ensure the wetting of the metal surfaces of which they are formed. Additionally, an envelope that can be placed around the ultrasonic transducer in conjunction with a suction appliance provides a mechanism through which the impurities can be removed from the area of the immersed seal.

- 4421 FUEL ROD FOR LIQUID METAL COOLED NUCLEAR REACTORS. Vinz, P. (to Messerschmitt-Boelkow-Blohm G.m.b.H., Muenchen (Germany, F.R.)). German (FRG) Patent 2,449,597/C/. 25 Aug 1977. 5p. (In German).

This fuel rod should, in spite of increased

thermal surface loading, exclude the formation of steam bubbles and local overheating with certainty, which otherwise occur, on non-wetting cans. The can, made as is usual for sodium cooled reactors of precious metal with nitrated non-wetting surface layer is wound with a compatible precious metal wire of 0.5 to 0.05 mm diameter. The prestressed winding leaves a space of about 1/10 diameter between turns. The turns are fixed to the can by diffusion welding giving intensive thermal contact. The windings produce the decisive effects: as the precious metal wire is completely wetted by hot sodium, the danger of forming 'hot spots' at the can surface which is associated with a non-wetted can due to defective heat transfer is avoided. Also, the back channel formed between 2 windings, i.e. around the whole winding forms a nucleus for bubbles in the space between the wetted wire surface and the non-wetted can surface.

- 4422 LIQUID METAL COOLED FAST BREEDER NUCLEAR REACTORS. Durston, J.G. (to United Kingdom Atomic Energy Authority). US Patent 4,043,866. 23 Aug 1977. Priority date 6 Dec 1973, United Kingdom of Great Britain and Northern Ireland (UK), 4p.

A liquid metal fast breeder nuclear reactor of the pool kind is described. The intermediate heat exchanger depends from the roof of the primary vessel in a housing and is immersed in the reactor coolant. A gas pocket seals the passage between the heat exchanger shell and the housing to prevent liquid metal by-passing the tube bundle.

- 4423 STRUCTURE FOR REDUCING CONVECTION CURRENTS WITHIN THE PRESSURE VESSEL OF A FAST REACTOR. Benque, J.P.; Lallement, J.; Lambert, P. (to Commissariat a l'Energie Atomique). US Patent 4,043,867. 23 Aug 1977. Priority date 3 Sep 1974, France, 4p.

A hollow metallic ring structure is secured to the periphery of the diagrid support and located within an internal annular space formed between the lateral neutron shield of the reactor core and an inner tank placed within a primary vessel. The ring structure is smaller in width than the annular space, has a maximum height equal to that of the reactor core, and is provided with partition-walls and holes for producing pressure drops and reducing convection currents.

- 4424 HEAT UTILIZATION OF FUTURE REACTOR SYSTEMS. Heller, A.; Minder, R. (Electro-Watt Engineering Services Ltd., Zurich (Switzerland)). Bull. Schweiz. Elektrotech. Ver.; 68: No. 16, 839-843 (13 Aug 1977). (In German).

From SEV/VSE meeting on heat utilization of nuclear power stations; Zurich, Switzerland (28 Jun 1977).

The types of nuclear reactor systems suitable for heat utilization are reviewed comparing the existing designs such as the PWR (pressurized water reactor) and BWR (boiling water reactor) with possible future reactor systems including the LMFBR (liquid metal fast breeder reactor) and HHT (high temperature helium turbine reactor). Next to the high pressure = high temperature advanced technology systems, the prospects of low technology solutions are discussed such as the Swedish SECURE (safe environmentally clean urban reactor) project designed as a pure heat producing plant.

- 4425 DRIVE FOR CONTROL ROD OF A NUCLEAR

REACTOR. Schabert, H.P.; Pawlitzki, R. (to Siemens A.G., Berlin (Germany, F.R.); Siemens A.G., München (Germany, F.R.)). German (FRG) Patent 1,813,293/C/. 11 Aug 1977. 3p. (In German).

For this drive, a control rod driven axially in the reactor core is uncoupled from its driving rod, and interlocked in the lowest position without involving moving parts. The control rod is coupled to one of the driving rods coming from above by a type of bayonet coupling by a short lifting and turning movement, this moves the control rod up and down in a profiled rod channel, e.g. a hexagonal tube in a sodium-cooled reactor, with hexagonal fuel element. Six cams on the circumference of the control rod guide it in the hexagonal tube, and prevent turning over the whole travel of, for example, 8 metres. Only in the shutdown condition of the reactor can window shaped cutouts in the 6 corners of the guide tube produce tangential rotation of the cam with the control rod. Thus the control rod can be interlocked in this position and can be prevented from lifting due to coolant flow.

- 4426 LIQUID METAL COOLED REACTOR PROVIDED WITH A SYSTEM LIMITING THE CORE DISPLACEMENT WITH RESPECT TO CONTROL RODS. Seed, G.; Hodgson, D.; Grime, C.J. (to Nuclear Power Co. (Whetstone) Ltd. (UK)). French Patent 2,361,721/A/. 11 Aug 1977. Priority date 12 Aug 1976, United Kingdom of Great Britain and Northern Ireland (UK), 5p. (In French).

This invention covers the construction of liquid metal cooled nuclear reactors. Under the invention, the core is immersed in a coolant mass contained in a primary vessel. This vessel is suspended to the roof of a containment pit and is surrounded by a leak proof jacket. The control rods are supported by the roof and can be introduced into the core. The core is supported from the wall of the lower part of the primary vessel, a device being provided in the space between this vessel and the leak proof jacket to restrict the amount of downward bending towards the lower part of the primary vessel. Hence, in the event of the wall of the reactor vessel bending, which would bring about a lowering of the reactor core in relation to the control rods, the leak proof jacket forms a secondary supporting structure for the core and restricts its movement.

- 4427 LIQUID METAL COOLED REACTOR PROVIDED WITH A SYSTEM LIMITING THE CORE DISPLACEMENT WITH RESPECT TO CONTROL RODS. Seed, G.; Hodgson, D.; Grime, C.J. (to Nuclear Power Co. (Whetstone) Ltd. (UK)). French Patent 2,361,722/A/. 11 Aug 1977. Priority date 12 Aug 1976, United Kingdom of Great Britain and Northern Ireland (UK), 9p. (In French).

This invention concerns the construction of liquid metal cooled nuclear reactors. Under the invention the reactor includes a core immersed in a coolant mass contained in a reactor jacket suspended from the roof of a containment pit and control rods supported by the roof can be introduced into the core. This core is maintained as from the wall of the reactor jacket by a platform and a second supporting structure is provided for the core to be used should the platform collapse. In the event of or partial failure of the platform or of its support, the resulting dropping of the reactor core with respect to the control rods is limited in full safety by the second supporting structure.

- 4428 LIQUID METAL COOLED NUCLEAR REACTOR. Seed, G.; Hodgson, D.; Grime, C.J. (to

Nuclear Power Co. (Whetstone) Ltd. (UK)). French Patent 2,361,720/A/. 11 Aug 1977. Priority date 12 Aug 1976, United Kingdom of Great Britain and Northern Ireland (UK), 9p. (In French).

Under this invention, in a nuclear reactor cooled by a liquid metal comprising a primary vessel suspended to the roof of a concrete containment pit, said reactor vessel containing the coolant mass includes an upper open end and is suspended from the roof by ties, this reactor vessel and ties being enveloped in a leak proof jacket sealed to the roof of the pit along its edge and in which there is an inert gas to cover the coolant mass. In the construction under the invention, no circumferential retainment is prescribed on the fixing of the primary vessel to the roof structure, so that the tangential stresses are suppressed on the edge. The leak tight jacket is not in contact with the coolant and, as it is cooled by a blanket gas virtually in contact with all its internal area, it is not subjected to the high temperature difference between the surface of the mass and the pit roof. Should the need be felt, an upper circumferential area of the leak tight jacket could be internally lined with a lagging to reduce the heat transmission by radiation from the coolant mass and could be cooled from the outside. In a preferred construction, the ties include rods or straps articulated or welded to an upturned skirt secured inside the primary vessel at a height situated under the level of coolant mass surface.

- 4429 SEAL FOR TURNABLE LIDS ON NUCLEAR REACTORS. Jansing, W.; Roehrs, H.; Rothfuss, H. (to Internationale Atomreaktorbau G.m.b.H. (INTERATOM), Bergisch Gladbach (Germany, F.R.)). German (FRG) Patent 1,921,377/C/. 4 Aug 1977. 4p. (In German).

This seal guarantees greatest leak-proofness even when turning the turn-lid and keeps off abrasion and dirt from the interior of the reactor vessel. This is caused by various individual seals in the space above the horizontal flange which closes the vessel at the top. An outer ring is removably supported on an outer diameter of this flange with the narrow side of its polygonal cross-section. An inner ring turns within this body with its narrow side on spheres of a support. The turn-lid is centred with its largest diameter in this inner ring and is supported by a part of the same body protruding it by means of screws. The vertical ring gap between the two ring bodies is sealed by two inflatable hollow seals; they are coated with PTE.

- 4430 (JAPFNR--264) FBR STRUCTURAL MATERIAL TEST PROGRAM. (Power Reactor and Nuclear Fuel Development Corp., Tokyo (Japan)). Aug 1977. Translation of N--251-77-22 39p. Dep. NTIS (US Sales Only), PC A03/MF A01.

Work performed under United States--Japanese Fast Reactor Exchange Program.

In parallel with development of FBR, Power Reactor and Nuclear Fuel Development Corporation (PNC) has planned and carried out a series of structural material tests in order to establish the rational temperature designs for structural components. These material tests are partially conducted at the O-arai Engineering Center (PNC) but mostly undertaken at the plant fabricator, material manufacturers, academic societies and associations, national research institutes and universities at the request of PNC. Work to date and future plans are discussed.

- 4431 THEORETICAL PREDICTION OF THE THERMAL CONDUCTIVITY OF URANIUM CARBIDE VAPOR. Cox, D.L.; Cronenberg, A.W. (New Mexico Univ., Albuquerque (USA)). J. Nucl. Mater.; 67: No. 3, 326-331(Aug 1977).

Theoretical predictions are made for the thermal conductivity of uranium carbide vapor. The calculations take into account collisional, dissociation, and chemical reaction effects.

- 4432 THEORETICAL PREDICTION OF THE THERMAL CONDUCTIVITY OF URANIUM NITRIDE VAPOR. Kullasha, M.A.; Cronenberg, A.W. (New Mexico Univ., Albuquerque (USA)). J. Nucl. Mater.; 67: No. 3, 320-325(Aug 1977).

A theoretical calculation of the thermal conductivity of uranium nitride vapor has been carried out. The calculational procedure is based on consideration of collisional, polyatomic, dissociation and reaction effects and only effects which do not perturb values by more than a factor of two are considered. Parameters such as the thermal conductivity of vapors are necessary for safety analyses of potential nuclear fuels for LMFBR reactors, such as uranium nitride.

- 4433 TAIL END OF THE FUEL CYCLE: COPING WITH THE CARTER EDICT. Olds, F.C. Power Eng.; 81: No. 8, 38-46(Aug 1977).

President Carter's unilateral attempt to achieve a worldwide moratorium on reprocessing, recycle, and breeder development has had a cold reception. The U.S. alone appears to honor the moratorium, and its prestige suffers as the bill of particulars against the plan takes form. Isotopic denaturing of plutonium fuel, however, is a promising new means for rendering the fuel cycle highly diversion-resistant. In this process the fissile isotopes of plutonium would be tied almost inseparably into a chain of fertile isotopes. This renders the material unsuitable for weapons and difficult to handle outside of the fuel cycle. For isotopic denaturing to be most effective, it should be instituted as widely as possible, throughout the world. This requires a number of procedural, political, and international policy measures. In short, the nuclear power nations need to agree on the use of denatured fuel, and to restrict export reactors to those using denatured fuel.

- 4434 DIAGNOSING MALFUNCTIONS IN LIQUID SODIUM HYDROSTATIC BEARINGS. Wilcock, D.F. (Mech Technol Inc, Latham, NY). Lubr. Eng.; 33: No. 8, 412-416(Aug 1977).

One of the principal methods being developed for the fast breeder reactor power plant for the transfer of heat from the reactor core is the use of a liquid sodium transfer loop. Operation of this loop requires large pumps capable of handling liquid sodium at temperatures over 1000 F. The lower impeller bearing in these vertical shaft pumps is conventionally a multipocket hydrostatic bearing supplied with pressure from the pump discharge. Continued operation of this bearing is vital to the power plant operation. Hence, diagnosis of its condition is important to assessing plant condition and scheduling outages for repair. A logical analysis of hydrostatic bearing faults and the observable symptoms which may be displayed as the result of each fault can be used to establish a desirable level of instrumentation. If proximeters, pressure sensors, and a bearing supply flow meter can be used, each type of fault that has been identified can be distinguished clearly. With this level of instrumentation, the power plant operator can

reach rational decisions related to continued operation of a large liquid metal pump after a bearing malfunction has been signalled. Furthermore, the fault-symptom logic forms a natural basis for automation of the instrumented surveillance of large sodium pumps.

- 4435 EFFECT OF PHASE INSTABILITY OF STAINLESS STEEL ON THE CLADDING DEFORMATION PROFILES OF LMFBR FUEL ELEMENTS. Hofman, G.L.; Walters, L.C.; McVay, G.L. (Argonne National Lab., Ill. (USA)). J. Nucl. Mater.; 67: No. 3, 289-294(Aug 1977).

Enhanced deformation rates in LMFBR fuel element cladding are shown to be consistent with the occurrence of carbide precipitates. Swelling and creep equations, when modified to include the effects of carbide precipitation, account for such phenomena as the second diameter peak and certain large heat-to-heat variations observed in the cladding and irradiated elements.

- 4436 EFFECTIVE TEMPERATURE OF AN EXPANDING TUBE WITH A RADIAL TEMPERATURE GRADIENT OVER THE WALL. Van Witzenburg, W.; Janssen, L.G.J.; Prijs, J. (Energieonderzoek Centrum Nederland, Petten). Nucl. Technol.; 35: No. 1, 184-187(Aug 1977).

By using the finite-strain theory, an effective temperature, defined as a uniform temperature producing the same deformation rates as the actual temperature gradient, of a thick-walled internally pressurized closed-end tube with an over-the-wall radial temperature gradient, is expressed in terms of original tube geometry, strain, temperature distribution, and creep properties of the tube material. For a stainless-steel cladding tube of a fission reactor fuel pin, with a radial temperature gradient of 50°C over the wall, the effective temperature equals the average of the instantaneous inner and outer surface temperatures to within 10°C.

- 4437 IMPORTANCE OF HEAT TRANSFER IN HYPOTHETICAL CORE DISRUPTIVE ACCIDENT ANALYSIS. Abramson, P.B. (Argonne National Lab., IL). Nucl. Technol.; 35: No. 1, 87-96(Aug 1977).

In the very unlikely event of a loss-of-flow accident in a liquid-metal fast breeder reactor being accompanied by complete failure to scram, the reactor could go prompt critical, generating a large amount of neutronic heat on a millisecond time scale. We find that fuel-to-steel heat transfer has a minimal influence upon the neutronic energy deposition during the prompt burst but that it can play an important role in material behavior in later stages of the hypothetical core disruptive accident. Furthermore, results obtained indicate that calculations of thermodynamic potential energy through adiabatic expansion to one atmosphere are conservative if performed at the end of the prompt burst and that fuel-to-steel heat transfer may significantly reduce the available work energy within the next 20 ms.

- 4438 CORROSION OF STEELS IN MOLTEN SODIUM HYDROXIDE. Newman, R.N.; Smith, C.A.; Smith, R.J. (Berkeley Nuclear Labs., Eng.). J. Electrochem. Soc.; 124: No. 8, 1247-1252(Aug 1977).

The role of sodium hydroxide corrosion is discussed in relation to the wastage of materials observed in fast reactor boilers under fault conditions in the vicinity of a water leak into sodium. An experimental technique to study the corrosion under varying

conditions is described. The results presented are for $2\frac{1}{4}$ Cr-1Mo obtained in static sodium hydroxide in a closed volume over the temperature range 1033°--1273°K. It is found that the corrosion rate can be followed by monitoring the hydrogen produced by the reaction, which can be written as $\text{Fe} + 2\text{NaOH} = \text{NaFeO}_2 + \text{NaH} + \frac{1}{2} \text{H}_2$. After an initial acceleration period the rate law is parabolic. The effect on the corrosion rate of melt and cover gas composition has been in part investigated, and the relevance of mass flow of reactant is discussed.

- 4439 ACOUSTIC DETECTION FOR SMALL-LEAK SODIUM-WATER REACTION. Nei, H.; Ohshima, I.; Ujihara, K.; Hori, M. (O-arai Eng Cent, Power React and Nucl Fuel Dev Cop, Ibaraki-ken, Jpn). J. Nucl. Sci. Technol. (Tokyo); 14: No. 8, 558-5264 (Aug 1977).

Characteristics of acoustic signals produced by sodium-water reaction due to steam injection and by Ar gas injection into sodium were experimentally investigated. Acoustic signals were measured by using Kistler 808A and 815A5 accelerometers. Root mean square (RMS) measurements and frequency analysis of the signal were conducted. The RMS measurements could detect a small water leakage into sodium, as small as 0.07 g/sec, in the present loop. The peaks in a frequency spectrum were caused by the natural vibration of a rod on which the acoustic transducer was mounted. The RMS was approximately proportional to the one-third power of the steam leak rate and increased to some extent with the ambient sodium temperature. RMS values, both for sodium-water reaction and Ar gas injection, were about the same order of magnitude, when the data were plotted against the volumetric flow rates of steam and Ar gas. 11 refs.

- 4440 CONSEQUENCES OF THE OVG MUENSTER'S DECISION ON KALKAR. Klein, H.H. (Deutscher Bundestag, Bonn (Germany, F.R.)). Ausschuss fuer Wirtschaft). Dtschl.-Union-Dienst; 31: No. 166, 1-3 (Aug 1977). (In German).

In the authors opinion, the higher administrative court at Muenster was right constitutionally as well as politically. Constitutionally: The Federal Constitutional Court has since the medical society verdict of 1972- often and with emphasis expressed itself in the sense that the greater the relevance of a decision to basic rights, and the more far-reaching its significance for everybody, all the more stringent the legislator's guidance for the executive has to be. Politically: The fact, that parliament has withdrawn itself concerning State guidance in the sense of political pilotage in favour of the government, apart from not being very effective, threatens to become a thorn in the side of many quarters. The article briefly outlines in which form parliament ought to be involved.

- 4441 ACOUSTIC DETECTION FOR SMALL-LEAK SODIUM-WATER REACTION. Nei, H.; Ohshima, I.; Ujihara, K.; Hori, M. (Power Reactor and Nuclear Fuel Development Corp., Oarai, Ibaraki (Japan). Oarai Engineering Center). J. Nucl. Sci. Technol. (Tokyo); 14: No. 8, 558-564 (Aug 1977).

Characteristics of acoustic signal produced by sodium-water reaction due to steam injection and by Ar gas injection into sodium were experimentally investigated. Acoustic signal was measured by using Kistler 808A and 815A5 accelerometers. Root mean square (RMS) measurements and frequency analysis of the signal were conducted. The RMS measurements

could detect a small water leakage into sodium, as small as 0.07g/sec, in the present loop. The peaks in a frequency spectrum were caused by the natural vibration of a rod on which the acoustic transducer was mounted. The RMS was approximately proportional to the one-third power of the steam leak rate and increased to some extent with the ambient sodium temperature. RMS values, both for sodium-water reaction and Ar gas injection, were about the same order of magnitude, when the data were plotted against the volumetric flow rates of steam and Ar gas.

- 4442 DECAY HEAT REMOVAL TEST OF SPENT FUEL IN 'MONJU' EX-VESSEL TRANSFER MACHINE. Yukishima, I.; Hayakawa, S.; Ishiguro, J. (Fuji Electric Co. Ltd., Kawasaki, Kanagawa (Japan)). FAPIG (Tokyo); No. 86, 2-7 (Aug 1977). (In Japanese).

Decay heat of spent fuel of the prototype fast breeder reactor 'Monju' during the transit is removed by direct argon gas cooling around and within the spent fuel subassemblies. Heat removal test was conducted to confirm the cooling characteristics with a model of the spent fuel subassembly and an argon gas cooling loop. The specifications of the test facility are heating and cooling capacity of 200 kW, argon gas blower capacity of 2,000 mmAq x 15 m³/min. and the fuel subassembly of approximately actual size. The test conditions are 1 - 8 kW of heat generation, about 150 deg. C of argon inlet temperature, and 0 - 10 m³/min. of argon flow rate. The correlation between Reynolds number and Stanton number or friction coefficient for cooling the spent fuel subassembly and the effect of sodium adhesion were experimented in this test, and these experimental data were compared to the analytical results using HECTIC-2a code for steady state and HECTIC-3 code for unsteady state. These codes are available to calculate accurately the maximum temperature of fuel pins and its time transient. No significant effect of sodium adhesion was observed.

- 4443 SUPPORT STRUCTURE FOR THE LATERAL NEUTRON SHIELD SYSTEM OF A FAST REACTOR CORE. Gallet, B.; Venot, R. (to Commissariat a l'Energie Atomique). US Patent 4,038,136. 26 Jul 1977. Priority date 11 Jun 1974, France, 4p.

A hexagonal ring structure whose internal contour conforms to the external contour of the reactor core rests on the periphery of the reactor diagrid and is constituted by a plurality of layers of metallic plates. The layers are maintained in relative positional relation by means of clamping members, the plates of one layer being angularly displaced with respect to the plates of adjacent layers. The bottom end-connectors of the elements constituting the lateral shield system are fitted in vertical through-holes formed in the ring structure.

- 4444 NUCLEAR REACTOR FUEL ELEMENTS. Linning, D.L.; Dodd, J.A. (to United Kingdom Atomic Energy Authority). US Patent 4,038,138. 26 Jul 1977. Priority date 7 Mar 1974, United Kingdom of Great Britain and Northern Ireland (UK), 2p.

A nuclear reactor fuel element is described which has wire wrap spacing means of a form which contacts the fuel element at a series of regularly spaced intermittent points so that coolant can flow between the wire wrap and the fuel element and between the points of contact. The wire wraps may be of single wire coiled coil form or twin interwound wires. 2 figures.

4445 NUCLEAR REACTOR FUELING SYSTEM. Wade, E.E. (to Westinghouse Electric Corp., Pittsburgh, PA (USA)). French Patent 2,359,485/A/. 20 Jul 1977. Priority date 22 Jul 1976, United States of America (USA), 17p. (In French).

Nuclear fuel transfer gear to move nuclear fuel assemblies between a storage vessel and a nuclear reactor vessel placed against this storage vessel, each of these vessels having coolant inlets and outputs for the coolant to flow through them. This gear includes: - a connexion system forming a passage between the reactor vessel and the storage vessel located below the level of the coolant, so as to permit the transfer of the fuel assemblies between the reactor vessel and the storage vessel whilst maintaining these fuel assemblies completely immersed in the coolant; - a first system for the transfer of fuel assemblies fitted in the reactor vessel above the reactor core; - and a second fuel assembly transfer system fitted in the storage vessel above the fuel assembly storage area. These facilities are characterised in that the first and second fuel assembly transfer systems include a first and second respective revolving appliance, to hold the fuel assemblies and to align them with the connexion system so as to transfer them through the passage formed by this connexion system.

4446 NUCLEAR REACTOR FUEL ELEMENT ASSEMBLIES. Betts, C.; Collinson, A.E.; Hart, D.F. (to United Kingdom Atomic Energy Authority). US Patent 4,036,690. 19 Jul 1977. Priority date 31 Dec 1974, United Kingdom of Great Britain and Northern Ireland (UK), 4p.

A nuclear reactor fuel element assembly comprising a bundle of fuel elements in a tubular wrapper for conducting liquid metal coolant flow has a cavitation suppressing impedance. The impedance comprises a tubular member housing a series of flow defining plates, the plates comprising two sets arranged so that plates of each set are positioned alternately along the tubular member, the plates of one set being of woven wire mesh and those of the other set being thick apertured plates.

4447 HEAT EXCHANGER. (to Combustion Engineering, Inc., Windsor, Conn. (USA)). Netherlands Patent 7,707,862/A/. 14 Jul 1977. 9p. (In Dutch).

A liquid metal heated tube and shell heat exchanger where straight tubes extend between upper and lower tube sheets. In order to prevent thermal stress problems, one tube sheet is fixed to the shell, and the other tube sheet is sealed to the shell by means of a flexible bellows. In the event of a catastrophic bellows failure, a housing that utilizes a packing gland sliding seal is used to enclose and back-up the bellows. Also, a key and slot arrangement is provided for preventing relative rotation between the shell and tube sheet which could damage the bellows and cause failure thereof. This exchanger is seen to be of use in sodium cooled reactors between the liquid sodium circuit and the steam generator.

4448 DISPERSION NUCLEAR FUEL AND PROCESS FOR ITS MANUFACTURE. Ondracek, G.; Nazare, S.; Thummmler, F. (to Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.)). German(FRG) Patent 1,916,370/B/. 14 Jul 1977. 6p. (In German).

A dispersion nuclear fuel for fast reactors is described, whose reprocessing is possible.

It consists of a heat conducting metal matrix (pure copper or copper alloy) which hardly absorbs any fast neutrons and a compatible fuel or breeding material for this matrix, such as U_2O or PuO_2 . The manufacturing process is described. The copper alloy contains at least one element from the group nickel, aluminium or chromium.

4449 NUCLEAR FUEL ASSEMBLY. Betten, P.R. (to Combustion Engineering, Inc., Windsor, CT (USA); Deutsches Patentamt, Muenchen (Germany, F.R.)). German(FRG) Patent 2,653,250/A/. 14 Jul 1977. 16p. (In German).

This is a nuclear fuel assembly for a liquid metal cooled reactor with improved coolant distribution in the peripheral and inner coolant flow channels. Swelling and radiation-induced growth are also taken into account. The parallel fuel rods each have a spirally wound spacer on the surface. A bundle of them is inserted in a shell, which has projections on the inside. These have a pattern, which is given by the angle of the spiral on the fuel rods. The play in the peripheral rods is reduced by this and the coolant flow in the inner-channels is improved. Compared to the outer coolant section of hexagonal cross section, the shell also has projections on its surface, which act as springs and are made in the form of ribs.

4450 NUCLEAR REACTOR FUEL ELEMENT SUB-ASSEMBLIES. Waite, E.; Ford, J. (to UKAEA). British Patent 1,478,985/A/. 6 Jul 1977. 7p.

Reference is made to fuel element assemblies for fast reactors. Normally these consist of a number of upstanding parallel pins between which liquid metal coolant flows. To facilitate insertion and withdrawal of fuel the pins are grouped in side-by-side sub-assemblies each comprising a bundle of pins enclosed by a tubular wrapper. The pins are end supported on a lower grid within the wrapper and are free to move longitudinally within a clearance limit afforded by an upper grid within the wrapper. The pins must be free to move longitudinally under irradiation growth and linear thermal expansion, but for stability of the reactor core it is desirable that the pins be held captive. Captivating the pins has been found difficult because of their close spacing and the need to maintain adequate coolant flow passages. In the arrangement described the pins have peripherally enlarged heads at one end and the heads are held captive between a fixed end abutment grid and a fixed cellular grid, with provision of coolant flow passages. The pins may have their enlarged heads at the ends which are intended to be uppermost in a reactor and be suspended from the cellular grid. Alternatively the pins may have their enlarged heads at the ends intended to be lowermost, in which case the pins are supported by the end abutment grid.

4451 METHOD OF DETECTING LEAKAGE OF REACTOR CORE COMPONENTS OF LIQUID METAL COOLED FAST REACTORS. Holt, F.E.; Cash, R.J.; Schenter, R.E. (to Energy Research and Development Administration). US Patent 4,033,813. 5 Jul 1977. Filed date 22 Oct 1975. 4p. PAT-APPL-624,804.

Disclosed is a method of detecting the failure of a sealed nonfueled core component of a liquid-metal cooled fast reactor having an inert cover gas. A gas mixture is incorporated in the component which includes Xenon-124; under neutron irradiation, Xenon-124 is converted to radioactive Xenon-125. The cover

gas is scanned by a radiation detector. The occurrence of 188 Kev gamma radiation and/or other identifying gamma radiation-energy level indicates the presence of Xenon-125 and therefore leakage of a component. Similarly, Xe-126, which transmutes to Xe-127 and Kr-84, which produces Kr-85/sup m/ can be used for detection of leakage. Different components are charged with mixtures including different ratios of isotopes other than Xenon-124. On detection of the identifying radiation, the cover gas is subjected to mass spectroscopic analysis to locate the leaking component. 2 claims.

- 4452 FUSION MATERIALS. Rovner, L.H. (Gen At Co). Power Eng.; 81: No. 7, 61-65(Jul 1977).

A study is made of materials requirements for tokamak nuclear fusion systems. Particular attention is paid to the problem of material erosion from the first wall due to the impingement of high-energy ions from the plasma. It is therefore suggested that a low atomic number material such as carbon or silicon carbide be chosen to interface with the plasma. Other problems discussed include irradiation-induced swelling of material and the use of graphite to moderate the damage. Finally, the problem of radiation-induced resistivity increases in superconducting magnets is discussed.

- 4453 HIGHER ADMINISTRATIVE COURT AT MUENSTER EXPRESSES DOUBTS CONCERNING THE CONSTITUTIONAL CHARACTER OF SECTION 7 OF THE ATOMIC ENERGY ACT. Gut; No. 19, 1-2(Jul 1977). (In German).

In connection with the procedure in contentious matters over the SNR 300, the chairman of the 7th senate of the Higher Administrative Court at Muenster has sent participants in the procedure a document, in which it is pointed out that in order to come to a decision in the law case in question within the framework of dutiful exercise of the judicial right of control, the constitutional character of section 7 of the Atomic Energy Act would have to be examined and also, whether the principles of basic law would be still warranted if the executive, and not parliament, makes decisions with considerable consequences (ultimate storage, plutonium industry, etc.) - Note: The matter was passed on to the Federal Constitutional Court on the 18th August 1977 in order that the constitutional character of section 7 of the Atomic Energy Act may be examined.

- 4454 BEHAVIOR OF STEEL X6CRN1811 UNDER COMBINED CREEP AND CYCLIC LOADING AT 823°K. Breitling, H.; Grosser, E.D.; Lorenz, H. Arch. Eisenhuettenwes.; 48: No. 7, 403-507(Jul 1977). (In German).

The behavior of the austenitic steel X6CrNi18 11 resembling AISI 304 in composition, was subjected to three series of tests at 823 K; viz, cyclic loading followed by creep loading to rupture (I); creep loading followed by cyclic loading to rupture (II); and successive short alternating creep and cycling loading to rupture (III). The results were evaluated using the linear damage rule. The damage factors, D, determined vary between 0.7 and 1.6. The highest values were obtained in series I and the lowest in series III. The lower D values for alternating loading can be attributed to the softening processes taking place when the type of loading is changed. A comparison of the data obtained with the damage factors indicated in the ASME BPVC, CC 1592, shows that

the D factors determined from the experimental results are, as in the ASME BPVC, lowest when the two damage fractions are approximately equal. Most of the D factors lie above the ASME values. The ASME curve represents a conservative lower limit of the results reported. (The steel is to be used in pressure vessel and its equipment and in the heat exchange system of a German fast sodium cooled breeder reactor, SNR 300). 12 refs.

- 4455 POSSIBILITIES FOR SOLVING THE PROBLEM OF REPROCESSING FUEL FROM FAST BREEDERS. SURVEY ON THE BASIS OF REPORTS BY EXPERTS ON THE MEETING OF THE IAEA IN MAY 1976 IN LENINGRAD. Arch. Energiewirtsch.; 31: No. 7, 605-622(Jul 1977). (In German).

From Meeting of the experts' group on reprocessing of fuels from liquid-metal cooled fast breeders; Leningrad, USSR (17 - 21 May 1976).

It is reported on the state of the R+D work on reprocessing of irradiated nuclear fuel from sodium-cooled fast breeders in several countries (France, FRG, Belgium, UK, Italy, Japan, USA). The basic work is concentrated on methods of separating the sodium from the fuel elements, transport, storage, cutting and dissolving of the fuel elements; further on separating insoluble particles from the fuel solution, adapting the Purex process to the higher Pu content and burn-up, removing gaseous fission products, and off-gas cleaning. Russian contributions to this catalogue of subjects are missing.

- 4456 HEAT TRANSFER MEASUREMENTS IN AN AIR MODEL OF A PARTLY BLOCKED REACTOR FUEL SUBASSEMBLY. Judd, A.M.; Maltcotsis, G. (Cambridge Univ. (UK). Dept. of Engineering). J. Br. Nucl. Energy Soc.; 16: No. 3, 237-242(Jul 1977).

The effect of blockages of up to six subchannels on heat transfer from a heated pin in a large-scale model of part of a fast reactor fuel subassembly has been measured, using air as a coolant. The results are compared with those of similar measurements in other, simpler, geometries. It is found that the surface heat transfer coefficient is in most cases increased, but there is a tendency for the increase in certain parts of the flow to be smaller for larger blockages. It is concluded that overheating in the region of the blockage is due to increased coolant temperatures rather than poor surface heat transfer.

- 4457 TURBULENCE MEASUREMENTS IN AN AIR MODEL OF A PARTLY BLOCKED REACTOR FUEL SUBASSEMBLY. Judd, A.M. (Cambridge Univ. (UK). Dept. of Engineering). J. Br. Nucl. Energy Soc.; 16: No. 3, 243-248(Jul 1977).

The Eulerian integral time-scale and the kinetic energy of the turbulence have been measured at various points in the recirculating regions behind blockages of up to 13 subchannels in a large-scale model of part of a fast reactor fuel subassembly using air to represent the coolant. It is found that roughly the time-scale is directly proportional and the kinetic energy is inversely proportional to the diameter of the blockage. From these measurements approximate values of the eddy diffusivity can be deduced, and are found to be independent of the blockage size. In a fast reactor, the eddy diffusivity behind a blockage would be far greater than the conductive thermal diffusivity.

- 4458 STRESS ANALYSIS OF FUEL CLADDINGS WITH AXIAL FINS INCLUDING CREEP EFFECTS. Krieg, R. (Gesellschaft fuer Kernforschung m.b.H., Karlsruhe (Germany, F.R.)). Nucl. Eng. Des.; 42: No. 2, 357-380 (Jul 1977).

For LMFBR fuel claddings with axial fins the stress and strain fields are calculated which may be caused by internal pressure, differential thermal expansion and irradiation induced differential swelling. To provide an appropriate description of the cladding material it is assumed that the total strain is the sum of a linear elastic and a creep term, where the latter one includes the thermal as well as the irradiation induced creep. First the linear elastic problem is treated by a semi-analytical method leading to a bipotential equation for Airys' stress function. Solving this equation analytically means that the field equations valid within the cladding are satisfied exactly. By applying a combined point matching-least square-method the boundary conditions could be satisfied approximately such that in most cases the remaining error is within the uncertainty range of the loading conditions. Then the nonlinear problem which includes creep is approximated by a sequence of linear elastic solutions with time as parameter. The accumulated creep strain is treated here as an imposed strain field. To study the influence of different effects such as fin shape, temperature region, irradiation induced creep and swelling or internal pressure, a total of eleven cases with various parameter variations are investigated. The results are presented graphically in the following forms: stress and strain distributions over the cladding cross section for end of life conditions and boundary stresses and strains versus time.

- 4459 PREDICTION OF TEMPERATURE DISTRIBUTION OF A SUBASSEMBLY INCLUDING INTERSUBASSEMBLY HEAT TRANSFER. Chang, L.K. (Argonne National Lab., Ill. (USA)). Nucl. Eng. Des.; 42: No. 2, 223-231 (Jul 1977).

A three-dimensional thermal hydraulic code, CLUSTER, has been developed in order to predict the temperature profile in a cluster of seven subassemblies during steady state conditions. The subassemblies under consideration include both pin-bundle and reflector types of subassemblies. An implicit finite difference representation of the governing energy equation is employed. Good agreement was obtained between the analytical results and the measured data.

- 4460 BREEDER REACTOR DEVELOPMENT: PROGRESS IN EUROPE AND JAPAN, DISCUSSION ON PRINCIPLES IN THE USA. Hueper, R. (Kernforschungszentrum Karlsruhe (Germany, F.R.). Projekt Schneller Brueter). At. Strom; 23: No. 4, 81-85 (Jul 1977). (In German).

15 refs..

The fast breeder reactor development is making progress in the Soviet Union, France, Great Britain, the Federal Republic (together with Belgium and the Netherlands) and Japan. India and Italy are also active in this field, and other countries such as Spain and Brazil are showing their strong interest. At the same time the United States, who initiated this development as early as 30 years ago, tend to slow down their own breeder activities substantially. The author gives a picture for breeder reactor development outside the USA, in particular in the Federal Republic of Germany. He then proceeds to give an outline of the discussion of principle that is going on in the USA.

- 4461 ENERGY FROM NUCLEAR REACTORS. PT. 4. THE FAST BREEDER: BETTER UTILIZATION OF URANIUM. Hospe, J. VDI (Ver. Dtsch. Ing.) Nachr.; 31: No. 27, 4 (Jul 1977). (In German).

Fast breeders operate with fast neutrons. They are the only reactor type which produces by a breeding process more fission materials than it uses. On account of this property they are of great importance for long-term nuclear fuel supply.

- 4462 ENERGY FROM NUCLEAR REACTORS. PT. 5. FAST BREEDER REACTOR SAFETY. Hospe, J. VDI (Ver. Dtsch. Ing.) Nachr.; 31: No. 28, 10 (Jul 1977). (In German).

The author briefly explains the safety technique applied to the fast breeder and compares it with the techniques for other nuclear power plants.

- 4463 SOME PROPERTIES OF IRON-BASE MATERIALS WITH CALCIUM FLUORIDE ADDITIONS FOR FRICTIONAL UNITS OF NUCLEAR PLANTS. Fedorchenko, I.M.; Shevchuk, Yu.F.; Miroshnikov, V.N.; Tuznikov, A.F.; Markov, V.G.; Gorynin, I.V.; Krasnoschekov, M.M.; Mostovskii, D.M. Sov. Powder Metall. Met. Ceram. (Engl. Transl.); 16: No. 7, 544-548 (Jul 1977).

The results of this investigation into the corrosion resistance and diffusion welding of sintered iron-base materials and into the effect of neutron irradiation upon their frictional properties suggest that a material of composition $\text{Fe}_{15}\text{Mo}_6\text{CaF}_2$ should prove useful in frictional units of sodium-cooled nuclear power plants. The material proved to be about twice as resistant to corrosion by liquid sodium as other materials investigated. 7 refs.

- 4464 EFFECT OF CARBIDES ON THE DECARBURIZATION BEHAVIOR OF 2.25 CR-1 MO STEEL IN HIGH TEMPERATURE SODIUM. Shida, Y.; Yoshikawa, K.; Morioishi, T. (Sumitomo Metal Industries Ltd., Amagasaki, Hyogo (Japan). Central Research Labs.). J. Jpn. Inst. Met.; 41: No. 7, 697-705 (Jul 1977). (In Japanese).

2 1/4 Cr-1 Mo steel is highly promising for construction materials of the LMFBR secondary system. The effect of carbides on the decarburization rate of 2 1/4 Cr-1 Mo steel in high-temperature sodium was studied. The effect was investigated by immersing specimens with different metallurgical structures and various kinds of carbides in static liquid sodium at temperatures from 550 to 700°C. The changes of carbides in the composition, phase and morphology were examined by the X-ray diffraction method, chemical analysis of carbides, electromicroscopic observation by extraction replica and the electron diffraction method. The following results were obtained. (1) Decarburization rate of 2 1/4 Cr-1 Mo steel in sodium can be related to phase, morphology, transformation rate and the coagulation process of carbide precipitates. Carbides dissolve in the order of $\text{M}_3\text{C} > \text{lamellar } \text{M}_{23}\text{C}_6 > \text{granular } \text{M}_7\text{C}_3$ asymptotically equals granular M_{23}C_6 asymptotically equals $\text{M}_2\text{C} > \text{M}_6\text{C}$. (2) Carbides dissolve so as to spheroidize themselves. Diffusion of Cr and Mo from carbide to the matrix seems to control the dissolution rate of comparatively stable carbide. (3) Carbides should be stabilized in order to minimize the rate of decarburization. It is most appropriate to make M_6C a dominant carbide phase in steel.

- 4465 CIRCUMFERENTIAL NONUNIFORMITY OF CLADDING RADIATION SWELLING OF FAST REACTOR

PERIPHERAL FUEL ELEMENTS. Reutov, V.F.; Parkhutdinov, K.G. At. Energ. (USSR); 43: No. 1, 12-15(Jul 1977). (In Russian).

The results are presented of the investigation into the perimeter radiation swelling of Kh18N10T stainless steel cladding in different cross sections of a peripheral fuel element of the BR-5 reactor. The fluence on the cladding is $1.8-2.9 \times 10^{22}$ fast neutr/cm², the operating temperatures in different parts of the fuel element being 430 deg to 585 deg C. There has been observed circumferential non-uniformity of the distribution, concentration, and of the total volume of radiation cavities, which is due to temperature non-uniformity along the cladding perimeter. It is shown that such non-uniformity of radiation swelling of the cladding material may result in bending of the peripheral fuel element with regard to the fuel assembly sheath walls.

4466 FISSION PRODUCT YIELDS DURING IRRADIATION OF ²³⁵U AND ²³⁹PU IN THE BOR-60 REACTOR. Gabeskiriya, V.Ya.; Gryzina, V.V.; Nivokov, V.V.; Prokopenko, V.S.; Prokop'ev, V.M.; Tikhomirov, V.V.; Chetverikov, V.A. At. Energ. (USSR); 43: No. 1, 59-60(Jul 1977). (In Russian).

4467 BUILD-UP AND DECAY OF ACTINIDE NUCLIDES IN FUEL CYCLE OF NUCLEAR REACTORS. Tasaka, K.; Kikuchi, Y.; Shindoh, R.; Yoshida, H. (Japan Atomic Energy Research Inst., Tokai, Ibaraki. Tokai Research Establishment). J. Nucl. Sci. Technol. (Tokyo); 14: No. 7, 519-531(Jul 1977).

In order to assess the feasibility of utilizing plutonium in thermal reactors, build-up and decay of actinide nuclides have been studied for BWR, PWR, HWR, HTGR and LMFR, which are uranium-oxide fueled or mixed-oxide fueled, and which produce electric power of 1,000 MW. The following items were examined: (1) quantities of actinide nuclides build-up in the reactor, (2) build-up and decay of activities of actinides in the spent fuel, (3) build-up and decay of activities of actinides after reprocessing, and (4) variation of isotopic composition of plutonium with high burn-up. It is concluded from the calculated results that precautions should be taken against high activities of resultant actinides if plutonium is utilized as a fissile material for thermal reactors. To make reprocessing and high-level waste management easy and practical, it is recommended that a thermal reactor should be fueled with uranium, the plutonium produced in a thermal reactor should be used in a fast reactor, and plutonium produced in the blanket of a fast reactor is more appropriate as fast reactor fuel than that from a thermal reactor.

4468 STATISTICAL ERROR OF CALCULATING REACTIVITY BALANCE. Kebabze, B.V.; Efimov, V.N.; Adamovskii, L.A. At. Energ. (USSR); 43: No. 1, 36-37(Jul 1977). (In Russian).

4469 FAST BREEDER NUCLEAR REACTOR COOLED WITH LIQUID METAL. Ackroyd, R.T.; Perks, M.A. (to UKAEA London Office). German(FRG) Patent 1,957,090/B/. 30 Jun 1977. 6p. (In German).

A variation of the construction of a liquid metal cooled nuclear reactor (a fast breeder)

is proposed, which has the following zones, starting on the inside and working outwards: A first breeding zone, which is surrounded by a nuclear fuel zone, a second breeding zone with surrounding nuclear fuel and a third breeding zone, which reaches to the outside of the reactor core. One obtains a high breeding yield with short doubling time. Various geometrically different variants are described.

4470 PROTECTIVE COATING FOR FLOOR COOLER. Friedrich, H.J.; Blokker, E. (to Internationale Atomreaktorbau G.m.b.H. (INTERATOM), Bergisch Gladbach (Germany, F.R.)). German(FRG) Patent 2,557,884/A/. 30 Jun 1977. 13p. (In German).

This protective layer (consisting of two layers) takes the molten fuel in a hypothetical reactor accident. The metallic circular floor trough contains the two layers of different thicknesses according to the invention. The upper layer, 5 to 10 cm thick, of uranium dioxide or (for sodium cooled fast breeder reactors) of thorium 'bodies' of high melting point and low conduction produces widespread dispersion of the liquid fuel with slow penetration. It prevents the formation of a core physical critical mass and does not react, or reacts only slightly, with the liquid fuel. The lower layer consisting of preferably hexagonal closely packed 15 to 20 cm high graphite bodies, conducts the heat flow from above more quickly than it arrives, into the floor trough. The melting point of the lower material in the separating layer from the upper material is not exceeded.

4471 SENSOR FOR IONIZABLE ELEMENTS. Berkey, E.; Reed, W.A. III; Hickam, W.M. (to Westinghouse Electric Corp., Pittsburgh, PA (USA); Deutsches Patentamt, Muenchen (Germany, F.R.)). German(FRG) Patent 2,557,132/A/. 23 Jun 1977. 13p. (In German).

A sensor is described which is to detect thermally ionizable elements or molecules in air, water vapour or oxygen or to be used as alkali leak detector in vacuum systems, e.g. in the pipe system of a liquid-metal cooled FBR. The sensor consists of an filament made of thorium-containing iridium as cathode with a temperature upto 1000°C and an anode sheet of molybdenum, nickel or stainless steel.

4472 PUMP TANK DIVIDER PLATE FOR SUMP SUCTION SODIUM PUMPS. George, J.A.; Nixon, D.R. (to Energy Research and Development Administration). US Patent 4,029,123. 14 Jun 1977. Filed date 20 Aug 1975. 6p. PAT-APPL-606,043.

A circular plate extends across the diameter of a sump suction pump, with a close clearance between the edge of the plate and the wall of the pump tank. The plate is located above the pump impeller, inlet and outlet flow nozzles but below the sodium free surface and effectively divides the pump tank into two separate chambers. On change of pump speed, the close fitting flow restriction plate limits the rate of flow into or out of the upper chamber, thereby minimizing the rate of level change in the tank and permitting time for the pump cover gas pressure to be varied to maintain an essentially constant level. 4 claims, 3 figures.

4473 TUBULAR GAGE FOR A LIQUID-METAL-COOLED FAST BREEDER REACTOR. Hutter, E.; Tuma, L.A. (to Energy Research and Development Administration). US Patent 4,028,811. 14 Jun 1977. Filed date 2 Mar 1976. 12p.

PAT-APPL-663,179.

Spring-loaded plungers are arranged about a housing for insertion into a polygonal tube, one plunger for each side of the tube. Each plunger has a locking cam and sliding wedge mechanism which can overcome the spring force associated with the plunger and lock it in any position. The wedges are operated by a rod movable axially in the housing. Several housings with their associated plungers can be stacked. The stack is lowered into the polygonal tube with all of the plungers locked in a fully inward position. When the stack is in the tube, each wedge is moved to release its locking cam, allowing each of the plungers to spring outward against an inner side of the tube. Each housing will thus gage the internal dimensions of the tube at its elevation. The plungers are locked in position, the entire stack is rotated to bring the plungers into the corners described by the intersections of the flat sides, and the stack is removed from the tube whereupon the dimensions across opposite locked plungers may be read by a micrometer.

- 4474 PRESENT STATE AND DEVELOPMENT POTENTIAL OF HIGH TEMPERATURE REACTORS. Hardt, L. Glueckauf; 113: No. 11, 545-551(2 Jun 1977). (In German).

General review of nuclear reactors is followed by evaluation of boiling water, pressurized water, and fast breeder reactors. Characteristics and safety aspects of high temperature reactors are discussed and use of process heat derived from them for coal gasification is considered. Development of reactor with helium turbine is noted. 9 refs.

The 1977 American Power Conference provided an immediate opportunity for electric utilities to make known their reactions to President Carter's nuclear policy statements. Continued development of the fast reactor, Pu cycle and reprocessing were all considered essential. A nuclear power reactor was the most difficult way of producing plutonium for bombs.

- 4490 ENERGY GAP AND THE FAST REACTOR. Hill, J. (UKAEA). Atom (London); No. 248, 106-109(Jun 1977).
The author discusses the case for nuclear energy and in particular for the fast reactor. The real limitations to the fast reactor system are considered from the viewpoints of physics, sodium coolant, fuel, and engineering.
- 4491 REVIEW OF THE POTENTIAL FOR THE USE OF NUCLEAR REACTORS FOR HYDROGEN PRODUCTION. Worley, N.G. (Babcock and Wilcox Ltd., London (UK)). Energy Dig. (London); 6: No. 3, 40-44(Jun 1977).
The possibilities of using reactors to carry out high temperature chemical processes are considered briefly. The relevant characteristics of the high temperature gas cooled reactor and fast breeder reactors are summarized. The use of 'off-peak' electricity to produce hydrogen by the electrolysis of water is considered. Various problems, political, social, organizational and technical are discussed.
- 4492 STREAMING PROBLEMS ARE THE MAJOR WORRY FOR SHIELDING EXPERTS. Martin, A. (Associated Nuclear Services, Epsom (UK)). Nucl. Eng. Int.; 22: No. 258, 30-31(Jun 1977).
The fifth international conference on reactor shielding was held in Knoxville, Tennessee, from 18 to 23 April, 1977 and was sponsored primarily by Oak Ridge National Laboratory. The design problems associated with LMFBR and fusion facilities were covered in many papers. Other aspects covered in detail were the recently encountered streaming problems and the increasing difficulties posed by activated corrosion products in LWR plants.
- 4493 TESTS IN SUPPORT OF LMFBR. Abrahamson, G.R.; Cagliostro, D.J.; Florence, A.L. (Stanford Research Inst., Menlo Park, Calif. (USA)). Nucl. Eng. Des.; 42: No. 1, 89-104(Jun 1977).
From International seminar on Containment of Fast Breeder Reactors; San Francisco, USA (22 - 23 Aug 1977).
Tests in support of LMFBR projects for potential incidents involving a hypothetical core disruptive accident or sodium-water interactions in steam generators have two possible goals: (1) to evaluate the integrity of the primary containment after the design is frozen or (2) to investigate design options in support of primary containment design. The test planning approach differs depending on the goal. The Fast Flux Facility tests had the first goal, the current Clinch River Breeder Reactor tests have the second goal. This paper discusses test planning, sources for simulating loads, modeling, and instrumentation. The main source described involves controlled venting of explosive gases. The source avoids generation of undesirable shock waves and facilitates calibration because the reaction rate of the explosive is independent of the response. It is indicated that the test program requiring the least time and cost involves a mixture of three types of models: small simple models, small complex models, and large complex models. Instrumentation is discussed that is required for validation of loading, response measurements for comparison with calculations, and response measurements on critical members where predictions are not possible.
- 4494 EXPERIMENTAL STUDY ON DYNAMIC RESPONSE OF REACTOR VESSEL TO AN HCDA. Ando, Y.; Kondo, S. (Tokyo Univ. (Japan). Faculty of Engineering); Yoshizawa, H. (Tokyo Shibaura Electric Co. Ltd., Kawasaki, Kanagawa (Japan). Research and Development Center); Sasanuma, K. (Advanced Reactor Engineering Department, Atomic Power Division, Toshiba, Minatoku, Tokyo, Japan); Kawaguchi, O.; Mochio, T. (Power Reactor and Nuclear Fuel Development Corp., Tokyo (Japan)). Nucl. Eng. Des.; 42: No. 1, 105-113(Jun 1977).
From International seminar on Containment of Fast Breeder Reactors; San Francisco, USA (22 - 23 Aug 1977).
This paper presents a discussion on the model experiments results for reactor structure dynamic response on FBR hypothetical core disruptive accident (HCDA) and the results of analysis using the dynamic response analysis code under experimental conditions. The purpose of this study is to clarify experimentally the dynamic response by use of scale models, as well as to attempt to confirm and improve the dynamic response analysis code on the basis of experimental data. The experimental results have clarified the inner barrel effects on reactor vessel deformation and its behavior due to a impact load. On the other hand, dynamic analysis was made of the 1/7.5 scale complex

model by a dynamic response analysis code 'PISCES-2DL', using the explosive combustion characteristics as inputs. Obtained values were compared with experimental values. Results showed that this method was fairly capable of evaluating radial deformation behavior in lower cylindrical parts of the vessel.

- 4495 CORE DEBRIS BEHAVIOUR AND INTERACTIONS WITH CONCRETE. Baker, L. Jr. (Argonne National Lab., Ill. (USA)). Nucl. Eng. Des.; 42: No. 1, 137-150 (Jun 1977).

From International seminar on Containment of Fast Breeder Reactors; San Francisco, USA (22 - 23 Aug 1977).

The behavior of LMFBR core debris following a hypothetical core-disruptive accident (HCDA) depends upon a wide range of physical and chemical phenomena. Current understanding of the key phenomena are summarized for core-debris behavior within the reactor vessel, within the reactor cavity, and within the concrete base mat below the reactor cavity. In-vessel behavior was the principal consideration of post-accident heat removal for the FFTF reactor. Several concepts of engineered core-retention systems within the reactor cavity have been considered for other reactors, including the cooled crucible concept, the sacrificial barrier concept, the stable barrier concept, and the catch tray concept. Behavior within the concrete base mat is an important part of a general concept of inherent core retention which depends upon an understanding of the complex interactions of core debris with concrete.

- 4496 APPLICATION OF CONTAINMENT CODES TO LMFBRs IN THE UNITED STATES. Chang, Y.W. (Argonne National Lab., Ill. (USA)). Nucl. Eng. Des.; 42: No. 1, 53-67 (Jun 1977).

From International seminar on Containment of Fast Breeder Reactors; San Francisco, USA (22 - 23 Aug 1977).

This paper describes the application of containment codes to predict the response of the fast reactor containment and the primary piping loops to HCDAs. Five sample problems are given to illustrate their applications. The first problem deals with the response of the primary containment to an HCDA. The second problem deals with the coolant flow in the reactor lower plenum. The third problem concerns sodium spillage and slug impact. The fourth problem deals with the response of a piping loop. The fifth problem analyzes the response of a reactor head closure. Application of codes in parametric studies and comparison of code predictions with experiments are also discussed.

- 4497 NUCLEAR ACCIDENT SIMULATION IN A 1/6 SCALE MODEL OF THE SNR-300 FAST BREEDER REACTOR. Egleme, M.; Fabry, J.P.; Lamotte, H. (Societe Belge pour l'Industrie Nucleaire, Brussels). Nucl. Eng. Des.; 42: No. 1, 115-122 (Jun 1977).

From International seminar on Containment of Fast Breeder Reactors; San Francisco, USA (22 - 23 Aug 1977).

In the frame of the licensing of the SNR-300 fast breeder reactor an HCDA has been investigated both by theoretical and experimental means. The latest phase of this programme was the simulation of a HCDA in a very well instrumented 1/6 scale model of the SNR-300 vessel. The Bethe-Tait accident was simulated by a slow burning charge. In order to check the reliability of the theoretical means allowing for an evaluation of these accidents, the German authorities wanted to receive,

before the shot, a theoretical precalculation report showing the main permanent deformations and responses of the pressure and strain gauges versus time. This paper compares and comments on the most meaningful results of this experiment with the SURBOUM-II precalculated estimations.

- 4498 ASSESSMENT OF ACCIDENT ENERGETICS IN LMFBR CORE-DISRUPTIVE ACCIDENTS. Fauske, H.K. (Argonne National Lab., Ill. (USA)). Nucl. Eng. Des.; 42: No. 1, 19-29 (Jun 1977).

From International seminar on Containment of Fast Breeder Reactors; San Francisco, USA (22 - 23 Aug 1977).

An assessment of accident energetics in LMFBR core-disruptive accidents is given with emphasis on the generic issues of energetic recriticality and energetic fuel-coolant interaction events. Application of a few general behavior principles to the oxide-fueled system suggest that such events are highly unlikely following a postulated core meltdown event.

- 4499 TRANSIENT CONTAINMENT RESPONSE AND INHERENT RETENTION CAPABILITY. Glueckler, E.L.; Dayan, A.; Hayes, F.; Kline, C.T. (General Electric Co., Sunnyvale, Calif. (USA)). Fast Breeder Reactor Dept.). Nucl. Eng. Des.; 42: No. 1, 151-167 (Jun 1977).

From International seminar on Containment of Fast Breeder Reactors; San Francisco, USA (22 - 23 Aug 1977).

For safety assessments of early sodium cooled fast breeder reactors, hypothetical events such as loss of flow or transient overpower sequences combined with the failure of the reactor protective systems have been evaluated. The intent of these evaluations was to demonstrate that even extremely unlikely combinations of failures which could lead to meltdown of a portion of the reactor core would not propagate into events harmful to the public. This paper investigates the consequences of a meltdown event. In general, reactor vessels and the primary sodium systems have an adequate inherent retention capability to retain dispersed or molten core debris and remove decay heat. For certain vessel designs, large core debris masses may penetrate through the vessel wall and drain into the reactor cell. Although significant uncertainties exist in the evaluations of debris retention and heat removal capabilities of the containment, there is indication that criteria for radiological limits can well be met. If the accident progression can be controlled in-vessel, consequences would be minimized.

- 4500 APPLICATION OF A COUPLED EULER-LAGRANGE COMPUTER PROGRAM TO THE STRUCTURAL RESPONSE OF AN LMFBR. Hancock, S.L. (Physics International Co., San Leandro, Calif. (USA)). Nucl. Eng. Des.; 42: No. 1, 69-74 (Jun 1977).

From International seminar on Containment of Fast Breeder Reactors; San Francisco, USA (22 - 23 Aug 1977).

This paper discusses the application of PISCES 2DELK, a coupled Euler-Lagrange computer code, to the response of an LMFBR to a hypothetical core-disruptive accident. The coupled Euler-Lagrange method allows one to use an Euler finite difference mesh to compute fluid flow and a Lagrange mesh to compute structural response. The finite difference equations are discussed, and a sample calculation is presented in which the sodium gas bubble expands around a movable internal structure.

4501 TESTING PHILOSOPHY AND SIMULATION

TECHNIQUES. Holtbecker, H. (Commission of the European Communities, Ispra (Italy). Joint Research Centre). Nucl. Eng. Des.; 42: No. 1, 75-87 (Jun 1977).

From International seminar on Containment of Fast Breeder Reactors; San Francisco, USA (22 - 23 Aug 1977).

This paper reviews past and present testing philosophies and simulation techniques in the field of structure loading and response studies. The main objective of experimental programmes in the past was to simulate a hypothetical energy release with explosives and to deduce the potential damage to a reactor from the measured damage to the model. This approach was continuously refined by improving the instrumentation of the models, by reproducing the structures as faithful as possible and by developing new explosive charges. This paper presents an analysis of the factors which are expected to have an influence on the validity of the results e.g. strain rate effects and the use of water instead of sodium. More recently the discussion of a whole series of accidents in the probabilistic accident analysis and the intention to compare different reactor designs has revealed the need to develop and validate computer codes. Consequently experimental programmes have been started in which the primary aim is not to test a specific reactor but to validate codes. This paper shows the principal aspects of this approach and discusses first results.

4502 EXPERIMENTS ON SODIUM FIRES AND THEIR

AEROSOLS. Morewitz, H.A.; Johnson, R.P.; Nelson, C.T. (Atomics International Division, Rockwell International, Canoga Park, California, USA). Nucl. Eng. Des.; 42: No. 1, 123-135 (Jun 1977).

From International seminar on Containment of Fast Breeder Reactors; San Francisco, USA (22 - 23 Aug 1977).

A number of new sodium fire and aerosol experiments were undertaken to provide data for LMFBR safety analyses: (1) Experiments on the burning of single drops of liquid sodium falling in air have been performed to aid in model development for sodium spray fire codes. (2) The leakage of sodium oxide aerosols through a straight smooth capillary tube, representative of the maximum size of a hypothetical gas leak in the wall of the secondary containment of an LMFBR, has been studied. Even in those cases in which the capillary did not plug, <11% of the entering mass was of a respirable size as it emerged from the capillary. In addition, there were a number of conditions under which the capillary plugged. (3) Experiments on the behavior of high temperature, high concentration aerosols have shown a rapid depletion of the aerosol concentration in the first 6 sec following injection of approximately 800 g/m³ aerosols at approximately 1000°C into a closed vessel. This depletion has been correlated with the early formation of 100 to 200 µm agglomerates which fall out promptly.

4503 RESPONSE OF LIQUID METAL FAST BREEDER

REACTOR CONTAINMENT TO A HYPOTHETICAL CORE MELTDOWN ACCIDENT. Peak, R.D.; Simpson, D.E.; Stepnewski, D.D. (Hanford Engineering Development Lab., Richland, Wash. (USA)). Nucl. Eng. Des.; 42: No. 1, 169-180 (Jun 1977).

From International seminar on Containment of Fast Breeder Reactors; San Francisco, USA (22 - 23 Aug 1977).

This paper presents an analysis of the response of the containment building of a 2500-

MW liquid metal fast breeder reactor to a hypothetical reactor core meltdown. Although not mechanistically justifiable, this type of event is chosen for analysis as a basis for risk assessments. Containment space atmosphere compositions, temperatures, pressures, and structural temperatures are calculated, based on decay energy release and chemical reactions associated with the incident. The CACECO containment analysis code, which was used to make the calculations, is described in detail. Results of the study show that by utilizing the passive heat absorption capability of structures normally present in containment design, reactor plant containment integrity can be maintained for more than a day, even for extreme hypothetical events.

4504 FATIGUE CRACK PROPAGATION IN TYPES 304 AND 308 STAINLESS STEEL AT ELEVATED

TEMPERATURES. Raske, D.F.; Cheng, C.F. (Argonne Natl Lab, Ill). Nucl. Technol.; 34: No. 1, 101-110 (Jun 1977).

The fatigue crack-growth behavior of Type 304 stainless-steel base metal and Type 308 stainless-steel weld metal at elevated temperature was investigated using axially loaded single-edge-notch specimens. The crack-growth rates were determined and are presented as a function of the stress-intensity factor range. Both the base- and weld-metal specimens were tested in the as-received (or as-welded) and thermally aged condition. The results indicate that the crack-growth rates in the weld metal are significantly lower than in the base metal. In addition, aging at 593°C for 1000 h improved the resistance to fatigue crack growth in both the base and weld metals. These results are relevant to austenitic stainless steels fabricated by welding for use in liquid-metal fast breeder reactors.

4505 ROLE OF RELIABILITY AND RISK ASSESSMENT

IN LMFBR DESIGN: IMPLEMENTATION OF RELIABILITY IN LMFBR DESIGN. Graham, J.; Zemanick, P.P. (Westinghouse Electric Corp., Madison, Pa. (USA). Advanced Reactors Div.). Nucl. Eng. Des.; 42: No. 1, 1-9 (Jun 1977).

From International seminar on Containment of Fast Breeder Reactors; San Francisco, USA (22 - 23 Aug 1977).

This paper concerns future developments in LMFBR licensing technology. Federal Regulations (10 CFR 50.34) require that the preliminary safety analysis provide analysis and evaluation 'with the objective of assessing the risk to public health and safety' to determine margins of safety and the adequacy of the plant. Hitherto the assessment of risk has been qualitative but it has become increasingly apparent that quantitative assessments would provide a better basis for judgement. Potential future roles of reliability and risk assessment are discussed in the context of providing additional confirmation of the safety of LMFBR designs. Potential acceptability criteria for risk evaluations are outlined. The reliability implications of designing components to the ASME Code Section III requirements are discussed. General judgements are provided as well as the preliminary results of probabilistic studies of selected specific limits. There is a different reliability significance for the mandatory rules for normal, upset, and emergency conditions versus the non-mandatory rules for normal, upset, and emergency conditions versus the non-mandatory guidance for faulted conditions.

4506 RESULTS OF THE POSTIRRADIATION EXAMINATIONS OF THE RAPSODIE-1 EXPERIMENT FUEL

PINS. Haas, D. (Belgonucleaire, Brussels); van de Velde, J.; Gaube, M.; Ketels, J.; van Loon, C. Nucl. Technol.; 34: No. 1, 75-88 (Jun 1977).

An experiment sponsored by the Gesellschaft für Kernforschung at Karlsruhe, by Belgonucleaire, and by Interatom was carried out in the French reactor Rapsodie from February 1971 to September 1972, in the frame of a research and development program for the fast breeder prototype reactor SNR. This experiment consisted in the irradiation of two bundles, each containing 34 mixed-oxide pins, with spacer grids and tie-rods, up to a peak burnup of 10.6 at.% and a peak total neutron fluence of $8 \times 10^{20} \text{ mm}^{-2}$, corresponding to a peak fast fluence ($E > 0.111 \text{ MeV}$) of $6.4 \times 10^{20} \text{ mm}^{-2}$. The postirradiation examinations showed that the cold-worked WNr. 1.4970 cladding stainless steel has a lower irradiation-induced swelling than the solution-annealed WNr. 1.4988. Important inelastic deformations of both types of claddings have been observed; the largest part of these deformations can be explained by the in-pile creep. A mechanical interaction between the fuel and the cladding is not excluded in the case of the pins with the cladding steel WNr. 1.4970. The destructive examinations emphasized the influence of the pellets' initial stoichiometry on the fission product migration, on the plutonium radial distribution, and on the fuel-cladding chemical interaction. An interaction between the fuel and the blanket pellets, due to the cesium migration and to the formation of cesium uranates, leading to local cladding strains, has been noted. These phenomena, as well as the chemical interaction between the fuel and the cladding, have been investigated by extensive microprobe analysis. Finally, the fuel restructuring has been analyzed and interpreted as a function of the fuel characteristics, irradiation conditions, and cladding deformations.

- 4507 INFLUENCE OF THE RADIAL TEMPERATURE GRADIENT ON CLADDING DILATATION. Venker, H. (Institut fuer Material- und Festkoerperforschung, Karlsruhe, Ger.); Bober, M.; Schumacher, G. Nucl. Technol.; 34: No. 1, 98-100 (Jun 1977).

In the steep radial temperature gradient existing in the cladding wall of an LMFBR fuel pin, migration of vacancies up and lattice atoms down the temperature gradient can take place. The transport mechanisms are thermal diffusion and diffusion due to a radial activity gradient of vacancies caused by the temperature-dependent supersaturation of vacancies. An estimation shows that thermal diffusion could contribute to cladding dilatation under fast-neutron irradiation. The enhancement of diffusion under irradiation is derived from in-pile diffusion data of copper and gold in aluminum, because corresponding data of stainless steel are not available.

- 4508 HIGH-PRESSURE CAPSULE FOR THE IRRADIATION OF FUEL SWELLING SPECIMENS IN THE FR2 REACTOR. Haefner, H.E. (Inst. of Materials and Solid State Research, Karlsruhe, Ger.). Nucl. Technol.; 34: No. 1, 69-74 (Jun 1977).

Designing advanced fuel element concepts for fast breeder reactors and assessing by models the fuel rod behavior over the intended in-pile time require information about creeping and swelling in the nuclear fuels under in-pile conditions. A new series of experiments serves the concrete purpose of a quantitative assessment of the parameters of carbides as potential fast breeder fuels, carbide being

more susceptible to swelling than oxides. The loading of the specimen is given by the cladding restraint with the swelling fuel, and does not cause any undue expansion of the cladding of realistic fuel rods under operating conditions. This permissible contact pressure is generally below 300 bar (30 MPa). In an in-pile capsule recently developed, fuel specimens having the form of thin annular pellets may be exposed to omnilateral loads of up to 50 N/mm² by an aerostatic gas pressure of 500 bar (50 MPa) maximum at temperatures of up to approximately 1800°C. The swelling of the fuel after various burnups under different test conditions will be measured in a postirradiation examination. Because of the extraordinary stress exerted upon these high-pressure capsules under irradiation conditions, extensive preliminary tests and trials were necessary. A first prototype rig with two swelling specimen capsules containing five annular UO₂ pellets each has now been successfully tested in the FR2 reactor over an in-pile period of 170 days. In this case, the fuel temperatures were approximately 1350°C, and the specimen stresses were 45 N/mm². Further experiments are planned with (U, Pu)C-fuel up to 1800°C and 50 N/mm².

- 4509 PERSPECTIVES OF NUCLEAR ENERGY DEVELOPMENT IN EUROPEAN COUNTRIES. Zaleski, C.P.L. Adrikhalut; 37: No. 6, 36-39 (Jun 1977).

In 1975, nuclear energy represented almost 2% of energy production in E.E.C. countries. Projections for 1985 indicate 17% of the total energy production furnished by nuclear plants. Within a reasonable range of hypotheses, it seems that one should expect for the European countries a contribution of nuclear energy at the beginning of the next century at a level of between 25% and 50% of total energy consumption. This kind of development raises a serious problem of uranium resources, and shows the need, and even the urgency, of breeder reactors development. The various strategies of reactor development and its connections with uranium availability and cost are discussed. 8 refs.

- 4510 ACOUSTIC EMISSION IN SUBCOOLED NUCLEATE POOL BOILING. Nishihara, H.; Bessho, Y. (Kyoto Univ, Jpn). J. Nucl. Sci. Technol. (Tokyo); 14: No. 6, 407-415 (Jun 1977).

The acoustic emission in boiling had frequency components up to and sometimes beyond 50 kHz; the shape of power spectral densities behaved differently for heat fluxes above and below a certain value at which the overall acoustic intensity assumed a maximum value. With the increase in heat flux the acoustic emission increased in high frequencies below this heat flux, while it became eminent in low frequencies above the same heat flux. This phenomenon is related to the transition from the region with single bubbles to the region with coalesced bubbles. 23 refs.

- 4511 (JAPFNR--263) TEMPERATURE, FLOW, AND ACOUSTIC NOISES IN A LOCALLY BLOCKED 37-PIN BUNDLE. Kikuchi, Y.; Ogino, T.; Ozaki, Y.; Inushima, H. (Power Reactor and Nuclear Fuel Development Corp., Oarai (Japan); Mitsubishi Electric Corp., Amagasaki, Hyogo (Japan)). Jun 1977. Translation of PNC-N--943-77-05 (CONF-770640--2). 9p. Dep. NTIS (US Sales Only), PC A02/MF A01.

From 7. liquid metal boiling working group meeting; Petten, Netherlands (1 Jun 1977).

Work performed under United States--Japanese Fast Reactor Exchange Program.

Temperature, flow, and acoustic noises were measured in a locally blocked 37-pin bundle. Comparison of sodium temperature noise obtained in the blocked and unblocked experiments led to the observation that the blockage formation increased the measured root-mean-square (RMS) value by approximately three times in the low frequency ranges (0.1 approximately 10 Hz). Noncondensable gas (argon) entrainment caused a considerable increase in the outlet flow noise measured by an eddy-current type flowmeter. The boiling caused a considerable increase in acoustic noise intensity at all frequencies, particularly in the high frequency ranges (5 approximately 100 kHz).

- 4512 EVALUATION OF EFFECTS OF FINITE MIXING TIME AND NON-CONDENSABLE GAS ON FUEL--SODIUM INTERACTIONS. Saito, S. (Jpn At Energy Res Inst, Tokai-mura, Ibaraki-ken). J. Nucl. Sci. Technol. (Tokyo); 14: No. 6, 395-406(Jun 1977).

An approach has been tried to provide more realistic estimates of pressure history and mechanical work caused by fuel-sodium interaction (FSI) in postulated fast reactor accident. The work reported here is focussed on the evaluation of the effects due to fragmentation process or finite mixing time and presence of non-condensable gas on FSI. 6 refs.

- 4513 (JAPFNR--262) TRANSIENT BOILING OF SODIUM IN A 19-PIN BUNDLE UNDER LOSS-OF-FLOW CONDITIONS. Kikuchi, Y.; Haga, K. (Power Reactor and Nuclear Fuel Development Corp., Oarai (Japan)). Jun 1977. Translation of PNC-N--943-77-04 (CONF-770640--3). 9p. Dep. NTIS (US Sales Only), PC A02/MF A01.

From 7. liquid metal boiling working group meeting; Petten, Netherlands (1 Jun 1977).

Work performed under United States--Japanese Fast Reactor Exchange Program.

Experimental studies were carried out on transient sodium boiling in an electrically heated 19-pin bundle under loss-of-flow conditions. In the first series of experiments temperature distributions in the bundle were measured under initial steady state non-boiling conditions. The measured temperature distributions agreed fairly well with the calculation by the computer code NORMAL. In the second series of experiments transient boiling phenomena were investigated under loss-of-flow conditions. No high superheat was observed for boiling initiation. The observed coolant voiding was initially limited to the center subchannel because of steep temperature gradient in the bundle and then spread slowly.

- 4514 DETERMINATION OF THE BENDING LOADINGS RESULTING FROM THE SUPERHEATED STEAM FLOW PATH VARIATION IN AN EXPANSION PIPE-BEND FOR SODIUM-WATER HEAT EXCHANGERS. Crucitti, N. (Ansaldo S.p.A., Genoa (Italy)). Energ. Nucl. (Milan); 24: No. 6, 327-334(Jun 1977).

The structural design of an asymmetric stiffened pipe incorporating an expansion bend, as applied in a sodium-water heat exchanger, was presented in *Energia Nucleare*, vol. 23(10) p. 507 (October 1976). The present article describes a further theoretical approach required to make such design more complete and reliable. In particular, the bending loadings exerted on the pipe-bend, as resulting from the path variation of the running fluid, are evaluated. All correlations associated to such loadings are derived in terms of the expansion bend sizing parameters and superheated steam flow properties and presented in a quick-use form for practical design purposes.

- 4515 EVALUATION OF EFFECTS OF FINITE MIXING TIME AND NON-CONDENSABLE GAS ON FUEL SODIUM INTERACTIONS. Saito, S. (Japan Atomic Energy Research Inst., Tokai, Ibaraki. Tokai Research Establishment). J. Nucl. Sci. Technol. (Tokyo); 14: No. 6, 395-406(Jun 1977).

An approach has been tried to provide more realistic estimates of pressure history and mechanical work caused by fuel-sodium interaction (FSI) in postulated fast reactor accident. The work reported here is specifically focussed on the evaluation of the effects due to fragmentation process or finite mixing time and presence of non-condensable gas on FSI. As one of the methods to describe the fragmentation process in FSI, the mass of fuel which interacts with sodium has been introduced as a function of time. The presence of non-condensable gas in the unheated sodium regions above and below the interaction region as well as in the interaction region itself has been taken into account in the model, which affects value of sonic velocity in the former, and volume change in the latter. An extensive parametric study has led the conclusion that the total mechanical work as well as a value of peak pressure at the initial period in which sodium remains liquid strongly decrease with the mixing time constants and/or non-condensable gas content in the system, and in the most plausible case, a possible maximum value of peak pressure through the entire period in the fuel-sodium interaction appears to be at most a few hundred atmospheres.

- 4516 DEVELOPMENT OF FAST REACTORS AND STUDIES ON MATERIALS. Mishima, Y. (Tokyo Univ. (Japan). Faculty of Engineering). Kinzoku; 47: No. 6, 7-12(Jun 1977). (In Japanese).

The effort of independent development has born fruit, and the fast experimental reactor "Joyo" has attained the criticality on April 24, 1977. The fast neutron source reactor in the University of Tokyo has been in operation since 1972, but Joyo is the first full-scale fast reactor. The refining techniques for sodium and the purity control for sodium in use were important problems. The cooling of fuel rods, the swelling of fuel due to high burn-up, the strict dimensional allowance for fuel assemblies owing to poor controllability, the supporting method without large flow resistance for fuel assemblies, the local overheat of claddings due to FP gas leak, and the irradiation damage of claddings were deemed to be the requirements. The method of manufacturing fuel pellets was investigated. The temperature of coolant has been set at 500 deg. C reluctantly because of the difficulties in the development of cladding material. Steam-cooled fast reactors were conceived to avoid delay, but were not materialized. The cladding material for Joyo is 316 stainless steel containing reduced nitrogen as the measures to helium damage. As the piping material, 2,1/4 Cr-1Mo steel without niobium was used. In Japan, nickelclad vanadium alloy has been investigated in the University of Tokyo to give sodium resistance with nickel cladding.

- 4517 FLOW IN SODIUM LOOP SURGE TANK. Matál, O.; Martoch, J. (Vyzkumny Ústav Zavodu Energetického Strojirenství, Brno (Czechoslovakia). Odbor Nukleární Techniky). Jad. Energ.; 23: No. 6, 207-211(Jun 1977). (In Czech).

The alternate liquid flow, the condition of vortex formation, gas entrainment in the discharge and the liquid level characteristics are studied using the models of the vertical and horizontal surge tanks of a sodium circuit

with pump and heat exchangers. The conditions for vortex formation are more favourable in the vertical cylindrical tank than in the horizontal tank. The size of the vortex produced in the tank is affected by the initial speed circulation, due as a rule to an unsuitable inlet design. The proposed design considers an inlet below the sodium level using capped perforated pipes. Vortex formation, gas transport to the discharge pipe and turbulences of the liquid in the tank may be prevented by dividing the tank to the discharge and the inlet areas using perforated partitions, and by inserting the discharge cylinder above the discharge pipe outflow. The liquid level in the tank may be damped by screens or by perforated plates. The adaptation of the surge tank of the sodium circuit will probably eliminate vortex formation and the entrainment of cover gas into the discharge piping and the sodium circuit under nominal conditions.

and accumulate the international competitive power in the economy of future practical reactors. The general construction and the reactor core of this loop type 300 MWe plant are described. SUS 316 stainless steel is used for the handling head, upper shield, cladding tubes, entrance nozzle, and wrapper tube, and molybdenum-clad tantalum is considered as the lower shield in core fuel assemblies. In blanket fuel assemblies, the diameter of cladding tubes is different, and the lower shield is made of SUS 316. SUS 304 stainless steel is used for neutron shields, surveillance assemblies, and neutron sources. However, the wrapper tubes for the surveillance assemblies and neutron sources are made of SUS 316. SUS 316 or 304 is used for the most parts of control assemblies except the controlling material of B₁C. Trial manufacture, irradiation test and other tests are carried out to develop the materials for Monju.

- 4518 FEW-GROUP CONSTANTS FOR CALCULATING $K_{SUB}(EFF)$ AND $\Delta(1/K_{SUB}(EFF))$ OF FAST REACTORS. Svarny, J. (Skoda, Pízen (Czechoslovakia)). *Zavod Vystavba Jadernych Elektraren*. *Jad. Energ.*; 23: No. 6, 201-207 (Jun 1977). (In Czech).

Theoretical and numerical analyses are made of the behaviour of the linear and bilinear averaging of group constants aimed at error accumulation in few-group reactivity coefficient ($k_{sub}(eff)$) calculations and of their first order perturbations ($\Delta(1/k_{sub}(eff))$) as a result of inaccuracies in weight functions. The results were confirmed using the BN-600 fast reactor model. The obtained results are in full agreement with theoretically derived relations.

- 4519 NATURAL EVAPORATION OF SODIUM UNDER THE CONDITIONS OF MIST FORMATION. Kumada, T.; Ishiguro, R. (Hokkaido Univ., Sapporo (Japan)). *Faculty of Engineering*; Abe, T. *Nippon Kikai Gakkai Ronbunshu*; 43: No. 370, 2278-2287 (Jun 1977). (In Japanese).

The natural evaporation of liquid sodium from a horizontal isothermal plane is described. Experiments were carried out by changing the temperature of liquid sodium or the pressure of argon gas. Estimation of the amount of evaporation was also made by the critical supersaturation model (CSM). The experimental results were compared with the theoretical estimation. The rate of evaporation was 1 to 3 times as large as that estimated from the analogy of heat transfer and material transfer, and was almost same as the result of forced evaporation experiment. The estimated values of vapor pressure by the CSM were accurate enough for practical use. However, this agreement does not mean the adequacy of assumption of the CSM. For the further discussion, more information concerning the mist formation is required.

- 4520 MATERIALS FOR FAST BREEDER PROTOTYPE REACTOR 'MONJU'. Kitagawa, H. (Power Reactor and Nuclear Fuel Development Corp., Tokyo (Japan)). *Kinzoku*; 47: No. 6, 18-22 (Jun 1977). (In Japanese).

The Power Reactor and Nuclear Fuel Development Corp. is forwarding the design of the fast breeder prototype reactor 'Monju'. The purposes of the development of Monju are to obtain the prospect on the performance, safety, reliability and operation of FBR power plants by the independent development and through the experiences of design, manufacture, construction and operation, in order to put FBRs in practical use in 1990s, and to develop

- 4521 BEHAVIOR OF CHROMEL-ALUMEL THERMOCOUPLES DURING EMERGENCY SHUTDOWN OF THE BR-10 REACTOR. Kruglov, A.S.; Vyrodov, P.V.; Redchenko, M.I. *At. Energ. (USSR)*; 42: No. 6, 504-505 (Jun 1977). (In Russian).

- 4522 BEHAVIOUR OF CHROMEL-ALUMEL THERMOCOUPLES DURING EMERGENCY SHUTDOWN OF THE BR-10 REACTOR. Kruglov, A.S.; Vyrodov, P.V.; Redchenko, M.I. *At. Energ. (USSR)*; 42: No. 6, 504-505 (Jun 1977). (In Russian).

ALUMEL; CHROMEL; DATA; HIGH TEMPERATURE; PHYSICAL RADIATION EFFECTS; SBR-5 REACTOR; SCRAM; THERMOCOUPLES; THERMOELECTRICITY; TIME DEPENDENCE

- 4523 LIQUID-METAL DIP SEAL WITH PNEUMATIC SPRING. Poindexter, A.M. (to Energy Research and Development Administration). *US Patent* 4,026,763. 31 May 1977. Filed date 12 Apr 1976. 4p.

PAT-APPL-675,845.

An improved liquid-metal dip seal for sealing the annulus between rotating plugs in the reactor vessel head of a liquid-metal fast-breeder nuclear reactor has two legs of differing widths communicating under a seal blade; the wide leg is also in communication with cover gas of the reactor and the narrow leg is also in communication with an isolated plug annulus above the seal. The annulus contains inert gas which acts as a pneumatic spring. Upon increasing cover gas pressure which depresses the level in the wide leg and greatly increases the level in the narrow leg, the pneumatic spring is compressed, and resists further level changes, thus preventing radioactive cover gas from bubbling through the seal.

- 4524 SUPERPHENIX. A BREEDER REACTOR IN FULL SCALE. Lingjaerde, R. (Institutt for Atomenergi, Kjeller (Norway)); Vendryes, G.A. *Tek. Ukebl.*; 124: No. 22, 12, 14, 16 (20 May 1977). (In Norwegian).

A description of the Super Phenix reactor is preceded by a brief discussion of the background for the development of the breeder reactor and of the basic principles of the fast breeder. In conclusion the time schedule for Super Phenix is presented and the future prospects for fast breeder nuclear power plants in France are briefly discussed.

- 4525 TERTIARY HEAT EXCHANGER. Hahn, G. (to Internationale Atomreaktorbau G.m.b.H. (INTERATOM), Bergisch Gladbach (Germany, F.R.)). German (FRG) Patent 2,550,329/A/. 18 May 1977. 9p. (In German).

The invention deals with the improvement of a tertiary heat exchanger possessing a contact medium besides a heating and working medium. These kind of heat exchangers are used in sodium-cooled nuclear power plants. The contact medium used so far should be replaced by a metal granulate which is used in porous bulk of single grains of varying size. It is advantageous to use copper as granulate.

- 4526 REACTOR ROTATING SHIELD WITH CONVECTION BARRIER FOR METAL VAPOURS. Rothfuss, H.; Koehler, M. (to Internationale Atomreaktorbau G.m.b.H. (INTERATOM), Bergisch Gladbach (Germany, F.R.)). German (FRG) Patent 1,813,820/C/. 18 May 1977. 2p. (In German).

This construction for liquid metal cooled reactors is to prevent the ingress of sodium vapour, for example, into the gap between the rotating shield and the reactor tank, without making this gap extremely small or constantly heating it. This is achieved by separating the functions of rotation and sealing. For sealing, the rotating shield when stationary, i.e. in normal operating conditions, is set on a flanged ring welded inside the tank, so that sodium vapour cannot pass upwards through this tank zone and gradually block up the space above. For rotation, i.e. during fuelling and fuel unloading periods of the reactor, the rotating shield is lifted by several lifting cylinders from this sealing surface. These lifting cylinders sit on a geared ring surrounding the top of the rotating shield, which is supported on the circumference on roller bearings and is sealed sideways against the surrounding tank wall by moving seals. The requirements for these seals are less than those for the stationary seal described above, as sodium temperatures and evaporation are appreciably reduced during refuelling periods compared with normal operation.

- 4527 FAST BREEDER REACTOR. Ziegler, A. (to Siemens A.G., Berlin (Germany, F.R.); Siemens A.G., Muenchen (Germany, F.R.)). German (FRG) Patent 1,948,912/C/. 5 May 1977. 6p. (In German).

The invention deals with a fast breeder reactor with liquid metal cooling and with fuel zone co-axially surrounded by a breeder zone without a separating wall, where the coolant is admitted to the whole cross-section of the breeder reactor with the same pressure. It is difficult in such nuclear reactors to maintain a constant pressure uniformly over the entire reactor cross-section. According to the invention, this is achieved in that one arranges the fuel elements as well as the breeder elements in open construction and designs flow-conducting devices arranged on top of one another which influence the coolant flow. The design of this flow-conducting device is part of the patent claims.

- 4528 IMPROVED NUCLEAR FUEL ASSEMBLY GRID SPACER. Marshall, J.; Kaplan, S. (to Energy Research and Development Administration). US Patent 4,021,300. 3 May 1977. Filed date 23 May 1975. 10p.

PAT-APPL-580,498.

Disclosed is an improved fuel assembly grid spacer and method of retaining the basic fuel rod support elements in position within the fuel assembly containment channel. The

improvement involves attachment of the grids to the hexagonal channel and forming the basic fuel rod support element into a grid structure, which provides a design which is insensitive to potential channel distortion (ballooning) at high fluence levels. In addition the improved method eliminates problems associated with component fabrication and assembly.

- 4529 DRYOUT HEAT FLUXES FOR INDUCTIVELY HEATED PARTICULATE BEDS. Dhir, V.; Catton, I. (Univ. of California, Los Angeles). J. Heat Transfer; 99: No. 2, 250-256 (May 1977). From Winter annual meeting of the American Society of Mechanical Engineers; Houston, TX, USA (30 Nov 1975).

Experimental observations of the dryout heat fluxes for inductively heated particulate beds have been made. The data were obtained when steel and lead particles in the size distribution 295 to 787 microns were placed in a 4.7-cm dia pyrex glass jar and inductively heated by passing radio frequency current through a 13.3-cm dia multiturn work coil encircling the jar. Distilled water, methanol and acetone were used as coolants in the experiments, while the bed height was varied from 1.9 to 8.9 cm. Different mechanisms for the dryout in deep and shallow beds have been identified. Dryout in shallow beds is believed to occur when the vapor velocity in the gas jets exceeds a certain critical velocity at which choking of the vapor, leading to obstruction in the flow of the liquid towards the bed occurs. However, deep beds dry out when gravitational force can no longer maintain a downward coolant flow rate necessary to dissipate the heat generated in the bed. Finally, the heat flux data of the present investigation and that from two previous investigations made at Argonne Laboratory and at UCLA have been correlated with semitheoretical correlations based on the proposed hydrodynamic models.

- 4530 STUDY OF POST-ACCIDENT MOLTEN FUEL DOWNWARD STREAMING THROUGH THE AXIAL SHIELD STRUCTURE IN THE LIQUID-METAL FAST BREEDER REACTOR. Gasser, R.D.; Kazimi, M.S. (Brookhaven National Lab., Upton, NY). Nucl. Technol.; 33: No. 3, 248-259 (May 1977).

A two-dimensional transient freezing model is developed to study the dynamics of solidification of a fluid flowing in a cylindrical channel, the walls of which are cooled below the freezing temperature of the fluid. The model is applied to the case of molten fuel flowing downward through the coolant channels in the lower shielding structure of current liquid-metal fast breeder reactor designs subsequent to a hypothetical core meltdown accident. The results indicate that under post-accident conditions, a high potential exists for rapid relocation of significant quantities of core debris across the shield structure.

- 4531 NONEQUILIBRIUM EVAPORATION AND CONDENSATION IN LIQUID-METAL FAST BREEDER REACTOR FUEL EXPANSION. Refling, J.G.; Reynolds, A.B.; Garner, P.L.; Rao, S.P. (Univ. of Virginia, Charlottesville). Nucl. Technol.; 33: No. 3, 275-289 (May 1977).

The effect of nonequilibrium mass transfer on two-phase oxide fuel expansion was studied. An analytical model was applied to fuel expansion tests being planned at Oak Ridge National Laboratory (ORNL) and to whole-core expansion of a uniform bubble in Clinch River Breeder Reactor geometry. Among the parameters varied in the study are the liquid droplet

radius ($R/\text{sub } p$) and the condensation and evaporation coefficients (σ). It was found that allowance for nonequilibrium mass transfer increased the expansion times for the ORNL tests when the ratio of $\sigma/R/\text{sub } p$ was $<1000 \text{ m}^{-1}$. Nonequilibrium mass transfer had little effect on the whole-core expansions until $\sigma/R/\text{sub } p$ reached unrealistically low values of $<10 \text{ m}^{-1}$.

4532 CARTER PUTS NUCLEAR POWER IN STRONG POSITION. Smock, R.W. Electr. Light Power (Boston); 55: No. 5, 11-12(May 1977).

As far as nuclear power is concerned, the most positive factor of the National Energy Plan is support for light-water reactors, coupled with the limitations imposed on fossil-fuel generation. On the negative side, the ban on commercial nuclear fuel reprocessing and the halt on construction of the Clinch River Breeder Reactor appear to limit the long-term prospects for nuclear power. The best news the author says, is Carter's awareness that energy supply, despite conservation, must grow. He also announced plans for a new uranium enrichment plant, badly needed to support LWR growth. Other portions of the Carter program ban natural gas as a utility fuel, raise the price of oil, and boost the environmental control costs of burning coal. If economic studies based on pre-policy conditions favored nuclear generation over coal or oil, they will overwhelmingly favor nuclear now. The administration made a number of vague proposals for the nuclear industry--that licensing be streamlined and safety standards be tightened, for example--but it remains to be seen how they will be implemented. On balance, the new Carter program gives nuclear a green light, Mr. Smock says. Some opinions extracted from papers presented at the American Power Conference on the President's policy regarding the breeder reactor are reviewed. One of the most hotly debated issues at the conference dealt with proliferation, with almost all speakers on the subject saying Carter's policy will not work. (MCW)

4533 CARTER PLAN GENERALLY BACKED EXCEPT ON BREEDERS, SCRUBBERS. Electr. Light Power (Boston); 55: No. 5, 1-2(May 1977).

Electric utilities see President Carter's energy plan as a yellow light to move cautiously the way they've been going: to more nuclear and coal-fired generation, to load management via new rate structures, to promotion of insulation programs, and toward incorporation of new energy sources and technologies into traditional utility systems. But the utilities see scrambled signals in Carter's plans to increase coal and nuclear power because they don't like requiring all new coal units to have scrubbers and they find it ironic that the President's conservation-oriented approach sacrifices the energy potential of plutonium. It is the general thrust of the program, the appeal to conservation, that is most important, along with the turn away from dependence on oil and natural gas for most of our energy needs. Specifics of the package will be in flux until Congress adopts it.

4534 IMPACT OF THE NEW ENERGY TECHNOLOGIES. Decker, G.L. (Dow Chem Co, Midland, Mich). Mech. Eng.; 99: No. 5, 24-27(May 1977).

According to a Ford Foundation report that "assumes that the nation will not deliberately impose any policies that might affect our ingrained habits of energy use, but will make a strong effort to develop supplies at a rapid

pace to match rising demand", U.S. energy demand in the year 2000 would reach 185 quads (a quad is defined in this article as one quadrillion Btu= 10^{15}) if historical trends were to continue. That is almost 2 1/2 times present use. Probably none of the so-called "wonder solutions"--solar energy, geothermal, burning wastes, coal gasification, etc.--will be ready for any meaningful contribution by that date. Only by intense exploitation of just about every known energy source (with special emphasis on coal), in addition to conservation of energy in every possible way, can economic stagnation and considerable change for the worse in the American life style be avoided. The article includes a chart forecasting the expected contribution in quads of energy, and the approximate date of (U.S.) commercialization of new energy technologies, for the period 1975 to 2000. A second chart compares the proportional contributions of 1972 technology and year 2000 technologies, including conservation and higher efficiencies. 6 refs.

4535 WORK STARTS IN SUPERPHENIX AT THE CREYS-MALVILLE SITE. Banal, M. Nucl. Eng. Int.; 22: No. 257, 41-45(May 1977).

Details are given of the 1200 MWe SuperPhenix fast breeder reactor. Design principles are outlined and essential differences between SuperPhenix and Phenix are discussed: the main differences are the new heat exchanger design and the containment system. Descriptions are given of the site layout, core, nuclear steam supply system, main secondary circuits and the fuel handling system. Safety features which are discussed include licensing procedure, core surveillance, decay heat removal and the containment system. A tables of parameters is included.

4536 STRUCTURAL ANALYSIS TECHNOLOGY FOR HIGH-TEMPERATURE DESIGN. Greenstreet, W.L. (Oak Ridge National Lab., Tenn. (USA)). Nucl. Eng. Des.; 24: No. 3, 375-386(May 1977).

Results from an ongoing program devoted to the development of verified high-temperature structural design technology applicable to nuclear reactor systems are described. The major aspects addressed by the program are (1) deformation behavior; (2) failure associated with creep rupture, brittle fracture, fatigue, creep-fatigue interactions, and crack propagation; and (3) the establishment of appropriate design criteria. This paper discusses information developed in the deformation behavior category. The material considered is type 304 stainless steel, and the temperatures range to 1100°F (593°C). In essence, the paper considers the ingredients necessary for predicting relatively high-temperature inelastic deformation behavior of engineering structures under time-varying temperature and load conditions and gives some examples. These examples illustrate the utility and acceptability of the computational methods identified and developed for predicting essential features of complex inelastic behaviors. Conditions and responses that can be encountered under nuclear reactor service conditions and invoked in the examples.

4537 RECENT DEVELOPMENTS IN EQUIPMENT FOR SODIUM TEST LOOPS AND FAST REACTORS. Orszak, P. Nucl. Eng. Int.; 22: No. 257, 53-55(May 1977).

Since completion of PFR, work of GEC Reactor Equipment Ltd. on sodium has developed further and a standard range of sodium components is being marketed. These include

level monitoring equipment, flow-meters, a wide range of electro-magnetic pumps, automatic plugging meters, cleanup units, filters, pressure vessels and valves. In order to test and prove these products the Company has established its own sodium test facility. Special test loops have been constructed to establish the performance, durability and reliability of components and for equipment calibration.

- 4538 CAREFUL ATTENTION TO DETAIL WAS NECESSARY IN DEVELOPING THE SUPERPHENIX STEAM GENERATORS. Robin, M.G. Nucl. Eng. Int.; 22: No. 257, 46-48(May 1977).

The development, design, and testing of the SuperPhenix steam generator are described. The generator is a once-through unit with economizer, evaporator, and superheater located along the same tube. Its features are illustrated, including the method of tube fastening and spacing. The material for the generator is 316 L stainless steel, and the tube bundle material Alloy 800. Development tests were conducted to investigate thermal and flow performance, tube penetrations under thermal shock, fatigue and wear of expansion bends, sodium flow and tube vibration, and safety in case of steam tube failure.

- 4539 OPERATION OF PROTOTYPE FAST REACTOR STEAM GENERATORS LED DIRECTLY TO COMMERCIAL-SIZE DESIGN. Taylor, D. Nucl. Eng. Int.; 22: No. 257, 49-53(May 1977).

The design and manufacture of the PFR steam generators are outlined. Experiences with leaks in evaporators and superheaters during operation are described. These have led to certain design changes for the steam generators for the commercial demonstration fast reactor, which are discussed. The main changes are: adoption of ferritic steel in place of austenitic to avoid stress corrosion and caustic cracking after a leak; elimination of welded joints to simplify manufacture and minimize the chance of leaks; redesign of the header system to eliminate thick tube plates and thermal shock problems. These changes can be accommodated in the 'U' tube type of generator but in place of the forced circulation system adopted for PFR a 'U' tube partial recirculation boiler with separate evaporator and superheater is proposed for the commercial fast reactor.

- 4540 INSTRUMENTATION AND CONTROL SYSTEMS ON PFR. McAffer, N.T.C. J. Inst. Nucl. Eng.; 18: No. 3, 66-73(May-Jun 1977).

An account is given of the instrumentation and control systems of the Prototype Fast Reactor at the UKAEA Dounreay Reactor Establishment under the following headings - outline of the plant; general requirements; main aspects of the overall system; some particular aspects (data reduction equipment, the automatic protective system, sodium measurements, hydrogen detection in the secondary sodium circuit, temperature measurements, examples of interlock and control logic, cabling and power supplies); and operating experience and possible future developments.

- 4541 STRESS ANALYSIS OF A NUCLEAR REACTOR GRID PLENUM ASSEMBLY AND ITS APPLICATION TO THE EBR-II. Chang, L.K.; Marchertas, A.H. (Argonne National Lab., Ill. (USA)). Nucl. Eng. Des.; 24: No. 3, 387-397(May 1977).

A structural model is presented to predict the stress and deformation of a nuclear reactor

grid plenum assembly. The model consists of two circular grid plates on top of one another which are interconnected by a large number of tubes, a perforated cylindrical shell and a cylinder at the outer edge of the plates. During normal reactor operation and shutdown the grid plenum assembly is subjected to both external and internal loads, in which the external load is due to the dead weight of the subassemblies resting on the upper grid plate and the coolant pressure, while the internal load is due to the temperature gradient and irradiation swelling in the grid plates accumulated through the life of the reactor. The structure is divided into many annular regions implying an axisymmetric treatment. The solution of the structural system is obtained by solving the equilibrium equations of the individual tubes, plates and shells, and satisfying the compatibility condition at the boundary of each region. The swelling strain in the grid plates is treated analogously to that of thermal strain in the elastic region. The numerical results of the problem are obtained by means of a computer code which uses a matrix-inversion technique to solve the simultaneous algebraic equations involved.

- 4542 SAFETY OF THE FAST REACTOR. Matthews, R.R. (Central Electricity Generating Board, London (UK). Nuclear Health and Safety Dept.). Atom (London); No. 247, 86-89(May 1977).

From Meeting at Imperial Coll. of Science and Technology; London, UK (15 Jan 1977). Verbatim of an address by R.R. Matthews, Chief Nuclear Health and Safety Officer, UK Central Electricity Generating Board given on January 15th 1977. The object of this address was to give some opinions on the safety issues of fast reactors as seen from an operational point of view. An outline of the basic responsibilities for nuclear safety is first given, and it is emphasized that the Central Electricity Generating Board has a statutory responsibility for the safe operation of its nuclear plant. The Nuclear Installations Act places absolute responsibility on the operator for ensuring that injury to persons and damage to property do not occur, and the new Health and Safety at Work Act does likewise. In addition the Board has a Nuclear Health and Safety Department that has to ensure that adequate provision for safety is made in the design, construction, and operation of nuclear plant, and safety at operational stations is monitored continuously by inspectors. In addition the requirements of the Nuclear Installations Inspectorate, laid down in the site licence conditions, must be satisfied. All these requirements are here discussed in the light of application to commercial fast reactors. It is considered that the hazards to fast reactor operating personnel are small and little different from those of other types of reactor, and in some respects the fast reactor has advantages, particularly in regard to the use of a Na coolant. The possibility of various types of accident is considered. Radioactive effluent discharge is also considered. The fast reactor as an international problem is discussed, including security matters. The extensive experience gained in operation of the experimental and prototype fast reactors at Dounreay is emphasized.

- 4543 ANALYSIS OF EBR-II SECONDARY SODIUM NETWORK FOR PRESSURE PULSES DUE TO LEAKS OF STEAM ON WATER INTO SODIUM. Srinivas, S.; Chopra, P.S. (Argonne National Lab., Ill. (USA)). Nucl. Eng. Des.; 24: No. 3, 313-325(May 1977).

A systematic procedure is presented for the safety analysis of the secondary sodium system of an LMFBR in the event of a leak of water or steam into sodium in an evaporator or a superheater. Using fracture mechanics, it is shown that the usual assumption of failure initiation by guillotine rupture of one or more water or steam tubes is unrealistic. A model is proposed for the gradual growth of leaks due to the phenomenon of wastage. The pressure rise in the system due to a sodium-water reaction is calculated solving one-dimensional hydrodynamic equations. By comparing results obtained for the proposed gradual growth model with those due to guillotine failure it is shown that the assumption of guillotine failure leads to a significant overestimation of pressures and stresses. Based upon the proposed leak progression model the stresses in the EBR-II secondary sodium system are shown to be within safe limits.

- 4544 HYPOTHETICAL ACCIDENT RULES FBR SAFETY. REPORT ON THE FAST BREEDER REACTOR SAFETY CONFERENCE IN CHICAGO. Pepler, W.; Royl, P. (Kernforschungszentrum Karlsruhe (Germany, F.R.). Inst. fuer Reaktorentwicklung). Atomwirtschaft, Atomtech.; 22: No. 5, 270(May 1977). (In German).
From International meeting on fast reactor safety and related physics; Chicago, Ill. (5 - 8 Oct 1976).

- 4545 METHOD FOR VAPORIZING MIXED OXIDE FAST REACTOR FUELS FOR ANIMAL INHALATION STUDIES. Allen, M.D.; Kaune, W.Y.; Craig, D.K. (Battelle Pacific Northwest Labs., Richland, Wash. (USA)). Health Phys.; 32: No. 5, 389-396(May 1977).

High-powered lasers were used to vaporize zirconium dioxide and uranium dioxide to show the feasibility of laser vaporization of UO_2 - PuO_2 fast reactor fuels to generate condensation aerosols for animal inhalation studies. Three types of pulsed lasers were used: a CO_2 gas laser with an energy output of 0.2 J/pulse, a ruby laser with an output of 8 to 10 J/pulse, and a neodymium-YAG laser with an output of approx. 35 J/pulse. An incandescent vapor plume resulted from each pulse for all three types of lasers, with the plume size dependent on beam energy. The aerosol, which was visually observed for each type of laser, was collected on membrane filter paper. The amount of aerosol collected on the filter paper per pulse was directly proportional to the energy density of the beam. Scanning electron micrographs of the aerosol showed branched chains composed of spherical particles of 0.1 μm diameter which are typical of the vaporization-condensation aerosols of most solids. X-ray diffraction analyses showed that the aerosol was primarily amorphous, with diffraction patterns from a few of the samples indicating simple cubic structure. Lack of structure in most of the samples was attributed to the fast quench of the laser plume.

- 4546 PHYSICS AND ENGINEERING CHARACTERISTICS OF A LMFBR IN LONG-TERM OPERATION. Kujal, J.; Jakab, J. (Ustav Jaderneho Vyzkumu, Rez (Czechoslovakia)). Jad. Energ.; 23: No. 5, 162-168(May 1977). (In Czech).

The results are presented of calculating the main physics and engineering parameters of a 1600 MWe fast breeder reactor. The changes in the parameters during long-term operation at a selected realistic fuel cycle are studied. Homogeneous isotope concentrations in the FBR

reactor core and breeding blankets in the initial state, and homogeneous concentrations of heavy fuel isotopes in all reactor regions before and after the 6th refuelling are tabulated. The mean burnup of fuel removed from the core under steady state conditions is 60 MWd/kg U+Pu, 3.5 MWd/kg U+Pu for the front breeding blanket and 5.6 MWd/kg U+Pu for the side breeding blanket. The course of breeding ratio is graphically shown for the entire reactor and partial breeding ratios are listed for the core, front and side breeding blankets. Changes were studied in the power distribution along the reactor radius and its levelling up during long-term operation is shown. The mathematical model of the reactor is briefly described as are the basic calculation procedures. Actual operating conditions of the reactor are considered, such as fractional discontinuous refuelling and reactor operation at a given output with $k_{sub}(eff)=1$.

- 4547 THERMAL OPENING OF IRRADIATED URANIUM OXIDE FUEL ELEMENTS OF BR-5 REACTOR WITH FUEL SEPARATION BY SOLUTION. Novoselov, G.P.; Bibikov, S.E. At. Energ. (USSR); 42: No. 5, 398-399(May 1977). (In Russian).

- 4549 IRRADIATION BEHAVIOUR OF CARBIDE FUEL ELEMENTS IN THE BOR-60 BREEDER REACTOR. Tsykanov, V.A.; Gryazev, V.M.; Davydov, E.F.; Kuz'min, V.I. (and others). At. Energ. (USSR); 42: No. 5, 378-382(May 1977). (In Russian).
The results of an investigation of irradiation behaviour of uranium carbide fuel elements in the BOR-60 reactor up to burnups of 10 per cent fima are presented. The fuel elements and fuel assemblies characteristics, as well as the irradiation history are shortly described. The most stringent irradiation mode was as follows: neutron fluence of 6×10^{22} neutr/cm² ($E > 0.1$ MeV), linear power density of 700 W/cm, fuel cladding temperature of 680 deg C. The axial core distribution as well as dependency of geometrical parameters of the stainless steel fuel cladding on fuel burnup and density were measured. To attain zero plastic deformation of the fuel cladding, total volume of voids in the fuel, and a radial gap between the fuel pellets and the cladding is indicated to be 20 per cent. The average rates of fuel swelling at fuel element core temperatures about 1200 ± 50 deg C were measured to be equal to 1.5 ± 0.2 per 1 per cent of burnup with respect to density variations. Good compatibility between the fuel and the cladding is underlined.

- 4550 TEST RESULT FOR THE CONTROL ROD DRIVE MECHANISM IN SODIUM FOR PROTOTYPE LMFBR 'MONJU'. Ishii, Y.; Murakami, Y. (Power Reactor and Nuclear Fuel Development Corp., Tokyo (Japan)). Doryokuro Giho; No. 22, 69-84(May 1977). (In Japanese).

The Japanese prototype LMFBR (liquid metal fast breeder reactor) "Monju" has nine rough control rods, three fine control rods, four safety rods and three back-up stopping rods, nineteen rods in total. These control rods must have very high reliability for the function of regulating reactivity, scramming, etc.. The Power Reactor and Nuclear Fuel Development Corporation ordered in 1971 the manufacture of three control rod drive mechanisms, the design of which was a little different each other, and these were tested in water first, then tested in sodium at the "Osai Engineering Center" one by one. About 500 times of scram test, and 10000 to 100000 times of driving test in full stroke and about 50 mm eccentric condition were carried out. These test results were very satisfactory, consequently second step of trial manufacture was conducted by reflecting the results of the tests and modifying the mock-ups. The arrangement of control rods in the core of "Monju", the functions of each rod, the design specification of the mock-ups of this mechanism, the structural design, the test facility in sodium, the test results, the characteristic evaluation and the feedback of these results to the design of the "Monju" mechanism are explained in this paper.

- 4551 ONE-DIMENSIONAL ANALYSES ON GENERATION AND PROPAGATION OF PRESSURE WAVES IN COMPRESSIBLE LIQUID RESULTING FROM FUEL COOLANT INTERACTION. Miyazaki, K.; Fujii, Y. (Osaka Univ., Suita (Japan). Faculty of Engineering). J. Nucl. Sci. Technol. (Tokyo); 14: No. 5, 327-342 (May 1977).

The pressure response obtained for a vertical column is identical to that resulting from the acoustic constraint model (which is adopted by Cho et al.) within the range of time required for the waves to traverse and retrace the column at $t < l/c$ (t is time, l is length of liquid column, c is propagation velocity of pressure wave), but beyond this time point, the present analysis yields the response that differs according to the history of the waves. On the other hand, for the spherical compression waves propagating symmetrically outwards in coolant, the solution of this pressure is obtained using the step function and $\exp(-ct/R)$ (R is radius of fuel coolant interaction boundary). It is suggested that the predicted pressure should be reduced appreciably by adopting the rigorous solution of the spherical acoustic constraint model, combined with realistic values chosen for the interaction time.

- 4552 CENTRAL COMPUTERIZED DATA BASE FOR LMFBR SAFETY CODES. Greene, N.M.; Flanagan, G.F.; Alter, H. (Oak Ridge National Lab., TN). CODATA Bull.; No. 23, 29-31 (May 1977).

From 5. international CODATA conference; Boulder, CO, USA (Jun 1976).

The status of the development of the SACRD (Safety Analysis Computerized Reactor Data) data base is described. The overall data base effort is concerned with gathering, evaluating, and distributing all necessary nondesign-related data required to perform safety analysis. These analyses cover a wide range of situations: initiating events and protected accidents, loss of subassembly integrity, core disassembly, structural response, aerosol transport and biological dose, and post-accident heat removal. The data in SACRD are structured by type, property, material, and version.

Shiraha, M.; Sakano, K.; Hayashi, S.; Hatakeyama, G. (Kawasaki Heavy Industries Ltd., Kobe (Japan)). FAPIG (Tokyo); No. 85, 15-21 (May 1977). (In Japanese).

The steam generator takes an important position specifically in the development of sodium-cooled fast breeder reactors. Though the electrically heated test rig of 0.1 MW for steam generators was already produced and tested, the new 0.1 MW sodium-heated test rig for straight tube type steam generators has been manufactured to forward the development of straight tube steam generators strongly. The testing purpose of the rig is to grasp the characteristics in the departure from nucleate boiling phenomenon caused on the water/vapor side under sodium-heating condition. At present, the static characteristic is being tested among the following planned tests: (1) static test (departure from nucleate boiling test, heat transfer test), (2) dynamic characteristic test, (3) flow stability test, (4) water leak detector test, (5) endurance test of sodium-immersed rupture disc, (6) thermal shock test of tube plates. The rig is composed of water and sodium systems of closed loops, and the straight tube type steam generator. Each part of the rig (steam generator, water system, sodium system, control system, alarm, interlock, cover gas) is equipped with a variety of detectors. From the results of trial run and static characteristic test, the time required to reach 100% load from start-up is about 15 hours, and 8 hours are required from 100% load to shut down. An example of the static characteristic showed that the gradient of sodium temperature distribution changed remarkably at the part 6.6 m downward from the sodium inlet. This shows that the departure from nucleate boiling occurred at the place. Calculation supported the above estimation.

- 4554 INFLUENCE OF COLD WORK ON THE IN-PILE STRESS RUPTURE STRENGTH OF 16 CHROMIUM--16 NICKEL--NIOBIUM AUSTENITIC STAINLESS STEELS. Closs, K.D.; Schaefer, L.

(Kernforschungszentrum, Karlsruhe, Ger.). J. Test. Eval.; 5: No. 3, 201-209 (May 1977).

From 8. international symposium on the effects of radiation on structural materials; St. Louis, MO, USA (4 May 1976).

The in-pile stress rupture strength of 16Cr--16Ni--Nb stainless steel was investigated. Different pretreatments were used, namely solution annealing plus various cold-working levels up to 20 percent. Thermal stability under irradiation and the high-temperature embrittlement of the different material conditions were studied. The specimens were irradiated in the form of electrically heated pressurized tubes at irradiation temperatures ranging from 615 to 720°C. Irradiation time was up to 4800 h, corresponding to a maximum fast neutron fluence ($E > 0.1$ MeV) of 8.2×10^{25} n/m². Neutron irradiation caused a marked reduction in stress rupture strength for the solution-annealed and the cold-worked specimens. For the solution-annealed tubes, this reduction was mainly attributed to high-temperature embrittlement; the decrease in rupture strain was less pronounced for the cold-worked tubes. The reduction in stress rupture strength came mainly from an increase in creep rate. As far as stress rupture strength and creep strength at high irradiation temperatures were concerned, the 15% cold-worked 16Cr--16Ni--Nb steel was superior to the other cold-work levels.

- 4553 TEST RIG OF STRAIGHT TUBE TYPE SODIUM-HEATED STEAM GENERATOR. Yoshizaki, A.;

4555 MATRIX HEAT EXCHANGER. Fewell, T.E.; Ward, C.T. (to Energy Research and

Development Administration, Washington, D.C. (USA)). German (FRG) Patent 2,647,653/A/. 28 Apr 1977. 17p. (In German).

Heat exchangers for nuclear reactors cooled with liquid metal are often of matrix construction. The invention deals with the improvement of the heat transfer behaviour of such aggregates. A small gap between the matrix and pipeline is to be filled with a liquid medium of good thermal conductivity (e.g. melted metal such as Bi, Pb, Hg or their alloys). Additions of Zr, Mg or Ti are to prevent the cooling pipe walls from corrosion. Advantageous variations of the composition and arrangement are given in detail.

4556 DEVICE TO DETECT GASES, IN PARTICULAR FISSION GASES, IN THE COOLING CHANNEL OF A LIQUID-COOLED NUCLEAR REACTOR FUEL ELEMENT. Gast, K. (to Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.)). German (FRG) Patent 1,807,801/C/. 28 Apr 1977. 2p. (In German).

In order to control sodium-cooled fast nuclear reactors, the early discovery and localization of cladding damage on individual fuel elements is important. It is thus suggested to create rotational movements in the cooling channel of a fuel element and to insert a heated thermoelement as detecting device in the cyclone centre. The thermoelement can be electrically heated or by embedment in a body containing fissionable material. The equipment invented is highly sensitive and has a short response time.

4557 PROCESS FOR COOLING A BREEDER REACTOR AND BREEDER REACTOR FOR CARRYING OUT THE PROCESS. Gast, K. (to Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.)). German (FRG) Patent 1,940,014/B/. 14 Apr 1977. 3p. (In German).

The invention concerns the guiding of the coolant flow in a sodium cooled breeder nuclear reactor. The coolant is first taken upwards from below through the breeding elements of the radial breeding zone, is diverted downwards to the inflow area of the fission zone and there flows through the fuel elements upwards from below in the well known way. A breeder reactor laid out for this flow is described.

4558 METHOD FOR CLEANING COMPONENTS CONTAMINATED PREFERABLY WITH RADIOACTIVE SODIUM AND FACILITY TO APPLY THE METHOD. Schultheiss, G.F.; Menzenhauer, P. (to Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.)); Deutsches Patentamt, Muenchen (Germany, F.R.)). German (FRG) Patent 2,545,031/A/. 14 Apr 1977. 9p. (In German).

An improvement of the method for cleaning components of nuclear installations contaminated with radioactive sodium is proposed. The method refers to the way of concentrating the wash solution and is to cause the amounts of liquid used to be reduced. The facility is described in detail. There are used water and steam under protective gas.

4559 NUCLEAR REACTOR EQUIPPED WITH A CONTROL MECHANISM. Ingham, R.V. (to UKAEA London Office). French Patent 2,348,545/A/. 12 Apr 1977. Priority date 13 Apr 1976, United Kingdom of Great Britain and Northern Ireland (UK), 8p. (In French).

The invention relates to a control mechanism for an LMFR type reactor, to ensure a fast power drop by varying the reactivity of an appropriate amount to meet the conditions of

continuous operation in complete safety should there be a partial drop in the flow or pressure of the coolant. Control rods in a neutron absorbing material are used to regulate the reactivity of the reactor. At least one control rod is sensitive to a triggering signal so as to be introduced in the reactor core in two successive stages, first by uncontrolled unidirectional injection and, secondly, by controlled introduction. The uncontrolled unidirectional injection may be carried out by free drop or by propulsion under the effect of stored energy.

4560 PROCESS AND APPARATUS FOR DETECTING THE POSITION OF A FAILED TUBE IN A TUBULAR LIQUID METAL-WATER HEAT EXCHANGER. Schrock, S.L.; Mangus, J.D. (to Westinghouse Electric Corp., Pittsburgh, PA (USA)). French Patent 2,348,483/A/. 12 Apr 1977. Priority date 12 Apr 1976, United States of America (USA), 16p. (In French).

The invention concerns a process and apparatus for detecting the position of a leak in a tube of a tubular heat exchanger of the liquid metal-water type, habitually employed in a sodium cooled nuclear reactor. Under the invention an inert gas is let in on the outside of the tubes, a pressure difference is created along the tube under test, the lower pressure taking place inside the tubes. The tube is then heated to bring about the dissociation and isolation of the reaction products which are then analysed to indicate the faulty tubes.

4561 HEAT EXCHANGER FOR HIGH TEMPERATURES AND PRESSURES. (to CEA, 75 - Paris (France)). French Patent 2,386,798/A/. 5 Apr 1977. 15p. (In French).

This invention refers to a heat exchanger for high temperatures and pressures. Specifically, the invention concerns a high temperature and high pressure heat exchanger of the type comprising, within a leaktight containment, a plurality of tubes around which flows a primary fluid and through which flows a secondary fluid, and at least one plate delimitating an outlet chamber for the secondary fluid at one of the ends of the containment. This exchanger prevents the establishment of excessive thermal gradients in the wall of this chamber, when rapid changes in the temperature of this secondary fluid occur.

4562 EVALUATED DELAYED NEUTRON SPECTRA AND THEIR IMPORTANCE IN REACTOR CALCULATIONS. Saphier, D. (Argonne National Lab., IL); Ilberg, D.; Shalev, S.; Yiftah, S. Nucl. Sci. Eng.; 62: No. 4, 660-694 (Apr 1977).

Delayed neutron emission spectra from thermal-neutron fission of ^{233}U , ^{235}U , ^{239}Pu , and ^{241}Pu , from fast-neutron fission of ^{232}Th , ^{235}U , ^{238}U , and ^{239}Pu and from high-energy neutron (14.7-MeV) fission of ^{235}U and ^{238}U , for six groups of delayed neutrons are evaluated. The evaluation is based on recent measurements of delayed neutron spectra from 20 fission product isotopes. The data are presented in graphic form and are compared to directly measured equilibrium spectra whenever available. Tables with a convenient 54-energy-group structure are provided to facilitate their use in reactor calculations. The results of a limited number of two-dimensional, multigroup, transient calculations for the Clinch River Breeder Reactor core, using the newly evaluated spectra, are compared with calculations using some older spectra. The importance of the inclusion of these data in reactor dynamic calculations is evaluated. 34 figures, 13 tables. 37 references.

- 4563 COSTS AND FINANCING OF ADVANCED REACTOR TYPE DEVELOPMENT. EXCERPT. Technol.-Nachr. Manage.-Inf.; No. 158, 1-16(Apr 1977). (In German).

The Federal Ministry for Research and Technology (BMFT) presented on March, 16th, 1977 the development programs for power reactors, their costs and their financing to the Budget Committee of the Bundestag. By means of this presentation, the BMFT is facing the opinion, that the costs management of huge armament programs (MRCA) could be transferred to huge technological projects set up by the BMFT. The presentation of finance concerning the development of reactors is extracted from the BMFT's paper (accentuated by special type setting).

- 4564 SIMPLE-2: A COMPUTER CODE FOR CALCULATION OF STEADY-STATE THERMAL BEHAVIOR OF ROD BUNDLES WITH FLOW SWEEPING. Jones, O.C. Jr.; Yao, S.C.; Henry, R.E. (Argonne National Lab., Ill. (USA)). Nucl. Eng. Des.; 41: No. 2, 205-217(Apr 1977).

A computer code has been developed for use in making single-phase thermal hydraulic calculations in rod bundle arrays with flow sweeping due to spiral wraps as the predominant crossflow mixing effect. This code, called SIMPLE-2, makes the assumption that the axial pressure gradient is identical for each subchannel over a given axial increment, and is unique in that no empirical coefficients must be specified for its use. Results from this code have been favorably compared with experimental data for both uniform and highly nonuniform power distributions. Typical calculations for various bundle sizes applicable to the LMFBR program are also included.

- 4565 ELECTROMAGNETIC PUMP FOR FBR. Namba, M.; Mukaida, H.; Taguchi, J.; Miyahara, M.; Miyagi, T. (Tokyo Shibaura Electric Co. Ltd., Kawasaki, Kanagawa (Japan)). Toshiba Rebyu; 32: No. 4, 314-317(Apr 1977). (In Japanese).

The development of liquid metal fast breeder reactors and research about related matters are being pushed forward in many countries. As liquid metal sodium is generally used, and for its recirculation use is made of mechanical pumps when the flow rate is high, and electromagnetic pumps when the flow rate is low. Toshiba, manufacturing various types of the latter, has obtained rich data on actual operation with sodium test facilities. Herein outlined are flat linear induction type and the annular linear induction type of them.

- 4566 UTILIZATION FACTOR OF NUCLEAR MATERIAL IN LMFBR. Tomabechi, K. (Power Reactor and Nuclear Fuel Development Corp., Tokyo (Japan)). J. Nucl. Sci. Technol. (Tokyo); 14: No. 4, 314-316(Apr 1977).

- 4567 SODIUM VAPOR DEPOSITION ONTO A HORIZONTAL FLAT PLATE ABOVE LIQUID SODIUM SURFACE. II. ANALYSIS OF SODIUM VAPOR DEPOSITION RATE WITH SODIUM MIST GROWTH WITHIN MAIN FLOW REGION. Kudo, K. (Hitachi Ltd., Ibaraki (Japan)). Hitachi Research Lab.; Hirata, Masaru. Nippon Kikai Gakkai Ronbunshu; 43: No. 368, 1407-1417(Apr 1977). (In Japanese).

The sodium vapor deposition onto a horizontal flat plate above liquid sodium surface was studied. The analysis was performed by assuming that the sodium mist is emitted into the main flow without condensation and then grows up in the main flow and drops on the sodium surface. The effects of growth of sodium mist to the system were investigated. The model of the phenomena is the sodium deposition onto a horizontal flat plate which is placed above the sodium surface with the medium cover gas. One-dimensional analysis can be done. The rate of deposition is greatly reduced when the temperature of the flat plate is lowered. For the analysis of this phenomena, it is assumed that the sodium mist grows by condensation. One of results is that the real state may be the state between the state that the condensation of mist is made in the boundary layer and the state that the mist is condensed in the main flow. Others are that there is no effect of sodium mist condensation on the rate of deposition, and that the rate of the vaporization of sodium is given by the original and the modified model.

- 4568 APPROACH TO SELECTED STRUCTURAL MECHANICS PROBLEMS OF THE FAST POWER REACTOR CORE. Dienstbier, J.; Pazdera, F. (Ustav Jaderneho Vyzkumu, Rez (Czechoslovakia)). Jad. Energ.; 23: No. 4, 140-146(Apr 1977). (In Czech).

Thermal deformations, swelling and thermal creep result in dimensional changes and deformations of fuel assemblies in the core and the side breeding blanket. The method of calculating bending deformations of the fuel assemblies is based on the theory of slim statically indefinite beams calculated using the matrix technique. The beam is divided into elements and linear temperature distribution and neutron flux distribution along the element length are assumed. The calculation method was used in compiling programme PA 2147 in the GIER ALGOL language, simulating straining and deformations of the individual assemblies during reactor operation. The programme also covers the calculation of assembly cross section increase due to thermal dilatation, swelling and to elastic creep deformation by sodium overpressure in the assembly. The results are briefly described of the behaviour of the BN-600 fast reactor assemblies and of the strength deformation calculations of assemblies of a 1600 MWe fast power reactor. A toroidal model is shown for the description of strength and deformation conditions in the spacing level of fast reactor assemblies. The model was used in writing programme PA 2132 in the GIER ALGOL language. The results show that stress and deformation conditions in the fast sodium cooled power reactor core approach limit conditions, which is mainly due to the swelling of structural material, i.e., austenitic steel.

- 4569 RESEARCH AND DEVELOPMENT ON STEAM GENERATOR FOR FAST BREEDER REACTOR. Tanaka, K. (Power Reactor and Nuclear Fuel Development Corp., Tokyo (Japan)). Karyoku Genshiryoku Hatsuden; 28: No. 4, 321-335(Apr 1977). (In Japanese).

The sodium-heated steam generator for a liquid metal fast breeder reactor is one of the most important components, but many problems exist, such as the possibility of sodium-water reaction in the steam generator, the heat transfer characteristics of sodium, the flow instability of water inside heat transfer tubes, the choice of material, etc. Much activity is concentrated for the research and development of the steam generator for "Monju" plant which is the first prototype

fast breeder, electricity-generating plant in Japan. The basic flow chart, the layout of the plant, the key parameters of the steam generator for 'Monju' plant are explained. For steam generators, many concepts for heat transfer tubes have been devised, for example helical coil tube, straight tube, U tube, hair pin tube, etc., and each type has advantages and also disadvantages. The research and development works for the steam generator are reviewed in general, and 50 MW steam generator test and many sodium-water reaction tests are described in detail, which have been carried out at Oarai Engineering Center of the Power Reactor and Nuclear Fuel Development Corporation.

- 4570 WASTAGE PHENOMENA DUE TO SMALL LEAK SODIUM-WATER REACTION. REACTION TEMPERATURE AND WASTAGE PATTERN. Nei, H. (Tokyo Shibaura Electric Co. Ltd., Kawasaki, Kanagawa (Japan)); Hori, M. Nippon Kikai Gakkai Ronbunshu; 43: No. 368, 1418-1425 (Apr 1977). (In Japanese).

A theory was developed for analyzing the wastage phenomena due to the sodium-water reaction. The theory is based on the viewpoint that the wastage is primarily due to corrosion. Equations for temperature and concentration distributions of reaction product jet were derived the first place and secondly, an equation for the temperature dependence of corrosion was derived. The results of theoretical analysis based on these equations were compared with the results of wastage experiments performed by the present authors and that performed at APDA (Atomic Power Development Associates). The results of authors' experiments are described together with the experimental conditions and used apparatus. Nozzle diameter, sodium-water temperature, and the water pressure were varied as parameters. As for theoretical analysis, descriptions are given of the analytical model, basic equations for jet flow accompanying chemical reactions, the shape of surface reaction, and the temperature distribution of jet flow. Finally, the mechanism of wastage is considered and discussed based on the theoretical analysis and comparison with the results of experiments.

- 4571 MECHANICAL PROPERTIES OF LIQUID-METAL FAST BREEDER REACTOR PRIMARY PIPING MATERIALS. Brinkman, C.R.; Sikka, V.K.; King, R.T. (Oak Ridge National Lab., TN). Nucl. Technol.; 33: No. 1, 76-95 (Apr 1977).

The available tensile and creep-rupture properties of relevant product forms of Types 316 and 304 stainless steel and associated as-deposited weld metals (i.e., Type 316) are reviewed. A description of both time-dependent and independent behavior is emphasized for Type 316 stainless steel, since this material and its weldments in hot-leg piping applications must operate at temperatures within the creep range. Therefore, elevated-temperature fatigue and creep-fatigue interaction of Type 316 stainless steel are discussed over the temperature range from 566 to 593°C for both air and sodium environments.

- 4572 EFFECT OF CHEMISTRY VARIATIONS ON THE SHORT-TERM RUPTURE LIFE AND TENSILE PROPERTIES OF 20% COLD-WORKED TYPE 316 STAINLESS STEEL. Duncan, D.R.; Paxton, M.M. (Hanford Engineering Development Lab., WA). Nucl. Technol.; 33: No. 1, 112-119 (Apr 1977).

The effects of compositional variations on the rupture life of 20% cold-worked Type 316 stainless steel were investigated at 19-ksi (131-MPa) uniaxial tensile stress and at 1400°F

(1033 K). Forty-nine different alloys were studied, with compositional variations from nominal in carbon, nitrogen, phosphorus, sulfur, boron, manganese, copper, silicon, molybdenum, cobalt, chromium and nickel. This alloy and cold-work level represents the duct and fuel cladding material choice for the first four core loadings of the Fast Flux Test Facility, a key element in the Liquid-Metal Fast Breeder Reactor Program. Tensile properties of four of the alloys were studied at temperatures from room temperature to 1600°F (1144 K). Boron, nitrogen, and molybdenum plus silicon additions significantly increased rupture life, while chromium and carbon additions decreased rupture life. Molybdenum plus silicon additions increased yield and ultimate strength and ductility at 1200°F (922 K) and below.

- 4573 (DOE-tr--177) LASER-DOPPLER MEASUREMENTS OF ENERGY DENSITY SPECTRA IN TURBULENT CHANNEL FLOW. Loercher, G. (Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.)). Inst. fuer Reaktorentwicklung). Apr 1977. Translation of KFK--2448 122p. Dep. NTIS, PC A06/MF A01. Work performed under United States--W. Germany Fast Reactor Exchange Program.

The results are presented of measurements in a turbulent channel flow. The measurements are carried out with a laser-Doppler anemometer. The fluid is water. Both the main flow components of the velocity and a component perpendicular to it are measured. The parameters are the Reynolds number and the distance from the wall. Especially the energy density spectra of the velocity fluctuations are evaluated. These spectra are considered in detail in this investigation. The spectra are subdivided into three ranges. The range of lower frequencies or wave numbers is represented by an approximate equation, and the parameters in the equation are calculated. The -1 pattern in this range is also evaluated.

- 4574 MAGNETOSTRICTIVE PROBE. Knaak, J. (to Internationale Atomreaktorbau G.m.b.H. (INTERATOM), Bergisch Gladbach (Germany, F.R.)). German (FRG) Patent 2,541,530/A/. 31 Mar 1977. 11p. (In German).

The probe consists of a rod-shaped magnetostrictive material with two coils axially wound around it. One coil serves as a measuring coil whenever pressure is applied axially on the rod, the other coil is for premagnetization of the rod. The front end of the rod is connected via bellows to a diaphragm, this constitutes the front part of the cylindrical probe-housing. The back end of the rod is connected to the housing by a sound-absorbing material. The device is used as a sound sensor, for example in the liquid sodium cooling circuit of a nuclear reactor.

- 4575 PROCEDURE AND CIRCUIT ARRANGEMENT FOR LEAK DETECTION. Fuge, R.; Pridoehl, E.; d'Avignon, H.; Froehlich, K.J.; Uhlmann, G. German (GDR) Patent 130,289/A/. 25 Mar 1977. 8p. (In German).

Procedure and circuit arrangement for detection of small leaks in sodium heated steam generators of fast breeder reactors are described. The noise arising from the liquid sodium-water reaction is received by microphones and the acoustic signals are processed with the aid of the following devices: amplifier, filter, variable-gain amplifier, discriminator, counter, comparator, and processor. In case of exceeding a certain threshold value an alarm system is switched on.

4576 EQUIPMENT FOR DETECTING FISSION

PRODUCTS. Jacobi, S. (to Deutsches Patentamt, Muenchen (Germany, F.R.); Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.)). German(FRG) Patent 2,037,053/C/. 24 Mar 1977. 4p. (In German).

A carrier gas charged with fission products is taken into a cylindrical precipitation vessel with a bottle-neck opening. There is an electromagnet on the bottle-neck which deflects the ionised solid fission products caesium and rubidium to a detector. The β and/or γ radiation emitted by the precipitated particles is measured with a detector. The wall of the precipitation vessel consists of non-ferromagnetic material in the area of the electromagnet. The measurement is still possible in the presence of metal vapour (sodium as coolant) and/or the presence of water vapour.

4577 REVERSE STEAM GENERATOR. Dubsek, F.; Srutek, J.; Sychrova, H.; Masek, V. Czech Patent 168,265/B/. 15 Mar 1977. 5p. (In Czech).

A steam generator is proposed for a liquid metal-cooled fast reactor power plant only featuring the primary circuit filled with liquid metal and lacking the liquid metal-filled secondary circuit. For such design, a so-called reverse steam generator should be used in which a failure of one heat transfer tube does not cause failures of other tubes. On the opposite, the intensity of the accident decreases with time or the liquid metal reaction with water or steam eventually stops. The proposed reverse steam generator design eliminates the disadvantages of the existing types resulting from very different thermal expansion values for the individual steam generator parts. For this purpose, a steam separation equipment is placed in the evaporating zone body of the steam generator, tubes are spaced in a square lattice and are shaped into bends forming an expansion compensator.

4578 ARRANGEMENT FOR LEAK DETECTION. Fuge, R.; Pridoehl, E.; d'Avignon, H.; Froehlich, K.J.; Uhlmann, G. German(GDR) Patent 130,080/A/. 11 Mar 1977. 5p. (In German).

An arrangement for the detection of microleaks in sodium heated steam generators of fast breeder reactors is described. A vessel with a free sodium surface is installed in the sodium circuit. In case of a microleak water and sodium react to form hydrogen, which escapes in the form of bubbles within the vessel. The noise resulting therefrom is received by one or several microphones located inside or outside the vessel.

4579 EQUIPMENT FOR TESTING A GROUP OF NUCLEAR

REACTOR FUEL ELEMENTS FOR DAMAGE TO THE CANS. Moha, F. (to Internationale Atomreaktorbau G.m.b.H. (INTERATOM), Bergisch Gladbach (Germany, F.R.)). German(FRG) Patent 2,537,393/A/. 3 Mar 1977. 15p. (In German).

Equipment is described for use in sodium cooled nuclear reactors, with which the fuel elements consisting of bundles of fuel and fertile rods can be examined for damage to the cans. Fission products occurring in the liquid coolant act as indicators. The coolant is sucked via pipelines which penetrate into the elements into a collecting container, and a special pipeline is available for every element

of a group, where the highest points of individual pipelines at different hydrostatic heads are taken to the collecting container. This permits the checking of one line at a time due to pressure changes.

4580 FUEL ELEMENT CLUSTER OF A NUCLEAR REACTOR. Kurilkin, V.V.; Kusmartsev, E.V. German(FRG) Patent 2,443,018/B/. 3 Mar 1977. 6p. (In German).

The suggestion deals with spacers in fuel elements for fuel element clusters used in fast nuclear reactors with liquid metal cooling. In order to counteract possible deformation at high power such as swelling etc., it is suggested to strengthen the wire wound around the jacket surface of each fuel element as spacer, with 2 wires each so that a wire bundle is formed which is rigidly joined on the sections between the contact planes.

4581 (JAPFNR--260) PROGRESS REPORT ON FAST BREEDER REACTOR DEVELOPMENT IN JAPAN, OCTOBER--DECEMBER 1976. (Power Reactor and Nuclear Fuel Development Corp., Tokyo (Japan)). Mar 1977. Translation of PNC-N--251-77-09 10p. Dep. NTIS (US Sales Only), PC A02/MF A01.

Work performed under United States--Japanese Fast Reactor Exchange Program.

Included are brief sections dealing with Joyo construction, Monju design, fast reactor kinetics, reactor components, reactor instrumentation, sodium technology, fuel development, reactor safety, and steam generator development. (DG)

4582 IN-REACTOR STRESS RELAXATION IN BENDING OF 20% COLD-WORKED 316 STAINLESS STEEL. Kenfield, T.A.; Busboom, H.J.; Appleby, W.K. (General Electric Co., Sunnyvale, Calif. (USA). Breeder Reactor Dept.). J. Nucl. Mater.; 65: No. 1, 238-243(Mar 1977).

From International conference on measurement of irradiation-enhanced creep in nuclear materials; Petten, The Netherlands (5 - 6 May 1976).

A test is in progress to measure in-reactor stress relaxation of 20% cold-worked 316 stainless steel in bending through the sequential irradiation in the experimental reactor EBR-II of two materials capsules. This paper details the results from the first capsule, the second capsule has completed irradiation and is awaiting examination. Approximately 50% total relaxation was measured following irradiation to $2 \times 10^{21} \text{ n/cm}^2$, $E > 0.1 \text{ MeV}$ at 370°C . The extent of relaxation was independent of specimen orientation to rolling direction, independent of initial stress level and only weakly dependent on neutron dose at this fluence level.

4583 BUILDING STOP FOR KALKAR FAST BREEDER REJECTED. Energiewirtsch. Tagesfragen; 27: No. 3, 234-236(Mar 1977). (In German).

The Administrative Court at Duesseldorf, with its decision of January 20th, 1977 - 3 L 1337/76 - has rejected the application of a high-school teacher in Moers for 'restitution of the claim's suspensive effect'. The costs of the procedure were awarded against the applicant. The decision also confirmed the exclusion of belated objections. The main reasons upon which the judgment is based are presented in full.

4584 (KFK-tr--522) FISSION PRODUCT MONITORING IN THE SODIUM COOLANT DURING OPERATION OF A FAST REACTOR. Ivanov, V.B.;

Polyakov, V.I.; Chechetkin, Yu.V.; Shipilov, V.I. (Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Internationales Buero/Uebersetzergruppe). Mar 1977. Translation of Operativnyi kontrol produktov deleniya v natrievom teplositele bystrogo reaktora 5p. (In German). Dep. NTIS (US Sales Only), PC A02/MF A01.

A Compton integral-gamma spectrometer is described serving to monitor the state of the core of fast reactors and to assess the activity of the coolant during operation.

- 4585 OPTIMIZATION OF REFUELING SCHEME OF FAST REACTOR CORE BY MEANS OF MAN MACHINE INTERACTIVE METHOD. Kobayashi, Y.; Kondo, S.; Togo, Y. (Tokyo Univ. (Japan). Faculty of Engineering). J. Nucl. Sci. Technol. (Tokyo); 14: No. 3, 177-194 (Mar 1977).

A computer system for performing quick survey and optimization has been developed to aid in-core fuel management of sodium cooled fast reactors. The method utilizes the conversational mode of computer operation, to perform on-line computation, display of results and acceptance of commands, thus permitting rapid exchange of information between the machine and the person in charge. To improve the overall efficiency of the system as problem-solver, an algorithm is introduced to provide for automated shuffling to determine the fuel loading patterns of successive cycles. This algorithm serves to model the refueling and shuffling arrangement after a prescribed optimized standard core pattern according to the extent of burnup of each fuel sub-assembly. The proposed system is applied to problems of: (1) straightforward simulation of fuel performance in given in-core fuel management programs, covering core and radial blanket refueling and control rod positioning, (2) optimization, and (3) modification of in-core fuel management programs. Several numerical examples are treated, to confirm the applicability of this conversational-mode problem-solving system to in-core fuel management.

- 4586 REACTOR VESSEL STRUCTURAL RESPONSE TESTS AT FBR HYPOTHETICAL ACCIDENT. Ando, Y.; Kondo, S. (Tokyo Univ. (Japan). Faculty of Engineering); Kawaguchi, O.; Kano, T.; Takei, A. Nippon Genshiryoku Gakkaishi; 19: No. 3, 177-184 (Mar 1977). (In Japanese).

Dynamic response characteristics of liquid metal cooled fast breeder reactor vessel structure subjected to hypothetical core disruptive accident load was investigated by a series of 1/15 and 1/7.5 scaled model tests using a specifically developed chemical explosive for pressure source simulating the postulated load condition. Dynamic pressure and strains were measured successfully at several points of the models and a lot of interesting and useful results were obtained under realistic loading conditions. General characteristics of the structural response was clearly shown by the test results.

- 4587 SMALL LEAK DETECTION BY MEASURING SURFACE OSCILLATION DURING SODIUM-WATER REACTION IN STEAM GENERATOR. Nei, H.; Hori, M. (Power Reactor and Nuclear Fuel Development Corp., Oarai, Ibaraki (Japan). Oarai Engineering Center). J. Nucl. Sci. Technol. (Tokyo); 14: No. 3, 200-209 (Mar 1977).

Small leak sodium-water reaction tests were conducted to develop various kinds of leak detectors for the sodium-heated steam generator in FBR. The super-heated steam was injected into sodium in a reaction vessel having a

sodium free surface, simulating the steam generator. The level gauge in the reaction vessel generated the most reliable signal among detectors, as long as the leak rates were relatively high. The level gauge signal was estimated to be the sodium surface oscillation caused by hydrogen bubbles produced in sodium-water reaction. Experimental correlation was derived, predicting the amplitude as a function of leak rate, hydrogen dissolution ratio, bubble rise velocity and other parameters concerned, assuming that the surface oscillation is in proportion to the gas hold-up. The noise amplitude under normal operation without water leak was increased with sodium flow rate and found to be well correlated with Froude number. These two correlations predict that a water leak in a 'MONJU' class (300 MWe) steam generator could possibly be detected by level gauges at a leak rate above 2 g/sec.

- 4588 EVALUATION OF THERMOCYCLIC STRENGTH OF STRUCTURAL MATERIALS AND STRUCTURAL ELEMENTS OF NUCLEAR POWER PLANTS WITH SODIUM HEAT CARRIER. Balandin, Yu.F.; Malygin, A.F.; Lisenkov, A.A.; Sennikov, E.V. Probl. Proch.; No. 3, 13-20 (Mar 1977). (In Russian).

A method of evaluation of the tensile properties is considered. The method is extended to parts of equipment made of structurally stable materials and subjected to the effects of thermal cycling and external loading. The theoretical evaluation of the strength of the structural elements in transient conditions is based on the utilization of experimentally determined limiting characteristics of resistance to thermal fatigue and long-time static failure. The proposed method is supported by the results of setup tests on half natural-size models in a sodium environment. 33 refs.

- 4589 MAIN TRENDS OF ACTIVITIES OF THE CMEA STANDING COMMISSION FOR PEACEFUL USES OF ATOMIC ENERGY. Neumann, J. (Ceskoslovenska Komise pro Atomovou Energii, Prague). Rev. Prum. Obchodu; 2: No. 3, 26-27 (Mar 1977). (In Czech).

The main spheres of activities are indicated of the Czechoslovak nuclear programme within COMECON, viz.: (1) The construction of more WWR-440 nuclear power plants - the V-2 power plant at Jaslovske Bohunice and the V-3 and V-4 nuclear power plants at Dukovany on the Jihlava river. (2) The Czechoslovak metallurgical and engineering industries start the production of reactor vessels, reactor internals, reactor control and protection systems, and the production of other components for the WWR-440 reactor primary circuits, i.e., steam generators, fittings, etc. (3) While continuing the production of WWR-440 reactor components the industries will gradually be introducing the production of WWR-1000 components. (4) The participation, with the other COMECON countries, in the research, development and manufacture of sodium cooled fast reactors. (5) The introduction of the production of nuclear power and heating plants.

- 4590 THERMOCYCLIC STRENGTH ESTIMATION FOR STRUCTURAL MATERIALS AND COMPONENTS OF NUCLEAR POWER PLANTS WITH SODIUM-COOLED REACTORS. Balandin, Yu.F.; Malygin, A.F.; Lisenkov, A.A.; Sennikov, E.V. Probl. Proch.; No. 3, 13-20 (Mar 1977). (In Russian).

A method for estimating the thermal-cycling resistance of elements of nuclear power stations with a sodium coolant was considered. The method extends to parts made of structure-stable materials and subjected to thermal

cycling and external loading. The calculated estimate of the resistance of the structural elements in transition regimes is based on the use of experimentally determined limiting characteristics of the resistance to thermal fatigue and to long-term static failure. The proposed method was proved by the results of stand testing of seminatural-size models in a sodium medium.

- 4591 SYSTEM FOR THE TRANSFER OF NUCLEAR FUELS OUTSIDE THE VESSEL. Wade, E.E. (to Westinghouse Electric Corp., Pittsburgh, PA (USA)). French Patent 2,343,314/A/. 23 Feb 1977. Priority date 23 Feb 1976, United States of America (USA), 19p. (In French).

The invention concerns a fuel transfer system for a LMFBF type reactor, for moving nuclear fuel assemblies between the reactor vessel and a storage container. The system has a fuel transfer chamber in communication with the reactor vessel and the storage container, and the storage container has an outlet orifice located outside the vessel, providing a storage area for the fuel assemblies. An out-of-vessel transfer system is located outside the reactor vessel and operates in conjunction with the storage container and the fuel transfer chamber, in order to transfer the fuel assemblies between the fuel transfer chamber and the storage container without placing the fuel assembly in a horizontal position. The transfer chamber and the storage container are generally placed below the level of the coolant fluid in the reactor vessel, so that the fuel assemblies stay completely immersed under a sheet of liquid coolant (sodium).

- 4592 FACILITIES OF FUEL TRANSFER FOR NUCLEAR REACTORS. Wade, E.E. (to Westinghouse Electric Corp., Pittsburgh, PA (USA)). French Patent 2,341,920/A/. 18 Feb 1977. Priority date 23 Feb 1976, United States of America (USA), 14p. (In French).

This invention relates to sodium cooled fast breeder reactors. It particularly concerns facilities for the transfer of fuel assemblies between the reactor core and a fuel transfer area. The installation is simple in construction and enables a relatively small vessel to be used. In greater detail, the invention includes a vessel with a head, fuel assemblies housed in this vessel, and an inlet and outlet for the coolant covering these fuel assemblies. The reactor has a fuel transfer area in communication with this vessel and gear inside the vessel for the transfer of these fuel assemblies. These facilities are borne by the vessel head and serve to transfer the fuel assemblies from the vessel to the transfer area; while leaving the fuel assemblies completely immersed in a continuous mass of coolant. A passageway is provided between the vessel and this transfer area for the fuel assemblies. Facilities are provided for closing off this passageway so that the inside of the reactor vessel may be isolated as desired from this fuel transfer area while the reactor is operating.

- 4593 DEVICE FOR MEASURING LIQUID SODIUM ABSOLUTE AND DIFFERENTIAL PRESSURES IN THE FAST NUCLEAR REACTOR COOLANT CIRCUIT. Bar, J.; Jung, J.; Pololanik, L. Czech Patent 167,817/B/. 15 Feb 1977. 3p. (In Czech).

A system with a vessel forming part of the circuit is proposed for measuring the absolute and the differential liquid sodium pressures in the fast reactor coolant circuit. The space above the sodium level in the vessel is filled with an inert argon atmosphere. Mounted onto

one vessel wall below the sodium level is a metal diaphragm closing one end of a tube filled with silicon oil. The other end of the tube is closed with a second metal diaphragm connected to the manometer pick-up.

- 4594 HEAT SHIELDS, FOR PUMP OR PIPE INSTALLATIONS. (to Neratoom N.V., The Hague (Netherlands)). Netherlands Patent 7,701,481/A/. 11 Feb 1977. 6p. (In Dutch).

1) The heat shield is characterised by the installation of at least two annular or plate-form components, so that during the operating process on optimal spacing is obtained between the shield and the wall surface. The heat shield is characterised by at least two layers of material with different coefficients of expansion. The heat shield has corrugations, two parts of sheet form wherein the mutual spacing is formed by means of a mechanical hinged link means, and a plate shaped part with an annular circumference so that on it the plate may be mounted and at least at one place may be sawcut and at least part of it may be of bimetallic form.

- 4595 PROCESS FOR DETECTING AND LOCATING FAILED FUEL ELEMENTS IN A NUCLEAR REACTOR. Wonn, J.W. (to Westinghouse Electric Corp., Pittsburgh, PA (USA)). French Patent 2,341,182 /A/. 9 Feb 1977. Priority date 11 Feb 1976, United States of America (USA), 17p. (In French).

The description is given of a process for detecting and locating a failed fuel element of a liquid cooled reactor. The fuel element includes fissile matter enclosed in a tubular metal cladding hermetically sealed both ends. The temperature of the fuel element is raised above the boiling point of the coolant so as to cause any liquid to boil that might enter the fuel element and the audio-frequency noise generated by the boiling liquid in the fuel element is monitored as the indication of a leak in the cladding.

- 4596 EXCHANGER PUMP UNIT FOR NUCLEAR REACTORS. Robin, M. (to CEA, 75 - Paris (France)). French Patent 2,379,881/A/. 4 Feb 1977. 36p. (In French).

This invention concerns an exchanger-pump unit comprising a double wall tube heat exchanger and a pump for circulating the primary exchange fluid integrated with this exchanger. This exchanger also enables any leaks through the walls of the exchange tubes to be monitored. The invention relates to a heat exchanger between two coolant fluids, primary and secondary respectively, which enables action to be taken on the exchange appliance, in the event of trouble, before the two fluids come into contact. This particularly concerns, although not exclusively the case, where the two fluids react chemically on each other and produce a destructive reaction. As will be imagined, special precautions have to be taken in such a case. Further, the apparatus described in the invention concerns the integration of the pump in the heat exchanger. This problem occurs particularly, although not exclusively, in the case of cooling systems of fast reactors cooled by liquid sodium or its alloys.

- 4597 METHOD FOR HEAT EXCHANGER LEAK DETECTION IN A LIQUID METAL COOLED NUCLEAR REACTOR. Sayre, R.K. (to Westinghouse Electric Corp.). US Patent T955,004. 1 Feb 1977. Filed date 5 Apr 1976. 2p.

An on-line method is described for early

detection of a leak through a tube of a liquid metal-to-water tube type heat exchanger in a liquid metal cooled nuclear reactor system. Introducing helium to the heat exchanger feedwater exposes the helium to any heat exchanger leak locations, and the helium will diffuse or flow through the leak location into the liquid metal. An increase in the helium content of the liquid metal evidences the existence of a leak. The content of helium in the liquid metal can be detected either by direct analysis of the reactor cover gas in a dual cycle reactor plant, or by removing a coolant sample from the reactor system downstream of the heat exchanger in a dual or triple cycle plant, separating the gaseous content of the sample, and analyzing the gaseous content for helium. The properties of helium are such that the invention method may result in identification of a tube leak before any water and liquid metal actually come in contact.

- 4598 STUDYING BEHAVIOUR OF HOT WASTES FROM REPROCESSING OF FAST REACTOR FUEL ELEMENTS BY THE GAS-FLUORIDE METHOD. Kirillovich, A.P.; Lavrinovich, Y.G.; Skiba, O.V.; Vorobei, M.P.; Starozhukov, D.I. At. Energ. (USSR); 42: No. 2, 94-98(Feb 1977). (In Russian).

The results of investigating certain physico-chemical and radiation properties of high level radioactive solid waste are presented. Reprocessing facility characteristics and investigation methods are described. Results of measuring heat generation from irradiated fuel and radioactive waste are reported. A fission product balance is presented. The radiation gas release rate is evaluated on the basis of observations over a period of one year. The amount of radionuclides released in the gas phase from solid waste is determined. The level of gas phase contamination during the waste storage is calculated. It is concluded that the radioactive waste should be placed in hermetically sealed containers for long-term storage under controlled conditions.

- 4599 STEAM GENERATORS OF SODIUM COOLED FAST REACTORS. Suransky, F. Jad. Energ.; 23: No. 2, 67-72(Feb 1977). (In Czech).

The basic classification of sodium-water steam generators by design is given, i.e., into body generators and modular (section) generators; the design of individual types is described and advantages and disadvantages listed. The individual systems differ also in operation, in the configuration of pipes and the design of the gas cushion. The basic demand put on all these steam generators is the protection of the system against the hazards of small or large sodium-water reactions. The structural criterion considered is the rupture of both walls of one pipe as the initial event; the growth of microleaks is also considered. The possibilities are given of leaks detection using chemical or physical processes arising during the sodium-water reaction. The criteria are listed for the selection of materials for steam generators, and the effects of corrosion related to the quality of feed water are considered.

- 4600 SAND FILTERS AS HIGH EFFICIENCY AEROSOL FILTERS IN NUCLEAR PLANTS. Boehm, L. (Rheinisch-Westfälischer Technischer Ueberwachungs-Verein e.V., Essen (Germany, F.R.)); Jordan, J.; Schikarski, W. (Gesellschaft fuer Kernforschung m.b.H., Karlsruhe (Germany, F.R.)). pp 661-670 of Proceedings. Seminar on high efficiency aerosol filtration in the nuclear industry.

Luxembourg; Commission of the European Communities (Feb 1977). (In German)

From Seminar on high efficiency aerosol filtration in the nuclear industry; Aix-en-Provence, France (23 Nov 1976).

See CONF-761145--.

In Liquid Metal Fast Breeder Reactors sodium is used as the cooling medium. Accidents at these nuclear installations may occur as a result of pipework leakage or major spills of radioactive sodium. To minimize the release of radioactivity to the environment in an accident case, a special filtration system is necessary. To date, nuclear installations with a possibility of sodium fires have been equipped with conventional glass-fibre filters. These filters have high retention efficiencies for chemically inert aerosols but do not resist aggressive sodium oxide aerosols. Sand bed filters have therefore been developed and tested for use in the ventilation extract system of the SNR-300. Filtration of aerosols by sand filters is widely practised, although no previous attempts to optimize them as regards efficiency and loading capacity have been reported. Experiments have been carried out with high aerosol concentrations (up to 40 g/m³) and flow velocities of 0-5 cm/sec in the Karlsruhe Nuclear Research Centre.

- 4601 HIGH EFFICIENCY FILTRATION OF LIQUID-METAL-GENERATED AEROSOLS. First, M.W. (Harvard School of Public Health, Boston, Mass. (USA)). pp 519-531 of Proceedings. Seminar on high efficiency aerosol filtration in the nuclear industry. Luxembourg; Commission of the European Communities (Feb 1977).

From Seminar on high efficiency aerosol filtration in the nuclear industry; Aix-en-Provence, France (23 Nov 1976).

See CONF-761145--.

This paper will present data on filter performance for the range of sodium-containing aerosols that can result from large and small releases of hot metallic sodium into confined spaces containing air or special atmospheres and will compare the particle collection effectiveness, space and power requirements, service life, and disposal of the collected materials for the several options. Prompt reduction of in-vessel aerosols with methods that induce rapid coagulation and sedimentation by the application of violent turbulence, sonic energy, or electrostatic attraction; by aerosol scavenging with massive inert dust additions; and by a number of other innovative methods is of special interest because of their potential ability to bring down the aerosol cloud very rapidly and thereby to reduce vessel out-leakage drastically; as well as to relieve the particle load on filters. These methods will be examined as supplements to filtration methods for control of sodium-containing aerosols.

- 4602 AVAILABILITY ANALYSIS OF COMMERCIAL FAST BREEDER REACTOR'S STEAM GENERATOR SYSTEM. Maekawa, I.; Shindo, Y.; Sakano, K. (Kawasaki Heavy Industries Ltd., Kobe (Japan)). FAPIG (Tokyo); No. 84, 8-12(Feb 1977). (In Japanese).

Optimization study for the availability and load factor of the sodium heated steam generator for a commercial fast breeder reactor was conducted as one of the economical feasibility study. Three cases were chosen for this availability analysis. The numbers of evaporator, super-heater and reheater are one each in case A, 4, 2 and 2 respectively in case B, and 5, 4 and 4 respectively in case C, and this plant has 1500 MWe capacity and four loops. The analysis was conducted by fixing the range of analysis, and then the factors of

plant outage especially for the probability of faults and maintenance time, and each fault mode was represented by the fault tree. The unavailability per each loop, the system unavailability and the load factor in cases A, B and C are shown, and the analytical results show that the load factor is the best in case B in this analysis. It is necessary to research the probability of faults in steam generator to accumulate the field data, and to investigate the system and the operational method to lessen low availability machinery to increase their availability.

- 4603 FILTRATION OF AEROSOLS PRODUCED BY A SODIUM FIRE. Duverger de Cuy, G.; Colome, J. (CEA Centre d'Etudes Nucleaires de Cadarache, 13 - Saint-Paul-les-Durance (France). Dept. de Surete Nucleaire). pp 533-544 of Seminar on high efficiency aerosol filtration in the nuclear industry. Luxembourg; Commission of the European Communities (Feb 1977). (In French)

From Seminar on high efficiency aerosol filtration in the nuclear industry; Aix-en-Provence, France (23 Nov 1976).

The containment system of the Super Phenix reactor takes account of the possibility of contaminated sodium fires, particularly in the vicinity of the fuel storage drum. It is thus necessary to contain the emitted radioactivity associated with a quantity of sodium aerosols of the order of some 10 g/m³. Investigations previously carried out had shown that the retention capacity of high-efficiency asbestos filters was clearly insufficient. A new research programme on the filtration of sodium aerosols has thus been worked out with the aim of: gaining a better understanding of the granulometry of the aerosols produced by the fire; checking the efficiency of the new glass-fibre media of which high-efficiency filters are composed; selecting a prefiltering system which, in conjunction with the high-efficiency filter, would ensure a suitable retention capacity for the whole unit. The following prefilterers are under investigation: agglomerating cyclones; fabric prefilterers (dense filter media - variable density filters - bag filters); water prefilterers; sand prefilterers. The experimental equipment on which this programme has been based is presented. Results have so far been obtained for agglomerating cyclones (recirculating loop with a cyclone of 95% efficiency), for a number of textile prefilterers and for the retention capacity of high-efficiency filters.

- 4604 (DOE-tr--179) TUFCEI, AN EXPERIMENTAL FACILITY TO STUDY THE MOLTEN-FUEL-COOLANT INTERACTION IN A FULL-SCALE FUEL ELEMENT. Beutel, H. (Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Inst. fuer Reaktorentwicklung). Feb 1977. Translation of KFK--2353 65p. Dep. NTIS, PC A04/MF A01.

The safety investigations on the Na-cooled fast breeder reactors also include experiments on the fuel-sodium reaction, in which especially the conversion of thermal energy into mechanical energy is to be determined in a simulated fuel element. The development of a test facility is described in which fuel-sodium reactions will be carried out in geometries which are typical for fuel elements. In contradistinction to the actual fuel elements in a core reactor, the walls in the reaction room are almost rigid for the expected pressure transients. The sodium- UO_2 contact is then produced both by the sodium striking the molten UO_2 and by injection of small amounts of sodium into the UO_2 (initiation reaction).

- 4605 SCRAM ROD SYSTEM FOR NUCLEAR REACTORS. Golden, M.P.; Govi, A.R. (to Westinghouse Electric Corp., Pittsburgh, Pa. (USA)). French Patent 2,339,937/A/. 21 Jan 1977. Priority date 28 Jan 1976, United States of America (USA), 34p. (In French).

A system of safety rods developed for sodium cooled reactors is described. Each rod is connected to a drive rod encircled by concentric bellows tightened to a magnetic plate at their upper end. These bellows constitutive the driving means and the annular space between them is in relation with pressure gas inlet and outlet means. An electromagnetic device is fitted up at the upper end of the drive rod stroke. The drive rod is maintained out of the nuclear reactor by the combined action of the electromagnetic device and the reduced gas pressure between the bellows.

- 4606 FUEL ASSEMBLY. Nishi, H.; Yoshida, H. (to Toshiba Corp., Kawasaki, Kanagawa (Japan)). Japanese Patent 1953-90,587/A/. 18 Jan 1977. 3p. (In Japanese).

A method to minimize the changes in the temperature distribution due to deviation of fuel pins in fuel assemblies of an lmfbr type reactor is described. A fuel assembly is supported on a plurality of support plates provided at the lower inside of a wrapper tube. Fasteners at the lower end plug of cladding tubes for closing the lower end thereof are assembled in such way that the directions of the fasteners are opposed to each other between each of adjacent fuel pins, in particular, those fuel pins supported on different support plates. With the above constitution, if the fuel pins tend to move laterally in the same direction acted by fluid pressure due to coolant flow, deviation of the fuel pins is not resulted to all of the pins since at least one of the adjacent fuel pins is fixed to the support plate by the fastener to be hindered from displacement.

- 4607 SUPPORTS FOR PIPES. Pollono, L.P. (to Westinghouse Electric Corp., Pittsburgh, Pa. (USA)). French Patent 2,339,800/A/. 17 Jan 1977. Priority date 28 Jan 1976, United States of America (USA), 9p. (In French). Support means for hot thin-walled pipes used in cooling circuits of liquid metal cooled nuclear reactors are described. They consist of tightening means put around the pipe, and a supporting structure. An insulating annular means is set up between the pipe and the tightening means: it is hollow and contains thermal insulating materials.

- 4608 NEUTRON TRANSPORT STUDIES IN FAST REACTOR SHIELDS. Vaidyanathan, R.; Murty, K.P.N.; Singh, R.S. (Reactor Research Centre, Kalpakkam, India). Natl. Bur. Stand. (U.S.), Spec. Publ.; No. 461, 163-165 (Jan 1977).

From International symposium on radiation physics; Calcutta, India (30 Nov 1974). See CONF-741109--.

The present study aims at evaluating the relative accuracies with which the different approximations to the transport theory represent the spatial and spectral distribution of neutrons in a typical fast reactor shield. Diffusion, removal diffusion and discrete ordinate transport calculations, with and without the inclusion of anisotropic scattering effects, have been performed for the lateral and axial shield configurations of the French fast reactor Rapsodie. The results have been compared, with the measurements made in Rapsodie and the NIOBE calculations made

earlier.

- 4609 (EURFNR--1447) HEATING RODS FOR SIMULATION OF FUEL PINS IN LIQUID METAL BOILING EXPERIMENTS. PART I. Casal, V.; Demski, A.; Graf, E.; Hartmann, W. (Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Inst. fuer Reaktorbauelemente). Jan 1977. Translation of KFK--2368 48p. Dep. NTIS, PC A03/MF A01.

Work performed under United States--Euratom Fast Reactor Exchange Program.

This report describes the design, development and testing of electrical heater rods for boiling tests in LMFBR fuel element simulators. The tests are required as a proof of the capability to control local and gross boiling in the core of SNR-300. The setup and performance of the tests call for heater rods simulating with a very high operating reliability the assumed incidents of SNR-300, even under transient conditions. Loads of the heating surface of up to 170 W/cm² must be attained at coolant temperatures of 950°C. The concept selected for the heater rod is an improvement of heater rods used in single-phase heat transfer tests. The heat is generated in the heater rod by ohmic heating of a tape helix. The heat passes the insulator, a layer made of compacted boron nitride powder, and reaches the cladding of the heater rod. The current conductor is made of a nickel-chromium alloy while the cladding material is stainless steel. The concept of the heater rod and the fabrication method have proved to be good. For instance, rejections in the fabrication process, including the instrumentation, are less than 1 percent. In the boiling experiments performed on two 7-rod bundles and one 169-rod bundle containing 88 heated rods no heater rod has failed so far.

- 4610 EVALUATION OF DESIRABLE ACCURACY FOR NUCLEAR DATA IN FAST REACTORS BY OPTIMIZATION METHOD. Miki, K.; Inoue, K. (Hitachi Ltd., Kawasaki, Kanagawa (Japan). Atomic Energy Research Lab.). J. Nucl. Sci. Technol. (Tokyo); 14: No. 1, 58-64 (Jan 1977).

The desirable accuracy of nuclear data for minimizing the design margin in fast reactor nuclear designs is evaluated through an optimization method, in which a parameter termed the "degree of difficulty" has been introduced in order to represent the relative degree of difficulty expected to be encountered in improving the accuracy of the data. This parameter serves to determine the desirable accuracy, by which the design margin could be reduced the least onerously, to obviate uselessly severe requirements being imposed on the accuracy demanded of data with high sensitivity coefficients. Application of this method to the equilibrium core of a prototype fast reactor leads to the conclusion that nuclear data that should to best advantage be improved in accuracy are: $\sigma_{sub(f)sup(41)}(400 \text{ -- } 0.5\text{keV})$, $\sigma_{sub(f)sup(49)}(1.4\text{MeV -- } 10\text{keV})$ and $\sigma_{sub(c)sup(28)}(100 \text{ -- } 0.5\text{keV})$. Furthermore, it is indicated that the ratio between the desirable accuracy and the present uncertainty level nuclear data is roughly inversely proportional to the square root of the product of the sensitivity coefficients and the present uncertainty level of nuclear data.

- 4611 PHENIX INTERMEDIARY HEAT EXCHANGER INTERVENTION. Conte, F. (CEA Centre de Marcoule, 30 - Bagnols-sur-Cèze (France). Service de la Centrale Phenix). Rev. Gen. Nucl.; No. 1, 57-59 (Jan-Feb 1977). (In French).

Operation on Phenix intermediary heat exchangers after the July and October 1976 incidents is analyzed. Included are remarks on conditions of repair work.

- 4612 HEAT TRANSFER CHARACTERISTICS OF STEAM GENERATORS FOR FBR. Takahashi, T. (Power Reactor and Nuclear Fuel Development Corp., Oarai, Ibaraki (Japan). Oarai Engineering Center); Tashino, M.; Sano, T.; Munezane, S.; Kiyokawa, T. Mitsubishi Juko Giho; 14: No. 1, 39-52 (Jan 1977). (In Japanese).

The development of the Fast Breeder Reactor (FBR) is urged for the effective use of the uranium resources. The Japanese Government has launched a national program plan to develop the demonstration FBR plant 'MONJU'. The Power Reactors and Nuclear Fuel Development Corporation (PNC) is charged with the responsibility for this program and also has been supervising it. The Steam Generator (SG) is one of the most important component in FBR plant. The high reliability is required in design, manufacture and installation of the SG because it exchanges the heat from sodium to water/steam. For these reason, the development work of the SG has been one of the critical area in the national program plan and consisted of the following three phases. The first one was for small scale 1 MW SGs and was already over. The second one was for medium scale 50 MW SGs and the last one is for 'MONJU' 238 MW SGs. All these SGs are the so-called helically coiled tube type units. Mitsubishi Heavy Industries received an order of the 50 MW SG No. 2 from PNC. Through this 50 MW SG No. 2 work, the various studies and experiments were done to design and manufacture the unit. The unit was completed and installed in Oct., 1975. Since then, PNC has been operating and testing it successfully. It is very important to examine the operational and test data from various technical aspects in every phase in order to confirm the design. This paper presents the thermal performance of 50 MW SGs comparing with its test data.

- 4613 OUTLINE OF 'MONJU' COORDINATED DESIGN, (3). Doryokuro Giho; No. 21, 53-78 (Jan 1977). (In Japanese).

Design of 'Monju', which is planned as a power-generating plant using the fast breeder reactor prototype, progressed in order. The coordinated design (3) was performed from November '75 to June '76. Based on the coordinated design (2), more minute machine design, unification of the specifications, the safety analysis, the aseismatic design, and the preparation of a variety of design criteria were achieved. The reactor auxiliary building was made a little smaller than in the coordinated design (2) by coordinating the arrangement of the equipments. Installation schedule and procedures were discussed. The reactor core has nearly cylindrical shape, and is composed of 198 core fuel assemblies and 172 blanket fuel assemblies. Hereinafter the following items are described: reactor core, reactor structure, fuel-handling system, heat-transferring system, steam-generating system, turbo-generator system, plant operation mode, electrical, instrumentation and control facilities, radioactive waste disposal system, and finally the reactor container and building, and miscellaneous facilities. The miscellaneous facilities include sodium supply, argon gas supply, nitrogen gas supply, sampling and analyzing, compressed air supply, auxiliary machine cooling, fresh water supply, fire extinguishing, maintenance and air conditioning systems.

- 4614 PRE-HEATER FOR FAST BREEDER REACTOR AND ITS LIFE. Takahashi, Y. (Sukegawa Electric Co. Ltd., Tokyo (Japan)). Haikan Gijutsu; 19: No. 1, 96-108 (Jan 1977). (In Japanese).

Pre-heating must be performed at the beginning of operation of the nuclear equipments using liquid metal as a heating medium, such as fast breeder reactors. The simplest means is to employ electric heaters. The life term of heaters has been tested because the life term same as that of reactors themselves has been required for the heaters. The heaters for pre-heating sodium facilities include sheathed heaters and micro-heaters, both of which have the construction that the heating wires are inserted in metal tubes filled with magnesia. After theoretically discussing the temperature difference and thermal stress of sheaths and heating wires, temperature cycle and stress cycle, low cycle thermal fatigue at high temperature and the theory of L.F. Coffin are explained, and the experiments have been performed based on the Coffin's theory. There were suspicions that inorganic heat insulators further fire as the water supplier to sodium and corrode stainless steel because of containing chlorides. Though it has been recently considered better to use metal insulation (utilizing the reflective index of polished aluminum surface), here the heat stored in inorganic heat insulators is calculated, and the conditions of heat conduction and heater restraint are experimented. In addition, the insulation resistance of heaters, the material, pitch non-uniformity, and eccentricity of heating wires are also discussed. At present, conclusion can not be obtained simply.

- 4615 (EURFNR--1425) EXPERIMENTAL INVESTIGATIONS INTO COOLANT CROSS MIXING IN MULTI-ROD CLUSTERS WITH GRID-TYPE SPACERS IN TURBULENT SODIUM FLOW. Hoffman, H.; Baumgartner, E.; Frey, H.H. (Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Inst. fuer Reaktorbauelemente). Jan 1977. Translation of KFK--2360 36p. Dep. NTIS, PC A03/MF A01.

Work performed under United States--Euratom Fast Reactor Exchange Program.

The thermo- and fluid-dynamic design of fuel elements of Liquid Metal-Cooled Fast Breeder Reactors needs characteristic values for the magnitudes of the coolant cross mixing. These were determined experimentally in sodium flow. 61-rod clusters were used with the specific dimensions of the SNR-300 fuel element (rod pitch to diameter ratio $P/D = 1.32$) equipped with grip-type spacers. The investigations were performed using the "heating method." Parameters are: the geometry of spacers (honeycomb-, ferrule-type); the Reynolds-numbers (8×10^3 less than or equal to Re less than or equal to 8×10^4); the support length of the rods within the cluster (150 less than or equal to H /mm/ less than or equal to 450); and the distance between grids and measuring plane (50 less than or equal to Δh /mm/ less than or equal to 160). In addition experiments were carried out using a 61-rod-cluster, $P/D = 1.2$, equipped with honeycomb-grids. Measured temperature profiles within the coolant outlet cross-section are reported as well as the mixing rates evaluated with respect to its definition in the MISTRAL-II-Code. The results show that the mixing rates are mainly influenced by the spacer type and the P/D -ratio.

- 4616 DEVELOPMENT OF STEEL TUBES FOR STEAM GENERATOR OF FAST BREEDER REACTOR. Yukitoshi,

T.; Moroishi, T.; Koizumi, I.; Yoshikawa, K.; Shida, Y. (Sumitomo Metal Industries Ltd., Amagasaki, Hyogo (Japan). Central Research Labs.). Sumitomo Kinzoku; 29: No. 1, 32-42 (Jan 1977). (In Japanese).

When austenitic steel and ferrite steel coexist in liquid sodium, the elements in the steels leach out and move through the liquid sodium. Especially when the decarburization occurs in ferritic steel, the lowering of high temperature strength becomes a design problem. The high-temperature strength, weldability, and decarburization behavior of 2 1/4 Cr-1 Mo steel with a wide variety of heat treatments and some carbon-stabilized 2 1/4 Mo steels in liquid sodium were examined for the purpose of material selection for the steam generator tubes of liquid-metal fast breeder reactors (LMFBR). The decarburization of 2 1/4 Cr-1 Mo steel in sodium depends on the matrix and the precipitates, and can be suppressed when the steel is appropriately normalized and tempered. The 2 1/4 Cr-1 Mo-Nb-Ni steel is superior to other stabilized steels, since the small addition of nickel assures sufficient strength, even if the normalizing temperature is as low as 950 degree C. Stabilized steels should be welded carefully to obtain fully penetrating beads. Preheating above 200 degree C and postheating above 720 degree C are required for the stabilization. As comparing all the investigated properties, the materials recommended for LMFBR steam generator tubes are normalized and tempered 2 1/4 Cr-1 Mo steel and, when the decarburization is not allowable, 2 1/4 Cr-1 Mo-Nb-Ni steel, with the condition that sound-welded joints can be available.

- 4617 REACTIVITY EFFECTS IN THE BN-350 REACTOR. Drov, V.V.; Troyanov, M.F.; Matveev, V.I. (and others). At. Energ. (USSR); 42: No. 1, 3-8 (Jan 1977). (In Russian).

The results of theoretical and experimental investigations of reactivity coefficients of the LMFBR type BN-350 reactor are presented. The isothermal temperature reactivity coefficients have been measured at temperatures ranging from 180 to 280 deg C. The corresponding calculated values take into account temperature induced changes in the geometry of the core, resonance neutron cross sections (the Doppler effect) and the coolant density (sodium). The power reactivity coefficients have been measured during step-by-step increase of the core's rating. The Doppler effect is noted to mostly contribute to the changes in the power reactivity coefficients (approximately 70%). The reactivity effects connected with variations in both the breeding ratio and the isotopic composition of the fuel have been also measured. It is pointed out that the experiments performed are the first-of-a-kind verification of the effects of temperature, power and fuel burn up on reactivity of a power fast breeder reactor. The models and methods used to calculate and design power fast breeder reactors are stressed to have proved valid and quite satisfactory.

- 4618 (BNWL-tr--340) RADIOACTIVITY OF LONG-LIVED NUCLIDES IN THE PRIMARY LOOP OF THE BOR-60 REACTOR DURING OPERATION WITH DEFECTIVE FUEL ELEMENTS. Gryazev, V.M.; Kizin, V.D.; Lisitsyn, E.S.; Polyakov, V.I.; Chechetkin, Yu.V. Jan 1977. Translation of NIIAR-P-5, No. 299, January 1977 23p. Dep. NTIS, PC A02/MF A01.

Generalized measured results are presented on the accumulation and distribution of radioactive nuclides from corrosion and fission products during the four years of operation of the BOR-60, including fairly long operation

with defective fuel elements in the core.

- 4619 ACOUSTICALLY INDUCED VIBRATION OF CIRCULAR CYLINDRICAL RODS. Lin, H.C.; Chen, S.S. (Argonne National Lab., IL). J. Sound Vib.; 51: No. 1, 89-96(1977).

An analysis is presented for the steady-state response of a circular cylindrical rod subjected to a plane wave; expressions for the rod displacement, the natural frequency (including the fluid inertia effect) and the radiation damping are obtained in closed form. It is shown that the added mass coefficient depends only on the non-dimensional wave number α and the radiation damping depends on α and the mass ratio β . The rod displacement is proportional to wave amplitude and rod radius, and depends on α and β .

- 4620 HOLLOW SPHERE FORMATION IN A GASSY TWO-LIQUID POOL. Bankoff, S.G.; Horin, W.A. (Northwestern Univ., Evanston, IL). Lett. Heat Mass Transfer; 4: No. 3, 225-229(1977).

Molten fuel pools with an overlying layer of steel can be expected to form in various stages of the LMFBR post-accident heat removal sequence, either on in-vessel or ex-vessel core catchers, or on a concrete or refractory floor beneath the reactor vessel. Since the boiling point of steel is approximately the same as the freezing point of UO_2 , one can expect that a crust of frozen UO_2 may form at the interface. However, there may be significant bubbling through the interface, either by boiling within the fuel pool or by gas released from the concrete or sacrificial material. The original objective of this work was therefore to study the conditions for crust formation in a simulant (hexane and water) pool with gas evolution. A unique physical phenomenon was observed, however, consisting of the formation of "ping-pong" balls of ice formed by water transported by the bubbles entering the cold overlying hexane. These formed a raft of hollow spheres at the top of the hexane layer. By analogy, one might expect considerable mixing of UO_2 in the form of hollow spheres into the molten steel, with important consequences for the pool geometry and heat transfer.

- 4621 ROLE OF NUCLEAR POWER IN THE NEXT FEW DECADES. Esselman, W.H. (Electric Power Research Inst., Palo Alto, CA). pp 16p, Paper 7 of Executive conference on uranium fuel supply. Hinsdale, IL; American Nuclear Society (1977).

From Conference of the American Nuclear Society; Monterey, CA, USA (24 Jan 1977). See CONF-770109--.

This paper presents a perspective on the potential of nuclear power over the next 25 years, based on EPRI studies. Factors affecting the electricity requirement are discussed; for the year 2000, it is projected to be 2.5 to 5 times the 1976 electricity usage. This increase will be met by coal and nuclear. It is doubtful that a large number of LMFBRs will be operating by 2000, and the potential energy resource in the spent LWR fuel elements is pointed out. (DLC)

- 4622 PREDICTION OF THE THERMAL CONDUCTIVITY OF UO_2 VAPOR. Tills, J.L.; Cronenberg, A.W. (New Mexico Univ., Albuquerque (USA)). Dept. of Nuclear Engineering; Schmidt, T.R. (Sandia Labs., Albuquerque, N.Mex. (USA)). J. Nucl. Mater.; 67: No. 1, 67-76(1977).

An important aspect of Liquid-Metal Fast Breeder Reactor (LMFBR) safety analysis is an accurate description of the transport phenomena

of the various reactor materials during a hypothetical core-disruptive accident. For the case of an accident sequence leading to fuel vaporization, the problem of energy losses by conduction, radiation, and latent heat and mass losses by condensation of the fuel vapor in the presence of cold structure and/or coolant is of particular interest since such losses will determine, to a large extent, the energetics of the fuel vapor expansion process following pin failure. In this paper, a theoretical estimate of the thermal conductivity of UO_2 vapor is determined, based upon kinetic theory for a multicomponent gas. Results indicate that at elevated temperatures, the conductivity is a strong function of temperature due to thermal dissociation of the UO_2 molecule, where the species concentrations are taken from calculations presented elsewhere. At 5000 K the thermal conductivity is 2.2×10^{-3} cal/cm-sec K, which is relatively high; thus, it should be considered in analyses of fuel vapor phenomenon. The functional relationship between conductivity and temperature can be approximated as: $\lambda_{\text{sub}}(T) = \exp[-39.66 + 1.891(-2)T - 3.561(-6)T^2 + 2.242(-10)T^3]$, for $3000 \text{ K} \leq T \leq 5500 \text{ K}$.

- 4623 ENERGY POLICY AND THE ROLE OF NUCLEAR POWER. Brookes, L.G. (UKAEA). pp 2.1-2.11 of Proceedings of symposium on energy in the 80s. London; Institution of Chemical Engineers (1977).

From Symposium on energy in the 80s; Middlesborough, UK (5 - 7 Apr 1977).

It is shown that sharply increased oil prices have harmed GNP performance and severely reduced the rate of substitution of nuclear for fossil energy. Reduction or stabilization of energy prices should be the primary objective of energy policy. It is suggested that the UK could help to maintain economic momentum by making the maximum use of gas while exporting oil. The taxes and royalties from the oil might best be fed back into the economy by reducing other forms of taxation. The complex interaction of the costs and prices of different fuels is discussed. The role of nuclear energy is considered. It is concluded that it is the cheapest, safest and cleanest way of producing electricity, and it is suggested that it should be bound up with the exploitation of the fast breeder reactor. The role of coal and of the Middle East oil reserves themselves is also considered.

- 4624 WAKE AND DISPERSION MODELS FOR THE EBR-II BUILDING COMPLEX. Halitsky, J. Atmos. Environ.; 11: No. 7, 577-596(1977).

Wind properties measured downwind of the reactor containment structure at the EBR-II complex were found to be in agreement with predictions made with a mathematical wake model that was derived from measurements in the wakes of suspended flat plates in a wind tunnel and modified for the presence of the ground boundary. Simultaneous concentration measurements of a tracer released in the lee of the reactor containment structure were found to be in agreement with the predictions of a mathematical dispersion model that incorporated the wake model in conjunction with atmospheric turbulence properties. The analysis provides insight into the nature and properties of building wakes in the atmosphere, and their influence on dispersion of released material.

- 4625 FLOW MODEL TEST DEVELOPMENT OF CRBRP INTERMEDIATE HEAT EXCHANGER. AbuRomia, M.M.; Vosch, R.J. Jr.; Cho, S.M.; Dietz, D.; Jaisingh, G. (Foster Wheeler Dev Corp,

- Livingston, NJ). Am. Soc. Mech. Eng., [Pap.]; No. JPGC-NE-10, 1-11(1977).
- The details of these tests, flow data achieved, finalized design configurations of the flow distribution devices, and final interpretation of the results are given in this paper. The tests consist of the: Primary Inlet Plenum Flow Model Test which has the objective of finalizing the design of the primary flow inlet plenum configuration that results in a circumferentially uniform flow entering the tube bundle; Tube Bundle Flow Model Test which has the objective of achieving optimum design configurations for the flow baffles in the bundle, which is based on the baffles capability to create the necessary forced fluid mixing of the shell side flow within the pressure drop limitation imposed on the unit's design; and Intermediate Flow Model Test with its objective of confirming the design of the intermediate flow inlet plenum, which has a hemispherical shape with a ring baffle attached, in distributing the flow evenly among the tubes. The paper includes details of the flow fields within various test models in a wide range of operating flow rates. 2 refs.
- 4626 STUDY OF THE DENSITY INTERFACE IN A STRATIFIED LMFBR OUTLET PLENUM. Lorenz, J.J.; Howard, P.A. (Argonne Natl Lab, Ill). Am. Soc. Mech. Eng., [Pap.]; No. 77-HT-23, 1-8(1977).
- Tests were performed with small scale model plenums using water as the test fluid. The movement of the interface was detected by vertical strings of closely spaced thermocouples. Considerable wave motion and unsteadiness were observed at the density interface. As the interface passed a given thermocouple location, the temperature was observed to drop abruptly while oscillating in the process. Using the theory of free submerged jets, a correlation was developed for the rise rate of the interface in terms of the Froude number based on local jet impingement parameters. This correlation can readily be incorporated into a computer code for outlet plenum analysis. 12 refs.
- 4627 CRBRP OUTLET PLENUM BEHAVIOR DURING STEADY STATE AND TRANSIENT CONDITIONS. Howard, P.A.; Lorenz, J.J.; Howarth, W.L.; Novodstern, E.H. (Argonne Natl Lab, Ill). Am. Soc. Mech. Eng., [Pap.]; No. 77-HT-32, 1-8(1977).
- Of major concern in this study were buoyancy-induced flow stratification and thermal oscillations ("thermal striping"). Tests were performed with a 1/10 scale model CRBRP outlet plenum complete with the Upper Internals Structure (UIS) using water as the test fluid. The components in the upper region of the outlet plenum experienced the characteristic temperature drop and recovery during the early development of flow stratification; temperature oscillations were observed at the stratification interface and in the neighborhood of the fuel assembly/blanket assembly boundary. Temperature measurements obtained provided the thermal boundary conditions required for calculating thermal stresses. 7 refs.
- 4628 VALIDATION OF TURBULENCE MODELS FOR LMFBR OUTLET PLENUM FLOWS. Chen, Y.B.; Golay, M.W. (MIT, Cambridge, Mass). Am. Soc. Mech. Eng., [Pap.]; No. 77-HT-34, 1-8(1977).
- Small scale experiments involving water flows are used to provide mean flow and turbulence field data for LMFBR outlet plenum flows. Measurements are performed at Reynolds number (Re) values of 33000 and 70000 in a 1/15 - scale FFTF geometry and at Re = 35000 in a 3/80-scale CRBR geometry. The experimental behavior is predicted using two different two-equation turbulence model computer programs, TEACH-T and VARR-II. It is found that the qualitative nature of the flow field within the plenum depends strongly upon the distribution of the mean inlet flow field, importantly also upon the degree of inlet turbulence, and also upon the turbulent momentum exchange model used in the calculations. In the FFTF geometry, the TEACH-T predictions agree well with the experiments. 7 refs.
- 4629 COMBINED FORCED AND FREE LAMINAR CONVECTION IN VERTICAL ROD BUNDLES WITH LONGITUDINAL FLOW. Ramm, H.; Johannsen, K. (Inst fuer Kerntechnik, Berlin, Ger). Am. Soc. Mech. Eng., [Pap.]; No. 77-HT-44, 1-12(1977).
- The heat-transfer problem of combined forced and free convection by fully developed laminar flow in a vertically mounted reactor fuel rod assembly has been solved analytically for both upflow and downflow. Results reveal the strong augmentation of buoyancy effects by radial gradients in the power generation across the assembly. 12 refs.
- 4630 ECONOMETRIC ANALYSIS OF ENERGY OVER THE NEXT 75 YEARS. Schmitt, R.W.; BenDaniel, D.J.; Stewart, P.J.; Manne, A.S. (GE Co, Schenectady, NY). IEEE Trans. Power Appar. Syst.; PAS-96: No. 4, 1353-1361(1977).
- An econometric model with a 75-year time horizon to determine base-load power generation mix is described. A number of conventional, evolutionary, and speculative generation systems are considered, together with constraints imposed by fuel availability and technical development times. Preliminary results are presented. 6 refs.
- 4631 ELECTROMAGNETIC FLOWMETERS FOR FAST REACTORS. Baker, R.C. (Imperial Coll. of Science and Technology, London (UK). Dept. of Mechanical Engineering). Prog. Sci.; 1: No. 1, 41-61(1977).
- This paper is in four parts. Section 1 explains the theory of the induced-voltage electromagnetic flowmeter and then considers various types which have been used. For the primary circuit of fast reactors both flow-through type and probe type have been proposed, although obtaining magnets which operate satisfactorily at high temperatures has been a problem. In the secondary circuit the high magnetic Reynolds numbers cause the field to be swept out of the magnet gap and this has led to the use of the long saddle-coil flowmeter. In Section 2 flux-distortion flowmeters are described. These have been proposed mainly for monitoring the primary circuit flow and again both flow-through and probe types have been tested. Sections 3 and 4 continue the discussion of the flux-distortion flowmeter by introducing two methods of analysing its performance. The first is a finite difference method which solves the non-linear problem by using a time marching method. It is shown that a linear approximation is adequate for the likely levels of flow encountered in the fast reactor and consequently two linearised solutions are used. The first method is a finite difference one and allows the instantaneous response of a step change in velocity to be observed as well as the effect of bubbles. In Part 4 the second linearized method uses current rings to divide up the conducting material. By considering the

interaction of all the rings, it is possible to obtain the current distribution and hence the magnetic field. In conclusion it is suggested that further development would be useful of the devices which are most suited to the liquid metal fast breeder reactor.

- 4638 COMPARISON OF THE PERFORMANCE OF SEVERAL NEUTRON DIFFUSION COMPUTER CODES FOR A FAST BREEDER REACTOR. Kuefner, K.; Buckel, G.; Stehle, B. (Kernforschungszentrum Karlsruhe (Germany, F.R.). Inst. fuer Neutronenphysik und Reaktortechnik). Atomkernenergie; 30: No. 2, 77-81(1977).

From Technical meeting on coarse-mesh methods: progress in the methods and their application to reactor problems; Erlangen, Germany, F.R. (25 - 26 Jan 1977).

Calculations have been performed with four computer codes solving the static multigroup neutron diffusion equations by means of the finite difference method. For this purpose a realistic model of a sodium cooled fast reactor has been developed. We found that only for a discretization step width h equal to or less than the minimum diffusion length the results for the multiplication factor $k_{sub}(eff)$ and for the neutron flux reproduce the asymptotic values as h tends to zero (within practical accuracy requirements). Furthermore we have investigated the influence of the number of energy groups on $k_{sub}(eff)$ and found, for suitable chosen group boundaries, well decoupled behaviour of the effects of spatial and energetic resolution.

- 4639 ROLE OF THE CRBRP IN MEETING THE NATION'S ENERGY REQUIREMENTS. Riley, D.R. (Clinch River Breeder Reactor Plant Project, Oak Ridge, TN). pp 602-610 of Proceedings of the third annual UMR-MEC conference on energy: energy crisis, an evaluation of our resource potential. Morgan, J.D. (ed.). North Hollywood, CA; Western Periodicals Co. (1977).

From 3. annual conference on energy; Rolla, MO, USA (13 Oct 1976).

See CONF-761038--.

For over two decades the United States has been conducting research and development on the breeder reactor concept--an advanced reactor that breeds or produces more nuclear fuel than it consumes. The Clinch River Breeder Reactor Plant (CRBRP) is the nation's first large scale breeder designed to demonstrate the feasibility of producing electricity for commercial consumption. The current status of the CRBRP and its important role in meeting the nation's energy requirements are described.

- 4640 EXPERIMENTAL EVALUATION OF THE FLOW DISTRIBUTION IN THE CRBRP MODULAR STEAM GENERATOR. Lee, Y.J.; Weinberg, L.; Moriarty, M.P.; Oliva, R.M. New York; American Society of Mechanical Engineers (1977). 12p. (CONF-770912--3).

From ASME-IEEE joint power generation conference; Los Angeles, CA, USA (18 Sep 1977).

The shell side sodium flow velocity distribution was determined as a function of axial and circumferential position on a full scale model of the CRBRP Steam Generator, using water as the test fluid. Flow velocity profiles were obtained at 15 longitudinal locations, four of which provided data in three radial axes, to determine the length required to achieve a uniform flow distribution within the tube bundle and the flow distribution throughout the model. Velocity measurements in the inlet flow annulus indicated that the local flowrate at 180 degrees from the inlet was about 3 times the flowrate in line with the inlet. Velocity measurements in the outlet flow

annulus indicated relatively uniform flow conditions. Velocities in the lower stagnant regions were also measured and reported.

- 4641 ANALYSIS OF THE MECHANICAL RESPONSE OF LMFBR FUEL CLADS SUBJECTED TO IN-SERVICE PROPERTY VARIATIONS. Subbaraman, G. Blacksburg, VA; Virginia Polytechnic Inst. and State Univ. (1977). 125p. University Microfilms Order No. 77-22,089.

Thesis (Ph. D.).

Evidence from available literature is presented to illustrate the degradation of 316 type stainless steel considered for use in Liquid Metal Fast Breeder Reactors where sodium is used as the coolant. Nonuniform changes in properties of the steel have been found to occur due to the thermal, thermochemical, and irradiation environment to which it is exposed. Variations in impurity concentrations (such as carbon in the steel) of several orders of magnitude compared to the original values have been observed under controlled sodium exposures. At temperatures relevant to the reactor system migration of impurities by diffusion, compound formations and carburization/decarburization behavior have been observed to occur. Mechanical property measurements such as tensile and yield strengths made under these conditions indicate that thermal and thermochemical influences can result in variations in the above properties quite different from the original material. Modified formulations of the elastic and elastic-plastic analysis of the degraded fuel-clad are presented in two dimensions. The elastic and plastic parameters relating to the properties of the degraded material are represented by spatially varying functions as opposed to being treated as constants which is the conventional case. The changes in the mathematical nature of the constitutive equations are demonstrated by sample illustrations and solutions involving continuous changes in the elastic moduli through-the-thickness of the clad. Recommendations for the establishment of improved Reactor Research Development Standards are made based on the studies.

- 4645 MATERIAL SELECTION FOR A SODIUM-HEATED STEAM GENERATOR. Grant, G.; Kakarala, C.R.; Hinton, B.M. (Babcock and Wilcox Co., Lynchburg, VA). Trans. Am. Nucl. Soc.; 27: 225-226(1977).

From ANS winter meeting; San Francisco, CA, USA (27 Nov 1977).

See CONF-771109--.

LMFBR. LMFBR TYPE REACTORS;STEAM GENERATORS; REACTOR MATERIALS;MECHANICAL PROPERTIES;DESIGN; CHROMIUM-MOLYBDENUM STEELS

- 4646 EFFECTS OF STOICHIOMETRY ON CLADDING ATTACK IN MIXED-OXIDE FUELS TO approx. ≈ 3.6 AT.% BURNUP. Hata, D.C.; Lawrence, L.A.; Weber, J.W. (Westinghouse Electric Corp., Richland, WA). Trans. Am. Nucl. Soc.; 27: 233-235(1977).

From ANS winter meeting; San Francisco, CA, USA (27 Nov 1977).

See CONF-771109--.

LMFBR. LMFBR TYPE REACTORS;FUEL PINS;FUEL-CLADDING INTERACTIONS;PLUTONIUM DIOXIDE;URANIUM DIOXIDE;STAINLESS STEEL-316;PERFORMANCE TESTING; BURNUP;STOICHIOMETRY

- 4647 ANALYSIS OF FUEL-CLADDING CHEMICAL INTERACTION AT HIGH BURNUP. Lawrence, L.A.; Weber, J.W.; Devary, J.L. (Westinghouse Electric Corp., Richland, WA). Trans. Am. Nucl. Soc.; 27: 235-236(1977).

From ANS winter meeting; San Francisco, CA, USA (27 Nov 1977).

See CONF-771109--.

LMFBR. LMFBR TYPE REACTORS;FUEL PINS;FUEL-CLADDING INTERACTIONS;BURNUP;PLUTONIUM DIOXIDE; URANIUM DIOXIDE;STAINLESS STEELS;PERFORMANCE TESTING

- 4648 IN-PILE HOMOGENIZATION OF MIXED-OXIDE FUEL. Mingst, B.; Olander, D.R. (Univ. of California, Berkeley). Trans. Am. Nucl. Soc.; 27: 236-237(1977).

From ANS winter meeting; San Francisco, CA, USA (27 Nov 1977).

See CONF-771109--.

LMFBR. LMFBR TYPE REACTORS;FUEL PINS;URANIUM DIOXIDE;PLUTONIUM DIOXIDE;BURNUP;PERFORMANCE TESTING;HOMOGENEOUS MIXTURES

- 4649 INTERACTION BETWEEN HYPERSTOICHIOMETRIC (U,PU)C AND MOLTEN STAINLESS-STEEL SHROUD MATERIAL. Latimer, T.W. (Los Alamos Scientific Lab., NM). Trans. Am. Nucl. Soc.; 27: 245-246(1977).

From ANS winter meeting; San Francisco, CA, USA (27 Nov 1977).

See CONF-771109--.

LMFBR. LMFBR TYPE REACTORS;FUEL PINS;FUEL-CLADDING INTERACTIONS;STAINLESS STEEL-316; PLUTONIUM CARBIDES;URANIUM CARBIDES;TEMPERATURE DEPENDENCE

- 4650 CALIBRATION SYSTEM FOR HYDROGEN METERS IN SODIUM. McKee, J.M. (Argonne National Lab., IL). Trans. Am. Nucl. Soc.; 27: 253(1977).

From ANS winter meeting; San Francisco, CA, USA (27 Nov 1977).

See CONF-771109--.

LMFBR. LMFBR TYPE REACTORS;STEAM GENERATORS; LEAKS;LEAK DETECTORS;HYDROGEN METERS; CALIBRATION;PERFORMANCE

- 4651 SODIUM-WATER REACTION TESTING IN THE LLTR. Neely, H.H.; DeBear, W.S.; Miller, A.E. (Atomics International, Canoga Park, CA). Trans. Am. Nucl. Soc.; 27: 256-258(1977). From ANS winter meeting; San Francisco, CA, USA (27 Nov 1977). See CONF-771109--.
- LMFBR. LMFBR TYPE REACTORS; STEAM GENERATORS; LEAKS; MOCKUP; TEST FACILITIES; TEMPERATURE GRADIENTS; PRESSURE GRADIENTS
- 4652 TH-U METALLIC FUEL: LMFBR POTENTIAL BASED ON EBR-II DRIVER-FUEL PERFORMANCE. Seidel, B.R.; Einziger, R.E.; Walter, C.M. (Argonne National Lab., Idaho Falls, ID). Trans. Am. Nucl. Soc.; 27: 282-283(1977). From ANS winter meeting; San Francisco, CA, USA (27 Nov 1977). See CONF-771109--.
- LMFBR TYPE REACTORS; FUEL PINS; PERFORMANCE TESTING; URANIUM ALLOYS; THORIUM ALLOYS; SWELLING; FISSION PRODUCT RELEASE; FUEL-CLADDING INTERACTIONS
- 4653 FEASIBILITY OF IRRADIATING $^{233}\text{U}/^{232}\text{Th}$ METAL FUEL EXPERIMENTS IN EBR-II. Foltman, A.J.; Meneghetti, D. (Argonne National Lab., IL). Trans. Am. Nucl. Soc.; 27: 285-286(1977). From ANS winter meeting; San Francisco, CA, USA (27 Nov 1977). See CONF-771109--.
- LMFBR. LMFBR TYPE REACTORS; FUEL PINS; THORIUM CYCLE; REACTOR KINETICS; REACTOR CORES; EBR-2 REACTOR
- 4654 STATUS OF MECHANICAL PROPERTIES AND MODELS FOR LMFBR AND LWR FUEL ELEMENT MODELING. Billone, M.C. (Argonne National Lab., IL). Trans. Am. Nucl. Soc.; 27: 298-299(1977). From ANS winter meeting; San Francisco, CA, USA (27 Nov 1977). See CONF-771109--.
- LMFBR TYPE REACTORS; BWR TYPE REACTORS; PWR TYPE REACTORS; FUEL ELEMENTS; PERFORMANCE; HYDRAULICS; HEAT TRANSFER; URANIUM DIOXIDE; PLUTONIUM DIOXIDE; URANIUM CARBIDES; PLUTONIUM CARBIDES; URANIUM NITRIDES; PLUTONIUM NITRIDES; MATHEMATICAL MODELS; COMPUTER CODES
- 4655 REALITIES OF UTILIZING THORIUM-BASED FUELS IN LWRs AND LMFBRs. Loewenstein, W.B.; Sehgal, B.R. (Electric Power Research Inst., Palo Alto, CA). Trans. Am. Nucl. Soc.; 27: 312-313(1977). From ANS winter meeting; San Francisco, CA, USA (27 Nov 1977). See CONF-771109--.
- LMFBR TYPE REACTORS; PWR TYPE REACTORS; BWR TYPE REACTORS; FUEL ELEMENTS; THORIUM CYCLE; REACTOR KINETICS; BREEDING RATIO; EFFICIENCY; PERFORMANCE
- 4656 LAMINAR MIXED-CONVECTION HEAT TRANSFER IN FINITE HEXAGONAL BUNDLES. Kim, J.Y.; Wolf, L. (Massachusetts Inst. of Tech., Cambridge). Trans. Am. Nucl. Soc.; 27: 384-385(1977). From ANS winter meeting; San Francisco, CA, USA (27 Nov 1977). See CONF-771109--.
- LMFBR. LMFBR TYPE REACTORS; FUEL ASSEMBLIES; HYDRAULICS; LIQUID FLOW; TEMPERATURE GRADIENTS; HEAT TRANSFER
- 4657 CRITICALITY CALCULATIONS FOR FAST REACTOR FUEL STORAGE FACILITIES. Otter, J.M.; Pacora, V.J.; Specht, E.R. (Atomics International, Canoga Park, CA). Trans. Am. Nucl. Soc.; 27: 412(1977). From ANS winter meeting; San Francisco, CA, USA (27 Nov 1977). See CONF-771109--.
- LMFBR. LMFBR TYPE REACTORS; FUEL POOLS; SPENT FUEL STORAGE; CRITICALITY; NEUTRON TRANSPORT THEORY; REACTIVITY WORTHS
- 4658 DESIGN AND FABRICATION CONSIDERATIONS FOR CRBRP EX-VESSEL STORAGE TANK (EVST). Der Manuel, G. (Atomics International, Canoga Park, CA). Trans. Am. Nucl. Soc.; 27: 485(1977). From ANS winter meeting; San Francisco, CA, USA (27 Nov 1977). See CONF-771109--.
- CLINCH RIVER BREEDER REACTOR; SPENT FUEL STORAGE; SPECIFICATIONS
- 4659 PHYSICS DESIGN OF A SAFETY RESEARCH MODIFICATION OF EBR-II. Foltman, A.J.; Franklin, F.C.; Grimm, K.N.; Meneghetti, D. (Argonne National Lab., IL). Trans. Am. Nucl. Soc.; 27: 513-515(1977). From ANS winter meeting; San Francisco, CA, USA (27 Nov 1977). See CONF-771109--.
- EBR-2 REACTOR; REACTOR EXPERIMENTAL FACILITIES; MODIFICATIONS; DESIGN; REACTOR CORES; REACTIVITY INSERTIONS
- 4660 GAS TAG DESIGNS FOR A GENERIC LMFBR. Figg, J.A. (Westinghouse Electric Corp., Richland, WA); Schenter, R.E.; DeClue, J.F. Trans. Am. Nucl. Soc.; 27: 578-579(1977). From ANS winter meeting; San Francisco, CA, USA (27 Nov 1977). See CONF-771109--.
- CLINCH RIVER BREEDER REACTOR; FAILED ELEMENT MONITORS; FAILED ELEMENT DETECTION; FUEL ELEMENT FAILURE; PERFORMANCE
- 4661 EXPERIMENTS AND ANALYSES FOR AN LMFBR INHERENT SHUTDOWN SYSTEM. Specht, E.R.; Paschall, R.K.; Jackola, A.S.; Chung, D.K. (Argonne National Lab., IL). Trans. Am. Nucl. Soc.; 27: 581-582(1977). From ANS winter meeting; San Francisco, CA, USA (27 Nov 1977). See CONF-771109--.
- LMFBR TYPE REACTORS; SCRAM; ENGINEERED SAFETY SYSTEMS; REACTOR PROTECTION SYSTEMS; SPECIFICATIONS
- 4662 MEASUREMENTS OF SODIUM OXIDE AGGLOMERATE PROPERTIES. Gieseke, J.A.; Reed, L.D. (Battelle Columbus Labs., OH). Trans. Am. Nucl. Soc.; 27: 616(1977). From ANS winter meeting; San Francisco, CA, USA (27 Nov 1977). See CONF-771109--.
- LMFBR. LMFBR TYPE REACTORS; REACTOR ACCIDENTS; CONTAINMENT BUILDINGS; RADIOACTIVE AEROSOLS; SODIUM OXIDES; AGGLOMERATION
- 4663 SOME APPROXIMATIONS IN AEROSOL BEHAVIOR MODELS FOR SOURCE-TERM COMPUTATION. van de Vate, J.F. (Energy Research Foundation, Petten, Netherlands). Trans. Am. Nucl. Soc.; 27: 617-618(1977). From ANS winter meeting; San Francisco, CA, USA (27 Nov 1977). See CONF-771109--.
- LMFBR. LMFBR TYPE REACTORS; REACTOR ACCIDENTS; CONTAINMENT BUILDINGS; RADIOACTIVE AEROSOLS

- 4664 GRAVITATIONAL AGGLOMERATION OF AEROSOLS. Pertmer, G.A.; Loyalka, S.K. (Univ. of Missouri, Columbia). Trans. Am. Nucl. Soc.; 27: 618-620(1977).
From ANS winter meeting; San Francisco, CA, USA (27 Nov 1977).
See CONF-771109--.
LMFBR. LMFBR TYPE REACTORS; REACTOR CORE DISRUPTION; CONTAINMENT BUILDINGS; RADIOACTIVE AEROSOLS; AGGLOMERATION
- 4665 APPLICATION OF ACOUSTIC AGGLOMERATORS FOR EMERGENCY USE IN LMFBR PLANTS. Wegrzyn, J.; Shaw, D.T.; Rajendran, N. (State Univ. of New York at Buffalo, Amherst). Trans. Am. Nucl. Soc.; 27: 620-621(1977).
From ANS winter meeting; San Francisco, CA, USA (27 Nov 1977).
See CONF-771109--.
LMFBR TYPE REACTORS; REACTOR ACCIDENTS; RADIOACTIVE AEROSOLS; AGGLOMERATION; CONTAINMENT SYSTEMS; AIR CLEANING SYSTEMS; PERFORMANCE
- 4666 COMPUTER MODEL FOR TRITIUM TRANSPORT IN AND RELEASE FROM THE CRBRP AND OTHER LMFBRs. Renner, T.A. (Argonne National Lab., NM); McPheeters, C.C.; McGuire, J.C. Trans. Am. Nucl. Soc.; 27: 621-622(1977).
From ANS winter meeting; San Francisco, CA, USA (27 Nov 1977).
See CONF-771109--.
CLINCH RIVER BREEDER REACTOR; LMFBR TYPE REACTORS; TRITIUM; RADIOACTIVITY TRANSPORT; PRIMARY COOLANT CIRCUITS; MATHEMATICAL MODELS
- 4667 MATERIAL RELEASE FOR VARIOUS FUELS FOLLOWING AN HCDA IN CRBR. Falotico, R.N.; Peddicord, K.L. (Oregon State Univ., Corvallis). Trans. Am. Nucl. Soc.; 27: 622-623(1977).
From ANS winter meeting; San Francisco, CA, USA (27 Nov 1977).
See CONF-771109--.
CLINCH RIVER BREEDER REACTOR; REACTOR CORE DISRUPTION; REACTOR CORES; FISSION PRODUCT RELEASE; PLUTONIUM DIOXIDE; URANIUM DIOXIDE; URANIUM CARBIDES; PLUTONIUM CARBIDES; URANIUM NITRIDES; PLUTONIUM NITRIDES; COMPARATIVE EVALUATIONS
- 4668 FUEL VAPOR TRANSPORT THROUGH A SODIUM POOL. Huang, T.C.; McDonald, J.W.; Still, R.K. (General Electric Co., Sunnyvale, CA). Trans. Am. Nucl. Soc.; 27: 623-625(1977).
From ANS winter meeting; San Francisco, CA, USA (27 Nov 1977).
See CONF-771109--.
LMFBR. LMFBR TYPE REACTORS; REACTOR CORE DISRUPTION; RADIOACTIVE AEROSOLS; COVER GAS; VAPORS
- 4669 CRBRP CONTAINMENT. Buhl, A.R. (Energy Research and Development Administration, Washington, DC); Piper, H.B. Trans. Am. Nucl. Soc.; 27: 646-647(1977).
From ANS winter meeting; San Francisco, CA, USA (27 Nov 1977).
See CONF-771109--.
CLINCH RIVER BREEDER REACTOR; CONTAINMENT BUILDINGS; CONTAINMENT SYSTEMS; PERFORMANCE; SPECIFICATIONS
- 4670 FIRST IN-REACTOR EXPERIMENT WITH SIMULATED LMFBR DEBRIS BED. Rivard, J.B. (Sandia Labs., Albuquerque, NM). Trans. Am. Nucl. Soc.; 27: 653-654(1977).
From ANS winter meeting; San Francisco, CA, USA (27 Nov 1977).
See CONF-771109--.
LMFBR TYPE REACTORS; MELTDOWN; CORIUM; RHR SYSTEMS; MOCKUP; SIMULATION; ACPR REACTOR; REACTOR EXPERIMENTAL FACILITIES
- 4671 EXPERIMENTS IN THE FORMATION OF PARTICULATE DEBRIS BEDS BY CONTACT OF MOLTEN CORE DEBRIS WITH SODIUM. Sowa, E.; Gabor, J.; Baker, L. Jr.; Pavlik, J.; Cassulo, J. (Argonne National Lab., IL). Trans. Am. Nucl. Soc.; 27: 654-655(1977).
From ANS winter meeting; San Francisco, CA, USA (27 Nov 1977).
See CONF-771109--.
LMFBR. LMFBR TYPE REACTORS; CORIUM; SIMULATION; MELTDOWN; SODIUM; FUEL-COOLANT INTERACTIONS; MOCKUP
- 4672 ONSET OF THERMAL CONVECTION IN A FLUID-SATURATED POROUS LAYER WITH HEAT SOURCE. Hwang, I.T.; Marr, W.W. (Argonne National Lab., IL). Trans. Am. Nucl. Soc.; 27: 655-656(1977).
From ANS winter meeting; San Francisco, CA, USA (27 Nov 1977).
See CONF-771109--.
LMFBR. LMFBR TYPE REACTORS; MELTDOWN; CORIUM; HEAT TRANSFER; RHR SYSTEMS; AFTER-HEAT REMOVAL
- 4673 FIRST IN-CORE MOLTEN FUEL POOL EXPERIMENT. Plein, H.G.; Carlson, G.A. (Sandia Labs., Albuquerque, NM). Trans. Am. Nucl. Soc.; 27: 656-658(1977).
From ANS winter meeting; San Francisco, CA, USA (27 Nov 1977).
See CONF-771109--.
LMFBR. LMFBR TYPE REACTORS; MELTDOWN; CORIUM; HEAT TRANSFER; MOCKUP; AFTER-HEAT REMOVAL; ACPR REACTOR; REACTOR EXPERIMENTAL FACILITIES
- 4674 INTERACTION OF HEAT-GENERATING MOLTEN URANIUM DIOXIDE WITH MAGNESIA BRICK. Stein, R.P.; Baker, L. Jr.; Gunther, W.H.; Cook, C. (Argonne National Lab., IL). Trans. Am. Nucl. Soc.; 27: 658-659(1977).
From ANS winter meeting; San Francisco, CA, USA (27 Nov 1977).
See CONF-771109--.
LMFBR. LMFBR TYPE REACTORS; CORIUM; HEAT TRANSFER; AFTER-HEAT REMOVAL; RHR SYSTEMS; CORE CATCHERS; MAGNESIUM OXIDES; PERFORMANCE TESTING
- 4675 INTERACTIONS BETWEEN MOLTEN CORE DEBRIS AND CORE CONTAINMENT MATERIALS. Swanson, D.G. (Aerospace Corp., Washington, DC); Zehms, E.H.; Goddard, D.M.; Ang, C.Y.; van Paassen, H.L.; Kidwell, G.D.; Marchese, A.R. Trans. Am. Nucl. Soc.; 27: 659-660(1977).
From ANS winter meeting; San Francisco, CA, USA (27 Nov 1977).
See CONF-771109--.
LMFBR. LMFBR TYPE REACTORS; MELTDOWN; CORIUM; HEAT TRANSFER; CORE CATCHERS; THERMAL STRESSES; THERMAL SHOCK; REACTOR MATERIALS; PERFORMANCE TESTING
- 4676 HEAT TRANSFER FROM A ROUND-BOTTOM POOL GENERATING HEAT INTERNALLY. Gabor, J.D.; Warner, J.G.; Cassulo, J.C.; Baker, L. Jr. (Argonne National Lab., IL). Trans. Am. Nucl. Soc.; 27: 660-662(1977).
From ANS winter meeting; San Francisco, CA, USA (27 Nov 1977).
See CONF-771109--.
LMFBR. LMFBR TYPE REACTORS; MELTDOWN; CORIUM; AFTER-HEAT REMOVAL; HEAT TRANSFER; MOCKUP

- 4677 EFFECT OF THERMAL STRESS ON OXIDE CRUSTS. Ostensen, R.W. (Sandia Labs., Albuquerque, NM). Trans. Am. Nucl. Soc.; 27: 662(1977).

From ANS winter meeting; San Francisco, CA, USA (27 Nov 1977).

See CONF-771109--.

LMFBR. LMEBR TYPE REACTORS; MELTDOWN; CORIUM; HEAT TRANSFER; LIQUID FLOW; THERMAL CONDUCTIVITY

- 4678 SOME COMMENTS ON SHOCK-INDUCED FRAGMENTATION AND DETONATING THERMAL EXPLOSIONS. Fauske, H.K. (Argonne National Lab., IL). Trans. Am. Nucl. Soc.; 27: 666-667(1977).

From ANS winter meeting; San Francisco, CA, USA (27 Nov 1977).

See CONF-771109--.

LMFBR. LMEBR TYPE REACTORS; FUEL ELEMENT FAILURE; FUEL-COOLANT INTERACTIONS; THERMAL SHOCK; FRAGMENTATION; FUEL PINS; TEMPERATURE GRADIENTS

- 4679 EFFECT OF INTERNAL RADIATION ON THE CONTACT INTERFACE TEMPERATURE BETWEEN UO_2 AND SODIUM. Cho, D.H. (Argonne National Lab., NM); Chan, S.H. Trans. Am. Nucl. Soc.; 27: 670-671(1977).

From ANS winter meeting; San Francisco, CA, USA (27 Nov 1977).

See CONF-771109--.

LMFBR. LMEBR TYPE REACTORS; FUEL-COOLANT INTERACTIONS; HEAT TRANSFER; TEMPERATURE GRADIENTS; THERMAL CONDUCTIVITY; SODIUM; URANIUM DIOXIDE

- 4680 THERMODYNAMIC PROPERTIES OF SODIUM FOR SAFETY ANALYSIS. Padilla, A. Jr. (Westinghouse Electric Corp., Richland, WA). Trans. Am. Nucl. Soc.; 27: 671-672(1977).

From ANS winter meeting; San Francisco, CA, USA (27 Nov 1977).

See CONF-771109--.

LMFBR. LMEBR TYPE REACTORS; REACTOR ACCIDENTS; SODIUM; THERMODYNAMIC PROPERTIES

- 4681 USE OF GALLIUM AND ITS ALLOYS AS HIGH-TEMPERATURE COUPLANTS FOR ACOUSTIC TRANSDUCERS. Fitzgerald, J.W. (Woodmont Associates, Ltd., Bethesda, MD); Carey, W.M. Trans. Am. Nucl. Soc.; 27: 687-689(1977).

From ANS winter meeting; San Francisco, CA, USA (27 Nov 1977).

See CONF-771109--.

LMFBR. LMEBR TYPE REACTORS; REACTOR INSTRUMENTATION; TRANSDUCERS; SPECIFICATIONS

- 4682 INVESTIGATION OF THE IMPURITY DEPOSITION RATE OF THE PLUGGING INDICATOR. Yamamoto, H. (Atomic Energy Research Lab., Kawasaki, Japan); Izumi, S.; Doi, A.; Goto, T. Trans. Am. Nucl. Soc.; 27: 690-691(1977).

From ANS winter meeting; San Francisco, CA, USA (27 Nov 1977).

See CONF-771109--.

LMFBR. LMEBR TYPE REACTORS; PRIMARY COOLANT CIRCUITS; IMPURITIES; MONITORING; REACTOR INSTRUMENTATION; PERFORMANCE

- 4683 ACOUSTIC DETECTION OF BOILING IN SODIUM TEST LOOPS. Anderson, T.T.; Bobis, J.P.; Spencer, B.W.; Gavin, A.P. (Argonne National Lab., IL). Trans. Am. Nucl. Soc.; 27: 691-620(1977).

From ANS winter meeting; San Francisco, CA, USA (27 Nov 1977).

See CONF-771109--.

LMFBR. LMEBR TYPE REACTORS; PRIMARY COOLANT CIRCUITS; BOILING DETECTION; PERFORMANCE; ACOUSTIC

MONITORING

- 4684 PERFORMANCE OF FFTF-TYPE EDDY CURRENT FLOWMETERS IN THE SLSF P-SERIES TEST TRAINS. Pedersen, D.R.; Anderson, T.T.; Wilson, R.E. (Argonne National Lab., IL). Trans. Am. Nucl. Soc.; 27: 691-692(1977).

From ANS winter meeting; San Francisco, CA, USA (27 Nov 1977).

See CONF-771109--.

LMFBR TYPE REACTORS; REACTOR INSTRUMENTATION; FLOWMETERS; PERFORMANCE TESTING

- 4685 SUPPORT FOR A NUCLEAR FUTURE: STUDENT RESPONSE TO THE CRBRP. Bremseth, M.D.; Clelland, D.A. (Univ. of Tennessee, Knoxville). Trans. Am. Nucl. Soc.; 27: 714-716(1977).

From ANS winter meeting; San Francisco, CA, USA (27 Nov 1977).

See CONF-771109--.

CLINCH RIVER BREEDER REACTOR; PUBLIC RELATIONS

- 4686 PLBR CAPITAL COST ASSESSMENT. Scarborough, J.C. (NUS Corp., Rockville, MD). Trans. Am. Nucl. Soc.; 27: 718-721(1977).

From ANS winter meeting; San Francisco, CA, USA (27 Nov 1977).

See CONF-771109--.

PLBR REACTOR; COST

- 4687 PROTOTYPE LARGE BREEDER REACTOR POOL CONCEPT. McDonald, J.S.; Brunings, J.E. (Atomics International, Canoga Park, CA). Trans. Am. Nucl. Soc.; 27: 721-722(1977).

From ANS winter meeting; San Francisco, CA, USA (27 Nov 1977).

See CONF-771109--.

PLBR REACTOR; REACTOR CORES; DESIGN

- 4688 LARGE-AMPLITUDE THERMAL OSCILLATIONS MEASURED IN AN LMFBR STEAM GENERATOR TUBE. France, D.M.; Chiang, T.; Carlson, R.D. (Argonne National Lab., IL). Trans. Am. Nucl. Soc.; 27: 734-735(1977).

From ANS winter meeting; San Francisco, CA, USA (27 Nov 1977).

See CONF-771109--.

LMFBR TYPE REACTORS; STEAM GENERATORS; HEAT TRANSFER; TEMPERATURE GRADIENTS; THERMAL STRESSES; LIQUID FLOW

- 4689 THERMAL-HYDRAULIC MODEL TESTS OF THE CRBR/IHTS THERMAL MIXER. Kasza, K.E.; Oras, J.J. (Argonne National Lab., IL). Trans. Am. Nucl. Soc.; 27: 735-737(1977).

From ANS winter meeting; San Francisco, CA, USA (27 Nov 1977).

See CONF-771109--.

CLINCH RIVER BREEDER REACTOR; HEAT EXCHANGERS; HYDRAULICS; HEAT TRANSFER; MIXING; LIQUID FLOW; TEMPERATURE DISTRIBUTION

- 4690 FLOW DISTRIBUTION IN EDGE SUBCHANNELS OF WIRE-WRAPPED 61-ROD ASSEMBLIES. Lin, E.I.H. (Argonne National Lab., IL); Schmitt, R.C.; Sha, W.T.; Goldner, F. (Argonne National Lab., IL). Trans. Am. Nucl. Soc.; 27: 741-743(1977).

From ANS winter meeting; San Francisco, CA, USA (27 Nov 1977).

See CONF-771109--.

LMFBR. LMEBR TYPE REACTORS; FUEL ASSEMBLIES; FUEL PINS; LIQUID FLOW; HYDRAULICS; HEAT TRANSFER; CONFIGURATION; FLOW RATE

4691 IMPACT OF BYPASS FLOW ON THERMAL TRANSIENTS IN LMFBR. Yang, J.W.; Agrawal, A.K. (Brookhaven National Lab., Upton, NY). Trans. Am. Nucl. Soc.; 27: 748-749(1977).
From ANS winter meeting; San Francisco, CA, USA (27 Nov 1977).
See CONF-771109--.
LMFBR TYPE REACTORS; REACTOR CORES; HYDRAULICS; LIQUID FLOW; HEAT TRANSFER; TEMPERATURE GRADIENTS

4692 ORIFIS: A COMPUTER CORE TO DISTRIBUTE REACTOR CORE COOLANT IN LARGE FBRS. McCurry, D.C.; Cantley, D.A. (Westinghouse Electric Corp., Richland, WA). Trans. Am. Nucl. Soc.; 27: 749-750(1977).
From ANS winter meeting; San Francisco, CA, USA (27 Nov 1977).
See CONF-771109--.
LMFBR TYPE REACTORS; REACTOR CORES; HYDRAULICS; LIQUID FLOW; TEMPERATURE DISTRIBUTION; POWER DISTRIBUTION; COMPUTER CODES

4693 EFFECT OF NONUNIFORM GAPS ON COMPACTION OF AN LMFBR CORE. Kalinowski, J.E.; Swenson, D.V. (Westinghouse Advanced Reactors Division, Madison, PA). Trans. Am. Nucl. Soc.; 27: 750-751(1977).
From ANS winter meeting; San Francisco, CA, USA (27 Nov 1977).
See CONF-771109--.
LMFBR TYPE REACTORS; REACTOR CORES; FUEL ASSEMBLIES; DEFORMATION; SPACERS; STRESSES; REACTIVITY COEFFICIENTS

4694 DESIGN CONFIGURATIONS FOR CONTROLLING SODIUM VOID WORTH IN LARGE FBR CORES. Chandler, J.C.; Marr, D.R. (Westinghouse Electric Corp., Richland, WA). Trans. Am. Nucl. Soc.; 27: 751-752(1977).
From ANS winter meeting; San Francisco, CA, USA (27 Nov 1977).
See CONF-771109--.
LMFBR TYPE REACTORS; REACTOR CORES; SODIUM; HYDRAULICS; LIQUID FLOW; VOID COEFFICIENT

4695 EFFECT ON PERFORMANCE OF CORE HEIGHT REDUCTION IN 1200-MW(E) LMFBRs. Su, S.F. (Argonne National Lab., IL). Trans. Am. Nucl. Soc.; 27: 752-753(1977).
From ANS winter meeting; San Francisco, CA, USA (27 Nov 1977).
See CONF-771109--.
LMFBR TYPE REACTORS; REACTOR CORES; SODIUM; HYDRAULICS; LIQUID FLOW; VOID COEFFICIENT; CONFIGURATION

4696 ASSESSMENT OF THE BREEDING POTENTIAL OF U--PU--ZR METAL-FUELED 1200-MW(E) LMFBRs. Lam, P.S.K.; Barthold, W.P. (Argonne National Lab., IL). Trans. Am. Nucl. Soc.; 27: 753-754(1977).
From ANS winter meeting; San Francisco, CA, USA (27 Nov 1977).
See CONF-771109--.
LMFBR TYPE REACTORS; REACTOR CORES; BREEDING RATIO; FUEL CYCLE; EFFICIENCY

4697 ADVANCED FUEL CORE DESIGNS FOR CRBRP. Galluzzo, N.G.; Vitti, J.A.; Brittingham, J.C.; von Arx, A.V.; Connors, P.A. (Atomic International, Canoga Park, CA). Trans. Am. Nucl. Soc.; 27: 754-755(1977).
From ANS winter meeting; San Francisco, CA, USA (27 Nov 1977).
See CONF-771109--.
CLINCH RIVER BREEDER REACTOR; REACTOR CORES; SPECIFICATIONS; URANIUM CARBIDES; PLUTONIUM

CARBIDES; PERFORMANCE

4698 PIN-DIAMETER OPTIMIZATION OF HOMOGENEOUS AND TIGHTLY COUPLED HETEROGENEOUS ²³³U--TH METAL-FUELED LMFBRs. Lam, P.S.K.; Su, S.F. (Argonne National Lab., IL). Trans. Am. Nucl. Soc.; 27: 755-756(1977).

From ANS winter meeting; San Francisco, CA, USA (27 Nov 1977).
See CONF-771109--.
LMFBR TYPE REACTORS; FUEL PINS; CONFIGURATION; OPTIMIZATION

4699 NUBOW-2D INELASTIC: A COMPUTER PROGRAM FOR THE BOWING HISTORY OF REACTOR CORES. Cha, B.K.; McLennan, G.A. (Argonne National Lab., IL). Trans. Am. Nucl. Soc.; 27: 756-757(1977).

From ANS winter meeting; San Francisco, CA, USA (27 Nov 1977).
See CONF-771109--.
LMFBR. LMFBR TYPE REACTORS; REACTOR CORES; DEFORMATION; TWO-DIMENSIONAL CALCULATIONS; COMPUTER CODES

4700 DESIGN AND DEVELOPMENT OF THE CRBRP EX-VESSEL TRANSFER MACHINE. Jones, C.E. Jr. (Atomic International, Canoga Park, CA). Trans. Am. Nucl. Soc.; 27: 762-763(1977).
From ANS winter meeting; San Francisco, CA, USA (27 Nov 1977).
See CONF-771109--.
CLINCH RIVER BREEDER REACTOR; FUEL ASSEMBLIES; REMOTE HANDLING EQUIPMENT

4701 ANALYSIS OF STREAMING THROUGH THE PRIMARY COOLANT PIPE CHASEAWAY OF THE CLINCH RIVER BREEDER REACTOR. Williams, M.L.; Engle, W.W. Jr. (Oak Ridge National Lab., TN). Trans. Am. Nucl. Soc.; 27: 779-780(1977).

- 4719 FLUX SYNTHESIS PROGRAMME KASY FOR THE APPROXIMATE SOLUTION OF THE THREE-DIMENSIONAL MULTIGROUP-NEUTRON-DIFFUSION-EQUATION. PRESENT STATE, PLANNED IMPROVEMENTS AND APPLICATIONS TO REACTOR DESIGN PROBLEMS. Buckel, G. (Kernforschungszentrum Karlsruhe (Germany, F.R.). Inst. fuer Neutronenphysik und Reaktortechnik); de Wouters, R.; Pilate, S. (Societe Belge pour l'Industrie Nucleaire, Brussels). Atomkernenergie; 30: No. 2, 82-87(1977).
From Technical meeting on coarse-mesh methods: progress in the methods and their application to reactor problems; Erlangen, Germany, F.R. (25 - 26 Jan 1977).
This paper describes the three-dimensional flux synthesis programme KASY and its application to practical reactor problems. The recent extensions or improvements of KASY comprise: a) solution of the adjoint problem, allowing three-dimensional perturbation calculations in connection with the three-dimensional evaluation programme AUDI 3; b) connection to the space-dependent reactor dynamics programme RAUMZEIT; c) inclusion into the modular programme system KAPROS, allowing the execution of three-dimensional reactor analysis by combined use of KASY and finite difference programmes. A compilation of the main applications of KASY to fast reactor analysis performed from 1970 up to now is presented. It contains in particular: a) evaluation of experiments performed in critical facilities as a support of SNR-300 design (ksub(eff), control rod worths, power mapping); b) application of KASY to the routine SNR-300 (and SNR-2) calculations in three-dimensional hexagonal geometry, for which the method proved efficient in spite of the case complexity; burn-up behaviour was taken into account.

- 4757 ABOVE-CORE STRUCTURAL RESPONSE TO A MOLTEN CORE DISASSEMBLY. Ash, J.E. (Argonne National Lab., IL). Trans. Am. Nucl. Soc.; 27: 517-518(1977).
From ANS winter meeting; San Francisco, CA, USA (27 Nov 1977).

- See CONF-771109--.
LMFBR. LMFBR TYPE REACTORS; REACTOR CORE DISRUPTION; STRESSES; MECHANICAL STRUCTURES; REACTOR INTERNALS; DEFORMATION
- 4758 ANALYSIS OF SLUG IMPACT AND COOLANT SPILLAGE USING A HYBRID LAGRANGIAN--EULERIAN METHOD. Chu, H.Y.; Chang, Y.W.; Fistedis, S.H. (Argonne National Lab., IL). Trans. Am. Nucl. Soc.; 27: 518-520(1977).
From ANS winter meeting; San Francisco, CA, USA (27 Nov 1977).
See CONF-771109--.
LMFBR. LMFBR TYPE REACTORS; REACTOR VESSELS; STRESSES; REACTOR CORE DISRUPTION; IMPACT SHOCK; CLOSURES; SODIUM; DEFORMATION; HYDRODYNAMICS; MATHEMATICAL MODELS; STRESS ANALYSIS
- 4759 COMPARISONS OF REXCO AND ICEPEL CODE CALCULATIONS WITH TESTS OF PLASTICALLY DEFORMABLE PIPES FILLED WITH COMPRESSIBLE FLUIDS. Nagumo, G. (Argonne National Lab., IL). Trans. Am. Nucl. Soc.; 27: 520-522(1977).
From ANS winter meeting; San Francisco, CA, USA (27 Nov 1977).
See CONF-771109--.
LMFBR. LMFBR TYPE REACTORS; REACTOR ACCIDENTS; CONTAINMENT; CONTAINMENT SYSTEMS; STRESSES; PIPES; DEFORMATION; COMPUTER CALCULATIONS; COMPARATIVE EVALUATIONS
- 4760 COMPARISON OF COMPUTER CODE PREDICTIONS WITH COVA EXPERIMENTS. Chang, Y.W.; Guildys, J.; Fistedis, S.H. (Argonne National Lab., IL). Trans. Am. Nucl. Soc.; 27: 522-524(1977).
From ANS winter meeting; San Francisco, CA, USA (27 Nov 1977).
See CONF-771109--.
LMFBR. LMFBR TYPE REACTORS; REACTOR ACCIDENTS; CONTAINMENT; CONTAINMENT SYSTEMS; REACTOR VESSELS; STRESSES
- 4761 STATISTICAL PARAMETRIC ANALYSES OF SODIUM FIRE. Person, L.W.; Vaurio, J.K. (Argonne National Lab., IL). Trans. Am. Nucl. Soc.; 27: 525-526(1977).
From ANS winter meeting; San Francisco, CA, USA (27 Nov 1977).
See CONF-771109--.
LMFBR TYPE REACTORS; FIRES; SODIUM; STATISTICS; MATHEMATICAL MODELS
- 4762 FILTRATION OF SODIUM FIRE AEROSOLS. Jordan, S.; Alexas, A.; Lindner, W. (Gesellschaft fuer Kernforschung mbH, Karlsruhe, Germany). Trans. Am. Nucl. Soc.; 27: 526-527(1977).
From ANS winter meeting; San Francisco, CA, USA (27 Nov 1977).
See CONF-771109--.
LMFBR TYPE REACTORS; FIRES; RADIOACTIVE AEROSOLS; FILTRATION; SODIUM; AIR FILTERS; PERFORMANCE
- 4763 LARGE-SCALE SODIUM INTERACTIONS: PRELIMINARY TEST RESULTS FOR LIMESTONE CONCRETE. Smaardyk, J.E.; Sutherland, H.J.; King, D.L.; Dahlgren, D.A. (Sandia Labs., Albuquerque, NM). Trans. Am. Nucl. Soc.; 27: 528(1977).
From ANS winter meeting; San Francisco, CA, USA (27 Nov 1977).
See CONF-771109--.
LMFBR TYPE REACTORS; REACTOR CORE DISRUPTION; CHEMICAL REACTION KINETICS; CONCRETES; SODIUM; SIMULATION; DECOMPOSITION; CORROSIVE EFFECTS
- 4764 THERMAL BEHAVIOR OF CONCRETE. Knight, R.L. (Sandia Labs., Albuquerque, NM). Trans. Am. Nucl. Soc.; 27: 528-529(1977).
From ANS winter meeting; San Francisco, CA, USA (27 Nov 1977).
See CONF-771109--.
LMFBR. LMFBR TYPE REACTORS; REACTOR MATERIALS; CONCRETES; DECOMPOSITION; SODIUM; CHEMICAL REACTION KINETICS; REACTOR CORE DISRUPTION; CORROSIVE EFFECTS
- 4765 EVALUATION OF THE EFFECT OF SHUTDOWN CRACKS IN TREAT-TESTED FUEL PINS. Scott, J.H. (Los Alamos Scientific Lab., NM). Trans. Am. Nucl. Soc.; 27: 530-531(1977).
From ANS winter meeting; San Francisco, CA, USA (27 Nov 1977).
See CONF-771109--.
LMFBR. LMFBR TYPE REACTORS; FUEL PINS; FUEL PELLETS; CRACKS; PHYSICAL RADIATION EFFECTS; TREAT REACTOR; TRANSIENTS; SIMULATION; REACTOR CORE DISRUPTION; FUEL ELEMENT FAILURE; SIMULATION
- 4766 APPLICATION OF LARSON--MILLER PARAMETER TO LMFBR FUEL FAILURE DYNAMICS. Sun, Y.H.; Henry, T.P. (Brookhaven National Lab., Upton, NY). Trans. Am. Nucl. Soc.; 27: 531-532(1977).
From ANS winter meeting; San Francisco, CA, USA (27 Nov 1977).
See CONF-771109--.
LMFBR TYPE REACTORS; FUEL ELEMENT FAILURE; MATHEMATICAL MODELS; TRANSIENTS; CALCULATION METHODS
- 4767 COMBINED MOTION OF FUEL AND COOLANT UNDER HIGH-RAMP TRANSIENT OVERPOWER CONDITIONS. Chang, K.I.; Cho, D.H. (Argonne National Lab., IL). Trans. Am. Nucl. Soc.; 27: 532-533(1977).
From ANS winter meeting; San Francisco, CA, USA (27 Nov 1977).
See CONF-771109--.
LMFBR. LMFBR TYPE REACTORS; EXCURSIONS; TRANSIENTS; MELTDOWN; HYDRODYNAMICS; FUEL-COOLANT INTERACTIONS; MATHEMATICAL MODELS; COMPUTER CALCULATIONS
- 4768 PLUTO2: A COMPUTER CODE FOR THE ANALYSIS OF OVERPOWER ACCIDENTS IN LMFBRs. Wider, H.U. (Argonne National Lab., IL). Trans. Am. Nucl. Soc.; 27: 533-534(1977).
From ANS winter meeting; San Francisco, CA, USA (27 Nov 1977).
See CONF-771109--.
LMFBR TYPE REACTORS; EXCURSIONS; TRANSIENTS; FUEL ELEMENT FAILURE; MATHEMATICAL MODELS; HYDRODYNAMICS; COMPUTER CODES; P CODES
- 4769 SIMPLIFIED METHOD OF COMPUTING CLADDING AND FUEL STRAIN DURING A SLOW OVERPOWER TRANSIENT. Frank, M.V.; Kastenber, W.E. (Univ. of California, Berkeley). Trans. Am. Nucl. Soc.; 27: 534-536(1977).
From ANS winter meeting; San Francisco, CA, USA (27 Nov 1977).
See CONF-771109--.
LMFBR. LMFBR TYPE REACTORS; FUEL CANS; FUEL ELEMENTS; TRANSIENTS; STRESSES; STRAINS; FUEL-CLADDING INTERACTIONS; COMPUTER CODES; MATHEMATICAL MODELS
- 4770 FAILURE PATTERN WITHIN AN FTR SUBASSEMBLY UNDER A TOP ACCIDENT. Yung, S.C.; Wilburn, N.P. (Westinghouse Electric Corp., Richland, WA). Trans. Am. Nucl. Soc.; 27:

- 536-537(1977).
From ANS winter meeting; San Francisco, CA,
USA (27 Nov 1977).
See CONF-771109---.
FFTF REACTOR;FUEL ASSEMBLIES;TRANSIENTS;FUEL
ELEMENT FAILURE;MATHEMATICAL MODELS
- 4771 BOILING INCOHERENCY EFFECTS IN
UNPROTECTED LOSS-OF-FLOW ACCIDENTS.
Theofanous, T.G. (Purdue Univ., West
Lafayette, IN); Miao, C.; Lois, L. Trans. Am.
Nucl. Soc.; 27: 536-537(1977).
From ANS winter meeting; San Francisco, CA,
USA (27 Nov 1977).
See CONF-771109---.
LMFBR. LMFBR TYPE REACTORS;REACTOR SAFETY;
LOSS OF FLOW;FUEL ASSEMBLIES;HYDRAULICS;BOILING;
HEAT TRANSFER
- 4772 INTERSUBASSEMBLY INCOHERENCIES AND
GROUPING TECHNIQUES IN LMFBR HYPOTHETICAL
OVERPOWER ACCIDENT. Wilburn, N.P.
(Westinghouse Electric Corp., Richland, WA).
Trans. Am. Nucl. Soc.; 27: 538-539(1977).
From ANS winter meeting; San Francisco, CA,
USA (27 Nov 1977).
See CONF-771109---.
LMFBR TYPE REACTORS;REACTOR SAFETY;REACTOR
ACCIDENTS;FUEL ELEMENT FAILURE;POWER
DISTRIBUTION
- 4773 FUSS: THE INTEGRATED FUMO, SAS3A,
NEUTRONICS UPDATE SYSTEM. Martin, F.J.
(Westinghouse Electric Corp., Richland, WA).
Trans. Am. Nucl. Soc.; 27: 539-541(1977).
From ANS winter meeting; San Francisco, CA,
USA (27 Nov 1977).
See CONF-771109---.
FFTF REACTOR;REACTOR SAFETY;LOSS OF FLOW;
MATHEMATICAL MODELS;REACTOR KINETICS;COMPUTER
CODES;F CODES
- 4774 NATURAL-CIRCULATION DECAY HEAT REMOVAL
IN AN LMFBR. Perkins, K.R.; Bari, R.A.;
Albright, D.C. (Brookhaven National Lab.,
Upton, NY). Trans. Am. Nucl. Soc.; 27: 542-
543(1977).
From ANS winter meeting; San Francisco, CA,
USA (27 Nov 1977).
See CONF-771109---.
LMFBR TYPE REACTORS;LOSS OF FLOW;HYDRAULICS;
HEAT TRANSFER;NATURAL CONVECTION;COMPUTER CODES;
MATHEMATICAL MODELS;AFTER-HEAT REMOVAL
- 4775 CURL: A TRANSIENT SIMULATION CODE FOR
LMFBRs. Cady, K.B. (Cornell Univ., Ithaca,
NY); Pavlenko, G.F.; Raber, J.R. Khatib-Rahbar,
M. (Cornell Univ., Ithaca, NY); Pavlenko,
G.F.; Raber, J.R. Trans. Am. Nucl. Soc.; 27:
543-545(1977).
From ANS winter meeting; San Francisco, CA,
USA (27 Nov 1977).
See CONF-771109---.
LMFBR TYPE REACTORS;REACTOR SAFETY;
TRANSIENTS;REACTOR KINETICS;HEAT TRANSFER;
HYDRAULICS;C CODES;COMPUTER CODES
- 4776 PLOOP CODE FOR THE PRIMARY LOOP COOLANT
FLOW AND HEAT TRANSFER ANALYSIS OF CERTAIN POOL-
TYPE LMFBRs. Kalimullah. (Argonne National
Lab., IL). Trans. Am. Nucl. Soc.; 27: 545-
546(1977).
From ANS winter meeting; San Francisco, CA,
USA (27 Nov 1977).
See CONF-771109---.
LMFBR TYPE REACTORS;REACTOR SAFETY;
TRANSIENTS;HYDRAULICS;HEAT TRANSFER;P CODES;
COMPUTER CODES
- 4777 EFFECTS OF NONCONDENSIBLE VOID FRACTION
ON FREEZING OF FLOWING FLUIDS. Greene, G.A.
(Brookhaven National Lab., Upton, NY); Jones,
O.C. Jr.; Kazimi, M.S. Trans. Am. Nucl. Soc.;
27: 546-547(1977).
From ANS winter meeting; San Francisco, CA,
USA (27 Nov 1977).
See CONF-771109---.
LMFBR. LMFBR TYPE REACTORS;REACTOR SAFETY;
MELTDOWN;CORIUM;SOLIDIFICATION;TWO-PHASE FLOW
- 4778 FLOW REGIME OBSERVATIONS IN TWO-PHASE
VOLUME-HEATED BOILING POOLS. Ginsberg, T.;
Jones, O.C. Jr. (Brookhaven National Lab.,
Upton, NY). Trans. Am. Nucl. Soc.; 27: 547-
549(1977).
From ANS winter meeting; San Francisco, CA,
USA (27 Nov 1977).
See CONF-771109---.
LMFBR. LMFBR TYPE REACTORS;REACTOR CORE
DISRUPTION;MELTDOWN;REACTOR SAFETY;TWO-PHASE
FLOW;LIQUID FLOW;BOILING;CORIUM
- 4779 FOAM: PRINCIPAL FLOW REGIME IN A VOLUME-
HEATED BOILING POOL. Epstein, M.; Condiff,
D.W. (Argonne National Lab., IL). Trans.
Am. Nucl. Soc.; 27: 549-550(1977).
From ANS winter meeting; San Francisco, CA,
USA (27 Nov 1977).
See CONF-771109---.

MELTDOWN;TWO-PHASE FLOW;LIQUID FLOW;BOILING;F
CODES;COMPUTER CODES
- 4780 SIMPLIFIED MULTICOMPONENT PHASE
TRANSITION MODEL. Suo-Anttila, A.J. (Los
Alamos Scientific Lab., NM). Trans. Am. Nucl.
Soc.; 27: 550-551(1977).
From ANS winter meeting; San Francisco, CA,
USA (27 Nov 1977).
See CONF-771109---.
LMFBR. LMFBR TYPE REACTORS;REACTOR SAFETY;
REACTOR CORE DISRUPTION;MELTDOWN;LIQUID FLOW;
HEAT TRANSFER;MATHEMATICAL MODELS;TRANSITION
FLOW
- 4781 EFFECTS OF INTERNAL CIRCULATION VELOCITY
AND NONCONDENSIBLE GAS ON VAPOR CONDENSATION
FROM A RISING BUBBLE. Ozisik, M.N. (North
Carolina State Univ., Raleigh, NC); Kress, T.S.
Trans. Am. Nucl. Soc.; 27: 551-552(1977).
From ANS winter meeting; San Francisco, CA,
USA (27 Nov 1977).
See CONF-771109---.
LMFBR. LMFBR TYPE REACTORS;REACTOR SAFETY;
REACTOR CORE DISRUPTION;FUEL-COOLANT
INTERACTIONS;GASES;BUBBLES;VAPOR CONDENSATION;
NATURAL CONVECTION;HEAT TRANSFER
- 4782 SIMMER-VENUS II COMPARISON FOR
MECHANICAL DISASSEMBLY OF AN LMFBR.
Henninger, R.J.; Alcouffe, R.E. (Los Alamos
Scientific Lab., NM). Trans. Am. Nucl. Soc.;
27: 553-554(1977).
From ANS winter meeting; San Francisco, CA,
USA (27 Nov 1977).
See CONF-771109---.
LMFBR TYPE REACTORS;REACTOR SAFETY;REACTOR
CORE DISRUPTION;POWER DISTRIBUTION;HEAT
TRANSFER;REACTIVITY COEFFICIENTS;S CODES;V
CODES;COMPUTER CODES;COMPARATIVE EVALUATIONS
- 4783 SYSTEM DAMAGE POTENTIAL FOR CRBRP.
Hakim, S.J. (Argonne National Lab., IL);
Abramson, P.B.; Henninger, R.J. Trans. Am.
Nucl. Soc.; 27: 554-555(1977).

- From ANS winter meeting; San Francisco, CA, USA (27 Nov 1977).
See CONF-771109--.
CLINCH RIVER BREEDER REACTOR; REACTOR SAFETY; REACTOR CORE DISRUPTION; HYDRAULICS; REACTOR INTERNALS; DAMAGE; DEFORMATION
- 4784 SIMMER-I ACCIDENT CONSEQUENCE CALCULATIONS. Bell, C.R.; Boudreau, J.E. (Los Alamos Scientific Lab., NM). Trans. Am. Nucl. Soc.; 27: 555-556(1977).
From ANS winter meeting; San Francisco, CA, USA (27 Nov 1977).
See CONF-771109--.
CLINCH RIVER BREEDER REACTOR; REACTOR CORE DISRUPTION; REACTOR SAFETY; REACTOR CORES; FUEL ASSEMBLIES; DEFORMATION; DAMAGE; S CODES
- 4785 STOCHASTICALLY VARIABLE PARAMETERS IN PROBABILISTIC ACCIDENT ANALYSIS. Abramson, P.B.; Hummel, H.H.; Gelbard, E.M.; Pizzica, P.A.; Sienicki, J.J. (Argonne National Lab., IL). Trans. Am. Nucl. Soc.; 27: 556-558(1977).
From ANS winter meeting; San Francisco, CA, USA (27 Nov 1977).
See CONF-771109--.
LMFBR. LMFBR TYPE REACTORS; REACTOR SAFETY; REACTOR CORE DISRUPTION; HEAT TRANSFER; HYDRAULICS; REACTIVITY COEFFICIENTS; MATHEMATICAL MODELS
- 4786 TRANSPORT/DIFFUSION COMPARISONS FOR SMALL-CORE LMFBR DISRUPTIVE ACCIDENTS. Tomlinson, E.T. (Oak Ridge National Lab., TN). Trans. Am. Nucl. Soc.; 27: 558-559(1977).
From ANS winter meeting; San Francisco, CA, USA (27 Nov 1977).
See CONF-771109--.
LMFBR TYPE REACTORS; REACTOR SAFETY; REACTOR CORE DISRUPTION; REACTIVITY COEFFICIENTS; NEUTRON DIFFUSION EQUATION; PERTURBATION THEORY; TRANSPORT THEORY; COMPARATIVE EVALUATIONS
- 4787 ENERGY INCREASE FROM BUBBLE COLLAPSE FOLLOWING RECRITICALITY IN LARGE MOLTEN POOLS. Fuller, E.L. (Electric Power Research Inst., Palo Alto, CA). Trans. Am. Nucl. Soc.; 27: 559-560(1977).
From ANS winter meeting; San Francisco, CA, USA (27 Nov 1977).
See CONF-771109--.

The transient energy transfer following a sudden contact between two media initially at different temperatures was investigated, taking into account the effect of internal radiation in the hot medium. Analytical expressions for the contact interface temperature valid for small times are derived. Illustrative calculations are presented for a sudden contact between molten uranium dioxide and sodium.

LMFBR TYPE REACTORS;REACTOR MATERIALS; MECHANICAL PROPERTIES;WELDED JOINTS;FABRICATION; CORROSION
- 4814 EXPERIMENTAL STUDY OF THE CONSEQUENCES OF ACCIDENTAL SODIUM RELEASE IN THE FORM OF PEROXIDE AEROSOLS ON THE TOMATO AND THE LETTUCE. Camus, H.; Delmas, J.; Grauby, A.; Disdier, R. (CEA Centre d'Etudes Nucleaires de Cadarache, 13 - Saint-Paul-les-Durance (France). Service d'Etudes et Recherches sur l'Environnement). Bull. Inf. Sci. Tech. (Paris); No. 222, 61-70(1977). (In French).
Industrial development of sodium cooled breeder reactors have lead to the study of consequences of accidents occurring in the cooling circuit. The effects on crops when aerosols are released in the atmosphere can be determined after a certain amount of molten sodium (stable element ^{23}Na) is brought into contact with the open air. Experiments are performed in a 'Phytotron' equipment on lettuces and tomatoes in dry atmosphere at two different moments during the growing process. The aerosol studied has a high content of sodium peroxide and the ground deposit varied between 17 and 450 mg/m² sodium equivalent. (Concentration at distances of 800 m and 1500 m calculated for a theoretical fire involving 10 tons of sodium). Necrosis, visible only with a microscope, were reported when deposits in sodium equivalent were under 300 mg/m². Leaves were destroyed if necrosis were numerous (deposit above 300 mg/m²). Tomatoes, and fruits in particular, were found to be more resistant than lettuces. Sodium embedded in dead cells does not migrate in the plant and does not disturb the plants physiological equilibrium. New sprouts have normal sodium percentage. The consequences are essentially burns of which the extent is more or less high depending on the deposits and the kind of species involved.
- 4815 STUDY OF FORCED CONVECTION BOILING OF SODIUM AT LOW HEAT FLUXES IN ELECTRICALLY HEATED SEVEN-ROD BUNDLES. Eisenhaver, S.W. Seattle; Univ. of Washington (1977). 165p. University Microfilms Order No. 77-26,820.
Thesis (Ph. D.).
An experimental study of forced convection boiling of sodium in electrically heated seven-rod bundles of fast reactor subchannel geometry is made. These conditions are similar to those found in in-core gamma-heated sodium boiling experiments. Analysis of the experimental data shows that various boiling patterns can be generated, depending upon the degree of incipient superheat, the amount of inlet throttling and the energy storage potential of the system. The voiding patterns associated with these parameters are related to the observed experimental signals and explained in terms of the controlling physical processes. The behavior of pressure signals generated during boiling is found to be highly time dependent and is accounted for by variations in the noise source and the attenuation properties of an expanding two-phase region. Calculations with the SAS3A computer code (10) show good qualitative agreement with the experiments. For slow transients in small bundles at low power, the multi-bubble model used in the code is a suitable approximation. Discrepancies between the code predictions and experimental data are explained in terms of the computational model. The importance of adequately accounting for system heat capacity and external heat losses is demonstrated. The design and analysis of in-core, gamma-heated boiling generators are examined in the light of these results. Significantly different voiding scenarios can be produced by variations in bundle design or operation. The expected neutronic and acoustic signals for several idealized voiding patterns are considered.
- 4816 MECHANISTIC STUDY OF FUEL FREEZING, CHANNEL PLUGGING, AND CONTINUED COOLABILITY DURING FAST REACTOR OVERPOWER EXCURSIONS. Wong, K.W. Los Angeles; Univ. of California (1977). 184p. University Microfilms Order No. 77-25,355.
Thesis (Ph. D.).
The work presents a mechanistic model which describes events following fuel pin failure which may lead to in-channel fuel plate-out. The thermal and hydraulic effects of the plate-out fuel are also evaluated. Results of the model indicate that during a slow transient power accident, in-core fuel freezing and channel plugging may be expected to occur. The extent of fuel freezing and channel plugging is sensitive to fuel particle size, amount of fuel injected and amount of fission gas injected into the coolant channel. Limiting curves for the initiation of melting can be established to indicate conditions for melting of wire wrap and adjoining cladding due to plate-out fuel.

Results predicted by this model are found to be consistent with the TREAT H-4 experiment, when the particle size and amount of fuel injected are adjusted to match the inlet flow rate.

- 4817 ADVANCED LMFBR FUELS. Leary, J.; Kittle, H. (eds.). La Grange Park, IL; American Nuclear Society (1977). 705p. (CONF-771008--).

From International meeting on advanced LMFBR fuels; Tucson, AZ, USA (10 Oct 1977).

Separate abstracts are included for forty-two of the forty-six papers presented concerning the national advanced LMFBR fuels development program; irradiation testing experience for oxide fuels; recent developments in properties of advanced fuels; irradiation testing experience for carbide and nitride fuels; safety aspects of advanced fuels; and irradiation performance analysis. Four papers have been previously included in the data base.

- 4818 US ADVANCED LMFBR FUELS DEVELOPMENT PROGRAM. Simmons, J.M.; Leary, J.A.; Kittel, J.H.; Cox, C.M. pp 2-14 of Advanced LMFBR fuels. Leary, J.; Kittle, H. (eds.). La Grange Park, IL; American Nuclear Society (1977).

See CONF-771008--.

Following the oil crisis in 1974, a national Advanced LMFBR Fuels Development Program was initiated in the U. S. This program was developed on the basis of the experience obtained during the exploratory years. As a result, most aspects of advanced fuels development have been expanded in the U. S. in a unified national program. The experience obtained during the exploratory phase has been summarized previously. The purpose of this paper is to describe the new program and to summarize recent major findings.

- 4819 UK STRATEGY AND PROGRAMMES FOR ADVANCED LMFBR FUELS. Bishop, J.F.W.; Chamberlain, A.; Gatley, J.A. pp 15-25 of Advanced LMFBR fuels. Leary, J.; Kittle, H. (eds.). La Grange Park, IL; American Nuclear Society (1977).

See CONF-771008--.

The first task for the UK is to develop a reliable plutonium oxide fuelled LMFBR with the associated plutonium storage, fabrication, transport, reprocessing and waste disposal parts of the complete fuel cycle in time for a substantial installation programme in AD 2000. This means a full scale demonstration in the first half of the 1990's. The second task is the establishment of this developed reactor system as part of the electricity generation network. For the purpose of this paper, two timescales can be delineated for objectives. The first is for oxide LMFBR systems. It is directed to a Demonstration Point of 1990 to 1995 and a continuing schedule leading to what we may call Fully Developed Oxide. The second is for other fuels and coolants where no dates have been fixed for Commercial Availability, but where these are definitely known to be later than the oxide timescale.

- 4820 SNR-CARBIDE PROGRAM: ITS POSITION BETWEEN PRESENT AND FUTURE. Karsten, G. (Gesellschaft fuer Kernforschung, Karlsruhe, Ger.). pp 26-50 of Advanced LMFBR fuels. Leary, J.; Kittle, H. (eds.). La Grange Park, IL; American Nuclear Society (1977).

From International meeting on advanced LMFBR fuels; Tucson, AZ, USA (10 Oct 1977).

See CONF-771008--.

Information on the development of carbide-fueled LMFBR reactors is presented concerning ecological perspectives; the nuclear fuel cycle; fast reactor strategy; and program review and fuel pin concept.

- 4821 FRENCH ADVANCED FUELS DEVELOPMENT PROGRAM. Pascard, R. (Centre d'Etudes Nucleaires de Fontenay-aux-Roses, France). pp 52-60 of Advanced LMFBR fuels. Leary, J.; Kittle, H. (eds.). La Grange Park, IL; American Nuclear Society (1977).

From International meeting on advanced LMFBR fuels; Tucson, AZ, USA (10 Oct 1977).

See CONF-771008--.

The aspects of the French carbide program are described. Since the beginning, it has experienced some inflexions but its main guidelines are maintained. In particular, the Na-bonded fuel element is still the reference concept to be developed in priority. With maybe the exception of reprocessing, where obviously some effort is needed, the actual program, as it is shaped, should bring sufficient knowledge to make possible in a few years a full assessment of the future of carbide fuel in fast reactors.

- 4822 JAPANESE DEVELOPMENT PROGRAM FOR ADVANCED LMFBR FUELS. Nomura, S. (Japan Atomic Energy Research Inst., Tokai); Shimokawa, J.; Uematsu, K.; Noro, K. pp 61-73 of Advanced LMFBR fuels. Leary, J.; Kittle, H. (eds.). La Grange Park, IL; American Nuclear Society (1977).

From International meeting on advanced LMFBR fuels; Tucson, AZ, USA (10 Oct 1977).

See CONF-771008--.

Information on the Japanese LMFBR fuels program is presented concerning the necessity and development program for advanced fuels; facility for mixed carbide, carbonitride, and nitride fuels; irradiation facilities in JOYO MK-2 core; and development program of advanced oxide fuels.

- 4823 DEVELOPMENT OF ADVANCED FUELS IN SWITZERLAND. Stratton, R.W. (Swiss Federal Inst. for Reactor Research, Wuerenlingen). pp 74-85 of Advanced LMFBR fuels. Leary, J.; Kittle, H. (eds.). La Grange Park, IL; American Nuclear Society (1977).

From International meeting on advanced LMFBR fuels; Tucson, AZ, USA (10 Oct 1977).

See CONF-771008--.

The development program for advanced carbide fuels for LMFBR reactors is described.

- 4824 CNEN PROGRAM ON ADVANCED LMFBR FUELS. Cecchi, P.; Covarelli, M.; Marucci, G.; Nobili, A. pp 86-93 of Advanced LMFBR fuels. Leary, J.; Kittle, H. (eds.). La Grange Park, IL; American Nuclear Society (1977).

From International meeting on advanced LMFBR fuels; Tucson, AZ, USA (10 Oct 1977).

See CONF-771008--.

CNEN activity on fast reactor fuels has been directed, in the past years, to the following purposes: study of basic phenomena affecting the in-pile behavior of fuel pins and feasibility studies of the vented-to-coolant fuel element and vibrocompacted fuel.

- 4825 UK IRRADIATION EXPERIENCE RELEVANT TO ADVANCED OXIDE FUEL CONCEPTS FOR LMFBR'S. Swanson, K.M.; Sloss, W.; Batey, W. pp 95-109

of Advanced LMFBR fuels. Leary, J.; Kittle, H. (eds.). La Grange Park, IL; American Nuclear Society (1977).

From International meeting on advanced LMFBR fuels; Tucson, AZ, USA (10 Oct 1977).

See CONF-771008--.

Most of the irradiation of oxide FR fuel in the UK has been in support of the driver charge fuel for PFR. Advanced oxide fuels mean fuels appreciably greater in linear rating and diameter than PFR driver charge fuels. The basic parameters of the two irradiated sub-assembly experiments to be described are given, along with those of the PFR driver charge for contrast. The irradiations were done in DFR, which completed its final run in March of this year, and the post irradiation examinations were done in the Dounreay cells.

4826 EXPERIENCE AND FUTURE PLAN OF FAST REACTOR OXIDE FUELS IRRADIATION IN JAPAN.

Uematsu, K. (Power Reactor and Nuclear Fuel Development Corp., Tokyo) Ishida, Y.; Komatsu, J. pp 110-121 of Advanced LMFBR fuels. Leary, J.; Kittle, H. (eds.). La Grange Park, IL; American Nuclear Society (1977).

From International meeting on advanced LMFBR fuels; Tucson, AZ, USA (10 Oct 1977).

See CONF-771008--.

The irradiation of mixed oxide fuels in Japan has been directed so far to the development of the JOYO MK-I core fuels. This program has been successfully completed and proved the satisfactory behavior and stability of JOYO type fuels. Current irradiation program is mostly directed to MONJU type fuel pins and JOYO MK-II fuel pins. JOYO MK-II core will be used for the irradiation testing facility for advanced fuel and materials. Besides the steady-state irradiation experiments, non-steady-state irradiation experiments will be emphasized in the future. They are overpowered experiments, run to failure experiments, which are to define the performance limit, and load followed experiments. Defective fuel pin irradiation experiments are also programmed in the loop of JOYO MK-II core. Future program and some results obtained so far for fuel pins, subassembly, and cladding materials are described.

4827 MECHANICAL BEHAVIOR OF A FUEL PIN FOR FAST REACTORS: EFFECT OF THE FUEL FORM AND OF THE APPROACH-TO-POWER ON THE CHANGE OF THE FUEL STACK LENGTH UNDER IRRADIATION.

Calza-Bini, A.; Caracchini, R.; Cosoli, G.; Filacchioni, G.; Lanchi, M.; Nobili, A.; Pesce, E.; Rocca, U.V.; Rotoloni, P.L. pp 122-135 of Advanced LMFBR fuels. Leary, J.; Kittle, H. (eds.). La Grange Park, IL; American Nuclear Society (1977).

From International meeting on advanced LMFBR fuels; Tucson, AZ, USA (10 Oct 1977).

See CONF-771008--.

Within the framework of an experimental programme, several fuel pins were irradiated. Measurements have been made on the change of the length of the fuel stack and of the cladding with power, temperature, and burnup. These experiments were done as an overall check of the pin behavior as well as to provide a key to interpret the contribution of the different phenomena to the observed changes. The present work consists of the analysis of the results obtained during three experiments in which the fuel was kept at a high heat rating. The behavior of solid and annular pellets has been compared; the effect of different approach-to-power rates has also been taken into account.

ADVANCED OXIDE FUELS. Cox, C.M. (Hanford Engineering Development Lab., Richland, WA); Hilbert, R.F.; Biancheria, A. pp 136-148 of Advanced LMFBR fuels. Leary, J.; Kittle, H. (eds.). La Grange Park, IL; American Nuclear Society (1977).

From International meeting on advanced LMFBR fuels; Tucson, AZ, USA (10 Oct 1977).

See CONF-771008--.

In June, 1977, 210 advanced oxide fuel elements had been irradiated or were under irradiation in EBR-II. By December, 1977, this total will be 294. Included are such design parameters as larger pin diameters, smaller cladding thicknesses, and higher fuel smear densities than the reference FFTF fuel element design. Structural materials include 316 and D9 stainless steels, Inconel 706, and PE 16.

4829 ADVANCED MIXED OXIDE FUEL ELEMENT FOR FAST REACTORS.

Delpyroux, P.; Arnaud, G.; Ollier, H.; Mogniot, J. (CEA-CEN, Cadarache, France). pp 149-152 of Advanced LMFBR fuels. Leary, J.; Kittle, H. (eds.). La Grange Park, IL; American Nuclear Society (1977).

From International meeting on advanced LMFBR fuels; Tucson, AZ, USA (10 Oct 1977).

See CONF-771008--.

After definitive specification of the mixed oxide fuel element for Superphenix 1, two avenues were open in France for the development of the next generation of fuel element for this reactor type: a carbide fuel element which had been under lengthy investigation by C.E.A.; and an advanced mixed oxide fuel element adapted to the heterogeneous-core concept. The basic concept being pursued in the preliminary element project for Superphenix 2 is outlined here.

4830 PROPERTIES AND IRRADIATION BEHAVIOR OF ADVANCED OXIDE PARTICLE FUEL.

Lahr, H.W.H. pp 153-164 of Advanced LMFBR fuels. Leary, J.; Kittle, H. (eds.). La Grange Park, IL; American Nuclear Society (1977).

From International meeting on advanced LMFBR fuels; Tucson, AZ, USA (10 Oct 1977).

See CONF-771008--.

Compared with the conventional pellet concept, fabrication of particle fuel has advantages in economy and in the reduction of the radiation burden to the personnel due to its capability of being automated. Moreover, the process is a very variable one; with minor modifications, oxides and carbides can be prepared for light water reactors, fast breeders and high-temperature reactors. Numerous irradiation tests did not yield disadvantages in the operating behavior, which are specifically attributable to this fuel variant. The tests described, which were, above all, intended to check the startup behavior of particle columns, prove that certain apprehensions concerning this fuel are unjustified for this phase of the operation.

4831 MIXED-NITRIDE FUEL PERFORMANCE IN EBR-II.

Bauer, A.A. (Battelle Columbus Labs., OH); Cybulskis, P.; Green, J.L. pp 299-312 of Advanced LMFBR fuels. Leary, J.; Kittle, H. (eds.). La Grange Park, IL; American Nuclear Society (1977).

From International meeting on advanced LMFBR fuels; Tucson, AZ, USA (10 Oct 1977).

See CONF-771008--.

Data have been obtained for a total of 42 fuel pins containing mixed-nitride fuel irradiated in EBR-II. Thirty-eight of the pins contained sodium-bonded fuel and four helium-bonded fuel. No failures occurred in the helium-bonded pins or in sodium-bonded pins in which

the fuel was supported by internal shrouds. Fission-gas release data are presented along with observations concerning fuel and fuel-pin dimensional and structural changes and the influence of design and operating parameters on pin performance.

- 4832 UK IRRADIATION EXPERIENCE RELEVANT TO ADVANCED CARBIDE FUEL CONCEPTS FOR LMFBR'S. Bagley, K.Q.; Batey, W.; Paris, R.; Sloss, W.M.; Snape, G.P. pp 313-325 of Advanced LMFBR fuels. Leary, J.; Kittle, H. (eds.). La Grange Park, IL; American Nuclear Society (1977).

From International meeting on advanced LMFBR fuels; Tucson, AZ, USA (10 Oct 1977).

See CONF-771008--.

Despite discouraging prognoses of fabrication and reprocessing problems, it is recognized that the quest for a carbide fuel pin design which fully exploits the favourable density and thermal conductivity of (U,Pu) monocarbide must be maintained. Studies in aid of carbide fuel development have, therefore, continued in the UK in parallel with those on oxide, albeit at a substantially lower level of effort, and a sufficient body of irradiation experience has been accumulated to allow discrimination of realistic fuel pin designs.

- 4833 GERMAN CARBIDE IRRADIATION TEST EXPERIENCE FOR FAST REACTORS. Kummerer, K.R. (Kernforschungszentrum, Karlsruhe, Ger.). pp 326-342 of Advanced LMFBR fuels. Leary, J.; Kittle, H. (eds.). La Grange Park, IL; American Nuclear Society (1977).

From International meeting on advanced LMFBR fuels; Tucson, AZ, USA (10 Oct 1977).

See CONF-771008--.

Most of the open problems in carbide pin design and performance are of a very simple nature. As was the case with mixed oxide one or two decades ago, we must get experience in the parameter field of design and operation conditions. The main design parameters are carbide composition, density, internal geometry. The operation conditions in question are temperature and linear rod power and, of course, the achievable burnup. This field of experience should include steady-state as well as power-cycling and transient conditions. Finally the performance of representative carbide bundle structures are to be considered.

- 4834 FRENCH IRRADIATION TEST EXPERIENCE FOR CARBIDE FUELS. Combette, P. (Centre d'Etudes Nucleaires de Fontenay-aux-Roses, France). pp 343-347 of Advanced LMFBR fuels. Leary, J.; Kittle, H. (eds.). La Grange Park, IL; American Nuclear Society (1977).

From International meeting on advanced LMFBR fuels; Tucson, AZ, USA (10 Oct 1977).

See CONF-771008--.

A research program has been performed at Commissariat a l'Energie Atomique to develop a carbide fuel element, for use in French breeder reactors. The major portion of the program is the evaluation of the performance of fuel elements irradiated in Osiris (thermal flux) or in Rapsodie (fast flux) reactors. The main parameters under investigation are the fuel pellet density (79 to 97 percent T.D., which corresponds to a smear density of 71 to 86 percent), the linear heat rating (70 to 140 kW/m), the burn up (up to 120,000 MWD/t) and the type of bond (He or Na). Up to now, a single grade of cladding material has been tested, solution annealed 316 stainless steel.

CARBIDE FUEL. Stratton, R.W.; Smith, L. (Swiss Federal Inst. for Reactor Research, Wuerenlingen). pp 348-360 of Advanced LMFBR fuels. Leary, J.; Kittle, H. (eds.). La Grange Park, IL; American Nuclear Society (1977).

From International meeting on advanced LMFBR fuels; Tucson, AZ, USA (10 Oct 1977).

See CONF-771008--.

A major part of the EIR programme developing (UPu)C sphere-pac fuel is the irradiation testing and subsequent post irradiation examination (P.I.E.) of vibro-filled fuel pins. Initial operating conditions were set to give maximum clad temperatures of approximately 650°C (sometimes exceeded) and peak linear ratings of 100 kW/m (often not attained). The FILOS series of irradiations in the EIR reactor SAPHIR have mean burn-up targets of 1 percent fima, most of the others in DIDO (UK), BR-2 (Belgium) and D.F.R. (Scotland) have reached mean values between 4 and 6.4 percent fima. All the tests reported have used fuel of two size fractions 600/800 μ m and 40/60 μ m. Smear density was in the range 76 to 77 percent theoretical. Plutonium content of the heavy metal is approximately 15 percent.

- 4836 IRRADIATION EXPERIMENTS OF URANIUM CARBIDE, CARBONITRIDE, AND NITRIDE FUELS IN JAERI. Watanabe, H.; Kurihara, M.; Shimokawa, J.; Ichikawa, M.; Uchida, M. (Japan Atomic Energy Research Inst., Tokai). pp 361-374 of Advanced LMFBR fuels. Leary, J.; Kittle, H. (eds.). La Grange Park, IL; American Nuclear Society (1977).

From International meeting on advanced LMFBR fuels; Tucson, AZ, USA (10 Oct 1977).

See CONF-771008--.

In JAERI, the irradiation test and analysis have been made to provide information on in-pile behavior of uranium carbide, carbonitride and nitride fuels as a preceding stage examination for the mixed uranium-plutonium fuels. Five capsules containing UC, UC/sub x/N/sub 1-x/(x = 0.75, 0.5 and 0.25) and UN fuel pins were irradiated in JMTR (Japan Material Testing Reactor) to investigate their dimensional changes and swelling rates, and to examine the compatibility of the fuel pellets with the cladding materials under sodium or helium environment.

- 4837 U.S. ADVANCED FUELS SAFETY PROGRAM. Rose, D. (Argonne National Lab., IL); Opendaker, A. pp 377-388 of Advanced LMFBR fuels. Leary, J.; Kittle, H. (eds.). La Grange Park, IL; American Nuclear Society (1977).

From International meeting on advanced LMFBR fuels; Tucson, AZ, USA (10 Oct 1977).

See CONF-771008--.

An advanced fuels safety program plan has been developed to provide a coordinated approach to resolving the safety issues arising from the use of the candidate advanced fuels (carbide/nitride) in LMFBRs. The advanced fuels safety program plan takes cognizance of the safety issues that have been identified for oxide-fueled LMFBRs, and of the safety technology required to resolve these issues. Specific additional technology needs are identified for advanced fuels. Thus, the program of work proposed builds on the similarities with work already in progress in the oxide program and focuses on the differences or issues unique to advanced fuels.

- 4838 EXPERIMENTAL STUDY OF ADVANCED FUEL-PIN FAILURE PHENOMENA. Wrona, B.J.; Galvin, T.M. (Argonne National Lab., IL). pp 421-432 of

Advanced LMFBR fuels. Leary, J.; Kittle, H. (eds.). La Grange Park, IL; American Nuclear Society (1977).

From International meeting on advanced LMFBR fuels; Tucson, AZ, USA (10 Oct 1977).

See CONF-771008--.

A direct-electrical-heating apparatus was used to perform fundamental fuel-motion experiments on unirradiated, clad and unclad UC pellets to investigate the response of the fuel to simulated in-reactor transient heating rates and power levels. The results show that the response of UC to applied power transients is significantly different than UO_2 behavior in similar situations. Because of the large temperature interval between the boiling and melting points of UC and the high thermal conductivity of UC that results in relatively flat radial temperature gradients, two regimes of gross fuel motion can occur, depending upon the fuel centerline temperature.

4839 GFEK EXPERIMENTAL APPROACH TO CARBIDE FUEL ELEMENT LICENSING. Plitz, H. (Gesellschaft fuer Kernforschung, Karlsruhe, Ger.). pp 433-454 of Advanced LMFBR fuels. Leary, J.; Kittle, H. (eds.). La Grange Park, IL; American Nuclear Society (1977).

From International meeting on advanced LMFBR fuels; Tucson, AZ, USA (10 Oct 1977).

See CONF-771008--.

Information is presented concerning the general approach to licensing the reference carbide fuel elements; design basis of the reference carbide fuel element concept; theoretical and feasible pin design aspects; irradiation statistics, experimental failure limits; incidental behavior and safety aspects; and experimental approach to licensing the reference carbide fuel element.

4840 CASE FOR FUEL REDESIGN AFTER IN PILE SAFETY EXPERIMENTS: THE "COMMANDO" TESTS. Chagrot, M. pp 455-467 of Advanced LMFBR fuels. Leary, J.; Kittle, H. (eds.). La Grange Park, IL; American Nuclear Society (1977).

From International meeting on advanced LMFBR fuels; Tucson, AZ, USA (10 Oct 1977).

See CONF-771008--.

The CEA reference design for LMFBR advanced fuel elements consisted of mixed carbide sintered pellets stacked in vented, stainless steel clad pins with a large liquid sodium bonded gap. For clearing up the uncertainties of pin behavior, in the case of bond blow-out, two tests were performed in the SCARABEE loop. This experimental program, named COMMANDO, although limited, yielded satisfactory results. The tests showed that no damageable cladding melting occurred and that a new workable steady-state was almost immediately recovered. From these findings and, although other concepts are now considered as well, a safer pin design was devised.

4841 CORRELATION BETWEEN PROPERTIES AND IRRADIATION BEHAVIOR FOR CARBIDE, CARBONITRIDE AND NITRIDE FUELS. Blank, H. (Joint Research Centre, Karlsruhe, Ger.). pp 482-501 of Advanced LMFBR fuels. Leary, J.; Kittle, H. (eds.). La Grange Park, IL; American Nuclear Society (1977).

From International meeting on advanced LMFBR fuels; Tucson, AZ, USA (10 Oct 1977).

See CONF-771008--.

A description is presented of the general fuel and pin behaviour on the basis of the presently available information of the project and is organized in the following way: the results of an analysis of the complex system

reactor-cladding-fuel in order to fix the parameters and their range of values in the problem of swelling; a description of the general pin behaviour follows as obtained from intermediate and final measurements of the permanent diameter increases ($\Delta D/D$) of the fuel pins; a detailed description of fuel restructuring and its correlation with the basic fuel properties; and the results are summarized and conclusions drawn about the potential of the various types of fuels and pins with regard to fuel composition.

4842 IRRADIATION PERFORMANCE ANALYSIS OF UK FAST REACTOR FUEL. Bellamy, R.G.; Hayns, M.R.; Matthews, J.R.; Wilmore, D. pp 502-515 of Advanced LMFBR fuels. Leary, J.; Kittle, H. (eds.). La Grange Park, IL; American Nuclear Society (1977).

From International meeting on advanced LMFBR fuels; Tucson, AZ, USA (10 Oct 1977).

See CONF-771008--.

Two theoretical fuel element models are used in the UK fast reactor fuel program. SLEUTH was originally developed to study gas cooled thermal reactor problems, while FRUMP was specifically developed for operational and safety studies of fast reactor fuel element behaviour.

4843 PROGRESS IN MODELING CARBIDE AND NITRIDE FUEL PERFORMANCE IN ADVANCED LMFBRs. Billone, M.C.; Jankus, V.Z.; Kramer, J.M.; Yang, C.I. (Argonne National Lab., IL). pp 516-536 of Advanced LMFBR fuels. Leary, J.; Kittle, H. (eds.). La Grange Park, IL; American Nuclear Society (1977).

From International meeting on advanced LMFBR fuels; Tucson, AZ, USA (10 Oct 1977).

See CONF-771008--.

The UNCLE-S and UNCLE-T codes have been developed to predict the steady-state and transient performance of (U,Pu)C and (U,Pu)N fuels in advanced LMFBRs. The fuel models and properties that have been incorporated into those codes and the comparison between code predictions and postirradiation data are reviewed. The need for further model development in the areas of fuel cracking and healing, fuel melting, fission-gas release and swelling, and high strain-rate fuel deformation are established. An improved model for fuel cracking is proposed.

4844 ANALYTICAL COMPARISON OF THE IRRADIATION BEHAVIOR OF FAST REACTOR CARBIDE AND OXIDE FUEL PINS. Nayak, U.P.; Boltax, A.; Skalka, R.J.; Biancheria, A. (Westinghouse Electric Corp., Pittsburgh). pp 537-561 of Advanced LMFBR fuels. Leary, J.; Kittle, H. (eds.). La Grange Park, IL; American Nuclear Society (1977).

From International meeting on advanced LMFBR fuels; Tucson, AZ, USA (10 Oct 1977).

See CONF-771008--.

Advanced breeder reactor system design studies indicate that mixed U,Pu carbide fuel provides potential advantages over mixed U,Pu oxide fuel related to nuclear, fuel cycle, and safety considerations. However, the state-of-the-art technology on carbide fuel lags the large world-wide effort on oxide fuel. An analytical comparison of the two fuel types under steady-state and transient conditions using the current versions of the LIFE fuel performance codes is presented.

4845 LIFE CODE SYSTEM FOR ANALYSIS OF OXIDE FUEL PIN THERMAL/STRUCTURAL BEHAVIOR. Stephen, J.D.; Biancheria, A.; Billone, M.C.

pp 562-581 of Advanced LMFBR fuels. Leary, J.; Kittle, H. (eds.). La Grange Park, IL; American Nuclear Society (1977).

From International meeting on advanced LMFBR fuels; Tucson, AZ, USA (10 Oct 1977).

See CONF-771008--.

The LIFE development program is providing national methods for thermal and mechanical analysis and design of FBR fuel pins. The program has produced the LIFE3 code and is developing LIFE4 and LIFE4-transient for (U,Pu)O₂, has encouraged the spinoff development of the UNCLE code for (U,Pu) Carbide and Nitride, and is in the early stages of development of codes for UO₂ (Th,U)O₂, ThO₂ and other blanket and alternate fuel concepts.

- 4846 DEVELOPMENT OF LMFBR CORE DESIGNS USING REFERENCE AND ADVANCED OXIDE FUEL. Chandler, J.C.; Marr, D.R.; McCurry, D.C.; Cantley, D.A.; Omberg, R.P. (Hanford Engineering Development Lab., Richland, WA). pp 583-593 of Advanced LMFBR fuels. Leary, J.; Kittle, H. (eds.). La Grange Park, IL; American Nuclear Society (1977).

From International meeting on advanced LMFBR fuels; Tucson, AZ, USA (10 Oct 1977).

See CONF-771008--.

The design of an LMFBR core is a complex process which is strongly dependent upon design philosophy, design criteria, selection of material properties, and the calculational procedure involved. The development of a core design with optimum characteristics, whether it be doubling time, power costs, or safety characteristics, requires a close coupling of the disciplines of reactor physics, thermohydraulics, mechanical design, and fuel pin performance. This, by necessity, forces the development of a closely-coupled multidiscipline approach. This is true regardless of whether the fuel is oxide, carbide, nitride, or metal, and regardless of whether the fuel cycle is Pu/U or U-233/Th.

- 4847 ASSUMPTIONS, CONSTRAINTS AND METHODOLOGY OF ANL ADVANCED FUELS SYSTEM STUDIES. Barthold, W.P.; Lam, S.K.; Orehwa, Y. (Argonne National Lab., IL). pp 594-613 of Advanced LMFBR fuels. Leary, J.; Kittle, H. (eds.). La Grange Park, IL; American Nuclear Society (1977).

From International meeting on advanced LMFBR fuels; Tucson, AZ, USA (10 Oct 1977).

See CONF-771008--.

A preliminary assessment has been made at ANL of the breeding performance of carbide and nitride fuels in 2000 MWe LMFBRs, and its sensitivity to changes in design and performance parameters. In addition, various design trade-off studies, as well as special problems connected with the design of large LMFBRs, were investigated. The preliminary nature of this assessment is a reflection of the lack of data related to the irradiation behavior of these fuels. Both types of fuel were either sodium- or helium-bonded to the cladding. The assumptions and constraints used throughout the study and the methodology employed for the performance and design analysis are summarized. Typical results are given as examples.

- 4848 OPTIMIZATION SYSTEM DESIGN STUDIES OF ADVANCED CARBIDE FUEL. Caspersson, S.A.; Noyes, R.C.; Kulwich, M.R.; diLauro, G.F.; Klinetob, R.H. (Combustion Engineering, Inc., Windsor, CT). pp 614-633 of Advanced LMFBR fuels. Leary, J.; Kittle, H. (eds.). La Grange Park, IL; American Nuclear Society (1977).

From International meeting on advanced LMFBR fuels; Tucson, AZ, USA (10 Oct 1977).

See CONF-771008--.

System design studies of advanced helium and sodium-bonded uranium-plutonium carbide fuel in commercial LMFBR's have been completed to develop recommendations for optimum values of advanced fuel pin design parameters. Fuel cycle costs, doubling times, and uranium ore requirements were applied as principal optimization criteria. When fuel pin diameter is allowed to vary, higher linear powers result in lower achievable fuel cycle costs and give low doubling times and low uranium ore requirements.

- 4849 INVESTIGATION OF SODIUM-BONDED CARBIDE FUEL ASSEMBLY DESIGN. Madell, J.T.; de Paz, J.F.; Yang, C.I. (Argonne National Lab., IL). pp 634-647 of Advanced LMFBR fuels. Leary, J.; Kittle, H. (eds.). La Grange Park, IL; American Nuclear Society (1977).

From International meeting on advanced LMFBR fuels; Tucson, AZ, USA (10 Oct 1977).

See CONF-771008--.

The engineering studies consisted of steady-state thermal-hydraulic analysis of the fuel assembly, transient thermal analysis of advanced fuel cores, performance studies of pin spacer types, structural analysis of the duct, flow induced vibration analysis, core resistant analysis and cladding structural lifetime calculations. The results of this study will be incorporated into a new assembly design.

- 4850 DESIGN AND PERFORMANCE OF SHROUD TUBES. Kerrisk, J.F.; Barner, J.O.; Petty, R.L. (Los Alamos Scientific Lab., NM). pp 648-659 of Advanced LMFBR fuels. Leary, J.; Kittle, H. (eds.). La Grange Park, IL; American Nuclear Society (1977).

From International meeting on advanced LMFBR fuels; Tucson, AZ, USA (10 Oct 1977).

See CONF-771008--.

Shroud tubes were conceived as a means of preventing the rearrangement and wedging of broken fuel pieces in sodium-bonded advanced-fuel elements. The specific design of a thin-walled tube with slots that fits closely around the fuel was arrived at by consideration of a number of competing mechanical and heat-transfer requirements. Postirradiation examination results obtained to date indicate that shroud tubes are meeting the design requirement of retaining fuel fragments. No cladding failures have been observed in any sodium-bonded element using a shroud tube. The excellent irradiation performance of sodium-bonded elements with shroud tubes as compared to similar elements without shroud tubes demonstrates the utility of the shroud-tube concept.

- 4851 STATUS OF INTERNATIONAL FUEL CLADDING DEVELOPMENT. Laidler, J.J. (Hanford Engineering Development Lab., Richland, WA). pp 681-694 of Advanced LMFBR fuels. Leary, J.; Kittle, H. (eds.). La Grange Park, IL; American Nuclear Society (1977).

From International meeting on advanced LMFBR fuels; Tucson, AZ, USA (10 Oct 1977).

See CONF-771008--.

Several substantial national and international programs on cladding and duct materials development are currently in progress, and great strides are being made in characterizing the behavior of current reference materials and in developing materials with improved performance capabilities. A brief overview of these programs, the state of materials development, and the nature of some

current important issues pertaining to materials behavior in the reactor environment are presented.

- 4852 THERMAL-HYDRAULIC EVALUATION OF ADVANCED WIRE-WRAP ASSEMBLIES. Wei, J.P. (GE, Sunnyvale, Calif.). AICHE Symp. Ser.; 73: No. 164, 105-113(1977).

Fuel assemblies for liquid-metal-cooled fast breeder reactors consist of a large number of rods uniformly spaced by wire wrap in a hexagonal array. Thermal-hydraulic analyses of a 217-rod wire-wrapped assembly with different wire-wrap geometries was accomplished. Advanced designs considered are staggered starts, distributed wireless fuel rods and locked wrap. 10 refs.

- 4853 EMPIRICAL METHOD TO CALCULATE CLINCH RIVER BREEDER REACTOR PLANT (CRBRP) INLET PLENUM TRANSIENT TEMPERATURES. Howarth, W.L. (Westinghouse Electr Corp, Madison, Pa.). AICHE Symp. Ser.; 73: No. 164, 114-119(1977).

Sodium flow enters the CRBRP inlet plenum via three inlet loops. An empirical equation was formulated to calculate transient temperatures in the inlet plenum from known inlet loop flows and temperatures. The constants in the empirical equations were measured in a (one quarter) scale Inlet Plenum Model using water as the test fluid and an electrolyte to simulate the sodium temperature distribution. Step electrolyte transients at 100% model flow were used to calculate the equation constants. The empirical equation was checked by comparing its results with test results from additional tests that covered the inlet plenum operational range. 4 refs.

- 4854 INFLUENCE OF SCALE SIZE AND FLUID THERMAL PROPERTIES IN SIMULATING LMFBR OUTLET PLENUM BEHAVIOR. Lorenz, J.J.; Carlson, R.D.; Howard, P.A. (Argonne Natl Lab, Ill.). AICHE Symp. Ser.; 73: No. 164, 120-126(1977).

The influence of scale size and fluid thermal properties in simulating LMFBR outlet plenum behavior was studied. Tests were performed with water and sodium using 1/15-scale models of LMFBR outlet plenums. It was found that differences in the behavior of sodium and water were relatively modest despite a large variance in the respective Peclet numbers. The effect of scale size was found to be unimportant as evidenced by the reasonably good overall agreement of the present 1/15-scale results and 0.55-scale data of J.A. Carr and L.J. Flanigan. It was concluded that for the purpose of obtaining engineering design data relating to LMFBR outlet plenums, small scale water tests will provide a fairly good direct simulation of full scale sodium behavior. 3 refs.

- 4855 INTERMEDIATE HEAT EXCHANGER DEVELOPMENT FOR THE CLINCH RIVER BREEDER REACTOR PLANT. Sawyer, R.H.; Cho, S.M.; Pai, D.H. (Foster Wheeler Energy Corp, Livingston, NJ). Am. Soc. Mech. Eng., [Pap.]; No. 77-WA/NE-10, vp(1977).

The design and development of the Intermediate Heat Exchanger (IHx) for the Clinch River Breeder Reactor Plant (CRBRP) has progressed from its performance sizing stage through flow testing of critical areas to its final performance analysis. The flow testing provided the impetus for the design evolution of the flow distribution and flow control devices throughout the IHx. The design evolution of the IHx was also shaped by factors, such as manufacturing economics, the

manufacturing experience of the Fast Flux Test Facility (FFTF) IHx, the structural considerations to meet the current code requirements, and flow-induced dynamic considerations within the bundle. These are but some of the areas discussed in this paper. 3 refs.

- 4856 DEVELOPMENT OF LMFBR STEAM GENERATOR LEAK PROTECTION SYSTEMS. Magee, P.M.; Gerrels, E.E.; Greene, D.A.; McKee, J. (GE, Sunnyvale, Calif.). Am. Soc. Mech. Eng., [Pap.]; No. 77-WA/NE-12, vp(1977).

Leak protection for Liquid Metal Fast Breeder Reactor steam generators is an important economic factor in the shutdown, repair and restart of a plant. Development of leak protection systems in the U.S. has concentrated on four areas: chemical (H_2 and O_2) leak detection meters; acoustic leak detection/location techniques; investigation of leak behavior (enlargement, damage effects, plugging and unplugging); and data management for plant operations. This paper discusses the status, design aspects, and applications of leak protection technology for LMFBR plants. 11 refs.

- 4857 TESTING OF FFTF FUEL HANDLING EQUIPMENT. Coleman, D.W.; Grazzini, E.D.; Hill, L.F. (US ERDA, Richland, Wash.). Am. Soc. Mech. Eng., [Pap.]; No. 77-WA/NE-9, vp(1977).

The Fast Flux Test Facility has several manual/computer controlled fuel handling machines which are exposed to severe environments during plant operation but still must operate reliably when called upon for reactor refueling. The test programs for two such machines--the Closed Loop Ex-Vessel Machine and the In-Vessel Handling Machine--are described. The discussion centers on those areas where design corrections or equipment repairs substantiated the benefits of a test program prior to plant operation. 4 refs.

- 4858 DEVELOPMENT OF SMALL SODIUM VALVES FOR THE FAST FLUX TEST FACILITY. Verderosa, M.A.; Bazinet, G.D. (US ERDA, Richland, Wash.). Am. Soc. Mech. Eng., [Pap.]; No. 77-WA/NE-13, vp(1977).

The FFTF utilizes approximately 250 small (10.2 cm or smaller) sodium valves in its auxiliary liquid metal systems. This paper traces the design evolution of the two valve concepts chosen along with the associated fabrication, inspection and testing histories focusing on the problems identified and the solutions employed. The post-test examinations of the valves are reviewed and the actual valve capabilities versus the original design goals are discussed. Recommendations for future valve development, including potential cost reduction schemes, are identified. 3 refs.

- 4859 EXTINCTION OF METAL FIRES. Mellottee, H. (Centre National de la Recherche Scientifique, 45 - Orleans-la-Source (France). Centre de Recherches sur la Chimie de Combustion et des Hautes Temperatures). Rev. Gen. Therm.; 16: No. 186, 527-538(1977). (In French).

The main points of a large bibliography on liquid and solid metal fires are set out. The various methods used to fight these fires are presented; covering by powders is specially emphasized. Since this method has promising results, the various possible techniques, extinction by cooling the metal, by blanketing, by formation of a continuous insulating layer (by fusion or pyrolysis of a powder) or by a

surface reaction between powder and metal are studied. The conditions of conservation and use of powders are outlined, then the various powders are described: inert powders, powders undergoing a physical transformation (fusion or vitrification of an organic compound, fusion of eutectic inorganic mixtures), multiple effect powders. Precise examples are quoted.

- 4860 ANALYSIS OF CORE DISRUPTIVE ACCIDENTS IN CARBIDE-FUELED LMFBRs. Mync, L.; Bowers, C.H.; Ferguson, D.R. (Argonne National Lab., IL). pp 389-406 of Advanced LMFBR fuels. Leary, J.; Kittle, H. (eds.). La Grange Park, IL; American Nuclear Society (1977).

From International meeting on advanced LMFBR fuels; Tucson, AZ, USA (10 Oct 1977).

See CONF-771008--.

Parametric studies of two hypothetical core disruptive accidents in a large carbide-fueled LMFBR are discussed. The SAS3A code is used to produce speculative scenarios for the unprotected loss-of-flow and transient overpower accident initiators. Aside from the treatment of transient phenomena unique to carbide fuel, the predictions are based mainly on a direct extrapolation from CDA phenomenology developed for oxide fuels. In addition, a comparison is made to the predicted behavior of a similarly-sized oxide-fueled LMFBR to these two accident initiators.

- 4861 SAFETY ASPECTS OF CARBIDE IRRADIATIONS IN FTR DRIVER POSITIONS. Nickerson, G.M.; Bergeron, R.J.; Siegmund, E.R. (Combustion Engineering, Inc., Windsor, CT). pp 407-420 of Advanced LMFBR fuels. Leary, J.; Kittle, H. (eds.). La Grange Park, IL; American Nuclear Society (1977).

From International meeting on advanced LMFBR fuels; Tucson, AZ, USA (10 Oct 1977).

See CONF-771008--.

An assessment has been made of safety implications for irradiation testing of advanced LMFBR carbide fuel in the Fast Test Reactor (FTR). Carbide fuel has been compared with FTR reference oxide fuel; findings indicate that carbide fuel can be irradiated in FTR safely. Investigations were made of two hypothetical core disruptive accident initiating transients: the transient overpower and the transient under cooling sequences. Improved modeling of sodium bond and shroud tube behavior has been developed. Events are changed little by including parametric variations in sodium bond and shroud tube behavior.

- 4862 ADVANCED FUELS SAFETY COMPARISONS. Grohmes, M.A. (Argonne National Lab., IL). pp 469-480 of Advanced LMFBR fuels. Leary, J.; Kittle, H. (eds.). La Grange Park, IL; American Nuclear Society (1977).

From International meeting on advanced LMFBR fuels; Tucson, AZ, USA (10 Oct 1977).

See CONF-771008--.

The safety considerations of advanced fuels are described relative to the present understanding of the safety of oxide fueled Liquid Metal Fast Breeder Reactors (LMFBR). Safety considerations important for the successful implementation of advanced fueled reactors must early on focus on the accident energetics issues of fuel coolant interactions and recriticality associated with core disruptive accidents. It is in these areas where the thermal physical property differences of the advanced fuel have the greatest significance.

- 4863 MEASUREMENTS OF SUBASSEMBLY AND CORE TEMPERATURE DISTRIBUTIONS IN AN LMFBR. Singer, R.M.; Gillette, J.L. (Argonne Natl Lab, Ill). AICHE Symp. Ser.; 73: No. 164, 97-104(1977).

In the analysis of temperature distributions in the core of a liquid metal cooled fast breeder reactor (LMFBR) under both normal and abnormal operating conditions, it is generally assumed that there is little, if any, thermal interaction between adjacent subassemblies. Since intersubassembly heat transfer tends to reduce the radial temperature gradient in a reactor, thereby ameliorating the effects of local overheating, this assumption is conservative. In order to assess the importance of this effect as well as that of flow redistribution in a reactor core, a series of in-core and subassembly outlet measurements were made in EBR-II over a wide range of operating power and flow conditions, encompassing both forced and natural convection. The results of this study indicate that radial heat transfer and flow redistribution are important mechanisms which should be taken into account in the thermal-hydraulic analyses of LMFBR cores, especially under low flow rate conditions. 14 refs.

- 4864 SOME OBSERVATIONS ON OXYGEN AND CARBON POTENTIALS IN U-Pu-O AND U-Pu-C SYSTEMS. Tetenbaum, M. (Argonne National Lab., IL). pp 179-188 of Advanced LMFBR fuels. Leary, J.; Kittle, H. (eds.). La Grange Park, IL; American Nuclear Society (1977).

From International meeting on advanced LMFBR fuels; Tucson, AZ, USA (10 Oct 1977).

See CONF-771008--.

Measurements to characterize the effect of plutonium valency on oxygen potential have been made at 2050 K for hypostoichiometric U-Pu-O fuel compositions having plutonium-to-metal ratios ranging from 0.15 to 0.30. The data indicate that oxygen potential is dependent on the plutonium-to-metal ratio and therefore, do not support the hypothesis that $\Delta G(O_2)$ values for the U-Pu-O system are a function of the metal whose oxidation state is changing. Equilibrium of the U-Pu-C solid solution system, where $Pu/(U + Pu) = 0.2$ and $C/(U + Pu) = 0.98$ with a carrier gas having a carbon activity of approximately 0.62 at 2050 K resulted in the formation of a residue of composition $C/(U + Pu) = 1.05$.

- 4865 THERMOPHYSICAL PROPERTIES OF LIQUID URANIUM CARBIDE. Finn, P.A.; Sheth, A.; Winslow, G.; Leibowitz, L. (Argonne National Lab., IL). pp 189-204 of Advanced LMFBR fuels. Leary, J.; Kittle, H. (eds.). La Grange Park, IL; American Nuclear Society (1977).

From International meeting on advanced LMFBR fuels; Tucson, AZ, USA (10 Oct 1977).

See CONF-771008--.

Uranium-plutonium carbide, which has better neutronic properties and higher thermal conductivity than uranium-plutonium oxide, has been considered as a fuel for nuclear reactors. In order to perform essential reactor safety analyses, many thermodynamic and transport properties at temperatures exceeding 6000 K are needed. The required values include vapor pressure, density, volume expansion, heat capacity, enthalpy, compressibility, and viscosity. It was necessary to develop a self-consistent method that could be used to extrapolate known property values to the liquid region. This report summarizes work on uranium carbide.

- 4866 FUEL PROPERTIES OF ADVANCED FUELS (U,Pu)CN IMPORTANT FOR OUT-OF-PILE AND IN-PILE KINETICS. Matzke, H.; Ronchi, C. (Joint Research Centre, Karlsruhe, Ger.). pp 218-244 of Advanced LMFBR fuels. Leary, J.; Kittle, H. (eds.). La Grange Park, IL; American Nuclear Society (1977).

From International meeting on advanced LMFBR fuels; Tucson, AZ, USA (10 Oct 1977).

See CONF-771008--.

The investigated fuels covered the whole range of (U,Pu)C over (U,Pu)C/sub x/N/sub 1-x/ to (U,Pu)N, and some additional work was devoted to oxycarbides (U,Pu)CO. The properties studied are described and include self-diffusion, sintering and densification, mechanical properties like plasticity and crack formation, thermal conductivity, pore mobility and fuel restructuring in an applied thermal gradient simulating expected in-pile thermal gradients, and solubility of fission products.

- 4867 CREEP BEHAVIOR OF MIXED-CARBIDE ADVANCED NUCLEAR FUEL. Singh, R.N. (Argonne National Lab., IL). pp 257-266 of Advanced LMFBR fuels. Leary, J.; Kittle, H. (eds.). La Grange Park, IL; American Nuclear Society (1977).

From International meeting on advanced LMFBR fuels; Tucson, AZ, USA (10 Oct 1977).

See CONF-771008--.

Primary and steady-state creep behavior of (U_{0.8}Pu_{0.2})C_{1.0} advanced nuclear fuel was investigated as functions of stress (6.89 to 68.9 MNm⁻²) and temperature (1573 to 1873 K). Mixed carbide fuel exhibits higher primary and steady-state creep rates when compared with stoichiometric mixed-oxide fuel of the same density, grain size, and Pu concentration for identical testing conditions.

- 4868 CHEMICAL STATE OF IRRADIATED CARBIDE FUEL PINS. Kleykamp, H. (Kernforschungszentrum, Karlsruhe, Ger.). pp 166-178 of Advanced LMFBR fuels. Leary, J.; Kittle, H. (eds.). La Grange Park, IL; American Nuclear Society (1977).

From International meeting on advanced LMFBR fuels; Tucson, AZ, USA (10 Oct 1977).

See CONF-771008--.

The postirradiation studies of uranium-plutonium carbide fuel pins for the development of a fuel element for operation in the German SNR-300 reactor have enabled characterization of the chemical state of carbide fuels. The latter is influenced by the compositional changes during irradiation resulting from the fission process and by redistribution of the fuel components and the fission products. These effects have been investigated by metallographic techniques, electronprobe microanalysis, and scanning electron microscopy on fuel pins that had been irradiated in the thermal reactors FR2 and BR2 and in the Dounreay Fast Reactor DFR. The current status of knowledge based on these irradiation experiments is reviewed.

- 4869 EDDY-CURRENT EXAMINATION OF IRRADIATED FUEL ELEMENTS AT THE HOT FUEL EXAMINATION FACILITY. Bhipps, R.D.; Kleiss R.E.; Coughlan, J.B. (Argonne National Lab., Idaho Falls, ID). pp 245-250 of Proceedings of the 25th conference on remote systems technology. Wojciechowski, D.R. (ed.). La Grange Park, IL; American Nuclear Society, Inc. (1977).

From 25. remote systems technology symposium; San Francisco, CA, USA (27 Nov 1977).

See CONF-771117--.

The use of eddy-current examinations on irradiated fuel cladding is a promising but

relatively undocumented testing method. At the Hot Fuel Examination Facility, an eddy-current cladding-integrity tester is being used to better understand the effects of radiation on fuel pins. The goal is a high throughput system that will test for microscopic flaws, cracks, or unusual defects that might be impossible to detect by any other available means.

- 4870 FUEL HANDLING AND STORAGE SYSTEM FOR LARGE COMMERCIAL LMFBRs. Davis, C.R.; Sciaccia, F.W. (General Electric Co., Sunnyvale, CA). pp 386-396 of Proceedings of the 25th conference on remote systems technology. Wojciechowski, D.R. (ed.). La Grange Park, IL; American Nuclear Society, Inc. (1977).

From 25. remote systems technology symposium; San Francisco, CA, USA (27 Nov 1977).

See CONF-771117--.

A fuel handling and storage system suitable for large commercial liquid-metal fast breeder reactor plants has been conceptually developed and designed. The system provides for all in-plant handling and storage of core components. The particular arrangements and features were chosen to provide rapid refueling capability, a highly reliable and safe system, a cost effective system, and a system that requires a minimum of research and development effort.

- 4871 ANALYSIS OF ERDA'S NATIONAL ENERGY PLAN. Coccio, C.L. (GE, Schenectady, NY). Am. Soc. Mech. Eng., [Pap.]; No. 77-WA/TS-2, vp(1977).

This national energy plan begins with five overall policy goals as follows: (a) maintain the security and policy independence of the nation, (b) maintain a strong and healthy economy, (c) provide for future needs so that future life styles are not limited by energy unavailability, (d) contribute to world stability, and (e) protect and improve the nation's environmental quality. Within this general framework, ERDA develops eight technology goals such as "increase the use of essentially inexhaustible domestic energy resources." Programs are then identified under each goal such as solar electric, breeder reactors, and fusion for the example above. A review of the plan shows that some of the more significant items called for in the legislation relating to anticipated program results, costs, and impacts were not described. When Congress became aware of this lack of quantification, letters were sent to ERDA requesting specific responses along the above lines. This paper presents ERDA's subsequently furnished program costs and benefits in the eight technology goal categories of the national energy plan.

- 4872 NUCLEAR PROLIFERATION AND NUCLEAR POWER. Woodruff, G.L. (Univ of Wash, Seattle). Am. Soc. Mech. Eng., [Pap.]; No. 77-WA/TS-1, vp(1977).

In April 1977, President Carter announced that the United States would defer indefinitely the commercial reprocessing of nuclear fuel and the commercialization of the liquid metal fast breeder reactor. These decisions were made out of concern for nuclear proliferation. It is very unlikely that even a simple majority of nations will forego the long-term benefits of reprocessing and breeders. At the time of this writing, not even the U.S. Congress seems inclined to accept these aspects of the President's program. International controls of enrichment and reprocessing are more-promising alternatives as proliferation safeguards. A number of safeguards approaches may be highly effective. For example, separated plutonium can

be "spiked" with radioactivity and thereby rendered relatively safe from theft by terrorists. Satellite monitoring of reactor operations can provide instant detection of attempts to divert fuel.

- 4873 FAST FLUX TEST FACILITY CORE COMPONENT MEASURING SYSTEM. Mullen, R.E. (Aerojet Manufacturing Co., Fullerton, CA); Harbison, S.G.; Martin, R.L. pp 67-77 of Proceedings of the 25th conference on remote systems technology. Wojciechowski, D.R. (ed.). La Grange Park, IL; American Nuclear Society, Inc. (1977).

From 25. remote systems technology symposium; San Francisco, CA, USA (27 Nov 1977).

See CONF-771117--.

Aerojet Manufacturing Company has designed and procured a core component measuring system for installation in the Fast Flux Test Facility (FFTF) interim examination/maintenance cell. This remotely operable and maintainable system will define the geometric changes that are expected to occur in FFTF core components by measuring cross sections, length, bow, and twist. The system will be used to measure the external temperature at a specific axial position along the hex duct, differential pressure across a core component, and axial flow rates of cooling gas through a component. Full automation of the measuring system makes it possible to acquire, process, and record vast amounts of data with minimal operator attention. Data printouts, historical comparison, distribution plots, and listings for irradiation experiments provide immediate and useful data to the sponsors of FFTF experiments.

- 4874 FAST FLUX TEST FACILITY ELEMENT MEASURING SYSTEM. Mullen, R.E. (Aerojet Manufacturing Co., Fullerton, CA); Harbison, S.G.; Martin, R.L. pp 78-89 of Proceedings of the 25th conference on remote systems technology. Wojciechowski, D.R. (ed.). La Grange Park, IL; American Nuclear Society, Inc. (1977).

From 25. remote systems technology symposium; San Francisco, CA, USA (27 Nov 1977).

See CONF-771117--.

Aerojet Manufacturing Company has been responsible for the overall design and procurement of an element measuring system to be installed in the Fast Flux Test Facility (FFTF) interim examination/maintenance cell. The system is remotely operable and maintainable and will be used to detect both geometric and weight changes occurring in FFTF elements. In addition, the system will be used to determine fuel pellet movement, gamma flux profiles, and isotope migrations, and to detect microscopic cladding failures. Fully automated computer control makes it possible to process and acquire data from up to 24 elements with minimal operator attention.

- 4875 DESIGN FEATURES AND OBJECTIVES OF THE FUELS AND MATERIALS EXAMINATION FACILITY. Doman, D.R.; Trego, A.L.; Burgess, C.A. (Westinghouse Hanford Co., Richland, WA). pp 90-102 of Proceedings of the 25th conference on remote systems technology. Wojciechowski, D.R. (ed.). La Grange Park, IL; American Nuclear Society, Inc. (1977).

From 25. remote systems technology symposium; San Francisco, CA, USA (27 Nov 1977).

See CONF-771117--.

The conceptual design has been nearly completed on the Fuels and Materials Examination Facility (FMEF), a hot-cell facility for destructive (DE) and

nondestructive examination (NDE) of irradiated fuels and materials tested in the Fast Flux Test Facility (FFTF) and other breeder reactors. The FMEF will be constructed near the FFTF and is scheduled to be operational by early 1983. A large cell with 22 work stations permits NDE of fuel assemblies and pins, while 12 smaller cells provide sectioning of failed assemblies or pins and DE. These cells contain a recirculating nitrogen atmosphere. To handle the large assemblies and increased number of fuels and materials specimens irradiated in the FFTF, the facility is highly mechanized to provide high throughput.

- 4876 ADVANTAGES OF EQUIPMENT TESTING IN THE IEM CELL MOCKUP. LeGore, T.; Dietrick, D.L.; Engstrom, J.W.; Richman, R.B. (Westinghouse Hanford Co., Richland, WA). pp 130-133 of Proceedings of the 25th conference on remote systems technology. Wojciechowski, D.R. (ed.). La Grange Park, IL; American Nuclear Society, Inc. (1977).

From 25. remote systems technology symposium; San Francisco, CA, USA (27 Nov 1977).

See CONF-771117--.

The Fast Flux Test Facility (FFTF) interim examination and maintenance cell will contain a large amount of equipment for handling FFTF core components. To adequately assure that the equipment is operational prior to installation at FFTF, a full-scale mockup was built and an extensive test program was carried out. The tests covered installation, remote maintenance, and systems integration of more than eighty different equipment items to be used in the cell.

- 4877 SPENT-FUEL SHIPPING SYSTEM FOR LARGE COMMERCIAL LMFBRs. Davis, C.R. (General Electric Co., Sunnyvale, CA). pp 397-402 of Proceedings of the 25th conference on remote systems technology. Wojciechowski, D.R. (ed.). La Grange Park, IL; American Nuclear Society, Inc. (1977).

From 25. remote systems technology symposium; San Francisco, CA, USA (27 Nov 1977).

See CONF-771117--.

A spent-fuel shipping system for large commercial liquid-metal fast breeder reactors (LMFBRs) has been conceptually developed and the major components designed. The system achieves double containment by seal welding individual spent-fuel assemblies into a shipping canister and sealing several canisters into a shipping cask with a dry cavity. The cask is loaded without removing it from its transporter and without contaminating its exterior surfaces. Early adoption of this (or an equivalent) spent-fuel shipping system is needed to provide guidance to the designers of LMFBR equipment and facilities, as well as of the LMFBR fuel reprocessing plant.

- 4878 NUCLEAR CRISIS. A QUESTION OF BREEDING. Gosling, D.; Montefiore, H. (eds.). Dorchester, Dorset; Prism Press (1977). 174p.

This book contains an edited account of the submissions and the cross-examination of Expert Witnesses at the Public Hearings on the projected Commercial Fast Reactor CFR-1 which were held at the London International Press Centre on 13 and 14 December 1976. The account is in chapters dealing with different aspects of the matter: (1) statement by Mr. Benn (Secretary of State for Energy) and replies; (2) future needs and goals for society; (3) risks (technological and social); (4) feasibility, economic and technological; (5) CFR-1 and alternative sources of energy; (6) epilogue.

- 4879 **QUANTITATIVE ASSESSMENT OF NUCLEAR INCINERATION OF ACTINIDE WASTE.** Harte, G.A.; Clarke, R.H. (Central Electricity Generating Board, Berkeley (UK). Berkeley Nuclear Labs.). pp 289-292 of Proceedings of the 4. International congress of the International Radiation Protection Association. Paris, 24-30 April 1977. Vol. 2. Fontenay-aux-Roses, France; Association Internationale de Protection contre les Rayonnements (1977).
From 4. congress of the International Radiation Protection Agency; Paris, France (24 Apr 1977).

See CONF-770409--. Available from M. Gilbert Bresson, General Secretary IRPA, B.P. No. 33, 92260 Fontenay-aux-Roses, France.

The actinide arisings from reactors currently of interest in Europe, both thermal and fast, are compared over cooling times from 10^0 to 10^6 years by use of an index of biological hazard. The effects of reirradiation of this waste are considered in both light water (PWR) and sodium cooled (LMFBR) commercial reactor designs, again in terms of the change in biological hazard index over long cooling times. The criterion for judging the effectiveness of nuclear incineration is proposed as the hazard index of the amount of ^{238}U plus its equilibrium daughter activities that is burned up in the primary reactor fuel cycle. This criterion enables an upper limit to the cooling (decay) time after irradiation which must be considered important for waste disposal. From these studies it is possible to conclude that the current national design of a plutonium fuelled LMFBR provides potential physics conditions for nuclear incineration to be feasible, whereas recycling the waste through a PWR fuel cycle is unlikely to provide any significant benefit. It is further shown that the actinide waste from early reactors is not worth incinerating unless essentially 100% uranium and plutonium removal is achieved before irradiation. If plutonium is used in either thermal or fast reactors, it is shown that U + Pu separation of greater than 99.9% is required before incineration will reduce the ultimate waste hazard at long cooling times and then only after an irradiation time of at least 30 years at peak flux in a commercial LMFBR.

- 4880 (KFK-tr--536) **EXPERIMENTAL RESULTS WITH CARBIDE FUEL RODS IN THE BOR-60 REACTOR.** Tsykanov, V.A.; Gryazev, V.M.; Davydov, E.F.; Kuz'min, V.I.; Malershin, A.A.; Syuzev, V.N.; Golovnin, I.S.; Men'shikova, T.S.; Bibilashvili, Yu.K.; Kotel'nikov, R.B. Translated from At. Energ. (USSR); 42: No. 5, 378-382(1977). 17p. (In German). Dep. NTIS (US Sales Only), PC A02/MF A01.

Translated from Russian: Rezul'taty ispytaniya v reaktore BOR-60 tvelov s karbidnym toplivom.

In recent research work, much attention has been paid to the study of carbide fuels for fast power reactors, which have a better thermal conductivity and a larger number of heavy atoms than conventional oxide fuels. This is due to the fact that they may help to shorten the doubling time, to increase the breeding rate and thus to improve the efficiency of fast reactors. The present paper gives some results of a study on the behaviour of irradiated carbide fuels and fuel rods which had been in constant operation in the BOR-60 reactor up to a burnup of 10% of the heavy atoms.

- 4881 **LEAK DETECTION OF STEAM OR WATER INTO SODIUM IN STEAM GENERATORS OF LIQUID-METAL FAST**

BREEDER REACTORS. Hans, R.; Dumm, K. (Internationale Atomreaktorbau G.m.b.H. (INTERATOM), Bergisch Gladbach (Germany, F.R.)). At. Energy Rev.; 15: No. 4, 611-699(1977).

The leakage of water or steam into sodium in LMFBR steam generators, including a study of how leaks are detected and located as well as the potential damage that could be caused by such leaks, is surveyed. The most interesting steam generator designs evolving in those countries that develop and construct LMFBRs are presented. The relevant protection measures are described. Fault conditions are defined and descriptions given of possible sequences of events leading to abnormal conditions in a steam generator. Taking into account theory, the potential of the hydrogen and oxygen detection systems is discussed. Different hydrogen and oxygen detection systems are fully described. In so far as interesting technical solutions are concerned, previously developed devices have also been taken into account. The way oxygen detection supplements hydrogen detection is described by listing the available oxygen measuring devices and the relevant theory. Only a few sonic and accelerometer measurements have been made on complete steam generator units so there is little system data available. Descriptions, however, have been included to give the state of the art achieved for the sensors and the achieved sensitivities or band widths. The potential of this monitoring method is made evident by adding the technical data of the sensors. Furthermore, the available systems for monitoring medium and large leakages are described. Finally, recommendations are made concerning steam generator development and the application of hydrogen and oxygen detection systems, as well as acoustic measuring methods for small-leakage detection.

- 4882 **FLOW IN THE INLET PLENUM FEATURE MODEL OF THE CLINCH RIVER BREEDER REACTOR.** McConnell, P.M. (Westinghouse Hanford Co, Richland, Wash.). Am. Soc. Mech. Eng., [Pap.]; 77-WA/FE-19: vp(1977).

Results of the Inlet Plenum Feature Model (IPFM) hydrodynamic design verification tests are presented. The IPFM models all hydrodynamically important wetted surfaces in a full 360° (one quarter scale) sector of the inlet plenum and lower internal components of the Clinch River Breeder Reactor (CRBR). These tests were aimed at establishing a near optimum inlet plenum configuration; determining the fluid dynamic performance of the current CRBR auxiliary flow port liner design; evaluating the susceptibility of the inlet plenum design to flow blockage from various types of hypothetical debris; and assessing the ability of the inlet plenum to break up hypothetical bubbles injected into the inlet piping. The test results indicate that the CRBR inlet plenum will produce flow maldistributions of less than ± 3 percent and that mixing of the liquid sodium coolant will not be appreciably affected by substantial changes in the plenum height or the reactor flow rate. 16 refs.

- 4883 **EULERIAN METHOD FOR LARGE-DISPLACEMENT FLUID-STRUCTURE INTERACTION IN REACTOR CONTAINMENTS.** Chang, Y.W.; Wang, C.Y. (Argonne Natl Lab, Ill). pp 1-14 of Canadian Nuclear Association--annual international conference proceedings, 17, Volumes 1 through 6, 1977. Montreal; Canadian Nuclear Association (1977).

From 17. annual international conference of the Canadian Nuclear Association; Montreal,

Ontario, Canada (5 Jun 1977).

An Eulerian method for analyzing large-displacement fluid-structure interaction in reactor containments is presented. The emphasis is on the development of a generalized hydrodynamic scheme to treat the irregular cells created by the movement of the structure with respect to the fixed Eulerian coordinates. A relaxation equation is derived from the boundary condition at the fluid-structure interface for the solution of the pressure at the interface. By combining this with the Poisson equation a sufficient set of equations is obtained for the determination of the advanced-time pressures in the fluid region and at the fluid-structure interfaces. Sample problems are given to illustrate the analysis.

- 4884 STRUCTURAL MECHANICS IN REACTOR TECHNOLOGY. VOL. E. STRUCTURAL DYNAMICS IN FAST REACTOR ACCIDENT ANALYSIS. Jaeger, T.A.; Boley, B.A. (eds.). Brussels; Commission of the European Communities (1977). 404p. (CONF-770807--Pt.E).

From 4. international conference on structural mechanics in reactor technology; San Francisco, CA, USA (15 Aug 1977).

This volume covers the sessions on structural dynamics in fast reactor accident analysis. Separate abstracts were prepared for each of the individual papers included.

- 4885 UNITED STATES URANIUM POSITION. Boyd, J. pp 143-151 of Uranium supply and demand. London; Mining Journal Books (1977).

From 2. symposium on uranium supply and demand; London, UK (22 Jun 1977).

See CONF-7706120--.

It is concluded that the time between the decision to mine and equip a given unit of uranium reserves and the time that it will be available to a power plant is 10 to 15 years. The time in which that uranium is in residence in a LWR before the derived plutonium and ^{238}U are recaptured for further use is of the order of 10 or more years. It will take several years to reverse the present prohibition on recycling and reactivate or build the required plants. It appears that, unless drastic action is taken, there will not be sufficient uranium forthcoming to sustain a nuclear industry based upon LWRs. As a consequence, it is imperative that we extend our uranium resources and reserves by developing and commercializing some sort of advanced converter as soon as possible. The present state of the art would indicate that this will have to be the Liquid Metal Breeder Reactor or the advanced system (Candu) adopted by the Canadians.

- 4886 IN-REACTOR DEFORMATION OF SOLUTION ANNEALED TYPE 304L STAINLESS STEEL. Flinn, J.E.; McVay, G.L.; Walters, L.C. (Argonne National Lab., Ill. (USA)). pp 210-223 of Measurement of irradiation-enhanced creep in nuclear materials. Cundy, M.R.; von der Hardt, P.; Loelgen, R.H. (eds.). Amsterdam, Netherlands; North-Holland (1977).

From International colloquium on measurement of irradiation enhanced creep in nuclear materials; Petten, Netherlands (5 May 1976).

See CONF-760530--.

Over the past six years at EBR-II, a great deal of information has been obtained on the in-reactor behavior of solution annealed-Type 304L stainless steel. This information consists of the following: (1) Irradiation induced swelling results in the form of immersion density and transmission electron microscope (TEM) measurements on unstressed material that extends over a temperature range of 395° to

530°C and a neutron fluence range of 1.8 to 9.3×10^{22} n/cm² (E>0.1 MeV). (2) Irradiation induced creep results from helium pressurized capsules irradiated at a temperature of 415°C. The hoop stress range covered in the experiment was 0 to 27.3 ksi, and the peak neutron fluence obtained to date is 7×10^{22} n/cm² (E>0.1 MeV). (3) Residual stress measurements (slit tube technique) with complementary TEM gradient studies on stressed and unstressed capsules. (4) Comparative swelling studies of stressed cladding material and unstressed capsule material from encapsulated EBR-II driver fuel experiments over wide ranges of temperature and neutron fluences. The deformation information derived from the four above studies represent an extensive data base from which to obtain an understanding of the in-reactor deformation of austenitic stainless steel. It is the purpose of this paper to review our information on the in-reactor deformation of solution annealed Type 304L stainless steel.

- 4887 IRRADIATION CREEP DATA IN SUPPORT OF LMFBR CORE DESIGN. Gilbert, E.R.; Straalsund, J.L.; Wire, G.L. (Hanford Engineering Development Lab., Richland, Wash. (USA)). pp 266-278 of Measurement of irradiation-enhanced creep in nuclear materials. Cundy, M.R.; Hardt, P. von der; Loelgen, R.H. (eds.). Amsterdam, Netherlands; North-Holland (1977).

From International colloquium on measurement of irradiation enhanced creep in nuclear materials; Petten, Netherlands (5 May 1976).

See CONF-760530--.

Temperature and neutron flux gradients occurring spatially within the core of an LMFBR generate distortions through the phenomena of swelling and irradiation creep in contemporary core materials. These distortions lead to subassembly interactions both during operation of an LMFBR and during refueling, and thereby limit the life of certain components. Core design and performance analyses therefore require good descriptions of swelling and irradiation creep. Sufficient data to quantify swelling and irradiation creep are finally beginning to materialize. Stainless steel swelling data are available for neutron fluences up to 10^{23} n/cm² (E>0.1 MeV). New testing techniques and analytical methods are being developed to determine the history dependence and stress-state dependence of irradiation creep at both low and high neutron fluence levels to systematically develop the rules required to describe irradiation creep under general multiaxial stress conditions. The initial high fluence results obtained from these new techniques are showing that the limited low neutron fluence, low temperature irradiation creep results available until now did not provide an adequate basis for development of equations which describe irradiation creep for the conditions existing in new experimental or commercial LMFBR systems. These new results are showing significantly more irradiation creep than predicted by extrapolation of the previously available low fluence and low temperature data.

- 4888 INTERNATIONAL CONFERENCE ON IRRADIATION EFFECTS IN STRUCTURAL MATERIALS FOR BREEDER REACTORS. Anderko, K.; Ehrlich, K. (Kernforschungszentrum Karlsruhe (Germany, F.R.). Inst. fuer Material- und Festkoerperforschung). KfK Nachr.; 9: No. 2, 60-61(1977). (In German).

From International conference on radiation effects in breeder reactor structural materials; Scottsdale, Ariz., USA (19 - 23 Jun 1977).

A short survey is given of the Scottsdale, USA (1977) conference on irradiation effects in

structural materials for breeder reactors. The following topics are dealt with in more detail: Mechanical properties; in-pile creep, swelling and microstructure, model calculations. It is generally assumed that apart from the basic composition of the metallic materials (Fe, Cr, Ni), small amounts of additives are also of great importance. In most national programmes, this results in a modification of reference materials, investigations of commercial materials with altered composition, and a development of new materials.

- 4889 PREDICTION OF PRIMARY CIRCUIT CONTAMINATION IN POWER REACTORS. Beslu, P.; Pepin, P. (CEA Centre d'Etudes Nucleaires de Saclay, 91 - Gif-sur-Yvette (France)); Costa, L.; Frejaville, G. (CEA Centre d'Etudes Nucleaires de Cadarache, 13 - Saint-Paul-les-Durance (France)). Atomkernenergie; 30: No. 4, 297-302(1977).

From 5. international reactor shielding conference; Knoxville, Tenn. (18 - 22 Apr 1977).

Knowledge of the amount and distribution of activity in the coolant circuit of a power reactor is of great practical importance for determining shielding and for predicting operating personnel radiation exposure. The present status of mathematical models to predict the contamination level in power reactor coolant circuits (High temperature, Fast breeder and Pressurised Water Reactors) are presented in this paper. Some applications are also given.

- 4890 BN-350 REACTOR SHIELDING STUDIES. Bakumenko, O.D.; Zvonarev, A.V.; Kulakovskiy, M.J.; Koleganov, J.F.; Pomerantsev, G.V.; Sergeev, V.A.; Tverdokvsky, N.D.; Savitsky, V.I.; Tsurukin, J.P.; Usanov, V.I. Atomkernenergie; 30: No. 4, 305-307(1977).

From 5. international reactor shielding conference; Knoxville, Tenn. (18 - 22 Apr 1977).

This paper presents the result from experimental and calculational studies carried out at the BN-350 reactor start-up with the aim of determining the efficiency of intra-vessel and biological shielding of the reactor: distributions of reaction rates for various indicators in the upper reactor shield, specific activity values for reactor coolant and gas system, radiation situation within primary circuit cells and in the rooms adjacent to the reactor. The experimental data obtained are compared with the calculated ones.

- 4891 IRRADIATION EFFECTS AND DESIGN OF LMFBR PERMANENT REACTOR STRUCTURES. Blackburn, L.D.; Knecht, R.L. (Westinghouse Hanford Co., Richland, Wash. (USA)). Atomkernenergie; 30: No. 4, 278-281(1977).

From 5. international reactor shielding conference; Knoxville, Tenn. (18 - 22 Apr 1977).

Current approaches to the design of permanent reactor structures for LMFBRs emphasize the restriction of neutron radiation exposure to levels which do not grossly alter the mechanical behavior of the materials of construction. Conventional quantitative design procedures can then be employed to limit calculated stresses to acceptable values. The decrease in material ductility with irradiation has generally been used as a criterion for limiting neutron exposure, and experimental results are examined in the light of establishing such limits. When radiation exposure must exceed the established limits, the properties of irradiated material must be

used to modify design allowable stress intensity values and creep-fatigue interaction. Fracture mechanics analyses are also a potentially important feature of the design procedure in this regime. Irradiation-induced swelling and creep effects also should be accounted for in the design. Several examples of relevant property changes are reviewed.

- 4892 RADIATION PROTECTION/SHIELD DESIGN. A NEED FOR A SYSTEMS APPROACH. Disney, R.K. (Westinghouse Electric Corp., Madison, Pa. (USA)). Atomkernenergie; 30: No. 4, 256-260(1977).

From 5. international reactor shielding conference; Knoxville, Tenn. (18 - 22 Apr 1977).

Radiation protection/shielding design of a nuclear facility requires a coordinated effort of many engineering disciplines to meet the requirements imposed by regulations. In the following discussion, the system approach to Clinch River Breeder Reactor Plant (CRBRP) radiation protection will be described, and the program developed to implement this approach will be defined. In addition, the principal shielding design problems of LMFBR nuclear reactor systems will be discussed in relation to LWR nuclear reactor system shielding designs. The methodology used to analyze these problems in the U.S. LMFBR program, the resultant design solutions, and the experimental verification of these designs and/or methods will be discussed.

- 4893 PREDICTION OF PRIMARY CIRCUIT CONTAMINATION IN POWER REACTORS. Beslu, P. (CEA/CEN de Saclay, France); Costa, L.; Frejaville, G.; Pepin, P. pp 374-391 of Reactor shielding. Roussin, R.W.; Abbott, L.S.; Bartine, D.E. (eds.). Princeton, NJ: Science Press (1977).

From 5. international conference on reactor shielding; Knoxville, TN, USA (18 Apr 1977). See CONF-770401--.

- 4895 BN-350 REACTOR: DEVELOPMENT, DESIGN AND OPERATING EXPERIENCE. Troyanov, M.F.

(Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Obninsk. Fiziko-Ehnergeticheskij Inst.). pp 775-787 of Nuclear power and its fuel cycle. Vol. I. Vienna; IAEA (1977). (In Russian)

From International conference on nuclear power and its fuel cycles; Salzburg, Austria (2 May 1977).

The author analyses the experience gained with the BR-1, BR-2, BR-5 and BOR-60 reactors, which has served as the basis for the development of the BN-350 reactor with a thermal power of 1,000MW and operating on ^{235}U . The most important design solutions for this reactor are discussed, together with the problems that arose during commissioning. Operating experience since then is described.

- 4896 STUDY OF APPLICABILITY OF AN ALBEDO MONTE CARLO METHOD FOR NEUTRON STREAMING CALCULATION. Kawai, M. (Nippon Atomic Industry Group Co., Ltd., Kawasaki, Japan); Yamauchi, M.; Kadotani, H.; Suzuki, I. pp 636-644 of Reactor shielding. Roussin, R.W.; Abbott, L.S.; Bartine, D.E. (eds.). Princeton, NJ; Science Press (1977).

From 5. international conference on reactor shielding; Knoxville, TN, USA (18 Apr 1977).

See CONF-770401--.

The applicability of albedo Monte Carlo (AMC) method for the calculation of neutrons streaming through cavities and ducts in LMFBR shielding materials was studied. In the present AMC calculation, MORSE-CG code was modified to include the energy-angle dependent differential albedo data, which were generated by ad hoc versions of ANISN code and SLDN code (invariant imbedding method). SLDN code can calculate exactly the albedo data for semi-infinite slab about 100 times as fast as ANISN code. As sample problems, neutron streaming through a sodium straight pipe and a sodium stepped annular pipe penetrating the shielding materials were chosen because the models can be solved exactly by a two-dimensional S_n transport code. It was found that the total neutron fluxes obtained by the AMC calculation agree with those by S_{16} calculation within a statistical error of AMC calculation and that the fast neutron spectrum was affected by the albedo boundary position. As an application, a problem of neutrons streaming through a large void surrounded by concrete was calculated.

- 4897 DEVELOPMENT OF A COMPUTER CODE FOR NEUTRON STREAMING CALCULATION IN LMFBR. Nishimura, T.; Kinjo, H. (Mitsubishi Atomic Power Industries, Inc., Ohmiya, Saitama, Japan). pp 680-687 of Reactor shielding. Roussin, R.W.; Abbott, L.S.; Bartine, D.E. (eds.). Princeton, NJ; Science Press (1977).

From 5. international conference on reactor shielding; Knoxville, TN, USA (18 Apr 1977).

See CONF-770401--.

A practical computer code MADONNA has been developed for neutron streaming calculations in LMFBR shielding with various shapes of void. The code is based upon a modified removal diffusion method coupled with an albedo-transport equation. To facilitate the solution of the albedo-transport equation, the kernel-albedo and the line-of-sight techniques are incorporated. The comparison has been made between this code and a more rigorous discrete ordinates code in a typical reactor shield. The result is quite satisfactory.

- 4898 RESULTS OF NEUTRON PROPAGATION IN STEEL SODIUM MIXTURES WITH VARIOUS SOURCE SPECTRA ON HARMONIE AND TAPIRO. Calamand, D. (CEA, Cadarache, France); Desprets, A.; Rancurel, H.

pp 795-803 of Reactor shielding. Roussin, R.W.; Abbott, L.S.; Bartine, D.E. (eds.). Princeton, NJ; Science Press (1977).

From 5. international conference on reactor shielding; Knoxville, TN, USA (18 Apr 1977).

See CONF-770401--.

The first results of a joint CEA/CNEN neutron propagation program conducted on the source reactors HARMONIE and TAPIRO are presented. In both cases, a buffer zone representative of the blanket of a commercial fast power reactor is interposed between the source reactor and the medium in which neutron propagation is measured. This buffer zone provides a realistic source spectrum to be propagated. Experimental results are compared to older results obtained without the buffer zone. The effect of the source spectrum on neutron propagation is discussed, as well as the coherence of the results obtained with the two installations.

- 4899 INTEGRAL DATA FOR THE PREDICTION OF NEUTRON PROPAGATION IN IRON-SODIUM MIXTURES. Estiot, J.C. (CEA, Cadarache, France); Trapp, J.P.; Palmiotti, G.; Salvatores, M. pp 804-811 of Reactor shielding. Roussin, R.W.; Abbott, L.S.; Bartine, D.E. (eds.). Princeton, NJ; Science Press (1977).

From 5. international conference on reactor shielding; Knoxville, TN, USA (18 Apr 1977).

See CONF-770401--.

This paper presents results of the first stage in the adjustment procedure used to improve the performances of the neutron propagation calculational scheme PROPANE, in a joint effort between CEA and CNEN. For this purpose, integral data for neutron propagation in pure iron and in iron-sodium mixtures are used. The calculational hypothesis and the adjustment procedure are discussed. The performances of this new version of PROPANE are compared to those of the non adjusted one.

- 4900 UK FAST REACTOR SHIELD DESIGN AND PERFORMANCE. Butler, J. (United Kingdom Atomic Energy Authority, Winfrith, Eng.); Brindley, K. pp 819-832 of Reactor shielding. Roussin, R.W.; Abbott, L.S.; Bartine, D.E. (eds.). Princeton, NJ; Science Press (1977).

From 5. international conference on reactor shielding; Knoxville, TN, USA (18 Apr 1977).

See CONF-770401--.

The development of new methods and data-sets for the shield design of CFR1 is described. The calculational routes are being validated using measurements made in mock-ups of large cores on ZEBRA, penetration benchmarks in the ASPIS bulk shield facility, and special thimbles irradiated in the PFR.

- 4901 TWO-DIMENSIONAL SHIELDING BENCHMARKS FOR SODIUM AND IRON AT YAYOI. Oka, Y. (Tokyo Univ.); An, S.; Kasai, S.; Sakata, S.; Miyasaka, S.; Koyama, K.; Hyodo, T. pp 833-840 of Reactor shielding. Roussin, R.W.; Abbott, L.S.; Bartine, D.E. (eds.). Princeton, NJ; Science Press (1977).

From 5. international conference on reactor shielding; Knoxville, TN, USA (18 Apr 1977).

See CONF-770401--.

Two dimensional distributions of neutron flux and gamma ray dose were measured at the fast neutron source reactor 'YAYOI' for two types of shields. One is a 1.8m thick, 1m square sodium shield and the other is a 70m thick, 1m square iron shield. The measurements were performed with threshold detectors, sandwich resonance foils and gold foils for neutrons and thermoluminescence detectors for gamma rays. The results were compared with

calculations by ANISN and TWOTRAN-II. C/E values are not satisfactory on the centerline of the shield. As for the shapes of the distribution of reaction rates in the shields, however, good agreements are obtained between the experiments and the calculations by TWOTRAN.

4902 IRRADIATION PROGRAMME KNK II.

Biermann, W.; Dietz, W.; Duenner, P.; Reichel, H.; Hess, B. (Internationale Atomreaktorbau G.m.b.H. (INTERATOM), Bergisch Gladbach (Germany, F.R.)). KFK Nachr.; 9: No. 3, . 64-65(1977). (In German).

The KNK II facility is the first German reactor with a fast core which can be used as a test reactor. The test zone of this reactor consists of plutonium elements of a Mark-Ia-like geometry. Thus a sufficient number of fuel elements with SNR-like geometry and design can be irradiated under SNR-typical operational conditions and investigated with regard to their burn-up. The article presents a survey of the irradiation programme.

4903 FUEL MOTION IN LOSS-OF-FLOW ACCIDENTS.

Lal, D. Atlanta; Georgia Inst. of Tech. (1977). 266p. University Microfilms Order No. 78-02,946.

Thesis (Ph. D.).

Fuel motion is studied in both one [axial] and two [radial and axial] dimensions in the pre-disassembly stage of a loss-of-flow accident in a liquid metal fast breeder reactor. The analysis is based on a model channel, consisting of an isolated single fuel pin with cladding and associated subassembly containment structure. A mathematical model is set up to describe the motion of the seven materials of interest: liquid fuel, liquid steel, solid fuel, solid steel, vapor fuel, vapor steel and gaseous fission products. The multi-field approach is used, avoiding the usual lumping of multiple fluids into a single fluid with average properties. The materials are treated as distinct fields, each with its own equations of density, momentum and energy transport. The various fields are linked together via binary exchange functions for mass, momentum and energy transfer. These exchange functions can be manipulated to give any desired degree of linkage between two fields. The cylindrical region is zoned into a mesh of fixed cells, and the differential equations are approximated by finite difference representations in these cells. The implicitly formulated difference expressions for density and momentum transport are solved iteratively for the density, velocity and pressure distributions. The explicit formulation for energy transport then permits calculation of the internal energy corresponding to these distributions. This numerical scheme has been programmed into the PLOFA computer code, designed for the efficient solution of multi-field confined flow problems. Results for a loss-of-flow accident are presented for single and multi-dimensional calculations. It is observed that an axial analysis is insufficient to predict the phenomena occurring in the initiation phase. The addition of a radial dimension is found to be vitally necessary for realistic accident modeling.

4904 PROGRAMME AND STATUS OF THE DEVELOPMENT OF THE FAST BREEDER REACTOR SYSTEM IN FRANCE.

Vendryes, G. (CEA, 75 - Paris (France)); Besse, G. (Compagnie Generale des Matieres Nucleaires (COGENA), La Bourssidiere, Le Plessis-Robinson, France); Rozenholtz, M. (Novatome, Le Plessis-Robinson, France); Saifcevsy, B. (Societe

Centrale Nucleaire Europeenne a Neutrons Rapides (NERSA), 69 - Lyon (France)). pp 371-390 of Nuclear power and its fuel cycle. Vol. I. Vienna; IAEA (1977). (In French)

From International conference on nuclear power and its fuel cycles; Salzburg, Austria (2 May 1977).

The fundamental justification for fast breeder reactors is based on their breeding ability, and the development of this reactor line is a matter of national importance because there is no reasonable and adequate alternative that could both cover the increasing future energy requirements and provide energy independence for France. The 250MW(e) Phenix power plant has been satisfactorily operated as a demonstration plant for two years now. This proof of the validity of the system was necessary. It underlined its reliability and confirmed the value of the process to the constructors and to the domestic utility, EDF, who confidently decided on industrial and commercial commitment to the new reactor line. This attitude is demonstrated in the following actions in France: (a) the construction by Nersa of the Super-Phenix power plant, a 1200MW(e) prototype commercial power plant which will provide experience in building and operating large fast-neutron power plants; (b) the firm intention of EDF to proceed and bring breeders into operation in the 1990s, representing about 8000MW(e); (c) the creation of a strong industrial organization: the creation in France of the Novatome Company corresponds to this objective - Novatome is now responsible for the industrial development of fast breeder reactors with Creusot-Loire as industrial basis and with all the know-how owned by CEA; (d) the Compagnie generale des matieres nucleaires, Cogema, a CEA subsidiary, is reviewing the actions necessary to reach industrial levels for the cost of the whole fuel cycle. On the other hand, the negotiation of international agreements adds the knowledge and experience gained in the R and D programmes of the various countries concerned. They improve the value and the technical, industrial and commercial basis of this new type of reactor, thus enlarging the prospects of development and commercialization.

4905 BIRTH OF THE BREEDER. Hinton, C. (Electricity Supply Research Council, London (UK)). pp 8-13 of Breeder reactor. Forrest, J.S. (ed.). Edinburgh; Scottish Academic Press (1977).

From Meeting on the breeder reactor; Strathclyde, UK (25 Mar 1977).

The background to the development of the British fast reactor programme is summarized. The problem of design proved to be even more difficult than had been expected and only a small team could be allocated to the work. A zero energy facility was built at Harwell and the small team of engineers at Risley started design of a 60 MW (thermal) experimental reactor. The reactor was commissioned in 1959; it was designed to give experience of control of fast reactors, to give experience of the use of liquid metals as coolants and to provide a facility for the development of fuel elements suitable for industrial fast reactors. It was more than successful in all of these things.

4906 AZIMUTHAL NON-UNIFORMITIES OF TEMPERATURE OF FUEL ELEMENTS ARRANGED IN REGULAR LATTICES FOR TURBULENT LIQUID METAL FLOW. Ushakov, P.A.; Zhukov, A.V.; Matyukhin, N.M. (Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Obninsk. Fiziko-Ehnergeticheskiy Inst.). Teplofiz. Vys. Temp.; 15: No. 1, 76-83(1977). (In Russian).

Three methods for semiempirical solution of the problem on nonuniformity of the temperature of fuel elements in regular lattices are considered. An analytical solution based on the hypothesis of analogy of the local heat transfer coefficients with those in equivalent parallel-sided slits is obtained. Another solution is also obtained, with the use of the universal temperature profile in a round pipe. It is believed that the solution in which a temperature profile for a "rod" flow is used for estimating azimuthal, heat flux in the coolant is the principal one. On the basis of an analysis of calculated and experimental data, a simple approximation formula for calculating nonuniformities in fuel element temperature is recommended.

- 4907 VALVES FOR THE SODIUM-COOLED FAST BREEDER KKW KALKAR (SNR 300). Wueliner, G.; Helbig, D. Three R Int.; 16: No. 8, 464-469(1977). (In German).

Valves for controlling the flow of liquid sodium are located in exposed positions. Exacting demands are imposed on the tightness of the pressure vessel and the proper functioning of all components in long-term operation. Valve design was re-examined by stress analysis using finite elements in order to determine what stresses the valves are subjected to as a result of temperature shocks. The bellows valves demonstrated their ability to function properly in prolonged tests under actual service conditions.

- 4908 (EURFNR--1435) FAST BREEDER PROJECT. QUARTERLY REPORT, 1977. Hueper, R. (comp.). (Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.)). 1977. Translation by T.J. Clark of KFK--1277/1 176p. Dep. NTIS, PC A09/MF A01.

Work performed within the framework of the Fast Breeder Project at Kernforschungszentrum Karlsruhe during the first quarter of 1977 is described. The work included fuel rod development, materials studies, physics, safety, and sodium technology.

- 4909 DESIGN OF FFTF SHIELDS. Bunch, W.L. (Hanford Engineering Development Lab., Richland, WA). pp 35-43 of Reactor shielding. Roussin, R.W.; Abbott, L.S.; Bartine, D.E. (eds.). Princeton, NJ: Science Press (1977). From 5. international conference on reactor shielding; Knoxville, TN, USA (18 Apr 1977). See CONF-770401--.

The Fast Flux Test Facility (FFTF) is to become the primary test facility in the United States for the development of liquid-metal-cooled, fast breeder reactors. Design philosophy for the facility was to place equipment in shielded cells to maximize the potential for maintenance. Dose rate criteria for each cell were coupled with design-basis radiation source strengths and equipment layouts to establish shielding requirements for each wall throughout the facility. High density concretes were employed to meet physical constraints established by the containment building. Point kernel calculations were made and documented for each wall and floor. Shield acceptance tests are planned to establish dose rates and radiation source strengths for comparison to design calculations.

- 4910 APPLICATION OF ULTRASONIC THERMOMETRY IN LMFBR SAFETY RESEARCH. Carlson, G.A.; Sullivan, W.H.; Plein, H.G. (Sandia Lab, Albuquerque, NM). Ultrason. Symp. Proc.; No. 77CH1264-1, 24-28(1977).

Ultrasonic thermometry has many potential applications in reactor safety research, where extremely high temperatures and lack of visual access may preclude the use of conventional diagnostics. An application (the in-core molten thermometers were used to measure temperatures in UO₂ to incipient melt (2860 C). Each thermometer included five sensor elements 10 mm long, providing five temperatures within the UO₂ at various axial locations. The 10 mm spatial resolution is about five times better than previous applications of the technique. Temperature resolution of $\pm 10^\circ\text{C}$ was indicated by calibration data. Besides providing temperature data approximately 1000°C higher than were obtained with thermocouples, the thermometer yielded valuable axial temperature profile data. 7 refs.

- 4911 SPATIO ENERGETIC SENSITIVITY OF THE EQUIVALENT THERMAL FLUX ON THE INTERMEDIATE HEAT EXCHANGER OF A TYPICAL FAST BREEDER REACTOR. Bololi, A.; Fiorini, L.; Moreau, J.; Suntinger, G. (CEN, Cadarache, France). pp 132-139 of Reactor shielding. Roussin, R.W.; Abbott, L.S.; Bartine, D.E. (eds.). Princeton, NJ: Science Press (1977).

From National Transportation Safety Board meeting; Washington, DC, USA (24 Jan 1977). See CONF-770104--.

The calculation of the thermal equivalent flux on the intermediate heat exchanger is the main problem of a pool type LMFBR Shielding. The present paper is related to a reactor which lateral shielding consists of a sodium-stainless steel mixture. The following problems are treated: Slowing down of neutrons (studied with "Channel Theory"), Sensitivity of the thermal flux on the heat exchanger to the following parameters: stainless steel and sodium total cross section, Legendre polynomial expansion. Some ways for shielding optimizations can be deduced from calculations performed with ANISN and SWANLAKE: use of moderator, local shielding, stainless steel volumetric percentage variable along the lateral shield. Finally, we give an estimate of thickness increase which results from multigroup cross section uncertainties.

- 4912 IRRADIATION EFFECTS AND DESIGN OF LMFBR PERMANENT REACTOR STRUCTURES. Blackburn, L.D.; Knecht, R.L. (Westinghouse Hanford Co., Richland, WA). pp 230-237 of Reactor shielding. Roussin, R.W.; Abbott, L.S.; Bartine, D.E. (eds.). Princeton, NJ: Science Press (1977).

From National Transportation Safety Board meeting; Washington, DC, USA (24 Jan 1977). See CONF-770104--.

Current approaches to the design of permanent reactor structures for LMFBRs emphasize the restriction of neutron radiation exposure to levels which do not grossly alter the mechanical behavior of the materials of construction. Conventional quantitative design procedures can then be employed to limit calculated stresses to acceptable values. The decrease in material ductility with irradiation has generally been used as a criterion for limiting neutron exposure, and experimental results are examined in the light of establishing such limits. When radiation exposure must exceed the established limits, the properties of irradiated material must be used to modify design allowable stress intensity values and creep-fatigue interaction. Fracture mechanics analyses are also a potentially important feature of the design procedure in this regime. Irradiation-induced swelling and creep effects also should be

accounted for in the design. Several examples of relevant property changes are reviewed.

- 4913 NEUTRON TRANSPORT THROUGH STRAIGHT AND ONCE BENT SODIUM PIPE IN SHIELDING OF FAST REACTOR. Burian, J. (Nuclear Research Inst., Rez, Czechoslovakia); Jansky, B.; Osmera, B.; Otopal, P.; Rataj, J.; Petrov, E.; Trykov, L.; Nikolajev, A.; Semenov, V. pp 246-252 of Reactor shielding. Roussin, R.W.; Abbott, L.S.; Bartine, D.E. (eds.). Princeton, NJ; Science Press (1977).

From National Transportation Safety Board meeting; Washington, DC, USA (24 Jan 1977). See CONF-770104--.

The paper presents measurements and calculations on the neutron attenuation along 40 cm diameter straight and bent sodium pipe. The following types of spectrometers were used in measurements on VVR-S reactor: stilbene scintillator, proportional hydrogen counter, multisphere technique and activation foils. Discrete ordinates and Monte Carlo methods were used to study this type of problem.

- 4914 STUDY OF FAST NEUTRON STREAMING THROUGH THE CORE SUPPORT-PLATE SHIELD OF A LMFR. Suzuki, I. (Power Reactor and Nuclear Fuel Development Corp., Tokyo); Oka, Y.; Wakabayashi, H.; An, S.; Sasaki, K.; Miyasaka, S.; Inoue, T. pp 271-279 of Reactor shielding. Roussin, R.W.; Abbott, L.S.; Bartine, D.E. (eds.). Princeton, NJ; Science Press (1977).

From 5. international conference on reactor shielding; Knoxville, TN, USA (18 Apr 1977). See CONF-770401--.

The paper presents measurements and calculations for the fast neutron streaming through the core support plate shield of a LMFR. Experiment was performed in the vertical column of YAXOI, the fast-neutron source reactor at University of Tokyo. The results are arranged in the form of the attenuation factor of the shields which have three types of coolant holes. Two and three dimensional calculations were carried out. The results are compared with experimental ones.

- 4915 ECONOMETRIC ANALYSIS OF ENERGY OVER THE NEXT 75 YEARS. Schmitt, R.W. (General Electric Co., Schenectady, NY); BenDaniel, D.J.; Stewart, P.J.; Manne, A.S. IEEE Trans. Power Appar. Syst.; PAS-96: No. 4, 1353-1361(1977).

From ASME/ASCE joint power generation conference; Buffalo, NY, USA (19 Sep 1976).

An econometric model with a 75-year time-horizon to determine base-load power generation mix is described. A number of conventional, evolutionary and speculative generation systems are considered, together with constraints imposed by fuel availability and technical development times. Preliminary results are presented.

- 4916 STATUS OF PROTOTYPE LARGE BREEDER REACTOR (PLBR) DESIGNS. Minnick, L.E. (Electric Power Research Inst., Palo Alto, CA). Proc. Am. Power Conf.; 39: 152-155(1977). (CONF-770403--).

From 39. annual meeting of the American Power Conference; Chicago, IL, USA (18 Apr 1977).

The background and current developments relating to the PLBR reactor are reviewed.

- 4917 MIXED FUEL CYCLE HYBRID LMFR CORES: DESIGN AND ANALYSIS. Shenoy, S.K. Gainesville, FL; Univ. of Florida (1977).

206p. University Microfilms Order No. 78-10,984.

Thesis (Ph. D.).

The positive sodium-void reactivity effects in large Liquid Metal Cooled Fast Breeder Reactors (LMFRs) may be reduced substantially if the (Pu- ^{239}U) fuel cycle is replaced by the (^{233}U -Th) fuel cycle in the center portion of the cores. Geometric spoiling methods, e.g., reducing the core height-to-diameter ratio, also achieve the same end. Both methods lead to economic penalties in the form of reduced breeding ratio (B.R.) and increased doubling time (D.T.). In this work the relative merits of the two methods of reducing the positive sodium-void reactivity-effect are compared. The calculations show that for comparable improvements in the sodium-void reactivity effect, the economic penalty for using a central core region of (^{233}U - ^{238}U) fuel is smaller than for using a flattened core.

- 4918 HEAT REJECTION FOR THE CLINCH RIVER BREEDER REACTOR PLANT. Donaldson, A.M. (Burns and Roe, Inc., Los Angeles). Proc. Am. Power Conf.; 39: 702-708(1977). (CONF-770403--).

From 39. annual meeting of the American Power Conference; Chicago, IL, USA (18 Apr 1977).

This paper details the optimization and selection of the following cooling systems: mechanical-draft wet tower, mechanical-draft wet/dry tower, hyperbolic or natural-draft tower, and a spray pond.

- 4919 CHEMICAL AND PHYSICAL CHANGES AT SODIUM-STAINLESS STEEL INTERFACES IN FAST REACTORS. Mathews, C.K. (Bhabha Atomic Research Centre, Bombay (India). Radiochemistry Div.). pp 77-90 of Proceedings of the symposium on chemistry and physics of surface of metals and their oxides. Bombay; Department of Atomic Energy (1977).

From Symposium on chemistry and physics of surface of metals and their oxides; Kalpakkam, Tamil Nadu, India (27 Jan 1976).

In the sodium loops of a fast reactor, mass transfer occurs due to the interaction of flowing sodium on stainless steel surfaces. Under the non-isothermal conditions prevailing in the loop some elements are preferentially leached from the surface layers of the hot zone and transported by sodium to the cooled zone where deposition may take place. The available information on the mass transport in non-isothermal sodium loops has been summarised, and an attempt has been made to understand the mechanisms involved, of which the chemical reactions at the sodium-stainless steel interface are especially important. The rate of diffusion towards the solid/liquid interface may be the rate-determining step in some of these reactions. When a ferritic surface layer is formed by the selective removal of austenitic stabilizing elements, diffusion of alloying constituents through the ferritic layer limits the growth of this layer. Only when the surface film is adherent, the diffusion across this layer becomes important. NaCrO_2 , for instance, has poor adherence, and a surface film of this compound may not inhibit further corrosion.

- 4920 FUTURE HELIUM REQUIREMENTS FOR ENERGY RELATED APPLICATIONS. Hilal, M.A.; Stone, E.L.; Van Sciver, S.W.; McIntosh, G.E.; Boom, R.W. Madison, WI; University of Wisconsin (1977). 119p.

Several high technology energy systems under study and development will require large

quantities of helium when used on a commercial scale. The study estimates the helium need for commercial units of these systems, regardless of feasibility, cost or projected use. This report covers fusion reactors, superconductive energy storage, superconducting transmission lines, magnetohydrodynamic (MHD) units, superconducting motors and generators, accelerators, and fission reactors. All these energy systems, except for fission reactors, utilize superconductivity and low temperature helium. Fission reactors may use helium as a gaseous coolant.

- 4921 Industrie nucleaire francaise. (FRENCH NUCLEAR INDUSTRY). Paris, France; CEA (1977). 96p. (In French).

The position of nuclear energy in the world energy market, the nuclear boiler industry (PWR, breeders, small nuclear plants) and the nuclear fuel cycle industry (U ore processing, transformation of U concentrates into hexafluoride, U enrichment, fuel fabrication, zirconium and its alloys, reprocessing) are reviewed. Numerous graphs and tables are given.

- 4922 DOUNREAY PROJECT. Blumfield, C.W. (UKAEA Reactor Group, Dounreay. Dounreay Experimental Reactor Establishment). pp 21-36 of Breeder reactor. Forrest, J.S. (ed.). Edinburgh; Scottish Academic Press (1977). From Meeting on the breeder reactor; Strathclyde, UK (25 Mar 1977).

The paper briefly refers to the history of the Dounreay Experimental Reactor Establishment and the 18 years of safe operation of the Dounreay experimental liquid-metal-cooled fast reactor (DFR). Reference is also made to the successful commissioning of the 250 MW(e) Prototype Fast Reactor (PFR). This long history of the use of fast reactor technology has shown that although fast reactors are different in concept to thermal reactors they are as easily operated, if not more so. The experience gained from the scientific research into materials suitable for fast reactors has provided a comprehensive library of information for the design of the next phase of fast reactors. Fuel assemblies have been operated at full power with flow restricted to produce coolant boiling conditions. These have shown that the high heat fluxes of fast reactors are adequately tamed by the liquid metal coolant. Experience in commissioning the PFR has enabled the designers of the demonstration Commercial Fast Reactor to progressively deal with important issues. In particular, the boiler design, which was always considered to be difficult technological issue, has evolved to eliminate the small water leaks that have occurred in the PFR boilers. This will be tested in the PFR well in advance of its use in the demonstration Commercial Fast Reactor. Reprocessing of the PFR fuel at Dounreay will commence in about a year's time. This has involved reconstructing a plant which was used for reprocessing of DFR fuel. The decommissioning of the plant to the colloquial green field state allowed the modifications to be carried out expeditiously. The new plant has been designed on the knowledge produced in experiments to determine the most efficient and safe method of separation and waste management.

- 4923 Energie nucleaire et energie electrique. (NUCLEAR ENERGY AND ELECTRIC POWER). Boutin, P.; Boutin, P.; Guinier, G.; Mouney, H.; Vincent, F. Paris, France; Eyrolles (1977). 122p. (In French).

The principal scientific aspects of some technical problems posed by nuclear energy

utilization and its transformation into electric power are discussed. Two types of reactors are envisaged in the framework of the present French programs: pressurized water-enriched uranium reactors, and the sodium cooled, fast neutron breeder reactors. After having introduced the concepts of cross sections and radioactive equilibrium, some important questions are outlined: the concept of reactor criticality, the role of delayed neutrons in reactor control, the enrichment of uranium in the 235 isotope. The scientific bases of radioprotection are given: definition of the absorbed dose and dose equivalent; examples of dose determination during an irradiation, of external origin or due to a radioactive contamination. Some aspects including the economy of nuclear power production have been voluntarily rejected, emphasis being put on the bases allowing a fruitful consultation of a more specialized technical and scientific literature in the field.

- 4924 ENERGY GAP AND THE FAST REACTOR. Hill, J. (UKAEA). pp 14-20 of Breeder reactor. Forrest, J.S. (ed.). Edinburgh; Scottish Academic Press (1977).

From Meeting on the breeder reactor; Strathclyde, UK (25 Mar 1977).

The background to the development of fast reactors is summarized. In Britain, the results of the many experiments performed, the operation of the Dounreay Fast Reactor for the past 18 years and the first year's operation of the larger Prototype Fast Reactor have all been very encouraging, in that they demonstrated that the performance corresponded well with predictions, breeding is possible, and the system is exceptionally stable in operation. The next step in fast reactor engineering is to build a full-scale fast reactor power station. There would seem to be little reason to expect more trouble than could reasonably be expected in constructing any large project of this general nature. However, from an engineering point of view continuity of experience is required. If a decision to build a commercial fast reactor were taken today there would be a 14-year gap between strating this and the start of the Prototype Fast Reactor. This is already much too long. From an environmental standpoint we have to demonstrate that we can manufacture and reprocess fast reactor fuel for a substantial programme in a way that does not lead to pollution of the environment, and that plutonium-containing fuel can be transported in the quantities required in safety and in a way that does not attract terrorists or require a private army to ensure its security. Finally, we have to find a way to allow many countries to obtain the energy they need from fast reactors, without leading to the proliferation of nuclear weapons or weapons capability.

- 4925 INTERNATIONAL SCENE. Simpson, H.C. (Strathclyde Univ., Glasgow (UK)). pp 37-48 of Breeder reactor. Forrest, J.S. (ed.). Edinburgh; Scottish Academic Press (1977). From Meeting on the breeder reactor; Strathclyde, UK (25 Mar 1977).

Six main nations or groups of nations are involved in the large scale development of Liquid Breeder Reactors, (1) the U.K., (2) France, (3) West Germany/Belgium/the Netherlands, (4) the U.S.S.R., (5) Japan and (6) the U.S.A. The prototype development programme of the last five of these groups is outlined. France with its 250 MW(e) Phenix plant has had two years of commercial service and has designed a 1200 MW(e) Super-Phenix

plant. Germany, in collaboration with Belgium and the Netherlands, is building a 300 MW(e) plant S.N.R.-300 which is due to go critical by 1981. The U.S.S.R., in addition to the B.N.-350 combined power and desalination plant now in operation, is now building a 600 MW(e) plant B.N.-600 which is due to go critical by the end of 1977, and Japan has also started work on a 300 MW(e) reactor MONJU due to be completed by 1986. Finally, the U.S.A. in addition to a very large experimental programme, is constructing a 380 MW(e) fast reactor at Clinch River, expected to start up in 1982. This implies roughly 2300 MW of electrical power being produced by breeder reactors in the near future.

- 4926 FUEL RECYCLING. Hunt, S.E. (Aston Univ., Birmingham (UK)). pp 53-63 of Breeder reactor. Forrest, J.S. (ed.). Edinburgh; Scottish Academic Press (1977).

From Meeting on the breeder reactor; Strathclyde, UK (25 Mar 1977).

The global nuclear power programme should be designed not only to produce electricity at the lowest possible cost, but also to make the best use of our fissile fuel reserves in the longer term. This clearly indicates the necessity of using breeder reactors, which with plutonium recycling, can achieve total fuel utilisation figures of 70% to 80% as opposed to the very small percentages available from non-breeders, even with recycling. The plutonium can be separated from spent fuel elements chemically. The United Kingdom is in a favourable situation to initiate a fast breeder reactor programme because it has appreciable supplies of plutonium accumulated from the Magnox programme, but on a global scale there is a danger that a sudden expansion of the nuclear programme based on non-breeder reactors will exhaust the supplies of commercially viable uranium before adequate supplies of plutonium have been built up to provide the cores for a significant fast breeder programme. This situation will be worse if, as seems likely, the thermal programmes are based on reactors which are poor producers of plutonium and themselves require enriched fuel. A more modest global expansion of the thermal nuclear programme to about 600,000 MW(e) by the year 2000 is possible using reasonably economic uranium reserves. If this were based on thermal reactors which were reasonably good producers of plutonium (Candu, Magnox and HTR) the programme could provide plutonium for the cores of 800,000 MW(e) of installed fast breeder capacity by the year 2000. Thereafter, if the doubling time of the electricity demand is shorter than that of the plutonium inventory, either the gas-cooled fast breeder or a combination of thermal 'near breeders' and liquid-metal fast breeders will be required.

- 4927 LIQUID METAL FAST BREEDER REACTOR.

Gibson, A.S. (General Electric Co., Sunnyvale, CA). pp 5.102-5.123 of Energy technology handbook. Considine, D.M. (ed.). New York; McGraw-Hill, Inc. (1977).

Information on LMFBR type reactors is presented concerning sodium characteristics, primary coolant circuit, reactor kinetics, design factors and safety considerations, past and present status of LMFBR reactors, fuel cycle considerations, and economic comparisons with other power sources.

From Winter annual meeting of the American Society of Mechanical Engineers; Atlanta, GA, USA (27 Nov 1977).

Separate abstracts were prepared for the individual papers included.

- 4930 EBR-II WIDE-RANGE REACTIVITY METER. Peterson, B.R.; Larson, H.A. pp 28.1-28.25 of Proceedings of the third power plant dynamics, control, and testing symposium. Kerlin, T.W. (ed.). Knoxville, TN; University of Tennessee (1977).

From 3. power plant dynamics, control and testing symposium; Knoxville, TN, USA (7 Sep 1977).

At the Experimental Breeder Reactor II (EBR-II) a wide range reactivity meter has been designed and is being tested. The meter uses flux sensors and a minicomputer system to provide a two-fold function: determination of system reactivity from inverse kinetics calculations and determination of both short-term and long-term anomalous reactivity. A wide range of reactivity measurement is achieved by using an on-line minicomputer to make the calculations over three overlapping ranges. They are the source or counter range, the intermediate range which makes use of Campbell's theorem, and the power or current range. The calculations made in these ranges are taken from proven systems models.

- 4931 FRENCH PROGRAM ON LMFBR CLADDING MATERIALS DEVELOPMENT. Dupouy, J.M. (Centre d'Etudes Nucleaires, Saclay, France). pp 1-11 of Radiation effects in breeder reactor structural materials. Bleiberg, M.L.; Bennett, J.W. (eds.). New York; American Institute of Mining, Metallurgical, and Petroleum Engineers, Inc. (1977).

From Conference on radiation effects in breeder reactor structural materials; Scottsdale, AZ, USA (19 Jun 1977).

The development of fast breeder reactors is strongly supported in France. The construction of the first reactor of commercial size (1200 MWe) called Super Phenix has been decided and the count-down has already started. As far as metallurgists are concerned, the materials constitutive of the core have already had to be decided upon. The problems at hand to date concern the most correct prediction of burn-up that can be attained and the preparation of the choices for the second core of this reactor and for the first core of the following ones. A brief description is given of research and development on these materials involving various teams in several centers of the CEA, in Cadarache, Grenoble, Marcoule, Fontenay and Saclay.

- 4932 RESEARCH AND DEVELOPMENT PROGRAMME IN THE DEBENE-AREA FOR FAST BREEDER MATERIAL DEVELOPMENT. Dietz, W. (INTERATOM, Bergisch Gladbach, Ger.); Ehrlich, K.; Huet, J.J. pp

13-25 of Radiation effects in breeder reactor structural materials. Bleiberg, M.L.; Bennett, J.W. (eds.). New York; American Institute of Mining, Metallurgical, and Petroleum Engineers, Inc. (1977).

From Conference on radiation effects in breeder reactor structural materials; Scottsdale, AZ, USA (19 Jun 1977).

Since 1964 a joint programme for the development of cladding and core structural materials for Fast Breeder Reactors (FBR) has been underway at the Research Centres in Belgium, Germany and Netherlands and with their industrial partners. Different organizations have contributed to this development in the DEBENE-area [Deutschland (FRG), Belgium, Netherlands], namely the Research Centres: Kernforschungszentrum Karlsruhe and CEN-SCK, Mol, and the industrial partners and Belgonucleaire, Brussel, and Interatom, Bensberg. At the starting point of this development several concepts for FBR's existed, steam cooled, gas cooled, and liquid sodium cooled versions. This was the reason for a relatively broad testing and development programme which took into account the following: (1) commercial austenitic stainless steels with high mechanical strength, (2) commercial nickel-based alloys especially for the purpose of steam cooled FBR's, (3) the development of a series of vanadium-based alloys, and (4) the introduction of dispersion-strengthened ferritic alloys.

4933 UKAEA FAST REACTOR PROJECT RESEARCH AND DEVELOPMENT PROGRAMME ON FUEL ELEMENT CLADDING AND SUB-ASSEMBLY WRAPPER MATERIALS. Harries, D.R. (Atomic Energy Research Establishment, Harwell, Eng.). pp 27-40 of Radiation effects in breeder reactor structural materials. Bleiberg, M.L.; Bennett, J.W. (eds.). New York; American Institute of Mining, Metallurgical, and Petroleum Engineers, Inc. (1977).

From Conference on radiation effects in breeder reactor structural materials; Scottsdale, AZ, USA (19 Jun 1977).

Research and development work on fuel element component (cladding, subassembly wrappers, etc.) materials for the U.K. sodium cooled fast reactor programme has been conducted at the United Kingdom Atomic Energy Authority (UKAEA) establishments at Dounreay, Harwell, Risley, and Springfields during the past fifteen years or so. This work has formed an integral part of, and has been co-ordinated by, the UKAEA Fast Reactor Project and has involved close liaison with the Nuclear Power Company (NPC) and the Central Electricity Generating Board (CEGB). The research and development were initially related to the Prototype Fast Reactor (PFR) but the scope has now been extended to cover the first Civil Fast Reactor (CFR1), which has recently been re-designated the Civil Demonstration Fast Reactor (CDFR). The paper outlines the present status of the development of sodium cooled fast reactors in the U.K. and proceeds to summarize the principal PFR and CDFR core and fuel element parameters which have determined the planning and direction of the fuel element materials programme. The current position on the fuel element cladding and wrapper research and development programme is reviewed, and the facilities and future irradiation programme to be carried out in PFR are described.

4934 EFFECTS OF FAST REACTOR EXPOSURE ON THE MECHANICAL PROPERTIES OF STAINLESS STEELS. Holmes, J.J.; Straalsund, J.L. (Hanford Engineering Development Lab., Richland, WA). pp 53-63 of Radiation effects in breeder

reactor structural materials. Bleiberg, M.L.; Bennett, J.W. (eds.). New York; American Institute of Mining, Metallurgical, and Petroleum Engineers, Inc. (1977).

From Conference on radiation effects in breeder reactor structural materials; Scottsdale, AZ, USA (19 Jun 1977).

The purpose of the paper is to review the progress made during the last 10 years in understanding the effects of fast reactor exposure on the post-irradiation tensile and creep properties of austenitic stainless steels. The paper emphasizes flow strength levels, stress-to-rupture, and deformation rate of 304 and 316 stainless steels. It is recognized that considerable work has been completed and is in progress on stabilized steels and advanced alloys, but because of the complexity of these systems, it is difficult to arrive at a universally applicable rationalization of response to irradiation. The emphasis on 304 and 316 stainless steels will concentrate on research conducted within the U.S. and U.K.

4935 MECHANICAL PROPERTIES OF IRRADIATED AUSTENITIC STAINLESS STEEL 1.4970. Anderko, K. (Kernforschungszentrum, Karlsruhe, Ger.); Schaefer, L.; Wassilew, C.; Ehrlich, L.; Bergmann, H.J. pp 65-82 of Radiation effects in breeder reactor structural materials. Bleiberg, M.L.; Bennett, J.W. (eds.). New York; American Institute of Mining, Metallurgical, and Petroleum Engineers, Inc. (1977).

From Conference on radiation effects in breeder reactor structural materials; Scottsdale, AZ, USA (19 Jun 1977).

The paper summarizes the results of post-irradiation tensile and creep tests and of some in-pile stress rupture tests on the stabilized austenitic stainless steel X10NiCrMoTiB 1515 (1.4970). Irradiations were carried out in three reactors: BR2 at Mol (Belgium) up to 1.03×10^{22} n/cm², Rapsodie at Cadarache (France) up to 6.2×10^{22} n/cm² and Dounreay Fast Reactor (Great Britain) up to 7.3×10^{22} n/cm² (all E > 0.1 MeV). Irradiation temperatures were within the range 400 to 720°C. Results for 1.4970 in the reference state: solution annealed + cold worked + aged at 800°C were compared with US data on 20% cold-worked type AISI 316 stainless steel. In addition, the influence of a modified thermal-mechanical treatment on the creep properties of 1.4970 has been investigated. The steel 1.4970 exhibits high yield and creep strengths at testing temperatures above about 600°C due to its high resistance to thermal and irradiation-induced recovery. The biaxial equivalent creep rupture ductility shows a minimum above 0.2%. Furthermore, the influence of the neutron spectrum on the tensile and on the creep rupture ductility of 1.4970 has been studied. TEM investigations were carried out on DFR-irradiated specimens before and after creep testing at 600°C. They showed fast resolution of loops and an annealing of voids accelerated by creep stresses.

4936 POST IRRADIATION MECHANICAL PROPERTIES OF ANNEALED AND COLD WORKED 316 STAINLESS STEEL AFTER IRRADIATION TO HIGH FAST NEUTRON FLUENCES. Dupouy, J.M. (Centre d'Etudes Nucleaires, Saclay, France); Erler, J.; Huillery, R. pp 83-93 of Radiation effects in breeder reactor structural materials. Bleiberg, M.L.; Bennett, J.W. (eds.). New York; American Institute of Mining, Metallurgical, and Petroleum Engineers, Inc. (1977).

From Conference on radiation effects in breeder reactor structural materials;

Scottsdale, AZ, USA (19 Jun 1977).

The mechanical properties of the steels used in fast reactor cores are strongly affected by irradiation. The report gives an account of the latest measurements and reports on changes in the properties of the materials irradiated in Phenix.

- 4937 EFFECTS OF IRRADIATION ON THE FRACTURE BEHAVIOR OF AUSTENITIC STAINLESS STEELS. Grossbeck, M.L. (Oak Ridge National Lab., TN); Stiegler, J.O.; Holmes, J.J. pp 95-116 of Radiation effects in breeder reactor structural materials. Bleiberg, M.L.; Bennett, J.W. (eds.). New York; American Institute of Mining, Metallurgical, and Petroleum Engineers, Inc. (1977).

From Conference on radiation effects in breeder reactor structural materials; Scottsdale, AZ, USA (19 Jun 1977).

Fracture in irradiated materials occurs by mechanisms which occur in unirradiated materials in addition to mechanisms related to irradiation phenomena. The paper examines radiation effects in austenitic stainless steels for use as core structural materials in fast breeder reactors.

- 4938 EFFECTS OF IRRADIATION ON FATIGUE AND CRACK PROPAGATION IN AUSTENITIC STAINLESS STEELS. Michel, D.J. (Naval Research Lab., Washington, DC); Korth, G.E. pp 117-137 of Radiation effects in breeder reactor structural materials. Bleiberg, M.L.; Bennett, J.W. (eds.). New York; American Institute of Mining, Metallurgical, and Petroleum Engineers, Inc. (1977).

From Conference on radiation effects in breeder reactor structural materials; Scottsdale, AZ, USA (19 Jun 1977).

The effects of fast neutron irradiation on low cycle fatigue and fatigue crack propagation in austenitic stainless steels are reviewed. The dependence of fatigue performance on irradiation temperature, neutron fluence, strain range and rate, hold time, and material thermomechanical history is discussed. The effects of neutron irradiation on subcritical crack propagation are reviewed with respect to the influence of irradiation and test temperatures, neutron fluence, hold time effects, and thermomechanical history. Predictive methods for estimating low cycle fatigue and crack propagation performance are discussed.

- 4939 POST-IRRADIATION MECHANICAL PROPERTIES OF AISI TYPE 316 STEEL AND NIMONIC PE16 ALLOY. Barnaby, J. (Dounreay Nuclear Power Development Establishment, Scotland); Barton, P.J.; Boothby, R.M.; Fraser, A.S.; Slattery, G.F. pp 159-175 of Radiation effects in breeder reactor structural materials. From Conference on radiation effects in breeder reactor structural materials; Scottsdale, AZ, USA (19 Jun 1977).

Austenitic stainless steel is a candidate material for the fuel cladding and other core components in the fast breeder reactor. For reactor design and safety analysis it is necessary to define the effects of neutron irradiation on the high temperature mechanical properties of the alloys. It is well established that fast reactor irradiation greatly reduces ductility of austenitic stainless steels. Ductility loss increases monotonically with neutron fluences in both tensile and creep-rupture test. Embrittlement of stainless steel irradiated at below 550°C is due to plastic instability while for the specimen irradiated at above 650°C embrittlement is due to helium produced by transmutation of constituents. The loss of ductility caused in the intermediate temperature range is believed due to both mechanisms. The paper presents the results of a study on mechanical properties of Type 316 stainless steel tube which was irradiated in the Dounreay Fast Reactor at temperature between 250 and 500°C and to fast neutron fluence of 2.0 to 7.8 x 10²² n/cm² (E > 0.1 MeV). The effects of helium injection on the creep rupture properties of Type 316 stainless steel with minor constitution variations as well as the effects of titanium modification on the tensile properties of irradiated Fe - 17Cr - 13Ni base alloys are also presented.

- 4941 IRRADIATION CREEP IN BREEDER REACTOR STRUCTURAL MATERIALS. Straalsund, J.L. (Hanford Engineering Development Lab., Richland, WA). pp 191-207 of Radiation effects in breeder reactor structural materials. Bleiberg, M.L.; Bennett, J.W. (eds.). New York; American Institute of Mining, Metallurgical, and Petroleum Engineers, Inc. (1977).

From Conference on radiation effects in breeder reactor structural materials; Scottsdale, AZ, USA (19 Jun 1977).

Irradiation enhanced creep was first observed in uranium by Roberts and Cottrell in 1955. The observed creep was explained on the basis of the internal stresses developed by the neighboring crystals undergoing anisotropic growth, a mechanism that was expected to operate only in an anisotropic material. Nevertheless, irradiation enhanced tensile stress relaxation in Type 304 stainless steel was observed in 1959 and verified by torsion stress relaxation measurements in 1962. It was not evident, however, whether the creep was a transient or continuing phenomenon until experiments were performed by Lewthwaite et al. in 1967 on several materials in Dounreay Materials Test Reactor. These experiments, which were performed by monitoring the length changes induced in dead weight loaded springs during irradiation, demonstrated the existence of a non-saturating irradiation creep phenomenon for a variety of nominally isotropic materials, including nickel, Nimonic 80-A, and Nimonic PE-16. However, possibly because of the low dose and irradiation temperature, the creep rate of Type 316 stainless steel appeared to

saturate after an initial transient. Experiments of a similar nature were performed by Mosedale and his associates in the Dounreay Fast Reactor in 1969 and continuing creep rates for all of the materials, including Type 316 stainless steel, were observed in this experiment. Thus, the phenomenon of irradiation creep for conditions relevant to fast reactor applications was first reported about two years after the void formation phenomenon was reported by Cawthorne and Fulton in 1967. In contrast to swelling, irradiation creep was considered to have little impact on breeder reactor core performance because of the relatively small creep rates which were observed.

A technique has been successfully developed for measuring the irradiation creep of metals under tensile stress during 4 MeV proton bombardment. The irradiation creep characteristics of both solution treated and cold-worked AISI Type 321 austenitic steel, as a function of temperature in the range 400° to 600°C and stresses up to 150 MPa at a damage rate of approximately 10^{-6} dpa s⁻¹ and doses up to 0.6 dpa, are described. In addition, specimens have been bombarded with protons under stress at a damage rate of approximately 2×10^{-5} dpa s⁻¹ to approximately 10 dpa in a second apparatus and the irradiation creep rates subsequently measured at the normal 10^{-6} dpa s⁻¹ damage rate, thereby enabling the irradiation creep behavior to be studied in voided material. The data are compared with results obtained by the other workers and related to the existing theoretical models of irradiation creep.

(Centre d'Etudes Nucleaires, Saclay, France); Lehmann, J.; Cartier, L.; Huillery, R.; Millet, P. pp 229-240 of Radiation effects in breeder reactor structural materials. Bleiberg, M.L.; Bennett, J.W. (eds.). New York; American Institute of Mining, Metallurgical, and Petroleum Engineers, Inc. (1977).

From Conference on radiation effects in breeder reactor structural materials; Scottsdale, AZ, USA (19 Jun 1977).

Irradiation creep is one of the major consequences of the presence of the high fast neutron fluxes. Its magnitude must be known with accuracy in order to calculate the behavior of the pins, of the wrapper tubes and of the entire core. The most desirable measurement of irradiation creep is naturally the direct, continuous in-pile recording of the deformation of a specimen submitted to a constant stress. This is what is achieved with the in-pile creep measuring device which has been designed, constructed and operated in Rapsodie. The latest measurements are presented and compared with the previous ones and with the published values from other countries.

OF COLD-WORKED W.-NR. 1.4981 IRRADIATED IN THE RAPSODIE REACTOR. Bergmann, H.J. (Internationale Atomreaktorbau GmbH, Bergisch Gladbach, Ger.); Haas, D.; Herschbach, K. pp 241-251 of Radiation effects in breeder reactor structural materials. Bleiberg, M.L.; Bennett, J.W. (eds.). New York; American Institute of Mining, Metallurgical, and Petroleum Engineers, Inc. (1977).

From Conference on radiation effects in breeder reactor structural materials; Scottsdale, AZ, USA (19 Jun 1977).

Biaxially loaded capsules manufactured out of two different heats of W.-Nr. 1.4981, 14% cold-worked, have been irradiated in the French reactor RAPSODIE up to a maximum neutron dose of 50 dpa/sub NRT/ at temperatures ranging from 400 to 505°C. Results of dimensional measurements are reported and discussed with the objective of getting information concerning irradiation induced creep and swelling of the reference steel for the SNR-300 wrapper and structural parts. A comparison of the irradiation creep behavior of W.-Nr. 1.4981 CW with SS 316 CW is made. The swelling of W.-Nr. 1.4981 starts after an incubation time corresponding to a dose of around 20 dpa. A weak temperature dependence between 420 and 480°C, with a maximum at approximately 460°C is noticed. The in-pile creep of W.-Nr. 1.4981 does not show a temperature dependence. Between 15 and 30 dpa, the creep rate increases rapidly. It is thought that the change of the creep rate is related to the onset of swelling. A linear stress dependence of creep is assumed to hold valid although some exceptions at higher dose levels and at 480°C, which are still unexplained, are noticed. Both heats show the same creep and swelling behavior.

- 4945 EFFECTS OF METALLURGICAL VARIABLES ON CREEP ON TYPE 316 STAINLESS STEELS. Kondo, Y. (Sumitomo Metal Industries, Ltd., Amagasaki, Japan); Yukitoshi, T.; Yoshikawa, K.; Nagai, N.; Ohta, S.; Fujiwara, M.; Yoshida, S.; Tanaka, C.; Uematsu, K.; Suzuki, K. pp 253-267 of Radiation effects in breeder reactor structural materials. Bleiberg, M.L.; Bennett, J.W. (eds.). New York; American Institute of Mining, Metallurgical, and Petroleum Engineers, Inc. (1977).

From Conference on radiation effects in breeder reactor structural materials; Scottsdale, AZ, USA (19 Jun 1977).

Creep rupture tests were carried out on non-irradiated and neutron-irradiated type 316 stainless steel cladding tubes. The effects of minor elements, solution treatment temperature, and cold work on the creep rupture properties of the non-irradiated tubes were studied in air and liquid sodium environments. Small additions of phosphorous and boron have remarkable effects on increasing the creep rupture strength due to finely dispersed precipitate inside grains. Cold work increases the rupture strength, but a higher level of cold work beyond a limit has a tendency to reduce the rupture strength at higher temperature and longer duration time due to recrystallization. The strength in sodium at 700°C is lower than in air, accompanied with the significant decarburization. The effects of neutron-irradiation on the creep rupture properties were studied for the sample tubes irradiated at Dounreay Fast Reactor to maximum fluences of about 5.3×10^{22} n/cm² ($E > 0.1$ MeV). The rupture life of the irradiated tubes was about one-tenth that of non-irradiated tubes.

- 4946 IRRADIATION EMBRITTLEMENT OF TYPE 304 STAINLESS STEEL WELDS AND PLATE AT 823 K (550°C). van der Schaaf, B.; de Vries, M.I.;

Elen, J.D. (Netherlands Energy Research Foundation, Petten). pp 307-316 of Radiation effects in breeder reactor structural materials. Bleiberg, M.L.; Bennett, J.W. (eds.). New York; American Institute of Mining, Metallurgical, and Petroleum Engineers, Inc. (1977).

From Conference on radiation effects in breeder reactor structural materials; Scottsdale, AZ, USA (19 Jun 1977).

The creep and tensile properties of DIN 1.4948, which is equivalent to type 304 stainless steel, have been determined at 823 K after irradiation at 823 K to fast neutron fluences of 10^{23} n . m⁻² and 5×10^{24} n . m⁻² ($E > 0.1$ MeV) and simultaneously to thermal fluences of 6×10^{22} n . m⁻² and 2×10^{24} n . m⁻² respectively. The data are required for the safety analysis of the reactor vessel and inner shields of the loop type sodium-cooled fast breeder reactor, SNR-300. Irradiated specimens from plate material show a creep life reduction of 0.1 compared to the unirradiated condition. Creep strains are reduced from 10% to 15% in unirradiated condition to about 2% after irradiation. Irradiated welded joints show a creep life reduction factor of 0.25; creep strains are decreasing from about 4% in reference condition to 0.5% in irradiated condition. Complementary tensile tests of plate material and welded joints indicate that the observed embrittlement is strain rate dependent; it does not appear at strain rates of 10^{-4} s⁻¹ and higher after a fluence of 10^{23} n . m⁻² and it does not appear for strain rates of 10^{-2} s⁻¹ and higher after a fluence of 5×10^{24} n . m⁻². Additional creep tests with specimens of plate material, irradiated to thermal neutron fluences ranging from 10^{17} n . m⁻² to 10^{22} n . m⁻², show that the thermal "threshold" neutron fluence for the observed embrittlement is 10^{18} n . m⁻², producing an atomic helium fraction of 6×10^{-12} . The irradiation embrittlement is attributed to formation of helium from nuclear reactions of thermal neutrons with the ¹⁰B isotope and its subsequent diffusion to the grain boundaries. Since a drastic reduction of the boron in steels is not feasible, it is suggested to set thermal fluence limits for strain and creep life reduction factors in design criteria.

4947 DUCTILITY OF IRRADIATED TYPE 304 AND 316 STAINLESS STEELS. Blackburn, L.D.; Ward, A.L.; Steichen, J.M. (Westinghouse Hanford Co., Richland, WA). pp 317-326 of Radiation effects in breeder reactor structural materials. Bleiberg, M.L.; Bennett, J.W. (eds.). New York; American Institute of Mining, Metallurgical, and Petroleum Engineers, Inc. (1977).

From Conference on radiation effects in breeder reactor structural materials; Scottsdale, AZ, USA (19 Jun 1977).

Ductility data for irradiated Type 304 and 316 stainless steels were correlated to yield trend curves as a function of temperature and total displacements, a spectrum sensitive exposure parameter. Experimental results are characterized by a linear decrease in ductility with logarithm of displacements (or total fluence) over a substantial range of ductility values at temperatures from 370° to 538°C. The correlation shows that the fluence required to reach a given ductility level (i.e., fluence limit) increases as the neutron energy spectrum becomes softer. Minimum ductility values can be estimated as one-half of nominal values.

4948 EXPLORATION OF THE INFLUENCE OF WELDING VARIABLES ON NOTCH DUCTILITY OF IRRADIATED AUSTENITIC STAINLESS STEEL WELDS. Hawthorne,

J.R.; Watson, H.E. (Naval Research Lab., Washington, DC). pp 327-336 of Radiation effects in breeder reactor structural materials. Bleiberg, M.L.; Bennett, J.W. (eds.). New York; American Institute of Mining, Metallurgical, and Petroleum Engineers, Inc. (1977).

From Conference on radiation effects in breeder reactor structural materials; Scottsdale, AZ, USA (19 Jun 1977).

Postirradiation notch ductility and fracture toughness (K/sub J/) trends of AISI Type 308 weld deposits were explored for radiation exposures in the range of 260 to 649°C. The welds were produced by the shielded metal arc (SMA) process and represented compositional variations (CRE vs non-CRE) and controlled delta ferrite content variations. Fracture toughness determinations were made with fatigue precracked Charpy-V specimens and J-Integral assessment procedures. Specimen irradiations were conducted in EBR-II and UCRR reactors. Large postirradiation decreases in Charpy-V (C/sub V/) energy absorption and fracture toughness were observed. The possibility for K/sub J/ values to be reduced below 88 MPa√m (80 ksi√in.) by moderate fluence exposures was demonstrated. The SMA weld with CRE appeared more sensitive to radiation than a non-CRE Type 308 submerged arc (S/A) weld. An influence of delta ferrite content on 260 or 649°C radiation resistance was not found. Fracture toughness assessments revealed high weld sensitivity to testing rate: a 2 : 1 difference in K/sub J/ level was observed between static vs dynamic test conditions.

4949 COMPARISON OF THE SWELLING PRODUCED IN NICKEL BY NEUTRON IRRADIATION AND BY ION BOMBARDMENT. Smidt, F.A.; Reed, J.R.; Sprague J.A. (Naval Research Lab., Washington, DC). pp 337-346 of Radiation effects in breeder reactor structural materials. Bleiberg, M.L.; Bennett, J.W. (eds.). New York; American Institute of Mining, Metallurgical, and Petroleum Engineers, Inc. (1977).

From Conference on radiation effects in breeder reactor structural materials; Scottsdale, AZ, USA (19 Jun 1977).

Ion bombardment is a useful tool for investigating the swelling behavior of candidate alloys for LMFBR cladding and duct applications because high doses can be attained in a matter of hours. There are, however, several questions which must be answered to increase the utility of the technique. Of major concern is the similarity in void nucleation and growth processes under neutron irradiation and under charged particle irradiation. The difference in damage production rate of some four orders of magnitude produces a change in the temperature dependence of swelling and may also influence the magnitude of the swelling. Differences in the cascade structure of the damage produced by charged particles and neutrons may also influence the results. A few comparisons of swelling produced by charged particles and by neutron irradiation at high doses have been made for technological materials. These results show that the incubation period for swelling to develop and the temperature shift for dose rate are both influenced by alloy composition, heat treatment, and stability. It is therefore desirable to study the phenomena in a pure material so as to separate the effects arising from alloy composition and stability from those inherent to the basic damage process. The swelling behavior of pure nickel has been extensively studied at NRL to characterize the influence of temperature, dose rate, and dose on the nucleation and growth of voids under ion bombardment. Observations are reported of the

swelling behavior of pure nickel of the same stock under neutron irradiation in EBR-II and these observations are compared with the previous ion bombardment results.

- 4950 EFFECTS OF STRAIN RATE ON HIGH TEMPERATURE MECHANICAL PROPERTIES OF IRRADIATED INCOLOY 800 AND HASTELLOY X. Boehm, H.; Closs, K.D. (Kernforschungszentrum, Karlsruhe, Ger.). pp 347-356 of Radiation effects in breeder reactor structural materials. Bleiberg, M.L.; Bennett, J.W. (eds.). New York; American Institute of Mining, Metallurgical, and Petroleum Engineers, Inc. (1977).

From Conference on radiation effects in breeder reactor structural materials; Scottsdale, AZ, USA (19 Jun 1977).

Austenitic steels with about 15% chromium content and about 10% nickel content, respectively, have been mainly used as cladding and core structural materials in the first generation of fast breeder reactors. Previous results on the irradiation behavior of these materials indicate that they probably will not allow attainment of very high burnups. This is due above all to the fact that void formation and irradiation induced creep will result in considerable deformations of the core components and thus set a limit to their service lives in the reactor. For this reason, intensive investigations have been carried on to improve core materials for commercial fast breeder reactors. A promising way seems to be the use of steels having higher nickel contents and of nickel base alloys, respectively. However, the helium production rates of these alloys are higher in the neutron spectrum of fast breeder reactors and thus the problem of high temperature embrittlement might become even more accentuated. Experience on the mechanical behavior under and after irradiation is relatively scarce for these materials. So, in order to get more details about high temperature embrittlement and the irradiation behavior of alloys having high nickel contents, the Incoloy 800 and Hastelloy X materials were irradiated up to high helium concentrations and the dependence of the mechanical properties on the strain rate was studied.

- 4951 RADIATION EFFECTS IN FERRITIC STEELS. Huet, J.J.; Delbrassine, A.; Van Asbroeck, P.; Vandermeulen, W. (C.E.N./S.C.K., Mol, Belgium). pp 357-365 of Radiation effects in breeder reactor structural materials. Bleiberg, M.L.; Bennett, J.W. (eds.). New York; American Institute of Mining, Metallurgical, and Petroleum Engineers, Inc. (1977).

From Conference on radiation effects in breeder reactor structural materials; Scottsdale, AZ, USA (19 Jun 1977).

Ferritic steels were studied in Mol (Belgium) for fast reactor core material applications. For cladding material application, dispersion strengthened ferritic steels were developed. Irradiations were conducted from room temperature to 700°C in the material testing reactor BR2 to investigate the high temperature irradiation embrittlement. In all cases, the ferritic steels were more resistant than the austenitic ones, the difference being very large when the tensile tests were conducted above 550°C. Most of the high fluence fast reactor irradiations are still running. In the few available samples, the density change is small and no single void in the ferritic phase has been detected by transmission electron microscopy. Fuel pins canned with dispersion strengthened ferritic steels were irradiated in the BR2. A burn-up of 120,000 MWd/

t was reached in the oxide pins before a failure occurred despite a very high smeared density (90%), a high temperature (670°C) and a high linear power (560 W/cm). This very encouraging result led to the decision of irradiating ferritic steel canned fuel pins in a fast reactor in realistic conditions.

- 4952 INFLUENCE OF HELIUM ON THE MECHANICAL PROPERTIES OF DIN 1.4970 AUSTENITIC STEEL. Sagases, A.A.; Schroeder, H.; Kesternich W.; Ullmaier, H. (Kernforschungsanlage, Juelich, Ger.). pp 367-375 of Radiation effects in breeder reactor structural materials. Bleiberg, M.L.; Bennett, J.W. (eds.). New York; American Institute of Mining, Metallurgical, and Petroleum Engineers, Inc. (1977).

From Conference on radiation effects in breeder reactor structural materials; Scottsdale, AZ, USA (19 Jun 1977).

Foil specimens of DIN 1.4970 austenitic stainless steel were cyclotron-implanted to uniform He concentrations up to 100 appm. Subsequently, tensile and creep tests at different stress levels and temperatures between 600 and 800°C were performed and compared to the results for He-free control specimens. Whereas the latter exhibit transgranular ductile fracture, the implanted material breaks by intergranular failure with a corresponding reduction of the elongation to fracture values by factors between 3 and 6. SEM and TEM examinations of the microstructure suggest an embrittlement model which is based on the stress-assisted nucleation and growth of helium-filled cavities in the grain boundaries and which correctly describes the observed strong stress and temperature dependence of the rupture time values.

- 4953 THEORY OF PARTICLE REDISTRIBUTION IN AN IRRADIATION ENVIRONMENT. Baron, M.; Chang, A.; Bleiberg, M.L. (Westinghouse Electric Corp., Madison, PA). pp 395-404 of Radiation effects in breeder reactor structural materials. Bleiberg, M.L.; Bennett, J.W. (eds.). New York; American Institute of Mining, Metallurgical, and Petroleum Engineers, Inc. (1977).

From Conference on radiation effects in breeder reactor structural materials; Scottsdale, AZ, USA (19 Jun 1977).

The stability of strengthening phases in an irradiation environment is an important consideration in the development of alloys for use in LMFBR. It is well known that when excess interstitials and vacancies are introduced by irradiation the diffusion of solute is enhanced. As a consequence, precipitation reactions as well as the redistribution of equilibrium phases can be considerably accelerated. The nucleation and growth of particles of minor phases during irradiation can lead to depletion of swelling inhibitors from solid solution causing excessive accelerated swelling. Furthermore, massive coarsening of precipitates would lead to deterioration of mechanical properties. As an aid for interpretation of experiments it is useful to have a kinetic theory describing the temporal evolution of particle size distributions and related quantities such as particle concentration, average radius and volume fraction of precipitate. The purpose of this investigation is to provide such a theory and to illustrate its usefulness by applying it to the case of in-reactor exposure and ion bombardment of alloys strengthened by γ' precipitates.

4954 COMPARISON OF THE IRRADIATION EFFECTS ON SWELLING AND MICROSTRUCTURE IN COMMERCIAL ALLOY A-286 AND A SIMPLE Fe-25 Ni-15Cr GAMMA PRIME HARDENED ALLOY. Chickering, R.W. (Westinghouse Electric Corp. Madison, PA); Bajaj, R.; Lally, J.S. pp 405-414 of Radiation effects in breeder reactor structural materials. Bleiberg, M.L.; Bennett, J.W. (eds.). New York; American Institute of Mining, Metallurgical, and Petroleum Engineers, Inc. (1977).

From Conference on radiation effects in breeder reactor structural materials; Scottsdale, AZ, USA (19 Jun 1977).

The irradiation behaviors of alloy A-286 as well as experimental gamma prime hardened alloys are being studied in the National Alloy Development Program for application of gamma prime hardened alloys in the liquid metal fast breeder reactor. The principal direction of the studies concerns the high temperature strength and swelling resistance of the alloys. Minor element compositions may affect the phase stability and void swelling. A high Ti to Al ratio indicates a tendency for the gamma prime $Ni_3(Ti,Al)$ to transform into eta phase (Ni_3Ti) after long term thermal aging and irradiation enhances the tendency for transformation. Another minor element, Si, as a constituent of G-phase, and irradiation may enhance G-phase formation. The Ti, Al, and Si contents affect the swelling of Fe-Cr-Ni alloys. The swelling resistance generally increases with increasing amounts of these three elements in the matrix. In the study the effects of Ti to Al ratio, Ti content, Al content, and Si content on swelling and phase stability were analyzed after Ni-ion irradiation.

4955 INFLUENCE OF FAST DIFFUSING SUBSTITUTIONAL ELEMENTS ON THE SWELLING BEHAVIOUR OF Ni- AND Cu-ALLOYS. Venker, H. (Kernforschungszentrum, Karlsruhe, Ger.); Giesecke, P.; Ehrlich, K. pp 415-420 of Radiation effects in breeder reactor structural materials. Bleiberg, M.L.; Bennett, J.W. (eds.). New York; American Institute of Mining, Metallurgical, and Petroleum Engineers, Inc. (1977).

From Conference on radiation effects in breeder reactor structural materials; Scottsdale, AZ, USA (19 Jun 1977).

Actual theories on swelling operate with mean diffusion coefficients to describe the swelling behavior of alloys. In the model described the partial diffusion coefficients of the components are taken into consideration to predict the swelling behavior under irradiation. From the fact that void formation occurs only if the mobility of the lattice atoms is neither too high nor too low, the conclusion is drawn that in cases where the partial diffusion coefficients of the components of an alloy are widely different, both conditions are less easily fulfilled simultaneously. From this fact a lower degree of swelling can be expected. Simulation experiments with some binary Ni- and Cu-alloys are described. They are in agreement with the model.

4956 EXCESS SUB-SURFACE SWELLING PRODUCED BY NI ION BOMBARDMENT. Johnston, W.G.; Morris, W.G.; Turkalo, A.M. (General Electric Co., Schenectady, NY). pp 421-430 of Radiation effects in breeder reactor structural materials. Bleiberg, M.L.; Bennett, J.W. (eds.). New York; American Institute of Mining, Metallurgical, and Petroleum Engineers, Inc. (1977).

From Conference on radiation effects in breeder reactor structural materials;

Scottsdale, AZ, USA (19 Jun 1977).

In an earlier study of the depth distribution of void swelling produced by bombardment with 5 MeV Ni ions at 625°C, anomalously high swelling was observed in the sub-surface region of an annealed Type 304 steel, but not in a Type 321 steel that had been annealed at 1093°C. The latter material is designated as Type 321-B. In both alloys there was a void-free zone of about 50 nm width at the electropolished and ion bombarded surface, and the swelling increased in the second 50 nm, so that at 100 nm and beyond there was no indication of swelling depletion due to loss of point defects to the surface. The term, "sub-surface," is used to denote the region beginning at 100 nm and extending to 200 to 300 nm depth. Additional observations are reported of excess subsurface swelling in an attempt to establish the origin of the effect. As in the earlier work, all of the experiments are with materials containing 15 appm of pre-injected helium.

4957 INFLUENCE OF ALLOYING ON THE IRRADIATION CREEP OF NICKEL. Jones, R.B.; Crossland, I.G. (Berkeley Nuclear Labs., Eng.). pp 443-453 of Radiation effects in breeder reactor structural materials. Bleiberg, M.L.; Bennett, J.W. (eds.). New York; American Institute of Mining, Metallurgical, and Petroleum Engineers, Inc. (1977).

From Conference on radiation effects in breeder reactor structural materials; Scottsdale, AZ, USA (19 Jun 1977).

In order to investigate the role of alloying on the irradiation creep of nickel, helical springs of three simple representative types of nickel alloy have been exposed under load in the breeder of the Dounreay Fast Reactor. The alloys consisted of a solid solution of nickel containing 14.8 w/o molybdenum, nickel in which about 1 volume % Al_2O_3 particles had been dispersed by powder metallurgy and a conventional age hardening alloy of nickel with 5.9 w/o aluminium heat treated to contain approximately 16 volume % Ni_3Al precipitates (γ'). The springs were stressed in shear between 13 and 28 MPa in a sodium filled rig over the temperature range 280 to 360°C at irradiation doses from 0.1 to 6 dpa. Results up to 4 dpa, from two out of the three irradiation exposures of the rig, have been analyzed. It was found that $Ni-Al_2O_3$ showed slightly less irradiation creep than pure nickel while the irradiation creep of $Ni-Mo$ and $Ni-Al$ was effectively zero except for a small transient component. These results are discussed in relation to the thermal creep behavior of the materials and in terms of published irradiation creep data on springs and pressurized tubes of nickel. It is concluded that alloying additions which lead to thermal creep strengthening also improve the irradiation creep resistance, at least for the relatively low doses encountered in the work described.

4958 IRRADIATION UNDER STRESS AND THE RESULTING MICROSTRUCTURE. Harbottle, J.E. (Berkeley Nuclear Labs., Eng.). pp 455-466 of Radiation effects in breeder reactor structural materials. Bleiberg, M.L.; Bennett, J.W. (eds.). New York; American Institute of Mining, Metallurgical, and Petroleum Engineers, Inc. (1977).

From Conference on radiation effects in breeder reactor structural materials; Scottsdale, AZ, USA (19 Jun 1977).

Internally pressurized, pure nickel tubes covering the stress range 0 to 120 MPa hoop stress have been periodically measured during neutron irradiation at 350°C to investigate the

effect of stress on swelling and its interaction with irradiation creep. At the highest stress the irradiated rupture lifetime only was measured and shown to have increased by a factor of two, corresponding to a strengthening of 20% compared with thermal rupture under identical conditions. The enhancement of swelling by stress, volumetric creep, is found to be a non-monotonic function of stress showing a significant increase in the swelling of 30% at approximately 1 dpa at an intermediate stress of 10 MPa. The increase is transitory, affecting principally the nucleation stage, however, the possibility of a long-term influence on the swelling rate is not rejected. Diameter and length measurements are found to be complementary and lead to a constitutive strain equation. Microstructural examination by TEM shows that the functional dependence of the volumetric creep on stress is followed by the average void volume and that the concentration is the inverse function of this. Final swelling estimated by microscopy agrees with the macroscopic result. The dislocation network after 4 dpa is characterized by bands of high density running in (110) directions irrespective of stress. In addition the tendency for voids to form a lattice is noted. At low doses (0.6 dpa) the rupture specimens exhibit ordered arrays of loops, again (110), and the minimal role of the stress in their formation is postulated.

- 4959 INFLUENCE OF ALLOY CONSTITUTION ON THE SWELLING OF AUSTENITIC STAINLESS STEELS AND NICKEL BASED ALLOYS. Watkin, J.S.; Gittus, J.H.; Standing, J. (UKAEA Reactor Group, Springfields, Eng.). pp 467-477 of Radiation effects in breeder reactor structural materials. Bleiberg, M.L.; Bennett, J.W. (eds.). New York; American Institute of Mining, Metallurgical, and Petroleum Engineers, Inc. (1977).

From Conference on radiation effects in breeder reactor structural materials; Scottsdale, AZ, USA (19 Jun 1977).

A range of annealed austenitic stainless steels and nickel based alloys have been irradiated unstressed in the Dounreay Fast Reactor to 48 atomic displacements per atom (dpa) at temperatures between 400 and 600°C. During irradiation voids have formed in all materials and caused the specimens, which are right solid cylinders, to swell. The magnitude of swelling has been determined from precise length measurements carried out on the specimens before and after irradiation. From these data the swelling rate with dose has been derived for each alloy at each irradiation temperature which has enabled comparisons of swelling as a function of temperature to be made between the alloys. It is concluded that swelling in Fe-Cr-Ni alloys is substantially controlled by alloy constitution together with a smaller, but not insignificant, contribution from minor elements in solution.

- 4960 VOID SWELLING AND MICROSTRUCTURAL CHANGES IN FUEL PIN CLADDING AND UNSTRESSED SPECIMENS IRRADIATED IN DFR. Bramman, J.I. (Risley Nuclear Power Development Establishment, Eng.); Brown, C.; Watkin, J.S.; Cawthorne, C.; Fulton, E.J.; Barton, P.J.; Little, E.A. pp 479-507 of Radiation effects in breeder reactor structural materials. Bleiberg, M.L.; Bennett, J.W. (eds.). New York; American Institute of Mining, Metallurgical, and Petroleum Engineers, Inc. (1977).

From Conference on radiation effects in breeder reactor structural materials; Scottsdale, AZ, USA (19 Jun 1977).

Structural stability and, in particular, the formation of voids producing swelling under fast neutron irradiation, has been extensively investigated using material irradiated in the Dounreay Fast Reactor as fuel pin cladding and as unstressed cylindrical and discoidal specimens. Fluences up to about 9×10^{22} neutrons cm^{-2} (corresponding to a displacement dose of 40 to 45 displacements per atom NRT) at temperatures covering the range of current design interest have been achieved. Several commercial alloys have been studied in this programme. Among them are unstabilized 316 type stainless steel--in the 20% cold-worked condition, the reference structural material for fuel pin components in PFR--the titanium-stabilized Type 321 (En58B) steel used as wrapper material in PFR, and niobium-stabilized FV548 steel and the nickel based precipitation hardening alloy Nimonic PE16 which are alternative clad and wrapper materials respectively. The early promise of Nimonic PE16 as a low swelling alloy has been confirmed by recent data. For longer term development, ferritic steels have been introduced into the evaluation programme.

- 4961 SWELLING IN NEUTRON-IRRADIATED 300-SERIES STAINLESS STEELS. Appleby, W.K. (General Electric Co., Sunnyvale, CA); Bloom, E.E.; Flinn, J.E.; Garner, F.A. pp 509-527 of Radiation effects in breeder reactor structural materials. Bleiberg, M.L.; Bennett, J.W. (eds.). New York; American Institute of Mining, Metallurgical, and Petroleum Engineers, Inc. (1977).

From Conference on radiation effects in breeder reactor structural materials; Scottsdale, AZ, USA (19 Jun 1977).

Swelling induced by fast neutron irradiation has been characterized in various 300-series stainless steels in the U.S. irradiation program. Data are described which give the temperature dependence of swelling to a fluence of 1.4×10^{23} n/cm², $E > 0.1$ MeV for Types-316 and -304 stainless steels in various metallurgical conditions and to somewhat lower fluences for titanium modified Type-316 and Type-321. Significant differences are found in the swelling response of these materials, particularly with respect to temperature dependencies of swelling and effects of cold working. The development of empirical descriptions of swelling for use in design analyses are described for 20% cold-worked Type-316 and solution-annealed Type-304.

- 4962 VOID FORMATION IN STABILIZED AUSTENITIC STAINLESS STEEL. Ehrlich, K.; Gross, R.; Schneider, W. (Kernforschungszentrum, Karlsruhe, Ger.). pp 529-541 of Radiation effects in breeder reactor structural materials. Bleiberg, M.L.; Bennett, J.W. (eds.). New York; American Institute of Mining, Metallurgical, and Petroleum Engineers, Inc. (1977).

From Conference on radiation effects in breeder reactor structural materials; Scottsdale, AZ, USA (19 Jun 1977).

The paper summarizes the results of several irradiation experiments in the reactors DFR (Dounreay Fast Reactor) and Rapsodie. Also included are investigations with heavy ions (46 MeV Ni) at the VEC (Variable Energy Cyclotron). The results with respect to the swelling of several niobium- and titanium-stabilized stainless steels DIN 1.4961, 1.4981 and 1.4970 are discussed in terms of minor alloying elements and the type of stabilizer. Also the influence of thermomechanical pretreatments on the swelling threshold and the mean swelling rate are discussed. Finally the dose dependence

of swelling is described for Types 1.4970 and 1.4988 stainless steels.

- 4963 SWELLING BEHAVIOR OF COLD WORKED TYPE 316 STAINLESS STEEL. Uematsu, K. (Power Reactor and Nuclear Fuel Development Corp., Tokyo); Kodama, T.; Ishida, Y.; Suzuki, K.; Koyama, M. pp 571-589 of Radiation effects in breeder reactor structural materials. Bleiberg, M.L.; Bennett, J.W. (eds.). New York; American Institute of Mining, Metallurgical, and Petroleum Engineers, Inc. (1977).

From Conference on radiation effects in breeder reactor structural materials; Scottsdale, AZ, USA (19 Jun 1977).

Dimensional measurement, immersion density measurement and transmission electron microscopy studies have been carried out on one heat of 10% cold worked Type 316 stainless steel claddings irradiated in DFR to fast neutron fluences up to 7.8×10^{22} n/cm² (E > 0.1 MeV), two heats of 10% cold worked Type 316 stainless steel claddings and 10 to 50% cold worked Type 316 stainless steel plate-specimens irradiated in Rapsodie to fast-neutron fluences up to 9.6×10^{22} n/cm² (E > 0.1 MeV). The irradiation induced swelling in Type 316 stainless steel claddings is shown to be strongly dependent upon contents of minor alloying elements such as phosphorus, boron, nitrogen and oxygen. It was observed as irradiation temperature increased that diameter increase, annealing of irradiation hardening and carbide precipitation in 10% cold worked Type 316 stainless steel claddings occurred nearly at the same irradiation temperature. Cold work effectively reduced swelling in Type 316 stainless steel, but the effect was suppressed when polygonization occurred during irradiation.

- 4964 ELECTRON-MICROSCOPY OF FUEL CLADDINGS FROM OCr16Ni15Mo3Nb STAINLESS STEEL IRRADIATED IN THE REACTOR BOR-60 TO BURN-UP 6.12 AND 10.8%. Agapova, N.P.; Ageev, V.S.; Africanov, I.N.; Loboda, E.M.; Unufriev, V.D.; Ostrovsky, Z.E.; Prokhorov, V.I.; Sokursky, Y.N. pp 613-624 of Radiation effects in breeder reactor structural materials. Bleiberg, M.L.; Bennett, J.W. (eds.). New York; American Institute of Mining, Metallurgical, and Petroleum Engineers, Inc. (1977).

From Conference on radiation effects in breeder reactor structural materials; Scottsdale, AZ, USA (19 Jun 1977).

Fuel cladding samples from OCr16Ni15Mo3Nb stainless steel have been examined after irradiation in the Reactor BOR-60 to the fluences 4.2×10^{22} and 6.6×10^{22} n/cm², E > or = 0.1 MeV. Voids, dislocation loops and precipitates are found. It is established that maximum swelling observed near approximately 500°C is equal to 6.5%. Intergranular M₂₃C₆ precipitates and intragranular fine dispersed Nb(C,N) and Laves phase type Fe₂(Mo, Nb) precipitates due to radiation-induced diffusion are found.

- 4965 EFFECTS OF ALLOY COMPOSITION ON VOID SWELLING. Bates, J.F. (Hanford Engineering and Development Lab., Richland, WA); Johnston, W.G. pp 625-644 of Radiation effects in breeder reactor structural materials. Bleiberg, M.L.; Bennett, J.W. (eds.). New York; American Institute of Mining, Metallurgical, and Petroleum Engineers, Inc. (1977).

From Conference on radiation effects in breeder reactor structural materials; Scottsdale, AZ, USA (19 Jun 1977).

Effects of alloy composition on void swelling have been recognized since early investigations of swelling, which indicated that impure metals swell less than pure metals and that certain austenitic stainless steels swell less than others. The sensitivity of swelling to variations in alloy composition offers the possibility of selecting or developing alloys that are more resistant to swelling than those currently in use as fast reactor core structural materials. The discussion presented tends to parallel the several approaches that have been followed in seeking improved alloys: (1) Austenitic stainless steels were originally the preferred core structural materials in the fast breeder reactor programs of various countries. Therefore, an attractive approach is to modify the composition of a commercial austenitic stainless steel to produce a swelling-resistant material while retaining the other desirable properties; (2) The observation that the superalloy, PE16, is much more swelling-resistant than the austenitic stainless steels suggests a second approach, which is to search for existing commercial alloys with suitable properties, including good swelling resistance, for use as a core structural material; (3) Surveys of swelling behavior of a wide range of commercial austenitic alloy by fast neutron irradiation and heavy ion bombardment indicated that resistance to swelling is strongly influenced by the major composition of an alloy. This observed correlation between swelling and Cr and Ni content suggested a third approach, in which the effects of major composition in simple ternary alloys and of minor element additions to such alloys are investigated separately, in order to provide compositional guidelines for selecting or developing swelling-resistant alloys.

- 4966 UKAEA VOID SIMULATION IN FAST REACTOR STRUCTURAL MATERIALS. Makin, M.J.; Hudson, J.A.; Mazey, D.J.; Nelson, R.S.; Walters, G.P.; Williams, T.M. (Atomic Energy Research Establishment, Harwell, Eng.). pp 645-665 of Radiation effects in breeder reactor structural materials. Bleiberg, M.L.; Bennett, J.W. (eds.). New York; American Institute of Mining, Metallurgical, and Petroleum Engineers, Inc. (1977).

From Conference on radiation effects in breeder reactor structural materials; Scottsdale, AZ, USA (19 Jun 1977).

A general description is given of the two main techniques which have been used in the UKAEA to simulate void swelling, namely 1 MeV electron and high energy ion bombardment, and their characteristics are discussed in relation to the effects produced by neutron irradiation. The experimental results obtained on AISI Type 316, 321 and FV548 austenitic steels, Nimonic PE16 and various other nickel base alloys, and ferritic steels are described in some detail. In particular, the dose and temperature dependencies of swelling and microstructure, the effects of minor compositional variations, heat treatment, cold work, gas content and temperature changes are described. The beneficial effects of minor additions of carbon and silicon are highlighted as well as the general effect of main element composition on swelling characteristics. The similarities and differences in results given by the two techniques are summarized. It is concluded that simulation experiments can provide a useful and reliable guide to the performance of structural materials in a reactor and are particularly useful in the identification of low void swelling commercial alloys.

- 4967 EFFECTS OF IRRADIATION ON SWELLING AND MICROSTRUCTURAL STABILITY OF PRECIPITATION STRENGTHENED ALLOYS. Bleiberg, M.L. (Westinghouse Electric Corp., Madison, PA); Bajaj, R.; Bell, W.L.; Thomas, L.E. pp 667-685 of Radiation effects in breeder reactor structural materials. Bleiberg, M.L.; Bennett, J.W. (eds.). New York; American Institute of Mining, Metallurgical, and Petroleum Engineers, Inc. (1977).

From Conference on radiation effects in breeder reactor structural materials; Scottsdale, AZ, USA (19 Jun 1977).

Neutron and charged particle irradiations were conducted on a series of commercial and experimental alloys covering a wide range of nickel contents and alloy structures. Based upon swelling measurements of aged alloy A-286, a fluence relationship between neutron irradiations, nickel ion bombardment, and electron bombardment was established at the peak swelling temperature. Using this fluence relationship and the calculated alloy matrix compositions, the peak swelling rates of the alloys were calculated based upon nickel ion bombardment results of simple Fe-Ni-Cr ternary alloys. Analysis of the limited neutron data and the extensive nickel ion and electron data indicated that the swelling was controlled by alloy matrix chemistry. However, there was evidence from the electron bombardments that in certain alloys the particles may increase the swelling rate. Experimental and theoretical considerations of the γ' -particle behavior under irradiation in the iron based alloys showed that an equilibrium particle size was obtained in conjunction with an excess of solute in solution over that predicted from thermal kinetics. This implies that overaging cannot occur in these alloys. Also, the excess Ti and Al was beneficial in maintaining the low swelling characteristics of these alloys. Radiation-induced phase instabilities were observed in A-286, In 706, and In 718.

- 4968 INFLUENCE OF METALLURGICAL VARIABLES ON VOID SWELLING IN TYPE 316 STEEL. Terasawa, M. (Toshiba Research and Development Center, Kawasaki, Japan); Shimada, M.; Kakuma, T.; Yukitoshi, T.; Shiraishi, K.; Uematsu, K. pp 687-707 of Radiation effects in breeder reactor structural materials. Bleiberg, M.L.; Bennett, J.W. (eds.). New York; American Institute of Mining, Metallurgical, and Petroleum Engineers, Inc. (1977).

From Conference on radiation effects in breeder reactor structural materials; Scottsdale, AZ, USA (19 Jun 1977).

Void swelling was investigated in a series of modified Type 316 stainless steel alloys that differ in fabrication process and/or chemistry variables. Thirty modified alloys were examined by 200 keV C^+ ion, 5 MeV Ni^+ ion and 1 MeV electron irradiations. Experimental results were presented on the effect of cold working, variations of minor impurity elements, C, P, B and N, and addition of Ti or Nb to 20% cold worked Type 316 steel, and heat treatments. General trends of swelling behavior were established for most of the experimental variables, though some exceptions existed. Of these results, Ti addition was most stimulating. The alloys with Ti showed no swelling when solution treated, but rather high swelling when cold worked by 10 to 20% or aged by certain thermo-mechanical treatment. Considering that the swelling inhibition was closely related to C content and the trend was also recognized for Nb addition, it may be concluded that Ti, Nb or C only in solutions is effective in reducing swelling and that any precipitation enhances swelling.

- 4969 EFFECT OF STRUCTURE AND ALLOYING ELEMENTS ON VOID FORMATION IN AUSTENITIC STEELS AND NICKEL ALLOYS. Levy, V.; Azam, N.; Le Naour, L.; Didout, G.; Delaplace, J. (Centre d'Etudes Nucleaires, Saclay, France). pp 709-725 of Radiation effects in breeder reactor structural materials. Bleiberg, M.L.; Bennett, J.W. (eds.). New York; American Institute of Mining, Metallurgical, and Petroleum Engineers, Inc. (1977).

From Conference on radiation effects in breeder reactor structural materials; Scottsdale, AZ, USA (19 Jun 1977).

One of the major problems in the development of a fast breeder reactor is the phenomenon of metal swelling due to the formation of radiation induced voids. In this field we are faced with two problems: provide estimates of the swelling that must be taken into account in the design of power reactors and develop alloys with very low swelling rates. To cope with these problems on a reasonable time scale a great deal of work has been developed using high flux ion or electron beams to reach the displacement dose levels involved in a power reactor. However the use of either tool for rapid simulation of the fast neutrons environment requires the knowledge of experimental and theoretical correlations between the swelling caused by neutrons and the swelling caused by other particles. In the case of pure metals a thorough investigation of the mechanisms involved in void swelling has led the Physical Metallurgy research group of the Commissariat a l'Energie Atomique to elaborate a simulation model which reproduces reasonably well the experimental swelling versus temperature curves for all the irradiating particles if dislocation densities are available.

- 4970 RADIATION DAMAGES IN CONSTRUCTIONAL STEELS AND HIGH-NICKEL ALLOYS IRRADIATED WITH NEUTRONS. Scherbak, V.I.; Bykov, V.N.; Vorobiev, A.N.; Dmitriev, V.D. (Institute of Physics and Power Engineering, Obninsk, USSR). pp 773-779 of Radiation effects in breeder reactor structural materials. Bleiberg, M.L.; Bennett, J.W. (eds.). New York; American Institute of Mining, Metallurgical, and Petroleum Engineers, Inc. (1977).

From Conference on radiation effects in breeder reactor structural materials; Scottsdale, AZ, USA (19 Jun 1977).

Results of electron microscope investigations of IKH12M2S2, OKH18N9T and OKH16N15M3B steels and OKH16N40B and OKH16N80B alloys irradiated at 500°C at doses up to 2.5×10^{22} n/cm² are presented. The dependences on nickel content of voids, dislocation loops and precipitate concentrations and mean size are discussed. The different viewpoints on the influence of the chemical composition on void swelling and dislocation structure development are considered. From experimental results it follows that the chemical composition change favorably affects the dislocation capability to capture point defects.

- 4971 IRRADIATION CREEP-SWELLING COUPLING: MICROSTRUCTURAL MODELING AND DATA ANALYSIS. Weiner, R.A.; Foster, J.P.; Boltax, A. (Westinghouse Advanced Reactors Div., Madison, PA). pp 865-878 of Radiation effects in breeder reactor structural materials. Bleiberg, M.L.; Bennett, J.W. (eds.). New York; American Institute of Mining, Metallurgical, and Petroleum Engineers, Inc. (1977).

From Conference on radiation effects in breeder reactor structural materials;

Scottsdale, AZ, USA (19 Jun 1977).

The irradiation creep behavior predicted by a model of microstructural evolution is compared with irradiation creep data on solution-annealed Type 304L stainless steel. These data are shown to be consistent with an irradiation creep-swelling coupling in which the swelling enhanced irradiation creep rate is proportional to the swelling raised to a power. The implications of this functional form for the irradiation creep-swelling coupling on the irradiation creep behavior of reactor components with time dependent stress and temperature histories, including the results to be expected from a comprehensive reactor history effects experiment, are discussed. The differences in the irradiation creep behavior of solution-annealed and cold-worked steels are investigated theoretically by incorporating the dose and temperature dependence of the line dislocation density into the microstructural model. This refinement of the microstructural model predicts that the ratio of the irradiation creep in cold-worked and solution-annealed steels will be dose dependent, the irradiation creep material constants will be temperature dependent, and below 550°C swelling enhanced irradiation creep will be the same in cold-worked and solution-annealed Type 316 stainless steel.

- 4972 COMPUTER SIMULATION AND NEUTRON, HEAVY-ION AND ELECTRON IRRADIATION CORRELATION. Ishino, S.; Iwata, S.; Matsutani, Y.; Tanaka, S. (Japan Atomic Energy Research Inst., Ibaraki, Japan). pp 879-898 of Radiation effects in breeder reactor structural materials. Bleiberg, M.L.; Bennett, J.W. (eds.). New York; American Institute of Mining, Metallurgical, and Petroleum Engineers, Inc. (1977).

From Conference on radiation effects in breeder reactor structural materials; Scottsdale, AZ, USA (19 Jun 1977).

Detailed calculations of various damage parameters as displacement cross section, PKA energy spectrum etc. have been performed for Fe, Cr, Ni and standard stainless steel for the neutron spectrum of the core centre of MONJU. The calculation takes into account elastic scattering as well as various non-elastic nuclear reactions as (n,n') , $(n,2n)$, (n,p) and (n,α) , which become more important for higher neutron energies.

- 4973 FUNDAMENTAL ASPECTS OF THE EVOLUTION OF, AND PHASE CHANGES IN, METALS AND ALLOYS UNDER IRRADIATION. Martin, G.; Bocquet, J.L.; Barbu, A.; Adda Y. (Centre d'Etudes Nucleaires de Saclay, Gif-sur-Yvette, France). pp 899-915 of Radiation effects in breeder reactor structural materials. Bleiberg, M.L.; Bennett, J.W. (eds.). New York; American Institute of Mining, Metallurgical, and Petroleum Engineers, Inc. (1977).

From Conference on radiation effects in breeder reactor structural materials; Scottsdale, AZ, USA (19 Jun 1977).

The quantitative prediction and the simulation of irradiation damage present a considerable interest for the technology of fast neutron and fusion reactors. However, at present time, even qualitative predictions are not always possible when the dose rate varies over a relatively large range; for example the formation of vacancy loops takes place instead of that of voids, precipitation occurs in under-saturated solid solutions etc. Therefore, in addition to a microscopic description of the phenomena, it seems important to elaborate an irradiation damage phenomenology. The results are reported of a systematic experimental study

of dose rate effects for radiation induced precipitation in Ni Si solid solution alloys. As will be seen, the existence of dose rate thresholds for this phenomenon is clearly established. The composition dependence of this threshold permits the definition of a solubility limit under irradiation which is both temperature and dose rate dependent. Finally, the various theoretical approaches to radiation induced precipitation are discussed.

- 4974 NATURAL CIRCULATION HEAT TRANSFER IN POOL-TYPE LMFBR'S. Singer, R.M. (Argonne National Lab., IL); Grand, D.; Martin, R. pp 239-264 of Thermal and hydraulic aspects of nuclear reactor safety. Vol. II. Jones, O.C. Jr.; Bankoff, S.G. (eds.). New York; American Society of Mechanical Engineers (1977).

From Winter annual meeting of the American Society of Mechanical Engineers; Atlanta, GA, USA (27 Nov 1977).

The authors present a state-of-the-art review of natural convection heat transfer in pool-type LMFBR's. Studies related to thermal stratification of the sodium in the primary vessel are reported and include topics such as mixed convection in vertical plane channels and rectangular cavities, and thermal interactions between the hot and cold regions of two-zoned reactor vessels. Results from laboratory and plant tests concerned with the natural circulation behavior of reactor primary heat transport systems are also summarized. From this review it is apparent that much is presently known about steady-state natural convection behavior of LMFBR's, but the study of transient phenomena is not well understood. 40 references.

- 4975 THERMAL HYDRAULIC RESPONSE OF AN LMFBR PLANT TO UPSET EVENTS. Bein, M.; Yahalom, R. (General Electric Co., Sunnyvale, CA). pp 8.1-8.17 of Proceedings of the third power plant dynamics, control, and testing symposium. Kerlin, T.W. (ed.). Knoxville, TN; University of Tennessee (1977).

From 3. power plant dynamics, control and testing symposium; Knoxville, TN, USA (7 Sep 1977).

The paper describes briefly a computer program for analyzing LMFBR plant dynamics and thermal hydraulic response of the system to some typical upset events. The reference plant design is a commercial size 900 MWe plant with a saturated steam cycle. The response of this system to a normal scram is compared with that of a superheated steam cycle. It is expected that the saturated steam cycle with the inherent heat capacity will have a better chance to sustain severe temperature transient than a design with less water inventory.

- 4976 HYBRID COMPUTER MODEL OF THE PROTOTYPE LARGE BREEDER REACTOR PLANT AND CONTROL SYSTEM. Walsh, J.M.; Kesavan, K. (Westinghouse Electric Co., Madison, PA). pp 20.1-20.26 of Proceedings of the third power plant dynamics, control, and testing symposium. Kerlin, T.W. (ed.). Knoxville, TN; University of Tennessee (1977).

From 3. power plant dynamics, control and testing symposium; Knoxville, TN, USA (7 Sep 1977).

The objective of the Hybrid Computer Model is to provide an analytical method for design and analysis of the Prototype Large Breeder Reactor (PLBR) plant and reactor control systems. The PLBR is a 3-loop, commercial-size plant. The Model is arranged on a two-loop basis, with one of the loops representing one

plant loop and the other representing the remaining plant loops lumped. The control systems for the Nuclear Steam Supply System (NSSS) are simulated on the analog computer with the exception of the control rod drive mechanism (CRDM) and controller which are simulated on the digital computer. The reactor, sodium pump drives, and reactor power setpoint generation are also included in the analog computer portion of the PLBR Hybrid Computer Model. The digital computer portion of this hybrid model includes the primary and intermediate sodium pumps and hydraulics, intermediate heat exchanger, steam generator system, and steam turbine system and controls. Results of plant and reactor control system analysis are provided including plant power transients and control system step responses at design and part load conditions. Plant power transients from 100% to 60% and back to 100% power conditions at $\pm$ 3% per minute ramp rates have been obtained and demonstrate high performance operation for the total PLBR plant and controls. Plant power demand steps of $\pm$ 10% rated power have demonstrated a high performance, stable, and coordinated plant control system over an operating range of 100% to 40% of rated power conditions. The results of the analysis show that the feed-forward and feedback NSSS control systems operate in a coordinated fashion to maintain design steam temperature and pressure conditions at the turbine throttle under plant power transient conditions.

- 4977 NATURAL CIRCULATION IN FFTF, A LOOP TYPE LMFBR. Additon, S.L.; Parziale, E.A. (Hanford Engineering Development Lab., Richland, WA). pp 265-283 of Thermal and hydraulic aspects of nuclear reactor safety. Vol II. Jones, D.C. Jr.; Bankoff, S.G. (eds.). New York; American Society of Mechanical Engineers (1977).

From Winter annual meeting of the American Society of Mechanical Engineers; Atlanta, GA, USA (27 Nov 1977).

The authors present a state-of-the-art review of natural circulation heat transfer in loop type reactor plants. Most of the examples are taken from Fast Flux Test Facility (FFTF) design experience, drawing on the authors' familiarity and a developing base of available documentation. On-going studies related to the Clinch River Breeder Reactor (CRBR) and some foreign experience are also noted where available in the literature. The emphasis is on the role of natural circulation in decay heat removal; however, free convection during either operation at power or normal shutdown does influence some aspects of the design and these are reviewed. In treating decay heat removal the topics discussed include steady state loop performance and transient dynamics for conditions immediately after scram and for the longer term which involves different considerations. The review summarizes complex dynamics, specific to the FFTF design evaluation, which particularly illustrate large available margins for decay heat removal (possibly involving coolant boiling). Also addressed are modelling considerations and the status of experimental programs for loop reactor applications. 28 references.

- 4978 STATUS AND SUMMARY OF TREAT IN-PILE EXPERIMENTS ON LMFBR RESPONSE TO HYPOTHETICAL CORE DISRUPTIVE ACCIDENTS. Dickerman, C.E.; Rothman, A.B.; Klickman, A.E.; Spencer, B.W.; De Volpi, A. (Argonne National Lab., IL). pp 19-50 of Thermal and hydraulic aspects of nuclear reactor safety. Vol. II. Jones, D.C. Jr.; Bankoff, S.G. (eds.). New York;

American Society of Mechanical Engineers (1977).

From Winter annual meeting of the American Society of Mechanical Engineers; Atlanta, GA, USA (27 Nov 1977).

A program of transient in-reactor experiments is being conducted by Argonne National Laboratory in the Transient Reactor Test (TREAT) facility to guide and support analyses of hypothetical core disruptive accidents (HCDA) in liquid metal fast breeder reactors (LMFBR). Test results provide data needed to establish the response of LMFBR cores to hypothetical accidents producing fuel failure, coolant boiling, and the movement of coolant, molten fuel, and molten cladding. These data include margins to fuel failure, and modes of failure and movements, and evidence for identification of the mechanisms which determine the failure and movements. A key element in the program is the fast neutron hodoscope, which detects fuel movement during experiments as a function of time within the test apparatus. 47 references.

- 4979 SODIUM BOILING IN FAST REACTORS: A STATE-OF-THE ART REVIEW. Peppler, W. (Gesellschaft fuer Kernforschung m.b.H., Ger.). pp 123-153 of Thermal and hydraulic aspects of nuclear reactor safety. Vol. II. Jones, D.C. Jr.; Bankoff, S.G. (eds.). New York; American Society of Mechanical Engineers (1977).

From Winter annual meeting of the American Society of Mechanical Engineers; Atlanta, GA, USA (27 Nov 1977).

Because of the importance regarding severe hypothetical accidents in liquid metal fast breeder reactors, sodium boiling has been studied in depth, including conditions of natural convection. This paper summarizes the work accomplished and delineates the need for future work in areas of loss of flow, local cooling disturbances, and decay heat removal. 46 references.

- 4980 CONTRIBUTION TO THE STUDY OF SODIUM BOILING DURING SLOW PUMP COASTDOWN IN LMFBR SUBASSEMBLIES. Costa, J. (Centre d'Etudes Nucleaires de Grenoble, France). pp 155-169 of Thermal and hydraulic aspects of nuclear reactor safety. Vol. II. Jones, D.C. Jr.; Bankoff, S.G. (eds.). New York; American Society of Mechanical Engineers (1977).

From Winter annual meeting of the American Society of Mechanical Engineers; Atlanta, GA, USA (27 Nov 1977).

Sodium boiling phenomena have been studied both experimentally and analytically within the framework of a hypothetical slow pump coastdown without scram accident for a large fast breeder reactor of the Super Phenix type. The voiding process of the channel is governed by a two phase flow instability called a flow excursion. Boiling in the single channel approximation of a subassembly is described. Considerations of the bundle effects, based on experiments in a 19 pin bundle, are also given. 46 references.

- 4981 MELTING, BOILING AND FREEZING: THE "TRANSITION PHASE" IN FAST REACTOR SAFETY ANALYSIS. Epstein, M. (Argonne National Lab., IL). pp 171-193 of Thermal and hydraulic aspects of nuclear reactor safety. Vol. II. Jones, D.C. Jr.; Bankoff, S.G. (eds.). New York; American Society of Mechanical Engineers (1977).

From Winter annual meeting of the American Society of Mechanical Engineers; Atlanta, GA, USA (27 Nov 1977).

Information regarding the transition phase

of a hypothetical accident sequence in a liquid metal fast breeder reactor is summarized. The review covers the current work on phenomenological sequences, molten clad behavior preceding and during fuel melting, boiling regimes with internal heat generation, and freezing of molten fuel-steel mixtures. 51 references.

- 4982 FUEL COOLANT INTERACTION IN FAST REACTORS. Board, S.J. (C.E.G.B. Berkeley Nuclear Labs., Eng.); Calderola, L. pp 195-222 of Thermal and hydraulic aspects of nuclear reactor safety. Vol. II. Jones, O.C. Jr.; Bankoff, S.G. (eds.). New York; American Society of Mechanical Engineers (1977).

From Winter annual meeting of the American Society of Mechanical Engineers; Atlanta, GA, USA (27 Nov 1977).

After a brief historical review, the most significant experiments are described and their results discussed and compared. The experiments range from basic studies with nonreactor materials to impile fuel failure tests. In all those involving fast reactor materials, only low efficiency interaction has occurred, apart from the case of sodium injection into fuel. The main theoretical models are critically reviewed in the light of the experimental evidence. Three main stages in energetic FCIs have been identified: an initial quiescent period in which the two fluids intermix and which requires film boiling; a small disturbance inducing local interaction; and a coherent propagation through the interacting masses. It is not yet possible to define completely the conditions under which these stages can occur, and there is not yet enough evidence to be completely confident that this description applies to the injection experiments of sodium into UO_2 . 104 references.

- 4983 EVALUATION OF THE POTENTIAL FOR ENERGETIC FUEL-COOLANT INTERACTIONS IN HYPOTHETICAL LMFBR ACCIDENTS. Henry, R.E.; Cho, D.H. (Argonne National Lab., IL). pp 223-237 of Thermal and hydraulic aspects of nuclear reactor safety. Vol. II. Jones, O.C. Jr.; Bankoff, S.G. (eds.). New York; American Society of Mechanical Engineers (1977).

From Winter annual meeting of the American Society of Mechanical Engineers; Atlanta, GA, USA (27 Nov 1977).

Mixing of hot and cold liquids can produce an explosive event when the temperature of the hot liquid is much higher than the boiling point of the cold liquid. The sudden vaporization of the cold liquid has been identified as a likely cause of this vapor explosion, currently termed a fuel-coolant interaction within the nuclear community. Size and time scales of such interactions are such that current understanding of detailed physical mechanisms is limited. Two important aspects of this field of research are discussed including nucleation and mixing, and the conclusion is drawn that large scale vapor explosions are unlikely in liquid metal fast breeder reactors having oxide fuels, although additional work in the area of rapid mixing during short period overpower transients is required. 35 references.

- 4984 RESIDUAL STRESS MEASUREMENT IN AUSTENITIC ALLOY TUBES. Gelpi, A.; Archer, J. (Novatome Industries, 92 - Le Plessis-Robinson (France)); Donati, J.R.; de Keroulas, F. (Electricite de France, 77 - Evreux). pp 332-337 of 4. Colloque international sur les methodes analytiques par rayonnements X.

Strasbourg, 9-13 mai 1977. Issy-les-Moulineaux, France; Compagnie Generale de Radiologie (1977). (In French)

From 4. international colloquium on x-ray analytical methods; Strasbourg, France (9 May 1977).

Residual stress measurement methods are presented and compared: stress gages and longitudinal cutting, stress corrosion test, X-ray diffractometry. Examples on 600 and 800 alloys and 18-10 stainless steel employed in nuclear station steam generator tubes are given.

- 4985 ON THE OPTIMIZATION OF A FAST HIGH-POWER REACTOR OF LMFBR TYPE BY MEANS OF A NON-CONVEX PROGRAMMING MATHEMATICAL MODEL. Pavelescu, M.; Dumitrescu, H.; Ochiana, G. (Inst. of Nuclear Power Reactors, Bucharest, Romania). Rev. Roum. Phys.; 22: No. 9, 997-1003(1977).

The authors consider the problem of minimizing the doubling time for an LMFBR. The decision vector is a distribution one of fissile and fertile material in the reactor which is considered a static system in initial state, and the mathematical model for optimization is a non-convex programming model. Modeling of the optimization problem is carried out by the SUMT method. 4 refs.

- 4986 PRODUCTION AND EMISSION OF CARBON-14 FROM NUCLEAR POWER STATIONS AND REPROCESSING PLANTS AND ITS RADIOECOLOGICAL SIGNIFICANCE. Bonka, H.; Bruessermann, K.; Schwarz, G.; Willrodt, U. (Technische Hochschule Aachen (Germany, F.R.)). pp 945-948 of Proceedings of the 4. International congress of the International Radiation Protection Association. Vol. 3. Fontenay-aux-Roses, France; Association Internationale de Protection contre les Rayonnements (1977).

From 4. congress of the International Radiation Protection Agency; Paris, France (24 Apr 1977).

In nuclear power reactors with 1000 MWe full load capacity Ci^{14} will be produced at rates of 10 to 100 Ci/a according to the reactor type. The yearly emission rate for LWR is assessed at 10 Ci, for HTR at 0.1 Ci and for LMFBR at 1 Ci. The corresponding RP for 40,000 MWe installed nuclear reactor capacity may release about 500, 3000 and 100 Ci/a according to the nitrogen impurities in the fuel elements and the coolant of the reactor type. In view of these assumptions the total body dose of the population in the vicinity of present commercial power reactors in the Federal Republic of Germany is significantly influenced by Ci^{14} , although the entire dose itself is very low. Regarding the collective dose to the world population radiocarbon is of the greatest importance for both nuclear power plant emissions and for gaseous wastes from reprocessing plants because of its wide dispersion in the ecosystems. The exposure due to globally distributed Ci^{14} is expected to increase significantly from the year 2000 on. In the long term it is therefore necessary to find a way of lowering the emissions, for example by reduction of the N-impurities, or by collection of radiocarbon with krypton control systems in RP, or by changing the head-end process of HTR-RP.

- 4987 POST-ACCIDENT HEAT REMOVAL IN LMFBR'S. Glueckler, E.L. (General Electric Co., Sunnyvale, CA); Baker, L. Jr. pp 285-324 of Symposium on the thermal and hydraulic aspects of nuclear reactor safety. Vol. 2. Jones, O.C. Jr.; Bankoff, S.G. (eds.). New York; American Society of Mechanical Engineers

(1977).

From Winter annual meeting of the American Society of Mechanical Engineers; Atlanta, GA, USA (27 Nov 1977).

For safety assessments of early sodium cooled fast breeder reactors (LMFBRs), extremely unlikely events such as unprotected loss of flow and transient overpower sequences have been evaluated. The prediction of the consequences of these postulated events involves investigations of decay heat dissipation and core retention. In general, these problem areas are referred to collectively as post-accident heat removal (PAHR). This paper reviews data on heat transfer, fluid mechanics, nuclear stability and material interactions associated with PAHR. Some concepts applied in early LMFBRs for consequence mitigation are also described.

- 4988 TIME-RESOLVED CODED APERTURE IMAGING SYSTEM FOR NUCLEAR FUEL MOTION MEASUREMENTS. Stalker, K.T.; Kelly, J.G. (Sandia Labs., Albuquerque, NM). pp 63-70 of Proceedings of the Society of Photo-Optical Instrumentation Engineers. Bellingham, WA; Society of Photo-Optical Instrumentation Engineers (1977).

A coded aperture imaging system for the measurement of nuclear fuel motion in simulated core disruptive accidents is described. A one dimensional Fresnel zone plate type coded aperture is used to modulate the fission gamma rays emitted from the fuel pin under test. Two active imaging systems have been developed to detect the coded image and record it on film using a high speed camera. The first system is an X-ray image intensifier which converts fission gamma rays to optical photons in a thin (0.1 mm) CsI(Tl) scintillator screen on which a photocathode is deposited. The photoelectrons thus created are collected and focused by electron optics and produce an image on the output phosphor. The second system utilizes a NaI(Tl) scintillator crystal and a separate high gain optical image intensifier to produce the desired coded image. With a few modifications both systems appear capable of achieving the preliminary design goals of 1 mm radial resolution, 5 mm axial (along the fuel pin axis) resolution and 1 msec temporal resolution. Presently, the X-ray image intensifier system offers the best resolution, but the second system provides higher gain and a wider selection of operating conditions. The temporal response of both systems is limited to a few milliseconds by the output phosphor. Experimental performance data for each system will be presented, and the results of preliminary nuclear fuel pin imaging experiment performed at the Sandia Pulsed Reactor will be shown.

- 4989 NUCLEAR REACTOR SAFETY HEAT TRANSFER. Bishop, A.A.; Kulacki, F.A.; Bankoff, S.G.; Jones, D.C. Jr. (eds.). New York; American Society of Mechanical Engineers (1977). 66p. (CONF-771120--P4).

From Winter annual meeting of the American Society of Mechanical Engineers; Atlanta, GA, USA (27 Nov 1977).

Included are seven papers, each of which has been separately processed for the Energy Data Base. (DG)

- 4990 ELECTROMAGNETIC FLOWMETERS FOR FAST REACTORS. Baker, R.C. (Imp Coll of Sci and Technol, London, Engl). Prog. Nucl. Energy; 1: No. 1, 41-61(1977).

This paper is in four parts. Section 1 explains the theory of the induced-voltage electromagnetic flowmeter and then considers

various types which have been used. In Section 2 flux-distortion flowmeters are described. These have been proposed mainly for monitoring the primary circuit flow and again both flow-through and probe types have been tested. Sections 3 and 4 continue the discussion of the flux-distortion flowmeter by introducing two methods of analyzing its performance. In Part 4 the second linearized method uses current rings to divide up the conducting material. By considering the interaction of all the rings, it is possible to obtain the current distribution and hence the magnetic field. In conclusion it is suggested that further development would be useful of the devices which are most suited to the liquid metal fast breeder reactor. 58 refs.

- 4991 HEAT TRANSFER, SODIUM BOILING AND FUEL PIN INTEGRITY AFTER A SEVERE LMFBR PIPING FAILURE. Gartside, C.H.; Hwang, I.T.; Marr, W.W.; Miles, K.J.; Tessler, J.H.; Thompson, D.H. (Argonne National Lab., IL). pp 9-15 of Nuclear reactor safety heat transfer. Bishop, A.A.; Kulacki, F.A.; Bankoff, S.G.; Jones, D.C. Jr. (eds.). New York; American Society of Mechanical Engineers (1977).

From Winter annual meeting of the American Society of Mechanical Engineers; Atlanta, GA, USA (27 Nov 1977).

A severe LMFBR piping system failure has been simulated with a thermal-hydraulically prototypic in-reactor experiment. The consequences of the simulated accident on the test fuel were much less than anticipated. Sodium boiling was stable and well behaved and no clad or fuel damage was observed. Analysis of the test data with the current heat transfer and sodium boiling models has demonstrated their conservatism. Sodium boiling is not well described by a single channel slug expulsion model and the two dimensional effects of coolant mixing and heat conduction may have an important impact on the boiling process. The predicted fuel-cladding gap conductance may be too small.

- 4992 HEAT AND MASS TRANSPORT PROCESSES OF A HORIZONTAL MELTING OR DECOMPOSING LAYER UNDER A MOLTEN POOL. Alsmeyer, H.; Reimann, M. (Kernforschungszentrum, Karlsruhe, Ger.). pp 47-53 of Nuclear reactor safety heat transfer. Bishop, A.A.; Kulacki, F.A.; Bankoff, S.G.; Jones, D.C. Jr. (eds.). New York; American Society of Mechanical Engineers (1977).

From Winter annual meeting of the American Society of Mechanical Engineers; Atlanta, GA, USA (27 Nov 1977).

After a hypothetical core disruptive accident of an LWR or FBR, melting of solid boundaries in contact with molten fuel may occur. Some of the melting materials of the structures or sacrificial barriers may be lighter and immiscible with the fuel. The influence of the Taylor-Helmholtz instability on the melting of horizontal plates under fuel has been investigated in different model experiments for the situation given above. A very regular square grid, as predicted from stability analysis, was found to govern the flow and heat transfer mechanisms for melting materials of large and small density differences. When melting is combined with the formation of crusts or evaporation of the molten material, Taylor instability again has an important effect. A two-component melting and evaporating horizontal plate was used to study the thermohydraulic aspects of decomposing concrete beneath UO_2 . The escaping gas flow was found to dominate the transport processes and to be similar to the Taylor instability flow. A theoretical model is

derived for the decomposition of concrete under the influence of a high heat flux. The decomposition process consists of a melting process at the surface of the material and of gas/steam release which will occur at well-defined temperatures in the depth of the material. The formation of a gas/steam layer on the surface of the concrete and the formation and departure of bubbles from this layer is very similar to film boiling on horizontal surfaces. Therefore, a hydrodynamical model is derived corresponding very closely to Berenson's film boiling model. The heat transfer between the bulk liquid and the decomposing material through the gas/steam layer is effected by radiation and conduction. A combination of the decomposition and the heat transfer model allows the calculation of melt front propagation rates dependent upon the bulk temperature of the core melt.

- 4993 MODELING THE MECHANICAL RESPONSE OF A DEGRADED REACTOR FUEL CLAD. Subbaraman, G. (Inst. for Resource Management Inc., Bethesda, MD); Reifsnider, K.L. pp 171-181 of Environmental degradation of engineering materials. Louthan, M.R. Jr.; McNitt, R.P. (eds.). Blacksburg, VA; Virginia Polytechnic Inst. and State Univ. (1977).

From Conference on environmental degradation of engineering materials; Blacksburg, VA, USA (10 Oct 1977).

In-service degradation is known to occur in fuel clads of reactor systems currently in operation and under design. Breach and failure of fuel clads because of degradation can lead to operational difficulties and closing down of reactors. The failure of a few fuel pins of a subassembly may lead to propagation of failures in other subassemblies due to thermal and pressure induced blanketing effects. From a mechanics analysis standpoint it is imperative that the degradation process be quantitatively described so that conservative selection of materials and design bases can be employed to avoid failure. The degradation of the LMFBR fuel clad (stainless steel Type 316) subjected to strong property variations due to the operating liquid sodium environment, and the elastic, elastic-plastic mechanics analysis of the clad is described, including these variations.

- 4994 MONTE CARLO APPROACH TO THE THEORETICAL PREDICTION OF TEMPERATURE NOISE IN LMFBR SUB-ASSEMBLIES. Firth, D. (UKAEA Reactor Group, Risley). pp 527-542 of Reactor noise - SMORN II. Williams, M.M.R. (Queen Mary Coll., London (UK). Dept. of Nuclear Engineering) (ed.). Oxford, England; Pergamon Press Ltd. (1977).

From Specialists meeting on reactor noise; Gatlinburg, TN, USA (19 Sep 1977).

A candidate technique for detecting incipient blockages in the fuel sub-assemblies of liquid-metal-cooled fast-breeder reactors is the measurement of coolant outlet temperature fluctuations caused by turbulence. A theoretical basis for the method is required, and one model is discussed. The model requires the paths of individual fluid particles to be traced, allowing their motions to vary randomly, subject to certain constraints of the turbulent motion. It is a Monte Carlo method, already used successfully in predicting the transport of scalar fluctuations. Its advantage is that it allows actual time-dependent temperatures to be computed, and so various methods of analysis (power spectral density, amplitude probability distribution, for example) can be examined.

- 4995 NEUTRON NOISE INDUCED BY VIBRATION ON THE FRENCH PHENIX LMFBR. Tigeot, T. (CEA Centre d'Etudes Nucleaires de Saclay, 91 - Gif-sur-Yvette (France). Div. d'Etude et de Developpement des Reacteurs); Le Guillou, G. pp 487-496 of Reactor noise - SMORN II. Williams, M.M.R. (Queen Mary Coll., London (UK). Dept. of Nuclear Engineering) (ed.). Oxford, England; Pergamon Press Ltd. (1977).

From Specialists meeting on reactor noise; Gatlinburg, TN, USA (19 Sep 1977).

The vibratory measurements which are available on the reactor have simultaneously been recorded with the fluctuations of neutronic power measurements. The following were observed: 1) a movement of the carrier concrete slab of the primary circuit at the fundamental frequency corresponding to the pumps rotary speed; 2) a low level vibration on a control rod drive corresponding to an incipient defect; 3) vibrations emergence on the core cover during a working cycle; and 4) all the time, a resonance corresponding to the first vibrational mode of the fuel assemblies under the cooling sodium flow. The evidence of the coherence function between the available neutronic noise measurements and the vibratory transducers. From the experience gained on PHENIX vibrations measurements are included in the SUPER PHENIX monitoring system.

- 4996 CROSS SECTIONS REQUIREMENTS FOR THE PREDICTION OF GAS PRODUCTION RATES FOR USE IN IRRADIATION DAMAGE STUDIES IN LMFBR. Ganesan, S. (Reactor Research Centre, Kalpakkam, India). J. Mysore Univ., Sect. B. Sci.; 26: 261-266(1977). (CONF-7606188--).

From National symposium on radiation physics; Mysore, India (10 Jun 1976).

The development of competitive commercial fast power reactors requires the achievement of long burnup of the fuel. To achieve the required burnup of the fuel, the unfavourable effects of radiation damage must be minimized and materials which resist radiation damage need to be developed. The production of gasses by transmutation reactions in the various constituents of stainless steel leads to deviations from normal mechanical properties and thus becomes an important factor in determining the life time of the material in fast power reactors. The helium that is produced by (n, α) reactions in structural elements can serve as nuclei for void formation. Helium production rates are calculated.

- 4997 STUDY OF THE CONTRIBUTION TO DOPPLER EFFECT FROM STRUCTURAL MATERIALS IN FAST POWER REACTORS. Sharma, M.L.; Ganesan, S. (Reactor Research Centre, Kalpakkam, India). J. Mysore Univ., Sect. B. Sci.; 26: 228-231(1977). (CONF-7606188--).

From National symposium on radiation physics; Mysore, India (10 Jun 1976).

The Doppler coefficient of reactivity is the only prompt reactivity coefficient in the considerations of the safety aspects of large fast power reactors during rapid power transients. Recently the delayed negative reactivity feed back due to the Doppler broadening of the resonances belonging to the structural elements like Ni, Mo, Cr and Fe has been found to be of some importance relative to the contribution of fissile material present in the reactor. The contribution of the structural elements to the overall Doppler coefficient of reactivity for two typical fast critical assemblies SEFOR and ZPPR-2 is analyzed. The choice for the SEFOR core in our analysis is because of the fact that SEFOR reactor was

mainly constructed for studying the Doppler effect in fast reactors and ZPPR-2 was chosen as it has a flattened, two enrichment zone cores which simulate the relative composition of PuO_2/UO_2 , steel and Na of demonstration size (350 to 500 MWe) fast reactor.

- 4998 RESULTS OF THE TEMPERATURE NOISE MEASUREMENTS IN SUBCHANNELS OF SODIUM COOLED ELECTRICALLY HEATED 28 ROD BUNDLE BEHIND A BLOCKAGE. Tuerkcan, E. (Stichting Energieonderzoek Centrum Nederland, Petten). pp 497-506 of Reactor noise - SMORN II. Williams, M.M.R. (Queen Mary Coll., London (UK). Dept. of Nuclear Engineering) (ed.). Oxford, England; Pergamon Press Ltd. (1977).

From Specialists meeting on reactor noise; Gatlinburg, TN, USA (19 Sep 1977).

For LMFBR safety studies a 28 rod bundle has been built at Petten (cooperation of GfK and ECN), representing a 60-degrees section of an SNR-300 fuel element having a 70% flat type central blockage. The aims of the temperature noise measurements were to determine the subchannel coolant velocities behind the blockage to study the mixing of coolant in subchannels of different temperature from behind the blockage to the outlet and to study the temperature noise due to boiling in a subchannel. The temperature noise measurements were carried out in parallel to the other measurements (temperature distribution, etc.), using signals of fourteen subchannel thermocouples placed in five measuring planes behind the blockage. The single phase measurements were made with several heat fluxes (5 W/cm^2 to 120 W/cm^2) inlet flows (0.25 to 3 m/s) and inlet temperatures (250°C to 600°C). Two phase flow is initiated and sustained either by a slow continuous pressure reduction or by stepwise reduction of the main flow. The temperature noise signals were amplified and recorded in analog form. Later the signals were digitized and analyzed by digital computers.

- 4999 BABCOCK AND WILCOX PLUTONIUM FUEL FABRICATION EXPERIENCE. Ross, W.J.; Benson, E.M. (Babcock and Wilcox Co., Apollo, PA). pp III.4.1-III.4.11 of Proceedings of the topical meeting on the plutonium fuel cycle. La Grange Park, IL; American Nuclear Society (1977).

From Conference on the plutonium fuel recycle; Miami Beach, FL, USA (2 May 1977).

The Babcock and Wilcox Plutonium Fuels Plant has fabricated 20,721 LMFBR type fuel pins of 25 w/o PuO_2 - UO_2 fuel for Core 1 of FFTF and is currently fabricating 35,500 additional fuel pins for Cores 3 and 4. LWR fuel pellets containing 2.6% PuO_2 - UO_2 were also fabricated, for in-reactor densification tests for EPRI, using equipment and the process considered typical for a 75 ton LWR plutonium fuel fabrication line. B and W's experience with the commercial plutonium fuel fabrication work has shown that a continuing effort must be directed toward an effective waste management program. The generation of waste must be minimized and controlled during the fabrication campaign to reduce the financial impact on the program.

- 5000 STUDY OF THE DISSOLUTION OF REFRACTORY PuO_2 IN AQUEOUS HYDRIODIC ACID SOLUTIONS. Tallent, O.K.; Mailen, J.C.; Williams, K.D. (Oak Ridge National Lab., TN). pp VI.4.1-VI.4.13 of Proceedings of the topical meeting on plutonium fuel cycle. La Grange Park, IL; American Nuclear Society (1977).

From Conference on the plutonium fuel recycle; Miami Beach, FL, USA (2 May 1977).

The dissolution of refractory PuO_2 in aqueous HI solution was studied as a part of a program to develop a suitable dissolution method for small amounts of PuO_2 remaining in residual solids after HNO_3 dissolution of LWR or LMFBR fuels. The PuO_2 dissolution reaction in HI was found to be second order with respect to mean HI activity and first order with respect to PuO_2 surface area. The apparent energy of activation for the dissolution reaction was found to be 13.4 kcal. The dissolved plutonium was found to be essentially all Pu(III) . Dissolution rates were found to remain relatively constant with time compared to the decreasing rates obtained in HNO_3 -HF- H_2O dissolvents.

- 5001 FULL SCALE TESTS AND THERMAL DESIGN CORRELATION FOR COILED ONCE-THROUGH STEAM GENERATORS. Campolunghi, F.; Cumo, M.; Ferrari, G.; Palazzi, G. (C.N.E.N., Rome, Italy). AICHE Symp. Ser.; 73: No. 164, 215-227(1977). (CONF-760816--).

From National heat transfer conference; St. Louis, MO, USA (8 Aug 1976).

Full scale heat transfer tests have been performed in a coiled once-through steam generating tube ($d_{\text{sub tube}} = 0.0155 \text{ m}$, $D_{\text{sub coil}} = 0.836 \text{ m}$), with subcooled water at inlet and superheated steam at outlet. Pressure (p) ranges from 80 to 170 bar, specific mass flowrate (G) from 1000 to 2500 $\text{kg}/\text{m}^2\text{s}$, surface heat flux (q'') from 10 to 30 $\times 10^4 \text{ W}/\text{m}^2$ q''/G ratios have been kept almost constant, close to a typical value for LMFBR's steam generators: q''/G approx. = 0.13 kJ/kg . It has been deduced that for $q''/\text{G} < 0.13 \text{ kJ}/\text{kg}$ no DNB occurs. Thus designers may consider a boiling length extended up to 100% quality. Along this length (an important one of steam generators) a mean boiling heat transfer coefficient is suggested: $h_{\text{sub b}} = 11.226 q''^{0.6} e^{0.0132 - \text{sub p}} / (\text{W}/\text{m}^2\text{°C})$ within a $\pm 30\%$ error margin. Internal and external side heat transfer coefficients, in the superheated steam region of the coil, may differ up to 100% and more.

- 5002 EFFECTS OF NONLINEAR OR 'NOT-LINEAR' CHARACTERISTICS OF REACTOR KINETICS ON POWER REACTOR NOISE ANALYSIS AND PROPOSAL OF APPLICATION OF SOME NEWLY DEVELOPING TECHNIQUES TO POWER REACTOR NOISE ANALYSIS. Kataoka, H. Prog. Nucl. Energy; 1: No. 2-4, 575-582(1977).

Since noise analysis techniques were proposed, they have been useful for subcritical assemblies and zero-power reactors, but not enough successful for power-reactors, because fundamental theory of power-reactor noise is not established yet. Despite various kinds of trial theory for understanding this discrepancy, none of them could get the final solution. Therefore, the author has proposed consideration of the effect of so-called 'not-linear' kinetics or special type of nonlinear kinetics combining the feedback in the nuclear reactor. The author shows many difficulties in the application of conventional noise analysis techniques to power reactors; and in order to overcome these difficulties, proposes the necessity and usefulness of the application of some newly-developing analysis-techniques. These techniques could be effective for the times both before and after high-power-reactor noise theory is established. 25 refs.

- 5003 THERMAL-HYDRAULIC EVALUATION OF ADVANCED WIRE-WRAP ASSEMBLIES. Wei, J.P. (General Electric Co., Sunnyvale, CA). AICHE Symp. Ser.; 73: No. 164, 105-113(1977). (CONF-760816--).

From National heat transfer conference; St.

Louis, MO, USA (8 Aug 1976).

Fuel assemblies for liquid-metal-cooled fast breeder reactors consist of a large number of rods uniformly spaced by wire wrap in a hexagonal array. Thermal-hydraulic analyses of a 217-rod wire-wrapped assembly with different wire-wrap geometries was accomplished. Advanced designs considered are staggered starts, distributed wireless fuel rods and locked wrap.

- 5004 EMPIRICAL METHOD TO CALCULATE CLINCH RIVER BREEDER REACTOR PLANT (CRBRP) INLET PLENUM TRANSIENT TEMPERATURES. Howarth, W.L. (Westinghouse Electric Corp., Madison, PA). AICHE Symp. Ser.; 73: No. 164, 114-119(1977). (CONF-760816--).

From National heat transfer conference; St. Louis, MO, USA (8 Aug 1976).

Sodium flow enters the CRBRP inlet plenum via three inlet loops. An empirical equation was formulated to calculate transient temperatures in the inlet plenum from known inlet loop flows and temperatures. The constants in the empirical equation were measured in a 1/4 scale Inlet Plenum Model using water as the test fluid and an electrolyte to simulate the sodium temperature distribution. Step electrolyte transients at 100% model flow were used to calculate the equation constants. The empirical equation was checked by comparing its results with test results from additional tests that covered the inlet plenum operational range.

- 5005 INFLUENCE OF SCALE SIZE AND FLUID THERMAL PROPERTIES IN SIMULATING LMFBR OUTLET PLENUM BEHAVIOR. Lorenz, J.J.; Carlson, R.D.; Howard, P.A. (Argonne National Lab., IL). AICHE Symp. Ser.; 73: No. 164, 120-126(1977). (CONF-760816--).

From National heat transfer conference; St. Louis, MO, USA (8 Aug 1976).

The influence of scale size and fluid thermal properties in simulating LMFBR outlet plenum behavior was studied. Tests were performed with water and sodium using 1/15-scale models of LMFBR outlet plenums. It was found that differences in the behavior of sodium and water were relatively modest despite a large variance in the respective Peclet numbers. The effect of scale size was found to be unimportant as evidenced by the reasonably good overall agreement of the present 1/15-scale results and 0.55-scale data of Carr and Flanagan. It was concluded that for the purpose of obtaining engineering design data relating to LMFBR outlet plenums, small scale water tests will provide a fairly good direct simulation of full scale sodium behavior.

- 5006 PREDICTIVE TECHNIQUE FOR TEMPERATURE AND EDDY DIFFUSIVITY DISTRIBUTIONS IN LIQUID METAL TURBULENT PIPE FLOW. Klein, G.A.; Sasonke, A. (Purdue Univ., West Lafayette, IN). AICHE Symp. Ser.; 73: No. 164, 127-132(1977). (CONF-760816--).

From National heat transfer conference; St. Louis, MO, USA (8 Aug 1976).

A semi-empirical technique was developed for determining the eddy diffusivity of heat, ϵ /sub H/, independent of temperature gradient measurements for liquid metals. Two functions represent ϵ /sub H/ in the low and high Reynolds number range, respectively. These describe available data and can be refined as additional results become available.

- 5007 MEASUREMENTS OF SUBASSEMBLY AND CORE TEMPERATURE DISTRIBUTIONS IN AN LMFBR. Singer, R.M.; Gillette, J.L. (Argonne

National Lab., IL). AICHE Symp. Ser.; 73: No. 164, 97-104(1977). (CONF-760816--).

From National heat transfer conference; St. Louis, MO, USA (8 Aug 1976).

In the analyses of temperature distributions in the core of a liquid metal cooled fast breeder reactor (LMFBR) under both normal and abnormal operating conditions, it is generally assumed that there is little, if any, thermal interaction between adjacent subassemblies. Since intersubassembly heat transfer tends to reduce the radial temperature gradient in a reactor, thereby ameliorating the effects of local overheating, this assumption is conservative. In order to assess the importance of this effect as well as that of flow redistribution in a reactor core, a series of in-core and subassembly outlet measurements were made in EBR-II over a wide range of operating power and flow conditions, encompassing both forced and natural convection. The results of this study indicate that radial heat transfer and flow redistribution are important mechanisms which should be taken into account in the thermal-hydraulic analyses of LMFBR cores, especially under low flow rate conditions.

- 5008 RADIATION-DAMAGE CONSIDERATIONS. Frost, B.R.T. (Argonne National Lab., IL). pp 521-543 of Fundamental aspects of structural alloy design. Jaffee, R.I.; Wilcox, B.A. (eds.). New York, NY; Plenum Publishing Corp. (1977).

The designs of nuclear-fission and fusion power plants do not, in general, appear to make unusual demands on materials in terms of mechanical-property requirements. The needs of the designer can be met by commercially available alloys. However, the radiation environment produces unique effects on the composition, microstructure, and defect population of these alloys, resulting in time-dependent and time-independent changes in mechanical properties. The material needs of the core of a Liquid-Metal Fast-Breeder Reactor (LMFBR) and of the first wall of a fusion reactor are discussed. In the case of the LMFBR core, the phenomenon of void swelling causes serious design problems, and a search is being made for a low-swelling alloy that has adequate mechanical properties. The fusion reactor poses different problems because the neutron energy is high (14 MeV) and is accompanied by a high flux of charged particles. The long-term choices for a wall material have been narrowed to vanadium and niobium alloys. In the search for low-swelling alloys, it has become clear that minor elements play an important role in determining the nature of the radiation effects. The segregation of minor elements to void surfaces and the dispersion and reformation of second-phase precipitates are two important radiation-induced phenomena that require additional study in view of their influence on void swelling and high-temperature properties.

- 5009 DETECTION OF SODIUM VAPOR BUBBLE COLLAPSE IN A LIQUID METAL FAST BREEDER REACTOR. Carey, W.M.; Gavin, A.P.; Bobis, J.P.; Sheen, S.H.; Anderson, I.T.; Doolittle, R.D.; Albrecht, R.W. (Argonne National Lab., Ill. (USA)). pp 437-468 of Reactor noise - SMORN II. Proceedings of the 2. specialists meeting on reactor noise, Gatlinburg, Tennessee, USA 19-23 September 1977. Williams, M.M.R. (Queen Mary Coll., London (UK). Dept. of Nuclear Engineering) (ed.). Oxford; Pergamon Press Ltd. (1977).

Sodium boiling detection utilizing the sound pressure emanated during the collapse of a

sodium vapour bubble in a subcooled media is discussed in terms of the sound characteristic, the reactor ambient noise background, transmission loss considerations and performance criteria. Data obtained in several loss of flow experiments on Fast Test Reactor Fuel Elements indicate that the collapse of the sodium vapour bubble depends on the presence of a subcooled structure or sodium. The collapse pressure pulse was observed in all cases to be on the order of a kPa, indicating a soft type of cavitation collapse. Spectral examination of the pulses indicates the response function of the test structure and geometry is important. The sodium boiling observed in these experiments was observed to occur at a low ($<50^{\circ}\text{C}$) liquid superheat with the rate of occurrence of sodium vapor bubble collapse in the 3 to 30 Hz range. Reactor ambient noise data were found to be due to machinery induced vibrations flow induced vibrations, and flow noise. These data were further found to be weakly stationary enhancing the possibility of acoustic surveillance of an operating Liquid Metal Fast Breeder Reactor. Based on these noise characteristics and extrapolating the noise measurements from the Fast Flux Test Facility Pump (FFTP), one would expect a signal to noise ratio of up to 20 dB in the absence of transmission loss. The requirement of a low false alarm probability is shown to necessitate post detection analysis of the collapse event sequence and the cross correlation with the second derivative of the neutronic boiling detection signal. Sodium boiling detection using the sounds emitted during sodium vapor bubble collapse are shown to be feasible but a need for in-reactor demonstration is necessary.

- 5010 DETERMINATION OF THERMOCOUPLE TRANSFER-FUNCTIONS AND FLUID-FLOW VELOCITIES BY TEMPERATURE-NOISE MEASUREMENTS IN LIQUID SODIUM. Benkert, J.; Mika, C.; Raes, K.H.; Stegemann, D. (Technische Univ. Hannover (Germany, F.R.)). pp 553-563 of Reactor noise - SMORN II. Williams, M.M.R. (Queen Mary Coll., London (UK). Dept. of Nuclear Engineering) (ed.). Oxford, England; Pergamon Press Ltd. (1977).

From Specialists meeting on reactor noise; Gatlinburg, TN, USA (19 Sep 1977).

The time response of TI-, TM- and intrinsic thermocouples has been investigated in sodium by determination of frequency dependent thermocouple transfer functions and related delay times. Experimentally temperature fluctuations (temperature noise), generated in sodium by heated channels or injection of hot sodium, have been used as driving sources. The measured transfer functions and delay times have been compared to predictions from theoretical models. Good agreement was found. Intrinsic and TM-type thermocouples are best suited if fast response is required. Delay times in the range of one millisecond or upper break frequencies of 1000 Hz were determined for intrinsic thermocouples. The determination of sodium flow velocities by the transit time correlation technique showed systematic error sources for analysis at low frequencies due to intermediate heat storage between the thermocouple positions. Statistical errors have been determined as function of thermocouple distance, frequency range and time analysis. Minimum errors are obtained for thermocouple distances from 100 to 150 mm and in the frequency range 90 to 120 Hz. A transit time correlator, which automatically tracks the maximum of the cross-correlation function and displays the velocity, has been successfully used for signals with correlation coefficients greater than 0.3.

- 5011 NOISE AND DC BALANCED OUTLET TEMPERATURE SIGNALS FOR MONITORING COOLANT FLOW IN LMFBF FUEL ELEMENTS. Edelmann, M. (Gesellschaft fuer Kernforschung m.b.H., Karlsruhe (Germany, F.R.)). pp 543-552 of Reactor noise - SMORN II. Williams, M.M.R. (Queen Mary Coll., London (UK). Dept. of Nuclear Engineering) (ed.). Oxford, England; Pergamon Press Ltd. (1977).

From Specialists meeting on reactor noise; Gatlinburg, TN, USA (19 Sep 1977).

Local cooling disturbances in LMFBF fuel elements may have serious safety implications for the whole reactor core. They have to be detected reliably in an early stage of their formation therefore. This can be accomplished in principle by individual monitoring of the coolant flow rate or the coolant outlet temperature of the sub-assemblies with high precision. In this paper a method is proposed to increase the sensitivity of outlet temperature signals to cooling disturbances. Using balanced temperature signals provides a means for eliminating the normal variations from the original signals which limit the sensitivity and speed of response to cooling disturbances. It is shown that a balanced signal can be derived easily from the original temperature signal by subtracting an inlet temperature and a neutron detector signal with appropriate time shift. The method was tested with tape-recorded noise signals of the KNK I reactor at Karlsruhe. The experimental results confirm the theoretical predictions. A significant reduction of the uncertainty of measured outlet temperatures was achieved. This enables very sensitive and fast response monitoring of coolant flow. Furthermore, it was found that minimizing the variance of the balanced signal offers the possibility for a rough determination of the heat transfer coefficient of the fuel rods during normal reactor operation at power.

- 5012 DETECTION OF LOCAL BOILING IN AN LMFBF SUBASSEMBLY BY TEMPERATURE FLUCTUATIONS ANALYSIS AT THE OUTLET. Krebs, L.; Weinkoetz, G. (Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Inst. fuer Reaktorbauelemente). pp 507-515 of Reactor noise - SMORN II. Williams, M.M.R. (Queen Mary Coll., London (UK). Dept. of Nuclear Engineering) (ed.). Oxford, England; Pergamon Press Ltd. (1977).

From Specialists meeting on reactor noise; Gatlinburg, TN, USA (19 Sep 1977).

The aim of the experiments is to detect boiling in a sodium cooled subassembly by measuring fluctuations behind the bundle outlet. The measurements were carried out on an electrically heated 28-rod bundle with a partially blocked section. Fast responding thermocouples were installed downstream of the bundle outlet and downstream of a flow mixing system. Statistical parameters were investigated such as root mean square (RMS) and power spectrum density (PSD). The boiling conditions were generated by reducing the system pressure or flow velocity reduction. The experiments have shown that statistical analysis of temperature fluctuations can produce significant results in the detection of boiling behaviour at both the outlet of a subassembly, and behind a flow mixing system.

- 5013 BOILING DETECTION IN FAST REACTORS BY NOISE ANALYSIS STUDIES PERFORMED IN FRANCE. Le Guillou, G.; Berger, R.; Brunet, M. (CEA Centre d'Etudes Nucleaires de Cadarache, 13 - Saint-Paul-les-Durance (France). Dept. des Reacteurs a Neutrons Rapides). pp 409-426 of

Reactor noise - SMORN II. Williams, M.M.R. (Queen Mary Coll., London (UK). Dept. of Nuclear Engineering) (ed.). Oxford, England; Pergamon Press Ltd. (1977).

From Specialists meeting on reactor noise; Gatlinburg, TN, USA (19 Sep 1977).

The onset of accidental conditions particularly the boiling of sodium is generally related to background noise modifications in an operating reactor. The detection of in-core boiling may be achieved by three different analysis methods: neutron noise, acoustic noise and temperature fluctuations at the subassembly outlets. This paper deals with tests and measurements made in this field. The subject is discussed under the following headings: boiling in the loop (general description of experiments, detection of boiling by monitoring flow and pressure noises, detection of boiling by thermal noise analysis, acoustic detection of boiling); detection of boiling in the core: description of the 'NABO' experiment carried out on the reactor RAPSODIE (brief description of experiment, detection of boiling by neutron noise analysis, detection of boiling by acoustic noise analysis).

5014 ACOUSTIC DETECTION OF BOILING IN LMFBRs: AN ESTIMATE OF SENSITIVITY DERIVED FROM EXPERIMENTS DURING THE COMMISSIONING OF PFR. Macleod, I.D.; Catling, E.; Taylor, C.G. (UKAEA Reactor Group, Springfield). pp 469-485 of Reactor noise - SMORN II. Williams, M.M.R. (Queen Mary Coll., London (UK). Dept. of Nuclear Engineering) (ed.). Oxford, England; Pergamon Press Ltd. (1977).

From Specialists meeting on reactor noise; Gatlinburg, TN, USA (19 Sep 1977).

This paper describes a programme of experiments undertaken during the commissioning of the 600-MW PFR at Dounreay. The objective of the programme was to obtain data on reactor background acoustic noise levels and to estimate the sensitivity of the installed acoustic boiling detection system. The boiling-noise detection system installed in PFR consists of seven waveguides. The waveguides are solid metal rods which extend from the reactor top to just above the core top level. Five are arranged on a 0.75m radius circle with two at the edge of the core. The sensing elements are standard accelerometers. For the commissioning experiments three rigs were installed in the core locations below three of the waveguides. Each rig carried three sodium-proof microphones at levels corresponding to core top, mid-core and core bottom. Each rig also carried an electrically-powered vapour generator which could inject a stream of sodium vapour into the surrounding 250°C sodium, so producing a boiling type noise. In addition to these nine microphones in the core, microphones were also installed at the inlet and outlet of each of the three pumps. To handle the data for this experiment a system of amplifiers and three fourteen-track tape recorders were used. To check amplifier gains a calibration signal was automatically injected at the end of each record. On-line one-third octave and narrow band analysis was also available, but the bulk of the analysis was done from the tape records. The commissioning programme was in two parts: a measurement of background noise and an investigation of the detection sensitivity at the waveguides of the noise from the vapour generator (this implicitly included the transmission loss).

5015 DESIGN RULES FOR HIGH TEMPERATURE PLANT - THE IMPLICATIONS OF RECENT RESEARCH IN RELATION TO CURRENT PRACTICE. Townley, C.H.A. (Central Electricity Generating Board, Berkeley (UK).

Berkeley Nuclear Labs.). pp 1-3 of Recent developments in high temperature design methods. London; Mechanical Engineering Publications for IMechE (1977).

From Conference on recent developments in high temperature design methods; London, UK (6 Dec 1977).

An historical summary is presented of design rules for high temperature plant, leading to the rules applicable to high temperature reactors, particularly the liquid metal fast breeder reactor. Special attention is given to creep rupture properties of ferritic and austenitic materials used for the construction of components such as boilers and pressure vessels.

5016 MATERIALS DATA FOR SEVERE VARIABLE LOADING. Wood, D.S. (UKAEA, Risley. Nuclear Power Development Labs.). pp 65-70 of Recent developments in high temperature design methods. London; Mechanical Engineering Publications for IMechE (1977).

From Conference on recent developments in high temperature design methods; London, UK (6 Dec 1977).

The reversed strain behaviour of structural materials at temperatures in the creep range is an important materials parameter in sodium cooled fast reactors. Existing rules for designing against combined creep/fatigue are suspect due to lack of long term data. A UK programme of creep/fatigue tests is outlined which includes long term tests and a study of cast variations. It is believed that information from this programme should substantially improve our ability to provide design guidance against creep/fatigue damage.

5017 DETECTION OF ACOUSTIC EMISSION EVENTS IN THE PRESENCE OF PARASITIC NOISE. Fuge, R. (Zentralinstitut fuer Kernforschung, Rossendorf bei Dresden (German Democratic Republic)). pp 681-690 of Reactor noise - SMORN II. Williams, M.M.R. (Queen Mary Coll., London (UK). Dept. of Nuclear Engineering) (ed.). Oxford, England; Pergamon Press Ltd. (1977).

From Specialists meeting on reactor noise; Gatlinburg, TN, USA (19 Sep 1977).

The optimum threshold for the detection of acoustic emission bursts, which are masked by parasitic noise is calculated. The theoretical results are applied to the acoustic noise generated by boiling sodium.

5018 MICROSTRUCTURAL ASPECTS OF NUCLEAR FUEL. Graham, R.A.; Rasmussen, D.E.; Carlson, M.C.J. pp 404-413 of Ceramic microstructures '76: with emphasis on energy related applications. Fulrath, R.M.; Pask, J.A. (eds.). Boulder, CO; Westview Press (1977).

From 6. international symposium - ceramic microstructures '76; Berkeley, CA, USA (24 Aug 1976).

Pore size distribution and morphology characterization data were obtained for a wide range of mixed oxide fuel microstructures and related to fabrication parameters. Fuel microhomogeneity is characterized as equivalent sized PuO_2 regions calculated from concentration dependent size distribution information. Techniques described can provide an effective basis for comparing and monitoring effectiveness of alternate fabrication techniques and definition of critical parameters.

5019 APPLICATION OF PROBABILISTIC METHODS TO SAFETY R AND D AND DESIGN CHOICES. Gavigan, F.X.; Griffith, J.D. (Energy Research and

Development Administration, Washington, DC). pp 22-41 of Nuclear systems reliability engineering and risk assessment. Fussell, J.B.; Burdick, G.R. (eds.). Philadelphia, PA; Society for Industrial and Applied Mathematics (1977).

From International conference on nuclear systems reliability engineering and risk assessment; Gatlinburg, TN, USA (20 Jun 1977).

The Liquid Metal Fast Breeder Reactor (LMFBR) safety program is committed to identifying and exploiting areas in which probabilistic methods can be developed and used in making reactor safety R and D choices and optimizing designs of safety systems. Emphasis will be placed on a positive approach of solidifying and expanding our knowledge. This will provide the groundwork for a consensus on FBR risk. The management structure which will be used is based on a mechanistic approach to an LMFBR Core Disruptive Accident (CDA) with risk partitioned into "Lines of Assurance," i.e., independent, phenomenologically-based barriers which will impede or mitigate the progression and consequences of accident sequences. Quantitative determination of the probability of breach of these barriers through the completion of work identified for each Line of Assurance will allow the quantification of the contribution to risk reduction associated with the success of each barrier. This process can lead to better use of resources by channeling R and D in directions which promise the greatest potential for reducing risk and by identifying an orderly approach to the development and demonstration of design features which will keep LMFBR risks at an acceptable level.

5020 PROBABILISTIC APPROACHES TO ADVANCED REACTOR DESIGN OPTIMIZATION. Burdick, G.R. (EG and G Idaho, Inc., Idaho Falls, ID); Rasmuson, D.M.; Weisman, J. pp 395-417 of Nuclear systems reliability engineering and risk assessment. Fussell, J.B.; Burdick, G.R. (eds.). Philadelphia, PA; Society for Industrial and Applied Mathematics (1977).

From International conference on nuclear systems reliability engineering and risk assessment; Gatlinburg, TN, USA (20 Jun 1977).

Approaches to advanced reactor design which combine probabilistic methods with system optimization techniques are proposed. In recognition that the best available design and manufacturing methods have been applied to component design and manufacture, it is suggested that significant improvement of nuclear systems performance is possible only through modification of the systems configuration. Thus, the models used in the optimization procedures are those for redundancy and diversity allocation or models which provide goals for such allocation. It is shown that diversity and redundancy allocation may be improved through the construction and use of functions which represent an estimate of the best cost obtainable for a given level of system availability. The use of functional relationships between cost and availability is extended to the case where acceptable levels of risk have been defined for plant operation. In this case, the cost functions for the various safety systems are used to form an overall objective function. Societal risk expressions are formulated in terms of safety system unavailabilities. Construction of the cost objective function and risk expressions constitutes completion of the top-level problem. A second-level problem is then solved which performs trade-offs of cost and availability among the safety systems. The second-level problem solution is a set of availability goals and cost guidelines which

can be used by designers in solution of third-level problems which are determinations of the actual safety system configurations.

5021 PROCEDURE FOR THE USE OF PROBABILISTIC RISK ASSESSMENTS TO ESTABLISH RANKING OF RESEARCH AND DEVELOPMENT GOALS. Temme, M.I.; El-Sheikh, K.A. (General Electric Co., Sunnyvale, CA). pp 418-442 of Nuclear systems reliability engineering and risk assessment. Fussell, J.B.; Burdick, G.R. (eds.). Philadelphia, PA; Society for Industrial and Applied Mathematics (1977).

From International conference on nuclear systems reliability engineering and risk assessment; Gatlinburg, TN, USA (20 Jun 1977).

A procedure for Ranking Research and Development goals on the basis of their importance to risk is described. Using information developed in a typical LMFBR risk assessment, rules for selection of the most important events or groups of events (e.g., event sequences) are defined. The procedure is illustrated through its application to an example, using a First Cycle Risk Assessment of FFTF.

5022 ROLE OF RELIABILITY AND RISK ASSESSMENT IN LMFBR DESIGN: IMPLEMENTATION OF RELIABILITY IN LMFBR DESIGN. Graham, J.; Zemanick, P.P. (Westinghouse Electric Co., Madison, PA). pp 686-709 of Nuclear systems reliability engineering and risk assessment. Fussell, J.B.; Burdick, G.R. (eds.). Philadelphia, PA; Society for Industrial and Applied Mathematics (1977).

From International conference on nuclear systems reliability engineering and risk assessment; Gatlinburg, TN, USA (20 Jun 1977).

This paper better concerns future developments in LMFBR licensing technology. Federal Regulations (10 CFR 50.34) require that the preliminary safety analysis provide analysis and evaluation "with the objective of assessing the risk to public health and safety" to determine margins of safety and the adequacy of the plant. Hitherto, the assessment of risk has been qualitative but it has become increasingly apparent that quantitative assessments would provide a better basis for judgement. Potential future roles of reliability and risk assessment are discussed in the context of providing additional confirmation of the safety of LMFBR designs. Potential acceptability criteria for risk evaluations are outlined. The reliability implications of designing components to the ASME Code Section III requirements are discussed. General judgements are provided as well as the preliminary results of probabilistic studies of selected specific limits. There is a different reliability significance for the mandatory rules for normal, upset, and emergency conditions versus the non-mandatory rules for normal, upset, and emergency conditions versus the non-mandatory guidance for faulted conditions.

5023 ON THE DEVELOPMENT OF NUCLEAR POWER. Emel'yanov, I.Ya. Power Eng.; 15: No. 5, 10-26(1977).

A brief exposition is given of experience in the development of nuclear power in the USSR beginning with the first nuclear reactor and the first atomic power station (APS) in the world and extending to large-scale construction of commercial APS. New trends and problems are characterized which have developed in nuclear power engineering at the contemporary stage of its development. Certain problems in the functioning of APS in combined electric power

systems are considered along with general problems of the utilization of nuclear reactors for centralized industrial and household heat supply, as well as for the realization of high-temperature industrial technology processes in the chemical industry, ferrous metallurgy, in the conversion of energy carriers, and in the production of hydrogen. Certain economic-ecological aspects of the development of nuclear power are elucidated in perspective.

- 5024 APPLICATION OF MAGNETOHYDRODYNAMIC GENERATORS IN NUCLEAR POWER ENGINEERING. Kirillin, A.; Sheindlin, A.E. Power Eng.; 15: No. 5, 27-34(1977).

The prospects for applying magnetohydrodynamic generators in nuclear power engineering in combination with various types of nuclear reactors are considered. The possibilities of combining liquid-metal fast-neutron reactors with liquid-metal MHD generators, high-temperature fission and fusion reactors with MHD generators operating on nonequilibrium plasma, and gas-phase fission reactors with MHD generators operating on uranium hexafluoride plasma are evaluated. It is concluded that MHD generators operating on a closed cycle may find fairly extensive application in nuclear power engineering.

- 5026 FLOW-INDUCED VIBRATION SCALE MODEL TEST OF THE CRBR INSTRUMENT POST. Mulcahy, T.M.; Yeh, T.T.; Lawrence, W.P. (Argonne National Lab., IL). pp 59-66 of Fluid structure interaction phenomena in pressure vessel and piping systems. Au-Yang, M.K.; Brown, S.J. Jr. (eds.). New York, NY; American Society of Mechanical Engineers (1977).
From Winter annual meeting of the American Society of Mechanical Engineers; Atlanta, GA, USA (27 Nov 1977).
The analysis is presented for the Clinch River Breeder Reactor Instrument Post which has a finned rocket-like geometry with high potential for excitation. Correlated shedding of vortices from the trailing edge of plates in smooth, parallel flow is well documented. The basis of the excitation mechanism is discussed as well as scaling criteria and distortions, model construction and instrumentation, and selected results. No indication of correlated vortex shedding was observed in the response.

- 5027 NUMERICAL FLUID-STRUCTURE INTERACTION ANALYSIS OF PIPING SYSTEMS. A-Moneim, M.T. (Argonne National Lab., IL). pp 107-121 of Fluid structure interaction phenomena in pressure vessel and piping systems. Au-Yang, M.K.; Brown, S.J. Jr. (eds.). New York, NY; American Society of Mechanical Engineers (1977).
From Winter annual meeting of the American Society of Mechanical Engineers; Atlanta, GA, USA (27 Nov 1977).

A computer code for transient two-

dimensional coupled hydrodynamic-structural response analysis of piping systems under the effect of internally travelling pressure pulses is described. Two dimensional hydrodynamic models for straight pipes, elbows, generalized piping component, tee branching junctions, and surge tanks are included and coupled together to form a general piping system that can be subjected to simultaneous pressure pulses of the form $P(t)$. Options are provided in the generalized piping component; namely, interior rigid wall simulation, nine different exterior wall configurations, and heat exchanger tube bundle effects. Thus, it can be used in modelling of valves, pipe flow area changes and heat exchangers.

- 5028 PRESSURE TRANSIENT ANALYSIS IN SINGLE AND TWO-PHASE WATER BY FINITE DIFFERENCE METHODS. Berry, G.F.; Daley, J.G. (Argonne National Lab., IL (USA)). pp 1-12 of Structural mechanics in reactor technology. Vol. B. Jaeger, T.A.; Boley, B.A. (eds.). Amsterdam, Netherlands; North-Holland (1977).
From 4. international conference on structural mechanics in reactor technology; San Francisco, CA, USA (15 Aug 1977).
An important consideration in the design of LMFBR steam generators is the possibility of leakage from a steam generator water tube. The ensuing sodium/water reaction will be largely controlled by the amount of water available at the leak site, thus analysis methods treating this event must have the capability of accurately modeling pressure transients through all states of water occurring in a steam generator, whether single or two-phase. The equation systems of the present model consist of the conservation equations together with an equation of state for one-dimensional homogeneous flow. These equations are then solved using finite difference technique with phase considerations and non-equilibrium effects being treated through the equation of state. Fluid-structure interactions were not included at the time of this writing but are treated in the systems code which will contain this water-side transient model.

- 5029 INVESTIGATION OF THE STRUCTURAL INTEGRITY OF THE REACTOR VESSEL FOR A POSTULATED CORE MELTDOWN ACCIDENT. Glueckler, E.L. (General Electric Co., Sunnyvale, CA (USA). Fast Breeder Reactor Dept.); Clever, R.M.; Rumble, E.T. (Science Applications, Inc., Palo Alto, CA (USA)). pp 1-12 of Structural mechanics in reactor technology. Vol. G. Jaeger, T.A.; Boley, B.A. (eds.). Amsterdam, Netherlands; North-Holland (1977).
From 4. international conference on structural mechanics in reactor technology; San Francisco, CA, USA (15 Aug 1977).
If a core meltdown accident is postulated to occur, a large mass of molten fuel and steel debris could collect at the bottom of the reactor vessel. As a consequence, the vessel would be subjected to rapid heating and surface melting. In the absence of adequate cooling, inelastic failure or meltthrough could occur. The two dimensional thermal response of the vessel was obtained from a multiregion ADI solution of the fully implicit finite difference analogues of the governing differential equations. These equations have been transformed into a coordinate system moving with the melting surface. All non-linear effects such as the surface boundary conditions were included using an iterative scheme with quasi-linear equations.

- 5030 DAMPING OF THE RADIAL IMPULSIVE MOTION

OF LMFBR CORE COMPONENTS SEPARATED BY FLUID SQUEEZE FILMS. Liebe, R.; Zehlein, H. (Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Inst. fuer Reaktorentwicklung). pp 1-12 of Structural mechanics in reactor technology. Vol. B. Jaeger, T.A.; Boley, B.A. (eds.). Amsterdam, Netherlands; North-Holland (1977).

From 4. international conference on structural mechanics in reactor technology; San Francisco, CA, USA (15 Aug 1977).

The core deformation of a liquid metal cooled fast breeder reactor (LMFBR) due to local pressure propagation from rapid energy releases is a complex three-dimensional fluid-structure-interaction problem. High pressure transients of short duration cause structural deformation of the closely spaced fuel elements, which are surrounded by the flowing coolant. Corresponding relative displacements give rise to squeezing fluid motion in the thin layers between the subassemblies. Therefore significant backpressures are produced and the resulting time and space dependent fluid forces are acting on the structure as additional non-conservative external loads. Realistic LMFBR safety analysis of several clustered fuel elements have to account for such flow induced forces. Several idealized models have been proposed to study some aspects of the complex problem. As part of the core mechanics activities at GfK Karlsruhe this paper describes two fluid flow models (model A, model B), which are shown to be suitable for physically coupled fluid-structure analyses. Important assumptions are discussed in both cases and basic equations are derived for one- and two-dimensional incompressible flow fields. The interface of corresponding computer codes FLUF (model A) and FLOWAX (model B) with structural dynamics programs is outlined. Finally fluid-structure interaction problems relevant to LMFBR design are analyzed; parametric studies indicate a significant cushioning effect, energy dissipation and a strongly nonlinear as well as time dependent damping of the structural response.

- 5031 REVIEW OF THE ACOUSTIC DETECTION OF BOILING IN NUCLEAR REACTORS. Scarton, H.A. (Rensselaer Polytechnic Inst., Troy, NY); McDonald, J.F.; Carey, W.M. pp 109-123 of Noise and fluids engineering. Hickling, R. (ed.). New York, NY: American Society of Mechanical Engineers (1977).

From Winter annual meeting of the American Society of Mechanical Engineers; Atlanta, GA, USA (27 Nov 1977).

A review is presented of over 260 references on the physics of boiling, stressing acoustic monitoring techniques. Recent experimental results are examined for sodium boiling during LMFBR excursions and the characteristics of the physical acoustic signatures are identified.

- 5032 EULERIAN ALGORITHM FOR ANALYZING FLUID-STRUCTURE INTERACTION IN THE FAST REACTOR CONTAINMENT. Wang, C.Y.; Chang, Y.W.; Fistedis, S.H. (Argonne National Lab., IL (USA)). pp E1/3 1-11 of Structural mechanics in reactor technology. Vol. E. Jaeger, T.A.; Boley, B.A. (eds.). Amsterdam, Netherlands; North-Holland (1977).

From 4. international conference on structural mechanics in reactor technology; San Francisco, CA, USA (15 Aug 1977).

This paper presents an algorithm for analyzing the coupled fluid-structure problems in the LMFBR consisting of various internals and primary vessel. The aim is at the development of a generalized Eulerian hydrodynamic scheme, which can be used to link

together the ICE technique with the finite-element structural dynamics method to provide sliding capability at interface, modeling of perforated structure, and analyses of fluid motions at the geometry discontinuity. Since the finite-element method has been already well developed, the work described concentrates on the fluid-structure interaction. The algorithm uses the Eulerian description in the hydrodynamic formulation principally because it has the deciding advantage of treating excessive distortion. It employs the implicit temporal integration scheme to solve the nonlinear, time-dependent equations of fluid mechanics. This scheme not only insures computational stability, but also eases the Courant condition on the time step. Furthermore, the implicit treatment of pressure and velocity fields allows the presence of all flow-speed regimes. Hence, the algorithm is applicable to any degree of excursion. Two sample problems are given, concerning wave propagation in a typical LMFBR which consists of radial shield, core barrel, core-support structure, and the primary vessel.

From 4. international conference on structural mechanics in reactor technology; San Francisco, CA, USA (15 Aug 1977).

Argonne National Laboratory has developed two-dimensional axisymmetric fluid-structure-interaction codes to predict the pressures and strains in the primary piping loop caused by HCDA-generated pressure pulses. Verification of these codes requires simple, well-defined experiments in which scale models of the primary piping are loaded with pressure pulses and the pressures, strains, and deformation in the pipe are measured. This paper presents the results of such an experimental program. Experiments were performed on 5-foot-long (3 inch OD, 0.065 inch wall) Ni 200 pipe sections filled with water. Experimental results are

compared with predictions from a one-dimensional, method-of-characteristics computer analysis of pressure pulses propagating in a plastically deforming pipe.

(INTERATOM), Bergisch Gladbach (Germany, F.R.)). pp D2/4 1-12 of Structural mechanics in reactor technology. Vol. D. Jaeger, T.A.; Boley, B.A. (eds.). Amsterdam, Netherlands; North-Holland (1977).

From 4. international conference on structural mechanics in reactor technology; San Francisco, CA, USA (15 Aug 1977).

The influence of temperature gradients, neutron fluence gradients and irradiation induced creep leads to individually different bowing effects of all elements in a core of a fast reactor. Subsequent contacts between neighbouring elements result in forces of different value. Eventually all elements will arrange in such a way, that an equilibrium of forces between all elements is achieved. The determination of this equilibrium configuration in different operational states of the reactor is of high significance especially for safety aspects. For this reason, in addition to existing 2-dimensional codes, a 3-dimensional code was developed to allow a good description of the whole core bowing behaviour. Because of nonlinearities, standard mathematical techniques for solving linear structural problems are not directly applicable. So an iterative procedure is applied to achieve the equilibrium force configuration. Each iteration step corrects the largest force discrepancy between neighbouring elements. This technique requires a long computer running time to converge, but the locations of gaps and contacts normally do not change if a rough equilibrium is found.

- 5037 CHARACTERIZATION OF RESIDUAL STRESS PROFILES IN IRRADIATED FUEL PIN CLADDING. Nygren, R.E. (Hanford Engineering Development Lab., Richland, WA (USA)). pp C2/5 1-9 of Structural mechanics in reactor technology. Vol. C. Jaeger, T.A.; Boley, B.A. (eds.). Amsterdam, Netherlands; North-Holland (1977).
- From 4. international conference on structural mechanics in reactor technology; San Francisco, CA, USA (15 Aug 1977).

During reactor operation a radial temperature gradient exists through the fuel pin cladding. The temperature gradient causes stress through differential thermal expansion and differential swelling. This paper describes a method for determining actual residual stress profiles in cladding. Work of this nature is currently in progress. The experimental method begins by measuring the diameter of a tubular specimen and then slitting the wall of the specimen axially and remeasuring the diameter. Successive, uniform layers of material are removed from the tube wall and after each increment of wall thinning the diameter is measured. The experimental goal is to provide enough data to describe the free deflection ΔD as a function of the wall thinning. Two specific applications for characterizing the residual stress in irradiated fuel pin cladding with limited, discrete data are developed in the paper. One represents a minimum effort approach and requires only four pairs of data. The end product is a 'curve' consisting of four linear segments that approximates the residual stress profile of the cladding specimen. The second technique is a semi-analytical technique for statistically fitting an assumed curve form to the data.

- 5038 DYNAMIC PROPERTIES OF FUEL PINS. Konstantinidis, S. Acta Polytech. (Prague), IV; No. 3, 97-111(1977). (In Czech).

The dynamic properties of fuel pins exposed to vibration by a liquid sodium flow were studied on the model of a fuel element designed for a sodium cooled fast reactor. The test pins consisted of thin-walled steel tubes 7 mm in diameter, 2310 mm in length, and 0.5 mm in wall thickness filled in two thirds of their height with cylindrical pellets 5 mm in diameter and 10 mm in height, or with another material. A model element comprised 37 pins in a hexagonal lattice, spacing was provided using a wire spiral 1 mm in diameter and 100+5 mm in pitch. A mathematical model is described for studying vibration from the point of view of the exciting force analysis and the system vibration. The natural frequency surface tension amplitudes and vibration amplitudes were measured tensometrically. Piezoelectric contact sensors were used for measuring natural frequencies and resistance-type sensors were used for measuring vibration attenuation. Some results are presented of measuring and calculating the pin natural frequencies in variation with internal positive pressure and the relative vibration attenuation of the pins in variation with a different pin fill.

In liquid metal fast breeder reactor and lithium cooled fusion reactor, a sodium loop is being proposed to transfer heat from the primary coolant loop to the steam turbine cycle. Although by careful design and quality assurance programs, the probability for steam generator tube failure can be minimized, failure will still occur. The direct contact of sodium and water could cause a chemical reaction where hydrogen and sodium compounds are produced. This paper presents an evaluation of the potential hazards as a result of such a reaction. The sodium-water reaction is explosive in nature with highly corrosive chemical by-products. An analytical method is developed to investigate the extent of the reaction zone and the propagation of the

pressure wave in the sodium system.

In recent years, the use of computer codes to study the response of primary containment of large, liquid-metal fast breeder reactors (LMFBR) under postulated accident conditions has been adopted by most fast reactor projects. This paper gives a brief survey of the computational methods and codes available for LMFBR containment analysis. The various numerical methods commonly used in the computer codes are compared. It provides the reactor engineers up-to-date information on the development of structural dynamics in LMFBR containment analysis. It can also be used as a basis for the selection of the numerical method in the future code development.

From 4. international conference on structural mechanics in reactor technology; San Francisco, CA, USA (15 Aug 1977).

This paper deals with the modeling of the reactor internals in the HCDA analysis. Internals which must be included in the analysis are core blankets, shields, fission-gas plenum, core barrel and core support structure. This is because they are placed so close to the reactor core that the expansion of the reactor core is strongly influenced by the presence of these internals. The general approach to the mathematical model is to incorporate, to the extent possible, the actual geometries and the correct material properties. In the HCDA analysis, the mechanism for producing mechanical damage to the primary containment is the expansion of the reactor core. Therefore, it is very important to model the core gas properly. The inertia of the core gas must be included. Four to six zones are needed for a proper representation of the core. The core blankets and shields can also be represented by zones while core barrels must be modeled as thin shells. The core support structure can be modeled either as a lattice of shell elements similar to the actual structure or as an elastic-plastic solid continuum material with overall bending stiffness equivalent to the actual structure. However, the connection between the core support and the reactor vessel must be modeled properly. Finally, to demonstrate the validity of the mathematical model, the results of comparisons with experimental data are presented.

This paper describes a computer code, MICE (Multifield Implicit Continuous-fluid Eulerian Containment Code), which is being developed at Argonne National Laboratory (ANL) for the analysis of containment response to a hypothetical core disruptive accident (HCDA). The code is applicable to multifield flow problems where material fields are allowed to have penetrations. Reactor structures are treated as axisymmetrical shells and solved by the large-displacement and small-strain theory. Two sample problems have been performed using the MICE code. The first illustrates the relative motions of the material fields after the initiation of a core disassembly accident. Core support structure and core barrel are modeled as rigid obstacles. The second demonstrates the interactions between fluid and structures. Core expansion and reactor wall deformation at several instants are shown by the computer-generated film plots.

The intent of the paper is to describe a combined analytical-experimental programme that is being performed at J.R.C. Ispra in the field of subassembly deformation. From the numerical side, 2D and 3D non-linear dynamic finite element codes are being developed for coupled hydrodynamics structures situations. The structural part of these codes is based on the use of flexural elements in which non-linearities arising from elastic-plastic behaviour and from large-displacement effects are accounted for. As far as the fluid flow phase is concerned, a Lagrangian code is used, due to the particular configuration of the subassemblies, the fluid distortions can be assumed to be relatively small. Nevertheless with the analytical work experiments are performed in steps of increasing complexity so that each component of the computer codes can be adequately tested.

5048 ANALYSIS OF MECHANICAL HCDA CONSEQUENCES IN THE COOLANT LOOPS FOR DEMONSTRATION OF PRIMARY CONTAINMENT INTEGRITY IN SNR 300.

Giese, B.; Pollak, R. (Internationale Atomreaktorbau G.m.b.H. (INTERATOM), Bergisch Gladbach (Germany, F.R.)). pp E4/5 1-9 of Structural mechanics in reactor technology. Vol. E. Jaeger, T.A.; Boley, B.A. (eds.). Amsterdam, Netherlands; North-Holland (1977).

From 4. international conference on structural mechanics in reactor technology; San Francisco, CA, USA (15 Aug 1977).

The demonstration of the accommodation of the mechanical consequences of a hypothetical core disruptive accident (HCDA) within the primary system is an essential objective in the safety assessment for SNR-300. For this purpose a mathematical model has been developed, in which the pressure pulse propagation in fluid-filled piping systems is calculated. This model takes into account the compressibility of the fluid as well as the elastic-plastic deformation of the pipe walls. It is the special aim of this work to estimate the attenuation of pressure peaks by elastic-plastic response of the pipe walls and to calculate the remaining strains. The basic system of partial differential equations includes the conservation laws for mass and momentum and the equations of state for the fluid and the pipe wall material. Additionally, the equation of motion for the pipe wall is provided, which considers the inertia of structure response after the pressure loading. The stress is described in a one-dimensional way. Axial stresses and strains are neglected. The numerical solution of the differential equations is carried out by an explicit extended Lax-Wendroff difference-scheme with the help of an intermediate step.

5049 LMFBR TYPICAL IMPULSIVE LOADING CHARACTERIZATION AND ITS APPLICATION TO SIMPLIFIED STRUCTURAL MODELS. Giuliano, V.; Lazzeri, L. (SAIGE S.p.A., Via P. Pesce 5, 1-16151 Genova-Sampierdarena, Italy). pp E2/7 1-16 of Structural mechanics in reactor technology. Vol. E. Jaeger, T.A.; Boley, B.A. (eds.). Amsterdam, Netherlands; North-Holland (1977).

From 4. international conference on structural mechanics in reactor technology; San Francisco, CA, USA (15 Aug 1977).

The aim of this paper is a discussion of the analytical methods which have been used for the dimensioning of the support structure of a LMFBR tank to cope with the explosive accident. Particular reference is given to fast but comprehensive methods developed in order to assist the designer in the preliminary stage of

the design. The three main steps necessary to define a general arrangement of the structure can be described as follows: (1) simplified equivalent characterization of the impulsive loading, (2) Characterization of the elastic plastic behaviour of simple structural elements, (3) parametric absorption of plastic energy with comparison with allowable strains. Each step has been extensively studied and the main results obtained in terms of the analytical methods developed and typical applications are presented and discussed. For step 1) a modified version of NONSAP code has been extensively used in order to analyze and to compare the effect of some different time histories of impulsive loading with that of a simplified 'equivalent' impulsive loading. For step 2) an original computer code (CARPA) has been developed and used for the elastic plastic analysis of beams of different sections. For step 3) a simple original computer code (CAT) based on an analytical integration technique, has been developed and used to evaluate parametric absorption of plastic energy correlated to the large displacements of the supported tank. Applications of these methods and codes are given.

5050 MAIN ASPECTS OF THE DESIGN OF A SUPPORT STRUCTURE OF A LMFBR WITH PARTICULAR REFERENCE TO THE EXPLOSIVE ACCIDENT CONSEQUENCES. Giuliano, V.; Lazzeri, L. (SAIGE S.p.A., Via P. Pesce 5, 1-16151 Genova-Sampierdarena, Italy). pp E2/8 1-15 of Structural mechanics in reactor technology. Vol. E. Jaeger, T.A.; Boley, B.A. (eds.). Amsterdam, Netherlands; North-Holland (1977).

From 4. international conference on structural mechanics in reactor technology; San Francisco, CA, USA (15 Aug 1977).

The aim of this paper is a review of the main aspects of the design of a support structure of a LMFBR tank, with particular reference to the analysis of the non-linear dynamic behaviour of the structure in the plastic range under the effect of an explosive accident within the tank. The structure is composed by a L-shaped flange, which supports the tank, connected by means of nine square beams to a rigid box-type ring, fixed to the concrete. The plug of the tank is connected to the L-shaped figure by means of a group of SS bars. The non-linear dynamic analysis of the explosive accident has been carried out on a lumped mass model, with elastic-plastic elements which simulate main components of the support structure and tank. The impulsive load connected to the explosive accident has been modelled (on the basis of extensive comparative studies carried out) as two triangular pressure impulses acting on the plug and on the bottom of the tank. A large amount of results, which describe displacements, velocities and accelerations of the plug, of the tank, and of the support structure, together with the forces and stresses acting on the main structural components are presented and discussed, with particular reference to the influence of the various parameters involved in the analysis.

5051 BULK COOLANT CAVITATION IN LMFBR CONTAINMENT LOADING FOLLOWING A WHOLE-CORE EXPLOSION. Jones, A.V. (Commission of the European Communities, Ispra (Italy). Joint Research Centre). pp E1/4 1-8 of Structural mechanics in reactor technology. Vol. E. Jaeger, T.A.; Boley, B.A. (eds.). Amsterdam, Netherlands; North-Holland (1977).

From 4. international conference on structural mechanics in reactor technology; San Francisco, CA, USA (15 Aug 1977).

An LMFBR core undergoing an explosion

transmits energy to the containment in a series of pressure waves and the containment loading is determined by their cumulative effect. These pressure waves are modified by their interaction with the coolant through which they propagate. It is necessary to model both the induction of bulk cavitation by tension waves and the interaction of pressure waves with cavitating liquid in realistic containment loading calculations. This paper sets out the progress which has been achieved in such modelling and first indications for the effect of bulk coolant cavitation in LMFBR containment loading. Conclusions may be briefly summarised: 1) Bulk cavitation must be included in realistic containment loading calculations. 2) Phenomenological models of cavitating liquid without memory are inappropriate. The best approach is to model bubble dynamics directly, including at least momentum conservation and surface tension. 3) The containment loading resulting from a given explosion is sensitive to the state of preparation of the coolant. The number density of nucleation sites should therefore accompany the results of model tests.

This paper describes finite-element formulations for the thermal stress analysis of LMFBR structures. The first formulation is applicable to large displacement rotation problems in which the strains are small. For this formulation, a general temperature-dependent constituent relationship is derived from a Gibbs potential and a temperature dependent surface. A second formulation is presented for problems characterized by both large displacement-rotations and large strains. Here a set of large strain hypoelastic-plastic relationships are developed to linearly relate the rate of stress to the rate of deformation. These developments were incorporated into two ANL developed finite-element computer codes: the implicit version of STRAW and the 3D implicit Structural Analysis code. A set of problems is presented to validate both the 3D and 2D programs and to illustrate their applicability to a variety of problems.

- 5054 STRUCTURAL RESPONSE OF LARGE LMFBR HEAD CLOSURES TO HYPOTHETICAL CORE DISRUPTIVE ACCIDENTS. Kulak, R.F.; Marciniak, T.J. (Argonne National Lab., IL (USA)); Belytschko, T.B. (Illinois Univ., Chicago (USA)). pp E1/7 1-9 of Structural mechanics in reactor

technology. Vol. E. Jaeger, T.A.; Boley, B.A. (eds.). Amsterdam, Netherlands; North-Holland (1977).

From 4. international conference on structural mechanics in reactor technology; San Francisco, CA, USA (15 Aug 1977).

A finite-element model was developed to assess the ability of a pool-type LMFBR head closure to sustain an energetic HCDA. From a conceptual representation of an expanded EBR-II type deck. It was determined that there is a reasonable amount of symmetry in the structure that an initial model would consist of a 120° sector. This model accounts for the main structural elements of the closure head: beams, plates, inner ring, in-tank component nozzle and concrete shielding. The mass of the in-tank component was treated as a concentrated mass located at its attachment in the structural members. The ANL-developed SADCAT code was used in this study. The model was used to study the effect of several design variations on the structural response of the deck to an energetic HCDA. Two types of outer boundary conditions were considered to determine the effect on the closure head's displacement and stress levels. In addition to the above study, an analysis was conducted to determine the structural contribution of the concrete shielding.

From 4. international conference on structural mechanics in reactor technology; San Francisco, CA, USA (15 Aug 1977).

Structural damage may occur in liquid metal cooled fast breeder reactors (LMFBR) when local failures escalate to a fast release of excessive thermal energy within one fuel element. Time scales (5 to 50. msec) and peaks of associated pressure pulses (50. to 500. bar) may exceed the burst pressure of the hexagonal wrapper containing the pin-bundle. Though after fuel rupture the pressure level in the vicinity is markedly reduced, still a significant pressure field is propagating through the core. Therefore surrounding subassemblies or control rods are exposed to impulsive differential pressures causing duct flexure as well as local cross section deformation. A theoretical and experimental research program at GfK Karlsruhe investigates the mechanical effects of conservative pressure transients on LMFBR fuel elements. As part of the program this paper describes two computer codes (BEDYN-2, CORE-1) for non-linear structural dynamics of single as well as clustered subassemblies.

- 5057 SIMULATION OF LMFBR EXCURSION MODELS BY MEANS OF ICECO. Marchertas, A.H.; Wang, C.Y.; Fistedis, S.H. (Argonne National Lab., IL (USA)). pp E2/5 1-11 of Structural mechanics in reactor technology. Vol. E. Jaeger, T.A.; Boley, B.A. (eds.). Amsterdam, Netherlands; North-Holland (1977).

From 4. international conference on structural mechanics in reactor technology; San Francisco, CA, USA (15 Aug 1977).

Some comparisons of transient fluid-structure tests with results from the ICECO containment code have already been published. Additional test data from the same series of experiments have again become available. Thus, the comparison of these more complex models with the ICECO results is the subject of this paper. The experimental data used herein pertain to test models composed of a spherical source within a cylindrical pool of water. The rigid ends of the container are connected by holddown bolts and cylindrical boundaries are made of one or two concentric deformable shells. The space above the surface of the water is occupied by air which may vent during the course of the experiment. In order to gain better insight into this problem, several analytical models with the thin vessel were studied. The principal means of comparison between experiment and analysis for both test configurations was the final deformation of the vessels. Certain pressure and impulse data at specified locations were also available and thus were used for comparison. The correspondence of experimental and analytical results was in general quite good.

- 5058 EXTENSION OF HCDA SAFETY ANALYSIS TO LARGE PCRV CONTAINMENT STRUCTURES. Marchertas, A.H.; Fistedis, S.H. (Argonne National Lab., IL (USA)); Bazant, A.P. (Northwestern Univ., Evanston, IL (USA)). Dept. of Civil Engineering; Belytschko, T. (Illinois Univ., Chicago (USA)). pp E4/1 1-12 of Structural mechanics in reactor technology. Vol. E. Jaeger, T.A.; Boley, B.A. (eds.). Amsterdam, Netherlands; North-Holland (1977).

From 4. international conference on structural mechanics in reactor technology; San Francisco, CA, USA (15 Aug 1977).

The prestressed concrete reactor vessel (PCRV) has thus far been applied for nuclear reactor containments involving steady-state loading. This paper, on the other hand, considers the PCRV for the LMFBR containment which must sustain dynamic effects stemming from the Hypothetical Core Disruptive Accident (HCDA). To perform a feasibility study of such a PCRV, a specialized formulation for transient analysis of such structures was developed. The analytical model of a PCRV is represented in a finite element computer code involving an explicit time-integration procedure. The formulation is particularized for the axisymmetric geometry and includes simulations of tensile cracking of concrete, reinforcement and prestressing capability. The code is applied to the analysis of a PCRV in a possible LMFBR configuration. The code provides a useful tool for evaluating the effect of reinforcement and prestressing on crack propagation. By means of the code, the design parameters can be varied to improve and optimize the PCRV configuration.

- 5059 ENERGY SOURCE FOR MODELING HCDA BUBBLES. Ploeger, D.W.; Cagliostro, D.J.; Goodale, T.C. (Stanford Research Inst., Menlo Park, CA (USA)). Poulter Labs.). pp E4/2 1-12 of Structural mechanics in reactor technology. Vol. E. Jaeger, T.A.; Boley, B.A. (eds.). Amsterdam,

Netherlands; North-Holland (1977).

From 4. international conference on structural mechanics in reactor technology; San Francisco, CA, USA (15 Aug 1977).

One concern in the safety analysis of liquid metal fast breeder reactor (LMFBRs) is the release of radioactive core materials to the environment following a hypothetical core disruptive accident (HCDA). The release depends on the transport properties of the expanding, two-phase, fuel-coolant bubble produced during the HCDA and the energy available in the bubble to damage the reactor containment system. Most predictions of the HCDA bubble pressure-volume change relationship assume an isentropic expansion of the bubble material from some known initial state. This work describes the development and characterization of an energy source that models the assumed initial conditions and the subsequent expansion of an HCDA bubble in a simple 1/30-scale model of the Clinch River Breeder Reactor (CRBR). The source is used in a study of the phenomena associated with expanding, rising HCDA bubbles, the transport of radioactive core materials to the cover gas region, and the loading resulting from the impact of the coolant slug with the vessel cover. The results imply that gaswork and slug kinetic energy predictions based on an equilibrium expansion of a superheated liquid may be too high by a factor of two.

(Nuclear Power Engineering Department, Technology Division, Kawasaki Heavy Industries, Ltd, 4-1, 2-Chome, Hamamatsu-cho, Minato-ku, Tokyo, 105, Japan). pp E5/5 1-12 of Structural mechanics in reactor technology. Vol. E. Jaeger, T.A.; Boley, B.A. (eds.). Amsterdam, Netherlands; North-Holland (1977).

From 4. international conference on structural mechanics in reactor technology; San Francisco, CA, USA (15 Aug 1977).

Large leak sodium-water reactions that would occur in a steam generator of LMFBR causes abrupt changes of pressure and velocity of fluid in a secondary sodium system and relief system. These changes exert unsteady forces on piping and components. The estimation of the effect of the pressure and forces is needed to assess the integrity of the system. SOWACS-III code has been developed to predict the pressure, velocity, flow-induced forces and the response of the piping and components to these forces. This paper described SOWACS-III together with its model and method. Results of analyses are also given, the comparison with experimental results of initial pressure spike being included.

- The paper emphasizes the computational aspects of combined analytical-experimental investigations concerning dynamic elastoplastic deformation of a single fuel subassembly under transverse pressure loading. To simulate the situation within a fast reactor core during a postulated local vapor explosion the cushioning effect of the thin sodium layers between subassemblies has to be included. Therefore a new computer code CORTAN was developed which combines both a one-dimensional axial squeeze flow model as well as a variable cross-section Timoshenko beam model. The ensuing program structure of the code is described.

- A two-dimensional coupled hydrodynamic-structural response analysis of piping systems is described. Implicit Continuous-Fluid Eulerian (ICE) technique is utilized in the hydrodynamics while a finite-element technique is used in the structural analysis. Different piping components such as elbow, valves, reducers, expansions, heat exchangers, and tees are modelled and coupled with the straight pipe model. An axisymmetric general component model that can be used in modelling valves, reducers, expansions, and heat exchangers is described. At the inlet and outlet region of such component the cross-sectional area may change suddenly or gradually, or may not change at all. Among the options available in this model are deformable exterior walls, interior rigid wall simulation, and tube bundle effect. Sample problems are presented to demonstrate the capabilities of the method; their results and future developments are discussed.

- Some aspects of continuum physics used to develop the new constitutive equations for fuel cladding are presented in this report. The theory of internal state variable, whose evolution is governed by ordinary differential equations, has been introduced into continuum mechanics. The components of the internal or hidden state variable vector may be scalars, components of vectors, components of second order tensors, etc. Irradiation, hardening, grain size, chemical reaction, etc., are scalar internal variables. Internal strain, dislocation loop density, etc., are all examples of second order tensors whose components are internal state variables. The internal state variables of this report are irradiation, ϕ , which satisfies the neutron density conservation law, and hardening. The isotropic hardening plasticity theory used in conjunction with creep has been incorporated into a computer code called PECTCLAD and has been correlated to annealing tests of 20X cold-worked Type 316 stainless steel and to tensile tests of annealed Type 316 stainless steel cladding. This correlated model is used to accurately predict the tensile, burst, and Fuel-Cladding Transient Testing (FCTT) data for 20X cold-worked Type 316 stainless steel cladding over a wide range of temperatures, temperature rates and strain rate. An excellent comparison is obtained between the predicted and measured data.
- 5069 SIMPLE STEEL/WATER MODEL FOR PRELIMINARY STUDIES OF ACOUSTIC VIBRATION IN LMFBR. Bentley, P.G.; Firth, D.; Rowley, R.; Beesley, M. (UKAEA, Risley. Nuclear Power Development Establishment). pp F5/7 1-11 of Structural

mechanics in reactor technology. Vol. F. Jaeger, T.A.; Boley, B.A. (eds.). Amsterdam, Netherlands; North-Holland (1977).

From 4. international conference on structural mechanics in reactor technology; San Francisco, CA, USA (15 Aug 1977).

One source of vibration excitation in Liquid Metal Fast Breeder Reactor is the acoustic energy which is generated by the circulating pump and transmitted through the fluid to various structural components. To gain some preliminary understanding of the extent and magnitude of vibration in fast reactors therefore, a simple model has been constructed in which only the major components are represented. The modeling theory is discussed and it is shown that adequate representation of the steel/sodium reactor materials can be obtained in the model based on the use of steel/water. Appreciable stresses are found on all the components in the primary circuit, not necessarily only those close to the simulated pump source. After scaling them to reactor size and allowing for the source calibration, it is found that stresses are unlikely to be sufficiently high to cause damage. The possibility of higher stresses being produced by better acoustic/structure coupling, similar to that found in smaller laboratory experiments, is to be further investigated on the model.

- 5070 THERMAL AND STRESS ANALYSES OF MELTDOWN CUPS FOR LMFBR SAFETY EXPERIMENTS USING SLSF IN-REACTOR LOOPS. Blomquist, C.A.; Pierce, R.D.; Pedersen, D.R. (Argonne National Lab., IL (USA)); Ariman, T. (Notre Dame Univ., IN (USA)). pp E4/4 1-11 of Structural mechanics in reactor technology. Vol. E. Jaeger, T.A.; Boley, B.A. (eds.). Amsterdam, Netherlands; North-Holland (1977).

From 4. international conference on structural mechanics in reactor technology; San Francisco, CA, USA (15 Aug 1977).

The test trains for the Sodium Loop Safety Facility (SLSF) in-reactor experiments, which simulate hypothetical LMFBR accidents, have a meltdown cup to protect the primary containment from the effects of molten materials. Thermal and stress analyses were performed on the cup which is designed to contain 3.6 kg of molten fuel and 2.4 kg of molten steel. Thermal analyses were performed with the Argonne-modified version of the general heat transfer code THTB, based on the instantaneous addition of 3200 °K molten fuel with a decay heat of 9 W/gm and 1920 °K molten steel. These analyses have shown that the cup will adequately cool the molten materials. The stress analysis showed that the Inconel vessel would not fail from the pressure loading, it was also shown that brittle fracture of the tungsten liner from thermal gradients is unlikely. Therefore, the melt-down cup meets the structural design requirements.

- 5071 SUBASSEMBLY BOWING EXPERIENCE IN EBR-II. Bottcher, J.H.; Hofman, G.L. (Argonne National Lab., IL (USA)). pp D2/9 1-7 of Structural mechanics in reactor technology. Vol. D. Jaeger, T.A.; Boley, B.A. (eds.). Amsterdam, Netherlands; North-Holland (1977).

From 4. international conference on structural mechanics in reactor technology; San Francisco, CA, USA (15 Aug 1977).

Bowing was not considered a problem in EBR-II until subassembly handling problems occurred. A typical handling problem, caused by top end deflection of the bowed subassembly, is centering of the subassembly removal mechanism over the subassembly. Another problem is excess loads of up to 375 kg that have been required

to remove bowed subassemblies from their grid position. All of the bowed type 304 stainless steel subassemblies that created handling difficulties were given a post-irradiation examination. Correlation of the in-core bowing phenomena with the bowing data base required both an axial and radial thermal and flux characterization, consideration of the subassembly design, interpretation of swelling and creep behavior and a simple workable model that could incorporate these factors. A thermal hydraulics code, 'CLUSTER' was used to calculate the operating temperatures at sixty radial locations for each of nineteen axial sections along the hex duct. For this analysis a simple beam method was used with postulated radial restraint bounds in simulating intersubassembly loading. The results of this analysis showed that the bow at a neutron fluence of $>2.7 \times 10^{22} \text{ n/cm}^2$, $E>0.1 \text{ MeV}$, in these structurally varying subassemblies was highly thermal gradient dependent.

Jaeger, T.A.; Boley, B.A. (eds.). Amsterdam, Netherlands; North-Holland (1977).

From 4. international conference on structural mechanics in reactor technology; San Francisco, CA, USA (15 Aug 1977).

It is shown how the mechanical problems concerning the tightness of main sodium pump penetrations through the deck of a pool type reactor have been solved in joint SNECMA - HISPANO-SUIZA/CIRNA studies. Extensive general studies have been performed and a comprehensive dossier of different possible solutions compiled. Wherever appropriate, information has been extrapolated from PHENIX experience. In the solution finally adopted, an elastic torus shaped ring, which forms a ball-and-socket type joint is used. A thin shell structure connects the bottom to the reactor internals in such a way as to permit both vertical and rotational displacements. Studies and calculation have been completed with the realization of a 1/5 scale model of the upper torus ring. Displacement, and angular and axial stiffness measurements have confirmed the validity of the hypotheses.

- 5073 PARAMETRIC INVESTIGATION OF DYNAMIC FRACTURE. Chopra, P.S.; Moustakakis, B. (Argonne National Lab., IL (USA)). pp D3/6 1-10 of Structural mechanics in reactor technology. Vol. D. Jaeger, T.A.; Boley, B.A. (eds.). Amsterdam, Netherlands; North-Holland (1977).

From 4. international conference on structural mechanics in reactor technology; San Francisco, CA, USA (15 Aug 1977).

This paper presents results of parametric finite element fracture mechanics analyses conducted to develop an analytical model for simulating dynamic brittle fracture. Although this work may have wider general application, the dynamic loads considered here are those that may arise due to rapid release of fission gases from a failed fuel element inside a subassembly duct in an LMFBR. The analyses were conducted on an edge-cracked panel with various configurations of primary and secondary flaws

similar to those investigated for quasi-static fracture earlier by Chopra, et al. For the fracture configurations analyzed, the peak dynamic crack opening stresses (COS) in the vicinity of the crack tip exceeded the static values by a factor of approximately 1.5. The displacement between two opposing nodes behind the crack tip, called the crack opening displacement (COD), also was investigated. The dynamic COD was found to be approximately 1.3 times greater than the corresponding static value.

The problem addressed in this paper is the optimal design of an LMFBR fuel assembly channel, subject to realistic material properties, operating environment and reactor geometric limitations. An LMFBR fuel assembly channel is a hexagonal thin-walled tube surrounding the fuel pin bundle to facilitate fuel handling and to control the flow of coolant through the core. The environment results in a ballooning of the channel from its original hexagonal shape due to irradiation swelling, thermal and irradiation enhanced creep, and the elastic pressure deformation of the channel material. The cross-section shape of the hexagonal channel is limited primarily by the principal stress and the total channel radial growth. It is presently considered preferable that adjacent channels do not touch from channel ballooning due to concerns about safety and refueling considerations. A computer program, WALLOP, has been developed as described in this paper to derive the wall shape of such an optimum channel, given

realistic design and material constraints. Within WALLOP, an initial cross-sectional shape is chosen and a beam model of the wall is used to determine the elastic deflection. The computer program sequentially perturbs the wall cross section and repeats the process until channel life is maximized. For prototypic 1200 MWe LMFBR cores, comparing uniform thickness channel walls and optimized cross section walls generally shows that wall optimization yields about a 25% to 50% increase in allowable channel life for the same amount of material.

The LIFE-III computer code has been developed to describe the steady-state performance of LMFBR fuel rods. The mechanical analysis in the original version of the code was based on the assumption that the strains in the fuel and the cladding could be considered as infinitesimal. However, this assumption is grossly violated in the vicinity of the central void. To provide a more accurate description of the mechanical behaviour of the fuel element, a finite-strain fuel-element model was developed. The finite-strain calculations in the modified code are based on an incremental analysis. The deformations are assumed to be axisymmetric. The fuel element is divided into a number (≤ 10) of axial segments. Each segment is assumed to be in a state of generalized plane strain. The deformation history of the fuel element is analyzed in discrete time steps, and the basic geometry of the element is updated after each time step. To carry out the calculation for nonlinear materials, each axial segment is divided into a number (≤ 25) of concentric cylindrical rings. The analysis maintains the overall force equilibrium of each ring and enforces geometric compatibility between the rings. To test the adequacy of the formulation, the code was applied to a number of benchmark problems, and excellent results were obtained. Sample calculations with actual fuel pins show that the modified code gives more satisfactory results in the fuel regions near the central void. The finite-strain capability requires only a modest increase (approximately 5%) in computing time.

Amsterdam, Netherlands; North-Holland (1977).
From 4. international conference on structural mechanics in reactor technology; San Francisco, CA, USA (15 Aug 1977).
Azimuthal variations of clad temperature in fuel pin bundles leads to pin bowing by differential thermal expansion. During irradiation in a fast flux further possibly more severe bowing is caused by differential neutron induced voidage swelling, which, being temperature sensitive, will also vary azimuthally. The problem of pin bowing in a fuel element cluster involves consideration of the thermal/hydraulic behaviour, allowing for both inherent and induced clad temperature non-uniformities, coupled with the restrained bowing behaviour, including differential thermal expansion, differential swelling, and irradiation creep. All pins must be considered simultaneously. In the temperature and stress ranges of interest thermal creep may be neglected. An existing computer code, IAMBIC solves the zero time thermal bowing problem for a cluster of up to 61 pins on hexagonal pitch, with up to 21 supports at arbitrary axial spacing. The present paper describes the basis of TRIAMBIC, a time dependent code which analyses the irradiation induced effects in fuel pin bundles due to fast neutrons.
- 5081 THREE-DIMENSIONAL ANALYSIS FOR FUEL PIN DEFORMATIONS IN AN LMFBR ASSEMBLY. Miki, K. (Hitachi Ltd., Kawasaki, Kanagawa (Japan). From 4. international conference on structural mechanics in reactor technology; San Francisco, CA, USA (15 Aug 1977).
A new analytical method is presented for analyzing, in three dimensions, the mechanical response of fuel pins with wire spacers, to their thermal and neutronic environment in an assembly of a Liquid Metal cooled Fast Breeder Reactor (LMFBR). It analyzes the mechanical interactions of the fuel pins in the assembly corresponding to three directions, which form an angle of $\pi/3$ radians with one another, and is based on the mathematical relationship of the displacement at the contact points and the associated contact forces with respect to all fuel pins in a direction corresponding to one of three axes. The displacement of the fuel pin is composed of its three components in each of the three directions thus calculated. In particular this method makes it possible to take into precise consideration the two factors affecting the deformation of the fuel pins - (a) the mutual interaction of fuel pins and (b) the forced breeding of the fuel pins due to the deformation of the wrapper tube. Based on this method, a new computational code, the Subchannel Deformation Analysis Code for Wire-Wrapped Assemblies (SHADOW) has been developed which can be applied to seven kinds of wire-wrapped fuel assemblies with a number of fuel pins ranging from 7 to 169.

In order to perform structural analyses of the CRBRP steam generators which include the effects of various system thermal hydraulic transients, detailed thermal profiles must be developed and transmitted to the stress analyst in a usable form. A unique, semi-automated computer system has been developed to optimally accomplish this task. This method has enabled very rapid analyses of complex thermal stress problems. For scoping purposes, simplified models have been used to determine the worst transients thus minimizing detailed analysis. The method has also permitted rapid analysis of the effect of design changes. While the method was developed for steam generator analysis, it is being applied, in full or part, to thermal stress analysis of other components resulting in significant engineering cost and time savings.

This paper describes an apparatus designed to simulate the continuously increasing internal pressure due to the accumulation of fission product gas. There is also an examination of the effects of increasing pressure on the thermal creep rate of cladding. Test specimens are 20% Cu type 316 stainless steel tubes with 6.5 mm OD, 5.6 mm ID and 200 mm length. Increasing pressure creep tests were performed at 700°C, the hoop stress was increased in steps with 3 incremental rates of 0.15, 0.075 and 0.0375 kg/mm²h. Constant pressure creep tests were also performed at the same temperature for comparison. The results show that the creep rates obtained from creep curves under increasing pressure are several times as high as the stationary creep rates measured under the same constant pressure. Creep strain rate under increasing pressure, due to the accumulation of gaseous fission

products in the actual fuel cladding, is approximately 2 to 5 times that of the constant pressure creep rates, although the creep rate magnification depends on the stress and the stress-increase rate.

- 5085 RESPONSE OF A GRID SPACED FUEL ASSEMBLY TO SHIPPING ENVIRONMENT. Pal, N.; Allen, D.C. (General Electric Co., Sunnyvale, CA (USA). Fast Breeder Reactor Dept.). pp D2/12 1-12 of Structural mechanics in reactor technology. Vol. D. Jaeger, T.A.; Boley, B.A. (eds.). Amsterdam, Netherlands; North-Holland (1977).
From 4. international conference on structural mechanics in reactor technology; San Francisco, CA, USA (15 Aug 1977).

This paper presents a dynamic analysis approach for design verification of a grid spaced nuclear fuel under conditions of shipping and handling using prototypical test examples of transportation by truck. Analytical response results were obtained using representative trailer bed acceleration time histories which had been recorded earlier under simulated shipping by truck transport environment. Important parameters affecting response are identified. Recognizing that the analytical estimate of the fundamental periods of the GSA cannot be very accurate owing to the complex geometry, upper bounds on acceleration responses were established using the standard response spectrum technique. Finally, the GSA design was verified by laboratory tests—both static and dynamic. Static tests were used to calibrate displacement response of the grid spacer tabs relative to the fuel rods. Prototypical dynamic shaking table tests were next employed in which the response of the GSA was determined in sinusoidal sweep type of excitation. Handling loads were represented by shock tests consisting of one-cycle impulses at various levels of acceleration. The results of laboratory testing were seen to reinforce credence of design verification by analysis of the GSA subjected to shipping and handling environment.

- 5086 PROBABILISTIC DESIGN METHOD FOR LMFBR FUEL RODS. Peck, S.O.; Lovejoy, W.S. (General Electric Co., Sunnyvale, CA (USA). Fast Breeder Reactor Dept.). pp C4/9 1-8 of Structural mechanics in reactor technology. Vol. C. Jaeger, T.A.; Boley, B.A. (eds.). Amsterdam, Netherlands; North-Holland (1977).

From 4. international conference on structural mechanics in reactor technology; San Francisco, CA, USA (15 Aug 1977).

Fuel rod performance analyses for design purposes are dependent upon material properties, dimensions, and loads that are statistical in nature. Probabilistic design methods provide a systematic way to reflect the uncertainties in design parameters. PECS-III is a computer code which employs Monte Carlo techniques to generate the probability density and distribution functions for time-to-failure and cumulative damage for sealed plenum LMFBR fuel rods on a single rod or whole core basis. The probability that some measure of rod performance will fall within given limits is estimated by the relative frequency with which the Monte Carlo samples fall within those limits. The PECS-III deterministic model is a one-dimensional structural analysis code. Cladding loading mechanisms considered include fission gas pressure, differential fuel-cladding thermal expansion, and differential fuel-cladding swelling. The model predicts thermal creep strain, irradiation creep strain, irradiation induced swelling, and cumulative damage fractions based on strain and time to rupture. In fuel rod design, it is oftentimes

low probability events (e.g. failure) that are of interest. Importance sampling techniques are used in PECS-III to accurately reproduce the output distribution in the area of interest without the high cost of a large number of samples.

- 5087 STRESS-INTENSITY FACTORS FOR IRRADIATION-EMBRITTLED HEXAGONAL SUBASSEMBLY DUCTS. Petroski, H.J.; Glazik, J.L. (Argonne National Lab., IL (USA)); Achenbach, J.D. From 4. international conference on structural mechanics in reactor technology; San Francisco, CA, USA (15 Aug 1977).

In the present work, the results of a finite-element analysis of the problem of a crack in a corner of a uniformly pressurized hexcan are reported, and they support the applicability of beam theory to the hexcan problem. In particular, modeling the hexcan corner as a cracked strip whose crack faces are loaded with the hexcan stress distribution has been found to give very good results for the particular hexcan studied. The finite-element results for uniformly pressurized hexcans have been used as the basis for computing stress intensity factors for cracks in non-uniformly loaded hexcans, under loading conditions that might simulate those of fission gas released from failed fuel pins or other non-uniform accident loading conditions. A finite-element analysis also has been carried out for the cracked hexcan loaded by midflat forces. The results of the different techniques are compared, and the simple model of a cracked strip loaded with the hexcan stress distribution is found again to agree closely with the finite-element results for the hexcan considered. However, the weight function technique is expected to apply to geometries for which the strip model is inadequate and to hold over a wider range of crack sizes.

- 5088 STATISTICAL MECHANICAL ANALYSIS OF LMFBR FUEL CLADDING TUBES. Poncelet, J.P.; Pay, A. (Societe Belge pour l'Industrie Nucleaire, Brussels). pp C4/2 1-14 of Structural mechanics in reactor technology. Vol. C. Jaeger, T.A.; Boley, B.A. (eds.). Amsterdam, Netherlands; North-Holland (1977).

From 4. international conference on structural mechanics in reactor technology; San Francisco, CA, USA (15 Aug 1977).

The most important design requirement on fuel pin cladding for LMFBR's is its mechanical integrity. Disruptive factors include internal pressure from mixed oxide fuel fission gas release, thermal stresses and high temperature creep, neutron-induced differential void-swelling as a source of stress in the cladding and irradiation creep of stainless steel material, corrosion by fission products. Under irradiation these load-restraining mechanisms are accentuated by stainless steel embrittlement and strength alterations. To account for the numerous uncertainties involved in the analysis by theoretical models and computer codes statistical tools are unavoidably requested, i.e. Monte Carlo simulation methods. Thanks to these techniques, uncertainties in nominal characteristics, material properties and environmental conditions can be linked up in a correct way and used for a more accurate conceptual design.

- 5089 EXPERIMENTS ON THE RESPONSE OF HEXAGONAL

SUBASSEMBLY DUCTS TO INTERNAL PRESSURE PULSES. Romander, C.M.; Cagliostro, D.J. (Stanford Research Inst., Menlo Park, CA (USA)). Poulter Labs.). pp E3/4 1-9 of Structural mechanics in reactor technology. Vol. E. Jaeger, T.A.; Boley, B.A. (eds.). Amsterdam, Netherlands; North-Holland (1977).

From 4. international conference on structural mechanics in reactor technology; San Francisco, CA, USA (15 Aug 1977).

The safety of Liquid Metal Fast Breeder Reactors depends in part on the ability of the hexagonal subassembly ducts (hexcans) to withstand accidental internal radial loads so that damaged hexcans can be removed from the reactor core. To predict deformations and strains in hexcans subjected to these internal loads and in hexcans surrounding the damaged hexcan, Argonne National Laboratory has developed the finite-element, two-dimensional structural code STRAW (Structural Transient Response of Assembly Wrappers). The experiments described here were performed to verify the modeling techniques used in STRAW and to determine the effects of material properties on hexcan response. Pressure pulses were applied in 12-inch-long hexcans of annealed, 20% CW, and 50% CW 316 stainless steel. The results of these experiments are presented in a form suitable for verifying two-dimensional structure codes designed to predict the response of hexagonal subassembly ducts to internal pressures.

5090 STRUCTURAL ANALYSIS OF EXPERIMENTAL CARBIDE FUELED DRIVER ASSEMBLY FLOW DUCT FOR TESTING IN THE FFTF. Rowe, G.H.; Mehta, D.D.; Desaulniers, W.E. (Combustion Engineering, Inc., Windsor, CT (USA)). pp D2/10 1-14 of Structural mechanics in reactor technology. Vol. D. Jaeger, T.A.; Boley, B.A. (eds.). Amsterdam, Netherlands; North-Holland (1977).

From 4. international conference on structural mechanics in reactor technology; San Francisco, CA, USA (15 Aug 1977).

Mixed carbide fueled driver assembly experiments will be tested in FFTF fuel driver positions as part of the National Advanced Fuel Program. The design of the experiment flow ducts must assure conformance to FFTF functional requirements in addition to service as a test vehicle for the carbide fuel irradiations. Test goals of damage fluence burnup, and fluence to burnup ratio exceed those of the standard oxide fueled drivers. As a consequence, the 20% cold worked type 316 stainless steel material of construction will experience significant irradiation induced creep and swelling. Additionally, the flow duct design must withstand the enhanced thermal transients produced by the action of carbide fuel during reactor scrams. A major FFTF functional requirement is that adjacent flow ducts do not touch each other except at the load pads. This requires a realistic analysis of the creep and swelling deformation of the flow duct during an experiment lifetime. Flow duct dilation, i.e., diametrical growth of the hexagonal cross section, was investigated by the MARC-CDC finite element program. Subroutines for irradiation creep and swelling were incorporated into the program.

5091 PROOF TESTS OF IRRADIATED EBR-II DUCTS. Ruther, W.E.; Staffou, J.D.; Chopra, P.S.; Lambert, J.D.B.; Srinivas, S. (Argonne National Lab., IL (USA)). pp D3/7 1-8 of Structural mechanics in reactor technology. Vol. D. Jaeger, T.A.; Boley, B.A. (eds.). Amsterdam, Netherlands; North-Holland (1977).

From 4. international conference on structural mechanics in reactor technology; San

Francisco, CA, USA (15 Aug 1977).

Permanent deformation and fracture of subassembly ducts due to potential pressure pulses generated by the discharge of fission gas from fuel elements are important considerations in determining the burnup limit of fuels in LMFBR's. This paper discusses the results of a series of dynamic pressure tests that were conducted on intentionally defected irradiated EBR-II subassembly ducts. The tests were designed to simulate failure of a fuel element in a cluster of such elements. The major objective of the tests was to provide complete assurance that cladding failure of a driven-fuel element, which might conceivably cause rapid release of stored fission gas, would not deform or otherwise damage subassembly ducts in a way that would hinder movement of a control rod. The test program described provides a reliable method of assessing the failsafety of LMFBR ducts. The test procedure is particularly important since present analytical solutions cannot adequately model the subassembly and the reactor conditions.

5092 INITIAL PRESSURE SPIKE AND ITS PROPAGATION PHENOMENA IN SODIUM-WATER REACTION TESTS FOR MONJU STEAM GENERATORS. Sato, M.; Hiroi, H.; Tanaka, N.; Hori, M. (Power Reactor and Nuclear Fuel Development Corp., Oarai, Ibaraki (Japan). Oarai Engineering Center). pp E5/6 1-12 of Structural mechanics in reactor technology. Vol. E. Jaeger, T.A.; Boley, B.A. (eds.). Amsterdam, Netherlands; North-Holland (1977).

From 4. international conference on structural mechanics in reactor technology; San Francisco, CA, USA (15 Aug 1977).

With the objective of demonstrating the safe design of steam generators for prototype LMFBR MONJU against the postulated large-leak accident, a number of large-leak sodium-water reaction tests have been conducted using the SWAT-1 and SWAT-3 rigs. Investigation of the potential effects of pressure load on the system is one of the major concerns in these tests. This paper reports the behaviour of initial pressure spike in the reaction vessel, its propagation phenomena to the simulated secondary cooling system, and the comparisons with the computer code for one-dimensional pressure wave propagation problems.

5093 EFFECT OF TUBE-SUPPORT INTERACTION ON THE DYNAMIC RESPONSE OF HEAT EXCHANGER TUBES. Shin, Y.S.; Jendrzyszczak, J.A.; Wambganuss, M.W. (Argonne National Lab., IL (USA)). pp F6/5 1-11 of Structural mechanics in reactor technology. Vol. F. Jaeger, T.A.; Boley, B.A. (eds.). Amsterdam, Netherlands; North-Holland (1977).

From 4. international conference on structural mechanics in reactor technology; San Francisco, CA, USA (15 Aug 1977).

To avoid detrimental tube vibration in heat exchangers, resonant conditions and instabilities must be avoided, and/or peak dynamic amplitudes must not exceed allowable limits. In attempting a theoretical analysis, questions arise as to the effects of tube/support interaction on tube vibrational characteristics (i.e. resonant frequencies, modes, damping) and response amplitude. As a part of ANL's Flow-Induced Vibration Program in support of the Clinch River Breeder Reactor Plant (CRBRP) steam generator design activity, tube/support interaction experiments are being performed not only to gain the insight into the dynamic behavior of CRBRP steam generator tubes, but also to provide the basis for developing design guidance. Test results were compared with analytical results based on

multispan tube with 'knife-edge' supports at the support locations.

- 5094 MODEL FOR PRESSURE IN AN LMFBR DUCT DUE TO DISCHARGE OF GAS FROM A FAILED FUEL PIN. Srinivas, S.; Chopra, P.S. (Argonne National Lab., IL (USA)). pp D3/5 1-12 of Structural mechanics in reactor technology. Vol. D. Jaeger, T.A.; Boley, B.A. (eds.). Amsterdam, Netherlands; North-Holland (1977).

From 4. international conference on structural mechanics in reactor technology; San Francisco, CA, USA (15 Aug 1977).

In this paper an analytical model for the calculation of pressure pulses in hexagonal ducts due to discharge of gas from a failed fuel pin is developed. The analysis yields the time history of the pressure pulse which can be used in the calculation of permanent deformation of the duct or in the assessment of the susceptibility of the duct to fracture. The real physical situation of gas discharging through a pin in a duct filled with liquid is complex to model. Here the phenomenon is modeled based on some reasonable assumptions. In this model the analysis is divided into two stages. In the first stage the gas expands as a spherical bubble, but the influence of the duct wall is taken into account. At the end of the first stage the spherical shape of the bubble is assumed to be lost and the gas is assumed to expand axially as a column. The analysis involves solving the continuity and momentum equations for the liquid along with the energy balance equation for the gas.

- 5095 ANALYSIS OF FUEL/CLAD MECHANICAL INTERACTION IN NON-STEADY REACTOR OPERATION VIA FUEL ROD MODELLING CODE IAMBUS. Steinmetz, B.; Gehr, H.L.; Toebe, H. (Internationale Atomreaktorbau G.m.b.H. It is known that defects in a heat transfer tube of an LMFBR SG (steam generator) can be a cause of water leakage, which, eroding the adjacent tubes away (wastage), may lead to a large-scale water leakage (water injection) and water-sodium reaction. This paper, which is a part of a large research program for safety design of SG, intends to present and discuss the results of a simulation study made to determine the water injection rate and the tube fracture aspect as a function of the wastage shape.

- 5097 ANALYSIS OF BOWED REACTOR CORES USING THE FIAT-PROGRAM. Urban, K. (Internationale Atomreaktorbau G.m.b.H. (INTERATOM), Bergisch

Gladbach (Germany, F.R.)). pp D2/6 1-11 of Structural mechanics in reactor technology. Vol. D. Jaeger, T.A.; Boley, B.A. (eds.). Amsterdam, Netherlands; North-Holland (1977).

From 4. international conference on structural mechanics in reactor technology; San Francisco, CA, USA (15 Aug 1977).

The core elements of a LMFBR are bowed due to neutron flux and temperature gradients. The movement of the elements due to free bowing is restricted by neighbouring elements or constraint rings. Consequently forces are induced in the core. To calculate the forces and bowed shapes of the fuel elements at different power and burn-up situations the program FIAT was developed. FIAT is based on the NUBOW code of ANL. FIAT calculates the force equilibrium configuration of elements in a spoke treating the ducts as beam members. The iteration technique, which is taken from NUBOW, is used in FIAT to calculate the gap distribution between the pads of the elements in the considered spoke. Knowing the gap distribution a direct solution of the unknown mechanical displacements and forces in the load planes can be given. As the gap distribution hardly changes during the burn-up history, the use of the iteration part is not required very often. The computer running times of the combined method are about 10 times less than the strict iteration technique as used in NUBOW. The computer running time reduction is improving with increasing numbers of load planes between the elements. Other improvements of FIAT over NUBOW are bowing of elements due to neutron induced swelling and creep effects, and the growth of duct width due to pressure drop and creep (bulging).

From 4. international conference on structural mechanics in reactor technology; San Francisco, CA, USA (15 Aug 1977).

In the system fuel-sodium-oxygen a reaction product (Na_3MO_x), where $M = \text{U} + \text{Pu}$, is formed after attaining an equilibrium oxygen concentration in the sodium. The reaction product is characterized by a low density (e.g. 5.5 g/cm³) and a low thermal conductivity (about 1/10 of that of the fuel). The melting point is about 1420°C. The reaction was predicted previously by thermodynamic assessment for UO_2 and for mixed oxide. First estimates were made for O-diffusion through the fuel to the defect after failing below the equilibrium O concentration in sodium. Because of the small diffusion coefficient, the calculated diffusion time was large and the swelling rate of the defected pin was

relatively low. There are now available some results of German irradiation experiments with defected pins in sodium. The measured swelling rates are much higher than the former predicted values. With two irradiation experiments of the German Fast Breeder Project SILOE S2 and MOL 7B it is now possible to discuss the effects of chemical fuel sodium reactions. The time dependence upon the swelling reaction was studied with a single pin in the French SILOE reactor and the long term behaviour of a failed 18 pin bundle in a sodium loop in the Belgian BR2 reactor was evaluated. The S2 pin showed a diameter increase of 25% after 50 d of irradiation. The respective values of the bundle after running 180 d beyond failure were some 30%. An evaluation of the pin defects referring to their orientation showed significant blockade in the colder channels of the bundle.

- 5100 2-D THERMOELASTIC ANALYSIS OF LMFBR FUEL ROD CLADDINGS. Wolf, L.; Wong, C.N.; Yeung, M.K. (Massachusetts Inst. of Tech., Cambridge (USA). Dept. of Nuclear Engineering). pp C4/4 1-16 of Structural mechanics in reactor technology. Vol. C. Jaeger, T.A.; Boley, B.A. (eds.). Amsterdam, Netherlands; North-Holland (1977).

From 4. international conference on structural mechanics in reactor technology; San Francisco, CA, USA (15 Aug 1977).

The primary purpose of this study is twofold. Firstly, unique 2-D and 3-D temperature fields for bare finite rod bundles are presented which result from detailed distributed-parameter analyses using the slug flow model. Secondly, these results together with azimuthally varying inside and outside pressure fields are used to derive thermoelastic stress and displacement fields. The 2-D temperature fields are obtained by an iterative multicell, multiregion technique. Multicell calculations are especially important for studying the pronounced asymmetry effects induced by the coolant cells which are bounded by the bundle wall. The solution takes into account an arbitrary flow split between wall and internal subchannels as well as different heat source densities in the pins. Results indicate that the adiabatic single cell calculation is not conservative under all circumstances as has been previously assumed. Integral mixing transport parameters which account for local temperature variations are quite different from those which are built into the subchannel codes and should be preferred in the future. The pin model used in these studies incorporates the following features: tilted power distribution as experienced across blanket rods; eccentric pellet position as the most probable pellet location at BOL, cracked pellet under higher burnup conditions.

To analyze the dynamic structural response of the LMFBR core subassembly hexagonal wrappers to postulated local energy releases and the sensitivity of the response to variations in both the pressure loading and the material properties of the stainless steel, a finite-element computer code STRAW has been developed. Supplementing the analysis, out-of-pile experiments have been performed on single hexcan sections subjected to internal pressure pulse loadings. The tests have been designed with the purpose of validating, and where necessary, extending the scope of the code. The dynamic pressure loading was generated by an explosive source. The source was designed to produce conditions simulating those of a hypothetical core accident. An example chosen was the hypothesized pressure pulse created by a fuel-coolant interaction resulting from the failure of a misloaded, overenriched fuel pin. A series of experiments was performed to study the effects of variations in material properties.

From 4. international conference on structural mechanics in reactor technology; San Francisco, CA, USA (15 Aug 1977).

To help evaluate the safety of LMFBRs, computer codes have been developed for predicting the structural response of LMFBRs to HCDAs. Validation of these codes is best done by performing experiments with simple scale models of a reactor. The work described here was performed to verify modeling techniques used in two-dimensional axisymmetric fluid-structure-interaction codes. A well-defined energy source with precision tolerances, and simple boundary conditions and the loading, strain, and deformations were measured. The experiments were performed in thick-walled and thin-walled vessels that are approximately 1/30-scale of the Clinch River Breeder Reactor (CRBR). The results of these experiments are presented in a form suitable for verifying two-dimensional fluid-structure codes designed to predict the response of reactor vessels to HCDA loads.

Amsterdam, Netherlands; North-Holland (1977).

From 4. international conference on structural mechanics in reactor technology; San Francisco, CA, USA (15 Aug 1977).

In Liquid Metal Fast Breeder Reactors of integrated type, the sodium pressure is low, but the dimensions are large. The thickness-diameter ratios are rather smaller than in other type of nuclear pressure vessels. Therefore buckling must be considered as a potential mode of failure. For instance, the bottom head of the main vessel is loaded by internal hydrostatic pressure and dead weight, and there is a need for buckling analysis. It must be pointed out that in practical cases, buckling occurs after plastic deformation. Due to the effect of initial imperfections elastic buckling is rather difficult to analyse. Moreover, elastic-plastic buckling theory is not a very clear theory and consideration must be given to finite deflexions (and perhaps to initial stresses). So the choice of a suitable mathematical model is a matter of good engineering judgment. In the CEASENT system of structural analysis by finite element method, a special program has been developed for that purpose. The model chosen (MOTAN) is near a tangent modulus model, because it seems a better approximation of the real behaviour of mechanical structures. The buckling load of shells of any shape can be predicted. The method is now operational but a validation program is still in progress.

- 5111 THERMAL ELASTO-PLASTIC ANALYSIS IN REACTOR VESSEL NOZZLES. Cesari, F.; Gradari, P.L. (Comitato Nazionale per l'Energia Nucleare, Bologna (Italy). Programma Reattori Veloci); Curioni, S. (Bologna Univ. (Italy)). pp G9/8 1-8 of Structural mechanics in reactor technology. Vol. G. Jaeger, T.A.; Boley, B.A. (eds.). Amsterdam, Netherlands; North-Holland (1977).
- From 4. international conference on structural mechanics in reactor technology; San Francisco, CA, USA (15 Aug 1977).
- In a sodium cooled nuclear fast reactor the thermal analysis has a particular importance as a consequence of the rapid transients and the high sodium conductivity. The aim of this work is to estimate the value of transient thermal stresses in elastic and plastic fields. In the first part, the loading conditions for different steady and transient operations are examined. It is not easy to evaluate theoretically the temperature distribution in the vessel wall as a consequence of different core transients. For this reason, a number of tests have been placed, which simulate in a mock-up the temperature changes in the upper part of the vessel for different thermal transients considered most dangerous: scram to full power, electric supply fault in a pump with reactor scram, pump seizure with reactor scram. In the second part of the work the thermo-elastic structural response is considered using the FEM analysis. The elastic approach has had two functions: the first is to find a simplified structure in two dimensions that has the same behavior as the 3-D nozzle; the second is to follow the thermal transient to look for the time of maximum stress.

During its lifetime a nuclear power plant undergoes cyclic thermal loadings, i.e. time variations of temperature spatial distribution; these thermal cycles combined with mechanical loads (pressure), can produce dimensional changes for creep, plastic cycling and/or ratchetting. This problem is in special way important for a Liquid Metal Fast Breeder Reactor (LMFBR) because temperatures in it are high (about 500°C) and change either in radial direction or in axial direction. While the plastic behaviour of a structure subjected to mechanical loads and/or mechanical cycle loads can be well studied by Finite Element analyses and several different computer programs, the thermal plastic behaviour was studied for simplified conditions only. Actually, the Bree, Miller, Burgreen model considers a thin cylindrical shell with a radial thermal gradient and in uniaxial stress state while Kalnins, Updike extend this model to a biaxial stress state. To obtain numerical results of the thermo-plastic behaviour of cylindrical shells, a mathematical model was developed and the special purpose computer program PLAST was implemented.

- 5114 ACOUSTIC WAVE MEASUREMENTS IN REACTOR-GRADE CONCRETES. Sutherland, H.J.; Kent, L.A. (Sandia Labs., Albuquerque, NM (USA)). pp E6/5 1-10 of Structural mechanics in reactor technology. Vol. E. Jaeger, T.A.; Boley, B.A. (eds.). Amsterdam, Netherlands; North-Holland (1977).

From 4. international conference on structural mechanics in reactor technology; San Francisco, CA, USA (15 Aug 1977).

In this paper, five reactor grade concretes were investigated during their initial cure period to gather information which is a suitable data base for interpreting the results of confirmatory reactor safety research programs. In particular, the concretes studied were the concrete proposed for the Clinch River Breeder Reactor (CRBR), which is a limestone mix with flyash, and two other limestone aggregate mixes and two basaltic-aggregate mixes. The curing process in these concretes

was followed with strength tests and with acoustic-wave velocity measurements. The choice of the latter technique was based on the successful programs of several investigators who used acoustic waves to follow the curing process in concrete and this information was also required for instrumentation techniques that are proposed for accident simulation studies.

- 5115 PROCESS INSTRUMENTS FOR SODIUM COOLED FAST REACTORS. Hunjan, A.S.; Rahman, O.A. (Reactor Research Centre, Kalpakkam (India). Fast Reactor Group). pp 11-16 of Nuclear reactor instrumentation. Vol. 2, Sect. 1. Bombay; Department of Atomic Energy (1977).

From Symposium on nuclear reactor instrumentation; Bombay, India (20 Dec 1976).

Liquid sodium is chosen as the best suited coolant for fast breeder reactors because of its low vapour pressure and good heat transfer properties. But liquid sodium reacts violently with air and water and is corrosive. It also acquires considerable radioactivity while passing through the reactor at temperatures as high as 600deg C. Hence, liquid sodium instruments have to be designed with great constraints in view; such instruments with sensor-in-pocket arrangement, for measurement of flow, level, pressure and temperature are discussed.

- 5116 INSTABILITY ANALYSIS OF ELBOWS IN THE PLASTIC RANGE. Sobel, L.H.; Newman, S.Z. (Westinghouse Electric Corp., Madison, PA (USA). Advanced Reactors Div.). pp L3/2 1-13 of Structural mechanics in reactor technology. Vol. L. Jaeger, T.A.; Boley, B.A. (eds.). Amsterdam, Netherlands; North-Holland (1977).

From 4. international conference on structural mechanics in reactor technology; San Francisco, CA, USA (15 Aug 1977).

The elbow components of a LMFBR piping system have a high degree of flexibility in comparison with that of the straight components. This flexibility may result in severe strain concentrations and instability of the elbow. This work presents some basic considerations underlying the instability in the plastic range of typical LMFBR elbows (radius-to-thickness ratio $r/t=20-50$), and the impact of these considerations on the practical aspects of solution by computer methods. The elbows are made from a strain hardening material and they are loaded by in-plane closing or opening bending moments. A simplified method of computer analysis is used and the particular type of instability considered is that of geometric buckling into a mode that is characterized by significant ovalization of the cross section and by a relatively gradual variation in shape along the length of the elbow. Emphasis is placed on the effects of including geometric nonlinearities (large displacement terms) in the inelastic (time-independent) analysis. Numerical results are presented for a typical LMFBR elbow.

- 5117 CREEP BUCKLING OF SHELLS. Stone, C.M.; Nickell, R.E. (Sandia Labs., Albuquerque, NM (USA)). pp L7/8 1-12 of Structural mechanics in reactor technology. Vol. L. Jaeger, T.A.; Boley, B.A. (eds.). Amsterdam, Netherlands; North-Holland (1977).

From 4. international conference on structural mechanics in reactor technology; San Francisco, CA, USA (15 Aug 1977).

Thin-walled structural members that are subjected to sustained loads while at elevated temperature may exhibit a time-dependent structural instability, referred to as creep

buckling. Because of the characteristics of LMFBR primary piping components (thin-walled, low pressure, high temperature), the designer must guard against creep buckling as a potential failure mode for certain critical regions, such as elbows, where structural flexibility and inelastic response may combine to concentrate deformation and cause instability. The ASME Boiler and Pressure Vessel Code through its elevated temperature Code Case 1592 (Section III, Division 1) provides design rules for Class 1 components aimed at preventing creep buckling during the design life. A similar set of rules is being developed for Class 2 and 3 components at this time. The creep buckling design rules were altered in order to accommodate load and strain factors of safety that were thought to be roughly equivalent to the factor of ten on service life. The specific concern is for the case of load-controlled time-dependent buckling where the load factor is 1.5 for normal, upset, and emergency operating conditions, and 1.25 for faulted operating conditions. The current study was conducted in an effort to determine the conservatism or lack of conservatism in current ASME design rules concerning time-dependent (creep) buckling. The two rules are examined from the standpoint of the materials behavior - specifically the secondary creep strain rate exponent.

- 5118 CREEP-FATIGUE DESIGN CRITERIA FOR APPLICATION TO A 2 1/4 CR-1 MO LMFBR STEAM GENERATOR. Campbell, R.D. (Engineering Decision Analysis Company, Inc., Irvine, CA, USA); Veljovich, W. (Rockwell International Corp., Canoga Park, CA (USA)). pp L7/2 1-11 of Structural mechanics in reactor technology. Vol. L. Jaeger, T.A.; Boley, B.A. (eds.). Amsterdam, Netherlands; North-Holland (1977).
From 4. international conference on structural mechanics in reactor technology; San Francisco, CA, USA (15 Aug 1977).
The existing ASME Boiler and Pressure Vessel Code, Code Case 1592-7, does not contain a complete set of rules for design of Class 1 elevated temperature components constructed of 2 1/4 Cr-1 Mo alloy steel. General criteria for evaluation of the components for deformation limits and creep-fatigue interaction are contained, but the required fatigue curves, interaction diagram, and K value are not provided. The Code Case allows the use of an alternate criterion by the Manufacturer, provided that such criterion is incorporated into the Owner's Design Specifications. Consequently, a study was undertaken to evaluate alternate criteria for creep-fatigue evaluation of LMFBR steam generators constructed of 2 1/4 Cr-1 Mo alloy steel.

- 5119 PROPERTY CHANGES IN FAST-REACTOR CORE-SUPPORT COMPONENTS DUE TO LOW DOSE RATE, LONG-TIME IRRADIATION. Johnson, D.L.; Hofman, G.L. (Argonne National Lab., IL (USA)). pp L8/7 1-10 of Structural mechanics in reactor technology. Vol. L. Jaeger, T.A.; Boley, B.A. (eds.). Amsterdam, Netherlands; North-Holland (1977).
From 4. international conference on structural mechanics in reactor technology; San Francisco, CA, USA (15 Aug 1977).
To ensure the integrity of LMFBR core-support structures, it is necessary to accurately predict the magnitudes and directions of the mechanical and physical property changes known to occur in structural materials during irradiation. Since the neutron-energy spectrum is relatively soft and the total neutron flux relatively low in the vicinity of the support structures, little

directly applicable data are obtainable. An analytical technique, such as the damage-function analysis, must be used to extrapolate from harder spectra data. This technique has been used to analyze the grid-support structure in the Experimental Breeder Reactor-II.

- 5120 FINITE ELEMENT ELASTIC-PLASTIC ANALYSIS OF LMFBR COMPONENTS. Levy, A.; Pifko, A.; Armen, H. Jr. (Grumman Aircraft Engineering Corp., Bethpage, NY (USA). - 5121 INELASTIC RESPONSE OF METALLIC IMPACT LIMITERS. Biffle, J.H.; Sagartz, M.J.; Weingarten, L.I. (Sandia Labs., Albuquerque, NM (USA)). pp J6/10 1-12 of Structural mechanics in reactor technology. Vol. J, Pt. b. Jaeger, T.A.; Boley, B.A. (eds.). Amsterdam, Netherlands; North-Holland (1977).
From 4. international conference on structural mechanics in reactor technology; San Francisco, CA, USA (15 Aug 1977).
Energy mitigators on some light water reactor (LWR) spent fuel shipping casks and conceptual designs for liquid metal fast breeder reactor (LMFBR) spent fuel shipping casks rely on the inelastic behaviour of metallic plate-like structures. A program was undertaken to investigate the response of mitigators to hypothetical shipping accidents with parallel experimental and theoretical studies. The theoretical studies consist of performing large deformation three dimensional transient dynamic analysis on several metal fin designs and correlating the results with the experimental results. The newly developed computer program WULFF was used. Testing of scale model fin specimens was performed at SLA's drop table facility. The test specimens are mounted on a force transducer and this assembly is bolted to the stationary bottom table. Extra weights are added to the drop table so that the total energy at impact is sufficient to cause large plastic deformation in the specimens. Accelerometers mounted on the drop table and the data from the force transducer are used to compute the energy absorbed during the test. Also framing camera coverage was used to observe the specimen deformation as it develops. The results of the theoretical analysis and experimental program can be used by designers responsible for impact limiters on spent fuel shipping casks. Without data to design impact limiters the integrity of the cask under accident conditions can be questionable. 9

- 5123 SOME COMMENTS ON THERMOMECHANICAL CONSTITUTIVE EQUATIONS FOR INELASTIC ANALYSIS OF LMFBR COMPONENTS. Haupt, P. (Bundesanstalt fuer Materialpruefung, Berlin (Germany, F.R.)). pp L1/6 1-13 of Structural mechanics in reactor technology. Vol. L. Jaeger, T.A.; Boley, B.A. (eds.). Amsterdam, Netherlands; North-Holland (1977).

From 4. international conference on structural mechanics in reactor technology; San Francisco, CA, USA (15 Aug 1977).

The safety analysis of the primary and secondary circuits of sodium-cooled fast breeder reactors (LMFBR) requires systematic methods to predict the inelastic behaviours of metal structures under complex thermomechanical loading conditions. To provide those methods, constitutive equations have been recommended for interim use. Essentially, the recommended constitutive theories are based on the additive decomposition of the total strain into elastic, plastic and viscoelastic parts. These parts are calculated independently according to Hooke's law, classical plasticity and particular creep laws. This paper is concerned with the physical evidence and consistency of these constitutive equations. In particular, shortcomings of the recommended constitutive theories may result from the bilinear approximation of the stress-strain-curve; the kinematic linear hardening rule and the very special kind of the proposed creep laws. Moreover, the elastic-plastic and creep equations are formulated independently: Except for hardening due to prior creep strains, possible interactions between viscoelastic and plastic material behaviors are neglected. Finally, the temperature appears as a given parameter, that means: The recommended constitutive assumptions do not allow for any coupling effects between the deformation and temperature field. A consistent set of constitutive equations should be based on a correct evaluation of the second law of thermodynamics.

- 5124 PLASTIC CREEP BEHAVIOUR ANALYSIS OF AN ELBOW PIPE. Bourrier, P. (Department Genie Industriel et Nucleaire, SOCOPEC, Paris, France); Hoffmann, A. (CEA Centre d'Etudes Nucleaires de Saclay, 91 - Gif-sur-Yvette (France)). pp L6/2 1-12 of Structural mechanics in reactor technology. Vol. L. Jaeger, T.A.; Boley, B.A. (eds.). Amsterdam, Netherlands; North-Holland (1977).

From 4. international conference on structural mechanics in reactor technology; San Francisco, CA, USA (15 Aug 1977).

High temperature components are liable to strong creep effects, in LMFBR for example. This phenomenon is analyzed here for an elbow pipe. Comparisons are performed between experiments and computations using CEASEMT codes, particularly piping-system analysis code TEDEL.

- 5125 ANALYSIS OF PIPING SYSTEMS FOR CREEP. Boyle, J.T.; Spence, J. (Strathclyde Univ., Glasgow (UK). Dept. of Mechanics of Materials). pp L2/7 1-14 of Structural mechanics in reactor technology. Vol. L. Jaeger, T.A.; Boley, B.A. (eds.). Amsterdam, Netherlands; North-Holland (1977).

From 4. international conference on structural mechanics in reactor technology; San Francisco, CA, USA (15 Aug 1977).

Until recently piping system design was justified in terms of purely elastic analysis principles. In evaluating the safety and reliability of high temperature systems, in

particular those associated with LMFBR development, inelastic behaviour must be admitted and the possibility of the accumulation of strain in the highly stressed locations accounted for. The purpose of this paper is to provide a survey of the current situation and to attempt to explain and clarify a number of misconceptions which have arisen in connection with approximative techniques. The paper analyses the motivation for a simplified approach to the initial stages of elevated temperature piping design, examines the implications for such an approach and provides a possible solution to the problems which arise.

- 5126 EVALUATION OF INELASTIC ANALYSIS METHODS. Corum, J.M. (Oak Ridge National Lab., TN (USA)). pp L4/1 1-12 of Structural mechanics in reactor technology. Vol. L. Jaeger, T.A.; Boley, B.A. (eds.). Amsterdam, Netherlands; North-Holland (1977).

From 4. international conference on structural mechanics in reactor technology; San Francisco, CA, USA (15 Aug 1977).

Interim constitutive equations have been developed for describing the inelastic behaviors of types 304 and 316 stainless steel and 2 1/4 Cr-1 Mo steel. Uniaxial and multiaxial exploratory tests were used to identify the essential inelastic behavioral features of significance, and these features, in turn, provided the basis for choosing the interim constitutive equations. Typical exploratory test results are presented to support the basic constitutive equation framework and to illustrate how the ad hoc rules were developed, evaluated, and improved. To assess the validity of the constitutive equations and analysis methods for high-temperature design, benchmark structural tests were conducted under time-varying loadings at elevated temperatures, and the results were compared to inelastic analysis predictions. Representative test results for beam and plate structures and for a pipe subjected to repeated thermal shocks are presented and compared to predictions. Although these comparisons are generally favorable, they did identify some specific analysis shortcomings. These are discussed, and procedures for improving the predictions are presented. Finally, the effects that normal material properties variations can have on analysis predictions are discussed and shown to be significant.

- 5127 PROBABILISTIC ASSESSMENT IN STRUCTURAL ANALYSIS OF MAIN COOLANT SYSTEMS FOR LMFBR UNDER ANTICIPATED THERMAL TRANSIENTS. Amesz, J.; Volta, G. (Commission of the European Communities, Ispra (Italy). Joint Research Centre); Cesari, F.G.; Righini, R. - 5128 POWER SUPPLY FOR CONTROL AND INSTRUMENTATION IN FAST BREEDER TEST REACTOR. Raghavan, K.; Shanmugam, T.K. (Reactor Research Centre, Kalpakkam (India)). pp 1-5 of Nuclear reactor instrumentation. Vol. 2, Sect. 2. Bombay, India; Department of Atomic Energy

(1977).

From Symposium on nuclear reactor instrumentation; Bombay, India (20 Dec 1976).

The design and operation of the four 'no-break' power supplies for control and instrumentation in the Fast Breeder Test Reactor (FBTR), Kalpakkam, are described. Interruptions in the power supplies are eliminated by redundancy and battery back-up source while voltage dips and transients are taken care by automatic regulation system. The four power supplies are : (1) 24 V D.C. exclusively for neutronic and safety circuits, (2) 48 V D.C. for control logic indication lamps and solenoid valves, (3) 220 V D.C. for switchgear control, control room emergency lighting and D.C. flushing oil pump for the turbine and (4) 220 V A.C. single-phase 50 HZ for computers and electronics of control and instrumentation. Stationary lead-acid batteries (lead antimony type) in floating mode operation with rectifier/charger are used for emergency back-up. All these power supplies are fed by 415 V, 3-phase, 50 HZ emergency supply buses which are provided with diesel generator back-up. Static energy conversion system (in preference to mechanical rotation system) is used for A.C. to D.C. and also for A.C. to A.C. conversion.

- 5129 DEVELOPMENT OF LEAK-PROOF CABLES FOR SIMPLIFYING CABLE PENETRATIONS ACROSS REACTOR CONTAINMENT BUILDING. Sangodkar, D.B.; Prabhakar, R.; Sivanandam, M. (Reactor Research Centre, Kalpakkam (India)). pp 24-28 of Nuclear reactor instrumentation. Vol. 2, Sect. 2. Bombay, India; Department of Atomic Energy (1977).

From Symposium on nuclear reactor instrumentation; Bombay, India (20 Dec 1976).

All penetrations including cable penetrations of the containment building must be leak-tight so that leakage rate for released radioactive material inside the containment building is kept to a minimum. Special leak-proof cables utilising elastic insulating compounds to seal the intrastand and interconductor space have been developed for the cable penetration assemblies for use in the Fast Breeder Test Reactor, Kalpakkam. More than 50 samples of these cables were tested for leak-tightness and the results are presented. Overall leakage rate for most of the samples of 3 metre length is found to be 0.02%. This rate will be lower by a factor of 10 for an in-field length of 50 meters, because an inverse relationship was observed to exist between cable length and leakage. Leakage is also found to be independent of electrical loading.

- 5130 NUCLEAR FUEL ASSEMBLY. Betten, P.R. (to Combustion Engineering, Inc., New York (USA)). French Patent 2,337,406/A/. 31 Dec 1976. 14p. (In French).

Under the invention the fuel assembly is particularly suitable for liquid metal cooled fast neutron breeder reactors. Hence, according to the invention a fuel assembly cladding includes inward corrugations with respect to the remainder of the cladding according to a recurring pattern determined by the pitch of the metal wire helically wound round the fuel rods of the assembly. The parts of the cladding pressed inwards correspond to the areas in which the wire encircling the peripheral fuel rods is generally located apart from the cladding, thereby reducing the play between the cladding and the peripheral fuel rods situated in these areas. The reduction in the play in turn improves the coolant flow in the internal secondary channels of the fuel assembly to the detriment of the flow in the peripheral

secondary channels and thereby establishes a better coolant fluid temperature profile.

- 5131 SAFETY DEVICE IN A NUCLEAR REACTOR FUEL ROD WITH A CLOSED FISSION GAS PLENUM. Gast, K. (to Gesellschaft fuer Kernforschung m.b.H., Karlsruhe (Germany, F.R.)). German (FRG) Patent 2,023,250/C/. 23 Dec 1976. 2p. (In German).

The invention deals with the design of the fission gas plenum of fuel rods for nuclear reactors cooled with liquid metal. The fission gas plenum is subdivided by honeycombed partition walls - preferably of dry powdered metal - being fully permeable for fission gases. In this way a slow, uniform pressure build-up is guaranteed. If the can of the fuel rod fails in this area, the stored amount of fission gas is released only delayed. The invention increases the safety of the fuel elements equipped with the device.

- 5132 FUEL ROD FOR LIQUID METAL-COOLED NUCLEAR REACTORS. Vinz, P. (to Messerschmitt-Boelkow-Blohm G.m.b.H., Muenchen (Germany, F.R.)). German (FRG) Patent 2,449,597/B/. 16 Dec 1976. 5p. (In German).

In fuel rods for nuclear reactors with liquid-metal cooling (sodium), with stainless steel tubes with a nitrated surface as canning, superheating or boiling delay should be avoided. The inner wall of the can is provided along its total length with a helical fin of stainless steel wire (diameter 0.05 to 0.5 mm) to be wetted by hot sodium. This fin is mounted under prestressing and has a distance in winding of 1/10 of the wire diameter.

- 5133 COOLING DEVICE FOR NUCLEAR POWER PLANT. Kawakami, H. (to Tokyo Shibaura Electric Co. Ltd., Kawasaki, Kanagawa (Japan)). Japanese Patent 1978-72,989/A/. 13 Dec 1976. 4p. (In Japanese).

A method to facilitate the calibration for flowmeters in a reactor cooling device after installation and during operation of a power plant is described. In a reactor cooling system for sodium cooled type fast reactor, an injection device for charging an activated sodium flow quantity measurement substance and a plurality of detectors for the γ -radiation emitted from the activated sodium injected are provided in optional portions in the secondary coolant system. The delays in time for the radiation detection of the sodium charged from the injection device are detected to determine sodium flow rate thereby calibrating the flowmeter in the secondary coolant circuit.

- 5134 PIPE CONNECTOR. Sullivan, T.E.; Pardini, J.A. (to Energy Research and Development Administration). US Patent Application 749,206. 9 Dec 1976. 6p.

A safety test facility for testing sodium-cooled nuclear reactor components includes a reactor vessel and a heat exchanger submerged in sodium in the tank. The reactor vessel and heat exchanger are connected by an expansion/deflection pipe coupling comprising a pair of coaxially and slidably engaged tubular elements having radially enlarged opposed end portions of which at least a part is of spherical contour adapted to engage conical sockets in the ends of pipes leading out of the reactor vessel and into the heat exchanger. A spring surrounding the pipe coupling urges the end portions apart and into engagement with the spherical sockets. Since the pipe coupling is submerged in liquid a limited amount of leakage of sodium from the pipe can be tolerated.

- 5135 FUEL ASSEMBLY. Yokoyama, T. (Nippon Atomic Industry Group Co. Ltd., Tokyo). (to Tokyo Shibaura Electric Co. Ltd., Kawasaki, Kanagawa (Japan)). Japanese Patent 1978-71,784/A/. 8 Dec 1976. 2p. (In Japanese).

A method to reduce useless neutron absorption into a wrapper tube covered a fuel assembly of an LMFBR type reactor by reducing the wall thickness of the wrapper tube is described. The fuel assembly is composed of fuel element clusters and the wrapper tube covering them. The wall thickness of the wrapper tube is changed near the boundary (referred to as transition point) between the core fuel and the blanket fuel. Specifically, the wall thickness of the wrapper tube below the transition point is made uniform determined by the highest inner pressure, which is thinner than the wall thickness above the transition point made uniform determined by the inner pressure at the transition point. By partially decreasing the thickness of the wrapper tube, useless absorption of neutrons into the wrapper tube can be reduced to thereby improve the breeding ratio.

- 5136 DETECTION METHOD FOR THE POSITION OF A SENSOR. Imai, T. (to Tokyo Shibaura Electric Co. Ltd., Kawasaki, Kanagawa (Japan)). Japanese Patent 1978-71,792/A/. 7 Dec 1976. 3p. (In Japanese).

A method for the positioning of a sensor in a guide tube disposed in an LMFBR type reactor at a predetermined position at the top of the guide tube irrespective of the length and the presence or the absence of curvatures in the guide tube is described. A reactor container has a core in which a plurality of nuclear fuel assemblies are arranged and the upper opening of the reactor container is closed with a rotational plug, through which instruments, control drives, a fuel exchanger and the likes are inserted into the container. A sensor for monitoring the flow rate and the temperature of sodium at the exit of the fuel assemblies is inserted through a guide tube and guided to the upper portion of the exit for each of the fuel assemblies. In this invention, electroconductive core wires are exposed at the top of a cable integrated with a sensor and a cable sheath is brazed to the cap. This enables to detect the arrival of the sensor at the top of the guide tube by the changes in the resistance value.

- 5137 SEALING DEVICE. Ugawa, Y. (to Tokyo Shibaura Electric Co. Ltd., Kawasaki, Kanagawa (Japan)). Japanese Patent 1978-71,786/A/. 7 Dec 1976. 5p. (In Japanese).

A method to reduce the damage in an elastomer seal and decrease the driving torque for keeping the sealing performance in a sealing device for cover gas upon rotation and jack up of a rotational shielding plug is described. A shielding plug comprising a stationary plug and a rotational plug is provided to the opening at the upper portion of a reactor vessel to seal the cover gas enclosed in the space above a coolant. A lip type elastomer seal is provided on the stationary plug and a sliding pad member with a concaved contact surface capable of slidably fitting against the lip portion of the elastomer is provided to the rotational plug. As a result, the gap defined between both of the above plugs can completely be sealed closely.

- 5138 EXPANSION JOINT. (to English Electric Co. Ltd., London (UK)). French Patent

2,334,047/A/. 1 Dec 1976. Priority date 2 Dec 1975, United Kingdom of Great Britain and Northern Ireland (UK), 15p. (In French).

The invention concerns the pipe connections used in LMFBR type nuclear reactors. In particular it concerns the expansion joints employed for connecting to the internal components of the reactor (at high temperature) the delivery pipes of the centrifugal pumps for moving the coolant, and sustained by the cooled concrete roof of the containment.

- 5139 EQUIPMENT FOR FBR TYPE REACTOR. Sakai, T. (to Toshiba Corp., Kawasaki, Kanagawa (Japan)). Japanese Patent 1953-68,393/A/. 1 Dec 1976. 3p. (In Japanese).

Purpose: To heat an equipment for use in a fast breeder reactor utilizing a liquid-metal as a coolant prior to the insertion thereof into the reactor thereby preventing the thermal shock from being imparted to the equipment at the time of the insertion thereof and curtailing the period of time of suspending the operation of the reactor. Constitution: When an equipment used in the fast breeder reactor such as fuel exchanger is transported into the reactor, the atmosphere within the cask is preheated with a heater. During this preheating operation these works such as substitution of cover gas within the reactor and lowering of the surface of the sodium solution are advanced in keeping pace therewith, and the preheating operation is stopped at the time when the fuel exchanger is transported into the reactor. By the above described preheating the temperature of the heat exchanger becomes substantially the same as that of sodium within the reactor, and therefore, when the fuel exchanger is dipped in sodium, it does not undergo thermal shock. Furthermore, since the preheating operation can be carried out in the cask, it is possible to curtail the driving rest period, and therefore the driving efficiency of the reactor can be raised.

- 5140 HIGH-TEMPERATURE ACOUSTIC DETECTOR. Miyazawa, T.; Uesugi, N.; Taguchi, J.; Hirano, H. (Tokyo Shibaura Electric Co., Ltd., Kawasaki, Kanagawa, Japan). Toshiba Rebyu; 31: No. 12, 1033-1036 (Dec 1976). (In Japanese).

An acoustic detector usable in high-temperature (700°C) liquid sodium has been developed for abnormality detection in a sodium-cooled fast breeder reactor plant. This detector, incorporating a LiNbO_3 crystal with a high Curie point, is of a piezo system and is so designed as to bear neutron irradiation. The results of its evaluation tests in high-temperature atmosphere, high-temperature liquid sodium and normal-temperature water and its prominent characteristics are as follows: (1) The LiNbO_3 is enclosed hermetically in a welded stainless-steel container; electric signals are transmitted through a coaxial cable for high-temperature use. (2) Its actual detective sensitivity is as designed: -150 dB (0 dB=1 V/ μ bar) in 600°C sodium. (3) Its life has been confirmed to be longer than 12,000 hours at 700°C. (4) Various investigations have been made about the internal construction of the detector container to actualize the above items (2) and (3). (5) In order to prevent performance deterioration due to neutron irradiation, a new kind of crystal has been developed, and now irradiation evaluation tests are being carried on by the cooperation between Toshiba and GfK, West Germany.

- 5141 SAFETY OF HIGH-PARAMETER SODIUM LOOP. Paryzek, R. (Ústav Jaderného Vyzkumu, Rez (Czechoslovakia)). Jad. Energ.; 22: No. 12,

443-447(Dec 1976). (In Czech).

The solution of problems of technical and fire safety is shown on the concrete example of the SMT-1 experimental sodium loop installed at the Institute of Nuclear Research at Rez. The general principles and measures adopted for the loop are described which were derived from a detailed analysis of the possible causes of failures or accidents. These causes include: leakage and cracks arising during production, leakage and cracks caused by the quick temperature changes in operation and by the incorrect heating up of circuits with solidified sodium, equipment failure caused by dilatation forces, by pressure increase above the permissible level and by the corrosive effects of sodium, accidents caused by failures in the measurement and loop control system, and leakage on the main container. The loop is equipped with an alarm system and closed-circuit television.

5142 (SMRE-Transl--7200) METHOD OF COMPUTING THE EFFECT OF GAS VOIDS IN LIQUID METAL COOLING. Malang, S.; Rust, K. Translated from Atomwirtschaft; 579-581(Dec 1976). 8p. Health and Safety Executive, Baynards House, London.

Under certain operating conditions, the coolant entering the reactor tank of loop-type liquid-metal cooled reactors may contain gas bubbles. Constructional measures help to make sure that most of the gas is separated before entering the fuel zone and flows through the radial blanket. The gas bubbles cause the temperature in the fuel rods to rise. The authors present a computer model for the calculation of a two-dimensional, instationary temperature field.

5143 IMPROVEMENT TO STRUCTURES CONTAINING A HOT LIQUID METAL IN BREEDER REACTORS. Chevallier, R.; Sauvage, M. (to Alstom, 75 - Paris (France); CEA, 75 - Paris (France)). French Patent 2,372,494/E/. 25 Nov 1976. 5p. (In French).

The main patent concerns a liquid metal cooled integrated breeder nuclear reactor which includes a main vessel comprising a central internal vessel containing the core and the hot liquid metal. This internal vessel is connected to individual cylindrical containments each possessing a heat exchanger. The surface of the internal vessel, opposite the hot liquid metal flow holes, is given shapes formed by a surface of revolution generated by an arc and the cylindrical containments are secured directly to the internal vessel at this location by joining these two surfaces by an externally facing concave toric surface. In the design forms of the main patent given as examples, the thermal protection of the internal central vessel and the individual cylindrical containments is carried out by two double walls, in the annular space of which cold liquid metal is made to flow. The object of this addendum is a design variant comprising these double walls, in which the thermal protection of the internal vessel and of the cylindrical containment is assured by a quasi static sheet of liquid metal topped by a static layer of a neutral gas in the annular space formed by these walls.

5144 METHOD AND APPARATUS OF STABILIZING METALLIC SODIUM. Nakajima, N.; Tomioka, Y.; Saigusa, M.; Suzuki, K. (to Mitsubishi Atomic Power Industries, Inc., Tokyo (Japan)). Japanese Patent 1978-65,598/A/. 24 Nov 1976. 4p. (In Japanese).

To safely treat a metallic sodium containing

radionuclide exhausted from a liquid-metal cooled fast breeder reactor, a novel method and apparatus for converting the metallic sodium chemically stable sodium hydroxide is described. By alloying metallic sodium with a low melting metal, while the Na-H₂O reaction velocity is being controlled, water decomposition treatment of the metallic sodium is made possible. Since low melting metal remains substantially in a mass state or in a powdery state after Na-H₂O reaction, it becomes possible to recover. Furthermore, a general waste liquid treating system which has heretofore been used is applicable for a heavy metal and radionuclide contained in the waste liquid produced in the case where non-radioactive sodium and sodium containing radionuclide have been treated.

5145 LIQUID METAL COOLED REACTOR. Tanaka, N.; Onogi, T. (to Power Reactor and Nuclear Fuel Development Corp., Tokyo (Japan)). Japanese Patent 1978-62,098/A/. 16 Nov 1976. 3p. (In Japanese).

Purpose: To mount a heat-exchanging pipe at the external of a cooling boundary and provide a cooler in the circuit of the heat-exchanging pipe, thus obtaining a small and efficient auxiliary cooling system in a reactor. Constitution: In a normal state, heat generated in the core is removed by a primary coolant from an inlet nozzle of a reactor container, and the heated primary coolant flows into an intermediate heat exchanger from an outlet nozzle of the container through the pipe. Then, the primary coolant is heat-exchanged with a secondary coolant, and the cooled primary coolant is again fed into the container. In the event the cooling system fails, the cooler is actuated to feed a cooled thermal medium to a circuit formed by the heat exchanging pipe, thereby lowering temperature of liquid metal coolant flowing the primary cooling pipe to remove decay heat in the core. On the other hand, a heater maintains a temperature of the liquid metal at a level above a melting point.

5146 (EURFNR--1405) TIME CREEP TESTS ON IRRADIATED SPECIMENS FOR THE MOL 1AL RADIATION PROGRAM. Schirra, M.; Seith, B. (Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Inst. fuer Material- und Festkoerperforschung). 12 Nov 1976. Translation of PSB--521 35p. Dep. NTIS, PC A03/MF A01.

The rupture and creep behavior of unirradiated specimen from two 12 percent Cr-steels were tested at 600°C and specimen from a modified AISI 316 LN at 700°C. The influence of the hardening-temperature for one 12 percent Cr-steel was examined. Metallographic examination shows the fracture behavior and changes in the structure.

5147 LOADING METHOD OF CORE CONSTITUTING ELEMENTS. Kasai, S. (Nippon Atomic Industry Group Co. Ltd., Tokyo). (to Tokyo Shibaura Electric Co. Ltd., Kawasaki, Kanagawa (Japan)). Japanese Patent 1978-60,485/A/. 11 Nov 1976. 3p. (In Japanese).

The purpose is to provide a remote-controlled replacing method for core constituting elements in a liquid-metal cooling fast breeder, wherein particularly, the core constituting elements are prevented from being loaded on the core position other than as designated. The method comprises a first step which determines a position of a suitable neutron shielding body in order to measure a reference level of complete insertion of the core constituting elements, a second step which

inserts a gripper for a fuel exchanger, a third step which decides stroke dimensions of the complete insertion, and a fourth step which discriminates the core constituting elements to begin handling of fuel rods. The method further comprises a fifth step which determines a loading position of fuel rod, and a sixth step which inserts and loads fuel rods into the core. The method still further comprises a seventh step which compares and judges the dimension of loading stroke and the dimension of complete inserting stroke so that when coincided, loading is completed, and when not coincided, loading is not completed and then the cycle of the fourth step is repeated.

- 5148 NUCLEAR REACTOR. Lambert, P. (Alstom, 75 - Paris (France)); Aubert, M. (to CEA, 75 - Paris (France)). French Patent 2,370,344/E/. 3 Nov 1976. 11p. (In French).

This improvement concerns a system for cooling the reactor jacket of a liquid sodium cooled integrated fast reactor. The reactor jacket is located inside a second vessel called the 'main vessel', the reactor jacket being suspended from the upper shield and comprising a first ring and a second ring. The upper edge of the first ring is free and the lower edge is connected and sealed to the reactor vessel which has apertures above the connection level of this first ring. The annular space between the reactor vessel and the first ring is the removal annular space. The annular space between the second ring on the one hand and the reactor jacket and the first ring on the other is the annular supply space.

- 5149 (EURFNR--1404) CONSIDERATIONS FOR THE FUTURE DEVELOPMENT OF SHELL- AND CORE-STRUCTURAL MATERIALS FOR FAST BREEDERS. Anderko, K.; Wassilew, C. (Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Inst. fuer Material- und Festkoerperforschung). Nov 1976. Translation of KFK--2369 33p. Dep. NTIS, PC A03/MF A01.

Work performed under United States--Euratom Fast Reactor Exchange Program.

The report gives (1) a survey on the projected or already progressing development work for the improvement of shell and core structural materials for Fast Breeder Reactors in the Debene countries, and (2) a detailed discussion of one of the property aspects, the creep strength depending on time. After a look at the creep rupture behavior of irradiated materials and at the role played by inter- and intragranular precipitations, and optimization program for the austenitic alloy X10 NiCrMoTiB 15 15 (1.4970) is outlined. The published data on the residual ductility after high neutron doses at short-term and creep loadings are reviewed.

- 5150 DESIGN BASIS OF AND MATERIALS REQUIREMENT FOR SODIUM HEATED STEAM GENERATORS FOR FAST REACTORS. Chetal, S.C.; Sabherwal, M.C. (Reactor Research Centre, Kalpakkam (India)). NHL (Natl. Metall. Lab.) Tech. J. (Jamshedpur, India); 18: No. 4, 73-80 (Nov 1976).

An attempt has been made to categorise the various materials which have been considered for a sodium heated steam generator. Choice of steam parameters, choice of sodium temperature, selection of material, problems of sodium heated generators, R and D efforts for indigenous materials for steam generators etc. have been discussed. It is concluded that stabilised ferritic steel will be a good selection as a sodium heated steam generator

material under Indian conditions.

- 5151 FUNDAMENTAL EXPERIMENT OF POTASSIUM HEAT EXCHANGER USING PRINCIPLE OF HEAT PIPE. Sumida, I.; Kotani, K. (Hitachi Ltd, Ozenji, Kawasaki-shi, Jpn). J. Nucl. Sci. Technol. (Tokyo); 13: No. 1, 648-655 (Nov 1976).

A potassium heat exchanger is described which features separate construction of primary and secondary coolant systems. A small amount of potassium plays a role as an intermediate media of heat transportation. Heat is transferred by evaporation and condensation of potassium on the surfaces of the primary and secondary coolant pipings, respectively. The tests were performed in the temperature range of 200 to 300°C and the maximum heat transfer reaches 1.3 kW (heat transfer rate at the primary heating source: 8.6 W/cm² at 300°C. 8 refs.

- 5152 (JAPFNR--259) STUDY ON SODIUM VOID REACTIVITY WORTH PREDICTIONAL METHOD. Kamei, T.; Yoshida, T.; Murakami, K.; Iijima, S. (Tokyo Shibaura Electric Co. Ltd., Kawasaki, Kanagawa (Japan); Nippon Atomic Industry Group Co. Ltd., Kawasaki, Kanagawa. Nuclear Research Lab.). Nov 1976. Translation of N--251-76-28 31p. Dep. NTIS (US Sales Only), PC A03/MF A01.

Work performed under United States--Japanese Fast Reactor Exchange Program.

The accurate evaluation of sodium void reactivity of a fast breeder reactor is of great importance in connection with a reactivity addition at high rates, which could cause a large nuclear energy release, in a hypothetical sodium loss accident. However, the complexity of the phenomena has prevented a reliable estimation of the sodium void reactivity worth. This paper presents a detailed analysis of sodium void experiments and assesses the adequacy of the calculational method, and then predicts the sodium void reactivity worth of the Japanese proto-type fast breeder reactor MONJU.

- 5153 MOCK-UP CRITICAL EXPERIMENTS FOR PROTOTYPE FAST BREEDER REACTOR 'MONJU'. Zukeran, A.; Inoue, T.; Suzuki, T.; Kawashima, K. (Power Reactor and Nuclear Fuel Development Corp., Oarai, Ibaraki (Japan). Oarai Engineering Center). Nippon Genshiryoku Gakkaishi; 18: No. 11, 672-684 (Nov 1976). (In Japanese).

The mock-up criticality experiments for Monju are roughly divided into the full mock-up test using the ZEBRA of Winfrith Institute, UKAEA, and the partial mock-up experiment with FCA of JAERI. The former test has been carried out over 18 months from September 1971 as the Japan-UK cooperative research project MOZART. With the FCA, the experiment complementing the MOZART has been carried out, focusing on the nuclear characteristics of Monju which can be simulated with a relatively small core, and the experiment on highly enriched control rods and shielding is being continued now with the FCA 7 core. The experimental data of the MOZART and the ZPPR series in USA were exchanged at the international symposium in Tokyo, thus the prediction and the accuracy evaluation of the nuclear characteristics of Monju became possible, and the highly reliable core design was able to be accomplished. The simulated criticality experiment is necessary for directly grasping the reliability of calculated values in comparison with the experimental values, and also for the experimental prediction of the nuclear characteristics. The outline and the analysis of the simulated

criticality experiment such as reactivity factor, control rod value, reaction rate distribution and sodium void reactivity are described, and the reflection of the results to the design of the core of Monju is explained.

- 5154 IN-CORE NEUTRON INSTRUMENTS. Takeda, T. (to Hitachi Ltd., Tokyo (Japan)). Japanese Patent 1978-56,495/A/. 29 Oct 1976. 3p. (In Japanese).

The purpose is to permit measurement of the neutron flux distribution within a central portion of the core of a fast reactor. A neutron detector is disposed within a cavity formed in a support rod, which is inserted in and secured to a control rod channel in a wrapper tube of a fast reactor. Since the neutron detector is disposed at the center of the core reactor, it is possible to detect the neutron flux in a zone where the void coefficient of sodium is positive, thus permitting accurate measurement of the neutron flux distribution within the core.

- 5155 CORE COOLING SYSTEM FOR REACTOR. Kondo, R.; Amada, T. (to Hitachi Ltd., Tokyo (Japan)). Japanese Patent 1978-54,691/A/. 27 Oct 1976. 5p. (In Japanese).

The purpose is to improve the function of residual heat dissipation from the reactor core in case of emergency by providing a secondary cooling system flow channel, through which fluid having been subjected to heat exchange with the fluid flowing in a primary cooling system flow channel flows, with a core residual heat removal system in parallel with a main cooling system provided with a steam generator. Heat generated in the core during normal reactor operation is transferred from a primary cooling system flow channel to a secondary cooling system flow channel through a main heat exchanger and then transferred through a steam generator to a water-steam system flow channel. In the event if removal of heat from the core by the main cooling system becomes impossible due to such cause as breakage of the duct line of the primary cooling system flow channel or a trouble in a primary cooling system pump, a flow control valve is opened, and steam generator inlet and outlet valves are closed, thus increasing the flow rate in the core residual heat removal system. Thereafter, a blower is started to cause dissipation of the core residual heat from the flow channel of a system for heat dissipation to atmosphere.

- 5156 PIPE PLATE AND ASSEMBLY FOR HEAT EXCHANGER. (to Neratoom N.V., The Hague (Netherlands)). Netherlands Patent 7,611,676/A/. 25 Oct 1976. 6p. (In Dutch).

The pipe assembly, especially for heat exchangers, consists of a pair of horizontal plates connected by a cylindrical tube with a side entry port connected with the space between the plates. The tube has a thicker section and smaller internal diameter at the ends where it holds a smaller outer diameter cylindrical tube. The end joints of the tubes and plates are soldered. The design is relevant to detection of leaks in sodium cooled nuclear power reactors.

- 5157 DOUBLE ARM HANDLING DEVICE FOR NUCLEAR REACTOR. Allain, A.; Buret, J. (to CEA, 75 - Paris (France)). French Patent 2,368,121/A/. 15 Oct 1976. 11p. (In French).

The invention concerns a machine which, inside a liquid sodium cooled reactor, makes it possible to transfer fuel assemblies forming the core, between the positions that these

assemblies fill inside the core to a storage position for these fuel assemblies inside the vessel. These operations are carried out when the reactor plug is in position and when the vessel is filled with liquid sodium, hence they are carried out without being seen. The improved charging system enables the handling time to be cut to a minimum and to diminish the number of positioning operations of the handling system inside the reactor vessel to effect the various charging and discharging operations. It includes a vertically positioned drum of which the top end crosses the plug; a first truck guided in vertical translation by guiding facilities integral with the drum and a second truck guided in vertical translation by other guiding facilities also integral with the drum, each truck being fitted with a horizontal arm at the free end of which is placed a grab hook for holding the fuel assemblies, the guiding facilities being such that the arms remain parallel to each other; gear for moving the trucks vertically and separately; facilities for controlling the opening and closing of the grabs and gear for turning the drum vertically about its centre line.

- 5158 SYSTEM FOR CHARGING AND DISCHARGING THE FUEL OF A NUCLEAR REACTOR. Allain, A.; Buret, J.; Plagnard, A. (Societe Technique pour l'Energie Atomique (Technicatome), Centre d'Etudes Nucleaires de Saclay, 91 - Gif-sur-Yvette (France)). (to CEA, 75 - Paris (France)). French Patent 2,368,122/A/. 15 Oct 1976. 13p. (In French).

The invention concerns a system for charging and discharging the fuel assemblies of a nuclear reactor, particularly although not exclusively, a liquid sodium cooled fast reactor. It lessens the drawbacks of the previous known solutions, particularly by enabling a fast fuel assembly handling rate to be sustained, whilst reducing the congestion in the transfer lock and making it possible for the latter to be adapted should the assembly guide ramps not have the same slope. To this end, the system considered includes a sealed lock capping, on the upper shield slab of the reactor, the ends of the two ramps closed by valves and respectively communicating with the reactor vessel and an external storage vessel. Inside the lock, two rail lengths carried by a vertically pivoted wheel extend the two ramps intended for receiving a mobile facility with an assembly to be charged or discharged. They slide on each ramp controlled by a winch located at the top of the lock. Each straight rail length is articulated on a horizontal shaft carried by a pivoting frame fitted in the lock and includes a lever extending the rail length beyond its shaft. This lever works in conjunction with a tilting system that moves the rail length from its inclined position in the extension of one of the ramps to the vertical position or vice versa. The invention thus combines the tilting movements of the rail lengths with a rotating movement of the wheel to redress these rail lengths and reverse their correspondence with the two ramps, in order to introduce into the vessel a new assembly simultaneously with the withdrawal from it of an irradiated assembly which, at the end of the operation, is received in a storage vessel.

- 5159 DEVICE FOR CONTROLLING FLOW RATE OF COOLANT FOR AN LMFBF TYPE REACTOR PLANT. Nakano, H.; Sato, M.; Sakuragi, M.; Iwashita, T. (to Tokyo Shibaura Electric Co. Ltd., Kawasaki, Kanagawa (Japan)). Japanese Patent 1978-48,193/A/. 13 Oct 1976. 7p. (In Japanese).

The purpose of the invention is to minimize

the change rate and change width of outlet temperature to inlet temperature of an intermediate heat exchanger or a steam generator to decrease a thermal shock. In a plant wherein an intermediate heat exchanger is connected to a reactor through a primary piping, a steam generator is connected to the heat exchanger through a secondary piping, water is fed to the steam generator through a third piping, and the thus obtained steam is fed to a turbine, a master unit including a primary to third coolant flow setter for controlling the primary to third coolant flow is provided to minimize the change rate and change width of the outlet temperature to the inlet temperature of the intermediate heat exchanger or the steam generator, to thereby control various control means.

- 5160 SODIUM LEAK DETECTOR. Aoki, K.; Iwasaki, T. (to Hitachi Ltd., Tokyo (Japan)). Japanese Patent 1978-43,194/A/. 1 Oct 1976. 3p. (In Japanese).

A method to permit accurate detection of sodium leakage by distinguishing between variations in the overflow tank level due to changes in sodium temperature accompanying changes in the power level or operating state of a liquid metal sodium cooled fast breeder, and a reduction in power level due to duct leakage is described. The volume of sodium in the primary cooling system is roughly estimated from the temperatures of hot and cold legs, and the duct leak preset level with respect to the sodium liquid level within an overflow tank when the plant is normal is varied according to the state of the plant. More particularly, the volume of sodium within the overflow tank is calculated on the basis of a signal representing the liquid level detected by a liquid level gauge in the overflow tank and a signal representing the temperature detected by hot leg and cold leg thermometers, thereby obtaining the preset value of the liquid level within the tank. This liquid level preset value and the afore-mentioned liquid level signal are compared, whereby sodium leakage due to breakage of the duct or other causes can be detected independently of the power state of the plant.

- 5161 INCIPIENT BOILING OF SODIUM IN AN ANNULAR CHANNEL HEATED BY A SINGLE-PIN WITH BLOCKAGE. Fujie, Y.; Okada, T.; Miyazaki, K.; Inoue, S.; Suite, T. (Osaka Univ., Suita (Japan); Faculty of Engineering). J. Nucl. Sci. Technol. (Tokyo); 13: No. 10, 596-608 (Oct 1976).

In simulation of partial failure affecting a fast breeder core, experiments on sodium boiling were performed in a single vertical channel of annular cross section (15mm I.D.), indirectly heated by high flux heater pin (6.5mm O.D., 60 cm heating length) and provided with a blockage disk (11 mm O.D., 1 mm thick, obstructing 42% of the channel area). The experimental conditions were: Pressure of cover gas: 1.0 kg/cm² abs., Heat flux: 0 -- 80 W/cm², Flow rate of sodium: 1 -- 4 l/min. The results revealed that the degree of incipient boiling superheat is reduced to a fraction of the value obtained previously for direct joule heating under similar conditions, and that, consequently, the intensity of pressure pulses is correspondingly reduced. On the other hand, the incipient boiling superheat increases, together with the extent of its scattering, with rising intensity of the heat flux. Local boiling was observed to precede the onset of bulk boiling, causing small pressure spikes to be detected by all three pressure sensors installed along the test channel. The pressures

evaluated from the measured velocities of the liquid sodium column based on single-bubble model were compared with the measured pressure signals, and a fairly good agreement was obtained.

- 5162 DEVELOPMENT OF SODIUM PENETRATION EQUIPMENT. Nihei, T.; Miyazawa, T. (Power Reactor and Nuclear Fuel Development Corp., Tokyo (Japan)). Doryokuro Giho; No. 20, 37-49 (Oct 1976). (In Japanese).

In the development of sodium-cooled fast breeder reactors, various measuring and monitoring methods are required for securing the safety and improving the operational rate, which have never been seen in conventional reactors. One of them is the requirement to monitor optically the state of the structures within a reactor as opaque liquid sodium is filled in it. The sodium penetration equipment, which scans with ultrasonic beam, monitors its reflecting or penetrating waves, and makes images, is promising. The development is carried out mainly by the Power Reactor and Nuclear Fuel Development Corporation in Japan. The main functions are the observation and identification of fuel assemblies, the observation of other structural changes, and the confirmation of the state of control rods. FFTF system in the U.S., Phenix system in France, the system for CFR in U.K., A-scope system in FRG, and PNC system in Japan are briefly explained. The sodium-penetrating equipment manufactured for trial comprises a supersonic transducer, transducer-driving mechanism, and display portion. The horizontally sodium-penetrating equipment is intended for confirming the gap between the core and the core upper mechanism, and it comprises also a supersonic transducer, transducer-driving mechanism, a reflecting plate and display portion. The basic test was carried out in water with reduced scale model, and the S/N ratio, the accuracy of fixing the reflecting plate, the limit of detecting the gap, the horizontal resolution, and mutual interference were examined.

- 5163 REPORT OF THE EXPERTS' COMMITTEE ON ADVANCED POWER REACTOR DEVELOPMENT ON MEASURES OF THE DEVELOPMENT. Genshiryoku Iinkai Geppo; 21: No. 8, 2-8 (Oct 1976). (In Japanese).

A report of the Committee on the policy of advanced reactors development in Japan, submitted to the AEC of Japan, is presented: utilization of light water reactors, establishment of Japan's own fuel cycle, development of a fast breeder reactor, development of an advanced thermal reactor, development of a multi-purpose high-temperature gas cooled reactor, introduction of overseas advanced reactors, the set up of utilizing developed reactors, and general research and development. In usage of nuclear power in Japan which has little energy resources, its development is necessary both in electric power generation and in industrial processes.

- 5164 PROVIDING RADIATION SAFETY AT NUCLEAR POWER PLANTS. Gusev, N.G. At. Energ. (USSR); 41: No. 4, 254-260 (Oct 1976). (In Russian).

A review of papers on radiation safety at atomic power stations is made. The following aspects are considered: radiation characteristics of the water coolant and their conformity with design data, personnel irradiation doses, blow-out of radioactive gases and aerosols, special gas decontamination systems, tritium at atomic power stations, radiation situation in the environment, requirements of tower-cooler layout, volume of

external radiation monitoring.

- 5165 REACTIVITY CHANGE RATE DURING THE BOR-60 REACTOR CORE LIFE. Afanas'ev, V.A.; Efimov, V.N.; Krasnoyarsov, N.V.; Skulkin, N.N.; Fedyakin, R.E. At. Energ. (USSR); 41: No. 4, 270-271 (Oct 1976). (In Russian).

ANALYTICAL SOLUTION; BOR-60 REACTOR; BURNUP; REACTIVITY; REACTOR CORES; SWELLING; REACTIVITY WORTHS

- 5166 DEVICE FOR DETECTING GASES, IN PARTICULAR FISSION GASES, IN THE COOLANT CHANNEL OF A LIQUID-COOLED NUCLEAR REACTOR FUEL ELEMENT. Gast, K. (to Gesellschaft fuer Kernforschung m.b.H., Karlsruhe (Germany, F.R.)). German (FRG) Patent 1,807,801/B/. 23 Sep 1976. 3p. (In German).

In controlling sodium cooled fast nuclear reactors it is important to provide for the early detection and localization of cladding tube defects in individual fuel elements. For this reason it is proposed to install in the coolant duct of a fuel element a cyclone assigning a rotary movement to the coolant in the duct, and in the center of the cyclone a heated thermocouple as a detector. For heating purposes the thermocouple may be embedded in a body containing fissile material, or it may be heated electrically. The device according to the invention for the detection of gases is very sensitive and has a short response time.

- 5167 NEUTRON FLUX MEASURING DEVICE. Marmonier, P.; Moreau, J.; Nervi, J.C. (to CEA, 75 - Paris (France)). French Patent 2,365,186/A/. 21 Sep 1976. vp. (In French).

This invention concerns a neutron flux measuring device for liquid coolant reactors and particularly applies to fast power reactors, cooled by liquid sodium. It is essential to have facilities for permanently measuring the flux of neutrons emanating from the core, not only when the reactor starts up but also when working at full power. An improvement to the solutions already considered allows for a more accurate and more sensitive measurement of the neutron flux, even when the reactor is working at very low rates. To this effect, the device considered, comprising at least one neutron detection chamber placed under and outside the vessel and as close as possible to it, is characterized in that it includes at least a neutron guide, composed of two separate superposed components. The first, top component includes a case open at the top, having an external profile identical to that of all the core assemblies and resting through its lower part on a bearing surface of a supporting prop on the diaphragm in which penetrates a foot centrally extending the case. The second, bottom component, in which the foot of the first engages coaxially, is fixed inside the supporting prop and includes a closed tube filled with an inert gas, extending past the diaphragm to near the internal surface of the bottom of the vessel. The first component contains a neutron emitting medium extending at least over its major part above the mid plane of the core.

- 5168 METHOD FOR LEAK-TESTING OF LIQUID-METAL WATER/STEAM HEAT EXCHANGERS. Dumm, K. (to Internationale Atomreaktorbau G.m.b.H. (INTERATOM), Bergisch Gladbach (Germany, F.R.)). German (FRG) Patent 2,329,549/C/. 16 Sep 1976. 5p. (In German).

A method is proposed for leak-testing of liquid-metal water/steam heat exchangers before

their initial start-up being applied at pressures and temperatures corresponding to those of later working conditions. The invention provides for the heat exchangers to be acted upon by a testing gas at testing pressure on the water/steam side and by hot liquid-metal on the liquid metal side. The cover gas atmosphere (argon) on the liquid metal side is monitored for the appearance of the testing gas which is present on the other side. This way, corrosion and the resulting repairs are avoided in the operation of nuclear power plants with sodium cooling.

- 5169 NUCLEAR REACTOR WITH ROTATING CLOSURE. Mohm, F. (to Internationale Atomreaktorbau G.m.b.H. (INTERATOM), Bergisch Gladbach (Germany, F.R.)). German (FRG) Patent 1,564,114/C/. 16 Sep 1976. 7p. (In German).

The invention concerns the arrangement of the decay channels of a nuclear reactor which has a closure which is eccentrically rotatable around its middle axis. According to the invention, the decay channels lie on the circle produced by the refuelling channel on rotation of the closure, but at another position than the charging channels, within the shielding. Therefore, the shielding may be used as decay store for the spent fuel elements and the time necessary for refuelling may be shortened. A rotating auxiliary cover facilitates the discharging procedure.

- 5170 ELECTROCHEMICAL SYSTEM FOR DETERMINING THE OXYGEN CONCENTRATION IN A LIQUID ALKALINE METAL. Roy, P.; Licina, G.J. (to General Electric Co., Schenectady, NY (USA)). French Patent 2,325,928/A/. 16 Sep 1976. 10p. (In French).

A description is given of an electrochemical system for determining the oxygen concentration in a liquid alkaline metal. Its features include: (a) a solid electrolytic body conducting oxygen-ions having a pair of opposed lateral surfaces, one being adapted so as to be in close contact with the liquid metal whose concentration in oxygen it is desired to determine; (b) a mixture containing a known concentration of one of the metals selected from among gallium, indium or tin and an oxide of this metal. This mixture is liquid at the operating temperature of the system and is in close contact with the second lateral surface of the electrolytic body so as to provide a reference electrode, and (c) an instrument for measuring any electromotive force generated between the reference electrode and the liquid metal by conduction of the oxygen-ions through the solid electrolyte in order to provide a reading indicating the oxygen concentration.

- 5171 CONTROL DEVICE IN A REACTOR. Onuki, K. (to Tokyo Shibaura Electric Co. Ltd., Kawasaki, Kanagawa (Japan)). Japanese Patent 1978-34,094/A/. 9 Sep 1976. 2p. (In Japanese).

The purpose of the invention is to flatten temperature distribution of coolant within a core. The control device of the present invention is to vary reactivity of a fast breeder to control a reactor power. In general, the control device of this kind comprises a guide pipe arranged within the core and a control rod movable up and down within the guide pipe, and a coolant flows from bottom toward top within the guide pipe. Since a cooling flow rate has a margin, temperature of coolant outlet is extremely low as compared to a fuel assembly, and therefore temperature gradient in the vicinity of the top of the control rod becomes sharp to possibly impart

thermal shock to the structural material. In the present invention, the flow passage of coolant is varied to thereby avoid outflow thereof into the core, thus flattening the temperature distribution of the coolant within the core.

- 5172 TESTING N 205 TYPE ANTIFRICTION BEARINGS IN LIQUID SODIUM. Metal, D. (Vyzkumny Ustav Zavodu Energetického Strojirenstvi, Brno (Czechoslovakia)); Handl, Z. (Vyzkumny Ustav pro Valiva Loziska, Brno (Czechoslovakia)). Strojirenstvi; 26: No. 9, 554-558 (Sep 1976). (In Czech).

Comprehensive tests were carried out of special N 205 antifriction bearing in liquid, hot sodium at temperatures of 370 degC and 420 degC. Sodium used for tests contained various amounts of oxygen. Visual inspection, X-ray spectral microanalysis, X-ray phase analysis and accurate measurements before and after tests were used to assess the influence of hot aggressive metal. It was found that under the conditions simulated by the tests the ball bearings can be expected to have a short service life.

- 5173 FUEL ASSEMBLY. Ito, A. (to Tokyo Shibaura Electric Co. Ltd., Kawasaki, Kanagawa (Japan)). Japanese Patent 1978-29,495/A/. 31 Aug 1976. 5p. (In Japanese).

The purpose of the invention is to improve thermal efficiency and safety of a FBR type reactor and prevent the generation of cavitation by permitting a desired quantity of coolant to flow into a fuel assembly used in the reactor. A fuel assembly accommodating a bundle of fuel rods is provided at its lower end with cylinders coaxial with respective fuel rods by respective connecting tubes, and a flow rate control mechanism is provided to cause the coolant to flow toward the inner wall of each of the cylinders. The flow rate control mechanism consists of, for instance, a guide hole formed in each cylinder and a round rod fitted in the associated connecting tube.

- 5174 POSITION CONTROL DEVICE FOR A CONTROL ROD. Ono, T.; Kusaka, S. (to Tokyo Shibaura Electric Co. Ltd., Kawasaki, Kanagawa (Japan)). Japanese Patent 1978-29,498/A/. 31 Aug 1976. 6p. (In Japanese).

The purpose of the invention is to reliably prevent dangerous operation in the control of the position of the control rod by checking for abnormal pulse motor coil excitation voltage and, at the time of occurrence of abnormality, immediately holding the control rod stationary lest it should be moved to an unsafe position, this being accomplished excitation from a compensating excitation system. In an LMFBR reactor, a circuit for memorizing the correct output states of individual drive signals at arbitrary instants and consequently producing the memorized results is provided, and the output of the circuit and the actual drive signal are compared at all times to discriminate whether the drive signal being compared is normal or not. When the actual drive signal is abnormal, a series signal varying after a predetermined pattern is shifted to enable replacement of the actual drive signal, so that irrespective of whether the problem drive signal is "on" or "off", a drive signal of the correct pattern may be supplied to the pulse motor to hold the control rod and prevent it from being moved toward the dangerous side due to its own weight or other causes.

- 5175 SODIUM LEAK DETECTOR. Tsukamoto, M.; Ibe, H. (to Hitachi Ltd., Tokyo (Japan)). Japanese Patent 1978-22,994/A/. 13 Aug 1976. 4p. (In Japanese).

The object of the invention is to detect change inflow due to clogging of a filter while maintaining a pressure differential, between upstream and downstream of the filter, constant, to enable quick responsive leak detection in a simple device. The atmosphere gas at a sampling point is subject to sampling by a blower via a filter and a flow meter. The pressure gage measures gas pressure in a sampling tube and controls the number of revolutions of the blower so that the gas pressure is constant. This gas pressure may be maintained constant to thereby maintain a pressure difference between the upstream and the downstream of the filter for each filter. A flow signal of the flow meter is transmitted to a signal processor via a multiplexer, and when the change rate of flow with respect to an initial flow reaches a threshold value, and alarm is given to indicate that sodium leak occurs.

- 5176 HEAT TRANSFER SYSTEM IN A FAST BREEDER. Suzuoki, A.; Sagawa, N. (to Hitachi Ltd., Tokyo (Japan)). Japanese Patent 1978-21,393/A/. 11 Aug 1976. 4p. (In Japanese).

The object of the invention is to remove a radioactive corroded product contained in liquid metal in a primary cooling system to decrease a dose rate of surface radiation of the machineries and pipes in the primary cooling system. There is provided a pressure-reduced distilling device having liquid metal on the primary within a flow passage of a primary cooling system used as a heating source and having fluid on the secondary within a flow passage of a secondary cooling system used as a cooling source, and the liquid metal on the primary containing impurities is partly introduced into the pressure-reduced distilling device, within which the impurities are removed, and the liquid metal on the primary with the impurities removed is returned into the flow passage of the primary cooling system.

- 5177 SAFETY EQUIPMENT IN A REACTOR. Shiratori, H.; Ishiyama, S.; Ugawa, Y. (to Tokyo Shibaura Electric Co. Ltd., Kawasaki, Kanagawa (Japan)). Japanese Patent 1978-21,391/A/. 10 Aug 1976. 3p. (In Japanese).

The object of the invention is to safely retain, even if fuel should be molten and flown through the bottom of a container in a reactor, the molten fuel to remove heat generation of the fuel to prevent occurrence of a critical trouble. A reactor container housing a core and coolant has thereunder a separation dome in a central portion thereof and a partitioning plate coaxially and circularly disposed in the periphery of the separation dome, with a tray formed of magnesium oxide being disposed. Further, a cooling path system is provided so as to surround the tray. The cooling path system and the reactor container are surrounded and protected by a reactor wall provided with heat insulating refractory bricks, a coolant pouring system extends through the reactor wall, and the coolant is supplied to the tray.

- 5178 RADIATION SHIELDING DEVICE. Matsumoto, F.; Yamazaki, H. (to Tokyo Shibaura Electric Co. Ltd., Kawasaki, Kanagawa (Japan)). Japanese Patent 1978-20,099/A/. 9 Aug 1976. 2p. (In Japanese).

The object of the invention, particularly in a fast breeder, is to positively shield

radiation leaking from a portion through which a measuring cable extends, the cable extending from the interior to the exterior of the reactor. An inner extension pipe connected to a drive portion of a fuel assembly is formed with a through hole, through which a measuring cable from a detector guides externally of the reactor. The support plates are provided on inlet and outlet of the through hole, interiorly of which is filled with boron carbide (B₄C) powder to absorb neutron to prevent leakage of radiation.

5179 PROPOSED STRATEGY FOR POWER REACTOR DEVELOPMENT LETS P.N.C. DOWN. At. Jpn.; 20: No. 8, 6-11(Aug 1976).

The strategy for power reactor development in Japan is discussed. The development of nuclear power is at the stage of requiring larger funds than ever. The developments of the prototype heavy water reactor Fugen and the experimental fast reactor Joyo are at the point of planning the next stages. The high temperature gas reactor project must be forwarded. The fuel cycle picture is a serious problem in Japan, and the national project on the development of heavy water reactors was started, and has been developed by the Power Reactor and Nuclear Fuel Development Corporation (PNFC). However, the users criticized this project. The prototype heavy water reactor will be in operation next year, and it will be after the prototype construction, switching should be made to a thorium-fueled reactor. Discord in the basic strategy for power reactor development arises from a plan to introduce CANDU reactors.

5180 SOWACS-3: A CODE FOR ANALYZING THE SYSTEM EFFECTS OF LARGE-LEAK SODIUM-WATER REACTIONS IN STEAM GENERATORS FOR LMFBR'S. Maekawa, I.; Shindo, Y. (Kawasaki Heavy Industries Ltd., Kobe (Japan)). FAPIG (Tokyo); No. 82, 31-42(Aug 1976). (In Japanese).

In liquid metal-cooled fast breeder reactors, since heat exchange is performed between sodium and water or steam, sodium-water reaction occurs if sodium leak arises, and it may give great influence on the secondary cooling system. Large leak sodium-water reaction shows the complex phenomena related to hydrodynamics, thermodynamics, and structural dynamics, and more complicate behavior is shown because the transient phenomena of the release system are superposed. SOWACS-3 (Sodium Water reaction in Compressible Sodium-3) is a code to analyze the instant complex phenomena in the large leak of steam generators, and the effect of sodium-water reaction over secondary coolant pipes, intermediate heat exchanger, steam generator and release system is analyzed. SOWACS-3 analyzes the one dimensional model of unsteady compressible fluid in accordance with flow equations and by the characteristics curve method. The report describes the fundamental formulae, numerical calculation procedures and the construction of computing codes.

5181 METHOD OF PREHEATING A NUCLEAR REACTOR COOLING SYSTEM. Kurokawa, M. (to Mitsubishi Heavy Industries Ltd., Tokyo (Japan)). Japanese Patent 1978-16,196/A/. 29 Jul 1976. 4p. (In Japanese).

The object of the invention is to permit efficient and uniform preheating of the cooling system of a nuclear reactor by utilizing apparatus constituting the cooling system, particularly utilizing an overflow column, through which preheating gas is supplied and discharged. When preheating a cooling system before the pouring of liquid sodium, a

cylindrical partition member is temporarily inserted into an overflow column with its lower end aligned with the outlet end of the overflow column, thus dividing the inner space in the column into a supply passage for supplying preheating gas and an exhaust passage for exhausting the preheating gas. A preheating gas supply source is connected to the upper end of the supply passage. Circulation of the preheating gas proceeds as follows. The preheating gas having returned after excursion through the cooling system in the reactor is exhausted from the exhaust passage and returned to the preheating gas supply source, and after re-heating it is supplied again to the cooling system.

5182 ABNORMAL CONDITION DETECTOR OF A REACTOR CONTAINER. Kanekubo, H. (to Tokyo Shibaura Electric Co. Ltd., Kawasaki, Kanagawa (Japan)). Japanese Patent 1978-13,097/A/. 22 Jul 1976. 4p. (In Japanese).

The object of the invention is to readily and accurately detect abnormality and abnormal point of a lining applied on the inside of a concrete wall within a container in a sodium cooled fast breeder. A dual lining made of steel is disposed internally of a room surrounded by concrete to house cooling equipment and piping therein. A space formed between the dual lining is divided into a plurality of spaces by partitioning plates. Each space is formed with an opening, which is connected to a pipe, and connected to a blower in an annulus exhaust system through a respective opening and closing valve in the midst thereof. A leak detector is provided in the midst thereof. The space in the lining is always maintained at negative pressure. When the abnormality is detected, the aforesaid valves are all closed and subsequently these valves are opened one by one. This operation can tell which divided space has abnormality.

5183 REFUELING MACHINE. Ito, M.; Ugawa, S.; Ito, T. (to Tokyo Shibaura Electric Co. Ltd., Kawasaki, Kanagawa (Japan)). Japanese Patent 1978-11,296/A/. 20 Jul 1976. 4p. (In Japanese).

The object of the invention is to prevent occurrence of such a trouble, when fuel assembly is disposed, that the fuel assembly to be disposed tends to interfere with another fuel assembly adjacent thereto resulting in failure of disposition. Signals of an angle sensor for sensing a relative angle between a rotary plug and a rotary housing and of an angle sensor for sensing a relative angle between the rotary plug and a fixed plug may be processed by an adder to sense a relative angle between a gripper arm and a core. When the fuel assembly is removed, a differential angle α relative to a reference direction may be sensed by the adder to memorize it by means of an angle displacement detector. On the other hand, a differential angle β relative to a reference direction, when the fuel assembly is disposed, may also be sensed by the adder similarly to the former to thereby sense a differential theta with respect to the α previously memorized in the angle displacement sensor by an operation. Where the theta is close to 30°, it means that performance of fuel assembly disposition is dangerous.

5184 INVERSE STEAM GENERATOR ESPECIALLY FOR LIQUID METALS. Krizek, V.; Dubsek, F. Czech Patent 163,989/B/. 15 Jul 1976. 3p. (In Czech).

The invention claims an inverse steam generator for liquid metals whose heat exchange

tubes have a non-circular (hexagonal, elliptic, cruciform, lemniscate) cross-section and are arranged in a parallel bundle.

- 5185 RAPID-ACTION VALVE ESPECIALLY FOR LIQUID METAL. Velek, V.; Cejka, J.; Jakl, J. Czech Patent 163,608/B/. 15 Jul 1976. 5p. (In Czech).

A rapid-action large-diameter valve and control fitting was designed for cooling circuits of nuclear power plants with fast liquid metal cooled reactors, namely sodium cooled. The design meets the requirements for axial symmetry about the flow axis and secures the equilibrium of hydraulic and hydrodynamic forces observing the uniformity of the thickness of the fitting walls which is a prerequisite for good resistance to thermal shock.

- 5186 IMPROVEMENTS TO LEVEL INDICATORS FOR LIQUID METALS. Playfoot, K.C.; Todd, W.H. (to Westinghouse Electric Corp., Pittsburgh, PA (USA)). French Patent 2,318,409/A/. 12 Jul 1976. Priority date 15 Jul 1975, United States of America (USA), 9p. (In French).

An inductive apparatus is described for detecting the level of a liquid metal, sodium for instance. It includes an inductive probe that may be introduced into a sealed tube directed downwards in the liquid metal chamber, comprising a twin-wire transformer; a constant amperage electricity supply electrically connected to the primary winding of the twin-wire transformer; an amplifier electrically connected to the secondary winding and to the compensating coil, the output signals of these windings being applied to the amplifier in order to produce an adjusted temperature output signal indicating the depth of liquid metal around the probe.

- 5187 FUEL ASSEMBLY IN FBR TYPE REACTOR. Miki, K. (to Hitachi Ltd., Tokyo (Japan)). Japanese Patent 1978-6,795/A/. 9 Jul 1976. 4p. (In Japanese).

The object of the invention is to make a wall thickness of a cladding tube at the top of fuel pins in the outermost periphery thicker than that of other portions so as to eliminate fretting corrosion of the cladding tube at the top of fuel pins when the latter are curved and deformed. A ring spacer is attached to the top of a fuel pin so as to increase the wall thickness of a cladding tube at the top portion. This prevents section deformation of the fuel pin due to outside load and avoid direct contact between the cladding tube and a wrapper tube wall at the top of fuel pin in the outermost periphery to prevent fretting corrosion of the cladding tube.

- 5188 REACTOR VESSEL. Wade, E.E. (to Westinghouse Electric Corp., Pittsburgh, Pa. (USA)). Swedish Patent 2,555,270/A/. 8 Jul 1976. 17p. (In German).

In the case of reactor vessels, especially in that of LMFBR type reactors, difficulties arise in lubricating the bearings and seals for the ducts in the top of the vessel. According to the invention, this is to be avoided by special supporting members which receive the rotatable parts of the cover and the design of which prevents the lubrication from entering into the inner part of the reactor.

- 5189 NUCLEAR FUEL ASSEMBLY. Ito, A.; Wakamatsu, M. (to Tokyo Shibaura Electric Co. Ltd., Kawasaki, Kanagawa (Japan)). Japanese Patent 1978-5,389/A/. 6 Jul 1976. 4p. (In

Japanese).

The object of the invention is to permit the coolant in an LMFBR type reactor to enter from the entrance nozzle into a nuclear fuel assembly without causing cavitation. In a nuclear fuel assembly, which comprises a number of thin fuel pins bundled together at a uniform spacing and enclosed within an outer cylinder, with a handling head connected to an upper portion of the outer cylinder and an entrance nozzle connected to a lower portion of the cylinder, the inner surface of the entrance nozzle is provided with a buffer member and an orifice successively in the direction of flow of the coolant. The coolant entering from a low pressure coolant chamber into the entrance nozzle strikes the buffer member and is attenuated, and thereafter flows through an orifice into the outer cylinder.

- 5190 LIQUID METAL COOLED NUCLEAR REACTOR. Durston, J.G.; Hind, J.R. (to UKAEA London Office). French Patent 2,317,734/A/. 6 Jul 1976. Priority date 7 Jul 1975, United Kingdom of Great Britain and Northern Ireland (UK), 11p. (In French).

The nuclear reactor described is cooled by a liquid metal. It includes a reactor containment filled with a mass of liquid metal in which is immersed a core enclosed in a vessel. It comprises a system to cover the internal surface of the vessel wall with liquid metal taken from the area of the mass outside the vessel and to circulate the liquid metal from there radially internally towards the core.

- 5191 FAST NEUTRON REACTOR. Jogand, P. (to CEA, 75 - Paris (France)). French Patent 2,357,987/A/. 6 Jul 1976. 9p. (In French).

The invention relates to a fast nuclear reactor of the integrated type in which the hot sodium on leaving the core, contained in the internal vessel, is made to flow between the core and the side wall of this vessel to be removed from it by manifolds connected together at the bottom of each exchanger with a central channel provided in it. Under this invention, the residual power can be evacuated, in the event of reactor trouble, by causing the liquid metal to flow by natural convection. To this effect, the upper end of the internal vessel is capped with an annular bell inverted and placed under the internal pressure of a neutral gas to prevent, in normal operation, direct communication between the hot liquid metal inside the internal vessel and the cold liquid metal in the annular space between the main vessel and the internal vessel. This bell caps an auxiliary exchanger outwardly circling the internal vessel in such a way that, in the event of reactor trouble and after the pressure of the neutral gas under the bell has been reduced, a flow of the liquid metal under the bell of the internal vessel takes place by natural convection towards the annular space by passing through the auxiliary exchanger.

- 5192 DEVICE OF EXTINGUISHING A LIQUID FUEL BY REMOTENESS. Colome, J.; Duchene, A.; Regnier, J. (to CEA, 75 - Paris (France)). French Patent 2,357,267/E/. 5 Jul 1976. 8p. (In French).

In the main patent specification a description was given and a claim made with respect to a system for the rapide extinction of an inflamed liquid combustible substance by isolating it rapidly from the ambient air. This system applies; inter alia, to a sheet of sodium flowing at high temperature accidentally coming from a nuclear installation and

particularly a fast nuclear reactor. This addendum concerns an improvement to the arrangements explained in the main specification, making it particularly possible to increase by any proportion the total capacity available for collecting the inflamed liquid by means of a receptacle formed of several separate tanks, fitted with appropriate connections permitting communication between these tanks to equalise the level of the liquid fuel collected in them, on the communicating vessels principle.

- 5193 PIPE SUPPORT FOR USE IN A NUCLEAR SYSTEM. Pollono, L.P.; Mello, R.M. (to Westinghouse Electric Corp., Pittsburgh, Pa. (USA)). French Patent 2,317,583/A/. 2 Jul 1976. Priority date 9 Jul 1975, United States of America (USA), 17p. (In French).

Priority claim: 9 Jul 1975, US.

Description is given of a vertical pipe support system. It comprises a tubular pipe support structure having the same inside diameter and the same wall thickness as the pipe, the pipe support structure having a generally triangularly shaped extension formed integral with and extending circumferentially around its outward side, the bottom side of this extension generally forming a ledge; an annular load-bearing insulation formed adjacent to the extension; means for clamping the load-bearing insulation to extension; and means for providing constant vertical support to means for clamping.

- 5194 DEVELOPMENT OF COLD TRAPS. Mochizuki, K.; Nagase, N. (Power Reactor and Nuclear Fuel Development Corp., Tokyo (Japan)). Doryokuro Gihō; No. 19, '37-45 (Jul 1976). (In Japanese).

Cold traps for liquid sodium coolant systems are described. Three basic designs of cold traps used at Oarai Engineering of Power Reactor and Nuclear Fuel Development Corp. are shown. Impurities are trapped by the cold traps at the entrance and exit of the mesh portion. The concentration of oxygen in liquid sodium depends on temperature. The operation temperature of cold traps for the experimental reactor Joyo is set at 150 degree C. In the secondary cooling system, hydrogen concentration is more important, and the temperature is decided by this concentration. It is necessary for designing a fast reactor to estimate the amount of impurities accumulating during its life time. In a primary cooling system, oxygen in purchased sodium, initially residual oxygen in the system, oxygen adsorbed on the surfaces of structural materials, oxygen brought in with fuel, oxygen transferred from cover gas and seal gas, and oxygen entering at the time of maintenance are considered. In a secondary system, Oxygen and hydrogen must be taken into account. Efficiency of trapping and the amount of trapped oxygen are described. Further improvement of cold traps is continued.

- 5195 SODIUM-WATER REACTION TEST FACILITY (SWAT-3). Shimazu, H.; Ukechi, K.; Sasakura, K.; Kusunoki, J. (Ishikawajima-Harima Heavy Industries Co. Ltd., Tokyo (Japan)). IHI Eng. Rev.; 9: No. 3, 81-92 (Jul 1976).

In the development of the liquid metal cooled fast breeder reactor (LMFBR), the steam generator (SG) is considered one of the most important components. The Power Reactor and Nuclear Fuel Development Corporation (PNC) is now promoting the research and development of the SG system used with the prototype fast breeder reactor 'Monju'. In this research, the phenomena of the sodium-water reaction in the SG are the key which must be investigated

for the solution of problems. The test facility (SWAT-3) simulating Monju's SG on the scale of 1/2.5 was designed, fabricated and installed by IHI at Oarai Engineering Center of PNC, its pre-operation being accomplished in February 1975. The purpose of SWAT-3 is summarized as follows: (1) To perform an overall test on the safety of Monju's SG and intermediate heat transport system under the design condition against sodium-water reaction accidents. (2) To investigate the damage of the SG structure caused by the sodium-water reaction, and the possibility of repair and recovery operations. The first test was accomplished successfully on June 9, 1975. As a result of the test, the fundamental function of this test facility was proven to be satisfactory as expected.

- 5196 APPARATUS FOR PURIFYING A PRIMARY COVER GAS. Arai, S.; Yoshizawa, K. (to Tokyo Shibaura Electric Co. Ltd., Kawasaki, Kanagawa (Japan)). Japanese Patent 1978-4,199/A/. 30 Jun 1976. 4p. (In Japanese).

Object: To prevent fine liquid metal particles and fission products floating in a primary cover gas from depositing upon a shield plug and in the surrounding space in an LMFBR type reactor. Structure: In a closed loop constituted by a reactor container provided with a shield plug and supporting the core top mechanism in a fixed position, a means for eliminating or reducing impurities and radioactivity in the gas and gas circulating means, these means being provided outside the container, and duct lines valves connecting the container and these means, a nozzle header having a plurality of nozzles is provided at underside of the shield plug and connected thereto by a duct line. The primary cover gas which is purified and fed out of the container is supplied to the nozzle header and sprayed therefrom to form an air curtain. This air curtain can prevent intrusion of the cover gas into the afore-mentioned space.

- 5197 MAINTENANCE EQUIPMENT FOR A FAST REACTOR. Yoshizawa, K. (to Tokyo Shibaura Electric Co. Ltd., Kawasaki, Kanagawa (Japan)). Japanese Patent 1978-4,189/A/. 30 Jun 1976. 3p. (In Japanese).

The object of the invention is to permit cleaning of through-holes of various diameters by mounting a spray nozzle on the lower end of a vertically movable extension tube connected to an Ar gas heater. After removing control rod drive mechanism and other apparatus mounted on the top of the reactor core for maintenance, a spray nozzle of a maintenance apparatus on a reactor top pit lid is inserted into a through-hole in a shield plug. Then, Ar gas heated by the heater is supplied through the extension tube and sprayed, thereby removing Na slug attached to and solidified on the inner surface of the hole by fusion.

- 5198 FUEL ASSEMBLY. Wakamatsu, M.; Ikeda, K. (to Tokyo Shibaura Electric Co. Ltd., Kawasaki, Kanagawa (Japan)). Japanese Patent 1978-1,787/A/. 29 Jun 1976. 5p. (In Japanese).

Object: To provide a fuel assembly having a handling head connected at the upper part thereof and an entrance nozzle connected at the lower part thereof, said assembly comprising spiral protrusions provided in the outer peripheral surface in the vicinity of a coolant inflow end of the entrance nozzle to restrain an inflow quantity of coolant into a low pressure cooling chamber. Structure: Spiral protrusions are provided in the outer peripheral surface adjacent the end of the

entrance nozzle in which coolant flows in to limit gaps between the fuel assembly and the partitioning wall and connection tube thereby controlling the flow of coolant into the low pressure coolant chamber so that even when the fuel assembly is eccentrically deformed, the flow distribution of the coolant in the blanket region can be maintained properly.

- 5199 NUCLEAR REACTOR. Ito, A.; Kumaoka, Y. (to Tokyo Shibaura Electric Co. Ltd., Kawasaki, Kanagawa (Japan)). Japanese Patent 1978-1,793/A/. 28 Jun 1976. 3p. (In Japanese).

The object of the invention is to improve the safety of an LMFB type reactor and also increase the thermal efficiency thereof by reducing the flow of the coolant from high pressure side to low pressure side even when floating of the fuel assembly results. A labyrinth is formed on the inner surface of a duct connecting a lower low pressure coolant chamber and an upper low pressure coolant chamber or on the surface of a lower portion of the fuel assembly inserted in the duct. With this labyrinth the rate of the coolant passing through a contact section between the fuel assembly and an upper partition member within the reactor is controlled.

- 5200 CONTROL ROD DRIVE MECHANISM. Yamada, K. (to Tokyo Shibaura Electric Co. Ltd., Kawasaki, Kanagawa (Japan)). Japanese Patent 1978-1,792/A/. 28 Jun 1976. 3p. (In Japanese).

The object of the invention is to reduce dislocation of upper and lower guide tubes for a control rod from their common axis in an LMFB type reactor using a rotary plug for fuel exchange and also prevent adverse effects upon the operation of the rotary plug. The upper guide tube has a lower tapered open portion, which is adapted to be inserted in the lower guide tube during the normal operation of the reactor. It is adapted to be released from the lower guide tube by raising the entire control rod drive mechanism. Since the upper and lower guide tubes are coupled to each other by insertion, as mentioned above, even slight dislocation is caused by an earthquake or the like, they will remain coupled to ensure stable scram operation.

- 5201 SYSTEM OF PENETRATION OF A NUCLEAR REACTOR SLAB FOR MEASUREMENT CABLES. Eyral, M.; Mahe, A. (to CEA, 75 - Paris (France)). French Patent 2,357,037/A/. 28 Jun 1976. 13p. (In French).

This invention concerns a device that enables the cables, connecting the sensors located inside a nuclear reactor vessel to the machines outside the vessel processing the information picked up by these sensors, to go through the vessel in a leak-tight manner. The aim of this device is to facilitate, by special means, the fitting of the sealing device through the upper shield and the installation of the cables when the nuclear reactor, of the fast liquid sodium cooled type, is being assembled. It includes a vertical tube closed at its lower end by a removable cover and at its upper end by a flange connecting it to the upper shield, bored to ensure a tight fit with respect to the upper shield, and a removable closure capping located above the flange. The tube is internally provided with at least one plate perpendicular to the axis of the tube, connected in a leak-tight manner to the tube by its periphery, the plate being fitted with holes for the leak-tight passage of a cable with a special insulating sheathing.

- 5202 EXTREMELY SENSIBLE METHOD AND DEVICE FOR DETECTING METALLIC VAPORS. Sun, K.H. (to Westinghouse Electric Corp., Pittsburgh, PA (USA)). French Patent 2,316,597/A/. 25 Jun 1976. Priority date 2 Jul 1975, United States of America (USA), 12p. (In French).

A method is described for detecting the presence of a metal gas in an enclosed atmosphere by means of a radioactive labelling substance. The metal gas comprises a metal selected from sodium, potassium and their mixtures. A current of this atmosphere is sent into an exchange column containing this labelling substance, then through an ionisation chamber to achieve the detection of the radioactivity and hence provide an indication of the presence of a metal gas. The characteristic of this method is that this radioactive labelling substance is capable of freeing tritium when it is in contact with the metal gas and includes at least one chemical compound in the group formed by XT_n , where T is the tritium and X is -OH, -OR, RCOO-, RO- and their mixtures, with R being equal to $C_{sub}(n)H_{sub}(2n+1)$ and n included between 1 and 20 inclusive.

- 5203 PROCESS AND SYSTEM FOR DETECTING AND PRE-LOCATING A CLAD FAILURE IN A FAST NEUTRON NUCLEAR REACTOR. Paziaud, A. (to CEA, 75 - Paris (France)). French Patent 2,356,244/A/. 23 Jun 1976. 6p. (In French).

The invention relates to a process and system for detecting and pre-locating a clad failure in the fuel assembly of a fast nuclear reactor cooled by a liquid metal (generally sodium) by counting the delayed neutrons emitted by the fission products escaping from the failed assembly and taken up by the liquid metal. The invention makes it possible to increase sensitivity in the detection of the neutron coming from the fission products. To this effect the process consists in performing a direct measurement of the delayed neutrons in the reactor coolant flow, inside the vessel itself containing this coolant. The measurement device has at least one detector for the neutrons emitted by the fission products carried in the coolant flow as a result of the failed fuel element. This detector is inserted inside the vessel in the coolant flow in an area protected from the neutrons emerging from the core by the coolant volume itself and by structures immersed in the annular space between the core and vessel. Preferably, the neutron detector is formed of a U-235 fission chamber, fitted inside a thimble immersed in the coolant.

- 5204 COOLING DEVICE OF A SPENT FUEL. Fujita, M. (to Fuji Electric Co. Ltd., Kawasaki, Kanagawa (Japan)). Japanese Patent 1977-154,996/A/. 18 Jun 1976. 4p. (In Japanese).

The object of the invention is to provide a bypass pipe between a coolant outlet pipe and a coolant inlet pipe to prevent occurrence of siphon effect, thus providing fail-safe means. In normal operation, sodium circulates from an outlet pipe to an inlet pipe through a pump and a cooler, while a part of sodium passes through a bypass pipe to be short-circuited. While the short-circuited flow is restricted by a throttle, it may be assured by a flow meter that the bypass pipe is not blocked. On the other hand, if a rupture should occur at a lower point of the pipe, the sodium within a spent fuel storage tank would be flown out because of the siphon effect of the inlet pipe and outlet pipe with the result a liquid level lowers. However, when the liquid surface is

exposed from the outlet pipe, then cover gas is sucked therethrough and also into the inlet pipe passing through the bypass pipe, whereby the siphon effect is impaired.

- 5205 LIQUID METAL COOLED REACTOR. Winnett, G.F. (to UKAEA London Office). French Patent 2,316,704/A/. 18 Jun 1976. Priority date 20 Jun 1975, United Kingdom of Great Britain and Northern Ireland (UK), 11p. (In French).

A liquid metal cooled reactor is described. The reactor core is immersed in the liquid metal contained in a primary vessel located in a containment concrete vessel. The upper part of the concrete vessel is insulated by a series of plates.

- 5206 FUEL ASSEMBLY FOR A FBR TYPE REACTOR. Kakehi, I.; Matsuzuka, R. (to Tokyo Shibaura Electric Co. Ltd., Kawasaki, Kanagawa (Japan)). Japanese Patent 1977-154,987/A/. 16 Jun 1976. 4p. (In Japanese).

The object of the invention is to allow a fuel assembly to be oriented by the assembly itself when the latter is charged into a core matrix, thus providing a smooth charging. A bearing is secured to a tapered surface disposed slightly lower than a level at which an outer cylindrical pipe in a tapered surface at an upper end of a handling head having a polygonal section or in an upper part of an entrance nozzle. With this structure, at the time of charging, one fuel assembly comes into contact with the other fuel assembly previously charged through a ball bearing, whereby the assembly is received in position while being rotated smoothly.

- 5207 SAFETY EQUIPMENT OF A REACTOR. Kasama, S. (Nippon Atomic Industry Group Co. Ltd., Tokyo). (to Tokyo Shibaura Electric Co. Ltd., Kawasaki, Kanagawa (Japan)). Japanese Patent 1977-154,988/A/. 16 Jun 1976. 2p. (In Japanese).

The object of the invention is to retain melting fuel, when a reactor vessel is failed as a result of melting a core, to remove heat generation of fuel, thus preventing recriticality accident. The safety equipment, which has a receiving vessel and a cooling device disposed below a reactor protector vessel, provides an arrangement wherein the melting fuel, which has led to failure of the reactor vessel and the protective vessel resulting from melting trouble of a core, drops onto the receiving surface of the receiving vessel. The thus dropped melting fuel is dispersed on the receiving surface by the action of protrusions formed on the receiving surface, thereby preventing the recriticality accident. The melting fuel gradually dissolves UO_2 or MgO which constitute the receiving surface. Sodium is fed through a sodium feed pipe, the sodium being heated by decay heat of the melting fuel and then boiled and vaporized. The decay heat of the melting fuel is partly removed even by the vaporized heat.

- 5208 APPARATUS FOR RETAINING MOLTEN FUEL IN A REACTOR. Sato, Y. (Nippon Atomic Industry Co. Ltd., Tokyo). (to Tokyo Shibaura Electric Co. Ltd., Kawasaki, Kanagawa (Japan)). Japanese Patent 1977-15,3097/A/. 16 Jun 1976. 4p. (In Japanese).

The object of the invention is to retain and cool molten fuel, when a reactor vessel is failed, to avoid assumption of a recritical state, thereby securing safety of the reactor. A molten fuel retaining apparatus formed with a

molten fuel cooling tray in an outer peripheral surface of a hollow conical body, which is internally formed with coolant passages and has a plurality of coolant passing holes, is disposed below a reactor vessel within a primary tank which surrounds the reactor vessel housing therein a primary coolant for cooling the core.

- 5209 NUCLEAR REACTOR CONSTRUCTION COOLED WITH LIQUID METAL. Barnes, S.; Fothergill, J.R. (to UKAEA London Office; Deutsches Patentamt, Muenchen (Germany, F.R.)). German (FRG) Patent 2,555,245/A/. 16 Jun 1976. 13p. (In German).

A liquid metal cooled reactor is presented possessing a device to transmit ultrasonic signals into a melt bath of the coolant and out of the latter by means of a liquid wave-guide consisting of a column of reactor coolant which is not interrupted by a membrane.

- 5210 DEVICE FOR THE TRANSFER OF COOLANT IN A NUCLEAR REACTOR. Mangus, J.D. (to Westinghouse Electric Corp., Pittsburgh, Pa. (USA)). French Patent 2,314,561/A/. 9 Jun 1976. Priority date 10 Jun 1975, United States of America (USA), 14p. (In French).

A system is described for the circulation of a nuclear reactor coolant, comprising a reactor vessel, a heat exchanger and a coolant circulation pump interconnected by pipes so that the coolant circulates in turn, by means of the pump, through the reactor vessel and the heat exchanger.

- 5211 SPENT FUEL CLEANING DEVICE. Sasaki, S. (to Tokyo Shibaura Electric Co. Ltd.). Japanese Patent 1977-148,799/A/. 4 Jun 1976. 3p. (In Japanese).

The object of the invention is to clean spent fuel of a fast breeder reactor safely and positively by a simple procedure. At the bottom of a cleaning tank is provided a carbon dioxide gas feeding device filled with carbon dioxide and a cleaning solvent tank for feeding lower pressure vapor is connected thereto. The spent fuel is put into the cleaning tank to clean it so that sodium adhered to the surface of the spent fuel may be cleaned while effecting reaction expressed by $2Na + 2CO_2 + 2H_2O \rightarrow 2NaHCO_3 + H_2$. On the other hand, hydrogen produced is discharged through a waste processing system, and concentration of hydrogen is maintained outside explosion of hydrogen concentration by means of dilution of rare gases.

- 5212 SAFETY EQUIPMENT IN A REACTOR. Nidome, J.; Kuroki, A. (to Tokyo Shibaura Electric Co. Ltd., Kawasaki, Kanagawa (Japan)). Japanese Patent 1977-148,792/A/. 4 Jun 1976. 5p. (In Japanese).

A method to satisfactorily protect storage equipment such as a primary tank, chamber walls of a reactor and the like even in case of trouble such as fuel melt, to prevent scattering of radioactive material to enhance safety of the reactor is described. A molten fuel holding device disposed within a molten fuel holding vessel and having a molten fuel cooling tray disposed in an outer periphery of a hollow conical body formed with a plurality of cooling water passing holes has its tray to receive molten fuel extending through a reactor container in scattered relation in the entire peripheral direction, and coolant, which enters through a hollow portion of the hollow conical body and outflows through the coolant passing holes to be heat-exchanged with coolant in the

primary tank for natural circulation, is used for cooling.

5213 FY 1976 OPERATION PROGRAM OF PNC. At. Jpn.; 20: No. 6, 29-36(Jun 1976).

The operational program of Power Reactor and Nuclear Fuel Development Corporation for FY 1976 is amended as follows. The development of power reactors, amounting to 16,368 billion (government subsidy) and 38,829 billion, covers the development of the fast breeder reactors, JOYO and MONJU, the development of the advanced thermal reactor ATR (heavy water reactor), the operation and preparation of equipments and facilities for common purposes, and the planning and management of research and development. The work on the experimental reactor JOYO will be advanced with the continuation of integral performance tests aiming at reaching criticality by the end of 1976. The sector experiments of the prototype reactor core will be carried out in the fast critical assembly (FCA) of the Japan Atomic Energy Research Institute (JAERI). PNC plans to participate in the BIZET experiment program, designed jointly with West Germany and the UK. The criticality of the prototype ATR will be attained in 1977. The facilities for plutonium fuel development and fuel material inspection will be introduced. Development of nuclear fuel, amounting to 2,303 billion (government subsidy) and 11,137 billion, covers the overseas surveys, the domestic prospecting in the Tohno district, the research at Ningyo-Toge mine, the utilization of plutonium, nuclear fuel cycle, and the development of uranium enrichment by centrifuges and cascades. The reprocessing of spent fuel amounting to 2,804 billion (government subsidy) and 13,985 billion, covers the reprocessing facilities and the development of techniques.

5214 SAFETY EQUIPMENT FOR A REACTOR.

Nagashima, K. (to Tokyo Shibaura Electric Co. Ltd., Kawasaki, Kanagawa (Japan)). Japanese Patent 1977-144,589/A/. 26 May 1976. 4p. (In Japanese).

A method to remove heat generated from the molten fuel, even if a core is molten and extends through a reactor vessel is described. Even if the reactor vessel is failed so that fuel fell, the thus fallen fuel is received in core catchers disposed below the reactor vessel. The fuel fallen into the core catchers produces decay heat but said heat is transmitted to coolant within a coolant vessel disposed externally of the core catchers. This coolant is introduced into a heat exchanger disposed externally of the reactor chamber with heat removed, after which it is pressurized by a circulating pump and returned to the coolant vessel. A low temperature coolant entered through a coolant inlet nozzle passes through a gap between the coolant vessel and the core catchers and flows into the core catchers and is moved out of a coolant outlet nozzle carrying the decay heat within the core catchers. The abovementioned operation is repeated for cooling.

5215 PROCEDURE AND EQUIPMENT FOR REGENERATING COOLING TRAPS IN LIQUID METAL CIRCUITS.

McKee, J.M. Jr. (to Energy Research and Development Administration, Washington, D.C. (USA)). French Patent 2,312,276/A/. 21 May 1976. Priority date 29 May 1975, United States of America (USA), 16p. (In French).

This invention refers to cold traps employed in a liquid metal system to precipitate and remove impurities. It particularly applies to sodium or sodium-potassium systems used for

transferring heat in nuclear energy generating plants. A process was sought that would determine if the cold trap contained an excess of hydride or oxide type impurities and to remove such impurities from the cold traps without having to dismantle them. An improved apparatus has been developed that includes a cold trap and enables the impurities contained in the cold trap to be removed while maintaining the latter in the liquid metal system.

5216 SODIUM LEAK DETECTOR. Iwasaki, T.; Koike, H.; Suzuki, M. (to Hitachi Ltd., Tokyo (Japan)). Japanese Patent 1977-140,795/A/. 19 May 1976. 3p. (In Japanese).

The object of the invention is to prevent a trouble on the side of a heater from being carried into the sodium loop side and to securely detect leak of sodium. In sodium piping in sodium cooling fast breeder plant, the sodium piping and a heater for preventing sodium condensation are locked through insulations, between which a tray for leaked sodium and a sensor for detection of sodium leakage are mounted.

5217 METHOD OF DETECTING A FUEL ELEMENT FAILURE. Cohen, Paul. (to Energy Research and Development Administration, Washington, D.C. (USA)). Canadian Patent 989,525/A/. 18 May 1976. 10p.

The coolant of a sodium-cooled fast breeder reactor is monitored for the presence of radioactive iodine by equilibrating a sample of the coolant with a molten salt consisting of a mixture of iodides such as the eutectic mixture of barium iodide and strontium iodide, whereby any radioactive iodine ions present in the coolant exchange with iodine ions present in the salt, separating the molten salt from the sodium and monitoring the molten salt for the presence of iodine. If necessary, the molten salt is equilibrated with non-radioactive sodium before monitoring it for the presence of iodine.

5218 FUEL ASSEMBLY. Kato, Y. (to Hitachi Ltd.). Japanese Patent 1977-137,588/A/. 14 May 1976. 3p. (In Japanese).

The object of the invention is to prevent supports of the fuel assembly of a high-flux reactor from becoming fragile due to irradiation with fast neutrons by the provision of a neutron shield between the endless nozzle arrangement of a wrapper tube and fuel pins of the fuel assembly. A neutron shield consisting of stainless steel is provided between an endless nozzle arrangement on the outer periphery of a wrapper tube and the fuel pins of the fuel assembly. Since neutrons passing through the gap in the fuel assembly can be prevented by the shield, it is possible to alleviate excessive stress in the entrance nozzle portion produced due to warping of the fuel assembly at the time of reactor operation.

5219 ROTARY PLUG SEAL DEVICE FOR LIQUID METAL COOLED REACTOR. Sosa, Y. (to Tokyo Shibaura Electric Co. Ltd., Kawasaki, Kanagawa (Japan)). Japanese Patent 1977-135,991/A/. 8 May 1976. 5p. (In Japanese).

The object of the invention is to prevent of metal vapor intruding into the gap between the reactor vessel and shield plug from depositing on the inner side, thereby assuring normal rotary function of the shield plug. A special metal vapor shield mechanism is provided in the gap formed between the reactor vessel and shield plug. This mechanism comprises a

partition member and a gutter accommodating liquid sodium. With this arrangement, even if a great quantity of sodium vapor present in the space above the reactor vessel enters the gap, it can't further proceed upwards by virtue of the shield mechanism. Thus, metal vapor intruding into the gap between the reactor vessel and shield plug can be prevented from depositing on the inner side to thereby guarantee normal rotary function of the shield plug.

- 5220 HEAT EXCHANGERS. Berniolles, J.M.; Jogand, P. (to CEA, 75 - Paris (France)). French Patent 2,350,566/A/. 4 May 1976. 7p. (In French).

This invention relates to a heat exchanger, more particularly intended, although not exclusively, for transferring the thermal power acquired by an initial fluid medium cooling the core assemblies of a nuclear reactor to another fluid medium isolated from the first, therefore having low activity and suitable them to generate steam in a separate generator. The invention applies particularly in the case where the first fluid medium or primary fluid is a liquid metal, generally sodium, used as coolant in a fast nuclear reactor, the second fluid medium or secondary fluid also being liquid sodium, flowing through tubes between two tube plates respectively to enter an intake manifold and an outlet manifold of the secondary sodium. These tubes are externally steeped in the primary sodium. The exchanger concerned comprises two tube plates fitted inside an external envelope crossed by a primary fluid. These two tube plates are joined by a bundle of tubes extending vertically over the major part of their length and through which a secondary fluid flows, these tubes being covered externally by the primary fluid exchanging heat with the secondary fluid through these tubes.

- 5221 SAFETY DEVICE IN A NUCLEAR REACTOR FUEL ROD WITH A CLOSED FISSION GAS PLENUM. Gast, K. (to Gesellschaft fuer Kernforschung m.b.H., Karlsruhe (Germany, F.R.)). German(FRG) Patent 2,023,250/B/. 29 Apr 1976. 2p. (In German).

The invention relates to the design of the fission gas plenum in fuel rods of liquid metal cooled nuclear reactors. The fission gas plenum is subdivided by separation walls (preferably made of sinter metals) arranged in a honeycomb structure, which are fully permeable to fission gases. In this way a gradual, uniform pressure buildup is achieved, and in case the fuel rod cladding tube were to burst in this region, the amount of fission gas accumulated would be released only after considerable delay. The safety of such fuel elements is enhanced by the invention.

- 5222 LIQUID METAL/WATER HEAT EXCHANGER WITH REPLACEABLE TUBE BUNDLES. Jansing, W.; Vinzens, K. (to Internationale Atomreaktorbau G.m.b.H. (INTERATOM), Bergisch Gladbach (Germany, F.R.)). German(FRG) Patent 2,448,832/A/. 22 Apr 1976. 11p. (In German).

The invention relates to an improvement of liquid metal-water exchangers used in nuclear power plants with the purpose of reducing the time needed to replace faulty tubes or components and to repair defects. For this purpose it is suggested to arrange the vertical tube bundles, each of which is surrounded by a shell open at the top and the bottom, so as to make them and the shell removable from the top and to close the free cross section between the

inner vessel wall and the outer shell wall. Other advantageous designs are indicated, above all those protecting the cold feedwater tubes from the hot metal.

- 5223 METHOD AND DEVICE FOR THE DETECTION OF A FAILED FUEL ELEMENT. Fryer, R.M.; Matlock, R.G. (to Energy Research and Development Administration, Washington, D.C. (USA)). German(FRG) Patent 2,546,034/A/. 22 Apr 1976. 9p. (In German).

The detection of the failure of a fuel element in a metal-cooled fast breeder reactor makes difficulties. It is proposed to use the fission gas released thereby as indicator. By the example of the EBR-II nuclear reactor it is described how each fuel subassembly is provided at the outlet with a gas trap - shaped like a reversed funnel with a valve - which may be individually read in the known manner so that a leak may be found without great effort.

- 5224 SEE-THROUGH DEVICE FOR A REFUELING MACHINE. Ito, J.; Sato, T. (to Tokyo Shibaura Electric Co. Ltd., Kawasaki, Kanagawa (Japan)). Japanese Patent 1977-127,590/A/. 20 Apr 1976. 4p. (In Japanese).

A method to make a fuel assembly visible without moving a grip of a refueling machine to enhance a locating accuracy of the refueling machine is described. In a see-through device, a pantagraph is opened before a rotary plug is rotated, and a standucer disposed at the foremost end of the pantagraph is inserted into a lower guide tube of a fuel assembly through a side hole. This transducer introduced into the lower guide tube has transmitting and receiving surfaces directed downwardly. In this state, the rotary plug is rotated to move the refueling machine to a desired position. The transducer transmits and receives ultrasonic waves until the refueling machine has been located accurately. After the refueling machine has been located, the pantagraph is closed and the transducer is removed from the lower guide tube and the fuel assembly is gripped by a gripper of the refueling machine.

- 5225 LIQUID METAL COOLING REACTOR. Ikeda, K. (to Tokyo Shibaura Electric Co. Ltd., Kawasaki, Kanagawa (Japan)). Japanese Patent 1977-125,996/A/. 15 Apr 1976. 6p. (In Japanese).

A guide passage which spirally swivels a coolant, within a coolant inlet nozzle to sufficiently mix the coolant flowing into the lower plenum is described. A coolant inlet nozzle is mounted at the bottom of a reactor vessel at a right angle to the wall surface of the reactor, and two wing plates radially twisted with each other are disposed within the inlet nozzle. As the coolant passes through the wing plates, these wing plates serve as a guide passage to create a swivelling flow whereby the coolant flows into the lower plenum in the form of a swivelling flow and is dispersed in a radial direction by a centrifugal force to be mixed with another coolant already present therein.

- 5226 HEAT EXCHANGER PROVIDED WITH PLATES. Chaix, J.E.; Fajean, M.; Chlique, B. (to CEA, 75 - Paris (France); Fives-Cail-Babcock, 75 - Paris (France)). French Patent 2,348,458/A/. 12 Apr 1976. 13p. (In French).

The invention relates to a heat exchanger of the plate type, in which two fluids exchange calories through parallel metal plates, delimiting spaces separated from each other in which two fluids respectively flow without

direct contact between them. The invention particularly applies in the case where one of the two fluids is water under pressure or else a circulating liquid metal, specially sodium, used in the system of a pressurised water or fast neutron reactor, the second fluid being water to be vaporised in the exchanger by the calories supplied by the first fluid. The arrangement is designed to give minimum bulk, particularly enabling the exchanger to be housed in the area between the core of a nuclear reactor and a casing or outer vessel, or else in an external sealed containment, with a view to recovering with the best efficiency the heat acquired by a coolant flowing through the core.

- 5227 MAINTENANCE CASK. Koizumi, K.; Yoshizawa, K. (to Tokyo Shibaura Electric Co. Ltd., Kawasaki, Kanagawa (Japan)). Japanese Patent 1977-122,795/A/. 9 Apr 1976. 3p. (In Japanese).

A maintenance cask to be used for a fast breeder as unit assembly comprising a sealing structure and a shield structure separate from each other is described. This maintenance cask comprises a door valve, a plurality of cylindrical casks stacked one above another on the door valve, a grid shaft seal member hermetically joined to the upper surface of the cask stack, a door valve shield covering the door valve, a cap member and a gripper. Thus, it is possible to assemble a maintenance cask to meet the shape of the associated apparatus by suitably using appropriate component parts.

- 5228 PROCESS AND DEVICE OF THERMAL SHIELDING OF THE VESSEL OF A NUCLEAR REACTOR. Gamma, J.M.; Paillard, L. (to CEA, 75 - Paris (France)). French Patent 2,347,749/A/. 6 Apr 1976. 10p. (In French).

This invention relates to the thermal protection of the vessel of a liquid metal cooled integrated nuclear reactor. The process consists in circulating along the vessel part of the liquid metal injected at the bottom of the core. In a leak tight annular chamber above the flowing liquid metal, an inert gas (argon) is placed under pressure to regulate the gas-liquid metal interface in this chamber so as to obtain a distribution of temperatures along the vessel so that the range of stress changes is restricted. According to a first variant of the invention, the inert gas pressure is created by trapping in the chamber a mass of argon under an initial pressure so that the level of the gas-liquid metal interface in this chamber is kept appreciably constant during the power changes of the reactor. According to a second variant of the invention, this pressure is achieved by trapping in the chamber a mass of argon, the pressure of which is adjusted, whilst the reactor is working, so that the power changes of the reactor generate movements of the gas-liquid metal interface that will maintain the thermal gradient, created along the vessel, at an appreciably constant and sufficiently low level.

- 5229 SHIELDING PLUG DEVICE. Orif, S.; Hasegawa, S.; Makishima, K. (to Tokyo Shibaura Electric Co. Ltd., Kawasaki, Kanagawa (Japan)). Japanese Patent 1977-121,196/A/. 5 Apr 1976. 3p. (In Japanese).

A method to reduce the size of and extend the life of a revolving bearing and facilitate the laying of driving cables and duct lines by providing plug raising means of a fast breeder on a stationary plug mounting base so as to prevent the shearing force of sodium from acting upon the revolving bearing is described.

The shield plug means comprises a stationary plug secured to the open end of the reactor container, a rotary plug rotatable with respect to the stationary plug, an annular base formed on top of the stationary plug so as to cover the rotary plug, a bearing secured to the rotary plug edge lower face and upper and lower locking plates. At the time of the rotation of the rotary plug, the upper locking plate is withdrawn, the stationary plug is raised to release the seal structure, and the lower locking plate is inserted between the bearing and stationary plug. In this way, smooth rotation of the rotary plug can be obtained.

- 5230 NUCLEAR REACTOR. Wade, E.E. (to Westinghouse Electric Corp., Pittsburgh, Pa. (USA)). French Patent 2,307,339/A/. 2 Apr 1976. Priority date 9 Apr 1978, United States of America (USA), 15p. (In French). Priority claim: 9 Apr 1975, US.

A nuclear reactor is described which includes a cylindrical pressure vessel, a nuclear core formed of an assembly of fuel elements held in the pressure vessel, a structure for lowering the nuclear reactor core, placed above the core to maintain the fuel elements in position, and at least two rotating plugs maintained in the upper wall of the receptacle, one of the plugs being fitted excentrically in relation to the other plug. It includes fuel element handling gear and is characterised by the lowering structure being composed of at least two parts corresponding to the rotating plugs and each part of the lowering structure is connected to the corresponding rotating plug to move with it.

- 5231 REACTOR CONTROL ROD. Saijo, T. (to Hitachi Ltd., Tokyo (Japan)). Japanese Patent 1977-121,198/A/. 2 Apr 1976. 4p. (In Japanese).

A method is described to enable quick descent of a control rod body even when some relative phase deviation between upper drive means and wrapper tube is produced, while permitting a coolant to effectively flow into a protective tube irrespective of the position of the control rod body. In a control rod used for a nuclear reactor such as a fast breeder, an orifice which dispenses with a cylindrical guide tube and has a greater inner diameter than the outer diameter of the protective tube of the control rod body is provided on the inner side of a wrapper tube, thus permitting smooth operation of the control rod body and also permitting the coolant to effectively flow into the protective tube irrespective of the control rod body.

- 5232 THERMAL PLANT FOR ENERGY PRODUCTION. Tillequin, Jean. (to Fives-Cail-Babcock, 75 - Paris (France)). French Patent 2,346,815/A/. 31 Mar 1976. 11p. (In French).

This invention relates to an energy production plant to serve a variable demand network, the basic thermal source of which is composed of a nuclear reactor, particularly of the fast neutron type and sodium cooled. The excess power produced during off-peak hours is stored in a heat accumulator for subsequent return to the network during peak periods. The heat accumulator is formed of a tank filled with a thermal fluid, a charging circuit is fitted to take heat on demand from the reactor, store it in the accumulator and a return circuit is fitted to release on demand the heat stored in the accumulator. The charging circuit is fitted to take it from the liquid sodium flowing through a cooling loop of the reactor and the return circuit is fitted to release

this heat to a steam generator that feeds an auxiliary steam turbine. Under this invention, the charging circuit is connected to the upper part of the accumulator so as to feed liquid sodium to it; this liquid sodium thus forming the thermal fluid for filling the tank, and to the bottom of the accumulator so as to return the liquid sodium to the cooling loop.

- 5233 FAST REACTOR. Berniolles, J.M.; Jogand, P. (to CEA, 75 - Paris (France)). French Patent 2,346,816/A/. 29 Mar 1976. 13p. (In French).

This invention relates to a fast reactor, using a novel arrangement for the heat exchangers fitted between the main vessel and the internal cylindrical vessel. The particular purpose of this lay-out is to ensure a better distribution of the hot liquid metal at the intake of the exchangers and better thermal insulation between the hot liquid metal and the cold liquid metal taken from the space separating the main vessel from the internal vessel. The invention also aims to allow a significant simplification in the design of the connection sleeves between the exchangers and the internal vessel.

- 5234 FAST BREEDER. Miki, K.; Inoue, K. (to Hitachi Ltd.). Japanese Patent 1977-115,991/A/. 26 Mar 1976. 3p. (In Japanese).

The object of the invention is to disperse curved directions of fuel assemblies due to the difference in temperature of walls of a wrapper tube and making use of interaction of adjacent fuel assemblies to limit deformation, thereby minimizing the deformation of a core. Two kinds of fuel assemblies in which wire spacers wound about fuel pins are opposite in rotative direction with each other are alternately arranged in each layer to constitute a core. Therefore, the fuel assemblies arranged in the radial direction of the core are different in curved direction in each layer, and the amount of deforming the core in the radial direction is restricted by the adjacent fuel assemblies. As a consequence, a load imposed on the fuel assembly near the center of the core due to a compulsive reaction from a restriction mechanism around the core is less than the conventional core. It will be noted that the curved direction of each fuel assembly is determined depending on pitch of the wire spacer.

- 5235 LIQUID-METAL COOLING REACTOR. Mitsutsuka, N.; Kubo, K.; Miyazawa, T. (to Tokyo Shibaura Electric Co. Ltd.). Japanese Patent 1977-115,992/A/. 25 Mar 1976. 9p. (In Japanese).

The object of the invention is to quickly and positively detect a failure condition of nuclear fuel inside the reactor to enhance safety. A coolant in contact with a core partly passes through a sampling pipe, a solenoid pump, a flow meter, a tank and a pipe. When a nuclear fuel charged in a core is failed, a nuclear fission formation gas in the coolant moves into a space above said tank. This gas flows into a first and second nuclear fission formation gas detectors, and a signal is sent to a system of failed fuel detection and diagnosis. The coolant discharged from the tank flows into ^{135}I detection system and is returned to a reactor vessel. At this time, an adsorption tank is adjusted in temperature, and after a lapse of given time, the flowing of coolant into the ^{135}I detection system is stopped for detection of $\text{sup}(^{135}\text{m})\text{Xe}$ and ^{135}Xe formed from ^{135}I by $\text{sup}(^{135}\text{m})\text{Xe}$ detection

portion and output signals from said detection portion are processed to calculate the amounts of $\text{sup}(^{135}\text{m})\text{Xe}$ and ^{135}Xe , and the amount of ^{135}I in the coolant from the operation conditions of the ^{135}I detection system.

- 5236 EMERGENCY SYSTEM FOR NUCLEAR REACTORS. (to CEA, 75 - Paris (France)). French Patent 2,345,792/A/. 24 Mar 1976. 8p. (In French).

The invention concerns a circuit called 'of emergency help' intended to remove, in a safe and quick manner, the residual thermal power on the safety vessel of a fast neutron reactor cooled by a liquid metal flow, in the event of a failure occurring inside the main reactor vessel or on it. This system includes a network of spray nozzle tubes, distributed around and near the external surface of the safety vessel, to project on to the surface of the vessel a mist of a liquid having high latent vaporisation heat. The steam produced on contact with the safety vessel is collected in the space provided between the safety vessel and the external protection vessel by at least one collector pipe for discharging this steam outside the vessel. Under a preferred design mode of the invention the liquid is water the use of which turns out to be particularly advantageous in practice owing to its favourable physical properties and its low cost.

- 5237 FUSE APPLIED TO DESIGNING A SCRAM DEVICE FOR NUCLEAR REACTOR. Taulier, H.H.L. (to Electricite de France, 75 - Paris). French Patent 2,345,709/E/. 24 Mar 1976. 11p. (In French).

This invention concerns a fuse and its application to the building of an emergency shutdown system for liquid sodium cooled fast reactors. The object of this system is to shut down the reactor automatically without manual intervention when an operating anomaly might cause the core fuel elements to melt. There are already aluminium fuses making up a charge in an absorbant substance forming one piece with a fixed part of the reactor and suspended above the free channel of the reactor core. In normal operation, the aluminium fuse melts at 800°C . At normal reactor operating temperature (around 560°) it is found that the fuse creeps and this could prematurely trigger off the emergency shutdown system. The object of this addendum is to improve the fuses described in the main patent specification, making it possible to achieve the cooling of the emergency shutdown system and therefore of the fuse by the sodium coolant of the reactor, whilst retaining the essential characteristics of the fuse. This fuse is not affected by any creep that might occur and this prevents an undesirable triggering off of the emergency shutdown system.

- 5238 LOW ALLOY STEEL FOR A HEATING PIPE OF A FAST BREEDER STEAM GENERATOR. Moroishi, T.; Shida, Y.; Yukitoshi, T.; Yoshikawa, K. (to Sumitomo Metal Industries Ltd., Osaka (Japan)). Japanese Patent 1977-110,398/A/. 12 Mar 1976. 6p. (In Japanese).

Object: To provide a low alloy steel for high temperature use, having excellent high temperature strength, tenacity, weldability and very small decarbonization under conditions of liquid sodium at a high temperature. Structure: A low Cr-Mo alloy steel having a structure which consists of from 0.02 to 0.15% C, from 0.10 to 1.50% Si, from 0.10 to 1.50% Mn, from 1.00 to 8.00% Cr, from 0.30 to 1.50% Mo, and balance essentially Fe. The structure is at

least one to three mixture out of ferrite, pearlite, tempered bainite or tempered martensite, and has untempered structure of either martensite or bainite.

- 5239 FUEL CAN FOR A LIQUID-METAL COOLED FAST BREEDER. Ozaki, S. (to Tokyo Shibaura Electric Co. Ltd., Kawasaki, Kanagawa (Japan)). Japanese Patent 1977-110,396/A/. 12 Mar 1976. 3p. (In Japanese).

A method to prevent effusion and migration of radioactive Co-60 produced by irradiation with neutrons into a coolant, and to reduce a concentration of the Co-60 in the coolant is described. A nickel alloy containing not more than 0.1% cobalt is coated on a surface of a fuel cladding tube of an alloy containing cobalt as impurity. The nickel alloy is a stainless steel, a nickel steel, a nickel base alloy, etc. Thickness of the cladding layer may be an order enough to withstand corrosion and wear during service (Generally 25 microns or more).

- 5240 FAILED FUEL DETECTOR. Takahara, K. (to Hitachi Ltd., Tokyo (Japan)). Japanese Patent 1977-106,095/A/. 3 Mar 1976. 5p. (In Japanese).

A method to eliminate a driving means such as a selector valve in a failed fuel detector of a sodium cooled fast reactor, by sampling a coolant with an ejector is described. There are provided a coolant-receiving opening facing to a coolant outlet of each fuel assembly, an ejector connected to each receiving opening, a gas-feeding mechanism for feeding a given gas to these ejectors, a container containing the coolant from a piping connected to a discharge side of each ejector, and a detector for detecting nuclear fission products in the container. The failed fuel detector is so arranged as to take a sample of the coolant in the fuel assembly in the container by means of an ascending force in the coolant of gas fed to the ejectors.

- 5241 FAST BREEDER REACTOR AND FUEL ASSEMBLIES FORMING THE CORE. Lunt, A.R. (to UKAEA London Office). French Patent 2,303,351/A/. 2 Mar 1976. Priority date 3 Mar 1975, United Kingdom of Great Britain and Northern Ireland (UK), 8p. (In French).

A description is given of a fast breeder reactor cooled by a liquid metal and comprising a core formed of several long fuel assemblies rising above the core bearing system. The feature of this reactor is that each assembly includes an inertia damper system in the region of the free upper end.

- 5242 FAILED FUEL DETECTOR IN REACTOR. Mitsuoka, N.; Miyazawa, T.; Kubo, K. (to Tokyo Shibaura Electric Co. Ltd.). Japanese Patent 1977-104,691/A/. 27 Feb 1976. 7p. (In Japanese).

The object of the invention is not only to make the detector small, but also to increase the detection sensitivity for concentration of nuclear fission iodine. Structure: Liquid sodium, a coolant, is introduced into a gas-liquid separator through a piping at an upper portion of a reactor container, and then into an adsorption container. At this time, Xe-135m produced by disintegrating I-135 in the liquid sodium migrates to a cover gas at an upper portion of the gas-liquid separator. I-135 introduced into an adsorber is cooled to 200°C or less in a cooler and is adsorbed on an adsorbent. Flow of the liquid sodium is stopped and Xe-135m in the adsorbent is migrated into

the cover gas by heating the adsorber to 300°C or more, as a determined quantity of the liquid sodium is extracted from the reactor container. Therefore, the cover gas is introduced into a radioactivity measuring instrument.

- 5243 NUCLEAR FUEL ELEMENT. Shimada, M. (to Tokyo Shibaura Electric Co. Ltd., Kawasaki, Kanagawa (Japan)). Japanese Patent 1977-101,384/A/. 20 Feb 1976. 2p. (In Japanese).

The object is to impart a sodium-resisting property to a cladding tube for preventing selective effusion of the alloy constituents in the liquid sodium, thereby preventing creation of deterioration in mechanical properties of cladding tube. In a nuclear fuel element, wherein a nuclear fuel material is received into a cladding tube, opposite ends of which are sealed by end plugs, the inner surfaces of the cladding tube comprise a layer of material which produces no swelling by irradiation of fast neutron, whereas the outer surfaces thereof comprise a layer not corroded by liquid metal.

- 5244 METALLIC COMPONENT WITH A CHROMIUM CARBIDE BASE PROTECTIVE COATING. Wolf, T.A.; Tucker, R.C. Jr. (to Union Carbide Corp., New York (USA)). French Patent 2,300,139/A/. 9 Feb 1976. Priority date 10 Feb 1975, United States of America (USA), 10p. (In French). Priority claim: 10 Feb 1975, US.

The invention concerns a coating system to protect metal components in sodium and helium cooled nuclear reactors. It includes a nickel or iron based alloy metal substrate, a first coat formed on the substrate and comprising chromium carbides and a binder selected among the chromium-nickel, chromium-cobalt, chromium-iron alloys and the super-alloys, the first coating being between 25 and 380 microns thick, and a surface coating comprising pure chromium carbides and being between 12.5 and 125 microns thick.

- 5245 ABSORBING SEALS FOR NUCLEAR REACTORS. Cooper, M.H. (to Westinghouse Electric Corp., Pittsburgh, Pa. (USA)). French Patent 2,301,072/A/. 5 Feb 1976. Priority date 13 Feb 1975, United States of America (USA), 13p. (In French).

Priority claim: 13 Feb 1975, US.

The system described is for preventing the leakage of short half life radioactive isotopes, from a gas contained in nuclear reactor vessels and crossing the various junctions of such vessels. This system includes seals located in the junctions and its feature is the system of retentions to contain all the isotope leaks passing through the seals during a sufficient time to allow these isotopes to decay until they reach a harmless concentration before they are released from this retention system.

- 5246 FAST BREEDER OF LOOP TYPE LIQUID METAL COOLING SYSTEM. Nakai, Y.; Hoshi, Y. (to Power Reactor and Nuclear Fuel Development Corp., Tokyo (Japan)). Japanese Patent 1977-92,090/A/. 28 Jan 1976. 3p. (In Japanese).

The object of the invention is to locate an upper edge of a guard vessel of each apparatus in a primary liquid metal system lower than a system level to shorten an axial length of a primary circulating pump and to form each guard vessel into a smaller size. Upper portions of guard vessels for a reactor vessel, an intermediate heat exchanger and a primary

circulating pump are disposed in position other than those in the vicinity of piping which forms a riser and are closed at a height lower than a system level, whereby a difference between the system level and an emergency level is reduced to shorten an axial length of a primary circulating pump.

- 5247 DETECTION SYSTEM OF SODIUM OXIDE VAPORS. Hundal, R. (to Westinghouse Electric Corp., Pittsburgh, Pa. (USA)). French Patent 2,299,640/A/. 26 Jan 1976. 6p. (In French).

The description is given of a sodium oxide vapor detection system which comprises a containment, a light source located to send a light beam into and through this containment and a photodetector located to intercept the light from the source after it has covered a given path through the containment. In response to the intensity of the incident light, the photodetector produces an output signal. The feature of this device is a first polarizer located near the light source, along the path of the light coming from it and designed to polarize the light projected through the containment in a given plane, and a second polarizer located near the photodetector, along the path of the polarized light and designed virtually to prevent all the light rays whose orientation differs from the given polarization plane from reaching the photodetector.

- 5248 FUEL ASSEMBLY. Uesugi, N. (to Tokyo Shibaura Electric Co. Ltd., Kawasaki, Kanagawa (Japan)). Japanese Patent 1977-89,795/A/. 23 Jan 1976. 4p. (In Japanese).

The object of the invention is to put a mark that may detect displacement in position between fuel assemblies to reduce error in signal. The device comprises a bundle of a plurality of fuel elements, a shroud which surrounds the outer peripheral surface of said bundle, a handling head positioned on said shroud, and discriminating marks and checking marks impressed on the upper end surface of said handling head, said discriminating marks having a single mark impressed to indicate a reference at the starting point thereof.

- 5249 DEVICE FOR DETECTING RADIOACTIVITY IN A LIQUID METAL COOLANT. Miyazawa, T.; Kubo, K.; Taguchi, J. (to Tokyo Shibaura Electric Co. Ltd., Kawasaki, Kanagawa (Japan)). Japanese Patent 1977-89,796/A/. 22 Jan 1976. 4p. (In Japanese).

The object of the invention is to considerably increase efficiency of neutron detection and at the same time, to facilitate maintenance and checking and to increase safety. A neutron detection system is provided in the outer periphery of a dual pipe line which extends upwardly from a cylinder type induction system magnet pump so that when a fissionable product is contained in the flowing coolant, a neutron released from said fissionable product is detected by the neutron detection system. In this case, the neutron detection system is mounted so as to surround the dual pipe line portion and can detect most of neutrons released over the range of 360 degrees. Since the neutron detection system and a coil in the cylinder type induction magnet pump are insertably mounted in the outer periphery of the dual pipe line portion wherein the coolant is flown from an outer passage towards an inner passage in a part of a piping line through which coolant flows, they can be merely pulled out and new ones may be fitted, in case of replacement.

- 5250 FUEL ASSEMBLY. Takeda, S. (to Hitachi Ltd., Tokyo (Japan)). Japanese Patent 1977-89,794/A/. 21 Jan 1976. 5p. (In Japanese).

The object of the invention is to make a distribution of coolant flow in a radial direction and an azimuth direction within a core of a fuel assembly as flat as possible as the fuel burns. An orifice formed in a side of an entrance nozzle at the end of a shroud is designed to have an area which varies in the azimuth direction to decrease the coolant flow and capacity of pump.

- 5251 CONTROL ROD FOR A FAST BREEDER. Saito, T.; Yamagishi, Y.; Koga, T. (to Power Reactor and Nuclear Fuel Development Corp., Tokyo (Japan)). Japanese Patent 1977-87,598/A/. 16 Jan 1976. 3p. (In Japanese).

The object of the invention is to dispose a stopper, which is destroyed when a reactor power increases, at an upper part within a shroud and to place a neutron absorber on the stopper so as to constitute a reactor stopping system which is simple in construction and high in accuracy. When the reactor power increases as a result of failure, fissionable material or a stopper whose melting point is the limit temperature at the core is destroyed and a neutron absorber moves down within the shroud until it comes into contact with a cushion material by means of a spring for the scrambling operation.

- 5252 METHOD OF CONTROLLING THE SECONDARY COOLANT IN FBR. Kajiyama, S.; Nakamura, A.; Watanabe, T. (to Hitachi Ltd., Tokyo (Japan)). Japanese Patent 1977-87,599/A/. 14 Jan 1976. 5p. (In Japanese).

The object of the invention is to stabilize and control flow rate without mutual interference by providing a closed-circuit flow control system for controlling the flow of secondary coolant to a superheater or a reheater, and a flow control system having an operator in which a relationship between the flow, opening degree of an adjusting valve and pressure is predetermined. A secondary coolant flow-signal detected by a detector and supplied from an intermediate heat exchanger to a first pipe line is fed into a ratio setting instrument, a second set signal obtained by a ratio of a first set signal is fed into an adjusting meter, a first adjusting valve is opened and closed on the basis of difference from the detection signal of the detector, the flow of secondary coolant branched into a second pipe line and supplied to the superheater is controlled in constant, a third set signal from the ratio setting instrument is fed into the operator to obtain a degree of valve opening, and a second adjusting valve is opened and closed to control in constant the flow of secondary coolant branched to a third pipe line and supplied to the reheater.

- 5253 LOW-SWELLING STAINLESS KEY TO LMFBR DEVELOPMENT. Obrzut, J. Iron Age; 217: No. 2, 34-35 (12 Jan 1976).

Stainless steel Type 316 or any other stainless used in liquid-metal fast breeder reactors can swell deleteriously under certain conditions by bombardment with intense high-energy neutrons. This irradiation-induced swelling can be reduced 5 to 10 times by additions of Ti and Si to the stainless composition. A table of Type 316 and alloys with lower Cr compositions with Ti and Si additions is shown. With such modified chemistry more Pu can be bred from each fission

atom and the breeder reactor will be able to operate at higher power levels. A test was developed to screen alloys quickly by bombarding the test alloys with Ni ions from the Oak Ridge National Laboratory's 5.5 MV Van de Graaff accelerator. Cold working could possibly further improve the resistance of the new alloys to swelling.

- 5254 TESTING EXPERIMENTAL FUEL ELEMENTS OF THE BN-600 FUEL ELEMENT TYPE UP TO VARIOUS DEPTH OF BURN UP IN THE BOR-60 REACTOR. Antipina, M.M.; Bibilashvili, Y.K.; Golovin, I.S. At. Energ. (USSR); 40: No. 1, 16-27 (Jan 1976). (In Russian).

Results of the investigation of experimental fuel elements are presented. The authors discuss fuel element construction, basic testing parameters, results of measuring gas release from fuel, deformation of cladding and swelling of steel, and also data on material investigations of macro- and micro-structures of fuel and cladding with an analysis of the degree and character of their physico-chemical interaction with fission fragments.

- 5255 NUCLEAR PROSPECTS. THE AMERICAN VIEW. S. Afr. J. Sci.; 72: No. 1, 3-4 (Jan 1976). BREEDER REACTORS; CANDU TYPE REACTORS; LMFBR TYPE REACTORS; LWBR TYPE REACTORS; NUCLEAR INDUSTRY; NUCLEAR POWER; PLANNING; USA; WASTE MANAGEMENT; WATER MODERATED REACTORS

- 5256 TRANSIENT ANALYSIS OF THE PRIMARY SYSTEM OF A LIQUID METAL-COOLED FAST BREEDER REACTOR PLANT. Pavlenko, G.F. Ithaca, NY; Cornell Univ. (1976). 360p. University Microfilms Order No. 77-8402.

Thesis (Ph. D.).

A computer-aided simulation is developed to analyze the transient behavior of the primary system of liquid-metal-cooled fast-breeder-reactor (LM GAMMA BR) plants of the loop type. A set of nuclear, thermal, hydraulic, and control models for the primary system is developed to simulate the transient response of sodium cooled fast breeder reactors for normal operating conditions, for a class of postulated accidents which do not disturb the system geometry, and for a major pipe rupture accident. The analytical submodels of the primary system components and systems are assembled into five major models which are coded in the FORTRAN IV language to form five computer codes. These major models simulate: (a) the dynamics of sodium flows in the primary system governed by forced and natural circulation effects and the operation of the primary pumps and primary flow/speed control system, (b) reactor heat-transfer, (c) neutron kinetics, reactivity feedbacks, and reactor power control, (d) intermediate heat exchanger heat-transfer, and (e) sodium transport in the primary piping system. The primary system code is used to analyze five representative transients: (a) ramp change of power level, (b) single pump coastdown, (c) reactor scram shutdown, (d) coastdown of all primary pumps, and (e) loss of coolant accident. The code can be used to analyze other transients as well, of similar or of different types, using appropriate sets of input data or by making minor modifications which can be easily accommodated.

- 5257 SPACE--TIME DYNAMICS OF A FAST BREEDER REACTOR FOR LOCALIZED DISTURBANCES. Doshi, J.B. Berkeley, CA; Univ. of California (1976). 238p. University Microfilms Order No. 77-4439.

Thesis (Ph. D.).

Sodium voiding accidents in Liquid Metal Fast Breeder reactors may cause a positive reactivity insertion due to a lack of balance between two competing effects following the voiding: (1) the shift in neutron energies to higher values which leads to a positive reactivity addition, and (2) the increased neutron diffusion which generates a negative reactivity. Since these two effects have strong spatial dependence, the amount of reactivity added in a voiding accident depends strongly on the position in the reactor core where the voiding accident has occurred. A method of analysis is developed for the localized voiding perturbation based on a flux factorization technique, accounting for the flux shape changes taking place near the region of the voided subassembly. Heat transfer equations are solved in conjunction with the neutronic equations and the two are coupled via feedback effects like the Doppler effect. For the purpose of analysis, a typical large (1000 MWe) LMFBR with two radial core-zones of different enrichments is considered. Time-dependent void fractions, which are the input quantities in the analysis, are taken to be typical of a channel flow blockage accident. The transients are analyzed for voidings taking place at three different radial locations in the core and for two different rates of voiding. Results of the calculations show that the voiding transients occurring at the center of the reactor core cause most severe effects in terms of the positive reactivity addition and the effects become progressively less severe for voidings occurring outward toward the periphery of the reactor.

- 5258 PARAMETRIC APPROACH TO LMFBR SAFETY EVALUATION. Burns, R.D. III. Lafayette, IN; Purdue Univ. (1976). 304p. University Microfilms Order No. 77-7424.

Thesis (Ph. D.).

The assessment of risk from LMFBRs has evolved to the present "design basis accident" approach. Of particular interest are consequences from low probability "hypothetical" accidents. Due to uncertainties involved in the accident progression, accident consequence spectra are needed to represent the probabilistic nature of the results of accident simulations. Many single simulations are needed in order to create probabilistic distributions of consequences. For these reasons, the accident simulation code PARSEC was developed. It runs more than two orders of magnitude faster than existing codes and is designed for use in parametric studies of uncertain input values. Parametric sensitivity studies show the relative impact of uncertainties on the results of the accident simulation. They indicate particular sensitivity to reactivity coefficients and core heat capacity. Many parameters, especially those associated with hydraulics calculations, show little sensitivity. An example of using simulation results for calculation of probabilistic accident consequence spectra shows wide variability of simulation results. The distributions appear to be largely symmetric, due to the lack of treatment of any highly nonlinear effects and the use of symmetric distributions for probabilistic input. The results show that the probability of realizing "limiting" or "bounding" case consequences is far out on the tail of the distribution, and are of vanishingly small probability. A comparison of PARSEC and SAS3A results for a 5 channel, unprotected loss-of-flow (LOF) accident shows that PARSEC predicts the core's behavior well. By applying a probabilistic

treatment of uncertainties in six input values, the errors in the PARSEC models are shown to be small compared to the overall uncertainties in the results themselves.

- 5259 PROSPECT OF FAST BREEDER REACTOR DEVELOPMENT. Ichino, I. (Power Reactor and Nuclear Fuel Development Corp., Tokyo (Japan)). pp 338-360 of Variety of problems in promotion of nuclear power generation. Tokyo, Japan; Fuji International (1976). (In Japanese)

Fast breeder reactors (FBR) are required because of the effective use of energy source or nuclear fuel. Besides, the influence on the environment is small, and the improvement of economy can be anticipated according to the future development toward low pressure and small size. In Japan, the diversification of energy sources is required to maintain the energy consumption and also to correct the excessive dependence on oil. From this viewpoint, the development of nuclear power generation, especially of FBRs, is desirable more than the significance of the national project. It is supposed that the development schedule for breeders must be restudied sooner or later. Though breeders have problems to be solved for the practical use, such as fuel, sodium technology and others, powerful investigation is being carried out in several countries because they hold the key for the solution of energy problems. The status of the development in the U.S., U.K., France and German Federal Republic is surveyed. In Japan, the development seems to be progressing with the steady procedure to aim at the practical use in 1980s through the step of experimental, prototype and demonstration reactors, though the start was late. The projects for the experimental fast reactor "Joyo" and the prototype "Monju" are in progress and the later is being prepared for the start of construction in 1977. Many experimental and developmental tests have been performed in parallel with the above projects. The related testing facilities are described.

- 5260 EXPERIENCE IN WELDING OF THE WEATHER-PROOF STEEL OUTER SHELL OF A REACTOR CONTAINMENT. Herberg, G. (Internationale Atomreaktorbau G.m.b.H. (INTERATOM), Bergisch Gladbach (Germany, F.R.)). Schweissen Schneiden; 28: No. 6, 227-228(1976). (In German).

Measures for quality assurance in welding the outer shell of WSt 52-3 steel of the SNR 300 nuclear power plant in Kalkar/Niederrhein are presented, the causes for the microcracks found in welded joints (light microscope, microprobe) are also investigated. These occurred above all when using stick electrodes with alloyed cladding, less with electrodes alloyed in the core and hardly in CO₂ weldings. These can be practically avoided by limiting the copper content in the welding material to about 0.40%.

- 5261 RADIOLOGICAL SIGNIFICANCE OF TRANSURANIUM RADIOISOTOPES RELEASED TO THE ENVIRONMENT DURING OPERATION OF THE LMFBR FUEL CYCLE. Barr, N.F. (Energy Research and Development Administration, Washington, D.C. (USA)). pp 649-655 of Transuranium nuclides in the environment. Vienna; IAEA (1976).

From Symposium on transuranium nuclides in the environment; San Francisco, Calif., USA (17 - 21 Nov 1975).

Estimates based on current knowledge and conservative assumptions indicate that release of transuranium elements from the Liquid Metal Fast Breeder Reactor (LMFBR) fuel cycle are

likely to produce population dose commitments small compared to those produced by naturally occurring alpha emitters and globally dispersed transuranium radioisotopes from tests of nuclear weapons in the atmosphere. Potential health consequences of these releases to current and future generations are estimated to be very small compared to risks associated with the production of energy by fossil fuels. The estimates are subject to a number of uncertainties imposed by lack of knowledge. Some of the uncertainties are not likely to be greatly reduced until LMFBR facilities are designed and operated. Others may be significantly reduced prior to facility design and operation. The paper discusses the sensitivity of the estimates to uncertainties and approaches to reducing those uncertainties that strongly influence the estimates.

- 5262 SOME CONSIDERATIONS ON FAST BREEDER REACTOR PENETRATION IN ITALY. Baldo, L.; Viotti, V. (Progettazioni Meccaniche Nucleari, Genoa (Italy)); Lanz, R.; Musso, B. (Nucleare Italiana Reattori Avanzati (NIRA) Genova, Italy). Energ. Nucl. (Milan); 23: No. 8, . 423-236(1976). (In Italian).

This paper deals with the possible role of liquid metal fast breeder reactors (LMFBR) in the Italian electric power system, in an optimized utilisation strategy of natural nuclear fuel resources. The effects on fast breeder reactor penetration of possible alternative policies of light-water and heavy-water nuclear plants installation are studied. Core design and fuel cycle parameters, limiting LMFBR maximum penetration in supplying a large portion of primary energy needs of the country, are also discussed.

- 5263 APPLICATION OF PROBABILISTIC METHODS IN THE FIELD OF NUCLEAR SAFETY. Carrino, A. (CEA Centre d'Etudes Nucleaires de Saclay, 91 - Gif-sur-Yvette (France). Dept. de Surete Nucleaire). Rev. Gen. Nucl.; No. 5, 406-419(1976). (In French).

Beyond the determination of the risks of accident to the reactors (Rasmussen Report), the probabilistic methods have other fields of application insofar as nuclear safety is concerned. These different fields of application are studied, i.e.: analysis of the accidents and of system performance, research for solutions to obtain an improved reliability, determination of the operating rules of the plants and drawing up of the regulations. In order to illustrate the work tending to improve the reliability, the studies concerning the design of the emergency shutdown system of the Super-Phenix are presented as an example.

- 5264 STATISTICAL OPERATION OF NUCLEAR POWER PLANTS. Gauzit, M. (Alsthom, 75 - Paris (France)); Wilmart, Y. (Novatome Industries, 92 - Le Plessis-Robinson (France)). Rev. Gen. Nucl.; No. 3, 236-248(1976). (In French).

A comparison of the statistical operating results of nuclear power stations as issued in the literature shows that the values given for availability and the load factor often differ considerably from each other. This may be due to different definitions given to these terms or even to a poor translation from one language into another. A critical analysis of these terms as well as the choice of a parameter from which it is possible to have a quantitative idea of the actual quality of the operation obtained is proposed. The second section gives, on an homogenous basis and from the results supplied by 83 nuclear power stations now in

operation, a statistical analysis of their operating results: in particular, the two light water lines, during 1975, as well as the evolution in terms of age, of the units or the starting conditions of the units during their first two operating years. Test values thus obtained are compared also to those taken 'a priori' as hypothesis in some economic studies.

- 5266 **NUCLEAR POWER GENERATION PLAN IN FRANCE.** Dejou, A. (Electricite de France, 75 - Paris). Genshiryoku Chosa Jiho; No. 9, 77-90(1976). (In Japanese).

From 9. annual conference of the Atomic Industrial Forum; Tokyo, Japan (10 Mar 1976).

The nuclear power generation plan in France was drawn up by taking the prediction of economical growth and power consumption, the capital cost and fuel cost, and also the reduction of the dependence on foreign energy resources and the saving of foreign currency into consideration. The nuclear power generation plan in France started with natural uranium-gas-graphite type reactors, and at present, 8 reactors are in operation. The policy of interrupting the development of this type of reactors and changing to PWRs was decided because of economical reason and the intention to advance into foreign markets. BWRs were abandoned because the cost of development was too expensive and the division of the domestic market should be avoided. The nuclear power stations of 900,000 kW being planned now comprise 32 reactors, and 6 of them were already ordered. 16 reactors will start the operation from 1979 to 1981. The light water reactors of 1.3 million kW will be adopted from 1982. Also the development of liquid metal FBRs was decided. In 1985, the power consumption will be 385 billion kWh, and the nuclear power will amount to about 49%. The policy of siting nuclear power stations in France is explained.

- 5267 **ERBR-II: MORE THAN A DECADE OF EXPERIENCE WITH AN EXPERIMENTAL LMFBR POWER**

PLANT. Staker, R.G.; Cissel, D.W.; Smith, R.N.; Smith, R.R. (Argonne National Lab., Idaho Falls, ID). Proc. Am. Power Conf.; 38: 237-245(1976).

From American power conference; Chicago, IL, USA (20 Apr 1976).

See CONF-760469--.

Experience from the 12 successful years of EBR-2 operation is reviewed. Topics covered include plant description, plant operations, plant maintenance, performance and reliability, and the irradiation program.

- 5268 **PHENIX POWER STATION EXPERIENCE.** Megy, J.M.; L-Zaleski, C.P. Proc. Am. Power Conf.; 38: 246-255(1976).

From American power conference; Chicago, IL, USA (20 Apr 1976).

See CONF-760469--.

Plant characteristics, construction and start-up experience, and operating experience for the Phenix Reactor are reviewed.

- 5269 **OBJECTIVES AND OVERVIEW: THE CLINCH RIVER BREEDER REACTOR PLANT.** Caffey, L.W.; Van Nort, P.S.; Copeland, R.L. (Project Management Corp., Oak Ridge, TN). Proc. Am. Power Conf.; 38: 256-264(1976).

From American power conference; Chicago, IL, USA (20 Apr 1976).

See CONF-760469--.

The objectives, schedule, reference design, management plan, resource requirements, and licensing issues for the CRBR project are reviewed.

- 5270 **RELATIVE CAPITAL COST OF THE LMFBR.** Levenson, M. (Electric Power Research Inst., Palo Alto, CA); Murphy, P.M.; L-Zaleski, C.P. Proc. Am. Power Conf.; 38: 265-269(1976).

From American power conference; Chicago, IL, USA (20 Apr 1976).

See CONF-760469--.

The construction cost estimate for the Clinch River Breeder Reactor is examined in the context of actual cost experience of the nuclear industry for LWR and sodium-cooled plants.

- 5271 **REACTOR SAFETY.** Draper, E.L. Jr. (Univ. of Texas, Austin). pp 43p, Chapter II of Proceedings of National Energy Forum. Volume I. Jackson, J.L. (ed.). Akron, OH; University of Akron (1976).

From National energy forum; Akron, OH, USA (26 Jul 1976).

See CONF-760761--P1.

Information is presented concerning basic reactor kinetics and design characteristics of PWR, BWR, HTGR, and LMFBR type reactors. Reactor protection systems, engineered safeguards, and design basis accidents are described.

- 5272 **DOPPLER REACTIVITY UNCERTAINTIES AND THEIR EFFECT UPON A HYPOTHETICAL LOF ACCIDENT.** Malloy, D.J. Lafayette, IN; Purdue Univ. (1976). 228p. University Microfilms Order No. 77-15,440.

Thesis (Ph. D.).

The statistical uncertainties and the major methodological errors which contribute to the Doppler feedback uncertainty were reviewed and investigated. Improved estimates for the magnitudes of each type of uncertainty were established. The generally applied reactivity feedback methodology has been extended by explicitly treating the coupling effect which exists between the various feedback components.

The improved methodology was specifically applied to the coupling of Doppler and sodium void reactivities. In addition, the description of the temperature dependence of the Doppler feedback has been improved by the use of a two-constant formula on a global and regional basis. Feedback and coupling coefficients are presented as a first comparison of the improved and the currently applied methods. Further, the energy release which results from hypothetical disassembly accidents was simulated with a safety response surface in the parametric safety evaluation code PARSEC. The impact of the improved feedback methodology and of Doppler coefficient uncertainties was illustrated by the usual parametric relationship between available work-energy and the Doppler coefficient. The work-energy was calculated with the VENUS-II disassembly code and was represented as a response surface in PARSEC. Additionally, the probability distribution for available work-energy, which results from the statistical uncertainty of the Doppler coefficient, was calculated for the current and the improved feedback methodology. The improved feedback description yielded about a 16 percent higher average value for the work-energy. A substantially larger increase is found on the high-yield end of the spectrum: the probability for work-energy above 500 MJ was increased by about a factor of ten.

- 5273 SPATIALLY CONTINUOUS APPROACH TO THE DESCRIPTION OF INCOHERENCIES IN FAST REACTOR ACCIDENT ANALYSIS. Luck, L.B. Lafayette, IN; Purdue Univ. (1976). 291p. University Microfilms Order No. 77-15,437.

Thesis (Ph. D.).

The current approach to LMFBR risk assessment is based on a small number of accident path calculations using computer models in which spatial variations are represented with a coarse geometrical mesh, neglecting part of the inter-subassembly incoherence and all intra-subassembly effects. Coherencies in the accident progression resulting from the coarse mesh structure may yield predicted ramp rates significantly higher than more realistic calculations using a finer mesh. Inter-subassembly incoherence can be treated by the use of more channels, but intra-subassembly effects may require a different approach. Future risk assessment is expected to consider, in addition, the effects of modeling and parameter uncertainties. A generalized cell-type approach is developed in which individual subassemblies are represented as a unit. By appropriate characterization of the results of separate detailed investigations, spatial variations within a cell are represented as a superposition. The advantage of this approach is that costly detailed cell-type information is generated only once or a very few times. Spatial information obtained by the cell treatment is properly condensed in order to drastically reduce the transient computation time.

- 5274 MECHANICAL PROPERTIES OF FAST REACTOR FUEL CLADDING FOR TRANSIENT ANALYSIS. Hunter, C.W.; Johnson, G.D. (Hanford Engineering Development Lab., Richland, WA). pp 101-118 of Irradiation effects on the microstructure and properties of metals. Wheeler, J.B.; Hoersch, H.M.; McGlinchey, E.J. (eds.). Philadelphia; American Society for Testing and Materials (1976).

From 8. symposium of the American Society for Testing and Materials on the effect of radiation on structural materials; St. Louis, MO, USA (4 May 1976).

See CONF-760515--.

In order to determine mechanical behavior under various simulated reactor transient events, internally pressurized specimens of fast flux-irradiated 20 percent cold-worked Type 316 stainless steel fuel pin cladding were rapidly heated until they burst. Tests were conducted at heating rates of 100°F/s and 200°F/s with pressures of 2500 to 14,300 psi (17.2 to 98.6 MPa), resulting in failure temperatures from 1000 to 2000°F (538 to 1093 K). The specimens were taken from subassemblies irradiated in the Experimental Breeder Reactor-II at temperatures from 700 to 1300°F (371 to 705 K). Peak burnup and fluence levels ranged from 28,000 to 50,000 megawatt days per metric ton metal (MWD/MTM) and 2.5 to 4.0 x 10²² neutrons (n)/cm² (E > 0.1 MeV), respectively. Irradiation decreased both the failure strain and failure strength, when the transient test conditions resulted in intergranular fracture; intergranular fracture occurred above 1000 to 1200°F (538 to 649 K), depending on strain rate. Below these temperatures the fracture mode is transgranular, so that the failure strength is not reduced. A correlation based on the ratio of irradiated material failure strain and failure strength was developed to describe the effects of irradiation on the mechanical properties of the cladding. The strain ratio correlation indicates that the failure strain does not further decrease beyond a fluence of 2 x 10²² n/cm². The mechanical properties of cladding which had contained fuel during irradiation were degraded more than were the properties of unfueled material.

- 5275 TENSILE PROPERTIES OF FAST REACTOR IRRADIATED TYPE 304 STAINLESS STEEL. Fish, R.L.; Hunter, C.W. (Hanford Engineering Development Lab., Richland, WA). pp 119-138 of Irradiation effects on the microstructure and properties of metals. Wheeler, J.B.; Hoersch, H.M.; McGlinchey, E.J. (eds.). Philadelphia; American Society for Testing and Materials (1976).

From 8. symposium of the American Society for Testing and Materials on the effect of radiation on structural materials; St. Louis, MO, USA (4 May 1976).

See CONF-760515--.

Tension tests were performed on annealed Type 304 stainless steel specimens sectioned from Experimental Breeder Reactor-II (EBR-II) duct thimbles. The specimens had accumulated neutron fluences of up to 10.3 x 10²² neutrons (n)/cm², E > 0.1 MeV (10.3 x 10²⁶ n/m², E > 16 fJ). Irradiation temperatures for the material tested ranged from 700 to 750°F (371 to 405 K). The tests were performed at temperatures of room temperature to 1400°F (773 to 705 K), employing strain rates of 2 x 10⁻³ to 2/min (3.3 x 10⁻⁵ to 3.3 x 10⁻²/s). At test temperatures below 800°F (700 K), the strength increased with fluence until about 7 x 10²² n/cm² (7 x 10²⁶ n/m²), beyond which no further increase was observed. The elongation decreased with fluence, reaching levels as low as 0.5 percent uniform and 1.3 percent total elongation at 700°F (644 K). High fluence failures below 800°F (700 K) occurred by transgranular channel fracture. At test temperatures above 1000°F (538 K), elongations were reduced to very low levels at high fluences (average total elongation (TE) = 0.03 percent). Extensive intergranular fracture at the high fluences produced the low ductility and resulted in failure of the specimens before reaching the strength characteristic of the true hardness of the material.

- 5276 DEVELOPMENT AND EVALUATION OF A STRESS-FREE SWELLING CORRELATION FOR 20 PERCENT COLD-

WORKED TYPE 316 STAINLESS STEEL. Garner, F.A.; Laidler, J.J.; Guthrie, G.L. (Hanford Engineering Development Lab., Richland, WA). pp 208-226 of Irradiation effects on the microstructure and properties of metals. Wheeler, J.B.; Hoersch, H.M.; McGlinchey, E.J. (eds.). Philadelphia; American Society for Testing and Materials (1976).

From 8. symposium of the American Society for Testing and Materials on the effect of radiation on structural materials; St. Louis, MO, USA (4 May 1976).

See CONF-760515--.

Sufficient data were accumulated on the swelling behavior of 20 percent cold-worked Type 316 stainless steel to make predictions of the anticipated swelling in the fast test reactor (FTR). A predictive stress-free swelling correlation was developed employing a limited data base developed in the Experimental Breeder Reactor-II (EBR-II). Insight gained from electron and ion simulation experiments aided in the correlation development. Application of this correlation to environments other than fast reactor core regions requires consideration of the differences in neutron spectrum and displacement rate in such environments.

5277 MICROSTRUCTURAL CHANGES IN ION-IRRADIATED COMMERCIAL ALLOYS. Bell, W.L. (General Electric Co., Pleasanton, CA); Lauritzen, T.; Darlin, E.S.; Warner, R.W. pp 353-369 of Irradiation effects on the microstructure and properties of metals. Wheeler, J.B.; Hoersch, H.M.; McGlinchey, E.J. (eds.). Philadelphia; American Society for Testing and Materials (1976).

From 8. symposium of the American Society for Testing and Materials on the effect of radiation on structural materials; St. Louis, MO, USA (4 May 1976).

See CONF-760515--.

The effect of heavy ion bombardment on the microstructural stability of several high nickel superalloys was evaluated by transmission electron microscopy techniques. The work was intended to simulate the type and magnitude of radiation damage occurring with high fluence exposure in a liquid metal fast breeder reactor (LMFBR) core. Results revealed a general acceleration in precipitation kinetics in alloys with high titanium-to-aluminum ratios, over the temperature range 475 to 725°C (887 to 1337°F). In the Inconel alloys 706 and 718, for example, bombardment produced the stable overaging precipitate η Ni_3Ti at the expense of the preexisting phases γ' , γ'' , and δ . Thermal control data over the same temperature range did not reveal the presence of η . Little or no changes in precipitate microstructure were observed in Nimonic PE16, an age-hardenable alloy with a titanium/aluminum ratio of unity.

5278 PHENIX CONSTRUCTION AND OPERATING EXPERIENCE. Megy, J.M.; Conte, F.; Goddet, J.; Noel, H. pp 3-12 of 1976 ASME-ANS international conference on advanced nuclear energy systems. New York; American Society of Mechanical Engineers (1976).

From ASME-ANS joint international conference on advanced nuclear energy systems; Pittsburgh, PA, USA (13 Mar 1976).

See CONF-760303--.

The methods and principles adopted for the construction of Phenix, which was put into service virtually on schedule and at a cost approaching the initial estimate, are discussed. By the end of 1975, Phenix had already proved a valuable experience, since this power plant has been operating

industrially since July 14, 1974, with availability greater than 73%. The operating results significantly confirm the options adopted for the project, and particularly the pool concept. Moreover, Phenix is a clean power plant, with almost undetectable gaseous wastes, a very low quantity of liquid wastes, and very low thermal wastes, thanks to its high efficiency (over 45%). The experience thus gained provides a solid base for the forthcoming construction of Super Phenix.

5279 SNR CONSTRUCTION EXPERIENCE. Brandstetter, A.; Guthmann, E.A.; Stoehr, K. (Internationale Natrium-Brutreaktor-Bau Gesellschaft mbH, Bensberg, Ger.). pp 97-103 of 1976 ASME-ANS international conference on advanced nuclear energy systems. New York; American Society of Mechanical Engineers (1976).

From ASME-ANS joint international conference on advanced nuclear energy systems; Pittsburgh, PA, USA (13 Mar 1976).

See CONF-760303--.

Construction of SNR 300 began 1973 at Kalkar, lower Rhine. The licensing procedure led to a delay of more than one year. The concrete work is nearly completed, component fabrication is well underway, the reactor vessel already has been pressure tested. Beginning of preoperational tests is expected for 1979.

5280 SNR COOLANT SYSTEM COMPONENTS. De Haas Van Dorsser, A.H. (Neratoom, The Hague, Netherlands); Mausbeck, H. pp 181-191 of 1976 ASME-ANS international conference on advanced nuclear energy systems. New York; American Society of Mechanical Engineers (1976).

From ASME-ANS joint international conference on advanced nuclear energy systems; Pittsburgh, PA, USA (13 Mar 1976).

See CONF-760303--.

The DEBENELUX prototype fast reactor power plant SNR 300 at Kalkar has a loop-type heat transfer system similar to that of the prototype LMFBR plants in the USA and Japan. There exist three 257 MW/sub th/ primary sodium loops, each with a hot leg centrifugal pump and three 85.6 MW/sub th/ intermediate heat exchangers in parallel. From there the heat is transferred to the steam generators via three secondary sodium loops with one cold leg sodium circulating pump in each. At a nominal reactor outlet temperature of 819°C and a turbine inlet power of 771 MW/sub th/ super heated steam of 166 bar and 733°C is produced, giving rise to a plant rating of 327 MW/sub e/ gross. The primary and secondary loops are described in detail.

5281 LMFBR COOLANT SYSTEM COMPONENTS DEVELOPMENT IN JAPAN. Nakai, Y.; Mochizuki, K.; Aoki, T.; Yamaki, H. pp 193-213 of 1976 ASME-ANS international conference on advanced nuclear energy systems. New York; American Society of Mechanical Engineers (1976).

From ASME-ANS joint international conference on advanced nuclear energy systems; Pittsburgh, PA, USA (13 Mar 1976).

See CONF-760303--.

A review is made on the major components and the research and developments (R and D) of them in the coolant system of sodium-cooled fast reactors in Japan. Two fast reactors, the experimental fast reactor 'Joyo' and the prototype fast breeder reactor 'Monju', are being developed as the national project by the Power Reactor and Nuclear Fuel Development Corporation (PNC). In accordance with the project, design, research and development have

been extensively made by PNC itself and industries, including in-sodium and water tests of prototype components, characteristic tests, fabrication tests, etc. for both reactors. "Joyo" with initial output of 50 Mwt is now in preoperational test, while "Monju" with 300 MWe is in the stage of check and review by the governmental authority.

5282 US LMFBR COOLANT SYSTEM COMPONENTS.

Skavdahl, R.E. (General Electric Co., Sunnyvale, CA); Buggy, J.J.; Barratt, R.O. pp 215-235 of 1976 ASME-ANS international conference on advanced nuclear energy systems. New York; American Society of Mechanical Engineers (1976).

From ASME-ANS joint international conference on advanced nuclear energy systems; Pittsburgh, PA, USA (13 Mar 1976).

See CONF-760303--.

Development and use of LMFBR coolant system components in the United States has progressed through more than two decades, with both the government and private sectors participating significantly in the support and conduct of the work. The purpose of this paper is to present the major functional requirements that these components are expected to meet, their current status and future direction of development, and recent test results. The components to be discussed are: (1) primary and intermediate system large sodium piping; (2) primary and intermediate system large sodium valves; (3) primary and intermediate main sodium pumps; (4) intermediate heat exchanger (IHX); and (5) sodium-heated steam generators. The major near-term activities associated with the above components are focused primarily on the Fast Flux Test Facility (FFTF), the Clinch River Breeder Reactor Plant (CRBRP), and the anticipated commercial LMFBR's.

5283 REACTOR SYSTEM COMPONENTS OF JAPAN'S

FAST BREEDER REACTORS. Nakai, Y.; Hirasawa, Y.; Kishida, K.; Nakano, H. pp 427-444 of 1976 ASME-ANS international conference on advanced nuclear energy systems. New York; American Society of Mechanical Engineers (1976).

From ASME-ANS joint international conference on advanced nuclear energy systems; Pittsburgh, PA, USA (13 Mar 1976).

See CONF-760303--.

Japan's experimental fast reactor JOYO is under the precommissioning test and is expected to go critical in late 1976. The design of the prototype MONJU, based on the original design philosophy and guidelines, is now approaching the final confirmation of the overall design in preparation for the construction permit application. A research and development program (R and D) in accordance with the MONJU design is presently being carried out and some tests have been completed. The results of the R and D program associated with JOYO and the experience gained in the construction of JOYO are extensively reflected on the MONJU design. Both JOYO and MONJU are of the loop type and basically of the same concept. This paper presents the principal design bases and the requirements of the two fast reactors, and the nature of research and development programs of the reactor key components.

5284 CLINCH RIVER BREEDER REACTOR PROJECT

FUEL HANDLING DEVELOPMENT PROGRAM. Foster, K.W. (Atomics International, Canoga Park, CA). pp 473-479 of 1976 ASME-ANS international conference on advanced nuclear energy systems. New York; American Society of Mechanical Engineers (1976).

From ASME-ANS joint international conference on advanced nuclear energy systems; Pittsburgh, PA, USA (13 Mar 1976).

See CONF-760303--.

The fuel handling system for the Clinch River Breeder Reactor Project (CRBRP) is based primarily on existing technology and in many respects follows the concept developed for the Fast Flux Test Facility (FFTF). However, several requirements are considerably more stringent and demand more advanced equipment. This paper describes the development program initiated to verify improved design features and performance characteristics.

5285 SUPER-PHENIX: STATUS OF THE CREYS-MALVILLE PLANT.

Casini, Robert; Janberg; Rodet; Megy; Crette; Leduc; Granito. pp 547-562 of 1976 ASME-ANS international conference on advanced nuclear energy systems. New York; American Society of Mechanical Engineers (1976).

From ASME-ANS joint international conference on advanced nuclear energy systems; Pittsburgh, PA, USA (13 Mar 1976).

See CONF-760303--.

The Creys-Malville plant, using a Super-Phenix NSS System, is designed as a basic power plant in the same manner as a light water plant. Main operating conditions, and main technical choices made in order to satisfy these operating conditions, are recalled. Then, the plant is briefly described.

5286 STATUS OF PRELIMINARY DESIGN OF SNR 2.

Guthmann, E.A. pp 563-569 of 1976 ASME-ANS international conference on advanced nuclear energy systems. New York; American Society of Mechanical Engineers (1976).

From ASME-ANS joint international conference on advanced nuclear energy systems; Pittsburgh, PA, USA (13 Mar 1976).

See CONF-760303--.

The SNR 2 is being designed by the Debenelux industry for an international utility association of RWE, EdF and ENEL, the same association that will order SUPERPHENIX. Boundary conditions, R + D, and design features of this large loop type fast breeder power plant, which will follow the SNR 300 after 1980, are discussed.

5287 STUDY OF THE COMMERCIAL FAST BREEDER REACTOR IN JAPAN.

Tanaka, N.; Kojima, T. (Tokyo Electric Power Co. Inc., Japan). pp 571-581 of 1976 ASME-ANS international conference on advanced nuclear energy systems. New York; American Society of Mechanical Engineers (1976).

From ASME-ANS joint international conference on advanced nuclear energy systems; Pittsburgh, PA, USA (13 Mar 1976).

See CONF-760303--.

The research and development (R and D) on the fast breeder reactor (FBR) in Japan are carried on mainly by Power Reactor and Nuclear Fuel Development Corporation (PNC). As the first step, construction and installation of the experimental FBR, "Joyo" at PNC O-arai Engineering Center, have been completed. It is under preoperational function tests, and is scheduled to go critical in mid-1976. As the second step, PNC has performed the R and D for the 300 MWe prototype FBR, "Monju" in preparation for construction. "Monju" is expected to go critical in about 1982. Several large facilities to obtain the technological experience for "Monju" have been installed at O-arai Engineering Center, and some tests have been completed. The R and D for "Monju" have also been progressed by several nuclear

manufacturers and in cooperation with the foreign countries. The FBR is recognized as the reactor type occupying the most important position after the LWR in view of effective utilization of nuclear fuel resources and reduction of separative work. In such consideration, TEPCO contributed in the operation of the Fermi-1 project in the United States, and has been participating in the PNC's activities. In addition to these efforts, to forecast the future situations of nuclear power as a utility, joint studies have been made with four nuclear industry groups since 1969, in order to make clear the concept of the large commercial FBR and the course of its development.

- 5288 OPERATING EXPERIENCE WITH EXPERIMENTAL BREEDER REACTOR-II (EBR-II). Perry, W.H.; Lentz, G.L.; Holmes, J.T.; Wolz, G.C. (Idaho National Engineering Lab., Idaho Falls). pp 29-54 of 1976 ASME-ANS international conference on advanced nuclear energy systems. New York; American Society of Mechanical Engineers (1976).

From ASME-ANS joint international conference on advanced nuclear energy systems; Pittsburgh, PA, USA (13 Mar 1976).

See CONF-760303--.

As originally designed and operated, EBR-II successfully demonstrated the concept of a sodium-cooled fast breeder power plant with a closed fuel reprocessing cycle (mini-nuclear park). Subsequent operation has been as a test and fuel irradiation facility, a role which will continue into the foreseeable future. Since 1961, the operating experience of EBR-II has been very satisfactory. Most of the components and systems have performed well. In particular, the mechanical performance of heat-removal systems has been excellent. A review of the operating experience reveals that all the original design objectives have been successfully demonstrated. To date, no failures or incidents have occurred where serious in-core or out-of-core consequences have resulted. No water-to-sodium leaks have been detected over the life of the plant. At the present time, the facility is operating very well and continuously except for short shutdowns required by maintenance, refueling, modification and minor repair. A plant factor of 66.1 percent was achieved for the calendar year 1975.

- 5289 FAST FLUX TEST FACILITY MAJOR COMPONENT TESTING EXPERIENCE AND PLANT CONSTRUCTION EXPERIENCE. Mairson, R.C.; Neuman, M.R.; Rutkauskas, V.J.; Shoemaker, F.M.; Tollbom, L.R.; Trego, L.A. (Westinghouse Hanford Co., Richland, WA). pp 55-88 of 1976 ASME-ANS international conference on advanced nuclear energy systems. New York; American Society of Mechanical Engineers (1976).

From ASME-ANS joint international conference on advanced nuclear energy systems; Pittsburgh, PA, USA (13 Mar 1976).

See CONF-760303--.

This paper presents the experiences gained to date in the testing of major reactor and plant prototype components, and in the construction of the Fast Flux Test Facility (FFTF). Several new sodium facilities were constructed and confirmation tests on the prototype components are continuing. Test conditions and results to date are reported for the primary pump, intermediate heat exchanger, sodium-to-air dump heat exchanger, large and small sodium valves, purification cold trap, in-vessel handling machine, instrument tree, control rod system, closed loop ex-vessel machine, refueling equipment and selected

maintenance equipment. The construction experiences described were generally selected to cover the significant differences from prior experiences on light water reactor plants.

- 5290 SAFETY ANALYSIS OF THE FAST BREEDER REACTOR CONFINEMENT MAIN PROBLEMS: APPLICATION TO SUPER PHENIX. Meyer-Heine, A. (Commissariat a l'Energie Atomique, Cadarache, France); Penet, F.; Chalot, A. pp 321-325 of 1976 ASME-ANS international conference on advanced nuclear energy systems. New York; American Society of Mechanical Engineers (1976).

From ASME-ANS joint international conference on advanced nuclear energy systems; Pittsburgh, PA, USA (13 Mar 1976).

See CONF-760303--.

This paper will be limited to the safety analysis problems of a fast reactor as far as large accidents are concerned. It will deal, more specifically with accidents which can happen in the core, and will not take into account accidents such as seisms, floods, or large sodium fires. Trying to be as general as possible, it is shown, taking Super Phenix as an example, how some specific problems of the fast breeders can be solved. The main difficulties involved in the confinement specifications will be exposed in the first part of the paper. The analysis of a highly hypothetical accident used to specify the confinement is performed.

- 5291 SAFETY DESIGN CRITERIA FOR LIQUID METAL FAST BREEDER REACTORS. Keaten, R.W. (Atomics International, Canoga Park, CA); Bradbury, P.; Hikido, K. pp 327-336 of 1976 ASME-ANS international conference on advanced nuclear energy systems. New York; American Society of Mechanical Engineers (1976).

From ASME-ANS joint international conference on advanced nuclear energy systems; Pittsburgh, PA, USA (13 Mar 1976).

See CONF-760303--.

The general safety approach for liquid metal fast breeder reactors (LMFBR's) is very similar to that which has been developed for light water reactors. The safety of the plant is assured by design features which prevent the occurrence of accidents, features which limit the damage and serve to protect the public against excessive exposure to radioactive material even in the event of a hypothetical, low-probability accident. Multiple barriers consisting of fuel and cladding, primary coolant boundary, and containment building or other low leakage containment structures are also the same as those utilized for light water reactors. Because of the great similarity in the general approach of LMFBR's and LWR's, the question of safety criteria for LMFBR's is discussed in terms of a comparison with LWR safety criteria.

- 5292 (BNWL-tr--266) THERMAL CONDUCTIVITY AND THERMAL BEHAVIOR OF ABSORBER MATERIALS FOR FAST BREEDERS. Horle, M.; Schulz, B. 1976. Translation of AED-Conf--1976-013-196 (CONF-760359--5). 10p. Dep. NTIS, PC A02/MF A01. From Reactor meeting; Duesseldorf, F.R. Germany (30 Mar 1976).

The thermal conductivity was determined for boron carbide and Eu_2O_3 to 1600 K, and for Eu sub 0.99/ B_6 , to 1200 K. Because of the sensitivity of the thermal conductivity of the latter compound to structure, aspects of metallography and chemical analysis are considered. 5 figures, 2 tables. (RWR)

- 5293 (DOE-tr--28) EDF RESEARCH ON FAST NEUTRON REACTORS. (Electricite de France, 75 - Paris. Direction des Etudes et Recherches). 1976. Translation of French report 6p. Dep. NTIS, PC A02/MF A01.

In order to make possible the calculation of the temperatures of the sodium, of the sheath and of the fuel in fast reactor assemblies, taking into account the mixing phenomena induced by the helicoidal wires, two design codes have been developed. These codes have then been adapted for their integration in the Supercalcyon system. This system shall constitute the reference tool for the development of those codes that shall manage Phenix, and other reactors of the family. Cooling accidents, thermohydraulic studies, and steam generator studies are also in progress.

- 5294 PHOSPHATE-BONDED ZIRCONIA RAMMING COMPOUNDS FOR THE THERMAL STRIPPING OF THE FUEL ELEMENTS OF FAST REACTORS. Pastushkov, V.G.; Novoselov, G.P.; Borisov, G.B. Refractories (USSR) (Engl. Transl.); 17: No. 11/12, 687-691(1976).

An investigation was carried out of the interaction of a phosphate-bonded rammed zirconia compound with molten stainless steel in the presence of (U, Pu)O₂. Trials were carried out in the thermal stripping of oxide fuel elements with a steel shell of a melting and separating unit with a concrete-lined induction coil and a rammed crucible of stabilized zirconia with a binder in the form of orthophosphoric acid. The constructional integrity of the unit remained intact after 75 cycles of thermal stripping. 10 refs.

- 5295 FLUIDIZED BED STEAM GENERATOR CONCEPTS FOR LMFBR. Keairns, D.L. (Westinghouse Research Lab., Pittsburgh); Newby, R.A.; Archer, D.H. pp 569-575 of Fluidization technology. Volume II. Keairns, D.L. (ed.). Washington, DC; Hemisphere Publishing Corp. (1976).

From International fluidization conference; Pacific Grove, CA, USA (15 Jun 1975).

See CONF-7506158--P2.

A fluidized bed steam generator, FBSG, system is being developed for the liquid metal fast breeder reactor, LMFBR. The FBSG eliminates the need for an intermediate sodium loop and heat exchanger utilized in the current design and isolates the sodium and water thus reducing the possibility of a sodium-water reaction. Alternative fluidized bed steam generator concepts are presented and design and operating parameters reviewed. An experimental program is underway to develop design data and demonstrate concept feasibility. The experimental program objectives are reviewed.

- 5296 RESTRAINTS FOR OPERATION OF FBTR STEAM GENERATOR. Vaidyanathan, G.; Kumar, S.S. (Reactor Research Centre, Kalpakkam (India). Fast Breeder Test Reactor Design Group). pp 144-154 of Proceedings of the symposium on power plant dynamics and control. Bombay; Department of Atomic Energy (1976).

From Symposium on power plant dynamics and control; Bombay, India (23 Feb 1976).

See CONF-760265--.

The sodium-heated once-through steam generator is a key component of FBTR plant. A compilation is presented of the restraints placed on the operation of the steam generator in static and dynamic conditions. These restraints arise from the corrosive potential of sodium and water, static and dynamic oscillations, thermal stresses, fluctuations of the nucleate boiling to film boiling transition

point, loss of grid etc. The basic factors characterising these phenomena are discussed.

- 5297 DYNAMIC MODEL OF THE UNITED STATES ENERGY SYSTEM: A TOOL FOR ENERGY R AND D PLANNING. Weyant, J.P. Berkeley, CA; Univ. of California (1976). 223p. University Microfilms Order No. 77-4649. Thesis (Ph. D.).

The benefits attributable to the technology products of alternative energy R and D programs should be evaluated in terms of how well the technologies would contribute as integral elements of the total U.S. energy system (rather than as isolated entities as has typically been done in the past). Thus, this model stimulates the dynamics of the evolution of the total energy system by requiring both existing and new technologies to compete for introduction (i.e., commercialization) on a cost-competitive basis that considers the time phasing of the: (1) retirement of energy conversion facilities, (2) growth in end-use demands, and (3) escalation of the costs of extracting depleting domestic energy resources. This approach contrasts with a static model used by ERDA, wherein assumptions must be made for each future year of interest for: (1) maximum capacity constraints for alternative types of conversion facilities, and (2) the cost of energy resources. This model is used to compare the relative consequences and merits of the technology products from three of ERDA's major energy R and D programs: (1) liquid-metal fast breeder reactors, (2) synthetic fuels derived from coal and oil shale, and (3) improved efficiencies for end-use utilizing devices (e.g., space heaters). It is found that the development of synthetic fuels derived from coal and oil shale is the only alternative (of the three considered) that provides energy independence for the U.S. in the next 50 years. However, the possible collapse of the world oil cartel is shown to pose a major retardant to synfuels commercialization by the private sector until at least the end of the century.

- 5298 HEAT TRANSFER IN HELICAL TUBE SODIUM HEATED STEAM GENERATORS. Duchatelle, L.; de Nucheze, L.; Robin, M.G. (CEN/Saclay, France). pp 269-285 of Future energy production systems. Heat and mass transfer processes. Volume I. Denton, J.C.; Afgan, N.H. (eds.). Washington, DC; Hemisphere Publishing Corp. (1976).

For the 1200 MWe Super Phenix project, the CEA jointly with EDF, has carried out a research and development program for an helically coiled tube steam generator to be manufactured by the Fives-Cail Babcock Company. In the 5 MW CEA test facility at Grand Quevilly an experimental program was performed in order to gain the basic knowledge on heat transfer and pressure drop for boiling water flowing in four helically coiled tubes heated by a counter flow liquid metal, which was badly needed for the design. For the experimental coil to tube diameter ratios of 630 : 20, 810 : 20, 1800 : 20, 2700 : 20 correlations for the predictions of the D.N.B., and the friction coefficient in the high Reynolds number range were obtained. A comparison between experimental results and predictions at various heat ratings shows a fair agreement. In addition it is demonstrated that experimental results compare very well with computer code predictions for a 45 MWt mock-up simulating a liquid metal heated once-through steam generator, with 24 tubes arranged in three layers, which has been tested at the EDF Renardieres facility. All correlations used in our computer code are reported.

- 5299 DIRECT AND INDIRECT HEATING EFFECT IN THE DNB TESTS FOR SODIUM HEATED STEAM GENERATORS FOR LMFBR'S. Cumo, M.; Farello, G.E.; Maciuga, C. pp 287-296 of Future energy production systems. Heat and mass transfer processes. Volume I. Denton, J.C.; Afgan, N.H. (eds.). Washington, DC; Hemisphere Publishing Corp. (1976).

LMFBR's steam generators design require the knowledge of the dryout or burn-out power. These systems help greater heated lengths and lower heat fluxes than reactor core channels, so that most of the existing burn-out correlations fail in predicting the burn-out power. The question arises if the electrically heated test sections are equivalent, for what pertains the dryout power determinations to the actual indirectly heated systems. The testing in actual conditions (sodium water systems) do not permit accurate measurement of the dryout power as is possible in electrically Joule heated systems. The present work shows the difference existing between the two basic boundary heating conditions and provides relations to correct the results obtained in Joule heated systems.

- 5300 INFLUENCE OF FISSION FRAGMENTS AND LIQUID-LIQUID CONTACT ON THE MINIMUM SUPERHEAT FOR BUBBLE NUCLEATION IN SODIUM. Bankoff, S.G. (Northwestern Univ., Evanston, IL). pp 297-303 of Future energy production systems. Heat and mass transfer processes. Volume I. Denton, J.C.; Afgan, N.H. (eds.). Washington, DC; Hemisphere Publishing Corp. (1976).

Claxton and Deltrich have computed superheat thresholds at various saturation temperatures as a function of the energy and type of incident radiation. The synergistic effects are considered that may result when a liquid-liquid interface is subjected to fission fragment bombardment, which is the most effective type of radiation for inducing bubble nucleation.

- 5301 INVESTIGATION OF TWO-PHASE LIQUID-METAL MAGNETOHYDRODYNAMIC POWER SYSTEMS. Amend, W.E. (Argonne National Lab., IL); Fabris, G.; Cutting, J. pp 305-317 of Future energy production systems. Heat and mass transfer processes. Volume I. Denton, J.C.; Afgan, N.H. (eds.). Washington, DC; Hemisphere Publishing Corp. (1976).

Magnetohydrodynamic power systems are receiving renewed interest as a result of the need to develop more efficient energy conversion systems. One of these systems, the two-phase Liquid-Metal MHD (LMMHD) system, is under development at the Argonne National Laboratory. The result of the detailed cycle analysis and systems studies, a description of the experimental facility and the basic results obtained, and the thermal and magneto fluid mechanics problems encountered in two-phase liquid-metal flows in the presence of a magnetic field are presented. Detailed cycle analysis and in-depth modeling studies have indicated that power cycles utilizing two-phase liquid metal MHD generators are attractive alternatives to conventional power-generation techniques from the standpoint of coupling to available heat sources and to provide improved efficiency. The studies indicate that the LMMHD cycle will operate efficiently in the temperature range of 1000--1600°F (50% efficiency with a maximum cycle temperature of 1600°F) and is therefore potentially compatible with many advanced heat sources under development such as the LMFBR, fluidized-bed coal combustor, HTGCR and the fusion reactor. Of special interest is the coupling to the

LMFBR thereby eliminating the costly, potentially hazardous liquid-metal/water interface. The results of detailed parametric studies of the heat transfer interfaces between an LMMHD power cycle and an LMFBR and a steam bottoming plant are described. It is shown that the interfaces do place restrictions on the possible range of operating parameters but that a viable system can be designed to couple with an LMFBR operating with a maximum coolant temperature at 1200°F to yield an overall conversion efficiency approaching 45%. Results of the cycle studies and thermodynamic analysis show that the two-phase generator approaches the operation of an infinite reheat turbine and is responsible for the high cycle efficiencies.

- 5302 PROBLEMS OF DISMANTLING, TREATING AND ANALYZING HIGHLY IRRADIATED FUEL ELEMENTS. Lefort, G.; Hayet, L.; Regnaud, F. (CEA Centre d'Etudes Nucleaires de Fontenay-aux-Roses, 92 (France)); Allain, A. (Compagnie d'Ingenierie pour les Reacteurs au Sodium (CIRNA), Centre d'Etudes Nucleaires de Saclay, 91 = Gif-sur-Yvette (France)); Calame-Longjean, A. (CEA Centre de Marcoule, 30 = Bagnols-sur-Ceze (France)); Moreau, C. (Ateliers et Chantiers de Bretagne (ACB), 44 = Nantes (France)). pp 119-140 of Design of and equipment for hot laboratories. Vienna; IAEA (1976). (In French)

From Symposium on the design of and equipment for hot laboratories; Otaniemi, Finland (2 Aug 1976).

For some years hot laboratories have been receiving highly irradiated fuel elements from experimental reactors and new-generation power reactors. The hazards associated with these fuel elements are greater than those encountered in the past and it has been necessary to re-equip numerous facilities, improving the techniques used and the precautions taken in respect of personnel so that the operating conditions remain satisfactory. The operation of well-designed facilities doing this type of work has in fact become safer. Four representative facilities are described as examples - a dismantling cell with an inert atmosphere, associated with the Phenix reactor, a mechanical chopper cell for oxide fuel elements installed at the head of a pilot reprocessing plant, a radiometallurgy laboratory handling breeder fuel elements and californium, and a facility for chemical analysis of fuel elements. The paper shows that proper control has been established over the different hazards inherent in this type of facility in normal operation and in emergency conditions. These results are confirmed by the conditions of operation with teams having very long experience.

- 5303 (BNWL-tr--317) ONE YEAR OF PHENIX OPERATION. Conte, F. Translated from Ann. Nucl. Energy; 3: 85-94(1976). 34p. Dep. NTIS (US Sales Only), PC A03/MF A01.

The report describes the chronological order of operations from the time that the Phenix Power Plant was first connected to the public supply grid on December 13, 1973. The end of tests prior to placement of the plant in service is described briefly. These tests were interrupted by periods for jobs which ended on July 14, 1974. From that date the operating level was appreciable, and the sequence of operations proceeded without major incident up to the present. This chronological description is accompanied by progress diagrams up to the end of March 1975, by production statistics, by the main operating characteristics under different conditions and by a summary of the incidents which occurred during operation.

These factors lead to load and availability ratios of 76% and 81%, respectively, with an overall efficiency above 45%.

- 5304 (RISLEY-Trans--3066) PROGRESS REPORT ON THE CONSTRUCTION OF KALKAR NUCLEAR POWER STATION AND THE PLANNING OF SNR-2. Traube, K. Translated from Atoomenerg. Haar Toepass.; 18: No. 7/8, 168-178(1976). 18p. British Library Lending Div., Yorkshire, England.

Portions of document are illegible.

Progress at the Kalkar Nuclear Power Station is described. The problems of the licensing procedure for this prototype reactor are discussed. As in previous years, the licensing and Safety Assessment procedure has led to further delays. As in previous years, the cause of this is not so much in inherent difficulties of the safety demonstrations for an FBR power station, but rather that the certificates and Safety Assessments necessary for building progress depend on detailed demonstrations, and such Safety Assessments can hardly be based on forerunners. Since commencement of building, this has led to an almost impossible number of conflicting situations resulting in changes in planning, delays and additional expenditure, which probably find a parallel only in the construction of the THTR prototype in Schmehausen, also burdened with similar difficulties.

- 5305 TOPOGRAPHICAL, MICROSTRUCTURAL, AND CHEMICAL EFFECTS OF SIMULATED HIGH HEAT FLUX ON THE CORROSION OF TYPE 316 STAINLESS STEEL IN FLOWING SODIUM. Babnall, C.; Shiels, S.A.; Orbon, S.J. Microstruct. Sci.; 4: 23-25(1976).

Earlier work, performed in Na test facilities around the world, have produced corrosion data for Type 316 SS which has been used to estimate metal loss rates from the core of a liquid metal fast breeder reactor. Practical difficulties precluded evaluation of the influence on corrosion of irradiation, a high heat flux and the high axial temp. gradient the latter produces. Results of corrosion experiments conducted in a test facility designed to produce a temp. rise in the fluid equivalent to a heat flux in the primary heat of approx. 0.5×10^6 Btu/h-ft²) are presented. The axial temp. gradient was such that the Na temp. was increased over a distance of 3 ft from 820°F (440°C) at the inlet, to 1360°F (740°C) at the outlet. The secondary ion mass spectrometer, the electron probe microanalyser, the scanning electron microscope and the optical microscope were used individually to characterize the various compositional, topographical, and structural changes that occurred in the stainless steel as a result of the Na exposure. Several important effects attributable to the high axial temp. gradient were noted.

- 5306 RATCHETTING AND CREEP-FATIGUE EVALUATION FOR NOZZLE-TO-CYLINDER INTERSECTION. Barsom, R.S.; Loomis, R.W.; Stewart, B.D. (Combustion Engineering, Inc., Windsor, CT). pp 57-75 of 1976 ASME--MPC symposium on creep-fatigue interaction. Curran, R.M. (ed.). New York, NY; American Society of Mechanical Engineers (1976).

From Winter meeting of the ASME; New York, NY, USA (5 Dec 1976).

An analytical investigation of the applicability of simplified ratchetting and creep-fatigue rules to liquid metal fast breeder reactor (LMFBR) component geometries is being conducted under the Oak Ridge National Laboratory's LMFBR High-Temperature Structural

Design Program. Both the detailed inelastic rules and the simplified elastic rules are applied to the results obtained from three-dimensional finite element analyses of a nozzle-to-cylinder intersection. The results of both evaluations are compared at several locations on the surface, and an assessment of the degree of conservatism of the simplified methods is discussed.

- 5307 ELEVATED TEMPERATURE FATIGUE: DESIGN-APPLICATION PERSPECTIVE WITH DIRECTIONS FOR IMPROVEMENT. Severud, L.K. (Westinghouse Hanford Co., Richland, WA). pp 41-55 of 1976 ASME--MPC symposium on creep-fatigue interaction. Curran, R.M. (ed.). New York, NY; American Society of Mechanical Engineers (1976).

From Winter meeting of the ASME; New York, NY, USA (5 Dec 1976).

Concerns of design-analysts about the present elevated temperature fatigue design criteria, methods, experimental basis, and application difficulties are presented. The present methods and rules used for evaluating elevated temperature fatigue life of LMFBR nuclear power plant components to satisfy ASME Code requirements are surveyed. Typical operating environments, loading conditions, analysis ingredients and procedures for design of these components are presented. Examples of inelastic time-dependent fatigue design analysis applications are discussed to show the translation of material fatigue specimen properties to the prediction of cyclic life of a nuclear component. Areas of interest to the design-analyst about the form and utilization of the present elevated temperature fatigue rules and criteria are identified with specific recommendations for further work and directions for improvement.

- 5308 FINITE ELEMENT FORMULATION FOR FLUID-STRUCTURE INTERACTION IN THREE-DIMENSIONAL SPACE. Kulak, R.F. (Argonne National Lab., IL). pp 21-37 of Dynamics of fluid-structure systems in the energy industry. Au-Yang, M.K.; Brown, S.J.; McDermott, J.R. (eds.). New York, NY; American Society of Mechanical Engineers (1976).

A development is presented for a three-dimensional hexahedral hydrodynamic finite-element. Using trilinear shape functions and assuming a constant pressure field in each element, simple relations were obtained for internal nodal forces. Because the formulation was based upon a rate approach it was applicable to problems involving large displacements. This element was incorporated into an existing plate-shell finite element code. Diagonal mass matrices were used and the resulting discrete equations of motion were solved using explicit temporal integrator. Results for several problems were presented which compare numerical predictions to closed form analytical solutions. In addition, the fluid-structure interaction problem of a fluid-filled, cylindrical vessel containing internal cylinders was studied.

- 5309 FUEL ASSEMBLY FOR NUCLEAR REACTOR. Betts, C.; Collinson, A.E.; Hart, D.F. (to UKAEA). French Patent 2,296,918/A/. 30 Dec 1975. Priority date 31 Dec 1974, United Kingdom of Great Britain and Northern Ireland (UK), 10p. (In French).

The present invention is intended for LMFBR type reactors. The fuel assembly according to the invention comprises an impedance suppressing the cavitation in the axial flow; the impedance consists of a tubular body

containing a series of plates for defining the flow, arranged in perpendicular relationship to the longitudinal axis of the body. In addition to the cavitation suppressing impedance, the fuel assembly comprises a fuel bundle located inside a tubular jacket extending the tubular body at one end, hinge pins being provided at the other end of the body for locating the fuel assembly inside the reactor core. The fuel assemblies are arranged side by side onto a grid and the coolant is circulated upwards through the jackets. The variable impedances are sturdy enough to endure the vibration forces generated from coolant circulation through narrow passages.

- 5310 IMPROVEMENTS TO BREEDER REACTOR STRUCTURES CONTAINING A HOT LIQUID METAL. Chevallier, R.; Sauvage, M. (to Alsthom, 75 - Paris (France); CEA, 75 - Paris (France)). French Patent 2,337,408/A/. 29 Dec 1975. 9p. (In French).

Description is given of an improvement to liquid metal cooled breeder nuclear reactors and composed of a main vessel composed of a central internal vessel containing the core and the hot liquid metal. This internal vessel is connected to individual cylindrical containments each containing a heat exchanger. Opposite the hot liquid metal flow through holes, the surfaces of the internal vessel and of the cylindrical containments are given shapes constituted by an axisymmetrical surface generated by an arc. Further, the cylindrical containments are secured directly to the internal vessel at that place by joining these two surfaces by a toroidal surface with an outward facing concavity.

- 5311 NEUTRON SHIELDING BLOCK. Goto, Y. (to Mitsubishi Atomic Power Industries, Inc., Tokyo (Japan)). Japanese Patent 1977-77,999/A/. 24 Dec 1975. 3p. (In Japanese).

A method is described to provide a neutron shielding block which does not require much space and is stable under a high temperature for a long period of time, effective for a wide neutron energy range as a local shielding material and easy to treat of induced radioactivity. The shielding block takes the form of container type. The interior of the container is divided into a plurality of sections by a partition plate, and one of the sections is filled with a thermal neutron absorber, and other sections is filled with a neutron moderator. Each section is provided with a vent hole to communicate the interior and exterior and with an air permeable cover for covering the hole.

- 5312 FUEL ASSEMBLY. Tsutsumi, K.; Kato, Y.; Hayashi, T.; Matsushima, H.; Hayashi, H. (to Hitachi Ltd., Tokyo (Japan)). Japanese Patent 1977-76,592/A/. 22 Dec 1975. 4p. (In Japanese).

The object of the invention is to uniformize the temperature and speed of a coolant at the outlet of a fuel assembly of a fast neutron reactor in order to stabilize the operation of measuring instruments within the reactor. In a fuel assembly in which shields having coolant passages are provided above and below fuel pins, the coolant passages are inclined with respect to the direction of the core axis to permit mixing of the coolant at the outlet of the fuel assembly.

- 5313 EMERGENCY CORE COOLING DEVICE. Kudo, K.; Suzuoki, A.; Goto, T. (to Hitachi Ltd., Tokyo (Japan)). Japanese Patent 1977-74,797/A/

- 19 Dec 1975. 5p. (In Japanese).

The object of the invention is to remove decay heat produced after a scram without subjecting the cooling system of a nuclear reactor to thermal shock. In the normal operation of the reactor, sodium passing through the low temperature section of a secondary cooling system is partly extracted and stored in a separately provided tank. The stored sodium is poured again into the low temperature section of the secondary cooling system when the cooling capacity thereof is lost.

- 5314 AUXILIARY COOLING SYSTEM FOR A PRIMARY HEAT EXCHANGER WORKING IN A NUCLEAR REACTOR. (to Societe Stein Industrie, 75 - Paris (France)). French Patent 2,335,916/A/. 18 Dec 1975. 5p. (In French).

The description is given of an auxiliary cooling system for the primary heat exchanger of a fast nuclear reactor. This exchanger comprises at least one tube bundle in which the water to be vaporised and superheated flows; a liquid alkaline metal constituting the primary fluid flows around the tubes and inside the casing. The exchanger casing is wrapped in a cladding with air intake and discharge facilities at its ends and this same casing is fitted with auxiliary surfaces for the exchange of heat with the air that can circulate in the cladding. The auxiliary heat exchange surfaces of the casing are points affixed to it, the air intake and discharge systems making it possible to have forced circulation or natural circulation of the air.

- 5315 CONTROL ROD DRIVES. Tanaka, J. (to Hitachi Ltd., Tokyo (Japan)). Japanese Patent 1977-72087/A/. 12 Dec 1975. 6p. (In Japanese).

A method to perform maintenance and inspection easily is described. This invention is characterized by division into an upper control rod driving device, which requires more in number of maintenance and inspection, and a lower control rod driving device, which requires less in number of maintenance and inspection. That is, the upper control rod driving device is provided with a driving means and the lower control rod driving device is provided with a control rod holding means and a scram accelerating means for accelerating the falling of the holding means at the time of urgent stoppage of reactor. With this construction, each of driving devices can be separated and individually carried by cask and gases to be fed into the scram accelerating device may be used as gases for operating the control rod holding device so that a single source of gas supply will suffice.

- 5316 CORE CATCHER IN A REACTOR. Kudo, K. (to Hitachi Ltd., Tokyo (Japan)). Japanese Patent 1977-70294/A/. 10 Dec 1975. 6p. (In Japanese).

A method is described to arrange a material, whose specific gravity is greater than molten nuclear fuel material and melting point is lower than temperature of coolant during operation of the reactor, close to a lower outer peripheral portion of a reactor container to positively prevent development of melt-through trouble. When molten nuclear fuel drops on the bottom within a reactor container resulting from occurrence of melting trouble in a fast breeder, through holes are formed in the bottom of the reactor container. Molten lead in an area of molten lead flows into the pressure vessel of the reactor through the through holes to form a boundary between sodium and molten

lead in a level in which pressure in the reactor container is balanced. At this time, since the molten nuclear fuel is smaller in specific gravity than that of molten lead, the molten nuclear fuel is afloat in the neighbourhood of the boundary to prevent outflow thereof toward outside the reactor container.

- 5317 MATHEMATICAL MODEL OF AN INDUCTIVE TYPE SODIUM LEVEL METER AND SOME APPLICATIONS. Asano, K. (Tokyo Shibaura Electr Co, Kawasaki, Jpn). IEEE Trans. Nucl. Sci.; NS-22: No. 6, 2689-2695 (Dec 1975).

The appearance of a liquid-metal-cooled fast-neutron fuel-breeder reactor has brought various problems to the field of process measurement. The measurement of liquid metal level is one of those problems. A mathematical model of an inductive type liquid sodium level meter has been developed, which simulates behavior of the level meter in various environmental conditions. A test model was made to confirm experimentally the accuracy of the mathematical model. It was recognized that the mathematical model shows fairly well the behavior of an actual level meter. Error estimates were accomplished with this mathematical model. Errors are caused by the change of ambient temperature and by the surface tension of sodium. 8 refs.

- 5318 CONTROL OF WATER LEAKAGE INTO SODIUM BY ACOUSTIC NOISE. Kozlov, F.A.; Sergeev, G.P.; Yugal, V.S. At. Energ. (USSR); 39: No. 6, 432-434 (Dec 1975). (In Russian). ACOUSTIC MONITORING; LEAKS; SODIUM; STEAM GENERATORS; LMFBF TYPE REACTORS; WATER

- 5319 NUCLEAR REACTOR. Aubert, M.; Lambert, P. (to CEA, 75 - Paris (France)). French Patent 2,333,328/A/. 26 Nov 1975. 14p. (In French).

The description is given of an improvement to the cooling system of the main vessel and/or the primary vessel of sodium cooled fast neutron integrated reactors of high power (approximately 1000 MWe). These reactors include a vessel placed inside a containment shell of which the upper part is closed by an upper shield and containing the reactor core, and which is partially filled with liquid sodium, topped with an inert gas blanket. These reactors also have facilities for taking from their upper part the 'hot' liquid sodium after it has been through the core and for re-injecting the cold liquid sodium at the bottom of the vessel and below the core. The vessel includes a first cylindrical ring forming between itself and the vessel a first annular space, one of the two annular spaces serving for the 'cold' liquid metal feed and the second annular space for discharging it. The first ring comprises an upper edge located above the maximum level of the cold liquid inside the discharge annular space. The upper edge is so shaped that the flow of the cold liquid metal from the feed annular space above the edge occurs without the liquid metal flow discharge breaking away from the wall of the first ring.

- 5320 ACCIDENT CONTROL ELEMENT OF SECTIONAL LIQUID METAL STEAM GENERATOR. Srutek, J.; Hlousek, V. Czech Patent 161,417/B/. 15 Nov 1975. 5p. (In Czech).

Sectional steam generators are used in large nuclear power plants with fast liquid metal

cooled reactors. Currently, the individual sections are connected to one compensating vessel in which the control element, e.g., the membrane is located. In case of the failure of one pipe in the section it is consequently necessary to shut down the whole generator. The invention claimed removes this disadvantage by connecting to each section of the generator a compensating vessel on which is mounted a control element, such as for instance a membrane, while a rapid-action valve is placed between the compensating vessels and outlet pipes to the pumps and the intake of sodium from the intermediate heat exchanger and the generator sections. In case of failure of one of the sections it is not necessary to shut down the whole generator but only that particular section while the other sections remain in operation.

- 5321 COVER GAS SYSTEM IN A REACTOR. Iwasaki, T.; Koike, H.; Kawashima, H.; Uemura, A. (to Hitachi Ltd., Tokyo (Japan)). Japanese Patent 1977-60399/A/. 14 Nov 1975. 5p. (In Japanese).

A tank for temporarily store surplus gases resulting from a pressure differential of cover gases required at the time of power operation and at the time of replacing fuel as the gases processed in a distilling column device for recovering radioactive rare gases is described. A cover gas space in a reactor vessel is connected to a first tank provided with a pressure gage. The cover gas within the first tank is sucked and compressed by a compressor to be stored in a second tank, and then passing through the rare gas removing and recovering device into a cover gas header and thence returned to the aforesaid cover gas space. On the other hand, a third tank is connected to the first tank, said third tank being connected to said cover gas header. Also, a cover gas feeding device is connected to the third tank. In this system, extra gases are stored in the third tank.

- 5322 REACTOR CONTAINMENT VESSEL. Kawashima, H.; Naito, K. (to Hitachi Ltd., Tokyo (Japan)). Japanese Patent 1977-59289/A/. 10 Nov 1975. 5p. (In Japanese).

A method is described to restrain a rise in pressure within a sealed space in a sodium cooled fast breeder, such rise in pressure being formed within a reactor vessel as a result of failure of coolant. A good thermal conductive member such as a heat pipe is disposed between a plurality of spaced sealing spaces for receiving a cooling system. When sodium leaks within one sealed space to cause a temperature to rise, part of the temperature is directly cooled by means of an atmosphere control system within own chamber while the other part of the temperature is transmitted to the other chamber by means of the heat pipe and is cooled by means of the atmosphere control system therein.

- 5323 DEFECTIVENESS DETECTOR. Michiguchi, Y.; Suzuki, K.; Takahashi, F. (to Hitachi Ltd., Tokyo (Japan)). Japanese Patent 1977-57498/A/. 7 Nov 1975. 4p. (In Japanese).

A method to permit three-dimensional determination of the position of abnormal sound generation and also permit early and reliable detection of the defectiveness of an apparatus is described. A plurality of wave guides providing different speeds of sound propagation are provided on a plurality of points in a machine at which the defectiveness is to be detected, and each of them is connected to a sound detector. The defectiveness is detected

by determining a point of generation of defectiveness from the time difference in the detection of a defective sound signal in each detector.

- 5324 STRAINER DEVICE. Mokuya, K. (to Hitachi Ltd., Tokyo (Japan)). Japanese Patent 1977-57499/A/. 7 Nov 1975. 4p. (In Japanese).

A method to provide a strainer device, which is adapted to facilitate flushing and is particularly suited for installation in the cooling system of a liquid metal cooled fast breeding reactor is described. A casing accommodating a strainer and a blind plate for the selection of a flow path is provided at a suitable portion of the duct line. The blind plate is adapted to be rotated by an opening and closing means consisting of a rod, bellows, shaft and so forth. At the time of flushing, the duct line is sealed by the blind plate.

- 5325 VAPOR TEMPERATURE CONTROL DEVICE FOR FAST BREEDER REACTOR PLANT. Morimoto, H.; Fujiwara, T. (to Mitsubishi Heavy Industries Ltd., Tokyo (Japan)). Japanese Patent 1977-57495/A/. 4 Nov 1975. 4p. (In Japanese).

A method to permit the temperature control system of a fast breeder reactor to efficiently control the fluid temperature at the outlet of the heated side is described. A bypass system from the outlet of a secondary system sodium pump to the sodium inlet side of a re-heater is provided, and a flow control valve is provided at an intermediate point in the bypass system. Meanwhile, the control system comprises a system for moving the control rods by means of a subtractor for comparing the output of a vapor temperature detector at the outlet of an over-heater and the output of a temperature setter and a subtractor for producing the set value of the temperature at the outlet of the reactor through a proportional integrator-differentiator from the output of said first-mentioned subtractor and a system for moving a bypass flow control valve by operating said proportional integrator-differentiator controller through a subtractor for comparing the output of the re-heater and the output of the temperature setter.

- 5326 THEORETICAL MODEL WITH VARIABLE MASSES FOR THE MOLTEN FUEL--SODIUM THERMAL INTERACTION IN A NUCLEAR FAST REACTOR. Caldarola, L. (Kernforschungszenz Karlsruhe, Ger). Nucl. Eng. Des.; 34: No. 2, 181-201 (Nov 1975).

The reaction has been assumed to occur in two successive phases, A and B. Phase A. A given number (function of time) of fuel particles come into intimate contact with a given mass of liquid sodium (function of time). The heat transfer process is characterized by good direct thermal contact between the fuel and the liquid coolant, and by a large contact area due to the small size of the particles. Phase B. The heat transfer process is now characterized by a very large contact area, and by thermal contact between the fuel and coolant which becomes increasingly worse with time, due to the formation of a sodium vapour layer at the external surface of the fuel fragments. The model accounts for the time history of the temperatures of each fuel particle by means of the use of specially averaged temperature values. The calculation of the heat transfer coefficient during phase B is based on experimental results. The presence of fission gases can also be taken into account. A size distribution of fuel particles has also been incorporated into the model as well as the effect of friction due to the channel walls and

that of the pressure losses at the outlet of the channel. Numerical evaluations are also included and the results are discussed. Diagrams, equations, graphs, and tables show data.

- 5327 ANALYSIS OF THE DECARBURIZATION AND AGING PROCESSES IN 2 1/4CR-1MO STEEL. Klueh, R.L.; Leitnaker, J.M. (Oak Ridge Natl Lab, Tenn). Metall. Trans., A; 6A: No. 11, 2089-2093 (Nov 1975).

Specimens of 2 1/4-Cr-1 Mo steel that had been decarburized in sodium or aged in an inert atmosphere for 26,500 h at 839 K were metallurgically examined with optical and transmission electron microscopy. The carbide particle density of the decarburized and aged specimens was considerably less after 26,500 h than after 10,000 h, was the density in the aged specimen being considerably greater than that in the decarburized specimen. For the aged specimen, the density decrease was a result of Ostwald ripening, and the total amount of carbide was not noticeably affected. Decarburization, however, resulted in a gradient in carbide density, with the smallest density near the surface. Carbides were electrolytically extracted and identified by X-ray diffraction. From the before-test material, which was in the annealed condition and had a ferrite-pearlite microstructure, 1.4 wt pct carbide was obtained. This sample contained M_3C , $M_{23}C_6$, and M_6C , with $M_{23}C_6$ constituting the major portion. In the aged specimen, 2.3 wt pct of precipitate was extracted and contained 60 pct M_6C , the balance $M_{23}C_6$. The decarburized specimen contained two regions with different carbide contents. The first 20 pct of the 1.6 mm thick (0.063 in.) specimen yielded 1.3 wt pct precipitate, which contained 94 pct M_6C , the balance $M_{23}C_6$. The interior of the specimen contained 1.6 wt pct precipitate, 86 pct M_6C .

- 5328 APPARATUS OF HOLDING MOLTEN FUEL IN A REACTOR. Nagashima, K. (Nippon Atomic Industry Group Co. Ltd., Tokyo). (to Tokyo Shibaura Electric Co. Ltd., Kawasaki, Kanagawa (Japan)). Japanese Patent 1977-53197/A/. 25 Oct 1975. 3p. (In Japanese).

A method to dispose below a reactor container, a sealed container receiving therein cooling medium and a molten fuel holding mechanism and provided with a cooling mechanism whose top plate is in a shape capable of receiving molten fuel thereby preventing an occurrence of re-criticality of molten fuel caused by accidents and to perform positive cooling is described. The molten fuel fallen through the reactor container due to accidents is diffused and stored on the top plate formed with an annular concave portion of a V-shaped section prevent an occurrence of re-criticality and thereafter falls into the molten fuel holding mechanism while being cooled by sodium resulting from destruction of top plate, causing a neutron absorbing material to absorb the neutron.

- 5329 DUAL CONSTRUCTION DEVICE HAVING A MECHANISM FOR DETECTING LEAKAGE OF SODIUM. Kimura, M. (to Hitachi Ltd., Tokyo (Japan)). Japanese Patent 1977-52092/A/. 24 Oct 1975. 3p. (In Japanese).

A method to provide a device, of which outer wall is composed of a transparent material, interiorly provided with a sodium emitting heater and exteriorly provided with a phototube, so as to early discover a leakage of liquid sodium is described. When the liquid sodium in the inner wall is leaked into the outer wall through a crack, a fluorescence is

generated by heat from a heater, and the generated fluorescence is detected by means of a phototube to actuate an alarm.

- 5330 DEVICE FOR STARTING A STEAM GENERATOR BY HEATING SODIUM IN A REACTOR. Nakano, H. (to Tokyo Shibaura Electric Co. Ltd., Kawasaki, Kanagawa (Japan)). Japanese Patent 1977-48797/A/. 16 Oct 1975. 5p. (In Japanese).

A method to enhance cooperation between ventilation and steam conditions of turbine and ventilation condition relative to a superheater at the time of starting a plant using a fast breeder, and to enhance safety with respect to failure of heat transmission tubes at the time of start is described. In a device in which steam generated in an evaporator is fed to a high pressure turbine through a superheater and an outlet steam of high pressure turbine is reheated by means of a re-heater and fed into a turbine on the side of low pressure to drive the turbine for power generation, opening and closing valves are mounted on outlet and inlet pipes, respectively, of the heat transmission pipe in the super heater, said outlet and inlet pipes being connected by a bypass pipe. Upstream side of the opening and closing valve on the inlet pipe and the downstream side of the opening and closing valve on the outlet pipe and connected by a bypass pipe in the re-heater and said bypass pipe in the re-heater is provided with a steam heat exchanger to be heated by steam in the outlet of the superheater, and a steam line in an auxiliary boiler is connected to the side of re-heater from the opening and closing valve on the heat transmission pipe in the re-heater.

- 5331 FLUIDIZED BED STEAM GENERATOR. Archer, D.H.; Kearns, D.L. (to Westinghouse Electric Corp., Pittsburgh, PA (USA)). French Patent 2,356,109/A/. 15 Oct 1975. Priority date 4 Nov 1974, United States of America (USA), 7p. (In French).

This invention concerns a fluidized bed steam generator used with the liquid metals of breeder reactors. Its purpose is to develop a simple heat exchanger for the safe exchange of heat between the slightly radioactive liquid metal and the water and/or steam without permitting any reaction between the liquid metal and the water and/or steam. This heat exchanger includes a vessel, a first bundle of tubes placed in the vessel and receiving the primary fluid and a second tube bundle placed in the vessel at a certain distance from the first bundle of tubes and designed to receive the secondary fluid. The products, in particle form, are placed in the vessel, in the interval existing between the first and second tubes, and a gaseous means fluidizes the particles to form a fluidized bed in the vessel and ensures good heat transfer between the first and second set of tubes by means of the fluidized bed.

- 5332 VENT MECHANISM. Iwai, S.; Ikarimoto, I. (to Mitsubishi Atomic Power Industries, Inc., Tokyo (Japan)). Japanese Patent 1977-47,196/A/. 13 Oct 1975. 5p. (In Japanese).

The object of the invention is to connect a plurality of cladding tubes with gas generating substances received therein to one gas reservoir thereby preventing an excessive rise in internal pressure of the cladding tubes and preventing gases generated by irradiation from being released into coolant. Gases generated from the gas generating substances within the cladding tubes are gathered in a gas plenum and flown into a gas reservoir through a gas communicating pipe, after which the gases pass

through a gas vent line and are released into a fuel exchanger and gas burner.

- 5333 CONTAINER FOR A LIQUID METAL COOLED REACTOR. Naito, K.; Fukushima, Y. (to Hitachi Ltd., Tokyo (Japan)). Japanese Patent 1977-43097/A/. 3 Oct 1975. 4p. (In Japanese).

A method is described to prevent combustion of leaked liquid metal by sealing the upper portion of a liquid metal pool which is disposed within a liquid metal duct chamber or the like, the liquid metal drain tube being inserted in the chamber, and the inside of the pool being filled with inert gas while disposing a liquid metal cover member. Structure: Sodium leaking into a primary cooling system duct chamber flows, as it fuses the plug, through a drain duct into a sodium pool section which is sealed with a lid. At this time, sodium causes inert gas filled there to flow out through a gas purge duct, thus causing a sodium cover member to float up and cover the top surface of the incoming sodium.

- 5334 COMPOSITION OF ETA CARBIDE PHASE IN 1 1/4 CR--1MO. Leitnaker, J.M.; Klueh, R.L.; Laing, W.R. (Oak Ridge Natl Lab, Tenn). Metall. Trans., A; 6A: No. 10, 1949-1955 (Oct 1975).

The steel investigated is of the type now projected for use in the steam generator of the demonstration Liquid-Metal Fast Breeder Reactor. The metal-to-carbon ratio in the eta phase in specimens of 2.25Cr-1Mo steel exposed to sodium at 566 C for 26,500 hr was found to approach four, rather than six, a fact which may be influenced by the presence of Si, O, and perhaps Cr. Silicon is present in the eta phase, probably on a metal sublattice, while oxygen is probably present on the metalloid sublattice. The observation is supported by both structural and compositional data from the literature.

- 5335 REACTOR. Miyazawa, T. (to Tokyo Shibaura Electric Co. Ltd., Kawasaki, Kanagawa (Japan)). Japanese Patent 1977-41795/A/. 29 Sep 1975. 6p. (In Japanese).

A method to permit failure detection for the reactor fuel through detection of the nuclear fission product in the gaseous phase or solid phase introduced into liquid metal coolant passing through the reactor body is described. Part of the liquid metal coolant passing through the reactor body is led through the sampling system to the outside of the reactor body and is returned through a tank to the reactor body. A neutron detector having a γ -ray shield function is disposed in the neighborhood of the afore-mentioned tank, whereby delayed neutrons emitted by the nuclear fission product contained in the coolant within the tank are decelerated into thermal neutrons for detection. In addition, gas present in the upper part of the tank is led to a nuclear fission product gas detector provided in the tank for detecting the nuclear fission product gas contained in the gas led to the detector. The operation of the reactor body is controlled in accordance with the output signals from the afore-mentioned detectors.

- 5336 CONTROL ROD ASSEMBLY. Matsushima, H.; Kato, Y.; Tsutsumi, K. (to Hitachi Ltd., Tokyo (Japan)). Japanese Patent 1977-41793/A/. 27 Sep 1975. 4p. (In Japanese).

A method to quickly shut down the reactor by permitting quick insertion of the control rod into the reactor core in a short period of time

is described. The wall of a guide tube into which a control rod is inserted is provided with through holes. Thus, when the control rod is inserted into the guide tube by momentarily inserting compressed rare gas at the time of emergency shut-down of a fast reactor, sodium below the control rod in the guide tube flows out through the aforementioned through holes. Consequently, the control rod can be quickly inserted.

5337 LIQUID METAL COOLED FAST BREEDER.

Nakai, Y.; Yamagishi, Y.; Koga, T. (to Power Reactor and Nuclear Fuel Development Corp., Tokyo (Japan)). Japanese Patent 1977-40296/A/. 26 Sep 1975. 3p. (In Japanese).

A method to increase the operation efficiency of the reactor by making optimum the flow distribution of coolant within a reactor container is described. In a fast breeder having a high pressure plenum communicating with the core fuel, a low pressure plenum communicating with the blanket fuel and a lower plenum communicating with the high pressure plenum, the low pressure plenum and lower plenum are connected together via a duct, and a flow control device is provided on the duct for controlling the flow of liquid metal flowing through the core fuel and blanket fuel. The flow control device comprises an electromagnetic pump, a flow control valve, and electromagnetic flow gauge and a pressure gauge. When the flow rate required for the low pressure plenum is lower than a preset flow rate, the electromagnetic pump is operated to return the undesired quantity of coolant from the low pressure plenum to the lower plenum, thus reducing the flow in the low pressure plenum.

5338 LIQUID METAL COOLED NUCLEAR REACTOR.

Guidez, J.; Jarriand, P. (to CEA, 75 - Paris (France); Alstom, 75 - Paris (France)). French Patent 2,326,011/A/. 26 Sep 1975. 9p. (In French).

The invention concerns a fast neutron nuclear reactor cooled by a liquid metal driven through by a primary pump of the vertical drive shaft type fitted at its lower end with a blade wheel. To each pump is associated an exchanger, annular in shape, fitted with a central bore through which passes the vertical drive shaft of the pump, its wheel being mounted under the exchanger. A collector placed under the wheel comprises an open upward suction bell for the liquid metal. A hydrostatic bearing is located above the wheel to guide the drive shaft and a non detachable diffuser into which at least one delivery pipe gives, envelopes the wheel.

5339 CONTROL ROD FOR FAST BREEDER.

Tsutsumi, K.; Takeda, S.; Yamamoto, M. (to Hitachi Ltd., Tokyo (Japan)). Japanese Patent 1977-39,096/A/. 22 Sep 1975. 2p. (In Japanese).

The object of the invention is to flatten the power distribution in a fast breeder using hexagonal fuel assemblies by inserting a control rod having Y-shaped sectional profile into the space between adjacent fuel assemblies. A control rod assembly is formed into a Y-shape in cross section so that it can be inserted into a space defined by three adjacent wrapper tubes of the fuel assemblies. For the control rod assembly may be used one, in which a pin containing B₄C accommodated in a stainless steel can is housed in a Y-shaped stainless steel sheath. Since this arrangement of absorbent body is more uniform than the conventional arrangement, the distortion of the power distribution in the direction of the

plane of reactor core caused by the insertion and removal of the control rod can be reduced.

5340 LEAK DETECTOR OF LIQUID SODIUM.

Himeno, Y. (to Power Reactor and Nuclear Fuel Development Corp., Tokyo (Japan)). Japanese Patent 1977-36,290/A/. 18 Sep 1975. 3p. (In Japanese).

Object: To arrange a cable core connected to a leakage current detector on the outer wall of piping for liquid sodium, devices or the like and apply a voltage to said core and outer wall to quickly and securely detect the leakage of liquid sodium. Structure: A cable, which is composed of metal coating formed of metal material (copper, steel, stainless, etc.) which is apt to be corroded by reaction products of liquid sodium with water and oxygen in air, and metal oxide (such as magnesium oxide, beryllium oxide, aluminum oxide) as an electric insulator is arranged on the outer wall of pipes or devices. In the event sodium is leaked from the pipes or devices, said metal coating and the insulator are corroded, and the leakage of sodium is sensed by a leakage current detector through the core in the cable.

5341 REACTOR.

Orii, S.; Fujiki, K. (to Tokyo Shibaura Electric Co. Ltd., Kawasaki, Kanagawa (Japan)). Japanese Patent 1977-36,287/A/. 16 Sep 1975. 5p. (In Japanese).

The object of the invention is to securely prevent interference of a fuel handling device with a reactor container even in trouble of an interlock device to enhance maneuverability and safety of the fuel handling device in a sodium cooled fast breeder. A simulator for simulating operation of an arm in the fuel handling device and rotational operation of a rotating shielding plug is provided outside the reactor container in cooperation with the fuel handling device and the rotating shielding plug. The simulator is electrically connected to the fuel handling device and the rotating shielding plug so as to control operation of the fuel handling device and the rotating shielding plug. Whereby, the simulator prevents interference of the arm of the fuel handling device with the reactor container.

5342 SODIUM-WATER REACTION PRODUCT CONTAINER FOR LIQUID METAL COOLED FAST BREEDERS.

Yoshida, K.; Tanaka, M.; Sakata, T. (to Babcock Hitachi K.K., Tokyo (Japan)). Japanese Patent 1977-32,496/A/. 8 Sep 1975. 4p. (In Japanese).

A method is described to provide a sodium-water reaction product container, which can reduce the increase in pressure due to the reaction without causing combustion of a great quantity of hydrogen at one time at the time of a sodium-water reaction accident. Hydrogen produced by the reaction between sodium and water and sodium vapor accompanying hydrogen are separated into sodium and hydrogen by a sodium separator within a reaction product container. Sodium is recovered from a pool exhaust valve at the bottom. The separated high temperature hydrogen gas is cooled by a heat exchanger and is thus reduced in volume, and it is then rendered into hydrides through reaction with metal particles such as Mg, Ti, Zr and so forth.

5343 CONTROL EQUIPMENT FOR EMERGENCY COOLING SYSTEM.

Watanabe, T.; Kuwayama, M. (to Hitachi Ltd., Tokyo (Japan)). Japanese Patent 1977-29598/A/. 29 Aug 1975. 7p. (In Japanese).

A method to improve the standby state of an emergency reactor core cooling system for a fast breeder reactor and increase the heat removal effect at the time of the start is described. An electromagnetic pump for an emergency reactor core cooling system is excited in reverse phase in the standby state so as to restrict the rate of natural circulation and thus hold the liquid metal at a low temperature. At the time of start, the electromagnetic pump is excited in the right phase from an emergency power source.

- 5344 LIQUID-METAL COOLED FAST BREEDER. Tanaka, N.; Yamagishi, Y.; Koga, T. (to Power Reactor and Nuclear Fuel Development Corp., Tokyo (Japan)). Japanese Patent 1977-25,996/A/ 25 Aug 1975. 3p. (In Japanese).

The object of the invention is to combine two kinds of entrance nozzles of neutron shielding assemblies to be capable of varying a distribution of flow rates of a high pressure plenum flow and a lower pressure plenum flow thereby accurately and efficiently cooling core forming elements of a liquid-metal cooled fast breeder. A connecting pipe for receiving therein an entrance nozzle for a neutron shielding assembly extends through a high pressure plenum and a lower pressure plenum down to a second low pressure plenum formed therebelow. The entrance nozzle has two kinds, one passing a coolant within the high pressure plenum only into the neutron shielding assembly, the other passing the coolant also into the second plenum. Thus, these two entrance nozzles may be combined to thereby vary the flow rate of high pressure plenum flow flowing into the core fuel assembly and that of low pressure plenum flow flowing into the blanket fuel assembly.

- 5345 LIQUID METAL COOLED FAST BREEDER REACTOR. Nakai, Y.; Yamagishi, Y.; Koga, T. (to Power Reactor and Nuclear Fuel Development Corp., Tokyo (Japan)). Japanese Patent 1977-25997/A/. 25 Aug 1975. 3p. (In Japanese).

A method to permit readily making optimum the distribution ratio between the low and high pressure plenum flows of the coolant by the provision of a low pressure lead-in chamber having a jet pump below the low pressure plenum is described. In a liquid metal cooled fast breeder, a high pressure plenum communicating with the core fuel and a low pressure plenum communicating with blanket core fuel are communicated with a lower plenum having a liquid metal inlet. A low pressure lead-in chamber having a lower opening and provided with a jet pump is formed below the low pressure plenum and is provided with a flow control device. Further, a duct open to the lower plenum is connected to the nozzle of the jet pump.

- 5346 IMPROVEMENT TO THE SECONDARY CIRCUITS OF A NUCLEAR REACTOR. Robin, M. (to CEA, 75 - Paris (France)). French Patent 2,321,750/A/. 22 Aug 1975. 7p. (In French).

The invention concerns an improvement to the design of the secondary systems of a nuclear reactor with a view to making them more compact in order to make a significant saving on the lengths of piping required and on the buildings protecting them, thereby reducing the corresponding capital expenditure. As the steam generator is designed with a central return duct for the cold sodium, the sodium is driven through the system by a pump whose suction is directly coupled to the central duct of the generator. The steam generator and circulating pump unit is mounted in a sealed bay integrated

in the reactor building, the connection with the intermediate exchanger in the secondary system being made by pipes passing through a leak-proof opening in the wall of the building.

- 5347 SYSTEM FOR EXTRACTING AND INSERTING AN IRRADIATION CAPSULE INTO A FUEL ASSEMBLY. Allain, A.; Delamotte, M. (Societe Technique pour l'Energie Atomique (Technicatome), Centre d'Etudes Nucleaires de Saclay, 91 - Gif-sur-Yvette (France)). (to CEA, 75 - Paris (France)). French Patent 2,320,616/A/. 5 Aug 1975. 18p. (In French).

The invention concerns a system enabling all the requisite operations to be carried out to extract or insert an irradiation capsule fitted with a holding head into a fuel assembly able to take such a capsule and in which the capsule can be locked. For such an assembly, the fuel elements are maintained between two coaxial tubes, the inner tube marking a housing for such a capsule and having a groove into which articulated claws on the capsule can engage. This invention applies satisfactorily in the fuel assembly handling system of a fast neutron nuclear reactor.

- 5348 SYSTEM OF EXTRACTION AND INTRODUCTION OF AN IRRADIATION CAPSULE INTO A FUEL ASSEMBLY. Allain, G.; Delamotte, M. (Societe Technique pour l'Energie Atomique (Technicatome), Centre d'Etudes Nucleaires de Saclay, 91 - Gif-sur-Yvette (France)). (to CEA, 75 - Paris (France)). French Patent 2,320,616/A/. 5 Aug 1975. 18p. (In French).

This invention applies in the fuel assembly handling system of a fast neutron reactor. This device enables an irradiation capsule to be extracted from or introduced into a fuel assembly when the latter is maintained vertical in a drum located inside the receptacle for storing new or irradiated assemblies which, located on the periphery of the reactor vessel, is filled with a liquid metal capped with an inert gas. The device can be moved straight up from an assembly. Inside a tubular body that can abut on the assembly in question, it includes a central tube ending with a part capable of coming into contact with the gripping head of the capsule and fitted with a grab; a grab control tube that can unlock the capsule in the assembly and a mechanical system capable of generating successive vertical displacements of the tubular body and the central tube in opposite directions, once the device has been immobilised.

- 5349 SAFETY MARGINS FOR SODIUM-BONDED CARBIDE FUEL. Siegmann, E.R.; Gilbertson, J.C. (Combust Eng Inc, Windsor, Conn). Nucl. Technol.; 26: No. 4, 452-459 (Aug 1975).

The consequences of the loss of bond in a sodium-bonded pin were considered. New calculations indicated that loss of bond could lead to fuel redistribution within the clad but not to clad failure. Fuel-coolant interactions with carbide fuel were considered. Interface temperatures between molten fuel and sodium were determined and applied to the Fauske criterion for spontaneous nucleation. Results indicate that rapid sodium vaporization is not likely with carbide fuel. Upper limit work-energy yields were calculated for sodium contact with molten oxide and carbide fuels using SOCOOL-II code. Temperatures, properties, and geometry were varied to determine the relative dependency of the results.

- 5350 OPTIMUM PIN DIAMETER FOR LMFBR CARBIDE FUELS. Noyes, R.C.; Doherty, P.K.;

Caspersson, S.A.; Hanus, N.; Stuteville, D.W. (Combust Eng Inc, Windsor, Conn). Nucl. Technol.; 26: No. 4, 460-471(Aug 1975).

Subsidiary parameters, including coolant velocity, burnup, and properties of the clad and subassembly duct material, were studied. The materials used were Type 316 stainless steel and a high strength, low swelling material capable of operation to a damage fluence of 3.6×10^{23} n/cm². Using doubling time and fuel cycle cost as the bases for judgment, an optimum pin outer diameter (o.d.) range of 0.37 to 0.40 in. was found for both the near-term and advanced structural materials. Because of practical limits of the Fast Test Reactor testing, an o.d. of 0.37 in. is recommended. The optimum pin diameter was found to be independent of fuel burnup. From a doubling time point of view, no incentive was found for development of carbide fuel with a burnup greater than 80 to 90 MWd/kg.

5351 DESIGN OF PROTOTYPE CARBIDE SUBASSEMBLIES AND AN EVALUATION OF PROOF-TESTING PLANS IN THE FFTF. Vittl, J.A.; Doherty, P.K.; di Lauro, G.F.; Gilbertson, J.C.; Stuteville, D.W. (Combust Eng Inc, Windsor, Conn). Nucl. Technol.; 26: No. 4, 442-451(Aug 1975).

Three subassembly configurations were designed, each capable of being directly substituted into FTR driver positions and made compatible with the FTR geometry, fuel handling, power, temperature, subassembly flow rates, and pin-bundle pressure drop. Two sodium-bonded designs, one with 91 fuel pins with a 0.370-in. o.d. and the other with 127 fuel pins with a 0.315-in. o.d. per subassembly were established. Calculated peak linear power and peak discharge burnup slightly exceed present commercial design objectives of 30 kW/ft and 73 MWd/kg. Individual assembly power history, flux, and enrichments are represented quite well in the FTR for commercial outer-zone fuel assemblies. Inner-zone operating conditions, however, are not simulated as closely. Impact effects of the proof-test assemblies on FTR operation are judged to be manageable.

5352 DESIGN AND MANUFACTURE OF GAS TAGS FOR FFTF FUEL AND CONTROL ASSEMBLIES. Strand, C.A.; Schenter, R.E. (Westinghouse Hanford Co, Richland, Wash). Nucl. Technol.; 26: No. 4, 472-479(Aug 1975).

The Fast Flux Test Facility being built near Richland, Washington for materials and component testing for development of the liquid-metal fast breeder reactor will employ "gas tagging" for locating failed fuel and control elements in the Fast Test Reactor (FTR). The fuel and control pins are "gas tagged" by loading a capsule with specially blended krypton and xenon isotopes. The encapsulation of the tag gas employs a unique application of laser technology: Stainless-steel capsules within a sealed glass-covered fixture containing the tag gas are first pierced and then seal welded with a laser beam. After inspection, the capsules are loaded in pins, and the gas is released by piercing the capsule with an electromagnetically activated internal penetrator. If the pin should develop a leak, the gas is released and the defect assembly is then located by mass spectrometric analysis of the reactor cover gas. Capsule filling yield for 40 000 capsules fabricated for 2 FTR cores was approx. 95%.

5353 EFFECT OF A LOSS OF FLOW ON A SINGLE LMFBR-TYPE FUEL PIN. Kwast, H. (React Cent Ned, Petten, Neth). Nucl. Technol.; 26: No.

4, 430-441(Aug 1975).

Capsule irradiations are being performed on fast reactor fuel pins in a sodium environment under loss-of-cooling conditions to determine the consequences of a fuel-pin failure. Special emphasis is given to the extent of possible fuel-sodium interactions (FSI) and the relocation of the fuel. The fuel pins were neither preirradiated nor prepressurized. So far no evidence has been found for a violent FSI on fuel ejection and sodium re-entry. Nevertheless, most probably a moderate FSI resulted from some fuel particles dropping into liquid sodium. These experiments indicate that considerable clad melting can occur before the fuel stack disintegrates. Considerable fuel relocation can occur, which can ultimately lead to failure of the sodium containment.

5354 EXTINGUISHING SYSTEM BY ISOLATION OF THE LIQUID FUEL. Colome, J.; Duchene, A.; Regnier, J. (to CEA, 75 - Paris (France)). French Patent 2,319,392/A/. 31 Jul 1975. 12p. (In French).

This invention concerns a system for extinguishing a sodium fire (or any other fuel in liquid sheet form) which complies with the safety requirements of a nuclear plant. To this effect, the system considered comprises a bottom receptacle for collecting the liquid fuel and an upper cover closing the receptacle. The cover has inclined flow drains for the liquid fuel and openings to allow the liquid through at the lower ends of these drains. These openings are closed by retractable shutters which withdraw under the pressure of the liquid in the drains and shut automatically after the liquid has passed through into the receptacle.

5355 SYSTEM FOR GUIDING A CONTROL ROD. Garchon, B.; Thaon, Y. (to CEA, 75 - Paris (France)). French Patent 2,319,958/A/. 31 Jul 1975. 7p. (In French).

The invention concerns an appliance to guide and maintain in a vertical position a control rod of a nuclear reactor and applies in particular to fast neutron nuclear reactors cooled by a liquid metal. An essential mandatory condition for the proper operation of such a control rod consists in efficient cooling of its absorbing part, through the correct flow of the liquid metal (generally sodium) cooling the core and flowing inside the rod sheath from the bottom upwards. The invention concerns a solution which, whilst ensuring that the rod will slide in its sheath without jamming, will leave the upper part of the sheath free.

5356 SYSTEM EXTINGUISHING A FIRE BY INSULATING A LIQUID FUEL. Colome, J.; Duchene, A.; Regnier, J. (to CEA, 75 - Paris (France)). French Patent 2,319,392/A/. 31 Jul 1975. 12p. (In French).

The invention refers to a system for quickly extinguishing a liquid fuel body on fire by insulating it completely from the ambient air. It applies particularly to the case of a high temperature liquid sodium sheet flowing accidentally from a circuit belonging to a fast neutron reactor. The system in question includes a lower receptacle for collecting the liquid fuel and a top cover shutting off the receptacle. This cover has inclined channels to take the liquid fuel flow and openings to allow this liquid through at the bottom end of the channels. These openings are closed by retractable shutters moving away under the pressure of the liquid in the channels and closing automatically after the liquid has

flowed into the receptacle .

5357 GUIDING SYSTEM FOR A CONTROL ROD.

Garchon, B.; Thaon, Y. (to CEA, 75 - Paris (France)). French Patent 2,319,958/A/. 31 Jul 1975. 7p. (In French).

This invention concerns a system for guiding and maintaining in a vertical position a control rod for a fast neutron nuclear reactor cooled by a liquid metal. These rods are fitted to slide in fixed sleeves, located at given places in the reactor core, and taking the shape of boxes with a regular polygonal straight cross section, open at their upper end and fitted with a positioning foot at their lower end. Efficient cooling of the absorbing part of the rod is assured through a proper flow of the liquid metal (sodium) cooling the core and flowing inside the control rod sleeve from the bottom upwards as from the bottom foot to the open top end. Most of this flow is forced to pass inside the rod itself and not between the rod and the sleeve in which it slides. The system, whilst ensuring that the rod slides in its sleeve without any risk of jamming, leaves the upper part of the sleeve free.

5358 TANK OF SODIUM COOLED FAST REACTOR.

Naito, K.; Ozawa, Y.; Minato, A.; Yokota, N.; Sato, Y. (to Hitachi Ltd., Tokyo (Japan)). Japanese Patent 1977-15980/A/. 30 Jul 1975. 4p. (In Japanese).

A tank is described which can safely and reliably accommodate high temperature sodium containing radioactive substance in case of occurrence of an accident in a sodium system and thus prevent spread of contamination. A sodium drain duct inserted into a tank from above the tank is provided at the position of its lower end with a buffer means for preventing direct flow-down of sodium to a bottom plate. A means for preventing the discharge of radioactive substance to the cover gas is provided above the lower end of the sodium drain tube so as to surround the sodium drain tube.

5359 FUEL ROD FOR FAST BREEDER. Miki, K. (to Hitachi Ltd., Tokyo (Japan)). Japanese Patent 1977-15,997/A/. 30 Jul 1975. 3p. (In Japanese).

The object of the invention is to improve heat-transfer factor of gap by reducing the quantity of loading fuel and alleviating the reduction of the ratio of presence of He gas in the gap due to combustion of fuel through reduction in the length of a blanket section in an axial direction. The fuel rod comprises a fuel pellet of a nuclear fission material consisting of Pu or U or a mixture thereof, a pellet consisting of beryllium oxide and a pellet of a parent material consisting of natural uranium or deteriorated uranium. Neutrons are decelerated by Be to increase the ratio of capture of U^{235} neutrons in the natural uranium or deteriorated uranium so as to increase the quantity of production of Pu^{239} . Further, with the He gas produced as the result of the nuclear reaction between Be and neutrons the ratio of presence of He gas in the gap is increased to permit alleviation of the reduction of the heat-transfer factor of the gap.

5360 INSULATING AND PROTECTING SYSTEMS FOR A CIRCUIT. Lemerrier, G. (to CEA, 75 - Paris (France)). French Patent 2,319,075/A/. 25 Jul 1975. 6p. (In French).

The invention concerns a device for

insulating and protecting systems or pipework carrying liquid sodium in fast neutron nuclear reactor installations or water or superheated steam. This device considerably lowers the risks whilst making it possible to give the insulating improved mechanical strength, without limiting its thermal protection performance and particularly to build into this insulating a protection and safety barrier against projections of the fluid outwards should the system burst accidentally. To this effect, the device considered includes on the outer surface of the system at least two successive windings of a continuous and long strip composed of a flat sock in knitted metal, comprising transversal openings to provide communication between the inside and outside of the sock, such openings allowing the insertion of thin successive metal sheets extending over the length of the strip.

5361 DEVICE OF THERMAL INSULATION AND MECHANICAL PROTECTION OF A CIRCUIT.

Lemerrier, G. (to CEA, 75 - Paris (France)). French Patent 2,319,075/A/. 25 Jul 1975. 6p. (In French).

The invention relates to circuits or conduits through which sodium flows (fast neutron nuclear reactor facilities) or else water or superheated steam. It concerns a lagging system which, without limiting the efficiency of the lagging in terms of thermal protection at high temperature, gives it improved mechanical strength and forms in this lagging a protective and safety barrier against projections of fluid outwards should the system burst accidentally. With this in view, the characteristic of the system under consideration comprises, on the outer surface of the system, at least two successive windings of a continuous long strip, composed of a flat metal mesh sock, fitted with transversal openings for communication between the inside and outside of the sock. These openings allow the introduction of successive thin metal sheets, extending along the length of the strip.

5362 INSULATING STRUCTURE. Lemerrier, G. (to CEA, 75 - Paris (France)). French Patent 2,319,073/A/. 24 Jul 1975. 7p. (In French).

The invention concerns an insulating structure for protecting a wall against a high temperature atmosphere. This structure has the advantage of being adaptable to the shape of the area to be protected, particularly in an annular space. It applies in particular where the wall to be protected is in an aerosol or liquid metal vapour atmosphere (sodium in particular) inside a fast neutron reactor vessel. To this end, the structure considered is built of numerous components joined together, each formed of two long angle bars, inter-slotted with reduced play between their parallel faces, these two angle bars themselves enclosing a soft metallic filling. The soft filling is formed of a stack of metal cloth, netting or knitting or stuffed with wool or chippings.

5363 THERMAL INSULATION SYSTEM FOR A VESSEL. Lemerrier, G. (to CEA, 75 - Paris (France)). French Patent 2,319,074/A/. 24 Jul 1975. 13p. (In French).

This invention concerns a thermal insulation system for the vessel wall of a nuclear reactor cooled by water, steam, gas or liquid metal. It applies in particular to the main vessel of a fast neutron nuclear reactor. This system includes numerous superimposed elastic lagging

elements, fitted in the annular space between the main vessel and the inner vessel. These elements extend circumferentially around the common centre of both vessels.

- 5364 FAST REACTOR. Ilyunin, V.G.; Murogov, V.M.; Shmelev, A.N. Czech Patent 158,840/B/. 15 Jul 1975. 17p. (In Czech).

A fast reactor is designed and schematically shown which has a configuration of fuel elements in the core and a heat removal system which permit increasing the energy load of the core without considerably increasing the core size. Several methods of arranging the primary and the auxiliary fuel elements in the reactor core are described. The energy load of the core may be increased by a factor of 1.3 to 1.5. A table is given comparing the parameters of the proposed reactor with those of known reactors.

- 5365 COOLING SYSTEM FOR THE HIGH WALL OF A NUCLEAR REACTOR VESSEL. Failla, H.; Schaller, K.; Vidard, M. (to CEA, 75 - Paris (France)). French Patent 2,316,705/E/. 2 Jul 1975. 5p. (In French).

Addition to the French patent document 7429648.

The invention concerns a cooling system for the high wall of a nuclear reactor vessel, particularly the main vessel of a liquid metal cooled fast neutron reactor. This system is composed of coils carrying a coolant which are in contact with an intermediate heat conducting substance in contact with the high wall. This intermediate substance can be a solid or gas. Among the appropriate solids mention can be made of thermal concrete and metals such as aluminum, copper or their alloys used in mass form or divided up (balls for instance). The gas that may be used are helium or nitrogen for instance. Should a gas be employed it is contained in a leak proof jacket. When the substance is a solid, all that is required is a bottom bearing surface.

- 5366 FUEL ASSEMBLIES FOR NUCLEAR REACTOR. Marmonier, P.; Mesnage, B.; Nervi, J.C. (to CEA, 75 - Paris (France)). French Patent 2,316,703/A/. 2 Jul 1975. 15p. (In French).

The invention concerns an assembly for a sodium cooled fast neutron reactor. The invention aims to simplify the assembly, whilst also assuring a reliable and uniform flow rate for each type of assembly entering into the construction of the core. The invention further aims to prevent any assembly, once ready to be set in position in the core, from being inserted by mistake in a place different from that assigned to it. An open casing contains the bundle of clad pins filled with a fuel. This casing is connected to a foot composed of a hollow cylindrical body, closed at its lower end by a plug. This cylindrical body is designed to be inserted in a vertical position in a hollow housing belonging to the diagrid. Inside the foot there is an appliance for pre-setting the flow rate of the coolant.

- 5367 IMPROVEMENT TO HIGH TEMPERATURE ALLOYS. Bleiberg, M.L.; Diamond, S.; Rowcliffe, A.F.; Spitznagel, J.A. (to Westinghouse Electric Corp., Pittsburgh, PA (USA)). French Patent 2,330,776/A/. 1 Jul 1975. 14p. (In French).

The description is given of an alloy exhibiting good physical properties at high temperatures up to 1325°F (720°C), low corrosion in molten sodium and low swelling under irradiation. The alloys consists

essentially of 14 to 19% chromium, 25 to 35% nickel, 2 to 3% molybdenum, 0.1 to 1% silicon, up to 0.5% manganese, 0.03 to 0.05% carbon, up to 0.01% sulphur, up to 0.01% phosphorus, up to 0.01% boron, up to 0.01% oxygen, up to 0.02% nitrate, small amounts of accidental impurities, the balance being iron.

- 5368 SODIUM CIRCULATING SYSTEM FOR A REACTOR. Sasazawa, A.; Nakao, N. (to Hitachi Ltd., Tokyo (Japan)). Japanese Patent 1977-4,991/A/. 30 Jun 1975. 4p. (In Japanese).

A method is described to provide an overflow system in a mechanical sodium pump, which eliminates the provision of an overflow column and makes it easy to install a guard vessel and minimizes entry of gas into sodium by passing it through an overflow tank. Structure: Overflowed sodium in a circulating pump is once introduced into an overflowing tank in an overflowing system provided in order to maintain a highest liquid level within a reactor vessel constant, and the thus introduced sodium is pumped into the reactor vessel by a pumping electromagnetic pump thereby providing positive treatment without using the overflow column and without possibility of entry of gas.

- 5369 SYSTEM FOR FIXING INSULATING PANELS. Aubert, M.; Lemerclier, G. (to CEA, 75 - Paris (France)). French Patent 2,315,055/A/. 16 Jun 1975. 8p. (In French).

This invention concerns a system for supporting and hanging insulating panels on a wall. It particularly applies to securing panels forming the protective lining of the horizontal sole and sides of the upper shield of the vessel and jacket of a fast neutron nuclear reactor (or a protective lining for the vertical rings around the component tubes entering into the design of such a reactor). An improvement enables the panels to be hung and fixed with the added advantage of allowing a slight movement of these panels with two degrees of play with respect to the plane of the wall requiring protection.

- 5370 LIKE-PROOF INSULATING PANEL. Lemerclier, G. (to CEA, 75 - Paris (France)). French Patent 2,315,054/A/. 16 Jun 1975. 12p. (In French).

The invention concerns a leak-proof insulating panel, designed for the operating conditions of an LMFBR reactor, enabling the structures of the reactor to be protected against the effects of temperature and those of corrosion by the liquid metal. The panel in question forms a flattened leak-proof containment, suitable for application against the wall needing protection. The containment is delimited by two parallel sealing metal plates welded together peripherally and providing between them a closed space stacked with wire cloth or netting and perforated plates or grids, the empty spaces between the cloth and perforated plates being filled with a neutral gas.

- 5371 DEVICE FOR PROTECTING DEFORMATIONS OF REACTOR CORES. Kato, Y.; Urushihara, H. (to Hitachi Ltd., Tokyo (Japan)). Japanese Patent 1976-148198/A/. 13 Jun 1975. 5p. (In Japanese).

The object of the invention is to provide a fluid pressure cylinder which is operated according to change in temperature of coolant for a reactor to restrain or release a core, to simply and effectively protect deformation of the core. A closed fluid pressure cylinder

interiorly filled with suitable fluid is disposed in peripherally equally spaced relation in an annular space between a core barrel of a reactor and a reactor vessel. A piston is mounted in fluid-tight fashion in a plurality of piston openings made in the cylinder, the piston being slidably moved according to expansion and contraction of the fluid filled in the cylinder. The piston has a movable frame mounted at the foremost end thereof, the movable frame being moved integral with the piston, and the surface opposite the mount thereof biasing the outermost peripheral surface of the core.

- 5372 PRIMARY COOLING DEVICE FOR A SODIUM COOLED FAST BREEDER. Kawashima, H. (to Hitachi Ltd., Tokyo (Japan)). Japanese Patent 1976-148199/A/. 13 Jun 1975. 4p. (In Japanese).

The object of the invention is to positively position a return pipe nozzle for leaked sodium in pump to a given depth below sodium level thereby eliminating possible entry of gas and the provision of a pump overflow column. In a primary cooling device for a sodium cooled fast breeder comprising a reactor vessel, an intermediate heat exchanger, a cold leg mechanical circulating pump, a pipe for leaked sodium in pump, and a guard vessel, a return pipe is provided to directly return leaked sodium in the circulating pump to a medium pressure and low temperature portion of the reactor vessel. Since the returning destination of the return pipe for leaked sodium in the pump is within the reactor vessel, the liquid level of the circulating pump is positively maintained above the liquid level of the reactor vessel so that the return pipe nozzle for leaked sodium in pump is positively positioned to a given depth below sodium level.

- 5373 THREE-COMPONENT HEAT EXCHANGER. Vinzens, K.; Berner, F. (to Internationale Atomreaktorbau G.m.b.H. (INTERATOM), Bergisch Gladbach (Germany, F.R.)). German (FRG) Patent 2,360,257/A/. 5 Jun 1975. 15p. (In German).

A three-component heat exchanger is proposed in which two media are carried in separate tube systems designed as approximately vertical, concentric, cylindrical (or plane) tube walls arranged in a vessel filled with a stagnant fluid compatible with the two media in such a way that a small clearance is left between the two tube walls. Such heat exchangers can be employed in nuclear power plants equipped with circuits carrying sodium and water (vapor). If the two media have very different enthalpies, the cross section or the arrangement of the different tubes relative to each other is balanced out. A lead-bismuth eutectic is proposed as the contact medium.

- 5374 NUCLEAR REACTOR FUEL ASSEMBLY. Marmonier, P.; Mesnage, B.; Nervi, J.C. (to CEA, 75 - Paris (France)). French Patent 2,313,742/A/. 5 Jun 1975. 7p. (In French).

This invention refers to fuel assemblies for a liquid metal cooled fast neutron reactor. Each assembly is composed of a hollow vertical casing, of regular polygonal section, containing a bundle of clad pins filled with a fissile or fertile substance. The casing is open at its upper end and has a cylindrical foot at its lower end for positioning the assembly in a housing provided in the horizontal diagrid, on which the core assembly rests. A set of flat bars located on the external surface of the casing enables it to be

correctly orientated in its housing among the other core assemblies.

- 5375 METHOD OF PREVENTING SODIUM FROM FLOWING WHEN PIPES OF A FAST BREEDER REACTOR ARE INJURED. Nakai, Y.; Yamagishi, Y.; Koga, T. (to Power Reactor and Nuclear Fuel Development Corp., Tokyo (Japan)). Japanese Patent 1976-141,992/A/. 2 Jun 1975. 3p. (In Japanese).

When the core cooling pipe on the inlet side is injured and as a consequence the pressure gage detects an abnormal condition of fluid pressure in the inlet nozzle, the valve is opened to allow high pressure sodium to inject into the inlet nozzle through a high pressure sodium supply pipe, thereby blocking a back-flow of sodium in the high pressure chamber into the core cooling pipe.

- 5376 BUBBLE SEPARATOR FOR FAST BREEDER REACTORS. Nakai, Y.; Yamagishi, Y.; Koga, T. (to Power Reactor and Nuclear Fuel Development Corp., Tokyo (Japan)). Japanese Patent 1976-141,993/A/. 2 Jun 1975. 3p. (In Japanese).

This separator comprises an up-pipe which extends through a core support plate positioned at the upper part of a high pressure chamber in a reactor vessel, a flowmeter and a flow regulating valve mounted on the upper end of the up-pipe, and a down-pipe mounted at the outlet side of the flow regulating valve to return fluids into the vessel, whereby when the flowmeter detects a flow passage of bubbles, the flow regulating valve is fully opened to remove gases from the high pressure chamber.

- 5377 CONTROL ROD ASSEMBLY FOR NUCLEAR REACTOR. Garchon, B.; Marmonier, P.; Thaon, Y. (to CEA, 75 - Paris (France)). French Patent 2,313,743/E/. 2 Jun 1975. 6p. (In French).

Addition to the French Patent document 7046296.

In the main patent a description was given of a control rod assembly for a fast neutron, liquid metal cooled, power reactor. This assembly includes a fixed sheath and a control rod with an absorbant part, a head enabling the rod to be held and moved vertically from a low position where the absorbant part is in the core and a high position where it is out of the core, and a foot on a level with the core when the rod is in the high position. Above and below the core, the sheath has inlets and outlets for the coolant. A guide bearing is located between the rod and the sheath (above core level), at the upper part of the sheath and provides just the right amount of play for the flow rate of the coolant circulating between the sheath and the rod to be an insignificant fraction of the amount flowing in and out of the sheath. This invention refers to an improvement which, whilst retaining the advantages proper to the operation of the guide bearing in question, allows a slight lack of alignment between the axis of the sheath and that of the control rod mechanism which is carried by a revolving plug placed inside the slab forming the upper closure of the reactor.

- 5378 METHOD FOR DRAINING LIQUID METAL. Yokota, N.; Naito, K.; Ozawa, Y.; Minato, A.; Fukushima, Y. (to Hitachi Ltd., Tokyo (Japan)). Japanese Patent 1976-137088/A/. 23 May 1975. 7p. (In Japanese).

The object of the invention is to connect a pit chamber, a primary cooling system piping and a machine room to a damp tank through a

drain passage thereby recovering leaked liquid metal to prevent the surrounding atmosphere from being contaminated. The pit chamber, primary cooling system piping and primary cooling system machine room are connected to a damp tank through a drain passage. A plug made of metal (such as lead, tin, etc.) having a low melting point is mounted at a connection between the aforementioned chambers and the drain passage. When high temperature liquid metal (Na, K, Li, etc.) are stayed on the plug, the plug is fused by heat to open the passage. Also, a gas take-out passage for allowing vapor from the damp tank to be escaped is disposed around the drain passage so that fluid flowing through the drain passage and fluid flowing through the gas take-out passage may be heat-exchanged. The materials suspended in the gases may be removed by a vapor trap or the like.

- 5379 APPARATUS FOR CONTROLLING A CORE COOLING SYSTEM IN CASE OF EMERGENCY. Watanabe, T. (to Hitachi Ltd., Tokyo (Japan)). Japanese Patent 1976-136096/A/. 19 May 1975. 4p. (In Japanese).

An apparatus is disclosed whose purpose is to securely perform low level control of main cooling system, particularly, vapor generator at the time of minor trouble such as power failure in a fast breeder plant and to securely and safely perform core cooling in combination with auxiliary cooling system. When power failure occurs, a sequence control gives instructions to start the auxiliary system secondary pump and blower and sodium temperature at outlet of air cooler is controlled constant by a damper control. Primary and secondary pumps in the main cooling system are tripped by respective controls and shifting into pony motor drive. By a pressure control, a superheater separating valve is closed and a flush valve is opened so that a vapor generator is formed into individual operation of evaporator and is switched to a low level control system. The water pump is shifted to motor drive and a water supply controller keeps a temperature on low temperature side of the main cooling system constant.

- 5380 METHOD OF REMOVING OXYGEN FROM MOLTEN METALS IN NUCLEAR TECHNOLOGY. Jakes, D. Czech Patent 158,060/B/. 15 May 1975. 2p. (In Czech).

The method is claimed of the electrolytic removal of oxygen from molten metals in nuclear technology, in which ionized oxygen atoms are converted by a system blocking the electron beam. This blocking system consists of one or more alkaline earth metal oxides and of a solid electrolyte. The formed gas molecules are removed by a stream of inert or reduction gas characteristic by the fact that the ionized oxygen atoms are converted by a system blocking the electron beam at a potential stability of maximally 10 mV/min, or to advantage at a stability of maximally 5 mV/min. At this stability value considerably less damage occurs to the electrolytic tube as a result of corrosion and solid electrolyte life is considerably longer.

- 5381 ROTARY SHIELD PLUG. Ugawa, Y. (to Tokyo Shibaura Electric Co. Ltd., Kawasaki, Kanagawa (Japan)). Japanese Patent 1976-130,790/A/. 12 May 1975. 3p. (In Japanese).

When the cover gas pressure abnormally increases with the seal alloy in the fused state, the level of the seal alloy within an annular space on the outer side of the liquid

seal is raised. With the rise of the level of the seal alloy a float ring is also raised under the guide of a ring holder rod. When the float ring is raised up to an upper check plate, a borderline gap formed in the upper check plate is blocked thereby to check a further rise in the liquid and prevent gas leakage.

- 5382 FUEL ASSEMBLY. Tsutsumi, K.; Kato, Y.; Aoi, H. (to Hitachi Ltd., Tokyo (Japan)). Japanese Patent 1976-130,786/A/. 9 May 1975. 5p. (In Japanese).

An elongated fuel pin is provided within a cylindrical member, and a seal member consisting of beryllium or an alloy thereof which is provided as a neutron decelerating material layer below the pin. Further, the seal member is covered with a stainless steel cover for reinforcing the fragility of beryllium.

- 5383 VALVES FOR FAST SODIUM REACTORS. Vinci, M. Quad. Pignone; No. 20, 37-42(May 1975).

The problems of valving the liquid sodium used for cooling fast nuclear reactors are discussed. The standard specifications are given. Methods of manufacturing valves to meet these specifications are described, and examples of specific developmental designs and methods of test are presented. What is described represents the present state of technology used by Nuovo Pignone, Florence, Italy. Research must now proceed on valves suitable for industrial-scale power plants, such as 40-inch valves as compared to the 1- to 8-inch valves so far manufactured.

- 5384 VAPOR GENERATOR SYSTEM EQUIPMENT FOR FAST BREEDER REACTOR. Kawakami, H.; Mori, K. (to Tokyo Shibaura Electric Co. Ltd., Kawasaki, Kanagawa (Japan)). Japanese Patent 1976-127,993/A/. 30 Apr 1975. 4p. (In Japanese).

At the occurrence of a sodium-water reaction accident, cover gas pressure in an evaporator is adapted to suddenly increase due to gas generation to cause rupture of a rupture disc, whereby the gas generated is discharged through a gas discharge duct, a container and a cyclone separator to the atmosphere. At the instant that the reaction ends, a drain valve and a pressure release valve are opened, whereby Na in the evaporator falls by its own weight down to a damp tank to cause the cover gas within the damp tank to be supplied through a cover gas duct, a container, and a gas discharge duct to the evaporator.

- 5385 THERMAL PROTECTION DEVICE FOR A NUCLEAR REACTOR SLAB. Boy-Marcotte, J.-L. (Societe Bertin et Compagnie, 78 - Plaisir (France)); Chevalier, G.; Gerij, J.; Leheu, J. (Societe Technique pour l'Energie Atomique (Technicatome), Centre d'Etudes Nucleaires de Saclay, 91 - Gif-sur-Yvette (France)). (to CEA, 75 - Paris (France)). French Patent 2,309,957/A/. 30 Apr 1975. 9p. (In French).

Description is given of a system for the thermal protection of the closure slab of a reactor vessel with respect to a gaseous medium topping the primary fluid of the vessel, passages being made in the slab and its walls in contact with the gaseous medium being covered by a metal plate, called a shield rim. The system comprises a relatively thin annular metal plate that is placed horizontally under the slab and is provided with holes facing the passages and marks with the shield rim plate

enclosed spaces confining an inert gas. The inside edge of the plate and the free edges delimited in the latter by the holes are connected to the edging sheet metal of the slab through a leaktight collar and the outer edge of the plate is connected by large radius connections to the sheet metal rim of the shield.

- 5386 METHOD OF CONTROLLED MAINTENANCE OF REACTOR. Orit, S.c.; Yoshizawa, K. (to Tokyo Shibaura Electric Co. Ltd., Kawasaki, Kanagawa (Japan)). Japanese Patent 1976-124792/A/. 22 Apr 1975. 3p. (In Japanese).

A method is disclosed to improve the operability of maintenance of a reactor at the time of function of a seal section for sealing radioactive material by employing a filler pouring method. Structure: When a rupture takes place in a seal bellows provided in a high-speed breeder reactor control rod drive mechanism upper guide duct, a sealing compound is poured from a back-up seal gas inlet hole formed in a control rod drive mechanism housing mounted on a lift rod mechanism and agglomerated to seal the upper portion of the guide duct so as to maintain gas-tightness on the inside, thereby preventing loss of reactor cover gas due to leakage.

- 5387 FACILITY OF AEROSOL FILTRATION. Duverger de Cuy, G.; Regnier, J. (to CEA, 75 - Paris (France)). French Patent 2,307,566/A/. 18 Apr 1975. 6p. (In French).

Said invention relates to a facility of aerosol filtration, particularly of sodium aerosols. Said facility is of special interest for fast reactors where sodium fires involve the possibility of high concentrations of sodium aerosols which soon clog up conventional filters. The facility intended for continuous operation, includes at the pre-filtering stage, means for increasing the size of the aerosol particles and separating clustered particles (cyclone separator).

- 5388 DEVICE OF IRRADIATION AND MEASUREMENT OF FUEL ELEMENTS FOR NUCLEAR REACTORS. Descamps, J.M. (to CEA, 75 - Paris (France)). French Patent 2,308,170/A/. 18 Apr 1975. 9p. (In French).

The description is given of a device for irradiating a cylindrical fuel element (and more particularly the fuel element of a sodium cooled fast reactor) which enables the behavior of such an element to be tested in a pool reactor. This system includes a closed containment extended at its upper part by a tube, the containment and tube being filled with a fluid identical to the coolant of the reactor. The containment able to take the element and the tube are greater in diameter than the element. The gear for moving the element from the containment to the upper end of the tube and the facilities for measuring the diameter of the element when it is engaged in the tube are located between the containment and the upper end of the tube. Means are also provided to maintain the fluid at a temperature significantly equal to that it would have in the reactor.

- 5389 NUCLEAR REACTOR ASSEMBLY. Garchon, B.; Lions, N.; Marmonier, P.; Mesnage, B.; Nervi, J.C. (to CEA, 75 - Paris (France)). French Patent 2,306,507/A/. 3 Apr 1975. 8p. (In French).

Improvements brought to the assemblies of sodium cooled fast reactors of the integrated type are presented. According to the patent,

all the assemblies have a standard head, whatever type of pins they contain, in order to make their handling easy. This head is fitted on the upper part and in axial prolongation of a long hollow casing of polygonal cross section constituting the assembly body. This head is provided with a cylindrical sleeve that has a reflecting power constant towards ultrasonic radiations in order to allow the accurate localization of each assembly.

- 5390 LIQUID LEVEL CONTROL SYSTEM OF FAST REACTOR SECONDARY COOLING SYSTEM. Mori, K.; Matsumoto, K. (to Tokyo Shibaura Electric Co. Ltd., Kawasaki, Kanagawa (Japan)). Japanese Patent 1976-113094/A/. 31 Mar 1975. 8p. (In Japanese).

A system is disclosed whose object is to minimize the range of the liquid level variation of the cooling system and reduce the time required for the liquid level control by sealing the gas of a cover gas respiration system which acts upon an evaporator and pump overflow column. In liquid level control by the cover gas pressure of a high-speed reactor secondary cooling system, upon occurrence of a sudden change in the rate of flow of the recirculated liquid, automatic check valves provided in an evaporator and pump overflow column cover gas respiration system are completely or substantially closed, while at the same time the recirculation cooling medium is sucked up and an automatic check valve provided in the overflow system is closed.

- 5391 ATOMIC POWER PLANT. Kawakami, H. (to Tokyo Shibaura Electric Co. Ltd., Kawasaki, Kanagawa (Japan)). Japanese Patent 1976-113096/A/. 31 Mar 1975. 6p. (In Japanese).

The object of the invention is to permit decay heat to be reliably removed after reactor shut-down at such instance as occurrence of loss of power by means of an emergency water supply pump. An atomic power plant has a closed cycle constructed by connecting a vapor generator, a vapor valve, a turbine having a generator, a condenser, and a water supply pump in the mentioned order, and is provided with an emergency water supply pump operated when there is a loss of power to the water supply pump, a degasifier pressure holding means for holding the pressure of the degasifier by introducing part of the vapor produced from said vapor generator, and a valve for discharge to atmosphere provided on the downstream side of said vapor generator.

- 5392 CONTROL SYSTEM FOR EMERGENCY CORE COOLING SYSTEM. Mae, Y. (to Hitachi Ltd., Tokyo (Japan)). Japanese Patent 1976-111596/A/. 26 Mar 1975. 4p. (In Japanese).

A system is disclosed whose object is to reduce thermal stress produced when the apparatus and ducts constituting the reactor and cooling system are rapidly cooled down at the time of operation of an LMFB emergency core cooling system. Structure: Decay heat produced from the reactor is led through a primary cooling system and an intermediate heat exchanger to an air cooler for removal, and a rise in reactor output temperature due to decay heat is detected by a detector and compared in a comparator with a signal from a secondary cooling system flow rate detector. The pump of the emergency cooling system is controlled through a PI controller and pump output controller such that heat in a quantity corresponding to the decay heat is supplied to the air cooler according to the difference signal from the comparator. A damper is

controlled according to the difference in the signal from a cooler output temperature detector from a preset value and also a difference in the signal from the cooler inlet temperature detector and difference of the signal from a bias setter, whereby the quantity of cooling air supplied to the air cooler is controlled.

- 5393 DOOR VALVE. Honda, N.; Sakaguchi, S.; Goto, T.; Horikawa, T. (to Hitachi Ltd., Tokyo (Japan)). Japanese Patent 1976-110194/A/ 24 Mar 1975. 3p. (In Japanese).

Leakage of inner fluid in a door valve is blocked by providing a bellows mechanism in a portion where a valve rod penetrates an oil hydraulic cylinder and by sealing opposite side valve seats of the valve body with an oil hydraulic type seal mechanism. A door valve comprising a valve body movably provided within a valve casing, an oil hydraulic mechanism driving a valve rod directly connected to the valve body, a bellows mechanism provided on a portion where a valve rod penetrates the cylinder of the oil hydraulic mechanism and an oil hydraulic seal mechanism provided on the inner side of an inlet of the valve casing opposing a valve seat of the valve body, thereby isolating such components as the reactor container, casker, relay container and fuel storage tank at the time of replacement of fuel and reliably preventing leakage of liquid metal vapor containing radioactive material.

- 5394 ROTARY PLUG. Orit, S.; Fujiki, K. (to Tokyo Shibaura Electric Co. Ltd., Kawasaki, Kanagawa (Japan)). Japanese Patent 1976-108194/A/. 19 Mar 1975. 3p. (In Japanese).

A rotary plug is provided for a reactor comprising a large disc and a small disc disposed eccentrically thereto and rotatably using liquid metal as the coolant, the large and small discs having sliding surfaces formed with stepped portions in which a resilient member is interposed, thus minimizing the amount of solidified and deposited Na steam to effect smooth rotation. A V-shaped annular spring having a surface hardened layer placed in intimate contact with a large rotary plug and a small rotary plug is provided to block, during the operation of the reactor, upward movement of Na steam which is produced from Na liquid surface and tends to be moved up after entry into an annular space, and to, when the furnace is stopped in operation to rotate the rotary plugs, minimize a shearing stress created when the small rotary plug is lifted and to minimize a reverse rotational torque created when the large and small rotary plugs are rotated relative to each other.

- 5395 METHOD OF CONTROLLING STEAM TEMPERATURE OF A FLUID HEATING SEPARATION TYPE STEAM GENERATOR. Iwashita, T.; Monta, K. (to Nippon Atomic Industry Group Co. Ltd., Tokyo). Japanese Patent 1976-108196/A/. 19 Mar 1975. 5p. (In Japanese).

A system is disclosed whose object is to keep constant the stability and normal deviation in the entire control system by connecting an element of variable gain substantially in proportion to a preset load in series with the ordinary PID type control system. Changes in steam temperature at an evaporator outlet due to changes in sodium flow rate are detected by a thermocouple. The resultant detection signal is compared with a preset value of the steam generator output temperature, and a portion proportional to the difference between them is added as an

operating signal, the operating signal also being used as a sodium flow rate control signal coupled to a sodium flow rate control means. In this method of control of vapor temperature of a fluid heating separation type steam generator, a control gain variable means is connected in series with a temperature control system to obtain control substantially proportional to the preset load.

- 5396 SAFETY VALVE SYSTEM FOR A NUCLEAR VESSEL COVER GAS. Itami, K. (to Hitachi Ltd., Tokyo (Japan)). Japanese Patent 1976-104190/A/ 12 Mar 1975. 4p. (In Japanese).

Leakage of a radioactive gas from a valve seat is presented by providing a burst plate downstream of a pressure relief valve. A pressure relief valve is disposed at the side of a nuclear reactor. A first burst plate is provided at an outlet opening in the valve in order to prevent the leakage of a radioactive gas. A compression system is provided to break the burst plate. A second burst plate is provided in the compression system thereby to bring the pressure in the space surrounded by the pressure relief valve and the first and second burst plates into equality with the pressure of the ambient atmosphere.

- 5397 PROTECTION DEVICE FOR REACTOR SAFETY. Miki, K.; Inoue, K. (to Hitachi Ltd., Tokyo (Japan)). Japanese Patent 1976-104189/A/. 12 Mar 1975. 3p. (In Japanese).

A molten fuel dropping from a reactor core is received in a container. The container is formed as the heater section of a heat pipe and is adapted to heat and gasify a medium of Li, Na, K or NaK in the pipe. The gasified medium is condensed by a radiator system and returned by capillary action to the heater (the container). An inert gas is ordinarily enclosed in the heat pipe in order to prevent the evaporation of the medium while the gas is exhausted from the pipe during an accident thereby to actuate the heat pipe.

- 5398 FUEL ASSEMBLY FOR A NUCLEAR REACTOR. Takeda, S.; Sakagami, M. (to Hitachi Ltd., Tokyo (Japan)). Japanese Patent 1976-104186/A/. 10 Mar 1975. 2p. (In Japanese).

To prevent the heat-induced bending of a fuel assembly for use in a fast breeder reactor due to a thermal difference radially of the fuel assembly within the reactor core. A wrapper tube is provided which has a corrugated or wavy wall portion on a higher output (or higher temperature) side of a reactor core thereby to absorb the elongation of the wall of the tube on the higher temperature side and to prevent the bending of the tube.

- 5399 FAILED FUEL DETECTOR FOR NUCLEAR REACTORS. Takahara, K. (to Hitachi Ltd., Tokyo (Japan)). Japanese Patent 1976-101693/A/. 4 Mar 1975. 4p. (In Japanese).

Cover gas is circulated by the suction of an ejector utilizing the potential energy of overflow sodium, thereby dispensing with power for cover gas circulation. Using the suction provided by the ejector the cover gas within the reactor container is withdrawn successively through a duct, vapor trap, failed fuel detector, and another duct. It is then mixed with sodium flowing through the overflow duct, and the mixture is led to an overflow tank for separation of gas and liquid. Next, the gas is returned to the reactor container through a duct, cover gas header and another duct.

5400 PRINCIPAL RESULTS OF OPERATION OF THE BOR-60 FACILITY. Kazachkovskii, O.D.; Afanas'ev, V.A.; Gryazev, V.M.; Kevrolev, V.P.; Kondrat'ev, V.I.; Nechaev, V.N.; Smirnov, A.M. *Sov. At. Energy (Engl. Transl.)*; 38: No. 3, 169-172 (Mar 1975).

General operating characteristics of the BOR-60 facility, fuel element tests, tests of the main equipment and additional measures for ensuring safety are described.

5401 EMERGENCY COOLING SYSTEM OF A NUCLEAR REACTOR. Ventre, E. (to Electricite de France, 75 - Paris). French Patent 2,330,123/E/. 18 Feb 1975. 6p. (In French).

This invention concerns a nuclear reactor emergency cooling system where the reactor core is composed of separate N modules, each module being cooled by a coolant kept flowing by a pump assigned to each module. This system applies in particular to liquid sodium cooled fast neutron reactors.

5402 ROTARY SHIELD PLUG. Maruya, K.; Okuma, T. (to Mitsubishi Atomic Power Industries, Inc., Tokyo (Japan)). Japanese Patent 1976-92994/A/. 12 Feb 1975. 4p. (In Japanese).

A device to shield Na vapor of a liquid metal coolant accommodated within the container of a fast reactor with a doublewall shield structure, thereby increasing the shielding reliability is described. A gap between the container wall of fast reactor container and rotary plug for closing the top opening of the reactor container is hermetically shielded at the upper end and is doubly shielded at the lower end by two shielding means. Of these shielding means, the first one projects from the container wall and is in contact with the bottom of the rotary plug, while the second shield means consists of a first annular member extending from the bottom of the rotary plug and a second annular member extending from the container wall and abutting the first annular member to define a space between the first and second annular members. Further, an inert gas circulating means is provided between a blow-in inlet positioned above the first shield means on the container wall and an exhaust outlet positioned above the space within the container wall.

5403 PROCESS OF FLATTENING OF THE HEAT RELEASE CURVE OF A NUCLEAR REACTOR CORE AND REACTOR CORE USING SAID PROCESS. Cachera, P. (to Electricite de France, 75 - Paris). French Patent 2,300,398/A/. 16 Feb 1975. 13p. (In French).

A procedure for flattening the heat release curve of the fuel elements in a fast reactor core is presented. Said core is made of vertical fuel elements with an axial channel large enough in diameter to make it possible for the molten fissile material to flow, in the event of a power excursion. Said axial channel diameter is reduced when going from the elements in the central core to the peripheral elements. Said decrease in diameter is proportional to the decrease in the neutron flux density, so as the conductivity integral to be maintained nearly constant.

5404 CONNECTION DEVICE OF AN APPARATUS IN A SYSTEM WITH STRUCTURES SUBJECT TO RELATIVE MOTIONS. Barneoud, R.E.; Guer, M. (Societe Nationale d'Etude et de Construction de Moteurs d'Aviation (SNECMA), 92 - Suresnes (France). Div. Hispano-Suiza); Roumailhac, J.; Lecouvreur, P. (Societe Technique pour l'Energie Atomique (Technicatome), Centre

d'Etudes Nucleaires de Saclay, 91 - Gif-sur-Yvette (France)). (to CEA, 75 - Paris (France)). French Patent 2,300,253/A/. 6 Feb 1975. 14p. (In French).

The invention relates to a system of sealed connection intended for sodium pumps of LMFBR type reactors. The fastening system is characterized in that the pump immersed in the liquid metal has its upper part suspended to the closure slab of the reactor shell through a first knee-joint system, and its lower part fastened by means of a second swivel-joint to a steady frame rigidly connected to the reactor vessel.

5405 SYSTEM OF BRACING INTENDED FOR A BUNDLE OF PARALLEL PINS INSIDE A FUEL ASSEMBLY OF NUCLEAR REACTOR. Marmonier, P.; Message, B.; Skoko, J.; Vayra, J. (to CEA, 75 - Paris (France)). French Patent 2,298,162/A/. 20 Jan 1975. 12p. (In French).

Description is given of a bracing system of the parallel pins of a bundle mounted inside a vertical axis open casing provided with a part supporting the pins so as to form a fuel or fertile assembly for a nuclear reactor. The plain structure endures quite well the effects of differential swelling of the pins, without entailing any pressure drop. Besides, the system is suitable in that a better stirring of the sodium flow through each fuel assembly is ensured while the volume percent of fuel inside the assembly is only weakly reduced.

5406 TEMPERATURE MEASUREMENT DEVICE. Fournier, C.; Lions, N. (to CEA, 75 - Paris (France)). French Patent 2,297,409/A/. 13 Jan 1975. 9p. (In French).

The present invention relates to a temperature measuring system that can be applied in particular to monitoring the temperature of the cooling liquid metal of the outlet of the core assemblies of a fast reactor. Said device combines a long hollow metallic pole, at least partially dipped into the liquid metal and constituting a first thermocouple junction between said pole, and two metallic conductors of different nature, joined at one of their ends to constitute the second thermocouple junction. Said conductors suitably insulated are arranged inside a sheath. Said sheath made of the same metals as the pole extends inside the latter and is connected with the pole through a soldered joint. Said reliable system permits an instantaneous measurement of a quantity representing the variations in the recorded temperature and a measurement of the mean surrounding temperature that can be directly used as a reference for calibrating the first one.

5407 PROTOTYPE FAST REACTOR DOUNREAY: SOME INTERESTING ASPECTS OF ITS DESIGN AND CONSTRUCTION. Outram, W.J. (UK At Energy Auth, Warrington, Lancs, Engl). *Proc. Inst. Electr. Eng. (London)*; 122: No. 1, 49-54 (Jan 1975).

Some of the more interesting aspects of the design and construction of the prototype fast reactor at Dounreay are discussed. These include the bringing together of the primary-vessel components, all of which are supported from the reactor roof, the construction of which involved the use of flotation. A description is included of the rotating shield and its function related to the charge procedures of the reactor. The use of the irradiated-cave facilities is described along with some of the special machines within this complex. 4 refs.

- 5408 TRANSIENT TEMPERATURE DISTRIBUTION IN REACTOR COOLANT CHANNEL FOLLOWING LOSS OF FLOW. Ozgu, M.; Chen, J.C. (Bethlehem Steel Corp, Pa). Lett. Heat Mass Transfer; 2: No. 1, 27-36 (Jan-Feb 1975).

Analytical solutions to the transient energy equation in a coolant filled channel subsequent to complete flow stoppage were obtained for different end boundary conditions and wall heat fluxes. Sinusoidal and stepwise heat flux distributions along the channel, and constant temperature and zero heat flux end boundary conditions were used. Analytical solutions for variations of temperature with time and axial position were obtained. Sample results were determined for liquid sodium with various values of initial Peclet number. 7 refs.

- 5409 LMFBR DESIGN BASIS ACCIDENTS AND THEIR ACCOMMODATION. Graham, J. pp 284-291 of Nuclear safety, 1975. Hetrick, D.L. (ed.). Hinsdale, IL; American Nuclear Society (1975). From ANS topical meeting on nuclear safety; Tucson, AZ, USA (5 Oct 1975). See CONF-751044--.

Accidents are defined of various consequences and probability for use as design bases in the design of reactor safety systems. In the past a core disruption was used to set requirements for containment barriers of small LMFBRs. It now seems that the use of such a design basis accident has created a misplaced emphasis. Greater safety is to be provided by the provision of reliability assurance, that such an accident is of such low probability that it is inappropriate as a design basis accident, and greater emphasis should be placed on the basic protection against accidents rather than on the mitigation of presumed consequences.

- 5410 CASE HISTORY OF FABRICATING NUMERICAL-CONTROLLED MACHINERY FOR THE NUCLEAR INDUSTRY. Lewis, J.F. Dearborn, MI; Society of Manufacturing Engineers (1975). 15p.

Working to tight tolerances, attaining specific mechanical properties and conforming to rigid specifications are some of the problems that occur in fabricating machinery for the nuclear industry. The equipment being built is the In-Vessel Handling Machine, which is to be used in the Fast Flux Test Facility. The largest fabrication for the machine is the Reactor Refueling Plug (RRP). The body of the RRP is a low-alloy steel forging (ASME SA508) that is 24 in. thick and 72 in. in dia. It is clad with a Ni-base alloy (AWS ERNiCr-3) wherever an attachment is welded on. All of the attachments are 304 series stainless steel except for an Inconel 600 attachment which forms a skirt around the bottom of the plug. The manufacturing sequence for the RRP called for the welding to be accomplished in three phases.

- 5411 BOUNDARY-VALUE THERMAL-HYDRAULIC SOLUTION IN A REACTOR FUEL BUNDLE. Sha, W.T.; Schmitt, R.C.; Huebotter, P.R. (Argonne Natl Lab, Ill). Am. Soc. Mech. Eng., [Pap.]; No. 75-HT-48, 13(1975).

A new computational model for steady-state, single-phase, thermal-hydraulic, multichannel analysis is presented. The model accounts for the conservation of mass, energy, and momentum subject to pressure-drop boundary conditions and leads to a nonlinear multipoint boundary-value problem. The turbulent interchange, radial thermal conduction and forced flow due to the wire-wrap or grid between the channels

are explicitly taken into account. The most important features of this new computational model are that: the effect of axial flow area variation has been incorporated into the derivation of governing equations; the crossflow approximation has been improved so that the assumption of constant transverse momentum flux in the direction under consideration is removed; and partial flow blockage occurring anywhere along the flow path can be analyzed, and the effect on the inlet mass velocity redistribution taken into account. 39 refs.

- 5412 THERMAL/HYDRAULIC PERFORMANCE TEST RESULTS OF SODIUM-HEATED STEAM GENERATOR MODEL EMPLOYING A DUPLEX TUBE. Waszink, R.P.; Hwang, J.Y.; Efferding, L.E. (Westinghouse Electr Corp, Tampa, Fla). Am. Soc. Mech. Eng., [Pap.]; No. 75-HT-65, 11(1975).

The paper presents thermal/hydraulic performance results of testing a single duplex tube sodium-heated steam generator model in the GPL-1/SWL-1 (sodium/water loops) test facility at the Westinghouse Advanced Reactors Division. The Small Steam Generator Model (SSGM) was designed, built and tested to proof-test a single tube of duplex wall construction at conditions identical to the alternate concept evaporator for the Clinch River Breeder Reactor Plant (CRBRP). 21 refs.

- 5413 PRELIMINARY THERMAL-HYDRAULIC DESIGN AND PREDICTED PERFORMANCE OF THE CLINCH RIVER BREEDER REACTOR CORE. Carelli, M.; Markley, R.A. (Westinghouse Adv React Div, Madison, Pa). Am. Soc. Mech. Eng., [Pap.]; No. 75-HT-71, 8(1975).

The preliminary thermofluids design of the core assemblies of the Clinch River Breeder Reactor Plant (CRBRP) is presented along with the predicted performance for various plant operating conditions. The selected radial blanket assemblies shuffling scheme and the new approach adopted for fuel and blanket assemblies orificing is discussed. Relevant thermofluids parameters (assembly flow rate and mixed mean outlet temperature, fuel rod temperatures, fission gas plenum pressure, etc.) are presented. Highlights of a detailed uncertainties study performed are summarized. This preliminary analysis has shown that the CRBRP core behavior is compatible with design limits and requirements; future developments for a final analysis are outlined. 4 refs.

- 5414 PREDICTION OF LOCAL AND INTEGRAL TURBULENT TRANSPORT PROPERTIES FOR LIQUID-METAL HEAT TRANSFER IN EQUILATERAL TRIANGULAR ROD ARRAYS. Ramm, H.; Johannsen, K. (Tech Univ Berlin, Ger). Am. Soc. Mech. Eng., [Pap.]; No. 75-HT-NN, 1-6(1975).

A theoretical method based on a phenomenological turbulence model has been applied to evaluate turbulent transport properties for liquid-metal heat transfer in bare equilateral triangular rod bundles. Results obtained for local distributions of thermal eddy diffusivity in the various directions are presented in terms of correlations. From a subsequent solution of the three-dimensional heat transfer problem between two characteristic interior subchannels under conditions characteristic for tracer-type mixing experiments, integral thermal mixing coefficients and thermal length scales have been evaluated. 10 refs.

- 5415 BRAZED THERMOCOUPLE PASS-THROUGH FOR SODIUM SERVICE IN A LIQUID-METAL-COOLED FAST

BREEDER REACTOR. Walker, D.E. Dearborn, MI; Society of Manufacturing Engineers (1975). 7p.

Sensors installed in special fuel elements for the EBR-II reactor have 30 ft long leads that pass from the Na environment through a sealed bulkhead. An H atmosphere, induction heated brazing furnace has been constructed to braze 20 to 26 separate sensor leads at one time. The brazed seals are leak-tight and the sheath wall has less than 10 percent interaction with the braze alloy.

5416 WE ALMOST LOST DETROIT. Fuller, J.G. New York; Reader's Digest Press (1975). 280p.

This is the documented, true account according to the author, of what happened on the afternoon of October 5, 1966, when the control panel inside the Enrico Fermi atomic reactor near Detroit, Michigan, suddenly registered high radiation levels, a sign of critical danger. Detroit was thirty miles away. The Fermi accident and the others described in this book demonstrate the fact that no matter how much diligence is exercised in the design, construction, and operation of reactors, things can go wrong. What is forgotten is that the public had a right to know these risks years ago, when the initial decisions regarding the acceptability of nuclear power were being made. Only now is it learned that the public was deliberately misled and deceived by the former Atomic Energy Commission regarding the possibility of major nuclear reactor accidents and the potential consequences of such accidents, states Mr. Carl J. Hovevar in the Foreword. The book surveys the accidents that have occurred in nuclear power stations here and abroad. (MCW)

5417 COMPATIBILITY OF A URANIUM METALLIC FUEL WITH OKH16N15M3B CHROME-NICKEL STEEL. Sergeyev, V.S.; Karpov, V.M.; Anuchkin, A.M. Sostoyaniye I Perspektivy Rabot Po Sozdaniyu Aes S Reaktorami Na Bystrykh Neytronakh; 2: 542-557(1975). (In Russian).

The designers of fast reactors are confronted with the question of the necessity of creating economically feasible fuel elements. One of the possible ways of solving this problem is the use of metallic uranium and uranium-plutonium fuel. They report that upon irradiation of uranium-plutonium fuel the achievable density of fission was equal, and in certain instances, exceeded the density of fission for oxide and carbide fuel without any notable change in the form of the samples. They investigated the mechanism of diffusion interaction of OKH16N15M3B steel with uranium and several alloys on its base for the purpose of seeking the possibility of ensuring compatibility of the fuel with the shell at temperatures up to 700--750°C. The samples were annealed in a temperature range of 400--800°C in a vacuum of $5 \cdot 10^{-5}$ mmHg. They give the microstructures of the zones of interaction between uranium and steel, obtained at various temperatures after 100 hours of diffusion annealing. Annealing at a temperature of 750°C and above leads to the formation of a eutectic and fusion of the samples. Preliminary investigations showed that the protective barriers of such materials as V, Zr, Nb, Ta, and Mo may ensure long-term compatibility at temperatures up to 700--800°C.

5418 PARAMETER OPTIMIZATION OF AES WITH A LARGE FAST REACTOR. Rineyskiy, A.A.; Orlov, V.V.; Subbotin, S.A.; Yarovitsin, V.V.; Novozhilov, A.I. Sostoyaniye I Perspektivy Rabot Po Sozdaniyu Aes S Reaktorami Na Bystrykh

Neytronakh; 1: 152-159(1975). (In Russian).

The temperature and pressure of the AES steam power cycle have a substantial influence on the physical characteristics of the LMFBR and on the economic indicators of AES as a whole. By means of the optimization program ROKBAR, a study was made of the influence of the temperatures of the heat-transfer agent at the output from the LMFBR on the doubling time (T_2) and reproduction coefficient (KV). A study was made of the range of preheatings of the heat-transfer agent (sodium) 150 to 240°C, which corresponds to output temperatures of 500 to 530°C. The thermal power for all variants was assumed as 4300 Mw. Plutonium from a thermal reactor was used as fuel, with the initial isotope composition: $^{239}\text{Pu}/^{240}\text{Pu}/^{241}\text{Pu} = 0.64/0.25/0.11$. The time of the external fuel-supply cycle was assumed as 0.5 years. Results are given of estimates of the effect of warming up the heat-transfer agent on the characteristics of a high-power LMFBR, particularly on the economic characteristics depending on the efficiency and preheating.

5419 HIGH POWER FAST REACTORS WITH COMBINED USE OF URANIUM-235 AND PLUTONIUM. Ilyunin, V.G.; Kuz'min, A.M.; Murogov, V.M.; Orlov, V.V.; Silayev, Y.V.; Troyanov, M.F.; Shmelev, A.N.; Yurova, L.N. Sostoyaniye I Perspektivy Rabot Po Sozdaniyu Aes S Reaktorami Na Bystrykh Neytronakh; 3: 20-36(1975). (In Russian).

The efficiency of combined use in an LMFBR of ^{235}U and ^{239}Pu was studied. The efficiency is related to the increase in unit capacities of the LMFBR up to 1000-2000 Mw, which in turn is expedient from the standpoint of reducing the specific capital investments and from the standpoint of the economics of the fuel-supply cycle. Combined use of U and Pu in the active zone of the LMFBR is one of the possible ways of ensuring stability and efficiency in flattening the profile of the heat release field; the value of the internal coefficient of reproduction of reactivity in this case is close to unity, since in the internal subzone a fuel (plutonium) is produced which is around 30 percent more efficient than the depleted ^{235}U ; a more negative value of the sodium coefficient of reactivity is ensured. This permits an increase in the length of operating the LMFBR without reloading and considerable rise in the power.

5420 MONITORING OF OXYGEN AND HYDROGEN IN A SODIUM CIRCULATION LOOP BY ELECTROMECHANICAL MEASURING METHODS. Kozlov, F.A.; Kuznetsov, E.K.; Kozub, P.S.; Ul'man, F.A.; Rets, T.; Teske, K. Sostoyaniye I Perspektivy Rabot Po Sozdaniyu Aes S Reaktorami Na Bystrykh Neytronakh; 2: 280-308(1975). (In Russian).

The article concerns measurement methods and instruments developed at the Rossendorf (GDR) Central Nuclear Research Institute. The instruments were installed and tested on a sodium loop in the FEI [R-and-D facility]. The authors verified the research on measuring cells in various exploitational conditions of the sodium circulation loop and compared the results obtained with the data from other methods of measuring impurities. They give the scheme and describe the experimental installation. They justify the choice of working parameters of the measuring cells for oxygen (temperature of 350 $\pm$ 5°C, consumption of sodium 0.2 m³/h, of air 2 to 4 l/h, rate of temperature increase of sodium 2°C/min), for which they conducted experiments on finding the influence of the consumption of sodium, consumption of air, and sodium temperature on the indications of the cells. They evaluate the stability of the indications of the cells and

the time of operation, the influence of hydrogen on the activity of oxygen in sodium. The measuring cell for oxygen and hydrogen operated in conjunction with a diffusion nickel membrane with a surface of 1750 cm² and thickness of 1 mm. The temperature of the membrane was 450°C, the consumption of the carrier gas (argon) was 6 l/h. They give examples of monitoring the working regime of the loop by electrochemical methods of measurement.

- 5421 DEVELOPMENT OF EXPERIMENTAL IRRADIATION DEVICES FOR MATERIALS TESTING IN THE BOR-60 REACTOR. Samsonov, B.V.; Shulimov, V.N.; Drutikova, V.V.; Seredkin, S.V.; Mel'der, R.R. Vopr. Atom. Nauki Tekhn. Ser: Radiatsion. Materialoved., Metokika Tekhn. Oblucheniya; 5: 7-13(1975). (In Russian).

The start-up of the industrial test BOR-60 fast-neutron reactor made it possible to greatly expand the breadth of research into radiation materials technology. It became possible to resolve such questions as finishing off fuel cells of newly-built fast-neutron reactors; study of radiation swelling of stainless steels, study of corrosive properties of materials in a flow of sodium under the influence of reactor irradiation, and some other questions. In order to perform the entire system of studies, experimental devices are necessary to permit irradiation of materials under different conditions. Methodology questions of design of irradiating devices for fast-neutron reactors are considered. The design of various types of materials technology packs, developed by the BOR-60 reactor, is described.

- 5422 PROPERTIES OF STABILIZED CHROME-MOLYBDENUM STEELS FOR STEAM GENERATORS OF FAST-NEUTRON REACTORS WITH A SODIUM HEAT CARRIER. Ilinchev, G.; Mayer, F.; Fresl, M. Sostoyaniye Perspekt. Rabot Sozlanuyu Aes Reaktor. Bystrykh Neytronakh; 2: 425-458(1975). (In Russian).

Mechanical properties and corrosion resistance were of steels on a base of 10Kh2 and 25Mn, stabilized with Nb and Ti in various combinations. Influence of oxygen on the transport of carbon was determined during 1000-h tests in liquid sodium containing about 2.10^{-4} or 3.45 to 6.58×10^{-2} mass percent oxygen. The corrosion resistance was studied at temperatures from 400 to 700°C (800°C for pure sodium). Furthermore, the structural stability, mechanical properties and impact viscosity at high resistance, weldability of the steels were studied and a microanalysis and phase analysis of the carbides were made. The tests showed that the investigated steels are distinguished by a low activity of carbon and therefore do not decarbonize under the effect of liquid sodium and at high temperatures (up to 600 to 700°C) also do not cause carbonization of the stainless chrome-nickel steels. The mechanical and technological properties of the stabilized steels were compared with the properties of the unstabilized steel type 10Kh2M and were satisfactory up to a temperature of 575°C. This makes it possible to use them as structural material for steam generators in high-speed reactors for the purpose of raising their working parameters and efficiency. 10 figures, 2 tables, 15 references.

- 5423 STUDY OF THE SIGNALS MEASURING THE TEMPERATURE OF SODIUM IN A NUCLEAR REACTOR. Joly, F.; de Lapparent, D.; Dubuisson, B.; Gaillard, P. (Univ de Technol de Compiègne, Fr). Automatisme; 20: No. 6/7, 268-

275(1975). (In French).

A method is proposed for studying signals measuring the temperature of sodium in the nuclear reactor Rapsodie. Each signal is viewed as a vectorial gaussian process, the properties of which are studied. The use of this signal makes it possible to assure monitoring of the thermocouples of the reactor core and discovery of abnormal phenomena.

- 5424 APPLICATION EXPERIENCE WITH CODES AND STANDARDS IN THE DESIGN OF HEAT EXCHANGERS FOR LIQUID METAL AND GAS COOLED REACTOR SYSTEMS. Pal, D.H.; O'Donoghue, J.K.; Stenner, J.R. (Foster Wheeler Energy Corp, Livingston, NJ). Am. Soc. Mech. Eng., [Pap.]; No. 75-Pwr-16, vp(1975).

This paper highlights some of the application experience with various codes and standards in the design of heat exchangers for liquid metal fast breeder reactor and high temperature gas cooled reactor systems. Application experience in the areas of elevated temperature design/analysis and classification of component parts and in-service inspection are discussed. Areas of deficiency in the current codes and standards are identified along with corrective recommendations.

- 5425 FLOW-INDUCED VIBRATIONS OF SPIRAL WIRE-WRAPPED FUEL ASSEMBLIES. Kinsel, W.C. (Westinghouse Hanford Co, Richland, Wash). Am. Soc. Mech. Eng., [Pap.]; No. 75-WA/HT-76, vp(1975).

The vibration characteristics of 217-pin spiral wire-wrapped fuel assemblies were investigated for a variety of flow rates, water temperatures and structural support conditions. The test results were used to optimize the mechanical design of fuel assemblies for the Fast Flux Test Facility (FFTF). The pin displacements were generally low (e.g., 5 mm or less), except for certain support conditions. Pin vibrations were characterized by distinct resonances at low flow rates; however, at high flow rates the response spectra were characteristic of broad-band Gaussian distributions. Both pin and shroud duct displacements were approximate functions of the square of the flow velocity. Water temperature had little effect on vibration levels. 11 refs.

- 5426 THERMAL/HYDRAULIC DESIGN CONSIDERATIONS FOR CLINCH RIVER BREEDER REACTOR PLANT INTERMEDIATE HEAT EXCHANGERS. Aburonia, M.M.; Cho, S.M.; Sawyer, R.H. (Foster Wheeler Energy Corp, Livingston, NJ). Am. Soc. Mech. Eng., [Pap.]; No. 75-WA/HT-101, vp(1975).

The heat transport system of the Clinch River Breeder Reactor Plant (CRBRP) includes intermediate heat exchangers (IHX's) to form barriers between the primary radioactive and secondary nonradioactive sodium coolant loops. The IHX is a vertical, cross/counter flow, shell-and-tube heat exchanger for high-temperature liquid-sodium service and its thermal rating is 325 Mw per unit. The secondary sodium flows vertically upward in 2850 parallel tubes and is heated by the downward flowing primary sodium on the shell side. This paper outlines the thermal and hydraulic design criteria and analyses for the IHX under all operating conditions; normal full and part load, startup and shutdown, upset and emergency events. 7 refs.

- 5427 LMFBR STEAM GENERATORS AREAS REQUIRING SPECIAL ATTENTION. McDonald, J.S. (Rockwell Int, Canoga Park, Calif). Am. Soc. Mech. Eng., [Pap.]; No. 75-WA/HT-104, vp(1975).

The steam generator is of vital importance to the economics and reliability of Liquid Metal Fast Breeder Reactor power plants. The properties of sodium, as well as the adverse effects which can result from tube leaks and associated Na-H₂O reactions, introduce a number of special considerations in the design of sodium heated steam generators. These special concerns are discussed in this paper, and the major problems which have occurred in liquid metal heated steam generators are reviewed. 5 refs.

- 5428 APPLICATION OF THE ASME BOILER AND PRESSURE VESSEL CODE AND RDT STANDARDS TO THE CLINCH RIVER BREEDER REACTOR PLANT SODIUM-HEATED STEAM GENERATOR. Parkman, M.F.; Watson, F.H.; Whipple, J.C. (GE, Sunnyvale, Calif.). Am. Soc. Mech. Eng., [Pap.]; No. 75-Pwr-19, vp(1975).

The Clinch River Breeder Reactor Plant sodium-heated steam generators are in the early stages of design and material procurement to the requirements of Section III of the ASME Code (Winter 1974 Addenda), elevated temperature Code Cases, and supplementary RDT Standards. Major features of the steam generator are described relative to application of the Code and Standards. Extensive modifications to RDT Standards have occurred, and new, simplified RDT M Standards for material have been issued. Problems in coordinating the Code and RDT Standards with the steam generator. Design Specification and long lead time materials procurement are outlined.

- 5429 FFTF OUTLET NOZZLE DESIGN CONSIDERING NATURAL AND FORCED CONVECTION FLOW IN PARALLEL ANNULI, WITH HEATING. Kinyon, B.W.; Vroom, D.W. (Combust Eng Inc, Windsor, Conn.). Am. Soc. Mech. Eng., [Pap.]; No. 75-WA/HT-105, vp(1975).

The FFTF reactor vessel is protected from the 1050 F (565.6 C) sodium in the outlet plenum by providing a bypass annulus fed by the 700 F (371.1 C) inlet sodium. The hot sodium is ducted across the bypass annulus into the outlet nozzles, which must have a smooth axial temperature gradient between the hot outlet pipe and the cooler vessel wall. To achieve the proper temperature profile, there is a liner between the nozzle and the outlet sodium duct, forming two annuli for out-flow of bypass sodium into the outlet pipe. Restricting orifices in each annulus control this bleed flow. A computer program designed to test the validity of the assumption of pure axial flow considers circumferential flow due to density differences as well as the axial flow due to the axial pressure gradients, and includes the heat transferred from the outlet sodium to the bleed sodium in the nozzle annuli. 2 refs.

- 5430 U.S. REACTOR DEVELOPMENT PROGRAM. Kintner, E.E. (Energy Research and Development Administration, Washington, DC). pp 3B.3.1-3B.3.4 of Proceedings of 1975 IEEE southeastern Region 3 conference. Volume I. Electricity: an expanding technology. New York; Inst. of Electrical and Electronics Engineers, Inc. (1975).
From IEEE southeastern; Charlotte, NC, USA (7 Apr 1975).

To meet a rapidly increasing demand for energy, the U.S. strategy is directed toward making the best use of all available resources. Nuclear power has a key role in this strategy and will be required to supply an ever larger share of electricity. Advanced reactors, or breeders, will be required to assure a long-

term energy supply. Consistent with this requirement, development of the Liquid Metal Fast Breeder Reactor (LMFBR) has been given priority in the AEC's broad reactor development program.

- 5431 MONITORING OF IMPURITIES IN LIQUID METAL FAST BREEDER REACTORS (LMFBR). Roy, P. (General Electric Co., San Jose, CA). pp 919-920 of Metal-slag-gas reactions and processes. Foroulis, Z.A.; Smeltzer, W.W. (eds.). Princeton, NJ; The Electrochemical Society, Inc. (1975).

From 147. symposium on metal-slag-gas reactions and processes; Toronto, Canada (11 May 1975).

The present state-of-the-art of oxygen and carbon monitoring devices to be used in liquid sodium is presented. (FS)

- 5432 ELECTROCHEMICAL OXYGEN METERS FOR LIQUID SODIUM FAST BREEDER REACTOR SYSTEMS. Berkey, E.; Reed, W.H. (Westinghouse Research Labs., Pittsburgh, PA). pp 921-922 of Metal-slag-gas reactions and processes. Foroulis, Z.A.; Smeltzer, W.W. (eds.). Princeton, NJ; The Electrochemical Society, Inc. (1975).

From 147. symposium on metal-slag-gas reactions and processes; Toronto, Canada (11 May 1975).

An oxygen meter was developed for use in the sodium coolant system. The meter consists of a high purity closed-end Y₂O₃ doped ThO₂ electrolyte ceramic tube containing air. The electrolyte tube is placed directly in the Na stream. It functions as a reliable, on-line measuring device. (FS)

- 5433 POLICY REPORT ON HIGH LEVEL RADIOACTIVE WASTES. Santa Fe, NM; Energy Resources Administration (1975). 81p. (NP-23948). Executive Office of the Governor, Energy Resources Administration, Santa Fe, New Mexico.
Report from the Governor's Task Force Committee.

For the near term, ERDA and the NRC believe bedded salt formations offer the best approach for implementing high-level radioactive waste disposal. Salt formations will likely be used as the repository site, with those in Southeastern New Mexico the most likely to be selected. If that happens, New Mexico must address the social issues that are bound to arise. Any ultimate waste disposal scheme that consumes regional resources such as land must pay the opportunity cost of consumption in perpetuity. A federal waste repository, of itself, will provide very little benefit to a region. Little local employment will result and other economic impacts will be minimal. There is no compelling reason for the people of New Mexico to accept a high-level waste repository. The recommendations are made: that a committee of technical competent individuals should be appointed by the Governor and the Energy Resources Board to oversee this federal work in the southeastern salt beds, and that New Mexico should do its own risk-benefit analysis of the high-level radioactive waste repository.

- 5434 CESIUM VAPOR CYCLE FOR AN ADVANCED LMFBR. Fraas, A.P. (Oak Ridge Natl Lab, Tenn.). Am. Soc. Mech. Eng., [Pap.]; No. 75-WA/Ener-5, 1-12(1975).

A cesium vapor topping cycle offers a promising means for coupling an advanced liquid metal-cooled fast breeder reactor to a steam system. If compared with a conventional sodium intermediate circuit, it yields an increase in thermal efficiency of about five points,

possesses important advantages from the maintenance standpoint, and greatly reduces the likelihood of serious troubles that might arise if a leak were to develop in the steam generator.

- 5435 TESTING AND EVALUATION OF ELASTOMERIC SEALS FOR SODIUM-COOLED FAST REACTOR SYSTEMS. Welch, F.H.; Kurzeka, W.J. (Rockwell Inst, Canoga Park, Calif). Am. Soc. Mech. Eng., [Pap.]; No. 75-WA/NE-1, 1-8(1975).

The Fast Flux Test Facility and the Clinch River Breeder Reactor Plant require elastomer seals for safe, reliable operation; these seals, with minimal maintenance, must be capable of preventing the leakage of radioactive gases to the atmosphere. A program was established to select commercial elastomers in standard shapes, such as O-rings, T-seals, Quad-rings and Q-seals, and to determine their pertinent characteristics. Buna N, ethylene propylene, polyurethane, and silicone elastomers were tested for their permeability, leakage, and compression set. The test variables included time, temperature, surface finish, percent compression, gas type, and lubricant. A method was developed for predicting gas leakage for permeability data.

- 5436 TEN YEARS' MAINTENANCE EXPERIENCE AT EBR-II. Buschman, H.W.; Hutter, E.; Leman, J.D.; Moriarty, K.J. (Argonne Natl Lab, Idaho Falls, Idaho). Am. Soc. Mech. Eng., [Pap.]; No. 75-WA/NE-3, 1-8(1975).

EBR-II has operated for over 10 years. This period has provided considerable experience in the maintenance and reliability of components and systems in a Liquid Metal Fast Breeder Reactor. This experience has provided a basis for extending the operation of EBR-II for another 10 years.

- 5437 ASSESSMENT OF ECONOMIC INCENTIVES FOR THE LIQUID METAL FAST BREEDER REACTOR. Stauffer, T.R.; Wyckoff, H.L.; Palmer, R.S. (Harvard Univ, Cambridge, Mass). Am. Soc. Mech. Eng., [Pap.]; No. 75-WA/NE-5, 1-9(1975).

This paper assesses the economic rationale for continuing the national commitment to the development of a fast breeder reactor. The question, "to breed or not to breed," is multifaceted, involving complex and conflicting considerations of cost, safety, and environmental impact for each competing electrical generation strategy. The discussion is focused upon estimating the savings in electricity costs which might ensue from the successful development of a commercial fast breeder reactor.

- 5438 LMFBR HARDWARE AND COMMERCIAL STANDARDS. Rowan, W.J.; Winkleblack, B.K. (Westinghouse Electr Co, Madison, Pa). Am. Soc. Mech. Eng., [Pap.]; No. 75-WA/NE-6, 1-4(1975).

This paper states the goals of the development program for Liquid Metal Fast Breeder Reactors (LMFBR's) and outlines the design, engineering, and documentation approaches being used. There is significant design and development work to be accomplished on the Clinch River Breeder Reactor (CRBRP); however, no technology breakthroughs are required since much of the component work consists of scaling up proven designs. Careful documentation is laying the groundwork for a commercial liquid metal fast breeder industry.

FACILITY. Toepel, F.P.; Moody, J.C. (R Ind, Energy Prod Div, Santa Ana, Calif). Am. Soc. Mech. Eng., [Pap.]; No. 75-WA/NE-2, 1-15(1975).

This paper covers selected features of a roller nut type Control Rod Drive Mechanism (CRDM) which was designed for the Fast Flux Test Facility (FFTF). A detailed discussion is given of each of the principal components which underwent special design and development to meet the unique environment and requirements of the sodium cooled Fast Test Reactor. The CRDM was developed by Royal Industries under contract to Westinghouse Electric Co., Advanced Reactors Division.

- 5440 SAFETY AND ENVIRONMENTAL IMPACT OF LIQUID METAL FAST BREEDER REACTORS. Buhl, A.R.; Graham, J. (Energy Res and Dev Agency, Knoxville, Tenn). Am. Soc. Mech. Eng., [Pap.]; No. 75-WA/NE-7, 1-4(1975).

Liquid metal fast breeder reactors are a necessary component in the national energy program planned for introduction as commercial power generating stations in the mid 1980's. This paper treats the safety and environmental impact of liquid metal fast breeder reactors by considering principally the matters of concern, most of them expressed by critics of the program in areas of safety and environmental impact. Areas of major concern, such as the use of sodium and its potential loss from the system as a coolant and the potential for critical reconfiguration accidents involving an energy release or damage to the core are considered. Other areas of concern such as plutonium toxicity and the potential for inadvertent or malicious release of plutonium, waste management and waste heat rejection, and accidental releases of radioactivity are also covered.

- 5441 RISK AVERSION AND ENERGY POLICY: A CASE FOR BREEDER RESEARCH AND DEVELOPMENT. Hamester, H.L.; Graves, G.A.; Plummer, J.L. (Natl Sci Found, Washington, DC). Energy Syst. Policy; 1: No. 3, 233-258(1975).

The continuance of breeder research and development can be argued at many levels. One level of argument views breeder RandD as an "insurance policy" to satisfy society's aversion to the following two categories of risk: (1) that without a commercial breeder capability by the 1990s, the electric power industry might be intolerably vulnerable to scarcities in environmentally acceptable uranium ore; and (2) that no other advanced central station electric power technology besides the breeder presently shows sufficient promise of being available for unsubsidized commercialization by the 1990s. This paper primarily addresses the first of these two categories of risk. The specific topics covered are electricity demand growth, uranium supply, advanced convertors versus breeders, program financing and management, and the relationship of benefit-cost analysis to breeder decision-making. The point is made that proceeding with breeder RandD does not commit the nation to breeder commercialization.

- 5445 DEVICE FOR TUNING THE ACOUSTIC CONTROL SYSTEM TO DETECT LIQUID-METAL COOLANT BOILING. Mitenkov, F.M.; Pakhomov, V.V.; Merkulov, V.I.; Artem'ev, L.N.; Karasev, V.N.; Kulikov, V.V. USSR Patent 441,596/A/. 30 Aug 1974. 3p. (In Russian).
A device for tuning a system of acoustic control of boiling of liquid metal coolant in a fast reactor is described. The device comprises a suspension with a hollow current-conducting bus installed thereon, and a casing with a heat element. In order to improve tuning accuracy, units for measuring the voltage drop in respective zones are installed along the entire heat element. The bus is connected to the middle section of the heater. The device may be placed in one of the core channels via the reactor cover and allows to obtain controlled boiling where it is anticipated during a local breakdown and in the presence of basic noises produced by the device.

- 5446 PIPING FOR NUCLEAR POWER REACTORS. REVIEW. Rodchenkov, B.S. At. Tekh. Rubezhom; No. 8, 3-10 (Aug 1974). (In Russian).
The article reviews production technology, inspection methods, and general characteristics of pipes and tubing: 1 - for piping of the primary loop made of austenitic stainless steels type 304 and 316, and of piping running from the reactor to the steam generator or directly to the turbine in which case it is made of bimetallic materials for PWR and BWR reactors; 2 - for the cladding of fuel elements of PWR and BWR reactors which is made of zirconium alloys. Thus the technology of the Japanese forms "Kobe Steel" and "Sumimoto Metal Industry" is described as it is applied to the fabrication of fuel element cladding for the "Fukushima-2" and "Mihama-2" reactors. This has produced piping of higher corrosion resistance, of more favorable hydrides orientation and more stringent allowances in fabrication; 3 - for fuel element cladding of the magnox type for graphite reactors cooled with CO_2 , for gas cooled reactors with elevated coolant temperatures (over 500°) made of chromenickel steel stabilized with titanium or niobium; 4 - for the fuel element cladding of fast reactors that are cooled with liquid sodium, where the cladding is made of type 316 stainless steel. The particularities of fabrication of channel tubing made principally of zircaloy-2 and zirconium-niobium alloy are given as well as the quality control required for the metal. Data are given on the types of materials used, on the dimensions and pressures used in the channel tubing made of zirconium alloys.

- 5447 ACOUSTIC TRANSDUCER AND ITS PROCEDURE OF FABRICATION. Smith, R.W.; Adamson, G.E. (to USAEC Directorate of Licensing, Washington, D.C.). French Patent 2,296,986/A/. 26 Jul 1974. Priority date 27 Jul 1973, United States of America (USA), 12p. (In French).
The invention relates to an acoustic transducer able to endure the high temperatures, high levels of radiations and the surrounding caustic media involved inside fast breeder reactors, said transducer being intended for reliable sodium control. A new process insures a continuous maximum acoustic coupling at the interface between the active piezoelectric element (made of ceramics, lead zirconate or lead titanate) and the face of the transducer. Said interface is obtained by coating the juxtaposed facing plate of the transducer and active surface of the element with wetting agents compatible with the bonding alloy subsequently used in view of ensuring the acoustic bonding.

- 5448 NUCLEAR POWER PLANT. Grinman, M.I.; Kruglikov, P.A.; Povolotskii, O.B.; Smolkin, Yu.V.; Rineiskii, A.A. USSR Patent 431559/A/. 5 Jun 1974. 3p. (In Russian).
A method is proposed for increasing the efficiency of vapour-moderated intermediary superheating in a power plant with a fast sodium-cooled reactor. In this case, the intermediary superheater on the side of the heating vapour is connected to a steam line located between the evaporator and the steam superheating sections of the steam generator. The line for draining heated steam from the intermediary superheater is connected to a regenerative heater. This arrangement provides better efficiency of intermediary superheating and promotes cheaper operation.

- 5449 FAST NUCLEAR REACTOR. Zhan-Marl Berniol; Sabino Gallo. USSR Patent 597,351/A/. 6 Mar 1974. 5p. (In Russian).
The invention may be used to improve the design of a pool type liquid metal cooled fast reactor. There is a vertical main tank containing components of the primary cooling circuit, and an internal tank enclosing the core. The invention is aimed at increasing the stability of liquid metal thermohydraulic flow inside the main tank of power reactors (1000 MWe and more) that must improve the reliability. The aim is achieved by attaching splitters to the main tank wall and locating the upper part of the lateral wall of the internal tank below the top of the core and above the level of the heat exchanger outlets. In this case the external side of the lateral wall is bent downward and attached directly to the main tank.

- 5450 STEADY TEMPERATURE DISTRIBUTIONS IN A MULTI-REGION NUCLEAR FUEL ROD. Krudener, R.M. (Therm Search Associates, Jackson, WY); Wolf, H. pp 239-262 of Tenth southeastern seminar on thermal sciences. Watts, R.G.; Sogin, H.H. (eds.); New Orleans, LA; Tulane Univ. (1974).

From 10. seminar on thermal sciences; New Orleans, LA, USA (11 Apr 1974).

Steady temperature distributions are presented for a multi-region nuclear fuel rod having a high-conductivity auxiliary path to conduct energy out to the cladding and thus to the coolant. The fuel material modeled was an 80-20 mixture of UO_2 and PuO_2 , respectively. A Reference Design power level of 18 kw/ft was selected and two sizes of center voids in the fuel pellet were investigated. It was shown that power levels of 27 kw/ft could be reached

with the maximum fuel temperature (4,880°F) still below the melt temperature (5,100°F) for a sodium coolant temperature of 1,000°F. The results were obtained by numerical solution of the elliptic conduction equation and are presented for representative values of the gap conductances between the fuel, auxiliary path, and cladding materials. Details of the numerical procedure are not given but are briefly described.

- 5451 INELASTIC ANALYSIS OF PIPELINES IN FFTF CLS MODULE. Pan, Y.S.; Jetter, R.I. (Rockwell International Corp., Canoga Park, CA). pp 235-251 of Pressure vessels and piping: analysis and computers. Tuba, I.S.; Selby, R.A.; Wright, W.B. (eds.). New York, NY; American Society of Mechanical Engineers (1974).

From Pressure vessels and piping-materials-nuclear conference; Miami Beach, FL, USA (24 Jun 1974).

The inelastic analysis of pipelines in the FFTF Closed Loop System is described. The analytical tool is the general purposed program, MARC-CDC. Specially developed pipe bend elements and the straight pipe elements are used to model the pipelines. The pipe bend element in the MARC system has the ability to predict the two-dimensional stress distribution in elbows of the pipeline. This ability permits a reasonably rigorous solution to the nonlinear behavior of pipelines. The analysis is performed for two representative lines in the system. Results of these analyses are presented and discussed. 15 references.

- 5452 SUPERHEAT IN FLOWING SODIUM. PAPER 3.10. Hammett, F.G. (Michigan Univ., Ann Arbor (USA). Dept. of Mechanical Engineering). pp 258-262 of Finite-amplitude wave effects in fluids. Bjoernoe, L. (Technical Univ. Denmark) (ed.). Guildford, England; IPC Science and Technology Press (1974).

From Symposium on finite-amplitude wave effects in fluids; Copenhagen, Denmark (20 Aug 1973).

State-of-the-art concerning bubble nucleation in molten sodium, particularly as it applies to sodium-cooled fast-breeder reactors, is discussed. In particular, the possibilities of significant 'superheat' in flowing sodium systems are discussed, along with the measurement of gas nuclei content in sodium and in water. It is believed that the development of this ability is requisite for further progress in this area.

- 5453 NUCLEAR REACTOR. Mishel, O.; Anri-Zhak, G.; Filipp, V. USSR Patent 499,845/A/. 7 Aug 1973. Priority date 8 Aug 1972, France, 4p. (In Russian).

A liquid-metal reactor cooling system is proposed, featuring a number of advantages over the prior designs. Along with insulation of the hot sodium inside the primary tank, a reduction in the volume of the hot sodium in the reactor is achieved, or an increase in the height of heat exchangers for a given volume. Another advantage offered by the invention resides in the possibility of insulating one or several heat exchangers. The arrangement is simple and convenient.

- 5454 (PNL-TR--356) FAST REACTOR PROGRAM REPROCESSING PROJECT-PYROCHEMICAL HEAD-END PRELIMINARY TECHNICAL AND ECONOMIC EVALUATION. Heylen, P.P. (Centre d'Etude de l'Energie Nucleaire, Mol (Belgium)). Mar 1973. Translation of BLG--478, ENI--67, BN--71238/060/

N/010 77p. Dep. NTIS, PC A05/MF A01.

This study has demonstrated the technical, economic and ecological possibilities of a pyrochemical head-end based on application of molten salts to the conditioning, transport and disaggregation of fuels irradiated in fast sodium-cooled reactors and reprocessed in a plant having a capacity of 1 t/day. Preliminary economic evaluation of a scheme with integrated use molten salts resulted in a total investment cost of 1692 million FB and a head-end reprocessing price (not including waste transport and conditioning) of 1318 FB/kg. However, some of the unit operations in this scheme are ready for immediate application.

- 5455 APPARATUS FOR CONTROLLING MOLTEN CORE DEBRIS. Golden, M.P.; Tilbrook, R.W.; Heylman, N.F. (to Energy Research and Development Administration). US Patent 4,036,688. 19 Jul 1972. Filed date 9 Apr 1975. 16p.

PAT-APPL-566,489.

Disclosed is an apparatus for containing, cooling, diluting, dispersing and maintaining subcritical the molten core debris assumed to melt through the bottom of a nuclear reactor pressure vessel in the unlikely event of a core meltdown. The apparatus is basically a sacrificial bed system which includes an inverted conical funnel, a core debris receptacle including a spherical dome, a spherically layered bed of primarily magnesia bricks, a cooling system of zig-zag piping in graphite blocks about and below the bed and a cylindrical liner surrounding the graphite blocks including a steel shell surrounded by firebrick. Tantalum absorber rods are used in the receptacle and bed. 9 claims, 22 figures.

- 5456 DEVICE FOR FAST REACTOR CHARGING. Rakhimov, V.V.; Artem'ev, L.N. USSR Patent 440,967/A/. 16 May 1972. 2p. (In Russian).

The invention refers to servomechanisms of industrial nuclear reactors with liquid metal coolant. In order to provide control over hermeticity of fuel elements assemblies during their transportation the wall of the directing tube of the transporting mechanism contains channels supplying gas for bubbling the alkali metal (coolant) with the outlet at the level of the fuel packet lower edge, and a channel for removing the gas, placed at sampling outlet.

- 5457 TRANSIT DEVICE FOR REACTOR FUELING. Saijo, T.; Hayashi, H.; Yamaki, H.; Sasaki, M. (to Hitachi Ltd., Tokyo (Japan)). Japanese Patent 1976-110195/A/. 10 Dec 1971. 3p. (In Japanese).

The object of the invention is to effect refueling without detracting from the safety of the nuclear container by providing a relay container which has two openings for communication with the inside and outside of the container and is also provided with cooling and heating means, a chain being provided with a bucket disposed for revolution between the inlet and outlet. A relay container filled with an inert gas and a nuclear container are connected together with a first fuel inlet and outlet passage provided with a door valve, and the relay container and outside of the nuclear container are connected together with a second fuel inlet and outlet passage having a door valve. Further, a transfer means including a fuel container capable of movement between both the passages is provided.

- 5458 DEVICE FOR HOLDING IN POSITION THE PINS

OF A CLUSTER INSIDE THE CASING OF AN ASSEMBLY INTENDED FOR NUCLEAR REACTORS. Boyer, P.; Lorient, P. (to CEA, 75 - Paris (France)). French Patent 2,301,070/A/. [nd]. 11p. (In French).

Said invention is intended for fissile or fertile fuel assemblies in fast reactors. It is related to an improvement to the devices supporting and holding in position the pins of a cluster inside an assembly, said devices ensuring the pins to be simultaneously locked in the vertical and transverse directions.

- 5459 (EURFNR--1412) INVESTIGATION OF THE THREE-DIMENSIONAL THERMOELASTIC DEFORMATION OF THE CORE ASSEMBLY OF A FAST BREEDER REACTOR UNDER STEADY-STATE OPERATING CONDITIONS. Hoang, Y.S. (Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Inst. fuer Reaktorentwicklung). [nd]. Translation of KFK--1874 196p. Dep. NTIS, PC A09/MF A01.

Work performed under United States--Euratom Fast Reactor Exchange Program. Thesis. Submitted to Karlsruhe Univ., Ger..

A method is described which has been developed in order to calculate three-dimensional deformation of the reactor core, taking into account thermal expansion. The computation method developed is applied to the MARK I core of SNR 300. Core deformations are calculated under different support conditions for the subassemblies in the grid plate and in the upper clamping plane. The results show that the tangential components of the force and deformations are not always smaller than the respective radial components: the ratio of these two variables strongly depends on the support conditions selected. If the support loads of a radial row of subassemblies are compared with those of subassemblies lying on the same radius and peripheral row, clear difference can usually be seen.

- 5460 Rapports de la Commission Consultative pour la Production d'Electricite d'origine Nucleaire 1970-1974. (REPORTS FROM THE ADVISORY COMMITTEE FOR NUCLEAR POWER GENERATION, 1970-1974. VOL. II). Paris; Documentation Francaise ([nd]). 226p. (In French).

The present report is first dealing with the general status of nuclear power production throughout the world and is defining more accurately the French position. It is then dealing with the various aspects of the quantitative programme based on light water reactor types for the VIth plan, its justifications, the problems involved and the importance of this programme. The various items of a subsidiary programme are presented for the reactor types, the development of which is to be examined for the future (sodium cooled fast neutron reactors, heavy water reactors involving the EL600 project, and HTRs). Two fields closely related to nuclear power realizations are discussed: the fuel cycle and the effort required in research and development

- 5461 (DOE-tr--71) APPLICATION OF INTEGRAL TRANSPORT THEORY WITH LINEARLY ANISOTROPIC SCATTERING TO THE CALCULATION OF THE NEUTRON DISTRIBUTION IN FINITE PLATE ARRAYS OF FAST REACTORS. Boehme, R. (Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Inst. fuer Neutronenphysik und Reaktortechnik). [nd]. Translation of KFK--2501 133p. Dep. NTIS (US Sales Only), PC A07/MF A01.

Work performed under United States--W. Germany Fast Reactor Exchange Program. Thesis. Submitted to Univ., Karlsruhe,

Germany.

A method was derived to calculate from integral transport theory the neutron flux density close to boundaries between plate lattice regions of fast zero power reactors. Leakage parallel to the plate planes is treated by a momentum method. Linearly anisotropic scattering and the space dependence of effective cross-sections in the resonance region are taken into account by suitable approximations. The method was applied to evaluate reaction rate measurements in the vicinity of the core-blanket boundary of a SNEAK assembly which reproduced parts of the SNR 300 reactor. Using the cross-section set KFKINR agreement with the experiment was achieved for the space dependence of the ^{239}Pu fission rate and the ^{238}U capture rate.

- 5462 (DOE-tr--113) KADIS: A PROGRAM TO ANALYZE THE DISASSEMBLY PHASE OF HYPOTHETICAL ACCIDENTS IN (LMFBRs). Schmuck, P.; Jacobs, G.; Arnecke, G. (Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Inst. fuer Neutronenphysik und Reaktortechnik). [nd]. Translation of KFK--2497, November 1977 207p. Dep. NTIS (US Sales Only), PC A10/MF A01.

Work performed under United States--West Germany Fast Reactor Exchange Program.

The KADIS program models the disassembly phase during power excursions in hypothetical LMFBR accidents. KADIS is based on point kinetics in the neutronics part and on a 2-dimensional representation of the reactor core in the hydrodynamics part. The core is modeled as an ideal, compressible fluid which is heated up adiabatically during the excursion. KADIS was built up with the help of the VENUS program of Argonne National Laboratory. Several important features were added to the basic VENUS model. A complete description of the mathematical models used is presented. The necessary information to handle the input/output of KADIS is included.

- 5463 (TNO-LMEC--29) 50 MW-TRIAL CIRCUIT. QUARTERLY REPORT, FIRST QUARTER 1978. (Nijverheidsorganisatie TNO, Apeldoorn-Zuid (Netherlands). Centraal Technisch Inst. TNO). [nd]. Translation of Kwartaalverslag 50 MW-beproevingscircuit 1e kwartaal 1978, April 1978 7p. Dep. NTIS (US Sales Only), PC A02/MF A01.

Work performed under United States--TNO Technical Exchange Program.

During the entire period just completed the 50 MW installation has been in operation. Operations were specifically directed towards the testing program of the 85 MW-ZWT; primarily with the Na system and incidentally with the steam feedwater system.

- 5464 (TNO-LMEC--30) OPERATION 50 MW CIRCUIT. QUARTERLY REPORT, SECOND QUARTER 1978. (Nijverheidsorganisatie TNO, Apeldoorn (Netherlands)). [nd]. Translation of Kwartaalverslag 2e kwartaal 1978: exploitatie 50 MW-circuit, July 1978 10p. Dep. NTIS (US Sales Only), PC A02/MF A01.

Work performed under United States--TNO Technical Exchange Program.

The operational shutdown which had already started in the previous reporting period continued during this period. Full continuous service was resumed on March 13 and a start has been made on a program of pre-operational tests anticipating the completion of putting the system into service including the 85 MW-ZWT.

- 5465 PROCESS FOR STABILIZING DIMENSIONS OF DUPLEX STAINLESS STEELS FOR SERVICE AT ELEVATED

TEMPERATURES. US Patent Application 055,210.
[nd]. 11p.

Duplex stainless steel materials containing austenite plus delta ferrite, are dimensionally stabilized by heating the material to a reaction temperature between about 1050 to 1450°F (566 to 788°C), holding it at this temperature during transformation of delta ferrite to austenite plus sigma phase, and

subsequently heating to a reversion temperature between about 1625 to 1750°F (885 to 954°C), whereby the sigma phase transforms back to ferrite, but the austenite remains dispersed in the ferrite phase. Final controlled cooling permits transformation of ferrite to austenite plus sigma and, later, precipitation of carbides.
