The test trains for the Sodium Loop Safety Facility (SLSF) in-reactor experiments, which simulate hypothetical LMFBR accidents, have a meltdown cup to protect the primary containment from the effects of molten materials. Thermal and stress analyses were performed on the cup which is designed to contain 3.6 kg of molten fuel and 2.4 kg of molten steel. The cup principal components are: 1. A 38 mm diameter tungsten spike which provides initial fuel quenching and prevents fuel boiling, 2. A 73 mm inside diameter tungsten liner to isolate the support vessel from the molten material high initial temperature, 3. An insulator which is an expedient for extending the experiment time, and 4. An Inconel 625 vessel which provides the structural support to withstand the thermal and pressure stresses. The spike, liner, and insulator are supported by a hemispherical tungsten end cap which fits inside the hemispherical bottom of the support vessel. This vessel is attached to the 316 stainless steel test train with an Inconel 750 wire-formed retaining ring. Thermal analyses were performed with the Argonne-modified version of the general heat transfer code IHTB, based on the instantaneous addition of 3200°K molten fuel with a decay heat of 9 W/gm and 1920°K molten steel. These analyses have shown that the cup will adequately cool the molten materials. The maximum temperature occurs at the center of the fuel region but it is always less than the fuel boiling point. The maximum temperature occurs at the center of the fuel region but it is always less than the fuel boiling point. The most severe heating occurs when there is no sodium flow outside the cup. For this case the sodium boils (approximately 1200°K) and the Inconel vessel and tungsten liner temperatures are approximately 1250°K and 2420°K, respectively.

- 1976 (INIS-mf--4592, pp vp) BULK COOLANT CAVITATION IN LMFBR CONTAINMENT LOADING FOLLOWING A WHOLE-CORE EXPLOSION. 1977.

From 4. international conference on structural mechanics in reactor technology; San Francisco, CA, USA (15 Aug 1977).

An LMFBR core undergoing an explosion transmits energy to the containment in a series of pressure waves and the containment loading is determined by their cumulative effect. Pressure waves are modified by their interaction with the coolant through which they propagate. In liquids in their normal state the main effect of the interaction is to steepen the fronts of waves leading to shock formation but in liquids which have undergone bulk cavitation the interaction is much stronger and is expected to be dissipative and dispersive. Since reflections of initial pressure waves from the core at free surfaces lead to the establishment of a state of tension and consequently of bulk cavitation over large volumes of the coolant, it is necessary to model both the induction of bulk cavitation by tension waves and the interaction of pressure

waves with cavitating liquid in realistic containment loading calculations. The progress which has been achieved in such modelling and first indications for the effect of bulk coolant cavitation in LMFBR containment loading. A model describing the interaction between cavitation bubbles and a host liquid subject to time-varying pressure fields, including the physical process of momentum conservation, phase change, heat conduction and mass diffusion is presented and used to determine which of the various physical processes involved dominate the results. It is shown that if only interested in bulk effects momentum transfer is the chief factor for the pressures and timescales of interest. To determine the effect of the state of purity of the liquid, the main characterising parameters are the initial radii of nucleation sites and their number density, the latter being very influential. To identify the important differences between model water and reactor sodium as far as cavitation is concerned are chiefly the lower surface tension and higher concentration of initially larger nucleation sites in the sodium.

- 1978 (INIS-mf--4592, pp vp) STRUCTURAL RESPONSE OF LARGE LMFBR HEAD CLOSURES TO HYPOTHETICAL CORE DISRUPTIVE ACCIDENTS. 1977.

From 4. international conference on structural mechanics in reactor technology; San Francisco, CA, USA (15 Aug 1977).

A finite-element model was developed to assess the ability of a pool-type LMFBR head closure to sustain an energetic HCDA. From a conceptual representation of an expanded EBR-II type deck, it was determined that there is a reasonable amount of symmetry in the structure that an initial model would consist of a 120° sector. This model accounts for the main structural elements of the closure head: beams, plates, inner ring, in-tank component nozzle and concrete shielding. The mass of the in-tank component was treated as a concentrated mass located at its attachment to the structural members. The ANL-developed SADCAT code was used in this study. The code is an explicit, three-dimensional finite-element code developed for analyzing transient, nonlinear, structural problems. The code has a triangular plate element and a three-dimensional continuum element. The above model was used to study the effect of several design variations on the structural response of the deck to an energetic HCDA. Two types of outer boundary conditions were considered to determine their effect on the closure head's displacements and stress levels. In addition to the above study, an analysis was conducted to determine the structural condition of the concrete shielding. Based upon the above preliminary calculations of pool-type LMFBR head closures, it is indicated that the shield-deck can be designed to survive the given HCDA loads without failure.

- 1980 (INIS-mf--4592, pp vp) STRUCTURAL DYNAMICS STUDIES FOR SINGLE AND CLUSTERED SNR-300 FUEL ELEMENTS: A COMPARISON OF ANALYTICAL AND EXPERIMENTAL RESULTS. 1977.

From 4. international conference on structural mechanics in reactor technology; San Francisco, CA, USA (15 Aug 1977).

Structural damage may occur in liquid metal cooled fast breeder reactors (LMFBR) when local failures escalate to a fast release of excessive thermal energy within one fuel element. Time scales (5. to 50. msec) and peaks of associated pressure pulses (50. to 500. bar) may exceed the burst pressure of the hexagonal wrapper containing the pin-bundle. Though after fuel element rupture the pressure level in the vicinity is markedly reduced, still a significant pressure field is propagating through the core. Therefore surrounding subassemblies or control rods are exposed to impulsive differential pressures causing duct flexure as well as local cross section deformation. A theoretical and experimental research program at GfK Karlsruhe investigates the mechanical effects of conservative pressure transients on LMFBR fuel elements. As part of the program this paper describes two computer codes (BEDYN-2, CORE-1) for non-linear structural dynamics of single as well as clustered subassemblies. Important features and idealizations of mechanical models are discussed before the codes are applied to several loading cases. Then two types of subassembly deformation experiments are outlined, and original records of the pressure pulses are used as input for BEDYN-2 to predict and compare deformation histories with experimental findings: (1) Quasistatic plane strain flat-to-flat loading of the hexagonal wrapper with and without the stiffening pin-bundle. (2) Transverse impulsive loading of a complete 1:1 SNR-300 type fuel element model on roller supports. In addition, pressure records from underwater explosion tests on SNR code models are taken as input for the multirow dynamics code CORE-1 and fairly good correlations were found between measured and predicted permanent deformations.

- 1981 (INIS-mf--4592, pp vp) ENERGY SOURCE FOR MODELING HCDA BUBBLES. 1977.

From 4. international conference on structural mechanics in reactor technology; San Francisco, CA, USA (15 Aug 1977).

This work describes the development and characterization of an energy source that models the assumed initial conditions and the subsequent expansion of an HCDA bubble in a simple /30-scale model of the Clinch River Breeder Reactor (CRBR). The source is used in a study of the phenomena associated with expanding, rising HCDA bubbles, the transport of radioactive core materials to the cover gas region, and the loading resulting from the impact of the coolant slug with the vessel cover. The source uses high-temperature, high-pressure water as the bubble material. The water, initially in the vessel's lower core, is released by opening an explosively driven, fast-opening valve between the lower and upper core barrel. When released, the water reaches a superheated state and flashes to vapor. The vapor expands out of the lower core, through the upper core barrel, and into the vessel containing the coolant simulant (water). High-speed photography is used to observe the

expansion through the transparent walls of the vessel. Characterization tests were performed with and without a vessel cover and with both nitrogen gas (1500 psi, room temperature) and water (1160 psi, 563°F, 0% quality) as the bubble material. The surface motion, bubble volume, pressures in the lower and upper core, and the slug impact pressure were measured. From these, the displaced volume-time, entrainment-time, pressure-volume change, gas-work-volume change, and slug kinetic energy-volume change relations were derived.

- 1982 (INIS-mf--4592, pp vp) SIMULATION STUDY OF THE SECONDARY RUPTURE OF SG TUBING FOR LMFBR. 1977.

From 4. international conference on structural mechanics in reactor technology; San Francisco, CA, USA (15 Aug 1977).

This paper, which is a part of a large research program for safety design of SG, intends to present and discuss the results of a simulation study made to determine the water injection rate and the tube fracture aspect as a function of the wastage shape. In the experiments, pre-milled aluminium tubes were allowed to burst under internal pressure given by water at room temperature. Aluminium was used because the mechanical properties were similar to those of the steel under the actual service conditions. The wastage was typified by two kinds of artificial surface flaw: one the flat bottom groove milled along the length of the tube (the flat flaw) and the other the oval concave milled by running a cylinder grinder bar transverse to the tube axis (the cylindrical flaw), the length (flat flaw) and the radius (cylindrical flaw) as well as the thickness remaining underneath the flaw being the variables. The inner diameter of the test tube was always 19.4 mm, while the wall thickness was so varied between 1.2 and 2.6 mm that the underflaw wall be selectable between 0.6 and 1.6 mm for the burst pressure to be between 80 and 200 kg/cm². To determine the water injection rate, the pressure history was measured by semi-conductor transducers at two points near the flaw; and the progress of crack opening was recorded by stroboscopic photography. The water injection rates calculated on those two measurements will be presented. It will be shown that the time the injection rate became constant was several tenths of a msec for the flat flaws and several msec for the cylindrical flaws, and that the time the crack opened to 90% of the maximum was again several tenths of a msec for the former and several msec for the latter.

- 1983 (INIS-mf--4592, pp v) HYDRODYNAMIC AND ELASTOPLASTIC STRUCTURAL ANALYSIS OF FAST BREEDER REACTOR CORE ACCIDENT. 1977.

From 4. international conference on structural mechanics in reactor technology; San Francisco, CA, USA (15 Aug 1977).

This paper describes the principles and examples of applications of an explicit Lagrangian coupled finite difference-finite element code HEMP-ESI developed in order to calculate the structural consequences of hypothetical core disruptive accidents (HCDA) in nuclear reactors. The explicit solution algorithm of the finite difference scheme used to discretize the hydrodynamic fluid domains is shown to be very similar to that used for the solution of the finite element discretized shell structures, hence permitting an easy and efficient coupling. Two examples of simulation show the applicability of the method to nuclear reactor core safety analysis (test problem).

1984 (INIS-mf--4592, pp v) DETAILED NON-LINEAR ANALYSIS OF THE RESPONSE OF THE DECK OF A FAST BREEDER REACTOR UNDER ACCIDENTAL SODIUM IMPACT. 1977.

1985 (INIS-mf--4623) EXAMPLE OF REGULATING PROCESS FOR AN ADVANCED REACTOR: CREYS-MALVILLE. Cravero, M. (Electricite de France, 92 - Courbevoie. Service Etudes et Projets Thermiques et Nucleaires). 1978. 18p. (CONF-780584--4). Dep. NTIS (US Sales Only), PC A02/MF A01.

From International conference on regulating nuclear energy; Brussels, Belgium (16 May 1978).

The general philosophy for the regulatory control of the Super-Phenix fast breeder reactor was the same as for other types of nuclear power plants. The licensing process for both conventional and nuclear aspects was also identical to that for other nuclear units. On the other hand, safety recommendations were especially prepared by the CEA's appropriate services on the basis of acquired experience. The paper analyses the development of the licensing process for the reactor and knowledge to be gained for future units of this type.

1986 (INIS-mf--4638, pp vp) PRESSURE TRANSIENT ANALYSIS IN SINGLE AND TWO-PHASE WATER BY FINITE DIFFERENCE METHODS. 1977.

From 4. international conference on structural mechanics in reactor technology; San Francisco, CA, USA (15 Aug 1977).

An important consideration in the design of LMFBR steam generators is the possibility of leakage from a steam generator water tube. The ensuing sodium/water reaction will be largely controlled by the amount of water available at the leak site, thus analysis methods treating this event must have the capability of accurately modeling pressure transients through all states of water occurring in a steam generator, whether single or two-phase. The equation systems of the present model consist of the conservation equations together with an equation of state for one-dimensional homogeneous flow. These equations are then solved using finite difference techniques with phase considerations and non-equilibrium effects being treated through the equation of state. The basis for water property computation is Keenan's 'fundamental equation of state' which is applicable to single-phase water at pressures less than 1000 bars and temperatures less than 1300°C. This provides formulations allowing computation of any water property to any desired precision. Two-phase properties are constructed from values on the saturation line. The use of formulations permits the direct calculation of any thermodynamic property (or property derivative) to great precision while requiring very little computer storage, but does involve considerable computation time. For this reason an optional calculation scheme based on the method of 'transfinite interpolation' is included to give rapid computation in selected regions with decreased precision. The conservation equations were solved using the second order Lax-Wendroff scheme which includes wall friction, allows the formation of shocks and locally supersonic flow. Computational boundary conditions were found from a method-of-characteristics solution

at the reservoir and receiver ends. The local characteristics were used to interpolate data from inside the pipe to the boundary.

1987 (INIS-mf--4638, pp vp) DAMPING OF THE RADIAL IMPULSIVE MOTION OF LMFBR CORE COMPONENTS SEPARATED BY FLUID SQUEEZE FILMS. 1977.

From 4. international conference on structural mechanics in reactor technology; San Francisco, CA, USA (15 Aug 1977).

The core deformation of a liquid metal cooled fast breeder reactor (LMFBR) due to local pressure propagation from rapid energy releases is a complex three-dimensional fluid-structure-interaction problem. High pressure transients of short duration cause structural deformation of the closely spaced fuel elements, which are surrounded by the flowing coolant. Corresponding relative displacements give rise to a squeezing fluid motion in the thin layers between the subassemblies. Therefore significant backpressures are produced and the resulting time and space dependent fluid forces are acting on the structure as additional non-conservative external loads. Realistic LMFBR safety analyses of several clustered fuel elements have to account for such flow induced forces. This paper describes two fluid flow models (model A, model B), which are shown to be suitable for physically coupled fluid-structure analyses. Important assumptions are discussed in both cases and basic equations are derived for one- and two-dimensional incompressible flow fields. The interface of corresponding computer codes FLUF (model A) and FLOWAX (model B) with structural dynamics programs is outlined. Finally fluid-structure interaction problems relevant to LMFBR design are analyzed; parametric studies indicate a significant cushioning effect, energy dissipation and a strongly nonlinear as well as time-dependent damping of the structural response.

1988 (INIS-mf--4638, pp vp) PTA-1 COMPUTER PROGRAM FOR TREATING PRESSURE TRANSIENTS IN HYDRAULIC NETWORKS INCLUDING THE EFFECT OF PIPE PLASTICITY. 1977.

From 4. international conference on structural mechanics in reactor technology; San Francisco, CA, USA (15 Aug 1977).

Pressure pulses resulting from a sodium-water reaction occurring in a steam generator in an LMFBR intermediate heat transport system may plastically deform the thin-walled piping typically used in such systems. This plastic deformation has a significant effect on pressure transient propagation, since it limits the peak pressure transmitted out of a pipe to approximately its yield pressure if the pipe is sufficiently long. The computer code PTA-1 incorporates the effect of plastic deformation of the piping on pressure transient propagation in complex hydraulic networks. Although it was developed for predicting the propagation of pressure pulses in the intermediate heat transport system of an LMFBR, it may also be used to analyze transient propagation in other complicated piping networks for which fluid-hammer theory is appropriate. PTA-1 uses the one-dimensional method-of-characteristics applied to fluid-hammer analysis of pressure transients in large piping systems. Non-linear convective terms, pipe friction and fluid compressibility are included in the formulation of the governing equations. The effect of plastic deformation of piping is incorporated through a modified fluid wave speed which varies with deformation history at each computational node in a plastically deforming pipe. An iterative procedure is employed to

locate the characteristic curves, through the wave speed, are a function of fluid pressure and pipe deformation history. Various types of junctions and fittings may be specified; these include closed ends, multi-branched tees, surge tanks, sudden expansions and contractions, dummy junctions, acoustic-impedance discontinuities, non-reflecting far-end boundaries, and simple models for pumps and rupture disks.

- 1989 (INIS-mf--4690, pp v) DYNAMIC INSTABILITY ANALYSIS OF AXISYMMETRIC SHELLS BY FINITE ELEMENT METHOD WITH CONVEXED COORDINATES. 1977.

From 4. international conference on structural mechanics in reactor technology; San Francisco, CA, USA (15 Aug 1977).

A rectilinear shell element formulated in the convected (co-rotational) coordinates is used to investigate the effects of edge conditions on the behaviors of thin shells of revolution under suddenly applied uniform loading. The equivalent generalized nodal forces under uniform loading are computed to the third order of the length of each element. A dynamic buckling load is defined as the load at which a great change in the response is observed for a small change in the loading. The problem studied is a shallow spherical cap. The cap is discretized into a finite number of elements. This discretization introduces some initial imperfections into the shell model. Nonetheless, the effect of this artificial imperfection is isolated from the effect of the edge conditions provided the same number of elements is used in all the cases. Four different edge conditions for the cap are used. These boundary conditions are fixed edge, hinged edge, roller edge and free edge.

- 1992 (INIS-mf--4760, pp 59-98) EXPLOSIVE PLUGGING OF NUCLEAR HEAT EXCHANGERS. Crossland, B.; Bahrani, A.S.; Townsley, W.J. (Queen's Univ., Belfast, Northern Ireland (UK)). 1976.

From 3. international symposium on the use of explosive energy in manufacturing metallic materials of new properties by explosive welding, cladding, hardening, and metal-powder pressing processes; Mariánské Lázně, Czechoslovakia (19 Oct 1976).

The explosive plugging techniques developed in the Department of Mechanical and Industrial Engineering of the Queen's University of

Belfast for the reheater and superheater of the PFR reactor and for the reheater of the AGR type reactor are described. For the PFR a point charge system was used which causes a spherical expansion of the plug, which gives two zones of welding. Using a parallel stand-off welding set up, it proved difficult or impossible to avoid a crevice. Consequently, a rim charge set up was developed which gives a circular ring expansion of the plug with two zones of welding. The problem is also considered of the distortion of holes adjoining the hole to which a plug is welded. Bunting of adjoining holes in order to reduce the distortion was also investigated. The described equipment is shown in drawings.

- 1993 (INIS-mf--4773) CASSANDRE: A 2D MULTIGROUP DIFFUSION BENCHMARK CODE FOR FAST REACTORS POWER EXCURSIONS ANALYSIS. Bardiaux, M.; Devooght, J.; Mund, E.; Saragossi, I. (Brussels Univ. (Belgium)); Dugnoille, P.; Goldwasser, M.; Joly, J.; Siebertz, A. (Brussels Univ. (Belgium)); Centre d'Etude de l'Energie Nucleaire, Mol (Belgium)). 1978. 13p. (CONF-781022--64). Dep. NTIS (US Sales Only), PC A02/MF A01.

From Meeting on nuclear power reactor safety; Brussels, Belgium (16 Oct 1978).

CASSANDRE uses a four group 2D diffusion model with finite elements up to quintic order. Time dependence involves a generalization of the quasistatic approximation with a different amplitude function for each group. The coupled shape and amplitude equations are cast into integral form and solved iteratively using a Newton-SOR algorithm. A simplified thermohydraulics feedback is incorporated. A great number of parametric studies involving different time steps and number of Newton iterations show that power transients accuracy near prompt critical may be strongly affected by reactivity and shape function convergence.

- 1994 (INIS-mf--4816, pp 2-6) IMPORTANCE OF THE FAST BREEDER FOR OUR ENERGY SUPPLY. Faude, D. (Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Projekt Schneller Brueter). 1978. (In German).

From Information meeting on questions concerning nuclear energy; Karlsruhe, F.R. Germany (13 Oct 1977).

A fuel balance is made for LWR and FBR reactors. The natural uranium consumption for different reactor strategies is compared, and it is found that the fast breeder technology is the only technical possibility of energy supply that is not hampered by limited fuel reserves.

- 1995 (INIS-mf--4816, pp 11-16) SAFETY OF SODIUM-COOLED FAST BREEDERS, USING THE EXAMPLE OF THE 300 MWE BREEDER PROTOTYPE POWER PLANT AT KALKAR (SNR 300). Heusener, G. (Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Projekt Schneller Brueter). 1978. (In German).

From Information meeting on questions concerning nuclear energy; Karlsruhe, F.R. Germany (13 Oct 1977).

The danger potential of fast breeders is similar to that of other reactor systems; suitable safety measures are required to prevent accidents. As in all reactors, the safety measures taken in fast breeders are highly reliable. There are measures to prevent accidents (preventive measures) and safety measures to keep the consequences of accidents small and under control within the reactor system (containment measures). The SNR 300 is constructed so as to control even the most extreme possible accident, the Bethe-Tait

accident which is highly improbable, within the containment so that no excessive radiation pollution of the environment will occur.

- 1996 (INIS-mf--4816, pp 7-10) TECHNICAL CONCEPT OF FAST BREEDER POWER PLANTS. Hueper, R. (Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Projekt Schneller Brueker). 1978. (In German).

From Information meeting on questions concerning nuclear energy; Karlsruhe, F.R. Germany (13 Oct 1977).

Fast breeders generate power and at the same time, produce nuclear fuel. The author describes constructional principles and the state of the art of sodium-cooled fast breeders.

- 1997 (INIS-mf--4816, pp 17-21) LARGE-SCALE USE OF SODIUM. Peppler, W. (Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Inst. fuer Reaktorentwicklung). 1978. (In German).

From Information meeting on questions concerning nuclear energy; Karlsruhe, F.R. Germany (13 Oct 1977).

The author outlines reserves, chemical and thermodynamic properties of sodium, as well as its use in breeder technology where heat transfer components play a special role with regard to their behaviour during accidents in case of sodium-air and sodium-water reactions. Sodium fires in the primary Na systems can be excluded as these spaces are always flooded with nitrogen. In the secondary system an effective sodium catcher system prevents sodium fires; Na-H₂O reactions in case of a steam generator break are prevented by a reliable, quick-action failure relief system.

- 1998 (INIS-mf--4857) FIVE YEARS EXPERIENCE OF THE OPERATION OF THE SODIUM CIRCUITS OF THE DOUNREAY PROTOTYPE FAST REACTOR. Walford, J.G. (UKAEA Dounreay Nuclear Power Development Establishment). 1978. 12p. Dep. NTIS (US Sales Only), PC A02/MF A01.

During the five years since the various coolant circuits of the PFR fast breeder were filled, some 36,000 hours of operation of each of the main plant components have been accumulated. A description is given of experiences on the major sodium pumps and their ancillaries, the sodium pipework and valves, the 'operational' in-reactor mechanisms such as control rod drives and the intermediate heat exchanger valves. The performance of sodium instrumentation is discussed as is that of the sodium purification loops. The major successes, as well as a number of operating difficulties and the measures taken or proposed to overcome them, are described.

- 1999 (INIS-mf--4862) SAFETY STUDY. THE CLINCH RIVER BREEDER REACTOR PLANT. Piper, H.B.; Leaver, D.E.; Wood, P.J. (Project Management Corp., Oak Ridge, TN (USA)). 1978. 9p. (CONF-781022--84). Dep. NTIS (US Sales Only), PC A02/MF A01.

From Meeting on nuclear power reactor safety; Brussels, Belgium (16 Oct 1978).

A risk assessment has been performed to provide a realistic evaluation of the risk to the public from the Clinch River Breeder Reactor Plant (CRBRP), to place that risk in perspective relative to other societal risks, and to provide a basis for assessing the comparability of the risk from the CRBRP with risks associated with previously licensed US reactors. The assessment formally and systematically evaluated the CRBRP risk and

showed that the risk associated with postulated accidents of the CRBRP is small when compared with non-nuclear risks to which the local population is already exposed, and that CRBRP risks are comparable to those from light-water reactors (LWR's) of the current generation as characterized in the Rasmussen Study.

- 2000 (INIS-mf--4911) INVESTIGATIONS OF TEMPERATURE FLUCTUATIONS IN LIQUID SODIUM IN ORDER TO DETERMINE CHARACTERISTIC FLOW PARAMETERS AND THERMOCOUPLE TRANSFER FUNCTIONS. Benkert, J. (Hannover Univ. (Germany, F.R.). Fakultät fuer Maschinenwesen). 1977. 104p. (In German). Dep. NTIS (US Sales Only), PC A06/MF A01.

Diss. (D.Eng.).

Because of narrow geometries and high thermal loads mainly thermocouples are used to monitor the coolant state in the reactor core, the heat exchangers and the piping. The aim of the present paper is to determine the transfer behavior of different types of thermocouples, the local influencing of the temperature fluctuations and to what extent the heat transfer coefficient fluid/wall may be evaluated from the measurements performed. The experiments to study these problems were carried out in three test beds for liquid sodium. The good agreement between model calculations and the experiments made allow the experimenter to make interpretations of extreme flow conditions on one hand and the owners of plants to select and apply optimally thermocouples under normal operating conditions on the other.

- 2001 (INIS-mf--4960) SODIUM FIRE AND CONTAINMENT LEAKAGE. Person, L.W. (Argonne National Lab., IL (USA)). 1978. 3p. (CONF-781022--108). Dep. NTIS (US Sales Only), PC A02/MF A01.

From Meeting on nuclear power reactor safety; Brussels, Belgium (16 Oct 1978).

A combination of statistical response surface method and existing sodium fire computer modelling will provide functional requirements to the reactor containment designer and give the range of radioactivity release to the environment via containment leakage for the radiation health physicist. It can be generalized as a viable approach to reducing the time and cost required to obtain estimates of radiation safety aspects of nuclear power reactors.

- 2002 (INIS-mf--4974, pp 334-344) TEMPERATURE DEPENDENCE OF VOID PARAMETERS IN THE OKH16N15M3BR STEEL FUEL CANS UNDER RADIATION CONDITIONS. Ostrovskii, Z.E.; Prokhorov, V.I. 1978. (In Russian). From Conference on reactor materials science; Alushta, Ukrainian SSR (29 May 1978).

An attempt is made to explain various swelling of the BOR-60 reactor fuel cans irradiated in the same fuel packet under identical conditions. Studies on the effect of different factors as possible causes of dispersions in the can swelling of identical fuel elements have shown that the most important factor is various gas content in the OKh16N15M3BR steel fuel can in the process of void formation.

- 2003 (INIS-mf--5083) UK FAST REACTOR COMPONENTS. SODIUM REMOVAL DECONTAMINATION AND REQUALIFICATION. Donaldson, D.M.; Bray, J.A.; Newson, I.H. (UKAEA Risley Nuclear Power Development Establishment). 1978. 26p. Dep. NTIS (US Sales Only), PC A03/MF A01.

Extensive experience gained at the U.K.A.E.A. Dounreay Nuclear Power Development Establishment is being applied to form the basis of the plant to be provided for sodium removal, decontamination, and requalification of components in future commercial fast reactors. In the first part of a three part paper, the factors to be taken into account, showing the UK philosophy and approach to maintenance and repair operations are discussed. In the second part, PFR facilities for sodium removal and decontamination are described and some examples are given of cleaning components such as pumps, charge machine, cold trap baskets, and steam generator units. Similar facilities at DFR are briefly described. In the third part of the paper a short description is given of the Harwell mass transfer loop, currently used to study the deposition of activated stainless steel corrosion products. Decontamination method for pipework specimens cut from the loop are described and results of first screening tests of various chemical decontaminants are presented.

- 2024 (INIS-mf--5107) COMPARISON OF SAFETY CHARACTERISTICS OF THE ADVANCED REACTOR LINES FAST BREEDER AND HTR. REPORT TO THE COMMITTEE FOR INTERNAL AFFAIRS OF THE GERMAN BUNDESTAG. MATERIALS. 1978. vp.p. (In German).

The following points are compared for SNR-300 and THTR-300: 1) Safety aspects; 2) safety characteristics, e.g. activity inventory and its enclosure by fuel can and fuel matrix, primary system and containment; 3) securing of barriers like shutdown ability, removal of afterheat, retention systems, and containment sealing; 4) emission of gaseous substances during normal operation; 5) accidents and their radiological effects.

- 2005 (INIS-mf--5114) REPORT OF THE ACTIVITIES DURING THE YEARS 1977 AND 1978. (Nijverheidsorganisatie TNO, The Hague (Netherlands). Projectgroep Kernenergie TNO). 8 Feb 1979. 28p. (In Dutch). Dep. NTIS (US Sales Only), PC A03/MF A01.

An introduction with general aspects is followed by more detailed descriptions of the separate projects concerned with sodium cooled, fast breeder reactors. These include material for use at high temperatures, safety related applied mechanics, specific sodium technology, joining techniques, heat transfer and current, not destructive testing, and pump developments.

- 2006 (INIS-mf--5244) ANNUAL REPORT 1978. (Stichting Energieonderzoek Centrum Nederland, The Hague). Jun 1979. 80p. (In Dutch). Dep. NTIS (US Sales Only), PC A05/MF A01.

The activities of ECN in 1978 give first the general analysis of the Dutch energy economy carried out by the Energy Study Centre (ESC). Studies on energy modelling and energy conservation in buildings are briefly discussed.

- 2007 (INIS-mf--5308, pp 99-117) BEHAVIOUR AND SOME PROPERTIES OF U-PU OXIDE FUEL RODS OF FAST REACTORS. Men'shikova, T.S.; Golovnin, I.S.; Flatkina, V.P.; Sytov, L.I.; Korostin, O.S.; Davydov, E.F.; Kuz'min, V.I. 1978. (In Russian).

From Conference on reactor materials science; Alushta, Ukrainian SSR (29 May 1978).

Methods of preparing homogeneous UPuO₂ specimens of different initial powders (mechanically mixed and co-precipitated) are considered. The relationships are presented

between creep rates of UPuO₂ rods at different temperatures and plutonium content. It is established that the creep rate increases with plutonium content from 10 to 30 mass.%. The dependence of the thermal resistance of a 'fuel-clad' gap on the gap width has been investigated. Thermal resistance approximately doubles with an increase of the gap from 0 to 0.4 mm. The interaction between a UPuO₂ rod and OKh16N15M3B steel clad has been studied in the BOR-60 reactor under the operational conditions.

- 2008 (INIS-mf--5308, pp 142-163) RESULTS OF IRRADIATION TESTS OF FAST REACTOR OXIDE FUEL AND FUEL ELEMENTS. Tsykanov, V.A.; Davydov, E.F.; Gryazev, V.M. 1978. (In Russian). From Conference on reactor materials science; Alushta, Ukrainian SSR (29 May 1978).

The experimental results are considered obtained in post-reactor investigations into the structure variation, plutonium redistribution, swelling and gas release in pellet and vibrocompacted oxide fuel. The data are generalized on the operating capabilities of BOR-60 fuel elements and BN-600 experimental fuel elements of UO₂ and UO₂-PuO₂ as well as on the swelling, mechanical properties and corrosion of the OKh16N15M3B steel claddings.

- 2009 (INKA-Conf--79-003-006) OXYGEN DISTRIBUTION IN FAST REACTOR OXIDE FUELS. Ewart, F.T. (UKAEA, Harwell. Chemical Technology Div.); Mari, C.M. (Milan Univ. (Italy). Istituto di Elettrochimica e Metallurgia); Fourcaudot, S.; Matzke, H.; Manes, L.; Toci, F. (Commission of the European Communities, Karlsruhe (Germany, F.R.). European Inst. for Transuranium Elements). (UKAEA Atomic Energy Research Establishment, Harwell). 1979. 5p. (IAEA-SM--236/7(preprint); CONF-790111--31). Dep. NTIS (US Sales Only), PC A02/MF A01.

From International symposium on thermodynamics of nuclear materials; Julich, F.R. Germany (29 Jan 1979).

The chemistry of irradiated fuel pins has been examined with respect to oxygen distribution. Two hypostoichiometric mixed oxide fuel pins have been irradiated to high burn up under controlled conditions in a materials testing reactor. The radial oxygen profile at the end of irradiation has been measured. Small specimens were extracted from differing points on the radius of the fuel; their oxygen potential was measured in a micro galvanic cell. The results have shown that, although the pins had initially widely different oxygen contents (O/M values of 1.948 and 1.976), the final O/M values were virtually identical at 1.992 and 1.997. This is contrary to the behaviour predicted from existing fuel chemistry theory. Oxidation above 1.997 O/M in the higher initial O/M pin is prevented by the oxidation of the clad.

- 2010 (INKA-Conf--79-082-001) INTERPRETATION OF LOCAL BOILING BEHAVIOUR IN THE KNS BLOCKAGE EXPERIMENTS. Clare, A.J. (Karlsruhe Univ. (TH) (Germany, F.R.). Inst. fuer Reaktortechnik). 1979. 1p. (CONF-7905160--1). NTIS (US Sales Only), PC A02/MF A01.

- 2012 (INTAT--78-70, pp 84-101) DESIGN VIEW POINTS AND MATERIAL ASPECTS FOR SNR ABSORBER. Duenner, P.; Toebbe, H. Aug 1978. (In German).

From KITG special meeting of the Fachgruppe Brennelemente; Bergisch Gladbach, F.R. Germany (25 Nov 1977).

The present meetings report gives a survey on the state of development for absorbers of fast reactors. Numerous materials, material combinations and geometrical configurations are for neutron-physical reasons possible for the various reactor concepts of control and shutdown. Boron carbide is primarily used as reference material in the SNR, however, numerous alternatives to realize long-term project targets are still being pursued.

- 2013 (INTAT--78.147) FAST BREEDERS AND ENVIRONMENT. Hoerning, H. (Internationale Atomreaktorbau G.m.b.H. (INTERATOM), Bergisch Gladbach (Germany, F.R.)). Dec 1978. 28p. (In German). (CONF-780917i--1; INKA-Conf--78-271-003). Dep. NTIS (US Sales Only), PC A03/MF A01.

From Conference on the role of the fast breeder reactor; Essen, F.R. Germany (27 Sep 1978).

The waste heat of a fast breeder has a thermal efficiency of 40%. This is the same as in conventional power plants, i.e. not typical of nuclear power plants. Wet and dry cooling towers are built with increasing frequency in order to protect rivers. The potential danger due to high radioactivity inventories in all fuel cycle stages is not the same as its actual danger. Radioactivity sources in fast breeders are listed and compared with those of LWR reactors. Activity sources and inventories are similar. Exposure pathways are listed which might endanger the population in the vicinity of fast breeders and other nuclear facilities in case of radioactivity release. In addition to the rated values stated in the Radiation Protection Ordinance for normal operation and accidents the very low radiation doses calculated for the SNR-300 are given. This is also proved by a comparison with natural and man-made radiation and their variation in West Germany. Fuel element reprocessing, experience so far, and waste conditioning are dealt with. The toxicity of high-activity waste of fast breeders and LWR reactors is compared, and its reduction on storage is shown. The West German concept for final storage is outlined.

- 2014 (IS-T--887) ELECTRO- AND THERMOTRANSPORT OF CARBON IN IRON-NICKEL ALLOYS. Okafor, I.C.I. (Ames Lab., IA (USA)). Mar 1980. Contract W-7405-ENG-82. 104p. Dep. NTIS, PC A06/MF A01.

Results of studies on the electrotransport, thermotransport and chemical diffusion of

carbon in γ -phase iron = 32.5 wt % nickel alloys are described. The transport parameters, Z, Q and D were measured as a function of temperature and carbon concentration and values for the activation energies for diffusion and electrotransport were obtained. The solubility limit of carbon in γ -Fe-32.5 wt % Ni for the temperature range 850 to 1200°C and the electrical resistivity versus temperature for carbon concentrations of 0.0, 0.1, 0.2, 0.5 and 0.86 wt % C between 25 and 1350°C were determined. An anomalously large mass transport effect observed in two-phase alloy during thermotransport experiments was investigated for the Fe-Ni-C system.

- 2015 (ITB--76.08) DECAY HEAT OF FISSION PRODUCTS AND ACTINIDES OF THE SNR 300. Groenefeld, G. (Internationale Atomreaktorbau G.m.b.H. (INTERATOM), Bergisch Gladbach (Germany, F.R.)). Jan 1976. 289p. (In German). Dep. NTIS (US Sales Only), PC A13/MF A01.

The computer code RASPA, which calculates build-up and decay of fission products and actinides is described. The verification of the code and its library has been performed by comparison with theoretical and experimental results of other authors whereby a good agreement has been achieved. Furthermore, an error analysis has shown that the error of the calculated decay heat, which is induced by uncertainties of nuclear data, is less than 10% up to decay times of one month. The time dependence decay heat and the gamma source strength in various zones of the core Mark IA and Mark II of the SNR 300 have been calculated with RASPA. The results are documented and discussed in detail.

- 2016 (IWGFR--3) INTERNATIONAL WORKING GROUP ON FAST REACTORS EIGHTH ANNUAL MEETING. SUMMARY REPORT, PART II. (International Atomic Energy Agency, Vienna (Austria). International Working Group on Fast Reactors). 1975. 114p. (CONF-7504136--P2). Dep. NTIS, PC A06/MF A01.

From 8. meeting international working group on fast reactors; Vienna, Austria (15 Apr 1975).

The various national programs in fast reactor research and development are reviewed.

- 2017 (IWGFR--5) INTERNATIONAL WORKING GROUP ON FAST REACTORS. (International Atomic Energy Agency, Vienna (Austria). International Working Group on Fast Reactors). 1975. 193p. (CONF-750527--(Summ.)). Dep. NTIS (US Sales Only), PC A09/MF A01.

From International working group on fuel failure mechanisms; Seattle, WA, USA (11 May 1975).

Separate abstracts were prepared for 18 of the 23 papers included. Abstracts have appeared previously for the remaining 5 papers.

- 2018 (IWGFR--5, pp 18-24) FUEL CLAD FAILURES IN RAPSODIE REACTOR AND AN EXPERIMENTAL IRRADIATION PROGRAM IN ORDER TO OBTAIN VOLUNTARY AND SPONTANEOUS FAILURES. Chalony, A.; Chantoin, P. 1975.

From International working group on fuel failure mechanisms; Seattle, WA, USA (11 May 1975).

An experimental program at the RAPSODIE Reactor for the study of FBR fuel pin failure is described. The results to date are also presented.

2019 (IWGFR--5, pp 30-34) STUDY OF FUEL FAILURE DUE TO MANUFACTURING FAULTS.

Gatesope, J.P.; Perret, F. 1975.

From International working group on fuel failure mechanisms; Seattle, WA, USA (11 May 1975).

The mechanism for FBR fuel pin failure following sodium entry into the pin through a defective weld is discussed.

2020 (IWGFR--5, pp 35-37) CONTRIBUTION TO THE SPECIALISTS MEETING ON FUEL FAILURE MECHANISMS. Goetzmann, O. 1975.

From International working group on fuel failure mechanisms; Seattle, WA, USA (11 May 1975).

The mechanism for inner cladding attack in FBR fuel pins is discussed.

2021 (IWGFR--5, pp 43-49) COMPLEMENTARY INFORMATION TO SUMMARY REPORT ON FUEL FAILURES, THEORETICAL APPROACH, AND SPECIAL PROGRAMS. Mayer, H. 1975.

From International working group on fuel failure mechanisms; Seattle, WA, USA (11 May 1975).

The objective of this note is to provide recent complementary information on the status of DFR-455 and Mol-7B and to cover some additional aspects of theoretical treatment of fuel failure mechanisms. Topics of an initiated safety related program are mentioned without detailed discussion.

2022 (IWGFR--5, pp 50-58) SUMMARY ON FUEL PIN FAILURES AND THEORETICAL APPROACH. Mayer, H. 1975.

From International working group on fuel failure mechanisms; Seattle, WA, USA (11 May 1975).

It is the purpose of this report to summarize the essential experimental facts and to give some hypothesis for interpretation as far as possible today. The status of theoretical description of fuel pin behaviour (code IAMBUS) is given with emphasis on a partial interpretation of failures. Both of course cannot be conclusive, but will show the main lines of thinking to be followed in the future. The findings and results reported are part of the joint fuel development program for the SNR-300 (Kernkraftwerk Kalkar).

2023 (IWGFR--5, pp 59-64) FUEL FAILURE STUDIES AND EXPERIENCES IN ITALY. Cicognani, G. 1975.

From International working group on fuel failure mechanisms; Seattle, WA, USA (11 May 1975).

Of great importance in the design of the fast breeder fuel element are the assumptions and the hypotheses on the statistical behaviour of the fuel pin under both nominal and transient conditions. It is well known that the assumed pin failure limits, as well as the behaviour of a defected pin under operation, affect the average conditions of the core. Therefore a better understanding of the pin failure and damage propagation related mechanisms is mandatory to improve the design criteria and specifications for the fuel and, finally, the economics of the system. A short review the activities carried out in this field by the Fast Reactor Department of the CNEN, both in-pile and out-of-pile, and of the effort on the calculation models and codes recently started by NIRA is presented.

2024 (IWGFR--5, pp 69-82) PNC IRRADIATION

PROGRAMS. Kawata, T.; Kikuchi, S.; Uematsu, K. 1975.

From International working group on fuel failure mechanisms; Seattle, WA, USA (11 May 1975).

The Power Reactor and Nuclear Fuel Development Corporation has been conducting various irradiation experiments for fuels and materials in support of design and construction of 'JOYO' experimental fast reactor and 'MONJU' prototype fast reactor.

2025 (IWGFR--5, pp 83-84) PIPER: A NEW FAST REACTOR FUEL PIN PERFORMANCE CODE. Kikuchi, S.; Yokouchi, Y. 1975.

From International working group on fuel failure mechanisms; Seattle, WA, USA (11 May 1975).

A new computer program (PIPER=Pin Performance) has been developed for analyzing and predicting LMFBR fuel pin performance with burnup. The objective of the PIPER program is to calculate the fuel pin performance including stresses and deformation in a reactor as the result of a history of power, coolant temperature, coolant flow and other operating conditions. The PIPER program treats the quasi-static transient analysis of a fuel element in the form of a long metallic tube which is the clad for a cylindrical column of porous fuel. Encapsulated pins can be treated as an option. The geometry is axisymmetric and all stresses, strains, forces and deflections are assumed to be axisymmetric. The fuel pin can be divided into as many as ten arbitrary axial sections plus one axial section to treat the fission gas plenum. The fuel region can be divided into up to twenty equal mass radial regions for all calculations except the stress and deformation calculations. To limit the computer running time required for the stress-strain calculations, the fuel region radial nodes are grouped into three regions for the stress-deformation calculations. Mechanical properties, temperature, porosity and concentration dependent models are appropriately weighted for each of these three regions.

2026 (IWGFR--5, pp 152-157) EXPERIMENTAL STUDY OF FAST REACTOR FUEL PIN PERFORMANCE. Davydov, E.F.; Kuzmin, V.I.; Lebedev, I.G.; Syuzev, V.N. 1975.

From International working group on fuel failure mechanisms; Seattle, WA, USA (11 May 1975).

Presented in this report are the results of extensive tests of fast fuel pin performance carried out in the BOR-60 reactor. Oxide fuel pins of the actual design were successfully irradiated to 10% burnup of heavy atoms. The 10 to 11% burnup fuel cladding mechanical strain was found to be not in excess of 0.5% and 1.3% for oxide and carbide fuel pins, respectively. The fuel pin characteristics are presented for those with failed cladding. The analysis of failures showed that they were caused mainly by cladding embrittlement resulted from chemical effects of impurities present in fuel. The failures were observed to occur under both steady-state and transient conditions. The further study program is presented aimed at the optimization of the oxide fuel element design and fabrication technology and testing several carbide fuel pin versions.

2027 (IWGFR--5, pp 158-174) BASIC PRINCIPLES OF PROGNOSTICATION FOR OXIDE FUEL ELEMENT WORKING ABILITY OF SODIUM COOLED FAST REACTORS. Golovnin, I.S.; Likhatchev, J.I. 1975.

From International working group on fuel failure mechanisms; Seattle, WA, USA (11 May 1975).

The basic parameter influencing the working ability of oxide fuel elements in sodium cooled fast reactors are determined, the principles for the choice of their optimal values are suggested and the main changes appearing in the oxide fuel element during its operation are discussed. The dynamic scale models of thermal-physical and strength estimation of fuel element design are given as well as the criteria for operational reliability. The data is given proceeding from the theoretical conceptions and experimental results on the behaviour of materials under in-off pile conditions.

- 2028 (IWGFR--5, pp 25-29) FUEL FAILURE ON THE RAPSODIE SUBASSEMBLY 'CAPRICORN 1.B'. Chalony, A.; Chantoin, P.; Cauvin, J.C.; Pages, J.P. 1975.

From International working group on fuel failure mechanisms; Seattle, WA, USA (11 May 1975).

Fuel pin failure in a 3-pin experimental subassembly in RAPSODIE is described. The location, removal, and post-irradiation examination of the subassembly is described and the postulated failure mechanism is discussed.

- 2029 (IWGFR--5, pp 38-42) SIMULATION OF DIFFERENT TRANSIENT CLAD FAILURE MECHANISMS IN FUEL PIN MODELLING. Kuczera, B. 1975.

From International working group on fuel failure mechanisms; Seattle, WA, USA (11 May 1975).

For the analysis of hypothetical core disruptive accidents (HCDAs), failure time and failure position of a fuel pin and the state of the fuel itself are important parameters with respect to the initial conditions of the subsequent fuel coolant interaction (FCI). Various, time dependent load conditions may cause the cladding tube to fail. The main failure reasons are: (1) mechanical fuel-clad interaction due to differential expansion, (2) loading due to fission gas pressure, (3) local contact of molten fuel and clad, and (4) clad melting under dry-out conditions. The influence of threshold values (failure criteria) on simulated accident sequences is demonstrated.

- 2030 (IWGFR--5, pp 67-68) MONJU FUEL PIN SAFETY IRRADIATION PROGRAM IN GETR. Kawata, T.; Kikuchi, S.; Uematsu, K. 1975.

From International working group on fuel failure mechanisms; Seattle, WA, USA (11 May 1975).

Within the activities of experimental support of the MONJU safety design, a total of twenty fuel pin tests are planned to be performed in GETR. Of these twenty tests, nine are of the loss of coolant flow (LOC) type, and six are of the local flow blockage (LFB) type. These tests include the experiments on the fresh pins as well as on the fuel pins preirradiated in the fast flux conditions. French fast reactor Rapsodie will be used for the preirradiation of the fuel pins. Remaining five test are of the overpower (OP) type and include only fresh pins. This synopsis gives the outlines of these three types of experiments.

- 2031 (IWGFR--5, pp 142-151) LABORATORY STUDIES ON MELTING AND GAS RELEASE BEHAVIOR OF IRRADIATED FUEL. Weber, E.R.; Slagle, D.D.; Hinman, C.A. 1975.

From International working group on fuel

failure mechanisms; Seattle, WA, USA (11 May 1975).

The response of irradiated fuels to rapid heating is a major factor which must be considered in safety analyses for fast reactors. A series of experiments at HEDL provide observations and data on the response of fast flux (EBR-II) irradiated fuel materials when subjected to rapid heating in the laboratory. Fuel samples within a resistively heated tungsten tube are subjected to thermal transients in a system providing for temperature and pressure measurements, in addition to continuous gamma radiography of the sample. Results of heating fuel at rates of 50° to 250°C/sec. are presented. Unirradiated UO₂ slumps rapidly when melted. Lower power irradiated fuel with uniform fission gas distribution was observed to break apart below the melting point, resulting in dispersal from the effect of released fission gas. Extensive gas bubble formation occurs below the solidus and bubble expansion results in a foam-like structure at the melting temperature. High power irradiated fuel behaves differently, consistent with the relative gas distribution and content. Less fuel motion is observed; the major effect of fission gas is to slow downward displacement upon melting. Measurements of the temperature dependence of gas release indicate that gas release begins at fuel temperatures near 2000°C and a significant fraction of the fission gas has been released when fuel reaches the melting temperature.

- 2032 (IWGFR--5, pp 174-189) IN-REACTOR SAFETY TESTS WITH FUELS FOR FAST NEUTRON REACTORS. Bailly, J.; Kessler, G.; Teague, N.J. 1975.

From International working group on fuel failure mechanisms; Seattle, WA, USA (11 May 1975).

The CEA has realized, alone and in collaboration with various foreign organizations, tests in in-pile loops for supporting the safety analyses of fast reactors. The first part of the SCARABEE program dedicated to cooling accidents was completed in 1974 at CEN-Cadarache. The main results obtained and the efforts in progress to interpret them are described.

- 2033 (IWGFR--8) NINTH ANNUAL MEETING, VIENNA, AUSTRIA, 30 MARCH--2 APRIL 1976. SUMMARY REPORT. PART I. (International Atomic Energy Agency, Vienna (Austria). International Working Group on Fast Reactors). Jun 1976. 26p. (CONF-760396--P1(summ.)). Dep. NTIS (US Sales Only), PC A03/MF A01.

From 9. meeting of the international working group on fast reactors; Vienna, Austria (30 Mar 1976).

This document constitutes the summary report of the Ninth Annual Meeting of the International Working Group on Fast Reactors.

2036 (IWGFR--9, pp 75-78) CAVITATION PROBLEMS IN SODIUM VALVES. Elie, X. Jun 1976.

From Specialist meeting on cavitation in sodium and studies of analogy with water as compared to sodium; Cadarache, France (12 Apr 1976).

Cavitation poses few problems for sodium valves in spite of the fact that the loops are not pressurized. This is no doubt due to the low flow velocities in the pipes. For auxiliary loop valves no attempt is made to standardize performances with respect to cavitation. For economic reasons cavitation thresholds are approached with large diameter valves.

2037 (IWGFR--9, pp 9-24) CAVITATION PROBLEMS IN MIXING DEVICES OF SNR-300 FUEL ELEMENTS. Benemann, A. (Internationale Atomreaktorbau G.m.b.H. (INTERATOM), Bensberg/Koeln (Germany, F.R.)). Jun 1976.

From Specialist meeting on cavitation in sodium and studies of analogy with water as compared to sodium; Cadarache, France (12 Apr 1976).

Because of a complex flow path within the mixing device developed for the fuel elements of the SNR-300, in order to determine the minimum allowable interval to the beginning of cavitation, experimental tests with the original geometry are necessary. These conclusions show that for cavitation values $CV > 1,3$ in the model and prototype - no cavitation zones can form. For reactor conditions a maximum velocity of $V_{sub(max)} = 4,7 \text{ m/sec}$ is therefore allowable in the free annular space of the compensator unit which corresponds to a massflow of $M = 22,5 \text{ kg/sec}$. A cavitation value of $CV = 1,5$ can be figured for the 120% load factor ($M = 20,4 \text{ kg/sec}$, $T = 560^\circ\text{C}$). The mixing device developed is free of cavitation under the present conditions in the SNR-300.

2038 (IWGFR--9, pp 25-33) CAVITATION PROBLEMS IN FAST REACTOR FUEL SUBASSEMBLIES. Bisci, R.; Muret, G.; Teulon, J. Jun 1976.

From Specialist meeting on cavitation in sodium and studies of analogy with water as compared to sodium; Cadarache, France (12 Apr 1976).

The main reasons are presented why sodium flow in Fast Reactors must be free from cavitation phenomena. Fuel subassembly cavitation problems are described and especially those encountered with flow regulation systems. The choice of a cavitation criterion is discussed: it is assumed that the beginning of cavitation in sodium flow can be extrapolated from measurements on water mock-ups. It is also assumed that the Thoma Number, which characterizes the beginning of cavitation, is strictly independent of the fluid nature.

2039 (IWGFR--9, pp 92-94) CAVITATION WORK CONDUCTED AT RISLEY ENGINEERING AND MATERIALS LABORATORIES. Collinson, A.E. (UKAEA). Jun 1976.

2040 (IWGFR--9, pp 94-101) NERATOOM WORK ON PUMP DEVELOPMENT. Hoornweg, C.J. (Neratoom N.V., The Hague (Netherlands)). Jun 1976.

From Specialist meeting on cavitation in sodium and studies of analogy with water as compared to sodium; Cadarache, France (12 Apr 1976).

The prototype pump has been manufactured by Stork Engineerings Works at Hengelo in 1969. The full-scale test on water has been carried out as part of the procedures of acceptance. Tests on sodium have been carried out in the pump test facility of Interatom at Bensberg (W. Germany); these tests started in March 1971 and were finished in October 1972. During that period nearly 6000 hours of pump testing were accomplished, of which 150 hours the pump was subjected to cavitation. During 30 hours the pump was subjected to a cavitation intensity of more than 3% loss of delivery head.

2041 (IWGFR--9, pp 89-92) EFFECT OF PUMP CAVITATION ON THE DESIGN OF THE PRIMARY PUMPS FOR C.F.R. Worster, R.C. (Weir Pumps Ltd., Alloa (UK)). Jun 1976.

From Specialist meeting on cavitation in sodium and studies of analogy with water as compared to sodium; Cadarache, France (12 Apr 1976).

In the design appraisal of the sodium pumps for the primary circuit of the proposed 1300 MW(e) CFR it has been recognised that cavitation, its effects and its control, is the outstanding hydraulic design problem. Careful consideration of this problem and of the possible effects of pump cavitation on the performance of other reactor systems has led to the conclusion that it is more prudent at present to specify pumps with zero cavitation at normal full speed operating conditions. Under abnormal operation it may be necessary to reduce the pumps' speed to prevent cavitation in the pumps or associated equipment. The principal reasons for this decision were uncertainties concerning the possibility of erosion due to limited cavitation in sodium and the possibility of pump cavitation noise interfering with acoustic detection of malfunctioning of reactor components or of boiling in the reactor core.

2042 (IWGFR--9, pp 62-67) ANALOGY OF WATER AS COMPARED TO SODIUM IN CAVITATION. Bisci, R.; Courbiere, P. (CEA Centre d'Etudes Nucleaires de Cadarache, 13 - Saint-Paul-les-Durance (France). Dept. des Reacteurs a Neutrons Rapides). Jun 1976.

From Specialist meeting on cavitation in sodium and studies of analogy with water as compared to sodium; Cadarache, France (12 Apr 1976).

After outlining the major aspects of the cavitation research and test program undertaken by the CEA(3) (survey of the parameters defining the onset of cavitation in water and sodium flow, and the consequences of operation under sustained cavitating conditions on sodium reactor structural components), this paper describes the test and measuring equipment that has been developed for such studies. The results of the initial tests in water and in sodium using a thin 20 mm dia. orifices plate, are then presented. Except for uncertainties about the measurements themselves, the cavitation threshold values in cold water and in sodium at temperatures above 400°C has shown

rather good concordance. Testing is currently in progress to confirm these findings. (1) EEC engineer assigned to DRNR/SEDC, (2) CEA engineer (DRNR/STRS), (3) French Atomic Energy Commission.

- 2043 (IWGFR--9, pp 46-57) SURVEY OF LMFBR CAVITATION TECHNOLOGY IN THE U.S.A. Cha, Y.S.; Huebotter, P.R. (Argonne National Lab., Ill. (USA)); Hopenfeld, J. (Energy Research and Development Administration, Washington, D.C. (USA)). Div. of Reactor Research and Development). Jun 1976.

From Specialist meeting on cavitation in sodium and studies of analogy with water as compared to sodium; Cadarache, France (12 Apr 1976).

Several experimental programmes of a basic and applied nature were established in the USA in order to develop guidelines to ensure design and operation of LMFBR hydraulic components free from cavitation and/or cavitation damage. As of March 1976, most of these experimental programs are still in progress. Each programme is briefly described. The available interim data are presented. References that are relevant are provided.

- 2044 (IWGFR--9, pp 33-41) ONSET OF CAVITATION IN PRESSURE DROPPING DEVICES IN WATER AND SODIUM. Collinson, A.E. (UKAEA). Jun 1976.

From Specialist meeting on cavitation in sodium and studies of analogy with water as compared to sodium; Cadarache, France (12 Apr 1976).

It is necessary to develop pressure dropping devices for the control of flow in LMFBR sub-assemblies and other components in and around the core. It is generally required that these devices should have a high flow rate, high pressure loss, occupy a very limited space and not be prone to cavitation. If it is intended to detect coolant boiling acoustically then it is important that there should be no cavitation noise background which would result in reduced sensitivity of the boiling noise monitor. This paper describes a series of tests conducted in water and sodium for the development of cavitation noise-free pressure dropping components for PFR. Initial tests were conducted on single ISA nozzles, being followed by the more practical multi-hole nozzle plates and wire meshes. Tests of a plug in a cylindrical bush are described as an example of a sealing unit with an annular gap.

- 2045 (IWGFR--9, pp 67-75) CAVITATION EXPERIMENTS AT BUTTERFLY VALVES IN WATER AND IN SODIUM AT 850K. Mendte, K.; Klemm, J. (Internationale Atomreaktorbau G.m.b.H. (INTERATOM), Bensberg/Koeln (Germany, F.R.)). Jun 1976.

From Specialist meeting on cavitation in sodium and studies of analogy with water as compared to sodium; Cadarache, France (12 Apr 1976).

Throttling valves fabricated by Gebrueder Adams, Bochum will be installed in the SNR-300 plant, serving as flow control devices during postcram operation. Valves of the same type were used in the pump test facility at INTERATOM (APB) to throttle down the sodium pump head. This test loop was to demonstrate at the same time that the prototype SNR valves could withstand the design conditions (flow and temperature) during endurance tests. To optimize the pump test facility design, a 350mm diameter valve was tested in water under cavitation conditions. With the aid of calculational method described herein, the

hydraulic kinetic relationships of the throttled flow could predict the influences leading to cavitation. The results of the calculational model showed close agreement with that, actually incurred during visual observations. Valves of the same type and in 350mm as well as in 600mm diameter sizes were again cavitation tested in sodium. The cavitation bubbles. b) The primary function of these valves in the test loop APB is to dissipate the pressure head of the pump being tested. Through energy dissipation across the valves, they become strong sources of noise generation, in broad-band frequency levels at these locations up to a factor 50 larger than those at the pump. The cavitation dependent vaporizing noise, developed by incipient cavitation, was, inspite of background noise, measurable. Similar to that for the water test runs, incipient cavitation was detected at the valves when the corresponding sigma worths were between 0.15 to 0.20.

- 2046 (IWGFR--9, pp 57-62) ACTUAL STATUS OF SODIUM CAVITATION STUDIES IN JAPAN. Yamamoto, K. (Power Reactor and Nuclear Fuel Development Corp., Tokyo (Japan)); Kamiyama, S.; Hashimoto, H. (Tohoku Univ., Sendai (Japan)). Inst. of High Speed Mechanics); Mochizuki, K.; Nakai, Y.; Ishibashi, E.; Tamaoki, T. Jun 1976.

From Specialist meeting on cavitation in sodium and studies of analogy with water as compared to sodium; Cadarache, France (12 Apr 1976).

A cavitation test has been conducted on some components of the fast experimental reactor JOYO. Design is in progress for the fast prototype reactor MONJU. Deliberate consideration has been taken against cavitation as this reactor will be operated under severer service conditions than that of JOYO. A cavitation test of entrance nozzles of MONJU fuel subassemblies was performed in water. In order to obtain design data a program of cavitation tests is planned.

From Meeting on inservice-inspection and monitoring of LMFBRs; Bensberg, German Democratic Republic (9 Mar 1976).

Ultrasonic testing is considered today as an important method for inservice inspection of the LMFBR type reactor components. A survey is made on what is available to the manufacturers of reactor components.

2052 (IWGFR--10, pp 86-93) TELEVISION/STILL CAMERA WITH COMMON OPTICAL SYSTEM FOR REACTOR INSPECTION. Hughes, G.; McBane, P. Jul 1976.

From Meeting on inservice-inspection and monitoring of LMFBRs; Bensberg, German Democratic Republic (9 Mar 1976).

One of the problems of reactor inspection is to obtain permanent high quality records. Video recordings provide a record of poor quality but known content. Still cameras can be used but the frame content is not predictable. Efforts have been made to combine T.V. viewing to align a still camera but a simple combination does not provide the same frame size. The necessity to preset the still camera controls severely restricts the flexibility of operation. A camera has, therefore, been designed which allows a search operation using the T.V. system. When an anomaly is found the still camera controls can be remotely set, an exact record obtained and the search operation continued without removal from the reactor. An application of this camera in the environment of the blanket gas region above the sodium region in PFR at 150°C is described.

2053 (IWGFR--10, pp 26-35) IN-SERVICE INSPECTION FOR 'MONJU'. Abe, S. Jul 1976.

From Meeting on inservice-inspection and monitoring of LMFBRs; Bensberg, German Democratic Republic (9 Mar 1976).

In-service inspection equipment for Liquid Metal Fast Breeder Reactors will be located in many cases in a limited space with high irradiation and high temperature. Design and research of inservice inspection for MONJU is introduced as follows: Inlet pipe of reactor vessel; Reactor vessel; Heat transfer tubes of IHX; Heat transfer tubes of steam generator. The test result is reported.

2054 (IWGFR--10, pp 43-50) INSPECTION REQUIREMENTS AND CONCEPTS FOR LMFBR HEAT EXCHANGERS AND PUMP. A MANUFACTURERS VIEW. de Boer, G.A.; Tromp, Th.J. Jul 1976.

From Meeting on inservice-inspection and monitoring of LMFBRs; Bensberg, German Democratic Republic (9 Mar 1976).

This paper deals with inspection requirements and concepts for liquid metal fast breeder reactor heat exchangers, steam generators and sodium pumps. Improvement of the on-load surveillance methods are specifically recommended. A chart on the levels of inspection is given.

2055 (IWGFR--10, pp 100-116) IN-SERVICE INSPECTION AND MONITORING OF LMFBR IN FRANCE. Bret, A.; Gallet, B.; Tomachevsky, E. Jul 1976. (In French).

From Meeting on inservice-inspection and monitoring of LMFBRs; Bensberg, German Democratic Republic (9 Mar 1976).

In France, the control and monitoring of the LMFBR type reactor is achieved by: temperature, fluxes and reactivity measurements; sodium leakage detection; ultrasonic testing methods; mechanical deformation and stress analysis.

2056 (IWGFR--10, pp 117-122) DEVELOPMENT OF ACOUSTIC MONITORING TECHNIQUES OF LMFBRs. Burtun, E.J. Jul 1976.

From Meeting on inservice-inspection and monitoring of LMFBRs; Bensberg, German Democratic Republic (9 Mar 1976).

Manufacturing defects may be identified by ultrasonic inspection or by stress wave emission. Mechanical failures arising from maloperation may be detected by visualisation under sodium using ultrasonics. Mechanical failures arising from material loss by corrosion or erosion may be anticipated by the detection of acoustic events. Overheating leading to core damage may be detected from the noise of sodium boiling. Mechanical failure from fatigue may be anticipated from an understanding of the vibrational modes of the sodium and its coupling with the structure.

2057 (IWGFR--10, pp 132-139) AN-APPROACH TO THE ON-LOAD SURVEILLANCE OF SODIUM COOLED REACTORS BY ACOUSTIC METHODS. Foerster, K. Jul 1976.

From Meeting on inservice-inspection and monitoring of LMFBRs; Bensberg, German Democratic Republic (9 Mar 1976).

Among a number of various tasks which are partially more conventional or in a similar way valid for other types of reactors, three topics were thought worth while to be considered for the development of acoustic control systems for fast reactors: 1) sodium boiling detection in reactor core, 2) detection of sodium-water reactions in steam generators and 3) crack detection by stress wave emission analysis.

2058 (IWGFR--10, pp 150-157) RADIOGRAPHIC AND ULTRASONIC INSPECTION OF AN AUSTENITIC PUMP BARREL. Haesen, W.; Klinkert, G.F.; Tromp, Th.J. (Neratoom N.V., The Hague (Netherlands)). Jul 1976.

From Meeting on inservice-inspection and monitoring of LMFBRs; Bensberg, German Democratic Republic (9 Mar 1976).

Volumetric testing of the welds of a radioactive pump barrel poses quite a few problems. This paper describes the series of preliminary tests for the sodium pumps of SNR-300. The tests involved were: Ultrasonic; radiographic.

2059 (IWGFR--10, pp 35-42) IN-SERVICE INSPECTION AT THE SNR 300 WITH THE RANGE JF REACTOR VESSEL. Leder, H. Jul 1976.

From Meeting on inservice-inspection and monitoring of LMFBRs; Bensberg, German Democratic Republic (9 Mar 1976).

A general view of the in-service inspection situation of the SNR 300 within the reactor vessel is given. Specification instructions and recommendations, including the licensing procedure, are shown.

- 2060 (IWGFR--10, pp 79-84) STUDIES IN NON-DESTRUCTIVE TESTING WITH POTENTIAL FOR IN-SERVICE INSPECTION OF LMFBRs. McClung, R.W. Jul 1976.

From Meeting on in-service-inspection and monitoring of LMFBRs; Bensberg, German Democratic Republic (9 Mar 1976).

A variety of nondestructive examination techniques have been and are being developed at ORNL with potential for ISI (In Service Inspection) in LMFBRs. Among these are radiographic techniques for radiation environment and image enhancement, advanced eddy-current techniques and equipment for flaw detection and thickness measurement and ISI of steam generator tubing, and ultrasonic methods for quantitative flaw evaluation using frequency-analysis and bore-side ultrasonic techniques for steam generator tubing. Further developments should result in positive application to ISI.

- 2061 (IWGFR--10, pp 144-146) VIBRATION-ACCELERATION MEASUREMENTS ON PROTOTYPE STEAM GENERATORS. Tromp, Th.J. (Neratom N.V., The Hague (Netherlands)). Jul 1976.

From Meeting on in-service-inspection and monitoring of LMFBRs; Bensberg, German Democratic Republic (9 Mar 1976).

Vibration-acceleration measurements on prototype steam generators of the sodium cooled fast reactor SNR-300 are reported. Vibration measurements were carried out in a sodium component test facility of 50MW. It was shown that no vibration difficulties would arise in the steam generators.

- 2062 (IWGFR--10, pp 139-143) APPLIANCE OF STRESS WAVE EMISSION IN PHENIX REACTOR. Tomachevsky, E.G. Jul 1976. (In French).

Specialists meeting on in-service inspection and monitoring of LMFBRs, Bensberg, Germany, F.R., March 9-11, 1976. Summary report.

The acoustic testing techniques developed in PHENIX are outlined. Feasibility is discussed.

- 2063 (IWGFR--11) SPECIALISTS MEETING ON HIGH TEMPERATURE STRUCTURAL DESIGN TECHNOLOGY OF LMFBRs, CHAMPION, PENNSYLVANIA, U.S.A., APRIL 27-30, 1976. SUMMARY REPORT. (International Atomic Energy Agency, Vienna (Austria). International Working Group on Fast Reactors). Oct 1976. 259p. (CONF-7604147--). Dep. NTIS (US Sales Only), PC A12/MF A01.

From Meeting on high temperature structural design technology of LMFBR's; Champion, PA, USA (27 Apr 1976).

Separate abstracts were prepared for each of the papers included.

- 2064 (IWGFR--11, pp 25-29) INFLUENCE OF CREEP-FATIGUE INTERACTION ON BEHAVIOUR OF TYPE 304 STAINLESS STEEL. Breittling, H.; Grosser, E.D.; Lorenz, H. Oct 1976.

From Meeting on high temperature structural design technology of LMFBR's; Champion, PA, USA (27 Apr 1976).

The influence of creep-fatigue interaction on creep and fatigue properties of the SNR-300 structural steel X 6 CrNi 1811 (similar to AISI 304 ss) has been studied. Specimens were either precrept and then fatigue loaded or prefatigued and then creep loaded. In a third type of test

alternating creep fatigue loading was applied. Tests were terminated when rupture occurred. The results were evaluated with respect to the validity of a linear creep-fatigue damage rule as specified in ASME CC 1592. The values determined for the damage factor D show a relatively large scatter and depend on the type of test and the relative amounts of creep and fatigue loading. Alternating loading is most damaging with respect to specimen lifetime. An evaluation of the data shows that the values given in ASME CC 1592 can be regarded as representing a lower bound of creep-fatigue interaction effects.

- 2065 (IWGFR--11, pp 75-80) CEASEMT SYSTEM OF FINITE ELEMENT COMPUTER PROGRAMS - USE FOR INELASTIC ANALYSIS IN LIQUID METAL COOLED REACTOR COMPONENTS. Jeanpierre, F.; Charras, T.; Goldstein, S.; Hoffmann, A.; Livolant, M.; Roche, R. Oct 1976.

From Meeting on high temperature structural design technology of LMFBR's; Champion, PA, USA (27 Apr 1976).

The system of finite element computer programs CEASEMT is described. Such a system is used to perform inelastic analysis in liquid metal cooled reactor components. The model for non-elastic strains is explained in some detail.

- 2066 (IWGFR--11, pp 106-111) COMPARISON OF TWO APPROXIMATE ANALYSES OF PIPING SYSTEMS IN A STATE OF CREEP. Johnstone, T.L. Oct 1976.

From Meeting on high temperature structural design technology of LMFBR's; Champion, PA, USA (27 Apr 1976).

Two approaches to study the state of creep of piping system in LMFBR type reactors are compared: The Kachanov approach (it is assumed that all stresses in the system will relax in the same manner) and the Spence approach.

- 2067 (IWGFR--11, pp 70-74) INELASTIC PIPING FLEXIBILITY ANALYSIS. A BEAM TYPE METHOD. Roche, R.L.; Hoffmann, A. Oct 1976.

From Meeting on high temperature structural design technology of LMFBR's; Champion, PA, USA (27 Apr 1976).

The principle and the simple formulation of a beam type method for inelastic piping flexibility analysis is outlined.

- 2068 (IWGFR--11, pp 169-171) TEST FACILITY FOR LARGE-DIAMETER BELLWS. Schallar, K.H. Oct 1976.

From Meeting on high temperature structural design technology of LMFBR's; Champion, PA, USA (27 Apr 1976).

This paper reports on the CADARACHE Test facilities for large diameter bellows for sodium cooled fast breeder reactors.

- 2069 (IWGFR--11, pp 58-64) ANALYSIS FOR OUT OF PLANE BENDING ON CURVED PIPES IN CREEP: DEVELOPMENT OF METHOD AND DESIGN FACTORS. Spence, J.; Boyle, J. Oct 1976.

From Meeting on high temperature structural design technology of LMFBR's; Champion, PA, USA (27 Apr 1976).

The aim is to study the out of plane bending of a curved pipe in creep. The current situation in elasticity, and the state of research into the creep of piping components, are briefly reviewed. The ultimate goals of the analysis of curved pipes under combined loading is discussed with the conclusion that, from the point of view of system analysis, it is more expedient to calculate an "energy factor"

rather than the classical "flexibility factor". An approximate energy based analysis is presented which utilises a simple power law of creep and direct optimisation methods on a computer. Results for various material and geometric parameters are presented.

2070 (IWGFR--11, pp 7-24) EXPLORATORY TESTING IN SUPPORT OF CONSTITUTIVE EQUATION DEVELOPMENT FOR INELASTIC ANALYSIS.

Swindeman, R.W.; Klueh, R.L. Oct 1976.

From Meeting on high temperature structural design technology of LMFBR's; Champion, PA, USA (27 Apr 1976).

This paper describes some of the significant inelastic behavioral features of type 304 stainless steel and of 2 1/4 Cr-1 Mo steel as observed from uniaxial exploratory mechanical testing. Exploratory tests of reference heats of type 304 stainless steel reveal that the initial yield strength is quite low, the work-hardening capability under both monotonic and cyclic straining is high, and the strain rate effects are almost negligible in the temperature range 400 to 600°C (752 to 1112°F). The influence of low stress creep exposure on the subsequent flow stress is of a hardening nature for the conditions of interest. The creep behaviour can be characterized as exhibiting pronounced creep hardening with minimal time-dependent recovery. Depending upon the specific test conditions, plasticity strain can either suppress or accelerate subsequent creep rates. Exploratory tensile and strain-cycling tests on annealed 2 1/4 Cr-1 Mo steel reveal that this material has a relatively high yield strength, low work-hardening capability, and significant response to different strain rates in the temperature range 300 to 600°C (572 to 1112°F). Exposure to low stress creep conditions can produce a loss in the hardening capability. The creep behaviour can be characterized as exhibiting modest creep hardening under low stress conditions but time-dependent recovery can be significant. As with the austenitic steels, plastic strain can either suppress or accelerate creep rates.

2071 (IWGFR--11, pp 112-121) CONSIDERATIONS FOR WELDMENT DESIGN FOR ELEVATED TEMPERATURE APPLICATIONS. Wei, B.C. Oct 1976.

From Meeting on high temperature structural design technology of LMFBR's; Champion, PA, USA (27 Apr 1976).

Because of the scarcity of data and because of the metallurgical and structural complexity of the weldments, current design practice does not generally take detailed account of the behaviour of the weldments, either in terms of criteria limits or in terms of deformation behaviour of weldments into structural analyses. Rather, careful consideration is given to the type and location of welds, to weld materials and to examination of welds; and reliance is placed on the factor of safety used in deriving stress limits from base metal properties to guard against failure of welds. In some cases, such as the K-stress indices factors given in Section III of the ASME code for piping and piping components, determination of these constants are based, in part, on fatigue tests of welded pipe joints. Experience has shown that this approach is adequate at subcreep temperatures where design stress limits are, for the most part, intended to prevent gross inelastic deformation.

2072 (IWGFR--11, pp 29-36) SOME ASPECTS OF THE CEA INVESTIGATIONS ON THE MECHANICAL BEHAVIOUR OF 316 STEELS IN THE MEDIUM TEMPERATURE RANGE. Weisz, M. Oct 1976.

From Meeting on high temperature structural design technology of LMFBR's; Champion, PA, USA (27 Apr 1976).

This document deals with the creep behaviour under variable stress of 316 steels. It reports results on the primary circuit welds for PHENIX (stress and strains).

2073 (IWGFR--11, pp 104-106) CONCEPTS ON HIGH TEMPERATURE DESIGN ANALYSIS FOR SNR 300. Bieniussa, K.; Zolli, E. Oct 1976.

From Meeting on high temperature structural design technology of LMFBR's; Champion, PA, USA (27 Apr 1976).

The paper briefly describes the evolution, the present situation and the next activities on the design of high temperature components of the DEBENELUX prototype fast breeder reactor SNR-300 with particular regard to the design criteria. Elastic structural analyses are performed for the basic design of the components and are supplied by the manufacturer. In agreement with the Safety Experts simplified and/or detailed inelastic analyses of the critical areas are supplied by the prime contractor of the plant. The elastic computations are evaluated on the basis of a set of design rules derived from ASME Code Case Interpretation 1331-4 but with more conservative limits, and the inelastic ones on the basis of the ASME Code Case Interpretation 1592.

2074 (IWGFR--11, pp 196-207) STATIC AND CYCLIC TESTING OF A PFR SECONDARY CIRCUIT PIPE BEND. Boulton, C.F. Oct 1976.

From Meeting on high temperature structural design technology of LMFBR's; Champion, PA, USA (27 Apr 1976).

This report describes tests carried out for the United Kingdom Atomic Energy Authority on specimens fabricated from stainless steel pipes and bends. The specimens were full-size replicas of a particular section of the secondary sodium pipework of the prototype fast reactor (PFR) at Dounreay. The specimens were tested under out-of-plane bending, simulating the loading experienced in the reactor under service conditions. The main object of the tests was to determine the onset of incipient buckling under various conditions of loading and temperature. Fatigue tests were carried out entirely at elevated temperature under a strain spectrum simulating the thermal cycling of the pipework in service. The tests have provided sufficient data to validate the stability and fatigue strength of the pipework under thermal loading.

2075 (IWGFR--11, pp 134-169) SOME ASPECTS OF HIGH TEMPERATURE STRUCTURAL DESIGN ON LMFBR SYSTEM AND COMPONENTS. Cesari, F.; Cecchini, F.; Labanti, M. Oct 1976.

From Meeting on high temperature structural design technology of LMFBR's; Champion, PA, USA (27 Apr 1976).

A series of tests has been carried out to study thermal and mechanical properties of LMFBR structural materials and components. Testing facilities are described and their specifications are given. Computer codes for analysis of experimental results are used.

2076 (IWGFR--11, pp 171-196) RECENT EFFORTS OF PNC ON CREEP-FATIGUE, CREEP-BUCKLING AND THERMAL RATCHETTING OF THE LMFBR PRIMARY COOLANT SYSTEM COMPONENTS. Nagata, T.; Imazu, A. Oct 1976.

From Meeting on high temperature structural design technology of LMFBR's; Champion, PA, USA

(27 Apr 1976).

A series of tests has been carried out to study elastic-plastic-creep behaviors of the model structures of the primary coolant piping components under some monotonic or cyclic loading and to investigate creep-buckling properties of the structures caused by accumulated creep strains under monotonic loading or to investigate their creep fatigue interactions under cyclic loadings and thermal ratcheting properties. Outlines of test rigs that are used for the tests, test procedures, test results and future test programs are presented.

- 2077 (IWGFR--11, pp 245-246) METHODS OF ANALYSIS IN THE STRUCTURAL DESIGN OF LMFBR COMPONENTS - FRENCH PRACTICE. Schaller, K.H. Oct 1976.

From Meeting on high temperature structural design technology of LMFBR's; Champion, PA, USA (27 Apr 1976).

The method of analysis in the structural design of LMFBR components performed by the French Atomic Energy Commission at Cadarache are outlined.

- 2078 (IWGFR--11, pp 65-69) INELASTIC THERMAL TRANSIENT ANALYSIS OF TUBESHEETS. Sumikawa, M.; Shibato, E.; Shimizu, T.; Kusumoto, S. Oct 1976.

From Meeting on high temperature structural design technology of LMFBR's; Champion, PA, USA (27 Apr 1976).

In this paper the following topics are treated: Models to calculate the metal temperature distribution in tubesheets and analysis of inelastic thermal transients.

- 2079 (IWGFR--11, pp 81-85) SIMPLIFIED METHODS OF ANALYSIS. Townley, C.H.A. Oct 1976.

From Meeting on high temperature structural design technology of LMFBR's; Champion, PA, USA (27 Apr 1976).

A simplified method to predict the stress levels and strain ranges for the design of fast reactor components is presented.

- 2080 (IWGFR--11, pp 37-43) DERIVATION OF TIME DEPENDENT DESIGN-VALUES FOR SNR 300 STRUCTURAL MATERIAL. Lorenz, H.; Breittling, H.; de Heesen, E. Oct 1976.

From IAEA international working group on fast reactors; Champion, PA, USA (27 Apr 1976).

Time-dependent design values were derived from long-term creep rupture data for steel X 6 CrNi 1811 in the unwelded and welded condition. The design values had to satisfy the ASME CC 1592 criteria with respect to creep rupture strength, time to reach 1% strain and transition to tertiary creep as well as the requirement of German regulatory rules to properly account for weld behaviour. For the evaluation and extrapolation 2 proven computer programmes were used. The design data derived under consideration of weld joints show relative good agreement with the values of ASME CC 1592. Consideration of welds leads to lower design values above 550°C and 5×10^3 h with the difference between rolled and weld material becoming larger with increasing time and temperature.

- 2081 (IWGFR--12, pp 26-32) PRESENT STATE OF DEVELOPMENT OF THE FAST BREEDER PROJECT IN THE FEDERAL REPUBLIC OF GERMANY, BELGIUM AND THE NETHERLANDS, AND PROGRESS ACHIEVED DURING 1975 AND EARLY 1976. Daeunert, U.; Kessler, G.

Nov 1976.

From 9. meeting of the international working group on fast reactors; Vienna, Austria (30 Mar 1976).

This report outlines the present state of development of the fast breeder project in the Federal Republic of Germany, Belgium and the Netherlands.

From 10. IAEA working group on fast reactors; Vienna, Austria (29 Mar 1977).
This paper reports on the Fast Reactor Programme of United Kingdom. These are the main lines: Dounreay Fast Reactor; Prototype Fast Reactor; Commercial Fast Reactor; engineering development; materials development; chemical engineering/sodium technology; fast reactor fuel; fuel cycle; safety; reactor performance study.
- 2091 (IWGFR--18, pp 8-11) REVIEW OF FAST REACTOR PROGRESS IN JAPAN. Tomabechi, K. Jun 1977.
From 10. IAEA working group on fast reactors; Vienna, Austria (29 Mar 1977).
Only highlights and some topics are reported: Using the Fast Critical Assembly (FCA), experiments to evaluate fission rate in the fuel storage position within the 'MONJU' vessel were performed; detectors of hydrogen in the sodium of the steam generator were developed; experiments to stimulate large sodium water reactions which might take place in a steam generator have been carried out; experiments concerning local fuel failure and tests on various components to be used for 'MONJU' have been continued; concerning safety, experiments of sodium burning were performed.
- 2092 (IWGFR--18, pp 35-45) DEVELOPMENT OF FRENCH PROGRAMME ON FAST REACTORS, FROM MARCH 1976 TO MARCH 1977. Vautrey, L. Jun 1977.
From 10. IAEA working group on fast reactors; Vienna, Austria (29 Mar 1977).
The following milestones of the French LMFBR programme are reported: RAPSODIE (irradiation experiments in order to study the behaviour of the different fuel components of a sodium cooled fast reactor); PHENIX (the burn-up of the first core has reached the nominal value of 50,000MWD/T); SUPER-PHENIX (status of construction).
- 2093 (IWGFR--18, pp 4-8) U.S. LMFBR PROGRAMME AS OF 4-1-77. Yevick, J. Jun 1977.
From 10. IAEA working group on fast reactors; Vienna, Austria (29 Mar 1977).
This summary covers the status of LMFBR projects and base programme activities: Experimental Breeder Reactor-II; the Fast Flux Test Facilities; the Clinch River Breeder Reactor Plant; the High Performance Fuel Laboratory; the Hot Pilot Plant.
- 2094 (IWGFR--18, pp 62-64) ACTIVITIES OF THE OECD-NEA IN THE FIELD OF FAST REACTORS. Royen, J. Jun 1977.
Tenth annual meeting, Vienna, Austria, 29 March - 1 April 1977. Summary report. Part II.
The OECD-NEA is performing the following activities in the field of fast reactors: Held ad hoc meetings of senior experts on safety, development and economics of LMFBR type reactors; publishing a Nuclear Safety Research Index (the index is now expanded to cover fast reactors) and distribution; collect test computer programmes, as well as neutron data.
- 2095 (IWGFR--18) TENTH ANNUAL MEETING. (International Atomic Energy Agency, Vienna (Austria). International Working Group on Fast Reactors). May 1976. 5p. (In Russian). (CONF-770398--). Dep. NTIS (US Sales Only), PC A04/MF A01.
From 10. IAEA working group on fast reactors; Vienna, Austria (29 Mar 1977).
Each paper has been separately processed for the Energy Data Base. (DG)
- 2096 (IWGFR--21, pp 123-132) VIBRATION STUDIES OF BN-350 AND BN-600 STEAM GENERATOR TUBE BUNDLES. Fyodorov, V.G.; Lyashenko, V.V.; Sokolov, A.S.; Lukasevitch, B.I.; Testov, I.N.; Titov, V.F. Dec 1977.
From International Atomic Energy Agency, international working group on fast reactors; Argonne, IL, USA (20 Sep 1977).
The report contains results of vibration studies on BN-350 superheater tube bundles on seven-tube simulators and full-scale steam generators, and of BN-600 vaporizer tube bundles on a multi-tube simulator. The discussion covers main vibrational characteristics of tubes of these steam generators, methods of estimation of full-scale steam generator tubes life derived from results of model vibration tests, and results of repeated in-service checks of BN-350 superheaters vibration. The report deals with vibration strength criteria and limiting norms of tubes vibration. It also provides a description or a method of tube vibration measurements, and steam generator designs.
- 2097 (IWGFR--21, pp 197-210) ANALYSIS OF FLOW INDUCED VIBRATION IN HEAT EXCHANGERS. van Beek, A.E. Dec 1977.
From International Atomic Energy Agency, international working group on fast reactors; Argonne, IL, USA (20 Sep 1977).
A description will be given of three different types of heat exchangers developed by the Dutch Nuclear Industry Group 'Neratom' in cooperation with TNO for the sodium-cooled fast breeder reactor SNR-300 at Kalkar. Moreover, the research related with flow induced vibrations carried out by TNO (Organization for Applied Scientific Research) will be presented. The flow induced forces on the tubes of the straight-tube steam generators were measured at the inlet and outlet section where partial cross-flow occurs. With the

measured flow induced forces the response of a tube was calculated as a function of the tube-to-support bush clearances taking into account the non-linear damping effects from the sodium. The theoretical results showed that for this particular design no tube impact damage is to be expected which was confirmed later by a full scale experiment. Special attention will be devoted to the steam generator with helical-coil tube-bundles, where the sodium flows in a counter cross-flow over the tube-bundle. Extensive measurements of the power spectra of the flow induced forces were carried out since no information could be found in the literature. The vibration analysis will be presented and vibration modes of the entire bundle will be compared with experimentally obtained results. Finally a description of the vibration tests to be carried out on the intermediate heat exchanger (IHx) will be presented.

- 2098 (IWGFR--21, pp 212-223) REVIEW OF ANL BASE TECHNOLOGY STUDIES IN SUPPORT OF THE U.S. LMFBR VIBRATION PROGRAM. Wambsganss, M.W.; Chen, S.S.; Mulcahy, T.M.; Shin, Y.S. Dec 1977.

From International Atomic Energy Agency, international working group on fast reactors; Argonne, IL, USA (20 Sep 1977).

Argonne National Laboratory (ANL) is the center for base technology studies of flow induced vibration for the US LMFBR Program. This paper reviews and summarizes published results, reports on the status of ongoing programs, and discusses future needs as outlined in the US LMFBR Vibrations Program Plan.

- 2099 (IWGFR--21, pp 224-234) INVESTIGATION OF ADDED MASSES AND DAMPING FACTORS FOR VIBRATIONS OF TUBE AND TUBE BUNDLES IN FLUID. Sinyavskii, V.F.; Fedotovskii, V.S.; Kukhtin, A.B. Dec 1977.

From International Atomic Energy Agency, international working group on fast reactors; Argonne, IL, USA (20 Sep 1977).

The vibrations of single cylinders in fluid being surrounded by the solid walls of different form as well as the bundles of cylindric rods have been considered in this report. A model of the hydrodynamic damping of vibrations and the analytic solution of a problem concerning the damping of cylinder vibrations in fluid surrounded by a concentric shell is proposed. The influence of fluid viscosity and vibration frequency on a value of the fluid added mass and the damping factor of vibrations is shown. For the cylinder being vibrated near the boundaries of a special type (for example, a flat wall, a plane gap) and for the cophased vibrations of some triangular and square packed rod bundles there have been carried out the calculations for the added masses and the damping factors by an electrodynamic analogy method. The calculational results are compared with the available experimental data. A satisfactory agreement between the experimental data and the calculational results indicates the possibility for practical using the suggested procedure and the calculational formulae for determining the natural frequencies and the damping factors of vibrations for elastic cylindrical elements in different fluids.

- 2100 (IWGFR--21) SPECIALISTS MEETING ON LMFBR FLOW INDUCED VIBRATIONS. (International Atomic Energy Agency, Vienna (Austria). International Working Group on Fast Reactors). Dec 1977. 237p. (CONF-770933--). Dep.

NTIS, PC A11/MF A01.

From International Atomic Energy Agency, international working group on fast reactors; Argonne, IL, USA (20 Sep 1977).

Separate abstracts were prepared for each of the individual papers included.

- 2101 (IWGFR--21, pp 7-26) FAST REACTOR FLOW INDUCED VIBRATION WITH PARTICULAR REFERENCE TO PFR AND CONCEPTUAL CDFR DESIGN. Collinson, A.E. Dec 1977.

From International Atomic Energy Agency, international working group on fast reactors; Argonne, IL, USA (20 Sep 1977).

This paper describes development work and basic design criteria as applied to vibration induced by fluid flow for the United Kingdom LMFBR programme. Possible harmful effects that could result from excessive vibration levels are highlighted with the associated excitation mechanisms. Instances of flow-induced vibration encountered in development models and in PFR are described. Basic design requirements and the overall philosophy are considered with respect to PFR and notional CDFRs. Ongoing research objectives are outlined giving some insight into the broad strategy involved. Finally, details are given concerning projects presently in progress along with more long term proposals.

- 2102 (IWGFR--21, pp 27-42) FLOW INDUCED VIBRATION STUDIES FOR LMFBR IN JAPAN: PAST AND RECENT STUDIES OF FIV FOR JOYO AND MONJU. Sato, K. Dec 1977.

Specialists meeting on LMFBR flow induced vibrations.

This paper presents the past and recent studies of flow induced vibration of the reactor components for the experimental fast breeder reactor JOYO and the prototype fast breeder reactor MONJU, in which many suggestive results for the higher flow velocity systems in a future reactor are contained. The fuel subassembly is the most important from the view point of the vibration. Thus, the studies were carried out with a mock-up subassembly for JOYO. In this experiment, statistical analysis results of the vibration characteristics of single core subassembly and the effects of external forced vibration, flow disturbance and fuel pin bundle vibration were reported. The further more detailed investigations are now being performed for MONJU. In addition to the above studies, the vibration failure of a sodium valve is reported. The valve is a 8-inch stop valve in sodium flow and heat transfer test loop at O-arai Engineering Center. The failure occurred in 1969 during the performance test of the mechanical pump, and this resulted in a small sodium leak. The cause of the failure was found to be the vibration fatigue of the metal bellows.

- 2103 (IWGFR--21, pp 43-50) VIBRATION MEASUREMENTS AND ANALYSIS FOR THE REACTOR VESSEL AND INTERNALS OF THE SNR-300. Schmidt, H. Dec 1977.

From International Atomic Energy Agency, international working group on fast reactors; Argonne, IL, USA (20 Sep 1977).

During normal operation the SNR-300 LMFBR power plant has a well defined coolant flow distribution with a moderate velocity level. The flow induced vibration potential is therefore very low. Nevertheless much effort has been devoted to study the vibrational behaviour of the reactor internals and the vessel structure. In recent years a number of flow vibration tests in water loops and performance tests in sodium have been conducted

with SNR fuel assemblies. Although some uncertainty will remain due to the reactor environment, the experimental evidence from these tests indicates that flow induced vibration in SNR-300 fuel assemblies will be insignificant. In order to meet the licensing conditions for securing the integrity of the internals, an iterative procedure is planned, consisting of theoretical and experimental structure analysis and a final vibration measurement during reactor commissioning. First results are presented.

- 2104 (IWGFR--21, pp 51-62) SUBSTANTIATION OF VIBRATION STRENGTH OF NUCLEAR REACTOR AND STEAM GENERATOR INTERNALS; MAIN PROBLEMS. Fyodorov, V.G.; Sinyavsky, V.F. Dec 1977.

From International Atomic Energy Agency, international working group on fast reactors; Argonne, IL, USA (20 Sep 1977).

The report details the scope and priority of studies necessary for substantiation of vibration strength of steam generator tube bundles and reactor fuel assemblies, and design modifications helping to reduce flow-induced vibration of the internals specified. Steam generator tube bundles are studied on the basis of a standard establishing vibration requirements at various stages of design, manufacture and operation of a steam generator at a nuclear power station. The main vibration characteristics of tubes obtained through model and full-scale tests are compared with calculation results. Results are provided concerning test-stand vibration tests of fuel elements and fuel assemblies.

- 2105 (IWGFR--21, pp 63-70) FUEL ELEMENT VIBRATIONS IN A FAST REACTOR CORE DUE TO SODIUM FLOW. Teulon, J.; Simonneau, J.P.; Brenir, Y. Dec 1977. (In French).

From International Atomic Energy Agency, international working group on fast reactors; Argonne, IL, USA (20 Sep 1977).

In a fast neutron reactor, the fluid reaches the highest speeds in the core. Very turbulent, the resulting excitation incites the core elements to vibrate. A knowledge of the relative amplitudes and relative lengthening attained is necessary for the evaluation of the damage which could ultimately be produced. These vibration studies are carried out at the CADARACHE Nuclear Center of the totality of the assemblies and on the constituents of these assemblies. Concurrently, an analysis of the fluctuating pressures in the fluid is carried out.

- 2106 (IWGFR--21, pp 99-110) FLOW INDUCED VIBRATION OF THE LARGE-SIZED SODIUM VALVE FOR MONJU. Sato, K. Dec 1977.

From International Atomic Energy Agency, international working group on fast reactors; Argonne, IL, USA (20 Sep 1977).

Measurements have been made on the hydraulic characteristics of the large-sized sodium valves in the hydraulic simulation test loop with water as fluid. The following three prototype sodium valves were tested: (1) 22-inch wedge gate type isolation valve, (2) 22-inch butterfly type isolation valve, and (3) 16-inch butterfly type control valve. In the test, accelerations of flow induced vibrations were measured as a function of flow velocity and disk position. The excitation mechanism of the vibrations is not fully interpreted in these tests due to the complexity of the phenomena, but the experimental results suggest that it closely depends on random pressure fluctuations near the valve disk and flow separation at the contracted cross section between the valve seat

and the disk. The intensity of flow induced vibrations suddenly increases at a certain critical condition, which depends on the type of valve and is proportional to fluid velocity.

- 2107 (IWGFR--21, pp 111-114) HEAT EXCHANGER VIBRATION. Richards, D.J.W. Dec 1977.

From International Atomic Energy Agency, international working group on fast reactors; Argonne, IL, USA (20 Sep 1977).

The heat exchangers of various types are common items of plant in the generation and transmission of electricity. The amount of attention given to the flow-induced vibrations of heat exchangers by designers is usually related to the operational history of similar items of plant. Consequently, if a particular design procedure yields items of plant which behave in a satisfactory manner during their operational life, there is little incentive to improve or refine the design procedure. On the other hand, failures of heat exchangers clearly indicate deficiencies in the design procedures or in the data available to the designer. When such failures are attributable to flow-induced vibrations, the identification of the mechanisms involved is a prime importance. Ideally, basic research work provides the background understanding and the techniques necessary to be able to identify the important mechanisms. In practice, the investigation of a flow-induced vibration problem may identify the presence of mechanisms but may not be able to quantify their effects adequately. In these circumstances the need for additional research work is established and the objectives of the research programme emerge. The purpose of this paper is to outline the background to the current research programme at C.E.R.L. on heat exchanger vibration.

- 2108 (IWGFR--21, pp 115-122) FLOW INDUCED VIBRATION OF SECONDARY PIPING OF LMFBR. Gibert, R.J.; Axisa, F. Dec 1977.

From International Atomic Energy Agency, international working group on fast reactors; Argonne, IL, USA (20 Sep 1977).

This paper presents a method for evaluating the characteristics of vibrations caused by internal flow in three-dimensional piping systems conveying high density fluids. The excitation of the circuit is mainly caused by the flow singularities, and it is shown that the problem may be reduced to calculate the response of the circuit to an acoustical pressure discontinuity, localised at each flow singularity. The theoretical formulation of the coupled acoustical-mechanical problem and to its numerical solution by the computer code TEDEL is discussed. An experimental test of the method is described. The tested piping system consists of a stainless steel tube circuit comprising four 90° bends, conveying water. Vibrations are excited by a half closed gate valve. Satisfactory results are obtained concerning both the frequencies of resonance of the circuit and the level of the vibrations observed.

- 2109 (IWGFR--21, pp 133-164) FFTF SCALE-MODEL CHARACTERIZATION OF FLOW INDUCED VIBRATIONAL RESPONSE OF REACTOR INTERNALS. Ryan, J.A.; Julyk, L.J. Dec 1977.

From International Atomic Energy Agency, international working group on fast reactors; Argonne, IL, USA (20 Sep 1977).

As an integral part of the Fast Test Reactor Vibration Program for Reactor Internals, the flow-induced vibrational characteristics of scaled Fast Test Reactor core internal and peripheral components were assessed under

scaled and simulated prototype flow conditions in the Hydraulic Core Mockup. The Hydraulic Core Mockup, a 0.285 geometric scale model, was designed to model the vibrational and hydraulic characteristics of the Fast Test Reactor. Model component vibrational characteristics were measured and determined over a range of 36% to 111% of the scaled prototype design flow. Selected model and prototype components were shaker tested to establish modal characteristics. The dynamic response of the Hydraulic Core Mockup components exhibited no anomalous flow-rate dependent or modal characteristics, and prototype response predictions were adjudged acceptable.

- 2110 (IWGFR--22) PROPERTIES OF PRIMARY CIRCUIT STRUCTURAL MATERIALS INCLUDING ENVIRONMENTAL EFFECTS. (International Atomic Energy Agency, Vienna (Austria). International Working Group on Fast Reactors). Dec 1977. 238p. (CONF-771052--). Dep. NTIS (US Sales Only), PC A11/MF A01.

From International working group on fast reactors (IAEA/IWGFR) specialists meeting; Bensburg, F.R. Germany (17 Oct 1977).

Summaries are presented of thirty-one papers dealing with structural materials behavior in LMFBR primary coolant circuits. (DG)

- 2111 (IWGFR--23) SODIUM REMOVAL AND DECONTAMINATION. (International Atomic Energy Agency, Vienna (Austria). International Working Group on Fast Reactors). Aug 1978. 214p. (CONF-780232--). Dep. NTIS (US Sales Only), PC A10/MF A01.

From IAEA meeting on sodium removal and decontamination; Richland, WA, USA (14 Feb 1978).

Separate abstracts are included for each of the papers presented concerning sodium removal and decontamination.

- 2112 (IWGFR--23, pp 1-7) STATUS OF SODIUM REMOVAL AND COMPONENT DECONTAMINATION TECHNOLOGY IN THE SNR PROGRAM. Haubold, W. (INTERATOM, Bergisch Gladbach, Germany); Smit, C.C.; Stade, K.C. Aug 1978.

From IAEA meeting on sodium removal and decontamination; Richland, WA, USA (14 Feb 1978).

The experience with sodium removal and component decontamination processes within the framework of the SNR project is discussed. The moist nitrogen process has been successfully applied to remove sodium from all 66 fuel elements of the KNK I core. Progress has been obtained in removing sodium from fuel elements and large components by vacuum distillation. Areas where future development is required are identified.

- 2113 (IWGFR--23, pp 8-12) TNO EXPERIENCE ON SODIUM CLEANING OF LARGE PLANT COMPONENTS BY VACUUM DISTILLATION. Smit, C.C. (Sodium Component Test Facility, Hengelo, Netherlands). Aug 1978.

From IAEA meeting on sodium removal and decontamination; Richland, WA, USA (14 Feb 1978).

The Intermediate Heat Exchanger and Steam generators developed within the framework of the SNR program are being tested in the 50 MW Test facility at Hengelo, The Netherlands. The facility was designed and built by Neratoom, and is operated by TNO, the Dutch Organization for Applied Scientific Research. Sodium technology work is done in close cooperation with Neratoom and with TNO-laboratories at Apeldoorn, where several smaller sodium rigs

and other facilities are available. Some work has been done to develop reliable vacuum distillation procedures for large components, based on the cleaning experience with small plant components. The results of these procedures applied to large plant components are reported in this paper.

- 2114 (IWGFR--23, pp 13-17) CORROSION AND CLEANING ASPECTS OF SODIUM SIDE CREVICES IN COMPONENTS OF LMFBR'S. Chirer, E.G. (Metals Research Inst. TNO, Apeldoorn, Netherlands). Aug 1978.

From IAEA meeting on sodium removal and decontamination; Richland, WA, USA (14 Feb 1978).

The aims of the investigations are: determination of the corrosive aspects of high concentration of caustic reaction products of sodium in crevices on the structural materials of the component; and comparison of the effectiveness of different cleaning procedures with respect to removal of sodium from crevices, e.g., water, steam, alcohol cleaning, vacuum distillation. Materials investigated are the Cr--Mo steels 2-1/4 Cr 1 Mo stabilized with Nb, 9 Cr 1 Mo, 12 Cr 1 Mo and the austenitic stainless steel AISI 304. The experiments are performed either on tubular specimens, consisting of two concentric tubes with crevices varying from a press fit to a positive clearance of approx. 0.05 mm, or on prestressed flat specimen. To observe the behavior of welded joints the specimens are provided with a weld seam.

- 2115 (IWGFR--23, pp 30-37) EXPERIENCE WITH CLEANING OF SODIUM-WETTED COMPONENTS AND DECONTAMINATION AT NUCLEAR RESEARCH CENTRE KARLSRUHE. Menzenhauer, P.; Borgstedt, U.; Stamm, H.H.; Dippel, T.; Kunze, S.; Hentschel, D. (Kernforschungszentrum, Karlsruhe, Germany). Aug 1978.

From IAEA meeting on sodium removal and decontamination; Richland, WA, USA (14 Feb 1978).

Within the framework of the Fast Breeder project various institutes of the Karlsruhe Nuclear Research Center operate sodium loops for corrosion studies and component tests under sodium. The operation of these loops has led to extensive experience in cleaning sodium-wetted components. This experience related to the alcohol method, the removal of sodium by melting, storage in air, and to cleaning by means of steam. Deposition samples from radioactive sodium loops were used for decontamination experiments employing various decontaminating agents. The department concerned with the treatment of radioactive waste studied the use of molten salts and paste type cleansers for components unsuitable for mechanical decontamination, primarily with the objective to reduce the amount of radioactive waste.

- 2116 (IWGFR--23, pp 38-42) SODIUM REMOVAL OF FUEL ELEMENTS BY VACUUM DISTILLATION. Buescher, E.; Haubold, W.; Jansing, W.; Kirchner, G. (INTERATOM, Bergisch Gladbach, Germany). Aug 1978.

From IAEA meeting on sodium removal and decontamination; Richland, WA, USA (14 Feb 1978).

Cleaning of sodium-wetted core components can be performed by using either lead, moist nitrogen, or alcohol. The advantages of these methods for cleaning fuel element without causing damage are well known. The disadvantage is that large amounts of radioactive liquids are formed during handling in the latter two

cases. A new method to clean components is described. The main idea is to remove all liquid metal from the core components within a comparatively short period of time. Fuel elements removed from the reactor must be cooled because of high decay heat release. To date, vacuum distillation of fuel elements has not yet been applied.

- 2117 (IWGFR--23, pp 42-46) INTERATOM EXPERIENCE OF CLEANING SODIUM-WETTED COMPONENTS. Haubold, W. (INTERATOM, Bergisch Gladbach, Germany). Aug 1978.

From IAEA meeting on sodium removal and decontamination; Richland, WA, USA (14 Feb 1978).

INTERATOM has been concerned since 1967 with the development, testing, and application of methods to clean sodium-wetted components by moist nitrogen, vacuum distillation or alcohol. The three cleaning methods mentioned above are practised at present, too, with minor modifications, by INTERATOM with methods of sodium removal since 1973 are summarized.

- 2118 (IWGFR--23, pp 47-50) CONTRIBUTION TO THE CHARACTERIZATION OF RADIOACTIVE SURFACES AFTER SODIUM CORROSION. Menken, G.; Holl, M. (INTERATOM, Bergisch Gladbach, Germany). Aug 1978.

From IAEA meeting on sodium removal and decontamination; Richland, WA, USA (14 Feb 1978).

Since 1972 INTERATOM is performing sodium mass and activity transfer investigations in a SNR-corrosion mockup loop which allows to study the transport of activated corrosion products in the primary heat transfer system of a sodium cooled reactor. The loop simulates the temperature and flow conditions and the materials combination of the SNR 300. The mass transfer examinations were aimed at the determination of the linear corrosion and deposition rates; the selective corrosion of the alloying elements; and the transfer of activated corrosion products.

- 2119 (IWGFR--23, pp 50-53) SHORT REVIEW OF SODIUM REMOVAL EXPERIENCE IN PNC. Kamei, M.; Mukaibo, R. (Osarai Engineering Centre, Tokyo, Japan). Aug 1978.

From IAEA meeting on sodium removal and decontamination; Richland, WA, USA (14 Feb 1978).

Since the establishment of the Power Reactor and Nuclear Fuel Development Corporation (PNC), various research work and development have been carried out for the development of sodium cooled fast breeder reactors. Most of the works, especially those related to large scale facilities are done at the Osarai Engineering Center (OEC) of the PNC. Sodium removal from components or assemblies has been an area with much concern from the beginning of these works. Among the conventional methods, removal by steam, water, alcohol and vacuumization at high temperatures have been done. In Joyo, the experimental fast breeder reactor which reached initial criticality on April, 1977, sodium removal from the grapples of the fuel handling facility and the fuel assemblies which come out of the reactor are done as routine work during refueling.

- 2120 (IWGFR--23, pp 100-107) PARAMETER SURVEY ON THE SATURATION BOILING PROCESS FOR CREVICE SODIUM REMOVAL. Kamei, M.; Kanbe, M.; Nakamura, K.; Fukada, T.; Ishii, Y.; Saito, R.; Mimoto, Y. (Osarai Engineering Centre, Tokyo, Japan). Aug 1978.

From IAEA meeting on sodium removal and decontamination; Richland, WA, USA (14 Feb 1978).

It was found out from the experiences that sodium removal from small crevices by conventional method was difficult. And, in order to improve the operation, a saturation boiling process was applied and experiments using test pieces have started. Since the purpose of this process is to remove final remaining deposits, bulk sodium removal must be done before. The saturation boiling process is a modification of the water charging process. When water is charged into the process cell or tank, the pressure inside is adjusted so that boiling of the water is initiated. The formation of hydro-oxide membranes at the surface of the sodium prevents further reaction between sodium and water. Results have been obtained from test pieces of bolts and crevices of flat plates and cylinders.

- 2121 (IWGFR--23, pp 108-123) UK FAST REACTOR COMPONENTS: SODIUM REMOVAL DECONTAMINATION AND REQUALIFICATION. Donaldson, D.M. (UKAEA, Risley, England); Bray, J.A.; Newson, I.H. Aug 1978.

From IAEA meeting on sodium removal and decontamination; Richland, WA, USA (14 Feb 1978).

Over the past two decades extensive experience on sodium removal techniques has been gained at the UKAEA's Dounreay Nuclear Establishment from both the Dounreay Fast Reactor (DFR) and the Prototype Fast Reactor (PFR). This experience has created confidence that complex components can be cleaned of sodium, maintenance or repair operations carried out, and the components successfully re-used. This past and continuing experience is being used in forming the basis of the plant to be provided for sodium removal, decontamination and requalification of components in the UK's future commercial fast reactors.

- 2122 (IWGFR--23, pp 124-138) PROGRESS IN DEVELOPMENT AND APPLICATION OF METHODS OF WASHING AND DECONTAMINATION OF OBJECTS IN CONTACT WITH SODIUM. Msika, D.; Lafon, A. (Centre de Cadarache, Saint-Paul-lez-Durance, France). Aug 1978.

From IAEA meeting on sodium removal and decontamination; Richland, WA, USA (14 Feb 1978).

In the technology of liquid sodium cooled fast reactors, the necessary processes for washing and decontamination have been demonstrated. For sodium removal, different solutions have been considered and tested in France. The study have been progressively oriented toward defining a process using a fine dispersion of water in a gas (atomization). The results obtained by that method on non-radioactive components were satisfactory insofar as the efficiency and safety of the operation was concerned. The purpose of decontaminating components from the reactor primary circuits is to reduce the level of surface activity to a level compatible with personnel access without biological shielding.

- 2123 (IWGFR--23, pp 139-145) CLEANING OF SMALL COMPONENTS OF COMPLEX GEOMETRY BY MEANS OF THE SODIUM-ALCOHOL REACTION. de Luca, B.; Grasso, C.; Spadoni, M. (CSN, Rome, Italy). Aug 1978.

From IAEA meeting on sodium removal and decontamination; Richland, WA, USA (14 Feb 1978).

The results of some experiments on the vacuum reaction between butylcellosolve and

sodium, contained in small diameter capillaries, are reported. The effects on the cleaning rate of the temperature, amount of solvent, diameter and position of the capillaries are analyzed. The facility, used for the cleaning of small components of complex geometry, is described.

- 2124 (IWGFR--23, pp 145-151) SODIUM COMPONENTS CLEANING STATUS IN THE ITALIAN FAST REACTOR PROGRAM. de Luca, B. (CSN, Rome, Italy); Labanti, V.; Mennucci, M. Aug 1978. From IAEA meeting on sodium removal and decontamination; Richland, WA, USA (14 Feb 1978).

As a consequence of the Italian Fast Reactor Development, mainly aimed to the PEC project and to the participation in the French Superphenix project, it is of increasing importance to set up a reliable method of sodium removal for specific reactor components and related test loops. So far the problem has been faced only in few occasions and in any case without contamination.

- 2125 (IWGFR--23, pp 151-153) SUMMARY OF SODIUM REMOVAL AND DECONTAMINATION PROGRAMS IN THE USA. Steele, D.P. (Rockwell International, Canoga Park, CA); Brehm, W.F. Aug 1978.

From IAEA meeting on sodium removal and decontamination; Richland, WA, USA (14 Feb 1978).

The goals of the United States Department of Energy sodium removal and decontamination programs are: (1) to identify plant requirements and develop safe effective processes for sodium removal, both for experimental facilities and for reactor components; (2) to develop effective decontamination processes for removing deposited radioactivity; (3) to establish and put into use a set of workable criteria for equalification and return to service of components after sodium removal and decontamination; (4) to design, build and operate facilities in which to perform the sodium removal and decontamination operations. A summary of progress toward each of these goals is presented.

- 2126 (IWGFR--23, pp 157-164) CHARACTERIZATION OF CORROSION PRODUCT DEPOSITS IN SODIUM SYSTEMS. Colburn, R.P. (Hanford Engineering Development Lab., Richland, WA). Aug 1978.

From IAEA meeting on sodium removal and decontamination; Richland, WA, USA (14 Feb 1978).

The characterization of mass transfer deposits on the containment surface of sodium systems is an essential step in the development of LMFBR decontamination processes. The surfaces of a sodium test facility used to study radioactive mass transport were examined to determine the chemical and physical nature of the deposits. The examination showed two fundamentally different problems will occur in the hot and cold leg regions of an LMFBR heat transport system. In the hot leg ^{60}Co , ^{59}Co and ^{54}Mn will diffuse into the base metal and decontamination may require the removal of several microns of the base metal. In the cold leg ^{54}Mn will be the dominant radionuclide.

- 2127 (IWGFR--23, pp 83-99) EXPERIENCE ON SODIUM REMOVAL FROM VARIOUS COMPONENTS. Kamei, M.; Kanbe, M.; Yagisawa, H.; Sasaki, S.; Kataoka, H.; Fukada, T.; Ishii, Y.; Saito, R.; Mimoto, Y. (Oarai Engineering Centre, Tokyo, Japan). Aug 1978.

From IAEA meeting on sodium removal and decontamination; Richland, WA, USA (14 Feb 1978).

Since 1970, OEC (Oarai Engineering Center) has been investigating the following methods for removal of sodium from the components of sodium plants: steam cleaning for the 50 MW steam generator, secondary proto-type pump of JOYO and dummy fuel assembly of JOYO, alcohol cleaning for sector model of intermediate heat exchanger (IHX) of JOYO and a proto-type isolation valve of JOYO and cleaning by vacuumization at high temperature for Regenerative Heat Exchangers. The outline of the sodium Disposal Facility and experience of sodium removal processing on the 50 MW steam generator, the crevices of the experimental subassemblies, the fuel handling machine of MONJU and the regenerative heat exchanger of the Sodium Flow Test Facility are outlined.

- 2128 (IWGFR--23, pp 164-173) DEVELOPMENT OF ACIDIC PROCESSES FOR DECONTAMINATING LMFBR COMPONENTS. Hill, E.F. (Rockwell International, Canoga Park, CA); Colburn, R.P.; Lutton, J.M.; Maffei, H.P. 1977.

From IAEA meeting on sodium removal and decontamination; Richland, WA, USA (14 Feb 1978).

The objective of the DOE decontamination program is to develop a well-characterized chemical decontamination process for application to LMFBR primary system components that subsequently permits contact maintenance and allows requalification of the components for reuse in reactors. The subtasks of deposit characterization, development of requalification and process acceptance criteria, development of process evaluation techniques and studies which led to a new acidic process for decontaminating 304 stainless steel hot leg components are described.

- 2129 (IWGFR--23, pp 173-181) NON-AQUEOUS REMOVAL OF SODIUM FROM REACTOR COMPONENTS. Welch, F.H.; Steele, D.P. (Rockwell International, Canoga Park, CA). 1977.

From IAEA meeting on sodium removal and decontamination; Richland, WA, USA (14 Feb 1978).

Reactor components from sodium-cooled systems, whether radioactive or not, must have the sodium removed before they can be safely handled for (1) disposal, (2) examination and test, or (3) decontamination, repair, and requalification. In the latter two cases, the sodium must be removed in a manner which will not harm the component, and prevent future use. Two methods for sodium removal using non-aqueous techniques have been studied extensively in the USA in the past few years: the alcohol process, which uses a fully denatured ethanol to react away the sodium; and the evaporative process, which uses heat and vacuum to evaporate the sodium from the component.

- 2130 (IWGFR--23, pp 195-203) EXPERIENCE OF CLEANING AND DECONTAMINATION OF THE BN-350 REACTOR COMPONENTS. Vasilenko, K.T.; Kochetkov, L.A.; Arkhipov, V.M.; Baklushin, R.P.; Gorlov, A.I.; Kiselev, G.V.; Rezinkin, P.S.; Samarkin, A.A.; Tverdokski, N.D. 1977.

From IAEA meeting on sodium removal and decontamination; Richland, WA, USA (14 Feb 1978).

In the course of start-up, adjustment and operation of the BN-350 reactor there arose a need for cleaning from sodium and decontamination of primary and secondary

equipment components. Design schemes of the systems provided for this purpose as well as those specially designed for cleaning of steam generator evaporators are considered. Technological processes of cleaning and decontamination for some reactor components (removable parts of circulating pumps, evaporators, valves) are described, the results are presented.

- 2131 (IWGFR--23, pp 182-195) EBR-2 EXPERIENCE WITH SODIUM CLEANING AND RADIOACTIVITY DECONTAMINATION. Ruth, W.E.; Smith, C.R.F. (Argonne National Lab., IL). 1977.

From IAEA meeting on sodium removal and decontamination; Richland, WA, USA (14 Feb 1978).

The EBR-II is now in its 13th year of operation. During that period more than 2400 subassemblies have been cleaned of sodium without a serious incident of any kind by a two-step process developed at Argonne. Sodium cleaning and decontamination of other reactor components has been performed only on the relatively few occasions in which a repair or replacement has been required. A summary of the EBR-II experience is presented. A new facility is described for the improved cleaning and maintenance of sodium-wetted primary components.

- 2132 (IWGFR--24-1) INTERNATIONAL WORKING GROUP ON FAST REACTORS ELEVENTH ANNUAL MEETING. SUMMARY REPORT, PART I. (International Atomic Energy Agency, Vienna (Austria). From 11. meeting on fast reactors; Bologna, Italy (17 Apr 1978).

The Summary Report (Part I) contains the minutes of the meeting. (DG)

- 2133 (IWGFR--24-3) INTERNATIONAL WORKING GROUP ON FAST REACTORS ELEVENTH ANNUAL MEETING. SUMMARY REPORT, PART III. (International Atomic Energy Agency, Vienna (Austria). International Working Group on Fast Reactors). Sep 1978. 30p. (CONF-780487--P3(Summ.)). Dep. NTIS (US Sales Only), PC A03/MF A01.

From 11. meeting on fast reactors; Bologna, Italy (17 Apr 1978).

The Eleventh Annual Meeting of the IAEA International Working Group on Fast Reactors was held at the Palazzo dei Congressi, Bologna, Italy from 17--20 April 1978. The Summary Report (Part I) contains the Minutes of the Meeting. The Summary Report (Part II) contains the papers which review the national program in the field of LMFBRs and other presentations at the Meeting. The Summary Report (Part III) contains the discussions on the review of the national programs.

- 2134 (IWGFR--26) SPECIALISTS' MEETING ON EQUATIONS OF STATE OF MATERIALS OF RELEVANCE TO THE ANALYSIS OF HYPOTHETICAL FAST BREEDER REACTOR ACCIDENTS. (International Atomic Energy Agency, Vienna (Austria). International Working Group on Fast Reactors). 1978. 143p. (CONF-780614--(Summ.)). Dep. NTIS (US Sales Only), PC A07/MF A01.

From Specialists' meeting on equations of state of materials of relevance to the analysis of hypothetical fast breeder reactor accidents; Harwell, UK (19 Jun 1978).

Summaries are included of ten papers.

- 2135 (IWGFR--27) COMPILATION OF PIPING BENCHMARK PROBLEMS - COOPERATIVE INTERNATIONAL EFFORT. McAfee, W.J. (comp.). (Oak Ridge National Lab., TN (USA)). Jun 1979. 590p. Dep. NTIS (US Sales Only), PC A25/MF A01.

This report is the culmination of an effort initiated in 1976 by the IWGFR to evaluate detailed and simplified analysis methods for piping systems with particular emphasis on piping bends. The procedure was to collect from participating member IWGFR countries descriptions of tests and test results for piping systems or bends, to compile, evaluate, and issue a selected number of these problems for analysis, and to compile and make a preliminary evaluation of the analysis results. A variety of both detailed and simplified analysis solutions were obtained. A brief comparative assessment of the analyses is contained in this report. All solutions submitted have also been included in order to provide users of this report the information necessary to make their own comparisons or evaluations.

- 2136 (JAERI-M--6851) STRATEGIES IN DEVELOPMENT OF ADVANCED FUELS FOR LMFBR. Hada, M. (Japan Atomic Energy Research Inst., Tokyo). Dec 1976. 59p. (In Japanese). Dep. NTIS (US Sales Only), PC A04/MF A01.

Strategies in development of advanced fuels for LMFBR are reviewed. Recent irradiation experiment and out-of-pile test data of the fuels are given in detail. The present status of development of oxide fueled LMFBR is also treated.

- 2137 (JAERI-M--6993) CALCULATION PROGRAM FOR FAST REACTOR DESIGN. 2. MULTI-DIMENSIONAL PERTURBATION THEORY CODE BASED ON DIFFUSION APPROXIMATION: PERKY. Iijima, S.; Yoshida, H.; Sakuragi, H. (Japan Atomic Energy Research Inst., Tokyo). Feb 1977. 51p. (In Japanese). Dep. NTIS (US Sales Only), PC A04/MF A01.

The program PERKY is used for calculating reactivity worth and kinetic parameters of a fast breeder reactor by ordinary first-order or exact perturbation theory based on two- or three-dimensional diffusion approximation. It calculates effective delayed neutron fraction, prompt neutron lifetime and nuclide reactivity worth mapping using microscopic cross-sections, and also reactivity change using microscopic or macroscopic cross-sections. The anisotropic effect of leakage on the reactivity change calculated by using macroscopic cross-sections can be estimated with bidirectional, diffusion coefficients calculated from the Bessist formulation. The real and adjoint neutron fluxes for perturbation calculations may be generated by multi-dimensional diffusion code CITATION, and the microscopic and macroscopic cross-sections be provided by effective cross-section generating code PIGEON.

- 2138 (JAERI-M--7139) ADEQUACY OF THE ANALYSIS OF MOCK-UP CONTROL ROD EXPERIMENT WITH FCA. Mizoo, N.; Nakano, M. (Japan Atomic Energy Research Inst., Tokyo). Jul 1977. 33p. (In Japanese). Dep. NTIS (US Sales Only), PC A03/MF A01.

A method of numerical analysis has been investigated for the mock-up control rod experiment of FCA VII-1 assembly constructed as the engineering mock-up of prototype fast breeder reactor MONJU. The results of criticality and B₀C mock-up control rod worths analysis for the assembly are described in comparison with the experimental ones. The

tendency of the C/E value with ^{10}B enrichment and the interaction effect of the multiple rods array was also examined. Reactivities and the mock-up rods worths were obtained with the X-Y geometry six groups diffusion theory. Twelve kinds of the mock-up rods with different ^{10}B contents and/or enrichments were used in the experiment; effective cross-sections are provided for each rod by calculation using the collision probability method. Criticality of VII-1 90Z assembly is underestimated for 3 reference critical configurations, ranging from $-0.65\%\Delta k/k$ to $-0.77\%\Delta k/k$. The C/E values at core center for 12 kinds of B₄C mock-up rods range from 1.03 to 1.09. The overestimate of the rod worth increases with macroscopic absorption cross-section of the rod region. The C/E values for 24 different arrays of the mock-up rods ranging from single rod to five rods lie between 1.04 and 1.08. The C/E value tends to decrease with increase in the number of rods inserted, the values for five rods arrays being about 4% lower than those for single rod arrays. The calculated interaction effects of the multiple rods arrays are slightly more negative than the experimental ones.

- 2139 (JAERI-M-7280) EXCURS: A COMPUTING PROGRAMME FOR ANALYSIS OF CORE TRANSIENT BEHAVIOUR IN A SODIUM COOLED FAST REACTOR. Saito, S. (Japan Atomic Energy Research Inst., Tokyo). Sep 1977. 67p. Dep. NTIS (US Sales Only), PC A04/MF A01.

In the code EXCURS developed for core transient behaviour calculation of a sodium-cooled fast reactor, a one-channel model is used to represent thermal behaviour of the reactor core. Calculations are made for three different channels; i.e. average, hot and hottest. In the average channel the power density and coolant velocity are equal to the mean values of the whole core. In the hot channel, a maximum power density of the core and a specific coolant velocity are introduced. In the hottest channel, engineering hot channel factors are considered to the hot channel. A one-point neutron kinetics equation with six delayed neutron groups is used to calculate the time-dependent power behaviour. Externally introduced reactivity effect and control rod movement in the case of a scram are taken into account. In the feedback effects evaluated on the basis of the average channel temperatures are considered Doppler effect, fuel axial expansion, cladding expansion, coolant expansion and structure expansion. The decay heat after reactor scram is also considered. Heat balance is taken in each cross section, neglecting the axial heat transfer except for the coolant region. Temperature dependence of the physical properties of materials is considered by second-order polynomials approximation, and also the fuel melting process. Each channel can be divided into a maximum of 20 regions in both radially and axially. The reactor core transient behaviour due to reactivity insertion or loss-of-coolant flow can be studied by EXCURS. The calculated results are plotted optionally by connected code EXPLOT.

- 2140 (JAERI-M-7291) REACTOR ENGINEERING DIVISION ANNUAL REPORT. (APRIL 1, 1976 - MARCH 31, 1977). Hirota, J.; Asaka, T.; Suzuki, T.; Mitani, H.; Akino, F. (eds.). (Japan Atomic Energy Research Inst., Tokyo). Sep 1977. 193p. Dep. NTIS (US Sales Only), PC A10/MF A01.

Research activities in the Division of Reactor Engineering in fiscal 1976 are described. Works of the division concern mainly the development of multi-purpose Very High

Temperature Gas Cooled Reactor, fusion reactor engineering, and the development of Liquid Metal Fast Breeder Reactor in Power Reactor and Nuclear Fuel Development Corporation. Contents of the report are nuclear data and group constants, theoretical method and code development, integral experiment and analysis, shielding, heat transfer and fluid dynamics, reactor and nuclear instrumentation, dynamics analysis and control method development, fusion reactor technology, and activities of the Committee on Reactor Physics.

- 2141 (JAERI-M-7763) INVESTIGATION OF LMFBRs WITH TH BLANKET FOR SUPPLY OF U-233 TO HTGR. Yoshida, H.; Ohta, F. (Japan Atomic Energy Research Inst., Tokyo). Jul 1978. 60p. (In Japanese). Dep. NTIS (US Sales Only), PC A04/MF A01.

A symbiotic energy system between fast breeder reactor and high temperature gas-cooled thermal reactor appears to be promising as an energy system self-sufficient in fuel to produce both electricity and high temperature process heat. In the system, LMFBR supplies sufficient quantity of Pu to keep itself going and also produces U-233 for Th- ^{233}U HTGR. In the investigation to find out such LMFBR with Th blanket having good Pu/U-233 breeding to keep the system in operation through neutronic and fuel cycle analyses, three types of 1000Mwe LMFBR were examined: conventional two-zoned core LMFBR, axial partial heterogeneous core LMFBR, and radial partial heterogeneous core LMFBR. In each type, the UO_2 -blanket is partly replaced by ThO_2 -blanket to produce U-233. Results indicate the axial partial heterogeneous core LMFBR is appropriate for the symbiotic energy system in breeding performance, safety performance (sodium void coefficient etc.) and economy.

- 2142 (JAERI-M-7844) REACTOR ENGINEERING DIVISION ANNUAL REPORT, APRIL 1, 1977-MARCH 31, 1978. (Japan Atomic Energy Research Inst., Tokyo). Oct 1978. 215p. Dep. NTIS (US Sales Only), PC A11/MF A01.

Research activities in the Division of Reactor Engineering in fiscal 1977 are described. Works of the Division are development of multi-purpose Very High Temperature Gas Cooled Reactor, fusion reactor engineering, and development of Liquid Metal Fast Breeder Reactor for Power Reactor and Nuclear Fuel Development Corporation. Contents of the report are nuclear data and group constants, theoretical method and code development, integral experiment and analysis, shielding, heat transfer and fluid dynamics, reactor and nuclear instrumentation, dynamics analysis and control method development, fusion reactor technology, and Committee on Reactor Physics.

- 2143 (JAERI-M-8117) EXPERIMENTAL STUDY OF LMFBR HETEROGENEOUS CORE AT FCA. Nakano, M.; Iijima, S.; Shirakata, K.; Hirota, J. (Japan Atomic Energy Research Inst., Tokyo). Mar 1979. 18p. NTIS (US Sales Only), PC A03/MF A01.

In order to investigate physics properties of the heterogeneous LMFBR core and to examine reliability of the current data and method for heterogeneous core configuration, an experimental study has been made on FCA VII-3 Assembly which has an internal blanket (IB) at midplane of the cylindrical core. Systematic measurements of the criticality, sample worth, fission rate ratio, reaction rate distribution and sodium void worth were made on the heterogeneous cores whose IBs were different in

composition and thickness. The sodium void worth for the region from the midplane to the middle of the core decreases with increase of ^{235}U or Pu atomic density in the IB. The worth is, however, not sensitive to composition of the IB. The void worth in the core is lowered by about 35% when the thickness of the IB is increased from 20 cm to 40 cm. The initial analysis using the JAERI-Fast Set Version II and the diffusion code CITATION was made for Assembly VII-3-1, the core with IB of 30 cm thickness. Comparison between the calculated and experimental results revealed the following: Pu worth is not well predicted in the core. Reaction rates sensitive to low energy neutrons are underestimated in the IB when they are normalized in the core. A discontinuity of more than 20% in the C/E value of the sodium void worth exists at the interface of the IB and the core.

- 2144 (JAPFNR--406) SODIUM MIST BEHAVIOR IN COVER GAS SPACE OF AN LMFBR: EXPERIMENTAL STUDY. Himeno, Y.; Takahashi, J. (Power Reactor and Nuclear Fuel Development Corp., Oarai, Ibaraki (Japan). Oarai Engineering Center). Feb 1978. 33p. (PNC-N--941-78-42). Dep. NTIS (US Sales Only), PC A03/MF A01.

Work performed under United States--Japanese Fast Reactor Exchange Program.

The paper describes the sodium mist behavior in a simulated Argon cover gas space of an LMFBR consisting of a test vessel of 1,400 mm in axial length, 305.5 mm in inner diameter and about 100 liters in volume. Measurements were made of the mist concentration and the mist gravitational settling flux between the sodium pool temperature range of 290° to 520°C. The results are discussed under the monosize assumption of the particles, and the particle sizes and evaporation rate are derived. Transient and steady state mist concentration behavior were also investigated.

- 2145 (JAPFNR--422) LOCAL FLOW BLOCKAGE EXPERIMENTS IN 37-PIN SODIUM COOLED BUNDLES WITH GRID SPACERS. Uotani, M.; Haga, K.; Kikuchi, Y.; Hori, M. (Power Reactor and Nuclear Fuel Development Corp., Oarai (Japan)). Oct 1978. 16p. Dep. NTIS (US Sales Only), PC A02/MF A01.

Work performed under United States--Japanese Fast Reactor Exchange Program.

A series of out-of-pile experiments were conducted on local temperature rises due to non-heat generating blockages in 37-pin bundles. In the central blockage experiment, the central 24 subchannels of the bundle were blocked with a 5 mm thick stainless-steel plate at upstream end of a grid spacer. The blocked area was 27% of the total flow area. In the edge blockage experiment, a stainless-steel plate blocked 39 subchannels of a 1/2 edge part of the cross-sectional area. In both cases of the central and the edge blockage, the pin surface temperature attained a local peak in the grid spacer behind the blockage and decreased with the distance from the blockage. The mass exchange rate and the coolant residence time in the wake regions were evaluated from the observed temperature rises. The mass exchange rate per unit interface area behind the edge blockage agreed fairly well with that behind the central blockage. The dimensionless coolant residence time was found independent of Reynolds number except in the low number range, and the value obtained in the edge blockage experiment was about 2.4 times as much as that obtained in the central blockage experiment. When experimental results were extrapolated to the reactor condition, an edge blockage of more

than 30% might cause local boiling in the wake region, while a central one would not cause local boiling in any blockage ratio less than 60%. The temperature rises in the blocked grid spacer were also discussed.

- 2146 (JAPFNR--423) ACOUSTIC NOISES WITH LOSS-OF-FLOW SODIUM BOILING EXPERIMENT IN 19-PIN BUNDLE. Ozaki, Y.; Haga, K.; Kikuchi, Y.; Morikawa, T.; Hori, M. (Mitsubishi Electric Corp., Amagasaki, Hyogo (Japan). Central Research Lab.; Power Reactor and Nuclear Fuel Development Corp., Oarai, Ibaraki (Japan). Oarai Engineering Center). Oct 1978. 10p. Dep. NTIS, PC A02/MF A01.

Work performed under United States--Japanese Fast Reactor Exchange Program.

The papers deals with the measurement of acoustic noises with sodium boiling in an electrically heated 19-pin bundle which simulated an LMFBR fuel subassembly. The intensity of boiling acoustic noises measured with the waveguide method was much higher than the background noises such as mechanical and flow noises. A distinct peak, which was observed at approximately 10 kHz, may be attributed to the peculiarity of sodium boiling phenomena because this peak could easily be distinguished from the resonance peaks of the experimental system. The waveform of the boiling acoustic noises was similar to the burst type acoustic emission (AE). The propagation speed of acoustic noises agreed well with a prediction by the theory based on the assumption that the measured acoustic signals were transmitted on the pipe as surface waves (Rayleigh waves) or Lamb waves.

- 2147 (JAPFNR--425) PROGRESS REPORT ON FAST BREEDER REACTOR DEVELOPMENT IN JAPAN, APRIL--JUNE 1978. (Power Reactor and Nuclear Fuel Development Corp., Tokyo (Japan)). Nov 1978. 12p. Dep. NTIS (US Sales Only), PC A02/MF A01.

Work performed under United States--Japanese Fast Reactor Exchange Program.

A brief summary is presented of design and development work related to the JOYO reactor and the MONJU reactor.

- 2148 (JAPFNR--434) HYDRAULIC SIMULATION OF LOCAL BLOCKAGE IN LMFBR FUEL SUBASSEMBLY. Nakamura, H.; Miyaguchi, K.; Takahashi, J. (Power Reactor and Nuclear Fuel Development Corp., Tokyo (Japan)). Jan 1979. 13p. (PNC-N--941-79-07). Dep. NTIS (US Sales Only), PC A02/MF A01.

Work performed under United States--Japanese Fast Reactor Exchange Program.

Experimental studies on the local flow blockage in LMFBR subassembly have been conducted to investigate the safety assessment. The water modeling tests have been carried out, in parallel with the development of the code UZU. Fundamental data on the flow field in a pin bundle containing a blockage have been accumulated and applied to check on uncertainties which came upon in the development of the code. The summary of the experimental results is presented.

- 2149 (JAPFNR--435) CREEP AND CREEP-RUPTURE PROPERTIES OF THE NUCLEAR FUEL CLADDING TUBE FOR FAST BREEDER REACTOR IN HIGH TEMPERATURE SODIUM: ON THE CLADDING TUBE (AISI TYPE 316SS, EFFECT OF BORON CONTENT) MANUFACTURED IN 1974 FOR MONJU. Yuhara, S.I.; Yoshida, E.; Funada, T.; Nakasuji, T. (Power Reactor and Nuclear Fuel Development Corp., Oarai, Ibaraki (Japan). Oarai Engineering Center). Nov 1978. 82p.

Dep. NTIS (US Sales Only), PC A05/MF A01.

Work performed under United States--Japanese Fast Reactor Exchange Program.

Creep-rupture tests under internal pressure were carried out on AISI Type 316 stainless steel nuclear fuel cladding tubes for MONJU. Two kinds of nuclear fuel cladding tubes, the tubes containing 1 and 10 ppm boron respectively, were used for the creep-rupture tests, which were manufactured by the S manufacturer in the 49th year of Showa (in 1974). The nominal dimensions of these tubes are 6.5 mm in diameter and 0.45 mm in wall thickness. The Material Test Sodium Loop 1 and the Material Test Sodium Loop 2 were used for the creep-rupture tests in flowing sodium environments at the two cold trap temperatures of 190°C and 145°C, respectively. Test temperatures were set at 700° and 650°C at the test sections of the Material Test Sodium Loop 1, and at 700°C at the test section of the Material Test Sodium Loop 2.

- 2150 (JAPFNR--459) LOW-CYCLE FATIGUE TESTS ON PRIMARY COOLANT PIPING SYSTEM COMPONENTS OF FAST REACTORS. Imazu, A. (Power Reactor and Nuclear Fuel Development Corp., Tokyo (Japan)). [nd]. 31p. Dep. NTIS (US Sales Only), PC A03/MF A01.

Work performed under United State-Japanese Fast Reactor Exchange Program.

The primary objectives of this series of tests are as follows: to assess the validity of the design method provided by Section III of ASME Boiler and Pressure Vessel Code with emphasis placed on low-cycle fatigue design; to make observations of propagation and penetration behavior of fatigue cracks developed in piping components; and to collect data relating to the inspections of a fast reactor in possible use. These data consist mainly of the measurements of acoustic emission.

- 2151 (JAPFNR--472) REACTOR PHYSICS ACTIVITIES RELEVANT TO FBR AND ATR PROGRAMS IN PNC, JAPAN, NOVEMBER 1978-SEPTEMBER 1979. Inoue, T. (Power Reactor and Nuclear Fuel Development Corp., Tokyo (Japan)). 1979. 11p. (PNC-N--241-79-26). Dep. NTIS (US Sales Only), PC A02/MF A01.

Work performed under United States-Japanese Fast Reactor Exchange Program.

Reactor physics activities have been performed in PNC, Japan, to support FBR and ATR development programs. The experimental fast reactor JOYO attained the second-stage thermal power of 75 MW in July 1979. Environmental impact of the prototype fast breeder reactor, MONJU, is now being assessed by both Japanese government and prefectural government and its construction will be started in 1981. A prototype reactor of heavy water-moderated, boiling light water-cooled, pressure tube type, FUGEN, went into its commercial operation in March 1979.

- 2152 (JAPFNR--473) ACTIVITIES IN SBL-FPL LOOPS FOR SAFETY STUDY OF LMFBR(I). (Power Reactor and Nuclear Fuel Development Corp., Darai, Ibaraki (Japan). Darai Engineering Center). Jun 1979. 21p. (PNC-N--941-79-79). Dep. NTIS (US Sales Only), PC A02/MF A01.

Work performed under USDOE-PNC FBR Information Exchange.

As the first step for the safety study of LMFBR, it is necessary to understand the initial events of possible accidents in LMFBR. Local faults and sodium boiling can be considered in that area. SBL and FPL were

constructed to understand such phenomena experimentally. Two loops own jointly the dump tank and the purification loop. SIENA is the generic name to both loops. A schematic diagram of SIENA is presented.

- 2153 (JAPFNR--479) STUDY ON PLAN OF MOCK-UP CRITICAL EXPERIMENT FOR LARGE FAST REACTORS BY USING THE FCA. (STUDY ON AN AMOUNT OF PU FUEL NEEDED FOR PARTIAL MOCK-UP EXPERIMENT IN LARGE FAST REACTORS). Takano, H.; Mitani, H.; Matsui, Y.; Ishiguro, Y.; Kuroi, H. (Power Reactor and Nuclear Fuel Development Corp., Darai (Japan); Japan Atomic Energy Research Inst., Tokyo). Jul 1979. 84p. (In English and Japanese). (PNC-SJ--250-79-18; JAERI-Memo--8362). Dep. NTIS (US Sales Only), PC A05/MF A01.

Work performed under United States--Japanese Fast Reactor Exchange Program.

Study on Pu-contents needed for partial mock-up experiment in large fast reactors was performed by considering zone loading, sector loading, and partial sum mock-up methods. Integral quantities, i.e., central reaction rate ratio, reaction rate distribution, Doppler reactivity coefficient, Na-void reactivity and control rod reactivity were calculated for full mock-up and these partial mock-up cores with various Pu-contents.

- 2154 (JAPFNR--482) OUT-OF-PILE EXPERIMENT OF FISSION GAS RELEASE IN LMFBR SUBASSEMBLY. 4. FEASIBILITY STUDY OF GAS RELEASE DETECTION BY USE OF FLOW FLUCTUATION SIGNAL. Irushima, H.; Ogino, T.; Ohkouchi, T.; Komaba, T.; Haga, K.; Hori, M. (Power Reactor and Nuclear Fuel Development Corp., Darai, Ibaraki (Japan). Darai Engineering Center; Mitsubishi Electric Corp., Amagasaki, Hyogo (Japan). Central Research Lab.). May 1979. 34p. (In English and Japanese). (PNC-N--941-79-49). Dep. NTIS (US Sales Only), PC A03/MF A01.

Work performed under United States-Japanese Fast Reactor Exchange Program.

Fission gas release tests were carried out in a 37-pin bundle to study the feasibility of fission product gas release detection by use of eddy current type flow meter. This 37-pin bundle simulated a normal subassembly of LMFBR. Flow and flow fluctuations were measured by an eddy-current type flow meter at the outlet of the bundle. The output signals from the flow meter were filtered and amplified through a specially made fluctuation measuring circuit. Thus, these measured signals were analyzed using a digital computer.

- 2155 (JAPFNR--487) ASSESSMENT OF GENERATION METHOD OF NUCLEAR REACTOR CONSTANTS SET USING THE JENDL-2 NUCLEAR DATA FILE. Takano, H.; Nakagawa, M.; Hasegawa, A.; Ishiguro, Y.; Matsui, Y.; Kaneko, K. (Japan Atomic Energy Research Inst., Tokyo). 1979. 67p. (JAERI-Memo--8233; PNC-J--250-79-13). Dep. NTIS (US Sales Only), PC A04/MF A01.

Work performed under United States-Japanese Fast Reactor Exchange Program.

Interpolation method of resonance shielding factor, group collapsing method with bilinear weight, and group structure were assessed for the purpose of generation of new nuclear reactor constants set using the JENDL-2 nuclear data file, and an adjustment plan was proposed for the methodology used. Concerned with the interpolation method of shielding factor, various methods used so far and, additionally, spline fitting method and Akima's method were intercompared in connection with computing accuracy and time. The spline method was found to give the most excellent and stable accuracy.

Concerning the bilinear-weight collapsing method, the difference between the flux- and bilinear-weight collapsings was studied by considering a group collapse from seventeen to twenty-five groups and by analyzing reactivity worth measurements for sodium void at ZPPR-2 and steam entry at ZPPR-9 Phase 1. The flux-weight collapsing method used so far was shown to be sufficient for the analysis of the measurement of sodium void reactivity worth.

- 2156 (JAPFNR--488) INVESTIGATION ON NEUTRONIC PERFORMANCES OF LARGE SCALE HETEROGENEOUS LMFBR. Iijima, S.; Yoshida, H.; Hotta, M. (Power Reactor and Nuclear Fuel Development Corp., Daiichi (Japan); Japan Atomic Energy Research Inst., Tokyo). Apr 1979. 32p. (In English and Japanese). (JAERI-Memo--8266; PNC-J--250-79-14). Dep. NTIS (US Sales Only), PC A03/MF A01.

Work performed under United States--Japanese Fast Reactor Exchange Program.

Heterogeneous LMFBR concept with internal blanket has received substantial attention for its good breeding performance and fairly low sodium void reactivity effect. A comparative study of neutronic performances between conventional and heterogeneous LMFBRs has been made to identify what is the main issue in analyzing physics performance of heterogeneous LMFBR. The heterogeneous LMFBRs investigated in the study were Axial Parfait and Radial Heterogeneous LMFBRs with power 1000 MWe and the neutronic performances were burnup, breeding, power distribution, and sodium void reactivity effect. Uncertainty of the neutronic performances related to neutron cross-section data uncertainty was also examined in the study using three different 25-group cross-section sets generated from JAERI-FAST, ENDF/B-IV and JENDL-1.

- 2157 (JAPFNR--494) STUDIES OF RARE EARTH ELEMENT AS CONTROL ROD MATERIAL FOR LMFBR. PART V. Suzuki, H.; Iseki, T.; Maruyama, T.; Ohno, A. (Tokyo Inst. of Tech. (Japan). Research Lab. of Nuclear Reactor). Apr 1979. 37p. (In Japanese). (PNC-J--261-79-02). Dep. NTIS (US Sales Only), PC A03/MF A01.

Work performed under United States--Japanese Fast Reactor Exchange Program.

Compatibility of Eu_2O_3 and a mixed oxide of $(\text{Eu,Gd})_2\text{O}_3$ with Type 316 stainless steel was examined by heating sintered monoclinic Eu_2O_3 pellets and the mixed oxide of $(\text{Eu,Gd})_2\text{O}_3$ pellets in contact with Type 316 stainless steel spacers. The heat-treatment was carried out in the range from 550°C to 1000°C for 500 h to 5000 h in out-of-pile conditions. The density of both Eu_2O_3 pellet and $(\text{Eu,Gd})_2\text{O}_3$ pellet is approximately 95% of theoretical density. The ratio of number of Eu to Gd atoms contained in the mixed oxide of $(\text{Eu,Gd})_2\text{O}_3$ is adjusted to be 1.0. Metallographic examination of the heat-treated stainless steel spacer indicated that chemical reaction between Eu_2O_3 and Type 316 stainless steel occurred at 650°C, and severe reaction, particularly grain boundary penetration, was observed in stainless steel sample which was heat-treated at 1000°C for 500 h.

- 2158 (JEN--363) CREEP-RUPTURE-STRENGTH AND CREEP-BEHAVIOUR OF STAINLESS STEEL X6CRNI 1811 (DIN 1.4948). Solano, R.R.; de las Rivas, M.; Seith, B.; Schirra, M. (Junta de Energia Nuclear, Madrid (Spain)). 1977. 25p. (In Spanish). Dep. NTIS (US Sales Only), PC A02/MF A01.

The steel X6CrNi 1811 (DIN 1.4948) that will be used as a structure material for the German

fast breeder reactor SNR 300, was creep-tested in a temperature range of 550-650 deg C under base material condition as well as welded material condition. Tests are foreseen up to 30,000 hours with a continuous measuring of the elongation. The test results up to about 4,000 hours are described. Taking into account the results of other programs carried out with the same material between 550 and 600 deg C at similar rupture time, the stresses were defined for the longterm test. The main point of this program ('Extrapolation Program') lies in the knowledge of the creep-rupture-strength and creep behaviour of the structure materials up to 3.10^4 h at high temperature in order to extrapolate up to 10^5 h for reactor operating temperatures.

- 2159 (JEN--389) PHYSICAL PROPERTIES OF LIQUID SODIUM. Alberdi Priniccia, J.; Martinez Piquer, T.A. (Junta de Energia Nuclear, Madrid (Spain)). 1977. 35p. (In Spanish). Dep. NTIS (US Sales Only), PC A03/MF A01.

Molten sodium has been the more accepted coolant for the first generation of FBR; for this reason the knowledge of its technology is needed for the development of the next LMFBR. A series of data necessary for designing liquid sodium systems is given. Tables and graphs about the most important physical properties of sodium between 1200-1400°C are gathered. The results have been obtained from equations that relate the properties with temperature using a Fortran IV program.

- 2160 (JEN--447) CREEP-RUPTURE-TESTS ON THE STAINLESS STEEL X6 CRNI 1811 (DIN 1.4948) IN THE FRAME OF THE 'EXTRAPOLATION-PROGRAM' PT. 2. Solano, R.R.; Barroso, S.; de las Rivas, M.; Schirra, M.; Seith, B. (Junta de Energia Nuclear, Madrid (Spain)). 1979. 58p. (In Spanish). NTIS (US Sales Only), PC A04/MF A01.

The austenitic stainless steel X6 CrNi 1811 (DIN 1.4948) that is used as a structure material for the German Fast Breeder Reactor SNR 300 was creep tested in a temperature range of 550-650 deg under base material condition as well as welded material condition. The main point of this program ('Extrapolation-Program') lies in the knowledge of the creep-rupture-strength and creep-behaviour up to 3X10⁴ hours at higher temperatures in order to extrapolate up to $(\geq)10^5$ hours for operating temperatures. In order to study the stress dependency of the minimum creep rate additional tests were carried out over temperature range 550 deg - 750 deg C. The present report describes the state in the running program with test-time up to 35,000 hours. Besides the creep-rupture behaviour it is possible to make a distinct quantitative statement for the creep-behaviour and ductility. Extensive metallographic examinations show the fracture behaviour and changes in structure.

- 2161 (KFK--1276/4) FOURTH QUARTERLY REPORT 1976. (Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Projekt Schneller Brueker). Apr 1976. 204p. (In German).

The 4th quarterly report 1976 describes activities which were carried out within the framework of the Fast Breeder project at the Gesellschaft fuer Kernforschung, Karlsruhe, or on its behalf. The sections refer to the following subjects: Fuel rod development; material studies and development; corrosion experiments and coolant analysis; physics experiments; reactor theory; fast breeder safety; instrumentation and signal processing for core control; effects on the environment;

sodium technology experiments; thermo- and fluid-dynamic tests in gas; design studies concerning sodium-cooled breeders.

- 2162 (KFK--1277/2, pp v) REACTOR THEORY AND PHYSICAL EXPERIMENTS. Jiang, S.H.; Werle, H.; Froehner, F.H.; Stein, E.; Krieg, B.; Fischer, E.A.; Kiesel, R.; Brandl, V.; Hoebel, W.; Kuefner, K. (Kernforschungszentrum Karlsruhe (Germany, F.R.). Inst. fuer Neutronenphysik und Reaktortechnik). Oct 1977. (In German).
Fast Breeder Project: Second quarter annual report 1977.

The neutron induced gamma radiation in iron has been determined in a test rig using fission neutrons of Cf-252. In the range between 0.5 and 2.0 MeV neutron energy the agreement with results obtained by gamma transport calculations with KEDAK data is satisfactory; below this region there are major deviations. Cross sections for resonance capture in structural materials (Fe, Ni, Cr) in the range of up to 0.3 MeV have been newly evaluated. This also allows a more accurate prediction to be made of the influence of these materials on the nuclear Doppler coefficient. To back up calculations by transport methods results of the SNEAK 9 C 2 critical assembly have been recalculated by Monte-Carlo methods. The results obtained by both techniques largely agree, but both differ considerably from the measured results, which is probably due to the inaccurate knowledge of cross sections. A summary is given of the use, further development and data management of the KAPROS reactor program system.

- 2163 (KFK--1277/2, pp v) REACTOR TECHNOLOGY. Wild, E.; Mack, K.J.; Dres, K.; Seeger, W.; Trippe, G.; Weinberg, D.; Marten, K.; Wiens, E.; Hoffmann, H. (Kernforschungszentrum Karlsruhe (Germany, F.R.). Inst. fuer Reaktorbauelemente); Rehme, K. (Kernforschungszentrum Karlsruhe (Germany, F.R.). Inst. fuer Neutronenphysik und Reaktortechnik). Oct 1977. (In German).
Fast Breeder Project - Second quarter annual report 1977.

The pressure drop, flow distribution, levitation point and subassembly stability were studied on a precursor model of a series of absorber bundles of the first shutdown unit of the SNR 300. Temperature form factors as a function of radial power form factors were determined by means of thermohydraulic calculations for various types of spacers of core elements. According to these calculations, helical wire spacers result in the most pronounced coolant temperature variations over the cross section of the element, and in the most adverse mean coolant temperature as well.

- 2164 (KFK--2353) TUFCI, AN EXPERIMENTAL FACILITY TO STUDY THE MOLTEN-FUEL-COOLANT-INTERACTION IN A FULL SCALE FUEL ELEMENT. Beutel, H. (Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Inst. fuer Reaktorentwicklung; Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Projekt Schneller Brueter). Feb 1977. 66p. (In German). Dep. NTIS (US Sales Only), PC A04/MF A01.

The safety-investigations for the Liquid-Metal-Fast-Breeder-Reactor also include experiments for fuel-coolant-interactions (FCI) in a simulated fuel element to find out the conversion factor from thermal to mechanical energy. This report describes the development of an experimental facility which makes it possible to produce an FCI in a geometry, which is typical for a fuel element. Other than in

real elements the wall of the reaction tube is rigid. Fuel-sodium contact is achieved by the impact of sodium and molten UO_2 as well as by the injection of smaller quantities of sodium into UO_2 (initiating-reaction). Finally an experiment is described in which smaller quantities of sodium were injected into liquid fuel.

- 2165 (KFK--2356) EXPERIMENTAL DETERMINATION OF TEMPERATURE FIELDS IN SODIUM-COOLED ROD BUNDLES WITH HEXAGONAL ROD ARRANGEMENT AND GRID SPACERS. Moeller, R.; Tschoeke, H.; Kolodziej, M. (Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Inst. fuer Reaktorbauelemente; Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Projekt Schneller Brueter). Jan 1977. 46p. (In German). Dep. NTIS (US Sales Only), PC A03/MF A01.

Three-dimensional temperature fields in the claddings of sodium cooled rods were determined experimentally under representative nominal operating conditions for a SNR typical 19-rod bundle model provided with spark-eroded spacers. These experiments are required to verify thermohydraulic computer programs which will provide the output data for strength calculations of the high loaded cladding tubes. In this work the essentials are reported of the measured circumferential distributions of wall temperatures of peripheral rods. In addition the sub-channel temperatures measured over the bundle cross section are indicated, they are required to sustain codes for the global thermohydraulic design of core elements. The most important results are: 1) The whole fuel element is located within the thermal entrance length. 2) High azimuthal temperature differences were measured in the claddings of peripheral rods, which are strongly influenced by the distance between the rod and the shroud, especially for the corner rod. 3) With decreasing Pe-number (< approximately 360) the circumferential temperature differences increase at a superproportional rate. The results of experiments described call for the settlement with priority of the following problems: 1) Experiments to determine the influence of the distance between the rods and the shroud on the temperature distribution in the claddings of peripheral rods, above all corner rods. 2) Completion of the presently used global design codes by multi-zone models applicable for local calculations of critical bundle zones.

- 2166 (KFK--2360) EXPERIMENTAL INVESTIGATIONS INTO COOLANT CROSS MIXING IN MULTI-ROD-BUNDLES WITH GRID-TYPE SPACERS IN TURBULENTLY FLOWING SODIUM. Hoffmann, H.; Baumgaertner, E.; Frey, H.H. (Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Inst. fuer Reaktorbauelemente; Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Projekt Schneller Brueter). Jan 1977. 17p. (In German). Dep. NTIS (US Sales Only), PC A02/MF A01.

The thermo- und fluiddynamic design of fuel elements of Liquid Metal-Cooled Fast Breeder Reactors needs characteristic values for the magnitudes of the coolant cross mixing. These were determined experimentally in sodium flow. 61-rod clusters were used with the specific dimensions of the SNR-300 fuel element (rod pitch to diameter ratio $P/D = 1.32$) equipped with grid-type spacers. The investigations were performed using the 'heating method'. The results show that the mixing rates are mainly influenced by the spacer type and the P/D -ratio.

- 2167 (KFK--2368) HEATER RODS FOR SIMULATION OF FUEL PINS IN LIQUID-METAL-BOILING EXPERIMENTS. PT. 1. Casal, V.; Demski, A.; Graf, E.; Hartmann, W. (Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Inst. fuer Reaktorbaulemente; Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Projekt Schneller Brueter). Jan 1977. 25p. (In German). Dep. NTIS (US Sales Only), PC A02/MF A01.

The report describes the design, development, and testing of electrical heater rods for boiling tests in LMFBR fuel element simulators. The tests are required as a proof of the capability to control local and gross boiling in the core of SNR-300. The setup and performance of the tests call for heater rods simulating with a very high operating reliability the assumed specifications of SNR-300, even under transient conditions. Loads of the heating surface of up to 170 W/cm² must be attained at coolant temperatures of 950°C.

- 2168 (KFK--2387(Pt.7)) KEDAK PROGRAM COMPENDIUM. PART VII: CALCUL-CALCULATION. Langner, I.; Meyer, R. (Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Inst. fuer Neutronenphysik und Reaktortechnik). Nov 1977. 121p. Dep. NTIS (US Sales Only), PC A06/MF A01.

Work performed under United States--West Germany Fast Reactor Exchange Program.

CALCUL is a program system to calculate composed cross section quantities and to arrange them according to KEDAK-conventions. A special command language has been generated to simplify the input and to provide interactive communication under time-sharing-option. In CALCUL any amount of data can be processed. The output of the program is a data set which can be directly used as an input to program system KEMA which modifies the KEDAK-library.

- 2169 (KFK--2416, pp 27-37) CORE ELEMENTS OF THE SNR-300. Biermann, W.; Toebbe, H.; Wenk, K.H. (Internationale Atomreaktorbau G.m.b.H. (INTERATOM), Bergisch Gladbach (Germany, F.R.)). 1976. (In German).

From KTG technical day on fuel element of the sodium-cooled breeder; Karlsruhe, F.R. (28 - 29 Oct 1976).

A survey is presented of the various core element types of the SNR core and of their constructional design.

- 2170 (KFK--2416, pp 80-88) STATUS OF DEVELOPMENT OF CLADDING AND STRUCTURAL MATERIALS FOR THE SNR CORE ELEMENTS. Dietz, W. (Internationale Atomreaktorbau G.m.b.H. (INTERATOM), Bergisch Gladbach (Germany, F.R.)). 1976. (In German).

From KTG technical day on fuel element of the sodium-cooled breeder; Karlsruhe, F.R. Germany (28 Oct 1976).

Problems concerning high-temperature plasticity and the swelling of cladding and fuel channel materials of the SNR-300 are dealt with. Plasticity of the material 1.4970 under short-term and long-term stress (10⁴h), the 0.2% yield point, and elongation before reduction of area of the irradiated material as well as creep rupture strength and the 0.2% creep limit of pipes made of 1.4970 (t = 700°C, irradiated and non-irradiated) are presented in diagrammes. Creep induced by irradiation of the materials 1.4970 and 1.4981 is also dealt with.

- Funke, P. (Alpha Chemie und Metallurgie G.m.b.H. (ALKEM), Hanau (Germany, F.R.)). 1976. (In German).

From KTG technical day on fuel element of the sodium-cooled breeder; Karlsruhe, F.R. Germany (28 Oct 1976).

A survey is presented of the fabrication of oxide and carbide fuels and of the fuel rod for fast breeders (KNK, SNR-300). The advantages of the chosen methods are explained. The main points of development concerning the oxide fuel rod are gone into. The process sequence for plutonium oxide and plutonium carbide processing is presented in a flow chart.

- 2172 (KFK--2416, pp 4-11) BASIC IDEAS ON THE DEVELOPMENT OF FUEL ELEMENTS FOR FAST BREEDER REACTORS. Karsten, G. 1976. (In German).

From KTG technical day on fuel element of the sodium-cooled breeder; Karlsruhe, F.R. Germany (28 Oct 1976).

Within the research for the development of fuel elements for sodium-cooled fast breeders, the emphasis is shifted from strategic to basic matters. Just breeding gain and burn-up are no longer to the fore, but fabrication methods and material problems above all. With regard to fabrication methods, shielding against plutonium and americium by means of mechanisation and automation plays a leading role, with regard to reprocessing it is fuel solubility. Concerning materials problems, the issue is resistivity against radiation damage, i.e. embrittlement, swelling and creep, and, in the accident programme, unsteady loads. Carbide and burn-up research, currently running second, is concerned with questions related to fabrication and concepts, and in the case of burn-up research with reliability tests.

- 2173 (KFK--2416, pp 19-26) FUEL ELEMENTS FOR BREEDER POWER PLANTS. INTERNATIONAL STATUS. Kummerer, K. (Kernforschungszentrum Karlsruhe (Germany, F.R.). Inst. fuer Material- und Festkoerperforschung). 1976. (In German).

From KTG technical day on fuel element of the sodium-cooled breeder; Karlsruhe, F.R. Germany (28 Oct 1976).

A survey is presented of 21 fast breeder reactors which are either already in operation, under construction, or in a concrete stage of planning. Design and operational data of the fuel rods and fuel elements of these reactors are given in tabular form. A synopsis reveals common aspects and differences in the line of development of the various countries.

- 2174 (KFK--2416, pp 60-70) STATUS OF THE DEVELOPMENT OF THE CARBIDIC FUEL ELEMENT. Muehling, G. 1976. (In German).

From KTG technical day on fuel element of the sodium-cooled breeder; Karlsruhe, F.R. Germany (28 Oct 1976).

The carbide irradiation programme for developing carbide fuel elements for the SNR-300, one of the programme items of the Gesellschaft fuer Kernforschung, Karlsruhe, is introduced. It is subdivided into 2 phases: in phase 1, individual rod irradiation is carried out in the thermal reactors FR-2 and BR-2. Phase 2 includes the focal points: cluster irradiation under rapid flux and tests concerning the incident behaviour of carbide rods. Irradiations carried out so far demonstrate that the swelling of fuel and can be got under control if the design is right.

- 2176 (KFK--2416, pp 102-108) DESIGN OF CARBIDE FUEL RODS. Steiner, H. (Kernforschungszentrum Karlsruhe (Germany, F.R.). Inst. fuer Material- und Festkoerperforschung). 1976. (In German).

From 5. space optics meeting; Marseille, France (14 Oct 1975).

The model theory for the design of carbide fuel rods, unlike that of the oxide fuel rod, is considered to be not yet fully developed. Therefore, one falls back on empirical material from irradiation experiments. The paper is concerned with thermal design, the swelling of carbide fuel, and the mechanical interactions of the system fuel/can. The following problems are dealt with in this connection: The space between fuel and can as a heat barrier, the temperature drop in the carbide pellet, model calculations on heat transfer, a rupture study of the carbide pellet, the stretching of cans during irradiation experiments, integral swelling rates, swelling pressure and creep deformation of cans.

- 2177 (KFK--2416, pp 72-79) CHEMICAL AND MECHANICAL INTERACTION IN THE OXIDE FUEL ROD. Thuemmler, F.; Dienst, W. (Kernforschungszentrum Karlsruhe (Germany, F.R.). Inst. fuer Material- und Festkoerperforschung). 1976. (In German).

From KTG technical day on fuel element of the sodium-cooled breeder; Karlsruhe, F.R. Germany (28 Oct 1976).

A survey is presented of chemical and mechanical interactions between mixed oxide fuel and can material, whereby the problems of fuel rod behaviour under load changes are dealt with in more detail. It is found that in all cases of cladding tube cracking internal corrosion plays a role.

- 2178 (KFK--2416, pp 50-59) DETECTIVE ROD AND ACCIDENT EXPERIMENTS. Plitz, H. (Kernforschungszentrum Karlsruhe (Germany, F.R.)). 1976. (In German).

From KTG technical day on fuel element of the sodium-cooled breeder; Karlsruhe, F.R. Germany (28 Oct 1976).

Fuel element behaviour of the SNR-300 during possible operational incidents is of particular interest for reasons of economy. Programmes for investigating the effects of operational incidents on the behaviour of fuel elements, and the behaviour of defective fuel rods during continued operation, are therefore carried out. The experimental incident programmes (performance and coolant incidents, cyclic operation, overload) and the programme concerning defective rods are introduced. The problem in connection with the Na-fuel swelling process is dealt with.

- 2179 (KFK--2416, pp 42-49) CORE ELEMENTS DURING RAMP POWERS AND INCIDENTS. Toebe, H.; Gestermann, F. (Internationale Atomreaktorbau G.m.b.H. (INTERATOM), Bergisch Gladbach (Germany, F.R.)). 1976. (In German).

From KTG technical day on fuel element of

the sodium-cooled breeder; Karlsruhe, F.R. Germany (28 Oct 1976).

Three modes of operation are taken as the basis of design for the core elements of the SNR 300, from which dissimilar design criteria are derived. Fuel rod behaviour during reactivity and coolant throughput is dealt with. Three examples of incidents, the loads during which and their effect on the core elements are explained and assessed, demonstrate that the core elements meet with the design requirements in cases of typical incidents.

- 2180 (KFK--2416) FUEL ELEMENT OF THE LMFBR. Karsten, G. (ed.). (Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Projekt Schneller Brueter). 1976. vp. (In German). (CONF-7610135--). NTIS.

From KTG technical day on fuel element of the sodium-cooled breeder; Karlsruhe, F.R. Germany (28 Oct 1976).

Separate abstracts are included for each of the individual papers presented.

- 2181 (KFK--2416, pp 89-95) DEVELOPMENT OF CLADDING AND STRUCTURAL MATERIALS. Anderko, K. 1976. (In German).

From KTG technical day on fuel element of the sodium-cooled breeder; Karlsruhe, F.R. Germany (28 Oct 1976).

The creep-fracture behaviour of the irradiated material 1.4970 and possibilities to improve its behaviour are discussed. From this, it follows that the alloy 1.4970 ought to be strengthened more still with regard to creep rupture ductility and strength. The planned optimization programme considers the following parameter variations: 1. Solution heat temperature; 2. cooling rate; 3. thermo-mechanical treatment; 4. chemical modification (B, C, Ti).

- 2182 (KFK--2416, pp 12-18) SNR-CORES: KNK-II, SNR-300 UP TO SNR-2. Hoechel, J. (Internationale Atomreaktorbau G.m.b.H. (INTERATOM), Bergisch Gladbach (Germany, F.R.)). 1976. (In German).

From KTG technical day on fuel element of the sodium-cooled breeder; Karlsruhe, F.R. Germany (28 Oct 1976).

The focal points in the development of fast breeder core design are outlined briefly, and the main data of the cores Na-2, SNR-300 MK-I, SNR-300 MK-Ia and SNR-300 MK-II are presented in tabular form. Steel 1.4970 is named as a new reference material for SNR fuel elements.

- 2183 (KFK--2451) LAYOUT, DESIGN AND POST IRRADIATION EXAMINATION OF NA-BONDED FUEL PINS OF THE TEST GROUP MOL 15. Steiner, H.; Freund, D.; Jacobi, O.; Weimar, P. (Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Inst. fuer Material- und Festkoerperforschung). Apr 1977. 80p. (In German). Dep. NTIS (US Sales Only), PC A05/MF A01.

The experiment Mol 15 includes the irradiation of 4 fuel rod specimens with UC/PuC fuel (25 wt% Pu and Usb(nat)) of different M_2C_3 shares with Na bonding. It is the first capsule irradiation of Na-bonded carbide rods within the Project Fast Breeder. In the present report, design, irradiation, and post-irradiation examination of the fuel rods are described. At linear power ratings of maximum 1,150 W/cm and cladding temperatures of maximum 500°C burn-ups of nearly 9% fima were obtained without getting rod defects. Cladding deformations remained decidedly small (0.3% at

the maximum). The cladding consisted of the material 1.4988 (X8CrNiMoVNB1613). The fuel structure is characterized by a highly porous zone in the interior followed by a narrow high-density zone. On three specimens, indications of a central cavity were found. Together with the anomalous bubble size, this suggests superheating of the after failure of the Na bonding during irradiation.

- 2184 (KFK--2472) HEAT TRANSMISSION DURING STARTUP IN CARBIDE FUEL RODS PROVIDED WITH AVERAGE TO LARGE FABRICATION GAPS. Steiner, H. (Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Inst. fuer Material- und Festkoerperforschung; Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Projekt Schneller Brueter). Jun 1977. 14p. (In German). Dep. NTIS (US Sales Only), PC A02/MF A01.

The influence was investigated of different geometry effects on the temperature distribution in helium bonded carbide fuel pins. For this purpose the heat conduction equation was solved using the development of the Fourier-series. Models were set up to describe concentric, excentric and stacked arrangements of pellets not cracked as well as pellet cracking followed by the displacement of pellet fractions towards the cladding. It appeared that the heat transmission coefficients, determined experimentally during startup, can be explained solely by the latter effect. The fact that this effect has not been taken into account is the cause of the discrepancy between the experimental results and the predictions by the GAPRS heat transmission model based on a concentric pellet not cracked.

- 2185 (KFK--2474) HEATER RODS FOR SIMULATION OF FUEL PINS IN LIQUID-METAL-BOILING EXPERIMENTS. Pt. 2. Casel, V.; Demski, A.; Graf, E.; Hartmann, W. (Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Projekt Schneller Brueter). Aug 1977. 25p. (In German). Dep. NTIS (US Sales Only), PC A03/MF A01.

This report describes advancements in the development of electric heater rods to be used in sodium boiling experiments. The heat is generated in the heater rod by ohmic heating of a tape helix. The heat passes through the insulator, a layer made of compacted boron nitride powder, and reaches the clad of the heater rod. By use of tantalum cladding tubes and conductors consisting of tantalum 10% tungsten, heat surface loads of more than 250 W/cm² can be realized with these heater rods at clad temperatures of 1050°C. Since the geometric layout and the fabrication methods were maintained, it was possible to benefit from experience gathered on heater rods for boiling experiments equipped with nickel-chromium conductors and stainless steel clads, which have operated successfully.

- 2186 (KFK--2475) DESCRIPTION OF THE TESTSECTIONS FOR LOCAL BOILING EXPERIMENTS IN THE KNS-LOOP. Huber, F.; Jenes, E.; Mattes, K. (Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.)). Apr 1978. 19p. (In German). Dep. NTIS (US Sales Only), PC A05/MF A01.

Within the context of the SNR-300 R+D program experimental studies have been made on the effects of local cooling disturbances within large pin bundle geometry, under conditions similar to those in the reactor. To this two test sections were built which were geometrically and thermohydraulically similar

to a SNR-300 fuel element. The first test section possesses a central 49% blockage and the second a 21% edge blockage. This report is a description of both the test section and considers the construction and instrumentation in particular detail.

- 2187 (KFK--2490) HYPOTHETICAL CORE DISRUPTIVE ACCIDENT ANALYSIS OF A 2000 MWSUB(E) LIQUID METAL COOLED FAST BREEDER REACTOR. Struwe, D. (Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.)). Dec 1977. 170p. (In German). Dep. NTIS (US Sales Only), PC A09/MF A01.

A structural phase diagram for hypothetical core disruptive accidents (HCDA) has been developed based on a variety of analyses for different LMFBR's. The intention was to identify the strategic phases of HCDA's important with regard to safety aspects of the plant. These phases are investigated in detail for a 2,000 MWSUB(e) LMFBR (SNR=2,000). Characteristic data of SNR=2,000 are discussed concerning their influence on safety analysis. Reasons for the choice of model parameters for special phenomena as fuel coolant interaction, fuel pin failure mechanisms and sodium voiding are given. The results of calculations with CAPRI-2, HOPE and KADIS are analyzed for possibilities to enter energetic core disassembly with consequences, making power values below 2,000 MWSUB(e) necessary. Investigation of these results shows that the expected consequences do not lead to design requirements, restricting the magnitude of the electrical power output of LMFBR's to values below 2,000 MWSUB(e). Therefore, consequences of HCDA's are principal not expected to limit the feasibility of conventional core design of this order of magnitude.

- 2188 (KFK--2491) ANALYSIS OF THE DISASSEMBLY PHASE OF HYPOTHETICAL CORE DISRUPTIVE ACCIDENTS (HCDA) FOR THE SNR-2000. Maschek, W. (Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Inst. fuer Neutronenphysik und Reaktortechnik; Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Projekt Schneller Brueter). Dec 1977. 245p. (In German). Dep. NTIS (US Sales Only), PC A12/MF A01.

In the present work main emphasis has been layed on the analysis of the disassemblyphase of HCDAs. In the first chapters the essential core design features and some remarks about the disassembly analysis of very large conventional breeder cores have been discussed. The course of the fore-mentioned accident types has been followed up until first neutronic shut down with the Karlsruher disassembly code KADIS. For all accidents the power histories, the energy and mass of molten fuel - which are measures for the severity of the excursion - are displayed. In a first approach the mechanical loads of the reactor tank structures generated by the power excursions have been estimated. Additionally the influence on the development of the loss of flow accident when using an extreme slow pump coast down curve or providing the subassembly inlet with flow diodes with direction dependent orificing properties, have been analyzed. The results of the safety analysis strongly support the conclusion that the requirements to withstand the consequences of HCDA's in principle will not limit the feasibility of conventionally designed LMFBRs up to a power of 2000 MW electric.

- 2189 (KFK--2497) KADIS: A PROGRAM TO ANALYSE THE DISASSEMBLY PHASE OF HYPOTHETICAL ACCIDENTS IN LMFBRs. Schumuck, P.; Jacobs, G.;

Arnecke, G. (Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Projekt Schneller Brueiter). Nov 1977. 218p. (In German). Dep. NTIS (US Sales Only), PC A11/MF A01.

The program KADIS models the disassembly phase during power excursions in LMFBR hypothetical accidents. KADIS is based on point kinetics in the neutronics part and on a 2-dimensional representation of the reactor core in the hydrodynamics part. The core is modeled as an ideal, compressible fluid which is heated up adiabatically during the excursion. KADIS was built up with the help of the VENUS program of Argonne National Laboratory. Several important features were added to the basic VENUS model. Therefore we give first a complete description of the mathematical models used. Secondly we provide the user with the necessary information to handle the input/output of KADIS.

2190 (KFK--2508) KINTIC-2 USER'S MANUAL. Vaeth, L. (Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Inst. fuer Neutronenphysik und Reaktortechnik; Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Projekt Schneller Brueiter). Nov 1977. 99p. Dep. NTIS (US Sales Only), PC A06/MF A01.

KINTIC-2 is a two dimensional reactor dynamics program, which can be used to analyze operational reactor transients or transients caused by accident situations. In the near future, it will be mainly used for the calculation of the predisassembly phase of LMFBR hypothetical accidents. Reactor kinetics may optionally be calculated with a simple point kinetics model or the adiabatic, normal or improved quasistatic method. The thermodynamics and material motion part, which was adapted from the CAPRI-2 system, uses representative coolant channels in a single channel model. It treats various phenomena which occur in intact fuel subassemblies: One phase steady state and transient heat transfer and coolant pressure distribution, pin deformation and failure, sodium voiding, slumping, and fuel coolant interaction. The report gives a short summary of the underlying physical models and some information on code organization and geometrical and thermohydraulic representation of the reactor. The main part consists of input and output description and sample cases. KINTIC-2 works in the KAPROS system and is operational since mid-1976.

2191 (KFK--2546) FURTHER DEVELOPMENT OF THE LMFBR ACCIDENT ANALYSIS CODES HOPE AND KADIS: AUTOMATIC DATA TRANSFER, NEW EQUATION OF STATE. Fischer, E.A.; Arnecke, G. (Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Inst. fuer Neutronenphysik und Reaktortechnik; Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Projekt Schneller Brueiter). Mar 1978. 75p. Dep. NTIS (US Sales Only), PC A05/MF A01.

To provide suitable tools for the analysis of hypothetical unprotected transient overpower accidents in LMFBR, the codes HOPE and KADIS were further developed. HOPE analyses the initiating phase of a reactivity ramp accident in an irradiated core, KADIS is a core disassembly code. An automatic data transfer from HOPE to KADIS was organized. A new equation of state, which includes fission gas pressures, was developed and introduced in KADIS. The system of the two codes allows a consistent treatment of fission gas effects in both the initiating and the disassembly phase. Care was taken to make sure that the fuel-coolant interaction models in both codes are as

well compatible as feasible. A reference transient overpower accident, initiated by a 15/sec reactivity ramp, was analyzed, using a melt fraction criterion for pin failure. To make sure that an energetic core disassembly occurs, the rather pessimistic assumption of mid-plane pin failure was made. In this accident, the fission-gas driven fuel ejection through the rip causes a positive fuel motion reactivity. On the other hand, fission-gas pressure disperses fuel during the super-prompt critical disassembly phase, and the total energy release is still less than predicted in an earlier analysis of the same accident sequence with the codes CAPRI-2 and KADIS. In addition, the 15/sec ramp accident was also analyzed with the more mechanistic burst stress failure criterion, but still sticking to the pessimistic assumption of mid-plane failure. In this case, the predicted energy release is again considerably less.

2192 (KFK--2559) DETECTION OF BAND-LIMITED COMPONENTS IN NOISE SIGNALS BY SURVEILLANCE OF THE AUTO- AND CROSS POWER SPECTRAL DENSITY. Ehrhardt, J. (Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.)). Mar 1978. 115p. (In German). Dep. NTIS (US Sales Only), PC A07/MF A01.

In technical plants disturbances are possible which generate small narrow-band components in the measured signals. For the detection of these oscillatory signals the observation of the frequency spectra of the measured signals' noise components is particularly advantageous because they produce additional characteristic peaks. In this paper detection systems for the fast detection of suddenly appearing peaks in the power spectral density of noise signals are presented based on auto- and cross correlation techniques. General criteria were developed to enable the determination of the optimal detection system and its sensitivity for the different problems. Specially auto- and cross correlation measurements were compared in dependence of the signal coherence. Theoretical results were confirmed in a number of experiments. Special experimental and theoretical parameter studies were done for the optimal detection of sodium boiling in LMFBR's. Computations showed that local sodium boiling can be detected in nearly the whole core range of SNR=300 by detection systems based on the observation of the neutron flux fluctuations.

2193 (KFK--2573) PHYSICS INVESTIGATIONS OF A COMPACT SIMULATION OF A LARGE FAST BREEDER REACTOR. SNEAK-ASSEMBLY 10. Giese, H. (Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Inst. fuer Neutronenphysik und Reaktortechnik). Jun 1978. 114p. Dep. NTIS (US Sales Only), PC A06/MF A01.

SNEAK-10 was the first SNEAK assembly devoted to the investigation of certain neutronic properties of breeder reactors with a nominal power of approx. 1200 MW/sub el/. The investigations were concentrated on flux tilts and related mutual control rod interactions, occurring upon changes of control insertion depths. As the physical size and fuel inventory of such reactors significantly exceed the capacity of SNEAK the investigated cores had to be compacted by a factor of approximately 2, without affecting the phenomena of interest. This was achieved by the use of densified compositions without sodium and adequate reduction of the physical dimensions. Lacking sufficient amounts of plutonium, uranium fuel was used in all investigated configurations.

- 2194 (KFK--2577) DESIGN, IRRADIATION AND POST-IRRADIATION EXAMINATION OF THE (U,Pu)C FUEL PINS OF THE TEST GROUPS 6A AND 6C. Steiner, H.; Weimar, P. (Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Inst. fuer Material- und Festkoerperforschung; Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Projekt Schneller Brueter). Mar 1978. vp. (In German). Dep. NTIS (US Sales Only), PC A10/MF A01.

The documentation in this report presents the objectives of the experiment, a detailed description of design, specification and fabrication of the pins, the irradiation history, and the post-irradiation examination. In conclusion several irradiation aspects of the fuel pins are analyzed by means of computer codes.

- 2195 (KFK--2584) THEORETICAL AND EXPERIMENTAL INVESTIGATION OF THE NONLINEAR STRUCTURAL DYNAMICS OF FAST BREEDER REACTOR FUEL ELEMENTS. Liebe, R. (Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Projekt Schneller Brueter; Karlsruhe Univ. (TH) (Germany, F.R.). Fakultat fuer Maschinenbau). Apr 1978. 146p. (In German). Dep. NTIS (US Sales Only), PC A08/MF A01.

Thesis.

This study describes theoretical and experimental investigations of the dynamic deformation behavior of single and clustered fuel elements under local fault conditions in a Fast Breeder Reactor core. In particular an energetic molten-fuel-coolant-interaction (FCI) is assumed in one subassembly with corresponding pressure pulses, which may rupture the wrapper and load the adjacent fuel elements impulsively. Associated coherent structural deformation may exceed tolerable and damage the control rods. To attack the outlined coupled fluid-structure-interaction problem it is assumed, that the loading at the structures is known in space and time, and that there is no feedback from the deformation response. Then current FCI-knowledge and experience from underwater core model explosion tests is utilized to estimate upper limits of relevant pulse characteristics. As a first step the static carrying capacity of the rigid-plastic hexagonal wrapper tube is calculated using the methods of limit analysis. Then for a general dynamic simulation of the complete elastoplastic subassembly response the concept of a discrete nonlinear hinge is introduced. A corresponding physical lumped parameter hinge model is presented, and general equations of motion are derived using D'Alembert's principle. Application to the static and dynamic analysis of a single complete fuel element includes the semiempirical modelling of the fuel-pin bundle by a homogeneous compressible medium. Most important conclusions are concerning the capability of the theoretical models, the failure modes and threshold load levels of single as well as clustered SNR-300 fuel elements and the safety relevant finding, that only limited deformations are found in the first row around the incident element. This shows in agreement with explosion test results that the structured and closely spaced fuel elements constitute an effective, inherent barrier against extreme dynamic loadings.

- 2196 (KFK--2586) SUMMARY OF RESULTS FOR THE SNEAK-9 SERIES OF CRITICAL EXPERIMENTS AND CONCLUSIONS FOR THE ACCURACY OF PREDICTED PHYSICS PARAMETERS OF THE SNR-300. Helm, F. (comp.). (Kernforschungszentrum Karlsruhe

G.m.b.H. (Germany, F.R.). Inst. fuer Neutronenphysik und Reaktortechnik). Aug 1978. 59p. Dep. NTIS, PC A04/MF/A01.

Work performed under United States--West Germany Fast Reactor Exchange Program.

In a series of critical assemblies in SNEAK physics parameters of interest for the prototype fast reactor SNR-300 were investigated and compared to the results of calculations. Since a complete mock-up of the SNR-300 was not possible with the material supply available, the measurements were performed in three different assemblies, each being adapted to the investigation of a particular set of problems. Work was concentrated on the following quantities: criticality, breeding ratio, Na-void effect, control rod worths, and power distribution.

- 2197 (KFK--2589) NEUTRON NOISE ANALYSIS FOR MALFUNCTION DIAGNOSIS AT SODIUM COOLED REACTORS. Hoppe, P. (Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Inst. fuer Neutronenphysik und Reaktortechnik; Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Projekt Schneller Brueter; Karlsruhe Univ. (TH) (Germany, F.R.). Fakultat fuer Maschinenbau). Sep 1978. 145p. (In German). Dep. NTIS (US Sales Only), PC A08/MF A01.

Thesis.

For the investigation of the potential use of neutron noise analysis at sodium cooled power reactors, measurements have been performed at the KNK I reactor over a period of 18 month under different operational conditions. The signal fluctuations of the following transducers have been recorded: In-core and Ex-core neutron detectors, temperature-, flow-, pressure-, vibration- and acoustic sensors. These extensive measurements have been analyzed in the frequency range from 0,001 Hz to 1000 Hz with all currently known methods for the identification of noise sources. The following results have been found: - Neutron noise for $f < 1$ Hz is due to reactivity fluctuations only, for $f > 20$ Hz the white detection noise prevails. In the region from 1 Hz to 20 Hz the vibrations of core components contribute to neutron noise. - Neutron noise is influenced by the state of the plant. - The contributions to neutron noise due to the fluctuations of coolant flow and inlet temperature are small compared to those produced by the movements of the control rod initiated by the reactor control system. The quantitatively unidentifiable amount of reactivity fluctuations (0,6 time-dependent thermal bowing of the core. With respect to these results and by calculation of the neutron noise patterns to be expected for the SNR 300, the following possible applications for neutron noise analysis have been found: By means of neutron noise analysis only reactivity fluctuations can be identified and supervised which are produced by time dependent changes of the core geometry. Furthermore neutron noise analysis is well suited for a sensitive detection of control rod vibrations and of local sodium boiling. Finally it can be used for the surveillance of the proper functioning of the reactor control system and of the control rod drive mechanism. (orig./HP) 891 HP.

- 2198 (KFK--2619) POSSIBILITIES TO DETERMINE THE HEAT TRANSFER BETWEEN NUCLEAR FUEL ELEMENTS AND THE COOLANT IN A SODIUM COOLED REACTOR DURING NORMAL POWER OPERATION. Mitzel, F. (Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Projekt Schneller Brueter). Jun 1978. 45p. (In German). Dep. NTIS (US Sales Only), PC A04/MF A01.

In order to improve the safety, the surveillance and economy of sodium cooled reactors it is desirable to obtain a more precise knowledge of the heat transfer between the fuel and the coolant. Different possibilities have been investigated to determine the corresponding heat transfer coefficient by measuring the pertinent transfer functions. The result was the following: The heat transfer coefficient can be determined with reasonable accuracy at the KNK II and the SNR by means of small pseudostochastic power oscillations. These power oscillations must be artificially induced but do not require an interruption of the normal plant operation. The accuracy could however still be further improved by an additional measurement of the fuel temperature with a special instrumentation.

- 2199 (KFK--2660) INVESTIGATIONS OF DECAY HEAT REMOVAL BY NATURAL CONVECTION WITH BOILING IN SODIUM COOLED FAST REACTORS. Kaiser, A.; Peppier, W.; Strake, M. (Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Inst. fuer Reaktorentwicklung; Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Projekt Schneller Brueter). Mar 1979. 70p. (In German). Dep. NTIS (US Sales Only), PC A05/MF A01.

The safety analysis of a LMFR indicates the requirement of safely removing the decay heat produced after a reactor shut-down, especially in the case of a failure of all primary circuits. To investigate the conditions under which power in the range of the decay heat can be transferred from a pin bundle to a sodium loop by natural convection, a series of experiments was carried out. Special attention was paid to the behaviour of the natural convection system when boiling occurs, and also to the limits of cooling capability. To apply the experimental results a computer program was made using a simplified model of the emergency cooling system of the SNR 300. With this program several cases of emergency cooling under the boundary conditions of in-tank natural convection were analyzed, assuming a breach of a primary circuit. As an example, the consequences of an increase of the flow resistances in a subassembly were investigated. It was demonstrated that under conditions of steady state boiling there will be only very low vapour qualities. Similar results were obtained from investigations when the sodium temperature at the inlet to the core was elevated, and when the flow resistances in the cold leg of the natural convection loop were increased by a factor of two. Further experiments gave evidence that the cooling of the bundle will substantially be maintained under conditions of low vapour qualities. In summary, it may be stated that even under very pessimistic assumptions concerning the progress of the in-tank natural circulation, the cooling will be maintained reliably, even if boiling occurs for some time.

- 2200 (KFK--2662) THEORETICAL INVESTIGATIONS OF THE MELTOFF AND RESOLIDIFICATION PROCESS OF FUEL CLADDINGS DURING ACCIDENTS IN LIQUID METAL COOLED FAST BREEDER REACTORS. Angerer, G. (Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Inst. fuer Neutronenphysik und Reaktortechnik; Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Projekt Schneller Brueter; Karlsruhe Univ. (TH) (Germany, F.R.). Fakultät fuer Maschinenbau). Aug 1978. 182p. (In German). Dep. NTIS (US Sales Only), PC A09/MF A01.

Thesis.
During loss-of-coolant-flow accidents in

liquid metal cooled fast breeder reactors with failure to scram the fuel claddings will melt after boiling and evaporation of the coolant. The CMOT model presented here describes the subsequent process of relocation and resolidification of the molten claddings. The basic thermohydrodynamics equations of the two-phase flow of cladding material and sodium vapor are solved numerically by differential approximations in a Eulerian reference net. The results calculated by the model improved the insight into the dynamics of the cladding relocation process. Here are the main results: - Shortly after the onset of cladding relocation large waves of molten cladding material are generated. The motion of these waves contributes considerably to the material transport. - The dynamics of cladding relocation exhibits strong local incoherences. - The formation of cladding blockages observed at the ends of the fuel region is confirmed by the calculations. - In case of incoherent cladding meltoff less cladding material is transported upwards. - Cladding relocation strongly depends on the axial pressure drop and the underlying friction factor correlations. Recalculation of the R5 loss-of-coolant-flow experiment performed in the U.S. TREAT test reactor is in good agreement with the experimental data. (orig./HP) 891 HP.

- 2201 (KFK--2668) ANALYSIS OF SODIUM-VOID EXPERIMENTS IN ZPPR-3 MODIFIED PHASE 3 CORE. Yoshida, T. (Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Inst. fuer Neutronenphysik und Reaktortechnik). Aug 1978. 45p. Dep. NTIS (US Sales Only), PC A03/MF A01.

Work performed under United States--W. Germany Fast Reactor Exchange Program.

An analysis is presented of a series of sodium-void reactivity measurements performed in assembly 3 of Zero Power Plutonium Reactor (ZPPR-3), a mockup of the US Demoplant. In this series, large-zone sodium-void effects were studied in detail in the presence of many singularities, namely, control rods (CRs) and control rod positions (CRPs). The Karlsruhe data-and-method have been applied to an analysis of these experiments, and the results are presented. The work is aimed at complementing the sodium-void reactivity analysis based on the SNEAK experiments, where it was difficult to simulate a large plutonium-core of a prototype fast breeder reactor.

- 2202 (KFK--2684) FLUIDDYNAMIC INVESTIGATIONS WITH THE ABSORBERS OF THE FIRST AND SECOND SHUT DOWN UNIT OF THE SNR-300. Marten, K.; Hoffmann, H. (Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Inst. fuer Reaktorbauelemente; Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Projekt Schneller Brueter). Jan 1979. 26p. (In German). Dep. NTIS (US Sales Only), PC A03/MF A01.

Two independent shut down systems with different design characteristics will be installed in the SNR-300. The first shut down unit also controls the reactor. It consists of a rigid absorber and operates due to gravity from top downward into the core. The second shut down unit each is composed of three articulated absorbers installed beneath the core and pulled up into the core by acceleration springs. To support the design of the absorbers of the two shut down units the pressure losses, the mass flow distributions and the floating characteristics have been investigated experimentally in water flow. Beside the mass flow rates the main parameters represent the axial and radial positions of the

absorber bundles within the guide tube. The transferability of the results to sodium flow is guaranteed.

- 2203 (KFK--2690) ANNUAL REPORT OF THE WORKING GROUP 'FUEL PIN AND FUEL ELEMENT MECHANICS' OF THE INSTITUT FÜR REAKTORTECHNIK (IRT) OF THE TECHNISCHE HOCHSCHULE DARMSTADT FOR THE FAST BREEDER PROJECT. Fabian, H.; Humbach, W.; Lassmann, K.; Mueller, J.J.; Preusser, T.; Schmelz, K. (Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Projekt Schneller Brüter). Sep 1978. 102p. (In German). Dep. NTIS (US Sales Only), PC A06/MF A01.

This report comprises six single lectures given at an information meeting organized by the Institut für Reaktortechnik der Technischen Hochschule Darmstadt (IRT) in Darmstadt on April 24, 1978. The lectures are an account of work performed at IRT on the mechanics of fuel pins and fuel elements and supported by the Fast Breeder Project (PSB) of KFK. These activities can be broken down into studies of the integral fuel pin (URANUS computer code) and into multidimensional studies of the fuel pin using the finite-element method (FINEL and ZIDRIG computer codes). Moreover, a report is presented of the status of the test facility for simulation of out-of-pile cladding tube loads and of the IRT project on the simulation and analysis of radiation damage.

- 2204 (KFK--2738) TP1, A COMPUTER PROGRAM FOR THE CALCULATION OF REACTIVITY AND KINETIC PARAMETERS BY ONE-DIMENSIONAL NEUTRON TRANSPORT PERTURBATION THEORY. Kobayashi, K. (Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Inst. für Neutronenphysik und Reaktortechnik). Mar 1979. 76p. Dep. NTIS (US Sales Only), PC A05/MF A01.

Work performed under United States-West Germany Fast Reactor Exchange Program.

TP1, a FORTRAN-IV program based on transport theory, has been developed to determine reactivity effects and kinetic parameters such as effective delayed neutron fractions and mean generation time by applying the usual perturbation formalism for one-dimensional geometry. Direct and adjoint angular dependent neutron fluxes are read from an interface file prepared by using the one-dimensional S/sub n/-code DTK which provides options for slab, cylindrical and spherical geometry. Multigroup cross sections which are equivalent to those of the DTK-calculations are supplied in the SIGMN-block which is also read from an interface file. This block which is usually produced by the code GRUCAL should contain the necessary delayed neutron data, which can be added to the original SIGMN-block by using the code SIGMUT.

- 2205 (KFK--2762) DEVELOPMENT OF FILTERING DEVICES FOR CHEMICAL AGGRESSIVE AEROSOLS. Jordan, S.; Lindner, W. (Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Lab. für Aerosolphysik und Filtertechnik 1). Mar 1979. 25p. (In German). Dep. NTIS (US Sales Only), PC A03/MF A01.

Different types of filtering devices were tested to deposit chemical aggressive aerosols. Sodium fire aerosols were used as test aerosols. Glas fiber filters, wet scrubbers and sandbed filters were investigated. Commercially available fiber filters and scrubbers were used. Small sized multilayer sandbed filters were developed and optimized with respect to high deposition rate and load capacity and low pressure drop. The experimental results are

explained by theoretical calculations. The results of the three different precipitators are compared. Multilayer sandbed filters are with respect to deposition rate and pressure drop similar to fiber filters. Nevertheless the load capacity of a sandbed filter is much higher.

- 2206 (KFK--2773) CREEP AND STRESS-RUPTURE BEHAVIOR UNDER INTERNAL PRESSURE OF TUBES MADE FROM AUSTENITIC STAINLESS STEEL X8 CR NI MO NB 1616 (MATERIAL NO. 1.4981). Schaefer, L.; Polifka, F.; Kempe, H. (Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Inst. für Material- und Festkörperforschung). May 1979. 88p. (In German). Dep. NTIS (US Sales Only), PC A05/MF A01.

Work performed under United States-EURFNR Fast Breeder Reactor Exchange Program.

Creep and stress rupture tests have been performed at 600, 650, 700 and 750°C on tubes made from three different heats from the austenitic stainless steel X8 Cr Ni Mo Nb 1616 (Material No. 1.4981). The tubes were loaded by internal pressure and the tangential (hoop) creep strain was measured continuously. The results are presented in form of creep curves, stress-time to rupture curves and curves for a creep limit. The average and minimum creep rates as a function of the applied stress have been evaluated and are described with a creep law analogous to Norton's creep law. An interpolation and extrapolation of the stress-rupture-strength and the creep strength are possible using the time-temperature-parameter-plot after Larson and Miller.

- 2207 (KFK--2794) CRISS POWER SPECTRAL DENSITY: A METHOD FOR CORRELATING SIGNAL COMPONENTS FROM DIFFERENT FREQUENCY RANGES. Vaeth, W. (Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Inst. für Neutronenphysik und Reaktortechnik). Apr 1979. 16p. Dep. NTIS (US Sales Only), PC A02/MF A01.

Work performed under United States-West Germany Fast Reactor Exchange Program.

A special method is described for measuring the correlation of two signal components at different frequencies: the CRISS power spectral density. From this new function in frequency analysis, the correlation of two components can be determined quantitatively either they stem from one signal or from two diverse signals. The principle of the method, suitable for the higher harmonics of a signal as well as for any other frequency combination is shown for the digital frequency analysis technique. Two examples of CRISS power spectral densities demonstrate the operation of the new method.

- 2208 (KFK--2802-B) PUBLICATION LIST CONCERNING LMFBR-WORK OF KFK FROM 1976 UNTIL 1978. Hueper, R. (Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Projekt Schneller Brüter). Apr 1979. 11p. (In German). Dep. NTIS (US Sales Only), PC A10/MF A01.

This list is a continuation of the lists of the Karlsruhe Fast Breeder Project publications given in the earlier reports KFK-Ext. 25/7-1 and 25/76-1. Corresponding to the present organization of the project in the framework of the cooperation between Germany, Belgium, the Netherlands and France, the list is subdivided into the fields of the working groups of the 'Arbeitsausschuss F+E-Programme des SNR-300'. In the last part of the list general surveys of the project work and its objectives are quoted.

- 2209 (KFK--2817) GERMAN OXIDE FUEL PIN IRRADIATION TEST EXPERIENCE FOR FAST REACTORS. Kummerer, K. (Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Inst. fuer Material- und Festkoerperforschung). Mar 1979. 27p. Dep. NTIS (US Sales Only), PC A02/MF A01. Work performed under United States-UKAEA Fast Reactor Exchange Program.

After a short introduction concerning features and problems in oxide fuel pin design, the experiments are described in some detail, including the design of the experimental pins, the parameter variations within the test groups, the irradiation conditions, and also some characteristic results. In order to get an easy survey, a lot of tables combined with schematic design drawings are presented. After that a nomographical synopsis indicates the regions of parameters covered. Finally conclusions are drawn concerning the experimental basis for a sound reference oxide fuel pin design. Out of the body of present knowledge the future trends and needs in developmental effort are indicated.

- 2210 (KFK--2820) OBSERVATIONS OF THE BEHAVIOR OF GAS IN THE WAKE BEHIND A CORNER BLOCKAGE IN FAST BREEDER SUBASSEMBLY GEOMETRY. Fukuzawa, Y. (Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Inst. fuer Reaktorentwicklung). Jul 1979. 44p. NTIS (US Sales Only), PC A03/MF A01.

Observations were made of gas behavior in the wake behind a 21% corner blockage in the subassembly geometry of a liquid metal fast breeder reactor. The test section used represented one half of the reactor fuel subassembly, divided along the vertical plane of symmetry through the blockage. A glass wall occupied the position of this plane. Water was allowed to flow between glass rods simulating fuel pins, the velocity being changed from 1.2 to 4.5 m/s. Argon was injected into the wake or into the flow upstream of the blockage, the injection rate being changed from 1 to 230 Ncm³/s (standard temperature and pressure).

- 2211 (KFK--2824) DEVELOPMENT OF A CODE FOR DESCRIPTION OF SODIUM SPRAY AND POOL FIRES. PART I: COMPARISON BETWEEN THE CODES SOFIRE II AND NABRAND. Alexas, A. (Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Lab. fuer Aerosolphysik und Filtertechnik 1). Sep 1979. 30p. (In German). Dep. NTIS (US Sales Only), PC A03/MF A01.

Work performed under United States-EURFN Fast Breeder Reactor Exchange Program.

In the scope of the development of a code to describe both, sodium pool- and spray fires, the ell-known codes SOFIRE II and NABRAND have been compared. Regarding the program technique of both codes, the NABRAND-code seems to be the better one, though it includes some conservatism in the modeling and in the transport coefficients used. For a realistic estimation of the consequences of large sodium fires in an LMFBR, an elimination of these conservatism is necessary. After that it must be investigated if a combination of the modified version of the NABRAND-code and of a spray fire-code (for example the code SPRAY) is efficient.

- 2212 (KFK--2827) DEPENDENCE OF DIFFUSION THEORY RESULTS ON THE MESH SIZE FOR FAST REACTOR CALCULATIONS. Buckel, G.; Gebhardt, W.; Kiefhaber, E. (Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Inst. fuer Neutronenphysik und Reaktortechnik). Jul 1979. 49p. NTIS (US Sales Only), PC A03/MF

A01.

In investigations concerning sodium void reactivities for SNEAK-9C2-assemblies inconsistencies were detected in the results coming from Δk of successive diffusion and exact perturbation calculations, respectively. Therefore, discretization and rounding errors in neutronic reactor calculations and their effects on numerical results are considered for a well known SNR-300 type benchmark problem as well as for the slightly simplified original problem.

- 2213 (KFK--2834) EXPERIMENTAL INVESTIGATIONS OF TURBULENT FLOWS IN ROD BUNDLES WITH AND WITHOUT SPACER GRIDS. Trippe, G. (Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Inst. fuer Reaktorbauelemente; Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Projekt Schneller Brueter; Karlsruhe Univ. (TH) (Germany, F.R.). Fakultae fuer Maschinenbau). Jul 1979. 92p. (In German). Dep. NTIS (US Sales Only), PC A06/MF A01.

Thesis.

In the thermofluiddynamic design of liquid metal cooled reactor fuel elements the lack of experimentally confirmed knowledge of the three-dimensional flow events in rod bundles provided with spacer grids has appeared as a significant problem. To close this gap of knowledge, detailed measurements of the local velocities were made on a 19-rod bundle model. The Pitot method of differential pressure measurements was used as the measuring system. In the first part of the work the fully developed flow regime not influenced by spacers was investigated. A simple relation was derived for distributing the mass flow among the subchannels of a rod bundle; it is but slightly dependent on the Reynolds number. This relation allows a quick, coarse calculation of the distribution of the undisturbed, fully developed mass flow in bundles with similar geometries. By evaluation of further experiments known from the literature, empirical relationships were found for the local velocity distribution within the subchannels of such bundles. In the second part the effect of grid shaped spacers was investigated. The three-dimensional flow events caused by the spacers were completely recorded and interpreted physically. The deeper understanding of these flow processes can now serve to improve the model concept used in the present design computer programs. Single results of the investigations which take primary importance are the quantitative relations existing between the changes of mass flow in the bundle boundary zone, caused by a spacer, and the geometry of this spacer. The transferability to other bundle geometries was discussed and delimited. Moreover, it was shown that the mass flow in the bundle boundary zone can be successively reduced by spacers placed one behind the other in the bundle. A noticeable dependence of flow events on the Reynolds number was not found for the range relevant in practical application ($30.000 \leq Re \leq 60.000$).

- 2214 (KFK--2834) EXPERIMENTAL INVESTIGATIONS OF TURBULENT FLOWS IN ROD BUNDLES WITH AND WITHOUT SPACER GRIDS. Trippe, G. (Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Inst. fuer Reaktorbauelemente). Jul 1979. 105p. (In German). Dep. NTIS (US Sales Only), PC A06/MF A01.

In the thermofluiddynamic design of liquid metal cooled reactor fuel elements the lack of experimentally confirmed knowledge of the three-

dimensional flow events in rod bundles provided with spacer grids has appeared as a significant problem. To close this gap of knowledge, detailed measurements of the local velocities were made on a 19-rod bundle model. The Pitot method of differential pressure measurements was used as the measuring system.

- 2215 (KFK--2841) HEAT TRANSFER FROM INTERNALLY HEATED FLUIDS WITH TEMPERATURE DEPENDENT VISCOSITY. Fieg, G. (Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Inst. fuer Neutronenphysik und Reaktortechnik). Aug 1979. 23p. (In German). Dep. NTIS (US Sales Only), PC A02/MF A01.

Work performed under United States-EURFN Fast Breeder Reactor Exchange Program.

Thermo-hydraulic experiments on heat transfer in fluids with high Prandtl-numbers and strong temperature dependent viscosity are described. Pure Benard-convection and volume heated liquids have been investigated. In both cases the results show no essential differences compared to the heat transfer in fluids with nearly temperature independent viscosity.

- 2216 (KFK--2858) CONTRIBUTION TO THE STRUCTURAL ANALYSIS OF CYLINDRICAL FUEL RODS OF NUCLEAR REACTORS WITH CONSIDERATION OF MULTIDIMENSIONAL BEHAVIOR, BASED ON FINITE-ELEMENT-METHOD. Fabian, H. (Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.)). Sep 1979. 208p. (In German). Dep. NTIS (US Sales Only), PC A10/MF A01.

Work performed under United States-EURFN Fast Reactor Breeder Reactor Exchange Program.

A critical review of the state-of-the-art in fuel rod structural analysis shows that in general analyses are based on one-dimensional models. This investigation considers the two-dimensional aspects of the fuel rod design. Therefore the FEM-codes, ZIDRIG and FINEL, have been developed. For the cladding the influences of manufacturing tolerances, integral ribs and end-plugs as well as the behavior during LOCA (ballooning) have been calculated. The pellets have been analyzed with their real dimensions and with consideration of plasticity and cracks. Finally the mechanical pellet-cladding-interaction is considered, i.e., bamboo like deformation.

- 2217 (KFK-EXT--8/76-4) LMFBR POST ACCIDENT HEAT REMOVAL TESTING NEEDS AND CONCEPTUAL DESIGN OF A TEST FACILITY. Kleefeldt, K.; Kuechle, M.; Royle, P.; Werle, H.; Boenisch, G.; Heinzel, V.; Mueller, R.A.; Schramm, K.; Smidt, D. (Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Inst. fuer Neutronenphysik und Reaktortechnik; Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Inst. fuer Reaktorentwicklung). Mar 1977. 196p. Dep. NTIS (US Sales Only), PC A09/MF A01.

A study has been carried out in which the needs and requirements for a test facility were derived, enabling detailed investigation of key phenomena anticipated during the post accident heat removal (PAHR) phase as a consequence of a postulated LMFBR whole core accident. Part I of the study concentrates on demonstrating the PAHR phenomena and related testing needs. Three types of experiments were identified which require in-pile testing, ranging from 10 to 70 cm test bed diameter and correspondingly, 30 to 5 W/g minimum power density in the test fuel. In part II a conceptual design for a test facility is presented, emphasizing the capability for accomodating large test beds. This is achieved by a below-reactor-vessel

testing device, neutronically coupled to a 100 Mwt sodium cooled fast reactor.

- 2218 (KFK-EXT--8/78-4) MEASUREMENT OF HEAT FLUX DISTRIBUTION OF A PROTOTYPE HEATER ROD WITH SINUSOIDAL AXIAL POWER PROFILE. Gonzalez, S. (Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Inst. fuer Reaktorentwicklung; Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Projekt Schneller Brueter). Oct 1978. 29p. Dep. NTIS (US Sales Only), PC A03/MF A01.

To support the safety analysis of the SNR-300 prototype sodium cooled fast breeder reactor core, experiments concerning integral boiling events will be performed in a 37 electrically heated rod bundle. For this purpose heater rods having a sinusoidal axial heat flux distribution have been developed in accordance with the SNR-300 fuel pins. The variation in the heat flux is attained by varying the band width of the conductor element. The heat flux distribution of one already manufactured heater rod has been measured and compared with an equation which describes the required distribution. It was found that the differences between the measurements and the theoretical values in the range of 50 to 850 mm of the heated length were less than 7%. It is concluded that the heater rod can simulate satisfactorily the SNR-300 fuel pin.

- 2219 (KFK-EXT--8/78-5) ASSESSMENT OF STRUCTURAL DYNAMICS PROBLEMS IN NUCLEAR REACTOR SAFETY. Liebe, R. (Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Inst. fuer Reaktorentwicklung; Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Projekt Schneller Brueter). Oct 1978. 56p. (In German). Dep. NTIS (US Sales Only), PC A04/MF A01.

The paper discusses important physical features of structural dynamics problems in reactor safety. First a general characterization is given of the following problems: Containment deformation due to pool-dynamics during BWR-blowdown; behavior of the core internals due to PWR-blowdown loads; dynamic response of a nuclear power plant during an earthquake; fuel element deformation due to local pressure pulses in an LMFBR core. Several criterias are formulated to classify typical problems so that a better choice can be made both of appropriate mathematical/numerical as well as experimental techniques. The degree of physical coupling between structural dynamics and fluid dynamics is discussed in more detail since it requires particular attention when selecting problem-oriented methods of solution. Some examples are given to illustrate the application and to compare advantages and disadvantages of several numerical methods. Then description is given of experimental techniques in structural dynamics and typical problem areas are identified. Finally some results are presented concerning the fuel element deformation problem in LMFBRs and from the general considerations some important conclusions are summarized. (orig.) 89i RW 892 AP.

- 2220 (KFK-tr--521) RATE OF REACTIVITY CHANGE OF THE BOR-60 REACTOR DURING THE OPERATION CYCLE. Afanas'ev, V.A.; Efimov, V.N.; Krasnoyarov, N.V.; Skulkin, N.N.; Fedyakin, R.E. (Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Internationales Buero/Uebersetzergruppe). 1977. 6p. (In German). Dep. NTIS (US Sales Only), PC A02/MF A01.

The result of measurements and calculations of the reactivity reserve at the BOR-60 reactor is reported. The results of the computations of the rate of change of the isotopic composition of the fuel during burn-up depending on the inventory of fissile material and the results of the computations aimed at showing the influence of radiation-induced volumetric swelling of the fuel on the reactivity change are represented graphically. The results of measurements and computations are compared with one another.

- 2221 (KFK-tr--575) RADIOACTIVE IMPURITIES ACCUMULATION IN BOR-60 COLD TRAP. Kizin, V.D.; Lisitsyn, E.S.; Poznyak, G.I.; Polyakov, V.I.; Chechetkin, Y.V. (Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Internationales Buero/Uebersetzergruppe). Jun 1978. 28p. (In German). Dep. NTIS (US Sales Only), PC A03/MF A01.

Radioactivity accumulation and distribution in BOR-60 cold trap have been studied. Cesium, iodine and some other radionuclide decontamination factors obtained using a standard cold trap in sodium coolant have been determined. Laboratory and loop experiments have been carried out to explain processes of radioactivity accumulation in the trap.

- 2222 (KFK-tr--576) RADIOACTIVITY OF LONG-LIVED NUCLIDES IN THE PRIMARY CIRCUIT OF THE REACTOR BOR-60 DURING OPERATION WITH DEFECTIVE FUEL ELEMENTS. Gryazev, V.M.; Kizin, V.D.; Lisitsyn, E.S.; Polyakov, V.I.; Chechetkin, Y.V. (Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Internationales Buero/Uebersetzergruppe). Jun 1978. 21p. (In German). Dep. NTIS (US Sales Only), PC A02/MF A01.

The summarized results of measurements of the enrichment and distribution of radioactive nuclides from corrosion and of fission products during the four years of operation of BOR-60, including a longer period of operation with defective fuel elements in the core, are presented. It is shown that for operation with approximately 1% leaking fuel rods radiation exposure becomes worse mainly because of release and enrichment of cesium isotopes in the coolant. Of the other fission products, the largest contribution to the dose rate in pipework and components is given by ^{140}Ba / ^{140}La and ^{95}Nb . On operation with 0.1 to 0.2% of leaking fuel rods, this contribution is comparable to that of the corrosion products ^{60}Co and ^{54}Mn . The radioactivity of corrosion products in the circuit has not increased within the last three years and was about one order of magnitude lower than the theoretical values. The corrosion and fission products are nonuniformly distributed over the circuit. Concentration of ^{95}Nb and ^{60}Co in the pipe for 'cold' sodium is larger by a factor of 2 - 5 and of ^{140}Ba and ^{54}Mn by a factor of 10-20 than in the pipes for 'hot' sodium. Most of the cobalt was found to deposit in the heat exchanges. The effectiveness of emptying the pipes from coolant in order to reduce the dose rate is assessed.

- 2223 (KFK-tr--578) SOME PROBLEMS OF OPERATION BEHAVIOUR OF HEXAGONAL BOXES FOR FUEL ELEMENTS OF FAST POWER REACTORS. Proshkin, A.A.; Zabud'ko, L.M. (Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Internationales Buero/Uebersetzergruppe). Jun 1978. 59p. (In German). Dep. NTIS (US Sales Only), PC A04/MF A01.

The present work shows a method to determine the operational behaviour of hexagonal fuel

cans for fast reactors by using tensions caused by the coolant pressure, and tensions due to a possible interaction of the fuel rod bundle and the can with axial symmetrical temperature distribution, taking into account the change of physical and mechanical, material properties of the can during irradiation. A few questions on the statistical assessment of the operational behaviour of the can are considered, based on which one can determine the probability of damaging the fuel cans during reactor operation and the contribution of various factors on the non-safeness in calculating the cans' operational behaviour. An example is given for the calculation of a fuel can for a large power plant based on the method shown.

- 2224 (LA--4319) URANIUM DIOXIDE EQUATION OF STATE FOR LMFBR EXCURSION ANALYSIS. Goplen, B. (Los Alamos Scientific Lab., NM (USA)). Jul 1969. Contract W-7405-ENG-36. 19p. Dep. NTIS, PC A02/MF A01.

Declassified 10 Jul 1974.

Reactor excursion analysis, which is essentially a coupled neutronics-hydrodynamics problem, is highly dependent upon the assumed equation of state for the reactor fuel. Unfortunately, equation-of-state information is not experimentally available for most reactor fuels. However, by using dynamic shock-wave techniques, it has been possible to measure the Hugoniot equation of state of uranium dioxide. Extension of the Hugoniot data along pressure release loci then allows an estimation of the equation of state in the desired high-temperature, low-pressure regime.

- 2225 (LA--6924-PR) EXAMINATION OF FAST REACTOR FUELS, FBR ANALYTICAL QUALITY ASSURANCE STANDARDS AND METHODS, AND ANALYTICAL METHODS DEVELOPMENT: IRRADIATION TESTS. PROGRESS REPORT, APRIL 1--JUNE 30, 1977. Baker, R.D. (comp.). (Los Alamos Scientific Lab., NM (USA)). Aug 1977. Contract W-7405-ENG-36. 14p. Dep. NTIS, PC A02/MF A01.

Characterization of unirradiated and irradiated LMFBR fuels by analytical chemistry methods will continue, and additional methods will be modified and mechanized for hot cell application. Macro- and microexaminations will be made on fuel and cladding, using the shielded electron microprobe, emission spectrograph, radiochemistry, gamma scanner, mass spectrometers, and other analytical facilities. New capabilities will be developed in gamma scanning, analyses to assess spatial distributions of fuel and fission products, mass spectrometric measurements of burnup and fission gas constituents and other chemical analyses. Microstructural analyses of unirradiated and irradiated materials will continue, using optical and electron microscopy and autoradiographic and x-ray techniques. Analytical quality assurance standards are designed to assure the quality of the chemical characterizations necessary to evaluate reactor components relative to specifications. Tasks include: (1) the preparation and distribution of calibration materials and quality control samples for use in quality assurance surveillance programs, (2) the development of and the guidance in the use of quality assurance programs for sampling and analysis, (3) the development of improved methods of analysis, (4) the preparation of continuously updated analytical method manuals, and (5) maintenance of referee analysis capabilities to characterize on a reimbursable basis, materials in dispute between fabricators (vendors) and reactor operators (purchasers). Highly reliable analytical methods for the measurement of burnup, various gases, and trace impurities in

irradiated fuels are also being developed.

- 2226 (LA--7038-PR) EXAMINATION OF FAST REACTOR FUELS, FBR ANALYTICAL QUALITY ASSURANCE STANDARDS AND METHODS, AND ANALYTICAL METHODS DEVELOPMENT: IRRADIATION TESTS. PROGRESS REPORT, JULY 1--SEPTEMBER 30, 1977. Baker, R.D. (comp.). (Los Alamos Scientific Lab., NM (USA)). Nov 1977. Contract W-7405-ENG-36. 22p. Dep. NTIS, PC A02/MF A01.

Information is presented concerning the examination of fast reactor fuels, FBR analytical quality assurance standards, and analytical methods development irradiation tests.

- 2227 (LA--7133-MS) FEASIBILITY STUDY FOR A POSTACCIDENT HEAT REMOVAL FACILITY. Barts, E.W.; Apperson, C.E. Jr.; Dunwoody, W.E.; Bennett, J.G. (Los Alamos Scientific Lab., NM (USA)). Jan 1978. Contract W-7405-ENG-36. 44p. Dep. NTIS, PC A03/MF A01.

An initial feasibility investigation for PAHRTEF, a Postaccident Heat Removal Test Facility, is presented. The facility would provide an experimental capability for PAHR experiments beyond that available in any currently existing or proposed U.S. safety test facility. The facility design presented in this report is based upon the technology developed for the ROVER nuclear rocket propulsion program. The core is a graphite-moderated, helium-cooled, epithermal core with radial reflector control. The PAHR experiments are located just below the reactor containment vessel, very near the bottom of the core. The experiments (up to 55% enriched) are driven and controlled by neutrons leaking axially from the core such that the PAHRTEF core and the experiment form a coupled reactor system. The experiment can be designed so that it is extremely unlikely that the test fuel by itself could form a critical system. The investigation indicates that adequate fission heating of large PAHR experiments could be provided at low driver core power levels. Both the reactor and the experiment handling and examination equipment can use available technology and, whenever possible, existing equipment and buildings.

- 2228 (LA--7161-MS) LOS ALAMOS FAILURE MODEL (LAFM): A CODE FOR THE PREDICTION OF LMFBR FUEL PIN FAILURE. Mast, P.K. (Los Alamos Scientific Lab., NM (USA)). Feb 1978. Contract W-7405-ENG-36. 47p. Dep. NTIS, PC A03/MF A01.

A new fuel pin failure model (the Los Alamos Failure Model) has been developed, a preliminary version of which is reported in this document. The model treats pin failure due to fuel-cladding differential thermal expansion, fission-gas pressurization, and cladding thermal stress. Radial fuel cracking and crack closure, as well as the presence of an initial circumferential fuel crack, are accounted for. The elastic-plastic stress-strain behavior of the cladding is calculated with a single node representation of the cladding using the Tresca Yield criterion. This results in a very fast running computer code with small storage requirements.

- 2229 (LA--7171-PR) EXAMINATION OF FAST REACTOR FUELS, FBR ANALYTICAL QUALITY ASSURANCE STANDARDS AND METHODS, AND ANALYTICAL METHODS DEVELOPMENT: IRRADIATION TESTS. PROGRESS REPORT 1 OCT--31 DEC 1977. Baker, R.D. (Los Alamos Scientific Lab., NM (USA)). Mar 1978. Contract W-7405-ENG-36. 19p. Dep. NTIS, PC

A02/MF A01.

Progress is summarized in the following areas: (1) examination of fast reactor fuels, (2) FBR analytical quality assurance standards and methods, and (3) analytical methods and irradiation testing techniques. (DG)

- 2230 (LA--7194-MS) APPLICATION OF THE SIMMER-I CODE TO LOF ACCIDENTS IN AN LMFBR. Henninger, R.J.; Alcouffe, R.E. (Los Alamos Scientific Lab., NM (USA)). Feb 1978. Contract W-7405-ENG-36. 22p. Dep. NTIS, PC A02/MF A01.

In the area of mechanical disassembly phase energetics, a comprehensive comparison and test against the VENUS-II code have been completed. The conclusions are that for energetic excursion (70s/s), the two calculations give essentially the same results. Comparisons to an isentropic expansion have also been made for the mechanical energy conversion as a result of expanding fuel vapor. SIMMER induced mixing effects are dominant when a temperature distribution is assumed for an expansion initial condition. The SIMMER code can be made to compare well with an isentropic expansion assuming a spatially uniform temperature. In the predisassembly models task, the SIMMER mockup of a SLUMPY calculation of initial fuel motion has been carried out. The results of the two calculations do not compare well because of incompatibilities in the SIMMER-I and SLUMPY models.

- 2231 (LA--7266-PR) EXAMINATION OF FAST REACTOR FUELS, FBR ANALYTICAL QUALITY ASSURANCE STANDARDS AND METHODS, AND ANALYTICAL METHODS DEVELOPMENT: IRRADIATION TESTS. PROGRESS REPORT, JANUARY 1--MARCH 31, 1978. Baker, R.D. (comp.). (Los Alamos Scientific Lab., NM (USA)). May 1978. Contract W-7405-ENG-36. 14p. Dep. NTIS, PC A02/MF A01.

Progress is reported for the following tasks: equipment development, analytical chemistry program for mixed oxide fuel, analytical chemistry program for boron carbide, determination of burnup, and development of measurement techniques for fission gas release.

- 2232 (LA--7564-PR) TRANSPORT AND REACTOR THEORY. PROGRESS REPORT, JULY 1--SEPTEMBER 30, 1978. Miller, W.F. Jr.; Dudziak, D.J.; O'Dell, R.D.; Alcouffe, R.E.; Gomez, M.F. (Los Alamos Scientific Lab., NM (USA)). Nov 1978. Contract W-7405-ENG-36. 37p. Dep. NTIS, PC A03/MF A01.

Progress is summarized in the areas of fission reactor neutronics, radiation shielding, fusion reactor nucleonics, reactor safety, and supporting research. (DG)

- 2233 (LA--7569-PR) EXAMINATION OF FAST REACTOR FUELS, FBR ANALYTICAL QUALITY ASSURANCE STANDARDS AND METHODS, AND ANALYTICAL METHODS DEVELOPMENT, IRRADIATION TESTS. PROGRESS REPORT, JULY 1--SEPTEMBER 30, 1978. Baker, R.D. (comp.). (Los Alamos Scientific Lab., NM (USA)). Nov 1978. Contract W-7405-ENG-36. 19p. Dep. NTIS, PC A02/MF A01.

Since the first quarterly report (LA--5798-PR), the Analytical Quality Assurance Standards and Methods project has been divided into the following two projects: FBR Analytical Quality Assurance Standards and Methods; and Analytical Methods Development, Irradiation Tests. Most of the investigations discussed here are of the continuing type. Results and conclusions described may therefore be changed or augmented as the work continues.

- 2234 (LA--7570-PR) ADVANCED FAST REACTOR FUELS PROGRAM. SECOND ANNUAL PROGRESS REPORT, JULY 1, 1975--SEPTEMBER 30, 1976. Baker, R.D. (comp.). (Los Alamos Scientific Lab., NM (USA)). Dec 1978. Contract W-7405-ENG-36. 114p. Dep. NTIS, PC A06/MF A01.

Results of steady-state (EBR-II) irradiation testing, off-normal irradiation design and testing, fuel-cladding compatibility, and chemical stability of uranium-plutonium carbide and nitride fuels are presented.

- 2235 (LA--7678-PR) EXAMINATION OF FAST REACTOR FUELS, FBR ANALYTICAL QUALITY ASSURANCE STANDARDS AND METHODS, AND ANALYTICAL METHODS DEVELOPMENT: IRRADIATION TESTS. PROGRESS REPORT, OCTOBER 1--DECEMBER 31, 1978. Baker, R.D. (comp.). (Los Alamos Scientific Lab., NM (USA)). 1978. Contract W-7405-ENG-36. 11p. Dep. NTIS, PC A02/MF A01.

This is the seventeenth quarterly report on the Examination of Fast Reactor Fuels and Fast Breeder Reactor (FBR) Analytical Quality Assurance and Methods of the Los Alamos Scientific Laboratory. Since the first quarterly report (LA-5798-PR), the Analytical Quality Assurance Standards and Methods project has been divided into the following two projects: FBR Analytical Quality Assurance Standards and Methods; and Analytical Methods Development - Irradiation Tests. Most of the investigations discussed here are of the continuing type. Results and conclusions described may therefore be changed or augmented as the work continues.

- 2236 (LA--7827-PR) EXAMINATION OF FAST REACTOR FUELS AND FBR ANALYTICAL QUALITY ASSURANCE STANDARDS AND METHODS. PROGRESS REPORT, JANUARY 1--MARCH 31, 1979. Baker, R.D. (comp.). (Los Alamos Scientific Lab., NM (USA)). May 1979. Contract W-7405-ENG-36. 15p. Dep. NTIS, PC A02/MF A01.

This project is directed toward the examination and comparison of the effects of neutron irradiation on Liquid Metal Fast Breeder Reactor (LMFBR) Program fuel materials. Unirradiated and irradiated materials will be examined as requested by the Reference Fuels System Branch of the Division of Reactor Research and Technology (DRRT). Reliable chemical characterizations are essential to the development of high-quality fuels, control rods, and other reactor components in the FBR Program. The objective tasks are designed to assure the quality of the chemical characterizations necessary to evaluate reactor components relative to specifications.

- 2237 (LA--7861-MS) SPECTRA-IV, BENCHMARK SPECTRA BASED ON LIB-IV. Kidman, R.B. (Los Alamos Scientific Lab., NM (USA)). Jun 1979. Contract W-7405-ENG-36. 99p. Dep. NTIS, PC A05/MF A01.

Flux and adjoint spectra for each of the Cross Section Evaluation Working Group fast reactor benchmarks are numerically and graphically presented in this handbook. The spectra were computed using a 50-group cross-section library (LIB-IV) that was generated with the MINX processing code using ENDF/B-IV data. The graphical figures compare smooth interpolated curves for the central flux, edge flux, central adjoint, transport reaction rate, and original cross-section averaging weighting function.

- 2238 (LA--7901-MS) PRELIMINARY FABRICATION STUDIES OF ALTERNATIVE LMFBR CARBIDE FUELS.

Gutierrez, R.L.; Herbst, R.J.; Johnson, K.W.R. (Los Alamos Scientific Lab., NM (USA)). Oct 1979. Contract W-7405-ENG-36. 11p. Dep. NTIS, PC A02/MF A01.

Preliminary fabrication studies were made of various compositions of thorium-uranium carbide and thorium-plutonium carbide fuel pellets that were prepared using the carbothermic reduction process. Temperatures of 1750 and 2000°C were used during the reduction cycle. Sintering temperatures of 1800 and 2000°C were used to prepare fuel pellets of low (87%) and high (> 94%) theoretical densities.

- 2239 (LA--7938-C) SPECIALISTS' WORKSHOP ON PREDICTIVE ANALYSIS OF MATERIAL DYNAMICS IN LMFBR SAFETY EXPERIMENTS, MARCH 13-15, 1979. Stevenson, M.G. (comp.). (Los Alamos Scientific Lab., NM (USA)). Jul 1979. Contract W-7405-ENG-36. 343p. Dep. NTIS, PC A15/MF A01.

Separate abstracts are included for each of the papers presented concerning the performance of reactor components and materials under accident conditions.

- 2240 (LA--7938-C, pp 9-20) FUEL CRACK VOLUME PREDICTIONS AND MEASUREMENTS. Fox, G.L.; Randklev, E.H. (Hanford Engineering Development Lab., Richland, WA). Jul 1979. Specialists' workshop on predictive analysis of material dynamics in LMFBR safety experiments, March 13-15, 1979.

Void volume within an FBR fuel pin has a substantial effect on calculations of cladding strain and lifetime for transient overpower accident analyses. A substantial fraction of this void volume is contained within startup cracks that are still present during fuel irradiation. This paper discusses a crack prediction method, crack measurement techniques, compares predictions with measurements, and includes a sufficient crack fraction data base to be of use to other fuel pin behavior analysts.

- 2241 (LA--7938-C, pp 21-38) INFLUENCE OF THERMAL CRACKING ON TRANSIENT PRE-FAILURE MOLTEN FUEL MOTION. Kuczera, B.; Billaux, M. (Kernforschungszentrum, Karlsruhe, Germany). Jul 1979.

Specialists' workshop on predictive analysis of material dynamics in LMFBR safety experiments, March 13-15, 1979.

Under hypothetical transient conditions analyzed in the frame of safety investigations of LMFBRs, the fuel pin will undergo various modifications which influence remarkably the instant and the location of the clad failure. The essential part of the present contribution concerns cracked fuel behaviour and transient pre-failure fuel relocation. Enhanced by experimental evidences a new transient model, called BREDA-III A, was developed which allows a more detailed simulation of the fuel pin behaviour under accident conditions until pin failure. The application of the model has led to a better understanding of the sequence of physical events observed during moderate transient overpower (TOP) experiments.

- 2242 (LA--7938-C, pp 39-51) ANALYSIS OF INTERNAL FUEL MOTION DURING PINEX-2 EXPERIMENT. Padilla, A. Jr.; Baars, R.E.; Porten, D.R.; Randklev, E.H. Jul 1979.

Specialists' workshop on predictive analysis of material dynamics in LMFBR safety experiments, March 13-15, 1979.

This paper describes the analyses performed for the PINEX-2 experiment to calculate the

ejection of molten fuel into the reflector and fission gas plenum for an internally-vented fuel pin during a simulated 5\$/s transient overpower excursion. The LAFM code was used to predict the transient fuel melting and fission gas release, and the HOTPIN and FUMO-T codes were used to predict the fuel ejection. The analytical results were compared with initial data from both the Pinhole-TV Imaging System and the fast-neutron hodoscope, as well as post-transient examinations of the fuel pin.

- 2243 (LA--7938-C, pp 52-66) PINEX II: FRENCH CONTRIBUTION TO AN INTERNATIONAL BENCHMARK EXPERIMENT. Melis, J.C.; Meyer-Heine, A. Jul 1979.

Specialists' workshop on predictive analysis of material dynamics in LMFBR safety experiments, March 13-15, 1979.

This note presents briefly the code PHYSURA used to interpret safety experiments. As an application, the French contribution to an international benchmark test, PINEX 2, is described. The results show that a simple code like PHYSURA gives good results even for such a complex experiment.

- 2244 (LA--7938-C, pp 67-84) PINEX-AR, A FUEL DYNAMICS CODE APPLIED TO PINEX-2 PREDICTION AND REACTOR ANALYSIS. Coddington, P. Jul 1979.

Specialists' workshop on predictive analysis of material dynamics in LMFBR safety experiments, March 13-15, 1979.

The PINEX-AR code is a fuel dynamics code that incorporates a heat transfer calculation to provide fuel and clad temperatures, a fission gas release routine, a method for determining the gas pressure within the molten fuel, the evaluation of the movement of molten fuel along the fuel pin and breeder central hole, and a determination of clad failure by reference to clad strain and molten fuel melt through. The code has been successfully applied to the PINEX-2 transient and demonstrates that molten fuel will be pushed into the gas plenum region and that the fuel pin clad is not expected to fail. The code has also been applied to fast reactor overpower transients and shows that molten fuel behavior similar to PINEX-2 can be expected for fast transients, whereas for slow transients the central hole is predicted to plug due to frozen fuel.

- 2245 (LA--7938-C, pp 85-98) CLAD STRAIN AND MELT-THROUGH FAILURE MODE ANALYSIS FOR FAST-RUNNING APPLICATION. Moorhead, T.P. (Atomic Energy Establishment, Winfrith, England). Jul 1979.

Specialists' workshop on predictive analysis of material dynamics in LMFBR safety experiments, March 13-15, 1979.

A system of calculations representing various phenomena affecting fuel pin failure in accident transients is described, which is simple and fast enough for repetitive calls and yet retains a sound physical basis with experimental background. Its current implementation in the whole-core accident code FRAX-2 is illustrated.

- 2246 (LA--7938-C, pp 99-115) FRESS PIN FAILURE MODEL AND ITS APPLICATION TO E-8 TREAT TEST. Kalimullah. (Argonne National Lab., IL). Jul 1979.

Specialists' workshop on predictive analysis of material dynamics in LMFBR safety experiments, March 13-15, 1979.

FRESS is a cladding rupture prediction model for an irradiated mixed-oxide LMFBR fuel pin

during transient heating based only on the internal pressurization of the cladding by the fission gas released from fuel grains during the transient. The model is applied to the analysis of the hottest PNL-10-53 pin in the 7-pin E-8 TREAT test which simulates a 3\$/sec transient overpower. Although the uncertainties of the inputs to the temperature calculation done with the COBRA code have not been included, the uncertain input parameters to FRESS have been varied over their estimated uncertainties. The cladding rupture predictions are a few tens of milliseconds late compared to the most probable failure time detected in the test. However, these calculations seem to indicate that fission gas pressure is a significant mechanism for causing clad rupture in this test.

- 2247 (LA--7938-C, pp 116-121) FUEL PIN MODELING OF THE FRESH OXIDE/SODIUM PROMPT BURST ENERGETICS EXPERIMENTS. Young, M.F. (Sandia Labs., Albuquerque, NM). Jul 1979.

Specialists' workshop on predictive analysis of material dynamics in LMFBR safety experiments, March 13-15, 1979.

A series of twelve Prompt Burst Energetics (PBE) experiments utilizing fresh uranium dioxide fuel in stagnant sodium coolant have been performed in Sandia Laboratories' Annular Core Pulse Reactor (ACPR). PBE experiments are designed to study the energetic response of important reactor fuel-clad-coolant systems under superprompt critical conditions. The direct aim is to identify and characterize the phenomena resulting in pressure generation and the conversion of thermal energy to work. Other PBE experiments have involved fresh UO_2 fuel in a helium filled capsule and fresh UC fuel in stagnant sodium. This paper presents results of this series of experiments and related analysis done with a pin model, EXPAND, developed to predict pin failure time and location for fresh fuel pins. The model also gives temperatures and pressures at failure for the fuel-clad-coolant system, which are used as initial conditions for analysis of the post-failure behavior of the ruptured fuel pin.

- 2248 (LA--7938-C, pp 122-124) SODIUM BOILING WITH STAINLESS STEEL CLAD MELTING AND RELOCATION OUT-OF-PILE EXPERIMENTAL RESULTS AND INTERPRETATION. Seiler, J.M. (Commissariat a l'Energie Atomique, Grenoble, France). Jul 1979.

Specialists' workshop on predictive analysis of material dynamics in LMFBR safety experiments, March 13-15, 1979.

A feasibility test of out-of-pile sodium boiling experiments with stainless steel clad melting has been successfully achieved at the Nuclear Research Center of Grenoble in December 1978 on the CESAR loop. Transient sodium boiling development, dry-out apparition, clad melting, and relocation could be followed.

- 2249 (LA--7938-C, pp 125-140) HYDRODYNAMIC FRAGMENTATION OF DROPS. Patel, P.D.; Theofanous, T.G. (Purdue Univ., West Lafayette, IN). Jul 1979.

Specialists' workshop on predictive analysis of material dynamics in LMFBR safety experiments, March 13-15, 1979.

Studies of the morphology of fragmentation of liquid drops in a liquid medium due to shock-induced flows are reported. For high density ratio and high interfacial tension systems, the fragmentation is found to be probably due to the penetration of the drop by unstable waves. An envelope of conditions which characterize drop breakup in these systems has been deduced.

Analytical models, which involve the time constants of both the drop-piercing Taylor instability and the wake-forming shear effects, reflect our experimental results well. In addition, it is found that the mercury-water system studied here should simulate the uranium dioxide/sodium pair, which is of interest in safety studies of fast reactors.

- 2250 (LA--7938-C, pp 141-152) FUEL AND COOLANT MOTIONS FOLLOWING PIN FAILURE: EPIC MODELS AND THE PBE-5S EXPERIMENT. Garner, P.L.; Abramson, P.B. (Argonne National Lab., IL). Jul 1979.

Specialists' workshop on predictive analysis of material dynamics in LMFBR safety experiments, March 13-15, 1979.

The EPIC computer code has been used to analyze the post-fuel-pin-failure behavior in the PBE-5S experiment performed at Sandia Laboratories. The effects of modeling uncertainties on the calculation are examined. The calculations indicate that the majority of the piston motion observed in the test is due to the initial pressurization of the coolant channel by fuel vapor at cladding failure. A more definitive analysis requires improvements in calculational capabilities and experiment diagnostics.

- 2251 (LA--7938-C, pp 153-162) ANALYSIS OF TREAT TRANSIENT OVERPOWER EXPERIMENTS USING THE PLUTO CODES. Wider, H.U.; Semenza, L.A. (Argonne National Lab., IL). Jul 1979.

Specialists' workshop on predictive analysis of material dynamics in LMFBR safety experiments, March 13-15, 1979.

Pre- and post-test computer analyses of TREAT transient overpower test H6 are presented and compared with an earlier analysis of E8. The computer models used were the PLUTO code and its successor, the PLUTO2 code. A good agreement with several events could be achieved in the post test simulations, which supports the basic modeling in the codes used. The pre-test analyses suffered from the uncertainty in the pin failure sequence. Fission-gas pressures in the pins at failure time were on the order of 15 to 30 MPa in both tests. Plenum fission-gas release may have played an important role in both tests. Although a stronger FCI tended to be promoted by the larger hydraulic forces in the H6 test with its higher pump pressure and flow velocity, the voiding was less pronounced for the same reasons. Fuel sweepout from short EBR-II irradiated pins failing into non-voided channels tended to be on the order of 5 to 20 g of fuel per pin.

- 2252 (LA--7938-C, pp 163-177) FUNDAMENTAL ASPECTS OF MOLTEN CLAD RELOCATION. Marrotte, G.N. (General Electric Corp., San Jose, CA); Theofanous, T.G. Jul 1979.

Specialists' workshop on predictive analysis of material dynamics in LMFBR safety experiments, March 13-15, 1979.

Experimental data on the transient motion of a suddenly sheared vertical liquid-metal film and its mechanical interaction with the driving gas flow are presented. New correlations describing these phenomena, and application to high interfacial tension systems are derived from these data and applied to the prediction of clad relocation dynamics in LMFBR core melt accidents.

- 2253 (LA--7938-C, pp 178-184) COMPARISON OF THE PREDICTIONS FROM THE MULTICHANNEL CLAD RELOCATION MODEL TO AVAILABLE IN-PILE EXPERIMENTAL DATA. Ishii, M.; Chen, W.L.;

Kuzay, T.M. (Argonne National Lab., IL). Jul 1979.

Specialists' workshop on predictive analysis of material dynamics in LMFBR safety experiments, March 13-15, 1979.

In a hypothetical unprotected undercooling accident in liquid-metal fast breeder reactors, coolant sodium is rapidly heated to boiling. The sodium boiling leads to the dryout and eventual melting of the cladding. The cladding motion upon melting is considered to be important in determining the reactivity effect, blockage formation, and its effect on subsequent fuel motion. A computer code MULCLAD which is based on multi-channel cladding motion model is used for the comparative studies with available experimental data. R4 and R5 TREAT in-pile test and 37 pin P3A test by SLSF Project in the Engineering Test Reactor have been analyzed in detail.

- 2254 (LA--7938-C, pp 185-196) SIMULATION OF CLADDING RELOCATION IN THE TREAT-EXPERIMENT R5 WITH THE CMOT CODE. Angerer, G.; Woll, D. Jul 1979.

Specialists' workshop on predictive analysis of material dynamics in LMFBR safety experiments, March 13-15, 1979.

The CMOT code is an analytical tool to simulate cladding motion after melting and its resolidification and blockage formation in voided coolant channels during hypothetical core disruptive accidents in LMFBR's. It was applied to the TREAT experiment R5 to check whether the code is able to correctly reproduce the cladding relocation process. The agreement achieved between experimental and analytical data is encouraging. The results show that cladding relocation may be simulated by the assumption of motion of the molten cladding as a film along the fuel pin surface. The results also show that wave formation and wave motion are important cladding transport mechanisms.

- 2255 (LA--7938-C, pp 197-217) ANALYSIS OF FUEL BEHAVIOUR IN SCARABEE 1ST PHASE EXPERIMENTS. Schmitz, F.; Matthews, J.R. Jul 1979.

Specialists' workshop on predictive analysis of material dynamics in LMFBR safety experiments, March 13-15, 1979.

After a short description of the SCARABEE first phase program and of the approach adopted in the interpretation, the main experimental results used for the fuel behaviour analysis are given. Calculation results from the different computer codes are then compared to the experimental results.

- 2256 (LA--7938-C, pp 218-241) SIMMER-II ANALYSIS OF THE R-7 TREAT TEST. Bohl, W.R. Jul 1979.

Specialists' workshop on predictive analysis of material dynamics in LMFBR safety experiments, March 13-15, 1979.

The SIMMER-II code was used in a simulation of the R-7 loss-of-flow TREAT test. Comparison with the test scenario encompassed thermocouple data, flowmeter traces, hodoscope data, and the posttest configuration. Reasonably successful results were obtained on the overall heat balance. The calculated boiling time was within 0.2 s of the experimental result, and respectable agreement with the integrated lower flowmeter trace was achieved over the first 2 s of boiling. Although the details of cladding relocation and blockage formation could not be well simulated, the calculated fuel motion appears to be plausible given the available experimental information. It was further concluded that this type of study is quite

useful for revealing areas for model improvement.

- 2257 (LA--7938-C, pp 242-256) ANALYSIS OF TREAT TESTS L7 AND L8 WITH SAS3D, LEVITATE AND PLUTO2. Bowers, C.H.; Tentner, A.M.; Wider, H.U. (Argonne National Lab., IL). Jul 1979.

Specialists' workshop on predictive analysis of material dynamics in LMFBR safety experiments, March 13-15, 1979.

Fuel motion in TREAT Tests L7 and L8 is analyzed with the SAS3D, LEVITATE, and PLUTO2 computer codes. These results are compared with fuel motion data obtained from the fuel neutron hodoscope. It is concluded that fission gas acts to disperse fuel during the early stages of fuel motion.

- 2258 (LA--7938-C, pp 257-268) COMPARISON OF FIGAS SWELLING AND GAS RELEASE PREDICTIONS WITH EXPERIMENT. Ostensen, R.W. (Sandia Labs., Albuquerque, NM). Jul 1979.

Specialists' workshop on predictive analysis of material dynamics in LMFBR safety experiments, March 13-15, 1979.

FIGAS calculations were compared to fuel swelling data from the FDI tests and to gas release data from the FGR39 test. Late swelling and gas release predictions are satisfactory if vacancy depletion effects are added to the code. However, early swelling predictions are not satisfactory, and early gas release predictions are very poor. Explanation of these discrepancies is speculative.

- 2259 (LA--7938-C, pp 269-279) ANALYSIS OF FUEL DISPERSAL IN DIRECT ELECTRICAL HEATING EXPERIMENTS. Gruber, E.E.; DiMelfi, R.J.; Bandyopadhyay, G. (Argonne National Lab., IL). Jul 1979.

Specialists' workshop on predictive analysis of material dynamics in LMFBR safety experiments, March 13-15, 1979.

The effects of transient history on fuel motion driven by fission gas have been investigated in a series of direct-electrical-heating tests on quartz-clad irradiated fuel. Variations in the slow, Stage-I portion of the transient thermal history resulted in pronounced differences in fuel behavior during the subsequent, more rapid, Stage-II portion. Analysis of transient fission-gas behavior, considering both the timing of gas release to grain boundaries and the non-equilibrium character of grain-boundary gas bubbles, provides a coherent picture of the role of fission gas in the observed fuel failure. The results indicate the conditions under which fission gas may efficiently drive expulsion of molten fuel through cracks, as well as conditions under which gross radial swelling of the fuel may be expected. These predictions are compatible with the observed nature of fuel failure.

- 2260 (LA--7938-C, pp 280-300) ANALYSIS OF A PROTOTYPIC AND A SIMULANT EXPERIMENT RELATED TO FREEZING IN FLOW CHANNELS. Hakim, S.J. (Argonne National Lab., IL). Jul 1979.

Specialists' workshop on predictive analysis of material dynamics in LMFBR safety experiments, March 13-15, 1979.

An analysis is presented of two experiments, one involving simulant materials, and a second more prototypic experiment, related to freezing of molten LMFBR core material in flow channels. Good agreement is obtained between predictions and experimental results for both experiments. It is argued that simulant experiments could provide a reasonable vehicle for validation of

isolated phenomena related to the freezing process while prototypic experiments provide a more realistic view of the integrated behavior of molten core material during the accident.

- 2261 (LA--7938-C, pp 301-307) MOLTEN FUEL RELOCATION AND CONNECTED PROBLEMS: THE GELCO CODE, COMPARISON WITH EXPERIMENTAL RESULTS, APPLICATION TO REACTOR. de Lapparent, D. Jul 1979.

Specialists' workshop on predictive analysis of material dynamics in LMFBR safety experiments, March 13-15, 1979.

The problem of fuel freezing is illustrated in the case of a Hypothetical Core Disruptive Accident. The GELCO Code and an experiment using molten UO_2 are presented. A tentative application is made to Reactor conditions.

- 2262 (LA--7938-C, pp 308-319) SIMMER ANALYSIS OF SRI HIGH PRESSURE BUBBLE EXPANSION EXPERIMENTS. Rexroth, P.E.; Suo-Anttila, A.J. Jul 1979.

Specialists' workshop on predictive analysis of material dynamics in LMFBR safety experiments, March 13-15, 1979.

SIMMER-II was used to analyze the results of the SRI nitrogen bubble expansion experiments. Good agreement was found for all of the experiments analyzed as well as the theoretical isentropic limiting case. Scaling to a full size CRBR reactor reveals no significant scaling effects for the structureless core.

- 2263 (LA--7938-C, pp 320-334) TERMINATION PHASE OF CORE DISRUPTIVE ACCIDENTS IN LMFBRs. Saito, M.; Theofanous, T.G. Jul 1979.

Specialists' workshop on predictive analysis of material dynamics in LMFBR safety experiments, March 13-15, 1979.

The most significant finding of this work is that the presence of entrainment during bubble growth was found significantly less than expected on the basis of the current literature. A small amount of entrainment is seen as the impact is approached and a new entrainment mechanism is suggested. Additional study of this region will be required to predict the extent of entrainment and quantify its impact on energy release.

- 2264 (LA--7975-PR) EXAMINATION OF FAST REACTOR FUELS AND FBR ANALYTICAL QUALITY ASSURANCE STANDARDS AND METHODS. PROGRESS REPORT, APRIL 1-JUNE 30, 1979. Maraman, W.J. (comp.). (Los Alamos Scientific Lab., NM (USA)). Aug 1979. Contract W-7405-ENG-36. 16p. Dep. NTIS, PC A02/MF A01.

This project is directed toward the examination and comparison of the effects of neutron irradiation on Liquid Metal Fast Breeder Reactor (LMFBR) Program fuel materials. Characterizations of unirradiated and irradiated fuels by analytical chemistry methods will continue, and additional methods will be modified and mechanized for hot-cell application. Macro- and micro-examinations will be made on fuel and cladding, using the shielded electron microprobe, emission spectrograph, radiochemistry gamma scanner, mass spectrometers, and other analytical facilities. New capabilities will be developed in gamma scanning analyses to assess spatial distributions of fuel and fission products, mass spectrometric measurements of burnup and fission gas constituents, and other chemical analyses. Reliable chemical characterizations are essential to the development of high-quality fuels, control rods, and other reactor components in the FBR Program. Tasks were

designed to assure the quality of a chemical characterizations necessary to evaluate reactor components relative to specifications. Tasks include: (1) the continual preparation and distribution of carefully characterized calibration materials and quality control samples for use in quality assurance surveillance programs of vendor and purchaser analytical chemistry laboratory operations, (2) the development of and the guidance in the use of quality assurance programs for sampling and analysis, (3) the development of improved methods of analysis, (4) the preparation of continuously updated analytical method manuals, and (5) maintenance of referee analysis capabilities to characterize, on a reimbursable basis, materials in dispute between fabricators (vendors) and reactor operators (purchasers). At this time, the emphasis is on the FFTF. The program will be extended, as appropriate, to the LMFBR demonstration and large production facilities in the future.

- 2265 (LA--8132=PR) EXAMINATION OF FAST REACTOR FUELS AND FBR ANALYTICAL QUALITY ASSURANCE STANDARDS AND METHODS. PROGRESS REPORT, JULY 1-SEPTEMBER 30, 1979. Maraman, W.J. (comp.). (Los Alamos Scientific Lab., NM (USA)). Nov 1979. Contract W-7405-ENG-36. 17p. Dep. NTIS, PC A02/MF A01.

This is the twentieth quarterly report on the Examination of Fast Reactor Fuels and Fast Breeder Reactor (FBR) Analytical Quality Assurance and Methods at the Los Alamos Scientific Laboratory. Most of the investigations discussed are of the continuing type. Results and conclusions described may therefore be changed or augmented as the work continues. Published reference to results cited in this report should not be made without obtaining explicit permission to do so from the person in charge of the work.

- 2266 (LA--8238=PR) EXAMINATION OF FAST REACTOR FUELS AND FBR ANALYTICAL QUALITY ASSURANCE STANDARDS AND METHODS. PROGRESS REPORT, OCTOBER 1-DECEMBER 31, 1979. Maraman, W.J. (comp.). (Los Alamos Scientific Lab., NM (USA)). Feb 1980. Contract W-7405-ENG-36. 12p. Dep. NTIS, PC A02/MF A01.

This project is directed toward the examination and comparison of the effects of neutron irradiation of Liquid Metal Fast Breeder Reactor (LMFBR) Program fuel materials. Unirradiated and irradiated materials will be examined as requested by the Reference Fuels System Branch of the Division of Reactor Research and Technology (DRRT). Reliable chemical characterizations are essential to the development of high-quality fuels, control rods, and other reactor components in the FBR Program. The objective tasks are designed to assure the quality of the chemical characterizations necessary to evaluate reactor components relative to specifications.

- 2267 (LA--8292=MS) EFFECT OF MODEL CHOICE AND SAMPLE SIZE ON STATISTICAL TOLERANCE LIMITS. Duran, B.S.; Campbell, K. (Los Alamos Scientific Lab., NM (USA)). Mar 1980. Contract W-7405-ENG-36. 50p. Dep. NTIS, PC A03/MF A01.

Statistical tolerance limits are estimates of large (or small) quantiles of a distribution, quantiles which are very sensitive to the shape of the tail of the distribution. The exact nature of this tail behavior cannot be ascertained from small samples, so statistical tolerance limits are frequently computed using a statistical model chosen on the basis of theoretical

considerations or prior experience with similar populations. This report illustrates the effects of such choices on the computations.

- 2268 (LA-UR--77-2378) FINITE-DIFFERENCE METHODS IN MULTI-DIMENSIONAL TWO-PHASE FLOW. Travis, J.R. (Los Alamos Scientific Lab., NM (USA)). 1977. Contract W-7405-ENG-36. 19p. (CONF-771204--1). Dep. NTIS, PC A02/MF A01.

From 3. international symposium on computing methods in applied sciences and engineering; Versailles, France (5 Dec 1977).

In the summer of 1974, the Theoretical Division of the Los Alamos Scientific Laboratory began several research programs in the area of reactor safety for the United States Nuclear Regulatory Commission. Research efforts were started in the Liquid Metal Fast Breeder (LMFBR) and the Light Water Reactor (LWR) safety programs. The character of the Theoretical Division was to develop computer codes for the safety analysis of these reactor systems. The question of whether or not, during the course of a hypothetical accident sequence in an LMFBR, the core will subside to a coolable configuration without secondary critical bursts has never been resolved. To aid the study of this question, a computer program called SIMMER (S/sub N/, Implicit, Multified, Multicomponent, Eulerian Recriticality) was to be developed to predict the dynamics of extreme hypothetical accident sequences during which extended core motion is expected. This time-dependent computer code called for combining an advanced multidimensional, multiphase fluid dynamic methodology with multidimensional neutron transport theory and improved equation-of-state technology. In the LWR program, the research emphasis was to push forward in two areas: (1) the development of advanced multiphase fluid dynamic methods and computer programs for performing basic research and analyzing areas in thermal hydraulics important to the safety of water reactors, and (2) the development of an advanced 'best estimate' systems code called TRAC (Transient Reactor Analysis Code) for analyzing loss-of-coolant accidents and anticipated-transients-without-scrum in light water reactors.

- 2269 (LA-UR--78-495) ROLE OF MECHANISTIC ANALYSIS IN PROVIDING PAHR INITIAL CONDITIONS. Jackson, J.F. (Los Alamos Scientific Lab., NM (USA)). 1977. Contract W-7405-ENG-36. 3p. (CONF-771108--9). Dep. NTIS, PC A02/MF A01.

From Post accident heat removal information exchange meeting; Chicago, IL, USA (2 Nov 1977).

The objective of this paper is to discuss how Postaccident Heat Removal (PAHR) calculations interface with the earlier accident phases in overall mechanistic accident analyses, to briefly review the evolution of the transition phase as an important path in LMFBR core disruptive accidents, and to assess the impact of the transition phase on PAHR analyses.

- 2270 (LA-UR--78-1265) TRANSPORT PROCESSES IN LMFBR CORE DISRUPTIVE ACCIDENTS. Boudreau, J.E.; Smith, L.L. (Los Alamos Scientific Lab., NM (USA)). 1978. Contract W-7405-ENG-36. 16p. (CONF-780918--2). Dep. NTIS, PC A02/MF A01.

From International centre for heat and mass transfer; Dubrovnik, Yugoslavia (4 Sep 1978).

In this paper, a few of the important problem areas in LMFBR safety are defined and the results of related SIMMER calculational results are outlined. The key transport

phenomena that are known have been identified and the need for specific experimental/analytical research has been discussed. The SIMMER code is in its early stages of developmental verification, and the need for a comprehensive experiment analysis activity is clear. Experimental research should include a balanced set of tests that lend insight both in the isolated phenomena as well as span the range of interest in interactive, high temperature transient behavior. If uncertainty bands for the transport phenomena can be quantified, sensitivity studies can be performed to evaluate the adequacy of our current state of knowledge, and conversely the need for further research.

- 2271 (LA-UR--78-2602) ANALYSIS OF TERMINATED TOP ACCIDENTS IN THE FTR USING THE LOS ALAMOS FAILURE MODEL. Mast, P.K.; Scott, J.H. (Los Alamos Scientific Lab., NM (USA)). 1978. Contract W-7405-ENG-36. 11p. (CONF-781022--29). Dep. NTIS, PC A02/MF A01.

From Meeting on nuclear power reactor safety; Brussels, Belgium (16 Oct 1978).

A new fuel pin failure model (the Los Alamos Failure Model), based on a linear life fraction rule failure criterion, has been developed and is reported herein. Excellent agreement between calculated and observed failure time and location has been obtained for a number of TOP TREAT tests. Because of the nature of the failure criterion used, the code has also been used to investigate the extent of cladding damage incurred in terminated as well as unterminated TOP transients in the FTR.

- 2272 (LA-UR--78-2650) REMOTE EXAMINATION OF SHROUD TUBES IN LMFBR FUEL ELEMENTS. Ledbetter, J.M.; Serna, O.; Nicol, A.G.; Wood, W.T. (Los Alamos Scientific Lab., NM (USA)). 12 Nov 1978. Contract W-7405-ENG-36. 12p. (CONF-781105--52). Dep. NTIS, PC A02/MF A01.

From ANS meeting; Washington, DC, USA (12 Nov 1978).

A system for providing a means of remote ejection and examination of sodium bonded shroud encapsulated fuels has been in use at LASL for over a year. The system is remotely capable of precise machining for clad separation and splitting at specified areas. Controlled heating and constant temperature monitoring is incorporated for sodium melting. The system provides for numerous operations such as: visual examinations, measurements, photography, and sodium dissolution.

- 2273 (LA-UR--78-2711) EVALUATION OF LMFBR FUEL-MOTION DIAGNOSTICS INSTRUMENTATION WITH PARKA. Evans, A.E. Jr.; Orndoff, J.D.; Talbert, W.L. Jr. (Los Alamos Scientific Lab., NM (USA)). 1978. Contract W-7405-ENG-36. 10p. (CONF-781033--15). Dep. NTIS, PC A02/MF A01.

From IEEE nuclear science symposium; Washington, DC, USA (18 Oct 1978).

To aid in the design of LMFBR safety test experiments and safety test facilities (STF), a program of evaluation of concepts for fuel-motion diagnostics instrumentation has been undertaken. A part of this evaluation is being done at PARKA, a Rover project critical assembly which has been modified to study the self nuclear image from driven FTR-type fuel assemblies. Feasibility of obtaining fast-neutron images of single-pin voids in assemblies of up to 127 fuel pins has been demonstrated, albeit marginally for the larger fuel bundles. The feasibility of using in-core detectors as fuel-motion monitors has also been studied. Use of PARKA in a pulsed mode to study

STF transient phenomena is discussed.

- 2274 (LA-UR--78-2932) IRRADIATION PERFORMANCE OF HELIUM-BONDED URANIUM--PLUTONIUM CARBIDE FUEL ELEMENTS. Latimer, T.W.; Petty, R.L.; Kerrisk, J.F.; DeMuth, N.S.; Levine, P.J.; Boltax, A. (Los Alamos Scientific Lab., NM (USA)). 1979. Contract W-7405-ENG-36. 12p. (CONF-790306--3). Dep. NTIS, PC A02/MF A01.

From International conference on fast breeder reactor performance; Monterey, CA, USA (5 Mar 1979).

The current irradiation program of helium-bonded uranium--plutonium carbide elements is achieving its original goals. By August 1978, 15 of the original 171 helium-bonded elements had reached their goal burnups including one that had reached the highest burnup of any uranium--plutonium carbide element in the U.S.--12.4 at.%. A total of 66 elements had attained burnups over 8 at.%. Only one cladding breach had been identified at that time. In addition, the systematic and coordinated approach to the current steady-state irradiation tests is yielding much needed information on the behavior of helium-bonded carbide fuel elements that was not available from the screening tests (1965 to 1974). The use of hyperstoichiometric (U,Pu)C containing approx. 10 vol% (U,Pu)₂C₃ appears to combine lower swelling with only a slightly greater tendency to carburize the cladding than single-phase (U,Pu)C. The selected designs are providing data on the relationship between the experimental parameters of fuel density, fuel-cladding gap size, and cladding type and various fuel-cladding mechanical interaction mechanisms.

- 2275 (LA-UR--78-2933) DESIGN AND PERFORMANCE OF SODIUM-BONDED URANIUM--PLUTONIUM CARBIDE FUEL ELEMENTS. Kerrisk, J.F.; DeMuth, N.S.; Petty, R.L.; Latimer, T.W.; Vitti, J.A.; Jones, L.J. (Los Alamos Scientific Lab., NM (USA)). 1979. Contract W-7405-ENG-36. 13p. (CONF-790306--4). Dep. NTIS, PC A02/MF A01.

From International conference on fast breeder reactor performance; Monterey, CA, USA (5 Mar 1979).

Recent results from irradiation tests indicate that sodium-bonded elements provide a practical advanced fuel element design for use in LMFBRs. Shroud tubes have effectively controlled fuel-cladding mechanical interaction; thicker and stronger claddings have also been effective in this respect. Burnups to 11 at.% have been achieved under typical operating conditions. A heterogeneous core with a breeding ratio of 1.55 and a compound system doubling time of less than 13 years has been designed using these element designs.

- 2276 (LA-UR--79-162) APPROXIMATE INVERSION METHOD FOR FIVE POINT DIFFERENCE MATRIX EQUATIONS. Steinke, R.B. (Los Alamos Scientific Lab., NM (USA)). 1979. Contract W-7405-ENG-36. 12p. (CONF-790402--43). Dep. NTIS, PC A02/MF A01.

From Computational methods in nuclear engineering; Williamsburg, VA, USA (23 Apr 1979).

SIMMER, a best estimate computer program for LMFBR disrupted core analysis, is being developed at the Los Alamos Scientific Laboratory. Recent fluid dynamics methods development for SIMMER was concerned with enhancing numerical stability and reducing calculational effort. One such development considered the evaluation of the pressure change and material density change

distributions during a time step. The spatially uncoupled approximate solution to be iterated was replaced with a correct spatially coupled simultaneous solution. This resulted in decreased calculational effort per time step as well as enhanced stability to allow much larger time steps to be taken. This improvement was realized by formulating the correct five diagonal matrix equations in two-dimensional rectilinear geometry and then solving them with an efficient matrix inversion routine. Initially, the Successive Line OverRelaxation (SLOR) method was used to solve these matrix equations. Instances of weakly diagonally dominant matrices requiring hundreds of SLOR iterations to invert them prompted consideration of a more efficient method. A new Approximate Inversion Method (AIM) was felt to have this efficiency. The method is a variation of the direct Crout--Cholesky forward elimination and backward substitute method. Crout--Cholwesky method element operations on a tridiagonal element matrix are applied in AIM as submatrix block operations on a tridiagonal block matrix. To make the method efficient, a submatrix collapsing approximation is applied. Making this approximation requires that the method be iterative. A description of this iterative algorithm and its approximate matrix inversion is included.

- 2277 (LA-UR--79-770) SIMMER ANALYSIS OF SRI HIGH PRESSURE BUBBLE EXPANSION EXPERIMENTS. Rexroth, P.E.; Suo-Anttila, A.J. (Los Alamos Scientific Lab., NM (USA)). 1979. Contract W-7405-ENG-36. 12p. (CONF-790310--3). Dep. NTIS, PC A02/MF A01.

From Specialists workshop on predictive analysis of material dynamics in LMFBR safety expts; Los Alamos, NM, USA (13 Mar 1979).

SIMMER-II was used to analyze the results of the SRI nitrogen bubble expansion experiments. Good agreement was found for all of the experiments analyzed as well as the theoretical isentropic limiting case. Scaling to a full size CRBR reactor reveals no significant scaling effects for the structureless core.

- 2278 (LA-UR--79-811) MEASUREMENT AND ANALYSIS OF DRAG IN MULTIPHASE FLOW SYSTEMS. Rexroth, P.E.; Starkovich, V.S. (Los Alamos Scientific Lab., NM (USA)). 1979. Contract W-7405-ENG-36. 16p. (CONF-790423--7). Dep. NTIS, PC A02/MF A01.

From 2. multiphase flow and heat transfer symposium workshop; Miami Beach, FL, USA (16 Apr 1979).

A combined experimental and analytical program undertaken to evaluate an interfield momentum coupling model used in the computer code SIMMER is described. The behavior of a slugging, vapor-particle flow system was observed and recorded using gamma densitometry, differential pressure measurement, and motion pictures. The primary parameter observed was slug period. When the system was modeled using SIMMER, the calculated behavior of the flow was qualitatively similar to that observed experimentally, but both the period and maximum slug height were underestimated, indicating too weak coupling between the vapor and particle fields. The SIMMER drag correlation was modified, resulting in much better agreement. Final discrepancies between experiment and analysis are discussed.

- 2279 (LA-UR--79-1230) HEAT TRANSFER AND THERMAL LOSSES IN ABOVE-CORE REGIONS. Bell, C.R.; Boudreau, J.E. (Los Alamos Scientific Lab., NM (USA)). 1979. Contract W-7405-ENG-36. 19p. (CONF-790810--1). Dep. NTIS, PC

A02/MF A01.

From 2. international seminar on containment of fast breeder reactors; Berlin, F.R. Germany (9 Aug 1979).

Heat transfer and thermal losses in above-core regions can substantially influence the conversion of thermal energy to damage potential following postulated core-disruptive accidents in a liquid metal fast breeder reactor. Any assessment of these influences is complex and difficult to substantiate because of the transient, interactive environment in which they occur. A perspective is developed for the role of heat-transfer processes in the context of fluid/structure dynamics, containment strength, accident severity, sodium involvement, and uncertainties in current knowledge. The Clinch River Breeder Reactor (CRBR) is used as an example to quantify this perspective. Containment limits are estimated for CRBR to allow a comparative evaluation of the containment tolerance as different physical effects are considered.

- 2280 (LA-UR--79-1874) OVERVIEW AND STATUS OF THE SIMMER TESTING PROGRAM. Scott, J.H. (Los Alamos Scientific Lab., NM (USA)). 1979. Contract W-7405-ENG-36. 13p. (CONF-790816--16). Dep. NTIS, PC A02/MF A01.

From International meeting on fast reactor safety technology; Seattle, WA, USA (19 Aug 1979).

Los Alamos Scientific Laboratory has undertaken an extensive experiment analysis program to test the results of SIMMER Liquid Metal Fast Breeder Reactor (LMFBR) accident calculations. Initially, we will test the postdisassembly work-energy partition problem. The SIMMER-calculated order-of-magnitude reduction of available kinetic energy following a severe hypothetical core-disruptive accident (HCDA) can be attributed to (1) purely fluid-dynamic effects; and (2) rate-controlled effects, such as phase transitions and heat transfer. We have chosen to test separately each class of mitigator. In this paper we review the experiments initially chosen for testing of each class of mitigator and report on the status of the analyses. We enumerate several problems in SIMMER that experiment analysis has disclosed. Finally, needs for future experiments are discussed.

- 2281 (LA-UR--79-1918) SIMMER-II CODE AND ITS APPLICATIONS. Smith, L.L. (Los Alamos Scientific Lab., NM (USA)). 1979. Contract W-7405-ENG-36. 11p. (CONF-790816--13). Dep. NTIS, PC A02/MF A01.

From International meeting on fast reactor safety technology; Seattle, WA, USA (19 Aug 1979).

The significant features of SIMMER-II, a disrupted-core analysis code, are described. The code has the capabilities to begin space-time neutronics calculations from nonstationary reactor states, to track the intermixing of fuel of different enrichments, and to model the complicated heat- and mass-transfer processes that occur in the transition phase. Example calculations are presented for analyses of whole-core accidents and for analyses of experiments supporting the code models.

- 2282 (LA-UR--79-1956) ROLE OF SIMILITUDE IN THE DESIGN OF LMFBR SAFETY-RELATED SIMULATION EXPERIMENTS. Chapyak, E.J.; Starkovich, V.S. (Los Alamos Scientific Lab., NM (USA)). 1979. Contract W-7405-ENG-36. 11p. (CONF-790816--15). Dep. NTIS, PC A02/MF A01.

From International meeting on fast reactor safety technology; Seattle, WA, USA (19 Aug

1979).

In this paper we examine the implications of scaling in the design of simulation experiments for two major areas of fast reactor safety research - the transition phase and postdisassembly energetics. Specific scaling requirements and compatible experimental designs are formulated and compared with ongoing programs having similar objectives. Suggestions are also outlined for future out-of-pile experimental research.

- 2283 (LA-UR--79-2037) DEVELOPMENTS IN THE LASL FUEL PIN IMAGING SYSTEM: PINEX-3A. Lumpkin, M.H.; Berzins, G.J.; Cosimi, R.A.; D'Hare, T.E.; Davidson, J.R. (Los Alamos Scientific Lab., NM (USA)). 1979. Contract W-7405-ENG-36. 11p. (CONF-790816--14). Dep. NTIS, PC A02/MF A01.

From International meeting on fast reactor safety technology; Seattle, WA, USA (19 Aug 1979).

The LASL Fuel Pin Imaging System was evaluated using a series of 10 TREAT transients, each of approx. 240-MW peak power. HEDL provided the fuel-ejection type capsule with annular fuel pellets. The pin visibility threshold was determined to be approx. 20-MW of TREAT power (approx. 130 W/g), almost an order of magnitude improvement over our PINEX-2 threshold. The impact of changes in instrumentation, imaging apertures, and fluors that produced the improved sensitivity are reported. Results of a time-integrated imaging technique are also presented.

- 2284 (LA-UR--79-2141) INFLUENCE OF TREAT NONPROTOTYPIC EFFECTS ON PREDICTION OF PIN FAILURE IN LMFBRs. Mast, P.K.; Scott, J.H. (Los Alamos Scientific Lab., NM (USA)). 1979. Contract W-7405-ENG-36. 12p. (CONF-790816--41). Dep. NTIS, PC A02/MF A01.

From International meeting on fast reactor safety technology; Seattle, WA, USA (19 Aug 1979).

The effect of the nonprototypic stagnant coolant environment in the static-capsule TOP TREAT tests has been investigated using the LAFM code. The cladding temperature was shown to be higher relative to the fuel temperature for the simulated 50 cents/s transients than in a hypothetical 50 cents/s FTR transient. This higher relative cladding temperature significantly decreases the importance of fuel-cladding differential thermal expansion as a failure mechanism and causes concern about the direct applicability of the 50 cents/s static-capsule TREAT test results to hypothetical FTR transients.

- 2285 (LA-UR--79-2245) INTEGRAL POSTDISASSEMBLY ENERGETICS TEST: A PRELIMINARY INVESTIGATION. Barts, E.W.; Asprey, M.W.; Burns, R.D. III; Chapyak, E.J.; Dunwoody, W.E.; Helmick, H.H. (Los Alamos Scientific Lab., NM (USA)). 1979. Contract W-7405-ENG-36. 12p. (CONF-790816--44). Dep. NTIS, PC A02/MF A01.

From International meeting on fast reactor safety technology; Seattle, WA, USA (19 Aug 1979).

Scaled, real-material integral tests could demonstrate mitigating mechanisms in postdisassembly energetic behavior during a hypothetical accident in a liquid metal fast breeder reactor (LMFBR). Such a test series could provide key data for accident analysis codes and LMFBR design and licensing. Studies were performed to determine important system parameters including the test geometry necessary to maintain prototypicality.

Neutronic behavior of the core and radial blanket configuration was studied to assure a controlled energetic burst. An engineering design study was performed to determine test feasibility.

- 2286 (LA-UR--79-2285) EXAMINATION OF SUBASSEMBLY SCALE FUEL MOTION USING THE SIMMER-II CODE. Alcouffe, R.E.; Henninger, R.J. (Los Alamos Scientific Lab., NM (USA)). 1979. Contract W-7405-ENG-36. 13p. (CONF-790865--1). Dep. NTIS, PC A02/MF A01.

From ANS/ENS international meeting on fast reactor safety technology; Vancouver, Canada (19 Aug 1979).

Subassembly scale motion during the early fuel dispersal and extended fuel motion phases of an LMFBR loss of flow accident are examined with the SIMMER-II code. Results are compared and contrasted with previous analyses and selected experiments. The early fuel motion with a SIMMER-II model is calculated with the results given by the SLUMPY module of the SAS3A code. SLUMPY may greatly overpredict the extent and magnitude of fuel motion on the time scale of interest using the nominal SLUMPY parameters. By comparing with pin geometry fuel freezing experiments, SIMMER-II is calibrated to calculate the experimental fuel penetration distances.

- 2287 (LA-UR--79-2340) SOME RECRITICALITY STUDIES WITH SIMMER-II. Bohl, W.R. (Los Alamos Scientific Lab., NM (USA)). 1979. Contract W-7405-ENG-36. 12p. (CONF-790816--38). Dep. NTIS, PC A02/MF A01.

From International meeting on fast reactor safety technology; Seattle, WA, USA (19 Aug 1979).

The SIMMER-II code was applied to the problem of evaluating the potential for recriticality in an LMFBR HCDA. The phenomenology examined was based on the post SAS3D behavior in a CRBR LOF accident. The SIMMER-II results were found to be sensitive to the development of fuel blockages. If blockages were formed close to the core, the core-disruption phase of the behavior resulted from the significant energy required following SAS3D termination to raise the average steel temperature to saturation conditions; also material deposition near heat sinks eliminated condensation surfaces and induced core pressurization and fuel collapse. Excessive ramp rates (greater than 100/s) were judged to be unlikely, but improved knowledge and calculational treatments of the applicable phenomenology would be desirable.

- 2288 (LA-UR--80-1159) DEEP PENETRATION CALCULATIONS. Thompson, W.L.; Deutsch, D.L.; Booth, T.E. (Los Alamos Scientific Lab., NM (USA)). Apr 1980. Contract W-7405-ENG-36. 29p. (CONF-800471--1). NTIS, PC A03/MF A01.

From Seminar on theory and applications of Monte Carlo methods; Oak Ridge, TN, USA (Apr 1980).

Several Monte Carlo techniques are compared in the transport of neutrons of different source energies through two different deep-penetration problems each with two parts. The first problem involves transmission through a 200-cm concrete slab. The second problem is a 90° bent pipe jacketed by concrete. In one case the pipe is void, and in the other it is filled with liquid sodium. Calculations are made with two different Los Alamos Monte Carlo codes: the continuous-energy code MCNP and the multigroup code MCMG.

2289 (LA-UR--80-1283) THERMAL CONDUCTIVITIES OF MIXED CARBIDE FUEL AND BLANKET MATERIALS. Lewis, H.D. (Los Alamos Scientific Lab., NM (USA)). May 1980. Contract W-7405-ENG-36. 13p. (CONF-800532--1). NTIS, PC A02/MF AJ1.

From Core components working group information meeting; Richland, WA, USA (13 May 1980).

Measurement of the thermal and electrical transport properties of the uranium-plutonium carbides began in 1950, the bulk of the experimental work being performed in the US, UK, and France. During 1974 and 1975, as part of the national LMFBR program effort to provide unified design parameters, a series of critical reviews on the thermodynamic, physical, chemical, and mechanical properties of uranium-plutonium carbide (and nitride) fuels was prepared by authors at several US laboratories. Property values recommended by these reviews were compiled in ANL-APP-27. The LASL review on the transport properties of uranium and plutonium carbides recommended the conductivity values that are presented.

2290 (LMC--77-2) CLS/DHX MODULE TESTING IN SPTF. FINAL REPORT. Archbold, P. (Liquid Metal Engineering Center, Canoga Park, CA (USA)). 30 Sep 1977. Contract EY-76-C-03-0700. 81p. AT.

This report covers testing of the Dump Heat Exchanger (DHX) installed in the Sodium Pump Test Facility (SPTF) at the Liquid Metal Engineering Center, Santa Susana, California. The overall objectives of the test program were to obtain data on heat transfer capability and instrumentation and controls associated with the heat exchanger for comparison against the models for the Closed Loop System (CLS) Dump Heat Exchanger (DHX) to be installed for the Fast Flux Test Facility (FFTF) at Hanford, Washington. Tests were performed on a noninterfering basis during the FFTF Prototype Pump Test Program. Early data on the heat transfer capability and preheat capability of the DHX indicated that the performance was somewhat lower than expected. Added insulation and rework of the baffle in the header box resulted in improved performance. Instrumentation and controls did not perform as expected and results indicate a need for reevaluation of the CLS/DHX control systems. Comparative tests for the flowmeter indicated the readings to be approximately 20 percent low.

2291 (LMC--77-3) CALIBRATION OF THE FFTF LEVEL MEASURING SYSTEMS. Fischer, B.E. (Liquid Metal Engineering Center, Canoga Park, CA (USA)). 1 Dec 1977. Contract EY-76-C-03-0700. 447p. AT.

This report summarizes the results of a program conducted at the Liquid Metal Engineering Center (LMC) to calibrate all of the FFTF inductive level measuring systems manufactured by Westinghouse Industrial and Government Tube Division. Sixty-two level measuring systems were calibrated during the program. Performance data was collected at sodium temperatures between 300 and 1200°F (149 and 649°C). Five of the sixty-two systems were calibrated in a NaK test facility at temperatures between 70 and 500°F (21.1 and 260°C).

2292 (LMC--77-4) FFTF PROTOTYPE PUMP TESTING IN SPTF. FINAL REPORT. Frangos, A.Z. (Liquid Metal Engineering Center, Canoga Park, CA (USA)). 15 Oct 1977. Contract EY-76-C-03-0700. 463p. AT.

In-sodium testing is described for the full-size Fast Flux Test Facility (FFTF) prototype pump in the Sodium Pump Test Facility (SPTF) at the Liquid Metal Engineering Center (LMC) over the complete range of steady-state hydraulic and thermal conditions as defined by Westinghouse-Hanford, the test requester. The overall objectives of the prototype pump test program were to demonstrate the highest possible confidence in the design of the pump prior to its actual operation in the FFTF plant. Test results reported include baseline and steady-state operation, thermal transient testing, hydraulic performance in sodium, endurance testing at steady-state conditions, cavitation tests, and assembly and disassembly procedures. A chronology for the test program is provided including a complete listing of test procedures, specifically the Special Test Procedures under which a major portion of the initial testing was performed.

2293 (LMC--77-5) TESTING OF THE FFTF PLANT PROTECTION SYSTEM PRESSURE TRANSDUCERS. Twa, G.J. (Dames and Moore, Los Angeles, CA (USA)). 15 Jan 1978. Contract EY-76-C-03-0700. 120p. AT.

The testing of three NaK transmission type, high-temperature pressure transducers is described. These transducers are identical to those procured for the FFTF Plant Protection System. Tests were conducted out of sodium to evaluate the performance characteristics and to determine if they meet the requirements of the procurement specification. The transducers were evaluated at process seal temperatures to 1200°F (649°C). Time response to step changes in pressure was performed to verify that these units met the 50-ms requirements. In-sodium tests were conducted to determine the effect of long-term exposure to sodium and to evaluate the long-term stability of the transducers. The transducers were tested for approximately 16,000 h in sodium with more than 10,000 h of this time at 1200°F (649°C).

2294 (LMC--77-6) MESHLESS COLD TRAP A PERFORMANCE EVALUATION BY TEST AND ANALYSIS. Goodman, L. (Liquid Metal Engineering Center, Canoga Park, CA (USA)). 5 Apr 1979. Contract EY-76-C-03-0700. 53p. AT.

Cold trap development has been hindered by an inadequate understanding of the basic phenomena involved. Consequently, there has been minimal guidance for designing a cold trap to provide a specified performance. Operational requirements at the Liquid Metal Engineering Center dictated a need for specified performance design. A full-scale, cold trap test was conducted to validate an analytical model for trap performance and to prove the effectiveness of traps without internal mesh. The test was successful on both counts.

2295 (LMC--77-7) SAMPLING AND CHARACTERIZATION OF SODIUM-WATER REACTION PRODUCTS. Eichelberger, R.L. (Liquid Metal Engineering Center, Canoga Park, CA (USA)). 15 Dec 1977. Contract EY-76-C-03-0700. 46p. Dep. NTIS, PC A03/MF A01.

The products of sodium-water reactions which had taken place in the Large Leak Test Rig at the Liquid Metal Engineering Center were sampled and characterized. The products consisted of the expected compounds in the Na-O-H system, and dissolved readily in ethanol. Removal of such products from a system by melting and draining does not appear feasible, but removal by dissolution in alcoholic solvents should be investigated further.

2296 (LMEC--77-8) DEMONSTRATION OF CONTACT AND PLUGGING TUBE TYPE LEAK DETECTOR PERFORMANCE IN FFTF REACTOR INLET GUARD PIPE. Klea, J.A. (Liquid Metal Engineering Center, Canoga Park, CA (USA)). 31 Jan 1978. Contract EY-76-C-03-0700. 87p. AT.

The performance (response) of a contact and plugging tube type leak detector was evaluated in a heated and inerted pipe mockup of the reactor inlet piping system in the vicinity of the inlet nozzle and guard vessel annulus. Other than an initial test at 600°F (315.6°C) and the last test at 400°F (204.4°C), the tests were run at 680°F (360°C) with 1 percent O_2 and 1000 ppm (vol) moisture. A leak rate system was designed to permit liquid sodium to leak from the inside radius surface of the inlet pipe onto the bottom of the guard pipe. Leak rates were varied in the 50- to 800-g/h range. The behavior and nature of the sodium was evaluated and photographed by disassembling the pipe mockup following each test.

2297 (LMEC--78-1) LIQUID METAL ENGINEERING CENTER (LMEC). ANNUAL TECHNICAL PROGRESS REPORT, JANUARY--DECEMBER 1977. (Liquid Metal Engineering Center, Canoga Park, CA (USA)). 15 Apr 1978. Contract EY-76-C-03-0700. 350p. AT.

The immediate objective of the LMEC is to support the LMFBR program by providing sodium component and instrumentation test facilities. In the past, emphasis has been in support of the FFTF. At this time, more and more effort is being channeled into base technology programs in support of LMFBR requirements beyond FFTF. This report is divided into two parts, one dealing with testing initiated by external organizations, the other with LMEC-initiated programs required to improve the test facilities or to meet special test requirements. Only those projects considered to be of technical interest to the LMFBR community are reported.

2298 (LMEC-TDR--78-3) EXPERIMENTAL RESULTS OF SODIUM-WATER REACTION TEST NO. 6. Miller, A.E.; Neely, H.H. (Liquid Metal Engineering Center, Canoga Park, CA (USA)). 6 Feb 1978. Contract EY-76-C-03-0700. 511p. AT.

The sixth (SWR-6) and final sodium-water reaction test of Series I was performed in the Large Leak Test Rig (LLTR) on November 3, 1977. Presented are computer-produced plots of the transient data obtained and the results of the post-test, nondestructive examinations and cleaning of the test article, Atomic International Modular Steam Generator (AI-MSG) and test system. In the five previous tests (SWR-1 through SWR-5), a double-ended guillotine (DEG) rupture was induced in a standard water tube of the AI-MSG. For SWR-6, a special rupture tube with three times the flow area (3-DEG) was installed in the hockey stick of the AI-MSG. Except for the larger H_2O injection rate (approximately 10.5 lbs/sec vs. approximately 4 lbs/sec) resulting from the larger flow areas (of the rupture tube and connecting injection circuit), SWR-6 and SWR-4 conditions essentially were identical. Superheated steam (approximately 700°F/1900 psig) was injected for 3 seconds into sodium (800°F/100 psig) in the hockey stick region of the AI-MSG, 1.75 inches from the upper tube sheet.

2299 (LMEC-TDR--78-4) AI SUBSCALE INDUCER TEST ARTICLE: FIRST AND SECOND 300 HOUR ENDURANCE TESTS. McDowell, M.W. (Liquid Metal Engineering Center, Canoga Park, CA

(USA)). 14 Feb 1978. Contract EY-76-C-03-0700. 41p. AT.

This report covers the results and associated incidents from the testing of the AI Subscale Inducer Test Article between September 1977 and January 7, 1978. Testing was performed in 750°F sodium at LMEC's Small Component Test Loop (SCTL). The tests conducted during this period were two 300 hour endurance runs. Test conditions were the same for each endurance run. Operation was performed near design speed with Q/N between .80 and .90 and NPSH between 16 and 18 feet. The pump was installed in the facility before each test and removed after each test.

2300 (LMEC-TDR--78-5) STRESSCOAT TEST OF 6-INCH PIPE CLAMP IN TTF. Rollins, C.T. (Liquid Metal Engineering Center, Canoga Park, CA (USA)). 15 Feb 1978. Contract EY-76-C-03-0700. 47p. AT.

This report describes the Stresscoat evaluation of the stress distribution in the clamp and adjacent pipe when subjected to clamp bolt load, tensile and compressive load on the clamp normal to the pipe. The Stresscoat evaluation was effective in determining the approximate stress distributions and the maximum stress locations for each type of loading. Based on these results detailed strain gage locations for subsequent testing were selected and presented.

2301 (MLM-MU--77-70-0004) AEROSOL CHARACTERIZATION FROM A SIMULATED HDCA. ANNUAL REPORT. NRC PROGRAM A1171-2. Johnson, E.W.; Fleming, D.L.; Zielinski, R.E.; Zanotelli, W.A. (Mound Lab., Miamisburg, OH (USA)). 27 Oct 1977. Contract EY-76-C-04-0053. 30p. Dep. NTIS, PC A03/MF A01.

Studies were performed to determine the existence of triiodine uranium (V) oxide (Na_3UO_4), since this compound's thermodynamic properties are similar to the compound $Na_3(U,Pu)O_4$ supposedly formed in a HCDA. Although the actual conditions of heat and inert atmosphere were not completely duplicated, a general idea of the compounds formed and their behavior were assessed. The study indicated that the major components formed from a reaction of sodium, uranium, and stainless steel in an air atmosphere were β -sodium metauranate (β - Na_2UO_4) and sodium diuranate ($Na_2U_2O_7$), rather than trisodium uranium (V) oxide (Na_3UO_4). The compound tetrasodium uranyl carbonate $Na_4UO_2(CO_3)_3$ was the major compound formed when the pellets were heated in an argon atmosphere. Although one exception was encountered, experimental evidence indicates that stainless steel does not react with sodium or uranium during a HCDA.

2302 (MP--45-SA-002) REMOVAL OF SODIUM/SODIUM WATER REACTION PRODUCTS FROM THE MSG BY REACTION WITH ORGANIC SOLVENTS. Stearns, J.D. (Energy Technology Engineering Center, Canoga Park, CA (USA)). Dec 1978. Contract EY-76-C-03-0700. 16p. AT.

This document describes the steps required to remove sodium and sodium-water reaction products from the Modular Steam Generator (MSG) following testing in Large Leak Test Rig (LLTR).

2303 (MRR--160, pp 511-529) COMPUTERS PROCESSING THE TEMPERATURE IN THE CORE OF PHENIX. Grisolle, J.; Quenee, R. (CEA Centre d'Etudes Nucleaires de Saclay, 91 - Gif-sur-Yvette (France)). Jul 1976. (In French). From IAEA/NPPCI specialists meeting on use

of computers for protection systems and automatic control; Neuherberg/Munchen, F.R. Germany (11 May 1976).

The operational reliability of industrial mini-computers justifies their application in reactor protection systems. Taking into consideration the conclusions drawn from experience, improvements have been made on the installation for monitoring core temperatures (TRCT) at the Phenix reactor resulting in the fact that during the last six months of operation no failures have been detected.

- 2304 (MRR--160, pp 531-543) COMPUTERS IN THE CORE SUPERVISION AND PROTECTION SYSTEM AT CREYS MALVILLE (SUPER PHENIX). Jeannot, A.; Grisolle, J.; Gourdon, J.; Paziaud, A. (CEA Centre d'Etudes Nucleaires de Cadarache, 13 - Saint-Paul-les-Durance (France)). Jul 1976. (In French).

From IAEA/NPPCI specialists meeting on use of computers for protection systems and automatic control; Neuherberg/Munchen, F.R. Germany (11 May 1976).

In French nuclear power plants there is a tendency to distinguish between conventional handling of information by a computer (monitoring of a measurement with respect to a threshold, contact monitoring) and management of the process according to each reactor type. In case of the Super Phenix the process management has been voluntarily subdivided by specialized tasks in order to increase the availability and in order to facilitate the intervention into the logic part during start-up and operation. The interconnection of 5 computers lead to numerous precautions to avoid that they might disturb each other and to meet the current regulations.

- 2305 (MRR--160, pp 573-584) DESIGN FEATURES OF THE FUEL ELEMENT COMPUTERIZED PROTECTION SYSTEM BESSY. Juengst, U. (Internationale Atomreaktorbau G.m.b.H. (INTERATOM), Bergisch Gladbach (Germany, F.R.)). Jul 1976.

From IAEA/NPPCI specialists meeting on use of computers for protection systems and automatic control; Neuherberg/Munchen, F.R. Germany (11 May 1976).

In the LMFB SNR 300 a process computer will be applied as a subsystem of the reactor protection system. It is to detect plugging fuel elements by monitoring the outlet temperatures of the 205 subassemblies. The system consists of four computers, three with 2 out of 3 majority voting for the task of engineered safeguards and one for the information output. The presentation describes the structural design of hard- and software and discusses some safety related features which may be considered by further integration of computers in reactor protection systems.

- 2306 (MTR--7485(Vol.1)) SYSTEMS DESCRIPTIONS AND ENGINEERING COSTS FOR SOLAR-RELATED TECHNOLOGIES. VOLUME I. SUMMARY. (Mitre Corp., McLean, VA (USA). METREK Div.). Jun 1977. Contract EX-76-C-01-2322. 157p. Dep. NTIS, PC A08/MF A01.

The results of the METREK solar energy engineering cost study, in support of the System to Project Utilization of Renewable Resources (SPURR) model, are presented. Generic systems designs are formulated and the associated engineering costs are evaluated and estimated. An aim of this study is to predict the likely costs and performance of solar equipment, once mass produced. The data have been summarized on generic design data forms and are presented. The systems are grouped into four major categories by application type: (1)

electric utility applications, (2) solar heating and cooling of buildings (SHADESIGN, nment contractors DB), (3) agricultural and industrial process heat (A/IPH), and (4) synthetic fuels and products (SFP). The electric utility application data are presented for five classes of systems: baseload, intermediate, semi-peaking, peaking and 'fuel savers'. Fuel savers are solar electric options without storage or backup. The SHACOB data are presented for five system types covering a wide range in demand load. These systems include domestic hot water only (liquid); heating and hot water (air and liquid); heating, cooling by absorption air-conditioning, and hot water (liquid); and heating, cooling and hot water with heat pump auxiliary (liquid). The A/IPH data are presented for eight applications using water, air and steam at delivery temperatures ranging from 40 to 800°C. System performance is estimated for nine locations representative of the census regions in climate, with proximity to industrial centers of concentration. The SFP data are delineated by product type. The only product applications considered are low and medium Btu gas, synthetic (high Btu) natural gas (SNG), synthetic crude oil (syncrude), methanol and ammonia. Costs for SFP systems are developed for biomass feedstocks, high sulfur coal, oil shale, and an equatorially-located ocean thermal energy conversion (OTEC) system.

- 2307 (MTR--7485(Vol.4)) SYSTEMS DESCRIPTIONS AND ENGINEERING COSTS FOR SOLAR-RELATED TECHNOLOGIES. VOLUME IV. CONVENTIONAL TECHNOLOGIES FOR ELECTRIC UTILITY APPLICATIONS. Miller, G. (Mitre Corp., McLean, VA (USA). METREK Div.). Jun 1977. Contract EX-76-C-01-2322. 101p. Dep. NTIS, PC A06/MF A01.

This document presents engineering costs and system performance for competitive fossil- and nuclear-fueled generation technologies. The data are developed to provide a data base for predicting future market penetration of solar technologies. To provide an accurate and consistent basis for market penetration analyses, the work reported in this volume was based on a set of assumptions common to all volumes and use of methodology consistent with that used for solar technologies. Competitive fossil- and nuclear-fueled generation technologies include those technologies expected to be most competitive between 1980 and 2020. On the basis of choosing a wide variety of technology types and of choosing those technologies exhibiting relatively competitive costs, eight technologies were chosen and are discussed: conventional coal/steam with flue gas desulfurization; open-cycle gas turbine/steam turbine with integrated coal gasification; atmospheric fluidized bed; light water reactor; liquid metal fast breeder reactor; open-cycle gas turbine with recuperator; open-cycle gas turbine-combined cycle; liquid metal fast breeder reactor and coal steam plant incorporating thermal oil storage. Most of the technologies are expected to have demonstrations completed by 1990. The LMFB and thermal oil storage are expected to have been demonstrated shortly after 1990. Generally the dates for demonstration represent optimistic estimates of the earliest timeframe within which prototype units could be completed. Sections 8 and 9 discuss the availability and anticipated costs of coal and nuclear fuels, respectively. (MCW)

- 2308 (N--78-11243) EFFECT OF SIMULATED SERVICE CONDITIONS ON STAINLESS STEEL TYPE 316. Kent, J.C.W.; Infield, J.A. (Bristol Univ.

(UK). Dept. of Mechanical Engineering). Jun 1977. 52p. (BU--77/B.4). NTIS PC A04/MF A01.

Materials used in high temperature applications are often subject to a departure from their virgin properties due to severe service conditions. It is therefore necessary to investigate the changes in the microstructure and mechanical properties of materials used in such applications in order to avoid premature and costly failure. The project was devised in order to determine the effect of prior damage and aging on stainless steel type 316 which is used in the construction of the fast breeder nuclear reactor. This was accomplished by subjecting prestrained, fatigued, and cold worked specimens to an accelerated aging process and observing subsequent changes in the tensile, hardness, creep, and impact properties of the material. The results obtained showed that for annealed material, irrespective of damage, the tensile strength increased with aging time after an initial period of weakening. Prior fatigue and prior strain were observed to accelerate these effects. Cold worked material tended to deteriorate continuously with aging, while the impact and hardness properties of all pretreated types of alloy decreased with aging.

2309 (NCSR-R--20, pp 89-117) INITIAL DATA COLLECTION EFFORTS OF CREDO. SODIUM VALVE FAILURES. Bott, T.F.; Haas, P.M. (Oak Ridge National Lab., TN (USA)). Nov 1978. From 5. symposium on reliability technology; Bradford, UK (Sep 1978).

The Centralized Reliability Data Organisation (CREDO) has been established at Oak Ridge National Laboratory to define, develop, and maintain a reliability data analysis center for use in advanced reactor safety and licensing. Its primary functions are collection, reduction, evaluation, storage, retrieval, and dissemination of reliability/maintainability data. Data-collection efforts have been initiated at several test loops, at the Experimental Breeder Reactor-II and at the Fast Flux Test Facility. Top priority is being given to collection data on safety and safety-related systems, primarily for sodium-cooled reactors. Sufficient operating time has been accumulated on sodium valves at test facilities to provide quantitative estimates of reliability characteristics with a reasonable degree of confidence. Sodium-valve failures have been categorized according to seat design, size, seal type, and actuator type.

2310 (ND-R--9(S)) COMPARISON OF THE APPLICATION OF PLATE AND BEAM THEORIES TO THE ELASTIC DILATION AND INTERACTION OF PFR SUB-ASSEMBLY WRAPPERS. Moss, R.L. (UKAEA Springfields Nuclear Power Development Labs.). 23 Jun 1977. 26p. Dep. NTIS (US Sales Only), PC A03/MF A01.

A wrapper face is assumed to be a long, narrow, rectangular plate. The mechanical interaction between adjacent dilating wrappers in contact along an axial line is discussed in terms of the theory of the bending of plates. A variational method is used to obtain neat and concise equations that determine both the interaction load and the length of the line of contact. The prime objective of the work is to compare the results obtained from plate theory with corresponding expressions from much simpler calculations based on beam theory. Numerical results indicate that the elastic dilation of a wrapper and its interaction with a neighboring wrapper can be calculated to adequate accuracy by simple beam theory.

2311 (ND-R--50(R)) SPECIFICATION OF SYSTEM - INDEPENDENT SEQUENCING CALLS FOR MODULAR CODE SCHEMES. Enderby, J.A. (UKAEA Reactor Group, Risley). Oct 1977. 14p. Dep. NTIS (US Sales Only), PC A02/MF A01.

To permit the writing of program modules which may be used without modification in any modular code scheme, a set of FORTRAN subroutine calls for setting up and communicating with modular code sequences has been defined. These calls, which are presented in the paper, have been defined so as to be independent of the way in which sequencing is implemented by the modular code scheme.

2312 (ND-R--178(R)) WHOLE-CORE ACCIDENTS IN AN LMFBR. Baker, A.R. (UKAEA Risley Nuclear Power Development Establishment). Nov 1978. 28p. Dep. NTIS (US Sales Only), PC A03/MF A01.

The lecture presents an introduction to the evaluation of whole-core accidents in a liquid-metal cooled fast breeder reactor (LMFBR). These accidents can be sub-divided into two types: transient overpower accidents or transient under-cooling accidents, according as the power or coolant flow is substantially disturbed from normal values. There would only be serious consequences in the event of failure of the reactor's automatic protection system or, for a few less important hypothetical accidents, in the event of sudden and catastrophic failure of a major structure. The treatment of whole-core accidents in safety presentations to responsible authorities is briefly discussed and the possible courses of such accidents are outlined, showing the importance of the Doppler fuel temperature and sodium void coefficients. The calculational methods are described with illustrations from studies with the UK code FRAX. The lecture concludes with brief consideration of the experimental validation of computer codes and the design consequences of whole-core accident studies.

2313 (ND-R--199(R)) VIBRATION TESTS ON SINGLE HEAT EXCHANGER TUBES IN AIR AND STATIC WATER. Collinson, A.E.; Warneford, I.P. (UKAEA Springfields Nuclear Power Development Labs.). Jul 1978. 25p. Dep. NTIS (US Sales Only), PC A03/MF A01.

The vibrational characteristics of a 7 span straight tube and a 26 span U-tube have been investigated for the effects of fluid medium (air/water), tube-grid clearance, tube-grid contact force, vibration transmission and scale. Measured frequency response and mode shapes compared favourably with theoretical values, vibration with pin-pin tube support being most readily excited. The frequency reduction on immersion in water corresponded to an added mass equivalent to the liquid displaced mass. Dynamic magnifiers varied in the range 12 to 135 with mean values of 30 to 40 in water and 45 to 60 in air. Principal vibration modes and damping values were reproducible in a half-scale model of a U-tube.

2314 (ND-R--230(R)) NOISE PROBLEMS IN PFR SAFETY SYSTEM POWER SUPPLIES. Hodgson, D. (UKAEA Risley Nuclear Power Development Establishment). Aug 1978. 10p. (ND-M-R--230(R)). NTIS, PC A02/MF A01.

Reactor power on PFR is controlled by eleven neutron absorbing rods. They are held vertically above the core by electromagnets which, in turn, are mounted on motorised lead screws. Five of the rods are used as power control elements; five are used as shut off

rods and the eleventh is a safety rod, positioned vertically above the centre of the reactor core. All rods fall under gravity into the reactor when the electro magnets are de-energised. In addition the safety rod can be driven into the reactor by a pneumatic piston and cylinder mechanism. This provides some degree of diversity from the common design of mechanism used by the control and shut off rods. Also being in the center it can be armed and ready for use when the above core shield is rotated. The automatic protective system for the plant provides the electro magnet currents and hence the reactor trip signals via two separate and diverse safety systems, namely a 'Relay System' and a 'Solid State System.' The two systems are completely separate and independent. The overall probability of failure of the complete system to release at least 3 rods when called upon to do so is less than 10^{-6} .

- 2315 (ND-R--304(R)) INTERNATIONAL PIPING BENCHMARKS: USE OF THE SIMPLIFIED CODE PACE 2. Boyle, J.T.; Spence, J. (UKAEA Risley Nuclear Power Development Establishment). May 1979. 31p. Dep. NTIS, PC A03/MF A01.

Work performed under United States-UKAEA Fast Reactor Exchange Programs.

This report compares the results obtained using the code PACE 2 with the International Working Group on Fast Reactors (IWGFR) International Piping Benchmark solutions. PACE 2 is designed to analyse systems of pipework using a simplified method which is economical of computer time and hence inexpensive. This low cost is not achieved without some loss of accuracy in the solution, but for most parts of a system this inaccuracy is acceptable and those sections of particular importance may be reanalysed using more precise methods in order to produce a satisfactory analysis of the complete system at reasonable cost.

- 2316 (NEDM--13981) STATE-OF-THE-ART OF RUPTURE DISKS FOR LMFBR APPLICATION. Verkamp, J.P. (General Electric Co., Sunnyvale, CA (USA). Breeder Reactor Dept.). Jul 1973. Contract EY-76-C-03-0189-061. 73p. AT.

Portions of document are illegible.

The Liquid Metal Fast Breeder Reactor (LMFBR) power plants as presently conceived have sodium heated steam generators. Steam-side-to-sodium-side leakage is possible. It is expected that safe relief of the products generated by a sodium/water reaction can be obtained by use of rupture disks. In this review the present state of the technology is examined with regard to rupture assemblies suited to LMFBR applications. Requirements to meet LMFBR needs are compared with characteristics of presently available rupture assemblies. Recommendations for meeting near term and future needs are included.

- 2317 (NEDM--14044) SMALL LEAK DAMAGE AND BEHAVIOR TEST RESULTS. Greene, D.A. (General Electric Co., Sunnyvale, CA (USA). Fast Breeder Reactor Dept.). Apr 1975. Contract EY-76-C-03-0893-010. 33p. AT.

Portions of document are illegible.

Small leak damage and behavior tests have been performed in a static sodium rig, a flowing sodium rig, and a rig with flowing sodium and flowing steam simulating LMFBR Steam Generator conditions. Approximately 160 wastage behavior tests have been completed in these rigs. The results obtained from these tests are presented. They include target damage rates, and the magnitude of orifice self-damage.

- 2318 (NEDM--14090) SODIUM WATER REACTION (SWR) CLEANUP SYSTEM STUDY AND IMPROVED DESIGNS OF COLD TRAP FOR SWR CLEANUP OF LMFBR PLANTS. Anand, R.K.; Reynolds, R.G. (General Electric Co., Sunnyvale, CA (USA). Fast Breeder Reactor Dept.). Jan 1976. Contract EY-76-C-03-0893-010. 95p. AT.

Portions of document are illegible.

This report documents an SWR Cleanup System Study for the hot sodium circulation process of removing sodium water reaction products (SWRP) from an Intermediate Heat Transport System (IHTS) of an LMFBR power plant. In essence, the SWR Cleanup System Study concludes that there will be a saving of several million dollars if a special fast SWR Cleanup System proposed in this report is used for in place removal of SWRP. A survey of the current state of knowledge regarding cold trap design and operation is presented. Two improved design concepts are recommended for SWR cleanup cold traps which incorporate the good design principles required for cleanup of highly impure sodium. Development programs are also recommended for a successful demonstration of the recommended sodium cleaning process.

- 2319 (NEDM--14091) OVERALL SEPARATION EFFICIENCY REQUIREMENT OF THE CENTRIFUGAL SEPARATOR FOR THE LMFBR SODIUM WATER REACTION PRESSURE RELIEF SYSTEM (SWRPS). Anand, R.K. (General Electric Co., Sunnyvale, CA (USA). Fast Breeder Reactor Dept.). Jan 1978. Contract EY-76-C-03-0893-010. 21p. AT.

An analysis was made to determine the overall separation efficiency requirement for a centrifugal separator in a LMFBR plant to stay within recommended Na_2O ground deposit limits and NaOH -air concentrations. Expected release from hypothetical sodium-water reactions associated with LMFBR steam generator is discussed in terms of effluent generation, atmospheric diffusion, release height and subsequent ground deposition. The analysis concludes that a centrifugal separator efficiency of 94 percent or greater will maintain NaOH concentrations well below the recommended allowable limits necessary to protect the health and safety of the public.

- 2320 (NEDM--14092) SMALL LEAK SHUTDOWN, LOCATION, AND BEHAVIOR. Sandusky, D.W. (General Electric Co., San Jose, CA (USA). Fast Breeder Reactor Dept.). Dec 1975. Contract EY-76-C-03-0893-010. 36p. AT.

The work reported is a continuation of an investigation of the nature and control of small steam leaks in LMFBR steam generators. The intent of the present work was to test methods to shut down a leaking steam generator and develop methods to locate small leaks. The testing was performed in a system designed to simulate steam and sodium conditions in an LMFBR steam generator (Loop 9). Shutdown tests were first performed to determine if any method would keep a small leak open. High pressure inert gas proved successful. Procedures involving cooling the sodium to $<316^\circ\text{C}$ before replacement of steam with inert gas proved successful. Cooling the sodium reduced the small leak self-damage rate. A preliminary shutdown procedure was determined.

- 2321 (NEDM--14104) THEORETICAL PREDICTIONS OF LOCAL HEAT TRANSFER AND WATER PURITY PARAMETERS FOR TRANSITION BOILING BASED UPON A FILM DRYOUT MODEL. Peterson, J.R. (General Electric Co., Sunnyvale, CA (USA). Fast Breeder Reactor Dept.). Mar 1976. Contract EY-76-C-03-0893-010. 54p. AT.

The report presents the development of a theoretical prediction of local heat transfer coefficients, wall temperatures and lengths for the Transition Region between the nucleate boiling and film boiling areas of an evaporator tube. The theoretical expressions are based upon a physical model which envisions the annular liquid film, thought characteristic of nucleate boiling at the conditions of interest, to break up into rivulets at the critical heat flux point. The length of the Transition Region is assumed to be dominated by the evaporation of these rivulets, and the dryout point for the rivulets is equated to the onset of film boiling. The model is solved for controlled heat flux and controlled temperature boundary conditions as well as for the liquid metal heated boundary condition appropriate for LMFBR steam generators.

- 2322 (NEDM--14109) SUMMARY OF THE EFFECTS OF MATERIAL COMBINATIONS AND WELD JOINT GEOMETRIES ON THE ELASTIC STRESS IN A DISSIMILAR METAL PIPE JOINT. Yang, T.M. (General Electric Co., Sunnyvale, CA (USA). Fast Breeder Reactor Dept.). May 1976. Contract EY-76-C-03-0893-010. 21p. AT.

An investigation of the temperature and thermal stress distribution in a 24 inch diameter dissimilar metal pipe joint during a thermal transient has been completed. Two material combinations, $2\frac{1}{4}\text{Cr}-1\text{Mo}$ to 316SS and $2\frac{1}{4}\text{Cr}-1\text{Mo}$ to Incoloy 800 were studied to determine the effect of material combination and weld joint geometry on thermal stresses. The study showed that material combination had a large effect on stresses; the smaller difference in thermal expansion resulted in lower stresses. Weld geometry had a secondary effect on thermal stresses.

- 2323 (NEDM--14110) CAUSTIC STRESS CORROSION TESTS FOR THE LLTR. Indig, M.E. (General Electric Co., Sunnyvale, CA (USA). Fast Breeder Reactor Dept.). May 1976. Contract EY-76-C-03-0893-010. 30p. Dep. NTIS, PC A03/MF A01.

A series of tests have been performed in order to determine the effects of the caustic resulting from the $\text{Na}/\text{H}_2\text{O}$ reaction on the materials used in the LLTR-MSG series of testing. Stainless steel, $2\frac{1}{4}\text{Cr}-1\text{Mo}$ and carbon steel have been evaluated. Stress corrosion cracking susceptibility and general corrosion are reported. Over the range of temperature, caustic concentration and heating rate tested the stainless steel stressed to 90% of yield or above suffered cracking. Whereas, the $2\frac{1}{4}\text{Cr}-1\text{Mo}$ and carbon steel were not cracked.

- 2324 (NEDM--14131) RESULTS OF SMALL LEAK BEHAVIOR AND DAMAGE PROPAGATION TESTS IN THE U.S. Greene, D.A.; Sandusky, D.W. (General Electric Co., Sunnyvale, CA (USA). Fast Breeder Reactor Dept.). Aug 1976. Contract EY-76-C-03-0893-010. 34p. AT.

A small leak of water into sodium in a liquid metal heated steam generator can cause damage to adjacent tubes, a phenomenon termed wastage. Theories on this phenomenon range from corrosion from sodium-water reaction products to erosion by supersonic particles. An alternative approach considers the water injection to form a simple combustion process. Using this approach many aspects of over 250 wastage experiments can be explained both analytically and physically. It is also found that water leaking into sodium causes self-enlargement of the defect, a phenomenon termed self wastage. Tests were performed in flowing and static sodium and steam. Self-wastage

appears to result from two separate causes; the first operating on plugged leaks possibly causing intermittent opening of the leak path, the second operating when a continuous flow of water passes through the leak path. Data on self-wastage were obtained for both austenitic and ferritic steels. When a small leak occurs and is detected, the steam generator shutdown sequence must be optimized to prevent intrusion of sodium into the steam system or plugging of the leak. Tests were performed using various shutdown procedures to identify optimum conditions for leak location. Methods to reopen plugged leaks were also tested. Some of the shutdown procedures repeatedly produced open leaks which were subsequently located with a helium mass spectrometer. Washing with chemical solutions successfully opened plugged leaks. It was found that pulsed eddy current and ultrasonic inspection appear promising for leak location techniques. Damage propagation and subsequent failure causes are being examined, and predictions made using combustion flame approaches. The flame characteristics have been measured, and the damage potential of both turbulent and pool flames have been examined.

- 2325 (NEDM--14137) SMALL LEAK SCOPING TESTS: SECONDARY TUBE FAILURE TEST; SODIUM/WATER REACTION FLAME PHOTOGRAPHY. Gudahl, J.A.; Hunsicker, J.C.; Ulpindo, C.Q. (General Electric Co., Sunnyvale, CA (USA). Fast Breeder Reactor Dept.). Aug 1976. Contract EY-76-C-0893-010. 36p. AT.

Two Sodium/Water Reaction Scoping Tests are described. In the first test, a 19 tube bundle of $2\frac{1}{4}\text{Cr}-1\text{Mo}$ material was assembled in a 1.22 inch (3.1 cm) triangular array, simulating the Clinch River Breeder Reactor Plant steam generator. The assembled test section was placed in a liquid sodium test vessel and a steam jet was directed through the liquid sodium to a target tube. The initial injection of water was directed through the space between two tubes to impinge on a tube 1.5 inches (3.9 cm) from the injection orifice. This target tube was pressurized with steam. The impinging jet penetrated the 0.109 inch (.8 cm) target tube after 20 minutes. Steam from the target tube then impinged onto one of the adjacent tubes causing it to fail after a further 63 seconds. The test and test results are described. The second group of tests was conducted to obtain photographs of a liquid sodium/water reaction. Combustion occurred in all six tests and in most cases, visual documentation, color still and cinema photography, showed that a flame or flame pattern was produced.

- 2326 (NEDM--14145) CHARACTERIZATION OF ESR AND VAR $2\frac{1}{4}\text{Cr}-1\text{Mo}$ ALLOY TUBING. Bubsom, H.J. (General Electric Co., Sunnyvale, CA (USA). Fast Breeder Reactor Dept.). Sep 1976. Contract EY-76-C-03-0893-010. 30p. Dep. NTIS, PC A03/MF A01.

Commercial tubing for LMFBR sodium-water steam generator applications was produced from ESR and VAR $2\frac{1}{4}\text{Cr}-1\text{Mo}$ alloy (Grade T22) and characterized regarding chemical composition, microstructure, physical characteristics, and short and long term mechanical properties. These results demonstrate that tubing meeting RDT Standard RDT M3-33 can be produced from either the ESR or VAR process and is acceptable to ASME Code Section III requirements. Metallurgical and mechanical properties are similar for both ESR and VAR material, indicating that either remelting practice is acceptable.

- 2327 (NEDM--14146(Rev.1)) EFFECTS OF REMELTING AND HEAT TREATMENT ON 2-1/4 CR-1MO STEEL ELEVATED TEMPERATURE TENSILE PROPERTIES. Offer, H.P.; Copeland, J.F.; Yuen, J.L. (General Electric Co., Sunnyvale, CA (USA). Fast Breeder Reactor Dept.). Sep 1976. Contract EY-76-C-03-0893-010. 70p. Dep. NTIS, PC A04/MF A01.

Vacuum arc remelting (VAR) and electroslag remelting (ESR) processes for steam generator tubesheet forgings and tubing are to be used at the CRBR. It was found that there is essentially no significant effect on the uniaxial tensile properties of 2 1/4 Cr-1Mo steel by VAR or ESR. A summary is presented of results of a study of heat treatment combined with post weld heat treatment. It was found that regardless of the primary heat treatment, the post weld heat treatment plus in-service conditions will reduce the yield strength at elevated temperature below the Code Case expected minimum curve. (FS)

- 2328 (NEDM--14149) INVESTIGATIONS INTO THE SODIUM-STEAM SURFACE INTERACTION ON A STAGNANT POOL. Stehling, S.G.; Hunsicker, J.C. (General Electric Co., Sunnyvale, CA (USA). Breeder Reactor Dept.). Sep 1976. Contract EY-76-C-03-0893-010. 53p. AT.

Experimental investigations into the interface reaction between a steam atmosphere and stagnant sodium pool have been conducted at the General Electric San Jose Test Facility. The objectives of the tests were to create worst case accident situations and evaluate the consequences with respect to the design of LMFBR Steam Generators. The most important results of these investigations were the creation and actual photographing of a "pool fire" and the determination that the primary damage mechanism associated with it is of a corrosive nature rather than thermal weakening as previously suspected.

- 2329 (NEDM--14150) THERMAL/HYDRAULIC TEST RESULTS INCLUDING CRITICAL HEAT FLUX CONDITIONS FOR A SODIUM-HEATED STEAM GENERATOR TUBE MODEL. Wolf, S.; Holmes, D.H. (General Electric Co., Sunnyvale, CA (USA). Fast Breeder Reactor Dept.). Sep 1976. Contract EY-76-C-03-0893-010. 56p. AT.

Thermal/hydraulic tests were performed with a sodium-heated water-steam tube prototypic of a CRBRP steam generator tube section. The test section was designed and is being used for DNB Effects testing to support engineering development of the CRBRP steam generators. The experimental ranges were: pressure, 1590 to 1890 psia (11.0 to 13.0 MPa); mass flux, 0.97 to 2.39 10^6 lbm/hr-ft² (4.74 to 11.7 10^6 kg/hr-m²); critical heat flux, 0.21 to 0.44 10^6 Btu/hr-ft² (0.66 to 1.39 MW/m²); and critical quality, 0.23 to 0.40. The thermal/hydraulic results of this test are analyzed and presented in this report. Specific results include: evaluation of critical steam quality correlations, determination of the length of the transition boiling region, and preliminary evaluation of tube wall thermal conductivity.

- 2330 (NEDM--14153) TEST RESULTS, LONG-TERM ENDURANCE TEST CONDITIONS, AND SENSITIVITY PARAMETERS FOR THE DNB EFFECTS TEST. Wolf, S.; Holmes, D.H. (General Electric Co., Sunnyvale, CA (USA). Fast Breeder Reactor Dept.). 8 Jun 1976. Contract EY-76-C-03-0893. 29p. AT.

Results of an evaluation of selected thermal/hydraulic data from the DNB Effects Test and analysis leading to a definition of thermal/hydraulic conditions for the long-term

endurance test to simulate the worst CHF condition occurring in CRBRP are reported. Analysis of data is based on THAN, a GE-developed data-reduction computer code. Specific results from THAN include a CHF quality correlation and a tube wall conductivity correlation for conditions corresponding to the long-term endurance test. The final long-term endurance test conditions are based on steam generator performance evaluation with the computer codes STMSYS and STMGEN utilizing the experimentally determined correlations from THAN. Sensitivity parameters for deviations from the nominal conditions corresponding to CHF location, Z/sub c/, and temperature oscillation, $\Delta(AT)/sub c/$, are also reported.

- 2331 (NEDM--14161) PRESSURE PULSE PROPAGATION IN PIPING ANALYTICAL/EXPERIMENTAL COMPARISON. Knight, D.D. (General Electric Co., Sunnyvale, CA (USA). Fast Breeder Reactor Dept.). Dec 1976. Contract EY-76-C-03-0893-010. 65p. AT.

A comparison of analytical results to experimental data is given to illustrate the ability of the TRANSWRAP code to model the transient pressure pulse phenomena in a simple piping system including attenuation due to elbows and a tee. Elbow attenuation is produced within the TRANSWRAP code with user specified elbow loss coefficients. Parametric analyses were done to determine loss coefficients to produce results which best fit the data. The TRANSWRAP method of evaluating the effect of a tee with one-dimensional area change relationships was found to be accurate for a broad pulse (compared to pipe diameter) but inadequate for a narrow pulse.

- 2332 (NEDM--14164) EVALUATION OF STRAIN CYCLING EFFECTS IN THE DNB ZONE OF THE CRBR EVAPORATORS. Magee, P.M.; Casey, D.F.; Chus, C.L.; Dillman, C.W.; Roberts, J.M.; Wolf, S. (General Electric Co., Sunnyvale, CA (USA). Breeder Reactor Dept.). Dec 1976. Contract EY-76-C-03-0893-010. 156p. AT.

Departure from nucleate boiling (DNB) occurs in the water-steam tubes of the CRBR evaporators. The flow preceding the DNB (or dryout) point is dispersed annular flow characterized by a film of liquid water adjacent to the tube wall. Heat transfer is by nucleate boiling. As the liquid film evaporates, it decreases in thickness and, at DNB, the film finally breaks up into rivulets and dry spots. After the rivulets have evaporated the wall is covered by bulk vapor with entrained droplets, and heat transfer is by film boiling with a heat transfer coefficient considerably lower than for the wet region immediately preceding dryout. Axial oscillation and/or movement of the DNB point cause oscillations between wet-wall heat transfer coefficients, which in turn produce oscillations in the tube wall temperatures and thermally induced stresses which can significantly reduce tube life and, in the limit, lead to fatigue of the tube wall. In March 1976, a task force was established to evaluate the DNB design basis for the CRBR steam generator system (system 53). The basic objectives of the task force investigation were as follows: (1) Determine if a DNB thermal cycling problem actually exists in the CRBR evaporator and, if so, its magnitude; (2) determine if the current design approach (recirculation ratio constant at full power value) is feasible and provides 30 years DNB thermal cycle fatigue life; and (3) if the current design approach is not feasible, recommend necessary design changes, giving

strong consideration to cost and schedule impact on system 53. This report summarizes the task force's technical evaluations, analyses and recommendations regarding the system 53 design.

- 2333 (NEDO--12324) PU, U REDISTRIBUTION IN (U,Pu)O₂ FUELS BY TEMPERATURE GRADIENTS. Adamson, M.G.; Aitken, E.A. (General Electric Co., San Jose, CA (USA). Nuclear Energy Div.). Aug 1972. 16p. General Electric Co., Nuclear Energy Div., San Jose, CA.

Portions of document are illegible.

A predictive model of the time-dependent evolution of radial Pu/U + Pu gradients in operating nonmolten mixed oxide fuels is being developed. This model is based on preferential evaporation-condensation and vapor transport of metal-bearing species either along cracks and porosity channels within the fuel or inside closed pores migrating up the temperature gradient; equilibrium thermodynamics are applied to calculate the continually changing vapor composition over the hot fuel. Predictions of the model are used in combination with recent in-pile experimental data (from nonmolten mixed oxide fuel pins irradiated in EBR-II from 0.2 to about 11 at. % burnup at varying powers) to delineate the key parameters in radial actinide redistribution. A correlation between fuel stoichiometry (O-to-Pu ratio) and the degree of redistribution (described by an enrichment factor $\gamma_{\text{sub Pu}}$) identified, however, the degree of restructuring of the fuel - as determined by the peak linear power rating, time at this power, and the initial fuel density - also has a strong influence on the final value of $\gamma_{\text{sub Pu}}$. Certain kinetic features of the process and intended modifications to the present model are discussed, and evidence for axial actinide vapor transport in an irradiated annular fuel is also presented.

- 2334 (NEDO--12325) THERMODYNAMIC STUDIES OF THE SODIUM FUEL REACTION AT GENERAL ELECTRIC. Adamson, M.G.; Aitken, E.A.; Evans, S.K. (General Electric Co., Pleasanton, CA (USA). Vallecitos Nuclear Center). Aug 1972. 12p. General Electric Co., Vallecitos Nuclear Center, Pleasanton, CA.

Portions of document are illegible.

Available thermodynamic information for the equilibrium system sodium (l) + sodium-fuel compound + unreacted fuel is critically reviewed. Results are interpreted primarily in terms of the equilibrium oxygen concentration sodium (C_O) and the oxygen potential Δ anti G/sub O₂) of the remaining fuel phase. Results of series of isothermal and nonisothermal capsule tests performed at General Electric are presented and an alternative experimental approach utilizing a high temperature EMF cell is also described. Vanadium wires were used to determine C_O in the isothermal tests. Although there is significant scatter in the vanadium wire results, practically all the C_O values fall within the range 0.1 to 1 ppm (oxygen by weight) between 700 and 850°C. When expressed as oxygen potentials these data are considerably more negative than Δ anti G/sub O₂/ values obtained either from determination of the O/M ratio of the unreacted fuel phase or calculations based on the known free energy of formation of Na₂UO₄. Unusual kinetic features of the sodium-fuel reaction are suspected as a possible cause of this discrepancy, but there is also some doubt concerning the validity of the thermodynamic approximations used to describe dilute solutions of oxygen in sodium.

- 2335 (NEDO--12326) OXYGEN REDISTRIBUTION IN LMFBR FUELS. Evans, S.K.; Aitken, E.A. (General Electric Co., Pleasanton, CA (USA). Vallecitos Nuclear Center). Aug 1972. 5p. General Electric Co., Vallecitos Nuclear Center, Pleasanton, CA 94566.

The behavior of oxygen in hypostoichiometric mixed oxide fuels in a temperature gradient is discussed from experiments performed out-of-pile. Oxygen migration toward the cold end of the temperature gradient has been consistently observed. However, the degree of distribution, characterized by the heat of transport, is a function of the over all stoichiometry and the Pu content of the fuel. An empirical relation between the heat of transport and the over-all stoichiometry of typical LMFBR oxide fuels has been formulated and used to predict the O-to-M profile under a given set of irradiation conditions. Cladding oxidation imposes an additional constraint and must be properly accounted for in predicting O-to-M profiles. Other reactions involving fission products may influence the O-to-M profile under certain conditions.

- 2336 (NEDO--12668) CONSTANT EXTENSION RATE TESTING FOR LMFBR STEAM GENERATOR APPLICATIONS. Indig, M.E. (General Electric Co., San Jose, CA (USA). Nuclear Energy Div.). May 1977. Contract EY-76-C-03-0893-027. 39p. (CONF-770524--4). Dep. NTIS, MF A01.

From ASTM symposium on fatigue testing of weldments; Toronto, Canada (May 1977).

Portions of document are illegible.

A high-temperature constant extension rate facility was developed to evaluate the stress corrosion resistance of alloys considered for the construction of LMFBR steam generators. The primary concern was stress corrosion that might occur on the water side during steam generator operation in locally faulted caustic environments. Most of the studies were performed at 316°C in 5 or 10% NaOH solutions with 2-1/4 Cr-1 Mo steel and Incoloy-800. With minor modification, the constant extension rate test was converted to a straining electrode test. Experiments conducted by the straining electrode test permitted the study of stress corrosion behavior in the high-temperature caustic solutions over a range of oxidizing potentials. It was found that 2-1/4 Cr-1 Mo steel was extremely resistant to caustic cracking at 316°C in all metallurgical conditions tested by the constant extension rate test and the straining electrode test. A few constant extension rate tests were performed at 232°C in 5 and 10% NaOH. At the lower temperature 2-1/4 Cr-1 Mo failed by intergranular and transgranular stress corrosion. Unlike 2-1/4 Cr-1 Mo, Incoloy-800 was susceptible to caustic cracking at 316°C. The susceptibility depended on the metallurgical condition and to some extent, the oxidizing potential. The cold-worked and Grade 1 conditions exhibited excellent resistance to caustic cracking in the constant extension rate test. However, limited studies in the straining electrode test showed the Grade 1 condition could be readily cracked at anodic oxidizing potentials.

- 2337 (NIIAR--15(309)) NEUTRON SPECTRUM MEASUREMENT IN THE BDR-60. Nigmatullin, N.R.; Gadzhiev, G.I. (Nauchno-Issledovatel'skij Inst. Atomnykh Reaktorov, Dimitrograd (USSR)). 1977. 15p. (In Russian). Dep. NTIS (US Sales Only), PC A02/MF A01.

The results of neutron spectrum measurement at the various points of the core radius, of the side shield and of the MOP-60 reactor vertical experimental channel by the foil

activation method have been given. The used technique is based on a regularization method, developed to solve incorrect problems and permits to restore spectra within the range from 0 to 20 MeV. Maximum neutron flux at the reactor centre is 5.05×10^{13} and in the vertical experimental channel is 6.7×10^{11} neutr./($\text{cm}^2 \cdot \text{cmw}$). Spectrum experimental data for the core centre (up to R approximately 13 cm) are in a good agreement with the calculation data. Spectrum experimental data for the area change insignificantly, and the integral current density decreases approximately 1.2 time. The most divergence of the experimental and calculation data is observed on the core boundary and the side shield, where the share of neutrons with the energy less than 10 keV decreases approximately 4 times as compared to the calculation.

- 2338 (NIIAR-P--2(296)) RADIOACTIVE IMPURITIES TRAPPING BY THE BOR-60 COLD TRAP. Kizin, V.D.; Lisitsyn, E.S.; Poznyak, G.I.; Polyakov, V.I.; Chechetkin, Yu.V. (Nauchno-Issledovatel'skiy Inst. Atomnykh Reaktorov, Dimitrovgrad (USSR)). 1977. 21p. (In Russian). Dep. NTIS (US Sales Only), PC A03/MF A01.

Experimental studies were made to elucidate the accumulation of radioactivity in the standard cold trap (120 deg C) of the BOR-60 reactor. The most dangerous isotopes (possessing maximum specific radioactivity, long half-life period, gamma-quantum energy in excess of 600 keV) in the circuit of the fast reactor incorporating defective fuel elements are represented by isotopes of ^{137}Cs and ^{134}Cs . It is shown that in the cold trap the following isotopes are concentrated: ^{65}Zn , ^{134}Cs , ^{136}Cs , ^{137}Cs , ^{131}I , ^{60}Co , ^{124}Sb , and ^{22}Na . It should be noted that sodium in the trap is almost completely cleaned of iodine and tellurium, while the radioactivity of cesium, antimony and cobalt isotopes in the trap constitutes 20 - 30% of their content in the first circuit. It is established that the ability of the trap to catch cesium is not directly associated with its mutual precipitation with the oxides, sorption on the oxides or filtration. A conclusion is made that the cold traps do not represent an effective means of reducing the radioactivity level of the sodium coolant.

- 2339 (NIIAR-P--4(270)) TWO-DIMENSIONAL MODEL OF A LARGE POWER SODIUM-COOLED FAST BREEDER REACTOR WITH AN OXIDE FUEL FOR TEST CALCULATIONS. Zizin, M.N.; Kudryashov, L.N.; Nikolaev, M.N. (Nauchno-Issledovatel'skiy Inst. Atomnykh Reaktorov, Dimitrovgrad (USSR)). 1976. 33p. (In Russian). Dep. NTIS (US Sales Only), PC A03/MF A01.

The suggested two-dimensional model of a fast breeding reactor is intended for performing comparative test calculations aimed at the comparison between the reactor characteristics calculated with the aid of the programmes and the constants employed in various research centres. The model corresponds to the reactor of the nuclear power plant with an electric power of 1500 MW. The technique of employing the model for testing is presented. The system of 6-group constants is proposed and the method of dividing the reactor volume by means of the end-difference grid for the basic calculations is shown. The initial data for the basic calculations has been the system of 26-group constants with regard to the changes in the group cross-sections of the main fissionable isotopes.

- 2340 (NIIAR-P--4(338)) REACTIVITY EFFECTS

ANALYSIS AS A MEANS OF FAST REACTOR DIAGNOSTICS. Afanas'ev, V.A.; Gryazev, V.M.; Efimov, V.N.; Krasnoyarsk, N.V.; Skulkin, N.N. (Nauchno-Issledovatel'skiy Inst. Atomnykh Reaktorov, Dimitrovgrad (USSR)). 1978. 24p. (In Russian). Dep. NTIS (US Sales Only), PC A03/MF A01.

The components of the temperature and power reactivity coefficients of the BOR-60 reactor have been experimentally and theoretically investigated. The dependence of the coefficients on the reactor power, fuel burnup, coolant flow rate and inlet temperature have been measured. In measuring the coefficients by a dynamic method the time constants of some reactor constituents have been determined. A satisfactory agreement has been observed between theory and practice. The temperature coefficient has proved weakly dependent on the reactor parameters and time. The power coefficient has a complicated dependence on the parameters and decreases with time. The developed technique of calculating the reactivity balance alongside the analysis of the reactivity components provides for early diagnostics of the reactor.

- 2341 (NIIAR-P--5(271)) STUDY OF BOR-60 REACTOR FUEL ELEMENT PERFORMANCE. Tsykanov, V.A.; Davydov, E.F.; Gryazev, V.M. (Nauchno-Issledovatel'skiy Inst. Atomnykh Reaktorov, Dimitrovgrad (USSR)). 1976. 20p. (In Russian). Dep. NTIS (US Sales Only), PC A03/MF A01.

Described are the test conditions and the results of the material researches of a series of the fuel element packets irradiated in the BOR-60 reactor up to burning-out of 6 to 11% of heavy atoms. Considered are the states of the jackets made of the OKh16N15M3B and 1Kh18N10T steels and fuel in the form of sintered uranium dioxide sleeves, effect of the irradiation parameters on the mechanical properties of the jacket, variation of the fuel element diameter and jacket density, accidents involving the breakdown of the fuel element jackets. It is shown that variation of the jacket diameter is due mainly to steel swelling. After irradiation up to burning-out of 8 - 11% of heavy atoms, the plasticity of the jackets has decreased by several tenth fractions of percent. It has been revealed that corrosion interaction of the fuel and jacket extends to the depth of up to 70 μm . It is concluded that the sealed fuel elements remain serviceable up to burning-out of 10 - 11% of heavy atoms.

- 2342 (NIIAR-P--5(299)) RADIOACTIVITY OF LONG-LIVED NUCLIDES IN THE BOR-60 PRIMARY CIRCUIT DURING OPERATION WITH SOME DEFECTIVE FUEL ELEMENTS. Gryazev, V.M.; Kizin, V.D.; Lisitsyn, E.S.; Polyakov, V.I.; Chechetkin, Yu.V. (Nauchno-Issledovatel'skiy Inst. Atomnykh Reaktorov, Dimitrovgrad (USSR)). 1977. 17p. (In Russian). Dep. NTIS (US Sales Only), PC A02/MF A01.

Presented are the generalized results of measurement of the accumulation and distribution of the corrosion radioactive nuclides and fission products, which have been gained during four years of service of the BOR-60 reactor, including long-time operation of the defective fuel elements in the active zone. It is shown that when the quantity of the defective fuel elements amounts to about 1%, the radioactive situation becomes worse mainly owing to the escape of cesium radioisotopes and their accumulation in the coolant. As to other fission products, the maximum contribution to the dose rate of the pipelines and equipment is made by ^{140}Ba , ^{140}La and ^{95}Nb . When the quantity of the defective fuel elements equals

0.1-0.2%, this contribution is identical to the contribution made by the corrosion products of ^{60}Co and ^{54}Mn . The radioactivity of the corrosion products in the circuit has not increased within the last three years and has been by one order of magnitude below the calculated value. The corrosion and fission products are non-uniformly distributed in the circuit. The concentration of ^{95}Nb and ^{60}Co in "cold" sodium pipeline was by 2-5 times more, and concentration of ^{140}Ba and ^{54}Mn was by 10-20 times more, than in "hot" sodium pipelines. It has been established that cobalt is deposited basically in the heat exchanger. The efficiency of coolant drain from the pipeline is estimated with a view to reducing the dose rate.

- 2343 (NIIAR-P--17(283)) DECLADDING OF BOR-60 AND BR-5 FUEL ELEMENTS BY CLAD MELTING. Barkov, V.A.; Bibikov, S.E.; Vasil'ev, G.I.; Ivanov, P.M.; Novoselov, G.P.; Pakhomov, V.V.; Serov, A.V.; Skiba, O.V. (Nauchno-Issledovatel'skij Inst. Atomnykh Reaktorov, Dimitrovgrad (USSR)). 1976. 16p. (In Russian). Dep. NTIS (US Sales Only), PC A02/MF A01.

Experiments have been carried out on thermal decladding of irradiated oxide fuel elements of BOR-60 reactors (maximum burning 11%, exposure 6 and 3 months) and BR reactors (burning up to 5%, exposure 13 years). Uranium yield during decladding has been 99.9%, that of plutonium - 98.8%, steel concentration in the opened fuel - 5% and less. The physical condition of the fuel after the fuel element casing has been removed does not show any variations. The oxide fuel is shown to give up to 80% cesium, and partially iodine on heating up to 1870°K, while other splinter elements evolve in insignificant amounts.

- 2344 (NIIAR-P--18(284)) EXPERIMENTAL REPROCESSING OF IRRADIATED URANIUM FUEL FROM BOR-60 REACTOR BY FLUORIDE VOLATILITY METHOD. Kikoin, I.K.; Tsykanov, V.A.; Dem'yanovich, M.A. (Nauchno-Issledovatel'skij Inst. Atomnykh Reaktorov, Dimitrovgrad (USSR)). 1976. 13p. (In Russian). Dep. NTIS (US Sales Only), PC A02/MF A01.

The results are described of experiments on fluoride regeneration of irradiated assemblies of the BOR-60 reactor with uranium dioxide, with an average burn-up about 10% and a hold-up time of 3 and 6 months prior to reprocessing. In the course of the experiments, about 4300 g of fuel of the "hot" portion of the assemblies has been regenerated with a 90% initial enrichment with respect to uranium-235, and 4738 g purified uranium hexafluoride obtained, which has been reprocessed into a crystalline dioxide. Using the regenerated fuel and applying the vibrocompaction method, fuel rods have been prepared for re-use in the reactor. The distribution of fission products and the total radioactivity all over the experimental process chain equipment and the regeneration products has been investigated. Data on the yield and purification of uranium, the amount and activity of the process waste are presented.

- 2345 (NIIAR-P--18(312)) DETERMINATION OF BOR-60 REACTOR DYNAMIC CHARACTERISTICS USING DATA FROM STATISTIC EXPERIMENTS. Adamovskii, L.A.; Kebabze, B.V. (Nauchno-Issledovatel'skij Inst. Atomnykh Reaktorov, Dimitrovgrad (USSR)). 1977. 18p. (In Russian). Dep. NTIS (US Sales Only), PC A02/MF A01.

Considered are the problems associated with

performance of a passive statistical experiment during investigation of the dynamic characteristics of an object. The procedure and equipment of the experiments conducted on the BOR-60 reactor are described. Presented is the procedure for calculating the pulse characteristic by reference to the experimental estimation of the correlation functions with the use of the regularization method. The efficiency of various types of regulators is described, and practical recommendations are given. Described are the results of measurements of the consumption - neutron flux in channels and those of the consumption - coolant temperature at the outlet of the reactor core, which have been obtained with the use of the standard transducers of the BOR-60 reactor measurement system. Analyzed is the effect of the non-correlated disturbance in the registered signal noise on the accuracy of measurements. Discussed are the problems of increasing the statistical accuracy of measurements and improving the procedure for recording and processing of the noises.

- 2346 (NIIAR-P--24(358)) SODIUM BOILING EXPERIMENTS AT THE BOR-60 REACTOR. Afanas'ev, V.A.; Aleksandrov, K.A.; Kebabze, B.V. (Nauchno-Issledovatel'skij Inst. Atomnykh Reaktorov, Dimitrovgrad (USSR)). 1978. 11p. (In Russian). Dep. NTIS (US Sales Only), PC A02/MF A01.

Experimental results on the diagnostics of sodium boiling in the BOR-60 reactor core are presented. Detailed information is given on the boiling fuel assembly and the experimental set-up. Sodium boiling in the assembly was achieved by gamma-heating of tungsten rods. The feasibility of boiling detection by acoustic emission and neutron noise is shown. Some results of spectral and correlation analyses are provided. The need for special signal shaping is stressed to improve the detection reliability.

- 2347 (NIIAR-P--27(321)) COMPUTERIZED SUBSYSTEM FOR CONDUCTING INVESTIGATIONS AT THE BOR-60 REACTOR. Efimov, V.N.; Kachalin, V.A.; Sviridov, Yu.F.; Skulkin, N.N.; Ul'yanov, V.N.; Fedorov, Yu.D. (Nauchno-Issledovatel'skij Inst. Atomnykh Reaktorov, Dimitrovgrad (USSR)). 1977. 14p. (In Russian). Dep. NTIS (US Sales Only), PC A02/MF A01.

Some problems in developing an on-line system for automating technological measurements and experimental data acquisition at the BOR-60 reactor are discussed. Main features of the information flow at the reactor are considered. A computerized subsystem is described which consists of the KIPARIS-2 measuring and transmitting apparatus coupled with the BESM-3M or BESM-4M multi-user computer. Major characteristics of the subsystem are given. The subsystem has been in operation at the BOR-60 reactor for more than a year and proved a high degree of efficiency and reliability.

- 2348 (NIIAR-P--240) EFFICIENCY OF DIFFERENT TECHNIQUES OF PHYSICAL FLATTENING BY FUEL WHILE SELECTION OF OPTIMUM ARRANGEMENT OF LARGE FAST REACTOR CORE. Grachev, E.A.; Deinega, N.L.; Mitin, A.M. (Nauchno-Issledovatel'skij Inst. Atomnykh Reaktorov, Dimitrovgrad (USSR)). 1974. 19p. (In Russian). Dep. NTIS (US Sales Only), PC A02/MF A01.

Results are given of calculations for selecting the parameters of the large fast breeder reactor core (1500 Mw) operating on oxide fuel with a sodium coolant. A complex optimum criterion was selected for energy

intensity, energy distribution, breeding ratio and critical load factor, run duration, burning, reactivity variations, influence of CV3, fuel overloads, and calculated fuel expenses. The effectivities of various methods for physical grading of fuel (enrichment and composition) were examined in accordance with the optimum criterion. Parameters of reactor cores optimum arrangements are presented. Continuous reactor operation during 0.8-1.0 yr. at energy intensity more than 400 kW was shown to be essential for attaining the optimum chosen.

- 2349 (NIIR-P--255) PROGRAM FOR CALCULATION OF A NONSTATIONARY TEMPERATURE FIELD FOR A CYLINDRICAL FUEL ELEMENT. Antipin, G.K. (Nauchno-Issledovatel'skij Inst. Atomnykh Reaktorov, Dimitrovgrad (USSR)). 1975. 21p. (In Russian). Dep. NTIS (US Sales Only), PC A01/MF A01.

A programme is described for calculation of nonstationary field of a trilaminar cylindrical fuel element sprinkled by a non-compressible coolant. The field is described by the three differential energy equations, namely for fuel, shell and coolant. The external layer of the fuel element is a shell, the intermediate-contact sublayer and internal layer are fuel. A system of differential equations in partial derivatives is solved through a method of finite differences with assumption adopted for fast reactors. The algorithm is represented by ALGOL-60 programme serving for calculation of the nonstationary temperature field through a pre-set time pitch. The programme and its block diagram are presented. The programme is well-adjusted and under tentative operation. It is used, in particular, for calculation of nonstationary processes in the core of fast reactors with a sodium coolant.

- 2350 (NIEFA-A--0340) ELECTROMAGNETIC PUMPS FOR FAST REACTORS PRIMARY COOLING CIRCUITS. Andreev, A.M.; Bezgachev, E.A.; Karasev, B.G.; Kirillov, I.R.; Ogorodnikov, A.P.; Semikov, G.T. (Nauchno-Issledovatel'skij Inst. Elektrofizicheskoy Apparatury, Leningrad (USSR)). 1977. 24p. (In Russian). Dep. NTIS (US Sales Only), PC A03/MF A01.

The review of the electromagnetic pump development for the main loops of the powerful atomic energy stations with fast neutron reactors is presented. The calculation results of the cylindrical pump at the pressure of 9×10^5 Pa and Na consumption of $15500 \text{ m}^3/\text{h}$ are given. Its design is described, the comparison of three pump versions, differing by the coil cooling method: water, Na-K, nitrogen is considered. The design and insulating material choosing, cavitation aspects and pump electric power at emergency heating conditions are discussed.

- 2351 (NIEFA-A--0345) EXPERIMENTAL STUDY RESULTS OF THE TSLIN-5/700 CYLINDRICAL LINEAR INDUCTION PUMP. Andreev, A.M.; Karasev, B.G.; Kirillov, I.R.; Ogorodnikov, A.P.; Ostapenko, V.P.; Semikov, G.T. (Nauchno-Issledovatel'skij Inst. Elektrofizicheskoy Apparatury, Leningrad (USSR)). 1977. 22p. (In Russian). Dep. NTIS (US Sales Only), PC A03/MF A01.

The results of an experimental investigation of a cylindrical induction pump TSLIN-5/700 with the following operating characteristics are presented: pressure 5×10^5 Pa, current intensity 770 A, flow rate $700 \text{ m}^3/\text{hr}$, power output 209 kW, efficiency 45%. The investigation has been carried out on a liquid-metal stand at a sodium temperature of 350 deg

C. The operating and start-up characteristics of the pump different voltages are obtained. The thermal regime of the winding and the pump operation on parallel branches are investigated. The operability of the pump design, in which the thermal contact between the channel wall and the magnetic guide is ensured by the difference in the coefficients of linear expansion of the channel and the magnetic guide with the clamping rings have been confirmed. The pump operates steadily without any signs of cavitations at a low gauge pressure (up to 0.05×10^5 Pa) at a channel speed of 13 m/s. On the whole, the investigations confirm the possibility of constructing high-productivity and high-efficiency electromagnetic pumps capable of satisfying the operating requirements in the main loops of nuclear reactors.

- 2352 (NOR--3686) REVIEW OF THE UK FAS REACTOR PROGRAM: MARCH 1978. Smith, R.D. (UKAEA Risley Nuclear Power Development Establishment). Mar 1978. 47p. Dep. NTIS (US Sales Only), PC A03/MF A01.

The UK fast reactor program is briefly reviewed under the following section headings: (1) engineering development, (2) materials development, (3) chemical engineering/sodium technology, (4) fast reactor fuel, (5) fuel cycle, (6) safety, and (7) performance studies.

- 2353 (NP--21709) SOME TOPICS OF SODIUM TECHNOLOGY RESEARCH AND DEVELOPMENT IN P.N.C., JAPAN. Ishibashi, E. (Power Reactor and Nuclear Fuel Development Corp., Oarai, Ibaraki (Japan). Oarai Engineering Center). [nd]. 26p. Dep. NTIS (US Sales Only), PC A03/MF A01.

LMFBR TYPE REACTORS; REACTOR TECHNOLOGY; SODIUM; JOYO REACTOR; MONJU REACTOR; RESEARCH PROGRAMS

- 2354 (NP--22742) PRESSURE PULSE PROPAGATION IN PIPING SYSTEMS. FINAL REPORT. Cagliostro, D.J.; Wiersma, S.J.; Florence, A.L. (Stanford Research Inst., Menlo Park, CA (USA)). Jun 1975. 123p. Stanford Research Inst., Menlo Park, CA.

Experiments were conducted in which well-characterized pulses were generated in water-filled stainless steel piping systems consisting of a straight section of pipe, an open rectangular loop, and a closed rectangular loop. In some of the experiments, the closed loop was fitted with a standoff pipe that was filled with either water or air. The pulse shapes were typical of those expected in the secondary piping system as a result of a sodium-water reaction in a Liquid Metal Fast Breeder Reactor. The pipe thickness and diameter and the elbow radius are those typical of the Clinch River Fast Breeder Reactor reduced to 1/8-scale. Elastic piping response was stimulated (no plastic deformations). Pulse propagation behavior was monitored by pressure transducers installed in the piping wall at key locations. The overall results show that pulse propagation behavior exhibits (1) reduction of peak pressure and impulse after traversing an elbow, (2) reduction of peak pressure, but not of impulse, after passing a filled standoff pipe, (3) annihilation when meeting an empty standoff pipe, and (4) simple pressure addition when meeting a similar pulse.

- 2355 (NRPB-R--73) INFLUENCE OF THE PHYSICO-CHEMICAL FORM OF THE AEROSOL ON THE RADIOLOGICAL CONSEQUENCES OF NOTIONAL ACCIDENTAL RELEASES OF RADIOACTIVITY FROM A

FAST BREEDER REACTOR. Kelly, G.N.; Jones, J.A.; Simmonds, J.R. (National Radiological Protection Board, Harwell (UK)). Jan 1979. 147p. Dep. NTIS (US Sales Only), PC A08/MF A01.

The radiological consequences of a wide range of notional accidental releases from a 1300 MW(e) LMFBR (Liquid Metal-cooled Fast Breeder Reactor) were assessed in a study published by the National Radiological Protection Board (NRPB) in 1977. In that study representative values were in general adopted for each of the important parameters while recognising that in reality they could vary considerably. The present study is concerned with the sensitivity of the predicted consequences to the physico-chemical form of the released aerosol. Of particular interest is the importance of a mixed sodium-transuranium element aerosol which may be formed in accidental releases of activity from sodium cooled FBRs. Two significant findings emerge from the study. First the predicted consequences in general are relatively insensitive to the range of physico-chemical forms analysed. For generic assessments therefore it is sufficient to assume the properties of the aerosol adopted in the initial study (1 μ m AMAD and each element in the oxide form); the exception concerns the estimation of the incidence of early morbidity, and to a lesser extent early mortality, but only for a limited range of release composition. The second finding is that the radiological consequences are not, contrary to what might have been expected, significantly increased for the release of a mixed sodium-element aerosol.

2356 (NTIS/PS--79/0208) **CORROSION OF STAINLESS STEEL. VOLUME 2. 1977-MARCH, 1979 (A BIBLIOGRAPHY WITH ABSTRACTS). REPORT FOR 1977 MARCH 1979.** Reed, W.E. (National Technical Information Service, Springfield, VA (USA)). Mar 1979. 135p. NTIS PC N01/MF N01.

Federally-funded research on stainless steel composition, mechanical properties, structure, and testing in relation to corrosion is cited. The majority of research concerns nuclear reactor materials. In addition, corrosion studies in coal gasification plants, rocket propellant tanks, underwater cables, batteries, and geothermal systems are included. (This updated bibliography contains 129 abstracts, 55 of which are new entries to the previous edition.)

2357 (NUREG--0262) **STUDY OF DRYOUT HEAT FLUXES IN BEDS OF INDUCTIVELY HEATED PARTICLES.** Dhir, V.K.; Catton, I. (California Univ., Los Angeles (USA). School of Engineering and Applied Science). Feb 1977. 92p. NTIS \$5.00.

Experimental observations of the dryout heat fluxes for inductively heated particulate beds have been made. The data were obtained when steel and lead particles in the size distribution 295-787 microns were placed in a 4.7 cm diameter pyrex glass jar and inductively heated by passing radio frequency current through a 13.3 cm diameter multi-turn work coil encircling the jar. Distilled water, methanol and acetone were used as coolants in the experiments, while the bed height was varied from 1.0 to 8.9 cm. Different mechanisms for the dryout in deep and shallow beds have been identified. Dryout in shallow beds is believed to occur when the vapor velocity in the gas jets exceeds a certain critical velocity at which choking of the vapor occurs, leading to obstruction in the flow of the liquid toward the bed. However, deep beds dry out when

gravitational force can no longer maintain a downward coolant flow rate necessary to dissipate the heat generated in the bed. The heat flux data of the investigation and that from two previous investigations made at Argonne Laboratory and at UCLA have been correlated with semi-theoretical correlations based on the proposed hydrodynamic models. The deep and shallow bed correlations are used to predict the bed height at which transition from deep to shallow bed would occur. An application of the study has been made to determine the maximum coolable depths of the core debris as a function of the particle size, bed porosity and decay heat.

2358 (NUREG--0286) **STUDY OF THE REACTIVITY EFFECT OF BUBBLE COLLAPSE IN MOLTEN LIQUID METAL COOLED REACTORS.** Munno, F.J.; Sheaks, D.J. (Maryland Univ., College Park (USA). Dept. of Chemical and Nuclear Engineering). Aug 1977. 60p. NTIS \$4.50.

The reactivity effect of void collapse on a Core Disruptive Accident in a sodium free fast reactor core was studied. A two-dimensional transport theory computer code was employed to obtain a reactivity model which incorporated random distributions of voids in spatial location and bubble size. This model was implemented into VENUS-II and several excursions were investigated for the purpose of assessing the effect of bubble collapse reactivity on excursion energy. In addition, comparisons were made between the VENUS-II results obtained using the transport reactivity model and those obtained using a reactivity model developed from the Behrens' formulation of the leakage effects due to the presence of bubbles. The results indicate that excursion energy is sensitive to the shape of the reactivity versus void fraction function and that reactivity models based strictly on leakage effects are probably conservative compared to models which include both self-multiplication and leakage.

2359 (NUREG--0330(Vol.3)(No.1)) **STATUS SUMMARY REPORT ADVANCED REACTOR SAFETY RESEARCH. BUFF BOOK 2. (Nuclear Regulatory Commission, Washington, DC (USA). Office of Nuclear Regulatory Research).** 27 Feb 1979. 85p. Nuclear Regulatory Commission, Washington, DC.

Information for monitoring and controlling the progress of safety research projects associated with the breeder reactor program is presented. Data is utilized pertaining to project schedules, cost, and status which have been integrated into a network-based management information system. As part of this system's initial development, information has been collected and analyzed from the Argonne National Laboratory, Brookhaven National Laboratory, Battelle Columbus Laboratories, Sandia Laboratories, several universities, and the RES staff. Cost information has been coordinated with the Controller's Office.

2360 (NUREG--0344) **CONDENSATION OF FUEL ONTO THE ABOVE-CORE STRUCTURE DURING AN LMFBR CORE-DISRUPTIVE ACCIDENT.** Erdman, C.A.; Reynolds, A.B. (Virginia Univ., Charlottesville (USA)). Aug 1977. 153p. NTIS \$8.00.

Condensation of a pure, saturated vapor onto a vertical, melting substrate is analyzed for both one- and two-material situations. Examination of the one-material situation indicates that the solution to the full transient condensation-induced melting problem may be approximated by using a transient,

conduction-only model for short times and a steady-state, flowing-film model for long times. This concept is extrapolated to the two-material situation in order to obtain a simulation of the transient solution. The models are applied to the specific case of uranium dioxide condensing onto solid stainless steel. Condensate solidification occurs for this pair of materials; however, this solidification may be neglected without introducing a serious error in the other phase-change rates. The condensation heat flux for this pair of materials is a very weak function of the initial substrate temperature and the vapor temperature. The results of this analysis have applications in the area of LMFBR accident analysis.

- 2361 (NUREG--0358) SAFETY EVALUATION REPORT. FAST FLUX TEST FACILITY. PROJECT NO. 448. (Nuclear Regulatory Commission; Washington, DC (USA). Office of Nuclear Reactor Regulation). 1 Aug 1978. 399p. NTIS \$13.25.

Information on the safety of the FFTF Reactor is presented under the following chapter headings: site characteristics; design of structures, components, equipment, and systems; reactor; reactor coolant system and connected systems; engineered safety features; electric power; auxiliary systems; radioactive waste management systems; radiation protection; conduct of operations; initial test programs; accident analysis; and quality assurance.

- 2362 (NUREG--0358(Suppl.1)) SAFETY EVALUATION REPORT RELATED TO OPERATION OF FAST FLUX TEST FACILITY. SUPPLEMENT NO. 1. (Nuclear Regulatory Commission, Washington, DC (USA). Office of Nuclear Reactor Regulation). May 1979. 160p. NTIS, PC A08/MF A01.

This supplement provides (1) the staff's evaluation of additional information received since issuance of the Safety Evaluation Report regarding previously identified uncompleted review items, (2) a discussion of comments made by the ACRS in its report of November 8, 1978, and (3) the staff's evaluation of additional or revised information related to new or old issues that have arisen since the issuance of the Safety Evaluation Report.

- 2363 (NUREG--0387) CORROSION CRITIQUE OF THE 2 1/4 CR-1 MO STEEL FOR LMFBR STEAM GENERATION SYSTEM APPLICATIONS. Zima, G.E. (Battelle Pacific Northwest Labs., Richland, WA (USA)). Jul 1977. Contract EY-76-C-06-1830. 79p. NTIS, MF A01.

Portions of document are illegible.

The unstabilized ferritic steel of nominal composition, 2 1/4Cr-1Mo, has been proposed for critical structural assignments in LMFBR powerplants, specifically: the tubing, tubesheet and shell of the evaporator and superheater components. The interest in this steel has been based on a presumably favorable general corrosion property spectrum, acceptable mechanical properties and fabricability, and certain economies associated with the low alloy content. This report is an attempt at a general corrosion assessment for the 2 1/4Cr-1Mo steel and an identification of corrosion problem areas potential to this steel from the sodium and water/steam systems of the proposed working environment. There is a considerable area of uncertainty in the sodium-side response of 2 1/4Cr-1Mo steel, centered in the loss and redistribution of carbon during long-term exposure to sodium of various impurity backgrounds. It is submitted that present evidence relating to the water/steam-side

corrosion behavior of the 2 1/4Cr-1Mo steel, under nominal and conceivable perturbed environmental conditions, constitutes the principal concern for the proposed LMFBR powerplant applications of this steel. It is suggested that this unfavorable corrosion aspect represents an inherent limitation of the low alloy content of this steel, probably largely independent of melting and processing recourses, and it is a sufficient basis to question the incentive for a continuation of the collateral studies of this steel for the proposed LMFBR steam generation system assignments.

- 2364 (NUREG--0391) PRIMARY AEROSOL PARTICLE-SIZE DISTRIBUTION FROM HOMOGENEOUS NUCLEATION CONDENSATION AND PARTICLE GROWTH. Kennedy, M.F.; Erdman, C.A.; Reynolds, A.B.; Walter, A.E. (Virginia Univ., Charlottesville (USA). Dept. of Nuclear Engineering and Engineering Physics). Nov 1977. 95p. (UVA--529106/NEEP-77/102). NTIS \$6.00.

The process of forming aerosols by homogeneous nucleation condensation followed by condensation growth was studied as a potential source of submicrometre aerosols in LMFBR accidents. A model was developed for calculating particle size distributions following nucleation and growth. This model was applied to experiments at ORNL where UD₂ fuel pellets were partially vaporized in an argon atmosphere and the resulting primary particle size distribution was measured. The low range of particle sizes observed in the ORNL tests could be reproduced by the model by assuming large mixing rates between the fuel vapor and the argon, thus indicating that homogeneous nucleation condensation was likely the source of the small particles observed.

- 2365 (NUREG--0457(Rev.0)) QUALIFICATION TESTING PROGRAM PLAN FOR SIMMER. A COMPUTER CODE FOR LMFBR DISRUPTED CORE ANALYSIS. Basdekas, D.L.; Silberberg, M.; Curtis, R.T.; Kelber, C.N. (Nuclear Regulatory Commission, Washington, DC (USA). Div. of Reactor Safety Research). Jul 1978. 48p. NTIS \$5.25.

The objective of SIMMER qualification testing program is to assure that the mathematical models and input parameters are derived from experimental data, which, on the basis of criteria still to be established, are representative of the phenomena and processes governing the progression of a CDA in an LMFBR. At the present time, the work to meet this objective can be classified into three general task areas as they relate to the use of SIMMER in CDA analysis: (1) The whole-core energetic disassembly accident, or the 'vessel problem': The objective here is to predict the partition of the total energy release, by a postulated severe power excursion, between the primary containment and the energy absorbed through nondestructive dissipative processes. (2) Single subassembly accident: The objective here is to determine the pertinent phenomena and to develop the capability to assess the significance and likelihood that such accidents might propagate to involvement of larger fraction of the core. (3) The whole-core transition phase accident: The objective here is to advance the understanding of the phenomena and processes involved, so that reliable predictions can be made of the possible consequences of a CDA and the potential for further nuclear excursions through recriticality.

- 2366 (NUREG--0657) REVIEW AND EVALUATION OF THE NUCLEAR REGULATORY COMMISSION SAFETY

RESEARCH PROGRAM FOR FISCAL YEAR 1981: REPORT TO THE CONGRESS OF THE UNITED STATES OF AMERICA. (Nuclear Regulatory Commission, Washington, DC (USA). Advisory Committee on Reactor Safeguards). Feb 1980. 53p. NTIS.

Information is presented concerning implications of the Three Mile Island accident and new directions in research: systems engineering; LOFT; code development; fuel behavior; primary system integrity; seismic, engineering, and site safety; advanced reactors; reactor environmental effects; fuel cycle; waste management; safeguards; risk assessment; and improved reactor safety.

- 2367 (NUREG/CP--0004(Vol.1), pp 85-99) ZERO-POWER BASIS OF FAST REACTOR DOSIMETRY. Sanders, J.E. (Atomic Energy Establishment, Winfrith, Eng.). 1977.

From 2. ASTM-EURATOM symposium on reactor dosimetry: dosimetry methods for fuels, cladding and structural materials; Palo Alto, CA, USA (2 Oct 1977).

Predictions of reaction rates, atomic displacements, and gamma-ray energy deposition in the Prototype Fast Reactor are based on cross-section data and calculation methods validated against the results of zero-power experiments. The paper reviews work in Zebra relevant to this dosimetry, including neutron spectrometry, power mapping, foil activations within core heterogeneities, and measurements with thermoluminescent detectors. Comparisons of experiment and calculation are discussed in relation to the accuracies required to meet materials testing objectives.

- 2368 (NUREG/CP--0004(Vol.3), pp 1141-1175) STATUS REPORT ON DOSIMETRY BENCHMARK NEUTRON FIELD DEVELOPMENT, CHARACTERIZATION, AND APPLICATION. Fabry, A. (SCK/CEN, Mol, Belgium); Grundl, J.A.; McElroy, W.N.; Lippincott, E.P.; Farrar, H. IV. 1977.

From 2. ASTM-EURATOM symposium on reactor dosimetry: dosimetry methods for fuels, cladding and structural materials; Palo Alto, CA, USA (2 Oct 1977).

The report attempts to present a brief, but comprehensive review of the status and future directions of benchmark neutron field development, characterization and application in perspective with two major objectives of reactor dosimetry: (1) fuel fission rate and burn-up passive monitoring, and (2) correlation of materials irradiation damage effects and projection to commercial power plants. The report focuses on the Light Water Reactor and Fast Breeder Reactor program needs.

- 2369 (NUREG/CP--0004(Vol.3), pp 1267-1278) FAST REACTOR FISSION YIELD MEASUREMENT PROGRAM AT THE IDAHO NATIONAL ENGINEERING LABORATORY. Maeck, W.J.; Emel, W.A.; Delmore, J.E. (Allied Chemical Corp., Idaho Falls, ID). 1977.

From 2. ASTM-EURATOM symposium on reactor dosimetry: dosimetry methods for fuels, cladding and structural materials; Palo Alto, CA, USA (2 Oct 1977).

The INEL fission yield measurement program and the current status of the results are reviewed. Fast reactor fission yields for ^{233}U , ^{235}U , ^{238}U , ^{239}Pu , ^{241}Pu , and ^{237}Np obtained for samples irradiated in Row-8 of EBR-II have been reported. The neutron spectrum associated with the reported yields has been reported. Measurement of fast reactor fission yields for ^{240}Pu , ^{242}Pu , and ^{241}Am is in progress. To supplement these data, and to provide additional correlation points relative to the effect of neutron energy on fission yields, a

series of samples previously irradiated in the axial blanket and Row-2 to 4 of EBR-II has been obtained for analysis. Future efforts relative to recommending and proof-testing methods for the analysis of burnup for FBR fuels are discussed.

- 2370 (NUREG/CP--0004(Vol.3), pp 1279-1287) STUDIES RELATIVE TO THE CORRELATION OF FISSION YIELDS WITH NEUTRON ENERGY. Maeck, W.J. (Allied Chemical Corp., Idaho Falls, ID). 1977.

From 2. ASTM-EURATOM symposium on reactor dosimetry: dosimetry methods for fuels, cladding and structural materials; Palo Alto, CA, USA (2 Oct 1977).

The status of fission yield data is briefly reviewed. Problems associated with the evaluation and compilation of fast reactor fission yields are discussed. A new approach for evaluating the change in fission yields with neutron energy is presented. Based on a comparison of relative isotopic abundances rather than absolute yield data, changes of only a few percent in the isotopic abundances of the neodymium isotopes as a function of neutron energy are easily detected.

- 2371 (NUREG/CP--0004(Vol.3), pp 1289-1306) REFERENCE AND STANDARD BENCHMARK FIELD CONSENSUS FISSION YIELDS FOR U.S. REACTOR DOSIMETRY PROGRAMS. Gilliam, D.M. (National Bureau of Standards, Washington, DC); Helmer, R.G.; Greenwood, R.C.; Rogers, J.W.; Heinrich, R.R.; Popek, R.J.; Kellogg, L.S.; Lippincott, E.P.; Hansen, G.E.; Zimmer, W.H. 1977.

From 2. ASTM-EURATOM symposium on reactor dosimetry: dosimetry methods for fuels, cladding and structural materials; Palo Alto, CA, USA (2 Oct 1977).

Measured fission product yields are reported for three benchmark neutron fields--the BIG-10 fast critical assembly at Los Alamos, the CFRMF fast neutron cavity at INEL, and the thermal column of the NBS Research Reactor. These measurements were carried out by participants in the Interlaboratory LMFBR Reaction Rates (ILRR) program. Fission product generation rates were determined by post-irradiation analysis of gamma-ray emission from fission activation foils. The gamma counting was performed by Ge(Li) spectrometry at INEL, ANL, and HEDL; the sample sent to INEL was also analyzed by NaI(Tl) spectrometry for Ba-140 content. The fission rates were determined by means of the NBS Double Fission Ionization Chamber using thin deposits of each of the fissionable isotopes. Four fissionable isotopes were included in the fast neutron field measurements; these were U-235, U-238, Pu-239, and Np-237. Only U-235 was included in the thermal neutron yield measurements. For the fast neutron fields, consensus yields were determined for three fission product isotopes--Zr-95, Ru-103, and Ba-140. For these fission product isotopes, a separately activated foil was analyzed by each of the three gamma counting laboratories. The experimental standard deviation of the three independent results was typically $\pm 1.5\%$. For the thermal neutron field, a consensus value for the Cs-137 yield was also obtained. Subsidiary fission yields are also reported for other isotopes which were studied less intensively (usually by only one of the participating laboratories). Comparisons with EBR-II fast reactor yields from destructive analysis and with ENDF/B recommended values are given.

- 2372 (NUREG/CP--0004(Vol.3), pp 1307-1321) EDB-II VALIDATED, KEY FISSION PRODUCT YIELDS

FOR FAST REACTOR APPLICATION. Kellogg, L.S.; Davis, R.I.; Lippincott, E.P.; Ruggles, J.M. (Hanford Engineering Development Lab., Richland, WA). 1977.

From 2. ASTM-EURATOM symposium on reactor dosimetry: dosimetry methods for fuels, cladding and structural materials; Palo Alto, CA, USA (2 Oct 1977).

Relative fission yields were measured for three different locations in the row 4 "Test Region" of the EBR-II reactor. Correlation of the relative fission yields to the measured average energy (anti E) and the measured ^{137}Cs $^{238}\text{U}/^{235}\text{U}$ spectral indices have been made. The measured relative fission yields for selected fission products from ^{235}U , ^{238}U , ^{239}Pu and ^{237}Np have been compared with those values reported by the Interlaboratory Reaction Rate (ILRR) program, EBR-II fast reactor yields from destructive analysis and summation, and the March 1977 version of ENDF/B-V.

2373 (NUREG/CP--0007, pp I.1.1-I.1.28) REVIEW OF HIGH TEMPERATURE MEASUREMENT TECHNIQUES FOR LMFBR SAFETY EXPERIMENTS. Starkovich, V.S. (Los Alamos Scientific Lab., NM). Oct 1979.

From Reactor Safety Instrumentation Review Group meeting; Silver Spring, MD, USA (24 Jul 1979).

A summary of the latest developments in ultrasonic thermometry and a discussion of the potential applications of pyrometry to LMFBR safety experiments is presented. A brief discussion of several high temperature measurement techniques which were presented at the 25th Instrumentation Society of America meeting in Anaheim, California, May 6 to 9, is also included.

2374 (NUREG/CR--0001) ROD-BUNDLE THERMAL-HYDRAULIC ANALYSIS USING BOUNDARY-FITTED COORDINATE SYSTEM. Sha, W.T.; Thompson, J.F. (Argonne National Lab., IL (USA)). Jan 1979. Contract W-31-109-ENG-38. 45p. (ANL--78-1). Dep. NTIS, PC A03/MF A00.

A formulation under development for a three-dimensional, time-dependent, compressible single-phase rod-bundle thermal-hydraulic analysis using boundary-fitted coordinate systems is discussed. The governing equations of conservation of mass, momentum, and energy are treated as a boundary-value problem in space and an initial-value problem in time. The numerical solutions can be in either implicit or explicit form, each with a choice of central or upwind convective derivatives. Two general types of coordinate systems are considered, analogous to rectangular and cylindrical systems. Complicated cross-sectional rod-bundle geometries, such as hexagonal fuel assemblies used in the LMFBR, can be transformed into either rectangular or cylindrical coordinates with uniform mesh.

2375 (NUREG/CR--0002) BUBBLE BEHAVIOR IN LMFBR CORE DISRUPTIVE ACCIDENTS. ANNUAL REPORT, JULY 1, 1976--SEPTEMBER 30, 1977. Erdman, C.A.; Reynolds, A.B. (Virginia Univ., Charlottesville (USA). Dept. of Nuclear Engineering and Engineering Sciences). Dec 1977. 126p. (UVA--529106/NE77/103). NTIS \$7.25.

Analytical research in three major areas is described: (1) particle production by homogeneous nucleation, (2) fuel condensation on above-core structure, and (3) small particle production by hydrodynamic fragmentation. Preliminary results on minimum expected particle sizes for one stage of LMFBR core disruptive accidents are presented along with

work on time scales for fragmentation and a status report of current efforts.

2376 (NUREG/CR--0011) LMFBR FUEL ANALYSIS. TASK A: OXIDE FUEL DYNAMICS. FINAL REPORT, OCTOBER 1, 1976--SEPTEMBER 30, 1977. Dhir, V.K.; Doshi, J.; Frank, M.; Hauss, B.; Kastenber, W.E.; Wong, K. (California Univ., Los Angeles (USA). Dept. of Chemical, Nuclear, and Thermal Engineering). Oct 1977. 132p. NTIS \$7.25.

The study presented deals with several areas of uncertainty in the analysis of the unprotected overpower transient for the Clinch River Breeder Reactor. These areas of uncertainty include the time, place, and mode of fuel pin failure; pre-failure fuel motion; fuel freezing, plugging, and plate-out following pin failure; and the potential for re-criticality. Internal molten fuel motion prior to pin failure was found to be sensitive to ramp rate and burnup. The strain-limit fuel failure criterion was found to be inappropriate for analysis based on existing data. The coupling of pre-transient- and transient-induced stresses tended to force the failure location towards the core midplane.

2377 (NUREG/CR--0012) LMFBR FUEL ANALYSIS. TASK B: POST-ACCIDENT HEAT REMOVAL. FINAL REPORT, OCTOBER 1, 1976--SEPTEMBER 30, 1977. Castle, J.; McDonough, J.M.; Ostrander, N.C.; Catton, I. (California Univ., Los Angeles (USA). School of Engineering and Applied Science). Oct 1977. 157p. NTIS \$8.00.

This task B annual report focuses on the interaction of concrete structures and core debris which may be released in a LMFBR core disruptive accident. A heat transfer calculational technique is described and applied to the exchange of energy from hot core debris to the concrete. Predictions are compared to several test conditions for which data are available. Calculations are made of the extent to which debris can penetrate the structure prior to solidification. The Clinch River plant and the FFTF are used as two examples in the calculations. The numerical characteristics of the Sandia INTER and Westinghouse WAYER post-accident heat removal codes are scrutinized. An evaluation is made of the heat transfer characteristics exhibited in material interaction tests conducted at the Aerospace Corporation.

2378 (NUREG/CR--0013) LMFBR FUEL ANALYSIS. TASK C: RELIABILITY ASPECTS OF LMFBRs. FINAL REPORT, OCTOBER 1, 1976--SEPTEMBER 30, 1977. Basti, W.; Kastenber, W.E. (California Univ., Los Angeles (USA). Dept. of Chemical, Nuclear, and Thermal Engineering). Oct 1977. 63p. NTIS \$5.25.

An analysis is presented for the availability of the electrical power supplies upon reactor shutdown. Successful power supply is defined in terms of the ability of the associated pumps (pump motors) to provide forced circulation and to deliver sufficient feedwater for proper cooldown of the core. Previous investigations of the reliability of the CRBR shutdown heat removal system concentrated on the mechanical systems and/or did not yet consider the diverse power supply. The shutdown heat removal system (SHRS) is discussed in the light of the availability of the electrical power systems, depending upon various types of initiating events. The unavailabilities of the essential power distribution and power supply buses are estimated, so that they can easily be used in connection with analyses of the entire SHRS.

Further estimates include mechanical failure of the pumps.

extensive subassembly voiding.

- 2379 (NUREG/CR--0015) ANALYSIS OF AEROSOL PARTICLES UNDERGOING GRAVITATIONAL AGGLOMERATION. ANNUAL PROGRESS REPORT, DECEMBER 15, 1976--SEPTEMBER 30, 1977. Loyalka, S.K. (Missouri Univ., Columbia (USA). Coll. of Engineering). Nov 1977. 66p. NTIS \$5.25.

Studies are reported of aerosol behavior following an LMFBR reactor core disruption. Highlights of progress in theoretical area have consisted of a clear and consistent formulation of the dynamical equations of motion for the colliding particles. Relevant Drag forces have been identified and methods for obtaining such forces are discussed. A computer program that determines the collision efficiency by solving the equations of motion and numerical experimentation is operational. At present, the Stokesian Drag forces with slip corrections are being used, but other drag forces will be also incorporated. Results obtained to date indicate that for the range of particle sizes studied so far the collision efficiency decreases with decrease in density. An extensive review of previous experimental work on collision efficiency in the atmospheric sciences was completed. Use of both the macroscopic and the microscopic type of experiments is recommended. The former include laser scattering type of work and the latter include similitude type of experiments. The similitude type of experiments is especially suitable for studying the density and shape effects on the collision efficiency, and the necessary apparatus has been assembled at the UMC. Preliminary experimental parameters have been identified, and initial results are expected to be available in the near future.

- 2380 (NUREG/CR--0016) PARAMETER SENSITIVITY STUDY IN THE DYNAMIC SIMULATION OF A SODIUM COOLED BREEDER REACTOR POWER PLANT. Kolb, G.J. (Arizona Univ., Tucson (USA). Coll. of Engineering). Jan 1978. 71p. NTIS \$5.25. Thesis.

The time domain sensitivity measure, peak sensitivity, was employed in studying the dynamics of a Clinch River Breeder Reactor Power Plant (CRBRP) digital simulator. With its use the most "safety sensitive" parameters in the plant model were identified for particular anticipated transients. Examples of such parameters include the Doppler feedback coefficient, fraction of power generated in the core, and the two phase flow friction multiplier. A method of putting first order bounds on a particular power plant transient due to parameter estimate error is also presented. This information is valuable since the CRBRP simulator was constructed with the intent of studying the safety of the system.

- 2381 (NUREG/CR--0018) POST-FAILURE PHENOMENA IN LMFBR TOP ACCIDENTS. FINAL REPORT, OCTOBER 1, 1976--SEPTEMBER 30, 1977. Erdman, C.A.; Bradley, D.R.; Kelley, J.L. (Virginia Univ., Charlottesville (USA). School of Engineering and Applied Science). Nov 1977. 75p. (UVA--529058/NEEP77/103). NTIS \$6.00.

Work in the area of post-failure phenomena in LMFBR TOP accidents is reported. Several different TOP-related topics are treated, including radial dependence of transient fission gas behavior in LMFBR pins; modeling of flowing-sodium pin failure tests in TREAT; gas plenum region pressurization due to sodium vaporization; and the effect of ejection rates of molten fuel from pins on the potential for

- 2382 (NUREG/CR--0076) EVALUATION OF MATERIALS FOR CRBRP CORE RETENTION. ANNUAL PROGRESS REPORT. Swanson, D.G. (Aerospace Corp., Los Angeles, CA (USA). Materials Science Lab.). Oct 1977. 152p. (ATR--77(7608)=2). NTIS \$8.00.

A series of experiments were performed to study the interactions expected in a hypothetical core meltdown accident between molten core debris, liquid sodium, and reactor materials. In "transient" molten core debris experiments, either UO_2 or stainless steel was melted in an electric arc furnace, poured on a specimen to simulate thermal shock, and allowed to cool. Later, in combined transient-sustained heating experiments, the UO_2 or steel layer was remelted in another arc furnace and maintained in a molten state in order to study the penetration of molten core debris into the specimen. During the liquid sodium experiments, sodium was poured on the material being tested and was then maintained at a predetermined temperature in a single operation. In both the molten core debris and liquid sodium experiments, interactions with MgO , basalt concrete, magnetic concrete, and two kinds of limestone concrete were investigated. Temperature data were obtained, and gas samples were analyzed in both series of experiments. In addition, penetration rates were determined in the molten core debris experiments. Some microstructural analysis has been completed but more remains to be done.

- 2383 (NUREG/CR--0084) AEROSOL MEASUREMENTS AND MODELING FOR FAST REACTOR SAFETY. QUARTERLY PROGRESS REPORT, OCTOBER 1--DECEMBER 31, 1977. Gieseke, J.A.; Jordan, H.; Lee, K.W.; Schmidt, E.W.; Vaishnavi, B.; Reed, L.D. (Battelle Columbus Labs., OH (USA)). May 1978. 44p. (BMT--1999). NTIS \$4.50.

Technical progress during the quarter was made in areas of HAARM-3 computer code improvements, comparisons of the code with the experimental data, BAM code evaluation, reference code development, and agglomerate characteristics measurements including calibration of the spiral duct centrifuge. Details of efforts directed toward the major technical areas are presented.

- 2384 (NUREG/CR--0115) EFFECTS OF ENERGY LOSSES OF ARBITRARY MAGNITUDE ON FUEL QUALITY, VAPOR DENSITY, AND BUBBLE DIAMETER IN AN IDEALIZED EXPANSION OF MIXTURES OF UO_2 AND NA. Bertini, H.W.; White, J.S. (Oak Ridge National Lab., TN (USA)). Jul 1978. Contract W-7405-ENG-26. 111p. (ORNL/NUREG/TM--185). Dep. NTIS, PC A06/MF A01.

A method is developed for calculating the characteristics of the expected bubble in capacitor-discharge UO_2 vaporization experiments in sodium. These characteristics are the quality of the vaporized UO_2 and its vapor density and the bubble diameter. Results are presented in tabular form for a parametric study covering the range of initial and final states to be expected in these experiments and for a variety of energy losses and mixtures of UO_2 and Na. These data can also be used for sensitivity studies of the fuel quality and vapor density in a bubble that might be formed from a hypothetical core-disruptive accident in a liquid-metal fast breeder reactor. In order to facilitate the calculations, idealized expansions are assumed, that is, expansions that are free of intervening structure and in which thermodynamic equilibrium exists at all times.

- 2385 (NUREG/CR--0117) LMFBR AEROSOL RELEASE AND TRANSPORT PROGRAM QUARTERLY PROGRESS REPORT, JANUARY--MARCH 1978. Kress, T.S. (Oak Ridge National Lab., TN (USA)). 25 Aug 1978. Contract W-7405-ENG-26. 62p. (ORNL/NUREG/TM--213). Dep. NTIS, PC A04/MF A01.

Progress is summarized in studies designed to investigate radionuclide release and transport from LMFBRs for reactor events of severity up to and including hypothetical core-disruptive accidents (HCDAs). Experimental program topics discussed include: recent Capacitor Discharge Vaporization tests in the CRI-III facility at its new FAST site; FAST facility installation progress; performance tests for the consumable electrode aerosol generator in NSPP and the U_3O_8 aerosol behavioral results accompanying the performance tests; development of a back-up "flame-spray" U_3O_8 aerosol generator for high densities; and progress in making a trial HCDA source term analysis.

- 2386 (NUREG/CR--0120) EFFECT OF ENERGY DENSITY ON AEROSOL YIELD AND PRIMARY PARTICLE SIZES PRODUCED BY THE CAPACITOR DISCHARGE VAPORIZATION (CDV) OF UO_2 . Wright, A.L.; Bertini, H.W.; Kress, T.S.; Tobias, M.L.; Kelly, M.J.; Parsly, L.F.; White, J.S. (Oak Ridge National Lab., TN (USA)). 31 Aug 1978. Contract W-7405-ENG-26. 54p. (ORNL/NUREG/TM--163). Dep. NTIS, PC A04/MF A01.

The report documents experimental results obtained in the CRI-III/CDV portion of the ORNL Aerosol Release and Transport (ART) Program, sponsored by the Advanced Reactor Safety Research Division of the Nuclear Regulatory Commission. In the CRI-III/CDV program, the capacitor discharge vaporization (CDV) technique is used to bring simulant LMFBR fuel samples (UO_2) to energy states representative of those calculated for severe hypothetical core-disruptive accidents (HCDAs). The high-energy molten UO_2 undergoes a free expansion in the CRI-III vessel, and the vapor produced converts to an aerosol. The report discusses the results of tests where the major objective was to establish the UO_2 aerosol mass made airborne (yield) and the size distribution of the primary aerosol as a function of the energy content of the UO_2 before expansion.

- 2387 (NUREG/CR--0137) PROMPT BURST 2NERGETICS EXPERIMENTS: URANIUM CARBIDE SERIES. PRELIMINARY RESULTS. Reil, K.O.; Young, M.F.; Camp, W.J.; Plitz, H. (Sandia Labs., Albuquerque, NM (USA)). Jun 1978. Contract EY-76-C-04-0789. 26p. (SAND--78-0752). Dep. NTIS, PC A03/MF A01.

A brief overview is presented of the results of the SG series of prompt burst energetics (PBE) experiments in the Sandia Laboratories Annular Core Pulse Reactor (ACPR). This series (PBE-SG, 2, and 3) involved single uranium-carbide fuel pins which were rapidly pulse heated in a stagnant sodium channel to extreme energy states characteristic of prompt burst conditions. The purpose of the PBE program is to characterize, in an integral pin geometry, the phenomena resulting in pressurization and conversion of thermal to mechanical energy. To this end temperature and pressure histories are directly monitored and the work energy imparted to the system constraint is measured using a movable piston technique. Knowing the neutron energy deposition, one is able to calculate the overall energy conversion efficiency of the experiment, and (somewhat indirectly) apportion the pressure generated between fuel and coolant vapor. Although only very preliminary analysis

has been performed, in the case of all three tests it appears that measured pressures cannot be explained on the basis of fuel vapor pressure alone. Further, in the test with the greatest energy deposition (SG2), peak pressures obtained were far greater than those obtained in any previous PBE test with uranium oxide fuel. Nevertheless overall thermal to mechanical energy conversion efficiency remains low for the experiment as a whole (although local efficiencies could be quite high).

- 2388 (NUREG/CR--0148) PHYSICS OF REACTOR SAFETY. QUARTERLY REPORT, JANUARY--MARCH 1978. (Argonne National Lab., IL (USA)). Jun 1978. Contract W-31-109-ENG-38. 52p. (ANL--78-52). Dep. NTIS, PC A04/MF A01.

This report summarizes work done on reactor safety, Monte Carlo analysis of safety-related critical assembly experiments, and planning of Safety-Related (ZPR) experiments. Work on reactor core thermal-hydraulic code development is also included.

- 2389 (NUREG/CR--0166) SUSTAINED MOLTEN STEEL/CONCRETE INTERACTIONS TESTS: A PRELIMINARY REPORT ON THE FEASIBILITY OF EXPERIMENTAL TECHNIQUES. Powers, D.A. (Sandia Labs., Albuquerque, NM (USA)). Jun 1978. Contract EY-76-C-04-0789. 52p. (SAND--77-1423). Dep. NTIS, PC A04/MF A01.

An experimental demonstration of the feasibility of using induction heating to maintain 200 kilograms of stainless steel molten while in contact with concrete is described. Data are presented to show that operation of an induction coil embedded in the concrete at 120 kW was sufficient to sustain temperatures near 1500°C in the melt for 10 minutes. Metal losses by gas induced expulsion from the crucible and oxidation may have been responsible for the inability to achieve higher temperatures. Techniques for monitoring melt temperatures, the compositions and temperatures of evolved gases, and concrete temperatures during the test are described.

- 2390 (NUREG/CR--0167) SURVEY OF EXISTING MOMENTUM EXCHANGE MODELS IN TWO-PHASE FLOWS FOR USE IN THE SIMMER FAST REACTOR SAFETY ANALYSIS CODE. Eisenhower, S.W. (Sandia Labs., Albuquerque, NM (USA)). Mar 1978. Contract EY-76-C-04-0789. 43p. (SAND--78-0167). Dep. NTIS, PC A03/MF A01.

Models which describe momentum exchange in two-phase, vapor-liquid flows are surveyed. These models are related to the momentum exchange coefficient formulations used in the SIMMER code. The result is a set of model-dependent exchange coefficients for various flow regimes. Criteria for flow regime transitions and experimental needs in momentum exchange modeling are also discussed.

- 2391 (NUREG/CR--0224) MULTIPHASE TRANSIENTS WITH COOLANT AND CORE MATERIALS IN LMFBR CORE DISRUPTIVE ACCIDENT ENERGETICS EVALUATIONS. Theofanous, T.G. (Purdue Univ., Lafayette, IN (USA)). School of Nuclear Engineering). Jun 1978. 298p. NTIS \$11.75.

An overview of core disruptive accidents in LMFBRs and an assessment of their potential for energetic consequences are presented. Areas in which current state-of-the-art is found inadequate are identified. In particular the early post disruptive period (called herein Transition to the Transition Phase) is identified as a key area having received inadequate attention to date. Further the idea of mild dispersal from a fully developed

Transition Phase at decay heat power levels does not appear justified. However considerable question exists as to the attainability of such full core pool under accident conditions. Specific recommendations for research work in relation to licensing needs are presented.

- 2392 (NUREG/CR--0240) SINGLE-PHASE PUMP MODEL FOR ANALYSIS OF LMFBR HEAT TRANSPORT SYSTEMS. Madai, I.K.; Cazzoli, E. (Brookhaven National Lab., Upton, NY (USA)). May 1978. Contract EY-76-C-02-0016. 52p. (BNL-NUREG--50859). Dep. NTIS, PC A04/MF A01.

A single-phase pump model for transient and steady-state analysis of LMFBR heat transport systems is presented. Fundamental equations of the model are angular momentum balance to determine transient impeller speed and mass balance (including thermal expansion effects) to determine the level of sodium in the pump tank. Pump characteristics are modeled by homologous head and torque relations. All regions of pump operation are represented with reverse rotation allowed. The model also includes option for enthalpy rise calculations and pony motor operation. During steady state, the pump operating speed is determined by matching required head with total load in the circuit. Calculated transient results are presented for pump coastdown and double-ended pipe break accidents. The report examines the influence of frictional torque and specific speed on predicted response for the pump coastdown to natural circulation transient. The results for a double-ended pipe break accident indicate the necessity of including all regions of operation for pump characteristics.

- 2393 (NUREG/CR--0244) BRENDA: A DYNAMIC SIMULATOR FOR A SODIUM-COOLED FAST REACTOR POWER PLANT. Hetrick, D.L.; Sowers, G.W. (Arizona Univ., Tucson (USA). Dept. of Nuclear Engineering). Jun 1978. 87p. (EES--010-3). NTIS \$6.00.

This report is a users' manual for one version of BRENDA (Breeder Reactor Nuclear Dynamic Analysis), which is a digital program for simulating the dynamic behavior of a sodium-cooled fast reactor power plant. This version, which contains 57 differential equations, represents a simplified model of the Clinch River Breeder Reactor Project (CRBRP). BRENDA is an input deck for DARE P (Differential Analyzer Replacement, Portable), which is a continuous-system simulation language developed at the University of Arizona. This report contains brief descriptions of DARE P and BRENDA, instructions for using BRENDA in conjunction with DARE P, and some sample output. A list of variable names and a listing for BRENDA are included as appendices.

- 2394 (NUREG/CR--0245) VAPOR EXPLOSION PHENOMENA WITH RESPECT TO NUCLEAR REACTOR SAFETY ASSESSMENT. Cronenberg, A.W.; Benz, R. (Idaho National Engineering Lab., Idaho Falls (USA)). Jul 1978. Contract EY-76-C-07-1570. 75p. (TREE--1242). Dep. NTIS, PC A04/MF A01.

Stringent licensing procedures for commercial nuclear reactor operation require an in-depth analysis of the phenomena associated with postulated reactor core overheating accidents. One aspect of nuclear reactor safety assessment is a prediction of the consequences of interaction between molten fuel and coolant, in which rapid heat transfer from the fuel may lead to explosive vaporization of the coolant. Some of the most recent theories relating to vapor explosion research for nuclear reactor safety assessment are critically reviewed and

assessed. Specifically, the spontaneous nucleation and pressure detonation models are discussed at length. In addition, modeling of the fragmentation of hot molten fuel upon contact with liquid coolant, and energy considerations for rapid fine-scale intermixing of such fragmented fuel with coolant are discussed in detail. 141 references.

- 2395 (NUREG/CR--0263) DEBRIS BED STUDIES AND EXPERIMENTS AT SANDIA LABORATORIES. Rivard, J.B. (Sandia Labs., Albuquerque, NM (USA)). Jul 1978. Contract EY-76-C-04-0789. 57p. (SAND--78-0299). Dep. NTIS, PC A04/MF A01.

An initial experiment simulating a 58 mm thick LMFBR fuel debris bed has been performed in liquid sodium in which the UO_2 particles composing the bed were internally heated by nuclear fission. The experiment was performed in the Annular Core Pulse Reactor (ACPR), as part of Sandia Laboratories' program examining the safety of advanced reactors. Supporting research included experiments utilizing other power sources and simulated debris and coolants, analysis and modeling, and auxiliary measurement of material properties and interactions. The specific power attained during the in-reactor experiment ranged up to about 1 kW/kg of UO_2 while the bulk sodium temperatures ranged up to 838 K. The particle-to-fluid interface does not appear to offer significant resistance to heat transfer at these power levels. The heat transfer behavior of the bed was quite reproducible, and edge effects appeared to be small.

- 2396 (NUREG/CR--0287) EXPERIMENTAL INVESTIGATION OF AEROSOL BEHAVIOR IN A POST-LMFBR ACCIDENT REACTOR CONTAINMENT ATMOSPHERE. Wegrzyn, J.; Shaw, D.T. (State Univ. of New York, Buffalo (USA). Dept. of Electrical Engineering). Jul 1978. 31p. (LAPES--78-02). NTIS \$4.50.

Results of experimental measurements of the aerodynamic properties of a sodium aerosol are presented. Essentially three separate experiments were performed; (1) the evaluation of the centrifuge as an in-situ measuring device, (2) the classification of the sodium aerosol, and (3) the shape factor measurements on an exploding wire (E.W.) aerosol.

- 2397 (NUREG/CR--0323(Vol.5)) ADVANCED REACTOR SAFETY RESEARCH. QUARTERLY REPORT, OCTOBER--DECEMBER 1977. (Sandia Labs., Albuquerque, NM (USA)). Oct 1978. Contract EY-76-C-04-0789. 134p. (SAND--78-0611(Vol.5)). Dep. NTIS, PC A07/MF A01.

Progress in LMFBR safety research is summarized for the following study areas: accident energetics, fuel dynamics, core debris behavior, aerosol source normalization, elevated temperature design assessment, accident delineation, and test and facility (ACPR Upgrade) technology.

- 2398 (NUREG/CR--0335(Vol.6)) ADVANCED REACTOR SAFETY RESEARCH. QUARTERLY REPORT, JANUARY--MARCH 1978. (Sandia Labs., Albuquerque, NM (USA)). Feb 1979. Contract EY-76-C-04-0789. 194p. (SAND--78-1421(Vol.6)). Dep. NTIS, PC A09/MF A01.

Progress is summarized in the following LMFBR safety-related areas: accident energetics, fuel dynamics, core debris behavior, aerosol source normalization, elevated temperature design assessment, accident delineation, and test and facility technology.

- 2399 (NUREG/CR--0339) LMFBR SAFETY. 6. REVIEW OF CURRENT ISSUES AND BIBLIOGRAPHY OF LITERATURE (1977). Buchanan, J.R.; Keilholtz, G.W. (Oak Ridge National Lab., TN (USA)). 13 Jul 1978. Contract W-7405-ENG-26. 105p. (ORNL/NUREG/NSIC--151). Dep. NTIS, PC A06/MF A01.

This report discusses the current status of liquid-metal fast breeder reactor (LMFBR) development. Selected bibliographic information on LMFBRs relative to the development and safety of the breeder reactor is presented for the year 1977. The bibliography consists of approximately 198 abstracts covering research and development, operating experience, and design practices. Keyword, author, and permuted-title indexes are included for completeness.

- 2400 (NUREG/CR--0340) LMFBR AEROSOL RELEASE AND TRANSPORT PROGRAM. QUARTERLY PROGRESS REPORT, APRIL--JUNE 1978. Kress, T.S.; Wright, A.L. (Oak Ridge National Lab., TN (USA)). 29 Sep 1978. Contract W-7405-ENG-26. 50p. (ORNL/NUREG/TM--244). Dep. NTIS, PC A03/MF A01.

Topics discussed include recent capacitor discharge vaporization tests in the CRI-III facility and the first shakedown test for the FAST facility; FAST facility installation progress; performance tests for the consumable electrode aerosol generator for the NSPP and comparison of results from three performance tests; performance of the first mixed sodium oxide and uranium oxide test in the NSPP; development of the backup plasma torch aerosol generator for use in generating high uranium oxide aerosol densities in the NSPP; and progress in development of a computer model to calculate the behavior of UO_2 vapor bubbles produced in core-disruptive accidents and in fuel-aerosol simulant test facility experiments.

- 2401 (NUREG/CR--0367) PROMPT BURST ENERGETICS EXPERIMENTS: FRESH OXIDE/SODIUM SERIES. Reil, K.O.; Young, M.F. (Sandia Labs., Albuquerque, NM (USA)). Aug 1978. Contract EY-77-C-01-0789. 83p. (SAND--78-1561). Dep. NTIS, PC A05/MF A01.

A series of in-pile experiments has been performed to provide information on thermal energy to work conversion under prompt burst excursion (PBE) conditions. These consisted of single pin tests using fresh uranium oxide or uranium carbide fuel in a capsule geometry, with either stagnant sodium or helium in the coolant channel. The experiments were irradiated with single or double pulses in the Annular Core Pulse Reactor (ACPR) to provide energy depositions up to 2900 J/g. This report covers the seven single and five double pulse UO_2 sodium-in tests. Experimental data includes pressure and linear motion transducer histories, measured work-energy conversion efficiencies, and post-irradiation examination. Analysis includes derived work-energy conversion efficiencies (up to 0.54%), pin failure modeling, hydrodynamic analysis of pressure pulse propagation in the channel, and piston stopping effects. Initial pressure events in the single pulse experiments appear to be dominated by fuel vapor pressure. Definite fuel-coolant interactions were observed in several experiments, including some that were coincident with stopping of the linear motion transducer piston, suggesting a possible triggering effect by the deceleration pressure.

- 2402 (NUREG/CR--0405) MARKOVIAN RELIABILITY ANALYSIS UNDER UNCERTAINTY WITH AN APPLICATION ON THE SHUTDOWN SYSTEM OF THE CLINCH RIVER BREEDER REACTOR. Papazoglou, I.A.; Gyftopoulos, E.P. (Brookhaven National Lab., Upton, NY (USA); Massachusetts Inst. of Tech., Cambridge (USA). Dept. of Nuclear Engineering). Sep 1978. Contract EY-76-C-02-0016. 258p. (BNL-NUREG--50864). Dep. NTIS, PC A12/MF A01.

A methodology for the assessment of the uncertainties about the reliability of nuclear reactor systems described by Markov models is developed, and the uncertainties about the probability of loss of coolable core geometry (LCG) of the Clinch River Breeder Reactor (CRBR) due to shutdown system failures, are assessed. Uncertainties are expressed by assuming the failure rates, the repair rates and all other input variables of reliability analysis as random variables, distributed according to known probability density functions (pdf). The pdf of the reliability is then calculated by the moment matching technique. Two methods have been employed for the determination of the moments of the reliability: the Monte Carlo simulation; and the Taylor-series expansion. These methods are adopted to Markovian problems and compared for accuracy and efficiency.

- 2403 (NUREG/CR--0408) NATURAL CONVECTION HEAT TRANSFER IN BEDS OF INDUCTIVELY HEATED PARTICLES. Rhee, S.J.; Dhir, V.K. (California Univ., Los Angeles (USA). School of Engineering and Applied Science). 1978. 93p. NTIS \$6.00.

Experimental observations of the onset of convective motion in beds of inductively heated particles have been made. The data for the heat transfer coefficient have been obtained in water-cooled beds of 304 stainless steel particles. The particulated bed was formed in a 10.4 cm diameter glass jar which was insulated on the sides and at the bottom. The free surface of the overlying layer of water was maintained at a constant temperature by a copper plate cooled with tap water. In the experiments, the height of the particulated bed and the height of the overlying fluid layer were varied systematically. The observations show that increasing the depth of the fluid layer over the bed tends to lower the critical internal Rayleigh number at which the onset of convection occurs.

- 2404 (NUREG/CR--0421) POSTACCIDENT HEAT REMOVAL: DEBRIS-BED EXPERIMENTS D-2 AND D-3. Rivard, J.B. (Sandia Labs., Albuquerque, NM (USA)). Aug 1978. Contract EY-76-C-04-0789. 57p. (SAND--78-1238). Dep. NTIS, PC A04/MF A01.

The second and third of the fission-heated experiments simulating fast-reactor debris in liquid sodium have been performed in the Annular Core Pulse Reactor (ACPR). These experiments were designed to assess the natural cooling capability that liquid sodium may provide for particulate debris which might be produced by a severe core-disruptive accident. Enriched UO_2 particles submersed in liquid sodium were used and were subjected to power levels ranging up to 1.28 kW/kg of oxide while the bulk sodium temperatures varied from 673 to 873 K. The particles were irregular in shape and ranged in size from about 100 to 1,000 μm . The D-2 bed loading was 600 kg/m² of oxide and the D-3 loading was 900 kg/m².

- 2405 (NUREG/CR--0425) AEROSOL MEASUREMENTS AND MODELING FOR FAST REACTOR SAFETY. QUARTERLY PROGRESS REPORT, JANUARY--MARCH 1978.

Gieseke, J.A.; Jordan, H.; Lee, K.W.;
Vaishnavi, B. (Battelle Columbus Labs., OH
(USA)). Sep 1978. 28p. (BMI--2005).
Dep. NTIS, PC A03/MF A01.

Technical progress during the quarter was made on the comparison of the HAARM-3 computer code with aerosol measurements, experimental measurements of uranium oxide aerosol characteristics, determinations of humidity effects on sodium aerosol formation, and development of the reference code. In addition, a mid-year review was presented to NRC staff on February 16, 1978. Technical progress on each of the above topics is discussed in the report.

- 2406 (NUREG/CR--0427) ACCIDENT PROGRESSION FOR A LOSS OF HEAT SINK WITH SCRAM IN A LMFB. Bari, R.A.; Ludewig, H.; Pratt, W.T.; Sun, Y.H. (Brookhaven National Lab., Upton, NY (USA)). Oct 1978. Contract EY-76-C-02-0016. 74p. (BNL-NUREG--50910). Dep. NTIS, PC A04/MF A01.

A description of a slow core meltdown in a liquid metal fast breeder reactor is presented for the conditions of loss-of-heat-sink following neutronic shutdown. Simple models are developed for the prediction of phase changes and/or relocation of the core materials including fuel, clad, ducts, control rod absorber material (B₄C), and plenum gases. The sequence of events is accounted for and the accident progression is described up to the point of recriticality. The neutronic behavior of the disrupted core is analyzed in R-Z geometry with a static transport theory code (TWOTRAN). For most scenarios assessed, the reactor is expected to become recritical although large ramp rates are not anticipated.

- 2407 (NUREG/CR--0443) CALCULATION OF SIGNALS IN CODED-APERTURE IMAGING OF MANY-PIN BUNDLES OF LMFB FUEL. McArthur, D.A.; Halbleib, J.A. Sr.; Morel, J.E. (Sandia Labs., Albuquerque, NM (USA)). Oct 1978. Contract EY-76-C-04-0789. 46p. (SAND--78-0503). Dep. NTIS, PC A03/MF A01.

Detailed Monte Carlo gamma-ray transport calculations have been performed to study the coded-aperture imaging problem for a 37-pin bundle. Realistic geometries have been used for the test fuel bundle, its containment, the coded aperture and the gamma-ray detector. A high-Z gamma-ray filter placed near the coded aperture was found to enhance the signal change caused by voiding of test fuel, and a non-linear relationship was found between the amount of fuel voided and the resulting signal change. The signal changes appear to be large enough that gamma-ray imaging would be useful for a 37-pin bundle.

- 2408 (NUREG/CR--0452(Vol.1)) USERS' MANUAL FOR THE SSC-L CODE. Agrawal, A.K. (Brookhaven National Lab., Upton, NY (USA)). Oct 1978. Contract EY-76-C-02-0016. 332p. (BNL-NUREG--50914(Vol.1)). Dep. NTIS, PC A15/MF A01.

A computer code, SSC-L, has been written on the CDC-7600 computing systems. This code simulates thermohydraulic transients in the entire liquid metal fast breeder reactor (LMFBR) plant. This report provides for all information related to the usage of this computer code to the potential users. It provides a complete description of modeling details and usage instructions with the exception of a generalized Plant Control and Protection Systems (PCS and PPS). These have also been modeled. These functions are needed to apply SSC-L for simulating operational transients.

- 2409 (NUREG/CR--0453(Vol.1)) SIMMER-II: A COMPUTER PROGRAM FOR LMFB DISRUPTED CORE ANALYSIS. Smith, L.L. (Los Alamos Scientific Lab., NM (USA)). Oct 1978. Contract W-7405-ENG-36. 279p. (LA--7515-M(Vol.1)). Dep. NTIS, PC A13/MF A01.

Physical models, and numerical methods are presented for SIMMER-II, a computer program to predict the neutronic and fluid dynamic behavior of an LMFB during a hypothetical core disruptive accident. Either the time-dependent multigroup neutron diffusion or neutron transport equation is solved by the quasistatic method to predict the reactor neutronic behavior during the accident. Cross sections depend on temperature and background cross sections. Three fields, a structure field, a liquid field, and a vapor field, are modeled to predict the fluid dynamic behavior of the reactor. Each field consists of density components, to follow the material motion, and energy components, to predict the material temperatures. For typical accident calculations, the materials are fertile fuel, fissile fuel, stainless steel, sodium, control material, and fission gas. Heat, mass and momentum transfer are calculated among the three fields and their components.

- 2410 (NUREG/CR--0453(Vol.2)) SIMMER-II: A COMPUTER PROGRAM FOR LMFB DISRUPTED CORE ANALYSIS. Smith, L.L. (Los Alamos Scientific Lab., NM (USA)). Sep 1978. Contract W-7405-ENG-36. 321p. (LA--7515-M(Vol.2)). Dep. NTIS, PC A14/MF A01.

Program description is presented for SIMMER-II, a computer program to predict the neutronic and fluid dynamic behavior of an LMFB during a hypothetical core disruptive accident. Either the time-dependent multigroup neutron diffusion or neutron transport equation is solved by the quasistatic method to predict the reactor neutronic behavior during the accident. Cross sections depend on temperature and background cross sections. Three fields, a structure field, a liquid field, and a vapor field, are modeled to predict the fluid dynamic behavior of the reactor. Each field consists of density components, to follow the material motion, and energy components, to predict the material temperatures. For typical accident calculations, the materials are fertile fuel, fissile fuel, stainless steel, sodium, control material, and fission gas. Heat, mass and momentum transfer are calculated among the three fields and their components.

- 2411 (NUREG/CR--0469(Vol.7)) ADVANCED REACTOR SAFETY RESEARCH QUARTERLY REPORT, APRIL-JUNE 1978. (Sandia Labs., Albuquerque, NM (USA)). May 1979. Contract EY-76-C-04-0789. 41p. (SAND--78-2001(Vol.7)). Dep. NTIS, PC A03/MF A01.

Progress in LMFB safety research is summarized for the following study areas: accident energetics; fuel dynamics; core debris behavior; aerosol source normalization; elevated temperature design assessment; LMFB accident delineation; and test and facility (ACPR upgrade) technology.

- 2412 (NUREG/CR--0470) ADVANCED REACTOR SAFETY RESEARCH. QUARTERLY REPORT, JULY-SEPTEMBER 1978. (Sandia Labs., Albuquerque, NM (USA)). Sep 1979. Contract EY-76-C-04-0789. 200p. (SAND--78-2002(Vol.8)). Dep. NTIS, PC A09/MF A01.

Progress in LMFB safety research is summarized for the following study areas: accident energetics, fuel dynamics, core debris

behavior, aerosol source normalization, elevated temperature-design assessment, accident delineation, and test and facility (ACPR upgrade) technology.

- 2413 (NUREG/CR--0477) PHYSICS OF REACTOR SAFETY. QUARTERLY REPORT, APRIL--JUNE 1978. (Argonne National Lab., IL (USA)). Aug 1978. Contract W-31-109-ENG-38. 91p. (ANL--78-85).

Work on LMFBR reactor safety programs, Monte Carlo analysis of safety-related critical assembly experiments, and reactor core thermal-hydraulic code development is summarized.

- 2414 (NUREG/CR--0482) LMFBR AEROSOL RELEASE AND TRANSPORT PROGRAM. QUARTERLY PROGRESS REPORT, JULY--SEPTEMBER 1978. Kress, T.S.; Wright, A.L. (Oak Ridge National Lab., TN (USA)). 10 Jan 1979. Contract W-7405-ENG-26. 44p. (ORNL/NUREG/TM--276). Dep. NTIS, PC A03/MF A01.

Progress is summarized for the Liquid-Metal Fast Breeder Reactor (LMFBR) Aerosol Release and Transport (ART) Program for the period July--September 1978. Program topics discussed include recent capacitor discharge vaporization (CDV) tests in the Fuel Aerosol Simulant Test (FAST)/Containment Research Installation (CRI-III) facility, including underwater and vacuum tests in the CRI-III vessel; analysis of data from the first Nuclear Safety Pilot Plant (NSPP) mixed-oxide aerosol test, performance and analysis of the second NSPP mixed-oxide aerosol test, and performance of the second NSPP sodium spray experiment; results from U_3O_8 aerosol tests in CRI-II using the dc plasma metal-oxygen torch, and development and testing of the dc plasma metal-oxygen torch for NSPP; and an evaluation of the HAARM-3 code fallout model using experimental data from NSPP tests.

- 2415 (NUREG/CR--0483) NUMERICAL RESULTS FOR A HEXAGONAL FUEL ASSEMBLY WITH A PLANAR BLOCKAGE USING THE COMMIX-1A COMPUTER CODE. Domanus, H.M.; Sha, W.T. (Argonne National Lab., IL (USA)). Sep 1978. Contract W-31-109-ENG-38. 136p. (ANL-CT--79-8). Dep. NTIS, PC A07/MF A01.

The numerical simulation of a 19-rod LMFBR fuel assembly with an edge blockage has been carried out using the computer code COMMIX-1A. This is a three-dimensional, transient, single-phase thermal-hydraulic computer code. The results have been obtained for high and low flow steady operating conditions. The computed outlet temperature distribution is in close agreement with the experimental measurements. The detailed results of velocity (axial and transverse) and temperature fields at various sections of the fuel assembly are presented to display the effects of planar blockage on the flow field.

- 2416 (NUREG/CR--0489) CHARACTERIZATION OF AGGLOMERATES OF UO_2 AEROSOL PARTICLES. Gordon, H.; Gieseke, J.A. (Battelle Columbus Labs., OH (USA)). Oct 1978. 29p. (BMI--2009). NTIS, PC A03/MF A01.

The report is the second report on a series of experiments designed to measure microscopic characteristics of aerosol particles that might be produced in core disruptive accidents of sodium cooled breeder reactors. The report covers experiments on UO_2 as a simulant of the radiotoxically most important aerosol species--the various isotopes of plutonium. Future experiments will be concerned with mixtures of these two species and with mixtures of fuel, coolant, and representative structural

material. For the branched chain-like particles characteristic of condensation aerosols of metallic oxides, two parameters have been found to be useful in describing deviation of particle conformation from the compact spherical: χ , a correction factor to the modified Stokes expression for fluid drag on a sphere and γ , a correction factor to the collision frequency for spherical particles undergoing coagulation. Results of experiments designed to measure the fluid drag correction factor χ are reported.

- 2417 (NUREG/CR--0527) SENSITIVITY ANALYSIS OF THE HAARM-3 CODE. Lee, K.W.; Gieseke, J.A.; Reed, L.D. (Battelle Columbus Labs., OH (USA)). Oct 1978. 92p. (BMI--2008). Dep. NTIS, PC A05/MF A01.

Battelle's Columbus Laboratories has recently developed and completed an improved computer model for predicting LMFBR aerosol behavior within the containment. This model is designated HAARM-3 (Heterogeneous Aerosol Agglomeration Revised Model-3). One of the important improvements incorporated in the HAARM-3 code compared to the previous models is that the effects of morphological properties of agglomerates (density, size, and shape) have been comprehensively corrected. Aerosol agglomeration mechanisms due to gas turbulence which had not been included previously has also been added into the HAARM-3 code. These HAARM-3 calculations have been compared with available experimental data and found to predict aerosol behavior more realistically. The report develops a methodology to perform sensitivity analysis of the HAARM-3 computer code and studies quantitatively the effects of various independent variables of the code such as initial aerosol properties and containment geometry upon aerosol behavior.

- 2418 (NUREG/CR--0587) AEROSOL MEASUREMENTS AND MODELING FOR FAST REACTOR SAFETY. QUARTERLY PROGRESS REPORT, APRIL 1--JUNE 30, 1978. Gieseke, J.A.; Jordan, H.; Schmidt, E.W.; Vaishnavi, B.; Lee, K.W. (Connecticut Yankee Atomic Power Co., East Hampton (USA)). Dec 1978. 36p. (BMI--2015). Dep. NTIS, PC A03/MF A01.

Technical progress during the quarter was made in areas of comparison of the HAARM-3 code with experimental data, sensitivity analysis of the code, reference code development, fuel aerosol agglomerate characteristics measurements, and evaluation of fuel aerosol resuspension. In addition, Battelle staff participated in a meeting at Oak Ridge National Laboratory on the 18th and 19th of April on the code verification plan.

- 2419 (NUREG/CR--0594) NUMERICAL THERMAL MIXING IN EULERIAN CALCULATIONS OF COUPLED THERMO/HYDRODYNAMIC MOTIONS. Sienicki, J.J.; Abramson, P.B. (Argonne National Lab., IL (USA)). Nov 1978. Contract W-31-109-ENG-38. 56p. (ANL--78-101). Dep. NTIS, PC A04/MF A01.

A great deal of effort has been devoted in the last five years by the reactor safety analysis community to the development of Eulerian computer codes for the combined thermodynamic and hydrodynamic analysis of accident progression. The systems to be analyzed have rather violent hydrodynamic motions initiated by strong pressure gradients which result from strong thermal gradients. Since hydrodynamic calculations in more than one dimension are easier to carry out in an Eulerian framework than in a Lagrangian framework, there has been strong motivation to

develop these new codes using Eulerian numerical schemes. Such schemes have a major drawback: they do not conserve thermodynamic potential energy. Eulerian schemes allow mass and energy to flow through calculational cells which are fixed in space. Pressures that drive the hydrodynamics are calculated from the average energy contents of the cells. Since mass and energy convect from cell to cell, at any time step the pressure of any cell represents the mass weighted average energy of that cell. Thus mass at higher specific energy is assumed by the nature of an Eulerian scheme to come instantaneously at each time step to thermal equilibrium with other mass in the cell at lower specific energy. It is shown that such numerical thermal mixing is unavoidable with pure Eulerian schemes and is a significant source of error in accident calculations.

- 2420 (NUREG/CR--0604) BUBBLE BEHAVIOR IN LMFBR CORE DISRUPTIVE ACCIDENTS. ANNUAL REPORT, OCTOBER 1977--SEPTEMBER 1978. Erdman, C.A.; Reynolds, A.B.; Chen, K.; Bradley, D.R.; Pilch, M. (Virginia Univ., Charlottesville (USA)). Dept. of Nuclear Engineering and Engineering Physics. Dec 1978. 120p. NTIS, PC A06/MF A01.

Analytical research performed at the University of Virginia during FY78 for the Reactor Safety Research (RSR) Division of the U.S. Nuclear Regulatory Commission is reported. The research is part of the Aerosol Release and Transport program of RSR. Three major areas were investigated: (1) particle production by hydrodynamic fragmentation, (2) particle production by homogeneous nucleation, and (3) bubble dynamics and heat transfer. Development of a Monte Carlo computer code for the analysis of particle-size distributions from vapor-liquid hydrodynamic fragmentation was initiated. The source of homogeneous nucleation in the ORNL CDV test was postulated to be expansion behind a spherical shock wave and modeling of this phenomenon was initiated. Analysis of the axial motion of bubble in the French EXCOBULLE tests was completed with the use of the EXCOBUL code in preparation for its use in assisting with the analysis of the ORNL under-water and under-sodium tests.

- 2421 (NUREG/CR--0620) NUMERICAL METHOD OF THE AEROSOL BEHAVIOR REFERENCE CODE, CRAB. Jordan, H.; Vaishnavi, B.; Gieseke, J.A. (Battelle Columbus Labs., OH (USA)). Jan 1979. 57p. (BMI--2016). NTIS, PC A04/MF A01.

A numerical method using arbitrary nodal spacing, linear elements and collocation at the nodal points for solving the aerosol agglomeration equation is described. A computer code employing this method has been developed and is named the CRAB (Contained Radioactive Aerosol Behavior) code. Comparisons between analytic solutions for two kernels, $K(x, x') = 1$ and $K(x, x') = x + x'$, and corresponding numerical calculations are given. In addition, a comparison run between the CRAB and two alternative codes, PARADISEKO-III and HAARM-3, for a lognormal initial distribution and a Brownian kernel is exhibited. An appendix traces the development of the present numerical method from related, but less suitable methods.

- 2422 (NUREG/CR--0653) PHYSICS OF REACTOR SAFETY. QUARTERLY REPORT, JULY--SEPTEMBER 1978. (Argonne National Lab., IL (USA)). Nov 1978. Contract W-31-109-ENG-38. 78p. (ANL--78-106). Dep. NTIS, PC A05/MF A01.

This report summarizes work done on reactor safety program by members of the Reactor Safety

Appraisals Group, Monte Carlo analysis of safety-related critical assembly experiments and Planning of Safety-Related (ZPR) Planning and Experiments Group. Work on reactor core thermal-hydraulic code development performed in the Components Technology Division is also included.

- 2423 (NUREG/CR--0676) AEROSOL MEASUREMENTS AND MODELING FOR FAST REACTOR SAFETY. ANNUAL REPORT FOR FY 1978. Gieseke, J.A.; Jordan, H.; Lee, K.W.; Reed, L.D. (Battelle Columbus Labs., OH (USA)). Jan 1979. 70p. (BMI--2021). Dep. NTIS, PC A05/MF A01.

The areas of major activity during that year were: development and subsequent sensitivity study of the HAARM-3 code; development of a code to study multiple zone effects; completion of the basic form of the reference code, CRAB; and measurements on fuel aerosol particles. Results of these activities are presented in the main body of this report. In addition, an appendix contains a compilation of experimental data on nuclear aerosols that have become available since the publication of a similar compilation in the previous annual report for this program.

- 2424 (NUREG/CR--0678) ANALYSIS OF THE HEAT AND MASS TRANSFER PROCESSES OF A UO_2 BUBBLE IN SODIUM FOR THE FUEL AEROSOL SIMULANT TEST (FAST). Tobias, M.L. (Oak Ridge National Lab., TN (USA)). 17 Apr 1979. Contract W-7405-ENG-26. 46p. (ORNL/NUREG/TN--307). Dep. NTIS, PC A03/MF A01.

The anticipated behavior of uranium oxide vapor bubbles produced by the capacitor discharge vaporization (CDV) method in the Fuel Aerosol Simulant Test (FAST) Facility is discussed on the basis of relatively simple physical models. Results of calculations for the rate of bubble rise and for heat and mass transfer rates are presented. Parametric studies indicate that future analysis efforts should emphasize the diffusion condensation process and the loss of heat from the bubble by radiation. Transfer of heat in the surrounding sodium is rapid enough that simplified models should be adequate. No important effects were noted in connection with bubble depth, initial quantity of UO_2 , or initial superheat.

- 2425 (NUREG/CR--0688) REACTOR SAFETY RESEARCH PROGRAMS. QUARTERLY PROGRESS REPORT, OCTOBER 1--DECEMBER 31, 1978. Agrawal, A.K.; Cerbone, R.J.; Jones, D.C. Jr.; Sastre, C.; Schweitzer, D.G.; van Rooyen, D. (Brookhaven National Lab., Upton, NY (USA)). Mar 1979. Contract EY-76-C-02-0016. 205p. (BNL-NUREG--50978). Dep. NTIS, PC A10/MF A01.

Current activities and technical progress are reported for the following projects: Gas Reactor Safety Evaluation; THOR Code Development; Code Review; SSC Code Development; LMFBR and LWR Safety Experiments; Fast Reactor Safety Code Validation; and Stress Corrosion Cracking of PWR Steam Generator Tubing.

- 2426 (NUREG/CR--0692) REPORTS DISTRIBUTED UNDER THE NRC REACTOR SAFETY RESEARCH FOREIGN TECHNICAL EXCHANGE PROGRAM. VOLUME VI, JULY--DECEMBER 1978. Queener, D.S. (Oak Ridge National Lab., TN (USA)). 6 Apr 1979. Contract W-7405-ENG-26. 111p. (ORNL/NUREG/NSIC--159; TID--3362(Vol.6)). Dep. NTIS, PC A06/MF A01.

Lists of documents exchanged during the second half of 1978 under agreements between the U.S. Nuclear Regulatory Commission's Office of Nuclear Regulatory Research and the

governments of France, Federal Republic of Germany, Japan, and the United Kingdom are presented. These agreements cover safety research on high-temperature gas-cooled reactors, light-water reactors, and fast reactors. During this period, the NRC received 46 reports from France, 72 from the Federal Republic of Germany, 43 from Japan, and 93 from the United Kingdom. In return, the NRC sent 177 U.S. light-water reactor safety research reports to each of these four countries, 26 fast reactor safety research reports to all except France, and 7 HTGR research reports to Japan.

2427 (NUREG/CR--0721) LMFBR FUEL ANALYSIS. TASK A: OXIDE FUEL DYNAMICS. FINAL REPORT, OCTOBER 1977--SEPTEMBER 1978. Dhir, V.K.; Frank, M.; Kastenber, W.E.; McKone, T.E. (California Univ., Los Angeles (USA)). Dept. of Chemical, Nuclear, and Thermal Engineering). Mar 1979. 85p. NTIS, PC A05/MF A01.

Three aspects of LMFBR safety are discussed. The first concerns the potential reactivity effects of whole core fuel motion prior to pin failure in low ramp rate transient overpower accidents. The second concerns the effects of flow blockages following pin failure on the coolability of a core following an unprotected overpower transient. The third aspect concerns the safety related implications of using thorium based fuels in LMFBR's.

2428 (NUREG/CR--0736) LMFBR FUEL ANALYSIS. TASK C: RELIABILITY. Cave, L.; Kastenber, W.E. (California Univ., Los Angeles (USA)). School of Engineering and Applied Science). Nov 1978. 28p. NTIS, PC A03/MF A01.

The work done by UCLA in the form of consultative support on a variety of topics is summarized briefly. In the case of one particular topic, the problem of establishing an adequate verification program for natural circulation in FFTF, a probabilistic approach was developed which may be of more general interest in relation to other fast reactors. The UCLA paper on this topic is reproduced as an Appendix to this report.

2429 (NUREG/CR--0737) LMFBR FUEL ANALYSIS. TASK B. POST-ACCIDENT HEAT REMOVAL. FINAL REPORT, OCTOBER 1977--NOVEMBER 1978. Catton, I.; Dhir, V.K.; Brinsfield, W.A.; McDonough, J.M.; Ostrander, N.D. (California Univ., Los Angeles (USA)). School of Engineering and Applied Science). Nov 1978. 77p. NTIS, PC A05/MF A01.

This Task B Annual Report presents a review of PAHR problems and UCLA views upon areas that include debris bed phenomena, molten pool growth, gas film boundaries and crusts, and the influence of basemat conduction upon pool formation and evolution. Directed toward FFTF applications, the review introduces plausible circumstances for the formation of non-coolable debris beds, and so leads to crude estimates of the initial dimensions of core debris distributions for pool growth problems. The GROWS code is reviewed and examples given using initial conditions derived from those estimates.

2430 (NUREG/CR--0740) 1978 ANNUAL REPORT: AEROSOL CHARACTERIZATION FROM A SIMULATED HCDA. Zanotelli, W.A.; Miller, G.D.; Johnson, E.W. (Mound Facility, Miamisburg, OH (USA)). Mar 1979. 33p. (MLM--2597). NTIS, PC A03/MF A01.

Simulated environmental conditions modelling the HCDA on a reduced scale have provided the

following information: Aerosols resulting from the condensation of gaseous constituents are generally spherical, small in diameter (0.01 to 0.25 μm), and branched chain-like structures. Electron diffraction analyses have identified actinide dioxides, the constituents of stainless steel, and various sodium actinates (uranates and zirconates). Some superstoichiometric oxides (UO_2 and U_3O_8) were noted also. X-ray analyses were not sensitive enough to verify presence of sodium uranates or plutonates. Electron diffraction of the plutonia-doped system should verify these components in this mixed-actinide system. Reaction products are kinetically controlled during cool-down rather than based upon equilibrium thermodynamics.

2431 (NUREG/CR--0752) LMFBR AEROSOL RELEASE AND TRANSPORT PROGRAM. QUARTERLY PROGRESS REPORT, OCTOBER--DECEMBER 1978. Kress, I.S.; Tobias, M.L. (Oak Ridge National Lab., TN (USA)). Jul 1979. Contract W-7405-ENG-26. 45p. (ORNL/NUREG/TM--318). Dep. NTIS, PC A03/MF A01.

This report summarizes progress for the Liquid-Metal Fast Breeder Reactor (LMFBR) Aerosol Release and Transport (ART) Program sponsored by the Division of Reactor Safety Research of the Nuclear Regulatory Commission (NRC) for the period October--December 1978. This program is designed to investigate radionuclide release and transport from LMFBRs for reactor events of severity up to and including hypothetical core-disruptive accidents (HCDAs). Program topics discussed include recent capacitor discharge vaporization (CDV) tests in the Fuel Aerosol Simulant Test (FAST)/Containment Research Installation (CRI-III) facility, including underwater and argon tests in the CRI-III vessel; sodium spray fire experiments in the Nuclear Safety Pilot Plant (NSPP); results from U_3O_8 aerosol tests in CRI-II using the dc plasma metal-oxygen torch, and development and testing of the dc plasma metal-oxygen torch for NSPP; and a parametric study of heat and mass transfer mechanisms for a UO_2 bubble rising in sodium.

2432 (NUREG/CR--0759) PHYSICS OF REACTOR SAFETY. QUARTERLY REPORT, OCTOBER--DECEMBER 1978. (Argonne National Lab., IL (USA)). Mar 1979. Contract W-31-109-ENG-38. 68p. (ANL--79-19). Dep. NTIS, PC A04/MF A01.

Progress is summarized in reactor-safety research and technical coordination of the RSQ safety analysis program, Monte Carlo analysis of safety-related critical assembly experiments, planning of safety-related critical experiments, and work on reactor core thermal hydraulics.

2433 (NUREG/CR--0760) SIMMER-II ANALYSIS OF THE R-7 TREAT TEST. Bohl, W.P. (Los Alamos Scientific Lab., NM (USA)). Mar 1979. Contract W-7405-ENG-36. 30p. (LA--7763-MS). Dep. NTIS, PC A03/MF A01.

The SIMMER-II code was used in a simulation of the R-7 loss-of-flow TREAT test. Comparison with the test scenario encompassed thermocouple data, flowmeter tracers, hodoscope data, and the posttest configuration. Reasonably successful results were obtained on the overall heat balance. The calculated boiling time was within 0.2 s of the experimental result, and respectable agreement with the integrated lower flowmeter trace was achieved over the first 2 s of boiling. Although the details of cladding relocation and blockage formation could not be well simulated, the calculated fuel motion appears to be plausible given the available

experimental information. It was further concluded that this type of study is quite useful for revealing areas for model improvement.

- 2434 (NUREG/CR--0780) ANALYSIS OF AEROSOL PARTICLES UNDERGOING GRAVITATIONAL AGGLOMERATION. ANNUAL PROGRESS REPORT, OCTOBER 1, 1977--SEPTEMBER 30, 1978. Loyalka, S.K. (Missouri Univ., Columbia (USA). Coll. of Engineering). Feb 1979. 109p. NTIS, PC A06/MF A01.

Progress is summarized in development of appropriate theoretical expressions for the collision efficiency of LMFBR aerosol particles of arbitrary shape undergoing gravitational agglomeration and in experimental work to verify the theoretical expressions.

- 2435 (NUREG/CR--0785) COMMIX-1: A THREE-DIMENSIONAL TRANSIENT SINGLE-PHASE COMPONENT COMPUTER PROGRAM FOR THERMAL-HYDRAULIC ANALYSIS. Sha, W.T.; Domanus, H.M.; Schmitt, R.C.; Oras, J.J.; Lin, E.I.H. (Argonne National Lab., IL (USA)). Sep 1978. Contract W-31-109-ENG-38. 122p. (ANL--77-96). Dep. NTIS, PC A06/MF A01.

A mathematical model, COMMIX-1 Computer Program, for three-dimensional, transient, single-phase, thermal-hydraulic analysis of reactor components is presented. A set of governing equations for the conservation of mass, momentum, and energy is solved as a boundary-value problem in space and as an initial-value problem in time. The model can treat both continuum (e.g., reactor plenum) and quasi-continuum (e.g., rod bundles or fuel assembly) sodium systems. Volume porosity, surface permeability, and distributed resistance are used in the quasi-continuum approach, which alleviates two inherent deficiencies associated with conventional subchannel analysis; one is the approximation used in the formulation of transverse momentum equations, the other is its inability of handling reverse flow or recirculatory flow.

- 2436 (NUREG/CR--0790) TOPICAL REPORT ON FUEL MOTION DIAGNOSTIC SYSTEMS. Wright, S.A. (ed.). (Sandia Labs., Albuquerque, NM (USA)). Oct 1979. Contract EY-76-C-04-0789. 75p. (SAND--79-0909). Dep. NTIS, PC A04/MF A01.
- Five papers are presented concerning the performance of fuel motion detection systems for LMFBR type reactors and test facilities.

- 2437 (NUREG/CR--0790, pp 13-24) DEVELOPMENT OF A CODED APERTURE FUEL MOTION DIAGNOSTICS SYSTEM FOR THE ACPR (UPGRADE). Kelly, J.G.; Stalker, K.T. (Sandia Labs., Albuquerque, NM). Oct 1979.

Topical report on fuel motion diagnostic systems.

As part of Sandia Laboratories' program to study simulated core disruptive accidents in reactor safety research, a fuel motion detection system based on coded aperture imaging is being developed for the Annular Core Pulsed Reactor (ACPR). Although fuel motion has been observed at the TREAT by the fast neutron hodoscope and with a Vidicon pinhole camera technique, the coded aperture system offers a potential for lower cost, higher spatial resolution, three dimensional imaging, and higher frame rates at lower fluences than either of the other techniques.

- 2438 (NUREG/CR--0790, pp 25-38) ANALOG AND DIGITAL RECONSTRUCTIONS OF FUEL PIN IMAGES

RECORDED WITH THE PROTOTYPE ACPR (UPGRADE) FUEL MOTION DIAGNOSTIC SYSTEM. Stalker, K.T.; Kelly, J.G. (Sandia Labs., Albuquerque, NM). Oct 1979.

Topical report on fuel motion diagnostic systems.

A coded aperture imaging system to provide time resolved images of LMFBR fuel rods undergoing simulated core disruptive accidents is being developed at Sandia Laboratories. The imaging results of the SPR-II and ACPR experiments are presented. How the information was decoded from the coded image is discussed. The results of two different methods of image reconstruction are presented and the relative merits of both approaches are discussed.

- 2439 (NUREG/CR--0790, pp 39-50) POTENTIAL FOR USING CODED APERTURE IMAGING FOR FUEL MOTION DETECTION MEASUREMENT IN THE STF. McArthur, D.A.; Halbleib, J.A. Sr.; Morel, J.E.; Kelly, J.G. (Sandia Labs., Albuquerque, NM). Oct 1979.

Topical report on fuel motion diagnostic systems.

At Sandia Laboratories, coded aperture imaging of both neutrons and γ -rays is being investigated for fuel motion detection in STF as part of the NRC Reactor Safety Research program. Based on work done for the development of a fuel motion detection system for the ACPR UPGRADE, coded aperture imaging of γ -rays will be capable of producing high-resolution images of at least up to seven fuel pins. However, because of the short mean free path of γ -rays in the test fuel, it is not clear that γ -ray imaging can provide useful information in the large-bundle tests to be made in STF. Investigation of these questions in detail has therefore commenced using γ -ray transport codes. Alternatively, fast neutrons have a somewhat longer mean free path than γ -rays, and it may be desirable to image with fast neutrons in the case of larger fuel bundles.

- 2440 (NUREG/CR--0790, pp 51-62) RELATION BETWEEN FUEL MOTION AND DETECTOR RESPONSE FOR IN-CORE FUEL MOTION DETECTION SYSTEMS. McDaniel, P.J. (Sandia Labs., Albuquerque, NM); Wright, S.A.; Scott, W.H. Jr. Oct 1979.

Topical report on fuel motion diagnostic systems.

The detection of fuel motion within test sections of reactors which have no slots (SLSF, EBR-II, SCARABEE) requires the use of an in-core fuel motion detection system. In-core systems can also be useful as auxiliary fuel motion monitoring systems for reactor facilities which do have slots. A supplementary in-core fuel motion detection system would be especially useful for large-bundle tests, since self-shielding effects may degrade the resolution of external viewing systems. With support from the US Nuclear Regulatory Commission, an experimental program is being conducted at Sandia to demonstrate the feasibility of in-core fuel motion detection systems. This program has two major developmental efforts. The first requires development of a suitable set of detectors, and the second requires development of analytical methods which can determine fuel motion from detector signals.

- 2441 (NUREG/CR--0790, pp 63-74) FLASH X-RADIOGRAPHY FOR MATERIAL MOTION DETECTION. Choate, L.M.; Buckalew, W.H.; Posey, L.D. (Sandia Labs., Albuquerque, NM). Oct 1979.

Topical report on fuel motion diagnostic systems.

The applicability of flash x-ray

cinematography for the detection of material motion during reactor safety experiments is being studied at Sandia Laboratories. As part of this study, a comparison is being made between conventional radiographic and coded source radiographic techniques. For the conventional radiographic technique, the effects of photon buildup and photon scattering upon spatial and areal density resolution capabilities in poor geometry situations are being evaluated. Two particular methods of producing a coded radiographic source are under investigation.

- 2442 (NUREG/CR--0799) EXPERIMENTAL INVESTIGATION OF AEROSOL BEHAVIOR IN A POST-LMFBR ACCIDENT REACTOR CONTAINMENT ATMOSPHERE. Wegrzyn, J.; Shaw, D.T. (State Univ. of New York, Buffalo (USA). Lab. for Power and Environmental Studies). Mar 1979. 52p. NTIS, PC A04/MF A01.

During the past year the following four tasks have been completed: (1) the generation, handling and study of a dry sodium aerosol, (2) the comparison and evaluation of techniques for the determination of the various sodium compounds, (3) the calibration of the impactor and centrifuge for a pool fire sodium aerosol, and finally (4) the determination of the shape factor and effective density of a sodium pool fire aerosol.

- 2443 (NUREG/CR--0816) PRETEST PREDICTION OF THE W-1 SLSF EXPERIMENT USING THE COMMIX-1A COMPUTER CODE. Domanus, H.M.; Chen, M.J.; Sha, W.T. (Argonne National Lab., IL (USA)). May 1979. Contract W-31-109-ENG-38. 105p. (ANL-CT--79-33). Dep. NTIS, PC A06/MF A01.

The numerical simulation of a 19-rod LMFBR fuel assembly undergoing a Loss of Piping Integrity (LOPI) transient has been carried out using the COMMIX-1A computer code. COMMIX-1A is a three-dimensional, transient, single-phase, thermal-hydraulic computer code. The results are compiled to form a pre-test prediction of the W-1 in-pile experiment which will begin in the near future. Since COMMIX-1A performs single-phase analyses, the simulation is terminated when boiling first occurs in the fuel assembly.

- 2444 (NUREG/CR--0820) ADVANCED REACTOR SAFETY RESEARCH DIVISION. QUARTERLY PROGRESS REPORT, JANUARY 1--MARCH 31, 1979. Romano, A.J. (comp.). (Brookhaven National Lab., Upton, NY (USA)). May 1979. Contract EY-76-C-02-0016. 135p. (BNL-NUREG--51014). Dep. NTIS, PC A07/MF A01.

The Advanced Reactor Safety Research Programs Quarterly Progress Report describes current activities and technical progress in the programs sponsored by the USNRC Division of Reactor Safety Research. The projects reported each quarter are the following: HTGR Safety Evaluation, SSC Code Development, LMFBR Safety Experiments and Fast Reactor Safety Code Validation.

- 2445 (NUREG/CR--0839) STUDY OF THERMAL AND HYDRODYNAMIC PROCESSES ASSOCIATED WITH MELTING OF HORIZONTAL SUBSTRATE. Taghavi-Tafreshi, K.; Dhir, V.K. (California Univ., Los Angeles (USA). School of Engineering and Applied Science). May 1979. 83p. NTIS, PC A05/MF A01.

The melting of a horizontal slab of frozen olive oil placed beneath a pool of warm water has been studied experimentally. The interfacial heat flux data are taken in quasi-static mode by noting the time rate change of

enthalpy of the pool of water. Because of little agitation of the pool due to low melt volume flux ($\rho_{\text{melt}}/\rho_{\text{water}} \approx 1.09$; $\Delta T = 5$ to 45K), the pool was found to stratify with time. Hence, heat transfer coefficient data have been based on both the mean pool temperature and the interfacial temperature. Visual observations show that melt removal is governed by Taylor instability and that melt releasing nodes lie about a Taylor wavelength apart. Predictions of the interface growth based on equilibrium between surface tension and buoyant forces have been made and found to compare well with the data obtained from the movies. The heat transfer coefficient data obtained at higher pool temperatures are also predicted well by the theoretical model.

- 2446 (NUREG/CR--0844) LMFBR AEROSOL RELEASE AND TRANSPORT PROGRAM. QUARTERLY PROGRESS REPORT, JANUARY--MARCH 1979. Kress, T.S.; Han, J.T. (Oak Ridge National Lab., TN (USA)). Aug 1979. Contract W-7405-ENG-26. 56p. (ORNL/NUREG/TM--329). Dep. NTIS, PC A04/MF A01.

This report summarizes progress for the Liquid-Metal Fast Breeder Reactor (LMFBR) Aerosol Release and Transport (ART) Program sponsored by the Division of Reactor Safety Research of the Nuclear Regulatory Commission (NRC) for the period January--March 1979. This program is designed to investigate radionuclide release and transport from LMFBRs for reactor events of severity up to and including hypothetical core-disruptive accidents (HCDAs). Program topics discussed include recent capacitor discharge vaporization (CDV) tests in the Fuel Aerosol Simulant Test (FAST)/Containment Research Installation (CRI-III) facility, including underwater and vacuum tests in the CRI-III vessel; fuel-oxide tests in the Nuclear Safety Pilot Plant (NSPP) using a newly installed dc plasma metal-oxygen torch; fuel-oxide aerosol size measurements using two different instruments in the CRI-II facility, and calculated results of average size and number of primary particles per aerosol agglomerate; an evaluation of the HAARM-3 code fallout model using NSPP data; and the development of a simple analytical method to estimate the buoyancy-induced air velocity in the NSPP tests.

- 2447 (NUREG/CR--0846) ANALYSIS OF ORNL PIPE RATCHETTING TESTS TTT-1 AND TTT-2. Swenson, D.V. (Sandia Labs., Albuquerque, NM (USA)). Jul 1979. Contract EY-76-C-04-0789. 33p. (SAND--79-1057). Dep. NTIS, PC A03/MF A01.

The benchmark problem described is based on an experiment performed at the Oak Ridge National Laboratory (ORNL) to obtain data for qualification of high temperature inelastic analysis methods. Both the material and loadings are representative of conditions in a Liquid Metal Fast Breeder Reactor. In the experiment two straight pipe test specimens were subjected to thermal downshocks, changes in internal pressure, and creep at elevated temperature. These loadings produced progressive inelastic deformations (ratchetting) of the test specimens.

- 2448 (NUREG/CR--0864) PHYSICS OF REACTOR SAFETY. QUARTERLY REPORT, JANUARY--MARCH 1979. (Argonne National Lab., IL (USA)). May 1979. Contract W-31-109-ENG-38. 45p. (ANL--79-37). Dep. NTIS, PC A03/MF A01.

This Quarterly progress report summarizes work done during the months of January--March 1979 in Argonne National Laboratory's Applied Physics and Components Technology Divisions for

the Division of Reactor Safety Research of the US Regulatory Commission. The work in the Applied Physics Division includes reports on reactor-safety research and technical coordination of the RSR safety analysis program by members of the Reactor Safety Appraisals Group, Monte Carlo analysis of safety-related critical assembly experiments by members of the Reactor Computations Group, and planning of safety-related critical experiments by members of the Zero Power Reactor (ZPR) Planning and Experiments Group. Work on reactor core thermal-hydraulics was performed in ANL's Components Technology Division.

- 2449 (NUREG/CR--0872) CRAB USER'S MANUAL. Jordan, H.; Gieseke, J.A.; Schumacher, P.M. (Battelle Columbus Labs., OH (USA)). May 1979. 30p. (BMI--2027). NTIS, PC A03/MF A01.

The CRAB reference code for contained aerosol behavior is described. The model equation used is presented and the numerical solution technique -- finite element discretization coupled with the GEAR ordinary differential equation solver -- is discussed briefly. A detailed account of this technique is contained in an earlier report. Input required by CRAB is given in detail, as is the result of a sample run. CRAB is intended to provide a best estimate of aerosol behavior in a homogeneously mixed containment as a reference for less rigorous but more practical codes.

- 2450 (NUREG/CR--0884) UPDATED WORK PLAN FOR THE FAST-CRI-III FUEL VAPORIZATION AND TRANSPORT EXPERIMENTS. Wright, A.L.; Smith, A.M. (Oak Ridge National Lab., TN (USA)). Oct 1979. Contract W-7405-ENG-26. 39p. (ORNL/NUREG/TM--326). Dep. NTIS, PC A03/MF A01.

This report presents the work plan for the Containment Research Installation-III (CRI-III) tests and the Fuel Aerosol Simulant Tests (FAST) which constitute tasks 4 and 5, respectively, of the Aerosol Release and Transport Program, sponsored by the Division of Advanced Reactor Safety Research of the Nuclear Regulatory Commission. Both tests utilize the capacitor discharge vaporization technique to place uranium dioxide fuel samples into the high energy states that could be produced in Liquid-Metal Fast Breeder Reactor hypothetical core-disruptive accidents. The FAST experiments described will be performed under water and under sodium. These tests will help to develop models to predict fuel aerosol source release in accidents and also to verify models in the SIMMER accident analysis code being developed at Los Alamos Scientific Laboratory. The CRI-III tests will be performed to develop the capability to simultaneously vaporize three fuel samples; in addition, special testing will answer questions related to previous argon energy density tests.

- 2451 (NUREG/CR--0900) EVALUATION OF MATERIALS FOR RETENTION OF SODIUM AND CORE DEBRIS IN REACTOR SYSTEMS. ANNUAL PROGRESS REPORT, SEPTEMBER 1977-DECEMBER 1978. Swanson, D.G.; Zehms, E.H.; McClelland, J.D.; Meyer, R.A.; van Paassen, H.L.L. (Aerospace Corp., El Segundo, CA (USA). Materials Sciences Lab.). Dec 1978. 49p. NTIS.

This report considers some of the consequences of a hypothetical core disruptive accident in a nuclear reactor. The interactions expected between molten core debris, liquid sodium, and materials that might be employed in an ex-vessel sacrificial-bed or in the reactor

building are discussed. Experimental work performed for NRC by Sandia Laboratories and Hanford Engineering Development Laboratory on the interactions between liquid sodium and basalt concrete is reviewed. Studies of molten steel interactions with concrete at Sandia Laboratories and molten UO_2 interactions with concrete at The Aerospace Corporation are also discussed. The potential of MgO for use in core containment is discussed and refractory materials other than MgO are reviewed. Finally, results from earlier experiments with molten core debris and various materials performed at The Aerospace Corporation are presented.

- 2452 (NUREG/CR--0906) DYNAMIC INTRAGRANULAR FISSION GAS BEHAVIOR MODEL. Catton, I.; Kastenber, W.E. (California Univ., Los Angeles (USA). School of Engineering and Applied Science). Jul 1979. 214p. NTIS.

A model for the non-equilibrium behavior of intragranular fission gas in oxide fuel is developed to study the fundamental phenomena that determine fission gas effects in the fuel. The model explicitly represents the dynamic behavior of point defects and includes the effects of variations in stoichiometry. The mathematics of the model use the principle of moments invariance to allow approximations that significantly reduce computational expense without sacrificing accuracy. The model is intended for use as a tool to identify and explore important variables in the behavior of fission gas and determine the regimes of validity of the various modeling assumptions. The Dynamic Intragranular Gas Release and Swelling (DIGRAS) computer code developed in this work is applicable to simulations of both steady-state and transient irradiations. Flexibility is built into the code and a summary of the physical process dynamics is included in the code output.

- 2453 (NUREG/CR--0914) VISUAL INVESTIGATION OF REACTOR FUELS RESPONSE TO SIMULATED LOF HEATING CONDITIONS, FIRST SERIES. Cano, G.L.; Ostensen, R.W.; Young, M.F. (Sandia Labs., Albuquerque, NM (USA)). Oct 1979. Contract EY-76-C-04-0789. 76p. (SAND--79-0940). Dep. NTIS, PC A05/MF A01.

In a loss-of-flow (LOF) accident in an LMFBR, the mode and timescale of disruption of fuel can establish the probability of a subsequent energetic excursion. To investigate these phenomena, in-pile disruption of internal-fission-heated fuel pellets, both fresh UO_2 and preirradiated mixed oxide, was recorded by high speed cinematography. Neither fuel frothing nor dust-cloud breakup occurred under the simulated LOF conditions. Instead massive and very rapid fuel swelling, not predicted by current transient fuel-swelling and gas-release models, occurred. This may be the initial and dominant mode of fuel disruption in a LOF. A new transient fuel-swelling model, FISGAS, has been developed at Sandia.

- 2454 (NUREG/CR--0951) COMPARISON OF PIPING MODELS FOR DIGITAL POWER PLANT SIMULATORS. Sowers, G.W. (Arizona Univ., Tucson (USA). Dept. of Nuclear Engineering). Aug 1979. 45p. NTIS.

Thesis.
Two piping models intended for use in a digital power plant simulator are compared. One is a finite difference approximation to the partial differential equation called PIPE, and the other is a function subroutine that acts as a delay operator called PDELAY. The two models are compared with respect to accuracy and execution time. In addition, the stability of

the PIP3 model is determined. The PDELAY model is found to execute faster than the PIPE model with comparable accuracy.

- 2455 (NUREG/CR--0984(Vol.10)) ADVANCED REACTOR SAFETY RESEARCH. QUARTERLY REPORT, APRIL-JUNE 1979. (Sandia Labs., Albuquerque, NM (USA)). Nov 1979. Contract EY-76-C-04-0789. 228p. (SAND--79-1597(Vol.10)). Dep. NTIS, PC A11/MF A01.

Progress in LMFBR safety research is summarized for the following study areas: accident energetics; fuel dynamics; core debris behavior; aerosol source normalization; containment analysis; elevated temperature design assessment; LMFBR accident delineation; and test and facility technology.

- 2456 (NUREG/CR--1002) URANIUM AND SODIUM OXIDE AEROSOL EXPERIMENTS: NSPP TESTS 201-203 AND TESTS 301-302, DATA RECORD REPORT. Adams, R.E.; Kress, T.S.; Han, J.T.; Parsly, L.F. Jr. (Oak Ridge National Lab., TN (USA)). Nov 1979. Contract W-7405-ENG-26. 88p. (ORNL/NUR3G/TM--343). Dep. NTIS, PC A05/MF A01.

This data record report summarizes the first three uranium oxide aerosol tests and two preliminary mixed uranium oxide-sodium oxide aerosol tests conducted in the Nuclear Safety Pilot Plant project at Oak Ridge National Laboratory. The goal of the project is to establish the validity (or level of conservatism) of the aerosol behavioral code, HAARM-3, and follow-on codes under development at the Battelle Columbus Laboratories for the US Nuclear Regulatory Commission. Included in the report are descriptions of the five tests, together with tables and graphs summarizing the results.

- 2457 (NUREG/CR--1027) DISASSEMBLY PHASE ENERGETICS: AN EXAMINATION OF THE IMPACT OF SIMMER MODELS AND ASSUMPTIONS. Henninger, R.J.; Alcouffe, R.E. (Los Alamos Scientific Lab., NM (USA)). Sep 1979. Contract W-7405-ENG-36. 57p. (LA--7998-MS). Dep. NTIS, PC A04/MF A01.

We present an assessment of several aspects of material motion as predicted by the SIMMER code during the disassembly and early transition phase of an unprotected loss of flow transient in a liquid metal cooled advanced reactor. We divide the study into the fuel expansion phase of an energetic disassembly and into the early fuel motion stage of subassembly scale pin disruption under the forces of fission gas dispersal and sodium vapor flow. In the expansion phase we concentrate mainly on assessing the SIMMER estimates of energy partitioning of the expanding fuel bubble through the upper core and internal structures which may typically be present. Comparison with simple models leads us to conclude that the SIMMER formulation predicts a reasonable energy partition when heat transfer is not taken into account. The modeling of heat transfer is so complex that no general statement about the physical realizability of the SIMMER predicted energy partition due to the effect can now be made. This is particularly true when fuel to sodium heat transfer is assumed. We compared the subassembly scale early fuel motion with that given by the SLUMPY module in the SAS3A code. We find that SLUMPY may greatly overpredict the extent and magnitude of fuel motion in the time scales involved under LOF conditions using the nominal SLUMPY parameters.

- 2458 (NUREG/CR--1036) ADVANCED REACTOR

SAFETY RESEARCH DIVISION QUARTERLY PROGRESS REPORT, APRIL 1-JUNE 30, 1979. Agrawal, A.K.; Cerbone, R.J.; Jones, D.C. Jr.; Schweitzer, D.G. (Brookhaven National Lab., Upton, NY (USA)). Sep 1979. Contract EY-76-C-02-0016. 98p. Dep. NTIS, PC A05/MF A01.

Information is presented concerning HTGR fission product release and transport; properties of HTGR materials; LMFBR accident analysis; and SSC code development.

- 2459 (NUREG/CR--1058) IMPACT OF SIMMER-II MODEL UNCERTAINTIES ON PREDICTED POSTDISASSEMBLY DYNAMICS. Bell, C.R.; Burns, R.D. III; Luck, L.B. (Los Alamos Scientific Lab., NM (USA)). Oct 1979. Contract W-7405-ENG-36. 60p. (LA--8053-MS). Dep. NTIS, PC A04/MF A01.

The SIMMER-II calculation of the system kinetic energy developed during a voided core postdisassembly expansion in a hypothetical loss of flow (LOF) accident sequence gives results which are more than an order of magnitude below that for an ideal expansion. This work attempts to determine the extent to which uncertainties in the various phenomenological models in SIMMER-II influence the calculated results. A series of 15 separate SIMMER-II calculations were designed to make this assessment. The system kinetic energies which resulted ranged from 2.5 to 20 MJ compared to 100 MJ for the ideal expansion. It is concluded that experimental research in the area of voided core expansions should entail a balance between two areas. First, experiments should be performed that test the major uncertainties in the sequence of events as outlined in this report. Second, in order to increase confidence in the ability of SIMMER to predict other classes of expansion, testing of isolated phenomenological models should proceed.

- 2460 (NUREG/CR--1062) LMFBR AEROSOL RELEASE AND TRANSPORT PROGRAM. QUARTERLY PROGRESS REPORT, APRIL-JUNE 1979. Kress, T.S.; Wright, A.L. (Oak Ridge National Lab., TN (USA)). Jan 1980. Contract W-7405-ENG-26. 50p. (ORNL/NUREG/TM--354). Dep. NTIS, PC A03/MF A01.

This program is designed to investigate radionuclide release and transport from LMFBRs for reactor events of severity up to and including hypothetical core-disruptive accidents (HCDAs). Program topics discussed include recent capacitor discharge vaporization (CDV) tests in the Fuel Aerosol Simulant Test (FAST)/Containment Research Installation-III (CRI-III) facility, including underwater tests in the FAST vessel and underwater and vacuum tests in the CRI-III vessel; preliminary results from three Nuclear Safety Pilot Plant (NSPP) uranium oxide aerosol tests using the dc plasma metal-oxygen torch as an aerosol generator; results from CRI-III sodium oxide aerosol tests using the liquid-metal-spray sodium oxide aerosol generator; results from the normalization of the spiral-duct centrifuge calibration at different speeds; and the presentation of possible methods for calculating the rise in water temperature at the bubble vapor-liquid interface in FAST water experiments.

- 2461 (NUREG/CR--1084) AEROSOL MEASUREMENTS AND MODELING FOR FAST REACTOR SAFETY. QUARTERLY PROGRESS REPORT, OCTOBER 1-DECEMBER 31, 1978. Gieseke, J.A.; Lee, K.W.; Jordan, H. (Battelle Columbus Labs., OH (USA)). Oct 1979. 34p. (BNI--2024). NTIS. Technical progress during the quarter is

- described on the HAARM-3 computer code calculations and related subjects. THE HAARM-3 calculation results for the postulated accident as specified by the Committee on the Safety of Nuclear Installations are presented. Included also are the results of parametric studies with HAARM-3 on the geometry of Nuclear Safety Pilot Plant, and the progress in formulating a procedure for validating the HAARM-3 code.
- 2462 (NUREG/CR--1096) PHYSICS OF REACTOR SAFETY. QUARTERLY REPORT, APRIL-JUNE 1979. (Argonne National Lab., IL (USA)). Aug 1979. Contract W-31-109-ENG-38. 61p. (ANL--79-79). Dep. NTIS, PC A04/MF A01.
- This Quarterly progress report summarizes work done during the months of April-June 1979 in Argonne National Laboratory's Applied Physics and Components Technology Divisions for the Division of Reactor Safety Research of the US Nuclear Regulatory Commission. The work in the Applied Physics Division includes reports on reactor-safety research and technical coordination of the RSR safety analysis program by members of the Reactor Safety Appraisals Group, Monte Carlo analysis of safety-related critical assembly experiments by members of the Reactor Computations Group, and planning of safety-related critical experiments by members of the Zero Power Reactor (ZPR) Planning and Experiments Group. Work on reactor core thermal-hydraulics was performed in ANL's Components Technology Division.
- 2463 (NUREG/CR--1101) REPORTS DISTRIBUTED UNDER THE NRC REACTOR SAFETY RESEARCH FOREIGN TECHNICAL EXCHANGE PROGRAM. VOL. VII (JANUARY-JUNE 1979). Queener, D.S. (Oak Ridge National Lab., TN (USA)). Nov 1979. Contract W-7405-ENG-26. 91p. (ORNL/NUREG/NSIC--170; TID--3362(Vol.7)). Dep. NTIS, PC A05/MF A01.
- Lists of documents exchanged during the first half of 1979 under agreements between the US Nuclear Regulatory Commission's Office of Nuclear Regulatory Research and the governments of France, Federal Republic of Germany, Japan, and the United Kingdom are presented. These agreements cover safety research on high-temperature gas-cooled reactors (HTGR), light-water reactors, and fast reactors. During this period, the NRC received 43 reports from France, 81 from the Federal Republic of Germany, 17 from Japan, and 84 from the United Kingdom. In return, the NRC sent 163 United States light-water reactor safety research reports to each of these four countries, 50 fast reactor safety research reports to all except France, and 8 HTGR research reports to Japan.
- 2464 (NUREG/CR--1123) FUEL AEROSOL SIMULANT TEST DATA RECORD REPORT: ARGON TESTS. Wright, A.L.; Smith, A.M.; Rochelle, J.M.; Kress, T.S. (Oak Ridge National Lab., TN (USA)). Mar 1980. Contract W-7405-ENG-26. 67p. (ORNL/NUREG/TM--365). Dep. NTIS, PC A04/MF A01.
- This data record summarizes 13 uranium dioxide (UO_2) vaporization experiments performed in an argon gas environment in the Fuel Aerosol Simulant Test (FAST) project. The FAST project is part of the ORNL Aerosol Release and Transport Program sponsored by the Division of Reactor Safety Research of the Nuclear Regulatory Commission. The argon test series was performed to determine the influence of argon gas pressure and temperature on the mass of fuel vaporized and on the fuel aerosol size distribution produced for various amounts of energy injected into the fuel sample.
- Included in the report are descriptions of the 13 tests along with tables and graphs summarizing the results.
- 2465 (NUREG/CR--1124) FISGAS: A CODE FOR FISSION-GAS MIGRATION AND FUEL SWELLING IN AN LMFBR ACCIDENT. Ostensen, R.W. (Sandia Labs., Albuquerque, NM (USA)). Nov 1979. Contract EY-76-C-04-0789. 82p. (SAND--78-1790). Dep. NTIS, PC A05/MF A01.
- A new computer program, FISGAS, has been written to model the microscopic behavior of fission-gas in uranium dioxide reactor fuel and its effect on the macroscopic swelling of that fuel in a reactor accident. A radial multinode capability is provided. Separate calculations are provided for gas bubble motion and coalescence and gas transfer inside the grain, on the grain face, and on the grain edge. Microscopic modeling of the gas bubbles includes vacancy-flow restriction on the bubble size and macroscopic pressure field restraint on bubble growth. The pressure field is controlled by the fuel swelling rate which is limited by macroscopic creep. FISGAS is primarily designed to provide a diagnostic tool for the Fuel Disruption test series being performed in the Annular Core Research Reactor at Sandia Laboratories.
- 2466 (NUREG/CR--1134) POSSIBLE MECHANISMS FOR THE FORMATION OF THE OBSERVED AND EXPECTED COMPOUNDS DURING A HYPOTHETICAL CORE DISRUPTIVE ACCIDENT (HCDA). Zanotelli, W.A.; Miller, G.D. (Mound Facility, Miamisburg, OH (USA)). Oct 1979. Contract EY-76-C-04-0053. 23p. (MLM--2637). Dep. NTIS, PC A02/MF A01.
- Results are presented for an evaluation of the thermodynamics and kinetics of the possible chemical reactions which may occur in an HCDA bubble environment during its transport within, and following, its release from the reactor primary system.
- 2467 (NUREG/CR--1160) LMFBR SAFETY. 7. REVIEW OF CURRENT ISSUES AND BIBLIOGRAPHY OF LITERATURE (1978). Buchanan, J.R.; Keilholtz, G.W. (Oak Ridge National Lab., TN (USA)). Jan 1980. Contract W-7405-ENG-26. 85p. (ORNL/NUREG/NSIC--166; ORNL/NUREG/NSIC--125(Vol.7)). Dep. NTIS, PC A05/MF A01.
- This report discusses the current status of liquid-metal fast breeder reactor (LMFBR) development. Selected bibliographic information on LMFBRs relative to the development and safety of the breeder reactor is presented for the year 1978. The bibliography consists of approximately 127 abstracts covering research and development, operating experience, and design practices. Keyword, author, and permuted-title indexes are included for completeness.
- 2468 (NUREG/CR--1165) AEROSOL MEASUREMENTS AND MODELING FOR FAST REACTOR SAFETY. QUARTERLY PROGRESS REPORT, JANUARY 1-MARCH 31, 1979. Gieseke, J.A.; Jordan, H.; Lee, K.W. (Battelle Columbus Labs., OH (USA)). Nov 1979. 37p. NTIS.
- Technical progress during the quarter covered by this report was made in areas of the HAARM-3 calculations for postulated accidents, sensitivity analysis of the code, formulation of the HAARM-3 code validation procedure, and reference code development.
- 2469 (NUREG/CR--1213) ANS54: A COMPUTER SUBROUTINE FOR PREDICTING FISSION GAS RELEASE. Rausch, W.N.; Panisko, F.E. (Battelle Pacific Northwest Labs., Richland, WA (USA)). Jan

1980. Contract EY-76-C-06-1830. 24p. (PNL-3077). Dep. NTIS, PC A02/MF A01.

The ANS5.4 committee developed fission gas release models for stable and radioactive species for both low and high temperatures. This report reproduces these models and presents a FORTRAN coding of the models. The coding comprises subroutine ANS54 which is in a format suitable for direct insertion into a code like FRAPCON. Also shown are comparisons of model predictions with light water reactor low burnup data and liquid metal fast breeder reactor high burnup data that were used in the model development.

2470 (NUREG/CR--1252) PHYSICS OF REACTOR SAFETY. QUARTERLY REPORT, JULY-SEPTEMBER 1979. (Argonne National Lab., IL (USA)). Nov 1979. Contract W-31-109-ENG-38. 39p. (ANL--79-98). Dep. NTIS, PC A03/MF A01.

The work in the Applied Physics Division includes reports on reactor safety research and technical coordination of the RSR safety analysis program by members of the Reactor Safety Appraisals Group, Monte Carlo analysis of safety-related critical assembly experiments by members of the Reactor Computations Group, and planning of safety-related critical experiments by members of the Zero Power Reactor (ZPR) Planning and Experiments Group. Work on reactor core thermal-hydraulics was performed in ANL's Components Technology Division.

2471 (NUREG/CR--1285) COMPUTATIONAL RESULTS FOR A 7-PIN HEXAGONAL FUEL ASSEMBLY DURING A FLOW RUNDOWN TRANSIENT USING THE COMMIX-1A COMPUTER CODE. Domanus, H.M.; Chen, M.J.; Sha, W.T. (Argonne National Lab., IL (USA)). Jan 1980. Contract W-31-109-ENG-38. 52p. (ANL-CT--80-10). Dep. NTIS, PC A04/MF A01.

The numerical simulation of a 7-pin LMFBF fuel assembly undergoing flow rundown transients has been carried out using the COMMIX-1A computer code. This code performs three-dimensional, transient, single-phase thermal-hydraulic simulations. Transient results have been obtained for two different operating conditions. The computed transient temperatures compare favorably with the experimental measurements.

2472 (NUREG/CR--1294) MULTIPLE ZONE AEROSOL BEHAVIOR MODEL. Jordan, H.; Schumacher, P.M.; Gieseke, J.A.; Lee, K.W. (Battelle Columbus Labs., OH (USA)). Jan 1980. 37p. (BML--2042). NTIS.

The localized nature of the aerosol source of some LMFBF accident scenarios, such as a sodium pool fire in the containment of an LMFBF, contradicts a basic assumption of all presently employed nuclear aerosol behavior codes. This assumption was tested by creating a cellular model, the ZONE code, which accounts for spatial inhomogeneities in an approximate fashion. Calculations using ZONE and a homogeneous (QUICK code) model show that the homogeneous model gives consistently conservative results. This conservatism never exceeds a factor of about 2 for full scale reactor containments. Once the sodium fire extinguishes, the cellular and homogeneous models agree very closely.

2473 (NUREG/CR--1323) SIMULATION OF A THERMOHYDRAULIC TRANSIENT IN A PIPE USING THE COMMIX-1A COMPUTER CODE. Chen, M.J.; Domanus, H.M.; Sha, W.T. (Argonne National Lab., IL (USA)). Feb 1980. Contract W-31-109-ENG-38. 82p. (ANL-CT--80-15). Dep. NTIS, PC A05/MF

A01.

The numerical simulation of a section of a LMFBF intermediate pipe loop during a typical CRBR scram has been carried out using the COMMIX-1A computer code. COMMIX-1A is a three dimensional, transient, single-phase component computer code with both Cartesian and cylindrical coordinates for thermal hydraulic analysis. A considerable top to bottom temperature differences in the pipe is found as a result of flow stratification. The top to bottom temperature difference can be as high as approximately 50% of the temperature difference of the forcing function employed in the transient.

2474 (NYO--3930-11) LIQUID METAL BEARINGS TECHNOLOGY FOR LARGE, HIGH-TEMPERATURE, SODIUM ROTATING MACHINERY. DEVELOPMENT AND TEST OF HIGH-TEMPERATURE PROXIMITY PROBE FOR USE IN LIQUID SODIUM. FOURTH TOPICAL REPORT. Hoogenboom, I.; Kissinger, C. (Mechanical Technology, Inc., Latham, NY (USA)). Jun 1971. 148p. (MTI--71TR27). Dep. NTIS, PC A07/MF A01.

An inductance-type, proximity-probe system for measurement of bearing film thicknesses and shaft orbits in high-temperature, liquid-sodium environment has been developed, built and tested. The probe system is designed to operate at temperatures up to 1200°F and gap range of 0.004" to 0.080", with good linearity over about three-quarters of the range, when using probe pairs connected in push-pull. The probes were tested extensively in both gas and sodium environments, culminating in a 684 hours continuous test in a temperature range of 1050°F to 1170°F. The probes operated stably, repeatedly and without undergoing performance changes.

2475 (ORAU/IEA--79-2(M)) DOMESTIC AND INTERNATIONAL DEPLOYMENT OF REACTOR SYSTEMS: STATUS AND RATIONALE. Barkenbus, J.N.; Ohanian, M.J. (Oak Ridge Associated Universities, Inc., TN (USA). Inst. for Energy Analysis). Jan 1979. Contract EY-76-C-05-0033. 35p. Dep. NTIS, PC A03/MF A01.

The objectives of this report are to summarize the existing and projected world nuclear capacity by country and by reactor type, to examine the reasons for the ascendancy gained by light water reactors (LWRs), and to consider factors that might be relevant to the deployment of future nuclear energy systems.

2476 (ORNL--5062/R1) VENTURE: A CODE BLOCK FOR SOLVING MULTIGROUP NEUTRONICS PROBLEMS APPLYING THE FINITE-DIFFERENCE DIFFUSION-THEORY APPROXIMATION TO NEUTRON TRANSPORT, VERSION II. Vondy, D.R.; Fowler, T.B.; Cunningham, G.W. (Oak Ridge National Lab., TN (USA)). Nov 1977. Contract W-7405-ENG-26. vp. Dep. NTIS, PC A16/MF A01.

The report documents the computer code block VENTURE designed to solve multigroup neutronics problems with application of the finite-difference diffusion-theory approximation to neutron transport (or alternatively simple P_1) in up to three-dimensional geometry. It uses and generates interface data files adopted in the cooperative effort sponsored by the Reactor Physics Branch of the Division of Reactor Research and Development of the Energy Research and Development Administration. Several different data handling procedures have been incorporated to provide considerable flexibility; it is possible to solve a wide variety of problems on a variety of computer configurations relatively efficiently.

- 2477 (ORNL--5178) TSF MEASUREMENTS OF NEUTRON TRANSMISSION THROUGH AN AI-LMFBR LOWER AXIAL SHIELD MOCKUP. 189A NO. 10028, ACTIVITY NO. HN 04 01 01 1. Clifford, C.E.; Muckenthaler, F.J.; Stevens, P.N. (Oak Ridge National Lab., TN (USA)). Aug 1977. Contract W-7405-ENG-26. 128p. AT.

The results are presented of an experiment performed at the ORNL Tower Shielding Facility to measure neutron transmission through a mockup of a blanket=shield assembly designed by Atomics International for the lower axial region of the Liquid Metal Fast Breeder Reactor demonstration plant. The neutron source for the experiment was a collimated beam from the Tower Shielding Reactor II modified to simulate the energy spectrum of a fast reactor. The mockup contained a UO₂ blanket region and a sodium=flow transition region, both of which were penetrated by a cylindrical plug simulating various conditions in a central control=rod channel, plus upper and lower grid plates separated by a sodium plenum region. Measurements were made of the fluence and energy spectra of neutrons both within and emerging from several different configurations comprised of sections of the mockup. The complete set of data obtained in the experiment are presented.

- 2478 (ORNL--5181) ANALYSIS OF THE ZPR-9 REVERSE APPROACH TO CRITICAL (RAC) LOW LEVEL FLUX MONITOR EXPERIMENT. Selby, D.L.; Flanagan, G.F.; Fox, P.B.; Simpson, D.B. (Oak Ridge National Lab., TN (USA)). Jul 1979. Contract W-7405-ENG-26. 37p. AT.

An experiment was performed in the ZPR-9 facility at Argonne National Laboratory to determine the adequacy of the ex=core Low Level Flux Monitors (LLFMs) for monitoring the initial approach to critical in the Fast Flux Test Facility (FFTF). While the purpose of the LLFMs (which are located in the radial shield) is to monitor refueling operations, if they prove to be adequate for monitoring the initial loading operation they would be more convenient and less expensive than in=core detectors. From the analysis performed it was determined that the detectors were located so close to the core that spatial effects in the core became a dominant factor. The detector response was influenced more by localized events than by events occurring over the core as a whole. This made interpretation very difficult, if not impossible.

- 2479 (ORNL--5229/R1) INPUT DATA REQUIREMENTS FOR SPECIAL PROCESSORS IN THE COMPUTATION SYSTEM CONTAINING THE VENTURE NEUTRONICS CODE. Vondy, D.R.; Fowler, T.B.; Cunningham, G.W. (Oak Ridge National Lab., TN (USA)). Jul 1979. Contract W-7405-ENG-48. 51p. Dep. NTIS, PC A04/MF A01.

User input data requirements are presented for certain special processors in a nuclear reactor computation system. These processors generally read data in formatted form and generate binary interface data files. Some data processing is done to convert from the user oriented form to the interface file forms. The VENTURE diffusion theory neutronics code and other computation modules in this system use the interface data files which are generated.

- 2480 (ORNL--5255, pp 368-376) METALLURGICAL CHARACTERIZATION OF PROTOTYPIC TUBESHEET FORGING. Offer, H.P. Mar 1977.

Mechanical properties test data for structural materials. Quarterly progress report for period ending January 31, 1977.

Study of vacuum=arc=remelted 2 1/4 Cr=1 Mo steel tubesheet for the CRBR steam generator is reported. The microstructure resulting from heat treatment is shown; proeutectoid ferrite is the predominant phase. The flow pattern of the metal during closed=die, hot forging is represented schematically. Results of an inclusion content determination are tabulated. 3 figures, 1 table. (RWR)

- 2481 (ORNL--5255, pp 2-10) MECHANICAL PROPERTY PROGRAM OF ALLOY 718. Korth, G.E.; Smolik, G.R. Mar 1977.

Mechanical properties test data for structural materials. Quarterly progress report for period ending January 31, 1977.

Creep=rupture tests were performed on several heats given the conventional (1750°F) heat treatment. Elongation and time to rupture are tabulated for tests at 1200, 1350, and 1400°F; also rupture life is plotted vs stress. 0.2% yield stress, ultimate tensile strength, and elongation are tabulated for room=temperature tensile test data. Tests were conducted to determine which type of strain=controlled loading is the most damaging to alloy 718 in a creep=fatigue test. Results on stresses, cycles to failure, time to failure, etc., are tabulated. 2 figures, 4 tables. (RWR)

- 2482 (ORNL--5255, pp 11-28) LOW-CYCLE FATIGUE OF TYPE 16-8-2 STAINLESS STEEL WELD METAL. Raske, D.T. Mar 1977.

Mechanical properties test data for structural materials. Quarterly progress report for period ending January 31, 1977.

Data on the suitability of type 16-8-2 stainless steel as a filler metal for joining type 316 stainless steel in the fabrication of the CRBRP thermal liner were obtained. Continuous=cycling and 360=s tension hold=time fatigue tests on weld specimens are reported; tests were conducted in air at 593°C and a strain rate of 4×10^{-3} s⁻¹. Stresses and fatigue life are tabulated. Fatigue properties and cycle life were better than those of type 316 stainless steel. Monotonic 0.2% offset yield strength is higher in root weld metal than surface weld metal; however, the elastic moduli of samples from the two locations are the same. 8 figures, 2 tables. (RWR)

- 2483 (ORNL--5255, pp 28-36) APPLICATION OF DAMAGE=RATE APPROACH TO CREEP-FATIGUE LIFE PREDICTION ANALYSIS IN DIFFERENT HEATS OF TYPE 304 STAINLESS STEEL. Malya, P.S.; Majumdar, S. Mar 1977.

Mechanical properties test data for structural materials. Quarterly progress report for period ending January 31, 1977.

The damage=rate approach and its use are briefly summarized. Stress=relaxation data from hold=time experiments on three heats of type 304 stainless steel are tabulated. Calculated fatigue life is plotted vs the experimental value for tensile and compressive hold=time tests. Time to rupture is shown as a function of plastic strain rate. 4 figures, 1 table. (RWR)

- 2484 (ORNL--5255, pp 35-49) INTERPRETATION OF HIGH-TEMPERATURE CREEP OF TYPE 304 STAINLESS STEEL. Chopra, O.K.; Natesan, K. Mar 1977.

Mechanical properties test data for structural materials. Quarterly progress report for period ending January 31, 1977.

Second=stage creep behavior of type 304 stainless steel is evaluated in terms of a theory incorporating both dislocation=glide and recovery creep theories of steady=state creep.

- The applied stress dependence of the creep rate is examined in terms of the measured effective and internal stresses. The observed value of apparent activation energy is related to the true activation energy for the rate-controlling process for high-temperature creep. 9 figures, 2 tables. (RWR)
- 2485 (ORNL--5255, pp 53-56) INFLUENCE OF SODIUM ENVIRONMENT ON THE LOW-CYCLE FATIGUE BEHAVIOR OF AUSTENITIC STAINLESS STEEL. Smith, D.L.; Zeman, G.J. Mar 1977.
Mechanical properties test data for structural materials. Quarterly progress report for period ending January 31, 1977.
The creep-fatigue interaction of annealed type 304 stainless steel at 600°C was investigated. Low-frequency fatigue tests were conducted at a strain rate of $4 \times 10^{-5} \text{ s}^{-1}$ in sodium that contained 0.3 ppm carbon. For a total strain range of 1.1%, the fatigue lifetime was a factor of 2 lower than at $4 \times 10^{-3} \text{ s}^{-1}$. However, no effect of strain rate was observed at 0.94% strain range. Substantial differences in the plastic strain-range behavior were observed for the two rates. 2 figures. (RWR)
- 2486 (ORNL--5255, pp 58-64) FLOW AND FAILURE CRITERIA: INFLUENCE OF STRAIN RATE AND TEST TEMPERATURE ON DUCTILITY OF TYPES 304 AND 316 STAINLESS STEEL. Sikka, V.K.; Stephenson, R.L. Mar 1977.
Mechanical properties test data for structural materials. Quarterly progress report for period ending January 31, 1977.
Three-dimensional and isothermal plots are presented for uniform and total elongation and reduction of area for annealed type 316 stainless steel. The tensile strain rate varied over six orders of magnitude, and the test temperature ranged from 0 to 800°C. The observed quantities all showed high values, essentially independent of test temperature. 6 figures. (RWR)
- 2487 (ORNL--5255, pp 65-67) COMPLEX MATERIALS BEHAVIOR STUDIES IN SUPPORT OF DESIGN METHODS DATA LIST USING REFERENCE HEATS: COMPRESSIVE CREEP OF 16-MM (5/8-IN.) PLATE OF TYPE 316 STAINLESS STEEL REFERENCE HEAT. Sikka, V.K.; Baldwin, R.H. Mar 1977.
Mechanical properties test data for structural materials. Quarterly progress report for period ending January 31, 1977.
Problems in compressive creep testing are mentioned. An axial specimen of 0.25 in. diameter and 0.40 in. length was loaded to 15.5 ksi at 1100°F. Compressive strain-time data are plotted, and a photograph of the specimen after testing is shown. 3 figures. (RWR)
- 2488 (ORNL--5255, pp 67-90) MECHANICAL PROPERTY CHARACTERIZATION OF TYPE 316 STAINLESS STEEL REFERENCE HEAT. Sikka, V.K.; Baldwin, R.H.; Patton, E.B. Mar 1977.
Mechanical properties test data for structural materials. Quarterly progress report for period ending January 31, 1977.
Pipes, plates, and bars were reannealed at 1950°F for 0.5 h, then tensile tested at 77, 400, 800, 1100, and 1200°F at a strain rate of 0.0044/min. 0.2% yield stress, ultimate tensile strength, uniform and total elongation, and reduction of area are plotted, tabulated, and discussed for the various test temperatures. Reannealing lowered the yield strength, while ultimate tensile strength was not significantly affected. Data are also presented for each form from creep testing at 1100°F and 35.0 ksi; average time to rupture was 398 h. Tensile properties of 5/8-in. plates were measured for strain rates ranging from 0.22 to 0.00044 min⁻¹; temperature dependence of yield stress, ultimate tensile stress, elongation, and reduction of area are reported for the various strain rates. 18 figures, 5 tables. (RWR)
- 2489 (ORNL--5255, pp 90-97) ELASTIC PROPERTIES OF ENGINEERING CONSTRUCTION MATERIALS. Hammond, J.P. Mar 1977.
Mechanical properties test data for structural materials. Quarterly progress report for period ending January 31, 1977.
The dynamic elastic constants were determined for 9 Cr--1 Mo steel plate from 24 to 649°C (75 to 1200°F) by acoustical methods. Also, the static Young's moduli at room temperature were determined for mild carbon steel and Inconel 718 by use of a mechanical extensometer fitted with the LVDT strain sensors. The latter may be used as the 'X₀' values in the cubic polynomials for representing Young's modulus as a function of temperature for these alloys. Results for 9 Cr--1 Mo steel were compared with those for 2 1/4 Cr--1 Mo steel. 1 figure, 5 tables. (RWR)
- 2490 (ORNL--5255, pp 97-100) INCONEL ALLOY 718 MECHANICAL AND PHYSICAL PROPERTY PROGRAM. Roche, T.K.; Feltner, J.C. Mar 1977.
Mechanical properties test data for structural materials. Quarterly progress report for period ending January 31, 1977.
Creep-rupture tests were carried out from 1000 to 1400°F for stresses up to 150 ksi. Rupture time, elastic and plastic strains, and creep rate are tabulated. Temperature dependence of rupture properties was indicated. 1 figure, 1 table. (RWR)
- 2491 (ORNL--5255, pp 101-120) MECHANICAL AND METALLURGICAL BEHAVIOR OF WELDMENTS FOR LMFBR. Goodwin, G.M.; Brinkman, C.R. Mar 1977.
Mechanical properties test data for structural materials. Quarterly progress report for period ending January 31, 1977.
(I) Creep-rupture properties of type 16-8-2 stainless steel submerged-arc weld specimens with type 316 stainless steel base metal were measured. (II) Creep-rupture tests of CPF8 and CPF8M centrifugally cast pipe were performed at 1000 and 1200°F; data on strain, time to rupture, etc., are tabulated. Ductility at rupture and creep strain to rupture are plotted. (III) Tangential modulus of elasticity was determined for CPF8 and CPF8M piping, along with elastic compliance matrices. The results showed the importance of considering anisotropy in stress analyses for these materials. (IV) Variation of ultrasonic velocities with orientation in a multipass Inconel 82 weldment was measured. Both longitudinal and shear wave velocities vary by significant percentages in some planes. 14 figures, 5 tables. (RWR)
- 2492 (ORNL--5255, pp 130-135) HEAT-TO-HEAT VARIATION OF 2 1/4 CR--1 MO STEEL. Klueh, R.L. Mar 1977.
Mechanical properties test data for structural materials. Quarterly progress report for period ending January 31, 1977.
The 0.2% yield strength and ultimate tensile strength are plotted for 12 heats of 2 1/4 Cr--1 Mo steel in laboratory isothermally annealed condition. The dominant characteristic of the data is the dynamic strain aging peak when the ultimate tensile strength is given as a function of temperature. Much of the discussion

on the differences between heats is centered on dynamic strain aging and possible reasons for differences in behavior of the different heats. 1 figure, 1 table. (RWR)

- 2493 (ORNL--5255, pp 135-139) THERMAL AGING EFFECTS ON 2 1/4 CR--1 MO STEEL. Klueh, R.L. Mar 1977.

Mechanical properties test data for structural materials. Quarterly progress report for period ending January 31, 1977.

Room-temperature and aging-temperature tensile properties of aged commercial tubing heats of 2 1/4 Cr--1 Mo steel are tabulated for 850, 950, and 1050°F and aging times up to 5000 hours; properties included are yield, ultimate, and fracture strength, uniform and total elongation, and reduction of area. This material is to be used in the CRBR steam generators. 1 figure, 3 tables. (RWR)

- 2494 (ORNL--5255, pp 139-188) INTERIM ANALYSIS OF THE CREEP STRAIN--TIME CHARACTERISTICS OF ANNEALED AND ISOTHERMALLY ANNEALED 2 1/4 CR--1 MO STEEL. Booker, M.K. Mar 1977.

Mechanical properties test data for structural materials. Quarterly progress report for period ending January 31, 1977.

Constant-load isothermal creep strain--time data were analyzed over a range of stresses and temperatures to yield an expression for creep strain as a function of stress, time, and temperature. The equations contain terms involving elevated-temperature ultimate tensile strength, which greatly decrease the uncertainty in predictions caused by the large variations in the properties of the material due to heat treatment and heat-to-heat variations. This equation is recommended for use in the design of the CRBR steam generator. The analysis indicated that this material has two different creep mechanisms. 28 figures, 5 tables. (RWR)

- 2495 (ORNL--5255, pp 188-197) MECHANICAL PROPERTIES OF TRANSITION JOINT MATERIALS IN SUPPORT OF LMFR STEAM GENERATOR DESIGN. Brinkman, C.R.; King, J.F.; Strizak, J.P.; Klueh, R.L.; Booker, M.K. Mar 1977.

Mechanical properties test data for structural materials. Quarterly progress report for period ending January 31, 1977.

The area of primary concern requiring extensive characterization is the HAZ in the 2 1/4 Cr--1 Mo steel adjacent to the weld metal. Comparisons of the tensile properties obtained from annealed 2 1/4 Cr--1 Mo steel aged and tested at 510°C (950°F) indicate that aging reduces the ultimate tensile strength. The possibility of other aging effects at this temperature in the HAZ due to carbon depletion or precipitation of intermetallic phases or carbides needs to be investigated. Interim results of creep--rupture tests conducted on some of the various heat treatments (microstructures) possible across the HAZ are compared with similar all-weld-metal data. Annealed 2 1/4 Cr--1 Mo steel has the lowest creep--rupture strength but highest ductility at 510°C (950°F). Comparisons of interim individual material cyclic properties are given, including strain-controlled fatigue, cyclic stress--strain, and creep--fatigue interaction. The as-deposited ERNiCr-3 exhibited the highest cyclic strength and high-cycle fatigue resistance of the materials compared. 8 figures, 1 table. (RWR)

- 2496 (ORNL--5255, pp 197-204) CREEP AND

TENSILE PROPERTIES OF TRANSITION WELD JOINT MATERIALS. Klueh, R.L.; King, J.F. Mar 1977.

Mechanical properties test data for structural materials. Quarterly progress report for period ending January 31, 1977.

Joining the CRBR intermediate heat exchanger to the steam generator will require several joints, one of which will use Inconel 82 as a filler metal. Tensile properties of Inconel 82 weld metal (yield, ultimate, and fracture strengths, uniform and total elongations, and reduction of area) were determined for several plates at temperatures up to 1350°F. Analytical chemical results revealed that iron varied significantly across the cross section of the sample analyzed. The creep-rupture behavior of Inconel 82 weld metal is also briefly discussed. 4 figures, 2 tables. (RWR)

- 2497 (ORNL--5255, pp 205-222) HIGH-TEMPERATURE DESIGN. Corum, J.M.; Pugh, C.E. Mar 1977.

Mechanical properties test data for structural materials. Quarterly progress report for period ending January 31, 1977.

Uniaxial deformation studies on type 304 stainless steel emphasized nonsteady loading conditions including cyclic creep, reversal creep, and creep-plasticity interactions. Data obtained include tensile properties of specimens after discontinued creep, strain cycling behavior of specimens after discontinued creep, creep behavior of specimens after discontinued strain cycling, relaxation behavior during strain cycling, and creep behavior after interspersing of plasticity and creep strains of various types. Testing temperatures were 900, 1000, and especially 1100°F. Constant-strain-rate tests on type 316 stainless steel at 1100°F covered rates from 2.7×10^{-1} to 1.1×10^{-6} s⁻¹; stress--strain data are plotted. Cyclic hardening behavior of 316 SS at room temperature is exhibited, as are transient creep strain and plastic plus transient creep strain vs stress at 1100°F. Uniaxial and biaxial rupture data for type 304 stainless steel at 1100°F are compared. Axial and circumferential creep strains in constant-load biaxial rupture tests are shown. 22 figures. (RWR)

- 2498 (ORNL--5255, pp 270-277) FATIGUE CRACK PROPAGATION IN ALLOY 718: EFFECT OF HEAT TREATMENT ON MICROSTRUCTURE AND FATIGUE BEHAVIOR. Smith, H.H.; Michel, D.J. Mar 1977.

Mechanical properties test data for structural materials. Quarterly progress report for period ending January 31, 1977.

Fatigue crack propagation of Alloy 718 was investigated at 1100°F. Optical micrographs of microstructure and SEM examinations of fracture surfaces are presented. 3 figures, 2 tables. (RWR)

- 2499 (ORNL--5255, pp 279-287) DEFORMATION OF PRESSURIZED TUBES OF 316 SS AND ALLOY 718. Blackburn, L.D.; Steichen, J.M. Mar 1977.

Mechanical properties test data for structural materials. Quarterly progress report for period ending January 31, 1977.

Pressurized tube specimens of stainless steel 316 were tested at 900 to 1200°F at hoop stresses as high as 28.1 ksi. Corresponding numbers for Alloy 718 specimens were 700 to 1100°F and 77 ksi. Data for ambient temperature pressurization and hoop strain results for pressurized tubes after thermal exposure are tabulated. There is considerable scatter in the results. 5 tables. (RWR)

2500 (ORNL--5255, pp 287-300) **FATIGUE-CRACK PROPAGATION IN DISSIMILAR METAL WELDMENTS.** James, L.A. Mar 1977.

Mechanical properties test data for structural materials. Quarterly progress report for period ending January 31, 1977.

The crack propagation of three dissimilar metal welds finding application in LMFBR was studied. The specimens employed in this study were of the ASTM "Compact Type" design ($W = 2.00$ in., $B = 0.47$ in.), and were tested on a feedback-controlled machine with load as the control parameter. The cyclic frequency and stress ratio were 40 cpm and 0.05 for all tests. Tests were conducted at 427°C (800°F) and 538°C (1000°F) in an air environment. The three combinations of dissimilar metal weldments were Inconel 600/Inconel 82/Inconel 718, Inconel 718/Inconel 82/type 316 stainless steel, and Inconel 600/Inconel 82/type 316 stainless steel. An automatic gas-tungsten-arc (GTA) welding process was employed in welding the dissimilar base metals, using Inconel 82 filler wire in each case. The results for the three types of dissimilar metal weldments, each tested at two temperatures, are given. Also shown are scatter bands typical of the behavior of the base metals tested under identical conditions of temperature, frequency, loading waveform, and stress ratio. There is very little difference in the crack growth rates at the two temperatures. Fatigue-crack growth rates in the dissimilar metal weldments did not differ appreciably from those in the base metals tested under similar conditions. 6 figures. (RWR)

2501 (ORNL--5255, pp 302-314) **BASIC SPECIMEN TESTING.** Manjoine, M.J. (Westinghouse Research Labs., Pittsburgh). Mar 1977.

Mechanical properties test data for structural materials. Quarterly progress report for period ending January 31, 1977.

Detailed data from creep testing of type 304 stainless steel (SS) are tabulated. Rupture data are shown for 1000°F, and creep rate is plotted for 1100°F. For a step-loaded test where stress is increased from a lower value after considerable exposure time, the creep rates are higher than for a continuous loading test at the higher stress level. Creep data for type 316 SS at 1100°F are also given. 2 figures, 2 tables. (RWR)

2502 (ORNL--5255, pp 314-318) **TUBULAR SPECIMEN TESTING.** Gowda, B.; Thomas, K.C. Mar 1977.

Mechanical properties test data for structural materials. Quarterly progress report for period ending January 31, 1977.

Most of the work concerned heat treatment of type 316 SS tubular specimens. Both heat-treated flat specimens and specimens cut from heat-treated tubular specimens were tested for tensile, hardness, and grain size properties. The heat treatment procedure with 30-minute soak time yielded the following properties: 0.2 percent yield stress, 28 to 32 ksi; ASTM Grain Size, 3 to 5; Rockwell B Hardness, 60 to 72. The variation of these three properties as a function of soak time is shown. The 30-minute soak time treatment yielded the desired properties. In addition, some testing was done on type 304 SS. 1 figure, 2 tables. (RWR)

2503 (ORNL--5255, pp 318-330) **SODIUM EFFECTS ON MECHANICAL PROPERTIES OF STRUCTURAL MATERIALS.** Flagella, P.N.; Kahrs, J.; Denne,

J.; Schrock, S.L. Mar 1977.

Mechanical properties test data for structural materials. Quarterly progress report for period ending January 31, 1977.

Results from creep rupture and low-cycle fatigue tests in flowing sodium of solution-annealed type 316 stainless steel with various pretreatments are presented. Tests were conducted at 593°C and stresses of 224.1, 248.2, and 275.8 MPa for Na exposures of 0, 2000, and 5000 hours. Results include strain on loading, hours to various percentages of creep strain, minimum creep rate, time to third-stage creep (0.2 percent offset), time to rupture, and total elongation at rupture. Effects of frequency and tension-hold on low-cycle fatigue life of type 316 stainless steel are shown. Stress range response and effects of strain rate and tension-hold on stress range response are also plotted. 7 figures, 2 tables. (RWR)

2504 (ORNL--5255, pp 377-392) **MECHANICAL PROPERTIES OF DECARBURIZED 2 1/4 CR--MO STEEL IN SODIUM.** Pizzo, P.P.; Hampton, L.V. Mar 1977.

Mechanical properties test data for structural materials. Quarterly progress report for period ending January 31, 1977.

The effect of decarburization of 2 1/4 Cr--1 Mo steel on its high-temperature mechanical properties was studied. Conditions relevant to CRBR operation were investigated. Uniaxial creep data are tabulated for 950°F testing after two different heat treatments. A thermal aging phenomenon is indicated. Biaxial creep data (time to rupture) were correlatable with uniaxial data; therefore, biaxial test results can be used to evaluate decarburization. Surface carburization was observed in a tube exposed to static sodium for 2000 hours at 950°F in a 304 SS exposure chamber. Carburization was also seen in type 316 stainless steel (SS) foils. To determine the decarburization potential of the loop sodium, foils of 316 SS and Cr--Mo steel were used; data indicated the decarburization of 2 1/4 Cr--1 Mo and the carburization of 316 SS. 5 figures, 3 tables. (RWR)

2505 (ORNL--5255, pp 393-410) **MECHANICAL PROPERTIES OF CARBURIZED STAINLESS STEEL IN SODIUM.** Copeland, J.F.; Pizzo, P.P.; Yuen, J.L. Mar 1977.

Mechanical properties test data for structural materials. Quarterly progress report for period ending January 31, 1977.

The influence of liquid sodium on fatigue crack propagation rates for annealed type 316 stainless steel and weldments for the LMFBR Intermediate Heat Transport System was studied. Testing was done at about 0.5 cycles per minute and 950°F in carbon-saturated sodium (to study carburization). Fatigue fracture surfaces of air and sodium specimens were examined with a scanning electron microscope. The carbon profiles of the crevice carburization exposure specimens were determined with an electron microprobe. Creep testing of carburized 316 H stainless steel continued; the time to rupture of the argon control specimen was approximately 2.6 times that of the carburized specimen, although creep rates were essentially equivalent. 7 figures, 3 tables. (RWR)

2506 (ORNL--5255, pp 411-423) **FRACTURE TOUGHNESS OF LMFBR STEAM GENERATOR MATERIALS.** Copeland, J.F.; Yuen, J.L. Mar 1977.

Mechanical properties test data for structural materials. Quarterly progress report for period ending January 31, 1977.

Thick-section 2 1/4 Cr--1 Mo steel plates

were preheated to represent LMFBR conditions. Ten J-integral fracture toughness specimens were tested. Fracture toughness K_{Ic} values, as computed from J_{Ic} , illustrate the effects of temperature and welding on toughness. The elevated-temperature fracture toughness values for both the base metal and the shielded metal arc weld heat affected zone (HAZ) are significantly below the room-temperature results. Fracture toughnesses at room temperature are nearly identical for the HAZ and the base material. Results for gross membrane stress for fracture initiation are plotted as functions of crack size and fracture toughness. 7 figures, 2 tables.

- 2507 (ORNL--5281) HIGH-TEMPERATURE STRUCTURAL DESIGN PROGRAM. SEMIANNUAL PROGRESS REPORT FOR PERIOD ENDING DECEMBER 31, 1976. Corum, J.M.; Pugh, C.E. (Oak Ridge National Lab., TN (USA)). Nov 1977. Contract W-7405-ENG-26. 236p. AT.

Progress in the development of high-temperature structural design methods for LMFBR components is reported under the following headings: constitutive equation development; inelastic structural tests and analyses; design criteria and rules for time-dependent deformation and failure; simplified design methods; thermal ratchetting tests; and structural design methods for weldments.

- 2508 (ORNL--5286) NONDESTRUCTIVE TESTING DEVELOPMENT PROGRAM QUARTERLY PROGRESS REPORT FOR PERIOD ENDING MARCH 31, 1977. Hill, M.R. (Oak Ridge National Lab., TN (USA)). Jun 1977. Contract W-7405-ENG-26. 55p. AT.

Progress is reported for the following activities: (1) ultrasonic in-service inspection of EBR-II steam generator; (2) NDE support for departure nucleate boiling (DNB) test; (3) development of ultrasonic methods and equipment for LMFBR applications; (4) and advanced NDT development.

- 2509 (ORNL--5287) MECHANICAL PROPERTIES TEST DATA FOR STRUCTURAL MATERIALS. QUARTERLY PROGRESS REPORT FOR PERIOD ENDING APRIL 30, 1977. Hill, M.R. (comp.). (Oak Ridge National Lab., TN (USA)). Jun 1977. Contract W-7405-ENG-26. 526p. AT.

This is the fifteenth in a series of progress reports, the purpose of which is to record and distribute quarterly the collected results of all structural materials mechanical properties test programs sponsored by the Reactor Development and Demonstration and the Nuclear Research and Applications Divisions of the Energy Research and Development Administration. Eight individual abstracts were prepared for the data base.

- 2510 (ORNL--5287, pp 17-86) ARGONNE NATIONAL LABORATORY. Weeks, R.W. Jun 1977.

Mechanical properties test data for structural materials. Quarterly progress report for period ending April 30, 1977.

Results obtained on the fatigue behavior of Type 16-8-2 stainless steel weld metal, additional analysis of notch effects on the cyclic life of Type 304 stainless steel, and results from an experimental determination of bilinear stress-strain parameters for Incoloy 800 are described. An analysis of true stress-true strain tensile data obtained on titanium-modified Type 316 stainless steel exposed to flowing sodium is presented, and additional results on the effects of sodium environment on the fatigue behavior of Type 304 stainless steel are reported.

- 2511 (ORNL--5287, pp 87-353) OAK RIDGE NATIONAL LABORATORY. Slaughter, G.M. Jun 1977.

Mechanical properties test data for structural materials. Quarterly progress report for period ending April 30, 1977.

The ORNL mechanical properties effort comprises several programs. The program Mechanical Properties and Behavior for Structural Materials deals with materials of general applicability to the LMFBR program. Other programs are concerned with the mechanical properties of weldments in LMFBR components, the specific materials of interest for LMFBR steam generators, collection and correlation of mechanical data needed for design on high-temperature LMFBR systems, and materials for the primary circuit and steam generators of HTGR systems. 160 figs., 51 tables, 123 refs.

- 2512 (ORNL--5287, pp 365-384) HANFORD ENGINEERING DEVELOPMENT LABORATORY. Yoshikawa, H.H. Jun 1977.

Mechanical properties test data for structural materials. Quarterly progress report for period ending April 30, 1977.

The HEDL efforts involve evaluation of mechanical properties in the areas of normal and high strain rate tensile testing, creep testing and analysis, and fatigue crack growth and fracture toughness of such materials as weldments, vessel and piping, core support structures and reflectors as well as duct and cladding.

- 2513 (ORNL--5287, pp 385-424) WESTINGHOUSE ADVANCED REACTORS DIVISION. Bishop, E.C.; Ray, W.E. Jun 1977.

Mechanical properties test data for structural materials. Quarterly progress report for period ending April 30, 1977.

Test programs are described involving basic specimen testing and tubular specimen testing of LMFBR type reactor materials. Sodium effects on mechanical properties of structural materials are also reported. (GHT)

- 2514 (ORNL--5287, pp 425-472) UNIVERSITY OF CINCINNATI. Motteff, J.; Jang, H. Jun 1977.

Mechanical properties test data for structural materials. Quarterly progress report for period ending April 30, 1977.

The objective of this program is to (a) evaluate the time, temperature and stress-dependent mechanical properties of reactor structural materials, (b) determine the relationship of these properties to the microstructure, (c) show the contribution of the microstructure to the internal stress fields and the subsequent influence on microcracking and the grain boundary sliding behavior during the normal plastic deformation at elevated temperatures and (d) demonstrate the relationship of the hot micro-hardness properties with the hot-tensile properties of a class of commercial and advanced alloys presently under investigation at other laboratories. Special consideration is being given to operating conditions typical of nuclear reactor applications, including the knowledge that radiation environment can influence the substructure of these metals, a circumstance which can lead to significant changes in the conventional mechanical property behavior.

- 2515 (ORNL--5287, pp 474-485) METALLURGICAL

- CHARACTERIZATION OF PROTOTYPIC TUBESHEET FORGING. Offer, H.P. Jun 1977.
Mechanical properties test data for structural materials. Quarterly progress report for period ending April 30, 1977.
Room and elevated temperature tensile tests have been performed on the prototype lower tubesheet forging procured by GE from Cameron Iron Works (CIW). These preliminary tensile tests were performed on tubesheet specimens given either a full anneal plus a 40 hour 727°C (1340°F) post weld heat treatment (PWHT) (designated heat treatment P), or a full anneal plus this PWHT plus a 1000 hour 510°C (950°F) thermal aging/embrittlement treatment (designated heat treatment Q). The results are given in Table 8.2.1 along with the room temperature results supplied by CIW for heat treatment P.
- 2516 (ORNL--5287, pp 1-16) EG AND G IDAHO, INC. Keiser, D.D. Jun 1977.
Mechanical properties test data for structural materials. Quarterly progress report for period ending April 30, 1977.
The Alloy 718 Mechanical Property Program has as its primary objective the acquisition of the necessary mechanical property data to permit safe, efficient use of this material in LMFBR service. The specific immediate application is for selected structural components of the Clinch River Breeder Reactor Project (CRBRP). Other reactor service applications which require high levels of mechanical properties at temperatures up to 650°C (1200°F) are also expected to make use of this material. 4 tables, 7 figures.
- 2517 (ORNL--5293) SUBSTRUCTURES DEVELOPED DURING CREEP AND CYCLIC TESTS OF TYPE 304 STAINLESS STEEL (HEAT 9T2796). Swindeman, R.W.; Bhargava, R.K.; Sikka, V.K.; Moteff, J. (Oak Ridge National Lab., TN (USA)). Sep 1977. Contract W-7405-ENG-26. 36p. Dep. NTIS, PC A03/MF A01.
Substructures developed in tested specimens of a reference heat of type 304 stainless steel (heat 9T2796) are examined. Data include dislocation densities, cell and subgrain sizes, and carbide precipitate sizes. Testing conditions range for temperatures from 482 to 649°C, for stresses from 28 to 241 MPa, and for times from 4 to 15,000 hr. As expected, it is observed that temperature, stress, and time have strong influences on substructure. The change in the dislocation density is too small to measure for conditions which produce less than 1 percent monotonic strain. No cells form, and the major alteration of substructure is the precipitation of $M_{23}C_6$ carbides on grain boundaries, on twin boundaries, and on some dislocations. At stresses ranging from 69 to 172 MPa and at temperatures ranging from 482 to 593°C, the dislocation density increases with increasing stress and is generally higher than expected from studies made at higher temperatures. Dislocations are arranged in fine networks stabilized by carbides. At stresses above 172 MPa and temperatures to 649°C, the dislocation density is too great to measure. Cells develop which are finer in size than cells developed at similar stresses but at higher temperatures. Dislocation densities and cell sizes for cyclic specimens are comparable to data for creep-tested specimens. On the basis of the observed substructures, recommendations are made regarding further studies which would assist in the development of constitutive equations for high-temperature inelastic analysis of reactor components.
- 2518 (ORNL--5308, pp 250-253) CLINCH RIVER BREEDER REACTOR PLANT SAFETY DESIGN AND ELECTROMAGNETIC PULSE. Barnes, P.R. Jul 1978.
Health physics division annual progress report for period ending June 30, 1977.
The design of the Clinch River Breeder Reactor Plant is being examined to determine the probable effects of an intense electromagnetic pulse (EMP) environment. It has been found that the relatively high level of noise and electrical transient protection specified in the design will provide a high level of inherent hardness against an intense EMP environment. Thus, EMP is not considered a serious threat to the safety of the plant. However, as a precautionary measure, additional transient suppressors for some important battery power systems are recommended.
- 2519 (ORNL--5309, pp 261-265) NONDESTRUCTIVE TESTING. Smith, J.H. Nov 1977.
Liquid Metal Fast Breeder Reactor Materials Development Program. Quarterly progress report for period ending March 31, 1977.
Development of an ultrasonic inspection technique for the weld and weld interfaces in dissimilar-metal transition joints is discussed. Work involving alloy 800, stainless steels 304 and 316, and 2 1/4 Cr--1 Mo is described. Frequency shifts were noted for some of the materials. 2 figures. (RWR)
- 2520 (ORNL--5309) LIQUID METAL FAST BREEDER REACTOR MATERIALS DEVELOPMENT PROGRAM. QUARTERLY PROGRESS REPORT FOR PERIOD ENDING MARCH 31, 1977. Peterson, S. (comp.). (Oak Ridge National Lab., TN (USA)). Nov 1977. Contract W-7405-ENG-26. 296p. AT.
LMFBR materials programs conducted or overseen by the ORNL Metals and Ceramics Division are reported. Major areas of interest include the following: steam generator materials development (steam-side/water-side corrosion--the effect of heat flux on the corrosion of 2 1/4 Cr--1 Mo steel by superheated steam, mechanical properties of steam generator materials, nondestructive testing), alternate LMFBR structural materials (advanced ferritic alloys development for LMFBR steam generators, alloy 800 development for advanced LMFBR steam generators), joining technology development (welding development and mechanical testing of weldments for stainless steel components, high-temperature structural design data for austenitic stainless steel weldments, hardfacing development for valves and bearings, basic welding and brazing research--examination of 16-8-2 simulated welds, advanced transition joints), piping and fitting development (including technology of transition joints), and advanced absorber materials (characterization of advanced materials, irradiation testing, performance analysis). Seventeen contributions with significant amounts of data are abstracted separately. (RWR)
- 2521 (ORNL--5309, pp 105-111) WELDING DEVELOPMENT AND MECHANICAL TESTING OF WELDMENTS FOR STAINLESS STEEL COMPONENTS. Edmonds, D.P.; Roche, T.K. Nov 1977.
Liquid Metal Fast Breeder Reactor Materials Development Program. Quarterly progress report for period ending March 31, 1977.
304 and 316 stainless steels (SS) were welded by gas tungsten-arc and submerged arc processes with controlled-residual-element 308, 316, 16-8-2, and 17-8-2 SS used as the filler wire. Chemical compositions and ferrite numbers

are reported for these welds. Creep-rupture life and ductility at 1200°F are presented for 16-8-2 and 316 SS gas tungsten-arc welds. 2 figures, 4 tables. (RWR)

2522 (ORNL--5309, pp 111-114) HIGH-TEMPERATURE STRUCTURAL DESIGN DATA FOR AUSTENITIC STAINLESS STEEL WELDMENTS.

Goodwin, G.M.; Brinkman, C.R. Nov 1977.

Liquid Metal Fast Breeder Reactor Materials Development Program. Quarterly progress report for period ending March 31, 1977.

Mechanical properties of 16-8-2 submerged-arc welds in type 316 stainless steel plate were evaluated. The welds were made under conditions similar to those used for the CRBR thermal liner. Room-temperature Charpy impact tests were carried out for 16-8-2 submerged-arc welds aged at 1050 and 1200°F for 1000 and 1500 hours. The trend appears to be a decrease in average impact strength with increased aging time. 1 figure, 1 table. (RWR)

2523 (ORNL--5309, pp 133-172) PIPING AND FITTINGS. McEnerney, J.W. Nov 1977.

Liquid Metal Fast Breeder Reactor Materials Development Program. Quarterly progress report for period ending March 31, 1977.

Development of optimum fabrication methods for producing large-diameter (0.9 to 1.3 m), thin-walled (13 mm) austenitic stainless steel piping and fittings for LMFBR primary and secondary sodium loops is addressed. Fabrication methods were to be evaluated with respect to economic feasibility, dimensional control, and material behavior at LMFBR operating conditions. Formed-and-welded pipe and centrifugally cast-and-worked pipe are treated in considerable detail; dimensional evaluation was also performed on clamshell forged-and-welded elbows. 26 figures, 6 tables. (RWR)

2524 (ORNL--5309, pp 43-64) ANALYSIS OF THE TIME-DEPENDENT FATIGUE BEHAVIOR OF 2 1/4 CR--1 MO STEEL BASED ON THE CONCEPT OF LINEAR SUMMATION OF CREEP AND FATIGUE DAMAGE. Booker, M.K. Nov 1977.

Liquid Metal Fast Breeder Reactor Materials Development Program. Quarterly progress report for period ending March 31, 1977.

Determination of parameters required by the model is considered first. The projected relation between strain range and cycles to failure at constant hold time is shown at 800, 900, 1000, and 1100°F; the relation between life to failure and hold period at constant strain range is also shown for the same temperatures. Elastic analysis design curves were constructed for strain range vs cycle life and cycles to failure. 24 figures, 1 table. (RWR)

2525 (ORNL--5309, pp 65-68) ANALYSIS OF THE FATIGUE CRACK GROWTH BEHAVIOR OF ISOTHERMALLY ANNEALED 2 1/4 CR--1 MO STEEL. Booker, M.K.; Corwin, W.R.; Booker, B.L.P. Nov 1977.

Liquid Metal Fast Breeder Reactor Materials Development Program. Quarterly progress report for period ending March 31, 1977.

Attempts to develop analytical models to describe crack growth are summarized. Relations between crack growth rate and effective stress intensity factor, and crack growth constant and cycle period are shown. 2 figures. (RWR)

2526 (ORNL--5309, pp 77-95) ADVANCED FERRITIC ALLOYS DEVELOPMENT FOR LMFBR STEAM GENERATORS. Bryant, P.E.C. Nov 1977.

Liquid Metal Fast Breeder Reactor Materials Development Program. Quarterly progress report for period ending March 31, 1977.

(I) Results of creep and stress rupture tests are tabulated and plotted. Deleterious effects of an Ar atmosphere were confirmed. (II) Plates were welded by the shielded metal-arc or gas tungsten-arc process. Hardness determined by Charpy V-notch impact tests is tabulated. 6 figures, 9 tables. (RWR)

2527 (ORNL--5309, pp 116-127) BASIC WELDING AND BRAZING RESEARCH: EXAMINATION OF 16-8-2 SIMULATED WELDS. Leitnaker, J.M.; Russell, K.F.; Houck, C.W.; Oliver, W. Nov 1977.

Liquid Metal Fast Breeder Reactor Materials Development Program. Quarterly progress report for period ending March 31, 1977.

Results of Magne-Gage and hardness measurements of as-welded and aged weld metal are tabulated. Metallographic examinations revealed the presence of delta-ferrite in the starting materials. 7 figures, 1 table. (RWR)

2528 (ORNL--5309, pp 173-222) SURVEY OF AVAILABLE CREEP AND TENSILE DATA FOR ALLOY 800H. Booker, M.K.; Baylor, V.B.; Booker, B.L.P. Nov 1977.

Liquid Metal Fast Breeder Reactor Materials Development Program. Quarterly progress report for period ending March 31, 1977.

Most of the transition joints of the CRBRP will consist of trimetallic joints employing a spool piece of alloy 800 H. A summary of available creep and tensile data for 800H is presented, including analytical representations. Strength properties, ductility properties, stress-strain relations, creep properties, rupture life, time to tertiary creep, creep strain to tertiary creep, and creep strain-time behavior are discussed. 35 figures, 8 tables. (RWR)

2529 (ORNL--5309, pp 223-245) CREEP AND TENSILE PROPERTIES OF TRANSITION WELD JOINT MATERIALS. Klueh, R.L.; King, J.F. Nov 1977.

Liquid Metal Fast Breeder Reactor Materials Development Program. Quarterly progress report for period ending March 31, 1977.

Mechanical properties of filler materials used in welded transition joints of the CRBRP intermediate heat exchanger were investigated. Tensile properties, creep and rupture behavior of Inconel 82 (ERNiCr-3) welded metal are discussed. 13 figures, 5 tables. (RWR)

2530 (ORNL--5309, pp 245-261) FATIGUE PROPERTIES OF TRANSITION WELD JOINT MATERIALS. Strizak, J.P.; Brinkman, C.R.; King, J.F. Nov 1977.

Liquid Metal Fast Breeder Reactor Materials Development Program. Quarterly progress report for period ending March 31, 1977.

CRBRP piping weld joints will use ERNiCr-3 (commonly known as Inconel 82) as a weld filler metal (among others). Fatigue data on ERNiCr-3 are presented. Tests conducted on material in the 2 1/4 Cr--1 Mo steel heat-affected zone adjacent the fusion line are also discussed. Cyclic stress-strain and continuous-cycle strain-controlled fatigue properties were defined over the range 22 to 5930C. A comparison between ERNiCr-3 deposited by the automatic hot- and cold-wire gas tungsten-arc processes indicated that fatigue life of hot-wire material was slightly superior to that of the cold-wire material; however, similar cyclic stress-strain response of the two materials was found. 12 figures, 3 tables. (RWR)

- 2531 (ORNL--5309, pp 7-22) CREEP AND RUPTURE BEHAVIOR OF 2 1/4 CR--1 MO STEEL. Klueh, C.R. Nov 1977.

Liquid Metal Fast Breeder Reactor Materials Development Program. Quarterly progress report for period ending March 31, 1977.

Creep--rupture curves are shown for tempered bainitic steel plate and weld metal at 454, 510, and 566 C; a comparison of stress vs minimum creep rate relations is also given for the same conditions. Time and strain to onset of tertiary creep are tabulated for a 22-mm rod of normalized and tempered steel and for tempered weld metal. Data on stress to rupture in 10⁴ hours are given for bainitic and proeutectoid ferrite steels. 5 figures, 4 tables. (RWR)

- 2532 (ORNL--5309, pp 22-35) MECHANICAL PROPERTIES OF A 2 1/4 CR--1 MO STEEL FORGING FOR LMFBR TUBESHEETS. Klueh, R.L.; Griffith, J.L. Nov 1977.

Liquid Metal Fast Breeder Reactor Materials Development Program. Quarterly progress report for period ending March 31, 1977.

Forging and heat treatments undergone by the specimen are recalled. Samples were taken at various positions and orientations. A definite change in microstructure along the radius was noted: the amount of bainite increased from 10% at the surface to 30% near the center of the cylindrical forging. Metallography revealed that two types of bainite formed. Tensile tests showed that an increasing amount of bainite led to increasing strength. Results for tensile properties are presented for various orientations, locations, and temperatures. The cooling process for the forging is discussed. It is felt that a more uniform microstructure is achievable by a normalizing treatment than by isothermal annealing. 7 figures, 4 tables. (RWR)

- 2533 (ORNL--5309, pp 1-7) STEAM-SIDE/WATER-SIDE CORROSION: THE EFFECT OF HEAT FLUX ON THE CORROSION OF 2 1/4 CR--1 MO STEEL BY SUPERHEATED STEAM. Griess, J.C.; DeVan, J.H.; Maxwell, W.A. Nov 1977.

Liquid Metal Fast Breeder Reactor Materials Development Program. Quarterly progress report for period ending March 31, 1977.

Tests on vacuum-arc-remelted (VAR) steel are reported and compared with previous results from air-melted material. Specimen surface temperature ranged from 502 to 522°C. Data on weight change and penetration are presented. Effects of heat flux on penetration are noted. 3 figures, 2 tables. (RWR)

- 2534 (ORNL--5309, pp 36-38) THERMAL AGING EFFECTS ON 2 1/4 CR--1 MO STEEL. Klueh, R.L.; Griffith, J.L. Nov 1977.

Liquid Metal Fast Breeder Reactor Materials Development Program. Quarterly progress report for period ending March 31, 1977.

Room-temperature and aging-temperature tensile properties are tabulated for aged commercial tubing heats of 2 1/4 Cr--1 Mo steel. Aging time runs to 10,000 hours. Temperatures are 850, 950, and 1050 F. 2 tables. (RWR)

- 2535 (ORNL--5309, pp 36, 39-43) EFFECT OF SODIUM ON THE MECHANICAL PROPERTIES OF 2 1/4 CR--1 MO STEEL. Klueh, R.L. Nov 1977.

Liquid Metal Fast Breeder Reactor Materials Development Program. Quarterly progress report for period ending March 31, 1977.

Creep rupture tests were conducted on

specimens that had been exposed to sodium for 26,500 hours at 1050°F; specimens aged in a helium atmosphere under similar conditions were also tested. Elongation as a function of rupture life went through a maximum for both the aged specimen and the one decarburized by sodium. The maximum was higher for the helium-aged material, but results appear similar for longer rupture life. All fractures were ductile transgranular fractures. 4 figures, 1 table. (RWR)

- 2536 (ORNL--5314) ANALYSIS OF ZPPR-5 SOURCE LEVEL FLUX MONITOR EXPERIMENTS. Selby, D.L.; Flanagan, G.F. (Oak Ridge National Lab., TN (USA)). Feb 1978. Contract W-7405-ENG-26. 56p. AT.

Analysis of 24 configurations of the ZPPR-5 Source Level Flux Monitor experiment has been performed with Modified Source Multiplication Techniques. Transport methods were used to calculate detection efficiencies for the Modified Source Multiplication equation. Detection efficiency changes as large as 40 percent were observed when going from near critical to approximately -34 (\$). Count rate ratios were calculated within 20 percent of the experimental values. Calculated-to-experimental reactivity ratios near 1.0 were calculated for both a ²³⁵U fission counter and a BF₃ detector.

- 2537 (ORNL--5346) MEASUREMENTS AND ANALYSIS OF THE CRBR INCONEL-STAINLESS STEEL RADIAL SHIELD EXPERIMENT. Maerker, R.E.; Muckenthaler, F.J. (Oak Ridge National Lab., TN (USA)). Jul 1978. Contract W-7405-ENG-26. 215p. AT.

Portions of document are illegible.

Neutron spectral measurements and Bonner ball counting rates were made behind similar thicknesses of inconel and stainless steel from 13 cm up to 39 cm to ascertain the better radial shield to an incident neutron spectrum similar to the one leaking the proposed CRBR. Calculations of the experiment were performed using a two-dimensional discrete ordinates code together with a standard design 51 group cross section set based on ENDF/B-IV. Both the calculations and the experiment indicated that inconel is superior to stainless steel, but the inconel cross sections are not as accurate in predicting the results of the experiment as are those of stainless steel.

- 2538 (ORNL--5349, pp 2-29) MECHANICAL PROPERTY PROGRAM OF ALLOY 718. Korth, G.E.; Smolik, G.R. Dec 1977.

Mechanical properties test data for structural materials. Quarterly progress report for period ending October 31, 1977.

Load-controlled high-cycle fatigue tests were conducted at 75, 800, 1000, 1100, and 1200°F; strain-controlled low-cycle tests were carried out at 75 and 1100°F. Data obtained are plotted; alloy 718 apparently exhibits an endurance limit. Results of Charpy V-notch impact tests for temperatures up to 1400°F are presented; the energy required for fracture seems to decrease as plate thickness increases. Stress--rupture data and data on tensile properties at 75 and 1200°F are tabulated for twin heats of alloy 718. Mechanical properties for a roll-extruded alloy 718 tube were investigated; microstructure (at 1750, 1830, 1900, and 2000°F), tensile properties (at 70, 650, 1200, and 1400°F), stress--rupture properties (at 1200 and 1300°F), and fatigue properties (at 1200°F) were determined. 8 figures, 13 tables. (RWR)

2539 (ORNL--5349, pp 31-43) LOW-CYCLE FATIGUE AND CYCLIC-DEFORMATION BEHAVIOR OF SMA TYPE 308 (CRE) STAINLESS STEEL WELD METAL AT 571°C. Raske, D.T. Dec 1977.

Mechanical properties test data for structural materials. Quarterly progress report for period ending October 31, 1977.

Continuous-cycling fatigue tests at a strain rate of $4 \times 10^{-3} \text{ s}^{-1}$ are reported for specimens machined longitudinally from various locations in a prototypic weld. Specimens were aged for $3.6 \times 10^4 \text{ s}$ at 593°C prior to testing. Fatigue and tensile data are tabulated, and total, elastic, and plastic strain ranges are plotted vs cycles to failure. Results are compared with similar ones for type 304 steel. The cyclic hardening and subsequent softening of the weld metal are shown as functions of strain range and cycles, along with the cyclic stress-strain curve. It was found that, for a given cyclic-strain range, the initial stress response is highly variable and remains so far at least half the fatigue life. 8 figures, 3 tables. (RWR)

2540 (ORNL--5349, pp 43-57) INFLUENCE OF SODIUM ENVIRONMENT ON THE LOW-CYCLE FATIGUE BEHAVIOR OF AUSTENITIC STAINLESS STEELS. Zeman, G.J.; Smith, D.L.; Natesan, K. Dec 1977.

Mechanical properties test data for structural materials. Quarterly progress report for period ending October 31, 1977.

Fatigue properties of solution-annealed, thermally aged, and sodium-exposed 304 and 316 stainless steel in sodium of controlled purity were investigated at 550, 600, and 700°C. The relation between plastic strain range and fatigue life for 304 stainless steel is shown for the three above conditions. Carburization of these specimens at 600°C had negligible effect on the fatigue life. At 550°C, however, the sodium-exposed specimens had a significantly smaller fatigue life than the aged material; the difference is attributed to carburization of the sodium-exposed specimens. To understand the effect of metallurgical history on the mechanical behavior under fatigue-loading conditions, hysteresis loops from different tests were analyzed, and plots of cyclic stress as a function of number of cycles were generated for specimens of 304 and 316 steels with different treatments. Optical photographs and scanning-electron micrographs of fracture regions of the two types of steel under different treatments are also shown. 8 figures. (RWR)

2541 (ORNL--5349, pp 60-64) COMPLEX MATERIALS BEHAVIOR STUDIES IN SUPPORT OF DESIGN METHODS DATA LIST USING REFERENCE HEATS. Sikka, V.K.; Baldwin, R.H.; Stevens, C.O. Dec 1977.

Mechanical properties test data for structural materials. Quarterly progress report for period ending October 31, 1977.

Tensile creep data at 593°C and 207 MPa are shown for 16-mm plates of type 316 stainless steel subjected to the following conditions: mill annealing, mill annealing and strain cycling, and reannealing and strain cycling; specimens were subjected to 10 and 1000 cycles. A comparison of tensile and compressive creep curves at 593°C and 107 MPa is made. 3 figures. (RWR)

2542 (ORNL--5349, pp 64-94) ANALYTICAL REPRESENTATION OF THE CREEP STRAIN--TIME BEHAVIOR OF COMMERCIAL HEAT-TREATED ALLOY 718. Booker, M.K. Dec 1977.

Mechanical properties test data for

structural materials. Quarterly progress report for period ending October 31, 1977.

Data were measured at temperatures from 538 to 760°C. Expressions for rupture life and temperature were obtained by generalized regression techniques; the time and creep strain to onset of tertiary creep were similarly analyzed. Relations between the various creep properties are presented. Normalized creep curves are plotted for a number of temperatures. Stress-relaxation and variable-load creep data are shown. 31 figures, 1 table. (RWR)

2543 (ORNL--5349, pp 94-101) MECHANICAL PROPERTIES OF 16-8-2 GIRTH WELDS ON LARGE-DIAMETER PIPE. Klueh, R.L.; Edmonds, D.P.; Bolling, E.W. Dec 1977.

Mechanical properties test data for structural materials. Quarterly progress report for period ending October 31, 1977.

Elevated-temperature properties of pipe welds prototypic of FFTF pipe welds were investigated. Short lengths of type 316 stainless steel pipe were welded by the gas tungsten-arc process. Tensile properties of longitudinal and transverse weld metal specimens are tabulated. 2 tables. (RWR)

2544 (ORNL--5349, pp 101-111) THERMAL AGING OF 2 1/4 CR--1 MO STEEL. Klueh, R.L. Dec 1977.

Mechanical properties test data for structural materials. Quarterly progress report for period ending October 31, 1977.

To study the possible effect of thermal exposure on mechanical properties of the steam generator material for the CRBR, material was aged at 454, 510, and 566°C for 1000, 2500, 5000, 10,000, and 20,000 hours. The effect of aging on creep is examined, and possible metallurgical processes leading to changes in creep and tensile behavior are discussed. The complex aging behavior is governed by complicated carbide precipitation processes; these are discussed at some length. Yield strength and ultimate tensile strength are compared as a function of aging time. 2 figures, 2 tables. (RWR)

2545 (ORNL--5349, pp 111-114) CONTINUOUS CYCLING AND CREEP--FATIGUE BEHAVIOR OF 2 1/4 CR--1 MO STEEL. Strizak, J.P. Dec 1977.

Mechanical properties test data for structural materials. Quarterly progress report for period ending October 31, 1977.

Results of continuous-cycling, strain-controlled fatigue tests at 427°C are tabulated, as are those from long-term creep--fatigue tests at 482°C. An interaction of tension and compression effects was suggested. Attempts were made to predict the number of cycles to failure. 2 tables. (RWR)

2546 (ORNL--5349, pp 114-136) MECHANICAL PROPERTY CHARACTERIZATION OF LARGE-DIAMETER PIPES OF TYPES 304 AND 316 STAINLESS STEELS. Sikka, V.K.; McEnerney, J.W. Dec 1977.

Mechanical properties test data for structural materials. Quarterly progress report for period ending October 31, 1977.

Tensile tests were completed on four formed-and-welded pipes of type 316 stainless steel; 0.2 percent yield strength, ultimate tensile strength, uniform elongation, and reduction of area are tabulated. Specimens tested were taken from both the base and weld (16-8-2 or 316) metal. The pipes were welded by different welding procedures. The tensile tests were supplemented by photographs of the specimens,

and the welds were macroetched to reflect their structure. A number of conclusions are drawn. In general, welds showed lower ultimate tensile strength and poor ductility in comparison with the base metal. Irrespective of the welding process and filler metal combinations tested, the weld was the weakest link in the formed-and-welded pipe. 15 figures, 4 tables. (RWR)

- 2547 (ORNL--5349, pp 137-146) TENSILE PROPERTIES OF ERNCR-3 (INCONEL 82) WELD METAL. Klueh, R.L.; King, J.F. Dec 1977.

Mechanical properties test data for structural materials. Quarterly progress report for period ending October 31, 1977.

Tests were conducted at 25 to 732°C and at strain rates of 3×10^{-6} and 3×10^{-4} s⁻¹. The following observations from these tests are discussed: differences in strength for welds made on 13-mm-thick plates (made with seven weld passes) and 19-mm-thick plates (made with about forty weld passes); isolated grain boundary cracks on voids; serrated yielding; and peaks in the yield strength and ultimate tensile strength as functions of temperature. An increase in flow stress at low strain rates between 500 and 650°C was tentatively attributed to an order effect. 3 figures. (RWR)

- 2548 (ORNL--5349, pp 146-171) CYCLIC STRESS-STRAIN BEHAVIOR OF ERNCR-3. Baylor, V.B.; Booker, M.K.; Strizak, J.P.; Klueh, R.L. Dec 1977.

Mechanical properties test data for structural materials. Quarterly progress report for period ending October 31, 1977.

Plates of annealed 2 1/4 Cr-1 Mo steel were welded by the gas tungsten-arc process with hot or cold wire ERNCR-3 filler metal. Longitudinal and transverse samples were taken for fatigue testing. Monotonic tensile curves obtained showed inconsistent slopes in the elastic portions of the curves; therefore, curves were reconstructed by a different procedure. At low strain ranges ERNCR-3 displayed rapid initial hardening followed by stable stress levels at all temperatures. At strain ranges above 1.94 percent, the hardening behavior was more complicated: hardening and softening behavior was observed. Cyclic hardening constants for cyclic stress-strain curves are tabulated. Neither the monotonic nor the cyclic bilinear stress-strain constants depended significantly on the type of weld filler metal used. In addition, the cyclic stress-strain response of ERNCR-3 did not appear to vary with the orientation of the specimen with respect to the line of fusion. From the bilinear representation of the monotonic data it appears that the bilinear slopes are independent of strain rate and temperature. 27 figures, 4 tables. (RWR)

- 2549 (ORNL--5349, pp 191-195) TENSILE PROPERTIES OF 304 SS AND 316 SS. Ward, A.L.; Blackburn, L.D. Dec 1977.

Mechanical properties test data for structural materials. Quarterly progress report for period ending October 31, 1977.

Tension test properties and flow stress values are tabulated for unirradiated materials to be used in the FFTF/CRBR Materials Irradiation Experiment. 3 tables. (RWR)

- 2550 (ORNL--5349, pp 196-199) HEAT-TO-HEAT AND/OR MELT PRACTICE VARIATIONS IN CRACK GROWTH BEHAVIOR OF INCONEL 718. James, L.A. Dec 1977.

Mechanical properties test data for structural materials. Quarterly progress

report for period ending October 31, 1977.

Fatigue-crack growth behavior for several heats of Inconel 718 is being studied at five temperatures. Results of room-temperature tests are presented. Metallographic examinations suggest that differences among the heats are due to the presence of networks of grain boundary carbides. 1 figure, 1 table. (RWR)

- 2551 (ORNL--5349, pp 199-200, 201-203) EFFECT OF STRESS RATIO UPON FATIGUE-CRACK GROWTH IN TWO STRUCTURAL ALLOYS AT ELEVATED TEMPERATURE. James, L.A. Dec 1977.

Mechanical properties test data for structural materials. Quarterly progress report for period ending October 31, 1977.

Fatigue-crack growth rates are expressed in a manner that accounts for the effect of stress ratio by use of the "effective stress intensity factor." Results are shown for SA-386 Grade 11 steel tested at 316 and 427°C and SA-637 Grade 688 (Inconel X-750) tested at 538°C. Each plot represents a fairly wide range of stress ratios, and k_{eff} provides a reasonably good correlation of growth rates over these ranges in stress ratio. 3 figures. (RWR)

- 2552 (ORNL--5349, pp 200, 204-211) EFFECT OF TEMPERATURE ON THE ELASTIC-PLASTIC FRACTURE TOUGHNESS BEHAVIOR OF INCONEL X-750. Mills, W.J.; Knecht, R.L. Dec 1977.

Mechanical properties test data for structural materials. Quarterly progress report for period ending October 31, 1977.

The $J_{\text{sub Ic}}$ fracture toughness behavior of heat-treated Inconel X-750 was characterized at 75, 800, and 1000°F. The material was tested in the double-aged, precipitation-hardened condition. Chemical composition and mechanical properties are tabulated. Fracture tests were performed on deeply cracked specimens. The critical value of J associated with crack initiation was determined by the R-curve technique of ASTM STP 514. The $J_{\text{sub Ic}}$ fracture toughness was relatively insensitive to temperature, although the slopes of the elevated-temperature fracture resistance curves were greater than the slope of the room-temperature R-curve. This phenomenon was associated with an intergranular to transgranular fracture mechanism transition. 4 figures, 2 tables. (RWR)

- 2553 (ORNL--5349, pp 232-245) SODIUM EFFECTS ON MECHANICAL PROPERTIES OF STRUCTURAL MATERIALS. Flagella, P.N.; Kahrs, J.; Denne, J.; Schrock, S.L. Dec 1977.

Mechanical properties test data for structural materials. Quarterly progress report for period ending October 31, 1977.

Results on creep-rupture and low-cycle fatigue tests in flowing sodium of solution-annealed type 316 stainless steel are described. Exposure to sodium for 5000 hours at 593°C before testing decreased creep resistance and increased ductility. Creep-rupture curves show the effects of stress and prior history. The material with higher creep rate showed greater ductility. Rupture life for a circumferentially notched bar was more than twice that of a bar with three transverse holes meeting in the center. Cyclic stress range response curves are presented for tests of 316 SS in flowing sodium at 593 and 538°C, with and without tension-hold time. In all cases the as-fabricated material yielded the highest stress range values, with stress range decreasing as pretreatment time increased. 11 figures. (RWR)

2554 (ORNL--5349, pp 264-268) FRACTURE TOUGHNESS OF LMFBR STEAM GENERATOR MATERIALS. Copeland, J.F. Dec 1977.

Mechanical properties test data for structural materials. Quarterly progress report for period ending October 31, 1977.

The G.E. program to evaluate the fracture toughness of 2 1/4 Cr-1 Mo is described briefly. Results on yield strength, ultimate tensile strength, elongation, and area reduction are quoted for 24, 399, and 510°C. 2 tables. (RWR)

2555 (ORNL--5350) NONDESTRUCTIVE TESTING DEVELOPMENT PROGRAM. QUARTERLY PROGRESS REPORT FOR PERIOD ENDING SEPTEMBER 30, 1977. Hill, M.R. (comp.). (Oak Ridge National Lab., TN (USA)). Nov 1977. Contract W-7405-ENG-26. 58p. AT.

Nondestructive testing (NDT) research for LMFBR components is summarized. Included are NDT techniques and equipment for inspection and monitoring of welded joints and steam generators. NDT methods discussed employ ultrasonics, radiography, and eddy currents.

2556 (ORNL--5359) BREEDER REACTOR MATERIALS DEVELOPMENT PROGRAM QUARTERLY PROGRESS REPORT FOR PERIOD ENDING JUNE 30, 1977. Brinkman, C.R.; Bryant, P.E.C.; Duke, J.M.; Goodwin, G.M.; King, R.T.; Tennery, V.J. (Oak Ridge National Lab., TN (USA)). Feb 1978. Contract W-7405-ENG-26. 235p. AT.

Progress is reported in steam generator materials, structural materials, joining technology, piping and fitting developments, and advanced absorber materials for breeder reactors.

2557 (ORNL--5366) BREEDER REACTOR MATERIALS DEVELOPMENT PROGRAM QUARTERLY PROGRESS REPORT FOR PERIOD ENDING SEPTEMBER 30, 1977. Patriarca, P.; Brinkman, C.R.; Bryant, P.E.C.; Duke, J.M.; Goodwin, G.M.; King, R.T.; Tennery, V.J. (Oak Ridge National Lab., TN (USA)). Apr 1978. Contract W-7405-ENG-26. 160p. AT.

Research is summarized on steam generator materials development, alternate breeder reactor structural materials, joining technology piping and fitting, and advanced absorber materials. (JRD)

2558 (ORNL--5369) LONG-RANGE PROGRAM PLAN FOR HIGH-TEMPERATURE STRUCTURAL DESIGN. (Oak Ridge National Lab., TN (USA)). Dec 1977. Contract W-7405-ENG-26. 101p. AT.

The program described is concerned with developing and validating the high-temperature structural design technology required for breeder reactor components and with the effective transfer of that technology to component designers. The primary objective of the program is thus to establish, and transfer to designers, a rationally sound and experimentally verified high-temperature structural design technology that will assure freedom from structural failure. More specific objectives are: (1) To provide a technology for assuring that component designs will be both safe and reliable during their design lifetimes. (2) To provide the designer with improved methods, procedures, tools, and criteria that are more economical to apply, are not overly conservative, and will allow increased component design flexibility, thus resulting in better and cheaper component designs and, ultimately, in increased flexibility in plant design and operation. (3) To provide methods for better definition of

design margins (against identified failure modes). (4) To experimentally verify and validate each aspect of the technology. (5) To improve reliability and confidence levels of component designs. (6) To provide design methods, and thus designs, that are more defensible. (7) To provide an improved technological basis for licensing.

2559 (ORNL--5378) MECHANICAL PROPERTIES OF TUBESHEET FORGINGS FOR LMFBR STEAM GENERATORS. Klueh, R.L.; Griffith, J.L. (Oak Ridge National Lab., TN (USA)). Apr 1978. Contract W-7405-ENG-26. 36p. AT.

Tensile and creep-rupture properties were determined on a 2 1/4 Cr-1 Mo steel forging that had been manufactured by techniques typical of those used for tubesheets for steam generators. Specimens were taken from a 0.64-m-dia by 0.30-m-thick cylindrical forging in the as-received condition and on small pieces of the forging given a laboratory isothermal anneal. The microstructures in both conditions were primarily proeutectoid ferrite with small precipitate particles throughout. The laboratory isothermally annealed steel contained about 10 percent bainite and minor amounts of pearlite. On the other hand, the microstructure of the as-received forging depended on the position of the forging from which the specimen was taken. Near the external cylindrical surface, the microstructure contained about 10 percent bainite. For specimens taken at intervals toward the center of the forging, the amount of bainite increased and went through a maximum of about 30 percent, then decreased to about 25 percent at the center. The strength also went through a maximum with distance into the forging. This nonuniformity of microstructure and strength was attributed to a nonuniformity of cooling rate for the large forging. Detailed tensile and creep-rupture properties were determined for the as-received forging on specimens taken from about midway between the external cylindrical surface and the center, and these properties were compared with those for the laboratory isothermally annealed specimens. The tensile properties of the as-received steel exceeded those for the pieces of steel given the laboratory isothermal anneal, with the as-received steel showing a much greater dynamic strain aging effect. At high stresses, the creep-rupture properties of the as-received forging were greater than those of the steel that received the laboratory anneal.

2560 (ORNL--5381) TEST OF THE DIFFUSION THEORY DIFFERENCE EQUATIONS IN SLAB GEOMETRY (COMPUTER CODE VANCER). Vondy, D.R.; Fowler, T.B. (Oak Ridge National Lab., TN (USA)). Jun 1978. Contract W-7405-ENG-26. 40p. Dep. NTIS, PC A03/MF A01.

The difference equations for representing the diffusion theory approximation to neutron transport depend on the method of formulation. A parameterized set of equations were implemented for slab geometry with mesh points located at material intersections. Such formulations as the mesh edge with four nearest neighbors on planes are included by the equations, as well as the higher coupling of eight nearest neighbors on planes for such formulations as linear finite element. The formulations of primary interest were applied to two-dimensional problems, and to three-dimensional problems with coupling to nearest neighbors on planes. Solutions were obtained to multigroup problems over a wide range of problem type. Selected results are reported together with conclusions regarding the formulations.

- 2561 (ORNL--5385) NONDESTRUCTIVE TESTING DEVELOPMENT PROGRAM. QUARTERLY PROGRESS REPORT FOR PERIOD ENDING DECEMBER 31, 1977. Hill, M.R. (comp.). (Oak Ridge National Lab., TN (USA)). Mar 1978. Contract W-7405-ENG-26. 80p. AT.

This is the eleventh in a series of progress reports, the purpose of which is to record and distribute quarterly the collected results of all nondestructive testing development programs sponsored by the Division of Reactor Research and Technology of the Department of Energy for LMFBR components. Information is presented for research work at the following contractors: Argonne National Laboratory; General Electric Company; Hanford Engineering Development Laboratory; and Oak Ridge National Laboratory.

- 2562 (ORNL--5386) THERMAL RATCHETTING TESTS OF TYPE 304 STAINLESS STEEL PIPE: SPECIMENS TTT-1 AND TTT-2. Corum, J.M.; Battiste, R.L.; Sartory, W.K.; Smith, J.E.; Young, H.C. (Oak Ridge National Lab., TN (USA)). Jun 1978. Contract W-7405-ENG-26. 116p. AT.

The results of two high-temperature thermal ratchetting tests on straight sections of type 304 stainless steel pipe are presented, and the results are used to evaluate inelastic analysis predictions of the ratchetting behavior. The pipe specimens, each of which was machined from a well-characterized heat of material, were subjected to a series of thermal downshocks on their inner surface, followed by sustained periods under an internal pressure loading at a temperature of 593°C (1100°F). Testing was carried out in a special sodium test facility built for the purpose, and the outer-surface strain histories were measured and compared with inelastic analysis predictions obtained using a one-dimensional finite-element procedure based on inelastic analysis guidelines recommended for use in design of U.S. LMFBR components. The required mechanical property data for the analyses were obtained from specimens of the specific heat of material used for the pipe ratchetting specimens. For one of the two tests, the agreement between experiment and predictions was extremely good, while in the other case the predictions significantly overestimated the measured response.

- 2563 (ORNL--5389) PRELIMINARY EVALUATION OF ALTERNATIVE FUEL CYCLE OPTIONS UTILIZING FAST BREEDERS. Burns, T.J.; White, J.R. (Oak Ridge National Lab., TN (USA)). Oct 1978. Contract W-7405-ENG-26. 47p. Dep. NTIS, PC A03/MF A01.

Various "alternative" fuel cycles have been proposed to alleviate concerns about reactor fuel being diverted for the manufacture of nuclear weapons. This report addresses the impact of such fuel cycles on the performance of the classical (homogeneous) oxide-fueled Liquid Metal Fast Breeder Reactor. The primary fuel cycle analyzed is the $^{233}\text{U}/^{238}\text{U}/^{232}\text{Th}$ fuel cycle in which the fissile component ^{233}U is "denatured" with ^{238}U in order to restrict the use of reactor fuel as a source of weapons-usable material. The denatured reactor performance as a function of the fissile enrichment (% ^{233}U in U) is evaluated. The associated energy center concept in which dispersed denatured reactors are coupled to ^{233}U production reactors operating in such secure energy centers is described. The symbiotic system of dispersed/energy center reactors is analyzed both from the standpoint of energy growth supported and dispersed/centralized power production. Lastly, the

effects of proposed changes in the nuclear data on both the reactor performance and symbiotic system characteristics are addressed.

- 2564 (ORNL--5398(Exec.Summ.)) INTERIM ASSESSMENT OF THE DENATURED ^{233}U FUEL CYCLE: FEASIBILITY AND NONPROLIFERATION CHARACTERISTICS. Abbott, L.S.; Bartine, D.E.; Burns, T.J. (eds.). (Oak Ridge National Lab., TN (USA)). Dec 1979. Contract W-7405-ENG-26. 74p. Dep. NTIS, PC A04/MF A01.

A fuel cycle that employs ^{233}U denatured with ^{238}U and mixed with thorium fertile material is examined with respect to its proliferation-resistance characteristics and its technical and economic feasibility. The rationale for considering the denatured ^{233}U fuel cycle is presented, and the impact of the denatured fuel on the performance of Light-Water Reactors, Spectral-Shift-Controlled Reactors, Gas-Cooled Reactors, Heavy-Water Reactors, and Fast Breeder Reactors is discussed. The scope of the R, D and D programs to commercialize these reactors and their associated fuel cycles is also summarized and the resource requirements and economics of denatured ^{233}U cycles are compared to those of the conventional Pu/U cycle. In addition, several nuclear power systems that employ denatured ^{233}U fuel and are based on the energy center concept are evaluated.

- 2565 (ORNL--5404) CREEP AND CREEP-RUPTURE BEHAVIOR OF ERNCR-3 WELD METAL. Klueh, R.L.; King, J.F. (Oak Ridge National Lab., TN (USA)). Jun 1978. Contract W-7405-ENG-26. 46p. AT.

Creep and creep-rupture tests were made on AWS A5.14 Class ERNCR-3 weld metal, commonly known as Inconel 82. Tests were made over the range 454 to 732°C on specimens taken from welds made by the gas tungsten-arc process. The results fell into two categories: those for tests at 454, 510, and 566°C displayed different characteristics than those at 621, 677, and 732°C. At the lower temperatures the creep curves were characterized by a rapid transient, a long steady-state stage, and little tertiary creep. At the elevated temperatures the transient stage was not as rapid, the steady-state creep stage was shorter, and the tertiary stage was longer. The low-temperature creep-rupture curves and stress-minimum creep rate curves were also much flatter than those at the elevated temperatures. For certain tests at 454, 510, and 566°C the creep curves exhibited an "instantaneous elongation" or "strain burst" phenomenon, in which the creep curves contained strain jumps. At these same temperatures, several specimens failed prematurely. Strain bursts are postulated to be related to the formation of dislocation pileups in the matrix. When a localized pileup breaks through a barrier, a dislocation avalanche results and triggers neighboring pileups continuing into neighboring grains giving rise to the propagation of a deformation band along the gage length in a Luder's-type deformation. It was proposed that the premature failures were related to the strain burst phenomenon and some scattered "voids" or "cracks" that were observed in the as-welded microstructure.

- 2566 (ORNL--5417) NONDESTRUCTIVE TESTING DEVELOPMENT PROGRAM. QUARTERLY PROGRESS REPORT FOR PERIOD ENDING MARCH 31, 1978. Hill, M.R. (comp.). (Oak Ridge National Lab., TN (USA)). May 1978. Contract W-7405-ENG-26. 76p. AT.

Nondestructive testing (NDT) research

applied to in-service inspection and monitoring of LMFBR components is described. The following NDT methods are included: radiography, eddy currents, and ultrasonics. (DG)

- 2567 (ORNL--5419) HIGH-TEMPERATURE STRUCTURAL DESIGN: 1977 SUMMARY AND STATUS REPORT. (Oak Ridge National Lab., TN (USA)). Jul 1978. Contract W-7405-ENG-26. 89p. AT.

The High-Temperature Structural Design (HTSD) Program is concerned with developing and validating the HTSD technology required for breeder reactor components and with the effective transfer of that technology to component designers. The primary objective of the program is thus to establish, and transfer to designers, a rationally sound and experimentally verified HTSD technology that will assure freedom from structural failure. Particular emphasis is placed on those failure modes associated with high-temperature, time-dependent material effects--creep rupture, creep-fatigue interaction, creep-enhanced ratchetting, creep buckling, and environmental enhancement of low-temperature failure modes. The HTSD Program has the following tasks: (1) development, (2) validation, (3) application, and (4) piping. The report is intended to reflect the unified nature of the High-Temperature Structural Design Program by providing, in highlight form, a summary of what was undertaken and accomplished in each of the tasks in relation to previously identified needs and plans. The document is intended to provide a concise overview of the progress being made in establishing an adequate high-temperature structural design technology and a convenient listing of references to more detailed reports and papers in specific areas of interest.

- 2568 (ORNL--5430) THERMAL RATCHETTING TEST OF TYPE 316 STAINLESS STEEL SEAMLESS TO SEAM-WELDED PIPE: SPECIMEN TTT-4. Sartory, W.K.; Battiste, R.L.; Corum, J.M.; Young, H.C. (Oak Ridge National Lab., TN (USA)). Sep 1978. Contract W-7405-ENG-26. 101p. AT.

The results of a ratchetting test of a type 316 stainless steel pipe are presented and are compared with inelastic analysis predictions. The test specimen was a pipe consisting of two sections: a seamless section and a seam-welded section with two diametrically opposed welds with 16-8-2 stainless steel filler metal. In a special sodium test facility, the specimen was subjected to a series of thermal downshocks at the inner surface, followed by sustained periods of high-temperature operation under internal pressure. The outer surface strain history was measured for both sections and was compared with the prediction of a one-dimensional finite-element analysis for the seamless section. The inelastic analysis procedure was based on guidelines recommended for use in the design of U.S. liquid-metal fast-breeder reactor components. Mechanical properties required for the analysis were obtained from tests using a material of the same heat and product form as that used for the ratchetting specimen. The agreement obtained between analysis and experimental results was judged to be acceptable throughout the test.

- 2569 (ORNL--5433) HIGH-TEMPERATURE STRUCTURAL DESIGN PROGRAM SEMIANNUAL PROGRESS REPORT FOR PERIOD ENDING JUNE 30, 1978. Corum, J.M.; Pugh, C.E. (Oak Ridge National Lab., TN (USA)). Nov 1978. Contract W-7405-ENG-26. 276p. AT.

This report summarizes progress in the ORNL

High-Temperature Structural Design Program for January through June 1978. The technical activities of the program are comprehensively reported under six major headings, or subtasks, which correspond to the subtasks of the current 189a OH048 document: constitutive equations for inelastic design analysis; inelastic structural tests and analyses; design criteria and rules for time-dependent deformation and failure; simplified design methods; thermal ratchetting tests; and structural design methods for weldments.

- 2570 (ORNL--5440) NONDESTRUCTIVE TESTING DEVELOPMENT PROGRAM. QUARTERLY PROGRESS REPORT FOR PERIOD ENDING JUNE 30, 1978. Hill, M.R. (comp.). (Oak Ridge National Lab., TN (USA)). Sep 1978. Contract W-7405-ENG-26. 89p. AT.

Nondestructive testing (NDT) research related to LMFBR materials and components testing is reported. Included are NDT techniques and equipment for inspection and monitoring of steam generator tubes and welded joints, sodium rupture discs, and DNB water tubes. NDT methods employing ultrasonics, radiography, and eddy currents are discussed.

- 2571 (ORNL--5466) RODMOD: A CODE FOR CONTROL ROD POSITIONING. Vondy, D.R.; Fowler, T.B. (Oak Ridge National Lab., TN (USA)). Nov 1978. Contract W-7405-ENG-26. 133p. Dep. NTIS, PC A07/MF A01.

The report documents a computer code which has been implemented to position control rods according to a prescribed schedule during the calculation of a reactor history. Control rods may be represented explicitly with or without internal black absorber conditions in selected energy groups, or fractional insertion may be done, or both, in a problem. There is provision for control rod follower, movement of materials through a series of zones in a closed loop, and shutdown rod insertion and subsequent removal to allow the reactor history calculation to be continued. This code is incorporated in the system containing the VENTURE diffusion theory neutronics and the BURNER exposure codes for routine use. The implemented automated procedures cause the prescribed control rod insertion schedule to be applied without the access of additional user input data during the calculation of a reactor operating history.

- 2572 (ORNL--5474) HIGH-RESOLUTION BORESIDE RADIOGRAPHY OF SMALL-DIAMETER TUBE-TO-TUBESHEET WELDS. Foster, B.E.; Davis, E.V.; McClung, R.W. (Oak Ridge National Lab., TN (USA)). Feb 1979. Contract W-7405-ENG-26. 43p. AT.

Nondestructive testing is essential to assure the integrity of the separation boundaries between water and sodium in the steam generators of the Liquid-Metal Fast Breeder Reactor. Radiography is required for the evaluation of the tube-to-tubesheet weld joints, the only welds in the tubing. A high-resolution boreside radiographic technique was developed to evaluate these welds. The method involves placing a very small-diameter radiation source in the bore of the tube in alignment with the weld joint, putting a radiographic film around the joint, and making a 360° panoramic exposure of the joint on a single radiograph. To develop the technique the authors: (1) studied film cassette design; (2) compared radiographic sensitivities between several isotopes (thulium, ytterbium, and iridium) and small-diameter (9-mm) microfocus rod-anode x-ray units; and (3) studied equivalent radiographic sensitivity of plaque-

and wire-type penetrameters. Radiographic sensitivities of approximately 1% were achieved with the microfocus x-ray unit, while the best sensitivity obtained with the isotopes was approximately 3%. The resolution and sensitivity achieved in boreside radiography of small-diameter tube-to-tubesheet welds with the microfocus x-ray unit are superior to those of any known technique. The technique has been successfully applied to welds in tubing with inner diameters ranging from 10 to 32 mm. Similar results should be obtainable in tubing of even larger diameter. The established boreside radiographic technique was used to monitor weld quality as a function of welding parameters during the weld development program for the Clinch River Breeder Reactor (CRBR) at Atomic International. The technique and equipment are to be used to evaluate the tube-to-tubesheet welds during the manufacturing phase of the CRBR steam generators.

- 2573 (ORNL--5477/V1) SACRD: A DATA BASE FOR FAST REACTOR SAFETY COMPUTER CODES, GENERAL DESCRIPTION. Greene, N.M.; Forsberg, V.M.; Raiford, G.B.; Arwood, J.W.; Simpson, D.B.; Flanagan, G.F. (Oak Ridge National Lab., TN (USA)). Jan 1979. Contract W-7405-ENG-26. 29p. Dep. NTIS, PC A03/MF A01.

SACRD is a data base of material properties and other handbook data needed in computer codes used for fast reactor safety studies. Data are available in the thermodynamics, heat transfer, fluid mechanics, structural mechanics, aerosol transport, meteorology, neutronics, and dosimetry areas. Tabular, graphical and parameterized data are provided in many cases. A general description of the SACRD system is presented in the report.

- 2574 (ORNL--5477/V2) SACRD: A DATA BASE FOR FAST REACTOR SAFETY COMPUTER CODES, CONTENTS AND GLOSSARY OF VERSION 1 OF THE SYSTEM. Greene, N.M.; Forsberg, V.M.; Raiford, G.B.; Arwood, J.W.; Flanagan, G.F. (Oak Ridge National Lab., TN (USA)). Jan 1979. Contract W-7405-ENG-26. 80p. Dep. NTIS, PC A05/MF A01.

SACRD is a data base of material properties and other handbook data needed in computer codes used for fast reactor safety studies. This document lists the contents of Version 1 and also serves as a glossary of terminology used in the data base. Data are available in the thermodynamics, heat transfer, fluid mechanics, structural mechanics, aerosol transport, meteorology, neutronics and dosimetry areas. Tabular, graphical and parameterized data are provided in many cases.

- 2575 (ORNL--5483) INSTRUMENTATION AND CONTROLS DIVISION BIENNIAL PROGRESS REPORT, SEPTEMBER 1, 1976--SEPTEMBER 1, 1978. Sadowski, G.S. (ed.). (Oak Ridge National Lab., TN (USA)). Nov 1978. Contract W-7405-ENG-26. 93p. AT.

Progress is summarized in the following LMFBR related studies: reactor surveillance and diagnostics; neutron sensor development; advanced fuel recycle program; and miscellaneous project design, development, and installation assistance.

- 2576 (ORNL--5490) NONDESTRUCTIVE TESTING DEVELOPMENT PROGRAM. QUARTERLY PROGRESS REPORT FOR PERIOD ENDING SEPTEMBER 30, 1978. Hill, M.R. (Oak Ridge National Lab., TN (USA)). Dec 1978. Contract W-7405-ENG-26. 114p. AT.

Results of NDT development programs

sponsored by the Division of Reactor Research and Technology at Argonne National Laboratory, GE, Hanford Engineering Development Laboratory, and Oak Ridge National Laboratory are presented. Argonne's program consists of ultrasonic in-service inspection for the EBR-2 steam generators reliable examination techniques for coarse-grain SS especially welds, neutron laminagraphy tests on fuel assemblies, and ultrasonic wall thickness measurement in grooved tubes. GE reports on in-service inspection of the few tube test module and transition joints. Hanford describes radiographic eddy current, ultrasonic and hybrid methods and equipment. DRNL describes NDT for steam generators for the breeder reactor program, transition joints in pipes, and NDT development. (FS)

- 2577 (ORNL--5505) VITAMIN-E: AN ENDF/B-V MULTIGROUP CROSS-SECTION LIBRARY FOR LMFBR CORE AND SHIELD, LWR SHIELD, DOSIMETRY AND FUSION BLANKET TECHNOLOGY. Weisbin, C.R.; Roussin, R.W.; Wagschal, J.J.; White, J.E.; Wright, R.Q. (Oak Ridge National Lab., TN (USA)). Feb 1979. Contract W-7405-ENG-26. 27p. (ENDF--274). Dep. NTIS, PC A03/MF A01.

The Department of Energy (DOE) Office of Fusion Energy (OFE) and the Division of Reactor Research and Technology (DRRT) jointly sponsored the development of a coupled fine-group cross section library. This 171-neutron, 36-gamma-ray group library was based upon ENDF/B-IV and was intended to be applicable to fusion reactor neutronics and LMFBR core and shield analysis. Versions of the library are available from the Radiation Shielding Information Center (RSIC) at the Oak Ridge National Laboratory in both AMPX and CCC formats. Computer codes for energy group collapsing, interpolation on Bondarenko factors for resonance self-shielding and temperature corrections, and various other useful data manipulations are also available. The experience gained in the generation, validation and utilization of this library along with its broad range of applicability has led to the request for updating this data set using ENDF/B-V. Additional support in this regard has been provided by the Defense Nuclear Agency (DNA) and by the Electric Power Research Institute (EPRI) in support of weapons analyses and light water reactor shielding and dosimetry problems, respectively. The purpose of the report is to provide detailed specifications and rationale for the proposed ENDF/B-V update (designated VITAMIN-E) to the VITAMIN-C library.

- 2578 (ORNL--5512) INELASTIC RATCHETTING ANALYSIS OF THE 2 1/4 CR--1 MO STEEL TO TYPE 316 STAINLESS STEEL DISSIMILAR METAL WELDMENT REGION OF SPECIMEN TTT-3. Sartory, W.K. (Oak Ridge National Lab., TN (USA)). Mar 1979. Contract W-7405-ENG-26. 51p. AT.

The results of a ratchetting analysis of a dissimilar metal weldment between pipes of 2 1/4 Cr--1 Mo steel and type 316 stainless steel are presented and compared with earlier test results. The loading history consisted of 19 thermal downshocks at the inner surface, each followed by a sustained period under internal pressure at a temperature high enough for creep to occur in all three materials. Thermal analyses of the weldment region were performed, and the calculated outer-surface temperatures at the center plane of the weldment agree with the experiment. An inelastic structural analysis of the specimen was performed using constitutive equations. The agreement of the calculated strain with the experiment is about as close as was obtained earlier for the same pipe in regions far from any structural

discontinuities. Some limited creep damage results were also obtained.

operate in the creep range. (FS)

- 2579 (ORNL--5529) RECOMMENDATIONS CONCERNING MODELS AND PARAMETERS BEST SUITED TO BREEDER REACTOR ENVIRONMENTAL RADIOLOGICAL ASSESSMENTS. Miller, C.W.; Baes, C.F. III; Dunning, D.E. Jr. (Oak Ridge National Lab., TN (USA)). May 1980. Contract W-7405-ENG-26. 162p. NTIS, PC A08/MF A01.

Recommendations are presented concerning the models and parameters best suited for assessing the impact of radionuclide releases to the environment by breeder reactor facilities. These recommendations are based on the model and parameter evaluations performed during this project to date. Seven different areas are covered in separate sections.

- 2580 (ORNL--5538) INTERNAL BORE WELDING OF 2 1/4 CR-1 MO STEEL TUBE-TO-TUBESHEET JOINTS. Moorhead, A.J.; Reed, R.W. (Oak Ridge National Lab., TN (USA)). Jun 1979. Contract W-7405-ENG-26. 43p. AT.

We undertook a program to develop improved equipment for internal bore welding of the critical tube-to-tubesheet joints of steam generators and to gain understanding of the welding behavior of 2 1/4 Cr-1 Mo steel tubing by studying samples from four commercial heats of material. A commercial internal welding tip was improved by adding a Ta-10% W collet, which allowed use of a straight rather than bent tungsten electrode, and a fused quartz gas cup, which replaced three separate components. We found that the pressure differential (ΔP) between the inside and outside of the tubular weldments was critical in controlling weld bead geometry. With a slant tube manometer, we determined that ΔP held to 10 mm (0.4 in.) of water resulted in optimum bead contour. Several different procedures were evaluated for cleaning the tubing before welding. Weld porosity (determined by a very sensitive radiographic technique using a rod-anode microfocus x-ray source) was minimized by simple abrasion with a commercial mesh product followed by an alcohol rinse. Tubing from three of the four heats behaved very similarly in boreside welding; however, welds that were made in the fourth heat (which was from a VAR billet) under identical conditions as the others penetrated only about two-thirds of the tube wall. Consequently, we developed no single procedure that could be used to successfully weld all four materials. We conducted an extensive postweld heat treatment study on samples from a weld in each heat of tubing and measured the microhardness of various regions of the weldment in each sample. The heat-affected zones were harder than the fusion zones in these autogenous weldments. Furthermore, the weldments were harder than the base metals, even after lengthy thermal treatments at 677 or 732°C.

- 2581 (ORNL--5540) HIGH-TEMPERATURE STRUCTURAL DESIGN PROGRAM SEMIANNUAL PROGRESS REPORT FOR PERIOD ENDING DECEMBER 31, 1978. Corum, J.M.; Pugh, C.E. (Oak Ridge National Lab., TN (USA)). Oct 1979. Contract W-7405-ENG-26. 320p. AT.

Progress is summarized in the ORNL High-Temperature Structural design program concerning constitutive equations for inelastic design analysis, inelastic structural tests and analyses, design criteria and rules for time-dependent deformation and failure, simplified design methods, thermal ratcheting tests, and structural design methods and weldments for LMFBR and other reactor system components that

- 2582 (ORNL--5548) FY 1977 PROGRESS REPORT OF THE CLINCH RIVER BREEDER REACTOR SOURCE RANGE FLUX MONITOR ASSESSMENT STUDY FOR THE REFERENCE HOMOGENEOUS CORE. Emmett, M.B.; Engle, W.W. Jr.; Flanagan, G.F.; Knee, H.E.; Loyd, D.L.; Selby, D.L.; Williams, L.R. (Oak Ridge National Lab., TN (USA)). Sep 1979. Contract W-7405-ENG-26. 38p. Dep. NTIS, PC A03/MF A01.

Interpretability of Inverse Kinetics Rod Drop (IKRD) was examined and found to be feasible. The absolute count rate at beginning-of-life (BOL) full shutdown was calculated and determined to be below minimum recommended levels. However, geometry and material changes in the SRFM were identified which could be employed to achieve the desired minimum levels. Generalized perturbation interpolation schemes to estimate detection efficiency changes were investigated and found to be feasible but not very practical. In addition, the uncertainties associated with the devised subcritical monitoring procedure were examined.

- 2583 (ORNL--5557) ANALYSIS OF THE CLINCH RIVER BREEDER REACTOR (CRBR) SOURCE RANGE FLUX MONITOR (SRFM) COUNT RATE HISTORY DURING REFUELING OF THE FIRST FOUR CYCLES. Selby, D.L.; Knee, H.E. (Oak Ridge National Lab., TN (USA)). Sep 1979. Contract W-7405-ENG-26. 45p. AT.

An annual shutdown for refueling is scheduled for all operating cycles of the Clinch River Breeder Reactor (CRBR). Operating procedures require that during refueling the Source Range Flux Monitor (SRFM) provide a warning to the operator to assure that the reactor does not approach criticality any closer than that level from which criticality could be attained by a single refueling error, with adequate margin for the associated uncertainties. The present procedure requires the use of a changing count rate alarm set point. This alarm set point would represent the subcriticality level corresponding to the worst single refueling error plus appropriate uncertainties. This report is a summary of the work performed at ORNL to determine and analyze the count rate history during each step of refueling through the first four cycles. In addition, relative alarm point values were determined and an effort was made to estimate the amount of conservatism associated with the method used to monitor refueling.

- 2584 (ORNL--5568) REVIEW OF METHODS FOR TREATMENT OF SOURCE EFFECTS IN THE MODIFIED SOURCE MULTIPLICATION METHOD FOR MONITORING THE REACTIVITY IN REFUELING THE CRBR. Mihalcz, J.T. (Oak Ridge National Lab., TN (USA)). Sep 1979. Contract W-7405-ENG-26. 13p. AT.

There are three methods by which source effects can be treated in the interpretation of modified source multiplication measurements in refueling a liquid-metal fast breeder reactor: (1) measurement of and correction for axial and radial source intensity distributions; (2) use of an additional source to override burnt-in source effects so they can be neglected, and (3) calculations. The implementation of these methods and their adequacy for the Clinch River Breeder Reactor (CRBR) is discussed. Of the three methods, the use of an additional source is the only method where an increase or decrease in the count rate definitely means a corresponding increase or decrease in reactivity.

2585 (ORNL--5579) METALS AND CERAMICS DIVISION ANNUAL PROGRESS REPORT, OCTOBER 1, 1978-JUNE 30, 1979. Peterson, S. (ed.). (Oak Ridge National Lab., TN (USA)). Sep 1979. Contract W-7405-ENG-26. 72p. Dep. NTIS, PC A04/MF A01.

Research is reported concerning: (1) engineering materials including materials compatibility, mechanical properties, nondestructive testing, pressure vessel technology, and welding and brazing; (2) fuels and processes consisting of ceramic technology, fuel cycle technology, fuels evaluation, fuels fabrication and metals processing; and (3) materials science which includes, ceramic studies, physical metallurgy and properties, radiation effects and microstructural analysis, metastable and superconducting materials, structure and properties of surfaces, theoretical research, and x-ray research and applications. Highlights of the work of the metallographic group and the current status of the High-Temperature Materials Laboratory (HTML) and the Materials and Structures Technology Management Center (MSTMC) are presented. (FS)

2586 (ORNL/BRP--78/3) MECHANICAL PROPERTIES TEST MATRICES ON TYPE 316 STAINLESS STEEL AND 2 1/4 CR--1 MO STEEL FOR U.S. DEPARTMENT OF ENERGY BREEDER REACTOR PROGRAM. Sikka, V.K. (comp.). (Oak Ridge National Lab., TN (USA)). Oct 1978. Contract W-7405-ENG-26. 99p. AT.

Details of the mechanical properties test program being undertaken by the United States Department of Energy on Structural Materials for Breeder Reactor Program are presented. The current program covers type 316 stainless steel and associated weld metal and 2 1/4 Cr--1 Mo steel and the transition joint weld materials and weldments. Section I of this report covers the tests to be made in air and after irradiation; Section II covers tests to be made after prior exposure in sodium and those to be made in static and dynamic sodium. The current (August 1978) status of various programs is presented.

2587 (ORNL/BRP--78/4) SPECIAL INFORMATION MEETING ON HIGH-TEMPERATURE STRUCTURAL DESIGN APPLICATIONS EXPERIENCE, GERMANTOWN, MARYLAND, SEPTEMBER 14--15, 1978. SUMMARY REPORT. (Oak Ridge National Lab., TN (USA)). Dec 1978. Contract W-7405-ENG-26. 514p. AT.

The special information meeting on high-temperature structural design applications experience was held September 14 to 15, 1978, at the Department of Energy in Germantown, Maryland. Although the presentations largely addressed liquid-metal-cooled breeder reactor applications, high-temperature gas-cooled reactor applications were addressed as well. This summary report was prepared to document the meeting. It contains, in addition to the Agenda and List of Attendees, a brief introduction to and summary of the meeting and a very brief overview and copy of the visuals for each of the presentations.

2588 (ORNL/BRP--79/3) NONDESTRUCTIVE TESTING DEVELOPMENT PROGRAM SEMIANNUAL PROGRESS REPORT FOR PERIOD ENDING MARCH 31, 1979. McClung, R.W. (comp.). (Oak Ridge National Lab., TN (USA)). Jul 1979. Contract W-7405-ENG-26. 94p. AT.

Nondestructive testing (NDT) research for LMFBR components is summarized. The work covered NDT techniques and equipment for inspection and monitoring of steam generators

and piping. The NDT techniques included ultrasonics, radiography, and eddy current testing.

2589 (ORNL/BRP--79/4) MODIFIED 9 CR-1 MO STEEL DEVELOPMENT PROGRAM PROGRESS REPORT, MARCH 31, 1979. Distefano, J.R. (comp.). (Oak Ridge National Lab., TN (USA)). Sep 1979. Contract W-7405-ENG-26. 210p. AT.

Research concerning Cr-Mo steel for use in LMFBR plant components is described. Creep, weld filler metal development, weldability, tensile testing, Charpy V-notch toughness studies, thermal aging, corrosion, hydrogen embrittlement, precipitate extraction and identification, and stress rupture testing are reported. (FS)

2590 (ORNL/BRP/CD--78/6) CLAD/DUCT MATERIALS DEVELOPMENT. TECHNICAL STATUS REPORT FOR JUNE 1978. Rowcliffe, A.F. (Oak Ridge National Lab., TN (USA)). Jun 1978. Contract W-7405-ENG-26. 3p. AT.

The objective of the program is to identify and develop advanced alloys for cladding and duct use with improved resistance to swelling and to irradiation-induced mechanical property degradation. Information on stainless steel-316 and V-series alloys is presented.

2591 (ORNL/BRP/M--78/6) BREEDER REACTOR PROGRAM: MATERIALS. TECHNICAL STATUS REPORT FOR JUNE 1978. Goodwin, G.M. (Oak Ridge National Lab., TN (USA)). Jun 1978. Contract W-7405-ENG-26. 21p. AT.

Breeder reactor materials are discussed. Data are presented concerning improved welds, steam generator materials, NDT, advanced breeder structural materials development, mechanical properties of structural materials for breeders, and fabrication of piping and pipe fittings. (FS)

2592 (ORNL/CSD--35) NEUTRONIC ANALYSIS OF LMFBRs DURING SEVERE CORE DISRUPTIVE ACCIDENTS. Tomlinson, E.T. (Oak Ridge National Lab., TN (USA)). Jan 1979. Contract W-7405-ENG-26. 48p. Dep. NTIS, PC A03/MF A01.

A number of numerical experiments were performed to assess the validity of diffusion theory and various perturbation methods for calculating the reactivity state of a severely disrupted liquid metal cooled fast breeder reactor (LMFBR). The disrupted configurations correspond, in general, to phases through which an LMFBR core could pass during a core disruptive accident (CDA). Two-reactor models were chosen for this study, the two zone, homogeneous Clinch River Breeder Reactor and the Large Heterogeneous Reactor Design Study Core. The various phases were chosen to approximate the CDA results predicted by the safety analysis code SAS3D. The calculational methods investigated in this study include the eigenvalue difference technique based on both discrete ordinate transport theory and diffusion theory, first-order perturbation theory, exact perturbation theory, and a new hybrid perturbation theory. Selected cases were analyzed using Monte Carlo methods. It was found that in all cases, diffusion theory and perturbation theory yielded results for the change in reactivity that significantly disagreed with both the discrete ordinate and Monte Carlo results. These differences were, in most cases, in a nonconservative direction.

2593 (ORNL/CSD/TM--35) CALCULATION OF THE REACTIVITY DUE TO BUBBLE COLLAPSE WITH THE

PROBABILITY TABLE METHOD. Hoffman, T.J.; Petrie, L.M. (Oak Ridge National Lab., TN (USA)). Dec 1977. Contract W-7405-ENG-26. 29p. Dep. NTIS, PC A03/MF A01.

The probability table method, originally developed for unresolved resonance calculations; is adapted to the calculation of bubble worths in a reactor core. Unlike previous approaches to this problem, this method is applicable to a broad class of problems, avoids a high variance Monte Carlo calculation, and preserves the main features of a random bubble distribution. This approach is illustrated by the solution to several problems of varying degrees of complexity.

2594 (ORNL/CSD/TM--38) TRANSPORT-DIFFUSION COMPARISONS FOR SMALL CORE LMFBR DISRUPTIVE ACCIDENTS. Tomlinson, E.T. (Oak Ridge National Lab., TN (USA)). Nov 1977. Contract W-7405-ENG-26. 51p. Dep. NTIS, PC A04/MF A01.

A number of numerical experiments were performed to assess the validity of diffusion theory for calculating the reactivity state of various small core LMFBR disrupted geometries. The disrupted configurations correspond, in general, to various configurations predicted by SAS3A for transient undercooling (TUC) and transient overpower (TOP) accidents for homogeneous cores and to the ZPPR-7 configurations for heterogeneous core. In all TUC cases diffusion theory was shown to be inadequate for the calculation of reactivity changes during core disassembly.

2595 (ORNL/MIT--274) RADIATIVE HEAT TRANSFER IN A 19-PIN SODIUM-VOIDED BUNDLE. Machnitz, M.; Budiman, B.; Roberts, Y.Y. (Massachusetts Inst. of Tech., Oak Ridge, TN (USA). School of Chemical Engineering Practice). 26 Apr 1978. Contract W-7405-ENG-26. 46p. Dep. NTIS, PC A03/MF A01.

A theoretical study was made of the radiative heat removal capability in a 19-pin bundle simulating the fuel assemblies of the commercial-scale (217-pin) Clinch River Breeder Reactor. Pin surface temperature distributions and the maximum allowable uniform pin power (without causing cladding meltdown) were determined for a range of emissivities and duct-wall temperatures. It was concluded that radiative heat transfer ranging to 0.1 kW/ft was comparable to free convection ranging to 0.02 kW/ft, and was lower than that of forced convection cooling to 2.17 kW/ft by the sodium vapor.

2596 (ORNL/MIT--285) ANALYSIS OF SBTF QUADELLIPTICAL FURNACES. Anderson, F.E.; Schulz, R.B. (Massachusetts Inst. of Tech., Oak Ridge, TN (USA). School of Chemical Engineering Practice). 23 Feb 1979. Contract W-7405-ENG-26. 43p. Dep. NTIS, PC A03/MF A01.

A computer model was developed which predicts the axial temperature profile and heat flux at the outer surface of the test section of the Sodium Boiling Test Facility constructed by the Engineering Technology Division at ORNL. The model was in agreement with observed temperature profiles at furnace power levels representative of single phase, dual phase, and dry-out operations. A parametric study demonstrated the effect of sodium flow rate and surface emissivities on the predicted temperature profile. It was concluded that axial conduction in the Hastelloy tube and sodium must be incorporated into the model to improve accuracy.

2597 (ORNL/NUREG/CR--0678) ANALYSIS OF THE HEAT AND MASS TRANSFER PROCESSES OF A UO₂ BUBBLE IN SODIUM FOR THE FUEL AEROSOL SIMULANT TEST (FAST). Tobias, M.L. (Oak Ridge National Lab., TN (USA)). 17 Apr 1979. Contract W-7405-ENG-26. 44p. (ORNL/NUREG/TM--307). Dep. NTIS, PC A03/MF A01.

The anticipated behavior of uranium oxide vapor bubbles produced by the capacitor discharge vaporization (CDV) method in the Fuel Aerosol Simulant Test (FAST) Facility is discussed on the basis of relatively simple physical models. Results of calculations for the rate of bubble rise and for heat and mass transfer rates are presented. Parametric studies indicate that future analysis efforts should emphasize the diffusion condensation process and the loss of heat from the bubble by radiation. Transfer of heat in the surrounding sodium is rapid enough that simplified models should be adequate. No important effects were noted in connection with bubble depth, initial quantity of UO₂, or initial superheat.

2598 (ORNL/NUREG/NSIC--139) LMFBR SAFETY. 5. REVIEW OF CURRENT ISSUES AND BIBLIOGRAPHY OF LITERATURE (1975--1976). Buchanan, J.R.; Kailholtz, G.W. (Oak Ridge National Lab., TN (USA)). 8 Jun 1977. Contract W-7405-ENG-26. 575p. (ORNL/NUREG/NSIC--125(Vol.5)). Dep. NTIS, PC A25/MF A01.

The current status of liquid-metal fast breeder reactor (LMFBR) development and one of the principal safety issues, a hypothetical core-disruptive accident (HCDA), are discussed. Bibliographic information on worldwide LMFBRs relative to the development and safety of the breeder reactor is presented for the period 1975 through 1976. The bibliography consists of approximately 1618 abstracts covering early research and development and operating experiences leading up to the present design practices that are necessary for the licensing of breeder reactors. Keyword, author, and permuted-title indexes are included for completeness.

2599 (ORNL/NUREG/TM--124) SOURCE TERM ASSESSMENT CONCEPTS FOR LMFBRs: AEROSOL RELEASE AND TRANSPORT (ART) ANALYTICAL PROGRAM. Kress, T.S. (Oak Ridge National Lab., TN (USA)). Nov 1977. Contract W-7405-ENG-26. 72p. Dep. NTIS, PC A04/MF A01.

Analytical needs for LMFBR HCDA source term assessment are outlined and the physical events connected with the formation of an aerosol source are discussed. The important features of the movement of hazardous materials from the core site to the boundaries of the secondary containment are described, with accompanying brief reviews of prior work. The overall problem is broken down into tractable parts and approaches for attacks on the various problems are suggested. Topics include the state of the disrupted core, interactions with intact above-core structure, HCDA bubble formation, heat exchange with the sodium pool, aerosol formation by nucleation and fragmentation, attenuation effects, and aerosol behavior in secondary containments.

2600 (ORNL/NUREG/TM--129) FUEL AEROSOL SIMULANT TEST (FAST) PLAN. Wright, A.L.; Smith, A.M.; Kress, T.S. (Oak Ridge National Lab., TN (USA)). 14 Sep 1977. Contract W-7405-ENG-26. vp. Dep. NTIS, PC A02/MF A01.

This report presents the work plan for the Fuel Aerosol Simulant Test (FAST), which constitutes task 5 of the Aerosol Release and Transport (ART) Program, sponsored by the

Division of Reactor Safety Research of the Nuclear Regulatory Commission. These tests involve the study of the formation, rise, and condensation of a surrogate LMFBR fuel (UO_2) vapor bubble produced in liquid sodium to simulate phenomena associated with hypothetical core-disruptive accidents (HCDAs). UO_2 bubbles will be produced by the capacitor discharge vaporization (CDV) technique. Tests through FY 1979 will be done in argon, water, and in sodium; results will be analyzed using models developed in the ART program.

- 2601 (ORNL/NUREG/TM--142) BREEDER REACTOR AEROSOL RELEASE AND TRANSPORT PROGRAM. QUARTERLY PROGRESS REPORT, APRIL--JUNE 1977. Fontana, M.H.; Kress, T.S. (Oak Ridge National Lab., TN (USA)). 16 Nov 1977. Contract W-7405-ENG-26. 65p. Dep. NTIS, PC A04/MF A01.

The report summarizes studies designed to investigate radionuclide release and transport from breeder reactors for reactor events of severity up to and including hypothetical core-disruptive accidents (HCDAs). Experimental program topics discussed include (1) CDV-CRI-III design considerations and experimental operation; (2) fuel aerosol characterization studies in the CRI-II facility; (3) NSPP sodium oxide aerosol experiments; (4) FAST facility design, site preparation, and component procurement and fabrication; and (5) exploratory CDV experiments in support of the FAST program. Analytical program topics discussed include an idealized expansion calculational model and a model for UO_2 vapor condensation on cooler structural surfaces.

- 2602 (ORNL/NUREG/TM--148) MONTHLY HIGHLIGHTS FOR OFFICE OF NUCLEAR REGULATORY RESEARCH PROGRAMS AT OAK RIDGE NATIONAL LABORATORY, AUGUST 1977. Fee, G.G. (comp.). (Oak Ridge National Lab., TN (USA)). 13 Sep 1977. Contract W-7405-ENG-26. 30p. Dep. NTIS, PC A03/MF A01.

Technical highlights are presented for the following safety-related studies: heavy section steel technology, fission product beta and gamma energy release, fission product release from LWR fuel, fission product transport tests, multirod burst tests, Nuclear Safety Information Center, PWR blowdown heat transfer-separate effects, zircaloy fuel cladding collapse studies, zirconium metal-water oxidation kinetics, aerosol release and transport from LMFBR fuel, HTGR safety analysis and research, design criteria for piping and nozzles, and noise diagnostics for safety assessment.

- 2603 (ORNL/NUREG/TM--158) MONTHLY HIGHLIGHTS FOR OFFICE OF NUCLEAR REGULATORY RESEARCH PROGRAMS AT OAK RIDGE NATIONAL LABORATORY. Fee, G.G. (comp.). (Oak Ridge National Lab., TN (USA)). 11 Oct 1977. Contract W-7405-ENG-26. 25p. Dep. NTIS, PC A03/MF A01.

Brief highlights of technical progress during September 1977 are presented for thirteen separate program activities which comprise the ORNL research program for the Office of Nuclear Regulatory Research's Division of Reactor Safety Research.

- 2604 (ORNL/NUREG/TM--160) DEVELOPMENT OF THE CAPACITOR DISCHARGE VAPORIZATION TECHNIQUE TO PRODUCE AEROSOLS FORMED UNDER CONDITIONS POSTULATED FOR HYPOTHETICAL CORE DISRUPTIVE ACCIDENTS. Kelly, M.J.; Parker, G.W.; Rochelle, J.M. (Oak Ridge National Lab., TN

(USA)). 22 Jun 1978. Contract W-7405-ENG-26. 94p. (NUREG/CR--0226). Dep. NTIS, PC A05/MF A01.

This report describes the development of a Capacitor Discharge Vaporization (CDV) method for the out-of-pile creation of energy states in fast breeder reactor fuel (or simulants) that are consistent with those postulated for Hypothetical Core Disruptive Accidents (HCDAs). The results of the development experiments, concurrent planning, test article construction, peripheral equipment design and construction, and computer modeling studies are discussed in relation to their effects on the design of the Oak Ridge National Laboratory's Capacitor Discharge Vaporization (ORNL CDV) System. The completed ORNL CDV System is described in detail, including all the required subsystems and data acquisition equipment. Operational features, equipment capability, and expected performance are also discussed.

- 2605 (ORNL/NUREG/TM--165) INVENTORY AND RELATIVE BIOLOGICAL HAZARD OF LMFBR CORE MATERIALS. Tobias, M.L. (Oak Ridge National Lab., TN (USA)). 16 Jan 1978. Contract W-7405-ENG-26. 15p. Dep. NTIS, PC A02/MF A01.

Information on the composition of an LMFBR core by element has been collected on the basis of published design data and ORIGEN calculations. The mass quantities of structural materials, actinides, and fission products are in the ratio of 1:1.4:0.1 with actinides, particularly plutonium and neptunium, representing the major inhalation and ingestion hazard. Some of the fission products are present in quantities large enough to suggest that they warrant specific attention in source term analysis.

- 2606 (ORNL/NUREG/TM--172) NOVEMBER 1977 MONTHLY HIGHLIGHTS FOR OFFICE OF NUCLEAR REGULATORY RESEARCH PROGRAMS AT OAK RIDGE NATIONAL LABORATORY. Mynatt, F.R. (comp.). (Oak Ridge National Lab., TN (USA)). 12 Dec 1977. Contract W-7405-ENG-26. 31p. Dep. NTIS, PC A04/MF A01.

Brief highlights are presented for the following safety-related programs: heavy section steel technology, fission product beta and gamma energy release, fission product release from LWR fuel, fission product transport tests, multirod burst tests, Nuclear Safety Information Center, PWR blowdown heat transfer-separate effects, Zircaloy fuel cladding collapse studies, aerosol release and transport from LMFBR fuel, advanced instrumentation for reflood studies, HTGR safety analysis and research, design criteria for piping and nozzles, and noise diagnostics for safety assessment.

- 2607 (ORNL/NUREG/TM--173) BREEDER REACTOR AEROSOL RELEASE AND TRANSPORT PROGRAM QUARTERLY PROGRESS REPORT FOR JULY--SEPTEMBER 1977. Kress, T.S. (Oak Ridge National Lab., TN (USA)). Apr 1978. Contract W-7405-ENG-26. 54p. Dep. NTIS, PC A04/MF A01.

The report summarizes progress for the Aerosol Release and Transport Program. The program is designed to investigate radionuclide release and transport from breeder reactors for reactor events of severity up to and including hypothetical core-disruptive accidents (HCDAs). Experimental program topics discussed include fuel aerosol characterization studies in the CRI-II facility; NSPP sodium oxide pool fire and spray fire aerosol experiments; FAST facility design, component procurement and fabrication, site preparation, and CRI-III facility site change and reinstallation.

Analytical program topics discussed include a bubble condensation model for FAST experiments and discussion of breeder reactor core contents which can contribute to an aerosol generated by a hypothetical core-disruptive accident (HCDA).

- 2608 (ORNL/NUREG/TM--179) SODIUM OXIDE AEROSOL STUDY: NSPP RUNS 101 TO 105, DATA RECORD REPORT. Adams, R.E.; Kress, T.S.; Parsly, L.F. Jr. (Oak Ridge National Lab., TN (USA)). 9 Mar 1978. Contract W-7405-ENG-26. 83p. Dep. NTIS, PC A03/MF A01.

This data record report summarizes the first five sodium oxide aerosol tests conducted in the Nuclear Safety Pilot Plant (NSPP) project at Oak Ridge National Laboratory. The goal of the project is to establish the validity (or level of conservatism) of the aerosol behavioral code, HAARM-2, and follow-on codes under development at the Battelle Columbus Laboratories for the U.S. Nuclear Regulatory Commission (NRC). Included in the report are descriptions of the five tests together with graphs and tables summarizing the results.

- 2609 (ORNL/NUREG/TM--182) DECEMBER 1977 MONTHLY HIGHLIGHTS FOR OFFICE OF NUCLEAR REGULATORY RESEARCH PROGRAMS AT OAK RIDGE NATIONAL LABORATORY. Mynatt, F.R. (comp.). (Oak Ridge National Lab., TN (USA)). 12 Jan 1978. Contract W-7405-ENG-26. 28p. Dep. NTIS, PC A03/MF A01.

Technical highlights are presented for the following safety-related studies: heavy section steel technology, fission product release from LWR fuel, fission product transport tests, multirod burst tests, Nuclear Safety Information Center, PWR blowdown heat transfer-separate effects, Zircaloy fuel cladding collapse studies, aerosol release and transport from LMFBR fuel, advanced instrumentation for reflood studies (AIRS), HTGR safety analysis and research, design criteria for piping and nozzles, and noise diagnostics for safety assessment. (DG)

- 2610 (ORNL/NUREG/TM--193) BREEDER REACTOR AEROSOL RELEASE AND TRANSPORT PROGRAM. QUARTERLY PROGRESS REPORT FOR OCTOBER--DECEMBER 1977. Kress, T.S. (Oak Ridge National Lab., TN (USA)). 25 Apr 1978. Contract W-7405-ENG-48. 36p. (NUREG/CR--0090). Dep. NTIS, PC A03/MF A01.

This report summarizes progress for the Aerosol Release and Transport Program, sponsored by the Division of Reactor Safety Research of the Nuclear Regulatory Commission, for the period October--December 1977. The program is designed to investigate radionuclide release and transport from breeder reactors for reactor events of severity up to and including hypothetical core-disruptive accidents (HCDAs). Experimental program topics discussed include (1) fuel aerosol characterization studies in the CRI-II facility; (2) design and development of a mixed sodium oxide-uranium oxide generating system; (3) the first uranium oxide experiment in the Nuclear Safety Pilot Plant; (4) Fuel Aerosol Simulation Test Facility installation progress; and (5) progress in the relocation of the CRI-III facility. From the analytical program, calculations of the fuel vapor quality and bubble diameter resulting from expansion of saturated liquid fuel to a lower pressure and simultaneous evaporation of varying amounts of sodium are reported.

- 2611 (ORNL/NUREG/TM--197) FEBRUARY 1978 MONTHLY HIGHLIGHTS FOR OFFICE OF NUCLEAR

REGULATORY RESEARCH PROGRAMS AT OAK RIDGE NATIONAL LABORATORY. Mynatt, F.R. (comp.). (Oak Ridge National Lab., TN (USA)). 10 Mar 1978. Contract W-7405-ENG-26. 37p. Dep. NTIS, PC A03/MF A01.

Brief highlights are presented for the following safety-related studies: heavy section steel technology, fission product beta and gamma energy release, fission product release from LWR fuel, multirod burst tests, Nuclear Safety Information Center, PWR blowdown heat transfer--separate effects, Zircaloy fuel cladding collapse studies, aerosol release and transport from LMFBR fuel, advanced instrumentation for reflood studies, HTGR safety analysis and research, design criteria for piping and nozzles, noise diagnostics for safety assessment, improved eddy current inservice inspection for steam generator tubing, LWR pressure vessel irradiation, and NRC measured data repository.

- 2612 (ORNL/NUREG/TM--201) MARCH 1978 MONTHLY HIGHLIGHTS, OFFICE OF NUCLEAR REGULATORY RESEARCH PROGRAMS AT OAK RIDGE NATIONAL LABORATORY. Myatt, F.R. (comp.). (Oak Ridge National Lab., TN (USA)). Apr 1978. Contract W-7405-ENG-26. 40p. Dep. NTIS, PC A03/MF A01.

Technical highlights are presented for the following safety-related studies: heavy section steel technology, fission product beta and gamma energy release, fission product release from LWR fuel, fission product transport tests, multirod burst tests, nuclear safety information center, PWR blowdown heat transfer-separate effects, Zircaloy fuel cladding collapse studies, aerosol release and transport from LMFBR fuel, advanced instrumentation for reflood studies, HTGR safety analysis and research, design criteria for piping and nozzles, noise diagnostics for safety assessment, improved eddy current in-service inspection for steam generator tubing, light water reactor pressure vessel irradiation program, and the NRC measured data repository. (DG)

- 2613 (ORNL/RSIC--41, pp 107-119) EXPERIENCE IN DEVELOPING AND USING THE VITAMIN-C 171-NEUTRON, 36-GAMMA-RAY GROUP CROSS-SECTION LIBRARY. Roussin, R.W.; Weisbin, C.R. White, J.E.; Wright, R.Q.; Greene, N.M.; Ford, W.E. III; Wright, J.B.; Diggs, B.R. Oct 1978.

From Radiation shielding information center seminar; Oak Ridge, TN, USA (14 Mar 1978).

The Department of Energy (DOE) Division of Magnetic Fusion Energy (DMFE) and Reactor Research and Technology (DRRT) jointly sponsored the development of a coupled, fine-group cross-section library. The 171-neutron, 36-gamma-ray group library is intended to be applicable to fusion reactor neutronics and LMFBR core and shield analysis. Versions of the library are available from the Radiation Shielding Information Center (RSIC) at Oak Ridge National Laboratory in both AMPX and CCCC formats. Computer codes for energy group collapsing, interpolation on Bondarenko factors for resonance self-shielding and temperature corrections, and various other useful data manipulations are available. The experience gained in the utilization of this library is discussed. Indications are that this venture, which is designed to allow users to derive problem-dependent cross sections from a fine-group master library, has been a success.

- 2614 (ORNL/RSIC--42, pp 251-279) SENSITIVITY THEORY FOR REACTOR THERMAL-HYDRAULICS PROBLEMS. Oblov, E.M. (Oak Ridge

National Lab., Oak Ridge, TN). Feb 1979.

From Workshop on theory and application of sensitivity and uncertainty analysis; Oak Ridge, TN, USA (22 Aug 1978).

A sensitivity theory based on reactor physics experience was successfully developed for a reactor thermal-hydraulics problem. The new theory is derived for the case of non-linear, transient heat and mass transfer in a typical reactor subassembly. Suitable adjoint equations for heat and fluid flow are presented along with methods for deriving the sources and boundary and final conditions for these equations. Expressions for the sensitivity of any integral temperature response to problem input data are also presented. The theory is applied to a sample problem describing the steady-state thermal-hydraulic conditions in a CRBR fuel channel. For this case, sensitivity coefficients are derived for several thermal response functions (i.e. peak clad and peak fuel temperature) for all physical input data (i.e. the heat transfer coefficient, thermal conductivities, etc.). A typical uncertainty analysis for peak clad and peak fuel temperature was also performed using uncertainty information about the physical data. Conclusions are drawn about the applicability of this approach to more general problems and the procedures for its implementation in conjunction with large safety or thermal-hydraulics codes are outlined. The method is also compared with currently used response surface techniques.

- 2615 (ORNL/SUB--79/55455/1) IMPLEMENTATION OF THE UNIFIED PLASTICITY--CREEP CONSTITUTIVE EQUATIONS WITH THE FINITE ELEMENT METHOD. Stoneking, J.E.; Baker, A.J.; Levine, D.L.; Soliman, M.O. (Tennessee Univ., Knoxville (USA), Dept. of Engineering Science and Mechanics). 12 Apr 1979. Contract W-7405-ENG-26. 62p. AT.

The implementation of unified plasticity--creep constitutive models into production finite element structural analysis codes requires identification of efficient numerical integration procedures for solution of the resultant, highly nonlinear ordinary differential equation systems. A standard implicit integration algorithm has been embedded within a Newton iteration procedure and evaluated for solution of the unified model applied to an axisymmetric example problem. A computer code was written using the elementary constant-strain triangular finite element. Numerical results indicate the developed procedure is fully capable of solving the sample problem with reasonable numerical efficiency.

- 2616 (ORNL/Sub--4308/3) STATUS OF INCOLOY ALLOY 800 DEVELOPMENT FOR BREEDER REACTOR STEAM GENERATORS. DiStefano, J.R. (comp.). (Westinghouse Electric Corp., Tampa, FL (USA), Tampa Div.). Dec 1978. Contract W-7405-ENG-26. 278p. AT.

Development of Incoloy alloy 800 for use in breeder reactor steam generators has been discontinued. Previously unpublished work on the program is presented as a collection of three reports: Study of the Softening and Recrystallization Response of Cold Worked and Annealed Alloy 800, ASME and B and PV Code Recommendations of Design Stresses for Use of Annealed Alloy 800 in Elevated Temperature Nuclear Vessels, and Relation of Physical Metallurgy to Mechanical Creep Behavior of Alloy 800.

APPLICATION OF THE PLANS COMPUTER PROGRAM FOR ANALYSIS OF NUCLEAR REACTOR STRUCTURAL COMPONENTS. Levy, A.; Pifko, A.; Armen, H. Jr. (Grumman Aerospace Corp., Bethpage, NY (USA), Research Dept.). Jun 1977. Contract W-7405-ENG-26-4485. 65p. (RE--542). AT.

PLANS is a group of finite element computer programs for the nonlinear analysis of complex structures. Four modules of the PLANS group described in the report are BEND, for the elastic-plastic analysis of built-up structures where bending and membrane effects are significant; HEX, for the three-dimensional elastic-plastic analysis of general solids; REVBY, for the elastic-plastic analysis of axisymmetrically loaded bodies of revolution; and OUT-OF-PLANE-GM, for the elastic-plastic and geometric nonlinear analysis of built-up sheet-stringer type structures. The capabilities and present status of these modules are summarized. All of the modules in PLANS employ the 'initial strain' concept within an incremental procedure to account for the effect of plasticity and include the capability for cyclic analysis. Geometric nonlinearities are included in OUT-OF-PLANE-GM using the 'updated' or convected coordinate approach.

- 2618 (ORNL/SUB--4485/2) DEVELOPMENT OF THE PLANS COMPUTER PROGRAM FOR ELASTIC--PLASTIC--CREEP ANALYSIS OF NUCLEAR REACTOR STRUCTURAL COMPONENTS. Levy, A. (Grumman Aerospace Corp., Bethpage, NY (USA), Research Dept.). Jan 1979. Contract W-7405-ENG-26. 34p. AT.

This report summarizes the continued development of computationally efficient finite-element methods for accurately predicting the isothermal three-dimensional elastic--plastic--creep responses of thick and thin shell structures subjected to mechanical and thermal loads. This work is directed toward verifying the structural integrity of liquid metal fast breeder reactor (LMFBR) components in the creep regime. The most recent developments include the use of multistress points within an element, temperature variation within an element, combined time dependent creep and isothermal plasticity, and restart capabilities.

- 2619 (ORNL/Sub--7322/1) MORE EFFICIENT CREEP RATCHETING BOUNDS. Porowski, J.S.; O'Donnell, W.J. (O'Donnell and Associates, Inc., Pittsburgh, PA (USA)). Oct 1978. Contract W-7405-ENG-26. 46p. AT.

The O'Donnell-Porowski upper bound solutions for creep ratcheting are extended to include material-hardening effects and temperature-dependent yield properties. Energy methods are introduced in order to obtain more efficient bounds for loading histograms involving a limited number of severe cycles in the plastic ratcheting regime, interspersed with cycling of lesser magnitude.

- 2620 (ORNL/SUB--7463/1) SIMPLIFIED INELASTIC ANALYSES USING ONE-DIMENSIONAL MODELS. Kamal, S.A.; Chern, J.M. (Foster Wheeler Energy Corp., Livingston, NJ (USA)). Sep 1979. Contract W-7405-ENG-26. 106p. AT.

A method of inelastic analysis using simplified structural models is investigated with special emphasis on the predictions of creep-fatigue damage and inelastic strain accumulation. The simplified models considered include the generalized plane strain, axisymmetric thick-walled cylinder which is applicable when the thermal loading in the

- 2617 (ORNL/Sub--4485/1) DEVELOPMENT AND

actual structure is dominated by the through-the-wall temperature gradient, and the finite cylindrical shell which is appropriate when the meridional temperature gradient becomes dominant. From the thermal elastic analysis results of the detailed finite element model, the critical areas are identified, the dimensions of the simplified model selected, and the associated loading histograms derived. Inelastic analyses using efficient computer codes are then performed to simulate the stress-strain conditions of these critical areas. The method is applied to the primary inlet nozzle and Y-junction of the CRBRP-IHX for which detailed inelastic analysis results for unit load cycles are available for comparison. It is indicated in the first application that the generalized plane strain model is able to yield accurate and conservative predictions. In the second application in which the cylindrical shell model is employed with specified displacement boundary conditions, the general trend of stress variation in a complete load cycle can be simulated and the fatigue predictions were conservative. However, it was found that the rapid stress relaxation tends to underestimate the creep damage and inelastic strain accumulations. The end-of-life creep damage prediction becomes conservative if the trend of cyclic change is taken into consideration; the inelastic strain prediction is persistently non-conservative by a range of 27 to 81%. A procedure to improve predictions that combines the force and displacement boundary conditions is outlined.

- 2621 (ORNL/Sub--7644/10) RESEARCH IN REMOTE SIGNAL TRANSMISSION ELECTRONICS. Kennedy, E.J.; Blalock, T.V.; Phelps, J.; Rochelle, R.; Dyer, F. (Tennessee Univ., Knoxville (USA)). Dept. of Electrical Engineering. 1 Oct 1979. Contract W-7405-ENG-26. 89p. (TR-EE/EL--10). Dep. NTIS, PC A05/MF A01.

Research has been directed toward the evaluation of semiconductor circuits suitable for operation at temperatures of 250°C to 300°C. These circuits are to be utilized in monitoring neutron flux in a breeder reactor. Worst-case performance evaluations are made on an amplifier-discriminator circuit utilizing commercially available operational amplifier chips incorporated in a hybrid thick-film package, which is suitable for use to 250°C. Another hybrid thick-film amplifier-discriminator system was developed and tested for use to 300°C. A dc-dc converter to supply +10v and -10v for amplifier power was designed, and evaluated up to an operating temperature of 300°C. Detailed design theory equations for high temperature dc-dc converters are presented. Significant problems with ceramic capacitors utilized at 300°C were found.

- 2622 (ORNL-TM--3689) LMFBR SPENT FUEL TRANSPORT: CONCEPTUAL DESIGN AND PARTIAL SAFETY ANALYSIS OF A SODIUM-COOLED CASK. Irvine, A.R.; Shappert, L.B.; Evans, J.H.; Canonico, D.A. (Oak Ridge National Lab., TN (USA)). Feb 1972. Contract W-7405-ENG-26. 80p. Dep. NTIS, PC A05/MF A01.

Conceptual designs for 6- and 18-subassembly casks are presented. The casks are intended for transport of LMFBR spent fuel which has decayed a minimum of 30 days. These casks use sodium as the primary coolant, an auxiliary shield coolant system in normal operation, heavy steel members as both gamma shield and structure, and a eutectic mixture of LiOH and NaOH as a neutron shield. The analysis indicates that there will be no leakage of coolant or fission products under normal or hypothetical accident conditions.

- 2623 (ORNL-TM--4283) ORNL TSF PIPE CHASE NEUTRON STREAMING EXPERIMENT: PHASE TWO. McGregor, B.J.; Clifford, C.E.; Muckenthaler, F.J.; Mymatt, F.R. (Oak Ridge National Lab., TN (USA)). Aug 1975. Contract W-7405-ENG-26. 51p. Dep. NTIS, PC A04/MF A01.

A second ORNL Tower Shielding Facility experiment has been performed and analyzed in the investigation of techniques for predicting the extent of neutron streaming through the sodium coolant pipes of the Fast Flux Test Facility (FFTF). Measurements of neutron intensities were made with Bonner ball detectors, and neutron spectra were measured with a Benjamin spectrometer. The analysis consisted of calculations of the Bonner ball and spectrometer responses with the two-dimensional discrete ordinates code DOT-III using 50-group and 14-group cross-section sets and assumptions of both isotropic and anisotropic boundary sources at the pipe-chase entrance. The Monte Carlo codes AMC and MORSE were used to correct the DOT calculations for three-dimensional geometric effects inherent in the experiment. For points inside the plenum, the calculated and experimental Bonner ball responses are in exceptionally good agreement; for points outside the plenum the calculated responses are approximately 20% higher than the experimental results. The calculated and measured neutron spectra agree at all three locations. It is concluded that the same calculational approach would accurately predict, or possibly slightly overpredict, the neutron flux levels that will exist in the heat exchanger vaults of the FFTF.

- 2624 (ORNL/TM--5836) EVALUATION OF INITIAL FUEL LOADING MONITORING IN THE CLINCH RIVER BREEDER REACTOR PLANT. Ackermann, N.J. Jr.; Booth, R.S. (Oak Ridge National Lab., TN (USA)). Dec 1977. Contract W-7405-ENG-26. 14p. AT.

Methods to monitor the initial core loading of the CRBRP are evaluated and ranked in terms of their sensitivity, interpretability, ease of implementation, and cost. This monitoring is an essential element of the administrative control of the initial fuel loading operation, which is the basic protection against an inadvertent criticality and its attendant safety problems. The recommended method for monitoring the initial fuel loading operation involves the addition of a special neutron source to the central region of the core during the initial fuel loading and the use of ex-vessel neutron detectors (referred to as 'source enhanced, ex-vessel detector method'). This method resolves the refueling interference problem of the in-core detector method and the poor sensitivity problem of the ex-vessel detector method.

- 2625 (ORNL/TM--5865/V5) EXPERIMENTAL ENGINEERING SECTION SEMI-ANNUAL PROGRESS REPORT, MARCH 1, 1976--AUGUST 31, 1976. VOLUME 5. REACTOR PROGRAMS. Ryon, A.D. (comp.). (Oak Ridge National Lab., TN (USA)). Mar 1978. Contract W-7405-ENG-26. 168p. AT.

The work covered LMFBR Iodex tests, voloxidizer studies (rotary kiln residence-time distribution and heat transfer tests), HTGR fuel refabrication, HTGR off-gas processing, and leaching of radium with nitric acid from uranium ores and tailings. (DLC)

- 2626 (ORNL/TM--5868) CREEP-PLAST II USER'S MANUAL. Clinard, J.A. (Oak Ridge National Lab., TN (USA)). May 1978. Contract W-7405-ENG-36. 122p. AT.

This report summarizes program operations and provides necessary user information to implement CREEP-PLAST II, a finite-element computer program for elastic-plastic-creep analysis of two-dimensional (plane stress or axisymmetric) structures.

- 2627 (ORNL/TM--5889) STATE OF THE ART OF FUEL PIN SIMULATORS FOR LMFBR OUT-OF-REACTOR SAFETY TESTS; STATUS REPORT. Baucum, W.E.; MacPherson, R.E.; Clark, D.L.; McCulloch, R.W. (Oak Ridge National Lab., TN (USA)). 22 Aug 1977. Contract W-7405-ENG-26. 178p. AT.

The liquid-metal fast breeder reactor (LMFBR) program out-of-reactor tests require high-performance, electrically heated fuel pin simulators (FPSs) to duplicate the configuration, heat flux profiles, and operational capabilities of nuclear fuel pins. Fuel pin simulators having a maximum heat flux of 315 W/cm^2 ($10^6 \text{ Btu hr}^{-1} \text{ ft}^{-2}$) in 1000°C (1830°F) sodium (category II) are considered state of the art when fabricated using conventional BN powder filling techniques, provided appropriate materials and fabrication techniques are used. In addition, fuel pin simulators of the same geometry for continuous operation in boiling sodium at 1000°C and having the capability for surviving for a short interval after void initiation and film dryout (category III) are also required in many test procedures. The results presented here have provided guidance for procurement, inspection, and assembly of fuel pin simulators for eight 19-pin bundles which have been extensively tested in the THORS facility.

- 2628 (ORNL/TM--5906) HEAT-TO-HEAT VARIATION OF TENSILE PROPERTIES OF ANNEALED 2 1/4 CR-1 MO STEEL. Klueh, R.L. (Oak Ridge National Lab., TN (USA)). Jul 1977. Contract W-7405-ENG-26. 40p. AT.

The tensile properties of twelve heats of 2 1/4 Cr-1 Mo steel were examined over the range 25 to 566°C . The twelve heats included: five air-melted tubing heats, two pieces from vacuum-arc remelted (VAR) forgings, two pieces from electroslag remelted (ESR) plates, two air-melted plates, and one air-melted forging. Tests were made on the steel in the as-received condition (vendor anneal) and, in order that all heats could be compared from a common basis, material from each of the heats was tested after it was annealed in our laboratory. For the twelve heats of steel tested, large property variations were observed. Decided differences were noted between the air-melted tubing, the air-melted plates and forging, and the ESR and VAR steels. Explanations for these differences are offered in terms of the types of precipitation reactions that occur in these steels at elevated temperatures.

- 2629 (ORNL/TM--5940) LMFBR SAFETY AND CORE SYSTEMS PROGRAMS. PROGRESS REPORT, JANUARY--MARCH 1977. Fontana, M.H.; Wantland, J.L. (Oak Ridge National Lab., TN (USA)). 25 Jul 1977. Contract W-7405-ENG-26. 94p. AT.

Topics discussed are program coordination; THORS analysis and data evaluation; detection methods development; THORS facility operation; materials for fuel pin simulation; the sodium boiling test facility; neutronics analysis of a disrupted core; central computerized data base for LMFBR safety codes; model evaluation of LMFBR reactivity releases; LMFBR reliability data analysis center; and environmental assessment of advanced LMFBR fuels.

PLASTICITY MODEL FOR STRUCTURAL METALS AT HIGH TEMPERATURE. Robinson, D.N. (Oak Ridge National Lab., TN (USA)). Oct 1978. Contract W-7405-ENG-26. 62p. AT.

A constitutive theory for use in high-temperature structural analysis of breeder reactor components is presented. It is unified in the sense that plastic and creep strains are considered to arise from similar physical mechanisms. The theory is presented in multiaxial terms along with a discussion of its underlying assumptions, its relationship to other theories and the experimental observations upon which it is based and is intended to model. The results of an extensive parameter sensitivity study are reported which provide understanding of the influence of the various model parameters on the critical features of predicted response.

- 2631 (ORNL/TM--5976) NUCLEAR SHIPPING AND WASTE DISPOSAL COST ESTIMATES. Hudson, C.R. II. (Oak Ridge National Lab., TN (USA)). Nov 1977. Contract W-7405-ENG-26. 24p. Dep. NTIS, PC A03/MF A01.

Cost estimates for the shipping of spent fuel from the reactor, shipping of waste from the reprocessing plant, and disposal of reprocessing plant wastes have been made for five reactor types. The reactors considered are the light-water reactor (LWR), the mixed-oxide-fueled light-water reactor (MOX), the Canadian deuterium-uranium reactor (CANDU), the fast breeder reactor (FBR), and the high-temperature gas-cooled reactor (HTGR). In addition to the cost estimates, this report provides details on the bases and assumptions used to develop the cost estimates.

- 2632 (ORNL/TM--5992) ANALYSES OF TSF EXPERIMENTS ON RADIATION HEATING IN A STAINLESS STEEL-SODIUM CRBR RADIAL SHIELD MOCKUP USING A 32-INCH DIAMETER COLLIMATED BEAM SOURCE. Maerker, R.E. (Oak Ridge National Lab., TN (USA)). Oct 1977. Contract W-7405-ENG-26. 60p. AT.

Analyses of the second phase of the radiation heating experiments performed at the Tower Shielding Facility have been made where the emphasis was placed on investigating the accuracy of TLD measurements in mockups of the CRBR radial shield. In particular, it is concluded that with the aid of flux calculations described in this report the corrections to both the LiF and CaF_2 TLD measurements are well enough understood that the TLD measurements can be brought into $\pm 3\%$ agreement with both ion chamber measurements and with each other. The accuracy of the gamma-ray calculations is limited by the accuracy of the 51 neutron group transport calculations; the production cross sections present in ENDF/B-IV are adequate for ^{235}U , sodium, and stainless steel.

- 2633 (ORNL/TM--5993) ADVANCED FUEL RECYCLE PROGRAM PROGRESS REPORT, APRIL 1--JUNE 30, 1977. Unger, W.E. (comp.). (Oak Ridge National Lab., TN (USA)). Sep 1977. Contract W-7405-ENG-26. vp. AT.

This quarterly progress report on the Fuel Recycle Program covers the ongoing development program aimed at providing the technology for production-scale advanced fuels recycle. The continuing basic laboratory and hot-cell studies, engineering research, and component equipment development activities are in support of a cold integrated equipment test scheduled for 1981 and a current conceptual design of a hot experimental facility scheduled for operation in 1988.

- 2630 (ORNL/TM--5969) UNIFIED CREEP-

- 2634 (ORNL/TM--5995) ERRORS IN MEASURING LEVEL AND DENSITY WITH PURGED DIP TUBES. Bradley, N.C.; Murray, W.P.; Googe, J.M. (Oak Ridge National Lab., TN (USA)). Nov 1977. Contract W-7405-ENG-26. 21p. AT.
- Measurement of liquid level and density and dip-tube sensors was evaluated by analysis and experiment. A model was developed to predict the characteristic error caused by the purge-gas bubble (dip-tube bias). Experimental results are presented to support these predictions and are also compared with data reported in the literature. It was shown that properly designed and calibrated dip tubes do not make significant contributions to the error in dip-tube level and density-measurement systems.
- 2635 (ORNL/TM--6020) BREEDER REACTOR SAFETY AND CORE SYSTEMS PROGRAMS. PROGRESS REPORT, APRIL--JUNE 1977. Fontana, M.H.; Wantland, J.L. (Oak Ridge National Lab., TN (USA)). 21 Nov 1977. Contract W-7405-ENG-26. 94p. AT.
- Information is presented concerning THORS analysis and data evaluation; detection methods development; THORS facility operation; materials for fuel pin simulation; Sodium Boiling Test Facility (SBTF); neutronics analysis of a disrupted core; central computerized data base for breeder reactor safety codes; model evaluation of breeder reactor radioactivity releases; breeder reactor reliability data analysis; and environmental assessment of advanced breeder reactor fuels.
- 2636 (ORNL/TM--6025) THORIUM ASSESSMENT STUDY QUARTERLY PROGRESS REPORT, THIRD QUARTER FISCAL 1977. Spiewak, I.; Bartine, D.E.; Burns, T.J.; Cleveland, J.C.; Thomas, W.E.; White, J.R. (Oak Ridge National Lab., TN (USA)). 30 Sep 1977. Contract W-7405-ENG-26. 57p. Dep. NTIS, PC A04/MF A01.
- The objective of the program described is to contribute to the ongoing assessment of the potential role of thorium fuel cycles for alleviating safeguards concerns. Scenarios include (1) no fuel recycle permitted, (2) fuel recycle permitted only in secure regions ("energy parks") with denatured (chemically non-separable) fuels only outside these regions, and (3) no limits on fuel recycle. A further objective is to provide nuclear mass balance data on HTGRs required by ERDA contractors for comparative cost-benefit studies.
- 2637 (ORNL/TM--6029) SURVEY OF AVAILABLE CREEP AND TENSILE DATA FOR ALLOY 800H. Booker, M.K.; Baylor, V.B.; Booker, B.L.P. (Oak Ridge National Lab., TN (USA)). Jan 1978. Contract W-7405-ENG-26. 178p. AT.
- Most of the transition joints in the Clinch River Breeder Reactor Plant (CRBRP) will consist of trimetallic joints employing a spool piece (about 0.3 m long) of alloy 800H between 2 1/4 Cr-1 Mo steel and austenitic stainless steel. It is therefore important that the mechanical properties of alloy 800H be well characterized and understood. This report presents a summary of the available creep and tensile data for this material, including analytical representations of behavior.
- 2638 (ORNL/TM--6081) INSPECTION OF BOILER TUBES: STATUS AND PLANS. McClung, R.W. (Oak Ridge National Lab., TN (USA)). Oct 1977. Contract W-7405-ENG-26. 11p. AT.
- Manufacturing examination and in-service inspection techniques are being developed for steam generators for the Breeder Reactor Program. The activities in the Breeder Reactor Program (BRP) to develop and apply techniques for both manufacturing and in-service inspection of sodium/water steam generators are summarized. The principal effort has been on the units for the Clinch River Breeder Reactor (CRBR).
- 2639 (ORNL/TM--6092) ADVANCED FUEL RECYCLE PROGRAM PROGRESS REPORT, JULY 1--SEPTEMBER 30, 1977. Unger, W.E. (comp.). (Oak Ridge National Lab., TN (USA)). Nov 1977. Contract W-7405-ENG-26. 128p. AT.
- This quarterly progress report on the Fuel Recycle Program covers the ongoing development program aimed at providing the technology for production-scale advanced fuels recycle. The continuing basic laboratory and hot-cell studies, engineering research, and component equipment development activities are in support of a cold integrated equipment test scheduled for 1981 and a current conceptual design of a hot experimental facility scheduled for operation in 1988.
- 2640 (ORNL/TM--6100) CONCEPTUAL STUDY FOR THE REPROCESSING OF SPENT CARBIDE AND NITRIDE FAST REACTOR FUELS IN RELATION TO GASBORNE RADIOLOGICAL RELEASES. Morse, L.E. (Oak Ridge National Lab., TN (USA)). Dec 1977. Contract W-7405-ENG-26. 64p. AT.
- A literature survey was made to develop conceptual chemical flow diagrams for the aqueous chemical reprocessing of spent carbide and nitride fast reactor fuels in order to characterize the gasborne radioactive emissions during normal operation of the chemical plant. The conceptual flow diagrams include a head-end for the preparation of the aqueous feed for solvent extraction in which the carbides and nitrides are converted to the oxides and the internal sodium bond is deactivated by voloxidation. Uranium and plutonium values are recovered and decontaminated by Purex solvent extraction technology and subsequently converted to solid oxide products by calcination. Processes for the confinement of gasborne radionuclides are described. The estimated releases of gasborne radionuclides from the reprocessing of oxide, carbide, and nitride fast reactor fuels generating 50 GW(e) year power were very similar except for ¹⁴C, which was found to be a function of the concentration and isotopic composition of nitrogen in the fuel. 79 references, 6 tables, 5 figs.
- 2641 (ORNL/TM--6106) STEADY-STATE SODIUM TESTS IN A 19-PIN FULL-LENGTH SIMULATED LMFBR FUEL ASSEMBLY: RECORD OF STEADY-STATE EXPERIMENTAL DATA FOR THORS BUNDLE 6A. Wantland, J.L.; Clapp, N.E.; Fontana, M.H.; Gnadt, P.A.; Hanus, N.; Thornton, R.H. (Oak Ridge National Lab., TN (USA)). Mar 1978. Contract W-7405-ENG-26. 331p. AT.
- The experimental data obtained during steady-state sodium operation with test bundle 6A in the Liquid-Metal Fast Breeder Reactor (LMFBR) Thermal-Hydraulic Out-of-Reactor Safety (THORS) Facility are presented. Bundle 6A was a full-length, simulated LMFBR subassembly consisting of 19 electrically heated pins contained in a hexagonal duct. The rods had outside diameters of 5.84 mm (0.230 in.) and were spaced by 1.42-mm-diam (0.056-in.) wire wraps on a 305 mm (12.0-in.) helical pitch. The gap between the bundle and its containing duct was 0.71 mm (0.028 in.), which is half the nominal pin-to-

pin spacing. The bundle duct was of 0.51-mm-thick (0.020-in.) type 316 stainless steel backed by insulation to provide low thermal inertia. The heated length was 900 mm (36 in.) with variable-pitch heater windings to produce a 1-3 axial peak-to-mean power distribution, and an unheated simulated fission gas plenum was downstream of the heated section. The primary purpose of bundle 6A steady-state tests was to establish bundle temperature distributions at various flow-power ratios with a fixed number of rods heated. These temperature distributions can be compared with those of previous tests and with those of future tests with larger bundles.

- 2642 (ORNL/TM--6128) STRESS-STRAIN BEHAVIOR OF ERNCR-3 WELD FILLER METAL UNDER STRAIN CONTROLLED CYCLIC LOADING. Baylor, V.B.; Booker, M.K.; Strizak, J.P.; Klueh, R.L. (Oak Ridge National Lab., TN (USA)). Jan 1978. Contract W-7405-ENG-26. 39p. AT.

Weld filler metal ERNCR-3 is expected to be used in the transition joints of the steam generators in breeder reactors. Design and analysis of these joints require consideration of the mechanical properties of the materials involved. This study suggests analytical representations for the cyclic stress-strain response of ERNCR-3 as observed during strain-controlled continuous-cycling fatigue tests. Specifically, areas to be discussed include cyclic hardening and softening during testing, development of cyclic stress-strain curves from stress-strain amplitude coordinates, and development of bilinear representations of cyclic stress-strain behavior as recommended for inelastic analysis by current interim inelastic design rules. Those rules were originally developed for austenitic steels, but were extended here to provide a framework within which to analyze the behavior of ERNCR-3. 33 figures, 4 tables.

- 2643 (ORNL/TM--6158) BREEDER REACTOR SAFETY AND CORE SYSTEMS PROGRAMS. PROGRESS REPORT, JULY--SEPTEMBER 1977. Fontana, M.H.; Wantland, J.L. (Oak Ridge National Lab., TN (USA)). Mar 1978. Contract W-7405-ENG-26. 120p. AT.

Topics discussed are program coordination, Thermal-Hydraulic Out-of-Reactor Safety (THORS) analysis and data evaluation, THORS facility operation, materials for fuel pin simulation, the sodium boiling test facility, neutronics analysis of a disrupted core, central computerized data base for breeder reactor safety codes, model evaluation of breeder reactor reactivity releases, breeder reactor reliability data analysis center, and environmental assessment of breeder reactor fuels.

- 2644 (ORNL/TM--6170) ROOM-TEMPERATURE INELASTIC TEST OF A NOZZLE-TO-SPHERICAL-SHELL MODEL SUBJECTED TO PRESSURE AND MOMENT LOADING. Gwaltney, R.C.; Richardson, M.; Battiste, R.L. (Oak Ridge National Lab., TN (USA)). Apr 1978. Contract W-7405-ENG-26. 36p. AT.

Portions of document are illegible. The measured room-temperature elastic-plastic response is presented for a nozzle attached to a spherical shell that was subjected to an internal pressure loading and a cyclic moment applied to the nozzle. The test was performed to qualify the facility and provide experimental benchmark problem data suitable for assessing inelastic analysis methods and validating structural analysis computer programs. The nozzle-to-sphere model is representative of geometries encountered in

design because it exhibits the essential features of inelastic behavior of nozzle attachments in pressure vessels. The specimen was machined from a well-characterized heat of type 304 stainless steel, and all tests were performed at a temperature of 21°C (70°F). Test results are presented in terms of loads and strains that typify the overall structural behavior.

- 2645 (ORNL/TM--6228) LONAC: A COMPUTER PROGRAM TO INVESTIGATE SYSTEMS DYNAMICS UNDER CONDITIONS OF LOW FORCED FLOW AND NATURAL CONVECTION. Ribando, R.J. (Oak Ridge National Lab., TN (USA)). 16 Mar 1978. Contract W-7405-ENG-26. 47p. AT.

Portions of document are illegible. LONAC (LOw flow and NATural Convection), a fast-executing code for studying systems dynamics under conditions of low forced flow and natural convection, is discussed. Although written specifically for the THORS loop at ORNL, it can easily be adapted to other thermal-hydraulic facilities. The components included in the code are electrically heated fuel pin simulators, an expansion tank, a pump, valves, a heat dump, and a bypass line. The one-dimensional, single-phase conservation equations are written assuming density is solely a function of temperature, thus eliminating acoustic effects.

- 2646 (ORNL/TM--6234) PLAN FOR THE DETERMINATION OF MECHANICAL AND THERMAL PROPERTIES OF CONCRETES TO TEMPERATURES OF 621°C (1150°F). Oland, C.B.; Robinson, G.C.; Dougan, J.R.; Callahan, J.P. (Oak Ridge National Lab., TN (USA)). Sep 1978. Contract W-7405-ENG-26. 63p. AT.

A detailed description of a testing program designed to define the variations in physical properties of limestone aggregate structural concrete and lightweight insulating concrete exposed to sustained heating at discrete temperatures up to 621°C (1150°F) is given. A total of 200 specimens will be tested to identify basic trends in the effect of temperature on unconfined compressive strength, shear strength, rebar bond strength, sustained loading (creep) behavior and thermal properties consisting of expansion, conductivity and diffusivity.

- 2647 (ORNL/TM--6285) INFLUENCE OF SMALL AMOUNTS OF NIOBIUM ON MECHANICAL AND CORROSION PROPERTIES OF TYPE 304 STAINLESS STEEL. Sikka, V.K.; Moorhead, A.J.; Brinkman, C.R. (Oak Ridge National Lab., TN (USA)). Jun 1978. Contract W-7405-ENG-26. 77p. AT.

Creep and creep-rupture properties of several experimental heats of type 304 stainless steel containing 20, 50, 100, 200, 500, 700, and 1000 ppm (by weight) Nb were investigated in the temperature range 482 to 649°C. Resistance to intergranular corrosion of these heats was also studied. Results of the tests on the experimental heats were compared with the creep properties of 20 commercial heats of type 304 stainless steel and data from the literature on several heats of type 347 (4000 to 8000 ppm Nb) stainless steel. Results on experimental heats were used to check that heat-to-heat variations in creep properties of 20 commercial heats of type 304 stainless steel are caused by variations in carbon, nitrogen, grain size, and for the most part by residual niobium (10 to 200 ppm). The time to rupture increased and minimum creep rate decreased with increasing niobium content until a saturation level was attained at about 500 to 1000 ppm. Type 304 stainless steel containing 500 ppm Nb

offers superior creep and creep-rupture properties with improved creep ductility and a factor of approximately 5 better intergranular corrosion resistance (in boiling CuSO_4 solution) than type 304 stainless steel (20 ppm Nb). Type 304 containing 500 to 1000 ppm Nb exhibits a weldability similar to that of type 304 stainless steel.

- 2648 (ORNL/TM--6287) STABILITY OF IODIC ACID UNDER IODOX INTERIM STORAGE CONDITIONS. Clark, W.E.; Mailen, J.C. (Oak Ridge National Lab., TN (USA)). Aug 1978. Contract W-7405-ENG-26. 21p. AT.

Small-scale irradiation experiments indicate that little, if any, volatilization of I_2 will occur from irradiated solutions of iodic acid in azetropic HNO_3 , as long as the solutions continue to boil vigorously. This conclusion is confirmed by experiments in which the radiolytic generation of nitrite was simulated by introducing N_2O_5 gas into a boiling solution of iodic acid in HNO_3 . Free I_2 formed rapidly in cooler solutions. It appears that only a minimum sparge will be required to prevent volatilization of iodine from the Iodex storage tank, but that a rapid buildup of free iodine may occur if boiling is allowed to cease. The minimum G-value for generation of HNO_2 in the boiling storage solution was found to be approximately 9.7. The actual G-value is almost certainly somewhat higher, with 14.6 as the probable maximum.

- 2649 (ORNL/TM--6288) BREEDER REACTOR SAFETY AND CORE SYSTEMS PROGRAMS PROGRESS REPORT, OCTOBER--DECEMBER 1977. Fontana, M.H.; Wantland, J.L. (Oak Ridge National Lab., TN (USA)). Jun 1978. Contract W-7405-ENG-26. 107p. AT.

This report covers progress made during October--December 1977 by the Breeder Reactor Safety and Core Systems Programs at the Oak Ridge National Laboratory. Topics discussed are program coordination, Thermal-Hydraulic Out-of-Reactor Safety (THORS) analysis and data evaluation, THORS facility operation, Sodium Boiling Test Facility (SBTF), materials for fuel pin simulation, neutronics of a disrupted core, environmental assessment of breeder reactor fuels, model evaluation of breeder reactor radioactivity releases, Nuclear Safety Information Center, central computerized data base for breeder reactor safety codes, and breeder reactor reliability data analysis center.

- 2650 (ORNL/TM--6296) IN-REACTOR DEFORMATION AND FRACTURE OF AUSTENITIC STAINLESS STEELS. Bloom, E.E.; Wolfer, W.G. (Oak Ridge National Lab., TN (USA)). Jun 1978. Contract W-7405-ENG-26. 26p. AT.

An experimental technique for determining in-reactor fracture strain was developed and demonstrated. Differential swelling between a sample holder and a test specimen with a lower swelling rate produced uniaxial deformation. In-reactor deformations of 0.7 to 2.1% were achieved in type 304 stainless steel previously irradiated to fluences up to 8.8×10^{22} n/m² without fracture. These strains are significantly higher than found in postirradiation creep-rupture tests on similar samples. From the measured strain values and published irradiation creep data and correlations, the stress levels during the irradiation were calculated. On the basis of previous postirradiation creep-rupture results, many of the samples that did not fail would be predicted to fail. Thus we conclude that the in-reactor rupture life is longer than predicted

by postirradiation tests. Strain in a fractured sample was estimated to be less than 3.8%, and the in-reactor fractures were intergranular--the same fracture mode as found in postirradiation tests. Irradiation creep may relax stresses at crack tips and sliding boundaries, thus retarding the initiation and/or growth of cracks and leading to longer rupture lives in-reactor. However, the very high ductility or superplastic behavior predicted by the strain rate sensitivity of irradiation creep is not achieved because of the eventual interruption of the deformation process by grain boundary fracture.

- 2651 (ORNL/TM--6306) ADVANCED FUEL RECYCLE PROGRAM PROGRESS REPORT, JANUARY 1 TO MARCH 31, 1978. Unger, W.E. (comp.). (Oak Ridge National Lab., TN (USA)). May 1978. Contract W-7405-ENG-26. 135p. AT.

This quarterly progress report on the Fuel Recycle Program covers the ongoing development program aimed at providing the technology for production-scale advanced fuels recycle. The continuing basic laboratory and hot-cell studies, engineering research, and component equipment development activities are in support of a cold integrated prototype equipment test scheduled for 1981 and a current conceptual design of a hot experimental facility planned for operation in the early 1990s.

- 2652 (ORNL/TM--6309) PRELIMINARY NEUTRONIC STUDY OF ACTINIDE TRANSMUTATION IN A FAST REACTOR. Williams, M.L.; McAdoo, J.W.; Flanagan, G.F. (Oak Ridge National Lab., TN (USA)). Aug 1978. Contract W-7405-ENG-26. 33p. Dep. NTIS, PC A03/HF A01.

Preliminary results are cited from a neutronic study of actinide recycle in a fast reactor, using an LMFBR model. The work was performed as part of a Chemical Technology Division program for assessing the merit of actinide transmutation as a means of waste disposal. Calculations were performed by coupling two-dimensional diffusion theory calculations with point-depletion recycle calculations. Cross sections were obtained from a "preliminary" version of ENDF/B-V. Results are given concerning the recycled-actinide equilibrium condition and the waste-actinide destruction rate. The effect of adding U-238 diluent to reduce power peaking is examined parametrically. The heterogeneous effects of placing an actinide target assembly in a fuel lattice are also examined.

- 2653 (ORNL/TM--6343) SIMBD: A SIMPLE BOILING MODEL OF THE RESPONSE OF A SIMULATED SODIUM-COOLED BREEDER REACTOR SUBASSEMBLY TO AN UNDERCOOLING TRANSIENT. Garrison, P.W. (Oak Ridge National Lab., TN (USA)). Sep 1978. Contract W-7405-ENG-26. 59p. AT.

Portions of document are illegible. A highly simplified thermal-hydraulic code, SIMBD, has been developed to investigate the influence of the fuel-assembly duct wall on the results of a series of boiling tests in the THORS facility at ORNL. The code is based on an implicit solution to a single-channel axial energy transport equation coupled through a film coefficient to an explicit solution to a multiple-radial-node conduction model. A quasi-steady approximation of the momentum equation is used in conjunction with the Martinelli-Lockhart two-phase flow correlation. Predictions made by the model are compared with experimental results from the THORS bundle 6A test series.

- 2654 (ORNL/TM--6373) FLUID MECHANICS MODEL TO ESTIMATE THE LEAKAGE OF INCOMPRESSIBLE FLUIDS THROUGH LABYRINTH SEALS. Han, J.T. (Oak Ridge National Lab., TN (USA)). Aug 1978. Contract W-7405-ENG-26. 29p. AT.

An analytical model for estimating the leakage of incompressible fluids through straight labyrinth seals has been described. Recent developments in theoretical and experimental studies of recirculating flow inside rectangular cavities and of flow in a channel have been incorporated in the model to solve a practical problem. The approach used in this model is different from those of previous ones for compressible fluids in which the gas-dynamics laws with some empirical coefficients determined from gas data were used. The seal leakages predicted by the model are in reasonable agreement with these measured indirectly in sodium and those obtained for gas at low Mach number and small pressure variations. It can be concluded from this study that the labyrinth seal formed with cavities has less leakage than the one formed with threads if all other conditions are the same. Furthermore, the fluid leakage through straight labyrinth seals (for both cavity and thread types) is strongly dependent upon the seal clearance and pressure drop.

- 2655 (ORNL/TM--6393) INSTRUMENTATION AND CONTROL DEVELOPMENT AND DESIGN PHILOSOPHY FOR ADVANCED FUEL RECYCLE. Hamel, W.R.; Bradley, N.C.; Jansen, J.M. Jr. (Oak Ridge National Lab., TN (USA)). Aug 1978. Contract W-7405-ENG-26. 39p. AT.

This document provides a definition and an explanation of the instrumentation and controls philosophy being utilized in the Advanced Fuel Recycle Program (AFRP). The general objectives and assumptions used in defining the philosophy are based on overall AFRP objectives. The philosophy presents architectural concepts, functional capabilities, performance requirements, safeguards factors, and implementation techniques. A brief summary of current development activities is also presented.

- 2656 (ORNL/TM--6408) MODEL OF A FISSION COUNTER SYSTEM FOR OPTIMIZING PERFORMANCE AT HIGH GAMMA DOSE RATES. Pare, V.K. (Oak Ridge National Lab., TN (USA)). Nov 1978. Contract W-7405-ENG-26. 44p. Dep. NTIS, PC A03/MF A01.

A mathematical model has been developed for predicting the ability of a fission counter to operate at a high gamma dose rate. There are several potential applications in reactor programs for detectors that can accurately measure neutron fluxes in the range 0.1 to 1.0 nv(th) while subjected to gamma dose rates of 10^4 to more than 10^6 R/hr. Fission counters for such service have up to now been designed on the basis of laborious testing of prototypes combined with extrapolation from existing designs. The objective of this work is to make it possible to arrive at an optimum design without expensive testing. In this model, the complete system of counter, cables, preamplifier, main amplifier, filters, and discriminator is considered, including the effects of interaction of counter capacitance with cable and preamplifier impedance. Electrical noise theory is used to calculate the frequency spectrum of the interfering signal generated by pileup of gamma pulses, to add to it a contribution from electronic noise, and to obtain the rate at which the total noise signal triggers the discriminator. The shapes and widths of neutron and gamma pulses are calculated from the electron drift velocity and

electrode spacing.

- 2657 (ORNL/TM--6411) ASSESSMENT OF NORMALIZED AND TEMPERED VERSUS ANNEALED OR ISOTHERMALLY ANNEALED 2-1/4 CR--1 MO STEEL. Klueh, R.L.; Booker, M.K. (Oak Ridge National Lab., TN (USA)). Aug 1978. Contract W-7405-ENG-26. 43p. AT.

Commercially, 2 1/4 Cr-1 Mo steel is used in various heat-treated conditions. Present standards for breeder reactor steam generators specify that the steel will be used only in an annealed or isothermally annealed condition. Future breeder reactor steam generators may offer an incentive to use a normalized-and-tempered steel. The property differences between the normalized-and-tempered and annealed or isothermally annealed conditions are assessed to determine the advisability of using the normalized-and-tempered material for breeder reactor steam generators.

- 2658 (ORNL/TM--6439) BREEDER REACTOR SAFETY AND CORE SYSTEMS PROGRAMS. PROGRESS REPORT, JANUARY--MARCH 1978. Fontana, M.H.; Wantland, J.L. (Oak Ridge National Lab., TN (USA)). Sep 1978. Contract W-7405-ENG-26. 91p. AT.

Portions of document are illegible.

Progress made during January--March 1978 by the Breeder Reactor Safety and Core Systems Programs at the Oak Ridge National Laboratory is reported. Topics discussed are program coordination, Thermal-Hydraulic Out-of-Reactor Safety (THORS) analysis and data evaluation, THORS Facility operation, Sodium Boiling Test Facility (SBTF), materials for fuel pin simulation, neutronics of a disrupted core, environmental assessment of breeder reactor fuels, model evaluation of breeder reactor radioactivity releases, Nuclear Safety Information Center, central computerized data base for breeder reactor safety codes, and breeder reactor reliability data analysis center.

- 2659 (ORNL/TM--6464) INTERIM ANALYTICAL DESCRIPTION OF THE CREEP AND CREEP-RUPTURE BEHAVIOR OF ERN1Cr-3 WELD METAL. Booker, M.K.; Klueh, R.L. (Oak Ridge National Lab., TN (USA)). Nov 1978. Contract W-7405-ENG-26. 58p. AT.

Filler metal of AWS A5.14 Class ERN1Cr-3 (67% Ni--20% Cr--3% Mn--2.5% Nb), often known as Inconel 82, is conventionally used for austenitic-to-ferritic dissimilar-metal transition weld joints. For example, this filler metal is proposed for use in the transition joints for the steam generator system of the Clinch River Breeder Reactor Plant. Recent efforts to develop analytical descriptions of the creep and creep-rupture behavior of ERN1Cr-3 weld metal are described. These results are compared with previous analyses of the behavior of 2 1/4 Cr--1 Mo steel and alloy 800H, the two base metals that would be joined by the ERN1Cr-3 filler metal in one of the proposed CRBRP transition joints.

- 2660 (ORNL/TM--6497) DISCRETE ORDINATE ANALYSIS OF THE TSF EXPERIMENT ON NEUTRON STREAMING IN A CRBR PROTOTYPIC COOLANT PIPE CHASEWAY. Maerker, R.E. (Oak Ridge National Lab., TN (USA)). Nov 1978. Contract W-7405-ENG-26. 64p. AT.

The results are summarized of calculations of neutrons streaming through a prototypic multilegged CRBR coolant pipe chaseway performed with the two-dimensional discrete ordinates code DOT 3.5, together with a

pecially written auxiliary routine that transformed the angular fluxes transmitted through one leg into an approximation source for the calculation of the next leg. Comparisons with measured fluxes at intermediate points along the duct indicate an approximate factor-of-two accuracy in the S_{sub}/n calculations using a recommended procedure for geometric modeling of each leg. The accuracy of an alternate geometric approximation was assessed and found to be generally inferior to that of the recommended procedure.

- 2661 (ORNL/TM--6498) STEADY-STATE SODIUM TESTS IN A 19-PIN INTERNALLY GUARD-HEATED SIMULATED LMFBR FUEL ASSEMBLY WITH A SIX-CHANNEL INTERNAL BLOCKAGE: RECORD OF EXPERIMENTAL DATA FOR THORS BUNDLE 3C. Hanus, N.; Nelson, W.R.; Clapp, N.E.; Fontana, M.H.; Gnadt, P.A.; Thornton, R.H.; Wantland, J.L. (Oak Ridge National Lab., TN (USA)). Feb 1979. Contract W-7405-ENG-26. 379p. AT.

The report is a record of experimental data obtained during steady-state sodium operation with test bundle 3C in the Liquid-Metal Fast Breeder Reactor (LMFBR) Thermal-Hydraulic Out-of-Reactor Safety (THORS) Facility. Bundle 3C consisted of 19 heated pins [fuel pin simulators (FPSs)] surrounded by 12 heated edge pins installed in a stainless steel duct. The pins had outside diameters of 5.84 mm and were spaced by 1.42-mm-dia wire wraps on a 305-mm pitch, the same as for the proposed Clinch River Breeder Reactor (CRBR). A 6.4-mm stainless steel plate was attached to the central pin and blocked the six central channels 381 mm downstream from the start of the heated section. The uniformly heated length of the bundle was 533 mm. Hollow pins 1.6 m long, which simulate the fission gas plenum of a reactor, were attached to the downstream end of the 19 central FPSs. The purpose of the bundle 3C steady-state tests was to determine the thermal-hydraulic effects of the internal blockage at various flow-power ratios with a fixed number of pins heated. The report includes a description of the test facility and instrumentation, data reduction procedures, and the test data from experiments completed in this series.

- 2662 (ORNL/TM--6522) FUEL CYCLE COST STUDIES: FABRICATION, REPROCESSING, AND REFABRICATION OF LWR, SSCR, HWR, LMFBR, AND HTGR FUELS. Olsen, A.R.; Judkins, R.R.; Carter, W.L.; Delene, J.G. (Oak Ridge National Lab., TN (USA)). Mar 1979. Contract W-7405-ENG-26. 41p. Dep. NTIS, PC A03/MF A01.

The comparative analysis of power generation costs for the various reactor cycles that is being performed in the Nonproliferation Alternative Systems Assessment Program (NASAP) and the International Nuclear Fuel Cycle Evaluation (INFCE) requires that the costs associated with processing of fuel materials for use in these cycles be estimated. The study described here provided unit cost estimates for the fabrication, reprocessing, and refabrication of a variety of fuels for several reactor systems. We examined in detail the facility requirements and operations to estimate capital and operating costs. Unit processing cost determinations were based on a cash flow analysis technique in which income from sales over the life of each facility was equated to the total capital and operating expenses of that facility plus a specified return on equity investment. The effects of plant capacities were determined by application of scaling factors to individual components of

the reference plant costs. Capital and operating costs were estimated for 21 reactor and fuel cycle combinations. Based on these estimates, unit costs were determined for fabrication, reprocessing, and refabrication of the fuels. In each instance, the effect of plant capacities on unit costs associated with the processing of fuels was determined. All costs were based on mature industries, and first-of-a-kind costs were not included. Unit cost determinations were based on three financing techniques, which included government financing, typical industrial financing, and high-risk industrial financing. The unit costs recommended for the comparative analysis of power generation costs are those associated with the economic assumptions of a typical industry.

- 2663 (ORNL/TM--6531) MICROCOMPUTER-CONTROLLED ULTRASONIC DATA ACQUISITION SYSTEM. Simpson, W.A. Jr. (Oak Ridge National Lab., TN (USA)). Nov 1978. Contract W-7405-ENG-26. 55p. Dep. NTIS, PC A04/MF A01.

The large volume of ultrasonic data generated by computer-aided test procedures has necessitated the development of a mobile, high-speed data acquisition and storage system. This approach offers the decided advantage of on-site data collection and remote data processing. It also utilizes standard, commercially available ultrasonic instrumentation. This system is controlled by an Intel 8080A microprocessor. The MCS80-SDK microcomputer board was chosen, and magnetic tape is used as the storage medium. A detailed description is provided of both the hardware and software developed to interface the magnetic tape storage subsystem to Biomation 8100 and Biomation 805 waveform recorders. A boxcar integrator acquisition system is also described for use when signal averaging becomes necessary. Both assembly language and machine language listings are provided for the software.

- 2664 (ORNL/TM--6553) SODIUM BOILING IN A FULL-LENGTH 19-PIN SIMULATED FUEL ASSEMBLY (THORS BUNDLE 6A). Ribando, R.J.; Clapp, N.E.; Fontana, M.H. (Oak Ridge National Lab., TN (USA)). Jan 1979. Contract W-7405-ENG-26. 117p. AT.

Sodium boiling in liquid-metal fast breeder reactor (LMFBR) fuel subassemblies was investigated using an electrically heated 19-pin bundle in the Thermal-Hydraulic Out-of-Reactor Safety (THORS) Facility. Results of 6 of some 60 tests are presented in detail. From these results and from analytical results also discussed, it appears that increased thermal inertia due to sodium in the insulation surrounding the pin assembly contributed to incoherent (i.e., non-one-dimensional) boiling and delayed dryout.

- 2665 (ORNL/TM--6558) BREEDER REACTOR SAFETY AND CORE SYSTEMS PROGRAMS. PROGRESS REPORT, APRIL--JUNE 1978. Fontana, M.H.; Wantland, J.L. (Oak Ridge National Lab., TN (USA)). Nov 1978. Contract W-7405-ENG-26. 86p. AT.

This report covers progress made during April--June 1978 by the Breeder Reactor Safety and Core Systems Programs at Oak Ridge National Laboratory. Topics discussed are program coordination, Thermal-Hydraulic Out-of-Reactor Safety (THORS) analysis and data evaluation, THORS facility operation, Sodium Boiling Test Facility (SBTF), material for fuel pin simulation, neutronics of a disrupted core, environmental assessment of alternate FBR

fuels, model evaluation of breeder reactor radioactivity releases, Nuclear Safety Information Center, central computerized data base for breeder reactor safety codes, and breeder reactor reliability data analysis center.

- 2666 (ORNL/TM--6568) HYDROGEN RETENTION OF (U,Pu)O/SUB 2-Y/. Pechin, W.H.; Bradley, R.A.; Sease, J.D. (Oak Ridge National Lab., TN (USA)). Dec 1978. Contract W-7405-ENG-26. 17p. AT.

An improved process for sintering (U,Pu)O/sub 2-y/ fast breeder reactor fuel was developed. The process resulted in lower gas content in the as-fabricated fuel. One of the specifications for such fuel is that the amount of gas released by vacuum extraction at 1600°C be less than 90 cm³/kg. In the preparation of (U,Pu)O/sub 2-y/ for irradiation testing, pellets with densities less than 90% of theoretical could release 10 to 20 times the maximum amount of gas permitted. Thus, an improved process was required. Several approaches were used to investigate what gas was being retained by the fuel and the retention mechanism. First, fuel was cooled from the sintering temperature in different gas atmospheres, and the quantity and type of retained gas were determined. Gas analyses of sintered material as a function of extraction temperature were also informative. Gas release measurements on fuels of varying degrees of oxygen stoichiometry helped define the retention mechanism. The retained gas was found to be primarily hydrogen, which had combined with the fuel during cooling after hydrogen reduction. The amount of retained hydrogen was greatest for most highly reduced and porous fuel.

- 2667 (ORNL/TM--6577) ADVANCED FUEL RECYCLE PROGRAM. PROGRESS REPORT, JULY 1--SEPTEMBER 30, 1978. Unger, W.E. (comp.). (Oak Ridge National Lab., TN (USA)). Dec 1978. Contract W-7405-ENG-26. 113p. AT.

This quarterly progress report on the Fuel Recycle Program covers the ongoing development program aimed at providing the technology for production-scale advanced fuels recycle. The continuing basic laboratory and hot-cell studies, engineering research, and component equipment development activities are in support of a cold Integrated Equipment Test scheduled for 1981 and a current conceptual design of a Hot Experimental Facility planned for operation in the early 1990's.

- 2668 (ORNL/TM--6582) NONLINEAR PLASTICITY MODEL FOR STRUCTURAL ALLOYS AT ELEVATED TEMPERATURE. Robinson, D.N. (Oak Ridge National Lab., TN (USA)). Nov 1978. Contract W-7405-ENG-26. 33p. AT.

A nonlinear, time-independent plasticity model is presented which incorporates some aspects of both isotropic and kinematic hardening. The model characterizes a material with limited memory, i.e., in the sense that part of the deformation history as recorded in the internal dislocation structure is erased at stress reversals. This feature ensures that the predicted response eventually reaches a limit cycle under cyclic stressing, even in the presence of creep and relaxation. The model is intended as a candidate for replacing the nonlinear model now residing in Sect. 4.3.6 of RDT Standard F9-5T.

- 2669 (ORNL/TM--6600) ELECTRON-BEAM WELDING OF FUEL PIN SIMULATORS TO A TUBESHEET. Gnadt,

P.A.; King, J.F. (Oak Ridge National Lab., TN (USA)). Dec 1978. Contract W-7405-ENG-26. 24p. AT.

The Thermal-Hydraulic Out-of-Reactor Safety (THORS) Facility, a large-scale sodium flow facility at the Oak Ridge National Laboratory (ORNL), was used to test simulated Liquid-Metal Fast Breeder Reactor (LMFBR) fuel subassemblies for safety-related occurrences. These subassemblies are composed of bundles of electrically heated rods with the same linear power density and external configuration as LMFBR fuel rods. This report describes the electron-beam (EB) welding procedures developed for joining these rods [known as fuel pin simulators (FPSs)] to a tubesheet as part of the fabrication of the complex test assemblies.

- 2670 (ORNL/TM--6640) NUCLEAR FUEL FABRICATION AND REFABRICATION COST ESTIMATION METHODOLOGY. Judkins, R.R.; Olsen, A.R. (Oak Ridge National Lab., TN (USA)). Nov 1979. Contract W-7405-ENG-26. 70p. Dep. NTIS, PC A04/MF A01.

The costs for construction and operation of nuclear fuel fabrication facilities for several reactor types and fuels were estimated, and the unit costs (prices) of the fuels were determined from these estimates. The techniques used in estimating the costs of building and operating these nuclear fuel fabrication facilities are described in this report. Basically, the estimation techniques involve detailed comparisons of alternative and reference fuel fabrication plants. Increases or decreases in requirements for fabricating the alternative fuels are identified and assessed for their impact on the capital and operating costs. The impact on costs due to facility size or capacity was also assessed, and scaling factors for the various capital and operating cost categories are presented. The method and rationale by which these scaling factors were obtained are also discussed. By use of the techniques described herein, consistent cost information for a wide variety of fuel types can be obtained in a relatively short period of time. In this study, estimates for 52 fuel fabrication plants were obtained in approximately two months. These cost estimates were extensively reviewed by experts in the fabrication of the various fuels, and, in the opinion of the reviewers, the estimates were very consistent and sufficiently accurate for use in overall cycle assessments.

- 2671 (ORNL/TM--6679) ULTRASONIC EVALUATION OF DISSIMILAR-METAL TRANSITION JOINT WELDS. Smith, J.H. (Oak Ridge National Lab., TN (USA)). Apr 1977. Contract W-7405-ENG-26. 48p. AT.

Ultrasonic techniques for the nondestructive examination of the dissimilar-metal transition joints designed for the Clinch River Breeder Reactor were studied. This included determining the acoustical properties of the various materials involved and evaluating the relative merits of several examination techniques and associated parameters. Using the results of these studies, ultrasonic inspection methods that can be used to evaluate 12.7- and 25.4-mm-thick dissimilar-metal welds in transition joints in the as-manufactured (machined) condition were developed. A 2:1 signal-to-noise ratio notches whose depths are 8% of the weld thickness at any of the four weld root interfaces and in the weld root volume of both welds can be detected. Better sensitivity can be obtained if multiple test frequencies are used and if only the root areas of the welds and weld interfaces are considered.

- 2672 (ORNL/TM--6679/R1) ULTRASONIC EVALUATION OF DISSIMILAR-METAL TRANSITION JOINT WELDS. Smith, J.H. (Oak Ridge National Lab., TN (USA)). Jun 1979. Contract W-7405-ENG-26. 48p. AT.

We have studied ultrasonic techniques for the nondestructive examination of the dissimilar-metal transition joints designed for the Clinch River Breeder Reactor. This included determining the acoustical properties of the various materials involved and evaluating the relative merits of several examination techniques and associated parameters. Using the results of these studies we developed ultrasonic inspection methods that can be used to evaluate 12.7- and 25.4-mm-thick dissimilar-metal welds in transition joints in the as-manufactured (machined) condition. We can routinely detect with a 2:1 signal-to-noise ratio notches whose depths are 8% of the weld thickness at any of the four weld root interfaces and in the weld root volume of both welds. Better sensitivity can be obtained if multiple test frequencies are used and if only the root areas of the welds and weld interfaces are considered.

- 2673 (ORNL/TM--6688) FUEL PIN SIMULATORS FOR SODIUM BOILING TESTS IN THE THORS FACILITY. Gnadt, P.A.; MacPherson, R.E.; McCulloch, R.W. (Oak Ridge National Lab., TN (USA)). Apr 1979. Contract W-7405-ENG-26. 65p. AT.

The Breeder Reactor Program (BRP) at Oak Ridge National Laboratory (ORNL) requires high-performance, electrically heated fuel pin simulators (FPSs) to duplicate the configuration, heat flux profiles, and operational capabilities of nuclear fuel pins. These FPSs have been assembled into 19-pin bundles and operated to temperature levels sufficient to cause sodium boiling in the Thermal-Hydraulic Out-of-Reactor Safety (THORS) Facility at ORNL. This report describes the procurement, assembly, and evaluation of the FPSs and their subsequent operation in THORS as bundles 6A and 3C. The two test bundles operated for over 11,000 hr (total) in sodium at temperatures between 316°C (600°F) and 1010°C (1850°F). Over 60 tests were run to conditions where sodium boiling occurred. Boiling was usually sustained for a period of 10 to 30 sec. Several of the tests resulted in clad dryout (unstable) conditions. The bundle 3C FPSs contained a uniform-pitch Nichrome V heating element, and those in bundle 6A contained a constant-width, variable-pitch Pt-8% W heating element, which gave a chopped-cosine heat flux pattern to the FPS. A complete description of the two FPS designs is presented.

- 2674 (ORNL/TM--6698) BREEDER REACTOR SAFETY AND CORE SYSTEMS PROGRAMS. PROGRESS REPORT, JULY--SEPTEMBER 1978. Fontana, M.H.; Wantland, J.L. (Oak Ridge National Lab., TN (USA)). Feb 1979. Contract W-7405-ENG-26. 92p. AT.

Topics discussed are program coordination, THORS analysis and data evaluation, THORS Facility operation, SBTf, material for fuel pin simulation, neutronics of a disrupted core, environmental assessment of alternate FBR fuels, model evaluation of breeder reactor radioactivity releases, NSIC, central computerized data base for breeder reactor safety codes, and breeder reliability data analysis center. The completed THORS Bundle 3C (8% of flow area blocked) boiling tests are summarized, and typical data are presented. Preliminary analysis indicates that no dryout and no bulk flow instability occurred during

sodium boiling. The SAS 3A computer code was used to study the interaction between two heated bundles operated in parallel with a bypass flow channel. These results indicate that bundle interaction depends on bundle inlet flow impedance. The THORS Facility has operated for a total of 26,400 hr. Test bundles have been operated at varying power levels for approx. 2300 hr; sodium boiling tests have been conducted in four bundles. The boiling propagation tests for Bundle 3C have been completed. The facility has been shut down for modification and for installation of the 61-pin Bundle 9. The piping to the new 2.0-MW heat dump will also be installed, giving the facility a full 2.0-MW(e) input and heat-removal capability. Assembly of Bundle 9 is 90% complete. The SBTf became operational during this reporting period. Approximately 2 hr of boiling time was logged before distortion of the test section forced shutdown for refurbishment. Work on the quasi-static Monte Carlo Code SPQR has been halted. Present efforts in this task are directed to safety sensitivity analysis. Two reports on environmental assessment of alternate FBR fuels were submitted during this period for publication. Sites for weather monitoring equipment in the Lemhi Pass thorium resource region were selected following an aerial and ground survey.

- 2675 (ORNL/TM--6744) CORROSION BEHAVIOR OF LMFBR FUEL CLADDING IN SIMULATED WATER POOL STORAGE CONDITIONS. Wu, P.C.S. (Oak Ridge National Lab., TN (USA)). May 1979. Contract W-7405-ENG-26. 59p. AT.

The corrosion behavior of sodium-exposed prototypic LMFBR fuel cladding was investigated under simulated water pool storage conditions for breeder reactor spent fuels. As an extension of a previous scoping study on a similar subject, the current investigation has not only generated additional data, which has enhanced the statistical confidence of the results obtained in the scoping study, but baseline information has also been provided for the corrosion behavior of irradiated cladding specimens. Water exposure of the cladding specimens was conducted in simulated breeder reactor water pool storage conditions for periods up to 12 months at 82°C. No observable material deterioration or failure occurred among the hot-leg cladding specimens (exposed in the corrosion region of a dynamic sodium loop).

- 2676 (ORNL/TM--6745) DATA MANAGEMENT SYSTEM FOR THE THERMAL-HYDRAULIC OUT-OF-REACTOR SAFETY FACILITY COMPUTER-CONTROLLED DATA ACQUISITION SYSTEM CONFIGURATION FOR BUNDLE 3C OPERATION. Clapp, N.E. (Oak Ridge National Lab., TN (USA)). Feb 1979. Contract W-7405-ENG-26. 51p. AT.

The Thermal-Hydraulic Out-of-Reactor Safety (THORS) Facility Data Acquisition System (DAS) consists of a PDP-8E computer with a 32,000-word memory, a 1.6-million-word disk, a 7-track magnetic tape for data storage, a teletype, a cathode-ray-tube (CRT) display, a character printer, a 256-channel multiplexer, gain selectable amplifiers (one per box), and an analog-to-digital (A/D) converter. The data system has the capability of sampling, checking out-of-limit situations, and storing data at a rate of 10,000 channels/sec. The data system under computer control provides the capability of near-real-time data analysis and quick-look displays of test data. The software system is designed to provide the flexibility required to meet the demands of the facility research program. The software system consists of two

levels: (1) the interpreter, which transforms program statements into machine language statements; and (2) the collection of program statements required to perform a given data acquisition or calculation task. The data stored on tape by this system are not directly usable on the IBM 360 computers. The FORTRAN programs required to transform and convert the data tape into a compatible engineering unit data tape are discussed.

- 2677 (ORNL/TM--6778) COMPARISON OF NUMERICAL RESULTS WITH EXPERIMENTAL DATA FOR SINGLE-PHASE NATURAL CONVECTION IN AN EXPERIMENTAL SODIUM LOOP (THORS BUNDLE 6A). Ribando, R.J.; Clapp, N.E.; Fontana, M.H.; Hanus, N.; Nelson, W.R.; Wantland, J.L. (Oak Ridge National Lab., TN (USA)). Sep 1979. Contract W-7405-ENG-26. 88p. AT.

A comparison is made between computed results and experimental data for single-phase natural convection in an experimental sodium loop. The tests were conducted in the Thermal-Hydraulic Out-of-Reactor Safety (THORS) facility. Heat generation in the 19 pin assembly during these tests was typical of decay heat levels. Tests were conducted both with zero initial forced flow and with a small initial forced flow. The bypass line was closed in most tests, but open in one. The computer code used to analyze these tests [LONAC (LOW flow and NATURAL Convection)] is an ORNL-developed, one-dimensional, single-phase, finite-difference model for simulating forced and free convection transients in the THORS loop.

- 2678 (ORNL/TM--6782) INFLUENCE OF MELTING PRACTICE AND HEAT TREATMENT ON THE CONTINUOUS CYCLING FATIGUE AND SUBCRITICAL CRACK GROWTH PROPERTIES OF 2 1/4 CR--1 MO STEEL. Strizak, J.P.; Brinkman, C.R. (Oak Ridge National Lab., TN (USA)). May 1979. Contract W-7405-ENG-26. 33p. AT.

Interim results are reported for continuous cycling strain-controlled fatigue and fatigue crack growth tests of 2 1/4 CR--1 Mo steel. Heat-to-heat variations due to different melting practices and postweld heat treatment of annealed and isothermally annealed material were considered. Apparently, continuous cycle fatigue behavior at 427 and 538°C did not differ among the heats manufactured by air-melt, vacuum-arc remelt, and electro-slag remelt practices. Furthermore, a possible postweld heat treatment of 40 h at 726°C on initially annealed or isothermally annealed material did not influence continuous cycle fatigue life. Interim fatigue crack growth rate results at 510°C extended data to higher stress intensity levels. Fatigue crack growth rate data for isothermally annealed air-melt material obtained at frequencies of 0.067 and 0.67 Hz over a stress intensity range of 30 to 60 MPa $\sqrt{m}$ agreed well with previous results not exceeding 40 MPa $\sqrt{m}$. Cyclic life tests using both hourglass-shaped and uniform-gage specimens were compared. The 5.08-mm-diam hourglass-shaped specimen had a lower fatigue life than the 6.35-mm specimen. The discrepancy in the results for these two hourglass-shaped specimens decreases with decreasing total axial strain range. Furthermore, the uniform-gage specimen had a lower fatigue life than the 6.35-mm-diam hourglass-shaped specimen.

- 2679 (ORNL/TM--6792) SODIUM BOILING TESTS IN A 19-PIN INTERNALLY GUARD HEATED SIMULATED LMFBR FUEL ASSEMBLY WITH A SIX-CHANNEL INTERNAL BLOCKAGE: RECORD OF EXPERIMENTAL DATA FOR THORS BUNDLE 3C. Morris, R.H.; Nelson, W.R.;

Clapp, N.E.; Hanus, N.; Fontana, M.H.; Gnadt, P.A.; Montgomery, B.H.; Thornton, R.H.; Wantland, J.L. (Oak Ridge National Lab., TN (USA)). May 1979. Contract W-7405-ENG-26. 376p. AT.

A record is presented of experimental data obtained during boiling propagation tests with bundle 3C in the Liquid-Metal Fast Breeder Reactor (LMFBR) Thermal-Hydraulic Out-of-Reactor Safety (THORS) Facility. The objective of these tests was to verify that boiling in the wake of a local blockage will not propagate axially or radially. Bundle 3C consisted of 19 electrically heated pins [fuel pin simulators (FPSs)], having the same configuration and heat flux capability as Fast Flux Test Facility (FFTF) and Clinch River Breeder Reactor (CRBR) fuel, surrounded by 12 heated edge pins installed in a stainless steel duct. A 6.4-mm (0.25-in.) stainless steel plate attached to the central pin blocked the six central channels 381 mm (15.0 in.) downstream from the start of the heated section. The test bundle and the loop were designed to simulate prototypic boundary pressure conditions and downstream heat capacity characteristics.

- 2680 (ORNL/TM--6851) BREEDER REACTOR SAFETY AND CORE SYSTEMS PROGRAMS PROGRESS REPORT FOR OCTOBER--DECEMBER 1978. Fontana, M.H.; Wantland, J.L. (Oak Ridge National Lab., TN (USA)). Aug 1979. Contract W-7405-ENG-26. 111p. AT.

This report covers progress made during October--December 1978 by the Breeder Reactor Safety and Core Systems Programs at Oak Ridge National Laboratory (ORNL). Topics discussed are program coordination, thermal-hydraulic out-of-reactor safety (THORS) analysis and data evaluation, THORS Facility Operation Sodium Boiling Test (SBT) Facility, analytical models for energetics accommodation, environmental assessment of alternate Fast Breeder Reactor (FBR) fuels, model evaluation of breeder reactor radioactivity releases, Nuclear Safety Information Center (NSIC), central computerized data base for breeder reactor safety codes, and breeder reliability data analysis center.

- 2681 (ORNL/TM--6862) COMPARISON OF COMPUTATIONAL RESULTS OF THE SABRE LMFBR PIN BUNDLE BLOCKAGE CODE WITH DATA FROM WELL-INSTRUMENTED OUT-OF-PILE TEST BUNDLES (THORS BUNDLES 3A AND 5A). Dearing, J.F. (Oak Ridge National Lab., TN (USA)). Sep 1979. Contract W-7405-ENG-26. 41p. AT.

The Subchannel Analysis of Blockages in Reactor Elements (SABRE) computer code, developed by the United Kingdom Atomic Energy Authority, is currently the only practical tool available for performing detailed analyses of velocity and temperature fields in the recirculating flow regions downstream of blockages in liquid-metal fast breeder reactor (LMFBR) pin bundles. SABRE is a subchannel analysis code; that is, it accurately represents the complex geometry of nuclear fuel pins arranged on a triangular lattice. The results of SABRE computational models are compared here with temperature data from two out-of-pile 19-pin test bundles from the Thermal-Hydraulic Out-of-Reactor Safety (THORS) Facility at Oak Ridge National Laboratory. One of these bundles has a small central flow blockage (bundle 3A), while the other has a large edge blockage (bundle 5A). Values that give best agreement with experiment for the empirical thermal mixing correlation factor, FMIX, in SABRE are suggested. These values of FMIX are Reynolds-number dependent, however, indicating that the coded turbulent mixing correlation is not appropriate for wire-wrap

pin bundles.

- 2682 (ORNL/TM--6900) SENSITIVITY THEORY APPLIED TO A TRANSIENT THERMAL-HYDRAULICS PROBLEM. Weber, C.F.; Oblow, E.M. (Oak Ridge National Lab., TN (USA)). Oct 1979. Contract W-7405-ENG-26. 112p. Dep. NTIS, PC A06/MF A01.

A new method for sensitivity analysis of transient nonlinear problems is developed and applied to a reactor thermal-hydraulics problem. The method resembles the differential sensitivity methods currently used in the linear problems of reactor physics, but it is applicable to nonlinear systems as well. The equations governing heat transfer and fluid flow in a fuel pin and surrounding coolant are given and used to derive a second set of equations (commonly known as the adjoint equations) used in the sensitivity analysis. Both systems contain one second-order parabolic and one first-order hyperbolic partial differential equation. Difference equations are derived to approximate both systems and the convergence properties of these discrete systems are evaluated, yielding a useful analysis of the numerical solution. The solution functions are used to derive sensitivity coefficients for any desired integral response. These sensitivity coefficients are used in a first-order perturbation theory to predict changes in a response resulting from changes in parameter values. The results of a test problem are shown, verifying that this procedure is indeed useful for a wide variety of sensitivity calculations.

- 2683 (ORNL/TM--6947) ORNL BREEDER REACTOR SAFETY: LOA 2, 3, 4, AND 5. QUARTERLY TECHNICAL PROGRESS REPORT, JANUARY-MARCH 1979. Fontana, M.H. (Oak Ridge National Lab., TN (USA)). Sep 1979. Contract W-7405-ENG-26. 146p. AT.

Progress is summarized for the following lines-of-assurance (LOA) tasks: thermal-hydraulic out-of-reactor safety program, analytical models for energetics accommodation, environmental assessment of alternate FBR fuels, model evaluation of breeder reactor radioactivity releases, Nuclear Safety Information Center, breeder reactor reliability data analysis center, and central data base for breeder reactor safety codes.

- 2684 (ORNL/TM--6996) PRECONCEPTUAL STUDY OF PROLIFERATION-RESISTANT HETEROGENEOUS SPHERE-PAC-FUELED LMFBR CORES. Selby, D.L. (Oak Ridge National Lab., TN (USA)). Sep 1979. Contract W-7405-ENG-26. 206p. AT.

In October, 1977, a multi-institutional Proliferation-Resistant Preconceptual Core Design Study (PRPCDS) was initiated which extended to September, 1978. The objective of the study was to establish the proliferation resistance and performance potential of a wide range of sodium-cooled fast breeder reactor core designs. Each participating organization was responsible for publishing the results from its part of the study, and this report describes ORNL's work on the Vibro-Pac fuel design concept. Special characteristics of Vibro-Pac fuel (low density, etc.) were considered in terms of effects on Doppler coefficient, fuel time constant, breeding performance, etc., in a heterogeneous core configuration. A comparison was made with a reference pellet pin design. No significant differences between Vibro-Pac and high density pellet pins were identified.

- 2685 (ORNL/TM--6998) ELEVATED-TEMPERATURE DEFORMATION AND FAILURE TEST OF A TYPE 304 STAINLESS STEEL CAPPED CYLINDRICAL SHELL: SPECIMEN CC-2. Clinard, J.A.; Richardson, M.; Battiste, R.L.; Sartory, W.K. (Oak Ridge National Lab., TN (USA)). Oct 1979. Contract W-7405-ENG-26. 57p. AT.

Results are presented from a high-temperature deformation and failure test of a type 304 stainless steel capped cylindrical shell, specimen CC-2. The specimen was subjected to time-varying pressure and temperature which produced elastic-plastic-creep response. The test was terminated when failure occurred by opening of a creep crack which propagated circumferentially in the junction region between the cap and the cylinder. The test, which was performed to provide for assessment of the accuracy and validity of structural analysis methods and related computer programs, was conducted as part of the ORNL High-Temperature Structural Design (HTSD) Program effort related to development and verification of a design methodology applicable to liquid-metal fast breeder reactor (LMFBR) system components. The specimen was fabricated using a well-characterized heat (heat 9T2796) of type 304 stainless steel. Capacitive-type strain gages provided reliable strain-time response over the specimen life of 3300 hr. Complete test results are provided on microfiches. Analysis activities are discussed and computed results are compared to measured specimen response. Inelastic analysis predictions of the deformation phase were in reasonable agreement with strain-gage data. Failure predictions, based on both elastic and inelastic calculations, were conservative, although the degree of conservatism of inelastic failure predictions for this test could not be exactly determined since computational difficulties prevented complete solution of the large-deformation failure phase.

- 2686 (ORNL/TM--7086) SPQR: A MONTE CARLO REACTOR KINETICS CODE. Cramer, S.N.; Dodds, H.L. (Oak Ridge National Lab., TN (USA)). Feb 1980. Contract W-7405-ENG-26. 41p. Dep. NTIS, PC A03/MF A01.

The SPQR Monte Carlo code has been developed to analyze fast reactor core accident problems where conventional methods are considered inadequate. The code is based on the adiabatic approximation of the quasi-static method. This initial version contains no automatic material motion or feedback. An existing Monte Carlo code is used to calculate the shape functions and the integral quantities needed in the kinetics module. Several sample problems have been devised and analyzed. Due to the large statistical uncertainty associated with the calculation of reactivity in accident simulations, the results, especially at later times, differ greatly from deterministic methods. It was also found that in large uncoupled systems, the Monte Carlo method has difficulty in handling asymmetric perturbations.

- 2687 (ORNL/TM--7181) COVERX SERVICE MODULE OF THE FORSS SYSTEM. Drischler, J.D. (Oak Ridge National Lab., TN (USA)). Apr 1980. Contract W-7405-ENG-26. 42p. (ENDF--291). Dep. NTIS, PC A03/MF A01.

The COVERX Service Module includes seven execution paths to aid in understanding and using multigroup cross-section covariance matrices contained in the standard interface file COVERX. The execution paths provide the following operations on COVERX file(s): list

the contents of a COVERX file; allow adding new multigroup cross-section covariance matrices to an existing COVERX file; allow deletion of multigroup covariance matrices from an existing COVERX file; merge two COVERX files and creates a new file; change the mode of a file from unformatted to formatted and conversely; allow modification of the records contained in a COVERX file; and selectively edits or copies a file.

- 2688 (ORD--5295-1) BENEFIT-COST ANALYSIS FOR DYNAMIC TESTING IN THE FAST FLUX TEST FACILITY. Huynh, Q.A.; Kerlin, T.W. (Tennessee Univ., Knoxville (USA). Dept. of Nuclear Engineering). Jun 1978. Contract EN-77-S-05-5295. 341p. Dep. NTIS, PC A15/MF A01.

Thesis.

Dynamic tests for the Fast Flux Test Facility (F.F.T.F.) were studied to determine their potential benefits and their costs. This required the development of a mathematical model for the plant. Models were developed with several different treatments of the heat transfer and the reactivity feedback effects to determine the model complexity required to represent the system adequately. The model was used to assess the benefits of dynamic testing. Specifically, sensitivity studies were performed to evaluate the identifiability of important performance-related plant parameters (such as reactivity feedback coefficients and heat transfer coefficients). Also, a test was designed that uses only existing in-plant hardware and instrumentation. It was concluded that the potential benefits of dynamic testing in the F.F.T.F. are high and the costs are low.

- 2689 (PB--254737, pp 324-359) FEASIBILITY STUDIES OF ACTINIDE RECYCLE IN LMFBRs AS A WASTE MANAGEMENT ALTERNATIVE. Beaman, S.L.; Aitken, E.A. 1976.

Proceedings of the conference on the management of radioactive waste: waste partitioning as an alternative.

Actinide recycle in LMFBRs offers an attractive alternative on long-term storage of the actinides. The concept will not significantly affect the performance of the LMFBR, but will affect other parts of the nuclear fuel cycle. Assuming that hands-on maintenance will be allowed for Pu-recycle fuel fabrication facilities, the transplutonium actinides should be kept separate from the PuO_2 - UO_2 fuel. Thus, the "reference" recycle scheme should be defined as a scheme in which the actinides are recycled in target assemblies. The target assemblies should be reprocessed either in batches separate from spent-fuel batches or in a separate, relatively small, special purpose reprocessing plant. The target assemblies should be fabricated in a special purpose, remotely maintained facility.

- 2690 (PB--263917) REPORT OF THE AD HOC PANEL ON THE USE OF ACCELERATORS TO STUDY IRRADIATION EFFECTS. Reed, C.K. (National Academy of Sciences - National Research Council, Washington, DC (USA). Committee on Nuclear Science). 1974. Contract NSF-C310. 64p. NTIS PC A04/MF A01.

A panel was assembled under the auspices of the National Academy of Sciences, Committee on Nuclear Sciences to review the ways nuclear physicists might apply their skills and instrumentation to problems in material sciences. The panel looked into problems related to the effects of radiation on dimensional stability, mechanical properties, structural and compositional changes and

surface effects. The role the accelerator might play in these studies and the effects of specific particle irradiation is presented in some detail.

- 2691 (PB--273304) CONDENSATION OF FUEL ONTO THE ABOVE-CORE STRUCTURE DURING AN LMFBR CORE-DISRUPTIVE ACCIDENT. Garner, P.L.; Erdman, C.A.; Reynolds, A.B. (Virginia Univ., Charlottesville (USA). Dept. of Nuclear Engineering). Oct 1977. Contract AT(49-24)-0316. 157p. (UVA--529106/NE77/101). NTIS PC A08/MF A01.

Condensation of a pure, saturated vapor onto a vertical, melting substrate is analyzed for both one- and two-material situations. The condensate and melt regions are treated as laminar boundary layers in the steady-state analyses. The convective momentum and energy transport terms in the conservation equations and the shear stress at the condensate/vapor interface are found to be non-negligible; neglect to these terms results in overestimating the phase-change rates by a factors of 2 to 3. The phase-change rates are reduced if the vapor is moving upward at low speed rather than stagnant.

- 2692 (PB--274091) THE CLINCH RIVER BREEDER REACTOR PLANT: AN ANALYSIS OF THE IMPACTS OF ITS IN-MIGRANT CONSTRUCTION WORKERS ON LOCAL PUBLIC SERVICES. FINAL REPORT. Braid, R.B. Jr.; Kyles, S.D. (East Tennessee Energy Projects Coordinating Committee, Clinton (USA)). May 1977. Contract ARC-TQ-10/TN-5105-76-I-302-0401. 328p. NTIS PC A15/MF A01.

The socioeconomic impact study identifies certain impacts which are projected to occur to local public services in each of 14 Tennessee communities in the Oak Ridge-Knoxville area during the construction of the Clinch River Breeder Reactor Plant. Various in-migration scenarios are utilized, and detailed qualitative and quantitative analyses of each public service are undertaken. Per capita in-migrant cost-revenue impacts are calculated for each community in each in-migration scenario.

- 2693 (PB--280695) A LOOK AT ALTERNATIVE CORE DISRUPTION ACCIDENTS IN LMFBR'S. PART II. A GENERAL EVALUATION APPROACH TO RISK-BENEFIT FOR LARGE TECHNOLOGICAL SYSTEMS AND ITS APPLICATION TO NUCLEAR POWER. Badham, V.; McKone, T.K.; Steele, W.; Chan, C.K. (California Univ., Los Angeles (USA). Dept. of Chemical, Nuclear, and Thermal Engineering). Dec 1977. 59p. (UCLA-ENG--7776). NTIS PC A04/MF A01.

The report investigates the effects of fuel behavior and control rod motion of an LMFBR core in a postulated accident scenario, in which the heatup of the fuel is caused mainly by decay heat. The sequence of this class of accidents is usually characterized by the loss of sodium, cladding, and can wall before major fuel melting occurs. There are two possible paths for the core to gain reactivity: either as a result of fuel slump or by loss of control rod material from the active core region. A parametric approach is adopted as a first order estimation for the possibility and manner of achieving recriticality. A major factor in preventing fuel slump before fuel melting is fuel swelling at elevated temperature. A model is developed to estimate the intragranular fission gas behavior and the subsequent fuel swelling after the loss of the subassembly wall. The heat radiated from the fuel pin would cause the melting of the structural material of the control rod. The loss of the control rod

material from the active core would cause a ramp insertion of reactivity. Because of the complex nature of core geometry, the core transient behavior is studied in terms of the initial temperature, ramp rates, and other reactor parameters.

- 2694 (PB--283030) A QUALIFICATION TESTING PROGRAM PLAN FOR SIMMER; A COMPUTER CODE FOR LMFBR DISRUPTED CORE ANALYSIS. RESEARCH PROGRAM PLANNING REPORT. Basdekas, D.L.; Silberberg, M.; Curtis, R.T.; Kelber, C.N. (Nuclear Regulatory Commission, Washington, DC (USA)). Sep 1978. 52p. NTIS PC A04/MF A01.

The SIMMER Code, developed at Los Alamos Scientific Laboratory, analyzes the various phases of a CDA (Core disassembly accident) in an LMFBR. The qualification testing program, comprised of two stages, is discussed. The first stage is developmental verification, which involves interaction with code development. The second stage is independent qualification testing and it involves an independent audit of the first stage and confirmatory predictions of large experiments without a priori adjustments of the Code. An experimental and analytical approach is described intended to accomplish this task.

- 2695 (PB--283231) MULTIPHASE TRANSIENTS WITH COOLANT AND CORE MATERIALS IN LMFBR CORE DISRUPTIVE ACCIDENT ENERGETICS EVALUATIONS. TECHNICAL REPORT. Theofanous, T.G.; Beecher, J.; Miao, C.; Marrotte, G.; Patel, P. (Purdue Univ., Lafayette, IN (USA)). School of Nuclear Engineering. Jul 1978. Contract NRC-03-76-181. 302p. NTIS PC A14/MF A01.

An overview of core disruptive accidents in LMFBRs and an assessment of their potential for energetic consequences are presented. Areas in which current state-of-the-art is found inadequate are identified. In particular, the early post disruptive period (called herein Transition to the Transition Phase) is identified as a key area having received inadequate attention to date. Further the idea of mild dispersal from a fully developed Transition Phase at decay heat power levels does not appear justified. However, considerable questions exist as to the attainability of such full core pool under accident conditions. Specific recommendations for research work in relation to licensing needs are presented.

- 2696 (PB--284227) PROCEEDINGS OF THE WORKSHOP ON INSTITUTIONAL ALTERNATIVES FOR LMFBR DEVELOPMENT AND COMMERCIALIZATION HELD AT THE MITRE CORPORATION IN MCLEAN, VIRGINIA ON SEPTEMBER 8 AND 9, 1976. FINAL REPORT. (Mitre Corp., McLean, VA (USA)). METREK Div.). Jul 1977. 513p. NTIS PC A22/MF A01.

The workshop assembled representatives of utilities, nuclear vendors, and government and research organizations to consider institutional issues of the development and commercialization of liquid metal fast breeder reactors (LMFBR). The document contains transcripts of the presentations as well as discussions in several topical areas. The Energy Research and Development Administration's LMFBR program was outlined. Several studies of the development and commercialization of light water reactors were presented as background and a basis of discussion. Nuclear technology development and commercialization in foreign countries were outlined in several presentations, suggesting alternatives for development of LMFBR technologies in this country. The critical

stage appears to be the transition between R and D and commercialization, i.e., the first thirty commercial reactors, and the appropriate government role at this stage needs to be defined.

- 2697 (PB--285544) SAFETY, SAFEGUARDS, AND ENVIRONMENTAL EFFECTS OF LIQUID METAL FAST BREEDER REACTORS IN RELATION TO LICENSE ABILITY AND PUBLIC ACCEPTANCE. FINAL REPORT. O'Leary, J.F. (National Science Foundation, Washington, DC (USA)). Div. of Policy Research and Analysis. 3 Sep 1974. 28p. NTIS PC A03/MF A01.

Public concerns with the Liquid Metal Fast Breeder Reactor (LMFBR) have emerged in three areas: the relative environmental impact of this energy source, the potential for reactor accidents, and the risk of plutonium diversion. Compared with other central station electricity generation options, the LMFBR is environmentally more benign. More reliable engineered defenses against results of a voiding accident can possibly be developed, but the added protection of remote siting should be used. The safeguards issue is the principal obstacle to public acceptance, and the best attempts at quantification have shown the risk to public health and safety from diversion significantly greater than risk of reactor accident. Siting policy options offer the best means of reducing this risk by reducing the physical transport of plutonium in various stages of the fuel cycle. Integrated fuel cycle facilities, integrated LMFBR facilities, and integrated nuclear generating facilities are three such options for the integration concept that may have other attractions as well.

- 2698 (PB--285567) ENVIRONMENTAL, SAFETY, AND PUBLIC ACCEPTANCE ASPECTS OF LMFBRs. MEMO REPORT. Moss, L.I. (National Science Foundation, Washington, DC (USA)). Office of Energy Research and Development Policy. 9 Sep 1974. 50p. NTIS PC A03/MF A01.

The liquid metal fast breeder reactor (LMFBR) offers a number of important benefits, but should be evaluated in the context of a more rational energy policy than the present policy. Elimination of subsidies and internalization of social and environmental costs, reordering RandD priorities to reflect environmental acceptability, reassessment of the growth rate of US electrical energy demand, and availability of domestic high-grade uranium ores are all necessary energy policy reforms that will affect the supply role of LMFBRs. LMFBRs have some environmental, health and safety advantages over light water reactors, but also some disadvantages. A program to capture the advantages and minimize the hazards of LMFBRs should include development of integrated nuclear centers, safety analysis and experiments to quantify hazards, assessing underground siting, and developing the capability to separate and recycle actinides through LMFBRs.

- 2699 (PB--286865) EXPERIMENTAL INVESTIGATION OF AEROSOL BEHAVIOR IN A POST-LMFBR ACCIDENT REACTOR CONTAINMENT ATMOSPHERE. ANNUAL REPORT SEP 1977--JAN 1978. Wegrzyn, J.; Shaw, D.T. (State Univ. of New York, Buffalo (USA)). Dept. of Electrical Engineering. Jun 1978. Contract AT(49-24)-0359. 35p. NTIS PC A03/MF A01.

Under the support of the Nuclear Regulatory Commission, work has been done at SUNY=Buffalo for the year 1977 on the experimental measurements of the aerodynamic properties of a sodium aerosol. With this format essentially

three separate experiments were performed; (1) the evaluation of the centrifuge as a in-situ measuring device, (2) the classification of the sodium aerosol, and (3) the shape factor measurements on an exploding wire (E.W.) aerosol.

2700 (PB--287481) NATURAL CONVECTION HEAT TRANSFER IN BEDS OF INDUCTIVELY HEATED PARTICLES. TOPICAL REPORT. Rhee, S.J.; Dhir, V.K. (California Univ., Los Angeles (USA)). Aug 1978. Contract NRC-04-76-246. 99p. NTIS PC A05/MF A01.

The estimation of heat-removal-capability from core debris that may be formed as a result of a hypothetical fuel disruptive accident in a LMFBR is of interest in the nuclear reactor safety analysis. After the accident, the fuel debris in the form of particles may settle on various horizontal surfaces, such as thermal baffles, and there may exist an overlying sodium layer above the core debris bed. The decay heat from the fuel debris bed will be removed either by conduction or convection across the superposed layer before the initiation of ebullition. Experimental observations of the onset of convective motion in such beds of inductively heated particles have been made. The data for the heat transfer coefficient have been obtained in water-cooled beds of 304 stainless steel particles. The observations show that increasing the depth of the fluid layer over the bed tends to lower the critical internal Rayleigh number at which the onset of convection occurs. For overlying fluid-layer-depth-to-particulate-bed-depth ratios of 1 of greater, natural convection has been observed to begin at RI approximately equal to 12. However, for no fluid layer at the top of the bed, natural convection has been observed to occur at R sub I approximately equal to 45, which is about the same as observed in earlier studies made with Joule heating and no fluid layer at the top of the bed.

2701 (PB--293190) BUBBLE BEHAVIOR IN LMFBR CORE DISRUPTIVE ACCIDENTS. ANNUAL REPORT, 1 OCTOBER 1977-30 SEPTEMBER 1978. Erdman, C.A.; Reynolds, A.B.; Bradley, D.R.; Chen, K.; Pilch, M. (Virginia Univ., Charlottesville (USA)). Dept. of Nuclear Engineering and Engineering Physics. Mar 1979. Contract AT(49-24)-0316. 124p. NTIS, PC A06/MF A01.

Analytical research performed at the University of Virginia during FY78 for the Reactor Safety Research (RSR) Division of the U.S. Nuclear Regulatory Commission is reported. The research is part of the Aerosol Release and Transport program of RSR. Three major areas were investigated: (1) particle production by hydrodynamic fragmentation, (2) particle production by homogeneous nucleation, and (3) bubble dynamics and heat transfer. Development of a Monte Carlo computer code for the analysis of particle-size distributions from vapor-liquid hydrodynamic fragmentation was initiated. The source of homogeneous nucleation in the ORNL CDV test was postulated to be expansion behind a spherical shock wave and modeling of this phenomenon was initiated. Analysis of the axial motion of bubble in the French EXCOBULLE tests was completed with the use of the EXCOBUL code in preparation for its use in assisting with the analysis of the ORNL under-water and under-sodium CDV tests.

(California Univ., Los Angeles (USA)). School of Engineering and Applied Science). Mar 1979. Contract NRC-03-77-001. 82p. NTIS, PC AA05/MF A01.

This report presents a review of post-accident heat removal problems and views upon areas that include debris bed phenomena, molten pool growth, gas film boundaries and crusts, and the influence of basemat conduction upon pool formation and evolution. It introduces plausible circumstances for the formation of non-coolable debris beds, and so leads to crude estimates of the initial dimensions of core debris distributions for pool growth problems. The GROWS code is reviewed and examples given using initial conditions derived from those estimates. Gas film boundaries with crusting and freezing phenomena are qualitatively discussed as potentially significant factors in defining heat split and pool evolution. Research on density gradient mixing in dense pools overlying light sacrificial materials is reviewed. The conductive transport of heat in the solid basemat surrounding the pool is discussed as a factor that might influence the initial spreading of a molten mass upon a basemat, may influence the shape of a pool when strong top surface cooling is present, and is a dominant factor in defining the cessation of penetration.

2703 (PB--294243) LMFBR FUEL ANALYSIS. TASK C: RELIABILITY. FINAL REPORT, 1 OCTOBER 1977-15 NOVEMBER 1978. Cave, L.; Kastenber, W.E. (California Univ., Los Angeles (USA)). School of Engineering and Applied Science). Mar 1979. Contract NRC-03-77-001. 30p. NTIS, PC AA03/MF A01.

This report consists of consultative support on a variety of topics, the main items being (1) evaluation of certain aspects of the Fast Flux Test Facility design; (2) examination of means of alleviating the effects of systems interaction; and (3) evaluation of the suitability for licensing in the United States of alternative reactor systems, and of alternative fuel cycles for existing systems, which might assist in the reduction of proliferation risks. In the case of one particular topic, the problem of establishing an adequate verification program for natural circulation in the Fast Flux Test Facility, a probabilistic approach was developed which may be of more general interest in relation to other fast reactors.

2704 (PB--295077) EXPERIMENTAL INVESTIGATION OF AEROSOL BEHAVIOR IN A POST-LMFBR ACCIDENT REACTOR CONTAINMENT ATMOSPHERE. ANNUAL REPORT, 1 OCTOBER 1977-30 SEPTEMBER 1978. Wegrzyn, J.; Shaw, D.T. (State Univ. of New York, Buffalo (USA)). Lab. for Power and Environmental Studies). Apr 1979. Contract NRC-04-76-359. 52p. NTIS, PC A04/MF A01.

For large-scale testing of sodium-fire aerosols, no off-the-shelf instrument is available for accurate measurement of the particle size distribution function in the diameter region from 0.5 - 30 μ m. In the long range, cascading impactors are considered to be most suitable for in-situ measurement of sodium-fire aerosols because of simplicity of operation and maintenance. The calibration of cascading impactors can be best carried out by a combined use of the centrifuge (for particles with diameter range from 0.5 - 5 μ m) and by direct observation with a microscope (for particles ranging from 5 - 30 μ m). Three distinctly different characteristics are found. To avoid the complex problem of controlling the chemical composition of the sodium-fire aerosol during and after the particle generation, it is

2702 (PB--294102) LMFBR FUEL ANALYSIS. TASK B: POST-ACCIDENT HEAT REMOVAL. FINAL TECHNICAL REPORT 1 OCTOBER 1977-15 NOVEMBER 1978. Catton, I.; Dhir, V.K.; Brinsfield, W.A.; McDonough, J.M.; Ostrander, N.C.

best to analyze the aerosol by first classifying the particles according to their size - with either a centrifuge or a cascading impactor - and then to determine the chemical composition of the particles in each size range by electron diffraction technique. Very limited information is available at the present time for the particle size distribution measurement in the diameter range 5 - 30 m.

- 2705 (PEL--250) DEVELOPMENT OF ACCURATE DATA FOR THE DESIGN OF FAST REACTORS. Rossouw, P.A. (Pretoria Univ. (South Africa). Faculty of Mathematics and Natural Sciences; Atomic Energy Board, Pelindaba, Pretoria (South Africa)). Apr 1976. 99p. (In Afrikaans). Dep. NTIS (US Sales Only), PC A05/MF A01.

The proposed use of nuclear power in the generation of electricity in South Africa with the use of fast reactors in the country's nuclear program requires a method for fast reactor evaluation. The availability of accurate neutron data and neutronics computation techniques for fast reactors is required for such an evaluation. The reactor physics and reactor parameters of importance in the evaluation of fast reactors are discussed, and computer programs for the computation of reactor spectra and reactor parameters from differential nuclear data are presented. In endeavouring to increase the accuracy in fast reactor design, two methods for the improvement of differential nuclear data were developed and are discussed in detail. The computer programs which were developed for this purpose are also given. The neutron data of the most important fissionable and breeding nuclei (U^{235} x U^{238} x Pu^{239} and Pu^{240}) are adjusted using both methods, and the improved neutron data are tested by computation with an advanced neutronics computer program. The improved and original neutron data are compared, and the use of the improved data in fast reactor design is discussed.

- 2706 (PNC-J--225-78-04) RESEARCH REPORT ON DESIGN ALLOWABLE VALUES OF STRUCTURAL MATERIALS FOR LMFBR. (Power Reactor and Nuclear Fuel Development Corp., Tokyo (Japan)). Nov 1978. 216p. (In Japanese). NTIS (US Sales Only), PC A11/MF A01.

The present report is composed of the following two main parts. i) review and re-evaluation on test results by FCI Sub-committee studies, performed from 1973 to 1976, ii) review on procedures for determining design allowable values of structural materials for LMFBR components. Re-evaluation works have been made on monotonic tensile properties at elevated temperatures, creep and creep rupture properties, creep-fatigue properties (strain rate and tensile strain hold time effects on strain fatigue properties at elevated temperatures) of Types 316 and 304 stainless steel and 2 1/4Cr-1Mo steel (base and weld metals) produced in Japan. In the first half of the present report, creep-fatigue test results obtained by FCI Sub-committee studies are subjected to re-evaluation by the present P-FCI Sub-committee. Reviews have been made on testing methods on FCI's-creep-fatigue experiments with other test data of the test materials; high temperature monotonic tensile data, creep and creep rupture data, and origin of the test materials. The data of FCI studies are compared with other reference data obtained by several Japanese laboratories. In the latter half of the present report, procedures including ASME's are reviewed for setting design allowable values for LMFBR components on the basis of high temperature strength properties obtained with materials produced in

Japan. A creep rupture data of Japanese steels are issued and examined to make proposal for a design allowable stress of $S_{sub}(t)$ through parameter survey.

- 2707 (PNC-N--251-76-12(Vol.1), pp 25-32) REVIEW AND PERSPECTIVE OF FCI RELATED ACTIVITIES IN JAPAN. Kawaguchi, O. (Power Reactor and Nuclear Fuel Development Corp., Tokyo (Japan)). 1976.

From 3. specialists' meeting on sodium fuel interaction; Tokyo, Japan (Mar 1976).

LMFBRs are the most promising reactors among several nuclear options, and the safety must be established for the future commercialization. One of the most crucial issues in the LMFBR safety is the molten fuel-coolant interaction which takes place in the various phases of hypothetical core disruptive accident. The objectives of this paper are to summarize the current considerations on the FCI applied to the design of the prototype FBR, Monju, in Japan, and to review the supporting R and D activities. The calculation with the codes SUGAR and DETECT on the initiation of the pin-level FCI, the comparison of transient overpower and loss of flow cases in the initiating phase of the whole core accident, the analysis of the mechanical disassembly phase with the upgraded version of VENUS, the treatment of the structural response with PISCES-2DL or two codes ASPRIN 2 and CAMEL, and the systematic approach with SIMMER to the post-accident heat removal are explained. In order to support the Monju design described above, several basic experiments have been in progress to elucidate the FCI aspects, such as liquid-liquid contact and thermal explosion, the effect of the boundary conditions surrounding FCI zones on vapor explosion, the efficiency of converting stored thermal energy to mechanical work, the fragmentation of molten metal, and the incoherence effects in FCI. The out-of-pile and in-pile experiments on the UO_2 -Na system have also been carried out since 1969.

- 2708 (PNC-N--251-76-12(Vol.1), pp 285-305) SIMULATION EXPERIMENT AND ANALYSIS ON THE EFFECTS OF IN-COHERENCE IN FUEL COOLANT INTERACTION. Kondo, S.; Togo, Y.; Iwamura, T. (Tokyo Univ. (Japan). Faculty of Engineering). 1976.

From 3. specialists' meeting on sodium fuel interaction; Tokyo, Japan (Mar 1976).

Experimental and analytical studies were conducted to investigate effects of incoherence (space time behavior of molten fuel) on molten fuel coolant interaction. In experiments, a 2 mm diameter molten tin jet was injected upward into the water in a slender tank. The results were analyzed based on the pressure records and high speed photographs. The pressure records indicated that there were two types of interaction between molten jet and water, intermittent explosion mode and continuous one. The explosion mode appeared when the temperature of molten tin was above 350°C or so and that of water was below 70°C or so. The high speed photograph indicated that an establishment of a stable jet column was necessary for an explosive interaction and that a bubble like region grew and collapsed at the root of the jet in accordance with the generation of pressure pulse. It was found that the mass of metal which contributed to the vapor explosion was only a small part of the injected metal in the case of jet injection type contact mode and this was the reason why the gross thermal to mechanical energy conversion ratio was around 0.03% in this type of contact mode, though this ratio was around 2% if only the part of record around the

pressure pulse was taken into consideration. In the analysis part, a multi-channel FCI model was developed to evaluate the spatial incoherence effect on pressure at subassembly exit. The calculated pressure trace indicated that the spatial incoherence has considerable effects for an evaluation of structure response under FCI pressure loading.

- 2709 (PNC-N--251-76-12(Vol.1), pp 97-127)
FUEL-COOLANT INTERACTIONS. SOME BASIC STUDIES AT THE UKAEA CULHAM LABORATORY. Reynolds, J.A.; Dullforce, T.A.; Peckover, R.S.; Vaughan, G.J. (UKAEA Research Group, Abingdon. Culham Lab.). 1976.

From 3. specialists' meeting on sodium fuel interaction; Tokyo, Japan (Mar 1976).

In a hypothetical fault sequence important effects of fuel-coolant interactions include voiding and dispersion of core debris as well as the pressure damage usually discussed. The development of the fuel-coolant interaction probably depends on any pre-mixing Weber break-up that may occur, and is therefore a function of the way the fuel and coolant come together. Four contact modes are identified: jetting, shock tube, drops and static, and Culham's experiments have been mainly concerned with simulating the falling drop mode by using molten tin in water. It was observed that the fuel-coolant interaction is a short series of violent coolant oscillations centred at a localized position on the drop, generating a spray of submillimeter sized debris. The interaction started spontaneously at a specific time after the drop first contacted the water. There was a definite limited fuel-coolant interaction zone on a plot of initial coolant temperature versus initial fuel temperature outside which interactions never occurred. The interaction time was a function of the initial temperatures. Theoretical scaling formulae are given which describe the fuel-coolant interaction zone and dwell time. Bounds of fuel and coolant temperature below which fuel-coolant interactions do not occur are explained by freezing. Upper bounds of fuel and coolant temperatures above which there were no fuel-coolant interactions are interpreted in terms of heat transfer through vapour films of various thicknesses.

- 2710 (PNC-N--251-76-12(Vol.1), pp 381-442)
SOME EXPERIENCES AND INPILE EXPERIMENTAL PROGRAMME ON FUEL COOLANT INTERACTION IN NSRR. Saito, S.; Fujishiro, T.; Inabe, T.; Ishikawa, M. (Japan Atomic Energy Research Inst., Tokai, Ibaraki. Tokai Research Establishment). 1976.

From 3. specialists' meeting on sodium fuel interaction; Tokyo, Japan (Mar 1976).

One of the main interests in the phase-I programme of the NSRR (Nuclear Safety Research Reactor) project is to investigate the degree of fuel dispersal into the coolant, molten fuel-coolant interaction and its mechanical effect in the reactor condition. The NSRR is a large-pulsed reactor, its maximum pulsing performance attained with 4.67 dollar reactivity insertion is energy release of 117 MW.sec, peak power of 21,100 MW at a minimum reactor period of 1.17 msec. The phase-I experiments started in October, 1975, and more than ten in-pile tests have been performed in water environment with ambient pressure and temperature condition so far. Among them fuel failure occurred in two cases and in 292 cal/g.UO₂ test, the test fuel was almost completely melted and broken into large five pieces and accompanying particles. Even in this case, however, detectable pressure generation was not observed. Several hundred tests are planned in the phase-I programme for water reactor fuels and fast reactor fuels in

water environment and in sodium environment, respectively. The out-of-pile experiment on fuel-coolant interaction has been also performed using several sorts of simulant metals mainly to find out the thermal conditions for fragmentation. Some interesting results on the thermal thresholds for occurrence of fragmentation were obtained. The analytical model for evaluation of fuel-coolant interaction has been developed. The compressibility of liquid sodium and fragmentation process under simple assumption are taken into account in the model. The effects of several sensitive parameters, for instance, mixing time, the presence of non-condensable gas in the interaction region, heat transfer coefficient between fuel particle and sodium, and so on, on the amounts of peak pressure and mechanical energy have been studied quantitatively.

- 2711 (PNC-N--251-76-12(Vol.1), pp 467-506)
FUEL COOLANT INTERACTION RESULTS IN THE FUEL PINS MELTING FACILITY(PMF). Uruwashi, S.; Hirabayashi, T.; Mizuta, H. (Power Reactor and Nuclear Fuel Development Corp., Tokai, Ibaraki (Japan). Tokai Works). 1976.

From 3. specialists' meeting on sodium fuel interaction; Tokyo, Japan (Mar 1976).

The experimental work related to FCI at PNC has been concentrated to molten UO₂-dropping test. The primary objectives of the fuel pin-melting facility test are to obtain the detailed experimental results on the FCI under transient overpower and loss of flow conditions, to observe the movement of fuel before and after the failure of a pin by X-ray cinematography, to simulate the fuel behavior in the pin-pile test, and others. In the experimental apparatus, the UO₂ pellets clad in SUS 304 tubes are melted by direct electrical heating in a liquid sodium column, and the molten UO₂ coming out of the cladding tubes interacts with the surrounding sodium. The variation of electrical voltage and current, temperature, pressure and the movement of the sodium column are measured. The results of four capsule tests are presented in this paper, two for the open type test section and two for the closed type. Although the fuel motion and the FCI in the closed test section appeared to be different from those in the open test section, more experimental data are required to come to a conclusion. The best heating condition for UO₂ pellets in the FCI study with the pin-melting facility was able to be established. Further development will be continued for providing thermocouples in UO₂ pellets, increasing the stack length of pellets, visualizing the movement of fuel, and forwarding the loop test.

SIMPLE AND CONSISTENT EQUATION OF STATE FOR SODIUM IN THE SINGLE PHASE AND TWO PHASE REGIONS. Breton, J.P. (CEA Centre d'Etudes Nucleaires de Cadarache, 13 - Saint-Paul-les-Durance (France). Dept. des Reacteurs a Neutrons Rapides). 1976.

From 3. specialists' meeting on sodium fuel

interaction; Tokyo, Japan (Mar 1976).

An equation of state valid over an extended temperature and density range has been derived. Then, the following properties have been deduced: coefficient of thermal expansion, isothermal coefficient of bulk compressibility, thermal pressure coefficient, heat capacity at constant pressure, at constant volume, along the saturation curve for liquid, for vapor, heat of vaporization, speed of sound, and finally the Mollier diagram and the entropy diagram. All the obtained properties are thermodynamically consistent and satisfy the basic relations of thermodynamics for both single phase and two-phase regions. Experimental results were always used when available.

VAPOR EXPLOSION WITH SUBCOOLED FREON. Henry, R.E.; Fauske, H.E.; McUmber, L.M. (Argonne National Lab., Ill. (USA)). 1976.

From 3. specialists' meeting on sodium fuel interaction; Tokyo, Japan (Mar 1976).

A set of experiments utilizing a well-wetted system of freon and mineral oil was performed to provide a more definite test of the interface temperature representation by subcooling cold liquid. These experiments were conducted in two different manners to investigate the relative importance of the interface temperature. The first was performed with freon initially at its normal boiling point and mineral oil at the temperature ranging from 80 to 220 deg C in 10 degree increments, and the second was carried out with the mineral oil temperature held constant at 190 deg C and decreasing freon temperature from -41 to -14C deg C in 20 degree decrements. The tests were carried out in the apparatus similar to that discussed in the previous report. The principal difference between the facilities is that in this case, the interaction vessel always contained freon, and hot oil was poured into the vessel. This change in contact state has little significance when freon-22 is saturated, but for subcooled freon, it provides better experimental resolution for the initial freon temperature. These experiments demonstrate that the interface temperature model not only allows to predict the explosive range of a given pair of liquids, but also enables to correlate the maximum explosive pressure which could be produced by a system which lies within the explosive limits.

IMPORTANCE OF SODIUM FUEL INTERACTION IN FAST REACTOR SAFETY EVALUATION. CEA POINT OF VIEW. Tanguy, P. (CEA, 75 - Paris (France)). 1976.

From 3. specialists' meeting on sodium fuel interaction; Tokyo, Japan (Mar 1976).

The consequences of the interaction between molten metal (aluminum-uranium alloy) and water have long been a subject of concern for those in charge of reactor safety, following the accidents observed in BORAX, SL1, and SPERT 1D reactors. Similarly, the consequences of the possible contact between molten mixed uranium and plutonium oxides and sodium must be carefully studied, since such contact may occur in the accident conditions in sodium is explicitly mentioned in the recommendation made by a group of experts in France concerning the safety of fast neutron nuclear power stations. None of the in- or out of pile experiments carried out to date on UO_2 and sodium showed violent phenomena, except three out of pile tests by Armstrong. Recently, the work by Fauske on spontaneous nucleation and that by Board and Hall have contributed to the better understanding of the phenomena. In order to

define clearly the importance of the interaction phenomena, the accident within an assembly due to blockage and the overall accident concerning a core were examined. The violent interaction caused by the blockage in an assembly is unlikely. In case of the overall accident on the core of a fast reactor, the interaction is the consequence of the retention of mechanical energy and the recovery of fuel fragments in overall cooled configuration with local cooling problems.

EXPERIMENTAL WORK AT HARWELL ON THE INJECTION OF SODIUM INTO LIQUID STEEL. Asher, R.C.; Bradshaw, L.; Collett, R.; Davies, D. (UKAEA Research Group, Harwell. Atomic Energy Research Establishment). 1976.

From 3. specialists' meeting on sodium fuel interaction; Tokyo, Japan (Mar 1976).

The equipment and experimental technique used to inject molten sodium beneath the surface of molten steel (and subsequently molten uranium dioxide) are described. The results of an exploratory experiment, in which 2 g of sodium at 380°C were injected into 54 g of steel at 1530°C, are outlined. A violent reaction occurred, apparently as a result of a vapour explosion, and a number of pulses were recorded by a force transducer. A preliminary examination of the steel debris is reported.

CURRENT STATUS OF EXPERIMENTAL AND THEORETICAL WORK ON SODIUM/FUEL INTERACTION(SFI) AT KARLSRUHE. OUT-OF-PILE EXPERIMENTS. Beutel, H. (Kernforschungszentrum Karlsruhe (Germany, F.R.). Inst. fuer Reaktorentwicklung); Bojarsky, E.; Caldarola, L.; Jacobs, H.; Reiser, H. 1976.

From 3. specialists' meeting on sodium fuel interaction; Tokyo, Japan (Mar 1976).

In April 1975, the operation of the sodium loop test facility for out-of-pile experiments started at the Institute of Materials and Solidstate Research. In this facility, it is possible to melt down single UO_2 rods and the small bundles of up to 7 rods in sodium flow by heating them electrically. The rods are subjected to power transient, starting from steady operating conditions. This gives rise to rod failure and to fuel-sodium interaction within several hundreds of msec. During the power excursion, pressure, flow, electrical voltage and current are measured. Prior to the power excursion, the conditions can be established in the cooling channels, which are comparable to those existing in the SNR fuel element. In one of the experiments, the cladding melted at the bottom of the fuel zone after the power excursion had been initiated, and liquid UO_2 was released into sodium flow. This produced very short pressure peaks in the test section. The major change of flow took place at the same time. The temperature profile inside the fuel rod was calculated with the computer program ELEKTRA. It must be concluded that the all interactions were very mild. The works in cooperation with the European Nuclear Research Center at Ispra have been carried out, and hot materials fractured in all tests, but no energetic interaction was observed.

RECENT ADVANCES IN UNDERSTANDING LARGE SCALE VAPOUR EXPLOSIONS. Board, S.J.; Hall, R.W. (Central Electricity Generating Board, Berkeley (UK). Berkeley Nuclear Labs.). 1976.

From 3. specialists' meeting on sodium fuel interaction; Tokyo, Japan (Mar 1976).

The whole process of efficient large scale

vapour explosions is considered in the following three stages; a) the setting up of a quasi-stable initial configuration, b) the triggering of this configuration, and c) the propagation of the explosion. Each stage is considered in turn, with the review of the relevant experimental information and theory to see to what extent the requirements for energetic explosions, and the physical processes that can satisfy these requirements, are understood. Particular attention is paid to an attractively simple criterion for explosivity, suggested by Fauske, that the contact temperature should exceed the temperature for spontaneous nucleation of the coolant, because on this criterion, sodium and uranium oxide in particular are not explosive.

EXPERIMENTAL STUDIES OF THERMAL INTERACTIONS AT AEE WINFRITH. Briggs, A.J. (UKAEA Reactor Group, Winfrith. Atomic Energy Establishment). 1976.

From 3. specialists' meeting on sodium fuel interaction; Tokyo, Japan (Mar 1976).

The assessment of the consequences of very severe reactor accidents in which fuel melts involves the evaluation of the nature of any thermal interaction between the molten fuel or cladding and reactor coolant. The need for further experimental data in this area was one of the main reasons for having established the new experimental facilities at Winfrith. They provide the capability to carry out the experiments involving explosion under safe conditions by setting them up inside a strong test cell at the center of 200 m exclusive area. The instrumentation is provided for the transient measurements of pressure and strain and for high speed cinematography. The program concerned with the propagation of thermal interaction through a metal/water system was started in early 1975, and it is not yet completed. It is plausible to consider the development of large thermal interaction as a three stage process, namely mixing phase, the trigger process initiating thermal interaction, and the propagation of the interaction. With the rig THERMIR, the experiments on producing the violent interaction of tin and water and that of aluminum and water were carried out, and the characteristics of both interactions are reported. As the second stage of the Winfrith program, the UO_2/Na system will be studied, and this program is discussed.

EXPERIMENTAL STUDY ON CONVERSION OF STORED THERMAL ENERGY TO MECHANICAL WORK IN FUEL-COOLANT INTERACTION. Fujie, Y.; Kondo, S.; Miyazaki, K. (Osaka Univ., Suita (Japan). Faculty of Engineering). 1976.

Proceedings of the third specialist meeting on sodium/fuel interaction in fast reactors.

In the present study the process how the thermal energy stored in the coolant should be converted into the mechanical work is emphasized as well as the generation of pressure waves, eliminating the complicated problems involved in FCI, such as fragmentation, heat transfer from molten fuel to coolant, etc. A simulation experiment has been performed in a small scale vertical channel using stagnant potassium. Large superheat inherent in liquid metals was utilized as the method to accumulate the thermal energy. The following experimental parameters were chosen to examine their effects on the energy conversion ratio: the heat flux, the cover gas pressure, the liquid column length, the temperature of the upper unheated region and the incipient boiling superheat

(corresponding to the stored thermal energy). The results are summarized that the conversion ratio from thermal to kinetic energies has increasing trends with increases of the incipient boiling superheat, the cover gas pressure and the temperature of upper unheated region, ranging over 0.02-0.75% in the present experiment.

INJECTION OF SODIUM INTO LIQUID STAINLESS STEEL. A REPORT OF THE SECOND EXPERIMENT NA-SS/1. Abbey, M.J.; Asher, R.C.; Bradshaw, L.; Davies, D.; Sangwine, S.J. (UKAEA Research Group, Harwell. Atomic Energy Research Establishment). 1976.

From 3. specialists' meeting on sodium fuel interaction; Tokyo, Japan (Mar 1976).

Also published in AERE-M--2771.

A second experiment in which liquid sodium was injected beneath the surface of molten steel has been carried out using an experimental technique based on that described in AERE - M 2770 but incorporating several improvements particularly in the instrumentation. The sodium (~ 1.5 g) was at $400 - 450^\circ\text{C}$ and the steel (stainless steel in this instance) was at $1750 - 1800^\circ\text{C}$. A vapour explosion occurred after a measured dwell time and two force pulses > 100 N and 60 N, separated by an interval of ~ 1 ms were transmitted to the base of the crucible containing the molten steel. Most of the sodium 'vapourized' but only a minor part of the steel was converted into small particles.

PHYSICAL MODEL AND CALCULATION CODE FOR FUEL COOLANT INTERACTIONS. Goldammer, H.; Kottowski, H. (Commission of the European Communities, Ispra (Italy). Joint Research Centre). 1976.

From 3. specialists' meeting on sodium fuel interaction; Tokyo, Japan (Mar 1976).

A physical model is proposed to describe fuel coolant interactions in shock-tube geometry. According to the experimental results, an interaction model which divides each cycle into three phases is proposed. The first phase is the fuel-coolant-contact, the second one is the ejection of the coolant, and the third phase is the impact and fragmentation. Physical background of these phases are illustrated in the first part of this paper. Mathematical expressions of the model are exposed in the second part. A principal feature of the computational method is the consistent application of the fourier-equation throughout the whole interaction process. The results of some calculations, performed for different conditions are compiled in attached figures.

- 2724 (PNC-N--251-76-12(Vol.2), pp 561-593) MILLISECOND-PERIOD MELTDOWN EXPERIMENTS ON PROMPT-BURST EFFECTS AND MOLTEN-TIN-WATER DROPPING EXPERIMENTS. Wright, R.W. (Nuclear Regulatory Commission, Washington, D.C. (USA)); Coats, R.L.; Schmidt, T.R.; Arakeri, V.H. 1976.

From 3. specialists' meeting on sodium fuel interaction; Tokyo, Japan (Mar 1976).

The U.S. Nuclear Regulatory Commission has initiated a program of confirmatory research for the safety assessment of LMFBR plants. In the sodium-fuel interactions area, this research includes a series of real-time in-pile experiments on the pressure and work potential of prompt-burst excursions as well as laboratory dropping experiments with molten tin and water. The in-pile experiments are performed by Sandia Laboratories in the Annular Core Pulse Reactor (ACPR), which has a minimum period of 1.3 milliseconds. These single-pin experiments are performed in a piston-loaded, stagnant-sodium autoclave, that is conceptually similar to the one used in the S-11 TREAT test. Unlike the S-11 test, however, realistic radial temperature profiles are obtained in the fuel, the cladding, and the sodium by pre-pulsing the reactor about 1/2 second before the main pulse. A series of preparatory runs have been made with helium-filled capsules and at low energy with sodium-filled capsules. The first significant fuel-coolant interaction run is scheduled for late March 1976. This will be a double-pulsed run at 2700 J/gm UO_2 . A continuing series of experiments is planned with oxide and advanced fuels in both fresh and irradiated form. In molten-tin-water dropping experiments at UCLA, microsecond duration multi-flash photography has been used for event diagnostics. Transition or nucleate boiling was found to trigger energetic interactions or vapor explosions. Temperature stratification in the water was found to reduce the threshold tin temperature necessary to produce vapor explosions below that the predicted by the coolant homogeneous nucleation hypothesis. Interaction zone growth times of a few msec. were measured.

- 2726 (PNC-N--251-76-12(Vol.2), pp 651-680) ANALYSIS OF REACTOR STRUCTURAL RESPONSE TO FUEL SODIUM INTERACTION IN A HYPOTHETICAL CORE DISRUPTIVE ACCIDENT. Suzuki, K. (Nippon Atomic Industry Group Co. Ltd., Tokyo); Tashiro, M.; Sasanuma, K.; Nagashima, K. 1976.

From 3. specialists' meeting on sodium fuel interaction; Tokyo, Japan (Mar 1976).

This study shows the effect of constraints around FSI zone on FSI phenomena and deformations of reactor structures. SUGAR-PISCES code system has been developed to evaluate the phenomena of FSI and the response of reactor structure. SUGAR calculates the phenomena of FSI. PISCES, developed by Physics International Company in U.S.A., calculates the dynamic response of reactor structure in two-dimensional, time-dependent finite-difference Lagrangian model. The results show that the peak pressure and energy by FSI and the

deformation of reactor structures are about twice in case of FSI zone surrounding by blanket than by coolant. The FSI phenomena highly depend on the reactor structure and the realistic configuration around core must be considered for analyzing hypothetical core disruptive accident. This work was supported by a grant from Power Reactor and Nuclear Fuel Development Corporation.

- 2727 (PNC-N--251-76-12(Vol.2), pp 751-783) INVESTIGATIONS ON FUEL-COOLANT INTERACTION WITH THE RCN CODE VS-4. Van der Putten, A.P.W.M.; Koning, H.; Van den Bogaard, J.P.A. (Reactor Centrum Nederland, Petten). 1976.

From 3. specialists' meeting on sodium fuel interaction; Tokyo, Japan (Mar 1976).

A set of partial differential equations describing the conservation of mass, energy and momentum in a coolant channel as a function of axial coordinate and time are solved with the RCN Code VS-4, using the method of characteristics. The viscosity and turbulence of coolant are taken into account in the usual manner of technical thermodynamics by the introduction of a friction coefficient in the momentum equation. The heat transported by the axial mass flow in the subassembly is assumed to be so large that the heat transport by axial conduction may be neglected. The heat transport by conduction in the radial direction is assumed to be perfect. The calculation results are discussed and concluded as follows. (1) The method of characteristics was proved to be applicable not only to the one phase but also to the description of the homogeneous equilibrium two phase part of a thermohydraulic process. (2) To investigate the reactor safety aspects of FCI (fuel-coolant interaction) process and to evaluate the experimental research on FCI, it is indispensable to take the axial dependence effects into account. To this end, the axially dependent code VS-4 based on the method of characteristics is available. (3) At present, the thermodynamic properties of sodium according to Golden and Tokar are used in the program. To improve the accuracy of the code for high temperature and pressure, a consistent set of thermodynamic properties of sodium must be incorporated in the program.

- 2728 (PNC-N--251-76-12(Vol.2), pp 819-837) CURRENT STATUS OF EXPERIMENTAL AND THEORETICAL WORK ON SODIUM/FUEL INTERACTION (SFI) AT KARLSRUHE 'CODE DEVELOPMENTS'. Beutel, H. (Kernforschungszentrum Karlsruhe (Germany, F.R.G.). Inst. fuer Reaktorentwicklung); Bojarsky, E.; Caldarola, L.; Jacobs, H.; Reiser, H. 1976.

From 3. specialists' meeting on sodium fuel interaction; Tokyo, Japan (Mar 1976).

Two computer codes have been developed. The first code contains a heat transfer model based on the inverse Leidenfrost phenomenon. The exact solution of the thermal diffusion equation for a sphere is included in the code. The time history of each fuel particle, the presence of fission gas, the size distribution of fuel particles, the effect of the friction due to channel walls, and the effect of the pressure loss at channel outlet can be taken into account. Extensive parametric study has been carried out with this code, and the main conclusions are summarized. The second code is used for the analysis of propagation effect. The interaction region can be subdivided into arbitrary number of sections, each containing fuel and coolant. The thermal conductivity of liquid sodium and the presence of non-condensing gas can be taken into account. The numerical results are generally consistent with those obtained with the first code. Vapor

bubbles and their collapse seem to be the most probable mechanism of the fragmentation of UO_2 in sodium. For this reason, work has been focused on modeling this mechanism, and a preliminary model was developed. The first theoretical model for FCI developed at Karlsruhe was coupled to the American REXCO code which is available at Ispra, and the FCI subroutine is already available.

2729 (PNC-N--251-76-12(Vol.2), pp 785-817)

MODEL FOR FUEL-SODIUM INTERACTION.

APPLICATION TO THE JEF EXPERIMENTS. Breton, J.-P.; Antonakas, D. (CEA Centre d'Etudes Nucleaires de Cadarache, 13 - Saint-Paul-les-Durance (France). Dept. des Reacteurs a Neutrons Rapides). 1976.

From 3. specialists' meeting on sodium fuel interaction; Tokyo, Japan (Mar 1976).

A model of sodium-fuel interaction, referred to as TRACONA-BUEE, has been developed. The fuel particles are assumed to be introduced in the interacting zone within a finite mixing time, according to a given function (not necessarily linear). The equations for heat transfer inside fuel particles are those of Cho and Wright (transient conduction for phase A and quasi-steady state heat transfer for phase B). During phase B several options for heat transfer from fuel to sodium can be assumed (no transfer, transfer proportional to the volume fraction of liquid sodium, given duration of transfer, etc...). Two versions are available: a spherical one (EPISCOPUS) and an axial one (TEXAS). For application to the JEF experiments a model of heat losses along the cold column had to be introduced into TEXAS. It was found that the phenomenon is essentially governed by the heat losses. The velocity of the cold sodium in the column presents marked maxima and minima. The agreement with experiment is satisfactory.

INTERACTIONS WITH SMALL AND LARGE SODIUM TO UO_2 MASS RATIOS. Clerici, G.; Holtbecker, H.; Schins, H.; Schlittenhardt, P. (Commission of the European Communities, Ispra (Italy). Joint Research Centre). 1976.

From 3. specialists' meeting on sodium fuel interaction; Tokyo, Japan (Mar 1976).

This paper presents final results of the Ispra dropping experiments. After a brief explanation of the alteration of the experimental facility the results of experiments and their theoretical interpretations are presented. And it is concluded that the test have shown that coherent energetic explosions cannot be produced by dropping small amounts of molten UO_2 into large quantities of sodium. The second, the study of sodium entrapment is described. An experimental device to inject sodium in a UO_2 filled crucible is explained. The third part briefly describes two computer codes, Press 1 and 2. In the first one, the constraint supplied by the solidifying UO_2 shell around a sodium drop is evaluated. In the second one, a liquid-liquid contact between UO_2 and sodium is considered. Some numerical evaluations were made with these codes. Results of the evaluations of the mechanical constraint due to the solidifying UO_2 shell, and the heating and expansion of sodium in UO_2 are presented.

CALCULATIONS OF THE POSSIBLE CONSEQUENCES OF MOLTEN FUEL SODIUM INTERACTIONS IN SUBASSEMBLY AND WHOLE CORE GEOMETRIES. Coddington, P.; Fishlock, T.P.; Jakeman, D. (UKAEA Reactor

Group, Winfrith. Atomic Energy Establishment). 1976.

From 3. specialists' meeting on sodium fuel interaction; Tokyo, Japan (Mar 1976).

The possible consequences of molten fuel sodium interactions are calculated using various modelling assumptions and key parameters. And the significance of the choice of assumptions and parameters are discussed. As for subassembly geometry, the results of one-dimensional code EXPEL are compared with the solutions of the one-dimensional Lagrangian equations of a compressible fluid (TOPAL was used). The adequacy of acoustic approximation used in EXPEL is discussed here. The effects of heat transfer time constant on the behaviour of peak pressure are also analyzed by parametric surveys. Other items investigated are the length and position of the interacting zone, the existence of a non-condensable gas volume, and the vapour condensation on cold clad. As for whole core geometry, a simple dynamical model of arc expanding spherical interacting zone immersed in a semi-infinite sea of cold liquid was used (SHORE code). Within the interacting zone a simple heat transfer model (including a heat transfer time and a fragmentation time) was adopted. Vapour blanketing was considered in a number of ways. Representative results of the calculations are given in a table. Containment studies were also performed for 'ducted' design and 'open pool' design. The development of new codes in the U.K. for these analysis are also briefly described.

2732 (PNC-N--251-76-12(Vol.2), pp 623-650)

REVIEW OF FRAGMENTATION MODELS RELATIVE TO MOLTEN UO_2 BREAKUP WHEN QUENCHED IN SODIUM COOLANT. Cronenberg, A.W. (New Mexico Univ., Albuquerque (USA)); Grolmes, M.A. 1976.

From 3. specialists' meeting on sodium fuel interaction; Tokyo, Japan (Mar 1976).

An important aspect of the fuel-coolant interaction problem relative to liquid metal fast breeder reactor (LMFBR) safety analysis is the fragmentation of molten oxide fuel during contact with liquid sodium coolant. A proper description of the kinetics of such an event requires an understanding of the breakup process and an estimate of the size and dispersion of such finely divided fuel in coolant. In recent years, considerable interest has centered on the problem of determining the nature of such fragmentation. In this paper, both analytic and experimental studies pertaining to such breakup are reviewed in light of recent developments in the understanding of heat transfer and solidification phenomena during quenching of UO_2 in sodium. A more extensive review of this subject can be found in Ref. 1.

2733 (PNC-N--251-76-12(Vol.2), pp 733-750)

REVIEW OF THE MEETINGS OF THE WORKING GROUP ON THE COMPARISON OF CALCULATION MODELS.

Jakeman, D. (UKAEA Reactor Group, Winfrith. Atomic Energy Establishment). 1976.

From 3. specialists' meeting on sodium fuel interaction; Tokyo, Japan (Mar 1976).

Physical models used in various SFI analysis codes are reviewed and the results of the comparison of productions when the codes were applied to specific test cases are presented. Several representative codes are taken up for comparisons. The features that are compared and discussed in this review paper are; the fragmentation of molten fuel; heat transfer for Stage A (single phase coolant); heat transfer for Stage B (two phase coolant); hydrodynamics; and equation of the state of sodium. A brief description of the interaction conditions

applied for the test cases is given followed by the results of comparisons. Instantaneous fuel fragmentation time of 10 ms. were assumed throughout the comparison calculations. The items being compared and discussed are the peak pressure and work done in Stage A, peak pressure in Stage B, time for expulsion of sodium from channel, and the work done in expelling sodium from channel. Results of comparisons of calculated values are presented in tables and figures. One of the main conclusions drawn from these comparisons is that if expulsion times are the main interest the various treatments adopted in different codes do not lead to very different predictions.

- 2734 (PNC-N--251-76-12(Vol.2), pp 681-732) PARAMETRIC STUDY ON REACTOR CONTAINMENT RESPONSE TO FUEL-SODIUM INTERACTION. Sawada, T.; Hasegawa, Y.; Nishimura, A. (Mitsubishi Atomic Power Industries, Inc., Tokyo (Japan)). 1976.

From 3. specialists' meeting on sodium fuel interaction; Tokyo, Japan (Mar 1976).

Evaluations have been made on the effects of FSI parameters which affect dynamic responses of reactor containment structures. A coupled computer code FCI-II/ASPRIN-II has been employed in this study. The FCI-II code is based on a modified rate-limited model originally developed by Cho, Ivins and Wright. The ASPRIN-II code is a modified version of the reactor containment response analysis code ASPRIN originally developed by G. L. Fox. Coupling between an FSI region and its surroundings is determined by FSI zone pressure, $P(V,t)$, as well as by FSI zone volume which is a function of constraint conditions. A spherical FSI zone in the core of a demonstration plant is assumed in this study. 1000Kg of molten fuel at 3338°K is mixed with 105Kg of sodium coolant at 900°K. The parameters changed are constraint conditions and FSI parameters such as a fuel particle size, a rate of fragmentation and mixing, a fuel-sodium mixing ratio and a two-phase heat transfer coefficient at a fuel particle surface.

- 2735 (PNC-N--251-76-26) PROGRESS REPORT ON FAST BREEDER REACTOR DEVELOPMENT IN JAPAN. OCTOBER 1975--JANUARY 1976. (Power Reactor and Nuclear Fuel Development Corp., Tokyo (Japan)). May 1976. 8p. Dep. NTIS (US Sales Only), PC A02/MF A01.

Following the completion of the in-argon, high temperature test, the in-sodium functional test of Joyo has set in. The fabrication of the equipments for monitoring the flow rate and temperature in the center channel and the power distribution was finished. The modification of design of the prototype fast breeder reactor Monju came into its phase 3. The interim report on the check-up and review of the Monju project by the Government is now ready. Various calculation codes were developed or are in development stage. The mock-up assembly FCA 7-1 has been built, which consists of the Pu-fueled sector region simulating the Monju core and the U-235-fueled driver region. Various reactor physics experiments have been carried out in this assembly. Also, the calculation methods for reactor physics parameters have been developed, and the detailed calculation on the main shield of Joyo was performed. The situation of the developments of the components for Joyo and Monju and the measuring and control systems is shown. Almost all the existing sodium test facilities in Oarai Engineering Center were in service without any trouble, and the new test facility named

'Carbon transfer test loop' was commissioned. The progress in the fields of sodium technology, fuel and material, safety and steam generators is reported.

- 2736 (PNC-N--251-78-02) PROGRESS REPORT ON FAST BREEDER REACTOR DEVELOPMENT IN JAPAN, OCTOBER - DECEMBER 1977. (Power Reactor and Nuclear Fuel Development Corp., Tokyo (Japan)). Jul 1978. 12p. Dep. NTIS (US Sales Only), PC A02/MF A01.

As for the development of the experimental fast breeder reactor 'Joyo', the low power performance test was carried out, and the sodium void effect, power distribution and others were measured. It was finished on November 19, 1977. Thereafter, the work of installing a pile oscillator started, while the periodical inspection was under way. The maintenance work for the transfer rotor has been completed. Fabrication of the pump maintenance cask, construction of the spent fuel storing and cooling facility and others are continued. The operation, maintenance and inspection of various systems were made in preparation for the reactor performance test. The examination on the safety of the reactor for power increase up to 100 MW is continued. The core characteristic analysis is in progress. The construction preliminary design (1) of the prototype fast breeder reactor 'Monju' is being carried out. For the analysis and preparation of data to be submitted for the safety licensing, the analysis of decay heat (2) was finished, and the draft of application for the installation of the reactor plant has been completed. The development of various calculation codes is in progress. The preliminary design studies on the demonstration reactor (3) are continued. The situations of various researches and developments on fast breeder reactors are described.

- 2737 (PNC-N--952-76-04) OPERATION MANUAL FOR SODIUM-MEASURING EQUIPMENT TEST LOOP. Ooyama, N.; Nakamoto, K.; Sekiguchi, N.; Nakasuti, T.; Atsumo, H. (Power Reactor and Nuclear Fuel Development Corp., Tokyo (Japan)). Jan 1976. 190p. (In Japanese). Dep. NTIS (US Sales Only), PC A10/MF A01.

This operation manual contains the materials and references required to operate and maintain the sodium-measuring equipment test loop that was built for the test in sodium of in-core monitoring instrumentation for the fast breeder prototype reactor 'Monju'. The test loop consists of sodium equipment and piping installation, gas and vacuum equipment and piping installation, preheat and heat insulation facilities, instrumentation and control equipments, power supply unit, rack and stand installation and others. It uses liquid metal sodium of approximately 2900 kg as the fluid and high purity argon gas as the cover gas. Maximum sodium temperature is specified at 600 deg C, maximum sodium flow is approximately 1000 l/min each in main circulation and auxiliary systems, and maximum working pressure is 5 kg/cm² G (normally 2 kg/cm² G). The procedures of start-up, operation and shut down are described, and the measures in abnormal and emergency conditions, maintenance and checking-up, electrical instrumentation equipments, and sodium, gas and vacuum systems are explained in detail. The last two sections are included for the reference because they are necessary for operation and maintenance, but are not used very often.

DETERMINATION OF O/M RATIOS OF UO_2 - PuO_2 MIXED OXIDE FUEL, (1). STATISTICAL ANALYSIS OF O/M RATIOS. Sone, T.; Okamoto, H.; Isagawa, H.; Ochiai, Y.; Kano, K. (Power Reactor and Nuclear Fuel Development Corp., Tokyo (Japan)). Dec 1975.

Semi-annual progress report of Power Reactor and Nuclear Fuel Development Corporation, Tokai Works. Jan--Jun 1975.

Statistical analysis of variance was made for the determination of the O/M ratio of MONJU fuel pellets. Two procedures were used for this purpose. One is the experimental layout procedure with ramification, and the other is the two-way layout procedure with repetition. The experimental methods used for the determination of O/M ratio are presented in the first part. Two mechanically blended pellets taken from one lot in a production line were crushed and divided into five parts. Three of them were analyzed on the first day, and the remaining two parts were kept in a desiccator for analysis on another day. The procedures of the analysis of variance are explained in the second part. The production lot, the date of analysis, and the divided parts were selected as the variation factors of the measured O/M ratio. Two procedures of analysis are explained and summarized in tables. The measured results of O/M ratio and the results of analysis by two procedures are presented in tables. Some discussion is given in the third part, based on those results.

2739 (PNCT--831-77-01, pp 95-99) DEVELOPMENT OF NONDESTRUCTIVE MEASUREMENT OF COLD WORK RATE, (1). Tsunoda, N.; Ando, H.; Kamimura, H.; Inada, E. (Power Reactor and Nuclear Fuel Development Corp., Tokyo (Japan)). Apr 1977.

Semi-annual progress report of Power Reactor and Nuclear Fuel Development Corporation, Tokai Works, January--June 1976.

Cold-worked stainless steel type 316 is used as the cladding tube material for the prototype FBR Monju in Japan. The in-reactor life term of cold-worked stainless steel is longer than that of solution-treated, but there is no method of measuring cold work rate at present. In order to develop the nondestructive method for measuring the distribution of cold work rate over the length of cladding tubes, a study was made on the method of measuring the residual magnetism in cladding tubes. The test specimen was a cladding tube made of the same material and by the same process as those for Monju. The block diagram for the system measuring the residual magnetism is shown. First, the tube is demagnetized by rotating it in strong alternating magnetic field. Next, the tube is linearly moved without rotation through strong unidirectional magnetic field and magnetized. Then the tube is rotated at constant speed above the magnetometer probe, and the retained field is detected. The measurement was made at nine locations. The residual magnetism of the specimen was constant when a magnetizing force over 2000 gauss was applied. The high degree of correlation was shown between the residual magnetism and the cold work rate. Therefore, it is possible to know cold work rate by measuring residual magnetism.

2740 (PNCT--831-77-02, pp 27-41) INSPECTING EXAMINATION OF MOCKUP FUEL ASSEMBLIES OF MONJU AFTER SODIUM FLOW TEST. Miura, M.; Ando, H.; Taki, K.; Kitano, M. (Power Reactor and Nuclear Fuel Development Corp., Tokai, Ibaraki (Japan)). Tokai Works. Sep 1977.

Semi-annual progress report of Power Reactor and Nuclear Fuel Development Corporation, Tokai Works. Jul. - Dec. 1976.

As a part of the out-of-pile examinations of fuel assemblies for the prototype fast breeder reactor MONJU, the sodium flow test of mockup assemblies was performed. Each tested fuel assembly contains 166 - 169 fuel pins, which are 6.5 mm in diameter, arranged in triangular array, and wrapped in a hexagonal wrapper tube. The total number of tested fuel assemblies are 9; 4 of wire wrapped type, 4 of honeycomb grid type and 1 of rhombus grid type. The sodium flow test was conducted under the conditions of 600°C (temperature), 524 - 4800 hr (time), and 2 - 60 ppm (oxygen content in sodium). After this flow test, the fuel assemblies were dismantled, and the fuel pin bundles were inspected by visual inspection and pin gap measurement, and the fuel pins were inspected by helium leak test, weight measurement, micrograph of external condition, surface roughness measurement, total length measurement, test of looseness of wire, bending measurement and measurement of axial wire wrapping pitch. Some increase of surface roughness, minute form change, and others have been recognized as the result of these various nondestructive tests.

2741 (PNL--2413) ANALYSIS OF THE IMPACT OF RETRIEVABLE SPENT FUEL STORAGE. Merrill, E.T.; White, M.K.; Fleischman, R.M. (Battelle Pacific Northwest Labs., Richland, WA (USA)). Mar 1978. Contract EY-76-C-06-1830. 19p. Dep. NTIS, PC A02/MF A01.

The impact of retrievably storing spent fuel is measurable in terms of the contribution the stored spent fuel makes to implementing the fuel management option selected. For the case of a decision to recycle LWR fuel in LWRs, a useful indicator of impact is the ratio of energy production with varying degrees of spent fuel retrievability to that achievable with total spent fuel retrievability. For a decision made in the year 2000, this ratio varies from 0.81 (10 yr storage in reactor basins) to 0.97 (retrievable storage for 25 years after fuel discharge). An earlier decision to recycle in LWRs results in both of these ratios being nearer to 1.0. If a decision is reached to implement a breeder reactor economy, the chosen comparison is the installed breeder capacity achievable with varying degrees of spent fuel retrievability. If a decision to build breeder reactors is reached in the year 2000, the maximum possible installed breeder capacity in 2040 varies from 490 GWe (10 yr storage in reactor basins) to 660 GWe (all fuel retrievably stored). If all fuel is retrievably stored 25 years, 635 GWe of breeder capacity is achievable by 2040. For an earlier decision date, such as 1985, the maximum possible installed breeder capacity in 2040 ranges from 740 GWe (no retrievable storage) to 800 GWe (all fuel retrievably stored). As long as a decision to reprocess is reached before 2000, most of the potential benefit of retrievable storage may be realized by implementing retrievable storage after such a decision is made. Neither providing retrievable spent fuel storage prior to a decision to reprocess, nor designing such storage for more than 25 years of retrievability appear to offer significant incremental benefit.

2742 (PNL--2417) FRACTURE MECHANICS OF THIN WALL CYLINDRICAL PRESSURE VESSELS: AN INTERIM REVIEW. Kurtz, R.J.; Olson, N.J. (Battelle Pacific Northwest Labs., Richland, WA (USA)). Aug 1977. Contract EY-76-C-06-1830. 40p. Dep. NTIS, PC A03/MF A01.

The report is a result of activities in the LMFBR Fuel Rod Transient Performance Program sponsored by the LMFBR Branch of the Division

of Project Management, U.S. Nuclear Regulatory Commission. One of the objectives is to develop predictions relative to the length, direction, and rate of growth of cladding rips subsequent to (or concurrent with) the initial cladding breach during unprotected transients. To provide a basis for evaluation, Battelle, Pacific Northwest Laboratories has reviewed most available fracture mechanics assessments relative to thin-wall cylindrical pressure vessels. The purpose of the report is to review the various fracture mechanics models and to describe the pertinent fracture parameters. It is intended to provide a formal basis for assessing future analytical predictions of fracture behavior of materials exposed to transient LMFBR thermal and mechanical loading conditions. In addition, the report is expected to provide reference material for evaluating or developing experimental programs required to properly address the problem of predicting fracture behavior of materials during transient events.

- 2743 (PNL--2447) EVALUATION OF LIQUID METAL LEAK DETECTION METHODS FOR THE CLINCH RIVER BREEDER REACTOR PLANT. Morris, C.J.; Doctor, S.R. (Battelle Pacific Northwest Labs., Richland, WA (USA)). Dec 1977. Contract EY-76-C-06-1830. 111p. Dep. NTIS, MF A01.

This report documents an independent review and evaluation of sodium leak detection methods described in the Clinch River Breeder Reactor Preliminary Safety Analysis Report. Only information in publicly available documents was used in making the assessments.

- 2744 (PNL--2500(Pt.1), pp 3.55-3.58) CHARACTERIZATION OF MIXED LMFBR FUEL-SODIUM AEROSOLS GENERATED BY LASER VAPORIZATION. Allen, M.D. Feb 1978.

Pacific Northwest Laboratory annual report for 1977 to the DOE Assistant Secretary for Environment. Part 1. Biomedical sciences.

A laser was used to vaporize $\text{PuO}_2\text{-UO}_2$ from the surface of a rotating fuel pellet to simulate LMFBR fuel-sodium condensation aerosols. The branched, chain-like $\text{PuO}_2\text{-UO}_2$ aggregates are swept by argon into a sodium vapor atmosphere. The sodium condenses on the aggregates, and the mixed aerosol is diluted with 50% relative humidity air. These aerosols are being characterized according to physical appearance, crystalline structure, and aerodynamic behavior.

- 2745 (PNL--2500(Pt.1), pp 3.59-3.60) TRANSLOCATION OF MIXED LMFBR FUEL-SODIUM AEROSOLS FROM THE LUNG FOLLOWING INHALATION BY RODENTS. Mahlum, D.D.; Hess, J.O.; Allen, M.D. Feb 1978.

Pacific Northwest Laboratory annual report for 1977 to the DOE Assistant Secretary for Environment. Part 1. Biomedical sciences.

Rats were exposed to aerosols consisting of either LMFBR fuel or mixtures of sodium and fuel. Pulmonary deposition of the mixed aerosol was usually less than that of the fuel only because of the larger size of the mixed aerosol. When the ratio of sodium to fuel was high (>32), the rate of clearance from the lung was faster than for the aerosols with low sodium-to-fuel ratios.

- 2746 (PNL--2805) ANALYSIS OF VARIOUS NDT TECHNIQUES TO DETERMINE THEIR FEASIBILITY FOR DETECTING THIN LAYERS OF FERRITE ON TYPE 316 STAINLESS STEEL. Dudder, G.B.; Atteridge, D.G.; Davis, T.J. (Battelle Pacific Northwest Labs., Richland, WA (USA)). Sep 1978.

Contract EY-76-C-06-1830. 30p. Dep. NTIS, PC A03/MF A01.

The applicability of various NDT techniques for detecting thin layers of ferrite on Type 316 stainless steel cladding was studied. The ability to detect sodium-induced ferrite layers on fuel pins would allow an experimental determination of the fuel pin temperature distribution. The research effort was broken down into three basic sections. Phase one consisted of a theoretical determination of the ferrite detection potential of each of the proposed NDT techniques. The second phase consisted of proof-of-principle experiments on the techniques that passed phase one. The third phase consisted of in-hot cell testing on actual EBR-II fuel pins. Most of the candidate techniques were eliminated in the first phase of analysis. Four potential techniques passed the initial phase of analysis but only three of these passed the second analysis phase. The three techniques that passed the proof-of-principle section of analysis were heat tinting, magnetic force and electromagnetic techniques. The electromagnetic technique was successfully demonstrated on actual fuel pins irradiated in EBR-II in the third phase of analysis while the other two techniques were not carried to the hot cell analysis phase. Results of this technique screening study indicates that an electromagnetic and/or heat tinting ferrite layer NDT technique should be readily adoptable to hot cell inspection requirements. It was also concluded that the magnetic force technique, while feasible, would not readily lend itself to hot cell fuel pin inspection.

- 2747 (PNL--2850(Pt.1), pp 3.34-3.46) DISSOLUTION OF LMFBR FUEL-SODIUM AEROSOLS. Allen, M.D.; Moss, O.R. Feb 1979.

Pacific Northwest laboratory annual report for 1978 to the DOE Assistant Secretary for Environment. Part 1. Biomedical sciences.

Plutonium dioxide, normally insoluble in biological fluids, becomes much more soluble when mixed with sodium as the aerosol is formed. Sodium-fuel aerosols are approximately 20 times less soluble in simulated lung fluid than in distilled water. Solubility of sodium-fuel aerosols increases when Na_2CO_3 are added to the distilled-water dissolution fluid. Mixed-oxide fuel aerosols without sodium present are relatively insoluble in distilled water, simulated lung fluid, and distilled water with Na_2CO_3 and NaHCO_3 added.

- 2748 (PNL--2850(Pt.1), pp 3.47) SPECTROPHOTOMETRIC ANALYSES OF LMFBR FUEL-SODIUM AEROSOLS. Morgan, L.G.; Ryan, J.L.; Allen, M.D. Feb 1979.

Pacific Northwest laboratory annual report for 1978 to the DOE Assistant Secretary for Environment. Part 1. Biomedical sciences.

Spectrophotometric investigations of $(\text{Pu,U})\text{O}_2$, sodium- $(\text{Pu,U})\text{O}_2$, and sodium- PuO_2 aerosols show that enhanced solubility of uranium and plutonium occurs as a result of interaction of sodium with either mixed-oxide or PuO_2 aerosols, with or without exposure to air. Results indicate that uranium is oxidized in the presence of sodium and air and is soluble as sodium uranyl tricarboxylate. Plutonium is soluble as a Pu(IV) species from aerosols exposed to sodium and air. No evidence of a soluble Pu(VI) species has been found.

- 2749 (PNL--2850(Pt.1), pp 3.48-3.50) BIOLOGICAL BEHAVIOR OF MIXED LMFBR-FUEL-SODIUM AEROSOLS. Mahlum, D.D.; Hackett, P.L.; Hess, J.O.; Allen, M.D. Feb 1979.

Pacific Northwest laboratory annual report for 1978 to the DOE Assistant Secretary for Environment. Part 1. Biomedical sciences.

Immediately after exposure of rats to mixed aerosols of sodium-LMFBR fuel, about 80 to 90% of the body burden of ^{239}Pu is in the gastrointestinal tract; 1.5 to 4% is in the lungs. With fuel-only aerosols, less of the body burden was in the GI tract and more in the lung and the head. Blood and urine values suggest an increased absorption of ^{239}Pu from sodium-fuel than from fuel-only aerosols.

- 2750 (PNL--2923) COBRA-IV COMPARISON WITH THE WARD 11:1 SCALE LMFBR AIR FLOW TESTS. Basehore, K.L.; George, T.L. (Battelle Pacific Northwest Labs., Richland, WA (USA)). Mar 1979. Contract EY-76-C-06-1830. 61p. Dep. NTIS, PC A04/MF A01.

The COBRA-IV code was verified against the results of the Westinghouse Advanced Reactor Division (WARD) 11:1 scale liquid metal fast breeder reactor (LMFBR) fuel assembly air flow tests. The major effort in comparing COBRA results with the data was directed toward matching the transverse velocities, though axial velocity comparisons were also made. Four input parameters to the COBRA code are known to have a significant effect on the velocity distribution within a wirewrapped LMFBR bundle. The relevant parameters are: the turbulent mixing coefficient, the turbulent crossflow resistance factor, the effective pitch length for forcing crossflow and the transverse momentum geometry factor. Computational results for various values of each of these input quantities are presented for the transverse velocity component of the flow field. Axial velocity comparisons are also made using the calibrated set of parameters.

- 2751 (PNL--2938) COBRA-IV WIRE WRAP DATA COMPARISONS. Donovan, T.E.; George, T.L.; Wheeler, C.L. (Battelle Pacific Northwest Labs., Richland, WA (USA)). Feb 1979. Contract EY-76-C-06-1830. 42p. Dep. NTIS, PC A03/MF A01.

Thermal hydraulic analyses of hexagonally packed wire-wrapped fuel assemblies are complicated by the induced crossflow between adjacent subchannels. The COBRA-IV computer code simultaneously solves the hydrodynamics and thermodynamics of fuel assemblies. The modifications and the results are presented which are predicted by the COBRA-IV calculation. Comparisons are made with data measured in five experimental models of a wire-wrapped fuel assembly.

- 2752 (PNL--3129) ENVIRONMENTAL CONTROL ASPECTS FOR FABRICATION, REPROCESSING AND WASTE DISPOSAL OF ALTERNATIVE LWR AND LMFBR FUELS. Nolan, A.M.; Lewallen, M.A.; McNair, G.W. (Battelle Pacific Northwest Labs., Richland, WA (USA)). Nov 1979. Contract EY-76-C-06-1830. 94p. Dep. NTIS, PC A05/MF A01.

Environmental control aspects of alternative fuel cycles have been analyzed by evaluating fabrication, reprocessing, and waste disposal operations. Various indices have been used to assess potential environmental control requirements. For the fabrication and reprocessing operations, 50-year dose commitments were used. Waste disposal was evaluated by comparing projected nuclide concentrations in ground water at various time periods with maximum permissible concentrations (MPCs). Three different fabrication plants were analyzed: a fuel fabrication plant (FFP) to produce low-activity uranium and uranium-thorium fuel rods; a plutonium fuel

refabrication plant (PFRFP) to produce plutonium-uranium and plutonium-thorium fuel rods; and a uranium fuel refabrication plant (UFRFP) to produce fuel rods containing the high-activity isotopes ^{232}U and ^{233}U . Each plant's dose commitments are discussed separately. Source terms for the analysis of effluents from the fuel reprocessing plant (FRP) were calculated using the fuel burnup codes LEOPARD, CINDER and ORIGEN. Effluent quantities are estimated for each fuel type. Bedded salt was chosen for the waste repository analysis. The repository site is modeled on the Waste Isolation Pilot Program site in New Mexico. Wastes assumed to be stored in the repository include high-level vitrified waste from the FRP, packaged fuel residue from the FRP, and transuranic (TRU) contaminated wastes from the FFP, PFRFP, and UFRFP. The potential environmental significance was determined by estimating the ground-water concentrations of the various nuclides over a time span of a million years. The MPC for each nuclide was used along with the estimated ground-water concentration to generate a biohazard index for the comparison among fuel compositions.

- 2753 (PNL--3249) MASS FLOWS FOR LMFBRs FUELED WITH VARIOUS TYPES OF PLUTONIUM AND FERTILE MATERIAL. Jenquin, U.P. (Battelle Pacific Northwest Labs., Richland, WA (USA)). Dec 1979. Contract EY-76-C-06-1830. 39p. Dep. NTIS, PC A03/MF A01.

Results are presented of neutronics analyses performed to determine fueling requirements and mass flows for a typical 1200 megawatt electric (MWe) liquid metal fast breeder reactor (LMFBR). In performing the analyses, three plutonium compositions were considered to fuel the reactor. The composition depended on the amount of irradiation either a UO_2 or $\text{PuO}_2\text{-ThO}_2$ fuel had received in a light water reactor (LWR). Uranium and thorium fertile materials were considered. Calculations were performed to determine the cross sections, reactivity, and burnup for each fuel-fertile material configuration. Based on these calculations, the mass flows, plutonium enrichment requirements, and breeding ratios for each configuration were determined.

- 2754 (PNL--3255) DEPENDENCE OF LMFBR FUELING REQUIREMENTS ON PLUTONIUM ISOTOPIC COMPOSITION. Jenquin, U.P.; Newman, D.F. (Battelle Pacific Northwest Labs., Richland, WA (USA)). Dec 1979. Contract EY-76-C-06-1830. 45p. Dep. NTIS, PC A03/MF A01.

When the liquid metal fast breeder reactors (LMFBRs) start up, plutonium from thermal reactors will be required to enrich the reactor fuel. Neutronics analyses performed to determine the fueling requirements for an 800 megawatt electric (MWe) breeder reactor are described. This study was initiated when it was assumed that thermal reactor plutonium recycle would take place prior to the introduction of the breeder. Therefore, a range of plutonium compositions was fed into the LMFBR and the fueling requirements were determined for these various compositions. Depleted uranium was used as the diluent. The analysis was performed for two reactor designs - a reference small fuel pin design and an advanced large fuel pin design. Burnup calculations were performed to determine the compositions of the discharge plutonium.

- 2755 (PNL-8A--7503) INITIAL STAGE RESTRUCTURING IN SPHERE-PAC MIXED-CARBIDE FUEL. Guenther, R.J.; Peddicord, K.L. (Battelle Pacific Northwest Labs., Richland, WA (USA)).

1979. Contract EY-76-C-06-1830. 10p.
(CONF-790306--25). Dep. NTIS, PC A02/MF A01.
From International conference on fast breeder reactor performance; Monterey, CA, USA (5 Mar 1979):
The analysis of sintering models and mechanisms for mixed-carbide sphere-pac fuel has shown that volume diffusion is the dominant mechanism. The actual diffusion path is not clearly defined but the importance of small pressures in increasing neck growth is apparent. The time dependence of the neck ratios indicates that significant restructuring occurs within 5.6 hours which may be used as a bench mark for the beginning of pore migration.
- 2756 (PNL-SA--7521) CORTAN CODE FOR TEMPERATURE PREDICTIONS IN AN LMFBF DURING A NATURAL CIRCULATION TRANSIENT. Khan, E.U.; Hinds, A. (Battelle Pacific Northwest Labs., Richland, WA (USA); Argonne National Lab., IL (USA)). Jan 1979. Contract EY-76-C-06-1830. 6p. (CONF-790602--92). Dep. NTIS, PC A02/MF A01.
From ANS annual meeting; Atlanta, GA, USA (3 Jun 1979).
Three transient thermal-hydraulic models, TRAN I, II, III, have been incorporated into the CORTAN code. The TRAN I, II, III models are similar in as much as they retain the wire-wrap mixing and swirl flow models of the Energy code, i.e., the wire-wrap mixing is modeled by an enhanced eddy diffusivity in the central regions of the bundle and a swirl flow in the region near the duct wall. The fuel rod and duct wall models required to treat the stored heat and thermal inertia effects, are also similar in the three models. Up to 10 radial nodes are allowed in the rods and 6 radial nodes in the duct wall to solve the one-dimensional conduction equation for the rods and duct wall, by finite difference. Temperature-dependent properties are taken into account in calculating rod temperatures.
- 2757 (PNL-SA--7878) ANALYSIS OF STEADY STATE COMBINED FORCED AND FREE CONVECTION DATA IN ROD BUNDLES. Juneau, J.; Khan, E.U.; Cheatham, R.L. (Battelle Pacific Northwest Labs., Richland, WA (USA)). Jun 1979. Contract EY-76-C-06-1830. 6p. (CONF-791103--75). Dep. NTIS, PC A02/MF A01.
From American Nuclear Society meeting; San Francisco, CA, USA (12 Nov 1979).
Fuel and blanket assemblies in an LMFBF are subjected to a wide range of power and power gradients during their life in the reactor. To accommodate these changes the assemblies operate in a wide range of flow regimes extending from forced convection, turbulent flow, to mixed convection, laminar flow. At low flow conditions the transverse temperature gradient in an assembly is considerably flattened because of energy redistribution by not only wire-wrap mixing and thermal conduction but also by flow redistribution because of buoyancy-induced crossflow. This has significance in LMFBF design. For the mixed convection regime of bundle operation, the transverse velocity profiles within a bundle change axially because of buoyancy-induced crossflow. It was therefore decided to use the ENERGY II and ENERGY III computer programs for the analysis of the rod bundle mixed convection data.
- 2758 (PP--04-PE-001) REMOVAL OF RESIDUAL SODIUM FROM AI MODULAR STEAM GENERATOR (SCTI-SP-312). (Liquid Metal Engineering Center, Canoga Park, CA (USA)). 6 Nov 1973. Contract EY-76-C-03-0700. 35p. AT.
Portions of document are illegible.
Process procedures are enumerated for the removal of residual sodium from the AI modular steam generator prior to its removal from the Sodium Components Test Installation at the Liquid Metals Engineering Center. (DG)
- 2759 (R--2267-DOE) EXAMINATION OF ALTERNATIVE NUCLEAR BREEDING METHODS. Dreyfuss, D.J.; Augenstein, B.W.; Mooz, W.E.; Sher, P.A. (RAND Corp., Santa Monica, CA (USA)). Jul 1978. Contract EX-76-C-01-2337. 126p. Dep. NTIS, PC A07/MF A01.
This report presents a preliminary evaluation of the economics of using external source neutrons (provided by a DT fusion device or by a high-energy accelerator providing a proton or deuteron particle beam) for breeding fissile fuel, and compares these costs with those of the most intensively investigated reactor breeder (or internal neutron source breeder), the liquid metal fast breeder reactor (LMFBF). A simple evaluation model is used that calculates the net present discounted value, using a 10 percent discount rate of the cost to satisfy a specific demand for electricity over the period to 2050. Present discounted values of costs are estimated for four energy technologies: the uranium-fueled light water reactor (LWR), the LMFBF, the fusion hybrid breeder, and the accelerator-driven breeder. The latter two technologies produce fissile fuel which is then consumed in ordinary converter reactors. The discounted costs to produce electrical energy using the three breeding technologies to satisfy this demand are calculated and compared to a standard or base case where the LWR satisfies the demand. The cost differences between the base case and the three alternatives are compared to estimate the savings possible over the LWR base case. The conclusion is that the fusion hybrid breeder and the accelerator breeder, given our present information about the various technologies, promise to be competitive with reactor-based breeders such as the LMFBF and offer a number of qualitative advantages as well.
- 2760 (RAND/N--1188-DOE) ANTICIPATED TRANSIENTS WITHOUT SCRAM FOR LIGHT WATER REACTORS: IMPLICATIONS FOR LIQUID METAL FAST BREEDER REACTORS. Kastenber, W.E.; Solomon, K.A. (RAND Corp., Santa Monica, CA (USA)). Jul 1979. Contract ET-78-S-03-2243. 40p. Dep. NTIS, PC A03/MF A01.
In the design of light water reactors (LWRs), protection against anticipated transients (e.g., loss of normal electric power and control rod withdrawal) is provided by a highly reliable scram, or shutdown system. If this system should become inoperable, however, the transient could lead to a core meltdown. The Nuclear Regulatory Commission (NRC) has proposed, in NUREG-0460 [1], new requirements (or acceptance criteria) for anticipated transients without scram (ATWS) events and the manner in which they could be considered in the design and safety evaluation of LWRs. This note assesses the potential impact of the proposed LWR-ATWS criteria on the liquid metal fast breeder reactor (LMFBF) safety program as represented by the Clinch River Breeder Reactor Plant.
- 2761 (RAND-P--6226) REPROCESSING OF NUCLEAR FUEL AND PLUTONIUM BREEDER COMMERCIALIZATION: IMPLICATIONS OF DEFERRAL. Perry, W.D. (RAND Corp., Santa Monica, CA (USA)). Nov 1978. 64p. (CONF-781182--4). Rand Corp., Santa Monica, CA.

From Joint national ORSA/TIMS meeting; Los Angeles, CA, USA (13 Nov 1978).

U.S. government nuclear weapons anti-proliferation policies that pertain to the deferral of commercial-scale reprocessing of nuclear fuel and plutonium breeding reactors are reviewed. Prior U.S. economic cost/benefit analyses of spent nuclear fuel reprocessing and recycling are also summarized. The time and capacity of commercial-scale reprocessing facilities and the associated minimum present discounted costs that would support a later decision to proceed with U.S. breeder commercialization are analyzed.

- 2762 (RAND/R--2441-ACDA) COMPARISON OF THE CAPITAL COSTS OF LIGHT WATER REACTOR AND LIQUID METAL FAST BREEDER REACTOR POWER PLANTS. Mooz, W.E.; Siegel, S. (RAND Corp., Santa Monica, CA (USA)). Feb 1979. 71p. Rand Corp., Santa Monica, CA.

Recent studies by Atomics International, General Electric, and Westinghouse yielded capital cost estimates for a fifth of a kind LMFBR. After adjusting these estimates for plant size and converting them to 1978 dollars, they ranged from \$1043 to \$1495 per kWe, excluding interest during construction (IDC). These cost estimates were compared in this study with a LWR estimated by GE to cost \$900 per kWe, also excluding IDC. Projecting these costs far into the future entails great uncertainty. The principal factors that affect future capital cost ratios between the LMFBR and the LWR are: the initial cost ratio that is assumed for the 1977 design plants; assumptions about changes in scope resulting from the social, political, and regulatory climate; and differential construction times for the two types of plant. The cost ratios are relatively unaffected by the LMFBR deployment schedule and cost learning effects, differential scaling effects, and the LMFBR introduction date.

- 2763 (RD-B-N--4254) REPORT ON THE SECOND SPECIALISTS' MEETING ON REACTOR NOISE (SMORN II), GATLINBURG, TENNESSEE, SEPTEMBER 19TH-23RD 1977. Greef, C.P. (Central Electricity Generating Board, Berkeley (UK). Berkeley Nuclear Labs.). Mar 1978. 19p. Dep. NTIS (US Sales Only), PC A03/MF A01.

The current state of power reactor noise analysis as presented at the Second Specialists' Meeting on Reactor Noise (SMORN II) is reviewed. Practical successes include the analysis of PWR core support barrel motions and BWR instrument tube vibrations, leading to better understanding of the Physical Processes involved. Future applications to LMFBRs are being actively pursued, but more information is required, notably on background noise sources in operating reactors. Theoretical understanding is improving in a number of specific areas, but general fundamental progress is hampered by the multiplicity of potential noise sources in a reactor. Past attempts to automate noise analysis so that simplified information may be presented to the reactor operator have not been totally successful. This has resulted from an over-hasty application of the techniques before all of the factors involved in physical phenomena were fully appreciated.

- 2764 (RDT-E--6-19T(3-78)) RADIAL REFLECTOR ASSEMBLY FOR LIQUID METAL FAST BREEDER REACTORS. (Department of Energy, Washington, DC (USA). Div. of Nuclear Power Development). Mar 1978. Contract EY-76-C-14-2170. 13p. RSO.

This standard sets forth the requirements

for the fabrication, inspection, and quality assurance of core radial reflector assemblies for use in liquid metal fast breeder reactors.

- 2765 (RDT-E--6-33T(Amend.1)(6-78)) CONTROL ROD ASSEMBLY FOR LIQUID METAL FAST BREEDER REACTORS. (Department of Energy, Washington, DC (USA). Div. of Nuclear Power Development). 8 Sep 1978. Contract EY-76-C-14-2170. 14p. RSO.

This standard establishes the requirements for fabrication, testing, and inspection of control rod assemblies for use in liquid metal fast breeder reactors.

- 2766 (RDT-E--13-16T) DRIVER FUEL ASSEMBLY. (Department of Energy, Washington, DC (USA). Div. of Reactor Development and Demonstration). Sep 1977. Contract EY-76-C-14-2170. 12p. RSO.

The standard establishes the requirements for fabrication, testing, and inspection of fuel assemblies for use in liquid metal fast reactors.

- 2767 (RDT-F--3-40T) METHODS FOR THE ANALYSIS OF SODIUM AND COVER GAS. (Department of Energy, Washington, DC (USA). Office of Nuclear Energy Programs). Jan 1976. Contract EY-76-C-14-2170. 16p. RSO. LMFBR TYPE REACTORS; COOLANTS; COVER GAS; SODIUM; REACTOR COOLING SYSTEMS; QUALITATIVE CHEMICAL ANALYSIS; STANDARDS

- 2768 (RDT-INDEX--(01-79)) RDT STANDARDS INDEX. (Oak Ridge National Lab., TN (USA)). 19 Jan 1979. Contract W-7405-ENG-26. 35p. RSO.

The January 1979 Index of RDT Standards for the period October through December 1978 is presented. The attached 'New Publications List' identifies each standard, amendment, and/or revision that was published during this period. An order form is provided in the Index for your convenience in requesting those RDT standards that may be needed by your organization.

- 2769 (RE-A--78-241) AUTOMATED COMMON CAUSE ANALYSIS USING AUTOCC. Wilson, J.R. (EG and G Idaho, Inc., Idaho Falls (USA)). Oct 1978. Contract EY-76-C-07-1570. 32p. Dep. NTIS, PC A03/MF A01.

This is a user's manual for AUTOCC, a code which prepares common cause analysis input for COMCAN II. Basic events are automatically analyzed for common cause susceptibilities, and data about initiators is reformed into generic cause common locations. AUTOCC is written in FORTRAN IV for the CDC 7600.

- 2770 (RFP--2887) PYROCHEMICAL COPROCESSING OF UO_2 -- PUO_2 LMFBR FUEL BY THE SALT TRANSPORT METHOD. Knighton, J.B.; Baldwin, C.E. (Atomics International Div., Golden, CO (USA). Rocky Flats Plant). 1979. Contract EY-76-C-04-3533. 24p. (CONF-790415--29). Dep. NTIS, PC A02/MF A01.

From 177. national meeting of the American Chemical Society; Honolulu, HI, USA (1 Apr 1979).

The pyrochemical coprocessing of spent nuclear fuel by the Salt Transport Process appears to be a potentially viable reprocessing method, not only as an 'exportable proliferation resistant technology,' but as a domestic reprocessing operation. All operations are nonaqueous and waste generation is in solid

form, thus requiring no conversion from aqueous solutions to solids.

- 2771 (RHO-LD--66) ENGINEERING STUDY OF DRY NEAR-SURFACE INTERIM STORAGE OF FAST FLUX TEST FACILITY SPENT FUEL. (Atomics International Div., Richland, WA (USA)). Rockwell Hanford Operations). Nov 1978. Contract EY-77-C-06-1030. 66p. Dep. NTIS, PC A04/MF A01.

A brief study was conducted to assess methods for dry, near-surface storage of FFTF spent driver fuel assemblies in the 200 Area at Hanford. The disposable cask, drywell and vault concepts are the most promising approaches for FFTF spent fuel storage in the Hanford 200 Area starting in 1986. The cost and risk for the vault concept are higher than for either the disposable cask or drywell concepts. The disposal cask and drywell concepts are both satisfactory for this application. The risk for any of these concepts is minimal. Design and construction of a disposable cask or drywell facility can be completed within the constraint of a 1986 startup date if the project is initiated in FY-1980.

- 2772 (RISLEY-Trans--4009) EXTINGUISHMENT OF SODIUM FIRES. Malet, J.-C. (UKAEA Risley Nuclear Power Development Labs.). 1978. 8p. British Library Lending Division, Boston Spa.

The chemistry of sodium reactions with water and with oxygen is described, and the formation of toxic and opaque aerosols on ignition of sodium. Precautions taken against sodium fires in the PHENIX and SUPER-PHENIX reactors are discussed. A fire extinguisher powder called MARCALINA, containing alkaline carbonates and graphite, is described.

- 2773 (RLO--1830-T6) CONCEPTUAL DESIGN OF A SURVEILLANCE AND INSERVICE INSPECTION SYSTEM FOR THE PRIMARY PIPING AND COMPONENTS, FAST FLUX TEST FACILITY. PHASE C REPORT. Wylie, R.D.; Pickett, A.G.; Gerlach, C.R.; Hawkesworth, W. (Southwest Research Inst., San Antonio, TX (USA)). 16 Jan 1970. Contract EY-76-C-06-1830. 26p. Dep. NTIS, PC A03/MF A01.

The conceptual design of a Surveillance and Inservice Inspection (SISI) System for the primary coolant boundary outside of the reactor vessel area is presented. This portion of the system consists of the primary coolant piping between the reactor vessel area and the heat transport cells, and the piping, pumps, intermediate heat exchanger (IHX), valves and flowmeters in the cells. The SISI system for this part of FFTF and for the reactor vessel area will be integral, compatible sections of the complete FFTF-SISI system.

- 2774 (RLO--2227/T32-2) BURNING ACTINIDES IN VERY HARD SPECTRUM REACTORS. Robinson, A.H.; Shirley, G.W.; Prichard, A.W.; Trapp, T.J. (Oregon State Univ., Corvallis (USA)). Dept. of Nuclear Engineering). 20 Mar 1978. Contract EY-76-S-06-2227-032. 7p. (CONF-780622--73). Dep. NTIS, PC A02/MF A01.

From ANS annual meeting; San Diego, CA, USA (18 Jun 1978).

The major unresolved problem in the nuclear industry is the ultimate disposition of the waste products of light water reactors. The study demonstrates the feasibility of designing a very hard spectrum actinide burner reactor (ABR). A 1100 MW/sub t/ ABR design fueled entirely with actinides reprocessed from light water reactor (LWR) wastes is proposed as both an ultimate disposal mechanism for actinides and a means of concurrently producing usable

power. Actinides from discharged ABR fuel are recycled to the ABR while fission products are routed to a permanent repository. As an integral part of a large energy park, each such ABR would dispose of the waste actinides from 2 LWRs.

- 2775 (RLO--2227/T32-6) STUDIES OF ACTINIDE WASTE BURNUP AND USE IN FAST SPECTRA. QUARTERLY REPORT, JANUARY 1--MARCH 31 1978. Robinson, A.H. (Oregon State Univ., Corvallis (USA)). Jul 1978. Contract EY-76-S-06-2227-032. 53p. Dep. NTIS, PC A04/MF A01.

Actinide Burning Reactors (ABR's) are assumed to consist of infinite arrays of actinides (i.e. no leakage), arranged in four different fuel compositions; each of which is in three different lattice arrangements. The consumption rate of the actinides is quite sensitive to the neutron energy spectrum, and the neutron flux level. The results obtained when the twelve different actinide configurations were placed inside an EBR-II driver region are presented. For these twelve cases the actinide region was 5cm in radius surrounded by a uranium fueled EBR-II driver region of 40cm radius. The core height was 40cm. Again a core average power density of 600kw/l was used. No reflector was included. Under these conditions the spectrum and flux levels are determined by the driver region. The maximum burnup of ^{241}Am was 32% while that for ^{243}Am was 20%. This lower burnup is due primarily to lower flux levels in the actinide region. The results show that approximately the same fractional burnup is obtained for all twelve cases. Thus, it appears essential that the driver region be optimized.

- 2776 (RRC--16) ANALYSIS OF THE BREEDING CAPABILITY OF VARIOUS FAST REACTOR FUELS. Reddy, C.P.; Lee, S.M.; Shankar Singh, R. (Reactor Research Centre, Kalpakkam (India)). Feb 1977. 19p. Dep. NTIS (US Sales Only), PC A02/MF A01.

A study of the breeding capability of a wide range of fast reactor fuels on recent evaluations of neutron cross sections is presented. A thin clad, sodium cooled, large fast reactor is considered fuelled with various combinations of the fissile materials Pu and ^{235}U and the fertile materials ^{238}U and Th. The fuel types studied are metal, oxide, carbide and nitride. The effect of variations in the structural steel fraction, the fuel smear density and the reactor excess reactivity for the plutonium uranium oxide fuel case is also presented. The results obtained are discussed in detail and give an indication of the expected breeding performance of other fast reactor fuels relative to that of the currently used plutonium-uranium oxide fuel.

- 2777 (RSA-TM--4) SURVEY OF THE CURRENT STATE OF KNOWLEDGE OF INCIPIENT BOILING SUPERHEAT IN SODIUM. Greer, B. (Mount Holyoke Coll., South Hadley, MA (USA)). 1979. Contract W-31-109-ENG-38. 38p. Dep. NTIS, PC A03/MF A01.

Superheat data obtained by various investigators indicate that many parameters affect this phenomenon. Controlling parameters appear to be inert gas concentration, oxide concentration, system pressure, pressure-temperature history, rate of temperature rise, heat flux, flow rate, operating time on the system, surface conditions, and radiation. Of these, the two believed most influential in controlling incipient boiling superheat are the inert gas concentration and oxide concentration. Experimental results for the

heat flux and rate of temperature rise appear to be the most inconsistent.

- 2778 (SAN--0115-097-T1) POTENTIAL HAZARD TO SECONDARY CONTAINMENT FROM HCDA-GENERATED MISSILES AND SODIUM FIRES. Romander, C.M. (SRI International, Menlo Park, CA (USA)). Feb 1979. Contract EY-76-C-03-0115-097. 32p. Dep. NTIS, PC A03/MF A01.

The potential hazard of HCDA-generated missiles is analyzed, and the current status of the potential hazards of sodium fires is summarized. Simple analyses are performed to determine lower bounds on the HCDA energetics required to generate missiles that could reach the secondary containment structure of a 1000-MWe LMFBR. The potential missiles considered include the vessel head, components mounted on the head, and control rods.

- 2779 (SAN--0115-T5) EXPERIMENTAL STUDIES IN CDA WORK-ENERGY ATTENUATION. QUARTERLY PROGRESS REPORT NO. 17, 1 JANUARY TO 31 MARCH 1979. Tobin, R.J.; Cagliostro, D.J.; Romander, C.M.; Goodale, T.C. (SRI International, Menlo Park, CA (USA)). 31 Mar 1979. Contract EY-76-C-03-0115. 22p. Dep. NTIS, PC A02/MF A01.

The objectives of this program are to: develop a basic understanding of the dynamics and thermodynamics of expanding bubbles similar to the core disassembly accident (CDA) bubble in liquid metal fast breeder reactors (LMFBR); determine experimentally the structural response of an LMFBR to simulated CDA loads resulting from a postulated fuel vapor expansion; investigate potential hazards of CDA-generated missiles and sodium fires to the secondary containment system of the reactor; and investigate phenomena that may limit the work potential of HCDA bubble expansions.

- 2780 (SAN--0115-T6) EXPERIMENTAL STUDIES IN CDA WORK-ENERGY ATTENUATION. QUARTERLY PROGRESS REPORT NO. 18, 1 APRIL-30 JUNE 1979. Tobin, R.J.; Cagliostro, D.J.; Romander, C.M. (SRI International, Menlo Park, CA (USA)). 30 Jun 1979. Contract EY-76-C-03-0115-097. 17p. Dep. NTIS, PC A02/MF A01.

A study on the CDA energetics necessary to generate missiles that could reach the secondary containment of a large-LMFBR is described. Scaling and prototypicality analyses on CDA work-energy attenuation are also described.

- 2781 (SAN--0115-T7) NONEQUILIBRIUM PHENOMENA IN FLASHING WATER USED AS AN HCDA SOURCE SIMULANT. TECHNICAL REPORT NO. 8. Tobin, R.J.; Cagliostro, D.J.; Florence, A.L. (SRI International, Menlo Park, CA (USA)). Poulter Lab.). Nov 1979. Contract EY-76-C-03-0115-097. 118p. Dep. NTIS, PC A06/MF A01.

The philosophy behind the design of liquid metal fast breeder reactors (LMFBR) is to keep the risk to the public from accidental releases of radioactivity extremely small. Consistent with this philosophy, LMFBR safety technology research sponsored by DOE includes the consideration of hypothetical core disruptive accidents (HCDA). Recent scale-model simulation experiments on HCDAs identified nonequilibrium phenomena in flashing liquids as a possible attenuation mechanism in the energetics of flashing reactor fuels during an HCDA.

- 2782 (SAN--0115-T8) STRUCTURAL RESPONSE OF 1/20 SCALE MODELS OF ABOVE CORE STRUCTURES TO

INCREASINGLY ENERGETIC HYPOTHETICAL CORE DISRUPTIVE ACCIDENTS. TECHNICAL REPORT 7. Romander, C.M. (SRI International, Menlo Park, CA (USA)). Jul 1979. Contract EY-76-C-03-0115-097. 103p. Dep. NTIS, PC A06/MF A01.

Six experiments were performed to evaluate the structural response of an above core structure (ACS) to increasingly energetic hypothetical core disruptive accidents (HCDA). The tests were performed in a thickwall 1/20-scale model of a liquid metal fast breeder reactor (LMFBR) demonstration plant to provide information on ACS displacement as a function of HCDA energy so that computer codes such as SIMMER might include ACS displacement when calculating core release energetics. The 1/20-scale ACS models include a 5-kg aluminum block with dimensions that simulate the overall geometry of the ACS and the four columns that support the ACS over the core of the reactor. Each column includes an 8-in-long, 0.7-in-diameter 0.050-in-wall Ni 200 tubular section that experiences all of the deformation upon HCDA loading. The columns are supported by a rigid structure that simulates the geometrical constraints provided by the cover of the reactor.

- 2783 (SAN--0824-027-T1) HIGH QUALITY TUBE-TO-TUBESHEET JOINTS - WHEN, WHERE AND WHY. Lillie, A.F. (Rockwell International Corp., Canoga Park, CA (USA). Energy Systems Group). [nd]. Contract EY-76-C-03-0824-027. 12p. Dep. NTIS, PC A02/MF A01.

An autogeneous butt weld using the internal bore weld process is described. The weld is designed for the CRBR steam generator tubes to tubesheets which are fabricated of 2 1/2 Cr-1 Mo low alloy ferritic steel. As a precaution against in-service weld cracking, each weld is heat treated prior to inspection. (FS)

- 2784 (SAN--0824-T1) SODIUM LEAK DETECTION VERIFICATION TEST RESULTS. Witherspoon, J.E. (Rockwell International Corp., Canoga Park, CA (USA)). 27 Jul 1979. Contract EY-76-C-03-0824-012. 230p. AT.

Portions of document are illegible.

The results are presented for Sodium Leak Detection Verification Tests. In these tests, the required performance of selected CRBRP sodium-to-gas leak detection methods, which have application in LMFBR plants, was verified. Testing, in accordance with N707DRS520001, was performed by ETEC personnel. Copies of ETEC reports on the tests are included in Appendix A which comprises Volume 2 of this report.

- 2785 (SAN--0824-T2) SODIUM LEAK DETECTION, LONG TERM PERFORMANCE TEST: RESULTS FOR FY 1978. Witherspoon, J.E. (Rockwell International Corp., Canoga Park, CA (USA)). 20 Jun 1979. Contract EY-76-C-03-0824-012. 36p. AT.

The results are presented for the first 18 months of the long-term performance tests of aerosol-type sodium leak detectors. The equipment, which was designed and assembled at AI-ESG, is installed at EBR-II, and the operation is monitored by EBR-II personnel.

- 2786 (SAN--0824-T3) NATURAL CONVECTION: SODIUM LEAK DETECTION TESTS. Amaro, G.; Morejon, J. (Rockwell International Corp., Canoga Park, CA (USA)). 15 Jul 1976. Contract EY-76-C-03-0824-012. 103p. AT.

Aerosol type leak detectors were tested to obtain information regarding their response time to sodium leaks when monitoring the test

cell gas alone. Tests were conducted using both 24-in. and 3-in. diameter pipes. The test results showed that effective detection of small sodium leaks in vented 24-in. diameter pipes (2 gm/H) by aerosol detectors can be accomplished at temperatures greater than 600°F. At lower temperatures aerosol detectors are less effective.

- 2787 (SAN--0824-T4) SODIUM LEAK DETECTION LONG TERM PERFORMANCE TEST: RESULTS FOR FIRST SIX MONTHS. Witherspoon, J.E. (Rockwell International Corp., Canoga Park, CA (USA)). 5 Jun 1978. Contract EY-76-C-03-0824-012. 34p. AT.

The results are described for the first 6 months of the long-term performance tests of aerosol-type sodium leak detectors. The operation of the equipment, installed at EBR-II, is monitored by EBR-II personnel.

- 2788 (SAN--0824-T5) LEAK DETECTION RESPONSE TIME CHARACTERIZATION AND OPTIMIZATION TEST ANALYSIS. Chang, S.; Morejon, J.; Griffin, C.W. (Atomics International Div., Canoga Park, CA (USA)). 20 Oct 1975. Contract EY-76-C-03-0824-012. 53p. AT.

A general sodium-to-gas leak detector evaluation, based on the test condition effects on the aerosol production and the test parameter effects on the differential pressure (DP) detectors sensitivity is discussed. Recommendations are made to further improve the sensitivity and response time of the DP detector which proved to have a high potential in sodium leak detection, and for optimum use of other candidate leak detection devices. Cable detectors, hydrogen detectors, and chemical analysis of filter pads were seen to have high potential for leak detection in special environmental conditions or critical locations.

- 2789 (SAN--0824-T6) SMALL PIPE - NATURAL CONVECTION - SODIUM LEAK DETECTION TESTS. Morejon, J.A. (Rockwell International Corp., Canoga Park, CA (USA)). 2 Dec 1976. Contract EY-76-C-03-0824-012. 13p. AT.

Sodium leaks were simulated in a small pipe (3 in. diameter) at various temperatures and environmental conditions. The small pipe was provided with a uniform annular space of approximately 1/2 inch in diameter. The results from these tests when compared with previous tests conducted with a small pipe with no annular space indicate that the annulus plays an important part in enabling rapid detection of sodium leaks.

- 2790 (SAN--0824-T7) SODIUM LEAK DETECTION VERIFICATION TEST RESULTS. Witherspoon, J.E. (Rockwell International Corp., Canoga Park, CA (USA)). 27 Jul 1979. Contract EY-76-C-03-0824-012. 54p. AT.

This report describes the results of Sodium Leak Detection Verification Tests. In these tests, the required performance of selected CRBRP sodium-to-gas leak detection methods, which have application in LMFBR plants, was verified. Testing, in accordance with N707DR520001, was performed by ETEC personnel. Copies of ETEC reports on the tests are included in Appendix A which comprises Volume 2 of this report.

- 2791 (SAN--0824-T8) SODIUM LEAK DETECTION. Fletcher, F.; Gajewski, W.M. (Rockwell International Corp., Canoga Park, CA (USA)). [nd]. Contract EY-76-C-03-0824-012. 102p.

AT.

Research and development in sodium leak detection is reviewed. Topics covered include leak detector types, applications and requirements, development test programs, and analytical efforts and systems sensitivities.

- 2792 (SAN--0824-T9) SODIUM-TO-GAS LEAK DETECTION MOCKUP TESTS. Morejon, J.A. (Atomics International Div., Canoga Park, CA (USA)). 23 Oct 1975. Contract EY-76-C-03-0824-012. 66p. AT.

Several types of sodium leak detectors were tested using a pipe configuration and environmental conditions typical of LMFBR's. Aerosol/vapor monitors as well as electrical type monitors were tested. Reliable detection of small sodium leaks in the upper sodium temperature range (600 to 1000°F) was observed for all instrumentation except the contact (spark plug) detector. The gas chromatograph used for hydrogen detection gave definite indication over this temperature range as well as the lower sodium temperature range (400 to 600°F).

- 2793 (SAN--0824-T10) SUMMARY OF DESIGN AND DEVELOPMENT STATUS OF THE LIQUID METAL TO GAS LEAK DETECTION SYSTEM FOR THE CRBRP. Morejon, J.A. (Rockwell International Corp., Canoga Park, CA (USA)). 20 Aug 1976. Contract EY-76-C-03-0824-012. 70p. AT.

This TI updates the material presented in TI-N099TI661006 which discussed the Reference Liquid Metal to Gas Leak Detection System capabilities, performance, preliminary design requirements, safety aspects, and costs. A series of meetings took place with the various RM's and with NRC to discuss the system design and the leak detection requirements. Background information as well as the leak detection requirements are presented in this TI.

- 2794 (SAN--0824-T11) INVESTIGATION AND RATING OF SODIUM-TO-GAS LEAK DETECTION TECHNIQUES. Nelson, C. (Atomics International Div., Canoga Park, CA (USA)). 6 Feb 1973. Contract EY-76-C-03-0824-012. 30p. AT.

The investigation and rating of the sodium-to-gas leak detection techniques are presented based upon the leak detection requirements for the LMFBR Demonstration plant. The results of the investigation indicate that a variety of detection techniques are required for complete surveillance of the plant.

- 2795 (SAN--0824-T12) TEST REPORT: SODIUM-TO-GAS LEAK DETECTION SYSTEM SCREENING TESTS. Nelson, C.T. (Atomics International Div., Canoga Park, CA (USA)). 20 May 1975. Contract EY-76-C-03-0824-012. 17p. AT.

The data indicate that the filter plugging sensor, when chemical analysis is included, will meet the leak sensitivity and time response requirements for both primary and secondary heat transfer systems in an LMFBR. The cable detectors are useful only under special conditions. It is recommended that the aerosol tests be run for sufficiently long time periods to demonstrate that a direct signal (i.e., a significant pressure drop across the filter) could be reliably obtained.

- 2796 (SAN--0824-T13) SODIUM-TO-GAS LEAK DETECTION SYSTEM PERFORMANCE EVALUATION. Morejon, J.A. (Atomics International Div., Canoga Park, CA (USA)). 26 Jul 1976. Contract EY-76-C-03-0824-012. 99p. AT.

The Sodium to Gas Leak Detection System described in SDD 66, Rev 0, was evaluated for performance and capability to meet the Leak Detection requirements recently established by the various RM's (Reactor Manufacturers) for their respective systems. Results of this study are presented in this document, along with a revised cost estimate of the Reference System.

- 2797 (SAN--0824-T14) SELECTION OF AEROSOL DETECTORS FOR CRBRP. Morejon, J.A. (Atomics International Div., Canoga Park, CA (USA)). 29 Oct 1976. Contract EY-76-C-03-0824-012. 14p. AT.

Several types of Liquid Metal Aerosol to Gas Leak Detectors were tested at AI and LMEC to determine their sensitivity and performance in detection of sodium leaks. This information coupled with cost information was utilized to recommend specific types of aerosol detectors for CRBRP applications.

- 2798 (SAN--0893-T1) PROGRAM PLAN: ACOUSTIC LEAK DETECTION/LOCATION DEVELOPMENT AT GE-ARSD. (General Electric Co., Sunnyvale, CA (USA)). Advanced Reactor Systems Dept. [nd]. Contract EY-76-C-03-0893-031. 9p. Dep. NTIS, PC A02/MF A01.

Provide the development and subsequent specification, design and testing of an acoustic leak protection system which will detect a leak within a LMFBR steam generator. The goal for this system is to be at least as rapid and no more expensive than the chemical leak detection system under development for the Clinch River Breeder Reactor Plant (CRBRP).

- 2799 (SAN--1011-113R) CORRELATION OF GROUND RESPONSE SPECTRA WITH MODIFIED MERCALLI SITE INTENSITY. TOPICAL REPORT. Werner, S.D.; Ts'ao, H.S. (Agabian Associates, El Segundo, CA (USA)). 30 Sep 1978. Contract EY-76-C-03-1011. 168p. AT.

The objective of this study was to develop and update seismic design criteria and analysis methods for future LMFBR facilities. This report considers one aspect of this overall objective, namely, the development of intensity-dependent spectra for the following purposes: (1) to investigate ground response characteristics; (2) to provide a basis for assessing results from current procedures for defining seismic input criteria; and (3) to form the basis for new recommendations for developing criteria spectra to represent a given site intensity.

- 2800 (SAN--1011-114) STUDY OF VERTICAL GROUND RESPONSE SPECTRUM SHAPES. Werner, S.D.; Ts'ao, H.S. (Agabian Associates, El Segundo, CA (USA)). Aug 1977. Contract EY-76-C-03-1011. 71p. AT.

The report provides the results of an investigation of the effect of different normalizing procedures on the shape of response spectra for vertical earthquake ground motion. Vertical free-field earthquake ground motion records processed at the California Institute of Technology were used for the study. Spectra shape comparisons were made for composite spectra (mean and mean $\pm$ sigma) derived from spectra normalized to peak ground acceleration, peak ground velocity, and peak ground displacement, respectively. Spectra shapes were also derived by a three segment method and from natural (i.e., not normalized) spectra. Effects of local geology and local soil conditions on response spectra shapes were also investigated. Vertical spectra were developed for five different damping ratios using the three

segment method. The results of the investigation indicate that spectra developed from the statistical analysis of natural ground motion data has two advantages over spectra developed from the statistical analysis of normalized spectra shapes, namely (1) the spectra will not be distorted by the normalizing process; and (2) the probability of exceedance of the composite spectra can be well defined rather than approximated. Comparisons of composite spectra developed from both natural data and from normalized spectra with Regulatory Guide 1.60 procedures indicate that Regulatory Guide 1.60 procedures lead to vertical ground response spectra that are overly conservative. Comparisons of spectra for different local site conditions indicate that the method selected for normalizing the data has an important bearing on the extent to which local site effects appear to influence the spectrum shape.

- 2801 (SAN--1011-116) EVALUATION OF SEISMIC ANALYSIS TECHNIQUES FOR LMFBR PIPING AND EQUIPMENT. (Agabian Associates, El Segundo, CA (USA)). Jan 1978. Contract EY-76-C-03-1011. 188p. AT.

The development of efficient and reliable methods for calculating the seismic forces on piping and equipment critical to nuclear power plant safety has been the subject of numerous studies. In an effort to evaluate the procedures currently used for deriving piping and equipment design spectra, the report (a) discusses considerations that arise in the aseismic design of equipment/structure systems, such as characterization of earthquake inputs and modeling of equipment/structure systems; (b) assesses calculation techniques of in-structure response spectra; (c) evaluates a currently used approximate seismic analysis method; and (d) presents an "exact" probabilistic analysis of a coupled equipment/structure system under earthquake-like excitation. The study concludes that of the three methods evaluated and compared for accuracy, feasibility, and confidence level of conservatism in the results of the analysis, the probabilistic approach is the most rational, the time-history method is the next, and the "direct methods" are the least rational. Additional work is required to reduce the probabilistic method to a simple, practical design procedure.

- 2802 (SAN--1011-117) SEISMIC DESIGN VERIFICATION OF LMFBR STRUCTURES. (Agabian Associates, El Segundo, CA (USA)). 1 Jul 1977. Contract EY-76-C-03-1011. 119p. TIC \$6.50.

The report provides an assessment of the seismic design verification procedures currently used for nuclear power plant structures, a comparison of dynamic test methods available, and conclusions and recommendations for future LMFBR structures.

- 2803 (SAN--1011-118R) ASSESSMENT OF SEISMIC ANALYSIS PROCEDURES FOR LMFBR IN-CORE COMPONENTS. (Agabian Associates, El Segundo, CA (USA)). Mar 1979. Contract EY-76-C-03-1011. 71p. Dep. NTIS (US Sales Only), PC A04/MF A01.

The report provides an assessment of state-of-the-art dynamic seismic analysis procedures for in-core components of liquid metal fast breeder reactors. It is based on a review of both United States and foreign published literature and upon discussions with technical personnel presently engaged in performing seismic design analyses of reactor in-core

components.

- 2804 (SAN--1011-200) TEST VERIFICATION OF SEISMIC RESPONSE OF LMFBR PIPING SYSTEMS. QUARTERLY TECHNICAL PROGRESS REPORT. (Agbabian Associates, El Segundo, CA (USA)). Jan 1979. Contract EY-76-C-03-1011. 96p. AT.

The objective of this investigation is to experimentally verify the analytically predicted dynamic response of a typical breeder reactor piping system to the design seismic input motions. This is a progress report on the first phase of a two-phase investigation. The objective of the first phase is to develop a test plan which would include the selection of the system to be tested, definition of the analytical and experimental studies to be performed, and the preparation of a cost estimate for the second phase. The second phase of the investigation is to provide the tests and supporting analyses. This report summarizes work performed through October 1978. Work performed consists of a background review, definition of a typical breeder reactor piping system and studies to define the problems associated with both the analytical and experimental portions of the verification program.

- 2805 (SAN--1011-202) EVALUATION OF SEISMIC ANALYSIS TECHNIQUES FOR BREEDER REACTOR PIPING AND EQUIPMENT. QUARTERLY TECHNICAL PROGRESS REPORT. (Agbabian Associates, El Segundo, CA (USA)). Apr 1979. Contract EY-76-C-03-1011. 116p. AT.

Progress is reported on an investigation being conducted to evaluate different methods used to predict the response of nuclear power plant piping and equipment subsystems to earthquake vibratory ground motions. The program is primarily concerned with simplified methods based on free-field response spectra as input rather than on time-history methods of analysis. The report summarizes results of investigations conducted since the issue of Topical Report SAN/1011-116 which provided an evaluation of an approximate direct amplification method based on a comparison of results obtained by this method with exact solutions based on four time-history input records. This study has been extended to provide a probabilistic evaluation based on ten time-history analyses. Approximate methods of seismic analysis of multisupported piping and equipment based on input spectra methods is also under investigation. Proximity spectra for two oscillators subjected to propagating nonstationary random excitation have been developed and are included in the report.

- 2806 (SAN--1359-T1) MATHEMATICS CLINIC. NUCLEAR SAFETY CODE STUDY. (Harvey Mudd Coll., Claremont, CA (USA)). Jan 1980. Contract EG-77-S-03-1359. 31p. Dep. NTIS, PC A03/MF A01.

What would happen during an overpower accident in an LMFBR is analyzed. To assist studying the problem, Rockwell Energy Systems Group is currently developing a model of an overpower accident. It is the responsibility of this year's Nuclear Safety Code Study team to develop a useable algorithm for numerical evaluation of the stiff equations which are expected to constitute a majority of the model.

- 2807 (SAN/0700--1) APPLICATIONS OF CAVITATION ANALYSIS TO DESIGN AND OPERATION OF SPTF-HFL PUMP LOOPS. Bowers, W.M. (Liquid Metal Engineering Center, Canoga Park, CA

(USA)). 1977. Contract EY-76-C-03-0700. 35p. AT.

A consistent set of cavitation equations has been developed in a form suitable for conceptual design of SPTF (Sodium Pump Test Facility) modifications or use as an operational aid. However, to apply the equation as design tools or operational aids, certain cavitation test data must be available. It is recommended that incipient cavitation conditions be induced on valve HV=130 in the existing loop and the acoustic data on cavitation be collected.

- 2808 (SAN/1112--1) APRICOT PROGRAM: COMPARISON AND BENCHMARKING OF COMPUTATIONAL METHODS FOR ANALYSIS OF LMFBR STRUCTURAL RESPONSE TO POSTULATED CORE DISRUPTIVE ACCIDENTS. PHASE I REPORT. (Science Applications, Inc., Oakland, CA (USA)). Oct 1977. Contract EY-76-C-03-1112. 103p. Dep. NTIS, PC A06/MF A01.

The results are presented of Phase I of the APRICOT (Analysis of Primary Containment Transients) Program. APRICOT is an international cooperative activity for comparison and benchmarking of computational methods used to analyze LMFBR structural response to pressure loads from CDA's (Core Disruptive Accidents). Phase I involved parallel calculations of three computer problems by scientific groups in Europe, Japan and the United States. Independent experts reviewed these calculations for the purpose of comparing computational results and methods of solution. The main conclusion was that all calculations were in reasonable agreement, although there were some basic differences in details and approach to solution of the problems.

- 2809 (SAND--76-0614) FLOW VISUALIZATION IN HEAT-GENERATING POROUS MEDIA. Lee, D.O.; Nilson, R.H. (Sandia Labs., Albuquerque, NM (USA)). Nov 1977. Contract EY-76-C-04-0789. 33p. Dep. NTIS, PC A03/MF A01.

The work reported is in support of the Sandia Post-Accident Heat Removal Program, in which simulated LMFBR beds will be subjected to in-pile heating in the ACPR (Annular Core Pulsed Reactor). Flow visualization experiments were performed to gain some insight into the flow patterns and temperature distributions in a fluid-saturated heat-generating porous medium. Although much of the information presented is of a qualitative nature, it is useful in the recognition of the controlling transport process and in the formulation of analytic and numerical models.

- 2810 (SAND--77-0161C) MOBILE HELIUM COOLING LOOP SYSTEM FOR IN-REACTOR PAHR EXPERIMENTS. Brammer, J.A. (Sandia Labs., Albuquerque, NM (USA)). 1977. Contract EY-76-C-04-0789. 8p. (CONF-771109--22). Dep. NTIS, PC A02/MF A01.

From ANS winter meeting; San Francisco, CA, USA (27 Nov 1977).

One objective of the PAHR program at Sandia Laboratories is to better simulate the decay heating of debris beds and molten pools by using the Annular Core Pulse Reactor (ACPR) operated in its steady-state mode to fission heat UD_2 fueled PAHR experiment capsules. Safe performance of these typically long duration, elevated temperature PAHR experiments within the ACPR first necessitated the development of a unique system for cooling, control, and diagnostics of the PAHR experiment capsule. The experimental equipment arrangement of the mobile helium cooling loop (HCL) system

connected through piping to the PAHR debris bed capsule located at the bottom of the 23 cm diameter by 7 m long dry experiment tube penetrating the core region of the pool-type ACPR reactor is described. The mobile HCL system uses low pressure helium gas to remove heat at rates up to 20 kW that was fission generated within the sealed capsule containing UO_2 and molten sodium.

- 2811 (SAND--77-0611) FAST REACTOR SAFETY RESEARCH PROGRAM. QUARTERLY REPORT, JANUARY--MARCH 1977. (Sandia Labs., Albuquerque, NM (USA)). Aug 1977. Contract EY-76-C-04-0789. 144p. (NUREG--0181-2). Dep. NTIS, PC A07/MF A01.

Progress is summarized in the following study areas: accident energetics; core debris behavior; sodium containment and structural integrity; research for elevated temperature design criteria; fuel motion detection; and ACPR fuel motion detection system.

- 2812 (SAND--77-0723) FIRE PROTECTION DEVICE FOR LMFBR SPENT FUEL SHIPPING CASKS. Moss, M.; Heckman, R.C. (Sandia Labs., Albuquerque, NM (USA)). Aug 1977. Contract EY-76-C-04-0789. 21p. Dep. NTIS, PC A02/MF A01.

This report describes the analysis and experimental evaluation of a device to provide fire protection for a shipping cask used to transport liquid metal fast breeder reactor (LMFBR) fuel rods. Thermal analyses of various fire protection schemes were conducted by means of the finite difference code, CINDA. The choice of materials for the cask body was determined to be less important than the dimensions and number of cooling fins attached to the cask. Of several protection methods considered, radiation/convection shields between the cooling fins looked most attractive; these were tested on a quarter-scale cask model. The shields consisted of bimetallic bands which expanded when heated, blocking the fire, and retracted when cooled. This automatic reversibility would allow the fins to dissipate internally generated heat of a full-size cask once the fire was out. Tests showed that, even in an asymmetric fire exposure, the bands expanded to provide protection to the cask. The directly exposed surface of the cask model, protected this way, reached a temperature of only 180°C compared with 295°C in the unprotected state, when subjected to a butane flame for 0.5 h at a distance of 15 cm. Greater relative effectiveness could be expected in an engulfing fire in which the bands would expand more symmetrically.

- 2813 (SAND--77-0924C) EVALUATION OF COMPUTATIONAL TECHNIQUES FOR LMFBR SAFETY ANALYSIS. Herrmann, W.; Gross, M. (Sandia Labs., Albuquerque, NM (USA); Science Applications, Inc., Oakland, CA (USA)). 1977. Contract EY-76-C-04-0789. 40p. (CONF-780803-1). Dep. NTIS, PC A03/MF A01.

From 4. conference on structural mechanics in reactor technology; San Francisco, CA, USA (15 Aug 1978).

Analysis of Primary Containment Transients (APRICOT) is an ERDA sponsored project in which a variety of reactor safety analysis groups around the world have been invited to participate by performing calculations to verify capabilities of large computer codes used to analyze postulated core disruptive accidents of liquid metal fast breeder reactors. Nine groups have performed calculations of the first three problems which were set, using ten computer codes. Two problems were simple test problems for which

analytical solutions exist, namely an ideal gas shock tube, and a suddenly pressurized spherical cavity in an infinite elastic medium. The third problem concerns an explosion in a partially water-filled overstrong cylindrical containment vessel for which experimental data exist. A critique of the results of these calculations is given in the paper.

- 2814 (SAND--77-0971C) RADIATION SHIELD DESIGN FOR LMFBR SPENT-FUEL SHIPPING CASKS. Dupree, S.A. (Sandia Labs., Albuquerque, NM (USA)). 1977. Contract EY-76-C-04-0789. 8p. (CONF-771109--68). Dep. NTIS, PC A02/MF A01.

From ANS winter meeting; San Francisco, CA, USA (27 Nov 1977).

Previous analyses have examined a limited number of the alternatives available for designing an LMFBR spent-fuel shipping cask (SFSC) using a non-volatile neutron shield; i.e., a neutron shield which will not be lost in an accident involving a fire. The present study extends the scope of these hypothetical designs to include combinations of volatile and non-volatile neutron shield materials.

- 2815 (SAND--77-1014C) CODED APERTURE IMAGING OF REACTOR ILLUMINATED LMFBR FUEL PINS. Kelly, J.G.; Stalker, K.T. (Sandia Labs., Albuquerque, NM (USA)). 1977. Contract EY-76-C-04-0789. 5p. (CONF-771109--37). Dep. NTIS, PC A02/MF A01.

From ANS winter meeting; San Francisco, CA, USA (27 Nov 1977).

As a part of Sandia Laboratories program to study simulated core disruptive accidents in reactor safety research, a fuel motion detection system based on coded aperture imaging is being developed. Until the experiments reported here were conducted it was not known whether either of two important questions could be properly answered. First, could an actual fuel pin illuminated by a reactor be imaged with a coded aperture and an active detector system with acceptable frame rates and spatial resolution. Second, could collimator and shield structures be fabricated for the Annular Core Pulsed Reactor (ACPR), for which the system is being built, that would provide acceptable signal to background ratios. Both of these questions can now be answered in the affirmative because of the favorable experiments recently conducted at the Sandia Pulsed Reactor (SPR II) and at the ACPR.

- 2816 (SAND--77-1015C) IN-CORE FUEL MOTION DETECTION IN THE SANDIA PULSE REACTOR. Wright, S.A.; Renken, J.H.; Kroeger, F.R. (Sandia Labs., Albuquerque, NM (USA)). 1977. Contract EY-76-C-04-0789. 6p. (CONF-771109--5). Dep. NTIS, PC A02/MF A01.

From ANS winter meeting; San Francisco, CA, USA (27 Nov 1977).

One of the major fuel motion diagnostic techniques under consideration for use in large scale fast reactor safety tests is in-core fuel motion detection. The Nuclear Regulatory Commission is funding a program at Sandia Laboratories to experimentally test the feasibility of using in-core neutron detectors to monitor fuel motion in medium- to large-scale tests. The new areas of research required by this program are the development of miniature neutron detectors which can be placed in hollow wire wrap and the development of unfolding methods which relate detector response to fuel motion.

- 2817 (SAND--77-1016C) HYDRODYNAMIC ANALYSIS

OF THE LMFBR PROMPT BURST EXCURSION (PBE) EXPERIMENT. Young, M.F. (Sandia Labs., Albuquerque, NM (USA)). 1977. Contract EY-76-C-04-0789. 7p. (CONF-771109--7). Dep. NTIS, PC A02/MF A01.

From ANS winter meeting; San Francisco, CA, USA (27 Nov 1977).

A series of in-pile experiments has been conducted at Sandia Laboratories to provide information on pressure levels and conversion of thermal energy into mechanical work in LMFBR cores during hypothetical, superprompt-critical excursions. Pressures generated in these experiments are recorded by a pressure transducer located at the top and bottom of a sodium channel surrounding a single, fresh UO_2 fuel pin. Work energy conversion is measured by a linear motion transducer connected to a piston at the top of the sodium column. Since the pressure transducers are located fairly far from the location of pin failure, it becomes necessary to determine the effect of channel geometry and piston motion on the observed pressure data. A two-dimensional, hydrodynamic analysis of pressure pulse propagation in the fuel pin-coolant channel geometry was therefore performed using the CSQII computer code. The initial series of PBE experiments consists of single, fresh UO_2 pins surrounded by a sodium-filled or dry-coolant channel contained in a closed test capsule. The capsule is subjected to a maximum pulse in the Annular Core Pulse Reactor (ACPR) resulting in an energy deposition of from 2350 to 2900 J/g (14 and 20 percent enriched pins). The pulse width at half maximum (PWHM) is about 5 ms.

2818 (SAND--77-1017C) EFFECT OF THERMAL STRESS ON OXIDE CRUSTS. Ostensen, R.W. (Sandia Labs., Albuquerque, NM (USA)). 1977. Contract EY-76-C-04-0789. 4p. (CONF-771109--9). Dep. NTIS, PC A02/MF A01.

From ANS winter meeting; San Francisco, CA, USA (27 Nov 1977).

In the transition phase in LMFBR hypothetical accidents, the existence of an insulating crust of frozen fuel between molten fuel and cold structure is of key importance. The disruption of such a crust for fuel flowing through the axial blanket regions can lead to rapid freezing and subsequent blockage formation. In a boiling pool of molten fuel and steel, the presence of the crust may be necessary in order to reduce the convective heat transfer rate and allow a subcritical boilup. This paper describes the effect of thermal stress on such a crust and points out that such crusts may be far weaker than previously believed.

2819 (SAND--77-1018C) FISSION-GAS BUBBLE MODELING FOR LMFBR ACCIDENTS. Ostensen, R.W. (Sandia Labs., Albuquerque, NM (USA)). 1977. Contract EY-76-C-04-0789. 10p. (CONF-771109--12). Dep. NTIS, PC A02/MF A01.

From ANS winter meeting; San Francisco, CA, USA (27 Nov 1977).

The behavior of fission-gas bubbles in unrestructured oxide fuel can have a dominant effect on the course of a core disruptive accident in an LMFBR. The paper describes a simplified model of bubble behavior and presents results of that model in analyzing the relevant physical assumptions and predicting gas behavior in molten fuel.

2820 (SAND--77-1032C) RATE EFFECTS IN THE DYNAMIC VAPORIZATION OF URANIUM DIOXIDE. Benson, D.A. (Sandia Labs., Albuquerque, NM (USA)). 1977. Contract EY-76-C-04-0789. 6p. (CONF-771109--23). Dep. NTIS, PC A02/MF

A01.

From ANS winter meeting; San Francisco, CA, USA (27 Nov 1977).

Information for vaporizing UO_2 at temperatures and vaporization rates appropriate to fast reactor safety analysis is now becoming available from several different types of experiments. These data are summarized and compared to models used in reactor safety analysis. It has been commonly assumed in fast reactor analysis that the vaporization of fuels at high temperatures can be described by an equation of state for material in chemical and thermal equilibrium. However, the comparisons of dynamic experiments in oxide material to equilibrium measurements produce contradicting results. These observations can be resolved by a rate dependent effect in the high temperature oxide.

2821 (SAND--77-1059C) LARGE SCALE SODIUM INTERACTIONS. PART 2. PRELIMINARY TEST RESULTS FOR LIMESTONE CONCRETE. Smaardyk, J.E.; Sutherland, H.J.; King, D.L.; Dahlgren, D.A. (Sandia Labs., Albuquerque, NM (USA)). 1977. Contract EY-76-C-04-0789. 4p. (CONF-771109--47). Dep. NTIS, PC A02/MF A01.

From ANS winter meeting; San Francisco, CA, USA (27 Nov 1977).

Any sodium cooled reactor system must consider the interaction of hot sodium with cell liners, and given either a failed liner or a hypothetical core disruptive accident, the interaction of hot sodium with concrete. The data base available for safety assessments involving these interactions is limited, especially for the concrete and failed liner interactions. To better understand what happens when hot sodium comes in contact with concrete, a series of tests is being carried out to investigate sodium-concrete reactions under conditions which are similar to actual reactor accident conditions. Tests cover the cases of sodium spills on bare concrete and on cells with defective steel liners. Specific objectives have been to obtain a complete description of the sodium/concrete interaction including heat balance, gas evolution and flow, movement and heat generation of the reaction zone, reaction product formation, and the layering or movement of the products.

2822 (SAND--77-1073C) LARGE SCALE SODIUM INTERACTIONS. PART 1. TEST FACILITY DESIGN. King, D.L.; Smaardyk, J.E.; Sallach, R.A. (Sandia Labs., Albuquerque, NM (USA)). 1977. Contract EY-76-C-04-0789. 7p. (CONF-771109--46). Dep. NTIS, PC A02/MF A01.

From ANS winter meeting; San Francisco, CA, USA (27 Nov 1977).

During the design of the test facility for large scale sodium interaction testing, an attempt was made to keep the system as simple and yet versatile as possible; therefore, a once through design was employed as opposed to any type of conventional sodium 'loop.' The initial series of tests conducted at the facility call for rapidly dropping from 20 kg to 225 kg of sodium at temperatures from 825°K to 1125°K into concrete crucibles. The basic system layout is described. A commercial drum heater is used to melt the sodium which is in 55 gallon drums and then a slight argon pressurization is used to force the liquid sodium through a metallic filter and into a dump tank. Then the sodium dump tank is heated to the desired temperature. A diaphragm is mechanically ruptured and the sodium is dumped into a crucible that is housed inside a large steel test chamber.

2823 (SAND--77-1092C) NETWORK MODEL OF FREE CONVECTION WITHIN INTERNALLY HEATED POROUS MEDIA. Conrad, P.W. (Sandia Labs., Albuquerque, NM (USA)). 1977. Contract EY-76-C-04-0789. 6p. (CONF-771109--15). Dep. NTIS, PC A02/MF A01.

From ANS winter meeting; San Francisco, CA, USA (27 Nov 1977).

A hypothetical core-disruptive accident (HCDA) in a liquid metal fast breeder reactor (LMFBR) may result in the formation of an internally heated debris bed. Considerable attention has been given to postulated mechanisms by which such beds may be cooled. It is the purpose of the work described to demonstrate a method for computing the heat transfer from such a bed to the overlying sodium pool due to single-phase, free convection.

2824 (SAND--77-1093C) THERMAL BEHAVIOR OF CONCRETE. Knight, R.L. (Sandia Labs., Albuquerque, NM (USA)). 1977. Contract EY-76-C-04-0789. 7p. (CONF-771109--18). Dep. NTIS, PC A02/MF A01.

From ANS winter meeting; San Francisco, CA, USA (27 Nov 1977).

The treatment of post accident containment problems requires an understanding of concrete when subjected to high temperatures due to thermal contact with molten core materials and/or coolant. Sodium spills on concrete are of special concern because the resulting chemical reactions are collectively exothermic. Among other possible safety problems, the gas released by the thermal decomposition of concrete has the potential of producing pressures sufficient to endanger the integrity of cell liners. Insight into these phenomena has been gained by constructing a computer model and performing a series of studies. The code presently calculates the following quantities as functions of space and time: (1) temperature of the cell liner, (2) temperature of the concrete, (3) ablation rate of the heated concrete surface, (4) the water, water vapor, and carbon dioxide evolution rates, (5) the total gas discharged, and (6) the decomposition energy absorption rate for each decomposing species. The code has been used to predict the decomposition of concrete both with and without a containment liner.

2825 (SAND--77-1094C) EFFECTIVE EQUATION-OF-STATE MEASUREMENTS ON URANIUM DIOXIDE. Reil, K.O.; Cronenberg, A.W. (Idaho National Engineering Lab., Idaho Falls (USA)). 1977. Contract EY-76-C-04-0789. 7p. (CONF-771109--4). Dep. NTIS, PC A02/MF A01.

From ANS winter meeting; San Francisco, CA, USA (27 Nov 1977).

The safety analysis of Liquid Metal Fast Breeder Reactor (LMFBR) systems requires knowledge of the vapor pressure of reactor fuels up to 6000 K. A new technique was developed to obtain experimental vapor pressure data for reactor fuel materials at high temperatures and pressures. Fuel samples are pulse fission heated in the Annular Core Pulse Reactor (ACPR) at heating rates comparable to those anticipated during a severe LMFBR transient. Since the vapor of reactor fuels may contain several dissociated fuel species, volatile fission products, and/or fission gas, and the evolution of that pressure may be time or rate dependent, the terminology "effective equation-of-state (EEOs) measurement" was used to differentiate these results from the vapor pressure of pure materials. This technique can be easily applied to plutonium bearing and previously irradiated fuels. The EEOs technique was used to determine the vapor pressure of

high purity uranium dioxide with an oxygen-to-metal ratio of 2.08. Energy depositions of up to 2720 J/g relative to room temperature were obtained, resulting in measured pressures in excess of 38 mpa.

2826 (SAND--77-1095C) LARGE SCALE SODIUM INTERACTIONS. PART 3. CHEMICAL PHENOMENA WITH LIMESTONE CONCRETE. Sallach, R.A. (Sandia Labs., Albuquerque, NM (USA)). 1977. Contract EY-76-C-04-0789. 4p. (CONF-771109--27). Dep. NTIS, PC A02/MF A01.

From ANS winter meeting; San Francisco, CA, USA (27 Nov 1977).

The description of the chemical processes and reaction products resulting from the exposure of concrete to molten sodium metal is important for a thorough, realistic assessment of the safety of CRBR-type reactors. Concretes are in general complex heterogeneous substances whose ingredients can be derived from many sources. Consequently a wide variety of reaction processes and products might be anticipated. Initial attention has focused on a concrete in which both the aggregate and sandy components are derived from limestone. Presented are the chemical observations and experimental data from tests in which molten sodium metal at approximately 500°C is dropped into cold limestone concrete crucibles. Thermocouples immersed in the sodium pool indicate that the reaction proceeds in two stages. In the first stage which lasts 5 to 8 minutes, the temperature of the reacting mass hovers around 500°C. This stage is followed by a second stage of longer duration--greater than 100 minutes--where the temperature is 700 to 800°C. The main reaction product is a hard, fused, black slag which contains about 3/4 of the sodium in the initial charge. A secondary product is sodium oxide aerosol which accounts for the remaining 1/4 of the charge. It is significant that no free sodium metal is found in the slag; all sodium has completely reacted.

2827 (SAND--77-1096C) FIRST IN-CORE MOLTEN FUEL POOL EXPERIMENT. Plein, H.G.; Carlson, G.A. (Sandia Labs., Albuquerque, NM (USA)). 1977. Contract EY-76-C-04-0789. 5p. (CONF-771109--36). Dep. NTIS, PC A02/MF A01.

From ANS winter meeting; San Francisco, CA, USA (27 Nov 1977).

If during a LMFBR accident a fuel debris bed is not adequately cooled by overlying sodium and dryout occurs, then the fuel would heat up and melt. Molten fuel pools are of concern due to their potential for ablation of the supporting structure and possible penetration of the reactor vessel. The major goal of the molten fuel pool program has been to develop a versatile experiment in which heat flux and structural ablation could be studied using real materials under typical temperature and heating conditions. This has now been accomplished, using the Annular Core Pulse Reactor (ACPR) to fission heat enriched UD_2 . In the first experiment conducted, a small portion of a 0.834 kg UD_2 sample was melted, and temperature data were recorded to above the melting point of the UD_2 using ultrasonic thermometry.

2828 (SAND--77-1101C) IMPORTANCE OF SCALE AND TRIGGERING EFFECTS IN VAPOR EXPLOSIONS. Williams, D.C. (Sandia Labs., Albuquerque, NM (USA)). 1977. Contract EY-76-C-04-0789. 6p. (CONF-771109--16). Dep. NTIS, PC A02/MF A01.

From ANS winter meeting; San Francisco, CA, USA (27 Nov 1977).

An attempt is made to show one way in which

large-scale, coherent vapor explosions can be understood in terms of local interaction properties. The impossible importance the presence of a suitable triggering event may have in determining whether an explosion actually occurs on a particular occasion is noted. Certain small-scale interaction properties are assumed to exist and the large-scale system behavior these imply are explored.

- 2829 (SAND--77-1117C) LARGE SCALE TEST TECHNOLOGY. Philbin, J.S.; Pickard, P.S.; Walker, J.V.; Young, M.F.; Odom, J.P. (Sandia Labs., Albuquerque, NM (USA); Science Applications, Inc., Albuquerque, NM (USA)). 1977. Contract EY-76-C-04-0789. 4p. (CONF-771109--6). Dep. NTIS, PC A02/MF A01. From ANS winter meeting; San Francisco, CA, USA (27 Nov 1977).

The paper presents an overview of conceptual designs of facilities suitable for performing large scale LMFBR reactor safety tests. The versatility offered by the approaches discussed is intended to satisfy many of the requirements for establishing a pertinent experimental data base for core disruptive accident parameters.

- 2830 (SAND--77-1134) ADVANCED REACTOR SAFETY RESEARCH PROGRAM QUARTERLY REPORT, APRIL-JUNE 1977. (Sandia Labs., Albuquerque, NM (USA)). Nov 1977. Contract EY-76-C-04-0789. 207p. (NUREG--0181-3). Dep. NTIS, PC A10/MF A01.

Information is presented concerning accident energetics; core debris behavior; sodium containment and structural integrity; research for elevated temperature design criteria; fuel motion detection; ACPR fuel motion system; and advanced reactor safety research assessment.

- 2831 (SAND--77-1157C) APPLICATION OF ULTRASONIC THERMOMETRY IN LMFBR SAFETY RESEARCH. Carlson, G.A.; Sullivan, W.H.; Plein, H.G. (Sandia Labs., Albuquerque, NM (USA)). 1977. Contract EY-76-C-04-0789. 19p. (CONF-771064--2). Dep. NTIS, PC A02/MF A01.

From Ultrasonics symposium; Phoenix, AZ, USA (26 Oct 1977).

Ultrasonic thermometry has many potential applications in reactor safety research, where extremely high temperatures and lack of visual access may preclude the use of conventional diagnostics. An application (the in-core molten fuel pool experiment) will be described in which thoriated tungsten ultrasonic thermometers were used to measure temperatures in UO_2 to incipient melt (2860°). Each thermometer included five sensor elements 10 mm long, providing five temperatures within the UO_2 at various axial locations. The 10 mm spatial resolution is about five times better than previous applications of the technique. Temperature resolution of $\pm 10^\circ C$ was indicated by calibration data. Besides providing temperature data approximately 1000°C higher than were obtained with thermocouples, the thermometer yielded valuable axial temperature profile data. Details of the sensors, exciting coils, and signal conditioning electronics will be given.

- 2832 (SAND--77-1342) EULERIAN FINITE-DIFFERENCE CALCULATIONS OF EXPLOSIONS IN PARTIALLY WATER-FILLED OVERSTRONG CYLINDRICAL CONTAINMENT VESSELS. Thompson, S.L.; Herrmann, W. (Sandia Labs., Albuquerque, NM (USA)). 1977. Contract EY-76-C-04-0789. 145p. Dep. NTIS, PC A05/MF A01.

Portions of this document are illegible.

Calculations, using the two-dimensional Eulerian finite-difference code CSQ, were performed for the problem of a small spherical high-explosive charge detonated in a closed heavy-walled cylindrical container partially filled with water. Data from corresponding experiments, specifically performed to validate codes used for hypothetical core disruptive accidents of liquid metal fast breeder reactors, are available in the literature. The calculations were performed specifically to test whether Eulerian methods could handle this type of problem, to determine whether water cavitation, which plays a large role in the loadings on the roof of the containment vessel, could be described adequately by an equilibrium liquid-vapor mixed phase model, and to investigate the trade-off between accuracy and cost of the calculations by using different sizes of computational meshes. Comparison of the experimental and computational data shows that the Eulerian method can handle the problem with ease, giving good predictions of wall and floor loadings. While roof loadings are qualitatively correct, peak impulse appears to be affected by numerical resolution and is underestimated somewhat.

- 2833 (SAND--77-1394) LAGRANGIAN FINITE-DIFFERENCE CALCULATIONS OF AN EXPLOSION IN A PARTIALLY WATER-FILLED RIGID CYLINDRICAL TANK. Swagle, J.W. (Sandia Labs., Albuquerque, NM (USA)). Apr 1978. Contract EY-76-C-04-0789. 77p. Dep. NTIS, PC A04/MF A01.

Calculations using the Lagrangian finite-difference code, TOODY, have been performed for the problem of an explosion in a partially water-filled rigid cylindrical tank. Experimental data for this problem formed the basis of comparison for one of a series of test problems designed to validate codes used to model reactor blowdown situations. The calculations presented here show effects of zoning variations on calculational results.

- 2834 (SAND--77-1413C) SANDIA IN-CORE MOLTEN FUEL POOL EXPERIMENT RESULTS. Plein, H.G.; Carlson, G.A. (Sandia Labs., Albuquerque, NM (USA)). 1977. Contract EY-76-C-04-0789. 2p. (CONF-771108--1). Dep. NTIS, PC A02/MF A01.

From Post accident heat removal information exchange meeting; Chicago, IL, USA (2 Nov 1977).

The major initial objective of the in-core molten fuel pool program at Sandia has been to develop a versatile experiment in which relative heat fluxes and structural ablation could be studied using real materials under typical temperature and heating conditions. The initial experiment series is designed to prove containment design, test ultrasonic thermometers, and provide material interaction data. The first two molten fuel pool experiments, MP-1 and MP-2, were successfully conducted in the Annular Core Pulse Reactor (ACPR) on June 24 and July 29, 1977. These first two experiments demonstrated the adequacy of the experiment package for heating and containment of UO_2 to melt. They have shown the usefulness of ultrasonic thermometry for making multiple temperature measurements to the melting point of UO_2 , but also indicated that some problems remain to be solved in this application of the technique.

- 2835 (SAND--77-1421C) LARGE SCALE SODIUM TEST FACILITY. King, D.L.; Smaardyk, J.E.; Sutherland, H.J.; Sallach, R.A. (Sandia Labs., Albuquerque, NM (USA)). 1977. Contract EY-76-C-04-0789. 8p. (CONF-771108--

4). Dep. NTIS, PC A02/MF A01.

From Post accident heat removal information exchange meeting; Chicago, IL, USA (2 Nov 1977).

The large scale sodium test facility in use at Sandia Laboratories was designed to be used for a wide range of sodium interaction experiments. Of initial concern is the interaction of hot sodium with concrete under conditions similar to accident conditions in any sodium cooled reactor. The tests to be run cover the cases of sodium spills and sprays on bare concrete and on cells with defective steel liners. The initial series of tests in progress at the facility involves rapidly dropping from 20 kg to 225 kg of sodium at temperatures from 550°C to 850°C into concrete crucibles that are representative of the concrete to be used at the Clinch River Breeder Reactor Plant (CRBRP). Specific objectives are to obtain sufficient information to completely describe the sodium/concrete interaction including: reaction rate, heat of reaction, gas evolution and flow, movement of the reaction front, reaction product formation, and the effects of variation of drop temperature and reaction area geometries.

2836 (SAND--77-1443C) IN-REACTOR EXPERIMENTS WITH SIMULATED LMFBR DEBRIS BEDS. Rivard, J.B. (Sandia Labs., Albuquerque, NM (USA)). 1977. Contract EY-76-C-04-0789. 4p. (CONF-771108--2). Dep. NTIS, PC A02/MF A01.

From Post accident heat removal information exchange meeting; Chicago, IL, USA (2 Nov 1977).

A LMFBR accident in which molten core material is suddenly quenched with subcooled liquid sodium could result in extensive fragmentation and dispersal of fuel as subcritical beds of particulate debris. The primary safety concern for these debris beds is their capacity for transfer of the fission product decay heat to overlying liquid sodium by natural processes. The objective of the D-series of experiments is to closely simulate decay-heated debris and to determine the limits of stable operation wherein dryout does not occur. This is accomplished by fission heating enriched UO_2 particulate in subcooled liquid sodium in the Annular Core Pulse Reactor (ACPR). Results to date are presented.

2837 (SAND--77-1470) DESIGN CONSIDERATIONS FOR EPITHERMAL PULSE REACTORS. Ostensen, R.W. (Sandia Labs., Albuquerque, NM (USA)). Jan 1978. Contract EY-76-C-04-0789. 33p. Dep. NTIS, PC A03/MF A01.

Simplified design criteria were developed for scoping analyses of epithermal pulse reactors for use in LMFBR safety testing. By using these criteria, materials and designs were investigated to determine performance limits of moderately sized reactor cores. Several designs are suggested for further study. These are a gas-cooled core fueled with a heterogeneous mixture of Fe- UO_2 cermet and BeO- UO_2 ceramic fuels, and a heavy-water-cooled core fueled with an Fe- UO_2 cermet.

2838 (SAND--77-1483) CONCEPTUAL DESIGNS FOR LMFBR SPENT FUEL SHIPPING CASKS. Allen, G.C. Jr.; Eakes, R.G.; Freedman, J.M.; Pope, R.B.; Dupree, S.A.; Schimmel, W.P. Jr. (Sandia Labs., Albuquerque, NM (USA)). Mar 1978. Contract EY-76-C-04-0789. 44p. Dep. NTIS, PC A03/MF A01.

A spent-fuel shipping cask for use at both the Fast Flux Test Facility (FFTF) and the Clinch River Breeder Reactor Plant (CRBRP) is

being developed. In compliance with milestones established for the Sandia Labs LMFBR spent-fuel shipping activity, conceptual designs of an LMFBR shipping cask are described. The detailed design based on one of the concepts will commence after review and comments have been received from the cognizant organizations. Conceptual designs described in this document comply with the shipping system requirements as defined in the LMFBR Spent-Fuel Shipping System Design Description. Additional considerations which have affected the conceptual designs currently being used are: (1) the rotating basket option has been excluded; (2) spent fuel must be adequately cooled during loading and unloading in a one-atmosphere argon environment; (3) passive cooling of the cask during shipment is required; (4) six-month cooled CRBRP fuel prescribes the radiation and thermal source; and (5) the shipping cask will be transported by rail. Heat transfer requirements during loading and unloading will substantially impact the shipping system. Spent-fuel assemblies may be placed in canisters containing a non-gaseous coolant prior to shipment or may be shipped bare subject to certain loading and cooling restrictions. The recommended option is to place a liquid metal in the canister and then insert the fuel assembly.

2839 (SAND--77-1486) EVALUATION OF ORGANIC COOLANTS FOR THE TRANSPORTATION OF LMFBR SPENT FUEL RODS. Arnold, C. Jr. (Sandia Labs., Albuquerque, NM (USA)). May 1978. Contract EY-6-C-04-0789. 41p. Dep. NTIS, PC A03/MF A01.

The physical and chemical processes that are likely to occur when sodium coated LMFBR spent fuel rods are submerged in various aromatic organic coolants was defined by means of immersion experiments carried out with sodium coated 304 stainless steel coupons. Upon immersion of sodium coated coupons at 220°C in hydrocarbon type coolants such as Therminol 88, a mixture of terphenyls, not only was the metallic sodium retained on the coupon, but a carbonaceous coating formed on the surface of the sodium. In contrast, coolants that contained aromatic ether bonds, such as Dowtherm A, reacted with sodium at 220°C to form phenolate and other salts, which precipitated from the coolant in the form of a dark sludge. With Dowtherm A, removal of metallic sodium from the coupon was essentially complete in a matter of hours at temperatures of 160--220°C. Data on the rate and efficiency of sodium removal upon immersion in Dowtherm A at elevated temperatures were obtained. In addition the kinetics and chemistry of the sodium/Dowtherm A reaction were defined. Because sodium sludges are potentially incompatible with the containing structural materials and the fuel elements, it is recommended that sodium be removed prior to immersion in the coolant via reaction with benzoic acid; this method should be adaptable to the facilities at reactor sites. In aging studies Dowtherm A was found to be thermally stable up to 400°C and radiatively stable at ambient conditions. The combined effect of heat and radiation was not defined.

2840 (SAND--77-1553C) DEVELOPMENT OF A CODED APERTURE FUEL MOTION DIAGNOSTICS SYSTEM FOR THE ACPR (UPGRADE). Kelly, J.G.; Stalker, K.T. (Sandia Labs., Albuquerque, NM (USA)). 1977. Contract EY-76-C-04-0789. 7p. (CONF-771210--1). Dep. NTIS, PC A02/MF A01.

From Meeting on fuel and clad motion diagnostics for fast reactor safety test facilities; Los Alamos, NM, USA (5 Dec 1977).

As part of Sandia Laboratories program to

study simulated core disruptive accidents in reactor safety research, a fuel motion detection system based on coded aperture imaging is being developed. Although fuel motion has been observed at the TREAT by the fast neutron hodoscope and with a Vidicon pinhole camera technique, the coded aperture system described offers a potential for lower cost, higher spatial resolution, three dimensional imaging, and higher frame rates at lower fluences than either of the other techniques.

- 2841 (SAND--77-1556) ELEVATED TEMPERATURE CREEP AND FATIGUE DAMAGE OF A 2.25 CR--1 MO STEEL WELDMENT. Van Den Avyle, J.A. (Sandia Labs., Albuquerque, NM (USA)). Jan 1978. Contract EY-76-C-04-0789. 35p. Dep. NTIS, PC A03/MF A01.

In weldments between dissimilar metals wide variations occur in metallurgical structure and mechanical properties, so that for good structural design it is necessary to understand the mechanical response of individual microstructural segments of the weld. This study investigates elevated temperature properties of a 2.25 Cr--1 Mo ferritic steel base metal welded with Chromenar 382V (Inconel 82) filler metal. Creep and low-cycle fatigue tests at 866°K (1100°F) show the filler metal and heat affected zone to be much stronger than the base metal. Optical microscopy does not show significant aging effects in the short-term fatigue tests or creep tests of 1180 hour duration.

- 2842 (SAND--77-1557) MICROSTRUCTURAL EVALUATION AND NON-DESTRUCTIVE EXAMINATION OF 2.25 CR--1 MO STEEL. Van Den Avyle, J.A.; Jones, W.B.; Gieske, J.H. (Sandia Labs., Albuquerque, NM (USA)). Jul 1978. Contract EY-76-C-04-0789. 61p. Dep. NTIS, PC A04/MF A01.

Specimens of 2.25 Cr-1 Mo steel were damaged to various levels by creep and combined creep-fatigue cycling at 866°K (1100°F) with hold periods. Ultrasonic shear wave velocity measurements were performed and showed small changes with large amounts of creep or fatigue damage; these changes were deemed too small for practical application. Measurements of magnetic properties were unsuccessful in following damage. Optical and transmission electron microscopy (TEM) were performed on the samples. TEM observations showed that microstructural changes which occurred at 866°K (1100°F) did not occur homogeneously throughout the matrix; during creep, carbide spheroidization and coarsening began in widely separated regions, with an increasing fraction of the material undergoing the process with time. A precipitate was observed to form during fatigue which did not occur during simple aging or creep.

- 2843 (SAND--77-1648C) FLASH X-RADIOGRAPHY FOR MATERIAL MOTION DETECTION. Choate, L.M.; Buckalew, W.H.; Posey, L.D. (Sandia Labs., Albuquerque, NM (USA)). 1977. Contract EY-76-C-04-0789. 12p. (CONF-771210--2). Dep. NTIS, PC A02/MF A01.

From Meeting on fuel and clad motion diagnostics for fast reactor safety test facilities; Los Alamos, NM, USA (5 Dec 1977).

A significant part of the experimental program dealing with the behavior of prototypic LMFBR fuel pin bundles under mild to severe power transients is that of the observation of fuel/cladding/coolant motion. The feasibility of using electron beam flash x-radiography as a diagnostic tool for safety test facilities is presently under evaluation. A summary of the

objectives and approach of the flash x-radiography program is presented.

- 2844 (SAND--77-1724) APPLICATION OF CODED SOURCE X-RADIOGRAPHY TO THE OBSERVATION OF NUCLEAR FUEL MOTION. Kelly, J.G. (Sandia Labs., Albuquerque, NM (USA)). Feb 1978. Contract EY-76-C-04-0789. 59p. Dep. NTIS, PC A04/MF A01.

The observation of nuclear fuel motion in the test section of a reactor designed for fast reactor safety experiments may be possible with an intense x-ray source. A study has indicated that during peak driver core power a high power relativistic electron accelerator may be required. The coded source technique allows high spatial resolution to be recovered without serious loss in detection efficiency. The results are summarized of the first application of the method to this broad spectrum, high energy realm using the Hermes II facility (10 MeV, 100 kA, 70 ns). A reconstruction of an LMFBR nuclear fuel pin shaped object has been obtained with 3 mm spatial resolution from a source that is 1.3 cm wide and 20 cm long.

- 2845 (SAND--77-1727) REVIEW OF NUCLEAR FUEL CYCLE ALTERNATIVES INCLUDING CERTAIN FEATURES PERTAINING TO WEAPON PROLIFERATION. Williams, D.C.; Rosenstroch, B. (Sandia Labs., Albuquerque, NM (USA)). Jan 1978. Contract EY-76-C-04-0789. 51p. Dep. NTIS, PC A04/MF A01.

Largely as a result of concerns over nuclear weapon proliferation, the U.S. program to develop and commercialize the plutonium-fueled breeder reactor has been slowed down; interest in alternative fuel cycles has increased. The report offers an informal review of the various nuclear fuel cycle options including some aspects relevant to weapon proliferation, although no complete review of the latter subject is attempted. Basic principles governing breeding, reactor safety, and efficient utilization of fission energy resources (thorium and uranium) are discussed. The controversial problems of weapon proliferation and its relation to fuel reprocessing (which is essential for efficient fuel cycles) are reviewed and a number of proposed approaches to reducing proliferation risks are noted. Some representative specific reactor concepts are described, with emphasis on their development status, their potentials for resource utilization, and their implications for proliferation.

- 2846 (SAND--77-1828C) PRELIMINARY RESULTS FROM INITIAL IN-PILE DEBRIS BED EXPERIMENTS. Rivard, J.B. (Sandia Labs., Albuquerque, NM (USA)). 1977. Contract EY-76-C-04-0789. 14p. (CONF-771109--62). Dep. NTIS, PC A02/MF A01.

From ANS winter meeting; San Francisco, CA, USA (27 Nov 1977).

An accident in a liquid metal fast breeder reactor (LMFBR) in which molten core material is suddenly quenched with subcooled liquid sodium could result in extensive fragmentation and dispersal of fuel as subcritical beds of frozen particulate debris within the reactor vessel. Since this debris will continue to generate power due to decay of retained fission products, containment of the debris is threatened if the generated heat is not removed. Therefore, the initial safety question is the capacity which debris beds may have for transfer of the decay heat to overlying liquid sodium by natural processes--i.e., without the aid of forced circulation of the coolant. Up to the present time, all experiments on debris bed

behavior either have used substitute materials (e.g., sand and water) or have employed actual materials, but atypical heating methods. Increased confidence in the applicability of debris bed simulations is afforded if the heat is generated within the fuel component of the appropriate fast reactor materials. The initial series of in-pile tests reported on herein constitutes the first experiments in which the internal heating mode has been produced in particulate oxide fuel immersed in liquid sodium. Fission heating of the fully-enriched UO_2 in the experiment while it is contained within Sandia Laboratories Annular Core Pulse Reactor (ACPR), operating in its steady-state mode, approximates the decay heating of debris. Preliminary results are discussed.

- 2847 (SAND--77-1975) ADVANCED REACTOR SAFETY RESEARCH PROGRAM. QUARTERLY REPORT, JULY--SEPTEMBER 1977. (Sandia Labs., Albuquerque, NM (USA)). May 1978. Contract EY-76-C-04-0789. 148p. Dep. NTIS, PC A07/MF A01.

Progress is summarized in the following LMFBR-related safety studies: (1) accident energetics, (2) core debris behavior, (3) sodium containment and structural integrity, (4) research of elevated temperature design criteria, (5) fuel motion detection, (6) ACPR fuel motion system, and (7) advanced reactor safety research assessment. (DG)

- 2848 (SAND--78-0078C) MEASUREMENT OF THE PENETRATION OF LIQUID SODIUM INTO LIMESTONE CONCRETE. Sutherland, H.J.; Kent, L.A. (Sandia Labs., Albuquerque, NM (USA)). 1978. Contract EY-76-C-04-0789. 7p. (CONF-780622--8). Dep. NTIS, PC A02/MF A01.

From ANS annual meeting; San Diego, CA, USA (18 Jun 1978).

A pulse-echo ultrasonic system is used to monitor the movement of the interface created by pouring hot, liquid sodium onto limestone concrete. The essence of this system is to measure the time required for an acoustic signal, generated by the transmitting transducer, to traverse the specimen, reflect at the pool/concrete interface, and then retrace the sample.

- 2849 (SAND--78-0216C) NETWORK MODEL OF FREE CONVECTION WITHIN INTERNALLY HEATED POROUS MEDIA. Conrad, P.W. (Sandia Labs., Albuquerque, NM (USA)). 1978. Contract EY-76-C-04-0789. 6p. (CONF-780622--6). Dep. NTIS, PC A02/MF A01.

From ANS annual meeting; San Diego, CA, USA (18 Jun 1978).

Portions of document are illegible.

A hypothetical core-disruptive accident in a liquid metal fast breeder reactor may result in the formation of an internally heated debris bed which is immersed in liquid sodium. A method is demonstrated for computing the heat transfer from such a bed to the overlying sodium pool due to single-phase, free convection.

- 2850 (SAND--78-0232C) PROMPT BURST ENERGETICS EXPERIMENTS URANIUM CARBIDE SERIES. Reil, K.O.; Young, M.F.; Plitz, H. (Sandia Labs., Albuquerque, NM (USA); Gesellschaft fuer Kernforschung m.b.H., Karlsruhe (Germany, F.R.)). 1978. Contract EY-76-C-04-0789. 14p. (CONF-780622--21). Dep. NTIS (US Sales Only), PC A02/MF A01.

From ANS annual meeting; San Diego, CA, USA (18 Jun 1978).

A series of three prompt burst energetics

(PBE) experiments utilizing fresh uranium carbide fuel and stagnant sodium coolant were performed in Sandia Laboratories Annular Core Pulse Reactor (ACPR). These experiments (PBE-SG1, -SG2, and -SG3) were collaborative efforts between the Breeder Reactor Project, GfK, Karlsruhe, West Germany, and Sandia Laboratories. PBE experiments are designed to study the energetic response of various reactor fuel-clad-coolant systems under superprompt critical conditions. The direct aim is to identify and characterize the phenomena resulting in pressure generation and the conversion of thermal energy to work.

- 2851 (SAND--78-0233C) CODED APERTURE IMAGING IN MANY-PIN FUEL BUNDLES. McArthur, D.A.; Halbleib, J.A. Sr.; Morel, J.E. (Sandia Labs., Albuquerque, NM (USA)). [nd]. Contract EY-76-C-04-0789. 12p. (CONF-780622--17). Dep. NTIS, PC A01/MF A01.

From ANS annual meeting; San Diego, CA, USA (18 Jun 1978).

As part of the experimental fast reactor safety research program at Sandia Laboratories for the Nuclear Regulatory Commission, the problems of fuel motion imaging in safety tests on a variety of facilities (ACPR UPGRADE, TREAT, TREAT UPGRADE, STF, CABRI) are being studied. Coded aperture imaging of both neutrons and gamma rays from many-pin fuel bundles is being studied. Realistic, detailed calculations are reported on gamma ray coded aperture imaging in many-pin bundles, and preliminary experiments on coded aperture imaging with fast neutrons.

- 2852 (SAND--78-0236C) SAS3A CALCULATIONS FOR FORCED CONVECTION SODIUM BOILING AT LOW POWER. Eisenhower, S.W.; Heames, T.J. (Washington Univ., Seattle (USA); Argonne National Lab., IL (USA)). 1978. Contract EY-76-C-04-0789. 7p. (CONF-780622--16). Dep. NTIS (US Sales Only), PC A02/MF A01.

From ANS annual meeting; San Diego, CA, USA (18 Jun 1978).

Recently, sodium boiling experiments have been performed using a gamma-heated bundle in the French test reactor Rapsodie. The amount of thermal energy that can be produced with this method is small, typically 1 to 10 kW/m² pin. In terms of the thermalhydraulics involved, this type of experiment can be classified as forced convection boiling at low heat flux since, by design, a small but positive net flow exists during boiling. The characteristics (low power, small coolant mass flux, and net upward flow) are different from those normally examined. In order to better understand such tests, out-of-core experiments were performed using electrically-heated seven rod bundles at the Kernforschungszentrum Karlsruhe (KfK). The paper examines a comparison between the data obtained in the KfK experiments and calculations performed with the SAS3A computer code.

- 2853 (SAND--78-0247C) CONCEPTUAL DESIGNS OF SPENT-FUEL SHIPPING CASKS FOR THE U.S. BREEDER REACTOR TECHNOLOGY PROGRAM. Allen, G.C. Jr.; Freedman, J.M. (Sandia Labs., Albuquerque, NM (USA)). 1978. Contract EY-76-C-04-0789. 18p. (CONF-780506--7). Dep. NTIS, PC A02/MF A01.

From 5. symposium on packaging and transportation of radioactive materials; Las Vegas, NV, USA (7 May 1978).

Portions of document are illegible.

Conceptual designs of spent-fuel shipping casks for use by facilities participating in the Breeder Reactor Program have been developed

by Sandia Laboratories, Albuquerque, New Mexico. Some aspects of conceptual designs that are reviewed are interface requirements and cask design features. The major emphasis of the work to date has been to develop cask designs which would be suitable for use at the Fast Flux Test Facility (FFTF) and the Clinch River Breeder Reactor Plant (CRBRP). However, the advanced technology utilized in developing spent-fuel shipping-cask designs for these facilities results in many cask features which would be required by all breeder reactor plants.

- 2854 (SAND--78-0252C) SENSITIVITY STUDY OF LMFBR CORE DISASSEMBLIES. Ostensen, R.W. (Sandia Labs., Albuquerque, NM (USA)). 1978. Contract EY-76-C-04-0789. 7p. (CONF-780622--22). Dep. NTIS, PC A02/MF A01. From ANS annual meeting; San Diego, CA, USA (18 Jun 1978).

The primary concern with respect to a prompt critical excursion in an LMFBR is whether the primary containment will be damaged, leading to an early release of radioactivity. The study examines the sensitivity of the damage potential of a core disassembly to ramp rate through prompt critical; initial power level; fuel heat capacity; fuel vapor pressure.

- 2855 (SAND--78-0255C) EFFECT OF CREEP ON THERMAL FRACTURING IN OXIDE CRUSTS. Lipinski, R.J. (Sandia Labs., Albuquerque, NM (USA)). 1978. Contract EY-76-C-04-0789. 7p. (CONF-780622--4). Dep. NTIS, PC A02/MF A01. From ANS annual meeting; San Diego, CA, USA (18 Jun 1978).

The stability of a fuel crust, especially on a molten sublayer such as steel, has been the subject of several papers. If the fuel crust is found to be unstable, the effect on a core-disruption accident could be far reaching: fuel would freeze more quickly in the structure above and below the core causing a plug and limiting the amount of early fuel dispersal, and high heat transfer to uninsulated walls, along with entrainment of cool steel droplets, would cool the fuel pool and reduce the amount of boilup. In a single subassembly accident, ablation of the walls would increase, thus increasing the amount of radial damage and the possibility of accident propagation. Conversely, a stable fuel crust would in general delay wall ablation and enhance upward fuel dispersal. It was recently proposed by Ostensen that a fuel crust would crack from thermal stress alone through as much as 75% of its thickness. In that paper, the effect of creep was left for future study. It is the purpose of this work to investigate that effect. A fuel crust growing on a layer of molten steel was considered.

- 2856 (SAND--78-0257C) CLOSE-IN SAMPLING OF AEROSOLS FROM FISSION VAPORIZED UO_2 FUEL. Elrick, R.M. (Sandia Labs., Albuquerque, NM (USA)). 1978. Contract EY-76-C-04-0789. 3p. (CONF-780622--9). Dep. NTIS, PC A02/MF A01.

From ANS annual meeting; San Diego, CA, USA (18 Jun 1978).

In order to assess the threat to public safety in the hypothesized event of a breach of containment following a core disruptive accident, it is necessary to know precisely the state and transport characteristics of the aerosols produced in the hypothesized accident. Data on the initial characteristics of these aerosols produced from neutronically heated fuel do not presently exist. The purpose of the Sandia in-pile aerosol experimental program is

to study the generation and transport of fuel debris produced from fission heating of reactor fuels as the debris interacts and is modified by structure and coolant. The paper covers the initial phase of the program in which a bare pin of fresh UO_2 was heated into the two phase liquid-vapor state by a 2380 kJ/kg 5 ms FWHM pulse. Close-in time-resolved sampling of the fuel particles established an aerosol source term for the fuel.

- 2857 (SAND--78-0266C) FIRST VISUAL IN-PILE FUEL DISRUPTION EXPERIMENTS. Cano, G.L. (Sandia Labs., Albuquerque, NM (USA)). 1978. Contract EY-76-C-04-0789. 10p. (CONF-780622--11). Dep. NTIS, PC A02/MF A01. From ANS annual meeting; San Diego, CA, USA (18 Jun 1978).

A number of in-pile and out-of-pile experiments as well as analytical studies have addressed LMFBR fuel disruption: several disruption models have been discussed in the literature. Hypotheses have included, among others, that the fuel could: (1) breakup rapidly in a 'dust-cloud'; (2) swell in the solid or liquid state to a 'froth' with fission gas forming the discontinuous phase; or (3) melt and slump with release of fission gas. Sandia Fuel Disruption Experiments are described which have been designed to study this phenomenology and to clarify this issue.

- 2858 (SAND--78-0274C) FUEL PIN MODELING FOR THE PROMPT BURST EXCURSION (PBE) EXPERIMENTS. Young, M.F. (Sandia Labs., Albuquerque, NM (USA)). 1978. Contract EY-76-C-04-0789. 5p. (CONF-780622--1). Dep. NTIS, PC A02/MF A01.

From ANS annual meeting; San Diego, CA, USA (18 Jun 1978).

A series of in-pile experiments has been conducted at Sandia Laboratories to provide information on pressure levels and conversion of thermal energy into mechanical work in various advanced fuel-coolant systems during hypothetical, superprompt critical excursions. Identification of the phenomena causing pressure generation requires knowledge of the thermodynamic state of the fuel and coolant at the time of pin failure and fuel-coolant motion and mixing following pin failure. The paper describes the salient features of a pin model, EXPAND, used to predict pin failure time and location, and to calculate internal fuel motion and the temperature profile in the fuel-clad-coolant system up to the time of failure.

- 2859 (SAND--78-0363C) ANALYSIS OF IN-PILE FUEL DISRUPTION EXPERIMENTS. Ostensen, R.W.; Young, M.F. (Sandia Labs., Albuquerque, NM (USA)). 1978. Contract EY-76-C-04-0789. 5p. (CONF-780622--3). Dep. NTIS, PC A02/MF A01.

From ANS annual meeting; San Diego, CA, USA (18 Jun 1978).

For analysis of a loss-of-flow (LOF) accident in an LMFBR, knowledge of the mode of disruption of irradiated fuel is of critical importance. In addition, to determine whether the reactor can undergo a severe prompt critical power excursion it is important to know the time of onset and rate of fuel dispersal, if any. A series of experiments has been performed at Sandia Laboratories to provide the necessary data base. The failure of irradiated fuel in the ACPR reactor was recorded by high speed cinematography. The paper compares the experimental data to available fuel disruption models, and indicates the model improvements needed to reconcile the models with the data.

2860 (SAND--78-0437C) IN-REACTOR EXPERIMENTS ON THE COOLING OF FAST REACTOR DEBRIS. Rivard, J.B. (Sandia Labs., Albuquerque, NM (USA)). 1978. Contract EY-76-C-04-0789. 10p. (CONF-781022--8). Dep. NTIS, PC A02/MF A01.

From Meeting on nuclear power reactor safety; Brussels, Belgium (16 Oct 1978).

Following a reactor accident, particulate debris beds may be formed. The primary safety question is, "Will decay-heated debris beds be cooled by the overlying sodium, or will they again melt and threaten the containment." This paper describes the first debris bed experiments using internally-heated oxide fuel in liquid sodium, summarizes the results from the first three in-reactor experiments, provides a description of an analysis of the sustained dryout phenomenon which occurred during the third experiment, and offers an important conclusion on debris bed dryout.

2861 (SAND--78-0742C) LEAKAGE EFFECTS ON LMFBR CELL LINERS. Stone, C.M.; Gartling, D.K.; Nickell, R.E. (Sandia Labs., Albuquerque, NM (USA); Pacifica Technology, Del Mar, CA (USA)). 1978. Contract EY-76-C-04-0789. 40p. (CONF-780609--4). Dep. NTIS, MF A01.

From ASME/CSME pressure vessels and piping conference; Montreal, Canada (25 Jun 1978).

Portions of document are illegible.

The thermostructural effects of a molten sodium spill onto a Liquid Metal Fast Breeder Reactor (LMFBR) cell liner are investigated utilizing a geometrically simple finite element model. The sodium spill is considered for various flow rate regimes. Because the actual characteristics of a spill are unknown, a parametric analysis was performed with the size of spill and heat transfer coefficient as variables.

2862 (SAND--78-0939C) INFLUENCE OF GAS GENERATION ON HIGH-TEMPERATURE MELT/CONCRETE INTERACTIONS. Powers, D.A. (Sandia Labs., Albuquerque, NM (USA)). 1979. Contract EY-76-C-04-0789. 3p. (CONF-790111--5). Dep. NTIS, PC A02/MF A01.

From International symposium on thermodynamics of nuclear materials; Julich, F.R. Germany (29 Jan 1979).

Accidents involving fuel melting and eventual contact between the high temperature melt and structural concrete may be hypothesized for both light water thermal reactors and liquid metal cooled breeder reactors. Though these hypothesized accidents have a quite low probability of occurring, it is necessary to investigate the probable natures of the accidents if an adequate assessment of the risks associated with the use of nuclear reactors is to be made. A brief description is given of a program addressing the nature of melt/concrete interactions which has been underway for three years at Sandia Laboratories. Emphasis in this program has been toward the behavior of prototypic melts of molten core materials with concrete representative of that found in existing or proposed reactors. The goals of the experimentation have been to identify phenomena particularly pertinent to questions of reactor safety, and phenomena particularly pertinent to questions of reactor safety, and provide quantitative data suitable for the purposes of risk assessment.

CONDITIONS: I. FAST REACTOR DEBRIS BED EXPERIMENTS. II. MOLTEN CORE PENETRATION MEASUREMENTS. Rivard, J.B.; Sutherland, H.J. (Sandia Labs., Albuquerque, NM (USA)). 1978. Contract EY-76-C-04-0789. 10p. (CONF-781022--6). Dep. NTIS, PC A02/MF A01.

From Meeting on nuclear power reactor safety; Brussels, Belgium (16 Oct 1978).

Following a fast reactor accident, particulate debris beds may be formed. The paper describes the first debris bed experiments using internally-heated oxide fuel in liquid sodium, summarizes the results from the first three in-reactor experiments, and offers an important conclusion on debris bed dryout. An acoustic technique is described which has been used to monitor the penetration of molten core materials into concrete. The measured initial penetration rate of the melt is of the order of 60 mm/min.

2864 (SAND--78-1249C) DEBRIS BED AND SACRIFICIAL MATERIALS INTERACTIONS AT HIGH TEMPERATURES. Plein, H.G.; Carlson, G.A. (Sandia Labs., Albuquerque, NM (USA)). 1978. Contract EY-76-C-04-0789. 5p. (CONF-781105--48). Dep. NTIS, PC A02/MF A01.

From ANS meeting; Washington, DC, USA (12 Nov 1978).

A series of high temperature furnace experiments were conducted to examine materials interactions under possible post-accident heat removal conditions following a hypothetical core disruptive accident. The study of material interaction within simulated dried-out debris beds and between such debris beds and candidate core retention materials produced results with significant reactor safety implications. Urania sintering dependence on particle size was examined because sintering may determine characteristics of the crust between molten fuel and structural or sacrificial material. The behavior of a mixed UO_2 /steel simulated debris bed was studied above the steel melting point. Finally the interaction of a particulate UO_2 bed with Harklase (98% MgO) brick was examined at various temperatures to determine the characteristics to be expected.

2865 (SAND--78-1251C) INTERPRETATION OF DEBRIS BED DRYOUT OBSERVED DURING THE D-3 EXPERIMENT. Rivard, J.B. (Sandia Labs., Albuquerque, NM (USA)). 1978. Contract EY-76-C-04-0789. 5p. (CONF-781105--39). Dep. NTIS, PC A02/MF A01.

From ANS meeting; Washington, DC, USA (12 Nov 1978).

In the D-3 experiment, a nominally 158 mm-deep particle bed was formed by 7.29 kg of UO_2 . The sodium volume fraction within the bed was 0.43. Runs were performed at bulk sodium temperatures of 773, 673, and 873 K. Dryout (liquid voidage by vapor blanketing) of a shallow zone at the bottom of the bed occurred when the power was increased in the already-boiling and convecting bed at 773 and 673 K. Temperature limitations on the experiment prevented the attainment of dryout at 873 K. Measurements and analysis of dryout observed during the D-3 experiment show: (1) the observed temperature transients during dryout can be explained in terms of a conduction process in an expanding zone; (2) the expansion is a displacement process; (3) expansion of the zone reduces the height of the overlying convection zone; and (4) while bed dryout may be a necessary condition for remelting of the fuel to occur, it may not always be a sufficient condition.

2863 (SAND--78-1223C) POST-ACCIDENT

2866 (SAND--78-1336C) TIME-RESOLVED

PENETRATION MEASUREMENTS OF LIQUID SODIUM INTO LIMESTONE CONCRETE. Smaardyk, J.E.; Sutherland, H.J.; Kent, L.A. (Sandia Labs., Albuquerque, NM (USA)). 1978. Contract EY-76-C-04-0789. 9p. (CONF-781105--26). Dep. NTIS, PC A02/MF A01.

From ANS meeting; Washington, DC, USA (12 Nov 1978).

The treatment of post-accident containment problems for advanced reactors requires an understanding of how the structural concrete beneath the reactor vessel behaves when subjected to molten reactor plant materials. Of special interest is the case of a sodium spill because the resulting chemical reactions are exothermic and generate considerable quantities of gas. An important parameter in these reactions is the rate at which the reaction zone penetrates the concrete.

2867 (SAND--78-1625) CODED APERTURE IMAGING: A COMPARISON BETWEEN FRESNEL ZONE APERTURES AND UNIFORMLY REDUNDANT ARRAY APERTURES. Chu, K.W. (Sandia Labs., Albuquerque, NM (USA)). Oct 1978. Contract EX-76-C-04-0789. 61p. Dep. NTIS, PC A04/MF A01.

Using computer simulations, comparisons are made between a one-dimensional Fresnel zone aperture and a one dimensional uniformly redundant array aperture. In the former case, artifacts may produce severe distortions in the reconstructed image, and an iterative technique to remove these artifacts is described. In comparison to the Fresnel zone aperture, images reconstructed from uniformly redundant array apertures have few artifacts. A quantum noise analysis for the uniformly redundant array is presented to indicate the conditions under which a uniformly redundant array will produce a signal-to-noise advantage compared to an equivalent pinhole aperture.

2868 (SAND--78-1754C) COOLING OF PARTICULATE DEBRIS BEDS: ANALYSIS OF THE INITIAL D-SERIES EXPERIMENTS. Rivard, J.B. (Sandia Labs., Albuquerque, NM (USA)). 1978. Contract EY-76-C-04-0789. 11p. (CONF-781079--1). Dep. NTIS, PC A02/MF A01.

From Postaccident heat removal information exchange; Ispra, Italy (10 Oct 1978).

In an effort to provide basic data on the cooling of fast reactor debris, three in-pile experiments employing oxide fuel particulate in liquid sodium were completed in late 1977. Preliminary results from these experiments were reported shortly after their completion at the Third Post-Accident Heat Removal Information Exchange, at Argonne National Laboratory. In these experiments, a distribution of 100 μ m to 1000 μ m-sized particles of enriched UO_2 was fission-heated to simulate decay-heated debris. In each experiment, the UO_2 particles were contained in a closed, flat-bottomed vessel 012 mm in diameter which was insulated on the diameter and bottom. Sufficient sodium was included to saturate the bed of particles and to provide a volume of bulk sodium above the bed at a controlled temperature. Parameters of interest in the experiments are given.

2869 (SAND--78-1910C) COMPARISON OF FISGAS SWELLING AND GAS RELEASE PREDICTIONS WITH EXPERIMENT. Ostensen, R.W. (Sandia Labs., Albuquerque, NM (USA)). 1979. Contract EY-76-C-04-0789. 12p. (CONF-790310--4). Dep. NTIS, PC A02/MF A01.

From Specialists workshop on predictive analysis of material dynamics in LMFBR safety expts; Los Alamos, NM, USA (13 Mar 1979).

FISGAS calculations were compared to fuel swelling data from the FDI tests and to gas

release data from the FGR39 test. Late swelling and gas release predictions are satisfactory if vacancy depletion effects are added to the code. However, early swelling predictions are not satisfactory, and early gas release predictions are very poor. Explanation of these discrepancies is speculative.

2870 (SAND--78-1919C) PIN FAILURE MODELING OF THE A SERIES CABRI TESTS. Young, M.F.; Portugal, J.L. (Sandia Labs., Albuquerque, NM (USA)). 1978. Contract EY-76-C-04-0789. 4p. (CONF-790310--2). Dep. NTIS, PC A02/MF A01.

From Specialists workshop on predictive analysis of material dynamics in LMFBR safety expts; Los Alamos, NM, USA (13 Mar 1979).

The EXPAND pin failure model, a research tool designed to model pin failure under prompt burst conditions, has been used to predict failure conditions for several of the A series CABRI tests as part of the United States participation in the CABRI Joint Project. The Project is an international program involving France, Germany, England, Japan, and the United States and has the goal of obtaining experimental data relating to the safety of LMFBR's. The A series, designed to simulate high ramp rate TOP conditions, initially utilizes single, fresh UO_2 pins of the PHENIX type in a flowing sodium loop. The pins are preheated at constant power in the CABRI reactor to establish steady state conditions (480 w/cm at the axial peak) and then subjected to a power pulse of 14 ms to 24 ms duration (PWHM).

2871 (SAND--78-2085C) FUEL PIN MODELING OF THE FRESH OXIDE/SODIUM PROMPT BURST ENERGETICS EXPERIMENTS. Young, M.F. (Sandia Labs., Albuquerque, NM (USA)). 1978. Contract EY-76-C-04-0789. 7p. (CONF-790310--1). Dep. NTIS, PC A02/MF A01.

From Specialists workshop on predictive analysis of material dynamics in LMFBR safety expts; Los Alamos, NM, USA (13 Mar 1979).

A series of in-pile experiments has been conducted at Sandia Laboratories to provide information on pressure levels and conversion of thermal energy into mechanical work in various advanced fuel-coolant systems during hypothetical, superprompt critical excursions. Identification of the phenomena causing pressure generation requires knowledge of the thermodynamic state of the fuel and coolant at the time of pin failure and fuel-coolant motion and mixing following pin failure. Experimental data from the UO_2/Na Prompt Burst Energetics (PBE) series are compared to the results obtained from a pin model, EXPAND, used to predict pin failure time and location, internal fuel motion and the temperature profile in the fuel-clad-coolant system up to the time of failure. The model uses a Larson--Miller Parameter-life fraction rule criterion to determine failure.

2872 (SAND--78-2140C) MEASUREMENT AND ANALYSIS OF TRANSIENT VAPORIZATION IN OXIDE FUEL MATERIALS. Gorham-Bergeron, E.; Benson, D.A. (Sandia Labs., Albuquerque, NM (USA)). 1978. Contract EY-76-C-04-0789. 25p. (CONF-790111--4; IAEA-SM--236/60). Dep. NTIS, PC A02/MF A01.

From International symposium on thermodynamics of nuclear materials; Julich, F.R. Germany (29 Jan 1979).

A series of experiments is described in which samples are heated to produce high vapor pressure states in times of 10^{-6} to 10^{-3} seconds. Experimental measurements of vapor

pressures over fresh UO_2 from the pulsed electron beam and pulsed reactor heating tests are presented and compared with other high temperature data. The interpretation of the vapor pressures measured in the tests is discussed in detail. Effects of original sample stoichiometry, chemical interactions with the container and non-equilibrium evaporation due to induced temperature gradients are discussed. Special attention is given to dynamic behavior in rapid heating and vaporization of the oxide due to chemical nonequilibrium. Finally, similar projected reactor experiments on irradiated fuel are described and vapor pressure predictions made using available equilibrium models. A discussion of information accessible from such future tests and its importance is presented.

- 2873 (SAND--78-2191) DEFORMATION OF THE SANDIA METALLIC RING SEAL TEST FIXTURE. Sagartz, M.J. (Sandia Labs., Albuquerque, NM (USA)). Jan 1979. Contract EY-76-C-04-0789. 19p. Dep. NTIS, PC A02/MF A01.

A fixture being used at Sandia Laboratories Albuquerque for testing a metallic ring-type seal is described and analyzed. Formulas for the deformation of the fixture are derived based on a simple mathematical model. Numerical results are presented for a set of parameters typical of an actual test. The seal is applicable to LMFBR spent fuel shipping casks.

- 2874 (SAND--79-0057C) STUDY OF THE DISPERSIVE POTENTIAL OF IRRADIATED FUEL USING IN-CORE EXPERIMENTS. Worledge, D.H.; Cano, G.L. (Sandia Labs., Albuquerque, NM (USA)). 1979. Contract EY-76-C-04-0789. 10p. (CONF-790816--42). Dep. NTIS, PC A02/MF A01. From International meeting on fast reactor safety technology; Seattle, WA, USA (19 Aug 1979).

Under prompt burst conditions the work potential of expanding fuel vapor is a sensitive function of the ability of fission product gases to cause fuel dispersal milliseconds before dispersal would occur from fuel vapor pressure alone. This relation is of potentially significant importance and merits investigation. A fuel disruption experiment at Sandia Laboratories exhibited rapid disruption probably below but near the fuel melt temperature. The fuel was being heated at 130K/msec when vigorous dispersal occurred in the hottest regions near the fuel melting point. Fuel vapor could not have been responsible. Dispersal is attributed to rapid release of fission product gases under the prompt burst conditions. Further tests are planned to explore this important phenomenon.

- 2875 (SAND--79-0079C) PROMPT BURST ENERGETICS IN THE OXIDE/SODIUM SYSTEM. Reil, K.O.; Young, M.F. (Sandia Labs., Albuquerque, NM (USA)). 1979. Contract EY-76-C-04-0789. 10p. (CONF-790816--34). Dep. NTIS, PC A02/MF A01.

From International meeting on fast reactor safety technology; Seattle, WA, USA (19 Aug 1979).

A series of twelve Prompt Burst Energetics (PBE) experiments utilizing fresh uranium dioxide fuel pins in stagnant sodium coolant has been performed in Sandia Laboratories' Annular Core Pulse Reactor (ACPR). Results and analysis described in the paper include: observation of FCIs (pressures up to 32 MPa) in the UO_2/Na system, some apparently triggered by small pressure transients (2 MPa); prediction of failure times via the pin model EXPAND; observed thermal-to-mechanical energy

conversion ratios up to approximately 0.4%; and identification of potential reactivity effects caused by the pre- and post-failure motion of fuel.

- 2876 (SAND--79-0081C) SUMMARY OF THE FIRST THREE IN-CORE PAHR MOLTEN FUEL POOL EXPERIMENTS. Plein, H.G.; Lipinski, R.J.; Carlson, G.A.; Varela, D.W. (Sandia Labs., Albuquerque, NM (USA)). 1979. Contract EY-76-C-04-0789. 11p. (CONF-790816--52(Summ.)). Dep. NTIS, PC A02/MF A01.

From International meeting on fast reactor safety technology; Seattle, WA, USA (19 Aug 1979).

Results from the first three Sandia in-core molten pool experiments are reviewed. Incipient melt of a fully enriched dry bed of UO_2 was achieved in the first experiment while 30g of UO_2 was melted in the second. The melting region developed a void surrounded by a dense crust as indicated by post-test x-radiographs. In the third experiment, a steel layer was melted by an overlying layer of UO_2 . Post-test x-radiographs showed no obvious penetration of the steel into the UO_2 porous matrix. Ultrasonic thermometry was used successfully to measure temperatures up to 3100°K. The thermal histories of the in-core experiments were satisfactorily modeled using conduction theory only. Disassembly of the experiment packages will be performed shortly.

- 2877 (SAND--79-0082C) STUDY OF HEAT TRANSFER FROM A FLOWING LIQUID TO A MELTING WALL. Eisenhower, S.W.; Lee, D.O.; Corradini, M.L.; Ostensen, R.W.; Gonzalez, F. (Sandia Labs., Albuquerque, NM (USA)). 1979. Contract EY-76-C-04-0789. 23p. (CONF-790816--36). Dep. NTIS, PC A02/MF A01.

From International meeting on fast reactor safety technology; Seattle, WA, USA (19 Aug 1979).

In order to investigate fuel freezing phenomenology in the transition phase of an LMFBR accident, a separate effects experiment was conducted. These tests investigated the melting behavior of an ice pipe due to warm refrigerant (R-11) flow. For turbulent flow, the water film is not entrained and the Nusselt number is not sensitive to the Reynolds number for a fixed mass flow rate. A thin film heat transfer model shows good agreement with the experimental results. When this thin film model is applied to the transient freezing and melting process in a fuel-steel LMFBR system, the predicted fuel penetration distance is in very good agreement with the experimental results of Spencer and Henry. This is an improvement over past fuel freezing models.

- 2878 (SAND--79-0091C) DEBRIS BED HEAT REMOVAL MODELS: BOILING AND DRYOUT WITH TOP AND BOTTOM COOLING. Lipinski, R.J.; Rivard, J.B. (Sandia Labs., Albuquerque, NM (USA)). 1979. Contract EY-76-C-04-0789. 14p. (CONF-790816--40). Dep. NTIS, PC A02/MF A01.

From International meeting on fast reactor safety technology; Seattle, WA, USA (19 Aug 1979).

A one-dimensional deep bed model for incipient dryout is developed which predicts deep bed behavior but not shallow bed behavior. A fluidization criterion results which indicates that a debris bed cannot be fluidized by the vapor flow. However, the maintenance of channels within the bed is predicted. A top-subcooled bed model is presented and evidence (both experimental and calculational) is given that the top-subcooled zone removes heat in series (not in parallel) with the boiling zone

- for sodium-cooled systems. The Sandia D-2 and D-3 top-subcooled dryout data is expressed in terms of non-subcooled dryout and compared with experimental data and model predictions from the literature. The data agrees with several predictions depending on whether the dryout in the boiling zone is dependent on the overlying subcooled zone thickness. A bottom-subcooled bed model is also presented. A post-dryout model is developed to explain the stable dry zone observed in the D-3 experiment and agreement with the data is found. Finally, the top-subcooled and post-dryout models developed are used to make predictions for the upcoming D-4 experiment.
- 2879 (SAND--79-0107C) ANALYSIS OF SANDIA IN-PILE EOS EXPERIMENTS. Breitung, W.; Gorham-Bergeron, E.; Murata, K.K. (Sandia Labs., Albuquerque, NM (USA)). 1979. Contract EY-76-C-04-0789. 10p. (CONF-790816--45). Dep. NTIS, PC A02/MF A01.
From International meeting on fast reactor safety technology; Seattle, WA, USA (19 Aug 1979).
Preliminary analysis has been carried out of the dynamic in-pile equation-of-state measurements for UO_2 , conducted at Sandia Laboratories, aimed at reducing the uncertainties in the effective UO_2 enthalpy corresponding to the measured pressures. Of the remaining width of the p-H band of some 350 J/g, about 200 J/g originate in the uncertainties of the analytical modelling and about 150 J/g result from the scatter in the experimental data.
- 2880 (SAND--79-0112C) PROMPT BURST ENERGETICS (PBE) EXPERIMENT ANALYSES USING THE SIMMER-II COMPUTER CODE. Tomkins, J.L.; Hitchcock, J.T.; Young, M.F. (Los Alamos Scientific Lab., NM (USA); Sandia Labs., Albuquerque, NM (USA)). 1979. Contract EY-76-C-04-0789. 10p. (CONF-790816--47). Dep. NTIS, PC A02/MF A01.
From International meeting on fast reactor safety technology; Seattle, WA, USA (19 Aug 1979).
Two of the Prompt Burst Energetics (PBE) in-pile experiments conducted at Sandia Laboratories PBE-5S and PBE-SG2, have been investigated with SIMMER-II. These two tests utilize fresh uranium oxide and fresh uranium carbide pins, respectively, in stagnant sodium. The purpose of the analysis is to investigate the applicability of SIMMER-II to this type of experiment. Qualitative agreement with measured data is seen for PBE-5S. PBE-SG2 results agree somewhat less well but demonstrate SIMMER-II's potential for describing fuel-coolant-interactions with further model development.
- 2881 (SAND--79-0123C) FUEL-COOLANT INTERACTION-PHENOMENA UNDER PROMPT BURST CONDITIONS. Jacobs, H.; Young, M.F.; Reil, K.O. (Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.); Sandia Labs., Albuquerque, NM (USA)). 1979. Contract EY-76-C-04-0789. 9p. (CONF-790816--33). Dep. NTIS, PC A02/MF A01.
From International meeting on fast reactor safety technology; Seattle, WA, USA (19 Aug 1979).
The Prompt Burst Energetics (PBE) experiments conducted at Sandia Laboratories are a series of in-pile tests with fresh uranium oxide or uranium carbide fuel pins in stagnant sodium. Fuel-coolant-interactions in PBE-9S (oxide/sodium system) and PBE-SG2 (carbide/sodium) have been analyzed with the MURTI parametric FCI code. The purpose is to gain insight into possible FCI scenarios in the experiments and sensitivity of results to input parameters. Results are in approximate agreement for the second (triggered) event in PBE-9S (32 MPa peak) and the initial interaction in PBE-SG2 (190 MPa peak).
- 2882 (SAND--79-0126C) MEDIUM-SCALE MELT-SODIUM FRAGMENTATION EXPERIMENTS. Chu, T.Y.; Beattie, A.G.; Drotning, W.D.; Powers, D.A. (Sandia Labs., Albuquerque, NM (USA)). 1979. Contract EY-76-C-04-0789. 15p. (CONF-790816--35). Dep. NTIS, PC A02/MF A01.
From International meeting on fast reactor safety technology; Seattle, WA, USA (19 Aug 1979).
The results of a series of fragmentation experiments involving up to 20 Kg of thermitically produced high temperature melts and 23 Kg of sodium are presented. Except for one experiment where some centimeter size particles are observed, the fragment distributions seem to be in the range of previous data. Spatial distribution of the fragments in the debris bed appears to be stratified. Scanning electron micrographs of fragments indicate fragmentation to be occurring in the molten state for the more intense interactions observed. Interaction data obtained show quiescent periods of 0.5 to 1.5 second between pressure pulses. The force impulse values per unit mass of melt seems to be in the same range as previous experiments.
- 2883 (SAND--79-0621) ULTRASONIC THERMOMETRY SYSTEM FOR MEASURING VERY HIGH TEMPERATURES IN REACTOR SAFETY EXPERIMENTS. Carlson, G.A.; Sullivan, W.H.; Plein, H.G.; Kerley, T.M. (Sandia Labs., Albuquerque, NM (USA)). Jun 1979. Contract EY-76-C-04-0789. 83p. Dep. NTIS, PC A05/MF A01.
Ultrasonic thermometry has many potential applications in reactor safety experiments, where extremely high temperatures and lack of visual access may preclude the use of conventional diagnostics. This report details ultrasonic thermometry requirements for one such experiment, the molten fuel pool experiment. Sensors, transducers, and signal processing electronics are described in detail. Axial heat transfer in the sensors is modelled and found acceptably small. Measurement errors, calculations of their effect, and ways to minimize them are given. A rotating sensor concept is discussed which holds promise of alleviating sticking problems at high temperature. Applications of ultrasonic thermometry to three in-core experiments are described. In them, five 10-mm-length sensor elements were used to measure axial temperatures in a UO_2 or UD_2 -steel system fission-heated to about 2860°C.
- 2884 (SAND--79-0740C) PROMPT BURST ENERGETICS (PBE) STUDIES. Reil, K.O.; Young, M.F. (Sandia Labs., Albuquerque, NM (USA)). 1979. Contract EY-76-C-04-0789. 16p. (CONF-790429--2). Dep. NTIS, PC A02/MF A01.
From 4. specialist meeting on fuel-coolant interaction in nuclear reactor safety; Bournemouth, UK (2 Apr 1979).
These studies involve an in-pile experimental program and complementary analytical investigation of the energetic response of important reactor fuel-clad-coolant systems subjected to energy deposition conditions associated with super-prompt critical excursions. The objectives of the present program include identification and characterization of the phenomena which dominate the conversion of thermal energy to

work, development of models which accurately predict the energetics associated with such hypothetical accidents, and provision of the necessary input data for those models. This program includes the examination of the integral effects of fuel-clad-coolant interactions, fission gas release, and fuel and fission product vapor pressure during super-prompt critical core disruptive conditions, and thus, serves to define the initial conditions for hydrodynamic expansion of the disrupted core. Progress to date is summarized.

- 2885 (SAND--79-0752C) FCI POTENTIAL OF OXIDE AND CARBIDE FUELS: RESULTS OF THE PROMPT BURST SERIES AT SANDIA LABORATORIES. Young, M.F.; Murata, K.K.; Hitchcock, J.T.; Camp, W.J. (Sandia Labs., Albuquerque, NM (USA)). 1979. Contract EY-76-C-04-0789. 13p. (CONF-790429-4). Dep. NTIS, PC A02/MF A01.

From 4. specialist meeting on fuel-coolant interaction in nuclear reactor safety; Bournemouth, UK (2 Apr 1979).

As part of an effort to establish the work potential of LMFBR fuel-coolant pairs under accident conditions, a series of prompt burst energetics (PBE) experiments has been carried out at Sandia Laboratories. In the PBE series FCI's have been observed both between UO_2 and Na and between UC and Na. As anticipated, FCI energetics are found to be greater for UC/Na. Preliminary conclusions from analyses of that series are reviewed herein. In addition to PBE analysis, work on modeling fuel fragmentation is briefly described. Finally, additional FCI-related experiments at Sandia are discussed.

- 2886 (SAND--79-1366) THERMAL EVALUATION FACILITY FOR LMFBR SPENT FUEL TRANSPORT. Wesley, D.A. (Sandia Labs., Albuquerque, NM (USA)). Apr 1980. Contract AC04-76DP00789. 107p. NTIS, PC A06/MF A01.

A full-scale mock-up of a 217 pin breeder reactor fuel assembly in a cylindrical pipe was initially designed and constructed by Oak Ridge National Laboratory (ORNL). It was transferred to Sandia where it was extensively redesigned and modified. The 217 pin hexagonal core assembly was installed in a smaller diameter stainless steel pipe which more closely represents the diameter of a shipping canister or shipping cask basket wall. Two-hundred four of the tubes are electrically heated over an active length of 4-feet and the remaining thirteen are instrumented with multiple junction thermocouples which can be traversed axially. Thermocouples and heat-flux gauges are located on the hex core and canister perimeters at several axial locations.

- 2887 (SAND--79-1602C) LMFBR ACCIDENT DELINEATION STUDY: APPROACH AND PRELIMINARY RESULTS. Williams, D.C.; Sholtis, J.A.; Rios, M.; Worledge, D.H.; Conrad, P.W.; Varela, D.W.; Pickard, P.S. (Sandia Labs., Albuquerque, NM (USA)). 1979. Contract EY-76-C-04-0789. 11p. (CONF-790816--27). Dep. NTIS, PC A02/MF A01.

From International meeting on fast reactor safety technology; Seattle, WA, USA (19 Aug 1979).

Event trees have been constructed for all phases of LMFBR accidents. The trees proved useful for identifying meaningful initiating accident categories and containment responses. In these areas, quantification appears feasible, given an adequate data base. Event trees were also used to represent in-core phenomenological questions governing accident progression and energetics, but here quantification appears impracticable because

pervasive phenomenological uncertainties exist. Infrequent accident initiation is the dominant factor in assuring low risk. Nevertheless, containment promises an additional measure of risk reduction provided severe energetics are highly unlikely. The delineation served to systematize LMFBR safety issues and should aid in evaluating LMFBR R and D priorities.

- 2888 (SAND--79-1685C) SURVEY OF MELT INTERACTIONS WITH CORE RETENTION MATERIAL. Powers, D.A. (Sandia Labs., Albuquerque, NM (USA)). 1979. Contract EY-76-C-04-0789. 11p. (CONF-790816--26). Dep. NTIS, PC A02/MF A01.

From International meeting on fast reactor safety technology; Seattle, WA, USA (19 Aug 1979).

A survey of the interactions of up to 220 kg stainless steel melts at 1973°K with the candidate core retention materials borax, firebrick, high alumina cement, and magnesia is described. Data collected for the interactions include rates of material erosion, aerosol generation, gas evolution, and upward heat flux. Borax acts as an ablative solid that rapidly quenches the melt. Firebrick is ablated by the steel melt at a rate of 8.2×10^{-6} m/s. High alumina cement is found to be an attractive melt retention material especially if it can be used in the unhydrated form. Magnesia is also found to be an attractive material though it can be eroded by the molten oxides of steel.

- 2889 (SAND--79-1693) HTFLO: A COMPUTER MODEL OF A RESISTIVELY-HEATED UO_2 PIN WITH A RATE-DEPENDENT HEAT CAPACITY. Smaardyk, J.E. (Sandia Labs., Albuquerque, NM (USA)). Feb 1980. Contract EY-76-C-04-0789. 40p. Dep. NTIS, PC A03/MF A01.

A one-dimensional model is presented to describe the thermal behavior of an uranium dioxide (UO_2) rod that is heated resistively and cooled by surface radiation. A standard forward differencing scheme is used for the heat transfer calculations. Temperature-dependent electrical and thermal properties are calculated at the beginning of each time step. In addition, the heat capacity is calculated from a dynamic enthalpy model based on equilibrium and instantaneous heat capacity models with a user-selectable relaxation time. This report describes the finite difference equations used, the treatment of the source and boundary terms, and the dynamic enthalpy model. Detailed input instructions are provided and a sample calculation is shown.

- 2890 (SAND--79-1708C) KINETICS OF FISSION-VAPORIZED UO_2 FUEL DETERMINED FROM SAMPLED FUEL DEBRIS. Elrick, R.M. (Sandia Labs., Albuquerque, NM (USA)). 1979. Contract EY-76-C-04-0789. 9p. (CONF-790816--46). Dep. NTIS, PC A02/MF A01.

From International meeting on fast reactor safety technology; Seattle, WA, USA (19 Aug 1979).

Close-in time-resolved sampling of fuel aerosols, high speed photography, and photometric measurement of fuel temperatures were used to determine the thermal and kinetic characteristics of UO_2 fission heated to vaporization with a single 5 msec FWHM pulse of 2380 KJ/kg. From these data it was possible to obtain energy temperature relations and debris kinetics including particle size, velocity, density, momentum and pressure. These results demonstrate techniques for study of dynamic interactions involving liquid and vapor between fuel, cladding, coolant and structure and

produce data important for determining initial HCDA aerosol formation.

- 2891 (SAND--79-1733C) MODEL AND COMPUTER CODE FOR ENERGY AND MASS TRANSPORT IN DECOMPOSING CONCRETE AND RELATED MATERIALS. Knight, R.L. & Beck, J.V. (Sandia Labs., Albuquerque, NM (USA)). 1979. Contract EY-76-C-04-0789. 6p. (CONF-790816--54). Dep. NTIS, PC A02/MF A01.

From International meeting on fast reactor safety technology; Seattle, WA, USA (19 Aug 1979).

In an HCDA, it is postulated that liquid metal coolants and more materials come in contact with the retaining concrete structure. A mathematical model and an associated computer program have been developed to describe the transient heat and mass transfer in the concrete. The program is unique in that it includes: (1) chemical reactions involving free water, chemically bound water and CO_2 ; (2) an implicit calculational procedure; and (3) change of the porosity as the concrete is decomposed. Predictions of the model are compared with experimental results obtained at Sandia Laboratories and at Hanford Engineering Development Laboratory.

- 2892 (SAND--79-2319A) HIGH-TEMPERATURE ELECTRONICS: AN OVERVIEW. Heckman, R.C. (Sandia Labs., Albuquerque, NM (USA)). 1979. Contract EY-76-C-04-0789. 8p. Dep. NTIS, PC A02/MF A01.

A summary is presented providing an overview of contemporary high-temperature electronics and identifying the major areas where developments are needed and the laboratories where research is being conducted. The geothermal program, high-temperature oil and gas well logging, jet engine monitors, and circuits for operation in the sodium coolant loop of the Clinch River Breeder reactor have stimulated research. (FS)

- 2893 (SAND--80-0026) CODED APERTURE IMAGING SYSTEM FOR NUCLEAR FUEL MOTION DETECTION. Stalker, K.T.; Kelly, J.G. (Sandia Labs., Albuquerque, NM (USA)). 1980. Contract EY-76-C-04-0789. 11p. (CONF-800453--1). Dep. NTIS, PC A02/MF A01.

From International optical computing conference; Washington, DC, USA (7 Apr 1980).

A Coded Aperture Imaging System (CAIS) has been developed at Sandia National Laboratories to image the motion of nuclear fuel rods undergoing tests simulating accident conditions within a liquid metal fast breeder reactor. The tests require that the motion of the test fuel be monitored while it is immersed in a liquid sodium coolant precluding the use of normal optical means of imaging. However, using the fission gamma rays emitted by the fuel itself and coded aperture techniques, images with 1.5 mm radial and 5 mm axial resolution have been attained. Using an electro-optical detection system coupled to a high speed motion picture camera a time resolution of one millisecond can be achieved. This paper will discuss the application of coded aperture imaging to the problem, including the design of the one-dimensional Fresnel zone plate apertures used and the special problems arising from the reactor environment and use of high energy gamma ray photons to form the coded image. Also to be discussed will be the reconstruction techniques employed and the effect of various noise sources on system performance. Finally, some experimental results obtained using the system will be presented.

- 2894 (SAND--80-0217C) DEBRIS BED EXPERIMENT NO. 4: A PRELIMINARY LOOK. Gronager, J. (Sandia Labs., Albuquerque, NM (USA)). 1980. Contract EY-76-C-04-0789. 14p. (CONF-800607--8). Dep. NTIS, PC A02/MF A01.

From American Nuclear Society annual meeting; Las Vegas, NV, USA (8 Jun 1980).

The experiment described is the fourth in a series of experiments designed to provide quantitative information on the behavior of debris beds formed from reactor materials following a core-melt accident. The D-series of experiments utilizes liquid sodium, particulate UO_2 (and in later experiments, stainless steel) to form debris beds which are fission heated, within the ACRR, to simulate fission-product heating of debris beds. The data obtained from the experiments will provide the basis of debris bed modeling in order to ascertain containment requirements.

- 2896 (SRD-R--82) REVIEW OF AEROSOL PROBLEMS AND THE THEORY OF AEROSOL PHYSICS WITH PARTICULAR REFERENCE TO SODIUM COOLED FAST REACTORS. Williams, R.J. (UKAEA Risley Nuclear Power Development Establishment, Culcheth. Safety and Reliability Directorate). Jan 1978. 35p. Dep. NTIS (US Sales Only), PC A03/MF A01.

Processes that would govern the development, transport, and removal of aerosols, which are of interest in the study of hypothetical core disruptive situations in pool type sodium cooled fast reactors, are discussed. Theoretical descriptions of these processes are presented and known inadequacies indicated. The interpretation of experimental data and numeric solution of the governing equations is briefly considered.

- 2897 (SRD-R--159) EFFECT OF UNCERTAINTIES IN THERMOPHYSICAL PROPERTIES OF UO_2 AND SODIUM ON MFCI'S. MacInnes, D.A.; Martin, D.; Vaughan, G.J. (UKAEA Risley Nuclear Power Development Establishment, Culcheth. Safety and Reliability Directorate). Jul 1979. 13p. Dep. NTIS (US Sales Only), PC A09/MF A01.

Work performed under United States-UKAEA Fast Reactor Exchange Program.

Recent work has led to the values of the physical properties of molten UO_2 and sodium to be questioned. The effect of these uncertainties on MFCI's is investigated - in particular, how the interface temperature/spontaneous nucleation temperature criterion for an interaction to occur and its yield are changed. It is concluded that it is not possible to exclude MFCI's between UO_2 and sodium by this criterion given the present uncertainties.

- 2898 (STI/PUB--490) DESIGN, CONSTRUCTION, AND OPERATING EXPERIENCE OF DEMONSTRATION LMFBRs. (International Atomic Energy Agency, Vienna (Austria)). Dec 1978. 882p. (In several languages). (CONF-780407--). IAEA, Vienna, Austria, \$74.00.

From Symposium on design, construction and operating experience of demonstration liquid metal fast breeder reactors; Bologna, Italy (10 Apr 1978).

Separate abstracts are included for each of the papers presented concerning the design and operation of LMFBR type reactors. Seven papers have previously been included in the data base.

2899 (STUDSVIK-K2--79/90) NEUTRONICS CALCULATIONS WITH EQUICYCLE VERSION 3 ON TWO HETEROGENEOUS LMFBR CONCEPTS. Haeggblom, H. (Aktiebolaget Atomenergi, Studsvik (Sweden)). Jan 1979. 14p. Dep. NTIS (US Sales Only), PC A02/MF A01.

The single-annulus LMFBR design introduced by the UKAEA Reactor Group, Risley, and the multicore concept "Bulls-eye" for which data were obtained from ORNL, have been studied using the diffusion program EQUICYCLE, developed in Studsvik. Two cross section libraries were used, namely, an adjusted set of data processed from ENDF/B-III and a set with the most important nuclides processed from ENDF/B-IV and the other data from ENDF/B-III. For the singleannulus design, an equilibrium burn-up composition was given. For the "Bulls-eye" concept, both a fresh core and an equilibrium cycle were studied. The $k_{sub}(eff)$ values obtained seem to agree approximately with other calculations using ENDF/B-IV. The adjusted cross section set gives lower breeding ratios than other data. The void coefficients were not very sensitive to the data sets used.

2900 (TI--00-LME-014) AI/LMEC EXPERIENCE WITH FREEZE SEAL AND BELLows SEAL VALVES. Freede, W.J.; Thorel, J.P. (Liquid Metal Engineering Center, Canoga Park, CA (USA)). 1977. Contract EY-76-C-03-0700. 20p. AT.

A statistical and process review was conducted regarding operational success and failure experience with freeze seal and bellows seal valves at the four principal former and present AI/LMEC sodium facilities (LCTL, SCTI, SRE, and HNPF). At three of these facilities, bellows seal valves had predominated in the initial construction. However, numerous bellows failures, sometimes accompanied by significant fire damage, soon led to large-scale conversions to freeze seal valves. One conclusion reached was that bellows seal valves simply couldn't be used for throttling purposes, as vibration and chatter on the valve disks would cause fatigue failure in the bellows.

2901 (TI--00-LME-023) SUMMARY OF LMEC SODIUM VALVE OPERATING HISTORY. Snair, G.L.; Mirless, G.; Dewart, W. (Liquid Metal Engineering Center, Canoga Park, CA (USA)). 14 Nov 1977. Contract EY-76-C-03-0700. 43p. AT.

LMEC/AI experience with valves for sodium service extend 27 years with many hundreds of thousands of valve service hours. A history of the sodium valves at the LMEC site from 1959 through 1971 was reported by Messrs Freede and Thorel. A continuation of this history to the present is presented herein. History of the more than 450 sodium valves in use during this period from 1971 to the present has included refurbishing more than 50 valves. Of these 50, less than half have been failures, and the rest have been routine overhaul or design modification. During this span since 1971 fifteen new procurement contracts have been placed for a total of 230 sodium service valves. Four special sodium valve tests involving seven test valves have also been run since 1971.

2902 (TI--04-LME-123) CALIBRATION OF 10" PM FLOWMETER IN SCTI: FRC-100E. DeVita, V. (Liquid Metal Engineering Center, Canoga Park, CA (USA)). 9 Sep 1976. Contract EY-76-C-03-0700. 100p. AT.

Portions of document are illegible.

The calibration is presented of a 10 inch PM flowmeter designated as FRC-100E at SCTI. The development of a flow factor that could be applied to the PM flowmeter measurements is described.

2903 (TID--3333-S6) LIQUID METAL FAST BREEDER REACTORS. A BIBLIOGRAPHY, JANUARY--DECEMBER 1977. Galde, D.O. (comp.). (Department of Energy, Oak Ridge, TN (USA). Technical Information Center). May 1978. 518p. Dep. NTIS, PC A22/MF A01.

Included are 2334 abstracts of LMFBR references compiled from the DOE Energy Information Data Base (EDB) covering the period January 1977 through December 1977. Corporate, Personal Author, Subject, and Report Number Indexes are provided. (DG)

2904 (TID--27701/5) LIQUID METAL FAST BREEDER REACTOR CONCEPTUAL PLANT DESIGN 1000 MWE. VOLUME V. COST/SCHEDULE. McDonald, J.S.; Andonedis, A.; Matte, J. III. (Atomics International Div., Canoga Park, CA (USA); Burns and Roe, Oradell, NJ (USA). Breeder Reactor Div.). May 1977. Contract EY-76-C-03-1142; EY-76-C-3-1145. 100p. (FBR--77-3(Vol.5)). AT.

An evaluation of the cost and schedule requirements for development of the 1000 MW(e) PLBR plant design is presented.

2905 (TID--27798) DEVELOPMENT OF LICENSING REQUIREMENTS FOR LMFBRs: A REACTOR DESIGNER'S VIEW. Bradbury, P.; Huang, H.C. (Westinghouse Electric Corp., Madison, PA (USA)). 1977. Contract EY-76-C-15-2395. 10p. Dep. NTIS, PC A02/MF A01.

The framework of rules and regulations for nuclear power plant licensing in the U.S. has been developed and established mainly through the experience in LWR licensing. Because of the important differences in technology and design between LMFBR and LWR plants, development of specific new requirements and criteria and appropriate modification of old ones must be undertaken such that the established licensing regulations can be equally and fairly implemented for commercial LMFBR licensing. The paper presents a broad overview of U.S. licensing rules and regulations and provides a review of licensing criteria, standards and ongoing development effort, with a focus on commercial LMFBR licensing needs. The review results are presented and discussed. In addition, the selection of design basis accidents and the treatment of events beyond Design Base are also reviewed and discussed.

2906 (TID--27816) DISC-DONUT-TUBE WEAR TEST REPORT, PHASE I. Kowal, K.; Knaus, S.E. (Atomics International Div., Canoga Park, CA (USA)). Jun 1976. Contract EY-76-C-03-0624-014. 77p. Dep. NTIS, PC A05/MF A01.

The report describes a test program which simulated the wear-inducing conditions in the AI Prototype CRBR Steam Generator. This was accomplished by simulating the wear inducing loading and motion of a steam tube against "disc-donut" tube spacer plates. It was found that 2-1/2 Cr-1 Mo tubes, wearing against 2-1/2 Cr-1 Mo tube spacer plates, seized and galled

as deep as .017 inches. Inconel 718 tube spacer plates uniformly wore the tubes as deep as .012 in. Aluminum bronze inserts wore as deep as .003 inches into the tube.

- 2907 (TID--27817) LLTR SERIES I TEST REQUEST. REVISION 4. GE SPECIFICATION NO. 22A3924, REV. 4. Regimbal, J.J. (General Electric Co., Sunnyvale, CA (USA). Fast Breeder Reactor Dept.). Jun 1977. Contract EY-76-C-03-0893-010. 160p. AT.

Series I tests in the Large Leak Test Rig (LLTR) using the AI-MSG (modified for large-leak testing) are requested for the LLTR test facility currently being constructed at LMEC by Atomics International. The requested program of testing provides for water and/or steam to be injected into sodium under near prototype conditions. Variables in the sodium/water reaction tests include leak size, steam generator type (evaporator or superheater) conditions, leak location, and sodium temperature. Test conditions and data acquisition requirements and methods are described in sufficient detail to serve as a basis for preparing the full scope of testing procedures necessary to accomplish the program objectives.

- 2908 (TID--27821) VIBRATION TESTS OF A FULL SCALE WATER MODEL OF A CLINCH RIVER STEAM GENERATOR MODULE. Durand, R.E.; Gabler, M.J.; Weinberg, L.; Yang, T.M. (Atomics International Div., Canoga Park, CA (USA); General Electric Co., Sunnyvale, CA (USA)). [nd]. Contract EY-76-C-15-2395. 17p. Dep. NTIS, PC A02/MF A01.

Cross and parallel flow induced vibrations were measured in a shortened full scale model of the CRBRP steam generators using water as the working fluid. Measurements were made on five selected tubes, some of which fit through oversize tube support holes. Power spectral density plots were made of vibration parameters at selected locations. Maximum displacement was about 3 mils and occurred at the lower frequencies. The maximum vibrational stress was calculated to be 2000 psi. Measurements of vortex shedding frequencies showed that vortices are not a dominant source of tube excitation. In general, no adverse effects on the CRBRP steam generators were identified which affect service life or structural integrity.

- 2909 (TID--27889) SEISMIC DESIGN STUDY ON CANTILEVER CYLINDRICAL SHELLS. Wu, J.Na.C.; Cory, J.F. Jr. (Babcock and Wilcox Co., Akron, OH (USA). Nuclear Equipment Div.). 1975. Contract EY-76-C-15-0003. 21p. Dep. NTIS, PC A02/MF A01.

One way to design a nuclear steam generating system to withstand seismic stresses is to establish a mathematical model, to which seismic loading can be applied, to determine the dynamic responses of the system. A practical approach for establishing such a model is to idealize the components in terms of beam elements which form the essential building blocks of the analytical model. The major shell structures of reactor vessels and steam generators are usually supported at a single elevation in the system, and are often simulated by cantilever beam elements. The use of a beam element to represent shell structure must be justified. The paper presents the results of a parametric study of thin-walled cylindrical shells which are clamped at one end while the other end is free. By using 3-D plate/shell finite element analysis, the region of application, where the beam element can

reasonably simulate the shell structure, has been defined as the combination of its geometrical parameters, e.g., the thickness/radius and length/radius. As an illustrative example, the 3-D finite element method has been used to investigate the seismic analysis of a cantilever cylindrical shell similar to the Clinch River LMFBR reactor vessel. The numerical values are compared with those produced by a beam element model. The results and conclusions obtained by this investigation can be applied to improve dynamic modeling techniques in general.

- 2910 (TID--27895) STANDPIPE-BUBBLER PUMP LEVEL CONTROL STUDY SYSTEM DESIGN LAYOUT (TASK A) W.P. 4413. ENGINEERING MEMORANDUM NO. 0153. Salant, R.F.; Cook, M.E. (Borg-Warner Corp., Los Angeles, CA (USA). Byron Jackson Pump Div.). 29 Apr 1975. Contract EY-76-C-03-0893-001. 125p. AT.

Pump tank liquid sodium level control within the specified normal and transient system operating modes utilizing a Standpipe Bubbler was investigated through computerized solution of analytic equations and complemented with testing of a physical model for confidence enhancement of the analytic approach. Sensitivity of pump tank fluid level as a function of: (1) Standpipe Bubbler location, (2) fluid temperature, (3) suction line to tank impedance, (4) cover gas mass flow rate, (5) cover gas system return pressure, and (6) Standpipe Bubbler area and nozzle size is presented in graphical form. Limited testing of the physical model shows close correlation to the computerized model and these data are also presented in graphical form. The preliminary results to date indicate that satisfactory fluid level control can be attained with the Standpipe Bubbler mechanization.

- 2911 (TID--28094) SPTF FLOW LOOP 18 INCH BUTTERFLY VALVE CAVITATION TEST REPORT, SPTF-LPP. Laird, R.A.; Bowers, W.M. (Liquid Metal Engineering Center, Canoga Park, CA (USA)). 29 Jun 1977. Contract EY-76-C-03-0700. 39p. AT.

Portions of document are illegible. Cavitation testing of the HV-130 18 inch butterfly valve located in the Flow Loop at SPTF was conducted from March 22 to April 1, 1977. These tests were performed to determine cavitation characteristics as a function of valve position and upstream pressure in sodium at 600°F. Similar tests had been performed on the same valve using water as the flow medium. Three different test approaches for cavitation were used.

- 2912 (TID--28193) PLBR PROJECT. DESIGN CRITERIA FOR THE PROTOTYPE LARGE BREEDER REACTOR. (Bechtel Corp., San Francisco, CA (USA)). Sep 1977. Contract EY-76-C-03-1144. 444p. AT.

The criteria to be used in the design of the Prototype Large Breeder Report (PLBR) Balance-of-Plant (BOP) are divided into six sections. The first section, General Design Criteria, contains nuclear design criteria, including radiation shielding, safety and NRC licensing requirements. These criteria generally involve more than one engineering discipline. The remaining sections correspond to the following discipline areas: civil/structural, piping stress analysis, mechanical, control systems, and electrical. Architectural design criteria will be included in the Civil/Structural section at a later date. The criteria presented should be regarded as tentative, based on the status of the PLBR design at the conclusion of

Phase II. As the design progresses from the current conceptual state to the detailed design stages, these criteria will be updated as required to meet project needs and any changes that may occur in PLBR project design objectives.

2913 (TID--28194) PROTOTYPE LARGE BREEDER REACTOR: PHASE II EXTENSION. VOLUME I. CONCEPTUAL DESIGN STUDIES. (Bechtel Corp., San Francisco, CA (USA)). Sep 1977. Contract EY-76-C-03-1144. 345p. AT.

The document is a compilation of an extension of the work done during Phase II of the ERDA/Electric Power Research Institute (EPRI) Prototype Large Breeder Reactor (PLBR) study. The objective of this Phase II extension was to investigate key engineering problems generic to the balance-of-plant for the loop concept which were identified during the Phase II effort. Included are the following reports which present the results of these investigations: (1) piping seismic restraint design for intermediate sodium piping between buildings (BTR-9); (2) containment building structural concept study (BTR-11); (3) heat transport system piping reliability enhancement study (BTR-12); (4) minimization of seismic loadings on components (BTR-13); and (5) heat transport cell liner design requirements (BTR-14).

2914 (TID--28195) PROTOTYPE LARGE BREEDER REACTOR. PHASE II EXTENSION. VOLUME II. ELTEMP PROGRAM UPDATE. Chow, H.Y.; Shih, M. (Bechtel Corp., San Francisco, CA (USA)). Sep 1977. Contract EY-76-C-03-1144. 495p. AT.

The ELTEMP Program was developed by Bechtel Power Corporation for design and analysis of Nuclear Class I piping for elevated temperature liquid metal service. This work was done as part of the Fast Flux Test Facility (FFTF) program. The program was originally coded to provide assessments of compliance of Class I piping systems with the stress and strain limits specified in ASME Code Case (C.C.) 1592-3. The program has been used extensively since 1972 in the preliminary design of FFTF and Prototype Large Breeder Reactor Heat Transfer System (PLBR HTS) piping. Since its original development, the program has not been updated to incorporate new developments and changes made in the applicable design codes, e.g., Code Case 1592-10. In the version of ELTEMP described, the creep-fatigue damage evaluation procedure has been completely revised to make it compatible with C.C. 1592-10 requirements, and the materials list expanded to include Incoloy 800 and 2 1/4 Cr-1 Mo Steel. A list of the major modifications made in the current version of ELTEMP Program is provided. The report describes the basic approach, organization, contents, and input data preparation for the new ELTEMP Program. An example of an ELTEMP run is included.

2915 (TID--28198) TURBULENT HYDRAULIC PENETRATION FROM TURBULENT PIPE FLOW INTO STAGNANT COLUMNS. Bloom, G.R. (Hanford Engineering Development Lab., Richland, WA (USA)). Jan 1978. Contract EY-76-C-14-2170. 113p. Dep. NTIS, PC A06/MF A01.

Thesis. Submitted to Washington State Univ., Pullman.

An experimental investigation was conducted on the depth of mixing of water from turbulent pipe flow into a vertically oriented pipe deadleg or stagnant column. The depth of turbulent penetration or mixing length (ML) was correlated as a function of the piping system Reynolds number (Re) and kinematic viscosity

(ν). The dimensionless mixing length (ML) is defined as the depth of hydraulic mixing divided by the inside diameter of the deadleg. Water was pumped at flow rates between 40 l/min and 750 l/min through smooth tubing sections with inside diameters between 22 mm and 73 mm. Isothermal experimental runs were performed at water temperatures between 30°C and 80°C.

2916 (TID--28251) PROTOTYPE LARGE BREEDER REACTOR: PHASE II FOLLOW-ON FINAL REPORT. (Westinghouse Electric Corp., Madison, PA (USA). Advanced Reactors Div.). Nov 1977. Contract EY-76-C-03-1141. 595p. AT.

The volume includes five separate reports on follow-on tasks which were assigned to Westinghouse Advanced Reactors Division at the end of Phase II of the PLBR studies. Although a decision was made in April 1977, to discontinue the PLBR studies and not to enter Phase III of the Program, the need to investigate a few outstanding issues prior to the end of FY 1977 was identified. Westinghouse ARD was assigned the following tasks: Task I - surveillance and in-service inspection; Task J - piping design and analysis; Task L-1 - primary piping integrity - licensability; Task N - Sulzer cycle - system operation at start-up, shutdown and part-load; and Task O - plant simulation and control of superheat cycle.

2917 (TID--28256) PRIMARY HEAT TRANSPORT SYSTEM AND REACTOR CONTAINMENT BUILDING: LAYOUT SELECTION STUDY. PROTOTYPE LARGE BREEDER REACTOR. PHASE II. Roecker, J.H.; Roe, K.K. (Atomics International Div., Canoga Park, CA (USA); Burns and Roe, Oradell, NJ (USA). Breeder Reactor Div.). Jan 1977. Contract EY-76-C-03-1142; EY-76-C-03-1145. 478p. AT.

The purpose of the study was to develop an optimum integrated primary heat transport system (PHTS) and reactor containment building (RCB) layout. The study basically involved a sequential development approach coordinated around an initial screening, preliminary evaluation and final selection process. Over 14 options were examined and evaluated, including a number of configuration evolutions that developed during the course of the study. Four of these configurations were pursued in detail. During the progression of the design effort, the best features of each group of configurations were carried forward and incorporated into the newer configurations wherever possible. These final four configurations benefitted from these design evolutions. The selected reference PHTS/RCB configuration is characterized by a 170 foot diameter RCB, expansion compensation via expansion loops, and an ex-containment location of the Ex-Vessel Storage Tank (EVST). The configuration has resulted in a PLBR design which is compact, efficient in Reactor Containment Building (RCB) space utilization (all radioactive sodium systems are contained within RCB), and readily licensable. This design has been achieved while retaining all established criteria (e.g., 3 ft. space allowance around piping and components for maintenance and ISI) and maintaining adequate stress design margins to provide contingency for detailed design and analysis.

2918 (TID--28259) PROTOTYPE LARGE BREEDER REACTOR: PHASE II FOLLOW-ON FINAL REPORT. EXECUTIVE SUMMARY. (Westinghouse Electric Corp., Madison, PA (USA). Advanced Reactors Div.). Nov 1977. Contract EY-76-C-03-1141. 32p. AT.

An Executive Summary is presented of five

reports pertaining to follow-on tasks which were assigned to Westinghouse Advanced Reactors Division at the end of Phase II of the PLBR studies. Although a decision was made in April 1977, to discontinue the PLBR studies and not to enter Phase III of the Program, the need to investigate a few outstanding issues prior to the end of FY 1977 was identified. Westinghouse ARD was assigned the following tasks: Task I--surveillance and in-service inspection; Task J--piping design and analysis; Task L-1--primary piping integrity-licensability; Task N--Sulzer cycle-system operation at start-up, shutdown and part-load; and Task O--plant simulation and control of superheat cycle. In parallel, Stone and Webster was assigned several tasks, for which they are issuing a separate report. A few of the tasks, such as the Surveillance and the Piping Design tasks, required some cooperation between the Westinghouse and the Stone and Webster teams, but most of the work was performed independently. The reports themselves are presented in a separate volume.

- 2919 (TID--28265) PROTOTYPE LARGE BREEDER REACTOR: PRIMARY HEAT TRANSPORT SYSTEM CELL STUDIES. FINAL REPORT, PHASE II EXTENSION. (Stone and Webster Engineering Corp., Boston, MA (USA)). Sep 1977. Contract EY-76-C-03-1146. 236p. AT.

The basic objective of the Prototype Large Breeder Reactor (PLBR) project was to develop the design of an LMFBR power plant that will be licensable and prototypical of subsequent breeder reactor plants. The PLBR is prototypical of all major characteristics of the commercial breeder reactor. The PLBR project was funded jointly by the Energy Research and Development Administration (ERDA) and Electric Power Research Institute (EPRI). Phase I of the program, which lasted 8 months, concentrated on the establishment of basic plant characteristics and the bases for prototype relationship between the PLBR and the commercial breeder reactor. This work was reported in the Phase I Final Report in July 1976. Phase II, which lasted 10 months, was intended to develop the overall plant conceptual design and to select specific concepts for the building arrangements, systems, and major components within the PLBR. Significant technical progress was achieved by the Westinghouse and Stone and Webster team in meeting these objectives concerning the PLBR design during Phase II. This technical progress is documented in detail in 4 volumes issued in June 1977. The technical detail presented in the Phase II report was not intended as an integrated plant design. Additional integrated plant design activities remained to be accomplished, together with detailed evaluation of the plant response to design base events and evaluation of the plant design for events beyond the design base. This integrated plant design had been planned for Phase III of the program which was not pursued.

- 2920 (TID--28269) PROTECTED BAYONET TUBE STEAM GENERATOR PROOF-OF-PRINCIPLE TESTS. FINAL REPORT. Cho, S.M.; Degutis, G.; Govignon, E. (Foster Wheeler Energy Corp., Livingston, NJ (USA)). 30 Sep 1974. Contract EY-76-C-03-0972. 196p. AT.

The results are presented of the sodium-water reaction Proof-of-Principle (POP) testing of the FWC Protected Bayonet Tube (PBT) Steam Generator. Incorporation of the protector tube in the steam generator design has been proven to prevent rapid progression of heat transfer tube failures resulting from a leaking water/steam tube, and thus increases the time available for an orderly shutdown of the steam

generator by an order of magnitude. The test program was performed in two test rigs; the SOWAT/SOLLACE and the Protector Tube Test Rig (PTTR). The test program performed in the PTTR provided full-size cross-section and full length protector tube test bundles. The water injection rate increased from 0.6×10^{-2} lb/sec up to 10 lb/sec, with the maximum total mass of 20 lb. The results of all tests are included in this report.

- 2921 (TID--28273/1) FOSTER WHEELER PROTECTED BAYONET TUBE LMFBR STEAM GENERATOR PRELIMINARY DESIGN. Govignon, E.; Wolowodiuk, W. (Foster Wheeler Energy Corp., Livingston, NJ (USA)). 1974. Contract EY-76-C-03-0972. 254p. AT.

Portions of document are illegible.

The preliminary design report presents the work accomplished by Foster Wheeler during the period from March 14, 1974 to August 23, 1974 on the PBT LMFBR Steam Generator Preliminary Design. This work was a follow on effort to the work reported in FWC document ND-73-69 dated December 21, 1973 and entitled "Conceptual Design LMFBR Bayonet Tube--Protector Tube Steam Generator." The PBT Design has evolved from earlier work conducted on the ESADA 7 tube evaporator work and on the PBT Proof of Principle testing as reported in FWC ND-74-58. General Electric Company Nuclear Energy Division has served as technical monitor for the effort which has been supported by the Atomic Energy Commission under AEC Contract AT(04-3)-972.

- 2922 (TID--28273/2) FOSTER WHEELER PROTECTED BAYONET TUBE LMFBR STEAM GENERATOR PRELIMINARY DESIGN. VOLUME II. APPENDICES. (Foster Wheeler Energy Corp., Livingston, NJ (USA)). 1974. Contract EY-76-C-03-0972. 291p. Dep. NTIS, MF A01.

Portions of document are illegible.

The appendix contains the sizing calculations for the major components of the steam generator. All calculations were performed in accordance with the ASME Boiler and Pressure Vessel Code, Section III, Class 1, with addenda through the Winter of 1973 and Code Case 1331-8.

- 2923 (TID--28546) SUITABILITY OF 2--1/4CR--1MO STEEL FOR LMFBR STEAM GENERATION SYSTEM APPLICATIONS: A CRITIQUE OF NUREG-0387. Spalaris, C.N. (comp.). (General Electric Co., San Jose, CA (USA). Fast Breeder Reactor Dept.). 1 May 1978. Contract EY-76-C-15-1200. 59p. AT.

Responses of industry representatives to a report which questioned the suitability of 2 1/4 Cr-1 Mo steel for LMFBR steam generators are presented. The responses reendorse the choice of 2 1/4 Cr-1 Mo steel for steam generator applications.

- 2924 (TID--28710) AI SELECTION OF SINGLE WALL OVER DOUBLE WALL LMFBR STEAM GENERATORS. (Atomic International Div., Canoga Park, CA (USA)). 1978. Contract EY-76-C-03-1142. 9p. AT.

The decision by AI to employ a single wall steam generator was based upon consideration of the following factors: (1) reliability and experience vis-a-vis single versus double wall designs, (2) technical aspects of the single versus double wall units, and (3) economic aspects of single versus double wall steam generators.

2925 (TID--28712) B AND W BASIS FOR DESIGN SELECTIONS FOR INTERMEDIATE "A" SINGLE WALL STEAM GENERATOR DESIGN. (Babcock and Wilcox Co., Barberton, OH (USA)). [nd]. Contract EN-77-C-02-4176. 9p. AT.

A design description of a single wall LMFR steam generator is presented. The basis for design selections is described.

2926 (TID--28713) DEVELOPMENT AND TEST RESULTS OF WESTINGHOUSE DOUBLE WALL TUBE STEAM GENERATOR INCLUDING THERMAL MODEL TEST. Lohmeier, A.; Bongaards, D.J. (Westinghouse Electric Corp., Tampa, FL (USA). Tampa Div.). Dec 1974. Contract EY-76-C-03-0962. 22p. AT.

Recognizing consequences of sodium water reaction in sodium heated steam generators, a study program at Westinghouse Tampa Division demonstrated design feasibility of utilizing duplex tubes with helium interface fluid to provide for sodium and water tube leak detection such that probability of sodium-water reaction is reduced. Program elements demonstrated grooved duplex tube manufacturing and inspection methods, thermal performance predictability and small sodium or water leak detection. A prototypic single-tube J-module steam generator model test was utilized to demonstrate thermal-hydraulic performance of the duplex tube under prototypic plant operating conditions.

2927 (TID--28715) BASIS FOR WESTINGHOUSE DOUBLE WALL TUBE STEAM GENERATOR WITH THIRD FLUID LEAK DETECTION CAPABILITY EXTRACTED FROM WESTINGHOUSE PROPOSAL TO THE DEPARTMENT OF ENERGY TO DEVELOP A STEAM GENERATOR FOR LARGE SCALE LIQUID METAL FAST BREEDER REACTORS. (Westinghouse Electric Corp., Tampa, FL (USA). Tampa Div.). Jun 1976. Contract EN-77-C-02-4177. 105p. AT.

Westinghouse is concerned about the potential consequences of having a sodium/water reaction in an operating sodium heated steam generator unit. This concern stems from an assessment of possible damage mechanisms resulting from the distribution of caustic reaction products throughout the system and the associated lengthy downtimes that appear required for cleanup, repair and recommissioning. It is proposed that a double-wall tube steam generator with third fluid leak detection capability be utilized in the first commercial LMFR plants. More specifically, the proposed high and low temperature commercial plant steam generators should be maximum size (350 MWT and 600 MWT, respectively) straight shell and tube integral evaporator and superheater once-through heat exchangers (as opposed to serpentine or helical coil tube units) to emphasize economic considerations without loss of component reliability. The proposed steam generator concepts are described.

2928 (TID--28746) BOUYANCY EFFECTS ON SODIUM COOLANT TEMPERATURE PROFILES MEASURED IN AN ELECTRICALLY HEATED MOCK-UP OF A 61-ROD BREEDER REACTOR BLANKET ASSEMBLY. Engel, F.C.; Markley, R.A.; Minushkin, B. (Westinghouse Electric Corp., Madison, PA (USA). Advanced Reactors Div.). 1978. Contract EY-76-C-02-3045-004. 20p. Dep. NTIS, PC A02/MF A01.

The paper describes test results selected to demonstrate the effect of buoyancy on the temperature profiles in a 61-rod electrically heated mock-up of an LMFR radial blanket assembly. In these assemblies, heat transfer occurs over a wide range of complex operating conditions. The range and complexity of

conditions are the result of the steep flux and power gradients which are an inherent feature of the blanket region and the power generation level in an assembly which can vary from 20 to 1100 kW.

2929 (TID--28755) FINAL REPORT: PHASE II EXTENSION, PROTOTYPE LARGE BREEDER REACTOR. PRIMARY HEAT TRANSPORT SYSTEM CELL STUDIES. (Stone and Webster Engineering Corp., Boston, MA (USA)). Sep 1977. Contract EY-76-C-03-1146. 229p. AT.

As a result of the premature suspension of the PLBR design activities, a number of questionable areas remained outstanding regarding the feasibility and practicality of the loop plant design. ERDA desired that these areas related to the feasibility of the loop plant design be studied in some detail during a 4 month period ending on September 30, 1977. Accordingly, Stone and Webster studied certain aspects of the PHTS cell design in more detail during this Phase II extension activity. The following objectives were established for this effort. TASK I--PHTS CELL DESIGN: Evaluate the primary heat transport system (PHTS) cell design features for a range of sodium spills. Establish PHTS cell design features that will contain sodium spills, limit sodium-concrete reactions, prevent excessive pressure buildup, and accommodate other effects of sodium leakage events. The cell configuration established at the end of Phase II will be used for this study. TASK II--PRIMARY PIPING DESIGN AND INSPECTION: Verify acceptability of Phase II primary piping arrangement for seismic conditions, determine location of pipe hangers and seismic snubbers, and define attachments to the cell structure. Evaluate methods of monitoring hanger and snubber performance and the capabilities to perform in-service inspection of the hangers and snubbers. TASK III--PHTS CELL PROVISIONS FOR MAINTENANCE: Investigate and evaluate the Phase II PHTS cell arrangement and features to facilitate manned access for local maintenance of primary components and recommend appropriate design changes. The objectives were met by design and analytical studies of PHTS cell structures, cell liners and sodium catch pans, primary piping supports, maintenance approaches, and by preparation of detailed composite drawings and construction of a scale model of the PHTS cell.

2930 (TID--28756) PROTOTYPE LARGE BREEDER REACTOR. PHASE II. FOLLOW-ON FINAL REPORT. Anderson, C.A. Jr. (Westinghouse Electric Corp., Madison, PA (USA). Advanced Reactors Div.). Nov 1977. Contract EY-76-C-03-1141. 573p. AT.

The volume includes five separate reports on tasks performed for the Department of Energy (previously ERDA, RDD) during the period of June 1, 1977 to October 1, 1977. These tasks are follow-on tasks which were assigned to Westinghouse Advanced Reactors Division at the end of Phase II of the PLBR studies. Although a decision was made in April 1977, to discontinue the PLBR studies and not to enter Phase III of the Program, the need to investigate a few outstanding issues prior to the end of FY 1977 was identified. Westinghouse ARD was assigned the following tasks: (1) surveillance and in-service inspection; (2) piping design and analysis; (3) primary piping integrity-licensability; (4) suizer cycle--system operation at start-up, shutdown and part-load; and (5) plant simulation and control of superheat cycle.

2931 (TID--28758) PROTOTYPE LARGE BREEDER

REACTOR: PHASE II EXTENSION. VOLUME I. CONCEPTUAL DESIGN STUDIES. (Bechtel Corp., San Francisco, CA (USA)). Sep 1977. Contract EY-76-C-03-1144. 411p. AT.

The document is a compilation of work sponsored by the Energy Research and Development Administration (ERDA) as an extension of the work done during Phase II of the ERDA/Electric Power Research Institute (EPRI) Prototype Large Breeder Reactor (PLBR) study. The objective of this Phase II extension was to investigate key engineering problems generic to the balance-of-plant for the loop concept which were identified during the Phase II effort. Volume I presents the results of the following investigations: (1) piping seismic restraint design for intermediate sodium piping between buildings (BTR-9), (2) containment building structural concept study (BTR-11), (3) heat transport system piping reliability enhancement study (BTR-12), (4) minimization of seismic loadings on components (BTR-13), and (5) heat transport cell liner design requirements (BTR-14).

- 2932 (TID--28937) REVIEW OF LITERATURE ON UNSTEADY FORCED CONVECTION HEAT TRANSFER WITH APPLICATION TO LMFBR THERMAL STRIPING. Snyder, P.H. (Westinghouse Electric Corp., Madison, PA (USA)). Advanced Reactors Div.). Jan 1979. Contract EY-76-C-15-2395; EY-78-C-15-0003. 47p. AT.

A literature review was conducted to determine what techniques are available to predict the unsteady forced convection heat transfer behavior of LMFBR upper core parts. The most suitable techniques are explored and pertinent methods are evaluated and extended to analyze the problem at hand. It is determined that available methods employ assumptions too restrictive to analyze the required situation and that further work should be aimed at the extension of these methods.

- 2933 (TID--29052) NUFACFS--NUCLEAR FUEL CYCLE ACTIVITY SIMULATOR: REFERENCE MANUAL. FINAL REPORT. Triplett, M.B.; Waddell, J.D.; Breese, T.A. (Battelle Columbus Labs., OH (USA)). 15 Aug 1978. Contract W-7405-ENG-92-089. 238p. Dep. NTIS, PC A11/MF A01.

Portions of document are illegible.

The Nuclear Fuel Cycle Activity Simulator (NUFACFS) is a package of Fortran subroutines which facilitate the simulation of a diversity of nuclear power growth scenarios. An approach to modeling the nuclear fuel cycle has been developed that is highly adaptive and capable of addressing a variety of problems. Being a simulation model rather than an optimization model, NUFACFS mimics the events and processes that are characteristic of the nuclear fuel cycle. This approach enables the model user to grasp the modeling approach rather quickly. Descriptions of the model and its components are provided with several emphases. First, a discussion of the modeling approach and basic assumptions is provided. Next, instructions are provided for generating data, inputting the data properly, and running the code. Finally, detailed descriptions of individual program element are given as an aid to modifying and extending the present capabilities.

- 2934 (TID--29088) NUCLEAR POWER WITHOUT NUCLEAR BOMBS. LINEAR ACCELERATOR-BREEDER CONCEPT FOR DECOUPLING THE NUCLEAR POWER ECONOMY FROM NUCLEAR WEAPONS PRODUCTION. Steinberg, M. (Brookhaven National Lab., Upton, NY (USA)). Jan 1977. Contract EY-76-C-02-0016. 15p. Dep. NTIS, PC A02/MF A01.

The role of nuclear weapon technology in

starting today's nuclear power plants is pointed out. There is another technology that can give us nuclear power without proliferation of weapons production: the linear accelerator-breeder (LAB) in which high-energy protons impinge on heavy metal targets to produce many neutrons which are absorbed in natural fertile material to produce fissile fuel for fission power reactors. Waste can also be transmitted in the same way. This is accomplished without the need for enrichment or reprocessing. The advantages of the LAB over LMFBRs are clear. The fuel cycle using the LAB device is described. Reprocessing and enrichment can only increase the supply of fissile fuel up to 30% whereas LAB can burn up practically all the fertile material which is an increase of 14,000%. (DLC)

- 2935 (TID--29350) DISTRIBUTION OF REVISIONS TO FFTF FSAR. Schade, A.R. (Hanford Engineering Development Lab., Richland, WA (USA)). 9 Nov 1978. Contract EY-76-C-14-2170. 137p. AT.

An amendment dealing with environmental design of mechanical and electrical equipment is presented for inclusion in the FFTF Final Safety Analysis Report

- 2936 (TR--097-330-009) MODULAR STEAM GENERATOR TEST REPORT: POST-PERFORMANCE TEST DISASSEMBLY AND EXAMINATION. Friske, W.H.; Page, J.P.; Williams, T.D. (Atomics International, Canoga Park, CA (USA)). 30 Aug 1974. Contract EY-76-C-03-0824-014. 41p. AT.

Selected regions of the Atomics International Modular Steam Generator (AI-MSG) were examined for the effect of 4000 hr of steaming service. Visual, dimensional, metallographic, and chemical techniques were employed in a search for: (1) water-steam-side effects, such as fouling, erosion, corrosion, and exfoliation, (2) sodium-side effects, such as corrosion, carbon transport, wear, fretting, erosion, and fouling, (3) overall effects, such as evidence of creep, fatigue, any evidence of infant mortality failure modes, and deterioration of properties of the wrought and welded 2-1/4 Cr - 1 Mo steel of which the steam generator is constructed, or (4) mechanical interference. On the basis of the results of this examination, it is concluded that both the basic design and the materials of construction are adequate for long-term LMFBR service.

- 2937 (TR--097-330-010) MODULAR STEAM GENERATOR FINAL PROJECT REPORT. Harty, R.B. (Atomics International Div., Canoga Park, CA (USA)). Sep 1974. Contract EY-76-C-03-0824-014. 206p. Participants in the LMFBR Program. Others request from TIC.

Atomics International designed, fabricated, and tested a prototype sodium cooled steam generator unit termed the Modular Steam Generator (MSG). The overall test program was divided into different phases, each with the intent of providing specific operational and performance information. These tests include preheat, vibration, pressurization (strain gauge), startup/shutdown, steady-state operation and heat transfer (thermal/hydraulics), impurities injection (leak detection), low-flow stability, and transients. Highlights of this test program are given. Test conditions at both a nominal 2400 and 1450 psig steam turbine pressure were tested at temperatures up to 950°F. Following the test program, a post-test disassembly and examination was conducted to determine if there was any loss of integrity or other potential

failure modes as a result of the imposed service conditions. The findings of this post-test examination are summarized. No evidence of any deleterious effects were found. Although the total operating time in the Sodium Components Test Installation represented but a few percent of the planned operating life in an LMFBR operating plant, the number of tube vibration cycles (approximately 10^9 cycles), localized temperature oscillations (10^7 on sodium-side lower mixing region, 10^8 in tube-side DNB region), and velocities in the bend region were such as to expose any evidence of possible wearout modes. Therefore, it was concluded that results provide strong indication of design suitability for long term service.

- 2938 (TREE--1116, pp 128-130) EVALUATED DECAY-SCHEME DATA FOR ILRR. Helmer, R.G.; Greenwood, R.C. Apr 1977.

Nuclear Technology Division annual progress report for period ending September 30, 1976.

The Interlaboratory LMFBR Reaction Rate (ILRR) program was organized for the purpose of making a series of precise measurements of rates of neutron-induced reactions for a set of well-defined and reproducible neutron spectra. For many of these reactions, the rates are determined by measurements of the gamma-ray spectra from the decay of the radioactive reaction products. A goal of the ILRR program is to measure fission reaction rates by means of gamma-ray spectrometry with accuracies of about ± 5 percent at the 95 percent confidence level. The computation of the reaction rates depends on two parameters of the nuclear decay scheme; these are the half-life and the absolute gamma-ray intensity. For the ILRR program, it is necessary that these parameters and their errors be as accurate and consistent as possible. Therefore, a series of regular reviews of the decay schemes of interest has been undertaken. Two earlier reviews were noted in Reference 1-3. The results of the most recent evaluation are given in Table I for selected gamma-rays. Original references, and published evaluations available as of November 1975 are included.

- 2939 (TREE--1168) USER'S GUIDE FOR THE RELIABILITY ANALYSIS SYSTEM (RAS). Rasmuson, D.M.; Marshall, N.H.; Burdick, G.R. (Idaho National Engineering Lab., Idaho Falls (USA)). Sep 1977. Contract EY-76-C-07-1570. 117p. Dep. NTIS, PC A06/MF A01.

The Reliability Analysis System (RAS) is an integrated package of computer programs for the quantification of fault trees. In particular, RAS has the capacity of performing phased mission analysis. RAS is based upon the MOCUS, POCUS, KITT-1, SRTPRN, and COMCAN programs. Mission cut set cancellation and four methods of bounding mission unreliability have been incorporated into RAS. A new cut set algorithm, FATRAM, is also included in RAS. RAS is written for the CDC Cyber-76 computer system and utilizes external storage devices. The program is available from the Argonne Code Center, 9700 South Cass Avenue, Argonne, Illinois 60439.

- 2940 (TREE--1255) EVALUATION OF ROLL-EXTRUDED ALLOY 718 TUBING. Smolik, G.R.; Korth, G.E. (Idaho National Engineering Lab., Idaho Falls (USA)). May 1978. Contract EY-76-C-07-1570. 44p. Dep. NTIS, PC A03/MF A01.

A sample of roll-extruded Alloy 718 tubing, a product identified for use in the Clinch River Breeder Reactor, was evaluated. The tubing satisfied AMS 5589 requirements for

seamless tubing, and had tensile and fatigue properties comparable to plate for the conventional 955°C (1750°F) heat treatment. Recrystallization was retarded in this product and bands of very small grains resulted from the conventional heat treatment. Both as-roll-extruded and directly aged material showed the results of thermomechanical processing in high strengths and reductions in area. It is recommended that work continue toward realizing improved fatigue and stress rupture properties in this product by means of 'Minigrain' and thermomechanical processing. 10 figures, 6 tables.

- 2941 (TREE--1289) COMCAN II: A COMPUTER PROGRAM FOR COMMON CAUSE FAILURE ANALYSIS. Rasmuson, D.M.; Wilson, J.R.; Marshall, N.H.; Burdick, G.R. (Idaho National Engineering Lab., Idaho Falls (USA)). Sep 1978. Contract EY-76-C-07-1570. 76p. Dep. NTIS, PC A05/MF A01.

This report is the user's manual for COMCAN II, a computer program for identifying possible common causes for the failure of fault tree minimal cut sets. The program is written in FORTRAN IV for the CDC CYBER-76 computer. A main feature of the program is its ability to identify minimal cut sets of any order with failure potential due to a single secondary failure (common cause).

- 2942 (TREE--1360) EVALUATION OF ROLL-EXTRUDED ALLOY 718 TUBES: SEAMLESS VERSUS WELDED. Smolik, G.R.; Flinn, J.E.; Korth, G.E. (Idaho National Engineering Lab., Idaho Falls (USA)). May 1979. Contract EY-76-C-07-1570. 77p. AT.

Large-diameter tubes of Alloy 718 are required for the upper core chimneys for the Clinch River Breeder Reactor and other liquid metal fast breeder reactor applications. This investigation was performed to: (1) determine the feasibility of using welded cylindrical blanks for roll-extrusion stock and (2) obtain material property data from roll-extruded tubes. Seamless and welded tubes were roll extruded from a common material source, Alloy 718 reference heat. Recrystallization, tensile, creep-rupture and fatigue behavior were determined for both tubes. Effects of solution anneal temperature upon mechanical properties of the seamless tube were checked. The effect of orientation upon selected properties of both the seamless and welded tubes was also examined. Finally, tensile properties of the roll-extruded tubes were compared with AMS specification requirements and data for cylindrical products formed by other processes.

- 2943 (TREE--1361) COMCAN II-A: A COMPUTER PROGRAM FOR AUTOMATED COMMON CAUSE FAILURE ANALYSIS. Rasmuson, D.M.; Marshall, N.H.; Wilson, J.R.; Burdick, G.R. (Idaho National Engineering Lab., Idaho Falls (USA)). May 1979. Contract EY-76-C-07-1570. 84p. Dep. NTIS, PC A05/MF A01.

The user's manual for COMCAN II-A, a computer program that identifies possible common causes for the failure of fault tree minimal cut sets, is presented. The program also contains options to help an analyst construct common locations and to assign susceptibilities to the components. The program is written in FORTRAN IV for the CDC CYBER-76 computer. A main feature of the program is its ability to identify minimal cut sets of any order with failure potential due to a single secondary failure (common cause).

2944 (UAC--41069) CONTROL OF OXYGEN, HYDROGEN, AND TRITIUM IN SODIUM SYSTEMS AT EXPERIMENTAL BREEDER REACTOR II. Osterhout, M.M. (Argonne National Lab., IL (USA)). 1978. Contract W-31-109-ENG-38. 14p. Dep. NTIS, PC A02/MF A01.

The source rates and steady-state concentrations have been measured for oxygen, hydrogen, and tritium impurities in EBR-II sodium systems. An analytical approach is used to determine the effectiveness of the cold traps for removing oxygen, hydrogen, and tritium. The cold-trap effectiveness data accumulated to date for removal of oxygen, hydrogen, and tritium indicate that EBR-II cold traps are highly effective in controlling these impurities to very low concentrations in the sodium systems.

2945 (UCRL--13916(Pt.1)(Add.)) MATERIAL CONTROL IN NUCLEAR FUEL FABRICATION FACILITIES. ADDENDUM TO PART I: FUEL DESCRIPTIONS AND FABRICATION PROCESSES. Borgonovi, G.M.; McCartin, T.J.; Miller, C.L.; Nguyen, T. (Science Applications, Inc., McLean, VA (USA)). Oct 1978. Contract W-7405-ENG-48. 27p. Dep. NTIS, PC A03/MF A01.

The addendum contains additional information on existing and planned nuclear fuel fabrication facilities in the world, and descriptions of a selected number of facilities including a conceptual facility which replaces the one initially presented and has been used as a basis for the discussions of material accountability and control. 8 figures, 4 tables.

2946 (UCRL--13942(Pt.1)) MATERIAL CONTROL IN NUCLEAR FUEL FABRICATION FACILITIES. PART I. FUEL DESCRIPTIONS AND FABRICATION PROCESSES, P.O. 1236909 FINAL REPORT. Borgonovi, G.M.; McCartin, T.J.; Miller, C.L. (Science Applications, Inc., McLean, VA (USA)). Dec 1978. Contract W-7405-ENG-48. 75p. (SAI--79-88-WA).

The report presents information on foreign nuclear fuel fabrication facilities. Fuel descriptions and fuel fabrication information for three basic reactor types are presented: The information presented for LWRs assumes that Pu-U Mixed Oxide Fuel (MOX) will be used as fuel.

2947 (UCRL--79653(Rev.1)) LASER DRIVEN FUSION FISSION HYBRIDS. Hansen, L.F.; Maniscalco, J.A. (California Univ., Livermore (USA). Lawrence Livermore Lab.). Nov 1977. Contract W-7405-ENG-48. 38p. (CONF-771102--15). Dep. NTIS, PC A03/MF A01.

From 20. annual AIChE meeting; New York, NY, USA (13 Nov 1977).

The role of the fusion-fission hybrid reactor (FFHR) as a fissile fuel and/or power producer is discussed. As long range options to supply the world energy needs, hybrid-fueled thermal-burner reactors are compared to liquid metal fast breeder reactors (LMFBR). A discussion of different fuel cycles (thorium, depleted uranium, and spent fuel) is presented in order to compare the energy multiplication, the production of fissile fuel, the laser efficiency and pellet gain requirements of the hybrid reactor. Lawrence Livermore Laboratory (LLL) has collaborated with Bechtel Corporation and with Westinghouse in two engineering design studies of laser fusion driven hybrid power plants. The hybrid designs which have resulted from these two studies are briefly described and analyzed by considering operational parameters, such as energy multiplication, power density, burn-up and plutonium production

as a function time.

2948 (UCRL--82614(Rev.1)) ELASTIC AND PLASTIC PROPERTIES OF URANIUM DIOXIDE FROM 5 TO 330 GPa. Gust, W.H. (California Univ., Livermore (USA). Lawrence Livermore Lab.). 11 Jul 1979. Contract W-7405-ENG-48. 5p. (CONF-790709--3(Rev.1)). Dep. NTIS, PC A02/MF A01.

From VII international AIRAPT conference; La Creusot, France (30 Jul 1979).

We have measured the shock-compression parameters for UO_2 to 330 GPa. The Hugoniot elastic limit was found to be 5.7 GPa. Evidence for a shock-induced phase transition was observed at about 54 GPa.

2949 (UJV--4156-T) RESULTS OF MEASURING LOCAL HYDRODYNAMIC CHARACTERISTICS OF GEOMETRICALLY DISTURBED ROD BUNDLE. I. Hejna, J.; Cervenka, J.; Mantlik, F. (Ustav Jaderneho Vyzkumu CSKA, Rez (Czechoslovakia)). Oct 1977. 68p. (In Russian). Dep. NTIS (US Sales Only), PC A04/MF A01.

The local hydrodynamic characteristics were studied on an open aerodynamic loop with a 19-rod bundle modelling the coolant flow through the fuel element of the BN-600 fast reactor. The relative lattice pitch in the bundle was $s/d=1.17$, the outer diameter of the model was 120 mm and total length 6,000 mm. The measuring cross-section was at a distance of 5,600 mm from the inlet. The central rod was deflected in the direction of the neighbouring rods with excentricities of 15.0 mm and 20.4 mm. The flow through the model was within the Reynolds number region of 47,800 to 141,000. Measured was the velocity field and the course of shear stress along the wetted perimeter. The results are given in tables and graphs. Friction losses were obtained as secondary results of the measurements which showed that the shift of the central rod had negligible effect on the losses and was comparable with errors in measurement.

2950 (UJV--4333-T) HEAT TRANSFER IN THE PERIPHERAL REGION OF A FAST REACTOR FUEL ASSEMBLY. PART I. EXPERIMENTAL EQUIPMENT; SOLUTION PREREQUISITES, TECHNOLOGICAL EXPERIMENTS. Sulc, V.; Masek, V. (Ustav Jaderneho Vyzkumu CSKA, Rez (Czechoslovakia)). May 1978. 52p. (In Russian). Dep. NTIS (US Sales Only), PC A04/MF A01.

Sodium stand S III was reconstructed at UJV Rez for the research of the effect of radial displacement of a side rod on the temperature field in a BN-600 fast reactor fuel assembly. A model was built of the BN-600 type fast reactor fuel assembly designated EK-16 containing 14 heating and 2 measuring rods. In heated rods the maximum linear heat flow of 53 W/cm² was attained on the outer rod surface. The differential equation is solved of the temperature field on a heating rod consisting of a heating coil, electric insulation and an outer tube. The course of the mean temperature is shown graphically in the rod and the coolant along the EK-16 channel at a power of 1 kW. Also shown graphically are the hydrodynamic and heat characteristics of stand S III with the EK-16 measuring section. The location of NiCr-Ni microthermocouples on measuring rods is described. Vacuum distillation was used in measuring the sodium oxide content. Technological experiments confirmed that the reconstructed stand can be used for the research of temperature fields in BN-600 type reactors with desired accuracy.

2951 (UJV--4576-T) EFFECT OF CONFIGURATION

DISTORTION ON VELOCITY AND TEMPERATURE FIELDS IN THE PERIPHERAL ZONE OF A FAST REACTOR FUEL ASSEMBLY AT LAMINAR FLOW. Milbauer, P. (Ustav Jaderneho Vyzkumu CSKAE, Rez (Czechoslovakia)). Nov 1978. 25p. (In Russian). NTIS (US Sales Only), PC A03/MF A01.

Calculations were performed of hydrodynamic and thermal characteristics for the peripheral zones of the BN-600 reactor fuel assembly. The distributions are shown of the tangential stress coefficient and of dimensionless thermal inhomogeneities along the fuel rod peripheries. The fundamental equations used in the calculations are reported.

2952 (UTNL-R--0030) EXPERIMENTAL STUDY ON FAST NEUTRON STREAMING THROUGH GRID-PLATE SHIELD OF A LMFBR. Oka, Y.; Wakabayashi, H.; An, S.; Suzuki, I. (Tokyo Univ. (Japan). Nuclear Engineering Research Lab.). 20 Jul 1976. 30p. Dep. NTIS (US Sales Only), PC A03/MF A01.

Neutron streaming through the holes penetrating the grid plate shield of a prototype LMFBR was experimentally examined. The mockups of the grid plate shield were made of iron and aluminum. Experiments were conducted at the vertical column of 'YAYOI', the fast neutron source reactor of University of Tokyo. A He-3 spectrometer was employed in order to measure the transmitted neutron spectrum, while rhodium and indium threshold foils were for the integral flux above specific energies and their spatial distributions in the form of reaction rates. The streaming factor for usual small banded holes is 1.28 ± 0.04 as to the integral neutron flux above 0.1 MeV and 1.30 ± 0.12 as to the reaction rate of indium foil. Use were made of the one and two dimensional neutron transport code ANISN and TWOTRAN for evaluation by computation. The reaction rates calculated by infinite slab model with ANISN code agree well with the experiments when normalized at the source point where neutrons are incident on the grid plate shield.

2953 (UTNL-R--0046, pp 44-49) TWO-DIMENSIONAL SHIELDING BENCHMARKS FOR SODIUM AND IRON AT YAYOI. Oka, Y. (Tokyo Univ. (Japan). Nuclear Engineering Research Lab.). Jun 1977. (In Japanese).

From Meeting on heat and structures in nuclear engineering, and symposium on numerical analysis of transport and diffusion phenomena in nuclear engineering; Tokai, Ibaraki, Japan (16 Mar 1977).

The benchmark experiments on two-dimensional shielding for sodium and iron with the reactor YAYOI were performed to obtain the data for designing fast breeder reactors. The deep (transparent) experiment with a plane source is described. The experiments were made with an iron sample of 94 cm x 94 cm x 70 cm, and with a sodium sample of 1 m x 1 m x 1.8 m. The distribution and attenuation of neutrons and gamma-ray in the samples were measured by activation foils and TLD. The fast neutron spectra at the injection points of the samples were observed with threshold detectors. The sandwich foil method was applied for the resonance energy region. Calculation was made by using the one dimensional and two dimensional discrete ordinate transport code ANISN and TWOTRAN-second. The experiment and calculated values on the central axis of the samples were compared, and the agreement between both values is not very good for the attenuation, whereas it is good for the shape of spectra.

2954 (WARD--353) RADIAL PARFAIT CORE DESIGN STUDY. Paxson, E. (Westinghouse Electric Corp., Madison, PA (USA). Advanced Reactors Div.). Jun 1977. Contract EY-76-C-03-1141. 205p. AT.

A study to design a core of the radial parfait (or bullseye) type for PLBR which, through its inherent characteristics, would give assurance that energetic core disruption would not result from transient overpower (TOP) or transient undercooling (TUC) accidents without scram, is described. In addition to the freedom from core disruption, the resulting core design was evaluated with respect to its effect on other reactor characteristics and components such as: thermal hydraulic performance, fuel and blanket assembly mechanical designs and performance, reactor structural design, refueling operation and scheduling, and fuel cycle and capital costs. During the course of the study, two refueling options developed, namely batch refueling on a multi-year cycle and partial core refueling on an annual cycle. Therefore, an additional objective was to make a recommendation relative to these two refueling approaches.

2955 (WARD-AD--3045-6) THEORY OF PARTICLE REDISTRIBUTION IN AN IRRADIATION ENVIRONMENT. Baron, M.; Chang, A.; Bleisberg, M.L. (Westinghouse Electric Corp., Madison, PA (USA). Advanced Reactors Div.). Apr 1977. Contract EY-76-C-02-3045-024. 25p. AT.

A new theory of particle redistribution in an irradiation environment is proposed based on the physical ideas of Nelson et al. The theory is a natural extension of the Lifshitz-Slyozov-Wagner approach to thermal coarsening. An equation governing the kinetic evolution of the particle size distribution is derived. It is solved for the equilibrium (i.e., displacement dose independent) distribution and together with the conservation of solute, provides a theoretical characterization of the equilibrium state. It is shown that due to solute resolution, the equilibrium state is characterized by the existence of a maximum stable radius and an amount of solute in dynamic solution which is in excess of the equilibrium thermal concentration for the irradiation temperature. Explicit formulae are given for the shape of the universal equilibrium particle size distribution, the maximum and average particle size at equilibrium, the excess amount of solute in dynamic solution and the concentration of particles per unit volume. The asymptotic form of the time dependent particle size distribution is discussed using the dynamic scaling hypothesis. The kinetic development of the maximum and average particle sizes are calculated based on dynamic scaling. Various special cases of the kinetic law governing the relaxation kinetics of the maximum (or average) particle size to their equilibrium values are discussed. Experimental data which are in excellent quantitative and qualitative agreement with theoretical predictions are presented.

2956 (WARD-CG--3045-2) SODIUM/CAVITY GAS EFFECT ON FATIGUE CRACK GROWTH IN 304SS UNDER FFTF PRIMARY COLD LEG PIPING CONDITIONS. Gowda, B.; Matheys, L. (Westinghouse Electric Corp., Madison, PA (USA). Advanced Reactors Div.). Mar 1978. Contract EY-76-C-02-3045-035. 46p. AT.

This report covers a portion of the work performed to determine the effect of sodium/cavity gas reaction products on fatigue crack growth in Type 304SS pipes. This program was

initiated to answer an important pipe integrity question, i.e. what is the effect of sodium/cavity gas reaction products on the possible extension of a fatigue crack in LMFBR primary piping. Following a description of the test apparatus and the specimens, the results are given for the first six of ten tests scheduled for Type 304SS. It is shown that the fatigue crack growth rate for Type 304SS in the sodium leak environment is not significantly different from that for a pure sodium environment at similar temperatures (600°F to 800°F) and stresses. It is also observed that the geometry of the specimens used (pipes) did not significantly alter the crack growth rates when compared to HEDL crack growth results obtained from compact tension type fracture specimens under conditions similar to the present tests.

- 2957 (WARD-CG--3045-3) CRACK GROWTH IN TYPES 304 AND 316 STAINLESS STEEL UNDER PROTOTYPIC LMFBR PRIMARY PIPING CONDITIONS. Gowda, B.C.; Matheys, W.L. (Westinghouse Electric Corp., Madison, PA (USA). Advanced Reactors Div.). Oct 1978. Contract EY-76-C-3045-035. 31p. AT.

The report presents test operations and results for tests 7 through 15 of the Sodium Effect on Crack Growth (SECG) program. The SECG program was initiated to determine whether the growth rate of a through-wall crack in LMFBR primary piping was affected by sodium leaking through the crack into the cavity gas. Tests to date (including tests 1-6 reported earlier) indicate that fatigue crack growth in both types of 304 SS and 316 SS is inhibited by a sodium/cavity gas environment to the same extent as that in pure sodium. From the limited number of tests it was observed that changes within the range of test variables (1 to 2 percent oxygen and 1000 to 5000 vppm moisture in cavity gas, 400 to 1015°F specimen temperature, 17.23 and 24.10 ksi of maximum stress) did not alter the benign nature of the sodium cavity gas environment. Tensile hold-time seems to slightly increase crack growth in type 304 SS pipes whereas it does not affect crack growth in 316 SS at the conditions and cycle frequency used in testing. However, the increase in crack growth rate with hold-time is not very significant and also is not consistent with some in-air test program results obtained at other laboratories.

- 2958 (WARD-CG--3045-4) ELEVATED TEMPERATURE FATIGUE CRACK GROWTH BEHAVIOR OF TYPE 304/308 STAINLESS STEEL WELDMENTS IN SODIUM/CAVITY GAS ENVIRONMENT. Gowda, B.C.; Matheys, W.L. (Westinghouse Electric Corp., Madison, PA (USA). Advanced Reactors Div.). Mar 1979. Contract EY-76-C-02-3045-035. 35p. AT.

Results of four tests on Type 304 Stainless Steel pipes with Type 308SS weldments performed under the Sodium/Cavity Gas Effect on crack growth program are presented. The objective of the program was to determine whether the growth rate of a through wall crack in LMFBR primary piping is affected by sodium leaking through the crack into the cavity gas or by interactions between crack tip material and sodium/cavity gas reaction products. Tests indicate that crack growth rates in welds and in the heat affected zone (HAZ) are decelerated by the presence of sodium/cavity gas environment present in the crack vicinity. Two tests conducted at 400°F showed faster crack growth rates than the two tests at 800°F. This observation is tentatively attributed to the higher stress levels used in tests at 400°F.

- 2959 (WARD-CN--3045-4) ANALYTICAL

COMPARISON OF THE IRRADIATION BEHAVIOR OF FAST REACTOR CARBIDE AND OXIDE FUEL PINS. Nayak, U.P.; Boltax, A.; Skalka, R.J.; Blancheria, A. (Westinghouse Electric Corp., Madison, PA (USA). Advanced Reactors Div.). 1977. Contract EY-76-C-02-3045-027. 38p. AT.

Advanced breeder reactor system design studies have shown that mixed U,Pu carbide fuel provides significant advantages over U,Pu oxide fuel with respect to nuclear, fuel-cycle and safety aspects. This report gives a comparative evaluation of the irradiation behavior of the two fuel types under steady-state and transient conditions, based on the LIFE-III fuel performance code. The analytical results show that properly designed carbide fuel pins will perform as successfully as oxide fuel pins in achieving high burnups on a reliable basis. In addition, for slow and terminated rapid overpower transients, carbide fuels are expected to cause lower levels of FCMI than oxide fuel pins. However, experimental verification of this prediction is required.

- 2960 (WARD-CR--3045-17) CORE RESTRAINT DEVELOPMENT. QUARTERLY PROGRESS REPORT FOR PERIOD ENDING MAY 31, 1977. Thompson, D.C. (Westinghouse Electric Corp., Madison, PA (USA). Advanced Reactors Div.). Aug 1977. Contract EY-76-C-02-3045-M. 25p. AT.

Progress related to the development of LMFBR reactor core restraints is summarized in the following areas: three-dimensional development tests, test component friction tests, simulated fuel assemblies, facility modification for full core tests, and TRITON code development. (DG)

- 2961 (WARD-CR--3045-19) CORE RESTRAINT DEVELOPMENT. QUARTERLY PROGRESS REPORT FOR PERIOD ENDING AUGUST 31, 1977. Thompson, D.C. (Westinghouse Electric Corp., Madison, PA (USA). Advanced Reactors Div.). Nov 1977. Contract EY-76-C-02-3045-005. 18p. AT.

Sample Friction Tests to support the 14 Row Test Program were initiated. Evaluation of Phase VI - Addendum C (Low Friction Compaction Test) data was completed. Evaluation of Phase VIII (121 Assembly Straight Core Withdrawal Test) data was initiated. Facility modification for the 14 Row Test was completed. Ninety-five percent of the core assemblies for these tests were assembled and aligned. Work was initiated to extend the next version of TRITON with capabilities of analyzing seven or more assemblies simultaneously. A comparison study of the radial shield assemblies model of TRITON with GHTX model calculations was initiated. Review of the draft for the TRITON code preliminary user's manual was completed.

- 2962 (WARD-CR--3045-20) NATIONAL CORE RESTRAINT DEVELOPMENT PROGRAM: SEVEN ROW TEST RESULTS. Thomson, J.D. (Westinghouse Electric Corp., Madison, PA (USA). Advanced Reactors Div.). Sep 1977. Contract EY-76-C-02-3045-005. 53p. AT.

The paper describes a test program required to develop the technology necessary to design breeder reactor core restraint systems and support applicable licensing processes. The basis for the qualification of analytical models is described and evaluated relative to the test results. Basic characteristics of the behavior of core assembly arrays are revealed through the implementation of special test methods. An understanding of the mechanical interactions of fuel assemblies in an array is necessary to qualify an analytical model for use as a design tool. "In air" tests were conducted to aid in developing a qualified model. These tests were designed utilizing test

components closely configured to the dimensional, elastic and frictional characteristics of breeder reactor core assemblies in sodium. Comparisons are made between the test results and predictions from an analytical model of the 7 Row test facility. The test facility was modeled using engineering approximations and assumptions characteristic of core restraint design practices. The report, the first of two reports, provides test results from the Westinghouse Core Restraint Test Facility (WCRTF). The report provides information and evaluation on the seven row core array for the following subjects: (1) generalized compaction characteristics, (2) uncertainties related to prediction of core array behavior, (3) comparisons between empirical data and analytical predictions, and (4) statistical modeling basis for core restraint analysis twist effects on core compactions. The results of the evaluation are discussed in terms of additional effort required to fully characterize the effects of mechanical interactions.

2963 (WARD-CR--3045-21) CORE RESTRAINT DEVELOPMENT. QUARTERLY PROGRESS REPORT FOR PERIOD ENDING NOVEMBER 30, 1977. Mangus, J.D. (Westinghouse Electric Corp., Madison, PA (USA). Advanced Reactors Div.). 1977. Contract EY-76-C-02-3045-005. 25p. AT.

All core assemblies for the 14 row tests have been aligned and placed on the core. The 14 row characterization tests have been initiated. Documentation of the insertion/withdrawal tests and the statistical modeling work is in progress. This activity must be completed prior to writing the 7 row final report. The Level I-A and I-C sections of the National Core Restraint Code Comparison/Verification Study have been completed using ANSYS 3-D. The TRITON 30° sector model is now operational. The TRITON code user's manual has been reviewed.

2964 (WARD-CR--3045-22) CORE RESTRAINT DEVELOPMENT. QUARTERLY PROGRESS REPORT FOR PERIOD ENDING FEBRUARY 28, 1978. Mangus, J.D. (Westinghouse Electric Corp., Madison, PA (USA). Advanced Reactors Div.). Oct 1978. Contract EY-76-C-02-3045-005. 21p. AT.

The LMFBR requires a core restraint system to provide both axial and radial support for the reactor assemblies. The primary requirements of the core restraint system are: (1) fuel, control, blanket, and removable shield assemblies must be located in predictable and reproducible positions; (2) refueling should be accomplished without damage to the assemblies; and (3) operating loads must not be excessive. Variables affecting the core restraint system are primarily the radiation-induced materials effects of swelling and creep which cause bowing deformations of the core assemblies during life and load pad friction. The objective of this development program is to evaluate potential restraint concepts both analytically and empirically, and develop, verify, and qualify analytical tools to be used to evaluate core restraint systems. A test facility, incorporating simulated core assemblies, has been prepared. This facility has the capability of modeling axial and radial core support restraint systems of various BR designs. Results from testing in this facility are used in the development of three-dimensional analytical models for predicting detailed performance of core restraint systems.

2965 (WARD-CR--3045-23) CORE RESTRAINT DEVELOPMENT. QUARTERLY PROGRESS REPORT FOR

PERIOD ENDING MAY 31, 1978. Mangus, J.D. (Westinghouse Electric Corp., Madison, PA (USA). Advanced Reactors Div.). Oct 1978. Contract EY-76-C-02-3045-005. 28p. AT.

The LMFBR requires a core restraint system to provide both axial and radial support for the reactor assemblies. The primary requirements of the core restraint system are: (1) fuel, control, blanket, and removable shield assemblies must be located in predictable and reproducible positions; (2) refueling should be accomplished without damage to the assemblies; and (3) operating loads must not be excessive. Variables affecting the core restraint system are primarily the radiation-induced materials effects of swelling and creep which cause bowing deformations of the core assemblies during life and load pad friction. The objective of this development program is to evaluate potential restraint concepts both analytically and empirically, and develop, verify, and qualify analytical tools to be used to evaluate core restraint systems. A test facility, incorporating simulated core assemblies, has been prepared. This facility has the capability of modeling axial and radial core support restraint systems of various BR designs. Results from testing in this facility are used in the development of three-dimensional analytical models for predicting detailed performance of core restraint systems.

2966 (WARD-CR--3045-24) CORE RESTRAINT DEVELOPMENT. QUARTERLY PROGRESS REPORT FOR PERIOD ENDING AUGUST 31, 1978. Mangus, J.D. (Westinghouse Electric Corp., Madison, PA (USA). Advanced Reactors Div.). Jun 1979. Contract EY-76-C-02-3045-005. 159p. AT.

Progress is summarized in the following areas: core mechanics and configuration performance; seven-row test evaluations; fourteen row testing; withdrawal/refueling test plan; FFTF load pad dimensional analysis; assessment of proposed Revision 4 creep and Revision 6(7) swelling equations; benchmark problem set for core restraint evaluation of irradiation creep and swelling equations; EBR-2 reflector assembly bowing assessment; swelling-irradiation creep opposition test; FFTF benchmark experiment technical feasibility assessment; TRITON development and verification; ANSYS and CRAMP friction effects evaluations; and national core mechanics and configuration performance plan.

2967 (WARD-CR--94000-1) CORE RESTRAINT DEVELOPMENT. QUARTERLY PROGRESS REPORT FOR PERIOD ENDING NOVEMBER 30, 1978. Sirota, B.B. (Westinghouse Electric Corp., Madison, PA (USA). Advanced Reactors Div.). 1978. Contract EY-76-C-02-3045-005. 62p. AT.

Information is presented concerning the Core Restraint Test Facility activities; core restraint structured analysis; and core restraint quality assurance.

2968 (WARD-CR--94000-2) CORE RESTRAINT DEVELOPMENT. QUARTERLY PROGRESS REPORT FOR PERIOD ENDING FEBRUARY 28, 1979. Sirota, B.B. (Westinghouse Electric Corp., Madison, PA (USA). Advanced Reactors Div.). 1979. Contract EY-76-C-02-3045-005. 58p. AT.

Processing of compaction data results from nominal and low friction tests on a straight 7 row core was continued. The 14 row straight core compaction (nested) and dislodged core tests were successfully completed. A numerical comparison of irradiation induced free bow shapes at three points in time indicate ANSYS deflections to be 4%, 17%, and 28% greater than the respective NUBOW-3D predictions; possible

reasons for the differences are being probed. Efforts were continued to provide an analytical evaluation of mechanical effects parameters and assess their significance by comparisons with the mechanical effects resulting from 7 row testing in the Core Restraint Test Facility (CRTF). Effort was started on a benchmark problem set to be used for core restraint evaluation of irradiation creep and swelling equations. Study results of the FFTF benchmark experiment indicate that the test goals are feasible in the multi-duct fuel test assembly (MFTA).

- 2969 (WARD-CR--94000-3) CORE RESTRAINT DEVELOPMENT. QUARTERLY PROGRESS REPORT FOR PERIOD ENDING MAY 31, 1979. Sirota, B.B. (Westinghouse Electric Corp., Madison, PA (USA). Advanced Reactors Div.). Oct 1979. Contract AM02-76CH94000. 77p. AT.

This quarterly progress report covers the period from March 1, 1979 to May 31, 1979. Processing of compaction data results from nominal and low friction tests on a straight 7 row core was continued. The 14 row straight core testing was focused on specialized compaction tests and assembly characterization measurements during this period. A comparison of irradiation induced free-bow shapes indicated that the NUBOW-3D solution is swelling dominated relative to the ANSYS solution. The first application of a benchmark problem set to be used for core restraint evaluation of irradiation creep and swelling equations was studied for a variety of cases.

- 2970 (WARD-D--0147) INTERNAL EXTERNAL CLADDING DEGRADATION. Travis, M.L. (Westinghouse Electric Corp., Madison, PA (USA). Advanced Reactors Div.). Feb 1977. Contract EY-76-C-02-3045-020. 66p. AT.

The purpose of the report is to provide information on Internal/External Cladding Degradation. Cladding degradation is used to denote both material loss and degradation of properties due to the high temperature sodium environment and the presence of fuel at high burnups. Various cladding degradation mechanisms that have been identified include: (a) loss of material and surface depletion (chromium and nickel) due to sodium corrosion, (b) degradation of material strength due to loss of carbon and nitrogen, (c) loss of material due to fretting and wear, and (d) internal cladding attack by redistributed fission products.

- 2971 (WARD-D--0178) CLOSURE HEAD CAPABILITY FOR THIRD LEVEL STRUCTURAL MARGIN LOADING. Todd, M.A.; Prevenslik, T.V.; Elder, G.G. (Westinghouse Electric Corp., Madison, PA (USA). Advanced Reactors Div.). Jun 1977. Contract EY-76-C-15-1200. 195p. AT.

The results of the most recent and detailed analysis of response of the Clinch River Breeder Reactor Plant Closure Head System to Third Level Structural Margin Loading are presented and assessed for Closure Head structural adequacy. Results obtained from scale model experiments are summarized and correlated with analytical predictions. Analytical and experimental results both indicate that the Closure Head is capable of withstanding 661 MJ Third Level Structural Margin loads without structural failures.

- 2972 (WARD-HT--3045-27) HIGH TEMPERATURE STRUCTURAL DESIGN TECHNOLOGY: VALIDATION. QUARTERLY PROGRESS REPORT FOR THE PERIOD ENDING MAY 31, 1977. Bishop, E.C. (Westinghouse

Electric Corp., Madison, PA (USA). Advanced Reactors Div.). Jul 1977. Contract EY-76-C-02-3045. 120p. AT.

Progress is summarized in the testing and analysis of types 304 and 316 stainless steel plates and tubular specimens for the purpose of documenting design criteria for FFTF and LMFBR core structural components. Included are data on core design methods, basic specimen testing, tubular specimen testing, structure testing, FFTF/INX nozzle testing, structural analysis, and crack propagation testing. (DG)

- 2973 (WARD-HT--3045-30) HIGH TEMPERATURE STRUCTURAL DESIGN TECHNOLOGY: VALIDATION. QUARTERLY PROGRESS REPORT FOR PERIOD ENDING AUGUST 31, 1977. Bishop, E.C. (Westinghouse Electric Corp., Madison, PA (USA). Advanced Reactors Div.). Oct 1977. Contract EY-76-C-02-3045-006. 112p. AT.

Progress is summarized in the testing and analysis of types 304 and 316 stainless steel plates and tubular specimens for the purpose of documenting design criteria for FFTF and LMFBR core structural compounds included are data on basic specimen testing, tubular specimen testing, structure testing, FFTF/INX nozzle testing, and structural analysis. (DG)

- 2974 (WARD-HT--3045-31) HIGH TEMPERATURE STRUCTURAL DESIGN TECHNOLOGY: VALIDATION. QUARTERLY PROGRESS REPORT FOR PERIOD ENDING NOVEMBER 30, 1977. Bishop, E.C. (Westinghouse Electric Corp., Madison, PA (USA). Advanced Reactors Div.). Jan 1978. Contract EY-76-C-02-3045-006. 95p. AT.

Progress is summarized in the testing and analysis of types 304 and 316 stainless steel plates and tubular specimens for the purpose of documenting design criteria for FFTF and LMFBR core structural components. Included are data on basic specimen testing, tubular specimen testing, structure testing, FFTF/INX inlet nozzle testing, and analysis methods and procedures.

- 2975 (WARD-HT--3045-34) HIGH TEMPERATURE STRUCTURAL DESIGN TECHNOLOGY: VALIDATION. QUARTERLY PROGRESS REPORT FOR PERIOD ENDING FEBRUARY 28, 1978. Bishop, E.C. (Westinghouse Electric Corp., Madison, PA (USA). Advanced Reactors Div.). Mar 1979. Contract EY-76-C-02-3045-006. 125p. AT.

Progress is summarized in the testing and analysis of types 304 and 316 stainless steel plates and tubular specimens for the purpose of documenting design criteria for FFTF and LMFBR core structural components. Included are data on basic specimen testing, tubular specimen testing, structure testing, FFTF/INX inlet nozzle testing, and analysis methods and procedures.

- 2976 (WARD-HT--3045-35) RESULTS FROM A BUCKLING TEST OF A 16-INCH (406MM) DIAMETER PIPING ELBOW. Peters, F.E. (Westinghouse Electric Corp., Madison, PA (USA). Advanced Reactors Div.). Jul 1978. Contract EY-76-C-02-3045-006. 228p. AT.

Portions of document are illegible. The report presents a description of a room temperature load test of a 16-inch (406 mm) diameter of Type 304 stainless steel seamless elbow under an in-plane closing bending moment. Strains, forces, displacements and deformations acquired during loading of the elbow test section are presented together with a description of the test, test section and measurement systems. Incremental increases in moment load produced a closing of the elbow

with attendant ovalization of the elbow. Buckling of the elbow was observed at 1.28 x 10⁶ in-lb (144.7 kNm) with no wrinkling of the elbow surface. Peak strains were noted at the elbow crown locations of the central plane (45° section) of the elbow as a result of the elbow ovalization. The report is limited to presentation of test results for comparison with analytical predictions.

- 2977 (WARD-HT--94000-1) STRUCTURAL DESIGN VERIFICATION TESTING TECHNIQUES AT WESTINGHOUSE ADVANCED REACTORS DIVISION. Elliott, D.N.; Horner, R.E.; Peters, F.E. (Westinghouse Electric Corp., Madison, PA (USA). Advanced Reactors Div.). Apr 1979. Contract EY-76-C-02-3045-006. 54p. AT.

Westinghouse Advanced Reactors Division is performing a program with Department of Energy funding support to validate structural analysis methods and design criteria for piping system components operating in the thermal creep range. The testing techniques discussed in this report relate to full scale tests of AISI 304 stainless steel piping elbows and nozzles. The nominal diameter of the test sections is 16 inch (406 mm), and the tests are performed at temperatures up to 1100°F (593°C). Basic features of the test equipment and test section design are described; however, the emphasis is on instrumentation techniques for measurement of strain and displacement. Instrumentation techniques are discussed for high temperature measurements on the elbow bending tests to determine: strain distribution using capacitance and resistance gages; ovalization at critical cross sections; linear displacement in three directions; rotational displacement and temperature distribution. Strain measurement techniques for nozzle thermal transient tests are discussed, and the selected method is described in detail. Conclusions drawn from this experience with full scale high temperature structural tests are presented in the form of recommendations for related applications.

- 2978 (WARD-HT--94000-2) PLASTIC IN-PLANE BENDING AND BUCKLING OF AN ELBOW: COMPARISON OF EXPERIMENTAL AND SIMPLIFIED ANALYSIS RESULTS. Sobel, L.H.; Newman, S.Z. (Westinghouse Electric Corp., Madison, PA (USA). Advanced Reactors Div.). Aug 1979. Contract AM02-76CH94000. 200p. AT.

This work shows that analytical predictions obtained from a large displacement MARC pipe-bend element 17 analysis are in reasonably good agreement with experimental results obtained in a companion room temperature test of a 16" OD Type 304 stainless steel elbow, which was loaded by an in-plane closing bending moment in a step-wise fashion until buckling occurred. Estimates of the buckling load obtained from the Southwell Plot Method and a number of presently used arbitrary methods are compared with the experimental buckling load. It is found that the Southwell Method provides an accurate estimate of the buckling load provided that it is based on the nonlinear component of the deformation. The three arbitrary methods considered herein all have the shortcomings of being dependent on the linear elastic region of the moment-deformation curves, whereas the plastic buckling load is not strongly dependent on this region, if at all, and of being devoid of a sound theoretical basis.

- 2979 (WARD-I--10134-2) POST TEST EXAMINATION OF DOUBLE-WALL TUBE FOR INTERFACE WEAR AND WATER SIDE CORROSION EFFECTS IN A LIQUID METAL HEATED STEAM GENERATOR. Padden,

T.R.; Schmidt, D.K. (Westinghouse Electric Corp., Madison, PA (USA). Advanced Reactors Div.). Dec 1977. Contract EY-76-C-03-0962. 162p. AT.

Post test evaluation of a double-wall steam generator tube of a liquid metal heated 2 1/4 Cr-1 Mo, single tube, J-modular evaporator was performed following a multi-phase test program to determine water side corrosion effects, tube-to-tube interface effects and weld performance. Exposure of the steam generator tubing to 8494 hours of "worst case" water chemistry conditions of 30 ppb sodium under evaporator tube wall "dry out" conditions at 240,000 Btu/hr-ft² heat flux produced no deleterious effects. A conditional maximum corrosion rate of 0.90 mils/year was calculated at the dry-out zone on the basis of corrosion oxide thickness measurements. Tube-to-tube interface wear did occur with a maximum wear depth of 7.9 mils. Tube-to-tubesheet welds and dissimilar metal welds were adequate with no signs of deterioration resulting from the test.

- 2980 (WARD-NA--3045-42) SODIUM TECHNOLOGY PROGRAM: FRICTION, WEAR, AND SELF-WELDING. QUARTERLY PROGRESS REPORT FOR PERIOD ENDING JANUARY 31, 1977. Ray, W.E. (Westinghouse Electric Corp., Madison, PA (USA). Advanced Reactors Div.). Apr 1977. Contract EY-76-C-02-3045. vp. AT.

Testing activities in support of the CRBRP Steam Generator tube/tube spacer plate interaction and Primary Control Rod System (PCRS) material combinations are described. Two tests involving actual 2 1/4 Cr-1 Mo electro-slag remelt (ESR) steam generator tubing rubbing against 2 1/4 Cr-1 Mo and Inconel 718 spacer plate materials were completed in 446°C (835°F) sodium. The tests involved a multiple interface test configuration to permit variations in contact load to be investigated during one test. The final two tests in the steam generator test series have been initiated. Results from tests completed during the reporting period continued to show similar tube wear resulting from interaction with 2 1/4 Cr-1 Mo and Ingot Iron spacer plates. Inconel 718 spacer plate material continued to demonstrate excellent wear behavior when interacting with 2 1/4 Cr-1 Mo tubing at both 446 and 343°C. Initial results appear to indicate little differences in tube wear depth when 2 1/4 Cr-1 Mo spacer plate material interacts with vacuum arc remelt (VAR) or electroslag remelt (ESR) tubing. However, ESR tubing does incur slightly more wear than VAR tubing when interacting with Inconel 718 spacer plate material. Relationships of tube wear depths to contact stress and sodium temperature were also demonstrated.

- 2981 (WARD-NA--3045-48) FRICTION AND WEAR TESTS IN SUPPORT OF LMFBR STEAM GENERATOR TUBE/TUBE SPACER PLATE INTERACTIONS. Galioto, T.A.; Wilson, W.L. (Westinghouse Electric Corp., Madison, PA (USA). Advanced Reactors Div.). Apr 1979. Contract EY-76-C-02-3045-003. 95p. AT.

The friction, wear, and self-welding behavior of 2-1/4Cr-1Mo steam generator tubing interacting with tube spacer plates has been investigated under prototypic LMFBR steam generator service conditions. Dynamic friction and self-welding characteristics were investigated by a simple pin-on-plate type test in flowing sodium at temperatures to 538°C (1000°F). Subsequent testing involved tube/tube spacer plate model tests utilizing actual steam generator tubing and tube spacer plate materials and configurations. Conditions of contact load, stroke, velocity, rubbing

distance, sodium temperature, and intermittent dwell periods were investigated. In addition, the behavior of potential alternate spacer plate materials Ingot Iron (Armco Electromagnetic Iron) and Inconel 718 as well as Vacuum Arc Remelt and Electroslag Remelt tubing were evaluated.

- 2982 (WARD-NA--3045-49) SODIUM TECHNOLOGY PROGRAM: FRICTION, WEAR, AND SELF-WELDING. QUARTERLY PROGRESS REPORT FOR PERIOD ENDING JULY 31, 1977. Ray, W.E. (Westinghouse Electric Corp., Madison, PA (USA). Advanced Reactors Div.). Dec 1977. Contract EY-76-C-02-3045-001. 57p. AT.

The objectives of the friction and wear test program are: To ensure that no component in the FFTF or CRBRP will fail to perform its function by evaluating the friction and wear behavior of reference and alternate material combinations in interface configurations simulating reactor components under prototypic service conditions and environments, and to provide reactor designers with the quantitative data and experience factors necessary to successfully design components or component interfaces which will experience sliding or static contact under load.

- 2983 (WARD-NA--3045-52) SELF-WELDING EVALUATION OF TRIBALLOY 400, 700, AND 800 IN FLOWING SODIUM. Chang, J.Y.; Schrock, S.L. (Westinghouse Electric Corp., Madison, PA (USA). Advanced Reactors Div.). Apr 1979. Contract EY-76-C-02-3045-001. 38p. AT.

The objective of this study is to provide experimental information on the self-welding characteristics of materials used in sodium cooled fast breeder reactor components. Materials in some components, such as pumps, valves, and core support structures, will be in static contact, under load, for extended periods while immersed in high-temperature sodium. The self-welding characteristics were determined by measuring the forces required to separate the test specimens in a tensile mode after simulated service exposures to time, temperature, and load in a prototypic sodium environment. Two types of separation tests were performed. In the first type, separation forces were measured at the exposure temperatures in a sodium test chamber (regular test), and the second type was measured at the room temperature in an air atmosphere after removal of the samples from the sodium chamber (screening test).

- 2984 (WARD-NA--3045-53) MICROSTRUCTURAL AND SURFACE CHARACTERIZATION OF COMMERCIAL CANDIDATE LMFBR FUEL CLADDING AND DUCT ALLOYS AFTER EXPOSURE TO FLOWING SODIUM AT 700°C. Bagnall, C.; Witkowski, R.E. (Westinghouse Electric Corp., Madison, PA (USA). Advanced Reactors Div.). Sep 1978. Contract EY-76-C-02-3045-002. 53p. AT.

A detailed description of the microstructural development of each material at 700°C is given so that the influence of the sodium exposure below the surface exposed to liquid metal may be evaluated. The solute-hardened alloys and the precipitation-hardened alloys displayed distinct and separate types of corrosion. Additional characteristic differences between the two basic groups demonstrate how the concentration of the element molybdenum influences the different surface morphologies that are developed as a result of the sodium exposure.

- 2985 (WARD-NA--3045-54) BEHAVIOR OF AN IRON

MANGANESE ALLOY AS A MONITOR FOR CARBON ACTIVITY IN LIQUID SODIUM. Bagnall, C.; Shiels, S.A. (Westinghouse Electric Corp., Madison, PA (USA). Advanced Reactors Div.). Jun 1978. Contract EY-76-C-02-3045-002. 27p. AT.

Owing to the shortcomings of a number of alloys previously selected for use as carbon activity monitoring materials in sodium systems, a need arose to investigate more fully the behavior of the remaining most promising candidate. Accordingly, DOE funding was provided to study an Fe-12Mn alloy, already identified as the reference material in the RDT Standard "Methods for the Analysis of Sodium and Cover Gas," (RDT-F-3-40T). Some concern had been raised as to the equilibration time and to the degree of response this alloy would have in both high and low carbon activity sodium environments. It was also important to determine how much manganese was lost during foil equilibration since this element has a direct influence on the carbon concentration established at a particular activity level. Four 200 hour tests were performed in an isothermal sodium test loop at 1300°F (704°C) under both carburizing and decarburizing conditions. The results showed that equilibrium was sufficiently established after 24 hours, although the ability of the Fe-Mn foil to carburize to significant levels was not demonstrated. Manganese depletion over a 200 hour period was significant. The surface concentration was lowered to 3-4 percent and the depth of depletion was about 0.8 mils. Several recommendations were made regarding the initial concentration of both manganese and carbon in the standard material, and to a limitation of the sodium exposure period. The need for additional evaluation was indicated.

- 2986 (WARD-NA--940002) PHYSICAL CHARACTERISTICS OF CORROSION PRODUCT DEPOSITS. Miller, R.L. (Westinghouse Electric Corp., Madison, PA (USA). Advanced Reactors Div.). Sep 1979. Contract AM02-76CH94000. 55p. AT.

Test objectives were to measure the flowrate required to remove deposits from a deposit bearing surface at 700°F and to characterize these sheared deposits. The test technique involved filtering the sodium inventory of a loop, MTL-4 to establish a loop blank, i.e., the quantity of particulates entrained in the sodium. Next, a deposit bearing specimen and filter were installed in MTL-4. Thereafter, the flowrate past the deposit surface was increased in sequential steps with a new filter installed at each test velocity. Comparison of the deposit weights, obtained from the loop blank and test velocity filters, yielded a possible shear velocity for deposit removal. Also the metallic composition and morphology of the filtered debris were determined.

- 2987 (WARD-NC--3045-2) LOOP HEAT CAPACITY MODELS AND THEIR EFFECTS FOR DEMO NATURAL CIRCULATION TRANSIENT ANALYSIS. Planchon, H.P.; Laster, W.R. (Westinghouse Electric Corp., Madison, PA (USA). Advanced Reactors Div.). Sep 1978. Contract EY-76-C-02-3045-034. 185p. AT.

As part of the DOE Applied Technology Breeder Reactor Natural Circulation Verification Program, improved computer models for the piping, IHX plena, and pump heat transport have been developed and/or adapted for incorporation in DEMO. The improved models include the fluid to surrounding structure heat transfer. Comparisons of the model's calculations with closed form solutions were made for verification. An assessment of the

effect of the fluid to structure heat transfer on the calculations of natural circulation and normal trip transients for the CRBRP configuration, for example, indicate the following: (1) The sodium to structure heat transfer is important when calculating natural circulation thermal heads and flows. The maximum core hot spot temperature immediately following the transition to natural circulation was 200°F higher with loop to sodium heat transfer. Thereafter the heat transfer tends to smooth thermal head and flow variations and reduce peak temperatures. (2) The sodium to structure heat transfer significantly mitigates thermal transients introduced at the reactor, IHX or steam generator. For example, the rate of decrease of temperature at the superheater inlet is reduced by a factor of $1/2$ by the loop heat transfer following a trip to pony motor flow. The mitigation is larger for lower flows and longer pipe runs.

- 2988 (WARD-NC--94000-1) COMPARISONS OF DEMO CALCULATIONS TO FFTF PUMP AND FLOW COASTDOWN MEASUREMENTS. Planchon, H.P.; Calvo, R.; Schurko, R.; Lin, S.S. (Westinghouse Electric Corp., Madison, PA (USA). Advanced Reactors Div.). Aug 1979. Contract EY-76-C-02-3045-014. 46p. AT.

Main coolant pump speeds and reactor plant flows calculated with DEMO (a whole plant nuclear-thermal-hydraulic transient simulation) are compared to the speed and flow coastdowns, following a pump trip, that were measured in the Fast Flux Test Facility. These comparisons test DEMO's validity for calculating the Reactor Plant coolant flows during the transition from forced circulation to natural circulation. The calculated and measured coastdowns compared closely. The good comparison indicates that DEMO is a valid model for the flow coastdown - that is (1) that the DEMO pump and hydraulic models include the physical elements necessary for calculating the Reactor Plant flow coastdown, and (2) that the DEMO pump and hydraulic models are functioning numerically as intended.

- 2989 (WARD-OX--3045-20) OXIDE FUEL ELEMENT DEVELOPMENT. QUARTERLY PROGRESS REPORT FOR PERIOD ENDING SEPTEMBER 30, 1975. Boltax, A.; Saling, J.H. (Westinghouse Electric Corp., Madison, PA (USA). Advanced Reactors Div.). Jan 1976. Contract EY-76-C-02-3045-M. 91p. AT.

Topics reported on include: coordination and evaluation of mixed-oxide irradiation tests; post-irradiation examination of fast reactor experiments; grid-type fuel assembly design; fabrication, development, and testing of LMFBR fuel assemblies; evaluation and analysis of fuel and cladding irradiation behavior; improvement of analytical methods and lifetime codes; and transient code development. (GHT)

- 2990 (WARD-OX--3045-23) OXIDE FUEL ELEMENT DEVELOPMENT. QUARTERLY PROGRESS REPORT FOR PERIOD ENDING DECEMBER 31, 1975. Boltax, A.; Saling, J.H. (Westinghouse Electric Corp., Madison, PA (USA). Advanced Reactors Div.). Apr 1976. Contract EY-76-C-02-3045-M. 151p. AT.

Progress is summarized in the following LMFBR fuel studies: coordination of mixed oxide irradiation tests; post-irradiation examination of fast reactor experiments; grid-type fuel assembly design; fabrication, development and testing of fuel assemblies; evaluation and analysis of fuel and cladding irradiation behavior; steady-state analytical methods; and transient code development. (DG)

- 2991 (WARD-OX--3045-24) OXIDE FUEL ELEMENT DEVELOPMENT. QUARTERLY PROGRESS REPORT FOR PERIOD ENDING MARCH 31, 1976. Boltax, A.; Saling, J.H. (Westinghouse Electric Corp., Madison, PA (USA). Advanced Reactors Div.). Aug 1976. Contract EY-76-C-02-3045-007;EY-76-C-02-3045-008;EY-76-C-02-3045-009. 110p. AT.

Information is presented concerning the coordination of mixed oxide irradiation tests; post-irradiation examination of fast reactor experiments; grid-type fuel assembly design; fabrication, development, and testing of LMFBR fuel assemblies; evaluation and analysis of fuel and cladding irradiation behavior; steady-state analytical methods; and transient code development.

- 2992 (WARD-OX--3045-26) OXIDE FUEL ELEMENT DEVELOPMENT QUARTERLY PROGRESS REPORT FOR PERIOD ENDING JUNE 30, 1976. Boltax, A.; Saling, J. (Westinghouse Electric Corp., Madison, PA (USA). Advanced Reactors Div.). Oct 1976. Contract EY-76-C-02-3045-007;EY-76-C-02-3045-008;EY-76-C-02-3045-009. 109p. AT.

Progress in LMFBR fuel development and testing is summarized in the following areas: coordination of mixed oxide irradiation tests; post-irradiation examination of fast reactor experiments; grid-type fuel assembly design; fabrication, development, and testing of LMFBR fuel assemblies; evaluation and analysis of fuel and cladding irradiation behavior; steady-state analytical methods; and transient code development. (DG)

- 2993 (WARD-OX--3045-27) OXIDE FUEL ELEMENT DEVELOPMENT. QUARTERLY PROGRESS REPORT FOR PERIOD ENDING SEPTEMBER 30, 1976. Boltax, A.; Saling, J. (Westinghouse Electric Corp., Madison, PA (USA). Advanced Reactors Div.). Nov 1976. Contract EY-76-C-02-3045-007;EY-76-C-02-3045-008;EY-76-C-02-3045-009. 110p. AT.

Information is presented concerning the coordination of mixed oxide irradiation tests; post-irradiation examination of fast reactor experiment; 217 rod grid-type fuel assembly mechanical design; fabrication, development, and testing of LMFBR fuel assemblies; evaluation and analysis of fuel and cladding irradiation behavior; steady-state analytical methods; and transient code development.

- 2994 (WARD-OX--3045-29) OXIDE FUEL ELEMENT DEVELOPMENT. QUARTERLY PROGRESS REPORT FOR PERIOD ENDING DECEMBER 31, 1976. Boltax, A.; Saling, J. (Westinghouse Electric Corp., Madison, PA (USA). Advanced Reactors Div.). Jun 1979. Contract EY-76-C-02-3045-007;EY-76-C-02-3045-008;EY-76-C-02-3045-009. 82p. AT.

Progress is summarized for the following tasks: coordination of mixed-oxide irradiation tests, post-irradiation examination of fast reactor experiments, evaluation and analysis of fuel and cladding irradiation behavior, radial blanket irradiation tests in EBR-2, grid type fuel assembly mechanical design, grid fabrication and tests, and fuel pin design criteria and code development.

- 2995 (WARD-OX--3045-31) OXIDE FUEL ELEMENT DEVELOPMENT. QUARTERLY PROGRESS REPORT FOR PERIOD ENDING MARCH 31, 1977. Boltax, A.; Cooper, M.H. (Westinghouse Electric Corp., Madison, PA (USA). Advanced Reactors Div.). Jun 1979. Contract EY-76-C-02-3045-007;EY-76-

C-02-3045-008;EY-76-C-02-3045-009. 125p. AT.

Progress is summarized for the following tasks: coordination of mixed-oxide irradiation tests, post-irradiation examination of fast reactor experiments, evaluation and analysis of fuel and cladding irradiation behavior, radial blanket irradiation tests in EBR-2, grid type fuel assembly mechanical design, grid fabrication and tests, and fuel pin design criteria and code development.

2996 (WARD-OX--3045-32) OXIDE FUEL ELEMENT DEVELOPMENT. QUARTERLY PROGRESS REPORT FOR PERIOD ENDING JUNE 30, 1977. Boltax, A.; Cooper, M.H. (Westinghouse Electric Corp., Pittsburgh, PA (USA). Advanced Reactors Div.). Jun 1979. Contract EY-76-C-02-3045-007;EY-76-C-3045-008;EY-76-C-02-3045-009. 100p. AT.

Progress is reported in the following studies: coordination of mixed-oxide irradiation tests, post-irradiation examination of fast reactor experiments, evaluation and analysis of fuel and cladding irradiation behavior, radial blanket irradiation tests in EBR-2, grid-type fuel assembly mechanical design, grid fabrication and tests, and fuel pin design criteria and code developments. (JWR)

2997 (WARD-OX--3045-34) OXIDE FUEL ELEMENT DEVELOPMENT. QUARTERLY PROGRESS REPORT FOR PERIOD ENDING SEPTEMBER 30, 1977. Boltax, A.; Cooper, M.H. (Westinghouse Electric Corp., Madison, PA (USA). Advanced Reactors Div.). Jun 1979. Contract EY-76-C-02-3045-007;EY-76-C-02-3045-008;EY-76-C-02-3045-009. 113p. AT.

Studies on LMFBF grid-type fuel assembly mechanical design include mixed-oxide irradiation tests; post-irradiation examination of fast reactor experiments; evaluation and analysis of fuel and cladding irradiation behavior; radial blanket irradiation tests in EBR-2; grid type fuel assembly mechanical design; fabrication, development, and testing of breeder reactor fuel assemblies; and fuel pin design criteria and code development.

2998 (WARD-OX--3045-35) APPLICATION OF LIFE TRANSIENT CODES TO EXPERIMENT AND CORE DESIGN. Roth, T.S.; Sundquist, B.E.; Biancheria, A. (Westinghouse Electric Corp., Madison, PA (USA). Advanced Reactors Div.). Feb 1978. Contract EY-76-C-02-3045-009. 26p. AT.

The LIFE series of codes model cylindrical fuel pin behavior for various types of fast breeder reactor fuels. Results from the transient codes which analyze off-normal, non-core disruptive events up to cladding breach are discussed. The results reported are from initial applications of the code to experiment and core design. The core design application involved analysis of mixed oxide fuel pin performance during design basis upset and emergency transients. The upset events considered produce moderate cladding damage. The emergency event is more severe, consuming about 60 percent of the cladding lifetime. Sensitivities of damage to variations in fabricated gap size, cladding swelling, and thermal hydraulic environment were examined. A mixed carbide 50 cents/sec transient experiment to be performed in TREAT was studied focusing on the peak power necessary to produce incipient failure. Sensitivities of cladding damage and strain to variations in initial fuel cladding mechanical interaction, thermal hydraulic environment, and fuel hot pressing were examined.

2999 (WARD-OX--3045-36) HYDRAULIC AND VIBRATION CHARACTERIZATION RESULTS OF PROTOTYPIC WATER FLOW TESTS OF A 217-ROD GRID SPACED RIVER ASSEMBLY. Akey, J.G.; Schwallie, A.L. (Westinghouse Electric Corp., Madison, PA (USA). Advanced Reactors Div.). Nov 1977. Contract EY-76-C-02-3045-008. 420p. AT.

The detailed results are presented of the data reduction for the flow induced vibration and mechanical response tests. The validity of these results are evaluated, and the application of these results and their conclusions to FFTF operation is discussed. These objectives are compatible with the original test objectives of defining the dynamic characteristics of the fuel assembly in air and stagnant water, of measuring the induced vibration of the model fuel rods, and of predicting the vibration characteristics of the driver fuel assembly based upon analysis of the model flow test data.

3000 (WARD-OX--3045-39) BREEDER REACTOR GRID-TYPE SUBASSEMBLY DESIGN AND EVALUATION. QUARTERLY PROGRESS REPORT FOR THE PERIOD ENDING DECEMBER 31, 1977. (Westinghouse Electric Corp., Madison, PA (USA). Advanced Reactors Div.). Apr 1978. Contract EY-76-C-02-3045-008. 20p. AT.

Studies on LMFBF grid-type fuel assembly mechanical design include ductless core design and the fabrication, development, and testing of assemblies. Objectives, prior work, and current progress in these studies are summarized.

3001 (WARD-OX--3045-40) BREEDER REACTOR GRID-TYPE SUBASSEMBLY DESIGN AND EVALUATION. QUARTERLY PROGRESS REPORT FOR THE PERIOD ENDING MARCH 31, 1978. Cooper, M.H. (Westinghouse Electric Corp., Madison, PA (USA). Advanced Reactors Div.). Oct 1978. Contract EY-76-C-02-3045-008. 36p. AT.

In the grid development program the effort is directed toward development of a fuel pin spacer system that will allow comparison with the wire-wrap system. The grid-type subassemblies will be tested in the first core of the FTR, where a one-to-one comparison of the two types of spacer systems can be made. The results of the analytical and experimental studies on experiments conducted in EBR-II will be fully utilized in this program.

3002 (WARD-OX--3045-45) EFFECTS OF TEMPERATURE CHANGES ON 20% COLD WORKED AISI 316 STAINLESS STEEL SWELLING. Foster, J.P.; Boltax, A. (Westinghouse Electric Corp., Madison, PA (USA). Advanced Reactors Div.). Feb 1979. Contract EY-76-C-02-3045-009. 23p. AT.

Large swelling values associated with a gradual temperature reduction during irradiation have been observed for pressurized tubes irradiated at two initial irradiation temperatures. A comparison of the pressurized tube data with WSA-4 fuel pin cladding swelling data shows that the same behavior is observed in fuel pins subject to temperature changes during irradiation. The fuel pin data cover a large temperature interval and this information was used to determine temperature and fluence dependencies of the observed enhanced swelling effect. The results show that the enhanced swelling with temperature reductions depends on the initial irradiation temperature with the maximum value occurring at about 500°C. The data indicate that the effect saturates with fluence.

- 3003 (WARD-PB--3045-1) FTF HYDROSTATIC PUMP BEARING PHASE-1 TEST REPORT (FINAL REPORT). (Westinghouse Electric Corp., Madison, PA (USA). Advanced Reactors Div.). [nd]. Contract EY-76-C-02-3045-014. vp. AT.

In-sodium tests were conducted to provide pertinent data related to various performance characteristics of a prototypic FTF sodium lubricated hydrostatic pump bearing. The characteristics evaluated included: (1) bearing load/deflection performance, (2) wear and galling resistance during bearing rubbing at low speeds and (3) the cleanability of the bearing assembly after exposure to a sodium environment. The test program provided the required load/deflection and cleanability data to the pump design organization as required; however, there is an undetermined degree of uncertainty associated with the wear characteristics data due to problems encountered with the test rig.

- 3004 (WARD-RB--3045-19) RADIAL BLANKET DESIGN AND DEVELOPMENT. QUARTERLY PROGRESS REPORT FOR PERIOD ENDING MAY 31, 1977. Bishop, E.C. (Westinghouse Electric Corp., Madison, PA (USA). Advanced Reactors Div.). Jul 1977. Contract EY-76-C-02-3045. 78p. AT.

Progress in LMFBR radial blanket studies is summarized in the following areas: heat transfer testing, irradiation testing, flow orificing tests, and rod bundle compaction tests. (DG)

- 3005 (WARD-RB--3045-21) RADIAL BLANKET DESIGN AND DEVELOPMENT. QUARTERLY PROGRESS REPORT FOR PERIOD ENDING AUGUST 31, 1977. Bishop, E.C. (Westinghouse Electric Corp., Madison, PA (USA). Advanced Reactors Div.). Sep 1977. Contract EY-76-C-02-3045-M. 87p. AT.

Summaries of prior work and current progress on LMFBR radial blanket design and development are presented for the following: heat transfer testing, irradiation testing, flow orificing test, and rod bundle compaction tests.

- 3006 (WARD-RB--3045-22) RADIAL BLANKET DESIGN AND DEVELOPMENT QUARTERLY PROGRESS REPORT FOR PERIOD ENDING NOVEMBER 30, 1977. Bishop, E.C. (Westinghouse Electric Corp., Madison, PA (USA). Advanced Reactors Div.). Jan 1978. Contract EY-76-C-02-3045-004. 74p. AT.

Summaries of prior work and current progress are presented for the following task areas: (1) radial blanket assembly heat transfer testing, (2) radial blanket assembly irradiation, (3) radial blanket flow orificing, and (4) radial blanket rod bundle compaction tests. (DG)

- 3007 (WARD-RB--3045-24) RADIAL BLANKET DESIGN AND DEVELOPMENT. QUARTERLY PROGRESS REPORT FOR PERIOD ENDING FEBRUARY 28, 1978. (Westinghouse Electric Corp., Madison, PA (USA). Advanced Reactors Div.). Jul 1978. Contract EY-76-C-02-3045-004. 92p. AT.

Progress is summarized in the following areas: radial blanket assembly heat transfer testing, radial blanket assembly irradiation, radial blanket flow orificing, and radial blanket rod bundle compaction tests. (DG)

- 3008 (WARD-RB--3045-29) RADIAL BLANKET DESIGN AND DEVELOPMENT. QUARTERLY PROGRESS REPORT FOR PERIOD ENDING MAY 31, 1978.

- Bishop, E.C.; Yingling, J.E. (Westinghouse Electric Corp., Madison, PA (USA). Advanced Reactors Div.). Jun 1979. Contract EY-76-C-02-3045-004. 85p. AT.

Information is presented concerning radial blanket assembly heat transfer testing; radial blanket assembly irradiation; radial blanket flow orificing; and radial blanket rod bundle compaction tests.

- 3009 (WARD-RB--3045-30) RADIAL BLANKET DESIGN AND DEVELOPMENT. QUARTERLY PROGRESS REPORT FOR PERIOD ENDING AUGUST 31, 1978. Bishop, E.C.; Yingling, J.E. (Westinghouse Electric Corp., Madison, PA (USA). Advanced Reactors Div.). Jun 1979. Contract EY-76-C-02-3045-004. 79p. AT.

Information is presented concerning radial blanket assembly heat transfer testing; radial blanket assembly irradiation; radial blanket flow orificing; and radial blanket rod bundle compaction tests.

- 3010 (WARD-RB--3045-31) RADIAL BLANKET DESIGN AND DEVELOPMENT. QUARTERLY PROGRESS REPORT FOR PERIOD ENDING NOVEMBER 30, 1978. Bishop, E.C. (Westinghouse Electric Corp., Madison, PA (USA). Advanced Reactors Div.). Jun 1979. Contract EY-76-C-02-3045-004. 80p. AT.

Information is presented concerning the radial blanket assembly heat transfer test; radial blanket assembly irradiation; radial blanket flow orificing; and radial blanket rod bundle compaction tests.

- 3011 (WARD-RB--94000-1) RADIAL BLANKET DESIGN AND DEVELOPMENT. QUARTERLY PROGRESS REPORT FOR PERIOD ENDING FEBRUARY 28, 1979. (Westinghouse Electric Corp., Madison, PA (USA). Advanced Reactors Div.). Aug 1979. Contract EY-76-C-02-3045-011. 74p. AT.

Summaries of prior work and current progress are presented for the following task areas: (1) radial blanket heat transfer testing; and (2) blanket assembly irradiation.

- 3012 (WARD-SD--3045-7) EFFECTS OF GEOMETRIC NONUNIFORMITIES ON THE STRESSES IN PIPING ELBOWS. Thomas, K. (Westinghouse Electric Corp., Madison, PA (USA). Advanced Reactors Div.). Jan 1978. Contract EY-76-C-02-3045-032. 76p. AT.

A comparative evaluation is presented of the effects of thickness variation, initial ovality, intrados wrinkling and longitudinal weld shrinkage on thin-walled elbow stresses under pressure and in-plane moment loadings. This comparison will identify the nonuniformities of greatest significance and will also provide a basis for evaluation of the Code method of determining stress indices for the case of initial ovality. The analysis method and analytical models developed using the STAGS program are described. The results for each of the nonuniformities investigated are presented.

- 3013 (WARD-SD--3045-8) ANALYSIS OF TESTS ON AXIALLY COMPRESSED CYLINDERS. Newman, S.Z.; Sobel, L.H. (Westinghouse Electric Corp., Madison, PA (USA). Advanced Reactors Div.). Nov 1977. Contract EY-76-C-02-3045-032. 34p. AT.

Four axial compression room temperature tests on 3.5 inch (8.9 cm) outer diameter by 0.095 inch (0.24 cm) thick AISI 304 stainless steel cylinders are documented. The cylinders are loaded to buckling and beyond, and their

deformation behavior is described. Two uniaxial tensile tests are performed on coupon specimens to determine material properties, and the results are given. The coupon specimens along with the four tested cylinders were cut from longer tubes, and they were all tested in the "as-received" condition.

- 3014 (WARD-SD--3045-9) PLASTIC BUCKLING OF AXIALLY COMPRESSED CYLINDERS. Dhalla, A.K.; Sobel, L.H. (Westinghouse Electric Corp., Madison, PA (USA). Advanced Reactors Div.). Nov 1977. Contract EY-76-C-02-3045-032. 89p. AT.

Analytical and experimental results are presented for the problem of plastic buckling of axially compressed cylindrical shells. The cylinders are made from strain hardening materials and their geometries (radius-to-thickness ratio $r/t = 10$ to 50) are in the range of interest encountered in the design of LMFBR reactor vessels, heat exchangers, and piping systems. The primary objective of this work is to determine which one (if any) of a number of simple closed form formulas for the buckling load is reasonably accurate, as all of the formulas are very convenient for design and scoping analysis purposes. The determination is based on a comparison of buckling loads predicted by the various formulas (simplified analysis) with those obtained from tests and from the more rigorous nonlinear buckling method of analysis (detailed analysis).

- 3015 (WARD-SD--3045-10) HIGH TEMPERATURE STRUCTURAL DESIGN TECHNOLOGY: APPLICATION. SEMIANNUAL PROGRESS REPORT FOR THE PERIOD ENDING SEPTEMBER 30, 1977. Griffin, D.S. (Westinghouse Electric Corp., Madison, PA (USA). Advanced Reactors Div.). Mar 1979. Contract EY-76-C-02-3045-032. 216p. AT.

Progress in the development of high-temperature structural design methods for LMFBR components is reported in the following areas: design criteria and standards; simplified inelastic analysis methods; computer program validation and utilization; and piping integrity.

- 3016 (WARD-SD--3045-11) PLASTIC COLLAPSE OF A PIPING ELBOW: CONVERGENCE OF A FINITE ELEMENT SHELL ANALYSIS. Dhalla, A.K. (Westinghouse Electric Corp., Madison, PA (USA). Advanced Reactors Div.). Jul 1978. Contract EY-76-C-02-3045-032. 206p. AT.

Deformation characteristics of a representative thin walled elbow were evaluated using a fully compatible doubly-curved isoparametric thin shell element of the MARC program. Geometric nonlinear shell analyses indicate that the solution converges monotonically from the stiff side, with element refinement and incremental load step refinement. Mesh refinement and load step sizes are established to compute the collapse load of an elbow structure. The overall deformation behavior of the elbow is classified into four categories, (a) linear elastic, (b) nearly linear elastic-plastic, (c) elastic-plastic with slight geometric nonlinearity, and (d) elastic-plastic substantially nonlinear. This classification may simplify selection of an analysis method in the design of a piping network.

- 3017 (WARD-SD--3045-12) USER'S GUIDE TO MAT3D: A THREE-DIMENSIONAL FINITE ELEMENT MESH GENERATOR PROGRAM FOR EIGHT-NODE ISOPARAMETRIC ELEMENTS. Kent, M.P.; Newman, S.Z.; Griffin, D.S. (Westinghouse Electric Corp., Madison,

PA (USA). Advanced Reactors Div.). Oct 1978. Contract EY-76-C-02-3045-032. 82p. AT.

The MAT3D computer program, described herein, is a mesh generator for the APACHE (thermal) and MATUS (structural) three-dimensional finite element computer programs. APACHE and MATUS use an eight-node, tri-linear, isoparametric element. The data required to describe a mesh composed of an assemblage of such elements consist of the three coordinates associated with each node and the eight nodes associated with each element. MAT3D automatically generates this data from a lesser amount of information provided by the user. A visual means of checking the correctness of the generated geometry is provided by MAT3D in the form of graphical output plots.

- 3018 (WARD-SD--3045-13) USER'S GUIDE TO APACHE: A THREE-DIMENSIONAL FINITE ELEMENT PROGRAM FOR STEADY-STATE OR TRANSIENT HEAT CONDUCTION ANALYSIS. Griffin, D.S. (Westinghouse Electric Corp., Madison, PA (USA). Advanced Reactors Div.). Oct 1978. Contract EY-76-C-02-3045-032. 56p. AT.

The APACHE computer program was designed to solve three-dimensional nonlinear steady-state or transient heat conduction problems, using the finite element method. Although APACHE is an independent program, it was written primarily as a thermal companion to the MATUS structural analysis program in order to provide a complete three-dimensional thermo-mechanical analysis capability. The MAT3D program (originally called MESH3D) can be used to generate finite element meshes for use in APACHE and MATUS. The capabilities and application of the APACHE program are described.

- 3019 (WARD-SD--3045-16) DESIGN GUIDELINES FOR ELBOWS WITH GEOMETRIC NONUNIFORMITIES. Thomas, K. (Westinghouse Electric Corp., Madison, PA (USA). Advanced Reactors Div.). Jan 1979. Contract EY-76-C-02-3045-032. 94p. AT.

The report presents methods and design guidelines for evaluating the effects of certain elbow nonuniformities under internal pressure loading. These nonuniformities are thickness variation, initial ovality, intrados wrinkling, and longitudinal weld shrinkage. The ultimate purpose of such an investigation is to enable designers to determine what level of nonuniformity can be tolerated in any given design and by this means form a rational basis for specification of a fabrication method. Two main aspects of this task emerge from the investigation, namely, the development of methods to determine the effects of the nonuniformities and the embodiment of these results in the design criteria. Thickness variation and wrinkling are covered by means of limits on the amount of nonuniformity while initial ovality is allowed for by determining the stress effects. The results of the present work could form the basis of additions to the criteria. These would give the designer the option of using these results to determine stress effects of the nonuniformity or using the existing criteria. Of course, in the case of longitudinal weld shrinkage, no rules exist currently.

- 3020 (WARD-SD--94000-1) CREEP TENSILE INSTABILITY. O'Donnell, W.J.; Porowski, J.S. (O'Donnell and Associates, Inc., Pittsburgh, PA (USA)). Jul 1979. Contract EY-76-C-02-3045-032. 46p. AT.

Creep tensile instability solutions are obtained for most cases encountered in design

applications. These include: (1) membrane load stresses of arbitrary biaxiality, (2) pressurized spherical vessels, and (3) pressurized cylindrical vessels and piping with combined axial loads. Solutions are obtained for both the effective (Mises) strains and the maximum tensile strains at instability. The results show that neither Triaxiality Factors nor factors based on plastic tensile instability solutions can be used to convert creep rupture ductility data to safe allowable design values for components operating in the creep regime. The present solutions can be used to obtain allowable strains for design applications using available uniaxial creep rupture ductility data.

- 3021 (WARD-SD--94000-2) MATLIB: A COMPUTER LIBRARY OF MATERIAL PROPERTIES VERIFICATION MANUAL. Konish, H.J.; Snow, A.L. (Westinghouse Electric Corp., Madison, PA (USA). Advanced Reactors Div.). Jul 1979. Contract EY-76-C-02-3045-042. 239p. AT.

The difficulties inherent to the analysis and evaluation of structural behavior in the elevated temperature regime may be significantly reduced by the use of the MATLIB library of computer programs and subroutines for characterizing material behavior at elevated temperatures. This library provides the analyst with a large selection of descriptions of material behavior in the elevated temperature regime and a variety of design limits with which predicted structural response may be compared to assess structural adequacy. These items are provided in a form that facilitates ready access and widespread general use. One of the principal virtues of MATLIB is that each item has been subjected to extensive verification prior to release for general use. The term verification, as used herein, refers to the correct execution of specified calculational procedures. The verification of MATLIB items is described in this report.

- 3022 (WARD-SR--3045-6) EFFECT OF REPAIR TIMES ON RELATIVE SHRS RELIABILITY. Bertucio, R.C. (Westinghouse Electric Corp., Madison, PA (USA). Advanced Reactors Div.). Nov 1978. Contract EY-76-C-02-3045-029. 67p. AT.

The impact of maintainability on the relative reliability of various Shutdown Heat Removal System Configurations on loop type LMFBR's is studied. The study found the Reactor Auxiliary Cooling (RAC) configurations maintain their reliability advantage over the Primary Reactor Auxiliary Cooling (PRACS) and Intermediate Reactor Auxiliary Cooling (IRACS); although this advantage is reduced by factors of three and four respectively. Sensitivity studies indicate the RACS will maintain its reliability advantage for all repair times of practical interest. The study also found that dependence on two loops to remove decay heat (rather than assuming each loop has 100% capacity) increases the unreliability by a factor of 500 to 7000 for the RACS and by a factor of 100 to 500 for the PRACS and IRACS. The RACS still maintains a reliability advantage, however.

- 3023 (WARD-SR--3045-7) LARGE LMFBR SHUTDOWN HEAT REMOVAL SYSTEM RELIABILITY TRADE-OFF STUDY. Bertucio, R.C. (Westinghouse Electric Corp., Madison, PA (USA). Advanced Reactors Div.). Feb 1977. Contract EY-76-C-02-3045-029. 102p. AT.

Various shutdown heat removal systems were evaluated to make a preliminary estimate of which configurations provide the most reliable

method of post-shutdown heat removal. Six design concepts were considered. Each concept was evaluated with and without a safety-related auxiliary condenser and feedwater system in the main heat transport system rejecting heat through the steam generators. For each design configuration, a Failure Mode and Effects Analysis was completed at the component level. This was used to make a qualitative judgment of reliability and to provide input to a Fault Tree Analysis. Predictions of numerical annual unreliability were completed. Each of the six designs were ranked relative to each other.

- 3024 (WARD-SR--3045-8) COMPARISON OF EXPERIMENT WITH ANALYSIS OF A WATER-FILLED PLASTICALLY DEFORMING PIPE USING THE COMPUTER CODE PTA-1. Mak, M. (Westinghouse Electric Corp., Madison, PA (USA). Advanced Reactors Div.). Oct 1978. Contract EY-76-C-02-3045-029. 45p. AT.

In a liquid metal cooled fast breeder reactor, pressure pulses resulting from hypothetical core disruptive accidents (HCDA) or sodium/water reactions may plastically deform the thin-walled piping typically used in the sodium systems. The plastic deformation has a significant effect on pressure-transient propagation since it limits the peak pressure of the fluid transmitted out of a pipe to the pressure approximately causing the pipe to yield if the pipe is sufficiently long. PTA-1 is a computer code developed by the Argonne National Laboratory for computing the transmission of pressure pulses through the system and the effect of plastic deformation of the piping on pressure-transient propagation. In order to provide experimental data to validate computer codes developed for the safety evaluations of reactors, Stanford Research Institute has completed a series of experiments of simple piping systems (Reference 2). One of these experiments, the flexible straight pipe test FP-SP-191, has been adopted here to verify the PTA-1 computed responses. Details of this test are described.

- 3025 (WARD-SR--3045-9) ASSESSMENT OF DEBRIS TRANSPORT METHODS IN HORIZONTAL LMFBR PIPING FOR PAHR CONDITIONS. Brown, R.G. (Westinghouse Electric Corp., Madison, PA (USA). Advanced Reactors Div.). Apr 1979. Contract EY-76-C-02-3045-029. 59p. AT.

In assessing the long-term coolability of debris following a postulated core disruptive accident, the distribution of the fragmented fuel and steel must first be determined. One area which has received relatively little attention is the potential for debris transport into the primary piping and the distribution of settled debris in the piping system. A review of existing methods for analyzing particle transport in horizontal pipes has been performed to assess the adequacy of these techniques for LMFBR post-accident heat removal (PAHR) evaluations. It was concluded that the existing methods for analyzing particle settling are inappropriate for the PAHR conditions of high density ratio, low concentration mixtures flowing in large pipes. Therefore, a modified correlation has been developed to predict the critical deposition velocity for solid-liquid flow in horizontal pipes for conditions of interest in PAHR evaluations.

- 3026 (WARD-SR--94000-1) NUCLEAR SAFETY AND RELIABILITY ENGINEERING. QUARTERLY PROGRESS REPORT FOR PERIOD ENDING MARCH 31, 1979. (Westinghouse Electric Corp., Madison, PA (USA). Advanced Reactors Div.). Apr 1979.

Contract EY-76-C-02-3045-031. 63p. AT.

Progress is summarized in the following LMFBF safety-related areas: (1) safe shutdown reliability program, (2) safety analysis in support of low risk design capability, (3) shutdown system reliability testing, (4) inherent shutdown system development, (5) safety analysis in support of limited core damage, (6) safety analysis in support of core debris accommodation, (7) low risk containment design criteria, (8) control of radiological consequences, and (9) radial blanket assembly flow blockage test.

3027 (WARD-SR--94000-2) NUCLEAR SAFETY AND RELIABILITY ENGINEERING. QUARTERLY PROGRESS REPORT FOR PERIOD ENDING JUNE 30, 1979.

(Westinghouse Electric Corp., Madison, PA (USA). Advanced Reactors Div.). Jul 1979. Contract EY-76-C-02-3045-031. 59p. AT.

Progress is summarized in the following LMFBF safety-related areas: (1) safe shutdown reliability, (2) safety analysis in support of low risk design capability, (3) shutdown system reliability testing, (4) inherent shutdown system development, (5) safety analysis in support of limited core damage, (6) safety analysis in support of core debris accommodation, (7) low risk containment design criteria, and (8) control of radiological consequences.

3028 (WARD-XS--3045-18) PHYSICS EVALUATIONS

AND APPLICATIONS. Arakali, V.; Davis, W.J.; Paik, N.C. (Westinghouse Electric Corp., Madison, PA (USA). Advanced Reactors Div.). May 1977. Contract EY-76-C-02-3045. 15p. AT.

Progress is summarized in the following areas: implementation of the VENTURE code on the Westinghouse NES CDC-7600 computer, Doppler effects on power transients initiated by a step reactivity insertion in a typical LMFBF, and analysis of blanket composition to minimize blanket power variation. (DG)

3029 (WARD-XS--3045-19) PHYSICS EVALUATIONS AND APPLICATIONS QUARTERLY PROGRESS REPORT FOR PERIOD ENDING JULY 31, 1977.

Yarbrough, M.; Arakali, V.; Davis, W.J. (Westinghouse Electric Corp., Madison, PA (USA). Advanced Reactors Div.). Aug 1977. Contract EY-76-C-02-3045-012. 30p. AT.

Information is presented concerning analysis of the ZPR-6-7 benchmark problems for the RRD code evaluation working group; implementation of the VENTURE code on the Westinghouse NES CDC-7600 computer; calculation of breeding ratio and sodium void worth in a large LMFBF using (U-Th) oxide and (U-Th) carbide fuels; and ERDA meeting on physics requirements to support alternate fuel cycles.

3030 (WARD-XS--3045-20) PHYSICS EVALUATIONS AND APPLICATIONS. QUARTERLY PROGRESS REPORT FOR PERIOD ENDING OCTOBER 31, 1977.

Arakali, V.; Davis, W.J. (Westinghouse Electric Corp., Madison, PA (USA). Advanced Reactors Div.). Mar 1978. Contract EY-76-C-02-3045-012. 27p. AT.

Progress is reported for the following activities: (1) Advanced System analyses of the heterogeneous core design concept for small and large LMFBFs; (2) Full implementation and utilization of the ERDA supported three dimensional burnup diffusion theory code, VENTURE, at ARD for the design verification required for the CRBRP FSAR and future LMFBF designs; (3) Utilization of the ERDA developed two-dimensional kinetics code, FX-2, for

transient analyses and HCDA energetics studies of advanced LMFBF design concepts; (4) Continued evaluations and applications of the ENDF/B-nuclear data files for general LMFBF analyses; and (5) Continued participation in the Cross Section Evaluation Working Group (CSEWG) and the Computer Code Coordination and Method Testing committees.

3031 (WARD-XS--3045-21) PHYSICS EVALUATIONS AND APPLICATIONS. QUARTERLY PROGRESS REPORT FOR PERIOD ENDING JANUARY 31, 1978. Arakali, V.S.; Calamai, G.J.; Yarbrough, M.B. (Westinghouse Electric Corp., Madison, PA (USA). Advanced Reactors Div.). Apr 1978. Contract EY-76-C-02-3045-012. 30p. Dep. NTIS, PC A04/MF A01.

Progress is reported for the following activities: (1) Advanced System analyses of the heterogeneous core design concept for small and large LMFBFs; (2) Full implementation and utilization of the ERDA supported three dimensional burnup diffusion theory code, VENTURE, at ARD for the design verifications and development of future tools required for LMFBF designs; (3) Utilization of the ERDA developed two-dimensional kinetics code, FX-2, for the transient analyses and HCDA energetics studies of advanced LMFBF design concepts; (4) Continued evaluations and applications of the ENDF/B-nuclear data files for general LMFBF analyses, and (5) Continued participation in the Cross Section Evaluation Working Group (CSEWG), the Computer Code Coordination and Method testing committees.

3032 (WARD-XS--3045-22) PHYSICS EVALUATIONS AND APPLICATIONS. QUARTERLY PROGRESS REPORT FOR PERIOD ENDING APRIL 30, 1978. Arakali, V.S.; Paik, N.C. (Westinghouse Electric Corp., Madison, PA (USA). Advanced Reactors Div.). Aug 1978. Contract EY-76-C-02-3045-012. 21p. AT.

Progress is summarized in studies of delayed neutron constants for large heterogeneous LMFBF cores and design analysis of an intermediate-size LMFBF. (DOG)

3033 (WARD-XS--3045-23) PHYSICS EVALUATIONS AND APPLICATIONS QUARTERLY PROGRESS REPORT FOR PERIOD ENDING JULY 31, 1978. Paik, N.C.; Rathbun, R.W.; Varner, S.K.; Petras, D.S.; Yarbrough, M.B. (Westinghouse Electric Corp., Madison, PA (USA). Advanced Reactors Div.). Oct 1978. Contract EY-76-C-02-3045-012. 25p. AT.

Progress is summarized in the following task areas: (1) advanced system analyses of the heterogeneous core design concept for small and large LMFBFs; (2) full implementation and utilization of the DOE supported three-dimensional burnup diffusion theory code, VENTURE, at ARD for the design verifications and development of future tools required for LMFBF designs; (3) utilization of the DOE developed two-dimensional kinetics code, FX-2, for the transient analyses and HCDA energetics studies of advanced LMFBF design concepts; (4) continued evaluations and applications of the ENDF/B-nuclear data files for general LMFBF analyses; and (5) continued participation in the Cross Section Evaluation Working Group (CSEWG), and the Computer Code Coordination and Method testing committees.

3034 (WARD-XS--3045-24) PHYSICS EVALUATIONS AND APPLICATIONS QUARTERLY PROGRESS REPORT FOR PERIOD ENDING OCTOBER 31, 1978. Yarbrough, M.B.; Calamai, G.J. (Westinghouse Electric Corp., Madison, PA (USA). Advanced Reactors

Div.). Mar 1979. Contract EY-76-C-02-3045-012. 39p. AT.

During this quarter, Westinghouse further quantified the disc usage charge components during the VENTURE analysis of the large 84 x 42 x 33 mesh, 9 group test problem. Previous work with the large test problem had shown that approx. 45% of the total job cost was attributable to storing and retrieving information from disc. Westinghouse therefore studied this problem in a three-step analysis program. First, a parametric study was performed to determine the impact of varying the disc file allocation and transfer size parameters, via the CDC-7600 job control language specifications. Second, the data transfers themselves were monitored during the flux solution iterations to identify the key cost components. Finally, the results of the two previous steps were combined to identify areas where modifications to the data transfer strategy may be beneficial to utilization of the code at Westinghouse.

3035 (WARD-XS--3045-25) PHYSICS EVALUATIONS AND APPLICATIONS QUARTERLY PROGRESS REPORT FOR PERIOD ENDING JANUARY 31, 1979. Paik, N.C.; Varner, S.K.; Yarbrough, M.B. (Westinghouse Electric Corp., Madison, PA (USA). Advanced Reactors Div.). 1979. Contract EY-76-C-02-3045-012. 21p. AT.

Under this advanced FBR system development task, ARD has initiated a study to determine the neutronic feasibility of a new and improved proliferation and diversion resistant FBR. This unique FBR design concept utilizes U^{235} fuel and incorporates an operating mode which does not require any refueling throughout the lifetime of the plant. These design features significantly enhance its proliferation and diversion resistance characteristics. Furthermore, it does not require an operating plutonium reprocessing plant.

3036 (WARD-XS--94000-1) PHYSICS EVALUATIONS AND APPLICATIONS. QUARTERLY PROGRESS REPORT FOR PERIOD ENDING APRIL 30, 1979. Yarbrough, M.B.; Varner, S.K. (Westinghouse Electric Corp., Pittsburgh, PA (USA). Advanced Reactors Div.). Jun 1979. Contract AM02-76CH94000. 15p. AT.

Current progress in LMFBR physics evaluations is reported in the following areas: three-dimensional perturbation module implementation and testing and a non-refueling ^{235}U -fueled LMFBR.

3037 (WHAN-IR--33) COOLANT MIXING IN A 217-PIN WIRE-WRAPPED FFTF FUEL ASSEMBLY. Reihman, T.C.; Hildner, R.A. (WADCO Corp., Richland, WA (USA)). Sep 1970. Contract EY-76-C-14-2170. 68p. AT.

An experimental study using a direct sampling technique was performed, with water as the test fluid, to determine the interchannel coolant mixing in a 217-pin wire-wrapped FFTF fuel assembly model. A comparative computer study was made to determine individual subchannel exchange rates from the experimental measurements.

3038 (WNET--116) RELIABILITY OF VARIOUS TUBE-TO-TUBESHEET WELD CONFIGURATIONS. Flury, R.L.; Morales, W.J.; York, J.W. (Westinghouse Electric Corp., Tampa, FL (USA). Tampa Div.). Jun 1975. Contract EY-76-C-03-0962. 59p. Dep. NTIS, PC A04/MF A01.

Through the application of FMEA and FTA Techniques the reliabilities of various tube-to-tubesheet weld configurations consisting of

different combinations single or duplex tubes and single or double tubesheets with or without leak detection are investigated for application to LMFBR steam generator design. Based on substantial failure experience accumulated on PWR units, the study confirms the high reliability these welds possess and in particular identifies the tube-to-boss fillet weld as the most efficient, reliable design.

3039 (ZfK--325) DETERMINATION OF DYNAMIC PARAMETERS OF THE REACTOR BOR-60 BY MEANS OF A REACTIVITY MODULATOR. Krause, H.; Otto, H.; Scholz, J.; Ziegenbein, D.; Afanasjew, W.; Britov, W.; Grjasew, W.; Jefimow, W.; Keadse, B. (Zentralinstitut fuer Kernforschung, Rossendorf bei Dresden (German Democratic Republic)). Feb 1977. 20p. (In German). Dep. NTIS (US Sales Only), PC A02/MF A01.

It is reported about first transfer function measurements performed at the reactor BOR-60 in the range 0.05 to 18 cps and at powers up to 45 MW by means of a rotating reactivity modulator. The construction of the modulator is described roughly. Its reliability is treated. By fitting the results of the measurements to a simple model for the heat transfer in the reactor it could be shown, that the dynamics of the reactor for frequencies >0.05 cps may be described by one power coefficient with the adequate time constant.

3040 (ZfK--337) PROBLEMS OF TECHNOLOGY AND CORROSION IN SODIUM COOLANT AND COVER GAS. Kuenstler, K.; Ullmann, H. (eds.). (Zentralinstitut fuer Kernforschung, Rossendorf bei Dresden (German Democratic Republic)). Jul 1977. 293p. (In Russian). (CONF-7703105--1). Dep. NTIS (US Sales Only), PC A09/MF A01.

From Meeting on problems of technology and corrosion in sodium coolant and cover gas; Dresden, German Democratic Republic (28 Mar 1977).

The meeting encloses the following themes: (i) Reactions in the system sodium-steel-cover gas (ii) Corrosion behaviour of structural and cladding materials (iii) Determination of impurities in sodium and cover gas (iv) Technology of sodium and cover gas (v) Testing equipments (vi) Safety problems.

3041 (ZfK--344) SODIUM BOILING EXPERIMENT IN THE REACTOR BOR-60. Afanasjew, V.A.; Mitenkov, F.M.; Fuge, R. (Zentralinstitut fuer Kernforschung, Rossendorf bei Dresden (German Democratic Republic)). Oct 1977. 9p. Dep. NTIS (US Sales Only), PC A02/MF A01.

Sodium boiling was generated in the BOR-60 core by γ -heating of a tungsten rod bundle in a special test assembly. The principal possibility of boiling detection by acoustic and neutron noise was shown. Some results of spectrum and correlation analysis are presented and the necessity for tailored signal evaluation methods in order to increase the reliability of boiling detection is pointed out.

3042 (ZfK--348) PERTURBATION MEASUREMENTS ON THE BOR-60 REACTOR. Kaetzmer, D.; Maletti, R.; Pohls, J.; Ziegenbein, D. (Zentralinstitut fuer Kernforschung, Rossendorf bei Dresden (German Democratic Republic)). Dec 1977. 11p. (In German). Dep. NTIS (US Sales Only), PC A02/MF A01.

It is reported about first perturbation measurements on the reactor BOR-60. The measurements were made on different reactor states, also in the state with sodium boiling

in the central cassette. The results correspond to former results, which were received by reactivity balance methods and animate to further researches. It was found, that the boiling does not influence the reactivity value of control rods and the power coefficient of reactivity.

- 3043 (ZPR-TM--348) EXPERIMENTAL STUDIES OF 350 MW(E) HETEROGENEOUS LMFBR CORES AT ZPPR. Collins, P.J.; McFarlane, H.F.; Beck, C.L.; Lineberry, M.J.; Carpenter, S.G.; Ducat, G.A.; Gasidlo, J.M.; Goin, R.W. (Argonne National Lab., IL (USA)). 5 Sep 1979. Contract W-31-109-ENG-38. 19p. (CONF-790933--2). Dep. NTIS, PC A02/MF A01.

From IAEA international symposium on fast reactor physics; Aix-en-Provence, France (24 Sep 1979).

The annular heterogeneous concept has been adopted for the Clinch River Breeder Reactor. To provide verification of design and safety analysis, fourteen core configurations were studied at ZPPR. The results and analysis of the early assemblies, ZPPR-7A, 7B, and 7C, have been previously reported and only the more significant conclusions are summarized here. Later assemblies, 7D to 7H, were designed to provide data on variations of control rod and internal blanket arrangements. Assemblies 8A to 8E provided data on the replacement of uranium by thorium in various blanket subassemblies.

- 3044 (ZPR-TM--349) EXPERIMENTAL STUDIES OF LARGE CONVENTIONAL LMFBR CORES AT ZPPR. Lineberry, M.J.; Carpenter, S.G.; Beck, C.L.; McFarlane, H.F.; Collins, P.J.; Olsen, D.N.; Grasseschi, G.L.; Kaiser, R.E.; Maddison, D.W. (Argonne National Lab., Idaho Falls, ID (USA)). 5 Sep 1979. Contract W-31-109-ENG-38. 22p. (CONF-790933--4). Dep. NTIS, PC A02/MF A01.

From IAEA international symposium on fast reactor physics; Aix-en-Provence, France (24 Sep 1979).

Results of a critical experiment program for 700 MW(e) LMFBRs are reviewed. Both a clean benchmark assembly and one simulating a power reactor design were constructed. Experiments discussed include reaction rate distributions and ratios, control rod worths and interactions, and sodium coefficients. Analysis of these experiments with ENDF/B Version IV cross sections is reported. The comparison between calculated and measured parameters is not too different in these cores than in the 350 MW(e) assemblies. An exception is that the radial fission rate is calculated up to 3% too high at the edge of the inner core relative to the core center.

- 3045 (PNL-TR--400) REVIEW OF THE DEVELOPMENT OF FAST BREEDER REACTORS IN THE USSR. Kochetkov, L.A.; Bagdasarov, Yu.E. (Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Obninsk. Fiziko-Ehnergeticheskij Inst.). 21 Apr 1980. Translation source information not available 12p. Dep. NTIS, PC A02/MF A01.

Information on fast breeder reactors in the USSR is presented concerning the BR-5 (BR-10) reactor; BOR-60 reactor; BFS-2 test rig; BN-350 reactor; BN-600 reactor; and BN-1600 reactor.

- 3046 (PNL-TR--398) STUDY OF THE OPERATIONAL CHARACTERISTICS OF THE CORE AND IRRADIATED FUEL PARAMETERS IN THE BOR-60 REACTOR. Gryazev, V.M.; Afanasiev, V.A.; Gadzhiev, G.I.; Efimov, V.N.; Inchagov, A.V.; Markin, S.A.; Nigmatullin, N.P.; Telkovtsev, A.A. (Nauchno-Issledovatel'skij Inst. Atomnykh Reaktorov,

Dimitrovgrad (USSR)). 14 Apr 1980. Translation of IAEA-SM--225/67. 14p. NTIS, PC A02/MF A01.

In order to determine the operational lifetimes of various fuels in terms of charge, temperature conditions, burn-up and integrated neutron flux, an extensive irradiation program for various types of fuel compositions and structural materials was carried out on the BOR-60 reactor. Ninety-percent enriched uranium dioxide in the form of sintered toroids with 10.2 g/cm³ density was used as the standard fuel. The claddings of 37 fuel elements 6 mm in diameter are made of 0X16H15M3B austenite class stainless steel. In all, 225 such assemblies (approx. 8300 fuel elements) were irradiated, including 194 assemblies with burn-up of over 8% heavy atoms. Maximum burn-up was 13.2% heavy atoms, neutron flux was 9.1×10^{22} neutrons/cm² (E > 0.1 MeV), linear power attained 540 W/cm, and cladding temperature reached 700°C.

- 3047 (PNL-TR--397) ENSURING SAFE OPERATION OF THE BOR-60 EXPERIMENTAL FAST REACTOR AS AN ATOMIC POWER PLANT. Gryazev, V.M.; Antipin, G.K.; Afanasiev, V.A.; Britov, V.N.; Efimov, V.N.; Kondrat'ev, V.I.; Kon'kov, V.F.; Smirnov, A.M. (Nauchno-Issledovatel'skij Inst. Atomnykh Reaktorov, Dimitrovgrad (USSR)). 14 Apr 1980. Translation of IAEA-SM--225/68, pp. 177-189. (CONF-780407--10). 23p. NTIS, PC A02/MF A01.

From Symposium on design, construction and operating experience of demonstration liquid metal fast breeder reactors; Bologna, Italy (10 Apr 1978).

On the basis of the BOR-60 facility an analysis is made of characteristic requirements for safe operation of a fast-reactor power plant, from the standpoint of stability against perturbations in the operation of the main components and systems and against deviations from the design values of process parameters. The self-regulation properties of the facility are discussed. Regulation by neutron flux and by sodium outlet temperature are compared from the point of view of increasing the reliability of the control system and minimizing temperature strains in the components during transient processes. Calculated and experimental data are presented on optimization of emergency shut-down and cooling regimes using different combinations of equipment. The means and methods used to verify the state of the reactor vessel, fuel assemblies and in-vessel reactor systems during operation on power and during reloading are described: operating experience with sodium/water steam generators is analyzed, as is the use of leak verification, control and protection for steam generators under accident conditions.

- 3048 (PNL-TR--393) USE OF DEMONSTRATION FAST REACTOR EXPERIENCE IN ASSESSING THE RADIATION SAFETY OF FAST POWER REACTORS IN THE DESIGN STAGE. Bakumenko, O.D.; Kiselev, G.V.; Kulakovskii, M.Ya.; Pomerantsev, G.B.; Samarkin, A.A.; Sergeev, V.A.; Skorikov, N.V.; Tverdovskii, N.D.; Tsurukin, Yu.P. (Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Obninsk. Fiziko-Ehnergeticheskij Inst.). 4 Apr 1980. Translation of IAEA-SM--225/65, 1978. (CONF-780407--11). 10p. NTIS, PC A02/MF A01.

From Symposium on design, construction and operating experience of demonstration liquid metal fast breeder reactors; Bologna, Italy (10 Apr 1978).

The results are presented of experimental studies on the behavior of fission products and radioactive corrosion products in the primary circuit of the BN-350 reactor during operation

at power levels of up to 650 MW with defective fuel elements in the core. Data are also given on radiation conditions in the reactor building, dose burden to personnel and activity loss from the primary circuit. The experimental data thus obtained are compared with design data.

3049 FISSION GAS RELEASE AND MICROSCOPIC SWELLING IN HIGHLY RATED ADVANCED FUELS.

Coquerelle, M.; Walker, C.T. (Commission of the European Communities, Karlsruhe, Germany). Nucl. Technol.; 48: No. 1, 43-53(Apr 1980).

Mixed carbide, carbonitride, and nitride fuels have been irradiated in DFR and Rapsodie to a maximum burnup of 7.8 at. % at a maximum linear power of 135 kW/m burnup, xenon release from helium-bonded fuels was found to be dependent on the chemical composition of the fuel. Release was greatest from carbide (75%) and least from nitride fuels (35%). At medium burnup, improved gap conductance led to a fall in the fuel centerline temperature and consequently a decrease in gas release. For nitride and carbonitride fuels, over 75% of the retained fission gas was contained in bubbles (<1 µm in diameter) and in the fuel matrix. For all three fuels, xenon release from the outer unrestructured region of the fuel was <15%, whereas release from the central porous region was 50% or more. In the restructured region, gas was released to the plenum by way of interconnected pores. Gas in pores contained proportionally more krypton than the bonded gas, and consequently, it is proposed that atomic diffusion is the principal mechanism of gas transport within the fuel.

3050 PLENUM-2A, A PROGRAM FOR TRANSIENT ANALYSIS OF LIQUID-METAL FAST BREEDER REACTOR OUTLET PLENUMS. Carbajo, J.J.; Howard, P.A. (Argonne National Lab., IL). Nucl. Technol.; 47: No. 2, 244-256(Feb 1980).

A new computer program, PLENUM-2A, has been developed to predict the conditions in the outlet plenum of a liquid-metal fast breeder reactor after a transient scram. This program divides the transient into three main consecutive discrete states. Two additional stages, one occurring before the transient begins and the other occurring as the transient ends, are also considered. The three main stages are described in detail, and calculations and experimental results are compared. The agreement between the calculations and experimental data is very good.

3051 ULTRASONIC INSPECTION OF LIQUID-METAL FAST BREEDER REACTOR STEAM GENERATOR DUPLEX TUBING. Longua, K.J.; Whitham, G.K.; Allen, C.C. (Argonne National Lab., Idaho Falls). Nucl. Technol.; 47: No. 2, 257-267(Feb 1980).

Two ultrasonic inspections of the Experimental Breeder Reactor II steam generator duplex tubing have been completed. Inspections performed on one evaporator in 1976 provided baseline data, and a subsequent inspection in 1978 revealed no change in tube condition. With the completion of the 1978 inspection, all available tubes in one evaporator have been inspected. The steam generator contains duplex tubes fabricated from 2 1/4 Cr-1 Mo ferritic steel. Access to the bore (water) side of the tubes was gained through the steam outlet piping. The inspection included a complete volumetric (100% of the tube material) examination, measurement of wall thickness, and evaluation of the condition of the braze bonding the two walls of the tube together. The test equipment was routinely calibrated against

a standard containing artificial flaws. Artificial flaws as small as 1.6 mm long x 0.25 mm deep were readily detected.

3052 EVAPORATIVE REMOVAL OF SODIUM FROM REACTOR COMPONENTS. Welch, F.H.; Steele, D.P. III. (Rockwell International Energy Systems Group, Canoga Park, CA). Nucl. Technol.; No. 2, 282-307(Feb 1980).

Evaporation of sodium from components using heat and vacuum was investigated as a method of sodium removal from liquid-metal fast breeder reactor components. The method was determined to be capable of efficiently cleaning components at temperatures as low as 260 to 315°C and at pressures of approx. 1×10^{-3} to 1×10^{-4} Pa. The most rapid cleaning was observed with small crevices, where the sodium is expelled by gases released from the sodium. The method was recommended as a viable process that should be investigated using full-size components.

3053 CONTAINMENT RESPONSE TO POSTULATED CORE MELTDOWN ACCIDENTS IN THE FAST FLUX TEST FACILITY. Gasser, R.D.; Pratt, W.T. (Brookhaven National Lab., Upton, NY). Nucl. Technol.; 47: No. 2, 282-307(Feb 1980).

An assessment is made of the containment margin available in the Fast Flux Test Facility to mitigate the consequences of a postulated failure of in-vessel post-accident heat removal following a hypothetical core disruptive accident. The consequences of a number of assumed meltdown configurations (both in-vessel and ex-vessel) are assessed using the CACECO (CAvity, CEll, COntainment) containment analysis computer code together with currently available melt front penetration models. The sensitivity of the accident scenarios to a number of crucial assumptions is established by scoping studies. It is concluded from both the in-vessel and exvessel analyses that sodium vapor combustion is a major source of reactor containment building (RCB) pressurization. The conditions (a combination of sodium-concrete reaction, pool size, and decay heat level) that most rapidly bring the sodium to boiling, together with those that enhance mass transfer of sodium vapor to the RCB, are the ones that most significantly affect the pressure response.

3054 NUCLEAR REACTOR WITH FUEL PIN BRACING GRID. Jolly, R. (to United Kingdom Atomic Energy Authority). US Patent 4,181,571. 1 Jan 1980. Priority date 9 Sep 1977, United Kingdom of Great Britain and Northern Ireland (UK), 6p.

A fuel pin bracing grid for a nuclear fuel sub-assembly comprises a honeycomb array of unit cells formed from discrete strips. The cells are hexagonal, three alternate sides having windows and the remaining sides have linear groups of three embossments to provide guide pads for fuel pins. The openings provide a measure of compliance for the grid to facilitate insertion and withdrawal of the pins. A fuel sub-assembly for a liquid metal cooled fast breeder nuclear reactor has a central fuel section with end extensions, the fuel section comprising a bundle of fuel pins in a hexagonal wrapper the pins being braced by a series of grids according to the invention. Reprocessing of the fuel is facilitated because the pins are withdrawable collectively from the compliant grids and wrapper combination merely by cutting an end extension from the wrapper. 4 claims.

3055 NUCLEAR REACTOR CONTROL. Ingham, R.V. (to United Kingdom Atomic Energy Authority). US Patent 4,181,569. 1 Jan 1980. Priority date 13 Apr 1976, United Kingdom of Great Britain and Northern Ireland (UK), 4p.

A liquid metal cooled fast breeder nuclear reactor has power setback means for use in an emergency. On initiation of a trip-signal a control rod is injected into the core in two stages, firstly, by free fall to effect an immediate power-set back to a safe level and, secondly, by controlled insertion. Total shut-down of the reactor under all emergencies is avoided. 4 claims.

3056 ANALYSIS OF THE DIFFERENCES IN BREEDING RATIO AND FISSILE INVENTORY BETWEEN HETEROGENEOUS AND HOMOGENEOUS LIQUID-METAL FAST BREEDER REACTORS. Tzanos, C.P. (Science Applications, Inc., Oak Brook, IL). Nucl. Technol.; 47: No. 1, 39-50 (Jan 1980).

The differences in fissile inventory and breeding ratio, with respect to the differences in fertile inventory and neutron spectrum, between equivalent heterogeneous and homogeneous configurations were analyzed. To quantify the effect of spectral changes on reaction rate ratios, a calculational scheme based on properly prepared one-group cross-section sets was used.

3057 EFFECTS OF TEMPERATURE CHANGES ON THE SWELLING BEHAVIOR OF 20% COLD-WORKED AISI TYPE 316 STAINLESS STEEL. Foster, J.P.; Boltax, A. (Westinghouse Electric Corp., Madison, PA). Nucl. Technol.; 47: No. 1, 181-188 (Jan 1980).

Large swelling values associated with a gradual temperature reduction during irradiation have been observed for pressurized tubes irradiated at two initial irradiation temperatures. A comparison of the pressurized tube data with WSA-4 fuel pin cladding swelling data shows that the same behavior is observed in fuel pins subject to temperature changes during irradiation. The fuel pin data cover a large temperature interval, and this information was used to determine temperature and fluence dependencies of the observed enhanced swelling effect. The results show that the enhanced swelling with temperature reductions depends on the initial irradiation temperature, with the maximum value occurring at approx. 500°C. The data indicate that the effect saturates with fluence.

3058 IRRADIATION BEHAVIOR OF EXPERIMENTAL MARK-II EXPERIMENTAL BREEDER REACTOR II DRIVER FUEL. Hofman, G.L. (Argonne National Lab., IL). Nucl. Technol.; 47: No. 1, 7-22 (Jan 1980).

Prototypic driver-fuel elements using metallic fuel and stainless-steel cladding, designed to achieve a high burnup, were tested in the Experimental Breeder Reactor II. The irradiation results showed that burnup of up to 10 at.% can be attained without cladding failure and that cladding deformation can be kept to acceptable values if Type 316 stainless steel is used as the cladding material.

3059 EFFECT OF INTRASUBASSEMBLY INCOHERENCIES ON THE FAST TEST REACTOR UNPROTECTED TRANSIENT OVERPOWER ACCIDENT. Yung, S.C.; Wilburn, N.P. (Hanford Engineering Development Lab., Richland, WA). Nucl. Technol.; 47: No. 1, 23-38 (Jan 1980).

Intrasubassembly incoherencies affecting the fuel pin failure pattern within a fast test reactor (FTR) subassembly during an unprotected transient overpower/hypothetical core

disruptive accident have been investigated using the COBRA-III/MELT code. Two dominant intrasubassembly incoherencies in an FTR subassembly were studied, namely, (a) the hydraulic effect, or the variation in pin-power-to-effective-coolant ratio between pins in the inner region and those in the outer region of the subassembly, and (b) the power skew, or variation in pinwise power density for pins throughout the subassembly.

3060 GRAVITATIONAL COLLISION EFFICIENCY OF POST HYPOTHETICAL CORE DISRUPTIVE ACCIDENT LIQUID-METAL FAST BREEDER REACTOR AEROSOLS: SPHERICAL PARTICLES. Pertner, G.A.; Loyalka, S.K. (Univ. of Missouri, Columbia). Nucl. Technol.; 47: No. 1, 70-90 (Jan 1980).

Sensitivity analyses have shown that the gravitational collision efficiency influences post hypothetical core disruptive accident aerosol behavior in liquid-metal fast breeder reactor (LMFBR) containment in important ways. Research was directed toward improving expressions for this quantity. Following the work of atmospheric sciences, dynamical equations for two particle motions were developed. A computer program GCEFF was constructed, options for using a variety of drag forces were provided, and the dynamical equations were solved by using Gear's method. Results were compared with the previous work of atmospheric sciences, and explicit results for several cases of interest in the LMFBR studies were provided.

3061 ROLE OF FISSION GAS AND FUEL MELTING IN FUEL RESPONSE DURING SIMULATED HYPOTHETICAL LOSS-OF-FLOW TRANSIENTS. Bandyopadhyay, G.; Buzzell, J.A. (Argonne National Lab., IL). Nucl. Technol.; 47: No. 1, 91-109 (Jan 1980).

Direct electrical heating (DEH) experiments have been performed to study fuel and fission gas behavior during transients with thermal conditions similar to those predicted for flow-coastdown and sodium voiding phases of a reference reactor hypothetical loss-of-flow accident case. Macroscopic fuel response, such as gross fuel swelling and fuel dispersal in DEH fuel pellet stacks, was monitored during the transients. It was noted that in the presence of a mild restraint (e.g., due to quartz "cladding"), fuel melting always occurred prior to any detectable gross fuel motion in the stack. The fuel response at failure was strongly dependent on the thermal history of the simulated flow-coastdown phase and the heating rates during the subsequent phase of the transient experiments. In the presence of a mild restraint, the thermal history before fuel melting occurred in the stack strongly influenced the fuel behavior.

3062 SELF LOCKING DRIVE SYSTEM FOR ROTATING PLUG OF A NUCLEAR REACTOR. Brubaker, J.E. US Patent 4,178,208. 11 Dec 1979. Filed date 23 Feb 1978. 8p.

PAT-APPL-880,679.

A self locking drive system for rotating the plugs on the head of a nuclear reactor which is able to restrain plug motion if a seismic event would occur during reactor refueling is described. A servomotor is engaged via a gear train and a bull gear to the plug. Connected to the gear train is a feedback control system which allows the motor to rotate the plug to predetermined locations for refueling of the reactor. The gear train contains a self locking double enveloping worm gear set. The worm gear set is utilized for its self locking nature to prevent unwanted rotation of the plugs as the result of an earthquake. The double enveloping

type is used because its unique contour spreads the load across several teeth providing added strength and allowing the use of a conventional size worm.

3063 FLOW MEASUREMENT IN MAIN SODIUM PIPES.

Hans, R.; Knaak, J.; Weiss, H.J. (Internationale Atomreaktorbau G.m.b.H. (INTERATOM), Bergisch Gladbach (Germany, F.R.)). At. Energy Rev.; 17: No. 4, 803-890 (Dec 1979).

The problems of sodium flow measurement in the main circuits of LMFBRs in the 1000MW power range are discussed and existing techniques reviewed with respect to their application to pipes of large nominal bore. The application conditions are summarized in the context of both pool and loop-type reactors. Electromagnetic, ultrasonic and transit-time measuring techniques are covered. In addition to the theoretical bases of the measurement - in particular for the reactor designer who is not familiar with the theoretical background - application aspects are discussed including accuracy, response speed, installation and maintenance. The merits and demerits of the different methods for particular reactor designs are outlined. The possibilities of redundancy and diversity are also discussed. Finally, the present state of development of these methods - as far as published - is summarized.

3064 FLOW BEHAVIOR OF VOLUME-HEATED BOILING POOLS: IMPLICATIONS WITH RESPECT TO TRANSITION PHASE ACCIDENT CONDITIONS.

Ginsberg, T. (Brookhaven National Lab., Upton, NY); Jones, G.C. Jr.; Chen, J.C. Nucl. Technol.; 46: No. 3, 391-398 (Dec 1979).

Observations of two-phase flow fields in single-component volume-heated boiling pools were made. Photographic observations, together with pool-average void fraction measurements, indicate that the churn-turbulent flow regime is stable for superficial vapor velocities up to nearly five times the Kutateladze dispersal limit. Within this range of conditions, a churn-turbulent drift flux model provides a reasonable prediction of the pool-average void fraction data. An extrapolation of the data to transition phase accident conditions suggests that intense boilup could occur where the pool-average void fraction would be >0.6 for steel vaporization rates equivalent to power levels $>1\%$ of nominal liquid-metal fast breeder reactor power density. The extended stability of bubbly flow to unusually large vapor fluxes and void fractions, observed in some experiments, is a major unresolved issue.

3065 THERMAL-HYDRAULIC ANALYSIS OF FUEL BLOCKAGES FORMED DURING TRANSIENT OVERPOWER ACCIDENTS IN LIQUID-METAL FAST BREEDER REACTORS.

Dhir, V.K.; Kastenber, W.E.; Varela, D.W. (Univ. of California, Los Angeles). Nucl. Technol.; 46: No. 3, 447-452 (Dec 1979).

Generally, the blockages that may form in the reactor core when molten fuel is ejected into the coolant channels during a transient overpower accident can be divided into two categories. The first type of blockage forms when semi-molten fuel particles hit a wire wrap and freeze on the wire wrap, whereas the second type of blockage forms when solid or semi-solid particles get stuck in the coolant channels. The thermal-hydraulic analysis of these proposed blockages indicates that under certain specific conditions, the blockages can lead to melting of the wire wrap and cladding and also to in-channel voiding. The second type of

blockage, if formed as a plug, may remelt before being quenched by subcooled or saturated sodium.

3066 COMPARATIVE STUDY OF HETEROGENEOUS AND HOMOGENEOUS LIQUID-METAL FAST BREEDER REACTOR CORES IN SOME ACCIDENT CONDITIONS.

Renard, A. (Belgonucleaire Rue du Champ de Mars, Brussels, Belgium); Evrard, G.; Wehmann, U. Nucl. Technol.; 46: No. 3, 453-464 (Dec 1979).
The behavior of a heterogeneous and a homogeneous design of a liquid-metal fast breeder reactor core with the same power and similar dimensions at beginning-of-equilibrium cycle is compared for several accident conditions (loss-of-flow and transient overpower) using the same failure criteria and model assumptions. The influence of the design is analyzed, and qualitative trends are deduced from the point of view of safety.

3067 CRITICAL EXPERIMENTAL STUDY OF INTEGRAL PHYSICS PARAMETERS IN SIMULATED LIQUID-METAL FAST BREEDER REACTOR MELTDOWN CORES.

Bhattacharyya, S.K.; Wade, D.C.; Bucher, R.G.; Smith, D.M.; McKnight, R.D.; LeSage, L.C. (Argonne National Lab., IL). Nucl. Technol.; 46: No. 3, 517-524 (Dec 1979).

Integral physics parameters of several representative, idealized meltdown liquid-metal fast breeder reactor (LMFBR) configurations were measured in mockup critical assemblies on the Zero Power Reactor 9 at Argonne National Laboratory. The experiments were designed to provide data for the validation of analytical methods used in the neutronics part of LMFBR accident analyses. Large core distortions were introduced in these experiments (involving 18.5% core volume), and the reactivity worths of configuration changes were determined. The neutronics parameters measured in the various configurations showed large changes on core distortion. Both diffusion theory and transport theory methods were shown to mispredict the experimental configuration eigenvalues. In addition, diffusion theory methods were shown to result in a nonconservative misprediction of the experimental configuration change worths.

3068 LOW SODIUM VOID CORES.

Barthold, W.P.; Beitel, J.C.; Lam, P.S.K.; Drechwa, Y.; Su, S.F.; Turski, R.B. (Argonne National Lab., IL). Nucl. Technol.; 46: No. 3, 525-528 (Dec 1979).
To avoid high energy releases in unprotected loss-of-flow accidents, cores can be designed such that the removal of sodium would add only a small amount of reactivity or even a negative reactivity to the reactor. Reduction in sodium void reactivity can be achieved by changing either the geometry or composition of the core. Pancake, modular, and heterogeneous core configurations were investigated. Heterogeneous cores showed sodium void reactivities in the 2-dollar range with only small penalties in doubling time when compared with the equivalent homogeneous cores. Liquid-metal fast breeder reactors using U-Th fuel in the form of metal, oxide, or carbide show negative sodium void reactivities but doubling times above 30 yr.

3069 LMFBR STEAM GENERATORS: BEHAVIOR OF HEAT EXCHANGE TUBES FACED WITH A THROUGH CRACK RESULTING IN CONTACT BETWEEN SODIUM AND WATER.

Quinet, J.L.; Lannou, L. (Electricite de France, Chatou). Nucl. Technol.; 46: No. 3, 582-590 (Dec 1979).
A survey on the behavior of cracked tubes under operating conditions of an industrial steam generator was conducted. A comparison was

first made of the development kinetics of the cracks according to the type of material: Incoloy 800, 2-1/4 Cr-1 Mo, 9 Cr-2 Mo, and to the initial leak. Then, two successive stages are evidenced in the self-development process of a water leak into sodium: (1) an incubation stage, during which the material is subject to intense corrosion in the crack area; and (2) a self-erosion stage, marked by the appearance of a leak rate that grows slowly at first, then suddenly, when the tube wall near the crack gives way under pressure.

- 3070 FUEL PINS AND CORE RESPONSE UNDER LIQUID-METAL FAST BREEDER REACTOR TRANSIENT OVERPOWER ACCIDENT CONDITIONS. Wilburn, N.P.; Smith, D.E.; Baars, R.E.; Atcheson, D.B.; Spencer, B.W. (Hanford Engineering Development Lab., Richland, WA). Nucl. Technol.; 46: No. 3, 591-599(Dec 1979).

Since the earlier liquid-metal fast breeder reactor transient overpower assessments were done (1975), new experimental data and modeling improvements have occurred that indicate later failures and more molten fuel squirted into the channel with a higher propensity for plugging. An initial sweepout still occurs, and an analysis shows that even if coherent instead of the expected stochastic failures occur, the blockages are partial, the reactor is strongly shut down, and a coolable geometry exists. Hence, the overall consequences would be benign.

- 3071 ANALYSIS OF TRANSIENT OVERPOWER ACCIDENTS IN THE FAST TEST REACTOR USING THE LOS ALAMOS FAILURE MODEL. Mast, P.K.; Scott, J.H. (Los Alamos Scientific Lab., NM). Nucl. Technol.; 46: No. 3, 600-605(Dec 1979).
A new fuel pin failure model, the Los Alamos Failure Model (LAFM), based on a linear life fraction rule failure criterion, has been developed to provide a reliable and inexpensive prediction of the time and axial location of liquid-metal fast breeder reactor fuel pin failure in a hypothetical transient overpower (TOP) accident. Code testing analyses for a number of TOP Transient Reactor Test Facility tests have resulted in excellent agreement between calculated and observed pin failure time and location. Because of the nature of the failure criterion used, the code has also been used to investigate the extent of cladding damage incurred in terminated as well as unterminated TOP transients in the Fast Test Reactor. The results of these analyses show that 3 dollar/s and 50 and 5 cent/s transients terminated by the secondary trip point (25% overpower) result in negligible calculated cladding damage.

- 3072 CONTROLLING CESIUM IN THE COOLANT OF THE EXPERIMENTAL BREEDER REACTOR II. Olson, W.H. (Argonne National Lab., Idaho Falls, IA); Ruther, W.E. Nucl. Technol.; 46: No. 2, 318-322(Dec 1979).

Carbon has been shown to be an effective getter for cesium in liquid sodium. A cesium trap containing reticulated vitreous carbon and operating at 190°C has been used at the Experimental Breeder Reactor II to reduce fission product cesium activity in the primary sodium coolant from a maximum of 15 kBq/g to approx. 870 Bq/g.

- 3073 MODES OF FAILURE OF FAST REACTOR FUEL PINS IRRADIATED UNDER LOSS-OF-COOLANT-FLOW CONDITIONS. Kwast, H. (Netherlands Energy Research Foundation ECN, Petten). Nucl. Technol.; 46: No. 2, 234-240(Dec 1979).

Capsule irradiations have been performed on single fast reactor fuel pins in a sodium environment under simulated loss-of-coolant-flow conditions. The main objectives were to determine the thresholds, modes, and mechanisms of fuel pin failures. The parameters were canning temperature and internal pin pressure. The loss-of-coolant-flow condition was simulated by adjusting midwall canning temperatures of approx. 850 and approx. 1000°C. The results indicated that the creep rupture is the predominant failure mechanism at canning temperatures of 1000°C and gas pressures of above 40 bars. The failure mechanism of fuel pins tested at approx. 850°C and gas pressures lower than 60 bars is probably cladding strain due to differential expansion of fuel and canning.

- 3074 INVESTIGATION OF LOCAL COOLING DISTURBANCES IN AN IN-PILE SODIUM LOOP IN THE BR2. Kramer, W. (Kernforschungszentrum Karlsruhe, Germany); Schleisiek, K.; Schmidt, L.; Vanmassenhove, G.; Verwimp, A. Nucl. Technol.; 46: No. 2, 281-288(Dec 1979).

The fuel element behavior under local off-normal cooling conditions and the possible pin-to-pin failure propagation are of special interest in the safety analysis of liquid-metal fast breeder reactors. In a program called Mol 7C, Kernforschungszentrum Karlsruhe and the Centre d'Etude de l'Energie Nucleaire/ Studiecentrum voor Kernenergie at Mol are performing related experiments in a sodium loop in the Br2 reactor. The test section contains a 37-pin bundle of UO₂ fuel with an artificial local blockage involving the 6 inner pins and parts of the pins of the second row (30 rods are active fuel pins, and 7 are stainless-steel dummy pins). After a pre-irradiation of some days, the transient test phase is initiated by interrupting the cooling in the local blockage region. The first and second of three planned experiments demonstrate that the cooling of the whole fuel bundle was not jeopardized, although several pins have failed. The performance of the third experiment had to be postponed for the end of 1979 due to the exchange of the beryllium matrix of the BR2 reactor during 1979.

- 3075 CONSIDERATIONS ON INCOHERENCY OF BOILING AND VOIDING IN LIQUID-METAL FAST BREEDER REACTOR SUBASSEMBLIES DURING A LOSS-OF-FLOW ACCIDENT. Nijsing, R.; Eifler, W. (Commission of the European Communities, Ispra, Italy). Nucl. Technol.; 46: No. 2, 289-299(Dec 1979).

The present version, THARC-8, of the transient thermohydraulic subassembly code, THARC, under development at the Joint Research Centre at Ispra, has been applied to predict the transient thermohydraulic behavior of liquid-metal fast breeder reactor subassemblies subjected to loss-of-flow conditions. Information is given on the present status of development of THARC. Computational results are presented for 217-rod subassemblies, both for grid and wire spacers. It is shown that radial power gradients and overcooling in the region adjacent to the wrapper wall cause boiling inception in the subassembly to be incoherent with, as a consequence, a more gradual boiling and voiding process than expected on the basis of a one-dimensional approach. It is demonstrated that heat capacity effects associated with the fuel rods and the wrapper wall are of considerable importance. Aspects associated with code validation in out-of-pile bundle experiments are also briefly discussed.

- 3076 ATTENUATION OF AIRBORNE DEBRIS FROM LIQUID-METAL FAST BREEDER REACTOR ACCIDENTS. Morewitz, H.A. (Rockwell International, Canoga Park, CA); Johnson, R.P.; Nelson, C.T.; Vaughan, E.U.; Guderjahn, C.A.; Hilliard, R.K.; McCormack, J.D.; Postma, A.K. Nucl. Technol.; 46: No. 2, 332-339(Dec 1979).

Experimental and theoretical studies have been performed to characterize the behavior of airborne particulates (aerosols) expected to be produced by hypothetical core disruptive accidents (HCDAs) in liquid-metal fast breeder reactors (LMFBRs). These aerosol studies include work on aerosol transport in a 20-m-high, 850-m³ closed vessel at moderate concentration; aerosol transport in a small vessel under conditions of high concentration (approx. 1 kg/m³), high turbulence, and high temperature (approx. 2000°C); and aerosol transport through various leak paths. These studies have shown that little, if any, airborne debris from LMFBR HCDAs would reach the atmosphere exterior to an intact reactor containment building.

- 3077 IN-REACTOR EXPERIMENTS ON THE COOLING OF FAST REACTOR DEBRIS. Rivard, J.B. (Sandia Labs., Albuquerque, NM). Nucl. Technol.; 46: No. 2, 344-349(Dec 1979).

First-of-a-kind fission-heated experiments utilizing uranium oxide particles in liquid sodium have been performed to assess the nature of the passive heat transfer between fast reactor fuel debris and overlying coolant. The experiments were designed to simulate the situation following a core disruptive accident in which molten core material is quenched, fragmented, and is dispersed as beds of decay-heated particulate within the reactor vessel. In two of the experiments, threshold dryout of the fuel particulate was produced. During several runs, dryout was maintained for long periods (approx. 1 h) with only modest temperature increases, demonstrating that while bed dryout may be a necessary condition for remelting of the fuel, it is not always a sufficient condition.

- 3078 MULTICHANNEL MODEL FOR FUEL-COOLANT INTERACTION IN A LIQUID-METAL FAST BREEDER REACTOR SUBASSEMBLY. Mehr, K. (Joint European Research Center, Ispra, Italy); Kottowski, H.M.; Goldammer, H. Nucl. Technol.; 46: No. 2, 362-368(Dec 1979).

A multichannel model and computer code for fuel-coolant interaction in a liquid-metal fast breeder reactor subassembly have been developed. The model takes into account the geometry of the subassembly and assumes a partial meltdown. Results obtained with the code show the influence of local initial perturbations. Furthermore, it is revealed that the common vapor space between the coolant and the molten fuel is the predominant coupling between the channels.

- 3079 IMPROVED TREATMENT OF THE NEUTRON STREAMING THROUGH CONTROL ROD FOLLOWERS IN A SODIUM-COOLED FAST REACTOR. Yoshida, T. (Inst. für Neutronenphysik und Reaktortechnik, Karlsruhe, Germany). Nucl. Sci. Eng.; 72: No. 3, 361-365(Dec 1979).

A method is presented for determining by numerical integration a diffusion coefficient, $D_{\text{sub } z}$, applicable to the axial direction of a control rod follower region in a sodium-cooled fast reactor. By comparing criticality values from transport and diffusion theory for a simplified reactor model, it is shown that this $D_{\text{sub } z}$ applies well to the followers from the viewpoint of the calculated

criticality factor, $k_{\text{sub eff}}$. By use of the same model, an intercomparison is also made between the present and other definitions of $D_{\text{sub } z}$. By using the present $D_{\text{sub } z}$, a conclusion is that the currently used D ($= 1/3 \Sigma$) for control rod followers leads to an underestimation of $k_{\text{sub eff}}$ by approx. 0.3% for a typical 300-MW (electric) class liquid-metal fast breeder reactor with one-third of the control rods inserted, which may increase to 0.4 to 0.5% for a case where all control rods are withdrawn.

- 3080 NATURAL CIRCULATION BOOSTS SAFETY OF POOL-TYPE FAST REACTOR. Gregory, C.V.; Anderson, R.; Bell, R.; Brown, G.A.; Dawson, C.W.; Lord, D.J. (UKAEA, Dounreay, Nuclear Power Development Establishment). Nucl. Eng. Int.; 24: No. 293, 29-33(Dec 1979).

Experiments are described which were carried out at Dounreay to investigate natural circulation within the PFR primary vessel. If, during a primary pump rundown caused by loss of electrical supplies, all three auxiliary motors were to fail, natural circulation, if demonstrable, could transfer heat from the core to the decay heat rejection loops. The results of the experiments showed that because of the good heat transfer properties of sodium and also the large thermal capacity of the sodium pool, natural circulation is a powerful intrinsic safety feature of pool type LMFBRs. The experiments also resulted in a smooth transition to natural circulation with temperatures which suggested that in the event of loss of all primary circuit pumping power natural circulation will provide inherent protection and coolant and fuel pin temperatures will not exceed normal operating temperatures. (UK).

- 3081 ANNULAR LINEAR INDUCTION PUMP WITH AN EXTERNALLY SUPPORTED DUCT. Craig, E.R.; Semken, R.S. (to Dept. of Energy). US Patent 4,174,190. 13 Nov 1979. Filed date 30 Jun 1977. 8p.

PAT-APPL-811,627.

Several embodiments of an annular linear induction pump for pumping liquid metals are disclosed having the features of generally one pass flow of the liquid metal through the pump and an increased efficiency resulting from the use of thin duct walls to enclose the stator. The stator components of this pump are removable for repair and replacement. 15 claims.

- 3082 SIMPLIFIED INTERASSEMBLY HEAT TRANSFER MODEL FOR THE ANALYSIS OF LIQUID-METAL FAST BREEDER REACTOR CORE RESTRAINT SYSTEMS. Wei, J.P. (General Electric Co., Sunnyvale, CA). Nucl. Technol.; 46: No. 1, 44-52(Nov 1979).

A simplified interassembly heat transfer model has been developed to satisfy liquid-metal fast breeder reactor core restraint system analysis needs that explicitly treats steady-state intra-assembly and interassembly heat transfer in core assemblies. The intra-assembly heat transfer inside reactor assemblies is modeled based on application of the subchannel concept together with the use of bulk parameters for coolant velocity and coolant temperature within a subchannel. The model utilizes a tri-grid system to treat interassembly heat transfer between assemblies. Because of this special nodal scheme, a set of finite difference equations, derived from the energy equation for all the subchannels, duct wall, and gap flow, is actually a rather special system of simultaneous linear algebraic equations which have a tri-diagonal matrix

form. Due to this special form, an efficient method of solution for computers is used without matrix elimination and inversion. Although this model was developed for core restraint applications, it is also well suited for the determination of core-wide coolant temperature distributions.

- 3083 OBSERVATIONS OF DILATION AND BOWING IN EXPERIMENTAL BREEDER REACTOR II DUCTS AND CLADDING. Walters, L.C.; Walter, C.M. (Argonne National Lab., Idaho Falls, ID). Nucl. Technol.; 46: No. 1, 134-148 (Nov 1979).

Irradiation-induced creep and swelling of stainless-steel Experimental Breeder Reactor II (EBR-II) components have been the subjects of intense surveillance programs during the operation of the EBR-II. Dilation, length change, and bow due to creep and swelling of stainless-steel ducts have all been of concern during the operation of the EBR-II, but in no instance have significant reliability or safety problems arisen due to these phenomena. Driver-fuel elements of two different designs have been irradiated to cladding breach. It was demonstrated that metal driver fuel is capable of high burnup when designed for interconnected porosity prior to fuel-cladding contact. Cladding breaches were found either adjacent to the fuel column or in the fuel-restrainer dimpler. The breach mode was intergranular cracking at both locations.

- 3084 BREEDER REACTOR: A VITAL OPTION. Golan, S. (Bechtel Corp., San Francisco, CA). Aware; No. 110, 6-8 (Nov 1979).

Appeared in Bechtel Briefs, September 1979. Plans for the breeder reactor depend more on political than scientific decisions. A breeder produces 60 times more energy from the same uranium resource. Breeder technology was pioneered by the US, but Russia, France, and UK are developing the breeder at the determined pace, while development in the US is stalled. The LMFB is in demonstration and is approaching commercialization. Mr. Golan says that we cannot, nor should be expected to, demonstrate that the breeder is now an essential element in our national energy production program. The breeder is insurance against a major future constraint on energy availability. If the best of circumstances comes about so that the breeder is not so urgently needed as it now appears, we have only made an eventually needed investment 5 or 10 years too early. If the worst of the range of possible circumstances develops, our nation will be grateful that we had the foresight to develop it. Proceeding with the construction of an experimental plant does not commit the US to large-scale deployment of breeder reactors, we are simply developing an energy option. (MCW)

- 3085 SIMULTANEOUS FREEZING AND MELTING IN FINITE MEDIA. Hakim, S.J. (Argonne National Lab., IL). Nucl. Sci. Eng.; 72: No. 2, 129-139 (Nov 1979).

From ASME winter meeting on simultaneous melting and freezing in the impingement region of a liquid jet; San Francisco, CA, USA (Win 1978).

Simultaneous crust growth in a fluid and the melting of an adjacent colder structure surface in contact with it are examined with emphasis on fast breeder reactor safety applications. The calculations were made subject to the following assumptions: (1) As long as a crust exists, melted structure adjacent to it stays in place until its melts. (2) When a crust melts, melted structure is ablated. The ablation process does not influence the

temperature profile in the remaining intact structure. The dependence of the Fourier number at which complete structure melting occurs on fluid-to-crust heat flux is obtained for uranium oxide and thorium oxide crusts forming on steel surfaces. The crust behavior is also investigated as the heat flux is varied. The dependence of the results on internal heat generation and the Biot number on the other side of the structure is determined.

- 3086 PLUTONIUM PROCESSING FOR THE FAST REACTOR FUEL CYCLE. Allardice, R.H. (UKAEA Culham Lab., Abington); Taylor, H.A. Nucl. Eng. Int.; 24: No. 292, 52-55 (Nov 1979).

Current Dounreay and Windscale experience in reprocessing, fabrication and plutonium waste operations together with the continuing UK development programme to establish process and plant design for larger scale operations is described. The necessity for considering these fuel cycle operations as an entity and avoiding the independent optimization of individual areas, in order to obtain the preferred balance for safe and reliable Pu processing operations is emphasized.

- 3087 PLUTONIUM RECOVERY GOES ON-STEAM. Barrett, T.R.; Mills, A.L. Processing; 25: No. 11, 42-43 (Nov 1979).

The Dounreay fast reactors DFR and PFR are very briefly described, with particular reference to their fuel elements. The spent fuel reprocessing plant is described in more detail under the headings: fuel subassemblies (dimensions, composition, preparation for reprocessing); dissolution and recovery (U-Pu separation from fission products, etc., and from each other); waste products.

- 3088 DOUNREAY REPROCESSING PLANT CLOSES NUCLEAR FUEL CYCLE. Spear, M. Process Eng.; 132-133 (Nov 1979).

The first fast reactor fuel reprocessing plant which has been officially opened at Dounreay will, when fully operational, represent our important link to the fast breeder program, reprocessing irradiated fuel from the PFR. A brief outline is given of the PFR fuel assemblies and of the operations following their removal from the core and in the reprocessing plant. Building the plant on the old plant site at a cost of Pound3.4 million, represents a saving of some Pound10 million, compared with the cost of a completely new plant.

- 3089 DOSE MORTALITY RELATIONSHIPS: IMPLICATIONS FOR HYPOTHETICAL ACCIDENTAL RELEASES FROM FBRS. Kelly, G.N. (National Radiological Protection Board, Harwell (UK)). Radiol. Prot. Bull.; No. 31, 16-18 (Nov 1979).

A summary is given of the findings detailed in the most recent of a series of radiological studies of a liquid metal-cooled fast breeder reactor (Kelly, G.N. Simmonds, J.R. Smith, H. and Stather, J.W., The radiological consequences of national accidental releases of radioactivity from fast breeder reactors: sensitivity to the dose-effect relationships adopted for early biological effects, Harwell, National Radiological Protection Board, NRPB-R87. London, HMSO (1979)). The results have indicated those areas where effort might be most profitably directed to improve the reliability of the predicted consequences. The composition of the released activity has been shown to have a marked influence on the sensitivity of the predicted consequences, and application of simple supportive medical

treatment has a potential for reducing the predicted consequences by factors of up to an order of magnitude, depending on the composition of the release.

- 3090 UNDERWRITING STRUCTURAL STEELS FOR THE SODIUM-COOLED FAST REACTOR. Charnock, W. (Central Electricity Generating Board, Berkeley (UK). Berkeley Nuclear Labs.); Haigh, C.P.; Horton, C.A.P.; Marshall, P. CEBG Res.; No. 10, 3-14(Nov 1979).

Material strength and fabrication considerations have led to the choice of AISI type 316 stainless steel for most of the components in the primary circuit and the intermediate heat exchanger for the UK fast reactor. High strength chromium-molybdenum ferritic steels are a common choice for boiler tubes and shells of the steam generator units. The physical and chemical influences of liquid sodium upon these structural steels are summarised. Laboratory techniques which have been used in investigating mechanical properties in various sodium conditions are described. Some of the results are presented and future plans for testing are discussed.

- 3091 ALLOYS FOR A LIQUID METAL FAST BREEDER REACTOR. Rowcliffe, A.F.; Bleiberg, M.L.; Diamond, S.; Bajaj, R. (to Dept. of Energy). US Patent 4,172,742. 30 Oct 1979. Filed date 6 Jan 1978. 12p. PAT-APPL-867,656.

An gamma-prime was precipitation-hardened iron-chromium-nickel alloy was designed with emphasis on minimum nickel and chromium contents to reduce the swelling tendencies of these alloys when used in liquid metal fast breeder reactors. The precipitation-hardening components have been designed for phase stability and such residual elements as silicon and boron, also have been selected to minimize swelling. Using the properties of these alloys in one design would result in an increased breeding ratio over 20% cold worked stainless steel, a reference material, of 1.239 to 1.310 and a reduced doubling time from 15.8 to 11.4 years. The gross stoichiometry of the alloying composition comprises from about 0.04% to about 0.06% carbon, from about 0.05% to about 1.0% silicon, up to about 0.1% zirconium, up to about 0.5% vanadium, from about 24% to about 31% nickel, from 8% to about 11% chromium, from about 1.7% to about 3.5% titanium, from about 1.0% to about 1.8% aluminum, from about 0.9% to about 3.7% molybdenum, from about 0.04% to about 0.8% boron, and the balance iron with incidental impurities.

- 3092 PROCESS AND APPARATUS FOR THE DETECTION AND PRELOCALIZATION OF A CAN FRACTURE IN A FUEL ASSEMBLY OF A FAST NUCLEAR REACTOR. Paziaud, A. (to Commissariat a l'Energie Atomique). US Patent 4,172,012. 23 Oct 1979. Priority date 23 Jun 1976, France, 4p.

Process and apparatus for the detection and prelocalization of a can fracture in a fuel assembly of a fast nuclear reactor are described. The device comprises at least one detector for the neutrons emitted by the fission products transported in the outflow of cooling agent as the result of the fracture of a can. The detector being immersed within the vessel in the outflow of cooling agent in an area protected from neutrons emitted by the core by the volume of cooling agent and by structures immersed in the annular space between the core and the vessel.

- 3093 LIQUID METAL COOLED NUCLEAR REACTOR

CONSTRUCTIONS. Seed, G.; Hodgson, D.; Grime, C.J. (to Nuclear Power Co. Ltd.). US Patent 4,172,010. 23 Oct 1979. Priority date 12 Aug 1976, United Kingdom of Great Britain and Northern Ireland (UK), 4p.

The fuel assembly in a nuclear reactor construction is supported from the wall of a primary vessel on a strongback with a secondary support means from the roof structure of a containment vault by ties. The secondary support provides a safety device whereby in the event of relaxation of the primary support relative movement between the fuel assembly and control rods is limited. Alternative secondary support means comprise a series of ties supporting the diagrid and a support stool beneath the fuel assembly.

- 3094 NUCLEAR REACTOR COMPOSITE FUEL ASSEMBLY. Burgess, D.M.; Cappiello, M.W.; Marr, D.R.; Omberg, R.P. (to Westinghouse Electric Corp., Pittsburgh, PA; USA). British Patent 2,018,009/A/. 10 Oct 1979. 8p.

A fuel assembly and core for a liquid-cooled breeder reactor is described which, it is claimed, reduces deficiencies found in typical present designs while maintaining a relatively high breeding ratio and low doubling time. (UK).

- 3095 LIQUID METAL COOLED FAST BREEDER NUCLEAR REACTORS. Gatley, J.A. (to Nuclear Power Co. Ltd., London; UK). British Patent 2,017,385/A/. 3 Oct 1979. 6p.

Breeder fuel sub-assemblies with electromagnetic brakes and fluidic valves for liquid metal cooled fast breeder reactors are described. The electromagnetic brakes are of relatively small proportions and the valves are of the controlled vortex type. The outlet coolant temperature of at least some of the breeder sub-assemblies are maintained by these means substantially constant throughout the life of the fuel assembly without severely pressurising the sub-assembly. (UK).

- 3096 HIGH INTEGRITY STEAM GENERATOR TUBE/TUBE PLATE JOINTS FOR THE LMFBR. Taylor, A.F. (Springfields Nuclear Power Development Labs., Salwick, England); Hayden, D. Weld. J. (Miami); 59: No. 10, 31-37(Oct 1979).

An extensive, two-year development program is now coming to a close. The basic process details necessary to obtain high integrity brazed joints for heat exchanger applications have been defined and are now being verified on a production basis by a leading UK Boilermaker. Replacement tube bundles are currently in manufacture and will be installed in the Prototype Fast Reactor at Dounreay in Scotland during 1981. The use of brazed joints in a sodium-heated steam generator may appear an exacting requirement. However, a comprehensive evaluation program has indicated that they will meet the stress and corrosion conditions anticipated in service. Confidence gained during the testing program has led to a further application at present under development. This is to exploit the technique in the repair of leaking tube-to-tube plate welds in current heat exchangers; the procedures being developed could have application to heat exchanger designs involving closely pitched smaller bore tubes.

- 3097 ANALYTIC PREDICTION OF THERMAL PROFILE DEVELOPMENT AND INVERSION FOR USE IN IN-PILE EXPERIMENTATION. Weber, D.P. (Argonne National Lab., IL). Nucl. Technol.; 45: No. 3, 203-218(Oct 1979).

The assessment of the consequences of hypothetical accidents in liquid-metal-cooled fast reactors often requires interaction between analysis and in-pile experiments, where experiments must provide geometry, boundary conditions, and thermal profiles that are prototypical of the accident scenario. Neutronic heating of test samples initially produces atypical thermal profiles, and a time period is required to elapse for thermal inversion. An analytic transient heat conduction analysis using multiregion eigenfunctions is provided to determine the space-time temperature profiles. With an assumed weak temporal dependence for eigenfunctions greater than the first, a determination of the motion of the position of maximum temperature is made, leading to a simple expression for the time to thermally invert completely, which requires knowledge of only the first eigenvalue and the expansion coefficient of the source for the fundamental mode, with similar analysis providing an estimate of the time to reach melting. A functional relationship is established between the operating reactor power, the thermal properties of the materials, and the boundary conditions to ensure satisfaction of both criteria of rapid thermal inversion and maximum temperatures above prescribed levels, such as melting. The analysis is then applied to a proposed in-pile experiment for studying pool boilup in internally heated fuel-steel pools with nuclear heated walls. It is shown that for a variety of external boundary conditions, a reactor power level may be chosen to ensure integrity of the insulating wall while simulating the pool boilup phenomena without the necessity of enrichment grading to enhance thermal inversion.

- 3098 TREAT TEST H6-A 50 CENTS TRANSIENT OVERPOWER ACCIDENT SIMULATION. Page, R.J.; Fink, C.L.; Rothman, A.B.; Lo, R.K.; Robinson, L.E.; Froehle, P.H. (Argonne National Lab., IL). Nucl. Technol.; 45: No. 3, 249-268(Oct 1979).

Transient Reactor Test Facility (TREAT) Test H6 was run to simulate a transient overpower (TOP) initiated 50 cent/s hypothetical core disruptive accident (CDA). The primary purpose was to investigate the extent to which molten fuel could be removed from the active core region following fuel pin failure, and the extent to which this would be accomplished while maintaining coolant flow. Coolant flow rates and pressures typical of those in the Fast Flux Test Facility were used. The test fuel sample consisted of a bundle of seven mixed-oxide fuel pins which had been preirradiated in the Experimental Breeder Reactor II to approx. 6 at % burnup. The liquid sodium coolant had an initial velocity of 6.20 m/s at a temperature of 742 K. A programmed TREAT power ramp with a period of 1.65 s was used to bring the experimental fuel sample to failure conditions. The test data showed that there were three main events associated with fuel pin failure. During the first of these events, fuel was removed from the active fuel region and relocated approx. 40 cm downstream. The coolant flow rate recovered to approx. 93% of its preevent value. Additional fuel was removed from the active fuel region during the second event and again relocated some 40 cm downstream. However, molten fuel also began to accumulate in a region centered on the centerline of the original fuel column. The coolant flow rate recovered to approx. 75% of its initial value. The third event was considerably more violent than the others and while a considerable quantity of fuel was relocated well downstream of the active fuel

column, a blockage was formed at the top of the fuel column which reduced the coolant flow to zero. Analysis of the flowmeter signals indicated that the fuel pin holder failed during the third event. This could be at least partially responsible for the coolant channel blockage following this event.

- 3099 BOR-60 SODIUM BOILING EXPERIMENT. Afanas'ev, V.A.; Aleksandrov, K.A.; Kebabze, B.V. (Nauchno-Issledovatel'skij Inst. Atomnykh Reaktorov, Dimitrovgrad (USSR)); Fuge, R.; Kaetzer, D. (Zentralinstitut fuer Kernforschung, Rossendorf bei Dresden (German Democratic Republic)). Kernenergie; 22: No. 10, 357-363(Oct 1979).

Sodium boiling was generated in the BOR-60 core by γ -heating of tungsten rod bundles in two different test rigs. The boiling noise was measured by means of an ionization chamber and several acoustic transducers. The results of noise analysis of the background and the boiling noise are presented and discussed from the point of view of reactor surveillance.

- 3100 CONTRIBUTION OF DOUNREAY TO THE DEVELOPMENT OF FAST REACTORS. Blumfield, C.W. (UKAEA Dounreay Nuclear Power Development Establishment). Nucl. Energy; 18: No. 5, 311-326(Oct 1979).

A review is presented of the fast reactor work performed at Dounreay on fuel and core materials, the reactor system, and fuel reprocessing. The following topics are discussed: Dounreay's role in the development work on ceramic fuels leading to a specification for PFR fuel; irradiation behaviour of materials, eg., quantification of effects of irradiation in mechanical properties, irradiation creep of stainless steels and work on void swelling; monitoring of reactor components and coolant; investigation of the performance of highly rated fuel under adverse conditions; and testing of oxide fuel elements in PFR. The determination of the behaviour of PFR boiler tubes and the study of the features large leaks, including the sodium-water reaction have been investigated in the large Super-Noah rig at Dounreay are described. Finally development work for PFR fuel reprocessing is discussed. This includes the dismantling of fuel assemblies, fuel dissolution, volume reduction and segregation of contaminated waste, and treatment of radioactive waste.

- 3101 CLOSING THE FAST FUEL CYCLE AT DOUNREAY. Moss, J. Electr. Rev. (London); 205: No. 11, 16-17(21 Sep 1979).

The opening of the new fast reactor fuel reprocessing plant at Dounreay enables plutonium based fuel used in the PFR to be reprocessed and the plutonium to be sent to Windscale for fabricating into new fuel rods. An outline is given of the fuel cycle including plans for waste disposal.

- 3102 NUCLEAR REACTOR. Aubert, M.; Lambert, P. (to Commissariat a l'Energie Atomique). US Patent 4,167,445. 11 Sep 1979. Priority date 26 Nov 1975, France, 10p.

A first annular space is formed between a cylindrical baffle and the reactor vessel and a second annular space is formed between the baffle and a counter-baffle. The level of liquid metal coolant is free within the two annular spaces which are separated by the baffle. The top edge of the baffle has a profile such that the supply of cold liquid metal which overflows into the discharge space

takes place without breaking away from the baffle wall.

- 3103 SELF-ACTUATED RATE OF CHANGE OF PRESSURE SCRAM DEVICE FOR NUCLEAR REACTORS. Noyes, R.C.; Zaman, S.U.; Stuteville, D.W. (to Combustion Engineering, Inc.). US Patent 4,167,443. 11 Sep 1979. Filed date 30 Aug 1977. 6p.

A sensor chamber having one cavity containing coolant separated by a diaphragm from another cavity containing a fixed mass of inert gas is located within a safety assembly of a liquid metal-cooled nuclear reactor. The liquid cavity is in fluid communication with the coolant outside the chamber through a flow limiting orifice. An actuating bellows in fluid communication with the gas cavity is in contact with coolant outside the chamber and is connected to a push rod, which serves as a trigger for a poison bundle release mechanism. During slow changes in reactor coolant pressure experienced under normal operation, the diaphragm moves to equalize the gas cavity and liquid cavity pressures with the coolant pressure outside the chamber. The actuating bellows does not move because it is biased so that a threshold pressure difference is required before it will expand. Under a more rapid drop in coolant pressure, such as is associated with a loss of forced flow, the threshold is overcome and the actuating bellows will also move, thereby triggering the release mechanism to shut down the reactor. The actuating bellows may be connected to the liquid cavity rather than to the gas cavity.

- 3104 HIGH TEMPERATURE TESTING OF A SODIUM PUMP. Atz, R.W.; Tessier, M.J. Contract EY-76-C-03-0700. New York; American Society of Mechanical Engineers (Sep 1979). 8p.

Problems encountered during high temperature sodium testing of a prototype breeder reactor heat transport pump at the Energy Technology Engineering Center (ETEC) are discussed. Special tests and analyses to resolve the uneven heating and resulting high shaft torque which was traced to cellular natural convection is discussed. Vibrations were observed during steady-state testing. Diagnostic testing and analyses (e.g., power spectral density) were developed to determine the source and to effect a solution. The source was discovered to be vortex shedding off the upper impeller wear ring outlet; subsequent pump modification, by stiffening the ring, mitigated the problem. During thermal transient testing, a shaft seizure by the hydrostatic bearing occurred. Densification of the bearing support material during prolonged high temperature operation caused the loss of clearance.

- 3105 MECHANISM OF RELEASE OF RADIOACTIVE PRODUCTS INTO LIQUID-METAL COOLANTS, THEIR TRANSPORT WITHIN THE CIRCUITS AND REMOVAL FROM LMFBRs. Feuerstein, H. (Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.)); Hooper, A.J. (Central Electricity Generating Board, Berkeley (UK). Berkeley Nuclear Labs.); Johnson, F.A. (UKAEA, Harwell. Atomic Energy Research Establishment). At. Energy Rev.; 17: No. 3, 697-761 (Sep 1979).

The sources, distribution and removal of the radioisotopes contributing to LMFBR primary circuit contamination are considered in three separate sections. The principal mechanisms of fission product generation and release from fast reactor fuels during normal reactor operation are examined. Published data on the radioactivity in circuits of experimental and power reactors, and for loop experiments, are

assessed and compared. Information on the behaviour of individual isotopes in the coolant circuit and cover gas and their removal via cold traps and other specialized means are reviewed.

- 3106 (DOE-tr--115) ANALYSIS OF THE DISASSEMBLY PHASE OF HYPOTHETICAL CORE DISRUPTIVE ACCIDENTS (HCDA) FOR THE SNR-2000. Maschek, W. (Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Inst. fuer Neutronenphysik und Reaktortechnik). Sep 1979. Translation of KFK--2491, December 1977 202p. Dep. NTIS (US Sales Only), PC A10/MF A01.

Work performed under United States-West Germany Fast Reactor Exchange Program.

During 1976 a first safety analysis of a large liquid metal fast breeder reactor (LMFBR) - the so-called SNR-2000 - has been performed in the framework of the fast breeder project. The reactor produces a thermal power of 5000 MW corresponding to 2000 MW electric. The analysis mainly dealt with the behavior of HCDAs in the SNR-2000 core. Transient over power (TOP), loss of flow (LOF), and LOF driven TOP's have been analyzed for two burn up status (begin of equilibrium cycle A (BEC-A) and end of equilibrium cycle B (BEC-B)). For these type of accidents the failure of the redundant and diversive shut down system has been assumed.

- 3107 MEASUREMENTS OF HYDROGEN CONCENTRATION IN LIQUID SODIUM BY USING AN INERT GAS CARRIER METHOD. Funada, T.; Nihei, I.; Yuhara, S.; Nakasugi, T. (Power Reactor and Nuclear Fuel Development Corp., Oarai, Ibaraki, Japan). Nucl. Technol.; 45: No. 2, 158-165 (Sep 1979).

A technique was developed to measure the hydrogen level in liquid sodium using an inert gas carrier method. Hydrogen was extracted into an inert gas from sodium through a thin nickel membrane in the form of a helically wound tube. The amount of hydrogen in the inert gas was analyzed by gas chromatography. The present method is unique in that it can be used over the wide range of sodium temperatures (150 to 700°C) and has no problems associated with vacuum systems. The partial pressure of hydrogen in sodium was determined as a function of cold-trap temperature ($T_{\text{sub c}}$). Sieverts' constant ($K_{\text{sub s}}$) was determined as a function of sodium temperature (T). From Sieverts' constant, the solubility of hydrogen in sodium is calculated. It was found that other impurities in sodium, such as (D) and (OH), have little effect on the hydrogen pressure in the sodium loop.

- 3108 PLANNING FOR THE FUTURE GENERATION. Heat. Air Cond. J.; 49: No. 571, 18-26 (Sep 1979).

The UK nuclear power programme is discussed under the following headings: introduction; reactor types (British commercial reactors - history, design, the Magnox reactors, the AGR, reactors in development - PFR); the cost of nuclear power; the nuclear fuel cycle; safety; organisation in the UK; fusion; the nuclear energy contribution; assessment.

- 3109 ACCIDENT PROGRESSION FOR A LOSS-OF-HEAT-SINK WITH SCRAM IN A LIQUID-METAL FAST BREEDER REACTOR. Bari, R.A.; Ludwig, H.; Pratt, W.F.; Sun, Y.H. (Brookhaven National Lab., Upton, NY). Nucl. Technol.; 44: No. 3, 357-380 (Aug 1979).

An analysis of a slow core meltdown in a liquid-metal fast breeder reactor was performed for the conditions of loss-of-heat-sink

following neutronic shutdown. Simple models were developed for the prediction of phase changes and/or relocation of the core materials, including fuel, coolant, cladding ducts, control rod absorber material (B₄C), and plenum gases. The sequence of events was accounted for, and the accident progression was described up to the point of recriticality. The neutronic behavior of the disrupted core was analyzed in r - z geometry with a static transport theory code (TWOTRAN). For most scenarios assessed, the reactor is expected to become recritical, although large ramp rates are not anticipated.

- 3110 EFFECT OF FLUID-TO-STRUCTURE HEAT TRANSFER ON THE STRUCTURAL DAMAGE POTENTIAL TO A LIQUID-METAL FAST BREEDER REACTOR. Hakim, S.J.; Abramson, P.B. (Argonne National Lab., Argonne, IL). Nucl. Technol.; 44: No. 3, 390-400 (Aug 1979).

Deterministic calculations simulating a hypothetical accident in a liquid-metal fast breeder reactor that leads to a hydrodynamic disassembly of the core have been carried out to estimate the system's damage potential due to the vapor-pressure-driven expansion of molten core material and its dependency on the heat transfer to the remaining structure. These calculations ignored the effect on the work potential of sodium left in the core during the disassembly. Results indicate that steel cladding in the upper axial blankets and fission gas plenum acts as a thermodynamic energy sink that could reduce the total thermodynamic work energy by between one and two orders of magnitude, provided little or no sodium is present in the core at the time of interaction. These results have been found to be insensitive to the rate of heat transferred from the molten fuel to the molten steel that comprises the molten core material.

- 3111 ACCURACY AND COMPUTATIONAL TIME OF A HIERARCHY OF GROWTH RATE DEFINITIONS FOR BREEDER REACTOR FUEL. Maudlin, P.J.; Borg, R.C.; Ott, K.D. (Purdue Univ., West Lafayette, IN). Nucl. Sci. Eng.; 71: No. 2, 202-227 (Aug 1979).

For a hierarchy of four logically different definitions for calculating the asymptotic growth of fast breeder reactor fuel, an investigation is performed concerning the comparative accuracy and computational effort associated with each definition. The definition based on detailed calculation of the accumulating fuel in an expanding park of reactors asymptotically yields the most accurate value of the infinite time growth rate, $\gamma/\sup \text{infinity}$, which is used as a reference value. The computational effort involved with the park definition is very large. The definition based on the single reactor calculation of the equilibrium surplus production rate and fuel inventory gives a value for $\gamma/\sup \text{infinity}$ of comparable accuracy to the park definition and uses significantly less central processor unit (CPU) time. The third definition is based on a continuous treatment of the reactor fuel cycle for a single reactor and gives a value for $\gamma/\sup \text{infinity}$ that accurately approximates the second definition. The continuous definition requires very little CPU time. The fourth definition employs the isotopic breeding worths, $w/\sub i/\sup *$, for a projection of the asymptotic growth rate. The CPU time involved in this definition is practically nil if its calculation is based on the few-cycle depletion calculation normally performed for core design and critical enrichment evaluations. The small inaccuracy (approx. =

1%) of the breeding-worth-based definition is well within the inaccuracy range that results unavoidably from other sources such as nuclear cross sections, group constants, and flux calculations. This fully justifies the use of this approach in routine calculations.

- 3112 (DOE-tr-142) POSSIBILITIES FOR THE DETERMINATION OF THE HEAT TRANSFER PROCESS BETWEEN NUCLEAR FUEL RODS AND THE COOLING MEDIUM IN A SODIUM-COOLED REACTOR DURING OPERATION. Mitzel, F. (Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Inst. fuer Neutronenphysik und Reaktortechnik). Aug 1979. Translation of KFK-2619, June 1978 52p. Dep. NTIS (US Sales Only), PC A04/MF A01.

Work performed under United States-W. Germany Fast Reactor Exchange Program.

In order to improve the safety, the surveillance and economy of sodium cooled reactors it is desirable to obtain a more precise knowledge of the heat transfer between the fuel and the coolant. Different possibilities have been investigated to determine the corresponding heat transfer coefficient by measuring the pertinent transfer functions. The result was the following: the heat transfer coefficient can be determined with reasonable accuracy at the KNK II and the SNR by means of small pseudo-stochastic power oscillations. These power oscillations must be artificially induced but do not require an interruption of the normal plant operation.

- 3113 IMPRESSIVE SUPER PHENIX. Olds, F.C. Power Eng.; 83: No. 8, 62-66 (Aug 1979).

The 1200-MWe fast breeder reactor, Super Phenix at Creys-Malville, is scheduled for commercial operation in 1983. This is the world's first near-commercial-sized fast breeder. As a near-commercial-sized unit, it represents essentially the technology and hardware of the first fully commercial follow-on units. In its size, its components, its design, the technology it represents, and its project schedule, it is impressive. As of May 1979, the Super Phenix nuclear steam boiler in the Creys-Malville plant bore an estimated cost of \$700 million, without fuel. The total cost of the Creys-Malville plant now is estimated at about \$1.4 billion. This is about twice the cost of a comparable standardized PWR being built in France today. However, it should be borne in mind that Creys-Malville carries the high cost of a first-of-the-line prototype, and that France's PWRs are standardized, second-generation units. Electricity from Creys-Malville is estimated to cost a little more than electricity would cost from a coal-fired plant complete with flue gas scrubbing.

- 3114 GAS BUBBLE ADHESION TO HEAT TRANSFER SURFACES. Winterton, R.H.S.; Chevalier, A.B.H.; Fowles, G.A. (Birmingham Univ. (UK). Dept. of Mechanical Engineering). Nucl. Eng. Des.; 53: No. 3, 347-354 (Aug 1979).

A model of gas bubble adhesion to heat transfer surfaces is developed, by considering the drag, surface tension and buoyancy forces acting on a gas bubble attached to a solid wall with liquid flowing past. The model is consistent with the fuel pin failures that were observed in the irradiation tests of fuel sub-assemblies for the British Prototype Fast Reactor, and predicts that changing to upward flow will not in itself necessarily prevent such failures in the future.

- 3115 HEAVY SECTION STEEL TECHNOLOGY (HSST)

PROGRAM. Canonico, D.A. (Oak Ridge National Lab., TN). Met. Prog.; 116: No. 2, 32-41 (Jul 1979).

Material characterization, fracture mechanics, fatigue crack growth, pressure vessel tests, irradiation effects, and thermal shock of BWR and PWR steam generators are part of the function of the heavy section steel technology program (HSST).

3116 MATERIALS TECHNOLOGY FOR LMFBR STEAM GENERATORS. Brinkman, C.R. (Oak Ridge National Lab., TN); Katcher, M. Met. Prog.; 116: No. 2, 54-61 (Jul 1979).

Research in support of steam generators for LMFBR reactors is summarized. A description of the reactor development and characterization of alloy fabrication are described.

3117 EXPERIMENTAL STUDY OF SCRAM TRANSIENTS IN GENERALIZED LIQUID-METAL FAST BREEDER REACTOR OUTLET PLENUMS. Howard, P.A.; Carbajo, J.J. (Argonne National Lab., IL). Nucl. Technol.; 44: No. 2, 210-220 (Jul 1979).

An experimental study was made of the transient behavior of the coolant in a generalized outlet plenum after a scram in a liquid-metal fast breeder reactor. Different conditions of fluid flow rate and temperature and plenum geometry were used for a three-exit loop-type reactor system. Water was used to simulate the coolant, and a small-scale model was used to simulate the various generalized plenum configurations. Thermocouples monitored the temperatures at 48 locations within the outlet plenum. The thermohydraulic behavior within the plenum has been studied in detail; analysis of this behavior is described as having three consecutive discrete stages. Correlations found in the literature accurately predict the height of the negatively buoyant plume. New correlations have been obtained.

3118 CARTER'S BREEDER POLICY HAS FAILED, CLAIMS WESTINGHOUSE MANAGER. Electr. Light Power (Boston); 57: No. 7, 26 (Jul 1979).

Nuclear nations developing liquid metal fast breeder reactor (LMFBR) technology have not been dissuaded by President Carter's efforts to stop the breeder program as a way to control the proliferation of nuclear weapons. There is no evidence that Carter's policy of moral persuasion has had any impact on their efforts. A review of the eight leading countries cites their extensive progress in the areas of breeder technology and fuel reprocessing, while the US has made only slight gains. The Fast Flux Test Facility at Hanford is near completion, but the Clinch River project has been slowed to a minimum.

3119 (ANL-Trans--1177) REPORT OF STUDY ON SAFETY WITH RESPECT TO SODIUM WATER REACTION. SECTION 4. WATER LEAK RATE EVALUATION IN THE LARGE SCALE SODIUM WATER REACTION. SECTION 5. CONCLUDING REMARKS. APPENDIX. ANALYSIS CODE: SUMMARY. (Japan Society of Mechanical Engineers, Tokyo). Jul 1979. Translation of Japanese report, March 1978, pp 143-261 175p. Dep. NTIS, PC A08/MF A01.

Methods for the estimation of water leak rate in an experiment on large-scale sodium water reactions are evaluated.

3120 SUCCESS AND PROBLEMS OF FAST BREEDER DEVELOPMENT. REPORT ON THE 1979 STATUS REPORT OF THE FAST BREEDER PROJECT GIVEN IN KARLSRUHE ON FEBRUARY 12, 1979. Hueper, R. (Kernforschungszentrum Karlsruhe G.m.b.H.

(Germany, F.R.)). Atomwirtsch., Atomtech.; 24: No. 7, 385-386 (Jul 1979). (In German).

After a pause of 3 years, a status report of the Fast Breeder Project was given at Karlsruhe Nuclear Research Centre on February 12, 1979. The report dealt mainly with the construction and operation of the SNR-300 reactor; it gave an outline of the political situation of the fast breeder reactor, German-French cooperation, nuclear safety in large breeders, and the proliferation safety of their fuel cycle.

3121 FATIGUE-CRACK PROPAGATION RESPONSE OF TWO NICKEL-BASE ALLOYS IN A LIQUID SODIUM ENVIRONMENT. Mills, W.J.; James, L.A. (Hanford Engineering Development Lab., Richland, WA). Contract EY-76-C-14-2170. J. Eng. Mater. Technol.; 101: No. 3, 205-213 (Jul 1979).

The elevated temperature fatigue-crack propagation response of Inconel 600 and Inconel 718 was characterized within a linear-elastic fracture mechanics framework in air and low-oxygen liquid sodium environments. The crack growth rates of both nickel-base alloys tested in liquid sodium were found to be considerably lower than those obtained in air. This enhanced fatigue resistance in sodium was attributed to the very low oxygen content in the inert sodium environment. Electron fractographic examination of the Inconel 600 and Inconel 718 fatigue fracture surfaces revealed that operative crack growth mechanisms were dependent on the prevailing stress intensity level. Under low growth rate conditions, Inconel 600 and Inconel 718 fracture surfaces exhibited a faceted, crystallographic morphology in both air and sodium environments. In the higher growth rate regime, fatigue striations were observed; however, striations formed in sodium were rather ill-defined. These indistinct striations were attributed to the absence of oxygen in the liquid sodium environment. Striation spacing measurements were found to be in excellent agreement with macroscopic growth rates in both environments.

3122 FATIGUE CRACK GROWTH BEHAVIOR OF STAINLESS STEEL TYPE 316 PLATE AND 16-8-2 WELDMENTS IN AIR AND HIGH-CARBON LIQUID SODIUM. Yuen, J.L.; Copeland, J.F. (General Electric Co., San Jose, CA). Contract EY-76-C-03-0893. J. Eng. Mater. Technol.; 101: No. 3, 214-223 (Jul 1979).

The fatigue crack growth rates of Type 316 stainless steel and 16-8-2 gas tungsten arc welds were measured in air and high-carbon liquid sodium at 510°C (950°F) for secondary sodium loop Liquid Metal Fast Breeder Reactor applications. Loading variables such as low frequency, load ratio, and hold time at peak load were studied. Supporting studies show that carburization of crack faces occurs prior to any crack tip carburization for the crack sizes and load frequencies of this study. Thus, a carburization effect on da/dN is not shown for relatively short-term tests. Low stress intensity, ultra-low frequency tests to simulate service would be required to show this effect. The crack growth rate curve for 16-8-2 welds was below Type 316 base metal curves for both air and high-carbon sodium at 510°C (950°F). Crack growth rate curves for Type 316 and 16-8-2 welds in high-carbon sodium were below the corresponding curves for air.

3123 MECHANISTIC ANALYSIS OF LMFBR ACCIDENT ENERGETICS. Boudreau, J.E. (Los Alamos Scientific Lab., NM). Nucl. Saf.; 20: No. 4, 402-413 (Jul 1979).

The state of the art is reviewed for liquid-metal-cooled fast breeder reactor (LMFBR) postdisassembly energetics analysis. Previous attempts have provided bounding and conservative efficiency estimates for converting fission energy into primary-system damage. However, calculational results using the SIMMER-II code indicate that current US primary-system designs may withstand substantially larger reactivity insertion rates than previously thought. Detailed results are presented for the energetics resulting from a voided-core expansion, along with a discussion of code-verification activities. Further results are presented for expansions involving other initial and boundary conditions, and the importance of the sodium initially present in the core is defined. Finally, the range of reactivity insertion rates that the primary system can accommodate is estimated for the voided-core case, and the remaining technical issues are defined.

- 3124 INTERNATIONAL PROGRESS WITH LIQUID-METAL FAST REACTORS. Moore, J. (UKAEA, Risley. Nuclear Power Development Establishment). Nucl. Eng. Int.; 24: No. 287, 37-49(Jul 1979).

The main lessons to be learnt from the operation of existing prototype fast reactors, ie, PFR, Phenix and BN350, are summarised. Experience has been good and it is expected that costs can be reduced. World energy requirements and uranium requirements for the next 50 years are examined. Uranium resources are limited and FBRs offer better uranium utilisation. The environment issues and risks of proliferation associated with fast reactor development are discussed. Safety and licensing aspects are considered. Comparisons are made between the two different basic design concepts, pool and loop types. The importance of fuel cycle performance is stressed. Finally programmes on fast reactor work in the European countries, Japan, Russia and USSR are summarised.

- 3125 TREAT: 20 YEARS OF TRANSIENT TESTING. Allen, A. (Argonne National Lab., IL (USA)). Nucl. Eng. Int.; 24: No. 287, 50-51(Jul 1979).

The Transient Reactor Test Facility (TREAT), after 20 years of operating experience, is scheduled for updating during the next three years in order to provide a new advanced test loop which will allow more realistic transient testing of LMFBR fuel bundles. Reasons for the past success of the facility are briefly discussed. Past and future programmes are considered.

- 3126 NUCLEAR REACTOR SAFETY. Head, J.L.; Goddard, A.J.H.; Grant, P.J. Phys. Rep.; 53: No. 4, 249-339(Jul 1979).

An account is given of the basic physics and engineering underlying the design of nuclear reactors, descriptions of the types of reactor currently operating, the principles of reactor fault detection and control, safety analysis and hazards assessment. The more serious hypothetical accidents are reviewed for water cooled and gas cooled reactors and for the liquid metal cooled fast breeder reactor. Safety criteria and the siting of nuclear power stations are discussed and illustrated by reference to procedures in the U.K. and a short examination is made of the environmental effects of nuclear power, spent fuel re-processing and the storage of highly radioactive waste.

- 3127 OPTIMUM NUCLEAR PIN BUNDLE FOR

PROTOTYPIC THERMAL-HYDRAULIC ENVIRONMENT IN LARGE-SCALE TESTING. Nguyen, D.H. (Sandia Labs., Albuquerque, NM (USA)). Nucl. Eng. Des.; 53: No. 2, 207-215(Jul 1979).

The optimum number of fuel pins in a test vehicle to achieve prototypic thermal-hydraulic conditions at the onset of pin failure has been determined. The power history considered was a prompt burst superposed on a low steady state power level. Slower transients without pre-clad-failure boiling did not change the conclusions presented. The analysis used the computer program COBRA-IV-I, with a unique capability of large wire-wrapped asymmetric rod bundles up to 217 pins. The results indicate that a 61-pin test scale is desirable to achieve thermal-hydraulic conditions for prototypic testing, with 37 pins probably an acceptable minimum.

- 3128 POTENTIAL FOR PLUGGED CORE PRESSURIZATION FOLLOWING A HYPOTHETICAL ACCIDENT IN AN LMFBR. Rothrock, R.A.; Kazimi, M.S. (Massachusetts Inst. of Tech., Cambridge (USA). Dept. of Nuclear Engineering). Nucl. Eng. Des.; 53: No. 2, 197-205(Jul 1979).

Steady state and transient conditions for a two-phase liquid-vapor cylindrical UO_2 pool are analytically investigated. The analysis relies on extrapolation of experimental results from internally heated boiling simulant fluid pools. The internal heat generation rates that can sustain a vapor-liquid pool under steady state conditions are calculated. The pressure transients that can be expected in the event of an imbalance between heat generation rate and heat removal rate are also calculated. The analysis presented demonstrates the significance of accounting for heat removal from the pool for proper assessment of its pressurization potential.

- 3129 BUILDING OF THE FIRST COMMERCIAL FAST BREEDER IN FRANCE. Odoewskii, M.S. Arch. Energiewirtsch.; 33: No. 7, 554-565(Jul 1979). (In German).

A survey is given on the technical particularities of the super phenix reactor which is to acquire its full power in 1985. The building of this reactor makes use of the experience gained with the Phenix pilot reactor. The state of building in March 1978 is reported.

- 3130 LIQUID METAL COOLED FAST BREEDER NUCLEAR REACTORS. Duncombe, E.; Thatcher, G. (to UKAEA London Office). British Patent 2,010,000/A/. 20 Jun 1979. 6p.p.

The invention described relates to a liquid metal cooled fast breeder nuclear reactor in which the fuel assembly has an inner zone comprised mainly of fissile material and a surrounding outer zone comprised mainly of breeder material. According to the invention the sub-assemblies in the outer zone include electro-magnetic braking devices (magnets, pole pieces and armature) for regulating the flow of coolant through the sub-assemblies. The magnetic fields of the electro-magnetic braking devices are temperature sensitive so that as the power output of the breeder sub-assemblies increases the electro-magnetic resistance to coolant flow is reduced thereby maintaining the temperature of the coolant outlets from the sub-assemblies substantially constant.

- 3131 METHOD AND APPARATUS FOR CONTROLLING THE NEUTRON FLUX IN NUCLEAR REACTORS. Minnick, L.E. (to Electric Power Research Institute, Inc.). US Patent 4,158,602. 19 Jun 1979.

Filed date 27 Jan 1977. 12p.

A control rod assembly in a nuclear reactor that automatically scrams the reactor when a loss of coolant flow occurs and that can also control the level of neutron flux in the reactor is described. The control rod assembly includes a separator plate having an orifice through which the reactor coolant flows and a sealing surface around the orifice. The control rod in the assembly has a complementary sealing surface. When the control rod and separator plate are brought into contact, the differential pressure across the separator plate caused by the flow of the primary coolant through the reactor core retains the two sealing surfaces together. If the flow of coolant stops or the differential pressure across the separator plate decreases for any reason, the control rod drops by gravity and the reactor is scrammed. The control rod is also automatically dropped as a result of the lateral vibration of an earthquake or by the downward motion of the rod drive shaft, either of which will open the sealing surfaces and reduce the sealing pressure.

- 3132 DEVICE FOR MEASURING NEUTRON FLUX IN A NUCLEAR REACTOR. Marmonier, P.L.; Moreau, J.; Nervi, J.C. (to Commissariat a l'Energie Atomique). US Patent 4,157,277. 5 Jun 1979. Priority date 21 Sep 1976, France, 8p.

A neutron guide consisting of two superposed and separable tubular elements extends from the reactor core to the immediate vicinity of the bottom wall of the reactor vessel directly above a neutron detection chamber located outside the vessel. The upper element contains a neutron-emissive medium a closed tube filled with inert gas engaged coaxially with the lower element which is positioned within a support sleeve. The lower element is provided with another closed sleeve filled with inert gas and terminating near the internal surface of the bottom of the reactor vessel.

- 3133 WEST GERMAN PERSPECTIVE ON THE NEED FOR THE PLUTONIUM-FUELED LMFBR. Hennies, H.H.; Jansen, P.; Kessler, G. Nucl. News; 22: No. 8, 69-75 (Jun 1979).

The need for the deployment of fast breeder reactors in West Germany is discussed and some of the arguments against deployment are examined. Topics covered include future energy demand, uranium demand in West Germany, world uranium demand, proliferation aspects, weapons use of nuclear materials, amount of sensitive materials in the fuel cycle, and alternative fuel cycles.

- 3134 ACOUSTIC BACKGROUND NOISE OF A LIQUID METAL FAST BREEDER REACTOR. Carey, W.M. (Scientific Consultant, Essex, Connecticut 06426). J. Acoust. Soc. Am.; 65: No. 6, 1461-1466 (Jun 1979).

Absolute measurements of the background noise in the upper plenum of an operating liquid metal fast breeder reactor (LMFBR), the Experimental Breeder Reactor II (EBR-II), have been performed over a 17-month period. The temporal spectral density characteristics of the data were found to be representative of a weakly stationary random process. Cross-power spectral density analyses established that below 5 kHz the spectral characteristics were dominated by pump-induced structural vibrations and the excitation of acoustic resonances in the upper plenum volume. The spectral characteristic of the data above 5 kHz were found to be consistent with sonic power generation at the reactor subassembly exit nozzles and the statistical response of the

cylindrical plenum volume. The production of sound by the exit flow from the subassembly nozzles was found to produce a broadband pressure level of 161 dB re 1 μ Pa, corresponding to an acoustic efficiency of 6×10^{-8} . This compares favorably with a theoretical (Lighthill) value of 159 dB re 1 μ Pa and an acoustic efficiency of 9×10^{-9} for a submerged water jet. These measurements show that the noise field in the plenum of a fast reactor is a weakly stationary random process with identifiable sources of sound.

- 3135 NUCLEAR DESIGN AND ECONOMIC COMPARISON OF A CONVENTIONAL AND BULLSEYE LIQUID-METAL FAST BREEDER REACTOR CORE. Vitti, J.A.; Felten, L.D.; Galluzzo, N.G.; Otter, J.M.; Brittingham, J.C. (Atomics International Div., Canoga Park, CA). Nucl. Technol.; 44: No. 1, 10-20 (Jun 1979).

Reactor system design and safety studies at Atomics International have focused on the selection of a core configuration for the Prototype Large Breeder Reactor that has inherent nonenergetic responses to postulated core disruptive accidents. These studies have led to the selection of a non-conventional heterogeneous design, referred to as the bullseye core, as the preferred concept. The nuclear design characteristics and economics of this bullseye core are compared to those of an optimized, conventional liquid-metal fast breeder reactor core configuration, referred to as the regular core. A reduced sodium void worth and an enhanced voiding incoherence are attained by the introduction of internal blanket regions in the bullseye core. The bullseye core total energy costs are shown to be acceptable considering the significant improvement in licensability due to reduced core energetics.

- 3136 PHYSICS STUDIES OF A HETEROGENEOUS LIQUID-METAL FAST BREEDER REACTOR. Lineberry, M.J.; McFarlane, H.F.; Collins, P.J.; Carpenter, S.G. (Argonne National Lab., Idaho Falls, ID). Nucl. Technol.; 44: No. 1, 21-43 (Jun 1979).

The first physics measurements for a heterogeneous design of a 1000-MW (thermal) liquid-metal fast breeder reactor were made in the Zero Power Plutonium Reactor (ZPPR) during the last half of 1976. This benchmark assembly, ZPPR-7, had a central blanket zone as well as three internal blanket rings. Fuel zones had a single enrichment. Cores with heavy plutonium buildup in the internal blankets as well as cores with clean internal blankets were investigated. Such key physics parameters as k /sub eff/, most of the important reaction rates, control rod worths, sodium void reactivity, and material worths were studied in the ZPPR-7 program. Results verified the gain in breeding that were predicted for the heterogeneous arrangement. When design-level calculations were used, calculated-to-experimental biases were different from those that had been found for homogeneous cores.

- 3137 PERFORMANCE CHARACTERISTICS OF HOMOGENEOUS VERSUS HETEROGENEOUS LIQUID-METAL FAST BREEDER REACTORS. Barthold, W.P.; Beitel, J.C. (Argonne National Lab., IL). Nucl. Technol.; 44: No. 1, 44-60 (Jun 1979).

Six homogeneous and heterogeneous core configurations with different fuel pin diameters and different degrees of neutronic coupling have been analyzed. All designs were based on the same design assumptions and constraints. Homogeneous and heterogeneous designs were evaluated with respect to fissile

inventory, flux and power distribution, burnup, breeding ratio and doubling times, sodium void reactivity, Doppler coefficient, control rod worth, and transient response. The sensitivity of breeding performance to different fuel life criteria was determined.

- 3138 PHYSICS PERFORMANCES OF A HETEROGENEOUS FAST REACTOR CORE CONCEPT STUDIED IN MASURCA. Bouget, Y.H. (Centre d'Etudes Nucleaires de Cadarache, Saint-Paul-les-Durance, France); Cosini, M.; Hammer, P.; Humbert, G.; Lyon, F.; Martini, M. Nucl. Technol.; 44: No. 1, 61-75(Jun 1979).

Experimental and theoretical work is now in progress at the Commissariat a l'Energie Atomique to support the sodium mixed-oxide fast reactor design calculations of the heterogeneous concept. The results obtained with the calculational method presently used are compared to the experimental values given by the PRE-RACINE program performed on the MASURCA facility. Critical masses, fission rate ratios, breeding gains of the different core zones, and sodium void effects are studied. The first results obtained with the new cross-section set CARNAVAL IV are given and compared to the values calculated with the previous CARNAVAL III set. The future development of the program is briefly described.

- 3139 NUCLEAR PERFORMANCE OF LIQUID-METAL FAST BREEDER REACTORS DESIGNED TO PRECLUDE ENERGETIC HYPOTHETICAL CORE DISRUPTIVE ACCIDENTS. Bailey, H.S.; Lu, Y.S. (General Electric Co., Sunnyvale, CA). Nucl. Technol.; 44: No. 1, 76-82(Jun 1979).

A study of various core designs was conducted to investigate design features pertaining to the preclusion of energetic hypothetical core disruptive accidents. The design data and core layouts for different designs are described. A summary of the nuclear performance predicted for several typical low sodium void worth cores is presented. It appears that the tightly coupled heterogeneous core configuration offers a substantial reduction in prompt void worth and flux level at the expense of greater inventory, large flux gradients, and large changes in internal blanket power over the operating cycle.

- 3140 MULTIAXIAL CREEP EQUATIONS FOR NONLINEAR AND VOLUME-NONCONSERVATIVE IN-REACTOR CREEP. Hall, M.M. Jr. (Argonne National Lab., IL). Nucl. Technol.; 44: No. 1, 172-176(Jun 1979).

Steady-state multiaxial creep equations that may be applied to the analysis of nonlinear and volume-nonconservative in-reactor creep data have been derived. Strain rate equations are expressed in terms of the stress exponent, n , a rate constant, B , and a material parameter, β . Equivalent stress states are assumed to give equal mechanical energy dissipation rates, and the associated equivalent stress and plastic strain rate criteria are shown to be functions of both the shear and hydrostatic components of the stress and strain-rate tensors, respectively. The deviatoric creep rate coefficient is shown to be an apparent function of stress state when swelling is stress dependent and the stress exponent is greater than unity. The possible magnitude of this stress-state effect is estimated for fast-neutron-irradiated austenitic stainless steel using available microstructural models.

- 3141 CRITICAL EXPERIMENTS WITH FAST TEST REACTOR FUEL PINS IN WATER. Bierman, S.R. (Battelle-Pacific Northwest Labs., Richland,

WA); Durst, B.M.; Clayton, E.D.; Scherpelz, R.I.; Kerr, H.T. Nucl. Technol.; 44: No. 1, 141-151(Jun 1979).

A series of criticality experiments with fast test reactor (FTR) fuel pins in water has been performed in support of the Advanced Fuel Recycle Program (AFRP). The objective of these experiments was to provide clean, easily defined criticality data on AFRP-type fuel pins in water for use in verifying calculational techniques and nuclear data used in calculations. Measurement data were obtained on water-flooded square lattices of FTR fuel pins. The number of fuel pins required for criticality was determined at lattice pitches of 7.7, 9.5, 9.7, 12.6, 15.3, and 19.1 mm to be 1268, 605, 580, 279, 205, and 162, respectively. These center-to-center fuel pin spacings correspond to water-to-fuel volume ratios of 1.67, 3.33, 3.49, 6.87, 10.88, and 17.53, respectively, and cover the neutron moderation range from near optimum to the highly undermoderated. KENO-IV calculations with ENDF data from the AMPX system overestimated the experimental results by 1 to 2% in $k_{\text{sub eff}}$. KENO-IV calculations with FLANGE-ETOG-THERMOS-EGGNIIT-processed ENDF data resulted in calculated values 1 to 6% high in $k_{\text{sub eff}}$.

- 3142 U.K. DEVELOPMENT TOWARD REMOTE FABRICATION OF BREEDER REACTOR FUEL. Nelson, R.L. (UKAEA-AERA, Harwell, England); Parkinson, N.; Kent, W.C.L.; Taylor, H.A. Trans. Am. Nucl. Soc.; 32: 227-228(Jun 1979). (CONF-790602--(Summ.)).

- 3147 DESIGN OF ELEVATED TEMPERATURE PIPING
FOR ADVANCED NUCLEAR PLANTS. Chang, T.Y.;
Kent, G.F.; Kuo, C.S. (Stone and Webster Eng
Corp, Boston, Mass). Am. Soc. Mech. Eng.,
[Pap.]; No. 79-NE-7, 1-12(Jun 1979).

This paper reviews the experience in design
and analysis accumulated by Stone and Webster
Engineering Corporation on elevated temperature
piping for advanced nuclear power generation
facilities. The presentation consists of two
parts: Part I describes existing and proposed
design criteria and procedures for elevated
temperature ASME Code Class 1, 2 and 3 piping.
Part II demonstrated the application of these
criteria and procedures to elevated temperature
nuclear piping systems of a High Temperature
Gas Cooled Reactor (HTGR) and a Prototype Large
Breeder Reactor (PLBR) plant.

- 3148 IHX DESIGN FOR POOL TYPE LMFBR SYSTEM
APPLICATION. DeFur, D.D. (Combust Eng, Inc,
Chattanooga, Tenn). Am. Soc. Mech. Eng.,
[Pap.]; No. 79-NE-3, 1-5(Jun 1979).

This paper presents the design of a 500 MWt
Intermediate Heat Exchanger (IHX) for
application in a multi-zone pool-type Liquid
Metal Fast Breeder Reactor System. The primary
feature around which this design was developed
is the ability to function under all steady-
state and transient conditions without the need
for a distinct mechanical feature to
accommodate differential thermal expansion
between the tube bundle and shell. This is
accomplished by using thermal baffles and
judiciously adjusting the ratio of shell length
in contact with the hot and cold pools of the
multi-zone reactor. Thus, the component shell
is maintained at a higher temperature than the
tube bundle and the tubes are basically tension
members. Under certain transient conditions the
tubes heat up and become compression members
but are not loaded to the point of buckling. A
secondary, but not less significant, feature is
the low primary side pressure drop and good
flow distribution offered by this design.

- 3149 HIGH RELIABILITY STRAIGHT TUBE LMFBR
STEAM GENERATOR DESIGN. Spring, A.H.; DeFur,
D.D. (Combust Eng, Inc, Chattanooga, Tenn).
Am. Soc. Mech. Eng., [Pap.]; No. 79-NE-4, 1-
5(Jun 1979).

Straight-tube counterflow steam generators
for LMFBR applications have been proposed,
tested, fabricated and operated with varying
degrees of success. A new embodiment of the
straight-tube concept is described which
incorporates a number of unique features which
contribute to high reliability and
availability. These features include a
replaceable bellows for accommodation of
differential thermal expansion between shell
and tubes and a redundant, crevice-free tube-to-
tubesheet joint design. The design can also
easily incorporate single-wall or double-wall
tubes. Single and double-wall tube versions are
described whose thermal and geometric size are
based on anticipated manufacturing limitations.
The results of scoping tests of the tube-to-
tubesheet welds are described which provide
positive indications of the soundness of the
weld design.

- 3150 PRELIMINARY ANALYSIS AND SCREENING
CRITERIA FOR ELEVATED TEMPERATURE PIPING.
Minami, H.M.; Naugle, F.V. (Rockwell Int,
Canoga Park, Calif). Am. Soc. Mech. Eng.,
[Pap.]; No. 79-NE-6, 1-7(Jun 1979).

The complexities of the ASME Class 1 nuclear
elevated temperature structural design criteria
precludes the possibility of performing a
complete Code Case 1592 analysis for all of the
alternative designs normally investigated in
the course of the design of a Liquid Metal Fast
Breeder Reactor (LMFBR) high-temperature piping
system. To enable the piping design to proceed
on an orderly controlled basis, the piping
design analysis is separated into the following
phases: screening analysis to determine pipe
routing feasibility, preliminary analysis to
determine pipe support configuration, final
design analysis (including transients) to
demonstrate Code compliance. The application of
the first phases of this procedure is
demonstrated by a summary of the analyses
performed in the development of the preliminary
design configuration for the primary system of
a commercial-sized LMFBR.

- 3151 IMPACT OF BUILDING DESIGN ON AUXILIARY
LIQUID METAL PIPING. Carter, A.L.; McNamara,
C.P. (Holmes and Narver, Inc, Orange, Calif).
Am. Soc. Mech. Eng., [Pap.]; No. 79-NE-8, 1-
5(Jun 1979).

The routing of elevated temperature liquid
metal piping within the constraints imposed by
a building design which becomes fixed during
the early design stages presents a set of
unique design problems. In addition to the
building size and layout, other factors such as
code requirements, system functions, inspection
and maintenance must be considered. This paper
examines the approach and methodology utilized
to arrive at an optimum routing for the
auxiliary liquid metal piping in a Liquid Metal
Fast Breeder Reactor (LMFBR) Plant during the
early design stages.

- 3166 CLADDING DAMAGE ANALYSIS APPLIED TO CARBIDE TREAT TESTS HC2 AND HC3. Tsai, H.C.; Neimark, L.A. (Argonne National Lab., IL). Trans. Am. Nucl. Soc.; 32: 223-224(Jun 1979). (CONF-790602--(Summ.)).
From ANS annual meeting; Atlanta, GA, USA (3 Jun 1979).
FUEL PINS; FUEL CANS; FFTF REACTOR; TRANSIENTS; STRAINS; TREAT REACTOR
- 3167 DEVELOPMENT OF ANNEALED ALLOY 800 FOR ELEVATED-TEMPERATURE NUCLEAR APPLICATIONS. Sessions, C.E.; Langford, P.J.; Duke, J.M. (Westinghouse Electric Corp., Tampa, FL). Trans. Am. Nucl. Soc.; 32: 268(Jun 1979). (CONF-790602--(Summ.)).
From ANS annual meeting; Atlanta, GA, USA (3 Jun 1979).
LMFBR TYPE REACTORS; STEAM GENERATORS; INCOLOY 800; CREEP; STRESSES; ANNEALING; TENSILE PROPERTIES
- 3168 LONG-TERM IN-REACTOR CORROSION OF STAINLESS-STEEL CLADDING IN LIQUID SODIUM. Jensen, B.W.; Weber, J.W.; Jost, J.W. (Westinghouse Electric Corp., Richland, WA). Trans. Am. Nucl. Soc.; 32: 265-266(Jun 1979). (CONF-790602--(Summ.)).
From ANS annual meeting; Atlanta, GA, USA (3 Jun 1979).
LMFBR TYPE REACTORS; STAINLESS STEEL-316; FUEL CANS; CORROSION; SODIUM; CORROSIVE EFFECTS

- 3169 STRESS-RUPTURE PROPERTIES OF SODIUM-DECARBURIZED AND THERMALLY AGED 2 1/4 CR-1 MO STEEL. Klueh, R.L. (Oak Ridge National Lab., TN). Trans. Am. Nucl. Soc.; 32: 262-263(Jun 1979). (CONF-790602--(Summ.)).
From ANS annual meeting; Atlanta, GA, USA (3 Jun 1979).
LMFBR TYPE REACTORS;STEAM GENERATORS;CHROMIUM-MOLYBDENUM STEELS;DECARBURIZATION;STRESSES;RUPTURES;AGING;HIGH TEMPERATURE;MECHANICAL PROPERTIES
- 3170 EFFECTS OF STOICHIOMETRY ON CLADDING REACTION IN MIXED OXIDE FUEL. Lawrence, L.A. (Westinghouse Electric Corp., Richland, WA). Trans. Am. Nucl. Soc.; 32: 249-250(Jun 1979). (CONF-790602--(Summ.)).
From ANS annual meeting; Atlanta, GA, USA (3 Jun 1979).
LMFBR TYPE REACTORS;FUEL-CLADDING INTERACTIONS;STOICHIOMETRY;URANIUM DIOXIDE;PLUTONIUM DIOXIDE;STAINLESS STEEL-316;BURNUP;FUEL ELEMENTS
- 3171 INFLUENCE OF OXYGEN-TO-METAL RATIO ON MIXED OXIDE FUEL PERFORMANCE. Lawrence, L.A.; Leggett, R.D. (Westinghouse Electric Corp., Richland, WA). Trans. Am. Nucl. Soc.; 32: 247-248(Jun 1979). (CONF-790602--(Summ.)).
From ANS annual meeting; Atlanta, GA, USA (3 Jun 1979).
LMFBR TYPE REACTORS;URANIUM DIOXIDE;PLUTONIUM DIOXIDE;STOICHIOMETRY;PERFORMANCE;FUEL-CLADDING INTERACTIONS;FISSION PRODUCTS;SOLID FUELS
- 3172 SODIUM COMPONENT RELIABILITY DATA COLLECTION AT CREDO. Bott, T.F.; Haas, P.M.; Manning, J.J. (Oak Ridge National Lab., TN). Trans. Am. Nucl. Soc.; 32: 480-482(Jun 1979). (CONF-790602--(Summ.)).
From ANS annual meeting; Atlanta, GA, USA (3 Jun 1979).
LMFBR. LMFBR TYPE REACTORS;REACTOR COMPONENTS;RELIABILITY;DATA COMPILATION;DATA ANALYSIS
- 3173 SERP DEPOSITION FROM TESTING AND CLEANING AN LMFBR GENERATOR. Neely, H.H.; Stearns, J.D.; Shepard, R.C.; McCoilum, W.A. (Rockwell International, Canoga Park, CA). Trans. Am. Nucl. Soc.; 32: 692-693(Jun 1979). (CONF-790602--(Summ.)).
From ANS annual meeting; Atlanta, GA, USA (3 Jun 1979).
LMFBR TYPE REACTORS;STEAM GENERATORS;TEST FACILITIES;MOCKUP;LEAKS;MOLTEN METAL-WATER REACTIONS;DEPOSITS
- 3174 SIMPLE PROCEDURE FOR DETERMINING IMPLICATIONS OF DESIGN CHANGES ON FAST REACTOR FUEL CYCLE COST AND BREEDING PERFORMANCE. Badruzzaman, A.; Becker, M. (Rensselaer Polytechnic Inst., Troy, NY). Trans. Am. Nucl. Soc.; 32: 405-406(Jun 1979). (CONF-790602--(Summ.)).
From ANS annual meeting; Atlanta, GA, USA (3 Jun 1979).
LMFBR TYPE REACTORS;FUEL CYCLE;COST;PLANNING
- 3175 COMPUTER MODELING OF THE DYNAMIC BEHAVIOR OF DELAYED-NEUTRON CONCENTRATIONS IN EBR-II. Gross, K.C.; Strain, R.V. (Argonne National Lab., IL). Trans. Am. Nucl. Soc.; 32: 798-799(Jun 1979). (CONF-790602--(Summ.)).
From ANS annual meeting; Atlanta, GA, USA (3 Jun 1979).
- (3 Jun 1979).
EBR-2 REACTOR;REACTOR INSTRUMENTATION;FAILED ELEMENT MONITORS;COMPUTER CALCULATIONS;MATHEMATICAL MODELS;ACCURACY
- 3176 OBSERVATIONS OF IN-REACTOR ENDURANCE AND RUPTURE LIFE FOR FUELED AND UNFUELED FTR CLADDING. Lovell, A.J.; Christensen, B.V.; Chin, B.A. (Westinghouse Electric Corp., Richland, WA). Trans. Am. Nucl. Soc.; 32: 217-218(Jun 1979). (CONF-790602--(Summ.)).
From ANS annual meeting; Atlanta, GA, USA (3 Jun 1979).
FFTF REACTOR;FUEL ELEMENT FAILURE;FUEL CANS;RUPTURES;STAINLESS STEEL-316;PERFORMANCE TESTING
- 3177 OBSERVATIONS OF IN-REACTOR STRAIN FOR FUELED AND UNFUELED FTR CLADDING. Gilbert, E.R.; Makenas, B.J.; Wilson, D.R. (Westinghouse Electric Corp., Richland, WA). Trans. Am. Nucl. Soc.; 32: 218-219(Jun 1979). (CONF-790602--(Summ.)).
From ANS annual meeting; Atlanta, GA, USA (3 Jun 1979).
FFTF REACTOR;FUEL CANS;STRAINS;CREEP;SWELLING
- 3178 CUMULATIVE DAMAGE AND WEIBULL ANALYSES OF EBR-II DRIVER FUEL LIFETIME. Seidel, B.R.; Shields, J.A. (Argonne National Lab., IL). Trans. Am. Nucl. Soc.; 32: 219-221(Jun 1979). (CONF-790602--(Summ.)).
From ANS annual meeting; Atlanta, GA, USA (3 Jun 1979).
EBR-2 REACTOR;FUEL ELEMENTS;SERVICE LIFE
- 3179 PERSPECTIVE ON THE EBR-II REMOTE FABRICATION EXPERIENCE. Feldman, M.J. (Oak Ridge National Lab., TN). Trans. Am. Nucl. Soc.; 32: 225-226(Jun 1979). (CONF-790602--(Summ.)).
From ANS annual meeting; Atlanta, GA, USA (3 Jun 1979).
EBR-2 REACTOR;FUEL ELEMENTS;FABRICATION;SOLID FUELS;REMOTE HANDLING
- 3180 EFFECT OF A TIME-VARYING POWER LEVEL IN EBR-II ON MIXED OXIDE FUEL BURNUP. Stone, I.Z.; Jost, J.W.; Baker, R.B. (Westinghouse Electric Corp., Richland, WA). Trans. Am. Nucl. Soc.; 32: 282-283(Jun 1979). (CONF-790602--(Summ.)).
From ANS annual meeting; Atlanta, GA, USA (3 Jun 1979).
EBR-2 REACTOR;BURNUP;POWER DENSITY;URANIUM DIOXIDE;PLUTONIUM DIOXIDE
- 3181 POSSIBLE METAL AND OXIDE FUEL LOADINGS OF EBR-II UTILIZING ²³²Th/²³³U. Foltman, A.J. (Argonne National Lab., IL). Trans. Am. Nucl. Soc.; 32: 283-284(Jun 1979). (CONF-790602--(Summ.)).
From ANS annual meeting; Atlanta, GA, USA (3 Jun 1979).
EBR-2 REACTOR;SOLID FUELS;THORIUM CYCLE
- 3182 NEUTRON SOURCE STRENGTH IN FFTF FUEL AS A FUNCTION OF IRRADIATION. Ombrellaro, P.A.; Petrowicz, N.E. (Westinghouse Electric Corp., Richland, WA). Trans. Am. Nucl. Soc.; 32: 736-737(Jun 1979). (CONF-790602--(Summ.)).
From ANS annual meeting; Atlanta, GA, USA (3 Jun 1979).
FFTF REACTOR;REACTOR CORES;FUEL ASSEMBLIES;REACTIVITY WORTHS;BURNUP

- 3183 ANALYSIS OF A LOSS-OF-PIPING-INTEGRITY TRANSIENT IN AN LMFBR FUEL ASSEMBLY. Domanus, H.M.; Chen, M.J.; Sha, W.T. (Argonne National Lab., IL). Trans. Am. Nucl. Soc.; 32: 827-829(Jun 1979). (CONF-790602--(Summ.)).
From ANS annual meeting; Atlanta, GA, USA (3 Jun 1979).
LMFBR TYPE REACTORS;FUEL ASSEMBLIES;LOSS OF COOLANT;REACTOR SAFETY;HYDRAULICS;HEAT TRANSFER; COMPUTER CALCULATIONS
- 3184 BUOYANCY EFFECTS ON PRESSURE LOSS IN ROD ARRAYS UNDER LAMINAR FLOW. Yang, J.W. (Brookhaven National Lab., Upton, NY). Trans. Am. Nucl. Soc.; 32: 829-830(Jun 1979). (CONF-790602--(Summ.)).
From ANS annual meeting; Atlanta, GA, USA (3 Jun 1979).
LMFBR TYPE REACTORS;REACTOR SAFETY; LOSS OF FLOW;NATURAL CONVECTION;REACTOR CORES; FUEL ASSEMBLIES;HYDRAULICS;HEAT TRANSFER
- 3185 SOLUTION OF RADIATION-CONDUCTION PROBLEMS IN LMFBR SAFETY WITH COLLOCATION METHOD. Chawla, T.C. (Argonne National Lab., IL); Chan, S.H.; Hauser, G.M. Trans. Am. Nucl. Soc.; 32: 287(Jun 1979). (CONF-790602--(Summ.)).
From ANS annual meeting; Atlanta, GA, USA (3 Jun 1979).
LMFBR TYPE REACTORS;REACTOR CORE DISRUPTION; MELTDOWN;RADIANT HEAT TRANSFER;NUMERICAL ANALYSIS;SERIES EXPANSION
- 3186 REGIONAL-TAILORING OF EBR-II FOR SLOW TRANSIENT TESTS. Grimm, K.N.; Franklin, F.C.; Meneghetti, D. (Argonne National Lab., IL). Trans. Am. Nucl. Soc.; 32: 501-502(Jun 1979). (CONF-790602--(Summ.)).
From ANS annual meeting; Atlanta, GA, USA (3 Jun 1979).
LMFBR TYPE REACTORS;REACTOR SAFETY; TRANSIENTS;FUEL PINS;DAMAGE;THERMAL STRESSES; TEMPERATURE GRADIENTS;EBR-2 REACTOR
- 3187 EFFECT OF PUMP-STORED KINETIC ENERGY ON NATURAL-CIRCULATION DECAY-HEAT REMOVAL IN LOOP-TYPE LMFBRs. Madni, I.K.; Khatib-Rahbar, M.; Agrawal, A.K. (Brookhaven National Lab., Upton, NY). Trans. Am. Nucl. Soc.; 32: 502-503(Jun 1979). (CONF-790602--(Summ.)).
From ANS annual meeting; Atlanta, GA, USA (3 Jun 1979).
LMFBR TYPE REACTORS;REACTOR SAFETY;LOSS OF FLOW;RHR SYSTEMS;AFTER-HEAT;AFTER-HEAT REMOVAL; NATURAL CONVECTION;HEAT TRANSFER;TEMPERATURE GRADIENTS;PERFORMANCE
- 3188 TRANSITION TO NATURAL CONVECTION FROM LOW-TEMPERATURE, LOW-FLOW CONDITIONS IN LOOP-TYPE LMFBRs. Khatib-Rahbar, M.; Madni, I.K.; Agrawal, A.K.; Cazzoli, E.G. (Brookhaven National Lab., Upton, NY). Trans. Am. Nucl. Soc.; 32: 503-504(Jun 1979). (CONF-790602--(Summ.)).
From ANS annual meeting; Atlanta, GA, USA (3 Jun 1979).
LMFBR TYPE REACTORS;REACTOR SAFETY;LOSS OF FLOW;AFTER-HEAT REMOVAL;PERFORMANCE;HEAT TRANSFER;NATURAL CONVECTION;HYDRAULICS
- 3189 FIRE HAZARDS ANALYSIS OF BARRIERS: AN ANALYTICAL APPROACH. Berry, D.L. (Sandia Labs., Albuquerque, NM). Trans. Am. Nucl. Soc.; 32: 504-505(Jun 1979). (CONF-790602--(Summ.)).
From ANS annual meeting; Atlanta, GA, USA (3 Jun 1979).
LMFBR TYPE REACTORS;FIRE PREVENTION; ENGINEERED SAFETY SYSTEMS;PERFORMANCE
- 3190 AERODYNAMIC PROPERTIES OF AEROSOLS FORMED BY A SODIUM POOL FIRE. Patel, S.; Wegrzyn, J.; Shaw, D.T. (State Univ. of New York, Buffalo). Trans. Am. Nucl. Soc.; 32: 505-506(Jun 1979). (CONF-790602--(Summ.)).
From ANS annual meeting; Atlanta, GA, USA (3 Jun 1979).
LMFBR TYPE REACTORS;REACTOR SAFETY; REACTOR CORE DISRUPTION;FIRES;SODIUM;AEROSOLS; AERODYNAMICS
- 3191 COMPARISON OF THE HAARM-3 FALLOUT MODEL WITH NUCLEAR SAFETY PILOT PLANT (NSPP) DATA. Han, J.T.; Kress, T.S.; Adams, R.E. (Oak Ridge National Lab., TN). Trans. Am. Nucl. Soc.; 32: 506-508(Jun 1979). (CONF-790602--(Summ.)).
From ANS annual meeting; Atlanta, GA, USA (3 Jun 1979).
LMFBR TYPE REACTORS;REACTOR SAFETY; REACTOR CORE DISRUPTION;AEROSOLS;SODIUM OXIDES; CONTAINMENT SYSTEMS;COMPUTER CALCULATIONS
- 3192 RELAP4/SNR: A PROGRAM TO SIMULATE STEAM GENERATOR TRANSIENTS OF FBRs. Schuetzle, R. (Univ. of Stuttgart, Germany); Friedel, T.; Wehner, H. Trans. Am. Nucl. Soc.; 32: 508-509(Jun 1979). (CONF-790602--(Summ.)).
From ANS annual meeting; Atlanta, GA, USA (3 Jun 1979).
SNR-1 REACTOR;REACTOR SAFETY;STEAM GENERATORS;TRANSIENTS;HYDRAULICS;HEAT TRANSFER; TEMPERATURE GRADIENTS;COMPUTER CALCULATIONS
- 3193 RESPONSE OF CRACKED HEXAGONAL SUBASSEMBLY DUCTS TO IMPACT LOADING. Glazik, J.L. Jr.; Petroski, H.J. (Argonne National Lab., IL). Trans. Am. Nucl. Soc.; 32: 511-512(Jun 1979). (CONF-790602--(Summ.)).
From ANS annual meeting; Atlanta, GA, USA (3 Jun 1979).
LMFBR TYPE REACTORS;FUEL ASSEMBLIES; FUEL CHANNELS;CRACKS;REACTOR SAFETY;IMPACT SHOCK;IMPACT STRENGTH
- 3194 NEW EULERIAN HYDRODYNAMIC TECHNIQUE FOR ANALYZING FBR CONTAINMENT WITH COMPLEX INTERNAL STRUCTURES. Wang, C.Y.; Chang, Y.W. (Argonne National Lab., IL). Trans. Am. Nucl. Soc.; 32: 512-513(Jun 1979). (CONF-790602--(Summ.)).
From ANS annual meeting; Atlanta, GA, USA (3 Jun 1979).
LMFBR TYPE REACTORS;CONTAINMENT SHELLS; REACTOR CORE DISRUPTION;HYDRODYNAMICS;STRESS ANALYSIS;PRESSURE GRADIENTS;MATHEMATICAL MODELS
- 3195 STRUCTURAL RESPONSE OF THE UPPER INTERNALS. Kennedy, J.M. (Argonne National Lab., IL); Belytschko, T.B. Trans. Am. Nucl. Soc.; 32: 513-514(Jun 1979). (CONF-790602--(Summ.)).
From ANS annual meeting; Atlanta, GA, USA (3 Jun 1979).
LMFBR TYPE REACTORS;REACTOR SAFETY; REACTOR CORE DISRUPTION;REACTOR INTERNALS; HYDRODYNAMICS;STRESS ANALYSIS;DEFORMATION
- 3196 COMPARISON OF ALICE PREDICTIONS WITH SRI FLEXIBLE VESSEL EXPERIMENTS. Chu, H.Y.; Chang, Y.W. (Argonne National Lab., IL). Trans. Am. Nucl. Soc.; 32: 515-516(Jun 1979). (CONF-790602--(Summ.)).

- From ANS annual meeting; Atlanta, GA, USA
(3 Jun 1979).
LMFBR. LMFBR TYPE REACTORS;CONTAINMENT
SHELLS;STRESS ANALYSIS;REACTOR SAFETY;REACTOR
CORE DISRUPTION;HYDRODYNAMICS;COMPUTER
CALCULATIONS
- 3197 COMPARISON OF ICECO CODE PREDICTIONS
WITH COVA EXPERIMENTAL DATA. Wang, C.Y.;
Chang, Y.W. (Argonne National Lab., IL).
Trans. Am. Nucl. Soc.; 32: 516-517(Jun 1979).
(CONF-790602--(Summ.)).
From ANS annual meeting; Atlanta, GA, USA
(3 Jun 1979).
LMFBR. LMFBR TYPE REACTORS;REACTOR SAFETY;
REACTOR CORE DISRUPTION;CONTAINMENT SYSTEMS;
STRESS ANALYSIS;PRESSURE GRADIENTS;COMPUTER
CALCULATIONS
- 3198 MILD TRANSIENT OVERPOWER ACCIDENTS WITH
ADVANCED FUELS. Henry, T.P.; Siegmann, E.R.
(Combustion Engineering, Windsor, CT). Trans.
Am. Nucl. Soc.; 32: 518-519(Jun 1979). (CONF-
790602--(Summ.)).
From ANS annual meeting; Atlanta, GA, USA
(3 Jun 1979).
LMFBR. LMFBR TYPE REACTORS;REACTOR SAFETY;
TRANSIENT OVERPOWER ACCIDENTS;URANIUM CARBIDES;
PLUTONIUM CARBIDES;FUEL PINS;FUEL ELEMENT
FAILURE;PERFORMANCE TESTING
- 3199 STUDY OF CORE DISRUPTIVE ACCIDENTS IN A
LARGE METAL-FUELED LMFBR. Bowers, C.H.;
Briggs, L.L.; Ferguson, D.R. (Argonne
National Lab., IL). Trans. Am. Nucl. Soc.; 32:
519-520(Jun 1979). (CONF-790602--(Summ.)).
From ANS annual meeting; Atlanta, GA, USA
(3 Jun 1979).
LMFBR TYPE REACTORS;REACTOR SAFETY;REACTOR
CORE DISRUPTION;REACTOR CORES;THERMAL STRESSES;
TEMPERATURE GRADIENTS;PRESSURE GRADIENTS
- 3200 CLADDING MOTION IN A 37-PIN LOSS-OF-FLOW
EXERIMENT: SLSF P3. Kuzay, T.M.; Bordner,
G.L.; Kraft, T.E.; Marr, W.W. (Argonne
National Lab., IL). Trans. Am. Nucl. Soc.; 32:
520-522(Jun 1979). (CONF-790602--(Summ.)).
From ANS annual meeting; Atlanta, GA, USA
(3 Jun 1979).
LMFBR. LMFBR TYPE REACTORS;REACTOR SAFETY;
FUEL PINS;LOSS OF FLOW;MELTDOWN;FLOW BLOCKAGE;
THERMAL STRESSES;SIMULATION;FUEL ELEMENT
FAILURE
- 3201 PHENOMENOLOGICAL MODELING OF SRI
CONDENSIBLE VAPOR SOURCE EXPERIMENTS.
Corradini, M.L.; Rohsenow, W.M.; Todreas, N.E.
(Massachusetts Inst. of Tech., Cambridge).
Trans. Am. Nucl. Soc.; 32: 522-523(Jun 1979).
(CONF-790602--(Summ.)).
From ANS annual meeting; Atlanta, GA, USA
(3 Jun 1979).
LMFBR. LMFBR TYPE REACTORS;REACTOR SAFETY;
REACTOR CORE DISRUPTION;HEAT TRANSFER;
HYDRAULICS;VAPORS
- 3202 MICROWAVE HEATING SIMULATIONS OF FISSION
ENERGY GENERATION IN VOLUME-BOILING POOL
SYSTEMS. Makowitz, H.; Ginsberg, T.
(Brookhaven National Lab., Upton, NY). Trans.
Am. Nucl. Soc.; 32: 523-524(Jun 1979). (CONF-
790602--(Summ.)).
From ANS annual meeting; Atlanta, GA, USA
(3 Jun 1979).
LMFBR. LMFBR TYPE REACTORS;REACTOR SAFETY;
LOSS OF FLOW;MELTDOWN;HYDRAULICS;HEAT TRANSFER;
CORIUM
- 3203 FILM BOILING AND VAPOR EXPLOSIONS FROM
SMALL SPHERES. Shih, C.; El-Wakil, M.M.
(Univ. of Wisconsin, Madison). Trans. Am.
Nucl. Soc.; 32: 524-525(Jun 1979). (CONF-
790602--(Summ.)).
From ANS annual meeting; Atlanta, GA, USA
(3 Jun 1979).
LMFBR. LMFBR TYPE REACTORS;REACTOR SAFETY;
REACTOR ACCIDENTS;FILM BOILING;HEAT TRANSFER
- 3204 MOLTEN CORE INTERACTIONS WITH COMMERCIAL
FIREBRICKS. Swanson, D.G. (Aerospace Corp.,
Los Angeles, CA); van Paassen, H.L.L.;
Marchese, A.R. Trans. Am. Nucl. Soc.; 32:
525-526(Jun 1979). (CONF-790602--(Summ.)).
From ANS annual meeting; Atlanta, GA, USA
(3 Jun 1979).
LMFBR. LMFBR TYPE REACTORS;REACTOR SAFETY;
MELTDOWN;CORE CATCHERS;PERFORMANCE TESTING;
ALUMINIUM OXIDES;SILICON OXIDES;URANIUM DIOXIDE;

3229 MODEL STUDIES OF BUBBLE SIZE DISTRIBUTION AND SOUND PROPAGATION AT MICROLEAKS IN SODIUM-HEATED STEAM GENERATORS. Uhlmann, G. (Zentralinstitut fuer Kernforschung, Rossendorf bei Dresden (German Democratic Republic)). Kernenergie; 22: No. 6, 198-205(Jun 1979). (In German).

The reaction zone of a small water leak in a sodium-heated steam generator (microleak) has been simulated by jet gassing or argon in water. The bubble diameter distribution in the bubble flow has been measured using a photoelectric method. The bubble size distribution obtained can be approached by an exponential distribution. For this case, phase velocity and sound damping have been calculated in the two-phase mixture. In the case of small ratios of sound frequency to the expected value of bubble resonance frequency, the frequency-

independent sound velocity of the homogeneous mixture is obtained as a function of the gas volume fraction. In the case of very high frequencies, the sound velocity of the pure liquid is obtained for any gas volume fractions. In the whole range investigated damping is strongly dependent on the frequency.

3230 (JAPFNR--458) FAST BREEDER REACTOR DEVELOPMENT IN JAPAN. PROGRESS REPORT, OCTOBER-DECEMBER 1978. (Power Reactor and Nuclear Fuel Development Corp., Tokyo (Japan)). Jun 1979. Translation of PNC-N--251-79-04 17p. Dep. NTIS (US Sales Only), PC A02/MF A01.

Work performed under United States-Japanese Fast Reactor Exchange Program.

Information is presented on the development of the experimental fast reactor JOYO; development of the fast breeder prototype reactor MONJU; design of a demonstration reactor; reactor physics; structural components; instrumentation and control; sodium technology; fuel materials; safety; and steam generator.

3231 THERMAL ANALYSIS OF AN IN-REACTOR LMFBR IRRADIATION CREEP EXPERIMENT. Feldman, E.E. (Argonne National Lab., IL (USA)). Nucl. Eng. Des.; 53: No. 1, 1-10(Jun 1979).

Thermal analyses of an in-reactor liquid metal fast breeder reactor (LMFBR) irradiation creep experiment and the test probe experiment which preceded it have been performed with the aid of a finite-difference heat transfer computer code. The calculated axial temperature distribution for the probe experiment is compared with the measured distribution. Although there is a 15% overprediction, the relative axial temperature distributions agree rather well. The thermal response of both experiments to a loss-of-flow transient is also analyzed.

3232 PROCESS AND APPARATUS FOR COOLING THE WALL OF THE VESSEL OF A FAST NEUTRON REACTOR. Andreani, A.; Chevallier, R.; Lambert, P. (to Commissariat a l'Energie Atomique). US Patent 4,156,629. 29 May 1979. Priority date 19 Apr 1977, France, 6p.

A process and apparatus for cooling the wall of the vessel of a fast neutron reactor comprising a main vessel which surrounds a second vessel containing the core and separating a volume of liquid metal contained in the main vessel into two regions called the hot collector and the cold collector respectively is described. The liquid metal drawn into the cold collector and passed through the core to the hot collector is circulated by means of pumps distributed around the core. A baffle and a counter-baffle are arranged concentrically to the main vessel wall and respectively define a first and second annular space issuing into the cold collector. The first annular space is traversed by a tapped flow of cooling liquid metal circulating from bottom to top in the first space in contact with the main vessel wall up to an upper constant level adjacent to the edge of the baffle. The liquid metal is poured into the second space up to a lower level corresponding to the free surface of the cold collector via helical channels in contact with the baffle wall directed towards the inside of the main vessel.

3233 CORE AND TRANSITION FUEL ASSEMBLY FOR A NUCLEAR REACTOR. Schreiber, R.E.; Sperhac, D.J. (to Westinghouse Electric Corp.). US

Patent 4,155,807. 22 May 1979. Filed date 22 Sep 1976. 10p.

A core and a transition fuel assembly for a nuclear reactor are described. They have a first fuel assembly including structure for laterally spacing parallel and coextending fuel rods positioned at preselected core elevations and also a second fuel assembly including lateral spacing structure at preselected core elevations at least one of which is different than the elevations of the spacing structure of the first fuel assembly. The transition fuel assembly is positioned between the first and second assemblies and includes lateral spacing structure positioned at each core elevation where the first and second fuel assemblies have a spacing structure. The transition fuel assembly ensures that contact among the fuel assemblies of the core is through the spacing structures. 9 claims.

3234 LIQUID METAL COOLED FAST BREEDER NUCLEAR REACTORS. Kenworthy, G.; Howard, R.S. (to Nuclear Power Co. Ltd.). US Patent 4,154,651. 15 May 1979. Filed date 2 Feb 1978. 4p.

In a liquid metal cooled fast breeder nuclear reactor of the pool kind the inner wall surface of the core tank has continuous fins inclined upwardly to form troughs through which cool liquid metal drawn from the outer region of the pool of coolant can cascade and thereby jacket the wall surface with relatively cool coolant.

3235 MAGNETIC NUCLEAR CORE RESTRAINT AND CONTROL. Cooper, M.H. (to Westinghouse Electric Corp.). US Patent 4,152,207. 1 May 1979. Filed date 20 Jan 1978. 6p.

A lateral restraint and control system for a nuclear reactor core adaptable to provide an inherent decrease of core reactivity in response to abnormally high reactor coolant fluid temperatures. An electromagnet is associated with structure for radially compressing the core during normal reactor conditions. A portion of the structures forming a magnetic circuit are composed of ferromagnetic material having a curie temperature corresponding to a selected coolant fluid temperature. Upon a selected signal, or inherently upon a preselected rise in coolant temperature, the magnetic force is decreased a given amount sufficient to relieve the compression force so as to allow core radial expansion. The expanded core configuration provides a decreased reactivity, tending to shut down the nuclear reaction.

3236 FRANCE SETS STANDARD FOR FAST REACTOR PROJECTS. Rippon, S. Energy Int.; 16: No. 5, 23-26(May 1979).

With their 1200-MW Super Phenix commercial fast reactor prototype under construction and the operational experience of a 250-MW experimental plant behind them, the French are acknowledged leaders in the development of these reactors. This has had a significant impact on other countries, and the adoption of the pool-type reactor in the United Kingdom and the Soviet Union makes it likely that this will be the basic type for all commercial fast-reactor plants in Europe, if not the world. U.S. policy, while delaying the commercialization of the fast breeder reactor, is maintaining a development program and could catch up if the political climate changes. A European license agreement is seen as the easiest way to launch a commercial fast reactor, however, and discussion between leading U.S. companies and the French have taken place.

3237 CHARACTERISTICS OF TRANSITION BOILING IN SODIUM-HEATED STEAM GENERATOR TUBES. France, D.M.; Carlson, R.D.; Chiang, T.; Priemer, R. (Argonne National Laboratory, Components Technology Division, Argonne, IL 60439). J. Heat Transfer; 101: No. 2, 270-275(May 1979).

Thermal fluctuations were measured in the tube wall in the transition boiling zone of a full-scale LMFBF sodium-heated steam generator tube. The tube had an inside diameter=10 mm, wall thickness=2.90 mm, heated length=13.1 m, and material=2 1/4 Cr-1 Mo steel. Water flowed vertically upwards inside the straight tube, and sodium flowed counter-currently in a surrounding annulus. Results of thermal, spectral, and thermal stress analyses are presented for a test within the normal operating range of LMFBF steam generators. Results of other tests are presented that show the effects and sensitivity of sodium temperature and water pressure on the severity of the thermal fluctuations.

3238 USE OF TEMPERATURE VARIANCE TO DETECT SODIUM BOILING. Meek, C.C. (Argonne National Lab., IL); Doerner, R.C.; Hurt, R.F. Nucl. Sci. Eng.; 70: No. 2, 201-204(May 1979).

Development of the temporal energy equations governing temperature variances has shown that abrupt increases in these quantities may be expected at coolant boiling inception. Such increases are dependent on local loss-of-coolant flow and the coupling between temperature and flow fluctuations. Observations from an in-pile liquid-metal fast breeder reactor simulation experiment demonstrate that variance increases can be appreciable.

3239 APPLICATION OF ACOUSTIC AGGLOMERATORS FOR EMERGENCY USE IN LIQUID-METAL FAST BREEDER REACTOR PLANTS. Shaw, D.T.; Rajendran, N. (State Univ. of New York, Buffalo). Nucl. Sci. Eng.; 70: No. 2, 127-134(May 1979).

The use of acoustic agglomerators for the suppression of sodium-fire aerosols in the case of a hypothetical core disruptive accident of a liquid-metal fast breeder reactor is discussed. The basic principle for the enhancement of agglomeration of airborne particles under the influence of an acoustic field is first discussed, followed by theoretical predictions of the optimum operating conditions for such application. It is found that with an acoustic intensity of 160 dB (approx. 1 W/cm²), acoustic agglomeration is expected to be several hundred times more effective than gravitational agglomeration. For particles with a radius larger than approx. 2 μ m, hydrodynamic interaction becomes more important than the inertial capture. For radii between 0.5 and 2 μ m, both mechanisms have to be included in the theoretical predictions of the acoustic agglomeration rate.

3240 FRENCH PROGRAM FOR ADVANCEMENT OF NUCLEAR POWER PLANTS WITH FAST BREEDERS. Vautrey, L. (CEA, 75 - Paris (France)). Kernenergie; 22: No. 5, 154-159(May 1979). (In German).

From 9. meeting on power plant engineering; Dresden, German Democratic Republic (25 - 26 Oct 1977).

A review is given of the development of fast reactors in France. The plants Rapsodie, Phenix and Superphenix, representing this development, are described, taking into consideration failures and difficulties hitherto observed.

3241 SENSITIVITY STUDY ON THE DAMAGE POTENTIAL OF A LIQUID-METAL FAST BREEDER REACTOR CORE DISASSEMBLY. Ostensen, R.W. (Sandia Labs., Albuquerque, NM). Nucl. Technol.; 43: No. 3, 301-313(May 1979).

In a core disruptive accident in a liquid-metal fast breeder reactor, rearrangement of core materials may lead to a prompt critical excursion. Damage to the primary containment, especially the head seals and head bolts, caused by the subsequent core disassembly is a primary concern of hypothetical accident analysis. A systematic study has been performed to evaluate the sensitivity of that damage in a commercial size reactor to various uncertainties. The damage is very insensitive to the equation-of-state of the fuel but highly sensitive to the reactivity ramp rate through prompt critical. From the point of view of vessel damage calculations, these results indicate that there is little incentive to improve our equation-of-state data on unirradiated mixed-oxide fuel.

3242 EFFECTS OF GRAIN BOUNDARY FISSION GAS ON TRANSIENT FUEL BEHAVIOR. DiMelfi, R.J.; Deitrich, L.W. (Argonne National Lab., IL). Nucl. Technol.; 43: No. 3, 328-337(May 1979).

The microstructural response of fast breeder reactor fuel to accident transients has been analyzed. Based on experimental results, fuel response can be classified as either basically brittle or basically ductile in nature. In the analysis, the type of response is assumed to be determined by the behavior of grain boundary fission gas. The transient variables taken into consideration are the temperature, heating rate, the mean gas content per bubble, mean bubble spacing in the grain boundary, and the stresses resolved normal to grain boundaries containing gas bubbles. By calculating the rate at which a grain boundary bubble grows as a sharp crack and comparing it to the rate of bubble growth by mass transport, a criterion is established to predict the characteristic response of a fuel sample to a specified thermal transient. A swelling threshold time is also determined for the case of ductile fuel behavior. Tensile stresses applied to the grain boundary are shown to enhance brittle behavior, and compressive stresses are shown to enhance ductile behavior. When average values of the relevant variables are extracted from a number of fission gas release and direct electric heating experiments and are used in the above calculation, fuel behavior predictions for these tests are found to correspond well with the experimental results.

3243 POSSIBILITY OF OBSERVING NEW MHD PHENOMENA IN THE LIQUID-METAL MASS IN THE FIRST LOOP OF THE BN-600 UNIT OF THE BELOYARSK ATOMIC POWER PLANT. Kirko, A.I.M.; Kirko, G.E. Sov. Phys. - Dokl. (Engl. Transl.); 24: No. 5, 399-400(May 1979).

Amplification of the magnetic field and the α -effect are discussed are discussed theoretically for the first loop of the fast-neutron reactor. (AIP)

3244 DEFORMATION ANALYSIS OF FUEL PINS WITHIN THE WIRE-WRAP ASSEMBLY OF AN LMFBR. Miki, K. (Hitachi Ltd., Ibaraki (Japan). Energy Research Lab.). Nucl. Eng. Des.; 52: No. 3, 371-384(May 1979).

Deformation of fuel pins within the wire-wrap fuel assembly of a fast breeder reactor is analyzed by two computational codes, the subchannel deformation analysis code SHADOW and the thermal-hydraulic analysis code DIANA. Coupling these codes makes it possible to

analyse precisely the mechanical interactions between all fuel pins in an assembly, and the deviation of coolant temperature distribution in deformed flow channels from the nominal distribution. In this paper, particular attention is paid to the effect on fuel pin deformation of the following factors; dimensional changes in the fuel assembly components, displacement of wrapper tube walls and changes in the radial power gradients.

3245 FAST-BREEDERS. THEIR CURRENT POSITION AND THEIR FUTURE PROSPECTS. Rozenholz, M. (Novatome Industries, 92 - Le Plessis-Robinson (France)); Megy, J. (CEA Centre d'Etudes Nucleaires de Saclay, 91 - Gif-sur-Yvette (France). Div. d'Etude et de Developpement des Reacteurs); Robert, E. (Societe Centrale Nucleaire Europeenne a Neutrons Rapides (NERSA), 69 - Lyon (France). Tech. Energ.; No. 26, 18-21(May 1979). (In French).

The introduction of fast-breeders in France should take place as follows: two plants of between 1200 and 1500 should be ordered at the beginning of 1980, 8000 to 10,000 megawatts of capacity should be installed by 1992, 25,000 megawatts by the year 2000. As it is very much a prototype, Creys-Malville will be relatively expensive (5.35 bln francs not counting the fuel). To get the cost down, one will have to count on the repetitive character of future construction programmes, on the simplification of the units and on technical progress. This anyway is the purpose of preparing the generation of reactors to follow Creys-Malville.

3246 NEW TYPE OF SIMULATOR, DEVELOPPED FOR SUPER-PHENIX BREEDER AND FOR PWR, ALLOWS PHENOMENA ANALYSIS AS WELL AS PROCESS CONTROL TRAINING. Bernard, P. (CEA Centre d'Etudes Nucleaires de Cadarache, 13 - Saint-Paul-les-Durance; France). Dept. des Reacteurs a Eau); Quinton, J.-C. (CEA Centre d'Etudes Nucleaires de Cadarache, 13 - Saint-Paul-les-Durance; France). Dept. des Reacteurs a Neutrons Rapides); Charton, H. (Compagnie Internationale de Services en Informatique, Centre d'Etudes Nucleaires de Cadarache, 13 - Saint-Paul-les-Durance; France)). Autom. Inf. Ind.; No. 77, 41-45(May 1979). (In French).

After an outline of the characteristics of study-type and training-type simulators, a new dual-purpose system is described which has been developed by the French CISI company, for a much lower cost than training simulator's one. For Super-Phenix reactor, the model describes the core, the primary vessel, reactor kinetics, the intermediate heat exchanger, the steam generator, piping and secondary tank, the turbine. For PWR, following components are modeled: core, steam generators, pressurizer, boiler. The control room includes two benchboards (trainee and instructor). A module design allows to move quickly from Super-Phenix configuration to PWR one.

3247 CONTRONIC 3 SYSTEM FROM HARTMANN AND BRAUN WILL ASSUME MEASUREMENT AND CONTROL FUNCTIONS OF THE SUPER-PHENIX REACTOR. Autom. Inf. Ind.; No. 77, 31(May 1979). (In French). AUTOMATION;ON-LINE CONTROL SYSTEMS;REACTOR CONTROL SYSTEMS;SUPER PHENIX REACTOR

3248 LIQUID METAL COOLED FAST BREEDER NUCLEAR REACTORS. Hopkins, S.R.; Diamond, A. (to Nuclear Power Co. Ltd., London (UK)). British Patent 2,005,901A/A/. 25 Apr 1979. 4p.

A liquid metal cooled fast breeder nuclear reactor comprises a core submerged in a pool of

liquid metal coolant in a primary vessel there being a fuel store disposed alongside the primary vessel and containing a second pool of liquid metal coolant. A rotary distributor disposed above and between the primary vessel and fuel store has complementary chutes which dip into the pools so that fuel carried in buckets can be transferred between the primary vessel and the fuel store. There is means for pumping coolant from each pool up to the distributor thence back to the pools by way of a distribution trough, tubes, a collecting trough and the chutes so that when irradiated fuel is being transferred from the fuel assembly to the store it is in contact with a continuously flowing stream of coolant.

- 3249 NUCLEAR POWER PLANT WITH EQUIPMENT FOR COOLANT CLEANING. Merkel, A. (to Internationale Atomreaktorbau G.m.b.H. (INTERATOM), Bergisch Gladbach (Germany, F.R.); Deutsches Patentamt, Muenchen (Germany, F.R.)). German (FRG) Patent 2,746,159/A/. 19 Apr 1979. 9p. (In German).

The cover gas argon which is located above the free surface of the sodium coolant, contains aerosols with Na, Cs 134 and Cs 137. In order to clean the cover gas and therefore the coolant, the cover gas with the aerosols is blown by a blower towards a vapour trap, which is provided with sintered metal bodies, where the liquid sodium is separated out. Subsequently the separated sodium is taken to a distillation device, where the Caesium is distilled off. The purified sodium then returns to the coolant circuit.

- 3250 AUXILIARY COOLING DEVICE FOR THE PRIMARY FLUID HEAT EXCHANGER OF A NUCLEAR REACTOR. Poudroux, P. (to Stein Industrie S.A.). US Patent 4,148,686. 10 Apr 1979. Priority date 18 Dec 1975, France, 4p.

An auxiliary cooling device for a primary fluid heat exchanger of a rapid neutron nuclear reactor is described, the exchanger having at least one nest of tubes in which there flows water to be heated to superheated steam and around whose tubes and inside whose casing there flows a liquid alkaline metal constituting the primary fluid. The casing of the exchanger is surrounded by a jacket having an air inlet tube and an air outlet tube at opposite ends. Inside the jacket there are auxiliary heat exchange surfaces such as spikes projecting from the casing of the primary heat exchanger proper. Application is to the absorption of residual power produced by a rapid neutron reactor after it is shut down.

- 3251 FAST REACTOR RECHARGING DEVICE. Artemiev, L.N.; Kurilkin, V.V. US Patent 4,147,588. 3 Apr 1979. Filed date 13 May 1977. 6p.

Disclosure is made of a device for recharging a fast-neutron reactor, intended for the transfer of fuel assemblies and rods of the control and safety system, having profiled heads to be gripped on the outside. The device comprises storage drums whose compartments for rods of the control and safety system are identical to compartments for fuel assemblies. In order to store and transport rods of the control and safety system from the storage drums to the recharging mechanism provision is made for sleeve-type holders. When placed in such a holder, the dimensions of a rod of the control and safety system are equal to those of a fuel assembly. To join a holder to a rod of the control and safety system, on the open end of each holder there is mounted a collet, whereas on the surface of each rod of the

control and safety system, close to its head, there is provided an encircling groove to interact with the collet. The grip of the recharging mechanism is provided with a stop interacting with the collet in order to open the latter and withdraw the safety and control system rod from its holder.

- 3252 DIFFUSION COEFFICIENTS OF SODIUM VAPORS IN ARGON AND HELIUM. Kumada, T.; Ishiguro, R.; Kimachi, Y. (Hokkaido Univ., Sapporo, Japan). Nucl. Sci. Eng.; 70: No. 1, 73-81 (Apr 1979).

Diffusion coefficients of sodium vapors in argon and helium gases were measured from 380 to 560°C by the Stefan method under atmospheric pressure. Careful considerations were made in the design of the apparatus to obtain data within a $\pm 10\%$ error, which arises from several sources inherent in the Stefan method. The experimental errors inherent in such sources were theoretically evaluated. The experimental diffusion coefficients were compared with those predicted by the majority of previous theoretical expressions. The comparisons revealed that the expressions proposed by Moulart for the sodium-argon mixture and by Aref'yev et al. for the sodium-helium mixture predicted values that were in excellent agreement with the measurements.

- 3253 WELDING THE CLINCH RIVER BREEDER REACTOR CORE SUPPORT STRUCTURE. Canary, W.W.; Franco-Ferreira, E.A. (Allis-Chalmers, York, PA). Weld. J. (Miami); 58: No. 4, 15-19 (Apr 1979).

The following accomplishments were realized in fabricating the CRBR core support structure: tools were obtained which successfully removed slag and ground starts and stops in a deep, narrow weld groove, dye penetrant examinations were successful and routinely performed in a deep, narrow weld groove, a single weld bead per layer technique was successfully used with no requirement for interpass grinding; a minimum amount of welding consumables and arc time was used in fabrication; a 24 in. (0.61 m) thick Type 304 stainless steel weld was qualified and a 21 in. (0.53 m) thick weldment was successfully made in production using the SAW process in a narrow groove; the CSP welding was completed without the requirement for any rework; the fabrication of the CSP was completed 2 1/2 months ahead of schedule; module liners were welded to close dimensional control and stringent inspection criteria, and a final assembly weld was made on final-machined components which met both stringent dimensional and inspection criteria.

- 3254 MECHANICAL BEHAVIOR OF HONEYCOMB SPOT-WELDED SPACER GRIDS IRRADIATED IN TWO FUEL ROD BUNDLES. Haas, D. (Belgonucleaire, Brussels, Belgium); Van de Velde, J.; Braun, H. Nucl. Technol.; 43: No. 1, 100-108 (Apr 1979).

In the Rapsodie-I experiment, two bundles, each containing 34 fast breeder reactor fuel pins, have been irradiated up to a peak burnup of 10.6 at. % and to a peak fast fluence ($E > 0.1$ MeV) of 6.65×10^{26} n/m². One of the main objectives of this experiment was to evaluate the mechanical behavior of a bundle with spacer grids. Two types of spacer grid designs have been tested: namely, a brazed ferrule grid design and a honeycomb spot-welded grid design. The grid material was in every case niobium-stabilized austenitic stainless steel type W.Nr.1.4981 in the annealed condition. The density and the dimensional measurements carried out on the spacer grids revealed that the geometrical changes in the grids were almost entirely due to material void swelling. In some cases, however, mechanical interactions

between grids and wrapper tubes and also between fuel pins and grid cells have been emphasized. These interactions had no detrimental influence on the in-pile bundle behavior. The postirradiation mechanical tests carried out on the honeycomb spacer grids showed that the mechanical properties of the grid cells have not been significantly altered by the irradiation. A decrease of the grid material Young's modulus has been correlated with void swelling. It has been concluded that the spacer grids operated satisfactorily despite their severe loading conditions.

3255 OVERVIEW OF FUEL ELEMENT DESIGN.

Olander, D.R. (Univ of Calif, Berkeley). Mech. Eng.; No. 4, 30-36(Apr 1979).

To sustain an adequate fission rate for optimum operation, the neutron flux in a fast reactor (LMFBR) must be 100 times larger than in a thermal or light water reactor. As a consequence, the LMFBR sustains far greater damage to its structural materials. The nature of this damage--the physics, chemistry, and mechanics of the processes occurring in the fuel and cladding--must be understood before commercialization of the breeder reactor can become a reality. This means that a successful fuel element design must be able to affirm with quantitative confidence that a potential design will remain intact for the reactor exposure to which it is to be subjected.

3256 NUCLEAR POWER TODAY AND TOMORROW.

Brown, K.T. (Atomic Energy Board, Pretoria, South Africa). Energy Environ.; 5: No. 4, 11, 15, 17-18(Apr 1979).

With this article the author wants to present a realistic assessment of the contribution which nuclear power is making now, and can make in the future, towards satisfying global energy demands. This paper also compares the possible effects of US policy on nuclear fuel resources (if they are generally adopted) with the former trend of the industry. He then comes to the following conclusions: (a) The future course of nuclear power will be largely determined by evolving national and international politics; (b) Recycling of plutonium in LWR's could relieve demands on uranium production, but could also impair the availability of plutonium for LMFBR's. (c) Current commercial systems will probably be adequate to fulfil predicted demand beyond the year 2000 in the Western world as a whole, but individual countries will experience uranium shortages then unless advanced systems can be developed. (d) The LMFBR is further advanced than any alternative type of breeder, and should be actively developed if it is to provide insurance as one possible means of helping to meet mankind's long term energy requirements. (e) There are many uncertainties involved in the development of an alternative fuel cycle, and the ability of any new system based on such a cycle to meet projected demands is also dubious.

3257 PROCEDURES USED IN THE UK FOR THE CERAMOGRAPHIC EXAMINATION OF (UPU)₂O₂ OXIDE FUELS FOR THE DOUNREAY PROTOTYPE FAST REACTOR.

James, G. (UKAEA, Windscale, Nuclear Power Development Labs.). J. Nucl. Mater.; 81: No. 1-2, 275-281(Apr 1979).

Ceramographic information on PFR fuel forms part of a comprehensive data bank established to record significant parameters on fuel, cladding and component materials loaded into the reactor. Collection of the data is essential for assessment of the effects of fuel and material variables on fuel element

performance. The methods developed for conversion of ceramographic data into computer compatible form for storage on the data bank, are described. The uniform code of practice used by the various laboratories involved in the manufacture of fuels for the PFR is explained and the methods by which the ceramographic information is fed into the data bank are indicated. The autoradiographic method used to establish plutonium distribution is discussed and the results compared with those from electron microprobe examination of unirradiated (UPu)₂O₂ specimens. Autoradiographic work on irradiated (UPu)₂O₂ is also discussed. Examples of Pu re-distribution are given and the results compared with those from EPMA examination of the specimens.

3258 (JAPFNR--460) PROGRESS REPORT ON FAST BREEDER REACTOR DEVELOPMENT IN JAPAN, JULY-SEPTEMBER 1978. (Power Reactor and Nuclear Fuel Development Corp., Tokyo (Japan)). Apr 1979. Translation of PNC-N--251-79-02 16p. Dep. NTIS (US Sales Only), PC A02/MF A01.

Work performed under United States - Japanese Fast Reactor Exchange Program.

Information is presented concerning development of the JOYO reactor; development of the MONJU reactor; reactor physics; structural components for the JOYO and MONJU reactors; instrumentation and control; sodium technology; fuel materials; structural materials; safety; and steam generator.

3259 STEEL Z6 CNTDV 25-15 FOR NUCLEAR BOLTS. DEVELOPMENT OF A TREATMENT ELIMINATING STRUCTURAL RETRACTION IN SERVICE AT HIGH TEMPERATURE. Cozar, R.; Julien, M. (Societe Creusot-Loire, 75 - Paris (France)); Gelpi, A. (Novatome Industries, 92 - Le Plessis-Robinson (France)). Mem. Sci. Rev. Metall.; 76: No. 4, 241-252(Apr 1979). (In French).

From 17. Meeting on alloy steels; Saint-Etienne, France (25 - 26 May 1978).

Two heat treatment were studied for the prevention of structural retraction produced under service conditions with conventional tempering and revealed by an increase in stress during the relaxation tests. The observed results are discussed.

3260 CORE CATCHER TUB WITH THERMAL INSULATION. Parr, A.; Kleffner, H.; Leder, H. (to Internationale Atomreaktorbau G.m.b.H. (INTERATOM), Bergisch Gladbach (Germany, F.R.)); Deutsches Patentamt, Muenchen (Germany, F.R.)). German (FRG) Patent 2,741,795/A/. 29 Mar 1979. 22p. (In German).

The tub collects the sodium coolant in case of a Bethe-Tait accident. It consists of a steel shell having got an internal layer of blocks from Al₂O₃ with an addition of Na₂O and traces of Si. The blocks are superposed and held together in a support structure of double-T glands, independent of the steel shell and geared with each other in the way of building blocks. The gaps are filled with a fibrous material or sheets. Support structure and blocks having got different coefficients of expansion, the support structure may stand on a support ring divided into several sectors. The sectors are arranged on an intermediate ring by means of rolls and can independently from each other be moved in radial direction. The intermediate ring itself is mounted by means of rolls, permitting radial motion, on a base ring provided with stops and fastened to the support structure.

3261 METHOD AND CIRCUIT ARRANGEMENT FOR THE

DETECTION OF COOLING DISTURBANCES. Edelmann, M. (to Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.)); Deutsches Patentamt, Muenchen (Germany, F.R.)). German (FRG) Patent 2,742,396/A/. 29 Mar 1979. 13p. (In German).

The circuit arrangement permits the detection of local cooling disturbances at the fuel element by measuring the fuel element outlet temperature of the coolant. For this purpose the operational variations of the measured signal lying in the low-frequency range are eliminated. The circuit consists basically of three measuring channels for neutron flux, inlet temperature of the coolant, and the coolant flow rate, the long-time average values of which are subtracted from the actual values of the coolant outlet temperature.

3262 NUCLEAR REACTOR. Jolly, R. (to UKAEA London Office; Deutsches Patentamt, Muenchen (Germany, F.R.)). German (FRG) Patent 2,839,211/A/. 15 Mar 1979. 20p. (In German).

The support grid for the fuel rods of a liquid metal cooled fast breeder reactor has a regular hexagonal contour and contains a large number of unit cells arranged honeycomb fashion. The totality of these cells make up a hexagonal shape. The grid contains a number of strips of material, and there is a window in each of three sidewalls staggered by one sidewall. The other sidewalls have embossed protrusions, thus generating a guide lining or guide bead. The windows reduce the rigidity of the areas in the middle between the ends of the cells.

3263 EMERGENCY SCRAM ACTUATION DEVICE FOR NUCLEAR REACTORS. Noyes, R.C.; Zaman, S.U.; Stuteville, D.W. (to Combustion Engineering, Inc., Windsor, CT (USA); Deutsches Patentamt, Muenchen (Germany, F.R.)). German (FRG) Patent 2,831,028/A/. 15 Mar 1979. 12p. (In German).

The safety parameter employed for emergency scrams of a liquid metal cooled reactor is the coolant pressure. An actuation bellows is provided which is connected to a measuring chamber by means of a flow system. Both units are installed in a coolant flow section. The measuring chamber proper is connected with the coolant by means of an aperture limiting the flow. Inside the measuring chamber there is an expansion space filled with gas. Pressure changes in the coolant affect the pressure in the expansion space. Expansion of the bellows actuates the release mechanism.

3264 UV VIEWING THROUGH SODIUM COOLANT. Minnick, L.E.; Pack, R.W. (to Electric Power Research Inst.). US Patent 1980,001. 6 Mar 1979. Filed date 29 Jun 1977. 3p.

Sodium-immersed components in a nuclear reactor are rendered observable by illumination with radiation in the ultraviolet (UV) spectrum and by detecting reflected radiation through a UV scanning means, such as a television type camera sensitive to UV radiation. The UV scanning means may be adapted to be immersed in molten sodium coolant to facilitate observation of selected locations within the nuclear reactor. Real-time images may be provided for monitoring reactor operation and remotely-controlled reactor maintenance operations.

3265 DEVICE FOR PROVIDING A LEAK-TIGHT PENETRATION FOR ELECTRIC CABLES THROUGH A REACTOR VAULT ROOF. Eyral, M.; Mahe, A. (to

Commissariat a l'Energie Atomique). US Patent 4,142,937. 6 Mar 1979. Priority date 28 Jun 1976, France, 8p.

The device for providing a cable penetration through the vault roof of a liquid sodium cooled fast reactor comprises a vertical tube closed at the top end by a flange-plate. Electric cables connected to measuring and detecting instruments are passed through the flange-plate which is joined to the reactor vault roof in leak-tight manner and enclosed within a removable hood. At least one horizontal plate is mounted within the vertical tube and provided with orifices for the leak-tight passage of the cables. Cable storage reels are placed within the tube and can be locked in position or released by controlled mechanical means.

3266 SPACER FOR SUPPORTING FUEL ELEMENT BOXES. Wild, E. (to Gesellschaft fuer Kernforschung m.b.H.). US Patent 4,142,934. 6 Mar 1979. Priority date 14 Dec 1976, German, Federal Republic of (F.R. Germany), 4p.

A spacer plate unit arranged externally on each side and at a predetermined level of a polygonal fuel element box for mutually supporting, with respect to one another, a plurality of the fuel element boxes forming a fuel element bundle, is formed of a first and a second spacer plate part each having the same length and the same width and being constituted of unlike first and second materials, respectively. The first and second spacer plate parts of the several spacer plate units situated at the predetermined level are arranged in an alternating continuous series when viewed in the peripheral direction of the fuel element box, so that any two spacer plate units belonging to face-to-face oriented sides of two adjoining fuel element boxes in the fuel element bundle define interfaces of unlike materials.

3267 NUCLEAR REACTOR. Wade, E.E. (to Westinghouse Electric Corp.). US Patent 4,142,935. 6 Mar 1979. Filed date 9 Apr 1975. 8p.

Disclosed is a nuclear reactor including two rotatable plugs and a positive top core holddown structure. The top core holddown structure is divided into two parts: a small core cover, and a large core cover. The small core cover, and the upper internals associated therewith, are attached to the small rotating plug, and the large core cover, with its associated upper internals, is attached to the large rotating plug. By so splitting the core holddown structures, under-the-plug refueling is accomplished without the necessity of enlarging the reactor pressure vessel to provide a storage space for the core holddown structure during refueling. Additionally, the small and large rotating plugs, and their associated core covers, are arranged such that the separation of the two core covers to permit rotation is accomplished without the installation of complex lifting mechanisms.

3268 HYDROGEN CONCENTRATION METER UTILIZING A DIFFUSION TUBE COMPOSED OF 2 1/4 CR-1 MO STEEL AND A SLEEVE OF NICKEL. Roy, P.; Sandusky, D.W.; Hartle, R.T. (to Dept. of Energy). US Patent 4,143,316. 6 Mar 1979. Filed date 7 Sep 1977. 4p.

PAT-APPL-831,191.

A diffusion tube hydrogen meter for improving the sensitivity and response time for the measurement of hydrogen in liquid sodium is described. The improved hydrogen meter has a composite membrane composed of pure nickel

sleeve fitted, for example, over a 2 1/4 Cr-1 Mo steel or niobium diffusion tube. Since the hydrogen permeation rate through 2 1/4 Cr-1 Mo steels is a factor of four higher than pure nickel, and the permeation rate of hydrogen through niobium is two orders of magnitude greater than the 2 1/4 Cr-1 Mo steel, this results in a decrease in response time and an increase in the sensitivity.

- 3269 INTERCOMPARISON OF AUTO- AND CROSS-POWER SPECTRAL DENSITY SURVEILLANCE SYSTEMS FOR SODIUM BOILING DETECTION IN FAST REACTORS. Ehrhardt, J. (Kernforschungszentrum, Karlsruhe, Germany). Nucl. Technol.; 42: No. 3, 250-263(Mar 1979).

Theoretical and experimental investigations on detection systems for small narrow-band components in noise signals were conducted. These detection systems are based on the continuous surveillance of the power spectral density for characteristic peaks. Detection sensitivity for auto- and cross-correlation measurements was computed for signals with normally distributed amplitudes in dependence of signal coherence. The derived detection criteria allowed the comparison of auto- and cross-power spectral density surveillance. Theoretical results were confirmed in a number of experimental parameter studies. Special theoretical investigations were done for the optimal detection of local sodium boiling in liquid-metal fast breeder reactors.

- 3270 BUBBLE WORTH VARIATION IN MOLTEN CORES FROM A HYPOTHETICAL CORE DISRUPTIVE ACCIDENT. Marotta, C.R. (U.S. Nuclear Regulatory Commission, Washington, DC). Nucl. Technol.; 3: No. 3, 350-352(Mar 1979).

A simple and accurate calculation method is presented for the variation of bubble worth in a molten core. The method depends on previous analysis of reactivity increase due to compaction of unmoderated fissile systems. The average density of the fuel material after it has expanded into the bubble region is the controlling parameter of the proposed method. Comparison with detailed bubble worth calculations due to Nicholson and Goldsmith shows excellent agreement. Given a quality base worth case, the bubble worth variation for the perturbed system (of fuel, either moving into or out of the bubble volume) can be accurately calculated in terms of the base worth value. The proposed method can be used to evaluate the physical reasonableness of complex calculations using transport theory or Monte Carlo for estimates of bubble worth.

- 3271 CHARACTERIZATION OF FRAGMENTED FUEL FROM A THERMAL FUEL-SODIUM INTERACTION. Gross, S.; Vollath, D. (Kernforschungszentrum, Karlsruhe, Germany). Nucl. Technol.; 42: No. 3, 264-271(Mar 1979).

Out-of-pile experiments were performed on fuel configurations, having a geometry similar to that of reactor fuel elements to study the thermal interaction between molten UO_2 and subcooled sodium. The fragmented fuel generated was investigated by means of a scanning electron microscope. The composition of the fuel particles and the test results, especially the pressure pulses measured are analyzed.

- 3272 EFFECT OF AXIAL STRESS ON THE TRANSIENT MECHANICAL RESPONSE OF 20%, COLD-WORKED TYPE 316 STAINLESS-STEEL CLADDING. Yamada, H. (Argonne National Lab., IL). Nucl. Technol.; 42: No. 3, 324-331(Mar 1979).

To understand the effects of the fuel-

cladding mechanical interaction on the failure of 20% cold-worked Type 316 stainless-steel cladding during anticipated nuclear reactor transients, the transient mechanical response of the cladding was investigated using a transient tube burst method at a heating rate of 5.6°C/s and axial-to-hoop-stress ratios in the range of 1/2 to 2. The failure temperatures were observed to remain essentially constant for the transient tests at axial-to-hoop-stress ratios between 1/2 and 1, but to decrease with an increase in axial-to-hoop-stress ratios above unity. The uniform diametral strains to failure were observed to decrease monotonically with an increase in axial-to-hoop-stress ratio from 1/2 to 2, and in general, the uniform axial strains to failure were observed to increase with an increase in axial-to-hoop-stress ratio. The fracture of the cladding during thermal transients was found to be strongly affected by the maximum principal stress but not by the effective stress.

- 3273 TRITIUM PERMEATION THROUGH FE-2 1/4 CR-1 MO STEAM GENERATOR MATERIAL. Renner, T.A.; Raue, D.J. (Argonne National Lab., IL). Nucl. Technol.; 42: No. 3, 312-319(Mar 1979).

The permeability of tritium through Fe-2 1/4 Cr-1 Mo steel (Croloy) steam generator material has been measured for the surface-clean metal and for the metal oxidized in steam at 755 K (482°C). The temperature dependence of tritium permeability has been measured for the unoxidized metal between 673 and 773 K; the apparent activation energy for permeation in this temperature range was found to be 39.14 ± 0.32 kJ/mol (9350 ± 80 cal/mol). After steam oxidation at 755 K and 0.2 MPa (2 atm) for about one month, the tritium permeation rate decreased by a factor of approx. 150 relative to the clean metal. This reduction factor agrees very well with that measured for a sample of tubing used in Atomic International's Modular Steam Generator experiments under typical liquid-metal fast breeder reactor steam generator conditions. These results may be used to calculate rates of tritium transport from the intermediate heat transport system sodium through the steam generator tubes and into the steam/water system. From this information, eventual release rates to the environment can be determined.

- 3274 FILTRATION OF SODIUM-FIRE AEROSOLS.

Alexas, A.; Jordan, S.; Lindner, W. (Kernforschungszentrum, Karlsruhe, Germany). Nucl. Technol.; 42: No. 3, 320-323(Mar 1979).

Different filter devices have been developed and tested with respect to their use in the off-gas system of liquid-metal fast breeder reactors to prevent the escape of sodium-fire aerosols that might be formed in case of an accident. The testing results have shown that the use of a multilayer sand bed filter is still the best method to filter limited amounts of sodium-fire aerosols over a long operating time. Efficiencies on the order of 99.98 and 98.8% were reached for loading capacities of 500 and 1000 g/m², respectively. Unlimited amounts of sodium-fire aerosols can be filtered by wet scrubbers with an efficiency of 70% per scrubber stage. Fiberglass filters cannot be used for the filtration of sodium-fire aerosols over a long operating time because the filter material can be destroyed after several days of operating.

- 3275 CORROSION BEHAVIOR OF SODIUM-EXPOSED STAINLESS STEELS IN CHLORIDE-CONTAINING AQUEOUS SOLUTIONS. Wu, P.C.S.; Grundy, B.R.; Miller, R.L. (Westinghouse Advanced Reactors

Division, Madison, PA). Metall. Trans., A; 10: No. 3, 319-325 (Mar 1979).

The corrosion behavior of sodium-exposed stainless steels in chloride-containing aqueous solutions was investigated. Results showed that sodium-corroded Type 316 stainless steel (prototypic Liquid Metal Fast Breeder Reactor (LMFBR) fuel cladding) maintains its integrity after five months exposure in these solutions at 82°C and with chloride content up to 500 ppm. In contrast, sensitized and sodium mass transfer deposit-containing Type 304 stainless steel failed in the high chloride solution (500 ppm) within ten days at the same temperature. The failure was initiated by pitting and subsequently accelerated by intergranular attack. The results also show that high pH tends to reduce the susceptibility to failure while procedures commonly used for sodium removal have no significant effect on the water corrosion behavior of the test material. Based on the current results, it is concluded that water shortage is feasible for spent fuels in a LMFBR reprocessing plant.

3276 HETEROGENEOUS CORES FOR LMFBR IMPROVES BREEDING. Nucl. Eng. Int.; 24: No. 282, 63 (Mar 1979).

3277 PHYSICS PROBLEMS OF FAST REACTOR SHIELDING. Farinelli, U. (Comitato Nazionale per l'Energia Nucleare, Casaccia (Italy). Centro di Studi Nucleari); Nicks, R. (Commission of the European Communities, Ispra (Italy). Joint Research Centre). At. Energy Rev.; 17: No. 1, 129-179 (Mar 1979).

The physics problems associated with the design of neutron and gamma shields for Liquid Metal Fast Breeder Reactors are reviewed. The main objectives of shielding in terms of biological protection, reduction of activation, radiation damage and nuclear heating are discussed in terms of the accuracies required for the design. Methods used to calculate the sources and the transport of neutrons and gammas are discussed in the light of the most recent developments and in view of their application to specific fast reactor problems; streaming problems tend to be more exacting than those associated with bulk shielding. Within the frame of the dominating transport $S_{sub}(n)$ and Monte Carlo approaches several new options are becoming available, while alternative methods continue to play an important role. Great progress has recently been achieved in obtaining nuclear data for fast reactor shielding applications; although a still better accuracy is required, the prospectives of obtaining an adequate and consistent data base are encouraging. Sensitivity studies and the assessment of uncertainties and covariances in nuclear data play an important part in this process. Integral experiments are used to improve, validate or assist calculations but very seldom to replace them. Simple and accurate experiments of a benchmark nature (such as neutron propagation in blocks of single materials) are currently being used to assess or improve the accuracy of nuclear data or calculational methods. Finally, calculations and experiments related to some actual and typical design problems are reported.

3278 INFLUENCE OF PHYSICO-CHEMICAL FORM ON THE CONSEQUENCES OF HYPOTHETICAL ACCIDENTAL RELEASES FROM FBRS. Kelly, G.N. (National Radiological Protection Board, Harwell (UK)).

Radiol. Prot. Bull.; No. 27, 12-14 (Mar 1979).

A summary is given of a recent Report (Kelly, G.N., Jones, J.A. and Simmonds, J., The influence of the physico-chemical form of the aerosol on the radiological consequences of notional accidental releases of radioactivity from a fast breeder reactor, NRPB-R73. London, HMSO (1979)). The results are of interest in view of the possibility of a release of a mixed sodium-transuranium element aerosol from a LMFBR; in this form the transuranium elements once inhaled, may be more readily transported to other body organs, thus increasing the doses. Consideration has been given to the sensitivity of the consequences of releases of activity to a wide range of physico-chemical forms of the aerosol (0.1 μ m activity median aerodynamic diameter (AMAD) to 10 μ m AMAD; mixed sodium-element aerosol or homogeneous aerosol of the same chemical composition as the fuel). The variation in biological effect with physico-chemical form was shown to be sufficiently low to justify the use of the 'reference' (1 μ m AMAD, oxide form) aerosol for generic assessments of releases from FBR, except in some estimates of the incidence of early morbidity and to a lesser extent early mortality resulting from large releases.

3279 LIQUID METAL COOLED FAST REACTORS DEVELOPMENT IN FRANCE. Bogatyreva, T.N. (Energomashinostroenie; No. 3, 39-42 (Mar 1979). (In Russian).

A brief history of LMFBR reactor development in France has been stated. Described are specifications and the experience of operation of 24 MW Rapsodie sodium-cooled reactor (1960 - 1967) and 250 MW Phenix sodium-cooled reactor (1965 - 1973) as well as characteristics of 1200 MW Phenix reactor under construction. It is shown that France takes the first place in the world in this field of atomic power industry due to great progress in development and construction of fast breeder reactors with liquid-metal coolant. The Super-Phenix project is now supposed to improve and on its base to create facilities of 1800-1900 MWe. Creation of 40 MWe experimental carbide fuel fast reactor is being planned in 1980-1984 within the framework of the plan of perspective improving fuel cycle.

3280 TEMPERATURE FLUCTUATIONS: AN ASSESSMENT OF THEIR USE IN THE DETECTION OF FAST REACTOR COOLANT BLOCKAGES. Greef, C.P. (Central Electricity Generating Board, Berkeley (UK). Berkeley Nuclear Labs.). Nucl. Eng. Des.; 52: No. 1, 35-55 (Mar 1979).

The temperature noise technique for the detection of local blockages in fast reactor subassemblies is discussed. The main factors involved in an assessment of the technique are outlined and the experimental and theoretical work that has been carried out at BNL on the various aspects of the problem is described. It is concluded that blockings appreciably smaller than those predicted to produce boiling should be detectable against a background noise level due to subassembly power tilts, on a time scale giving protection against rapidly developing incidents. Further work required to increase confidence in the application of the technique to the reactor is outlined, including measurements in fully representative geometries, data from sodium rigs and further information on reactor background noise levels.

3281 HEAT TRANSFER EFFECT OF ENTRAINED GAS IN LIQUID SODIUM SYSTEMS. Bishop, A.A. (Pittsburgh Univ., PA (USA)); Engel, F.C.; Markley, R.A. (Westinghouse Electric Corp.,

Pittsburgh, PA (USA). Advanced Reactors Div.). Nucl. Eng. Des.; 52: No. 1, 1-13(Mar 1979).

An analysis was made and a correlation developed to determine the reduction in heat transfer caused by entrained inert gas in sodium-cooled liquid metal systems. A 1% void fraction (1.62% volumetric flow rate of inert gas) is calculated to reduce the heat transfer coefficient by approximately 4% in a typical LMFBR. This reduction will not occur over the entire reactor, but only near the inlet of the radial blanket. It was concluded that a reduction in heat transfer in a system having a low oxygen concentration (<5 ppm) occurs only if the heat transfer surface is unwetted or only partially wetted and entrained gas is present. However, if the surface temperature is greater than some 530°C (1000°F), if the Reynolds number is greater than approximately 10^5 , and if the operating time is longer than that required for complete wetting at the reference temperature, no reduction in heat transfer is expected. The cause of the reduction in heat transfer is postulated to be a reduction in the thermal conductivity of a two-phase sodium-gas layer near the heated surface. It is proposed to calculate the thermal conductivity reduction using the average inert gas void fraction and a sintered-metal model. (Auth.)

- 3282 SOME POST OPERATIONAL ADJUSTMENTS TO THE PROTOTYPE FAST REACTOR AT DOUNREAY. Lunt, A.R.W. (Nuclear Power Co. (Risley) Ltd. (UK)). J. Inst. Nucl. Eng.; 20: No. 2, 57-63(Mar-Apr 1979).

Prior to and during the initial operation of the Prototype Fast Reactor at Dounreay certain features have been considered to be in need of adjustment to provide better operating characteristics. This article describes the work done to support the consequential changes of operational techniques and plant design in the following areas: maintenance of dry conditions at the superheater steam inlets, the temperature control of the reactor roof, and the introduction of a system enabling the reactor to continue running after a turbine trip.

- 3283 CHEMICAL REACTIONS OF SODIUM FIRE AEROSOLS IN THE FREE ATMOSPHERE. Hofmann, Ch.; Jordan, S.; Lindner, W. (Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.)). J. Aerosol Sci.; 10: No. 2, 191-192(Mar 1979).

- 3284 FIRST APPLICATION OF THE BAILEY CONTROL MICRO-Z SYSTEM. CONTROL OF SODIUM PURITY IN THE SUPER PHENIX REACTOR. Hureau, J.C. Autom. Inf. Ind.; No. 75, 35-39(Mar 1979). (In French).

The system for testing the purity of sodium in the Super Phenix reactor at Crey-Malville is one of the very first applications of the 'μz' Bailey Control system which, as is generally known, uses a microprocessor on each regulator. This characteristic is cleverly exploited here for discontinuous regulation, in stages, of an analog parameter: temperature, with a quite remarkable flexibility of use and an extremely reduced volume of equipment.

NEUTRON ABSORBING MASSES. Giuggio, N.; Noyes, R.C. (to Combustion Engineering, Inc.). US Patent 4,139,414. 13 Feb 1979. Filed date 19 Jun 1977. 6p.

An apparatus is disclosed for holding, releasing, and resetting a multiplicity of neutron absorbing balls within a safety vertically hinged trap doors resting on the shoulders of a generally cylindrical release valve, the actuation of which disengages the doors, permitting the poison balls above the doors to drop into the core. In the reset mode of operation a platform is raised, lifting the balls from the bottom of the core and swinging the trap doors upward until the balls are above the door hinges. The release valve is reset and the platform is lowered to reset the doors against the valve shoulders. In the disclosed embodiment, the valve is operated by a self-actuated, temperature responsive scram mechanism.

- 3286 MEASURING PROBE AND METHOD TO DETERMINE THE OXYGEN CONTENT OF GASES, VAPOURS AND LIQUIDS, IN PARTICULAR FOR LIQUID METALS. Sundermann, H.; Andrae, U. (to Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.)); Deutsches Patentamt, Muenchen (Germany, F.R.)). German(FRG) Patent 2,061,599/C/. 8 Feb 1979. 4p. (In German).

The core of the measuring probe consists of a pot-shaped solid state electrolyte with a metal holder and a reference chamber with a constant oxygen partial pressure out of which the reference electrode is led. The reference electrode is surrounded by a cylindrical metal mesh at a present potential. The solid state electrolyte consists of yttrium oxide stabilized zirconium dioxide or thorium dioxide, the holder is made of a Fe-Co-Ni alloy, and the material closing the reference chamber is soft glass. The measuring probe lends itself particularly well to applications in liquid metal cooling systems.

- 3287 FUEL ROD FOR A SODIUM-COOLED REACTOR. Ernst, H. (to Kraftwerk Union A.G., Muelheim an der Ruhr (Germany, F.R.)); Deutsches Patentamt, Muenchen (Germany, F.R.)). German(FRG) Patent 2,032,030/B/. 8 Feb 1979. 4p. (In German).

The fuel element is filled with pellets, and the space between the cladding and the fuel contains sodium for sodium bonding purposes. Between the fuel and the upper opening there is a throttle followed by a sealing cone. The throttle is easily permeable only to gases. The carrier of the rod is equipped with a non-return valve which, under normal conditions, only allows sodium to pass from the outside into the rod. It contains an additional relief valve which allows sodium to escape from the rod, if the internal pressure is too high. Thus, in case of leaks the sodium bonding can be restored from the rod carrier.

- 3288 LAMINAR, TRANSITION, AND TURBULENT PARALLEL FLOW PRESSURE DROP ACROSS WIRE-WRAP-SPACED ROD BUNDLES. Engel, F.C. (Westinghouse Advanced Reactors Div., Madison, PA); Markley, R.A.; Bishop, A.A. Nucl. Sci. Eng.; 69: No. 2, 290-296(Feb 1979).

Laminar, transition, and turbulent parallel flow pressure drop across wire-wrapped hexagonal rod bundles positioned inside a duct were determined in tests using water, sodium, and air. A smooth transition region from turbulent to laminar flow that occurred over the Reynolds number range from 5000 to 400 characterized the resulting friction factor

- 3285 SCRAM DEVICE HAVING A MULTIPLICITY OF

behavior. The continuous transition region could be explained in terms of the fraction of the flow area in turbulent flow. Laminar friction factors calculated from individual subchannel measurements could be correlated by the same expression found for rod-bundle-averaged conditions. Friction factor correlation functions are given for flows in the laminar range, the turbulent range, and the transition range. A general laminar flow friction factor correlation was developed which agrees satisfactorily with limited laminar flow data from rod bundles having different wire-wrap lead pitch-to-diameter ratios.

- 3289 FAST INTEGRAL MODELING OF HYPOTHETICAL CORE DISRUPTIVE ACCIDENTS IN LIQUID-METAL FAST BREEDER REACTORS. Mueller, C.J.; Vaurio, J.K. (Argonne National Lab., IL). Nucl. Sci. Eng.; 69: No. 2, 264-278 (Feb 1979).

The paper describes the basic equations and solution techniques of a collection of heat transfer and coolant voiding dynamics models that have been developed and successfully applied to simulate hypothetical accidents in liquid-metal-cooled fast breeder reactors (LMFBRs) to the point of permanent subcriticality or to the initiation of a prompt-critical excursion. These models emphasize analytic and integral solution techniques to minimize computational time and have been programmed into the SACO fast-running accident analysis computer code. The comparisons of SACO results to analogous SAS3D results used to qualify these models are illustrated and discussed. The fast-running nature of these models makes them an ideal sensitivity analysis tool for use in probabilistic evaluations of LMFBR accidents. Their use in this application is illustrated.

- 3290 MULTICHANNEL MODEL FOR RELOCATION OF MOLTEN FUEL CLADDING IN UNPROTECTED LOSS-OF-FLOW ACCIDENTS IN LIQUID-METAL FAST BREEDER REACTORS. Ishii, M.; Chen, W.L.; Grohmes, M.A. (Argonne National Lab., IL). Nucl. Sci. Eng.; 69: No. 2, 297-318 (Feb 1979).

During an unprotected undercooling accident in a liquid-metal fast breeder reactor, the motion and relocation of the molten fuel cladding can be important because of their potentially significant effect on reactivity, blockage formation, and subsequent fuel motion. The cladding relocation problem based on a multichannel film flow model is analyzed in the study. The important aspects considered in the analysis are the nonuniform transverse cladding melting pattern and sodium vapor flow diversions within a subassembly. It has been shown that the motion of molten fuel cladding and subsequent blockage formations can be significantly influenced by this interconnected channel effect. Several sample calculations have been made to demonstrate these points.

- 3291 REACTOR PHYSICS PARAMETERS OF ALTERNATE FUELED FAST BREEDER REACTOR CORE DESIGNS. Haffner, D.R.; Hardie, R.W. (Hanford Engineering Development Lab., Richland, WA). Nucl. Technol.; 42: No. 2, 123-132 (Feb 1979).

Nuclear nonproliferation considerations have resulted in renewed interest in the thorium fuel cycle. Reactor physics parameters of a typical 1200-MW(electric) fast breeder reactor design were compared for the cases when ^{233}U is substituted for plutonium as a fissile fuel and when ^{232}Th is substituted for ^{238}U as a fertile fuel. When the ^{238}U in the blanket is replaced with ^{232}Th , the reactor physics parameters are relatively unchanged. However, replacing ^{238}U in the core with ^{232}Th increases the critical

mass by 11 to 15% and decreases the breeding ratio by 0.13 to 0.16. In addition, replacing the plutonium in the core with ^{233}U decreases the critical mass by 4 to 6% and decreases the breeding ratio by 0.13 to 0.16. Both of the changes in the core make the sodium void coefficient more negative.

- 3292 PERFORMANCE OF THORIUM-FUELED FAST BREEDERS. Marr, D.R.; Cantley, D.A.; Chandler, J.C.; McCurry, D.C.; Omberg, R.P. (Hanford Engineering Development Lab., Richland, WA). Nucl. Technol.; 42: No. 2, 133-143 (Feb 1979).

Three studies were performed to evaluate the breeding ratio of fast breeders containing thorium. In a study of a small breeder, thorium metal and thorium oxide core designs were found to have similar breeding ratios. The slight advantage exhibited by the metal design was not considered significant, since the design was based on a limited amount of thorium metal swelling data. In a study of a 1200-MW(electric) plant, a plutonium-uranium oxide design was compared to a uranium-thorium metal design. The uranium-thorium design had a lower breeding ratio but also had a negative sodium void effect. In the third study, the effect of replacing thorium oxide radial blankets with thorium metal radial blankets was evaluated. This was found to have little effect on the breeding ratio.

- 3293 EFFECTS OF STOICHIOMETRY ON CLADDING ATTACK IN UO_2 - PuO_2 . Lawrence, L.A.; Hata, D.C.; Weber, J.W. (Hanford Engineering Development Lab., Richland, WA). Nucl. Technol.; 42: No. 2, 195-206 (Feb 1979).

A significant reduction in and a change in the character of fuel-cladding chemical interaction (FCCI) due to a reduction in the oxygen-to-metal ratio (O/M) were established for uranium-plutonium mixed-oxide fuels clad with 20% cold-worked Type 316 stainless steel irradiated in the Experimental Breeder Reactor II. Fuel pins from the Hanford Engineering Development Laboratory P-23C subassembly at initial fuel O/Ms of 1.94, 1.95, and 1.97 were examined at peak burnups of 1.1, 2.5, and 3.6 at.%. The depth of FCCI increased with increasing burnup and temperature, but the relative effects of fuel O/M did not change. An approximate three-fold reduction in FCCI resulted from a reduction in fuel O/M from 1.97 to 1.95 at approx. 3.6 at.% burnup. The peak FCCI in the lower O/M fuel was approx. 5 μm and appeared as a preferential loss of cladding at grain boundaries and slip planes on the cladding inner surface. In contrast, the typical FCCI in the higher O/M (1.97) fuel pin was matrix in character, and penetrated approx. 14 μm into the cladding. Thus, FCCI in mixed-oxide fuel can be reduced to negligible levels by lowering the O/M during manufacture of the fuel.

- 3294 SOME ELECTRON MICROPROBE ANALYSIS RESULTS CONCERNING THE INTERACTION BETWEEN URANIUM-PLUTONIUM MIXED-OXIDE FUEL AND STAINLESS-STEEL CLADDING. Walker, C.T.; Pickering, S. (European Inst. for Transuranium Elements, Karlsruhe, Germany). Nucl. Technol.; 42: No. 2, 207-215 (Feb 1979).

Analyses were performed on three mixed-oxide fuel pins. Two were irradiated in a fast flux, one in an epithermal-neutron flux. The compositions of the corrosion product phases in the fuel-cladding gaps of the different pins were similar. The phase was essentially a mixture of metal oxides, with chromium oxide the main constituent. Cesium chromate, if it

formed at all, was present in only small amounts. Oxides of iron and nickel were not detected, which suggests that the oxygen potential in the gap did not exceed that for the FeCr_2O_4 formation. Metallic fragments in the phase resulted from mechanical interactions involving the phase and cladding grains whose boundaries had been weakened by intergranular corrosion. Chromium and manganese were lost from the inner cladding surface of all three pins. Titanium loss also occurred from the two pins clad with titanium-stabilized steel. A grain boundary phase depleted in chromium was present at the inner cladding surface of one of the pins irradiated in a fast flux. The phase that was associated with intergranular attack occurred in advance of the corrosion front.

- 3295 EXPERIMENTAL PARAMETER INVESTIGATIONS ON THE TRIBOLOGICAL BEHAVIOR OF STELLITE 6 IN LIQUID SODIUM. Wild, E.; Mack, K.J. (Kernforschungszentrum Karlsruhe, Germany). Nucl. Technol.; 42: No. 2, 216-223 (Feb 1979).

The friction and wear behavior of various material combinations was studied in a liquid-sodium loop up to fluid temperatures of 900 K to guarantee self-alignment and safe operation of liquid-metal-cooled fast breeder reactor (LMFBR) components, such as subassemblies, control and shutdown units, instruments, and centering pads. Pin-on-disk, plate-on-plate, and tilting plane test section systems were used. Numerous material combinations exhibiting good corrosion resistances in liquid sodium were investigated under identical operating conditions. Those revealing the lowest wear rates and the lowest friction coefficients were subject to parameter tests. The influences on friction and wear behavior of friction velocity, contact force, sodium temperature, equipment criteria, and tribochemistry were studied. The experimental results are shown for a Stellite 6-Stellite 6 combination. They revealed friction and wear coefficients to be clearly below the set limits. However, this material combination has a high cobalt content and is therefore no optimum choice with respect to contamination problems of the primary system of an LMFBR. Other experiments are necessary to develop materials with zero contamination effects.

- 3296 FAST BREEDER. DO WE NEED IT. HOW DOES IT WORK. Hueper, R. Bild Wiss.; 16: No. 2, 71-85 (Feb 1979). (In German).

In Kalkar at the Lower Rhine, the German-Belgian-Dutch prototype of a fast breeder line is being built. This reactor type will generate power and turn non-fissile U^{238} into fissile Pu^{239} . The fast breeder thus makes much better use of natural uranium than normal nuclear power plants can. The breeder prototype at Kalkar was quite an issue in the nuclear power discussion: The liquid sodium used as heat transfer medium and the increased production of highly toxic plutonium require special safety measures in fast breeders.

- 3297 NUCLEAR INSTRUMENTATION CABLE END SEAL. Cannon, C.P.; Brown, D.P. (to Dept. of Energy). US Patent 4,137,423. 30 Jan 1979. Filed date 16 Dec 1977. 6p. PAT-APPL-861,132.

An improved coaxial end seal for hermetically sealed nuclear instrumentation cable exhibiting an improved breakdown pulse noise characteristic under high voltage, high temperature conditions is described. A tubular insulator body has metallized interior and exterior surface portions which are braze sealed to a center conductor and an outer

conductive sheath. The end surface of the insulator body which is directed toward the coaxial cable to which it is sealed has a recessed surface portion within which the braze seal material terminates.

- 3298 PRESSURE SENSOR. Forster, G.A. (to Department of Energy, Washington, DC (USA); Deutsches Patentamt, Muenchen (Germany, F.R.)). German (FRG) Patent 2,824,794/A/. 25 Jan 1979. 11p. (In German).

The pressure sensor will be used for pressure measurement in high-temperature liquids, in particular for Na or K during fast breeder operation. It has a soft membrane which is unshielded at the pressure medium side and can actuate a rigid membrane on the other side by means of a bottom element. The displacement of the rigid membrane is proportional to the difference between the liquid pressure and a reference gas pressure. The displacement can be measured by means of a capacity displacement measuring instrument, using a fixed plate as reference. Absolute calibration is performed by admitting pressurized gas into the zone between the membranes and into the zone between rigid membrane and fixed plate. The coupling between the soft and the rigid membrane is thus interrupted.

- 3299 BRACING SYSTEM FOR THE FUEL ELEMENTS OF A REACTOR CORE. Class, G. (to Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.); Deutsches Patentamt, Muenchen (Germany, F.R.)). German (FRG) Patent 2,162,171/B/. 25 Jan 1979. 8p. (In German).

The bracing system for the prismatic fuel elements of a sodium cooled reactor core, for example, helps the structural dimensions. Therefore the fuel elements are connected together in each bracing plane by bearing elements such as balls, rolls, ball - or needle bearings or by elastic, deformable spring elements. For bracing on the circumference of the reactor core, there are also bracing elements of hexagonal cross-section which are divided longitudinally in the bracing area. By interaction with the elastic elements the fuel elements are held in the right geometric position in the hexagonal lattice in the bracing planes while they are pushed together.

- 3300 NUCLEAR CORE POSITIONING SYSTEM.

Garkisch, H.D.; Yant, H.W.; Patterson, J.F. (to Westinghouse Electric Corp.). US Patent 4,135,974. 23 Jan 1979. Filed date 17 May 1974. 8p.

Disclosed is a structural support system for the core of a nuclear reactor which achieves relatively restricted clearances at operating conditions and yet allows sufficient clearance between fuel assemblies at refueling temperatures. Axially displaced spacer pads having variable between pad spacing and a temperature compensated radial restraint system are utilized to maintain clearances between the fuel elements. The core support plates are constructed of metals specially chosen such that differential thermal expansion produces positive restraint at operating temperatures.

- 3301 SYSTEM FOR DETECTING THE FAILURE OF A NUCLEAR FUEL ROD IN A NUCLEAR REACTOR. Mitsutsuka, N.; Kubo, K.; Miyazawa, T. (to Tokyo Shibaura Electric Co., Ltd.). US Patent 4,135,970. 23 Jan 1979. Priority date 27 Feb 1976, Japan, 8p.

A system for detecting the failure of a nuclear fuel rod in a nuclear reactor comprises

sampling a coolant in a nuclear reactor, cooling the sampled coolant to permit ^{135}I in the coolant to be adsorbed on an iodine adsorption device, moving $^{135}\text{m}/\text{sub Xe/}$ produced by the ^{135}I decay into a cover gas at the upper space of a gas-liquid separator, and introducing the $^{135}\text{m}/\text{sub Xe/}$ entrained cover gas into a radioactivity detector where the radioactivity of $^{135}\text{m}/\text{sub Xe/}$ is counted.

3302 CORE DISRUPTIVE ACCIDENT MARGIN SEAL.

Golden, M.P. (to Dept. of Energy). US Patent 4,135,973. 23 Jan 1979. Filed date 10 Mar 1977. 8p.
PAT-APPL-776,328.

An apparatus for sealing the annulus defined within a substantially cylindrical rotatable riser assembly and plug combination of a nuclear reactor closure head is described. The apparatus comprises an inflatable sealing mechanism disposed in one portion of the riser assembly near the annulus such that upon inflation the sealing mechanism is radially actuated against the other portion of the riser assembly thereby sealing the annulus. The apparatus further comprises a connecting mechanism which places one end of the sealing mechanism in fluid communication with the reactor cover gas so that overpressurization of the reactor cover gas will increase the radial actuation of the sealing mechanism thus enhancing sealing of the annulus.

3303 SAFETY ARRANGEMENT FOR NUCLEAR REACTORS.

Giuggio, N.; Noyes, R.C.; Zaman, S.U. (to Combustion Engineering, Inc., Windsor, CT (USA); Deutsches Patentamt, Muenchen (Germany, F.R.)). German (FRG) Patent 2,825,439/A/. 18 Jan 1979. 32p. (In German).

The temperature-dependent, automatic scram mechanism for liquid-metal cooled reactors uses the average outlet temperature of the cooling medium as critical quantity. It is determined by the interaction between the representative values of the flow- and throughput-amounts through a flow path of the cooling medium in a safety arrangement and the produced heat of the measurement fuel rod in this flow path. The outlet temperature is measured over a closed flow medium with a high expansion coefficient; its expansion is transformed in a linear force for the operation of the release mechanism. Temperature sensor, operation mechanism and safety rod are located in the safety arrangement.

3304 TECHNIQUE FOR DETECTING LIQUID METAL LEAKS.

Bauerle, J.E. (to Dept. of Energy). US Patent 4,134,290. 16 Jan 1979. Filed date 6 Sep 1977. 4p.
PAT-APPL-830,948.

In a system employing flowing liquid metal as a heat transfer medium in contact with tubular members containing a working fluid, i.e., steam, liquid metal leaks through the wall of the tubular member are detected by dislodging the liquid metal compounds forming in the tubular member at the leak locations and subsequently transporting the dislodged compound in the form of an aerosol to a detector responsive to the liquid metal compound. In the application to a sodium cooled tubular member, the detector would consist of a sodium responsive device, such as a sodium ion detector.

3305 PIPE SUPPORT.

Pollono, L.P. (to Dept. of Energy). US Patent 4,134,563. 16 Jan 1979. Filed date 28 Jan 1976. 4p.
PAT-APPL-653,044.

A pipe support for high temperature, thin-walled piping runs such as those used in nuclear systems is described. A section of the pipe to be supported is encircled by a tubular inner member comprised of two walls with an annular space therebetween. Compacted load-bearing thermal insulation is encapsulated within the annular space, and the inner member is clamped to the pipe by a constant clamping force split-ring clamp. The clamp may be connected to pipe hangers which provide desired support for the pipe.

3306 RADIATION SHIELDS.

Kanao, Y. (to Hitachi Ltd., Tokyo (Japan)). Japanese Patent 54-3688/A/. 11 Jan 1979. 3p. (In Japanese).
A penetrating portion having a step-like cross section is provided for a radiation shield, in which a level indicator having the outer circumference of the same configuration is inserted, and a step-like small borehole containing an electric wire for taking out a signal to the outside is formed through the radiation shielding portion of the level indicator. The step-like configuration of the penetrating portion can decrease with ease the radiation intensity passing through the penetrating portion.

3307 NEUTRON ABSORBER DROPPING DEVICE FOR NUCLEAR REACTORS.

Giuggio, N.; Noyes, R.C. (to Combustion Engineering, Inc., Windsor, CT (USA); Deutsches Patentamt, Muenchen (Germany, F.R.)). German (FRG) Patent 2,825,438/A/. 4 Jan 1979. 15p. (In German).
The device serves to release and restore a great number of neutron absorber balls (poison spheres from stainless steel) within a safety device with scram for a liquid metal reactor. Vertically coupled trap doors rest on the shoulders of a cylindrical trip gate valve within a safety shaft. The system release parameter is the coolant temperature. The trap doors form a bottom for the spheres. They are operated by tripping the gate valve and releasing the spheres that drop into the range of the safety shaft which is located in the reactor core. For restoring there is used a platform being also arranged in the safety shaft and by means of which the spheres can be lifted above the trap doors.

3308 LOW CYCLE FATIGUE BEHAVIOR OF TYPES 304 AND 316 STAINLESS STEEL TESTED IN SODIUM AT 550°C.

Zaman, G.J.; Smith, D.L. (Argonne National Lab., IL). Nucl. Technol.; 42: No. 1, 82-89 (Jan 1979).
Fatigue tests were conducted in sodium to investigate the influence of an elevated temperature sodium environment on the low cycle fatigue behavior of Types 304 and 316 stainless steel. The fatigue tests were conducted at 550°C in sodium of controlled purity, namely, 1 ppm oxygen and 0.3 ppm carbon, at a strain rate of $4 \times 10^{-3} \text{ s}^{-1}$. The fatigue life of annealed Type 316 stainless steel was substantially greater when tested in sodium than when tested in air, whereas the test environment had little influence on the fatigue life of Type 304 stainless steel. The effects of long-term sodium preexposure were also investigated. An 18-Ms (5000-h) preexposure to sodium produced little effect on the fatigue life of Type 316 stainless steel tested in sodium. However, a similar sodium exposure had a significant effect on the fatigue behavior of Type 304 stainless steel.

3309 SUMMARY OF THE ALARA NATURE OF DESIGN

EFFLUENTS FROM THE CLINCH RIVER BREEDER REACTOR PLANT. Ferguson, K.L. (Westinghouse Electric Corp., Monroeville, PA). Nucl. Technol.; 42: No. 1, 5-12 (Jan 1979).

Radioactive effluents and concentrations expected from the Clinch River Breeder Reactor (CRBR) during normal operation have been assessed. Developed were the individual off-site dose values as well as population doses within an 80-km (50-mile) radius of the proposed facility. Comparison has been with the as low as reasonably achievable (ALARA) exposure objective as in 10CFR50, Appendix I, of the Code of Federal Regulations. All estimated releases are well within the concentration limits found in 10CFR20. The calculated doses to individuals are consistently lower than values of 10CFR50, Appendix I. Population exposures are a very small fraction of that due to background radiation. Exposures due to CRBR effluents are also in conformity with cost-benefit arguments of the ALARA objective. Measures are in place to follow the design progression and operation of the facility to retain the ALARA aspect of the doses associated with the effluent releases.

3310 DYNAMIC SHAPE FACTORS FOR LMFBR MIXED-OXIDE FUEL AGGREGATES. Allen, M.D.; Moss, O.R.; Briant, J.K. (Battelle Pacific Northwest Labs., Richland, WA (USA)). J. Aerosol Sci.; 10: No. 1, 43-48 (Jan 1979).

Dynamic shape factors for aggregates of LMFBR mixed-oxide fuels have been measured with a LAPS spiral centrifuge. The aerosol was generated by pulsing a focused laser beam onto the surface of a LMFBR fuel pellet composed of (Pusub(0.2)Usub(0.8))Osub(1.96). The measured values of the dynamic shape factor depend on the aerodynamic diameter.

3311 EFFECTS OF ENERGY LOSSES OF ARBITRARY MAGNITUDE ON FUEL QUALITY, VAPOR DENSITY, AND BUBBLE DIAMETER IN AN IDEALIZED EXPANSION OF MIXTURES OF UO₂ AND SODIUM. Bertini, H.W.; White, J.S. (Oak Ridge National Lab., TN). Nucl. Sci. Eng.; 69: No. 1, 85-94 (Jan 1979).

Idealized equilibrium expansion calculations were made to determine the characteristics of UO₂ vapor bubbles produced under sodium in the capacitor discharge vaporization experiments at the Oak Ridge National Laboratory. These characteristics are the quality of the vaporized UO₂, its vapor density, and the bubble diameter. A parametric study was made over the range of initial and final states expected to occur in the experiments to determine the effects of losing arbitrary amounts of energy and of vaporizing arbitrary amounts of sodium. The results are sufficiently general to be of use in estimating bubble characteristics for a hypothetical core disruptive accident in a liquid metal-cooled fast breeder reactor.

3312 NUCLEX 78: BROAD OFFER - RESTRAINED INTEREST. REPORT ON THE 5TH INTERNATIONAL TRADE EXHIBITION AND EXPERT MEETING FOR THE NUCLEAR TECHNOLOGICAL INDUSTRY. Kalkoffen, F. (Babcock - Brown Boveri Reaktor G.m.b.H., Mannheim (Germany, F.R.)); Vollmer, H. (Hochtemperatur-Reaktorbau G.m.b.H., Mannheim (Germany, F.R.)); Morelle, J.M. (Internationale Natrium-Brutreaktor-Bau G.m.b.H., Bergisch Gladbach (Germany, F.R.)); Lurf, G. (Nuklear-Chemie und -Metallurgie G.m.b.H. (NUKEM), Hanau (Germany, F.R.)); Hoegl, A. (Frieske und Hoepfner G.m.b.H., Erlangen (Germany, F.R.)). Atomwirtsch., Atomtech.; 24: No. 1, 41-42 (Jan 1979). (In German).

From 5. international fair and technical meetings of the nuclear industries; Basel, Switzerland (3 - 7 Oct 1978).

The world's nuclear technology met in Basle between October 3 and 7, 1979 on the occasion of the 5th nuclex fair. Despite the obstacles in the way of the further expansion of nuclear programs in some countries, especially in the Federal Republic of Germany, more exhibitors were represented at this fair than had been at the last nuclex in 1975. Again, technical meetings and panel discussions accompanied the exhibition. Technical and scientific correspondents of 'atomwirtschaft' attended exhibitions and meetings and have recorded their impressions in a number of trend reports. The comprehensive review of nuclex '78 starts with some general criticism of the event and continues in five separate reports: LWR nuclear power plants; high temperature reactors; LMFBR's; nuclear fuel cycle; radiation measurement; radiological protection measurement.

3313 PURIFICATION OF SODIUM COOLANT BY MEANS OF COLD AND HOT TRAPS AND PURIFICATION OF THE COVER GAS. Subbotin, V.I.; Kozlov, F.A.; Zagorul'ko, Yu.I.; Volchkov, L.G.; Starkov, D.V.; Kononov, E.S. (Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Obninsk. Fiziko-Ehnergeticheskij Inst.); Bagretsov, V.F.; Gryazev, V.M.; Konyashov, V.V.; Polyakov, V.I. Kernenergie; 22: No. 1, 16-24 (Jan 1979). (In German).

The basic principles as well as results of experimental studies on purification of the sodium coolant and cover gas in fast reactors are considered. Moreover, data on the reaction mechanism in the cold traps and on separation of oxygen, hydrogen, carbon, sodium-water reaction products, corrosion products, and radioactive contaminants from sodium are presented. The test results of heterophase traps for separating sodium from carbonaceous impurities are described. Finally, some problems of purifying the cover gas of radioactive contaminants are discussed.

3314 Vorschlag fuer einen Beschluss des Rates zur Festlegung eines Forschungsprogramms fuer die Europaeische Atomgemeinschaft auf dem Gebiet der Codes und Normen Schneller Reaktoren (strukturelle Integritaat von Komponenten). (PROPOSAL FOR A DECISION BY THE COUNCIL ON THE DETERMINATION OF A RESEARCH PROGRAMME OF THE EUROPEAN ATOMIC COMMUNITY IN THE FIELD OF CODES AND STANDARDS OF FAST REACTORS (STRUCTURAL INTEGRITY OF COMPONENTS)). Bonn=Bad Godesberg, Germany, F.R.; Heger (Jan 1979). 9p. (In German).

The joint programme intends to enable the industry to provide a technical basis that will make it possible to do away step by step with differences in codes and standards for specific components for liquid-metal-cooled fast breeders (LMFBR). Specific LMFBR components are non-exchangeable components which come into contact or may come into contact with sodium, sodium steam, or cover gases.

3315 KNK II - AN EXPERIMENTAL POWER STATION EQUIPPED WITH A FAST CORE. Nucl. Eng. Int.; 24: No. 208, 41-44 (Jan 1979).

The main design features of the KNK II facility, equipped with a fast reactor core in 1974 and commissioned last year, are described and main parameters are given. The facility is subject to the same licensing procedures as commercial lightwater reactor stations. Its role is to provide experience for larger breeder demonstration reactors, to test fuel

bundles, and to assist in advancing sodium technology. An outline is given of the tests undertaken since the installation of the fast core. They include irradiation and post examination of fuel elements, absorber rods and structural materials. New types of reactor instrumentation which can be tested under the special operating conditions of the KNK II are summarised. Activity in the circuit components due to activation of either sodium or corrosion products will be recorded and general behaviour of all components in contact with sodium will be monitored.

- 3316 FAST FLUX TEST FACILITY READY TO RUN. Bliss, R.J.; Corrigan, D.C.; Peckinpaugh, C.L.; Squire, A. (Westinghouse Hanford Co., Richland, WA (USA)). Nucl. Eng. Int.; 24: No. 208, 45-50 (Jan 1979).

The FFTF reactor is described and design operating conditions are given. The various phases of the Acceptance Testing Programme are outlined and experiences associated with preoperational integrated leak rate testing, testing the heating and ventilating system, and initial filling with sodium of a secondary loop are described. The programme for research and development in the FFTF reactor after February 1980 is outlined.

- 3317 ENERGY FOR THE LONG RUN: FISSION OR FUSION. Kulcinski, G.L. (Univ. of Wisconsin, Madison); Kessler, G.; Holdren, J.; Haefele, W. Am. Sci.; 67: No. 1, 78-89 (1979).

The alternatives of the most likely and controversial long-range energy sources, fusion and fast-breeder fission, are compared in several areas: potential biological and social hazards, costs of research and development, capital costs, technical complexity, and time factors. It is concluded that from biological and social hazards standpoint, fusion is preferable to fast-breeder fission reactors; however, the LMFBR has already passed on the threshold of scientific and engineering feasibility. It is pointed out that LMFBR should not be compared with short-term energy sources, e.g. coal or oil, but should be compared only with other long-term energy sources, e.g. other types of breeder reactors.

- 3318 GUIDEBOOK TO NUCLEAR REACTORS. Nero, A.V. Jr. Berkeley, CA; University of California Press (1979). 302p. The Publisher, 2223 Fulton Street, Berkeley, CA 94720 \$9.95.

The volume presents a description of the important reactor types and fuel cycles and explains how the choice of nuclear systems relates to the broader contemporary issues, such as safety, pollution, resources, and proliferation. The book provides a general introduction to power reactions, identifying basic design features, characterizing the various fuel cycles, describing power plant emissions, and discussing accident potential. The book includes an analysis of four commercial or near-commercial reactor types: PWR, BWR, PHWR, and HTGR type reactors. Advanced reactor systems are briefly discussed.

- 3319 CARBON-14 PRODUCTION IN NUCLEAR REACTORS. Davis, W. Jr. (Oak Ridge National Lab., TN). pp 151-191 of Management of low-level radioactive waste. Volume I. Carter, M.W.; Moghissi, A.A.; Kahn, B. (eds.). Elmsford, NY; Pergamon Press (1979).

From Symposium on management of low level radioactive waste; Atlanta, GA, USA (23 May 1977).

Quantities of ^{14}C that may be formed in the fuel and core structural materials of light-water-cooled reactors (LWRs), in high-temperature gas-cooled reactors (HTGRs), and in liquid-metal-cooled fast breeder reactors (LMFBRs) have been calculated by use of the ORIGEN code (Be73). Information supplied by five LWR-fuel manufacturers pertaining to nitride nitrogen and gaseous nitrogen in their fuels and fuel-rod void spaces was used in these calculations. Average nitride nitrogen values range from 3 to 50 ppm (by weight) in LWR fuels, whereas gaseous nitrogen in one case is equivalent to an additional 10 to 16 ppm. Nitride nitrogen concentrations in fast-flux test facility (FFTF) fuels are 10 to 20 ppm. The principal reactions that produce ^{14}C involve ^{14}N , ^{17}O , and (in the HTGR) ^{13}C . Reference reactor burnups are 27,500 MWD per metric ton of uranium (MTU) for boiling water reactors (BWRs), 33,000 MWD for pressurized water reactors (PWRs), about 95,000 MWD per metric ton of heavy metal (MTHM) for HTGRs, and 24,800 MWD/MTHM for an LMFBR with nuclear parameters that pertain to the Clinch River Breeder Reactor.

- 3320 FFTF GAS PROCESSING SYSTEMS.

Halverson, T.G. (Westinghouse Hanford Co., Richland, WA). pp 439-451 of Management of low-level radioactive waste. Volume I. Carter, M.W.; Moghissi, A.A.; Kahn, B. (eds.). Elmsford, NY; Pergamon Press (1979).

From Symposium on management of low level radioactive waste; Atlanta, GA, USA (23 May 1977).

The design and operation of the two radioactive gas processing systems at the Fast Flux Test Facility (FFTF) exemplify the concept that will be used in the first generation of Liquid Metal Fast Breeder Reactors (LMFBR's). The two systems, the Radioactive Argon Processing System (RAPS) and the Cell Atmosphere Processing System (CAPS), process the argon and nitrogen used in the FFTF for cover gas on liquid metal systems and as inert atmospheres in steel lined cells housing sodium equipment. The RAPS specifically processes the argon cover gas from the reactor coolant system, providing for decontamination and eventual reuse. The CAPS processes radioactive gases from inerted cells and other liquid metal cover gas systems, providing for decontamination and ultimate discharge to the atmosphere.

- 3321 ASME publication 79-PVP-25 for meeting June 25-29, 1979, 12p. (INELASTIC ANALYSIS OF THE UPPER INTERNALS STRUCTURE FOR THE CLINCH RIVER BREEDER REACTOR PLANT). Falk, P.T.; Kosanich, M. Sr. Contract EW-76-C-15-2395. New York, NY; American Society of Mechanical Engineers (1979). 32p. (CONF-790615-3). American Society of Mechanical Engineers, 345 East 47th Street, New York, NY.

From 3. US national congress on pressure vessels and piping; San Francisco, CA, USA (25 Jun 1979).

Inelastic analysis is required for the Upper Internals Structure (UIS) of the Clinch River Breeder Reactor due to its operation in an elevated temperature environment where creep effects are significant. The UIS is a permanent reactor structure and is thus designed to survive in this environment for a 30-year design life. The rigorous inelastic finite element analyses of the critical lower plate ligament are presented. The interaction between the gross model, plate model and ligament model is also described. The analysis results are evaluated temperature design codes required to demonstrate the structural adequacy of the

design. The transient conditions, the environmental effects on mechanical properties, elevated temperature analysis guidelines, and the simplified analysis techniques used in determining the critical areas are described.

- 3322 3RD PART LICENCE FOR SNR-300, KALKAR (NO. 7;3 SNR). GRS Kurz-Inf., Reihe B; No. 2, 1-4(1979). (In German).

The 3rd part licence deals with the erection of a number of reactor components. Immediate realisation of this project is advisable in view of the particular public interest in the completion of the construction work.

- 3323 INSTRUMENT CALIBRATION PROGRAM FOR STARTUP OF FFTF. Swanson, C.D. (Westinghouse Electric Corp., Richland, WA). Trans. Am. Nucl. Soc., Suppl.; 32: No. 1, 36-37(1979).
FFTF REACTOR; REACTOR INSTRUMENTATION; CALIBRATION

- 3324 TREATMENT OF DEPENDENCIES IN RELIABILITY ANALYSES. Elerath, J.G.; Ingram, G.E. (GE, Sunnyvale, Calif). Proc., Annu. Reliab. Maintain. Symp.; 99-103(1979).

This paper presents a method for the evaluation of dependencies in discrete state reliability models. The theoretical basis for evaluation and the computer code PROBCALC which makes this method tractable for any system are presented. Examples of model dependencies are taken from analyses of Shutdown Heat Removal Systems in loop type Breeder Reactors. The general technique and the use of PROBCALC are both illustrated by application to an example Shutdown Heat Removal System.

- 3325 POTENTIAL OF ADVANCED GENERATION TECHNOLOGIES FOR NORTHEAST UTILITIES SYSTEM. Platts, J.E. New York, NY; Institute of Electrical and Electronics Engineers, Inc. (1979). 9p. (CONF-790214--).

From 1979 winter power meeting; New York, NY, USA (4 Feb 1979).

A study conducted by the Long Range System Planning Section of Northeast Utilities (NU) evaluated the potential application of eight advanced generation technologies for the development of the NU generation system in the next 30 years. The technologies studied were coal gasifier-combined cycle, coal gasifier-fuel cell, liquid metal fast breeder reactor, gas turbine-high temperature gas reactor, fuel cells, advanced combined cycle, batteries and advanced gas turbines. The study determined the economic competitiveness of these technologies compared to present options using busbar costs, and economic generation expansions over a 20 year period. Additional system benefits potentially offered by the advanced technologies were also identified. The study recommended that NU's future generation research should focus on the gasifier-combined cycle, gasifier-fuel cell, and gas turbine HTGR. The study results point to future potential for utility owned cogeneration with these technologies.

- 3326 PRIMARY AEROSOL PARTICLE-SIZE DISTRIBUTIONS FROM HOMOGENEOUS NUCLEATION CONDENSATION AND PARTICLE GROWTH. Kennedy, M.F. Charlottesville, VA; University of Virginia (1979). 121p. University Microfilms Under No. 79-16,275.
Thesis (Ph. D.).

The process of forming aerosols by homogeneous nucleation condensation followed by

condensation growth was studied as a potential source of submicrometre aerosols in LMFBR accidents. A model was developed for calculating particle-size distributions following nucleation and growth. This model was applied to experiments by ORNL in which UD_2 fuel pellets were partially vaporized in an argon atmosphere and the resulting primary particle-size distribution was measured. The low range of particle sizes observed in the ORNL tests could be reproduced by the model by assuming large mixing rates between the fuel vapor and the argon, thus indicating that homogeneous nucleation condensation was likely the source of the small particles observed.

- 3327 INTEGRATED QUALITY STATUS AND INVENTORY TRACKING SYSTEM FOR FAST FLUX TEST FACILITY DRIVER FUEL PINS. Gottschalk, G.P. (Westinghouse Electric Corp., Richland, WA). Trans. Am. Nucl. Soc., Suppl.; 33: No. 7, 26-27(1979).

- 3328 RADIATION EFFECTS IN STRUCTURAL MATERIALS. Stiegler, J.O.; Mansur, L.K. (Oak Ridge National Lab., TN). Annu. Rev. Mater. Sci.; 9: 405-454(1979).

When energetic particles impinge on a solid, atoms are displaced from their lattice positions. Single or clustered vacant atomic sites are produced and the displaced atoms come to rest in interstitial configurations. The bombarding particles may also induce nuclear transmutations. The initial disturbance of the material is termed radiation damage. At finite temperatures or under continued irradiation the defects migrate; some annihilate and others cluster, both among themselves and with solute atoms. The resulting microstructural changes in the material are more stable than the initial damage and lead to changes in properties termed radiation effects. In particular, changes in dimensions, composition on a microscale, and mechanical properties may be extreme.

- 3329 INFLUENCE OF CORE ASSEMBLY REFUELING REQUIREMENTS ON LMFBR CORE SYSTEM DESIGN. Fox, J.N. (GE, Sunnyvale, Calif). Am. Soc. Mech. Eng., [Pap.]; No. 79-PVP-33, 8(1979).
Liquid metal fast breeder reactor (LMFBR) core assemblies are exposed to an operational environment which induces permanent distortions in their main structural members. These distortions have a substantial impact on core assembly refueling since the distortions are large compared to the available spaces. Core assembly refueling requirements demand that refueling be accomplished without damage to adjacent core components or to the refueling equipment. This paper describes the core assembly refueling requirements and the design procedures used to demonstrate compliance with the requirements. This paper also provides an assessment relative to the influence of these requirements on LMFBR core system design.

- 3330 DESIGN CONSIDERATIONS IN LIQUID METAL FAST BREEDER REACTOR UPPER INTERNALS STRUCTURES. Wiltshire, F.R.; Kraus, S. (GE, Sunnyvale, Calif). Am. Soc. Mech. Eng., [Pap.]; No. 79-PVP-34, 7(1979).

Various functional requirements in Liquid Metal Fast Breeder Reactors (LMFBR's) necessitate that permanently installed structures be located directly above the reactor core. In present designs these structures are supported from the reactor closure and extend downward, through the

reactor outlet plenum, to the top of the core assemblies. They are, hence, subject to the severe thermal and hydraulic environment that is typical of the core exit plane. This paper reviews these functional requirements and operating conditions and discusses the impact that these factors have on the design of reactor Upper Internals Structures (UIS). The current design approaches to solving the problems are presented. Recommendations are proposed for future work to provide a better understanding of the problems and to develop design solution to these problems.

- 3331 NUMERICAL EVALUATION OF AN INELASTIC PIPING ELBOW ELEMENT. Scheller, J.D.; Mallett, R.H. (McDonnell Douglas Autom Co, St. Louis, Mo). Am. Soc. Mech. Eng., [Pap.]; No. 79-PVP-41, 15(1979).

The PIRAX computer program embodies a simplified model for predicting inelastic behavior of pipe elbows at elevated temperature. This model is evaluated for use in inelastic flexibility analysis of LMFBR (Liquid Metal Fast Breeder Reactor) piping by comparing results obtained using PIRAX with results obtained from more complex analytical models and tests. Isolated piping elbows are examined under in-plane and out-of-plane loading. Plasticity, thermal creep under load-controlled loading, and relaxation by thermal creep under deformation controlled loading are considered. The load versus deformation behavior obtained using the simplified model for piping elbows is judged to be a usable approximation. Based upon this evaluation, it is concluded that the inelastic flexibility analysis capability of the PIRAX computer program should be useful for detecting elastic followup in LMFBR piping systems and for classifying forces induced in LMFBR piping systems into load-controlled and deformation-controlled categories. 22 refs.

- 3332 ELEVATED TEMPERATURE, CYCLIC LOADINGS AND IRRADIATION EFFECTS ON FATIGUE CRACK OF LMFBR PRESSURE VESSELS. Ma, B.M. (Iowa State Univ, Ames). Am. Soc. Mech. Eng., [Pap.]; No. 79-PVP-59, 1-10(1979).

The elevated temperature, cyclic loadings and irradiation effects on the fatigue crack of the base and weld materials of an LMFBR pressure vessel are analyzed on the basis of experimental data. The power function law and the exponential function law of stress intensity factor range, ΔK , and effective stress intensity factor, $K_{sub\ eff}$, for the fatigue crack growth rate of the vessel materials (stainless steel Types 304 and 316 and nickel alloy Inconel 600) are, respectively, proposed and the equations are defined and derived. Based on these equations, relatively complete published and unpublished experimental data of fatigue crack growth rate for the vessel materials are reorganized, analyzed and plotted in the figures shown. At given temperature and fast neutron fluence, the high cyclic loading or low cyclic frequency can produce a large fatigue crack propagation rate in the pressure vessel.

- 3333 PRELIMINARY ANALYSIS AND SCREENING CRITERIA FOR ELEVATED TEMPERATURE PIPING. Mimani, H.M.; Naugle, F.V. Contract EY-76-C-03-0824-021. New York, NY: American Society of Mechanical Engineers (1979). 7p. (CONF-790615-28). \$3.00.

From 3. US national congress on pressure vessels and piping; San Francisco, CA, USA (25 Jun 1979).

The complexities of the ASME Class 1 nuclear elevated temperature structural design criteria

precludes the possibility of performing a complete Code Case 1592 analysis for all of the alternative designs normally investigated in the course of the design of a Liquid Metal Fast Breeder Reactor (LMFBR) high-temperature piping system. To enable the piping design to proceed on an orderly controlled basis, the piping design analysis is separated into the following phases: (a) screening analysis to determine pipe routing feasibility, (b) preliminary analysis to determine pipe support configuration, and (c) final design analysis (including transients) to demonstrate Code compliance. The application of the first phases of this procedure is demonstrated by a summary of the analyses performed in the development of the preliminary design configuration for the primary system of a commercialized LMFBR.

- 3334 TRIAL APPLICATION OF THE DRAFT STRUCTURAL DESIGN CRITERIA FOR BREEDER REACTOR CORE COMPONENTS TO A TYPICAL BLANKET ASSEMBLY DUCT; SUP 1. Sazawal, V.K. (Westinghouse Electr Corp, Madison, Pa). Am. Soc. Mech. Eng., [Pap.]; No. 79-PVP-27, 12(1979).

This paper presents the results of a comprehensive trial application of the draft structural design criteria for highly irradiated core components to a typical blanket assembly duct. The development of the criteria (proposed RDT F 9-7) is sponsored by the United States Department of Energy. The activity focuses on evaluation of the criteria using a typical breeder reactor blanket assembly as a test case and is not intended for judging the adequacy of the component design. Pertinent design rules from the draft criteria are applied to the component to determine: difficulties, if any, that may arise in interpretation and application of the criteria, and adequacy of the criteria rules and analysis methods to address various potential failure mechanisms expected in the reactor core during service. Based on the trial application, various recommendations are made to promote further development of the criteria. 15 refs.

- 3335 LOCAL PERTURBATION OF NUCLEAR REACTOR COOLING. A REMARKABLE EXPERIENCE. Vanmassenhove, G. (Centre d'Etude de l'Energie Nucleaire, Mol (Belgium)); Kramer, W. (Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.)). Consensus; No. 1, 17-31(1979). (In French).

Fuel element behaviour under local off normal cooling conditions and possible pin-to-pin failure propagation are of special interest in the safety analysis of fast reactors. In the experiments (loops Mol7C), the aim is to demonstrate that failure propagation does not occur and that total cooling of the pin bundle is not endangered even if the pins in a large part of the cross section of the bundle have failed.

- 3336 Grundsätze der Instrumentierung von flüssigmetallgekühlten schnellen Reaktoren. Entwurf. (PRINCIPLES OF INSTRUMENTATION OF LIQUID-METAL COOLED FAST REACTORS. DRAFT). Berlin, Germany, F.R.; Beuth (1979). 5p. (In German).

Instrumentation for measuring neutron flux density, coolant and reactor vessel, temperatures, for coolant monitoring, for monitoring of the protective gas systems and for reactor control.

- 3337 POST-SCRAM LMFBR HEAT TRANSPORT SYSTEM DYNAMICS. Brukx, J.F.L.M.; Latzko, D.G.H. Am. Soc. Mech. Eng., [Pap.]; No. 79-HT-8,

12(1979).

Using hybrid computer simulation, the paper evaluates alternative feed water control schemes for a loop-type liquid-metal-cooled fast breeder reactor heat transport system under post-scrum decay heat removal conditions. The results show the need for a secondary sodium flow feedforward signal in order to limit temperature transients. In addition, the paper deals with transition from forced to natural circulation of the primary and secondary sodium flows. 9 refs.

- 3338 FATIGUE CRACK GROWTH BEHAVIOR OF STAINLESS STEEL TYPE 316 PLATE AND 16-8-2 WELDMENTS IN AIR AND HIGH-CARBON LIQUID SODIUM. Yuen, J.L.; Copeland, J.F. (GE, San Jose, Calif.). Am. Soc. Mech. Eng., [Pap.]; No. 79-PVP-105, 13(1979).

The fatigue crack growth rates of Type 316 stainless steel and 16-8-2 gas tungsten arc welds were measured in air and high-carbon liquid sodium at 510 C (950 F) for secondary sodium loop Liquid Metal Fast Breeder Reactor applications. Loading variables such as low frequency, load ratio, and hold-time at peak load were studied. Supporting studies show that carburization of crack faces occurs prior to any crack tip carburization for the crack sizes and load frequencies of this study. Thus, a carburization effect on da/dN is not shown for relatively short-term tests. Low stress intensity, ultra-low frequency tests to simulate service would be required to show this effect. 16 refs.

- 3339 DEPRESSURIZATION OF INTERNALLY HEATED BOILING POOLS. Henry, R.E.; Smith, J.L.; Weber, J.T. (Argonne Natl Lab, Ill). Am. Soc. Mech. Eng., [Pap.]; No. 79-HT-101, 8(1979).

In assessing the behavior of molten fuel during hypothetical accident conditions, it is necessary to evaluate the behavior of boiling pools with internal heat generation under pressurized and blowdown (depressurization) conditions. In this experimental investigation, depressurization experiments were conducted with water in a transparent lucite vessel with various initial void fractions. Experiments were also carried out with bulk nucleation sites "seeded" in the liquid phase and with no such "seeding". The experiments show that with bulk nucleation sites the mixture maintains a homogeneous character during blowdown and essentially the entire liquid mass is vented during the depressurization. Without bulk nucleation sites, there is significant drift of vapor through the liquid phase and considerably less liquid is vented during the transient. 5 refs.

- 3340 IMPACT OF CLINCH RIVER BREEDER REACTOR PLANT ON BREEDER RESEARCH AND DEVELOPMENT PROGRAMS. Elias, D. (Clinch River React Plant Proj, Oak Ridge, Tenn). Am. Soc. Mech. Eng., [Pap.]; No. 79-JPGC-NE-5, 1-16(1979).

The Clinch River Breeder Reactor Plant (CRBRP), the first U.S. large-scale breeder reactor demonstration plant (375 MWe), is being developed jointly by the Government and industry to demonstrate the potential of a large-scale Liquid Metal Fast Breeder Reactor (LMFBR) as a future source of economic electric power in a utility environment. This paper summarizes CRBRP specific and generic research and development programs in support of the breeder program. General areas highlighted include fuels and materials, components, systems and analytical, and safety development programs. It provides information on the way

the development programs have been integrated with the CRBRP and managed to maximize the benefits to the United States. Examples relate development programs with large hardware being designed, fabricated, and delivered for operation. The adverse effects of not proceeding with this demonstration plant on development programs and on the ability to obtain information from foreign sources are discussed.

- 3341 COMPARATIVE ASSESSMENT OF THE LMFBR AND ADVANCED CONVERTER FUEL CYCLES. Heising-Goodman, C.D.; Saragossi, I.; Sharafi, P. (MIT, Cambridge, Mass). Am. Soc. Mech. Eng., [Pap.]; No. 79-JPGC-NE-3, 1-8(1979).

Three advanced reactor technologies and their fuel cycles were compared with respect to their relative economic potential and diversion resistance. These systems include the LWR once-through cycle with and without extended burnup, the LWR and LMFBR on uranium/plutonium recycle with and without CIVEX reprocessing methods and lastly, advanced converters in symbiosis with breeders on a denatured thorium cycle. To quantify relative diversion resistance, a method based on multi-attribute decision theory was applied. Economic potential was measured on the basis of a simple mills/kWh fuel cycle cost model. Preliminary results indicate that the LWR-LMFBR (U/Pu) cycle can be made as diversion resistant as the LWR once-through cycle if CIVEX-like methods are utilized. The denatured thorium cycle shows no obvious diversion resistance advantage and exhibits some economic penalty when compared to the other alternatives. The economic calculations show that the choice between cycles is less likely to be affected by direct economic considerations than by institutional factors such as fuel cycle implementability on an industry-wide basis, acceptability to U.S. regulators and the final prospects for their adoption by U.S. utilities. 15 refs.

- 3342 CURRENT PRACTICES FOR ULTRASONIC AND RADIOGRAPHIC EXAMINATION OF TUBES, TUBE PLATES AND TUBE-PLATE WELDS OF TUBE BUNDLES IN HEAT EXCHANGERS. CHAPTER 3. Hudgell, R.J.; Tickle, H. (UKAEA, Risley, Nuclear Power Development Establishment). pp 7-100 of Developments in pressure vessel technology - 2. Inspection and testing. Nichols, R.W. (ed.). London; Applied Science (1979).

The chapter describes the ultrasonic and radiographic inspection procedures that are applied to heat exchanger tube bundles. The inspection process starts with the ultrasonic examination of the tubes and tube plates during manufacture, followed by radiography of the tube-to-tube-plate welds during fabrication of the tube bundle. Ultrasonic methods are explained for welds which are amenable to this type of inspection. For the in-service inspection of tube bundles the chapter relates the authors' experiences on the ultrasonic inspection of tubes and tube plates in the Prototype Fast Breeder Reactor at Dounreay. At the end of the chapter some comments are made about future ultrasonic and radiographic developments for tube bundles.

- 3343 CLINCH RIVER BREEDER REACTOR PLANT: A BUILDING BLOCK IN NUCLEAR TECHNOLOGY. McCormack, M. (United States House of Representatives, Washington, DC). Electr. Perspect.; No. 79/4, 22-28(1979).

Interest in breeder reactors dates from the Manhattan Project to the present effort to build the Clinch River Liquid Metal Fast Breeder Reactor (LMFBR) demonstration plant.

Seven breeder-type reactors which were built during this time are described and their technological progress assessed. The Clinch River Breeder Reactor Project (CRBRP) has been designed to demonstrate that it can be licensed, can operate on a large power grid, and can provide industry with important experience. As the next logical step in LMFBR development, the project has suffered repeated cancellation efforts with only minor modifications to its schedule. Controversies have developed over the timing of a large-scale demonstration plant, the risks of proliferation, economics, and other problems. Among the innovative developments adopted for the CRBRP is a higher thermal efficiency potential, the type of development which Senator McCormack feels justifies continuing the project. He argues that the nuclear power program can and should be revitalized by continuing the CRBRP.

- 3344 COMPUTER ANALYSIS AND CONTROL FOR NONDESTRUCTIVE GAMMA SCANNING OF LMFBR FUEL PINS. Barnes, B.K.; Phillips, J.R.; Waterbury, G.R.; Quintana, J.N.; Murray, A.S.; Netuschil, J.R. (Univ. of California, Los Alamos, NM). pp 801-810 of Computers in activation analysis and gamma-ray spectroscopy. Carpenter, B.S.; D'Agostino, M.D.; Yule, H.P. (eds.). Washington, DC; Department of Energy (1979).

From Conference on computers in activation analysis and gamma-ray spectroscopy; Mayaguez, Puerto Rico (30 Apr 1978).

A program to modernize existing computer control and data analysis in a precision gamma-scanning system is described. This involves interfacing a new computer-based multichannel analyzer to existing equipment through a CAMAC system with an intelligent crate controller and writing software for scan control and data reduction. Both hardware and software requirements are discussed. 6 figures.

- 3345 NUCLEAR SAFETY IN FRANCE. Tanguy, P. (CEA Centre d'Etudes Nucleaires de Fontenay-aux-Roses, 92 (France). Inst. de Protection et de Surete Nucleaire). Ann. Nucl. Energy; 6: No. 5, 299-304(1979).

A brief description of the main safety aspects of the French nuclear energy programme and of the general safety organization is followed by a discussion on the current thinking in CEA on some important safety issues. As far as methodology is concerned, the use of probabilistic analysis in the licensing procedure is being extensively developed. Reactor safety research is aimed at a better knowledge of the safety margins involved in the present designs of both PWRs and LMFBRs. A greater emphasis should be put during the next years in the safety of the nuclear fuel cycle installations, including waste disposals. Finally, it is suggested that further international cooperation in the field of nuclear safety should be developed in order to ensure for all countries the very high safety level which has been achieved up till now.

- 3346 THORIUM FUEL CYCLES. Yang, C.S. Berkeley, CA; Univ. of California (1979). 184p. University Microfilms Order No. 80-00,578.

Thesis (Ph. D.).

Thorium fuel cycles for light-water reactors, heavy-water CANDU-type reactors and high-temperature gas-cooled reactors have been studied in this thesis. Fissile makeup consists of enriched ^{235}U or plutonium from uranium-

fueled reactors. Uranium resource requirement for each of the thorium fuel cycles has been calculated and compared with the uranium requirement of the fuel cycles of the corresponding uranium-fueled reference designs. Using thorium in the existing light-water reactors is the easiest way of introducing thorium fuel cycles in this country. The uranium ore requirement over a 30-year reactor lifetime, for the fully-enriched-uranium-thorium fuel cycle is only 17% less than that for the uranium fuel cycle, with uranium and plutonium recycle. Among all the fuel cycles studied in this thesis, the 93.5% ^{235}U -Th CANDU fuel cycle needs the least uranium resources. Self sustaining thorium breeding is also a possibility, with only small changes to the thorium-fueled CANDU reactor operating conditions. Therefore, this fuel cycle could be a logical choice if there were a serious delay in the commercialization of liquid-metal fast breeder reactor.

- 3347 LOW HEAT FLUX SODIUM VOIDING USING THE DRIFT FLUX FORMULATION. Senglaub, M.E. Chicago, IL; Northwestern Univ. (1979). 168p. University Microfilms Order No. 79-27,447.

Thesis (Ph. D.).

The drift flux formulation has been used to study the conditions of low-heat flux boiling in sodium-cooled fast-reactor systems. Models and numerical methods have been developed in an effort to study such events as the loss of heat sink type of transient in the next generation of fast reactors. A detailed derivation of the four-equation drift flux formulation is given with the required simplifying assumptions. The additional assumptions and physical arguments that have been used to arrive at the final formulation are presented. Along with the mathematical formulations, the derivation of the solution numerics, and the stability analysis of the procedure used have been carried out. To test the proposed numerics a number of cases were calculated for comparison with the limited number of existing experiments. In addition, a number of numerical experiments were performed to examine the capabilities of the solution techniques in regimes for which no experimental data exist. Finally, the applicability range has been established within physical constraints and the possible approaches for extending this range of applicability have been considered.

- 3348 (RISLEY-Trans--4087) STATE OF WORK ON FAST REACTORS IN THE USSR UP TO MARCH 1979. Inyutin, E.I.; Krasnoyarov, N.V. 1979. Translation of paper presented at 12th annual IWGFR meeting, Vienna, Austria, March 27-30, 1979 12p. Dep. NTIS (US Sales Only), PC A02/MF A01.

Information is presented concerning the BR-10 reactor; BOR-60; BN-350; BN-600 and BN-1600; and research activities.

- 3349 MICROSTRUCTURAL OBJECTIVES FOR HIGH-TEMPERATURE ALLOYS IN ADVANCED ENERGY SYSTEMS. Sims, C.T. (GE, Schenectady, NY). Am. Soc. Test. Mater., Spec. Tech. Publ.; No. 672, 480-513(1979).

From ASTM meeting on microstructural control; Houston, TX, USA (3 Apr 1978).

This paper reviews six advanced systems in a broad fashion helpful in orientation of engineering and technical personnel not directly involved in such developments. These are coal utilization systems including coal liquefaction, coal gasification and pressurized fluid beds, nuclear systems including liquid metal fast breeder reactors (LMFBR), and high-

temperature gas reactors (HTGR). In concert with these systems, yet cross-functioning, superalloy technologies are discussed for combined-cycle electrical plants and high-temperature heat exchangers. Then potential applications and problems for superalloys in the systems, are identified, drawing from this base examples that might typically be applied, utilizing these to discuss ideal microstructures one may find. 18 refs.

- 3350 NUCLEAR OXIDE FUEL ANALYSIS. Timofeev, G.A.; Gabeskiria, V.Ya.; Simakin, G.A.; Mishenev, V.B.; Bezz, A.S.; Rykov, A.G. (Nauchno-Issledovatel'skij Inst. Atomnykh Reaktorov, Dimitrovgrad (USSR)). J. Radioanal. Chem.; 51: No. 2, 377-383(1979).

From 9. Radiochemical conference; Piestany, Czechoslovakia (11 - 16 Sep 1978).

As a rule the analysis of nuclear oxide fuel includes the determination of uranium, plutonium, their isotopic composition, cation impurities, carbon, nitrogen, chlorine, fluorine, oxygen coefficient. In this paper different methods are discussed for the analysis of unirradiated uranium and plutonium oxide fuels used in the laboratories of the Analytical Chemistry Department: coulometry, emission analysis, chromatography, X-ray analysis. Much consideration is being given to the analysis of uranium and plutonium oxide samples and uranium-plutonium mixed fuels irradiated in the BOR-60 using mass-spectrometric (isotope dilution method) and radiometric techniques. The results of uranium and plutonium determination by these methods are compared. The main analytical characteristics of the methods are given.

- 3351 BREEDER REACTORS--WHAT ARE THE PROSPECTS.. Behnke, W.B. (Common Edison Co, Ill). Energy Technol. (Wash., D.C.); 6: 851-856(1979).

A discussion is presented which covers the following five points: first, the inseparable link between the breeder reactor and further expansion of nuclear electric power generation; second, the present stagnation of nuclear power in the United States; third, the Administration's energy policy and its significance in light of current world events; fourth, a suggestion on how we can get nuclear power development going forward again; and fifth, completion of the Clinch River Breeder Reactor and why it is the right choice for the next step in our breeder demonstration program. 7 refs.

- 3352 CONTROL OF UNIRRADIATED FUEL IN BOR-60 FAST REACTOR FUEL ASSEMBLIES BY NEUTRON RADIATION. Gryazev, V.M.; Gadzhiev, G.I.; Leshchenko, Yu.I.; Gorobets, A.K.; Semenov, A.L. (Nauchno-Issledovatel'skij Inst. Atomnykh Reaktorov, Dimitrovgrad (USSR)). pp 521-530 of Nuclear safeguards technology 1978. Vol. 1. Vienna, Austria; International Atomic Energy Agency (1979). (In Russian)

From IAEA symposium on nuclear material safeguards; Vienna, Austria (2 Oct 1978).

Experimental studies have been made of the possibility of monitoring the characteristics of unirradiated fuel assemblies for the BOR-60 reactor by means of the natural neutron radiation and the delayed-neutron emission initiated by a ^{252}Cf source. The experimental apparatus uses a neutron detector with a high efficiency (approximately 13% for the neutrons from the californium source) and a pneumatic transport system with a approximately 5×10^7 n/s californium source. A coincidence technique is employed to separate the spontaneous-fission

and the (α, n) -reaction neutrons in the natural neutron radiation of the fuel. The possibility of monitoring the fuel characteristics by means of delayed neutron emission has been tested by studying the sensitivity of the measurement results to the removal of fuel from the assemblies. For a fuel with a known enrichment, the measured values seem to be linearly related to the amount of ^{235}U over a limited range of fuel contents. An analysis of the results has shown that an estimate of the amount of ^{235}U in a fuel assembly can be obtained to an accuracy of better than 2% (2b) in a measurement time of 30 minutes. For fuel where the enrichment is unknown, use is made of the dependence of the measured values on the spectrum of the neutrons irradiating the assembly. The results for unirradiated fuel in BOR-60 assemblies show good agreement with the rated ^{235}U content. In connection with the use of this apparatus in safeguards systems, attention has been given to the possibility of falsification of the results and to ways of detecting this.

- 3353 BASIC PRINCIPLES OF ACCOUNTING AND CONTROL OF NUCLEAR MATERIALS IN THE BOR-60 EXPERIMENTAL FAST REACTOR. Gryazev, V.M.; Gadzhiev, G.I.; Alekseev, I.N. (Nauchno-Issledovatel'skij Inst. Atomnykh Reaktorov, Dimitrovgrad (USSR)). pp 531-543 of Nuclear safeguards technology 1978. Vol. 1. Vienna, Austria; International Atomic Energy Agency (1979). (In Russian)

From IAEA symposium on nuclear material safeguards; Vienna, Austria (2 Oct 1978).

Under a contract with the International Atomic Energy Agency, the V.I. Lenin Atomic Reactor Research Institute is currently carrying out a study of ways of organizing a nuclear materials accounting and control system for the BOR-60 fast reactor. Some results of this study are presented in the paper. The special physical and technological features of fast reactors create additional difficulties in safeguards systems and give rise to a number of new possibilities for the illicit removal of nuclear materials. These questions are discussed with reference to the BOR-60 reactor but the conclusions are probably applicable to all fast reactors. The proposed accounting and control system is based on non-destructive measurements of the amount of fissile materials in the operating fuel assemblies and screened bundles of the reactor, on the independent control of the principal facility parameters (a list of which is given) and on an automated information collection and evaluation system. Visual means of inspection can be very effective in fast reactor safeguards systems, especially for controlling storage, but they are not used with the BOR-60 reactor.

- 3354 STATUS OF THE SAFEGUARDS SYSTEM DEVELOPED FOR THE LMFB PROTOTYPE POWER PLANT SNR-300 (KKW KALKAR). Krinninger, H. (Internationale Natrium-Brutreaktor-Bau G.m.b.H., Bergisch Gladbach (Germany, F.R.)); Brueckner, C. (Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.)); Quandt, U.; Ruppert, E. (Internationale Atomreaktorbau G.m.b.H. (INTERATOM), Bergisch Gladbach (Germany, F.R.)); Tschampel, H. (Dr. Seufert GmbH, Karlsruhe, Germany, F.R.); Hulst, P. van der (Schnell-Brueter-Kernkraftwerksgesellschaft m.b.H. (SBK), Essen (Germany, F.R.)). pp 483-506 of Nuclear safeguards technology 1978. Vol. 1. Vienna, Austria; International Atomic Energy Agency (1979).

From IAEA symposium on nuclear material safeguards; Vienna, Austria (2 Oct 1978).

In this report the features of the safeguards system developed for the LMFB

- Prototype Power Plant SNR-300 (KKW Kalkar) are described. Due to the fact that LMFBR fuel assemblies are mostly handled in a sodium or inert gas environment, visual control and counting of the assemblies containing nuclear material, as routinely used in a LWR power plant, cannot be applied for LMFBRs. Consequently, for safeguarding the Kalkar Nuclear Power Station, an automatic and continuous monitoring of the fissile material inventory is the main objective of special instrumentation, the "Inaccessible Inventory Instrumentation System" (IIIS). For a qualitative distinction between the various types of assembly the detection of the emitted neutron and gamma radiation turned out to be most adequate. Based upon this conclusion and taking into account its tasks, the IIIS is composed of an activity measurement system, a position-sensing system and a micro-computer system (MCS). The high reliability, high fraud resistance and low maintenance requirements have had an important influence on the IIIS design. Access to IIIS data is protected by special hardware and software measures. To protect the system against the results of power failures the IIIS possesses an automatic restart facility and a battery-buffered power supply for the RAM-unit of the microprocessor system used for data acquisition and evaluation.
- 3355 SUPERPHENIX IN DETAIL. CONSEQUENT EXECUTION OF CONSTRUCTION PROGRAMS FOR NUCLEAR POWER PLANTS. Weber, R. VDI (Ver. Dtsch. Ing.) Nachr.; 33: No. 35, 9(1979). (In German).
- On the banks of the Rhone river, 60 km east of Lyon, the Superphenix nuclear power plant is being built. It is the prototype of a reactor line that will make up one fourth of the nuclear capacity in France already at the turn of the century. The principles and experiences of Superphenix are reviewed, taking only the most important of the many technical details.
- 3356 HALF-TIME IN THE CONSTRUCTION OF 'SUPERPHENIX'. THE NUCLEAR POWER PLANT SERVES AS A MODEL FOR THE FUTURE FRENCH STANDARD BREEDER. Weber, R. VDI (Ver. Dtsch. Ing.) Nachr.; 33: No. 34, 4(1979). (In German).
- Only the USSR and France are consequent in their way to the breeder reactor. The 1200 MWe Superphenix started in 1976 has reacted half-time for its construction according to schedule. This fast breeder, by far the biggest in the world in the eyes of French energy experts marks the beginning of serial fabrication and thus an important step to the independence from foreign energies.
- 3357 DESCRIPTION OF THE SODIUM LOOP ML-3. de la Torre, M.; Melches, I; Lapena, J.; Martinez, T.A.; De Miguel, D.; Duran, F. Energ. Nucl. (Madrid); 23: No. 121, 273-281(1979). (In Spanish).
- The sodium loop ML-3 is described. The main objective of this facility is to obtain mechanical property data for LMFBR materials in creep and low cycle fatigue testing in flowing sodium. ML-3 includes 10 test stations for creep and two for fatigue. It is possible to operate simultaneously at three different temperature levels. The maximum operating temperature is 650 deg C at flow velocities up to 5 m/s. The ML-3 loop has been located in a manner that permits the fill/dump tank cover gas and security systems to be shared with an earlier circuit, the ML-1.
- 3358 MAGNETIC NUCLEAR CORE RESTRAINT AND CONTROL. Cooper, M.H. (to Dept. of Energy). US Patent 4,131,510. 26 Dec 1978. Filed date 21 Jun 1977. 6p.
- Disclosed is a lateral restraint and control system for a nuclear reactor core adaptable to provide an inherent decrease of core reactivity in response to abnormally high reactor coolant fluid temperatures. An electromagnet is associated with structure for radially compressing the core during normal reactor conditions. A portion of the structures forming a magnetic circuit are composed of ferromagnetic material having a curie temperature corresponding to a selected coolant fluid temperature. Upon a selected signal, or inherently upon a preselected rise in coolant temperature, the magnetic force is decreased a given amount sufficient to relieve the compression force so as to allow core radial expansion. The expanded core configuration provides a decreased reactivity, tending to shut down the nuclear reaction.
- 3359 HORIZONTAL BAFFLE FOR NUCLEAR REACTORS. (to Westinghouse Electric Corp., Pittsburgh, PA (USA)). British Patent 1,536,645/A/. 20 Dec 1978. 10p.
- A physical partition in the annulus between the core barrel and a thermal barrier of the reactor vessel of an LMFBR prevents return of flow of the hot coolant and uses thermal bowing to enhance sealing and prevents contact of the coolant with the cooler structural members in the annulus below the partition.
- 3360 DETECTION DEVICE FOR FUEL FAILURE. Mimoto, Y.; Kitagawa, H. (to Power Reactor and Nuclear Fuel Development Corp., Tokyo (Japan)). Japanese Patent 1953-146,094/A/. 19 Dec 1978. 4p. (In Japanese).
- Purpose: To enable inspection for actual failures in the fuels of reactor core that are suspected to be failed with a high accuracy by the detection of the presence or absence of gaseous fission products leaked from failed fuel pins due to expansion under reduced pressure. Constitution: Fuel pins to be inspected in a reactor core suspected of failures are taken out of the reactor core by the drive of a fuel exchanger and then inserted in a containment pipe. Then, the lower end of the upper pipe is engaged to the upper end of the containment pipe and the pressure therein is reduced. If the fuel pins to be inspected in the containment pipe has actually failed, the gaseous fission products remained in the fuel pins are expanded under the reduced pressure and leak out of the failed fuel pins. Thereafter, the valve is opened and the gaseous products are introduced into a gaseous fission products detector and the presence of the products is checked.
- 3361 REACTOR COOLING SYSTEM. Karamori, A. (to Power Reactor and Nuclear Fuel Development Corp., Tokyo (Japan)). Japanese Patent 1953-143,892/A/. 14 Dec 1978. 3p. (In Japanese).
- Purpose: To decrease the cover gas pressure in the reactor containment while ensuring reactor safety well by the provision of a main cycling pump to a cold leg. Method: The other end of a degassing pipeway provided at the upper portion of an intermediate heat exchanger is inserted in a degassing pot, and the degassing pot is connected by way of a pipe line with the top of the reactor containment. Upon driving, the main cycling pump is driven to circulate coolants such as liquid sodium in a coolant loop. The heat generated in a reactor

core is gradually removed by the coolant flowing passing therethrough and the coolants heated to a high temperature is heat exchanged with secondary coolants in the intermediate heat exchangers.

- 3362 GAMMA PRIME HARDENED NICKEL--IRON BASED SUPERALLOY. Korenko, M.K. (to Dept. of Energy). US Patent 4,129,462. 12 Dec 1978. Filed date 7 Apr 1977. 8p. PAT-APPL-785,640.

A low swelling, gamma prime hardened nickel--iron base superalloy useful for fast reactor duct and cladding applications is described having from about 7.0 to about 10.5 weight percent (wt%) chromium, from about 24 to about 35 wt% nickel, from about 1.7 to 2.5 wt% titanium, from about 0.3 to about 1.0 wt% aluminum, from about 2.0 to about 3.3 wt% molybdenum, from about 0.05 to about 1.0 wt% silicon, from about 0.03 to about 0.06 wt% carbon, a maximum of about 2 wt% manganese, and the balance iron.

- 3363 METHOD AND EQUIPMENT FOR THE PERFORMANCE REDUCTION OF A NUCLEAR REACTOR DURING TEMPERATURE INCREASE. Zebroski, E.L. (to Electric Power Research Inst., Palo Alto, CA (USA)); Deutsches Patentamt, Muenchen (Germany, F.R.)). German (FRG) Patent 2,822,918/A/. 7 Dec 1978. 18p. (In German).

The performance of a fast breeder cooled with Na can be reduced independent of the operating and control mechanism. A thermal expansion body is used that is susceptible to temperature increase. It is arranged between the controlrod drive bar and the controlrod and, for example, made of B₄C. The thermal expansion body is in principle a part of the drive bar and consists of some coaxial cylinders of different radiuses. Their main axes are arranged parallel to the moving direction of the drive bar. The primary cooling medium can flow through them. The single cylinders have alternately high and low thermal expansion coefficients, they consist of stainless steel or of Invar. The thermal expansion body, together with the absorber, has a negative reactivity temperature coefficient and stabilizes the reactor during its operation.

- 3364 IMPROVEMENTS IN OR RELATING TO HEAT EXCHANGERS. Taylor, P.A. (to Babcock and Wilcox Ltd., London (UK)). British Patent 1,534,681/A/. 6 Dec 1978. 4p.

According to the present invention there is provided a method of producing superheated steam by use of the heat in liquid sodium, in which liquid sodium is caused to flow through a space having boundaries of which no part is common with the boundaries of a space in which vapour is produced, a fluid that is inert to sodium is heated by heat exchange at the boundaries of the space through which the liquid sodium flows and serves as the heating medium for the production of vapour, and the vapour is subsequently heated to the final degree of superheat by heat exchange with liquid sodium in a space that has a common boundary with a space through which liquid sodium is passed.

- 3365 COPROCESSING: AN EVALUATION OF CHEMICAL REPROCESSING WITHOUT PLUTONIUM SEPARATION. Pobereskin, M.; Kok, K.D.; Madia, W.J. (Battelle Memorial Inst., Columbus, OH). Nucl. Technol.; 41: No. 2, 149-167 (Dec 1978).

The technical feasibility of a coprocessing concept involving recovery of all the actinides

in the spent fuel as a product group has been analyzed. It has been shown that this can be accomplished by a simple modification of the Purex process. The recovered actinide product group can be reconstituted as a fuel for recycle in either light water reactors (LWRs) or liquid-metal fast breeder reactors (LMFBRs), either by addition of moderately enriched uranium for the LWR case or by controlled partial partitioning of uranium in the LMFB case. Partial partitioning of uranium from a uranium-plutonium extract (that may contain other transuranics, especially neptunium) can be carried out under Purex process conditions that preclude separation of plutonium. A steady-state fuel composition is approached in eight cycles (40 yr) for the LWRs and five cycles (20 yr) for the LMFBs. Potential for proliferation can be greatly reduced for subnational diversion since the plutonium is not separated from its actinide homologs, nor is the recovered actinide fuel fully decontaminated from fission products. The possibility of proliferation by national diversion can be impeded. Recycle of the actinides reduces, via transmutation, the cumulative amount of actinides produced, defers the bulk of the actinide waste disposal to the end of the useful fuel lifetime, and ameliorates the high-level waste management problem.

- 3366 LOW-DECONTAMINATION APPROACH TO A PROLIFERATION-RESISTANT FUEL CYCLE. Asquith, J.G.; Grantham, L.F. (Rockwell International, Canoga Park, CA). Nucl. Technol.; 41: No. 2, 137-148 (Dec 1978).

To prevent the diversion of nuclear material from power production to weapon production either by a nation or by clandestine groups within a nation, the nuclear fuel cycle must be proliferation-resistant and safeguarded. Potentially proliferation-resistant and safeguarded fuel cycles based on low-decontamination pyroprocessing have been developed for the light water reactor (LWR), fast breeder reactor (FBR), and FBR-LWR combination. The major penalty for recycling fission products to the LWR is that fuel enrichment must be somewhat greater to overcome parasitic fission product absorption of neutrons. In the FBR, the major penalty is a slight reduction in breeding ratio due to the displacement of fertile material by fission products. Preliminary cost analysis indicates that these fuel cycles are economically competitive with fuel cycles using conventional reprocessing or those using virgin uranium if spent fuel storage costs are considered.

- 3367 SOME PLUTONIUM RECYCLE PROGRAM FUEL CYCLES HAVING REDUCED PROLIFERATION CHARACTERISTICS. Eschbach, E.A. (Battelle-Pacific Northwest Labs., Richland, WA). Nucl. Technol.; 41: No. 2, 168-179 (Dec 1978).

A review of the plutonium fuel recycle program (1955-1967) did not reveal an economically compelling alternative fuel cycle to slightly enriched uranium, plutonium recycle, or the plutonium breeder. The review included systems involving no chemical separations compared with slightly enriched uranium once through. Nor did freestanding thorium systems appear economic, although synergisms between uranium and thorium may be worth considering, including reduced-density thorium fuels with high fuel durability as an alternative to uranium load following and peaking fuel. The crossed progeny system involving ²³³U enrichment of uranium in light water reactors (LWRs) and conversion of the plutonium to ²³³U in fast reactors may offer a method of providing a high-performance

denatured LWR fuel for the period beyond the availability of economic slightly enriched uranium.

- 3368 SWELLING IN MIXED-OXIDE FUEL PINS. Zimmermann, H. (Kernforschungszentrum, Karlsruhe, Germany). Nucl. Technol.; 41: No. 3, 408-410 (Dec 1978).

The swelling of mixed oxide fuel elements irradiated within the irradiation program of the German Fast Breeder Project was determined. In fuel pins with a burnup-independent high power level, a constant swelling rate of 0.5% per percent burnup was found at burnups above 4%. It is concluded that this swelling rate is induced by solid fission products. The volume-averaged swelling due to fission gases seems to be saturated at a value of approx. 6%.

- 3369 URANIUM REQUIREMENTS FOR ADVANCED FUEL CYCLES IN EXPANDING NUCLEAR POWER SYSTEMS. Banerjee, S. (McMaster Univ., Hamilton, Ont.); Tamm, H. Nucl. Technol.; 41: No. 2, 244-251 (Dec 1978).

When considering advanced fuel cycle strategies in rapidly expanding nuclear power systems, equilibrium analyses do not apply. A computer simulation that accounts for system delay times and fissile inventories has been used to study the effects of different fuel cycles and different power growth rates on uranium consumption. The results show that for a given expansion rate of installed capacity, the main factors that affect resource requirements are the fissile inventory needed to introduce the advanced fuel cycle and the conversion (or breeding) ratio. In rapidly expanding systems, the effect of fissile inventory dominates, whereas in slowly expanding systems, conversion or breeding ratio dominates. Heavy-water-moderated and -cooled reactors, with their high conversion ratios, appear to be adaptable vehicles for accommodating fuel cycles covering a wide range of initial fissile inventories. They are therefore particularly suitable for conserving uranium over a wide range of nuclear power system expansion rates.

- 3370 ANALYZING CONTAINMENT LEAKAGE FROM A SODIUM FIRE BY THE RESPONSE SURFACE METHOD. Person, L.W. (Argonne National Lab., IL). Nucl. Technol.; 41: No. 2, 252-256 (Dec 1978).

The SPOOL-FIRE code has been used with the response surface method and a Monte Carlo simulation to study sodium fire accidents. The study provides a simple method of estimating the radioactive release via containment leakage; the sensitivity of the output consequences to the variations in the input parameters is also presented.

- 3371 ASSESSMENT OF THE CONSEQUENCES OF BOILING IN THE RADIAL BLANKET DUE TO HYPOTHETICAL MAJOR PIPE LEAKS. Kadambi, N.P.; Tilbrook, R.W. (Westinghouse Electric Corp., Madison, PA); Nucl. Technol.; 41: No. 3, 276-282 (Dec 1978).

Boiling initiation in a liquid-metal fast breeder reactor (LMFBR) has in the past been assumed to lead inevitably to the potential for loss of coolable geometry. To ensure conservatism, it was necessary to preclude boiling under all accident conditions. Limited boiling in the radial blanket of the Clinch River Breeder Reactor due to a hypothetical major leak in the primary heat transport system is not likely to lead to assembly-wide dryout and cladding melting. A series of scoping calculations based on applicable physical

processes has shown that (a) boiling is likely to be limited to only six subchannels, (b) flow reversal is unlikely, (c) there are ample heat sinks for condensation of sodium vapor, (d) film dryout is unlikely, and (e) cladding melting is unlikely. The consequences listed are of continuously decreasing likelihood, hence providing confidence that coolable geometry is not threatened by limited boiling in the radial blanket. This analysis was performed for a conventional LMFBR core arrangement.

- 3372 SAS3D ANALYSIS OF UNPROTECTED LOSS-OF-FLOW TRANSIENTS FOR 1200-MW(ELECTRIC) LIQUID-METAL FAST BREEDER REACTOR HOMOGENEOUS AND HETEROGENEOUS CORE DESIGNS. Shih, T.A.; Temme, M.I. (General Electric Co., Sunnyvale, CA). Nucl. Technol.; 41: No. 3, 312-322 (Dec 1978).

A safety comparison was made for two 1200-MW(electric) liquid-metal fast breeder reactor cores with homogeneous and heterogeneous fuel arrangements, respectively. The two cores were conceptually designed to be identical except for those parameters affected by different fuel arrangements. The comparison was limited to the issue of initiating phase energetics in the hypothetical core disruptive accident. Both cores were assumed to be at end-of-equilibrium cycle and subject to unprotected loss-of-flow transients. The SAS3D code was used for analyses with four sets of phenomenological assumptions at different degrees of conservatism. Results of the four corresponding cases showed that the heterogeneous core consistently behaved more mildly than the homogeneous core due to its relatively much lower effective sodium voiding reactivity worth.

- 3373 RESPONSE OF OXIDE FUEL TO SIMULATED THERMAL TRANSIENTS. Bandyopadhyay, G. (Argonne National Lab., IL). Nucl. Technol.; 41: No. 3, 349-358 (Dec 1978).

Direct electrical heating (DEH) experiments have been analyzed to study the fuel and fission gas response to simulated thermal transient conditions in unirradiated UO_2 and irradiated mixed-oxide fuels. The results indicate that both fission gas and fuel melting strongly influence the fuel response behavior during transients. The information obtained from the DEH tests has been used to draw a preliminary fuel response diagram that contributes to an understanding of such macroscopic fuel behavior as gross fuel swelling and fuel failure as functions of the transient time and heating rate. A comparison of these test results and the trend depicted by the fuel response diagram with results obtained from experiments performed in the transient reactor test treat facility indicates that certain aspects of fuel behavior during transients can be reasonably simulated by the DEH technique.

- 3374 NICKEL AND NITROGEN ION IRRADIATION INDUCED VOID SWELLING AND DEFECT MICROSTRUCTURES IN Ni--Al, Ni--Cr AND Ni--Ti SOLID SOLUTIONS. Pinizzotto, R.F. Jr. (IBM Corp., Yorktown Heights, NY); Chen, L.J.; Ardell, A.J. Metall. Trans., A; 9: No. 12, 1715-1727 (Dec 1978).

The effects of solute content, temperature, and irradiation dose on the void swelling characteristics of pure nickel and several nickel base solid solutions (Ni--Al and Ni--Ti containing up to 8 at. pct solute and Ni--Cr containing up to 16 pct Cr) have been investigated. Samples were irradiated in the temperature range 400 to 650°C to a maximum

dose of 70 dpa using 3.5 MeV $^{58}\text{Ni}^+$, 400 keV $^{14}\text{N}^+$ and 400 keV $^{14}\text{N}_2^+$ ions. The irradiation induced microstructures were studied using transmission electron microscopy. The addition of Al, Cr or Ti to Ni is found to decrease the void swelling and mean void diameter and to increase the dislocation density. The behavior of the void number density, $N/\text{sub } v/$, as a function of solute content is found to be dependent upon the irradiation conditions as well as the particular solute addition. $N/\text{sub } v/$ passes through a maximum at approximately 2 pct solute content for Ni--Al and Ni--Cr alloys irradiated at 550°C, but through a minimum at 4 pct for Ni--Ti alloys irradiated at 550 and 600°C. $N/\text{sub } v/$ decreases monotonically as a function of Al content at 600 and 650°C. The results are discussed in terms of recent theories of void swelling suppression due to impurity or solute additions and in light of several correlations between void swelling and material parameters. The behavior of $N/\text{sub } v/$ is found to be best described by the actions of two competing processes. The first enhances void nucleation, is not strongly temperature dependent and is dominant at low solute contents. The second suppresses void swelling, is probably diffusion controlled and dominates in the more concentrated alloys.

- 3375 SENSITIVITY THEORY FOR REACTOR THERMAL-HYDRAULICS PROBLEMS. Oblow, E.M. (Oak Ridge National Lab., TN). Nucl. Sci. Eng.; 68: No. 3, 322-337(Dec 1978).

A sensitivity theory based on reactor physics experience was successfully developed for a reactor thermal-hydraulics problem. The new theory is derived for the case of nonlinear transient heat and mass transfer in a typical reactor subassembly. Suitable adjoint equations for heat and fluid flow are presented along with methods for deriving the sources and boundary and final conditions for these equations. Expressions for the sensitivity of any integral temperature response to problem input data are also presented. The theory is applied to a sample problem describing the steady-state thermal-hydraulic conditions in a Clinch River Breeder Reactor fuel channel. For this case, sensitivity coefficients are derived for several thermal response functions (i.e., peak clad and peak fuel temperature) for all physical input data (i.e., the heat transfer coefficient, thermal conductivities, etc.). A typical uncertainty analysis for peak clad and peak fuel temperature was also performed using uncertainty information about the physical data. Conclusions are drawn about the applicability of this approach to more general problems, and the procedures for its implementation in conjunction with large safety or thermal-hydraulics codes are outlined. The method is also compared with currently used response surface techniques.

- 3376 ROLE OF RAYLEIGH--TAYLOR INSTABILITIES IN FUEL-COOLANT INTERACTIONS. Cooper, F.; Dienes, J. (Los Alamos Scientific Lab., NM). Nucl. Sci. Eng.; 68: No. 3, 308-321(Dec 1978).

The growth of Rayleigh--Taylor instabilities following the deceleration of fuel by a less dense coolant is investigated using the method of generalized coordinates, which permits the study of the nonlinear, late-time aspects of the problem as well as the possibility of fuel freezing at the interface. The authors consider liquid coolant in contact with three possible states of fuel--pure liquid, pure solid, and liquid fuel freezing at the interface--and treat several acceleration mechanisms. For the case of UO_2 and sodium, they follow the growth of the fastest growing wavelength instability

for different acceleration mechanisms and determine the impulse needed for instabilities to grow when freezing is occurring at the interface.

- 3377 COMPARATIVE ANALYSIS OF THREE OF ERDA'S MAJOR R AND D PROGRAMS. Weyant, J.P. (Harvard Univ., Cambridge, MA (USA)). Energy (Oxford); 3: No. 6, 701-735(Dec 1978).

The present model simulates the dynamics of the evolution of the total energy system by requiring both existing and new technologies to compete for introduction on a cost-competitive basis that considers the time phasing of (1) retirement of energy conversion facilities, (2) growth in end-use demands, and (3) escalation of the costs of extracting depleting domestic energy resources. This approach contrasts with a static model used by the Energy Research and Development Administration, wherein assumptions must be made for each future year of interest for (1) maximum capacity constraints for alternative types of conversion facilities and (2) the cost of energy resources. The present model is used to compare the relative consequences and merits of the technology products from the following three of ERDA's major energy R and D programs: (1) the liquid-metal fast breeder reactor (LMFBR), (2) synthetic fuels derived from coal and oil shale, and (3) improved efficiencies for end-use devices (e.g. space heaters).

- 3378 COMPARATIVE ANALYSIS OF THREE OF ERDA'S MAJOR R AND D PROGRAMS. Weyant, J.P. (Harvard Univ, Cambridge, Mass). Energy (Oxford); 3: No. 6, 701-735(Dec 1978).

The model used simulates the dynamics of the evolution of the total energy system by requiring both existing and new technologies to compete for introduction (i.e. commercialization) on a cost-competitive basis that considers the time of phasing of (1) retirement of energy-conversion facilities, (2) growth in end-use demands, and (3) escalation of the costs of extracting depleting domestic energy resources. The model is used to compare the relative consequences and merits of the technology products from the following three of ERDA's major energy R and D programs: (1) the liquid-metal fast breeder reactor (LMFBR), (2) synthetic fuels derived from coal and oil shale, and (3) improved efficiencies for end-use devices (e.g. space heaters). It is found that the development of synthetic fuels derived from coal and oil shale is the only alternative (of the three considered) that provides energy independence for the United States in the next fifty years.

- 3379 FISSION AND FUSION REACTORS. CRITICAL ISSUES FACING THE LONG TERM DEPLOYMENT OF FISSION AND FUSION BREEDER REACTORS. Kulcinski, G.L. (Wisconsin Univ., Madison (USA). Dept. of Nuclear Engineering). Atomwirtsch., Atomtech.; 13: No. 12, 582-589(Dec 1978).

From Reactor congress; Hannover, Germany, F.R. (4 - 7 Apr 1978).

The paper discusses whether breeder reactors should be based on the fission or the fusion concept, taking into account aspects of safety, acceptability to environment and society, dependence on fuel, installation costs, complexity of the technology applied, and earliest possible availability.

- 3380 INTERNAL FLUID FLOW MANAGEMENT ANALYSIS FOR CLINCH RIVER BREEDER REACTOR PLANT SODIUM PUMPS. Cho, S.M.; Zury, H.L.; Cook, M.E.;

Fair, C.E. (Foster Wheeler Energy Corp, Livingston, NJ). Am. Soc. Mech. Eng., [Pap.]; No. 78, 1-12(Dec 1978).

The Clinch River Breeder Reactor Plant (CRBRP) sodium pumps are currently being designed and the prototype unit is being fabricated. In the design of these large-scale pumps for elevated temperature Liquid Metal Fast Breeder Reactor (LMFBR) service, one major design consideration is the response of the critical parts to serve thermal transients. Therefore, the design/development program includes tasks to assure adequate performance as well as reliable operation. In order to demonstrate sufficient margin for operability (i.e. against bearing seizure), a detailed thermal/structural analysis of the critical parts of the pump is required. Analytical and water test data were compared. This paper presents the details of the pump internal hydraulic analysis, and a comparison between analysis and half-scale model test results.

- 3381 MAINTENANCE ASSESSMENT FOR ADVANCED NUCLEAR POWER PLANTS. Basham, S.J. Jr.; Waddell, J.D.; Robinson, R.A.; Kok, K.D. (Battelle Mem Inst, Columbus Lab, Ohio). Am. Soc. Mech. Eng., [Pap.]; No. 78-WA/NE-1, 1-7(Dec 1978).

Proper planning for maintenance and inspection tends to increase the overall availability of nuclear power plants. High potential availability is the basic measure of a successful power plant since replacement power costs are high. The study reported here compared the maintenance and inspection requirements of generic pool and loop type Liquid Metal Fast Breeder Reactors to determine if there were significant differences in these two systems owing to their fundamental difference in design. The size, number and types of failed components affected downtime for maintenance but accessibility and arrangement of components also strongly influenced the downtime. 10 refs.

- 3382 VALUE OF PROTOTYPE TESTING IN THE DEVELOPMENT OF THE IN-VESSEL HANDLING MACHINE FOR FFTF. Sharbaugh, J.E. (Westinghouse Electr Corp, Madison, Pa). Am. Soc. Mech. Eng., [Pap.]; No. 78-WA/NE-3, 1-4(Dec 1978).
Refueling system components for Liquid Metal Fast Breeder Reactors require a high degree of accuracy because of the need to function remotely without visual access. Also, they must have proven reliability to assure minimum plant outage for reactor refueling. The experience gained in the development of the in-vessel handling machine (IVHM) for the Fast Flux Test Facility reactor dramatically indicates that construction, testing, and modification of the design are an essential part of the development of this type of equipment. It is suggested that design and development schedules for this type of equipment must allow for production and testing of prototypes to assure that functional requirements of plant equipment will be achieved.

- 3383 CLOSED LOOP IN-REACTOR ASSEMBLY (CLIRA)-- A FAST FLUX TEST FACILITY TEST VEHICLE. Oakley, D.J. (Westinghouse Hanford Co, Richland, Wash). Am. Soc. Mech. Eng., [Pap.]; No. 78-WA/NE-6, 1-15(Dec 1978).
The Closed Loop In-Reactor Assembly (CLIRA) is a test vehicle for in-core material and fuel experiments in the Fast Flux Test Facility (FFTF). The CLIRA is a removable/replaceable part of the Closed Loop System (CLS) which is a sodium coolant system. The primary purpose of the CLIRA is to provide a test vehicle which

will permit testing of nuclear fuels and materials at conditions more severe than exist in the FTR core and to isolate these materials for the reactor core. This paper characterizes the elements that comprise the CLIRA, and presents the requirements that established the design, describes the design, and evaluates the design conformance to the requirements. 7 refs.

- 3384 INELASTIC STRUCTURAL ANALYSIS: DESIGN IMPLICATIONS AND EXPERIENCE. Griffin, D.S. (Westinghouse Electric Corp., Madison, PA (USA). Advanced Reactors Div.). Nucl. Eng. Des.; 51: No. 1, 11-21(Dec 1978).
The current status of inelastic structural analysis is reviewed relative to the needs and requirements for design of elevated temperature nuclear reactor components. The classes of inelastic problems that can be solved in a practical way are identified and the overall scope of ongoing validation programs is reviewed. Three classes of problems are identified where the further development of simplified analysis techniques is necessary to make them tractable for design application.
3385 ESTABLISHING CONSTITUTIVE EQUATIONS FOR USE IN DESIGN OF HIGH-TEMPERATURE FAST-REACTOR STRUCTURES. Pugh, C.E. (Oak Ridge National Lab., TN (USA)). Nucl. Eng. Des.; 51: No. 1, 23-27(Dec 1978).
The presentation describes the approach being used to establish constitutive equations for wide use in the design of fast breeder reactor (FBR) components in the US. The approach combines exploratory experiments, constitutive model studies, studies of computational techniques, and tests of simple structural configurations. Short-time (elastic-plastic) behavior, long-time (creep) behavior, and their interactions are considered, and some of the background to equations now identified for use in current FBR design applications involving three structural alloys is discussed. Comments are also given on current efforts aimed at identifying improved constitutive equations for these alloys and on properties data required for design applications. References are cited which have addressed the status of the process at various times.

- 3386 SNR-300, STRATEGY AND STATE OF THE ELEVATED TEMPERATURE DESIGN. Bieniussa, K. (Interatom, 5060 Bergisch Gladbach 1, Germany, F.R.). Nucl. Eng. Des.; 51: No. 1, 81-84(Dec 1978).
This paper describes the procedure for the elevated-temperature structural analysis of the SNR-300. The preliminary analysis based on elastic calculations will be followed by detailed inelastic analysis, if required to provide assurance against all failure modes. In coherence with the progress of the project, experimental work is being done as a first phase of preparation to the elevated temperature design. On the one hand material data will be established and on the other hand analytical work for computer codes and design criteria will be done. The first inelastic investigations are running. Changes in the geometry of the components and/or the planned operating conditions can be considered in case the structural adequacy cannot be demonstrated even through detailed inelastic analysis.

- 3387 NO FAST BREEDER FOR THE FEDERAL REPUBLIC OF GERMANY. THE PROBLEM OF A TENDENCY TOWARDS NON-LICENSING. Fischerhof, H. (Frankfurt Univ. (Germany, F.R.)). Atomwirtsch., Atomtech.; 13: No. 12, 566-569(Dec 1978).

(In German).

The proposal by North Rhine-Westphalian State Minister of Economics Riemer to modify the SNR-300 prototype fast breeder power plant under construction at Kalkar since 1973 in such a way that the use of thorium instead of uranium-238 would no longer breed plutonium but consume it, has aroused considerable attention, chiefly also for the reason that the Minister no longer wants to issue the pending partial construction permit and the subsequent operating permit for the present fast breeder concept. In addition to technical and scientific implications this attitude has also raised legal questions. They above all relate to the question to what extent the basic decision of 1972, when the first construction permit was issued, is binding upon the licensing authority, both in terms of energy law and atomic law, and to what extent the Federal Government, which supports and funds most of the development of fast breeder reactors, has a right to issue directives in order to have the pending permit granted.

3388 CONSTRUCTION LICENSE FOR MECHANICAL ENGINEERING AND ELECTRICAL ENGINEERING COMPONENTS OF THE SNR. Bundesanzeiger; 30: No. 243, 2(Dec 1978). (In German).

CONSTRUCTION/ELECTRICAL EQUIPMENT; REACTOR LICENSING; SNR-1 REACTOR

3389 PROPOSED MECHANISM FOR INTERNAL CLADDING CORROSION IN LMFBR MIXED OXIDE FUEL PINS. Bradbury, M.H.; Pickering, S.; Whitlow, W.H. (Commission of the European Communities, Karlsruhe (Germany, F.R.). European Inst. for Transuranium Elements). J. Nucl. Mater.; 78: No. 2, 272-280(Dec 1978).

A model is proposed which describes a possible chronological sequence of events during inner cladding corrosion in mixed oxide fuel pins. The corrosion reaction is visualized as being primarily chemical in character, involving the cladding steel, the fuel and the more aggressive fission products, notably caesium in the presence of oxygen. The model attempts to explain how corrosion starts, how it depends on the oxygen potential, why it occurs non-uniformly; also covered are phase changes within the cladding steel and morphological features such as the intergranular form of attack and the distribution of corrosion products in the fuel/cladding gap.

3390 DEVELOPMENT OF A BEARING FOR SODIUM PUMPS. Gelijon, H.C. Energiespectrum; 2: No. 12, 296-301(Dec 1978). (In Dutch).

For the development of the prototype of a circulation pump for the fast breeder reactor SNR 300, a method is required to run a support bearing for a vertical rotor, about 7m long, working in a liquid sodium environment. It is convenient in such a situation to select the process medium as the lubricant. Liquid sodium from 500° to 600° has however, no attractive properties as a lubricant. The dynamic viscosity is a factor 4 to 5 lower than water at room temperature, so that for a hydrodynamic pressure build-up in the lubricant film, there is little prospect. A hydrostatic layer may be present. Such a bearing derives its carrying capacity from the supply of lubricant under pressure. For the case of the circulator pump, the feed to the bearing can be made from a tapping in the pump diffuser. As a contrast for the Nuclear Energy Project Group TNO and the BV Nerotoom, the Institute TNO for Machine Tool Constructions (IWeCo) has developed a new type of hydrostatic bearing.

3391 CONDITIONING OF LIQUID SODIUM PUMPS BY THE USE OF ACOUSTIC METHODS. Moelker, W.H.; ten Wolde, T. Energiespectrum; 2: No. 12, 302-303(Dec 1978). (In Dutch).

In pumps, cavitation is often a serious source of erosion, and can lead to negative effects such as a shortened lifetime for the rotor, a reduced performance of the pump and a deterioration in the reliability. For liquid sodium pumps such as those as for example, that have been made for the nuclear power station at Kalkar, cavitation must be seen as a phenomenon which can be reduced and in every case kept under scrutiny. It is consequently necessary to detect cavitation in liquid sodium pumps. This is no simple task as liquid sodium is non-transparent, the temperature is high (up to 650°C) the rotor blade cavities are rotating and cavitation is an undeveloped physical phenomenon. Nevertheless, there is a possibility of using relatively simple aids such as accelerometers and mechanical sensors to achieve a fairly reliable insight into the cavitation features within the pump. A contract from Neratoom has been undertaken by the Technical Physics Service of the TNO (TPD) using various detection methods.

3392 TRANSIENT FLOW AND HEAT TRANSFER OF LIQUID SODIUM COOLANT IN THE OUTLET PLENUM OF A FAST NUCLEAR REACTOR. Markatos, N.C.G. (CHAM Ltd., Wimbledon (UK)). Int. J. Heat Mass Transfer; 21: No. 12, 1565-1579(Dec 1978).

A calculation procedure for axisymmetric elliptic flows is applied to predict the transient velocity and temperature fields of a heavy fluid jet issuing vertically into a volume of relatively light fluid. This situation arises in the outlet plenum of a Liquid-Metal-Cooled Fast Breeder Reactor (LMFBR) during reactor transients. The time averaged conservation equations for momenta and heat transfer were solved on a CDC6600 digital computer for various plenum inlet transients, along with a two-equation model of turbulence and proper modelling of the buoyancy terms. Predictions are presented of flow and heat transfer in the form of velocity vector plots and temperature contours. Predictions are in qualitative agreement with expectations, invariably establishing that the flow by-passes the outlet plenum.

3393 CONTROL OF TRITIUM IN LIQUID-METAL-COOLED FAST BREEDER REACTORS (LMFBRs). McGuire, J.C. (Hanford Engineering Development Lab., Richland, WA (USA)); Renner, T.A. (Argonne National Lab., IL (USA)). At. Energy Rev.; 16: No. 4, 657-695(Dec 1978).

In liquid-metal-cooled fast breeder reactors tritium originates principally in two locations, the fuel and the control rods. It is created in the fuel by ternary fission and in control rods by neutron interaction with the boron in B₄C. Tritium diffuses readily through the cladding material of these components and is carried by the sodium coolant throughout the primary circuit. From primary sodium it may diffuse through heat exchangers to the secondary circuit, be released to the cover gas, permeate reactor walls into the containment vessel, or be removed by the primary cold trap. Similarly, from the secondary sodium tritium may diffuse through the heat transfer surfaces of the steam generator, be released to the cover gas, permeate through reactor walls to auxiliary containment, or be removed by the secondary cold traps. Protective oxide films on the outside walls of the reactor vessels and sodium piping significantly reduce the permeation rate

of tritium through the structural materials. In addition, tritium retention within the sodium containment is enhanced by coprecipitation with hydrogen in the cold traps. A substantial hydrogen influx to the secondary circuit as a result of steam-side corrosion and permeation through steam generator tubing provides a source of hydrogen that assists in tritium control. Once in the secondary circuit, hydrogen is either removed by the secondary cold traps or diffuses through the intermediate heat exchanger to the primary circuit. The hydrogen source term in a reactor is roughly 10^4 times greater than that for tritium. Therefore, in either the primary or the secondary circuit, sufficient hydrogen is available for efficient tritium removal by coprecipitation.

- 3394 Donen Ju-nenshi. (TEN YEARS' HISTORY OF POWER REACTOR AND NUCLEAR FUEL DEVELOPMENT CORPORATION). Tokyo, Japan; Power Reactor and Nuclear Fuel Development Corp. (Dec 1978). 636p. (In Japanese).

Power Reactor and Nuclear Fuel Development Corporation (PNC) has advanced steadily for ten years since its establishment along the policy lines of Japan's own nuclear energy development. Brilliant results thus include: the world's fifth nation of possessing an experimental fast reactor, completion of a (prototype) heavy-water power reactor, establishment of uranium ores prospecting and refining technology, successful approach to uranium enrichment, and fuel reprocessing and waste management leading to Japan's nuclear fuel cycle. Intended for further efforts by PNC personnel and for report to the those people concerned, the present volume of PNC's ten years' history is in chapters of power reactors development, nuclear fuel development, safety management, general administration, and safeguards and nuclear materials control.

- 3395 LIQUID METAL FAST BREEDER REACTORS. Khodarev, E. (International Atomic Energy Agency, Vienna (Austria). Div. of Nuclear Power and Reactors). Int. At. Energy Agency Bull.; 20: No. 6, 29-36 (Dec 1978).
The present state and trends in the development of LMFBR type reactors are analyzed. General principles of fast breeder reactors, main fast breeder reactor types and their design parameters are discussed.

- 3396 POSSIBILITY OF ACOUSTIC DETECTION ON SODIUM BOILING IN A FAST REACTOR BY A PULSE SYSTEM. Kebabze, B.V.; Aleksandrov, K.A.; Golovanov, V.V. At. Energ. (USSR); 45: No. 6, 461-463 (Dec 1978). (In Russian).
ACOUSTIC MONITORING; BOILING; BACKGROUND NOISE; BOILING DETECTION; FAST REACTORS; PULSE TECHNIQUES; SODIUM COOLED REACTORS

- 3397 CREYS-MALVILLE POWER PLANT. Rev. Gen. Nucl.; No. 6, 474-475 (Dec 1978). (In French).
This article presents the power plant construction works, which were started on the Creys-Malville area at the beginning of 1977, after the preparing of the site. Information is given on the different kinds of works going on, among which, for example, the construction of the reactor pressure vessel.

- 3398 (RISLEY-Trans--4105) MONITORING THE CONDITION OF SODIUM PUMPS USING ACOUSTIC METHODS. Moelker, W.H.; ten Wolde, T. Translated from Energiespectrum; 302-303 (Dec 1978). 6p. Dep. NTIS (US Sales Only), PC

A02/MF A01.

Cavitation is a serious source of erosion in pumps which can result in negative effects such as reduced impeller life, reduced pump performance and reduced reliability. For sodium pumps such as those which will form a part of the Kalkar Nuclear Power Station, for instance, cavitation must therefore be regarded as a phenomenon which must be avoided so far as is possible and which in any case must be monitored. Methods for detecting cavitation in sodium pumps are described.

- 3399 REFUELING DEVICE FOR A NUCLEAR REACTOR WITH FAST NEUTRONS. Artemev, L.N.; Vitalevitsch, K.V. (to Deutsches Patentamt, Muenchen (Germany, F.R.)). German (FRG) Patent 2,723,680/A/. 30 Nov 1978. 17p. (In German).

The refueling device has got a drum-shaped cartridge containing cells for unirradiated fuel assemblies and control rods as well as a grab for manipulation. The cells for the fuel assemblies are identical with those for the control rods. For the control rods in stock and those on the way from the drum-shaped magazine to the refueling mechanism there are provided cup-shaped casings (adapters) adapting their ends to the dimensions of the fuel assemblies. The casing is clamped to an annular tee-slot below the top by means of a collet. By this means fuel assemblies as well as control rods can be handled with the grab. By means of a stop on the grab the casing can be detached from the control rod.

- 3400 DEVICE FOR THERMAL PROTECTION OF A NUCLEAR REACTOR VESSEL. Gama, J.M.; Paillard, L. (to Commissariat a l'Energie Atomique). US Patent 4,127,444. 28 Nov 1978. Priority date 6 Apr 1976, France, 10p.

A part of the cold liquid metal which is injected at the base of the reactor core is circulated along the bottom portion of the main reactor vessel and guided by a shell which is concentric with the vessel. A mass of inert gas is trapped within a leak-tight annular chamber above the liquid metal. During reactor operation, the gas pressure is adjusted in order to maintain the gas/liquid metal interface at a substantially constant level and to obtain along the vessel a temperature distribution which ensures limited amplitude of stress variation.

- 3401 CONTROL ROD DRIVE FOR A NUCLEAR REACTOR. Schutachkov, I.I.; Gorunov, V.S.; Zalcev, B.I.; Derevyankin, N.E.; Petrov, V.A.; Istomin, S.D.; Kovalentschik, D.I.; Archipov, E.A.; Serebryakov, V.I.; Katschaln, V.S. (to Deutsches Patentamt, Muenchen (Germany, F.R.)). German (FRG) Patent 2,722,050/A/. 23 Nov 1978. 32p. (In German).

The control of the rod repositioning gear unit and the control unit of the profile grab of the control rod drive for the alkali metal-cooled fast breeder reactor is achieved by an electromotor being arranged outside the hermetic drive casing. The guide tube is directly repositioned by the rod repositioning gear unit. Coupling control of the drive with the control rod is done in the lower operative position of the control rod and that because of the interaction of the tie rod arranged on the spring-mounted control rod with the induction transmitter for the lower position of the control rod. In the transfer position the rod is fixed within the guide tube.

- 3402 REFUELING FACILITIES. Daiku, M. (to

Toshiba Corp., Kawasaki, Kanagawa (Japan)). Japanese Patent 1953-132,690/A/. 18 Nov 1978. 3p. (In Japanese).

Purpose: To provide the subject facilities by which fuel or core assemblies together with coolants are charged and discharged in a state where the fuel and core assemblies are placed in a pot, thereby preventing the reactor coolants from overflowing and falling from and in the reactor. Constitution: The pot in a state where core assemblies and coolants are contained therein is transferred to a pot relaying device outside the reactor by means of a pot charging and discharging device. The pot moves at a predetermined distance by the pot relaying device to a position where only fuel or core assemblies are caught and taken out by the fuel transfer device. On the other hand, the second fuel or core assemblies are carried by means of a fuel transfer device, and placed in the pot, then they being transferred by the refueling machine and inserted into the reactor vessel.

3403 SODIUM-WATER REACTION PRODUCT FLOW SYSTEM. Shirataki, K.; Wada, H. (to Mitsubishi Atomic Power Industries, Inc., Tokyo (Japan)). Japanese Patent 1953-132,695/A/. 18 Nov 1978. 3p. (In Japanese).

Purpose: To provide the subject equipments wherein thermal insulating layers which neither exfoliate nor react by the impact due to high temperature sodium and hydrogen gas and are used for mitigating the thermal impact are provided on the inner surfaces of the emission system equipments, thereby preventing the destruction of the emission system equipments. Constitution: Thermal insulating layers are formed on the inner surfaces of sodium-water reaction product emission system equipments, that is, the inner surface of the emission system pipeline, that of the accommodation vessel and the surface of the cyclone separator, by film treatment, coating or heat resisting coating, and these surfaces are covered with the layers. Each of the layers is made of a material which does not cause a rapid reaction with high temperature sodium or hydrogen gas nor exfoliates and is withstandable for several seconds in which the thermal impact of at least the emission system comes into question, and its thickness is more than one capable of securing the necessary thermal resistance computed by the thermal impact analysis of the emission system.

3404 METHOD OF SAFE OPERATION OF LMFBR TYPE REACTOR. Kondo, R.; Amada, T. (to Hitachi Ltd., Tokyo (Japan)). Japanese Patent 1953-131,394/A/. 16 Nov 1978. 3p. (In Japanese).

Purpose: To provide the subject method of heat exchange between a primary cooling system where a liquid metal circulates and a water-steam system by means of a stable substance which reacts with neither the liquid metal nor water, thereby elevating the workability, reliability and economy of the reactor. Method: The heat transmission tube of a heat exchanger is of a double structure, and the interior of the inner tube of the heat transmission tube forms a flow passage of the water-steam system, and the outer periphery of the outer tube of the heat transmission tube forms a flow passage of the liquid metal which is a primary coolant. The heat exchange between the inner tube of the heat transmission tube is carried out by means of a stable substance such as mercury which reacts with neither water nor the liquid metal which is filled in the annulus section between the inner tube of the heat transmission tube and the outer tube thereof. The stable

substance is circulated in a loop shape as necessary.

3405 NUCLEAR FUEL ELEMENTS. Ozaki, S.; Ochi, Y.; Matsumura, K. (to Toshiba Corp., Kawasaki, Kanagawa (Japan)). Japanese Patent 53-131,397/A/. 16 Nov 1978. 5p. (In Japanese).

The purpose is to use a low swelling alloy, in which the formation of voids in the metal of alloy is suppressed by the action of fast neutrons at high temperatures, as a cladding material in a fuel rod used in a fbr type reactor and a structural material for supporting the fuel core. The fuel core composed of an oxide, a nitride or a carbide of uranium is clad with an austenite stainless steel containing 6 to 26% of chromium, 0.03 to 0.5% of titanium, and less than 0.7% of silicon.

3406 TEMPERATURE-DEPENDENT LIQUID METAL FLOWRATE CONTROL DEVICE. Carlson, R.D. (to Dept. of Energy). US Patent 4,125,221. 14 Nov 1978. Filed date 7 Sep 1977. 4p. PAT-APPL-831,193.

A temperature-dependent liquid metal flowrate control device includes a magnet and a ferromagnetic member defining therebetween a flow path for liquid metal, the ferromagnetic member being formed of a material having a curie temperature at which a change in the flow rate of the liquid metal is desired. According to the preferred embodiment the magnet is a cylindrical rod magnet axially disposed within a cylindrical member formed of a curie material and having iron pole pieces at the ends. A cylindrical iron shunt and a thin wall stainless steel barrier are disposed in the annulus between magnet and curie material. Below the curie temperature flow between steel barrier and curie material is impeded and above the curie temperature flow impedance is reduced.

3407 METHOD FOR PRE-HEATING LMFBR TYPE REACTORS. Yokozawa, A.; Kataoka, H. (to Power Reactor and Nuclear Fuel Development Corp., Tokyo (Japan)). Japanese Patent 53-129,798/A/. 13 Nov 1978. 3p. (In Japanese).

Purpose: To enable pre-heating for the inside of the reactor container and the inside of the coolant recycling system with no additional facilities. Method: The coolant recycling system is composed of a heat exchanger, a mechanical pump, a check valve, a flow meter or the like and it is connected in series by way of a pipe line to a reactor container. The mechanical pump is used as a gas recycling device upon pre-heating and it is designed so that a blower such as a fan can be replaced for the impeller of the pump. The inside of the reactor container and the inside of the coolant recycling system is at first filled with an inert gas such as for use with cover gas. Then, nuclear fuels are loaded to attain criticality. Simultaneously, the blower is started and the control rods are operated while cooling the nuclear fuel with the inert gas thus to obtain heat required for pre-heating the pipe line or the like from the nuclear fuels. After the completion of the pre-heating, the liquid metal is charged.

3408 BETHE DECRIES U.S. LAG IN BREEDERS AND NAVY'S NEAR-BREEDER SECRETS. Energy Res. Rep.; 4: No. 20, 2-6(6 Nov 1978).

Part two of an interview with Hans Bethe continues with his projection of uranium

supplies lasting through 2030 and his concern that U.S. policy is retarding development of breeder reactors to the point where imported breeders may be needed. Bethe prefers the liquid-metal breeder reactor concept because of its efficient cooling properties and its low pressure compared to light-water reactors. He feels that safety concerns about the critical mass potential are not warranted, but that the heat-exchanger design is more critical. The discussion covers a comparison of the French program, which he finds to be the most advanced; the Shippingport "near breeder"; and the Canadian program, which he considers the best "near-breeder" if it is modified to use thorium.

- 3409 FAST NUCLEAR REACTOR. Iljunin, V.G.; Kusnezov, I.A.; Murogov, V.M.; Silaev, J.V.; Schmelev, A.N. (to Deutsches Patentamt, Muenchen (Germany, F.R.)). German (FRG) Patent 2,323,938/B/. 2 Nov 1978. 5p. (In German).

The FBR BN-350 has got a reactor core with a set of fuel cartridges. In vertical direction the inner space of the cartridges is divided into two sections containing fuel elements. In order to improve the conversion ratio the lower fuel elements-regarded in flow direction of the coolant - are filled with metallic uranium and the upper fuel elements with ceramic plutonium. The height of the lower section amounts to 0.3 up to 0.7 times the length of a cartridge.

- 3410 USE OF ZERO POWER PLUTONIUM REACTOR MEASUREMENTS AS A SUPPORT OF CRITICALITY PREDICTION FOR THE SNR-300. Pilate, S. (Belgonucleaire Rue du Champ de Mars, Brussels, Belgium); de Wouters, R.; Wehmann, U.; Helm, F.; Scholtyssek, W. Nucl. Technol.; 41: No. 1, 5-11 (Nov 1978).

Evaluations of criticality measurements performed in various SNEAK and Zero Power Plutonium Reactor (ZPPR) cores are compared. The best available methods of calculations (including transport theory) are used. The ZPPR results support well the trend indicated by the SNEAK evaluations for clean cores and for cores with followers; for cores with absorbers partially inserted, the agreement is only rough. Evaluations of control rod worth measurements are therefore also compared, using the routine method of calculation for SNR-300 (diffusion theory). The control rod worths are largely underestimated in SNEAK ($C/E = 0.89$), but only slightly underestimated in the ZPPR ($C/E = 0.97$). The difference in the nature of core fuel (uranium in SNEAK, plutonium in the ZPPR) could be at the origin of this discrepancy.

- 3411 ACTINIDE REDISTRIBUTION IN THE OUTER REGIONS OF MIXED-OXIDE FUEL. Lawrence, L.A.; Hata, D.C.; Washburn, D.F. (Hanford Engineering Development Lab., Richland, WA). Nucl. Technol.; 41: No. 1, 60-70 (Nov 1978).

Significant actinide redistribution was observed in the outer low-temperature region of uranium-plutonium mixed-oxide fuel. Data from the large number of fuel pins examined indicated boundaries within which redistribution in the outer low-temperature regions of the fuel occurred. Plutonium redistribution was not observed in fuel pins with an initial fuel oxygen-to-metal ratio (O/M) of >1.98 or in fuel irradiated to burnups of <5.0 at. %. Fuel pins with an initial O/M ratio of 1.96 exhibited plutonium enrichments in the equiaxed grain region and uranium enrichments in the equiaxed grain region and uranium enrichments on the fuel outer periphery at a burnup of greater than or equal to 5.0 at. %.

Approx. 6.5 at. % burnup, a transition in character of the actinide distribution occurred, resulting in plutonium enrichments on the outer periphery of the fuel. Increasing the fuel initial O/M to 1.97 decreased the burnup at which plutonium enrichment occurred near the equiaxed grain region from 6.5 to 5.0 at. %. Conversely, decreasing the initial O/M ratio from 1.96 to 1.95 increased the burnup at which plutonium enrichment occurred in the equiaxed grain region from approx. 6.5 to approx. = 7.5 at. %.

- 3412 RESISTANCE WELDING OF PRESSURIZED CAPSULES FOR IN-PILE CREEP EXPERIMENTS. de Burbure, S. (Centre d'Etude de l'Energie Nucleaire, Mol, Belgium). Weld. J. (Miami); 57: No. 11, 23-30 (Nov 1978).

Resistance welding was chosen to obtain welds that could qualify in in-pile tests of fuel cans for use in LMFBR reactors to obtain creep behavior information on ferritic steel. Methods and resistance welding equipment are described. (FS)

- 3413 BURNING RATES OF SODIUM POOL FIRES. Newman, R.N.; Payne, J.F.B. (CEGB, Berkeley Nucl Lab, Gloucestershire, Engl.). Combust. Flame; 33: No. 3, 291-297 (Nov 1978).

The burning rates of sodium pool fires were measured at pool diameters of 50, 100, and 220 mm. The pool burning was found to exhibit a flat flame zone residing close to the surface of the liquid metal pool. A model of sodium poolburning is produced dealing in particular with the variation of burning rate with pool size. This analysis forms the basis of prediction of heat release and smoke release rates as may occur from large pool fires following accidents in sodium-cooled fast breeder nuclear reactors.

- 3414 LOAD-VARYING OPERATION OF A NUCLEAR POWER PLANT WITH FAST BREEDER REACTORS. Iljunin, V.G.; Kuznetsov, I.A.; Murogov, V.M.; Shmelev, A.N. (Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Obninsk. Fiziko-Ehnergeticheskij Inst.). Kernenergie; 21: No. 11, 341-344 (Nov 1978). (In German).

The possibility of effectively using fast breeders in nuclear power plants with several nuclear reactors of different type is discussed. This possibility may emerge in a nuclear power plant where some nuclear reactors generate heat in a single thermodynamic cycle. In such a nuclear power plant metallic fuel can be used in the fast breeder such increasing the breeding ratio and, at the same time, making possible generation of high temperature heat in the plant.

- 3415 MODEL TO DESCRIBE THE ROLE OF NON-EQUILIBRIUM INTRAGRANULAR FISSION GAS BUBBLES DURING TRANSIENT HEATING. Wood, M.H. (UKAEA, Harwell. Atomic Energy Research Establishment). J. Nucl. Mater.; 78: No. 1, 58-63 (Nov 1978).

The presence of fission gases in nuclear fuel could markedly affect the course of possible fast reactor accidents. Thus, it is important to understand the behaviour of these gases under the various possible accident situations. Recent out-of-pile rapid heating experiments on pre-irradiated fuel have indicated that non-equilibrium intragranular gas bubbles may be formed during a transient. Moreover, it is anticipated that the formation of such overpressured bubbles could produce important consequences for the subsequent transient behaviour. In the present work the author has extended a previous model of the

fission gas behaviour under rapid heating conditions, which considered all gas bubbles to be in equilibrium throughout the transient, for application to possible non-equilibrium regimes. Results of calculations performed with the models show the importance of employing the more extensive theoretical approach.

- 3416 EXPERIMENTAL INVESTIGATION OF THE EFFICIENCY OF INTERMEDIATE HEAT EXCHANGERS OF THREE-LOOP NUCLEAR POWER PLANTS. Karetnikov, G.B.; Rassokhin, N.G.; Mel'nikov, V.N. Teploenergetika (Moscow); No. 11, 62-65 (Nov 1978). (In Russian).

An experimental determination of effective coefficients of overflows and an investigation of mixed convection in the inter-tube space of single-bundle and triple-bundle models of the BN-350 intermediate heat exchangers was carried out. The triple-bundle model consisted of a narrow box-type housing with three vertical U-shaped tube bundles 1 m high. Sodium was used in both loops as the heat carrier. 11 refs.

- 3417 EXTINGUISHER POWDER FOR LIQUID METAL FIRES. Menzenhauer, P.; Ochs, G. (Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Inst. fuer Reaktorentwicklung). Brandschutz; 32: No. 11, 318-321 (Nov 1978). (In German).

The extinguisher introduced here based on graphite exhibited considerably improved extinguishing properties compared to other extinguishing powders. It has no aggressive properties, is, as far as could be tested in the short time available, non-hygroscopic and thus very easy to remove after extinguishing and cooling of the fire. The amount of extinguisher necessary is only a fraction of the amounts needed of other common powders. Storage is no problem and merely a small storage amount is required. This extinguisher is excellently suitable for fighting sodium surface fires.

- 3418 EVALUATION OF ANELASTICITY AND PLASTIC CREEP LIMIT FOR ALLOY 800. Tavassoli, A.A. (CEA Centre d'Etudes Nucleaires de Saclay, 91 - Gif-sur-Yvette (France). Service de Recherches Metallurgiques Appliquees). Nucl. Eng. Des.; 50: No. 3, 425-430 (Nov 1978).

The elevated temperature tensile, anelastic and creep properties of a precipitation strengthened Ni-Cr austenitic steel (alloy 800) have been evaluated with respect to LMFBFR application. These properties have been estimated and formulated for small strains and temperatures on the order of 823 K. It has been shown that despite suppression of the in-service stresses to beneath the alloy's yield strength, deformation will occur at such temperatures and the stress below which plastic strain is effectively zero (plastic creep) is negligible for a reactor life time. The plastic creep limit at a given time and temperature markedly depends on the degree of precipitation hardening or prior cold deformation for alloy 800. The contribution from anelastic deformation is less than 0.05% and only becomes important for strict dimensional control and constrained parts.

- 3419 EXPERIMENTS IN SODIUM BOILING ON THE BOR-60 REACTOR. Afanas'ev, V.A.; Aleksandrov, K.A.; Kabadze, B.V. At. Energ. (USSR); 45: No. 5, 338-342 (Nov 1978). (In Russian).

Data on boiling fuel assembly (BFA), measuring system and experimental results on sodium boiling in the BOR-60 reactor core are presented. BFA consists of 18 tungsten rods and

an iron rod of 6 mm in diameter and 450 mm in length. Sodium boiling in the BFA of the BOR-60 core achieved as a result of heating of tungsten rods by γ -radiation. Four regimes of boiling were tested depending on the power rise rate till 10 MW. A conceptual possibility of detecting boiling by acoustic and neutron noises and some results of spectral and correlation analyses are demonstrated. It is shown that signal forming is necessary to increase detection reliability of boiling in the fast reactor core.

- 3420 EXPERIMENTAL DETERMINATION OF VISCOSITY OF SODIUM VAPOR. Sidorov, N.I.; Tarlov, Yu.V.; Yargin, V.S. (Moscow Aviat Inst, USSR). Heat Transfer - Sov. Res.; 10: No. 6, 125-131 (Nov-Dec 1978).

Viscosities of sodium were measured between 1101 to 1186; degree; K and 0.2 to 0.8 bar with an accuracy of $\pm$ 3 percent. The results of their theoretical correlation for the range of 900 to 1300; degree; K and 0.01 to 2 bar are presented. 6 refs.

- 3421 KEY ISSUES OF NUCLEAR POWER R AND D IN JAPAN. An, Shigehiro (Tokyo Univ. (Japan). Faculty of Engineering). Genshiryoku Kogyo; 24: No. 11, 41-46 (Nov 1978). (In Japanese).

Nuclear power technology, spreading over a number of specialized areas, is so-to-speak an extreme technology requiring the cooperation of scientists and technologists in respective fields. Its research and development require tremendous amounts of funds and manpower, with long lead times from the basic research up to the practical use. The nuclear power technology exerts thus large influences both socially and economically. The research and development of nuclear power do not remain only in technology. It is a problem spreading over society, economy, politics and diplomacy and compatibility is required in an extensive national system containing nuclear power. On the research and development of nuclear power in Japan, the following matters are described: targets of nuclear power development and the reality; perfection in LWR technology; FBR development; establishment of the nuclear fuel cycle comprising uranium resources, uranium enrichment, downstream and spent fuel storage; and the funding and program of research and development, cooperation of respective organizations, etc.

- 3422 RESERVATIONS CONCERNING AND PRECISION OF THE ATOMIC ENERGY ACT. THE CONSTITUTIONALITY OF THE FAST BREEDER OF KALKAR. Rengeling, H.W. Neue Jurist. Wochenschr.; 31: No. 44, 2217-2223 (Nov 1978). (In German).

During the constitutional review of section 7 Atomic Energy Act, the principles of reservations and of precision of the law were in the centre of the discussions. The author shows in detail that these standards, due to their constitutional derivation and their concretisation by jurisdiction, did not lead to unconstitutionality of section 7 AtG, as far as this regulation makes the licensing of the nuclear power plant of the type of the so-called fast breeders possible.

- 3423 DEVICE TO CONTROL THE COOLANT FLOW IN FUEL OR FERTILE ELEMENTS OF NUCLEAR REACTORS. Werner, F. (to Siemens A.G., Berlin (Germany, F.R.); Siemens A.G., Muenchen (Germany, F.R.); Deutsches Patentamt, Muenchen (Germany, F.R.)). German (FRG) Patent 2,005,868/C/. 26 Oct 1978. 5p. (In German).

Metering the coolant flow through the zone

of fuel or blanket elements is difficult because of the very limited possibility for external impact on the reactor core. In the invention, the coolant feed duct is to be connected with the coolant inlet side of the reactor by means of a variable throttle. The throttle is made up by the foot point of a fuel element; it can be varied by turning this foot point around the axis of the fuel element. Thus, turning of the fuel element in its seat within the support plate allows the flow to be controlled for the group combined in a subassembly and arranged in the same cooling channel. This metering system can be used in all reactor systems, but it offers special advantages when employed in fast breeder assemblies cooled by sodium.

- 3424 NUCLEAR REACTOR REFUELLING SYSTEM. Hopkins, S.R. (to UKAEA). British Patent 1,528,012/A/. 11 Oct 1978. 4p.

A handling system for fuel element assemblies of a liquid metal cooled nuclear reactor is described, the system comprising a transfer bucket and ramp means for guiding the bucket for lifting or lowering in a direction inclined to the vertical. A branch of the ramp means causes a change of attitude of the bucket on the ramp between parallelism and a vertical attitude. Guide means are provided for ensuring that the bucket engages said branch during lifting so as to change its attitude from vertical towards inclined.

- 3425 NUCLEAR REACTORS. Hopkins, S.R. (to UKAEA). British Patent 1,528,272/A/. 11 Oct 1978. 4p.

A nuclear reactor construction is described of the kind comprising a reactor core submerged in a pool of liquid metal contained by a primary vessel. The construction has an inclined chute for guiding a bucket containing a fuel element assembly into and out of the primary vessel and shock absorbing means at the foot of the chute for arresting a falling bucket. There is a vertical shaft displaceable along the longitudinal axis and a horizontally pivoted hooked link arranged so that the link can be pivoted to engage a radial projection on the bucket when in an inclined position and, by upward displacement of the shaft, pivot the bucket about its base into a vertical position.

- 3426 ULTRASONIC TRANSDUCERS. Bishop, J. (to UKAEA). British Patent 1,526,950/A/. 4 Oct 1978. 3p.

An ultrasonic transducer is described for use in a liquid metal environment, comprising piezo-electric material having a metallic coating which is bonded to a nickel diaphragm with lead. The piezo-electric material is lead zirconate titanate, and the metallic coating for the piezo-electric material is of silver.

- 3427 NUCLEAR REACTOR INSULATION AND PREHEAT SYSTEM. Wampole, N.C. (to Dept. of Energy). US Patent 4,118,278. 3 Oct 1978. Filed date 27 Sep 1976. 6p.
PAT-APPL-727,081.

An insulation and preheat system is disclosed for preselected components of a fluid cooled nuclear reactor. A gas tight barrier or compartment of thermal insulation surrounds the selected components and includes devices to heat the internal atmosphere of the compartment. An external surface of the compartment of enclosure is cooled, such as by a circulating fluid. The heating devices provide for preheating of the components, as well as maintenance of a temperature sufficient

to ensure that the reactor coolant fluid will not solidify during shutdown. The external cooling limits the heat transferred to other plant structures, such as supporting concrete and steel. The barrier is spaced far enough from the surrounded components so as to allow access for remote or manual inspection, maintenance, and repair.

- 3428 VARIABLE FLOW CONTROL FOR A NUCLEAR REACTOR CONTROL ROD. Carleton, R.D.; Bhattacharyya, A. (to Dept. of Energy). US Patent 4,118,275. 3 Oct 1978. Filed date 12 Dec 1974. 6p.

PAT-APPL-532,285.

A variable flow control for a control rod assembly of a nuclear reactor that depends on turbulent friction through an annulus. The annulus is formed by a piston attached to the control rod drive shaft and a housing or sleeve fitted to the enclosure housing the control rod. As the nuclear fuel is burned up and the need exists for increased reactivity, the control rods are withdrawn, which increases the length of the annulus and decreases the rate of coolant flow through the control rod assembly.

- 3429 TRANSIENT PRESSURIZATION AND TRANSPORT OF A TWO-COMPONENT GAS WITHIN INTERCONNECTED POROSITY OF SOLID MIXED-OXIDE FUEL. Hofmann, J.R. (Argonne National Lab., IL). Nucl. Sci. Eng.; 68: No. 1, 73-90 (Oct 1978).

A model has been developed to describe the transient pressure field within the interconnected porosity of solid mixed-oxide fast reactor fuel during a reactor transient. The pore gas may be composed of up to two distinct chemical species, so that gas released from fuel grains may differ chemically from the fill gas originally present within the porosity of the fuel. The volume expansion of fuel upon melting is accounted for, but mechanical deformation of the solid fuel is not modeled. Results are presented for a hypothetical unprotected transient overpower accident in a gas-cooled fast reactor with ramp rates of 0.10, 1.0, and 10.0 dollar/s. In these calculations, fuel cladding failure is computed from a linear accumulative damage law and a Larson-Miller parameter correlation.

- 3430 EFFECTS OF NOZZLE-TO-TARGET DISTANCE ON WASTAGE IN SMALL-LEAK SODIUM-WATER REACTIONS. Kanegae, N.; Hashiguchi, K.; Ikemoto, I.; Hori, M. (Power Reactor and Nuclear Fuel Development Corp., Ibaraki, Japan). Nucl. Technol.; 40: No. 3, 261-277 (Oct 1978).

The wastage effects of a sodium-water reaction resulting from a small leak in a liquid-metal fast breeder reactor steam generator were investigated. These experiments were conducted at low steam injection rates, ranging from 0.07 to 13.8 g/s, with the following test conditions: sodium temperature 480°C, sodium velocity 0.24 m/s, and target material 2 1/2% Cr-1 Mo steel. Employed were nozzle diameters (D) from 0.2 to 1.5 mm, nozzle-to-target distances (L) from 5 to 100 mm, and L/D ratios from 7.14 to 400. An empirical equation of wastage rate of 2 1/2% Cr-1 Mo steel was obtained, including parameters of sodium temperature, steam injection rate, and nozzle-to-target distance. The depth curves and the widths of the area affected by wastage were examined. These test results were applied to the safety considerations for the prototype steam generators in Japan.

- 3431 SUBCRITICALITY GUIDELINES FOR LIQUID-METAL FAST BREEDER REACTOR SPENT FUEL SHIPPING

CASK DESIGNS. Philbin, J.S.; Dupree, S.A. (Sandia Labst, Albuquerque, NM). Nucl. Technol.; 40: No. 3, 284-296(Oct 1978).

A series of three-dimensional Monte Carlo criticality calculations has been performed to examine the criticality problems that exist in liquid-metal fast breeder reactor spent fuel shipping casks. The reactivity effects of subassembly loading sequences, total fuel payloads, subassembly pitches, neutron poisons, and choices of cask coolants and structural materials were considered. The analyses showed that, for a given type of fuel, the system k /sub eff/ can be displayed in a manner that permits determination of the maximum number of subassemblies that can be safely loaded in a particular cask. For a given cask coolant, this maximum number can be fixed independent of (1) the sequence or positions in which the subassemblies are loaded; (2) the detailed design of the basket supporting the subassemblies, including small changes in the distance between the subassemblies; and (3) changes in the cask design outside the fuel region. Thus, the shielding, structural, and thermal problems inherent in the design of the outer cask structure can be addressed without reference to the criticality problem.

3432 THEORY OF VOID NUCLEATION IN METALS. Russell, K.C. (Massachusetts Inst. of Tech., Cambridge). Acta Metall.; 26: No. 10, 1615-1630(Oct 1978).

A general theory of void nucleation in irradiated metals is developed via the nodal line/critical point formalism of Poincare. The theory reduces to several simple subcases, depending on the experimental conditions, in particular the damage rate, temperature, and gaseous and non-gaseous impurity concentrations. The most important of these subcases are: spontaneous (i.e., no activation barrier) void nucleation driven by inert gas, heterogeneous nucleation on metastable gas: vacancy clusters, heterogeneous nucleation on clusters of non-gaseous impurities, and homogeneous nucleation with or without the assistance of mobile, surface active impurities. Simple nucleation rate equations are presented for each of these cases. Equations for void number density are derived for the various steady state nucleation cases on the basis of a simple void growth equation. The predictions of void number densities are found in reasonable agreement with measurements on pure Ni, type 316 stainless steel, and on the Nimonic alloy, PE-16. The theory also reproduces the shape of the void number density vs. $1/T$ curves, including the activation energies.

3433 CORE COMPONENT MATERIALS FOR SODIUM-COOLED FAST REACTORS. Harries, D.R. (UKAEA, Harwell, Engl). J. Inst. Nucl. Eng.; 17: No. 4, 301-311(Oct 1978).

The principal technological consequences of irradiation-induced void swelling and creep in the materials already chosen or being considered for core component (particularly the fuel element subassembly wrapper or duct) applications in sodium-cooled fast reactors are summarized. The current understanding of the mechanisms of the phenomena is briefly described and the influences of irradiation and materials parameters in determining the magnitudes of the void swelling and irradiation creep are reviewed.

3434 CORROSION OF MATERIALS FOR SODIUM-COOLED FAST REACTORS. Antill, J.E. (UKAEA, Harwell, Engl). J. Inst. Nucl. Eng.; 17: No.

4, 313-319(Oct 1978).

Major compatibility topics in sodium-cooled fast reactors are considered and cover the corrosion of boiler tube materials by aqueous environments in boilers and by the products of sodium-water reactions and the interaction of structural materials with sodium coolants. Reference is also made to the cleaning of surfaces and the tribology of sliding interfaces.

3435 EXPERIENCE IN SODIUM TECHNOLOGY OF SOVIET FAST REACTORS. Karpov, A.V.; Archipov, V.M.; Archangel'skii, V.V.; Ivanenko, V.N. (Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Obninsk. Fiziko-Ehnergeticheskij Inst.). Kernenergie; 20: No. 10, 322-326(Oct 1978). (In German).

From CMEA specialist meeting on problems of technology and corrosion in sodium coolant and cover gas; Dresden, German Democratic Republic (28 Mar - 1 Apr 1977).

Experience gathered with sodium technology during operation of the Soviet fast reactors BR-5, BOR-60 and BN-350 is considered. Problems on pretreatment of the sodium coolant before filling the main circuits of the reactors are briefly presented. The results of studies on impurities in the coolant during start-up operations and during operation are discussed. Finally, some problems of equipment cleaning, sampling, and fighting against sodium fires are considered. Some experience in cover gas technology is given.

3436 COMPATIBILITY OF STAINLESS-STEEL CLADDING MATERIALS WITH URANIUM CARBIDE FUEL. Stumpf, W.E.; Venter, S. (Atomic Energy Board, Palindaba, Pretoria (South Africa). Physical Metallurgy Div.). J. S.Afr. Inst. Min. Metall.; 79: No. 3, 51-58(Oct 1978).

Some of the factors that govern the choice of a nuclear fuel are briefly discussed, special reference being made to the introduction of advanced carbide fuels into fast-breeder programmes. One of these factors, i.e. the compatibility of carbide fuels with stainless-steel cladding, is discussed in depth. A very sensitive technique for the study of compatibility interactions between fuel and cladding is described in respect to the effects of particle size, specific surface area and surface oxidation of the fuel, and microstructure of the cladding on the compatibility behaviour of the cladding with the fuels. Finally, the need for the development of modified or stabilized uranium carbide fuels is discussed, and some results are presented to show the effects of small amounts of sulphur in these fuels on their compatibility with stainless-steel cladding materials.

3437 CORE COMPONENT MATERIALS FOR SODIUM-COOLED FAST REACTORS. Harries, D.R. (UKAEA, Harwell. Atomic Energy Research Establishment). Nucl. Energy; 17: No. 4, 301-311(Oct 1978).

From INCO power conference 1977; Lausanne, Switzerland (5 - 7 Oct 1977).

The principal technological consequences of irradiation-induced void swelling and creep in the materials already chosen or being considered for core component applications, particularly the fuel element subassembly wrapper or duct, in sodium-cooled fast reactors are summarized. The current understanding of the mechanisms of the phenomena is briefly described and the influences of irradiation and materials parameters in determining the magnitudes of the void swelling and irradiation creep are reviewed.

- 3438 CORROSION OF MATERIALS FOR SODIUM-COOLED FAST REACTORS. Antill, J.E. (UKAEA, Harwell. Atomic Energy Research Establishment). Nucl. Energy; 17: No. 4, 313-319 (Oct 1978).

From INCO power conference 1977; Lausanne, Switzerland (5 - 7 Oct 1977).

Major compatibility topics in sodium-cooled fast reactors are considered. They cover the corrosion of boiler tube materials by aqueous environments in boilers and by the products of sodium-water reactions, and the interactions of structural materials with sodium coolants. Reference is also made to the cleaning of surfaces and the tribology of sliding interfaces.

- 3439 STATUS OF FRENCH BREEDER DEVELOPMENT AND GERMAN-FRENCH COOPERATION. Vendryes, G. (CEA, 75 - Paris (France). Direction des Applications Industrielles Nucleaires); Hennies, H.H. (Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.)). Atomwirtsch., Atomtech.; 23: No. 10, 448-451 (Oct 1978). (In German).

The development of fast breeder reactors in France is at present characterized by the successful operation of the 250 MW reactor, Phenix, and the speedy progress made in construction of the 1200 MW Superphenix plant. The technical concept of Superphenix is a logical extension of the Phenix concept, i.e., the pool type sodium cooled breeder reactor. While the only change in the primary system has been an increase in capacity, the main modification over Phenix is the change from small modular steam generators to four large units. The development of the work to date does not cast any doubt upon the envisaged date of first criticality in the second half of 1982. The basis of German-French cooperation is a joint declaration by the then Ministers for Research of the two countries on February 13, 1976 in which the Ministers had expressed themselves in favor of close cooperation between both countries in the development of safe, reliable and economic fast breeder reactors. On this basis, the two governments, the research centers and the industrial partners in the two countries, including the previous partners in Belgium, the Netherlands and Italy, agreed on the general principles of this cooperation. Meanwhile, the cooperation formalized in 1977 has been activated. Both in research and development and among planning and building industries the exchange of know-how and cooperation is in full swing. The joint company, SERENA, is the pool for the know-how introduced by the partners and the sole representative of the partners in the scheme. (orig.) 691 UA.

- 3440 BREEDER DEVELOPMENT AND FRANCO-GERMAN COOPERATION. Vendryes, G.; Hennies, H.H. (CEA, Paris, Fr.). Atomwirtsch., Atomtech.; 23: No. 10, 448-451 (Oct 1978). (In German).

- 3441 ELECTRON BEAM WELDING OF AUSTENITIC STAINLESS STEEL. ELEVATED TEMPERATURE PROPERTIES. Susei, S.; Matsui, S.; Nagai, H.; Mori, E. (Kawasaki Heavy Industries Ltd., Akashi, Hyogo (Japan). Technical Inst.); Shimizu, S. Kawasaki Gihō; No. 68, 20-27 (Oct 1978). (In Japanese).

Austenitic stainless steel is used for liquid metal-cooled fast breeder reactors with operating temperature of about 550 deg C, because its elevated temperature properties are excellent and the results of use are abundant. The welded joints in LMFBRs require high degree of safety, and the application of electron beam welding is studied to make welding joints of high quality. When the inelastic deformation in a certain limit is allowed as prescribed in the ASME Code, Case 1592, the elevated temperature properties of the welded joints of structures are particularly important. The materials tested were 10 mm thick plates of SUS 304, SUS 316 and SUS 321 steels, and 150 kV - 40 mA electron beam welder was employed. The method of welding was one side, one pass Uranium welding, and first, the appropriate welding conditions were decided. Elevated temperature tensile test was carried out on the parent materials and welded joints by electron beam welding and coated arc welding. Creep rupture test and elevated temperature fatigue test were also carried out. In EB-welded austenitic stainless steel, delta ferrite is scattered finely in austenite, and its quantity is very small and less than 1.5%. The tensile strength and 0.2% proof stress of EB-welded joints are almost same as those of parent materials. The creep rupture and fatigue properties of the joints are also close to those of parent materials.

- 3442 COMPILATION OF REFERENCES, DATA SOURCES AND ANALYSIS METHODS FOR LMFBR PRIMARY PIPING SYSTEM COMPONENTS. Reich, M.; Esztergar, E.P.; Ellison, E.G.; Erdogan, F.; Gray, T.G.F.; Wells, C.H. (Brookhaven National Lab., Upton, NY (USA)). Nucl. Eng. Des.; 50: No. 2, 273-304 (Oct 1978).

A survey and review program for application of fracture mechanics methods in elevated temperature design and safety analysis was initiated in December of 1976 by the Structural Analysis Group at Brookhaven National Laboratory. The aim of this paper is to provide a critical review of the theories of fracture and the application of fracture mechanics methods to life prediction, reliability and safety analysis of piping components in nuclear plants undergoing sub-creep and elevated temperature service conditions.

- 3443 RECENT RESEARCHES ON THERMAL-

HYDRODYNAMIC TRANSIENT PHENOMENA EXPERIENCED IN LMFBRs. Maekawa, I.; Koishikawa, S.; Sakano, K. (Kawasaki Heavy Industries Ltd., Kobe (Japan)). FAPIG (Tokyo); No. 90, 11-19 (Oct 1978). (In Japanese).

Recent researches on thermal-hydrodynamic transient phenomena and the hydrodynamic load due to the phenomena are introduced in this paper. Investigations were made on the items of the drastic transient phenomena due to the break down of the pipings of steam-water system, the propagation of pressure waves in sodium pipings at the time of sodium-water reaction, and the response of pipings to hydrodynamic loading. The thermodynamical non-equilibrium model shows good agreement with the experimental results regarding the propagation of reduced-pressure waves. When the pressure loss can be neglected, initial critical flow rate is smaller than steady critical flow rate. The results of analytical studies on the propagation of pressure waves were compared with the experimental results. The cavitation in sodium was in good agreement with the liquid column separation model. The analysis of the propagation of pressure waves due to the elastoplastic response of pipings was in good agreement with experimental results by the consideration of plastic deformation effect. The hydrodynamic loading following the blowdown of water-steam system and sodium flow-in reaches to several hundreds of tons. The stress of pipings due to the hydrodynamic loading is larger than that due to the own weight of the pipings or earthquake loading.

3444 METHOD AND APPARATUS FOR PRE-HEATING DUCTS FORMING LIQUID SODIUM FLOW PASSAGE. Nanba, M. (to Toshiba Corp., Kawasaki, Kanagawa (Japan)). Japanese Patent 1953-11,0797/A/. 27 Sep 1978. 3p. (In Japanese).

A method to pre-heat ducts by connecting an AC power source to the exciting coil of a flowmeter provided in the duct for the measurement of a sodium flow rate and exerting the magnetic field resulted by the coil on the duct is described. Upon charging liquid sodium in a non-magnetic duct such as made of stainless steel for forming flow passage for the sodium, AC voltage is applied through a turn-over switch to the excitation coil of an electromagnetic flowmeter provided to the duct. The flowmeter thus operates as an induction type heater to produce eddy current in the duct and pre-heat the same. Upon turning-over the above switch to apply DC voltage to the excitation coil, the flowmeter operates as a flow-measuring instrument.

3445 LIQUID METAL COOLED NUCLEAR REACTOR. Marcotte, J.L.B.; Chevalier, G.; Gerij, J.; Leheu, J. (to Commissariat a l'Energie Atomique). US Patent 4,116,765. 26 Sep 1978. Filed date 16 Dec 1976. 6p.

The concrete vault roof of a liquid metal cooled fast reactor is provided with a heat-insulating lining plate and has a central passage for rotating shield plugs surrounded by passages for heat exchangers and pumps. An annular plate of relatively small thickness is placed horizontally beneath the vault roof and its external edge is joined to the lining plate by means of shaped members having a long radius of curvature so as to form closed spaces for trapping an inert gas. The free edges formed by the openings in the annular plate are joined to the lining plate by means of a sealing shell.

3446 ULTRASONIC DIP SEAL MAINTENANCE SYSTEM. Poindexter, A.M.; Ricks, H.E. (to Dept. of

Energy). US Patent 4,116,766. 26 Sep 1978. Filed date 31 Aug 1976. 10p.

PAT-APPL-719,310.

Disclosed is a system for removing impurities from the surfaces of liquid dip seals and for wetting the metal surfaces of liquid dip seals in nuclear components. The system comprises an ultrasonic transducer that transmits ultrasonic vibrations along an ultrasonic probe to the metal and liquid surfaces of the dip seal thereby loosening and removing those impurities.

3447 SAFETY APPLIANCE FOR A STEAM GENERATOR HEATED BY LIQUID METAL. Taylor, D.; Watts, M.J. (to UKAEA London Office; Deutsches Patentamt, Muenchen (Germany, F.R.)). German (FRG) Patent 1,936,409/C/. 21 Sep 1978. 4p. (In German).

The invention should increase the safety of a heat exchanger (sodium/water). It is characterized by a safety tube connected to the lower end of the vessel that contains the tubes for both liquids, which leads to a catch tank installed below the vessel. If a heatpipe of the vessel breaks and the pressure increases because of the Na-H₂O reaction, the rupture disk in the safety pipe responds and the sodium is extracted from the reaction zone by pressure and gravity and flows into the catch tank. The invention is explained by the example of a steam generator in a sodium cooled fast breeder reactor.

3448 FAST NEUTRON NUCLEAR REACTOR. Jogand, P. (to Commissariat a l'Energie Atomique). US Patent 4,115,192. 19 Sep 1978. Priority date 6 Jul 1976, France, 4p.

A fast neutron nuclear reactor is described comprising on the inside a main vessel having a vertical axis suspended by its upper open part on a thick protective slab which seals a cavity surrounding said vessel, a volume of a liquid cooling metal and also positioned within said main vessel an inner vessel having a cylindrical wall containing the core of the reactor submerged beneath the liquid metal level, the intermediate space between the main vessel and the inner vessel having heat exchangers and pumps which pass below the level of the liquid metal, wherein the upper end of the inner vessel is covered by an inverted annular bell cap and is placed under the internal pressure of a neutral gas in order to prevent in normal operation direct communication between the hot liquid metal within the inner vessel and the cold liquid metal in the annular space between the main vessel and the inner vessel, said bell cap covering an auxiliary exchanger which externally surrounds the inner vessel in such a way that if there is a fault in the reactor and after reducing the neutral gas pressure beneath the bell cap as a result of natural convection a circulation of the liquid metal takes place beneath the bell cap of the inner vessel towards the annular space and passes through the auxiliary exchanger.

3449 NUCLEAR REACTOR PRESSURE VESSEL SUPPORT SYSTEM. Sepelak, G.R. (to Dept. of Energy). US Patent 4,115,193. 19 Sep 1978. Filed date 17 Aug 1976. 10p. PAT-APPL-715,255.

Disclosed is a support system for nuclear reactor pressure vessels which can withstand all possible combinations of stresses caused by a postulated core disrupting accident during reactor operation. The nuclear reactor pressure vessel is provided with a flange around the upper periphery thereof, and the flange

includes an annular vertical extension formed integral therewith. A support ring is positioned atop of the support ledge and the flange vertical extension, and is bolted to both members. The plug riser is secured to the flange vertical extension and to the top of a radially outwardly extension of the rotatable plug. This system eliminates one joint through which fluids contained in the vessel could escape by making the fluid flow path through the joint between the flange and the support ring follow the same path through which fluid could escape through the plug risers. In this manner, the sealing means to prohibit the escape of contained fluids through the plug risers can also prohibit the escape of contained fluid through the securing joint.

3450 CONTROL OF NUCLEAR POWER POSES CHALLENGE TO U.S. Freeman, S.D. Energy User News; 3: No. 38, 22-23(18 Sep 1978).

Excerpted from remarks made at the Atomic Industrial Forum Fuel Cycle Conference held in New York City.

S. David Freeman, Chairman, the Tennessee Valley Authority, criticizes the nuclear industry for what he considers childish reactions to competition from newly funded energy alternatives when the bulk of research and development funds continue to go for nuclear power. Freeman favors the use of both nuclear and coal-fired power plants on the grounds that neither option can supply the entire demand without serious environmental and security problems. He considers solar energy to be technologically and economically feasible for some applications and a serious competitor to breeder and fusion reactors in the future. He sees time as the real enemy in resolving the energy crisis and emphasizes the importance of having the proponents of specific energy sources work together to resolve the conflicts that are preventing progress. He would resolve the breeder debate by (1) using a fuel cycle that discourages proliferation, (2) incorporates the known state-of-the-art, and (3) is funded equally by the public and the utilities.

3451 (DOE-tr--61) DIRECT NUMERICAL SIMULATION OF TURBULENT VELOCITY, PRESSURE, AND TEMPERATURE FIELDS IN CHANNEL FLOWS.

Groetzsch, G. (Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Inst. fuer Reaktorentwicklung). 15 Sep 1978. Translation of KFK--2426, October 1977 217p. Dep. NTIS (US Sales Only), PC A10/MF A01.

Work performed under United States--W. Germany Fast Reactor Exchange Program.

For the simulation of nonsteady, three-dimensional, turbulent flow- and temperature-fields in channel flows of fluids with constant properties a method is presented which is based on a finite difference scheme of the complete conservation equations for mass, momentum, and enthalpy. The fluxes of momentum and heat within the grid cells are described by subgrid scale models. The subgrid scale model for momentum introduced here is for the first time applicable to small Reynolds numbers, rather coarse grids, and channels with space-dependent roughness distributions. The new developed subgrid scale model for temperature also takes the influence of the molecular Prandtl number into consideration. For Prandtl numbers of about one, the theoretical model confirms the empirically derived values for the turbulent subgrid scale Prandtl number, which are currently used by other authors. For very small molecular Prandtl numbers of liquid metals, the model shows that the total resolution of all relevant temperature fluctuations can be

achieved on the basis of presently realizable grids. The method is realized in the computer code TURBIT-2. It can be used for the simulation of laminar flows in plane channels and annuli as well as for turbulent flows with Reynolds numbers larger than about 10^4 . The numerical results for the flow field show only a small influence of the model parameters. For smooth, rough, and partly roughened channels with secondary flows the agreement with experimental results is fairly good even when rather coarse grids are used. The temperature fields simulated are very insensitive to the parameters of the model. The numerical results are in good agreement with consistent, reliable experimental results.

3452 NUCLEAR REACTOR WITH EQUIPMENT FOR PREVENTING THE CONVECTION OF METAL VAPORS. Lakra, R.J.; Freund, J.; Rauschert, G. (to Internationale Atomreaktorbau G.m.b.H. (INTERATOM), Bergisch Gladbach (Germany, F.R.); Deutsches Patentamt, Muenchen (Germany, F.R.)). German(FRG) Patent 2,709,914/A/. 14 Sep 1978. 11p. (In German).

Convection of Na-vapors and -aerosols towards cooler parts of the reactor above the coolant surface and condensation of the metal on these parts is prevented. This is achieved by means of quasi-tight convection barriers in the form of e.g. conical sheets arranged in the gas plenum and dividing it with respect to its height. If the closure head consists of several rotating shields embossed in each other the convection barriers are constructed out of several single sheets and designed congruently and coaxially rotatable with the shields. A gas possibly existing between reactor vessel and closure head is protected by means of a labyrinth packing.

3453 CORE DISRUPTIVE ACCIDENT MARGIN SEAL. Garin, J.; Belsick, J.C. (to Dept. of Energy). US Patent 4,113,564. 12 Sep 1978. Filed date 13 Aug 1976. 8p. PAT-APPL-714,220.

Disclosed is an apparatus for sealing the annulus defined between a substantially cylindrical rotatable first riser assembly and plug combination disposed in a substantially cylindrical second riser assembly and plug combination of a nuclear reactor system. The apparatus comprises a flexible member disposed between the first and second riser components and attached to a metal member which is attached to an actuating mechanism. When the actuating mechanism is not actuated, the flexible member does not contact the riser components thus allowing the free rotation of the riser components. When desired, the actuating mechanism causes the flexible member to contact the first and second riser components in a manner to block the annulus defined between the riser components, thereby sealing the annulus between the riser components.

3454 APPARATUS FOR CONTROLLING COOLANT LEVEL IN A LIQUID-METAL-COOLED NUCLEAR REACTOR. Jones, R.D. (to Dept. of Energy). US Patent 4,113,562. 12 Sep 1978. Filed date 20 Apr 1977. 6p. PAT-APPL-789,154.

A liquid-metal-cooled fast-breeder reactor which has a thermal liner spaced inwardly of the pressure vessel and includes means for passing bypass coolant through the annulus between the thermal liner and the pressure vessel to insulate the pressure vessel from hot outlet coolant includes control ports in the thermal liner a short distance below the normal

operating coolant level in the reactor and an overflow nozzle in the pressure vessel below the control ports connected to an overflow line including a portion at an elevation such that overflow coolant flow is established when the coolant level in the reactor is above the top of the coolant ports. When no makeup coolant is added, bypass flow is inwardly through the control ports and there is no overflow; when makeup coolant is being added, coolant flow through the overflow line will maintain the coolant level.

- 3455 NUCLEAR REACTOR CORE CONFIGURATION. Baxi, C.B. (to General Atomic Co., San Diego, CA (USA); Deutsches Patentamt, Muenchen (Germany, F.R.)). German (FRG) Patent 2,808,370/A/. 7 Sep 1978. 19p. (In German).
- The high temperature reactor cooled by He (or also a reactor cooled by Na) has got a core of hexagonal geometry with fuel elements and, arranged around them in three rows, breeding blanket elements. Both types of elements have got flow guiding devices. In addition, in each breeding blanket element there is provided, looking in flow direction, before or behind the breeding blanket rods, arranged in compact packing in the element, a flow restrictor. It consists of an inner casing in which are arranged rods, aligned parallel to each other and to the flow direction, with a roughened surface. The flow restrictor makes use of the principle that the friction factor is essentially reduced if the Reynolds number of the flow changes from e.g. 4×10^3 to 2×10^3 . This causes the percentage of the total coolant flow passing through the breeding blanket elements to become larger at low circulation rate than that of the total coolant flow at full load operation.

- 3456 COLLECTING TANK WITH EVAPORATION PROTECTION FOR A NUCLEAR REACTOR. Pischel, G.; Dumm, K.; Friedrich, H.J. (to Internationale Atomreaktorbau G.m.b.H. (INTERATOM), Bergisch Gladbach (Germany, F.R.); Deutsches Patentamt, Muenchen (Germany, F.R.)). German (FRG) Patent 2,709,471/A/. 7 Sep 1978. 11p. (In German).
- In order to prevent evaporation and aerosol formation in the containment e.g. of a FBR in case of the coolant (e.g. sodium or fused salt) escaping into it after a Bethe-Tait accident, floating bodies are placed in the collecting tank. These are axially symmetrical, especially spherical, hollow bodies made of e.g. chrome-nickel steel. They are present in the collecting tank in such number that in beginning to swim they completely cover the surface of the coolant. In order to prevent tumbler or rotation movements causing each time fresh coolant to be brought over the layer of floating bodies, which then could evaporate, these floating bodies are provided with ballast weights keeping them in a well-defined position. For depressurization of the interior of the floating bodies, these have got a relief boring in the region of the ballast weights. For utilization of the maximum degree of covering the coolant surface the floating bodies sink into the coolant with half their volume.

- 3457 PACKED ROD NEUTRON SHIELD FOR FAST NUCLEAR REACTORS. Eck, J.E.; Kasberg, A.H. (to Dept. of Energy). US Patent 4,111,747. 5 Sep 1978. Filed date 8 Jun 1976. 8p. PAT-APPL-693,990.
- Disclosed is a fast neutron nuclear reactor including a core and a plurality of vertically

oriented neutron shield assemblies surrounding the core. Each assembly includes closely packed cylindrical rods within a polygonal metallic duct. The shield assemblies are less susceptible to thermal stresses and are less massive than solid shield assemblies, and are cooled by liquid coolant flow through interstices among the rods and duct.

- 3458 EFFECT OF SWELLING AND CREEP ON LIQUID-METAL FAST BREEDER REACTOR PERFORMANCE. Barthold, W.P.; Beitel, J.C. (Argonne National Lab., IL). Nucl. Technol.; 40: No. 2, 138-148 (Sep 1978).

The impact of swelling and creep phenomena, as expressed in the various Nuclear Systems Materials Handbook correlations and their updates, on liquid-metal fast breeder reactor (LMFBR) fuel assembly duct design and LMFBR performance was investigated. As more data on irradiation-induced creep and swelling became available, the predicted creep and swelling rates increased. This leads to increases in interassembly gaps required for the same duct life. Penalties in breeding ratio, doubling times, and fuel cycle cost are the result of the increased interassembly gaps. The most significant penalties are encountered when the updated correlations on creep and swelling are used to update the duct life calculation. To compensate for increases in predicted duct dilation, the duct lifetime has to be reduced significantly.

- 3459 OPERATION OF THE WATER-TO-SODIUM LEAK DETECTION SYSTEM AT THE EXPERIMENTAL BREEDER REACTOR II. Osterhout, M.M. (Argonne National Lab., IL). Nucl. Technol.; 40: No. 2, 159-169 (Sep 1978).

A water-to-sodium leak detection system was installed at the Experimental Breeder Reactor II in April 1975. The system is designed for early detection of steam generator leaks, using hydrogen meters at the sodium outlets of the evaporators and superheaters. The leak detectors operate by measuring the rate of diffusion of hydrogen from the liquid sodium through a nickel membrane into a dynamic vacuum system. The advantages of this detection system are rapid response time, high sensitivity, stability, and reliability. The system was operated on an experimental basis for the first two years. During this period, data were obtained on detector stability, reliability, maintenance needs, computer interface requirements, calibration, and background hydrogen-level fluctuations. A generic defect in the original detectors was also discovered, requiring redesign of the units. When the new units were installed and proven to be reliable, the system was made fully operational. The data from the hydrogen meters are now used as the primary basis for detection of water-to-sodium leaks.

- 3460 (JAPFNR--336) PROGRESS REPORT ON FAST BREEDER REACTOR DEVELOPMENT IN JAPAN, JANUARY--MARCH 1978. (Power Reactor and Nuclear Fuel Development Corp., Tokyo (Japan)). Sep 1978. Translation of PNC-N--251-78-03 13p. Dep. NTIS (US Sales Only), PC A02/MF A01.
- Work performed under United States--Japanese Fast Reactor Exchange Program.

Information is presented concerning the development of the Joyo Reactor; development of the Monju Reactor; reactor physics; development of reactor components; instrumentation and control; sodium technology; fuel materials; structural materials; reactor safety; and steam generators.

- 3461 BREEDER--NOW OR NEVER. Murphy, P.M. (EPRI, Palo Alto, Calif.). Mech. Eng.; 100: No. 9, 22-24(Sep 1978).

The timing of the commercial introduction of the LMFBR (Liquid Metal Fast Breeder Reactor) will be an important factor in its ability to supply a significant fraction of the nation's future electrical needs. The number of breeders we can build initially will be limited by the size of our low-cost uranium resources and by the rate at which LWR's (Light Water Reactors) are placed in service. Since this uranium resource is fixed in size while electrical demand will grow geometrically, it is clear that the sooner the breeder is introduced commercially the larger will be the fraction of electrical demand that it can supply. An early commercial introduction on an adequate scale requires full-scale resumption of LWR construction and redirection of LMFBR development programs toward a near-term commercial prototype.

- 3462 FAST BREEDER REACTOR I. Klose, W. (Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.)). Phys. Bl.; 34: No. 9, 407-419(Sep 1978). (In German).

The paper deals with the neutron balance in the chain reaction in LWR reactors and fast breeders and with the role of delayed neutrons. Safety problems are discussed in great detail. A short view on the SBR prototype SNR 300 now under construction is followed by a comparison of the different reactor types. Finally, some political problems and the proliferation problem are briefly commented upon.

- 3463 ^{235}U , ^{238}U , AND ^{239}Pu α VALUE MEASUREMENTS IN THE BOR-60 REACTOR CORE. Prokopenko, V.S.; Gabeskiya, V.Ya.; Inchagov, A.V.; Novikov, Yu.B.; Prokop'ev, V.M.; Tikhomirov, V.V.; Chetverikov, A.P. At. Energ. (USSR); 45: No. 3, 230-231(Sep 1978). (In Russian).
BOR-60 REACTOR; CAPTURE-TO-FISSION RATIO; DATA; ERRORS; NEUTRON REACTIONS; PLUTONIUM 239 TARGET; REACTOR CORES; URANIUM 235 TARGET; URANIUM 238 TARGET

- 3464 INVESTIGATION OF THE BOR-60 REACTOR DYNAMIC CHARACTERISTICS WITH A REACTIVITY OSCILLATOR. Afanas'ev, V.A.; Britov, V.N.; Gryazev, V.M.; Efimov, V.N.; Kebabze, B.V.; Krauze, Kh.; Otto, Kh.; Shol'ts, J.; Tsigenbaja, D. At. Energ. (USSR); 45: No. 3, 175-179(Sep 1978). (In Russian).

The BOR-60 reactor power coefficient GITA and its time constant τ have been investigated. The reactivity oscillator represents a rotating cylinder, wherein d neutron absorber B_4C and a scatterer $\text{Zrsub}(2)\text{Hsub}(1.82)$ are located on opposite sides. The shape of the periodic reactivity disturbance is close to the harmonic one with a double amplitude approximately $2 \times 10^{-4} \Delta k/k$. The bench-mark and in-pile oscillator experimental results are presented. The on-line pile oscillation technique is shortly described. The amplitude and phase-frequency characteristics have been measured at reactor power $N=22$ and 45 MW in the frequency range from 0.05 to 18 Hz. The results have proved the applicability of a simple model with one GITA and related τ for the reactor dynamics at the power regimes investigated and $f > 0.5$ Hz.

- 3465 (DOE-tr--90) BEHAVIOUR OF THE CORE OF A FAST SODIUM-COOLED BREEDER REACTOR OF 2000 MW(E) DURING DISRUPTIVE ACCIDENTS WITH A VERY

LOW LIKELIHOOD OF OCCURRENCE. Struwe, D. (Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.)). Inst. fuer Neutronenphysik und Reaktortechnik. Sep 1978. Translation of KFK--2490 204p. Dep. NTIS (US Sales Only), PC A10/MF A01.

Work performed under United States--W. Germany Fast Reactor Exchange Program.

A structural phase diagram for hypothetical core disruptive accidents (HCDA) has been developed based on a variety of analyses for different LMFBRs. The intent was to identify the strategic phases of HCDAs which are important with regard to the safety aspects of the plant. These phases are investigated in detail for a 2000 MW(e) LMFBR (SNR-2000). Characteristic data of the SNR-2000 are discussed concerning their effect on safety analysis. Reasons for the choice of model parameters for special phenomena such as fuel-coolant interaction, fuel rod failure mechanisms, and sodium boiling are given. The results of calculations with CAPRI-2, HOPE and KADIS are analyzed for possibilities of entering into energetic core disassembly with consequences which would require power values below 2000 MW(e).

- 3466 BUBBLE NOISE AT MAGNETIC FLOWMETERS. Fuge, R.; Langenbrunner, H. (Zentralinstitut fuer Kernforschung, Rossendorf bei Dresden (German Democratic Republic)). Nucl. Eng. Des.; 49: No. 3, 205-212(Sep 1978).

The effect of bubbles in the liquid flow on the output signal of magnetic flowmeters is theoretically and experimentally investigated. In the theoretical model the bubble noise is due to the superposition of single pulses generated by individual bubbles which are randomly distributed in the liquid. On the basis of this model the rms value of the bubble noise is found to be proportional to the void fraction, and inversely proportional to the square root of the bubble flowrate. Owing to electromagnetic forces the factor of proportionality depends on the imposed magnetic field. The theoretical results are verified by experiments in sodium test loops.

- 3467 LONG-TERM ATOMIC ENERGY RESEARCH, DEVELOPMENT AND UTILIZATION PROGRAM FORMULATED. At. Jpn.; 22: No. 9, 5-19(Sep 1978).

Japan Atomic Energy Commission has submitted the report on the new 'Long-term Atomic Energy Research, Development and Utilization Program' to the Government. It reflects recent severe circumstances represented by the oil crisis, opposition to nuclear power, and the nuclear non-proliferation issue. Although it covers very wide range of atomic energy industry, the basis of this report can be summarized as follows. (1) To improve the reliability and availability of LWRs, and implement standardization. (2) Commercialization of FBR by the year 2000. (3) Practical application of nuclear fusion at the earliest possible date in the 21st Century. Time schedule and necessary funds are estimated for each specific item of research and development projects.

- 3468 PERFORMANCE ANALYSIS OF MESH-PACKED COLD TRAPS. Murase, M.; Sumida, I.; Kotani, K.; Yamamoto, H. (Hitachi Ltd., Ibaraki (Japan). Energy Research Lab.). J. Nucl. Sci. Technol. (Tokyo); 15: No. 9, 711-713(Sep 1978).

LMFBR. COLD TRAPS; COOLANT CLEANUP SYSTEMS; COOLANTS; EFFICIENCY; LIQUIDS; PERFORMANCE; PURIFICATION; SODIUM; SODIUM OXIDES; LMFBR TYPE REACTORS

3469 APPLICATION OF A MICROPROCESSOR-BASED DISTRIBUTED SYSTEM TO SUBASSEMBLY FAULT DETECTION OF LMFB. Kimura, Y.; Hasegawa, K.; Sekiguchi, A. (Tokyo Univ. (Japan). Faculty of Engineering). Tokyo Daigaku Kogakubu Fuzoku Sogo Shikenjo Nenpo; 37: 167-172(Sep 1978). (In Japanese).

Single subassembly fault detection of LMFB requires the use of individual subassembly instrumentation and the processing of outgoing signals. A computerized system instead of a conventional hardwired electronic one will likely have to be used for handling a large number of these signals. There are, however, some problems in using a computerized system in high reliability application. The adoption of a microprocessor-based distributed system will be one of the means to solve these problems. This report describes the performance estimation of a proposed microprocessor-based distributed subassembly fault detection system. The results show the feasibility of the proposed system.

3470 DEVELOPMENT OF COLD TRAP FOR LMFB. Ohshima, I.; Ohtani, R.; Nei, H. (Toshiba Corp., Kawasaki, Kanagawa (Japan). Research and Development Center); Adachi, S.; Honda, M. Toshiba Rebyu; 33: No. 9, 782-786(Sep 1978). (In Japanese).

The purity control for the liquid sodium is an important task for reliable operation of sodium-cooled fast breeder reactors. In view of early detection of water leakage in the steam generator, detectors of the hydrogen concentration monitoring type are equipped. For satisfactory function of the detectors, it is necessary that the hydrogen concentration is kept below a definite low level. The writers, abstracting the problematic points about the cold trap in the secondary cooling system, developed a design technique to solve the problems, carried out experiments on the hydrogen removing function of cold trap, and made analytical evaluation to confirm the validity of the design technique. The reliability of the cold traps and, consequently, of fast breeder reactor plants is expected to be raised by this achievement.

3471 FRACTURE OF NUCLEAR PIPING CAUSED BY IMPACT LOADING. Yagawa, G.; Aizawa, T.; Ando, Y. (Tokyo Univ. (Japan). Faculty of Engineering). Tokyo Daigaku Kogakubu Fuzoku Sogo Shikenjo Nenpo; 37: 181-186(Sep 1978). (In Japanese).

With the modelled specimen of the primary piping for a nuclear reactor, the experiment of dynamic rupture was performed to clarify the dynamic behavior of a pipe with a crack. Also, the effect of creep damage to the dynamic rupture was evaluated using plate test pieces which were subjected to various degrees of creep damage before dynamic test. The special experimental apparatus which gives mechanical shock to test specimens with the solenoid and the lever mechanism, the mechanical properties of each specimen, the shapes and dimensions of the specimens for creep, uniaxial tensile and impact loading test, the instrumentation system, the conditions of creep test and the three types of initial crack in the modelled specimens are presented. As for the experimental results and the relating evaluation, the nondimensional parameters under plane stress condition being introduced by Hutchinson's and the author's methods are compared, and the characteristic stress distribution at the crack tip is reported. These evaluations were conducted under plastic deformation. The time response of net stress and axial strain in the test specimens without notch and with an inner circumferential notch

are shown. From the test results and the proposed evaluation method, it was found that the nonlinear fracture mechanics is available for the reasonable design of structures under elevated temperature.

3472 (DOE-tr--40) FAST BREEDER PROJECT. SECOND QUARTERLY REPORT, 1977. (Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.)). 31 Aug 1978. Translation of KFK--1277/2, October 1977 209p. Dep. NTIS (US Sales Only), PC A10/MF A01.

Work performed under United States--W. Germany Fast Reactor Exchange Program.

Progress is summarized in the areas of fuel rod development, materials studies, reactor kinetics, reactor safety, and cooling system technology.

3473 TUBE BOILER HEAT EXCHANGER. Hayden, D.; Sheward, G.E.; Ormrod, D.T.; Willby, C.R.; Firth, G.F. (to UKAEA; Deutsches Patentamt, Muenchen (Germany, F.R.)). German(FRG) Patent 2,705,195/A/. 17 Aug 1978. 27p. (In German).

The tube boiler heat exchanger has been designed for use in a steam generator circuit of a sodium cooled fast breeder reactor. U-type heat exchanger tubes with legs of different lengths are suspended within the boiler. They are made of steel with 9% chrome content. Each tube is passed through an opening in the tube wall with some clearance and then tightly sealed to the tube wall by means of a sleeve. This seal is achieved by a brazed connection using Microbraz 135 brazing metal (nickel base alloy) applied by means of a high frequency induction technique.

3474 NUCLEAR REACTOR. Howard, R.S.; Hodgson, D.O.; Dale, J.G.; Thomas, C. (to Nuclear Power Co. Ltd., London (UK); Deutsches Patentamt, Muenchen (Germany, F.R.)). German(FRG) Patent 2,805,188/A/. 17 Aug 1978. 18p. (In German).

In a sodium cooled fast breeder reactor the fuel assembly proper is separated by a partition wall. The inner wall is equipped with a thermal insulation. It consists of a large number of spaced layers of stainless steel plates. Each layer has square panels fixed on the wall surface in vertical and horizontal rows. The gaps between the panels are closed by cruciform covers. The arms of the covers overlap the opposite areas of adjacent panels. The cruciform cover strips, the panels and the spacers between the cover strips constitute labyrinth seals for the coolant.

3475 NUCLEAR REACTOR CONTROL. Ingham, R.V. (to UKAEA London Office). British Patent 1,521,615/A/. 16 Aug 1978. 5p.

The reactor control described is applicable to liquid metal cooled fast breeder nuclear reactors and provides that in the event of an emergency condition wherein the rate of coolant flow is reduced a rapid power set-back of appropriate magnitude is achieved by causing limited injection of control rods into the reactor, the insertion being sufficient to reduce reactivity to a safe level, and, subsequently, fine control at the reduced power output is achieved by automatic control.

3476 REACTOR. Toyama, M.; Kasai, S. (to Toshiba Corp., Kawasaki, Kanagawa (Japan)). Japanese Patent 53-92,095/A/. 12 Aug 1978. 4p. (In Japanese).

Purpose: To provide a LMFB type reactor

wherein effusion of coolants through a loop contact portion is reduced even when fuel assemblies float up, and misloading of reactor core constituting elements is prevented thereby improving the reactor safety. Constitution: The reactor core constituents are secured in the reactor by utilizing the differential pressure between the high-pressure cooling chamber and low-pressure cooling chamber. A resistance port is formed at the upper part of a connecting pipe, and which is connect the low-pressure cooling chamber and the lower surface of the reactor core constituent. This resistance part is formed such that the internal sectional area of the connecting pipe is made larger stepwise toward the upper part, and the cylinder is formed larger so that it profiles the inner surface of the connecting pipe.

- 3477 DEVICE OR INSTALLATION FOR USE IN A LIQUID ALKALI METAL ENVIRONMENT. Campbell, C.S. (to UKAEA London Office; Deutsches Patentamt, Muenchen (Germany, F.R.)). German (FRG) Patent 2,802,577/A/. 10 Aug 1978. 11p. (In German).

The invention relates to the use of materials in liquid alkali metals, especially sodium, for support faces. It is proposed to use as a complementary support face for stainless steel bearings a nickel base aluminized alloy. The invention is explained by the example of a heat exchanger for a liquid sodium cooled fast breeder reactor. In the design, fuel rods with stainless steel claddings are supported by cell type grids. In the invention, these grids are made of nickel base alloys and carry bushings with aluminized bores constituting the complementary support faces for the nuclear fuel rods.

- 3478 LIQUID METAL COOLED FAST BREEDER REACTOR. Durston, J.G.; Hind, J.R. (to Nuclear Power Co. Ltd., London (UK); Deutsches Patentamt, Muenchen (Germany, F.R.)). German (FRG) Patent 2,804,560/A/. 10 Aug 1978. 11p. (In German).

The proposal relates to a change in the design of the inner vessel surrounding the fuel subassembly supported on a grid plate in a liquid metal cooled fast breeder reactor. In the invention, this vessel which is surrounded by liquid metal, carries a number of vertical ribs on its inner surface which are to serve the purpose of reducing the stresses acting on the wall of the vessel as a result of the differential temperatures in the coolant. A cover plate and baffles and guide vanes add to the effect of the ribs.

- 3479 TECHNICAL CONCEPT OF THE BREEDER NUCLEAR POWER STATION AND ITS REALIZATION IN THE FRG. Hueper, P. (Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.)). Technica (Basel); 27: No. 15, 1230-1231 (4 Aug 1978). (In German).

An introductory outline for the nonspecialist is presented.

- 3480 FAST SHUTDOWN DEVICE FOR A NUCLEAR REACTOR. Minnick, L.E. (to Electric Power Research Inst., Palo Alto, CA (USA); Deutsches Patentamt, Muenchen (Germany, F.R.)). German (FRG) Patent 2,801,005/A/. 3 Aug 1978. 27p. (In German).

The fast shutdown effect is based on an intervention into the operative connection between control rod and control rod drive mechanism. During operation of the LMFBR the coolant sodium is developing sufficient differential pressure on the separating plate

and on the seal of the control rod to press the rod against the separating plate and to keep it above the neutron high-flux region of the core. If the flow rate of the coolant is reduced (accident, leak or rupture in the primary loop, earthquake) or the control rod is moved laterally the differential pressure on the separating plate decreases. The control rod drops because of gravity. A scram will follow.

- 3481 PRESSURE SENSOR FOR HIGH-TEMPERATURE LIQUIDS. Forster, G.A. (to Dept. of Energy). US Patent 4,103,555. 1 Aug 1978. Filed date 6 Jun 1977. 6p.

PAT-APPL-804,123.

A pressure sensor for use in measuring pressures in liquid at high temperatures, especially such as liquid sodium or liquid potassium, comprises a soft diaphragm in contact with the liquid. The soft diaphragm is coupled mechanically to a stiff diaphragm. Pressure is measured by measuring the displacement of both diaphragms, typically by measuring the capacitance between the stiff diaphragm and a fixed plate when the stiff diaphragm is deflected in response to the measured pressure through mechanical coupling from the soft diaphragm. Absolute calibration is achieved by admitting gas under pressure to the region between diaphragms and to the region between the stiff diaphragm and the fixed plate, breaking the coupling between the soft and stiff diaphragms. The apparatus can be calibrated rapidly and absolutely.

- 3482 FAST BREEDER REACTOR. ENERGY WITHOUT DEPLETION OF NATURAL RESOURCES. Vaughan, R.D. (Nuclear Power Co. (Risley) Ltd. (UK)); Farmer, A.A. (UK Atomic Energy Authority). Electr. Eng. (Johannesburg); 15-16, 18 (Aug 1978).

Primary energy growth during the next decades is predicted, and the role of the fast breeder reactor in relation to such a prediction is discussed. Attention is given to the fact that breeder reactors can provide energy without depleting natural uranium resources.

- 3483 (ANL-Trans--1140) DISTAV CALCULATION CODE FOR DETERMINING SODIUM TEMPERATURES IN DEFORMED HELICOID WIRE PIN BUNDLES IN FAST NEUTRON REACTORS. Leteturier, D.; Dufour, P.; Eyriey, M. (CEA Centre d'Etudes Nucleaires de Cadarache, 13 - Saint-Paul-les-Durance (France); Societe ORDINA, 13 - Marseille (France)). Aug 1978. Translation of Paper NR-7 (CONF-780805--7). 18p. Dep. NTIS, PC A02/MF A01.

From 6. heat transfer conference; Toronto, Canada (7 Aug 1978).

The DISTAV (distribution of temperatures in an assembly during its lifetime) code is described. The code calculates sodium and pin sheath temperatures in a fast neutron reactor assembly which has been subject to deformations under irradiation is presented. The preliminary results obtained with this code are discussed and the experimental program required for its validation is described.

- 3484 OXYGEN GETTERS FOR FAST REACTOR FUEL PINS. Johnson, C.E.; Fee, D.C. (Argonne National Lab., IL). Nucl. Technol.; 40: No. 1, 89-97 (Aug 1978).

Oxidative attack of stainless-steel cladding in mixed uranium-plutonium oxide fast reactors may limit the life of the fuel pins. Present knowledge of cladding reactions suggests that the key factor in controlling cladding attack may be control of the oxygen potential (Δ anti

$G/\text{sub } O_2/ = RT \ln p/\text{sub } O_2/)$ by the insertion of oxygen getters within the fuel pin. Niobium, titanium, and vanadium are prime candidates as oxygen getters because they are easily oxidized at more negative oxygen potentials than the stainless-steel cladding. On the basis of predicted oxidation rates at the low oxygen pressures encountered in fuel pins, the recommended order of getter suitability is $V > Nb > Ti$.

- 3485 FUEL AND FISSION GAS RESPONSE TO SIMULATED THERMAL TRANSIENTS: EXPERIMENTAL RESULTS AND CORRELATION WITH FISSION GAS RELEASE AND SWELLING MODEL. Bandyopadhyay, G. (Argonne National Lab., IL). Nucl. Technol.; 40: No. 1, 62-78(Aug 1978).

To evaluate the role of fission gas in hypothetical core disruptive accidents, experimental and analytical information describing the fission gas behavior in rapid temperature transients is urgently needed. A direct-electrical-heating apparatus was used to obtain information on the fission gas behavior and the response of mixed-oxide fuel elements to simulated thermal transient conditions. The experimental results indicate that fission gas response and swelling behavior are strongly dependent on the transient heating rate, and that fission gas can contribute significantly to the failure of a fuel stack during a temperature transient. The microstructural results from these tests were subsequently used to perform a limited verification of the fission gas release and swelling code, FRAS, which was developed to describe the fission gas release behavior in rapid temperature transients. A comparison of the measured intragranular bubble sizes (and in some cases bubble densities) with the calculated bubble sizes (and densities) revealed that the current version of the FRAS code is inadequate in some transient conditions. A nonequilibrium of bubble coalescence may be necessary to describe the fission gas behavior in such temperature transients.

- 3486 EFFECTS OF RECENT MODELING DEVELOPMENTS IN PROMPT BURST HYPOTHETICAL CORE DISRUPTIVE ACCIDENT CALCULATIONS. Sienicki, J.J.; Abramson, P.B. (Argonne National Lab., IL). Nucl. Technol.; 40: No. 1, 106-115(Aug 1978).

The main objective of the development of multifield, multicomponent thermohydrodynamic computer codes is the detailed study of hypothetical core disruptive accidents (HCDAs) in liquid-metal fast breeder reactors. The main contributions such codes are expected to make are the inclusion of detailed modeling of the relative motion of liquid and vapor (slip), the inclusion of modeling of nonequilibrium/nonsaturation thermodynamics, and the use of more detailed neutronics methods. Scoping studies of the importance of including these phenomena performed with the parametric two-field, two-component coupled neutronic/thermodynamic/hydrodynamic code FX2-TWQPOOL indicate for the prompt burst portion of an HCDA that: (1) Vapor-liquid slip plays a relatively insignificant role in establishing energetics, implying that analyses that do not model vapor-liquid slip may be adequate. Furthermore, if conditions of saturation are assumed to be maintained, calculations that do not permit vapor-liquid slip appear to be conservative. (2) The modeling of conduction-limited fuel vaporization and condensation causes the energetics to be highly sensitive to variations in the droplet size (i.e., in the parametric values) for the sizes of interest in HCDA analysis. Care must therefore be exercised in the inclusion of this phenomenon in

energetics calculations. (3) Insignificant differences are observed between the use of space-time kinetics (quasi-static diffusion theory) and point kinetics, indicating again that point kinetics is normally adequate for analysis of the prompt burst portion of an HCDA. (4) No significant differences were found to result from assuming that delayed neutron precursors remain stationary where they are created rather than assuming that they move together with fuel. (5) There is no need for implicit coupling between the neutronics and the hydrodynamics/thermodynamics routines, even outside the prompt burst portion.

- 3487 BENCHMARK CALCULATIONS FOR A SODIUM-COOLED BREEDER REACTOR BY TWO- AND THREE-DIMENSIONAL DIFFUSION METHODS. II. Buckel, G.; Kuefner, K.; Stehle, B. (Kernforschungszentrum Karlsruhe, Ger.). Nucl. Sci. Eng.; 67: No. 2, 257-259(Aug 1978).

Results for our liquid-metal fast breeder reactor benchmark problem obtained by several diffusion computer programs for two- and three-dimensional reactor models showed unexplained behavior or discrepancies. With the help of additional calculations and comparisons, it was possible to improve some of the computer programs. Most of the original calculations have been repeated (and, in addition, some new calculations have been performed), and the revised results of the comparison are presented.

- 3488 FAST BREEDER REACTOR: A MILLENIUM OF PEACEFUL POWER. Compressed Air; 83: No. 8, 8-13(Aug 1978).

Proliferation concerns affecting the development of the LMFBR in the U.S. are reviewed and the search for more proliferation-resistant fuel cycles is described. Topics discussed include civilian reprocessing, breeder deferral, enrichment capacity, uranium supply, breeder economics, world energy needs, the Civex process, and institutional controls.

- 3489 QUANTITATIVE COMPARISON OF SOLIDIFICATION ANALYSIS FOR SINGLE-COMPONENT AND MIXED-OXIDE FUELS. Welch, T.D. (Oak Ridge National Lab., TN); Cronenberg, A.W. (Univ. of New Mexico, Albuquerque). Nucl. Sci. Eng.; 67: No. 2, 263-269(Aug 1978).

An important question to the liquid-metal fast breeder reactor safety program is a description of molten fuel dynamics, or, more specifically, whether fuel will freeze locally on structural material within the reactor core, preventing dispersal and nuclear shutdown, or in the extremities of the fuel assembly. A comparison is made between the solidification processes for single-component (i.e., UO_2) and mixed-oxide fuel [i.e., $(U,Pu)O_2$] by solving a Stefan-type problem for both pure and binary alloy solidification. Analytic calculations indicate that the freezing rate of the mixed fuel is not significantly different from that for the single-component system; thus, single-front analysis may be used for such mixed-oxide fuels in assessing safety questions associated with solidification phenomena.

- 3490 INVESTIGATION OF IRRADIATED URANIUM--PLUTONIUM CARBONITRIDE FUEL BY MICROPROBE ANALYSIS. Walker, C.T. (Joint Research Centre, Karlsruhe, Ger.). Nucl. Technol.; 39: No. 3, 289-296(Aug 1978).

A mixed carbonitride fuel irradiated to 3.9% fissions of initial metal atoms in a fast flux was examined by electron microprobe analysis. The fuel contained a large porous zone.

Inclusions at the edge of the zone contained palladium and tin and were formed from the liquid phase. Within the porous region, the platinum metals occurred in the UPd_3 and $U(Tc_{0.02}Ru_{0.75}Rh_{0.2}Pd_{0.06})_3C$ phases, molybdenum and technetium formed inclusions of the $(U,Pu)_{sub x}/(Mo,Tc)_{sub y}/C_{sub z}$ type, and part of the rare earth elements reacted with impurity oxygen to give a sesquioxide phase. Plutonium depletion was found near the fuel center, and plutonium enrichments were measured at the outer part of the porous zone and at healed cracks in the dense fuel. Cladding carburization occurred and, at the inner cladding surface, the carbon concentration was 0.4 wt %.

project have chosen to concentrate their assault on the plant design, stating that it is obsolete, that its size was improperly selected, and that it contributes to the risk of nuclear weapons proliferation to a greater extent than other moderately enriched fuel cycle concepts, such as the Shippingport light water breeder reactor. Arguments are presented that the design is up to date, its size was appropriately selected, and that contrary to contributing to nuclear weapons proliferation, it provides the United States an opportunity to implement the results of the International Fuel Cycle Evaluation (INFCE) in the near term, thereby assuring a leadership role in the worldwide nuclear community.

- 3491 RECENT IMPROVEMENTS IN IDENTIFYING FISSION PRODUCT SOURCES IN THE EXPERIMENTAL BREEDER REACTOR II. Lambert, J.D.B. (Argonne National Lab., IL); So, B.Y.C.; Kirn, F.S.; Armstrong, J.R.; Ebersole, E.R.; Laug, M.T. Nucl. Technol.; 39: No. 3, 275-282(Aug 1978).

The detection of a xenon tag released from an element with breached cladding has proved to be the best method of identifying a source of fission product release in the Experimental Breeder Reactor II. From experience gained from December 1974 to September 1977 in identifying the sources of 25 major releases, allowance can now be made for the composition changes in xenon tags brought about by irradiation and for the presence of more than one tag in the cover gas. This experience has also shown that calculated ratios of fission gas to tag gas in subassemblies can be used in identifying a source of release. An ancillary method, which uses the measured $^{131}Xe/^{134}Xe$ ratio in the cover gas, can also determine whether or not the source is uranium. The success of these recent improvements is reflected in the short time to identify a source and in the small number of other sources, frequently none, that are suspect.

- 3492 PRIMARY PIPE RUPTURE ACCIDENT ANALYSIS FOR THE CLINCH RIVER BREEDER REACTOR. Albright, D.C.; Bari, R.A. (Brookhaven National Lab., Upton, NY). Nucl. Technol.; 39: No. 3, 225-257(Aug 1978).

Analyses of primary pipe rupture accidents in the Clinch River Breeder Reactor were carried out with Brookhaven National Laboratory-modified versions of the DEMO code. The thermal transient responses of the core and radial blanket were calculated for a large number of initial conditions and plant configurations. These include studies of variations of pipe break size and operating power. Pipe ruptures commencing from two-loop initial operating conditions are presented. The sensitivity of the thermal response to variations in particular parameters within the estimated ranges of their uncertainties has been studied. Conditions under which sodium boiling in the core occurs are delineated.

- 3493 EVALUATION OF THE CLINCH RIVER BREEDER REACTOR PLANT DESIGN. Hill, E.H. (Proj Manage Corp). Power Eng.; 82: No. 8, 93-98(Aug 1978).

Recent months have seen the Clinch River Breeder Reactor Plant (CRBRP) Project become perhaps the most controversial and debated power issue in the United States. The project is faced with the prospect of termination, or at best a significant delay, either of which promises to place the United States well behind several other industrialized nations in breeder reactor development. The opponents of the

- 3494 THREE-DIMENSIONAL DEFLECTION ANALYSES OF WIRE-SPACED FUEL PIN BUNDLES UNDER TEMPERATURE AND HYDRODYNAMIC FORCE FIELDS WITH IRRADIATION EFFECTS. Sakai, K.; Okubo, Y.; Hishida, H. (Mitsubishi Atomic Power Industries, Inc., Omiya, Saitama (Japan). Engineering and Development Div.). Nucl. Eng. Des.; 48: No. 2, 595-610(Aug 1978).

An analytical method of evaluating the effects of non-uniform thermal expansion, hydrodynamic force acting on the periphery of a fuel pin and thermal and irradiation-induced creep and swelling on the three-dimensional deflection modes of a fuel pin bundle, as well as the deviation in engineering hot channel factor, are presented. The analysis consists mainly of deriving an expression for a flexibility matrix in terms of the general solution of a beam deflection equation with an arbitrary number of loads under either fuel pin to fuel pin or fuel pin to wrapper tube contact condition. The resulting matrix equation is solved for loads corresponding to all contact points, in terms of which the deflection modes are given. The drag coefficient for a wire-wrapped fuel pin in flowing fluid was investigated experimentally. Several cases of sample calculation show that for a prototype LMFBR fuel subassembly consisting of 169 fuel pins, the engineering hot channel factor accounting for the three-dimensional fuel pin bundle deflection is around 1.023-1.035 at zero irradiation and further increase to 1.045 after 500 day irradiation. The maximum load due to pin contact and the order of pin bundle deflection increase according to the irradiation level.

- 3495 PROBABILISTIC DISTRIBUTIONS OF PIN GAPS WITHIN A WIRE-SPACED FUEL SUBASSEMBLY AND SENSITIVITIES OF THE RELATED UNCERTAINTIES TO PIN GAP. Sakai, K.; Hishida, H. (Mitsubishi Atomic Power Industries, Inc., Omiya, Saitama (Japan). Engineering and Development Div.); Nakai, Y.; Saito, S. (Power Reactor and Nuclear Fuel Development Corp., Tokyo (Japan)). Nucl. Eng. Des.; 48: No. 2, 505-515(Aug 1978).

Probabilistic fuel pin gap distributions within a wire-spaced fuel subassembly and sensitivities of the related uncertainties to fuel pin gaps are discussed. The analyses consist mainly of expressing a local fuel pin gap in terms of sensitivity functions of the related uncertainties and calculating the corresponding probabilistic distribution through taking all the possible combinations of the distribution of uncertainties. The results of illustrative calculations show that with the reliability level of 0.9987, the maximum deviation of the pin gap at the cladding hot spot of a center fuel subassembly is 8.05% from its nominal value and the corresponding probabilistic pin gap distribution is shifted to the narrower side due to the external confinement of a pin bundle with a wrapper

tube.

3496 ANALYSIS OF RADIOACTIVE CORROSION PRODUCT TRANSFER IN SODIUM LOOP SYSTEMS.

Polley, M.V.; Skyrme, G. (Central Electricity Generating Board, Berkeley (UK). Berkeley Nuclear Labs.). J. Nucl. Mater.; 75: No. 2, 226-237(Aug 1978).

A solution-precipitation model for radioactive corrosion product transfer in LMFBR primary circuits and experimental sodium loops is discussed. Expressions are given for the quantity released to flowing sodium from steel undergoing bulk corrosion. The observed super-stoichiometric release of ^{54}Mn and sub-stoichiometric release of cobalt isotopes are attributed to high and low relative solubilities in sodium, respectively. It is shown that relative solubility values are required for calculating ^{58}Co and ^{60}Co release but not for calculating ^{54}Mn release. An expression is given for the quantity deposited onto a surface undergoing either bulk corrosion or bulk deposition. This is reduced to a table of simple relationships which is used to interpret experimental data. It is thereby concluded that ^{60}Co deposition is controlled by diffusion in the liquid and ^{54}Mn deposition is likely to be controlled by solid-state diffusion at high temperatures and bulk deposition at low temperatures.

3497 FAST BREEDER REACTORS, CURRENT STATUS AND DEVELOPMENT TRENDS.

Kessler, G. (Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Projekt Schneller Brueiter). Kerntechnik; 20: No. 8, 349-356(Aug 1978). (In German).

The prototype fast breeder reactors Phenix, PFR and BN-350 have so far shown satisfactory operating performance and have reached a maximum fuel burnup of 75,000 Mwd/t. FFTF, BN-600 and SNR-300 are still under construction and are scheduled for commissioning in 1980-83. In France, the construction of the power plant Super-Phenix was started in 1977. In Britain and the USSR large breeder reactor power plants of 1300 and 1600 MW respectively are still in the detailed planning stage. The research and development programmes pursued concurrently with this construction activity are concentrated on reactor physics and safety engineering investigations of large cores and on the development of steels with low swelling and creep at high neutron fluences. (orig.) 891 HP.

3498 ANALYSIS OF THE EFFECT OF EMERGENCY OPERATING REGIMES OF A FAST POWER REACTOR ON THE FUEL PERFORMANCE.

Proshkin, A.A.; Bagdasarov, Yu.E.; Zabud'ko, L.M.; Buksha, Yu.K.; Likhachev, Yu.I. At. Energ. (USSR); 45: No. 2, 98-104(Aug 1978). (In Russian).

Performance of the BN-600 reactor type fuel elements have been analysed in different emergency regimes including power supply failure, cooling circuit cut-off and reactivity insertions. The stress-strain states have been calculated in terms of two models assuming strong fuel-to-cladding bonding (1) and mere contact (2). Fuel element performance criteria are formulated. According to the calculations the contribution of the emergencies to the fuel element failure rate in the model 2 is higher than in the model 1. In this case, the reactor accidents with faultless operation of corresponding emergency safety systems contribute little to the rate, should the accidents occur up to 5 times during the reactor life time.

3499 FAST BREEDER REACTOR.

Brandstetter, A. (Internationale Atomreaktorbau G.m.b.H. (INTERATOM), Bergisch Gladbach (Germany, F.R.); Internationale Natrium-Brutreaktor-Bau G.m.b.H., Bergisch Gladbach (Germany, F.R.)). Tech. Mitt.; 71: No. 8, 439-446(Aug-Sep 1978). (In German).

Sodium as a coolant, technology of sodium, cooled fast breeders, safety behaviour, the plutonium problem, and their role in energy policy are discussed. (orig.) 891 RW.

3500 FAST BREEDER REACTOR.

Brandstetter, A. (Internationale Atomreaktorbau G.m.b.H. (INTERATOM), Bergisch Gladbach (Germany, F.R.); Internationale Natrium-Brutreaktor-Bau G.m.b.H., Bergisch Gladbach (Germany, F.R.)). Tech. Mitt.; 71: No. 8, 439-446(Aug-Sep 1978). (In German).

Sodium as a coolant, technology of sodium, cooled fast breeders, safety behaviour, the plutonium problem, and their role in energy policy are discussed.

3501 CONSTRUCTION OF SUPER-PHENIX AND THE EUROPEAN COOPERATION IN THE FIELD OF BREEDERS.

Ertaud, A.; Naigeon, J. (Novatome Industries, 92 - Le Plessis-Robinson (France)). Rev. Gen. Nucl.; No. 4, 327-332(Aug-Sep 1978). (In French).

Laying stress on the essential part which can be played by the breeders to meet with power requirements, the authors describe the various steps of european cooperation in this field, and the industrial and commercial organization which has been setup for the development of Super-Phenix.

3502 COMPUTER CONTROL SYSTEM FOR SODIUM TEST LOOPS.

Takamatsu, S.; Okano, H.; Shigemasa, T. (Tokyo Shibaura Electric Co. Ltd., Kawasaki, Kanagawa (Japan). Research and Development Center); Satoh, M.; Satoh, T. J. Nucl. Sci. Technol. (Tokyo); 15: No. 8, 612-620(Aug 1978).

A digital computer system was developed for automatic operation of the Toshiba Sodium Test Loops, intended for studying the control system of liquid metal fast breeder reactors. The test installation is controlled by a system of two TOSBAC-40C central processing units, which take care of plant monitoring, data logging, information display, sequence control and closed loop control. The operator console linked to the computers can handle more than 3,000 process input/output signals. The state of the plant and measured data are displayed on two color cathode-ray tube installed on the console. Normal operation of the four loops constituting the installation can be supervised by one single operator. Safety in the case of power failure and other emergencies is assured by a safety protection system that functions independently of the computer system.

3503 APPLICATION OF GALERKIN METHOD TO HYDRAULIC ANALYSIS FOR TURBULENT FLUID FLOW AROUND LMFBR FUEL ROD.

Shimizu, T.; Kawamura, H. (Nippon Atomic Industry Group Co. Ltd., Kawasaki, Kanagawa. Nuclear Research Lab.). J. Nucl. Sci. Technol. (Tokyo); 15: No. 8, 628-631(Aug 1978).

ANISOTROPY; COOLANTS; FLOW MODELS; FUEL RODS; GALERKIN-PETROV METHOD; HYDRAULICS; LMFBR TYPE REACTORS; TURBULENT FLOW; TWO-DIMENSIONAL CALCULATIONS; VELOCITY

3504 REPROCESSING FAST REACTOR FUEL IN

BRITAIN. Nucl. Eng. Int.; 23: No. 275, 45-46(Aug 1978).

The existing reprocessing plant at Dounreay is being modified and extended to accommodate fuel from PFR in 1979. The changes are necessary because of higher rating, burn-up, and plutonium content. Sodium must also be removed from the fuel-assemblies before reprocessing. Changes in flow sheet, instrumentation, design of certain components, use of lasers for dismantling, and waste management are discussed briefly. Reference is made to R and D work in progress.

3505 PIPES IN STEEL OR SPECIAL MATERIALS FOR NUCLEAR BOILERS. Delcroix, J. (Vallourec, 75 - Paris (France)). Rev. Gen. Nucl.; No. 4, 277-281(Aug-Sep 1978). (In French).

Some of the main achievements among the tubular products used for the construction of nuclear power stations are described i.e.: housing tubes, steam generator tubes, welded tubes for heat exchangers and condensers. The quality control organization which has been set up for the development of this equipment is presented.

3506 CHARACTERIZATION OF LMFBR FUEL-SODIUM AEROSOLS. Allen, M.D.; Briant, J.K. (Battelle Pacific Northwest Labs., Richland, WA (USA)). Health Phys.; 35: No. 2, 237-254(Aug 1978).

Liquid Metal Fast Breeder Reactor (LMFBR) fuel-sodium condensation aerosols which may be formed in a major reactor accident have been investigated. A pulsed beam from a high-powered CO₂ laser vaporized PuO₂-UO₂ from the surface of a rotating LMFBR fuel pellet. The PuO₂-UO₂ vapor rapidly condensed and coagulated into branched, chain-like aggregates. These aggregates were swept by argon into a sodium vapor atmosphere. The sodium condensed on the aggregates and the mixed aerosol was introduced into 50% relative humidity air. These aerosols have been characterized according to physical appearance, crystalline structure, and aerodynamic behavior. The mixed PuO₂-UO₂-Na aerosol appeared physically similar to sodium aerosol alone. X-ray and electron diffraction analyses indicated that no chemical interaction occurred between the PuO₂-UO₂ aggregates and sodium aerosol, or at least that the product of a reaction is amorphous, if they were kept in a fairly dry atmosphere; however, when exposed to water vapor, sodium uranyl tricarbonate was formed. The activity median aerodynamic diameter (AMAD) of the PuO₂-UO₂ aggregates was approximately 0.80µm, depending somewhat on the energy input per laser pulse. The AMAD of the mixed PuO₂-UO₂-Na aerosol was higher than for the PuO₂-UO₂ aerosol alone, and increased as the sodium-to-mixed oxide ratio increased.

3507 MEASUREMENT OF TRITIUM AND TRITIATED WATER VAPOUR IN NUCLEAR POWER INSTALLATIONS. I. TRITIUM FORMATION AND TRANSPORT IN NUCLEAR POWER INSTALLATIONS. Gilar, O.; Kubalek, J.; Sedakov, V. (Tesla, Premysleni (Czechoslovakia)). Vyzkumny Ustav Pristroju Jaderne Techniky. Jad. Energ.; 24: No. 8, 290-296(Aug 1978). (In Russian).

The formation of tritium is described in heavy water-cooled, WWER-type and LMFBR-type reactors. In heavy water reactors tritium results, among others, as the product of reaction D(n,γ)T and its amount depends on the reactor output and the duration of D₂O irradiation. In a reactor with a mean neutron flux density of 10¹³ cm⁻²s⁻¹ after one year of operation in 1 kg D₂O about 1.85x10¹⁰ s⁻¹ tritium is formed, this in the form of gas or oxides. In WWER type reactors tritium results

from uranium fission in fuel elements and neutron capture by boron. It has the form of HTO or tritiated water vapours. In a power unit fitted with two WWER reactors with an output of 2x500 MWsub(th), the amount of tritium in the primary circuit is stabilized at 3.7x10¹⁰ s⁻¹m⁻³ and in the reactor water regime at 7.4x10⁹ s⁻¹m⁻³. In LMFBR reactors tritium is formed also from actinide fission and by neutron capture in boron and lithium. Tritium activity is in fast reactors higher than in PWR's and its transport depends on the content of tritium in the primary circuit and in the coolant cover atmosphere. Tritium formation is also described in research reactors, reprocessing facilities, in radiochemical and radiological laboratories, and in particle accelerator laboratories.

3508 OUTLINE OF THE PRELIMINARY WORKING DESIGN (1) OF PROTOTYPE FBR 'MONJU'. Doryokuro Giho; No. 27, 78-104(Aug 1978). (In Japanese).

Following the conceptual design, the preliminary working design (1) of the prototype fast breeder reactor 'Monju' has been completed by five industrial firms. The design connects the conceptual design to the actual working design. In this design, therefore, the designs were detailed in coordination of machinery, pipings, wirings, etc. with building structures. Prior to the design, recheck was made on the basis of the results of design studies and research and development, and the specifications were partially modified. It serves also for the purpose of governmental safeguard inspection. The features of the prototype FBR Monju are heat output of 714 MW, electric output of 300 MW, fuel of PuO₂-UO₂, breeding ratio of 1.2, and coolant of sodium. The following matters are described: reactor core, reactor construction, fuel handling system, heat transfer system, steam generating system, turbo-generator system, plant operation mode, electric, instrumentation and control equipments, radioactive waste treatment facility, layout, buildings and containment, etc..

3509 NEW WELDING METHOD FOR TUBES AND TUBE PLATES OF HEAT EXCHANGERS FOR FBRs. Shibato, E.; Koyama, T. (Hitachi Ltd., Ibaraki (Japan)). Hitachi Works. Yosetsu Gijutsu; 26: No. 8, 72-76(Aug 1978). (In Japanese).

The cooling systems for FBRs comprise the intermediate heat exchanger for exchanging heat between primary sodium and secondary sodium and the steam generator for exchanging heat between the secondary sodium and water. The intermediate heat exchanger is that of shell and tube type, and it becomes large as the reactor proceeds to a demonstration reactor and a commercial reactor. Accordingly, the number of heat transfer tubes and the size of tube plates increase, and the welding method for tubes and tube plates to obtain the high reliability of welded parts and to achieve low cost and short delivery is required. For this purpose, the method of inserting heat transfer tubes into tube plates by same dimension as their wall thickness and welding them by automatic TIG method so as to attain perfect penetration was developed. In order to confirm the reliability of the welded joints by this method, the test for evaluating the short time and long term strength was carried out. As the result, it was confirmed that the satisfactory performance of the welded joints was able to be obtained, and this method can be applied to actual heat exchangers. Besides, non-destructive inspection technique required for the development of this welding method was

developed. The determination of welding torch position and the improvement of welding efficiency are being studied.

- 3510 (DOE-tr--27) FUEL QUANTITIES, ACTIVITY INVENTORIES, AND RADIOACTIVE RELEASES FROM LIGHT-WATER REACTORS AND SODIUM-COOLED FAST BREEDERS. Papp, R. (Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Abt. fuer Angewandte Systemanalyse). 28 Jul 1978. Translation of KFK--2453, June 1977 51p. Dep. NTIS (US Sales Only), PC A04/MF A01. Work performed under United States--W. Germany Fast Reactor Exchange Program.

A survey is given of mass flows and nuclide inventories in the fuel cycles in light-water and breeder reactors. Data are also given for typical quantities of radioactive waste. However, this report is mainly concerned with the radioactive harmful materials released to the environment when energy is produced on the basis of these reactor systems. In spite of the uncertainty associated with the data, it can be said that on the basis of the quantities which pertain to the environment in comparison to the thermal reactor, the fast breeder reactor does not represent a new category of environmental impact.

- 3511 POSITIONING AND LOCKING DEVICE FOR FUEL PIN TO GRID ATTACHMENT. Frick, T.M.; Wineman, A.L. (to Department of Energy, Washington, DC (USA)). Canadian Patent 1,035,474/A/. 25 Jul 1978. 10p.

The invention comprises an elongated fuel pin assembly having a fuel pin lower end cap, said end cap having a keyed slot perpendicular to its major axis; a positioning and locking bar adapted to slidably mate with a first part of said keyed slot, said bar having multiple, spaced apart, notches exposed along its length; a thin wall fuel pin attachment and flow distribution block disposed below said fuel pin assembly, said block having an upper edge adapted to support said positioning and locking bar at each extremity thereof and having spaced apart elongated keyed slots in the walls thereof, each of said slots having its major axis parallel to the major axis of said assembly; a fuel pin attachment grid beam adapted to slidably mate with said keyed slot of said fuel assembly whereby multiple fuel pin assemblies are originally maintained in locked spaces apart rows.

- 3512 METHOD OF SHIELDING A LIQUID-METAL-COOLED REACTOR. Sayre, R.K. (to Dept. of Energy). US Patent 4,102,739. 25 Jul 1978. Filed date 30 Sep 1976. 6p. PAT-APPL-728,359.

The primary heat transport system of a nuclear reactor - particularly for a liquid-metal-cooled fast-breeder reactor - is shielded and protected from leakage by establishing and maintaining a bed of a powdered oxide closely and completely surrounding all components thereof by passing a gas upwardly therethrough at such a rate as to slightly expand the bed to the extent that the components of the system are able to expand without damage and yet the particles of a the bed remain close enough so that the bed acts as a guard vessel for the system. Preferably the gas contains 1 to 10% oxygen and the gas is passed upwardly through the bed at such a rate that the lower portion of the bed is a fixed bed while the upper portion is a fluidized bed, the line of demarcation therebetween being high enough that the fixed bed portion of the bed serves as guard vessel for the system.

- 3513 FAST NEUTRON REACTOR. Berniolles, J.M.; Jogand, P. (to Commissariat a l'Energie Atomique). US Patent 4,101,377. 18 Jul 1978. Priority date 29 Mar 1976, France, 8p.

A cylindrical inner vessel containing the reactor core is placed coaxially within a main vessel. Heat exchangers are disposed within the annular space formed between the two vessels, each heat exchanger being delimited by an outer shell and a coaxial inner shell which surrounds a central feed duct having a vertical axis. The upper end of the annular space communicates with a flared end portion of the central duct through a first circular window formed in the inner shell. The lower end of the annular space communicates with the region located between the inner vessel and the main vessel through a second circular window formed in the outer shell.

- 3514 (DOE-tr--178) HEAT TRANSMISSION DURING START-UP IN CARBIDE FUEL RODS PROVIDED WITH AVERAGE TO LARGE FABRICATION GAPS. Steiner, H. (Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Inst. fuer Material- und Festkoerperforschung). 5 Jul 1978. Translation of KFK--2472, June 1977 35p. Dep. NTIS, PC A03/MF A01.

Work performed under United States--W. Germany Fast Reactor Exchange Program.

The effect of various geometries on the temperature distribution in helium bonded carbide fuel rods was investigated by solving the heat-conduction equation by means of a Fourier series development. In particular, concentric, eccentric, and staggered arrangements of uncracked pellets as well as pellet cracking with subsequent displacement of pellet fractions toward the cladding were described by means of a model. It turned out that the heat transmission coefficients, determined experimentally during start-up in helium-bonded carbide fuel rods with average fabrication gaps, can only be explained by this last effect. The fact that this effect has not been taken into consideration is also the reason for the discrepancy between the experimental results and the predictions by the GAPRS heat transmission model which is based on a concentrically placed, uncracked pellet.

- 3515 (DOE-tr--175) ANALYSIS OF THE STRUCTURE AND THE THERMAL BEHAVIOR OF THE UO_2 -- PuO_2 FUEL IN THE IRRADIATION EXPERIMENT FR2 CAPSULE TEST SERIES 5A. Lopez Jimenez, J.; Elbel, H. (Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Inst. fuer Material- und Festkoerperforschung). 3 Jul 1978. Translation of KFK--2477, June 1977 50p. Dep. NTIS, PC A03/MF A01.

Work performed under United States--W. Germany Fast Reactor Exchange Program.

In the Karlsruhe FR2 research reactor nine fuel pins were tested in a total of three irradiation capsules within the framework of the 5a test series. The fuel pins contained UO_2 -- PuO_2 fuel pellets. The irradiation times were different for the three capsules. They reached burnup values of approximately 6, 17, and 47 MWd/kgMe for rod power levels of 400 to 600 W/cm and cladding surface temperatures between 500 and 700°C. A detailed analysis of the fuel structure was carried out in order to determine the fuel surface temperature. For this purpose two models were used which describe the formation of the columnar crystal zone or the zone where the directed growth of the grain depends upon the irradiation time and the temperature profile in the fuel.

3516 (DOE-tr--174) FAST BREEDER CLADDING TUBES PROVIDED WITH HELICAL FINS: DEVELOPMENT AND TESTING. Jacobi, O. (comp.). (Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Inst. fuer Material- und Festkoerperforschung). 1 Jul 1978. Translation of KFK--2442, April 1977 69p. Dep. NTIS, PC A04/MF A01.

Work performed under United States--W. Germany Fast Reactor Exchange Program.

Development of fast breeder tubes with helical fins started around 1966. The development was initiated mainly by the search for a more favorable alternative to the conventional spacers such as grids and spiral wires. First of all the possibility was investigated of fabricating them on an industrial scale. The first thermohydraulic and fluid dynamic tests were made in parallel by AEG, GfK, and Interatom. The different stages of development are shown and, finally, two rather large projects are described. These projects are the licensing for the irradiation of finned-tube oxide fuel elements in KNK-II and the already complete 19-rod fuel element bundle irradiation experiment Mol 7D GfK performed in the 500 kW sodium loop of the Belgian BR2 reactor. In this BR2 experiment the maximum target burnup of 85,000 MWD/t of oxide was attained without complications.

3517 LIQUID-METAL FAST BREEDER REACTOR FUEL ROD PERFORMANCE AND MODELING AT HIGH BURNUP. Verbeek, P. (Belgonucleaire, Brussels); Toebbe, H.; Hoppe, N.; Steinmetz, B. Nucl. Technol.; 39: No. 2, 167-185 (Jul 1978).

The fuel rod modeling codes IAMBUS and COMETHE were used in the analysis and interpretation of postirradiation examination results of mixed-oxide fuel pins. These codes were developed in the framework of the SNR-300 research and development (R and D) program at Interatom and Belgonucleaire, respectively. SNR-300 is a liquid-metal fast breeder reactor demonstration plant designed and presently constructed in consortial cooperation by Germany, Belgium, and the Netherlands. RAPSODIE I, the two-bundle irradiation experiment, was irradiated in the French test FBR RAPSODIE FORTISSIMO and is one of the key irradiation experiments within the SNR-300 R and D program. The comparison of code predictions with postirradiation examination results concentrates on clad diameter expansions, clad total axial elongations, fuel differential and total axial elongations, fuel restructuring, and fission gas release. Fuel rod modeling was considered in the light of benchmarking of the codes, and there was consideration of fuel rod design for operation at low and high burnup.

3518 EFFECT OF PRIOR IRRADIATION CREEP ON THE SUBSEQUENT BURST STRENGTH OF 20% COLD-WORKED TYPE 316 STAINLESS-STEEL CLADDING. Duncan, D.R. (Hanford Engineering Development Lab., Richland, WA). Nucl. Technol.; 39: No. 2, 199-206 (Jul 1978).

Creep rates of metals can be greatly enhanced by neutron irradiation experienced in a fast reactor environment. Because irradiation-induced creep strains can be large in magnitude for duct and cladding components, the effect of irradiation creep on subsequent mechanical property behavior must be quantified to provide a design base for core component performance assessment. Pressurized tubes that had sustained a peak value of irradiation creep strain of 1.04% and peak fast fluences of 10×10^{22} n/cm² under irradiation in the Experimental Breeder Reactor II from 650 to 857 K were tested in subsequent transient burst loading. Results of testing show that

subsequent deformation is unaffected by prior irradiation creep within experimental error.

3519 HYDROGEN BURDEN FROM THE STEAM SIDE CORROSION IN SODIUM-HEATED STEAM GENERATORS. Roy, P.; Rodgers, D.N. (General Electric Co., San Jose, CA). Nucl. Technol.; 39: No. 2, 213-215 (Jul 1978).

It has been observed that in sodium-heated steam generators most of the hydrogen produced from water- or steam-side corrosion permeates into the secondary sodium. The amount of hydrogen that diffuses into the secondary side is extremely important from the standpoint of the design of the cold trap, hydrogen background levels, and tritium concentrations in the secondary system. We have compiled all the available data on H₂ permeation from all operating sodium-heated steam generators. In addition, based on the available steam-side corrosion data, we have made tentative recommendations: Steady-state H₂ flux, (1) Evaporator (2 1/4 Cr--1 Mo)--1.8 to 2.2 $\times 10^{-11}$ g H/cm².s. (2) Superheater (2 1/4 Cr--1 Mo)--1.2 to 1.7 $\times 10^{-11}$ g H/cm².s. Initial H₂ flux (up to 2000 h): Evaporator and superheater (2 1/4 Cr--1 Mo)--approximately 7 to 8 $\times 10^{-11}$ g H/cm².s.

3520 ELECTROCHEMICAL OXYGEN SENSOR FOR MEASUREMENT OF OXYGEN IN LIQUID SODIUM. Roy, P.; Bugbee, B.E. (General Electric Co., San Jose, CA). Nucl. Technol.; 39: No. 2, 216-218 (Jul 1978).

The results obtained from approximately 4000 h of operation of an electrochemical oxygen meter developed at General Electric Company for measuring oxygen activities in liquid sodium are described. In the present design, a small ceramic cup (ThO₂ with 7 to 8 wt % Y₂O₃) has been brazed to a metal tube that is inserted into the liquid sodium via a standard sodium flange. The reference electrode used in the present design consists of In/In₂O₃. Several meters were tested in a flowing sodium system, where the oxygen concentrations were controlled by a cold trap. At 500°C, the oxygen electromotive force (emf) output can be expressed as $\text{emf}/\text{sub (V)} = 0.269 + (160/T) (+ - 0.003 \text{ V})$, where T is the cold-trap temperature in K. The temperature coefficient of the meters can be expressed as $(dE/dT) = 0.51 \pm (0.02) \text{ mV}/^\circ\text{C}$.

3521 MECHANISTIC STUDY OF FUEL FREEZING, CHANNEL PLUGGING, AND CONTINUED COOLABILITY DURING FAST REACTOR OVERPOWER EXCURSIONS. Wong, K.W.; Dhir, V.K.; Kastenber, W.E. (Univ. of California, Los Angeles). Nucl. Technol.; 39: No. 2, 121-137 (Jul 1978).

A mechanistic model that describes events leading to in-channel fuel plateout following fuel pin failure under slow transient overpower accident conditions has been proposed. The thermal and hydraulic effects of the plated out fuel have also been investigated. Results based on this model indicate that during a slow transient overpower accident (2.4 cent/s), in-core fuel freezing and channel plugging can be expected to occur. The extent of fuel freezing and channel plugging is sensitive to fuel particle size, the amount of fuel injected, and the amount of fission gas injected into the coolant channel. The results are also compared with experimental data from the TREAT H-4 experiment.

3522 (BNWL-tr--335) BEHAVIOR OF STANDARD RAPSODIE FORTISSIMO FUEL AT HIGH BURNUP. Blanchard, P.; Lambert, G.; Millet, P.; Mikailoff, H. (International Atomic Energy

Agency, Vienna (Austria)). Jul 1978.
Translation of IAEA-SM--225/8 (CONF-780407--
7). 21p. Dep. NTIS (US Sales Only), PC A02/
MF A01.

From Symposium on design, construction and
operating experience of demonstration liquid
metal fast breeder reactors; Bologna, Italy (10
Apr 1978).

Results are presented which were obtained by
destructive examination of a complete fuel
bundle of 61 rods with 10 at. % burnup from the
Rapsodie Fortissimo reactor. A set of
micrographic sections was cut through the
bundle at linear power levels of 290 to 400 W/
cm. The temperature distributions evaluated at
a given height, starting from the positions at
the limit of the zones containing columnar
grains, are remarkably similar from rod to rod
(mean deviation ca. 25°C), whereas the central-
hole diameters are strongly disperse. These
dispersions are clearly greater than expected
from the range of data on fuel fabrication. It
is shown that they are due to several factors:
random radial distribution of the clearance in
the fissures, variable swelling of the steel of
the cans and variable in-pile sintering of the
oxide. In-pile sintering of pellets and
swelling of cans lead to overheating of the
oxide surface and to continuous evolution of
the structures. However, the central
temperatures continue to be low, and below
their value at the start of the service life.

3523 (BNWL-tr--339) SEPARATION OF
RADIOACTIVE IMPURITIES BY THE COLD TRAP OF THE
BOR-60 REACTOR. Kizin, V.D.; Lisitsyn, E.S.;
Poznyak, G.I.; Polyakov, V.I.; Chechetkin,
Yu.V. Jul 1978. Translation of NIIAR-P-2,
No. 296, 1977 27p. Dep. NTIS, PC A03/MF A01.

The separation of radioactivity in the
regular cold trap of the BOR-60 reactor was
studied experimentally. It was shown that ^{65}Zn ,
 ^{134}Cs , ^{136}Cs , ^{137}Cs , ^{131}I , ^{60}Co and ^{124}Sb
accumulate in this trap. The sodium is purified
almost completely of iodine in the cold trap,
and the radioactivity of the cesium isotopes
there amounts to 20-30% of their content in the
primary loop. Experiments were carried out to
determine the quantitative characteristics of
the processes of separation of cesium from
sodium by sorption on the sodium oxides and
metal surfaces.

3524 (BNWL-tr--334) ANALYSIS OF THE
PERFORMANCES OF THE ASSEMBLIES AND OF THE CORE
OF PHENIX. Ravier, J.; Delpeyroux, P.;
Estavoyer, M.; Bernard, B.; Carnoy, M.;
Courcon, P.; Jallade, M.; Ollier, H.; Coulon,
P.; Dupouy, J.M. (International Atomic Energy
Agency, Vienna (Austria)). Jul 1978.
Translation of IAEA-SM--225/9 (CONF-780407--
9). 23p. Dep. NTIS, PC A02/MF A01.

From Symposium on design, construction and
operating experience of demonstration liquid
metal fast breeder reactors; Bologna, Italy (10
Apr 1978).

The recent operating characteristics of the
PHENIX Reactor are described and the core and
fuel assembly performance is discussed.

3525 KERNKRAFTWERK KALKAR (SNR-300) =
CONSTRUCTION OF THE INERTING SYSTEMS WJ01 AND
WJ02 AND THE TECHNICAL HEAVY-CURRENT EQUIPMENT
FOR THE POWER SUPPLY OF THE PROTECTION SYSTEM.
RECOMMENDATION OF THE
REAKTORSICHERHEITSKOMMISSION DURING ITS 134TH

3526 (JAPFNR--316) FAST BREEDER REACTOR
DEVELOPMENT IN JAPAN. PROGRESS REPORT,
OCTOBER--DECEMBER 1977. (Power Reactor and
Nuclear Fuel Development Corp., Tokyo (Japan)).
Jul 1978. Translation of PNC-N--251-78-02
13p. Dep. NTIS (US Sales Only), PC A02/MF
A01.

Work performed under United States--Japanese
Fast Reactor Exchange Program.

Progress in LMFBR research and development
is reported in the following areas: JOYO
development, MONJU development, reactor
physics, structural components, instrumentation
and control, sodium technology, fuels and
materials, safety, and steam generators.

3527 INFLUENCE OF THE CHEMICAL COMPOSITION OF
AUSTENITIC STAINLESS STEELS ON THEIR CORROSION
BEHAVIOUR IN HIGH-TEMPERATURE SODIUM.
Eremias, B.; Fresl, M. (G.V. Akimov State Res
Inst of the Prot of Mater, Prague, Czech). J.
Nucl. Mater.; 75: No. 1, 186-192(Jul 1978).

Results of weight losses, carbon analysis
and mechanical properties after exposure to
sodium as well as argon atmosphere are given.
The five steels can be sorted into several
families, dependent on their composition. 15
refs.

3528 SWELLING OF TYPE-316 STAINLESS STEEL AT
HIGH FLUENCES IN EBR-2. Kenfield, T.A.;
Appleby, W.K.; Busboom, H.J.; Bell, W.L. (GE,
Sunnyvale, Calif). J. Nucl. Mater.; 75: No.
1, 85-97(Jul 1978).

Density determinations showed swellings of
up to 15% $\Delta V/V$ for 20% cold worked
steel at a neutron fluence level of $1.4 \times 10^{23} \text{ n/cm}^2$,
 $E > 0.1 \text{ MeV}$ (70 dpa). The peak swelling
temperature range was 550°C-600°C regardless of
the extent of cold working. Increasing the cold
work level reduced the swelling and tended to
broaden the swelling temperature peak. Cold
working reduced the average void sizes. 18
refs.

3529 SWELLING OF TYPE-316 STAINLESS STEEL AT
HIGH FLUENCES IN EBR-II. Kerfield, T.A.;
Appleby, W.K.; Busboom, H.J. (General Electric
Co., Sunnyvale, Calif. (USA). Fast Breeder
Reactor Dept.); Bell, W.L. (General Electric
Co., Pleasanton, Calif. (USA). Vallecitos
Nuclear Center). J. Nucl. Mater.; 75: No. 1,
85-97(Jul 1978).

A test to measure swelling induced by fast
neutron irradiation in unstressed specimens of
type-316 stainless steel has completed
irradiation in the EBR-II reactor. Results are
reported and discussed which describe the
swelling as a function of neutron fluence,
temperature of irradiation and extent of cold
work in the alloy. Density determinations
showed swellings of up to 15% $\Delta V/V$ for
20% cold worked type-316 stainless steel at a
neutron fluence level of $1.4 \times 10^{23} \text{ n/cm}^2$, $E > 0.1$
 MeV (70 dpa). The peak swelling temperature
range was 550°C-600°C regardless of the extent
of cold working. Increasing the cold work level
reduced the swelling and tended to broaden the
swelling temperature peak. Transmission
electron microscopy (TEM) investigations showed
that cold working had reduced the average void
sizes compared to those observed in the
solution annealed material.

3530 BREEDERS: OPERATIONAL EXPERIENCE WITH
FAST POWER REACTORS IN FIVE STATES - MORE
INTENSIVE GERMAN-FRENCH BREEDER COOPERATION.
Hueper, R. (Kernforschungszentrum Karlsruhe

G.m.b.H. (Germany, F.R.). Projekt Schneller Brueter). At. Strom; 24: No. 4, 103-109 (Jul-Aug 1978). (In German).

In the past year contracts have been signed and implemented for German-French cooperation in LMFBR development and commercialization. The first German nuclear power station with a sodium cooled fast reactor, KNK II in Karlsruhe, is going into operation. Construction of the prototype SNR 300 at Kalkar (Lower Rhine) is slowing down awaiting a decision of the German Federal Constitutional Court. On the international level, remarkable experience in the operation of fast power reactors has accumulated. Possible fuel cycle alternatives are being evaluated by an international committee.

3531 STOP ON CONSTRUCTION OF FAST BREEDER AT KALKAR REFUSED. Energiewirtschaft. Tagesfragen; 28: No. 7, 450-453 (Jul 1978). (In German).

The application of a plaintiff was refused by the verdict of the High Court for North Rhine-Westphalia of 16.6.1978, which would have restored the delaying effect of his application against the defendant Minister of the Land (his opponent) on the first part licence of the Kalkar nuclear power station. The plaintiff had to bear the costs of the proceedings, including extra legal costs of the co-defendant nuclear power company. The value of the object of the case was set at DM 10,000. This means that construction can continue. The most important reasons for turning down the application are given.

3532 COMPUTER MODELLING OF PIPING COMPONENTS FOR TRANSIENT HYDRODYNAMIC-STRUCTURAL RESPONSE. A-Moneim, M.T.; Chang, Y.W.; Fistedis, S.H. (Argonne National Lab., Ill. (USA)). Nucl. Eng. Des.; 49: No. 1, 175-186 (Jul 1978).

From 4. international conference on structural mechanics in reactor technology; San Francisco, Calif., USA (15 - 19 Aug 1977).

The paper describes three new piping components that are coupled with existing pipe and elbow models so that transient hydrodynamic-structural response analysis of general piping systems is possible. The three models are: a generalized piping component model, a tee-branching junction model, and a surge tank model. Optional interior rigid wall simulation and heat exchanger tube bundle representation in the generalized piping component model makes possible its use in modelling valves, pipe expansions and reducers, and heat exchangers. Two-dimensional implicit continuous-fluid Eulerian finite difference technique is utilized in the hydrodynamics calculations. A convected coordinates finite element method is used in the structural analysis which considers both the membrane and bending strengths of the thin axisymmetric shells representing the walls.

3533 COMPARISON OF ICEPEL CODE PREDICTIONS WITH STRAIGHT FLEXIBLE PIPE EXPERIMENTS. A-Moneim, M.T.; Chang, Y.W. (Argonne National Lab., Ill. (USA)). Nucl. Eng. Des.; 49: No. 1, 187-196 (Jul 1978).

From 4. international conference on structural mechanics in reactor technology; San Francisco, Calif., USA (15 - 19 Aug 1977).

Experimental results on the pressure pulse propagation along plastically deforming pipes are interpreted. The tests are also analyzed by the ICEPEL piping code and the results compared with the experimental measurements of both pressure and circumferential strain histories in the pipe.

3534 COMPARISON OF FINITE ELEMENT CALCULATIONS WITH EXPERIMENTS FOR THE DYNAMIC RESPONSE OF LMFBR CORE SUBASSEMBLY DUCTS. Ash, J.E. (Argonne National Lab., Ill. (USA)). Nucl. Eng. Des.; 49: No. 1, 79-92 (Jul 1978).

From 4. international conference on structural mechanics in reactor technology; San Francisco, Calif., USA (15 - 19 Aug 1977).

The capability of a finite-element computer code STRAW to predict the structural response of LMFBR core subassembly hexagonal wrappers to postulated accidental local energy releases has been verified by comparisons with test data from out-of-pile experiments. The code was applied to the analysis of the dynamic response of hexcans subjected to internal pressure pulse loadings, and the computational results were correlated with data from a series of tests on individual hexcan sections. The pressure was generated by a PETN burning mixture. Two specified pressure pulse shapes were generated to simulate hypothetical conditions created by a fuel-coolant interaction resulting from a fuel pin failure.

3535 FINITE ELEMENT FORMULATION FOR THERMAL STRESS ANALYSIS OF THIN REACTOR STRUCTURES. Kulak, R.F.; Kennedy, J.M. (Argonne National Lab., Ill. (USA)); Belytschko, T.B. (Northwestern Univ., Evanston, Ill. (USA)). Dept. of Civil Engineering; Schoeberle, D.F. (Illinois Univ., Chicago (USA)). Nucl. Eng. Des.; 49: No. 1, 39-50 (Jul 1978).

From 4. international conference on structural mechanics in reactor technology; San Francisco, Calif., USA (15 - 19 Aug 1977).

This paper describes the formulation of a finite-element procedure for the thermal stress analysis of thin wall reactor components. A general temperature-dependent constituent relationship is derived from a Gibbs potential function and a temperature-dependent yield surface. This form of constitutive relationship is applicable to problems of small strain. A similar form of a hypoelastic-plastic type is also developed for large strains. The variation of the yield surface with temperature is based upon a temperature-dependent, work-hardening model. The model uses a temperature-equivalent stress-plastic strain diagram which is generated from isothermal uniaxial stress-strain data.

3536 EFFECTS OF CRACKS IN IRRADIATION-EMBRITTLED HEXAGONAL SUBASSEMBLY DUCTS. Petroski, H.J.; Glazik, J.L. (Argonne National Lab., Ill. (USA)). Nucl. Eng. Des.; 49: No. 1, 51-68 (Jul 1978).

From 4. international conference on structural mechanics in reactor technology; San Francisco, Calif., USA (15 - 19 Aug 1977).

Plane-strain stress intensity factors for hexagonal subassembly ducts with a crack in a corner or midflat are presented in convenient graphical form for representative LMFBR hexcan dimensions. Calibrations based on several different models of the round hexcan corner and a finite element analysis of a uniformly pressurized hexcan with a corner crack corroborate each other. A weight function for this geometry is validated, and simple analytical tools are demonstrated to be adequate for parametric studies of cracked hexagonal ducts. The effects of different numbers of cracks, different locations for cracks, and different loading modes are discussed and some comments are made on the application of linear elastic fracture mechanics to cracked hexagonal ducts which have suffered a high degree of fast-neutron irradiation embrittlement.

- 3537 NUMERICAL METHOD FOR PREDICTING SEISMIC-INDUCED IMPACT BETWEEN SUBASSEMBLIES IN LMFBR CORES. Schreyer, H.L. (Argonne National Lab., Ill. (USA)). Nucl. Eng. Des.; 49: No. 1, 69-78(Jul 1978).

From 4. international conference on structural mechanics in reactor technology; San Francisco, Calif., USA (15 - 19 Aug 1977).

Structural problems that incorporate impact usually require small time steps for numerical integration and, consequently, solutions are very expensive. Since impact is one of the basic phenomena involved in any study of fast breeder reactor cores subjected to seismic disturbances, it is imperative that simplified models be introduced to make safety studies economically feasible. An approach is proposed whereby just the magnitude of each impulse and not the history of the impact force is determined for each impact. The consequence of the procedure is that the maximum time step is governed by system parameters and not by a detailed characteristic of the contact region such as an equivalent contact spring. The concepts are developed with the use of a single-degree-of-freedom model and the approach is applied to a three-assembly model of a reactor core.

- 3538 COMPARISON OF REXCO CODE PREDICTIONS WITH FLEXIBLE VESSEL EXPERIMENTS. Chang, Y.W.; Gvildys, J. (Argonne National Lab., Ill. (USA)). Nucl. Eng. Des.; 49: No. 1, 131-144(Jul 1978).

From 4. international conference on structural mechanics in reactor technology; San Francisco, Calif., USA (15 - 19 Aug 1977).

This paper deals with the REXCO code predictions of the flexible vessel tests. Comparisons are made with the data from experiments which were designed specifically for the purpose of code verification and/or modification. These experiments were performed with a well-defined and calibrated energy source in cylindrical vessel with precision tolerances and simple well-defined boundary conditions. The experimental data can thus be used as reliable test data for validation of computer codes, as well as of the modeling techniques used in the computer analysis. The inputs to the computer analysis are the vessel and core barrel dimensions and boundary conditions, the stress-strain relationships for the vessel and core barrel materials, the equation of state for the coolant, and the pressure-volume relationship of the energy source. The REXCO-predicted wall deformations, pressure loadings, and integrated impulses at various gauge positions are compared with the experimental data. Results of the comparisons are discussed.

- 3539 ANALYSIS OF LMFBR CONTAINMENT RESPONSE USING A MULTIFIELD IMPLICIT CONTINUOUS-FLUID EULERIAN CODE (MICE). Chu, H.Y.; Chang, Y.W. (Argonne National Lab., Ill. (USA)). Nucl. Eng. Des.; 49: No. 1, 107-118(Jul 1978).

From 4. international conference on structural mechanics in reactor technology; San Francisco, Calif., USA (15 - 19 Aug 1977).

An Eulerian computer code, MICE, for analyzing multifield-fluid flow problems in LMFBR containments is presented. The hydrodynamics of the MICE code is based upon the implicit multifield (IMF) method which includes the treatment of multifield fluids, the interpenetration of materials, the heat transfer, and the material phase changes. The finite-difference equations and the numerical techniques used in obtaining the equilibrium

pressures and in calculating the fluid-structure interactions are described in detail. Sample problems are given to illustrate the capabilities of the code.

- 3540 RESPONSE OF BREEDER REACTOR COMPONENTS AND SYSTEMS TO ABNORMAL EVENTS. Fistedis, S.H. (Argonne National Lab., Ill. (USA)). Nucl. Eng. Des.; 49: No. 1, 3-15(Jul 1978).

From 4. international conference on structural mechanics in reactor technology; San Francisco, Calif., USA (15 - 19 Aug 1977).

The paper contains a brief overview of applied mechanics as it is utilized in the safety and design of fast breeder nuclear reactors. It also attempts to consolidate and delineate the objectives of the following 13 specific papers of the same program, into an entity describing the present status and the remaining problems of this sector of nuclear technology.

- 3541 DYNAMIC STRUCTURAL RESPONSE OF LMFBR HEAD CLOSURES TO HYPOTHETICAL CORE DISRUPTIVE ACCIDENTS. Kulak, R.F. (Argonne National Lab., Ill. (USA)). Nucl. Eng. Des.; 49: No. 1, 119-129(Jul 1978).

From 4. international conference on structural mechanics in reactor technology; San Francisco, Calif., USA (15 - 19 Aug 1977).

Presented here is an investigation of the dynamic structural response of the primary vessel's head closure to a hypothetical core disruptive accident (HCDA). Two head-closure designs were considered: the first represents a loop-type design and the second represents a pool-type design. Using representative configurations of liquid metal fast breeder reactors (LMFBR), independent models were used (1) to derive loading pressure histories and (2) to study the structural response of the head closures. Results for loading pressures, displacement histories, deformed profiles, stress magnitudes and plastically deformed regions are presented.

- 3542 ANALYSIS AND APPLICATION OF PRESTRESSED CONCRETE REACTOR VESSELS FOR LMFBR CONTAINMENT. Marchertas, A.H.; Fistedis, S.H. (Argonne National Lab., Ill. (USA)); Bazant, Z.P.; Belytschko, T.B. (Northwestern Univ., Evanston, Ill. (USA). Dept. of Civil Engineering). Nucl. Eng. Des.; 49: No. 1, 155-173(Jul 1978).

From 4. international conference on structural mechanics in reactor technology; San Francisco, Calif., USA (15 - 19 Aug 1977).

An analytical model of a prestressed concrete reactor vessel (PCRV) for LMFBR and the associated finite element computer code, involving an explicit time integration procedure, is described. The model is axisymmetric and includes simulations of the tensile cracking of concrete, the reinforcement, and a prestressing capability. The tensile cracking of concrete and the steel reinforcement are both modeled as continuously distributed within the finite element. The stresses in the reinforcement and concrete are computed separately and combined to give an overall stress state of the composite material. Attention is given to the fact that cracks do not form instantaneously, but develop gradually.

- 3543 COMPARISON OF ICECO CODE PREDICTIONS WITH FLEXIBLE VESSEL EXPERIMENTS. Wang, C.Y. (Argonne National Lab., Ill. (USA)). Nucl. Eng. Des.; 49: No. 1, 145-154(Jul 1978).

From 4. international conference on structural mechanics in reactor technology; San

Francisco, Calif., USA (15 - 19 Aug 1977).

Some comparisons of ICECO code predictions with experimental data concerning transient fluid-structure interaction are given. The test results are taken from flexible vessel experiments conducted by Stanford Research Institute under the direction of Argonne National Laboratory. Two different experiments are considered: one with a rigid core barrel, and one with a flexible core barrel. Both experiments are performed in simple reactor vessels with a well-defined energy source and simple boundary conditions. Correlations of pressures and impulses are made at all available gauge stations. The permanent deformations of the core barrel and the cylindrical vessels are compared with ICECO predictions. The effects of core barrel flexibility on the wave propagation and vessel deformation are also investigated. The agreement between the analysis and experiments is found to be quite good.

- 3544 ANALYSIS OF NONLINEAR FLUID-STRUCTURE INTERACTION IN LMFBR CONTAINMENT. Wang, C.Y.; Chang, Y.W.; Fistedis, S.H. (Argonne National Lab., Ill. (USA)). Nucl. Eng. Des.; 49: No. 1, 93-105 (Jul 1978).

From 4. international conference on structural mechanics in reactor technology; San Francisco, Calif., USA (15 - 19 Aug 1977).

A generalized Eulerian method has been incorporated into ICECO for analyzing the nonlinear fluid-structure interaction in the primary containment of an LMFBR, consisting of complicated structural components such as the radial shield, core barrel, core-support structure, and the primary vessel. The method employs a Poisson equation to determine the hydrodynamic pressure in the fluid region while using a relaxation equation to compute the pressure adjacent to the structure. A generalized coupling scheme is developed for treating the sliding condition at the fluid-structure interface, modeling the perforated structure, and analyzing the fluid motion at the geometrical discontinuities. Detailed formulations are given. Sample problems concerning wave propagation in a typical reactor containment are presented. It is shown from the results that this implicit, iterative method is unconditionally stable, and is especially suitable for excursions involving large material distortions.

- 3545 ABILITY TO CHALLENGE PARTIAL LICENCES ACCORDING TO THE ATOMIC LAW. REMARKS ON THE VERDICT OF THE HIGH COURT AT MUENSTER ON 16. JUNE 1978. Buedenbender, U. Energiewirtsch. Tagesfragen; 28: No. 7, 429-431 (Jul 1978). (In German).

The verdict of the High Court at Munster deserves full agreement. The verdict denied the legal interest of the plaintiff stopping the completion of the first partial licence of construction with convincing reasons, in spite of practically complete execution of the construction work contained in the first partial licence of construction, who had complained because of his legal conception of the relation of the first partial licence of construction to subsequent licences. The significance of this decisions extends beyond the concrete fast breeder project and even beyond legal processes in nuclear power station projects, to basic statements of the meaning of the first partial licence for subsequent licences.

- 3546 NUMERICAL STUDY OF BURNUP CHARACTERISTICS OF 300 MWE LMFBR BASED ON THREE-

DIMENSIONAL CALCULATION. Takeda, S. (Hitachi Ltd., Ibaraki (Japan). Energy Research Lab.). J. Nucl. Sci. Technol. (Tokyo); 15: No. 7, 502-513 (Jul 1978).

The burnup characteristics of a 300 MWe LMFBR are studied numerically based on three-dimensional calculations. The analysis covers the effects brought by differences in the assumed positions of the control rods and by changing the number of energy groups adopted for calculating the burnup reactivity loss and the detailed space distribution of major Pu isotopes after prescribed periods of irradiation. Results are also compared between three- and two-dimensional models used for the calculations. The results reveal significant influence of control rod position on the depletion and buildup of Pu isotopes not only in the core region but also in the blanket region. Burnup calculations based on two energy groups prove to provide a fairly good approximation of the results obtained with three groups; this is not the case with one-group calculations, so long as the conventional method is adopted for reducing the energy groups. The errors introduced by the approximative methods in estimating the changes brought to the amounts of Pu isotopes resulting from irradiation increases with the atomic weight, in the order ^{239}Pu , ^{240}Pu and ^{241}Pu . Hence for accurate estimation of breeding characteristics, it would be necessary to perform three-dimensional burnup calculations with account taken of the individual positions of control rods distributed in discrete channels over the cross sectional plane. The use of an adequate number of energy groups is also essential unless a suitable improved one-group method is adopted.

- 3547 CORRELATION MEASUREMENTS OF SODIUM FLOW RATE WITH MAGNETIC SENSORS. Kebabdz, B.V.; Krasnoyarov, N.V.; Adamovskii, L.A.; Golushko, V.V.; Sroelov, V.S. At. Energ. (USSR); 45: No. 1, 30-35 (Jul 1978). (In Russian).

The results of bench-mark experiments and those carried out at the BOR-60 reactor to measure the sodium coolant flow rate by a correlation method are presented. The method is based on detecting the eddy type flow hydraulic nonuniformities using magnetic flowmeters. The measurements were fulfilled in a broad range of flow rates ($G=10-10^4 \text{ m}^3/\text{h}$, $Re=2 \times 10^5-2 \times 10^7$). The measured and calculated mutual correlation functions are presented with parallel and perpendicular orientations of the flowmeters magnetic fields. A good accord is stated. Prerequisites to the arrangement of the measuring systems are formulated. As an important advantage of the correlation method a possibility of the flowmeter calibration in situ is highlighted.

- 3548 INCIPIENT BOILING OF SODIUM IN SEVEN-PIN BUNDLE UNDER FORCED CONVECTION CONDITIONS. Kikuchi, Y.; Haga, K. (Power Reactor and Nuclear Fuel Development Corp., Oarai, Ibaraki (Japan). Oarai Engineering Center). J. Nucl. Sci. Technol. (Tokyo); 15: No. 7, 533-542 (Jul 1978).

Experimental studies were carried out on incipient boiling of sodium flowing in an electrically heated seven-pin bundle under forced convection. In the first series of experiments temperature distributions in the bundle were measured under non-boiling conditions. The measured temperature distributions agreed fairly well with the calculation by the NORMAL code. In the second series of experiments incipient-boiling (IB) phenomena were investigated, with particular reference to the IB superheat and the voiding

patterns. The IB wall superheat decreased with increase in flow velocity. The observed coolant voiding was limited in the central subchannel because of the steep radial temperature gradient in the bundle. In order to describe this voiding process a two-dimensional voiding model was required.

- 3549 SUBASSEMBLY ANALYSIS. McAreavey, G. (UKAEA, Risley. Nuclear Power Development Establishment). Nucl. Energy; 17: No. 3, 217-224 (Jul 1978).

Papers on sub-assembly analysis presented at the SMIRT 4 conference are reviewed together with others from the session on local effects, all in relation to LMFBR fuel elements. The papers are indicative of some problems of most concern to LMFBR designs, in relation to clad and structural materials property changes due to fast reactor irradiation. The topics discussed are the interaction between bowing and diluting of sub-assemblies in relation to restrained cores, irradiation creep deformation of wrapper walls, dynamic loading of defective and embrittled ducts, and bowing of fuel pins. A number of conclusions are drawn.

- 3550 STUDY OF THE VERTICAL STRAIGHT TUBE TYPE STEAM GENERATOR FOR LMFBR, 1. TEST RIG OF A SODIUM-HEATED STEAM GENERATOR AND EXPERIMENTAL RESULTS OF DRYOUT. Roko, K.; Shiraha, M.; Yoshizaki, A.; (Kawasaki Heavy Industries Ltd., Akashi, Hyogo (Japan). Technical Inst.); Takitani, K.; Sakano, K. Kawasaki Giho; No. 67, 8-14 (Jul 1978). (In Japanese).

This paper outlines a 0.1 MWt test rig of a LMFBR (Liquid Metal Fast Breeder Reactor) vertical straight tube type sodium-heated steam generator which has been built at KHI's Technical Institute for studying various aspects of the steam generator. It also presents the experimental results of dryout quality with special attention given to heat transfer characteristics. The experiments covered a steam pressure range of 52 to 153 kg/cm² and a mass velocity range of 250 to 550 kg/m²s. A new correlation for the dryout quality was proposed in terms of the steam pressure and the mass velocity. The comparison of the correlation with the experimental data from the above-mentioned test and the preliminary Joule-heated test verified that it was applicable to a broad steam pressure range of 18 to 153 kg/cm² and a mass velocity range of 160 to 550 kg/m²s. The R.M.S. (root mean square) error of the correlation was 0.0232.

- 3551 COMPUTER MODELS FOR SUBASSEMBLY SIMULATION. Belytschko, T.B. (Northwestern Univ., Evanston, Ill. (USA). Dept. of Civil Engineering); Kennedy, J.M. (Argonne National Lab., Ill. (USA)). Nucl. Eng. Des.; 49: No. 1, 17-38 (Jul 1978).

Two-dimensional finite element models for the treatment of the nonlinear, transient response of fluids and structures are described. The fluid description is quasi-Eulerian, so that the mesh can move independently of the material and it includes a new finite element upwinding scheme. The structural description is based on a corotational formulation in which the coordinate system is embedded in the elements, and which is applicable to arbitrarily large rotations. The interface between the fluid and structure permits relative sliding, but because of the quasi-Eulerian fluid description the nodes of the fluid and structure can be allowed to remain contiguous. Modelling procedures for treating the various aspects of subassemblies, such as the narrow fluid channels, the fuel

bundles which are immersed in the coolant, and the axial flow, are developed. Calculations are made for a symmetric seven-subassembly cluster and compared to experimental results. In addition, the application to a 19-subassembly cluster is described.

- 3552 WASTAGE PHENOMENA BY SMALL LEAK SODIUM-WATER REACTION. II. PARAMETERS EFFECT. Nei, H.; Hashiguchi, K. (Toshiba Corp., Kawasaki, Kanagawa (Japan)). Nippon Kikai Gakkai Ronbunshu; 44: No. 383, 2439-2448 (Jul 1978). (In Japanese).

The wastage phenomena due to sodium-water reaction were studied both experimentally and theoretically. An equation for the wastage rate, which is defined as the value of maximum wastage depth divided by steam injection time, was derived semi-analytically. First, an empirical formula for the wastage rate was derived as a function of sodium temperature and steam leak rate. Secondly, the leak rate corresponding to the maximum wastage rate was replaced by an equation derived from the flame model theory, and the semi-analytical equation for wastage rate was finally obtained as a function of many parameters such as nozzle diameter, nozzle-target distance, steam pressure, etc. The accuracy of this equation was verified by comparing with the results of experiments by the authors and other researchers. This paper explains the derivation of the equation together with its experimental background, and evaluates the applicability of this equation.

- 3553 FAST REACTOR FUEL PIN PERFORMANCE. Matthews, J.R. (UKAEA, Harwell. Atomic Energy Research Establishment). Nucl. Energy; 17: No. 3, 211-216 (Jul 1978).

Papers on fast reactor fuel performance presented at the SMIRT 4 conference and at the post-conference seminar on fuel element modelling are reviewed. The principal computer codes used for analysis of pin behaviour are discussed. Other main topics are cladding swelling, fuel cracking, studies on fuel pin failures and accident analysis of fuel cladding.

- 3554 REVISION OF THE SECOND BASIC PLANS OF POWER REACTOR DEVELOPMENT IN POWER REACTOR AND NUCLEAR FUEL DEVELOPMENT CORPORATION. Genshiryoku Iinkai Geppo; 23: No. 3, 9-11 (Jul 1978). (In Japanese).

Revision of the second basic plans concerning power reactor development in PNC (Power Reactor and Nuclear Fuel Development Corporation) is presented. (1) Fast breeder reactors: as for the experimental fast breeder reactor, after reaching the criticality, the power is raised to 50 MW thermal output within fiscal 1978. The prototype fast breeder reactor is intended for the electric output of 200 MW to 300 MW, using mixed plutonium/uranium oxide fuel. Along the above lines, research and development will be carried out on reactor physics, sodium technology, machinery and parts, nuclear fuel, etc. (2) Advanced thermal reactor: The prototype advanced thermal reactor, with initial fuel primarily of slightly enriched uranium and heavy water moderation and boiling water cooling, of 165 MW electric output, is brought to its normal operation by the end of fiscal 1978. Along the above lines, research and development will be carried out on reactor physics, machinery and parts, nuclear fuel, etc.

- 3555 (DOE-tr--176) EXPERIMENTAL

INVESTIGATION OF THE TURBULENT FLOW THROUGH A WALL SUBCHANNEL OF A ROD BUNDLE. Rehme, K. (Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Inst. fuer Neutronenphysik und Reaktortechnik). 30 Jun 1978. Translation of KFK--2441, April 1977 114p. Dep. NTIS, PC A06/MF A01.

Work performed under United States--W. Germany Fast Reactor Exchange Program.

An experimental investigation was carried out to obtain reliable information on the transport properties of turbulent flow through subchannels of rod bundles. Detailed data were obtained on the distributions of the average-flow velocity, the turbulence intensities in all directions and, thus, the kinetic energy of turbulence, the shear stresses in the directions normal and parallel to the walls, and the wall shear stresses for a wall subchannel of a rod bundle of four parallel rods. The pitch-to-diameter ratio of the rods, which was equal to the wall-to-diameter ratio, was 1.07, and the Reynolds number for the investigation was $Re = 8.7 \times 10^4$. On the basis of the data measured, the eddy viscosities in the directions normal to and parallel to the walls were calculated. Thus, detailed data on the eddy viscosities in directions parallel to the walls in rod bundles were obtained for the first time. The results of the measurements were compared with the results of the VELASCO computations.

3556 FISSION PRODUCT ARRANGEMENT OF A FAST NEUTRON REACTOR. Iliunin, V.G.; Murogov, V.M.; Troianov, M.F.; Rinieiskii, A.A.; Schmelev, A.N. (to Deutsches Patentamt, Muenchen (Germany, F.R.)). German (FRG) Patent 2,656,841/A/. 22 Jun 1978. 15p. (In German).

In fast breeder reactors, the large spatial share of the structural materials means a worsening of the neutron balance. By reducing the hydraulic resistance of the fuel element arrangement, the balance is partially improved. The fuel elements are arranged so that the total height without shortening the fuel element length is considerably reduced.

3557 NUCLEAR REACTOR REFUELING SYSTEM. Wade, E.E. (to Westinghouse Electric Corp.). US Patent 4,096,031. 20 Jun 1978. Filed date 22 Jul 1976. 10p.

A system for transferring fuel assemblies between a nuclear reactor core and a fuel storage area while the fuel assemblies remain completely submerged in a continuous body of coolant is described. The system comprises an in-vessel fuel transfer machine located inside the reactor vessel and an ex-vessel fuel transfer machine located in a fuel storage tank. The in-vessel fuel transfer machine comprises two independently rotatable frames with a pivotable fuel transfer apparatus disposed on the lower rotatable frame. The ex-vessel fuel transfer machine comprises one frame with a pivotable fuel transfer apparatus disposed thereon. The pivotable apparatuses are capable of being aligned with each other to transfer a fuel assembly between the reactor vessel and fuel storage tank while the fuel assembly remains completely submerged in a continuous body of coolant. 9 claims, 7 figures.

3558 MONITORING DEVICE FOR NUCLEAR REACTOR CONTROL RODS. Blanc, R.; Jacquelin, R. (to Commissariat a l'Energie Atomique). US Patent 4,094,369. 13 Jun 1978. Priority date 8 Oct 1974, France, 8p.

Weighing of each control rod and at least

the moving portion of the control rod drive mechanism is carried out in continuous operation by means of an assembly comprising at least one strain gage mounted in a circuit for measuring the electrical resistance of the gage according to the change in length which is a function of the weight being measured.

3559 AUTOMATIC CONTROL MECHANISM FOR NUCLEAR REACTOR SCRAM. Giuggio, N.; Croissant Noyes, R.; Uz Zaman, S. (to Combustion Engineering, Inc., New York; USA). French Patent 2,394,150/A/. 9 Jun 1978. 26p. (In French).

A mechanism is described in which the mean temperature of the coolant on leaving the core of a liquid cooled nuclear reactor is detected and which allows a poison to fall quickly into the core of the reactor when a critical temperature is reached. The reactor comprises a safety pipe located in the core and rising above it, a vertical flow path for the reactor coolant passing through the pipe and a poison bundle absorbing the neutrons, retained by a supporting system. Several fuel rods are located in the flow path of the coolant, a temperature sensitive control device is located in the flow path near the upper end of the fuel rods, a retaining device is fitted between the poison bundle support system and the control system so as to release the poison bundle when the control system makes a preset movement.

3560 SWELLING ANALYSIS OF HIGHLY-RATED MX-TYPE LMFBR FUELS. II. MICROSCOPIC SWELLING BEHAVIOR. Ronchi, C.; Ray, I.L.F.; Thiele, H.; Van De Laar, J. (Comm of the Eur Communities, Eur Inst for Transuranium Elem, Jt Res Cent, Karlsruhe, Ger). J. Nucl. Mater.; No. 2, 193-211(2 Jun 1978).

Fission gas bubbles in these compounds grow to large sizes if the in-pile temperature rises above a critical value (swelling critical temperature $T_{sub c}$). A comparison has been made of the swelling rates in fuels of different composition, showing that $T_{sub c}$ increases from carbides to nitrides. In fuels subjected to in-pile restructuring (highly rated He-bonded pins) microscopic swelling is affected by pore and grain boundary migration. 16 refs.

3561 COMPOSITION OF THE CORROSION PRODUCT OXIDE PHASES IN THE GAPS OF THREE LMFBR-TYPE MIXED OXIDE FUEL PINS. Walker, C.T. (Jt Res Cent, Eur Inst for Transuranium Elem, Karlsruhe, Ger). J. Nucl. Mater.; 74: No. 2, 358-362(2 Jun 1978).

Full analyses (including oxygen) are presented for the gray and light-gray corrosion product phases in the gap of pin section AU07-10. The findings support the proposal that chromium oxide is the principal constituent of the phases. 9 refs.

3562 FAST BREEDER REACTORS. (to Nuclear Power Co. (Whetstone) Ltd. (UK)). French Patent 2,393,405/A/. 2 Jun 1978. 13p. (In French).

The subject of this invention is a liquid metal cooled nuclear reactor construction in which a concrete pit is lagged to protect it from the heat radiated from the reactor in normal operation but in which the efficiency of the lagging is reduced in case of emergency to allow the excess heat generated by the reactor to be dissipated throughout the pit. The lagging is in two layers, the first covering the internal surface of the pit wall is impermeable to the liquid metal, whilst the

second layer over the first is permeable.

- 3563 NUCLEAR REACTOR. (to Nuclear Power Co. (Whetstone) Ltd. (UK)). French Patent 2,393,406/A/. 2 Jun 1978. 8p. (In French).

A nuclear reactor is described comprising a fuel assembly and components housed in a pit and a chamber located above the pit containing a device for handling the components of the reactor, passages being provided in the roof of the pit for transferring the reactor components.

- 3564 FUEL ASSEMBLY FOR FAST BREEDER LIQUID METAL COOLED REACTOR. (to Nuclear Power Co. (Whetstone) Ltd. (UK)). French Patent 2,393,402/A/. 2 Jun 1978. 9p. (In French).

The description is given of a fuel assembly for a fast breeder liquid metal cooled reactor comprising a bundle of fuel pins spaced out in a sheath with a pointed extension for fitting into a supporting housing in the fuel assembly, the feature of this rod being that the sheath is articulated at the pointed extension.

- 3565 METHOD OF REDUCING THE HAZARD WHICH MAY OCCUR AS A CONSEQUENCE OF A REACTOR CORE MELTDOWN. Donne, M.D.; Dorner, S.; Schumacher, G. (to Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.); Deutsches Patentamt, Muenchen (Germany, F.R.)). German(FRG) Patent 2,653,258/A/. 1 Jun 1978. 14p. (In German).

The core melt resulting from a meltdown accident of a GFB, LWR or LMFBR is collected by a core catcher from graphite placed below the core. The core melt is penetrating step by step into a borate store in the collecting vessel and is dissolving in it. Therefore the borate at the same time will absorb the decay heat. In order to remove the solidified and cooled down melted mass water is applied eliminating the borate. The remaining oxide state of the powdery core is sucked off again from the core catcher together with the water. The borate store (e.g. alkali borate) itself consists of separate layers with shaped parts, the coverings of which are made of steel, iron, cast iron, nickel, iron or nickel alloys, ceramic material or glass.

- 3566 MEASURING PROBE AND METHOD FOR DETERMINING THE OXYGEN CONTENT IN GASES, VAPORS, AND LIQUIDS, ESPECIALLY IN LIQUID METALS. Sundermann, H.; Andrae, U. (to Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.); Deutsches Patentamt, Muenchen (Germany, F.R.)). German(FRG) Patent 2,061,599/B/. 1 Jun 1978. 4p. (In German).

The invention is concerned with the improvement of the measuring probe described in the main patent no. 1798002 with which the oxygen content in liquid metals, e.g. Na, is to be determined. In order to avoid the glass stopper shutting off the reference space having to be ground out it is proposed to connect the solid electrolyte firmly and hermetically with a metallic mounting support (e.g. Fe-Co-Ni alloy), having the same thermal coefficient of expansion as the solid electrolyte (e.g. zirconium dioxide stabilized with yttrium oxide or thorium dioxide). Further details of the design are very explicitly described.

- 3567 EFFECTS OF INTERNAL CIRCULATION VELOCITY AND NONCONDENSABLE GAS ON VAPOR CONDENSATION

FROM A RISING BUBBLE. Gezisik, M.N. (North Carolina State Univ., Raleigh); Kress, T.S. Nucl. Sci. Eng.; 66: No. 3, 397-405(Jun 1978).

The effects of internal circulation velocity and the presence of noncondensable gas on vapor removal rate by condensation from a rising large vapor-gas bubble produced in a hypothetical core disruptive accident are investigated by solving the resulting transient heat and mass transfer problem of turbulent flow. Sample calculations are performed for the condensation of UO_2 and sodium vapors containing noncondensable fission gases. The time-averaged condensation heat transfer coefficients are presented for the condensation of UO_2 and sodium vapors for different internal circulation velocities and the concentration of noncondensable gas.

(Argonne National Lab., IL). Trans. Am. Nucl.
Soc.; 28: 277-278 (Jun 1978).
From ANS annual meeting; San Diego, CA, USA
(18 Jun 1978).
See CONF-780622--.
LMFBR, LMFBR TYPE REACTORS; REACTOR CORE
DISRUPTION; HYDRODYNAMICS; MATHEMATICAL MODELS
- 3607 FIRST VISUAL IN-PILE FUEL DISRUPTION
EXPERIMENTS. Cano, G.L. (Sandia Labs.,
Albuquerque, NM). Trans. Am. Nucl. Soc.; 28:
437 (Jun 1978).
From ANS annual meeting; San Diego, CA, USA
(18 Jun 1978).
See CONF-780622--.
LMFBR TYPE REACTORS; LOSS OF FLOW; REACTOR
CORE DISRUPTION; MELTDOWN
- 3608 ANALYSIS OF IN-PILE FUEL DISRUPTION
EXPERIMENTS. Ostensen, R.W.; Young, M.F.
(Sandia Labs., Albuquerque, NM). Trans. Am.
Nucl. Soc.; 28: 437-438 (Jun 1978).
From ANS annual meeting; San Diego, CA, USA
(18 Jun 1978).
See CONF-780622--.
LMFBR TYPE REACTORS; REACTOR CORE DISRUPTION;
LOSS OF FLOW; MELTDOWN
- 3609 SAS3A SIMULATIONS FOR A 19-PIN DRYOUT
EXPERIMENT. Han, J.T.; Tomlinson, E.T. (Oak
Ridge National Lab., TN). Trans. Am. Nucl.
Soc.; 28: 438-440 (Jun 1978).
From ANS annual meeting; San Diego, CA, USA
(18 Jun 1978).
See CONF-780622--.
LMFBR TYPE REACTORS; FUEL ELEMENT CLUSTERS;
DRYOUT; S CODES; COMPUTER CALCULATIONS
- 3610 SIMPLE TRANSIENT ANALYSIS OF THE THORS
BUNDLE 6A BOILING TEST RESULTS. Garrison,
P.W. (Oak Ridge National Lab., TN). Trans.
Am. Nucl. Soc.; 28: 440-442 (Jun 1978).
From ANS annual meeting; San Diego, CA, USA
(18 Jun 1978).
See CONF-780622--.
LMFBR TYPE REACTORS; FUEL ELEMENT CLUSTERS;
BOILING; HYDRAULICS; HEAT TRANSFER; ONE-
DIMENSIONAL CALCULATIONS
- 3611 EVALUATION OF INCOHERENCY EFFECT ON
CLADDING MOTION IN R-SERIES TEST. Ishii, M.;
Chen, W.L. (Argonne National Lab., IL).
Trans. Am. Nucl. Soc.; 28: 442-443 (Jun 1978).
From ANS annual meeting; San Diego, CA, USA
(18 Jun 1978).
See CONF-780622--.
LMFBR TYPE REACTORS; FUEL ELEMENTS; MELTDOWN;
BOILING; HEAT TRANSFER
- 3612 SODIUM VOIDING DYNAMICS AND CLADDING
MOTION IN A 37-PIN FUEL ASSEMBLY DURING AN LOF
TRANSIENT. Hwang, I.T.; Kuzay, T.M.; Marr,
W.W.; Miles, K.J. (Argonne National Lab.,
IL). Trans. Am. Nucl. Soc.; 28: 443-445 (Jun
1978).
From ANS annual meeting; San Diego, CA, USA
(18 Jun 1978).
See CONF-780622--.
LMFBR TYPE REACTORS; LOSS OF FLOW; FUEL
ASSEMBLIES; BOILING; MELTDOWN; FUEL CANS
- 3613 TWO-PHASE MOMENTUM EXCHANGE EXPERIMENT
AND ANALYSIS. Rexroth, P.E.; Starkovich, V.
(Los Alamos Scientific Lab., NM). Trans. Am.
Nucl. Soc.; 28: 445-446 (Jun 1978).
From ANS annual meeting; San Diego, CA, USA
(18 Jun 1978).
See CONF-780622--.

From 4. international conference on structural mechanics in reactor technology; San Francisco, USA (15 - 19 Aug 1977).

Analysis of Primary Containment Transients (APRICOT) is an ERDA sponsored project in which a variety of reactor safety analysis groups around the world have been invited to participate by performing calculations to verify capabilities of large computer codes used to analyze postulated core disruptive accidents of liquid metal fast breeder reactors. Nine groups have performed calculations of the first three problems which were set, using ten computer codes. Two problems were simple test problems for which analytical solutions exist, namely an ideal gas shock tube, and a suddenly pressurized spherical cavity in an infinite elastic medium. The third problem concerns an explosion in a partially water-filled over-strong cylindrical containment vessel for which experimental data exist. A critique of the results of these calculations is given in this paper.

- 3687 ALTERNATIVE NUCLEAR FUEL CYCLES: THE IMPLICATIONS ON URANIUM RESOURCE UTILIZATION. Till, C.E.; Chang, Y.I. (Argonne National Lab., IL). Combustion; 49: No. 12, 22-26 (Jun 1978).

The authors attempt to summarize the implications of fuel-cycle selection by criteria based on proliferation grounds and on achievable nuclear electric capacities within a limited natural resource base. The question is how far can uranium supplies be stretched if criteria of this kind are used to define

admissible reactor cycles. The question is a simple one. The problem in answering it lies in the very number of reactor types, fuel cycles, and deployment permutations; and the widely varying opinion currently held on both the magnitude of the uranium resource base and the amount and time span of nuclear power that may represent an adequate objective. 1 ref.

- 3688 (JAPFNR--317) FAST BREEDER REACTOR DEVELOPMENT IN JAPAN. PROGRESS REPORT, JULY--SEPTEMBER 1977. (Power Reactor and Nuclear Fuel Development Corp., Tokyo (Japan)). Jun 1978. Translation of PNC-N--251-78-01 17p. Dep. NTIS (US Sales Only), PC A02/MF A01.

Work performed under United States--Japanese Fast Reactor Exchange Program.

Progress in LMFBR development in Japan is summarized. The development program has progressed from the experimental JOYO Reactor to design work and mockup testing of components for the MONJU prototype reactor.

- 3689 ULTRASONIC INSPECTION METHODS FOR SMALL-BORE APPLICATIONS. Cook, K.V.; Cunningham, R.A. Jr. Mater. Eval.; 36: No. 7, 49-54 (Jun 1978).

The nondestructive inspection of tubing and tube-to-tubesheet weldments in heat exchangers for reactor systems is necessary to ensure the high integrity essential for safe, reliable, continuously operating units. An ultrasonic inspection system has been developed for small-bore applications. The current system can be used to inspect tubing or weldments with bores as small as 10.1 mm (0.4 in.) for transversely or longitudinally oriented discontinuities; however, similar inspections are possible within even smaller bores. Since the probe head is rotated to provide inspection along a helical path, special ultrasonic signal connectors are employed. The miniature probe heads employed are designed for rapid exchange in the mechanical scanner. These probes use commercially available transducers and are capable of performing various ultrasonic inspections with both single and dual examination techniques. The inspection methods and equipment are discussed, along with results of calibration, recording, and correlation studies performed on laboratory-type specimens. Reference notches with depths representing 2 percent of the wall thickness were detected and recorded from the bore of 15.88 mm OD x 2.77 mm wall (0.625 x 0.109 in.) tubing.

- 3690 EXPERIMENTAL INVESTIGATION ON AIR-DISTRIBUTION IN WATER FLOWING THROUGH A 61-ROD BUNDLE WITH HELICAL SPACERS. Chung, M.K. J. Korean Nucl. Soc.; 10: No. 2, 79-86 (Jun 1978). (In English and Korean).

Data were obtained on air-distributions in two-phase up flow in a vertical rod-bundle test-section. The test-section was a hexagonal shaped 61-rod bundle where each rod was wrapped with helical spacers. The variables were flow rates of air and water and air inlet positions. Experimental data were obtained at the outlet of the test-section. Experiments were performed in two parts. First data were taken at increasing flow rates of air keeping water flow rates constant, and second at simultaneous increase of air and water flow rates. At each flow condition, air supply position could be changed to 4 different positions. Data obtained by electrical void-needle technique were analyzed and are presented here in graphical forms for comparison. Results demonstrate qualitatively that air-distribution tends to be more uniform as water flow rates are increased. The air supply positions have noticeable

effects on the pattern of air-distribution.

enables the licensing of fast breeders.

- 3691 EUROPIA AS A NUCLEAR CONTROL MATERIAL. Wu, P.C.S. (Westinghouse Advanced Reactors Div., Madison, PA). Nucl. Technol.; 39: No. 1, 84-94(Jun 1978).

The Physical and nuclear properties of Eu_2O_3 were reviewed, evaluated, and compared with those of the other potential control materials for breeder reactors. Europia with a 90% theoretical density has approximately the same amount of europium atoms per unit volume as the pure metal. Consequently, the reactivity worth per unit volume of Eu_2O_3 is similar to that of pure metal. In addition, the reactivity of Eu_2O_3 is superior to tantalum and is comparable to natural B_4C . The decay heat of Eu_2O_3 is much lower than that of tantalum over the range of decay times that is of interest with respect to handling. Irradiation-induced swelling of Eu_2O_3 is lower than that of B_4C , and postirradiation examination revealed only approx. 1% dimensional changes in the thermal- and/or fast-neutron spectrum ($8 \times 10^{25} \text{ n/m}^2$). Although surface reaction between Eu_2O_3 and the fast test reactor reference cladding Type 316 stainless steel leads to the formation of a europium silicate, it is expected that Eu_2O_3 would be compatible with low-silicon Type 316 stainless steel. In addition, the Eu_2O_3 -sodium system was also shown to be compatible under stimulated liquid-metal fast breeder reactor conditions without significant change. Consequently, Eu_2O_3 is an excellent alternate candidate compared to B_4C as the neutron absorber for fast breeder reactors.

- 3692 COMPOSITION OF THE CORROSION PRODUCT OXIDE PHASES IN THE GAPS OF THREE LMFBR-TYPE MIXED OXIDE FUEL PINS. Walker, C.T. (Commission of the European Communities, Karlsruhe (Germany, F.R.). European Inst. for Transuranium Elements). J. Nucl. Mater.; 74: No. 2, 358-362(Jun 1978).

Identification of the corrosion product oxide phases in the gaps of mixed oxide fuel pins clad with austenitic stainless steel is an important step in understanding the mechanisms of corrosion. Once the oxide is identified the reaction paths by which it is formed can be established. The corrosion product oxide will also be a reliable indication of the oxygen potential in the gap. A grey oxide phase which is recognised to contain the products of cladding corrosion is often observed in the gaps of mixed oxide fuel pins. Its main constituents are known to be chromium, caesium and oxygen, and recently the composition of the grey oxide phase in the gaps of three fuel pins was shown to be broadly similar, and it was proposed that the phase was essentially chromium oxide.

- 3693 CONSTITUTIONALITY OF SECTION 7 OF THE ATOMIC ENERGY ACT: SECTION 20 GG 'KALKAR DECISION'. Z. Energiewirtsch.; No. 2, 156-160(Jun 1978). (In German).

OVG Muenster, decision dated Aug. 18th, 1977 - VII A 338/74: 'Section 7 of the Atomic Energy Act disagrees with the constitution in as far as it also allows the licensing of FBR type reactors'. The grounds upon which the judgment is based are given in detail: According to the opinion of the Senate, section 7 of the Atomic Energy Act does not conform to the principle of separation of powers (section 20, sub-section 2, sentence 2 GG), to the principle of parliamentary democracy (section 20, sub-section 1 and 2 GG) and to the principles of the law and order state (section 20, sub-section 3 GG) in as far as the present version

- 3694 CONSTRUCTION OF THE WORLD'S FIRST FULL-SCALE FAST BREEDER REACTOR. 1. ORGANIZATION OF AN INTERNATIONAL PROJECT. Nucl. Eng. Int.; 23: No. 272, 43-60(Jun 1978).

The 1200 MWe nuclear power station under construction at Creys-Malville in S.W. France contains the fast breeder reactor Super Phenix. A survey is presented which comprises six sections describing the following:- organisation; lay-out and main design; main safety features; design and development of main components; core structure and assemblies; site assembly and construction progress. A coloured cut-away pull-out wall-chart of the reactor and reactor buildings and a list of all main parameters are included.

- 3695 RADIOACTIVITY IN THE PRIMARY CIRCUIT OF THE FAST BOR-60 REACTOR. Kizin, V.D.; Lisitsyn, E.S.; Polyakov, V.I.; Chechetkin, Yu.V. At. Energ. (USSR); 44: No. 6, 492-498(Jun 1978). (In Russian).

The experimental results of the accumulation and distribution study of radioactive corrosion and fission products in the primary circuit of the BOR-60 are presented. It is shown that after the reactor prolonged operation with defective fuel elements, the radiation conditions at repair works are determined by the fission radioactive products. The most radiation-dangerous nuclides are ^{137}Cs , ^{140}Ba , ^{95}Nb . The BOR-60 cold trap purifies the coolant practically completely from iodine radionuclides by 20-90% from cesium radionuclides, by 20-30% from antimony and cobalt. At reactor operating approximately with 1% of defective fuel elements, the dose rate in the primary circuit boxes after sodium draining from the reactor loops equals $70-100 \mu\text{Rxc}^{-1}$, the radiation conditions at the NPP BOR-60 for the whole operation period remaining satisfactory. NPP radioactive releases of ^{41}Ar do not exceed 500 Ci a year.

- 3696 IRRADIATION EFFECTS OF BORON CARBIDE USED AS CONTROL ROD ELEMENTS IN FAST BREEDER REACTORS. Inoue, T.; Onchi, T.; Koyama, H. (Central Research Inst. of Electric Power Industry, Tokyo (Japan)). J. Nucl. Mater.; 74: No. 1, 114-122(Jun 1978).

The paper describes radiation effects on B_4C pellets used as control rod elements in the Enrico Fermi Fast Breeder Reactor. Pellet swelling ($\Delta V/V$) caused by irradiation was less than 1% in which crystal lattice swelling was less than 20%. Many microcracks, a main cause of pellet swelling, appeared in the irradiated pellets. The production of microcracks was related to graphite precipitation in the pellets before irradiation. Open pores which did not exist in the unirradiated pellets were formed in the irradiated ones. In a unit cell of B_4C , the a-axis elongated by 0.025 Å and the c-axis shrank by 0.07 Å by irradiation. Moreover, three recovery stages were found which were from room temperature to 400°C, from 400 to 750°C and from 850 to 1100°C. The recovery mechanisms in the irradiated pellets are discussed in terms of the helium behaviour.

- 3697 COUPLED PROBLEMS IN TRANSIENT FLUID AND STRUCTURAL DYNAMICS IN NUCLEAR ENGINEERING. PT.2. A DISCRETE MODEL FOR SQUEEZE FLOW BETWEEN TWO ADJACENT LMFBR SUBASSEMBLIES. Zehlein, H. (Gesellschaft fuer Kernforschung m.b.H., Karlsruhe (Germany, F.R.)). Appl. Math. Model.; 2: No. 2, 90-98(Jun 1978).

The paper deals with a detailed

investigation of the interaction between sub-assemblies and coolant dynamics within an LMFBR core under transient pressure loading. The one-dimensional discrete model approximates the axial squeeze flow by a combined Lagrangian particle Euler cell approach. The coupling between the fluid and the structure is achieved by a step by step scheme. An energy balance criterion is used to improve its computational efficiency. An extension for two-dimensional squeeze flow, where axial and transverse flow around the subassembly may occur, completes the mathematical model.

- 3698 OPEN ROAD TO CONTROL OF CONSTITUTIONALITY OF SECTION 7 OF THE ATOMIC ENERGY ACT. COMMENTS ON THE INTERIM NOTICE OF THE FEDERAL CONSTITUTIONAL COURT IN THE MATTER OF THE 'FAST BREEDER' AT KALKAR. Rengeling, H.W. (Bonn Univ. (Germany, F.R.)). *Energiewirtschaftl. Tagesfragen*; 28: No. 6, 372-375 (Jun 1978). (In German).

The Federal Constitutional Court (BVerfG), in answer to the court order of the Higher Administrative Court at Muenster, has affirmed in its interim decision of Jan. 31st, 1978 the permissibility of the concrete judicial review of the constitutionality of section 7 as being correct, and thus it has accepted at the same time the responsibility for the decision as being the responsibility of the Federal Constitutional Court. For practical reasons the decision is to be welcomed because it is very likely that the question of the constitutionality of section 7 of the Atomic Energy Act as far as it permits the licensing of FRBs, which has come into the open now on account of the Muenster decision, would have been referred again in the near future to the BVerfG, if the court had considered Muenster's order as not permissible. From the judicial point of view, the BVerfG's grounds are of interest; the permissibility of the judicial review of the constitutionality within the framework of the Kalkar case already having been very much in dispute before the verdict. The arguments of the BVerfG, which could be of great interest for similar proceedings in the future are briefly looked at in a critical manner, because the decision made in Karlsruhe will not remain without impacts on law concerning energy and environmental protection and on relevant policies.

- 3699 COUPLED PROBLEMS IN TRANSIENT FLUID AND STRUCTURAL DYNAMICS IN NUCLEAR ENGINEERING. PT.1. SAFETY PROBLEMS SOLVED BY FLOW SINGULARITY METHODS. Krieg, R. (Gesellschaft fuer Kernforschung m.b.H., Karlsruhe (Germany, F.R.)). *Appl. Math. Model.*; 2: No. 2, 81-89 (Jun 1978).

Some important problems in coupled fluid-structural dynamics which occur in safety investigations of liquid metal fast breeder reactors (LMFBR), light water reactors, and nuclear reprocessing plants are discussed and a classification of solution methods is introduced. A distinction is made between the step by step solution procedure, where available computer codes in fluid and structural dynamics are coupled, and advanced simultaneous solution methods, where the coupling is carried out at the level of the fundamental equations. Results presented include the transient deformation of a two-row pin bundle surrounded by an infinite fluid field, vapour explosions in a fluid container and containment distortions due to bubble collapse in the pressure suppression system of a boiling water reactor. A recently developed simultaneous solution method is presented in detail. Here the fluid dynamics (inviscid,

incompressible fluid) is described by a singularity method which reduces the three-dimensional fluid dynamics problems to a two-dimensional formulation. In this way the three-dynamics fluid dynamics as well as the structural (shell) dynamics can be described essentially by common unknowns at the fluid-structural interface. The resulting equations for the coupled fluid-structural dynamics are analogous to the equations of motion of the structural dynamics alone.

- 3700 SWELLING ANALYSIS OF HIGHLY-RATED MX-TYPE LMFBR FUELS. II. MICROSCOPIC SWELLING BEHAVIOUR. Ronchi, C.; Ray, I.L.F.; Thiele, H.; Laar, J. van de (Commission of the European Communities, Karlsruhe (Germany, F.R.)). *European Inst. for Transuranium Elements*. *J. Nucl. Mater.*; 74: No. 2, 193-211 (Jun 1978).

Microscopic swelling has been investigated by electron microscopy in several MX-type fuels, irradiated in fast and thermal flux. The results show that fission gas bubbles in these compounds grow to large sizes if the in-pile temperature rises above a critical value (swelling critical temperature $T_{sub}(c)$). A comparison has been made of the swelling rates in fuels of different composition, showing that $T_{sub}(c)$ increases from carbides to nitrides. In fuels subjected to in-pile restructuring (highly rated He-bonded pins) microscopic swelling is affected by pore and grain boundary migration. The influence of these phenomena on the fuel swelling performance has been discussed.

- 3701 TOPICAL PROBLEMS OF CORROSION RESEARCH FOR NUCLEAR POWER PURPOSES. Eremias, B. (Statni Vyzkumny Ustav Ochranu Materialu G.V. Akimova, Prague (Czechoslovakia)). *Jad. Energ.*; 24: No. 6, 201-205 (Jun 1978). (In Czech).

Currently, research is focused on stress corrosion, intergranular corrosion, corrosion in water and steam, hydrogen-induced corrosion and corrosion in liquid sodium. The effort to limit stress corrosion resulted in the application of high nickel content austenitic steels. In these steels, the susceptibility to stress corrosion is mainly affected by previous heat treatment and the presence of chloride ions. Attention is also paid to medium and high-alloy chromium steels and susceptibility is studied to intergranular corrosion and stress corrosion. Of low-alloy steels the 21/4Cr-1Mo type steels stabilized with Nb or nonstabilized are studied with respect to decarburization kinetics and changes in mechanical properties in the presence of hydrogen. Of nonferrous metals zirconium alloys are studied used as cladding materials for fuel elements, mainly Zircaloy 2 and 4, with regard to their resistance to high-temperature oxidation, high-pressure steam action, etc.

- 3702 SODIUM AEROSOL GENERATION. Allen, M.D.; Briant, J.K.; Kaune, W.T.; Craig, D.K. (Battelle Pacific Northwest Labs., Richland, WA (USA)). *Health Phys.*; 34: No. 6, 39-54 (Jun 1978).

A method for generating a respirable sodium aerosol at a constant rate is described for use in rodent inhalation studies. These studies will assess the toxicologic effect of aerosols which may be formed if pipes carrying liquid sodium in a LMFBR rupture. The mass generation rate and aerodynamic size distribution of the aerosol are characterized.

- 3703 FLOW DUCT FOR NUCLEAR REACTORS.

Straalsund, J.L. (to Dept. of Energy). US Patent 4,089,743. 16 May 1978. Filed date 21 Jan 1977. 6p.

PAT-APPL-761,038.

Improved liquid sodium flow ducts for nuclear reactors are described wherein the improvement comprises varying the wall thickness of each of the walls of a polygonal tubular duct structure so that each of the walls is of reduced cross-section along the longitudinal center line and of a greater cross-section along wall junctions with the other walls to form the polygonal tubular configuration.

3704 NUCLEAR REACTOR FUEL ELEMENT ASSEMBLIES. Betts, C.; Collinson, A.E.; Hart, D.F. British Patent 1,510,127/A/. 10 May 1978. 7p.

Reactor fuel element assemblies are described having axial flow cavitation suppressing impedances. The latter comprise a tubular member housing a series of flow defining plates arranged transversely to the longitudinal axis of the tubular member, the series being formed from a first and a second set of plates clamped into face-to-face abutment and arranged so that a plate of one set alternates, as viewed in the direction of flow, with a plate of the other set. The first set of plates is of woven wire mesh construction and the second set have aligned cylindrical apertures that define the present impedance flow area. The arrangement is particularly suitable for liquid metal cooled fast breeder reactors.

3705 APPARATUS AND METHOD FOR THERMAL POWER GENERATION. Cohen, P.; Redding, A.H. (to Westinghouse Electric Corp.). US Patent 4,087,985. 9 May 1978. Filed date 17 Mar 1976. 8p.

An improved thermal power plant and method of power generation is described which minimizes thermal stress and chemical impurity buildup in the vaporizing component, particularly beneficial under loss of normal feed fluid and startup conditions. The invention is particularly applicable to a liquid metal fast breeder reactor plant.

3706 RADIONUCLIDE TRAP. McGuire, J.C. (to Dept. of Energy). US Patent 4,088,533. 9 May 1978. Filed date 18 Jan 1977. 8p.

PAT-APPL-760,301.

The deposition of radionuclides manganese-54, cobalt-58 and cobalt-60 from liquid sodium coolant is controlled by providing surfaces of nickel or high nickel alloys to extract the radionuclides from the liquid sodium, and by providing surfaces of tungsten, molybdenum or tantalum to prevent or retard radionuclide deposition.

3707 TEMPERATURE CONTROL SYSTEM FOR A J-MODULE HEAT EXCHANGER. Basdekas, D.L.; Macrae, G.; Walsh, J.M. (to Dept. of Energy). US Patent 4,088,182. 9 May 1978. Filed date 29 May 1974. 4p.

PAT-APPL-474,287.

The level of primary fluid is controlled to change the effective heat transfer area of a heat exchanger utilized in a liquid metal nuclear power plant to eliminate the need for liquid metal control valves to regulate the flow of primary fluid and the temperature of the effluent secondary fluid.

3708 NUCLEAR REACTOR. Chevallier, R.;

Sauvage, M. (to Societe Generale de Constructions Electriques et Mecaniques Alsthom S.A.). US Patent 4,087,325. 2 May 1978. Priority date 29 Dec 1975, France, 6p.

Described is an integrated nuclear reactor cooled by a liquid metal and constituted by a main tank, which contains a central inner tank containing the core and the hot liquid metal, this inner tank being connected to individual cylindrical chambers each containing a heat exchanger wherein the surfaces of the inner tank and of the cylindrical chambers bulge radially outwards at the level of supply orifices for transferring the hot liquid metal from the inner tank to the heat exchangers and wherein the cylindrical chambers are fixed directly onto the inner tank by neck portions interconnecting the two bulges and providing a path for liquid metal flow.

3709 EFFECT OF FINITE PLANT LIFE ON THE DOUBLING TIME OF A BREEDER REACTOR POPULATION. Lee, S.M. (Reactor Research Center, Tamilnadu, India). Nucl. Technol.; 38: No. 3, 384-386 (May 1978).

When very large values are obtained for the doubling time of a breeder reactor type, it becomes interesting to see how the finiteness of the lifetime of a reactor plant affects the growth of a breeder population. A possible effect is the time lag between expiration of one plant and start of operation of its replacement plant. An analytical expression for the necessary correction to the compound system doubling time of the reactor population can be derived. Numerical examples show that in realistic cases, correction to the compound system doubling time will be small.

3710 CONDENSED REVIEW OF THE TECHNOLOGY OF POST-ACCIDENT HEAT REMOVAL FOR THE LIQUID-METAL FAST BREEDER REACTOR. Kazimi, M.S. (Massachusetts Inst. of Tech., Cambridge); Chen, J.C. Nucl. Technol.; 38: No. 3, 339-366 (May 1978).

The analyses performed to evaluate the capacity to contain the core materials after a hypothetical core meltdown accident are generally grouped under the area of post-accident heat removal (PAHR). Substantial advancement in the state-of-the-art of the PAHR area has occurred within the last few years. The key issues of PAHR, as applied to safety analyses of liquid-metal breeder reactors, are summarized. The review includes heat source strength for post-accident conditions, in-vessel core debris retention, ex-vessel core debris retention, and the effects of alternate fuel materials.

3711 (BNWL-tr--326) PRINCIPLES OF DETERMINING DAMAGE TO THE FUEL ELEMENTS OF FAST POWER REACTORS BY MONITORING SODIUM AND GAS ACTIVITY. Iefimov, I.A.; Kulakovskii, M.Ya.; Filonov, V.S. May 1978. Translated from pp 399-416 of engineering of fast reactors for safe and reliable operation (international conference) proceedings, Vol. I, Karlsruhe, Germany, October 9-13, 1972 (CONF-721006--13). 20p. Dep. NTIS, PC A02/MF A01.

From International conference on engineering of fast reactors for safe and reliable operation; Karlsruhe, F.R. Germany (9 Oct 1972).

This paper states the main requirements which have to be met by systems for determining damage to the fuel elements of fast power reactors by delayed neutrons, gas activity, and sodium coolant activity monitoring. The influence of reactor layout, detector geometry, neutron background, and gamma background on the

sensitivity of such systems is examined. The paper contains theoretical data on the magnitude of the effective signal resulting from damage to fuel elements in the BN-350 and BN-600 reactors and experimental data relating to the use of such systems in determining fuel element damage during operation in the BR-5 reactor.

- 3712 WATER LEAKS IN SODIUM-HEATED FAST REACTOR BOILERS. Hayes, D.J. (Central Electricity Generating Board, Berkeley (UK). Berkeley Nuclear Labs.). Phys. Technol.; 9: No. 3, 96-100(May 1978).

Constraints on plant design which may result from considerations of leak behaviour and leak detection limits are briefly considered. The sodium-water interface and reactions, the behaviour of small leaks, hydrogen bubbles and detection methods, including galvanic cell methods, are included.

- 3713 CORE DESIGN: FUEL MANAGEMENT AS A BALANCE BETWEEN IN-CORE EFFICIENCY AND ECONOMICS. Robichaud, G.G.; Tulenko, J.S.; Strauss, S.D. (Babcock and Wilcox Co). Power (N.Y.); 122: No. 5, 52-57(May 1978).

After a brief review of the steps involved in the transformation of enriched uranium into the highly engineered fuel assemblies that drive a nuclear reactor, a state-of-the-art survey of fuel-management techniques is given. To optimize the nuclear fuel cycle, the industry is using available fuel-management techniques, such as multibatch shuffling, use of burnable poisons, coast-down, and fuel-assembly reinsertion. In addition, new techniques are under investigation, including designing for a wetter lattice (higher ratio of water to fuel in the core), use of gadolinium as a burnable poison in pressurized-water reactors (PWRs), increasing fuel burnup limits, and designing for minimum use of poison structural material within the core.

- 3714 INFLUENCE OF SODIUM ENVIRONMENT ON THE UNIAXIAL TENSILE BEHAVIOR OF TITANIUM MODIFIED TYPE 316 STAINLESS STEEL. Natesan, K.; Chopra, O.K.; Kassner, T.F. (Argonne Natl Lab, Ill). J. Nucl. Mater.; 73: No. 2, 137-150(May 1978).

True stress-true strain tensile data have been obtained for titanium-modified type 316 stainless steel in the solution-annealed condition and after exposure to a flowing sodium environment at temperature of 700, 650, 600 and 550°C. The specimens were exposed between 120 and 5012 h to produce carbon penetration depths in the range 0.05-0.30 mm. When compared with solution annealed specimens, the tensile flow behavior of the sodium-exposed specimens is characterized by a higher strain hardening rate, which decreases rapidly as the flow stress increases. The loss in tensile ductility of the material due to carburization in sodium environment was minimal.

- 3715 SIMULATION EXPERIMENTS ON LOCAL COOLING CHANNEL BLOCKAGES IN TYPICAL SNR FUEL ELEMENT CLUSTERS. Basmer, P.; Schultheiss, G.F. (Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Inst. fuer Reaktorentwicklung). Atomwirtsch., Atomtech.; 23: No. 5, 218-220(May 1978). (In German).

TL

- 3716 DRIED HOT CONCRETE VESSEL FOR NUCLEAR REACTORS: PROPOSAL OF A NEW DESIGN CONCEPT. Bazant, Z.P. (Northwestern Univ., Evanston,

Ill. (USA). Dept. of Civil Engineering); Fistedis, S.H. (Argonne National Lab., Ill. (USA)). Nucl. Eng. Des.; 47: No. 2, 317-324(May 1978).

The paper discusses special features of the concept of a dried hot prestressed concrete reactor vessel for pool-type liquid metal cooled fast breeder reactors. In particular, the potentially advantageous feature of removing evaporable water from concrete when it is being kept hot is discussed along with its technological implications.

- 3717 ASSESSMENT OF FUEL FREEZING AND DRAINAGE PHENOMENA IN A REACTOR SHIELD PLUG FOLLOWING A CORE DISRUPTIVE ACCIDENT. El-Genk, M.; Cronenberg, A.W. (New Mexico Univ., Albuquerque (USA). Dept. of Nuclear Engineering). Nucl. Eng. Des.; 47: No. 2, 195-225(May 1978).

An important problem related to the assessment of the recriticality potential for an LMFBR following a core disruptive accident is an understanding of the freezing phenomena of molten fuel on a cold structure which may prevent fuel dispersal and subsequent shutdown. Transient analytical freezing and drainage calculations have been applied to molten UO_2 travel through the rather cold lower shield plug of the Clinch River Breeder Reactor (CRBR). The successive approximation technique is used to obtain a solution of the non-linear freezing problem, where such effects as heat generation, viscous heat dissipation, temperature dependent thermophysical properties and a convective boundary condition at the solidification front have been incorporated into the present analytical formulation. Results indicate that previous steady-state analyses overestimated the rate of frozen layer build-up by about a factor of two. However, of primary importance is the driving force for drainage and the diameter of the shield plug flow channel.

- 3718 VISCOSITY OF MOLTEN ALUMINA. Blomquist, R.A.; Fink, J.K.; Leibowitz, L. (Argonne National Lab., IL). Am. Ceram. Soc. Bull.; 57: No. 5, 522(May 1978).

Viscosity data on molten ceramics are needed in the analysis of core containment and heat-removal associated with hypothetical core disruptive accidents in LMFBR reactors. The oscillating-cup technique was used to determine the viscosity of alumina. (FS)

- 3719 LONG-TERM OPTIONS FOR THE FR FUEL CYCLE. Flowers, R.H.; Johnson, K.D.B.; Miles, J.H.; Webster, R.K. (UKAEA Research Group, Harwell. Atomic Energy Research Establishment). Atom (London); No. 259, 138-142(May 1978).

From 5. Energy technology conference; Washington, USA (Feb 1978).

This paper is designed to complement and amplify the general philosophy developed by Dr. W. Marshall (UKAEA) in his Graham Young Memorial Lecture "Nuclear power and the proliferation issue", February 1978. The position at say about the year 2050 is discussed, taking the Liquid Metal Fast Breeder Reactor as the typical reactor. It is assumed that by then fast reactors will have completely displaced thermal reactors from the power system. The safeguarding of Pu is considered. Headings are as follows -Reasons for reprocessing in a fast reactor fuel cycle; fuel processing procedures in a fully evolved LMFBR cycle (processing requirements set by the fast reactor system; possible developments in LMFBR fuel processing; co-processing of U with Pu; fuel fabrication by the gel process; integrated fuel plants); potential further developments

for reducing plutonium accessibility; relaxation of specifications on fission product levels in new fast reactor fuel; and enhanced recycle of fission products.

- 3720 CHOICE OF SYSTEMS AND OPTIMUM USE OF NUCLEAR MATERIAL RESOURCES. Ferrari, A.; Kresmer, J.; Pierre, C. (CEA). Ann. Mines; 184: No. 5-6, 77-96(May-Jun 1978). (In French).

The authors review the salient features of key nuclear systems and give, for each of these, the worldwide distribution of existing power reactors, and those under construction or contracted for. The review covers the Light Water Reactors (LWR) which account for 77% of all electric power generated by the former group of reactors and for 89% by the latter, with a clear trend toward the Pressurized Water Reactors (PWR). Some advanced systems such as the High Temperature Reactors (HTR) and the Liquid Metal Fast Breeder Reactors (LMFBR) are also discussed. Factors that must be considered when selecting a nuclear system are examined, and an explanation is given of how the French chose the PWR system complemented by breeder reactors.

- 3721 NUCLEAR POWER IN THE SOVIET UNION. Nucl. Can./Can. Nucl.; 17: No. 5, 6-7(May 1978). (In English and French).

Thermal reactors in the Soviet Union are of two kinds, the PWR and the graphite moderated water cooled boiling water reactor (LGR). During the period 1971-6, 85 billion kWh of nuclear electricity were produced. A 350 MWe LMFBR near Shevchenko achieved criticality in 1973. For PWR reactors, 440 and 1000 MWe are standard sizes; for LGR's, 1 GWe. It is intended to produce a series of 1.6 GWe LMFBR's. The Soviet export agency has installed or is constructing nuclear stations in Bulgaria, Finland, the German Democratic Republic, Hungary, Poland and Romania. F.R. Germany has used Soviet enrichment capacity.

- 3722 SPATIAL MESH EFFECT IN THREE-DIMENSIONAL DIFFUSION CALCULATIONS FOR FAST REACTORS. Sakagami, M.; Takeda, S. (Hitachi Ltd., Ibaraki (Japan). Energy Research Lab.). J. Nucl. Sci. Technol. (Tokyo); 15: No. 5, 365-375(May 1978).

A correction to the numerical solution of the diffusion equation solved using the finite mesh spacing method has been studied for a fast breeder reactor. It has been found that the correction to the effective multiplication factor $k_{\text{sub}}(\text{eff})$ calculated with the finite mesh spacing method can be expressed approximately as $-\Delta k(\Delta r, \Delta z) = k - k_{\text{sub}}(D)(\Delta r, \Delta z)$ asymptotically equals $-[(\Delta r)^2(c_1\rho + c_2) + (\Delta z)^2(c_3\rho + c_4)]$, where k and $k_{\text{sub}}(D)(\Delta r, \Delta z)$ are, respectively, the eigenvalues of the diffusion equation and its approximate finite difference equation with mesh spacings Δr in the x-y plane and Δz along the z axis. The quantity ρ is the total reactivity worth of control rods inserted into the core. The constants c_1 , c_2 , c_3 and c_4 are determined from the geometrical shape and atomic densities of constituent materials of a reactor core. For a prototype LMFBR, Δk with $\Delta r = \Delta z = 11.5$ cm (hexagonal-z mesh model) amounts to 0.8% Δk for the state with all control rods fully withdrawn or 1.9% Δk for the state with control rods fully inserted. The Δk 's with $\Delta r = \Delta z = 3.83$ cm (triangular-z mesh model) are less than 0.23% Δk for various patterns of the control rods. As for the power distribution, the hexagonal-z mesh model overestimates the power near the mid plane of

the core with all control rods fully withdrawn (inserted), by 0 -- 1.6% (0 -- 3.9%) in the inner core and by 0 -- 3.7% (0 -- 4.8%) in the radial blanket, but underestimates it by 0 -- 1.4% (0 -- 1.6%) in the outer core, compared with that from the triangular mesh model.

- 3723 ACCIDENT ALARM IN STEAM GENERATORS IN SODIUM COOLED FAST REACTOR POWER PLANTS. III. EXPERIMENTAL RESEARCH IN FLOW FLUCTUATIONS IN PIPES FOLLOWING WATER LEAK IN SODIUM. Banovec, J.; Matal, O. (Vyzkumny Ustav Zavodu Energetického Strojirenstvi, Brno-Slatina (Czechoslovakia)). Jad. Energ.; 24: No. 5, 162-166(May 1978). (In Czech).

The fluctuations of sodium flow rate due to water injected into the sodium were measured on an experimental sodium loop using two electromagnetic flowmeters. A leak of water into sodium of 0.01 g/s was reliably detected above the level of the noise signal of the flowmeter. The ratio of the signal of the flowmeter that was placed at a greater distance from the point of leak to the signal of the flowmeter nearer to the point of leak changed with the flow rate of sodium and was 2 to 6. The dominant frequency varied in dependence on the sodium flow rate from 1.5 to 8.8 Hz. The application of the results to the ZEUS measuring system shows that the system may well be used for measuring leaks of water into sodium in the order of 10^{-1} g/s in a steam generator of the modular type. The results obtained allow the assumption that the electromagnetic flowmeter will be able to operate as a sensor for detecting water leaks into sodium with a sensitivity as high as 10^{-2} g/s.

- 3724 VIBRATIONAL ANALYSIS OF THE SUPERPHENIX INTERNAL SHELLS. Livolant, M.; Jeanpierre, F. (CEA Centre d'Etudes Nucleaires de Saclay, 91 = Gif-sur-Yvette (France)). Nucl. Eng. Des.; 47: No. 2, 289-296(May 1978). (In French).

The geometry of the internal shells of Superphenix is somewhat complicated: they are mainly axisymmetric with some special parts, like pumps and heat exchanger crossing, non-axisymmetric. The flow leaving the reactor core or the heat exchanger strikes some of these shells and induces vibrations. Owing to the expected long life of the plant, without the possibility of intervention on the shells, it is necessary to verify that the vibrational level is sufficiently low and that there is no risk of fatigue. A first estimate of the vibrational level has been calculated. This paper explains the formalism used and describes the main steps of the calculation: (a) estimation of the fluctuating pressures; (b) calculation of the structural resonances, taking into account the sodium effects; and (c) estimation of the resulting vibrational amplitude. A short review of the experimental work planned to verify and validate the calculation results is presented.

- 3725 SIMULATION OF THE DYNAMIC CHARACTERISTICS OF STEAM GENERATOR FOR FBR PLANT. Kawamata, K. (Power Reactor and Nuclear Fuel Development Corp., Oarai, Ibaraki (Japan). Oarai Engineering Center); Morimoto, H.; Maruyama, H.; Hida, K.; Hakogami, T. Mitsubishi Juko Giho; 15: No. 3, 318-325(May 1978). (In Japanese).

The development of the liquid metal fast breeder reactor (FBR) in Japan has been pushed forward as a national project under the guidance of the Power Reactor and Nuclear Fuel Development Corporation (PNC) who is charged with the responsibility for this program. The

project is aimed at constructing the "Monju", 300 MWe prototype FBR. As the steam generator is one of the most important components of the thermal transportation system of the FBR plant, we have put emphasis on the research and development of a more efficient steam generator. As the manufacture of the components of the FBR plant we have been making the analysis and evaluation of the dynamic characteristics of the steam generator by mathematical simulation. In order to improve the performance, safety, reliability and utility rate of the whole plant by the sure operation of the steam generator, these analysis and evaluation should be as accurate as possible, for which it is necessary to know the dynamic characteristics of the steam generator and verify the accuracy of simulation program. This paper reports on the results of our verification of the accuracy of the simulation program developed by our company by the comparison of the calculated results with the results of tests on the dynamic characteristics of the 50 MW No. 2 steam generator for "Monju" R and D which our company designed, manufactured and delivered to the PNC Oarai Engineering Center. As the result of this comparison it has been confirmed that the values obtained by use of this program are in good agreement with experimental values concerning the dynamic characteristics of the steam generator under high, low and very low load conditions and that simulation can be made in a practically short calculation time (CPU time).

3726 DECAY HEAT REMOVAL TEST OF SPENT FUEL IN "MONJU" EX-VESSEL TRANSFER MACHINE, PHASE 2. Inoue, T. (Fuji Electric Co. Ltd., Kawasaki, Kanagawa (Japan)). FAPIG (Tokyo); No. 89, 2-6, 12(May 1978). (In Japanese).

Concerning decay heat removal of spent fuel assemblies in the ex-vessel transfer machine for the prototype fast breeder reactor "Monju", the construction of which is being planned in the Power Reactor and Nuclear Fuel Development Corporation, indirect cooling test has been made on the mock-up fuel assembly in a pot containing sodium. From the test, many useful data for the design of the actual ex-vessel transfer machine was able to be acquired. In this way, the validity of a thermal calculation code for the design was also examined, and its practicability was confirmed. The indirect cooling test and its results and the analysis including that on code validity are described. (1) The emissivity on the outside surface of the pot is 0.5 - 0.8. (2) The maximum temperature on fuel-pin surfaces in sodium flow with natural convection by the calculation code was in good agreement with the test results. (3) Not only the natural convection inside and outside the fuel assembly but also local natural convection above the heat generating part contribute to the heat removal.

3727 SUPER-PHENIX: FIRST STEP IN THE COMMERCIAL DEVELOPMENT OF BREEDER REACTORS. Banal, M. (Electricite de France, 75 - Paris); Megy, J. (CEA, 75 - Paris; France)). Ann. Mines; 184: No. 5-6, 127-140(May-Jun 1978). (In French).

Super-Phenix is an indispensable step in a program for the development of the breeder reactors. Its power and technical options are recalled. The administrative directives - particularly concerning safety - are in agreement with the regulation enforced in France relative to nuclear power stations and work has begun on the Creys-Malville site within the international framework where the

development of breeders in Europe now finds its place. The saving in uranium due to breeders is certain, but their cost prices remain to be proved. The construction of Super-Phenix is the proof that it is possible to rely on the breeders in the final energetic results for the future, but it is of a type which can still be modified to a considerable extent, especially in order to reduce investments.

3728 FUEL CONFIGURATION FOR A NUCLEAR REACTOR COOLED WITH LIQUID METAL. Duncombe, E.; Gratton, C.P.; Adamson, J. (to UKAEA London Office; Deutsches Patentamt, Muenchen (Germany, F.R.)). German(FRG) Patent 2,746,555/A/. 20 Apr 1978. 15p. (In German).

In a liquid metal-cooled reactor there are provided openings along the coolant channels in order to reduce local thermal peaks. At the outlet of the coolant channel a transducer is monitoring the cooling of the fuel. The heat is removed by several open heat transfer pipes distributed over the cross-section of the coolant channel.

3729 IMPROVEMENTS IN OR RELATING TO PIPE JOINTS. Lee, A.S. (to English Electric Co. Ltd., London (UK)). British Patent 1,507,948/A/. 19 Apr 1978. 9p.

Pipe joints are described that are particularly suitable for liquid metal cooled nuclear reactors. The object is to provide a joint capable of accommodating movements resulting from differential expansion of the reactor components. Full constructional details are given.

3730 TUBE IN SHELL HEAT EXCHANGERS. Linning, D.L. (to UKAEA). British Patent 1,507,833/A/. 19 Apr 1978. 3p.

An improved tube-in-shell heat exchanger is described for use as a boiler for generating steam by heat exchange with liquid metal. It comprises a bundle of spaced tubes that conduct the liquid metal between headers and that extends through a shell containing water, the ends of this shell being closed by tube sheets spaced from the headers. The heat exchange tubes have internal thermally insulating sleeves each of which comprises a pair of spaced co-axial tubes sealed together at each end to form a closed interspace that contains inert gas. In this arrangement the heat flux between the tubes and tube sheet adjacent the inlet header for liquid metal is greatly reduced and the deposition of salts on the water side of the tube sheet and on the outside of the tubes in the vicinity of the tube sheet is thereby greatly reduced.

3731 ON-LINE ULTRASONIC GAS ENTRAINMENT MONITOR. Day, C.K.; Pedersen, H.N. (to Dept. of Energy). US Patent 4,083,225. 11 Apr 1978. Filed date 17 Mar 1976. 6p. PAT-APPL-667,924.

Apparatus employing ultrasonic energy for detecting and measuring the quantity of gas bubbles present in liquids being transported through pipes is described. An ultrasonic transducer is positioned along the longitudinal axis of a fluid duct, oriented to transmit acoustic energy radially of the duct around the circumference of the enclosure walls. The back-reflected energy is received centrally of the duct and interpreted as a measure of gas entrainment. One embodiment employs a conical reflector to direct the transmitted acoustic energy radially of the duct and redirect the reflected energy back to the transducer for reception. A modified embodiment employs a

cylindrical ultrasonic transducer for this purpose.

- 3732 **POLITICS OF REPROCESSING.** Barnaby, F. (Stockholm International Peace Research Inst. (Sweden)). New Sci.; 78: No. 1097, 18-19(6 Apr 1978).

The political and economic questions surrounding the use of plutonium as a nuclear fuel are examined. The advantages of liquid-metal fast breeder reactors are considered against the background of the sharp decline in demand for nuclear power. However the very real problems of their use with respect to the possible proliferation of nuclear weapons are discussed and the use of plutonium from fuel elements removed from the core and the breeder blanket in the fabrication of nuclear weapons is considered. The part played by reprocessing of spent fuel elements from ordinary reactors for use in breeder reactors and possible proliferation restrictions imposed in countries with no such reprocessing facilities are mentioned.

- 3733 **THERMAL POWER PLANT.** Mangus, J.D. (to Westinghouse Electric Corp., Pittsburgh, Pa. (USA)). German (FRG) Patent 2,741,945/A/. 6 Apr 1978. 24p. (In German).

The patent claims a method to improve intermediate superheating in nuclear power plants with liquid-metal-cooled reactors, so that temperature changes in the steam led from the high-pressure turbine to the intermediate superheater can be taken up.

- 3734 **FUEL SUBASSEMBLY LEAK TEST CHAMBER FOR A NUCLEAR REACTOR.** Divona, C.J. (to Dept. of Energy). US Patent 4,082,607. 4 Apr 1978. Filed date 30 Sep 1976. 4p. PAT-APPL-728,360.

A container with a valve at one end is inserted into a nuclear reactor coolant pool. Once in the pool, the valve is opened by a mechanical linkage. An individual fuel subassembly is lifted into the container by a gripper; the valve is then closed providing an isolated chamber for the subassembly. A vacuum is drawn on the chamber to encourage gaseous fission product leakage through any defects in the cladding of the fuel rods comprising the subassembly; this leakage may be detected by instrumentation, and the need for replacement of the assembly ascertained.

- 3735 **DETERMINATION OF REACTIVITY FROM POWER SPECTRAL DENSITY MEASUREMENTS WITH ^{252}Cf .** Mihalcz, J.T.; Pare, V.K.; Ragan, G.L.; Mathis, M.V.; Tillett, G.C. (Oak Ridge National Lab., TN). Nucl. Sci. Eng.; 66: No. 1, 29-59(Apr 1978).

The theory of a method of determination of reactivity from power spectral density measurements with ^{252}Cf and the results of experiments with a critical assembly mockup of a liquid-metal fast breeder reactor (LMFBR) and with uranium (93.2 wt % ^{235}U) metal cylinders and a sphere are presented. This method of reactivity determination has an advantage over existing methods in that it determines the reactivity only from properties of the reactor at the subcritical state of interest and thus does not require a calibration near delayed criticality. In these experiments, the reactivity was varied by changing the fissile loading or the amount of neutron absorber inserted; for the LMFBR mockup, the reactivity varied to approximately 75 dollars subcritical, and for the uranium metal assemblies to approximately 30 dollars subcritical. These

experiments verified for the first time the predictions of theory that could be tested in the measurements. This method has potential use in the fuel loading of reactors to determine the reactivity far subcritical before initial criticality is achieved. It has the advantage of not requiring a calibration at known reactivity by another method; furthermore, the interpretation of the measured data to obtain the reactivity does not depend on relative or absolute values of the source intensity or detection efficiency. It can also be used to determine the reactivity of assemblies where loading to criticality is undesirable or where sufficient material to achieve criticality is not available.

- 3736 **CALCULATION OF THE REACTIVITY DUE TO BUBBLE COLLAPSE WITH THE PROBABILITY TABLE METHOD.** Hoffman, T.J.; Petrie, L.M. (Oak Ridge National Lab., TN). Nucl. Sci. Eng.; 66: No. 1, 67-74(Apr 1978).

The probability table method, originally developed for unresolved resonance calculations, is adapted to the calculation of bubble worths in a reactor core. Unlike previous approaches to this problem, this method is applicable to a broad class of problems, avoids a high variance Monte Carlo calculation, and preserves the main features of a random bubble distribution. This approach is illustrated by the solution to several problems of varying degrees of complexity.

- 3737 **PROBABILISTIC ACCIDENT ANALYSIS WITH DETERMINISTIC CODES USING STOCHASTICALLY VARIABLE PARAMETERS.** Abramson, P.B.; Hummel, H.H.; Gelbard, E.M.; Pizzica, P.A.; Sienicki, J.J. (Argonne National Lab., IL). Nucl. Sci. Eng.; 66: No. 1, 14-23(Apr 1978).

In the use of large computers to analyze severe accidents in liquid-metal fast breeder reactors (LMFBRs), it has long been recognized that many of the fundamental phenomena cannot be precisely predicted because of uncertainty in the parameters that govern them. As a direct result, mechanistic analysis of such accidents has proceeded along a parametric path in which these variables are fixed at a certain constant value for the entire calculation. The influence of variation of this value is assessed by making a series of complete calculations with the parameter set at a different value for each such element of the series. While some parameters may be thought of as 'correlated' or fixed for an entire calculation, very few are in fact constant throughout a reactor, and many are (for practical purposes) nearly completely uncorrelated, either in space or time, during the hypothetical accident. Thus, such analysis has created a set of results that are not indicative or representative of an accident involving uncorrelated or only partially correlated variable parameters. A methodology is described for dealing with various degrees of uncertainty or incoherence in these parameters. By using two very different mechanistic codes (FX2-PQOL and EPIC), we demonstrate that the treatment of uncorrelated parameters, such as droplet/particle size in a hypothetical core disruptive accident, as random variables with a certain probability distribution during each complete calculation of a series of calculations produces as much as an order of magnitude less uncertainty in the end result than had been obtained assuming perfect correlation. A small list of parameters is categorized as either correlated or uncorrelated for some of the other LMFBR accident analysis codes. The technique can be easily implemented in a broad spectrum of accident analysis codes with

similar benefits.

- 3738 EXPERIMENTAL INVESTIGATION OF GAS EVOLUTION AS THE MECHANISM FOR FREE-CONTACT FRAGMENTATION. Shiralkar, G. (Univ. of California, Berkeley); Rohsenow, W.; Sonin, A.; Todreas, N. Nucl. Sci. Eng.; 66: No. 1, 103-109(Apr 1978).

An experimental investigation was made to assess the hypothesis of Epstein that violent release of dissolved gas upon rapid cooling of a molten metal is responsible for observed free-contact fragmentation. Results from quenching tin drops initially heated in vacuum and air to develop drastic initial differences in oxygen solubility levels did not demonstrate any differences in observed fragmentation occurrence or intensity. It is concluded that this hypothesis is not the operative mechanism for free-contact fragmentation in the tin-water system.

- 3739 (IAEA-CN--36/342) SAFETY OF SODIUM-COOLED FAST REACTORS. Bagdasarov, Yu.E.; Matveev, V.I.; Kuznetsov, I.A.; Krasnoyarsov, N.V.; Kochetkov, L.A.; Kulakovskiy, M.Ya.; Pomerantsev, G.B. Apr 1978. Translation of USSR paper (CONF-770505--54(trans)). 21p. Dep. NTIS, PC A02/MF A01.

From International conference on nuclear power and its fuel cycles; Salzburg, Austria (2 May 1977).

Some physical and technical aspects of sodium-cooled fast reactor safety are discussed. An approach to the solution of safety problems used in the designs of the USSR first fast-reactor generation was based (as a result of thermal-reactor operating experience) on a logical analysis of the tree of failures, on careful development and testing of safety systems and devices, and on duplication and echelonment of the most important of them. A review of main works carried out for the last two decades is given and the most important results of design studies, research and operating experience obtained on fast reactors as to accumulation of data and characteristics in the area of safety are presented.

- 3740 (IAEA-CN--36/356) USSR FAST REACTOR DEVELOPMENT PROGRAM AND ITS CURRENT STATE. Kazachkovski, D.D.; Meshkov, A.G.; Mitenkov, F.M. Apr 1978. Translation of USSR paper, 1977 (CONF-770505--190(Trans.)). 24p. Dep. NTIS, PC A01/MF A01.

From International conference on nuclear power and its fuel cycles; Salzburg, Austria (2 May 1977).

Fast power reactors make it possible to use in a more efficient way existing natural resources of nuclear raw materials, ensuring by that large-scale development of nuclear power. The state of fast reactor development work in the USSR and some questions of fuel cycle are discussed.

- 3741 DIFFUSION AND TRAPPING OF TRITIUM IN GRAIN BOUNDARIES OF 304L STAINLESS STEEL. Abraham, P.M.; Elleman, T.S.; Verghese, K. (North Carolina State Univ., Raleigh (USA). Dept. of Nuclear Engineering). J. Nucl. Mater.; 73: No. 1, 77-88(Apr 1978).

Permeation rates of tritium through 304L stainless steel are calculated using a grainboundary diffusion model and measured values of bulk and grainboundary diffusion coefficients. Computed results show that the tritium release rate through grainboundaries should be significantly greater than through the lattice. These predictions, however, are

not borne out by permeation experiments. In order to explain this discrepancy, autoradiographic examinations were carried out. The results show that although grainboundaries are indeed fast diffusion paths, their contribution to the overall permeation rate may be minimized by trapping in surface oxide films and possibly by low solubility of tritium within the grainboundaries.

- 3742 EFFECT OF ION-PLATED MOLYBDENUM ON CORROSION OF V/MO ALLOYS IN LIQUID SODIUM. Iwao, N.; Suzuki, T.; Fukutomi, M.; Okada, M.; Watanabe, R. (National Research Inst. for Metals, Tokyo (Japan)). J. Nucl. Mater.; 73: No. 1, 105-110(Apr 1978).

The effect of ion-plated molybdenum of less than 5 μm in thickness on corrosion of V-Mo alloys has been examined in high purity liquid sodium at 700°C for 500 h. The oxygen concentration in the sodium was about 1.0 ppm ('Vanadium Wire Equilibration Method'). By molybdenum coating, the oxygen absorption from sodium was remarkably suppressed and the dissolution of solid metal into sodium was reduced to less than 10 percent of that for the uncoated alloy. The tensile properties at room temperature, the fractography and the microhardness have shown good promise for resistance of the molybdenum coating to corrosive attack by sodium.

- 3743 NEW NUCLEAR POWER PLANTS IN THE FEDERAL REPUBLIC OF GERMANY 1978. Atomwirtsch., Atomtech.; 23: No. 4, 164-177(Apr 1978). (In German).

A survey in tabular form of all nuclear power plants in operation up to March 1978 is followed by various chapters describing the main data of the 12 power reactors now under construction. Finally, 11 nuclear power plant projects are described.

- 3744 ASSESSMENT OF THE PERFORMANCE OF UK CFR CANDIDATE STRUCTURAL MATERIALS. Charnock, W.; Marshall, P. (Central Electricity Generating Board, Berkeley (UK). Berkeley Nuclear Labs.). Nucl. Energy; 17: No. 2, 119-132(Apr 1978).

The service performance and the extent of degradation of properties of the main UK commercial fast reactor candidate structural materials AISI 316 and 9 Cr-1 Mo over a 30 year lifetime in a sodium cooled reactor are assessed. From the point of view of creep and fatigue behaviour the following effects are judged to be unlikely to give rise to problems either at plain surfaces or at crack tips: substitutional element transfer; ferrite layer formation; liquid metal embrittlement; tertiary creep embrittlement; carbon transfer in primary and secondary circuits; oxygen effects at normal operating levels; and self welding. Much of the information required for design may be obtained in air or in inert gas environments. The self-welding phenomenon, however, has implications for seals, contacting surfaces, and demountable components. Important areas of uncertainty are as follows: thermal degradation of parent material welds, especially transition joints; caustic and very high oxygen concentrations arising from fault conditions; loss of toughness and ductility due to irradiation, particularly in welds; and localized carburization adjacent to pump leaks.

- 3745 OPTIMIZATION OF SODIUM COOLED FAST REACTORS. CONFERENCE REPORT. Grieve, M.S. (Central Electricity Generating Board, London (UK). Nuclear Health and Safety Dept.). Nucl. Energy; 17: No. 2, 80-84(Apr 1978).

A review is presented of the conference on Optimization of Sodium Cooled Fast Reactors, held by the British Nuclear Energy Society in London. Some of the more important topics and others of particular interest are reviewed. From the opening session, a view of the optimisation approach of different countries is obtained. Other papers are considered under the topics of safety; core, subassemblies and fuel; overall design; sodium circuits and steam plant; and system benefit. Heterogeneous cores were the subject of some divergence of opinion in the closing session.

3746 CLAYMORE CODE AND ITS USE FOR DESCRIBING COOLANT BOILING IN LMFBR SUBASSEMBLIES.

Gregory, C.V.; Lord, D.J. (UKAEA, Dounreay. Nuclear Power Development Establishment). Nucl. Energy; 17: No. 2, 107-114 (Apr 1978).

The interest in subassembly incidents as an important factor in liquid metal fast breeder reactor safety analysis has led to the development of the CLAYMORE code at the Dounreay Nuclear Power Development Establishment. The code contains a simple boiling model and, being derived from SABRE, is able to describe recirculating flows in subchannel geometries. The code is briefly described, particular attention being paid to the homogeneous boiling model and the method adopted for the inclusion of slip, and results from a range of calculations are presented. The results are used to demonstrate the influence on the description of boiling of three inherent uncertainties in the code, provided by lack of knowledge on inter-channel mixing, by the assumption of a bundle geometry unaffected by the temperature field, and, for blockage calculations, by the difficulty in assessing the magnitude of the leakage flow through the blockage.

3747 NUCLEAR POWER AND THE PROLIFERATION ISSUE. Marshall, W. (UKAEA). Atom (London); No. 258, 78-102 (Apr 1978).

This paper by the Deputy Chairman of the UK Atomic Energy Authority discusses what is termed nuclear proliferation on the basis of which problems are real and which are a misapprehension and suggests a way that will retain the benefits of nuclear power while providing a more certain safeguard against undesirable proliferation. Headings include Pu production and accessibility, the use of Pu, fast reactor fuel, and policy for the interim period until fast reactors are well established throughout the world. The author considers that the availability of Pu is not the most serious proliferation problem facing the world. Appendices include alternative routes for obtaining nuclear weapon materials, critical mass of Pu, the flow of Pu in the pressurised water and liquid metal fast breeder reactors.

3748 FEDERAL CONSTITUTIONAL COURT AFFIRMS ADMISSIBILITY OF DECISION IN THE MATTER OF THE FAST BREEDER KALKAR. Energiewirtsch. Tagesfragen; 28: No. 4, 265 (Apr 1978). (In German).

In the case of the examination of the constitutionality of section 7 Atomic Energy Act, in as far as this article enables the licensing of nuclear power plants of the type called Fast Breeder, the Second Senate of the Federal Constitutional Court has answered the OVG Muenster's motion to stay proceedings dated Aug 18th, 1977, with the following 'interim decision' - 2 B v L 8/77 - dated Jan 31st, 1978: 'The action is admissible'. The verdict was unanimous. The main grounds upon which the interim judgment is based are given in full.

3749 OPERATING EXPERIENCE AND SODIUM-WATER REACTION TESTING IN THE LARGE LEAK TEST RIG. DeBear, W.S.; Neely, H.H. (Liquid Metal Engineering Center, Canoga Park, CA). J. Eng. Power; 100: No. 2, 347-355 (Apr 1978).

3750 IRRADIATION EFFECTS ON THE BEHAVIOR OF STRUCTURAL MATERIALS AT ELEVATED TEMPERATURE. Abo-El-Ata, M.M. (San Francisco State Univ., CA). J. Eng. Mater. Technol.; 100: No. 2, 121-127 (Apr 1978).

A qualitative review of the effects of fast neutron irradiation on the mechanical behavior of materials used in the construction of Fast Breeder Reactor Core Components is presented in three sections. First, effects of preirradiation on the strength, ductility, elastic moduli, thermal creep, creep-rupture, and fatigue are discussed. Second, the phenomenon of irradiation induced swelling is explained and the effects of temperature, cold work, and stress on swelling are presented. Third, irradiation creep is defined and the effects of temperature, stress, and cold work on irradiation creep are discussed. The review is based on the most recently available experimental data on austenitic stainless steels.

3751 FACING THE MATERIALS CHALLENGE IN FAST REACTOR STEAM GENERATOR TECHNOLOGY. Little, E.A.; Pugh, S.F. (UKAEA, Harwell. Atomic Energy Research Establishment). Nucl. Eng. Int.; 23: No. 270, 39-43 (Apr 1978).

Highlights are presented from an international conference on 'Ferritic steels for fast reactor steam generators' held in London, 1977. Papers covered all relevant materials aspects of chrome molybdenum steels, the main choice for fast reactor steam generators and super heaters being 2 Cr/Mo, 9Cr/Mo and 12Cr/Mo steels. The heat treatment response of the Cr/Mo steels, is such that it is possible to achieve a wide range of mechanical properties. Consideration is given to general metallurgy, operating experience, effect of composition on properties, corrosion in sodium, water-side corrosion, and fabrication processes.

3752 USE AND STATUS OF FAST BREEDER DEVELOPMENT. Brandstetter, A. (Internationale Natrium-Brutreaktor-Bau G.m.b.H., Bergisch Gladbach (Germany, F.R.)); Internationale Atomreaktorbau G.m.b.H. (INTERATOM), Bergisch Gladbach (Germany, F.R.)). Waerme; 84: No. 2, 57-61 (Apr-Jun 1978). (In German).

The high boiling point of sodium accounts for its excellent safety characteristics permits conventional steam states, i.e. high plant efficiencies. It is wrong to describe sodium as an explosive medium. Sodium-water reactions and sodium fires will, at the most, reduce availability. They present a low danger potential for the operating personnel and no danger potential at all for the population in the neighbourhood of the plant. The operation of test facilities and power plant has shown that the state of the art of sodium technology permits reliable power plant operation.

3753 ACTUAL CONTROLLING OF STANDARDS CONCERNING THE 'FAST BREEDER REACTOR'. REMARKS ON THE DECISION OF THE OVG MUENSTER TO PRESENT A CASE TO THE FEDERAL CONSTITUTIONAL

COURT. Rengeling, H.W. (Hamburg Univ. (Germany, F.R.)). Off. Verwalt.; No. 8, 277-282(Apr 1978). (In German).

If the decision of the OVG Muenster to present the case to the Federal Constitutional Court asking whether Article 7 of the atomic energy law corresponds to the constitution or not, as far as the article allows the licensing of a fast breeder reactor, two problems arise: The legal question in how far the actual controlling of standards is to be preceded by a statement of facts given by the court of first instance, and the problem behind concerning the responsibility of decision. The Federal Constitutional Court should accept the responsibility of decision to be borne by it.

- 3754 ULTRA-SONIC FLOW METER FOR THE SODIUM COOLED FAST BREEDER REACTOR. Iida, S.; Araki, H.; Oda, M.; Matsunaga, Y.; Yoshiyama, Y. (Mitsubishi Electric Corp., Tokyo (Japan)). Keisoku Jido Seigyo Gakkai Ronbunshu; 14: No. 2, 178-183(Apr 1978). (In Japanese).

This paper describes an ultra-sonic flow meter (U.S. FM) designed to measure coolant flow rate of the fast breeder reactor power plant. The coolant is high temperature liquid sodium, the U.S. FM was improved to be useful in the high temperature environment. First, to eliminate the high temperature influence of the pipe to transducers, the guide rods were used. Second, the electronic circuits were improved to measure the flow rate by the difference in the transmission time of signals. Third, the electronic circuits were endowed with a capability of automatic temperature compensation and protected against bubble disturbance. With the improved U.S. FM, a study of acoustic transmission in liquid sodium was carried out. It was found that the sonic property of liquid sodium is similar to that of water. The U.S. FM was tested in a water flow to exhibit its operational characteristics including the linearity, the time constant and the bubble influence. The results showed up as expected and confirmed the promising aspects of the present measuring method.

- 3755 DEVELOPMENT AND PRODUCTION OF TUBES WITH INNER FINNING FOR NUCLEAR POWER. Starek, J.; Stanek, B. (Vyzkumny Ustav Hutnictvi Zeleza, Dobra (Czechoslovakia)). Strojirenstvi; 28: No. 4, 200-202(Apr 1978). (In Czech).

Increased heat transfer due to inner finning of tubes results in increasing the life of tubes in steam generators of sodium cooled reactors and in limiting unfavourable effects of temperature changes on the tubes. The development was therefore commenced of tubes with inner longitudinal and inner helical fins. The technology of drawing tubes on linear drawing benches using a short cylindrical mandrel was accepted as most suitable. The effect was studied of the geometry of tools and fixtures and the relationships were tested between the size of drawing reduction of the diameter and the initial wall thickness of different tubes. It was found that the increase in the fin height depended on the size of the wall thickness reduction. Tubes 18 mm in diameter, 3 mm in wall thickness and 0.5 and 1 mm in fin height, 2 mm in fin width and 5.5 to 7 m in length, and tubes with helical fins of 0.5 mm and 1 mm in fin height and with a pitch of 200, 250 and 300 mm were subject to tests confirming that for longitudinal fins heat transfer improved by 20% and for helical fins by 50%.

- 3756 IMPROVEMENT OF LIQUID-METAL FAST BREEDER REACTOR CHARACTERISTICS BY APPLYING A MAGNETIC

FIELD. Shmelev, A.N.; Ilyunin, V.G.; Murogov, V.M. At. Energ. (USSR); 44: No. 4, 359-360(Apr 1978). (In Russian).

FLOW RATE; FUEL ASSEMBLIES; HYDRAULICS; LMFBR TYPE REACTORS; MAGNETIC FIELDS; MECHANICAL VIBRATIONS; POWER DENSITY; SODIUM; TURBULENT FLOW

- 3757 NUCLEAR REACTOR FACILITY. Wampole, N.C. (to Westinghouse Electric Corp., Pittsburgh, PA (USA)); Deutsches Patentamt, Muenchen (Germany, F.R.). German (FRG) Patent 2,742,009/A/. 30 Mar 1978. 13p. (In German).

In order to improve the performance of maintenance and inspections it is proposed for a nuclear reactor facility with a primary circuit containing liquid metal to provide a thermally insulated chamber, within which are placed a number of components of the primary circuit, as e.g. valves, recirculation pump, heat exchangers. The isolated placement permit controlled preheating on one hand, but prevents undesirable heating of adjacent load-bearing elements on the other. The chamber is provided with heating devices and, on the outside, with cooling devices; it is of advantage to fill it with an inert gas. (UWI) 891 HP.

- 3758 NUCLEAR REACTOR CORE COOLING ARRANGEMENT. Redding, A.H. (to Westinghouse Electric Corp.). US Patent 4,080,252. 21 Mar 1978. Filed date 18 Feb 1975. 8p.

A core cooling system for a nuclear reactor having a plurality of primary fluid flow systems is described. The reactor coolant flow from the primary systems is joined upon entering the pressure vessel. Jointure is accomplished in a common chamber causing high coolant flow velocities at low static pressures. If a pipe ruptures in one of the primary fluid flow systems, the low pressure in the common chamber minimizes leakage from the intact flow systems. This allows continuation of coolant flow through the nuclear core for a sufficient length of time to effectively eliminate the possibility of thermal damage.

- 3759 HORIZONTAL BAFFLE FOR NUCLEAR REACTORS. Rylatt, J.A. (to Dept. of Energy). US Patent 4,080,255. 21 Mar 1978. Filed date 31 Aug 1976. vp.

PAT-APPL-719,318.

A horizontal baffle disposed in the annulus defined between the core barrel and the thermal liner of a nuclear reactor thereby physically separating the outlet region of the core from the annular area below the horizontal baffle is described. The horizontal baffle prevents hot coolant that has passed through the reactor core from thermally damaging apparatus located in the annulus below the horizontal baffle by utilizing the thermally induced bowing of the horizontal baffle to enhance sealing while accommodating lateral motion of the baffle base plate.

- 3760 METHOD OF LOCATING A LEAKING FUEL ELEMENT IN A FAST BREEDER POWER REACTOR. Honekamp, J.R.; Fryer, R.M. (to Dept. of Energy). US Patent 4,080,250. 21 Mar 1978. Filed date 20 Nov 1973. 8p.

PAT-APPL-417,652.

Leaking fuel elements in a fast reactor are identified by measuring the ratio of ^{134}Xe to ^{133}Xe in the reactor cover gas following detection of a fuel element leak, this ratio being indicative of the power and burnup of the failed fuel element. This procedure can be used to identify leaking fuel elements in a power breeder reactor while continuing operation of

the reactor since the ratio measured is that of the gases stored in the plenum of the failed fuel element. Thus, use of a cleanup system for the cover gas makes it possible to identify sequentially a multiplicity of leaking fuel elements without shutting the reactor down.

- 3761 PLUG-TO-PLUG GAS TRANSFER SYSTEM. Poindexter, A.M. (to Dept. of Energy). US Patent 4,080,254. 21 Mar 1978. Filed date 28 Apr 1978. 8p.
PAT-APPL-680,826.

A system is described for conducting a fluid from one component to another component of a nuclear reactor wherein at least one such component is a rotatable closure head plug capable of movement relative to the other component. The conducting system utilizes the annulus located between the components as a connecting passageway for the fluid.

- 3762 CORE DISRUPTIVE ACCIDENT MARGIN SEAL. Garin, J. (to Dept. of Energy). US Patent 4,078,969. 14 Mar 1978. Filed date 13 Aug 1976. 10p.
PAT-APPL-714,221.

An apparatus is described for sealing the annulus defined between a substantially cylindrical rotatable first riser assembly and plug combination disposed in a substantially cylindrical second riser assembly and plug combination of a nuclear reactor system. The apparatus comprises a flexible metal member having a first side attached to one of the riser components and a second side extending toward the other riser component and an actuating mechanism attached to the flexible metal member while extending to an accessible location. When the actuating mechanism is not activated, the flexible metal member does not contact the other riser component thus allowing the free rotation of the riser assembly and plug combination. When desired, the actuating mechanism causes the second side of the flexible metal member to contact the other riser component thereby sealing the annulus between the components.

- 3763 SEALED HEAT ACCESS AREA ENCLOSURE. Golden, M.P.; Govi, A.R. (to Dept. of Energy). US Patent 4,078,968. 14 Mar 1978. Filed date 28 Jul 1976. 6p.
PAT-APPL-709,351.

A liquid-metal-cooled fast breeder power reactor is provided with a sealed head access area enclosure disposed above the reactor vessel head consisting of a plurality of prefabricated structural panels including a center panel removably sealed into position with inflatable seals, and other panels sealed into position with semipermanent sealant joints. The sealant joints are located in the joint between the edge of the panels and the reactor containment structure and include from bottom to top an inverted U-shaped strip, a lower layer of a room temperature vulcanizing material, a separator strip defining a test space therewithin, and an upper layer of a room temperature vulcanizing material. The test space is tapped by a normally plugged passage extending to the top of the enclosure for testing the seal or introducing a buffer gas thereinto.

- 3764 NUCLEAR REACTOR WITH SELF-ORIFICING RADIAL BLANKET. Bishop, A.A.; Weiss, E.H.G.; Engel, F.C. (to Westinghouse Electric Corp.). US Patent 4,077,835. 7 Mar 1978. Filed date 29 Apr 1975. 6p.

The peripheral blanket of a breeder reactor

requires a coolant flow rate which is a varying fraction of that of the central core region. A self-orificing blanket cooling structure which is characterized by a predominance of radial coolant flow, generated by the pressure difference across the blanket, is utilized to supply the necessary cooling. The blanket fuel assemblies are surrounded by perforated cans to allow for radial crossflow through the blanket region.

- 3765 MAINTENANCE DEVICE FOR LIQUID SEALS IN NUCLEAR REACTORS. Poindexter, A.; Ricks, H. (to Westinghouse Electric Corp., East Pittsburgh, PA (USA); Deutsches Patentamt, Muenchen (Germany, F.R.)). German (FRG) Patent 2,738,634/A/. 2 Mar 1978. 33p. (In German).

As a maintenance device for liquid seals arranged in the annular gaps between rotating closure plates of lids of fast breeder reactors an ultrasonic transducer is proposed. It is to be mounted onto a probe in the tank lid. The oscillation emitted by the oscillating area of the ultrasonic transducer are to make undesired deposits detach from the sealing fluid and thus retain the wetting capability of the metal surfaces, thereby preventing the passage of radioactive gases through the seal. The use of this system allows even those parts of a nuclear reactor plant to be maintained to which access is difficult. The design of the probe and that of the system is described in detail.

- 3766 THERMAL EXPANSION WORTHS FOR A LIQUID-METAL FAST BREEDER REACTOR INFERRED FROM SMALL-SAMPLE REACTIVITY MEASUREMENTS. Wei-Teh Lee, B. (General Electric Co., Sunnyvale, CA); Kaiser, R.E.; Hitchcock, J.T.; Russell, C.S. Nucl. Sci. Eng.; 65: No. 3, 429-440 (Mar 1978).

An indirect experimental technique for determining the expansion coefficient was developed to provide uncertainty estimates for expansion coefficient calculations. This technique uses an R_z reactivity worth map synthesized from small-sample reactivity traverse measurements for major materials over the reactor core and blanket regions. The experimentally based expansion coefficients, representing the reactivity change due to uniform axial and radial expansion, are deduced by appropriately integrating measured worth profiles. This technique was evaluated in Phase A of the Zero Power Plutonium Reactor Assembly 5. Direct calculations of the expansion coefficients were performed, and results were compared with the experimentally determined values. The validity of the technique used to derive expansion coefficients from worth measurements was evaluated. It is concluded that the total expansion coefficients are reasonably well calculated; however, the calculated radial expansion coefficient was overestimated. Sources of possible systematic errors in the experimentally based values were studied. Based on the present experiment, an uncertainty of $\pm 20\%$ (90% level of confidence) on expansion calculations using ENDF/B-III data is estimated for a clean core configuration.

- 3767 PRODUCTION OF ^{232}U IN A 1200-MW(E) LIQUID-METAL FAST BREEDER REACTOR. Mann, F.M.; Schenter, R.E. (Hanford Engineering Development Lab., Richland, WA). Nucl. Sci. Eng.; 65: No. 3, 544-547 (Mar 1978).

Uranium-232 production has been calculated in a 1200-MW(e) liquid-metal fast breeder reactor as a function of position, time, and core composition. Whenever thorium is present in the core, large quantities of ^{232}U relative to uranium (approximately 1000 ppm) are

generated. For ^{232}U generated in the blanket, production is on the order of 50 ppm.

design of future commercial liquid-metal fast breeder reactors.

- 3768 RADIOLOGICAL ASSESSMENT OF REPROCESSING ADVANCED LIQUID-METAL FAST BREEDER REACTOR FUELS. Till, J.E.; Bomar, E.S.; Morse, L.E.; Tennery, V.J. (Oak Ridge National Lab., TN). Nucl. Technol.; 37: No. 3, 328-339 (Mar 1978).

Results of the assessment were compared with those for reference oxide fuel. Candidate advanced fuels analyzed included $[(\text{U,Pu})\text{C}]$ and $[(\text{U,Pu})\text{N}]$ with selected concentrations of ^{15}N . Core neutronics and designs appropriate to advanced-fueled LMFBRs were used with the ORIGEN computer code to calculate compositions of spent core and blanket fuel equivalent to 50 GW-y of electrical energy generation. Confinement factors, specific to each radionuclide released to the atmosphere at the reprocessing plant, were used to calculate source terms describing the emission of radionuclides. Radiological impact within a 80-km radius of the facility was determined with the AIRDOS-II computer code, while the dose to the world population from ^{14}C released at the reprocessing plant was estimated with a multicompartiment global carbon cycling model. For carbide fuel, the calculated dose commitment to the total body of the maximally exposed individual was approximately 2.8 mrem. Corresponding dose commitments when nitride fuels were substituted ranged between 59 and 3.4 mrem, as the ^{14}N content in fuel was varied from 99.64%, the natural abundance of ^{14}N , to zero (i.e., 100% enrichment with ^{15}N), respectively. Dose commitment to the world population from ^{14}C produced in nitride fuel made with natural nitrogen may prohibit use of this fuel from an environmental standpoint. However, a combination of ^{15}N enrichment in the fuel and confinement of at least part of the ^{14}C at the reprocessing plant can significantly reduce both the amount of ^{14}C ultimately released to the atmosphere and the global impact from ^{14}C . It was concluded that no major differences exist in the radiological impact when carbide fuel is substituted for oxide fuel at the reprocessing plant. The use of nitride fuel may, however, require substantial enrichment with ^{15}N or significant improvement in effluent treatment techniques proposed for ^{14}C retention. 7 tables, 5 figs.

- 3769 CORE EXIT INSTRUMENTATION OF THE CLINCH RIVER BREEDER REACTOR PLANT. Carelli, M.D. (Westinghouse Electric Corp., Madison, PA). Nucl. Technol.; 37: No. 3, 261-273 (Mar 1978).

Assembly exit thermocouples are chosen for the Clinch River Breeder Reactor Plant as the instrumentation providing the most useful information at the minimum cost. One thermocouple is positioned at the exit of each fuel assembly and at approximately half of the radial blanket assemblies. The number of thermocouples, their positions, and characteristics are selected to satisfy the reactor control, surveillance, and design verification functions. The various uncertainties affecting the assemblies' coolant exit temperature measurements are quantitatively defined to correlate the measured temperature with the fuel rod design cladding temperature, which is the major parameter in determining the allowable fuel rod burnup and lifetime. Thus, appropriate factoring of thermocouple measurements allows the fuel assembly burnup to be increased quite significantly, with related cost savings of hundreds of millions of dollars. Due to the tremendous economic leverage on operating costs over the plant lifetime, close attention to proper instrumentation should be paid in the

- 3770 ELIMINATION OF TRANSURANIUM ELEMENTS BY BURNUP IN A POWER FAST BREEDER REACTOR. Oliva, G. (Univ. of Rome); Palmiotti, G.; Salvatores, M.; Tondinelli, L. Nucl. Technol.; 37: No. 3, 340-352 (Mar 1978).

The elimination of transuranium (TRU) elements by neutron absorption has been investigated in an actual power liquid-metal fast breeder reactor (LMFBR) (of the Superphenix type). Special fuel elements containing TRU oxides were considered in different core locations. The effects on design parameters have also been evaluated. The results show that the advantages of TRU elimination by means of LMFBRs, compared with using a thermal reactor, consist mainly of the small perturbation of the integral properties and design parameters of the reactor for the large amount of TRU that can be introduced. However, from the point of view of the TRU transmutation reaction rates, thermal reactors seem to be better. The choice of a compromise between the variation of design parameters and the TRU amount to be transmuted depends on the actual reactor design.

- 3771 COVA PROGRAMME FOR THE VALIDATION OF COMPUTER CODES FOR FAST REACTOR CONTAINMENT STUDIES. Hoskin, N.E. (UKAEA Weapons Group, Aldermaston. Atomic Weapons Research Establishment); Lancefield, M.J. (UKAEA Reactor Group, Winfrith. Atomic Energy Establishment). Nucl. Eng. Des.; 46: No. 1, 17-46 (Mar 1978).

From 4. international conference on structural mechanics in reactor technology; San Francisco, USA (15 - 19 Aug 1977).

The UKAEA and the Joint Research Centre, Euratom, Ispra are engaged in a collaborative experimental programme carrying out a series of small scale, well instrumented tests aimed at providing high quality data of the stresses, strains and loads occurring when a well characterized source is released within a fluid in a containment vessel. In the UK the data are being used to validate the computer codes ASTARTE and SEURBNUK which are used in studies of the response of the fast reactor primary containment system in the event of a hypothetical reactor excursion. This paper describes the UK experimental programme and the development of the low density explosive which is used as the energy source; the rationale of the code development programme is presented together with a report on the progress that has been made in validating the two codes against the experimental data.

- 3772 STATUS REPORT ON ULTRASONIC TESTING OF AUSTENITIC WELDS. Herberg, G.; Laufer, W. Materialpruefung; 20: No. 3, 120-124 (Mar 1978). (In German).

Experience in the field of austenite systems has shown that surface and irradiation testing are not sufficient on their own to judge welded joints. Particularly in consequence of the development of Na-cooled breeder reactors, it appears necessary to demand the same expenditure for fabrication and iterative tests as for ferrite components for light water reactors (LWR). As the primary and secondary circuit components of Na breeders are fabricated from austenite materials, the ultrasonic (US) testing must also be adapted to the coarse-grained directional solidifying microstructure of austenite welded seams. World-wide development works are being carried out on this subject. The procedure here is not uniform.

- 3773 LMFBR--AN INTERNATIONAL EFFORT. Horst, K.M. (GE, Sunnyvale, Calif.). IEEE Trans. Power Appar. Syst.; PAS-97: No. 2, 529-535 (Mar-Apr 1978).

Major programs are underway in the industrialized nations to develop the Liquid Metal Fast Breeder Reactor (LMFBR) for application in their electric utility supply systems. In addition to the United States, these nations include France, the United Kingdom, the Federal Republic of Germany, Japan and the USSR. Belgium and The Netherlands have joined forces with Germany, and Italy is participating with France. Each of these nations has major laboratory facilities dedicated to the development of supporting technologies. They also have been building a series of reactors to provide the essential steps leading to widescale application. The purpose of this paper is to review the international progress which has already been made in the development of the LMFBR and to identify selected technical features of similarity and contrast. Note will also be made on the operating experiences to date and projections for the future. 19 refs.

- 3774 SODIUM BOILING EXPERIMENTS IN THE FRAME OF FAST REACTOR SAFETY STUDIES. Cenni, R.; Meneghello, S.; Ricci, F.; Romagnoli, M.; Savoni, O.; Scavano, G.; Sirtori, L. (CNEN, Cent Stud Nucl, Casaccia, Rome, Italy). Energ. Nucl. (Milan); 25: No. 3, 123-134 (Mar 1978). (In Italian).

This article presents the sodium boiling experiments recently performed at the Centro Studi Nucleari della Casaccia (Rome) in the frame of the fast reactor safety studies being carried out by CNEN. In particular, it describes three types of experiments, performed on test-sections mounted on the ENA-2 loop, in order to study the influence of the heat flux axial distribution, single phase transient and radial temperature profile on boiling dynamics. A preliminary analysis allows a rough extrapolation of the results obtained on a seven-rod test section to the case of a fast reactor fuel element. 10 refs.

- 3775 (JAPFNR--306) SODIUM OXIDE AEROSOL BEHAVIOR IN A CLOSED CHAMBER UNDER THERMAL CONVECTION FLOW. Nishio, G.; Kitani, S.; Takada, J. (Japan Atomic Energy Research Inst., Tokai, Ibaraki. Tokai Research Establishment). Mar 1978. Translation of PNC-J--250-75-14 Tr 29p. Dep. NTIS (US Sales Only), PC A03/MF A01.

Work performed under United States--Japanese Fast Reactor Exchange Program.

The present work was undertaken to obtain the effect of thermophoretic adherence of nuclear aerosol on the reactor containments in the event of a hypothetical accident of LMFBR. In the accident, sodium oxide aerosol containing PuO_2 -- UO_2 fuel and fission products may be suspended in the containment and tends to deposit on the cold wall of the containment, so that the aerosol concentration decreases by thermophoresis in addition to settling and diffusional plating. Experiment was made to determine the relation for the degree of thermophoretic adherence of sodium oxide aerosol in a chamber. The results obtained by the experiment were compared with those of the calculation.

- 3776 DESIGN OF THE CORE CATCHER SYSTEM FOR THE FAST BREEDER REACTOR SNR 300. Keintzel, G. (Steinmueller (L. u. C.) G.m.b.H.,

Gummersbach (Germany, F.R.)); Rothfuss, H. (Internationale Atomreaktorbau G.m.b.H. (INTERATOM), Bergisch Gladbach (Germany, F.R.)). Kerntechnik; 20: No. 3, 127-134 (Mar 1978). (In German).

The core catcher system of the sodium-cooled fast breeder reactor SNR 300 is intended to limit the consequences of a hypothetical core-melt accident and, as such, is relevant from the safety viewpoint. This paper describes the functions, concept and design of this system and presents a few examples illustrating the extreme conditions for which this system is designed.

- 3777 SELECTION OF THE MAIN CIRCULATION PUMPS FOR THE FIRST LOOP OF PROMISING PLANTS WITH SODIUM HEAT CARRIER. Kostin, V.I.; Kuropatov, A.I. Teploenergetika (Moscow); No. 3, 54-57 (Mar 1978). (In Russian).

Problems of selection of the flow-through part of the pump are considered. An evaluation of the mass and dimensional characteristics of several compared pumps is given. Economic efficiency of several variants of the design of a first-loop pump envisaged for promising commercial nuclear power plants with fast reactors is analyzed. Based on this analysis, conclusions are drawn on the selection of the optimal pump variant from the point of view of its characteristics and the minimal costs of a set of pumps for the plant.

- 3778 STUDIES ON TEMPERATURE-CONTROLLED POOL-BOILING HEAT TRANSFER. Sakurai, A.; Shiotsu, M. (Kyoto Univ, Inst of At Energy). Tech. Rep. Inst. At. Energy, Kyoto Univ.; No. 175, vp (Mar 1978).

A new computer-controlled experimental system to realize stable temperature-controlled operation in nucleate, transition and film boiling regions was developed. Characteristics of temperature-controlled pool-boiling heat transfer covering nucleate, transition and film boiling regions were studied for a platinum wire heater in water at atmospheric pressure. Effects of subcooling, heater orientation, heater dimension, heater surface contamination and of surface active agent were also studied. Thermal hysteresis effects due to increasing and decreasing heater temperature were found, for the first time, both in the nucleate boiling region and in the transition boiling region near the maximum heat flux point. Maximum heat flux of nucleate boiling and maximum heat flux of transition boiling were not the same. Artificial contamination on the heater surface and slight addition of surface active agent in water both severely influenced the transition boiling heat transfer. It was confirmed that the transition boiling was the combination of nucleate and film boiling. These results have application to once-through boilers forming a part of sodium cooled power reactors. 15 refs.

- 3779 PARLIAMENTARY POWERS CONCERNING GUIDING POLITICAL DECISIONS. DECISION OF THE OVG MUENSTER TO PRESENT THE LICENSING CASE OF THE KALKAR FAST BREEDER TO A HIGHER COURT. Kisker, G. Z. Parlam.; 9: No. 1, 53-62 (Mar 1978). (In German).

The author concludes that the step towards a plutonium industry would result in damage of unknown proportions if the forecast risks accumulate to an accident. For the author, the engagement of the Federal Diet seems to be therefore indispensable. The decision on the acceptance and restraining of such a risk should not be made in the offices of regional authorities without discussing the pros and

cons in parliament, i.e. in public.

- 3780 SODIUM VAPOR DEPOSITION ONTO A HORIZONTAL FLAT PLATE ABOVE LIQUID SODIUM SURFACE, (3). CONCENTRATION AND DIAMETER DISTRIBUTIONS OF SODIUM MIST IN COVER GAS. Kudo, K. (Hitachi Ltd., Ibaraki (Japan). Hitachi Research Lab.); Hirata, M. Nippon Kikai Gakkai Rombunshu; 44: No. 379, 1025-1035 (Mar 1978). (In Japanese).

Sodium vapour and sodium mist in the cover gas of a sodium system of a fast breeder reactor caused various problems. In this report, with the results of measurements of sodium mist concentration, the distribution of sodium mist diameter in cover gas was analytically obtained. The analysis was made by using the different nucleus model B. The measurement of the concentration of sodium mist was carried out with a sodium mist pot designed by the author. The experiment was done at the sodium temperature of 400 and 500 degree centigrade. The relations among sodium temperature, upper wall temperature, and the sodium mist concentration in cover gas were obtained. Evaluation of effective condensed nuclear radius in the cover gas was made by the comparison of analysis and experimental results. The results of this evaluation shows the following conclusions. It is impossible to express the distribution of sodium mist diameter by normal distribution or logarithmic normal distribution. Drop of sodium temperature results in the decrease of weight mean radius of generated sodium mist. Drop of upper wall temperature causes the decrease of weight mean radius, and increases sodium mist concentration.

- 3781 MOLTEN FUEL-SODIUM INTERACTION IN FAST REACTOR ACCIDENTS. Suchomel, J.; Adamik, V. (Vyskumny Ustav Energeticky, Jaslovske Bohunice (Czechoslovakia)). Jad. Energ.; 24: No. 3, 81-86 (Mar 1978). (In Czech).

A survey is presented of the problems of molten fuel-sodium interaction in model accidents of fast reactors with the occurrence of rapid heat transfer and the resulting strong pressure pulses. The INTER computation model is described which emphasizes the heat transfer and the CEFRA model which is focused on the significant influence of the dynamics of structures on the course of the interaction. The results of molten fuel-coolant interaction computations are given carried out for the fuel assembly and for the whole fast reactor core.

- 3782 EVALUATION OF HEAT TRANSFER TUBE FAILURE PROPAGATION DUE TO SODIUM-WATER REACTION IN STEAM GENERATOR. Nei, H. (Tokyo Shibaura Electric Co. Ltd., Kawasaki, Kanagawa (Japan)). J. Nucl. Sci. Technol. (Tokyo); 15: No. 3, 192-199 (Mar 1978).

An evaluation was made of heat transfer tube failure propagation due to sodium-water reaction wastage in a sodium heated steam generator, by comparing an empirically derived wastage equation with leak detector responses. The experimental data agreed well with the wastage equation even for different values of distance-to-nozzle diameter ratio, though the formula had been based on wastage data obtained for only one given distance. The time taken for failure propagation was estimated for a prototype steam generator, and compared with the responses characteristics of acoustic detectors and level gages. It was found that there exists a range of leak rate between 0.5 and 100 g/sec, where the level gage can play a useful role in leak detection. The acoustic detector can be expected to respond more

rapidly than the cover gas pressure gage, if noise is kept below ten times the value observed in an experimental facility, SWAT-2.

- 3783 BOILING HEAT TRANSFER UNDER FORCED CONVECTION OF SODIUM. Sakurai, Akira; Serizawa, Akimi; Kataoka, Isao; Shiozu, Masahiro (Kyoto Univ., Uji (Japan). Inst. of Atomic Energy). Kyoto Daigaku Genshi Enerugi Kenkyusho Iho; 2: 24-26 (Mar 1978). (In Japanese).

As the basic research on the heat transfer concerning the safety of sodium-cooled fast neutron reactors, the authors have carried out the research on the boiling heat transfer under the natural convection of sodium. Moreover, the basic research on the non-boiling and boiling heat transfer under forced convection in steady and unsteady states is planned. As the unsteady state, the transient phenomena accompanying the rapid increase of heat generation of a heater and the rapid decrease of sodium flow rate are considered. First, as the research on the boiling heat transfer under the forced convection of sodium, the non-boiling heat transfer in the heat flux below the point of initial bubble generation was examined. It is the interesting problem to examine experimentally the heat transfer characteristics of sodium over the whole range of laminar flow, transition and turbulent flow regions. The experimental apparatuses and the experimental method are explained. The result of experiment is shown in relation to Nusselt number and Peclet number. In the experiment by the authors, the effect of heat conduction in axial direction was negligibly small. In liquid sodium also, in the transition region from laminar flow to turbulent flow, the tendency similar to the forced convection heat transfer obtained with mercury by Petukhov was shown. (Kako, I.)

- 3784 MATERIAL STUDY OF THE BOR-60 SHIM ROD THIMBLE IRRADIATED WITH 1.6×10^{23} N/CM² ($E > 0.1$ MEV). Krasnoselov, V.A.; Kosenkov, V.M.; Loboda, E.M.; Ostrovskii, Z.E.; Goncharenko, Yu.D. At. Energ. (USSR); 44: No. 3, 228-231 (Mar 1978). (In Russian).

A BOR-60 reactor shim rod thimble, made of the Kh18N9 austenitic steel with diffusion-chromized surface, has been investigated from the point of view of material science. It is established, that maximum radiation swelling of the material reaches approximately 15% at the distance of approximately 80 mm over the central plane of the reactor core at approximately 425 deg C. The thimble was irradiated with 1.5×10^{23} neut/cm² ($E > 0.1$ MeV) fluence. Thereby, discovered are significant differences in changing the volume and linear sizes of thimble faces. It is also established, that over the whole core length the thimble material has the zero plasticity level at 20 and 500 deg C test temperatures. Material embrittlement is suggested to relate not only with the irradiation effect, but with the structural changes in its interaction zone with sodium and, in particular, with Cr₂N phase formation, having a great parameter of volume discrepancy with austenite.

- 3785 PRIMARY AND SECONDARY SODIUM PURIFICATION SYSTEMS OF FAST REACTORS. Baklushin, R.P.; Kozlov, F.A. At. Energ. (USSR); 44: No. 3, 224-228 (Mar 1978). (In Russian).

Rational designing of sodium cleanup systems based on cold traps is investigated. Contributions of different sources to the total impurity burden of primary P₁ and secondary P₂

cooling circuits are evaluated using the operating experience of the BN-350 reactor. For 20 year lifetime period the impurity burden of P_1 will make up about 1400 kg of O_2 (approximately 5.5 t of impurities), the main share being due to core corrosion products. In the same lifetime the impurity burden of P_2 will amount to 3-14, mainly hydrogen compounds. Given are the method and results of calculations of an optimal number of a needed to cleanup the sodium. Currently available cold traps are noted to be sufficiently adequate in terms of productivity and capacity to ensure the purification of sodium cooled fast reactors up to 4000-5000 MW(th.).

- 3786 METHOD OF CONTINUOUS TESTING FOR LEAK-TIGHTNESS AND MECHANICAL RESISTANCE OF A REACTOR VESSEL JACKET AND A REACTOR IN WHICH SAID METHOD IS EMPLOYED. Cachera, P.C. (to Electricite de France (Service National)). US Patent 4,076,585. 28 Feb 1978. Priority date 7 Sep 1973, France, 4p.

The space formed between the primary vessel of a sodium-cooled fast reactor and a leak jacket surrounding the vessel is filled with an inert gas which is maintained at a pressure in the vicinity of atmospheric. A vacuum is created within the space formed between the leak jacket and the concrete reactor vault and means are provided for detecting the presence of inert gas within the evacuated space and thus continuously testing the jacket for leak-tightness and mechanical resistance. 4 claims, 1 figure.

- 3787 CONTROL FOR NUCLEAR REACTOR. Ash, E.B.; Bernath, L.; Facha, J.V. (to Rockwell International Corp.). US Patent 4,076,583. 28 Feb 1978. Filed date 4 Oct 1976. 10p.

A nuclear reactor is described having an inherently safe automatic shutdown capability comprising a pressure vessel, a core located within the vessel and containing a sufficient amount of fissionable material to establish and sustain a chain-type fission reaction, and a plurality of elongated conduits disposed in a regular arrangement within the vessel. Each of the conduits defines a fluid flow path and comprises a first section located within and extending through the core, and a second section located exteriorly of the core and positioned above the first section. Each of the conduits contains a plurality of substantially spherical bodies in a sufficient quantity to substantially fill the first section of each of the conduits. The conduits are provided with a first fluid connection to a lower part of the first section and a second fluid connection to an upper part of the second section for the passage of a pressurized fluid therethrough while maintaining the reactor in operation. The nuclear reactor further comprises a means for supplying the pressurized fluid to said first fluid connection for moving all of said plurality of bodies from said first section to said second section of each of the elongated conduits to form a hydraulically stacked bed of the spherical bodies. A bypass means is located intermediate the second fluid connection, and the second section of each of the conduits and includes a plurality of fluid passageways distributed along the length of the second section for permitting a portion of the pressurized fluid to bypass a portion of the stacked bed of bodies during normal operation of the reactor. 5 claims, 7 figures.

- 3788 FUSE AND APPLICATION OF SAID FUSE TO THE CONSTRUCTION OF AN EMERGENCY SHUTDOWN SYSTEM FOR A NUCLEAR REACTOR. Taulier, H.H.L.;

Brugelle, G. (to Electricite de France (Service National)). US Patent 4,076,587. 28 Feb 1978. Filed date 1 Mar 1976. 8p.

A fuse device for an automatic emergency shutdown system in fast reactors provides a coupling between a casing tube placed within a fuel can and a series of neutron-absorbing masses held together above the reactor core under normal operating conditions but released in free fall to the lower portion of the casing tube at the level of the reactor core as a result of melting of the fuse when operating characteristics such as temperature or neutron flux attain a level which exceeds a predetermined threshold.

- 3789 RODDED SHUTDOWN SYSTEM FOR A NUCLEAR REACTOR. Golden, M.P.; Govi, A.R. (to Dept. of Energy). US Patent 4,076,584. 28 Feb 1978. Filed date 28 Jan 1976. 16p.

PAT-APPL-653,175.

A top mounted nuclear reactor diverse rodged shutdown system utilizing gas fed into a pressure bearing bellows region sealed at the upper extremity to an armature is described. The armature is attached to a neutron absorber assembly by a series of shafts and connecting means. The armature is held in an uppermost position by an electromagnet assembly or by pressurized gas in a second embodiment. Deenergizing the electromagnet assembly, or venting the pressurized gas, causes the armature to fall by the force of gravity, thereby lowering the attached absorber assembly into the reactor core.

- 3790 SELF LOCKING DRIVE SYSTEM FOR ROTATING PLUG OF A NUCLEAR REACTOR. Brubaker, J.E. (to Dept. of Energy). US Patent Application 880,679. 23 Feb 1978. 13p.

The disclosure describes a self-locking drive system for rotating the plugs on the head of a nuclear reactor which is able to restrain plug motion if a seismic event should occur during reactor refueling. A servomotor is engaged via a gear train and a bull gear to the plug. Connected to the gear train is a feedback control system which allows the motor to rotate the plug to predetermined locations for refueling of the reactor. The gear train contains a self locking double enveloping worm gear set. The worm gear set is utilized for its self locking nature to prevent unwanted rotation of the plugs as the result of an earthquake. The double enveloping type is used because its unique contour spreads the load across several teeth providing added strength and allowing the use of a conventional size worm.

- 3791 METHOD FOR REMOVING FISSION PRODUCTS FROM A NUCLEAR REACTOR COOLANT. Colburn, R.P. (to Westinghouse Electric Corp.). US Patent 4,075,060. 21 Feb 1978. Filed date 31 Jul 1974. 6p.

A method is described for removing cesium 137, iodine 131, and tritium from a liquid sodium reactor coolant. Hydrogen is introduced into the liquid sodium causing sodium hydride to precipitate in a cold trap. The cesium, iodine, and tritium isotopes are removed from the liquid sodium by coprecipitating as impurities in the sodium hydride.

- 3792 DISPERSION STRENGTHENED FERRITIC ALLOY FOR USE IN LIQUID-METAL FAST BREEDER REACTORS (LMFBRs). Fischer, J.J. (to International Nickel Co., Inc.). US Patent 4,075,010. 21 Feb 1978. Filed date 5 Feb 1976. 10p.

A dispersion-strengthened ferritic alloy is

provided which has high-temperature strength and is readily fabricable at ambient temperatures, and which is useful as structural elements of liquid-metal fast breeder reactors. 4 tables.

- 3793 NUCLEAR REACTOR WITH LIQUID METAL COOLING. Seel, G.; Hodgson, D.; Grime, C.J. (to Nuclear Power Co. Ltd., London (UK); Deutsches Patentamt, Muenchen (Germany, F.R.)). German(FRG) Patent 2,736,253/A/. 16 Feb 1978. 12p. (In German).

In a sodium cooled fast breeder reactor, the primary vessel is suspended from the ceiling of a safety containment, where the edge of the vessel is made gas-tight in order to contain an inert cover gas. In order to limit uncontrolled movement of the core relative to the control rods, apart from the support construction a second support device is provided for the core.

- 3794 NUCLEAR REACTOR WITH LIQUID METAL COOLING. Seel, G.; Hodgson, D.; Grime, C.J. (to Nuclear Power Co. Ltd., London (UK); Deutsches Patentamt, Muenchen (Germany, F.R.)). German(FRG) Patent 2,736,251/A/. 16 Feb 1978. 13p. (In German).

The reactor tank of a sodium cooled fast breeder reactor is immersed in a safety dome which is open in the upward direction towards the coolant basin and is suspended from the ceiling. A leakage container contains an inert cover gas for the coolant basin and is sealed at the ceiling.

- 3795 NUCLEAR REACTOR WITH LIQUID METAL COOLING. Seel, G.; Hodgson, D.; Grime, C.J. (to Nuclear Power Co. Ltd., London (UK); Deutsches Patentamt, Muenchen (Germany, F.R.)). German(FRG) Patent 2,736,252/A/. 16 Feb 1978. 9p. (In German).

The primary vessel, reactor core and control assemblies are suspended from the ceiling so that they are immersed in sodium in a sodium cooled fast breeder reactor. A collecting vessel is provided around the primary vessel, in order to collect the coolant in the case of a loss of coolant accident.

- 3796 LID CONSTRUCTION FOR NUCLEAR REACTOR VESSEL. Garin, J. (to Westinghouse Electric Corp., East Pittsburgh, PA (USA); Deutsches Patentamt, Muenchen (Germany, F.R.)). German(FRG) Patent 2,729,976/A/. 16 Feb 1978. 29p. (In German).

A rotatable lid for the reactor vessel with closing plates for a sodium cooled reactor is introduced. The eccentric lid plates have annular, metallic and flexible seals, which keep out oxygen, from outside and prevent the escape of radio-active materials in case of containment vessel failure.

- 3797 NUCLEAR REACTOR CORE CATCHING APPARATUS. Barleom, L.; Dorner, S.; Goetzmann, O.; Kussnau, G. (to Gesellschaft fuer Kernforschung). US Patent 4,073,682. 14 Feb 1978. Priority date 21 Dec 1973, German, Federal Republic of (F.R. Germany), 4p.

An apparatus for containing the components of a nuclear reactor core during a core-melt-down accident, comprising a container consisting at least its inner surface of a highly temperature resistant material. 5 claims, 4 figures.

- 3798 REASON ENOUGH FOR THE BREEDER. Wise, C.E. Mach. Des.; 50: No. 3, 26-28, 30-32(9

Feb 1978).

Breeder reactors use 60% of the energy available in natural uranium, while conventional light-water reactors use only 2%. What is more, the vast quantities of uranium tailings, which are presently useless, could be converted by a breeder reactor to plutonium at such a rate as to eliminate the need for mined uranium for 100 years. Proponents of the breeder feel that sufficient momentum has been gained by the project for it to become a reality. The only real threat to breeder technology may come from the laser-enrichment process for uranium now under development by Exxon.

- 3799 BOTTOM COOLER FOR NUCLEAR REACTORS. Friedrich, H.J. (to Interatom, Internationale Atomreaktorbau GmbH). US Patent 4,072,561. 7 Feb 1978. Priority date 11 Aug 1975, German, Federal Republic of (F.R. Germany), 6p.

A cooler for a bottom tray of a liquid metal-cooled nuclear reactor is described, the tray serving as a receptacle for a melting reactor core in the event of a hypothetical accident, comprising coolant distribution and collecting pipes disposed below the bottom tray about the circumference thereof, and a plurality of parallel tubes connecting said distribution and collecting pipes, said tubes being in the shape of involutes running between the center and circumference of said tray. 7 claims, 4 figures.

- 3800 HEAT EXCHANGER WITH INTERMEDIATE EVAPORATING AND CONDENSING FLUID. Fraas, A.P. (to Dept. of Energy). US Patent 4,072,183. 7 Feb 1978. Filed date 29 Nov 1976. 10p. PAT-APPL-745,941.

A shell and tube-type heat exchanger, such as a liquid sodium-operated steam generator for use in nuclear reactors, comprises a shell containing a primary fluid tube bundle, a secondary fluid tube bundle at higher elevation, and an intermediate fluid vaporizing at the surface of the primary fluid tubes and condensing at the surface of the secondary fluid tubes.

- 3801 (ANL-Trans--1121) DEVICE FOR THERMAL SHIELDING OF A REACTOR VESSEL. Defauchy, J.; Malaval, C. Feb 1978. Translation of French Patent Application No. 74 37575 16p. Dep. NTIS, PC A02/MF A01.

The invention deals with a device for thermal shielding of a reactor vessel. More specifically, this invention concerns a thermal shielding device for the vessel of an integrated liquid metal-cooled fast reactor in which the complete primary cooling circuit is located in the interior of the main tank.

- 3802 (ANL-Trans--1119) SYSTEM FOR COOLING THE UPPER WALL OF A NUCLEAR REACTOR VESSEL. Pailla, H.; Schaller, K.; Vidard, M. Feb 1978. Translation of French Patent 7,429,648 17p. Dep. NTIS, PC A02/MF A01.

The invention deals with a cooling system for the upper wall of a nuclear reactor vessel, especially the main tank of a liquid metal-cooled fast reactor.

- 3803 (ANL-Trans--1120) HEAT INSULATING SYSTEM FOR THE HORIZONTAL CLOSING SURFACES FOR A LIQUID METAL COOLED NUCLEAR REACTOR. Jullien, R.; Perons, M.; Venot, R. Feb 1978. Translation of French Patent Application No. 74 30347 12p. Dep. NTIS, PC A02/MF A01.

The invention described concerns a heat

insulating system designed especially for use in a liquid metal cooled nuclear reactor in order to assure thermal shielding of the upper closing surfaces of the vessel of such a reactor, this vessel containing a metal tank confining the volume of liquid cooling metal covered with a neutral gas atmosphere, generally consisting of argon. These closing surfaces in particular carry the closing slab proper consisting of a horizontal concrete wall clad with a stainless steel metal plate on its surface in contact with the neutral gas, rotary plugs, components having the same structure as the slab, occupying one of the openings made in the latter and providing access to the reactor core within the vessel.

- 3804 (ANL-Trans--1124) HEAT INSULATING SYSTEM, ESPECIALLY FOR INSULATING THE UPPER ZONE OF THE ANNULUS SEPARATING THE PRIMARY AND SAFETY VESSELS OF A FAST REACTOR. Lemerrier, G. Feb 1978. Translation of French Patent 2,289,032, May 21, 1976 13p. Dep. NTIS, PC A02/MF A01.

The invention concerns a heat insulating system, more specifically designed for insulating the upper zone of an annulus provided between the primary and safety vessels of a fast reactor, these vessels having a common vertical axis, being open at the top and covered by a horizontal slab, usually of concrete, in which the ends of these vessels or "straps" are seated so as to allow their suspension from the slab.

- 3805 (ANL-Trans--1127) LIQUID-COOLED NUCLEAR REACTOR. Mueller, A. Feb 1978. Translation of German Patent No. 2,013,586 15p. Dep. NTIS, PC A02/MF A01.

The invention concerns a liquid metal cooled nuclear reactor consisting of a stationary reactor vessel containing a fission zone and a stationary component vessel containing heat exchangers and coolant circulating pump, where the component vessel is connected to the reactor vessel by a coaxial pipe in which the coolant flows from the fission zone to the heat exchangers and back.

- 3806 IMPURITY INTERACTION ANALYSIS IN MESH-PACKED COLD TRAPS. Murase, M.; Sumida, I.; Kotani, K.; Yamamoto, H. (Hitachi Ltd., Kawasaki, Japan). Nucl. Technol.; 37: No. 2, 138-147(Feb 1978).

An impurity interaction code for a mesh-packed cold trap was developed, and the properties of the packed trap, such as the trapping efficiency and capacity, were calculated using this code. As a result, the trapping efficiency and capacity are greatly affected by the packing ratio and the wire diameter of the mesh packing. Precipitation of impurity is promoted at the entrance to the mesh packing. This facilitating effect hastens flow blockage and decreases the capacity. Moreover, the capacity decreases with increase in the efficiency.

- 3807 (ANL-Trans--1128) STUDIES NEEDED TO PREVENT THE USE OF EXPANSION BENDS IN LMFBR INTERMEDIATE HEAT EXCHANGERS. Kayser, G. (CEA Centre d'Etudes Nucleaires de Cadarache, 13 - Saint-Paul-les-Durance (France). Dept. des Reacteurs a Neutrons Rapides). Feb 1978. Translation of French Paper F7/11. Vol. 2: Reactor core coolant circuit, Part F (CONF-750908--9). 11p. Dep. NTIS, PC A02/MF A01.

From 3. international conference on structural mechanics in reactor technology; London, UK (1 Sep 1975).

The LMFBR IHX built in France consists in a vertical tube bundle welded on 2 tube sheets. The secondary sodium flows down a central pipe to the lower collector then up through the tube bundle where it is heated. During the preliminary studies for the PHENIX reactor, it was soon evident that a structure with expansion bends on tubes would lead to prohibitive sheet-thickness. Moreover, the presence of bends increased the total length, made vibration problems more complicated, and, finally made the structure more expensive. Therefore, a solution with straight tubes was studied, and, despite the pressure and diameter increase, the Phenix sheets had the same thickness as Rapsodie's ones. Evidently, the solution of the problems raised by the presence of thermal stresses needed thorough studies and led to the following theoretical and experimental developments: (1) A computer code was written for structural analysis. The structure was divided in annular elements that could be studied by means of the elementary theory of shells and plates; and reduced elastic coefficients were given to the tube sheets to account for the presence of drilled holes. (2) An experimental study was undertaken to determine the reduced elastic coefficients of the tube sheets. (3) A computer code was written to study the primary sodium flow around the tube bundle, and experimental studies were made on a mockup, the fluid being water. (4) The results of the previous code were used to determine, by means of a code for thermal analysis, the temperature field in the bundle both in steady state and transient regimes. Up to now, many transients were performed and the Phenix heat exchangers have been operating quite satisfactorily; this seems to prove the design assumptions were correct.

- 3808 EXPERIMENTAL STUDIES OF THE GROWTH OF AN INTERNALLY HEATED LIQUID POOL IN A SOLID BED. Farhadieh, R.; Baker, L. Jr. (Argonne National Lab., IL). Nucl. Sci. Eng.; 65: No. 2, 394-400(Feb 1978).

Two-dimensional simulation experiments have been conducted on the growth of an internally heated liquid pool in a solid bed. The solid bed is a water-soluble wax, whereas the liquid pool is an electrolyte solution. The liquid pool and the molten solid are mutually miscible. The initial density of the liquid pool is greater than that of the solid at the melting point. The growth characteristics of the hot liquid pool in the solid are affected by the initial density, viscosity, and internal heat generation. The size of the liquid pool is affected only by power density.

- 3809 PROBABILISTIC ANALYSIS OF LIQUID-METAL FAST BREEDER REACTOR ACCIDENT CONSEQUENCES WITH RESPONSE SURFACE TECHNIQUES. Vaurio, J.K.; Mueller, C. (Argonne National Lab., IL). Nucl. Sci. Eng.; 65: No. 2, 401-413(Feb 1978).

Response surface techniques are presented for obtaining the probability distributions of selected consequences of a liquid-metal fast breeder reactor hypothetical core disruptive accident. The uncertainties of the consequences are considered as a variability of the system and model input parameters used in the accident analysis. Probability distributions are assigned to the input parameters, and parameter values are systematically chosen from these distributions. These input parameters are then used in deterministic consequence analyses that are performed by fast-running analogs of the comprehensive mechanistic accident analysis codes. The results of these deterministic consequence analyses are used to generate the coefficients for response surface functions

that approximate the consequences in terms of the selected input parameters. These approximating functions are then used to generate the probability distributions of the consequences with random sampling being used to obtain values for the accident parameters from their distributions. Two different schemes are presented for selecting the knot-point values of the input parameters. The first generates a single second-order polynomial for the entire parameter space; the second generates separate polynomials for specified regions of the parameter space. The calculation of conditional distributions of the consequences and the use of these distributions to define importance distributions of the input parameters are presented. The use of these procedures is illustrated by applications to a postulated loss-of-flow transient with failure to scram in a Clinch River Breeder-type reactor.

- 3810 MODERN APPLICATIONS FOR CAST AND WROUGHT SUPERALLOYS. Green, D.R. (Union Carbide UK Ltd.). Metallurgia; 45: No. 2, 80-85(Feb 1978).

This paper covers casting and wrought alloys for gas turbines, alloys for power generation (nuclear applications), automotive applications, alloys for corrosion resistance, and hot working tools. The section on nuclear applications includes references to the use of a niobium stabilised 20 Cr - 25 Ni Nb austenitic stainless steel for fuel cladding for the A.G.R., and other alloys based on chromium and nickel for such purposes as fuel element components for the P.F.R. and bolts in steam turbine plant.

- 3811 UNIAXIAL COMPRESSIVE STRENGTHS OF CONCRETE FOR TEMPERATURES REACHING 1033 K. Callahan, J.P.; Robinson, G.C. (Oak Ridge National Lab., Tenn. (USA)); Burrow, R.C. (Burns and Roe, Inc., Oradell, N.J. (USA)). Nucl. Eng. Des.; 45: No. 2, 439-448(Feb 1978).

From 4. international conference on structural mechanics in reactor technology; San Francisco, USA (15 - 19 Aug 1977).

A series of tests was conducted to evaluate effects of sustained heating on the strengths of limestone aggregate concrete for the Clinch River Breeder Reactor Plant. Twenty-four 15.24-cm dia. by 30.48-cm long cylinders were divided into two groups subjected to either open-hot or closed-cold conditions. All specimens were heated for 14 days at soak temperatures of 450, 644, 839 and 1033 K. Unconfined compressive strengths were determined at these temperatures for the open-hot cylinders and after cooling for the closed-cold set. The results provided realistic upper and lower bounds for published strength data.

- 3812 (EURFNR--1427) MIPLO: A GRAPHIC PROGRAM FOR THE REPRESENTATION OF TEMPERATURE DISTRIBUTIONS IN BUNDLES WITH HEXAGONAL ROD CONFIGURATION USED IN CONNECTION WITH MISTRAL-II. Frey, H.H. (Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Inst. fuer Reaktorbauelemente). Feb 1978. Translation by T.J. Clark of KFK--2393 51p. Dep. NTIS, PC A04/MF A01.

Work performed under United States--Euratom Fast Reactor Exchange Program.

A digital FORTRAN-IV program is described, which gives the temperature distribution in hexagonal LMFBR rod bundles. For bundles with 7 to 217 rods, the following variations for temperature profiles for channel-center and surface temperatures are possible: (a) wall-traverse, (b) corner-traverse, (c) circumference (peripheral channels), (d) axial

temperature curve of individual sub-channels, (e) axial development of profile, and (f) desired route. In variants a, b, c, and f, the temperature profiles of the last computer planes in the bundle exit are plotted. The representations can be inscribed according to the variant, and provided with explanations, so that a drawing with sufficient information will be produced. The report contains the description of the read-statements in Subroutine M3PLOT and shows a selection of examples of its applications.

- 3813 MECHANICAL RESPONSE OF LMFBR AND P1 CLADDING TUBES UNDER TRANSIENT HEATING. Youngdahl, C.A.; Ariman, T.; Pierce, R.D.; Lepacek, B.E. (Argonne National Lab., Ill. (USA)). Nucl. Eng. Des.; 45: No. 2, 383-391(Feb 1978).

From 4. international conference on structural mechanics in reactor technology; San Francisco, USA (15 - 19 Aug 1977).

Type 316 stainless steel tubing specimens comparable to LMFBR cladding were burst tested with relatively constant internal pressure in the 219-836 psi range and with increasing temperature. Continuous measurements of diameter change, temperature, and pressure were recorded as the samples were heated to temperatures near the melting point at rates from 10-1800°F/sec. The effects of varying initial wall thickness, cold work level, length, and thermal experience were explored. Ductile failures were observed at 10°F/sec, and stable strains at time of failure were greater than those reported by HEDL. At 200°F/sec the initially 20% cold-worked, 15-mil wall tubing produced brittle failures; while initially 40% cold worked, 10-mil wall samples displayed a mixture of ductile and brittle features. At approximately 1000°F/sec the behavior of the latter material was predominately brittle, although stable strains as large as 6% were observed. Failure temperatures were generally above 2000°F.

- 3814 CONDUCTION CENTRIFUGAL ELECTROMAGNETIC PUMP. Bonciani, L.; Grassi, W. (Pisa Univ. (Italy)). Energ. Nucl. (Milan); 25: No. 2, 92-102(Feb 1978).

After a general introduction on the characteristics of conduction and induction electromagnetic pumps, the model of a particular type of conduction centrifugal electromagnetic pump is at first illustrated; a simplified theory of the pump operational principle is then given, as well as a relation between pump head and capacity. Working at null capacity is also described from both the theoretical and experimental viewpoints.

- 3815 HEAT TRANSFER AROUND A CIRCULAR CYLINDER IN LIQUID SODIUM CROSSFLOW. Ishiguro, R.; Kumada, T.; Sugiyama, K. (Hokkaido Univ., Sapporo (Japan). Faculty of Engineering). Hokkaido Daigaku Kogakubu Kenkyu Hokoku; No. 86, 133-147(Feb 1978). (In Japanese).

The local and average heat transfer coefficients are experimentally determined for sodium flow normal to a circular cylinder. A sodium loop with special specifications is designed for the purpose. The measurement covers the range of Reynolds number 360 -- 16,900 with three test cylinders of different diameter. The data are compared with the analytical values obtained by Grosh and Cess under the assumption of inviscid flow. Their analysis predicts satisfactorily heat transfer coefficients at the front part of a cylinder where a boundary layer is developing. However, the experimental data are much smaller than the

analytical values over the region beyond separation point. It is concluded that the assumption of inviscid flow leads to large errors in the prediction of both local and average heat transfer coefficients even in such a fluid of low Prandtl number as sodium. A numerical analysis is also tried under the assumption of viscous flow at a Peclet number of 7.8 and is in agreement with the experimental data in reasonable accuracy.

- 3816 (JAPFNR--318) PARAMETER SURVEY ON THE SATURATION BOILING PROCESS FOR CREVICE SODIUM REMOVAL. Kamei, M.; Kanbe, M.; Nakamura, K.; Fukada, T.; Ishii, Y.; Saito, R.; Mimoto, Y. (Power Reactor and Nuclear Fuel Development Corp., Tokyo (Japan)). Feb 1978. Translation of PNC-N--941-78-49 22p. Dep. NTIS (US Sales Only), PC A02/MF A01.

Work performed under United States--Japanese Fast Reactor Exchange Program.

It was found from the experiences that sodium removal from small crevices by conventional methods was difficult. And, in order to improve the operation, a saturation boiling process was applied and experiments using test pieces have started. Since the purpose of this process is to remove final remaining deposits, bulk sodium removal must be done before. The saturation boiling process is a modification of the water charging process. When water is charged into the process cell or tank, the pressure inside is adjusted so that boiling of the water is initiated. The formation of hydro-oxide membranes at the surface of the sodium prevents further reaction between sodium and water. Results have been obtained from test pieces of bolts and crevices of flat plates and cylinders.

- 3817 (JAPFNR--319) EXPERIENCE ON SODIUM REMOVAL FROM VARIOUS COMPONENTS. Kamei, M.; Kanbe, M.; Yagisawa, H.; Saasaki, S.; Kataoka, H.; Fukada, T.; Ishii, Y.; Saito, R.; Mimoto, Y. (Power Reactor and Nuclear Fuel Development Corp., Tokyo (Japan)). Feb 1978. Translation of PNC-N--941-78-48 39p. Dep. NTIS (US Sales Only), PC A03/MF A01.

Work performed under United States--Japanese Fast Reactor Exchange Program.

Descriptions are presented for studies on the following methods for removal of sodium from the components of sodium plants: steam cleaning for the 50 MW Steam Generator, secondary proto-type pump of "JOYO" and Dummy fuel assembly of "JOYO"; alcohol cleaning for the Sector Model of the Intermediate Heat Exchanger (IHX) of "JOYO", a sector model of Sodium-to-Air cooler of "JOYO" and a proto-type isolation valve of "JOYO"; and cleaning by vacuumization at high temperature for the Regenerative Heat Exchanger. This report describes the outline of the Sodium Disposal Facility and experience of sodium removal processing on the 50 MW Steam Generator, the crevices of the experimental subassemblies, the Fuel Handling Machine of "MONJU", and the regenerative heat exchanger of the Sodium Flow Test Facility.

- 3818 SODIUM CORROSION OF WEAR RESISTANT COBALT ALLOYS (STELLITE). Borgstedt, H.U. (Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Inst. fuer Material- und Festkoerperforschung). Werkst. Korros.; 29: No. 2, 81-91(Feb 1978). (In German).

STELLITE 6B and 6H suffer changes of the morphology and composition of their surfaces during the exposure to flowing sodium in a loop constructed of austenitic stainless steels. At high temperatures (973 K) mass transfer causes

the formation of a metallic phase as an unequal cover of the surfaces. At lower temperature (873 K and less) a chromium rich oxide layer is formed. The metallic particles exceed the materials in an unfavorable manner. Losses of material do not play an important role in the sodium corrosion of the group of materials.

- 3819 ACOUSTIC MEASUREMENTS OF THE BOILING STABILITY TESTS ON THORS SODIUM LOOP. Sheen, S.H.; Bobis, J.P.; Carey, W.M. (Argonne National Lab., IL). IEEE Trans. Nucl. Sci.; NS-25: No. 1, 255-258(Feb 1978).

Acoustic data of boiling stability tests on the THORS (Thermal-Hydraulic Out-of-Reactor Safety) facility were obtained using three sodium-immersible high temperature microphones. The data was analyzed in both the time and frequency domains and provides the following information: (1) the acoustic signal due to sodium boiling was clearly observed; (2) the signal level and the repetition rate of boiling pulses are directly proportional to the applied heat flux; (3) a typical boiling pulse consists of a high frequency signal due mainly to the bubble collapses and a low frequency void oscillation; (4) the frequency spectra of the boiling and background pulses can be mostly assigned to various acoustic resonance frequencies of the THORS loop. The characterization of these data is pertinent to the design of sodium boiling detection systems.

- 3820 FINITE ELEMENT ELASTIC-PLASTIC ANALYSIS OF LMFBR COMPONENTS. Levy, A.; Pifko, A.; Armen, H. Jr. (Grumman Aircraft Engineering Corp., Bethpage, N.Y. (USA). Research Dept.). Nucl. Eng. Des.; 45: No. 2, 411-418(Feb 1978).

From 4. international conference on structural mechanics in reactor technology; San Francisco, USA (15 - 19 Aug 1977).

The present effort involves the development of computationally efficient finite element methods for accurately predicting the isothermal elastic-plastic three-dimensional response of thick and thin shell structures subjected to mechanical and thermal loads. This work will be used as the basis for further development of analytical tools to be used to verify the structural integrity of liquid metal fast breeder reactor (LMFBR) components. The methods presented here have been implemented into the three-dimensional solid element module (HEX) of the Grumman PLANS finite element program. These methods include the use of optimal stress points as well as a variable number of stress points within an element. This allows monitoring the stress history at many points within an element and hence provides an accurate representation of the elastic-plastic boundary using a minimum number of degrees of freedom. Also included is an improved thermal stress analysis capability in which the temperature variation and corresponding thermal strain variation are represented by the same functional form as the displacement variation. Various problems are used to demonstrate these improved capabilities.

- 3821 ANALYSIS OF DYNAMICALLY LOADED NON-LINEAR STRUCTURES. Davidson, I. (9 Dale Lane, Appleton, Warrington, UK); Bradbury, J.N. (Nuclear Power Co. (Risley) Ltd. (UK)). Nucl. Eng. Des.; 45: No. 2, 399-410(Feb 1978).

From 4. international conference on structural mechanics in reactor technology; San Francisco, USA (15 - 19 Aug 1977).

Small models of a proposed prestressed concrete containment structure for a sodium cooled fast breeder reactor have been made and tested. They were partly filled with water and

loaded internally by detonating explosive charges. Prior to the tests the model was analysed by an axisymmetric dynamic relaxation computer program. No difficulties occurred with the analyses which were arranged to print out, *inter alia*, stresses, deflections and cracks at suitable time intervals during and after the pressure excursions which lasted for up to 3000 μ sec. A previous paper describing the program, has shown how cracks can be calculated simply and accurately. The correlation of computer and test results is discussed.

- 3822 MATERIALS REQUIREMENTS FOR LIQUID METAL FAST BREEDER REACTORS. Bennett, J.W.; Horton, K.E. (Energy Research and Development Administration, Washington, DC). Metall. Trans., A; 9: No. 2, 143-149 (Feb 1978).

Materials requirements for Liquid Metal Fast Breeder Reactors (LMFBRs) are quite varied with requisite applications ranging from ex-reactor components such as piping, pumps, steam generators and heat exchangers to in-reactor components such as heavy section reactor vessels, core structurals, fuel pin cladding and subassembly flow ducts. Requirements for ex-reactor component materials include: good high temperature tensile, creep and fatigue properties; compatibility with high temperature flowing sodium; resistance to wear, stress corrosion cracking, and crack propagation; and good weldability. Requirements for in-reactor components include most of those cited above for ex-reactor components as supplemented by the following: resistance to radiation embrittlement, swelling and radiation enhanced creep; good neutronics; compatibility with fuel and fission product materials; and resistance to mass transfer via flowing sodium. Extensive programs are currently in place in a number of national laboratories and industrial contractors to address the materials requirements for LMFBRs. These programs are focused on meeting the near term requirements of early LMFBRs such as the Fast Flux Test Facility and the Clinch River Breeder Reactor as well as the longer term requirements of larger near-commercial and fully-commercial reactors.

- 3823 (JAPFNR--398) SODIUM VAPOR DEPOSITION ON A SIMULATED MODEL OF AN LMFBR ROTATING SHIELD PLUG ANNULUS (2). Himeno, Y. (Power Reactor and Nuclear Fuel Development Corp., Oarai, Ibaraki (Japan). Oarai Engineering Center). Feb 1978. Translation of PNC-N-941 78-44 27p. Dep. NTIS (US Sales Only), PC A03/MF A01.

The paper discusses sodium vapor deposition on a simulated LMFBR rotating shield plug annular walls, both experimentally and on the basis of numerical calculation. Experiments were carried out to investigate the effects of cover gas natural convection within the annulus to local and average deposition rates. It was found that the generalized average deposition rate, which is similar to Sherwood number, depends on Rayleigh number. Numerical calculation of saturated vapor condensation rate along the wall was also carried out to demonstrate the effect of vapor condensation to be small to real deposition phenomena. The results suggested that deposition process is controlled by the mist transfer and their deposition onto the wall.

- 3824 (JAPFNR--405) SODIUM VAPOR DEPOSITION ON A SIMULATED MODEL OF AN LMFBR ROTATING SHIELD PLUG ANNULUS (1). Himeno, Y. (Power Reactor and Nuclear Fuel Development Corp., Oarai, Ibaraki (Japan). Oarai Engineering

Center). Feb 1978. Translation of PNC-N-941 78-43 23p. Dep. NTIS (US Sales Only), PC A02 MF A01.

The paper presents sodium vapor deposition rates onto annular walls of the test assemblies, which consist of three annuli and are mounted in the cover gas space of the sodium vessel. Experiments carried out include measurements of deposition rates and their dependence on pool temperature, cover gas pressure, and temperature drop across cover gas space above the pool. The results are discussed and compared with those derived from previously known theories on evaporation of vapor in the presence of mist formation. The experimental results and theoretical predictions did not agree. The dependence of the experimental data were known to be caused by the evaporation rate dependence on these factors.

- 3825 FUEL FAILURE DETECTION EXPERIMENT USING UO_2 -LOADED SODIUM IN-PILE LOOP. Sakai, E.; Fujino, M.; Imai, K.; Yoshida, H.; Katagiri, M.; Terada, H.; Itoh, H. (Jpn At Energy Res Inst, Tokaimura, Ibarakiken). IEEE Trans. Nucl. Sci.; NS: No. 1, 266-277 (Feb 1978). (CONF-771023--).

From Nuclear science symposium; San Francisco, CA, USA (19 Oct 1977).

Performance of various types of fuel failure detection systems has been studied using a uranium oxide loaded sodium in-pile loop. The detection systems include a delayed neutron monitor (graphite or polyethylene moderator), a moving-wire precipitator (detecting beta- and gamma-rays separately), a cover gas gamma-ray spectrometer (single Ge(Li) or an anticoincidence hyperpure Ge), and a Si(Li)-precipitator. Construction and performance of these detection systems are described as well as the methods of the detection efficiency determination. A method is introduced which gives the fission product release fraction from the fuels and the fission product transfer rate from sodium to cover gas, using only the fission product concentrations in the cover gas. 15 refs.

- 3826 ACOUSTICS OF THE SODIUM LOOP SAFETY FACILITY P2 EXPERIMENT. Anderson, T.T.; Carey, W.M.; Oats, M. (Argonne Natl Lab, Ill). IEEE Trans. Nucl. Sci.; NS25: No. 1, 112-115 (Feb 1978). (CONF-771023--).

From Nuclear science symposium; San Francisco, CA, USA (19 Oct 1977).

In the highly instrumented P2 experiment to simulate an unprotected loss of flow in an LMFBR core, two high-temperature sodium-immersed microphones were used to obtain the acoustic scenario of the 9-second flow coastdown, boiling sodium coolant, fuel failure, and re-establishment of flow after reactor scram. Acoustic data from this and previous experiments indicate that singular larger voids are formed in the sodium boiling process. These singular larger voids were observed to collapse upon contacting the subcooled sodium or structures, at repetition rates comparable to formation rates of sodium vapor bubbles. The acoustic observations were made in the presence of sodium exposed to argon cover gas at LMFBR operating conditions, and in the presence of fission gas from fuel pin failure. 6 refs.

- 3827 EFFECT OF NP-239 ON FAST REACTOR BURNUP CALCULATION. Takeda, S.; Miki, K. (Hitachi Ltd., Kawasaki, Kanagawa (Japan). Atomic Energy Research Lab.). J. Nucl. Sci. Technol. (Tokyo); 15: No. 2, 156-158 (Feb 1978).

- 3828 COULD NUCLEAR WASTE RECYCLED IN REACTORS. Hermann, R. Arch. Energiewirtsch.; 32: No. 2, 119-123 (Feb 1978). (In German).

To reduce the danger due to spent nuclear fuel, it is best to use this radioactive waste in new fuel elements and thus to recycle it in the reactor. The fundamentals of a possible technology are discussed.

- 3829 TRANSIENT BOILING OF SODIUM IN A SINGLE-PIN GEOMETRY UNDER LOSS-OF-FLOW CONDITIONS. Kikuchi, Y.; Haga, K. (Power Reactor and Nuclear Fuel Development Corp., Oarai, Ibaraki (Japan). Oarai Engineering Center). J. Nucl. Sci. Technol. (Tokyo); 15: No. 2, 100-108 (Feb 1978).

Transient sodium boiling experiments have been conducted in an electrically heated single-pin annular channel under loss-of-flow conditions. Each run was made by reducing or stopping the flow at constant heater power. Records were obtained of the changes of temperatures, flow rates, pressures and voids. The experimental results were compared with analytical calculations. There was no strong effect of temperature ramp rate on the incipient-boiling (IB) wall superheat in the range of the present experimental conditions. The pressure rise at the initial vaporization compared well with the vapor pressure corresponding to the IB wall superheat. The pressure pulse occurred at the vapor collapse correlated reasonably well with the collision velocity between the re-entrant liquid columns, but the measured value was less than the theoretical value predicted from the sodium hammer analysis. The observed voiding pattern agreed fairly well with the calculation by the NAIS-P2 code (single-bubble slug expulsion model). The initial expulsion acceleration of liquid agreed well with the theoretical prediction from the one-dimensional liquid column expulsion analysis. The thickness (0.05 and 0.29 mm) of the residual liquid film became thinner with higher IB wall superheat.

- 3830 WORLD'S POWER DEVELOPMENT AND IMPORTANCE OF NUCLEAR POWER. Neumann, J. (Ceskoslovenska Komise pro Atomovou Energii, Prague). Energetika (Prague); 28: No. 2, 81-86 (Feb 1978). (In Czech).

Based on data on the current state of world power submitted to the 9th World Power Conference in 1974, factors are discussed affecting the future development of power generation in the world. Particular attention is devoted to nuclear power, mainly with respect to Czechoslovak needs. Reactors of the WWER-440 and WWER-1000 type are briefly described and questions are discussed of the reactor fuel cycle, safety, and process heat utilization. The BN-600 fast reactor is also briefly described.

- 3831 ACCIDENT ALARM IN STEAM GENERATORS IN SODIUM COOLED FAST REACTOR POWER PLANTS. II. MEASURING THE ACOUSTIC SPECTRUM INDUCED BY THE SODIUM/WATER REACTION AS A METHOD OF BREAKDOWN DETECTION OF LIQUID SODIUM-HEATED STEAM GENERATORS. Matál, O.; Martoch, J. (Vyzkumny Ústav Zavodu Energetického Strojírenství, Brno-Slatina (Czechoslovakia)); Taraba, O.; Hanke, V. (Česke Vysoké Učení Technické, Prague (Czechoslovakia)). Jad. Energ.; 24: No. 2, 41-44 (Feb 1978). (In Czech).

Conditions were simulated in the economizer of a steam generator of water leaks in sodium

at a sodium flow of 0.62×10^{-3} to 1.24×10^{-3} m³/s and a sodium temperature of 320 to 380 degC by injecting water at a pressure of 6 to 10 MPa which roughly corresponds to conditions in an economizer of an actual steam generator with leaks within the limits of 0.01 to 0.3 g/s. The leak was recorded by acoustic detectors at all observed sodium flow rates and temperatures. The mean signal-to-noise ratio was in all cases greater than 2. At the assumed 25 dB noise level of the real steam generator of micromodular design it may be assumed that using existing acoustic detectors with waveguides a 0.02 g/s leak of water into sodium may be detected. The measurements showed that the technical standard of the equipment is at least as good as that of the flowmeter system of accident monitoring.

- 3832 NATURAL EVAPORATION OF SODIUM UNDER THE CONDITIONS OF MIST FORMATION, (2). DISCUSSIONS OF CRITICAL SUPERSATURATION MODEL BY OBSERVATION AND PHOTOGRAPHING OF MIST REGION. Kumada, T.; Ishiguro, R. (Hokkaido Univ., Sapporo (Japan). Faculty of Engineering); Shimizu, T. Nippon Kikai Gakkai Ronbunshu; 44: No. 378, 608-616 (Feb 1978). (In Japanese).

The mist generated when sodium evaporates naturally in the atmosphere of argon kept at room temperature was observed with helium-neon gas laser. The dust free range is formed between the region of mist generation and liquid surface mainly by the effect of heat migration. The inside border of the region of mist generation is separated from the liquid surface as the temperature at sodium surface rises. The supersaturation on the inside border of the region of mist generation is extremely large. The mist visible to naked eye is generated when the temperature of the sodium liquid surface rises to around 270 deg. C. As a result, two assumptions of the critical supersaturation model were evaluated when the temperature of evaporating surface was sufficiently higher than that of gas phase and the amount of evaporation was comparatively small.

- 3833 OUTLINE OF SODIUM-WATER REACTION TEST IN CASE OF LARGE LEAK WITH SWAT-3 TESTING EQUIPMENTS. Sato, M. (Power Reactor and Nuclear Fuel Development Corp., Oarai, Ibaraki (Japan). Oarai Engineering Center). Doryokuro Giho; No. 25, 54-67 (Feb 1978). (In Japanese).

The key component in sodium-cooled fast reactors is steam generators, and the sodium-water reaction owing to the break of heating tubes may cause serious damages in equipments and pipings. The main factor controlling this phenomenon is the rate of leak of water. When the rate of water leak is small, the propagation of heating tube breaking may occur owing to 'wastage phenomenon', on the other hand, when the rate of water leak is large, the phenomena of explosive pressure and flow occur due to the reaction heat and a large quantity of hydrogen generated by the reaction. In PNC, the testing equipments of SWAT-2 for small water leak and SWAT-1 for large leak were constructed, and the development test has been carried out to establish the method of safety design experimentally. The synthetic test equipment for the safety of steam generators, SWAT-3, was constructed to carry out the large water leak test in the scale close to actual plants. The object of the test, the outline of the test equipment, the phenomena of pressure and flow in the water injection test, the confirmation of the occurrence of secondary breaking of adjacent heating tubes, and the disposal of reaction products are described in this paper. This test is still going on, and the

final conclusion will be reported later.

- 3834 NUCLEAR REACTOR APPARATUS. Wade, E.E. (to Westinghouse Electric Corp.). US Patent 4,071,402. 31 Jan 1978. Filed date 9 Aug 1976. 6p.

A lifting, rotating and sealing apparatus for nuclear reactors utilizing rotating plugs above the nuclear reactor core is described. This apparatus permits rotation of the plugs to provide under the plug refueling of a nuclear core. It also provides a means by which positive top core holddown can be utilized. Both of these operations are accomplished by means of the apparatus lifting the top core holddown structure off the nuclear core while stationary, and maintaining this structure in its elevated position during plug rotation. During both of these operations, the interface between the rotating member and its supporting member is sealingly maintained.

- 3835 MEASURING FLUID PRESSURE. Lee, A.S. (to English Electric Co. Ltd.). British Patent 1,499,100/A/. 25 Jan 1978. 5p.

A method and apparatus are described for measuring the pressure of a fluid having characteristics that make it unsuitable for connection directly to a pressure gauge. The method is particularly suitable for the periodic measurement of the pressure of a supply of liquid Na to Na-lubricated bearings of pumps for pumping Na from a reservoir to the bearing via a filter, the reservoir being contained in a closed vessel containing an inert blanket gas, such as Ar, above the Na.

- 3836 NUCLEAR REACTOR REMOVABLE RADIAL SHIELDING ASSEMBLY HAVING A SELF-BOWING FEATURE. Pennell, W.E.; Kalinowski, J.E.; Waldby, R.N.; Rylatt, J.A.; Swenson, D.V. (to Dept. of Energy). US Patent 4,070,241. 24 Jan 1978. Filed date 16 Feb 1977. 6p. PAT-APPL-769,371.

A removable radial shielding assembly for use in the periphery of the core of a liquid-metal-cooled fast-breeder reactor, for closing interassembly gaps in the reactor core assembly load plane prior to reactor criticality and power operation to prevent positive reactivity insertion is described. The assembly has a lower nozzle portion for inserting into the core support and a flexible heat sensitive bimetallic central spine surrounded by blocks of shielding material. At refueling temperature and below the spine is relaxed and in a vertical position so that the tolerances permitted by the interassembly gaps allow removal and replacement of the various reactor core assemblies. During an increase in reactor temperature from refueling to hot standby, the bimetallic spine expands, bowing the assembly toward the core center line, exerting a radially inward gap-closing-force on the above core load plane of the reactor core assembly, closing load plane interassembly gaps throughout the core prior to start-up and preventing positive reactivity insertion.

- 3837 NUCLEAR REACTOR FUEL TRANSFER SYSTEM. Wade, E.E. (to Westinghouse Electric Corp.). US Patent 4,069,099. 17 Jan 1978. Filed date 23 Feb 1976. 8p.

A system for transferring fuel assemblies between a nuclear reactor core and a fuel transfer area while the fuel assemblies remain completely submerged in a continuous body of coolant is described. The system comprises an in-vessel transfer machine and a valve capable of isolating the reactor vessel from the

remainder of the fuel transfer system. The in-vessel transfer machine consists of a positioning mechanism and a lifting mechanism. The positioning mechanism is composed of a plurality of rotatable plugs located on the reactor vessel head. The lifting mechanism which is capable of lifting or lowering a chosen fuel assembly is disposed on a tilted plug at an angle relative to the tilted plug's plane of rotation. The rotatable plugs together with the lifting mechanism are capable of transferring a fuel assembly between the fuel transfer area and any core location or between any two core locations while the fuel assembly remains completely submerged in a continuous body of coolant.

- 3838 EX-VESSEL NUCLEAR FUEL TRANSFER SYSTEM. Wade, E.E. (to Westinghouse Electric Corp.). US Patent 4,069,098. 17 Jan 1978. Filed date 23 Feb 1976. 8p.

A system for transferring fuel assemblies between a fuel transfer area and a fuel storage area while the fuel assemblies remain completely submerged in a continuous body of coolant is described. A fuel transfer area filled with reactor coolant communicating with the reactor vessel below the reactor coolant level provides a transfer area for fuel assemblies in transit to and from the reactor vessel. A positioning mechanism comprising at least one rotatable plug disposed on a fuel transfer tank located outside the reactor vessel cooperates with either the fuel transfer area or the fuel storage area to position a fuel assembly in transit. When in position, a transporting mechanism cooperating with the positioning mechanism lifts or lowers a chosen fuel assembly. The transporting mechanism together with the positioning mechanism are capable of transferring a fuel assembly between the fuel transfer area and the fuel storage area.

- 3839 ADSORPTION SEAL FOR NUCLEAR REACTORS. Cooper, M.H. (to Westinghouse Electric Corp.). US Patent 4,069,100. 17 Jan 1978. Filed date 13 Feb 1975. 6p.

A system is disclosed for reducing the possibility of leakage of fission gases from a nuclear reactor of the gas-cooled type or of a type utilizing a liquid coolant, for example a liquid metal with a cover gas above free surfaces of the coolant. The disclosed system reduces the leakage of fission gases from the cover gas through joints between a pressure vessel and a pressure vessel head in the nuclear reactor by installing an adsorbent material between two seals placed in the joints. This adsorbent material provides sufficient delay time to allow all radioactive isotopes, except long-lived nuclides, to decay to innocuous concentrations before escaping from the pressure vessel. 5 claims, 4 figures.

- 3840 (EURFNR--1413) EXPERIMENTAL DETERMINATION OF TEMPERATURE FIELDS IN SODIUM-COOLED ROD BUNDLES WITH HEXAGONAL ROD ARRANGEMENT AND GRID SPACERS. Moeller, R.; Tschoeke, H.; Kolodziej, M. (Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.)). Inst. fuer Reaktorbauelemente. 2 Jan 1978. Translation by T.J. Clark of KFK--2356, Jan 1977. 87p. Dep. NTIS, PC A05/MF A01.

Work performed under United States--Euratom Fast Reactor Exchange Program.

The development of valid methods of calculation for the determination of local three-dimensional temperature fields in rod bundle geometries is studied. In order to get

more precise short-term and mid-term design documents, among others, the azimuthal temperature distributions were determined as a function of the heated length in the cladding tubes of the "critical" rods in the wall region with the inclusion of grid-shaped spacers. This is the principal subject of this report. Parallel to these experiments, the temperature profiles in bundle cross-sections were also measured. Since, for the calculation of local temperature distributions in the cladding tubes of rod bundles, the precise knowledge of the average sub-channel temperatures is a necessary prerequisite, two characteristic experiments (uniform heating and oblique load) for measured sub-channel temperatures are reported on.

- 3841 POWER/ENERGY PROGRESS REPORT: A PASTICHE OF DEVELOPMENTS PROMISES NEAR AND LONG-TERM APPLICATIONS. Kaplan, G. IEEE Spectrum; 15: No. 1, 49-53 (Jan 1978).

A progress report on current energy and power projects covers developments in power generation and transmission, improvements in hardware, techniques for dry-cooling, computerized load management, and breeder safety. A new power station in Prudhoe Bay, Alaska, is farther north than any electric system in the world. Other generating advances include generator/motors for pumped storage, an innovative static excitation system, turbines to prevent subsynchronous resonance, superconductivity-based generators, and solid-state converters. Research on ultra-high voltage (UHV) and high-voltage direct current (HVDC) transmission has progressed along with improvements in relays and gas-insulated switch gear. Relief for power plant siting problems may be available through dry-cooling techniques. Research on computer software is aimed at better control of loads and more-efficient and economic use of equipment. British safety tests on an experimental liquid metal fast breeder reactor are encouraging. Other electric power energy-related projects are listed, including the total estimated funding and the funding agencies (where available).

- 3842 FLEX: A CODE FOR CALCULATING NEUTRON FLUX MICRODISTRIBUTIONS IN LATTICES CONSISTING OF HEXAGONAL FUEL ASSEMBLIES. Agthe, G.; Mai, W.; Moeller, W.; Mueller, A. (VEB Kombinat Kraftwerksanlagenbau, Berlin (German Democratic Republic)). Kernenergie; 21: No. 1, 18-22 (Jan 1978). (In German).

Physical and mathematical fundamentals as well as the coarse structure of the FLEX code are reviewed. In a flexible manner this programme allows one to calculate two-dimensional neutron flux and power density microdistributions in hexagonal geometry for both regular lattices of fuel elements as they exist in zero power reactors and lattices consisting of hexagonal fuel assemblies of WWER type or FBR type reactors. The gaps between fuel rod bundles provided for reasons of design (assembly cans, coolant) can be taken into account in detail. Some results of recalculating test set-up experiments are given.

- 3843 RADIATION BEHAVIOR OF VITREOUS SILICA. Primak, W. (Argonne National Lab., IL). Nucl. Sci. Eng.; 65: No. 1, 141-196 (Jan 1978).

Several properties of vitreous silica relevant to application as an optical element in a reactor were studied, including density, refractive index, optical path, stress relaxation, and optical absorption. The

irradiations were in fields characteristic of the fuel regions of several operating reactors and at temperatures up to 370°C. The radiation-induced changes in optical path are significant, but are much smaller than those in the density and refractive index because the last two are of opposite sign. The thermal coefficient of optical path causes changes of comparable magnitude. Optical absorption is not a serious matter in the upper end of the visible region.

- 3844 EXPERIMENTAL INVESTIGATION OF NEUTRONS STREAMING THROUGH THE GRID-PLATE SHIELD OF LIQUID-METAL FAST BREEDER REACTORS. Uchida, S. (Hitachi Ltd., Igaraki, Japan); Kitamura, M.; Miyasaka, S. Nucl. Sci. Eng.; 65: No. 1, 155-159 (Jan 1978).

Experiments were undertaken to determine the distribution of neutron flux on the core support grid plate of liquid-metal fast breeder reactors by using a semimockup of the grid-plate shield consisting of carbon-steel and aluminum slabs. The experiments were calculated with a conventional calculational procedure containing the TRD-3 two-dimensional removal diffusion code. It was demonstrated that the calculated radial distribution of the fast neutron reaction rates of $^{151}\text{In}(n,n')$ /sup 115m/In agreed with the measured values within a factor of 2.

- 3845 VOID DISTRIBUTION IN BOILING POOLS WITH INTERNAL HEAT GENERATION. Kazimi, M.S. (Massachusetts Inst. of Tech., Cambridge); Chen, J.C. Nucl. Sci. Eng.; 65: No. 1, 17-27 (Jan 1978).

An analytical and experimental investigation of void distribution in internally heated boiling pools is presented. The experimental investigation involved measurement of the vertical profile of the void fraction and the average void fraction in an aqueous solution of ZnSO_4 . If the results of this investigation are extended to a boiling pool of UO_2 , it is predicted that substantial voiding will occur even when only a very small fraction of nominal operating power density in nuclear reactors is consumed in internal vaporization.

- 3846 SPACE--TIME DYNAMICS OF A FAST BREEDER REACTOR FOR LOCALIZED DISTURBANCES. Doshi, J.B.; Grossman, L.M. (Univ. of California, Berkeley). Nucl. Sci. Eng.; 65: No. 1, 106-129 (Jan 1978).

A method of analysis is developed for nuclear reactor accident initiating events that are localized in space. The method is based on a flux factorization technique, accounting for the flux shape changes taking place near the region of perturbation. In the steady state, the neutron shape functions are expanded in a series of eigenfunctions of the steady-state group removal operator. During the unsteady state, the time-dependent group shape functions are expanded in a series of the same stationary eigenfunctions with time-dependent Fourier coefficients. An auxiliary function is added to this expansion to take account of the spatial variation of the spectral hardening of neutrons in the immediate vicinity of the disturbed region. From the resulting representation of the group shape functions, the equations to be satisfied by the time-dependent Fourier coefficients and the time-dependent auxiliary shape function due to the disturbed region are developed consistently. A typical large [1000-MW(e)] liquid-metal fast breeder reactor with two radial core zones of different enrichments is analyzed by the above method. The transient initiating perturbation is taken to be a

specified rate of coolant voiding from a single subassembly in the reactor core. The results show a strong dependence of the reactivity added on the radial location of the voiding perturbation and on the rate of voiding.

- 3847 **FAILED FUEL PIN PERFORMANCE IN FAST METAL-COOLED REACTORS.** Plitz, H. (Gesellschaft fuer Kernforschung mbH, Karlsruhe, Ger.). Nucl. Technol.; 37: No. 1, 48-58 (Jan 1978).

Experience with continued operation of failed mixed-oxide fuel pins in liquid-metal-cooled reactors or in-pile sodium loops is available from a variety of beyond-fuel-failure experiments. The phenomena and effects on a large reactor system of continued beyond-fuel-failure operation are not well understood, but, except for the release and deposition of fission products and the chemical reaction of sodium coolant to oxide fuel, leading to pin swelling, no failure propagation due to continued operation of failed fuel pins has been observed. For economic reactor operation, further investigations are needed to establish a catalog of fuel failure types, sizes, and locations to describe the time-dependent effects of continued operation on reactor operation, shutdown requirements, instrumentation, surveillance, circuit systems, contamination, maintenance systems, and plant efficiency.

- 3848 **ANALYSIS OF THE CENTRAL BLOCKAGE WAKE IN AN LMFBR-SUBASSEMBLY.** Arai, M.; Hirata, N. (Tokyo Shibaura Electric Co. Ltd., Kawasaki, Kanagawa (Japan). Research and Development Center). Nucl. Eng. Des.; 45: No. 1, 127-132 (Jan 1978).

A simple model is presented to estimate the wake size and the average velocity of the circulating flow downstream of a central blockage in a subassembly. A computer code, newly developed for the purpose was used to examine the model results. It is shown that both the model results and the code closely fit experimental results. It is seen that the size of a turbulent wake is nearly independent of inlet coolant velocity, whereas the velocity of the circulating flow in the wake is nearly proportional to the inlet velocity. Both the length of the wake and the velocity in it increase as the blockage increases. The maximum temperature is reached with a blockage of more than 0.6 of the subassembly cross section, and varies inversely with inlet velocity.

- 3849 **SIMPLE FORCED DIVERSION MODEL FOR STUDY OF THERMAL-HYDRAULIC TRANSIENTS IN LMFBR SUBASSEMBLY.** Chen, W.L.; Grohms, M.A.; Ishii, M. (Argonne National Lab., Ill. (USA)). Nucl. Eng. Des.; 45: No. 1, 53-66 (Jan 1978).

The generalized simple, transient, integral energy balances based on the average properties for the fuel and cladding have been used in a new multichannel thermal-hydraulic model for calculating the transient behavior of coolant in the rod bundle. This model was developed to provide a simple useful tool for analyzing the flow and thermal transients in a rod bundle with reasonable accuracy, and to understand the fundamental characteristics of flow in the rod bundle under both normal and abnormal condition of reactor-core operation.

- 3850 **ENERGY FROM THE ATOM.** Walton, G.N. (Imperial Coll. of Science and Technology, London (UK). Dept. of Chemical Engineering and Chemical Technology). Educ. Chem.; 15: No. 1, 18-21 (Jan 1978).

A brief account is given of the source of nuclear energy, the types of power reactor (thermal and fast reactors) commissioned or under development, the factors involved in processing the irradiated fuel elements, the part played by fast breeder reactors in conserving uranium supplies, and the storage of radioactive waste.

From KTG technical day on fuel element of the sodium-cooled breeder; Karlsruhe, F.R. Germany (28 Oct 1976).

Fuel element of the sodium breeder. An important consideration for the design of fuel rods is the prevention of damage to the cladding, and especially of fissures in the cladding up to the desired burn-up. Cladding, tube stresses leading to the formation of cracks can originate from inside through mechanical stresses on the cladding, in which a chemical reaction between the fuel and the cladding tube also plays an important and damaging part. Work on the chemical and mechanical interaction between the fuel and cladding material in fuel elements for fast breeder reactors is described.

3858 (EURFNR--1418, pp 83-90) STATE OF DEVELOPMENT OF CLADDING AND STRUCTURAL MATERIAL FOR SNR CORE ELEMENTS. Dietz, W. Jan 1978. Translation by T.J. Clark of KFK--2416, Oct 1976.

From KTG technical day on fuel element of the sodium-cooled breeder; Karlsruhe, F.R. Germany (28 Oct 1976).

Fuel element of the sodium breeder. The questions of high-temperature plasticity and the swelling which play an important part in the mechanical design of the core are studied. These questions must be treated generally for components and their materials in the region of the SNR core: Here there is a limitation to the materials and their metallurgical status, as they are specified for the cladding tube and fuel element shroud for the SNR-300 Mk-Ia. The experimental data come from the radiation tests illustrated. Temperature and neutron dosages are given as significant amounts.

3861 PERFORMANCE TEST PROGRAM OF DASHPOT FOR FFTF COLD LEG CHECK VALVE. Sharma, D.K.; Henschel, R.; Krawchuk, M. (Foster Wheeler Corp., Livingston, N.J. (USA). John Blizard Research Center). Int. J. Pressure Vessels Piping; 6: No. 1, 41-52 (Jan 1978).

The performance tests that were carried out on the prototypical dashpot for the Fast Flux Test Facility Cold Leg Check Valve (FFTF-CLCV) are described and evaluated. The study consisted of acceptance testing in freon, argon and air, and final testing in liquid sodium. It was concluded that the dashpot performance was acceptable. This dashpot was previously developed through a test program that was primarily conducted in water.

3862 DASHPOT DEVELOPMENT TEST FOR FFTF COLD LEG CHECK VALVE. Sharma, D.K.; Henschel, R.; Krawchuk, M. (Foster Wheeler Corp., Livingston, N.J. (USA). John Blizard Research Center). Int. J. Pressure Vessels Piping; 6: No. 1, 23-39 (Jan 1978).

Work that was performed to develop the dashpot for the Fast Flux Test Facility Cold Leg Check Valve is presented. It comprised the water testing of two basic dashpot designs and their modifications. The two basic designs included an annular and a non-annular concept. The programme consisted of subjecting each dashpot to a series of tests in water to investigate its filling, recocking and damping behaviour. The test results discussed showed the non-annular design to be superior and to meet performance requirements in virtually all cases.

3863 EFFECTS OF STRESS ON SWELLING IN 316 STAINLESS STEEL. Bates, J.F.; Gilbert, E.R. (Hanford Engineering Development Lab., Richland, Wash. (USA)). J. Nucl. Mater.; 71: No. 2, 286-291 (Jan 1978).

Stress was found to increase the magnitude of irradiation-induced swelling in 316 stainless steel. Measurement of the densities of pressurized tube specimens, irradiated at temperatures of approximately 430-475°C to peak fluences of approximately 9×10^{22} n/cm² ($E > 0.1$ MeV) in EBR-II, has indicated increased swelling in both the annealed and 20% cold worked conditions of this alloy. Swelling in the annealed specimens was observed to increase linearly with hoop stress up to approximately 20 ksi (130 MPa), whereupon further increases in stress resulted in reduced swelling. Swelling in the cold worked material was linear with stress up to levels of approximately 28 ksi (193 MPa).

3864 INCREASED SWELLING IN 20% COLD WORKED 316 STAINLESS STEEL DUE TO INREACTOR TEMPERATURE REDUCTIONS. Bates, J.F.; Gelles, D.S. (Hanford Engineering Development Lab., Richland, Wash. (USA)). J. Nucl. Mater.; 71: No. 2, 365-367 (Jan 1978).

This letter describes the swelling behavior of test specimens of 20% cold worked 316 stainless steel when a reduction in temperature takes place during the course of irradiation in a fast reactor.

3865 GROWTH OF A SODIUM VAPOUR BUBBLE RISING IN THE SUPERHEATED LIQUID. Shah, V.L.

(Wisconsin Univ., Milwaukee (USA)); Sha, W.T. (Argonne National Lab., Ill. (USA)). Nucl. Eng. Des.; 45: No. 1, 81-91 (Jan 1978).

The growth of a single spherical bubble moving in a uniformly superheated liquid is considered. The equations of motion and energy are presented in the forms which take into consideration the interaction between the motion and the growth. The fourth order Runge-Kutta method is used to obtain a simultaneous solution of equations of motion and growth rate. The solution is compared with the available experimental results. The results for liquid sodium are presented for a range of pressures and Jakob numbers.

3866 (EURFNR--1418) FUEL ELEMENT OF THE SODIUM BREEDER. Karsten, G. (ed.). (Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Projekt Schneller Bruefer). Jan 1978. Translation by T.J. Clark of KFK--2416, Oct 1976 (CONF-7610135--). 132p. Dep. NTIS (US Sales Only), PC A07/MF A01. From KTG technical day on fuel element of the sodium-cooled breeder; Karlsruhe, F.R. Germany (28 Oct 1976).

Work performed under United States--Euratom Fast Reactor Exchange Program.

Separate abstracts are presented for 10 papers on fuel elements and core materials for LMFBR type reactors. Five papers have been previously abstracted and added to the data base.

3867 (EURFNR--1421) DESIGN, IRRADIATION, AND POST-IRRADIATION EXAMINATION OF NA-BONDED (U,Pu)C FUEL RODS OF THE TEST GROUP MOL 15. Steiner, H.; Freund, D.; Jacobi, O.; Weimar, P. (Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Inst. fuer Material- und Festkoerperforschung). Jan 1978. Translation by T.J. Clark of KFK--2451 169p. Dep. NTIS (US Sales Only), PC A08/MF A01.

Work performed under United States--Euratom Fast Reactor Exchange Program.

The Mol 15 experiment entails the irradiation of four fuel rod samples with UC/PuC fuel with various M_{23} proportions under Na bonding. In order to be able to make judgments among them on the development potential of fuel variants, it was necessary to get comparable irradiation results, which could be optimally realized in so-called "integrated" experiments: In an irradiation capsule, 4 short rods were tested under practically identical irradiation conditions. In order to obtain high burn-ups in a comparatively short time span, fuel rods with a small fuel rod diameter of 5.6 mm were used. A detailed description of this experiment is given in the present report. In addition to a representation of the design and the specification, the manufacture of the test samples, the course of the irradiation, as well as the non-destructive and destructive post-investigation are documented. Finally, the fuel swelling, the fuel structure which arises, and the Pu-redistribution are discussed in comparison with previous experiments.

3868 ABSORBER BALLS TESTED FOR LMFBR SECONDARY SHUTDOWN. Marshall, P. Nucl. Eng. Int.; 23: No. 266, 26-27 (Jan 1978).

The hydraulic performance of a column of tantalum alloy absorber balls and a flow shutoff valve which could be used as a fast breeder shutdown assembly is being evaluated in the Hydraulic Testing facility at the Liquid Metal Engineering Centre in California. The balls are designed to fall into the reactor core by gravity when the coolant flow is interrupted. A second concept involves and

articulated absorber with a high degree of chain-like flexibility. Both systems are intended for an Inherent Secondary Shutdown System for advance LMFBRs. Assemblies and tests are briefly described.

3869 THEORETICAL ANALYSIS APPLIED TO ELECTROMAGNETIC INSTRUMENTS USED IN LIQUID SODIUM. Farrington, B.J.; Hughes, G. (Central Electricity Generating Board, Berkeley (UK). Berkeley Nuclear Labs.). Nucl. Energy; 17: No. 1, 57-64 (Jan 1978).

The solution of Maxwell's equations to obtain the electric field distribution in a conductive, isotropic, inhomogeneous medium is performed using a finite difference approach. The initial application is devoted to the case of coils, carrying a low frequency sinusoidal driving current, which are surrounded by media having any desired combination of electrical conductivity and linear magnetic permeability. An estimate is made of the errors involved, particularly when using this technique to analyse electromagnetic sensors for use in liquid sodium. The results obtained when the developed program is used to solve a simple problem are compared with the corresponding analytical Bessel solution, proving the validity of the method. Expressions are derived to enable the calculation of flux density, induced voltage, coil impedance and the effect of flowing media from the computed values of electric field. Detailed analyses are made of an electromagnetic temperature sensor, constructed of stainless-steel-sheathed mineral-insulated cable, and of a flux distortion flow meter used in the Dounreay prototype fast reactor. Satisfactory agreement with the experimental performance of these sensors is obtained.

3870 DASHPOT DEVELOPMENT TEST FOR FFTF COLD LEG CHECK VALVE. Sharma, D.K.; Henschel, R.; Krawchuk, M. (Foster Wheeler Energy Corp, John Blizard Res Cent, Livingston, NJ). Int. J. Pressure Vessels Piping; 6: No. 1, 23-29 (Jan 1978).

This paper presents work that was performed to develop the dashpot for the Fast Flux Test Facility Cold Leg Check Valve. The portion covered herein involved the water testing of two basic dashpot designs and their modifications. The program consisted of subjecting each dashpot to a series of tests in water to investigate its filling, recocking and damping behavior. The test results discussed herein showed the nonannular design to be superior and to meet performance requirements in virtually all cases. 6 refs.

3871 PERFORMANCE TEST PROGRAM OF DASHPOT FOR FFTF COLD LEG CHECK VALVE. Sharma, D.K.; Henschel, R.; Krawchuk, M. (Foster Wheeler Energy Corp, Livingston, NJ). Int. J. Pressure Vessels Piping; 6: No. 1, 41-52 (Jan 1978).

This paper describes and evaluates the performance tests that were carried out on the prototypical dashpot for the Fast Flux Test Facility Cold Leg Check Valve (FFTF-CLCV). The study consisted of acceptance testing in freon, argon and air, and final testing in liquid sodium. Based upon this work it was concluded that the dashpot performance was acceptable. This dashpot was previously developed through a test program that was primarily conducted in water. 5 refs.

3872 ROLE OF FISSION PRODUCTS IN WHOLE-CORE ACCIDENTS IN FAST REACTORS. Baker, A.R.

(UKAEA Fast Reactor Development Directorate, Risley); Teague, H.J. (UKAEA Safety and Reliability Directorate, Culcheth). Nucl. Energy; 17: No. 1, 31-40 (Jan 1978).

Revised version of paper presented at IAEA Specialists' Meeting at Harwell, June 1977. Also available as ND-R-4(R).

The review of the role of fission products in whole-core accidents falls into two parts. Firstly, there is a discussion of the hypothetical accidents usually considered in the UK, and of how they are dealt with. Secondly, individual topics, where fission products are known to be important or might be so, are discussed. There is a brief discussion of the UK work on the establishment of an equation of state for unirradiated fuel and on how this might be extended to incorporate fission product effects. An important issue is the contribution of fission products to the effective vapour pressure and the experimental programme on the pulsed reactor VIPER investigates this. Fission products may influence the probability of occurrence and the severity of interactions between molten fuel and coolant. Finally, the fission product effects in the pre-disassembly, disassembly, and recriticality stages of an accident are discussed.

3873 TEMPERATURE FLUCTUATION OF SODIUM IN ANNULAR FLOW CHANNEL HEATED BY SINGLE-PIN WITH BLOCKAGE. Miyazaki, K.; Kimura, J.; Ogawa, M.; Okada, T. (Osaka Univ, Jpn). J. Nucl. Sci. Technol. (Tokyo); 15: No. 1, 10-23 (Jan 1978).

Root mean square (RMS) value and power spectral density (PSD) of temperature fluctuation were measured with use of forced-circulating sodium in an annular channel (6.5 mm I.D., 20 mm O.D.) with a concentric disk to simulate blockage (about 80%) of sodium flow. The RMS value is proportional to the wall-to-bulk-fluid temperature difference in heat transfer, presenting the similar dependence on the heat flux and flow velocity. The fluctuations of temperature are greatly attenuated in the upper unheated section where the radial temperature gradient is absent, and consequently it is suggested that the fluctuations of temperature should be caused by the local turbulence of flow, such as a vortex street due to blockage in the present experiment, under the presence of large gradient of temperature near the heating surface. 13 refs.

3874 AIM, CONSTRUCTION AND OPERATION OF THE FAST-BREEDER NUCLEAR POWER STATION IN KALKAR (SNR-300). Schoenig, R. Braunkohle; 30: No. 1, 11-19 (Jan 1978). (In German).

From Lecture during the 43rd meeting of the DEBRIV committee Feuerungstechnik und Waermewirtschaft; Koeln, Germany, F.R. (21 Oct 1977).

After many years of research and development work the governments of the Federal Republic of Germany, Belgium and Holland decided in 1972 to promote the construction of a prototype power plant with a sodium-cooled fast-breeder reactor with an electrical capacity of approx. 300 MW. Experience is to be gained with this plant in order to determine in how far this type of reactor can be used for the commercial generation of power. The FBR can contribute on the one hand to closing the energy gap becoming apparent in the future and on the other hand to ensuring some 60 times better utilisation of existing U reserves. Furthermore, it also offers an important contribution to solving the depollution problem as it not only converts the U^{235} - which is a non-fissionable matter in LWR and which occurs to about 99% in natural U -

into fissile Pu, but also uses the Pu generated in the reactors, removing it from the ecological cycle. All tests have shown that the FBR has been mastered according to present-day engineering standards and that the operation of FBR brings no increased dangers for population or environment compared with other types of nuclear power stations. The construction of the prototype power plant in Kalkar has begun in 1973. It is expected that it will be completed and commissioned by 1983.

3875 TEMPERATURE FLUCTUATION OF SODIUM IN ANNULAR FLOW CHANNEL HEATED BY SINGLE-PIN WITH BLOCKAGE. Miyazaki, K.; Kimura, J.; Ogawa, M.; Okada, T. (Osaka Univ., Suita (Japan). Faculty of Engineering). J. Nucl. Sci. Technol. (Tokyo); 15: No. 1, 10-23 (Jan 1978).

Root mean square (RMS) value and power spectral density (PSD) of temperature fluctuation were measured with use of forced-circulating sodium in an annular channel (6.5 mm I.D., 20 mm O.D.) with concentric disk to simulate blockage (about 80%) of sodium flow. The experimental range of the heat flux was 40 - 150 W/cm² and the bulk flow velocity 0.14 - 0.41 m/sec ($Re = 7.7 \times 10^3 - 2.3 \times 10^4$) under a temperature of 500 - 800°C. The RMS value measured at the exit of heating section (150 mm downstream from the blockage) is larger by a factor of 2 - 3 than that in the wake (10 - 20 mm downstream from the blockage), marking a few deg.C for a heat flux of 105 W/cm² and a flow velocity of 0.27 m/sec. The RMS value is proportional to the wall-to-bulk-fluid temperature difference in heat transfer, presenting the similar dependence on the heat flux and flow velocity. The fluctuations of temperature are greatly attenuated in the upper unheated section where the radial temperature gradient is absent, and consequently it is suggested that the fluctuations of temperature should be caused by the local turbulence of flow, such as a vortex street due to blockage in the present experiment, under the presence of large gradient of temperature near the heating surface.

3876 CRACK GROWTH BEHAVIOUR OF THE AUSTENITIC STEELS X 6 CRNI 18 11 AND X 6 CRNIMO 17 13 UNDER THE CONDITIONS OF A NATRIUM-COOLED FAST BREEDER REACTOR. Stahlberg, R. (Technischer Ueberwachungs-Verein Rheinland e.V., Koeln (Germany, F.R.). Inst. fuer Materialpruefung und Chemie). Arch. Eisenhuettenwes.; 49: No. 1, 1-8 (Jan 1978). (In German).

Mathematical description of the crack growth behaviour of the steels X 6 CrNi 18 11 containing 0.06% C, 18% Cr and 11% Ni and also X 6 CrNiMo 17 13 containing 0.06% C, 17% Cr, 2.5% Mo and 13% Ni in air at temperatures up to 646°C and stress cycle frequencies of $8.3 \cdot 10^{-2}$ to $4.1 \cdot 10^3$ cycles/min. Influence of carbide precipitates. Comparison of the effect of thermal and fast neutrons. Frequency dependence of the crack propagation rate. Delayed crack propagation in the neighbourhood of welded joints. Crack growth under vacuum and in liquid sodium between 427 and 538°C.

3877 CERTAIN ASPECTS OF ALTERNATIVE CORE DISRUPTION ACCIDENTS IN LMFBRS. Chan, C.K.; Min, T.K.; Okrent, D. (California Univ., Los Angeles (USA). Dept. of Chemical, Nuclear, and Thermal Engineering). Nucl. Eng. Des.; 51: No. 2, 263-272 (Jan 1978).

This paper examines the initial course of a postulated accident scenario in an LMFB, involving the rupture of all piping connected to the reactor vessel, in the event of an earthquake (or an equivalent scenario involving

both loss of heat removal and system rupture). The core is successfully shut down, but decay heat imposes a threat to core integrity. At the onset of pipe rupture, the fuel elements are cooled by natural circulation, followed by subcooling and nucleate boiling. Continuation of sodium evaporation leads to core dryout, clad melting, and subassembly wall failure. Clad melting is found to occur at a location close to the top of the core at a rate of 0.08 ft³/s. The sodium vapor velocity is not high enough to carry the molten steel to the upper blanket region; therefore, flow-channel blockage in the lower axial blanket region is expected. At the time of clad melting, the fuel temperature rises by approximately 20°F/s, while the temperature-rise rate at the can wall, due to heat radiation from the fuel pin, is 10°F/s. Failure of the can wall initiates gross fuel motion. Continuation of the heat generation in the fuel pellet leads to the melting of the control rod support. Both the fuel motion and the control rod failure mark the start of reactivity insertion.

- 3878 RESEARCH AND DEVELOPMENT ACTIVITIES RELATIVES TO THE REACTOR VESSEL. Benoist, E. (CEA Centre d'Etudes Nucleaires de Cadarache, 13 - Saint-Paul-les-Durance (France). Dept. des Reacteurs a Neutrons Rapides). Bull. Inf. Sci. Tech. (Paris); No. 227, 99-110 (Jan-Feb 1978). (In French).

The Super Phenix vessel is very similar in design to that of Phenix. In this way it has been possible to benefit from past experience and to reduce the number of preliminary tests needed for the definition of equipment. However the increase diameter of the reactor vessel has led to the evolvement, for certain components, of new solutions requiring development trials. Conversely other components technologically satisfactory will only undergo qualification tests.

- 3879 STUDIES AND FABRICATION OF THE FUEL. Chaumont, J.M.; Wallet, P. (CEA Centre d'Etudes Nucleaires de Cadarache, 13 - Saint-Paul-les-Durance (France). Dept. des Reacteurs a Neutrons Rapides); Grignon, F. (Compagnie Generale des Matieres Nucleaires (COGEMA), 92 - Chatillon (France)). Bull. Inf. Sci. Tech. (Paris); No. 227, 63-80 (Jan-Feb 1978). (In French).

In this article the general characteristics of the fuel subassemblies in the SUPER PHENIX reactor are presented, and a detailed description is given of the various types of core subassemblies: fissile, fertile, control and shielding subassemblies. The principles guiding the studies and design of the different types of subassemblies are exposed, and the technological limitations adopted for fuel element operation are given. The various types of damage leading to these limitations are reviewed, and reference is made to operation experience gained from prototype reactors RAPSDIE and PHENIX. The organization of the fuel element fabrication for SUPER PHENIX is then presented. The various steps in this fabrication are reviewed, and the quality control organization is described. The capacity of the plants and the foreseen agenda for fabrication of fuel subassemblies are given. The fabrication of fertile subassemblies and other core components is then shortly described.

- 3880 DESIGN AND CONSTRUCTION OF THE NUCLEAR BOILER. Bull. Inf. Sci. Tech. (Paris); No. 227, 39-61 (Jan-Feb 1978). (In French).
The Creys-Malville station is equipped with

a nuclear boiler of the Super Phenix 1 type, delivering a thermal power of 3000MW and possessing a sodium-cooled fast neutrons reactor. The options taken continue in the direct line of the Phenix boiler technology, which means that it was possible to benefit largely from experience of the building start-up and piloting of this station. All equipment and components of the nuclear boiler except the steam generators and their associated auxiliary circuits are housed in the reactor and handling building. The steam generators and auxiliaries are built on in a star formation to the outside of the reactor building enclosure. The sodium-cooled fast breeder reactor is of the 'integrated primary circuit' type. This means that the whole primary sodium circuit passing through the core is placed in the main reactor vessel with its four main pumps and eight intermediate exchanges which transfer calories from the core to four outer and independent secondary loops. The reactor is planned to start up during the year 1983.

- 3881 RESEARCH AND DEVELOPMENT ACTIVITIES CONCERNING THE SUPER-PHENIX CORE. Ravier, J.; Sicard, B.; Estavoyer, M. (CEA Centre d'Etudes Nucleaires de Cadarache, 13 - Saint-Paul-les-Durance (France). Dept. des Reacteurs a Neutrons Rapides). Bull. Inf. Sci. Tech. (Paris); No. 227, 111-117 (Jan-Feb 1978). (In French).

A research and development programme supplies the necessary guarantees to solutions adopted for the Super Phenix core design. Studies are in progress to examine the start-up pattern, test programme management and follow-up of the fuel assemblies.

- 3882 CREYS-MALVILLE POWER STATION. Robert, E.; Rodet, E.; Lucenet, G. (Societe Centrale Nucleaire Europeenne a Neutrons Rapides (NERSA), 69 - Lyon (France)). Bull. Inf. Sci. Tech. (Paris); No. 227, 11-32 (Jan-Feb 1978). (In French).

This article reviews the main characteristics and essential options held for this station. The following points are examined in turn: the context chosen for its construction (especially at the level of the European Electricity Producer's Association); essential data concerning the Creys Malville site (general situation, climatology, hydrology, geology and seismology ...); major options relative to the running of the station; specifications of the machine room and the power evacuation water-steam circuit; system of confinement by consecutive barriers; certain safety options (disturbances from outside or inside) directly affecting the design of the buildings; origin and nature of gaseous effluents and liquid wastes from a plant of this kind. The state of advancement of the project is also summed up: administration procedures, markets and building work.

- 3883 STUDIES AND RESEARCH RELATIVES TO THE SAFETY OF THE SUPER-PHENIX PROJECT. Anselin, F.; Penet, F. Bull. Inf. Sci. Tech. (Paris); No. 227, 119-139 (Jan-Feb 1978). (In French).

The analysis of safety reports concerning the Creys Malville power station (Superphenix) must be based on technical data supplied by the NERSA, responsible for the plant, and on results of research and development programme carried out in various establishments and at the CEA in particular. By virtue of the procedure laid down for the safety analysis, i.e. analysis by the barrier method, verification of reactor shut down rules at power, permanence of cooling, confinement of

dangerous products in the event of hypothetical failure of the above two functions safety R and D programmes have a double aspect: accident prevention on the one hand and study of the development of accident, even the most hypothetical on the other. In the accident prevention field the studies deal with the resistance of barriers under normal and accidental working conditions, inspection systems and reactor safety functions allowing abnormal situations to be detected and the reactor shut down; whence the special emphasis placed on emergency shut-down and cooling systems. In the accident field the R and D activities cover a wide range of studies on phenomena liable to arise, independently of their probability of occurrence during the lifetime of the reactor; heating in the mass or boiling of sodium, fuel, meeting, movements of fused materials, fuel-sodium thermal interaction, core deformation, resistance of confinement recovery of molten fuel, post-accident cooling, transfer of radioactivity and contamination outside the reactor, radiological consequences and means of confinement of dangerous products.

- 3884 MANIPULATION OF SCIENTIFIC DATA FOR NUCLEAR ENERGY CALCULATIONS. Montgomery, K.R. pp 160-165 of Generalized data management systems and scientific information. Paris; OECD Nuclear Energy Agency (1978).

From OECD/NEA working group on nuclear information; Berkeley, CA, USA (5 Oct 1977).
See CONF-771062--.

Fuel management strategy is vital to the efficient operation of the PFR at Dounreay. The strategy encompasses planning, operational, and post-operational activities. Fuel management calculations are outlined for these stages of operation. The unusual nature of the associated problems, the ideal requirements of the system to be adopted, and the present technique for their solution are given. Some of the essential requirements of a scientific data base to support these calculations are defined. (RWR)

- 3885 DATABANK FOR THE PROTOTYPE FAST REACTOR. Montgomery, K.R. pp 250-256 of Generalized data management systems and scientific information. Paris; OECD Nuclear Energy Agency (1978).

From OECD/NEA working group on nuclear information; Berkeley, CA, USA (5 Oct 1977).
See CONF-771062--.

This databank is a large set of files controlled by a management suite of CQBOL data handling programs. The data, data dictionary and data directory are stored on exchangeable disc packs in the Random Access Index Sequential mode on an ICL 4/72 computer at the UKAEA headquarters at Risley. It is a databank for the UKAEA Prototype Fast Reactor which stores data pertaining to the entire composition of the in-core components, concentrating particularly upon the fissile fuelled driver assemblies and the many experimental assemblies of both fuel pin and cladding/structural materials. When the reactor is operating at full power the databank will contain reactor operating history and reactor physics data, and also post-irradiation examination data for the discharged units. The databank will represent a complete data compilation of in-reactor performance of fully documented materials. The current size of the databank is of the order of 100 megabytes and is expected to increase to approximately 200 megabytes over the next 2 years.

- 3888 EFFECT OF ENGINEERED SAFETY FEATURES ON THE RISK OF HYPOTHETICAL LMFBR ACCIDENTS. Cybulskis, P. (Battelle Columbus Labs., OH). Nucl. Saf.; 19: No. 2, 190-204(1978).

The risks of hypothetical core-disruptive accidents in liquid-metal-cooled fast breeder reactors which involve meltthrough of the reactor vessel are compared for two plant designs: one design without specific provisions to accommodate such an accident and the other design with an ex-vessel core catcher and a cavity hot liner. The approach to risk analysis used is that developed in the Reactor Safety Study (WASH-1400). Since the probability of occurrence of such an event has not been evaluated, however, insight into the potential risk is gained only on a relative basis. The principal conclusions of this study are: (1) adding a core catcher--hot liner reduces the probability of accidents having major consequences; (2) the degree to which hot liner--core catcher systems can reduce the risk of melt-through accidents is limited by the failure probability of these systems; (3) fractional radioactive releases to the environment in the liquid-metal-cooled fast breeder reactor accidents considered are comparable to those from the light-water reactors evaluated in WASH-1400; (4) since sodium--concrete reactions are a dominant driving force during the accident, the integrity of the cavity liner is as important as the function of the core catcher; (5) there may be other accidents or paths to radioactive releases that are not affected by the addition of a hot liner--core catcher.

- 3889 CLINCH RIVER BREEDER REACTOR PLANT SAFETY STUDY. Piper, H.B.; Conradi, L.L.; Buhl, A.R.; Wood, P.J.; Leaver, D.E.W. Nucl. Saf.; 19: No. 3, 316-329(1978).

The article presents a review and discussion of the objectives, methods, techniques, and results of a safety study that was conducted for the Clinch River Breeder Reactor (CRBR) Plant. The objectives of the study were: (1) to provide a realistic assessment of accident risks to the public associated with operation

of the CRBR, (2) to place these identified risks in perspective with other local societal risks, and (3) to aid in determining whether accident risks from the CRBR are comparable to those of previously licensed reactors. Achievement of the objectives of the study has required identification of significant contributors to risk in a logical and orderly manner. Consideration of a comprehensive set of accident initiators, inclusion of experience data, reliance on proven methods and techniques, evaluation of a wide range of radionuclide releases and associated health effects, and utilization of experienced risk analysis are the salient elements employed in the systematic approach to this study. This, together with heavy reliance on experience gained during years of LWR design, licensing, and operation, provides reasonable assurance that the study objectives have been achieved. The results of the CRBR Plant Safety Study indicate that the risk arising from the operation of the CRBR Plant is small in comparison to other local societal risks and that the risk from the CRBR Plant is comparable to the risk from previously licensed nuclear power plants, as identified in the Reactor Safety Study.

- 3890 SODIUM LOOP SAFETY FACILITY. Gartside, C.H.; Bezella, W.A.; Thompson, D.H.; Lennox, D.H.; Tessier, J.H. (Argonne National Lab., IL). Nucl. Saf.; 19: No. 3, 339-354(1978).

As the only facility in the United States capable of conducting safety tests on relatively large, full-length liquid-metal fast breeder reactor (LMFBR) fuel assemblies at steady-state power levels, the Sodium Loop Safety Facility (SLSF) is an important part of the LMFBR Safety Program. The in-pile experiments that began in September 1975 in the Engineering Test Reactor (ETR) are providing data needed for assessment of critical safety questions. Presented in the article are descriptions of the facility, its experimental capabilities, and the overall research program.

- 3897 COMPUTER CODE SEURBNK-2 FOR FAST

REACTOR CONTAINMENT SAFETY STUDIES. Cameron, I.G.; Hankin, B.C.; Warham, A.G.P. (UKAEA Weapons Group, Aldermaston. Atomic Weapons Research Establishment); Benuzzi, A.; Yerkess, A. (Commission of the European Communities, Ispra (Italy). Joint Research Centre). Comput. Phys. Commun.; 13: No. 5, 297-310(1978).

The paper describes the theory and capabilities of the SEURBNUK-2 fluid flow code developed by JRC Ispra and AWRE Aldermaston for use in containment analysis for fast reactor safety studies. It is a 2D Eulerian code and is a major extension of the SURBOUM code developed earlier by Belgonucleaire and Aldermaston. SEURBNUK-2 has a full thin shell treatment for tanks of arbitrary shape and is able to include the effects of compressibility of the fluid. To check on the codes treatment of compressibility, results are presented for SEURBNUK calculations of an Ispra test shot 114 for the expansion of a Belgonucleaire charge in an overstrong water filled vessel. Comparisons are made both with experimental results and with calculations done on the 2D Lagrangian code REXCO-H and ASTARTE-2.

3898 TRANSFER FUNCTION OF TEMPERATURE FLUCTUATIONS FOR LIQUID METAL SLUG FLOW. Bunsch, J. (Eidgenössische Technische Hochschule, Zurich (Switzerland). Inst. fuer Reaktortechnik). Atomkernenergie; 31: No. 1, 23-27(1978).

The axial transport of temperature fluctuations in vertical slug flow is investigated. The behaviour of the temperature fluctuations in the high frequency range is well described only if heat conduction as a dissipation mechanism is taken into account. In the case of high thermal conductivity of the fluid a simple approximation for the transfer function of temperature fluctuations is found. Its form explains why the fluid velocity may be derived from the peak of temperature cross-correlation functions. Numerical results for the transfer function are given for liquid sodium. The influence of the axial conduction on the determination of heat transfer coefficient from temperature transfer functions is discussed.

3899 SODIUM-NAK ENGINEERING HANDBOOK. VOLUME III. SODIUM SYSTEMS, SAFETY, HANDLING, AND INSTRUMENTATION. Foust, O.J. (ed.). New York; Gordon and Breach, Science Publishers, Inc. (1978). 346p. (TID--28754).

The handbook is intended for use by present and future designers in the Liquid Metals Fast Breeder Reactor (LMFBR) Program and by the engineering and scientific community performing other type investigation and experimentation requiring high-temperature sodium and NaK technology. The arrangement of subject matter progresses from a technological discussion of sodium and sodium-potassium alloy (NaK) to discussions of various categories and uses of hardware in sodium and NaK systems. Emphasis is placed on sodium and NaK as heat-transport media. Sufficient detail is included for basic understanding of sodium and NaK technology and of technical aspects of sodium and NaK components and instrument systems. Information presented is considered adequate for use in feasibility studies and conceptual design, sizing components and systems, developing preliminary component and system descriptions, identifying technological limitations and problem areas, and defining basic constraints and parameters.

3900 FLOW AND MIXING CONDITIONS IN THE UPPER

PLENUM OF THE SNR 300. Benemann, A.; Granner, N.; Penny, W.; Schmidt, H.; Voj, P. (Internationale Atomreaktorbau G.m.b.H. (INTERATOM), Bergisch Gladbach (Germany, F.R.)). pp 126-129 of Reaktortagung, Hannover. Sektion 1. Reaktorauslegung. Eggenstein-Leopoldshafen, Germany, F.R.; Zentralstelle fuer Atomkernenergie-Dokumentation (1978). (In German)
From Reactor congress; Hannover, F.R. Germany (4 Apr 1978).

The sodium-cooled nuclear reactor is characterized by a relatively large upper tank plenum within which phenomena of energy and material transport determine the temperature and velocity distributions in the hot legs of the primary loop. During steady-state as well as transient loads this flow volume has the function of a mixing chamber for homogenizing the flow conditions and the sodium temperatures. Decisive for the mixing process are the different forces acting on the mass transport respectively the relations between them. During transient phenomena with greatly changing density conditions pressure gradients, forming on account of the differential densities, possibly may not be reduced because of the inertia forces of the flow, thus subvolumes of the upper plenum not taking part any more in the mixing process.

(CEA Centre d'Etudes Nucleaires de Grenoble, 38 (France)). pp 122-125 of Reaktortagung, Hannover. Sektion 1. Reaktorauslegung. Eggenstein-Leopoldshafen, Germany, F.R.; Zentralstelle fuer Atomkernenergie-Dokumentation (1978).

From Reactor congress; Hannover, F.R. Germany (4 Apr 1978).

In the case of SUPER-PHENIX, in view of both the difficulties involved in the apprehension of sodium temperatures under turbulent flow conditions, with forced, natural or mixed convection and the lack of accurate data on the characteristics of certain stainless steels at temperatures between 500°C and 600°C, it is clear that extensive means of investigation must be developed, including both computer programs and test facilities. Present results would tend to indicate that the choice of a double vessel system, using two vessels separated by a sodium filled cavity acting as a buffer between the hot and cold collectors, would provide a satisfactory solution from the technological viewpoint. With this type of set-up, the inner vessel acts essentially as a heat shield whereas the outer vessel bears the weight of the surrounding structures: It is required to withstand certain primary stresses but remains relatively cool.

- 3906 EXPERIMENTAL DETERMINATION OF LOCAL TEMPERATURE FIELD VARIATIONS DUE TO SPACER GRIDS IN THE CLADDING TUBES OF A ROD CLUSTER FLOWED THROUGH BY SODIUM. Moeller, R.; Tachoeke, H. (Kernforschungszentrum Karlsruhe (Germany, F.R.). Inst. fuer Reaktorbauelemente). pp 110-113 of Reaktortagung, Hannover. Sektion 1. Reaktorauslegung. Eggenstein-Leopoldshafen, Germany, F.R.; Zentralstelle fuer Atomkernenergie-Dokumentation (1978). (In German)

From Reactor congress; Hannover, F.R. Germany (4 Apr 1978).

If spacer grids are used to keep the fuel rods in their places - as in the fuel elements of the SNR series, exact tests are necessary to find out whether and to what extent temperature peaks near the supporting points affect cladding tube design. To clarify this special problem, experimental investigations have been carried out for the first time in a rod cluster

Eggenstein-Leopoldshafen, Germany, F.R.; Zentralstelle fuer Atomkernenergie-Dokumentation (1978).
From Reactor congress; Hannover, F.R. Germany (4 Apr 1978).
The comparative loss of flow accident analysis has provided a deeper understanding about possibilities and limits of the different applied approaches to accident analysis. The outlined differences could be explained by more detailed model comparisons. Although the degree of sophistication in modeling was considerably different all codes lead to a reasonably good agreement in integral results such as the molten fuel energy.

Work performed under United States-Japanese Fast Reactor Exchange Program.
This report summarizes the water test of the MONJU primary sodium pump mock-up. The water test was performed in 1977. The cross sectional configuration and general design characteristics of the MONJU primary sodium pump mock-up are given.

- 3919 THOUGHTS ON THE ENERGY SITUATION. Wideroe, R. (Nussbaumen, Baden, Switz). Atomkernenergie; 31: No. 2, 67-73(1978).
The only possible solution to the energy problem in the long term is breeder reactors, according to the author. The non-proliferation treaty (NPT) is explained, and it is shown that supervision of plutonium production necessary for breeder power plants would be possible. The fusion of deuterium and tritium today still remains a "magic talisman" and will only provide power under economically acceptable conditions after a long development time. 27 refs.

- 3920 APPLICATION OF REACTOR SCRAM EXPERIENCE IN RELIABILITY ANALYSIS OF SHUTDOWN SYSTEMS. Edison, G.E.; Gerstner, M.T. Nucl. Saf.; 19: No. 6, 712-722(1978).
Scram experience at a liquid-metal-cooled fast breeder reactor (LMFBR) and 14 commercial light-water reactors (LWRs) has been reviewed and analyzed for application in the reliability analysis of LMFBR shutdown systems. The date and reactor power for each scram were compiled from monthly plant operating reports and personal communications with plant operating personnel. The scram frequency in the Experimental Breeder Reactor II (EBR-II) has been higher than that in commercial LWRs because of its conservative shutdown system

design which leads to more scrams from minor causes. The scram frequency of the EBR-II has declined rapidly with operating experience as some of the overly conservative scrams are eliminated. The EBR-II data trend and other facts suggest that the scram frequency for large LMFBRs is likely to be in the same general range as that for commercial LWRs. The scram frequency curve in LWRs resembles a reliability bathtub curve, with the useful-life phase of operation leveling off at approximately 2.5 scrams per year. A Weibull distribution appears to represent the data well in the early-life portion of the curve. No sign of a wear-out phase is evident after 16 years of operation.

- 3921 **EXPERIMENTAL DETERMINATION OF RELIABILITY DATA.** Brasz, J.; Smit, C.C. (TNO-50MW Test Facility, Hengelo, Netherlands). pp 161-180 of Reliability problems of reactor pressure components. Vol. 1. Vienna; International Atomic Energy Agency (1978). From Symposium on application of reliability techniques to nuclear power plants; Vienna, Austria (10 Oct 1977).
- Failure data of sodium components in the TNO-50MW Test Facility at Hengelo in the Netherlands have been collected and evaluated from start-up in July 1971 up to 1977, covering a total operating time of about 25000h. Failure rates together with the 90% confidence intervals have been determined for the following sodium components: valves, pumps, pipes, pipe welds, thermocouples and trace-heating elements. Statistical data are presented from which the failure rates have been calculated. Different failure modes are considered. The relatively high failure rates for most of the components during the start-up phase of the 50MW Test Facility were followed by much lower constant failure rates. For components for which enough statistics were available, a bath-tub curve could be demonstrated without showing an increase in failure rate due to fatigue or wear. The availability of the 50MW Test Facility increased more than corresponds with the increasing mean time between failure (MTBF) owing to a simultaneous decrease in the mean time to repair (MTTR). The minimum sample size for the experimental determination of a failure rate highly depends on the required confidence level. High confidence levels yield very pessimistic results, especially when the number of failures occurring in the test sample is limited.
- 3922 **PMS: AN EFFECTIVE MANAGEMENT SYSTEM FOR POWER PLANT ENGINEERING DESIGN.** Hover, J.G.; Simmons, R.T. (Burns and Roe, Inc., Oradell, NJ). Am. Soc. Mech. Eng., [Pap.]; No. 78-WA/Mgt-6, 1-11(1978).
- The design and construction of today's large and complex power plants (especially nuclear) demand close control of costs and schedules. Thus, there is an urgent need for an efficient system for controlling cost and schedule performance. This paper describes Burns and Roe's experiences in developing and implementing a management control system that conforms to the requirements of the Department of Energy's Performance Measurement System (PMS). The paper explores the underlying structure of the system and its effectiveness as an important tool for all levels of management of the Clinch River Breeder Reactor Plant Project. Analysis of the PMS criteria issued by the Division of Reactor Research and Technology (RRT) of the Department of Energy (DOE) reveals many basic project elements which are essential to an effective management

control system. Rather than attempt to cover all the criteria, Burns and Roe has chosen to discuss several key elements which we feel can be applied to the engineering and architectural design of any size design or construction project regardless of whether compliance with the PMS is a requirement. These elements are: astute organization of project work; rigorous budget and schedule baseline maintenance; integration of costs, schedules, and work scope; and performance measurement. This paper examines these elements in detail and discusses their application to the Clinch River Project. The paper concludes that the application of the basic management control principals embodied in the criteria, and in particular the four elements discussed, can provide project management and the Client with a highly effective means of managing the detailed costs and complex schedules associated with power plant engineering design.

- 3923 **MAINTENANCE EXPERIENCE WITH SODIUM SYSTEMS AT EXPERIMENTAL BREEDER REACTOR II (EBR-II).** Leman, J.D. (Argonne National Lab., Idaho Falls, ID). Am. Soc. Mech. Eng., [Pap.]; No. 78-JPGC-NE-5, 0-12(1978).
- The reliability of components in sodium and sodium-related systems has been very high over the past fourteen years at EBR-II. Fuel-handling components require the most maintenance, but even these components have functioned with only minor difficulties with over 17,000 operations. One primary pump was removed in 1971 for repairs. The second pump has operated for over 70,000 hr and has not been removed since original start-up. Maintenance of auxiliary systems, such as the purification systems and secondary sodium system, have required the replacement of several bellows sealed valves and several cold traps but very little other repair work has been required. Sodium system component repair requires unique, but usually simple, techniques and equipment. A run-beyond-cladding-breach-program was initiated in the Spring of 1977; in conjunction with this program, some counter measures to control fission-gas release were implemented.
- 3924 **MAINTENANCE AND REQUALIFICATION OF A LARGE LMFBR COMPONENT.** Marshall, J.L.; Coops, W.J.; Baxter, W.F.; Goolsby, D.K. (Hanford Engineering Development Lab., Richland, WA). Am. Soc. Mech. Eng., [Pap.]; No. 78-JPGC-NE-1, 1-13(1978).
- The engineering model of the Fast Flux Test Facility (FFTF) In-Vessel Fuel Handling Machine was utilized to demonstrate the water vapor nitrogen process for cleaning 1 and intricate sodium wetted components, determine criteria for requalification of such components before reinstallation in the FFTF, and test design features of the handling system that will be used at FFTF after the components become radioactive. The paper describes the above activity and the radioactive handling equipment currently being assembled for testing. The paper also describes repair operations of a large radioactive component. 2 refs.

Probst, A.; Lenzer, C.; Pfeifer, A.; Benz, G.; Engelsberger, M.; Gerstein, L.; Hubrig, H.; Riesenhuber, H.; Laufs, P.; Stabenhausen, L. Bonn-Bad Godesberg, Germany. F.R.; Heger (1978). 3p. (In German).
- The Federal government has proposed an

amendment of the Atomic Energy Act according to which breeders can only be licensed if they are facilities with a demonstration and prototype character. The regulation eliminates all reliable, governmental backing conditions for public utilities which want to order breeders. It is not realistic to assume that the power industry will notably invest in the commercial utilization of breeders when the Atomic Energy Act not only does not promise their utilization, but even excludes it for the time being. This also means that there is no reason for considerable governmental financial support for breeders, as governmental promotion only becomes justified when there are prospects of commercial utilization. Furthermore, the question arises whether the reprocessing of spent fuel elements is now endangered, because reprocessing has been defended so far on the ground that by using Pu and U in breeders, uranium can be utilized up to a factor 60 times higher.

to be the identification of options for international cooperation which merited further consideration and which might become the subject of subsequent, more detailed analysis. During the course of the study, modifications in U.S. breeder policy led to an expansion of the analysis to embrace the pros and cons of the major breeder-related policy issues, as well as the respective views of national governments on those issues. The resulting examination of views and patterns of international collaboration emphasizes what was implicit from the outset: Options for international cooperation cannot be fashioned independently of national objectives, policies and programs. Moreover, while similarity of views can stimulate cooperation, this cannot of itself provide compelling justification for cooperative undertakings. Such undertakings are influenced by an array of other national factors, including technological development, industrial infrastructure, economic strength, existing international ties, and historic experience.

- 3926 PERFORMANCE CONSIDERATIONS OF NUCLEAR REACTOR ACTINIDE RECYCLE AS A WASTE MANAGEMENT ALTERNATIVE. Murphy, D.J. Jr. Tucson, AZ; Univ. of Arizona (1978). 161p. University Microfilms Order No. 7812922.

Thesis (Ph. D.).

Transplutonium actinide disposal by fission reactor recycle is examined. The neutronic parameters are evaluated for several average reactor neutron flux energies in the range 325 to 1071 keV. Simplified one-dimensional analytical models of CRBR and EBR-2 in conjunction with the computer codes ANISN and DEER are used for the computations. Results indicate that if the average neutron flux energy is large enough (above approx. 580 keV), then the transplutonium waste actinides behave more as fuels than as wastes. Using the same volumetric power density and radial geometry as EBR-2, a "generic actinide burner reactor" model, fueled solely with transplutonium actinides, is studied. Results show that the actinides are neutronically reactive enough to support a critical chain reaction. The long-term burnup performance indicates that equilibrium is established faster as average flux spectrum energy increases. Increasing the power density increases the time required to establish equilibrium. The specific reactivity (fuel value) and the long-term burnup performance of several actinide-lanthanide mixtures are evaluated. It is shown that although the lanthanides degrade the fuel value of the mixture, the time required to establish equilibrium actinide concentration is essentially unchanged. An analysis of the sensitivity of the results to uncertainties in the actinide nuclear cross section data show that the long-term actinide burnup performance is only slightly affected by relatively large uncertainties in the nuclear area. - 3927 INTERNATIONAL COOPERATION ON BREEDER REACTORS. Gray, J.E.; Kratzer, M.B.; Leslie, K.E.; Paige, H.W.; Shantzis, S.B. New York; Rockefeller Foundation (1978). 180p.

In March 1977, as the result of discussions which began in the fall of 1976, the Rockefeller Foundation requested International Energy Associates Limited (IEAL) to undertake a study of the role of international cooperation in the development and application of the breeder reactor. While there had been considerable international exchange in the development of breeder technology, the existence of at least seven major national breeder development programs raised a *prima facie* issue of the adequacy of international cooperation. The final product of the study was

From 1978 winter meeting of American Nuclear Society; Washington, DC, USA (12 Nov 1978).
CLINCH RIVER BREEDER REACTOR; REACTOR INSTRUMENTATION; FAILED ELEMENT DETECTION
- 3948 CALIBRATION OF ELECTROMAGNETIC FLOWMETERS BY AVERAGE-FREQUENCY METHOD. Fujino, M.; Izumi, S. (Hitachi Ltd., Ibaraki, JP); Fukuda, T.; Sano, K. Trans. Am. Nucl. Soc.; 30: 510-512(1978). (CONF-7811109--).
From 1978 winter meeting of American Nuclear Society; Washington, DC, USA (12 Nov 1978).
LMFBR. LMFBR TYPE REACTORS; PRIMARY COOLANT CIRCUITS; FLOWMETERS; CALIBRATION
- 3949 DEVELOPMENT OF A STATE-OF-ART THERMAL MIXER. Kasza, K.E.; Bobis, J.P. (Argonne National Lab., IL). Trans. Am. Nucl. Soc.; 30: 524-525(1978). (CONF-7811109--).
From 1978 winter meeting of American Nuclear Society; Washington, DC, USA (12 Nov 1978).
CLINCH RIVER BREEDER REACTOR; PRIMARY COOLANT CIRCUITS; SODIUM; LIQUID FLOW; PIPES; MIXERS; PERFORMANCE; THERMAL STRESSES; FAILURES
- 3950 COMPARISONS OF XX08 STEADY-STATE TEMPERATURE MEASUREMENTS WITH ANALYTICAL PREDICTIONS. Betten, P.R.; Chang, L.K.; Tokar, J.V. (Argonne National Lab., IL). Trans. Am. Nucl. Soc.; 30: 528-529(1978). (CONF-7811109--).
From 1978 winter meeting of American Nuclear Society; Washington, DC, USA (12 Nov 1978).
LMFBR. LMFBR TYPE REACTORS; FUEL ASSEMBLIES; HYDRAULICS; HEAT TRANSFER; COMPUTER CODES
- 3951 TRIANGULAR EDGE-SUBCHANNEL WIRE-WRAP PHIFUNCTIONS FOR FLOW BLOCKAGE ANALYSIS. Lin, E.-I.H.; Sha, W.T. (Argonne National Lab., IL). Trans. Am. Nucl. Soc.; 30: 529-531(1978). (CONF-7811109--).
From 1978 winter meeting of American Nuclear Society; Washington, DC, USA (12 Nov 1978).
LMFBR. LMFBR TYPE REACTORS; FUEL ASSEMBLIES; FLOW BLOCKAGE; COMPUTER CODES; HYDRAULICS; TEMPERATURE GRADIENTS
- 3952 THERMAL CONDUCTIVITY DURING INITIAL STAGE RESTRUCTURING IN SPHERE-PAC FUEL. Ades, M.; Peddicord, K.L.; Guenther, R.J. (Oregon State Univ., Corvallis). Trans. Am. Nucl. Soc.; 30: 531-532(1978). (CONF-7811109--).
From 1978 winter meeting of American Nuclear Society; Washington, DC, USA (12 Nov 1978).
LMFBR. LMFBR TYPE REACTORS; FUEL PARTICLES; THERMAL CONDUCTIVITY
- 3953 THREE-DIMENSIONAL NUMERICAL SIMULATION OF FLOW BLOCKAGE IN A 19-PIN LMFBR FUEL ASSEMBLY. Domanus, H.M.; Sha, W.T. (Argonne National Lab., IL). Trans. Am. Nucl. Soc.; 30: 534-535(1978). (CONF-7811109--).
From 1978 winter meeting of American Nuclear Society; Washington, DC, USA (12 Nov 1978).
LMFBR TYPE REACTORS; FUEL PINS; FUEL ASSEMBLIES; FLOW BLOCKAGE; HYDRAULICS; HEAT TRANSFER
- 3954 THREE-DIMENSIONAL COUPLED COOLANT CELL HEAT TRANSFER ANALYSIS OF FINITE HEXAGONAL LMFBR BUNDLES. Wong, C.N.; Wolf, L. (Massachusetts Inst. of Tech., Cambridge). Trans. Am. Nucl. Soc.; 30: 540-541(1978). (CONF-7811109--).
From 1978 winter meeting of American Nuclear Society; Washington, DC, USA (12 Nov 1978).
LMFBR TYPE REACTORS; FUEL ASSEMBLIES; HEAT TRANSFER; THREE-DIMENSIONAL CALCULATIONS; TEMPERATURE GRADIENTS
- 3955 PRESSURE DROP MEASUREMENTS IN LMFBR WIRE-WRAPPED BLANKET BUNDLES. Chiu, C.; Todreas, N.E.; Rohsenow, W.M. (Massachusetts Inst. of Tech., Cambridge). Trans. Am. Nucl. Soc.; 30: 541-543(1978). (CONF-7811109--).
From 1978 winter meeting of American Nuclear Society; Washington, DC, USA (12 Nov 1978).
LMFBR TYPE REACTORS; FUEL ASSEMBLIES; PRESSURE DROP; HYDRAULICS; CONFIGURATION
- 3956 TURBULENT MIXING EXPERIMENT AND MODEL FOR WIRE-WRAPPED ASSEMBLIES. Chiu, C.; Todreas, N.E.; Rohsenow, W.M. (Massachusetts Inst. of Tech., Cambridge). Trans. Am. Nucl. Soc.; 30: 547-548(1978). (CONF-7811109--).
From 1978 winter meeting of American Nuclear Society; Washington, DC, USA (12 Nov 1978).
LMFBR. LMFBR TYPE REACTORS; FUEL RODS; HYDRAULICS; TURBULENT FLOW; FUEL ASSEMBLIES
- 3957 CRITICAL HEAT FLUX MEASUREMENTS IN AN LMFBR EVAPORATOR TUBE. France, D.M.; Chiang, T.; Carlson, R.D. (Argonne National Lab., IL). Trans. Am. Nucl. Soc.; 30: 548(1978). (CONF-7811109--).
From 1978 winter meeting of American Nuclear Society; Washington, DC, USA (12 Nov 1978).
LMFBR TYPE REACTORS; STEAM GENERATORS; CRITICAL HEAT FLUX
- 3958 POOL-TYPE LARGE BREEDER REACTOR PLANT DESIGN. McDonald, J.; Brunings, J.; Moody, E. (Atomics International, Canoga Park, CA). Trans. Am. Nucl. Soc.; 30: 564-565(1978). (CONF-7811109--).
From 1978 winter meeting of American Nuclear Society; Washington, DC, USA (12 Nov 1978).
LMFBR TYPE REACTORS; SPECIFICATIONS
- 3959 1000-MW(E) POOL PLANT LMFBR FABRICATION AND CONSTRUCTION. Moody, E. (Atomics International, Canoga Park, CA); Cook, J.P.; Gill, C.J. Trans. Am. Nucl. Soc.; 30: 565-566(1978). (CONF-7811109--).
From 1978 winter meeting of American Nuclear Society; Washington, DC, USA (12 Nov 1978).
LMFBR TYPE REACTORS; FABRICATION; CONSTRUCTION
- 3960 IMPACT OF DESIGN CONSTRAINTS ON THE SELECTION OF FEASIBLE DESIGNS. Lam, P.S.K.; Turski, R.B.; Barthold, W.P. (Argonne National Lab., IL). Trans. Am. Nucl. Soc.; 30: 573-575(1978). (CONF-7811109--).
From 1978 winter meeting of American Nuclear Society; Washington, DC, USA (12 Nov 1978).
LMFBR. LMFBR TYPE REACTORS; FUEL PINS; DESIGN; COMPARATIVE EVALUATIONS
- 3961 GENERIC TRANSIENT LIMIT CURVES FOR LMFBR CORE DESIGN GUIDANCE. Coffield, R.D. Jr.; Markley, R.A.; Dickson, P.W.; Anderson, H.C. III. (Westinghouse Advanced Reactors Div., Madison, PA). Trans. Am. Nucl. Soc.; 30: 575-576(1978). (CONF-7811109--).
From 1978 winter meeting of American Nuclear Society; Washington, DC, USA (12 Nov 1978).
LMFBR TYPE REACTORS; REACTOR CORES; FUEL PINS; SPECIFICATIONS; TRANSIENTS; DESIGN; PERFORMANCE

- 3962 NUCLEAR DESIGN OF HETEROGENEOUS CARBIDE-FUELED LMFBR CORES. Brittingham, J.C.; Vitt, J.A. (Atomics International, Canoga Park, CA). Trans. Am. Nucl. Soc.; 30: 576-578(1978). (CONF-7811109--).
From 1978 winter meeting of American Nuclear Society; Washington, DC, USA (12 Nov 1978).
LMFBR TYPE REACTORS; REACTOR CORES; SPECIFICATIONS
- 3963 PHYSICS PERFORMANCE OF HETEROGENEOUS LMFBRs WITH INTERNAL AXIAL BLANKETS. Su, S.F. (Argonne National Lab., IL). Trans. Am. Nucl. Soc.; 30: 578-579(1978). (CONF-7811109--).
From 1978 winter meeting of American Nuclear Society; Washington, DC, USA (12 Nov 1978).
LMFBR TYPE REACTORS; REACTOR CORES; REACTOR KINETICS; REACTIVITY WORTHS; REACTIVITY COEFFICIENTS; CONFIGURATION; SPECIFICATIONS
- 3964 SELECTION OF REACTOR COVER SEALS AND BEARINGS FOR A 1000-MW(E) LMFBR. McEdwards, J.A.; Brunings, J.E.; Materas, J.L.; Sayles, C.W. (Atomics International, Canoga Park, CA). Trans. Am. Nucl. Soc.; 30: 579-580(1978). (CONF-7811109--).
From 1978 winter meeting of American Nuclear Society; Washington, DC, USA (12 Nov 1978).
LMFBR TYPE REACTORS; REACTOR VESSELS; CLOSURES; SEALS; SPECIFICATIONS
- 3965 DECOMMISSIONING OF FERMI-1. Alexanderson, E.L. (Detroit Edison Co., Detroit, MI). Trans. Am. Nucl. Soc.; 30: 551-553(1978). (CONF-7811109--).
From 1978 winter meeting of American Nuclear Society; Washington, DC, USA (12 Nov 1978).
ENRICO FERMI-1 REACTOR; REACTOR DECOMMISSIONING
- 3966 THERMAL AND ECONOMIC PERFORMANCE OF HETEROGENEOUS CARBIDE-FUELED REACTORS. Felten, L.D.; Galluzzo, N.G.; Vitt, J.A.; von Arx, A.V. (Atomics International, Canoga Park, CA). Trans. Am. Nucl. Soc.; 30: 487-488(1978). (CONF-7811109--).
From 1978 winter meeting of American Nuclear Society; Washington, DC, USA (12 Nov 1978).
LMFBR TYPE REACTORS; ECONOMICS; REACTOR OPERATION; FUEL CYCLE; PERFORMANCE; PLUTONIUM CARBIDES; URANIUM CARBIDES; THORIUM CARBIDES
- 3967 B₄C ABSORBER PIN IN-REACTOR RUPTURE TEST. Pitner, A.L.; Hollenberg, G.W.; Jackson, J.L.; Basmajian, J.A. (Hanford Engineering Development Lab., Richland, WA). Trans. Am. Nucl. Soc.; 30: 188-189(1978). (CONF-7811109--).
From 1978 winter meeting of American Nuclear Society; Washington, DC, USA (12 Nov 1978).
BORON CARBIDES; CONTROL ELEMENTS; RUPTURES; TESTING; EBR-2 REACTOR; PRESSURE DEPENDENCE; PHYSICAL RADIATION EFFECTS
- 3968 IN-CORE GAS RELEASE CAPSULE DEVELOPMENT. Kolowith, R.; Miller, W.C. (Hanford Engineering Development Lab., Richland, WA). Trans. Am. Nucl. Soc.; 30: 635-636(1978). (CONF-7811109--).
From 1978 winter meeting of American Nuclear Society; Washington, DC, USA (12 Nov 1978).
FFTF REACTOR; FAILED ELEMENT MONITORS; TESTING; FISSION PRODUCTS; GASES
- 3969 CORRELATIONS OF CALCULATED REACTIVITIES OF EBR-II LOADINGS. Meneghetti, D.; Opelka, J.H. (Argonne National Lab., IL). Trans. Am. Nucl. Soc.; 30: 707-708(1978). (CONF-7811109--).
From 1978 winter meeting of American Nuclear Society; Washington, DC, USA (12 Nov 1978).
EBR-2 REACTOR; REACTIVITY; REACTOR CORES; CONFIGURATION
- 3970 EXPERIENCE IN REMOTELY FABRICATING EBR-II FUEL. Feldman, M.J. (Oak Ridge National Lab., TN); Grant, N.R.; Hampson, D.C.; Fryer, R.M. Trans. Am. Nucl. Soc.; 30: 309-310(1978). (CONF-7811109--).
From 1978 winter meeting of American Nuclear Society; Washington, DC, USA (12 Nov 1978).
EBR-2 REACTOR; FUEL ELEMENTS; FABRICATION
- 3971 INSPECTION TECHNIQUES AND PROCESSES FOR CONTROLLING FFTF FUEL QUALITY. Powers, H.G.; McLemore, D.R. (Hanford Engineering Development Lab., Richland, WA). Trans. Am. Nucl. Soc.; 30: 324-325(1978). (CONF-7811109--).
From 1978 winter meeting of American Nuclear Society; Washington, DC, USA (12 Nov 1978).
FFTF REACTOR; FUEL PELLETS; FUEL PINS; INSPECTION; QUALITY CONTROL
- 3972 MECHANICAL PROPERTIES OF TRANSIENT-TESTED IRRADIATED FAST REACTOR CLADDING. Johnson, G.D.; Hunter, C.W. (Hanford Engineering Development Lab., Richland, WA). Trans. Am. Nucl. Soc.; 30: 195-196(1978). (CONF-7811109--).
From 1978 winter meeting of American Nuclear Society; Washington, DC, USA (12 Nov 1978).
FFTF REACTOR; FUEL CANS; SWELLING; STRESSES; TRANSIENTS; PHYSICAL RADIATION EFFECTS; STAINLESS STEEL-316
- 3973 COMPARATIVE STUDIES OF FFTF UPPER-PLENUM MIXING AND STRATIFICATION. Yang, J.W. (Brookhaven National Lab., Upton, NY). Trans. Am. Nucl. Soc.; 30: 535-536(1978). (CONF-7811109--).
From 1978 winter meeting of American Nuclear Society; Washington, DC, USA (12 Nov 1978).
FFTF REACTOR; REACTOR CORES; PRIMARY COOLANT CIRCUITS; HYDRAULICS; HEAT TRANSFER; MIXING
- 3974 FAST FLUX TEST FACILITY CONTAINMENT BUILDING INTEGRATED LEAK-RATE TEST. Farabee, O.A. (Dept. of Energy, Richland, WA); James, E.B. Trans. Am. Nucl. Soc.; 30: 634-635(1978). (CONF-7811109--).
From 1978 winter meeting of American Nuclear Society; Washington, DC, USA (12 Nov 1978).
FFTF REACTOR; CONTAINMENT BUILDINGS; LEAK TESTING; CONTROLLED ATMOSPHERES
- 3975 IMPROVED METHOD FOR CONDUCTING FAILED FUEL EXPERIMENTS IN LWRs. Thomas, R.W.; Klingler, W.B. (EG and G Idaho, Idaho Falls). Trans. Am. Nucl. Soc.; 30: 637-638(1978). (CONF-7811109--).
From 1978 winter meeting of American Nuclear Society; Washington, DC, USA (12 Nov 1978).
ETR sodium loop safety facility. LMFBR TYPE REACTORS; FUEL ELEMENT FAILURE; TRANSIENTS; LOSS OF FLOW; TESTING; ETR REACTOR
- 3976 MEASUREMENT OF INTEGRAL PHYSICS PARAMETERS IN SIMULATED LMFBR MELTDOWN CONFIGURATIONS. Bhattacharyya, S.K.; Bucher, R.G.; Morman, J.A.; Smith, D.M.; Bennett, E.F.; Cohn, C.E.; Robinson, W.R. (Argonne National Lab., IL). Trans. Am. Nucl. Soc.; 30: 699-

- 700(1978). (CONF-7811109--).
From 1978 winter meeting of American Nuclear Society; Washington, DC, USA (12 Nov 1978).
LMFBR TYPE REACTORS; MELTDOWN; REACTIVITY WORTHS; MULTIPLICATION FACTORS; CONTROL ROD WORTHS; CONFIGURATION
- 3977 LOCATION-DEPENDENT COMMON-CAUSE ANALYSIS WITH AN APPLICATION TO FIRES. Leaver, D.; vonHerrmann, J.; Olmos, J.; Boardman, R. (Science Applications, Inc., Palo Alto, CA). Trans. Am. Nucl. Soc.; 30: 360-362(1978). (CONF-7811109--).
From 1978 winter meeting of American Nuclear Society; Washington, DC, USA (12 Nov 1978).
CLINCH RIVER BREEDER REACTOR; REACTOR SAFETY; FIRES; FIRE HAZARDS; RISK ASSESSMENT; MATHEMATICAL MODELS
- 3978 EXPERIMENTAL DETERMINATION OF DECAY POWER IN EBR-II. Gillette, J.L.; Tokar, J.V.; Chang, L.K.; Mohr, D. (Argonne National Lab., IL). Trans. Am. Nucl. Soc.; 30: 412(1978). (CONF-7811109--).
From 1978 winter meeting of American Nuclear Society; Washington, DC, USA (12 Nov 1978).
LMFBR. LMFBR TYPE REACTORS; REACTOR SAFETY; REACTOR SHUTDOWN; AFTER-HEAT; HEAT TRANSFER; HYDRAULICS; EBR-2 REACTOR
- 3979 LMFBR TRANSITION TO NATURAL CIRCULATION FROM AN INITIAL ISOTHERMAL STATE. Singer, R.M.; Gillette, J.L.; Mohr, D.; Tokar, J.V. (Argonne National Lab., IL). Trans. Am. Nucl. Soc.; 30: 412-413(1978). (CONF-7811109--).
From 1978 winter meeting of American Nuclear Society; Washington, DC, USA (12 Nov 1978).
LMFBR TYPE REACTORS; LOSS OF FLOW; REACTOR SAFETY; HYDRAULICS; HEAT TRANSFER; NATURAL CONVECTION; AFTER-HEAT REMOVAL
- 3980 SODIUM VOID REACTIVITY REDUCTION IN METAL-FUELED LMFBRs. Orehwa, Y.; Barthold, W.P. (Argonne National Lab., IL). Trans. Am. Nucl. Soc.; 30: 415-416(1978). (CONF-7811109--).
From 1978 winter meeting of American Nuclear Society; Washington, DC, USA (12 Nov 1978).
LMFBR TYPE REACTORS; REACTOR SAFETY; LOSS OF FLOW; SODIUM; VOID COEFFICIENT; REACTIVITY WORTHS
- 3981 RADIATION HEAT TRANSFER IN A 19-PIN SODIUM-VOIDED BUNDLE. Machbitz, M. (Massachusetts Inst. of Tech., Cambridge); Budiman, B.; Roberts, Y.Y.; Senkan, S.M.; Han, J.T. Trans. Am. Nucl. Soc.; 30: 416-417(1978). (CONF-7811109--).
From 1978 winter meeting of American Nuclear Society; Washington, DC, USA (12 Nov 1978).
LMFBR. LMFBR TYPE REACTORS; REACTOR SAFETY; FLOW BLOCKAGE; FUEL ASSEMBLIES; HEAT TRANSFER; AFTER-HEAT; FUEL PINS
- 3982 MAXIMUM SODIUM TEMPERATURE CORRELATION FOR SIX-CHANNEL FBR SUBASSEMBLY BLOCKAGES. Hanus, N.; Han, J.T.; Fontana, M.H.; Wantland, J.L. (Oak Ridge National Lab., TN). Trans. Am. Nucl. Soc.; 30: 417-419(1978). (CONF-7811109--).
From 1978 winter meeting of American Nuclear Society; Washington, DC, USA (12 Nov 1978).
LMFBR TYPE REACTORS; REACTOR SAFETY; FUEL ASSEMBLIES; FUEL PINS; SODIUM; BOILING; HEAT TRANSFER; TEMPERATURE GRADIENTS; FLOW BLOCKAGE
- 3983 POTENTIAL GAS ENTRY INTO FFTF AFTER A POSTULATED PIPE RUPTURE. McCall, T.B. (Westinghouse Electric Corp., Richland, WA); Markowski, F.J.; Shire, P.R. Trans. Am. Nucl. Soc.; 30: 419-420(1978). (CONF-7811109--).
From 1978 winter meeting of American Nuclear Society; Washington, DC, USA (12 Nov 1978).
FFTF REACTOR; REACTOR SAFETY; LOSS OF COOLANT; PRIMARY COOLANT CIRCUITS; PIPES; FAILURES; HEAT TRANSFER; HYDRAULICS
- 3984 COMPARISON OF THE BEHAVIOR DURING A TUC OF CRBR CARBIDE RELOAD DESIGNS TO THE REFERENCE OXIDE DESIGN. Bergeron, R.J. (Combustion Engineering, Inc., Windsor, CT). Trans. Am. Nucl. Soc.; 30: 420-421(1978). (CONF-7811109--).
From 1978 winter meeting of American Nuclear Society; Washington, DC, USA (12 Nov 1978).
CLINCH RIVER BREEDER REACTOR; REACTOR CORES; REACTOR SAFETY; FUEL PINS; TRANSIENTS; REACTIVITY WORTHS; MOTION
- 3985 BEHAVE-SST INTERPRETATION OF TREAT EXPERIMENTS HUT 5-5A AND HUT 5-5B. Gregoire, K.E.; Atcheson, D.B. (General Electric Co., Sunnyvale, CA). Trans. Am. Nucl. Soc.; 30: 422-423(1978). (CONF-7811109--).
From 1978 winter meeting of American Nuclear Society; Washington, DC, USA (12 Nov 1978).
LMFBR TYPE REACTORS; TRANSIENTS; REACTOR SAFETY; FUEL CANS; FUEL ELEMENT FAILURE
- 3986 STRAIN RATE EFFECTS IN TRANSIENT OVERPOWER CLADDING FAILURE ANALYSES. Atcheson, D.B.; Cole, C.V. (General Electric Co., Sunnyvale, CA). Trans. Am. Nucl. Soc.; 30: 423-424(1978). (CONF-7811109--).
From 1978 winter meeting of American Nuclear Society; Washington, DC, USA (12 Nov 1978).
LMFBR. LMFBR TYPE REACTORS; REACTOR SAFETY; FUEL CANS; STRAINS; FUEL ELEMENT FAILURE; TRANSIENTS; STAINLESS STEEL-316; COMPUTER CODES
- 3987 ANALYSIS OF A HYPOTHETICAL LMFBR ACCIDENT USING THE CODES FUTURE AND FRUMP. Grosberg, A.J. (Imperial Coll. of Science and Tech., London, England); Head, J.L.; Tregonning, K. Trans. Am. Nucl. Soc.; 30: 424-426(1978). (CONF-7811109--).
From 1978 winter meeting of American Nuclear Society; Washington, DC, USA (12 Nov 1978).
LMFBR TYPE REACTORS; FUEL CANS; STRAINS; DEFORMATION; REACTOR SAFETY; TRANSIENTS; REACTOR ACCIDENTS; COMPUTER CODES; FUEL ELEMENT FAILURE
- 3988 DYNAMIC INSTABILITY ANALYSIS OF RUPTURE DISKS BY FINITE ELEMENT METHOD. Hsieh, B.J. (Argonne National Lab., IL). Trans. Am. Nucl. Soc.; 30: 426-427(1978). (CONF-7811109--).
From 1978 winter meeting of American Nuclear Society; Washington, DC, USA (12 Nov 1978).
LMFBR. LMFBR TYPE REACTORS; STEAM GENERATORS; PRESSURE RELEASE; ENGINEERED SAFETY SYSTEMS; PERFORMANCE; RELIEF VALVES; FINITE ELEMENT METHOD
- 3989 THREE-DIMENSIONAL FLUID-STRUCTURE INTERACTION CALCULATIONS FOR THE DYNAMIC RESPONSE OF A POOL-TYPE REACTOR'S IN-TANK COMPONENT. Kulak, R.F.; Fiala, C. (Argonne National Lab., IL). Trans. Am. Nucl. Soc.; 30: 428-429(1978). (CONF-7811109--).
From 1978 winter meeting of American Nuclear Society; Washington, DC, USA (12 Nov 1978).
LMFBR. LMFBR TYPE REACTORS; REACTOR INTERNALS; REACTOR CORE DISRUPTION; REACTOR SAFETY; HYDRAULICS; THREE-DIMENSIONAL CALCULATIONS
- 3990 SODIUM SLUG KINETIC ENERGY BEHAVIOR FOR

- VARYING HCDA ENERGETICS. Zeuch, W.R.; Bratis, J.C. (Argonne National Lab., IL). Trans. Am. Nucl. Soc.; 30: 431-432(1978). (CONF-781109--).
From 1978 winter meeting of American Nuclear Society; Washington, DC, USA (12 Nov 1978).
LMFBR. LMFBR TYPE REACTORS; REACTOR SAFETY; REACTOR CORE DISRUPTION; HYDRAULICS; SODIUM; LIQUID FLOW; STRESSES
- 3991 ANALYSIS OF PRESTRESSED CONCRETE VESSELS FOR HCDA LOADS. Marchertas, A.H. (Argonne National Lab., IL); Belytschko, T.B. Trans. Am. Nucl. Soc.; 30: 432-424(1978). (CONF-781109--).
From 1978 winter meeting of American Nuclear Society; Washington, DC, USA (12 Nov 1978).
LMFBR. LMFBR TYPE REACTORS; REACTOR SAFETY; REACTOR CORE DISRUPTION; REACTOR VESSELS; PRESTRESSED CONCRETE; STRESS ANALYSIS; STRESSES
- 3992 MECHANICAL FAILURE OF SUBASSEMBLY DUCTS AND ITS EFFECTS ON TRANSITION-PHASE ANALYSIS. Hakim, S.J.; Kennedy, J.M. (Argonne National Lab., IL). Trans. Am. Nucl. Soc.; 30: 433-435(1978). (CONF-781109--).
From 1978 winter meeting of American Nuclear Society; Washington, DC, USA (12 Nov 1978).
FTTF REACTOR; REACTOR SAFETY; LOSS OF FLOW; FUEL PINS; FUEL CANS; FUEL ELEMENT FAILURE; COMPUTER CODES; MELTDOWN
- 3993 DEBRIS BED AND SACRIFICIAL MATERIALS INTERACTIONS AT HIGH TEMPERATURES. Plein, H.G.; Carlson, G.A. (Sandia Labs., Albuquerque, NM). Trans. Am. Nucl. Soc.; 30: 436-437(1978). (CONF-781109--).
From 1978 winter meeting of American Nuclear Society; Washington, DC, USA (12 Nov 1978).
LMFBR. LMFBR TYPE REACTORS; REACTOR SAFETY; REACTOR CORE DISRUPTION; MELTDOWN; CORIUM; URANIUM DIOXIDE; STAINLESS STEELS; MAGNESIUM OXIDES; THORIUM OXIDES; COMPATIBILITY; CHEMICAL REACTIONS; HYDRAULICS
- 3994 INTERPRETATION OF DEBRIS BED DRYOUT OBSERVED DURING THE D-3 EXPERIMENT. Rivard, J.B. (Sandia Labs., Albuquerque, NM). Trans. Am. Nucl. Soc.; 30: 437-438(1978). (CONF-781109--).
From 1978 winter meeting of American Nuclear Society; Washington, DC, USA (12 Nov 1978).
LMFBR. LMFBR TYPE REACTORS; REACTOR SAFETY; REACTOR CORE DISRUPTION; MELTDOWN; CORIUM; URANIUM DIOXIDE; DRYOUT; HEAT TRANSFER
- 3995 FUEL DISASSEMBLY EXPERIMENTS USING THE CAPACITOR DISCHARGE VAPORIZATION (CDV) TECHNIQUE. Wright, A.L.; White, J.S.; Kress, T.S.; Bertini, H.W. (Oak Ridge National Lab., TN). Trans. Am. Nucl. Soc.; 30: 438-439(1978). (CONF-781109--).
From 1978 winter meeting of American Nuclear Society; Washington, DC, USA (12 Nov 1978).
LMFBR. LMFBR TYPE REACTORS; REACTOR SAFETY; REACTOR CORE DISRUPTION; FUEL PELLETS; URANIUM DIOXIDE; RADIOACTIVE AEROSOLS; DECOMPOSITION; EVAPORATION
- 3996 MODELING EJECTION OF FRESH FUEL INTO SODIUM UNDER PROMPT-BURST CONDITIONS. Garner, P.L. (Argonne National Lab., IL); Abramson, P.B.; Pizzica, P.A.; Portugal, J.L.; Young, M.F. Trans. Am. Nucl. Soc.; 30: 439-440(1978). (CONF-781109--).
From 1978 winter meeting of American Nuclear Society; Washington, DC, USA (12 Nov 1978).
LMFBR. LMFBR TYPE REACTORS; REACTOR SAFETY; REACTOR CORE DISRUPTION; FUEL-COOLANT INTERACTIONS; COMPUTER CODES; HYDRAULICS
- 3997 EXPLORATORY STUDIES ON CARBIDE FUEL/COOLANT INTERACTIONS. Mync, L. (Argonne National Lab., IL). Trans. Am. Nucl. Soc.; 30: 441(1978). (CONF-781109--).
From 1978 winter meeting of American Nuclear Society; Washington, DC, USA (12 Nov 1978).
LMFBR. LMFBR TYPE REACTORS; REACTOR SAFETY; REACTOR CORE DISRUPTION; FUEL-COOLANT INTERACTIONS; URANIUM CARBIDES; PLUTONIUM CARBIDES; COMPUTER CODES
- 3998 CAMEL SEVEN-PIN FUEL SWEEPOUT TESTS. Spencer, B.W.; Bova, L.; Goldfuss, G.T.; Henry, R.E.; Raridon, D. (Argonne National Lab., IL). Trans. Am. Nucl. Soc.; 30: 443-444(1978). (CONF-781109--).
From 1978 winter meeting of American Nuclear Society; Washington, DC, USA (12 Nov 1978).
LMFBR. LMFBR TYPE REACTORS; REACTOR SAFETY; TRANSIENTS; REACTOR CORE DISRUPTION; CORIUM; HYDRAULICS; LIQUID FLOW; FUEL PINS; FUEL ELEMENT FAILURE
- 3999 SYSTEM HYDRAULIC EFFECTS ON FUEL SWEEPOUT IN THE HYPOTHETICAL TOP ACCIDENT. Spencer, B.W. (Argonne National Lab., IL); Henry, R.E.; Jones, B.G. Trans. Am. Nucl. Soc.; 30: 444-445(1978). (CONF-781109--).
From 1978 winter meeting of American Nuclear Society; Washington, DC, USA (12 Nov 1978).
LMFBR. LMFBR TYPE REACTORS; REACTOR SAFETY; TRANSIENTS; REACTOR CORE DISRUPTION; CORIUM; HYDRAULICS; LIQUID FLOW; FUEL PINS; FUEL ELEMENT FAILURE
- 4000 RESULTS OF FUEL FREEZING TESTS WITH SIMULATED CRBR-TYPE FUEL PINS. Spencer, B.W.; Roth, R.L.; Goldfuss, G.T.; Henry, R.E. (Argonne National Lab., IL). Trans. Am. Nucl. Soc.; 30: 446-447(1978). (CONF-781109--).
From 1978 winter meeting of American Nuclear Society; Washington, DC, USA (12 Nov 1978).
CLINCH RIVER BREEDER REACTOR; REACTOR SAFETY; FUEL PINS; LOSS OF FLOW; TRANSIENTS; FUEL ELEMENT FAILURE; URANIUM DIOXIDE; LIQUID FLOW; SOLIDIFICATION; CORIUM
- 4001 MECHANISTIC MODEL OF FUEL FLOW REGIMES AND FUEL PLATEOUT IN LMFBR OVERPOWER ACCIDENTS. Tentner, A.M.; Wider, H.U.; Bowers, C.H. (Argonne National Lab., IL). Trans. Am. Nucl. Soc.; 30: 448-450(1978). (CONF-781109--).
From 1978 winter meeting of American Nuclear Society; Washington, DC, USA (12 Nov 1978).
LMFBR TYPE REACTORS; REACTOR SAFETY; TRANSIENTS; REACTOR CORE DISRUPTION; CORIUM; SOLIDIFICATION; LIQUID FLOW

- 4022 DEPARTMENT OF ENERGY AUTHORIZATION. VOLUME IV. HEARINGS OF THE COMMITTEE ON SCIENCE AND TECHNOLOGY, U.S. HOUSE OF REPRESENTATIVES, NINETY-FIFTH CONGRESS, SECOND SESSION, MARCH 21, 22, AND APRIL 4, 1978. Washington, DC; Committee on Science and Technology (1978). 442p. GPO.

Under Secretary of Energy Dale Myers said in the hearing on March 21, 1978, that the Administration's position is that Clinch River is not needed, but that technology should be kept in the forefront; that a program must be carried out that "means carrying on those pieces of Clinch River that apply to the technology from an engineering standpoint in terms of testing these various components. Further, have a design study which uses all of the top professional people in these various teams that have been associated with Clinch River, to aid in making design studies of those

things which are coming out of alternate fuel studies." At the March 22, 1978 hearing, Rep. Barry Goldwater, Jr. presented his views on the administration's proposal before proceeding with testimonies. He felt testimonials at the previous hearing did not include answers to "legal, financial, and other implications of terminating the Clinch River project." He said he was (1) concerned about the lengthy delay the abandonment of CRBR followed by a study of the new breeder would entail and (2) confused by the proposed coupling of fuel-cycle studies with plant design. He feels we should pay more attention to the plant itself, especially to such matters as performance, reliability, maintainability, and safety and worry about the fuel cycle later as a means of accelerating this project. At the April 4, 1978 hearing, panelists from industry, utilities, and university and public-interest personnel presented views on the future of the U.S. breeder program. (MCW)

From British Nuclear Energy Society conference on ferritic steels for fast reactor steam generators; London, UK (30 May 1977).

Papers are presented on aspects of the technological development of ferritic steels for fast breeder reactors including physical and mechanical properties, behavior in sodium, corrosion by water, welding, and fabrication. (FS)

- 4031 FERRITIC STEELS FOR FAST REACTOR STEAM GENERATORS. Pugh, S.F.; Little, E.A. (eds.). London, England; British Nuclear Energy Society (1978). 272p. (CONF-770545--P2).

From British Nuclear Energy Society conference on ferritic steels for fast reactor steam generators; London, UK (30 May 1977).

Data are presented concerning ferritic steels for fast reactor steam generators. Separate abstracts were prepared for papers within the scope of the energy data base. (FS)

- 4032 ADVANCED LIQUID METAL FAST BREEDER REACTOR DESIGNS. Sayles, C.W. (Rockwell Int, At Int Div, Canoga Park, Calif). pp vp of Greater Los Angeles Area energy symposium. North Hollywood, CA; West Period Co. (1978).

From 4. energy symposium; Los Angeles, CA, USA (23 May 1978).

Fast Breeder reactor power plants in the 1000-1200 MW(e) range are being built overseas and are being designed in this country. While these reactors have many characteristics in common, a variety of different approaches have been adopted for some of the major features. Some of those alternatives are discussed.

- 4033 THERMAL EXPLOSION HAZARDS IN (FAST) NUCLEAR REACTORS. Zyszkowski, W. (Institute of Nuclear Research, Warsaw (Poland)). At. Energy Rev.; 16: No. 1, 3-87(1978).

The thermal explosion hazard is at the moment one of the crucial issues in the LMFBR safety programme that must be resolved before the commercial introduction of safe, reliable and economic fast breeder reactors. The present status of the understanding of thermal explosions and research activities is reviewed. The results of basic simulation experiments and

out-of-pile and in-pile engineering tests are discussed. The former give some insight into the physical phenomena, such as the triggering and propagation mechanisms of thermal explosion, and the latter reveal real peak pressures and the damage potential that can be expected during reactor accident conditions. The maximum loading of the reactor structure calculated with a variety of parametric models exceeds the containment capability of the present fast reactor design. On the other hand, a discrepancy exists between theory and the experimental evidence, and that, being the main point of the controversy, is discussed in the review.

- 4034 WATER CHEMISTRY IN THE DOUNREAY PROTOTYPE FAST REACTOR (PFR) POWER STATION. Melhuish, K.R.; Bray, J.A. (UKAEA, Dounreay. Nuclear Power Development Establishment). pp 63-76 of Water chemistry of nuclear reactor systems. London, England; Thomas Telford for BNES (1978).

From International conference on chemistry of nuclear reactor systems; Bournemouth, UK (24 Oct 1977).

The water treatment plants comprise three stages: a pre-treatment plant to deal with the high organic loading arising from the moorland catchment area; a make-up plant which was originally a twin stream demineralisation unit, each stream comprising cation bed, anion bed and mixed bed; and a condensate polishing plant of the 'deep bed' type with pre-coat filters. There are two 50% flow candle filter units followed by three 50% flow cation topped mixed bed units. The use of austenitic steels in the superheater and reheater requires close control from the drum water content for sodium, chloride and oxygen to minimise the risks of chloride or caustic stress corrosion.

- 4035 COMMERCIAL FAST REACTOR. Risley, UK; Nuclear Power Co. Ltd. (1978). 13p.

The design of the CFR is briefly described with sections on the primary circuit arrangement, fuel and reactor equipment handling, containment, steam generators, sodium pumps, intermediate heat exchangers and fuel and core layout.

- 4036 OPTIMISATION OF SODIUM-COOLED FAST REACTORS. London, England; British Nuclear Energy Society (1978). 464p. (CONF-771123--). British Nuclear Energy Society, London, England.

From BNES conference on optimization of sodium cooled fast reactors; London, UK (28 Nov 1977).

Separate abstracts were prepared for the individual papers presented at the meeting.

- 4037 SODIUM--NAK ENGINEERING HANDBOOK. VOLUME IV. SODIUM PUMPS, VALVES, PIPING, AND AUXILIARY EQUIPMENT. Foust, D.J. (ed.). Contract EY-76-C-03-0700. New York, NY; Gordon and Breach, Science Publishers, Inc. (1978). 296p. (SAN--0700-T1). Rockwell International Corp., Canoga Park, CA.

The handbook is useful for designers in the Liquid Metals Fast Breeder Reactor (LMFBR) program and by the engineering and scientific community performing investigation and experimentation requiring high-temperature Na and NaK technology. Data are presented for pumps, bearings and seals, valves, vessels and piping, and auxiliary equipment including vapor traps, freeze plugs, fuel-channel flow regulators, antivortexing devices, and miscellaneous mechanical elements. Reactor

materials are also discussed. (FS)

- 4038 FLUIDIZED BED HEAT TRANSPORT BETWEEN PARALLEL, HORIZONTAL TUBE-BUNDLES. (Westinghouse Electr Corp, Res and Dev Cent, Pittsburgh, Pa). pp 320-326 of Fluidization. Newby, R.A.; Keairns, D.L. New York, NY; Cambridge Univ. Press (1978).

From Conference on fluidization; Cambridge, UK (1 Apr 1978).

A fluidized bed heat transfer facility is described and results related to advanced fluidized bed heat exchanger concepts are discussed. Bed-to-tube heat transfer rates within compact tube-bundles and heat transport rates by bed mixing between parallel, horizontal tube-bundles are considered based on preliminary test results. The compact tube-bundles improve bubble distribution in the air-fluidized bed of 80 -M magnesia powder at velocities up to 30 cm/sec. Tube-to-bed heat transfer coefficients for centrally located tubes are generally increased by the presence of compact tube-bundles. A coefficient of bed transport is estimated for the tube-bundle configurations. This work is pertinent to electric power generation.

- 4039 SYSTEM MODELING FOR TRANSIENT ANALYSIS OF LOOP-TYPE LIQUID-METAL-COOLED FAST BREEDER REACTORS. Khatib-Rahbar, M. Ithaca, NY; Cornell Univ. (1978). 386p. University Microfilms Order No. 78-17,862.

Thesis (Ph. D.).

A digital computer simulation model for the dynamic analysis of multiloop liquid-metal-cooled fast breeder reactor plants is developed. The model is capable of simulating operational transients, anticipated incidents, postulated accidents which do not disturb the system geometry, and a major pipe rupture accident in the primary heat transport system. The mathematical model includes: point reactor kinetics, reactivity feedback, and reactor power control; primary, secondary, and tertiary thermal and coolant dynamics governed by forced and natural circulation; and plant protection and control systems.

- 4040 PROBABILISTIC METHODS IN REACTOR LICENSING. Tanguy, P. (Commissariat a l'Energie Atomique, Fontenay-aux-Roses, France). pp I.3.1-I.3.10 of Probabilistic analysis of nuclear reactor safety. La Grange Park, IL; American Nuclear Society, Inc. (1978).

From Probabilistic analysis of nuclear reactor safety; Los Angeles, CA, USA (8 May 1978).

Four years after the publishing of the WASH-1400 report, probabilistic methods still play little part in reactor licensing. One of the reasons could be the need for the general public of a maximum credible accident. Probabilistic methods will play a significant role in licensing only if they are introduced progressively and at different levels: assistance to safety assessments with present safety rules, introduction of new probabilistic safety criteria, definition of an overall risk acceptance level, use of operational experience feedback. The present situation in France is discussed, with the progress achieved and the difficulties met, both on PWR and on LMFBR. For the future, reactor licensing should be more probabilistic, but this requires an international consensus, which could be easily developed for the fast breeders.

- 4041 DEVELOPMENT OF A PROBABILISTIC MODEL OF

CONTAINMENT CONDITIONS FOLLOWING A CORE DISRUPTION ACCIDENT IN A BREEDER REACTOR. Peck, C.B. (General Electric Co., Sunnyvale, CA); Sultan, P. pp V.3.1-V.3.11 of Probabilistic analysis of nuclear reactor safety. La Grange Park, IL; American Nuclear Society, Inc. (1978).

From Probabilistic analysis of nuclear reactor safety; Los Angeles, CA, USA (8 May 1978).

Development of a probabilistic model for the evaluation of conditions in the containment of a breeder reactor following a core disruptive accident is discussed. The model as developed in the third phase of a risk assessment development program is presented. This model orders possible accident progression sequences, using various initial states, reaction modes and rates, and responses of engineered safety systems.

- 4042 RISK ASSESSMENT METHODS APPLICATION TO THE FAST FLUX TEST FACILITY. Feller, K. (General Electric Co., Sunnyvale, CA). pp V.4.1-V.4.12 of Probabilistic analysis of nuclear reactor safety. La Grange Park, IL; American Nuclear Society, Inc. (1978).

From Probabilistic analysis of nuclear reactor safety; Los Angeles, CA, USA (8 May 1978).

The technical approach and results of a risk assessment study based on the Fast Flux Test Facility reference design are summarized. The study was conducted as part of an ongoing effort to develop a technology base for breeder reactor risk assessment. The primary study objective was methods development. Due to the limited scope and lack of expert participation from many important technology areas, the results are not intended to represent the risk resulting from FFTF operation.

- 4043 APPLICATION OF JAMES-STEIN ESTIMATORS IN THE EVALUATION OF THE PHENIX REACTOR DATA BANK. Dubau, J.; Koen, B.V.; Georgin, J.P. pp VI.4.1-VI.4.8 of Probabilistic analysis of nuclear reactor safety. La Grange Park, IL; American Nuclear Society, Inc. (1978).

From Probabilistic analysis of nuclear reactor safety; Los Angeles, CA, USA (8 May 1978).

The James-Stein estimators are used to evaluate failure rate data for the French fast breeder reactor operating components. A comparison with other estimators is also performed.

- 4044 RISK ALLOCATION APPROACH TO REACTOR SAFETY DESIGN AND EVALUATION. Gokcek, O.; Temme, M.I.; Derby, S.L. (General Electric Co., Sunnyvale, CA). pp VII.3.1-VII.3.12 of Probabilistic analysis of nuclear reactor safety. La Grange Park, IL; American Nuclear Society, Inc. (1978).

From Probabilistic analysis of nuclear reactor safety; Los Angeles, CA, USA (8 May 1978).

This paper describes a risk allocation technique used for determining nuclear power plant design reliability requirements. The concept of risk allocation-optimum choice of safety function reliabilities under a maximum risk constraint - is described. An example of risk allocation is presented to demonstrate the application of the methodology.

- 4045 USE OF QUANTITATIVE RISK AND PROBABILISTIC SAFETY CRITERIA IN THE CONCEPTUAL DESIGN OF A LARGE POOL-TYPE LMFBR. Hartung, J.A.; Lancet, R.T. (Atomics International

Div., Canoga Park, CA). pp VII.4.1-VII.4.10 of Probabilistic analysis of nuclear reactor safety. La Grange Park, IL; American Nuclear Society, Inc. (1978).

From Probabilistic analysis of nuclear reactor safety; Los Angeles, CA, USA (8 May 1978).

This paper describes how quantitative risk and probabilistic safety criteria have been used to supplement licensing regulations to guide the safety-related design of a large (1000 MWe) pool-type LMFBR.

4046 DESIGN STAGE PROBABILISTIC ASSESSMENT OF PROTOTYPE LMFBR SAFETY SYSTEMS. Kondo, S.; Togo, Y. (Univ. of Tokyo, Japan). pp VII.6.1-VII.6.20 of Probabilistic analysis of nuclear reactor safety. La Grange Park, IL; American Nuclear Society, Inc. (1978).

From Probabilistic analysis of nuclear reactor safety; Los Angeles, CA, USA (8 May 1978).

Probabilistic assessment has been applied to the design of prototype liquid metal cooled fast breeder reactor safety systems. Natural convection cooling or sufficient length of allowable outage time has been found to be the most desirable feature for assuring high availability of the decay heat removal system. The allowable outage time has been evaluated from probabilistic point of view, and it has been found that large temperature margin is required to determine it due to the uncertainty in the decay heat curve and in the friction factor for fluid flow. For safe shutdown system, several designs of rod drive mechanism as well as structure of logic train have been compared from the reliability viewpoint. Highly reliable shutdown capability has been obtained by the combination of two independent systems. Some discussion has been devoted to the effect of grouping of instrument channels sets, cross-linking, and the reliability under the earthquake condition.

4047 ROLE OF DISTRIBUTED MICROSCOPIC PHYSICAL PHENOMENA IN PROBABILISTIC ACCIDENT ANALYSIS WITH DETERMINISTIC CODES. Abramson, P.B.; Hummel, H.H.; Gelbard, E.M.; Pizzica, P.A.; Sienicki, J.J. (Argonne National Lab., IL). pp VIII.4.1-VIII.4.13 of Probabilistic analysis of nuclear reactor safety. La Grange Park, IL; American Nuclear Society, Inc. (1978).

From Probabilistic analysis of nuclear reactor safety; Los Angeles, CA, USA (8 May 1978).

Analysis of Hypothetical Core Disruptive Accidents with large computer codes is based upon the assumption that enough basic physical information is available to enable the analyst to write down the proper analytical description of these processes and that macroscopic behavior will be properly calculated as an end product. The thermodynamic and hydrodynamic processes that go on during such a disrupted state analysis are dependent upon the geometry and flow regime, which are unknown and not deterministically predictable with any ease. Thus analysts have associated variable parameters with these processes and the sensitivity of macroscopic results to the microscopic parameters has been examined by studying the response function of a straight through calculation to a different parametric value. However, the processes depend upon functions which are distributed rather than single valued. Analysis which adds in the information about the distributed nature of the microscopic processes reduces the sensitivity of the macroscopic result to the microscopic parameter.

4048 GRAVITATIONAL AGGLOMERATION OF POST-HCDA LMFBR AEROSOLS. Partner, G.A. Columbia, MD; Univ. of Missouri (1978). 256p. University Microfilms Order No. 7906908.

Thesis (Ph. D.).

A Hypothetical Core Disruptive Accident (HCDA) in an LMFBR may release a very complex and radioactive aerosol into the primary containment atmosphere. After release, the aerosol particles will settle and there will be particle-particle collisions. Coagulation between the particles leads to the formation of a third, larger aerosol particle. The coagulation process of aerosols is stipulated to be composed of three separation mechanisms - Brownian, turbulent, and gravitational coagulation. This dissertation is concerned only with gravitational coagulation, which occurs due to the differential settling velocities of two aerosol particles. Results are presented for the calculation of the gravitational collision efficiency for various conditions. Both constant density and size dependent density aerosol particles are analyzed. The larger particle radius is varied from 0.5 μ to 100 μ , and appropriate drag force terms are utilized. Also, since the containment atmospheric properties may vary during the course of an accident, the effect on epsilon of changing the fluid properties is investigated. The results show that both the particle size and density have a strong effect on the gravitational collision efficiency. In general, it is difficult to construct a simple representation of epsilon as a function of these variables.

4049 BUOYANCY EFFECTS ON SODIUM COOLANT TEMPERATURE PROFILES MEASURED IN AN ELECTRICALLY HEATED MOCK-UP OF A 61-ROD BREEDER REACTOR BLANKET ASSEMBLY. Engel, F.C.; Markley, R.A.; Minushkin, B. (Westinghouse Electr. Corp., Madison, Pa). Am. Soc. Mech. Eng., [Pap.]; No. 78-WA/HT-25, 1-14(1978).

This paper describes test results demonstrating the effect of buoyancy on the temperature profiles in a 61-rod electrically heated mock-up of an LMFBR radial blanket assembly. In these assemblies, heat transfer occurs over a wide range of complex operating conditions. The range and complexity of conditions are the result of the steep flux and power gradients which are an inherent feature of the blanket region and of the power generation level in an assembly which can vary from 20 to 1100 kw.

4050 SIMPLE FUEL PIN TRANSIENT AND MELTING MODEL AND ITS APPLICATION TO THERMAL-HYDRAULICS IN LMFBR SUBASSEMBLY. Chen, W.L.; Ishii, M.; Groimes, M.A. (Argonne Natl. Lab., Ill). Am. Soc. Mech. Eng., [Pap.]; No. 78-WA/HT-26, 1-16(1978).

A simple conduction model with phase change has been developed for the transient analysis of a reactor fuel pin based on lumped parameter techniques. The purpose of this analysis is to provide a simple useful tool to obtain the general information about fuel and clad leading into the cooling transients and melting. Such a simple fuel and clad thermal transient model is particularly useful to multichannel analysis where conventional conduction computer codes require considerable computing time and storage space. At present, this formulation is being employed for the analysis of sodium thermohydraulics, sodium voiding, and melting of cladding and fuel in a subassembly of a fast reactor core. A detailed analysis of predicted coolant, fuel and cladding thermal transients leading into sodium voiding and fuel pin

melting has been made in comparison with the results of various in-pile experiments and with the predictions from the existing more complicated codes.

- 4051 PAST AND PRESENT ROLE OF FAST BREEDER REACTORS IN JAPAN. Tomabechi, K. (Power Reactor and Nuclear Fuel Development Corp., Tokyo, Japan). pp 15-27 of Design, construction, and operating experience of demonstration LMFBRs. Vienna, Austria; International Atomic Energy Agency (1978).

From Symposium on design, construction and operating experience of demonstration liquid metal fast breeder reactors; Bologna, Italy (10 Apr 1978).

To meet increasing future energy demand in Japan utilization of fission energy should be promoted. In particular it is of vital importance to develop and utilize FBRs as soon as possible in order to save the natural uranium needed. Ten years have passed since the development of FBRs in Japan was initiated as a national project with the highest priority and now the experimental fast reactor JOYO is successfully being commissioned and the prototype fast breeder reactor MONJU has reached the stage of proceeding to construction. Experience gained from past development work encourages further strong effort towards the commercialization of FBRs. The important role to be played by FBRs, the development programme for FBRs, and the experience gained so far from the programme in Japan are reviewed.

- 4052 PAST AND PRESENT ROLE OF FAST BREEDER REACTORS IN THE FEDERAL REPUBLIC OF GERMANY. Guthmann, E. (INTERATOM, Bergisch Gladbach, Germany); Kessler, G.; Stoehr, H. pp 57-68 of Design, construction, and operating experience of demonstration LMFBRs. Vienna, Austria; International Atomic Energy Agency (1978).

From Symposium on design, construction and operating experience of demonstration liquid metal fast breeder reactors; Bologna, Italy (10 Apr 1978).

Studies on future energy needs, the introduction of light water reactors and the availability of uranium on the world market lead to the conclusion that the fast breeder should be available for commercial introduction after 1990. The fast breeder development programme in the FRG, Belgium, and The Netherlands is concentrating on these project aims. At present the KNK II test reactor is in operation and the 300 MW(e) prototype fast reactor SNR 300 is under construction. It is intended to build a future commercial-size fast breeder in close co-operation with Belgium, The Netherlands, France, and Italy.

- 4053 PAST AND PRESENT ROLE OF FAST BREEDER REACTORS IN FRANCE: EXPERIENCE GAINED WITH RAPISODIE AND PHENIX. Conte, F. (CEA, Centre de Marcoule, Bagnols-sur-Cèze, France); Brosseau, G.; Pontier, R. pp 69-78 of Design, construction, and operating experience of demonstration LMFBRs. Vienna, Austria; International Atomic Energy Agency (1978). (In French)

From Symposium on design, construction and operating experience of demonstration liquid metal fast breeder reactors; Bologna, Italy (10 Apr 1978).

Rapisodie has recently celebrated ten years of operation, which provides an occasion for reviewing the performance of the facility--availability, behaviour of the main components, experiments carried out, evolution of operating conditions, and difficulties encountered. A

major operation recently carried out successfully, i.e. the replacement of the control plug, is described. The experience gained during four years of industrial operation of the Phenix facility is also discussed. An account is given of the behaviour of the material, fuel performance (burn-up, number of assemblies irradiated, breeding ratio), the dosimetry and the wastes produced. Among the difficulties encountered the main event has been a sodium leak on the intermediate heat exchangers; all six exchangers have been repaired under satisfactory working conditions, without causing any irradiation of the personnel.

- 4054 PAST AND PRESENT ROLE OF FAST BREEDER REACTORS IN THE USSR. Kochetkov, L.A.; Bagdasarov, Yu.E. (Inst. of Physics and Power Engineering, Obninsk, USSR). pp 79-87 of Design, construction, and operating experience of demonstration LMFBRs. Vienna, Austria; International Atomic Energy Agency (1978). (In Russian)

From Symposium on design, construction and operating experience of demonstration liquid metal fast breeder reactors; Bologna, Italy (10 Apr 1978).

The development of sodium-cooled fast reactors in the USSR is reviewed. First the results of general research, and of the development and operation of experimental facilities, test rigs and reactors are briefly discussed--work which made it possible to formulate the basic principles for the design and construction of demonstration power plants such as BN-350. The experience derived from the construction and operation of BN-350 and from the construction of BN-600 is discussed. The experience of start-up, adjustment, and operation of BN-350 shows that sodium-cooled fast reactors have successfully completed the stage of industrial-scale pilot operation. The characteristics of the planned series of BN-1600 power plants are mentioned and compared with those of BN-350 and BN-600.

- 4055 PAST AND PRESENT ROLE OF FAST BREEDER REACTORS IN THE UNITED KINGDOM. Moore, J. (United Kingdom Atomic Energy Authority, Risley, England). pp 89-103 of Design, construction, and operating experience of demonstration LMFBRs. Vienna, Austria; International Atomic Energy Agency (1978).

From Symposium on design, construction and operating experience of demonstration liquid metal fast breeder reactors; Bologna, Italy (10 Apr 1978).

Predictions of requirements for energy and availability of primary energy sources in the UK during the next few decades show a strong incentive for early introduction of fast reactors. After the turn of the century they appear to be the only known method for meeting long-term ore that would be necessary for an on-going thermal reactor programme. Current proposals are to construct a commercial demonstration fast reactor, CDFR, with its fuel plants, to obtain the experience and confidence that would be necessary to launch a programme of fast reactors. Confidence in ability to proceed with CDFR is based on a substantial programme of development during the past 25 years culminating in the prototype fast reactor, PFR, and its fuel fabrication and reprocessing plants. Experience with PFR has been invaluable in guiding the design of CDFR.

- 4056 PAST AND PRESENT ROLE OF FAST BREEDER REACTORS IN ITALY. Castelli, G. (ENEL, Rome, Italy); Cicognani, G.; Ghilardotti, G.; Musso,

B. pp 105-114 of Design, construction, and operating experience of demonstration LMFBRs. Vienna, Austria; International Atomic Energy Agency (1978).

From Symposium on design, construction and operating experience of demonstration liquid metal fast breeder reactors; Bologna, Italy (10 Apr 1978).

The programme that is under development in Italy for fast breeder reactors is described. The Italian engagement in the construction of the Creys-Malville plant is discussed as well as the work at present under way in R and D activities and on the PEC reactor. The roles of the different organizations involved in the fast breeder reactor programme are also considered with particular attention to the activities carried out by AGIP NUCLEAR, CNEN, ENEL, NIRA, and by the manufacturing companies. An overall picture of the different agreements between European countries is also given with reference to the construction of the Creys-Malville plant and to research and industrial development activities.

- 4057 PAST AND PRESENT ROLE OF FAST BREEDER REACTORS. Megy, J. (Centre d'Etudes Nucleaires de Saclay, Gif-sur-Yvette, France). pp 115-139 of Design, construction, and operating experience of demonstration LMFBRs. Vienna, Austria; International Atomic Energy Agency (1978). (In French)

From Symposium on design, construction and operating experience of demonstration liquid metal fast breeder reactors; Bologna, Italy (10 Apr 1978).

The LMFBR type reactor development programs of the UK, Japan, USSR, USA, German Federal Republic, France, and Italy are reviewed.

- 4058 MEASUREMENTS IN PFR OF IMPORTANCE TO SAFETY AND REACTOR PERFORMANCE. Smith, D.C.G. (Dounreay Nuclear Power Development Establishment, Caithness, England); Crowe, D.S.; Lennox, T.A.; Hampshire, R. pp 143-158 of Design, construction, and operating experience of demonstration LMFBRs. Vienna, Austria; International Atomic Energy Agency (1978).

From Symposium on design, construction and operating experience of demonstration liquid metal fast breeder reactors; Bologna, Italy (10 Apr 1978).

Measured values of a number of important parameters associated with PFR core performance are given and compared with calculations. Generally agreement is good but where discrepancies have been found attention is drawn to possible reasons.

- 4059 SHUTDOWN SYSTEMS OF KNK AND SNR 300. Glinsky, H.W.; Mehren, F.; Voj, P.; Hoffmann, H.; Marten, K. (INTERATOM, Bergisch Gladbach, Germany). pp 191-203 of Design, construction, and operating experience of demonstration LMFBRs. Vienna, Austria; International Atomic Energy Agency (1978).

From Symposium on design, construction and operating experience of demonstration liquid metal fast breeder reactors; Bologna, Italy (10 Apr 1978).

The shutdown systems are an integral part of the reactor protection system. Two independent systems are installed to increase the reactor safety. These systems consist of several separate units which operate in different ways to avoid common mode failures. One of the shutdown systems also controls the reactor. The development of the shutdown systems is supported by an extensive experimental programme: tests with components; tests with prototypes in water and sodium; tests with

units which are to be installed in the reactor; and a final operational test in the reactor. The principle of the KNK II shutdown systems is described.

- 4060 OPERATING EXPERIENCE OF THE BN-350 FAST REACTOR (1972-1977). Yurchenko, D.S.; Vasilenko, K.T.; Demin, A.A.; Pomerantsev, G.B.; Samarkin, A.A.; Skorikov, N.V.; Tverdokskii, N.D.; Shkol'nik, V.S. (BN-350 Reactor, Shevchenko, USSR). pp 227-246 of Design, construction, and operating experience of demonstration LMFBRs. Vienna, Austria; International Atomic Energy Agency (1978). (In Russian)

From Symposium on design, construction and operating experience of demonstration liquid metal fast breeder reactors; Bologna, Italy (10 Apr 1978).

The start-up and power commissioning of the BN-350 reactor are reported together with the results of experimental studies. The main results of operation from the time the reactor reached a power level of 650 MW(th) till 1 January 1978 are given. Operating experience with the principal equipment and technological system is discussed and radiation conditions are described. The cases of failure of the steam generator heat-transfer surfaces are considered.

- 4061 THEORETICAL AND EXPERIMENTAL STUDIES ON THE PHYSICAL CHARACTERISTICS OF THE BN-350 REACTOR. Alekhin, L.A.; Zvonarev, A.V.; Ivanov, A.P. (Inst. of Physics and Power Engineering, Obninsk, USSR). pp 263-285 of Design, construction, and operating experience of demonstration LMFBRs. Vienna, Austria; International Atomic Energy Agency (1978). (In Russian)

From Symposium on design, construction and operating experience of demonstration liquid metal fast breeder reactors; Bologna, Italy (10 Apr 1978).

The main results of physics studies on the BN-350 reactor which were carried out during physical and power commissioning and in the early stages of operation are discussed. The characteristics considered were the critical parameters, the efficiency of the power control and instrumentation system components, the temperature and power coefficients of reactivity, reactivity effects due to fuel burn-up, the distribution of various reaction rates over the reactor, and the ratios of the average cross-sections of the fissionable isotopes. The calculated results were obtained by different methods and computation programs. It is shown that the theoretical approaches developed during the design of the reactor, together with the BNAB-70 multigroup constants, ensure good agreement between the calculated and experimental values in most cases.

- 4062 PRIMARY CIRCUITS OF PHENIX AND SUPER-PHENIX. Vial, B. (Centre de Marcoule, Bagnols-sur-Geze, France); Thevenin, M.; Guidez, J.; Sauvage, M.; Schaler, K. pp 295-312 of Design, construction, and operating experience of demonstration LMFBRs. Vienna, Austria; International Atomic Energy Agency (1978). (In French)

From Symposium on design, construction and operating experience of demonstration liquid metal fast breeder reactors; Bologna, Italy (10 Apr 1978).

An account of the operating experience of the primary circuits of Phenix since it went into industrial-scale operation is presented. After a brief description of the primary circuits, the principal incidents which have

interfered with reactor operation, mainly those which affected the pumps and intermediate exchangers, are mentioned. Detailed comments are made of how the operations of removal, repair and re-installation of the intermediate exchangers were carried out. The second part gives a comparative description of the Phenix and Super-Phenix primary circuits. The reasons which led to design changes in Super-Phenix are explained. The most important modifications involved the reactor cover and the type of heat insulation used, the supporting structure of the plate resting on the bottom of the main vessel and the use of double recess.

- 4063 COMPARATIVE ANALYSIS OF LAYOUT AND DESIGN IN THE RN-600 AND BN-350 REACTORS. Makovskii, A.A.; Mitenkov, F.M.; Pakhomov, V.V.; Shiryayev, V.I. (Gorkii Polytechnic Inst., USSR). pp 313-325 of Design, construction, and operating experience demonstration LMFBRs. Vienna, Austria; International Atomic Energy Agency (1978). (In Russian)

From Symposium on design, construction and operating experience of demonstration liquid metal fast breeder reactors; Bologna, Italy (10 Apr 1978).

The technical solutions adopted for the primary circuit, individual items of equipment and the design of the most important components of the BN-350 and BN-600 reactors emphasizing layout characteristics are presented. The advantages and disadvantages of the loop and pool designs are discussed with regard to the reliability and safety of these reactors, and the experience acquired in building them. The technical advantages of the pool design are substantiated for fast reactors in the medium power range.

- 4064 PROBLEMS OF DESIGNING AND TESTING PRIMARY LOOP COMPONENTS OF FAT REACTORS. Braggamoli, F. (CEN, Bologna, Italy); Tonarelli, L.; Bandiera, P.G. pp 327-335 of Design, construction, and operating experience demonstration LMFBRs. Vienna, Austria; International Atomic Energy Agency (1978). (In Italian)

From Symposium on design, construction and operating experience of demonstration liquid metal fast breeder reactors; Bologna, Italy (10 Apr 1978).

The main problems encountered in Italy in connection with designing and testing the primary loop components of the PEC, the Creys-Malville power plant, and the Super-Phenix line are described. The work carried out on piping, intermediate heat exchangers, drives, mechanical pumps, and inflatable joints, and also the present status of developmental work on sodium test loops for this type of component are described.

- 4065 DEVELOPMENT, DESIGN, CONSTRUCTION, AND TESTING OF PUMPS, INTERMEDIATE HEAT EXCHANGERS AND MANIPULATOR SYSTEMS FOR IN-SERVICE INSPECTION OF SNR 300. Vroom, J.P. (B.V. Neratoom, The Hague, Netherlands); Heslenfeld, M.W.; Westerweele, W.J.; Hoeft, J.E.; Kirchner, G.F.; Menck, J.W.; van Willigen, A. pp 347-374 of Design, construction, and operating experience demonstration LMFBRs. Vienna, Austria; International Atomic Energy Agency (1978).

From Symposium on design, construction and operating experience of demonstration liquid metal fast breeder reactors; Bologna, Italy (10 Apr 1978).

The development, design, construction, and testing activities for sodium pumps and intermediate heat exchangers as carried out by

NERATOOM in the Netherlands are described. Testing of full-size components under operational conditions yielded important information for the design of the components for SNR 300. Information is also given in brief on the manufacture of the components. The second part reviews the work done on manipulator systems for in-service inspection as carried out by INTERATOM in Germany. In this field again experience gained from tests had important consequences for the design of the apparatus for SNR 300.

- 4066 DESIGN AND EXPERIMENTAL TESTING OF INTERMEDIATE HEAT EXCHANGERS. Budov, V.M.; Golovko, V.F.; Grddichko, E.M.; Lukasevich, B.I.; Loginov, S.A.; Sabin, M.I. pp 375-392 of Design, construction, and operating experience demonstration LMFBRs. Vienna, Austria; International Atomic Energy Agency (1978). (In Russian)

From Symposium on design, construction and operating experience of demonstration liquid metal fast breeder reactors; Bologna, Italy (10 Apr 1978).

The design and principal characteristics of the intermediate heat exchangers selected for the BN-350 and BN-600 reactors are presented. The problems which arose during the design of the heat exchangers and the approach adopted for their solution are considered. The experimental testing of heat exchangers, involving the study of thermal, hydrodynamic, and vibrational characteristics, is discussed.

- 4067 OPERATING EXPERIENCE WITH THE PFR PRIMARY CIRCUIT AND DESIGN INTENTIONS FOR CDFR. Broadley, D. (Nuclear Power Co. (Risley) Ltd., England); Laithwaite, J.M.; Walford, J.G. pp 403-410 of Design, construction, and operating experience demonstration LMFBRs. Vienna, Austria; International Atomic Energy Agency (1978).

From Symposium on design, construction and operating experience of demonstration liquid metal fast breeder reactors; Bologna, Italy (10 Apr 1978).

The high reliability of the reactor and the primary circuit of PFR is noted. Despite a small number of difficulties associated with the auxiliaries the operation of the reactor has been unaffected. The current status of the CDFR design is described. The influence on this design by the substantial and valuable experience gained from PFR is discussed.

- 4068 FUEL AND COMPONENT HANDLING IN PFR AND INTENTIONS FOR CDFR. Broomfield, A.M. (Dounreay Nuclear Power Development Establishment, Caithness, England); Holmes, J.A.G.; Webb, J. pp 425-433 of Design, construction, and operating experience demonstration LMFBRs. Vienna, Austria; International Atomic Energy Agency (1978).

From Symposium on design, construction and operating experience of demonstration liquid metal fast breeder reactors; Bologna, Italy (10 Apr 1978).

The extensive operating experience with fuel and component handling in the Prototype Fast Reactor (PFR) is summarized, with emphasis on the fuel transfer system. The route for fuel sub-assemblies, including preparation in the new fuel cell, transfer to the storage rotor within the reactor vessel, transfer between rotor and core and the return to the irradiated fuel cave is described with details of experience so far. The cave was commissioned in 1977 and has received the first irradiated fuel from the reactor for examination. A large number of sub-assemblies has been handled

between storage rotor and core without significant difficulty and the design rates of transfer have been achieved. The fuel charge machine must be loaded into the reactor for each refuelling operation. The design of a machine which can remain in the reactor during operation is being prepared, since experience indicates that the time for refuelling shutdowns can be substantially reduced.

- 4069 ELECTROCHEMICAL AND PHYSICAL METHODS FOR REACTOR DIAGNOSIS. Fuge, R.; Teske, K.; Ullmann, H. (Central Inst. for Nuclear Research, Rossendorf, Germany). pp 435-449 of Design, construction, and operating experience demonstration LMFBRs. Vienna, Austria; International Atomic Energy Agency (1978).

From Symposium on design, construction and operating experience of demonstration liquid metal fast breeder reactors; Bologna, Italy (10 Apr 1978).

Electrochemical cells with solid electrolyte have been developed to measure the oxygen and the hydrogen concentration in sodium and cover gas. Experimental results are presented and the method is recommended for the detection of water leaks in steam generators. A supplementary method for the leak detection is the "bubble noise" in magnetic flowmeter output signals. Hydrogen and argon void fractions of one per cent can be detected. Some results of R and D work for the acoustic monitoring of the reactor and the steam generator are presented.

- 4070 FUEL HANDLING EXPERIENCE WITH LIQUID-METAL REACTORS. Foster, K.W. (Atomics International, Canoga Park, CA). pp 451-464 of Design, construction, and operating experience of demonstration LMFBRs. Vienna, Austria; International Atomic Energy Agency (1978).

From Symposium on design, construction and operating experience of demonstration liquid metal fast breeder reactors; Bologna, Italy (10 Apr 1978).

The basic design approach for fuel-handling equipment for Liquid Metal Fast Breeder Reactors in the USA originated from the Experimental Breeder Reactors (EBR) I and II and the Sodium Reactor Experiment (SRE). EBR-II paved the way for many of the current in-vessel handling concepts, such as rotating plugs, and although the SRE was a thermal reactor, the mechanical design of ex-vessel handling machines evolved from this concept. Early fuel-handling system design concepts are described. Design, development, fabrication, and operating problems that led to the next design generation are discussed. Reactor concepts discussed include SRE, HNPFF, EBR-II, Fermi, SEFOR, FFTF, and CRBRP. Also, concepts under consideration for the commercial size Prototype Large Breeder Reactors (PLBR) are covered.

- 4071 TANK FOR STORAGE OF SPENT FUEL ELEMENTS UNDER SODIUM: SPECIAL DESIGN FEATURES AND SOLUTIONS PROPOSED. Debauche, M.; Dehon, C.; Brahy, N. (Belgonucleaire, Brussels, Belgium). pp 477-488 of Design, construction, and operating experience of demonstration LMFBRs. Vienna, Austria; International Atomic Energy Agency (1978). (In French)

From Symposium on design, construction and operating experience of demonstration liquid metal fast breeder reactors; Bologna, Italy (10 Apr 1978).

A short explanation is given of the handling circuit for the SNR fuel. In the description of the storage facility the emphasis is on the components, which are examined in detail. A

brief reference to their functions is followed by a description of the solution adopted and a discussion of its advantage.

- 4072 CONTRIBUTION OF ITALIAN INDUSTRY TO THE DEVELOPMENT OF REACTOR COMPONENTS AND FUEL-HANDLING SYSTEMS OF FAST REACTORS. Giordano, P. (NIRA, SpA, Genoa, Italy); Di Leo, S.; Berni Canani, S.; Piana, F. pp 489-505 of Design, construction, and operating experience of demonstration LMFBRs. Vienna, Austria; International Atomic Energy Agency (1978).

From Symposium on design, construction and operating experience of demonstration liquid metal fast breeder reactors; Bologna, Italy (10 Apr 1978).

The principal activities carried on by Italian industry concerning in-core structures, core facilities, and fuel-handling systems are described. In particular the following items are described: the PEC reactor central experimental zone equipment (test channel), whose design is in progress at NIRA; the core support structures for Super-Phenix 1, which will be constructed by BREDA; the out-of-core fuel-handling system of PEC, delegated to SNIA-TECHINT, who have now completed the feasibility studies and are proceeding to construction plans; the parts of the primary fuel-handling system for Super-Phenix 1, i.e. charging and discharging machines and the straight-pull machine, designed and made by NIRA and CMI.

- 4073 OPERATION OF THE PFR AND DESIGN OF THE CDFR SECONDARY CIRCUIT. Taylor, D. (Nuclear Power Co. (Risley) Ltd., England); Smedley, J.; Broomfield, A.M. pp 509-525 of Design, construction, and operating experience of demonstration LMFBRs. Vienna, Austria; International Atomic Energy Agency (1978).

From Symposium on design, construction and operating experience of demonstration liquid metal fast breeder reactors; Bologna, Italy (10 Apr 1978).

The design and operational experience of the Prototype Fast Reactor (PFR) secondary circuits are reviewed. The preparation of the design proposal for this development strategy is the intention to install Replacement Tube Bundles (RTB) in the superheater and reheater shells, which will be virtually full-size prototypes of the CDFR superheater units.

- 4074 DESIGN, CONSTRUCTION, AND OPERATING EXPERIENCE OF SECONDARY SODIUM CIRCUITS OF FAST REACTORS. Robin, M.G. (Centre d'Etudes Nucleaires de Saclay, Gif-sur-Yvette, France); Saur, J.M.; Vial, B.; Brachet, A. pp 527-555 of Design, construction, and operating experience of demonstration LMFBRs. Vienna, Austria; International Atomic Energy Agency (1978). (In French)

From Symposium on design, construction and operating experience of demonstration liquid metal fast breeder reactors; Bologna, Italy (10 Apr 1978).

The designs of the secondary sodium circuits of fast reactors developed in France are presented. Each sodium loop comprises the following main components: two intermediate heat exchangers in which the secondary sodium circulates inside the tubes; a steam generator (single passage of water) which may be either of the multi-module (Phenix) or of the single-module (Super-Phenix) type; and a vertical mechanical pump immersed in the sodium expansion tank. Main characteristics, date of sodium filling and duration of power operation are specified for the Phenix. A more detailed description is given of the incidents which have occurred and of the measures taken to

prevent their recurrence; also of the main modifications to the circuits. The means of monitoring the physico-chemical characteristics of sodium are listed and the principal findings as regards its purity are presented.

- 4075 DESIGN OF THE MONJU HEAT TRANSPORT SYSTEM AND THE RELATED R AND D WORK, INCLUDING STEAM GENERATOR. Kanamori, A.; Imanaka, N.; Nakai, Y. (Power Reactor and Nuclear Fuel Development Corp., Tokyo, Japan). pp 573-585 of Design, construction, and operating experience of demonstration LMFBRs. Vienna, Austria; International Atomic Energy Agency (1978).

From Symposium on design, construction and operating experience of demonstration liquid metal fast breeder reactors; Bologna, Italy (10 Apr 1978).

The heat transport system of the prototype plant MONJU is based on the 'loop-type' concept and consists of three circuits of both primary and intermediate loops. The main pumps are located in the cold leg in both loops and the intermediate heat exchangers are of the vertical shell and tube type with no sodium level. The steam generators are composed of helically coiled tubes and are divided, with superheater and evaporator, both of which contain cover gas. Various kinds of R and D work have been conducted since 1970 to demonstrate the feasibility of the components and the experimental results have been reflected in detailed designs.

- 4076 DEVELOPMENT, DESIGN, CONSTRUCTION, AND PROTOTYPE TEST EXPERIENCE OF STEAM GENERATORS FOR SNR 300. Knaap, M.H. (B.V. NERATOOM, The Hague, Netherlands); Ludwig, P.W.P.H.; Smit, C.C.; Van Westenbrugge, M.K.; Broodman, J.J.; Vander Krogt, C.A.J. pp 587-603 of Design, construction, and operating experience of demonstration LMFBRs. Vienna, Austria; International Atomic Energy Agency (1978).

From Symposium on design, construction and operating experience of demonstration liquid metal fast breeder reactors; Bologna, Italy (10 Apr 1978).

Development and construction of the steam generators for the SNR 300 LMFBR are described. Basic design, test results of the prototypes and experiences with the licensing process are described. The test of the straight-tube type made some design changes necessary; the test of the helical-tube type was flawless. During testing of both the straight-tube and the helical-tube steam generator spurious hydrogen signals occurred.

- 4077 DESIGN, R AND D, AND MANUFACTURE OF THE COMPONENTS OF SECONDARY CIRCUITS FOR FAST SODIUM POWER PLANT. Avanzini, P.G. (NIRA, Genoa, Italy); Valentini, P.; Bottiglioni, F. pp 605-627 of Design, construction, and operating experience of demonstration LMFBRs. Vienna, Austria; International Atomic Energy Agency (1978).

From Symposium on design, construction and operating experience of demonstration liquid metal fast breeder reactors; Bologna, Italy (10 Apr 1978).

The efforts of Italian industry in the field of components for fast sodium power plants are presented. The main components involved are steam generators, sodium/air heat exchangers and large sodium valves. The development work carried out for these components is outlined and the main realizations are presented. A brief account is also given of the current situation of sodium plants supporting the development of these components. Research on

materials and the development of special sodium components are also reported upon.

- 4078 PROBLEMS OF SODIUM/WATER STEAM GENERATOR SAFETY AND THEIR SOLUTION IN THE USSR. Poplavskii, V.M.; Bagdasarov, Yu.E.; Kozlov, F.A.; Kochetkov, L.A.; Titov, V.F. (Inst. of Physics and Power Engineering, Obninsk, USSR). pp 629-644 of Design, construction, and operating experience of demonstration LMFBRs. Vienna, Austria; International Atomic Energy Agency (1978). (In Russian)

From Symposium on design, construction and operating experience of demonstration liquid metal fast breeder reactors; Bologna, Italy (10 Apr 1978).

The main results of experimental and theoretical studies on emergency conditions associated with sodium/water interaction are discussed. The current Soviet approach to the safety problems of sodium/water steam generators with single-wall separation of coolants is described.

- 4079 EXPERIMENTS ON THE FLUID DYNAMICS AND THERMODYNAMICS OF ROD BUNDLES TO VERIFY AND SUPPORT THE DESIGN OF SNR-300 FUEL ELEMENTS: STATUS AND OPEN PROBLEMS. Moeller, R.; Weinberg, D.; Trippi, G.; Tschoeke, H. (Kernforschungszentrum, Karlsruhe, Germany). pp 673-692 of Design, construction, and operating of demonstration LMFBRs. Vienna, Austria; International Atomic Energy Agency (1978).

From Symposium on design, construction and operating experience of demonstration liquid metal fast breeder reactors; Bologna, Italy (10 Apr 1978).

The reliable design of reactor core elements calls for precise knowledge of the 3D-temperature fields of the different components; this primarily applies to the fuel element cladding tubes, these being the first safety barrier. Where the 3D-temperature fields so far determined exclusively with the help of global thermohydraulic computer codes (SUBCHANNEL-Codes) have to be determined more accurately by local investigations is analyzed. The basis of these investigations is the measurement of local velocities and temperature in 19-rod bundle models of the SNR-300 fuel element performed at the Kernforschungszentrum Karlsruhe (KfK). Some important results of the extensive experimental investigations are reported and compared with global and local recalculations. Open problems are pointed out. The influence of the uncertainties in the thermohydraulic design with respect to the strength analysis are discussed.

- 4080 DESIGN, CONSTRUCTION, AND OPERATING EXPERIENCE OF DEMONSTRATION LMFBR. THE APPLICATION OF CORE AND FUEL PERFORMANCE EXPERIENCE IN BRITISH REACTORS TO COMMERCIAL FAST REACTOR DESIGN. Bagley, K.Q. (UKAEA, Risley, England); Gatley, J.A. pp 725-736 of Design, construction, and operating of demonstration LMFBRs. Vienna, Austria; International Atomic Energy Agency (1978).

From Symposium on design, construction and operating experience of demonstration liquid metal fast breeder reactors; Bologna, Italy (10 Apr 1978).

The Prototype Fast Reactor (PFR) sub-assembly design is described with particular emphasis on the choice of factors that are important in determining satisfactory performance. Reasons for the adoption of specific clad and fuel design details are given in their historical context, and irradiation experience--mostly from the Dounreay Fast

Reactor (DFR)--in support of choices is described. The advantages of restrained core and the application of this concept to the Commercial Demonstration Fast Reactor (CDFR) core design is described. Probable future trends in pin and sub-assembly design are reviewed and the scope of associated irradiation testing programmes defined. Arrangements for monitoring and evaluating fuel performance, both in reactor and post-irradiation, are outlined and the provisions for endorsement of CDFR pin, sub-assembly and core design details in PFR are indicated.

- 4081 FUTURE PLANS FOR THE DESIGN AND CONSTRUCTION OF FAST REACTOR POWER STATIONS. Moore, J. (Risley Nuclear Power Development Establishment, England). pp 739-751 of Design, construction, and operating of demonstration LMFBRs. Vienna, Austria; International Atomic Energy Agency (1978).

From Symposium on design, construction and operating experience of demonstration liquid metal fast breeder reactors; Bologna, Italy (10 Apr 1978).

The development programs for LMFBR type reactors in France, Germany Federal Republic, Italy, Japan, The UK, the USA, and USSR are reviewed.

- 4082 FUTURE PLANS FOR THE DESIGN AND CONSTRUCTION OF FAST BREEDER REACTORS IN FRANCE. Benmergui, A. (Electricite de France, Paris-La-Defense); Megy, J.; Vautre, L.; Villeneuve, J. pp 753-773 of Design, construction, and operating of demonstration LMFBRs. Vienna, Austria; International Atomic Energy Agency (1978). (In French)

From Symposium on design, construction and operating experience of demonstration liquid metal fast breeder reactors; Bologna, Italy (10 Apr 1978).

The motives underlying the development of fast neutron reactors in France and the chief characteristics of Super-Phenix together with the state of construction of the power station are discussed. Prospects for the construction of fast breeder reactors in France following Super-Phenix are analyzed. There is reference to the industrial organization and the European agreements established for the purpose. A detailed description of Super-Phenix (Creys-Malville Power Station) is given.

- 4083 FUTURE PLANS FOR THE DESIGN AND CONSTRUCTION OF FAST REACTOR POWER STATIONS IN THE FEDERAL REPUBLIC OF GERMANY. Kempken, M. (Federal Ministry for Research and Technology, Bonn, Germany); Koehler, M.; Wolfe, M. pp 775-783 of Design, construction, and operating of demonstration LMFBRs. Vienna, Austria; International Atomic Energy Agency (1978).

From Symposium on design, construction and operating experience of demonstration liquid metal fast breeder reactors; Bologna, Italy (10 Apr 1978).

Some important design features of future fast reactors in the Federal Republic of Germany (FRG) are presented, in particular for the demonstration plant SNR 2 which is to follow the prototype SNR 300, presently under construction in Kalkar. The SNR 2 conceptual design will be based on the SNR 300 design as far as possible. Programmes for the introduction of fast breeder reactor power stations on the part of the governments, the utilities, and suppliers are based on broad international co-operation.

- 4084 FUTURE PLANS FOR THE DESIGN AND

CONSTRUCTION OF FAST REACTOR POWER STATIONS IN ITALY. Castelli, G. (ENEL, Rome, Italy); Ghilardotti, G.; Musso, B.; Pierantoni, F. pp 785-792 of Design, construction, and operating of demonstration LMFBRs. Vienna, Austria; International Atomic Energy Agency (1978).

From Symposium on design, construction and operating experience of demonstration liquid metal fast breeder reactors; Bologna, Italy (10 Apr 1978).

Studies related to fast reactor technology have been pursued in Italy for a long time and this country is now deeply engaged in the demonstration and marketing phases, in accordance with the outlines of the Italian national energy plan. The following topics are examined: current possibilities for introducing fast reactors in Italy; the main social and political constraints concerning their introduction; the necessary industrial and organizational structures (in the broadest meaning) existing or foreseen; the national programme pertaining to activities towards achieving this goal.

- 4085 FUTURE PLANS FOR THE DESIGN AND CONSTRUCTION OF FAST REACTOR POWER STATIONS IN JAPAN. Tomabechi, K.; Miki, R. (Power Reactor and Nuclear Fuel Development Corp., Tokyo, Japan). pp 793-804 of Design, construction, and operating of demonstration LMFBRs. Vienna, Austria; International Atomic Energy Agency (1978).

From Symposium on design, construction and operating experience of demonstration liquid metal fast breeder reactors; Bologna, Italy (10 Apr 1978).

Tests for increasing the power of the experimental fast reactor JOYO which went critical in 1977 will begin soon and the maximum power of 50 MW(t) will be attained in the middle of 1978. Construction of the prototype reactor MONJU of 300 MW(e) will begin in 1979 with a schedule of operation in the mid-1980s. Following operation on MONJU, construction of a large demonstration reactor of 1000 to 1500 MW(e) will be undertaken. Some 2 to 3 years after the construction of the demonstration reactor, a series of reactors will be constructed similar in size and design to promote commercialization of LMFBRs. The future programme of developing LMFBRs is considered the most desirable way to promote commercialization of LMFBRs and strong efforts will be made to put this programme into practice. It is expected that LMFBRs will play an important role in mitigating the serious problem of energy supply in Japan foreseeable around the turn of the century.

- 4086 FUTURE PLANS FOR THE DESIGN AND CONSTRUCTION OF FAST REACTOR POWER STATIONS IN THE UNITED KINGDOM. Vaughan, R.D.; Wolff, P.H.W. (Nuclear Power Co. (Risley) Ltd., England). pp 805-816 of Design, construction, and operating of demonstration LMFBRs. Vienna, Austria; International Atomic Energy Agency (1978).

From Symposium on design, construction and operating experience of demonstration liquid metal fast breeder reactors; Bologna, Italy (10 Apr 1978).

There is to be held in the United Kingdom a public inquiry into the need for fast reactors, and specifically the construction of a demonstration plant which must precede a commercial breeder programme. In anticipation of a successful outcome of this inquiry, current attention is directed toward the objectives, design, and construction of the demonstration reactor. The technical objectives of this reactor are: to validate all technical

features of the first commercial reactors; to optimize operating techniques; to provide long-term information in advance of the commercial projects, and in due course to provide a vehicle for testing developments needed for later breeder programmes. Construction of the reactor will also establish in the UK the technical and manufacturing competence, the project organization and financial relationships necessary for a successful commercial programme.

- 4087 FUTURE PLANS FOR THE DESIGN AND CONSTRUCTION OF FAST REACTOR POWER STATIONS IN THE USSR. Kazachkovskii, O.D.; Mitenkov, F.M.; Troyanov, M.F. (Inst. of Physics and Power Engineering, Obninsk, USSR). pp 817-827 of Design, construction, and operating of demonstration LMFBRs. Vienna, Austria; International Atomic Energy Agency (1978). (In Russian)

From Symposium on design, construction and operating experience of demonstration liquid metal fast breeder reactors; Bologna, Italy (10 Apr 1978).

The principal structural, heat-engineering and physical characteristics of a fast reactor intended for a 1600 MW(e) power unit are presented. Sodium is used as coolant in the primary and secondary circuits and water and steam in the tertiary circuit. The reactor is so designed as to ensure high fuel cycle performance and economic power generation.

- 4088 REPLACEMENT OF THE RAPSODIE CONTROL PLUG: EXPERIENCE WITH AN IMPORTANT OPERATION. Delisle, J.P.; Allegre, R.; Besoux, M.; Laland, R.; Ollivier, J.; Snrech, D. (Centre d'Etudes Nucleaires de Cadarache, France). pp 413-423 of Design, construction, and operating experience demonstration LMFBRs. Vienna, Austria; International Atomic Energy Agency (1978). (In French)

From Symposium on design, construction and operating experience of demonstration liquid metal fast breeder reactors; Bologna, Italy (10 Apr 1978).

The Rapsodie control plug is a 4.5 tonne structure located above the core at the center of the reactor and thus highly radioactive. It was replaced in 1977 after several years of study. The operation, which was carried out without much difficulty, and the conclusions that could be drawn are described.

- 4089 STUDY OF THE OPERATIONAL CHARACTERISTICS OF THE CORE AND IRRADIATED FUEL PARAMETERS IN THE BOR-60 REACTOR. Gryazev, V.M.; Afanas'ev, V.A.; Gadzhiev, G.I.; Efimov, V.N.; Inchagov, A.V.; Narkin, S.A.; Nigmatullin, N.R.; Teikovtsev, A.A. (All-Union Research Inst. of Nuclear Reactors, Dimitrovgrad, USSR). pp 659-672 of Design, construction, and operating experience of demonstration LMFBRs. Vienna, Austria; International Atomic Energy Agency (1978). (In Russian)

From Symposium on design, construction and operating experience of demonstration liquid metal fast breeder reactors; Bologna, Italy (10 Apr 1978).

The results are presented of studies on the physical, thermophysical, and technological characteristics of the core and on the parameters of irradiated fuel of the BOR-60 reactor for the 1970-1977 operational period. The main purpose of BOR-60 operation was to gain experience of reliable functioning of the basic equipment and to carry out large-scale tests on fuel elements and structural materials to be used in demonstration fast reactors. BOR-60 has been used for an extensive programme of

irradiation of standard fuel elements based on 90% enriched uranium dioxide. Studies are being conducted on assemblies with vibro-compacted fuel, mixed oxide fuel, cladding steels of different grades on so on--all of which are necessary if the efficiency of the fuel cycle is to be improved in future fast reactors.

- 4090 SAFETY ASPECTS OF FAST REACTOR CORE OPERATION. Gourdon, J. (Centre d'Etudes Nucleaires de Cadarache, Saint-Paul-lez-Durance, France); Penet, F.; Savineau, M. pp 159-175 of Design, construction, and operating experience of demonstration LMFBRs. Vienna, Austria; International Atomic Energy Agency (1978). (In French)

From Symposium on design, construction and operating experience of demonstration liquid metal fast breeder reactors; Bologna, Italy (10 Apr 1978).

On the basis of the operating experience for Phenix, procedures are described for monitoring the main safety parameters of the core without appreciably disturbing the power plant operation. Guarding against errors of core loading during handling operations is discussed. The methods and the results of checking control rod efficiency and following up the core reactivity and the neutron negative feedback factors are presented. The preventive measures, spread over the handling chain, which were effective in preventing any core loading error during three years of operation are indicated.

- 4091 SAFE OPERATION OF THE BOR-60 EXPERIMENTAL FAST REACTOR IN POWER PLANT CONDITIONS. Gryazev, V.M.; Antipin, G.K.; Afanas'ev, V.A.; Britov, V.N.; Efimov, V.N.; Kondrat'ev, V.I.; Kon'kov, V.F.; Smirnov, A.M. (All-Union Scientific Research Inst. of Nuclear Reactors, Dimitrovgrad, USSR). pp 177-189 of Design, construction, and operating experience of demonstration LMFBRs. Vienna, Austria; International Atomic Energy Agency (1978). (In Russian)

From Symposium on design, construction and operating experience of demonstration liquid metal fast breeder reactors; Bologna, Italy (10 Apr 1978).

On the basis of the BOR-60 facility an analysis is made of characteristic requirements for safe operation of a fast-reactor power plant, from the standpoint of stability against perturbations in the operation of the main components and systems and against deviation from the design values of process parameters. The self-regulation properties of the facility are demonstrated, which ensure smooth transient regimes even when there are perturbations in reactivity and in the flow rate and temperature of the sodium at the reactor inlet. Regulation by neutron flux and by sodium outlet temperature are compared from the point of view of increasing the reliability of the control system and minimizing temperature strains in the components during transient processes. The calculated and experimental data on optimization of emergency shut-down and cooling regimes using different combinations of equipment are analyzed. The means and methods used to verify the state of the reactor vessel, fuel assemblies and in-vessel reactor systems during operation on power and during reloading are described; operating experience with sodium water steam generators is analyzed, as is the use of leak verification, control, and protection for steam generators under accident conditions.

- 4092 USE OF DEMONSTRATION FAST REACTOR

EXPERIENCE FOR ASSESSING THE RADIATION SAFETY OF FAST POWER REACTORS AT THE DESIGN STAGE. Bakumenko, O.D.; Kiselev, G.V.; Kulakovskii, M.Ya.; Pomerantsev, G.B.; Samarkin, A.A.; Sergeev, V.A.; Skorikov, N.V.; Tverdokskii, N.D.; Tsurukin, Yu.P. (Inst. of Physics and Power Engineering, Obninsk, USSR). pp 287-291 of Design, construction, and operating experience of demonstration LMFBRs. Vienna, Austria; International Atomic Energy Agency (1978). (In Russian)

From Symposium on design, construction and operating experience of demonstration liquid metal fast breeder reactors; Bologna, Italy (10 Apr 1978).

The results are presented of experimental studies on the behavior of fission products and radioactive corrosion products in the primary circuit of the BN-350 reactor during operation at power levels of up to 650 MW with defective fuel elements in the core. Data are also given on radiation conditions in the reactor building, dose burden to personnel and activity loss from the primary circuit. The experimental data thus obtained are compared with design data.

- 4093 CHEMICAL SIMULATION MODELING OF FUEL MOTION IN LMFBRs. Wheeler, P.A. Provo, UT; Brigham Young Univ. (1978). 146p. University Microfilms Order No. 79-11,877. Thesis (Ph. D.).

Chemical reactions were used to simulate fuel motion in LMFBR core disruptive accidents. The superficial vapor velocity necessary for transition between bubbly flow and dispersed flow was calculated for the chemical systems with the Kutateladze stability criterion. The actual vapor velocity at transition was measured experimentally in an open vessel. It was 50 to 100% higher than calculated. Closed vessel experiments showed a decrease in vapor velocity for a given concentration due to pressurization. A small heat sink added sufficient condensation to allow full dispersion of fluids even in a pressurized vessel. These results were compared to accident sequences in an LMFBR core.

- 4094 Opređenje temperatury v tvelakh yadernago reaktora (s zhidkometallicheskim teplositelem). (DETERMINATION OF THE TEMPERATURE IN FUEL ELEMENTS OF NUCLEAR REACTORS (WITH LIQUID METAL COOLANTS)). Sholokhov, A.A.; Zasorin, I.P.; Minashin, V.E.; Rumyantsev, V.N. Moscow, USSR; Atomizdat (1978). 232p.

An analysis is made of heat exchange in the active zone of a fast neutron nuclear reactor with a liquid metal coolant. Methods are given for computing temperature during changes in heat emission along the axis and cross-sectional direction of fuel elements. An examination is made of a method computing non-stationary temperature when there is a time change in the output of the reactor. A review is made of research results on heat exchange between the fuel and casing of the fuel element. A description is given of methods and results of computing temperature fields in fuel elements with local deterioration of heat exchange caused by fuel element defects. Considerable attention is given to a description of the physical aspect of the process. The subject material is illustrated by examples with numerical results. The book is intended for engineers engaged in the planning, construction, and operation of fast neutron nuclear reactors with liquid metal coolants, and for senior students in appropriate fields of specialization. 104 references, 60 figures, 23 tables.

- 4095 TEMPERATURE CONDITIONS IN AN LMFBR POWER PLANT FROM PRIMARY SODIUM TO STEAM CIRCUITS. Aubert, M.; Chaumont, M.; Moughnot, M.; Recolin, M. (CEA Centre d'Etudes Nucleaires de Cadarache, 13 - Saint-Paul-les-Durance (France)); Acket, M. pp 305-310 of Optimization of sodium-cooled fast reactors. London; Thomas Telford for the British Nuclear Energy Society (1978).

From BNES conference on optimization of sodium cooled fast reactors; London, UK (28 Nov 1977).

The subject is discussed under the headings: introduction; method and procedure (optimization program, review of process constraints - fuel limitations, turbine, steam generators, parameter selection - core parameters, temperatures, counterbalancing forces affecting temperatures); optimum values of parameters, with effect on costs; conclusion, (U.K.).

- 4096 OPTIMISATION OF A ONCE-THROUGH STEAM GENERATOR FOR LMFBR. Avanzini, P.G.; Barberis, M.; Monaci, R. (Nucleare Italiana Reattori Avanzati, Genoa). pp 349-353 of Optimization of sodium-cooled fast reactors. London; Thomas Telford for the British Nuclear Energy Society (1978).

From BNES conference on optimization of sodium cooled fast reactors; London, UK (28 Nov 1977).

Optimization studies are reported on the design of a steam generator consisting of a straight tube unit in a modular arrangement. The object was to determine the minimum total price of the unit assuming, as variables, materials tube size, matrix pitch fluids specific flow rates, losses of power, manufacturing and control costs, frequency of damage occurrence and repair times.

- 4097 OPTIMIZATION OF SODIUM PURIFICATION SYSTEMS FOR FAST REACTOR NUCLEAR POWER PLANTS. Baklushin, R.P.; Kozlov, F.A. (Institute of Physics and Power Engineering, Obninsk (USSR)). pp 383-389 of Optimization of sodium-cooled fast reactors. London; Thomas Telford for the British Nuclear Energy Society (1978).

From BNES conference on optimization of sodium cooled fast reactors; London, UK (28 Nov 1977).

A problem of rational construction of efficient primary and secondary sodium purification systems for fast reactor nuclear power plants is considered. On the basis of the BN-350 operating experience and published data some values are presented which allow evaluations to be made of the systems for the plants to come.

- 4098 OPTIMIZATION OF INTERMEDIATE HEAT EXCHANGERS FOR SODIUM COOLED FAST BREEDER REACTORS. Barratt, R.O.; Cox, J. (Foster Wheeler Energy Corp., Livingston, NJ (USA)); Beith, R.M.V. pp 355-367 of Optimization of sodium-cooled fast reactors. London; Thomas Telford for the British Nuclear Energy Society (1978).

From BNES conference on optimization of sodium cooled fast reactors; London, UK (28 Nov 1977).

Design evolution of the Intermediate Heat Exchanger for the U.S. Fast Breeder Programme is traced from the initial FFTF through to the Clinch River Designs and anticipated onward Commercial Plant Concepts. Supporting development work is outlined. Technical merits of certain features, such as sine wave tube

banks and replaceable tube banks (in-situ), are weighed up against quantified cost advantages with simpler arrangements. Future design trends are outlined which will lead eventually to fully optimised designs.

- 4099 U.S. SODIUM-COOLED BREEDER - SEEKING OPTIMIZATION. Beckjord, E.S.; Hardigg, G.W.; Iacobellis, S.F.; Laney, R.V.; Richards, R.B.; Squire, A. pp 23-29 of Optimization of sodium-cooled fast reactors. London; Thomas Telford for the British Nuclear Energy Society (1978).
From BNES conference on optimization of sodium cooled fast reactors; London, UK (28 Nov 1977).

The subject is dealt with under the following headings: major objectives of the U.S. sodium-cooled breeder program; present status of program (evaluation of progress, FFTF status, CRBR status, PLBR status, study of proliferation resistant fuel cycles); recent studies of alternative design choices (loop-type systems, pool-type system, homogeneous vs. heterogeneous cores, steam cycle conditions, major components, refueling schemes, automated fuel fabrication process development); future plans.

- 4100 OPTIMISATION OF DECAY HEAT REMOVAL SYSTEMS FOR SNR 2 WITH RESPECT TO SAFETY AND RELIABILITY. Blombach, J.; Guenther, K.; Gyr, W. (Internationale Atomreaktorbau G.m.b.H. (INTERATOM), Bergisch Gladbach (Germany, F.R.)). pp 37-42 of Optimization of sodium-cooled fast reactors. London; Thomas Telford for the British Nuclear Energy Society (1978).
From BNES conference on optimization of sodium cooled fast reactors; London, UK (28 Nov 1977).

The general safety requirements for decay heat removal systems (DHR) are briefly described. The contradictory requirements of safety criteria, reliability of DHR and projected plant operation are shown. Two basic modes of DHR are identified, one using the main heat transfer loops, the other one being directly attached to the reactor vessel. Various system designs are possible for each mode, moreover combinations of the two basic models are feasible. Taking into account the safety requirements some systems prove to be inadequate. In addition it is shown that only combinations of different DHR systems can meet all requirements. For further optimisation the results of the reliability analyses of the SNR-300 DHR systems performed with respect to the licensing process are used. Taking into account the probability of common mode failures and the reliability target of DHR the necessary redundancy of each system is determined. A DHR concept is described covering both safety and reliability requirements.

- 4101 DEVELOPMENT OF FAST BREEDER REACTORS IN GERMANY, BELGIUM, AND THE NETHERLANDS. Brandsetter, A.; Eitz, A.W. pp 3-8 of Optimization of sodium-cooled fast reactors. London; Thomas Telford for the British Nuclear Energy Society (1978).

From BNES conference on optimization of sodium cooled fast reactors; London, UK (28 Nov 1977).

The subject is treated in general and then under the following reactors: SNR-300, Superphenix, SNR-2. The SNR-2 is discussed in some detail: basic decisions, main boundary conditions, technical keypoints (primary system, reactor vessel, decay heat removal system, large components, containment, core design).

- 4102 COST/BENEFIT AND RISK/BENEFIT ANALYSES IN LMFBR PROGRAM PLANNING. Brewer, S.T.; Benson, R.A.; Palmer, R.S. pp 433-444 of Optimization of sodium-cooled fast reactors. London; Thomas Telford for the British Nuclear Energy Society (1978).

From BNES conference on optimization of sodium cooled fast reactors; London, UK (28 Nov 1977).

The subject is discussed under the following headings: incentives analyses, uranium availability, electrical demand, the present value of future savings, alternatives to the breeder, environmental considerations, development program risks, results and conclusions.

- 4103 SIZING OF DECAY HEAT REJECTION LOOPS FOR LMFBRs. Broadley, D.; McSweeney, R.N. (Nuclear Power Co. (Risley) Ltd. (UK)). pp 117-124 of Optimization of sodium-cooled fast reactors. London; Thomas Telford for the British Nuclear Energy Society (1978).

From BNES conference on optimization of sodium cooled fast reactors; London, UK (28 Nov 1977).

The paper briefly looks at the overall safety requirements for decay heat removal for LMFBRs. The number of DHR loops, and the way in which they are distributed, is not considered. The paper goes on to discuss the optimisation and sensitivity of the capacity of the DHR system, as a function of the peak shutdown reactor temperature. Calculations are performed for a pool-type CFR and for two designs of loop-type LMFBR. It is shown, as would be expected, that the relatively small thermal capacity of a loop-type reactor requires a relatively large DHR system to limit its temperature to an acceptable value.

- 4104 ANALYSIS OF SODIUM VOID COEFFICIENT IN HETEROGENEOUS CORE FAST POWER REACTORS. Bruna, G.B.; Cecchini, G.P.; Gastaldo, G. pp 91-100 of Optimization of sodium-cooled fast reactors. London; Thomas Telford for the British Nuclear Energy Society (1978).

From BNES conference on optimization of sodium cooled fast reactors; London, UK (28 Nov 1977).

In the framework of the Italian fast reactors program activities, neutronics studies were made on the heterogeneous core concept. The aim of the work was to single out some configurations and designs which permit a substantial improvement of the breeding and burn-up performance, in comparison to a homogeneous core, without affecting safety and, when possible, improving it. In the present paper, a summary of the main results obtained is presented, and some suggestions for the future development of optimisation activities are derived, in accordance with some assumptions determined by the Italian energy provisioning situation.

- 4105 ASSESSMENT OF THE EFFECT OF REACTOR SIZE ON HYPOTHETICAL CORE DISRUPTIVE ACCIDENTS. Buttery, N.E.; Board, S.J. (Central Electricity Generating Board, Berkeley (UK). Berkeley Nuclear Labs.). pp 57-65 of Optimization of sodium-cooled fast reactors. London; Thomas Telford for the British Nuclear Energy Society (1978).

From BNES conference on optimization of sodium cooled fast reactors; London, UK (28 Nov 1977).

There is a general tendency towards larger plant sizes, in the interests primarily of economies of scale. In this paper the effect

of core size on hypothetical core disruptive accidents (HCDA) is considered, and it is shown that the energy yield increases rapidly with size, primarily due to a tendency towards coherence of voiding in reactors with a large positive void coefficient. Small cores compare favourably in this respect with alternative large designs with low void coefficient cores, because the reduced mass more than compensates for the reduced doppler constant, and they also have a potential advantage in later stages of HCDA (transition phase and after). If energetic HCDA cannot be shown to be unrealistic and if containment of these events is provided as part of the general safety philosophy, then the costs (which may increase disproportionately with yield) of engineering an adequately reliable system needs to be accounted for. Containment costs are only one of many factors which need to be taken into account in optimising the design and so the energy release from a HCDA must take its proper place in the optimisation according to the safety principles and safety case agreed for LMFBRs.

- 4106 OPTIMISATION OF FUEL DESIGN IN RELATION TO REACTOR PERFORMANCE AND THE CONFLICTING DEMANDS OF OTHER PARTS OF THE FUEL CYCLE. Chamberlain, A.; Taylor, H.A.; Allardice, R.H.; Gatley, J.A. pp 175-179 of Optimization of sodium-cooled fast reactors. London; Thomas Telford for the British Nuclear Energy Society (1978).

From BNES conference on optimization of sodium cooled fast reactors; London, UK (28 Nov 1977).

An examination is made of the interactions between the designing of LMFBR fuel for reactor performance, encompassing generating costs and uranium conservation with the demands of the other parts of the fuel cycle notably fabrication and reprocessing. It is shown that the requirements are often conflicting and have to be weighed against each other to obtain an optimum balance whilst attaining an overall reconciliation with safety aspects.

- 4107 INTERMEDIATE HEAT EXCHANGER LEAK ON PHENIX PLANT AND THEIR REPAIR. Conte, F.; Sauvage, M.; Roumailhac, J.F. pp 291-296 of Optimization of sodium-cooled fast reactors. London; Thomas Telford for the British Nuclear Energy Society (1978).

From BNES conference on optimization of sodium cooled fast reactors; London, UK (28 Nov 1977).

The incidents which have occurred concerning the PHENIX heat exchangers are discussed under the following headings; early years of PHENIX operation; action on the intermediate heat exchangers (description of heat exchanger, incident of 11 July 1976, incident of 3 October 1976, exchanger dismantling and repair, decontamination of exchangers, personal exposure); information gained from the incidents (safety of the plant, power station availability; information concerning the optimization of fast neutron power stations); conclusions.

- 4108 SUPER-PHENIX 1 FUEL ELEMENT OPTIMIZATION - FIRST CHECK OF OVERALL BEHAVIOUR. Delpeyroux, R.; Ollier, H.; Rousseau, J.; Peray, R.; Carteret, Y.; Dupouy, J.M.; Balloffet, Y.; Nervi, J.C. pp 125-131 of Optimization of sodium-cooled fast reactors. London; Thomas Telford for the British Nuclear Energy Society (1978).

From BNES conference on optimization of sodium cooled fast reactors; London, UK (28 Nov

1977).

The subject is dealt with as follows: Super Phenix 1 fuel element characteristics and operating conditions; present methods of pin and clad behaviour evaluations; main options of the irradiation testing programme; tentative conclusions; Super Phenix 1 fuel pin definition.

- 4109 ENGINEERING ASPECTS OF HETEROGENEOUS AND HOMOGENEOUS REACTORS. Dickson, P.W. Jr. (Westinghouse Electric Corp., Madison, PA (USA). Advanced Reactors Div.). pp 269-278 of Optimization of sodium-cooled fast reactors. London; Thomas Telford for the British Nuclear Energy Society (1978).

From BNES conference on optimization of sodium cooled fast reactors; London, UK (28 Nov 1977).

The core arrangement in an LMFBR can potentially affect the lower internals, upper internals, radial shielding, vessel, hot leg transients, head access area and control systems as well as breeding ratio, doubling time and core inventory. This paper describes the results of a study of the impact on these components and parameters that would result if the Clinch River Breeder Reactor were to incorporate a heterogeneous core.

- 4110 OPTIMISATION OF REACTOR DESIGN FOR NATURAL CIRCULATION DECAY HEAT REMOVAL IN A POOL-TYPE LMFBR. Durham, M.E. (Central Electricity Generating Board, Berkeley (UK). Berkeley Nuclear Labs.). pp 67-76 of Optimization of sodium-cooled fast reactors. London; Thomas Telford for the British Nuclear Energy Society (1978).

From BNES conference on optimization of sodium cooled fast reactors; London, UK (28 Nov 1977).

The paper presents the results of studies on the thermal-hydraulic behaviour of the primary circuit of a pool-type liquid metal cooled fast breeder reactor following the loss of A.C. supplies, in the event that natural circulation provides the only means of core heat removal. The effects of part load operation, and of providing secondary circuit cooling are considered, as well as some parameters associated with the design of the primary circuit. It is shown that optimisation of the primary pump rundown time alone is insufficient to ensure natural circulation. Substantial secondary circuit cooling is required during the primary pump run-down following operation at part-load to avoid the possibility of excessive temperatures in the core.

- 4111 EVOLUTION OF FRENCH FAST NEUTRON REACTOR CORE DESIGN AND PERFORMANCE. Estavoyer, M.; Ravier, J.; Chaumont, J.M. (CEA Centre d'Etudes Nucleaires de Cadarache, 13 - Saint-Paul-les-Durance (France)). pp 189-196 of Optimization of sodium-cooled fast reactors. London; Thomas Telford for the British Nuclear Energy Society (1978).

From BNES conference on optimization of sodium cooled fast reactors; London, UK (28 Nov 1977).

The subject is discussed with reference to the cores of Rapsodie, Phenix, Super Phenix 1 and Super Phenix II, under the headings: heterogeneous vs. homogeneous core; mechanical aspects of core design (reactivity, handling); subassembly design; core protection and monitoring.

- 4112 RELIABILITY TECHNOLOGY IN LMFBR OPTIMISATION. Fawcett, S. (UKAEA Reactor

Group, Culcheth). pp 85-90 of Optimization of sodium-cooled fast reactors. London; Thomas Telford for the British Nuclear Energy Society (1978).

From BNES conference on optimization of sodium cooled fast reactors; London, UK (28 Nov 1977).

Quantification and in-depth analysis, as used in safety and reliability assessments, are examined in four widely dissimilar applications. At the most general level, cost and effort for more intensive design, development and reliability programmes to achieve higher availability are optimised against extra revenue, but the scope for quantification is, as yet, limited. Both safety and availability criteria apply in optimising structural design, development and manufacture: progress in quantification and analysis is observed on responsive aspects. Introducing availability into optimising the number and size of cooling circuits (and also turbine generating plant capacity) might call for more spare capacity in LMFBRs than has previously been needed in power stations.

- 4113 CDFR FUEL DESIGN OPTIMISATION. Gatley, J.A.; Brindley, K.W. (Nuclear Power Co. (Risley) Ltd. (UK)). pp 167-173 of Optimization of sodium-cooled fast reactors. London; Thomas Telford for the British Nuclear Energy Society (1978).

From BNES conference on optimization of sodium cooled fast reactors; London, UK (28 Nov 1977).

The main considerations that have been involved in progressing from generalised parametric surveys to the determination of the leading features of a preferred fuel design for CDFR are described. The criteria of merit and practical engineering limitations are discussed, and detailed results of studies of fuel pin diameter, and wrapper and fuel can thickness are presented.

- 4114 STEAM CYCLE FOR HIGH POWER LIQUID METAL FAST BREEDER REACTOR PLANTS. Gaudy, B. (Electricite de France, 92 - Courbevoie. Service Etudes et Projets Thermiques et Nucleaires). pp 297-303 of Optimization of sodium-cooled fast reactors. London; Thomas Telford for the British Nuclear Energy Society (1978).

From BNES conference on optimization of sodium cooled fast reactors; London, UK (28 Nov 1977).

Out of the various types of possible steam cycles, it is proposed to select three of them: the reheating cycle by sodium, the reheating cycle by extracted steam with moisture separation, the reheating cycle by extracted steam without moisture separation.

- 4115 THERMODYNAMIC AND FLUIDDYNAMIC ASPECTS IN OPTIMIZING THE DESIGN OF FAST REACTOR SUBASSEMBLIES. Hoffmann, H.; Weinberg, D. (Gesellschaft fuer Kernforschung m.b.H., Karlsruhe (Germany, F.R.)). pp 133-139 of Optimization of sodium-cooled fast reactors. London; Thomas Telford for the British Nuclear Energy Society (1978).

From BNES conference on optimization of sodium cooled fast reactors; London, UK (28 Nov 1977).

Temperature distributions and pressure drops were calculated for sub-assemblies with grid-type and helical spacers by means of experimentally supported codes. The influences of rod arrangements and power form factors were investigated. Optimum bundles with grid-type spacers were selected for which the temperature

form factor reached a minimum. All considered bundle configurations are optimized for identical maximum coolant temperatures and identical pressure drops. An optimum subassembly can then be found with respect to the overall thermal behavior of the plant.

- 4116 GENERAL ELECTRIC/BECHTEL PROTOTYPE LARGE BREEDER REACTOR (PLBR). Horst, K.M.; Gibson, A.S.; Davies, S.M. (General Electric Co., Sunnyvale, CA (USA)); Golan, S. pp 223-237 of Optimization of sodium-cooled fast reactors. London; Thomas Telford for the British Nuclear Energy Society (1978).

From BNES conference on optimization of sodium cooled fast reactors; London, UK (28 Nov 1977).

The General Electric/Bechtel PLBR is a conservatively designed 1000 MWe gross (914 MWe net) plant which gives confidence that a practical LMFBR can be built for U.S. application. A significant finding is that the LMFBR achieves lowest costs with a low reactor outlet temperature (468°C) and a low pressure (6.89 x 10⁶ Pa) saturated steam cycle. Moreover, the risks of failing to meet performance or other goals are lower for these cycle conditions than for higher temperature superheat cycle conditions.

- 4117 SODIUM DEPOSITION FROM FAST REACTOR GAS BLANKETS - FACTORS INFLUENCING THE CHOICE OF ARGON OR HELIUM COVER GAS. Hotchkiss, R.C.; Roberts, R.A. (Central Electricity Generating Board, Southampton (UK). Marchwood Engineering Labs.). pp 147-157 of Optimization of sodium-cooled fast reactors. London; Thomas Telford for the British Nuclear Energy Society (1978).

From BNES conference on optimization of sodium cooled fast reactors; London, UK (28 Nov 1977).

Sodium evaporates from the sodium/gas interface in fast reactors. Cooling of sodium laden gas due to thermal gradients in the gas space above the sodium results in the formation of an aerosol. Sodium condenses directly from the vapour phase and the aerosol deposits of the cooler surfaces exposed to the cover gas. The major difference between argon and helium cover gas is the dependence of density of the sodium saturated gas upon temperature. The density of argon displays the usual inverse dependence upon temperature but that of sodium saturated helium at reactor hot pool temperatures is almost independent of temperature because of the low molecular weight of the gas compared with the evaporating species. Convection is therefore the main sodium transport mechanism in argon but diffusion is more important in some situations with helium. Simple comparative experiments on evaporation and deposition of easily handled liquids in argon and helium are described. Apparatus has been constructed to measure sodium deposition rates from argon and helium cover gases under conditions relevant to a fast reactor. The results are compared with a natural convection mass transfer theory which describes the evaporation of sodium from the pool surface under conditions of aerosol formation. Sodium loadings have been measured in helium (and should soon be obtained in argon). Attempts have been made to estimate the aerosol size distribution by catching the particles on fine fibres and examining them in a scanning electron microscope. Area integrated sodium deposition rates, which are approximately equal to the evaporation rates, in argon are close to calculated open pool evaporation rates. Integrated rates in helium are considerably lower than in argon but local deposition rates at the top of the cover gas

space, which is the region of most concern, may not be significantly lower. Local deposition rates from He indicate that deposition is much less uniform than from Ar.

- 4118 MECHANICAL DESIGN TRADE-OFF STUDIES OF REACTOR CORE FOR LMFB. Iwayoshi, S.; Hasegawa, Y.; Ozawa, M.; Iwai, S. pp 141-146 of Optimization of sodium-cooled fast reactors. London; Thomas Telford for the British Nuclear Energy Society (1978).

From BNES conference on optimization of sodium cooled fast reactors; London, UK (28 Nov 1977).

This paper discusses the relationships between concepts of the core support system, fuel handling system and reactor shutdown system, which poses major problems in the design of the reactor internals for future LMFBs. Designers of the LMFB reactor internals will be forced to solve the structural materials problems which are caused by the fast neutron irradiation. The enhanced bowing of the core component ducts due to radiation-induced swelling has posed difficult problems in the core restraint design. Three types of core restraint systems - the active, passive and the static systems - were compared with each other along with such additional considerations as the acceptable load capacity of IVHM, the alignment of the absorber assembly channels and the controlling reactivity and the maintainability of the structure elements of the active system. The fluence limit requirements on core support structures to minimize the irradiation-induced degradation of the mechanical properties of the structural materials demanded the choice of the design concept which incorporates replaceability of any structure elements essential to safety in order to avoid longer fuel assembly features caused by the provision of considerably thick shielding region. But this option brought the restriction in available in-vessel fuel handling systems. The conceptual studies of absorber assemblies and drive mechanisms, especially scram assisting methods, for the primary and the secondary shutdown systems have also been conducted by taking account of such effects on scram times as bowing of the individual control duct assemblies, displacements caused by core deflection and earthquakes.

- 4119 DESIGN CONSIDERATIONS FOR THE PRIMARY SYSTEM AND THE PRIMARY COMPONENTS OF SNR-2. Kohler, M.; Hillekum, H.; Ratzel, W.; Wagner, J.; de Boer, G.; Heslenfeld, M.W. pp 317-323 of Optimization of sodium-cooled fast reactors. London; Thomas Telford for the British Nuclear Energy Society (1978).

From BNES conference on optimization of sodium cooled fast reactors; London, UK (28 Nov 1977).

The conceptual design of the primary system, including its large components, of the 1300 MWe SNR-2 demonstration plant is described. As the SNR-300 Kalkar plant, the SNR-2 is based on the loop concept. Four heat transfer loops, each arranged in a cylindrical primary cell (pot) close to the reactor vessel, are foreseen. The atmosphere inside the primary cells is heated to the temperature of the primary sodium. Inside each cell, 2 IHX's, 1 hot leg pump, 2 valves and the piping, support and instrumentation structures are arranged. The pot is the common cavity in case of leaks.

- 4120 OPTIMIZATION STUDY OF A DEMONSTRATION FAST BREEDER REACTOR PLANT. Kurosawa, K.; Sugizaki, T.; Kataoka, I.; Kishida, K.

(Mitsubishi Atomic Power Industries, Inc., Omiya, Saitama (Japan). Engineering and Development Div.); Tomabechi, K.; Nakai, Y.; Miki, R. pp 15-22 of Optimization of sodium-cooled fast reactors. London; Thomas Telford for the British Nuclear Energy Society (1978).

From BNES conference on optimization of sodium cooled fast reactors; London, UK (28 Nov 1977).

An optimization study on the reactor heat transport system of a 1,000 MW e loop type fast breeder reactor plant has been conducted. This study includes survey of the main coolant pipe size, the number of loops and sizing and selection of main components. Steam cycles, steam conditions and the system operating temperatures are also investigated. Normalized electrical generation cost comparison is made for various combinations of these plant parameters.

- 4121 DESIGN CONSIDERATIONS AND COST ANALYSES OF THE SECONDARY SYSTEM OF SNR 2. Lievense, K.; Jansing, W.; Vinzens, K.; de Hes, M.; Raas, J.L.; Renders, A.H.I.; van Westenbrugge, J.K. pp 311-316 of Optimization of sodium-cooled fast reactors. London; Thomas Telford for the British Nuclear Energy Society (1978).

From BNES conference on optimization of sodium cooled fast reactors; London, UK (28 Nov 1977).

A review is given of the considerations influencing the concept for the SNR 2 secondary sodium loops, including the steam generator buildings and the steam generators.

- 4122 FAST REACTOR CORE RESTRAINT SYSTEMS. Loveday, S.F.; Beckett, V.S. (Nuclear Power Co. (Whetstone) Ltd. (UK)). pp 181-188 of Optimization of sodium-cooled fast reactors. London; Thomas Telford for the British Nuclear Energy Society (1978).

From BNES conference on optimization of sodium cooled fast reactors; London, UK (28 Nov 1977).

The normal operational and transient behaviour of the preferred restrained core design for a commercial size fast breeder reactor is described and its performance illustrated by typical analytical results from purpose written computer codes. Two alternative design concepts are considered and their relative advantages and disadvantages highlighted. The preferred design of restrained core employs a barrel type structure around the outside of the core shield elements. This structure restrains the core via contact pads on each sub-assembly at two levels; the lower just above the active core region, and the upper just below the tops of the sub-assemblies.

- 4123 STUDY OF ALTERNATIVE BOILER FEED PUMP ARRANGEMENTS FOR A CIVIL FAST REACTOR. Marshall, F. (UKAEA Reactor Group, Culcheth). pp 325-331 of Optimization of sodium-cooled fast reactors. London; Thomas Telford for the British Nuclear Energy Society (1978).

From BNES conference on optimization of sodium cooled fast reactors; London, UK (28 Nov 1977).

The paper assumes a design utilizing two standard 660 MW Turbo Generators and examines various feed pump arrangements to suit such a scheme. The paper predicts the performance of a combination of steam and electric driven pumps compared with all electric driven pumps and suggests that there will be a distinct advantage in adopting an all electric system.

4124 ATOMICS INTERNATIONAL (AI) PROTOTYPE LARGE BREEDER REACTOR (PLBR). McDonald, J.S. (Atoms International Div., Canoga Park, CA (USA)); Campise, A.V.; Brunings, J. pp 239-246 of Optimization of sodium-cooled fast reactors. London; Thomas Telford for the British Nuclear Energy Society (1978).

From BNES conference on optimization of sodium cooled fast reactors; London, UK (28 Nov 1977).

The AI-PLBR breeder plant design prepared for ERDA and EPRI is of 1000 MWe size, utilizing a loop-type sodium system configuration and producing 2200 psig/850°F steam. A 'bullseye' core geometry type sodium system configuration and is employed with PuO₂-UO₂ fuel and UO₂ fertile material. The reactor outlet coolant temperature is 930°F. A modified 'A'-frame refueling system is employed, which is capable of handling 1/3 of a core loading in 12 days. An inducer-type mechanical pump is used in the primary circuit because of its excellent NPSH characteristics. Hockey sticks steam generators are used to produce near-fossil steam conditions at the turbine throttle. The balance of plant (BOP) design was developed by the architectural-engineering firm of Burns and Roe. It includes Allis-Chalmers - KWU 1800-rpm tandem-compound turbine, selected with high-, intermediate-, and two double-flow low-pressure cylinders equipped with two moisture separator cyclones. A design feature to enhance the licensability of the reference design is the three-level Decay Heat Removal System (DHRS), which consists of normal, backup, and diverse decay heat removal paths. The Atomics International PLBR design illustrated the technical soundness of the LMFBR system for meeting the world's long-term electrical energy supply needs. The design includes design features to assure licensability and innovative engineering features to enhance reliability, constructability, economics, and U.S. utility grid compatibility. The design concept provides a sound basis for the future detailed design of a prototype plant and subsequent development of larger LMFBR plants.

4125 INCORPORATING THE UTILITY VIEWPOINT IN THE DESIGN OF THE PROTOTYPE LARGE BREEDER REACTOR (PLBR). Minnick, L.E. (Electric Power Research Inst., Palo Alto, CA (USA)). pp 207-210 of Optimization of sodium-cooled fast reactors. London; Thomas Telford for the British Nuclear Energy Society (1978).

From BNES conference on optimization of sodium cooled fast reactors; London, UK (28 Nov 1977).

The PLBR is intended to become the first full-scale demonstration breeder plant in the U.S.A. Three reactor designer/architect engineer teams have been developing plant designs under the joint sponsorship and management of ERDA and the Electric Power Research Institute. The evaluation of many difficult trade-offs is implicit in the design of such an initial demonstration plant. In general, utility requirements emphasize conservative design, use of demonstrated technology to the extent possible, minimum new development, maximum anticipated reliability, minimum complexity, and the lowest predicted operating costs possible in view of the stated considerations.

4126 LMFBR STEAM CYCLE DESIGN TRADE-OFFS. Morabito, J.J.; Ross, F.A. pp 369-382 of Optimization of sodium-cooled fast reactors. London; Thomas Telford for the British Nuclear Energy Society (1978).

From BNES conference on optimization of

sodium cooled fast reactors; London, UK (28 Nov 1977).

Large breeder reactor plant conceptual design studies performed by three reactor manufacturer-architect engineer teams resulted in the recommendation of two alternative steam cycle conditions and associated reactor coolant outlet temperatures: a superheated cycle, supplying steam at 2200 psig (15,168 k Pa), 850°F (454°C) to the turbine; and a dry and saturated cycle, supplying steam at 985 psig (6,791 k Pa), 545°F (285°C) to the turbine. Extensive evaluations of the comparative attributes of these alternative steam cycle conditions were performed to facilitate a choice. The key issues and comparative cycle attributes identified, and the conclusions of these evaluations are outlined in this paper.

4127 OPTIMIZATION STUDY OF LMFBR HAVING SMALL SODIUM VOID COEFFICIENT FROM FUEL CYCLE PERFORMANCE VIEWPOINT. Nishimura, H.; Yoshida, H.; Hirata, M. pp 43-48 of Optimization of sodium-cooled fast reactors. London; Thomas Telford for the British Nuclear Energy Society (1978).

From BNES conference on optimization of sodium cooled fast reactors; London, UK (28 Nov 1977).

Under the constraint of an allowable level of sodium void coefficient in a mixed oxide fuel 1000MWe LMFBR, three types of core concepts - a pancake core, an annular core and an internal blanket concept - were investigated on the basis of same analysis methods. The twenty-five group JAERI-Fast set was used as the basic cross section data. Neutronics calculations containing sodium void coefficient predictions and burnup characteristic analyses were performed based on the two-dimensional diffusion method and six-energy group cross sections collapsed. The fuel cycle performance was analyzed on such items as burnup characteristics, breeding performance and fuel inventory. It was found that the annular core concept had a flexibility to a more strict constraint upon the sodium void coefficient.

4128 EFFECT OF CORE DESIGN CHANGES ON THE DOUBLING TIME AND THE FUEL CYCLE COST OF A 1,000 MWE LMFBR. Otake, I.; Inoue, T.; Tomabechi, K. (Power Reactor and Nuclear Fuel Development Corp., Tokyo (Japan)); Osada, H.; Aoki, K. pp 409-418 of Optimization of sodium-cooled fast reactors. London; Thomas Telford for the British Nuclear Energy Society (1978).

From BNES conference on optimization of sodium cooled fast reactors; London, UK (28 Nov 1977).

Core design studies were performed to improve the doubling time and to minimize the fuel cycle cost of a 1,000 MWe Fast Demonstration Reactor. A core was designed mainly based on the technology being used for the design of a prototype fast reactor MONJU, because much valuable experience will be forthcoming from this reactor. Design parameters with a wide variable range were used to clarify the relations between breeding characteristics, fuel economics and various designs.

4129 EFFECT OF STEAM CYCLE CONDITIONS UPON THE ECONOMICS AND DESIGN OF A SODIUM-COOLED FAST REACTOR. Philpott, E.F.; Pounder, F.; Wilby, C.R. (Nuclear Power Co. (Risley) Ltd. (UK)). pp 333-348 of Optimization of sodium-cooled fast reactors. London; Thomas Telford for the British Nuclear Energy Society (1978).

From BNES conference on optimization of sodium cooled fast reactors; London, UK (28 Nov

1977).

The paper studies the effect of variation of steam and feedwater conditions upon the economics, design and layout of a sodium-cooled fast reactor. The parameters investigated are steam temperature and pressure, feedwater temperature, and boiler recirculation ratio. The paper also includes an assessment of the effects of associating the fast reactor with saturated steam cycle conditions.

- 4130 HOW THE ARCHITECT-ENGINEER MANAGES DESIGN OBJECTIVES AND RESTRAINTS FOR OPTIMIZING SODIUM COOLED REACTORS. Roe, K.A.; Roe, K.K. (Burns and Roe, Inc., Oradell, NJ (USA)). pp 197-205 of Optimization of sodium-cooled fast reactors. London; Thomas Telford for the British Nuclear Energy Society (1978).

From BNES conference on optimization of sodium cooled fast reactors; London, UK (28 Nov 1977).

The design objectives of low capital and operating costs and high reliability are best attained by carefully defining criteria early in the development stage. Throughout the design development, unusual attention to constructibility, reliability and availability requirements, and the early resolution of licensing issues by designated engineering specialists are some of the approaches used to minimize design restraints. Effective management of these design objectives and restraints can assure that, on balance, LMFBR costs can be improved, reliability increased, and maintenance can be effective.

- 4131 DESIGN TRADE-OFFS IN VIEW OF SAFETY CONSIDERATIONS. Saji, G.; Kishida, K. (Mitsubishi Atomic Power Industries, Inc., Tokyo (Japan)); Inoue, T. pp 49-56 of Optimization of sodium-cooled fast reactors. London; Thomas Telford for the British Nuclear Energy Society (1978).

From BNES conference on optimization of sodium cooled fast reactors; London, UK (28 Nov 1977).

In view of resolving conflicting demands of cost, safety, flexibility of operation and design margins, safety design of various plant systems is discussed referring to their weight on construction costs. An influence of hypothetical core disruptive accident (HCDA) and loss of piping integrity (LOPI) on plant design and thus on construction materials is discussed, in optimising future commercial FBR plants.

- 4132 LOOP AND POOL FAST REACTORS. Taylor, D. (Nuclear Power Co. (Risley) Ltd. (UK)); Cage, F. pp 211-222 of Optimization of sodium-cooled fast reactors. London; Thomas Telford for the British Nuclear Energy Society (1978).

From BNES conference on optimization of sodium cooled fast reactors; London, UK (28 Nov 1977).

There are basically two different ways of arranging the primary circuits of L.M.F.B.R.'s. One in which all the components are housed in separate vessels connected together by pipework, normally referred to as the loop and the other whereby all the components are housed in a single large vessel, normally referred to as the pool. The paper discusses the two arrangements and identifies some of the major engineering differences and the effect these have upon design and operation.

- 4133 RECENT COMMERCIAL FAST REACTOR DESIGNS WITH IMPROVED SAFETY FEATURES. Thornton, D.E.J. (UKAEA, Risley. Nuclear Power

Development Establishment); Brindley, K.W. pp 77-84 of Optimization of sodium-cooled fast reactors. London; Thomas Telford for the British Nuclear Energy Society (1978).

From BNES conference on optimization of sodium cooled fast reactors; London, UK (28 Nov 1977).

Most CDFR design work in the UK in the past has related to simple cylindrical cores of fuel surrounded by breeder material. It became apparent, however, that with this design there was room for improvement in the response to certain hypothetical accidents in which sodium coolant was expelled from the core, and a number of alternative designs have been examined in recent years. Most of these variants involved simple alterations in core layout using existing subassembly designs, principally by introducing local breeder regions into the fuelled core, in the form of radial spokes, annuli or clusters. A few others modified the subassembly design, using axial shortening, introduction of breeder layers, and reducing the sodium fraction; the effect of reducing the core size was also examined.

- 4134 OPTIMIZATION STUDY OF LMFBR WITH THORIUM-BLANKET FOR THE SUPPLY OF U-233 TO MULTI-PURPOSE HTGR. Yoshida, H.; Nishimura, H.; Hirata, M. (Japan Atomic Energy Research Inst., Tokai, Ibaraki. Tokai Research Establishment). pp 401-407 of Optimization of sodium-cooled fast reactors. London; Thomas Telford for the British Nuclear Energy Society (1978).

From BNES conference on optimization of sodium cooled fast reactors; London, UK (28 Nov 1977).

The conventional, parfait blanket and heterogeneous core LMFBR concepts with thorium-blanket have been investigated to identify potential configurations of fast breeder reactor for the supply of U 233 to the associated multi-purpose HTGR in the symbiotic system, from the view points of fuel sufficiency, inherent safety and fuel cycle cost. It was found that the parfait concept could be preferable as the LMFBR in the symbiotic system from its best performances in the condition imposed.

- 4135 INHERENTLY SAFE REACTOR DESIGN. Lancet, R.T.; Specht, E.R.; Cooper, M.; Adkins, R.; Bailey, H.S.; Grantz, A.L.; Millunzi, A. pp 101-110 of Optimization of sodium-cooled fast reactors. London; Thomas Telford for the British Nuclear Energy Society (1978).

From BNES conference on optimization of sodium cooled fast reactors; London, UK (28 Nov 1977).

The U.S. LMFBR Inherently Safe Reactor Design Program is discussed with the emphasis on the results obtained to date and future plans. Specific design concepts for inherent core shutdown systems are presented as well as the corresponding experimental verification program.

- 4136 CONSEQUENCES OF SAFETY PRESCRIPTIONS FOR FAST BREEDER REACTOR DESIGN IN FRANCE. Megy, J.M. (CEA Centre d'Etudes Nucleaires de Saclay, 91 - Gif-sur-Yvette (France)); Cravero, M.; Leduc, J.; Noel, H. pp 9-13 of Optimization of sodium-cooled fast reactors. London; Thomas Telford for the British Nuclear Energy Society (1978).

From BNES conference on optimization of sodium cooled fast reactors; London, UK (28 Nov 1977).

An approach to optimization of a power plant and its boiler is described, with particular

reference to Rapsodie, Phenix, Super Phenix and Super Phenix 2, under the following headings: accident prevention (at the option stage: through component reliability; core cooling; reactor shut-down; cooling system failure detection); accident containment (earthquakes; missiles; sodium fires; core fusion accidents).

- 4137 PHYSICS AND SAFETY ASPECTS OF PRELIMINARY SNR 2 CORE DESIGNS. Morelle, J.M. (Internationale Natrium-Brutreaktor-Bau G.m.b.H., Bergisch Gladbach (Germany, F.R.)); Evrard, G.; Renard, A.; De Wouters, R.; Pilate, S.; Wehmann, U.; Spenke, H.; Loehr, H.; Kieflhaber, E. pp 31-36 of Optimization of sodium-cooled fast reactors. London; Thomas Telford for the British Nuclear Energy Society (1978).

From BNES conference on optimization of sodium cooled fast reactors; London, UK (28 Nov 1977).

Recent design work on SNR 2 has involved inserting fertile regions into inner parts of the core, to improve inherent safety characteristics, to improve the breeding capabilities and to improve the core performance. These aspects are discussed.

- 4138 SAFETY OF NUCLEAR POWER PLANTS WITH FAST BREEDER REACTORS - ENGINEERING ASPECTS. Adam, E.; Schwarz, M. (Technische Univ., Dresden (German Democratic Republic). Sektion Energieumwandlung). Wiss. Z. Tech. Univ. Dresden; 27: No. 6, 1305-1309(1978). (In German).

For the safe operation of nuclear power plants with fast breeder reactors the removal of energy released under operational or accidental conditions is important. Proceeding from considerations on the basis accident 'total voltage breakdown', two cooling systems (loop construction and pool construction) are studied for a sodium-cooled reactor. Criteria for the efficiency of cooling systems are the temperatures within the primary coolant circuit after an accident. The temperature curves have been calculated, using a computer code. The results obtained are discussed and conclusions are drawn for designing the whole nuclear power plant.

- 4139 POSSIBLE LONG TERM OPTIONS FOR THE FAST REACTOR PLUTONIUM FUEL CYCLE. Flowers, R.H.; Johnson, K.D.B.; Miles, J.H.; Webster, R.K. (United Kingdom Atomic Energy Authority, Harwell, England). pp 256-263 of Energy technology V: challenges to technology. Hill, R.F. (ed.). Washington, DC; Government Institutes, Inc. (1978).

From 5. energy technology conference; Washington, DC, USA (27 Feb 1978).

The role of fuel reprocessing in a fast reactor fuel cycle is discussed with reference to an advanced point in time at which fast reactors dominate the nuclear power base. Emphasis upon minimisation of the out-of-reactor fuel inventory, and the consequent higher activity levels present in the reprocessing plant, may lead to a progressive introduction of co-processing, gel fuel production, and integrated fuel reprocessing-fabrication plants. The further possibility of a relaxation in the degree of fission product removal in a remotely operated integrated plant is introduced, and conceptual flowsheets to achieve particular levels of fission product recycle are described.

- 4140 OPTIMIZATION OF THE WESTINGHOUSE/STONE AND WEBSTER PROTOTYPE LARGE BREEDER REACTOR.

Anderson, C.A. Jr. (Westinghouse Electric Corp., Pittsburgh, PA (USA). Advanced Reactors Div.). pp 247-259 of Optimization of sodium-cooled fast reactors. London; Thomas Telford for the British Nuclear Energy Society (1978).

From BNES conference on optimization of sodium cooled fast reactors; London, UK (28 Nov 1977).

The optimization of the Westinghouse/Stone and Webster Prototype Large Breeder Reactor (PLBR) is described. This reactor plant, designed for ERDA and EPRI, resulted from optimization and tradeoffs on plant size, number of loops, steam cycles, system temperature, pump location, refueling concept, reactor shut-down system logic, control system logic, steam generating system, residual heat removal system, core arrangement and reactor vessel. The result is a three loop LMFBR rated at 1000 MWe gross with sodium entering the reactor vessel at 650°F (345°C) and leaving at 950°F (510°C). The reactor vessel has a flat closure head on top, containing three rotating plugs on which are mounted the upper internals structure and the in-vessel transfer machine. The core has three radial layers of core material separating four radial blanket regions. An inclined refueling chute penetrates the reactor vessel. Plant efficiency of 37% is achieved with the use of once-through steam generators operating in the modified Sulzer mode, producing 2200 psi, 850°F (15.2 x 10⁶ pa/455°C) steam. The residual heat removal system (RHRS) consists of three independent heat removal paths in which the intermediate sodium is cooled in air blast heat exchangers (author).

- 4141 POTENTIAL OF LARGE HETEROGENEOUS REACTORS. Barthold, W.P.; Tzanos, C.P.; Beitel, J.C. (Argonne National Lab., IL (USA)). pp 279-290 of Optimization of sodium-cooled fast reactors. London; Thomas Telford for the British Nuclear Energy Society (1978).

From BNES conference on optimization of sodium cooled fast reactors; London, UK (28 Nov 1977).

Different 1200 MWe heterogeneous core configurations have been evaluated and compared with a homogeneous 1200 MWe LMFBR design. This study discusses the neutronic coupling concept which was employed to discriminate between different heterogeneous core designs. Reactivity control, breeding performance, safety parameters, fuel pin optimization, transient behaviour and thermal performance were investigated in detail and results of these analyses are presented.

- 4142 STUDIES ON MOLTEN FUEL. Goetzmann, O.; Schulz, B. (Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Inst. fuer Material- und Festkoerperforschung); Dorner, S.; Fieg, G.; Werle, H. (Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Inst. fuer Neutronenphysik und Reaktortechnik); Alsmeyer, H.; Barleon, L.; Guenther, C. (Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Inst. fuer Reaktorbauelemente); Perinic, D. (Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Bereich Ingenieurtechnik). KFK Nachr.; 10: No. 3; 4, 87-91(1978). (In German).

In building the SNR 300 it was assumed that melting of the whole core had to be dealt with and that the proof of retention within the tank could not be furnished in time for the SNR 300. In order to cover the risk associated with this there was provided an external core-catcher which can be cooled and which is coated by UO₂ resp. ThO₂. The work carried out with respect to core meltdown is oriented on this problem

and comprises investigations in the following areas: - Model experiments and theoretical studies on thermodynamics. - Explanation of important phenomena in the interaction of reactor materials (UO₂, steel, Na) at representative temperatures. - Determination resp. confirmation at representative temperatures of materials data required for transferring the thermodynamics results to core meltdown. - With respect to the work concerned with gas-cooled breeders, a core-catcher concept for this reactor type.

- 4143 EXPERIMENTAL STUDIES ON LOCAL COOLING PERTURBATIONS. Huber, F.; Peppier, W. (Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Inst. fuer Reaktorentwicklung); Casal, V. (Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Inst. fuer Reaktorbaulemente). KFK Nachr.; 10: No. 3; 4, 101-104(1978). (In German).

The following statements can be made and applied to a SNR Mk Ia cluster: - Under SNR 300 nominal conditions the boiling temperature will only be reached behind wall or corner obstructions of greater than 15% of the blocking cross-section. - Without the influence of gas the region of the obstruction itself can be cooled relatively well even under boiling conditions. The interval between the conditions at the beginning of boiling and those leading to continuing interruption of cooling depends on the form of boiling that will occur. - If in combination with an obstruction there will be released fission gas direct transition from the single phase stage to local interruptions of cooling will be possible. This statement is true, however, only for the region immediately behind the obstruction. - Direct transition from local boiling to boiling in the whole cluster, caused by thermodynamical instability, can be excluded.

- 4144 IN-PILE INVESTIGATION OF LOCAL COOLING PERTURBATIONS (MOL 7C). Kramer, W.; Schleisiek, K. (Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Inst. fuer Reaktorentwicklung); Gelthoff, D.; Schmidt, L. (Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Inst. fuer Material- und Festkoerperforschung); Vanmassenhove, G.; Vervimp, A. (Centre d'Etude de l'Energie Nucleaire (Belgium)); Rahn, A. (Centre d'Etude de l'Energie Nucleaire, Mol (Belgium)). KFK Nachr.; 10: No. 3; 4, 135-108(1978). (In German).

In the BR2 in Mol there was to be studied in three experiments the behavior of a sodium-cooled fuel subassembly under locally disturbed cooling conditions. The present paper gives a report on the kind of performance and the results of the first two experiments. The third one is planned for the end of 1979.

- 4145 VALIDATION OF THE COMPUTER CODE ARES FOR CALCULATING THE TANK LOAD UNDER OVERPOWER CONDITIONS. Malmberg, T.; Hoang, Y.S. (Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). Inst. fuer Reaktorentwicklung). KFK Nachr.; 10: No. 3; 4, 83-86(1978). (In German).

The present paper deals with the fundamental aspects of the computer code ARES as well as the experimental set-up and its simulation by the code. In addition the occurring hydromechanical phenomena are described qualitatively. Finally experiment and calculation are compared with one another.

THORIUM FUELS IN POWER REACTOR SYSTEMS. Nair, S. (Central Electricity Generating Board, Berkeley (UK). Berkeley Nuclear Labs.). Ann. Nucl. Energy; 5: No. 6, 259-266(1978).

A study has been made of the relative hazards of waste arising from the use of thorium fuels in certain power reactor systems. The hazard estimates were made using the ICRP maximum permissible concentrations for the ingestion pathway for both water-soluble and insoluble wastes. Two separate conceptual fuel cycles were considered, the one (referred to as the advanced fuel cycle) involving the use, in the THTR, of thorium and uranium bred in an LMFBTR thorium blanket, the other involving the use of thorium and ²³⁵U-enriched uranium in a THTR. The waste hazards were compared with those resulting from the use of ²³⁵U-enriched fuel in HTR and PWR and the effect of recycling uranium and ²³⁹Pu-rich plutonium was also investigated. Thorium, uranium and plutonium extraction efficiencies of 99.9% were assumed wherever relevant before waste hazard estimates were computed.

- 4147 PHOTOELASTIC INVESTIGATION OF A REACTOR BUILDING. Jullien, F.J.; Morel, A. pp 855-859 of 6. Internationale Konferenz 'Experimentelle Spannungsanalyse'. Duesseldorf, Germany, F.R.; VDI-Verl. (1978). (In French)

From 6. conference on experimental stress analysis; Munich, F.R. Germany (18 Sep 1978).

This paper is devoted to the study of the nuclear reactor containment sheltering the Super Phenix Surgenerator. This structure of civil engineering is very important because of its sizes and of its complexity. A model of this building and of the next soil has been fabricated with a reduced Scale of 1/200; the soil has been there considered as a boundary condition. The fabrication of a closely fitting model has required many studies on the materials, and on the technology adapted to the mouldering and the loading of this reduced structure. The results confirm the whole behavior as obtained by the calculation. In addition, they complete the study by giving the local behavior in singular areas; in this way, they allow the optimisation of the design.

- 4148 OPERATING EXPERIENCE WITH THE PFR EVAPORATORS. Evans, A.D.; Broomfield, A.M.; Smedley, J.A.; Bray, J.A. (UKAEA, Dounreay. Nuclear Power Development Establishment). pp 3-15 of Ferritic steels for fast reactor steam generators. Pugh, S.F.; Little, E.A. (UKAEA, Harwell. Atomic Energy Research Establishment) (eds.). London, England; British Nuclear Energy Society (1978).

From British Nuclear Energy Society conference on ferritic steels for fast reactor steam generators; London, UK (30 May 1977).

This paper describes operating experience with the PFR evaporator units with particular emphasis on those features associated with the use of 2 1/4 Cr 1Mo steels. The problems of small leaks in the tube to tube sheet welds, where twelve out of the three thousand used have been affected, are discussed. Normal operation of the units has demonstrated that the use of 2 1/4 Cr 1Mo steel is entirely satisfactory for both the sodium and water circuits involved.

- 4149 DESIGN PHILOSOPHY AND FUNCTIONAL REQUIREMENTS OF A SODIUM HEATED STEAM GENERATOR MADE OF FERRITIC STEEL. Robin, M.G.; Birault, J. (CEA Centre d'Etudes Nucleaires de Saclay, 91 - Gif-sur-Yvette (France). Div. d'Etude et de Developpement des Reacteurs). pp 50-54 of

Ferritic steels for fast reactor steam generators. Pugh, S.F.; Little, E.A. (UKAEA, Harwell. Atomic Energy Research Establishment) (eds.). London, England; British Nuclear Energy Society (1978).

From British Nuclear Energy Society conference on ferritic steels for fast reactor steam generators; London, UK (30 May 1977).

Since the first use of 2.25 Cr-1Mo Croloy for the first single wall sodium heated steam generator installed, in the early sixties, on the Enrico Fermi Atomic Power Plant, it has been recognised that ferritic steels would be suitable for such applications. Unfortunately, due to decarburization in liquid sodium, and low creep strength, 2.25 Cr-1Mo steel is somewhat limited in its operational temperature range. Starting from the design philosophy of a once-through unit and considering the functional requirements of a steam generator operated under normal and abnormal conditions, it is shown that, after suitable development, a high strength 9% Cr ferritic steel could be used for the tube bundle of a modern high temperature and pressure steam generator for the LMFBR.

- 4150 SODIUM HEATED STEAM GENERATORS. NEAR TERM AND PROJECTED INFORMATION NEEDS-FERRITIC STEELS. Spalaris, C.N.; Challenger, K.D.; Dutina, D.; Ring, P. (General Electric Co., San Jose, CA (USA)). pp 55-63 of Ferritic steels for fast reactor steam generators. Pugh, S.F.; Little, E.A. (UKAEA, Harwell. Atomic Energy Research Establishment) (eds.). London, England; British Nuclear Energy Society (1978).

From British Nuclear Energy Society conference on ferritic steels for fast reactor steam generators; London, UK (30 May 1977).

The use of 2-1/4Cr-1Mo as steam generator material in the U.S. was predicated upon the assumption that consumable remelting be used for processing tubing and tubesheets. This was necessary to assure high quality sodium/water pressure boundary members and tube-to-tubesheet welds, envisioned as decisive factors for achieving high steam generator performance potential. Recognizing that the remelting processes may alter the behaviour of the alloy, development programs are being carried out to confirm that ASME Code design requirements for 2-1/4Cr-1Mo can be met. Additionally, environmental effects such as corrosion and decarburization are being studied to assure that data base from air melted steel used in the development of our present understanding of the alloy can be applied in the design of components. Cost differentials for consumable remelting have been modest in comparison to the cost of finished steam generator modules. On-going development programs are addressing most identified areas of concern, although specific requirements may arise as more experience is gained through operation of ferritic sodium heated steam generators.

- 4151 POST-PERFORMANCE EXAMINATION OF THE 50 MW STEAM GENERATOR FOR THE PROTOTYPE FAST BREEDER REACTOR 'MONJU'. Tsuda, H.; Kawara, M.; Shibato, E. (Hitachi Ltd., Ibaraki (Japan). Hitachi Works); Kanamori, A. (Power Reactor and Nuclear Fuel Development Corp., Tokyo (Japan)). pp 22-26 of Ferritic steels for fast reactor steam generators. Pugh, S.F.; Little, E.A. (UKAEA, Harwell. Atomic Energy Research Establishment) (eds.). London, England; British Nuclear Energy Society (1978).

From British Nuclear Energy Society conference on ferritic steels for fast reactor steam generators; London, UK (30 May 1977).

This paper describes the disassembly and examination of the 50 MW Steam Generator

following performance tests at the 50 MW Steam Generator Test Facility. This disassembly and examination consists of a visual examination, dimensional check and nondestructive examination of parts of interest, metallurgical examination of tubes and so forth. On the basis of the results of this examination, it was concluded that the integrity of the 50 MW Steam Generator was confirmed and that there was negligible degradation of materials or components during the performance test.

- 4152 RESULTS OF THE TEST AND INSPECTION PROGRAMME OF THE PROTOTYPE SNR-300 STEAM GENERATORS. Van Westenbrugge, J.K.; Tromp, Th.J.; De Maeijer, J.R. (Neratoom N.V., The Hague (Netherlands)). pp 16-21 of Ferritic steels for fast reactor steam generators. Pugh, S.F.; Little, E.A. (UKAEA, Harwell. Atomic Energy Research Establishment) (eds.). London, England; British Nuclear Energy Society (1978).

From British Nuclear Energy Society conference on ferritic steels for fast reactor steam generators; London, UK (30 May 1977).

Results are presented of the dismantling and inspection of two of the Neratoom prototype steam generators. Neither the straight tube nor the helical coil tube steam generator showed major problems.

- 4153 MATERIAL CHOICES FOR THE COMMERCIAL FAST REACTOR STEAM GENERATORS. Willby, C.; Walters, J. (Nuclear Power Co. (Risley) Ltd. (UK)). pp 40-49 of Ferritic steels for fast reactor steam generators. Pugh, S.F.; Little, E.A. (UKAEA, Harwell. Atomic Energy Research Establishment) (eds.). London, England; British Nuclear Energy Society (1978).

From British Nuclear Energy Society conference on ferritic steels for fast reactor steam generators; London, UK (30 May 1977).

Experience with fast reactor steam generators has shown them to be critical components in achieving a high availability. This paper presents the designers views on the use of ferritic materials for steam generators and describes the proposed design of the steam generators for the Commercial Fast Reactor (CFR), prototype of which are to be inserted in the Prototype Fast Reactor at Dounreay.

- 4154 BREEDER: NOW OR NEVER. Murphy, P.M. (Electric Power Research Inst., Palo Alto, CA). Proc. Am. Power Conf.; 40: 86-91(1978). (CONF-780440--).

From American power conference; Chicago, IL, USA (Apr 1978).

The timing of the commercial introduction of the liquid metal fast breeder reactor (LMFBR) will be an important factor in its ability to supply a significant fraction of the nation's future electrical needs. The number of breeders we can build initially will be limited by the size of our low-cost uranium resources and by the rate at which light water reactors (LWRs) are placed in service. Since this uranium resource is fixed in size while electrical demand will grow geometrically, it is clear that the sooner the breeder is introduced commercially the larger will be the fraction of electrical demand it can supply. An early commercial introduction on an adequate scale requires full-scale resumption of LWR construction and redirection of LMFBR development programs toward a near-term commercial prototype.

- 4155 HISTORIC DEVELOPMENT OF STEELS CONTAINING 8-10% MO AND FUTURE DIRECTIONS FOR

LMFBR APPLICATIONS. King, R.T. (Oak Ridge National Lab., TN (USA)); Egnell, L. (Sandvik AB (Sweden)). pp 74-81 of Ferritic steels for fast reactor steam generators. Pugh, S.F.; Little, E.A. (UKAEA, Harwell. Atomic Energy Research Establishment) (eds.). London, England; British Nuclear Energy Society (1978).

From British Nuclear Energy Society conference on ferritic steels for fast reactor steam generators; London, UK (30 May 1977).

Recent developments of steels containing about 8-10% Cr and 0-2% Mo are reviewed for LMFBR steam generators and structural applications. Several promising alloy compositions are identified. Future research to qualify the better materials for service must further define effects of processing history and chemistry including heat treatment, and move in an orderly manner to acquisition of long-term data and demonstration of test components in prototypic coolant loops.

- 4156 DEVELOPMENT OF 9CR-MO STEEL FOR FAST BREEDER REACTOR STEAM GENERATORS. Yukitoshi, T.; Yoshikawa, K.; Tokimasa, K.; Kudo, T.; Shida, Y.; Inaba, Y. (Sumitomo Metal Mining Co. Ltd., Ichikawa, Chiba (Japan). Central Research Lab.). pp 87-90 of Ferritic steels for fast reactor steam generators. Pugh, S.F.; Little, E.A. (UKAEA, Harwell. Atomic Energy Research Establishment) (eds.). London, England; British Nuclear Energy Society (1978).

From British Nuclear Energy Society conference on ferritic steels for fast reactor steam generators; London, UK (30 May 1977).

Newly developed 9Cr-2Mo steel has not only good formability and weldability, but also higher allowable stresses than 2-1/4Cr-1Mo or 9Cr-1Mo steels. This new steel has already been used without trouble for over 2 years as reheater and superheater-tubes in boilers. This paper gives a summary review of the basic characteristics such as mechanical properties, creep properties, fatigue properties, weldability and corrosion resistance which will be required when 9Cr-2Mo steel is applied to LMFBR steam generators.

- 4157 MATERIALS DATA REQUIREMENTS FOR THE HIGH-TEMPERATURE STRUCTURAL DESIGN OF 2 1/4CR-1 MO STEEL COMPONENTS. Corum, J.M. (Oak Ridge National Lab., TN (USA)); Dalcher, A.W. (General Electric Co., Sunnyvale, CA (USA). Fast Breeder Reactor Dept.). pp 69-73 of Ferritic steels for fast reactor steam generators. Pugh, S.F.; Little, E.A. (UKAEA, Harwell. Atomic Energy Research Establishment) (eds.). London, England; British Nuclear Energy Society (1978).

From British Nuclear Energy Society conference on ferritic steels for fast reactor steam generators; London, UK (30 May 1977).

The materials data needs that can arise when a structural alloy is used for the first time in liquid-metal fast-breeder reactor system components are discussed from the standpoint of the high-temperature structural designer. Recent experience with 2 1/4 Cr-1 Mo steel is used as an example. A common structural problem, involving repeated thermal transient loadings, is discussed, and the current high-temperature structural design methods and criteria used to design for such loadings are outlined. It is shown that the limiting design consideration for 2 1/4 Cr-1 Mo steel is likely to be the accumulation of creep-rupture damage during the relaxation of residual stresses arising from thermal transient loadings. It is concluded that although many data needs for a new alloy are readily apparent, others are unique to each particular material and are often identified only as the material is

employed in actual design.(author).

- 4158 DEVELOPMENT OF A 9 CR STEEL WITH IMPROVED STRENGTH AND TOUGHNESS. Bodine, G.C.; Chakravarti, B.; Harkness, S.D.; Owens, C.M.; Roberts, B.; Vandergriff, D.; Ward, C.T. (Combustion Engineering, Inc., Chattanooga, TN (USA)). pp 160-164 of Ferritic steels for fast reactor steam generators. Pugh, S.F.; Little, E.A. (UKAEA, Harwell. Atomic Energy Research Establishment) (eds.). London, England; British Nuclear Energy Society (1978).

From British Nuclear Energy Society conference on ferritic steels for fast reactor steam generators; London, UK (30 May 1977).

A development program was initiated to provide an alternate code-approved advanced ferritic alloy for LMFBR use. Approximately 30 laboratory heats were made of the type 9Cr-1Mo-Nb-V-W. In elevated-temperature properties the experimental alloys are superior to code-approved and candidate commercial steels. Improvements realized in weldability, toughness, and elevated-temperature strength and stability are discussed.

- 4159 TOUGHNESS OF 2 1/4CR-1MO STEEL FOR LMFBR STEAM GENERATOR APPLICATIONS. Copeland, J.F.; Yuen, J.L.; Offer, H.P. (General Electric Co., San Jose, CA (USA)). pp 151-154 of Ferritic steels for fast reactor steam generators. Pugh, S.F.; Little, E.A. (UKAEA, Harwell. Atomic Energy Research Establishment) (eds.). London, England; British Nuclear Energy Society (1978).

From British Nuclear Energy Society conference on ferritic steels for fast reactor steam generators; London, UK (30 May 1977).

The toughness of 2 1/4Cr-1Mo steel has been evaluated with regard to Liquid Metal Fast Breeder Reactor (LMFBR) steam generator tubesheet, shell, and nozzle region applications. Drop weight nil-ductility transition (NDT), Charpy V-notch (CVN), tensile, and thick compact tension specimen J-Integral tests were performed. J-Integral and CVN tests from thick section plates and weldments were performed to temperatures as high as 510°C. Toughness in the vicinity of room temperature is adequate, in these cases, but elevated temperature toughness is reduced by low energy tear fracture.

- 4160 MAIN CHARACTERISTICS OF 9% CHROMIUM-2% MOLYBDENUM-NIOBIUM-VANADIUM STEEL TUBES. INFLUENCE OF VARIATIONS OF COMPOSITION AND THERMAL TREATMENT. Gunz, G.; Pellicani, F. (Centre d'Etudes Vallourec, 59 - Aulnoye (France)); Houis, J.; Duquaire, B. (Usinor Service Metallurgique, Thionville (France)). pp 164-170 of Ferritic steels for fast reactor steam generators. Pugh, S.F.; Little, E.A. (UKAEA, Harwell. Atomic Energy Research Establishment) (eds.). London, England; British Nuclear Energy Society (1978).

From British Nuclear Energy Society conference on ferritic steels for fast reactor steam generators; London, UK (30 May 1977).

EM 12 steel is well established as a material for use in superheater tubes of conventional power plant. Furthermore, this steel exhibits an acceptable combination of hot tensile and creep strength, together with resistance to stress-corrosion cracking and liquid sodium decarburization, which renders it suitable for LMFBR steam generator applications. The mechanical properties of EM12 as a function of composition and heat treatment are described. Emphasis is placed on the influence of delta-ferrite on the impact and creep properties and the optimization of these

properties by control of the content of ferrite-forming elements and austenitizing temperature.

- 4161 TNO RESEARCH ACTIVITIES ON FERRITIC STEELS FOR LMFB STEAM GENERATORS. Schinkel, J.W. (Nijverheidsorganisatie TNO, Apeldoorn (Netherlands)). pp 82-86 of Ferritic steels for fast reactor steam generators. Pugh, S.F.; Little, E.A. (UKAEA, Harwell. Atomic Energy Research Establishment) (eds.). London, England; British Nuclear Energy Society (1978).

From British Nuclear Energy Society conference on ferritic steels for fast reactor steam generators; London, UK (30 May 1977).

The niobium stabilized 2 1/4Cr1Mo-steel showed satisfactory regarding hot cracking, cold cracking and reheat embrittlement. The sensitivity to hot and cold cracking is very low; some tendency for reheat embrittlement could be related to carbon level. Other chromium molybdenum steels showed low to moderate hot cracking susceptibility. The unstabilized 2 1/4Cr1Mo showed decarburization after 2000 h exposure at 520°C; 9Cr1Mo steel showed some chromium depletion at 550°C in sodium.

- 4162 BREEDER REACTOR PROGRAM IN THE USA. PAST, PRESENT AND FUTURE. Brewer, S. (Department of Energy, Washington, DC (USA)). Gensan Nenji Taikai Gijiroku; No. 11, 118-124, 154-155(1978). (In Japanese).

In the United States, commercial fuel reprocessing and demonstration test of plutonium breeder reactors were now postponed. LMFB project and schedule of FFTF and afterwards await the results of INFCE. However, this is not discarding the development of LMFBs. With the existing energy resources, the United States can have the opportunity to make careful and thorough study. Emphasis is placed on the research and development on new alternative types of fuel. FFTF going to be operated soon should provide effective means for the developments of FBR fuel and materials. High priority is to be retained for the test and development of sodium system hardware. The nuclear proliferation problem is not related to heat transfer and secondary systems; it is associated with the selection of fuel and fuel cycle. The whole program is centered around LMFB design and development. The target output will be 600×10^3 -- 700×10^3 MW. In the United States, now is the time to develop excellent products and to study the nuclear proliferation problem more carefully.

- 4163 FAST BREEDER REACTOR DEVELOPMENT PROGRAM IN FRANCE. OUTLOOK FOR PRACTICAL UTILIZATION. Rozenholz, M. (Novatome Industries, 92 - Le Plessis-Robinson (France)). Gensan Nenji Taikai Gijiroku; No. 11, 103-113, 138-147(1978). (In Japanese).

In France, the experimental fast reactor Rapsodie and the prototype fast reactor Phenix are now in operation. The commercial demonstration fast reactor Super-Phenix Mark I will attain the criticality in 1982, and start normal operation in 1983. Industrial setup for constructing fast reactors was made from 1976 to 1977, and NOVATOME was organized by (EA) and reactor component makers. EDF plans to materialize two power plants with fast breeder reactors in 1981 and total capacity of 8,000 -- 10,000 MWe by 1992. Following on the Mark I, the first plant may have the capacity of 1,200 MWe or more as optimal from the experiences of design and construction of the demonstration plant. Along with the reactor plants, CEA and COGEMA started preliminary design studies on fuel fabrication and reprocessing plants. In

this way, in the former half of 1980s, fast reactor power plants will be introduced in series.

- 4164 INTERACTION SOLID SOLUTION HARDENING IN 2.25CR-1MO STEEL. Klueh, R.L. (Oak Ridge National Lab., TN). Mater. Sci. Eng.; 35: 239-253(1978).

The creep behavior of annealed 2.25Cr-1Mo steel - a low-alloy ferritic steel - is complicated by the metallurgical processes that occur in the steel. These processes, which involve both solid solution and precipitation effects, give rise to creep curves that differ from a classical three-stage creep curve in that two steady-state stages occur. During the first steady-state stage, the creep rate is controlled by the motion of dislocations that contain atmospheres of carbon and molybdenum atom clusters, a process termed interaction solid solution hardening. Eventually, the precipitation of Mo_2C removes molybdenum and carbon from solution, and the creep rate increases to a new steady state where the creep rate is controlled by atmosphere-free dislocations moving through a precipitate field. These nonclassical curves occur at intermediate stresses. As the stress decreases, the first steady-state stage disappears because the dislocation velocity decreases and the molybdenum-carbon atmosphere will be able to diffuse with the dislocation. At high stresses a classical curve occurs when the creep rate is controlled by a combination of processes that operate in the two steady-state stages of the nonclassical curves.

- 4165 DATABANK FOR THE PROTOTYPE FAST REACTOR. Montgomery, K.R. (UKAEA). pp 250-256 of Generalized data management systems and scientific information. Paris, France; OECD Nuclear Energy Agency (1978).

This databank is a large set of files controlled by a management suite of COBOL data handling programs. The data, data dictionary and data directory are stored on exchangeable disc packs in the Random Access Index Sequential mode on an ICL 4/72 computer. It is a databank for the UKAEA Prototype Fast Reactor which stores data pertaining to the entire composition of the in-core components, concentrating particularly upon the fissile fuelled driver assemblies and the many experimental assemblies of both fuel pin and cladding/structural materials. At this time, the reactor is not yet operating at full power. This should be achieved in 1977 and the databank will then contain reactor operating history and reactor physics data, and also post-irradiation examination data for the discharged units. The databank will then represent a complete data compilation of in-reactor performance of fully documented materials. The current size of the databank is of the order of 100 megabytes and is expected to increase to approximately 200 megabytes over the next 2 years. The ICL 4/72 computer will be phased out during 1977 and replaced by an ICL 2980 computer. The Databank Management System adopted by ICL is IDMS (Integrated Database Management System), and it will be available on the 2980 computer. Initially, the databank will be moved on to the 2980 in its current form, but IDMS potential will be probed by moving selected sub-sets of the databank into this management system.

- 4166 DRYOUT CHARACTERISTICS AT LOW MASS VELOCITIES IN A VERTICAL STRAIGHT TUBE OF A STEAM GENERATOR. Roko, K.; Takitani, K.; Yoshizaki, A.; Shiraha, M. pp 429-434 of

- International heat transfer conference. Vol. 1. Toronto, Ontario; National Research Council of Canada (1978).
From 6. heat transfer conference; Toronto, Canada (7 Aug 1978).
Dryout characteristics of forced convective water flow in a vertical straight tube are experimentally studied in order to evaluate the practical performance and design of a LMFBF (Liquid Metal Fast Breeder Reactor) steam generator. Experiments were carried out over the range of mass velocity 160-550 kg/m²s and steam pressure 18-153 kg/cm², employing two different methods of heating such as sodium-heating and Joule-heating. First, a new correlation is proposed for the dryout quality in terms of steam pressure and mass velocity. Second, the characteristics of the wall temperature around the dryout point, such as the temperature gradient along tube axis and the oscillatory behavior, are studied in relation to the steam pressure and mass velocity.
- 4167 STUDIES OF WATERSIDE CORROSION AND HEAT TRANSFER ON LMFBF EVAPORATOR TUBES. Ralph, J.C.; Tomlinson, L.; Silver, P.J.B.; Lilley, W. pp 379-384 of International heat transfer conference. Vol. 4. Toronto, Ontario; National Research Council of Canada (1978).
From 6. heat transfer conference; Toronto, Canada (7 Aug 1978).
A useful method for studying heat transfer and waterside corrosion on short lengths of LMFBF evaporator tube, under representative conditions (350°C, 176 bar), is described. The technique allows simple control of the applied heat flux during steady running and of the temperature ramps during dryout transients. Waterside heat transfer coefficients based on outside wall temperature measurements are in general agreement with predictions for single phase and boiling heat transfer. The rate of waterside corrosion was found to be insensitive to changes in heat flux or steam quality.
- 4168 EXPERIMENTAL DETERMINATION OF CLADDING TEMPERATURE FIELDS IN THE CRITICAL REGIONS OF ROD BUNDLES WITH TURBULENT SODIUM FLOW AND COMPARISON WITH CALCULATIONS. Moeller, R.; Tschoeke, H. pp 29-34 of International heat transfer conference. Vol. 5. Toronto, Ontario; National Research Council of Canada (1978).
From 6. heat transfer conference; Toronto, Canada (7 Aug 1978).
Being the first safety barrier, the rod claddings of reactor core elements constitute a highly loaded and hence extremely important structural element. Their reliable and optimum design determines the operating safety and the economy of the reactor system. This calls among others for the precise knowledge of the three-dimensional temperature fields under all operation conditions conceivable. Such temperature fields were determined experimentally with an LMFBF 19-rod bundle model in turbulent sodium flow by means of a measurement technique especially suitable for high temperature liquid metal cooling. The most important results of the investigations are reported and compared with other experiments, global and local calculations on indicating the boundary conditions to be taken into account. The adaption of both computation methods to the experiments presented and suitable coupling of them are necessary. The significant geometry parameter in the duct wall zone remains to be investigated in further experiments.
- 4169 SODIUM NATURAL CONVECTION FROM A VERTICAL PLATE. Sheriff, N.; Davies, N.W. pp 131-136 of International heat transfer conference. Vol. 5. Toronto, Ontario; National Research Council of Canada (1978).
From 6. heat transfer conference; Toronto, Canada (7 Aug 1978).
There are many components in LMFBF's which are in contact with quiescent sodium, and consequently natural convective heat transfer conditions are of interest to the designers. This paper describes a sodium natural convection experiment in which the primary objective was to establish the validity of analytical correlations for a low Prandtl number fluid (Pr similar to 0.007). The experiment consists of an electrically heated vertical plate immersed in a sodium pool; the latter is cooled externally by a highly rated air cooler. Varying thermal conditions can be applied at the heater surface from six independently adjustable heater sections which comprise the heater. Constant heat flux conditions were used in all of the tests reported.
- 4170 STUDY OF TRANSIENT, BUOYANCY-INDUCED FLOW STRATIFICATION RELEVANT TO THE PRIMARY POOL OF A LIQUID-METAL-COOLED FAST BREEDER REACTOR. Jones, P. pp 137-142 of International heat transfer conference. Vol. 5. Toronto, Ontario; National Research Council of Canada (1978).
From 6. heat transfer conference; Toronto, Canada (7 Aug 1978).
The paper presents the results of a study of the transient motion of a vertical jet issuing into a cylindrical vessel following a sudden increase in the density of the jet. This vessel was an idealized, axisymmetric model of the reactor, where the sudden cooling of the primary sodium following a reactor trip was simulated by switching the flow from pure water to brine. The aim of the work was to investigate the criterion for buoyancy influence on the transient flow. Observation of the flow pattern was achieved either by flow visualization or, for more quantitative results, by introducing the brine at a different temperature from that of the pure water and monitoring the transient temperature field with an array of fast response thermocouples. On the basis of this work, it is concluded that the buoyancy influence can be described by an overall Richardson number and that typical reactor post-trip flows will be buoyancy influenced.
- 4171 FRAGMENTATION OF UO₂ SUB 2% AND UC DROPS ENTERING A SODIUM POOL. Ganguli, A.; Bankoff, S.G. pp 149-154 of International heat transfer conference. Vol. 5. Toronto, Ontario; National Research Council of Canada (1978).
From 6. heat transfer conference; Toronto, Canada (7 Aug 1978).
In this paper attention is focused on whether coarse premixing of fuel and coolant is possible according to the jet penetration hypothesis, with applications to a hypothetical accident in a liquid metal cooled nuclear reactor. For UO₂ SUB 2% or UC fuel drops entering a sodium pool, the rapid bubble growth and collapse phenomenon, followed by crust breakup due to jet penetration, is analyzed as a function of the system pressure and coolant temperature. It appears that the UO₂ SUB 2%-Na system fragments rapidly upon contact, for coolant temperatures above 300°C, while the corresponding temperature for the carbide fuel is around 600°C, at atmospheric pressures. For UO₂ SUB 2% but not for UC, there is a cut off pressure in the 0.1-3 MPa range,

above which the crust does not break up for a particular coolant temperature between 400 and 800°C. Higher sodium temperatures aid the break up for both fuels. One concludes that coarse premixing for UO₂, but not necessarily for UC, is difficult to attain.

- 4172 NEUTRON THEORY, BREEDING PROPERTIES AND DOUBLING TIME IN A BREEDER REACTOR. Mathieu, Ph.; Degeling, M. (Liege Univ. (Belgium)). Univ. Liege, Fac. Sci. Appl., Coll. Publ.; No. 74, 61-86(1978). (In French).

In this work the mathematical expression of the fundamental parameters of a breeder reactor, i.e. the breeding ratio BR and the doubling time TD, is established. The influences of various quantities entering the expression of these parameters and the way leading to the decrease of Tsub(D), are investigated. The decrease of Tsub(D) is classically obtained by an increase of the breeding ratio, of the core specific power and of the fuel burn-up and by a decrease of the plutonium inventory and of its residence time out of pile and of the losses in the reprocessing. For a given enrichment, the total breeding ratio is itself improved by an increase of the density and of the volumetric fraction of the fuel in the core and of the fertile material in the sheath, by a decrease of the structural material and of the number of control rods and by an increase of the thickness of the sheath. One has pointed out the influence of the flattening of the power distribution curve on the decrease of Tsub(D) and the role played in that way by the design of a heterogeneous core, in which the fertile material is judiciously arranged in small blocks in the fuel zone whose enrichment is uniform in opposite to cores with several enrichment zones. Finally a classical neutronic theory allows for the establishment of relationship between the critical size and the core composition by a one or several neutron groups model for bare cores and cores with reflectors in steady conditions.

- 4173 TRANSIENT RADIATIVE HEAT TRANSFER BETWEEN TWO EMITTING-ABSORBING MEDIA. Chan, S.H.; Cho, D.H. pp 367-372 of International heat transfer conference. Vol. 3. Toronto, Ontario; National Research Council of Canada (1978).

From 6. heat transfer conference; Toronto, Canada (7 Aug 1978).

Numerical (exact) solutions have been obtained for the transient energy exchange by radiation between two emitting-absorbing media that are suddenly brought into contact. Results for the temperature profile and radiative heat flux are presented for two different values of the initial temperature ratio (0.8 and 0.5). Also discussed are two approximate methods, one of which yields an analytical expression for the temperature profile valid for small times. An application of the solutions to accident analysis of liquid-metal-cooled fast breeder nuclear reactors is illustrated.

- 4174 HEAT TRANSFER IN REACTOR SAFETY. Tong, L.S. pp 285-309 of International heat transfer conference. Vol. 6. Toronto, Ontario; National Research Council of Canada (1978).

From 6. heat transfer conference; Toronto, Canada (7 Aug 1978).

This paper describes the basic heat transfer phenomena and the predictive techniques which are particularly important in nuclear reactor safety, and also presents the state-of-the-art of reactor heat transfer. Previous review

papers are identified. Emphasis is placed on recently published information, and areas are noted where research efforts should be encouraged.

- 4175 POWER INTO THE 21ST CENTURY. Foster, A.R. pp 151-181 of Convention of the Pan American Federation of Engineering Societies. Vol. 4. Santiago, Chile; Pan American Federation of Engineering Societies (1978).

From 15. Pan American Federation of Engineering Societies convention; Santiago, Chile (1 Oct 1978).

The sources of power which may be available in the future decades are considered. Solar energy, ocean thermal power, and fusion power systems are briefly reviewed, and it is predicted that coal and nuclear systems will have to fulfill the major part of the demands for energy. For systems using high sulfur coal, it is hoped that it will be possible to utilize a fluidized bed. On the other hand, if the sulfur content is low, sometimes there may be a problem with high sodium in the ash. Undoubtedly coal gasification will also be developed. A detailed solution is given to three nuclear systems, namely, the Canadian pressurized heavy water reactor (CANDU), the high temperature gas-cooled reactor using a direct gas turbine cycle (HTGR), and the breeder reactor (LMFBR), its controversy and its promise.

- 4176 TRIBOLOGICAL BEHAVIOUR OF MATERIALS FOR USE IN SODIUM COOLED FAST BREEDER STEAM GENERATOR APPLICATIONS. Hartle, R.T. (General Electric Co., San Jose, CA (USA). Breeder Reactor Dept.); Gallo, T.A.; Wilson, W.L. (Westinghouse Electric Corp., Madison, PA (USA). Advanced Reactors Div.). pp 320-325 of Ferritic steels for fast reactor steam generators. Pugh, S.F.; Little, E.A. (UKAEA, Harwell. Atomic Energy Research Establishment) (eds.). London, England; British Nuclear Energy Society (1978).

From British Nuclear Energy Society conference on ferritic steels for fast reactor steam generators; London, UK (30 May 1977).

Friction and self-welding behaviour of 2 1/4Cr-1Mo Vacuum Arc Remelted steel has been characterized by pin/plate tested to obtain dynamic and breakaway coefficients of friction. These tests were followed by steam generator tube/support plate model tests to obtain tube wear characteristics, under prototypical conditions (temperature, loading, and sodium environment). The average dynamic coefficients of friction ranged from 0.5 to 0.75 under contact loads from 88.5 N to 295.8 N. Breakaway friction factors ranged up to 1.50. Ingot Iron and Inconel 718 have been tested and evaluated as alternate support plate materials. Marked reduction in wear resulted with the use of Inconel 718 at both 502C and 446C.

- 4177 FERRITIC STEELS IN REACTOR TRIBOLOGY. Wild, E.; Mack, K.J. (Gesellschaft fuer Kernforschung m.b.H., Karlsruhe (Germany, F.R.)). pp 326-330 of Ferritic steels for fast reactor steam generators. Pugh, S.F.; Little, E.A. (UKAEA, Harwell. Atomic Energy Research Establishment) (eds.). London, England; British Nuclear Energy Society (1978).

From British Nuclear Energy Society conference on ferritic steels for fast reactor steam generators; London, UK (30 May 1977).

The materials so far used as structural and fuel element cladding materials for sodium cooled fast reactors have been austenitic steels. However, their swelling behaviour under irradiation has negative consequences with

respect to stresses generated in the core. For this reason, ferritic steels are being discussed as a back-up solution. The tribological behaviour of two such grades of steel on a hard alloy and like on like has been investigated and the results have been compared with those obtained with austenitic steels. Their suitability for use in full-scale components was determined on the basis of test rigs in model scale geometries.

4178 CREEP BEHAVIOUR OF 2 1/4Cr1MoNb STEEL.

Husslage, W.; Dortland, W. (Nijverheidsorganisatie TNO, Apeldoorn (Netherlands)). pp 228-233 of Ferritic steels for fast reactor steam generators. Pugh, S.F.; Little, E.A. (UKAEA, Harwell. Atomic Energy Research Establishment) (eds.). London, England; British Nuclear Energy Society (1978).

From British Nuclear Energy Society conference on ferritic steels for fast reactor steam generators; London, UK (30 May 1977).

The creep behaviour of Nb-stabilized 2 1/4Cr1Mo-steel was investigated by means of creep strain tests performed between 500 and 650°C up to 15,000 h on 30 mm plate material and on a welded joint in two stress relieved conditions. Results were compared with the rather meagre data in the literature. The strength under LMFBR design conditions was estimated by extrapolation with the Larson-Miller parameter. Special attention was paid to the creep retardation observed at high stresses and relatively low temperatures. A comparison was made with creep results obtained at 550°C 2 1/4Cr1MoNb in a ferritic condition.

4179 BILINEAR REPRESENTATION OF THE CYCLIC STRESS-STRAIN BEHAVIOR OF INCOLOY 800.

Maiya, P.S. (Argonne National Lab., IL). pp 1-13 of Inelastic behavior of pressure vessel and piping components. Chang, T.Y.; Krempl, E. (eds.). New York, NY; American Society of Mechanical Engineers (1978).

The bilinear stress-strain analysis for Incoloy 800 under cyclic-loading conditions is described. Although the method of determining the bilinear stress-strain parameters is based on a procedure proposed in the RDT Standard F9-1 for inelastic analysis of fast-flux-test-facility components, the accuracy and consistency of results have been improved by an analytical technique that includes certain simplifications. The bilinear stress-strain parameters of solution-annealed Incoloy 800 (heat HH7058A) under cyclic-loading conditions at a strain rate (ϵ /sub t/) of $8.6 \times 10^{-5} \text{ s}^{-1}$, total strain range ($\Delta\epsilon$ /sub t/) between 0.2 and 0.8%, and temperatures from 22 to 593°C have been determined. The dependence of bilinear cyclic-hardening parameters on strain ϵ /sub max/ (ϵ /sub max/ = $\Delta\epsilon$ /sub t/2) at various temperatures and their correlation with accumulated plastic strain are discussed.

4180 PROGRESS IN LIQUID-METAL FAST BREEDER REACTOR SAFETY RESEARCH AND DEVELOPMENT - AN OVERVIEW OF THE ISSUES.

Fontana, M.H. (Oak Ridge National Lab., TN (USA)). Prog. Nucl. Energy; 2: No. 3, 199-218(1978).

A comprehensive review is presented of the research and development directed towards an understanding of the events that could contribute to the release and transport of fission products and transuranic elements up to the boundary of the secondary containment of LMFBRs. The subject is discussed under headings corresponding to four fundamental lines of assurance which have been defined for the analysis of event sequences in this field

ie: accident prevention; limitation of core damage; containment of accident products in inner barriers (primary system); and attenuation of radiological products.

4181 ECONOMIC EVALUATION OF TOKAMAK POWER PLANTS.

Reid, R.L.; Steiner, D. (Oak Ridge National Lab., TN (USA)). pp 757-774 of Fusion reactor design concepts. Vienna; IAEA (1978).

From IAEA conference and workshop on fusion reactor design; Madison, WI, USA (12 Oct 1977).

In this study we determine the impact of plasma operating characteristics, engineering options, and technology on the capital cost trends of tokamak power plants. Tokamak power systems are compared to other advanced energy systems and found to be economically competitive. A three-phase strategy for demonstrating commercial feasibility of fusion power, based on a common-site multiple-unit concept, is presented.

4182 CORROSION OF 2 1/4 CR-1MO STEEL UNDER SUPERHEAT TRANSFER CONDITIONS.

Griess, J.C.; Devan, J.H. (Oak Ridge National Lab., TN (USA)); Hampton, L.V.; Challenger, K.D. (General Electric Corporation, USA). pp 367-270 of Ferritic steels for fast reactor steam generators. Pugh, S.F.; Little, E.A. (UKAEA, Harwell. Atomic Energy Research Establishment) (eds.). London; British Nuclear Energy Society (1978).

From British Nuclear Energy Society conference on ferritic steels for fast reactor steam generators; London, UK (30 May 1977).

Steam generators being developed for use with liquid metal fast breeder reactors (LMFBR's) will operate at substantially greater heat fluxes than conventional fossil-fired steam plants. To establish the corrosion allowance for the superheater tube walls, tests on 2 1/4Cr-1Mo steel with a heat flux of 126 kW/m² across the specimen surface were conducted under steam conditions similar to those that will exist in LMFBR superheaters.

4183 STRESS CORROSION STUDIES FOR 2 1/4Cr1Mo STEEL.

Indig, M.E. (General Electric Co., Pleasanton, CA (USA)). pp 408-412 of Ferritic steels for fast reactor steam generators. Pugh, S.F.; Little, E.A. (UKAEA, Harwell. Atomic Energy Research Establishment) (eds.). London; British Nuclear Energy Society (1978).

From British Nuclear Energy Society conference on ferritic steels for fast reactor steam generators; London, UK (30 May 1977).

Both the evaporators and the superheaters of future LMFBR steam generators are to be constructed with 2 1/4Cr-1Mo steel. One of the major concerns is the possibility that caustic contamination may occur during operation on the aqueous and steam sides of the steam generator. Under specific environmental and mechanical conditions caustic solutions are known to cause stress corrosion cracking of ferritic steels. For this reason the susceptibility of 2 1/4Cr-1Mo to caustic cracking was determined in badly faulted high temperature aqueous (316°C) and superheated steam environments (482°C). It was found that 2 1/4Cr-1Mo was extremely resistant to stress corrosion cracking in all metallurgical conditions tested over a wide range of stresses and oxidizing potentials. While no stress corrosion was detected at 316°C and 482°C, the rate of general corrosion was significant in the caustic environments. Major differences in corrosion rates were noted among different heats of the alloy at 316°C, while at 482°C all samples corroded excessively, 1.27 to $2.54 \times 10^{-3} \text{ mm/h}$ (0.05 to 0.1 mil/h). At lower

temperatures, 232°C corrosion rates were considerably reduced, and the alloy was readily cracked in constant extension rate tests. These studies form the basis for the operating of steam generator units and provide information for the handling of components under postulated off-chemistry conditions.

- 4184 CORROSION BEHAVIOUR OF IRON-CHROMIUM ALLOYS USED AS BOILER TUBE MATERIALS IN FAST REACTOR STEAM GENERATORS. Pritchard, A.M.; Knights, C.F.; Marsh, G.P.; Peakall, K.A.; Perkins, R.; Myatt, B.L.; Antill, J.E. (UKAEA, Harwell. Atomic Energy Research Establishment). pp 360-366 of Ferritic steels for fast reactor steam generators. Pugh, S.F.; Little, E.A. (UKAEA, Harwell. Atomic Energy Research Establishment) (eds.). London; British Nuclear Energy Society (1978).

From British Nuclear Energy Society conference on ferritic steels for fast reactor steam generators; London, UK (30 May 1977).

Experiments have been carried out, chiefly on 9Cr-1Mo material, using (i) capsules fabricated from tubing and containing various corrodents to study corrosion under static conditions, (ii) a high pressure water loop to study salt deposition under realistic mass flow and heat transfer conditions using radiotracers, (iii) a rotating disc assembly to study wastage mechanisms by corrosion and erosion in Na₂O-NaOH melts, and (iv) C-rings for constant strain and constant strain rate tests to assess susceptibility to cracking in concentrated NaOH solutions under controlled potential conditions.

- 4185 WEAR BEHAVIOUR OF Nb-STABILIZED 2 1/4Cr-1Mo STEEL TUBES IN SODIUM. Van Westenbrugge, J.K.; Beijer, N.H.H. (Neratoom N.V., The Hague (Netherlands)); Schinkel, J.W.; De Gee, A.W.J. (Nijverheidsorganisatie TNO, Apeldoorn (Netherlands)). pp 338-341 of Ferritic steels for fast reactor steam generators. Pugh, S.F.; Little, E.A. (UKAEA, Harwell. Atomic Energy Research Establishment) (eds.). London; British Nuclear Energy Society (1978).

From British Nuclear Energy Society conference on ferritic steels for fast reactor steam generators; London, UK (30 May 1977).

The inspection of the 50MW prototype straight tube steam generator tested in the 50MW-facility in Hengelo revealed some wear of the tubes. Corrective actions were taken for the SNR-300 straight tube steam generator design. To corroborate these actions tubes and supports have been tested in a specially designed tube wear test rig. In support small specimen testing has been performed. Both types of testing showed that the wear damage is small and will remain within acceptable limits.

- 4186 WELDING EXPERIENCE WITH TUBE-TO-TUBESHEET JOINTS OF STEAM GENERATORS IN 2 1/4Cr-1Mo STABILIZED FERRITIC STEEL. Beyer, N.H.H. (Neratoom N.V., The Hague (Netherlands)). pp 459-465 of Ferritic steels for fast reactor steam generators. Pugh, S.F.; Little, E.A. (UKAEA, Harwell. Atomic Energy Research Establishment) (eds.). London; British Nuclear Energy Society (1978).

From British Nuclear Energy Society conference on ferritic steels for fast reactor steam generators; London, UK (30 May 1977).

Tube bundles for the steam generators of the SNR 300 plant have been fabricated. In order to guarantee a high quality weld an extensive R and D program was successfully carried out. This program and the destructive and non-destructive testing methods used are described

in this paper.

- 4187 WELDABILITY AND JOINT PROPERTIES OF ADVANCED CARBON STABILIZED 2.25Cr-1Mo STEEL FOR LMFR. Terai, K.; Shimizu, S.; Nakai, Y.; Murakami, T. (Kawasaki Heavy Industries Ltd., Kobe (Japan)); Ota, S.; Fujiwara, M. (Kobe Steel Ltd. (Japan)). pp 442-446 of Ferritic steels for fast reactor steam generators. Pugh, S.F.; Little, E.A. (UKAEA, Harwell. Atomic Energy Research Establishment) (eds.). London; British Nuclear Energy Society (1978).

From British Nuclear Energy Society conference on ferritic steels for fast reactor steam generators; London, UK (30 May 1977).

A series of experimental tests have been carried out for weld cracking sensitivity and joint properties to establish the welding technique for 2.25Cr-1Mo-Nb and 2.25Cr-1Mo-Nb-Ni steels which have been newly developed as structural materials for LMFR steam generators. The results are as follows: (i) The weld cracking sensitivity of 2.25Cr-1Mo-Nb steel is nearly equivalent to that of 2.25Cr-1Mo steel; (ii) The creep rupture strength and fatigue strength of 2.25Cr-1Mo-Nb steel and 2.25Cr-1Mo-Nb-Ni steel are equal to, or superior to that of 2.25Cr-1Mo steel. During tests, all materials rupture within base metal, and the tensile strengths are satisfactory. The impact value of 2.25Cr-1Mo-Nb steel is relatively low; on the other hand, the impact value of 2.25Cr-1Mo-Nb-Ni steel is satisfactory.

- 4188 MECHANICAL PROPERTIES OF TRANSITION JOINT MATERIALS IN SUPPORT OF LMFR STEAM GENERATOR DESIGN. Brinkman, C.R.; King, J.F.; Strizak, J.P.; Klueh, R.L.; Booker, M.K. (Oak Ridge National Lab., TN (USA)). pp 496-503 of Ferritic steels for fast reactor steam generators. Pugh, S.F.; Little, E.A. (UKAEA, Harwell. Atomic Energy Research Establishment) (eds.). London; British Nuclear Energy Society (1978).

From British Nuclear Energy Society conference on ferritic steels for fast reactor steam generators; London, UK (30 May 1977).

Mechanical data needs are identified for transition joint weldments between austenitic and ferritic structural materials planned for LMFR service. Since the heat-affected zone in the ferritic material is apparently the critical area, particular attention must be given to behaviour in this region. Interim results are given to show differences in mechanical properties of the joint materials with particular emphasis on the ferritic materials.

- 4189 CRITICAL TECHNICAL ISSUES: LARGE LMFR PLANT. Anderson, C.A. Jr.; Fillnow, R.H. (Westinghouse Electric Corp., Madison, PA). Proc. Am. Power Conf.; 40: 255-265 (1978). (CONF-780440--).

From American power conference; Chicago, IL, USA (Apr 1978).

Problems anticipated in the development of large LMFR type reactors are reviewed.

- 4190 LOW-TEMPERATURE POOL-TYPE LARGE BREEDER. Cage, J.F.; Davies, S.M.; Sim, R.G. (General Electric Co., Sunnyvale, CA). Proc. Am. Power Conf.; 40: 266-277 (1978). (CONF-780440--).

From American power conference; Chicago, IL, USA (Apr 1978).

A low-temperature saturated cycle pool-type LMFR suitable for utility application in the United States is presented. The configuration of the primary heat transport system and the

selection of steam cycle are described. Breeder generation costs and variable (fuel) costs are also discussed.

4191 STATUS OF PHENIX AND SUPER PHENIX.

Zaleski, P. (European Nuclear Society, Paris, France). Proc. Am. Power Conf.; 40: 278-284(1978). (CONF-780440--).

From American power conference; Chicago, IL, USA (Apr 1978).

The operating history of Phenix and the construction status of Super Phenix are reviewed. Problems with the intermediate heat exchanger in Phenix are discussed in some detail.

4192 CONSERVATIVE POOL CONCEPT FOR A LARGE BREEDER REACTOR.

McDonald, J.S. (Rockwell International, Canoga Park, CA); Storrs, C.L.; Gills, C. Proc. Am. Power Conf.; 40: 285-291(1978). (CONF-780440--).

From American power conference; Chicago, IL, USA (Apr 1978).

A conceptual design of a large pool-type LMFBR is presented.

4193 TRANSITION JOINT WELDING DEVELOPMENT FOR LMFBR STEAM GENERATORS.

King, J.F.; Slaughter, G.M. (Oak Ridge National Lab., TN (USA)); Sullivan, M.D. (General Electric Co., San Jose, CA (USA)). pp 476-480 of Ferritic steels for fast reactor steam generators. Pugh, S.F.; Little, E.A. (UKAEA, Harwell. Atomic Energy Research Establishment) (eds.). London; British Nuclear Energy Society (1978).

From British Nuclear Energy Society conference on ferritic steels for fast reactor steam generators; London, UK (30 May 1977).

The objective of this study was to develop an improved transition weld joint between stainless steel and ferritic steel piping to circumvent the failures and concerns with joints made by existing technology. The primary concern of mismatch in coefficients of thermal expansion between the ferritic and austenitic steels and the high stresses it imposes at the interface between ferritic steel and weld metal led to an extensive elastic stress analysis involving base metal combinations, filler metals, and weld joint geometries. This analysis indicated that for pipe, stress imposed at the joint could be reduced considerably by using a transition material with an intermediate coefficient of thermal expansion between the 2 1/4Cr-1Mo ferritic steel and the austenitic stainless steel. Alloy 800H was selected as an appropriate intermediate material for this application. The advantage of using this material and the welding development involved in making these joints is described.

4194 WATERSIDE CORROSION OF STABILISED 2 1/4%Cr-1%Mo FERRITIC STEEL UNDER HIGH HEAT FLUX CONDITIONS.

Tomlinson, L.; Hurdus, M.H.; Silver, P.J.B.; Lilley, W. (UKAEA, Harwell. Atomic Energy Research Establishment). pp 353-359 of Ferritic steels for fast reactor steam generators. Pugh, S.F.; Little, E.A. (UKAEA, Harwell. Atomic Energy Research Establishment) (eds.). London; British Nuclear Energy Society (1978).

From British Nuclear Energy Society conference on ferritic steels for fast reactor steam generators; London, UK (30 May 1977).

The waterside corrosion of stabilised 2 1/4%Cr 1%Mo ferritic steel tubes has been studied under conditions which simulate the inlet region of a Prototype Fast Reactor (PFR) evaporator. The amount of corrosion occurring

in times from 1000 to 3400 hours was found to be unaffected by: thermal and pressure changes which simulate extreme conditions in the plant; 1 ppm NaCl or 7 ppm NaOH in the loop water; steam quality; heat flux; tube surface condition; the presence of large defects. Large defects in the heat flux zone were able to concentrate soluble species present in the loop water. The presence of a high heat flux (660 kW/m²) resulted in an increased deposition of non-porous magnetite onto the tube surface.

4195 SURVEILLANCE OF THE VIBRATIONAL BEHAVIOUR OF PRIMARY-CIRCUIT COMPONENTS.

Brillon, A.; Puyal, C. (Electricite de France, 78 - Chatou. Direction des Etudes et Recherches); Carre, J.C.; Tigeot, Y. (CEA Centre d'Etudes Nucleaires de Saclay, 91 - Gif-sur-Yvette (France)). pp 377-393 of Nuclear power plant control and instrumentation, 1978. Vol. 1. Vienna, Austria; International Atomic Energy Agency (1978). (In French)

From IAEA symposium on nuclear power plant control and instrumentation; Cannes, France (24 Apr 1978).

Surveillance of the vibration of nuclear power station components can be performed by analysing fluctuations in the signals produced by ionization chambers and detecting elements. The paper contains a description of surveillance techniques applied to French fast neutron reactors (Phenix) and pressurized water reactors (Chooz, Fessenheim, Bugey). The detection of stray objects is also considered.

4196 SYSTEMS FOR DETECTING FAILED FUEL IN FAST REACTORS.
