- 2007 ASPECTS OF THE EVALUATION FROM THE VIEW OF GENETICS OF LIMITING VALUES CONCERNING RADIATION LOADS. Barthelmess, A. (Muenchen Univ. (Germany, F.R.)). pp 309-316 of Viertes deutsches Atomrechts-Symposium. Referate und Diskussionsberichte. Cologne; Heymanns (1976). (In German)

From 4. German symposium on nuclear law; Goettingen, Germany, F.R. (26 May 1975).

2 tabs.; with refs..

Genetic science cannot indicate any determined limit which would be harmless for individuals and the population from genetic aspects. However, for legal reasons limits must be fixed, though they ought to be as low as possible. The most important limits from the view of genetics for those professionally exposed to radiation and for the neighbouring population of nuclear facilities are compared in tables subdivided into the First Radiation Protection Ordinance and its amendment. The approximate value for the first group is taken to be 20 rem as an accumulated dose during a life span (annual dose of 0.5 rem for 25 years of occupational activity in the control area). For the second group, the limit for internal plus external radiation charges can be said to

be the value of 30 mrem p.a. which is already applied in the licensing practice and which is stipulated in sect. 43 (3) of the draft.

As to employees and patients, first of all the individual risk must be observed, i.e. in figures: 10^{-6} for 1 mrem 1% probability to get cancer per additional rem. Welcome changes in the present draft are the obligation for documentation by the authorized physicist and the radiation passport for the employees, the obligation of documentation in case of radiation application on patients by the doctor. This will contribute to valuating accumulated doses. The result of this documentation should be a more efficient self-control of those concerned and a reduction of the individual risk. In the sense of an effective protective function, however, such documentation will remain insufficient if the data are not supplied to an evaluation and if they do not serve for further supervision.

- 2010 PROTECTION OF PERSONS OCCUPATIONALLY EXPOSED TO RADIATION AND OF PATIENTS. Stieve, F.E. (Bundesgesundheitsamt, Berlin (Germany, F.R.)). pp 317-334 of Viertes deutsches Atomrechts-Symposium. Referate und Diskussionsberichte. Cologne; Heymanns (1976). (In German)

19 refs..

The experiences of the last ten years have shown that the measures of the First Radiation Protection Ordinance generally proved to be sufficient for the protection of the employed or of the patients. They had to be amended in so far as the exposure to radiation for those occupationally exposed can be reduced. This results in changes to the regulations so that certain groups of persons can also be effectively controlled. The recognition that medical supervision for radiation protection reasons is reasonable only if exposure has occurred should be additionally utilized in the regulations if the Euratom standards make this possible. The protection of patients attains some new rules which can be derived from handling and from therapeutical use. In this case too experience resulted in a more reasonable application of ionizing radiation and radioactive materials than was expected when the First Radiation Protection Ordinance was issued.

- 2011 INTERNAL DOSIMETRY FOR NUCLEAR MEDICINE FROM THE VIEWPOINT OF MIRD RECOMMENDATIONS. Tautz, M.; Ertl, S. (Städtisches Klinikum Berlin-Buch (German Democratic Republic). Radiologisches Zentrum). Radiobiol. Radiother.; 17: No. 1, 65-70(1976). (In German)

The advantages of MIRD recommendations are represented. The definitions of absorbed dose constants and of the absorbed fraction are especially discussed. Improvements are introduced by omitting the energy-independent average geometric factor in the sense of Marinelli and by renouncing mean beta energy by including all disintegration components and their probabilities into the dose calculation. The application of the MIRD concept is explained with the aid of two examples: 1. In radioiodine therapy of the thyroid there is a difference in dose values of only about 1 per cent compared with the classical method. Differences in the whole-body dose arise from the geometric factor. 2. For ^{125}I the dose difference to the classical method of calculation is considerable (factor of about 2.5), which can be explained by the complete inclusion of all disintegration components. Organ unburdening by the radionuclide ^{125}I has been overestimated in the past.

- 2012 SIGNIFICANCE OF THE RADIATION PROTECTION PRINCIPLES. Basse, H. (Bayerisches Staatsministerium fuer Landesentwicklung und Umweltfragen, Muenchen (Germany, F.R.)). pp 87-98 of Viertes deutsches Atomrechts-Symposium. Referate und Diskussionsberichte. Koeln, Germany, F.R.; Heymanns (1976). (In German)

From 4. German symposium on nuclear law; Goettingen, Germany, F.R. (26 May 1975).

34 refs..

The requirements of sect. 28 of the draft are based on the new ICRP recommendations and the EURATOM and OECD(NEA) basic standards. The application range of the basic principle of this section (any unnecessary exposure to radiation or contamination has to be avoided and has to be kept as far as possible below the fixed dose limit) as well as the consequences therefrom are discussed on the basis of three individual cases: 1) uranium-containing enamel colours; 2) ionisation fire alarm; 3) treatment and removal of radioactive waste materials (example: radioactive sewage sludge disposal on the Leopoldshafen dump).

- 2013 INTERNATIONAL LEGAL BASIS FOR THE DRAFT OF THE RADIATION PROTECTION ORDINANCE. Bischof, W. pp 39-59 of Viertes deutsches Atomrechts-Symposium. Referate und Diskussionsberichte. Cologne; Heymanns (1976). (In German)

From 4. German symposium on nuclear law; Goettingen, Germany, F.R. (26 May 1975).

84 refs..

A brief survey of the international legal bases to be considered for the amendment is given: 1) UNSCEAR reports; 2) ILO regulations; 3) WHO standards; 4) IAEA standards; 5) NEA regulations; 6) amendment of the EURATOM basic standards; 7) international regulations on the transport of radioactive materials; 8) international maritime law on disposal of radioactive materials in the sea; 9) international conventions for keeping rivers and waters clean; 10) use of SI units in test technology; 11) recent recommendations of ICRP and ICRU as well ISO standards.

2014 EXIT DOSE MEASUREMENTS IN ASSESSMENT OF EFFECTIVE BODY THICKNESS. Agarwal, M.S.; Pant, G.C.; Srinivasan, S.; Sood, P.C. (Banaras Hindu Univ. (India)). pp 429-438 of Proceedings of the national symposium on thermoluminescence and its applications. Bombay; Bhabha Atomic Research Centre (1976). From National symposium on thermoluminescence and its applications; Kalpakkam, India (12 Feb 1975).

14 refs..

Exit dose measurements play an important role in the dose assessment during radiotherapy. Many reports on this subject are available and practically all of them deal with such measurements in cases of body in homogeneities. In the absence of any known air cavity or high density media in the treatment field, it is customary to consider the irradiated volume to be made up of unit density soft tissue and the doses are calculated on that basis. The high recurrence rate of about 20-25% observed in the treated cases of carcinoma of cervix raises the question whether the pelvic region really behaves like a unit density material as is thought of for dose calculations. The exit dose measurements in 50 such cases revealed that the effective body thickness is more in majority of the cases and the dose received by them is about 7% lower than planned dose on the basis of measured body thickness.

2015 AUTOMATIC DETERMINATION OF ISODOSES IN HUMAN RADIOTHERAPY USING WHOLEBODY COMPUTERTOMOGRAPHY. Bagge, E. (Kiel Univ. (Germany, F.R.). Inst. fuer Reine und Angewandte Kernphysik); Duehnke, E.; Gremmel, H. (Kiel Univ. (Germany, F.R.). Radiologische Klinik). Atomkernenergie; 28: No. 4, 283-288(1976). (In German).

5 figs.; 1 tab.; 12 refs..

The computertomograph produces a matrix of absorption coefficients over any investigated cross-section of a human body. These absorption coefficients are the result of the photo and Compton scattering of the analysing X-rays. If one operates the X-ray tube at two different voltages and/or if one is gathering the penetrating quanta of different energies in separated channels at the detector side, it is possible in principle to get two or more matrices of absorption coefficients for different energies of the quanta and this will permit us by help of the theoretical formulae for photo and Compton effect to get the distribution of the electron densities and the corresponding pattern of local mean atomic numbers Z separately over this cross-section. This signifies that one calculate now the curves of the isodoses for any other therapeutic radiation (electrons, X-rays and gamma rays) and it would allow us to use the same computer which generates the original matrices of absorption coefficients to calculate directly in a second step also the curves of the isodoses to be used immediately for therapeutic purposes.

2016 NEGLIGIBLE AND NON-NEGLIGIBLE RISKS IN RADIODIAGNOSTIC EXAMINATION OF PATIENTS. Scholte, P.J.L. (Free Univ. Hospital, Amsterdam); van der Wielen, A.W.; Ruys, P.N. Radiol. Clin. Biol.; 45: No. 2-4, 315-325(1976).

Ionizing radiation is regarded as a health hazard, but one is prepared to neglect this factor on the basis of certain motives. In 1975, Knox published an analysis of these motives, none of which proved tenable. He concluded that a situation which in daily usage is described as safe, is one which entails

risks considered to be negligible so that no safety measures are taken. It can be empirically established that in various health-endangering situations a health hazard of less than 1×10^{-5} is being neglected. This article studies the risk factors to the individual patient in radiodiagnostic examinations involving low, medium and high radiation exposures. The estimates show that radiohygienic measures on behalf of the patient are advisable.

2017 IMMUNOSUPPRESSIVE EFFECT OF EXTRACORPOREAL IRRADIATION OF THE BLOOD USING A PORTABLE ^{90}Sr - ^{90}Y SOURCE AND SMALL TRANSIT DOSES. Birkeland, S.A. (Odense Univ. Hospital (Denmark). Institute of Pathology). Scand. J. Immunol.; 5: No. 4, 323-329(1976).

17 references.

The immunosuppressive effect of extracorporeal irradiation of the blood (ECIB) using small transit doses (TD) over a long time period was studied. The blood of 15 uremic patients undergoing hemodialysis in preparation for kidney transplantation was treated with 15-, 25-, or 41-rad TDs for a total of 150 h, using the beta-emitting radioisotope ^{90}Sr - ^{90}Y . The number of blood volumes (BV) irradiated ranged from 159 to 265. The irradiation resulted in selective lymphocytopenia, but the effect on the immune response of lymphocytes, as measured in vitro with lymphocyte transformation tests, varied. Six kidney transplantations were performed resulting in rejection in two cases, one of which was easily reversed, and one with many rejection episodes, resulting in death. Thus treatment with small TDs over long periods can reduce lymphocyte counts, but any subsequent immunosuppressive effect is uncertain. The results do not support the hypothesis that such irradiation can influence the immune response of lymphocytes without destroying the cells.

2018 THYROID NEAPLASIA: A DELAYED COMPLICATION OF LOW-DOSE HEAD AND NECK IRRADIATION. Guansing, A.R.; Engbring, N.; Cerletty, J.; Holmes, R.; Wilson, S.; Komorowski, R.; Shetty, K.R. 2019 IN VIVO EVALUATION OF STANDARD MAN MODEL DOSE CALCULATIONS USING ^{99m}Tc -SULFUR COLLOID. Jones, J.P. Nashville; Vanderbilt Univ. (1976). 220p. University Microfilms Order No. 76-22,348.

Thesis (Ph. D.).

The purpose of this research is to evaluate the applicability of the absorbed fraction data presented in MIRD Pamphlets No. 5 and 11 for calculating patient dose. These data have been computed using a model of the human body geometry, but since this model is an idealization, it is important to check its accuracy directly with patients. This was done for the radiopharmaceutical ^{99m}Tc -sulfur colloid, which concentrates in the liver and spleen. The dose to a five centimeter square slab of lithium fluoride, located on the skin anterior to the center of the liver, was

measured with lithium fluoride thermoluminescence dosimeters for each patient studied. The corresponding dose per emitted photon had been calculated for the model through the courtesy of Dr. W. S. Snyder and Dr. J.W. Poston of Oak Ridge National Laboratory. Therefore, the calculated dose for each patient was obtained by multiplying this dose per photon by the number of photons emitted (the cumulated activity), and the model evaluated by comparing these measured and calculated doses for several patients. For a proper evaluation, the dose and cumulated activity must be accurately measured, so careful attention was paid to these measurements. The method of dose measurement was evaluated with repeated exposures to both ^{99m}Tc and ^{137}Cs sources, and felt to have an absolute accuracy of ± 8 percent, and reproducibility of ± 3 percent. The cumulated activity was determined from serial activity measurements, and was evaluated using both analytical considerations and repeated heterogeneous phantom measurements, which together implied an uncertainty of ± 10 percent. Therefore, patient discrepancies on the order of ± 18 percent might be masked by experimental errors, but larger discrepancies could be (and were) discerned.

2020 BASIC PHYSICS OF RADIATION THERAPY.

Selman, J. (ed.). Springfield, IL; Charles C Thomas, Publisher (1976). 762p. \$25.75.

The subject is discussed under the following chapter headings: simple mathematics gradation therapy; matter and energy; the nature of radiation; reactions between radiation and matter; x-ray production and control; high-energy therapy units and particle accelerators; quantity of x rays and γ rays; x-ray quality; dosage in x-ray and γ -ray therapy; therapy planning; radioactivity and nuclear physics; implant therapy with radium, radon, and artificial radionuclides; surface therapy with β particles; medical use of radionuclides; radiobiology; radiotherapy with heavy particles; and protection in radiotherapy-health physics. (ERB)

2021 RADIATION PROTECTION FOR MEDICAL AND ALLIED HEALTH PERSONNEL. Washington, DC; National Council on Radiation Protection and Measurements (1976). 80p. (NCRP--48).

With the ever-increasing use of x rays and radioactive materials, more and more persons may be exposed to ionizing radiations in the course of their work. The professional status of these individuals ranges from the highly-trained radiation specialist to the casual interdepartmental messenger. Many of these people have very little information about the possible biological effects of radiation or about the amounts which may be significant. Their attitudes toward possible exposure vary from indifference to almost pathological fear. Frequently they have questions about radiation and radiation protection practices but are reluctant or unable to seek out those who could provide answers. Their concern and interest, however, should not be ignored. This report seeks to meet their needs.

2022 LEGAL POSITION OF THOSE RESPONSIBLE FOR RADIATION PROTECTION. Ellerkmann, W. (Hahn-Meitner-Institut fuer Kernforschung Berlin G.m.b.H. (Germany, F.R.)). pp 99-105 of Viertes deutsches Atomrechts-Symposium. Referate und Diskussionsberichte. Cologne; Heymanns (1976). (In German)

From 4. German symposium on nuclear law; Goettingen, Germany, F.R. (26 May 1975).

The report is subdivided into a description of the legal and appointed persons responsible for radiation protection, their qualification, obligations and rights and indicates some ideas for amending the draft, the legal position of the person appointed being discussed mainly.

2023 AMENDMENT OF THE EURATOM BASIC STANDARDS AND THE RADIATION PROTECTION ORDINANCE DRAFT. Eriskat, H. (Commission of the European Communities, Luxembourg. Directorate for Health Protection). pp 61-68 of Viertes deutsches Atomrechts-Symposium. Referate und Diskussionsberichte. Cologne; Heymanns (1976). (In German)

From 4. German symposium on nuclear law; Goettingen, Germany, F.R. (26 May 1975). 13 refs..

The draft for the amendment of the First Radiation Protection Ordinance principally corresponds to the minimum requirements fixed by the new EURATOM basic standards. It is only doubted whether national regulations exceeding the requirements of the basic standards will not affect proper functioning of the Common Market and will not be contradictory to Art. 3, chapter h and 100 and the following of the EEC agreement.

2024 CONSTITUTIONALITY OF DOSE LIMITING VALUES. Goetz, V. pp 177-186 of Viertes deutsches Atomrechts-Symposium. Referate und Diskussionsberichte. Cologne; Heymanns (1976). (In German)

From 4. German symposium on nuclear law; Goettingen, Germany, F.R. (26 May 1975). 16 refs..

The fundamental right according to Art. 2 par. 2 sentence 1 of the German Constitution is relevant for the set-up and application of radiation protection law. Resulting from Art. 2 par. 2 sentence 1 of the Constitution it is a general obligation of the state to protect life (Federal Constitutional Court, judgment of 25th Feb., 1975, BVerfGE 39:1) and physical soundness. The subjective basic right of everybody to defend against official encroachments his personal integrity corresponds to the right of the individual within the framework of the official obligation for protection from the state (to ward off danger). The term of danger, as to the degree of its determination, corresponds to that of the encroachment. To speak of danger in a legal sense, the causal connection between a certain source of danger and certain damage must be ascertained and proved. Topical controversies as to the admissibility of activity discharges of low doses range in the field of risk reduction and thus in the field of the duty of the state to take precautionary steps against risks (Art. 2 par. 2 sentence 1 of the Constitution). The constitution, however, does not contain any basic right that every risk has to be avoided. On the other hand, the necessity of cautions valuation of radiation risks can be derived from the Constitution. The fixation of dose limits and their application in connection with general radiation protection principles (paragraph 28 E of the Radiation Protection Ordinance) do not contain any 'interference' with the basic right in the sense of Art. 2 par. 2 sentence 3 of the Constitution. Neither from aspects of the principle of the legal state nor from Art. 80 par. 1 of the Constitution can the use of the legal form of the Ordinance be doubted.

2025 LEGAL PROVISIONS CONCERNING PROTECTIVE MEASURES IN CASE OF ACCIDENTS AND INCIDENTS. Gross, R. pp 245-249 of Viertes deutsches

Atomrechts-Symposium. Referate und Diskussionsberichte. Cologne; Heymanns (1976). (In German)

From 4. German symposium on nuclear law; Goettingen, Germany, F.R. (26 May 1975).

It is tried to show the systematic connection between the new regulations and the existing radiation protection regulations. The present legal situation is briefly discussed and also the stipulations of the Radiation Protection Ordinance draft from the view of the designer.

2026 CONSTITUTIONALITY OF THE DOSE LIMITS. REMARKS WITH REFERENCE TO FUNDAMENTAL LAW ON A DRAFT BY THE MINISTRY OF THE INTERIOR OF AN ORDINANCE ON THE PROTECTION AGAINST DAMAGE THROUGH IONIZING RADIATION. DRAFT FROM 24TH MAR 1975. Hinz, M.O. (Bremen Univ. (Germany, F.R.)). pp 165-175 of Viertes deutsches Atomrechts-Symposium. Referate und Diskussionsberichte. Cologne; Heymanns (1976). (In German)

From 4. German symposium on nuclear law; Goettingen, Germany, F.R. (26 May 1975).

27 refs..

The following items are primarily discussed: 1) the problem of constitutionality of standard dose values; 2) individual points exemplified by the draft of the new Radiation Protection Ordinance (annual total body equivalent dose, differentiation in the determination of limiting values, fixation of tasks) and 3) acceptability of fixation of limiting values.

2027 POSITION OF THE RADIATION PROTECTION ORDINANCE IN NUCLEAR LAW. Mennicken, A. pp 25-30 of Viertes deutsches Atomrechts-Symposium. Referate und Diskussionsberichte. Cologne; Heymanns (1976). (In German)

From 4. German symposium on nuclear law; Goettingen, Germany, F.R. (26 May 1975).

The relations of the present draft of a new Radiation Protection Ordinance to the nuclear law and the importance of a Radiation Protection Ordinance de lege lata and de lege ferenda are briefly discussed.

2028 LEGAL PROVISIONS CONCERNING PROTECTIVE MEASURES IN CASE OF ACCIDENTS AND INCIDENTS. Mutschler, U. (Muenster Univ. (Germany, F.R.)). pp 251-257 of Viertes deutsches Atomrechts-Symposium. Referate und Diskussionsberichte. Cologne; Heymanns (1976). (In German)

From 4. German symposium on nuclear law; Goettingen, Germany, F.R. (26 May 1975).

With refs..

The drafts of sections 35-37 of the Radiation Protection Ordinance have the purpose of realizing licensing standards provided in sections 6,7,9, AtG and in the draft. The compatibility between licensing regulations according to sect. 7 AtG and the above-mentioned sections of the draft is analysed.

2029 LEGAL ADMISSIBILITY OF TESTS WITH RADIOPHARMACEUTICALS AND WITH PHARMACEUTICALS MARKED RADIOACTIVE FOR RESEARCH PURPOSES. Pabel, H. (Bundesministerium fuer Jugend, Familie und Gesundheit, Bonn-Bad Godesberg (Germany, F.R.)). pp 113-118 of Viertes deutsches Atomrechts-Symposium. Referate und Diskussionsberichte. Cologne; Heymanns (1976). (In German)

From 4. German symposium on nuclear law; Goettingen, Germany, F.R. (26 May 1975).

Presentation of the present and future legal position: 1) Tests with radiopharmaceuticals and marked medicine are absolutely necessary in the interest of the protection of the patient.

2) According to the valid radiation protection law such tests must be allowed. Restrictions can be decreed according to sect. 17 of the Atomic Energy Act. 3) According to the draft of the new Radiation Protection Ordinance, a licence may be refused in view of opposing primarily public interests. It is doubtful whether the rules provided in sect. 40 is covered by the authorizing standard. 4) The draft of a law for a reform of medicine law offers the possibility to issue detailed regulations on the testing of medicine. 5) The prohibition in sect. 7 of the medicine law also covers medicine, which is intended for experiments. The regulation according to sect. 7, however, admits release to hospitals and scientific research facilities.

2030 DRAFT OF A NEW RADIATION PROTECTION ORDINANCE. Pfaffelhuber, J.K. pp 17-24 of Viertes deutsches Atomrechts-Symposium. Referate und Diskussionsberichte. Cologne; Heymanns (1976). (In German)

From 4. German symposium on nuclear law; Goettingen, Germany, F.R. (26 May 1975).

One of the many drafts for the planned amendment to the First Radiation Protection Ordinance is introduced. Note: the final bill meanwhile is available as Bundesratsdrucksache 375/76.

2031 JUSTIFICATION OF DOSE LIMITING VALUES WITH A VIEW TO MEDICINE AND BIOLOGY. Rausch, L. (Giessen Univ. (Germany, F.R.)). pp 277-299 of Viertes deutsches Atomrechts-Symposium. Referate und Diskussionsberichte. Cologne; Heymanns (1976). (In German)

From 4. German symposium on nuclear law; Goettingen, Germany, F.R. (26 May 1975).

3 figs.; 6 tabs.; 99 refs..

As there is a certain relation between the dose limits for limited groups and those for the total population with the maximum admissible person doses for those professionally exposed to radiation (1 : 30 or 1 : 90), the grounds for general dose limits and for limits for those professionally exposed to radiation are discussed together. It is shown why empirical data must be completed by risk estimates where minimum and small radiation doses (0 to 1 rem; 1 to 10 rem) are concerned. In this connection a maximum calculable risk is ascertained as a result of cautious assumptions of ICRP, which as a rule overestimates the actual risk to a large extent. Furthermore, the established values in most cases are used partly only. Therefore, the dose limits and maximum person doses include additional safety reserves. These statements are documented by tables and graphs. A comparison of maximum person doses and dose limits with professional and general life risks is provided, so as to see the quantitative dimension. Finally, a catalogue of direct or indirect objections against maximum general doses and maximum doses for persons occupationally exposed to radiation is provided. These statements are discussed and correlated with a typology of errors in medical science. It shows that most objections e.g. are based on overconsideration of hypotheses or are of a dogmatic nature or constitute inadmissible simplifications.

2032 JUDICIAL FACTS ON LICENSING AND SUPERVISORY PROCEDURES CONCERNING RADIATION PROTECTION LAW. Rosenbaum, O. (Ministerium fuer Arbeit, Gesundheit und Soziales des Landes Nordrhein-Westfalen, Duesseldorf (Germany, F.R.)). pp 31-38 of Viertes deutsches Atomrechts-Symposium. Referate und

Diskussionsberichte. Cologne; Heymanns (1976). (In German)

From 4. German symposium on nuclear law; Goettingen, Germany, F.R. (26 May 1975).

With tabs..

Some statistical studies on the present licensing and supervision procedures are discussed, viz. on 1) owner of a licence accord. to sect. 3 and 4 of the 1st Radiation Protection Ordinance; 2) special licences according to section 1 of the Radiation Protection Ordinance for the release of radioactive materials in air and water (required in a very few cases only); 3) violations of the regulations were not of a severe nature (mostly from industry). The author concludes that the present regulations proved to be satisfactory. Minor corrections relating to licence-free handling, restriction of the requirements for a licence as well as to prohibition of illegal use of the radiation warning sign are desired.

- 2033 PROTECTIVE EFFECT OF CYSTEAMINE ON GAMMA IRRADIATED HUMAN ERYTHROCYTES. Pantev, T.; Kuzova, K. (Nauchno-Issledovatel'ski Inst. po Radiologiya i Radiatsionna Khigiena, Sofia (Bulgaria)). *Rentgenol. Radiol.*; 15: No. 2, 82-86(1976). (In Bulgarian).

The effect of gamma rays in doses from 8 to 64 kR on the red cell membrane was studied. The percentage of cells undergone hemolysis after postirradiation 20 hours incubation of red cell-suspensions at 4deg C served as index of radiation injury. An attempt was made to modify radiation injury by means of cysteamine. Group '0', Rh(+) human glucose citrate blood after 15-30 days storage was used. Subhemolyses radiation doses followed by incubation at 4deg C for 20 hours resulted in red cell hemolysis which increased proportionally to the gamma ray dose. The percentage of hemolyzed cells was much lower among those irradiated in the presence of cysteamine. The dose-effect relation of irradiated red cells may satisfactorily be described with the indicative function $y = 40.8 \cdot 10^{-3} \cdot D_{sup}(1.59)$; under conditions of protection - with a second degree polynom $y = 59.15 \cdot 10^{-4} \cdot D^2 - 4.24 \cdot 10^{-2} \cdot D$ ('y' being the percentage of hemolyzed cells, 'D' the dose in kR).

- 2034 OCCURRENCE OF HEINZ-BODIES IN ERYTHROCYTES OF PERSONNEL OCCUPATIONALLY EXPOSED TO LOW DOSES. Jacobsohn, E.; Arndt, D.; Schuettmann, W.; Konopatzky, H. (Staatliches Amt fuer Atomsicherheit und Strahlenschutz, Berlin (German Democratic Republic)). *Folia Haematol. (Leipzig)*; 103: No. 2, 191-195(1976). (In German).

274 persons were examined by the Heinz-body test according to Beutler. 168 of them were occupationally exposed to ionizing radiation. No correlation could be found between the presence of Heinz-bodies and the dose which was below the maximum permissible dose in nearly all cases. Only 4 persons were exposed to higher doses. The total doses obtained from summing up the annual doses were also considered.

- 2035 APPLICABILITY OF ALKALINE GRANULOCYTE PHOSPHATASE DETERMINATION IN THE DIAGNOSIS OF RADIATION DAMAGES CAUSED BY LOW DOSES. Jacobsohn, E.; Arndt, D.; Schuettmann, W.; Konopatzky, H. (Staatliches Amt fuer Atomsicherheit und Strahlenschutz, Berlin (German Democratic Republic)). *Folia Haematol. (Leipzig)*; 103: No. 2, 196-200(1976). (In German).

In order to find dose-response relationships

the alkaline granulocyte phosphatase (AGP) indices were determined in 304 persons, 180 of them had been occupationally exposed to ionizing radiation. A certain trend expressible as a negative exponential function between the AGP and the dose could be observed in the range of 0.01 to 3.0 rem/yr.

- 2036 DETECTION OF CHRONIC RADIOLESIONS AND THEIR TREATMENT. Birkner, R.; Consentius, K. (Staedtisches Krankenhaus Moabit, Berlin (Germany, F.R.). Roentgeninstitut; Staedtisches Krankenhaus Moabit, Berlin (Germany, F.R.). Isotopeninstitut; Staedtisches Krankenhaus Moabit, Berlin (Germany, F.R.). Strahlentherapeutische Abt.). pp 65-76 of *Der ermaechtigte Arzt im Sinne der Strahlenschutzgesetzgebung. Spezielle Beitrage der Medizin zum Strahlen- und Umweltschutz*. Stuttgart; Thieme (1976). (In German)

From 15. annual meeting of the Vereinigung Deutscher Strahlenschutzaezte e.V.; Karlsruhe, Germany, F.R. (14 Jun 1974).

29 refs..

It is manifested that commenting on eventual damage two aspects must be given preference to, especially in the critical case of low doses: 1) one should try to find out if irradiation has really taken place. The chromosomal analysis of the peripheral blood lymphocytes can be an additional help for this. 2) The risk estimation for the mostly unspecific effects of small dose rates and low doses must see somatic and genetic effects in the light of the extraordinarily high reparative capacity of the organism.

- 2038 OCCUPATIONAL RADIOLESIONS IN THE FRG BETWEEN 1953 AND 1969. Rahm, G. pp 126-139 of *Der ermaechtigte Arzt im Sinne der Strahlenschutzgesetzgebung*. Braun, H.; Ladner, H.A.; Mehl, J.; Messerschmidt, O.; Moehrl, G.; Stieve, F.E. (eds.). Stuttgart; Thieme (1976). (In German)

From 15. annual meeting of the Vereinigung Deutscher Strahlenschutzaezte e.V.; Karlsruhe, Germany, F.R. (14 Jun 1974).

10 tabs..

Using statistic documents of the industrial boards following points were set up in tabular form: 1) distribution of the radiolesions in accordance to the Federal States; 2) distribution of the cases of radiation damage, sort of damage, industrial branches, and sources of damage; 3) distribution of all sorts of damage with regard to professions 4) risk assessment for persons exposed to radiation for occupational reasons.

- 2039 BIOLOGICAL EFFECTS OF LOW-LEVEL RADIATION PERTINENT TO PROTECTION OF MAN AND HIS ENVIRONMENT. REPORT ON THE INTERNATIONAL SYMPOSIUM HELD IN CHICAGO FROM 3 TO 7 NOVEMBER 1975. Sinclair, W.K. (Argonne National Lab., Ill. (USA)); Kobayashi, S.; Nishiwaki, Y. (International Atomic Energy Agency, Vienna (Austria)). At. Energy Rev.; 14: No. 1, 173-178 (1976).

Published in summary form only.

BIOLOGICAL RADIATION EFFECTS; ENVIRONMENT; GENETIC RADIATION EFFECTS; HUMAN POPULATIONS; LOW DOSE IRRADIATION; MEETINGS; RADIATION HAZARDS; REVIEWS

- 2040 VALUE OF PHYSICAL RADIATION PROTECTION CONTROL IN INCORPORATION MONITORING. Erlenbach, H.R. (Gewerbeaufsicht des Landes Nordrhein-Westfalen, Duesseldorf (Germany, F.R.)). Zentralstelle fuer Sicherheitstechnik, Strahlenschutz und Kerntechnik. pp 85-94 of Der ermaechtigte Arzt im Sinne der Strahlenschutzgesetzgebung. Braun, H.; Ladner, H.A.; Mehl, J.; Messerschmidt, O.; Moehrle, G.; Stieve, F.E. (eds.). Stuttgart; Thieme (1976). (In German)

From 15. annual meeting of the Vereinigung Deutscher Strahlenschutzärzte e.V.; Karlsruhe, Germany, F.R. (14 Jun 1974).

2 figs.; 9 refs..

The valuation of the incorporation monitoring given here (mainly whole-body counting for x-sources and urinalysis for β -sources) is based on the experiences of the ZfS of the trade inspection of North Rhine Westphalia. The high sensitivity achieved by practically all physical-chemical incorporation monitoring methods in their respective fields should not only be seen in the light of the total resulting internal radiation exposure, which is negligible in most of the known incorporation cases, since prophylaxis against a possible habituation to the incorporation risk and an impulse towards optimization of the working conditions for handling unsealed radioactive substances and nuclear fuels are aspects of equal importance.

- 2041 PSYCHOLOGICAL ATTITUDES OF NUCLEAR INDUSTRY WORKERS. Faes, M.; Stoppie, J. (Centre d'Etude de l'Energie Nucleaire, Mol (Belgium)). pp 389-406 of Les concepts de faible dose de rayonnements ionisants en radiobiologie et en radioprotection. II. Cayet-Pennaneac'h, O. (ed.). Montrouge; Societe Francaise de Radioprotection (1976). (In French)

From 2. Seminar on radiobiology; Fontenay-aux-Roses, France (29 Apr 1975).

An investigation was carried out within the frame of occupational medicine on the psychological attitudes of workers in the nuclear industry towards ionizing radiations. Three aspects were considered: awareness of the danger; feeling of safety in the working environment; workers' feelings following incidents or accidents; satisfaction level felt by the workers in the plant.

- 2042 SPECIAL PHYSICAL METHODS OF EXAMINATION FOR PRACTICAL INDUSTRIAL MEDICINE IN THE FIELD OF RADIATION PROTECTION. Fruhmann, G. (Muenchen Univ. (Germany, F.R.)). Inst. und Poliklinik fuer Arbeitsmedizin. pp 32-36 of Der ermaechtigte Arzt im Sinne der Strahlenschutzgesetzgebung. Braun, H.; Ladner, H.A.; Mehl, J.; Messerschmidt, O.; Moehrle, G.; Stieve, F.E. (eds.). Stuttgart; Thieme (1976). (In German)

From 15. annual meeting of the Vereinigung Deutscher Strahlenschutzärzte e.V.; Karlsruhe,

Germany, F.R. (14 Jun 1974).

3 figs.; 1 tab.; 2 refs..

The topic is restricted to organs of the thorax. EKG on exertion and the exhalation test according to Tiefenau (capacity per second).

- 2043 PROBLEMS OF RADIATION PROTECTION IN CONNECTION WITH RADIOACTIVE CARCASSES AND CORPSES. Henseler, H. (Bayerisches Landesamt fuer Umweltschutz, Muenchen (Germany, F.R.)). pp 242-249 of Der ermaechtigte Arzt im Sinne der Strahlenschutzgesetzgebung. Braun, H.; Ladner, H.A.; Mehl, J.; Messerschmidt, O.; Moehrle, G.; Stieve, F.E. (eds.). Stuttgart; Thieme (1976). (In German)

From Annual meeting of the Fachverband fuer Strahlenschutz e.V.; Helgoland, Germany, F.R. (27 Sep 1974).

1 fig.; 2 tabs..

Problems of radiation protection and safety measures for the disposal of radioactive animal carcasses and for handling radioactive corpses, mainly from nuclear medical therapy, are explained, going into detail. While dealing with radioactive corpses two regulations ought to be taken into consideration: 1) If the residual activity of the radioactive substances in the corps is higher than 5 mCi, a person responsible for radiation protection should be in attendance during the autopsy, who is able to estimate the radiation exposure to be expected and who can undertake the necessary protection measures. If the residual activity is below 30 mCi, baling, burial and cremation is possible without particular protection measures. For the burial and the preparations for the burial of radioactive corpses, the author suggests 14 rules which should be paid attention to.

- 2044 RADIATION PROTECTION PROBLEMS IN HANDLING NUCLIDE GENERATORS. Herzberg, B.; Kaul, A. (Freie Univ. Berlin (Germany, F.R.)). Abt. fuer Nuklearmedizin. pp 223-232 of Der ermaechtigte Arzt im Sinne der Strahlenschutzgesetzgebung. Braun, H.; Ladner, H.A.; Mehl, J.; Messerschmidt, O.; Moehrle, H.; Stieve, F.E. (eds.). Stuttgart; Thieme (1976). (In German)

From Annual meeting of the Fachverband fuer Strahlenschutz e.V.; Helgoland, Germany, F.R. (27 Sep 1974).

4 figs.; 6 tabs.; 7 refs..

The studies on possible radiation exposure during handling $^{99}\text{Mo}/\text{sup}(99\text{m})\text{Tc}$ -generators show that the maximum radiation exposure during the processes 'labelling' and 'application' is to be seen on the hands of the persons concerned. The maximum possible number of processes per year and person, which is 500-600 and results with an average activity of 30 mCi; during the process of labelling, means that the maximum permitted dose of 60 rem per year is not exceeded during this process. As far as 'application' is concerned, however, the maximum permitted dose is likely to be transgressed on the hands during the course of a year. Granting 5 applications per person and day of 10 mCi each the maximum permitted dose on the hands can be reached after 90 days already. The radiation exposure of the whole body and eyes resulting from the single processes will not reach the maximum permitted dose of 5 rem per year thus not restricting the maximum possible number of processes per year and person. Ways to reduce the radiation exposure of the hands during the process of application are shown.

- 2045 NEUTRON MEASUREMENTS ON CARDIAC PACEMAKERS WITH ^{238}Pu BATTERIES. Kluge, H.;

Zill, H. (Physikalisch-Technische Bundesanstalt, Braunschweig (Germany, F.R.)). pp 199-206 of Der ermächtigte Arzt im Sinne der Strahlenschutzgesetzgebung. Braun, H.; Ladner, H.A.; Mehl, J.; Messerschmidt, O.; Moehrle, G.; Stieve, F.E. (eds.). Stuttgart; Thieme (1976). (In German)

From Annual meeting of the Fachverband fuer Strahlenschutz e.V.; Helgoland, Germany, F.R. (27 Sep 1974).

1 tab.; 10 refs..

Pacemakers, the energy need of which is met by the energy set free during the α -decay of ^{238}Pu , emit, besides photons, also neutrons which partly emerge from the spontaneous fission of ^{238}Pu , and partly from (α, n) -reactions on light nuclei. The maximum neutron flow emitted to a certain space angle and its energy distribution were measured. Using the results of the measuring we can determine the energy dose rates produced on certain points in the patient's tissue as well as the dose rates equivalents possible to occur in his environment with sufficiently low uncertainty.

2046 LOW DOSES AND ISOTOPIC PACEMAKERS.

Laurens, P. (Hopital Broussais, 75 - Paris (France)). pp 337-357 of Les concepts de faible dose de rayonnements ionisants en radiobiologie et en radioprotection. II. Cayet-Pennaneac'h, O. (ed.). Montrouge; Societe Francaise de Radioprotection (1976). (In French)

From 2. Seminar on radiobiology; Fontenay-aux-Roses, France (29 Apr 1975).

A review is made of the conditions of pacemaker implants, calculation and experimental measurement of dose rate equivalents, the biological supervision of patients and their life expectancy.

2047 MEDICAL EVALUATION OF THE VALUES

MEASURED FOR RADIATION EXPOSURE. Oster, H. (Nuklear-Chemie und -Metallurgie G.m.b.H. (NUKEM), Hanau (Germany, F.R.)). pp 94-99 of Der ermächtigte Arzt im Sinne der Strahlenschutzgesetzgebung. Braun, H.; Ladner, H.A.; Mehl, J.; Messerschmidt, O.; Moehrle, G.; Stieve, F.E. (eds.). Stuttgart; Thieme (1976). (In German)

From 15. annual meeting of the Vereinigung Deutscher Strahlenschutzärzte e.V.; Karlsruhe, Germany, F.R. (14 Jun 1974).

The essay examines briefly: 1) how to assess the values obtained by personnel dosimetry and the points to be taken into account by the authorized physician; 2) how to take into consideration other radiation exposures; 3) which points must be considered for the medical examinations and the following measures to be taken by the authorized physician.

2048 RADIATION PROTECTION DURING WORKING WITH

SEALED RADIOACTIVE SUBSTANCES. Pape, U. (Städtisches Krankenhaus Moabit, Berlin (Germany, F.R.). Abt. fuer Strahlungsphysik). pp 171-177 of Der ermächtigte Arzt im Sinne der Strahlenschutzgesetzgebung. Braun, H.; Ladner, H.A.; Mehl, J.; Messerschmidt, O.; Moehrle, G.; Stieve, F.E. (eds.). Stuttgart; Thieme (1976). (In German)

From Annual meeting of the Fachverband fuer Strahlenschutz e.V.; Helgoland, Germany, F.R. (27 Sep 1974).

Dealing with sealed radioactive substances of medium activity, avoidable dose exposure is in most cases due to carelessness and failure to comply with elementary rules of radiation protection in critical moments. The essay is to help to reduce the occurrence of disturbances as seen in the literature by showing mistakes

which turn up very frequently in practice.

2049 RADIATION EXPOSURE DUE TO IMPLANTED PACEMAKERS WITH ^{238}Pu -NUCLIDE BATTERIES.

Plesch, E. (Kernforschungszentrum Karlsruhe (Germany, F.R.). Abt. Strahlenschutz und Sicherheit). pp 192-199 of Der ermächtigte Arzt im Sinne der Strahlenschutzgesetzgebung. Braun, H.; Ladner, H.A.; Mehl, J.; Messerschmidt, O.; Moehrle, G.; Stieve, F.E. (eds.). Stuttgart; Thieme (1976). (In German)

From Annual meeting of the Fachverband fuer Strahlenschutz e.V.; Helgoland, Germany, F.R. (27 Sep 1974).

5 figs.; 3 tabs.; 12 refs..

The radiation exposure of patients and environment due to neutron and γ -radiation was determined using the results of outdoor and model measurements and direct measurements carried out on 7 patients with implanted ^{238}Pu -pacemakers. For measuring the neutron dose equivalent a directly recording proportional counter was used, which was calibrated with a ^{238}Pu -neutron source for various tissue depths. The distribution of fluence in the tissue surrounding the neutron source was determined by means of 0,3 mm thick nuclear track etching detectors in a phantom. Corresponding measurements of γ -doses were carried out with LiF-dosimeters. The dose equivalent of neutrons and gamma radiation is determined as function of the distance from the source; the build-up and the attenuation in the tissue being taken into account. The radiation exposure of the patient and environment is compared with the long-term radiation exposure due to natural and civilizing factors.

2050 RADIATION PROTECTION IN THE OPERATION OF TELECURIE EQUIPMENT.

Pohle, G. (Städtisches Krankenhaus Moabit, Berlin (Germany, F.R.). Abt. fuer Strahlungsphysik). pp 162-170 of Der ermächtigte Arzt im Sinne der Strahlenschutzgesetzgebung. Braun, H.; Ladner, H.A.; Mehl, J.; Messerschmidt, O.; Moehrle, G.; Stieve, F.E. (eds.). Stuttgart; Thieme (1976). (In German)

From Annual meeting of the Fachverband fuer Strahlenschutz e.V.; Helgoland, Germany, F.R. (27 Sep 1974).

9 figs..

Critical points and danger for attendants and patients which could be reported until today in handling telecurie equipment are pointed out.

2051 INQUIRY ON THE RADIATION EXPOSURE OF THE SWISS POPULATION BY X-RAY DIAGNOSIS.

Poretti, G.G. (Bern Univ. (Switzerland). Radium Inst.; Bern Univ. (Switzerland). Abt. fuer Medizinische Strahlenphysik); Jonesco-Farca, F. (Bern Univ. (Switzerland). Abt. fuer Medizinische Strahlenphysik); Lanz, W. (Bern Univ. (Switzerland). Radium Inst.). pp 147-156 of Der ermächtigte Arzt im Sinne der Strahlenschutzgesetzgebung. Braun, H.; Ladner, H.A.; Mehl, J.; Messerschmidt, O.; Moehrle, G.; Stieve, F.E. (eds.). Stuttgart; Thieme (1976). (In German)

From Annual meeting of the Fachverband fuer Strahlenschutz e.V.; Helgoland, Germany, F.R. (27 Sep 1974).

3 tabs.; 2 refs..

The genetic load on a population is usually expressed in terms of the so-called 'Genetically Significant Dose' (GSD), i.e. the dose which, averaged over the total population, produces the same results as the varying amounts of radiation received in reality by the individuals making up the population. It may be

calculated taking into account the following parameters: 1) total number of male and female persons in the population per age group, including the fetuses, 2) average expectation of children per person, 3) number of persons having received a certain type of X-ray examination, and 4) experimental gonadal dose for this examination (for men, women and fetuses - not to be confused with the GSD). The GSD of the Swiss population for the year 1971 was calculated per age group on the basis of physicians' data on some 60,000 patients. The gonadal dose was determined experimentally in various hospitals by means of TLD dosimeters, sensitive high-pressure ionization chambers and normal chambers. The computer programme to calculate the GSD (PL/I language) is very time-consuming, but its structure allows a new selective investigation to be made later on by merely changing the input. The results show that in Switzerland as in other countries there is a 3-4% increase per year in X-ray examinations for diagnostic purposes. The GSD for 1971 is 42-43 mrad per person in Switzerland as compared to 22 mrad for 1957. The GSD percentage is about 57% for men, about 35% for women and about 8% for fetuses. The number of X-ray examinations is almost equal for general practitioners (53.8%) and hospitals (46.2%).

- 2052 RADIATION EXPOSURE OF THE EYE LENS DUE TO ROUTINE DIAGNOSTIC X-RAY EXAMINATIONS IN DENTAL PRACTICE. Schmidt, T.; Seibert, A. (Erlangen-Nuernberg Univ., Erlangen (Germany, F.R.). Inst. fuer Radiologie). pp 157-162 of Der ermaechtigte Arzt im Sinne der Strahlenschutzgesetzgebung. Braun, H.; Ladner, H.A.; Mehl, J.; Messerschmidt, G.; Moehrle, G.; Stieve, F.E. (eds.). Stuttgart; Thieme (1976). (In German)
From Annual meeting of the Fachverband fuer Strahlenschutz e.V.; Helgoland, Germany, F.R. (27 Sep 1974).

2 tabs.; 7 refs..

A table gives radiation doses to the eye near the cone or at a distance from it for various X-ray techniques in dental practice and in dental clinics, measured with a LiF-TLD.

- 2053 CONTRL OF THE BLOOD COUNT AND THE HAEMATOPOIETIC TISSUES. Schreml, W. (Ulm Univ. (Germany, F.R.). Abt. Haematologie). pp 49-55 of Der ermaechtigte Arzt im Sinne der Strahlenschutzgesetzgebung. Braun, H.; Ladner, H.A.; Mehl, J.; Messerschmidt, G.; Moehrle, G.; Stieve, F.E. (eds.). Stuttgart; Thieme (1976). (In German)
From 15. annual meeting of the Vereinigung Deutscher Strahlenschutzärzte e.V.; Karlsruhe, Germany, F.R. (14 Jun 1974).

2 figs.; 10 refs..

This chapter deals with the question in which level of radiation exposition existing haematologic routine methods are able to show damage. The author also refers to the question which methods are applicable or should be developed for early manifestation of damage in haematogenic tissues caused by low radiation doses.

- 2054 CHROMOSOMAL ANALYSIS TO DETERMINE THE EFFECT OF SMALL DOSES. Stephan, G. (Bundesgesundheitsamt, Neuherberg/Muenchen (Germany, F.R.). Inst. fuer Strahlenhygiene). pp 56-65 of Der ermaechtigte Arzt im Sinne der Strahlenschutzgesetzgebung. Braun, H.; Ladner, H.A.; Mehl, J.; Messerschmidt, G.; Moehrle, G.; Stieve, F.E. (eds.). Stuttgart; Thieme (1976). (In German)
From 15. annual meeting of the Vereinigung

Deutscher Strahlenschutzärzte e.V.; Karlsruhe, Germany, F.R. (14 Jun 1974).

6 figs.; 1 tab.; with refs..

The analysis of the metaphase-chromosome - count of dicentric chromosomes and ring chromosomes - has proved to be the best method to record radiation exposure quantitatively, especially in estimating low doses. Considerable efforts must be made to obtain reliable results since only little structural chromosomal changes are induced within this region and therefore a large number of metaphase plates must be evaluated. The band staining techniques which were developed recently offer the possibility of identifying chromosomes better.

- 2055 RADIATION PROTECTION FOR PACEMAKERS WITH RADIONUCLIDE BATTERIES. Stieve, F.E. (Bundesgesundheitsamt, Berlin (Germany, F.R.). Abt. fuer Strahlenhygiene). pp 178-191 of Der ermaechtigte Arzt im Sinne der Strahlenschutzgesetzgebung. Braun, H.; Ladner, H.A.; Mehl, J.; Messerschmidt, G.; Moehrle, G.; Stieve, F.E. (eds.). Stuttgart; Thieme (1976). (In German)
From Annual meeting of the Fachverband fuer Strahlenschutz e.V.; Helgoland, Germany, F.R. (27 Sep 1974).

5 figs.; 3 tabs.; 35 refs..

Radionuclide batteries (^{147}Pm , ^{238}Pu) in pacemakers bring risks for the patient and the environment, if the radioactive material cannot be secured for subsequent application or for safe end storage. This is why the expenditure connected with pacemakers is very high. So the application of such pacemakers is only indicated when the patient's expectation of life is presumably higher than 5-10 years, when there are no other diseases besides cardiac dysrhythmia, and when the securing of the radionuclide batteries is guaranteed.

- 2056 SUPPLEMENTARY REMARKS ON THE SAFETY AND RISKS OF CARDIAC PACEMAKERS WITH RADIONUCLIDE BATTERIES. Kowalewsky, H. (Bundesanstalt fuer Materialpruefung, Berlin (Germany, F.R.)). pp 206-211 of Der ermaechtigte Arzt im Sinne der Strahlenschutzgesetzgebung. Braun, H.; Ladner, H.A.; Mehl, J.; Messerschmidt, G.; Moehrle, G.; Stieve, F.E. (eds.). Stuttgart; Thieme (1976). (In German)
From Annual meeting of the Fachverband fuer Strahlenschutz e.V.; Helgoland, Germany, F.R. (27 Sep 1974).

7 figs..

The BAM has undertaken the task of compiling the material and construction data and the main nuclide properties (^{147}Pm , ^{238}Pu), of carrying out mechanical safety tests and of measuring the γ -radiation field in the FRG for the equipment offered at present. The results obtained until today are positive.

- 2057 EFFECTS OF RADIATION ON MAN: NOW AND IN THE FUTURE. Morgan, K.Z. (Georgia Inst. of Tech., Atlanta). pp 251-261 of Energy and the environment cost-benefit analysis. Karam, R.A. (ed.). Elmsford, NY; Pergamon Press, Inc. (1976).

From Proceedings of energy and the environment - cost benefit analysis; Atlanta, GA, USA (23 Jun 1975).

See CONF-750697--.

Although much remains to be learned about chronic effects of ionizing radiation, we know more about these effects than those produced by other pollutants. Acute radiation damage requires a threshold dose before becoming manifest while chronic damage increases more-or-less linearly. Considerable human low dose

exposure data support the linear hypothesis. Evidence suggests the linear hypothesis is non-conservative for high LET radiations. Persons worried about population exposure should be concerned about unnecessary medical exposure. The radiation risk of nuclear power plants can be made acceptable but several improvements are required.

- 2058 DIRECTORY OF PERSONNEL RESPONSIBLE FOR RADIOLOGICAL HEALTH PROGRAMS. Rockville, MD; Department of Health, Education, and Welfare (1976). 32p.

Personnel responsible for radiological health programs are listed by state. Regional offices of radiological health programs are given and personnel listed. An alphabetical index of all personnel in radiological health programs is included. (ERB)

- 2059 ABOUT EPIDEMIOLOGIC STUDIES. Mechali, D. (CEA Centre d'Etudes Nucleaires de Fontenay-aux-Roses, 92 (France). Dept. de Protection). pp 165-178 of Concepts of low doses of ionizing radiation in radiation biology and protection. Vol. 2. Cayet-Pennaneac'h, G. (ed.). Montrouge; Societe Francaise de Radioprotection (1976). (In French)

From 2. Seminar on radiobiology; Fontenay-aux-Roses, France (29 Apr 1975).

The epidemiology surveys conducted to study the relationship between a number of malignant affections and ionizing radiation exposure are reviewed. The difficulties met in the conduction and interpretation of such surveys and the results are considered.

- 2060 RADIATION HYGIENE SUPERVISION OF X-RAY UNITS IN VETERINARY ESTABLISHMENTS OF THE SOUTH BOHEMIAN REGION. Trueille, M.A. Veterinarstvi; 26: No. 8, 371-372(1976). (In Czech).

The number of X-ray examinations increased after 1971 with the launching of the nationwide screening of breeding boars and sows for rhinitis. For this purpose the Regional Hygiene Officer permitted the use of CHIRAX X-ray apparatus in field-work. Blood sampling and medical check-ups are carried out of all workers by the Department of Occupational Diseases of the Regional Health Centre in Ceske Budejovice. All X-ray operators are equipped with film dosimeters. Hygienic inspection is regularly carried out by the Department of Radiation Hygiene of the Regional Hygiene Centre in Ceske Budejovice. The screenings are carried out in the pigsty or in the preparation room. The X-ray operators operate behind a Pb shield. The animal is tied up and the plate is inserted into its oral cavity. The auxiliary staff keeps as far away as possible from the X-ray apparatus. At a distance of 6 m from the X-ray apparatus the radiation intensity of 3 mR/h was measured. The harmful radiation dose is far below permissible values (5 rem/year).

- 2061 ASSESSMENT OF PHYSICAL RADIATION PROTECTION CONTROL: PERSONNEL DOSE MEASUREMENTS. Wachsmann, F. (Gesellschaft fuer Strahlen- und Umweltforschung m.b.H., Neuherberg/Muenchen (Germany, F.R.). Inst. fuer Strahlenschutz). pp 77-85 of Der ermaechtigte Arzt im Sinne der Strahlenschutzgesetzgebung. Braun, H.; Ladner, H.A.; Mehl, J.; Messerschmidt, G.; Moehrl, G.; Stieve, F.E. (eds.). Stuttgart; Thieme (1976). (In German)

From 15. annual meeting of the Vereinigung Deutscher Strahlenschutzärzte e.V.; Karlsruhe, Germany, F.R. (14 Jun 1974).

5 figs.; 5 tabs..

The rightness of the prescriptions by the 1st Radiation Protection Ordinance and the X-ray ordinance referring to the personnel dosimetry for persons exposed to radiation for professional reasons is explained. The author shows furthermore to what extent today's methods are efficient and what can be expected from these methods. For this purpose he critically compares the dosimeters used.

- 2062 RESULTS OF MEDICAL EXAMINATIONS.

Zimmer, R. (Bayerisches Landesinstitut fuer Arbeitsmedizin, Muenchen (Germany, F.R.)). pp 120-125 of Der ermaechtigte Arzt im Sinne der Strahlenschutzgesetzgebung. Braun, H.; Ladner, H.A.; Mehl, J.; Messerschmidt, G.; Moehrl, G.; Stieve, F.E. (eds.). Stuttgart; Thieme (1976). (In German)

From 15. annual meeting of the Vereinigung Deutscher Strahlenschutzärzte e.V.; Karlsruhe, Germany, F.R. (14 Jun 1974).

3 tabs..

The medical surveillance of persons exposed to radiation consists of a direct and an indirect method. While the direct method involves the medical investigation of findings and the measuring of the personnel dose by external and internal radiation exposure, the indirect method lays stress on the knowledge of the place of work, the recognition of the sources of danger, i.e. facts of occupational medicine. The authorized physician must be able both to decide on the employment of persons working in the control field using the findings, and to give his opinion on evaluation results on physical and radiochemical basis. With respect to his special knowledge, he will be asked in case of improvements of the place of work and of corresponding protective measures.

- 2063 PROTECTURE MEASURES AGAINST RADIATION EXPOSURE DUE TO THE EMISSION OF RADIOACTIVE SUBSTANCES INTO THE AIR. Kretschko, J.; Wolf, I. (Technische Univ. Muenchen (Germany, F.R.). Nuklearmedizinische Klinik und Poliklinik). pp 214-220 of Der ermaechtigte Arzt im Sinne der Strahlenschutzgesetzgebung. Spezielle Beitrage der Medizin zum Strahlen- und Umweltschutz. Braun, H. (ed.). Stuttgart, Germany, F.R.; Thieme (1976). (In German)

From Annual meeting of the Fachverband fuer Strahlenschutz e.V.; Helgoland, Germany, F.R. (27 Sep 1974).

2 figs.; 3 tabs.; 10 refs..

In clinical practice problems of radiation protection are due to radioactivation of the air during the use of high-energy accelerators in radiotherapy, use of radioactive aerosols and gases in the nuclear-medical diagnosis, and production of radioactive solutions for application. Protection and surveillance measures referring to these points (such as air conditioning, equipment etc.) should already be taken when the clinics are being planned.

- 2064 THERMOLUMINESCENT MATERIALS IN PHYSIOLOGICAL AND DOSIMETRIC INVESTIGATIONS OF THE THYROID. Malone, J.F.; O'Connor, M.K.; Taaffe, J.K. (College of Technology, Dublin (Ireland)); Cullen, M.J. pp 575-579 of Physics in Industry. O'Mongain, E.; O'Toole, C.P. Oxford; Pergamon Press (1976).

From International conference on physics in industry; Dublin, Ireland (9 Mar 1976).

The use of LiF and Ca SO₄ thermoluminescent discs in monitoring the levels of ¹³¹I in the human thyroid is described. The former are suitable for monitoring high level therapy doses while the latter are sufficiently

sensitive for the small tracer doses used for diagnosis. The results show that use of these materials simplifies observation of iodine kinetics, to the extent that the measurements may be made by the patient in his own home. An excellent correlation is obtained between effective half-life measured by conventional techniques and measurements based on thermoluminescent discs. Other potential applications of the method are presented, in particular, an evaluation of the quantity of ^{131}I in the gland, and an alternative method of performing the TSH stimulation test.

In implementing radiation protection in the fields of X-ray application there are still lots of open points. This brochure, answering a series of frequently occurring questions, deals with the following topics: 1) questions about legal provisions in the field of radiation protection, 2) questions about physical and technical fundamentals, and 3) questions about X-ray applications. The booklet is intended to serve as a guide for radiation protection specialists and other groups of technical and medical personnel concerned with the operation of X-ray facilities.

- 2065 SURVEY ABOUT VALID LEGAL PRESCRIPTIONS AND NORMS. Pfaffelhuber, J.K. (Bundesministerium des Innern, Bonn (Germany, F.R.)). pp 1-3 of Der ermächtigte Arzt im Sinne der Strahlenschutzgesetzgebung. Spezielle Beiträge der Medizin zum Strahlen- und Umweltschutz. Braun, H.; Ladner, H.A.; Mehl, J.; Messerschmidt, G.; Moehrle, G.; Stieve, F.E. (eds.). Stuttgart, Germany, F.R.; Thieme (1976). (In German)

From 15. annual meeting of the Vereinigung Deutscher Strahlenschutzärzte e.V.; Karlsruhe, Germany, F.R. (14 Jun 1974).

A survey about the valid legal prescriptions in the region of atomic energy and radiation protection law and the transport of radioactive substances in the FRG.

- 2066 TASKS AND DUTIES OF THE AUTHORIZED PHYSICIAN. Moehrle, G. (Badenwerk A.G., Karlsruhe (Germany, F.R.)). pp 11-15 of Der ermächtigte Arzt im Sinne der Strahlenschutzgesetzgebung. Spezielle Beiträge der Medizin zum Strahlen- und Umweltschutz. Braun, H.; Ladner, H.A.; Mehl, J.; Messerschmidt, G.; Moehrle, G.; Stieve, F.E. (eds.). Stuttgart, Germany, F.R.; Thieme (1976). (In German)

From 15. annual meeting of the Vereinigung Deutscher Strahlenschutzärzte e.V.; Karlsruhe, Germany, F.R. (14 Jun 1974).

The essay shows the tasks and duties of the authorized physician emerging from the present rules, regulations, and guidelines as well as prospective new regulations.

- 2067 LEGAL FUNDAMENTALS, REGULATIONS AND BASIC NORMS, INTERNATIONAL RECOMMENDATIONS. Stieve, F.E. (Bundesgesundheitsamt, Berlin (Germany, F.R.)). Abt. fuer Strahlenhygiene. pp 18-27 of Der ermächtigte Arzt im Sinne der Strahlenschutzgesetzgebung. Spezielle Beiträge der Medizin zum Strahlen- und Umweltschutz. Braun, H.; Ladner, H.A.; Mehl, J.; Messerschmidt, G.; Moehrle, G.; Stieve, F.E. (eds.). Stuttgart, Germany, F.R.; Thieme (1976). (In German)

From 15. annual meeting of the Vereinigung Deutscher Strahlenschutzärzte e.V.; Karlsruhe, Germany, F.R. (14 Jun 1974).

1 tab.; 15 refs..

The task of this survey is to show the fundamentals which are reflected in the laws and regulations of the Federal Government. The development which might influence the actions in the future is briefly dealt with.

- 2068 Fragen und Antworten zum Strahlenschutz beim Betrieb von Röntgeneinrichtungen. (QUESTIONS AND ANSWERS CONCERNING RADIATION PROTECTION IN OPERATING X-RAY FACILITIES). Koenig, W.; Taschner, P.; Menzel, B.; Anger, K. (Staatliches Amt fuer Atomicherheit und Strahlenschutz, Berlin (German Democratic Republic)). Berlin; Verlag Tribuene (1976). 173p. (In German).

- 2069 REDUCTION OF DOSE BY FILTRATION IN PEDIATRIC FLUOROSCOPY AND FLUOROGRAPHY. Heinrich, H.; Schuster, W. (Siemens A.G., Erlangen (F.R. Germany); Giessen Univ. (F.R. Germany). Zentrum fuer Radiologie). Ann. Radiol.; 19: No. 1, 57-66(1976).

The old idea of reducing the dose to the patient by filtering the primary X-ray beam has been taken up again. It was found that by using a 0.1mm molybdenum plate as a filter the skin dose can be reduced by a factor of 2 to 3, while the X-ray tube voltage remains unchanged, the exposure time doubles and the radiographic image quality changes only slightly. The reduction of the skin dose is due to the fact that the Mo-plate attenuates essentially the low-energy part of the spectrum.

- 2070 VARIABLES AND PARAMETERS OF RELEVANCE IN THE STUDY OF THE EFFECTS OF LOW-LEVEL RADIATION. Delattre, P. (CEA Centre d'Etudes Nucleaires de Saclay, 91 - Gif-sur-Yvette (France). Dept. de Biologie). pp v.1 p.275-301 of Biological and environmental effects of low-level radiation. Proceedings of a symposium on biological effects of low-level radiation pertinent to protection of man and his environment organized by the IAEA and the WHO and held in Chicago, 3-7 November 1975. Vienna; IAEA (1976). (In French)

From Symposium on biological effects of low-level radiation pertinent to protection of man and his environment; Chicago, Ill., USA (3 Nov 1975).

For irradiation at relatively high levels, the amount of energy (dose D) absorbed by an irradiated system is a reference parameter as a function of which one can consider the observed effects at a suitable level of approximation. The phenomena involved can be assumed to occur in two distinct stages with completely different reaction (transformation) rates: a fast stage, where only radiation-induced transformations are significant; a slower stage, involving only the spontaneous reactions of the irradiated system. This represents only an approximation, less justified for irradiation at lower intensities, when the system's own kinetics begin to compete and interfere directly with the radiation-induced transformations. The two types of phenomenon must then be considered simultaneously. The theoretical necessity can be demonstrated for replacing the concept "dose" by two explicitly separated factors - the parameter "intensity" (or "dose rate") and the variable "time"; also, the fact that the dose rate cannot be regarded as a mere correction factor, but must be integrated into the theory as a fundamental parameter. The great variety of phenomena which can occur with low-intensity irradiation, in contrast to high-level irradiation is considered. With the theory is associated a procedure for model studies on the basis of experimental results which enables one to avoid a priori modelling, where it is always difficult to verify validity.

- 2071 **PROCEDURE FOR MODEL STUDIES WITHIN A THEORETICAL FRAMEWORK SUITED TO THE STUDY OF THE EFFECTS OF LOW-LEVEL RADIATION.** Delforge, J. (CEA Centre d'Etudes Nucleaires de Saclay, 91 - Gif-sur-Yvette (France). Dept. de Biologie). pp v.1 p.303-317 of Biological and environmental effects of low-level radiation. Proceedings of a symposium on biological effects of low-level radiation pertinent to protection of man and his environment organized by the IAEA and the WHO and held in Chicago, 3-7 November 1975. Vienna; IAEA (1976). (In French)

From Symposium on biological effects of low-level radiation pertinent to protection of man and his environment; Chicago, Ill., USA (3 Nov 1975).

During study of the effects of low-level radiation, many phenomena not predictable on the basis of classical models developed for high-level radiation can occur. This means that the theoretician must revise his approach to the development of models and, in particular, demonstrates the need for a theory which is so general that all the phenomena observed - at high and low levels - can be interpreted within a single formalism. P. Delattre's theory relating to systems in which transformations occur (see paper IAEA-SM-202/503 of P. Delattre in the same symposium) provides a suitable theoretical framework. The author describes - at a time when the method in question is just starting to be applied in collaboration with several laboratories - the complete identification procedure as proposed for linear systems. Based on P. Delattre's theoretical approach, it enables a valid, precise model to be obtained. The model is valid because its development is based solely on information derived from experimental results obtained through close collaboration between the experimentalist and the theoretician. There is no a priori hypothesis as regards the internal structure of the model, and the uncertainties result for the greater part from experimental errors. Thanks to the numerical methods employed, the uncertainties can be limited and a precise model obtained by defining experimental conditions which permit minimization of the errors associated with the numerical values of the model parameters. Current studies should lead in most cases to a model possessing structural uniqueness.

- 2072 **LOW-LEVEL EFFECTS IN RELATION TO TRACK STRUCTURE THEORY.** Katz, R. (Nebraska Univ., Lincoln (USA). Dept. of Physics). pp v.1 p.343-360 of Biological and environmental effects of low-level radiation. Proceedings of a symposium on biological effects of low-level radiation pertinent to protection of man and his environment organized by the IAEA and the WHO and held in Chicago, 3-7 November 1975. Vienna; IAEA (1976).

From Symposium on biological effects of low-level radiation pertinent to protection of man and his environment; Chicago, Ill., USA (3 Nov 1975).

The delta-ray theory of track structure assigns the principal responsibility for many radiation effects to secondary and higher generation electrons, whatever the primary incident radiation. The "electron slowing-down spectrum" is taken to be relatively independent of the primary source. Thus, the dose-effect relationship obtained with gamma rays is used to translate the radial distribution in "local dose" about an ion's path into a radial distribution in probable effect. The shape of the gamma-ray dose-effect relationship plays an important role in the calculation of response to heavy ions,

especially the low-level part of the gamma-ray dose-response relationship. One-hit detectors display exponential response to gamma rays and, in turn, to radiations of all quality. The RBE is independent of dose, and declines with an increase in z^2/β^2 of an incident track-segment bombardment. As nuclear emulsions, detectors would not display electron tracks, but could be blackened by a beam of electrons or of gamma rays of sufficient intensity. Following irradiation with heavy ions the survival curves pass gradually from a shouldered survival curve, as after γ irradiation, to an apparent exponential curve with an increase in z^2/β^2 , as the ion-kill probability (for inactivation by a single passing ion) increases from 0 to 1. Here the RBE depends on dose, and on LET, passing through a maximum where P is approximately equal to 0.5. A possibility of producing higher generation electrons, exists everywhere along the path of an electron, hence end-of-track effects. If a single electron can activate the detector, its influence will dominate at all dose levels. The author has formally examined the "2-component model" and found that, if an initial slope is observable in the gamma-ray survival curve, the RBE is typically less than 1 at all LET.

- 2073 **LEGAL ADMISSIBILITY OF TESTS WITH RADIOPHARMACEUTICALS AND WITH PHARMACEUTICALS MARKED RADIOACTIVE FOR RESEARCH PURPOSES.** Schultz, C. (Hoffmann-La Roche (F.) and Co., Basel (Switzerland)). pp 119-137 of Viertes deutsches Atomrechts-Symposium. Referate und Diskussionsberichte. Cologne; Heymanns (1976). (In German)

From 4. German symposium on nuclear law; Goettingen, Germany, F.R. (26 May 1975). 1 tab.; 18 refs..

The drafts for governing experiments on human beings with radioactive marked pharmaceuticals, which exist in the Federal Republic of Germany and in Switzerland deal with fixing the principles of carrying out such tests - under consideration of the risks for the test person and the benefit for medical science and hence for the general public. They can be summarized as follows: 1) fixation of the maximum admissible radiation doses on the basis of the Radiation Protection Ordinance; 2) development of a clearly fixed authorization obligation for each single research project and determination of those responsible therefor as well as supervision of the experiments and recording of the results; 3) limitation to the testing of medicaments; 4) improvement of the protection of the test person consent is a very important personal right, no legal substitution possible for persons partly incapable or incapable of exercising rights).

- 2074 **LEGAL POSITION OF THE PERSON RESPONSIBLE FOR RADIATION PROTECTION IN PRACTICE.** Spang, A. (Kraftwerk Union A.G., Erlangen (Germany, F.R.)). pp 107-111 of Viertes deutsches Atomrechts-Symposium. Referate und Diskussionsberichte. Cologne; Heymanns (1976). (In German)

From 4. German symposium on nuclear law; Goettingen, Germany, F.R. (26 May 1975).

The author states that the present First Radiation Protection Ordinance is difficult to understand for those responsible for radiation protection (most of them are technicians) but the new draft is even less understandable for those who are to apply the regulations in practice. He does not think it is right (it is wrong) that persons in question cannot directly and clearly infer their obligations and responsibility, their tasks and the breaches of the rule from the wording of the regulations

but that they can learn the contents only through legal comments or through their legal departments. Experience has shown that different interpretations induce confusion and make the technician develop his own interpretation, which might be legally doubtful but which might become general practice after all.

- 2075 PHYSICAL QUANTITIES IN RADIATION PROTECTION REGULATIONS AND THEIR MEASUREMENT. Wagner, S. (Physikalisch-Technische Bundesanstalt, Braunschweig (F.R. Germany)). pp 479-488 of Aspects fondamentaux et appliques de la dosimetrie. VIII. Congres international de la Societe Francaise de Radioprotection. Saclay, France, 23-26 Mars 1976. Montrouge, France; Societe Francaise de Radioprotection (1976).

From 8. International congress of the French Society for Radiation Protection: basic and applied aspects of dosimetry; Saclay, France (23 Mar 1976).

Legal regulations for the health protection of the public and workers exposed to ionizing radiation often fall short in providing a clear-cut guide to the necessary measurements and their interpretation. Even where these regulations conform to the recommendations of the ICRP, which are based on organ dose considerations, they fail in the translation of these recommendations into practicable rules. The organ dose can only be determined, if at all, at considerable metrological expense. Fortunately however, this is not necessary in routine radiation protection work, but only in the rare cases of gross accidental over-exposure, where the absorbed organ dose initiates further medical treatment. The quantities for routine work should therefore be easily and unequivocally measurable and provide a sufficiently safe estimate of the permissible ICRP limits for organ doses. The legal regulations should then state maximum permissible limits for these quantities, and not for such quantities which generally cannot and need not be measured. A suitable quantity serving this purpose is the individual or personal dose, defined as the dose equivalent at a point of the body which is representative of the radiation exposure of the worker. The further implications and consequences of this simplifying suggestion are discussed. It is shown, that most of the requirements of radiation protection can be fulfilled in this way.

- 2076 SOUTHERN ARIZONA: A SKIN CANCER FACTORY. Schreiber, M.M. Ariz. Med.; 33: No. 3, 191-192(1976).

More cancers occur on the skin than any other site of the human body. The most common types of skin cancer, Basal Cell Carcinoma and Squamous Cell Carcinoma, have their highest incidence in regions of the earth where sunlight is most intense and in areas of the body exposed most to the sunlight. For the past 70 years, it has been known that these two types of skin cancer are caused almost exclusively by solar ultraviolet radiation between 290 nm and 320 nm. Those wavelengths less than 290 nm are extremely dangerous to living tissue, so fortunately wavelengths less than this are completely absorbed by the ozone layer in our atmosphere. Of those light rays reaching the earth's surface, 99 percent are greater than 400 nm and 1 percent are between 290-400 nm. Of this, only .2 percent falls in the skin damaging range (290 to 320 nm). Many geographic and meteorological factors govern the amount of harmful radiation reaching the skin. The most important is latitude, the lower

the latitude in the Northern Hemisphere, the greater the damage. Other factors include altitude, time of the year, and time of day. The human factors include the type of skin, the amount of time spent in the sun, extent of coverage by clothing, and activity. Southern Arizona is unique in possessing all of these geographic, meteorologic, and human factors in optimum amounts providing for intense and prolonged sunlight exposure. Southern Arizona in 1969 had an incidence of 422 cancers per 100,000 population, which is much greater than other reported incidences in the United States.

- 2077 LEUKEMIA IN HIROSHIMA ATOMIC BOMB SURVIVORS FROM 1946 TO 1975. A SUMMARY OF THE FINDINGS AND RECENT TRENDS. Ohkita, T. (Hiroshima Univ.). pp 77-90 of Proceedings of the Hiroshima University. Hiroshima; Research Inst. for Nuclear Medicine and Biology (1976). (In Japanese)

The findings of studies for the period from 1946 to 1975 on the leukemia observed in Hiroshima atomic bomb survivors were summarized. In the last five years, 134 cases of death from leukemia among Hiroshima citizens were recorded. Of these, 23 cases (17 acute and 6 chronic types) were atomic bomb survivors exposed with 2000 m from the hypocenter. Fifteen of them (65 percent) were over 60 years of age. The frequency of chronic lymphocytic leukemia was still low. Although the risk of leukemia was greatly reduced since 1961, and the frequency of chronic granulocytic leukemia, one of the most characteristic type of Hiroshima atomic bomb-induced leukemia was also decreased, the death rate of leukemia as a whole among survivors exposed within 2000 m or 1500 m from the hypocenter was about 3 to 4 times higher than the mean death rate of all Japan. Therefore, careful and long-range follow-up surveillance should be continued. A brief review was also made of relevant studies such as the influences of environmental and host factors in the epidemiology of leukemia, the incidence of leukemia from children exposed in utero and leukemia in offspring of atomic bomb survivors.

- 2078 BIOLOGICAL EFFECTS OF DIAGNOSTIC IRRADIATION. Miller, P.E. Radiol. Technol.; 48: No. 1, 11-17(1976).

Medical radiation continues to be an area of concern to the patient. However, the technologist can reassure him that trained operators apply the radiation and that there are many built-in and accessory safety factors. Beyond that, however, the technologist can reassure himself that he is not responsible for unnecessary radiation by making full use of all safety measures, whether they are part of or accessory to the equipment, or are part of his judgment as to technique. To do this, he needs a sound knowledge of how damage occurs and a continual updating on research and equipment that will make his reassuring words to the patient honest ones.

- 2079 DEVELOPMENT TRENDS IN RADIATION PROTECTION STANDARDIZATION WITH REGARD TO MEDICAL ASPECTS. Mehl, J. (Bundesministerium des Innern, Bonn (Germany, F.R.)). pp 4-10 of Der ermächtigte Arzt im Sinne der Strahlenschutzgesetzgebung. Braun, H.; Ladner, H.A.; Mehl, J.; Messerschmidt, O.; Moehrl, G.; Stieve, F.E. (eds.). Stuttgart; Thieme (1976). (In German)

From 15. annual meeting of the Vereinigung Deutscher Strahlenschutzärzte e.V.; Karlsruhe, Germany, F.R. (14 Jun 1974).

31 refs..

A survey of the development tendencies in the region of radiation protection standardization in the FRG and internationally (ICRP, ICRU, ORCD/NEA EURATOM) which are important for the radiology.

2080 ENGAGEMENT AND CONTROL EXAMINATION.

Flach, H.D. (BASF A.G., Ludwigshafen am Rhein (Germany, F.R.)); Hinz, G. (Bundesgesundheitsamt, Berlin (Germany, F.R.)). Abt. fuer Strahlenhygiene. pp 27-32 of Der ermaechtigte Arzt im Sinne der Strahlenschutzgesetzgebung. Braun, H.; Ladner, H.A.; Mehl, J.; Messerschmidt, O.; Moehrl, G.; Stieve, F.E. (eds.). Stuttgart; Thieme (1976). (In German)

From 15. annual meeting of the Vereinigung Deutscher Strahlenschutzärzte e.V.; Karlsruhe, Germany, F.R. (14 Jun 1974).

The legal provisions of the 1st radiation protection ordinance and of the X-ray ordinance valid in the FRG at present prescribe an engagement examination for persons who are exposed to radiation for professional reasons. These persons are also to be examined by authorized physicians at certain intervals. An employee may only be employed in the controlled area if this employment is not thought to cause any hazards to his health.

2081 RADIATION PROTECTION DURING WORKING WITH UNSEALED RADIOACTIVE SUBSTANCES.

Oberhausen, E. (Universitaet des Saarlandes, Homburg/Saar (Germany, F.R.)). Abt. fuer Nuklearmedizin und Medizinische Physik. pp 212-214 of Der ermaechtigte Arzt im Sinne der Strahlenschutzgesetzgebung. Braun, H.; Ladner, H.A.; Mehl, J.; Messerschmidt, O.; Moehrl, G.; Stieve, F.E. (eds.). Stuttgart; Thieme (1976). (In German)

From Annual meeting of the Fachverband fuer Strahlenschutz e.V.; Helgoland, Germany, F.R. (27 Sep 1974).

2082 EXPERIENCE IN APPLYING AN IMAGE

INTENSIFIER SINGLE-PICTURE CAMERA IN HYSTEROSALPINGOGRAPHY. Nitzsche, H.; Klengel, G. (Medizinische Akademie, Dresden (German Democratic Republic)). Radiologische Klinik; Nitzsche, M. (Medizinische Akademie, Dresden (German Democratic Republic)). Frauenklinik. Radiol. Diagn.; 17: No. 3, 429-434 (1976). (In German)

The use of an image intensifier in hysterosalpingography is described. Comparative evaluations of picture quality and radiation exposure demonstrate the special advantages of this technique. The decrease of the gonad dose takes the first place and the application of this method in hysterosalpingography is recommended. The possibility to save films is an additional, economic advantage.

2083 CANCERS AT NAGASAKI AND HIROSHIMA.

Delpa, M. (Electricite de France, 75 - Paris. Comite de Radioprotection). pp 153-163 of Concepts of low doses of ionizing radiation in radiation biology and protection. II. . Cayet-Pennaneac'h, O. (ed.). Montrouge; Societe Francaise de Radioprotection (1976). (In French)

From 2. Seminar on radiobiology; Fontenay-aux-Roses, France (29 Apr 1975).

Epidemiological surveys conducted at Nagasaki from 1950 to 1970 shows that whole-

body γ exposure of short duration, when it was not lethal is not statistically carcinogenic for any localization but for the bone-marrow and only in the 400 rem range class. A 50 rem exposure seems to have added a negative risk of leukemogenesis. At Hiroshima, interpretation of the data is more difficult on account of neutrons. It should then be all the more interesting to compare Nagasaki and Hiroshima data.

2084 MALIGNANCIES IN BLOOD-FORMING ORGANS FOLLOWING DIAGNOSTIC AND THERAPEUTIC PROCEDURES: A REVIEW.

Hodgkin, J.D.; Webster, P.D. (Veterans Administration Hospital, Augusta, GA). South. Med. J.; 69: No. 10, 1363 (1976). Ionizing radiation used for diagnosis or therapy has been associated with an increased incidence of malignancies of blood-forming organs. The increased incidence of hematopoietic malignancies following exposure to ionizing radiation obtained in the course of occupation, diagnosis and therapy of disease, or as a weapon of war is documented. The natural occurrence and the induced progression to acute leukemia of polycythemia rubra vera, Hodgkin's disease, multiple myeloma, Di Guglielmo's disease, and reticuloendothelial malignancies are discussed. The status of transplantation and immunodeficiency states and their relationship to acute leukemia is reviewed. Finally, drugs, toxins, and the use of cytotoxic radiomimetic agents for nonmalignant purposes are shown to lead to the development of acute leukemia. Background information relevant to the proper use of future diagnostic and therapeutic modalities is provided.

2085 RADIATION PROTECTION ASPECTS IN THE USE OF CALIFORNIUM-252 SOURCES.

Subrahmanian, G.; Venkataraman, G.; Madhvanath, U. (Bhabha Atomic Research Centre, Bombay (India). Div. of Radiation Protection). pp 207-236 of Some physical, dosimetry and biomedical aspects of californium-252. Vienna; IAEA (1976).

From Educational seminar on the uses of californium-252 in teaching and research; Karlsruhe, Germany, F.R. (14 - 18 Apr 1975). Californium-252 neutron sources are already being used in various fields including cancer therapy, industrial radiography, radiobiological research, and education and training programmes all over the world. However, one should not lose sight of the fast neutron hazard associated with them. This paper outlines the salient radiobiological data for protection purposes and discusses in detail radiation protection measures that are to be scrupulously followed. Although built-in safety can go a long way to minimizing risks in the industrial application of these sources, special situations involving exposure to the staff and public arise in brachytherapy departments at various stages of their use, storage, source preparation, transportation, application of the sources into patients, segregation and nursing care of patients. Other aspects such as leak-testing, damage to needles and tackling emergency situations arising out of loss or misplacing of needles are also discussed. Experience gained over the past 20 years in the use of radium-226 and, recently, cobalt-60 in various hospitals in India is extended to encompass the special problems encountered with ^{252}Cf . Details of the layout, structural shielding and other safety features in the use of large activity ^{252}Cf sources are also presented. Finally, the necessity for providing special training of personnel who intend to use ^{252}Cf sources is stressed.

- 2086 RADIATION PROTECTIVE SHIELD FOR USE DURING ARTHROGRAPHY. Johnson, N.E. (Eitel Hospital, Minneapolis). Radiol. Technol.; 48: No. 1, 35-38 (1976).

Protecting both the patient and hospital personnel against unnecessary radiation is one of the prime responsibilities of a radiologic technologist. Pertinent though it is to all radiologic procedures, it presents a specific problem during arthrography when the radiologist must work close to the patient. As a result of this challenge we devised a simple shield that is easily adapted for use in such procedures.

- 2087 PARTIAL-TARGET MUTAGENESIS AND CARCINOGENESIS. Von Borstel, R.C. (Alberta Univ., Edmonton (Canada)). pp v.1 p.361-368 of Biological and environmental effects of low-level radiation. Proceedings of a symposium on biological effects of low-level radiation pertinent to protection of man and his environment organized by the IAEA and the WHO and held in Chicago, 3-7 November 1975. Vienna; IAEA (1976).

From Symposium on biological effects of low-level radiation pertinent to protection of man and his environment; Chicago, Ill., USA (3 Nov 1975).

As a first-order or second-order mutagenic or carcinogenic event arises from a spontaneous background, the first increases in frequency with dose appear superficially as partial-hit or partial-target kinetic events. This appearance does not necessarily reflect reality, for when one subtracts the spontaneous mutation frequency at each dose point, the first- or second-order dose-effect relation still obtains, continuing even below the spontaneous mutation level. On the other hand, even taking into consideration spontaneous events, partial-target mutagenic and carcinogenic dose-effect kinetics have been observed at low doses of ionizing radiation. The partial-target events can be explained by assuming (1) that mixtures of cells of different sensitivity are in the target population; (2) that energy must be absorbed in two or more closely involved cells for the event to take place; or (3) that cumulative damage is taking place in repair systems.

- 2088 NATURAL POPULATION LOAD FROM THE RADIOACTIVITY OF BUILDING MATERIALS. PART 1. ESTIMATION OF RADON-THORON DOSE. Toth, A. (Mecseki Ercbanyaszati Vallalat, Pecs II (Hungary)). Izotoptechnika; 19: No. 4, 148-160 (1976). (In Hungarian).

2 figs.; 11 refs.; 6 tabs..

Some factors influencing the radon, thoron and decomposition products' concentration in the air of a living room are reviewed as follows: enrichment time; perflation rate; the height of building and the role of cellars; meteorological factors (fluctuation of barometric pressure and velocity and direction of wind). On the base of 841 measurements the arithmetical mean values of the radon decomposition products recorded in the air of Hungarian non-ventilated living rooms on several stores are given as a function of the wall material. The respiratory, lungs and kidneys dosages caused by inhaling radon products are about 300, 50 and 2 mrad/a respectively. The dosages in the respiratory organs, lungs and kidneys brought about by thoron products are about 1.4, 6.3, and 1.1 mrad/a respectively.

TO THE POPULATION BY RADIATION AND CHEMICALS. Jacobi, W. (Gesellschaft fuer Strahlen- und Umweltforschung m.b.H., Neuherberg/Muenchen (Germany, F.R.)). Inst. fuer Strahlenschutz). pp 191-206 of Kernenergie und Umwelt. Aurand, K. (ed.) (Bundesgesundheitsamt, Berlin (Germany, F.R.)). Inst. fuer Wasser-, Boden- und Lufthygiene). Berlin; Schmidt (1976). (In German)

5 figs.; 20 refs..

The reflections on the risk of cancer indicate that radiation and carcinogens behave in a very similar way with regard to the dose-risk relation and the dose dependence of the cancer induction time. In contrast to radiation we are not yet in the position to estimate quantitatively the somatic risks of chemical environmental influences. For this reason, a numerical comparison of risks between nuclear power plants and power plants operating on fuel is only possible with difficulty at the moment. It has been estimated that under the same conditions the mortality risk, as a result of SO₂- and dust emission from an oil power plant, is about a factor 3 to 5 higher for the population than the risk of cancer due to radiation from a nuclear power plant of the same power. When the uncertainties in risk estimations, especially for the effects of SO₂ and dust, are considered, this difference should not be over-emphasized. It is on the one hand, premature to stress the harmlessness of nuclear power plants to the environment, but on the other hand, it would also be completely wrong to compare their dangers with those of oil- or coal-fired power plants. But as regards safety, the risks from both kinds of plants are small in comparison to other man-made risks.

- 2090 NUCLEAR ENERGY - ENVIRONMENTAL PROTECTION AND PUBLIC HEALTH SERVICE. Aurand, K. (Bundesgesundheitsamt, Berlin (Germany, F.R.)). Inst. fuer Wasser-, Boden- und Lufthygiene). pp 11-17 of Kernenergie und Umwelt. Aurand, K. (ed.) (Bundesgesundheitsamt, Berlin (Germany, F.R.)). Inst. fuer Wasser-, Boden- und Lufthygiene). Berlin; Schmidt (1976). (In German)

In connection with the discussion on the benefits and risks of nuclear power plants, the importance of radiation protection for the population and environment is pointed out and warning of overemphasizing the danger, given. With regard to nuclear power plants in routine operation, the radiation protection values are considerably below those elaborated by medicine and biology. They led also finally to sophisticated safety measures in order to further reduce accident risks. One of the main tasks of public health service nowadays is the radiation of monitoring in the field of medicine.

- 2091 NUCLEAR ENERGY AND THE ENVIRONMENT. Berg, J. (Bundesministerium des Innern, Bonn (Germany, F.R.)). pp 18-20 of Kernenergie und Umwelt. Aurand, K. (ed.) (Bundesgesundheitsamt, Berlin (Germany, F.R.)). Inst. fuer Wasser-, Boden- und Lufthygiene). Berlin; Schmidt (1976). (In German)

In a further education meeting, for members of the public health service, on information on nuclear energy and environment, their problems as a competent authority are outlined, namely to enlighten the population by presenting the hazards in an objective way and thus being a mediator between technical experts and the population.

- 2092 DOSE LIMITS IN RADIATION PROTECTION. Gans, I. (Bundesgesundheitsamt, Berlin)

- 2089 COMPARATIVE VIEWS ON THE SOMATIC RISKS

- (Germany, F.R.). Inst. fuer Wasser-, Boden- und Lufthygiene). pp 173-178 of Kernenergie und Umwelt. Aurand, K. (ed.)

A short outline of the effects of genetically significant doses on the population in the FRG through natural radioactivity, radiology, nuclear energy, application of ionized radiation in research and technology, and occupational radiation exposure.
- 2094 Radiatsionnyi risk na zemle i v kosmose. (RADIATION DANGERS ON THE EARTH AND IN SPACE). Kovalev, E.E. Moscow; Atomizdat (1976). 256p.
Book was dedicated to the development and new approach to the problem of radiation protection of man upon cosmic flights. Basic to this approach lies the utilization of the conception of acceptable risk, that permits to establish unity for systems of cosmic ship safety criteria and can be used in other spheres of activities of man, connected to application of sources of ionizing radiations. The book was designed for scientific workers and engineers, workers in the field of cosmonautics, rocket technology and radiation safety, post-graduate students and students of associated specialties.
- 2095 REPORT ON THE 17TH ANNUAL MEETING OF THE ASSOCIATION OF GERMAN RADIATION PROTECTION PHYSICIANS AT GIESSEN, 11 AND 12 JUNE, 1976. Messerschmidt, O. Atomkernenergie; 28: No. 4, 299-300 (1976). (In German).
From 17. annual meeting of the Vereinigung Deutscher Strahlenschutzärzte; Giessen, Germany, F.R. (11 Jun 1976).
To be published in 'Strahlenschutz in Forschung und Praxis', Georg Thieme Verlag, Stuttgart.
Main subjects: 1) experience from the point of view of the physician in radiation protection in nuclear facilities, 2) measures taken by physicians in case of incidents and accidents, 3) experience and consequences concerning radiation protection training and instruction in the field of medicine, 4) radiobiology, 5) theory and practice of radiation protection in x-ray diagnostics, 6) the usefulness of mammography (HP)..

4 figs.; 5 tabs.; 6 refs..

As the medical exposure represents a concentrated irradiation with small doses, the pessimistic risk consideration of the assumption of a linear dose-effect relationship is justified. However for the smallest weakened beams, it is probable that a minimum of energy is necessary to produce measurable effects. This energy minimum is probably always exceeded in medical exposure so that there is a true danger which becomes complicated due to the possible combination effect regarding the sensitizing effect of other noxes.

- 2103 ENDANGERMENT RISK IN APPLYING RADIOACTIVE MATERIALS FOR THERAPEUTICAL PURPOSES. Herzberg, B.; Kaul, A. (Freie Univ. Berlin (Germany, F.R.). Klinik fuer Radiologie, Nuklearmedizin und Physikalische Therapie). pp 174-181 of Risiko der Gefaehrung durch die Strahlenexposition in der Medizin. Strahlenschutz bei der Luft- und Raumfahrt. 1 fig.; 3 tabs.; 13 refs..

For patients having undergone radionuclide therapy with a ^{131}I therapy, the individual risk for radiation induced thyroid carcinoma increases by an order of magnitude of 2 to 3 to a risk of the $3\text{sup}(\text{rd})$ order. In the therapy with ^{192}Ir , the thyroid carcinoma risk in an unfavourable case increases by an order to the $5\text{sup}(\text{th})$ order of risk. The therapy with ^{32}P does not increase the leukemia risk. An increase of the risks for genetical damage is not to be expected for the above mentioned therapy methods, as furthermore, the therapeutized patients in many cases are first treated from the $4\text{sup}(\text{th})$ decennium upwards. There is also no significantly recognizable increase of spontaneous cancer frequency for the total population as a result of the average radiation exposure of 0.17 rem per head and

Gremmel, H. Stuttgart, Germany, F.R.; Thieme (1976). (In German)

From 16. annual meeting of the Vereinigung Deutscher Strahlenschutzaezte e.V.; Kiel, Germany, F.R. (21 Jun 1975).

3 figs.; 6 tabs.; 14 refs..

By means of risk considerations and epidemiological investigations, a value of 1 mrd/a in the FRG has been estimated for the GSD. Compared to the height of the natural radiation exposure, it is deduced from the investigation of individuals in the population with radiodiagnostics that there is no genetic risk for the population in general.

- 2105 ENDANGERMENT RISK IN APPLYING IONIZING BEAMS AND RADIOACTIVE MATERIALS FOR PERSONS PROFESSIONALLY USING RADIATION. Kossel, F. (Bundesgesundheitsamt, Neuherberg/Muenchen (Germany, F.R.). Inst. fuer Strahlenhygiene). pp 189-195 of Risiko der Gefaehrung durch die Strahlenexposition in der Medizin. Strahlenschutz bei der Luft- und Raumfahrt. Gremmel, H. Stuttgart, Germany, F.R.; Thieme (1976). (In German)

From 16. annual meeting of the Vereinigung Deutscher Strahlenschutzaezte e.V.; Kiel, Germany, F.R. (21 Jun 1975).

3 figs.; 3 tabs.; 4 refs..

From the results of the personnel dose monitoring by the authoritative measuring places in the FRG from the years 1962 to 1974 and from the information of the responsible authorities of the federal counties, it is seen that the number of professionally exposed and personnel dosimeter monitored persons has risen to 30,000 persons. The number is still small compared with the entire population. The average radiation exposure per person professionally dealing with radiation is between 250 and 400 mrem per year, the genetically significant dose of the population is 40 to 50 μrem per year. The closer examination by specific investigations of the obvious frequency of dose excesses in individual concerns is encouraged.

It is shown that the radiation treatment of tumour patients with special consideration to avoiding risks on the basis of new natural scientific and technical knowledge, is not merely the concern of a few therapists but a task of society. The radiation treatment can only then help mankind when it is shown how it can be humanized. In this way it is possible to summarize the human needs and the scientific

developments with all risks.

The so-called radiation risk is supportable for the individual patient in order to diagnose a tumour sickness and to introduce a specific treatment. The known data on the lifetimes of non-treated cancer sick persons allow no other conclusion. Series investigations using ionizing radiation are to be planned with the help of the formula developed by Rausch. An unnecessary radiation risk can thus be avoided. Discrepancies in the literature on the question of radiation risks are indicated which render the judgement of the set problem very hard.

- 2109 RADIATION CANCER, SAFETY STANDARDS AND CURRENT LEVELS OF EXPOSURE. Mole, R.H. (Medical Research Council, Harwell (UK). Radiobiological Research Unit). pp 191-203 of Pollution de l'environnement et risques cancérogènes. Rosenfeld, C.; Davis, W. (eds.). Paris, France; Institut National de la Santé et de la Recherche Médicale (1976).

From INSERM symposia on environmental pollution and carcinogenic risks; Lyon, France (3 - 5 Nov 1975).

Cancer can be induced by radiation in any tissue where cancer occurs naturally. The observation that antenatal diagnostic radiography causes a small but definite increase in childhood cancer is as good evidence as could be expected in support of the scientific expectation that there would be no threshold of dose for carcinogenesis. A linear relation between radiation dose and frequency of induced cancer is a necessary assumption for a system of radiological protection but is not necessarily a reasonable basis for realistic assessments of cancer risk. Indeed there are radiobiological and epidemiological reasons to the contrary. If the linear hypothesis is accepted then at the present time in the UK the routine practice of medicine is of about 2 orders of magnitude more important in causing cancer than environmental pollution by discharge of radio-activity. The acceptability of radiation safety standards for occupational exposure may be justified by comparison of radiation cancer risks with risks from fatal accidents in the safer industries. The acceptability of the corresponding standards for members of the public seems to require more

public discussion of the concept of negligible risk. Emotional reactions to uncontrolled releases of radio-activity are based at least in part on a failure to appreciate the hypothesis of linearity.

- 2110 APPLICATION OF VARIOUS CALCULATION METHODS TO THE ASSESSMENT OF THE DOSE FROM ²⁴¹AM PHOTONS, IN CASE OF LIVER CONTAMINATION. Nikpay-Aslie, P. (Teheran Univ. (Iran). Inst. of Nuclear Science and Technology); Le Grand, J.; Parmentier, N. (CEA Centre d'Etudes Nucleaires de Fontenay-aux-Roses, 92 (France). Service de Protection Sanitaire). Radioprotection; 11: No. 4, 285-303(1976). (In French).

In case of internal contamination, organ photon dose estimation is rather difficult. Many calculations can be made with different assumptions. Comparisons were made between the results obtained with different classical methods and an original one. This method simulated the organ by a cloud of points considered both as emitting points and targets simultaneously. Thus not only the mean dose to the organ but also the dose to some selected points were obtained. The case of liver uniformly contaminated by americium 241 was chosen as an example. Doses calculated by the different methods were compared to doses measured in a contaminated liver included in a tissue equivalent phantom. The doses obtained by Monte-Carlo method and points cloud method were in good agreement with experimental results.

- 2111 La radioprotection en chirurgie dentaire (radiodiagnostic). (RADIATION PROTECTION IN DENTAL RADIODIAGNOSTIC). Pellerin, Y. Paris, France; Julien Prelat (1976). 88p. (In French).

Medical irradiation, and mostly radiodiagnostic is, at present time, the most important artificial source of irradiation. Reasons of this importance are reviewed for dental radiodiagnostic and different solutions to decrease it, are considered. French regulations concerning standardization of dental X-ray equipment and agreement of installations are reported. Radiological practice associated with this equipment in accordance with radiation protection regulations are examined.

9 figs.; 11 refs..

The assessment of the radiation cancer risk is to be taken note of: The observed irradiated population must be sufficiently large in order to acquire statistically reliable results. An additional radiation cancer risk can only be recognized when due to the former, a statistically significant increase of the spontaneous cancer risk occurs. To assess the radiation cancer risk in the region of small doses or dose-rates, one must probably depend on the observation of the effects with higher doses or dose-rates. In the region of small doses or dose-rates one should proceed

- according to the proposal of the ICRP for radiation protection observations, i.e. the risk-dose relationship is linear, and there is no threshold value for the dose or dose-rate.

6 figs.; 16 tabs.; with refs..
Despite values relatively high for medicine, the average GSD of the human population in the FRG as a result of all kinds of ionizing radiations produced and used by man only reached dose values which are only half as high as the average radiation exposure values from natural sources. Thus it remains below the maximum value from natural sources in the FRG. Endangering of the overall population is not to be assumed. The risk is to be seen in the exposure of the individual.

- 2118 CYTOGENETIC STUDIES IN WOMEN WITH MENSTRUAL DISTURBANCES, WORKING IN AN ENVIRONMENT OF IONIZING RADIATION (EXTERNAL IRRADIATION). Marinova, G.; Dimcheva, M.; Kyncheva, V. (Meditsinska Akademiya, Institut po Akusherstvo i Ginekologiya, Sofia (Bulgaria)). Akush. Ginekol. (Sofia); 15: No. 6, 448-453(1976). (In Bulgarian).
Cytogenetic studies of peripheral blood lymphocytes involved a sample of 30 female radiation workers with menstrual disorders from a total of 400 subjects (female physicians, laboratory technicians, and attendant personnel) included in dispensary polyclinic supervision records for a five-year period. Clinical conditions were distributed as follows: 16 patients, with oligomenorrhea; 8, with irregular bleedings; 3, with hypermenorrhea; 2, with a history of obstetric pathology; and 1, with ovarian cyst. Length of occupational experience in a radiation environment (external exposure) varied from 2 to 25 years; patient age, from 21 to 45 years. Chromosome anomalies were found in 17 of the 30 subjects investigated. Types of chromosome abnormalities detected: aneuploidy, fragments and gaps, and in one case, dicentric aberrations. Amounts of chromosome damage induced were shown to be related to years at risk.
- 2119 CARCINOGENIC RISKS ASSOCIATED WITH RADIATION POLLUTION. Latarjet, R. (Fonation Curie-Institut du Radium, Paris). IARC Sci. Publ.; No. 13, 179-180(1976). (In French).
The cancerogenic pollution by non-ionizing radiations is limited to the case of solar ultraviolet, whose activity at ground level may be increased as a consequence of the stratospheric depletion of ozone, produced by certain chemical pollutants: nitrogen oxides from supersonic aircrafts, freon. As regards ionizing radiations, the discussion is focused on the fundamental problem of the threshold, and on the means by which one may obtain some quantitative data related to carcinogenesis by small radiation doses in man. A new concept, that of a practical threshold, is proposed. A theory which links radiocarcinogenesis, as well as chemical carcinogenesis, to errors produced in the repair of lesions in the DNA is discussed. The rads-equivalent project for chemical mutagens and carcinogens is described.
- 2120 RADIATION CANCER, SAFETY STANDARDS AND CURRENT LEVELS OF EXPOSURE. Mole, R.H. (MRC Radiobiology Unit, Harwell, Eng.). IARC Sci. Publ.; No. 13, 191-204(1976).
Cancer can be induced by radiation in any tissue where cancer occurs naturally. The observation that antenatal diagnostic radiography causes a small increase in childhood cancer is good evidence in support of the scientific expectation that there would be no threshold dose for carcinogenesis. A linear relation between radiation dose and frequency of induced cancer is a necessary assumption for a system of radiological protection but is not

necessarily a reasonable basis for realistic assessments of cancer risk. Indeed there are radiobiological and epidemiological reasons to the contrary. If the linear hypothesis is accepted then at the present time in the UK the routine practice of medicine is of about 2 orders of magnitude more important in causing cancer than environmental pollution by discharge of radio-activity. The acceptability of radiation safety standards for occupational exposure may be justified by comparison of radiation cancer risks with risks from fatal accidents in the safer industries. The acceptability of the corresponding standards for members of the public seems to require more public discussion of the concept of negligible risk.

- 2121 PRELEUKEMIC STATES IN ATOMIC BOMB SURVIVORS IN JAPAN. Kamada, N.; Uchino, H. (Hiroshima Univ.). *Nouv. Rev. Fr. Hematol./Blood Cells*; 17: No. 1-2, 57-65(1976).

Cytologic and cytogenetic studies were performed on the bone marrow cells in atomic bomb-exposed patients who had prolonged periods of blood disorders with termination of acute leukemia (group I, 6 cases) and without the termination (group II, 6 cases), and survivors who were in apparent good health (group III, 85 cases). All but one patient in group I, who were examined at the preleukemic state, had abnormal clones. In 4 out of 6 of group I patients, morphologic abnormalities of bone marrow cells taken 3-10 years before leukemic development were found, such as giant neutrophils or basophils, binucleated granulocytes or megakaryocytes, and bridge formation of chromatid in metaphases. All patients in group II had stable types of chromosome aberrations. The persistent and high percentages of cytologic and cytogenetic abnormalities in patients with prolonged periods of blood disorders, regardless of history of radiation exposure, would suggest a preleukemic state, and also give some clue to the problems of leukemogenesis.

- 2122 RADIATIONS AND PUBLIC HEALTH. Jammet, H.; M'echali, D.; N'etot, J.C.; Coulon, R. (Commissariat a l'Energie Atomique, Fontenay-aux-Roses, France). *Rev. Epidemiol. Sante Publique*; 24: No. 6, 509-522(1976).

A short review is made of the general characteristics of electromagnetic and corpuscular radiations to which man can be exposed. Following some considerations on the action of ionizing radiations and the radiobiological factors governing their effects on health, the overall characteristics of pathological effects differentiating stochastic from non-stochastic effects are summarized. The uncertainties remaining as to low-level exposures are stated as well as the cautious assumptions usually made in this field. The various sources of exposure to which the population is submitted are considered, i.e., exposures from natural, medical, domestic, industrial sources or from fallout from nuclear weapon tests; the present or predictable levels of exposure and their variations are given for each source. But for medical irradiation, all the exposures connected to human activities are much lower than natural exposure variations; such exposures should modify the incidence of certain affections but quite insignificantly as compared with the regional or local variations observed.

- 2123 IONIZING RADIATIONS AND THEIR IMPACT ON BASIC FUNCTIONS OF THE GENITAL SYSTEM ON THE WOMEN (EXTERNAL EXPOSURE). Marinova, G.

(Meditsinska Akademiya, Sofia (Bulgaria). Inst. po Akusherstvo i Ginekologiya). *Akush. Ginekol. (Sofia)*; 15: No. 5, 351-358(1976). (In Bulgarian).

Data were summarized from dispensary polyclinic follow-up records over the period September 1969 through 1975 for 400 female X-ray personnel and 90 control employees free of occupational radiation exposure. In 80% of subjects in the survey group, first employment in radiation work was at less than 30 years of age. Exposure rates, as estimated from dosimetry film records, ranged from 20 to 100 mR/month, and integrated doses in no case exceeded the permissible annual levels over the past 5 years. The proportion of subjects presenting with menstrual disturbances was 42% for radiation workers versus 7.7% for controls. Distribution by types of disorders was as follows: oligomenorrhea, 35%; hypermenorrhea, 29%; irregular cycles, 15%; secondary amenorrhea, 9%; and dysmenorrhea associated with oligo- or hypermenorrhea, 22%. In 30 subjects with menstrual disturbances developing during the follow-up period, examinations included vaginal microbiology, cyclic vaginal cytodiagnosics, and pregnandiol levels. Immunoserologic assays were conducted in a total of 275 subjects, with or without menstrual disturbances, who were matched to allow comparison of results. Cytogenetic analysis of peripheral blood lymphocytes in 30 subjects with menstrual disturbances indicated radiation-induced chromosome aberrations to be present in 17 cases. Benign tumors and cancer of genital organs were diagnosed in 7.5 and 8.0%, respectively, of radiation workers as compared with 10.0 and 0.0%, respectively, in controls. All of the 66 pregnancies observed ended at term with delivery of live, apparently normal, progeny and an uneventful placental period. Gross and microscopic examination of 20 placentas and 30 chorions from artificially interrupted pregnancies disclosed no pathologic alterations. For the total of subjects under dispensary observation, there was a high rate of abortions by request.

- 2124 RISK OF HAZARDS IN THE APPLICATION OF IONIZING RADIATION AND RADIOACTIVE SUBSTANCES REFLECTED IN INTERNATIONAL RECOMMENDATIONS AND NATIONAL LAW. Wendorff, D. (Sozialministerium des Landes Schleswig-Holstein, Kiel (Germany, F.R.)). pp 65-73 of *Risk of hazards due to radiation exposure in medicine. Radiation protection in aeronautics and astronautics*. Gremmel, H. Stuttgart, Germany, F.R.; Thieme (1976). (In German)

From 16. annual meeting of the Vereinigung Deutscher Strahlenschutzärzte e.V.; Kiel, Germany, F.R. (21 Jun 1975).

Review in the light of the historic developments of the NCRP and ICRP recommendations and the UNSCEAR report, without EURATOM, NEA/OECD and German law.

- 2125 CARCINOGENIC RISKS ASSOCIATED TO POLLUTION BY RADIATIONS. Latarjet, Raymond (Institut du Radium, 75 - Paris (France)). pp 179-189 of *Pollution de l'environnement et risques cancerogènes*. Rosenfeld, Claude; Davis, Walter (eds.). Paris, France; Institut National de la Sante et de la Recherche Medicale (1976). (In French)

From INSERM symposia on environmental pollution and carcinogenic risks; Lyon, France (3 - 5 Nov 1975).

Four aspects of the problem of carcinogenic risks associated to pollution by radiations are taken into consideration: the carcinogenic pollution by non-ionizing radiations is limited to the case of solar ultraviolet, whose

activity at ground level may be increased as a consequence of the stratospheric depletion of ozone, itself produced by certain chemical pollutants: nitrogen oxides from supersonic aircrafts, freon. As regards ionizing radiations, the discussion is focused on the fundamental problem of the 'threshold', and on the means by which one may obtain some quantitative data related to carcinogenesis by small radiation doses in Man. A new concept, that of a 'practical threshold' is proposed. One discusses a theory which links radiocarcinogenesis, as well as chemical carcinogenesis, to errors produced in the repair of lesions in the DNA. One presents and discusses the 'rads-equivalent' project for chemical mutagens and carcinogens.

- 2126 Entwicklung der Nuklearmedizin in Berlin (West) 1953 bis 1975. (DEVELOPMENT OF NUCLEAR MEDICINE IN BERLIN (WEST) 1953 TO 1975). Hinz, G.; Pietzsch, W. Berlin, Germany, F.R.; BGA (1976). 34p. (In German).

Three investigations with all users of unsealed radioactive materials in clinics and practices have been carried out in West Berlin for the years 1953 to 1968, 1970 and 1975. The object of these inquiries was to be able to state in what form and to what extent, unsealed radioactive materials are being applied to people and in order to be able to make a determination of population or organ doses through nuclear medicine. The extraordinarily high annual growth rate in nuclear medical diagnostics, as well as the fact that similar investigations have so far not been carried out, called for the necessity of these inquiries. Nuclear-medical therapeutical applications of unsealed radioactive materials did not increase during the period of investigation. The value of the genetically significant dose for nuclear medicine has risen from about 0.1 mrad in 1968 to about 2 mrad in the year 1975. Calculations concerning the for leukemia significant dose were carried out for the years 1970 and 1975. The evaluated total application number for 1968 was 21,300, for 1970, 30,300 and for the year 1975, 64,700. The present report gives an analysis of the total applications from various aspects (e.g. type of radionuclides applied and their chemical compound, applied activity, age distribution of the patients, organ examined).

- 2127 RECOVERY OF THE HUMAN ORGANISM AFTER RADIATION EXPOSURE. PRINCIPLES AND RECOMMENDATIONS. Gerber, G.B. Zivilverteidigung; No. 4, 28-32(1976). (In German).

The repair of radiation damage in the human organism is reviewed. A distinction is made between the single repair steps, first the molecular repair of sublethal damage during the periods of 30 min to 2 h and several days to months, second the substitution of the whole cells during a period of reproduction which is specific for the kind and persistence of the cells. One example is the radiosensitive stem cell with a reproduction rate of 40% and a redoublication time of 10 d at 100 rads and the very low reproduction rate of 1% with redoublication time of 7 d after a dose of 400 rads. 5 rads seems to be acceptable for systems with recovery and repeated exposure, single doses normally should not exceed 25 rads, not 100 rads/d for to save human life, and not a total dose of 500 rads. About 20% of irradiation damage is not repaired and leads to late effects, for example the induction of tumors, the shortening of life span and an increase in embryonic mortality. The author recommends the acceptance of a radiation dose

leading to 20 additional cases of leucemia in the whole population of Germany and an increase of tumor frequency of 1%. The shortening of life span should not exceed 0.5%. The equivalent residual dose (ERD) can be calculated by the following equation: $ERD = \text{last effective dose} - 5 \text{ rads} \times \text{number of days}$.

- 2128 EVALUATION OF HUMAN GENETIC DAMAGES ASSOCIATED WITH AN EXPOSURE TO IONIZING RADIATIONS. Leonard, A. (Centre d'Etude de l'Energie Nucleaire, Mol (Belgium)). Ann. Biol. Anim. Biochim., Biophys.; 1: No. 1, 77-100(1976). (In French).

In a normal human population 10 to 13% of all detectible conceptions are associated with chromosome anomalies. Most of them will result in prenatal loss but it is generally accepted that chromosome anomalies are observed in about ten per 1,000 live newborn infants. If one considers also the gene mutations one must admit that 6 to 10% of the population present genetic defects. It is normally expected that exposure to chemical or physical mutagens such as ionizing radiations will result in an increase of the incidence of such mutations. The extensive studies performed on man failed, however, to demonstrate the production of genetic effects by ionizing radiations. The difficulties in performing valid epidemiological studies leave, therefore, no alternative to using the results obtained with experimental animals. From these results it can be inferred that 5 rem per 30 year reproductive generation (the genetic dose-limit) appears to be safe.

- 2129 ROLE OF RADIATION IN HUMAN LEUKEMIA. Shatterly, L.W. Houston, TX; Univ. of Texas (1976). 469p. University Microfilms Order No. 77-9280.

Thesis (Ph. D.).

In the analysis of radiation induced leukemia only two studies (one on the survivors of the atomic bombing and the other the British series on ankylosing spondylitics) appear to show a causal relationship. In both studies, a peak in the occurrence of leukemia was reached about five years from the initial exposure: The dose-response curves were approximately linear between 50-450 rads (A-bomb survivors) and 300-1,500 rads (spondylitics), and their excess in leukemia incidence was about 1-2 cases/10⁶/year/rad. The cancer incidence of A-bomb survivors has shown that after a latency period of two or three years the number of cases of leukemias increased rapidly to peak in 1950-1952. During this period, leukemia deaths were more than 50 times normal in the highest dose group and by 1965-1970 were about eight times normal. For other cancers, by 1965-1970, deaths were about one and one-half times normal, i.e., an increase of about 50 percent among the survivors who had doses exceeding 100 rads. In ankylosing spondylitic patients treated with x-rays, certain trends were observed. In utero exposure to A-bomb irradiation involves five studies: Childhood cancer, sex ratios, mortality, growth and development, and mental retardation. No increase in the incidence rate of solid tumors and leukemia was observed during the first ten years after the bombings. The findings from the study of in utero exposure to clinical x-rays, radiation exposure to radiologists, and therapeutic irradiation to the pelvic region were all inconclusive. Although a common etiology for leukemia goes unidentified, evidence now available suggests that the mechanism of leukemogenesis in man involves a block or an aberration in one or more factors associated with white cell

maturation. A proposed sequence of events involving major potential leukemogenic factors such as radiation, viral, chemical, genetic, and hormonal factors is presented.

- 2130 SOMATIC AND GENETIC EFFECTS OF SMALL DOSES OF IONIZING RADIATIONS IN MAN. Goutier, R. (Centre d'Etude de l'Energie Nucleaire, Mol (Belgium)). J. Belge Radiol.; 59: No. 1, 21-33(1976). (In French).

Estimations on the somatic and genetic effects of small doses of ionizing radiations in Man have been proposed by the Advisory Committee on the Biological Effects of Ionizing Radiation, set up by the U.S. National Academy of Sciences. They have been published in an important report, issued in 1972, from which we briefly analyze here the Chapter dealing with the somatic effects. Small doses of radiations are expected to promote only carcinogenic effects. After a rapid survey of the human experience on which the estimations are based, as regards the latent period of cancers, the plateau region (period of high risk) and the absolute and relative risk expressed per rem, per 10⁶ persons, per year, for leukaemia (having the highest risk) and for the "other cancers". These estimations were obtained by linear extrapolation to the 1 rem level from observations made after irradiation at relatively high dose levels and much higher dose-rates. This extrapolation procedure, though relatively reliable for high LET radiations (α -rays, neutrons), would yield overestimated values when applied to X- and γ -rays, since the carcinogenic effects of low LET radiations: - do not follow a linear dose-response relationship; - are mostly apparent above a threshold dose; - are strongly dose-rate dependent.

- 2131 POST-THERAPEUTIC RADIATION INJURIES OF THE NERVOUS SYSTEM: REFLECTIONS ON THEIR PREVENTION. Zeman, W.; Shidnia, H. (Indiana Univ. Medical Center, Indianapolis). J. Neurol.; 212: 107-115(1976).

The introduction of the concept of Nominal Standard Dose and of Time, Dose Fractionation Factors ostensibly permits definition of tolerance doses for normal tissues in unequivocal terms. However, even with these refinements, tolerance doses remain, at best, guidelines, because radiobiologic effectiveness is governed not only by the effective dose, but also by individual factors, which will modify the response. Attention must be accorded to these biologic parameters, in order to prevent injury to healthy tissues. Of particular significance are the relative size or volume of the irradiated tissue, the possible presence of co-existing pathology in the exposed organ and the development of disease after the termination of the treatment. Even if these factors are properly respected, the risk of radiation injury cannot entirely be eliminated. The radiotherapist is therefore obligated to use an approach which minimizes the exposure of the healthy nervous tissue, a goal which has become attainable with the advent of modern accelerators as radiation sources.

- 2135 (CONF-760744--2) GENETIC EFFECTS OF RADIATION. Selby, P.B. (Oak Ridge National Lab., Tenn. (USA)). 1976. Contract W-7405-ENG-26. 13p. Dep. NTIS \$3.50.

From Conference on energy sources of the future; Oak Ridge, TN, USA (5 Jul 1976).

Data are reviewed from studies on the genetic effects of x radiation in mice and the extrapolation of the findings for estimating genetic hazards in man is discussed. Data are included on the frequency of mutation induction following acute or chronic irradiation of male or female mice at various doses and dose rates.

- 2136 (CONF-760947--3) EFFECT OF AGING AND RADIATION IN MICE OF DIFFERENT GENOTYPES. Storer, J.B. (Jackson Lab., Bar Harbor, Maine (USA); Oak Ridge National Lab., Tenn. (USA)). 1976. Contract E(11-1)-3267; W-7405-ENG-26. 22p. Dep. NTIS \$3.50.

From Conference on genetic effects on aging; Bar Harbor, ME, USA (12 Sep 1976).

Data are presented on the life span of nine inbred strains and five hybrid strains of mice based on 400 mice of each sex for inbred and 200 mice of each sex for hybrid. Some of these mice were exposed when 120 days old to 250 R or 450 R of x radiation delivered at a dose rate of 60 R/min. Data on strain, sample size, and mean survival times are presented in tables.

- 2137 (COO--3097-16) EFFECT OF RADIATION ON NORMAL HEMATOPOIESIS AND ON VIRAL INDUCED CANCERS OF THE HEMATOPOIETIC SYSTEM. THREE-YEAR TECHNICAL PROGRESS REPORT, AUGUST 1, 1973-APRIL 30, 1976. Okunewick, J.P. (Allegheny General Hospital, Pittsburgh, Pa. (USA). Cancer Research Unit). 1976. Contract E(11-1)-3097. 77p. Dep. NTIS \$5.00.

In studies conducted during the first three-year segment of this contract, it was observed that in the process of viral leukemogenesis the

affected animals became more radioresistant than normal. Initial studies into the reason for the enhanced radioresistance implicated an increase in the number of pluripotent stem cells as one possible cause. During the current period, studies were carried out to further define the effect of the virus on stem cells and their kinetics using exposure to tritiated thymidine ($^3\text{HTdR}$) in vivo and in vitro. In addition, separate studies were initiated in an attempt to determine if the immune system played a part in the radioresistance, as well as what the effects might be of immune manipulations on the disease during the oncogenic period. Finally, studies were also undertaken to assess the sensitivity of the virus itself to radiation in vitro and in vivo to radiation and treatment with cells transplanted from viral resistant mice.

such as the proliferative state of the hair follicles and epidermis at the time of and subsequent to irradiation. The interaction of radiation and other carcinogens, especially ultraviolet light, is under study because of epidemiologic evidence suggesting a potential synergism for induction of scalp tumors. Radiobiological recovery processes have been studied in tumor response experiments using split doses of radiation separated by various times. The recovery rate for electron induced tumors has been measured, and the oncogenic effects of high LET particles (proton, alpha, argon) are being investigated.

- 2138 (COO--3380-23) RAT SKIN CARCINOGENESIS AS A BASIS FOR ESTIMATING RISKS AT LOW DOSES AND DOSE RATES OF VARIOUS TYPES OF RADIATION. Burns, F.J.; Vanderlaan, M.; Strickland, P.; Albert, R.E. (New York Univ., N.Y. (USA). Inst. of Environmental Medicine). 1976. Contract E(11-1)-3380. 15p. (CONF-760445--4). Dep. NTIS \$3.50.

From 3. international symposium on detection and prevention of cancer; New York City, NY, USA (26 Apr 1976).

The recovery rate, age dependence and latent period for tumor induction in rat skin were measured for single and split doses of radiation, and the data were analyzed in terms of a general model in an attempt to estimate the expected tumor response for various types of radiation given at low dose rates for long periods of time. The dorsal skin of male rats was exposed to electrons, x rays, or protons in either single or split doses for several doses and the tumor responses were compared during 80 weeks of observation. A two stage model incorporating a reversible or recoverable mode was developed and various parameters in the model, including recovery rate, dose-response coefficients, and indices of age sensitivity, were evaluated experimentally. The measured parameters were then utilized to calculate expected tumor responses for exposure periods extending for duration of life. The calculations indicated that low dose rates could be markedly ($1/100$ to $1/1000$) less effective in producing tumors than the same dose given in a short or acute exposure, although the magnitude of the reduction in effectiveness declines as the dose declines.

- 2139 (COO--3380-26) TUMORIGENIC ACTION OF BETA, PROTON, ELECTRON AND ALPHA RADIATION IN RAT SKIN. COMPREHENSIVE PROGRESS REPORT, AUGUST 1, 1973--JULY 31, 1976. Burns, F.J.; Albert, R.E. (New York Univ., N.Y. (USA). Inst. of Environmental Medicine). 1976. Contract AT(11-1)-3380. 35p. Dep. NTIS \$4.00.

Rat skin has been studied for a number of years as a model of radiation carcinogenesis in a solid tissue. Accessibility of the skin enables the tumors to be detected early so that growth rate, proliferation rate, and onset times can be established accurately and, of course, the superficial location permits an accurate assessment of doses and a localization of the radiation to the tissue of interest. We have been attempting to establish as accurately as possible the nature of the dose response curve, i.e., the rate of tumor occurrence as of function of radiation dose, and the importance of tumor induction of radiologic factors, such as dose rate, fractionation, dose localization, linear energy transfer and of biologic factors,

- 2140 (COO--3380-27) TUMORIGENIC ACTION OF BETA, PROTON, ELECTRON AND ALPHA RADIATION IN RAT SKIN. PROGRESS REPORT, AUGUST 1, 1975--JULY 31, 1976. Burns, F.J.; Albert, R.E. (New York Univ., N.Y. (USA)). 1976. Contract AT(11-1)-3380. 20p. Dep. NTIS \$3.50.

The carcinogenic effect of ionizing radiation on rat skin was studied in an attempt to learn more about radiation carcinogenesis, especially how various parameters of the irradiation, such as dose distribution within the tissue and dose rate, affect the yield of tumors. It was found that when the dose was localized to a small region of skin, the tumor yield was reduced and the magnitude of the reduction indicated that the region of reduced response might extend about $150\ \mu$ into the irradiated zone. The proliferative state of the hair follicles at the time of irradiation had relatively little effect on tumor induction although old animals are less susceptible than young or newborn animals. The penetration requirement of at least 0.3 mm for producing tumors suggests that the hair follicle germ cells could be the oncogenic targets. The recovery rate for tumor induction measured by split-dose exposure protocols was 4 hours for electrons. Proton radiation exhibited nearly complete recovery at 24 hours PI. UVL promotion of electron induced tumors did not significantly alter tumor yields. Radioresistance to tumor induction appears to increase with age.

- 2141 (INIS-mf--3315, pp 30) GENETIC DAMAGE IN MICE FOLLOWING CHRONIC GAMMA IRRADIATION. Bajrakova, A. (Nauchno-Izledovatel'ski Inst. po Radiologiya i Radiatsionna Khigiena, Sofia (Bulgaria)). 1976. (In Bulgarian).

From 2. national conference on medical biology and genetics with international participation and symposium on population genetics and demography of hereditary diseases; Varna, Bulgaria (2 Oct 1976).

Published in summary form only. English abstract available.

Second national conference on medical biology and genetics with international participation and symposium on population genetics and demography of hereditary diseases. Abstracts.

Adult mouse males were exposed continuously to a radium-266 source. Mean total doses ranging from 100 to 900 rad were delivered at an average dose rate of either 0.1 or 1.0 rad/hour. Three to four months postirradiation, diakinesis-metaphase I primary spermatocytes were examined cytogenetically to score multivalent configurations - rings or chains of 3, 4, etc. univalents - as an indication of translocations occurring between nonhomologous chromosomes in irradiated spermatogonial cells. Evidence was obtained for poor efficiency of chronic gamma irradiation in producing this type of genetic damage, and the hypothesis was supported that there may exist a threshold dose

rate (a few millirads per minute) under which chronic gamma rays will show no further change in efficiency.

- 2142 (INIS-mf--3315, pp 36) SOMATIC AND GERM-CELL CHROMOSOME ABERRATIONS IN RABBITS EXPOSED TO LOW-DOSE-RATE GAMMA RAYS. Benova, D.; Vyglenov, A.; Baev, I.; Karadzhev, A. (Nauchno-Izledovatelski Inst. po Radiologiya i Radiatsionna Khigiena, Sofia (Bulgaria)). 1976. (In Bulgarian).

From 2. national conference on medical biology and genetics with international participation and symposium on population genetics and demography of hereditary diseases; Varna, Bulgaria (2 Oct 1976).

Second national conference on medical biology and genetics with international participation and symposium on population genetics and demography of hereditary diseases. Abstracts.

Prediction of genetic risks involved in chronic irradiation is particularly important from a practical point of view. One possibility for risk assessment by means of a readily accessible somatic measure would be offered if a ratio could be ascertained between chromosome aberrations in peripheral lymphocytes and in spermatogonia for a number of mammals, and then extrapolated to man. In the present study, rabbits were exposed to ^{137}Cs gamma rays at 0.008 rad/min, the total dose delivered being 280 or 390 rad. The latter results, respectively, in 4 and 6.25% dicentrics for peripheral lymphocytes, and in 2.5 and 3.3% translocations for spermatogonia as assert in spermatocytes. The dicentric - to - translocation ratio was thus 1.5 to 2 : 1. Comparisons were made with the ratios for rabbits given acute exposure, as found in our and in other laboratories. As compared with acute exposure data, reduction in dose rate appears to lead to a decrease in the frequency of dicentrics in lymphocytes, while the frequency of translocations in spermatogonia remains unchanged.

- 2143 (ORO--4465-15) PRODUCTION, PURIFICATION AND ASSAY OF THROMBOPOIETIN. PROGRESS REPORT, AUGUST 1, 1975--JULY 31, 1976. McDonald, T.P. (Tennessee Univ., Knoxville (USA). Memorial Research Center and Hospital). 1976. Contract E(40-1)-4465. 29p. Dep. NTIS \$4.00.

Experiments were conducted which indicate that thrombopoietin can be detected by both a bioassay and an immunoassay in sera of patients with various platelet production disorders. Other studies have shown that the kidney appears to have a vital role in thrombopoietin production; the mechanism of how platelet-specific antisera causes thrombocytopenia has been investigated. Also, an investigation has been made into the preparation of assay mice and the different methods for the measurement of thrombopoietin. These studies indicate that mice in rebound-thrombocytosis are more sensitive to exogenous TSF than normal or platelet transfused mice. Also, ^{35}S incorporation into platelets of assay mice is the most sensitive measurement of thrombopoiesis. The effects of hypoxia on platelet production was also investigated along with the release of thrombopoietin in animals exposed to RAMPS and whole-body x-irradiation.

- 2144 (TID--27097) LOW-LEVEL X-IRRADIATION OF THE BRAIN DURING DEVELOPMENT: MORPHOLOGICAL, PHYSIOLOGICAL AND BEHAVIORAL CONSEQUENCES. PROGRESS REPORT, SEPTEMBER 1, 1975--AUGUST 31, 1976. Altman, J. (Purdue

Univ., Lafayette, Ind. (USA)). 1976. Contract AT(11-1)-2000. 13p. Dep. NTIS \$3.50.

Results are reported from a study of the effects of exposure of rat cerebellum at days 4 through 15 following birth to various doses of low-level x radiation on amino acid levels in brain tissues, development of the alfactory bulb, and motor performance. Functional recovery with age was also investigated. (CH)

- 2145 (UCD--472-123, pp 28-44) PATHOLOGY IN A LIFESPAN STUDY OF X-IRRADIATED ADULT FEMALE BEAGLES. Chrisp, C.E.; Phemister, R.D.; Andersen, A.C.; Rosenblatt, L.S.; Goldman, M. 1976.

Annual report, fiscal year 1976.

Both neoplastic and non-neoplastic disease contributed to decreased dose-related cumulative survival rates in female beagles exposed to various doses and dose rates of x radiation at one year of age. Increased dose-related cumulative incidence rates of deaths due to mammary tumors was seen in nulliparous but not in parous beagles. A markedly dose-related increase in incidence of uterine polyps was found. The importance of ovarian, thyroid, urinary bladder, and other neoplasms is discussed.

- 2146 (UCD--472-123, pp 50-52) FRACTIONATED X-IRRADIATION DAMAGE TO DEVELOPING OVARIES IN THE BONNET MONKEY (MACACA RADIATA). Andersen, A.C.; Hendrickx, A.G. 1976.

Annual report, fiscal year 1976.

Fractionated x-ray exposures of 11.5 rads each (total 200 rads) given twice weekly between 75 to 137 days postcoitum (pc) severely damaged the ovary of 8 out of 9 fetal bonnet monkeys. This radiation regimen delayed oogenesis in some instances and reduced follicle counts by 75 percent or more. Fractionated x-irradiation earlier in gestation (148 to 104 da pc) did not cause ovarian damage.

- 2147 (UCD--472-123, pp 67-82) HEMATOPOIETIC EFFECTS. Wilson, F.D.; Stitzel, K.A.; Munn, S.L. 1976.

Annual report, fiscal year 1976.

Progress is reported on studies on the internal radiation effects of ^{90}Sr and ^{226}Ra in beagles and investigation of leukemias induced by various doses of whole-body ^{60}Co γ . Newer studies on health effects of non-nuclear energy production, in particular the response of macrophage progenitors to particulate fly ash, are described. Previously developed bone marrow cloning techniques, which allow quantitation of bone marrow cell progenitors in vitro, were modified for quantitation of progenitors of alveolar macrophages. In view of the potential importance of silica components in particulate fly ash and the use of silica as an immunosuppressive agent during bone marrow transplantation therapy in experimental leukemia, pilot studies were initiated to investigate the effects of iv-administered silica on bone marrow, lymphoid, and macrophage cell populations in mice and dogs.

- 2148 CHANGES IN CHROMOSOME ABERRATION FREQUENCY IN CHINESE HAMSTER LIVER RELATED TO LET AND MICRODOSE DISTRIBUTION. Brooks, A.L.; McClellan, R.G. (Inhalation Toxicology Research Inst., Albuquerque, NM). pp 767-778 of Health effects of plutonium and radium. Webster, S.S. (ed.). Salt Lake City; Univ. of Utah (1976).

From Workshop on the biological effects and

toxicity of Pu 239 and Ra 226; Sun Valley, ID, USA (6 Oct 1975).

See CONF-751043--.

The effect of radiation quality on the frequency of chromosome aberrations in liver cells was determined by exposing animals to either ^{60}Co gamma irradiation as a reference standard or to radionuclides that deposit in liver; ^{144}Ce , a beta emitter, ^{238}Pu , ^{239}Pu and ^{241}Am , alpha emitters, and ^{252}Cf , an isotope which emits alpha, fission fragments, neutrons, and gamma rays. All the radionuclides were injected as the citrate which resulted in a large fraction of their total activity being deposited in the liver. With the exception of acute gamma exposure, all dose response relationships could be adequately described by a linear equation. Quality factors for the different LET exposures were derived by comparing the slopes of the dose response curves. Using protracted ^{60}Co exposures as the reference, the quality factor for the beta emitter ^{144}Ce - ^{144}Pr is 1. Quality factors for the alpha emitters ^{238}Pu , ^{239}Pu and ^{241}Am ranged from 11 to 20 which seems to be higher than the value of 10 used in establishing radiation protection standards. The factor derived for ^{252}Cf was 10. The lower quality factor compared to pure alpha emitters was attributed to the ineffectiveness of fission fragments in producing measurable chromosome damage. (auth)

- 2149 (ERDA-tr--160, pp 75-81) INFLUENCE OF THE DEPTH DISTRIBUTION OF BASAL CELLS ON THEIR SURVIVAL IN THE IRRADIATION OF SKIN WITH BETA PARTICLES WITH VARIOUS ENERGIES. Osaov, D.P.; Rakova, V.A.; Klykov, G.V.; Filatov, V.V. 1976. Translated from Radiobiologiya; 16: No. 1, 59-63(1976).

Radiobiology. The distribution of basal cells within the skin of sexually immature pigs was investigated in the normal state and after irradiation with β particles of various energies. The results of the investigation permits an explanation of the peculiarities of the damage and repair of the skin after various radiation influences and a substantiation of the selection of the depth and thickness of the layers of skin within which it is advisable to determine the absorbed dose under set conditions of irradiation.

- 2150 (ERDA-tr--160, pp 151-154) EFFECTS OF X IRRADIATION ON THE 5'-NUCLEOTIDASE ACTIVITY OF THE PLASMA MEMBRANES OF THE RAT LIVER. Ryskulova, S.T. 1976. Translated from Radiobiologiya; 16: No. 1, 115-117(1976).

Radiobiology. The effects of x irradiation on the 5'-nucleotidase activity of the plasma membranes of the rat liver were investigated. The irradiation of rats leads to an increase in the activity of the enzyme of the liver plasma membranes in all the investigated periods. It is thought that the prolonged increase in activity may be a consequence of a complex of postradiation disruptions in the chain of intermediary metabolism. (ERB)

- 2151 (ERDA-tr--160, pp 155-158) USE OF THE METHOD OF MONOLAYER CULTURES OF THE GUINEA PIG SPLEEN FOR THE EVALUATION OF THE RADIOPROTECTIVE ACTION OF MEXAMINE ON THE SURVIVAL OF COLONY-FORMING CELLS. Baisogolov, G.D.; Rudakova, S.F.; Rudakov, I.A.; Konoplyannikov, A.G. (Scientific Research Inst. of Medical Radiology, Obninsk, USSR). 1976. Translated from Radiobiologiya; 16: No. 1, 117-120(1976).

Radiobiology. Data are presented on the

influence of mexamine on the survival of colony-forming guinea pig spleen cells under the conditions of γ irradiation in vitro. It was found that colony-forming spleen cells possess substantially greater radioresistance in comparison with colony-forming bone marrow cells. The dose reduction factor for mexamine in these experiments was found to be about 1.3. The results obtained indicate the possibility of using the method of monolayer cultures for a quantitative evaluation of the radioprotective action of various preparations on precursor cells in the hematopoietic organs of animals. (ERB)

- 2152 (ERDA-tr--160, pp 179-182) AUTOIMMUNIZING ACTION OF X IRRADIATION AND AN ANTIBIOTIC. Ter-Pogosyan, R.A.; Malikoyan, S.A. (Ministry of Health of the Armenian SSR, Erevan). 1976. Translated from Radiobiologiya; 16: No. 1, 134-137(1976).

Radiobiology. The peculiarities of the autoimmune process developing in the case of the combined use of ionizing radiation and a widely used antibiotic, penicillin, were studied. The experiments were conducted on guinea pigs using fractionated radiation. It was found that in the combination of fractionated irradiation and the injection of penicillin, both an intensification of the production of radiation autoantibodies and an increase in the sensitivity to penicillin were noted in the guinea pigs. (ERB)

- 2153 (ERDA-tr--160, pp 183-187) STUDY OF THE REPRODUCTIVE FUNCTION OF MONKEYS IN CHRONIC IRRADIATION. Artem'eva, N.S.; Kosichenko, L.P.; Andreeva, A.V.; Zvereva, G.A. (Scientific Research Lab. of Experimental Immunobiology, Moscow). 1976. Translated from Radiobiologiya; 16: No. 1, 137-140(1976).

Radiobiology. The functional activity, reproductive capacity, and structural changes in the ovaries of sexually mature and sexually immature female monkeys after chronic x irradiation were studied. Our observations of the influence of long-term chronic irradiation on monkeys confirm the data obtained on other animals (mice, rats, guinea pigs, rabbits) on substantial disruptions of the function of the ovaries, inhibition and total suppression of the reproductive capacity. In our investigations we were unable to establish an increase in the prenatal mortality, which was clearly shown on small laboratory animals. The cause of the decrease in fertility might be changes in the oviducts and uterus. However, the destructive processes that we observed in the ovaries of irradiated monkeys, which might be aggravated as the dose and period of irradiation are increased, might undoubtedly be the cause of the functional and structural pathological changes.

- 2154 PROLIFERATION AND DIFFERENTIATION OF HEMOPOIETIC STEM CELLS IN HYPOKINESIA. Portugalov, V.V.; Shvets, V.N. Byull. Eksp. Biol. Med.; No. 4, 501-503(1976). (In Russian).

Studies were performed to evaluate the effects of prolonged hypokinesia on proliferation and differentiation of hemopoietic stem cells. Female mice (20 to 22 g; (CBA x C57BL) F_1) mice were held in special low-volume containers; on the 1, 3, 7, 15, 30, and 45th day of limited movement, marrow was removed from their liver and spleen. A cell suspension was prepared from these samples and administered intravenously to the same mice which had been irradiated with 900 R gamma-rays ^{137}Cs . The course of differentiation of splenic

or marrow cells in recipient bone marrow followed expected patterns of differentiation while bone marrow cells from the donor showed an increase in erythropoietic differentiation in the recipient bone marrow.

- 2155 SOMATIC RADIATION EFFECTS. Konermann, G. (Freiburg Univ. (F.R. Germany). Inst. fuer Biophysik und Strahlenbiologie). Atomkernenergie; 28: No. 1, 3-21(1976). (In German).

From Symposium on medical and biological problems of radiation exposure; Borstel, F.R. Germany (30 May 1975).

21 figs.; 2 tabs.; with refs..

Mechanisms of the origin and the compensation of somatic radiation effects are discussed using experimental and some human data. Cell cultures or different tissues respectively serve as models in order to demonstrate the amount of doses, the quality of doses and the dose rate as the most important physical parameters as well as the activity of proliferation and the degree of differentiation and maturity as the most important biological parameters for the irradiation effects. Alterations at the level of organs are represented for testicles, ovary, intestine, haemopoietic system and the central nervous system. Furthermore, immediate and longtime sequelae of irradiation during development are shown for animals, with regard to their transferability to man. After a loss of cells the capacity of a compensating proliferation is estimated as an important determinant for acute somatic effects in both adult and growing organs. On the other hand, it can be deduced from curves for late effects (tissue degeneration, unspecific life shortening or carcinogenesis) that latent engrammes for these events are accumulated from doses which are insufficient for acute alterations.

- 2156 EFFECT OF ACUTE IRRADIATION ON THE DEVELOPMENT OF LIMBS IN SHEEP. Rajtova, V. (Institut fuer Normale Anatomie der Hochschule fuer Veterinaermedizin, Kosice, Czechoslovakia); Horak, J. Biologia (Bratislava); 31: No. 3, 171-178(1976). (In German).

The effect of acute irradiation on the limb development in sheep was studied. The pelvic area of a pregnant sheep was irradiated locally on the 28th, 29th and 30th days after fertilization. The fetus was removed on the 15th day after irradiation and treated histologically. A single exposure with 250 R (higher exposures killed the fetus) was found to cease the limb development on the 28th day after irradiation (the critical period of the sheep limb development), to induce persistence of the intermedial ray on the 29th and 30th days, an early disappearance of the side finger rays, an early disappearance, fusion or deformation of some carpal and tarsal elements on the 29th and the 30th days after irradiation.

- 2157 COMPARATIVE STUDIES OF RADIATION-INDUCED CHROMOSOME ABERRATIONS IN SEVERAL MAMMALIAN SPECIES. Muramatsu, S.; Matsuoka, O. (National Inst. of Radiological Sciences, Chiba (Japan)). pp v.1 p.229-236 of Biological and environmental effects of low-level radiation. Proceedings of a symposium on biological effects of low-level radiation pertinent to protection of man and his environment organized by the IAEA and the WHO and held in Chicago, 3-7 November 1975. Vienna; IAEA (1976).

From Symposium on biological effects of low-level radiation pertinent to protection of man and his environment; Chicago, Ill., USA (3 Nov

1975).

The dose-response relationship for inducing chromosome aberrations in peripheral lymphocytes of five mammalian species - man, cynomolgus monkey, rabbit, domestic cat and beagle dog - were studied comparatively by whole-blood microculture technique following in-vitro exposures at various doses with 200-kVp X rays. The yields of induced chromosome aberrations were dependent on exposure doses between 48 and 480 rads in all the species examined. The relationship between exposure dose (D in rads) and frequency of induced dicentric per cell (Y) was expressed by: $Y_{\text{sub}}(\text{man}) = 14.38 \times 10^{-6} D^{\text{sup}}(1.94)$; $Y_{\text{sub}}(\text{monkey}) = 18.12 \times 10^{-6} D^{\text{sup}}(1.86)$; $Y_{\text{sub}}(\text{rabbit}) = 1.88 \times 10^{-6} D^{\text{sup}}(2.06)$; $Y_{\text{sub}}(\text{cat}) = 78.66 \times 10^{-6} D^{\text{sup}}(1.35)$; $Y_{\text{sub}}(\text{dog}) = 46.13 \times 10^{-6} D^{\text{sup}}(1.37)$. Taking the frequency of dicentric in man as 1.00, the relative frequency in each species was estimated as 0.79, 0.24, 0.22 and 0.16 in monkey, rabbit, cat and dog, respectively. From these results the consistent relationship could not be discovered between X-ray doses and the dicentric yield based on the arm number effect proposed by Brewen et al., whereas the nuclear DNA contents and the arm number in all the species used are roughly similar to those in man. The authors considered that such interspecies differences may be derived from the cellular and/or physiological features of PHA-responsive lymphocytes (T-cells) in each species, and that may be due to the level of development of each species on the phylogenetic or evolutionary scale.

- 2158 LIFE SHORTENING, NEOPLASIA AND SYSTEMATIC INJURIES IN MICE AFTER SINGLE OR FRACTIONATED DOSES OF NEUTRON OR GAMMA RADIATION. Ainsworth, E.J.; Fry, R.J.M.; Brennan, P.C.; Stearner, S.P.; Rust, J.H.; Williamson, F.S. (Argonne National Lab., Ill. (USA)). pp v.1 p.77-92 of Biological and environmental effects of low-level radiation. Vienna; IAEA (1976).

From Symposium on biological effects of low-level radiation pertinent to protection of man and his environment; Chicago, Ill., USA (3 Nov 1975).

The late somatic effects of fission neutrons from the Janus reactor or of ^{60}Co γ radiation are being evaluated in hybrid B6Cf₁ mice (C57BL/6xBALB/c) of both sexes. The effects of dose, dose rate, number of radiation fractions, age at exposure, and quality of radiation were investigated. Principal end points include life shortening, age-specific rates of neoplastic and non-neoplastic diseases, and late manifestations of damage to the vasculature, cell-mediated immune responsiveness, and haematopoiesis. Over the range of single doses, from data now available, life shortening is inversely related to dose and the RBE ranges from approximately 2 to 7. Single doses were administered at 115, 190 or 280 days of age. Increased age affords some sparing effect for both neutron and γ radiations, but an increased RBE was observed at 270 days. When neutron or γ doses are protracted over 6 months, similar mortality (rates) result from weekly doses of 3.3 neutron and 35 γ rad; under these conditions the RBE is estimated at 10-13. Life shortening and age-specific death and tumour rates are compared when a total dose of 240 neutron rad is administered as a single dose or as fractionated doses distributed over 6 months; greater life shortening and higher age-specific death and tumour rates result from dose fractionation. The structural and functional integrity of the vasculature, assessed by clearance of ^{133}Xe after a single dose or fractionated doses of neutron or γ radiation,

indicates that the late effects of neutrons are at least total-dose-dependent, whereas a significant sparing effect is observed with fractionated γ irradiation. Late effects on cell-mediated immunity are evident in both γ and neutron-irradiated animals based on splenic repopulation by thymus-derived lymphocytes (T cells) and on the mitogen response of T cells that repopulate the spleen.

- 2159 BIOLOGICAL EFFECTS OF HADRONS AT VERY LOW DOSES. Baarli, J.; Bianchi, M.; Sullivan, A.H. (European Organization for Nuclear Research, Geneva (Switzerland)); Di Paola, M. (Comitato Nazionale per l'Energia Nucleare, Rome (Italy)). pp v.1 p.195-203 of Biological and environmental effects of low-level radiation. Vienna; IAEA (1976).

From Symposium on biological effects of low-level radiation pertinent to protection of man and his environment; Chicago, Ill., USA (3 Nov 1975).

Several sensitive biological tests have been utilized to investigate any possible effects of hadron interactions in tissue. These include lens opacification in mice, testes weight loss in mice, inhibition of 10-day growth of *Vicia faba* bean roots, and type-B spermatogonia survival in mice. The radiations employed were 600- and 400-MeV neutron beams, a stopped negative pion beam, as well as Pu-Be and 14-MeV neutrons. The results obtained are summarized and discussed.

- 2160 RISK OF MAMMARY ONCOGENESIS FROM EXPOSURE TO NEUTRONS OR GAMMA RAYS: EXPERIMENTAL METHODOLOGY AND EARLY FINDINGS. Clifton, K.H.; Sridharan, B.N.; Gould, M.N. (Wisconsin Univ., Madison (USA)). pp v.1 p.205-211 of Biological and environmental effects of low-level radiation. Vienna; IAEA (1976).

From Symposium on biological effects of low-level radiation pertinent to protection of man and his environment; Chicago, Ill., USA (3 Nov 1975).

A project has been initiated to define the risk of oncogenesis per rad of high or low linear energy transfer (LET) radiation per surviving mammary cell and its modification by hormones. This work was undertaken because: (a) mammary carcinoma is the principle neoplastic disease of American women; (b) rats have been demonstrated to be remarkably susceptible to mammary oncogenesis following neutron irradiation; (c) rats are similar to women in the importance of hormones to carcinoma induction and progression in their mammary glands; and (d) exposure to neutrons is likely to increase with increasing use of nuclear reactors and development of neutron radiotherapy sources. To measure mammary cell survival and, ultimately, postirradiation repair capacity, the authors are developing an in-vivo end-point dilution assay based on the formation of glandular structures after the transplantation of known numbers of monodispersed rat mammary epithelial cell suspensions. Such grafts initially give rise to alveolus-like spheres and, with time, to complete glands. Growth and secretion can be stimulated in them by hormonal manipulation. In the short-term assays and the longer-term carcinogenesis studies, elevated endogenous mammotropic hormone, prolactin (M_{TH}) levels have been induced by grafting of anterior pituitary tissue or of M_{TH} (M_{TH}-secreting pituitary tumours). Steroid hormone levels have been manipulated by surgical ablation or injection. Irradiations have been performed with a modified neutron fission spectrum generated by a Triga reactor, or with ¹³⁷Cs γ

rays. Results with two inbred rat strains indicate: (a) that the type (carcinoma or fibroadenoma), incidence and latency of mammary tumours is markedly influenced by the circulating levels of M_{TH}; and (b) that adrenal deficiency markedly enhances the induction of mammary carcinomas in irradiated rats with high endogenous M_{TH} levels. Further studies are in progress.

- 2161 EFFECTS OF CONTINUOUS PRENATAL γ RADIATION ON THE PIG AND RAT. Erickson, B.H.; Martin, P.G. (Comparative Animal Research Laboratory, Oak Ridge, Tenn., USA). pp v.1 p.111-117 of Biological and environmental effects of low-level radiation. Vienna; IAEA (1976).

From Symposium on biological effects of low-level radiation pertinent to protection of man and his environment; Chicago, Ill., USA (3 Nov 1975).

Little is known of the effects of continuous low-level irradiation applied prenatally to the long-lived mammal. As compared with the rodent, developmental events are protracted in long-lived species and consequently are at risk longer. Estimation of radiation risk to man therefore requires data from animals in which developmental events are similarly protracted. Pigs were irradiated continuously for the first 108 days of their 112-day gestation period at rates of 20, 9, 3 and 1.5 R per 22-hour day. Six pregnant gilts and six controls were employed at each dose rate. Foetal doses were 7, 3, 1 and 0.5 rad/d. Neither the health of the gilt nor the number of live births was affected by any exposure. Postnatal viability was also unaffected. Radiation effects on growth and organic development were assayed at birth, 70 and 150 days of age. Body weight and growth were unaffected by dose rates of 3 rad/d or less; and other than the gonad, only the weight of the brain was affected by 3 rad/d. At 1 rad/d or less only gonadal weight was reduced. The most spectacular finding at doses of 7 and 3 rad/d was sterility in both sexes. Following 1 rad/d, germ-cell number was reduced to 5% and 2% of control in the female and male, respectively. At 0.5 rad/d, germ cells were reduced to 43% of control in the female and 11% of control in the male. In contrast to the pig, 7 rad/d reduced the germ-cell population of male and female rats to only 49% and 35% of control, respectively, and 1 rad/d produced no apparent effect in either sex. It appears, therefore, that interspecific differences in the response to continuous γ radiation are large and that the germ cell is the most labile cell type.

- 2162 EFFECT OF PITUITARY ISOGRAFTS ON RADIATION CARCINOGENESIS IN MAMMARY AND HARDERIAN GLANDS OF MICE. Fry, R.J.M.; Garcia, A.G.; Allen, K.H.; Salliese, A.; Staffeldt, E.; Tahmisi, T.N.; Devine, R.L.; Lombard, L.S.; Ainsworth, E.J. (Argonne National Lab., Ill. (USA)). pp v.1 p.213-226 of Biological and environmental effects of low-level radiation. Vienna; IAEA (1976).

From Symposium on biological effects of low-level radiation pertinent to protection of man and his environment; Chicago, Ill., USA (3 Nov 1975).

The effects of single-dose fractionated and protracted exposures to ⁶⁰Co γ radiation and of single-dose and fractionated exposures to Janus reactor neutrons (fn) on mammary and Harderian gland tumorigenesis were studied in B6C₃F₁ mice. The incidence of mammary tumours is about 1% in the hybrid B6C₃F₁ mouse (C57BL/6JxBALB/cJ)_{F₁} and shows little increase with low-dose protracted γ irradiation. After exposure to

fission neutrons from the Janus reactor with single doses of 20, 80 and 240 rads, or with 80 and 240 rads given in 24 fractions, or to single and fractionated doses of γ irradiation, the incidence of mammary tumours increased somewhat. The influence of certain hormone levels on mammary and Harderian gland tumorigenesis were studied. The proliferative activity in the mammary and Harderian gland was determined by autoradiographic analysis after isografting two pituitaries under the spleen capsule or after administration of diethylstilbestrol diphosphate or prolactin. In the second type of experiment, mice with pituitary isografts were exposed to a single dose of 20 or 80 rad Janus fn, or to 90 or 269 rad γ radiation. Preliminary results indicated two major effects of the combined treatment of pituitary isografts and neutron irradiation on tumorigenesis: 1) a reduced latent period and increased incidence of mammary tumours; 2) (a) a reduced latent period for Harderian tumours, (b) a marked increase in their incidence (e.g. from 2.5% in controls to about 37% after a single dose of 80 rad fn), and (c) an increase in the fraction of Harderian gland tumours with metastases.

- 2163 SPERMATOGONIAL CELL RENEWAL UNDER CONTINUOUS IRRADIATION AT 1.8 AND 45 RADS PER DAY. Hsu, T.H.S. (University of Southern California, Los Angeles (USA). Dept. of Radiology); Fabrikant, J.I. (Montreal General Hospital, Quebec (Canada)). pp v.1 p.157-167 of Biological and environmental effects of low-level radiation. Vienna; IAEA (1976).

From Symposium on biological effects of low-level radiation pertinent to protection of man and his environment; Chicago, Ill., USA (3 Nov 1975).

The cell population kinetics and radiation response of continuously irradiated C57BL/6J mouse testes have been analysed. The changes in spermatogonial cell population sizes and cell kinetic parameters have provided information on the degree of radiosensitivity within the seminiferous epithelium at sublethal continuous irradiation doses and the manner in which the tissue responds. At 1.8 rad/d, spermatogonial cell renewal was maintained at near-normal levels through compensatory cell proliferation and recruitment from the Asub(s) stem cell pool. However, at 45 rad/d, depopulation of the testes took place through radiation depletion and maturation-differentiation of surviving elements. At this higher dose rate, the five type-A subpopulations were maintained at near-steady states of growth. The seminiferous epithelium displayed a remarkable capacity to recover. After two weeks of continuous irradiation at 45 rad/d, recovery commenced with proliferation from the Asub(s) spermatogonial stem cells, leading to full restoration of the seminiferous epithelium.

- 2164 MODULATION OF TUMOUR SPECTRA IN C 57 BLACK MICE FOLLOWING FAST-NEUTRON VERSUS CO IRRADIATION AT LOW DOSAGE. Mewissen, D.J.; Rust, J.H. (Chicago Univ., Ill. (USA). Dept. of Radiology; Franklin McLean Memorial Research Inst., Chicago, Ill. (USA)). pp v.1 p.181-193 of Biological and environmental effects on low-level radiation. Vienna; IAEA (1976).

From Symposium on biological effects of low-level radiation pertinent to protection of man and his environment; Chicago, Ill., USA (3 Nov 1975).

A total of 7109 C 57 Black mice of either sex were either sham-, neutron- or cobalt-irradiated at the age of 33+-3 days. The dose range extended from 3.2 to 47.2 rads for neutrons and from 18 to 141 rads for γ rays.

This experiment was aimed at assessing relative biological effectiveness (RBE) and its possible dose dependence from radiation mortality and morbidity data, using actuarial statistics. The primary goal was to define the spontaneous or basic tumour spectrum in control animals of either sex, which included a major proportion of lymphocytic lymphomas, followed by reticulum cell lymphomas. A variety of other tumours were observed, among them various adenocarcinomas, squamous cell carcinomas and leiomyosarcomas of the gastrointestinal tract, liver and spleen hemangiomas, micro- and macrofollicular hyperplasia as well as papillary adenomas of the thyroid, fibromas and fibrosarcomas of connective tissue, muscles and bones, myomas and fibrosarcomas of uterus, luteomas and cysts of the ovary, papillary and transitional cell carcinomas of kidneys and an occasional mammary adenocarcinoma or skin epithelioma. Modulation of the basic tumour pattern by neutrons or cobalt was primarily operative on the reticular tissue. Age-specific incidence rates for combined mature and immature lymphocytic lymphomas decreased following neutron or cobalt irradiation at higher dose levels. In reticulum cell sarcomas, however, the tumour type evidently shifted almost entirely from the mature to the immature type. Furthermore, all rates increased markedly following irradiation at all dose levels. One major finding in all groups was the non-linearity of tumour response. Furthermore, it appeared that the control as well as the radiation-modulated tumour spectra were likely to proceed from intercompetitive stochastic processes rather than from some probabilistic random distribution. Some implications of these primary results are discussed.

- 2165 INTERSPECIES COMPARISON OF RESPONSES OF MICE AND DOGS TO CONTINUOUS ^{60}Co γ IRRADIATION. Norris, W.P.; Tyler, S.A.; Sacher, G.A. (Argonne National Lab., Ill. (USA)). pp v.1 p.147-155 of Biological and environmental effects of low-level radiation. Vienna; IAEA (1976).

From Symposium on biological effects of low-level radiation pertinent to protection of man and his environment; Chicago, Ill., USA (3 Nov 1975).

Young-adult purebred beagle dogs were exposed continuously, 22h/d, to ^{60}Co γ rays until they died. The daily dose rates ranged from 3.5 to 210 rad. At 3.5 rad/d the mean survival time was in excess of 1860 days (the study was still in progress in Nov.1975), while at 210 rad/d mean survival time was 13 days. The data are compared with those from previously published information from similarly irradiated mice. The comparison is made in terms of radiation-specific death rate, defined as $1/\text{MASsub}(i) - 1/\text{MASsub}(c)$, where $\text{MASsub}(i)$ and $\text{MASsub}(c)$ are the mean after-survival times of the irradiated and control populations, respectively. In both species, when log radiation-specific death rate is plotted against log dose rate, the response has a slope=2, i.e. the death rate increases with the square of dose rate. This occurs over the entire dose rate range where damage to haematopoietic tissues is the primary cause of death. In the mouse, at daily dose rates below 20 rad/d, haematopoietic injury is no longer a primary cause of death and the response curve shifts to slope=1 where injury is dependent only on total accumulated dose and is independent of dose rate. The data available so far suggest that a similar inflection may occur with the dog at dose rates below 3.5 rad/d. An experiment is being initiated to determine whether this will be the case. Statistical considerations, essential to the design of the

study, are presented.

- 166 EFFECT OF INSTANTANEOUS DOSE RATE ON SURVIVAL TIME OF MICE. Willhoit, D.G.; Wiggins, S.M. (North Carolina Univ., Chapel Hill (USA)). pp v.1 p.93-101 of Biological and environmental effects of low-level radiation. Vienna; IAEA (1976).

From Symposium on biological effects of low-level radiation pertinent to protection of man and his environment; Chicago, Ill., USA (3 Nov 1975).

The effect of instantaneous dose rate on the survival time of mice was studied for groups of LAF₁ mice receiving weekly γ radiation exposures, for duration of life, ranging from 150 to 300 R at instantaneous dose rates of 0.1, 1, 10 and 100 R/min. Two additional groups were irradiated at 100 R/min with weekly exposures of 150 and 250 R in which the dose was delivered in two equal fractions two hours apart. The range of weekly doses was selected with the anticipation that mean survival times would be in the range of 200 to 250 days, since the deaths associated with survival times in this range are due to tumours, leukaemia and degenerative diseases. The cause of death was not determined in this study since the primary purpose was to obtain survival time data from which leukaemia dose-rate studies could be designed. For comparison of the relative effectiveness of the instantaneous dose rates, the log median survival times were plotted as a function of weekly dose. The weekly dose to yield a median survival time of 200 days was determined, by interpolation, to be 228, 193 and 173 R/week for instantaneous dose rates of 0.1, 10 and 100 R/min, respectively. The results from the two groups which received the weekly dose in two fractions, separated by an interval of two hours, indicated a decrease in effectiveness equivalent to about 24% of the initial fraction. Similar comparisons between the 0.1 and 10 R/min groups and the 0.1 and 100 R/min groups indicated differences in effectiveness of 35 and 55 rad/fraction, respectively. It was concluded that the recovery kinetics operating during prolonged fractionation regimes have a dependence on instantaneous dose rate quantitatively similar to that observed in short-term LD_{50/30} studies.

- 2167 SPONTANEOUS AND EVOKED CEREBRAL ACTIVITY MODIFICATIONS ON WHOLE-BODY γ IRRADIATED ADULT RABBIT. Court, L.; Dufour, R.; Bassant, M.H.; Fatome, M. (CEA Centre d'Etudes Nucleaires de Fontenay-aux-Roses, 92 (France). Dept. de Protection; Centre de Recherches du Service de Sante des Armees, Centre d'Etudes Nucleaires de Fontenay-aux-Roses, 92 (France)). Radioprotection; 11: No. 2, 87-102(1976). (In French).

From Seminar on radiobiology; Fontenay-aux-Roses, France (29 Apr 1975).

Whole-body γ -exposure from 150 to 850 rads (dose-rate: 14 rads.min⁻¹) delivered to adult rabbits chronically implanted with electrodes resulted in prompt and delayed changes of behavior, arousal and spontaneous and evoked electrical activities. Electrophysiological techniques of polygraphic recording and signal processing showed that the alterations were related to the absorbed dose. The threshold dose accompanied with transient changes of arousal should be in the range of 50 to 100 rads; below this range, to the exclusion of some possible behavior changes, exposure should act as a stimulation that would become nociceptive at higher doses only.

- 2168 RELATIONSHIP BETWEEN X-RAY IRRADIATION AND CHROMOSOMAL DAMAGE IN BONE MARROW TISSUE OF MICE. Chaubey, R.C.; George, K.P.; Sundaram, K. (Bhabha Atomic Research Centre, Bombay (India). Bio-medical Group). pp 205-222 of Proceedings of the symposium on structural and functional aspects of chromosomes, Bombay, March 25-26, 1975. Bombay; Department of Atomic Energy (1976).

From Symposium on structural and functional aspects of chromosomes; Bombay, India (25 Mar 1976).

15 refs., 10 figures.

X-ray induced chromosomal damage in bone-marrow tissue of male mice was studied using micronucleus technique. Dose response relationship was evaluated. Male Swiss mice received whole body x-ray irradiation at different doses from 25-1000 rads. Animals were sacrificed at the end of 24 hours, bone-marrow smears were made and stained in May-Grunwald-Giemsa. The preparations were scored for the following types of aberrations: micronuclei in young erythrocytes-polychromatic cells and in the mature erythrocytes-normochromatic cells. A dose dependent increase in the frequency of micronuclei in polychromatic cells up to a dose of 100 rads was observed. In addition the effect of post-irradiation duration on the frequency of micronuclei in polychromatic and normochromatic cells were studied. Male Swiss mice were exposed to 200 rads x-rays and were then sacrificed at different time intervals after irradiation and bone-marrow preparations were made and scored. Maximum polychromatic cells with micronuclei were observed in 24 hours post-irradiated animals, thereafter a decrease in the frequency of polychromatic cells with micronuclei was observed in 40 hours post irradiated animals. (author).

- 2169 MODIFICATION OF DEATH RATE OF IRRADIATED MICE BY B.C.G. Allain, P.; Chaleil, D.; Maingot, D. (Centre Hospitalier Universitaire, 49 - Angers (France)); Larra, F. (Centre de Lutte contre le Cancer Paul-Papin, 49 - Angers (France)). C. R. Soc. Biol.; 170: No. 1, 31-36(1976). (In French).

Freeze-dried Bacillus Calmette Guerin (BCG) of Institut Pasteur was given by intravenous route to mice at 1,2 and 4mg/kg before and after γ irradiation of animals by 1000 rad. B.C.G. 1 mg/kg injected the day or the day after irradiation has a protective effect (mortality reduced from 77% for controls to 58% and 50% for treated mice). B.C.G. given before irradiation in single or double doses increased mortality.

- 2170 USE OF PULMONARY MACROPHAGES AS INDICATOR OF RADIATION EXPOSURE. Gensicke, F.; Grigoroff, L.A. (Staatliches Amt fuer Atomsicherheit und Strahlenschutz, Berlin (German Democratic Republic)). Radiobiol. Radiother.; 17: No. 2, 265-268(1976). (In German).

After a single whole-body x irradiation of rats with 50, 100, 200, and 300 rad, pulmonary macrophages were obtained by endobronchial lavages after 3 and 24 hours. The mitotic index in the macrophage population and percentage frequency of the cells with aberrations were determined. At both times the results show a high decrease of the mitotic index with increasing dose. Three hours after doses of 50 rad only a stimulating effect is observed. The number of cells with aberrations increases 3 and 24 hours after irradiation with increasing dose. With time going on after irradiation with doses between 100 and 250 rad a reduction of aberrant cells is observed. After about 300 rad the number of cells with aberrations increases

essentially more whereas the time-dependent differences are reduced. The results show that pulmonary macrophages can be used for the demonstration of radiation damages.

rate of 25 to 100 R/day, the decrease in the DNP content over the investigated period proved irreversible. The observed data were compared with the changes in the DNP concentration and the weight of the organs.

- 2171 IN VIVO SURVIVAL OF GERM CELLS IN MALE RATS: APPLICATION TO THE ANALYSIS OF THE EFFECTS OF LOW DOSES. MODEL. Lemaire, Guy; Grillon, Gerard (CEA Centre d'Etudes Nucleaires de Fontenay-aux-Roses, 92 (France). Dept. de Protection). pp 103-140 of Concepts of low doses of ionizing radiation in radiation biology and protection. Vol. 2. Cayet-Pennaneac'h, D. (ed.). Montrouge; Societe Francaise de Radioprotection (1976). (In French)

From 2. Seminar on radiobiology; Fontenay-aux-Roses, France (29 Apr 1975).

Gonadal weight involution of male rats after whole-body irradiation may be used to determine in vivo survival of germ cells. The method is applied to the analysis of low doses.

- 2172 (ERDA-tr--210, pp 11-16) DNA REPAIR, CHANGE IN THE DNA POLYMERASE AND DNA LIGASE ACTIVITIES IN THE REGENERATING LIVER OF GAMMA-IRRADIATED RATS. Zakrzhevskaya, D.T.; Vtyurin, N.N.; Gaziev, A.I. (Inst. of Biological Physics, Pushchino, USSR). 1976. Translated from Radiobiologiya; 16: No. 2, 171-174(1976).

Radiobiology. It was shown that in the regenerating liver of γ -irradiated rats, in a period of 3 hrs after irradiation, an incomplete repair of single-stranded breaks in DNA is observed. By 5 to 10 hrs after irradiation, the repair of breaks in DNA is not recorded, and a decrease in the activity of DNA polymerase and DNA ligase is observed. The change in the enzymes in the regenerating liver is correlated with the effectiveness of DNA repair and is not associated with the appearance of an inhibiting factor.

- 2173 (ERDA-tr--210, pp 17-22) INVESTIGATION OF THE PROCESS OF TRANSCRIPTION IN THYMUS CELLS OF RATS SUBJECTED TO X IRRADIATION. COMMUNICATION 2. INFLUENCE OF EXOGENOUS DEOXYRIBONUCLEIC ACIDS ON THE HYBRIDIZATION OF NUCLEAR RNA WITH REPETITIVE AND UNIQUE DNA SEQUENCES. Zhivotovskii, B.D.; Khanson, K.P. (Central Roentgeno-Radiological Scientific Research Inst., Leningrad). 1976. Translated from Radiobiologiya; 16: No. 2, 175-178(1976).

Radiobiology. The hybridization of heterogeneous nuclear RNA (hnRNA) of rat thymus cells, stimulated by PHA, under conditions of the reaction with a large excess of DNA, was studied. It was shown that x-irradiation of the animals at a dose of 40 rad suppresses the hydrolyzability of the hnRNA of the thymocytes in culture. The introduction of 2.5 μ g/ml exogenous nuclear and mitochondrial DNA into the medium does not lead to normalization of the process studied.

- 2174 (ERDA-tr--210, pp 43-49) CHANGE IN THE CONTENT OF DEOXYRIBONUCLEOPROTEIN IN THE RAT SPLEEN AND THYMUS IN THE CASE OF CHRONIC GAMMA IRRADIATION. Misurova, E.; Frasliska, M.; Mackova, N. (Inst. of General Biology, Kosice, Czech.). 1976. Translated from Radiobiologiya; 16: No. 2, 195-199(1976).

Radiobiology. Chronic irradiation of rats at dose rates up to 10 R/day, in 60 days of irradiation, produced only a temporary decrease in the content of deoxyribonucleoproteins (DNP) in the spleen and thymus; in the case of irradiation at a dose

- 2175 (ERDA-tr--210, pp 61-65) CHEMILUMINESCENCE OF LIVER MITOCHONDRIA OF RATS IRRADIATED WITH FAST NEUTRONS. Druzhina, N.A.; Chebotarev, E.E.; Ryabova, E.Z.; Serkiz, Ya.I. (Inst. of Problems of Oncology, Kiev). 1976. Translated from Radiobiologiya; 16: No. 2, 209-212(1976).

Radiobiology. The chemiluminescence of the liver mitochondria of rats irradiated with fast neutrons was studied in the work. Luminescence was induced with ferrous ions. The kinetics of the development of luminescence of the mitochondria during the early periods after irradiation (1 to 6 days) was demonstrated. As the development of radiation sickness progressed, an exponential increase in the intensity of the rapid flash was noted. Dilution of the mitochondria to a definite level leads to a decrease in the "radiation effect."

- 2176 (ERDA-tr--210, pp 66-72) RESTORATION OF THE NUMBER OF COLONY FORMING UNITS IN THE BONE MARROW AND SPLEEN OF DNA-TREATED IRRADIATED MICE. Luzanov, V.M. 1976. Translated from Radiobiologiya; 16: No. 2, 213-217(1976).

Radiobiology. It was shown by methods of endogenous and exogenous colonies that the introduction of isologous DNA promoted a more intensive restoration of the number of colony-forming units (CFU) in irradiated mice. Probably such an action of exogenous DNA occurs on account of an intensification of the proliferative activity of the CFU and an increase in their migration from the bone marrow into the spleen. The optimum doses of DNA were 0.3 to 0.7 mg per mouse.

- 2177 (ERDA-tr--210, pp 73-78) INFLUENCE OF CERTAIN BIOLOGICALLY ACTIVE PREPARATIONS ON A POPULATION OF CELLS OF THE STEM FRACTION OF HEMOPOIESIS AND ON THE SURVIVAL OF IRRADIATED MICE. COMMUNICATION 3. INTERFERON. Semina, O.V.; Neifakh, Yu.A.; Soboleva, E.L.; Konoplyannikov, A.G.; Poverennyi, A.M. (Scientific Research Inst. of Medical Radiology, Obninsk, USSR). 1976. Translated from Radiobiologiya; 16: No. 2, 218-222(1976).

Radiobiology. It has been established that when animals are administered partially purified exogenous interferon two days before irradiation, the yield of endogenous spleen colonies is increased, and the survival of the irradiated mice is increased. Incubation of a suspension of bone marrow cells of mice with interferon leads to a decrease in the yield of exogenous spleen colonies. Evidently such an action of interferon is associated with its influence on the cell cycle of the CFU. It is suggested that a great role in the mechanism of the action of poly I:C on a cell population of the stem fraction of hemopoiesis is played by the level of endogenous interferon.

- 2178 (ERDA-tr--210, pp 100-105) CERTAIN BIOCHEMICAL EFFECTS OF PARTIAL IRRADIATION OF THE ORGANISM UNDER THE COMBINED ACTION OF RADIATION. Matyushichev, V.B.; Taratukhin, V.R.; Yuzhakova, G.A. 1976. Translated from Radiobiologiya; 16: No. 2, 239-242(1976).

Radiobiology. The influence of x-irradiation at a dose of 50 R (total,

irradiation of the anterior third or posterior two-thirds of the body), as well as external β irradiation with ^{85}Kr at a dose of 3.05 krad, used separately and in combinations, on the ATPase and creatin kinase activity of aqueous extracts from the brain, liver, and spleen tissue of rats 5, 12, 19, and 26 days after irradiation was investigated. It was shown that under the conditions selected, the partial radiation loads are entirely comparable in their biochemical effectiveness with the effect of whole-body irradiation. Combined irradiation as a whole was less effective than separate irradiation.

- 2179 (ERDA-tr--210, pp 114-119) PECULIARITIES OF THE TOXICITY AND RADIOPROTECTIVE ACTIVITY OF AMINOPROPYL AMINOETHYL THIOPHOSPHATE. Terekhov, A.V.; Besedina, L.N.; Zharebchenko, P.G.; Znamenskii, V.V.; Suslikov, V.I.; Titov, B.A. 1976. Translated from Radiobiologiya; 16: No. 2, 249-252(1976).

Radiobiology. The toxicity and radioprotective activity of aminopropyl aminoethyl thiophosphate (APAETP) were studied in the work in comparison with cystaphos. It was shown that APAETP somewhat surpasses cystaphos in magnitude of the radioprotective effect, but in duration of action in the case of intraperitoneal injection, it is inferior to the latter. APAETP, in contrast to cystaphos and other sulfur-containing radioprotectors, does not cause spastic reactions in animals in toxic doses. The median lethal dose of APAETP in the molar expression is 1.5 times lower, and the optimum radioprotective dose almost three times lower than for cystaphos. Consequently, APAETP has almost twice the latitude of radioprotective action of cystaphos. APAETP, like cystaphos, exhibits a pronounced radioprotective effect not only at a high dose rate of γ radiation (355 R/min), but also at a comparatively low dose rate (10.7 R/min).

- 2180 (ERDA-tr--227, pp 24-30) EFFECTS OF PROLONGED EXPOSURE TO DIVIDED DOSES OF RADIATION ON LEVELS AND BIOSYNTHESIS OF NUCLEIC ACIDS IN THE RAT THYMUS. Kisel'gov, E.I.; Mushkacheva, G.S. 1976. Translated from Radiobiologiya; 16: No. 4, 502-507(1976).

Radiobiology. Repeated daily exposure of rats to 50 R radiation for 2.5 months resulted in decreased weight of thymus, decreased number of cells and nucleic acid content per gram tissue. The rate of DNA biosynthesis was increased, starting with a cumulative dose of 250 R. The intensity of tracer uptake in RNA was at the control level up to a cumulative dose of 1500 R and thereafter it showed a 50 percent decrease. The demonstrated changes in nucleic acid metabolism are indicative of a change in proliferation and differentiation of thymus cells after repeated exposure to divided doses of radiation.

- 2181 TRITIUM TOXICITY: INCREASED RELATIVE BIOLOGICAL EFFECTIVENESS OF ^3HOH WITH PROTRACTION OF EXPOSURE. Dobson, R.L.; Arrington, J.H.; Kwan, T.C. (Univ. of California, Livermore). pp 349-353 of Radioecology and energy resources. Cushing, C.E. Jr. (ed.). New York; Halsted Press (1976).

From 4. national symposium on radioecology; Corvallis, OR, USA (12 May 1975).

See CONF-750503--.

Concern with environmental tritium from nuclear energy operations relates primarily to possible effects of chronic, low-level exposure to ^3HOH . However, direct data on such exposure

are very limited. Information on protracted irradiation comes chiefly from gamma-ray studies, while data for tritium are mostly from higher-level, more acute exposures. Consequently, for realistic evaluation of potential ecological impact and biological hazard, it is necessary to examine, in these contrasting exposure conditions, tritium's relative biological effectiveness (RBE) compared to gamma rays. This is all the more important since tritium's RBE has been found not to be constant, but to rise at low doses. Such a study is reported here. Weanling mice were exposed to ^3HOH in body water at 20 $\mu\text{Ci/ml}$ for 5 days, receiving beta radiation to cells at 4.1 rads/day. Surviving primary oocytes were counted microscopically in ovaries and compared to controls; survival was 43 percent. For comparison, other weanlings were exposed to ^{60}Co gamma irradiation at 5.9 rads/day. Oocyte survival was again 43 percent. Comparison of the dose-responses indicated an RBE for tritium of 1.4. This contrasts with 2.0 found previously (at the same effective dose of gamma rays) in 14-day-old mice given continuous, protracted exposure from conception. Although the lower RBE found with short-term exposures may be due to the higher dose rates used, experimental and theoretical evidence questions this. Alternatively, the higher RBE with protracted exposure may reflect more effective microdistribution of tritium atoms within cells, from the longer time available for metabolic turn-over and incorporation. These results indicate that ^3HOH becomes increasingly more damaging compared to gamma rays when exposure is low-level and protracted. This has special significance from the standpoint of both health and environmental protection.

- 2182 WORKSHOP: RES-RADIOBIOLOGY AND ENVIRONMENTAL FACTORS. Flemming, K. (Univ. of Freiberg i.B., Ger.); Reichard, S.; Escobar, M. pp 437-440 of Reticuloendothelial system in health and disease: immunologic and pathologic aspects. Friedman, H. (ed.). New York; Plenum Press (1976).

From 7. international congress of the Reticuloendothelial Society; Pamplona, Spain (15 Sep 1975).

See CONF-7509172--P2; CONF-7509173--P2.

A phagocytic increase was observed in mice following whole-body x irradiation. This increase was thought to be derived from bacterial endotoxins or lipopolysaccharides that enter the blood through the damaged intestinal mucosa. To determine whether macrophages were injured by radiation the response of mice to phagocytosis-stimulating drugs, lipopolysaccharides, olive oil, triolein, was studied before and after irradiation. Results showed that the effectiveness of the drugs was reduced and it was concluded that activity of macrophages was depressed following whole-body irradiation. (HLW)

- 2183 PHYSIOLOGIC MECHANISMS IN RADIATION RESISTANCE. Reichard, S.M. (Medical Coll. of Georgia, Augusta). pp 440-443 of Reticuloendothelial system in health and disease: immunologic and pathologic aspects. Friedman, H. (ed.). New York; Plenum Press (1976).

From 7. international congress of the Reticuloendothelial Society; Pamplona, Spain (15 Sep 1975).

See CONF-7509172--P2; CONF-7509173--P2.

Some topics discussed are as follows: role of the reticuloendothelial system in the regeneration of the hematopoietic system;

- uptake of colloidal agents by liver and spleen cells following graded doses of x radiation; effects of x radiation on peritoneal macrophages of rats; stimulation of phagocytic activity of the reticuloendothelial system by estrogens, serum albumin, and bacterial endotoxins; and sequestration of particulate material within the reticuloendothelial organs following x irradiation. (HLW)
- 2184 (ERDA-tr--210, pp 147-151) PECULIARITIES OF THE DYNAMICS OF CERTAIN COUPLED ENZYMES OF AMINO NITROGEN METABOLISM IN THE LIVER OF THE IRRADIATED ORGANISM. Savitskii, V.I. (Odessa Medical Inst.). 1976. Translated from Radiobiologiya; 16: No. 2, 272-275(1976).
Radiobiology. The dynamics of five enzymes involved in amino nitrogen metabolism during the post radiation period as well as their intracellular distribution in the liver were studied in whole-body x irradiated rabbits. The data presented are evidence not only of definite changes in the activity of the investigated enzymes of amino nitrogen metabolism and their subcellular organization but also of time peculiarities in the changes in the activities of these enzymes, and to a definite degree, of a directedness of the reactions catalyzed by them. (ERB)
- 2185 (ERDA-tr--210, pp 157-162) FREQUENCY OF CHROMOSOME ABERRATIONS IN THE GERM CELLS OF MICE UNDER THE CHRONIC INFLUENCE OF GAMMA RAYS AT LOW DOSES. Bikkulov, R.I. (Leningrad Scientific Research Inst. of Radiation Hygiene). 1976. Translated from Radiobiologiya; 16: No. 2, 279-282(1976).
Radiobiology. The mutagenic aftereffects of multimonth irradiation, simulating radiation influences under occupational conditions were studied. It was found that in the case of chronic irradiation, simulating radiation influences under occupational conditions, the changes in the frequency of chromosome aberrations in the germ cells of mice depend on the age of the animals and the daily dose rate. A dependence on the value of the summary dose, on the other hand, is observed in the second age period, when an age increase in the frequency of chromosome aberrations is also noted for the control animals. (ERB)
- 2186 (ERDA-tr--210, pp 192-195) DEPENDENCE OF THE RESPONSE OF THE PITUITARY-ADRENAL CORTEX SYSTEM ON THE CONDITIONS OF THE INFLUENCE OF IONIZING RADIATION AT LOW DOSES. Taits, M.Yu.; Dudina, T.V. (Inst. of Physiology, Minsk). 1976. Translated from Radiobiologiya; 16: No. 2, 301-304(1976).
Radiobiology. The dynamics of the level of corticosterone in the peripheral blood plasma of animals after single, fractionated, and chronic influences of ionizing radiation in low doses were studied. It was found that under the influence of a chronic action of ionizing radiation at relatively low doses, in irradiated animals there are changes in the functional activity of the hypothalamo-pituitary-adrenal cortex system, determined chiefly by the state of its hypothalamo-pituitary link. (ERB)
- 2187 (ERDA-tr--227, pp 114-119) LONG-TERM SEQUELAE IN RATS OF EXTERNAL, LOW DOSE BETA RADIATION. Moskalev, Yu.I.; Shelesnova, V.I. 1976. Translated from Radiobiologiya; 16: No. 4, 576-580(1976).
Radiobiology. Exposure of mongrel, white female rats to whole-body radiation using ^{90}Sr - ^{90}Y β -rays in doses of 100, 200 and 400 rad increases the incidence and rate of development of benign and malignant tumors of the mammary gland and skin, without affecting mean survival time. The overall incidence of mammary gland tumors per rad constituted 0.09 percent, that of carcinoma of the mammary gland and skin, 0.0195 and 0.017 percent, respectively.
- 2188 (ERDA-tr--227, pp 120-126) MECHANISM OF DELETERIOUS EFFECT OF IONIZING RADIATION ON THE FETUS AND THE PROGENY. Kuz'mina, T.D. 1976. Translated from Radiobiologiya; 16: No. 4, 581-586(1976).
Radiobiology. It was established, in experiments on sheep exposed to 550 R γ rays and rats given 0.4 $\mu\text{Ci/Gm}$ ^{131}I , that along with antitissular antibodies to internal organs, irradiated pregnant animals develop antibodies to placental tissue. Administration of homologous and heterologous antiplacental antibodies to nonirradiated pregnant rats increases placental permeability to dyes and autoantibodies. Antitissular antibodies, including antiplacental ones, are transmitted to the offspring, not only through the placental barrier, but with ingestion of milk of an irradiated female.
- 2189 (ERDA-tr--227, pp 168-172) DIFFERENTIATION CAPACITY OF HEMOPOIETIC STEM CELLS AS RELATED TO DIFFERENT RADIATION DOSES. Shvets, V.N. 1976. Translated from Radiobiologiya; 16: No. 4, 618-622(1976).
Radiobiology. The objective of the present work was to make a comparative study of differentiation capacity of CFU in mice exposed to brief, prolonged and chronic radiation in the same dosage, 600 R. Differentiation of CFU in the direction of the three main types of hemopoiesis is rather similar after brief irradiation for 2 to 16 min and prolonged exposure for 2 to 12 days. The only exception was referable to precursor cells of erythropoiesis and myelopoiesis in mice irradiated at the rate of 300 and 50 R/day. In both instances, there was a reliable decrease in erythropoietic capability of stem cells, and with exposure at the rate of 300 R/day, of granulopoietic capacity as well, in stem cells settling in the recipient spleen. In the case of brief exposure at rates of 300 and 37 R/min, we merely observed a tendency toward diminished capacity of stem cells to form erythroid colonies in the recipient spleen. In the case of chronic irradiation at the rates of 10 and 2.5 R/day, differentiation of stem cells proliferating in both the spleen and bone marrow did not differ from differentiation of stem cells in intact animals. Thus, brief irradiation was associated with only a tendency toward diminished erythropoietic capacities of CFU, whereas prolonged exposure led to a reliable decrease in such capacities. Brief and prolonged radiation differed only with regard to effects on erythroid precursors, whereas both types of radiation had the same effect on thrombopoietic precursor cells, enhancing their capacity to form megakaryocyte colonies. However, it should be borne in mind that impairment of CFU differentiation under the influence of brief and prolonged radiation occurred only in the population of stem cells that settled in the recipient spleen. Those that settled in bone marrow did not show a change in nature of differentiation, regardless of radiation dose rate.
- 2190 (ERDA-tr--227, pp 179-193) EFFECTS OF

CHRONIC LOW DOSE GAMMA RADIATION ON THE COURSE OF CANDIDIASIS IN ALBINO RATS. Berchev, K.; Krushkov, I. (Scientific Research Inst. of Radiobiology and Radiation Hygiene, Sofia). 1976. Translated from Radiobiologiya; 16: No. 4, 627-631(1976).

Radiobiology. Small doses of ionizing radiation lead to microstructural lesions in the organism, which are not demonstrable with the existing investigative methods due to the compensatory capabilities of physiological and pathological repair. If, however, the organism submitted to small doses of chronic irradiation is exposed to increased loads (infection, fatigue, pregnancy, lactation, etc.), the compensatory reserves of different tissues, organs and systems, and their adaptational capabilities are impaired and depleted, and then the injurious effects of ionizing radiation become more prominent. Development of candidiasis in rats chronically exposed to small doses of radiation was investigated in order to assess both the reactivity of the irradiated macroorganism and conditions generated for development of conditionally pathogenic microorganisms, such as candida. On the basis of the demonstrated changes in animals infected with a candidal culture and previously exposed to small doses of γ rays, it is concluded that the developing candidemia rapidly leads to a state of cardiovascular insufficiency with interstitial and perivascular edema, dystrophic changes in parenchymatous organs that are most pronounced. The animals present considerably poorer resistance to candidal infection, for this reason there is no cellular reaction and no candidal granulomas develop in animals that die by the 4th day. A comparison to animals infected with candidal culture but not irradiated shows that the organism lyses bacteria, and only one rat developed candidal granuloma; it died primarily of renal insufficiency.

- 2191 GENETIC RISK AT LOW DOSES. Vignes, S. (Electricite de France, 75 - Paris). pp 361-371 of Biological and environmental effects of low-level radiation. II. Vienna; IAEA (1976). (In French)

From Symposium on biological effects of low-level radiation pertinent to protection of man and his environment; Chicago, Ill., USA (3 Nov 1975).

How are we to assess the genetic risk to man resulting from exposure to low doses of irradiation from the environment of nuclear power plants. The team of Brewen and Preston showed that there was a decrease by a factor of four in the rate of chromosomal aberrations existing in germinal cell line as compared with somatic cell (leukocyte) line. They subsequently demonstrated the importance of the selection process taking place at the time of gametogenesis. However, their study went only as far as a 50-rem dose. Applying fractionation of a 275-rem dose (55 daily sessions of 5 rem each), Sheridan was unable to induce in mice either dominant or recessive mutations in quantities greater than in the controls; the recessives would appear to have been fewer, but the difference was not significant. Nor did experiments by various teams involving systematic irradiation (either chronic or acute) of several tens of generations of mice and rats succeed in producing mutants over the different generations. In order to affect fertility and also mortality before weaning, it is necessary to achieve single doses of the order of 500 rem. Results of this kind, which show the existence of both repair and selection, are reassuring, although they are obtained at dose rates that have nothing in

common with those which are relevant to the environment. They support the assumption that no deleterious effect is present in the latter case.

- 2192 STUDY OF THE DIELECTRIC PARAMETERS OF BLOOD PLASMA OF RATS PROTECTED BY ADETURONE AND EXPOSED TO X RAYS. Bancheva, E. (Nauchno-Izslodovatel'ski Inst. po Radiologiya i Radiatsionna Khigiena, Sofia (Bulgaria)). Rentgenol. Radiol.; 15: No. 1, 22-26(1976). (In Bulgarian).

The frequency dispersion of the dielectric parameters of the blood plasma of rats protected with adeturone (S-2-aminoethyl-isothiuronium bromide hydrobromide adenosine triphosphate) and X-irradiated with doses of 200 R, 400 R and 600 R in the spectral interval 0,6 MHz - 3,5 MHz was studied. Electric conduction and plasma dielectric constant were measured by means of alternate current admittance measurer type SWM-2 on the first, third and tenth day after cessation of irradiation. The results of this study on the effect of ionizing radiation on the dielectric parameters of blood plasma of irradiated rats are analyzed and the possible mechanism of action of adeturone discussed.

- 2193 INFLUENCE OF ADETURONE ON THE RADIATION INJURY IN TWO MICE STRAIN EXPOSED TO CHRONIC GAMMA IRRADIATION. Nikolov, I.; Pantev, T.; Bajrakova, A.; Pavlova, V.; Kirov, Ch. (Nauchno-Izslodovatel'ski Inst. po Radiologiya i Radiatsionna Khigiena, Sofia (Bulgaria)). Rentgenol. Radiol.; 15: No. 3, 165-169(1976). (In Bulgarian).

The radioprotective properties of adeturone (adenosine triphosphate salt of AET), on chronically irradiated mice of lines C57BL and H were studied. The experimental and control animals were gamma-irradiated (226-radium) with a dose rate of 1.0 $\pm$ 0.1 R per hour. The total dose for C57BL mice was 600 R (for 26 days) and for H mice - 900 R (for 39 days). During the irradiation the experimental animals were given a daily dose of 300 mg of adeturone. Once the irradiation course was completed, the content of nucleic acids (NA) in peripheral blood leucocytic mass was determined. The changes in the leucocyte counts and the white blood formula were repeatedly checked up from the onset of irradiation till the 170th day. There was a statistically significant rise in the blood NA concentration in adeturone-protected animals, as compared with control ones. Radiation leucopenia was essentially milder in mice receiving daily adeturone. After completion of the radiation course the leucocyte counts returned to normal for a much shorter period in adeturone-treated animals than in the control ones.

- 2194 GENETIC EFFECTS OF IONIZING RADIATIONS IN EUKARYOCYTES. Jullien, P. (Institut du Radium, 91 - Orsay (France)). pp 65-79 of Les concepts de faible dose de rayonnements ionisants en radiobiologie et en radioprotection. 2. Cayet-Pennaneac'h, D. (ed.). Mont rouge; Societe Francaise de Radioprotection (1976). (In French)

From 2. Seminar on radiobiology; Fontenay-aux-Roses, France (29 Apr 1975).

The literature on the genetic effects of ionizing radiations is reviewed, especially as concerns specific loci or chromosome mutations. Extrapolation from one species to another is considered as well as extra-nuclear mutations.

- 2195 CHROMOSOME ABERRATIONS INDUCED IN MOUSE

SPERMATOGONIA BY EXPOSURE TO NEUTRONS OF VERY HIGH ENERGY. Pecrot, M.; Wambersie, A.; Meulders, J. (Louvain Univ. (Belgium)); Leonard, A. (Centre d'Etude de l'Energie Nucleaire, Mol (Belgium)). C. R. Soc. Biol.; 170: No. 2, 474-476(1976). (In French).

The incidence of reciprocal translocations induced in mouse spermatogonia has been studied in CBA mice given X-ray or neutron exposure. Analysis of dividing spermatocytes at diakinesis-first metaphase stage of meiosis shows that in X-irradiated mice there is a linear dose-response relationship. After exposure to fast neutrons the yield of translocations follows a humped curve with a maximum of chromosome exchanges after exposure to 100 rad.

2196 BIOPHYSICAL MODEL AND LOW DOSES.

Parmentier, N. (CEA Centre d'Etudes Nucleaires de Fontenay-aux-Roses, 92 (France). Dept. de Protection). pp 43-55 of Concepts of low doses of ionizing radiation in radiation biology and protection. II. Cayet-Pennaneac'h, O. (ed.). Montrouge; Societe Francaise de Radioprotection (1976). (In French)

From 2. Seminar on radiobiology; Fontenay-aux-Roses, France (29 Apr 1975).

Many models have attempted to explain the mode of action of radiations, especially in the case of cellular death. Two examples of dose-effect relationships (chromosome aberrations, survival curves) are given as an illustration.

2197 (ERDA-tr--222) RADIOBIOLOGY.

Translation of Radiobiologiya; 16: No. 3, 323-480(1976). 204p. Dep. NTIS \$7.75.

Separate abstracts were prepared for the 37 papers presented in this English translation of Radiobiologiya. Reviews of three books are also presented. (HLW)

2198 (ERDA-tr--222, pp 14-20) INCORPORATION OF EXOGENOUS DNA IN TISSUE OF IRRADIATED ANIMALS. Rusinova, G.G.; Libinon, R.E. 1976. Translated from Radiobiologiya; 16: No. 3, 333-338(1976).

Radiobiology. Exposure of rats to γ -rays in doses of 100, 300 and 800 R inhibited incorporation of exogenous, homologous ^3H -DNA administered immediately after irradiation into bone marrow, spleen and mucosa of the small intestine at the rate of 1 Gm tissue per cell. As compared to immediate administration of the biopolymer after exposure to ionizing radiation, later administration led to increased uptake of the biopolymer by bone marrow and mucosa of the small intestine, as determined per cell.

2199 (ERDA-tr--222, pp 38-42) INHIBITORY EFFECT OF BLOOD SERUM FROM IRRADIATED ANIMALS ON IN VITRO INCORPORATION OF ^3H -THYMIDINE IN RAT THYMOCYTE DNA. Sizhenikina, L.V.; Mikhaillets, L.P.; Kuzin, A.M. (Inst. of Biological Physics, Pushchino, USSR). 1976. Translated from Radiobiologiya; 16: No. 3, 353-356(1976).

Radiobiology. It was demonstrated that blood serum of irradiated animals (rats, guinea pigs) has an inhibitory effect on incorporation of ^3H -thymidine in DNA of isolated thymocytes of rats. Maximum inhibition was observed 4-8 hours after irradiation of rats, and it was less marked by the 24th hour. It was established that there is a strict correlation between the inhibitory effect and magnitude of dosage in the range of 30-200 R. Studies were pursued to identify the nature of the

inhibitory factor.

2200 (ERDA-tr--222, pp 66-71) EFFECTS OF PROLONGED IRRADIATION AT LOW DAILY DOSE RATES ON HEMOPOIETIC STEM CELLS AND PERIPHERAL BLOOD OF MICE. Praslicka, M.A.; Kalina, I. (Univ., Kosice, Czech.). 1976. Translated from Radiobiologiya; 16: No. 3, 376-380(1976).

Radiobiology. Changes were observed in number of stem cells (CFU--colony forming units), number of bone marrow cells and peripheral blood elements in mice exposed to prolonged (23 hours per day) radiation for 130 days at dose rates of 1, 3, 6 and 10 R per day. It was established that 3 R/day is the critical limit at which a decline of CFU and agranulocytes is observed; 3 to 6 R/day is the critical dose rate at which there is a decrease in medullary cells and thrombocytes. The decline of these indices is constant at a dose rate of 10 R/day. In this case, the number of erythrocytes and agranulocytes does not change, but there is a 60 percent drop of the CFU index.

2201 INTERFERENCE WITH ANTIBODY-FEEDBACK BY IRRADIATION, THYMUS CELLS, THE ALLOGENEIC EFFECT, AND SERUM FACTORS. Sinclair, N.R.S.; Lees, R.K.; Chan, P.L. (Univ. of Western Ontario, London). Adv. Exp. Med. Biol.; 66: 623-633(1976).

Low doses of irradiation, increased number of T cells, increased T cell activity as in the allogeneic effect, or early activation of an in vitro cell-mediated immune response all confer resistance to antibody feedback. In some of these systems, the resistance is directed against immunosuppression by intact IgG antibody whereas suppression by F(ab')_2 antibody is either not changed or increased. These forms of interference with immunosuppression by antibody are explained in terms of an Fc-dependent model for antibody-feedback regulation.

2202 LEUKAEMOGENESIS BY LOW-LEVEL RADIATION. Warren, S.; Gates, O. (New England Deaconess Hospital, Boston, Mass. (USA). Cancer Research Inst.). pp v.1 p.169-180 of Biological and environmental effects of low-level radiation. Vienna; IAEA (1976).

From Symposium on biological effects of low-level radiation pertinent to protection of man and his environment; Chicago, Ill., USA (3 Nov 1975).

Intermittent X radiation administered in 3-R doses for ten successive weeks to RAP mice did not increase the incidence of leukaemia. A total dose of 100 R (10 R weekly) significantly increased the level. A total dose of 300 R (30 R weekly) increased the incidence of leukaemia only slightly but not significantly over that induced by the 100-R total dose. The two leukaemogenic doses of X radiation (100 and 300 R) yielded incidences of leukaemia comparable to those following mean doses of perinatal γ exposure at 200 and 1000 rads. However, continuous lifetime exposure of five successive generations to 30 rads was by far more effective than the higher doses of γ or X radiation. In these wide discrepancies between leukaemogenic effects of equal low doses of γ and X radiation, there are two disparate factors: chronic versus intermittent exposure and the populations at risk - young adult mice versus mice exposed from conception to death. Evidence of a greater sensitivity of immature compared with mature mice is not reflected in the leukaemic incidence or in the projected lifespan of non-leukaemic mice following 1000 rads perinatal γ exposure. Apart from the

possible greater effectiveness of chronic exposure, the importance of indirect effects is suggested by the greatly extended lifespan of the 30-R X-irradiated mice as compared with those receiving 30 rads γ . The force of constitutional factors and/or an inhibitory influence of high doses is apparent in the response of rats (NEDH strain) to whole-body single doses within the range 700 to 1100 R. Single rats, or one of a parabiotic pair thus treated, showed only marginal differences in incidence of leukaemia compared with control rats, and parabiosis alone yielded a comparable incidence of leukaemia.

- 2203 LIPID COMPONENTS OF PLASMA OBTAINED FROM DIFFERENT SITES OF RABBIT CARDIOVASCULAR SYSTEM DURING EXPERIMENTAL ACUTE URAEMIA. Madry, K.; Lutz, W.; Lepertand, R.; Papiernik, E. (Military Medical Academy, Lodz, Poland). *Acta Med. Pol.*; 17: No. 4, 241-247(1976).

It was found that the thymus extract (TFX) administered intraperitoneally in a dose of 0.5 mg in 0.1 mm³ of 0.9 percent NaCl caused in Albino-Swiss mice a statistically significant rise in the activity of lysosomal acid phosphatase (AP) determined by the cytochemical method of Barka and Anderson in peripheral blood neutrophils. TFX prevented radiation-induced (450 r) fall in the number of these cells observed 14 days after radiation exposure. TFX modified, moreover, changes in the activity of this enzyme during radiation exposure. In the irradiated mice in the control group a rise was observed in AP activity, in mice receiving TFX a significant fall in this activity occurred. After 64 days from radiation exposure no statistically significant changes were observed between the control irradiated group and the group receiving TFX.

- 2204 LATE EFFECTS OF IN UTERO EXPOSURE TO CARCINOGENS IN RATS, WITH SPECIAL REFERENCE TO POSTNATAL GROWTH AND TUMORIGENESIS. Naito, Y.; Takizawa, S.; Watanabe, H.; Hirose, F. (Hiroshima Univ.). pp 126-136 of Proceedings of the Hiroshima University. Hiroshima; Research Inst. for Nuclear Medicine and Biology (1976). (In Japanese)

The 15th-day pregnant Wistar/Furth rats were irradiated with 100 rads of x-ray or fast neutrons (14.1 MeV). Fast neutrons were found to be more effective in reducing the number of live-births and in retarding the postnatal growth of the offspring than x-ray. Among the various organs examined, the brain, uterus, spleen and gonads were highly radiosensitive in terms of organ weight. Microscopic examination revealed a marked dysplasia of the ovary in the fast neutron-irradiated rats. Pre-conception irradiation did not cause any deleterious effects on the offspring. No substantial difference was noted on the peripheral blood pictures and on the tumor incidence in rats born from the irradiated female rats. On the other hand, it was noteworthy that N-butyl nitrosourea given transplacentally induced 3 cases of brain tumor. The incidence of leukemia and mammary tumor was significantly higher in the irradiated or carcinogen-treated, pregnant rats.

- 2205 FINE STRUCTURE OF IRRADIATED MOUSE HEART. Yang, V.V.; Stearner, S.P. (Argonne National Lab., IL). pp 184-185 of Thirty-fourth annual meeting, Electron Microscopy Society of America. Bailey, G.W. (ed.). Baton Rouge, LA; Claitor's Publishing Div. (1976).

From 34. Electron Microscopy Society of America annual meeting; Miami Beach, FL, USA (9

Aug 1976).

See CONF-760803--.

Mice were exposed to 240 rad fission neutrons and 788 rad gamma rays and killed at intervals up to 18 months later. Electron microscope studies of the heart showed abnormal capillaries, degenerating muscle fibers, and other ultrastructural changes. Quantitative estimations of myofibrillar and capillary degeneration revealed that damage was most severe at 1 to 3 months in both neutron- and gamma-irradiated groups. (HLW)

- 2206 (ERDA-tr--222, pp 175-178) QUANTITATIVE PATTERNS OF INJURY AND RECOVERY OF BLOOD FOLLOWING SINGLE AND CHRONIC EXTERNAL γ -IRRADIATION. Zapol'skaya, N.A.; Borisova, V.V.; Yakovleva, N.G. (Leningrad Scientific Research Inst. of Radiation Hygiene). 1976. Translated from *Radiobiologiya*; 16: No. 3, 462-464(1976).

Radiobiology. Two groups of rats were used. One group was exposed once to 300 R gamma radiation while the other was exposed to daily irradiation at the rate of 5R/day for 2 yrs. Observations were made on the morphological composition of peripheral blood and incidence of aberrant mitoses in hematopoietic cells of bone marrow. Results showed that rates of recovery of peripheral blood cells and hematopoietic cells with aberrant mitoses were about 50 percent lower with chronic irradiation than with single exposure. (HLW)

- 2207 CORRELATION BETWEEN THE RELATIVE AMOUNT OF THYMINE CLUSTERS IN THE DNA OF THE ORGANISM AND ITS RADIOSENSITIVITY. Kritskii, G.A.; Lakhtin, V.M.; Aleksandrov, S.V. (Inst. of Biochemistry, Moscow). *Dokl. Biochem. (Engl. Transl.)*; 226: No. 1-6, 91-94(1976).

Translated from *Dokl. Akad. Nauk SSSR*; 226: No. 6, 1459-1462(Feb 1976).

DNA was isolated from hemopoietic tissues of guinea pigs, cattle, rats, chicks, and rabbits. Column chromatography was used for separation of hydrolysis products of DNA. A table is presented to show variation in content of pyrimidine oligonucleotide fragments of rabbit bone marrow and spleen DNA after whole-body gamma radiation. A significant correlation was detected between the radiosensitivity of the organism and the relative content of comparatively long thymine-enriched pyrimidine oligonucleotide fragments of DNA. (HLW)

- 2208 (ERDA-tr--241, pp 79-84) EFFECTS OF LYMPHOCYTES ON HEMOPOIESIS IN THE IRRADIATED ORGANISM. Shvets, V.N. 1976. Translated from *Radiobiologiya*; 16: No. 5, 707-711(1976).

Radiobiology, Vol. 16, No. 5, 1976. A study was made of the effect of lymphocytes of lymph nodes and the thymus on differentiation of hemopoietic stem cells in mice. It was established that primarily colonies of the erythroid type were formed with interaction of medullary and thymus cells in the spleen and medullary canal of syngenic recipients. Cortisone-resistant thymus cells exercised such an effect. Lymph node cells had an analogous property. In a nonsyngenic organism (parent-hybrid), thymus and lymph node lymphocytes did not have the same properties. The thymus cells, like in the syngenic variant of the experiment, intensified differentiation of stem cells in the erythroid direction, regardless of the site of their proliferation (spleen, bone marrow). In the case of interaction between lymph node cells and bone marrow of the parental genotype, the effect consisted of redifferentiation of stem cells from the erythroid to the myeloid route.

- 2209 (ERDA-tr--241, pp 102-107) EVALUATION OF FUNCTIONAL ACTIVITY OF CANINE TESTES CONTINUOUSLY EXPOSED TO GAMMA RADIATION FOR SIX YEARS. Fedorova, N.L. 1976. Translated from Radiobiologiya; 16: No. 5, 727-731(1976). Radiobiology, Vol. 16, No. 5, 1976. Male dogs were exposed to chronic γ irradiation for 6 years, at the rate of 0.06, 0.17 and 0.34 rad/day (cumulative doses of 126, 380 and 750 rad). The functional changes in the testes were related more to the dose rate than cumulative dosage, and they were distinctly manifested in animals exposed to a dosage of 0.34 rad/day with accumulation of 80-100 rad. During the experiment, there was lower function of spermatogenic epithelium of these male dogs.
- 2210 (ERDA-tr--241, pp 122-130) COMBINED EFFECT OF ACCELERATION AND TWO-FOLD EXPOSURE TO RADIATION IN DOSES OF 50 AND 100 R ON CONDITIONED REFLEXES OF RATS AND ON TRANSFER OF MAZE EXPERIENCE. Meizerov, E.S. 1976. Translated from Radiobiologiya; 16: No. 5, 744-749(1976). Radiobiology, Vol. 16, No. 5, 1976. Conditioned reflexes are the most sensitive to two-fold irradiation in a total dosage of 150 R, lateral accelerations (10 g, 4 min) and the combined effect of these factors. The capacity to transfer maze experience is somewhat less sensitive, and a developed maze skill is considerably more resistant. The combined effect of radiation followed by acceleration was more marked than exposure to the same factors in reverse order.
- 2211 (ERDA-tr--241, pp 138-141) EFFECTS OF IONIZING RADIATION ON ION TRANSPORT PROCESSES IN HEPATIC MITOCHONDRIA. Medvedev, B.I.; Evtodienko, Yu.V.; Kuzin, A.M. (Inst. of Biological Physics, Pushchino, USSR). 1976. Translated from Radiobiologiya; 16: No. 5, 756-759(1976). Radiobiology, Vol. 16, No. 5, 1976. According to structural metabolic theory, an important stage in radiation lesion to the cell is impairment of processes of energy conversion in the mitochondria. A considerable part of the published works dealing with the effects of radiation on mitochondrial function describes changes in rate of respiration and phosphorylation, and the P/O coefficient. However, the mechanism of the changes observed is still not entirely clear. According to current conceptions, the processes of energy conversion in mitochondria (including ATP synthesis) are based on reactions of membrane potential generation and electrogenic transport of H^+ ions. For this reason, it is interesting to demonstrate possible changes in permeability of mitochondrial membranes and ion transport in mitochondria under the influence of ionizing radiation. In the present work, we investigated the effects of ionizing radiation on oxidative phosphorylation, magnitude of membrane potential and ion transport in mitochondria of the rat liver. The results obtained show that, at the early postradiation stages, one can demonstrate distinct changes in the system of energy conversion in hepatic mitochondria, in particular in the ion transport system. The observed increase in rate of ATP synthesis 3 hours after irradiation may be interpreted as a compensatory process related to an increased energy demand. The postradiation increase in "calcium capacity" and decrease in permeability of potassium ions in mitochondria are perhaps the consequence of radiation damage to the system of energy transformation in cells.
- 2212 (ERDA-tr--241, pp 142-144) EFFECTS OF EXPOSURE TO DIVIDED DOSES OF X-RAYS, AS WELL AS CHRONIC RADIATION AND CHRONIC RADIATION COMBINED WITH ACUTE COBALT-60 GAMMA RADIATION, ON CATECHOLAMINE CONTENT OF RAT MYOCARDIUM. Karpovich, N.V. (Inst. of Physiology, Minsk). 1976. Translated from Radiobiologiya; 16: No. 5, 759-761(1976). Radiobiology, Vol. 16, No. 5, 1976. The significance of catecholamines as regulators of adaptational reactions of the heart is determined, first of all, by their capacity to activate metabolic processes in the myocardium and intensify access of nutrient and energy substrates from other organs and tissues. At the present time it can be considered proven that the concentration of catecholamines in the myocardium is related to capture of biogenous amines from circulating blood, synthesis and secretion thereof from sympathetic nerve endings and extraneuronal deposition. Most of the monoamines demonstrated in the mammalian heart consist of norepinephrine, while the concentration of dopamine is much lower. Analysis of the literature of recent years warrants the statement that the myocardium is relatively resistant to diverse stressors. However, there is extremely limited information concerning the effects of ionizing radiation on catecholamine content of the myocardium. At the same time, it is known that radiobiochemical changes are observed in the myocardium under the influence of acute and chronic ^{60}Co γ radiation, as well as x radiation. For this reason, it was interesting to investigate the concentration of norepinephrine and dopamine in the myocardium of white rats during and after exposure to ionizing radiation in small doses. Analysis of the obtained results indicates that the changes demonstrated in each series of experiments are far from identical, either in intensity or direction, and they are related not only to cumulative dosage, but largely to the nature of the radiation factor. The changes established in catecholamine content of the myocardium under the above experimental conditions should be taken into consideration when assessing the radiobiochemical changes that occur in the organism at different postradiation times.
- 2213 (ERDA-tr--241, pp 151-155) EFFECT OF HETEROLOGOUS HIGH POLYMER DNA ON RESTORATION OF COLONY-FORMING UNITS IN HEMOPOIETIC TISSUES OF IRRADIATED MICE. Luzanov, V.M. 1976. Translated from Radiobiologiya; 16: No. 5, 767-770(1976). Radiobiology, Vol. 16, No. 5, 1976. It is imperative to investigate the effects of DNA preparations on colony-forming units (CFU) in order to comprehend processes of recovery of hemopoiesis in irradiated and DNA-treated animals. The data in the literature dealing with this question are sparse and contradictory. In this work, we studied the effect of heterologous DNA obtained from the calf thymus and fish milt on restoration of CFU in bone marrow and spleen of irradiated mice. Restoration of CFU should be directed, first of all, toward normalization of cellular composition of bone marrow and spleen. The number of myelokaryocytes in bone marrow was higher between the 6th and 20th days in treated mice than in untreated animals. Probably this was due to increased differentiation of CFU. Thus, administration of heterologous DNA to irradiated mice accelerated recovery of CFU in bone marrow and spleen, due to the effect of this biopolymer on processes of proliferation and migration of colony-forming units.

- 2214 (ERDA-tr--241, pp 156-159) ERYTHROPOIETIC ACTIVITY OF PLASMA OF IRRADIATED ANIMALS. Gritsak, A.N.; Starodub, N.F.; Rekun, G.M.; Shur'yan, I.M. (Inst. of Molecular Biology and Genetics, Kiev). 1976. Translated from Radiobiologiya; 16: No. 5, 770-773(1976).

Radiobiology, Vol. 16, No. 5, 1976. In the recent literature, there is discussion of the role of erythropoiesis-stimulating factors, the presence of which has been demonstrated in human and animal blood. There is a sharp increase in erythropoietin production following bloodletting, in the presence of hypoxia and diverse types of anemia. Yet, there are only isolated works dealing with erythropoietic activity of plasma of animals with postradiation anemia, and their findings are quite contradictory. In this work, we submit experimental data on the effects of ionizing radiation on erythropoietic activity of rat plasma, in vivo and in vitro, which is a mandatory stage in learning about the mechanism of postradiation injury to the hemopoietic system, bearing in mind the role of erythropoietic factors in maintaining the quantitative parameters of erythron. The combination of x-rays and phenylhydrazine elicits a somewhat lesser effect than each factor separately. Thus, in the course of radiation sickness in rats, a decline in erythropoietic activity of plasma was observed on the 1st day after 3-fold injections to irradiated animals. In the dosage we used, phenylhydrazine probably has a radioprotective effect. In this regard, of interest are data to the effect that phenylhydrazine, in small doses (10 mg/kg), has a radioprotective effect and stimulates cell division in hemopoietic tissue regardless of time of administration, whereas in a dosage of 100 mg/kg it increases radiosensitivity and inhibits erythropoiesis. Yet, there is a report that there was a high level of erythropoietin in the plasma of mice exposed successively to 100 R x rays and phenylhydrazine (up to 80 mg/kg). Thus, in the course of radiation sickness in rats, as in the case of phenylhydrazine anemia, a reliable increase is observed in erythropoietic activity of plasma.

- 2215 (ERDA-tr--241, pp 160-163) ROLE OF TOCOPHEROL (VITAMIN E) IN THE CONCOMITANT DELETERIOUS EFFECT OF POSTRADIATION HYPEROXIA. Ivanov, I.F. (Kiev Scientific-Research Inst. of Roentgenoradiology and Oncology). 1976. Translated from Radiobiologiya; 16: No. 5, 773-776(1976).

Radiobiology, Vol. 16, No. 5, 1976. One of the best known natural antioxidants that is consistently present in the organism is vitamin E (tocopherol). It is not synthesized de novo in animal tissues, so that the organism's vitamin E requirements are met by means of exogenous sources. Tocopherol is ingested in a biologically inactive form and then undergoes several enzymatic conversions. Under experimental conditions, following intraperitoneal injection of tocopherol, a maximum increase in hepatic lipids, in biologically active (free) form occurred by the 18th hour. After administration per os tocopherol is stored in various organs, particularly in the liver where a maximum is demonstrable in 6 hours. It is assumed that conversion of tocopherol into active form is relatively easier in this instance, as compared to intraperitoneal administration, due to processing thereof by secretions of gastrointestinal glands. On the basis of the foregoing, our objective was to make a quantitative evaluation of the effect of

tocopherol on postradiation hyperoxia when given both before and after irradiation. The obtained data demonstrated unequivocally that, in the integral organism of warm-blood animals, the additional deleterious effect of postradiation hyperoxia can be averted by means of preliminary (6 to 18 hours before irradiation) administration of tocopherol. The existence of a latency period in tocopherol action is, apparently, due to the need for it to change into a biologically active form. The duration of this period coincides with the time of conversion into free form with antioxidant properties. For this reason, we cannot rule out the possibility that the additional deleterious effect of postradiation hyperoxia is due to activation by oxygen of free oxidation in irradiated tissues and, in particular, peroxidation, in the reactions of which tocopherol is a specific blocking factor.

- 2216 (ERDA-tr--241, pp 164-167) DYNAMICS OF MYELOKARYOCYTES DURING PROLONGED AND REPEATED GAMMA IRRADIATION. Voronin, V.S.; Murzina, L.D.; Sukhodoev, V.V. 1976. Translated from Radiobiologiya; 16: No. 5, 777-779(1976).

Radiobiology, Vol. 16, No. 5, 1976. Changes in number of myelokaryocytes with irradiation of small laboratory animals are evaluated by counting medullary cells in the femur. However, in the case of protracted irradiation, when irradiated animals gain weight at an appreciably slower rate than intact ones, the use of this method may distort the true results. Hence, the objective of the present work was to make a dynamic study of myelokaryocytes in the entire skeleton in the course of prolonged irradiation of rats, and to compare these data to the change in number of cells in the femur. There was a difference in dynamics of bone marrow cell content of the rat skeleton with the two different daily doses of radiation. While no changes in number of myelokaryocytes, as compared to intact animals, were noted with exposure to 25 R/day for 8 months, with a daily dose of 50 R their number declined from the very start of the experiment. These differences are, apparently, due to less destruction of medullary cells with the low daily dosage and more profound injury to compensatory mechanisms with 50 R/day. Other investigators have also reported differences in change in number of myelokaryocytes with different daily doses of radiation. It is important to mention that, with both doses used, the dynamics of quantitative composition of femoral bone marrow cells, with consideration of the correction factor, reflected quite accurately the nature of change in number of karyocytes in the entire skeleton of the animal.

- 2217 (ERDA-tr--241, pp 179-183) TESTICULAR REACTION TO COMBINED RADIATION. Kondratenko, V.G.; Ganzenko, L.F. (Inst. of Biological Physics, Pushchino, USSR). 1976. Translated from Radiobiologiya; 16: No. 5, 788-791(1976).

Radiobiology, Vol. 16, No. 5, 1976. In view of the broad development of atomic energy and possible use of space stations, it is interesting to investigate the effects of chronic radiation in low doses combined with a single dose of irradiation. In this work, we investigated the testicular reaction of animals exposed to combined radiation. The testicular reaction to combined radiation resembles the one seen with delivery of divided doses of radiation to these organs. However, it should be stressed, that this is only an external similarity, since there are more profound disturbances in the seminiferous tubules with combined radiation, they are manifested with

- lower doses and when the intervals between exposures are considerably longer. All this is indicative of the specific reaction of the testes to combined radiation. In our opinion, the described changes in the spermatogenic epithelium induced by ionizing radiation cannot be interpreted as being merely the result of local disturbances. They are apparently determined by impairment of complex neurohormonal mechanisms of regulation of spermatogenesis.
- 2218 (ERDA-tr--241, pp 62-67) CHANGES IN NUMBER AND PROLIFERATIVE ACTIVITY OF HEMOPOIETIC STEM CELLS DURING PROLONGED EXTERNAL GAMMA-IRRADIATION. Muksinova, K.N. 1976. Translated from Radiobiologiya; 16: No. 5, 693-698(1976).
Radiobiology, Vol. 16, No. 5, 1976.
Prolonged daily exposure of BALB/c mice to 25 and 50 R/day radiation (at the rate of 10 R/min) led to appreciable depletion of CFC [colony-forming cells] population in the bone marrow and spleen. The rate and severity of CFC decline were more marked in the group of animals exposed to 50 R/day. A significant increase in proliferative pool of CFC maintained the population of these cellular elements throughout a long period of irradiation. The authors discuss the possible mechanisms of the demonstrated changes in number of CFC and their functional state.
- 2219 (ERDA-tr--241, pp 68-72) CHANGES IN KINETICS OF ERYTHRONORMOBLAST PROLIFERATION DURING PROLONGED GAMMA IRRADIATION. Voronin, V.S.; Murzina, L.D. 1976. Translated from Radiobiologiya; 16: No. 5, 699-702(1976).
Radiobiology, Vol. 16, No. 5, 1976. No decrease in number of erythronormoblasts was demonstrable after exposing Wistar rats to 48.5 rad/day radiation for 70 days. Compensation of erythropoiesis may be related to faster proliferation of erythropoietic elements of bone marrow. This process is due to 25--30 percent reduction of erythronormoblast generation time and increased number of divisions of erythroblasts and basophil normoblasts.
- 2220 RADIATION DAMAGE AND REPAIR. Pauly, H. Zivilverteidigung; No. 3, 26-34(1976). (In German).
10 figs.; with refs..
This survey intends to show that the reversible component of radiation damage has again become of interest. Although there was no need for living organisms in the course of their development to develop special means of repairing the damage caused by a high amount of ionizing radiation, they are able to do so in a high degree.
- 2221 (ERDA-tr--266, pp 117-119) INVESTIGATION OF EFFECTS OF LOW MOLECULAR DNA ON THE GENOME OF SOMATIC CELLS OF HEALTHY AND IRRADIATED ANIMALS. Nikolaevskaya, N.G. 1976. Translated from Radiobiologiya; 16: No. 6, 897-899(1976).
Radiobiology. It has been shown in several works that high molecular DNA lowers the incidence of chromosomal radiation damage in somatic cells of irradiated animals. The present work was undertaken to determine the significance of molecular weight in lowering the incidence of radiation damage to chromosomes. At the same time, we investigated the effect of low molecular DNA on the genome of somatic cells of healthy animals. The influence of exogenous DNA on incidence of chromosomal aberrations is determined largely by the molecular weight of the biopolymer. In our opinion, the lack of beneficial effect of low molecular DNA, with respect to reducing the radiation-induced chromosomal aberrations, is indicative of the prime significance of complementary fragments of the administered biopolymer in the mechanism of action of exogenous DNA on repair of chromosomes.
- 2222 CHANGES IN THE ACTIVITIES OF BLOOD AND TISSUE ADENOSINETRIPHOSPHATASE AND LACTATE DEHYDROGENASE AFTER EXPOSURE TO ^{60}Co GAMMA-RAYS IN ASSOCIATION WITH SOME DRUG TREATMENTS. Pausescu, E.; Teodosiu, T.; Paun, C.; Duduggian, L.M. (Fundeni Clinical Hospital, Bucharest). Rev. Roum. Morphol., Embryol. Physiol., Physiol.; 13: No. 1, 61-66(1976).
Experiments in rats exposed to a moderate dose of ^{60}Co gamma-radiation and treated with either cystamine, AET, complamin or alpha-methyldopa suggested that the efficiency of a radioprotective drug might be related to its ability to maintain low levels of ATP-ase activity in blood and tissues after irradiation.
- 2223 INFERENCES FROM THE COLLABORATION IN THE FIELD OF PHARMACO-CHEMICAL PROTECTION AND TREATMENT OF RADIATION INJURY ACCORDING TO THE 'INTERCOSMOS' PROGRAM. STUDY OF NEW PROPHYLACTIC AND THERAPEUTIC AGENTS TO MANAGE RADIATION DISEASE FROM PROTRACTED EXPOSURE. TOPIC 5. Rogozkin, D.D. (Institut Biofiziki, Moscow (USSR)). Rentgenol. Radiol.; 15: No. 1, 55(1976). (In Russian).
From Meeting of the working groups of scientists from socialist countries on cosmic biology and medicine; Varna, Bulgaria (19 - 25 May 1975).
Primary consideration was given to agents promoting general systemic resistance. In short-term or protracted irradiation experiments, confirmatory evidence was obtained for antiradiation effects produced by amitetravit, urease, and yeast polysaccharides. On Ehrlich ascites tumor cells and lymphosarcoma cells, exogenous DNA was shown to enhance repair of the DNA molecule, even with regard to double-strand breaks. Usefulness of serum globulins as an antiradiation agent was substantiated in acute experiments on rabbits, where survival of animals was seen to rise and natural immunity factors to be normalized and stimulated. A similar favorable effect of serum globulins was demonstrated on hemopoiesis in mice, where incidence of autoinfections was also decreased. Studies are continuing to elucidate mechanisms underlying hemopoiesis protection by hypoxic hypoxia and hypoxic hypothermy in mice. Minimum amounts of protective preparations needed to produce an appreciable effect on mouse stem cells were determined. ATP and noradrenalin were found to act largely through their influence on blood formation.
- 2224 GENETIC DAMAGE FROM CHRONIC GAMMA IRRADIATION. Bajrakova, A. (Nauchno-Izledovatelski Inst. po Radiologiya i Radiatsionna Khigiena, Sofia (Bulgaria)). Suvrem. Med.; 27: No. 11, 9-12(1976). (In Bulgarian).
Human irradiation occurs to a large extent under protracted, low-dose-rate exposure conditions. In assessing the genetic risk thereby incurred one has, by necessity, to rely primarily on information gained from animal experiments. Review of the evidence obtained indicates that chronic relative to acute gamma irradiation is less effective with regard to both gene mutation and chromosome aberration

- induction. When delivered under chronic exposure conditions, gamma radiation to spermatogonia has been found to produce one-third the gene mutations and one-fifth the chromosome translocations resulting from acute exposure. Dose-rate effects have been observed in irradiation of spermatogonia and oocytes, that is gametogenesis stages that cumulate life-long doses, largely from protracted exposures. The reduction in effect with decreasing dose rate is perceivable until a certain low 'threshold' level is attained, which is estimated to be of the order of magnitude of some tens of R/min for gene mutations and a few mR/min for chromosome aberrations.
- 2225 EXPERIMENTAL ADIASPIROMYCOSIS IN ANIMALS WITH A MODIFIED REACTIVITY (ALBINO MICE) AFTER IRRADIATION. Zlatanov, Z.; Michev, A. (Republikanska Protivoepidemichna Stantsiya, Sofia (Bulgaria)). *Epidemiol., Mikrobiol. Infekts. Boles.*; 13: No. 4, 310-315(1976). (In Bulgarian).
The nature of the pathologic process in experimental adiaspiromycosis, following intraperitoneal inoculation with elements of the mycelium phase of *Emmonsia crescens* Emmons et Jellison (1960), depends on the reactivity of the experimental animals. Compared with a control group of animals, inoculated albino mice (with a single dose of 250 rad) contracted adiaspiromycosis more readily, there was a higher incidence of positive findings, aleiropore dissemination to distant organs outside the abdominal cavity occurred earlier, the intensity of tissue and organ insemination of the host was much higher. The results of these studies show that individuals with low resistance and increased susceptibility to infection are particularly liable to contract adiaspiromycosis.
- 2226 ACTIVITY OF LYSOSOMAL ACID PHOSPHATASE IN THE PERIPHERAL BLOOD LYMPHOCYTES OF MICE IRRADIATED WITH GAMMA RAYS. Aleksandrowicz, J.; Wazewska-Czyzewska, M.; Szybinski, Z.; Bodzon, A.; Plonka, I.; Sasiadek, U.; Lisiewicz, J. (Akademia Medyczna, Krakow (Poland)). *Postepy Fiz. Med.*; 11: No. 2, 87-96(1976). (In Polish).
In the peripheral blood lymphocytes of Albino-Swiss mice after irradiation with 450 R an intracellular increase in the acid phosphatase activity was determined with Barka and Anderson's cytochemical method. The increase in the enzyme activity was accompanied by the increase in the absolute count of enzyme-positive lymphocytes exhibiting high activity of the enzyme, i.e. containing more than five enzyme-positive lysosomal granules. The absolute count of cells of diffuse enzymatic reaction type did not increase after irradiation.
- 2227 RADIATION-INDUCED FETAL TESTICULAR DAMAGE IN THE MONKEY (*MACACA RADIATA*). Johnson, M.I.; Newman, L. (Univ. of California, Davis). *J. Med. Primatol.*; 5: No. 3, 195-199(1976).
The testes of five monkeys (*Macaca radiata*) were examined histologically for evidence of damage, following in utero fractionated x-irradiation. Radiation-induced damage was found in the testes of animals beginning at total exposures of 170 R, when compared to controls.
- 2228 EFFECT OF X-RAY SMALL DOSE FRACTIONATION ON THE SURVIVAL RATE OF MICE OOCYTES. Rudnicki, T.; Sloninska, B. (Akademia Medyczna, Poznan (Poland)). *Postepy Fiz. Med.*; 11: No. 1, 9-15(1976). (In Polish).
By using the method of double irradiation the effect of the length of the intervals between split doses on the number of oocytes in mice has been studied. The damaging effect was found to depend on the accumulated dose rather than on its distribution in time. No recovery in oocytes even for the dose of 5 R has been observed.
- 2229 RESEARCH ON HEPATIC AND OVERALL COLLAGEN METABOLISM IN IRRADIATED RATS. Vladescu, C.; Gheorghe, N.; Ganea, E.; Petrescu, L. *Pathol.-Biol.*; 24: No. 10, 671-676(1976). (In French).
The effects of ionizing radiations on hepatic and overall collagen metabolism in rats were studied. Doses of 100 and 250 rads produced a reduction in urinary hydroxyproline while doses of 500 and 700 rads produced an increase. These results may be interpreted in favour of an increase in reticulation in the first case and in the second case, destruction of inter-molecular bonds. The quantity of total and insoluble collagen increases proportionally to the dose 40 days after the irradiation. This proportional relationship is not observed during the first few days after the irradiation. Prolonged irradiation with 700 rads produces a marked reduction in all collagen fractions, compared with 4 days after acute irradiation. Among the substances studied 'folcisteine' had the best radio-protective effect when administered before irradiation with 700 rads.
- 2230 ETIOLOGIC RELATED STUDIES OF ULTRAVIOLET LIGHT-MEDIATED CARCINOGENESIS. Black, H.S.; Chan, J.T. (Veterans Administration Hospital, Houston, TX). *Oncology*; 33: No. 3, 119-122(1976).
Comparisons were made of cholesterol-5 α 6 α -epoxide (CAE) levels in skin of hairless mice maintained on a regular or antioxidant supplemented diet and receiving chronic ultraviolet light (UVL) radiation over an 18-week period. Cholesterol-5 α , 6 α -epoxide levels in skin of animals on antioxidant supplemented diet, while reaching a peak four weeks after that of animals on regular diet, thereafter were consistently higher. Dietary antioxidants nevertheless had an inhibitory effect on UVL-induced tumors. These data are inconsistent with the theory of CAE involvement as an ultimate carcinogen in UVL-mediated carcinogenesis.
- 2231 CHANGES IN FUNCTIONAL VASCULARITY AND CELL NUMBER FOLLOWING X IRRADIATION OF A MURINE CARCINOMA. Clement, J.J.; Song, C.W.; Levitt, S.H. (Univ. of Minnesota Medical School, Minneapolis). *Int. J. Radiat. Oncol., Biol. Phys.*; 1: No. 7-8, 671-678(1976).
Post-irradiation changes in vascular function and cell number in the transplantable SCL carcinoma of A/J mice were examined. Vascular volume/g tumor, as measured by ⁵¹Cr-labeled red blood cell dilution, increased within 1 day after 1000 or 2000 rad and then decreased. The number of living cells/g tumor, estimated from single-cell preparations, declined to a minimum at day three post-irradiation with 1000 or 2000 rad. Calculation of vascularity on a per living cell basis indicated that the vascular volume increased to 197 percent and 286 percent of controls 3 days after irradiation with 1000 and 2000 rad, respectively. These data indicate that post-irradiation reoxygenation of hypoxic tumor cells may be caused by a decrease in oxygen consuming cells which is greater in magnitude

than the corresponding decrease in functional vascularity.

- 2232 EFFECT OF ACUTE AND FRACTIONATED PARTIAL BODY X-IRRADIATION ON CIRCULATING IMMUNOGLOBULIN LEVELS IN MICE. Markoe, A.M.; Asbell, S.O.; Weidanz, W.P.; Saluk, P.; Antoniadis, K.; Brady, L.W. (Hahnemann Medical Coll. and Hospital, Philadelphia). Int. J. Radiat. Oncol., Biol. Phys.; 1: No. 5-6, 465-470(1976).

Circulating immunoglobulin (Ig) levels of normal SJL/J mice were measured following total- or half-body x irradiation 12 days after a single exposure of 875 R (an LD95/30 exposure) or on the 12th and final day of fractionated irradiation to a total of 2000 R (200 R fraction, 10 fractions in 12 elapsed days). IgG₁ and IgG₂ were markedly depressed following total body acute exposure but were also reduced after the fractionated half-body exposure (representing no hematopoietic repopulation based on spleen and thymic weights). Irradiation below the diaphragm caused a greater depression than above the diaphragm. However, 12 days after acute half-body exposure, IgG levels were within the control range. IgM levels were depressed significantly only after acute total body exposure. IgA levels were not greatly altered by any mode of x irradiation. Serum IgG levels may change after x irradiation by virtue of intestinal damage resulting in abnormal losses or of depression of IgG-secreting plasmacytes. In the case of IgM, intestinal dependency is not shown. Moreover, compensatory IgM secretion may occur from plasmacytes located in the unirradiated half of the body and is, thus, independent of hematopoietic repopulation. The failure of IgA levels to change markedly after total or partial body irradiation remains unexplained.

- 2233 CHANGES IN PLATELET AND MICROCIRCULATION FUNCTION INDUCED BY IONIZING RADIATION TO THE LIVER. Bicher, H.I.; Ashbrook, D.W.; Harris, D.R.; Dalrymple, G.V. (Univ. of Arkansas for Medical Sciences Campus, Little Rock). Int. J. Radiat. Oncol., Biol. Phys.; 1: No. 7-8, 679-685(1976).

Platelet aggregation and adhesiveness, as well as partial pressure of oxygen in tissue (TpO₂) responses to hypoxia, were measured as microcirculation parameters in beagle dogs who were subjected to ⁶⁰Co ionizing radiation to a dose of 4600 rad in 5 weeks. Simultaneously, changes in blood chemistry and coagulation also were determined. Marked changes in tissue oxygenation and an increase in platelet aggregation in the post-irradiation period led to the conclusion that radiation liver damage is, at least in part, mediated through microcirculation function disturbances.

- 2234 EFFECT OF RADIATION IN UTERO ON MOUSE TESTES LACTATE DEHYDROGENASE-X. Prasad, N.; Prasad, R.; Bushong, S.C. (Baylor Coll. of Medicine and Veterans Administration Hospital, Houston, TX). Int. J. Radiat. Oncol., Biol. Phys.; 1: No. 3/4, 285-287(1976).

Lactate dehydrogenase-X(LDH-X), a sperm specific isozyme of mammals, can be used as a marker for active spermatogenesis. LDH-X electrophoretic patterns may also be affected in radiation-induced sterility following in utero irradiation. To investigate this relationship pregnant female mice were given 100 rad x radiation on day 10, 13, and 17 following gestation. All male offspring were sacrificed 20 days after birth and testes tissues obtained. The testes were homogenized

to obtain crude extracts for starch gel electrophoresis and zymogram staining for LDH-X. Results to date show that the LDH-X is not expressed in the testis when fetal irradiation occurred at 10 and 13 days following gestation. Faint bands of LDH-X were observed in testes homogenates of mice whose mothers were irradiated 17 days following gestation. Pronounced LDH-X bands were present in all control preparations.

- 2235 (HEDL-SA--1086-FP) YEAR 2000 ESTIMATED POPULATION DOSE FOR THE TENNESSEE VALLEY REGION. Fletcher, J.F.; Strauch, S.; Siegel, G.R.; Witherspoon, J.P. (Hanford Engineering Development Lab., Richland, Wash. (USA)). 1976. Contract E(45-1)-2170. 21p. (CONF-760622--42). Dep. NTIS \$3.50.

From American Nuclear Society 1976 annual meeting; Toronto, Ontario, Canada (13 Jun 1976).

A comprehensive study has recently been completed of the potential regional radiological dose in the Tennessee and Cumberland river basins in the year 2000, resulting from the operation of nuclear facilities. This study, sponsored jointly by the U.S. Energy Research and Development Administration and the Tennessee Valley Authority, was performed by the Hanford Engineering Development Laboratory (HEDL), the Oak Ridge National Laboratory (ORNL), and the Atmospheric Turbulence and Diffusion Laboratory (ATDL). This study considered the operation in the year 2000 of 33,000 MWe of nuclear capacity within the study area, and of 110,000 MWe in adjacent areas, together with supporting nuclear fuel fabrication and reprocessing facilities. Air and water transport models used and methods for calculating nuclide concentrations on the ground are discussed. (CH)

- 2236 (AED-Conf--76-134-023) ¹²⁵I THERAPY OF HYPERTHYROIDISM. Reddy, A.R. (Freie Univ. Berlin (Germany, F.R.). Klinikum Steglitz). 1976. 14p. (CONF-760592--5). NTIS (US Sales Only).

From 7. scientific meeting of the Deutsche Gesellschaft fuer Medizinische Physik e.V.; Heidelberg, F.R. Germany (5 May 1976). 1 fig.; 1 tab.; 24 refs..

In recent years increasing interest is shown in the use of ¹²⁵I for the therapy of hyperthyroidism, instead of the traditional ¹³¹I, based on the postulate that there is a relative sparing of the reproductive integrity of the thyroid follicular cell and a consequent possibility of smaller incidence of hypothyroidism after therapy. Dosimetric and radiobiological bases of this postulate are first described in this paper and then a brief review of the results of the pilot clinical trials conducted at different centers using ¹²⁵I for the management of hyperthyroidism is given.

- 2237 (AED-Conf--76-430-004) PROBLEMS IN RADIOLOGICAL PROTECTION INVOLVING ALPHA EMITTERS IN BONE. Dolphin, G.W. (National Radiological Protection Board, Harwell (UK)). 1976. 16p. (CONF-760992--16). NTIS (US Sales Only).

From 2. international symposium on biological effects of Ra-224; Neuherberg/Muenchen, F.R. Germany (20 Sep 1976). 4 tabs.; with refs..

Quantitative dose/effect relationships for humans exposed to alpha emitters can only be established from data on humans exposed to this type of radiation. The risk of bone sarcoma

from exposure to plutonium-239 may be established from the data on the human cases exposed to radium-226 either by consideration of the radiation dose to the osteoprogenitor cells or by use of the average bone dose together with a modifying factor to take into account the greater toxicity of plutonium relative to radium. The relative toxicity can be evaluated from the data on osteosarcoma incidence in animals. Both methods of risk estimation are given and criticised in the paper. In future recommendations, ICRP will not use the critical organ concept and the late effects from α emitters deposited in organs other than the bone will have to be taken into account in setting maximum permissible annual intakes. The implications of this and other proposed changes in ICRP concepts are discussed.

- 2238 (AED-Conf--76-430-011) INTRAVENOUS INJECTION OF RA-224 AS A TREATMENT IN MORBUS PAGET. Koch, W. (Zentralstelle fuer Atomkernenergie-Dokumentation (ZAED), Eggenstein-Leopoldshafen (Germany, F.R.)). 1976. 7p. (CONF-760992--11). TIC.

From 2. international symposium on biological effects of Ra-224; Neuherberg/Muenchen, F.R. Germany (20 Sep 1976).

Between 1956 and 1973, 21 patients with histologically verified Morbus Paget were treated at the author's hospital with low dosage ^{224}Ra . In none of these patients an immediate or late impairment of the hematogenic or parenchymal organs was observed.

- 2239 (ANL--76-88(Pt.2)) RADIOLOGICAL AND ENVIRONMENTAL RESEARCH DIVISION ANNUAL REPORT, JULY 1975--JUNE 1976. (Argonne National Lab., Ill. (USA)). 1976. Contract W-31-109-ENG-38. 183p. Dep. NTIS \$7.50.

Separate abstracts were prepared for eighteen sections of the report. Abstracts of an additional nine items are also included in the report as well as appendices presenting exposure data for radium patients and radium-induced malignancies. (HLW)

- 2240 (ANL--76-88(Pt.2), pp 26) LONG-TERM EFFECTS OF RADIUM EXPOSURE IN FEMALE DIAL WORKERS: HEMATOCRIT AND BLOOD PRESSURE. Polodnak, A.P. 1976.

Radiological and Environmental Research Division annual report, July 1975--June 1976.

Statistically significant results were obtained using univariate and multivariate (multiple regression) analyses for women aged 65 to 84. The effect (i.e., lower hematocrit at higher doses) appeared to be greatest in the highest dose group, especially at 1000+ rad. It did not, however, involve a higher frequency of 'low' hematocrit suggestive of anemia. No apparent effect of dose on blood pressure was evident in the women exposed in 1913 to 1929. In women exposed in 1930 to 1954, dose was a significant predictor of systolic blood pressure in 45- to 54-year olds, but not in the 55- to 64-year olds. Analysis of longitudinal data on these populations will be required.

- 2241 (ANL--76-88(Pt.2), pp 30-37) CHROMOSOME ABERRATIONS IN THE PERIPHERAL LYMPHOCYTES OF THORIUM WORKERS WITH LOW BODY BURDENS OF ^{212}Bi . Hoegerman, S.F. 1976.

Radiological and Environmental Research Division annual report, July 1975--June 1976.

Cytogenetic analysis of 8 thorium workers and 3 controls has not shown a significant elevation in the level of chromosome breakage in the workers' peripheral lymphocytes. This

finding is consistent with an estimate of the amount of damage to be expected in these cases, based on the level of chromosome breakage observed in Thorotrast cases with measured ^{212}Bi burdens.

- 2242 (ANL--76-88(Pt.2), pp 38-39) GROSS DISTRIBUTION OF ^{226}Ra IN MAN FROM EXTERNAL COUNTING. Rundo, J.; Essling, M.A.; Huff, D.R. 1976.

Radiological and Environmental Research Division annual report, July 1975--June 1976.

When the first γ -ray measurements of a radium patient's body radioactivity indicate a content in excess of about 20 nCi of ^{214}Bi (RaC), a '7-position scan' is made. Measurements are made with two detectors, above and below the supine subject, at seven equally spaced positions along the length. The spacing is set at 15% of the subject's height. Such scans have been made for 40 different patients, and although the detectors are uncollimated, a surprising amount of information on the distribution is revealed. In general, the distribution could be assigned fairly unambiguously to one of four categories. In Category I (18 cases) a clear maximum of activity was observed in the lowest third of the body. Category II (12 cases) was the reverse; the highest counting-rate was observed from the uppermost third of the body. Rough symmetry of activity distribution down the length of the body was seen in the other two categories. In Category III (7 cases) the counting-rate was at a maximum near the middle of the body, while it was at a minimum for Category IV (3 cases). There was considerable variability within any one category, and no correlation between body content of radium, or mode of intake, and category.

- 2243 (ANL--76-88(Pt.2), pp 40) MACRODISTRIBUTION OF ^{226}Ra IN THE SKELETON OF A RADIUM DIAL PAINTER. Holtzman, R.B.; Simmons, D.J. 1976.

Radiological and Environmental Research Division annual report, July 1975--June 1976.

The concentrations of ^{226}Ra were determined in 190 samples of bone and in four teeth from a woman who had worked for two years as a radium dial painter 52 years prior to her death. The terminal body content of ^{226}Ra was 200 nCi. The weighted mean concentration of activity in bone was 146 ± 11 pCi/g ash, with a range of 12 to 1000 pCi/g ash. The mean level in cortical bone was 116 ± 14 pCi/g ash, while that in porous bone (trabecular and eroded cortex) was 227 ± 25 pCi/g ash.

- 2244 (ANL--76-88(Pt.2), pp 47-53) VARIABILITY IN THE EXHALATION RATE OF RADON. Rundo, J.; Markun, F.; Sha, J.Y.; Cameron, P. 1976.

Radiological and Environmental Research Division annual report, July 1975--June 1976.

In a day-long study, twenty-eight 10-min samples of breath were collected from a former radium dial painter and were analyzed for radon. The radon exhalation rate showed good short-term reproducibility, but there was a dramatic short-lived increase in the first samples collected after lunch and a slow but steady increase during the course of the day.

- 2245 (ANL--76-88(Pt.2), pp 70-79) MACRODISTRIBUTION OF ^{226}Ra IN THE HUMAN SKELETON AS DETERMINED IN VITRO BY GAMMA-RAY SPECTROMETRY. Essling, M.A.; Huff, D.R. 1976.

Radiological and Environmental Research

Division annual report, July 1975--June 1976.

A large number of γ -ray measurements of ^{226}Ra in human bone has been made both at MIT and CHR-ANL. These data are analyzed for correlations of the specific activity ratio of a bone group with other parameters, an interlaboratory comparison of the measurements, and an estimate of the errors expected when a whole-body content is calculated from the ^{226}Ra determination on a partial skeleton.

2246 (ANL--76-88(Pt.2), pp 82-85) USE OF ^{103}Pd AS A CALIBRATION SOURCE FOR THE DETERMINATION OF ^{239}Pu IN VIVO. Toohey, R.E. 1976.

Radiological and Environmental Research Division annual report, July 1975--June 1976.

As one component of mock plutonium, ^{103}Pd is frequently used as a calibration source for the determination of ^{239}Pu . Some considerations involved in its use are discussed; it is shown that the plutonium calibration curve derived from ^{103}Pd agrees well with that from ^{238}Pu .

2247 (ANL--76-88(Pt.2), pp 17-21) HAZARD PLOTTING AND ESTIMATES FOR THE TUMOR RATE AND THE TUMOR GROWTH TIME FOR RADIOGENIC OSTEOSARCOMAS IN MAN. Groer, P.G.; Marshall, J.H. 1976.

Radiological and Environmental Research Division annual report, July 1975--June 1976.

The tumor rate (hazard rate) and the tumor growth time were estimated from a multiply censored sample of observed tumor appearance times in persons with an initial intake of ^{226}Ra and ^{228}Ra larger than about 230 $\mu\text{Ci/kg}$ bone. The tumor appearance times in these individuals appear to be exponentially distributed and follow, therefore, a straight line if plotted against the cumulative hazard on linear paper, the hazard paper for an exponential failure time distribution. This implies a constant dose independent tumor rate for osteosarcoma induction in the limit of large radiation doses. An expression for tumor rate from a stochastic model, described earlier in detail showing this behavior, is discussed briefly.

2248 (ANL--76-88(Pt.2), pp 22-25) VARIANCE OF THE NUMBER OF TUMORS IN A MODEL FOR THE INDUCTION OF OSTEOSARCOMA BY ALPHA RADIATION. Groer, P.G.; Marshall, J.H. 1976.

Radiological and Environmental Research Division annual report, July 1975--June 1976.

An earlier report on a model for the induction of osteosarcoma by alpha radiation gave differential equations for the mean numbers of normal, transformed, and malignant cells. In this report we show that for a constant dose rate the variance of the number of cells at each stage and time is equal to the corresponding mean, so the numbers of tumors predicted by the model have a Poisson distribution about their mean values.

2249 (BNWL-SA--5523) FOOD: AN INTERACTIVE CODE TO CALCULATE INTERNAL RADIATION DOSES FROM CONTAMINATED FOOD PRODUCTS. Baker, D.A.; Hoenes, G.R.; Soldat, J.K. (Battelle Pacific Northwest Labs., Richland, Wash. (USA)). 1976. Contract E(45-1)-1830. 8p. (CONF-760407--3). Dep. NTIS \$3.50.

From Conference on environmental modeling and simulation; Cincinnati, OH, USA (20 Apr 1976).

An interactive code, FOOD, has been written in BASIC for the UNIVAC 1108 to facilitate calculation of internal radiation doses to man from radionuclides in food products. In the

dose model, vegetation may be contaminated by either air or irrigation water containing radionuclides. The model considers two mechanisms for radionuclide contamination of vegetation: direct deposition on leaves and uptake from soil through the root system. The user may select up to 14 food categories with corresponding consumption rates, growing periods and either irrigation rates or atmospheric deposition rates. These foods include various kinds of produce, grains and animal products. At present, doses may be calculated for the skin, total body and five internal organs from 190 radionuclides. Dose summaries can be displayed at the local terminal. Further details on percent contribution to dose by nuclide and by food type are available from an auxiliary high-speed printer. This output also includes estimated radionuclide concentrations in soil, plants and animal products.

2250 (BNWL-SA--5659) ASSESSMENT OF A CERIUM--PRASEODYMIUM-144 INHALATION CASE. Glenn, R.D.; Heid, K.R.; Houston, J.R. (Battelle Pacific Northwest Labs., Richland, Wash. (USA)). 1976. Contract E(45-1)-1830. 21p. (CONF-760652--6). Dep. NTIS \$3.50.

From Health Physics Society meeting; San Francisco, CA, USA (27 Jun 1976).

A case involving an acute exposure to a ^{144}Ce - ^{144}Pr contaminated atmosphere is presented with a discussion of the treatment and evaluation of data collected out to 800 days post intake. Treatment included irrigation of the upper nasal passages with normal saline, nebulization with normal saline mist and DTPA therapy. Assessment of the deposition and the resulting dose commitment was based on in vivo measurements and excretion data. The initial pulmonary burden, which cleared with three distinct half times, was estimated at 2.1 μCi of ^{144}Ce .

2251 (CONF-760444--1) FIFTY YEAR DOSE COMMITMENT TO VARIOUS ORGANS AND TISSUES FROM INHALATION OF ^{133}Xe . Bernard, S.R.; Snyder, W.S. (Oak Ridge National Lab., Tenn. (USA)). 1976. 16p. Dep. NTIS \$3.50.

From Symposium on radiopharmaceutical dosimetry; Oak Ridge, TN, USA (26 Apr 1976).

A metabolic model for a single inhalation of ^{133}Xe , together with the computer code in use at this Laboratory, was employed for estimating dose commitments to various organs and tissues in the adult human body. The code uses Monte Carlo data for photons and assumes complete absorption of the energy from the emitted electrons in organs and tissues. For bone, a model was used to estimate dose to red and yellow marrow and to endosteal cells of both trabecular and cortical bone. For a single inhalation of 1 mCi of ^{133}Xe , the 50 year dose to gonads was about 0.4 mrad. The dose to lungs from ^{133}Xe dissolved in tissues is about the same, but the dose to the lungs from ^{133}Xe in air spaces was about 1 mrad. (auth)

2252 (CONF-760444--2) DOSE TO THE STOMACH WALL FROM INJECTED /SUP 99M/TC PERTECHNETATE. Ford, M.R.; Deus, S.F.; Snyder, W.S. (Oak Ridge National Lab., Tenn. (USA)). 1976. 12p. Dep. NTIS \$3.50.

From Symposium on radiopharmaceutical dosimetry; Oak Ridge, TN, USA (26 Apr 1976).

In estimating the radiation dose to the gastrointestinal tract (GIT) it has been assumed generally that the measured activity in the tract, i.e., in the walls, is present in the contents. This assumption has been necessary because absorbed fractions for

photons were available only for the source in the contents. During the past year and a half, however, absorbed fractions, or specific absorbed fractions, have been estimated for photon emitters in the walls. In the work presented here new values are applied to estimate dose to the walls of the GIT from administration of ^{99m}Tc pertechnetate. The dose to the stomach wall from photons is found to be less than the dose from nonpenetrating radiation, assuming complete absorption of energy. Thus, a correct estimation of average dose to the wall requires use of absorbed fractions of energy for electrons as well as for photons. The problem is discussed and values of absorbed fractions for electrons are given which are based on a uniform distribution of the activity. However, a final resolution of the problem will require further biological data on the fraction of activity in the wall and the fraction in the contents. (auth)

- 2253 (CONF-760444--4) EFFECTS OF BODY AND ORGAN SIZE ON ABSORBED DOSE: THERE IS NO STANDARD PATIENT. Poston, J.W. (Oak Ridge National Lab., Tenn. (USA)). 1976. 32p. Dep. NTIS \$4.00.

From Symposium on radiopharmaceutical dosimetry; Oak Ridge, TN, USA (26 Apr 1976). The problem of estimating the absorbed dose to organs and tissues of the human body due to the presence of a radiopharmaceutical in one or more organs is discussed. Complications are introduced by the fact that the body is not homogeneous and in many cases the organ shapes are not regular. Publications of the MIRD Committee have provided a direct means of estimating the absorbed dose (or absorbed fraction) for a number of radioisotopes. These estimates are based on Monte Carlo calculations for monoenergetic photons distributed uniformly in organs of an adult phantom. The medical physicist finds that his patient does not resemble the adult phantom. In addition, the absorbed fractions for the adult are not reasonable values for the child. This paper examines how these absorbed fraction estimates apply to a nonstandard patient. (auth)

- 2254 (CONF-760444--5) ESTIMATION OF DOSE TO THE URINARY BLADDER AND TO THE GONADS. Snyder, W.S.; Ford, M.R. (Oak Ridge National Lab., Tenn. (USA)). 1976. 33p. Dep. NTIS \$4.00.

From Symposium on radiopharmaceutical dosimetry; Oak Ridge, TN, USA (26 Apr 1976). Radiation dose to the bladder from a radionuclide emitter present in the contents varies with many parameters such as radioactive half-life, biological half-lives of activity entering the bladder from other sites, rate of urine production, distention of the bladder, and individual habits. These are discussed and some practical rules are formulated for estimation of dose from photon emitters or beta emitters present in urine. A new point kernel for electrons due to Berger which takes straggling and bremsstrahlung into account has been tried and procedures are given for estimation of dose from a radioactive daughter. This is illustrated particularly for radionuclides of short radioactive half-life. Estimates of genetic dose due to internally deposited radionuclides are generally inaccurate as data on uptake of activity in the gonads are not documented in sufficient detail. (auth)

- 2255 (CONF-760444--6) DEVELOPMENT OF A MATHEMATICAL PHANTOM REPRESENTING A 10-YEAR-OLD

CHILD FOR USE IN INTERNAL DOSIMETRY CALCULATIONS. Deus, S.F.; Poston, J.W. (Oak Ridge National Lab., Tenn. (USA)). 1976. 14p. Dep. NTIS \$3.50.

From Symposium on radiopharmaceutical dosimetry; Oak Ridge, TN, USA (26 Apr 1976).

With the increased growth of nuclear energy generating facilities, estimates of absorbed radiation dose to human population groups (e.g., children) are required. In addition, children are being exposed to many nuclear medicine procedures and accurate dose estimates are needed. The main purpose of this research is to design a mathematical phantom representing as closely as possible a 10-year old child. (auth)

- 2256 (CONF-760992--17) MODEL FOR THE INDUCTION OF BONE CANCER BY ^{224}Ra . Groer, P.G.; Marshall, J.H. (Argonne National Lab., Ill. (USA)). 1976. Contract W-31-109-ENG-38. 14p. Dep. NTIS, PC A02/MF A01.

From 2. international symposium on biological effects of Ra-224 ; Neuherberg/Muenchen, F.R. Germany (20 Sep 1976).

A mathematical model for the transformation of normal endosteal cells into malignant tumor cells by α irradiation is applied to ^{224}Ra . The model postulates that a normal endosteal cell near the bone surface is transformed into a malignant cell by three consecutive events. The first two events are the initiation events. The probability of their occurrence is proportional to the absorbed endosteal dose and they generate dormant tumor cells. These dormant tumor cells are promoted by the third event, the promotion event. The probability of this last event is proportional to the rate of bone remodeling but independent of the radiation dose. In competition with these transforming events is the killing of any endosteal cell by α irradiation. Killing is balanced by replacement of killed endosteal cells by normal stem cells. This model provides the following interesting predictions for the human ^{224}Ra cases: after the decay of ^{224}Ra the tumor rate decreases exponentially at a rate proportional to the bone turnover rate; for exposure to the same dose the model predicts an increased number of tumors for protracted exposure (i.e., exposure at a lower dose rate). Implications of this model for the therapy of ankylosing spondylitis are discussed. Statistical procedures are suggested for comparison of this theoretical model with the existing data on the induction of osteosarcomas by ^{224}Ra in man.

- 2257 (CONF-770101--2) NEED FOR COLLECTION OF QUANTITATIVE DISTRIBUTION DATA FOR DOSIMETRY AND METABOLIC MODELING. Lathrop, K.A. (Chicago Univ., Ill. (USA). Dept. of Radiology; Franklin McLean Memorial Research Inst., Chicago, Ill. (USA)). 1976. Contract EY-76-C-02-0069. 8p. Dep. NTIS, PC A02/MF A01.

From 7. symposium on sharing of computer programs and technology in nuclear medicine, computer assisted data processing; Atlanta, GA, USA (16 Jan 1977).

Problems in radiation dose distribution studies in humans are discussed. Data show the effective half-times for ^{7}Be and ^{75}Se in the mouse, rat, monkey, dog, and human show no correlation with weight, body surface, or other readily apparent factor that could be used to equate nonhuman and human data. Another problem sometimes encountered in attempting to extrapolate animal data to humans involves equivalent doses of the radiopharmaceutical. A usual human dose for a radiopharmaceutical is 1 ml or 0.017 mg/kg. The same solution injected into a mouse in a convenient volume of 0.1 ml results in a dose of 4 ml/kg or 240 times that

received by the human. The effect on whole body retention produced by a dose difference of similar magnitude for selenium in the rat shows the retention is at least twice as great with the smaller amount. With the development of methods for the collection of data throughout the body representing the fractional distribution of radioactivity versus time, not only can more realistic dose estimates be made, but also the tools will be provided for the study of physiological and biochemical interrelationships in the intact subject from which compartmental models may be made which have diagnostic significance. The unique requirement for quantitative biologic data needed for calculation of radiation absorbed doses is the same as the unique scientific contribution that nuclear medicine can make, which is the quantitative *in vivo* study of physiologic and biochemical processes. The technique involved is not the same as quantitation of a radionuclide image, but is a step beyond.

- 2258 (FMI--1000-763) RECENT PROGRESS IN CALIFORNIUM-252 DOSIMETRY. Lanzl, L.H.; Rozenfeld, M.; Bednarek, D.; Oswald, R.; Moser, F.; Koch, R.; Mewissen, D.J. (Franklin McLean Memorial Research Inst., Chicago, Ill. (USA)). 1976. 7p. (CONF-760436--5). Dep. NTIS \$3.50.

From International symposium on californium-252 utilization; Paris, France (26 Apr 1976).

Studies are being conducted on increasing the accuracy of dose determinations in irradiated animals with small implanted tumors. Three experimental methods of *in-phantom* dosimetry are being employed in this work since any one method thus far has not led to a determination of dose to an accuracy within 5 percent at distances close to a source and since each method has distinct advantages for a given problem. Descriptions are given of these methods which are as follows: dosimetry using dielectric ionization chambers; dose contribution from moderated neutrons near a Cf source; and measurement of dose at various locations in a tumor-mouse radiobiological system. (HLW)

- 2259 (FMI--1000-764) ACQUISITION OF QUANTITATIVE BIOLOGIC DATA IN HUMANS FOR RADIATION ABSORBED DOSE ESTIMATES. Lathrop, K.A.; Harper, P.V.; Charleston, D.B.; Atkins, F.B.; Mock, B.H. (Chicago Univ., Ill. (USA)). 1976. 10p. (CONF-760444--7). Dep. NTIS \$3.50.

From Symposium on radiopharmaceutical dosimetry; Oak Ridge, TN, USA (26 Apr 1976).

Guidelines are presented for the collection in humans of quantitative *in vivo* biokinetic data suitable for the estimation of radiation absorbed doses. Technique and instrumentation are discussed. Internal checks built into the procedures are described which assure accountability for 100 percent of the radioactivity. (auth)

- 2260 (INIS-mf--3315, pp 33) CHROMOSOME ANOMALIES IN THE PERIPHERAL BLOOD OF PATIENTS RECEIVING DIAGNOSTIC DOSES OF RADIOACTIVE GOLD. Grigorov, L.A.; Khristova, O.; Yaneva, M. (Vissh Meditsinski Inst., Plovdiv (Bulgaria)). 1976. (In Bulgarian).

From 2. national conference on medical biology and genetics with international participation and symposium on population genetics and demography of hereditary diseases; Varna, Bulgaria (2 Oct 1976).

Second national conference on medical biology and genetics with international

participation and symposium on population genetics and demography of hereditary diseases. Abstracts.

Chromosome analysis of peripheral lymphocytes was carried out in patients injected intravenously for the purpose of hepatic scanning, with 200 to 300 μ Ci of radioactive gold. Control blood samples, taken from each subject prior to radionuclide administration, generally indicated but the presence of isolated chromosome fragments (0.3%). Three hours following ^{198}Au administration, types and amounts of chromosome anomalies were found to be increased over control figures. All patients displayed one-break (5.9%) and two-break (1.7%) aberrations, chromosome fragments (4.8%), acentric and centric rings (0.3%), and dicentric (1.4%). It must be concluded that the above ^{198}Au activities do cause chromosomal damage to peripheral lymphocytes.

- 2261 (LA-UR--76-1718) CALIBRATION PROCEDURES FOR IN-VIVO SODIUM IODIDE SPECTROMETRY OF PLUTONIUM AND AMERICIUM IN THE HUMAN LUNGS. Umbarger, C.J.; Jett, J.H. (Los Alamos Scientific Lab., N.Mex. (USA)). 1976. Contract W-7405-ENG-36. 18p. (CONF-760634--5). Dep. NTIS \$3.50.

From Pacific regional symposium; Seattle, WA, USA (24 Jun 1976).

This paper described the calibration techniques and associated error analysis for the *in-vivo* measurement by NaI spectrometry of heavy elements in the lung of personnel, specifically ^{238}Pu , ^{239}Pu and ^{241}Am . A very brief description of the instrumentation system is included.

- 2262 (LA-UR--76-2097) CESIUM-137 WHOLE-BODY CONTENT IN A NORMAL NEW MEXICO POPULATION. Thomas, R.G.; Richmond, C.R.; Furchner, J.E.; Anderson, E.C. (Los Alamos Scientific Lab., N.Mex. (USA)). 1976. Contract W-7405-ENG-36. 14p. (CONF-761031--5). Dep. NTIS \$3.50.

From 10. midyear symposium for Health Physics Society; New York, NY, USA (11 Oct 1976).

A fairly consistent population of normal New Mexicans has been whole body counted periodically, for almost 20 years. Availability of the same individuals has not always been possible but the size of any group over one counting period has rarely been below 40 individuals. Nanocuries of cesium-137 and grams of potassium have been the primary measurements, the latter determined through potassium-40 counting. The whole-body gamma ray counting has been performed using a large liquid scintillation detector, designed and built at the Los Alamos Scientific Laboratory. The data are generally expressed in terms of picocuries of cesium-137 per gram of body potassium (pCi/gK). Following the peaks of high level atmospheric testing (early to mid-1960s) the levels rose, approaching 120 pCi/gK. For the five year period beginning in 1964 there was a steady decline. During the years of 1969 through 1973 the whole-body levels were essentially constant at approximately 20 pCi/gK. A gradual decline occurred over the next two years, reaching the current level of about 10 pCi/gK. A group of 100 individuals was counted during the summer of 1976 and these data are presented, showing that they follow a normal distribution.

- 2263 (MLM--2347(OP)) SOME RECENT CHANGES IN TRITIUM HANDLING AND CONTROL AT MOUND LABORATORY. Rhinehammer, T.B. (Mound Lab.,

Miamisburg, Ohio (USA)). 1976. Contract EY-76-C-04-0053. 7p. (CONF-7606114--1). Dep. NTIS \$3.50.

From Review of SLL Tritium Research Laboratory; Livermore, CA, USA (22 Jun 1976).

Significant reductions in tritium effluents and personnel exposures at Mound Laboratory have been made during the past 5 yr. Yearly effluents are less than 3 percent of former levels and personnel exposures have been reduced by a factor of 300. Several recent changes which have contributed to these reductions include lowered tritium levels in gloveboxes, and the efficiency and capacity of Mound's new effluent removal system. Personnel exposures have been reduced dramatically by changing to precious metal catalytic converters or oxidizers for use with the glovebox gas purification system. Unlike some former systems using hot copper or proprietary reactants for oxygen removal, a catalyst provides very effective removal of both oxygen and tritium. Both oxygen and tritium can be monitored and, if necessary, increments of hydrogen in argon can be added until the oxygen level is brought down to the desired value.

- 2264 (MLM--2365(OP)) MOUND LABORATORY RESPIRATORY PROTECTION PROGRAM. Wright, E.M. (Mound Lab., Miamisburg, Ohio (USA)). 1976. Contract E(33-1)-GEN-53. 12p. (CONF-760967--1). Dep. NTIS \$3.50.

From Loss prevention conference; St. Louis, MO, USA (27 Sep 1976).

The Mound Laboratory Respiratory Protection Program provides quality assurance to ensure that equipment is approved (U.S. Bureau of Mines) and adequate orientation and training, respirator fitting, maintenance of equipment, and records maintenance.

- 2265 (ORO--2401-87) IN-VIVO EVALUATION OF STANDARD MAN MODEL ABSORBED FRACTIONS USING / SUP 99M/Tc-SULFUR COLLOID. Jones, J.P.; Wagner, J.; Brill, A.B. (Vanderbilt Univ., Nashville, Tenn. (USA). Div. of Nuclear Medicine and Biophysics). 1976. Contract E(40-1)-2401. 8p. (CONF-760444--3). Dep. NTIS \$3.50.

From Symposium on radiopharmaceutical dosimetry; Oak Ridge, TN, USA (26 Apr 1976).

Results are reported from a study performed to check how well the calculated absorbed radiation dose fraction data (S-factors) given in MIRD Pamphlet No. 5 and related reports apply to living patients administered radionuclides. An external target region was defined on the skin of the Snyder-Fisher phantom, anterior to and overlaying the center of the liver. This target was a 5 cm square by 0.089 cm thick slab of LiF, and the S-factors were computed for this target and uniform distributions of /sup 99m/Tc in the liver and spleen. Experimentally, this target was represented by placing thirteen LiF TLD's of the same thickness in a correspondingly positioned 5 cm square area. An experiment performed with the Mr. Adam phantom showed good agreement between the measured (TLD) and calculated (S-factor) doses. In the patient studies, the group of thirteen TLD's was correspondingly positioned, and the measured TLD dose compared to that calculated from the patient cumulated activity and the Snyder-Fisher phantom S-factors. In most cases, these doses agreed to within 30 percent, although larger discrepancies were observed with non-standard sized patients. Based upon these results, it is desirable to make further investigations of this type, especially with lower energy gamma emitters, and the methods of dose and activity measurement used in this

study should be useful unless the photon energy is too low, or the source activity changes rapidly with time. (auth)

- 2266 (UCD--472-123, pp 120-121) DOSE LIMITATIONS TO HUMANS FROM ¹²⁹I. Book, S.A. 1976.

Annual report, fiscal year 1976.

From metabolic data on humans, suppression of thyroidal uptake of ¹²⁹I was predicted, and doses subsequently were calculated. Doses were estimated to be on the order of 7 mrem/nCi ¹²⁹I up to single oral dosages of 1 nCi, declining thereafter. Beyond 10 nCi, the dose/nCi decreased markedly, dropping below 1 mrem/nCi at dosages in excess of 1000 nCi.

- 2267 SURVIVAL, CAUSES OF DEATH, AND ESTIMATED TISSUE DOSES IN A GROUP OF HUMAN BEINGS INJECTED WITH PLUTONIUM. Rowland, R.E. (Argonne National Lab., IL); Durbin, P.W. pp 329-341 of Health effects of plutonium and radium. Webster, S.S. (ed.). Salt Lake City; Univ. of Utah (1976).

From Workshop on the biological effects and toxicity of Pu 239 and Ra 226; Sun Valley, ID, USA (6 Oct 1975).

See CONF-751043--.

To determine the relationship between urinary excretion and plutonium body content, 18 patients of short life expectancy were injected with ²³⁹Pu between 1945 and 1947. Seventeen of these 18 individuals have been identified; eight were found to have survived for at least eight years and four are still alive today (1975). The causes of death of 13 of these individuals have been determined from death certificates; none appear to be related to the administered Pu. Doses to the liver and to the cells on the surface of bone were calculated for these Pu cases. The liver doses do not appear to be high enough to be carcinogenic, but comparison of the bone-surface doses with radium doses that have induced bone tumors indicates that six of these cases have received doses high enough to be considered carcinogenic. However, no bone tumors have yet appeared. (auth)

- 2268 ESTIMATED RISK TO HUMAN BONE FROM ²³⁹Pu. Mays, C.W. (Univ. of Utah Coll. of Medicine, Salt Lake City); Spiess, H.; Taylor, G.N. pp 343-362 of Health effects of plutonium and radium. Webster, S.S. (ed.). Salt Lake City; Univ. of Utah (1976).

From Workshop on the biological effects and toxicity of Pu 239 and Ra 226; Sun Valley, ID, USA (6 Oct 1975).

See CONF-751043--.

The cumulative risk in terms of average skeletal dose from ²³⁹Pu, was tentatively estimated on a linear model to be about 200 bone sarcomas/10⁶ person . rad. This estimate predicts that about 200 cases of bone sarcoma may be induced during the lifetime of 1,000,000 persons each receiving one rad to the skeleton from ²³⁹Pu. The risk estimate is based on the observed incidence of bone sarcomas in German patients receiving long protracted irradiation from repeated injections of 3.62-day ²²⁴Ra, an α-emitter which like ²³⁹Pu decays to a large extent on bone surfaces. Independent support for this risk estimate comes from the fact that it exceeds the bone sarcoma risk from 1600-yr ²²⁶Ra in man by roughly the same factor as the risk from bone-surface seeking ²³⁹Pu exceeds that from bone-volume seeking ²²⁶Ra in experimental animals. The risk estimate is restricted to protracted irradiation from bone-surface seeking α-emitters, such as ²²⁴Ra, ²³⁹Pu, and ²⁴¹Am at cumulative doses not to

exceed a few thousand rad. It should not be used for the bone-volume seekers nor for the β -emitters. The risk estimate must be regarded as provisional and open to future revision. (auth)

2269 PLUTONIUM TOXICOLOGY AND OTHER

TOXICOLOGY. Stannard, J.N. (Univ. of Rochester, New York). pp 363-372 of Health effects of plutonium and radium. Webster, S.S. (ed.). Salt Lake City; Univ. of Utah (1976).

From Workshop on the biological effects and toxicity of Pu 239 and Ra 226; Sun Valley, ID, USA (6 Oct 1975).

See CONF-751043--.

The acute and chronic toxicity and carcinogenicity of ^{239}Pu are compared with that of a number of chemical poisons, biological toxins, and selected radionuclides. It is concluded that the acute toxicity of Pu is less than that of many other substances but that the long half-life of Pu makes it a potent carcinogen in man. (CH)

2270 MALIGNANCIES IN PATIENTS CONTAMINATED WITH RADIUM. Brues, A.M. (Argonne National Lab., IL). pp 451-455 of Health effects of plutonium and radium. Webster, S.S. (ed.). Salt Lake City; Univ. of Utah (1976).

From Workshop on the biological effects and toxicity of Pu 239 and Ra 226; Sun Valley, ID, USA (6 Oct 1975).

See CONF-751043--.

The frequency of known radiogenic tumors and other malignancies in relation to mean radiation dose to the skeleton was examined based on clinical and pathologic data obtained from records of those persons (patients and dial painters) whose radium burdens (^{226}Ra) have been measured. This preliminary survey indicates that the total excess of malignant tumors seen in patients receiving 500 rads and above can be accounted for by those of bone and the air cavities of the head. (auth)

2271 CHRONIC RADIUM INTOXICATION: MORPHOLOGY OF BONE AND MARROW INFARCTS. Sharpe, W.D. (Cabrini Health Care Center, New York). pp 457-483 of Health effects of plutonium and radium. Webster, S.S. (ed.). Salt Lake City; Univ. of Utah (1976).

From Workshop on the biological effects and toxicity of Pu 239 and Ra 226; Sun Valley, ID, USA (6 Oct 1975).

See CONF-751043--.

Using direct and polarized light microscopy and a variety of standard histologic stains, the morphology of two groups of bone and marrow infarcts are compared. One group is from patients whose infarcts can, with confidence, be related to ischemia, trauma, or embolization and whose histories exclude radium ingestion or exposure. The second group is from radium dial painters whose pre-terminal body burdens of ^{226}Ra ranged from 1.67 μCi to some value equal to or below 0.0042 μCi . The individual bone or marrow infarct among the radium cases does not differ radically from those in the ischemia-injury group, although taken as a whole, the radium-related infarcts are marked by less osteogenetic activity, a less prominent blood supply, much less cellular fibrous tissue and more extensive deposits of basophilic bone debris than the ischemia-injury group. (auth)

2272 IMMUNOLOGICAL STUDIES IN THE HUMAN RADIUM POPULATION. Lloyd, E.L.; Menon, M. (Argonne National Lab., IL). pp 485-496 of Health effects of plutonium and radium. Webster, S.S. (ed.). Salt Lake City; Univ. of

Utah (1976).

From Workshop on the biological effects and toxicity of Pu 239 and Ra 226; Sun Valley, ID, USA (6 Oct 1975).

See CONF-751043--.

Sera from patients carrying high body burdens of radium were evaluated by indirect immunofluorescence for antibodies reactive with tissue culture cell lines derived from five osteosarcomas and one malignant melanoma. These were compared with the sera from normal controls and patients with sarcomas and other malignancies. No significant difference could be detected between the number of reactions seen with the radium patients and the controls. By contrast, cross reactions between sera from all the tumor patients tested were greatly increased over the controls. With one osteosarcoma cell line, RPMI-41, 11 out of 12 of the tumor patients' sera reacted compared with 6 out of 17 for the controls. In addition, 30 out of 32 of the tumor patients' sera reacted with the malignant melanoma cell line compared with only 3 out of 12 for the controls. This suggests that if serum from a radium patient could be shown to cross react with a large number of carefully selected cell lines, the presence of a tumor might be suspected. (auth)

2273 SOME SIMILARITIES OF RADIUM AND PLUTONIUM TOXICITY IN THE BEAGLE AND MAN. Taylor, G.N.; Jee, W.S.S.; Mays, C.W. (Univ. of Utah Coll. of Medicine, Salt Lake City). pp 523-536 of Health effects of plutonium and radium. Webster, S.S. (ed.). Salt Lake City; Univ. of Utah (1976).

From Workshop on the biological effects and toxicity of Pu 239 and Ra 226; Sun Valley, ID, USA (6 Oct 1975).

See CONF-751043--.

The value of many toxicity studies, involving various experimental animals, is contingent on how reliably the data can be related to man. An equation has been proposed for extrapolating the Pu syndrome from dog studies to man. It employs the extensive human radium experience and a plutonium-radium toxicity ratio in the dog. The validity of this method is contingent on similar target tissues for both Pu and Ra and approximately equal RBE's for Pu relative to Ra in both man and the dog. Thus, although the radiosensitivity might be significantly different, the endpoints within a given tissue in man and the animal model must necessarily be comparative. The degree of parallelism in the radium-induced syndromes of man and the beagle are examined in order to assess the practicability of estimating Pu risk in man through use of a Pu-Ra toxicity ratio in the beagles. (auth)

2274 DOSIMETRY OF ^{239}Pu AND ^{226}Ra IN MAN AND ANIMALS. Spliers, F.W.; Whitwell, J.R. (Cookridge Hospital, Leeds, Eng.). pp 537-552 of Health effects of plutonium and radium. Webster, S.S. (ed.). Salt Lake City; Univ. of Utah (1976).

From Workshop on the biological effects and toxicity of Pu 239 and Ra 226; Sun Valley, ID, USA (6 Oct 1975).

See CONF-751043--.

Calculations of the absorbed dose rates to the tissues of bone from ^{226}Ra and ^{239}Pu were made on the basis of measured distributions of linear path lengths through the marrow spaces and trabeculae of specimens of human and animal bone (beagle and miniature swine). These show that differences occur, particularly in the dose rates to marrow, between man and animals because of differences in their bone structure. Evidence is presented relating to tumour

occurrence and trabecular surface area that shows the radiosensitivity of the endosteum in cortical bone to be much less than that in trabecular bone. Finally some estimates are made, in terms of dose rates to relevant tissues of the total risk to bone tissues from ^{226}Ra and ^{239}Pu as well as estimates of the consequent maximum permissible body burdens.

2275 PLUTONIUM: A POSSIBLE LEUKAEMIC RISK.

Vaughan, J. (Bone Research Lab., Oxford). pp 691-705 of Health effects of plutonium and radium. Webster, S.S. (ed.). Salt Lake City; Univ. of Utah (1976).

From Workshop on the biological effects and toxicity of Pu 239 and Ra 226; Sun Valley, ID, USA (6 Oct 1975).

See CONF-751043--.

Information about the retention and pattern of distribution of plutonium in the bone marrow is reviewed together with a summary of experimental and clinical evidence that leukemia or associated blood dyscrasias may occur as a result of a Pu body burden. The importance of thorotrast studies in assessing plutonium hazards is discussed. (auth)

2276 RNA-INSTRUCTED DNA POLYMERASE ACTIVITY

IN RADIATION-INDUCED OSTEOSARCOMAS. Frazier, M.E. (Battelle Pacific Northwest Labs., Richland, WA); Park, J.F.; Jee, W.S.S.; Taylor, G. pp 707-716 of Health effects of plutonium and radium. Webster, S.S. (ed.). Salt Lake City; Univ. of Utah (1976).

From Workshop on the biological effects and toxicity of Pu 239 and Ra 226; Sun Valley, ID, USA (6 Oct 1975).

See CONF-751043--.

Viruses of the RNA tumor group are etiologic agents of spontaneously occurring neoplastic disease in a number of animal species. These oncornaviruses possess certain biochemical properties which permit them to be easily detected in infected cells, including RNA-instructed DNA polymerase (RIDP) and a closely associated 70S RNA genome in a cytoplasmic particulate fraction having a density of 1.15-1.20 g/ml. Tissues from three dogs with radiation-induced lung tumors and four dogs without tumors did not contain RIDP. However, RIDP was detected in materials prepared from five beagles with radiation-induced osteosarcomas. (auth)

2277 THEORY OF THE INDUCTION OF BONE CANCER

BY ALPHA RADIATION: A SUMMARY. Marshall, J.H.; Groer, P.G. (Argonne National Lab., IL). pp 717-728 of Health effects of plutonium and radium. Webster, S.S. (ed.). Salt Lake City; Univ. of Utah (1976).

From Workshop on the biological effects and toxicity of Pu 239 and Ra 226; Sun Valley, ID, USA (6 Oct 1975).

See CONF-751043--.

A theory of the induction of osteosarcoma by alpha particles is summarized. When the postulates of the theory have been written as a set of four differential equations, they have been found to provide acceptable fits to the dose-time-response surface for ^{226}Ra - ^{228}Ra in man and for ^{226}Ra in dogs. That is, the theory appears to fit not only the cumulative incidence as a function of radium intake for man and dog over the whole range of dose, but also the distribution of appearance times of the tumors at each dose level. (auth)

2278 RELATIONSHIP OF LUNG CANCER INDUCTION TO INHALATION OF SUBMICRON PARTICLES, EITHER STABLE OR RADIOACTIVE.

Huth, G.C. (Univ. of

California, Los Angeles); Dugas, D.J. pp 729-750 of Health effects of plutonium and radium. Webster, S.S. (ed.). Salt Lake City; Univ. of Utah (1976).

From Workshop on the biological effects and toxicity of Pu 239 and Ra 226; Sun Valley, ID, USA (6 Oct 1975).

See CONF-751043--.

A number of plutonium inhalation experiments with ostensibly conflicting results are actually consistent if interpreted on the basis of the evolving knowledge of tumor immunology. A hypothesis was developed which proposes that lung cancer is induced by the long term inhalation specifically of submicron sized particles. The hypothesis can probably accommodate both radioactive and non-radioactive particles. In the postulated sequence of events, chronically inhaled, submicron particulates, which are in the size range that is known to be cleared through the lymphatic system, act to impede the normal feedback of the lymphatic-immune system to insulated regions of the bronchial tree or lung. Such particulates act as irritants, either in transit through the epithelial layer, in lymph channels, or even transferred to lymph nodes causing a fibrosing response in these reticular tissues which eventually impedes the movement of immunological cells. The carcinogenic insult can then occur from a variety of sources with the resulting tumor lesion growing unimpeded from immune attack. If the particles are radioactive the induction of fibrosis is much enhanced with the additional possibility that the radioactivity furnishes the insult for carcinogenesis. (auth)

2279 CYTOGENETIC EFFECTS OF INTERNAL ALPHA

EMITTERS ON HUMAN LYMPHOCYTES. Hoegerman, S.F. (Argonne National Lab., IL). pp 779-791 of Health effects of plutonium and radium. Webster, S.S. (ed.). Salt Lake City; Univ. of Utah (1976).

From Workshop on the biological effects and toxicity of Pu 239 and Ra 226; Sun Valley, ID, USA (6 Oct 1975).

See CONF-751043--.

A review and analysis of several papers on the cytogenetic effects of ^{226}Ra , ^{239}Pu , ^{222}Rn , ^{212}Pb , and Thorotrast (colloidal $^{232}\text{ThO}_2$), is presented. Examples of calculations of the dose to cultured lymphocytes and an overview of attendant practical and statistical problems are given. (auth)

2280 IS THE BODY'S URANIUM THE CAUSE OF

BENDS. Nor. Olje Revy; 2: No. 2, 27(1976). (In Norwegian).

The symptoms of the 'bends' and its more serious forms the 'staggers' and the 'chokes', are briefly described. It has been found that 6% of divers and nearly 19% of others who breathe compressed air are affected by changes in bone structure and density, mostly near the hip, knee and shoulder joints, which may reach a disabling degree. The mechanism of formation of the the bubbles of helium or nitrogen which cause the 'bends', and whose restriction of blood flow is believed to cause the bone deterioration, is uncertain. It is suggested here that the energy required to initiate bubble formation, of the order of several MeV, may come from the spontaneous fission of uranium traces in the body. It is significant that the distribution of uranium in the body is similar to that of the bone deterioration.

2281 EXPOSURE OF THE HANDS TO RADIATION IN HANDLING ^{99}Mo --/SUP ^{99}mTc GENERATORS AND /SUP ^{99}mTc SOLUTIONS.

Husak, V.; Lidova, L.;

Trousil, J.; Kukaska, R. *Med. Radiol.*; 21: No. 11, 33-36(1976). (In Russian).

The article contains the results of monitoring the hand and the finger exposure during the work with ^{99}Mo and $^{99\text{m}}\text{Tc}$ generators and $^{99\text{m}}\text{Tc}$ solutions. For this purpose the film dosimeters as well as thermoluminescent dosimeters LiF having the diameter of 13 mm and thickness of 0.4 mm were used. The approximate formula for the exposure rate on the surface of glass syringes containing radioactive substance is given. A table containing the results obtained allows one to estimate easily the finger exposure of workers of other departments of nuclear medicine. The hand exposure does not exceed the maximum permissible value 75 rem/year. Though the hand exposure is relatively small, still it is necessary to use regularly the protective means.

- 2282 ESTIMATED RISK FROM ^{239}Pu TO HUMAN BONE, LIVER AND LUNG. Mays, C.W. (Utah Univ., Salt Lake City (USA). Radiobiology Div.). pp 373-380 of Biological and environmental effects of low-level radiation. Vol. 2. Vienna; IAEA (1976).

From Symposium on biological effects of low-level radiation pertinent to protection of man and his environment; Chicago, Ill., USA (3 Nov 1975).

The cumulative risks to humans, in terms of average organ doses from ^{239}Pu , are tentatively estimated as follows: bone sarcoma risk = 200 bone sarcomas/ 10^6 person.rad; liver cancer risk = 100 liver cancers/ 10^6 person.rad; and lung cancer risk = 200 lung cancers/ 10^6 person.rad. The considerations on which risk estimates are based are discussed for bone, liver and lung. An effort has been made to derive risk estimates that are realistic, rather than too low or too high. However, each of these estimated risks must be regarded as provisional and open to subsequent revision. The proposed risk for lung cancer is especially uncertain, although in rodents the incidence per rad from Pu-induced lung cancers seems somewhat similar to that for Pu-induced bone sarcomas. An inherent complication in each of these estimated risks is to what extent the true dose-responses deviate from the assumed linear relationships. These risk estimates should not be used for organ doses considerably above 1000 rads.

- 2283 EVALUATION OF RADIATION-INDUCED PULMONARY LESIONS BY SPIT AUTORADIOGRAPHY. Paun, C. (Clinical Hospital Fundeni, Bucharest (Romania)); Nicolae, M. (Institutul de Fizica Atomica, Bucharest (Romania)). pp 229-234 of Biological and environmental effects of low-level radiation. Vol. 2. Vienna; IAEA (1976).

From Symposium on biological effects of low-level radiation pertinent to protection of man and his environment; Chicago, Ill., USA (3 Nov 1975).

Internal irradiation caused by radionuclides incorporated in pulmonary tissue is guilty of producing two kinds of biological effect: pulmonary fibrosis and carcinogenesis. The role of irradiation in the etheopathogenesis of carcinogenesis should be argued first by proving the presence of contamination radionuclides in pulmon, which is revealed by spit eliminations. To prove the presence of contaminating radionuclides inhaled in pulmon, spit autoradiography was used, representing the only way of showing the presence in pulmon of α - and β -emitting elements. Active elements contained in spit samples were identified by drawing the histograms of the path length of

particles. Contamination was considered significant when the difference between average density of α traces determined on sample and average density of traces on control exceeded two to three times the average fluctuation. In the case of contamination with β -emitting elements, specific autoradiographic images were noticed for accumulations of β activity at cellular level. Spit autoradiography was applied during complex periodic medical examinations of miners working in radioactive ore mines. By means of exhaustive clinical and laboratory examinations, correlations were established between autoradiographic findings and pulmonary radiopathological aspects. At present, methodological improvements are being dealt with to standardize spit smear collecting and processing methods and especially to obtain exact quantitative determinations of pulmonary contamination. In this way it is hoped to establish a dose-effect relation that would be an objective element in considering pulmonary lesions caused by internal irradiation.

- 2284 INFERENCES ON RADIATION CARCINOGENESIS REVEALED BY SELECTED STUDIES IN ANIMALS. Bustad, L.K.; Goldman, M.; Rosenblatt, L. (Washington State Univ., Pullman). pp 13-29 of Biology of radiation carcinogenesis. Yuhas, J.M. (ed.). New York; Raven Press (1976).

From Conference on the biology of radiation carcinogenesis; Gatlinburg, TN, USA (7 Apr 1975).

See CONF-750443--.

Studies of heterogeneous populations of animals with long lives and humans, exposed to various radionuclides and particularly those related to the nuclear energy fuel cycle, are instructive for deriving inferences relative to the cinogenic risk of energy-related radiation. Dose-response curves for various radionuclides [with varying half-lives, qualities of radiation (LET), and metabolic characteristics] provide similarities regardless of the species studied or the tissues at risk. (CH)

- 2285 GROSS DISTRIBUTION OF ^{241}Am IN A MAN SEVEN YEARS AFTER INHALATION. Toohey, R.E.; Essling, M.A. (Argonne National Lab., Ill. (USA)). pp 153-160 of Biological and environmental effects of low-level radiation. Vol. 2. Vienna; IAEA (1976).

From Symposium on biological effects of low-level radiation pertinent to protection of man and his environment; Chicago, Ill., USA (3 Nov 1975).

The gross distribution of ^{241}Am remaining in a man seven years after exposure to airborne americium particles has been determined by several techniques. Measurements were made of the radiation with NaI(Tl) crystals, one above and one below the supine subject at seven equally spaced points along the long axis. The patterns obtained indicated skeletal deposition in addition to material in the thorax. More detail was obtained from a longitudinal profile scan made at 10-cm intervals with a slit-collimated detector. A general labelling of the skeleton consistent with bone surface deposition was observed, together with a pronounced increased concentration in the thorax. A transverse profile scan was made at the point which had yielded the highest counting rate in the longitudinal scan. Unequivocal evidence for a lung burden was observed in the asymmetry of this scan. The presence of the long-term lung burden was further confirmed by measurements made over the chest with a gas-filled proportional counter. The ratio of primary quanta in the 60-keV peak to those which had been forward scattered

indicated that the radiation had passed through approximately 5 cm of soft-tissue equivalent absorber. Since estimates of the subject's chest wall thickness were only about 2.5 cm, the major part of the radiation was coming from deeper in the chest, below the level of the rib cage. Therefore the material in the chest was primarily in the lungs and not in the bones of the thoracic cage. The proportional counter also showed that there was little contamination in the liver and spleen. This was expected since the subject had undergone extensive chelation therapy with DTPA at another centre. The whole-body content of ^{241}Am was estimated to be $1.00 \pm 0.03 \mu\text{Ci}$, with about 25% of this amount in the lungs. Thus a sizable fraction of the material retained is still in the lungs after seven years.

- 2286 (ORNL-tr--4247) PROBLEM OF HOT PARTICLES. Jacobi, W. Translated by S.D. Blalock Jr. from *Atomkernenergie*; 28: No. 1, 29-37(1976). 20p. (CONF-7505122--1). Dep. NTIS \$3.50.

From Conference of the medical and biological problems of radiation exposure; Borstel, F.R. Germany (30 May 1975).

Proceeding from an analysis of the dose distribution and the expected cytological effects in the surrounding of hot Pu-particles in the lung, the results of relevant animal experiments and the observations among overexposed Pu-workers are summarized. From these empirical findings no unusual high effectiveness of hot particles for the generation of late effects in the lung can be concluded. On the contrary they indicate that the late effect risk from hot, α -active particles is probably smaller compared with an uniform irradiation of the lung with the same mean dose. Accordingly there is no biological justification of the Tamplin--Cochran-proposal to revise in the case of hot α -active particles the concept of the mean lung dose, as it is currently used in radiation protection.

- 2287 LOW-LEVEL CHRONIC EXPOSURE TO TRITIUM: AN IMPROVED BASIS FOR HAZARD EVALUATION. Dobson, R.L. (California Univ., Livermore (USA). Lawrence Livermore Lab.). pp 57-62 of Biological and environmental effects of low-level radiation. Vol. 2. Vienna; IAEA (1976).

From Symposium on biological effects of low-level radiation pertinent to protection of man and his environment; Chicago, Ill., USA (3 Nov 1975).

The possibility that significant biological effects may result from chronic low-level exposure to ^3HOH is the main health and environmental concern regarding tritium from nuclear energy operations. Direct data for such exposure are, however, largely still unavailable. Information on chronic irradiation at low levels derives mostly from γ -ray studies, so extrapolations are necessary for tritium. But controversy exists on tritium's relative biological effectiveness (RBE) compared to γ radiation and on the related quality factor (Q) used for radiation protection (recently adjusted downward from 1.7 to 1). A firmer basis for extrapolation is needed. The author has obtained quantitative data for low-level ^3HOH and ^{60}Co γ -ray exposures in the intact mammal. Developing mice were exposed to various doses over 33 days; surviving oocytes were then counted in ovaries and compared with controls, providing dose-response curves for both radiations. By comparing these curves, RBE values were determined. The RBE was found to vary inversely with dose, in accord with the theory of dual

radiation action. At γ -ray doses of 50 rads, the RBE was 1.6. It increased at lower doses, reaching a value of approximately 3. With short exposures, the RBE was lower, due possibly to differences in microdistribution of ^3H . These results demonstrate that conclusions from both high-dose and short-term experiments are likely to underestimate the effects of low-level chronic exposure to ^3HOH . Measurement of the systematic variation of tritium's RBE with dose and recognition of the effect of exposure duration provide a more secure basis for hazard evaluation.

- 2288 BIOLOGY AND TOXIC ACTION OF PLUTONIUM AND TRANSPLUTONIUM ELEMENTS. Nenot, J.C.; Lafuma, J. (CEA Centre d'Etudes Nucleaires de Fontenay-aux-Roses, 92 (France). Dept. de Protection). *Radioprotection*; 11: No. 3, 165-181(1976). (In French).

From Meeting on toxicity and ecology of plutonium and transplutonium elements; Chatenay-Malabry, France (11 Mar 1976).

A detailed analysis of plutonium and transplutonium elements is made both in the case of inhalation and contaminated wounds, and the various therapeutic procedures are given. The present state of knowledge on the toxicity of plutonium is discussed as well as the specific problems of hot spots and the mechanism of the effect of low level doses. Finally, the approach to the setting of safety standards and the methods of workers surveillance are presented.

- 2289 (ERDA-tr--222, pp 115-119) QUESTION OF EXTRAPOLATION TO MAN OF BEHAVIOR PATTERNS OF STRONTIUM-90 IN THE ANIMAL ORGANISM. Sarapul'tsev, I.A.; Rasin, I.M.; Panchenko, I.Ya. 1976. Translated from *Radiobiologiya*; 16: No. 3, 417-420(1976).

Radiobiology. A comparison was made of patterns of metabolism of radiostrontium obtained in dogs to analogous data in man. It was established that they are identical, and this permits direct extrapolation of radiation loads of radiostrontium from dogs to man.

- 2290 THYROID CANCER. CLINICAL ASPECTS OF TRH/TSH/T₃ INTERACTIONS. Piers, D.A. Groningen, Netherlands; Rijksuniversiteit, Netherlands (1976). 121p. (In Dutch). INIS.

Available from Library KNAW, Kloveniersburgwal 29, Amsterdam, Netherlands; 447 refs., 29 figs., 30 tables; with summary in English; Thesis.

The role of ionizing radiation in the introduction of thyroid carcinoma is discussed. In the treatment of thyroid cancer, radioiodine administration is of value as an ablation procedure, completing the thyroidectomy and as a method to irradiate selectively functioning thyroid carcinoma tissue that cannot be removed surgically. Results of the clinical management of 155 patients with malignant thyroid tumours are presented. The ablation dose of iodine-131 can be decreased to 40 millicuries thus effectively reducing the patients whole body radiation dose.

- 2291 NUCLEAR POWER. *Radiol. Technol.*; 48: No. 2, 176-178(1976).

It is assumed that nuclear capacity in the United States will increase from 6,000 megawatts in 1970 to 800,000 megawatts in 2000. There is a postulated 25-fold increase in uranium mining and milling and a 15-fold increase in fuel fabrication facilities. The primary problem in uranium mines is radon-222

and its short-lived daughters. Radium-226 and its decay products constitute the hazard from uranium mills and fabrication plants. The location of uranium mills in sparsely populated areas and the appropriate control of tailings and liquid wastes can prevent population exposures from this source. The important stack discharges from reactors are radionuclides of noble gases in the elemental form, tritium as water vapor, and iodine in a variety of forms. Sources of contamination from liquid metal fast breeder reactors are isotopes of Pu and Na. Estimated dose rates from power reactor effluents are discussed and hazards from reactor accidents are considered. (HLW)

- 2292 EXAMPLES OF MICRODOSIMETRIC PROBLEMS IN RADIATION PROTECTION: TRITIUM AND PLUTONIUM. Metalli, P. Radiat. Alta Energ.; 182-203(1976). (In Italian).

A short review is presented on the biological bases of the theory of microdosimetry, pointing out both the advantages of this modern approach for the understanding of radiation action, and its limitations with regard to practical applications. Two examples of extreme non-uniformity of energy deposition in living tissue are then briefly discussed, which are of some interest for radiation protection: the internal contamination by tritium and by plutonium deposition at the bone surfaces.

- 2293 MULTIPLE EXTERNAL-INTERNAL RESORPTIONS AS LATE EFFECTS OF THORIUM X (^{22}Ra).

Reichart, P.; Eckhardt, W.; Reznik, G. (Medizinische Hochschule Hannover (Germany, F.R.)). J. Oral Pathol.; 5: 52-59(1976).

Multiple external-internal resorptions are infrequent and are related to a variety of etiological factors. Thorium X (^{22}Ra) is believed to cause the dental resorptive changes observed in two patients who had received a series of injections each containing 8 to 70 μCi of ^{22}Ra 25 years previously.

(Environmental Protection Agency, Washington, D.C. (USA). Office of Radiation Programs). pp 587-600 of Transuranium nuclides in the environment. Vienna; IAEA (1976).

From Symposium on transuranium nuclides in the environment; San Francisco, Calif., USA (17 Nov 1975).

Estimates of excess cancer mortality, based on the linear non-threshold hypothesis and calculated by means of the absolute risk estimates in the NAS-BEIR Report, are given for a number of current occupational limits. These include continuous whole-body exposure to adults, age 20 to 65 at 5rad/a from external

low LET radiation and skeletal body burdens for 45 years at the critical organ limits given by ICRP Committee II for ^{226}Ra and ^{239}Pu . The estimated cancer mortality for these three situations differs by a factor of 8. Additional mortality estimates are made for americium and curium isotopes and for the case of continuous ingestion. These estimates include the cancer risk to liver as estimated from the excess mortality observed in persons containing large thorotrast burdens and newer estimates of the relative damage factor for radionuclides deposited on bone surfaces. For all the transuranics studied the estimated excess mortality due to liver cancer is a major risk and often the largest.

MICROSCOPE STUDIES OF VIRUSES IN TUMORS INDUCED
BY ^{239}Pu IN MICE. Lloyd, E.L.; Loutit, J.F.
1976.

Radiological and Environmental Research
Division annual report, July 1975--June 1976.

Tumors induced by the intraperitoneal
injection of 100 nCi, 30 nCi, and 10 nCi of
 ^{239}Pu -citrate into male and female CBA mice
were examined with the electron microscope for
the presence of viruses. The tumors examined
included 14 osteosarcomas, 2 lymphomas, 1
carcinoma, 1 haemangiosarcoma, and 1 reticulum-
cell sarcoma. C-type viruses were positively
identified in all the tumors examined with the
exception of 3. In one of the exceptions, a
lymphoma in a lymph node, suspicious virus-like
particles were observed; in the other two, an
osteosarcoma and a carcinoma of the lung from
the same animal, there was no evidence of viral
particles. In addition, no viruses could be
detected in three samples of normal tissue.
Despite the presence of virus in tumor and not
in normal tissue, evidence from ongoing
research is presented to suggest that the virus
is merely a passenger.

- 2301 (COO--2506-2) BIOLOGICAL EFFECTS OF
IMPLANTED NUCLEAR ENERGY SOURCES FOR ARTIFICIAL
HEART DEVICES. PROGRESS REPORT, SEPTEMBER 1,
1975--AUGUST 31, 1976. Kallfelz, F.A.;
Wentworth, R.A.; Cady, K.B. (New York State
Coll. of Veterinary Medicine, Ithaca (USA).
Dept. of Physical Biology). 1976. Contract
E(11-1)-2506. 62p. Dep. NTIS \$4.50.

A total of sixty dogs were implanted with
radioisotope-powered artificial heart systems
producing radiation fluxes similar to that of
plutonium-238, but having no associated heat,
at levels of from one to seventy times the
radiation flux expected from a 30-watt
plutonium-238 source. Results from studies
lasting up to 6 years after implantation
indicate that these animals, and by inference
human beings, may be able to tolerate the
radiation flux from 30-watt ^{238}Pu power
sources. Results of heat dissipation studies in
calves indicate that it may be possible to
induce a vascularized connective tissue capsule
sufficient to dissipate 30 watts of additional
heat from a surface area of approximately 500
cm sq., allowing a heat flux of 0.06 watts per
cm sq.

biology and genetics with international
participation and symposium on population
genetics and demography of hereditary diseases;
Varna, Bulgaria (2 Oct 1976).

Second national conference on medical
biology and genetics with international
participation and symposium on population
genetics and demography of hereditary diseases.
Abstracts.

Histologic changes in oocytes following
intraperitoneal injection of 0, 10, 25, or 50
 μCi phosphorus 32 per mouse were studied. Time
course of the response was followed by scoring
the number of primordial follicles present on
days 30, 60, and 90 postadministration. The
amounts of primordial follicles definitely
diminished with increase in phosphorus 32
activity (increase in ovarian dose) and with
length of time after administration. Complete
destruction of oocytes was observed two months
after injection of 50 μCi of phosphorus 32.

- 2304 (INIS-mf--3515, pp 29) DOMINANT
LETHALS FOLLOWING ADMINISTRATION OF TRITIUM
(THO) TO RAT MALES. Yagova, A.; Baev, I.;
Bairakova, A. (Nauchno-Izslodovatel'ski Inst. po
Radiologiya i Radiatsionna Khigiena, Sofia
(Bulgaria)). 1976. (In Bulgarian).

biology and genetics with international
participation and symposium on population
genetics and demography of hereditary diseases;
Varna, Bulgaria (2 Oct 1976).

Second national conference on medical
biology and genetics with international
participation and symposium on population
genetics and demography of hereditary diseases.
Abstracts.

Adult rat males were given a single
intraperitoneal tritium (THO) injection at 0.01
or 0.001 mCi/g body weight (1/100 or 1/1000 of
LD₅₀(50/30), respectively). Twelve days after
treatment each male was mated to 3 to 5 intact
females, and the latter were replaced by fresh
ones every 12 following days over a 120-day
period. Mated females were killed to score
conceptions, corpora lutea, and live and dead
embryos. Estimations were made of F₁ prenatal
death rate (according to Bateman, 1958) and the
frequency of induction of dominant lethal
mutations (according to Roehrborn, 1970). The
results observed indicated paternal exposure to
tritium (THO) to produce dominant lethals both
in pre- and post-meiotic germ cells in the rat.
The extent of the genetic damage studied was
found to depend on the amount of activity
administered as well as on the time interval
between treatment and conception.

- 2305 (ORO--1643-126) STUDIES IN IODINE
METABOLISM. PROGRESS REPORT, APRIL 1975--
MARCH 1976. Van Middlesworth, L. (Tennessee
Univ., Memphis (USA). Dept. of Physiology and
Biophysics). 1976. Contract AT(40-1)-1643.
38p. Dep. NTIS \$4.00.

Investigations during the past twelve months
have included the following subjects: factors
which influence release of radioiodine from
thyroid glands; contamination of commercially
available low-iodine diets; effects of hypoxia
on release of iodine from thyroid glands of
rats and mice; development of practical tests
for available iodine in low-iodine diets;
reproduction and abnormal thyroglobulin of rats
maintained on low-iodine diets; observations on
radioactivity in animal thyroids; collaboration
with other laboratories regarding radium in
bovine thyroids.

- 2306 (UCD--472-123, pp 85-86) IMMUNE COMPETENCE OF ^{226}Ra -INJECTED DOGS AND AGE-MATCHED CONTROLS AS MEASURED BY THE MICRO-LYMPHOCYTE STIMULATION TEST. Shifrine, M.; Taylor, N.J.; DeRock, E.W.; Worthington, B.M. 1976.

Annual report, fiscal year 1976.

The micro-lymphocyte stimulation test was used to evaluate the immune competence of ^{226}Ra -injected dogs and normal age-matched controls. Ability of lymphocytes to divide was significantly reduced in tumor-bearing ^{226}Ra -injected dogs, and possibly reduced in the oldest ^{226}Ra -injected dogs. The test showed large variability in the oldest normal dogs tested (12.4 to 12.7 yrs old).

- 2307 (UCD--472-123, pp 90-93) CLINICAL CASE LOAD FOR RADIONUCLIDE-TREATED BEAGLES, CALENDAR YEAR 1975. Holbrook, C.H.; MacMillan, K.L.; Maslowski, S.F.; Muggli, F.M. 1976.

Annual report, fiscal year 1976.

Medical and surgical cases among the approximately 500 surviving beagles of the $^{226}\text{Ra}/^{90}\text{Sr}$ internal irradiation study are categorized on the basis of body system involved. The substantial increase in case load that occurred during calendar year 1975 (while mortality rates remained stable) is attributed primarily to an increase in spontaneous, rather than radiation-induced, disease conditions in the aging (8 to 15 years old) beagles.

- 2308 (UCD--472-123, pp 94-103) CUMULATIVE MORTALITY IN RADIONUCLIDE TREATED BEAGLES. Crisp, C.E.; Pool, R.R.; Spangler, W.; Goldman, M.; Rosenblatt, L.; Wolf, H.G. 1976.

Annual report, fiscal year 1976.

The first osteosarcoma in the ^{90}Sr injected dose was seen and late occurring myeloproliferative diseases were also seen. Non-radiation induced malignant tumors are assuming increased importance as the colony ages.

- 2309 (UCD--472-123, pp 116-117) METABOLISM OF ^{129}I IN YOUNG BEAGLES. Book, S.A.; McNeill, D.A. 1976.

Annual report, fiscal year 1976.

Iodine-129 was administered orally to young beagles. As the dosage increased, ^{129}I thyroid uptake and whole-body retention decreased, thereby limiting the radiologic risk associated with assimilation of this long-lived radionuclide.

- 2310 INFLUENCE OF AGE AND PHYSICOCHEMICAL FORM ON THE EFFECTS OF ^{239}Pu ON THE SKELETON OF THE RAT. Sikov, M.R.; Mahlum, D.D. (Battelle Pacific Northwest Labs., Richland, WA). pp 33-47 of Health effects of plutonium and radium. Webster, S.S. (ed.). Salt Lake City; Univ. of Utah (1976).

From Workshop on the biological effects and toxicity of Pu 239 and Ra 226; Sun Valley, ID, USA (6 Oct 1975).

See CONF-751043--.

The distribution, retention, and acute toxicity of the monomeric and polymeric forms of ^{239}Pu were earlier shown to be different in adult, weanling, and newborn rats. The femurs of rats from this series, which had been injected intravenously with doses of monomeric or polymeric ^{239}Pu over the range of 6-90 $\mu\text{Ci/kg}$, were studied at intervals through nine months postexposure to investigate the response of the skeleton relative to age. The dose rates to the femur were initially similar in the three age groups, but there was increasing divergence with time. Study of autoradiographs

suggested that periosteal deposition of activity was greater in the weanlings than in adults and newborns. Gross lesions of the skeleton, including pathologic fracture and abnormal healing, were observed in the rats exposed as weanlings. Bone strength was inversely related to radiation dose in the adults and weanlings although chemical composition was altered only at the highest doses. Histologic changes of bone, including exostosis, necrosis, and epiphyseal abnormalities, were most marked in the weanlings injected with monomer, less in the adults, and least in the newborns. (auth)

- 2311 INFLUENCE OF TEMPORAL DISTRIBUTION OF ALPHA DOSE IN BONE TUMOR INDUCTION. Mahlum, D.D. (Energy Research and Development Administration, Washington, DC); Sikov, M.R.; Hungate, F.P. pp 49-56 of Health effects of plutonium and radium. Webster, S.S. (ed.). Salt Lake City; Univ. of Utah (1976).

From Workshop on the biological effects and toxicity of Pu 239 and Ra 226; Sun Valley, ID, USA (6 Oct 1975).

See CONF-751043--.

Studies in which adult and weanling rats were intravenously injected with ^{239}Pu or ^{253}Es resulted in overlapping ranges of radiation doses to the skeleton. Comparison of the results has provided some insight into the carcinogenicity of that fraction of an alpha dose delivered at low dose rates during long periods after exposure relative to that delivered at higher rates at early times. Approximately 60 percent of the radiation dose to the adult from ^{253}Es , but only 5 percent of the dose from ^{239}Pu , was delivered within 30 days post-injection. The weanlings incurred a substantially greater fraction of the radiation dose from ^{239}Pu during the first month after injection (about $1/3$); the time distribution of dose from ^{253}Es was similar to the adults. The incidence of bone tumors among the rats that received the two higher doses of ^{239}Pu as adults was elevated and was higher than the incidence in adults that received equivalent cumulative radiation doses from ^{253}Es . The incidences of bone tumors among the weanlings that received ^{239}Pu were also greater than in those receiving comparable radiation doses from ^{253}Es . Direct comparisons of these results are complicated by differences in the microscopic distribution of dose. They nevertheless suggest that the initial radiation dose is less important in the induction of bone tumors than the dose delivered at a lower rate over a longer period of time. (auth)

- 2312 INDUCTION OF OSTEOGENIC SARCOMA BY POLYMERIC PLUTONIUM ($^{239}\text{Pu(IV)}$) IN BEAGLES. Stevens, W. (Univ. of Utah, Salt Lake City); Atherton, D.R.; Jee, W.S.S.; Buster, D.S.; Grube, B.J.; Bruenger, F.W.; Lindenbaum, A. pp 81-95 of Health effects of plutonium and radium. Webster, S.S. (ed.). Salt Lake City; Univ. of Utah (1976).

From Workshop on the biological effects and toxicity of Pu 239 and Ra 226; Sun Valley, ID, USA (6 Oct 1975).

See CONF-751043--.

Previous studies have demonstrated that a single I.V. injection of $^{239}\text{Pu(IV)}$ in monomeric form (Pu-Cit) will induce osteogenic sarcomas in beagles. The latent period for tumor induction decreased as the injected dose increased from 0.016 to 0.9 $\mu\text{Ci/kg}$ $^{239}\text{Pu(IV)}$. The effect of the chemical form of the injected ^{239}Pu on its distribution within the dogs was studied. Two dogs were injected with 0.9 $\mu\text{Ci/kg}$ of polymeric ^{239}Pu (Pu-P) for lifespan studies. Both of those dogs developed osteogenic

sarcomas with latent periods somewhat less than those observed in animals which received 0.9 $\mu\text{Ci } ^{239}\text{Pu/kg}$ of monomeric plutonium. The fraction of the injected polymeric plutonium retained in the skeleton increased from 2.2 percent at 14 days post injection to 24.4 percent at death (1166 days average). Plutonium retention in organs with a high percentage of mononuclear phagocytes showed a significant loss of Pu-P from these organs during this period. Dose calculations indicate that the slow release of Pu, primarily from the liver, and the subsequent protracted and continuous deposition of the nuclide on the skeletal surfaces was much more efficient in producing osteogenic sarcoma than the deposition resulting from a single injection of monomeric Pu. (auth)

- 2313 IRRADIATION OF THE LUNG WITH STATIC PLUTONIUM MICROEMBOLI. Holland, L.M.; Prine, J.R.; Smith, D.M.; Anderson, E.C. (Los Alamos Scientific Lab., NM). pp 127-138 of Health effects of plutonium and radium. Webster, S.S. (ed.). Salt Lake City; Univ. of Utah (1976).

From Workshop on the biological effects and toxicity of Pu 239 and Ra 226; Sun Valley, ID, USA (6 Oct 1975).

See CONF-751043--.

Syrian hamsters were exposed to selected lung burdens of ^{238}Pu or ^{239}Pu contained in 10 μm diameter microspheres of ZrO_2 ceramic. After injection into the jugular vein, the microspheres lodge in the lung capillaries and remain immobile throughout the lifetime of the animal. The specific activity of the microspheres varied from 0.22 to 59 pCi/sphere, and the lung burdens achieved varied from 0.44 to 354 nCi. The distribution in the lung was essentially random except in the groups receiving high numbers of spheres. Since entrapment in the lung approached 100 percent, there was essentially none of the involvement of other organs seen with inhalation methods. Hamsters were also exposed intratracheally to ^{210}Po to compare the results from an experiment in which other organs are involved and in which a high tumor yield may be anticipated. Tumor production in the microemboli experiment was quite low, and the overall damage to the lung was minimal in comparison to the intratracheal experiments with ^{210}Po or with published data from aerosol experiments. (auth)

- 2314 EARLY PATTERNS OF PULMONARY CELLULAR RESPONSE IN SYRIAN HAMSTERS FOLLOWING PLUTONIUM INHALATION. Slauson, D.O.; Hobbs, C.H.; Mewhinney, J.A.; Miglio, J.J.; McClellan, R.O. (Inhalation Toxicology Research Inst., Albuquerque, NM). pp 139-159 of Health effects of plutonium and radium. Webster, S.S. (ed.). Salt Lake City; Univ. of Utah (1976).

From Workshop on the biological effects and toxicity of Pu 239 and Ra 226; Sun Valley, ID, USA (6 Oct 1975).

See CONF-751043--.

Syrian hamsters were exposed as young adults (84 days of age) to aerosols of $^{239}\text{PuO}_2$ to obtain graded initial lung burdens (ILB) which ranged from levels calculated to result in early deaths from radiation pneumonitis and pulmonary fibrosis down to a level equivalent on a body weight basis to the currently accepted maximum permissible lung burden for man. The activity median aerodynamic diameter of the aerosol was 2.0 μm with a geometric standard deviation of 1.5. Early patterns of pulmonary cellular response are reported for 37 hamsters in the group that had the highest lung burdens (380 nCi, geometric mean) and survived

for 66 to 279 days with a mean survival of 95 days. All of these animals exhibited marked pulmonary inflammatory changes at death. (auth)

- 2315 PULMONARY LESIONS INDUCED BY INHALED PLUTONIUM IN BEAGLES. Dagle, G.E.; Lund, J.E.; Park, J.F. (Battelle Pacific Northwest Labs., Richland, WA). pp 161-167 of Health effects of plutonium and radium. Webster, S.S. (ed.). Salt Lake City; Univ. of Utah (1976).

From Workshop on the biological effects and toxicity of Pu 239 and Ra 226; Sun Valley, ID, USA (6 Oct 1975).

See CONF-751043--.

The histopathologic features of pulmonary fibrosis and bronchiolo-alveolar carcinoma in beagles exposed to aerosols of ^{238}Pu or ^{239}Pu oxide are reviewed. A hypothesis of the pathogenesis of radiation pneumonitis induced by inhalation of plutonium oxide is presented; this hypothesis included phagocytosis of Pu particles, fibrosis responding to the necrosis, and alveolar cell hyperplasia compensating for alveolar cells killed by alpha radiation. Histopathologic features of the epithelial changes suggest a progression from hyperplasia to metaplasia and, finally, to bronchiolo-alveolar carcinoma. The possibility of concurrent radiation-induced lymphopenia contributing to the development of bronchiolo-alveolar carcinoma through a loss of immunologic surveillance is discussed. (auth)

- 2316 RADIATION INDUCED SKELETAL CHANGES IN BEAGLE: DOSE RATES, DOSE, AND AGE EFFECT ANALYSIS FROM ^{226}Ra . Momeni, M.H. (Univ. of California, Davis); Williams, J.R.; Rosenblatt, L.S. pp 389-408 of Health effects of plutonium and radium. Webster, S.S. (ed.). Salt Lake City; Univ. of Utah (1976).

From Workshop on the biological effects and toxicity of Pu 239 and Ra 226; Sun Valley, ID, USA (6 Oct 1975).

See CONF-751043--.

Radiation-induced skeletal injury (E) and the rate of skeletal injury were studied as a function of time and dose in beagles administered $^{226}\text{Ra Cl}_2$ in eight semimonthly iv injections starting at 2, 4, or 14 months of age. Skeletal changes were evaluated with a radiographic x-ray scoring system in 20 skeletal regions; each region was scored on a 0 to 6 scale. Bone changes in six regions of humeri were qualitatively analyzed for comparison with total skeletal changes. Skeletal changes were classified by endosteal or periosteal cortical sclerosis and thickening, fractures, osteolytic lesions, and trabecular coarsening. (auth)

- 2317 PATHOLOGY OF TUMORS INDUCED IN HARWELL MICE BY ^{239}Pu AND ^{226}Ra . Loutit, J.F.; Sansom, J.; Carr, T.E.F. (Medical Research Council, Harwell, Eng.). pp 505-521 of Health effects of plutonium and radium. Webster, S.S. (ed.). Salt Lake City; Univ. of Utah (1976).

From Workshop on the biological effects and toxicity of Pu 239 and Ra 226; Sun Valley, ID, USA (6 Oct 1975).

See CONF-751043--.

Single intraperitoneal doses of ^{226}Ra and ^{239}Pu solutions given to Harwell-strain mice, produced mainly osteosarcoma. C3H mice were sensitive and CBA mice more resistant to ^{226}Ra . Plutonium-239 caused additionally lymphoma in CBA and possibly an increase in miscellaneous malignancies. The histology suggests that Ra and Pu produce osteosarcoma in areas of accentuated bone turnover in cortical bone. (auth)

2318 ACTINIDE CARCINOGENESIS: A DIRECT OR AN INDIRECT RADIATION EFFECT. Taylor, D.M. (Inst. of Cancer Research, Surrey, Eng.). pp 681-690 of Health effects of plutonium and radium. Webster, S.S. (ed.). Salt Lake City; Univ. of Utah (1976).

From Workshop on the biological effects and toxicity of Pu 239 and Ra 226; Sun Valley, ID, USA (6 Oct 1975).

See CONF-751043--.

The passage of an alpha-particle through a cell nucleus is likely to produce such intense ionization that the resultant damage to the genetic structure of the cell will be lethal. Thus direct nuclear irradiation by alpha particles appears unlikely to be the primary event in the initiation of a malignant neoplasm. Plutonium-239, and the actinide elements in general, deposit in lysosomal structures within cells and in liver and testes cells the deposition of ^{239}Pu has been shown to cause release of lysosomal enzymes into the cytosol. It is suggested that the release of lysosomal enzymes, including acid deoxyribonuclease, into the cytosol can produce chromosomal damage and may be key events in the initiation and development of tumours by ^{239}Pu and other alpha-particle emitting radionuclides. (auth)

2319 DOMINANT LETHAL TESTS OF MALE MICE GIVEN ^{239}Pu SALT INJECTIONS. Luening, K.G.; Froelen, H.; Nilsson, A. (Foersvarets Forskningsanstalt, Stockholm (Sweden)). pp 39-48 of Biological and environmental effects of low-level radiation. Vol 1. Vienna; IAEA (1976).

From Symposium on biological effects of low-level radiation pertinent to protection of man and his environment; Chicago, Ill., USA (3 Nov 1975).

To study the possible genetic effects of ^{239}Pu manifesting in dominant lethals, five test series (E1-E5) were performed. Males from an inbred CBA strain were given ^{239}Pu salt injections intravenously and mated weekly to 3 CBA females each for 12 to 24 weeks. Some interruptions in the mating scheme were made. For the first two test series (E1, E2) ^{239}Pu nitrate solution and ^{239}Pu citrate, used in E3-E5, were prepared. The solution was millipore filtered just prior to injection. Among a total of 10255 implants sired by males given Pu-nitrate in E1 and E2 no significant excess of intra-uterine death relative to 7216 control implants occurred. Test series E3-E5 with 60 males each, used three groups of 20, with one control group. In E3, 0.5 μCi and 0.1 μCi were given per male/group, respectively; in E4 and E5, 0.25 μCi and 0.05 μCi , respectively. The males given 0.5 μCi in E3 became successively sterile from the 7th week. The results in E3-E5 point in the same direction with significant excess of intra-uterine death in E3 and E5. In E4 the females from matings from the 9th, 14th and 16th week, and in E5 females from the 9th week, were allowed to litter to give F_1 offspring. Dominant lethal tests of F_1 males gave concordant results in all four samples, showing significantly excessive death in offspring to F_1 males whose fathers had received Pu. The excessive death was evenly distributed and did not indicate the presence of semisterile F_1 males. In tests of Pu-injected males and of F_1 males a remarkable excess of death in late stages of foetal development was observed. Such effects had never before been observed in this CBA strain in tests of extrinsic and intrinsic exposure to ionizing irradiation.

2320 PATHOLOGICAL ANATOMY, ETIOLOGY AND PATHOGENESIS OF DELAYED AFTEREFFECTS OF EXPOSURE TO RADIOACTIVE DUST. Likhachev, Yu.P. (Akademiya Meditsinskikh Nauk SSSR, Moscow. Inst. Gigieny Truda i Professional'nykh Zabollevaniy). Arkh. Patol.; 38: No. 4, 18-26(1976). (In Russian).

Thorium (Th) is one of the widely spread radioactive substances in nature, and together with other aerosols it can penetrate into the organism. The article considers relationships between various histological forms of neoplasms induced by a radioactive dust agent containing Th and the rate of this etiological factor (total body dose and its rate). In experiments with 3000 white rats a 150 rad dose accumulated in the lungs during 15-21 months has lead to an increase in the number of cases of reticulosarcoma, a 300 rad dose produces no such effects. Doses as high as 1000 to 2700 rad brings about multicentric adenomas and glandular cancerous tumours against the background of pneumocirrhosis. But no reticulosarcomas of the lung have been noticed. Adenocarcinomas and squamous-cell carcinomas are distributed most often in the neighbourhood of accumulated radioactive dusts. The question is raised about the need of taking into account the microdistribution of energy in the lung tissue in exposure to α -active aerosols with subsequent microdosimetry; due account also should be made of detailed registration of forms of tumours and degree of their malignancy, which is not also observed by researchers in radiobiological investigations.

2321 GENETIC AND HAEMATOPOIETIC EFFECTS OF LONG-TERM TRITIATED WATER INGESTION IN MICE. Carsten, A.L.; Cronkite, E.P. (Brookhaven National Lab., Upton, N.Y. (USA)). pp 51-55 of Biological and environmental effects of low-level radiation. II. Vienna; IAEA (1976).

From Symposium on biological effects of low-level radiation pertinent to protection of man and his environment; Chicago, Ill., USA (3 Nov 1975).

The effect of large amounts of tritiated water (HTO) from reactors on the environment is evaluated. Randomly bred mice of the Hale-Stoner-Brookhaven strain have been maintained on HTO (3 $\mu\text{Ci}/\text{ml}$ itre) for extended periods. First-generation animals on HTO from four weeks of age have been evaluated for changes in growth pattern, and second-generation animals (also on HTO) for breeding efficiency, dominant lethal mutation rate and bone-marrow integrity. A total of 18831 embryos were examined. Statistical analysis of these results using either Student's 't' test or Kruskal and Wallis rank test indicates that there was a significant ($p < 0.01$) reduction in viable embryos and an increase in early deaths in matings involving animals drinking HTO. Beginning at eight weeks of age and monthly thereafter, the haematopoietic stem cell content of the bone marrow was determined using the exogenous spleen colony technique. Although the total cellularity of the bone marrow remains comparable in the control and treated groups, the total number of stem cells (CFU) was reduced beginning after approximately 12-20 weeks on the tritium regime. These findings indicate a reduction in the total number of pluripotent stem cells in the marrow together with the ability of this reduced number of cells to maintain normal levels of total cellularity in the bone marrow. Thus, continuous ingestion of HTO at a concentration of 3 $\mu\text{Ci}/\text{ml}$ itre by mice results in: (1) Reduction in number of viable embryos present in the female at late pregnancy from matings when either the female or both parents have

been on HTO; (2) Increase in number of early post-implantation deaths when both parents are on HTO; (3) Reduction in bone-marrow stem cell content after 12 weeks or longer on HTO; (4) No apparent effect on breeding efficiency (percentage of females pregnant) or body weight. These results are discussed in relation to the accumulated radiation dose.

OF CARRIER. Skupinski, W.; Masse, R.; Lafuma, J. (CEA Centre d'Etudes Nucleaires de Fontenay-aux-Roses, 92 (France). Dept. de Protection). pp 35-44 of Biological and environmental effects of low-level radiation. II. Vienna; IAEA (1976). (In French)

From Symposium on biological effects of low-level radiation pertinent to protection of man and his environment; Chicago, Ill., USA (3 Nov 1975).

Studies were undertaken to compare the toxic action of inhaled β - and α -emitters. About a hundred rats were contaminated by inhalation of acidic ^{144}Ce chloride. The initial activities ranged from 0.5 μCi to 10 μCi , so that the rats were subjected to doses of 500-5000 rads. It was observed that, depending on the dose, the life span of the animals was shortened and some ten lung cancers appeared in the animals which had received the highest doses. In another experiment, the activation product ^{141}Ce is inhaled in oxide or chloride form, the doses ranging from 50 rads to 2000 rads. Other animals inhaled stable cerium oxide. Lung cancers have already been observed in the animals which inhaled ^{141}Ce . The locations and histological types of the cancers induced by the three β -emitters are comparable with those observed after the inhalation of α -emitters.

- 2322 LUNG CANCER INDUCED IN RATS BY RADON AND ITS DAUGHTER NUCLIDES AT DIFFERENT CONCENTRATIONS. Chameaud, J.; Perraud, R. (CEA, Service medical, Direction des productions, Razes, France); Masse, R.; Nenot, J.C.; Lafuma, J. (CEA Centre d'Etudes Nucleaires de Fontenay-aux-Roses, 92 (France). Dept. de Protection). pp 223-228 of Biological and environmental effects of low-level radiation. II. Vienna; IAEA (1976). (In French)

From Symposium on biological effects of low-level radiation pertinent to protection of man and his environment; Chicago, Ill., USA (3 Nov 1975).

In previous experiments on rats, nearly all the animals inhaling radon and its daughter nuclides in high concentrations developed bronchopulmonary cancers. In the experiments described here, the dose-effect relationship was studied as a function of several parameters: influence of total inhaled doses which were lower than in the previous experiments; influence of the concentration of the gas and its state of equilibrium with its daughter nuclides; influence of the duration of daily and total exposure. There was a definite increase in the frequency of cancers as a function of cumulative exposure. The respective effects of active deposition and daily dose are shown quite clearly. In view of the considerable importance of the dose-effect relationship in the radiation protection of uranium miners, it seemed worth while to compare these different experimental findings with the results of epidemiological studies made in this category of workers.

- 2325 BIOLOGICAL EFFECTIVENESS OF ^{239}Pu , ^{144}Ce AND ^{90}Sr CITRATE IN PRODUCING CHROMOSOME DAMAGE, BONE-RELATED TUMOURS, LIVER TUMOURS AND LIFE SHORTENING IN THE CHINESE HAMSTER. Benjamin, S.A.; Brooks, A.L.; McClellan, R.O. (Inhalation Toxicology Research Institute, Lovelace Biomedical and Environmental Research Institute, Albuquerque, New Mexico, USA). pp 143-151 of Biological and environmental effects of low-level radiation. Vol. 2. Vienna; IAEA (1976).

From Symposium on biological effects of low-level radiation pertinent to protection of man and his environment; Chicago, Ill., USA (3 Nov 1975).

Determination of the biological effectiveness for internally deposited α - and β -emitting radioactive materials using a number of endpoints is needed to make meaningful risk estimates for man. Late-occurring biological effects were studied in Chinese hamsters injected with ^{239}Pu , ^{144}Ce or ^{90}Sr citrate. Pu-239 is an α emitter which localizes in liver and bone, whereas ^{144}Ce and ^{90}Sr are β emitters which localize in liver and bone, and in bone, respectively. Biological alterations on the cellular, organ and organism level can be used in determining the relative effectiveness of α and β radiation in producing these endpoints. Significant life shortening was induced by all three radionuclides and was considered in evaluating time-related incidence of bone and liver neoplasms. Osteosarcomas were seen in animals injected with 1.0 μCi ^{90}Sr citrate and 0.002 μCi ^{239}Pu citrate/g body weight, while liver tumours including hemangiosarcomas, fibrosarcomas and hepatocellular neoplasms, were seen after injection of 0.25 μCi ^{144}Ce citrate and 0.002 μCi ^{239}Pu citrate/g body weight. Comparisons of bone and liver tumour incidences with cumulative radiation dose were made to derive quality factors for tumour production. In both cases, the derived factors (3.6 for bone tumours and 7.4 for liver tumours) were lower than the figure of 10 generally accepted for comparing α and β radiation. The factor derived from comparison of chromosome damage in liver cells was higher (15), indicating that other factors are involved between damage at the cellular level and final tumour production, and that direct correlations of genetic damage and tumorigenicity are hazardous.

- 2323 INDUCTION OF CANCERS IN THE RAT AFTER INHALATION OF ALPHA-EMITTING RADIONUCLIDES. Morin, M.; Nenot, J.C.; Masse, R.; Nolibe, D.; Metivier, H.; Lafuma, J. (CEA Centre d'Etudes Nucleaires de Fontenay-aux-Roses, 92 (France). Dept. de Protection). pp 109-119 of Biological and environmental effects of low-level radiation. II. Vienna; IAEA (1976). (In French)

From Symposium on biological effects of low-level radiation pertinent to protection of man and his environment; Chicago, Ill., USA (3 Nov 1975).

Experiments have been conducted for several years on the toxic action of inhaled alpha-emitters on laboratory rats. The inhaled radionuclides were ^{239}Pu , ^{238}Pu and ^{241}Am in oxide and nitrate form. The initial alveolar activities varied to give total activities ranging from 1 to 200 thousand million alpha-particles per gram of lung. Variations, depending on the physico-chemical form of the nuclides, in the space and time distributions of the dose are observed. The influence of the two parameters on life span reduction, latency time and frequency of cancer occurrence, initial location of tumours and their histological types were studied. A theoretical model relating the cancerous effect to the dose is compared with experimental data.

- 2324 EXPERIMENTAL STUDY OF ACTION OF INHALED CERIUM-144 AND CERIUM-141. LIFE SPAN REDUCTION AND CANCER INDUCTION - ROLE OF DOSE - INFLUENCE

2326 EFFECT OF SIZE AND ALPHA FLUX OF $^{239}\text{PuO}_2$ PARTICLES ON PRODUCTION OF CHROMOSOME ABERRATIONS IN LIVER OF CHINESE HAMSTER. Brooks, A.L.; McClellan, R.O.; Peters, R.F.; Mead, D.K. (Inhalation Toxicology Research Institute, Lovelace Biomedical and Environmental Research Institute, Albuquerque, New Mexico, USA). pp 131-141 of Biological and environmental effects of low-level radiation. Vol. 2. Vienna; IAEA (1976).

From Symposium on biological effects of low-level radiation pertinent to protection of man and his environment; Chicago, Ill., USA (3 Nov 1975).

Two important variables in determining the biological effect of α -emitting radioactive particles, "hot particles", are the flux of α emissions per particle and the fraction of the cell population exposed. To generate a spectrum of these conditions, Chinese hamsters were injected intravenously with $^{239}\text{PuO}_2$ or $^{238}\text{PuO}_2$ particles or with ^{239}Pu or ^{238}Pu citrate. The plutonium was retained with a long effective half-life in the liver for both the citrate and oxide forms. The particles of $^{239}\text{PuO}_2$ tended to aggregate as a function of time after injection. The level and distribution of chromosome damage in liver cells were determined as a function of the dose, fraction of liver exposed and α flux per particle. Aberration frequency following injection of ^{239}Pu and ^{238}Pu citrate increased with slopes of 4.8×10^{-3} and 3.8×10^{-3} aberrations/cell/rad, respectively. This rate was about three times higher than observed for $^{239}\text{PuO}_2$ particles and ten times as high as observed following injection with the smallest $^{238}\text{PuO}_2$ particles. When aberration frequency was related to average dose there was little effect of change in α flux until it reached a value of 860 disintegrations/particle/day. Above this level, there was a marked decrease in the aberration frequency per rad dose. Evidence of cell killing and extreme amounts of chromosome damage was found in liver cells after injection of $^{238}\text{PuO}_2$ and $^{239}\text{PuO}_2$. Increasing the percentage of the liver irradiated increased the amount of chromosome damage produced. More cells are at risk for cellular damage with uniformly distributed plutonium, and those cells in close proximity to plutonium particles may be lethally irradiated and would not be at risk for tumour production.

2327 BIOLOGICAL ASSESSMENT OF CONTINUOUS EXPOSURE TO TRITIUM AND LEAD IN THE RAT. Cahill, D.F.; Reiter, L.W.; Santolucito, J.A.; Rehnberg, G.I.; Ash, M.E.; Favor, M.J.; Bursian, S.J.; Wriht, J.F.; Laskey, J.W. (Environmental Protection Agency, Research Triangle Park, N.C. (USA)). pp 65-76 of Biological and environmental effects of low-level radiation. Vol. 2. Vienna; IAEA (1976).

From Symposium on biological effects of low-level radiation pertinent to protection of man and his environment; Chicago, Ill., USA (3 Nov 1975).

A broad investigation of the effects of simultaneous exposure to two potentially synergistic environmental pollutants, tritiated water (HTO) and lead, was conducted. Sprague-Dawley rats were continuously exposed to HTO and/or Pb in drinking water from conception of the F_1 through adulthood of the F_2 generation. A 12-cell exposure matrix was used employing HTO activities calculated to provide approximately 3-300 mrad/d whole-body irradiation and Pb levels of 5 or 50 ppm in drinking water. Observations were made on the reproductive capacity of the F_1 generation and

the effects of lifetime parental exposure to HTO and/or lead on the F_2 neonates. The effects of single and combined exposures on the development and function of the central nervous system, some brain catecholamine levels and electroencephalogram patterns were also examined in both generations. The results indicate that, in both generations, continuous HTO exposures as low as 3 mrad/d delayed development of righting reflexes in young rats; 30 mrad/d additionally depressed the spontaneous activity of adult male rats. Continuous exposure to 5 ppm lead produced similar effects on righting reflex development and adult spontaneous activity. The relative brain weight of F_2 neonates was decreased after lifetime parental exposure to 300 mrad/d or 5 and 50 ppm lead. Chronic lead exposure also appears to induce superovulation and increase preimplantation deaths in F_1 dams. Dose-effect responses to both HTO and lead were less than additive in their interactive effects on the parameters measured.

2328 DOSE, DOSE RATE AND AGE PARAMETERS IN ANALYSIS OF RISK FROM BONE-SEEKING RADIONUCLIDES: AN EXTRAPOLATION OF LOW LEVELS. Momeni, M.H.; Williams, J.R.; Rosenblatt, L.S. (California Univ., Davis (USA). Radiobiology Lab.). pp 197-209 of Biological and environmental effects of low-level radiation. Vol. 2. Vienna; IAEA (1976).

From Symposium on biological effects of low-level radiation pertinent to protection of man and his environment; Chicago, Ill., USA (3 Nov 1975).

Radiation-induced primary bone sarcomas (PBS) and life-span shortening (Δ) were studied as a function of dose, dose rate and time in beagles fed from midgestation to 1.5 years of age diets containing $^{90}\text{Sr Cl}_2$ in equilibrium with ^{90}Y , or administered $^{226}\text{Ra Cl}_2$ in eight semimonthly intravenous injections starting at 2, 4 or 14 months of age. PBS and Δ from $^{90}\text{Sr}+^{90}\text{Y}$ and ^{226}Ra were dependent on interaction of dose rate, dose, age and time after the administration of the radioactivities, and mode of administration with a dynamic non-linear organ system, the skeleton. Incidence of PBS from $^{90}\text{Sr}+^{90}\text{Y}$ and ^{226}Ra was calculated from life-tables. Probability of greater than 1% PBS incidence was normally distributed with respect to dose and age. Delay period between exposure and tumour incidence was suggested to be proportional to time to 1% incidence of PBS (t_0). For $^{90}\text{Sr}+^{90}\text{Y}$ dogs, estimated t_0 were 9.4 years, 5.1 years, and 1.5 years for an average daily ingestion of 4.12 and 36 μCi $^{90}\text{Sr}+^{90}\text{Y}$ starting from birth, respectively. For ^{226}Ra , estimated t_0 were 3.8, 3.3, 1.7 and 1.3 years for cumulative injections of 3.14, 9.4, 28.1, and 83.6 μCi , respectively. Radiation-induced life-span shortening was estimated from "practical survival age", age at 8% population survival. At a maximum dose rate $D_{\text{sub(max)}}$ of 2.5 rad/d, $^{90}\text{Sr}+^{90}\text{Y}$ and ^{226}Ra were equally effective in reducing life-span, but for $D_{\text{sub(max)}} > 2.5$ rad/d, $^{90}\text{Sr}+^{90}\text{Y}$ was more effective than ^{226}Ra . A dose of 100 rads for radium and 1700 rads for strontium integrated to $T_{\text{sub(max)}} = 16.5$ years did not induce a detectable life-span shortening.

2329 GRAFTS OF PULMONARY TISSUE OF RATS CONTAMINATED WITH PLUTONIUM OXIDE IN ATHYMIC MICE. Nolibé, D.; Masse, R.; Fritsch, P.; Lafuma, J. (CEA Centre d'Etudes Nucleaires de Fontenay-aux-Roses, 92 (France). Dept. de Protection). pp 95-107 of Biological and environmental effects of low-level radiation. Vol. 2. Vienna; IAEA (1976). (In French)

From Symposium on biological effects of low-level radiation pertinent to protection of man and his environment; Chicago, Ill., USA (3 Nov 1975).

Pulmonary fragments from control rats (Wistar) of varying age and contaminated with PuO_2 were grafted in an immunodeficient medium onto mice or histocompatible rats. In both cases the authors observed lesions presenting the histological characteristics of pulmonary cancer in rats; proliferation, however, remained discrete. After grafting on the athymic mice, the lungs of the control animals exhibited a percentage of tumoral-type differentiations which increased with age. In the contaminated rats, for an initial pulmonary burden of 10 nCi and cumulative doses of between 6×10^8 and $38 \times 10^9 \text{ } \alpha/\text{g}$ of lung, the grafts showed a clear-cut increase in lesions of this type. Their frequency increased with the total dose delivered. Conversely, if the dose delivered during a three-month period varied from 2×10^8 to $50 \times 10^9 \text{ } \alpha/\text{g}$ of lung, the maximum proliferation was observed at the lowest doses. Furthermore, the histological nature of the proliferations varied with the dose delivered. This transplantation technique would appear to show the existence of lesions which are not yet overt and which are a consequence either of ageing or of α -irradiation. The authors discuss the meaning of these lesions and the immunological component of the phenomenon.

- 2330 EFFECT OF ^{241}Am ON BONE STRUCTURE ACCORDING TO ITS MICRODISTRIBUTION. Polig, E. (Kernforschungszentrum Karlsruhe (Germany, F.R.). Inst. fuer Strahlenbiologie). pp 161-170 of Biological and environmental effects of low-level radiation. Vol. 2. Vienna; IAEA (1976).

From Symposium on biological effects of low-level radiation pertinent to protection of man and his environment; Chicago, Ill., USA (3 Nov 1975).

Female rats, eight weeks old, were injected intravenously with monomeric $^{241}\text{Am}(\text{III})$ -citrate ($30 \text{ } \mu\text{Ci}/\text{kg}$) and sacrificed after 7, 28 and 56 days. Half of the animals received once weekly an intraperitoneal injection of Ca-DTPA ($30 \text{ } \mu\text{mol}/\text{kg}$), the first dose being administered 1.5 h after ^{241}Am . From the distal end of the femurs, $20\text{-}\mu\text{m}$ -thick longitudinal and sagittal sections were prepared. Both dose-rate distributions and morphometric parameters were determined by an electronic image analyser by scanning cellulose nitrate α detectors or microradiographs. Initially after injection, ^{241}Am is heavily deposited on the epiphyseal and metaphyseal sides of the cartilage plate as well as near the articular cartilage, whereas the labelling of the periosteal and endosteal surfaces in cortical bone and of all trabecular surfaces is less pronounced. Seven days after injection the maximum dose rate in the metaphyseal band amounts to approximately $120 \text{ rad}/\text{d}$ and increases to $170 \text{ rad}/\text{d}$ at 56 days. Deformations of the trabecular structure are presented quantitatively as deviations in the frequency function of chord lengths over trabeculae or marrow spaces. The endosteal surface area is lower in ^{241}Am animals than in controls and the complexity of the bone structure is reduced. In control animals the surface/volume ratio varies between 36 mm^{-1} and 64 mm^{-1} . The mean trabecular width ranges between $40 \text{ } \mu\text{m}$ and $100 \text{ } \mu\text{m}$ and the mean width of the marrow spaces range between $90 \text{ } \mu\text{m}$ and $210 \text{ } \mu\text{m}$. As a result of the locally high activity, the mechanism of bone resorption is strongly impaired in the metaphysis, manifesting as abnormal trabeculation. There is no pronounced diminution of DTPA efficacy over the period of

observation. Ca-DTPA treatment lowers the dose rates in the metaphysis and as a consequence the inhibition of bone resorption seems to be partially suspended.

- 2331 COMPARISON OF CARCINOGENICITY OF ^{131}I AND ^{125}I IN THYROID GLAND OF THE RAT. Ruiter, J. de; Putten, L.M. van (Gezondheidsorganisatie TNO, Rijswijk (Netherlands). Radiobiologisch Instituut TNO); Hollander, C.F.; Boorman, G.A. (Gezondheidsorganisatie TNO, Rijswijk (Netherlands). Instituut voor Experimentele Gerontologie); Hennemann, G.; Docter, R. (Erasmus Universiteit, Rotterdam (Netherlands)). pp 21-31 of Biological and environmental effects of low-level radiation. II. Vienna; IAEA (1976).

From Symposium on biological effects of low-level radiation pertinent to protection of man and his environment; Chicago, Ill., USA (3 Nov 1975).

To determine whether there was a difference in the carcinogenicity of ^{131}I and ^{125}I for the thyroid gland, groups of 40 rats on a low-iodine diet were injected with various doses of one of the nuclides. The doses of ^{131}I injected were 125, 50, 20, 8 and $3.2 \text{ } \mu\text{Ci}$; doses of ^{125}I were four times higher. The surviving rats were killed two years after injection and autopsies with complete histopathological examinations were performed. The results of survival and thyroid function studies revealed that the dose ranges in μCi for the two nuclides could not be directly compared and that each dose of ^{125}I could best be compared with a 10- to 25-fold lower dose of ^{131}I . The morphological findings in the follicular epithelium of the thyroid gland showed that the peak of induction of hyperplasia, cysts and tumours by ^{125}I occurred in the group injected with $80 \text{ } \mu\text{Ci}$, whereas comparable changes after ^{131}I administration were observed in the group injected with the lowest dose ($3.2 \text{ } \mu\text{Ci}$). The peak of tumour induction by ^{125}I in the parafollicular epithelium was found in the group injected with $32 \text{ } \mu\text{Ci}$; the peak with ^{131}I was probably missed, since the comparable dose for this nuclide was below the range of doses injected. The highest incidence of tumours of these parafollicular cells was 2.5 times the spontaneous incidence in control rats. However, extrapolation of these results to man seems unreliable, since the spontaneous incidence of tumours of the parafollicular cells is much higher in rats than in man. It may be concluded that ^{125}I does not induce more tumours of the follicular cells than does ^{131}I as has been suggested by others.

- 2332 (ERDA-tr--227, pp 102-106) REACTION OF ENDOCRINE GLANDS TO CHRONIC INTAKE OF STRONTIUM-90. Goloshchapova, Zh.A. 1976. Translated from Radiobiologiya; 16: No. 4, 567-570 (1976). Radiobiology.

Experiments were conducted on rats to investigate the structure of the hypophysis, thyroid and adrenals as related to chronic intake of strontium-90 at the rate of 0.00005 to $5.0 \text{ } \mu\text{Ci}/\text{day}$ per animal. The studies demonstrated that these organs were structurally highly radioresistant. The minimum amount of isotope leading to development of structural changes in endocrine glands when ingested daily constituted $0.5 \text{ } \mu\text{Ci}$ per animal; the minimum accretion in a critical organ constituted 5 krad.

- 2333 (ERDA-tr--227, pp 184-187) ROLE OF AGE AND DOSAGE OF ADMINISTERED PLUTONIUM IN ONSET OF OSTEOSARCOMA IN RATS. Sinyakov, E.G. 1976. Translated from Radiobiologiya; 16: No. 4, 631-634 (1976). Radiobiology.

In view of the universal

possibility of exposure of young organisms to radioisotopes, we undertook a study of the dose effectiveness of plutonium-239, according to yield of osteosarcomas in young rats, and to compare it to the data obtained on adult animals. We observed signs of radiation lesion in month-old rats given 5 and 2.5 $\mu\text{Ci/kg}$ plutonium, 2-3 months after administration of this isotope: less mobility, ruffled fur and loss of hair, as well as retarded weight gain, as compared to controls. In older groups of rats given 2.5 $\mu\text{Ci/kg}$ and month-old ones given smaller doses of plutonium, we failed to observe external signs of a radiation lesion. With decreased irradiation, there was manifestation of a tendency toward relative increase in incidence of osteosarcoma, as noted in other studies; thus, in series V-VIII, the absorbed doses were 7-54 times smaller, while yield of osteosarcoma presented a 4.5-28-fold decrease. Thus, we established that 2.5 $\mu\text{Ci/kg}$ is the optimum sarcomagenic dosage of plutonium for month-old rats, like adult animals. The latency period of development of osteosarcoma and survival of the animals are inversely proportional to age and absorbed doses, while the absence of skeletal tumors in the group of animals given 0.02 $\mu\text{Ci/kg}$ enables us to set the threshold at the 1 percent level of tumors.

- 2334 STUDY OF THE BARRIER FUNCTION OF THE UPPER RESPIRATORY TRACT COVERING EPITHELIUM IN THE EVENT OF COMBINED RESPIRATORY TRACT INJURIES. Ivanov, Z.; Kolev, K.; Dermendzhiev, Kh.; Nikolova, M.; Kantardzhiev, V. (Nauchno-Izslodovatel'ski Inst. po Radiologiya i Radiatsionna Khigiena, Sofia (Bulgaria)). *Rentgenol. Radiol.*; 15: No. 1, 31-34(1976). (In Bulgarian).

Functional and morphologic impairment of upper respiratory tract mucous membranes after chronic exposure to the three major occupational noxious agents in ore mining - radon-222, silica dust, and respirable dust - has been studied experimentally. Over a 6-month period, rats were given daily treatments, with the agents applied either individually or in combination. Radon-222 (at 1×10^{-10} Ci/l, corresponding to the maximum permissible concentration in uranium mine atmospheres) and respirable dust (dispersed silicogen at 100 mg/ m^3) were administered four hours daily in toxicological chambers. Monodisperse silica dust was given by tracheal tube, at 50 mg in 1 ml of saline per rat. At the end of the treatment period, the barrier function of the respiratory epithelium was tested, and found to have been affected, by measuring beta radioactivity in blood following introduction into the animal's nasopharynx of a ^{32}P -labelled staphylococcus culture. The most severe degree of impairment was found to result from simultaneous exposure to radon and respirable dust. Any of the agents given individually caused a similar degree of impairment. Intratracheal administration of silicic acid anhydride appeared to have no deleterious consequences. The evidence for functional impairment was supported by histologic findings, indicating development of ulcerous bronchitis, metaplasia of cylindrical epithelium, etc., after both individual and combined radon exposure.

- 2335 EXPERIMENTAL LUNG CANCERS. INCIDENCE OF DOSE DISTRIBUTION. Lafuma, J. (CEA Centre d'Etudes Nucleaires de Fontenay-aux-Roses, 92 (France). Dept. de Protection). pp 141-151 of *Les concepts de faible dose de rayonnements ionisants en radiobiologie et en radioprotection*. 2. Cayet-Pennaneac'h, O. (ed.). Montrouge; Societe Francaise de

radioprotection (1976). (In French)

From 2. Seminar on radiobiology; Fontenay-aux-Roses, France (29 Apr 1975).

The experiments conducted at the CEA on the induction of lung cancers by alpha-emitters are presented, especially, the effects of temporal and spatial dose distributions, the processes of cancer induction, life-span shortening and the development of a biological model in order to have an insight on low dose effects.

Available from ZAED.

Assessing the biological effects of radioactive iodine isotopes is still an urgent problem due to its application in nuclear medicine diagnostics as well as to the iodine emissions from nuclear power stations. The paper therefore gives a survey of the information on the biological effects of ^{131}I acquired in animal experiments; radiolesions in general and carcinogenesis are gone into. The article states that ^{131}I accumulation in the thyroid and radiolesions of the thyroid are a function of age. Apart from this, studies on the gonadotropic action of ^{131}I supplied over a longer period of time are also reported on. Many studies also deal with the combined effects of ^{131}I and external irradiation. Preliminary studies on the transport of ^{131}I to embryos and fetuses have been carried out. It is found that further studies on teratogenesis will be necessary.

- 2337 ESTIMATION OF TUMOUR RISK AT LOW DOSE FROM EXPERIMENTAL RESULTS AFTER INCORPORATION OF SHORT-LIVED BONE-SEEKING ALPHA EMITTERS ^{224}Ra AND ^{227}Th IN MICE. Luz, A.; Mueller, W.A.; Goessner, W.; Hug, O. (Gesellschaft fuer Strahlen- und Umweltforschung m.b.H., Neuherberg/Muenchen (Germany, F.R.). Inst. fuer Biologie). pp 171-181 of *Biological and environmental effects of low-level radiation*. II. Vienna; IAEA (1976).

From Symposium on biological effects of low-level radiation pertinent to protection of man and his environment; Chicago, Ill., USA (3 Nov 1975).

As a revision of older and recent data of experimental bone-tumour induction in mice after single and repeated incorporation of short-lived ^{224}Ra and ^{227}Th , the following indications for estimation of tumour risk at low dose can be given. (1) Dose rate has considerable influence on tumour risk following internal irradiation, but the relative increase of risk with decreasing dose rate is dose dependent. (2) At a tumour risk of about 10% the range of incidence in repeated experiments is high. It therefore seems difficult to find the exact dose-effect relationships in low-risk experiments. (3) On the other hand, the lower incidence at lower dose level seems to be, rather, a risk of the second half of lifespan. In addition, the high range of the rate of spontaneously occurring neoplasms at greater age does not permit exact statements about the whole lifespan. (4) However, one can tentatively assume that it should be possible to find dose limits for the tumour risk during the first half of the lifespan. (5) Besides radiation dose, other cofactors may interfere at the low-dose and low-risk level. There is no significant decrease in osteosarcoma risk if the incorporation period starts after stunting of growth. The greater risk in female mice than

in males indicates hormones as an example of cofactors for the pathogenesis of osteosarcoma.

- 2338 RESPONSE OF MOUSE FOETUS TO RADIATION FROM NA SUP(99m)TCO₄. Lathrop, K.A.; Gloria, I.V.; Harper, P.V. (Franklin McLean Memorial Research Inst., Chicago, Ill. (USA)). pp 211-220 of Biological and environmental effects of low-level radiation. Vol. 2. Vienna; IAEA (1976).

From Symposium on biological effects of low-level radiation pertinent to protection of man and his environment; Chicago, Ill., USA (3 Nov 1975).

Technetium has assumed ecological importance as a source of low-level radiation, with the use of sup(99m)Tc in nuclear medicine and production of sup(99m)Tc in power generation reactions. Technetium introduced as pertechnetate into the bloodstream of pregnant females is transported across the placental barrier to the foetus, where a portion appears to be incorporated into biomolecules. When combined as biomolecules, radionuclides that decay by electron capture or isomeric transition show a lethality greater than that predicted in cell cultures and radiation therapy. The decay of sup(99m)Tc by isomeric transition, together with the above considerations, places a high priority on the investigation of its radiation effects due to clinical doses of up to 25 mCi. Female mice were given daily intravenous injections of 0, 5, 50 and 500 µCi of sup(99m)Tc as pertechnetate in isotonic saline throughout gestation, gestation and lactation, or lactation. At two months of age, the progeny were mated with randomly selected litter mates to produce a second generation; the process was repeated for production of the third generation. Only the first generation was irradiated. An injection of 5 µCi/mouse and 10 mCi/human both approximately equal 0.2 µCi/g of body weight; however, the mouse foetus receives an estimated radiation dose of 0.05 rad, and the human 1 rad. Throughout the gestation period, a mouse at the 5 µCi level receives about 100 µCi of sup(99m)Tc, resulting in approximately 1 rad to the foetus. Significant reduction of body weight was noted in all experimental groups. The greatest effects were seen in the progeny of mothers treated during gestation only. These preliminary results reinforce the existing concern about use of sup(99m)Tc-pertechnetate in pregnant or potentially pregnant subjects.

- 2339 CURRENT STATUS OF UTAH LONG-TERM ²³⁹PU STUDIES. Jee, W.S.S.; Atherton, D.R.; Bruenger, F.; Dougherty, J.H.; Lloyd, R.D.; Mays, C.W.; Nabors, C.J. Jr.; Stevens, W.; Stover, B.J.; Taylor, G.N. (Utah Univ., Salt Lake City (USA). Coll. of Medicine). pp v.2 p.79-93 of Biological and environmental effects of low-level radiation. Vienna; IAEA (1976).

From Symposium on biological effects of low-level radiation pertinent to protection of man and his environment; Chicago, Ill., USA (3 Nov 1975).

Osteosarcomas have been the chief cause of death in the Utah young adult beagles injected intravenously with ²³⁹Pu citrate solution. There was nearly a 100% incidence of bone sarcomas above the 0.015 µCi/kg dose levels. At the 0.015 µCi/kg dose level there was a 29% (4 of 14) incidence. The latent period lengthened with decreasing injected dose. The only other pathology was liver regenerative foci occurring at doses as low as 0.0018 µCi/kg and an incidence of 12% (3 of 25) bile duct carcinomas at the 0.048 and 0.015 µCi/kg dose levels. Studies using older (5-year) and growing (3-

months) beagles, young adult St. Bernards and young adult beagles injected with polymeric ²³⁹Pu showed variation in sensitivity for bone tumour induction. The polymeric model represents a continuous cycling of ²³⁹Pu from the liver to a mature skeleton and the St. Bernard model typifies the relationship between high spontaneous and radiation-induced tumour sensitivity. No results are available for the older adult, but one bone tumour in a growing beagle injected with 0.3 µCi/kg suggests decreased sensitivity. There is increased sensitivity in St. Bernards and polymeric injected dogs for bone tumour induction.

- 2340 (ERDA-tr--241, pp 118-121) HEMODYNAMICS OF DOGS FOLLOWING INHALATION OF POLYMERIC PLUTONIUM-239. Kalmykova, Z.I. 1976. Translated from Radiobiologiya; 16: No. 5, 740-743(1976).

Radiobiology, Vol. 16, No. 5, 1976.

Changes were observed in arterial and venous pressure, slower blood flow, increased mass of circulating blood and an increase in amount of extracellular fluid in mongrel dogs following inhalation of polymeric plutonium-239 in doses that induce acute, subacute and chronic lesions. The time of appearance, severity and direction of the above changes are related to the magnitude of accretion of plutonium-239 in the organism and postinhalation time.

- 2341 INFLUENCE OF VARIATIONS IN DOSE AND DOSE RATES ON BIOLOGICAL EFFECTS OF INHALED BETA-EMITTING RADIONUCLIDES. McClellan, R.O.; Benjamin, S.A.; Boecker, B.B.; Hahn, F.F.; Hobbs, C.H.; Jones, R.K.; Lundgren, D.L. (Inhalation Toxicology Research Institute, Lovelace Biomedical and Environmental Research Institute, Albuquerque, New Mexico, USA). pp 3-18 of Biological and environmental effects of low-level radiation. II. Vienna; IAEA (1976).

From Symposium on biological effects of low-level radiation pertinent to protection of man and his environment; Chicago, Ill., USA (3 Nov 1975).

The biological effects of inhaled β-emitting radionuclides, ⁹⁰Y, ⁹¹Y, ¹⁴⁴Ce and ⁹⁰Sr, are being investigated in beagle dogs that received single acute exposures at 12 to 14 months of age. The aerosols studied have included ⁹¹YCl₃, ¹⁴⁴CeCl₃, ⁹⁰SrCl₂, and ⁹⁰Y, ⁹¹Y, ¹⁴⁴Ce or ⁹⁰Sr in aluminosilicate particles. Thus, ⁹¹YCl₃, ¹⁴⁴CeCl₃ and the aluminosilicate containing radionuclide particles all resulted in significant exposures to lung; ⁹¹YCl₃, ¹⁴⁴CeCl₃ and ⁹⁰SrCl₂ resulted in significant exposures to bone; ⁹¹YCl₃ and ¹⁴⁴CeCl₃ resulted in significant exposures to liver. The higher initial dose-rate exposures have been more effective than low dose-rate exposures on a per-rad basis in producing early effects. To date (<5 years postinhalation exposure) only a limited number of neoplasms have been observed in these animals. In animals with protracted lower dose-rate exposure to bone, liver and lung, late-occurring neoplasms have frequently been observed at relatively high total doses. In other studies on the toxic effects of a single inhalation exposure of mice to ¹⁴⁴CeO₂, it was observed that, on a µCi initial lung burden per kilogram body weight basis, mice did not develop pulmonary tumours whereas beagle dogs did. To find out the reason for this observation mice have been repeatedly exposed by inhalation to ¹⁴⁴CeO₂ to maintain lung burdens of ¹⁴⁴Ce that resulted in radiation dose rates similar to that observed in beagle dogs. Several of the repeatedly exposed mice developed malignant pulmonary tumours. Thus, with similar dose rates and cumulative doses to

the lung, mice and dogs responded in a similar manner to chronic β radiation.

- 2342 BONE TUMORS INDUCED BY INHALATION OF $^{239}\text{PuO}_2$ IN DOGS. Park, J.F.; Lund, J.E.; Ragan, H.A.; Hackett, P.L.; Frazier, M.E. Recent Results Cancer Res.; No. 54, 17-35(1976).

Plutonium-238, an alpha-emitting radionuclide, is used as a heat source in thermoelectric power generators such as have been employed on lunar expeditions of communications satellites and in cardiac pacemakers. It has an 86.4 year half-life and emits 5.5 MeV alpha particles. Beagle dogs were given single 10 to 30 minute exposures to $^{239}\text{PuO}_2$ aerosols to study the long-term translocation of plutonium and biological effects. Dogs with a terminal body burden ranging from 7 to 260 μCi were euthanized due to respiratory insufficiency related to plutonium-induced pneumonitis during the first 3 years after exposure. Nine of the 11 dogs euthanized during the 4 to 6 year postexposure period had osteosarcomas. The terminal plutonium body burden in the tumor-bearing dogs ranged from 0.5 to 2.6 μCi with 30 to 55 percent of the plutonium in the skeleton. Experiments are in progress to further define the dose-effect relationship of inhaled $^{239}\text{PuO}_2$ and investigate the mechanisms of plutonium-induced neoplasia.

- 2343 EXPERIMENTAL INDUCTION OF BONE TUMORS BY SHORT-LIVED BONE-SEEKING RADIONUCLIDES. Goessner, W.; Hug, O.; Luz, A.; Mueller, W.A. Recent Results Cancer Res.; No. 54, 36-49(1976).

Single and repeated applications of ^{224}Ra and single applications of ^{227}Th to more than 600 female NMRI mice 3 to 4 weeks old, and to male NMRI mice have led to a high rate of osteosarcomas. Tumor incidence is dose-related. ^{227}Th is more carcinogenic than ^{224}Ra which induced the highest tumor incidence of 60 percent after a single injection of 5 μCi per Kg body weight or more. Repeated injections of ^{224}Ra to female mice yielded a tumor incidence of up to 92 percent. Most of these osteosarcomas consist of well-differentiated bone-forming osteoplastic tissue. Half of the tumors occurred in the spine, particularly in the lumbar region. In protraction experiments, multifocal osteosarcomas have been observed. Less than 10 percent of the mice with osteosarcoma had developed metastases in lung, spleen, liver, and kidney. The possible mechanisms of the protraction effect are discussed.

- 2344 RADIATION DOSE TO MOUSE TESTES FROM ^{239}Pu . Green, D.; Howells, G.R.; Humphreys, E.R.; Vennart, J.; Thorne, M.C. (Medical Research Council, Harwell, Eng.). pp 21-31 of Health effects of plutonium and radium. Webster, S.S. (ed.). Salt Lake City; Univ. of Utah (1976).

From Workshop on the biological effects and toxicity of Pu 239 and Ra 226; Sun Valley, ID, USA (6 Oct 1975).

See CONF-751043--.

Twelve week old male CBA mice were injected intravenously with an ultrafiltered solution of ^{239}Pu in 1 percent trisodium citrate and were killed four or 12 weeks later. The plutonium in the testes was measured radiochemically and autoradiographically. Most of the plutonium was found in the intertubular spaces but about 40 percent of the α -activity was shown to irradiate the spermatogonial cells lying at the periphery of the seminiferous tubules. At both

times dose-rate to the inter-tubular tissue and to the 10 μm shell of tissue containing the spermatogonial stem-cells surrounding each tubule was found to be greater than that averaged throughout the testis. The consequences of this inhomogeneous distribution are discussed. (auth)

- 2345 (ANL--76-88(Pt.2), pp 54-61) UNUSUAL CASE OF INTERNAL CONTAMINATION WITH ^{241}Am . Rundo, J.; Essling, M.; Huff, D.R.; Fairman, W.D. 1976.

Radiological and Environmental Research Division annual report, July 1975--June 1976.

A woman accidentally swallowed two sources of ^{241}Am of the type used in domestic smoke detectors; the nominal activity of each source was 2.5 μCi , and they were not voided until the 16th and 24th days after intake. A little less than 1% of the total activity of the two sources was found in the fecal material after removal of the sources and ^{241}Am was detected in the urine until the second source had been voided.

- 2346 (BNL--20909) KINETICS OF TOTAL BODY RETENTION AND CLEARANCE OF XENON AND KRYPTON AFTER INHALATION. Susskind, H.; Atkins, H.L.; Cohn, S.H.; Ellis, K.J.; Richards, P. (Brookhaven National Lab., Upton, N.Y. (USA)). 1976. 4p. (CONF-760802--1). Dep. NTIS \$3.50.

From 11. international conference on medical and biological engineering; Ottawa, Canada (2 Aug 1976).

The total body retention of Xe-127 and Kr-79 and their clearance rates following inhalation were measured in vivo. These data are useful for refined Xe-127 dosimetry calculations, to determine the potential radiation hazard of fission product Kr-85, and more generally to study the behavior of anesthetic gases. While data are available on the solubilities and partition coefficients of Xe and Kr in fat, blood, and other individual body constituents, few measurements of their retention and clearance from the entire body have been reported.

- 2347 (MLM--2339(OP)) CALIBRATION FOR PLUTONIUM-238 LUNG COUNTING AT MOUND LABORATORY. Tomlinson, F.K. (Mound Lab., Miamisburg, Ohio (USA)). 1976. Contract E-33-1-GEN-53. 13p. (CONF-760634--2). Dep. NTIS \$3.50.

From Pacific regional symposium; Seattle, WA, USA (24 Jun 1976).

The lung counting facility at Mound Laboratory was calibrated for making plutonium-238 lung deposition assessments in the fall of 1969. Phoswich detectors have been used since that time; however, the technique of calibration has improved considerably. The current technique of calibrating the lung counter is described as well as the method of error analysis and determination of the minimum detectable activity. A Remab hybrid phantom is used along with an attenuation curve which is derived from plutonium loaded lungs and ground beef absorber measurements. The errors that are included in an analysis as well as those that are excluded are described. The method of calculating the minimum detectable activity is also included. (auth)

- 2348 (STI/PUB--411) DIAGNOSIS AND TREATMENT OF INCORPORATED RADIONUCLIDES. PROCEEDINGS SERIES. PROCEEDINGS OF AN INTERNATIONAL SEMINAR, VIENNA, AUSTRIA, DECEMBER 8--12, 1975. (International Atomic Energy Agency, Vienna

(Austria)). 1976. 638p. (CONF-751205--). IAEA \$39.00.

From IAEA international seminar on diagnosis and treatment of incorporated radionuclides; Vienna, Austria (8 Dec 1975).

Some 50 papers discuss methods of treatment of incorporated radionuclides in personnel and report the results of related studies in laboratory animals. Emphasis is placed on methods for the assessment of the body burden of ^{239}Pu , ^{241}Am , and other transuranic elements following accidental inhalation or uptake through puncture wounds. The effectiveness of DTPA and other chelating compounds for decorporation is discussed. (CH)

2349 CHEMICAL FORM OF PLUTONIUM IN URINE. Popplewell, D.S.; Stradling, G.N.; Ham, G.J. (National Radiological Protection Board, Harwell, Eng.). pp 245-248 of Health effects of plutonium and radium. Webster, S.S. (ed.). Salt Lake City; Univ. of Utah (1976).

From Workshop on the biological effects and toxicity of Pu 239 and Ra 226; Sun Valley, ID, USA (6 Oct 1975).

See CONF-751043--.

Evidence from in vivo and in vitro experiments points to citrate as the plutonium-binding agent in human urine. (auth)

2350 LOS ALAMOS SCIENTIFIC LABORATORY'S HUMAN AUTOPSY TISSUE ANALYSIS STUDY. McInroy, J.F. (Los Alamos Scientific Lab., NM). pp 249-270 of Health effects of plutonium and radium. Webster, S.S. (ed.). Salt Lake City; Univ. of Utah (1976).

From Workshop on the biological effects and toxicity of Pu 239 and Ra 226; Sun Valley, ID, USA (6 Oct 1975).

See CONF-751043--.

Since 1959, the Health Division, Los Alamos Scientific Laboratory has analyzed the tissues from 81 former employees of the Laboratory for plutonium. Additionally, approximately 700 autopsy cases from the general population have also been analyzed for Pu resulting from fallout. The variation in the distribution of Pu in the bodies of the occupationally exposed individuals suggest that each exposure incident is unique and must be evaluated on the basis of the chemical form, solubility, particle size, mode of entry, and duration of exposure. Particle size distribution of Pu in a lymph node of a long-term chronic exposure case was estimated to have a mass median diameter of 0.32 μm with a geometric standard deviation of 1.5. The baseline concentrations of environmental Pu have been estimated for the general population and the tissue distributions compared with the occupationally exposed cases. (auth)

2351 HEALTH OF HANFORD PLUTONIUM (PU) WORKERS. I. Norwood, W.D. (Hanford Environmental Health Foundation, Richland, WA); Newton, C.E.; Kirklín, C.W.; Heid, K.R.; Breitenstein, B.D. pp 271-296 of Health effects of plutonium and radium. Webster, S.S. (ed.). Salt Lake City; Univ. of Utah (1976).

From Workshop on the biological effects and toxicity of Pu 239 and Ra 226; Sun Valley, ID, USA (6 Oct 1975).

See CONF-751043--.

Health, mortality and cause of death in 452 Hanford known Pu deposition cases was analyzed for the period 1944 to 1975. Malignant disease as a cause of morbidity and mortality was carefully examined because of its occurrence in laboratory animals subjected to very large doses of Pu. Other serious diseases were also

considered. The average years at risk in these individuals with depositions was 23 (range 2 to 31) years. The average years following deposition in those estimated to have more than 4 nCi was 16.7 (range 6 to 30) years. Using clinical judgment in evaluating severity of malignancy, and other disease, there does not appear to be any meaningful difference between the health and mortality of the employees with low deposition of Pu (less than or equal to 2 nCi) and that of employees with higher systematic depositions (2 nCi to 400 nCi). (auth)

2352 MACRO-DISTRIBUTION OF PLUTONIUM IN SELECTED BONES FROM AN ABNORMAL SKELETON. Larsen, R.P.; Toohey, R.E.; Ilcewicz, F.H. (Argonne National Lab., IL). pp 315-320 of Health effects of plutonium and radium. Webster, S.S. (ed.). Salt Lake City; Univ. of Utah (1976).

From Workshop on the biological effects and toxicity of Pu 239 and Ra 226; Sun Valley, ID, USA (6 Oct 1975).

See CONF-751043--.

The distribution of plutonium in the skeleton of a female patient who received about 0.3 μCi by injection in 1945 is being determined. At the time of the injection she was terminally ill; she died 17 months later. From the analysis of a selected number of bones, it has been possible to establish a preliminary view of the trabecular vs cortical distribution pattern and to provide a concentration profile of the tibia. The presence of ^{241}Am in the skeleton was observed; the decay of ^{241}Pu which was shown to have been present in the injected Pu was demonstrated to be its source. (auth)

2353 MICROSCOPIC DISTRIBUTION OF ^{239}Pu DEPOSITED IN BONE FROM A HUMAN INJECTION CASE. Schlenker, R.A.; Oltman, B.G.; Cummins, H.T. (Argonne National Lab., IL). pp 321-328 of Health effects of plutonium and radium. Webster, S.S. (ed.). Salt Lake City; Univ. of Utah (1976).

From Workshop on the biological effects and toxicity of Pu 239 and Ra 226; Sun Valley, ID, USA (6 Oct 1975).

See CONF-751043--.

The distribution of ^{239}Pu was studied in bone from a female patient who received an intravenous injection of 0.3 μCi ^{239}Pu in 1945 at age 18 and who died 17 months later with Cushing's Syndrome. The average depth at which ^{239}Pu was deposited by appositional bone growth in trabeculae ranged from 40 to 60 μm in seven bones. The average for all sites of deposition studied was 52 μm . Surface and volume concentrations in bone which covered surfaces in trabeculae ranged between 0.26 and 0.63 pCi/cm² and 56 and 160 pCi/cm³ respectively in seven bones. The mean values of the data for the seven bones were 0.39 pCi/cm³ and 94 pCi/cm³. The volume concentration contributes only about 4 percent of the total terminal dose rate in a layer of cells 10 μm thick lining the endosteal surfaces of trabeculae in the 6th thoracic vertebra. In other bones the contribution from bone volume would be even less. Concentrations on the periosteal, endosteal and Haversian canal surfaces in the shafts of six long bones ranged between 0.18 and 0.64 pCi/cm², 0.14 and 0.31 pCi/cm², and 0.13 and 0.59 pCi/cm² respectively. These concentrations are considerably less than those observed on overgrown surfaces at the same sites. (auth)

2354 GROSS DISTRIBUTION OF ^{226}Ra IN MAN FROM

EXTERNAL COUNTING. Rundo, J.; Essling, M.A.; Huff, D.R. (Argonne National Lab., IL). pp 409-420 of Health effects of plutonium and radium. Webster, S.S. (ed.). Salt Lake City; Univ. of Utah (1976).

From Workshop on the biological effects and toxicity of Pu 239 and Ra 226; Sun Valley, ID, USA (6 Oct 1975).

See CONF-751043--.

When the first γ -ray measurements of ^{226}Ra retention in patients indicate a content in excess of about 20 nCi of RaC (^{214}Bi), a whole-body is made. Measurements are made with two detectors, above and below the supine subject, at seven equally spaced positions along the length. The spacing is set at 15 percent of the subject's height. Such scans have been made for 40 different patients and although the detectors are uncollimated, a surprising amount of information on the distribution is revealed. The following points are demonstrated graphically: the gross distribution is extremely variable, and the variability is unrelated to the mode of intake; there is no correlation between regions of high levels of radium and sites of malignancies, and the general pattern of distribution is stable over periods of some years. (auth)

2355 MACRODISTRIBUTION OF ^{226}Ra IN THE SKELETON OF A RADIUM DIAL PAINTER. Holtzman, R.B. (Argonne National Lab., IL); Simmons, D.J. pp 421-436 of Health effects of plutonium and radium. Webster, S.S. (ed.). Salt Lake City; Univ. of Utah (1976).

From Workshop on the biological effects and toxicity of Pu 239 and Ra 226; Sun Valley, ID, USA (6 Oct 1975).

See CONF-751043--.

The concentrations of ^{226}Ra were determined in 190 samples of bone and in four teeth from a woman who had worked for two years as a radium dial painter 52 years prior to her death. The terminal body content of ^{226}Ra was 200 nCi. The weighted mean concentration of activity in bone was 146 ± 11 pCi/g ash. The concentrations of the ^{226}Ra in long bones were fairly constant along the shafts and increased greatly towards the ends. The concentration patterns were generally symmetrical with respect to right and left sides. The patterns in bone from the lower limbs (femur, tibia, and fibula) were similar to each other but differed from those in the upper limbs (humerus and radius). (auth)

2356 MICROSCOPIC DISTRIBUTION OF ^{226}Ra IN THE BONES OF RADIUM CASES: A COMPARISON BETWEEN DIFFUSE AND AVERAGE ^{226}Ra CONCENTRATIONS. Schlenker, R.A.; Farnham, J.E. (Argonne National Lab., IL). pp 437-449 of Health effects of plutonium and radium. Webster, S.S. (ed.). Salt Lake City; Univ. of Utah (1976).

From Workshop on the biological effects and toxicity of Pu 239 and Ra 226; Sun Valley, ID, USA (6 Oct 1975).

See CONF-751043--.

Diffuse concentration measurements were made at various sites in the skeletons of ten patients administered ^{226}Ra using alpha track autoradiography. The ratio of the highest to lowest concentration observed within a skeleton was found to be 2.8 ± 1.4 . Measurements were made at five pairs of contralateral sites in one case and bilateral asymmetry was found. Diffuse and average concentrations showed similar distribution patterns along the lengths of femora from three cases. Ratios of diffuse to uniform concentration, when analyzed using the ICRP model of alkaline earth metabolism indicated that the most representative compact bone remodeling rate for these skeletons was in

the range 0 to 0.4 percent/year. (auth)

2357 COMPARISON OF THE LATE EXCRETION OF ^{226}Ra AND ^{239}Pu BY MAN. Rundo, J.; Holtzman, R.B. (Argonne National Lab., IL). pp 497-504 of Health effects of plutonium and radium. Webster, S.S. (ed.). Salt Lake City; Univ. of Utah (1976).

From Workshop on the biological effects and toxicity of Pu 239 and Ra 226; Sun Valley, ID, USA (6 Oct 1975).

See CONF-751043--.

Excretion rates of ^{226}Ra (12 cases) and ^{239}Pu (2 cases) at roughly 10^3 and 10^4 days after intake are reviewed and compared with each other and with the predictions of various models. There are more differences than similarities between the behavior of Ra and that of Pu, but the excretion rates at 10^3 days are similar when expressed as percent of initial dose, as are the coefficients of elimination at 10^4 days. At the late times, about 1.5 percent of the body's content of either element is excreted annually. Between individuals there is enormous variability in the late excretion of Ra, which may also be present in Pu cases. The role (if any) of osteoporosis needs to be clarified. (auth)

2358 NATURE OF THE PROCESSES THAT TAKE PLACE DURING THE UPTAKE OF STRONTIUM RADIOISOTOPES BY FORMED BONE CRYSTALS. SORPTION. Golutvina, M.M. (Inst. of Biophysics, Moscow). Nauchn. Dokl. Vyssh. Shk., Biol. Nauki; No. 3, 35-39(1976). (In Russian).

In vitro experiments performed under physiological conditions (pH 7.3, ionic strength 0.16, temperature 37°C) with apatite isolated from human and rat bone and with a synthetic substitute for bone mineral showed that ion exchange is dominant in the initial phase of contact between radiostrontium and apatite. Strontium disappears from the solution while calcium in equimolar amounts enters it. The process is largely reversible even if the crystals are exposed to the isotope for as long as 2 weeks. Thereafter a slow process takes place in which strontium is irreversibly incorporated into the crystal lattice of the mineral. The kinetic parameters are similar in animals. Within 5 minutes of intravenous injection of rats with strontium 85, the isotope was found to be concentrated in bone. The amount of isotope in the skeleton increased with increasing time between its injection and sacrifice of the animal.

2359 TO THE PROBLEM OF HOT PARTICLES. Jacobi, W. (Gesellschaft fuer Strahlen- und Umweltforschung m.b.H., Neuherberg/Muenchen (F.R. Germany). Inst. fuer Strahlenschutz). Atomkernenergie; 28: No. 1, 29-37(1976). (In German).

From Symposium on medical and biological problems of radiation exposure; Borstel, F.R. Germany (30 May 1975).

6 figs.; 1 tab.; with refs..

Proceeding from an analysis of the dose distribution and the expected cytological effects in the surrounding of hot Pu-particles in the lung, the results of relevant animal experiments and the observations among overexposed Pu-workers are summarized. From these empirical findings no unusual high effectiveness of hot particles for the generation of late effects in the lung can be concluded. On the contrary they indicate that the late effect risk from hot, α -active particles is probably smaller compared with an uniform irradiation of the lung with the same mean dose. Accordingly there is no biological

justification of the Tamplin-Cochran-proposal to revise in the case of hot α -active particles the concept of the mean lung dose, as is it currently used in radiation protection.

- 2360 RADIATION EXPOSURE STUDY OF THE OTTAWA COUNTY, OKLAHOMA POPULATION FROM DIETARY INTAKE OF RADIUM-226. Keefer, D.H. Dallas; Univ. of Texas (1976). 210p. University Microfilms Order No. 76,23,152.

Thesis (Ph. D.).

Communities in Ottawa County and vicinity derive their water from the Roubidoux Formation in the Canadian Series of the Cambro-Ordovician Period. It was demonstrated in this study that wells on the eastern side of the county have radium-226 concentrations less than 1 pCi/l, reflecting the level of radium-226 existing along the hydrologic gradient of the aquifer. Water supplies in southwestern Ottawa County contain radium-226 concentrations as high as 11.2 pCi/l. This elevated radium-226 value is accompanied by 1.2 pCi/l of radium-228; together they exceed by a factor of 2.5 the maximum permissible contaminant level to be allowed by the Safe Drinking Water Act of 1974.

- 2361 DISTRIBUTION AND DOSIMETRY OF ^{52}Fe AND ^{59}Fe IN BONE MARROW AND OTHER ORGANS. Lillicrap, S.C.; Steere, H.; Clink, H.M. pp 79-90 of Radioaktive Isotope in Klinik und Forschung. Bd. 12. Hoefer, R. (ed.). Wien; H. Egermann (1976).

From International symposium on radioactive isotope in clinical medicine and research; Bad Gastein, Austria (12 Jan 1976).

13 refs..

^{59}Fe and ^{52}Fe have been used for haematological studies. The distribution and dosimetry of both ^{59}Fe and ^{52}Fe in patients with normal marrow function and distribution, and patients with poor or zero marrow function is described. The results were obtained using a quantitative dual-headed total body scanner situated in a low background environment. Differences in the distribution of the radionuclides are observed and the role of the sup(^{52}m)Mn daughter product of ^{52}Fe and of the different chemical forms of the radionuclides have been examined as possible reasons for these differences. An estimation of the distribution of the erythropoietic marrow in patients with normal marrow function has been made from the quantitative marrow scans. These results are compared with the estimates obtained from autopsy studies.

- 2362 TECHNICAL FAILURE IN A CONTAINER SEAL IN THE NUCLEAR RESEARCH CENTRE KARLSRUHE. At. Inf.; No. 8, . 9-10(1976). (In German).

Article identical with abstract.

On the morning of the 10th of August 1976, there was a technical failure on the seal of a container for highly active waste solution in the Hot Cells of the Nuclear Research Centre Karlsruhe. Thus, at the beginning of an experiment, about one liter of waste solution escaped into the operating room. The latter and adjoining rooms were thus radioactively contaminated. No activity was released to the outside. Some of the rooms concerned have already been decontaminated. Several people were contaminated in this incident. The evaluation of the personnel dosimeters showed a dose well below the permissible value for all persons involved.

- 2363 BIOLOGICAL BEHAVIOUR OF PLUTONIUM 239. Lafuma, J. (Commissariat a l'Energie Atomique, Brussels (Belgium)). Ann. Biol. Anim.

Biochim., Biophys.; 1: No. 1, 43-53(1976). (In French).

Plutonium is scarcely incorporated from the environment into the food chain because of its inability to penetrate biological membranes. Workers can be contaminated through inhalation or deposition in wounds. Pu present in the pulmonary alveoles or incorporated in wounds is redistributed in the organism either through cellular transport resulting in an important accumulation in the lymphatic ganglia either by blood transport as dissolved Pu bound to proteins. This mechanism results in a progressive accumulation of the radioelement in liver and bone. It is estimated that about 40% of the Pu present in the blood is deposited in the liver from which one half is eliminated every ten years. 50% is deposited in bone from which the elimination takes much longer and 10% is eliminated with the urines. Intravenous injection of DTPA is very useful for Pu elimination immediately after contamination. For elimination of pulmonary Pu the technique of 'pulmonary washing' is suggested. This method reduces the pulmonary contamination in laboratory animals by a factor 10.

- 2364 STATISTICAL EVALUATION OF THE RADIOTOXICITY OF INHALED PLUTONIUM IN INSOLUBLE FORM. Cave, L. (Pollution Prevention (Consultants) Ltd., Crawley (UK)); Freedman, L. (Medical Research Council, London (UK)). pp 547-565 of Transuranium nuclides in the environment. Vienna; International Atomic Energy Agency (1976).

From IAEA international symposium on transuranium nuclides in the environment; San Francisco, CA, USA (17 Nov 1975).

See CONF-751105--.

The purpose of the paper is to analyse statistically the available human data relating to plutonium toxicity to see whether two outstanding uncertainties can be resolved: (1) whether there is a marked increase in toxicity with size of particle, due to a 'hot particle' effect; (2) whether the commonly used value of 0.016 μCi for the maximum permissible lung burden for occupational workers is an adequate interpretation of the ICRP recommendation that the dose to the lung should not exceed 15rem/a. Of the human data available, only that for the group of 25 LASL workers who acquired substantial lung burdens during 1944/45 can, at present, make a substantial contribution to the statistical analysis. Data relating to particle size distribution in plutonium handling facilities is reviewed. This review shows that it is reasonable to assume that the distributions to which these workers were exposed was reasonably representative of those that might be encountered in the normal operation of such facilities, and in accident conditions at such plants or at such nuclear power stations. The statistical methods employed provide estimates of 'risk factors' in terms of unit activity burden or per particle. They are able to take account of substantial random errors in the basic data and to give an appropriate weight to various hypotheses as to the extent, if any, of a 'hot particle' effect. The results of the analysis give little support to the view that there is a substantial 'hot particle' effect. Some published estimates of 'risk per particle' appear to be too large by factors of at least 1000. The total exposure represented by the available human data is not yet large enough to substantiate fully, on a statistical basis, the value of 0.016 μCi for the maximum permissible lung burden. However, regarded as a 'best estimate' this value should not be too high by a factor of more than 15 or, by a factor of more than 40 at the 95% upper confidence level.

2365 CALCULATED DOSES FROM INHALED TRANSURANIAN RADIONUCLIDES AND POTENTIAL RISK EQUIVALENCE TO WHOLE-BODY RADIATION. Strom, P.O. (US Nuclear Regulatory Commission, Rockville, Maryland, USA); Watson, E.C. (Battelle Pacific Northwest Labs., Richland, Wash. (USA)). pp 603-625 of Transuranium nuclides in the environment. Vienna: International Atomic Energy Agency (1976).

From IAEA international symposium on transuranium nuclides in the environment; San Francisco, CA, USA (17 Nov 1975).

See CONF-751105--.

The report examines the distribution of radiation dose commitments within the body that can result from the lung deposition of a number of transuranic radionuclides. The variables that influence these organ dose commitments include the mobility of the particle or its dissolution products within the body, the radiation characteristics of the inhaled radionuclides and their progeny, and the size of the particles inhaled. The calculated dose commitments form a part of the bases of a more speculative section of the report. Estimates of the risk of excess deaths from cancer due to whole-body radiation doses are included in the calculations to provide an estimate of cancer death risks associated with the inhalation of transuranic compounds. These results are then equated to those from whole-body radiation doses. The uncertainties associated with such calculations are recognized, and, in particular, the implicit assumptions of internally and externally generated dose equivalence and dose-effect linearity are acknowledged.

2366 (BNWL-SA--5896(Rev.)) LIFE HISTORY OF PLUTONIUM DIOXIDE IN THE LUNG: FROM MACROPHAGE TO CARCINOMA. Sanders, C.L.; Ade, R.R.; Rhoads, K.; Madison, R.M. (Battelle Pacific Northwest Labs., Richland, Wash. (USA)). 1976. Contract E(45-1)-1830. 33p. (CONF-760927--2). Dep. NTIS \$4.00.

From 16. annual Hanford biology symposium on pulmonary macrophage and epithelial cells; Richland, WA, USA (27 Sep 1976).

The pulmonary macrophage exerts a large influence upon the distribution of alpha energy from inhaled $^{239}\text{PuO}_2$, while the pulmonary epithelium serves as the prime 'target' cell for neoplastic transformation. In the rat, of the total radiation energy absorbed in the lung, about 80 percent is delivered to the alveolar septae, 19 percent to the vascular tissues and less than 1 percent to the bronchial epithelium. Of the radiation energy delivered to the alveolar septae, about 10 percent is absorbed by alveolar epithelium, 10 percent by macrophage, 10 percent by endothelium and 70 percent by other cellular and noncellular elements. Both the type II alveolar epithelium and the bronchiolar epithelium serve as the probable cells of origin for induced adenocarcinoma.

2367 PLUTONIUM INCORPORATION THROUGH INGESTION BY YOUNG ANIMALS. Finkel, M.P.; Kisleleski, W.E. (Argonne National Lab., IL). pp 57-69 of Health effects of plutonium and radium. Webster, S.S. (ed.). Salt Lake City: Univ. of Utah (1976).

From Workshop on the biological effects and toxicity of Pu 239 and Ra 226; Sun Valley, ID, USA (6 Oct 1975).

See CONF-751043--.

Studies to determine whether animals nursed by dams with a ^{239}Pu burden would themselves acquire plutonium showed that rats incorporated

about 0.019 percent of the amount injected into the dam, mice incorporated about 0.11 percent, and cats about 0.28 percent. Plutonium obtained in this fashion was avidly retained by bone and resulted in the appearance of two osteogenic sarcomas in a seven and one-half-year-old cat with an estimated terminal body burden of 0.23 to 0.27 μCi . In comparing the incorporation of ingested Pu-milk and Pu-citrate by rats of different ages, it was found that nurslings incorporated more than weanlings and weanlings more than adults. Also, 1.6 to 3 times as much plutonium was incorporated from ingested Pu-milk as from ingested Pu-citrate. (auth)

2368 CORRELATIONS BETWEEN THE METABOLIC BEHAVIOR OF INHALED AND INTRAVENOUSLY INJECTED PLUTONIUM IN BEAGLE DOGS. Cuddihy, R.C.; McClellan, R.O.; Mewhinney, J.A.; Muggenburg, B.A. (Inhalation Toxicology Research Inst., Albuquerque, NM). pp 169-182 of Health effects of plutonium and radium. Webster, S.S. (ed.). Salt Lake City: Univ. of Utah (1976).

From Workshop on the biological effects and toxicity of Pu 239 and Ra 226; Sun Valley, ID, USA (6 Oct 1975).

See CONF-751043--.

Long-term studies of radiation dose distribution patterns in Beagle dogs after inhalation of ^{239}Pu oxide aerosols have been conducted at the Battelle Northwest Laboratories. Parallel studies with ^{239}Pu citrate injected into Beagles have been conducted at the University of Utah. In the present study, a mathematical model for describing internal organ retention patterns for ^{239}Pu was used to compare results obtained from these previous studies. The model was also used to assess new data being developed at the Lovelace Inhalation Toxicology Research Institute, ITRI, where dogs inhaled ^{239}Pu aerosols of varied solubility. In studies with inhaled ^{239}Pu oxide, most of the ^{239}Pu which deposited in the lower respiratory tract was retained in lung with a four year half-time. The ^{239}Pu slowly absorbed from lung accumulated about 75 percent in liver and 21 percent in the skeleton. After injection of ^{239}Pu citrate the early deposition favored skeleton over liver, however, only 21 percent of the injected dose was retained in the skeleton at times greater than two years. Early time (56 day) distribution of ^{239}Pu after inhalation reported from studies at ITRI were similar to the ^{239}Pu citrate injection studies in relative skeleton and liver deposition. Analyses with the ^{239}Pu deposition and retention model suggested that an early deposition pattern favoring skeletal deposition of ^{239}Pu may have been present but not readily apparent in the Battelle studies due to very slow movement of ^{239}Pu to internal organs. (auth)

2369 INVESTIGATIONS OF IODINE-131 RELEASE IN RATS. Correns, H.J.; Vogler, H.; Fink, V.; Hollenbach, K. pp 687-694 of Radioaktive Isotope in Klinik und Forschung. Bd. 12. Teil 26. Hoefer, R. (ed.). Wien; H. Egermann (1976). (In German)

From International symposium on radioactive isotope in clinical medicine and research; Bad Gastein, Austria (12 Jan 1976).

19 refs..

The effects of potassium iodide, sodium perchlorate and Methimazole in combination with TSH on iodine release following ^{131}I intake has been studied in rats 6 and 12 hours after the administration of ^{131}I . Combination of Methimazole with TSH six hours after therapy could reduce radiation dose to the thyroid by 51.8% and 12 hours later by 42.3%. Addition of

perchlorate during the first day had a synergetic effect.

- 2370 (ERDA-tr--266, pp 98-102) DISTRIBUTION AND BIOLOGICAL EFFECTS OF INTRATRACHEAL ADMINISTRATION OF CALIFORNIUM-252. Moskalev, Yu.I.; Stepanov, S.V.; Zalikin, G.A.; Kalistratova, V.S. 1976. Translated from Radiobiologiya; 16: No. 6, 882-885(1976).

Radiobiology. A study was made of distribution and biological effects of californium-252 nitrate (pH 3.0) on rats. It was shown that the skeleton, liver and kidneys are the principal organs of secondary deposition, which constituted 29.2 percent, 4.5 percent and 1.4 percent, respectively, of the given dose. An evaluation was made of the effect of Cf on mean life expectancy, composition of peripheral blood, weight, blood cholinesterase and alkaline phosphatase activity.

- 2371 INFLUENCE OF EXTERNAL IRRADIATION ON THE BIOLOGICAL HALF-LIFE OF TRITIUM IN RATS. Bilkiewicz, J.; Radwan, I.; Jaworowski, Z. (Centralne Lab. Ochrony Radiologicznej, Warsaw (Poland)). Postępy Fiz. Med.; 11: No. 2, 97-102(1976).

Wistar inbred rats were irradiated with 350 rads of X-rays and given subcutaneously 2.5 μ Ci of tritiated water per gram of body weight. Samples of the liver, lung, kidney, skin, muscle, small and large intestine and growing hair were collected at 1, 3 and 5 days intervals within 21 days of the experiment. Incorporation rate of tritium in particular tissues were determined. The biological half-life of tritium was calculated from regression equations obtained by means of the least square technique. In irradiated animals the biological half-life of free water tritium was similar in various tissues and ranged from 4.3 $\pm$ 0.2 days to 4.9 $\pm$ 0.4 days. These values were slightly higher than those found in nonirradiated rats, however, the differences were not statistically significant. The retention of tissue bound tritium was more variable in both groups of animals. The biological half-life tissue bound tritium varied in irradiated rats from 7.3 $\pm$ 0.8 days in the small intestine to 26.9 $\pm$ 9.3 days in the muscle and was significantly higher than in non-irradiated rats. The increase in tritium incorporation in the growing hair after irradiation has also been observed.

- 2372 (UCD--472-123) ANNUAL REPORT, FISCAL YEAR 1976. Goldman, M. (California Univ., Davis (USA). Radiobiology Lab.). 1976. Contract EY-76-C-03-0472. 179p. Dep. NTIS, PC A08/MF A01.

Separate abstracts were prepared for 22 sections of this report. A list is included of 60 publications during the period covered and tabulated data covers the health status of aging beagles administered ^{90}Sr or ^{22}Ra . (CH)

- 2373 (CONF-751022-- , pp 37-41) PRINCIPLES OF STANDARDS SETTING: THE RADIATION EXPERIENCE. Parker, H.M. (HMP Associates, Inc., Richland, WA). 1976.

From 3. life sciences symposium; Los Alamos, NM, USA (15 Oct 1975).

Impact of energy production on human health: an evaluation of means for assessment.

The basis and use of standards generally are repeated from material used in the Joint Committee on Atomic Energy Hearings on Radiation Protection Standards. A brief history of radiation protection standards is related to this base. The recent history emphasizes the

delayed production of leukemia and other cancers as a principal risk. A linear relationship between such effects and dose is accepted as a prudent policy. What really happens at low dose and low dose rate is unknown and may remain so. Whether linear or not, it is likely (but also unproven) that the deleterious effects are nonthreshold. Standards setting then becomes a public responsibility not soluble on purely technical grounds. It is implied that hazards of numerous environmental pollutants from alternative energy sources operate in the same way. To apply equal diligence to all pollutants as is now given to radiation would cost astronomical sums. Steps are outlined to reduce some of the excesses that have troubled the radiation case. The most useful step is probably to avoid the "Father knows best" approach that has encouraged some lack of credibility.

- 2374 (CONF-751022-- , pp 75-84) MUTAGENESIS AND TERATOGENESIS AS END POINTS IN HEALTH IMPACT ASSESSMENT. Bender, M.A. (Brookhaven National Lab., Upton, NY). 1976.

From 3. life sciences symposium; Los Alamos, NM, USA (15 Oct 1975).

Impact of energy production on human health: an evaluation of means for assessment.

The genetic and teratogenic effects of agents released to the environment as a consequence of energy production are exceedingly difficult to evaluate. Nevertheless, these effects on human health may be very costly in the context of cost-benefit analysis. In fact, the procedures required to limit mutagenic or teratogenic agents to the levels considered acceptable by regulatory bodies may constitute a major fraction of the cost of energy, especially where prudence dictates that a lack of empirical data requires extremely conservative regulations. Experience with ionizing radiation and with regulation of nuclear power installations illustrates the difficulty of genetic and teratogenic health impact assessment and the great uncertainties involved, as well as the influence of these impacts on the regulatory process and the consequent increased cost of power from this source. Data on genetic and teratogenic impacts on human health from chemical agents released to the environment by other energy technologies are much less complete, and, because of the large number of potentially active agents involved, it is evident that generic solutions to health impact assessment will be required to evaluate these energy alternatives.

- 2375 (CONF-760301--3) STATE AND FEDERAL REGULATORY MEASUREMENT RESPONSIBILITIES AROUND MEDICAL FACILITIES. Lanzl, L.H. (Chicago Univ., Ill. (USA). Dept. of Radiology). 1976. Contract E(11-1)-69. 14p. Dep. NTIS \$3.50.

From NBS symposium on measurements for the safe use of radiation; Gaithersburg, MD, USA (1 Mar 1976).

Radiation exposure to man is due chiefly to diagnostic x-ray procedures, in which radiation is intentionally directed toward a patient. Radiation therapy presents a lesser problem because a smaller percentage of the population is subjected to such treatment. Recently, some innovative steps were taken in the State of Illinois to reduce patient exposure in four diagnostic procedures without reducing the benefits derived therefrom. However, if these procedures are to be carried out properly, it is necessary to increase the precision and accuracy of radiation exposure measurements to the order of ± 2 percent. The usual accuracy and precision of radiation protection measurements are of the order of ± 20 percent.

Thus, should the Illinois radiation protection rules become widely adopted, the national dosimetry network will need to upgrade exposure measurement techniques. (auth)

Solar and galactic radiation, nuclear collisions of primary particles and their secondary processes, and solar eruptions and their effects having been dealt with briefly, maps of the radiation exposure of the FRG's population are presented.

- 2377 (INIS-mf--3312) ANNUAL REPORT OF THE DEPARTMENT OF ATOMIC ENERGY 1975--76. (Department of Atomic Energy, Bombay (India)). 1976. 119p. NTIS (US Sales Only).
The activities of the various constituent units of the Department of Atomic Energy such as the Bhabha Atomic Research Centre, Reactor Research Centre, Variable Energy Cyclotron, the power stations and a few others during the year 1975--76 are reported. The progress achieved in the field of atomic minerals, nuclear medicine, nuclear power, development of radioisotopes, etc., is presented in detail. The responsibilities and achievements of the public sector undertakings under the Department of Atomic Energy, such as Indian Rare Earth Ltd., Electronics Corporation of India Ltd., Uranium Corporation of India Ltd., are highlighted. Other activities, such as planning and execution, economic and personnel health aspects, international relations, etc. are also mentioned.

- 2378 (NP--21778) ANNUAL REPORT, 1976. (Ankara Nuclear Research and Training Center (Turkey)). 1976. 20p. Dep. NTIS (US Sales Only), PC A02/MF A01.
The Ankara Nuclear Research and Training Center carries out applied research and development work, most of which is directly related to Turkish industry. The Center consists of the following eight departments: nuclear physics, nuclear chemistry, electronics, radioisotope applications in industry, health physics, agricultural and biological radioisotope applications, technical information, and technical services. Very brief, nontechnical summaries of work done are presented. (RWR)

- 2379 ESTIMATION OF RADIATION HAZARD IN MAN'S HABITATIONAL MICROENVIRONMENT IN POLAND. Pensko, J. (Institute of Nuclear Research, Warsaw (Poland)). Postepy Fiz. Med.; 11: No. 2, 73-86(1976). (In Polish).
Previous research proved that the population

of Poland received absorbed doses of natural background radiation for the whole body of approx. 100 mrad/a outdoors, 75-100 mrad/a in wooden houses, 100-150 mrad/a ceramic brick houses and 120-300 mrad/a in prefabricated ones. The doses for cells of bronchi epithelium due to alpha radiation of radon and its daughters were found to be between 1.3 and 500 mrad/a outdoors and 2-2550 mrad/a indoors. From these data the expected biological effects were evaluated applying a linear dose - effect approach with no threshold relationship. The existing and future housing development as well as demographic forecast of the population and alive birthrate for the decades of 1950-2009 have been adopted. It has been proved that the critical hazards in form of malignancies of bronchi epithelium may be expected. Some conclusions and recommendations are given.

- 2380 (AED-Conf--76-134-063) PATIENT DOSE WITH WHOLE-BODY COMPUTER TOMOGRAPHY. Krauss, O.; Schuhmacher, H. (Deutsches Krebsforschungszentrum, Heidelberg (Germany, F.R.). Inst. fuer Nuklearmedizin). 1976. 11p. (In German). (CONF-760592--10). NTIS (US Sales Only).

From 7. scientific meeting of the Deutsche Gesellschaft fuer Medizinische Physik e.V.; Heidelberg, F.R. Germany (5 May 1976). 5 figs..

The radiation doses in the whole-body computer tomography for brain, lungs, liver and kidney investigations were measured by means of LiF-TLD in the Alderson phantom. With a single-layer image of the trunk (filtration 6 mm aluminium) dose values of 1.2 rad were found for the skin on the entering side and of 90 mrad on the exiting side. Using a close-to-reality investigating technique of, e.g., 5 layers next to each other in the upper stomach, one gets maximum tissue doses at the entering side of 1.8 rad, in the body axis of 700 mrad and at the exiting side of 230 mrad. The gonadal doses are smaller than 2-4 mrad when the body cross-section last investigated is at a distance of more than 15 cm from the gonads.

- 2381 TRANSITION FROM THE ATOMIC BOMB CASUALTY COMMISSION TO THE RADIATION EFFECTS RESEARCH FOUNDATION. Bond, V.P. (Brookhaven National Lab., Upton, N.Y. (USA)). pp 419-420 of Biological and environmental effects of low-level radiation. Vol. 2. Vienna; IAEA (1976).

From Symposium on biological effects of low-level radiation pertinent to protection of man and his environment; Chicago, Ill., USA (3 Nov 1975).

The events resulting in the establishment of the new foundation (RERF) to replace the Atomic Bomb Casualty Commission (ABCC) are briefly described.

- 2382 (AD-A--019804) NUCLEAR EMULSION MEASUREMENTS OF THE ASTRONAUTS' RADIATION EXPOSURES ON SKYLAB MISSIONS 2, 3 AND 4. Schaefer, H.J.; Sullivan, J.J. (Naval Aerospace Medical Inst., Pensacola, Fla. (USA)). 10 Dec 1975. 19p. (NAMRL--1220). NTIS \$3.50.

On the Skylab missions, Ilford G.5 and K.2 emulsions were flown as part of passive dosimeter packs carried by the astronauts on their wrists. Due to the long mission times, latent image fading and track crowding imposed limitations on a quantitative track and grain count analysis. For Skylab 2, the complete proton energy spectrum was determined within reasonable error limits. A combined mission dose equivalent of 2,490 millirems from

protons, tissue stars and neutrons was measured on Skylab 2. A stationary emulsion stack, kept in a film vault drawer on the same mission, displayed a highly structured directional distribution of the fluence of low-energy protons (enders) reflecting the local shield distribution. On the 59- and 84-day missions 3 and 4, G.5 emulsions had to be cut on the microtome to 5 to 7 microns for microscopic examination. Even so, the short track segments in such thin layers precluded a statistically reliable grain count analysis. However, the K.2 emulsions still allowed accurate proton ender counts without special provisions. (GRA)

- 2383 (N--76-16746) NUCLEAR EMULSION MEASUREMENTS OF THE ASTRONAUTS' RADIATION EXPOSURES ON SKYLAB MISSIONS 2, 3, AND 4. Schaefer, H.J.; Sullivan, J.J. (Naval Aerospace Medical Research Lab., Pensacola, Fla. (USA)). 10 Dec 1975. 17p. (NASA-CR--147436; NAMRL--1220). NTIS \$3.50.

On the Skylab missions, Ilford G.5 and K.2 emulsions were flown as part of passive dosimeter packs carried by the astronauts on their wrists. For Skylab 2, the complete proton energy spectrum was determined within reasonable error limits. A combined mission dose equivalent of 2,490 millirems from protons, tissue stars and neutrons was measured on Skylab 2. A stationary emulsion stack, kept in a film vault drawer on the same mission, displayed a highly structured directional distribution of the fluence of low-energy protons (enders) reflecting the local shield distribution. On the 59 and 84-day mission 3 and 4, G.5 emulsions had to be cut on the microtome to 5-7 microns for microscopic examination. Even so, the short track segments in such thin layers precluded a statistically reliable grain count analysis. However, the K.2 emulsions still allowed accurate proton ender counts without special provisions. (GRA)

- 2384 CHANGES IN RADIOIODINE UPTAKE IN NEW ZEALAND. Ross, I.T.H. (Wellington Hospital, N.Z.). N.Z. Med. J.; 82: No. 553, 380-381(10 Dec 1975).

The radioiodine uptakes of 965 patients presenting at Dunedin, over the period January 1959 to January 1970 have been examined. A small change toward lower values of uptake was noted, however, the change was much less than the changes reported in the USA.

- 2385 (COO--2539-32) IMMUNOLOGICAL AND VIRAL ASPECTS OF RADIATION-INDUCED TUMORS. ELEVENTH ANNUAL REPORT, FEBRUARY 1, 1975--FEBRUARY 29, 1976. Reif, A.E. (Boston City Hospital, Mass. (USA)). 5 Dec 1975. Contract AT(11-1)-2539. 7p. Dep. NTIS \$3.50.

Preliminary data are presented for studies on the immunological and viral aspects of radioinduced neoplasms in mice. The biological activity of oncogenic viruses is discussed. (CH)

- 2386 IN-WIRE MEASUREMENT OF THE NEUTRON DOSE RATE ON PATIENTS WITH ^{238}Pu PACEMAKERS IMPLANTED. Piesch, E.; Burgkhardt, B.; Kollmeier, W. (Kernforschungszentrum Karlsruhe (F.R. Germany). Abt. Strahlenschutz und Sicherheit). Nucl. Instrum. Methods; 131: No. 1, 191-196(1 Dec 1975).

In-vivo measurements of the neutron dose on Medtronic pacemakers have been performed by using a proportional counter and a

scintillation counter. The paper discusses the technique of free air and phantom calibration and the method of in-vivo measurement of the neutron fluence and the estimation of the dose equivalent. The neutron dose equivalent rate measured on seven patients with ^{238}Pu pacemakers implanted were found to be (5.6+-0.1) mRem/h at the surface of the pacemaker in 1.25 cm distance from the center of the source corresponding to a neutron emission rate of 940 ns⁻¹. The results are in good agreement with results of other methods reported by different authors.

- 2387 ENVIRONMENTAL IMPACT DUE TO NUCLEAR POWER PLANTS. AN ATTEMPT TO DETERMINE THE RISK FACTOR. Kellermann, O. (Institut fuer Reaktorsicherheit der Technischen Ueberwachungs-Vereine e.V., Koeln (F.R. Germany)); Balfanz, H.P. (Institut fuer Reaktorsicherheit der Technischen Ueberwachungs-Vereine e.V., Koeln (F.R. Germany). Abt. Auslegung). Tech. Ueberwach.; 16: No. 12, 364-368(Dec 1975). (In German).

1 fig.; 6 tabs.; 8 refs..

The environmental impact due to nuclear power plants is smaller than that due to fossil-fired power plants. The risks of the nuclear power plant operation are determined by the quantity and the probability of the release of radioactive materials. According to the value, the risks of normal operation can be compared to the accident risks. An attempt should be made to effectively reduce the remaining risk at unfavourable sites with the emphasis on accidents with larger effects than design basis accidents.

- 2388 (GEAP--14034-5) RADIOLOGICAL ASSESSMENT MODELS FIFTH QUARTERLY REPORT, SEPTEMBER--NOVEMBER 1975. (General Electric Co., Sunnyvale, Calif. (USA). Fast Breeder Reactor Dept.). Dec 1975. Contract E(04-3)-893. vp. AT.

The objectives of the program are to develop models for analyzing and evaluating postulated radiological sources, aerosol dynamics, sodium fires, and radiological dosages arising from hypothetical core disruptive accidents in liquid metal fast breeder reactors.

- 2389 (WaBoLu--30/75) TRITIUM IN THE ENVIRONMENT DUE TO THE PEACEFUL USE OF NUCLEAR ENERGY. Mattern, F.C.M.; de Regt, H.J.B.; Aurand, K.; Ruehle, H. (Bundesgesundheitsamt, Berlin (Germany, F.R.). Inst. fuer Wasser-, Boden- und Lufthygiene). Dec 1975. 9p. (In German). Dep. NTIS (US Sales Only), PC A02/MF A01.

With values of several prem/a and more, the present tritium exposure due to nuclear power stations and nuclear research centres in the FRG and the Netherlands is still very low. A theoretical estimation of the radiation exposure due to 100 hypothetical nuclear power stations along the Rhine - each with a power of 1,000 MWe - would give an additional radiation exposure of only about 0.15 mrem if the surface water were used as drinking water. Estimations of the tritium emission for the year 2000 show that the global environmental pollution is also low, having a mean value of about 0.1 mrem/a. The highest future environmental pollution due to tritium is expected from reprocessing plants. To keep tritium emissions with the waste water from reprocessing plants as low as possible, it should be found out whether waste water may, e.g. be pumped into deeper strata of the earth or into the deep sea.

- 2390 ISOLATION OF CHLAMYDIA IN IRRADIATED AND NON-IRRADIATED MCCOY CELLS. Johnson, L.; Harper, I.A. (New Cross Hospital, Wolverhampton (UK). Public Health Lab.). J. Clin. Pathol.; 28: No. 12, 1003-1004(Dec 1975).

Specimens from eye and genital tract were cultured in parallel in irradiated and non-irradiated McCoy cells and the frequency of isolation of chlamydia using these culture methods was compared. There was a significant difference between the frequencies of isolation; irradiated McCoy cells produced a greater number of positive results.

- 2391 POTENTIATION BY CAFFEINE OF ULTRAVIOLET-LIGHT DAMAGE IN CULTURED HUMAN CELLS. Schroy, C.B.; Todd, P. (Pennsylvania State Univ., University Park (USA). Dept. of Biophysics). Mutat. Res.; 33: No. 2/3, 347-355(Dec 1975).

Five cultured human cell lines (T-1 kidney, Chang liver, H.Ep. No. 2, HeLa-S3 and HeLa-O) were irradiated with ultraviolet light and immediately exposed to 1.0 and 3.0 mM caffeine for 44h thereafter. This caffeine treatment reduced the surviving fraction (assayed by colony formation) of the irradiated population, but did not significantly reduce the colony-forming ability of unirradiated control cells. These findings suggest that many cultured human cell lines exhibit post-UV potentiation of potentially lethal damage by caffeine.

- 2392 REPAIR MECHANISMS OF RADIATION DAMAGE. RECENT FINDINGS IN RADIOBIOLOGY. Pellerin, P. (Ministere de la Sante, 78 - Le Vesinet (France). Service Central de Protection contre les Rayonnements Ionisants). Atomwirtsch., Atomtech.; 20: No. 12, 617-620(Dec 1975). (In German).

Recent findings in radiobiology seem to indicate with a probability bordering on certainty that there is a threshold level of radiation damage to the organism. This fact, which has long been postulated by radiobiologists and geneticists, does not contradict the fact that cell nuclei may be damaged by radiation effects. For, it is seen from the natural repair mechanism of the cell structure that there is a quality assurance system without which any living organism would have to degenerate immediately in view of the large number of defects in the molecular structure, so that life would not be possible. In the human organism, for instance, several millions of cells must be renewed every second. The findings outlined above clearly show that the repair capability is constantly needed to balance out a certain measure of structural defects, also without any radiation impact, which is far above the damaging capability of low radiation doses.

- 2393 (AD-A--019797) PREDICTING SAFE DISTANCES TO PREVENT RETINAL BURNS FROM NUCLEAR DETONATIONS. INTERIM REPORT, DEC1972--DEC 1974. Richey, E.O.; Lof, N.E. (School of Aerospace Medicine, Brooks AFB, Tex. (USA)). Dec 1975. 71p. (SAM-TR--75-30). NTIS \$4.50.

The visual effects of chorioretinal burns are discussed, and a mathematical model is described for predicting the retinal burns threshold distance or safe distance from a low-altitude nuclear detonation. Mathematical equations for the model are derived, and a Fortran computer program to solve these equations is described. Retinal burn threshold distances are predicted and compared to experimental data for several nuclear detonations. This program is recommended for Air Force use to predict retinal burn safe-

separation distances for planning purposes. (GRA)

- 2394 (AD-A--021270) USE OF A THERMOLUMINESCENT DOSIMETRY SYSTEM IN MEASURING DOSE TO PATIENTS UNDERGOING XEROMAMMOGRAPHY. Guice, D.L. (Air Force Inst. of Tech., Wright-Patterson AFB, Ohio (USA). School of Engineering). Dec 1975. 160p. (GNE/PH--75-17). NTIS \$6.75.

Thesis.

The response of lithium fluoride (TLD-100) thermoluminescent dosimeters (TLDs) was calibrated against known exposures to x-ray beams having most probable energies of 11.6, 19, 24.9, and 42 keV. Separate impressions were made of the right breast of a female volunteer positioned for two x-ray views used in xeromammography with a General Electric MMX-2 Mammography Unit. The impressions were used to cast Mix-D breast phantoms for an Alderson-RANDO man phantom. The TLDs were used to measure the exposure distributions on and within the breast phantoms that result from xeromammography. Exposure distributions were measured at x-ray generating potentials of 30 to 38 kVp for the craniocaudal view and 32 to 40 kVp for the mediolateral view. A technique of 300 mAs and 1.5 mm Al_{eq} filtration was used for all exposures. Maximum skin doses, calculated from the measured exposure, ranged from 730 to 1620 mrad for the craniocaudal view and 1030 to 2150 mrad for the mediolateral view as the generating potential was increased. (GRA)

- 2395 RADIATION EXPOSURES ABOARD COMMERCIAL AIRCRAFT. Uselman, J.; McKlveen, J.W. (Arizona State Univ., Tempe). Health Phys.; 29: No. 6, 881-883(Dec 1975).

Recently there has been concern, discussion and legislation restricting the type and amount of radioactivity shipped in cargo holds of passenger aircraft. Whereas abnormal packaging or breakage may result in significant exposure to personnel, the primary source of chronic radiation is undoubtedly cosmic rays. The study reported herein used highly sensitive thermoluminescent dosimetry (TLD) to discriminate and quantify both types of radiation. Results indicated that airline employees and passengers who accrue considerable amounts of flying time may receive yearly exposures which are twice that received by the general public. (auth)

- 2396 RADIOGRAPHIC TECHNIC, SAFETY, AND INTERPRETATION IN THE NEWBORN NURSERY. Holbert, C.L.; Frey, G.D.; Levkoff, A.H.; Travis, E.L. (Univ. of South Carolina, Charleston). Shonika Rinsho; 87: No. 6, 968-972(Dec 1975).

The technic and safety aspects of the radiographic evaluation of neonates with RDS are discussed. A study of radiographs taken in an intensive care nursery revealed that densitometric measurements are helpful in distinguishing changes in lung aeration from changes in radiographic quality. The radiation exposure to neonates was 5.1 (SD 2.3) mR per film and 44.9 (SD 39.7) mR per neonate. Limited chromosomal studies revealed no detectable abnormalities. The radiation exposure to the staff was minimal. The low-radiation exposure to the staff and neonates is the result of careful attention to radiation hygiene.

- 2397 GONADAL DOSE TO THE POPULATION OF THE CZECH SOCIALIST REPUBLIC FROM NATURAL EXTERNAL IRRADIATION. Spurny, Z.; Kovar, Z.

(Ceskoslovenska Akademie Ved, Prague. Laborator Radiologicke Dozimetrie). Jad. Energ.; 21: No. 12, 451-454(Dec 1975). (In Czech).

The gonadal population dose in the Czech Socialist Republic resulting from the effects of Earth crust gamma radiation and of cosmic radiation is discussed. The mean annual gonadal dose due to external natural radiation background was calculated to be $910 \mu\text{J.kg}^{-1}$ (91 mrad/s).

- 2398 RADIATION DOSAGE TO THE BREAST IN WELL-WOMEN SCREENING SURVEYS. Asbury, D.L.; Barker, P.G. (University Hospital of South Manchester (UK)). Br. J. Radiol.; 48: No. 576, 963-967(Dec 1975).

The D.H.S.S. is supporting research in several centres to determine the feasibility of establishing a nationwide Breast Cancer Screening Programme. This paper answers the questions 'What is the radiation dose produced by mammography, and is it safe'. In the context of well-women screening surveys a maximum skin dose of 2 R has been recommended. The variation of dose across the breast surface is recorded and the reasons for this enumerated. The lowest mean dose recorded with industrial quality film was 4.9 R, so that such fine-grain film cannot be used for this purpose. Doses within the recommended safety limit are achieved by the use of vacuum-packed film-screen combinations. The new rare-earth phosphor screens produced the lowest dose (0.2 R). There was no significant gonad dose. It is concluded that mammographic examination of well-women can be performed at safe radiation levels.

- 2399 SOMATIC AND GENETIC RISKS FOR POPULATION DUE TO THE NATURAL RADIATION AND TYPE OF THE BUILDING DEVELOPMENT IN POLAND. Pensko, J. (Institute of Nuclear Research, Swierk (Poland). Zaklad Ochrony przed Promieniowaniem). Kerntechnik; 17: No. 12, 533-536(Dec 1975).

7 figs.; 1 tab.; 15 refs..

Previous research proved that the population of Poland could receive the absorbed doses of natural background radiation for the whole body of approx. 100 mrad/a outdoors, 75 ... 100 mrad/a in wooden houses, 100 ... 150 mrad/a in ceramic brick houses and 120 ... 300 mrad/a in prefabricated ones. The doses for cells of bronchi epithelium due to alpha radiation of radon and its daughters could be within 1.3 ... 500 mrad/a outdoors and 2 ... 2,550 mrad/a indoors. Basing on these data the expected biological effects were evaluated applying a linear dose-effect approach with no threshold relationship. The existing and expected housing development as well as demographic forecast of the population and alive birth-rate for the decades of 1950-2009 were adopted. It was proved that critical hazards in form of malignancies of bronchi epithelium may be expected. Some conclusions and recommendations were given.

- 2400 ASSAY OF BIOLOGICAL DOSIMETRY FROM THE CHANGED NUMBER OF LYMPHOCYTES AND HYPERSEGMENTED NEUTROPHILES. Zak, M.; Rezny, Z.; Dienstbier, Z.; Uhlirova, A. (Karlova Universita, Prague (Czechoslovakia). Biofyzikalni Ustav). Strahlentherapie; 6: No. 150, 579-584(Dec 1975).

3 figs.; 3 tabs.; 5 refs..

The paper presented deals with the statistical utilization of changes in lymphocyte and hypersegmented neutrophils counts in peripheral blood after irradiation for the biological detection of ionizing radiation. Both parameters are in a good

correlation during simultaneous evaluation of their changes, and they fail during evaluation in various time intervals after irradiation. The changes of the two hematological parameters after irradiation, lymphopenia and hypersegmentation of cellular nuclei of granulocytes were therefore utilized. The changes under examination were elaborated in the computer and evaluated by a method of regression classification and by discriminatory analysis. This analytical way enables a new conception in the evaluation of individual hematological post-irradiation changes. This study is being continued along several lines. On the one hand, further statistical methods of making the results more precise will be used; on the other hand, other laboratory animals will be tested as well. Last but not least, the best statistical method will be used in an attempt to biologically detect the changes after therapeutical irradiation in man.

- 2401 PATH TO SPATIAL IRRADIATION PLANNING. PT. 2. VECTORIAL DESCRIPTION OF THE SPATIAL DOSE DISTRIBUTION WITHIN A SINGLE RAY BEAM; FIRST CONSEQUENCES FOR PRACTICAL APPLICATION. Sonntag, A. (Ulm Univ. (F.R. Germany). Dept. Radiologie). Strahlentherapie; 6: No. 150, 569-578(Dec 1975). (In German).

4 figs..

Spatial irradiation planning among other things demands spatial consideration of the dose distribution within the single useful ray beam. From this point of view, the vectorial dose quantities introduced in part I of this paper are reviewed, their correlations are examined as well as their dependences on different influencing quantities e.g. on the rotational position of the wedge filter with the central ray as an axis of rotation. The vectorial description of dose distribution used in this paper, additionally offers information on the total effect upon the inclination of isodose surfaces or curves respectively, caused either simultaneously by different influences (simultaneous effect) or in temporal succession by separate influences (succession effect). The correlations observed can be verified diagrammatically or dosimetrically using simple practical examples. Thus, it is possible for instance to obtain a continuous defined variation of the isodose inclination by varying the weights of the partial doses with successive irradiation with or without a wedge filter.

- 2402 ORAL CARE OF THE PATIENT HAVING HEAD AND NECK IRRADIATION. Trowbridge, J.E.; Carl, W. (Roswell Park Memorial Inst., Buffalo). Am. J. Nursing; 75: No. 12, 2146-2149(Dec 1975).

Saliva is an effective oral cleanser and lubricant. But salivary glands are sensitive to radiation therapy and their diminished function poses acute and painful problems for the patient.

- 2403 CRITERIA FOR RADIATION PROTECTION. Nooteboom-Beekman, Z.M. (Reactor Centrum Nederland, Netherlands). Atoomenerg. Haar Toepass.; 17: No. 12, 253-255(Dec 1975). (In Dutch).

The Third European Congress of the International Radiation Protection Association organised by the Netherlands Association for Health Physics was held 13-16 May 1975 in Amsterdam. Much new information was contributed about the doses from different natural and non-natural sources of radiation, the measurement and calculation of these doses, and methods of limiting them. In particular new data were presented on the natural occurrence of

hereditary effects, the natural frequency of mutations and the occurrence of chromosome abnormalities.

- 2404 HEREDITARY INFLUENCES OF ATOM-BOMB RADIATION. Awa, A. (Radiation Effect Research Foundation, Hiroshima (Japan)). Idem; 29: No. 12, 33-38(Dec 1975). (In Japanese).

Genetical investigation of an early time (including the time immediately after the atom-bomb exposure), epidemiological studies of mortality and cellular-hereditary investigations were conducted to the children of atom-bomb survivors, and the results were summarized. There was no statistically significant difference in any hereditary influences.

- 2405 EFFECTS FROM PLACENTAL EXPOSURE. Kawamoto, S. (Radiation Effect Research Foundation, Hiroshima (Japan)). Idem; 29: No. 12, 28-32(Dec 1975). (In Japanese).

Investigations of the effects on the people who had received placental exposure at either Hiroshima or Nagasaki were discussed. All of the subjects were children who had been born at either Hiroshima or Nagasaki between noon of 31, May, 1946 and the atomic-bomb detonation. Deaths of embryos and neonates were determined by the radiation dosage and the growth phase of embryos. Bifid uvula and a slight decrease of number of lumbar vertebra were observed in 14 males and 3 females at Nagasaki. Mental deficiency occurred in 25% of the children whose mothers had received radiation at Nagasaki, and in 8% at Hiroshima. The occurrence of microcephaly was high at both places in the children who had received placental exposure of more than 150 rad. A significant retardation of growth was observed in those who had had a high radiation dosage. Congenitally abnormal persistence of pupillary membrane was very frequently observed in the group which had received a high dosage of radiation. Concerning progeria, mortality of infants under one year of age was increased in the group which had received a high dosage of radiation, but mortality statistics should continue to be observed.

- 2406 SEARCH FOR THE LOWEST IRRADIATION DOSE FROM LITERATURES ON RADIATION-INDUCED BREAST CANCER. Yoshizawa, Y.; Kusama, T. (Tokyo Univ. (Japan). Faculty of Medicine). Nippon Igaku Hoshasen Gakkai Zasshi; 35: No. 12, 1125-1130(Dec 1975). (In Japanese).

A survey of past case reports concerning radiation-induced breast cancer was carried out in order to find the lowest irradiation dose. The search of literature published since 1951 revealed 10 cases of radiation-induced breast cancer. Only 5 cases had precise descriptions of the irradiation dose. The lowest irradiation dose was estimated at 1470 rads in the case of external X-ray irradiation for tuberculous angioma. All of cases of radiation-induced breast cancer had received radiation for the treatment of nonmalignant tumors, such as pulmonary tuberculosis, mastitis, and tuberculous angioma. There also were three statistical studies. The first concerned atomic bomb survivors, the second, pulmonary tuberculous patients subjected to frequent fluoroscopies, and the third, patients of acute post partum mastitis. These statistical studies had revealed a significant increase in the incidence of breast cancer in the irradiated group, but there was little information about the lowest irradiation dose. It was noticed that radiation-induced breast cancer was more numerous in the upper inner quadrant of the

breast. Most histopathological findings of radiation-induced breast cancer involved duct cell carcinoma. The latent period was about 15 years.

- 2407 EXPOSURE DOSES TO ATOMIC BOMB IN HIROSHIMA AND NAGASAKI. Hashizume, T. (National Inst. of Radiological Sciences, Chiba (Japan)). Idem; 29: No. 12, 5-10(Dec 1975). (In Japanese).

In determining estimates of exposure doses in victims of an atomic air raid, the following things should be taken into consideration: the presence and type of interceptors, such as buildings around the site of the bombing; the distance of the victims who are immediately exposed to radioactivity from the site of the bombing; and the time at which they were exposed. When estimates of exposure doses of each organ are determined, approximately a 20% error should be taken into consideration.

- 2408 EVALUATION OF INTERNAL ABSORBED DOSE OF PUBLIC RESULTING FROM RADIOACTIVE PATIENT AND INDEX OF RADIOACTIVE LEVELS FOR DISCHARGE. Nishizawa, K.; Ohara, K.; Maekoshi, H.; Orito, T. (Nagoya Univ. (Japan). Faculty of Medicine); Koga, S. Kaku Igaku; 12: No. 6, 631-636(Dec 1975). (In Japanese).

The amount of radiation internally absorbed by the public contaminated by inhalation of air or excretion (sputa, urine, sweat and so on) of the radioactive patient was calculated. This dose determined the permissible radiation level in a room occupied by a patient injected or prescribed radioisotopes. The permissible dose level of radiation absorbed internally by the public must not exceed 0.5 rem/year. The allowable radiation level in the regular room of a radioactive patient should not exceed more than 10 mrem/week of radiation absorbed by another patient in the same room. The absorbed dose by the family in the home of the radioactive patient must not exceed 0.5/3 rem per investigation. The radioactive levels are obtained by calculation for the eight radionuclides ^{51}Cr , ^{59}Fe , ^{75}Se , $\text{sup}(99\text{m})\text{Tc}$, ^{131}I , ^{125}I , ^{198}Au and ^{203}Hg in both cases.

- 2409 CAFFEINE INHIBITION OF THE REPAIR OF ULTRAVIOLET-IRRADIATED ADENOVIRUS IN HUMAN CELLS. Day, R.S. III (National Institutes of Health, Bethesda, Md. (USA)). Mutat. Res.; 33: No. 2;3, 321-325(Dec 1975).

Caffeine is shown to block repair of ultraviolet-irradiated adenovirus 2 when the irradiated virus infects normal human fibroblasts from a xeroderma pigmentosum (XP) variant. Such blockage is not observed when the irradiated virus infects XP fibroblasts belonging to XP complementation group A. Thus normal and XP variant cells have a caffeine-sensitive repair process. This may be either excision or an excision dependent repair process because fibroblasts belonging to XP complementation group A are believed to lack the excision repair process.

- 2410 TWENTY-YEAR-CLINICAL HISTORY OF VICTIMS OF RADIOACTIVE FALLOUT IN BIKINI. Kumatori, T. (National Inst. of Radiological Sciences, Chiba (Japan)). Idem; 29: No. 12, 39-43(Dec 1975). (In Japanese).

A study was made on clinical course over a 20 years period in a former crew of the 5th Fukuryumaru who had been exposed to radioactive fallout in Bikini in 1954. The estimate of exposure dosage and general clinical findings, such as skin damage, blood dyscrasia, abnormal chromosome, the physical improvement and so

forth were described.

11 CANCER DEVELOPING AMONG ATOM-BOMB SURVIVORS. Yamamoto, T. (Radiation Effect Research Foundation, Hiroshima (Japan)). *Iden*; 29: No. 12, 17-22(Dec 1975). (In Japanese).

Cancer (with the exception of leukemia) which had often been observed among atom bomb survivors was discussed. Prevalence of thyroid carcinoma was high in the people who had been exposed to more than 50 rad of the atomic radiation. A great difference in prevalence of cancer was seen between irradiated people whose age had been under 20 years at the time of exposure and non-irradiated. More women than men had papillary adenocarcinoma. The highest prevalence was seen 16 to 20 years after exposure to atomic radiation, but there was no difference in prevalence between those from Hiroshima and from Nagasaki. Lung cancer comprised 89% of all cancers of the people whose age was 50 years and over. Most of them had been exposed to atomic radiation of more than 300 rad. The type was cellular retrograde cancer. The prevalence of gastric carcinoma was low, and breast cancer occurred at an early age before menopause. The occurrence of cancer in juvenile survivors was several times higher in the patients who had been exposed to atomic radiation of more than 100 rad than in non-irradiated. These values indicate that cancer occurs more frequently than leukemia does in such survivors.

2412 RELATIONSHIP BETWEEN RADIOACTIVITY FROM ATOMIC BOMB AND LEUKEMIA. Ishimaru, Toranosuke (Radiation Effect Research Foundation, Hiroshima (Japan)). *Iden*; 29: No. 12, 11-16(Dec 1975). (In Japanese).

A study was made on the atomic bomb survivors in whom leukemia subsequently occurred in Hiroshima and Nagasaki. The incidence of leukemia averaged 30 per one million people 5--26 years after they had been exposed to less than one rad. Among the atomic bomb survivors who had been exposed to 1--99 rads, leukemia occurred within 5--10 years, which showed a slightly higher incidence than that among those who had been exposed to one rad. Among survivors exposed to more than 100 rads, leukemia occurred within 5--10 years on an average of 900 per one million, which was more than 30 times as high as that among those with one rad. Among those aged 15--29 years at the time of bombing, it was high 10--15 years afterward, but was low among those aged 30--44 years at the time of bombing. Among people over 45 years, it became high within 10--15 years, and was still high 15--26 years after bombing. It was suspected that it took 2--3 years after the bombing to develop. From 1950 to 1961, among survivors with exposure to more than 50 rads in Hiroshima, there was a higher incidence of leukemia than there was in Nagasaki. This suggests that neutron-rays have a stronger effect on the incidence of leukemia than have γ -rays. Survivors who had been exposed to neutron-rays in Hiroshima, often had acute or chronic leukemia. On the other hand, some of the survivors with exposure to γ -rays in Nagasaki had only acute leukemia.

2413 STUDIES ON THE LIFE SPANS OF ATOM-BOMB SURVIVORS. Kato, H. (Radiation Effect Research Foundation, Hiroshima (Japan)). *Iden*; 29: No. 12, 23-27(Dec 1975). (In Japanese).

A shortening of whole life as late injuries of atom-bomb survivors was discussed from the aspects of aging and the studies on the causes of leukemia and cancers. Twenty-one thousands four hundreds and forty-seven of 109000

subjects died during the period between 1950 and 1970. Mortality by exposure doses presented a high value with exposure doses. Mortality of subjects which had received exposure doses of more than 200 rads rose to a level which was 1.27 times in all causes of deaths of the control which had received exposure doses of 0 to 9 rads, and it showed 1.32 times in all deaths of sickness, 18.3 times in leukemia, and 1.48 times in death from cancer. Mortality due to leukemia decreases after 1950-1954, but in the group which had received exposure doses over 100 rads, the mortality was significantly higher than that in all districts in Japan. The shape of dose-reaction curve in Hiroshima was different from that in Nagasaki. In the same dose, mortality due to leukemia in Hiroshima was higher than that in Nagasaki. The younger the age at exposure was, the higher the risk rate of occurring cancer was. Especially, the risk rate of cancer was high in the patients who were exposed to atomic bomb during the age of 0 to 9 years old. Mortality due to cancer increased with the dose. Cancers which statistically showed higher mortality than that in the control group are lung cancer, cancer of the breast (100-199 rad), carcinoma of the esophagus, cancer of the urinary organ (200-299 rad) and gastric cancer (over 300 rads). There are not so clear difference in the mortality due to cancer between Hiroshima and Nagasaki, comparing with the mortality due to leukemia.

2414 FIRST ASIAN REGIONAL CONGRESS ON RADIATION PROTECTION. Kumar, S.K. (Bhabha Atomic Research Centre, Bombay (India). Library and Technical Information Section). *J. Sci. Ind. Res.*; 34: No. 12, 658-662(Dec 1975).

Due to the rapid progress in the development of nuclear energy and its applications in medicine, agriculture and industry, the potential danger to large groups of population due to radiation hazards has increased. Thus, radiation protection has become an important aspects of industrial and public hygiene. The article reviews the deliberations of the First Asian Regional Congress on Radiation Protection which was held during 15-20 December 1974 at the Bhabha Atomic Research Centre. 190 papers were presented on the following broad subjects: (1) organization of radiation protection services on a countrywide scale and significant problems and experiences; (2) research and cooperation, mutual assistance, education and training; (3) personnel monitoring; (4) nuclear industry risks and benefits; (5) radiation protection legislation and (6) panel discussions and regional international cooperation in the field of radiation protection.

2415 COMPARISON STUDY OF THE ORGAN ABSORBED DOSES PER UNIT EXPOSURE IN EXTERNAL IRRADIATION. Kaminaga, H.; Kumazawa, S.; Furuta, T.; Tatsuta, H. (Japan Atomic Energy Research Inst., Tokai, Ibaraki. Tokai Research Establishment). *Hoken Butsuri*; 10: No. 4, 193-201(Dec 1975). (In Japanese).

The dose absorbed in an organ due to external radiation depends on the photon energy and incident direction to the body. The results of organ absorbed dose measured by C. Zeow et al. were revised into the absorbed dose in the organ per unit exposure (rad/R); these values are tabulated for each organ, photon energy and incident direction to the body. The gonadal doses are compared with those reported by other workers in energy dependence at a typical incident direction, and problems in conversion factor (rad/R) to the organ dose are described. The results for the tests agree with those by other workers for anterior and horizontal

rotational irradiations. There is disagreement, however, for posterior and left-side irradiations. This may be due to the differences in shape of the phantom and position of the organ. On the other hand, the ovary dose for all the incident directions is in good agreement with that by other workers.

- 2416 BACKGROUND GAMMA RADIATION: CONTRIBUTION TO THE EXPOSURE OF THE POPULATION IN ITALY. Cardinale, A. (Agip Nucleare, Milan); Cortellessa, G.C.; Gera, F.; Ilari, O.; Lembo, G. Com. Naz. Energ. Nucl., Nct.; 21: No. 12, 107-118(Dec 1975). (In Italian).

The distribution of the individual absorbed doses to the Italian population due to the natural background radiation was measured all over the country by means of a portable high-pressure ionization chamber. The collective dose, in man rads, was also estimated for the population of each region and of all the country. From these measurements, it resulted that the values of the average dose to the individuals of the population in the different Regions of Italy range from 38 mrad/year for the Molise Region to about 140 mrad/year for the Campania Region. The natural means is about 68 mrad/year. All these values do not include contribution due to cosmic rays.

- 2417 TRISOMY AND TRIPLOIDY INDUCED BY X IRRADIATION OF MOUSE SPERMATOCYTES. Szemere, G.; Chandley, A.C. (Western General Hospital, Edinburgh (UK)). Mutat. Res.; 33: No. 2/3, 229-237(Dec 1975).

Analysis of second meiotic metaphase divisions in control and irradiated male mice shows that while the spontaneous rates of autosomal and sex chromosomal anaphase I non-disjunction are extremely low, they can be enhanced by x ray treatment of prophase spermatocytes. Irradiation at pre-leptotene results in a higher rate of anaphase I non-disjunction than does irradiation at pachytene. Early spermatogonia are relatively insensitive. Experiments to detect trisomic progeny among the F₁ fetal offspring of male mice mated during weeks 5 and 6 following irradiation (sampling of irradiated early spermatocytes and late spermatogonia) showed that none were present. Possible explanations for this are considered. Two triploid fetuses were however found.

- 2418 EFFECTS OF SINGLE OR MULTIFRACTIONATED IRRADIATION WITH 2 MEV FAST NEUTRONS ON C₃H MOUSE MAMMARY CARCINOMA. Tsunemoto, H.; Kutsutani, Y.; Koike, Y.; Ando, K.; Furukawa, S. (National Inst. of Radiological Sciences, Chiba (Japan)). Nippon Igaku Hoshasen Gakkai Zasshi; 35: No. 12, 1116-1124(Dec 1975). (In Japanese).

Experimental assay method were used to estimate the growth delay time of irradiated tumors. Average growth delay times were plotted on a semilogarithmic graph as a function of dose, and the relative biological effectiveness (RBE) was estimated. The RBE after a single dose irradiation increased with increasing dose, when the tumors were irradiated under aerobic conditions. The RBE needed to produce a growth delay of 20 or 50 days was 2.6 or 3.1, respectively. On the other hand, if the irradiation was given under hypoxic conditions, the RBE needed to produce 10 or 20 days' delay was 3.5 or 3.1, respectively. For the fractionated dose irradiations, a treatment regime of 3 times a week was used, i.e., six equal doses were given in two weeks. The growth delay time after a single 600 rads of fast neutrons was 21.8 days, while it was prolonged

to 24.6 days if the same total dose was given in 6 fractions. A similar result was observed after a larger neutron dose. On the other hand, fractionated X-ray doses were less effective than a single dose. The growth delay time was 60.1 or 40.6 days for tumors irradiated with a single dose or six doses of 4800 rads. These results might indicate that some of the features of high LET radiations are that tumor cells irradiated with fast neutrons were capable of repairing sublethal damage less extensively than those irradiated with X-rays and that chronically hypoxic tumor cells might be sterilized more effectively by fast neutrons than by X-rays. The latter phenomenon might lead to extensive reoxygenation after neutron dose and that of fractionated neutron doses are effective.

- 2419 EFFECT OF X-IRRADIATION ON THE METABOLISM OF RAT ERYTHROCYTES. Prokes, J.; Sromova, S.; Vulterin, K.; Stavovcikova, O. (Karlova Universita, Prague (Czechoslovakia). Fakulta Vseobecneho Lekarstvi); Proksova, M. (Vojensky Veterinarni Vyzkumny Ustav, Prague (Czechoslovakia)). Vet. Med. (Prague); 20: No. 12, 705-713(Dec 1975). (In Czech).

Rats and rabbits were whole-body irradiated with x rays at a dose of 100 to 750 R. At daily intervals samples of blood were taken and kept in heparin. After addition of ³²P phosphate they were incubated for 35 minutes at 37 degC in vitro. The incorporation in the erythrocytes decreased significantly for doses of 250 to 500 R. The maximum response was obtained between the 6th and 14th day. The method may be applied for the examination of the state of the organism irradiated with a dose of x radiation higher than 250 R. The specificity of the method is discussed.

- 2420 IRRADIATION AND RADIATION EXPOSURE. Rennert, O.M. Clin. Obstet. Gynecol.; 18: No. 4, 177-183(Dec 1975).

The induction of chemical damage in DNA following irradiation exposure is clear, and it is well established that the radiation sensitivity of mammalian cells with regard to the induction of mutation, malignant transformation, or cell death is a function of the cell cycle with respect to the time of exposure to radiation. The radiosensitivity of mammalian cells is related to their proliferative capacity. Evidence at the present time clearly indicates that damage to the heterocyclic bases in DNA is a major lesion resulting from irradiation. In the future biologic science must direct itself to elucidation of the excision and repair processes within a cell, development of methodologies for determination of strand breaks in DNA of molecular weight greater than 5 x 10⁶ daltons, and elucidation of the relation of strand breakage to the biologic effects of ionizing radiation on mammalian cells.

- 2421 SPECIFIC LOCUS MUTATION RATES AFTER REPEATED SMALL RADIATION DOSES TO MOUSE OOCYTES. Lyon, M.F.; Phillips, R.J.S. (Medical Research Council, Harwell (UK). Radiobiological Research Unit). Mutat. Res.; 30: No. 3, 375-381(Dec 1975).

When female mice were given a dose of 20 x 10 rad x-rays, the specific locus mutation rate among offspring conceived up to 7 weeks after the end of treatment was 1/39887 or 0.18 x 10⁻⁷/rad/locus, whereas when the same total dose of 200 rad was given in a single exposure, the mutation rate was 9/34813 or 1.85 x 10⁻⁷/rad/locus. The lower mutation rate after the 20 x

10 rad dose was obtained whether the total of 200 rad was given over a period of 5 days or 4 weeks, and if only young conceived in the first 20 days, rather than 7 weeks, were considered. It is suggested that each 10 rad fraction had the same small effect, and hence that these results confirm and extend Russell's previous finding that the dose-response relationship for specific locus mutations in females is curved.

- 2422 CYTOLOGICAL INVESTIGATIONS ON THE EFFECTS OF ^{131}I IN MALE MICE. Subramanyam, S.; Murthy, D.K.; Reddi, O.S. (Osmania Univ., Hyderabad (India). Dept. of Genetics). Indian J. Med. Res.; 63: No. 12, 1680-1687 (Dec 1975). 30 refs..

Cytological investigations on the effects of the intraperitoneal administration of ^{131}I into male mice belonging to the CBA strain at doses of 0.01, 0.05, 0.07 and 0.1 μCi , revealed the induction of translocations and polyploid cells. There was a significant increase in such aberrations over the controls. The experimental/control response shows a gradual fall in the frequency of translocations during the period of observation, namely, from the first to the seventh day. No dosage effect was observed. Cytological studies confirmed that translocations had been induced.

- 2423 OBSERVATION OF TRITIUM BIOLOGICAL HALF-LIFE AND ESTIMATION OF INTERNAL RADIATION DOSE. Fu, Y.K.; Chen, L.H. (Inst. of Nuclear Energy Research, Lung-Tan, Taiwan). Nucl. Sci. J. (Taiwan); 12: No. 4, 219-231 (Dec 1975).

The tritium urinalysis by using azetropic distillation was developed at Institute of Nuclear Energy Research. It was compared with the method by adding the raw urine directly to the scintillation liquid, and with the method by distilling the sample and counting a portion of the distillate for tritium beta. Personnel exposed to tritium in Taiwan Research Reactor submitted 16h urine sample following exposure. The excretion data were fitted by computer program LLSFTE. Biological half-life values of 7, 8, 9.5, and 12 days were obtained. These were within the range of values between 4.1 and 13 days recommended by ICRP. The dose commitment estimations were calculated based on a permissible RBE dose rate to the critical organ, on the time integral of radioactivity in critical organ, and also on Butler's method.

- 2424 COMPARATIVE MEASUREMENTS OF THE PLANE-DOSE PRODUCT, THE SURFACE DOSE AND ORGAN EXPOSURE IN RADIODIAGNOSTIC ROUTINE EXAMINATIONS. Fiebach, O.; Even, K. (Essen Univ. (Gesamthochschule) (F.R. Germany). Radiologisches Zentrum; Gewerbeaufsicht des Landes Nordrhein-Westfalen, Duesseldorf (F.R. Germany). Zentralstelle fuer Sicherheitstechnik, Strahlenschutz und Kerntechnik). Roentgen Bl.; 28: No. 12, 609-612 (Dec 1975). (In German).

From 56. meeting of the Deutsche Roentgengesellschaft, Gesellschaft fuer Medizinische Radiologie, Strahlenbiologie und Nuklearmedizin e.V.; Berlin, F.R. Germany (1 May 1975).

2 figs.; 1 tab.; 1 ref..

Measurements have been carried out using an Alderson-Rando phantom. Their purpose was a comparison between the surface and organ doses of radiobiologic interest and the plane dose product, important for the documentation according to the Roentgen rules.

- 2425 METHOD OF PROTECTING HUMAN SKIN FROM ACTINIC RADIATION. Fusaro, R.M. (to Univ.

of Minnesota). US Patent 3,920,808. 18 Nov 1975. Filed date 8 May 1973. 8p.

Enhanced protection from sunlight is achieved by applying to human skin beforehand separate, time-spaced applications of (1) a carbonyl compound which is reactive with amino groups in human skin, for example dihydroxyacetone, and (2) a benzo- or naphtho-quinone such as lawsone. Preferably several sequential applications of each active component in a separate carrier are made the evening before the first exposure, and protection is thereafter maintained by applying each component separately each evening.

- 2426 METHOD FOR THE DIFFRACTION OF TERRESTRIAL RADIATION, GAMMA RADIATION, ETC. Busenbach, P. German (FRG) Patent 2,364,935/A/ 13 Nov 1975. 11p. (In German). 3 figs..

The patent claim concerns shielding against so-called earth radiation. These rays originate from water veins etc., cannot be defined any closer, and are supposed to cause injury to health. The author claims that shielding is possible with the aid of welding electrodes which have cores of nickel.

- 2427 (HRP--0006878) PERSONNEL RADIATION EXPOSURES IN A FUEL REPROCESSING FACILITY. Resnikoff, M. (Rachel Carson Coll., Amherst, N.Y. (USA)). Nov 1975. 15p. NTIS PC A02/MF A01.

This paper was presented at the 1975 Annual Meeting of the American Public Health Association..

Nuclear Fuel Services (NFS) was the first and only commercial nuclear fuel reprocessing facility which has operated in the United States, and as such, presents an experimental base with which to compare claims by nuclear proponents and opponents. This paper presents a review of the personnel radiation exposure record at NFS. The average whole body exposures to full-time NFS personnel rose steadily during the operating history of the plant, from 2.74 rems in 1968 to 7.15 rems in 1971; the plant ceased operation in January 1972. In addition to these 165 full-time personnel, the plant hired approximately 1,000 short term employees in an average year. After a brief presentation of the basic fuel reprocessing operation, the paper discusses the reasons for, and the plans of the company to reduce, these high exposure levels. Methods are suggested to reduce the projected levels still further for the modified NFS plan. (APHA)

- 2428 (PB--250729) INDIVIDUAL AND POPULATION DOSES FOR 1972 DISCHARGES FROM THE GINNA NUCLEAR POWER PLANT, UNIT NUMBER ONE.

Cochran, J.A.; Horton, T.R. (Environmental Protection Agency, Las Vegas, Nev. (USA). Office of Radiation Programs). Nov 1975. 39p. (ORP/LV--75-6). NTIS \$4.00.

The report presents the results of a study to determine the dose to the population in the vicinity of the Ginna Nuclear Power Plant (located in New York State) based upon 1972 discharge data. Doses calculated from release data are compared with current standards. This report fulfills the need to document the actual environmental impact of operating nuclear power reactors in contrast to Final Environmental Statement (FES) projections.

- 2429 (Juel-Conf--17, pp 39-49) NUCLEAR ENERGY AND RADIATION HAZARDS. Feldmann, A. Nov 1975. (In German). 4 figs.; 5 tabs.; 13 refs..

Profits and risks of nuclear energy. Lectures held at a seminar organized by the 'Arbeitsgruppe Kernenergie-Information' of the Kernforschungsanlage Juelich GmbH.

A survey is given of the present proportion between the population exposure to natural and to artificial radioactivity as well as of the radiobiological effects ionizing radiation has and radiation damage. Factor dependence of somatic and genetic damage is very clearly described and illustrated by data and figures. Genetic radiation risks, taking the population as a whole, is dealt with.

- 2430 DIP AND DIP + 2 AS GLUTATHIONE OXIDANTS AND RADIATION SENSITIZERS IN CULTURED CHINESE HAMSTER CELLS. Harris, J.W.; Power, J.A. (California Univ., San Francisco (USA). Lab. of Radiobiology); Kosower, N.S.; Kosower, E.M. Int. J. Radiat. Biol.; 28: No. 5, 439-445 (Nov 1975).

Two diamide analogues, diazene dicarboxylic acid bis (N'-methyl-piperazide) or DIP, and its bis-N'-methyl iodide salt, or DIP + 2, were tested for their ability to penetrate cultured Chinese hamster cells and oxidize intracellular glutathione. DIP penetrated the cells at a reasonable rate at 18°C, 160 nmoles being required to oxidize the endogenous glutathione of 2×10^6 cells, but it penetrated very slowly at 0°C. DIP + 2 did not effectively oxidize glutathione in Chinese hamster cells, possibly because it did not enter the cells. DIP became toxic after about 10 min of exposure, but its toxicity could be moderated by using anoxic conditions. DIP, but not DIP + 2, sensitized anoxic Chinese hamster cells to x radiation by a factor of 1.5, an effect that was due entirely to removal of the shoulder from the survival curve.

- 2431 OXYGEN-ENHANCEMENT RATIO FOR REPRODUCTIVE DEATH INDUCED BY ^3H OR ^{125}I DAMAGE IN MAMMALIAN CELLS. Koch, C.J. (California Univ., San Francisco (USA). Lab. of Radiobiology); Burki, H.J. Int. J. Radiat. Biol.; 28: No. 5, 417-425 (Nov 1975).

The oxygen-enhancement ratio (o.e.r.) for ^3H - and ^{125}I -induced cell death at 40°C was determined in cultured Chinese hamster cells. The o.e.r. for cell death induced by ^3H -thymidine was 3.2, essentially the same value as that previously reported for X-ray induced cell death. For cell death induced by ^{125}I -iododeoxyuridine ($^{125}\text{IdUrd}$), the o.e.r. was less than 1.4. The lower o.e.r. for ^{125}I -induced death was not due to the presence of the base analogue, since cells that had incorporated unlabelled IdUrd and were X-irradiated had an o.e.r. of 2.8 and cells that were inactivated by ^3H -IdUrd damage at 40°C had an o.e.r. even greater than 3. These results suggest that ^{125}I -decay damage, like high-linear-energy-transfer radiation damage, is only slightly increased by the presence of oxygen.

- 2432 (AECL--5309) PROGRESS REPORT, BIOLOGY AND HEALTH PHYSICS DIVISION, JULY 1 TO SEPTEMBER 30, 1975. (Atomic Energy of Canada Ltd., Chalk River, Ontario. Chalk River Nuclear Labs.). Nov 1975. 73p. (PR-B--107). INIS.

Interim results are reported for research in health physics, i.e. dosimetry, detectors, and monitoring; environmental research (limnology, radionuclide migration and kinetics; population research (radiation carcinogenesis, radiation effects in human populations); and biology (radiobiology).

- 2433 (KFK-EXT--20/75-2) ACCIDENT REPORT 1974. Windbuehl, E. (Kernforschungszentrum Karlsruhe (Germany, F.R.). Abt. Strahlenschutz und Sicherheit). Nov 1975. 54p. (In German). INIS.

11 refs.; with figs. and tabs..

This report continues the series of annual evaluations of accidents which took place at Gesellschaft fuer Kernforschung. The statistics are supplemented by examples of accidents and of preventive actions. The following objectives are pursued by this compilation: (1) Providing a survey of the development of the number of accidents which occurred from 1960 until 1974 and comparison of figures indicated. (2) Classification of accidents under different aspects and, hence, indication of accidents most frequently occurring. (3) Report about accident prevention activities.

- 2434 (SSI--1975-034) RADIATION DOSES TO THE PERSONNEL AT INSERTION OF GYNAECOLOGICAL IMPLANTS AND CLEANING OF RADIOACTIVE APPLICATORS. Lax, I. (Statens Straalskyddsinstitut, Stockholm (Sweden)). Nov 1975. 27p. (In Swedish). INIS.

The measurements of the radiation doses to the personnel consisted of dose measurements on the fingers and on the body. The radiation doses to the fingers and to different parts of the body at on one hand the insertion of gynecological implants and on the other the cleaning of them have been measured before at the wards of gynecological application at the department of oncology (Radiumhemmet), the Caroline Institute. Thermoluminescent dosimeters were used to measure the radiation doses to the finger tips. The dimensions of these dosimeters are nowadays so small that they are no hindrance to the work.

- 2435 (SSI--1975-035) RADIATION DOSES TO PATIENTS AT DENTAL RADIOGRAPHY. Paulusson-Odenhagen, M. (Statens Straalskyddsinstitut, Stockholm (Sweden)). Nov 1975. 10p. (In Swedish). INIS.

An investigation about the technique and the equipment at x-ray investigations and the distribution of the radiation doses to the thyroid and the gonads has been made in the dental polyclinics belonging to the county council of the province of Stockholm. This investigation, which was suggested by the National Institute of Radiation Protection and the faculty of odontology in Stockholm, consisted of on one hand a distributed questionnaire and on the other visits. The questionnaire was distributed to all dentists (altogether 343) belonging to the dental polyclinics of the county council of the province of Stockholm. 22 dentists of these were visited.

- 2436 X-RAYS IN INDUSTRY. Natl. Saf. News; 112: No. 5, 98-103 (Nov 1975).

A description of the sources and uses of industrial x-ray equipment is followed by data on design, maximum permissible doses, radiation monitoring and medical examinations. General procedures for the protection of operating personnel are outlined.

- 2437 Verordnung ueber den Schutz vor Schaeden durch ionisierende Strahlen. Entwurf. (ORDINANCE ON THE PROTECTION AGAINST DAMAGE FROM IONIZING RADIATION. DRAFT). Bonn; Bundesministerium des Innern (Nov 1975). 87p. (In German).

With figs. and tabs..

Complete text, including definition of terms and appendix, of the latest draft which is very much under discussion.

a poignant phrase, Morgan has stated "Radiation doesn't have to be feared, but should be respected."

- 2438 STUDIES ON THE TECHNIQUES OF PITUITARY IRRADIATION USING 6 MEV LINAC X-RAY. Tanaka, Y. (Keio Univ., Tokyo (Japan). School of Medicine). Keio Igaku; 52: No. 6, 463-481(Nov 1975). (In Japanese).

Forty patients with pituitary adenomas were treated by 6 MeV Linac X-ray from April 1966 to March 1974. Before 1971, conventional irradiation techniques such as the bilateral opposed fields method, or moving beam therapy situated in the sectional plane of the skull, were used. Since 1971, 360° moving beam therapy, situated in the coronal plane, and excluding the eye balls from exposed area (Yamashita's method) has been applied. Comparative physical and clinical studies of these irradiation techniques were made. Clinical improvement occurred in 26 of 40 cases. It was concluded that Yamashita's method is the most appropriate therapy for patients with pituitary adenomas.

- 2439 THYROID IRRADIATION AND CARCINOGENESIS. REVIEW WITH ASSESSMENT OF CLINICAL IMPLICATIONS. Foster, R.S. Jr. (Univ. of Vermont, Burlington). Am. J. Surg.; 130: No. 5, 608-611(Nov 1975).

Clinicians experienced in the management of thyroid disease are well aware of an association between irradiation of the thyroid and the subsequent development of carcinoma of the thyroid. Less widely known is the nature of the dose response relationship between the amount of irradiation and the incidence of carcinoma. High doses of irradiation to the thyroid may actually protect against the development of carcinoma whereas inappropriate diagnostic doses may occasionally fall into a range that has a significant potential for irradiation induction of carcinoma. This review will examine data relative to carcinogenesis from thyroid irradiation and summarize the implications for clinical practice.

- 2440 RADIATION AS AGENTS OF SOMATIC AND GENETIC ALTERATIONS. de Eston, V.R. (Univ., Sao Paulo, Brazil). J. Am. Med. Women's Assoc.; 30: No. 11, 445-449(Nov 1975).

According to the report on "The Effects on Population of Exposure to Low Levels of Ionizing Radiation," whether we regard a risk as acceptable or not depends on how avoidable it is, and, if not avoidable, how it compares with the risks of alternative options and those usually accepted by society. Regarding the use of ionizing radiation: No exposure should be permitted without the expectation of a commensurable benefit. The public must be protected from radiation, but not to the extent that the degree of protection provided results in the substitution of a worse hazard than that of the radiation avoided. Medical radiation exposure can and should be reduced considerably by limiting its use to clinically indicated procedures, utilizing efficient exposure techniques and optimal operation of radiation equipment. Consideration should be given to the following: (a) Restriction of the use of radiation for public health purposes, unless there is reasonable probability of significant detection of disease. (b) Inspection and licensing of radiation and ancillary equipment. (c) Appropriate training and certification of involved personnel. (d) Gonad shielding, especially shielding of the testis, is strongly recommended as a simple and highly efficient way to reduce the genetic significant dose. In

- 2441 (COD--3489-8) RADIOCHEMICAL AND RADIOECOLOGICAL STUDIES ON BRAZILIAN AREAS OF HIGH NATURAL BACKGROUND. PROGRESS REPORT, OCTOBER 30, 1974--OCTOBER 30, 1975. Costa-Ribeiro, C.; Penna-Franca, E.; Rocha-Nogueira, A.; Christian-Pfeiffer, W. (Rio de Janeiro Univ. (Brazil). Instituto de Biofisica). Nov 1975. Contract E(11-1)-3489. 7p. Dep. NTIS \$3.50.

The absorption of ^{212}Pb and/or ^{212}Bi by erythrocytes was investigated in an attempt to explain the in vivo genesis of somatic chromosomal aberrations of the type detected in peripheral blood lymphocytes of workers professionally exposed to ^{220}Rn and its decay products, as well as in dwellers of Brazilian areas of high natural radioactivity. (auth)

- 2442 RETINAL CHANGES INDUCED BY HEAVY PARTICLES: A NEW THERAPY MODALITY. Hunter, D.M. Aeromed. Rev.; 6: 3-13(Nov 1975).

The nature of the lesions produced by the oxygen particles appears similar to the experimental and clinical radiation retinopathies which have been reported previously. These reports, as well as our own findings, indicate that the lesion is primarily a circulatory one, with other retinal changes being secondary. Retinal changes of the magnitude produced with the oxygen ions have been reported with the use of cobalt plaques sewn to the sclera in the treatment of intraocular tumors. Doses that led to such clinical changes, however, were 8 times that required with the accelerated particles and required months to develop rather than 1 day or 1 week. Thus, retinal lesions produced with accelerated oxygen particles exhibit a significant compression of time and dose over those reported in the clinical literature. This study demonstrated that the tissue effectiveness of the accelerated particle is far greater than that of any previously utilized irradiation source. The oxygen atom is only the beginning; with the introduction of the Bevalac at the Lawrence Radiation Laboratory, multiple ion sources of various atomic weights will be available in future years. The radiation levels reported in this paper represent an "overkill" in the amount of radiation required for destruction of ocular tissue. With the development of a suitable particle source, and a collimated beam, these particles could become a clinically important therapeutic modality. By using B-scan ultrasonography and taking advantage of the relative energy absorption in tissue following heavy ion irradiation, one may have an effective radiation tool for treatment of choroidal melanomas and retinal blastomas.

- 2443 OSTEOSARCOMOGENIC EFFECT OF PLUTONIUM-239 DEPENDENT ON THE AGE AND SEX OF ANIMALS. Sinyakov, E.G. Radiobiologiya; 15: No. 6, 937-940(Nov 1975). (In Russian).

For English translation see the journal Radiobiology.

Plutonium-239 (2.5μ curie-kg) was administered to male and female rats at the age of 1, 6 and 12 months. Besides, one-month-old rats were momentarily given 5μ curie-kg. It has been found that the highest sensitivity to osteosarcomogenic effect of plutonium is exhibited by six-month-old animals; a lesser one - by one-month-old, and the least one - by 12-month-old rats. Males of all age groups are almost twice more sensitive than females.

- 2444 (PB--250753) THE CLINICAL TESTING OF MALE GONAD SHIELDS. TECHNICAL REPORT. Church, W.W.; Burnett, B.M. (Bureau of Radiological Health, Rockville, Md. (USA)). Nov 1975. 33p. (DHEW/FDA--76-8025). NTIS \$4.00.

Two types of male gonad shields, designed for use with support garments, were tested in a number of hospitals and clinics throughout the United States. The clinical evaluation consisted of: (1) measuring dose reduction with thermoluminescent dosimeters; and (2) determining acceptability of the shields for routine use in x-ray facilities, through the use of survey forms completed by patients, technologists, and facilities. The shields proved to provide a basis for a very satisfactory male gonad shield program. (GRA)

- 2445 (BNWL--2067) REVIEW OF REPORTS BY J.W. GOFMAN ON INHALED PLUTONIUM. Bair, W.J. (Battelle Pacific Northwest Labs., Richland, Wash. (USA)). 10 Oct 1975. Contract E(45-1)-1830. 12p. Dep. NTIS \$4.50.

Two recent widely circulated reports on the subject of inhaled plutonium have provoked concern among the press and in Congress. These reports, The Cancer Hazard from Inhaled Plutonium, CNR Report 1975-1R, May 14, 1975, and Estimated Production of Human Lung Cancers by Plutonium from Worldwide Fallout, CNR Report 1975-2, July 10, 1975, were written by John W. Gofman and issued by the Committee for Nuclear Responsibility, P. O. Box 2329, Dublin, California 94566. Gofman's reports do not present an objective analysis of the hazard of inhaled plutonium; his arguments, in fact, contradict many conclusions drawn in the scientific literature and supported by experimental data. Because the reports are skillfully written, however, they could easily mislead readers who are not well versed in this area. The purpose of this review, therefore, is to examine Gofman's reports in the light of recent research studies and to identify errors of fact and logic in his arguments.

- 2446 SCIENTIFIC ADVISORY BOARD OF THE FEDERAL MEDICAL SOCIETY (BUNDESAERZTEKAMMER) ANNOUNCES: COMMENT ON THE SUBJECT 'ENDANGERMENT BY NUCLEAR POWER PLANTS'. Dtsch. Aerztebl.; No. 41, 2821-2824 (Oct 1975). (In German).

The committee 'Endangerment by nuclear power plants' of the working group 'Environmental Medicine' of the Federal Medical Society (Bundesärztekammer) expresses its opinion on the risk of nuclear power plants to the population in the memorandum. The committee confirms that by keeping to the safety specifications, established until now, one can reckon with a radiation exposure averaging on 1/100th of the natural radiation exposure. Regarding the question of the thermal load, this proves to be no special problem of nuclear engineering. In the case of accidents, it is shown that the safety precautions are such as to exclude the endangering of persons in the environment of nuclear power stations. The probability of so-called hypothetical accidents endangering the population is several orders of magnitude smaller than that of earthquakes or other natural catastrophes.

- 2447 (MD/PUB--251) COMPUTER PROGRAM FOR THE DRAWING OF ISODOSE LINES IN AN IDEALISED FALLOUT PATTERN. Horst, J.W. (Ministerie van Defensie, The Hague (Netherlands). Advies Bureau der Genie). Oct 1975. 56p. (In Dutch). INIS.

Available from Technisch Documentatie en Informatiecentrum voor de Krijgsmacht, afd. Rapportencentrale, Frederikkazerne, Van Alkemadelaan 774, The Hague (Netherlands).

The mathematical formulae (polynomials) and the computer calculations for the plotting of isodose or iso-intensity lines for radioactive fallout after a nuclear explosion are given as well as two computer programs in FORTRAN. Parameters are wind velocity, distance from and time after explosion, fallout fraction, exploded weight, height above the ground.

- 2448 (NIRS-M--10, pp 65-69) RADIOACTIVE CONTAMINATION OF MARINE ORGANISMS AND ITS CONTRIBUTION TO THE INTERNAL RADIATION DOSE. Suzuki, Y. (National Inst. of Radiological Sciences, Chiba (Japan)). Oct 1975. (In Japanese).

From 2. National Institute of Radiological Sciences seminar; Chiba, Japan (28 Feb 1975).

Fundamental aspects of marine radioecology. I.

The pathway and transfer of radioactivity from sea water to man through sea food was investigated on Cs-137 originated from fallout. The present study summarizes the results on the basis of the data obtained in field studies concerning marine fish and total diet. The accumulation of Cs-137 in marine fish from the environmental water was examined from three points of view: concentration factors (CF), observed ratios (OR) and specific activities (SA). Using ^{137}Cs -K observed ratio (OR human body-total diet) of 2.35 for Japanese adults, the cumulative internal radiation dose to the whole body due to Cs-137 was estimated to be 7.3 mrad during the period from 1963 to 1971, and the cumulative dose from fishes and shellfishes would be 0.7 mrad at the most. On the other hand, it was found that a group of fishermen and their families might receive an internal radiation dose of about 1 mrad/year from Cs-137 in marine fish, because of the local radioactive contamination of sea water from the operation of a nuclear fuel reprocessing plant in the coastal site of Ibaraki prefecture.

- 2449 CHEMICAL FORM AND THE BIOCONDENSATION OF RUTHENIUM-106. PROBLEMS AND ESTIMATION OF THE EXPOSURE DOSE OF RUTHENIUM-106. Ishikawa, M. (National Inst. of Radiological Sciences, Chiba (Japan)). Hoshasen Kagaku; 18: No. 10, 187-192 (Oct 1975). (In Japanese).

^{106}Ru , one of the liquid radioactive wastes which nuclear fuel reprocessing plants produce, was described. Problems and the changes of the chemical form of ^{106}Ru were explained regarding the coefficient of ^{106}Ru condensation. The body exposure dose, based on intake of marine products in which ^{106}Ru had accumulated, was estimated using the coefficient of condensation.

- 2450 MEDICAL USES OF NUCLEAR DATA. Tilbury, R.S.; Bigler, R.E.; Zeitz, L.; Laughlin, J.S. (Memorial Sloan-Kettering Cancer Center, New York). Natl. Bur. Stand. (U.S.), Spec. Publ.; No. 425, 520-526 (Oct 1975).

From Proceedings on nuclear cross section and technology; Washington, DC, USA (3 Mar 1975).

See NBS-SPEC.PUBL.--425 (Vol.2); CONF-750303 P2.

Nuclear data is used in modern medicine in a myriad of ways. Activation cross sections are used in the calculation of radioisotope production rates for both neutron and charged particle activation. The radioisotopes so produced are used in diagnostic nuclear

medicine for the early detection of disease and for therapy either by external radiation or by internal radiation. The calculation of radiation dose from internally administered radioisotopes involves a knowledge of the decay scheme, mode and energy of decay, internal conversion coefficients, x-ray fluorescent and Auger electron yields. The decay scheme of radioisotopes including parent-daughter equilibria is essential knowledge for their accurate assay and for the understanding of radioisotope generators. Range-energy relationships for neutrons of various energies, charged particles, gamma-rays and electrons are also necessary for therapy and dose considerations. Applications to in vivo neutron activation analysis and photon absorptiometry for bone mineral measurement are also considered. An attempt is made to briefly describe these applications and to point out where more basic nuclear data measurements would be helpful. (auth)

- 2451 BASIC STUDIES ON TUMOR-SCINTIGRAM WITH USE OF ^{67}Ga -CITRATE. RELATION BETWEEN UPTAKE OF ^{67}Ga -CITRATE AND BLOOD FLOW /SUP 99m/Tc-ALBUMIN IN IRRADIATED TUMOR. Kwangok, B. (Nippon Dental Coll., Tokyo). Shigaku; 63: No. 4, 373-379 (Oct 1975). (In Japanese).

^{67}Ga -citrate scintigram, become frequently negative in tumors in the irradiation field after radiotherapy. In order to investigate the degree of decrease of the ^{67}Ga -citrate uptake in tumors in the early stage after irradiation and its causes, the relationship between the uptake and blood flow was examined using Ehrlich tumors. The following results were obtained. As the dose of irradiation increased, the uptake of ^{67}Ga -citrate in tumors decreased. The decrease was remarkable even by the irradiation of a fairly small dose, 500 rad. In the measurements of the blood flow including blood infiltration into tumors by using sup(99m)Tc-albumin, no significant relationship was observed between the blood flow and the ^{67}Ga -citrate uptake. A fair relation was observed between the angiographic findings by the Indian ink method and the ^{67}Ga -citrate uptake. It was suggested that the decrease in the ^{67}Ga -citrate uptake in tumors was much due to the effect of irradiation on the tumors themselves, and was due also to the effect of the vasculature.

- 2452 "PROTECTIVE" EFFECT OF CELLS GAMMA-IRRADIATION AT THE METAPHASE OF MITOSIS AFTER UV-IRRADIATION AT THE S-PERIOD. Lebedeva, L.I.; Chubykin, V.L. (AN SSSR, Novosibirsk. Inst. Tsitologii i Genetiki). Genetika; 11: No. 10, 24-29 (Oct 1975). (In Russian).

For English translation see the journal Sov. Genet..

As a result of the ultraviolet irradiation in vitro of the embryo fibroblasts of BALB mice in the S-stage with an incident dose of 40 erg/mm², 20.1% cells showed chromosome aberrations. Additional gamma irradiation of cells in the metaphase of the first mitosis with a dose of 5 krad leads with a high degree of certainty to a decrease to 11.7% in the frequency of aberrant cells observed in the same mitotic stage. The frequency of spontaneous aberrations does not change during the first few minutes after the gamma irradiation of intact cells. The "protective" effect of gamma rays cannot be attributed to non-uniform changes in the duration of the mitotic stages for aberrant and normal cells, to the adhesion of chromosome fragments or to the breaking of bridges in the anaphase. The destruction of cells during irradiation is also an unlikely explanation of the observed effect. It is assumed that the

decrease in the frequency of aberrations is a result of the previously predicted modification of the processes involved, when potential chromosome damage becomes visible aberrations during metaphase.

- 2453 (INIS-mf--3243, pp 323) "RISK VERSUS BENEFIT" FOR DIAGNOSTIC X-RAYS AND RADIONUCLIDES. Uzunov, I. Oct 1975. (In Bulgarian).

From 4. national congress of radiology and nuclear medicine; Varna, Bulgaria (27 Oct 1975).

Fourth national congress of radiology and nuclear medicine.

In the fifties, when a radiation protection program in medicine was initiated in the country, permissible population exposure standards were based solely on genetic risk, and medical irradiations were excluded from these standards. It is currently thought, however, that somatic-stochastic consequences of the carcinogenic effect of ionizing radiations are commensurable with genetic lesions. Since carcinogenic risk is determined by organ dose, it is much higher than the genetic risk in most X-ray and radionuclide examinations. Furthermore, the majority of authors feel that medical radiation should be included in total maximum permissible population dose (5 rem up to 30 years of age). Taking into consideration that over 95% of population exposure in the following decades is expected to result from medical radiation, and that the risk of induction of malignancies cannot be taken to be "negligible" even at an exposure level of the order of natural background, it is evident that in any specific case where radiation is to be applied, "risk vs. benefit" should be appraised with adequate precision. This will necessitate a thorough revision of problems involving patient protection, particularly so since shortcomings in this respect have lately been brought to light (for instance, cardiac catheterization or roentgenoscopic examination for expertise purposes), unmotivated mass screening tests, etc.), such cases occurring mostly because of unsatisfactory regulatory activities, especially as regards use of X-rays by non-radiologists. The paper discusses carcinogenic risk for a number of specific procedure types and stresses the need for a symposium on radiation protection in medical practice, with participation of physicians employed in areas of medicine relevant to X-ray and radionuclide diagnostics, in order to arrive at reasonable decisions enabling the achievement of a drastic reduction in population exposure.

Evidence from world statistics indicates that about 75% of excess radiation exposure to the population over that due to natural background results from diagnostic and prophylactic X-ray examinations. Current assessment of population exposure implies assessment of the genetically significant dose. Studies on a global scale have shown bulk figures for genetically significant dose

delivered to the population with medical X-rays to vary from 20 mrem per annum in Japan to 170 mrem per annum in New York. Rise or fall in these doses is closely related to measures taken in a country for patient protection. Apart from being highly dependent on professional skill of clinicists and radiologists, protection of patients involves a complex of physico-technical and organizational safeguards. From these considerations, specifically designed studies have been undertaken at 20 health establishments: polyclinics, hospitals, TB dispensaries, and others, i.e., where large numbers of people are exposed to be X-rayed. End-points investigated were: number of X-ray examinations, clinical motivation, proportion of negative X-ray findings, technical state of the facilities used, measures taken to protect patients, etc. From the general features found to characterize the state of patient protection in diagnostic and prophylactic X-ray examinations, conclusions were drawn and suggestions given for its improvement.

Fourth national congress of radiology and nuclear medicine.

Population exposure in excess of that due to natural radiation background is known to result primarily (to 70-90%) from medical X-rays given in mass screening. Protection of the population is a problem of great concern in present-day radiology and is approached by balancing benefits of diagnostic X-rays against risks presented by the probability of overexposing the patient. An evaluation on such a basis necessitates detailed and accurate information on patient radiation exposure and takes into account factors leading to a population hazard by making assessments in terms of so-called genetically significant doses. Gonad doses have to be carefully analysed, implying a need for studies of various types of X-ray procedures, precautionary measures taken, etc. An important issue in the choice and adoption of an appropriate method for large-scale gonad dose assessments in routine practice. To obtain an estimate of radiation hazard from medical roentgenology in terms of genetically significant doses and identify measures necessary to limit exposure risks, collaborative efforts are needed involving participation of roentgenologists and hygienists, and use of dosimetric, organizational-methodological, and statistical techniques. These efforts should lead to an abrupt reduction in radiation burden to the population from diagnostic X-rays.

- 2456 (INIS-mf--3243, pp 312) SOME RADIATION EXPOSURE PROBLEMS IN HYSTEROSALPINGOGRAPHY PROCEDURES. Dakov, L.; Vasilev, D. Oct 1975. (In Bulgarian).

From 4. national congress of radiology and nuclear medicine; Varna, Bulgaria (27 Oct 1975).

Published in summary form only. English abstract available.

Fourth national congress of radiology and nuclear medicine.

While stressing the diagnostic usefulness of hysterosalpingography in gynecological

practice, the authors point out that generally much unjustified radiation exposure occurs during the procedure, affecting both the subjects investigated - usually women of reproductive age - and the attending personnel. Common faults in this respect are: disregard to preliminaries (team-work coordination, information on patient's condition), inadequate adaptation, roentgenoscopic examinations small in number but of long duration, a tendency to follow on the screen some aspects of the filling of genital tract sections that are of no particular relevance to diagnostic, quite unsatisfactory limitation of diaphragm aperture resulting in a 4 to 5 and even more times larger field than necessitated by the object of the investigation, either in roentgenoscopy or roentgenography, etc. The authors have measured the times of individual hysterosalpingography phases and present an analysis of a number of end-points: mean duration of the procedure, relative roentgenoscopic time, number of roentgenoscopic examinations, scopy-to-film ratio, failure to use maximum diaphragm-aperture constriction, etc. To achieve higher reliability, data were collected from 100 patient examinations involving one radiologist and three gynecologists. Finally, recommendations are given for a reasonable hysterosalpingography procedure aimed at reducing radiation exposure to female patients of reproductive age as well as medical personnel and providing permanent records by means of a larger number of films obtained under routine conditions instead of resorting to roentgenoscopic examinations of long duration associated with appreciable amounts of excessive exposure.

- 2457 (INIS-mf--3243, pp 313) ASSESSMENT OF HEALTH ASPECTS IN SOME X-RAY EXAMINATION TYPES FROM GONAD DOSE MEASUREMENTS ON PHANTOMS WITH OR WITHOUT SHIELDING. Dermendzhiev, Kh.; Velikov, V.; Katerinov, E. Oct 1975. (In Bulgarian).

From 4. national congress of radiology and nuclear medicine; Varna, Bulgaria (27 Oct 1975).

Fourth national congress of radiology and nuclear medicine.

X-ray mass screening examinations have been found to lead, particularly in countries with a welldeveloped medical service, to substantial population exposure, namely in the range of 20 to 150 mrad per year versus 100 mrad per year from natural radiation background. A substantial share of this exposure stems from gonad doses delivered to patients in the course of various types of diagnostic X-ray procedures. The magnitude of doses absorbed by the gonads depends to a large extent on shielding devices used to protect the patient during the examination, on the nature of the examination - whether gonads lie directly under the beam - and a number of other factors. For the present study, four phantoms corresponding to a selection of ages (2, 7, 14, and 25 years of age) were prepared. Dosimetric measurements were performed on a "Hoffmann SR 700 D" X-ray apparatus, with simulation of various types of diagnostic procedures: roentgenoscopic examinations or films, with or without shielding, with or without use of image converters. The data obtained indicated that the X-ray procedure types investigated may be grouped, in descending order of associated radiation exposures, as follows: roentgenoscopy of GI tract in children or women, roentgenography of lumbar vertebrae, pelvic organs, kidneys, thighs. There are cases where shielding is unfeasible (roentgenoscopy of GI

tract in children or women, pelvic organ and kidney examination in women). In other cases, gonad shielding is of low efficiency: roentgenoscopy of lumbar vertebrae, skull or chest films in men. With use of image converters, a gonad-dose reduction by a factor of 2 to 9 is achieved. In terms of gonad dose level to the patient, X-ray procedure types may be distributed into three main groups: (1) low level (skull or chest films, etc.); (2) intermediate level (lung roentgenoscopy, thigh film, etc.); (3) high level, with gonads lying in the primary-beam field (GI tract roentgenoscopy, pelvic film, etc.).

- 2458 (INIS-mf--3243, pp 308) IRRADIATION OF THE SKIN FROM EXTERNAL CONTAMINATIONS OCCURRING IN MEDICAL APPLICATION OF RADIOACTIVE MATERIALS. Vasilev, G.; Mikhajlov, M. Oct 1975. (In Bulgarian).

From 4. national congress of radiology and nuclear medicine; Varna, Bulgaria (27 Oct 1975).

Fourth national congress of radiology and nuclear medicine.

Radioactive skin contamination of medical personnel engaged in use of unsealed radioactive sources for radiation therapy and radioisotope diagnostics was studied. Data analysis concerned contamination of hand and face areas in handling radioactive compounds of iodine, gold, phosphorus, and some other isotopes. From measurements of the degree of radioactive contamination and from experimentally determined pattern of in-depth radioactivity distribution, estimates were made of radiation doses to the basal layer considered to be critical for skin. In a number of cases, dose rates to basal layer cells were found to attain excessive levels - up to tens and even hundreds of rad/hr - clearly indicating that problems involved in protection from radioactive contamination should be given full attention.

Working with unsealed radioactive substances used for radiation therapy and radioisotope diagnostics, medical personnel may experience external as well as internal exposure. In the latter case, potential routes of intake are ingestion, inhalation, and percutaneous absorption. This paper presents the results of a survey of radioisotope body burdens in medical personnel handling unsealed radioactive substances. Subjects investigated were measured in the whole-body counter of the Institute of Roentgenology and Radiobiology (Sofia). Deposition of radioactivity in the body and resulting radiation doses to clinical organs were estimated. Based on findings from examinations of a medical staff sample and relevant dosimetric measurements, the authors conclude that personnel radiation exposures from medical applications of unsealed radioactive substances are primarily contributed through external irradiation.

- 2460 (INIS-mf--3243, pp 309) RADIATION EXPOSURE TO MEDICAL PERSONNEL DURING ROUTINE DIAGNOSTIC OR THERAPEUTIC X-RAY PROCEDURES. Vasilev, G.; Karadzhov, A.; Khristova, M. Oct 1975. (In Bulgarian).

From 4. national congress of radiology and nuclear medicine; Varna, Bulgaria (28 Oct 1975).

Fourth national congress of radiology and nuclear medicine.

The paper presents a statistical analysis of 19 thousand individual measurements of monthly radiation exposures to medical personnel engaged in work with X-ray apparatuses used for routine diagnostic purposes as well as radiotherapy. These measurements used film dosimeters worn over the breast and changed monthly. Exposure distribution patterns were studied and respective typical distributions identified. From these data, mean radiation doses to selected critical organs were estimated. The radiation burden sustained by personnel was assessed by comparing dose estimates obtained with currently accepted maximum permissible dose levels.

From 2. National Institute of Radiological Sciences seminar; Chiba, Japan (28 Feb 1975).

Fundamental aspects of marine radioecology. I.

Three different methods of estimating internal radiation doses to organs of human body are briefly described and reviewed. These are the method recommended for calculation of dose equivalent by Committee 4 of the International Commission on Radiological Protection, the method developed for absorbed dose calculation by the Medical Internal Dose Committee of the Society of Nuclear Medicine (USA), and the method used in computing MPC values in sea waters and introduced as a specific activity approach by the National Academy of Science and the National Research Council (USA).

- 2462 (NRPB-R--40) STUDY OF THE NRPB FAST NEUTRON PERSONAL MONITORING SERVICE. Bartlett, D.T.; Knight, A.; Marshall, T.O. (National Radiological Protection Board, Harwell (UK)). Oct 1975. 31p. NTIS (US Sales Only).

Available from H.M. Stationery Office, price Pound0.50.

The NRPB Fast Neutron Personal Monitoring Service has been reviewed and modifications have been, or are being, introduced to improve the accuracy and reliability of the nuclear emulsion dosimeter employed by the Service. This report presents the conclusions of the study. Experimental results of the investigations undertaken in the course of this study, together with full details of the dosimeter and Service, are appended.

- 2463 (PB--254273) A REVIEW OF BIOLOGICAL EFFECTS AND POTENTIAL RISKS ASSOCIATED WITH ULTRAVIOLET RADIATION AS USED IN DENTISTRY. TECHNICAL REPORT. Mills, L.F.; Lytle, C.D.; Andersen, F.A.; Hellman, K.B.; Bockstahler, L.E. (Bureau of Radiological Health, Rockville, Md. (USA)). Oct 1975. 41p. (FDA/BRH--76/40; DHEW/PUBL/FDA--76/8021). NTIS \$4.00.

Several dental procedures, recently developed and currently in use by the dental profession, involve the use of near or far ultraviolet (UV) radiation in the oral cavity. Recent studies on the biological effects of near and far UV radiation suggest potential risks to individuals from excessive UV exposure. In this paper the dental procedures are briefly described, the bases for UV safety standards are reviewed, effects of UV exposure to the skin and eyes and how these effects may relate to oral mucosa exposure are considered, potential modes of action by UV radiation on oral tissues as suggested by cell culture studies are summarized, and potential risks from UV exposure of individuals which might result from the dental procedures are discussed. (GRA)

- 2464 (SSI--1975-029) RADIATION DOSES FROM DENTAL RADIOGRAPHY AT PRIVATE PRACTITIONERS. Hylthen, J.A. (Statens Strålskyddsinstitut, Stockholm (Sweden)). Oct 1975. 49p. (In Swedish). INIS.

This investigation was made in January 1975 together with a seminar group from the faculty of odontology in Stockholm. Every four private practising dentists in Stockholm and its environs were selected by haphazard to get an enquiry equipment etc. Every forty private practising dentists were then selected by haphazard to get a visit. 32 x-ray plants were investigated. The radiation doses showed a great spreading. The mean value of the radiation doses to the irradiated organs had been reduced about 5 times compared to a similar investigation, which was made in 1960. The use of long metal tubes and high-speed film gave the lowest dose values, while a short cone of bakelite and a low-speed film gave the highest dose values. Fluctuations in the dose values seemed also to depend on the technique. The reasons for this may be variations in the settings of the instruments and in the dark room technique.

- 2465 BIOLOGICAL EFFECTS OF LOW DOSES OF IONIZING RADIATION. Polikarpov, G.G. (Scientific Council on Problems of Radiobiology, Kiev). Visn. Akad. Nauk Ukr. RSR; No. 10, 101 (Oct 1975).

A Plenary Session of the Scientific Council on Problems of Radiobiology, of the Academy of Sciences Ukrainian SSR, was held at the Institute of Biology of the Southern Seas of the Academy of Sciences Ukrainian SSR in Sevastopol, from 15 to 17 April. It was devoted to the achievements of the last year and to new tasks planned for the next year, as well as to biological effects of low doses of ionizing radiation.

- 2466 EFFECTS OF IONIZING RADIATION ON MAN. Watson, G.M. (Australian Atomic Energy Commission Research Establishment, Lucas Heights). At. Energy Aust.; 18: No. 4, 1-11 (Oct 1975).

This paper describes the major effects of ionizing radiation on man and the relationship between such effects and radiation dose, with the conclusion that standards of radiological safety must be based on the carcinogenic and mutagenic properties of ionizing radiation. Man is exposed to radiation from natural sources and from man-made sources. Exposure from the latter should be regulated but, since there is little observational or experimental evidence for predicting the effects of the very small doses likely to be required for adequate standards of safety, it is necessary to infer them from what is seen at high doses. Because

the formal relationship between dose and effect is not fully understood, simplifying assumptions are necessary to estimate the effects of low doses. Two such assumptions are conventionally used; that there is a linear relationship between dose and effect at all levels of dose, and that the rate at which a dose of radiation is given does not alter the magnitude of the effect. These assumptions are thought to be conservative, that is they will not lead to an underestimation of the effects of small radiation doses although they may give an overestimate.

- 2467 MEDICAL USE OF FAST NEUTRONS IN RADIOTHERAPY AND RADIOGRAPHY. Bewley, D.K. (Hammersmith Hospital, London). Natl. Bur. Stand. (U.S.), Spec. Publ.; No. 425, 527-532 (Oct 1975).

From Proceedings on nuclear cross section and technology; Washington, DC, USA (3 Mar 1975).

See NBS-SPEC.PUBL.--425 (Vol.2); CONF-750303--P2.

Over 400 patients have been treated with fast neutrons from a cyclotron at Hammersmith Hospital, London, using 16 MeV deuterons on beryllium. A large variety of malignant disease is included in this trial. A randomized trial of fast neutron therapy for cancer of the mouth and throat is in progress and preliminary results will be given. Fast neutron radiographs are often taken to check the positions of the fields used on the patients. These show no contrast from bone, but demonstrate only the presence of gas-filled cavities. As a diagnostic method, fast neutron radiography suffers from a number of disadvantages, the main ones being lack of sensitivity of the image-forming system and the hazard to the patient due to a large Quality Factor. Estimation of the absorbed dose given to different types of tissue is an important factor in the medical use of fast neutrons. More data are needed on the processes whereby fast neutrons impart energy to matter, particularly for neutrons above 15 MeV. (auth)

- 2468 ALTERATION OF T CELL FUNCTION IN HEALTHY PERSONS WITH A HISTORY OF THYMIC X IRRADIATION. Rieger, C.H.L.; Kraft, S.C.; Rothberg, R.M. (Univ. of Chicago). J. Allergy Clin. Immunol.; 56: No. 4, 273-281 (Oct 1975).

The possible late effects of x irradiation to the infantile thymus were investigated by studying immune functions in 12 healthy persons with a history of thymic x irradiation and healthy control subjects. No differences were found in serum immunoglobulin values, humoral antibody levels, lymphocyte counts, and lymphocyte reactivity to phytohemagglutinin, vaccinia virus, purified protein derivative (PPD), and allogeneic cells. The irradiation group exhibited cellular hyperresponsiveness to streptokinase-streptodornase (SK-SD). In contrast, mean skin and in vitro lymphocyte responses to *Candida albicans* were depressed in the patients with thymic irradiation. A dissociation of these two *Candida* responses was found in only 1 of 14 healthy control subjects but in 7 of 12 irradiated individuals. While thymic irradiation did not result in impaired immunologic defenses leading to clinical disease, it caused alterations in T cell responses similar to those reported in patients with chronic mucocutaneous candidiasis.

- 2469 SKIN REACTIONS AFTER DIFFERENT FRACTIONATION SCHEDULES GIVING THE SAME CUMULATIVE RADIATION EFFECT. Turesson, I.; Notter, G. (Sahlgrenska Sjukhuset, Goeteborg

(Sweden)). Acta Radiol., Ther., Phys., Biol.; 14: No. 5, 475-484(Oct 1975).

The CRE formula was used for calculation of biologically equivalent radiation doses with different fractionation schedules. The early radiation effects, skin erythema and pigmentation were measured with a reflectance spectrophotometer at wavelengths 578 and 660 nm. The course and maximum for both erythema and pigmentation agreed well with the two types of fractionation. The results seem to justify further use of this simple formula.

- 2470 HEALTH PHYSICS IN THE UNIVERSITY. van Elegem, P.; Bette, L.; Lejeune, S. (Brussels Univ. (Belgium)). Rayonem. Ionis. Tech. Mes. Prot.; No. 4, 179-181(Oct 1975). (In French).

From 3. European congress of the International Radiation Protection Association: criteria for radiation protection; Amsterdam, Netherlands (13 May 1975).

A health physics experiment carried out in 120 services, occupying about 2000 people directly exposed, is reported. The policy of followed-up systematic help gives extremely satisfactory results.

- 2471 IRRADIATION RISKS FOR HOSPITAL STAFF WORKING WITH RADIOTECHNETIUM. Heaton, B.; Brown, L.D. (Aberdeen Univ. (UK)). Rayonem. Ionis. Tech. Mes. Prot.; No. 4, 173-178(Oct 1975). (In French).

From 3. European congress of the International Radiation Protection Association: criteria for radiation protection; Amsterdam, Netherlands (13 May 1975).

The handling of technetium-99m can lead to the irradiation of personnel during the five main stages of its use. Experience shows that the nurses and radiopharmacists are subjected to an exposure difficult to reduce below a certain threshold, but with adequate precautions and job rotation the dose received by the personnel is nevertheless very slight. The practitioners themselves, who have been the centre of attention over the last few years, undergo a negligible irradiation.

- 2472 PROSPECTIVE SURVEY ON THE INCIDENCE OF CHEST MALIGNANCIES AFTER REPEATED FLUOROSCOPY DURING ARTIFICIAL PNEUMOTHORAX THERAPY FOR PULMONARY TUBERCULOSIS. Kitabatake, T.; Kurokawa, S.; Yamasaki, M.; Sato, T.; Kurokawa, H. (Niigata Univ. (Japan). School of Medicine). Nippon Igaku Hoshasen Gakkai Zasshi; 35: No. 10, 895-899(Oct 1975). (In Japanese).

Patients with pulmonary tuberculosis treated in 4 sanatoria in Niigata Prefecture between 1941 and 1961 were followed up by a mail questionnaire. Of 2756 patients, 1193 responded and sent back effective information, letters to 1224 were returned because of uncertain or unknown new address, 326 did not respond, and 13 were excluded because of incomplete answers. Out of the 1193 effective responders, 568 had been treated by artificial pneumothorax (the pneumothorax group), and 552 had not been treated by pneumothorax (the control group). There were 65 deaths in the pneumothorax group, but none of them were from chest malignancies; and 40 deaths in the control group with 4 from chest malignancies. In this survey, there was no evidence of an increased number of chest malignancies (including leukemia) after pneumothorax fluoroscopy.

- 2473 CARCINOMA OF THE THYROID AFTER RADIATION TO THE NECK. Crile, G. Jr. Surg. Gynecol. Obstet.; 141: No. 4, 602-603(Oct 1975).
The incidence of thyroid cancer following

irradiation of the neck is discussed. It is determined to be a dose related phenomenon following a bell shaped curve. (ERB)

- 2474 RADIATION AND THYROID CANCER. Debra, D.W. Jr. J. Med. Assoc., Ga.; 64: No. 10, 395-396(Oct 1975).

It should be the policy in all institutions and practices which administered head and neck irradiation to identify from its records those individuals so treated and to seek them out and advise them to have a thyroid evaluation. Physicians engaged in the general care of adults should incorporate questioning about head and neck irradiation into their history-taking. Further, they should direct the patient to inquire of his parents or guardian if a negative history is obtained. Records regarding the type of radiation given and dosimetry should be sought. Irradiated patients should have a thorough examination, including careful palpation of the thyroid and adjacent node-bearing areas. A chest film should be made and a thyroid scan performed. Surgery should be recommended to all who have the findings mentioned in the text above. For those who do not, it is recommended that they be placed on a suppressive dose of thyroid hormone (sodium L-thyroxine 0.15 to 0.25 mg/day) and that serum TSH levels be measured to ascertain suppression. The patient probably should have a careful examination of his thyroid gland performed annually throughout his life. The occurrence of any nodules should be grounds for surgery, unless a satisfactory and certain alternative explanation can be found.

- 2475 SEARCH FOR THE LOWEST IRRADIATION DOSE FROM LITERATURES ON RADIATION-INDUCED CANCER IN UTERUS. Yoshizawa, Y.; Kusama, T. (Tokyo Univ. (Japan). Faculty of Medicine). Nippon Igaku Hoshasen Gakkai Zasshi; 35: No. 10, 900-907(Oct 1975). (In Japanese).

A survey of past case reports on radiation-induced cancer of the uterus was carried out with the main object of finding the lowest irradiation dose. Search of literature published since 1912 revealed 548 cases of radiation-induced cancer of the uterus. All of these cases of radiation-induced cancer had received radiation for the treatment of non-malignant disease. The primary gynecological conditions which were the object of radiation therapy were functional bleeding, endometrial hyperplasia, myoma, endometritis, and polyps. The lowest irradiation dose was estimated at 1000-1450 rad in the case of external X-ray irradiation, and 100 mg.hr for intrauterine radium therapy, which corresponds to 100-1000 rad. It was noted that there were more cases of corpus cancer than cervical cancer. Histopathological findings of radiation-induced uterine cancer were carcinoma, sarcoma, and mixed mesodermal tumors. The latent period was distributed in the range of 1 to 40 years, with the average of 10.1 years.

- 2476 THYROID CANCER: DELAYED EFFECTS OF HEAD AND NECK IRRADIATION IN CHILDREN. Earle, J. (Stanford Univ., CA). West. J. Med.; 123: No. 4, 340(Oct 1975).

Thyroid abnormalities were found in 21% of patients surveyed who had previous head or neck irradiation 18 to 35 years ago for benign conditions. Technetium 99 scintiscanning was a part of the survey procedure. (ERB)

- 2477 EXPERIMENTAL INVESTIGATIONS OF THE DOSIMETRIC FEATURES OF X-RAY RADIATION USED IN X-RAY DIAGNOSIS. Prostyakova, M.A. Gig.

Sanit.; No. 10, 40-45(Oct 1975). (In Russian).

For English translation see the journal Hyg. Sanit..

For radiation hygiene estimates of the extent of the irradiation of various organs and tissues in roentgenological investigations, the quality and quantity of the primary radiation beam and its behaviour in the irradiated medium are assessed. It is shown that the effective energy of x-rays generated at 50-100 kV and with different radiation field dimensions at different depths in a tissue-equivalent irradiated medium is more or less constant, varying within the range 25 to 32 keV. The constancy of effective x-ray energies in a tissue-equivalent medium enables one to use, for different x-ray tube regimes, constant values of the roentgen-rad conversion factor for soft tissue and bone tissue. The investigations confirm the desirability of using high voltages across the x-ray tube in practical x-ray work.

- 2478 POSSIBLE OBSTETRIC FACTORS EFFECTING LEUKEMIA IN TWINS. Keith, L.; Brown, E.R.; Ames, B.; Stotsky, M. (Northwestern Univ., Chicago). Bibl. Haematol.; No. 43, 221-223(Oct 1975).

Each of the following, acting alone or in conjunction, may be contributory in the etiopathogenesis of leukemia in twins: exposure to ionizing radiation; cojoined intrauterine circulation; direct metastasis of maternal tumors to the fetus, and chromosomal abnormalities. The question we must ask ourselves is whether or not the literature has presented an artificial picture, represented by underreporting of "uninteresting" or discordant pairs. Further study among leukemic twins and careful analyses of both members of the twin pair as presented by national Twin Registers is needed to clarify the uncertainty presently recognized.

- 2479 HEALTH AND SAFETY ASPECTS OF INDUSTRIAL RADIOGRAPHY. Boggs, R.; Moore, R. Indian J. Occup. Health; 18: No. 10, 211-216(Oct 1975).

The risk of potential exposure to ionizing radiation to personnel due to increased application of industrial radiography for extensive nondestructive testing procedures in recent years, has been explained. The growing demands on those concerned with industrial hygiene and radiation safety to: (1) obtain a basic understanding of the potential hazards associated with the operation of all kinds of radiographic and fluoroscopic equipment (including the increasingly popular particle accelerators); (2) know the health and safety standards and radiation exposure criteria that have been developed; and (3) be alert in recognizing potentially hazardous conditions, etc. are reviewed in relation to the use of X-ray equipment and radioisotopes for industrial radiography.

- 2480 HYGIENIC FEATURES OF WORKING CONDITIONS PREVAILING IN X-RAY CABINETS. Usolt'sev, V.I.; Serebryanyi, V.A. (Leningradskij Inst. Usovershenstvovaniya Vrachej (USSR)). Gig. Sanit.; No. 10, 38-40(Oct 1975). (In Russian).

The results of an investigation of 352 x-ray cabinets showed that their personnel is subjected to simultaneous action of a number of factors: discomfortable microclimate, small concentrations of ozone and nitrogen oxides (within 0.1 of the maximum permissible concentration). The hands of the personnel, especially those of the x-ray laboratory

assistants are contaminated with lead (2.38mg in the hands washings). Therefore the assessment of labour conditions prevailing in an x-ray cabinet and the accomplishment of measures of their improvement should be carried out with due regards to all the complex of the above mentioned factors besides the ionizing radiation.

- 2481 (INIS-mf--3243, pp 318) ASSESSMENT OF THE RELATIVE BIOLOGICAL EFFECTIVENESS OF MIXED NEUTRON-GAMMA RADIATION BY CONFORMATION SHIFT EFFECTS IN BLOOD PLASMA PROTEIN FRACTIONS. Paskalev, Z. Oct 1975. (In Bulgarian).

From 4. national congress of radiology and nuclear medicine; Varna, Bulgaria (27 Oct 1975).

Published in summary form only. English abstract available.

Fourth national congress of radiology and nuclear medicine.

To determine the relative biological effectiveness (RBE) of mixed neutron-gamma fields, nuclear reactor radiations have commonly been used. In such studies, however, there is a wide variation in gamma - to - neutron ratios and, hence, the mixed radiation is not readily characterized. On the other hand, RBE values for mixed neutron-gamma radiations have been estimated using total doses in the range of 200 to 600 rad. No information is available for lower total doses (in the range of 5 - 20 rad). This paper concerns the assessment of RBE of mixed neutron-gamma radiation at various proportions of its constituents (neutron components of 10, 25, 50, or 75%) on mice given total doses of 5, 10, or 20 rad, in terms of conformation-shift effects in blood-plasma protein fractions, as determined from measurements of blood-plasma electroconductivity and dielectric constant. RBE values were found to vary from 1.25 to 3.70 at neutron-component proportions of 10 to 75% in mice exposed to 4.1 MeV neutrons (plutonium-beryllium source) and gamma rays (radium source).

- 2482 (INIS-mf--3243, pp 317) STUDY ON THE CHANGES IN BLOOD PLASMA ELECTROCONDUCTIVITY AND DIELECTRIC CONSTANT IN IRRADIATED MAMMALS. Paskalev, Z.; Bancheva, E. Oct 1975. (In Bulgarian).

From 4. national congress of radiology and nuclear medicine; Varna, Bulgaria (27 Oct 1975).

Published in summary form only. English abstract available.

Fourth national congress of radiology and nuclear medicine.

Blood plasma electroconductivity and dielectric constant were measured in C57BL mice exposed to an uncontaminated gamma or neutron field or a mixed gamma-neutron field at a total dose of 5, 10, 15, 20, or 25 rad. Measurements were also made with blood plasma from Wistar rats given 200, 400, or 600 R X-rays. The results obtained revealed a characteristic pattern of radiation-induced changes in electroconductivity and dielectric constant, these end-points being indicative, respectively, or shifts in saline concentrations and in conformation of protein fractions of blood plasma. Analysis of the data showed that within a few days after exposure there were changes occurring in cellular and tissue water-salt metabolism, followed by enhancement or recovery to norm, depending on the dose. A possibility is thus rendered to use the blood plasma parameters studied as a test for detecting early shifts in cellular water-salt metabolism and in conformation of protein fractions at a time when no characteristic

changes are yet to be observed in amounts of individual types of protein fractions from blood plasma of irradiated organisms.

- 2483 (INIS-mf--3243, pp 321) STUDY ON PROLIFERATIVE ACTIVITY OF FEMALE GENITAL TRACT CELLS DURING POSTNATAL DEVELOPMENT AFTER BEING AFFECTED BY 500-RAD EXPOSURE. Tileva, M. Oct 1975. (In Bulgarian).

From 4. national congress of radiology and nuclear medicine; Varna, Bulgaria (27 Oct 1975).

Published in summary form only. English abstract available.

Fourth national congress of radiology and nuclear medicine.

Female albino rats were given, at the age of 8 or 19 days, a single whole-body exposure to 500 rad on a "Rocus-M" apparatus. Mitotic activity of epithelium cells from uterus, cervix, and vagina were examined at 2, 6, 12, 26, 50, and 74 hr postradiation. At 8 days of age (period of active growth), uterine, cervical, and vaginal epithelia had high mitotic indices (28.4%, 21.2%, and 23.0%, respectively). At 2 hr postradiation, mitotic index was found to drop to 3.0%; at 6 hr it began to rise, to attain a maximum at 12 hr (39.8%, 37.0%, 42.9%). A second maximum, of virtually similar extent, was noted at 74 hr postradiation. Over the period from 26 hr to 50 hr, mitotic activity was below maximum. At 19 days of age (period of prefunctional differentiation), mitotic indices of epithelium cells from uterus, cervix, and vagina were 2.9%, 7.1%, and 14.4%, respectively. The radiation induced suppression of mitotic activity in epithelia from the organs studied, as observed at 2 hr postradiation, was succeeded by a gradual rise with a maximum level between 12 hr and 50 hr; this peak rate exceeded control figures by a factor of 5 for uterus and a factor of 2.5 for cervix and vagina. At 74 hr postradiation, cervical and vaginal epithelia had recovered a normal mitotic rate, while uterine epithelium had a mitotic rate still twice the initial figure. The results of the study indicate that recovery of mitotic activity is more rapid and of a higher level for uterine epithelium from animals irradiated at 19 days of age. This is likely to be accounted for by a longer mitotic cycle - 203.4 hr - in uterine epithelium cells, with relatively more extended radiation sensitive phases of the cycle.

- 2484 GENETIC EFFECTS OF ACUTE AND CHRONIC IRRADIATION WITH 14 MEV NEUTRONS. 1. GENETIC ASPECTS. 2. TECHNIQUE OF NEUTRON IRRADIATION. Luening, K.G.; Roennbaeck, C.; Sheridan, W.; Holmberg, M. (Kungliga Karolinska Mediko-Kirurgiska Institutet, Stockholm (Sweden); Foersvarets Forskningsanstalt, Stockholm (Sweden)). Acta Radiol., Ther., Phys., Biol.; 14: No. 5, 401-416 (Oct 1975).

Male CBA mice were exposed to 14.5 MeV neutron, either in an acute (150 or 250 rad) or a chronic dose (250 rad) and the genetic effects of the irradiations were compared. No detectable difference in the rate of mutations existed between acute and chronic exposure, with these neutrons.

- 2485 EFFECT OF CONTINUOUS IRRADIATION UPON SOME BIOLOGICAL PROPERTIES OF MURINE LYMPHOSARCOMA LS/BL. Juraskova, V.; Drasil, V. (Ceskoslovenska Akademie Ved, Brno. Biofyzikalni Ustav). Folia Biol. (Prague); 21: No. 5, 340-348 (Oct 1975).

Mouse lymphosarcoma LS/BL cells passaged in syngeneic hosts were continuously irradiated

with ^{60}Co gamma rays at an exposure rate of 1 R/hour. Long-term irradiation did not substantially alter the proliferative rate of leukaemic cells. Radiation exposure in the duration of 60 and 70 weeks led to an increase in the mean survival time of the hosts and in the generation time of the cells. When compared with the changes observed in the hosts of unirradiated leukaemic cells, the decrease in erythrocyte counts was greater during the first few days after inoculation of irradiated tumour cells, whereas the increase in leucocyte counts was slower.

- 2486 MITOTIC INDEX IN THE MOUSE FETUS LIVER AS A BIOLOGICAL INDICATOR OF RADIATION EFFECTS. Kusama, T.; Yoshizawa, Y. (Tokyo Univ. (Japan). Faculty of Medicine). Nippon Igaku Hoshasen Gakkai Zasshi; 35: No. 10, 908-912 (Oct 1975). (In Japanese).

This study was carried out in order to determine whether the mitotic index in mouse fetus liver tissue can be used practically for a biological indicator of radiation effects. Pregnant mice (ddY strain) which were in the 14th and 16th day of gestation were given 5, 10, 25, 50 or 100R of whole body γ -ray irradiation. At 30, 60 and 90 minutes after exposure, the pregnant mice were sacrificed to remove the fetuses. Smears were prepared from minced fetus liver. The mitotic index and the frequency of prophase cells in the liver were determined by observing 10000 cells from every fetus. The change of mitotic index and the frequency of prophase cells with fetus age between the 14th and 16th days were observed. The change of mitotic index and frequency of prophase cells with time after γ -irradiation was observed. There was a decrease at 30 minutes and an increase at 90 minutes after irradiation. It was found that the threshold dose in regard to the decrease of mitotic index and frequency of prophase cells in mouse fetus liver was between 5R and 10R.

- 2487 CHEMICAL AND RADIATION-INDUCED MUTAGENESIS OF THE RAT LIVER CHROMOSOMES. Mutovin, G.R.; Akif'ev, A.P.; Nikonov, V.P. (Vtoroj Moskovskij Gosudarstvennyj Meditsinskij Inst. (USSR); AN SSSR, Moscow. Inst. Obshchej Genetiki). Genetika; 11: No. 10, 170-172 (Oct 1975). (In Russian).

It was shown that radiation and chemical mutagenesis in rat liver cells is determined chiefly by long-lived premutational potential changes. The intensification of intrachromosomal processes under the action of an inducer of gene activity - phenobarbital - does not modify the yield of chromosome aberrations, both under the action of radiation and under the action of an alkylating agent - dipin. The facts obtained support the hypothesis that the chemical nature of the premutational changes differs from the primary molecular damages to DNA.

- 2488 (INIS-mf--3243, pp 314) ASSESSMENT OF LUNG CANCER RISKS FOR SOME CATEGORIES OF UNDERGROUND WORKERS. Dimitrov, M. Oct 1975. (In Bulgarian).

From 4. national congress of radiology and nuclear medicine; Varna, Bulgaria (27 Oct 1975).

Published in summary form only. English abstract available.

Fourth national congress of radiology and nuclear medicine.

In radioactive mines as well as in hardrock mines, tunnels under construction, and other underground workings, increased atmospheric levels of radioactive-gas daughter products are

associated with a potential hazard of inhalation overexposure to workers. Absorbed dose from the alpha-activity component of deposition occurring in the process of breathing manifests a maximum in the area of secondary to quarternary bronchi. In this critical tissue, radiation exposure, along with other deleterious factors, produces conditions favourable to initiation of lung cancer, with a frequency of the latter proportional to cumulative dose. An assessment was made of absolute radiation risk to workers inhaling a radon-daughter contaminated atmosphere, on the basis of an estimated cumulative dose and a dose-response relation arrived at from epidemiological studies by other authors. For a range with a lower limit representing the product of maximum permissible concentration and half of the underground experience assigned to first category labor, and an upper limit determined by the product of maximum 'hidden' alpha-decay energy measured and a full underground experience (180 months), cumulative exposures were found to vary from 90 to 8100 WLM. Rough estimates of corresponding lung cancer incidence ranged from 2 to 150 cases per year per 10,000 workers, versus 2-5 cases per year per 10,000 members of the general male population of the country. Results, obtained from a reconnaissance statistical study on a sample of 230 underground workers, with suitable working experiences and personal cumulative exposures, indicated a predicted frequency of lung cancer development of 0.43 cases per year, leading to an estimate of 19 cases per year per 10,000 workers. Such a magnitude of risk clearly shows an urgent need for introducing effective measures to improve radiological conditions in the occupational environment for a large proportion of the underground workers.

- 2489 RADIATION DOSE TO THE PATIENT AFTER ADMINISTRATION OF RADIOACTIVE LABELLED COLLOIDS. Wolf, R.; Hahn, K. (Mainz Univ. (F.R. Germany). Inst. fuer Klinische Strahlenkunde). Fortschr. Geb. Roentgenstr. Nuklearmed.; 123: No. 4, 324-330 (Oct 1975). (In German).

1 fig.; 4 tabs.; 23 refs..

The radiation dose to the patient after injection of radioactive colloids is calculated for three substances: colloidal radiogold, sup(99m)Tc sulfur colloid and sup(113m)In colloid. For the calculation normal and pathological conditions were assumed.

- 2490 (INIS-mf--3243, pp 311) CHROMOSOME ANOMALIES FROM INTERNAL CESIUM 131 APPLICATION IN RAT BONE-MARROW CELLS. Grigorov, L.; Karag'ozova, T.; Vylkova, G.; Lyutakova, E. Oct 1975. (In Bulgarian).

From 4. national congress of radiology and nuclear medicine; Varna, Bulgaria (27 Oct 1975).

Published in summary form only. English abstract available.

Fourth national congress of radiology and nuclear medicine.

Analysis of chromosome anomalies was performed on a total of 6160 bone-marrow cells from rats injected intraperitoneally with cesium-131 activities equivalent to diagnostic doses (6 μ Ci) or exceeding such doses by a factor of 5 or 10, respectively. Cytological observations were made at 1, 3, 7, and 14 days post-administration. At day 1 after injection of 6 μ Ci cesium-131, chromosome anomalies were found in 2.3% of bone-marrow cells blocked at metaphase. At day 3 (2%), day 7 (1.5%), and day 14 (1.3%), there was a tendency for aberrant cell yields to fall without, however, returning

to control level (0.6%). After administration of 30 μ Ci, aberrant cell yields were significantly increased over 6- μ Ci yields, the increase being particularly marked at day 1 and day 3 post-administration. As for 60- μ Ci doses of Cesium-131, the amounts of aberrant cells produced were superior to 6- μ Ci yields, but showed no trend toward a further increase over 30- μ Ci yields. Structural chromosome aberrations encountered were mostly of one-hit types (chromatid or chromosome fragments), with an insignificant proportion of two-hit types (polycentrics, rings, interstitial deletions) which were limited almost exclusively to day 1 post-administration.

- 2491 EFFECT OF RADIOPHOSPHORUS ON HEMATOLOGY OF MICE DURING POSTNATAL DEVELOPMENT. Malhotra, N.; Srivastava, P.N. (Jawaharlal Nehru Univ., New Delhi (India). School of Life Sciences). Strahlentherapie; 150: No. 4, 411-426 (Oct 1975).

5 figs.; 5 tabs.; 13 refs..

Swiss albino mice at different stages of their postnatal development (one day, one week, two weeks, three weeks, four weeks age groups) were injected intraperitoneally with radioactive phosphorus (P-32) at the dose of 1.0 μ Ci/g body weight and studied for their hematological response at weekly intervals up to six weeks of age when they attain sexual maturity. In all the treated groups in both males and females, the radiation injury was evident after injection of radioactive phosphorus. Animals showed reduction in blood cell number and fall in hemoglobin and hematocrit levels after injection. Reparation was also evident in the animals after some lapse of time following P-32 administration. Morphological changes in different white blood cells were not observed. No radiation sickness symptoms were observed in any of the treated groups during the study. There was no radiation mortality. The radiation damage to blood forming organs was moderate. It was observed that the females showed a greater hematological damage than the males.

- 2492 INFLUENCE OF OESTROGEN ON THE EXCRETION OF STRONTIUM-90 AND -85 IN MICE. Roennbaeck, C.; Nilsson, A. (Foersvarets Forskningsanstalt, Stockholm (Sweden)). Acta Radiol., Ther., Phys., Biol.; 14: No. 5, 485-496 (Oct 1975).

Groups of male CBA-mice were treated with oestrogenic hormones alone or in combination with ^{85}Sr and ^{90}Sr . The strontium retention was measured in special skeleton parts and also by means of whole body counting. After a period of increasing bone weight in mice treated with oestrogen and ^{90}Sr , there were signs of a serious breakdown of that newly formed 'oestrogenic' bone tissue. The strontium retention was in no case found higher in animals treated with both the hormones and ^{90}Sr when compared to those treated with ^{90}Sr alone. The life span was shortened in mice given the combined treatment. The results support the theories that at the same time irradiated and stimulated cell populations are exposed to a larger risk for induction of tumours and that the irradiation injury cannot be referred entirely to the irradiation dose in a physical sense.

- 2493 (AD-A--017507) LASER EXPOSURES IN THE MACULAS OF HUMAN VOLUNTEERS. FINAL REPORT. Wolbarsht, M.L.; Landers, M.B. III. (Duke Univ., Durham, N.C. (USA). Dept. of Ophthalmology). 30 Sep 1975. Contract N00014-67-A-0251-0011. 45p. NTIS \$4.00.

Patients whose eyes require enucleation for

medical reasons were exposed to focused argon laser beams in a regular pattern of locations in the eye, especially in the macula, including the fovea. The power levels were suprathreshold to just produce instantaneous lesions. The ophthalmoscopic appearance of the resultant lesions was correlated with loss of function and with subsequent histological examination. An argon laser lesion in the macula may have greater functional impairment than a comparable ruby laser lesion. In lesions outside the macula the damage is confined to the retinal pigment epithelium and adjacent structures. In markedly suprathreshold lesions the outer segments of the rods were less disturbed than the inner nuclear and plexiform layers. Within the macula there are usually two damage locations separated by unchanged layers of the retina. In the pigment epithelium in which the damage was the same or less than in lesions outside the macula, there was a larger area of damage in the outer plexiform layer. Foveal lesions had greater damage to the fiber layer of Henle (outer plexiform layer) than in adjacent areas of the macula at comparable power levels. (GRA)

- 2494 (ORNL-tr--4302) PRODUCTION, DISPOSAL, AND RELATIVE TOXICITY OF LONG-LIVED FISSION PRODUCTS AND ACTINIDES IN THE RADIOACTIVE WASTES FROM NUCLEAR FUEL CYCLES. Haug, H.O. (Kernforschungszentrum Karlsruhe (Germany, F.R.). Inst. fuer Heisse Chemie). 26 Sep 1975. Translation by E.G. Silver of KFK--2022. 190p. Dep. NTIS, PC A09/MF A01.

Chapters are devoted to the following topics: predicted future development of nuclear energy in the German Federal Republic and in Western Europe, fuel cycle variations and production of fission products and actinides in the radioactive waste from reprocessed nuclear fuels, long-lived fission products and actinides in the waste streams from the reprocessing of nuclear fuels, relative toxicity index, presently preferred waste management concepts, and alternative concepts for the elimination of high-level wastes. - 2498 DOSE COMMITMENTS OF PERSONNEL AT NUCLEAR FACILITIES. Herrmann, H.J. (Institut fuer Reaktorsicherheit der Technischen Ueberwachungs-Vereine e.V., Koeln (F.R. Germany)). IRS Mitt.; No. 3, 17-21 (Sep 1975). (In German).

1 tab..

In connection with the increasing number of nuclear plants in the FRG, the compilation of data on the radiation exposure of monitored personnel has begun. This inventory is to serve the recognition of critical aspects and as a basis for expert activity in the field of radiation work protection. In the radiation exposure considerations, one differentiates between normal operation and the revision phase of the nuclear plant. Also a breakdown of the total dose of all monitored persons according to exposed persons for own and foreign personnel is carried out. The high exposure values in the revision and operational phases exceeding authorized basic allowance, whose increase with operational time of a plant is approximately squared, makes one realize the necessity of paying more attention to 'radiation work protection'.

- 2499 ATTITUDE TO NUCLEAR POWER QUESTIONS. PROF. STERNGLASS ON ALLEGED EFFECTS OF RADIOACTIVE FALLOUTS. Merton, A.; Butz, H.P. (Institut fuer Reaktorsicherheit der Technischen Ueberwachungs-Vereine e.V., Koeln (F.R. Germany)). IRS Mitt.; No. 3, 27-31 (Sep 1975). (In German).

1 fig..

The main arguments of Sternglass connected with radioactive fallout of nuclear weapon explosions are the increase in the death rate of children in the USA and the occurrence of leukemia in children in the Troy-Albany region. Professor Sternglass' claims do not stand up to a precise check. His hypotheses have instead brought forth a flood of criticism on the selection of data and their processing. The criticism can be summarized in the following points: The selection of some data does not support his hypotheses as he has neglected much more extensive data. It has been proved that false assumptions have been used. Other investigations to support his thesis are falsely interpreted. Indispensable mathematical evidence has been omitted in the evaluation of the data material.

- 2500 FACTORS AFFECTING THE QUANTITATION OF DOSE-RESPONSE CURVES FOR MUTATION INDUCTION IN V79 CHINESE HAMSTER CELLS AFTER EXPOSURE TO CHEMICAL AND PHYSICAL MUTAGENS. Fox, M. (Christie Hospital and Holt Radium Inst., Manchester (UK). Paterson Labs.). Mutat. Res.; 29: No. 3, 449-466 (Sep 1975).

Using four common mutagens, ethyl methanesulphonate, methyl methanesulphonate, UV, and X-irradiation, the relationship between dose of mutagen, cellular lethality and frequency of 8-azaguanine resistant colonies in V₇₉ Chinese hamster cells has been examined. Several factors affecting the recovery of mutants including inter and intra-clone metabolic co-operation have been quantitated and their influence on survival response curves examined.

- 2501 (EPA--520/1-75-001) MANUAL OF PROTECTIVE ACTION GUIDES AND PROTECTIVE ACTIONS FOR NUCLEAR INCIDENTS. (Environmental Protection Agency, Washington, D.C. (USA). Office of Radiation Programs). Sep 1975. 99p. Environmental Protection Agency, Office of Radiation Programs, Washington, DC.

This manual was prepared to provide practical guidance to State, local, and other officials on criteria to use in planning protective actions for radiological emergencies that could present a hazard to the public. The guidance presented here is not intended as a substitute for, or an addendum to, a State radiological emergency response plan. It is intended only to provide information for use in the development of such a plan.

- 2502 (RD/B/N--3496) USERS GUIDE TO THE POPDOS PROGRAM FOR EVALUATING COLLECTIVE DOSES. Henning, M.J. (Central Electricity Generating Board, Berkeley (UK). Berkeley Nuclear Labs.). Sep 1975. 25p. Dep. NTIS (US Sales Only) \$3.50.

A complete description is given of the input data needed to use the computer program POPDOS for estimating collective doses to the population of England and Wales following atmospheric releases of radioactivity. Details are given of the Job Control Language used for normal execution of the program. A complete test case is included to facilitate program transfer to other computers. POPDOS is written in Fortran IV (level H) and is compiled under OPT-2, using ASP3 on the IBM 370/168 computer. A list of subroutines and their functions is given together with a tabulation of the major dimensioned variables. Finally there is a description of the procedure by which a collective dose surface can be generated using the CALCOMP plotting facilities. (auth)

- 2503 CRITERIA FOR AN OPTIMAL ISOTOPE TO BE USED IN GYNECOLOGIC RADIATION THERAPY. Walstam, R. (Radiofysiska Institutionen, Stockholm (Sweden)). Strahlentherapie; 150: No. 3, 258-260(Sep 1975). (In German). 1 fig.; 2 tabs.; 4 refs. Lecture from the Symposium on Afterloading Techniques, Wuerzburg 1974.

With regard to the evident disadvantages of radium, nowadays an artificial radiation source always should be considered, since it may be much more favorable for any intracavitary application. The most usual ones are Cs-137, Co-60 and Ir-192. Each of these isotopes has its advantages and disadvantages; therefore the choice of the isotope must take into account the criteria and requirements for each intracavitary radiation technique.

- 2505 LEUKEMIA IN CHILDREN WITH WILMS TUMOR. Schwartz, A.D.; Lee, H.; Baum, E.S. (Northwestern Univ., Chicago). Shonika Rinsho; 87: No. 3, 374-376(Sep 1975).

Recently there have been numerous reports of second neoplastic diseases developing in individuals years after completion of therapy for their primary, apparently unrelated, malignancy. The authors have observed two children who developed leukemia following therapeutic control and apparent cure of Wilms tumor. These children and the discovery by a mail survey of three similar cases form the basis for this report. To our knowledge this is the first documentation of leukemia occurring in children who have been treated for Wilms tumor or any other common nonlymphomatous childhood neoplasm.

- 2506 BONE MARROW TRANSPLANTATION - A FIELD IN CONTINUOUS DEVELOPMENT. Pfeffer, P.F. (Forsvarets Forskningsinstitut, Kjeller (Norway)). Sanit. Nytt; 21: No. 2, 154-167(Sep 1975). (In Norwegian). 27 references.

The symptoms of the radiation syndrome are described briefly and the Vinca accident in 1958 is used as an illustration of the application of bone marrow transplantation as a treatment in radiation accidents. Thereafter the immunological problems arising when a permanent substitution of donor marrow is required are discussed. Greatest experience in bone marrow transplantation has been had in the treatment of aplastic anemia and acute leukemia. In these cases the recipient's bone marrow cells must be killed by whole body irradiation or by cyclophosphamide to preclude graft-host reaction. The removal of marrow from the donor and transplanting in the recipient are described, as is the progress of the patient in a typical case. The graft-host reaction is then discussed, as is the danger of secondary infections. In conclusion the long term results are evaluated and the future developments of the treatment discussed.

- 2507 CATARACTS IN URANIUM MINERS. France, A. (Zavodni Ustav Narodniho Zdravi Uranoveho Prumyslu, Pribram (Czechoslovakia)). Cesk. Oftalmol.; 31: No. 5, 340-344(Sep 1975). (In Czech).

The question was studied of whether or not uranium miners with a long history of work underground develop alterations of the eye lens as a result of a long-term chronic exposure to gamma radiation. Investigated were the area of opacities and the occurrence of alterations of the lens posterior pole in a group of 800 uranium miners (i.e., 1,600 eyes) with work underground longer than 10 years. As against controls, no statistical differences were found in the lens transparency. Significant differences were also not found in the extent of cataracts and the occurrence of posterior pole alterations, nor in the rate of an increased occurrence of cataracts due to age.

- 2508 LEGAL AND TECHNICAL REGULATIONS IN RADIATION PROTECTION AND THEIR EFFECTS ON RADIOTHERAPY. Betz, B. (Gesellschaft fuer Strahlen- und Umweltforschung m.b.H., Neuherberg/Muenchen (F.R. Germany). Inst. fuer Strahlenschutz). Roentgen Ber.; 4: No. 3, 198-211(Sep 1975). (In German). 5 refs..

During the last few years, new regulations and guidelines in the field of radiation protection have been issued which affect radiotherapy, too. On September 1st, 1973 the X-ray Ordinance became effective; a few weeks later, new guidelines for radiation protections when using radioactive substances in the field of medicine were published. Of particular topical interest is the appendix of these new

guidelines, in which the principles of technical competence in radiation protection when handling radioactive substances in the field of medicine are laid down uniformly for the FRG. Amongst these more recent regulations, there is also the direction by the Minister of the Interior to put the operation of accelerators in the field of medicine according to section 19 of the Atomic Energy Act under the supervision of the state and to employ newly issued administrative guidelines. After a short survey on the radiation protection laws in force, a selection of important stipulations within the new legal regulations and guidelines is discussed with a view to their effects on radiotherapy.

- 2509 CLINICAL STATISTICS IN A FOUR-YEAR PERIOD (1971-1974) AND INCIDENCE OF MALIGNANT TUMOR IN GENERAL PATIENTS AND A-BOMB EXPOSED PATIENTS IN THE JAPAN RED CROSS NAGASAKI ATOMIC BOMB HOSPITAL. Noutomi, H.; Kanetake, H.; Ihara, K.; Takano, M.; Kakimoto, S. (Nagasaki Atomic Bomb Hospital (Japan)). Nagasaki Igakkai Zasshi; 50: No. 3, 193-202(Sep 1975). (In Japanese).

Clinical cases of the Japan Red Cross Nagasaki Atomic Bomb Hospital during the four-year period from 1971 to 1974 were analyzed statistically according to inpatient or outpatient, age, sex, disease and method of operation. Malignant tumor cases were divided into general patients and A-bomb exposed patients and in order to see if there was any significant difference in incidence of malignant tumor between these two groups, a total of 101 cases of malignant tumor during the 11-year period from 1964 to 1974 were studied statistically. A-bomb exposed patients consisted of 2547 outpatients and 370 inpatients. The male-female ratio was 1:1.04 in outpatients and 1:0.37 in inpatients. The rate of hospitalization was 17.0%. Aged patients over 70 years of age occupied 47.4% of the inpatients. During the 11 years from 1964 to 1974, there occurred 101 cases of malignant tumors and these cases were studied statistically to see the difference in incidence between the general patients group and the A-bomb exposed group. Prostatic cancer showed a significant difference between these two groups in outpatients with higher incidence for the A-bomb exposed group but no significant difference in inpatients. Other malignant tumors showed no significant difference.

- 2510 A COMPARISON OF CHROMOSOMAL RADIOSENSITIVITIES OF SOMATIC CELLS OF MOUSE AND MAN. Sasaki, M. (Tokyo Medical and Dental Univ. (Japan). Medical Research Inst.). Mutat. Res.; 29: No. 3, 433-447(Sep 1975).

A cell culture technique for quantitative analysis of radiation-induced chromosome aberrations in somatic cells has been developed and used for the comparison of chromosomal sensitivity of skin cells of mouse and man to ⁶⁰Co-γ-rays. This includes culture of irradiated tissues or cells in culture in arginine and isoleucine deficient medium and subsequent refeeding with complete medium. With this technique, radiation-induced chromosome aberrations can be analyzed selectively in the cells exposed in G₁ phase and recovered at their first post-irradiation mitosis. When tested on the human embryonic cells, the dicentric yield was essentially the same whether they were skin cells irradiated in situ or cultured cells at various in vitro passages irradiated in vitro. In contrast, when studied in the skin cells irradiated in situ, mouse embryos and newborns were insensitive to the induction of dicentricies. In young mice on day

11 however, the sensitivity was at a level comparable to that in human embryonic cells and it was intermediate on day 4. Such embryonic insensitivity of the mouse cells was rapidly lost during serial transfer in vitro, and when tested at 4th or later subculture generations, mouse and human cells were equally sensitive to the induction of dicentricies. These results suggest that the chromosomal radiosensitivity is essentially the same for mouse and human cells but can be modified by some biological factors, possibly DNA repair mechanisms, which differ between species as well as among the states of differentiation of particular cell types. Special attention was paid to the parallelism between the age-dependent changes in the chromosomal, mutational and carcinogenic radiosensitivities in the mouse. If this parallelism can be carried over to man, human pre-natal irradiation will not present any reduced genetic hazards.

- 2511 CHROMOSOME ABERRATIONS IN SOMATIC CELLS. Awa, A.A. (Radiation Effects Research Foundation, Hiroshima (Japan)). J. Radiat. Res.; 16: No. suppl., 122-131(Sep 1975).

Evidence concerning cytogenetic effects of A-bomb irradiations on the somatic cells of survivors of Hiroshima and Nagasaki is reviewed. It has been demonstrated that (1) radiation-induced chromosome aberrations have persisted in the circulating lymphocytes as well as in the bone marrow cells of survivors more than two decades after radiation exposure, and (2) that the chromosome-aberration frequency is in general proportional to the dose received. The relation, if any, between the occurrence of induced structural rearrangements of chromosomes and the health status of the survivors is as yet unknown, and the need for further and continued evaluation for possible associations between them is stressed.

- 2512 GROWTH AND DEVELOPMENT FOLLOWING PRENATAL AND CHILDHOOD EXPOSURE TO ATOMIC RADIATION. Blot, W.J. (National Cancer Inst., Bethesda, Md. (USA)). J. Radiat. Res.; 16: No. suppl., 82-88(Sep 1975).

Studies of growth and development of Hiroshima and Nagasaki children have shown significant long-range effects associated with exposure to the atomic bombs. Radiation to the fetus during early pregnancy, even at relatively low doses, may result in reduced growth, smaller head size, and mental retardation. Harmful effects of radiation later in pregnancy and in early childhood have not been as clearly demonstrated, however reduction in growth is also found among Hiroshima children.

- 2513 CATARACTS. Dodo, T. (Hiroshima Univ. (Japan). School of Medicine). J. Radiat. Res.; 16: No. suppl., 132-137(Sep 1975).

Several months to years after exposure to ionizing radiation of the atomic bombs (A-bombs), some survivors developed cataracts. The characteristic clinical finding was a localized lenticular opacity on the inner surface of the posterior polar capsule presenting a polychromatic sheen, and punctate opacities or aggregations thereof in the subcapsular cortical layer of the posterior polar region. In the majority of the affected survivors, the degree of opacification of these radiation cataracts was minimal to moderate and remained unchanged. These cases had no other subjective disturbances associated with this condition.

- 2514 AGING. Finch, S.C. (Yale Univ., New Haven, Conn. (USA). School of Medicine); Beebe, G.W. J. Radiat. Res.; 16: No. suppl., 108-121(Sep 1975).

The hypothesis that ionizing radiation accelerates natural aging has been under investigation at the Atomic Bomb Casualty Commission since 1959. Postmortem observations of morphologic and chemical changes, tests of functional capacity, physical tests and measurements, clinical laboratory tests, tissue changes, morbidity, and mortality have all been examined by ABCC investigators interested in this hypothesis. These studies have been beset with conceptual difficulties centered on the definition and measurement of aging. An empirical approach early led to the calculation of an index of physiologic age as a linear combination of age-related tests of various organ systems. Most studies have been negative but have not involved the large numbers that might be required to provide strong evidence for or against the hypothesis. Mortality, however, has been examined on the basis of a large sample and over the period 1950-1972 had provided no support for the hypothesis of radiation-accelerated aging. Ionizing radiation dose, of course shorten human life, but its life-shortening effect appears to be the result of specific radiation-induced disease, especially neoplasms. The hypothesis is now much less attractive than it was 10-20 years ago but still has some value in stimulating research on aging. The experience of the A-bomb survivors provides an unusual opportunity for a definitive test of the hypothesis.

- 2515 LEUKEMIA AND RELATED DISORDERS. Ichimaru, M. (Nagasaki Univ. (Japan). School of Medicine); Ishimaru, T. J. Radiat. Res.; 16: No. suppl., 89-96(Sep 1975).

The studies of radiation leukemogenesis in atomic bomb survivors is reviewed. Leukemia appeared early and was one of the most striking evident somatic effects of radiation in atomic bomb survivors. Leukemogenic effects of radiation vary by quality and quantity of radiation dose, age at the time of exposure, elapsed time after exposure and type of leukemia. Although the risk of leukemia in atomic bomb survivors is now greatly reduced with elapsed time after exposure, there is no evidence that the risk of leukemia has returned to control levels in those survivors who received a significant radiation dose even almost 30 years after the bombings. No significant clinical and pathologic manifestation of leukemia related to radiation dose was reported except the absence of chronic lymphocytic leukemia in those survivors who received a significant dose. A briefer review is also made of various studies concerning atomic bomb exposure and the incidence of related disorders such as malignant lymphoma, aplastic anemia and other hematologic disorders.

- 2516 GENETIC EFFECTS. EARLY GENETIC SURVEYS AND MORTALITY STUDY. Kato, H. (Radiation Effects Foundation, Hiroshima (Japan)). J. Radiat. Res.; 16: No. suppl., 67-74(Sep 1975).

In 1948-1953 a large scale field survey was conducted to investigate the possible genetic effects of A-bomb radiation on over 70,000 pregnancy terminations in the cities of Hiroshima and Nagasaki. The indices of possible genetic effect including sex ratio, birth weight, frequency of malformation, stillbirth, neonatal death, deaths within 9 months and anthropometric measurements at 9 months of age for these children were investigated in relation to their parent's exposure status to

the A-bomb. There were no detectable genetic effects in this sample, except for a slight change in sex ratio which was in the direction to be expected if exposure had induced sex-linked lethal mutations. However, continued study of the sex ratio, based upon birth certificates in Hiroshima and Nagasaki for 1954-1962, did not confirm the earlier trend. Mortality in these children of A-bomb survivors is being followed using a cohort of 54,000 subjects. No clearly significant effect of parental exposure on survival of the children has been demonstrated up to 1972 (age 17 on the average). On the basis of the regression data, the minimal genetic doubling dose of this type of radiation for mutations resulting in death is estimated at 46 rem for the father and 125 rem for the mother.

- 2517 ACUTE EFFECTS. Ohkita, T. (Hiroshima Univ. (Japan). Research Inst. for Nuclear Medicine and Biology). J. Radiat. Res.; 16: No. suppl., 49-66(Sep 1975).

An outline of the acute effects of the Hiroshima and Nagasaki atomic bombs are summarized, based on documentary records. Acute injuries caused by the atomic bombs have been classified as thermal, mechanical, and radiation injuries. Combinations of these were most common. Many died from the immediate effects of blast and burns, but individuals often succumbed to trauma or burns before the radiation syndrome developed. Many more would have died from irradiation, had they been saved from the effects of trauma or burns. Nearly all who died within 10 weeks had signs suggestive of radiation injuries. Remarkable variation in sensitivity of body tissues to ionizing radiation was apparent. Radiation-induced bone marrow depletion was the most critical damage leading to death. In these instances, leukopenia and thrombocytopenia, and subsequent infections and hemorrhagic tendencies were the main causes of death. The clinical symptoms and signs of radiation injuries; the RBE of the atomic bomb neutrons for acute effects; and the effects of irradiation on spermatogenesis are also discussed.

- 2518 PHYSICAL DOSE ESTIMATES FOR A-BOMB SURVIVORS. STUDIES AT CHIBA, JAPAN. Hashizume, T.; Maruyama, T. (National Inst. of Radiological Sciences, Chiba (Japan)). J. Radiat. Res.; 16: No. suppl., 12-23(Sep 1975).

In-air tissue absorbed doses from the primary and scattered radiations of the Hiroshima and Nagasaki atomic bombs, without shielding, were estimated as function of distance from the hypocenters. Gamma-ray dose was determined from the thermoluminescence in bricks and tiles; neutron dose, from ^{60}Co activity induced in concrete-embedded iron of buildings. The ratio of the absorbed dose in critical organs to the in-air tissue absorbed dose was determined by phantom measurements using simulated radiation sources for the atomic bombs. The absorbed doses in the thyroid gland, the gonads, and the fetus in utero were thus estimated as a function of distance from the hypocenters.

- 2519 DOSE ESTIMATION FROM RESIDUAL AND FALLOUT RADIOACTIVITY. III. FALLOUT IN THE NAGASAKI, NISHIYAMA DISTRICT. Okajima, S. (Nagasaki Univ. (Japan). School of Medicine). J. Radiat. Res.; 16: No. suppl., 35-41(Sep 1975).

Fallout from the Nagasaki atomic bomb was mainly concentrated in the Nishiyama district of Nagasaki. Studies conducted in 1945 and 1946 indicated the average dose due to the external

irradiation from fallout in Nishiyama to be as high as 30 to 130 R. A significant leucocytosis occurred among Nishiyama residents two months following the explosion. In the present 1969-1972 investigation, Nishiyama residents and appropriate comparison residents elsewhere in Nagasaki underwent comprehensive clinical evaluations including thyroid function and chromosome studies, radiochemical urinalysis and whole body counting. No clinical abnormalities were found among the Nishiyama residents, but whole body counting demonstrated significantly elevated ^{137}Cs concentrations with parallel results by radiochemical urinalysis. Increased ^{137}Cs contents of soil and agricultural products of the Nishiyama area were apparently responsible for the relatively high body burdens. The annual internal doses from ^{137}Cs in the Nishiyama district were estimated to be 0.292 mrad per year for males and 0.187 mrad for females.

2520 DIAGNOSTIC AND THERAPEUTIC RADIATION EXPOSURE. Russell, W.J. (Radiation Effects Research Foundation, Hiroshima (Japan)). J. Radiat. Res.; 16: No. suppl., 42-48(Sep 1975).

Diagnostic and therapeutic radiology were studied as possible contaminants in the evaluations of A-bomb survivors in the ABCC-JNIH Adult Health Study for radiation effects. Hiroshima and Nagasaki subjects received X-ray examinations elsewhere within three months of their ABCC visits at rates of 23 and 12%, respectively. Medical X-ray examinations were more frequent among survivors than comparison subjects. Hiroshima and Nagasaki radiologic practice steadily increased since 1948, and differed markedly by city. From 1946-70 the Hiroshima and Nagasaki X-ray bone marrow doses were 2,300 and 1,000 g-rads, respectively. By 1970, cumulated medical X-ray doses approximated A-bomb doses at distances from the hypocenters of 2,000 m in Hiroshima and 2,800 m in Nagasaki. ABCC X-ray examination doses per subject are routinely updated for comparison with A-bomb doses. Each subject's reported fluoroscopy, photofluorography and radiation therapy exposure elsewhere are for future reference. Dental radiography, though increasing, was not currently an important contributor to survivors' overall exposure. Radiation therapy exposures of 137 subjects were confirmed, and doses estimated for most. Two-thirds the treatments were for malignancies; therapy differed markedly by city; and five cancers possibly arose from earlier radiation therapy. This underscores the importance of considering diagnostic and therapeutic radiology when attributing diseases to the atomic bombs.

2521 DOSE ESTIMATION FROM RESIDUAL AND FALLOUT RADIOACTIVITY. I. AREAL SURVEYS.

Takeshita, K. (Radiation Effects Research Foundation, Hiroshima (Japan)). J. Radiat. Res.; 16: No. suppl., 24-31(Sep 1975).

External dose rates and cumulative doses for early entrants from areal surveys and simulated experiments are reviewed. The average cumulative doses to infinity at the hypocenters were 101 rad in Hiroshima and 32 rad in Nagasaki, with a variation of about 60 percent. Radioactive fallout areas nearly matched the "black rain" areas in Nagasaki and in Hiroshima. Radioactivity in the fallout areas was affected by radioactive decay and by the leaching and dissipation by rains. Considering these factors, the cumulative dose to infinity in the fallout area of Hiroshima was estimated to be 13 rad, excluding internal radiation doses from inhaled and ingested radionuclides. Attempts to estimate radiation dose from

internally deposited radionuclides are also described.

2522 CANCERS OTHER THAN LEUKEMIA. Beebe, G.W.; Kato, H. (Radiation Effects Research Foundation, Hiroshima (Japan)). J. Radiat. Res.; 16: No. suppl., 97-107(Sep 1975).

Cancers which are unlikely to appear among atomic bomb survivors in excess of natural incidence include skin cancer and bone cancer, as these appear to require for their initiation doses that are incompatible with life if administered on a whole body basis. Although chronic lymphocytic leukemia continues to provide an important exception, and for many sites of cancer there is not yet evidence that radiation has increased incidence above normal levels, the data on A-bomb survivors are otherwise consistent with the hypothesis that the carcinogenic effect of ionizing radiation is general, involving all tissues. Studies of cancer among A-bomb survivors are notably limited with respect to the influence of variables other than dose, age, sex, and time. It seems highly desirable that other risk factors be studied in conjunction with radiation dose and demographic variables in an effort to detect interactions that might provide clues as to the etiology of cancer and as to the mechanisms by which ionizing radiation produces cancer. Provisional estimates suggest that the absolute risk of cancer, in terms of excess cases per 10^6 person-year rads (T65 dose) are about 1.6 for leukemia, 1.2 for thyroid, 2.1 for breast and 2.0 for lung, when estimation is based on age-ATB groups that have demonstrated these effects.

2523 FUTURE RESEARCH. Beebe, G.W.; Hamilton, H.B. (Radiation Effects Research Foundation, Hiroshima (Japan)). J. Radiat. Res.; 16: No. suppl., 149-164(Sep 1975).

Much remains to be learned from continued monitoring of the medical experience of the Hiroshima and Nagasaki A-bomb survivors. Many effects are so small, or have such long latent periods, that there is not even now a complete catalogue of effects visible in this large population. There is as yet no evidence of a mutagenic effect, but biochemical and cytogenetic approaches now offer powerful tools for a final effort to derive information that may set limits on the size of the doubling dose for mutations in man. The list of specific neoplasms induced by the whole-body exposure to the A-bomb radiation remains incomplete, and the quantitative dose-response aspects of established carcinogenic effects remains to be worked out in relation to time, host factors, linear energy transfer (LET) characteristics of radiation, and risk factors other than radiation. The dose-response estimates must be made, where possible, in terms of tissue dose. If there is to be any definitive test of the hypothesis of radiation accelerated aging in man, it will doubtless come from observations on the A-bomb survivors. The experience of the A-bomb survivors can make no direct contribution to knowledge of dose rate, and is much too small to provide direct information in the region of low dose. Nevertheless, as better knowledge of mechanisms of radiation damage and repair accumulates from laboratory experimental programs, this unique human experience will be of increasing value to radiation biology. Continued monitoring of the health and medical experience of the A-bomb survivors will depend on the voluntary cooperation of the subjects and their families, and on the interest of the physicians in the community. Present indications are that the research would gain

from a closer association with medical care and health maintenance programs.

- 2524 HEALTH SURVEILLANCE STUDIES. Hamilton, H.B.; Brody, J.A. (Radiation Effects Research Foundation, Hiroshima (Japan)). J. Radiat. Res.; 16: No. suppl., 138-148 (Sep 1975).

The majority of studies of the A-bomb survivors in Hiroshima and Nagasaki are concerned with monitoring the populations for long-term after-effects of exposure to ionizing radiation. Nonetheless, the health surveillance programs in the two cities must also be concerned with investigation of diseases which, though not directly related to radiation exposure, are of importance to the individual's overall health. This paper describes some examples of these investigations. Laboratory determination of levels of various serum components provide normal base line values in a healthy ambulatory population. Cytogenetic investigations yield data about normal chromosome variation, basic for future environmental pollution monitoring. Blood group gene antigen distributions, prevalences of inherited serum and red cell protein variants, and the cytogenetic information provide comparative data for a projected study of the children of the exposed generation. In the course of these population surveys, a number of extremely rare (genetic) traits unrelated to radiation exposure, such as the hereditary lack of a tissue enzyme, an unusual blood type, mutant hemoglobins, have been discovered. These traits appear to have little or no impact on the individual's health, but are of potential intrinsic interest to clinicians, geneticists, and molecular biologists.

- 2525 GENETIC EFFECTS, 2. CYTOGENETIC STUDY. Awa, A.A. (Radiation Effects Research Foundation, Hiroshima (Japan)). J. Radiat. Res.; 16: No. suppl., 75-81 (Sep 1975).

Chromosomes of the children of A-bomb survivors and appropriate control groups in Hiroshima and Nagasaki have been investigated to see if there are any genetic effects of A-bomb irradiation on the germ cell chromosomes of their parents. Data thus obtained have been compared with those derived from surveys on consecutive live-born infants undertaken by investigators in western countries, as well as those from induced abortuses in Japan, in terms of the frequency of individuals with both sex chromosome aneuploidy and autosomal balanced structural rearrangements. A preliminary statistical analysis shows no significant difference in frequency of chromosome anomalies in children born to the exposed compared with children of non-exposed parents, or with neonates or abortuses. The need for continuing this survey is clearly indicated.

- 2526 CLINICAL EXPERIENCE WITH SOLCOSERYL JELLY FOR ULCERATIVE SKIN DISEASES. FOR RADIATION INJURY OF SKIN, SCALDING ULCER, CRURAL ULCER, AND BEDSORE. Kamihata, S.; Tani, M. (Kobe Univ. (Japan). School of Medicine); Doi, A.; Nakamura, T.; Sakata, A. Kiso To Rinsho; 9: No. 10, 2480-2492 (Sep 1975). (In Japanese).

The clinical effect of solcoseryl jelly was examined on 20 cases of radiation injury of skin, 28 cases of scalding ulcer, 27 cases of crural ulcer, and 27 cases of bedsore, a total of 102 cases. In observation periods of less than 8 weeks, the drug was effective or remarkably effective for 16 cases, 23 cases, 21 cases, and 15 cases, respectively. No side effect was observed other than algogenic stimulation in 2 cases. Based on the above

results, solcoseryl jelly is thought to compare favorably with other topical drugs for the treatment of ulcers.

- 2527 PHYSICAL DOSE ESTIMATES FOR A-BOMB SURVIVORS. STUDIES AT OAK RIDGE, U.S.A. Auxier, J.A. (Oak Ridge National Lab., Tenn. (USA)). J. Radiat. Res.; 16: No. suppl., 1-11 (Sep 1975).

The radiation exposures for the survivors of the nuclear bombings of Hiroshima and Nagasaki have been determined in the course of studies conducted since the mid-1950's at the Oak Ridge National Laboratory. An extensive series of experiments in Japan, at weapons tests, and in the laboratory were supported by a comprehensive calculational effort to produce the "air dose" distributions and the shielding factors. The absorbed doses to tissues of the body have been calculated for the case of homogeneous tissue cylinders, and studies of dose distribution in heterogeneous, anthropomorphic configurations are under way. Because the device detonated over Hiroshima was never test fired before or after the bombing, the greatest difficulties were associated with the normalization of the radiation yield of this device. However, after several years of study, the "air dose" curves were obtained to an accuracy of $\pm 15\%$ for Hiroshima and $\pm 10\%$ for Nagasaki. Subsequently, the shielding factors for typical dwellings in both cities were determined to a comparable accuracy. Continuing work is focused on obtaining shielding factors for the heavily shielded survivors, the doses to survivors who are now located in the United States, and more comprehensive depth dose distributions.

- 2528 MECHANISM OF RELATIVELY LOW RADIATION DOSES EFFECTS ON THE COMPARTMENTALIZATION OF AMINO ACIDS IN THE CENTRAL NERVOUS SYSTEM. Dovgalevich, I.I. (Simferopol'skij Gosudarstvennyj Univ. (Ukrainian SSR); Belorusskij Gosudarstvennyj Univ., Minsk). Radiobiologiya; 15: No. 5, 750-754 (Sep 1975). (In Russian).

For English translation see the journal Radiobiology.

Action of relatively low (40 rad) radiation doses on the compartmentalization of amino acids in the exposed organism has been studied. It has been found that the compartmentalization of free, bound and of a total pool of amino acids in various parts of the central nervous system depends on the kind of the penetrating radiation and on the functional state of certain elements and integrating systems of the organism. The conclusion is drawn that the compartmentalization of amino acids in the irradiated organism is stipulated by both the specific and non-specific components.

- 2529 METABOLISM OF TISSUES OF THE INTESTINAL EPITHELIUM AS A POSSIBLE INDICATION OF RADIATION DAMAGE TO THE ORGANISM. Puchkova, S.M.; Goloshchapova, Zh.A. Radiobiologiya; 15: No. 5, 760-762 (Sep 1975). (In Russian).

For English translation see the journal Radiobiology.

The mitotic index (MI) and the ability of the small intestine mucosa to incorporate alanine- ^3H have been studied in mice exposed to acute doses of γ rays and treated with mercamine. Preventive treatment with mercamine helps to maintain the stable level of the mitotic index within first 24 min after the exposure and considerably increases it after 3 to 7 days. Variations in the time at which radiation damage to the protein synthesis manifests itself and changes in the MI of the

intestinal epithelium cells are discussed.

30 CHANGES IN THE QUANTITY OF THE COLONY-FORMING CELLS OF THE BONE MARROW IN MICE IN THE PROCESS OF IRRADIATION WITH DIFFERENT DOSE RATES. Shvets, V.N.; Gorlov, V.G. Radiobiologiya; 15: No. 5, 675-679(Sep 1975). (In Russian).

For English translation see the journal Radiobiology.

A protracted total-body irradiation of mice with a low dose rate (0.5 to 10 R/d) does not cause any considerable changes in the quantity of CFU and nucleus-containing cells of the bone marrow. A radiobiological effect at varying dose rates (300 R/min to 0.5 R/d) is a function of a cumulative dose and its dose rate. A graphical representation of this dependency has enabled us to determine, by means of extrapolation the value of the threshold dose rate for various cumulative radiation doses. A linear relationship has been found between the threshold dose rate and a cumulative dose of radiation.

2531 RADIOPROTECTION OF THE DIGESTIVE TRACT BY INTRAVENOUS INFUSION OF VASOPRESSIN. Juillard, G.J.F.; Peter, H.H.; Weisenburger, T.H.; Tesler, A.S.; Langdon, E.A.; Barenfus, M.; Lagasse, L.D.; Watring, W.E.; Smith, M.L. (Univ. of California, Los Angeles). Gynecol. Oncol.; 3: No. 3, 233-243(Sep 1975).

The effect of venous infusions of vasopressin during fractionated abdominal radiation exposures was evaluated in four pairs of dogs. In each pair, the control dog was given venous infusion of saline during irradiation. The results were analyzed from clinical observation, autopsy findings, and pathological examination. It appears that venous infusion of vasopressin has a definite and reproducible effect of radioprotection on the gastrointestinal tract, the dose modifying factor (DMF) being 1.5. Radiation therapy of the gynecologic malignancies would be one major application since the radiosensitivity of the intestinal tract is often a limiting factor in delivering high doses to the tumor, and further investigations are being done to study the effects of vasopressin on the radiosensitivity of malignant tumors.

2532 (ORP/CSD--75-4) PRELIMINARY FINDINGS RADON DAUGHTER LEVELS IN STRUCTURES CONSTRUCTED ON RECLAIMED FLORIDA PHOSPHATE LAND. (Environmental Protection Agency, Washington, D.C. (USA). Office of Radiation Programs). Sep 1975. 38p. Environmental Protection Agency, Washington, DC.

Preliminary results are reported from a survey of the radon daughter levels in structures in Polk County, Florida, built on reclaimed phosphate tailings containing various amounts of ^{226}Ra . The structures surveyed consisted primarily of private dwellings although a few office buildings were also surveyed. Track-etch films and TLD air samplers were used to measure the levels of radon daughters within the structures and in structures built on non-phosphate land. Radiation levels were converted to WL units (the working level (WL) unit is defined as the potential α energy from the short-lived daughters of Rn which will produce 1.3×10^5 MeV in one liter of air). The highest observed level in any structure was 0.2 WL. Possible health hazards to long-time occupants are discussed. (CH)

IN HUMAN PLACENTA. Makarova, V.P.; Piskunov, L.I.; Treiger, S.I. Radiobiologiya; 15: No. 5, 778-780(Sep 1975). (In Russian).

For English translation see the journal Radiobiology.

Average concentration of Ca, ^{90}Sr and ^{137}Cs in human placenta was measured in one of the towns of the North Urals in 1971. It was 3.2 ± 0.1 mg/g, 5.6 ± 0.4 and 15 ± 1 pcurie/kg, respectively (normal birth). The possibility of using these data to estimate the uptake of ^{90}Sr and ^{137}Cs by the embryovia placenta is discussed.

2534 PROBABILITY DISTRIBUTION OF DOSE RATES IN THE BODY TISSUE AS A FUNCTION OF THE RHYTHM OF ^{90}Sr ADMINISTRATION AND THE AGE OF ANIMALS. Rasin, I.M.; Sarapul'tsev, I.A. Radiobiologiya; 15: No. 5, 691-694(Sep 1975). (In Russian).

For English translation see the journal Radiobiology.

The probability distribution of tissue radiation doses in the skeleton were studied in experiments on swines and dogs. When introducing Sr-90 into the organism from the day of birth till 90 days dose rate probability distribution is characterized by one, or, for adult animals, by two independent aggregates. Each of these aggregates correspond to the normal distribution law.

2535 DEVICE FOR PROTECTING THE GONADS IN X-RAY DIAGNOSTICS. Gaede, E.A. German(FRG) Patent 2,406,717/A/. 21 Aug 1975. 13p. (In German).

7 figs..

Device for protecting the gonads in X-ray diagnostics, for application in X-ray diagnostics instruments with a scattered-rays diaphragm which are equipped with a sight vane for recording the object field of the X-rays, with a shadow generator movably connected to a bearing device attachable to the scattered-rays diaphragm and consisting of a carrier of light- and X-ray-transparent material and of a disk of light- and X-ray-non-transparent substance.

2536 SEPARATION OF ^{85}Kr FROM THE OFF-GASES OF REPROCESSING PLANTS. IRS Kurz-Inf., Reihe C; 30: No. 15, 1(Aug 1975). (In German).

The aspect of keeping the radiation exposure to the population as small as possible, the following is recommended: 1) skin dose of maximum 10 mrem/a, global exposure maximum 10^6 Ci/a; 2) decontamination factor of ≥ 100 ; 3) storage of separated ^{85}Kr in pressure gas bottles, sinking in deep sea; 4) test-sinking in agreement with international panel.

2537 (KFK-EXT--20/75-1) MONITORING FOR ENVIRONMENTAL RADIOACTIVITY AT THE KARLSRUHE NUCLEAR RESEARCH CENTER IN 1974. Winter, M.; Tachlinski, W. (Kernforschungszentrum Karlsruhe (Germany, F.R.G.). Abt. Strahlenschutz und Sicherheit). Aug 1975. 50p. (In German). INIS.

With figs. and tabs..

Monitoring for environmental radioactivity at the Karlsruhe Nuclear Research Center is the responsibility of the Radiation Protection Department. A description is given of the routine environmental monitoring program as approved by the competent supervising authority of the state of Baden-Wuerttemberg. The letterpress of this report (extract from KFK Report No. 2155) is a summarizing representation of measured results obtained in 1974. Moreover, it includes a survey of special monitoring steps and of results of background

measurements performed for two nuclear power stations presently under construction. The comprehensive data section of the report contains a list of all individual measurement results of the routine measurement program. The measurement values prove that in 1974 the operation of the nuclear facilities of the Center caused at no time an inadmissible radiation burden on the population living in the vicinity.

- 2538 (DEU--76-1) NATURAL RADIONUCLIDES IN PHOSPHATE FERTILIZERS AND THEIR CONTRIBUTION TO THE EXTERNAL POPULATION EXPOSURE IN THE FRG. Pauly, H.; Pfister, H.; Philipp, G. (Erlangen-Nuernberg Univ., Erlangen (Germany, F.R.). Inst. fuer Radiologie). Aug 1975. 44p. (In German). INIS.

4 figs.; 8 tabs.; 35 refs. Available from ZAED.

The activity concentrations determined of ^{226}Ra , ^{232}Th and ^{40}K in nCi/kg P_2O_5 for the five most important kinds of fertilizer as well as their percent share in the economy year 1973/74 in the FRG are compiled in a table. From these values, the consumption of 0.917 million tons P_2O_5 and from an average annual fertilizer coverage of 68.3 kg/ha one can calculate a distribution of 32 Ci ^{226}Ra , 1Ci ^{232}Th and 543 Ci ^{40}K over the total agriculturally used area, in other words, a deposit of 2.4 μCi ^{226}Ra , 0.07 μCi ^{232}Th and 40.5 μCi ^{40}K per ha. Taking a pessimistic view, an external radiation exposure of 0.11 mrad/a was calculated for gonads and bone marrow. If the total accumulation of ^{226}Ra (38% of the radiation exposure) from phosphate fertilizers from the ground during the last 80 years is assumed, then there is a exposure of 1.7 mrad/a for individual members of the population and 2.0 mrad/a for those in occupied in agriculture.

- 2539 RADIATION EXPOSURE OF THE DENTIST. Regulla, D.F.; Wachsmann, F. (Institut fuer Strahlenschutz, Munich). Dtsch. Zahnarztzt. Z.; 30: No. 8, 552-554(Aug 1975). (In German).

The radiation doses per person undergoing dental treatment measured at the trunk is rather considerable, though not alarming. However, the number of people whose hands had been exposed to radiation as well as the individual extent of exposure were unexpectedly high. The radiation doses measured at the hands was about 100 times bigger than the radiation doses determined at the trunk for the whole body. Although these results may be very impressive, it should be borne in mind that the data on which the investigation was based date from 1967/68 and may no longer be fully applicable to the present situation. Whether and to what extent this assumption is justified ought to be found out by control studies regarding radiation doses per person and Roepak programs which are presently being started and whose results will be discussed in this journal.

- 2540 FREQUENCY OF MARRIAGE AND LIVE BIRTH AMONG SURVIVORS PRENATALLY EXPOSED TO THE ATOMIC BOMB. Biot, W.J. (National Cancer Inst., Bethesda, MD); Shimizu, Y.; Kato, H.; Miller, R.W. Am. J. Epidemiol.; 102: No. 2, 128-136(Aug 1975).

Frequency of marriage and birth as of January 1973 was determined for persons exposed in utero to the atomic bombs in 1945 and for controls. The marriage rate was lower in persons heavily exposed in utero than in the non-exposed or lightly exposed. This difference is attributed partly to the lesser

marriageability of persons with mental retardation who are significantly more numerous among the heavily exposed, and partly to unmeasured variables, possibly including social discrimination against survivors of the atomic bomb. No consistent relation was observed between radiation exposure and three reproductive indices: childless marriages, number of births, and interval between marriage and first birth.

- 2541 ESTIMATION OF THE PATIENT EXPOSURE IN TOMOGRAPHY. Maekoshi, H.; Orito, T.; Nishizawa, K. (Nagoya Univ. (Japan). Faculty of Medicine); Koga, S. Danso Satsueiho Kenkyukai Zasshi.; 3: No. 1, 48-50(Aug 1975). (In Japanese).

The author evaluated the estimation method of radiation dose according to surface and intracorporeal dose distribution in chest-tomography. In the study with phantom it was found that the maximum dose area of the skin surface became small and variation of dose in the surrounding area was sharp in proportion to the depth of the cross section. Therefore the author considers that the skin surface dose in tomography should be represented by the highest skin surface dose. In the intracorporeal distribution, the circular tomography undertaken at 10 cm deep from the surface indicated a larger equivalent dose area and higher yielding rate than those in curvilinear tomography. When the phantom filled with water and the one filled with lung equivalent material, cork, were compared; the radiation dose around the radiation field in the phantom with cork was 2-2.5 times the other in circular tomography. However, if the distance from the radiation field became as far as 40 cm, the cork of phantom made little difference. If the radiation dose on the cross section is estimated as 100% in drawing the intracorporeal dose distribution, the results change depending on lung equivalent material. Therefore the author considers that the highest skin dose will be more universal to be taken as the standard.

- 2542 RADIATION DOSE OF GONAD BY TOMOGRAPHY OF THE GALLBLADDER. Yamamoto, S.; Matsumoto, S.; Ishii, M.; Nakai, T. (Nissei Hospital, Osaka (Japan). Dept. of Radiology). Danso Satsueiho Kenkyukai Zasshi.; 3: No. 1, 44-47(Aug 1975). (In Japanese).

The author determined radiation dose of the gallbladder during hypocycloidal tomography. The skin surface dose at the center of the focus was determined in males and females totaling 14, and the gonad dose was also determined in 9 females. The skin surface dose at the center of the focus was in the range of 1150-2300 mR using 100 mA, and 600-1100 mR with 50 mA. The radiation dose increased as the voltage used for tomography increased, and the increasing rate was greater with 100 mA than with 50 mA. Female gonad dose decreased as the exposure voltage increased in prone position and also in VLAQ. The bilateral gonad doses calculated according to the theory of Hyuga were 0.5-9 mR and 0.4-6.5 mR in the prone position, and 3-16 mR and 1.5-30 mR in VLAQ.

- 2543 ESTIMATION OF RADIATION RISK IN OPERATIONS FOR REMOVAL OF LUMINOUS PAINTS. Dyachok, V.K.; Rymarchuk, A.A. Voenno-Med. Zh.; No. 8, 51-53(Aug 1975). (In Russian).

A sanitary-hygienic examination was made on several parts of the body during removal of luminous paint from equipment dials. The exposure dose rate to the facing surface of the body and the degree of irradiation of the foot,

leg, wrist, and forearm were determined. Gamma and beta radiation doses to different parts of the body were calculated. It was shown that removal of luminous paint may be classified as class III work with regard to radiation hazard. The controlling radiation is gamma radiation. It is suggested that constant hygienic supervision by experts and definite work conditions must be provided during removal of luminous paint.

- 2544 OBSERVATIONS ON A SET OF RADIATION-INDUCED DOMINANT T-LIKE MUTATIONS IN THE MOUSE. Bennett, D. (Cornell Univ., New York (USA). Medical Coll.); Dunn, L.C.; Spiegelman, M.; Artzt, K.; Cookingham, J.; Schermerhorn, E. Genet. Res.; 26: No. 1, 95-108 (Aug 1975).

Genetic analysis of seven dominant short tailed mutations independently induced by radiation of male mice showed that six were allelic to T (Brachyury) but not identical to it. Homozygotes for each mutant die at least 2 days earlier than T/T homozygotes; two that were studied histologically are indistinguishable from one another. The development of these abnormal embryos is arrested by seven days of gestation, when cells of embryonic ectoderm cease proliferation and become pycnotic. Endoderm and extra-embryonic ectoderm do not seem to be primarily affected, and survive and grow for at least 2 days more. Serological studies of one of these mutations suggest that it is a deletion. A review is presented of these and other T-like mutations that have been described; from this it appears that five different categories of T-like mutants are discernible.

- 2545 (ORP/CSD--75-3) RADIOACTIVITY DISTRIBUTION IN PHOSPHATE PRODUCTS, BY-PRODUCTS, EFFLUENTS, AND WASTES. Guimond, R.J.; Windham, S.T. (Environmental Protection Agency, Washington, D.C. (USA). Office of Radiation Programs). Aug 1975. 39p. Environmental Protection Agency, Washington, DC.

Phosphate rock throughout the world contains uranium in concentrations ranging from a few ppm to a few hundred ppm. In the United States, phosphate rock normally contains between 100 to 150 ppm uranium. Mining and processing of these ores redistributes much of the uranium daughters among the various products, by-products, and wastes. These materials are then widely dispersed throughout the environment. This redistribution may lead to increased exposure of the public to these naturally-occurring radionuclides. In determining the magnitude of the population exposure caused by this redistribution and in developing environmental standards and controls to prevent contamination of the biosphere from these naturally-occurring radionuclides it is necessary to determine the concentrations and total quantities of these radionuclides in the products, by-products, effluents and wastes of phosphate mining and manufacturing. Samples of phosphate ores, products, by-products, effluents, and wastes were obtained and analyzed for their radioactivity content. Quantities of radioactivity entering the environment through various products, by-products, effluents, and wastes were estimated.

- 2546 BIOLOGICAL EFFECTS OF TRITIUM. Akita, Y. (Ibaraki Univ., Mito (Japan)). Genshiryoku Kogyo; 21: No. 8, 14-17 (Aug 1975). (In Japanese).

The uptake of tritium (^3H) in an organism, especially man, was discussed. The distribution in the body, evacuation, biological half life,

dosage of ^3H in the body, and relative biological effectiveness were also discussed. The biological actions of ^3H , such as the cutting of DNA polynucleotide chains, the fatal effect on cells and the induction of mutation, were summarized. (Tsukamoto, Y.).

- 2547 (DOCKET-50213--480) HADDAM NECK PLANT. REPORTABLE OCCURRENCE REPORT: APPARENT EXPOSURE OF AN EMPLOYEE TO RADIATION IN EXCESS OF THE LIMIT. (Connecticut Yankee Atomic Power Co., Hartford (USA)). 15 Jul 1975. 2p.

Exposure of employee to radiation in excess of limit. CONNECTICUT YANKEE REACTOR; PERSONNEL; RADIATION DOSES

- 2548 NORMAL TISSUE RESPONSES TO RADIATION THERAPY. Bloomer, W.D.; Hellman, S. New Engl. J. Med.; 293: No. 2, 80-83 (10 Jul 1975).

Therapeutic strategy is discussed with regard to risk-benefit considerations and theoretical curves describing the probability of tumor control and the risk of developing major complications in relation to radiation dose are presented. Acute effects are discussed with regard to dose rate and time-dose fractionation characteristics; cellular radiation lethality; acute effects on bone marrow, skin, intestinal epithelium, respiratory epithelium, and bladder; and treatment of acute mucosal and epithelial reactions. Intermediate effects are discussed with regard to time-dose fractionation characteristics; radiation pneumonitis; radioinduced heart disease; and radioinduced paresthesia in extremities. Late effects are discussed in relation to the total effective dose received by the limiting normal tissue within a treatment portal. (HLW)

- 2549 (DOCKET-50293--592) PILGRIM NUCLEAR POWER STATION, UNIT 1. REPORTABLE OCCURRENCE REPORT: TWO INDIVIDUALS WERE EXPOSED TO RADIATION IN EXCESS OF SPECIFIED LIMITS. (Boston Edison Co., Mass. (USA)). 2 Jul 1975. 3p.

Two individuals were exposed to radiation in excess of specified limits. PILGRIM-1 REACTOR; PERSONNEL; RADIATION DOSES; RADIOACTIVE WASTE FACILITIES; CLEANING; RADIOACTIVE WASTE PROCESSING

- 2550 REPORT OF EXPERT COMMITTEE ON ACCIDENT COMPENSATION FOR THE WORKERS OF ATOMIC INDUSTRY. Genshiryoku Iinkai Geppo; 20: No. 7, 4-7 (Jul 1975). (In Japanese).

This report was prepared by the expert committee on this subject and was submitted to the chairman of the Japan Atomic Energy Commission. It is based on the previous report (1965) and discusses specific problems which require urgent solution. Present status, problems, and countermeasures are described for three fundamental areas of radiation accident compensation. The first area is the recognition of the cause and effect relation between accidents and diseases. Some recommendations are given for the role of the auxiliary organization for the recognition and approval of the relation. The second area is the problem of keeping the record of the radiation exposure dosage for individual workers. The necessity of establishing a national record-keeping system is recommended. The third area is the compensation system. The relation with the ordinary labor accident insurance is discussed.

- 2551 (HRP--0005527) ENVIRONMENTAL HEALTH

AND HEALTH PLANNING. (Western Massachusetts Health Planning Council, Inc., West Springfield (USA). Environmental Health Task Force). Jul 1975. 90p. NTIS \$5.00.

Areas of environmental concern are identified and recommendations for improving environmental health are proposed by the Environmental Health Task Force of the Western Massachusetts Health Planning Council. Environmental health concerns in Western Massachusetts are in the areas of: air pollution; dental health and the specific problem of water fluoridation; housing; injury control, including accidental death and disability; land use, and the specific problem of critical receptors; noise pollution; occupational hazards, specifically occupational accidents; pesticides; radiological exposure, particularly medical X-ray exposure and nuclear exposure; rural health care; sanitation; solid waste; and water quality including private and public water supplies, road salting, and rural sewerages. Each area of concern and specific problem are broken down into sections: background information; comments which incorporate recommendations for general problem-solving activities; and resources, including lists of key organization, individuals, laws and regulations, and publications relevant to the area of concern. Recommendations are presented based on long-term and short-term environmental goals. An inventory of environmental health organizations in Western Massachusetts is included. Appendices contain the charge to the Task Force, a definition of environmental health, sources of drinking water, the sanitation and sanitary codes, and housing and sanitation standards. Portions of this document are not fully legible. (GRA)

2552 EFFECT OF IRRADIATION ON THE PHOSPHORYLATION OF THE NUCLEAR PROTEINS OF THE LIVER AND THYMUS OF RATS. Umanski, S.R.; Zotova, R.N.; Tokarskaya, V.I. (AN SSSR, Pushchino-na-Oke. Inst. Biologicheskoy Fiziki). Radiobiologiya; 15: No. 4, 526-530(Jul 1975). (In Russian).

For English translation see the journal Radiobiology.

The exposure of the nuclei and chromatin of the rat liver and thymus in vitro to small doses (1 to 5 krad) stimulates, and to high doses (10 to 20 krad) inhibits the protein phosphorylation. Dephosphorylation is only inhibited when thymus nuclei are irradiated. Phosphorylation of the nuclear proteins of the liver and thymus is increased by 37% and 15%, respectively, 15 minutes after the exposure in vivo to a dose of 1 krad. Phosphorylation of histones is most- and of the nuclear sap proteins, least enhanced. A 10-per cent increase in the phosphorylation of the liver nuclei, and a 23-per cent decrease in that of the thymus nuclei, as compared to the controls, are observed two hours after the exposure. A possible relationship between radiation impairment of the nuclear protein phosphorylation and of the RNA synthesis is discussed.

2553 EFFECT OF STORAGE AND CULINARY TREATMENT OF IRRADIATED POTATO ON THE CYTOGENETIC ACTIVITY OF EXTRACTS OBTAINED THEREFROM. Osipova, I.N.; Shillinger, Yu.I.; Zaitsev, A.N. (Akademiya Meditsinskikh Nauk SSSR, Moscow. Inst. Pitaniya). Vopr. Pitan.; No. 4, 54-57(Jul 1975). (In Russian).

Male-rats (25-27 g) were given perorally extracts separated from potato subjected to gamma-radiation in a dose of 10krad (test groups) and from non-irradiated tubers (controls). The extracts were introduced for a

period of one week, daily in an amount of 1 ml. The males from the test groups (each numbering 8-10 animals) received extracts of the raw potato stored for 4 months after irradiation and of the potato subjected to thermal treatment (cooking) after 1 day, 1 and 4 months of its storage. The frequency of chromosomal aberrations in the bone marrow cells was determined by the anaphase method. Altogether about 34000 cells (500-600 from each animal) were counted. The results testified to a significantly reduced frequency of chromosomal aberrations (bridges and fragments) occurring in the bone marrow cells of the mice which received extracts from the raw stored irradiated potato and from thermally treated freshly irradiated tubers, as compared to extracts obtained from the raw freshly irradiated potatoes. The extracts of irradiated potato cooked after 1 and 4 month of storage did not display any mutagenic properties.

2554 (PB--246642) PUBLIC HEALTH IMPLICATIONS OF RADIOLUMINOUS MATERIALS. Moghissi, A.A.; Carter, M.W. (Georgia Inst. of Tech., Atlanta (USA). Office of Interdisciplinary Programs). Jul 1975. Contract FDA-233-74-6091. 54p. NTIS \$4.50.

The safety, efficacy, and relative merits of radium, tritium, and promethium in radioluminous materials, particularly as used in the dial paint of timepieces and instruments, were evaluated. The reduced use of radium in recent years is reflected in estimates of the population dose for 1973--3600 person-rem from 24 million tritium watches versus 2500 person-rem from 8.4 million radium clocks. Had radium still been used in watches, the dose could have been significantly higher. No reliable data are available on the activity of promethium used for this purpose. Assuming a minimum dose of 6100 person-rem from all these radionuclides, an average of 0.03 mrem/year is estimated for the U.S. population. Because of the unavoidable radiation hazard, it is recommended that radium no longer be used in radioluminous materials. Furthermore, the 'frivolous' use of other radionuclides for this purpose should be discouraged. (GRA)

2555 (PB--246674) NASHVILLE DENTAL PROJECT: AN EDUCATIONAL APPROACH FOR VOLUNTARY IMPROVEMENT OF RADIOGRAPHIC PRACTICE. TECHNICAL REPORT. Crabtree, C.L.; Johnson, O.N.; Gibbs, S.J. Jul 1975. 65p. (DHEW/FDA--77-8011). NTIS \$4.50.

Survey data were collected on 110 x-ray units (72 dental offices) in Nashville, Tennessee in 1972. Dental consultants visited the offices two months later to present the survey findings and demonstrate needed improvements in radiographic practice. In 1973, a followup survey was conducted to determine the effectiveness of the consultation visits. Mean exposure per film was 542 mR in 1972 and 340 mR in 1973. Machines with large workloads generally had the lowest skin exposure per film. When weighted by workload, average exposures were 472 mR/film in 1972 and 311 mR/film in 1973. Thus, the study indicated the effectiveness of an educational approach to reducing unnecessary radiation. (GRA)

2556 (PB--246837) SUGGESTED OPTIMUM SURVEY PROCEDURES FOR DIAGNOSTIC X-RAY EQUIPMENT. (Nationwide Evaluation of X-Ray Trends Task Force (USA)). Jul 1975. 113p. NTIS \$5.50.

The manual contains survey procedures to test medical and dental x-ray machines for radiation safety in general and specifically for CSG regulations (Council of State

Governments). (GRA)

7 RADIATION BURDEN TO HANDS OF NUCLEAR MEDICINE PERSONNEL. Kukacka, R. (Krajska Hygienicka Stanice, Ostrava (Czechoslovakia)); Husak, V.; Charamza, O. (Palackeho Universita, Olomouc (Czechoslovakia). Fakulni Nemocnice); Trousil, J. (Ustav pro Vyzkum, Vyrobu a Využití Radioisotopu, Prague (Czechoslovakia)). *Cesk. Radiol.*; 29: No. 4, 260-265 (Jul 1975). (In Czech).

Radiation burden is discussed imposed to the hands of nuclear medicine personnel handling ^{99}Mo -sup($^{99\text{m}}\text{Tc}$) generators, imported from the GDR and Great Britain. The results are compared with available foreign data. Routine monitoring of the hands of nuclear medicine personnel is recommended. Suitable types of dosimeters for such measurements are briefly discussed. The need is stressed of better care paid in periodic preventive examinations to the finger skin of those personnel, whose hands come in contact with radiopharmaceuticals during production or application.

2558 IRRADIATION HAZARDS AND SAFETY STANDARDS FOR PATIENTS IN DENTAL RADIOGRAPHY. Williamson, B.D.P. *N.Z. Dent. J.*; 71: No. 325, 129-135 (Jul 1975).

The historical developments which have led to a reduction in the hazards or potential hazards to patients in dental radiography are reviewed. Based on a simple risk estimate, the safety of present-day techniques employed in routine dental radiography is assessed. Also included in the review is a description of techniques used and results obtained from the National Radiation Laboratory's (NRL) surveillance programme of patients' exposure to irradiation in dental radiography. The possibilities of and need for achieving further reductions of irradiation are discussed.

2559 STUDY OF SOME IMMUNOLOGICAL INDICATORS IN TIN-TUNGSTEN ORE MINERS ALSO EXPOSED TO RADON. Richter, J.; Landa, K.; Cizek, P. (Krajska Hygienicka Stanice, Usti Nad Labem (Czechoslovakia)). *Prac. Lek.*; 27: No. 6, 201-204 (Jul 1975). (In Czech).

The Ig G, Ig A, Ig M and Ig D immunoglobulin values and the lysozyme values were ascertained in 75 tin-tungsten ore miners who were also exposed to radon and in a control group of 32 coal miners. The mean values did not differ between the groups, but in the tin-tungsten ore miners the Ig G and Ig M values were 37.3% and 17.33% outside normal values. The lysozyme values were higher in the ore miners whereas in the control group the findings were within standard.

2560 SERVICE FACTOR CALCULATED FROM AN EXPERIMENTAL SIMULATION OF CHRONIC OCCUPATIONAL IRRADIATION. Berikashvili, V.S. *Radiobiologiya*; 15: No. 4, 577-582 (Jul 1975). (In Russian).

A correlation has been studied between the body weight, basal metabolism, lifespan, the period of water exchange, average life of erythrocytes and average rate of pulse-beat, and values $\text{LD}_{50/30-60}$, half-recovery period after irradiation and time of leucopenia occurrence in different species of laboratory animals and man. An authentic degree-interrelation of these indices has been revealed, and the dependency of radiobiological effects on the body weight of animals has been estimated. Similarity conditions of dose accumulation upon chronic irradiation of animals and man have been obtained on the basis

of Blair's and Davidson's equations for an effective dose of a single exposure. Service factor and coefficients of intensity and duration of irradiation of various animals have been calculated, simulating professional irradiation with 5 rad/a within 20 years.

2561 RADIOSENSITIZING EFFECT OF INTRALESIONAL ADMINISTRATIONS OF BUDR. Usui, S.; Todoroki, T. (Chiba Univ. (Japan). School of Medicine); Koike, S.; Ando, K.; Nesumi, N. *Nippon Igaku Hoshasen Gakkai Zasshi*; 35: No. 7, 580-582 (Jul 1975). (In Japanese).

The effect of intralesional injections of BUDR (5-Bromodeoxy-uridine) to enhance the response of tumor cells to ionizing radiation was studied. Experimental animal tumors were third generation isotransplants of a mammary carcinoma that had arisen spontaneously in a C3H female mouse. The TRT_{50} or 50% tumor regrowth time was determined for tumors that received X-ray alone and those treated with X-rays and BUDR. DMF (dose modifying factor) was 1.29 or 1.26 if the tumors were irradiated under air or hypoxic condition respectively. These results indicated that the agent was capable of sensitizing tumor cells which were acutely or chronically hypoxic.

2562 EFFECT OF PROLONGED IRRADIATION WITH LOW DOSES ON THE BRAIN OF RAT EMBRYOS. Semagin, V.N. (AN SSSR, Moscow. Inst. Vysshej Nervnoj Deyatel'nosti i Neirofizologii). *Radiobiologiya*; 15: No. 4, 583-588 (Jul 1975). (In Russian).

For English translation see the journal *Radiobiology*.

Pregnant rats (the last third of pregnancy) exposed to doses of 0.0008 to 10 R/d within 18 hours a day, showed a stimulated development of higher nervous system in the embryos.

2563 EFFECT OF INTERFERON ON THE UNSPECIFIC RADIORESISTANCE OF WHITE MICE TO X RAYS. Binyashevskii, E.V.; Ternovoi, N.K. (Kievskij Nauchno-Issledovatel'skij Inst. Ortopedii (Ukrainian SSR)). *Vrach. Delo*; No. 7, 138-141 (Jul 1975). (In Russian).

Intraperitoneal administration of the interferonogen, poly I:C, at 0.2 or 2.0 mg/kg to mice 2 hr or 1 day before exposure to x irradiation protected the animals as long as the dose of irradiation did not exceed 600 R. When poly I:C was also administered one every 4 days after irradiation, survival was increased to an even greater extent than when it was given only as a pretreatment.

2564 OCCURRENCE OF HEMANGIOSARCOMAS IN BEAGLES WITH INTERNALLY DEPOSITED RADIONUCLIDES. Benjamin, S.A.; Hahn, F.F.; Chiffelle, T.L.; Boecker, B.B.; Hobbs, C.H.; Jones, R.K.; McClellan, R.O.; Snipes, M.B. (Lovelace Foundation, Albuquerque, NM). *Cancer Res.*; 37: No. 7, 1745-1755 (Jul 1975).

In a series of related experiments to evaluate the relative toxicity of inhaled radionuclides, beagles were exposed to aerosols containing relatively soluble (chloride) or relatively insoluble (fused clay) forms of ^{144}Ce and ^{90}Sr . With the soluble $^{144}\text{CeCl}_3$, significant radiation doses were delivered in the lungs, liver, and skeleton whereas, after $^{90}\text{SrCl}_2$ exposure, the radiation dose was delivered predominantly to the skeleton. In dogs exposed to ^{144}Ce and ^{90}Sr in fused clay particles, radiation doses were delivered mostly to the lungs and tracheobronchial lymph nodes. In most dogs dying within 2 years after exposure, deaths were attributable to

nonneoplastic radiation-induced lesions in the target organ systems. At later times after exposure, neoplasms were the major cause of death, again occurring mostly in target organs or the adjacent tissues. Lung, liver, and bone-related neoplasms, including five hepatic hemangiosarcomas, developed after $^{144}\text{CeCl}_3$ exposure. Among the bone-related sarcomas seen in dogs exposed to $^{144}\text{CeCl}_3$ or $^{90}\text{SrCl}_2$, the incidence of hemangiosarcomas was over 40 percent. Among the 20 dogs dying with pulmonary neoplasms after exposure to ^{144}Ce or ^{90}Sr in fused clay particles, all had hemangiosarcomas and several also had other neoplasms. This high incidence of hemangiosarcomas has occurred within 7 years after exposure and differs from results in other laboratories where beagles have been exposed to both α - and β -emitting radionuclides. (auth)

- 2565 (SGAE--2475) DETERMINATIONS OF TRITIUM LEVELS IN URINE AND BLOOD SAMPLES, MEDICAL EXAMINATIONS OF PERSONS EMPLOYED AT RC SEIBERSDORF. Irlweck, K.; Teherani, D.K. (Oesterreichische Studiengesellschaft fuer Atomenergie G.m.b.H., Vienna). Jul 1975. 17p. (In German). (ST--47/75; BL--14575). INIS.

to be published in Health Physics.

Tritium determinations in urine and blood samples were performed with a liquid scintillation counter (Tri Carb No. 3375, PACKARD). In urine samples tritiated water (HTO) was measured after separation of organic substances by adsorption with activated charcoal and following distillation to dryness. In some urine and blood samples total Tritium content was determined by combustion in a sample Oxidizer (Mod. 306, PACKARD). Detection limits for HTO and total Tritium measurements were 2,5pCi/ml and 7 or 15pCi/ml respectively, taking 2sigma of statistical error of background values. Tritium concentrations in daily urine of occupational exposed persons, employed in RC Seibersdorf occurred up to 8pCi HTO/ml. An arithmetic mean was 3,85+-2,11pCi/ml from investigations on 16 persons. Tritium content in urine samples of occupational non exposed persons were about the same level up to 10pCi HTO/ml. An arithmetic mean was 3,70+-2,65pCi/ml from measurements on 20 persons. Statistical error of single values was sigmaequal to+-1,85pCi/ml. There was found no significantly higher concentration in urine of occupational exposed persons compared with a group of non exposed ones. Total Tritium content in urine samples seemed to be somewhat higher than HTO concentrations, also for occupational non exposed persons. Tritium levels in blood were notably higher than have to be expected assuming homogeneous distribution of HTO in body fluids. For occupational exposed persons in RC Seibersdorf Tritium concentrations between 26-58pCi/ml were found. An estimation about Tritium intake based on such results showed no more than 0,5% of maximum permissible intake for occupational exposed persons in the most unfavorable case.

- 2566 (N--75-25541) RADIATION SAFETY OF COSMONAUTS. Golovachev, V. 12 Jun 1975. Translated from Trud (USSR), 1 Feb 1975, p. 2. (NASA-TT-F--16323). 6p. NTIS \$3.25.
- Radiation monitoring in manned space flight is discussed with reference to the Salyut 4 and Soyuz 9 flights. Solar activity as the major source of dangerous radiation is explained and radiation dosages for the cosmonauts are reported. (GRA)

- 2567 WHAT PLANT ENGINEERS SHOULD KNOW ABOUT

RADIATION HAZARDS. Ulman, R. (VLN Corp, Cleveland, Ohio). Plant Eng. (Barrington, Ill.); 29: No. 12, 162-165(12 Jun 1975).

An introduction to radiation hazards and radiation monitoring devices alerts the plant engineer to the means and methods available for industrial radiation protection.

- 2568 (PB--253377) NUCLEAR MEDICINE ENVIRONMENTAL DISCHARGE MEASUREMENT. FINAL REPORT. Gesell, T.F.; Prichard, H.M.; Davis, E.M.; Pirtle, O.L.; DiPietro, W. (Texas Univ., Houston (USA). School of Public Health). Jun 1975. Contract EPA-1554-61-0407. 93p. NTIS \$5.00.

The discharge of most man-made radioactive materials to the environment is controlled by Federal, State or local regulatory agencies. Exceptions to this control include the radioactive wastes eliminated by individuals who have undergone diagnostic or therapeutic nuclear medicine procedures. The purpose of this study is to estimate the amount of radioactivity released to the environment via the nuclear medicine pathway for a single sewage drainage basin and to measure the amounts discharged to the environment. The report is organized into a review of previous studies, scope of work, facility data, environmental measurements and estimates of population exposure. (GRA)

- 2569 (INIS-mf--2010) NUCLEAR POWER: SHOULD WE HAVE DOUBTS: WHAT DO THE EXPERTS THINK. PROCEEDINGS OF LECTURES HELD AUTUMN 1974--SPRING 1975 IN OSLO, NORWAY. (Norsk Atomenergiforening, Oslo). Jun 1975. 332p. (In Norwegian). NTIS (US Sales Only).
- Separate entries were made for items of interest.

- 2570 (KFK--2262, pp 142-143) INVESTIGATION OF THE LONG-TERM RADIOLOGICAL ENVIRONMENTAL IMPACT CAUSED BY AN ACCUMULATION OF NUCLEAR FACILITIES. Bayer, A.; Kalckbrenner, R.; Schueckler, M. (Kernforschungszentrum Karlsruhe (Germany, F.R.). Inst. fuer Neutronenphysik und Reaktortechnik). Jun 1975. (In German). 1 fig.; 1 tab..

Semiannual report 1975/2.

After the incorporation of several additional atmospheric and hydrospheric transport effects the part of the computer program incorporating these effects is now nearly completed. The relevant input data like site characteristics, release rates, deposition velocities, etc. have been updated on the basis of recent reports and personal communications. Partial results of a few exposure pathways have already been obtained.

- 2571 (INIS-mf--2010, pp 1-25) ELECTRIC POWER - THE NUCLEAR OPTION. Rasmussen, N.C. Jun 1975.

Lectures, autumn 1974 - spring 1975.

Arguments are presented for regarding nuclear power as the safest, most economical and environmentally preferable source of electric power available today. The methodology of the safety evaluation performed in producing the 'Rasmussen Report' (WASH-1400) is explained. The risk of fatalities due to the operation of nuclear power plants is compared with those due to a number of other activities. The potential number of casualties is also stated not to be greater in the case of a reactor accident than for other kinds of catastrophe. The genetic and delayed radiation effects resulting from a major nuclear power plant accident would not be statistically

discernable. Although thyroid nodules would be a noticeable effect, these, provided medical care was available, would not be a serious problem. Experience has shown that nuclear plants can tolerate system failures. The questions of waste disposal and fissile materials diversion are also briefly discussed.

- 2572 MEASUREMENT OF CONTAMINATION BY RADIOISOTOPES FOR MEDICAL EXAMINATION AND TREATMENT IN MEDICAL ORGANIZATIONS. Hamada, M. (National Cancer Center, Tokyo (Japan)). Byoin; 34: No. 6, 84-87 (Jun 1975). (In Japanese).

For safety control of radioactive contamination by medical examination and treatment in medical organizations, establishment of a Health and Physics Department is desired. It is necessary to dispose of radiopharmaceuticals according to the classification of safety and to separate the use of non-sealed nuclides from the radiotherapy room. In relation to radioactive air pollution, attention should be paid to the sampling test of hood, management of ^{133}Xe using room, and air pollution in the disposal storage room and patient urine storage room. Concerning the disposal of liquid waste, it is most important to devise entirely different method of disposal according to the level differences in the amount of diagnostic use and the therapeutic dose. The method of use is most important also for the decision of the size of storage tank. For sampling and monitoring it is advisable to use up to the 10th rank nuclide for safety counting in consideration of physicochemical conditions.

- 2573 EFFECT OF RADIOIODINE ON SWINE SPERMATOGONIA. Krishna, M.; Ebenezer, D.N.; Reddy, P.P.; Reddi, O.S. (Osmania Univ., Hyderabad (India). Dept. of Genetics). J. Nucl. Agric. Biol.; 4: No. 2, 33-35 (Jun 1975). 22 refs..

Ten Yorkshire white boars were injected with a dose of 25 mCi of ^{131}I and were mated to normal females after ninety days to screen the effects on spermatogonia. The pregnant females were allowed to go to term and litter size, sex-ratio and body weights of F_1 offsprings were recorded. There was a significant reduction in the litter size at birth. Neo and postnatal mortalities of F_1 offsprings of treated male were also significantly high when compared to control. Hence further decrease in litter size at weaning was noted. The gonadal cell survival studies were also made in males injected with 25 mCi of ^{131}I . The cell counts of spermatogonia and resting primary spermatocytes were made on 3rd and 120th day after treatment. A high cell killing effect of radionuclide on germ cells on 3rd day was noted. Almost complete recovery was seen by 120th day. The results clearly indicate the genetic and cell killing effects on spermatogonia - the germ cells is of great importance from the point of view radiation hazards.

- 2574 (DHEW/FDA--75-8024 (Rev.)) GONAD SHIELDING IN DIAGNOSTIC RADIOLOGY. (California Univ., San Francisco (USA)). Jun 1975. Contract FDA 72-13. 24p. GPO.

The use of gonad shielding is an important radiation protection technique, intended to reduce unnecessary x-ray exposure of the gonads of patients from diagnostic x-ray procedures. This pamphlet will provide physicians and radiologic technologists with information which will aid their appropriate use of gonad shielding.

- 2575 (INIS-mf--2010, pp 40-46) NUCLEAR RADIATION AND ITS EFFECT ON MAN. Aamlid, H. Jun 1975. (In Norwegian).

From Nuclear power - should we have doubts - what do the experts think; Oslo, Norway (11 Feb 1975).

Lectures, autumn 1974 - spring 1975.

A brief presentation is made of the biological effects on man of nuclear radiation. The sources of such radiation, natural and artificial, are summarised. The philosophy on which the maximum permissible doses to various groups and to the population are based is briefly described. Tables are given illustrating the various aspects discussed.

- 2576 CURE OF CANCER AND RADIATION INJURY AS RESULTS OF RADIOTHERAPY. Umegaki, Yoichiro (National Inst. of Radiological Sciences, Chiba (Japan)). Gan No Rinsho; 21: No. 7, 576-584 (Jun 1975). (In Japanese).

Radiation injury is a limiting factor in radiation therapy for cancer. Results of radiotherapy in the National Cancer Center Hospital 1962-1968 were analyzed from this standpoint. The higher the survival rate was, the larger was the risk of radiation injuries, including late effects. In some places, however, in spite of a high survival rate a remarkable decrease in the incidence of injury was observed, as a result of improved treatment techniques. Injuries were classified into 4 types, acute, subacute, chronic and late. Fatal injuries were observed in all of the types, and the incident time showed a log normal distribution after treatment. Cure of cancer and incidence of radiation injury showed similar dose responses, suggesting that both are essentially the same phenomenon.

- 2577 THE FUNDAMENTALS OF RADIATION DAMAGE AND PROTECTION TO LIVING PROCESS. Mohindra, R.K. (Kurukshetra Univ. (India). Dept. of Physics). J. Phys. Educ.; 3: No. 1, 13-19 (Jun 1975).

A brief introduction to the sources and units of radiation handled or used by men in laboratories and reactors is given. The distribution of radionuclides which enter the human body due to various causes and their elimination is described. The mechanism of radiation damages such as: (i) immediate radiochemical effects (ii) biological effects (iii) the temporal stages of radiation action and (iv) genetic effects of radiation-mutation as well as the principle of radiation protection are explained. An account of the various meters used such as monitors, dosimeters, etc. is given. Important precautions to be taken while handling radioactive substances are enumerated.

- 2578 THYROID TUMOR RISK FROM RADIATION DURING CHILDHOOD. Silverman, C.; Hoffman, D.A. (Public Health Service, Rockville, MD). Prev. Med.; 4: No. 2, 100-105 (Jun 1975).

From Health Physics Society eighth midyear topical symposium; Knoxville, TN, USA (21 Oct 1974).

Estimated risks of thyroid tumor development following radiation during infancy and childhood are presented from seven followup studies. In most of the studies the thyroid absorbed doses are high but in two of them the doses associated with thyroid cancer and adenoma are of diagnostic interest. Estimates are presented of thyroid doses associated with several diagnostic procedures involving the head and neck region. The need for evaluation of radiopharmaceutical techniques in children to minimize radiation exposure necessary for

essential diagnostic information is suggested.

- 2579 CASE REPORT OF RADIATION NECROSIS OF THE HIP. Gross, H.P.; DeClark, R.P. (Medical X-ray Center, Sioux Falls, SD). S. Dak. J. Med.; 28: No. 6, 5-6 (Jun 1975).

A 73-year-old lady with a pathologic fracture of the hip, secondary to radiation for melanoma 25 years after treatment is presented. This was treated with total hip replacement. A review of the symptoms, physical findings, x-ray changes, and pathology is presented. (auth)

- 2580 EVALUATION OF A PO-210 BIOASSAY AS AN INDEX OF THE EXPOSURE OF URANIUM MINE WORKERS IN JAPAN TO RADON DAUGHTERS. Okabayashi, H.; Suzuki, M.; Hongo, S. (National Inst. of Radiological Sciences, Chiba (Japan)); Watanabe, S. J. Radiat. Res.; 16: No. 2, 142-151 (Jun 1975).

As an indicator nuclide for inhalation exposure of mine workers to Rn daughters in a Japanese uranium mine, ^{210}Po urinalyses of the workers and surveys of some environmental factors were conducted. An estimation study of concentrations of Rn daughters in a mine, indicated that about 800-50 pCi of ^{210}Po could have been accumulated in each miner's body. However, according to the results of urinalyses performed several times in 5 years, a statistical difference in the quantity of ^{210}Po in urine among miners and non-mining workers there was not clearly identified. Investigations of ^{210}Po concentrations in the mine's air, water, foods (of about 30 kinds) and cigarettes, and investigations of feces-urine ^{210}Po ratios in humans revealed that these factors would greatly affect the metabolism and ^{210}Po excretion of the workers. In particular, some marine foods in Japan contained a great amount of ^{210}Po (several hundreds times that of other foods) and cigarettes showed 0.3-0.8 pCi of ^{210}Po per gramme. Smokers definitely excreted more ^{210}Po in urine than non-smokers. Feces-urine ratios ranged between 5.2-42.9 in one human subject. Therefore, it can be concluded that ^{210}Po would not be a good indicator for human exposure to Rn daughters, unless great care is taken regarding the eating and smoking habits of mine workers, as well as the exposure conditions in the uranium mine.

- 2581 RADIATION CANCER IN MAN, ESPECIALLY ON THE CASES DEVELOPED AFTER IRRADIATION FOR MALIGNANT CONDITIONS. Kikuchi, A. (Tohoku Univ., Sendai (Japan). School of Medicine). Gan No Rinsho; 21: No. 7, 464-469 (Jun 1975). (In Japanese).

Twelve cases in which radiation cancer was observed at the Tohoku University are reported. Half of them had been treated for tuberculous cervical lymphadenitis, one for lupus vulgaris and five for various malignant conditions. The average latent period was 27 years in 7 cases which were treated for benign conditions and 13 years in 5 cases treated for malignant conditions. In Japan, 12 cases of radiation cancer after irradiation for malignant conditions, excluding leukemia, have been reported. The clinical features of these 17 cases in addition to 5 cases are reviewed.

- 2582 CHROMOSOME ABERRATION FREQUENCY INDUCED BY FISSION RADIATION IN HUMAN PERIPHERAL BLOOD LYMPHOCYTES. BIOLOGICAL DOSIMETRY FOR A CRITICALITY ACCIDENT. Inoue, Y.; Bingo, K.; Fujita, M. (Japan Atomic Energy Research Inst., Tokai, Ibaraki. Tokai Research Establishment). Hoken Butsuri; 10: No. 2, 73-77 (Jun 1975).

(In Japanese).

For the purpose of utilizing radiation-induced chromosome aberrations in human peripheral blood lymphocytes as a means of dose evaluation in a criticality accident, a study was made of the relationship between fission neutron + gamma dose and the chromosome aberrations. Human peripheral blood lymphocytes were exposed in vitro to fission neutrons + gamma rays at Japan Research Reactor No.4 for 5, 10, 20, 30, or 40 min at 200 kW. The cells were observed at their first mitotic division stage in culture. The frequency of the chromosome aberrations per cell, Y, was expressed as a power function of exposure time in minutes, t, as follows: $Y = 0.0018t^{1.12}$. On the assumption that there was no mutual interaction between chromosome aberrations induced by the neutrons and those aberrations induced by gamma rays and that there was a similarity in the effects of the gamma rays produced in fissions and those aberrations produced by Co-60 gamma rays, estimation was made of the contribution of gamma rays to the total yields. However, there was a contradiction: the contribution of gamma rays exceeded the total yield.

- 2583 MODIFIED INTRAORAL PROSTHESIS FOR DIRECTING A RADIATION BEAM. Parel, S.M.; Drane, J.B. (Univ. of Texas, Houston). J. Prosthet. Dent.; 33: No. 6, 666-671 (Jun 1975).

A method of modifying an intraoral radiation cone has been presented. A custom-fitted metal extension can be obtained either directly or indirectly using this technique. The final radiation stent allows consistent and stable direction of a radiation beam for treating intraoral lesions.

- 2584 CASE OF MESODERMIC MIXED TUMOR OF THE UTERUS DEVELOPING AFTER THE TREATMENT OF MYOMA WITH X-RAY IRRADIATION. Hiura, M.; Mano, A.; Egawa, K.; Katsube, Y.; Sasaki, T. (Hiroshima Univ. (Japan). School of Medicine). Sanfujinka No Jissai; 24: No. 6, 501-505 (Jun 1975). (In Japanese).

A case of mesodermic mixed tumor primarily developing in the endometrium was reported with some discussion. The anamnesis was interesting that the patient had been exposed to the secondary radioactivity of the atomic bomb in Hiroshima and to X-ray for the treatment of myoma. Histological examination revealed adenoma as the epithelial element and fibromyxoma-like tissues, cartilage tissues, vascular tissues, and endometrial interstitium-like tissues as the non-epithelial elements.

- 2585 PARA-AORTIC LYMPH NODE IRRADIATION FOR CARCINOMA OF THE UTERINE CERVIX USING SPLIT COURSE TECHNIQUE. Piver, M.S.; Vongtama, V.; Barlow, J.J. (Roswell Park Memorial Inst., Buffalo). Gynecol. Oncol.; 3: No. 2, 168-175 (Jun 1975).

Twenty women with previously untreated cervical cancer received radical irradiation to the para-aortic lymph nodes and pelvis. Ninety percent received 6000 rads to the para-aortic nodes and pelvis in 8 weeks using split course technique. The mortality from complications of therapy, without evidence of recurrence, was 25%. Forty percent of the women were dead from recurrent cervical cancer (4-23M), and even with this short follow-up only 35% were surviving NED (6-29M). Methods for improving future trials of irradiation to the para-aortic nodes are discussed.

- 2586 RADIATION THERAPY IN THE TREATMENT OF

INVASIVE CARCINOMA OF THE CERVIX UTERI AND THE MORBIDITY. Reddi, P.R. (West Virginia Univ. Medical Center, Morgantown). W. Va. Med. J.; 71: No. 6, 129-132 (Jun 1975).

The radiation therapy management consisted of external irradiation with Megavoltage using four pelvic ports, an anterior and posterior port and two lateral ports. All the dose calculations and planning of isodose plots were done individually for each patient with the aid of a computer. On the day following the completion of the course of radiation therapy, a singly radium insertion with a Fletcher-Suit apparatus was done. In case of para-aortic node involvement, the treatment was directed to this area in relation to the pelvis with the two parallel opposing ports. A gap ranging from 2.5 to 3.5 centimeters was given at the surface of the skin, depending upon the portal size, source skin distance, and anterior posterior thickness of the patient. Results are reported on a total of 71 patients with invasive carcinoma of the cervix uteri.

- 2587 (AD-A--015187) RADIOBIOLOGY OF LARGE ANIMALS. FINAL REPORT, AUG 1969--JUN 1975. Krebs, J.S.; Jones, D.C.L. (Stanford Research Inst., Menlo Park, Calif. (USA)). Jun 1975. Contract DAHC20-70-C-0219. 16p. NTIS \$6.25.

Topics discussed are lethality in sheep exposed to ^{60}Co gamma radiation using various exposure parameters; hematological findings in sheep exposed to lethal levels of ^{60}Co gamma rays at various dose rates and under various conditions of exposure; cellular changes in bone marrow of mice and sheep during and after exposure to ^{60}Co gamma rays; and biological and mathematical analysis of lethality in large animals exposed to ionizing radiation. (GRA)

- 2588 INFLUENCE OF LIVER RADIATION ON THE BONE MARROW. Kitahara, T.; Kiga, M. (Showa Univ., Tokyo (Japan). School of Medicine). Gan No Rinsho; 21: No. 7, 549-552 (Jun 1975). (In Japanese).

The purine requiring nature of bone marrow cells was responsible for a decrease in the DNA synthesis by liver irradiated rabbits. De novo purine, measured by glycine 2- ^{14}C incorporation, was also decreased in bone marrow. Administration of purine after liver irradiation improved the DNA synthesis rate in bone marrow. These results claimed the role of indirect effect and hepatic factor in radiation leukopenia. It is possible that indirect and slight damage to the liver may cancel the purine supply to the bone marrow.

- 2589 EFFECTS OF X-RAY IRRADIATION ON THE SUBSEQUENT GONADOTROPIN SECRETION IN NORMAL AND NEONATALLY ESTROGENIZED FEMALE RATS. Matsumoto, A. (Juntendo Univ., Tokyo (Japan). School of Medicine); Asai, T.; Wakabayashi, K. Endocrinol. Jpn.; 22: No. 3, 233-241 (Jun 1975).

Female rats were irradiated with 190 R of x rays at 10 days of age and sacrificed 4.7 or 12 months later. Their ovaries were histologically examined and serum levels and the pituitary contents of luteinizing hormone (LH) and follicle-stimulating hormone (FSH) were determined by radioimmunoassay. Both serum levels and pituitary contents of LH and FSH rose significantly 4 and 7 months after irradiation, although the ovaries were markedly reduced in weight. However, 12 months after irradiation, the ovaries increased in weight and consisted mostly of polyhedral, hyperplastic interstitial cell masses, and both LH and FSH in the serum and pituitary were

reduced to normal levels. These characteristic changes in the ovarian weight and the histological appearance could not be observed in similarly irradiated animals which were receiving daily injections of estrone for the first 30 days of postnatal life, i.e., daily injections of 54 μg for the first 10 days, 100 μg for the middle 10 days and 200 μg for the last 10 days. Serum LH levels in the estrogenized irradiated rats 7 or 12 months of age did not increase, although levels of FSH were significantly higher than the non-irradiated intact levels. From these results, a rise in the blood levels of LH and FSH may be attributed to the increase in weight and the histological changes in the ovaries of the irradiated female rats. The elevation of only FSH level may not result in an abnormal growth of the irradiated ovaries.

- 2590 (AAEC/E--346) ULTRASTRUCTURE CHANGES PRODUCED BY THE ACTION OF URANYL ACETATE ON THE HUMAN ERYTHROCYTE IN VITRO. Wyatt, J.H. (Australian Atomic Energy Commission Research Establishment, Lucas Heights). Jun 1975. 22p. INIS.

21 figs..

Human erythrocytes exposed in vitro to low concentrations of uranyl ions are immediately changed in shape to stomatocytes. Electron microscope examination demonstrates that cellular damage is confined to the plasma membrane. Endocytosis of the cell membrane produces groups of inside out membrane-lined vesicles within the cell; lipid from the membrane enters the cell, giving rise to intracellular myelin figures, and breaks are seen in the cell membrane. It is proposed that the lipid fraction of the cell membrane is the primary target for damage by uranyl ions.

- 2591 THOROTRAST INJURY IN JAPAN. STATISTICAL STUDY ON AUTOPSY CASES AND FOLLOW-UP STUDY ON 147 CASES. Mori, T.; Maruyama, T. (Kanagawa Prefectural Junior Coll. of Nursing and Technol. (Japan)); Hatakeyama, S.; Miyaji, T.; Tsuya, A. Nippon Igaku Hoshasen Gakkai Zasshi; 35: No. 6, 439-452 (Jun 1975). (In Japanese).

Thorotrast injuries in Japan were discovered after 1945, and 94 autopsy cases were examined up to 1970. These autopsy cases included 60 cases of malignant tumor of the liver and 9 cases of blood disease. Examination of thorotrast-administered autopsy cases in Japan has revealed, among other things, that about one-half of all thorotrast-administered cases were war-wounded ex-servicemen and that the dates of injection in these cases were concentrated between 1932 and 1945. Based on this preliminary findings, a follow-up study was made on 147 thorotrast-administered war-wounded ex-servicemen after a lapse of 31 to 36 years from injection, and 6 cases of malignant tumor of the liver, 1 case of leukemia, 1 case of thrombocytopenic purpura, and 5 cases of liver cirrhosis were found among the samples. The incidence of these diseases in the samples was significantly higher than in the controls. The total number of thorotrast-administered persons living in Japan as of 1973 was roughly estimated at 5,000.

- 2592 (INIS-mf--2010, pp 73-119) PLUTONIUM - RADIOLOGICAL PROTECTION. Dolphin, G.W.; Dunster, H.J. Jun 1975.

The text of this lecture was based on report NRPB-R29 (Sep 1974) by G. Dolphin et al., reproduced here, 99 references.

Lectures, autumn 1974 - spring 1975.

For the protection of persons exposed to

plutonium isotopes and higher actinides there are five important requirements. First it is essential to evaluate all the appropriate data and develop basic dose standards for control of exposure of body organs, particularly bone, liver, and lung; these must be comparable to standards for exposure to external gamma and x radiation. Secondly, from these basic standards, values for maximum permissible concentrations in air and permissible annual intakes must be derived using metabolic models for plutonium in humans. As part of the biological monitoring of workers it is necessary to make assessments of the amount of plutonium in the body either by measurement of the excretion rate of plutonium in the urine or by external counting of gamma or x radiations over the chest or contaminated wound site. For the treatment of cases of high over-exposure therapeutic techniques should be available for accelerating the excretion or removal of the radioactivity from the body. Finally, plans must be made to cover the possibility of a large release of plutonium into the environment and these should include acceptable values for ground contamination levels.

- 2593 (PB--243898) ADVANCED TECHNIQUES FOR RADON GAS REMOVAL. RESEARCH REPORT, 22 MAY 1973--15 APR 1975. (Little (Arthur D.), Inc., Cambridge, Mass. (USA)). May 1975. Contract H0230022. 220p. (ADL--75946). NTIS \$7.25.

Results are summarized of engineering feasibility studies whose purpose was to assess the probable efficiency, reliability, safety and cost of a number of possible methods for removal of radon gas from the ambient air in underground mines particularly uranium mines. Fourteen candidate techniques were evaluated. Seven of these were based on specific individual principles, and seven were based on combinations of these principles. The individual principles were activated charcoal; organic fluids; semipermeable membranes; molecular sieves; cryogenics; chemical reaction; and, centrifuge. This study makes an initial assessment of basic techniques, and an examination of various possibilities for combining or modifying those techniques so as to improve their effectiveness and/or lower their cost. Any safe and practical technique that can result in the reduction of this insidious hazard to the health of underground miners, and that can substantially reduce the need for massive primary ventilation of the mines would be of considerable value to the industry and to the society. (GRA)

- 2594 (LURI--1975-04) MORPHOLOGICAL AND DYNAMIC STUDIES OF THE ACCUMULATION OF ^{123}I AND $^{99\text{m}}\text{Tc}$ IN THE THYROID. Cederquist, E.; Naversten, Y.; Persson, R.B.R.; Strand, S.E. (Lund Univ. (Sweden). Radiophysiska Institutionen). May 1975. 16p. (CONF-7505116--1). INIS.

From International symposium on nuclear medicine; Karlovy Vary, Czechoslovakia (20 May 1975).

This investigation was undertaken to compare the use of ^{131}I , ^{123}I and $^{99\text{m}}\text{Tc}$ for scintigraphic studies of the thyroid. ^{123}I has the most ideal physical and biological characteristics for this purpose. The detectability of ^{123}I with scintillation camera was found to be more than 200 times better than of ^{131}I in consideration of the absorbed dose to the patient. We have found that an activity of about $200\mu\text{Ci}$ ^{123}I is enough for thyroid scintigraphy. This activity will give about the same count rate with the scintillation camera as when 2mCi $^{99\text{m}}\text{Tc}$ -pertechnetate is used. Oblique scintillation camera views, which

have been found to be of value especially when cold areas were present in the thyroid, can be performed with both ^{123}I and $^{99\text{m}}\text{Tc}$. But when $^{99\text{m}}\text{Tc}$ is used, a greater fraction of circulating activity is registered. After i.v. administration of ^{123}I or $^{99\text{m}}\text{Tc}$ -pertechnetate sequential scintigrams were registered over the thyroid and the aortic region with a scintillation camera. The activity time curves were analyzed and uptake parameters were evaluated with a computer. The initial trapping curve could thus be studied in patients with different thyroid disorders.

- 2595 CHANGE IN THE QUANTITY OF CELLS IN SMALL INTESTINE OF MICE UNDER THE ACTION OF VARIOUS RADIATION DOSES. Semenov, L.F.; Altukhova, L.N. (Akademiya Meditsinskikh Nauk SSSR, Sukhumi. Inst. Eksperimental'noj Patologii i Terapii). Radiobiologiya; 15: No. 3, 447-449(May 1975). (In Russian).

For English translation see the journal Radiobiology.

Dose dependence of radiation injury to the intestinal tissue of mice exposed to 100-4000 r of γ -quanta has been studied by means of a new method of quantitative estimation of proliferation. It has been found that the initial radiation damage to cells of the intestine is independent of the radiation dose whereas the final result of the damage depends on the dose value.

- 2596 (SAAS--178) OCCUPATIONAL RADIATION EXPOSURE IN THE GDR IN 1971. Koenig, W.; Larssen, A.; Rothe, W. (Staatliches Amt fuer Atomsicherheit und Strahlenschutz, Berlin (German Democratic Republic)). May 1975. 40p. (In German). NTIS (US Sales Only).

In 1971, 32, 843 occupationally exposed persons were monitored by the central film badge service of the National Centre for Radiation Protection. The monthly over-exposures (more than 0.4 rad) totaled to 685. In 40 cases the quarterly dose (3 rad) was exceeded during one month. 12 of these records could be assessed as real over-exposures. Most of the over-exposures could be attributed to an insufficient application of safety regulations. The results were analyzed according to type of institution, type and duration of employment as well as age of employees.

- 2597 (SSI--1975-019) INFORMATION FROM THE NATIONAL INSTITUTE OF RADIATION PROTECTION ABOUT RADIATION DOSES AND RADIATION RISKS AT X-RAY SCREENING. (Statens Straalskyddsinstitut, Stockholm (Sweden)). May 1975. 17p. (In Swedish). INIS.

This report gives a specification of data concerning radiation doses and risks at x-ray investigations of lungs. The dose estimations are principally based on measurements performed in 1974 by the National Institute of Radiation Protection. The radiation doses at x-ray screening are of that magnitude that the risk for acute radiation injuries is non-existent. At these low doses it has not either been able to prove that the radiation gives long-range effects as changes in the genes or cancer of late appearance. At considerable higher doses, more than tens of thousands of millirads, a risk of cancer appearance at a small part of all irradiated persons has been proved, based on the assumption that the cancer risk is proportional to the radiation dose. Cancer can thus occur at low radiation doses too. Because of the mass radiography in Sweden 1974 about twenty cases of cancer may appear in the future.

- 2598 EDUCATION CAMPAIGN FOCUSES ON EFFECTS OF IRRADIATION THERAPY. *Ill. Med. J.*; 147: No. 5, 430, 446(May 1975).

An educational campaign was recently launched to call attention to the increased risk of thyroid carcinoma resulting from radiotherapy administered to the head and neck during childhood or adolescence. Although irradiation therapy for benign conditions of the head and neck was discontinued 15 years ago, the late effects of this treatment are being reported with increasing frequency. Thyroid screening programs are being established in the Chicago area. (ERB)

- 2599 ELECTRON MICROSCOPIC STUDIES OF NEUROBLASTOMA. ESPECIALLY FINE STRUCTURAL COMPARISON IN UNTREATED NEUROBLASTOMA WITH IRRADIATED NEUROBLASTOMA. Nakayama, I.; Muta, H.; Tsuji, K.; Oyakawa, Y.; Matsuo, T. (*Nagasaki Univ. (Japan). School of Medicine*). *Nippon Rinsho Denshikenbikyō Gakkai Shi*; 8: No. 1-2, 21-31(May 1975). (In Japanese).

The fine structure of irradiated neuroblastoma has been compared with that of untreated neuroblastoma. After irradiation the tumor showed massive necrosis, however, remaining cells were markedly enlarged. The nucleus showed a deep nuclear indentation with decreased heterochromatin. The Golgi region occupied much of the cytoplasm. There appeared near the Golgi region an increased number of small granules having a dense core. The rough endoplasmic reticulum was considerably increased in amount. Various types of lysosomes or phagosomes were found in the cytoplasm. Cytoplasmic processes with the formation of neurites were increased in number. They contained significantly increased numbers of both cored and electron lucid granules compared with those of untreated neuroblastoma.

- 2600 EDUCATION CAMPAIGN FOCUSES ON EFFECTS OF IRRADIATION THERAPY. *Ill. Med. J.*; 147: No. 5, 430, 446(May 1975).

Patients having radiation therapy for benign conditions of the head and neck during 1930 to 1960 should submit to screening for possible thyroid carcinoma. A campaign is under way in the Chicago area to advise physicians and hospitals of the problem and to encourage former patients to submit to the screening procedure. (ERB)

- 2601 COMPLEMENTARY IRRADIATION IN LYMPHOGRANULOMA. 1. TECHNIQUE AND DOSIMETRY. Konecny, M.; Pecina, J. (*Onkologický Ústav, Brno (Czechoslovakia). Betatronové Pracoviště*). *Cesk. Radiol.*; 29: No. 3, 147-153(May 1975). (In Czech).

In radiotherapy of lymphogranuloma, complementary irradiation has substantial advantages as compared with local irradiation or irradiation using an extended field. Difficulties arising from the necessity of protecting the more sensitive tissues or of irradiating homogeneously all larger lymphatic groups of the given half of the body may at least partly be eliminated by an individually fitted shielding block placed at a distance of approximately 50 cm above the patient. This distance, the shielding of block edges in the radiation beam direction and the shielding equivalent of approximately 5 half-layers gives satisfactory protection to the tissue and provides a small half-shade. The measurements performed confirmed a homogeneous dose distribution, specified the dependence of the depth dose on the shielding value and permitted a more accurate adjustment of the shielding

block.

- 2602 PRINCIPLES OF BIOLOGICAL DOSIMETRY IN ACUTE RADIATION SICKNESS. Vorob'ev, A.I.; Brilliant, M.D.; Baranov, A.E.; Selidovkin, G.D.; Pyatkin, E.K.; Pokrovskaya, V.N. *Klin. Med. (Moscow)*; 53: No. 5, 69-74(May 1975). (In Russian).

On the basis of their own observations and data from the literature, the authors analyze a number of biological indicators to determine their usefulness for biological dosimetry and in particular the degree of dose correspondence (or rather dose range) they give. The leucocyte count 7, 8 and 9 days after exposure, the time of onset of agranulocytosis and the lymphocyte level 48 to 72 hours following irradiation were found to be useful biological dosimeters. A clear relationship was found between the number of brain cells with damaged chromosomes and the radiation dose received by the brain. The importance of the time at which vomiting begins is emphasized as a means of gauging the seriousness of radiation damage in general. On the basis of information derived from the literature, the authors provide data on the radiation doses to individual organs and tissues which cause the first clinical signs of radiation injury, i.e. threshold doses. A number of indices are given which make it possible to gauge threshold doses for the skin and small intestine.

- 2603 STUDY IN THE RADIOPROTECTIVE ACTION OF BETA-MERCAPTOPYLAMINE AGAINST A PROLONGED IRRADIATION. Tikhomirova, M.V.; Davydova, S.A.; Vodyakova, L.M. *Radiobiologiya*; 15: No. 3, 379-383(May 1975). (In Russian).

For English translation see the journal *Radiobiology*.

In experiments on mice it was shown that the radioprotective action of β -mercaptopylamine (MPA) is weakened when the rate of gamma-irradiation is reduced from 400.9 to 10.70 and 3.76 R/min. In dogs irradiated at a dose rate of 1 R/min administering MPA prophylactically did not increase the effectiveness of the treatment applied after irradiation.

- 2604 CYTOGENETIC EXAMINATION OF THE DOGS IRRADIATED WITHIN SIX YEARS. Tsessarskaya, T.P. *Radiobiologiya*; 15: No. 3, 434-437(May 1975). (In Russian).

For English translation see the journal *Radiobiology*.

Cytogenetic effects were studied as a function of the rate and dose of continuous gamma irradiation (dose rates 21, 63, 125 rad/year and total doses 125, 375, 750 rad). The structural damage to chromosomes seen in the metaphase of the mitosis of bone-marrow cells was investigated. A sharp increase in the frequency of aberrations was caused only by the highest of the dose rates used in the experiment, namely 125 rad/year, while at 21 and 63 rad/year the radiation effect was detected only in some periods. A characteristic feature was the absence of a single-valued dependence between the magnitudes of the effect and the irradiation dose.

- 2605 DEPENDENCE OF THE AVERAGE LIFE SPAN, MORTALITY AND OSTEOSARCOMA OCCURRENCE IN RATS ON THE RADIATION DOSE ABSORBED (SR 90). Shvedov, V.L.; Pantelev, L.I. *Radiobiologiya*; 15: No. 3, 402-406(May 1975). (In Russian).

For English translation see the journal *Radiobiology*.

The dose dependence of mortality and osteosarcoma development frequency is studied

in white rats which have received 0.00005-5.0 μ Ci/day of strontium-90 throughout their lives. It is shown that total mortality in the dose range 0-10 krad is a more sensitive test than osteosarcoma frequency, osteosarcomatosis hardly reducing the mean life span of the irradiated rats.

- 2606 LIVER INSULINASE AND INSULIN-LIKE ACTIVITY OF THE BLOOD PLASMA IN IRRADIATED RATS. Zhikhareva, A.I.; Dokshina, G.A. (Tomskij Gosudarstvennyj Univ. (USSR)). Radiobiologiya; 15: No. 3, 454-456 (May 1975). (In Russian).

For English translation see the journal Radiobiology.

Comparative quantitative analysis of the functional effect of radiation on the activity of liver insulinase of irradiated rats has shown that the insulinase activity of the blood plasma decreases (21-45%) one to three days after the exposure at betatron. Insulinase activity of the liver extracts is also inhibited (16-22%) as compared to intact liver extracts. Twelve days after the exposure and later, insulin-like activity of the plasma and the enzyme activity increase up to 37 per cent.

- 2607 INACTIVATION OF HEMOPOIETIC STEM CELLS BY LYMPHOCYTES AS RELATED TO GENOTYPE OF INTERACTING CELLS. Petrov, R.V.; Soslavina, L.S.; Panteleev, E.I.; Egorova, O.S. Tsitologiya; 17: No. 5, 560-564 (May 1975). (In Russian).

Inoculation of a mixture of bone marrow cells with allogeneic lymphocytes into irradiated mice of inbred strains or into F_1 hybrids results in the depression of bone marrow cell proliferation in the spleen of the recipient: the effect of inactivation of nonsyngeneic stem cells. The inactivation of stem cells by allogeneic lymphocytes can be detected in all tested combinations of mice strains - donors of lymphocytes and bone marrow cells and mice - recipients but the degree of inactivation differs and depends on the genotype of cell donors rather than on the genotype of the recipient. Lymphocytes of some mice strains (haplotypes H-2sup(k) and H-2sup(a)) are more active killers of bone marrow cells as compared with lymphocytes of other strains (haplotypes H-2sup(b) and H-2sup(d)). Probably, the degree of stem cells inactivation by lymphocytes depends on the differences of their histocompatibility in H-2 system.

- 2608 ESTIMATION OF WHOLE BODY ABSORBED DOSE OF THE PATIENT ADMINISTERED ^{57}Co -BLEOMYCIN FOR TUMOR DIAGNOSIS. Anzai, I. (Tokyo Univ. (Japan). Faculty of Medicine); Kanno, M.; Higashi, T.; Kato, H.; Nakamura, K. Radioisotopes (Tokyo); 24: No. 5, 327-331 (May 1975).

The whole body absorbed dose of the patient administered ^{57}Co -Bleomycin for tumor diagnosis was estimated in accordance with the MIRD Committee method. The whole body retention function was well described by the two component exponential model. The effective half-lives were several hours in the initial rapidly decreasing phase and 2 to 3 months in the successive slow phase. The accumulated whole body absorbed dose following intravenous administration of 1mCi of ^{57}Co -Bleomycin was calculated to be approximately 3 rads, more than 90% of which was delivered in the first one year following injection. It was also revealed that no less than 99% of the dose was brought by the slow phase component, which indicated the importance of obtaining slow phase excretion data for dose estimation

concerning the newly applied radiosubstances, irrespective of necessity or unnecessity for the diagnosis itself. Relatively high level of deposition was observed in the liver of a male patient of 82 years old who died of lung cancer 15 days after intravenous injection of ^{57}Co -Bleomycin.

- 2609 TOXICITY OF PLUTONIUM. Takagi, J. Kagaku (Tokyo); 45: No. 5, 309-316 (May 1975). (In Japanese).

Tamplin and Cochran evaluated the rate of carcinogenetic action of nonuniform exposure with PuO_2 particles deposited in the lungs and suggested to reduce the present standard of plutonium to 1/115,000. The author examined the management of nonuniform exposure based on various views and appraised the risk. The number of "permissible" particles for occupational exposures with the risk of 1/1,000 in a year was found to be 2s^{-2} or 25d^{-6} for personal and 0.2s^{-2} or 2.5d^{-6} for the general public against a particle with radioactivity of 5 pCi and diameter of μ . This result essentially supported the suggestion of Tamplin and Cochran.

- 2610 ACTION OF STRONTIUM-90 CHRONICALLY ADMINISTERED TO RATS ON CERTAIN PARTS OF THEIR DIGESTIVE TRACT. Boystova, V.P.; Goloshchapov, P.V.; Soroka, L.P. Radiobiologiya; 15: No. 3, 389-393 (May 1975). (In Russian).

For English translation see the journal Radiobiology.

The protracted uptake of ^{90}Sr has been found to cause structural disorders in all the layers of the intestinal wall, their degree being proportional to the dose absorbed by the osseous tissue. An increase in the intestinal autoflora, and a retrograde separation and modification of its species composition take place aggravating the toxemia, which is supported by the data of the histological and biochemical analyses of the liver.

- 2611 A STUDY OF QUANTITATIVE SCALE DISPLAY OF THE ORGAN UPTAKE WITH GAMMA-CAMERA. Ishigami, K.; Matsumoto, M. (Kumamoto Univ. (Japan) School of Medicine). Radioisotopes (Tokyo); 24: No. 5, 322-326 (May 1975). (In Japanese).

The fundamental study of quantitative scale display of the organ uptake with γ -camera was performed in special respect of the thyroid gland and the pancreas. As one of the measurements on certain dimension of the organ, an optical progression outside the digital image was expressed, and was subjected to the quantitative scale with the use of the threshold level. And a rather satisfactory correlation was clinically obtained between the scale display and the thyroidal ^{131}I uptake. For the purpose of revising the above scale display, the organ depth was measured with RI by the aid of the phantom. Then the pancreas depth determined by the count rate ratio curve of 140 and 270 keV peak of ^{75}Se energies. However, the body background and the radioactive rays from the neighboring organs interfered with this curve.

- 2612 EVALUATING ERROR DISTRIBUTION IN THE UPTAKE OF RADIOISOTOPES IN THE RESPIRATORY SYSTEM. Lekhtmakher, S.O.; Ruzer, L.S. Izmer. Tekh.; 18: No. 5, 75-76 (May 1975). (In Russian).

The errors in determining the uptake of radioactive isotopes in the respiratory organs are estimated. For the evaluation of the measurements of physical characteristics and

with increasing errors a Gaussian distribution for the errors is no longer applicable. A logarithmic-normal distribution law for the errors is proposed. The uptake of isotopes in the organism is discussed and an expression for its activity is given according to the new standards of radioactive protection (NRP-69). A large difference between the real and the calculated values of isotope activity in respiratory organs is found and discussed. For this large spread of results the expression for the logarithmic-normal distribution, for the real value and for the geometric mean are given.

- 2613 INVESTIGATION OF THE ROLE OF CERTAIN LIVER COMPONENTS IN FIXATION OF Pu^{239} . Popov, D.K.; Rushonik, S.I.; Shvydko, N.S. (Nauchno-Issledovatel'skij Inst. Radiatsionnoj Gigieny, Leningrad (USSR)). Gig. Sanit.; No. 5, 112-113 (May 1975). (In Russian).

- 2614 (AD-A--023777) THE NEW NUCLEAR RADIATION CASUALTY CRITERIA. Warshawsky, A.S. (Army Nuclear Agency, Fort Bliss, Tex. (USA)). May 1975. 9p. NTIS \$3.50.

Information paper on topics associated with nuclear weapons.

Many years of detailed analysis and experimentation have produced an improved understanding of nuclear weapons technology and phenomena, and of human and animal response to nuclear radiation. The information and data used to develop new radiation casualty criteria are briefly described, and it is shown how these criteria can be used by the battlefield commander and staff in planning nuclear strikes to inflict enemy casualties. The radiation criteria discussed apply only to initial radiation doses resulting from a single nuclear detonation; they do not apply to doses resulting from exposure to radioactive fallout. Moreover, the criteria do not consider synergistic effects due to the air blast and/or thermal energies that accompany initial radiation.

- 2615 DECREE NO. 75-306 OF 28 APRIL 1975 RESPECTING THE PROTECTION OF WORKERS AGAINST THE HAZARDS OF IONIZING RADIATION IN BASIC NUCLEAR PLANTS. J. Off. Repub. Fr.; 107: No. 101, 4428-4432 (30 Apr 1975). (In French).

Scope; administrative provisions concerning the project, construction and operational stages of nuclear facilities, plant safety organisation, modifications to existing structures, etc.; marking out of off-limits areas; protection of personnel required to enter these areas against external radiation and radioactive contamination; warning notices indicating off-limit areas; inspection, monitoring of protective equipment; monitoring of environment; individual monitoring for exposure to radiation and contamination; action to be taken in the case of over-exposure; safety engineering methods in off-limits areas (shielding, remote handling, glove boxes, etc.); medical rules; emergency organisation and fire prevention. A series of definitions is appended.

- 2616 METHOD AND APPARATUS FOR DOSE CONTROL IN THE IRRADIATION OF PERSONS. Vogel, T.M. (to Varian Associates, Palo Alto, Calif. (USA)). German (FRG) Patent 2447959/A/. 17 Apr 1975.

43p. (In German).

4 figs..

A method to control the aimed irradiation of a subject, e.g., part of the body, by a radiation source which is movable along a path relative to the irradiation subject is described. The method enables the detection of non-uniformities of the radiation and their compensation limiting the emitted quantity of radiation, to a previously determined maximum. The moving path of the source is thus subdivided into steps and the quantity of radiation of each step is measured and controlled. Several closures are designed to de-energize the system if various faults occur. Furthermore, devices are designed to control the mobility rate of the source or the dose rate of the source. The system is explained and illustrated in detail.

- 2617 CHROMOSOMAL ABERRATIONS IN PERIPHERAL BLOOD LYMPHOCYTES OF MONKEYS SUBJECTED TO LONG-TERM DAILY IRRADIATION. Kosichenko, L.P. (Inst. of Experimental Pathology and Therapy, Moscow). Genetika; No. 3, 134-140 (14 Apr 1975). (In Russian).

Following a prolonged period of daily exposure to low doses of gamma radiation for a total dose in the range of 826 to 3677 R, cytogenetic studies were commenced on the chromosomes of peripheral lymphocytes of eight male and three female rhesus monkeys 4.5 to 11 years after the last exposure. With rare exceptions, chromosomal aberrations consisted of symmetrical chromosomal exchanges; the incidence of aberrations in the 1st, 14th and the 20th chromosome pair was 1.67%, 2.2% and 3.0%, respectively, for the irradiated monkeys against an incidence of 0.6% for control monkeys. The total exposure dose or the time between the last exposure and the study did not influence the incidence of chromosomal aberrations.

- 2618 UNDETECTED LATROGENIC HYPOTHYROIDISM: A LATE COMPLICATION OF RADIO-IODINE THERAPY. Smidt, K.P. (Univ. of Otago Medical School, Dunedin, New Zealand). N.Z. Med. J.; 81: No. 537, 325-328 (9 Apr 1975).

The thyroid status of 317 patients treated with radioactive iodine between 1951 and December 1971 was investigated. Information was obtained on 236 patients and hypothyroidism, either treated or untreated, was present in 48 percent of women and 37 percent of men at mean follow-up intervals of 5.5 and 4.4 years respectively. Ninety-four of the 241 patients still alive were assessed personally by clinical examination and serum thyroxine assay, and 10 were found to have previously undiagnosed hypothyroidism. Seven of these patients had symptoms and in five these symptoms were the cause of significant distress. The importance of undertaking a long term review program following radioactive iodine therapy is emphasized. (auth)

- 2619 (LURI--1975-03) LONG-LIVED RADIONUCLIDE-IMPURITIES IN ELUATES FROM MOLYBDENUM-TECHNETIUM GENERATORS AND THE ASSOCIATED ABSORBED DOSE TO THE PATIENT. Finck, R.; Mattsson, S. (Lund Univ. (Sweden). Radiofysiska Institutionen). Apr 1975. 23p. INIS.

The activity-concentrations of several long-lived gamma-emitting radionuclides present in technetium generators and in eluates from these generators have been determined by means of Ge(Li) gamma-spectrometry. The principal contaminants of the eluates were: ^{192}Ir (T/sub 1/2/ = 74.3 d), ^{134}Cs (2.05 a), ^{131}I (8.05 d), /

sup 110m/Ag (255 d), ¹⁰³Ru (39.5 d), ⁹⁹Mo (66.7 h) and ⁶⁰Co (5.26 a). The impurity-concentrations were found to vary considerably from generator to generator. Changes in the impurity-concentrations in eluates from the same generator have also been recorded during an elution-period of one week. In accord with their ability to be eluted from the generators, the long-lived radionuclide-impurities may be arranged in the following sequence ¹³⁴Cs > ¹⁰³Ru greater than or equal to /sup 110m/Ag > ¹⁹²Ir > ⁶⁰Co.

- 2620 (PB--242983) RADIOACTIVITY IN CONSTRUCTION MATERIALS A LITERATURE REVIEW AND BIBLIOGRAPHY. TECHNICAL NOTE (FINAL). Eadie, G.G. (Environmental Protection Agency, Las Vegas, Nev. (USA). Office of Radiation Programs). Apr 1975. 50p. (ORP/LV--75-1). NTIS \$3.75.

Surveys to determine the radioactive content of specific building materials used in the United States have not been reported in the literature. The external dose to the U.S. population from exposure to natural radioactive materials (exclusive of uranium mill tailings) contained in U.S. building materials has not been evaluated, and the possibly significant external exposure from the use of by-product gypsum and fly-ash materials should be evaluated. The effects of various construction materials on the attenuation of cosmic and terrestrial radiations have been evaluated in a limited number of surveys in the urban areas of Boston, New York, and Livermore, California. The measurement of radon and radon daughter product concentrations has only been reported for a few dwellings and several multi-story office buildings in Boston and in several State-owned buildings in North Carolina. This literature search has found a lack of meaningful data for use in evaluating the U.S. population exposure from building materials. (GRA)

- 2621 (DHEW/FDA--75-8007) STANDARD TECHNIQUE FOR ESTIMATING PATIENT EXPOSURE FROM PHOTOFLUOROGRAPHIC X-RAY MACHINES. Gaeta, N.A.; Burnett, B.M. (Bureau of Radiological Health, Rockville, Md. (USA)). Apr 1975. 19p. GPO.

Many different techniques have been used to measure exposures from photofluorographic x-ray machines. To evaluate patient radiation exposures and enable comparison of data from different machines, a standard technique for estimating patient exposure is recommended. Human chest exposures were evaluated using a copper sheet as the attenuating medium. Relationships are developed between patient and copper sheet exposures; details of the survey method are presented; x-ray machine problems and recommendations for correction are discussed. The method is applicable to 14 x 17 wall chest and other phototimed units.

- 2622 CELL PROLIFERATION KINETICS IN HUMAN TUMOR CELLS. Brown, J.K. (Australian Atomic Energy Commission Research Establishment, Lucas Heights. Environment and Public Health Div.). Aust. N.Z. J. Med.; 5: No. 2, 182(Apr 1975).

From Annual scientific meeting of the Australian and New Zealand society of nuclear medicine; Sydney, Australia (22 May 1974).

Abstract only.

Fundamental studies of the mechanism by which radiation acts on mammalian cell systems have to date not contributed one well-documented example of a significant improvement in the cure rate of human cancer. In part, this failure is due to ethical and technical

difficulties of conducting experiments on tumors in situ and, in part, to the fact that the results of in vitro studies are obtained under conditions hardly relevant to tumor cell populations. Present knowledge of the kinetics of tumor cells will be described by reference to in vivo and in vitro experiments employing labelled (tritium, carbon-14, iodine-125) precursors of DNA. Such experiments have revealed that the doubling times of solid human tumors may be several orders of magnitude less than expected due to cell loss (75 to 90%) and the large proportion of cells not in the proliferative phase (25 to 40%). By means of a new tissue culture technique, a human malignant cell line has been grown in suspension culture in the form of multicellular 'spheroids' comprised of up to 10⁴ cells. The spheroids morphologically and radiobiologically resemble the nodular structure of many human and animal neoplasms, consisting of a peripheral zone of actively metabolising cells relatively sensitive to radiation, and an inner core of hypoxic cells resistant to radiation.

- 2623 (NRPB-R--35) STUDY OF CHROMOSOME ABERRATION YIELD IN HUMAN LYMPHOCYTES AS AN INDICATOR OF RADIATION DOSE. 5. A REVIEW OF CASES INVESTIGATED: 1974. Purrott, R.J.; Lloyd, D.C.; Prosser, J.S.; Dolphin, G.W.; Tipper, P.A.; Reeder, E.J.; White, C.M.; Cooper, S.J.; Stephenson, B.D. (National Radiological Protection Board, Harwell (UK)). Apr 1975. 15p. NTIS (US Sales Only).

Available from H.M. Stationery Office, price Pound0.50.

Results from cytogenetic investigations into 28 cases of suspected overexposure to radiation are reviewed. This report is a sequel to NRPB-R5, R10 and R23 which contained data on 141 studies. Results from all 169 investigations have been pooled for general analysis. Brief accounts are given in an appendix of the circumstances behind the past year's 28 investigations and where possible physical estimates of dose have been included for comparison. Dose response studies have been completed for 250 kV X-rays delivered at 100 rads/min and for two dose rates of cobalt-60 γ radiation at 50 rads/min and 18 rads/hr. The data have been fitted to a quadratic function of the form $Y = \alpha D + \beta S^2$ and values for the coefficients α and β are given for the three curves. The lower limits of detection with cytogenetic dosimetry are equivalent whole body doses of 4 rads for X-rays and 10 rads γ radiation. Several weeks may elapse between exposure and blood sampling without detriment to the dose estimate.

- 2624 (NRPB-R--36) ASSESSMENT OF THE HAZARD TO THE PUBLIC FROM ANTI-STATIC BRUSHES CONTAINING POLONIUM-210 IN THE FORM OF CERAMIC MICROSPHERES. Webb, G.A.M.; Wilkins, B.T.; Wrixon, A.D. (National Radiological Protection Board, Harwell (UK)). Apr 1975. 21p. NTIS (US Sales Only).

Available from H.M. Stationery Office, price Pound0.50.

Anti-static brushes containing polonium-210 in the form of ceramic microspheres have been tested and evaluated with regard to their availability to the general public. After summarising existing test information, results are given of routine leakage tests and special tests intended to simulate severe but credible abuse and accidents with these devices. It is found that the low levels of removable contamination and the possible loss of complete microspheres, although in principle undesirable, do not present a significant hazard. The containment integrity of ceramic

microspheres under severe conditions (impact and fire) has been found unsatisfactory and it is considered possible that ICRP dose limits could be approached or even exceeded under these severe but credible abuse, accident or disposal conditions. The results of comparative tests with nonradioactive methods for static elimination did not demonstrate any adequate justification for the use of a radioactive material. The potential exposure from Staticmaster Brushes is therefore considered an unnecessary hazard to members of the public.

- 2625 (SSI--1975-016) TOPICAL STANDARDIZATION OF DOSIMETRY. TRAVEL REPORT FROM A MEETING AT BIPM IN PARIS IN APRIL 1976. (Statens Straalskyddsinstitut, Stockholm (Sweden)). Apr 1975. 7p. (In Swedish). INIS.

The international concordance, concerning the measuring of exposure dose (unit: Roentgen), has now become about 0.5 percent to as well low energy x-radiation (10 - 50 kV) as to conventional x-radiation (50 - 250 kV) and Co 60-radiation. The statement from the laboratory of BIPM in Paris will valid as an international guide value. Bearing in mind the needs within the field of medical radiation treatment, international comparisons will be made during the next few years in order to determine absorbed dose (unit: rad) in graphite during irradiation with Co 60-radiation in a graphite phantom under defined irradiation conditions. Work will also be done about absorbed dose in water in a water phantom with a view to the possibility of calibration of an ionisation chamber for absorbed dose from Co 60-radiation.

- 2626 (TU-Inf--05-12-75) COMPARISON OF VARIOUS MODELS FOR THE ASSESSMENT OF RADIATION DOSES TO THE GASTROINTESTINAL TRACT. Schillinger, K.; Schuricht, V. (Technische Univ., Dresden (German Democratic Republic). Sektion Physik). Apr 1975. 14p. (In German). NTIS (US Sales Only).

Various models for the assessment of internal radiation doses to the gastrointestinal tract are shortly described and compared. It is concluded that the existing models are satisfying from the viewpoint of radiation protection.

- 2627 MEDICAL SUPERVISION OF RADIATION WORKERS IN THE GERMAN DEMOCRATIC REPUBLIC.

Schuettmann, W. (Staatliches Amt fuer Atomsicherheit und Strahlenschutz, Berlin (German Democratic Republic)). 2. Gesamte Hyg. Ihre Grenzgeb.; 21: No. 4, 289-295 (Apr 1975). (In German).

- 2628 DETERMINATION OF RADIATION REDUCTION TO THE LENS DURING POLYTOMOGRAPHY OF THE PETROUS PYRAMID. Ellwood, R.A.; Morrison, J.L.; Pfeil, C.E. (Madigan Army Medical Center, Tacoma, WA). Mil. Med.; 140: No. 4, 276-277 (Apr 1975).

The preclusion of unwarranted radiation to critical organs is a basic principle of radiation safety to the patient. The lens of the eye is a critical organ in that ionizing radiation may induce cataract formation. In order to obviate this complication, a study was undertaken to determine the dosage to the ocular lens during petrous hypocyloidal tomography with and without ocular lead

shields. (auth)

- 2629 HAZARDS OF LARYNGEAL CANCER IN URANIUM MINERS. Placek, V. (Ustav Hygieny Prace Uranoveho Prumyslu, Kamenna (Czechoslovakia)); Sevc, J. (Institut Hygieny a Epidemiologie, Prague (Czechoslovakia)). Ustav Hygieny Zarení. Prac. Lek.; 27: No. 4, 113-115 (Apr 1975). (In Czech).

From Seminar of the Institute of Hygiene and Epidemiology, Centre of Radiation Hygiene; Prague, Czechoslovakia (2 May 1974).

The results are presented of an epidemiological study showing that no significant differences exist between the estimated and the observed incidence of cancer of the larynx in a group of uranium miners. The comparison of results of the epidemiological study, of the total number of larynx cancer in uranium miners ascertained so far, and of literature data shows that the low incidence of larynx cancer in uranium miners does not differ from the incidence of this disease among the male population in Czechoslovakia.

- 2630 MICROWAVE LENS EFFECTS IN HUMANS. Appleton, B.; Hirsch, S.; Kinton, R.O.; Soles, M.; McCrossan, G.C.; Neidlinger, R.M. Arch. Ophthalmol. (Chicago); 93: No. 5, 257-258 (Apr 1975).

Continuation of earlier studies (CIS 74-1296) extended to cover a total of 2343 microwave workers and 801 controls over 5 years. Comparison of lens abnormalities found (opacities, vacuoles, or posterior subcapsular iridescence) showed the 2 groups to be essentially the same, and did not support the hypothesis that microwave exposure causes lens damage in humans. The results suggest that the existing safety level of 10 mW/cm² is adequate.

- 2631 RADIATION HYGIENE IN PHOTOFLUOROGRAPHY. Welde, F. (The state institute of radiation hygiene, Montebello, Oslo (Norway)). Acta Radiol., Ther., Phys., Biol.; 14: No. 2, 187-194 (Apr 1975).

This paper comprises measurements and experiences from the surveillance of 36 photofluorographic units in Norway. Measured patient doses are given. Practical means for reducing the doses are emphasized. The radiation hygiene for the personnel in mass chest surveys is discussed.

- 2632 SIGNIFICANCE OF LENTICULAR OPACITY FROM THE VIEW POINT OF THE EXPOSURE DOSE OF A-BOMB RADIATION. Sugimoto, S. (Sugimoto Hospital, Hiroshima (Japan)). Hiroaki Igaku; 28: No. 4, 443-446 (Apr 1975). (In Japanese).

Two cases of lenticular opacity were discussed from the view point of exposure dose of A-bomb radiation. Case 1: female, 22 year and 5 months old when she was exposed to A-bomb radiation. The presumed exposure dose was 482.0 rad. Cataract due to A-bomb radiation. Case 2: female, 21 years and 6 months old when she was exposed to A-bomb radiation. The presumed exposure dose was more than 1,000 rad. Cataract due to A-bomb radiation and incipient cataract senilis. It was reported here that there was a marked difference in opacity findings of cataract due to A-bomb radiation in accordance with difference in exposure dose of radiation. It was also presumed from the findings of incipient cataract senilis that with increasing exposure dose, the aging phenomenon was promoted.

- 2633 EPIDEMIOLOGICAL STUDY ON PATIENT

EXPOSURE TO MEDICAL RADIATION. Kitabatake, T. (Niigata Univ. (Japan). School of Medicine). Nippon Igaku Hoshasen Gakkai Zasshi; 35: No. 4, 228-242 (Apr 1975). (In Japanese).

Several aspects of radiation risk were studied: 1) epidemiology, 2) X-ray mass surveys, 3) factors related to patients dose, 4) clinical judgment and the indications for X-ray examination, 5) abdominal X-rays of women of child bearing age, 6) irradiation of the fetus, and 7) radiotherapy for benign disease. The survey results showed that 1) frequent fluoroscopic examinations may be related to late induction of leukemia, 2) radiation risk in X-ray mass surveys can be reduced by solving some technical problems and general problems of mass screening, 3) patients with high benefit health insurance tend to receive more X-rays than patients with low benefit insurance, 4) of 2000 patients on whom gastrointestinal tract X-ray examinations were requested, no necessity for the examination was recognized in 10% of the cases, 5) only about half of the female patients of child bearing age were checked for menstrual cycle at the time of an X-ray study, 6) radiodiagnostic histories of 1485 pregnant women showed that 22% were X-rayed at any time during the gestation period, with an over age dose of 61 mrad (a dose which would correspond to introduction of 19.5 excess leukemias in children under the age of 10 years), and 7) about 10% of the patients in radiotherapy departments are being treated for benign diseases. (Evans, J.).

2634 COMMON PROBLEMS IN THE SCIENTIFIC, INDUSTRIAL APPLICATIONS AND IN THE MEDICAL APPLICATIONS. FROM STUDY MEETING ON THE APPLICATION OF ^{252}Cf . Matsuoaka, O. (National Inst. of Radiological Sciences, Chiba (Japan)); Ueno, K.; Kawashima, K.; Enomoto, S.; Kobayashi, M. Radioisotopes (Tokyo); 24: No. 4, 262-272 (Apr 1975). (In Japanese).

Latent danger of ^{252}Cf was mentioned in problems on ^{252}Cf metabolism and injuries. Characteristics of ^{252}Cf radiation toxicity were considered from three points of character of emission radiation, chemical nature and metabolism within living body. Acute biological effect, delayed effect, nucleic nature and chemical nature of ^{252}Cf were also discussed. On radiation source engineering, raw materials of ^{252}Cf , manufacture of radiation source for medical and industrial use, safety estimation of radiation source were discussed.

2635 MEDICAL APPLICATIONS OF ^{252}Cf . FROM STUDY MEETING ON THE APPLICATIONS OF ^{252}Cf . Tsunemoto, H.; Umegaki, Y. (National Inst. of Radiological Sciences, Chiba (Japan)); Onai, Y.; Tsuya, A. Radioisotopes (Tokyo); 24: No. 4, 249-261 (Apr 1975). (In Japanese).

Problems to be considered when ^{252}Cf is used as radiation source of small radiation source therapy were mentioned as follows: a) decision of adaptation range for therapy, b) necessity of clinical discussion in normal tissue injuries, and c) necessity of discussion on biological effect of irradiation in tissues with low dose. Therapy with ^{252}Cf must be made by the "after lounding technique", and occupational exposure must be avoided. Problems on ^{252}Cf dosimetry and radiation protection were also described. The structure of small radiation source for medical applications and its clinical applications were also mentioned.

2636 LEVELS OF IRRADIATION OF THE INHABITANTS OF VYBORG DUE TO NATURAL γ -BACKGROUND OF THE TERRITORY AND THE BUILDINGS. Kataev, V.G. (Leningradskij Inst. Radiatsionnoj Gigieny

(USSR)). Gig. Sanit.; No. 4, 48-53 (Apr 1975). (In Russian).

The author classed the population according to the levels of γ -background and estimated the absorbed doses of external irradiation of the population and the gonad doses. The data obtained allow the radiation hygiene specialists to differentiate the means of investigating the connection of vitally important health indices of the population with small radiation doses.

2637 RADON IN TREATMENT OF INFILTRATING CARCINOMA OF URINARY BLADDER. Hendricks, E.D.; Massey, B.D.; Nation, E.F.; Gallup, C.A.; Massey, B.D. Jr.; Edwards, J.W. Urology (Ridgewood, N.J.); 5: No. 4, 465-469 (Apr 1975).

Shown here are the results from the use of radon in the treatment of 146 patients with infiltrating carcinoma of the bladder. Ninety-four percent of the tumors had invaded the muscle of the bladder; 54 percent were Stage B₂ or worse. Ninety percent of the radon implantations were done cystoscopically. Twenty-one percent of the patients survived five years or longer, free of recurrence. An additional 8 percent were cured by follow-up treatment of recurrences. Complications and morbidity are minimal. Survival results compare favorably with more dangerous and debilitating methods of treatment.

2638 (AD-A--013250) BIOLOGICAL MEASUREMENTS IN RODENTS EXPOSED CONTINUOUSLY THROUGHOUT THEIR ADULT LIFE TO PULSED ELECTROMAGNETIC RADIATION. SCIENTIFIC REPORT. Baum, S.J.; Ekstrom, M.E.; Skidmore, W.D.; Wyant, D.E.; Atkinson, J.L. (Armed Forces Radiobiology Research Inst., Bethesda, Md. (USA)). Apr 1975. 22p. (AFRRI-SR--75-11). NTIS \$3.25.

Rodents were exposed continuously for 94 weeks of their adult life to a total of 2.5×10 to the 8th power pulses from the AFRRI electromagnetic pulse (EMP) simulator which provides five pulses per second with a peak electric field intensity of 447 kV/m, a 5-nsec rise time and 550-nsec 1/e fall time. The following biological parameters were measured: blood chemistry, blood and bone marrow cellular concentration, chromosomal aberrations, erythrocyte production, effects on fertility and reproductive capability and appearance of tumors and other late effects. At no time before and particularly as the rodents approached the end of their life-span did any of the biological measurements indicate an effect of the EMP radiation. While it is extremely difficult to prove the absence of any injury, it can be unequivocally stated that EMP exposure presented no biological hazard to the rodents of the present study. (GRA)

2639 (NIOSH--75-171) SOCIOLOGICAL ANALYSIS OF THE REDUCTION OF HAZARDOUS RADIATION IN URANIUM MINES. Pearson, J.S. (Denver Univ., Colo. (USA)). Apr 1975. 137p. Public Health Service, Salt Lake City, UT.

The report describes the responses of companies, unions, and government enforcement agencies to the problem of excessive radiation in uranium mines resulting in respiratory cancer in Colorado chiefly between the years 1950 and 1969. It focuses on the organizational actions which ultimately solved the hazard as well as the non-technological factors that prevented an earlier solution of the problem.

2640 SUBCLINICAL NEUROPATHY AT SAFE LEVELS OF LEAD EXPOSURE. Seppalainen, A.M.; Tola, S.;

Hernberg, S.; Kock, B. (University Central Hospital, Helsinki). Arch. Environ. Health; 30: No. 4, 180-183 (Apr 1975).

Electrophysiological methods revealed subclinical neuropathy in 26 workers, exposed from 1 to 17 years to lead and whose blood lead (PbB) values had never exceeded 70 µg/100 ml, as ascertained by checking the monitor reports of the factory and by careful exposure history. The PbB determinations had been tested repeatedly and had been found valid. The main findings were slowing of the maximal motor conduction velocities of the median and ulnar nerves and particularly the conduction velocity of the slower fibers of the ulnar nerve. Electromyographical abnormalities comprised fibrillations, diminution of the number of motor units on maximal contraction, and an abnormally long duration of the units. Earlier similar measurements from heavily exposed workers had been even more abnormal. Thus, a dose-response relationship exists on a group basis. Since the regular monitoring of PbBs in most workers during their entire period of exposure excludes the possibility of a body burden out of proportion to the PbB slight neurological damage is produced at exposures hitherto regarded as quite safe.

2641 (COO--119-250, pp 128-137) INDUCTION OF OSTEOGENIC SARCOMA BY $^{239}\text{PuIV}$ (POLYMERIC) IN BEAGLES. Stevens, W. (Argonne National Lab., IL); Atherton, D.R.; Buster, D.S.; Grube, B.J.; Bruenger, F.W.; Lindenbaum, A. 31 Mar 1975.

Research in radiobiology. Annual report of work in progress in the internal irradiation program.

Previous studies in this laboratory have demonstrated the ability of monomeric $^{239}\text{PuIV}$ to induce osteogenic sarcomas in beagles when administered as a single injection in a wide range of doses. The latent period for induction decreased as the injected dose increased from 0.016 up to 0.9 µCi/kg ^{239}Pu . The effect of the chemical form of the injected ^{239}Pu on its distribution within the dog has been studied (1). At the time of these experiments, two additional dogs were injected with 0.9 µCi/kg of polymeric ^{239}Pu for lifespan studies. Both of those dogs have developed osteogenic sarcomas with latent periods similar to those in animals which received 0.9 µCi ^{239}Pu /kg of monomeric plutonium. Dose response calculations disclose that slow release of plutonium from the liver and subsequent protracted and apparently continuous deposition of the nuclide in the skeleton was much more effective in producing osteogenic sarcoma than deposition resulting from a single injection of monomeric plutonium.

2642 (COO--119-250, pp 182-187) CURRENT STATUS OF, AND OCCURRENCE BY SITE OF OSTEOSARCOMA IN BEAGLES INJECTED WITH RADIUM-226. Kimmel, D.B.; Taylor, G.N.; Dell, R.B.; Johnson, F.; Jee, W.S.S. 31 Mar 1975.

Research in radiobiology. Annual report of work in progress in the internal irradiation program.

A total of 76 osteosarcomas occurred in 58 beagles injected with radium-226. There were 15 sites examined for incidence with no obvious trends noted. The sites of the R2 (0.35 µCi ^{226}Ra /kg injected) osteosarcomas were distal femur, proximal femur, ischium, hard palate, and proximal humerus. The R1.7 (0.16 µCi ^{226}Ra /kg) osteosarcoma site was the cribriform plate. The osteosarcoma latent period became longer as the dosage of Ra-226 was decreased.

2643 (COO--119-250, pp 197-209) MAMMARY NEOPLASIA IN A CLOSED BEAGLE COLONY. Taylor, G.N.; Shabestari, L.; Williams, J.; Mays, C.W.; Angus, W.; McFarland, S. 31 Mar 1975.

Research in radiobiology. Annual report of work in progress in the internal irradiation program.

The incidence rate of mammary neoplasia in a large colony of beagles and its relationship to internal skeletal and/or liver radiation, age, relatively late ovariectomy (4 years and older), endometritis, parity status, and adrenal weight was examined. Of these various factors, age was the only condition that was clearly correlated with changes in the mammary tumor incidence. The rate became significant at approximately eight years of age and increased progressively throughout the successively older age classes. Within the female dogs, the incidence of mammary cancer was higher than that of any other form of spontaneous malignancy.

2644 (COO--119-250, pp 231-237) FISSION FRAGMENT INDUCTION OF BONE SARCOMAS. Mays, C.W.; Taylor, G.N.; McFarland, S.S.; Pollard, T.A.; Brammer, D.; Brammer, T.; Taysum, D.H. 31 Mar 1975.

Research in radiobiology. Annual report of work in progress in the internal irradiation program.

Fission fragments, emitted by the spontaneous fission of ^{252}Cf , were much less effective per unit energy than were α -particles in the induction of bone sarcomas in C57Bl mice. This agrees with a similar finding by A. L. Brooks et al. on the ineffectiveness of fission fragments from ^{252}Cf in producing chromosome aberrations in the livers of Chinese hamsters. The reduced effectiveness of fission fragments is attributed to their extremely high LET (about 4000 keV/µm of tissue) which results in fewer cellular traversals, and probably more overkill per cell traversed than occurs with the same dose of α -particles, for which the LET is about 135 keV/µm. The indicated RBE of fission fragments relative to α -particles in the induction of bone sarcomas was between the 95 percent confidence limits of (--) 0.85 and (+) 0.35. Our best estimate of the RBE is about 0.03, based on theoretical considerations.

2645 IONIZING RADIATIONS AND THEIR EFFECT ON THE SWISS POPULATION. Pretre, M.S. Rev. Polytech.; No. 3, 265, 271 (25 Mar 1975). (In French).

The radiation load of all the Swiss population is considered, including those occupationally especially exposed to radiation. The figures are expressed in man.rems/yr and then multiplied by the population at risk. It is thus shown that whereas radiation induced death from natural radiation might account for some 36 deaths/yr, hypothetical deaths from diagnostic radiography could be as high as 216/yr (although it appears to be assumed that every member of the population is so exposed each year), and thus the greatest immediate benefit could be obtained by reducing diagnostic dosages of x-rays.

2646 (LURI--1975-02) PATIENT DOSIMETRY AT MAMMOGRAPHY. Gustafsson, M. (Lund Univ. (Sweden). Radiofysiska Institutionen). Mar 1975. 22p. (In Swedish). INIS.

As mammography has become a frequently used diagnostic technique, it is important to estimate the radiation doses. Experiments with thermoluminescent dosimeters are described. The dosimeters were calibrated against an ionization chamber (Victoreen). The sensitivity

of the dosimeters was determined directly after the compression tube and behind 27 mm polystyrene. Dose measurements on patients are described and mean absorbed dose in the mammary gland is calculated. Finally use of more sensitive films to reduce patient doses is discussed.

- 2647 (N--76-19801) GONAD DOSAGE IN MALES RESULTING FROM X-RAY DIAGNOSTICS. Koen, J.A.; Huyskens, C.J. (Interuniversitair Reactor Instituut, Delft (Netherlands)). Mar 1975. 73p. (IRI--190-75-05). NTIS \$4.50.

The genetically significant dosage (GSD) resulting from x-ray diagnostics in Dutch hospitals was investigated. The frequency distribution of the dosage per patient was determined for eight x-ray diagnostic types which together produce about 90 % of the GSD. Some 6600 tests were carried out, and an estimate of 20 mrad was obtained for GSD in males. No correlation could be made between measured gonad dosage and the technical parameters of x-ray diagnostics. Some recommendations are made for possible further studies, which should result in suggestions for dosage-limiting measures. (GRA)

- 2648 RADIATION SAFETY IN FLIGHTS OF HIGH ALTITUDE AIRCRAFT. Kovalev, E.E.; Petrov, V.M. Kosm. Biol. Med.; 9: No. 2, 54-59(Mar 1975). (In Russian).

- 2649 THE OCCUPATIONAL EXPOSURE OF RADIATION WORKERS, I. Kawasaki, S.; Yamada, N.; Sakurai, K. (Yamaguchi Univ., Ube (Japan). School of Medicine). Yamaguchi Igaku; 24: No. 1, 33-38(Mar 1975). (In Japanese).

Because the medical use of x-rays and radioisotopes is gradually increasing for diagnosis and therapy, radiation workers, special doctors, nurses and radiological technicians have occupational exposure. Procedures for monitoring external exposure of personnel include the wearing of a film badge or a pocket chamber. The results of film badge monitoring in Yamaguchi University Hospital for the last 10 years were described. In 1964, the total number of film badges that radiation workers used during a 2 week period of radiological examination and therapy was 610. This has been increasing yearly, and in 1972 it was 1999. Radiological technicians generally had low occupational exposure, and about 90 per cent of their film badges were exposed to less than 10 mR. Approximately 65 per cent of the film badges that nurses used were less than 10 mR, but some nurses who worked in radium therapy at the isotope ward suffered large doses. Some nurses had occasionally exposure higher than 100 mR in radiological examination. Some doctors sustained an occupational exposure of more than 150 mR. From these data, some problems on radiation monitoring using a film badge were discussed.

- 2650 REPORT ON CYCLOTRON ACCIDENTS. Hoshasen Kagaku; 18: No. 3, 49-54(Mar 1975). (In Japanese).

Exposure accident in relation to a cyclotron is reported. The cyclotron was set up for cancer treatment, diagnosis of various diseases, and the production of short life isotopes, using neutrons. The aim of jobs and the arrangement of personnel at the time of the

accident are explained. Occurrence of injury of fingers was found, and the experiment for investigating the causes, and exposure dose estimation experiment were attempted. The course of the injured and the action taken after the accident are briefly reported. Accident prevention measures are proposed against further injury. (Yamamoto, Y.).

- 2651 MEASUREMENTS OF EXPOSURE IN CHEST X-RAY EXAMINATIONS CONDUCTED IN YAMAGUCHI PREFECTURE. Otsuka, A. (Yamaguchi Univ., Ube (Japan). School of Medicine); Oda, T.; Ito, Y. Nippon Hoshasen Gijutsu Gakkai Zasshi; 30: No. 6, 559-563(Mar 1975). (In Japanese).

In recent years, people have become increasingly concerned about radiations, especially those use in the medical field. In this situation, many radiological technicians are required to know about X-ray irradiation doses given to patients. It also is considered important for us to learn practical irradiation doses in X-ray examinations conducted in each hospital and clinic. Therefore, by taking an example of the chest X-ray examination which is one of the most popular diagnostic procedures, we measured the exposure in air just at the back of a 20 cm-thick thorax model made of foaming polystyrol at 30 different institutions in Yamaguchi Prefecture. In these measurements, pocket chambers and film badges were employed. As a result, the average exposure in air was found to be 23.5 mR $\pm$ 8.5 (SD).

- 2652 NOTES ON A PERIODICAL INSPECTION OF THE SKIN FOR RADIOLOGICAL HEALTH. Yoshizawa, Y.; Kusama, T. (Tokyo Univ. (Japan). Faculty of Medicine); Hoshino, M.; Ono, M. Hoken Butsuri; 10: No. 1, 13-16(Mar 1975). (In Japanese).

- 2653 ISSUES OF THE MEETING OF THE MAIN COMMITTEE OF THE INTERNATIONAL COMMISSION ON RADIOLOGICAL PROTECTION (ICRP) IN BRIGHTON (ENGLAND, APRIL, 1973). Moskalev, Yu.I. Gig. Sanit.; No. 3, 93-95(Mar 1975). (In Russian).

For English translation see the journal Hyd. Sanit..

An information on dose limits of irradiation, reports of 4 committees of the commission, and ICRP committee members' communications on concepts and basic problems of radiation protection and measurements were presented at the meeting. It was decided to create several new working groups to develop basic standards of radiation protection based on existing radiobiologic information on effects of protracted radiation exposure and LET contribution to genetic and somatic effects of radiation. The first committee discussed the radiation dose limit problem, radiation protection and maximum tolerable levels for eye lens and skin exposure being of particular interest. Data on the genetic load from radiotherapy of young patients of reproductive age, and the relative significance of radiation-induced carcinogenesis and mutagenesis as tolerable dose limiting factors are analyzed. The second committee reported on the manual in preparation on dosimetry of incorporated radionuclides, with basic principles of calculation and reported actual figures of tolerable levels of radioisotope and radioactivity concentrations in air under conditions of professional irradiation (40-hr working week). The third committee was concerned with protection from external

radiation sources. A special group on patient protection in radiotherapeutic use of ionizing radiation has been formed. The joint working group of the third and fourth committees has continued its work on revision of the 5th ICRP publication on treatment and storage of radioactive material in hospitals and scientific institutions. The fourth committee reported on results for the 1972-73 period, concerning recommendations related to accidental irradiation, and radiation protection in uranium mines, also relevant to labor conditions elsewhere.

- 2654 CLINICAL TRIALS WITH NEW RADIATION MODALITIES. Bush, R.S. (Ontario Cancer Inst., Inc., Toronto). J. Can. Assoc. Radiol.; 26: No. 1, 54-63(Mar 1975).

It is suggested that the investigation of a new clinical modality involves a major commitment by the whole clinical group of the department involved and not just by the people chosen to be the primary investigators. As a base for comparison, it requires a detailed knowledge of the results and sites of failures and complications of the therapy used by that department. To make adequate relative biologic effect studies for the new modality, suitable comparative, quantitative tissue and tumor assays have to be done with photons and these could be done and established before the new modality came on line. For the Phase III trial, which is usually considered a randomized comparative trial, it can be argued (and a method is proposed) for the use of a non-randomized study to make the maximum use of patients coming to the center.

- 2655 ANIMAL EXPERIMENTS IN RADIOTHERAPY. I. SMALL ANIMALS. Kallman, R.F. (Stanford Univ. School of Medicine, CA). J. Can. Assoc. Radiol.; 26: No. 1, 15-24(Mar 1975).

From Annual meeting of the Canadian Association of Radiologists; Vancouver (22 Apr 1974).

This is a brief review of the contribution that the small laboratory animal, in particular the mouse, has made to experimental radiotherapy. Despite the great differences between mouse and man (e.g. size and life span), there are similarities of tissue cell kinetics and radiation response which greatly aid in the mouse-to-man extrapolation. The crucial advantage of being able to perform experiments with spontaneous tumors transplanted into syngeneic hosts is discussed. Examples are given of work using the tumor control dose (TCD₅₀) endpoint, the endpoint dilution assay, two different clone-counting assays, and the tumor regrowth system. The sophistication that can be achieved with an animal as small as a mouse is illustrated by two studies: one of prolonged intra-arterial catheterization, the other of blood flow measurements in an irradiated limb.

- 2656 DOSE AND EFFECT RELATIONSHIP OF RADIATION INDUCED CANCER AND ITS INFLUENCING FACTORS IN EXPERIMENTAL ANIMALS. I. Sasaki, S.; Sato, F.; Eto, H. (National Inst. of Radiological Sciences, Chiba (Japan)). Hoshasen Kagaku; 18: No. 3, 42-48(Mar 1975). (In Japanese).

The data of risk evaluation of external irradiation were integrated with animal experiments from the aspects of qualitative generalizations of characteristics of radiation induced tumors. Studies covered competition of cause of death, figure of dose-to-effect relationship, characteristics of low dose rate of irradiation, relative biological

effectiveness (RBE) of high LET radiation, effects of fractionated irradiation, complex actions with chemical substances, effects of protectional medium, differences of radiosensitivity by species and strains, and age dependency of sensitivities. Competition of cause of death by time length of latent period and degree of malignancy of the disease. Discussion on competition of death suggested the following idea: 1) incidence of tumor induction in the individual level did not correspond to transformation in the cellular level, and 2) relative incidence of tumor induction after a certain dose of whole body irradiation did not indicate the relative sensitivity of each tissue, for the relationship between tumor incidence and exposure dose was not a linear relationship. The dose-to-effect relationship of tumor induction was decided by the following factors: i) sensitivity on transformation of cells, ii) sensitivity on the death of potential tumor cells, and iii) competition of the cause of death. Tumor induction by low dose rate irradiation was also studied by comparing qualitative and quantitative differences between high dose rate single irradiation and a series of low dose rate irradiation.

- 2657 GENETIC EFFECTS OF ³²P IN SWINE. Reedy, P.P.; Ebenezer, D.N.; Krishna, M.; Reddi, O.S. (Osmania Univ., Hyderabad (India). Dept. of Genetics). J. Nucl. Agric. Biol.; 4: No. 1, 11-15(Mar 1975).

26 refs..

Genetic effects of ³²P administration in single dose and chronic doses has been studied in both male and female swine. Parameters measured were litter size at birth and weaning, sex ratio, neonatal and postnatal mortality, body weight and congenital abnormalities. Observations show that ³²P, in particular if administered in chronic doses causes chromosome breaks in male and female germ cells and therefore any indiscriminate use of ³²P in human medicine is fraught with genetic hazard.

- 2658 EFFECTS OF LOW DOSE X-RAY ON THE GENESIS AND DIFFERENTIATION OF THE CEREBROCORTEX. III. EARLY CHANGES OF UNDIFFERENTIATED CELLS OF THE NERVOUS SYSTEM OF THE CEREBRUM OF MOUSE EMBRYOS EXPOSED ON THE 10TH EMBRYONIC DAY. Hayashi, Y.; Hoshino, K.; Kameyama, Y. (Nagoya Univ. (Japan). Research Inst. of Environmental Medicine). Nago. Daigaku Kankyo Igaku Kenkyusho Nempo; 26: 152-154(Mar 1975). (In Japanese).

One systemic irradiation of 25 R and of 100 R (for comparison) of X-ray was performed on the 10th pregnant day of CF 1 mice, and the brain mantle of the embryos exposed in the placenta was observed under electron microscope 30 minutes, 1 hour, 2 hours, 3 hours, and 5 hours, after irradiation. In both 25 R and 100 R groups, there were observed two types of dense body 30 minutes after irradiation; one contacting the nucleus with an obscure border and the other being present apart from the nucleus and not being covered with the membrane. No prominent change was observed in the nucleus or membrane of cells possessing a dense body in the cytoplasm. Three hours after irradiation, there were numerous cells possessing a dense body covered with the membrane as well as nuclear concentration.

- 2659 EFFECTS OF LOW DOSE X-RAY ON THE GENESIS AND DIFFERENTIATION OF THE CEREBROCORTEX. II. OBSERVATIONS ON THE CELL CYCLE AND PYKNOSIS OF THE MATRIX CELLS OF THE END-BRAIN OF MOUSE EMBRYOS EXPOSED ON THE 13TH EMBRYONIC DAY.

Hoshino, K.; Hayashi, Y.; Kameyama, Y. (Nagoya Univ. (Japan). Research Inst. of Environmental Medicine). Nagoya Daigaku Kankyo Igaku Kenkyusho Nempo; 26: 150-151(Mar 1975). (In Japanese).

CF 1 mice were irradiated to 25 R or 100 R of X-ray on the 13th pregnant day. Immediately after irradiation ^3H -thymidine was injected, and litters were collected at intervals of 1-2 hours for the preparation of autoradiograms of the end-brains of the litters. The cell cycle and each stage of matrix cells of the end-brain were obtained by measuring the graph on which the rate of labeled mitotic cells in the matrix was plotted with the lapse of time. For the incidence of pyknosis more than 1000 Cells of the nervous system of the mantle of the end-brain were observed. The fluctuations of the cell cycle of end-brain matrix cells were more prominent in both the 25 R and 100 R groups than in the exposure on the 10th embryonic day, showing shortening of Stage S in proportion to dose, which was not observed in the exposure on the 10th embryonic day, as well as prolongation of Stage G₂. In addition, shortening of Stage G₁ was observed in the 100 R group. The incidence of pyknosis was higher in both the 25 R and 100 R groups than in the exposure on the 10th embryonic day. The 25 R group showed a peak of 8% 5 hours exposure, and the 100 R group showed two peaks, 35% 4 hours later and 45% 8 hours later.

- 2660 EXPERIMENTAL CEREBRAL DYSPLASIA PRODUCED BY X-RAY. CEREBROCORTICAL DYSPLASIA OF MICE DUE TO EXPOSURE TO 50 R OR 100 R IN THE EMBRYONIC STAGE. III. Kameyama, Y.; Hayashi, Y.; Hoshino, K.; Ito, Y. (Nagoya Univ. (Japan). Research Inst. of Environmental Medicine). Nagoya Daigaku Kankyo Igaku Kenkyusho Nempo; 26: 147-149(Mar 1975). (In Japanese).

CF 1 mice were irradiated to 50 R or 100 R of X-ray on the 17th embryonic day, and observations were made on the weight of brain, the thickness of cerebrocortex, the density of cortical cells, and the growth condition of the dendrite of nerve cells of exposed litters 6-52 weeks after birth. Similar observations to those in the previous report were made on the brain of litters exposed on the 10th, 13th, or 15th embryonic day, 52 weeks after birth. The group exposed on the 17th embryonic day showed no change in the weight of brain, the thickness of cortex, or the density of cortical cells, but a slight dysplasia of the dendrite of pyramidal cells was observed as was in litters exposed on the 15th embryonic day. Shortage of the cortical cell count in the 52nd week was observed only in litters exposed to 100 R on the 13th embryonic day.

- 2661 AUTOPSY CASE WITH MALIGNANT LIVER TUMOR CAUSED BY THOROTRAST. Sugiura, T.; Katayama, K.; Shinta, K. (Matsue City Hospital, Shimane (Japan)); Yamazaki, I. Shimane Igaku; 5: No. 3, 310-315(Mar 1975). (In Japanese).

This paper reported the roentgenographic, laparoscopic and autopsy findings of a patient with thorotrast liver complicated with malignant liver tumor, which was considered to develop 35 years after the infusion of thorotrast. Laboratory findings of a 67-year-old man, who got a war wound before 35 years and received angiography by using thorotrast at that time, indicated marked symptoms of liver parenchymal disturbance, biliary occlusion and malignant liver tumor. X-ray examination revealed arborescent and reticular abnormal shadow in the liver and the spleen and spotted shadow at the liver hilus. Laparoscopic findings revealed reticulate grayish-yellow particles adhered to the recessus of the

nodules in the surface of the liver. Liver biopsy showed deposition of thorotrast granules and necrosis and scar formation of the hepatic cells. Microautoradiography revealed α -track from the region where thorotrast was deposited. Postmortem findings revealed thorotrast liver cirrhosis, primary liver tumor (reticulo-endothelial sarcoma), circular calcium deposit in the hepatic duct, the bile duct and the portal vein, and cholangitis, demonstrating delayed disturbance by thorotrast.

- 2662 PRENATAL EFFECTS OF IODINE-131 IN MICE. Ebenezer, D.N.; Krishna, M.; Reddy, P.P.; Reddi, D.S. (Osmania Univ., Hyderabad (India). Dept. of Botany). J. Nucl. Agric. Biol.; 4: No. 1, 26-28(Mar 1975).

23 refs..

Pregnant mice of C₃H/He strain were injected intraperitoneally with 10 μCi of radioiodine on 3.5 day of gestation and allowed to go to term. There was no effect of isotope on the mortality and fertility of treated mice although the data showed an apparent reduction in respective parameters. The litter size recorded at birth was significantly ($P < 0.05$) lower than in control indicating the marked effect of radioiodine on the embryos dying at pre- and post-implantation levels. Further, reduction in litter size recorded at weaning was due to neo- and post-natal mortalities. The data on sex-ratio and body weights in experimental group did not differ significantly ($P < 0.05$) from those obtained in the control group.

- 2663 DETERMINING OF THE GENERAL ACTIVITY OF TRITIUM IN AN ALIVE BODY. Bogdanov, K.M.; Kalinina, E.V.; Kossova, G.V.; Romanovskaya, L.D. (Moskovskij Gosudarstvennyj Univ. (USSR). Biologo-Pochvennyj Fakul'tet; Akademiya Meditsinskikh Nauk SSSR, Obninsk. Nauchno-Issledovatel'skij Inst. Meditsinskoj Radiologii). Gig. Sanit.; No. 3, 88-90(Mar 1975). (In Russian).

For English translation see the journal Hyg. Sanit..

The proposed technique includes sampling of 1 to 3 ml of venous blood which is subjected to chemical analysis and further calculation of general activity of the aqueous phase of host and that of tritium involved in metabolism of biochemical structures. The total isotope concentration in the host is obtained by summarizing these data. The in vivo measurements of the general tritium activity well provide an effective means of controlling the health of people dealing with radioactive hydrogen, and a direct diagnostic method of detecting hydrogen metabolism fluctuations and, therefore, to follow protein and fat metabolism in human biochemical structures in normal conditions and in case of pathology.

- 2664 INVOLVEMENT OF T- AND B-LYMPHOCYTES IN THE IMMUNE RESPONSE TO THE PROTEIN EXOTOXIN AND THE LIPOPOLYSACCHARIDE ANTIGENS OF VIBRIO CHOLERAE. Kateley, J.R.; Patel, C.B. Friedman, H. (Albert Einstein Medical Center, Philadelphia). Ann. N.Y. Acad. Sci.; 249: 404-412(28 Feb 1975).

The immune response at the level of individual immunocytes to the somatic lipopolysaccharide antigen derived from whole *Vibrio cholerae* and to the purified protein exotoxin from this organism were studied in terms of the role of T- and B-lymphocytes. By adoptive cell transfer studies with irradiated recipient mice, it was shown that normal spleen cells from normal syngeneic mice could readily transfer the capability of responding to both types of cholera antigens. However, when the

spleen cells were depleted of T-cells with anti-theta serum and complement, antibody responsiveness to the LPS antigen, but not the exotoxin, could be achieved in recipients. Furthermore, by appropriate transfer of either bone marrow, thymus, or thymus-marrow cell mixtures to irradiated mice, it was shown that the response to the cholera somatic antigen was relatively independent of thymus cells, whereas the response to exotoxin required "helper" T-cells.

- 2665 URINARY EXCRETION OF ^{87}Rb IN UNEXPOSED INDIVIDUALS. Holgye, Z. (Ustav Hygieny Prace v Uranovem Prumyslu, Pribram (Czechoslovakia)). Cas. Lek. Cesk.; 114: No. 6, 175-177 (Feb 1975). (In Czech).

The amount of ^{87}Rb in the urine of 25 non-exposed male adults was investigated. It was found that the mean daily amount excreted by these individuals was 32.9 pCi ^{87}Rb /day corresponding to 1.73 mg Rb/day, the specific activity of ^{87}Rb being equal to 1.9×10^{-8} Ci/1 g Rb.

- 2666 RESULTS OF CLINICAL AND HYGIENIC OBSERVATIONS OF LABOUR CONDITIONS AND THE STATE OF HEALTH OF PERSONNEL AT RESEARCH REACTOR FACILITIES. Moiseitsev, P.I.; Denisova, E.A.; Korlyakova, E.A.; Sizikova, N.V. At. Energ. (USSR); 38: No. 2, 90-93 (Feb 1975). (In Russian).

For English translation see the journal Sov. J. At. Energy.

Complex studies of operating conditions and health status of the personnel employed in research reactors or in critical assembly have been undertaken in order to define more precisely the regulations, requirements, and norms of radiation safety to be applied during the designing and operation of various facilities. The main potential sources of external radiation, dose rates for gamma radiation, neutron fluxes, and maximum annual doses received by personnel under normal reactor operation have been determined. Clinical physiological studies have shown that the health of the personnel employed at nuclear reactors is satisfactory.

- 2667 (AD--A029400) COMPARISON OF ENVIRONMENTAL IMPACTS OF COAL AND NUCLEAR SYSTEMS FOR MILITARY UTILITY APPLICATION AND CONSEQUENCES OF REACTOR ACCIDENTS. FINAL REPORT. Doyle, M.R.; Golay, M.W.; Rasmussen, N.C. (Massachusetts Inst. of Tech., Cambridge (USA). Dept. of Nuclear Engineering). Feb 1975. Contract DAAK02-74-C-0308. 126p. NTIS (US Sales Only) \$6.00.

This study compares the environmental impacts of a coal district heating station and a high temperature gas cooled reactor total energy system. In addition, the consequences of nuclear accidents are predicted. Radioactive, chemical and thermal emissions from the two plants are determined and methods of control are discussed. The costs of control systems are estimated from a variety of sources including current prices provided by manufacturers. The consequences of nuclear accidents are predicted by use of the computer model developed for the Wash 1400 Reactor Safety Study of the Atomic Energy Commission. This model predicts the number of acute deaths, illnesses, cancers, and genetic diseases and the monetary cost which would be expected from the worst possible accident at the nuclear plant. (Author) (GRA)

- 2668 METHODS FOR REDUCING EXPOSURE TO PERSONNEL LEAK-TESTING SEALED RADIUM SOURCES.

Pasternak, T.J.; Bohning, D.E.; Vacirca, S.J. Health Phys.; 28: No. 2, 111-121 (Feb 1975).

A proposed method of leak-testing a drawer containing sealed radium source is described: if the result of an initial wet wipe of the upper surface of the drawer is positive, the sources are tested individually, starting with the one having the least activity and ending as soon as a contaminated source is found, with the exception that the last (highest activity) source is never tested since it is inferred to be the leaker if no preceding source has been found to be contaminated. Detailed evaluation of this procedure is given. Consideration is also given to storage arrangements: using the recommended leak-testing procedure, exposure is minimum when the distribution of sources among drawers is as alike as possible with respect to the number, arrangement and activity of sources per drawer.

- 2669 BENEFIT VS RISK IN THE PRACTICE OF NUCLEAR MEDICINE. Loken, M.K.; Payne, J.T. (Univ. of Minnesota, Minneapolis). Minn. Med.; 58: No. 2, 173-186 (Feb 1975).

Uses of radioisotopes in the practice of medicine have increased several fold during the past two decades leading to the establishment in 1972 of certification in the specialty of Nuclear Medicine by the National Board of Medical Examiners. An overview of radiation exposures to patients undergoing Nuclear Medicine procedures has been presented along with considerations of benefits that patients might derive from having had these procedures performed. Specific reference has been made to representative procedures in which specific radiopharmaceuticals are administered to patients. The radiation dose to patients is shown to be quite low for most procedures, almost always less than that delivered during comparable radiologic procedures. The risk from low doses of radiation has been conservatively estimated by extrapolating to zero dose from data on radiation effects observed at high dose levels. Thus, this conservative estimate represents the maximum risk, with the actual risk likely to be considerably below this value. This fact has been substantiated in many experiments in radiation biology in which a radiation dose has been delivered using several fractionated smaller doses, allowing for repair and recovery between each dose and thus reducing the radiation effect from that which would have occurred had the radiation been delivered acutely.

- 2670 (DHEW/FDA--75-8020) AUTOMATION OF SCHEDULING AND FILE ROOM FUNCTIONS OF A DIAGNOSTIC RADIOLOGY DEPARTMENT. VOLUME I. Lazarus, C.B.; Poitras, J.W.; Mitchell, W.P.; Knowlton, R.H.; Kaley, M.E.; Ianello, J.M.; Arenson, R.L.; Taveras, J.M.; Barnett, G.O. (Massachusetts General Hospital, Boston (USA)). Feb 1975. Contract FDA 72-71. 163p. GPO \$2.35.

The automation of patient scheduling and file room functions of a diagnostic radiology department has been successfully accomplished at the Massachusetts General Hospital. Carried out under contract from the Bureau of Radiological Health, the pilot system includes scheduling, file room, and registration modules. The system has resulted in a reduction in delays in obtaining examinations and reports, and reduction in unnecessary radiation by allowing for the detection of possible duplicate, similar, or conflicting examinations. Film tracking ensures knowledge of the location of a master folder at all times.

2671 (IAEA-R--1365-F) COMPUTERIZATION OF THE ISODOSE DISTRIBUTION OF HIGH-ENERGY ELECTRONS IN HUMAN TISSUES. FINAL REPORT FOR THE PERIOD 15 MAY 1973 - 14 MAY 1974. Poretti, C. (International Atomic Energy Agency, Vienna (Austria)). Feb 1975. vp. NTIS (US Sales Only).

High energy electron beams are used very often for the treatment of cancer and the representation of the isodose distributions in case of radiation therapy with electrons is an absolutely necessary step for the improvement of the therapeutical results. Only a computer calculated plan can give the physicians the possibility to choose the right treatment plan between different proposals. Within the terms of this contract, a semi-automatic device for the digitalization of the electron isodose curves and contours is designed and constructed. It transfers the graphic information into a 13 bit BCD digital signal and can be stored on a paper tape with ASCII code. The paper tape can be converted in EBCDIC code by MDS2400 and be taped on a magnetic tape. A set of different computer subprograms enables the transfer of the data from the magnetic tape into the main program for the subsequent calculation of the isodose distributions in the body. The trial calculations with a IBM/370 computer has been successfully completed and some examples have been presented.

2672 (SSI--1975-009) GENERAL GUIDE-LINES FOR PERMISSIBLE RADIATION DOSES TO REVISION PERSONNEL OR THE LIKE AT NUCLEAR POWER PLANTS. Snihs, J.O. (Statens Stralskyddsinstitut, Stockholm (Sweden)). Feb 1975. 3p. (In Swedish). INIS.

It is both possible and reasonable, according to experiences so far, to keep the collective professional radiation dose to production and service personnel at a nuclear power plant below 0.2 manrem per year and MWe. Almost half the total professional irradiation may arise in connection with the revisions. For a nuclear power plant of the size 1000 MWe the revision work would imply 100 manrem per year. The mean value of the radiation dose to personnel professionally exposed is below 0.5 rem per year. If this mean value is applied to revision personnel 100 manrem per year would imply a staff of 200 persons working with radioactivity.

2673 NATURAL BACKGROUND RADIATION EFFECTS ON HUMAN BODIES. Eto, H.; Muramatsu, S. (National Inst. of Radiological Sciences, Chiba (Japan)). Hoshasen Kagaku; 18: No. 2, 21-26 (Feb 1975). (In Japanese).

The relationship between long-term exposure of low level natural background radiation and possible hazards were discussed referring to literature of various foreign countries. The frequencies of osteosarcoma, leukemia, cancer, and congenital malformation, and neonatal death rate, were compared between probable presence area and unlikely presence area. There were no significant differences between two types of areas because background radiation contributed slightly and other factors also corresponded. Researches in India and Brazil where background radiation was high were described.

674 CASE REPORT OF NECROSIS OF THE FEMORAL HEAD DUE TO RADIATION THERAPY IN INFANCY. Sekiguchi, K.; Kimura, H.; Kojima, T.; Takagi, H.; Miura, Y. (Tokyo Medical Coll. (Japan)). Kanto Seikei Geka Saigai Geka Kai Zasshi; 6: No. 1, 16-22 (Feb 1975). (In Japanese).

A case of necrosis of the femoral head due to radiation therapy of the hip joint in early infancy is presented. The patient (a seven-year-old female) who had been diagnosed as malignant melanoma four months after birth, received radiation therapy of 6500 R by a betatron. She also received radiation therapy of 8100 R after the radical operation. When she was two years old, a diagnosis of necrosis of the femoral head was made. When she was four, she had extreme lameness of the right leg. Subtrochanteric osteotomy was performed at the diseased site of the right hip joint, and a patho-histological study was made of a biopsy. The authors also report the microangiographical and patho-histological studies of fifty young rabbits which had received 300 rads and 6000 rads of Linac X-ray.

2675 BIOLOGICAL PROBLEMS OF PLUTONIUM. Matsuo, O. (National Inst. of Radiological Sciences, Chiba (Japan)). Genshiryoku Kogyo; 21: No. 2, 13-19 (Feb 1975). (In Japanese).

Toxicity of ^{239}Pu in vivo was discussed from the aspects of its physical, chemical, and in vivo metabolic characteristics. Biological actions of ^{239}Pu in vivo shown in literature, i.e., acute and late toxicities, and hazards of human bodies, were summarized. The proposition made by Tamplin, and arguments against it controverted by Bair et al. were discussed, and the significant problems of the controversy were as follows: 1) significance of the methodology of assessing the biological hazards, 2) shortage of radiobiological data concerning internal exposure by hot particles, 3) difficulty of extrapolating the data from experimental animals to those of human being, and 4) specificity of α -ray hazards. The maximum permissible dose would be restricted much more strictly.

2676 (DPST--74-551 (Rev.)) GAMMA EXPOSURE RATES IN THE STEEL CREEK AND LITTLE HELL LANDING AREAS. Marter, W.L. (Du Pont de Nemours (E.I.) and Co., Aiken, S.C. (USA)). Savannah River Lab.). 20 Jan 1975. 23p. Dep. NTIS \$3.50.

Aeroradiographic and ground transect γ surveys in the summer of 1974 were conducted to determine the degree of offsite radioactive contamination in an area immediately below the Savannah River plant boundary. Since it is recognized that mechanisms in the biosphere tend to cause nonhomogenous distribution and redistribution of radionuclides released to the environment, a plan was developed to continually evaluate the radioactivity of the offsite area. As part of this plan, a 1300-foot-long section of offsite swamp (42.9 acres) adjacent to the SRP boundary was surveyed in the latter half of October 1974 on a 10-foot grid pattern. The results of this survey show that 6.6 of the 42.9 acres surveyed in detail has γ exposure rates exceeding 57 $\mu\text{R/hr}$ (approximately 500 mR/yr). The maximum exposure rate found at a single grid point was 120 $\mu\text{R/hr}$. Approximately 5.8 Ci of ^{137}Cs was deposited in the 42.9-acre 10-foot grid survey area. It was calculated a hypothetical person residing continuously in the location of highest exposure rate when the swamp is not flooded (77 percent of the time each year) could receive an annual dose of about 809 mR. Previous surveys of this area indicated a maximum external annual dose of 357 mR under the same residency conditions. Even with the higher exposure rates detected in the 10-foot grid survey, the more probable incremental radiation dose (above background) to hunters and fishermen who spend a few hours to a few hundred hours in this section of swamp would range from less than 1

mR to a few tens of mR per year. (auth)

- 577 SPONTANEOUS MOTILITY EEG, AND SLEEP-WAKEFULNESS CYCLE DISTURBANCES IN RATS SUFFERED FROM FETAL X IRRADIATION. Kiyono, S.; Seo, M.; Takasu, K.; Shoji, R.; Takeuchi, I.; Murakami, U. (Inst. for Developmental Research, Aichi, Prefectural Colony, Kasugai, Japan). J. Phys. Soc. Jpn.; 37: No. 1, 4-6(1 Jan 1975).

In accordance with the recent development of behavioral studies in prenatally x-irradiated animals, several works have revealed functional changes in the maze learning and avoidance conditioning in those subjects. Since no reports, however, have examined the effects upon the sleep-wakefulness cycle except that of the acute lethal influence, preliminary results were presented in this paper.

- 2678 DETERMINATION OF THE ^{210}Po CONTENT IN THE URINE OF FILIPINO SMOKERS AND NON-SMOKERS. Juan, N.B.; Cruz, W.; Ballelos, E.; Bartolome, Z.M. (Philippine Atomic Energy Commission, Quezon City). Philipp. Nucl. J.; 3: No. 1, 243-246(Jan 1975).

The polonium content in the urine of Filipino smokers was compared with that of nonsmokers. The polonium was recovered from urine by centrifugation and deposition into silver discs. Quantitative results were obtained by counting the silver discs using a silicon surface-barrier detector. The average value obtained for smokers which was 0.5003 ± 0.2988 pCi/24 h sample was significantly higher than the value obtained for non-smokers which was 0.2313 ± 0.1664 pCi/24 h sample.

- 2679 APPLICATION OF THERMOLUMINESCENT DOSIMETRY IN X-RAY DIAGNOSTICS. Doubravsky, J.; Lidova, L.; Kamenicek, O. (Palackeho Universita, Olomouc (Czechoslovakia). Lekarska Fakulta). Cesk. Radiol.; 29: No. 1, 1-6(Jan 1975). (In Czech).

The radiodiagnostic application is discussed of thermoluminescent dosimetry using lithium fluoride (LiF). The use of thermoluminescent dosimetry in skiagraphic examinations is dealt with taking into consideration radiation load of gonads in hysterosalpingography. The advantages of thermoluminescent dosimetry are shown.

- 2680 OXYGEN-DEPENDENT EFFECT OF DOSE RATE IN γ -IRRADIATED PROTEINS. Kharchenko, L.I.; Pavlovskaya, T.E. (AN SSSR, Sverdlovsk. Inst. Khimii). Radiobiologiya; 15: No. 1, 21-26(Jan 1975). (In Russian).

For English translation see the journal Radiobiology.

The number of oxygen atoms bound per molecule of human serum albumin, gamma-irradiated in 10% solution at the maximum dose used (1000 kR), is 2.24, 2.62, 3.15 and 3.90 for dose rates 400, 200, 100 and 50 R/sec, respectively. The observed decrease in efficiency of irradiation at higher dose rates is explained by a rapid uptake of oxygen by radiation-chemical reactions which creates a hypoxic state in the object studied. It is supposed that the oxygen-dependent effect of dose rate can be found in all objects, provided the appropriate choice of intensity and total dose of irradiation is made.

- 2681 (AD-A--022183) ON THE STRINGENCY OF DOSAGE CRITERIA FOR BATTLEFIELD NUCLEAR OPERATIONS. Cohen, S.T. (RAND Corp., Santa Monica, Calif. (USA)). Jan 1975. 24p. (P--5332). NTIS \$3.50.

The major emphasis has been placed on dosage criteria for the production of a specified reduction in combat effectiveness, for relevant military tasks, within a given period after exposure. This has taken the form of determining a single dosage to describe the radiobiological effectiveness of a tactical nuclear weapon. The requirement for this dosage is that it produces a severe performance degradation within a short time after exposure and that the effect represents a specific human response -- i.e., permanent combat ineffectiveness. Such factors as transient incapacitation; delayed casualties and fatalities; less than severe performance degradation; and performance degradation resulting from synergistic relationships between weapon effects have not been given serious or adequate attention. (GRA)

- 2682 (NIRS-M--7, pp 77-79) OUTDOOR AND INDOOR DOSES. Fujimoto, K.; Abe, S. Jan 1975. (In Japanese).

From 1. NIRS seminar; Chiba, Japan (15 Feb 1974).

Methods and techniques for measurement of environmental radiation.

Human beings begin to be exposed to direct and indirect artificial radiation with the recent use of radioisotopes, artificial radiation sources and nuclear reactors, besides natural radiation. Even though these doses are very small in amount, their values as considered for the whole people in the country must be grasped always for future reference. The problems to be considered in case of obtaining the relation between indoor and outdoor doses and indoor dose rate were investigated. Here, population dose means gonad dose or bone marrow dose. The examination using multiple sampling is difficult to realize. So it is required to determine the population dose based on the surveys of lifeactivity and movement of population by determining typical dose in various environmental stages, as the second best plan. The proposal to estimate the present average dose in Japan is shown. Estimated values for natural radiation contribution are 36 mrad/y for earth origin, 26 mrad/y for cosmic ray contribution; total 62 mrad/y.

- 2683 (NIRS-M--7, pp 80-84) POPULATION DOSE ESTIMATION. Kato, Y. Jan 1975. (In Japanese).

From 1. NIRS seminar; Chiba, Japan (15 Feb 1974).

Methods and techniques for measurement of environmental radiation.

Critical organs in the individual or group injury due to radiation exposure are gonad and bone marrow. Estimation of the injury is performed with gonad dose and bone marrow dose, respectively. It is performed with genetically significant dose and leukaemia significant dose for groups. Estimation of the dose absorbed into the critical organs and population dose (significant) is described, but in limited case of photons. Tissue equivalent phantom must be utilized to determine the absorbed dose of critical organs. Absorbed dose distribution in human body is more complex because environmental radiation is not parallel beam, but impinges from 4 π directions, and its flux is directional. Simple explanation on both gonad dose and bone marrow dose is conducted. In estimating population dose, it is necessary to multiply the weight based on individual condition. The dose determined in accordance with the above concept is significant dose. Genetically significant and leukaemia significant doses are defined. Though the

United Nations Scientific Committee employs average bone marrow dose per year per man instead of the leukaemia significant dose, the Committee will transfer to use the significant dose corrected with weighting factor in future.

2684 STUDIES OF RADIATION HAZARDS.

Kumatori, T. (National Inst. of Radiological Sciences, Chiba (Japan)). Karada No Kagaku; No. 9, 61-66 (Jan 1975). (In Japanese).

The author reviews studies about radiation hazards in Japan, particularly the exposure to radiation in Nagasaki, Hiroshima and Bikini. The report by Dr. Masao Tsuzuki on the effect of radiation is summarized in the item concerning radiation hazards attributed to atomic bombs. It describes research studies of delayed radiation induced hazards, such as intrauterine exposure, cataract and malignancy from the reports of investigations conducted by ABCC (Atomic Bomb Casualty Commission) and from other reports. In addition, exposure dose and residual radioactivity are discussed, as well as the outline and process of hazards relative to the exposure at Bikini.

2685 SAFETY AND PROBLEMS IN USING RADIOACTIVE DRUGS IN HOSPITALS. Arimizu, N. (National Inst. of Radiological Sciences, Chiba (Japan)). Genshiryoku Kogyo; 21: No. 1, 17-20 (Jan 1975). (In Japanese).

The safety and the control problem of non-closed RI (radiopharmaceuticals) of which use has rapidly been increased, were studied. At present, the hospitals with an independent clinic for the nuclear medicine are very limited and many doctors, nurses and safety controllers who are working in the clinic belong to other clinics. As for the diagnosis using RI examination, the dangers of the persons who are working with radioimmunoassay, especially using Au-antigen kit were studied. Furthermore, the problems concerning the reduction of exposure dose by the use of a short half-life RI, such as ^{99m}Tc and the dangers of external exposure on the persons who use the isotope were studied. In addition, the control of RI ward for RI therapy was discussed. The author considered the specialization and fixation of doctors, nurses and technicians are becoming of necessity with the advancement of RI therapy. In addition, the necessity of training nurses for the nuclear medicine was insisted on.

2686 REDUCTION OF PATIENT EXPOSURE IN ROUTINE X-RAY DIAGNOSIS. Koga, S.; Naito, Y.; Sawada, T. (Fujita-Gakuen Univ., Aichi (Japan). School of Medicine). Rinsho Hoshasen; 20: No. 1, 67-70 (Jan 1975). (In Japanese).

Exposure in X-ray diagnosis was critical in spite of the fact that exposure dose of each examination was little, because the exposed population was large. In our study, exposure dose by routine diagnostic roentgenography could successfully reduce to 20 per cent of that under the standard condition. Reduction of exposure dose was achieved by using intensifying screen, such as MS, LT-II, and MSS for examination of infant pelvis, and obstetrical abdomen, and film as Sakura QS or Fuji Rx-s. X-ray quality was hardened by adding filter of 2mm Al, and total filtration was made up to 4 mm Al equivalent. Tube voltage was elevated to obtain favorable picture within short exposure time. Victoreen r-meter and Kyokko TLD1200 Type, elemental device included in Mg_2SiO_4 glass capsule, and water phantom were used for dosimetry. Area exposure dose in fluoroscopy was measured in the digestive tract exam. using Hitachi dose monitor. Above

mentioned exposure factors were combined, and under each conditions, exposure dose of the skin in various regions of the body. Chest roentgenography using LT-II screen showed 25 m of exposure dose obtaining 63 per cent reduction from standard roentgenography without screen. Furthermore, use of QS film decreased the exposure dose to 17 mR (43 per cent), and added 0.5 mm Al filter reduced it to 13 mR (33 per cent). Finally, filter of 0.3 mm Cu and 0.5 mm Al reduced it to 8 mR (20 per cent of standard exposure dose).

2687 RADIATION PROTECTION IN UNIVERSITIES.

Morikawa, N. (Tokyo Univ. (Japan)). Genshiryoku Kogyo; 21: No. 1, 21-23 (Jan 1975). (In Japanese).

Characteristics of the RI usage in universities are examined, and the problems of safety management are pointed out. Considering these factors, countermeasures are suggested for facilities, management organization and education and training. The facilities should be divided into two radiation levels, low and high. In the University of Tokyo "Radiation operator notebook" is utilized, and "Inspection system for radiation safety management" is examined.

2688 BIOLOGICAL ASPECT ON RADIUM THERAPY, AND APPROACH TO NEW RADIOTHERAPY BY SEVERAL SESSIONS A DAY. Mochizuki, S. (Jikei Univ., Tokyo (Japan). School of Medicine). Gan No Rinsho; 22: No. 2, 111-115 (Jan 1975). (In Japanese).

Through radiobiological study of treatment with radium, it was revealed that radium therapy has two such important features as (1) short overall treatment time and (2) low-dose rate irradiation and that it showed a higher therapeutic ratio than that of conventional high-dose rate fractionated irradiation. After searching for a high-dose rate irradiation method with these advantages of radium treatment, results were obtained which suggested the possibility of new radio-therapy with several sessions a day. In the new method, a small dose was applied several times a day. Then, the time-dose relationship of the new therapy was investigated, and an attempt was made to calculate the dose fractionation that seemed practical. The results obtained were in good agreement with those of Svoboda's recent clinical experience. However, since these results were based on many biological hypotheses, clinical application of them at present is risky. Prior to clinical application, it will be necessary to conduct a number of animal experiments.

2689 SOME ASPECTS OF BREEDING ECOLOGY OF WILD RODENTS IN CONNECTION WITH LIFE IN BIOGEOCENOSSES POLLUTED WITH ^{90}Sr . Isaev, S.I. (AN SSSR, Moscow. Inst. Morfologii Zhivotnykh). Ekologiya; No. 1, 45-51 (Jan 1975). (In Russian).

For English translation see the journal Ecology.

BIOLOGICAL RADIATION EFFECTS; CHRONIC IRRADIATION; CONTAMINATION; ECOSYSTEMS; EMBRYOS; FERTILITY; MORTALITY; POPULATION DYNAMICS; REPRODUCTION; RODENTS; SOILS; STRONTIUM 90

2690 ACTION OF IONIZING RADIATION ON CATALASE SYNTHESIS IN THE RAT LIVER. Komov, V.P.; Streikova, M.A. (Leningradskij Khimiko-Farmatsevticheskij Inst. (USSR)). Radiobiologiya; 15: No. 1, 111-113 (Jan 1975). (In Russian).

For English translation see the journal

Radiobiology.

3-amino-1,2,4-triazole was used to study the effect of total-body X-ray irradiation on the rates of catalase synthesis and breakdown in rat liver. It was found that in the interval between hour 22 and hour 144 of radiation sickness, the average rate of catalase synthesis in the liver was 2.6 times lower in rats that received a dose of 800 rads than in control rats.

- 2691 COMPARATIVE EVALUATION OF RADIATION DAMAGE TO THE INTESTINE IN LABORATORY ANIMALS DIFFERING IN RADIOSENSITIVITY. Fedotova, M.I.; Belousova, O.I. Radiobiologiya; 15: No. 1, 151-154 (Jan 1975). (In Russian).

For English translation see the journal Radiobiology.

The total number of cells in the duodenum of animals differing by radiosensitivity (Wistar rats, guinea pigs and rabbits) was determined at the time of the maximum fall in the quantity of such cells after irradiation with doses from 100 to 5000 R. The dynamics of cell number after 900, 1200 and 5000 R irradiation was also studied. The fall in the cell number was dose-dependent in the dose range of 1200 to 1500 R and the extent of devastation for a single dose varied with the species. A two-fold decrease in the cell number (CD_{50}) was observed at 500, 650 and 750 R for rats, rabbits and guinea pigs, respectively. Increasing the dose from 1500 to 5000 R did not result in any further fall of duodenum cell number in rats and guinea pigs (1200 R was the absolutely lethal dose for rabbits). The devastation process was the most rapid and pronounced in rats; in rabbits, and especially in guinea pigs, it developed slower and to a lesser extent.

- 2692 CHEMICAL PROTECTION OF MICE AGAINST REPEATED NEUTRON-IRRADIATION. Kavukchyan, T.V.; Sverdlov, A.G. (AN SSSR, Leningrad. Inst. Yadernoj Fiziki). Radiobiologiya; 15: No. 1, 74-78 (Jan 1975). (In Russian).

For English translation see the journal Radiobiology.

Radioprotective effects of chemicals have been studied using repeated neutron irradiation of mice at a dose of 3×100 rad and 2- and 4-day intervals between the treatments. Higher survival and efficiency of chemical radioprotection (Cystaphos-44.8%, cystamine-32%, mexamine-21%) have been observed for such mode of irradiation as compared to the single treatment with the same dose. This effect is attributed to the recovery processes taking place in the critical organs - the intestine and bone marrow.

- 2693 ACTION OF POLYVINYLSULPHATE ON METABOLISM OF NUCLEIC ACIDS AFFECTED BY RADIATION. Kharitanovich, N.P.; Dokshina, G.A.; Pegel, V.A.; Yartsev, E.I.; Yashunskii, V.G. (Institut Biofiziki, Moscow (USSR); Tomskij Gosudarstvennyj Univ. (USSR). Nauchno-Issledovatel'skij Inst. Biologii i Biofiziki). Radiobiologiya; 15: No. 1, 104-107 (Jan 1975). (In Russian).

For English translation see the journal Radiobiology.

Polyvinyl sulphate (PVS) as a nuclease inhibitor was used to protect endogenic nucleic acids from irradiation-activated nucleases. The survival of 700 rad irradiated rats was 33% and 60% in the control and PVS-treated (25 mg/kg) groups, respectively. PVS intravenously injected to 1000 R irradiated animals at 50 mg/kg inhibited DNase I in the liver and spleen and stimulated DNase 2 in the liver. A partial restoration of DNA level in the liver was

observed simultaneously with the inhibitory effect on alkaline nucleases (no restoration effect had been found in the spleen).

- 2694 ACTION OF THRICE- AND FIVE-TIMES REPEATED EXPOSURES OF RATS TO A LOW DOSE OF X-RAYS ON THE CARBOHYDRATE-ENERGY METABOLISM OF THE BRAIN. Mironova, T.M.; Cherkasova, L.S.; Fomichenko, V.G. (AN Belorusskoj SSR, Minsk. Inst. Fiziologii). Radiobiologiya; 15: No. 1, 42-45 (Jan 1975). (In Russian).

For English translation see the journal Radiobiology.

Rats have been subjected to whole-body X-irradiation either 3 times with 2- and 3-day intervals and the total dose of 40 R or 5 times with 3-day intervals and the total dose of 50 R. One day after the end of the 3 times irradiation course the following concentrational changes have been observed in brain hemispheres: increase in the biologically active glycogen-protein complex and creatine phosphate, and decrease in glucose-1-phosphate; after the 5 times irradiation course the changes have not been significant, though an elevated corticosterone level in blood has been noted in both cases. 9 to 15 days after the quintuple irradiation a discoordination of glycogenolysis processes against the background of lowered corticosterone level has been observed. The trend towards restitution of metabolism becomes apparent at the normal hormone level. The glycogenlipid complex has probably an adaptive function.

- 2695 MECHANISM OF RADIATION INDUCED CHANGES IN THE HETEROGENEOUS SYSTEM OF HAEMOGLOBIN. Starodub, N.F. (AN Ukrainskoj SSR, Kiev. Sektor Molekulyarnoj Biologii i Genetiki). Radiobiologiya; 15: No. 1, 27-31 (Jan 1975). (In Russian).

For English translation see the journal Radiobiology.

Alterations in fractional composition of rat hemoglobin resulting from in vitro and in vivo irradiation have been studied. Essential differences as well as similarities of the damage caused by the two modes of treatment to the heterogeneous system of this hemoprotein have been observed. The changes are, however, non-specific since similar alterations have been noted on exposure of hemoglobin to factors other than irradiation. The reasons of quantitative changes in the hemoglobin heterogeneous system of peripheral erythrocytes of irradiated animals are discussed.

- 2696 KINETICS OF THE IMMUNE RESPONSE OF UNEVENLY IRRADIATED (A PART OF THE BONE MARROW AND THYMUS SHIELDED) MICE OF VARIOUS LINES. Batyrbekov, A.A. Radiobiologiya; 15: No. 2, 309-310 (Jan 1975). (In Russian).

For English translation see the journal Radiobiology.

An attempt was made to amplify the immune response of non-uniformly irradiated mice by screening the bone marrow (B-lymphocyte source) by means of simultaneous protection of the thymus gland (T-lymphocyte source). Genetically determined differences between CBA mice (with high responses to sheep erythrocytes) and C57BL/6 mice (with high responses to sheep erythrocytes) were found to be associated with dissimilarly pronounced cooperative interactions between T- and B-cells. These interactions may have been due to dissimilar intensities of migrations of B- or T-lymphocytes from the bone marrow or thymus gland, respectively.

- 2697 DYNAMICS OF THE PHOSPHOLIPID METABOLISM IN THE RAT LUNGS AFTER INHALATION OF NITRATE SOLUTION OF POLYMERIC PLUTONIUM. Surina, A.G. Radiobiologiya; 15: No. 1, 145-147 (Jan 1975). (In Russian).

For English translation see the journal Radiobiology.

The content and synthesis of certain phospholipids was studied in the lungs of rats after single inhalation of polymeric plutonium nitrate solution (0.26 μ Ci per 1 g of lung tissue). The changes in phospholipid metabolism in plutonium-treated lungs were represented by an increased content and inhibition of synthesis of these substances. All phospholipid fractions, and to the most extent phosphatidyl choline, accounted for the increase in total phospholipids observed from 2 weeks to 2 months after the treatment.

- 2698 HEMATOLOGICAL EFFECTS OF TRITIUM-LABELLED COMPOUNDS AND PHOSPHOROUS-32 ON FIELD RATS (R. R. MINDANENSIS). de la Cruz, B.; Soriano, E.A.; Padrelanan, E.M.; Paradero, R.R.; Gregorio, J.S.; Yumul, B.V.; Medina, F.I.S. (Philippine Atomic Energy Commission, Manila). Philipp. Nucl. J.; 3: No. 1, 268-273 (Jan 1975).

The range of normal values for red blood cells, hemoglobin, blood platelets, total white blood cells and differential count for the adult male and female field rats (*Rattus rattus*) was determined. The mean values for the eosinophils, neutrophils, and lymphocytes which were 2.3%, 25.69% and 69.05% for the male rats were higher than the corresponding mean values of 1.2%, 20.48% and 64.44% in the female. The hemoglobin values of 14.61 gms/100 ml in the female rats were found to be higher than 12.8 gm/100 ml in the male rats. During the whole period of the hematological investigation, bone marrow studies were not available. Although occasional binucleate, lymphocytes and a typical granulocytes were seen in the peripheral blood, no manifestations in the different peripheral blood elements were detected to indicate the presence of a leukaemic process in the irradiated animals. Regarding the somatic effects of internal radiation which will shorten the life span of the experimental animals, only one male rat which was exposed to 50 μ Ci tritiated thymidine developed a tumor in the right kidney. In general, no shortening of life span was observed and the treated parent rats could still reproduce and give birth to certain progenies with heritable defects.

- 2699 (PB--266490) FILMS AND FILMSTRIPS ON OCCUPATIONAL SAFETY AND HEALTH. (National Inst. for Occupational Safety and Health, Cincinnati, Ohio (USA)). Jan 1975. 55p. (DHEW/PUB/NIOSH--75/128; NIOSH--75/128). NTIS PC A04/MF A01.

Films and filmstrips on occupational safety and health are listed by general topics, and by title, indicating whether the item is a motion picture or filmstrip, whether it has sound, is in color, the time length, the date of production, its loan-free source (including address) and its contents briefly. Also included is a list of organizations that offer rental and sale of films and filmstrips. Topics include safety with chemicals, construction and plant safety, electricity, equipment, eyes and vision, falls, slips, and backs, fire and explosion, general safety, hospitals and nursing, industrial hygiene, industrial medicine, laboratory safety, lead poisoning, mental health, chronic mercurialism, mining, noise, pesticides, power tools, protective devices, radiation, skin, supervision and

welding.

- 2700 GONAD DOSE IN THE GASTRIC FLUOROSCOPY. Higashida, Y.; Otsuka, A. (Yamaguchi Univ., Ube (Japan). School of Medicine). Nippon Hoshasen Gijutsu Gakkai Zasshi; 30: No. 5, 475-482 (Jan 1975). (In Japanese).

In recent years, with the increasing use of the medical X-ray examinations in Japan, the frequency of the irradiated persons has also increased year by year. In Japan, X-ray examinations of the gastrointestinal tract occupy almost half of the genetically significant dose. The gonad dose of female in the gastric fluoroscopy has been estimated. This study particularly concerns the difference of fluoroscopic time between the radiologists and nonradiologists and also between the patients.

- 2701 THOSE DANGEROUS ROENTGEN BACKGROUND, REVIEW OF BASIC RADIATION ACTION, AND THE FEDERAL GOVERNMENT'S ROLE IN POPULATION PROTECTION. Fleming, R.D. S. C. Dent. J.; 33: No. 1, 60-63 (Win 1975).

This first article briefly states the historical background of the general field of Radiology with specific direction to Dental Radiology. Also, information is presented concerning the Government's interest in the safety of the population of the United States as a result of the alarming rise in radiation exposure to the population for medical and dental purposes. Radiation damage at a cellular level as well as at the whole individual level is briefly outlined.

- 2702 HAZARDS ASSOCIATED WITH STAGE ONE-MINING. pp 11-15 of Uranium. Metal of menace. Melbourne, Australia; ACF (1975). Radiation hazards in uranium mining arise from the presence of radon-222, a gas which can escape from exposed rock surfaces into the air. Radon daughter products have been associated with an increased incidence of respiratory lung cancer. Other hazards include the tailings which arise from the extraction of uranium ores. The tailings still contain most of the original radium and emit gamma rays and radon gas. The hazards associated with uranium enrichment and fuel manufacture are also discussed.

- 2703 (RT/PROT--75-20) RADIATION PROTECTION PLANNING FOR A LIQUID RADIOACTIVE WASTES TREATMENT SYSTEM. Brofferio, C.; DeAngelis, F.; Papa, C.; Paribelli, S. (Comitato Nazionale per l'Energia Nucleare, Rome (Italy)). 1975. 42p. (In Italian). INIS.

The main principles of radiation protection are discussed, in view of a sound design of liquid waste processing systems. Critical pathways, doses to workers and people at large are also discussed.

- 2704 PROBLEMS OF RADIATION SAFETY IN RADIOACTIVE REFUSES TREATMENT. Dermendzhiev, K.; Velikov, V.; Konstantinov, P. (Nauchno-Izslodovatel'ski Inst. po Radiologiya i Radiatsionna Khigiena, Sofia (Bulgaria)). Letopisi Khig. Epidemiol. Inst.; 9: No. 1, 110 (1975). (In Bulgarian).

After a brief characteristic of radioactive refuses, the methods of their treatment are outlined. A more detailed description is given of the hazards, arising in the different stages of their treatment. The necessity of dosimetric control when working with radioactive refuses

is stressed. The radioactivity of different natural objects such as rivers, seas, foodstuffs, etc. should be measured as they are subject to contamination in the process of throwing out or rendering innocuous radioactive waste matter. It is pointed out that the process of collection, keeping and treatment of radioactive wastes is an occupational entailing work with radioactive substances, and therefore all radiation safety requirements should be observed.

- 2705 (AED-Conf--75-769-043) ENVIRONMENTAL IMPACTS OF THE NUCLEAR FUEL CYCLE. Hamard, J. (International Atomic Energy Agency, Vienna (Austria)). 1975. 29p. (CONF-7509129--118). NTIS (US Sales Only).

From Meeting on nuclear power plant project planning and implementation; Karlsruhe, F.R. Germany (17 Sep 1975).

1 fig.; 3 tab..

A survey about the environmental pollution and the population exposure caused by the nuclear fuel cycle is set up. Proceeding from the environmental changes caused by the construction of plants, the author shows the hazards of the operation of the plants. The fuel cycle beginning with the mining of nuclear fuels and reaching to their reprocessing, the environmental pollution by radionuclides and the population exposure resulting from this are outlined. After indicating the advantages of the concentration of nuclear plants, the author shows comparatively the hazards caused by conventional energy sources.

- 2706 (DHEW/FDA--76-8026, pp 26-59) PERSPECTIVES ON RADIOACTIVE RELEASES FROM THE NUCLEAR FUEL CYCLE. Turnage, J.C. 1975.

From 7. annual national conference on radiation control; Hyannis, MA, USA (27 Apr 1975).

7th annual national conference on radiation control.

The following topics are discussed: the nuclear fuel cycle; radioactive effluents during mining, milling, conversion to UF₆, enrichment, and fuel fabrication; radioactive releases from nuclear power plants; radioactive effluents during reprocessing of spent nuclear fuel; effect on public health of radioactive releases from the nuclear fuel cycle; the probability and consequences of nuclear accidents; and implications for energy policy. (HLW)

- 2707 RADIOACTIVE POLLUTION OF THE ENVIRONMENT BY NUCLEAR POWER STATIONS AND REPROCESSING PLANTS IN NORMAL OPERATION. Bonka, H. (Technische Hochschule Aachen (F.R. Germany). Lehrstuhl fuer Reaktortechnik). ISU Mitt.; 4: No. 1, 73-106(1975). (In German).

23 figs.; 7 tabs.; 42 refs..

The paper shows that except for the radiation load due to iodine, the additional population exposure to radionuclides emitted from nuclear installations is very small. The additional radiation load is by far smaller than the regional variation of the natural radiation load in the FRG. The emission rates of radioiodine in the off-air from nuclear power stations with LWR reactors, in particular with BWR reactors, should be lowered by concerted gland leak-off.

- 2708 (DHEW/FDA--76-8026, pp 117-119) KERR--MCGEE INCIDENT. McHard, D. 1975.

From 7. annual national conference on radiation control; Hyannis, MA, USA (27 Apr 1975).

7th annual national conference on radiation control.

A contamination incident at the Kerr-McGee Corporation in November 1974, was reported to the AEC and the Oklahoma State Department of Health. The health physics personnel discovered skin contamination in an employee; no source within the plant could be found. The contamination was alleged to be due to a glove leak, but no leak could be found. An investigation revealed the apartment of the employee to be extensively contaminated with moderate levels of plutonium. An investigation of the Kerr-McGee plutonium plant by the OCAW International Union resulted in three citations of violations of AEC requirements. The death of the employee a short time later in a car accident was reported as accidental and not related to radiation exposure. It is emphasized that the case was very complex and that oversimplification should be guarded against. (HLW)

- 2709 (DHEW/FDA--76-8026, pp 170-173) STATUS OF URANIUM FUEL CYCLE STANDARDS AND PLUTONIUM STANDARD DEVELOPMENT. Martin, J.E. 1975.

From 7. annual national conference on radiation control; Hyannis, MA, USA (27 Apr 1975).

7th annual national conference on radiation control.

Uranium fuel cycle standards were reviewed by federal agencies and an appendix to the document by the Nuclear Regulatory Commission is discussed. The appendix pertains just to light-water cooled nuclear power plants. The EPA standard is proposed to limit doses to human populations and to limit the discharge of long-lived materials into the environment to prevent long-term buildup of significant radionuclides. The standard will limit the dose to man to 25 millirems per yr for the whole body and 75 millirems per yr to the thyroid. (HLW)

- 2710 POWER SUPPLY OF CARDIAC PACEMAKERS.

Kowalewsky, H. (Bundesanstalt fuer Materialpruefung, Berlin (Germany, F.R.)). Med. Pr.; 23: No. 10, 330-334(1975). (In German).

9 figs.; 2 tabs.; with refs..

The author examines power sources for the supply of cardiac pacemakers under discussion at the moment. According to different types of batteries, lifetimes ranging from 5 - 10 years result from the power consumption of the voltage circuit, from the circuit generating stimulating pulses, and from battery losses due to self-discharge and - on the other hand - result in the power accumulation of batteries. Apart from primary chemical elements and chargeable secondary elements (accumulators) radionuclide batteries are described. The heat of the batteries generated by radiation is utilized in order to obtain electric energy in thermoelements. The author goes into detail as far as safety aspects are concerned, considering particularly radionuclide batteries which also have to be implanted. The author comments on the further development and further chances of the various battery types.

- 2711 (AED-CONF--75-538-000, pp v) MAINTENANCE AND REPAIR IN NUCLEAR POWER PLANT OPERATION. Weckesser, A. 1975. (In German).

From IRS symposium on operational experience with nuclear power plants; Koeln, F.R. Germany (30 Oct 1975).

16 figs. With abstract in English and German.

IRS symposium 1975: operational experience with nuclear power plants. Full text of papers.

Maintenance and repair work represents an essential part of plant operation. When designing new plants, it is necessary to take into account the special requirements of a nuclear power plant. The intermittent demand for repairing staff during the planned annual outages has to be coordinated in detail to avoid availability problems due to the number of employees and radiation exposure limitations. (DE)

- 2712 ROUTINE OPERATION OF NUCLEAR POWER PLANTS. IS IT CORRECT THAT RADIATION DOSES FROM RELEASES TO THE ATMOSPHERE ARE SO LOW. Tveten, U.; Thomassen, D. (Institutt for Atomenergi, Kjeller (Norway)). Fra Fys. Verden; 37: No. 3, 58-66(1975). (In Norwegian).

The various sources of gaseous radioactive release during routine operation of a PWR are described and their significance and treatment discussed. Atmospheric dilution is also briefly treated. The simplified calculation of the annual dose to a person downwind from the stack, with reference to the prevailing wind direction, at the same height above ground as the release point, and at a distance of 1 km, is presented. Both whole-body and skin doses are calculated. The results are compared with the ICRP recommendations, with measured releases from a number of PWR plants in the USA and with the doses from natural background radiation.

- 2713 (DOCKET-50219--818) OYSTER CREEK NUCLEAR POWER PLANT, UNIT 1. SEMIANNUAL REPORT NO. 13, JULY--DECEMBER 1975. (Jersey Central Power and Light Co., Morristown, N.J. (USA)). 1975. 89p. Dep. NTIS \$5.00. Net electrical power generated was 1,600,885 MWh(e) with the reactor on line 3,682.2 hrs. Information is presented concerning operations, power generation, shutdowns, corrective maintenance, chemistry and radiochemistry, facility changes, occupational radiation exposure, tests, experiments, release of radioactive materials, and environmental monitoring of atmospheric radiation, fallout, domestic water, surface waters, and marine life. (FS)

- 2714 (AED-Conf--75-571-001) PREDICTION OF THE POPULATION EXPOSURE DURING HYPOTHETICAL ACCIDENTS. Huebschmann, W.G. (Kernforschungszentrum Karlsruhe (Germany, F.R.). Abt. Strahlenschutz und Sicherheit). 1975. 10p. (In German). (CONF-751191--4). INIS.

From Annual meeting of the project nuclear safety; Karlsruhe, F.R. Germany (11 Nov 1975).

3 figs.; 2 tabs.; 8 refs..

In the prognosis of the population exposure in hypothetical accidents, the emission prognosis presents the considerably more difficult problem, whereas the diffusion prognosis presents no particular problems with availability of a meteorological information system, at least with short emission times (about 1 h). Thus a radiation measuring team can be dispatched directly and at short notice in order to measure the activity concentration (in the air or on the ground) in the area of the concentration maximum. Such measurements are necessary to draw conclusions about the source strength. The equipping of the fixed measuring-point ring around the nuclear power plant is not further dealt with here. With

longer emission periods to be expected (greater than 3 h), a specific diffusion prognosis has proved to be purposeful which is related to the time of day and the stability class at the beginning of the emission and gives the area in which the maximum concentrations should be expected with greatest possibility. These data present an extension of the immediate information from the short-term prognosis and can be made available to the reactor personnel in simple diagrams.

- 2715 (EUR--5176) ORGANISATION AND OPERATION OF RADIOACTIVITY SURVEILLANCE AND CONTROL IN THE VICINITY OF NUCLEAR PLANTS. A PRACTICAL GUIDE. (Commission of the European Communities, Luxembourg). 1975. 35p. NTIS (US Sales Only).

Guidance is presented for the development of environmental monitoring programs and procedures relevant to the operation of nuclear plants. The essential aim of an environmental monitoring program is to ensure that the exposure of the general public does not exceed certain set limits. A certain uniformity of criteria in the organization of monitoring networks around nuclear installations may prove to be very useful. These criteria are set out in detail. Progress is reported on the following studies: monitoring of radioactive contamination of atmosphere, water, soils and foodstuffs; monitoring of external radiation.

- 2716 (AED-Conf--75-631-001) ENVIRONMENTAL IMPACT OF NUCLEAR POWER STATIONS. ATTEMPT AT A RISK ASSESSMENT. Kellermann, G.; Balfanz, H.P. (Institut fuer Reaktorsicherheit der Technischen Ueberwachungs-Vereine e.V., Koeln (Germany, F.R.)). 1975. 23p. (In German). (CONF-751244--1). INIS.

From Lecture meeting: nuclear energy--the energy of today and tomorrow; Dusseldorf, F.R. Germany (4 Dec 1975).

1 fig.; 6 tabs.; 8 refs..

Following a comparative consideration of the present and future environmental impact by coal, oil, and nuclear power plants, the special risks connected with the use of the latter are dealt with. A distinction is made in considering the risk between public exposure in the environment of a plant due to operational leakage and radiation exposure in the plant under normal operation and in the case of an accident. The accident risk consideration is the basis of the Rasmussen study where the different containment construction of german plants as well as the higher population density for sites in the FRG are considered. Evaluation parameters are given to quantify the risks, and using this, the risks of various cases of impact of nuclear power plants are compared. The comparison shows that the risks of nuclear power plant operation according to the value in normal operation are comparable to those in the case of an accident.

- 2717 CRITERIA FOR NUCLEAR CRITICALITY SAFETY CONTROLS IN OPERATIONS WHERE SHIELDING PROTECTS PERSONNEL. Hinsdale, IL; American Nuclear Society (1975). 5p.

This Standard is applicable to operations outside of nuclear reactors with ^{235}U , ^{233}U , ^{239}Pu , and other fissile and fissionable materials in which shielding and containment are provided for protection of personnel, except the assembly of these materials under controlled conditions, such as in critical experiments. Criteria are provided that may be used for criticality control under shielded conditions. The Standard does not include the details of administrative procedures for

control, which are considered to be management prerogatives, nor details regarding the design of processes and equipment or descriptions of instrumentation for process control.

2718 (DHEW/FDA--76-8026, pp 60-69)

SKEPTICAL VIEWPOINT OF NUCLEAR POWER.

MacKenzie, J. 1975.

From 7. annual national conference on radiation control; Hyannis, MA, USA (27 Apr 1975).

7th annual national conference on radiation control.

Some topics discussed are: hazards of large releases of ^{85}K and tritium; continued building of light-water reactors in relation to the energy crisis; opposition to nuclear power plants; problems of waste storage; effectiveness of the emergency core cooling system; lethal effects of strontium and plutonium; public health problems of plutonium; and the use of coal, solar energy, and wind power as alternatives to nuclear power. (HLW)

2719 SKYSHINE: A PAPER TIGER. Rindi, A.; Thomas, R.H. (California Univ., Berkeley (USA). Lawrence Berkeley Lab.). Part. Accel.; 7: No. 1, 23-39(1975).

The study of large-distance transport of high-energy accelerator radiation is of fundamental interest and is important in the calculation of the exposure of the population living near the accelerator. The most significant experimental data accumulated since the construction of the early particle accelerators and their theoretical interpretation are reviewed.

2720 EXPOSURE TO EXAMINER AND PATIENTS IN X-RAY DIAGNOSTICS. Schmitt, G.; Ewen, K. pp 159-176 of Fundamentals of practical radiation protection in medical X-ray installations. Ewen, K. (Gewerbeaufsicht des Landes Nordrhein-Westfalen, Duesseldorf (F.R. Germany). Zentralstelle fuer Sicherheitstechnik, Strahlenschutz und Kerntechnik); Schmitt, G. (Essen Univ. (Gesamthochschule) (F.R. Germany). Radiologisches Zentrum). Stuttgart; Enke (1975). (In German)

11 figs.; 5 tabs.; 11 refs..

Following explanations on the radiation exposure to patients, which are supplemented by data in tables, the sensitivity of the patient exposure to technical as well as organisational parameters is gone into. Single points such as the influence of the tube voltage, the distance, field size, filtration, object thickness, intensification foils as well as examiner experience and training are briefly explained. The radiation exposure to the examiner as well as patient dosimetry are dealt with.

2721 (CONF-750671--) INTERNATIONAL SYMPOSIUM ON AREAS OF HIGH NATURAL RADIOACTIVITY. Cullen, T.L.; Penna Franca, E. (eds.). (Pontificia Universidade Catolica do Rio de Janeiro (Brazil)). 1975. Contract EY-76-C-02-2592. 191p. Dep. NTIS, PC A09/MF A01.

From International symposium on areas of high natural radioactivity; Pocos de Caldas, Brazil (16 Jun 1975).

Twelve papers and abstracts of nine papers are included that were presented at a conference to review what is known about the world's natural radioactive anomalies and their biological implications was held in Pocos de Caldas, Minas Gerais, Brazil, June 16 to 20, 1975. Pocos de Caldas was selected as the site

of the symposium because of its proximity to Morro do Ferro, a hill on which the external radiation level is as much as 300 times normal. The natural thorium in the rocks and soils give a remarkable exposure to the native flora and fauna due to the absorption of nuclides. Other reported radioactive anomalies are the monazite sand areas of Brazil and India, and a number of places throughout the world in which the radioactivity of drinking water and certain foods are known to be elevated above normal to a significant degree. The objectives of the symposium were: to inventory those places in the world where such anomalies are known to exist; to review the status of investigations being conducted; and to assess the extent to which research in such places can add much needed information on the effects of low level exposure to ionizing radiation. For the purpose of this symposium, an anomalous radioactive environment was defined as one that is characterized by one or more of the following: the exposure rate from external terrestrial sources, over extended areas, is greater than 200 mR/yr; the long lived alpha activity, ingested with the local diet and water, is greater than 50 pCi/day; the radon-222 concentration of potable water is greater than 5000 pCi/l; and the radon 220 and 222 concentration of the atmosphere is greater than 1 pCi/l. Abstracts of two of the papers appeared previously in ERA.

2722 RADIOLOGICAL ASPECTS OF NUCLEAR WARFARE. Edvarson, K. (Foersvarets Forskningsanstalt, Stockholm (Sweden)). Ambio; 4: No. 5-6, 209-210R(1975).

The radioactive fallout from nuclear explosions is one of the major effects of nuclear warfare. Those levels causing acute radiation sickness are to be expected only within the close-in or intermediate areas downwind from surface bursts. Global fallout from high yield explosions will be fairly evenly distributed in the hemisphere where the explosions occurred and cause irradiation from ground deposit, inhaled material and contaminated food. The collective doses and the order of magnitude of late casualties from this global contamination are estimated for a given total explosion yield.

2723 Izotopy radona i produkty ikh raspada v prirode. (ISOTOPES OF RADON AND ITS DECAY PRODUCTS IN NATURE). Serdyukova, A.S.; Kapitanov, Yu.T. Moscow; Atomizdat (1975). 296p.

In the book are described the formation, chemical and physical properties, processes of extension and carrying over of isotopes of radon and products of their decomposition. Data concerning the content of isotopes of radon and products of their decomposition in different environments are given. The causes and ways of appearance of indicated isotopes in organism of man, their biological action and average annual permissible concentration are examined. Methods of determination of concentration of isotopes of radon and products of their decomposition, coefficients of diffusion, emanation, and exhalation are described. Isotopes of radon and methods of dosimetric check of impurity of air by isotopes of radon and by products of their composition are described. Information concerning utilization of isotopes of radon and products of their decomposition, concerning the complexity of engineering-technical measures according to the supporting of concentration of isotopes of radon and products of their decomposition on a permissible level is given.

2724 (ERDA--92(Vol.2), pp 622-637)
MIGRATION OF TRITIUM FROM A NUCLEAR WASTE
BURIAL SITE. Hawkins, R.H. (E.I. du Pont de
Nemours and Co., Aiken, SC). 1975.

From 3. ERDA environmental protection
conference; Chicago, IL, USA (23 Sep 1975).

Proceedings of the third environmental
protection conference.

The Savannah River Plant (SRP) has routinely
and continuously monitored the local
environment since 1951. A three-part study was
made to assess the tritium migration from an
onsite burial ground for solid nuclear wastes
and the resulting dose-to-man. A major source
of tritium is buried, massive, Li-Al, melt,
residues from the thermal extraction step in
the SRP tritium production process. A melt with
its extraction crucible and lid were immersed
in water to measure the amounts of tritium
released as HTO and HT to the water and to air.
The result was a rapid release of 23 curies, of
which approximately 99 percent was HTO that
remained in the immersion water, and 1 percent
was HT that passed into the air. Three
crucibles and lids were buried in a soil-
filled, open-top lysimeter. Results showed that
177 curies were released as HTO to the
percolate water during the first 93 weeks of
the test. Approximately one curie of tritium
was released as HT to the air. Tritium
concentrations were measured monthly for a year
in 41 groundwater monitoring wells at the
burial ground and in 6 adjacent wells for a
shorter time. Average concentrations were used
to estimate that some 50 kilocuries of tritium
are in the groundwater underlying the 77-acre
burial site. The travel time of tritium in the
groundwater from the burial ground to a
tributary stream 3000 feet away is about 60
years. Radioactive decay and dilution in the
Savannah River will limit the dose-to-man to
the down-river population to approximately 0.02
man-rem yearly. (auth)

2725 (INIS-mf--2098) 1974 ANNUAL REPORT OF
STATE INSTITUTE FOR PROTECTION AGAINST
RADIATION. Lindell, B.; Snihs, J.O.;
Swedjemark, G.A.; Bengtsson, G. (Statens
Straalskyddsinstitut, Stockholm (Sweden)).
1975. 15p. (In Swedish). NTIS (US Sales
Only).

This report submitted to the Swedish Council
for Atomic Research deals with research work in
nuclear physics, special laboratories, and the
dosimetric laboratory, in particular with
exposure of miners to radioactive substances
(causing lung cancer), natural radioactive
constituents of building materials and in
drinking water, deposits of uranium in human
lungs, radioactive substances in foods and in
human bodies.

2726 EFFECT OF SEDIMENT DISPLACEMENT ON THE
DISPERSAL OF RADIONUCLIDES. Schaeffer, R.
(Electricite de France, 75 - Paris). pp 263-
274 of Impacts of nuclear releases into the
aquatic environment. Proceedings of an
international symposium on radiological impacts
of releases from nuclear facilities into
aquatic environments held by the IAEA at
Otanemi, Finland, 30 June to 4 July 1975.
Vienna; International Atomic Energy Agency
(1975). (In French)

From International symposium on radiological
impacts of releases from nuclear facilities
into aquatic environments; Otanemi, Finland
(30 Jun 1975).

The bulk of discharged radionuclides are
adsorbed by the sediments in water courses. It
follows from this that the volumetric activity
of the water decreases with distance from the
disposal point in an approximately exponential

manner. However, the activity accumulated by
the sediments deposited on the river bed does
not follow this law: the bottom transport to
which these sediments are subjected reverses
the direction of the variation for them so that
their activity increases progressively in the
downstream direction, reaching a maximum which
may be situated a great distance away after a
long period of disposal. In the long term,
therefore, the sediments could constitute the
main source of irradiation of populations
living on river banks fairly far from a
disposal point. In view of this variation of
sediment activity in time and in space, the
paper draws attention to the fact that a very
limited number of measurements repeated at a
single point is not representative.

2727 (DHEW/FDA--76-8026) 7TH ANNUAL
NATIONAL CONFERENCE ON RADIATION CONTROL:
ASSURING RADIATION PROTECTION, APRIL 27--MAY
2, 1975, HYANNIS, MASS. (Food and Drug
Administration, Rockville, Md. (USA)). 1975.
317p. (CONF-7504107--). GPO \$4.40.

From 7. annual national conference on
radiation control; Hyannis, MA, USA (27 Apr
1975).

Separate abstracts were prepared for 40
papers presented at the conference. (HLW)

2728 (DHEW/FDA--76-8026, pp 7-10) ASSURING
RADIATION PROTECTION FOR THE PUBLIC. Hardin,
C.M. 1975.

From 7. annual national conference on
radiation control; Hyannis, MA, USA (27 Apr
1975).

7th annual national conference on radiation
control.

Some topics discussed are: accomplishments
and activities of the Conference Task Forces;
incorporation of the Conference in the state of
Arkansas; state regulations for the control of
radiation; role of U. S. Department of Labor in
development of uniform radiation regulations;
and meetings of the Executive Committee with
Commissions of the NRC. (HLW)

2729 (DHEW/FDA--76-8026, pp 250-251) REPORT
OF THE TASK FORCE ON THE MEASURE OF PROGRAM
EFFECTIVENESS AS RELATED TO RADIOACTIVE
MATERIALS. Watkins, G.; Morris, J.; Russo, J.
1975.

From 7. annual national conference on
radiation control; Hyannis, MA, USA (27 Apr
1975).

7th annual national conference on radiation
control.

It was recommended that a task force be
established: to contact the 50 states,
territories, and federal agencies to accumulate
information on the existing indices for
radioactive material program effectiveness
evaluation; to consider the quantifiable
indices of radioactive materials program, the
size of the population at risk in the various
medical and nonmedical groups, and those
indices that can be applied to all forms and
uses of radioactive material; and to consider
possible indices for such items as emergency
response capability, laboratory capability and
reliability. It was also recommended that the
federal and state agencies support studies on
how to measure radioactive material program
effectiveness. (HLW)

2730 EFFECT OF AGE ON CELL-MEDIATED IMMUNITY
IN LONG-LIVED MICE. Goodman, S.A. (Univ. of
Tennessee, Oak Ridge); Makinodan, T. Clin.
Exp. Immunol.; 19: 533-542(1975).

The cytolytic ability of sensitized spleen

cells to kill allogeneic target cell in vitro, a correlate of cell-mediated immune activity, was assessed in aging long-lived hybrid mice. There was a 3-4 fold decline with age, of which about half could be accounted for by the decrease in relative numbers of immunocompetent precursor cell units. The terminally differentiated progeny cells of antigen-stimulated precursor cells of old mice were as efficient in killing targets cells as were those of precursor cells of young mice. Thus, it would appear that a decrease in the proliferative and transforming capacities of antigen-stimulated precursor cells of old mice can account for the other half decline with age in the cytolytic activity. Cytolytic activity may not be the limiting function in resistance to tumor formation. This was indicated by the observation that resistance to allogeneic tumor cell challenge declines with age by as much as 500-fold in mice, showing only a 4-fold decline in their cytolytic activity.

- 2731 Leitfaden der medizinischen Röntgentechnik. Diagnostik - Dosimetrie - Strahlenschutz - Strahlentherapie. (GUIDE FOR MEDICAL X-RAY TECHNOLOGY. DIAGNOSTICS - DOSIMETRY - RADIATION PROTECTION - RADIOTHERAPY). Laubenberger, T. (Universitaet des Saarlandes, Homburg/Saar (F.R. Germany). Radiologische Klinik; Stadtkrankenhaus Hanau (F.R. Germany). Strahlenklinik). Koeln, F.R. Germany; Deutscher Aerzte-Verl. (1975). 386p. (In German).

With figs. and tabs..

This book turns to the medical X-ray assistants. The guide comprises in brief the most important details of X-ray diagnostics and radiotherapy. Modern methods and new trends in the techniques of medical radiology are presented. In order to make the technical steps more easily understood, physical model concepts are submitted.

- 2732 INVESTIGATION OF ^{125}I AS AN ISOTOPIC SOURCE FOR MAMMOGRAPHY. Fairchild, R.; Atkins, H.L.; Lebowitz, E.; Greenberg, D. (Brookhaven National Lab., Upton, NY). Invest. Radiol.; 10: No. 5, 511-518(1975).

An isotopic radiation source ^{125}I was investigated for use in soft tissue radiography, with particular attention to possible use in mammography for mass screening. Film sensitivities, exposure rates, absorbed doses, contrast and resolution were determined, and compared to conventional x-ray units. It was found that contrast and resolution were comparable to 30 kVp x-rays (W anode) but that surface absorbed dose was reduced by a factor of two with ^{125}I . These results experimentally verified the advantage to be obtained from monoenergetic radiations, which had been predicted from theoretical considerations by others. Duration of exposure was estimated to be between 4 and 12 sec with a 40 Ci source. The 60-day half life of ^{125}I may necessitate its use in conjunction with an image intensification system or electron radiographic techniques, in order to preclude source replacement at inconveniently short intervals. - 2733 (EUR--5484) PROGRAMME BIOLOGY - HEALTH PROTECTION. ANNUAL REPORT 1975. (Commission of the European Communities, Brussels (Belgium)). 1975. v.1 p.1-618, v.2 p.619-953p. NTIS (US Sales Only).

French and German version also available.

The scientific results for 1975, of the five-year Biology-Health Protection programme adopted in 1971, are presented in two volumes.

In volume one, Research in Radiation Protection are developed exclusively, including the following topics: measurement and interpretation of radiation (dosimetry); transfer of radioactive nuclides in the constituents of the environment; hereditary effects of radiation; short-term effects (acute irradiation syndrome and its treatment); long-term effects and toxicology of radioactive elements. In volume, two Research on applications in Agriculture and Medicine are developed. It includes: mutagenesis; soil-plant relations; radiation analysis; food conservation; cell culture; radioentomology. Research on applications in Medicine include: Nuclear Medicine and Neutron Dosimetry.

- 2734 MATHEMATICAL MODEL OF ABSORBED DOSE IN A LIVING ORGANISM DURING NEUTRON IRRADIATION AS A FUNCTION OF SIZE OF THE OBJECT. Paskalev, Z. Nauchni Tr., Nauchnoizsled. Inst. Radiobiol. Radiats. Khig.; 5: No. 1, 9-12(1975). (In Bulgarian).

The purpose of this study is by the use of a Monte Carlo method to develop a model of the absorbed dose from neutron irradiation which takes into account the linear dimensions of the irradiated object. In studying the distribution of absorbed neutron dose it is found that the maximum dose is found mainly at the surface of the biological object under irradiation. It is shown that the part of the body opposite to the side from the neutron flux only receives 30 percent of the dose given to the directly exposed side in the case of the rat, while the corresponding figure is approximately 70 percent for mice. 4 refs.

- 2735 (ERDA-tr--110, pp 124-127) INVESTIGATION OF THE REPAIR OF SINGLE-STRANDED BREAKS IN DNA OF THE REGENERATING LIVER OF γ -IRRADIATED RATS BY THE METHOD OF SEDIMENTATION. Zakrzhevskaya, D.T.; Gaziev, A.I. (Inst. of Biological Physics, Pushchino, USSR). 1975. Translated from Radiobiologiya; 15: No. 4, 593-596(1975).

Radiobiology. The formation and repair of single-stranded breaks in DNA of the regenerating liver of γ -irradiated rats were studied using the method of sedimentation. The data obtained permit the conclusion that in the regenerating rat liver, just as in a culture of mammalian cells, during the first hour after irradiation with γ rays the process of DNA repair begins to function. (ERB)

- 2736 BIOLOGICAL EFFECT OF IONIZING RADIATIONS AND THE PRIMARY STRUCTURE OF DNA. Kritskij, G.A.; Lakhtin, V.M.; Aleksandrov, S.V.; Kopylov, V.A. (AN SSSR, Moscow. Inst. Biokhimi; AN SSSR, Pushchino-na-Oke. Inst. Biologicheskij Fiziki). Stud. Biophys.; 53: 9-12(1975).

From 3. International symposium on primary and initial mechanisms of the effect of ionizing radiation on the cell; Erevan, USSR (26 May 1975).

Pyrimidine oligonucleotides were determined in diphenylamine/formic acid hydrolysates of DNA. It was shown that DNA regions with a predominant content of oligonucleotides of the polythymine (or AT) type are damaged by irradiation in vivo to a greater extent as compared with those with a predominant content of oligonucleotides of the polycytidyl (or GC) type.

- 2737 (AED-Conf--75-780-000, pp 269-282) RECOVERY OF IRRADIATED L-CELLS: CHANGES OF THE MEMBRANE POTENTIAL. Baisch, H.; Linden, W.A.; Bluhm, H. 1975. (In German).

From Meeting of the Schutzkommission beim Bundesministerium des Innern; Erlangen, F.R. Germany (May 1975).

10 figs.; 13 refs. Available from ZAED.

Meeting of the Schutzkommission beim Bundesministerium des Innern.

The cell membranes and their structures play an essential role in radiation damage. Membrane-bound enzymes and their damaging by radiation are further important factors in the question of recovery from radiation damage. The present investigation deals with these problems. L 929 cells, which grow as a monolayer, from a mouse cell strain were irradiated, and the corresponding survival curves with marked shoulder were characterized and discussed for the repair of radiation damage. The results are not particularly clear from the radiation protection aspect, as it is not yet explained to what extent the measured damage of the membrane affects the survival of the cells. On the other hand, the measured effects occurred at doses which are only just lethal, i.e. lying in the region of the survival curve and not only at overkill doses. Furthermore, the time-recovery slope is discussed.

- 2738 (COO--3286-11) STUDY OF THE RADIATION EFFECTS ON NUCLEIC ACIDS AND RELATED COMPOUNDS. ANNUAL PROGRESS REPORT, AUGUST 15, 1974--AUGUST 14, 1975. Wang, S.Y. (Johns Hopkins Univ., Baltimore, Md. (USA)). 1975. Contract E(11-1)-3286. 21p. Dep. NTIS \$3.50.

Interest is being centered on the chemical and physical nature of radiation-induced lesions to nucleic acids and their components. These investigations have revealed the enormous complexity of chemical events in these systems and the possible degradation of nucleic acids by strand breakage. Therefore, work in the ionizing radiation of DNA and its components has proceeded along a dual course. For chemical studies, our prime concern is the stepwise isolation and identification of the radiation products of derivatives of pyrimidines and the study of the actual mechanisms of their formation. For biological studies, H. influenzae cells, the Chinese hamster V79B-1 cell line, and the Dunn osteosarcoma lung colony system were used. During the last year, the method of synthesis of 5-hydroperoxymethyluracil ($T^{\alpha}OOH$) was greatly improved. Large-scale preparation of 5-hydroxy-6-hydroperoxy-5,6-dihydrothymine ($T^{\alpha}OOH$) were carried out in order to study the action of $T^{\alpha}OOH$ on neighboring bases, glycosidic bond-breakage, cell mutagenesis, chromosomal aberrations, and possible synergistic effects on x radiation. These results allow one to relate radiobiological effects with radiation chemical changes in DNA.

- 2742 IN VITRO TRANSFORMATION: INTERACTION OF CHEMICALS, VIRUSES, AND IRRADIATION. Casto, B.C. (Biolabs, Inc., Northbrook, IL); DiPaolo, J.A. Bibl. Haematol.; 40: 197-199(1975).

The data obtained from the viral enhancement studies suggest that induction of lesions in host cell DNA by irradiation or chemical carcinogens increases the sensitivity of cells to viral transformation. The enhancement may be the result of creation of additional sites for incorporation of viral genetic material into cell DNA during repair synthesis or to gaps in cell DNA arising during scheduled DNA synthesis in areas opposite unrepaired damage. Persistence of enhancement following treatment with MMS and DMBA could be correlated with the rate at which DNA repair synthesis proceeded. All of the agents thus far tested, that have the capacity to induce host cell DNA single-strand breaks and/or DNA repair synthesis, will enhance adenovirus transformation, but such damage is not a prerequisite for enhancement to occur. Enhancement of chemical transformations by MMS and x irradiation does not appear to be related in the same way to cell DNA repair synthesis, since maximal enhancement was obtained 48 hr after treatment. Alteration of scheduled DNA synthesis did not seem to be involved since treated cells were indistinguishable from control cells in their synthesis of DNA at 24 and 48 hr following MMS treatment. - 2743 (ERDA-tr--99, pp 20-24) RECOVERY OF RADIORESISTANCE AND HEMATOGENIC STEM CELLS. Butomo, N.V.; Pegov, A.A. (Military-Medical Academy, Leningrad). 1975. Translated from Radiobiologiya; 15: No. 3, 345-347(1975).
Radiobiology. A comparison of the recovery of radioresistance was conducted on mice irradiated at a dose of 400 R, according to the value of LD_{50} of repeated irradiation and the dynamics of the content of colony-forming units in the bone marrow. No parallelism was detected in the changes in these indices. (tr-auth)

- 2744 (ERDA-tr--99, pp 114-117) ROLE OF ATP IN THE REPAIR OF DN OF GAMMA-IRRADIATED CHINESE HAMSTER CELLS. Fomenko, L.A.; Gaziev, A.I.; Mantseygin, Yu.A.; Kublik, L.N. (Inst. of Biological Physics, Pushchino, USSR). 1975. Translated from Radiobiologiya; 15: No. 3, 420-423(1975).

Radiobiology. The role of ATP in the regeneration of DNA of mammalian cells after γ irradiation was studied using monolayer cultures of fibroblast-like cells of the Chinese hamster. The results obtained permit

the conclusion that ATP plays an important role in the repair of DNA of mammalian cells. Irradiated cells have a sufficient amount of ATP available for the maintenance of DNA repair. (ERB)

- 2745 DOSE-RESPONSE RELATIONSHIP FOR ULTRAVIOLET-LIGHT-INDUCED MUTATIONS AT THE HYPOXANTHINE-GUANINE PHOSPHORIBOSYLTRANSFERASE LOCUS IN CHINESE HAMSTER OVARY CELLS. Hsie, A.W. (Oak Ridge National Lab., TN); Brimer, P.A.; Mitchell, T.J.; Gosslee, D.G. Somatic Cell Genet.; 1: No. 4, 383-389(1975).

Exposure of Chinese hamster ovary (CHO) cells clone K₁BH₄ to ultraviolet (uv) light at doses up to 86 ergs/mm² did not significantly reduce cell survival, but uv doses of 86-648 ergs/mm² produced an exponential cell killing. Observed mutation frequency to 6-thioguanine resistance induced by uv increases approximately in proportion to increasing doses up to 260 ergs/mm² in a range of 5-648 ergs/mm² examined. The pooled data of mutation frequency $f(X)$ as a function of dose X from 0-260 ergs/mm² is adequately described by $f(X) = 10^{-6} (13.6 + 2.04 X)$. That the uv-induced mutations to 6-thioguanine resistance affects the hypoxanthine-guanine phosphoribosyltransferase (HGPRT) locus is supported by the observation that all randomly isolated drug-resistant colonies contained highly reduced or undetectable HGPRT activity.

- 2746 INVESTIGATION OF THE EFFECTS OF FAST NEUTRONS ON DNA BY SEDIMENTATION ANALYSIS. Schroeder, E.; Magdon, E. (Akademie der Wissenschaften der DDR, Berlin. Zentralinstitut fuer Krebsforschung). pp 87-92 of Grundlagen der Neutronentherapie. Graffi, A. (ed.). Berlin; Akademie-Verlag (1975). (In German)
From Symposium on neutron therapy; Rossendorf, Dresden, German Democratic Republic (26 Apr 1973).

Sedimentation analyses were used to demonstrate the difference between ⁶⁰Co gamma irradiation and neutron irradiation of HeLa cells. Though the rate of DNA strand breaks was nearly the same for gamma radiation and fast neutrons there was a significant difference with regard to the repair. Whereas the DNA breaks induced by gamma radiation were completely repaired after an incubation time of 30 minutes, breaks caused by neutrons showed practically no repair even after a recovery of 8 hours.

- 2747 (ERDA-tr--146, pp 48-53) ROLE OF DIRECT PROTECTION OF CELLS OF THE HEMATOGENIC SYSTEM IN THE RADIOPROTECTIVE ACTION OF CERTAIN BIOGENIC AMINES ON THE ANIMAL ORGANISM. Smirnova, I.B.; Dontsova, G.V.; Yanushevskaya, M.I.; Graevskii, E.Ya. (Inst. of Developmental Biology, Moscow). 1975. Translated from Radiobiologiya; 15: No. 5, 680-683(1975).

Radiobiology. It was established by the method of spleen exocolonies on mice that serotonin, adrenaline, and noradrenaline possess the ability to protect both isolated bone marrow cells and cells in situ; a significant fraction in the radioprotective action of the investigated amines on the animal organism consists of the direct protective action on their cells; in the case of serotonin and adrenaline, the cell protection in the organism is supplemented by the radioprotective action of tissue hypoxia induced by these amines.

- 2748 RECOVERY DURING RADIATION AND CHEMICAL

MUTAGENESIS. Deen, D.F. Lawrence, KS; Univ. of Kansas (1975). 213p. University Microfilms Order No. 76-16,714.

Thesis (Ph. D.).

These investigations were directed toward the study of recovery in radiation and chemical mutagenesis in cultured mammalian cells. A mutagenesis system was established in which mutation of V79-17b Chinese hamster cells to 8-azaguanine resistance was tested. The effects of split dose and postirradiation treatments upon both x-ray and EMS induced mutagenesis were determined. Increasing the cell inoculum by a factor of 5 (from 10⁵ to 5 x 10⁵) decreased both the spontaneous and x-ray induced mutation frequencies by two orders of magnitude. The x-ray induced mutation frequency was found to be higher for those cells allowed to attach for 5 hours before irradiation, in comparison to those allowed to attach for 2 hours. The uv spectrum of 8-azaguanine changes as a function of storage time at low temperature, but not when diluted to either 10 µg/ml or 30 µg/ml and maintained at 37°C. The optimal expression time required after irradiation is dose dependent and can be determined from the relationship: E.T. = 1.93(10⁻²)D + 15.5. (E.T. = hours; D = rads). The duration of the optimal expression time can be estimated by summing the cell cycle time and the radiation induced lag time.

- 2749 ALTERATIONS IN RNA TURNOVER FOLLOWING X-IRRADIATION. Hetzel, F.W.; Kolodny, G.M. (Massachusetts General Hospital, Boston). Radiat. Res.; 62: 585(1975).

Mouse embryonic fibroblasts, 3T3, were irradiated in growing and confluent states with 280KV x-rays to a dose of 3750 rads. All cells were prelabeled while growing with ¹⁴C thymidine for 24 hours and for 24 hours with ³H uridine in either the growing or confluent state. The turnover of prelabeled cellular RNA was then studied. While RNA turnover normally occurs in confluent cells and does not occur in subconfluent cells the results of this study suggested the existence of RNA turnover in both cell populations following radiation. The rate of RNA turnover in irradiated confluent cells was less than that seen in normal confluent cells while for irradiated growing cells the rate of turnover was higher than in controls. The two rates were approximately equal in both irradiated populations. In each case the amount of prelabeled DNA lost from the acid insoluble fraction was approximately 50 percent after 10 days. The possible significance of these results in relation to radiation induced giant cell formation and alterations in RNA minor bases will be discussed.

- 2750 DNA DAMAGE AND ITS REPAIR IN HYPERTHERMIC MAMMALIAN CELLS: RELATION TO ENHANCED CELL KILLING. Ben-Hur, E.; Elkind, M.M. (Hebrew Univ., Jerusalem). pp 703-717 of Radiation research. Biomedical, chemical, and physical perspectives. Nygaard, O.F. (ed.). New York; Academic Press, Inc. (1975).

From 5. international radiation research congress meeting; Seattle, WA, USA (14 Jul 1974).

See CONF-740715--.

Recently, it was reported that cultured mammalian cells are killed more readily under hyperthermia compared to normal conditions. In this presentation we summarize observations relative to the sensitizing effects of hyperthermia and several agents that are known to induce DNA damage. Correlations between cell killing and DNA damage and repair are noted, and the possible use of this approach in cancer therapy is discussed.

- 2751 CHEMICAL RADIOSENSITIZATION STUDIES WITH MAMMALIAN CELLS GROWING IN VITRO. Chapman, J.D.; Dugle, D.L.; Reuvers, A.P.; Gillespie, C.J.; Borsa, J. (Whiteshell Nuclear Research Establishment, Pinawa, Manitoba). pp 752-760 of Radiation research. Biomedical, chemical, and physical perspectives. Nygaard, O.F. (ed.). New York; Academic Press, Inc. (1975).

From 5. international radiation research congress meeting; Seattle, WA, USA (14 Jul 1974).

See CONF-740715--.

The study of chemicals which can sensitize cells to the lethal action of ionizing radiation has proved useful in the elucidation of cellular radiation mechanisms. Those which selectively radiosensitize hypoxic cells could have a role, in combination with radiotherapy, in an improved treatment of some solid tumors. The scope of this paper is restricted to those compounds which appear to mimic the radiosensitizing action of molecular oxygen in mammalian cells and have come to be known as electron-affinic (EA) sensitizers.

- 2752 THE INITIAL SLOPE OF THE GAMMA-RAY SURVIVAL CURVE IN THE THEORY OF RBE. Katz, R.; Sharma, S.C. (Nebraska Univ., Lincoln (USA)). pp 78-85 of Cell survival after low doses of radiation: theoretical and clinical implications. Proceedings of the sixth L.H. Gray conference, held at Bedford College, London, 16-21 September 1974. Alper, T. (ed.). London; Institute of Physics and Wiley (1975).

From 6. L.H. Gray conference; London, UK (16 Sep 1974).

Inferences about the initial slope of the survival curves of cells exposed to gamma rays may be drawn from the variations of RBE with dose and with radiation quality. As perceived by a biological cell capable of accumulating sublethal damage, the essential difference between a primary photon and a primary heavy particle lies in the probability that a single particle can eject sufficient delta rays to inactivate the cell through which it passes. Various examples of RBE-LET relationships are discussed. A calculation is presented of the survival of several population mixtures of cells having radiosensitivity parameters appropriate to hamster cells in (A) early S, (B) G₁, and (C) G₂ phases. RBE-dose relations have been calculated for neutrons of various energies for different mammalian cells. It is stated that, in summary, the RBE-dose relations may be taken to support the view of the theory of RBE that gamma-ray survival curves have an initial shoulder (rather than an initial negative slope) where the RBE exceeds 1 at any LET.

- 2753 STATISTICAL AND BIOPHYSICAL ASPECTS OF THE SURVIVAL CURVE. Kellerer, A.M. (Columbia Univ., New York (USA). Coll. of Physicians and Surgeons). pp 69-77 of Cell survival after low doses of radiation: theoretical and clinical implications. Proceedings of the sixth L.H. Gray conference, held at Bedford College, London, 16-21 September 1974. Alper, T. (ed.). London; Institute of Physics and Wiley (1975).

From 6. L.H. Gray conference; London, UK (16 Sep 1974).

Statistical fluctuations in a series of repeated x-ray survival curves of non-synchronized V79 hamster cells are considered. Within each experiment the fluctuations are close to those theoretically expected on the basis of Poisson statistics. Between successive

experiments however sensitivity fluctuations of the order of 10% occur. The mean and the variance of the survival curves in nine repeated experiments are analysed and are compared to the conventional parameters n and q . A normalization utilizing the observed mean values for each experiment leads to an idealized x-ray survival curve. This curve corresponds only in its lower dose range to a mathematical expression in which the logarithm of the survival curve is proportional to a linear and a square term in absorbed dose. For V79 cells in late S-phase however one obtains full agreement with such an equation. Microdosimetric considerations are used to derive the distances over which radiation products or sublesions must interact to cause a nonlinear component in absorbed dose. It is found that for interaction distances of the order of 10 to 100 nm the linear component must always be predominant up to doses of 1000 rad or more. A higher-order term in absorbed dose which is comparable to the linear term at doses of a few hundred rad implies interaction distances close to a micrometre.

- 2754 GENETIC DAMAGE AND MAMMALIAN CELL SURVIVAL CURVES. Burki, H.J. (California Univ., Berkeley (USA)). pp 209-216 of Cell survival after low doses of radiation: theoretical and clinical implications. Proceedings of the sixth L.H. Gray conference, held at Bedford College, London, 16-21 September 1974. Alper, T. (ed.). London; Institute of Physics and Wiley (1975).

From 6. L.H. Gray conference; London, UK (16 Sep 1974).

Recent studies have shown that both the extent of shoulder of the Chinese hamster cell survival curve and the final slope are influenced by the ploidy of the cells. These results suggest that chromatin and chromosomal damage may be the major cause of reproductive death in these cells. After low doses most likely deletions predominate in causing death while after large doses two-hit aberrations predominate. Both the shoulder and the slope of the mammalian cell survival curve are changed by changing the quality of the lesion in the chromatin using tritiated thymidine or ¹²⁵I Udr incorporated into the DNA. The survival curve found after ¹²⁵I damage is almost exponential with a final D₀ of 50 rad while the survival curve after tritiated thymidine incorporation has a D_{sub}(q) of 750 rad and a final D₀ of 450 rad. This change is analogous to the change found when the effects of radiation of normal and high LET are compared. Although the number of strand breaks per unit dose to the nucleus is similar when cells are exposed to tritium or ¹²⁵I decays in the DNA or cells are exposed to x-rays, when compared on a dose to the nucleus basis the repairability of the single-strand breaks produced is quite different. A large percentage of the single-strand breaks induced by ¹²⁵I disintegrations are not rejoined. This lack of rejoining suggests that the efficiency of radiation in activating cells is related to the production of non-repaired DNA damage as has been observed in micro-organisms.

- 2755 RADIOPROTECTORS, RADIOSENSITIZERS AND THE SHAPE OF THE MAMMALIAN CELL SURVIVAL CURVE. Chapman, J.D.; Gillespie, C.J.; Reuvers, A.P.; Dugle, D.L. (Atomic Energy of Canada Ltd., Pinawa, Manitoba. Whiteshell Nuclear Research Establishment). pp 135-140 of Cell survival after low doses of radiation: theoretical and clinical implications. Proceedings of the sixth L.H. Gray conference, held at Bedford College, London, 16-21 September 1974. Alper, T. (ed.). London; Institute of Physics and Wiley

(1975).

From 6. L.H. Gray conference; London, UK (16 Sep 1974).

Chemical radioprotectors and radiosensitizers have been used as tools in the study of mechanisms of mammalian cell inactivation by ionizing radiations. A correspondence between the rate of inactivation of cellular proliferative capacity and the rate of induction of strand breaks in cellular DNA has been found. The Chadwick-Leenhouts model, which relates unrepaired DNA double-strand breaks to cell inactivation, accurately describes the inactivation kinetics of Chinese hamster cells irradiated in the presence of various chemical modifiers. Hydroxyl radicals, the species responsible for the bulk of indirect effect in mammalian cells, have been found to contribute to cell inactivation resulting from single (α) as well as from double (β) events. Free radical repair, by hydrogen donation from sulphhydryls, can protect cells against both α and β inactivating events. Molecular oxygen and other radical-oxidizing chemicals potentiate cell inactivation predominantly by enhancing single-strand breakage (β events). At doses of 500 rad and less, cell inactivation results predominantly from single events. A model for cell inactivation based on these observations has provided a framework whereby experimental data from studies in microdosimetry, radiation chemistry, radiation molecular biology, and radiotherapy can be inter-related.

- 2756 X-RAY SURVIVAL CURVES OF CULTURED HUMAN DIPLOID FIBROBLASTS. Cox, R.; Masson, W.K. (Medical Research Council, Harwell (UK). Radiobiological Research Unit). pp 217-222 of Cell survival after low doses of radiation: theoretical and clinical implications. Proceedings of the sixth L.H. Gray conference, held at Bedford College, London, 16-21 September 1974. Alper, T. (ed.). London; Institute of Physics and Wiley (1975).

From 6. L.H. Gray conference; London, UK (16 Sep 1974).

Primary foetal lung cells had shouldered x-ray survival curves. The shoulder was lost after only two in vitro population doublings, but had returned in three late passage cultures tested. Changes in the cloning efficiency, population doubling times and distribution of karyotypes were observed during the in vitro life-span of the cells but the nature of the changes in radiosensitivity observed remains uncertain.

- 2757 INTERCELLULAR CONTACT: ITS INFLUENCE ON THE $D_{SUB}(Q)$ OF MAMMALIAN CELL SURVIVAL CURVES. Durand, R.E. (Wisconsin Univ., Madison (USA). Dept. of Radiology); Sutherland, R.M. pp 237-247 of Cell survival after low doses of radiation: theoretical and clinical implications. Proceedings of the sixth L.H. Gray conference, held at Bedford College, London, 16-21 September 1974. Alper, T. (ed.). London; Institute of Physics and Wiley (1975).

From 6. L.H. Gray conference; London, UK (16 Sep 1974).

Cell survival in tissues exposed to a given dose of ionizing radiation is usually greater than that of similar cells grown individually in vitro, despite the fact that the radiosensitivities (D_0) are virtually identical under the two conditions. An analogous increase in cell survival is observed when Chinese hamster V79-171 cells are grown in suspension culture and irradiated as multicell spheroids. Unfortunately, the information gained from the survival curves so obtained is limited by the inhomogeneity of the cell population with

respect to both degree of contact and cell cycle position. The latter can be studied using synchronized small spheroids. The ratio of $D_{SUB}(Q)$ of spheroid cells to $D_{SUB}(Q)$ of single cells increased as the cells progressed through the cell cycle, from a minimum of 1.3 for G_1 phase cells to a maximum of 2.2 for late S-phase cells. The enhanced survival, or 'contact effect', developed slowly as the spheroids grew, after an initial latent period of about one generation cycle of the cells. A second effect of intercellular contact on mammalian cell survival has also been observed. When cells are assayed under conditions in which intercellular contact is maintained, the net cellular survival is increased further. This effect is different from the usual repair of potentially lethal damage, in that it occurs much more slowly and results in modification of the survival-curve shoulder. Not all cell types tested have shown enhanced survival when grown as spheroids. Several MNNG-induced mutants of the Chinese hamster V79-171 line have been isolated and sublines which do and do not show the contact effect are now available. These may permit study of the mechanism(s) of contact effects.

- 2758 SURVIVAL OF X-IRRADIATED HAMSTER CELLS. ANALYSIS IN TERMS OF THE CHADWICK-LEENHOUTS MODEL. Gillespie, C.J.; Chapman, J.D.; Reuvers, A.P.; Dugle, D.L. (Atomic Energy of Canada Ltd., Pinawa, Manitoba. Whiteshell Nuclear Research Establishment). pp 25-31 of Cell survival after low doses of radiation: theoretical and clinical implications. Proceedings of the sixth L.H. Gray conference, held at Bedford College, London, 16-21 September 1974. Alper, T. (ed.). London; Institute of Physics and Wiley (1975).

From 6. L.H. Gray conference; London, UK (16 Sep 1974).

Survival measurements, with well synchronized cells, are compared with the equation derived from the Chadwick-Leenhouts model. Corrections for DNA replication are shown to be required. Corrected data are accurately fitted by the equation at all stages of the cell cycle. Synthesized data for asynchronous cells are shown to conform fortuitously to the same equation, as found experimentally. Evidence from DNA strand breakage and repair studies supports the direct relationship with survival proposed in the model. Use of the equation to establish the initial shape of survival curves appears to be well justified. On this basis, the initial shape is always a finite slope, except for predominantly late interphase or mitotic cells, for which zero slope may be approximated.

- 2759 EFFECTS OF PROTRACTED GAMMA IRRADIATION ON CELLS FROM A RAT RHABDOMYOSARCOMA TREATED IN VITRO AND IN VIVO. Kal, H.B. (Gezondheidsorganisatie TNO, Rijswijk (Netherlands). Radiobiologisch Instituut TNO). pp 259-267 of Cell survival after low doses of radiation: theoretical and clinical implications. Proceedings of the sixth L.H. Gray conference, held at Bedford College, London, 16-21 September 1974. Alper, T. (ed.). London; Institute of Physics and Wiley (1975).

From 6. L.H. Gray conference; London, UK (16 Sep 1974).

Experiments designed to obtain insight into factors which influence reproductive death of R-1 tumour cells during and after protracted irradiation with ^{137}Cs gamma rays are discussed. Cells were derived from a transplantable rat rhabdomyosarcoma which can also be cultured in vitro. Results of experiments with in vitro cultured cells show

that repair of sublethal damage takes place during protracted gamma irradiation. Nevertheless an acute single dose given at the end of a protracted irradiation of many hours is more effective with respect to cell inactivation than a single acute dose applied without pretreatment. This increased radiosensitivity at the end of a low dose rate treatment can be explained by the observation that cells were redistributed over the cell cycle phases with relatively more cells in the G_2 phase. For R-1 cells in the tumour irradiated in situ and assayed in vitro, repair of sublethal damage and redistribution was observed as well. In addition, it was found that reoxygenation of hypoxic cells took place. The effectiveness of protracted irradiation on R-1 cells cultured in vitro as compared to acute irradiation depends on the dose rate. The dose-rate modification factor for R-1 calls irradiated in the tumour in situ, however, does not vary with the dose rate in the range 75 to 150 rad h^{-1} . The D_0 of the slope of a low dose rate survival curve is not an accurate measure of the D_0 of the initial slope of a high dose rate survival curve. Results are compared with data obtained with protracted irradiation on a normal tissue, the rat skin.

- 2760 RELATION OF INTRACELLULAR CYCLIC AMP TO THE SHAPE OF MAMMALIAN CELL SURVIVAL CURVES. Lehnert, S. (McGill Univ., Montreal, Quebec (Canada)). pp 226-235 of Cell survival after low doses of radiation: theoretical and clinical implications. Proceedings of the sixth L.H. Gray conference, held at Bedford College, London, 16-21 September 1974. Alper, T. (ed.). London; Institute of Physics and Wiley (1975).

From 6. L.H. Gray conference; London, UK (16 Sep 1974).

Results of experiments with V79 cells growing in tissue culture indicate that the reproductive survival of cells following irradiation is influenced by the level of intracellular 3', 5'-cyclic adenosine monophosphate (cyclic AMP) at the time of irradiation. Cells containing high levels of cyclic AMP induced by treatments with drugs show a characteristic survival curve in which the extent of the shoulder is increased so that the survival after low doses is enhanced. The exponential slope or D_0 , however, is decreased so that at high doses the survival of cells containing high levels of cyclic AMP may be less than that of controls. Naturally occurring changes in radiosensitivity such as those observed as cells pass through the division cycle, may also be related to parallel changes in cyclic AMP concentration occurring during the cycle. Injection of mice with compounds producing elevated cyclic AMP prior to whole-body irradiation increases survival at seven days post-irradiation. The shape of the survival curve for intestinal stem cells in these mice differs from that of the control in having an increased extrapolation number; no change in D_0 is observed in this in vivo situation.

- 2761 THE EFFECT OF REPEATED SMALL DOSES OF RADIATION ON RECOVERY FROM SUBLETHAL DAMAGE BY CHINESE HAMSTER CELLS IRRADIATED IN OXIC OR HYPOXIC CONDITIONS IN THE PLATEAU PHASE OF GROWTH. McNally, N.J. (Mount Vernon Hospital, Northwood (UK)). pp 119-125 of Cell survival after low doses of radiation: theoretical and clinical implications. Proceedings of the sixth L.H. Gray conference, held at Bedford College, London, 16-21 September 1974. Alper, T. (ed.). London; Institute of Physics and Wiley (1975).

From 6. L.H. Gray conference; London, UK (16

Sep 1974).

Unfed plateau phase Chinese hamster cells have been irradiated with either single doses or up to ten fractions of x-rays six hours apart. These cells remained in an extended G_1 -like phase throughout the irradiation period. The single-dose log survival curve had an extrapolation number of about 9 and the oxygen enhancement ratio was three. Cells were exposed either to 200 rad per fraction in air and 600 rad per fraction in hypoxia (during irradiation only), or 150 rad per fraction in air and 450 rad per fraction in hypoxia. The resulting fractionated log survival curves did not fit a multitarget model of cell survival, being much steeper than that would predict. The addition of a single-hit component to the lethal effect of the radiation gave reasonable agreement for the first five fractions although the curves tended to bend downwards with increasing number of fractions. The log survival curve for cells irradiated with five fractions of 200 rad (or 600 rad in hypoxia) six hours apart and graded doses six hours after the fifth fraction had an extrapolation number much less than that following single doses, implying a decreased ability to absorb radiation damage as sublethal. The ratio of the initial slopes of the fractionated log survival curves for irradiation in air and hypoxia was less than three, implying that the oxygen enhancement ratio on the shoulder may be less than that in the exponential region of survival.

- 2762 RESPONSE OF HELA AND CHINESE HAMSTER CELLS TO LOW DOSES OF PHOTONS AND NEUTRONS. Nias, A.H.W.; Gilbert, C.W. (Christie Hospital and Holt Radium Inst., Manchester (UK)). Paterson Labs.). pp 93-99 of Cell survival after low doses of radiation: theoretical and clinical implications. Proceedings of the sixth L.H. Gray conference, held at Bedford College, London, 16-21 September 1974. Alper, T. (ed.). London; Institute of Physics and Wiley (1975).

From 6. L.H. Gray conference; London, UK (16 Sep 1974).

Survival of colony-forming ability has been estimated for HeLa and Chinese hamster (ovary) cells irradiated in vitro with 300 kV x-rays at 100 rad min^{-1} , with ^{60}Co gamma rays over protracted periods of time, with 14 MeV DT neutrons at 10 to 30 rad min^{-1} and with protracted ^{252}Cf neutron irradiation. A computer program has been used to analyse the experimental data to determine the best fit to a Puck-type survival curve. Comparison of the survival curves of HeLa cells show that oxygen was a simple DMF when cells were only hypoxic but not when they were completely anoxic. The same contrast applied to a change in LET from 300 kV x-rays to 14 MeV neutrons; with CHO cells a simple DMF was found but with HeLa cells it was not. With protracted cobalt gamma-irradiation, oxygen was a simple DMF; with californium it was not. The comparison between cobalt and californium is therefore complicated. In two series of experiments the dose-response of both HeLa and CHO cells was measured over the shoulder as well as the straight-line portions of the Puck curves for both 300 kV x-rays and 14 MeV neutrons. The initial slopes of the survival curves could therefore be computed. These observations lead to the conclusion that for x-rays the initial slope of the survival curve for CHO cells is only just significantly different from zero. For HeLa cells the x-ray curve has a well defined initial slope.

- 2763 EFFECT OF CYSTEAMINE ON THE YIELD OF CHROMOSOMAL ABERRATIONS IN LYMPHOCYTES OF HUMAN

BLOOD IRRADIATED WITH GAMMA RAYS. Mileva, M. Nauchni Tr., Nauchnoizsled. Inst. Radiobiol. Radiats. Khig.; 5: No. 1, 36-40(1975). (In Bulgarian).

Whole blood is irradiated with ^{60}Co gamma rays at doses of 93, 188, 372 and 558 rads with and without the addition of cysteamine at a dose of 200 gammas per 1 mm of blood. A lymphocyte culture is fixed 52 hours after stimulation with phytohemagglutinin, and various chromosomal aberrations were determined. The protective effect of cysteamine is manifested on all types of aberrations. A protective factor P was calculated from the relation: $P = (100 - O/K) 100$. Here O is the number of aberrations with protection, and K is the number of aberrations without protection by cysteamine. The protective effect is 18.4 percent at 93 rad, 53.3 percent at 188 rad, 69.7 percent at 372 rad, and 75.7 percent at 558 rads. It is concluded that cysteamine protects the somatic cells of man from radiation damage by gamma rays. 17 refs.

- 2764 EXPERIMENT TO DETERMINE THE RELATIVE GENETIC EFFICIENCY OF FAST NEUTRONS IN INDUCING RECIPROCAL TRANSLOCATIONS IN SPERMATOGONIA OF MICE. Khadzhiyeva, T. Nauchni Tr., Nauchnoizsled. Inst. Radiobiol. Radiats. Khig.; 5: No. 1, 87-91(1975). (In Bulgarian).

A neutron dose of 25 R from a plutonium-beryllium source was given to male mice of the C57 BI line over a period of 10, 70 and 720 hours and corresponding dose rates of 0.0410, 0.006 and 0.0006 rads per minute. A gamma dose of 200 R was administered over a period of 10, 70 and 720 hours and at corresponding dose rates of 0.33, 0.048 and 0.0048 rads per minute. Cytological analysis of primary spermatocytes in diakinesis of metaphase I was carried out to determine reciprocal translocations occurring in spermatogonia. A total of 1.2, 2.6 and 2.8 cells with translocations were measured in the neutron series. At neutron dose rates of 0.0410, 0.006 and 0.0006 rads per minute the corresponding translocation rates were 0.6×10^{-3} , 1.0×10^{-3} and 1.1×10^{-3} translocations per rad per cell respectively. In the gamma irradiations the translocation rates were 0.06, 0.06 and 0.08 translocations per rad per cell respectively. These results indicate a high genetic risk to man from radiation with a high linear input of energy. 11 refs.

- 2765 GENETIC CONSEQUENCES OF RADIOACTIVE ISOTOPES. VI. EMBRYONIC LETHALITY IN THE FIRST GENERATION OF MALE MICE TREATED WITH PHOSPHOROUS-32 IN THE PREMEIOTIC STAGE. Baev, I.; Bairakova, A.; Manchev, V. Nauchni Tr., Nauchnoizsled. Inst. Radiobiol. Radiats. Khig.; 5: No. 1, 97-100(1975). (In Bulgarian).

Male mice of the BALB/C line were given intraperitoneally ^{32}P doses of 0, 25, 50, 75 and 135 microcuries of ^{32}P per mouse. Nineteen days after injection these male mice were housed with five intact females of the C₅₇ BI line. On the 18th day after fertilization the females were dissected, and a count was made of the living and dead embryos and of the yellow bodies. The dominant lethals (DL) were calculated from the formula: $DL = 1 - (\text{ratio of embryos per yellow body on irradiation} / \text{ratio of embryos per yellow body in the controls})$. The dominant lethals were found to increase in the order 0, 2, 10, 28 and 23 percent in the above cases. The embryonic mortality was 13.4, 14.9, 21.8, 37.5 and 33.3 percent respectively in the above cases. 10 refs.

- 2766 GENETIC CONSEQUENCES OF RADIOACTIVE

ISOTOPES. II. CHROMOSOMAL ANOMALIES (TRANSLOCATIONS) FROM IODINE-131 AND STRONTIUM-89 IN MALE SEX CELLS OF RATS. Baev, I.; Bairakova, A.; Benova, D. Nauchni Tr., Nauchnoizsled. Inst. Radiobiol. Radiats. Khig.; 5: No. 1, 101-104(1975). (In Bulgarian).

Male Wistar rats were divided into three groups. The first group was given 3.5 microcuries of ^{129}I per rat; the second group, 10 microcuries of ^{89}Sr per rat, and the third group was injected intraperitoneally with water to serve as controls. The translocation frequency in rat spermatocytes were found to be 1.5 percent, 3.8 percent and zero respectively in the above three groups. 6 refs.

- 2767 CYTOGENETIC STUDIES IN RATS FED IRRADIATED WHEAT. Vijayalaxmi. (National Inst. of Nutrition, Hyderabad, India). Int. J. Radiat. Biol.; 27: No. 3, 283-285(1975).

The results of a study in which irradiated wheat was stored for 12 weeks before being fed to rats and the time-course of the appearance of polyploid cells with increasing duration of feeding freshly-irradiated wheat are presented. The data presented suggest that when irradiation is used as a method for sterilization and preservation, it is necessary to recommend that irradiated wheat be stored for periods extending beyond three months before it can be considered wholesome for consumption. 7 refs..

On July 1st, 1974, TWA have announced an embargo on the transport of dangerous materials (including radiopharmaceuticals such as Tc generators) on passenger planes which has since then led to modifications of the IATA regulations. They were forced to this step by the assertion that the transport of radiation sources would mean an unreasonably high radiation load to the flight personnel. It had also been claimed that the incidence of spontaneous abortions is considerably higher for stewardesses in these flights than for others. These claims are invalidated by dose rate measurements of flight personnel in the USA and of Lufthansa flight personnel as well as by the radiological findings of animal experiments. Restrictions on the transport of radiopharmaceuticals by air may also endanger the supply to patients in large hospitals.

Physical and radiological terms, quantities, and units are presented. Basic principles of radiation protection (ICRP, IAEA, EURATOM, FRG) are discussed. Biological effects of ionizing radiation and objectives of practical radiation protection are also discussed.

- 2773 (BMVg-FBWT--75-1) GAMMA RADIATION AND GAMMA RAY PROTECTION FACTORS OF SHIPS IN VARIOUS SITUATIONS OF RADIOACTIVE FALL-OUT. Brehm, E.H.; Holst, T. (Bundesministerium der Verteidigung, Bonn (Germany, F.R.). Abt. Wehrtechnik). 1975. 66p. (In German). TIC.

4 refs.; with figs. and tabs. Available from ZAED.

In this report the development of methods of evaluating gamma ray protection factors (GSF) of ships for various situations of radioactive fall-out is described. The joining calculations of gamma ray protection factors are performed by the newly developed computer procedure GASUFA. These protection factors determine - in connection with a measured gamma radiation dose at a given detector point - the gamma radiation in different compartments of the ships. The computer program GASUFA is able to perform calculations considering the dependence of energy, place and time for the following situations: - the ship is under a radioactive cloud without fall-out; - the ship is under a radioactive cloud with fall-out; - the ship is contaminated by radioactive fall-out; - the clean or decontaminated ship is going through a zone, which is contaminated by radioactive fall-out; - the ship and the surrounding water surface are contaminated by radioactive fall-

out.

- 2774 (CEA-CONF--3461) STUDY OF A ²⁵²Cf SOURCE PROJECTOR FOR PLESIOCURIETHERAPY. Blanche, J.; Brault, G.; Barthelemy, P.; Boucher, R.; Berger, R.; Chemtob, M.; Parmentier, N. (CEA Centre d'Etudes Nucleaires de Fontenay-aux-Roses, 92 (France). Dept. de Genie Radioactif). 1975. 9p. INIS.

From 4. International transplutonium element symposium; Baden-Baden, F.R. Germany (13 Sep 1975).

The source projector described is roughly a sphere 1.10m in diameter with an octagonal steel body and weighs about a metric ton. This device is designed for the purposes: to provide a biological shielding for the storage of 16 source-holders containing a total amount of 25µg of californium-252 and to insure the simultaneous ejection of up to 6 source-holders through the applicators. The availability of the californium-252 source-projector by the end of this year will provide major assistance in the clinical evaluation program of neutron plesiocurietherapy by facilitating the implantation of source-assemblies and reducing the radiation dose to hospital staff.

From 7. annual national conference on radiation control; Hyannis, MA, USA (27 Apr 1975).

7th annual national conference on radiation control.

A review is given of the design, manufacture, quality control, and testing of microwave ovens to ensure that they comply with federal regulations. Some aspects of the review are common to all electronic products regulated under the radiation control for Health and Safety Act of 1968. The majority of microwave

ovens deliver about 600 to 675 watts to the oven cavity, utilizing a fixed frequency magnetron tube which is driven at about 4000 volts. Factors influencing personal exposure are time the oven operates per day and location of people in relation to the oven. Various types of door seals and an interlock for shutting the oven off when the door is opened are described and illustrated. Before an oven design is introduced into commerce an extensive testing program is carried out. (HLW)

From 7. annual national conference on radiation control; Hyannis, MA, USA (27 Apr 1975).

7th annual national conference on radiation control.

Some topics discussed are: enforcement program for diagnostic x-ray; evaluation of manufacturer's reports; product testing in FDA laboratories; inspection of completed assembly of the x-ray machine; state contracting plans for x ray inspections; national diagnostic compliance; and activities of the Colorado Department of Health. (HLW)

2784 (DHEW/FDA--76-8026, pp 136-143) SURVEY OF MAMMOGRAPHIC EXPOSURE LEVELS AND TECHNIQUES USED IN EASTERN PENNSYLVANIA. Bicehouse, H.J. 1975.

From 7. annual national conference on radiation control; Hyannis, MA, USA (27 Apr 1975).

7th annual national conference on radiation control.

Radiation exposures from routine mammographic techniques utilized by 70 facilities in eastern Pennsylvania for a cranio-caudal mammograph on a medium-density, medium-sized breast ranged from 0.25 to 47 R. Five facilities apparently overexposed and underdeveloped their films resulting in the highest exposures observed. Approximately one-third of the facilities did not follow the film supplier's recommendations for image-receptor development. Approximately two-thirds of the x-ray units surveyed had measured half-value layers consistent with total filtrations of from 1.0 to 2.5 mm of aluminum. Apparently, three-fifths of the surveyed facilities had not optimized their mammographic procedures for x-ray energies and image-receptor development. This lack of optimization led to a blurring of techniques and exposures making various techniques statistically indistinguishable in

the lower ranges of exposures; e.g., less than 5 R. The overall range of exposures is consistent with an empirical factor due to the radiologist's choice of desired density. The desired density differences for the same image receptor system cause exposure differences of up to a factor of ten.

2785 (DHEW/FDA--76-8026, pp 144-146) POST-TREATMENT RADIOLOGY FOR QUALITY ASSURANCE IN DENTISTRY. Gerusky, T.M. 1975.

From 7. annual national conference on radiation control; Hyannis, MA, USA (27 Apr 1975).

7th annual national conference on radiation control.

It is emphasized that to justify the use of radiation the patient must derive a benefit. Guidelines are presented in an attempt to define conditions in which the probability of the patient receiving a benefit is sufficiently great to justify the additional post-treatment radiation exposure. In general, post-treatment radiographs are a benefit to the patient only when they indicate that radiographically detectable lesions have not been treated and the dental treatment performed is inappropriate for the individual patient's oral environment. (HLW)

2786 (DHEW/FDA--76-8026, pp 148-153) PENNSYLVANIA'S EXPERIENCE IN MASS SCREENING. Gerusky, T.M. 1975.

From 7. annual national conference on radiation control; Hyannis, MA, USA (27 Apr 1975).

7th annual national conference on radiation control.

A policy statement issued in 1972 by the Assistant Secretary for Health and Scientific Affairs of the Department of Health, Education, and Welfare recommended that community chest x-ray surveys should not be used as a screening procedure for the detection of cardiopulmonary disorders and that when chest x-ray screening programs are justified for selected population groups, the full size photograph, rather than the miniature film, is preferred. A survey conducted in 1974-75 revealed that chest x-rays were required for prisoners, prison employees, school employees, food handlers, and students who wished to participate in sports. Meetings were held with medical associations in the hope of stopping the local mass-screening operations. Of 27 groups in Pennsylvania involved in tuberculosis screening, 12 groups refused or were unwilling to phase out their photofluorographic procedures. The problem will be resolved by regulation. (HLW)

2787 (DHEW/FDA--76-8026, pp 154-156) OVERVIEW OF QUALITY ASSURANCE IN DIAGNOSTIC MEDICAL X-RAY EXAMINATIONS. Benson, J.S. 1975.

From 7. annual national conference on radiation control; Hyannis, MA, USA (27 Apr 1975).

7th annual national conference on radiation control.

Quality assurance is defined as reduction of patient exposure and improvement in film quality. The history of quality assurance programs is briefly reviewed. The Dental Exposure Normalization Technique for improving dental practices and dental equipment is discussed. Data on exposure of patients to medical radiation show wide variations. Some causes of poor film quality are inconsistent machine output, poor beam alignment, timer inaccuracy, improper film-screen combination, and poor film-screen contact. (HLW)

2788 (DHEW/FDA--76-8026, pp 157-159) TASK FORCE'S VIEWPOINT OF THE CURRENT BRH PROGRAM. GONAD SHIELD, PART F. Dolezal, A. 1975.

From 7. annual national conference on radiation control; Hyannis, MA, USA (27 Apr 1975).

7th annual national conference on radiation control.

A previous report on radiation protection during diagnostic exposure is reviewed. Some topics discussed are: Task Force regulations for the model by which routine use of patient shielding or gonad shielding would be required; shielding in relation to collimation, scatter radiation, and enforcement of regulations; and proposed regulations for reduction of unnecessary radiation. (HLW)

2789 (DHEW/FDA--76-8026, pp 160-165) BRH GONAD SHIELDING PROGRAM: WHERE IT HAS LED. Arcarese, J.S. 1975.

From 7. annual national conference on radiation control; Hyannis, MA, USA (27 Apr 1975).

7th annual national conference on radiation control.

Some topics discussed are: Bureau of Radiological Health guidelines; types of gonad shields; specific area shielding; gonad shielding guidelines; and publication of pamphlet on types of shields and circumstances under which they should be used. (HLW)

2790 (DHEW/FDA--76-8026, pp 180-183) PROPOSED REGULATIONS ON DOSIMETRY CERTIFICATION. Weiss, B.H. 1975.

From 7. annual national conference on radiation control; Hyannis, MA, USA (27 Apr 1975).

7th annual national conference on radiation control.

Some topics discussed are: development of testing laboratory concept; need for establishing a film dosimetry calibration laboratory; federal agency to direct a continuing performance testing program; need for regulatory device to compel personnel dosimetry suppliers to submit to testing; and criteria for testing of personnel dosimetry suppliers. (HLW)

2791 (DHEW/FDA--76-8026, pp 206-212) LATEST DEVELOPMENTS IN EMERGENCY PREPAREDNESS PLANNING. Collins, H.E. 1975.

From 7. annual national conference on radiation control; Hyannis, MA, USA (27 Apr 1975).

7th annual national conference on radiation control.

Emergency preparedness is discussed under the following headings: federal administrative actions concerning emergency preparedness; technical guidance; training; review of state radiological emergency response plans; field assistance effort; and federal response programs under development. (HLW)

2792 (DHEW/FDA--76-8026, pp 213-217) USE AND MISUSE OF THE BEIR REPORT AND NCRP REPORT NO. 43. Hilberg, A.W. 1975.

From 7. annual national conference on radiation control; Hyannis, MA, USA (27 Apr 1975).

7th annual national conference on radiation control.

The BEIR report on the effects on populations of exposure to low levels of ionizing radiation is being used as a radiation

protection guide and to establish radiation standards. This was not the intent of the document. Several statements most often used in the misinterpretation of the BEIR report are quoted and discussed. Report 43 of the NCRP substantiates the value of the BEIR report and brings to attention the necessary understanding of the warnings and restrictions of the use of the BEIR report. (HLW)

- 2793 (DHEW/FDA--76-8026, pp 218-232) RADIATION PROTECTION PHILOSOPHY AND RISK ESTIMATES. NCRP REPORT 43 (1975), NAS-BEIR COMMITTEE REPORT (1972, UNSCEAR REPORT (1972). Casarett, G.W. 1975.

From 7. annual national conference on radiation control; Hyannis, MA, USA (27 Apr 1975).

7th annual national conference on radiation control.

The purpose of the NCRP report no. 43 was to determine what influence the epidemiological and experimental radiobiological reports of the past several years should have on current NCRP radiation exposure standards. The position of the NCRP is that the lowest practicable radiation level below the recommended dose limits is the fundamental basis for establishing radiation protection standards, and on the assumption that the most important health hazards do not have a dose threshold. The BEIR report states that societal needs can be met with far lower average exposures and risks than permitted by the current Radiation Protection Guide of 170 millirems per yr, and that the current Guide is unnecessarily high. A review is given of the recent history of radiation protection standards and a discussion is given of similarities and differences between the BEIR and UNSCEAR reports. (HLW)

- 2794 (DHEW/FDA--76-8026, pp 233-234) REPORT OF THE TASK FORCE ON NATIONWIDE EVALUATION OF X-RAY TRENDS. Ward, J.O. 1975.

From 7. annual national conference on radiation control; Hyannis, MA, USA (27 Apr 1975).

7th annual national conference on radiation control.

Objectives of the NEXT program are to identify optimum components of a survey, provide for uniform data collection, provide a system for assigning program priorities, and provide a system for measuring program effectiveness. Studies on new methods of organ dose estimation are discussed and the problem of credibility of NEXT data is considered. (HLW)

- 2795 (DHEW/FDA--76-8026, pp 238-242) REPORT OF THE TASK FORCE ON PERSONNEL DOSIMETRY. Lloyd, L.L. 1975.

From 7. annual national conference on radiation control; Hyannis, MA, USA (27 Apr 1975).

7th annual national conference on radiation control.

Recommendations of the workshop on personnel dosimetry are presented and conditions under which reliability testing is to be performed are listed. A baseline study of commercial personnel dosimeter services was conducted to evaluate the state-of-the-art of personnel dosimeters and to test current and proposed standards that apply to evaluation and testing of dosimeters. The Task Force recommended that: the conference support the NRC in the development of regulations requiring licensees to utilize tested personnel dosimetry services; the conference support continued efforts by the Task Force and the various federal agencies in

evaluation of existing standards pertaining to personnel dosimeters and to the development of new criteria and standards which can be applied to the testing laboratory and to suppliers of personnel dosimeters; the Task Force continue in a monitoring status. (HLW)

- 2796 (DHEW/FDA--76-8026, pp 243-246) SUMMARY OF RTC ACTIVITIES. 1975.

From 7. annual national conference on radiation control; Hyannis, MA, USA (27 Apr 1975).

7th annual national conference on radiation control.

A summary of Regional Training Committee activities is presented with regard to assessment of training needs and implementation of training, mechanisms of communication, formal training courses in basic radiological health and radiation emergency planning, and other training services. A summary of available training resources is presented. Recommendations of the National Training Coordination Committee are as follows: continue the RTC concept; broaden the role of the NTCC; the individual should assess its regional resources; increase financial support of RTC; and conference members should support federal efforts in training. (HLW)

- 2797 (DHEW/FDA--76-8026, pp 275-278) WORKSHOP SUMMARY REPORTS. Parrott, M. 1975.

From 7. annual national conference on radiation control; Hyannis, MA, USA (27 Apr 1975).

7th annual national conference on radiation control.

Summaries are presented of the activities of the following workshops: develop criteria for an adequate state radiological health program for radiation sources not covered under the atomic energy act; develop user assistance programs at the state level to improve diagnostic x-ray quality; define the role and functions of states in the implementation of current and proposed transportation standards, regulations, and guidelines; explore and define the role of paid radiation consultants in assuring use compliance with state regulations; develop guidance to state radiation health programs in the control and regulation of multiphasic screening mobile laboratories; evaluate federal efforts in assisting states in emergency response planning; develop criteria for the evaluation and distribution of radioactive sources and devices manufactured in nonagreement states; and evaluate the radiation protection practices in nuclear medicine. (HLW)

- 2798 (DHEW/FDA--76-8026, pp 249) REPORT OF THE TASK FORCE ON RADIOPHARMACEUTICALS.

Lacker, D.K.; Porter, B.J.; Watkins, G. 1975.

From 7. annual national conference on radiation control; Hyannis, MA, USA (27 Apr 1975).

7th annual national conference on radiation control.

The procedures for evaluation of IND and NDA applications were reviewed by FDA and the state members of the Task Force believe that there is significant progress being made toward expeditious handling of these items. Progress toward publication of the final rule on radiopharmaceuticals has reduced the need for state regulatory activity in investigational aspects of radiopharmaceutical research to the point that the original concept for the training is no longer valid. (HLW)

- 2799 (DOC-LFEN--163-b) RADIATION PROTECTION

IN PORTUGAL: HEALTH, SAFETY AND LEGAL ASPECTS. Galvao, J.P.; Carreiro, J.V.; Bettencourt, A.O.; Vaz, A.N.; Severo, A. (Junta de Energia Nuclear, Sacavem (Portugal). Lab. de Fisica e Engenharia Nucleares). 1975. 16p. (In French). Dep. NTIS (US Sales Only), PC A02/MF A01.

5 figs..

The paper describes the basic legal and technical principles governing radiation protection in Portugal. The methods used in the medical surveillance of occupationally exposed persons (especially in the assessment of biological effects) are described, and the results of recent studies carried out with a view to improving biological dosimetry techniques are reported. An account is also given of dosimetry at nuclear centres in mines, at research establishments, in industry and in hospitals and private clinics, the accumulated doses being examined in the light of international recommendations relating to radiation protection. Statistical data on the granting of licences to different kinds of establishment are considered from the radiation safety point of view by the authors, who also describe the methods used for controlling waste from nuclear facilities and the measures taken in such special situations as the visit of a nuclear-powered ship to a Portuguese port or the disposal of radioactive waste into the Atlantic Ocean. A brief account is given of recent efforts to check on radioactive pollution (especially the contamination of milk by ^{90}Sr). Lastly, the criteria followed in licensing and controlling Portuguese establishments which work with radioactive substances or other radiation sources are reviewed and, on the basis of experience, a critical appraisal is made of the application of the fundamental technical and legal principles, which presupposes the necessary co-operation between license-issuing authority, facility operator and staff.

2800 (ERDA--77-29) EIGHTH ANNUAL REPORT OF RADIATION EXPOSURES FOR ERDA AND ERDA CONTRACTOR EMPLOYEES. (Environmental Research and Technology, Inc., Concord, Mass. (USA)). 1975. 49p. Dep. NTIS, PC A03/MF A01.

In 1968, the U.S. Atomic Energy Commission (AEC) established a program for reporting certain occupational radiation exposure information to a central radiation records repository maintained at the Union Carbide Computing Technology Center, Oak Ridge, Tennessee. Annual summaries (WASH-1350-R1 through WASH-1350-R6) were reported for the years 1968 to 1973 and included data on AEC contractor employees as well as employees of companies in the private sector licensed by the AEC. The 1974 data for what is presently ERDA and ERDA contractor employees are published in the ERDA 76/119 report. In January 1975, two new agencies, the Energy Research and Development Administration (ERDA) and the U.S. Nuclear Regulatory Commission (NRC) were formed and now share the responsibilities previously held by the AEC. Previous AEC licensees now report to NRC while the contractors report to ERDA. This report contains 1975 radiation exposure data for ERDA and ERDA contractor employees.

2801 (FRNC-TH--624) CONTRIBUTION TO RESEARCH ON RADIATION PROTECTION OF THE EYES. Soussan, R.E. (Paris-6 Univ., 75 (France)). 1975. 67p. (In French). NTIS (US Sales Only), PC A04/MF A01.

Copies available from Service de Documentation, CEN Saclay, B.P.N2, 91190 Gif-sur-Yvette (France). Thesis.

The problem of the harmful effects of different radiations to which workers are more or less seriously exposed was studied as a whole. It is shown that any ray without exception can cause damage to the ocular apparatus since even natural light, when suffered too intensely or for too long, can cause sight disorders and lesions, and this applied even more to so-called invisible rays: infrared, ultraviolet, laser. Powerful short-range radar waves and X, gamma and cosmic rays are also mentioned. This work covers both a physical study of the above radiations and a clinical anatomical study on the pathogenesis of the eye lesions they cause (more or less serious and more or less irreversible damage to the retina, cornea, crystalline lens, conjunctive tissue). General and individual protective measures are reported, and finally the work laws are discussed in terms of their application to radiation-induced eye troubles.

2802 (INIS-mf--1906) ROLE OF CERENKOV RADIATION IN THE EYE-FLASHES OBSERVED BY APOLLO ASTRONAUTS. McNulty, P.J.; Pease, V.P.; Bond, V.P. (Clarkson Coll. of Tech., Potsdam, N.Y. (USA)). 1975. 40p. INIS.

From 18. COSPAR plenary meeting. Radiation biology; Varna, Bulgaria (29 May 1975).

The variety of visual phenomena experienced by dark-adapted human observers when a pulse of extremely relativistic particles passes through the eyeball have been studied in experiments at the Alternating Gradient Synchrotron at Brookhaven National Laboratory. Experiments with muons and pions involving three subjects were carried out in such a manner that Cherenkov radiation was the physical mechanism initiating the visual sensation. Standard psychophysical techniques were used to determine threshold. Considerable success was obtained in using collimated beam pulses to simulate the types of visual phenomena described by Apollo astronauts. (auth)

2803 (INIS-mf--2078, pp 56-57) THE EFFECT OF PSORALEN AND ULTRAVIOLET LIGHT UPON HUMAN CHROMOSOMES. Waksvik, H.; Broegger, A. 1975.

2804 (INIS-mf--3133, pp III 4-III 7) EVALUATION OF DOSES GIVEN TO FOETUS IN DIAGNOSTIC RADIOLOGY IN ISRAEL. Schlesinger, T.; Donagi, A.; Karpinovitz, A. (Israel Atomic Energy Commission, Yavne. Soreq Nuclear Research Center); Lichter, A.; Hai, J.; Amir, Y.; Naveh, M. (Ministry of Health, Tel Aviv (Israel)). 1975.

From Joint annual meeting of the Israel Nuclear Society and the Israel Health Physics Society (IRPA); Haifa, Israel (30 Nov 1975).

Transactions of the Israel Nuclear Society and the Israel Health Physics Society (IRPA), of the joint annual meeting 1975. Vol. 3.

Among the various groups exposed to diagnostic radiation, pregnant women, during the first months of pregnancy, require special attention, because of the high sensitivity of the developing foetus to ionizing radiation. In light of this sensitivity, special limitations were adopted in different countries, concerning female X-ray technicians in the reproductive age. However, it frequently happens that a

pregnant woman is irradiated during the first months of pregnancy, due to the fact that neither she nor the attending physician is aware that she is pregnant. Many times, after this fact is realized, physicists are asked to "reconstruct" the radiographs in order to evaluate the foetus dose. The purpose of this "reconstruction" is to determine whether an abortion is to be performed. The present work constitutes the first stage of a research designed to provide the radiologist with typical Israeli data, which he could use for evaluating the order of magnitude of the foetus dose. The purpose of this "preliminary evaluation" carried out by the radiologist is to determine whether the foetus dose is of such a magnitude justifying the performance of a specific "reconstruction test" or not.

- 2805 (INIS-mf--3141, pp 129-136) UNACCEPTABLE UNCERTAINTY IN RISK ANALYSIS RELATED TO THE MEDICAL CONSEQUENCES OF NUCLEAR FISSION. Keestra, P.C. 1975. (In Dutch).

From Symposium on key questions about the fast breeder reactor; Delft, Netherlands (27 Nov 1975).

10 refs..

Symposium on key questions about the fast breeder reactor.

The biological radiation effects, as a consequence of the increasing application of nuclear fission and the accompanying migration of radioactive materials like krypton 84, tritium and carbon 14, are usually heavily underestimated. Two reasons are given: 1. the increased sensitivity for ionizing radiation of cells in the process of mitosis and 2. the effects of mutations as a consequence of autoradiolysis of DNA by the decay of tritium and carbon 14. It is argued that those and other effects should be re-examined in detail.

- 2806 (INIS-mf--3141, pp 157-169) IS THE MAXIMUM PERMISSIBLE RADIATION BURDEN FOR THE POPULATION INDEED PERMISSIBLE. Renesse, R.L. van. 1975. (In Dutch).

From Symposium on key questions about the fast breeder reactor; Delft, Netherlands (27 Nov 1975).

29 p..

Symposium on key questions about the fast breeder reactor.

It is argued that legislation based on the ICRP doses will, under economical influences, lead to a situation where the population is exposed to radiation doses near the maximum permissible dose. Due to cumulative radiation effects, this will introduce unacceptable health risks. Therefore, it will be necessary to lower the legal dose limit of 170 millirem per year per person by a factor 10 to 20.

Symposium on key questions about the fast breeder reactor.

A review is given of the units used in radiation protection. The radiation hazards incurred by human populations can be divided into early and late somatic radiation effects and genetic radiation effects. Examples and motivations of risk analysis estimates are given. For genetic radiation effects, the significance dose and the doubling dose are defined. The minimum permissible dose for different human populations are compared with the doses received from natural radioactivity with medical applications. The risk caused by nuclear reactors and fall-out and its consequences are given for the year 1972 and estimated for the year 2000.

- 2809 (INIS-mf--3179) DICTIONARY OF TERMS AND DEFINITIONS USED IN RADIATION PROTECTION TECHNOLOGY. (Sovet Ekonomicheskoy Vneshnepromyshlennoy Komissiiya po Ispol'zovaniyu Atomnoj Ehnergii v Mirnykh Tselyakh). 1975. 86p. (In Russian). NTIS (US Sales Only).

The dictionary contains terms and definitions used in radiation protection technology. This document is developed by the Section of CMEA Secretariat on peaceful atomic energy application on the basis of materials provided by member states. The dictionary contains versions of terms and definitions in the languages of member states. Total number of terms is 94.

From 9. seminar on the methods of determination and on significance of trace elements in biological materials; Prague, Czechoslovakia (15 Apr 1975).

Trace elements '75.

The biochemical effects were studied of uranyl salt trace amounts on metabolism. In vitro experiments show that microamounts of uranyl salt (from 0.4 to 4 $\mu\text{g U/ml}$) reduce the dehydrogenase activity of D-glyceraldehyde-3-phosphate while increasing its phosphatase activity. The concentration of 10^{-2} $\mu\text{g U/ml}$ increases the activity of glucosyl-6-phosphate dehydrogenase while amounts 10 to 100-times greater significantly inhibit the activity. The process was also studied of the oxidation of nicotinamide coenzymes by gaseous oxygen and by uranium miners' erythrocyte stromata.

2812 (IPNO--75-11) ACTIVITY REPORT OF THE MEDICAL SECTION OF RADIOPROTECTION, 1974-1975. (Paris-11 Univ., 91 - Orsay (France). Inst. de Physique Nucleaire). 1975. 16p. (In French). INIS.

This report supersedes the activities of the medical section of the Radioprotection Department of the Orsay Institute of Nuclear Physics: industrial medicine, monitoring of ionizing radiation effects.

2813 (N--76-16913) GAMMA RADIATION AND GAMMA PROTECTION FACTORS ON BOARD SHIPS DURING RADIOACTIVE FALLOUT. Brehm, E.H.; Holst, T. (Brown, Boveri und Cie A.G., Mannheim (Germany, F.R.)). 1975. 70p. (BMVG-FBWT--75-1). NTIS \$4.50.

Sponsored by Bundesmin. Der Verteidigung. Methods of evaluating Gamma Ray Protection Factors (GRPF) for ships in various situations of radioactive fallout are discussed. These factors determine, in connection with a measured gamma radiation dose at a given detector point, the gamma radiation in different compartments of the ship. A computer program GASUFA was developed to calculate the GRPF. GASUFA performs calculations, considering energy, place, and time dependence, for the following situations: the ship under a radioactive cloud, with or without fallout; the ship contaminated by fallout; the clean or decontaminated ship going to a contaminated zone; and the ship and the surrounding water surface contaminated by fallout. 2814 STUDY OF CERTAIN ASPECTS AFFECTING PATIENT DOSE AND DIAGNOSTIC ACCURACY. Ambiger, T.Y.; Ayappan, P.; Hatimbhai; Viswanathan, P.S.; Iyer, P.S. (Bhabha Atomic Research Centre, Trombay, India). pp 529-537 of Biomedical dosimetry. Vienna; International Atomic Energy Agency (1975). From International symposium on advances in biomedical dosimetry; Vienna, Austria (10 Mar 1975).

See STI/PUB--401; CONF-750331--.

With a view to investigating the extent of the implementation of the latest recommendations of the International Commission on Radiological Protection in connection with the protection of patients undergoing diagnostic x ray examinations, certain studies have been carried out in India. These include the study of the sensitometric properties of the high-speed medical x ray films most commonly used in India, the dark-room techniques practised in different x ray departments in the country and the consequent effect on the patient dose, and the equipment parameters of the fluoroscopy units currently being used in the country. The results of these investigations are presented and discussed. The results indicate that the sensitometric properties of the indigenous film-screen combinations are satisfactory. The dark-room techniques lead to undesirable underdevelopment of the films resulting in the overexposure of the patient and loss of contrast. About 45 percent of the fluoroscopy units have table-top exposure rates higher than the ICRP-recommended value resulting in excessive patient exposure. Further, although the target-to-table top distances of the fluoroscopy units examined satisfy the ICRP recommendations, a major drawback of most of the units is the inadequacy of the tube filtration. (auth)

2815 IMAGE QUALITY AND PATIENT EXPOSURE IN MAMMOGRAPHY, TOMOGRAPHY, ANGIOGRAPHY, AND BONE RADIOGRAPHY. Haus, A.G.; Rossmann, K.; Doi, K.; Chiles, J.T. (Univ. of Chicago). pp 539-

555 of Biomedical dosimetry. Vienna; International Atomic Energy Agency (1975).

From International symposium on advances in biomedical dosimetry; Vienna, Austria (10 Mar 1975).

See STI/PUB--401; CONF-750331--.

In diagnostic radiology, the physical factors affecting image quality and patient exposure are complex and must be studied for each individual procedure. They are a function of recording system unsharpness, geometric unsharpness, image noise, and of the shape, size, and absorption properties of the anatomic part radiographed and the lesion to be detected. The choice of recording system has a significant effect on image quality, and the speed of the recording system is directly related to patient exposure for each procedure. This paper discusses the complexities involved in the selection of recording systems for four radiologic procedures. The authors describe in detail their most recent work on mammography with the Lo-Dose system, whereby a significant reduction in exposure may not reduce, but may even increase, the diagnostic accuracy by reducing geometric unsharpness. We also describe several examples: in tomography, image resolution is not decreased and diagnostic certainty is affected by a change from a medium-speed screen to a high-speed screen recording system; in fine-detail skeletal radiography, the diagnostic information is increased significantly by a change from a conventional screen-film technique to a non-screen technique with fine-grain film and optical magnification, but at the cost of increased patient exposure; and in cerebral angiography, diagnostic information can be increased by use of a screen-film recording system of higher resolution, but lower speed for imaging of small blood vessels. Modulation transfer functions and clinical examples are used to illustrate each procedure. (auth)

2816 ASSESSMENT OF POPULATION DOSE IN X-RAY DIAGNOSIS IN BRAZIL. Alves, R.N.; Araujo, A.M.; Nette, P.H.; Peixoto, J.E.; Reis, V.R.; Tostes, H.C.; Vasconcellos, J.M. (Instituto de Radioprotecao e Dosimetria, Rio de Janeiro). pp 557-560 of Biomedical dosimetry. Vienna; International Atomic Energy Agency (1975).

From International symposium on advances in biomedical dosimetry; Vienna, Austria (10 Mar 1975).

See STI/PUB--401; CONF-750331--.

Measurements of gonadal and thyroidal doses were made in Brazil to estimate the contribution of mass chest and dental radiography to the population dose during diagnostic radiography. A survey of the conditions under which the x-ray machines were used and of the film processing procedures in a representative sample of institutes indicated easy measures that could be taken to reduce the population dose. (auth)

2817 HAZARDS ASSOCIATED WITH STAGE ONE: MINING. pp 11-15 of Uranium: metal of menace. East Melbourne, Australia; Australian Conservation Foundation (1975).

Radiation hazards in uranium mining arise from the presence of ^{222}Rn , a gas which can escape from exposed rock surfaces into the air. Radon daughter products have been associated with an increased incidence of respiratory lung cancer. Other hazards include the tailings which arise from the extraction of uranium ores. The tailings still contain most of the original radium and emit gamma rays and radon gas. The hazards associated with uranium enrichment and fuel manufacture are also discussed. (AT)

- 2818 BIOLOGICAL EFFECTS OF RADIATION. pp 36-40 of Uranium: metal of menace. East Melbourne, Australia; Australian Conservation Foundation (1975).

The controversy of the biological effects of radiation is discussed. The arguments for the acceptance of the radiation risks associated with nuclear power are criticized. (RL)

- 2819 POLYCYTHEMIA VERA TREATED WITH ^{32}P AND MYLERAN: DEVELOPMENT OF CHRONIC GRANULOCYTIC LEUKEMIA WITH CHROMOSOMAL ABNORMALITIES IN ONE PATIENT. Stavem, P.; Sandnes, K. (Rikshospitalet, Oslo (Norway)); Hagen, C.B. van der (Oslo Univ. (Norway)); Vogt, E. (Statens Institutt for Folkehelse, Oslo, Norway). Clin. Genet.; 7: 227-231(1975).

Chronic granulocytic leukemia developed in a 59-year-old woman who had previously received a total of 21 mCi ^{32}P for polycythemia vera. She was treated with Myleran (busulphan) for her chronic granulocytic leukemia. Cytogenetic studies revealed deletion of chromosomes No. 8 and 12, and translocation between 1 and 8. The patient also developed a severe autoimmune hemolytic anemia, for which she received prednisone treatment. She died with a perforated stomach ulcer. (INIS)

- 2820 RADIOCARDIOGRAPHIC DATA ON HEMODYNAMICS IN INDIVIDUALS OCCUPATIONALLY EXPOSED TO SOURCES OF IONIZING RADIATION. Denisova, E.A.; Smirnova, M.I. (Scientific Research Inst. of Labor Hygiene and Occupational Diseases, Moscow). Radiobiologiya; No. 8, 106-110(1975). (In Russian).

Radiocardiography was employed to obtain hemodynamic data for 51 middle aged subjects occupationally exposed to gamma- or x-rays (total exposure amounting to 30-50 rem in the majority of cases) and 41 control subjects without such exposure. The resultant data showed that the control values were as follows: 124.5 $\pm$ 5.1 mm Hg maximum arterial pressure, 73.2 $\pm$ 3.0 mm Hg minimum arterial pressure, 72.7 $\pm$ 3.3 beats/min pulse frequency, 66.2 $\pm$ 2.0 ml circulating volume, 4.4 $\pm$ 0.12 liters/min/m² minute index, 65.2 $\pm$ 2.9 ml/m² stroke index, 16.4 $\pm$ 0.8 sec systemic blood flow, 5.1 $\pm$ 0.12 sec pulmonary blood flow, and 1.72 $\pm$ 0.05 for circulatory efficiency coefficient. The corresponding values for the exposed subjects were, respectively, 119.7 $\pm$ 4.8 mm Hg 72.8 $\pm$ 3.2 mm Hg, 70.6 $\pm$ 5.6 beats/min, 73.98 $\pm$ 3.6 ml, 4.9 $\pm$ 0.1 liters/min/m², 72.8 $\pm$ 3.5 ml/m², 17.2 $\pm$ 1.2 sec, 6.7 $\pm$ 0.36 sec and 1.76 $\pm$ 0.1. The hemodynamic changes were most pronounced in subjects with a 6-10 year work history, and less remarkable in those with shorter or longer employment. Hemodynamic changes were also more pronounced and encountered more frequently among individuals with functional disorders of the nervous system, such as neurocirculatory dystonia. That the hemodynamic differences are dependent on the duration of work suggests that these changes are adaptive in nature.

- 2821 REVIEW OF BIOLOGICAL EFFECTS AND POTENTIAL RISKS ASSOCIATED WITH ULTRAVIOLET RADIATION AS USED IN DENTISTRY. Mills, L.F.; Lytle, C.D.; Andersen, F.A.; Hellman, K.B.; Bockstahler, L.E. Rockville, MD; Department of Health, Education, and Welfare (1975). 33p. GPO \$0.85.

Several dental procedures, recently developed and currently in use by the dental profession, involve the use of near or far ultraviolet (uv) radiation in the oral cavity.

Recent studies on the biological effects of near and far uv radiation suggest potential risks to individuals from excessive uv exposure. In this paper the dental procedures are briefly described, the bases for uv safety standards are reviewed, effects of uv exposure to the skin and eyes and how these effects may relate to oral mucosa exposure are considered, potential modes of action by uv radiation on oral tissues as suggested by cell culture studies are summarized, and potential risks from uv exposure of individuals which might result from the dental procedures are discussed.

- 2822 (ERDA-tr--110, pp 105-111) CALCULATION OF THE CONDITIONS OF IRRADIATION IN EXPERIMENTAL MODEL STUDIES OF CHRONIC OCCUPATIONAL IRRADIATIONS. Berikashvili, V.Sh. 1975. Translated from Radiobiologiya; 15: No. 4, 577-582(1975).

Radiobiology. The correlation of the body weight and other physiological indices with the values of LD_{50/30-60} and the half-recovery period after irradiation in man and in laboratory animals of various species was investigated. A significant exponential interrelationship of these indices was detected, and the parameters of the dependence of the radiobiological indices on the body weight of the animals were found. Mathematical conditions of similarity of the accumulation of doses in chronic irradiation of man and animals were obtained on the basis of the equations of Blair and Davidson for the effective dose after a single irradiation. The conversion factors, as well as the intensities and durations of irradiation of various animals simulating occupational irradiation of 5 rad/year for 20 years, were calculated. (tr-auth)

- 2823 CLINICO-MORPHOLOGIC STUDY OF LEUKOPLAKIA OF THE VULVA PRIOR TO AND AFTER PHOSPHORUS 32 TREATMENT BY USE OF APPLICATORS. Tileva, M.D.; Iliev, E. (Meditsinski Fakultet, Plovdiv (Bulgaria). Radioizotopen Tsentyr s Radiologichna Klinika). Rentgenol. Radiol.; 14: No. 2, 134-141(1975). (In Bulgarian).

- 2824 TOTAL-BODY IRRADIATION AND HUMAN CHROMOSOMES. V. ADDITIONAL EVIDENCE OF A TRANSFERABLE SUBSTANCE IN THE PLASMA OF IRRADIATED PERSONS TO INDUCE CHROMOSOMAL BREAKAGES. Goh, K. (Oak Ridge Associated Universities, TN). J. Med. (Westbury, N.Y.); 6: No. 1, 51-60(1975).

A substance (or substances) produced or activated by total-body irradiation in man and capable of affecting the chromosomes for an extended time has been postulated. Leukocytes from normal persons were cultured with autologous plasma, homologous plasma or serum from patients irradiated 10.5 years previously. Thirty (5.5 percent) chromosomal breaks were found in the 550 metaphases from the control cultures, 152 (13 percent) in the 1175 metaphases from the irradiated plasma cultures and 130 (12 percent) in the 1100 metaphases from the irradiated serum cultures. This finding confirms and extends our previous observation that plasma from total-body irradiated persons is capable of inducing chromosomal breakage in normal leukocytes even 10.5 years after the irradiation. (auth)

- 2825 DOSES OF HUMAN SKIN IRRADIATION DUE TO POLLUTION WITH LIQUID RADIOACTIVE SUBSTANCES. Vasilev, G.; Mikhajlov, M.G.; Sharov, P. (Nauchno-Izslédovatel'ski Inst. po Radiologiya i Radiatsionna Khigiena, Sofia (Bulgaria)). Rentgenol. Radiol.; 14: No. 1, 42-43(1975). (In Bulgarian).

- 2826 MANUAL ON RADIATION PROTECTION IN HOSPITALS AND GENERAL PRACTICE. VOLUME 2. UNSEALED SOURCES. Frost, D.; Jammet, H. Geneva; World Health Organization (1975). 113p. SF.24.00.
Published under the auspices of the International Labour Organization, the International Atomic Energy Agency and the World Health Organization, this volume, the second of a series of 5, reviews the radiation protection requirements in hospitals using unsealed radioactive sources and discusses the problems associated with the administration, handling, and transportation of these sources: characteristics of unsealed sources and radiation hazards; diagnostic and therapeutic applications of radionuclides; organization and staffing; planning of facilities and general layout of a department for the use of unsealed sources, with examples; safe handling of unsealed sources; waste treatment and disposal; monitoring; special problems relating to tritium and carbon-14; decontamination; protection of patients; handling of cadavers with incorporated radionuclides; protection of personnel and members of the public; measures for dealing with accidents. Characteristics of some commonly used radionuclides and doses used in diagnostic examination are appended.
- 2827 THE BIOLOGICAL EFFECTS OF RADIATION. pp 36-40 of Uranium. Metal of menace. Melbourne, Australia; ACF (1975).
The controversy of the biological effects of radiation is discussed. The arguments for the acceptance of the radiation risks associated with nuclear power are criticised.
- 2828 ADVANCE IN RADIATION HYGIENE. Klenner, V. (Institut Hygieny a Epidemiologie, Prague (Czechoslovakia). Ustav Hygieny Zarení). Rev. Czech. Med.; 21: No. 4, 216-224(1975).
The development is reviewed of radiation hygiene in Czechoslovakia during the past twenty years since the formation of the branch as an independent discipline. The responsibilities of individual radiation hygiene research institutes in the country are indicated and the main tasks that have been solved so far are briefly outlined, including the research into the incidence of pulmonary cancer in uranium miners in which Czechoslovak radiation hygiene ranks first in the world.
- 2829 CONTROLLED EARLY REHABILITATION FOR CONSERVATION OF FITNESS OF AGING PERSONS WITH REGARD TO OCCUPATIONAL EXPOSURE TO IONIZING RADIATION. Schuettmann, W.; Arndt, D. (Staatliches Amt fuer Atomsicherheit und Strahlenschutz, Berlin (German Democratic Republic)). Wiss. Z. Humboldt-Univ. Berlin, Math.-Naturwiss. Reihe; 24: No. 2, 228-230(1975). (In German).
In order to conserve the fitness of occupationally exposed personnel, particularly highly specialized personnel, a programme for early rehabilitation was established by the National Board of Nuclear Safety and Radiation Protection of the GDR. The programme aimed at detecting and intensively treating relevant pathological processes is described emphasizing chronic diseases of the respiratory and circulatory organs, kidneys, liver, skin and the hematopoietic system.
- 2830 RADIATION PROTECTION: PURPOSES AND ECONOMICAL ANALYSIS. Lacourly, G. (CEA Centre d'Etudes Nucleaires de Fontenay-aux-Roses, 92 (France). Dept. de Protection). Radioprotection; 10: No. 2, 103-119(1975). (In French).
There are three basic principles to radiation protection, viz the limitation of individual doses, justification of exposure and optimization of protection. The practical application of these principles requires the following investigations: an evaluation of the critical group exposure; a cost-benefit analysis showing the benefit versus specific hazards; a cost-effectiveness analysis demonstrating the optimal protection level. The first one is now a usual method, the other two belong to decision making methods and their application raises a number of difficulties in the ethical rather than in the technical field.
- 2831 RADIOPROTECTIVE SHIELD - AN ADEQUATE RADIOPROTECTIVE DEVICE FOR ROUTINE STOMATOLOGICAL RADIODIAGNOSIS. Wiltzschke, F. (Ernst-Moritz-Arndt-Univ., Greifswald (German Democratic Republic)); Taschner, P.; Koenig, W.; Menzel, B. (Staatliches Amt fuer Atomsicherheit und Strahlenschutz, Berlin (German Democratic Republic)). Stomatol. DDR; 25: No. 10, 701-705(1975). (In German).
Starting from the shortcomings of the radioprotective devices at present used in routine stomatological radiodiagnosis, the authors describe the advantages of a radioprotective shield which has been produced in the Greifswald University Stomatological Clinic. On the basis of dosimetric studies, the National Board for Nuclear Safety and Radiological Protection of the GDR (Staatliches Amt fuer Atomsicherheit und Strahlenschutz der DDR) could demonstrate the suitability of this shield as a radioprotective device for routine stomatological radiodiagnosis.
- 2832 THE EFFECT OF THE RADIATION DOSE ON THE HEALTH OF THE WORKING WOMEN. Correns, H.J. (Humboldt-Universitaet, Berlin (German Democratic Republic). Bereich Medizin (Charite)); Koenig, W. (Staatliches Amt fuer Atomsicherheit und Strahlenschutz, Berlin (German Democratic Republic)). Z. Gesamte Hyg. Ihre Grenzgeb.; 21: No. 11, 813-814(1975). (In German).

DOSE LIMITS; IONIZING RADIATIONS; OCCUPATIONS; PERSONNEL; RADIATION DOSES; RADIATION HAZARDS; WOMEN
- 2833 FUNDAMENTALS OF RADIOLOGICAL PROTECTION. Tschirf, E. Sichere Arb.; 28: No. 2, 5-8(1975). (In German).
Definitions and units of measurement: radiation sources, activity, field, flux, energy, path of particulate radiation in human tissue, absorbed dose. Maximum permissible doses in Austria for occupational exposure to radiation, for the various parts of the body. A brief review of the commonest types of radiation employed in industry brings out the major role played by hard (electromagnetic and neutron) radiation. Consequently, radiological protection measures should be aimed primarily at external radiation (dose determination,

limited duration of exposure, remoteness from source, shields).

50m long, with a vertical wall, 2m high and a platform 8m wide. The dose rates were calculated close to the walls, taking account of the various γ and β radiation emitted either by the walls or by atmospheric radon or by the ore dust deposited on the skin. The calculated values were close to the measured values. The radiation contribution depends on the conditions of exposure; exposure is mainly due to γ radiation close to very thick wall whereas β radiation is prevailing in a contaminated atmosphere or in the case of skin contamination.

- 2834 HEALTH PROTECTION OF RADIATION WORKERS. Norwood, W.D. Springfield, IL; Charles C. Thomas (1975). 442p. \$27.50.

This textbook is addressed to all those concerned with the protection of radiation workers. It provides full coverage of the implications of radiation in exposed workers, and, after a chapter outlining, in simple terms, the basic facts about radiation, deals with measurement of ionising radiation; radiation dosimetry; effectiveness of absorbed dose; general biological effects of ionising radiation; somatic effects of radiation; the acute radiation syndrome; other somatic effects; hereditary effects; radiation protection standards and regulations; radiation protection; medical supervision of radiation workers; general methods of diagnosis and treatment; metabolism and health problems of some radioisotopes; plutonium and other transuranium elements; radiation accidents; emergency plans and medical care; atomic power plants; medico-legal problems.

- 2835 RADIOLOGICAL PROTECTION IN DENTAL PRACTICE. London; Dept. of Health and Social Security (1975). 18p.

Intended to be complementary to the more comprehensive document, "Code of Practice for the protection of persons against ionizing radiations arising from medical and dental use" (CIS 74-423), the purpose of this booklet is to give dentists some basic information on the safe use of X-rays. Contents: why protection from X-rays; responsibility for radiation protection; protection during a dental examination; ensuring a safe installation; sources of further information. Appendices: maximum permissible doses; useful addresses; summary of relevant recommendations from the Code of Practice; notes on film processing.

- 2836 IONISING RADIATION: HAZARDS AND PROTECTIVE MEASURES. Brats, G.; Cavigneaux, A. Paris; Institut National de Recherche et de Securite (1975). 2p. (In French).

Brief review of developments and technical background information on ionizing radiations and their use in industry. Biological effects. Safe working methods: protection against external radiation, internal contamination, radioactive waste, transport of radioactive material, monitoring of premises and personnel, detection of radiation. Preventive medicine and role of the plant physician: staff information; pre-employment medical examination and subsequent check-ups. Texts of the principal French legislation in force concerning radiological protection.

- 2837 A CALCULATION OF EXTERNAL EXPOSURE IN A URANIUM MINE. Fourcade-Cancelle, N. (CEA Centre d'Etudes Nucleaires de Fontenay-aux-Roses, 92 (France). Service Technique d'Etudes de Protection et de Pollution Atmospherique). Radioprotection; 10: No. 1, 11-28(1975). (In French).

The dose rate measured at the centre of a tunnel excavated in an ore at 1p. thousand of uranium was assessed to average 0.5mrad/h. This value was verified by calculations taking account of the source geometries and the main emitters of the uranium family. The dose rate from external exposure was calculated for two typical cases: in a cylindrical tunnel (length=50m, diameter=2m); in an open quarry

- 2838 A NEW DEVELOPMENT OF HEALTH PHYSICS MONITORING BOARDS. Joffre, H. (CEA Centre d'Etudes Nucleaires de Saclay, 91 - Gif-sur-Yvette (France). Service de Protection contre les Rayonnements). Radioprotection; 10: No. 1, 45-48(1975). (In French).

From Scientific and technical one-day meeting on health physics monitoring boards; Saclay, France (25 Feb 1975).

A new generation of health physics monitoring boards has been developed through reliability improvements, miniaturized components, and use of computers with a view to a more efficient monitoring of workers.

- 2839 PRACTICAL LIMITATIONS OF CRITERIA FOR LIMITING RADIATION RISKS TO THE PUBLIC. MacDonald, H.F. (Central Electricity Generating Board, Berkeley (UK). Berkeley Nuclear Labs.). Ann. Nucl. Energy; 2: No. 9; 10, 625-635(1975).

The methods employed to relate basic dose limits recommended by the I.C.R.P. and the M.R.C. to measurable environmental parameters through Derived Working Limits (DWLs) and Emergency Reference Levels (ERLs) are outlined. The simplifying assumptions underlying these concepts and the practical limitations which they impose upon the use of DWLs and ERLs in the control of radiation exposure are described. It is shown that although derived parameters, such as DWLs and ERLs, will continue to be relevant in cases where a single radionuclide irradiates predominantly a single human body organ via a well defined pathway, the simplifications involved in their derivation impose limitations upon their usefulness in many practical situations. The implications of new dose estimation techniques in the design and operation of nuclear plant are discussed and, in the case of accidental discharge limits, a modification of the current ERL dose limits used within the U.K. is suggested to take account of the relative risks associated with single organ and whole body exposure.

- 2840 ENVIRONMENTAL PROTECTION DEMANDS RADIATION PROTECTION WHEN USING NUCLEAR ENERGY FOR CIVIL PURPOSES. Aurand, K. (Bundesgesundheitsamt, Berlin (F.R. Germany)). pp 283-296 of Kernenergie und internationale Politik. Zur friedlichen Nutzung der Kernenergie. Kaiser, K.; Lindemann, B. (eds.) (Deutsche Gesellschaft fuer Auswaertige Politik e.V., Bonn (F.R. Germany). Forschungsinstitut). Munich; Oldenbourg (1975). (In German) 12 refs..

A survey is given on international cooperation and tasks regarding radiation protection (HP/LN).

- 2841 RADIATION EXPOSURE OF MANKIND. Koelzer, W. (Kernforschungszentrum Karlsruhe (F.R. Germany). Abt. Strahlenschutz und Sicherheit). pp 11-17 of Aktuelle Themen zur Kernenergie. Mannheim, F.R. Germany; BBC (1975). (In German)

8 figs.; 9 tabs.; with refs..

This paper deals with population exposure to natural and man-made radiation sources. It is shown that the operation of nuclear power plants only accounts for a minimum (less than 1 %) of the population's whole body dose average.

- 2842 DO ONE-HIT CHROMOSOME EXCHANGES EXIST. DOSE-RESPONSE RELATION FOR IRRADIATED HUMAN LYMPHOCYTES. Luchnik, N.V. (Akademiya Meditsinskikh Nauk SSSR, Obninsk. Nauchno-Issledovatel'skij Inst. Meditsinskij Radiologii). Radiat. Environ. Biophys.; 12: No. 3, 197-204(1975).

2 figs.; 3 tabs.; 18 refs..

It is demonstrated that the expectation of a quadratic dose-response relation for two-hit aberrations is not correct. In fact the theoretical curve is changed from near-quadratic to near-linear when the dose increases and fits well the experimental data on production of exchanges in human lymphocytes by radiation. The commonly used relation $y = \alpha D + \beta D^2$ shows systematic deviations from the observed frequencies. Therefore, no reason exists to postulate some fraction of exchanges to be produced by a one-hit mechanism.

- 2843 LATE EFFECTS OF ACUTE EXTERNAL EXPOSURE TO IONIZING RADIATION IN MAN. Jablon, S. (National Research Council, Washington, DC). pp 132-145 of Radiation research. Biomedical, chemical, and physical perspectives. Nygaard, O.F. (ed.). New York; Academic Press, Inc. (1975).

From 5. international radiation research congress meeting; Seattle, WA, USA (14 Jul 1974).

See CONF-740715--.

The late effects of acute external exposure to ionizing radiation in man are discussed. Included among the late effects are non-neoplastic mortalities and mortalities due to cancer including leukemia. The hazards of prenatal irradiation are considered. (ERB)

- 2844 CHEMICAL AND RADIATION CARCINOGENESIS IN MAN AND EXPERIMENTAL ANIMALS. Miller, J.A.; Miller, E.C. (Univ. of Wisconsin, Madison). pp 158-168 of Radiation research. Biomedical, chemical, and physical perspectives. Nygaard, O.F. New York; Academic Press, Inc. (1975).

From 5. international radiation research congress meeting; Seattle, WA, USA (14 Jul 1974).

See CONF-740715--.

It is now well established that some cancer in man results from exposures to certain chemicals and radiations, both ultraviolet and ionizing radiations. These chemical and physical agents are also carcinogenic in experimental animals and, where adequately tested, in mammalian cell cultures. However, only very limited data are available on the relative roles of and the interrelationships, if any, between these various environmental agents in the causation of the majority of the cancers in man. Nothing is known of the relationship between these agents and possible carcinogenic viral information in the etiology of cancer in man. Furthermore, little is known about the molecular mechanisms by which chemicals and radiations induce cancers in either man or experimental animals. The objective of this brief review is to present certain aspects of chemical and radiation carcinogenesis in man and experimental animals and some of the problems in the elucidation of their roles in carcinogenesis in the human.

- 2845 USE OF CHROMOSOME ABERRATIONS FOR PREDICTING GENETIC HAZARDS TO MAN. Brewen, J.G.; Preston, R.J. (Oak Ridge National Lab. TN). pp 926-936 of Radiation research. Biomedical, chemical, and physical perspectives. Nygaard, O.F. (ed.). New York; Academic Press, Inc. (1975).

From 5. international radiation research congress meeting; Seattle, WA, USA (14 Jul 1974).

See CONF-740715--.

The question of the use of chromosome aberrations for predicting genetic hazards to man is discussed under the following headings: interspecific comparisons of dicentric and deletion production in peripheral leukocytes; comparison of dicentric yields in leukocytes to reciprocal translocation yield in spermatogonia; recovery of spermatogonia induced translocations in the sons of irradiated males; cytologically and genetically detected deletions; and current gaps in our knowledge and problems of future interest.

- 2846 MUTATION AND THE AMOUNT OF HUMAN ILL HEALTH. Newcombe, H.B. (Atomic Energy of Canada Ltd., Chalk River, Ontario). pp 937-946 of Radiation research. Biomedical, chemical, and physical perspectives. Nygaard, O.F. (ed.). New York; Academic Press, Inc. (1975).

From 5. international radiation research congress meeting; Seattle, WA, USA (14 Jul 1974).

See CONF-740715--.

The genetic hazards to main interest in the proliferation of nuclear power plants is discussed. The following topics are included in the discussion: general principles; methods of estimating risks; dominant diseases; and the cost of preventing a genetic defect. It is concluded that we must draw the line somewhere between protection of the germ plasm and over protection resulting in unnecessary delay of the replacement of energy sources that are no longer readily available. (ERB)

- 2847 COMPARISON OF THE MUTAGENIC EFFECTS OF CHEMICALS AND IONIZING RADIATION (CHAIRMAN'S REMARKS). Sobels, F.H. (Univ., Leiden). pp 958-965 of Radiation research. Biomedical, chemical, and physical perspectives. Nygaard, O.F. (ed.). New York; Academic Press, Inc. (1975).

From 5. international radiation research congress meeting; Seattle, WA, USA (14 Jul 1974).

See CONF-740715--.

A comparison is made between the mutagenic effects of various chemicals (mutagens) and ionizing radiation. The following topics are included in the discussion; differences between the effects of chemicals and irradiation; relationship between mutations and chromosome aberrations; specificity; dose effect relationships; and the mutation spectrum. (ERB)

- 2848 CHANGES IN THE RATE OF PROLIFERATION IN NORMAL TISSUES AFTER IRRADIATION. Denekamp, J. (Mount Vernon Hospital, Northwood, Eng.). pp 810-825 of Radiation research. Biomedical, chemical, and physical perspectives. Nygaard, O.F. (ed.). New York; Academic Press, Inc. (1975).

From 5. international radiation research congress meeting; Seattle, WA, USA (14 Jul 1974).

See CONF-740715--.

In tissues where reproductive cell death is known to cause the functional tissue damage (e.g., intestine and skin), repopulation

becomes important only after the death of the radiation-damaged cells. Since these tissues have a fairly rapid turnover, this can occur within a short period of time and can assist in the healing of tissues during fractionated therapy. However, in tissues which express their damage late, such as the lung, it is very unlikely that repopulation will be stimulated before cell death is manifested and this does not occur during the period over which fractionated radiotherapy is administered. Although repopulation may be of no importance in these tissues, e.g., lungs and kidneys, there appears to be some other "repair" process which requires additional radiation dose to be administered to achieve the same endpoint if the overall time is increased.

- 2849 Strahlenschutzärztliche Aufgaben bei der Ueberwachung beruflich strahlenexponierter Personen. (TASKS OF THE RADIATION PROTECTION PHYSICIST IN MONITORING PERSONNEL EXPOSED TO RADIATION). Ohlenschlaeger, L. (Kernforschungszentrum Karlsruhe (F.R. Germany). Medizinische Abt.). Stuttgart; Gentner (1975). 46p. (In German). (KFK--2245).

10 figs.; 2 tabs.; 27 refs..

The monitoring of personnel exposed to radiation is the responsibility of the radiation protection physician according to article 46 of the 1st Radiation Protection Ordinance and article 42 of the X-Ray Ordinance. The findings in radiobiology and radiopathology are the foundation of radiation protection medicine. The activities consist of preventive examinations which are to protect the staff against the dangers of ionizing radiation. It is the physician's task to discover findings which speak against employment in controlled areas or against the handling of open radioactive materials. Specific duties include first-aid measures in cases of contamination, incorporations, contaminated injuries as well as outer and internal excessive radiation loads.

- 2850 LEGAL SPECIFICATIONS AND REGULATIONS IN THE FIELD OF X-RAY APPLICATION. Rosenbaum, O. pp 1-20 of Fundamentals of practical radiation protection in medical X-ray installations. Even, K. (Gewerbeaufsicht des Landes Nordrhein-Westfalen, Duesseldorf (F.R. Germany). Zentralstelle fuer Sicherheitstechnik, Strahlenschutz und Kerntechnik); Schmitt, G. (Essen Univ. (Gesamthochschule) (F.R. Germany). Radiologisches Zentrum). Stuttgart; Enke (1975). (In German)

1 fig.; 1 tab.; 7 refs..

Starting with the reasons for the issuing of the X-ray ordinance, the content of the single paragraphs of the ordinance are discussed. Besides the required preconditions for the operation of X-ray equipment such as notification procedures, experts' opinions, expert evidence as well as other duties to be fulfilled by the operator, the operation regulations themselves are gone into in detail. They are concerned with the persons performing certain activities or duties as well as the equipment and rooms and in particular with the type and manner of X-ray application in view of the health of the patients. Connected with this, the right of the inspecting authorities stated in paragraph 37 and 38 to order measures or tests to be carried out by experts and to punish offences against regulations of the ordinance, as stated in paragraph 52, is also dealt with.

- 2851 GENETIC RISKS FROM MEDICAL RADIATION.

Seelentag, W. (World Health Organization, Geneva). World Health Organ. Chron.; 29: No. 4, 117-122(1975).

After a brief discussion of the sources of radiation exposure of human populations (natural and man made), the genetically significant dose per person per year from medical examinations is presented and discussed. The data are taken from world-wide sources. The problems of radiation protection in hospitals is discussed briefly. (ERB)

- 2852 CONNECTION BETWEEN RELATIVE GENETIC EFFECTIVENESS AND LINEAR ENERGY TRANSFER IN ANALYSIS OF CHROMOSOME ABERRATIONS IN HUMAN LYMPHOCYTES. Todorov, S. (Meditsinska Akademiya, Sofia (Bulgaria). Tsentyr po Zarazni i Parazitni Bolesti). C. R. Acad. Bulg. Sci.; 28: No. 3, 415-417(1975).

The relative genetic effectiveness (RGE) of electromagnetic (roentgen and gamma rays) and corpuscular (protons and neutrons) radiations is determined on the basis of the quantitative characteristics of the chromosome aberrations yields, induced while irradiating entire human blood in vitro: 0,76 for ^{60}Co radiation, 0,80 for protons 50 MeV, 2,14 for fission neutrons and 1,00 for 180 kV X-rays. The linear energy transfer (LET) for the radiations applied has the following mean values: 0,28 Kev/ μm for ^{60}Co gamma radiation, 1,8 Kev/ μm for protons 50 MeV, 2,5 Kev/ μm for 180 kV X-ray radiation and 45-55 Kev/ μm for fission neutrons. The analysis shows certain dependence between the RGE and the LET. An optimal quantity of energy must be deposited in a fixed volume in order to evoke a primary chromosome aberration. The RGE is not related to the quality of different kinds of radiations but depends on the LET typical for a given kind of radiation.

- 2853 "DOUBLING DOSE" OBTAINED FROM THE ANALYSIS OF THE CHROMOSOME DISTURBANCES IN HUMAN LYMPHOCYTES. Todorov, S.L. C. R. Acad. Bulg. Sci.; 28: No. 12, 1705-1707(1975).

Proceeding from personal experimental material on the incidence of spontaneous and radiation-induced chromosomal aberrations in cultures from human peripheral blood lymphocytes, the author estimated the doubling dose for some types of radiations, i.e. the radiation dose which induces the same number of chromosomal aberrations as the spontaneously arising ones. The parameters aberrations per cell per rad and breaks per cell per rad were used. The doubling dose for quick neutrons has the lowest value - 0.35 to 0.48 rad. The doubling dose for 180 kV X-radiation is 0.80 to 1.15 rad, for protons 50 MeV - 0.98 to 1.23 rad and for gamma radiation from Cobalt-60 - 1.05 to 1.40 rad. The doubling dose for poorly ionizing radiations is therefore approximately 1.20 rad, whereas for strongly ionizing ones it is much lower.

- 2854 SPONTANEOUS FREQUENCY OF THE STRUCTURAL CHROMOSOME ABERRATIONS (ANOMALIES) IN LYMPHOCYTES FROM HUMAN BLOOD. Todorov, S. (Akademiya na Selskostopanskite Nauki, Sofia (Bulgaria). Veterinaren Institut za Infektsiozni i Parazitni Bolesti). C. R. Acad. Bulg. Sci.; 28: No. 10, 1427-1430(1975).

Chromosomal aberrations are observed both in irradiated cells and in cells which have not been irradiated but submitted to the action of the natural radioactive background. The reasons for these "spontaneous chromosomal aberrations" are both the natural radioactivity and a complex of physical, chemical and biological factors. A cytogenetic analysis of 6000 lymphocytes metaphases from

- the peripheral blood of 47 people indicates that the overall amount of the spontaneous aberrations is 2% with a ratio of chromosomal type aberrations to chromatide type aberrations of 1:5. Chromatide type aberrations are seen as the result of purely mechanical factors acting during slides preparation but yet another unknown moments cannot be excluded. They are more one hit type aberrations - chromatide and chromosomal fragments, whereas the two hit aberrations are very rare - one dicentric per 3000 cells. The chromosome type aberrations are proposed for comparison with radiation induced aberrations in human lymphocytes. They have a frequency of 0.0035 per cell or 0.0040 breakages per cell. Ionizing radiation does not induce qualitatively specific type of aberrations but increases many times the yield of anomalies, which are spontaneously observed.
- 2855 RADIOACTIVE RELEASES FROM NUCLEAR POWER PLANTS AND THE ENVIRONMENT. Martin, J.-J. (Electricite de France, 93 - Saint-Denis. Service de la Production Thermique). Radioprotection; 10: No. 4, 229-234(1975). (In French).
From Information meeting on nuclear environment; Paris, France (4 Feb 1975).
Gaseous and liquid radioactive effluents from operating or scheduled nuclear power plants are reviewed and a simple method of dose assessment for direct pathways of human exposure resulting from inhalation and tap water is given. The complete results of the assessment of all the direct or indirect exposure pathways show that the highest annual dose is to be a few millirems per year for a site such as Fessenheim. Environmental controls carried out both by the nuclear operator or Public Health Services should verify these assessments.
- 2856 HISTORY OF RADIATION HYGIENE AND MISSION OF THE STATE SANITARY CONTROL. Shamov, V.P. Rentgenol. Radiol.; 14: No. 4, 219-222(1975). (In Bulgarian).
Three main stages are outlined in the evolution of radiation hygiene as a science. The first of these is characterized by some underestimation of the radiation factor, particularly as regards potential long-term biological effects. The second stage (1940-1950) coincided historically with the atomic bomb explosions in Hiroshima and Nagasaki. With subsequent large-scale atomic weapons testing, the problem arose of radioactive contamination of the biosphere, and the need was recognized for quantifying potential radiation risks thereby incurred. A third stage developed in connection with scientific-technological revolution. Based on better understanding of radiation-related somatic and genetic effects, efforts were made to arrive at a reasonable assessment of hazards involved in peaceful uses of atomic energy. Two main lines of inquiry were followed, namely to (a) gain primary information on radiation exposure levels and (b) acquire better insight into biological effects so as to establish well-grounded regulations. There is a need for studies on natural background radiation in communities and environmental contamination in the vicinity of plants using radioactive materials, as well as for development of radiation control guides and optimization of environmental and occupational monitoring. Conditions are now more favourable for the solution of these problems since many countries, in particular socialist ones, are collaborating in efforts to limit radiation exposure.
- 2857 X-RAY EMISSIONS FROM COLOUR TELEVISION RECEIVERS IN NEW ZEALAND. Luketina, I.A. (National Radiation Lab., Christchurch, New Zealand). N.Z. Med. J.; 81: No. 534, 197-200(1975).
Color television receivers produced for the New Zealand market have been tested to ensure that any x-radiation emissions result in dose rates less than the 0.5 mrem/h (500 μ rem/h) limit allowed under the Radiation Protection Regulations, 1973. Five receivers representing the five different models available on the New Zealand market were surveyed and the maximum dose rate measured from any screen was 0.05 μ rem/h. The estimated maximum annual radiation dose to an average viewer from the receivers surveyed will be less than 5 μ rem or less than 5×10^{-3} percent of the dose from natural background radiation. This level of x radiation is well below that which could constitute a health hazard.
- 2858 CYTOGENETIC INVESTIGATION IN A BRAZILIAN POPULATION LIVING IN AN AREA OF HIGH NATURAL RADIOACTIVITY. Barcinski, M.A.; Abreu, M.C.A.; de Almeida, J.C.C.; Naya, J.M.; Fonseca, L.G.; Castro, L.E. (Inst. of Biophysics, Rio de Janeiro). Am. J. Hum. Genet.; 27: No. 6, 802-806(1975).
A cytogenetic survey is presented of the inhabitants from Guarapari, a small village on the coast of the state of Espirito Santo, Brazil, who live permanently exposed to high levels of radiation. The survey was performed in order to detect possible biological effects of chronic natural radiation exposure. An increase in the total number of chromosomal aberrations was found in the inhabitants of Guarapari, compared to a control group. (ERB)
- 2859 CARCINOGENESIS BY IONIZING RADIATION AND LESSONS FOR OTHER POLLUTANTS. Mole, R.H. (Medical Research Council, Harwell, Eng.). pp 860-868 of Radiation research. Biomedical, chemical, and physical perspectives. Nygaard, O.F. (ed.). New York; Academic Press, Inc. (1975).
From 5. international radiation research congress meeting; Seattle, WA, USA (14 Jul 1974).
See CONF-740715--.
The subject of ionizing radiations and carcinogenesis is discussed under the following topics: the nature of cancer; ionizing radiation as a carcinogen; carcinogenesis by low levels of exposure; latent period; the variety of the carcinogenic transformation; dose-response relationships and cell sterilization; and carcinogenesis in vivo-age and sensitivity to radiation. The author concludes that for a number of reasons ionizing radiation is of quite basic importance in the search for a fuller understanding of the process of carcinogenesis. (ERB)
- 2860 ANALYTICAL PREDICTION OF THE ABSORBED DOSE FROM EXTERNAL IRRADIATION AND FROM INHALATION OF RADIOACTIVE PARTICLES AFTER STARTUP OF A NUCLEAR POWER PLANT. Khristova, M.; Paskalev, Z. Nauchni Tr., Nauchnoizsled. Inst. Radiobiol. Radiats. Khig.; 5: 151-155(1975). (In Bulgarian).
Methods and formulas are presented for calculating the dose to a population living in the vicinity of a nuclear power plant. The total dose is found to consist of two components. The first component of the dose comes from radioactive gamma emitters deposited in the soil up to a depth of 5 to 6 cm. This dose component is a result of external irradiation of the population. The second dose

component originates from radioactive aerosol particles 5 microns in size or less. Formulas are given for calculating the lung dose for beta and gamma emitters. The activity and energies of the radioactive nuclides must be known to determine the lung dose. 8 refs. (SJR)

- 2861 IRRADIATION OF PEOPLE WORKING WITH OPEN RADIOACTIVE MATERIALS. CONSEQUENCES OF INHALATION. Vasiliev, G. Nauchni Tr., Nauchnoizsled. Inst. Radiobiol. Radiats. Khig.; 5: 169-173(1975). (In Bulgarian).

In practice the most-widely utilized radioactive compounds contain the following radioactive elements: carbon-14, phosphorus-32, iron-59, strontium-89, iodine-131, cesium-137, and gold-198. In order to estimate the dose it is necessary to know the activity concentration in the air, working time during which the person is exposed, and the kinetics of the radioactive element in the body. The average, allowable, annual working concentrations in curies per liter are 3.5×10^{-9} for C-14, 7.2×10^{-11} for P-32, 5.2×10^{-11} for Fe-59, 2.8×10^{-11} for Sr-89, 8.4×10^{-12} for I-131, 1.4×10^{-11} for Cs-137 and 2.4×10^{-10} for Au-198. From an analysis of 578 radioactive aerosol samples it is shown that in the radioisotope laboratory of the author the main dose to the personnel comes from external irradiation and that irradiation as a result of inhalation of activity is insignificant. 4 refs. (SJR)

- 2862 TECHNICAL COMMITTEE III: RADIATION DOSE AND RADIATION EFFECT. Muth, H. pp 41-50 of 25 years of research in the protection of the civilian population and disaster control. Bad Honnef, F.R. Germany; Usang (1975). (In German)

Report on the activities of the technical committee III of the Ministry of the Interior's Commission for the Protection of Civilians whose task it is to investigate the biological effect of penetrating radiation on the human organism.

- 2863 TECHNICAL COMMITTEE II: RADIOACTIVE FALLOUT. Schumann, G. pp 33-40 of 25 years of research in the protection of the civilian population and disaster control. Bad Honnef, F.R. Germany; Usang (1975). (In German)

Report on the activities of the technical committee II of the Ministry of the Interior's Commission for the Protection of Civilians. Its main field of work is to investigate radioactive fallout and radioactive radiation as a result of nuclear weapons explosions.

- 2864 RADIATION EXPOSURE IN THE STANDARDIZED METHOD OF CHEST EXAMINATION. Angerstein, W.; Stier, M.; Wolf, M. (Forschungsinstitut fuer Tuberkulose und Lungenkrankheiten, Berlin (German Democratic Republic)); Koenig, W.; Menzel, B. (Staatliches Amt fuer Atomsicherheit und Strahlenschutz, Berlin (German Democratic Republic)). Radiol. Diagn.; 16: No. 6, 863-868(1975). (In German).

Following a discussion of the technical parameters which influence the radiation dose to the gonads the dose values determined by condenser chambers for the chest X-rays made according to standard recommendations (posteroanterior takings, lateral takings, simultaneous tomograms, posteroanterior fluorographs) are given. According to those the incident dose is about 78 mR, the exit dose is about 7.5 mR and the gonad dose is about 52 μ R for survey exposures with film-foil combinations.

- 2865 COMPARATIVE ANALYSIS OF CHROMOSOME ABERRATIONS IN HUMAN LYMPHOCYTES INDUCED 'IN VITRO' BY VARIOUS TYPES OF IONIZING RADIATION. Todorov, S. (Meditsinska Akademiya, Sofia (Bulgaria)). Tsentyr po Infektsiozni i Parazitni Bolesti. Acta Med. Bulg.; 3: No. 1, 31-37(1975).

A quantitative analysis on various types of chromosome aberrations in human peripheral blood lymphocytes after in vitro whole blood irradiation with 180 kV X-rays, gamma rays from cobalt 60, 50 MeV protons and scission neutrons is carried out. The following aberrations are scored: breaks, total number of aberrations, aberrant cells, chromosome fragments, dicentric and interstitial deletions. The experimental data obtained are statistically processed applying the method of the least squares and employing four mathematical models: $Y = cD^2$, $Y = cD$, $Y = a + bD$ and $Y = a + bD + cD^2$. Statistical analysis showed that after treatment with low LET (linear energy transfer) radiations the most suitable for the description of the kinetic of the two break aberrations, total number of aberrations and breaks in relation to dose is the polynomial second degree model, whereas for one break aberrations and aberrant cells - the linear model. The linear model is equally appropriate for one or two breaks aberrations when it is a matter of high LET radiations. Using the linear component of the polynomial second degree equation a comparative characteristic of the RBE (relative biological effectiveness) for the various radiations types is made. The following mean values for RBE are obtained: 0.86 ± 0.44 for gamma radiation from cobalt 60, 0.98 ± 0.06 for 50 MeV protons and 2.38 ± 0.11 for scission neutrons.

- 2866 RADIATION ACCIDENTS AT WORKING WITH IONIZING IRRADIATION SOURCES IN BULGARIA FOR THE PERIOD 1962-1972. Vasiliev, G. (Nauchno-Izslodovatel'ski Inst. po Radiologiya i Radiatsionna Khigiena, Sofia (Bulgaria)). Letopisi Khig. Epidemiol. Inst.; 9: No. 6, 94-100(1975). (In Bulgarian).

Registered radiation accidents in the People's Republic of Bulgaria for the period 1962-1972 which have occurred at working with ionizing irradiation sources are considered. As radiation accident should be assumed the case when the worker receives a dose exceeding 5 times the maximum permissible annual dose for the corresponding critical organs. For the period examined 64 accidents are registered with 144 people affected. 42 accidents are related to external irradiation with gamma radiation, neutrons or X-rays, and in 22 accidents radioactive substances have entered the worker's organisms. Statistic analysis shows that the irradiation dose of the whole Bulgarian population as a cause of accidental irradiation is of the order of the dose due to professional irradiation of the medical staff working with X-rays under normal conditions.

- 2867 EFFECTS OF IONIZING RADIATION ON SOME CYTOGENETIC AND METABOLIC CHANGES IN HUMAN SOMATIC CELLS. Ivanov, B.A. Sofia; Meditsinska Akademiya (1975). vp. (In Bulgarian). INIS.

Thesis.

Chromosome aberration yields in human peripheral lymphocytes following in vitro exposure to 125-150 R x-rays are studied. Equations of best fit for yields of polycentric, minutes, chromosome fragments, aberrant cell percentage, and total breakage per cell are a prerequisite for biological

dosimetry. Thus, based on cytogenetic findings in the case of a radium-226 incident, doses to two subjects are estimated at 48 and 15 rad, respectively, which corresponds to values from physical dosimetry. In four children receiving diagnostic radiation exposure (heart catheterization), there are some cytogenetic changes, but these are inappropriate to be used for biological dosimetry purposes. Storing of human whole blood in plexiglass bottles for 24, 48, 72, or 173 hours at 5 deg, 20 deg, or 37 deg C with subsequent exposure to 125-150 R X-rays will produce significantly more chromosome aberrations than are obtained with irradiation of fresh blood. Blood stored in neutral glass and subsequently irradiated showed no such sensitizing effect. The RBE for 50-MeV protons relative to X-rays (180 kV, 15 mA, 0.35 mm Cu) for doses ranging from 0 to 500 R is estimated to be 0.91 as based on dicentric yields, 0.89 on minute yields, and 0.75 on breakage per cell. In these experiments, time in culture is 72 hours. Comparative studies between Gsub(o)- and G₂-cell response of 50-MeV proton exposure (time in culture, 66 hours) indicate susceptibility to induction of chromosome abnormalities to be higher in G₂- vs. Gsub(o)-cells by a factor of 6-8 for one-hit aberrations, 4.5-5.5 for breakage per cell, and 2.5-3.5 for aberrant cell percentage. In studies with acute or fractionated X-ray doses (125, 250, or 125 + 125 R) given to various cell cycle stages, evidence was obtained for the occurrence of repair processes heritable structures, this being most marked within the first 6 hours of the presynthetic period. Later through the synthetic period, repair proceeded at a fluctuating rate.

- 2868 SOME PROBLEMS ON RADIATION LOADING DURING THE PERFORMANCE OF HISTEROSALPINGOGRAPHY. Dakov, L.; Vasilev, D. (Meditsinska Akademiya, Sofia (Bulgaria). Inst. po Akusherstvo i Ginekologiya). Akush. Ginekol. (Sofia); 14: No. 6, 484-491(1975). (In Bulgarian).

Stressing the significance of histerosalpingography in the gynecologic diagnosis the authors pay attention of the irradiation of the patient and the attending personnel during this diagnostic procedure. Among the most frequent omission made in this respect the authors indicate the following: a rather continuous scoping, a lack of preliminary preparation for the procedure (coordination of the team), insufficient adaptation, a desire to examine also insignificant from the point of the diagnosis moments in the filling under scopic control, unsatisfactory diaphragm, etc. The authors carry out timing of the separate moments of the performance of histerosalpingography and propose an analysis of the data on the mean duration of the procedure, a part of which is due to light increase, the number of light increase, the ratio between roentgenological examination and roentgenological graphs the possibilities for maximal diaphragm, etc. For better statistical significance the data were observed on 100 consecutive histerosalpingographies with the participation of a roentgenologist and three gynecologists. The author recommend to rationalize the method of performing histerosalpingography in view of reducing irradiation of the patient and the medical staff.

- 2869 UNSEALED RADIOACTIVE MATERIALS IN MEDICAL PRACTICE IN NEW ZEALAND. McEwan, A.C. (National Radiation Lab., Christchurch, New Zealand). N.Z. Med. J.; 82: No. 547, 163-168(1975).

Information has been collected on numbers and types of radionuclide procedures in medical practice in New Zealand over a three-month period in the latter half of 1973. For in vivo procedures data on the age and sex of patients and the activities of radioactive materials administered were also collected. The changes in numbers of such procedures carried out over a seven-year period are discussed. A genetic radiation dose to the population of 0.24 mrad per person is derived for the year 1973, about 0.20 mrad of this dose arising from diagnostic procedures and 64% being attributable to brain imaging. Whereas formerly genetic doses have been estimated from data on activities of ¹³¹I and ³²P used, this is no longer possible.

- 2870 SMALL HEAD SIZE AFTER ATOMIC IRRADIATION. Miller, R.W.; Mulvihill, J.J. (National Cancer Inst., Bethesda, MD). Teratology; 14: 355-358(1975).

A study of children exposed to nuclear explosions in Hiroshima and Nagasaki showed small head size and mental retardation when exposure occurred less than 18 weeks of gestational age. Increased frequency of small head size occurred when maternal exposure was 10 to 19 rad. Tables and graphs are presented to show relationships between dose, gestational age, and frequency of small head size. (HLW)

- 2871 SCISSION NEUTRONS INDUCED PRODUCTION OF DICENTRICS IN LYMPHOCYTES FROM HUMAN PERIPHERAL BLOOD. Todorov, S. (Meditsinska Akademiya, Sofia (Bulgaria)); Bulanova, M.; Mileva, M.; Ivanov, B. (Nauchno-Izslodovatel'ski Inst. po Radiologiya i Radiatsionna Khigiena, Sofia (Bulgaria)). Acta Med. Bulg.; 3: No. 2, 45-48(1975).

Dicentric chromosome aberration yields in lymphocytes were studied following exposure of human peripheral blood to fission neutrons. Irradiations were performed on the IRT-2000 Experimental Nuclear Reactor, Sofia, with doses of 25, 50, 100, or 200 rad from the following neutron spectra and fluences: 0.025 eV to 0.4 eV, 4.29×10^6 neutrons/cm².sec; 0.4 eV to 0.5 MeV, 4.28×10^5 neutrons/cm².sec; and 0.5 MeV to 2-3 MeV, 9.64×10^6 neutrons/cm².sec. Doses were essentially delivered by fission neutrons, with gamma contamination in the beam contributing 10% to dose. Lymphocyte cultures were fixed 52 hours after phytohemagglutinin stimulation. Cytogenetic analysis indicated that dicentrics-per-cell yields increased with dose. Statistical treatment by least squares techniques showed experimental findings to be best fitted by a linear relationship, $Y = -0.0275 + (2.66 \pm 0.25) \times 10^{-3}D$. Discrepancies in comparison with results obtained by other investigators may be accounted for by use of different energy spectra and non-standard lymphocyte cultivation techniques.

- 2872 AUSTRIAN RADIATION MAP. AVERAGE POPULATION DOSES IN THE OPEN AIR THROUGH TERRESTRIAL AND COSMIC RADIATION. Tschirf, E.; Baumann, W.; Niesner, R. (Atominstitut der Oesterreichischen Hochschulen, Vienna); Vychytil, P. (Bundesministerium fuer Gesundheit und Umweltschutz, Vienna (Austria)). Vienna; Bundesministerium fuer Gesundheit und Umweltschutz (1975). 42p. (In German). 11 tables, 4 maps.

Background radiation in the open air was measured on behalf of the Ministry of Health and Environmental Protection. The measurements were carried out from the Atominstitut (Technical University) Vienna in all Austrian communities with more than 3000 inhabitants with a modified Geiger-Mueller tube. The

results were presented in the form of a map.

postoperative radiotherapy to the scar.

- 2873 KEEPING DOSE COMMITMENTS ALAP. Morgan, K.Z. (Georgia Inst. of Tech., Atlanta). pp 71-77 of Nuclear safety, 1975. Hetrick, D.L. (ed.). Hinsdale, IL; American Nuclear Society (1975).

From ANS topical meeting on nuclear safety; Tucson, AZ, USA (5 Oct 1975).

See CONF-751044--.

The dose commitment principle should be applied both to the individual and collectively to members of the public and to special subgroups in the population in relation to age, sex, condition of health, etc. It should be applied to each critical body organ in relation to possible somatic injury as well as to the gonads in terms of the genetically significant dose or genetic mutations. The maximum permissible dose commitments cannot and need not be set essentially at zero but they must be carefully selected such that they do not exceed values that knowledgeable and representable members of the public consider to be as low as practicable (ALAP) and that are believed to be as low as reasonably attainable (ALARA) after giving due and realistic consideration to the various alternatives.

- 2874 RADIATION EXPOSURE TO ANGIOGRAPHER DURING CORONARY ARTERIOGRAPHY USING THE U ARM IMAGE AMPLIFIER. Begg, F.R.; Hans, L.F. (Allegheny General Hospital, Pittsburgh). Cathet. Cardiovasc. Diagn.; 1: No. 3, 261-265(1975).

Radiation exposure to the angiographer was measured using thermoluminescent dosimeters (TLD), commercial film badges, and appropriate ionization survey meters. Data were collected during 47 coronary artery examinations with the lead overleaf. During a single coronary examination, the angiographer receives 0.9 mR to the lens and 2.8 mR to the hand. The calculated yearly exposure to the angiographer performing 10 examinations per week is 450 mR to the lens, 9% of the maximum permissible dose (MPD), and 1400 mR to the hand, 2% of the MPD. Exposure rates for the left anterior oblique (LAO) and right anterior oblique (RAO) projections during cine and fluoroscopy were taken at the position occupied by the angiographer. Scatter radiation is 5-10 times greater in the LAO projection. The second trial was monitored during 18 coronary artery examinations minus the lead overleaf. A significant decrease in radiation exposure was accomplished through the use of the lead overleaf.

- 2875 EVALUATION OF EFFECTIVENESS OF IRRADIATION OF SCAR AFTER RADICAL MASTECTOMY IN PATIENTS WITH BREAST CANCER. Jordan, E.; Krajewska, B. (Akademia Medyczna, Gdansk (Poland)). Pol. Przegl. Radiol. Med. Nukl.; 39: No. 6, 709-713(1975). (In Polish).

The authors report the results of an analysis of recurrences in postoperative scar in patients with breast cancer for evaluation of the effectiveness of postoperative radiotherapy. In a group of 423 cases recurrences in scar were observed in 51 (12.1%). In the group of patients who had been given postoperative radiotherapy to the scar the frequency of recurrences was lower (8.1%) as compared with the group treated only surgically (16.5%), in the group treated by preoperative radiotherapy it was high (17.1%) and in the group with postoperative radiotherapy given only to regional lymph nodes it was even higher (18.0%). The results of analysis indicate the effectiveness of

- 2876 RADIOTHERAPY OF BASAL-CELL CARCINOMA OF THE SKIN AT THE PROVINCE ONCOLOGICAL HOSPITAL IN POZNAN IN THE YEARS 1953 TO 1959. Ramlau, C. (Wojewodzki Szpital Onkologiczny, Poznan (Poland)). Pol. Przegl. Radiol. Med. Nukl.; 39: No. 6, 715-722(1975). (In Polish).

The author described the results of radiotherapy applied in 713 patients with basal-cell carcinoma of the skin treated at the Province Oncological Hospital in Poznan in the period from Aug. 1 1953 to Dec. 31 1959. Radium therapy was given to 468 patients (65.6%) and in 245 (34.4%) x-ray therapy was applied. Clinical progression of the disease was evaluated on the 4 grade gradation system T1, T2, T3, T4. Radium was applied in tubes or needles in a total dose of 2 mcd/1 cm² i.e. about 6000 R. x-ray treatment was given using a Dermix (90 to 95 kV) apparatus with daily fractionation of doses of 200 to 400 r up to a total dose of 6000 R. Control investigations of patients were carried out during the first 3 years every 2 months, then every 6 months, and after 5 years follow-up examinations were carried out once yearly. The 5-year follow-up period was survived by 579 patients and the 10-year follow-up was survived by 265 patients. In the radium-treated patients followed-up over 5 years in 1.8% of cases the neoplasm failed to disappear and recurrences were observed in 5.6% of cases. After X-ray therapy the neoplasma failed to regress in 4.2% of cases and recurrences developed in 8.5% of cases. In none of 4 grades of basal-cell carcinoma progression to statistically significant differences were observed between radium treatment and X-ray treatment. Development of recurrences even after a long time after treatment, especially with radium, indicates the necessity of following-up the patients over 5 years.

- 2877 MODIFICATION OF GASTROINTESTINAL SYMPTOMS FOLLOWING IRRADIATION BY LOW DOSE RATE TECHNIQUE. Cassidy, J.R.; Order, S.; Camitta, B.; Marck, A. (Harvard Medical School, Boston). Int. J. Radiat. Oncol., Biol. Phys.; 1: No. 1-2, 15-20(1975).

Tolerance of patients receiving 1000 rad total body irradiation at the low dose rate of 5 rad/min prior to bone marrow transplantation is presented. The striking gastrointestinal tolerance is stressed and, as a result of this experience, results in five patients with ovarian carcinoma receiving total abdominal irradiation with similar low dose rate irradiation are presented. Possible explanations for these results are presented and other potential applications of this technique are suggested.

- 2878 (AED-Conf--75-244-011) THE RISK OF GENETIC HAZARDS IN MEDICAL APPLICATIONS. Stephan, G. (Bundesgesundheitsamt, Neuherberg (Germany, F.R.). Inst. fuer Strahlenhygiene). 1975. 11p. (In German). (CONF-750689--9). INIS.

From 16. annual meeting of the Association of German Radiation Protection Physicians; Kiel, F.R. Germany (20 Jun 1975).

1 fig.; 4 tabs.; 20 refs. Available from ZAED.

The mutagenic action of ionizing radiation in humans is discussed, and a relationship is established between the absorbed dose and the genetic effects. The incidence of mutations is estimated on the basis of statistics. Results of animal experiments (mice) are referred to in order to estimate the ratio of absorbed dose to mutation frequency in humans. The rate of

mutations induced per dose unit is a function of the germinal state and of the acute or chronic radiation exposure. Chronic radiation exposure of humans is connected with increased frequency of miscarriages, stillbirths, and genetic damage of the descendants. Diagnostic use of ionizing radiation is a negligible risk to the individual.

COMBINED INJURIES AND THEIR SIGNIFICANCE IN
CATASTROPHIC MEDICINE. Messerschmidt, O.
1975. (In German).

From Meeting of the Schutzkommission beim
Bundesministerium des Innern; Erlangen, F.R.
Germany (May 1975).

87 refs. Available from ZAED.

Meeting of the Schutzkommission beim
Bundesministerium des Innern.

The problems involved in combined injuries and their significance for catastrophe medicine are investigated in animal experiments. Rats and mice were irradiated under various conditions. In addition, they were subjected to further traumas such as wounds, application of chemotherapeutics, stress, amongst others, in order to test these combined injuries. Certain pathological parameters such as the influence of these combined injuries on hematopoiesis, erythropoiesis, metabolic behaviour, histological investigations on organs, mortality, recovery phase were tested. It was thus shown that the dose and time dependence are of decisive importance. The effects of pure radiation injuries - compared to those injuries brought about by other parameters - generally do not give a summation of the injuries within the combined injuries. Rather, we find a very different effect picture of the combined injuries compared to the so-called 'single injuries'. The varying behaviour of the species is also remarkable so that one cannot directly relate these results to humans. The results clearly show that yet several animal species must be investigated in order to be able to draw conclusions regarding combined injuries in humans.

Meeting of the Schutzkommission beim
Bundesministerium des Innern.

Recovery after sublethal radiation damage was studied in the white blood count which shows a fast reaction to attacks caused by radiation. The so-called 'fractionated-dose method' was used. This method determines to what extent the total dose must be raised for two partial doses given at different times to produce the same amount of damage as a single irradiation. The second dose was applied after 7. days. A dose reduction by protraction of the first dose over 2 days was only found after doses of 300 to 400 rad. Regarding the anorexia connected with the radiation syndrome, no differences were found at low doses between protracted and one-time irradiation. This suggests that there is no repair.

- 2881 (ANL--76-99, pp 43-70) NEUTRON AND
GAMMA-RAY TOXICITY STUDIES. Ainsworth, E.J.
1975.

Division of Biological and Medical Research
annual report, 1975.

The focus of the program is on late effects of neutron and gamma radiation and assessment of risk. Principal research activities are in two complementary areas: life-span experiments with large populations of laboratory mice to compare the effectiveness of single or protracted doses of neutron or gamma radiation for life shortening due to cancer and other debilitating noncancerous diseases; and basic research on cellular injury and recovery for the evaluation of potential contributions of latent injury in the mouse circulatory, immune, and hematopoietic systems to life shortening, and for the comparison of late radiation effects in proliferating tissues. The data are used to test existing models and to formulate new models for prediction of radiation hazards and the relative biological effectiveness (RBE) of fission neutrons, particularly at low radiation doses. The neutron dose-response curve is nonlinear, with the life shortening effect decreasing from 3-4 day/rad to 1 day/rad with increasing dose over the range of 20-240 rad. Clearly, linear extrapolations from high neutron doses to estimate life shortening at low doses would underestimate risk; the underestimation is even greater when the enhancement of life shortening produced by fractionated neutron exposure, described previously by us, is also considered. These results from single neutron doses deviate from predictions of total dose dependency based on the predictive model of Kellerer and Rossi. The shape of the gamma radiation dose-response curve is linear over the range of 90 to 788 rad; linear dose-response curves for gamma radiation have been described previously by others, but a quadratic function has been considered by some to be most applicable.

- 2882 (COO--3380-25) DOSE RESPONSE CURVE FOR
TUMOR INDUCTION WITH SINGLE AND SPLIT DOSES OF
10 MEV PROTONS. Burns, F.J.; Albert, R.E.;
Vanderlaan, M.; Strickland, P. (New York
Univ., N.Y. (USA). Inst. of Environmental
Medicine). 1975. Contract AT(11-1)-3380.
18p. (CONF-7506138--1). Dep. NTIS \$3.50.

From Annual Radiation Research Society
meeting; Miami, FL, USA (Jun 1975).

The response of rat skin to proton irradiation shows a rapid form of recovery of both sublethal and suboncogenic injury and RBE values between 2 and 3. The combination of RBE values greater than one, and recovery indicates that while protons induce injury more efficiently per unit absorbed dose than electrons, there is still a reversible component to the injury process. (auth)

- 2883 (GSF-B--642) MOTTLED NEUHERBERG (MO/
SUP N/), A NEW MALE-LETHAL COAT COLOUR MUTATION
OF THE HOUSE MOUSE (MUS MUSCULUS). Schroeder,
J.H. (Gesellschaft fuer Strahlen- und
Umweltforschung m.b.H., Neuherberg/Muenchen
(Germany, F.R.). Inst. fuer Biologie). 1975.
8p. INIS.

2 figs.; 9 tabs.; 16 refs. Also published in
Theor. Appl. Genet.; 46: 135-142(1975).
Available from ZAED.

A new semidominant X-chromosomal mutation, Mottled Neuherberg (Mo/sup N/), which causes coat colour variegation is described. Mo/sup N/ arose in the second postirradiation generation after 2 x 200 R of x-rays (24 hours apart) to oocytes of X/O mice. Heterozygous Mo/sup N/ females have irregular patches of fully and lightly coloured fur over the whole coat with curly vibrissae. Their viability is reduced, about 3% of the heterozygotes dying prenatally and 6 to 28% dying postnatally before weaning. Survivors are fertile without externally visible abnormalities. Hemizygous Mo/sup N/

males die in utero after implantation. The recombination frequency between Mo/sup N/ and tabby (Ta) was $3.65 \pm 3.16\%$ (with 95% - confidence limits). Therefore, it is suggested that Mo/sup N/ is a new allele of the mottled (Mo) locus of the house mouse. Mo/sup N/-bearing ova seem to have a lower chance of becoming fertilized by wild-type spermatozoa than by Ta-bearing spermatozoa.

- 2884 (GWI-R--12-75) EFFECTS OF SUBLETHAL DOSES OF GAMMA RADIATION ON THE DEVELOPING RAT BRAIN. Cerda, H.; Carlsson, J.; Larsson, B.; Saefwenberg, J.O. (Uppsala Univ. (Sweden). Gustaf Werner Institutet). 1975. 23p. Dep. NTIS (US Sales Only), PC A02/MF A01.

Newborn rats were irradiated with ^{60}Co gamma rays. Doses of 0, 80 or 160 rads were given to the whole body. The whole body and brain weights, DNA and RNA contents of the brain and ^3H -thymidine or ^3H -uridine incorporated by the brain were measured at 5, 10 or 15 days after birth. A dose of 160 rads produced clear alterations in the brain but no clear effects could be detected when 80 rads were given.

- 2886 EXPERIMENTAL DETERMINATION OF THE RELATIVE BIOLOGICAL EFFECT OF ^{252}Cf . Letov, V.N.; Abdullaev, V.N.; Koval, G.N. (Scientific-Research Roentgeno-Radiological Inst., Moscow). Med. Radiol.; No. 10, 69-71(1975). (In Russian).

One of the most important problems in the process of preparing neutron therapy, especially with use of ^{252}Cf sources, is the study of the relative biological effect of this isotope in critical tissues--the skin, mucous membranes of the mouth, intestines and urinary bladder. Available data, however, are fairly limited and inconclusive. The present study was aimed at the relative biological effect of mixed γ -neutron radiation from ^{252}Cf . As test animals, 46 Chinchilla rabbits were used ranging in weight from 1.5 to 3.5 kg. Urinary bladder and rectum were subjected to local radiation from ^{252}Cf and ^{60}Co sources. Effects on viable cells were estimated by the modified method of M.I. Fedotova and L.M. Rozhdestvenskiy. Tabular and graphic data of the effects observed are given, along with computation formulas. (JPRS)

- 2887 ELIMINATION OF GAMMA RAYS FROM A THERMAL NEUTRON FIELD FOR MEDICAL AND BIOLOGICAL IRRADIATION PURPOSES. Kanda, K. (Kyoto Univ.); Kobayashi, T.; Ono, K.; Sato, T.; Shibata, T.; Ueno, Y.; Mishima, Y.; Hatanaka, H.; Nishiwaki, Y. pp 205-223 of Biomedical dosimetry. Vienna; International Atomic Energy Agency (1975).

From International symposium on advances in biomedical dosimetry; Vienna, Austria (10 Mar 1975).

See STI/PUB--401; CONF-750331--.

When a research reactor is used as a neutron source, a considerable amount of contamination with gamma rays is unavoidable. In biological and medical uses of neutrons, the gamma rays from the reactor core become background against the thermal neutrons. The paper proposes the use of a bismuth scatterer as a gamma-ray eliminator by which a neutron field with very few gamma rays can be obtained. A lithium-fluoride tile, manufactured by the sintering method, was also found to be a good neutron collimator as it produces few gamma rays while absorbing neutrons. The boron accumulation effect in tissue was estimated for a tissue-equivalent liquid model. The importance of minimizing gamma-ray contamination in the thermal neutron field is emphasized for selective irradiation of the boron-containing tissue. The neutron field was applied to several experiments, such as biological experiments for the treatment of cancers. (auth)

- 2888 (ERDA-tr--110, pp 41-46) INFLUENCE OF PROLONGED IRRADIATION ON THE ENZYMES OF DNA SYNTHESIS IN RAT BONE MARROW. Elkina, N.I. 1975. Translated from Radiobiologiya; 15: No. 4, 521-525(1975).

Radiobiology. The activity of the enzymes of DNA synthesis in the bone marrow of rats at various periods after prolonged daily irradiation at a dose of 50 R was studied. During the first five days of irradiation (dose 50 R), the activity of the enzymes of phosphorylation of thymidine and TMP to TTP and DNA polymerase was 50 percent higher calculated per myelokaryocyte than the activity of these enzymes in the control animals. The high activity of kinases and DNA polymerase was detected before the animals received a dose of 2000 R. As a result of the increased activity of the enzymes per karyocyte of the irradiated rats, the activity of the kinases and DNA polymerase per mg protein and per gram of tissue remained at a level close to the control. The activity of dCMP deaminase did not change appreciably during the first irradiation and gradually decreased beginning with a dose of 500 R. (tr-auth)

- 2889 (ERDA-tr--110, pp 77-81) DYNAMICS OF THE IMMUNOLOGICAL REACTIONS IN THE CHRONIC INFLUENCE OF RADIONUCLIDES AND EXTERNAL IRRADIATION. Shubik, V.M.; Livshits, R.E. (Leningrad Scientific Research Inst. of Radiation Hygiene). 1975. Translated from Radiobiologiya; 15: No. 4, 552-555(1975).

Radiobiology. In experiments on rats a comparative study was made of the nonspecific factors of immunity and the formation of autoantibodies under the action of comparable doses of chronic external γ irradiation and chronic administration of ^{137}Cs , ^{90}Sr , and ^{131}I . The absence of any significant differences in the changes in the immunological responses in the case of chronic external and uniform internal γ irradiation was demonstrated. Some peculiarities in the nature of the changes in the immunological responses depending on the biophysical properties of the radionuclides used in the experiments were detected. (tr-auth)

- 2890 (ERDA-tr--110, pp 100-104) FUNCTIONAL ACTIVITY OF THE SYMPATHICOADRENAL SYSTEM IN THE CASE OF CHRONIC AND FRACTIONATED IRRADIATION OF RATS. Musagalieva, G.M. (Kazakh Inst. of

- Physical Culture, USSR). 1975. Translated from *Radiobiologiya*; 15: No. 4, 573-576(1975).
 Radiobiology. The chronic action of low doses of ionizing radiation has a number of peculiarities in comparison with a single influence, determined by the differential sensitivity of various tissues to the radiation influence, the different ability for summation of the effects and repair of radiation damages. Until recently there has not been sufficient information on the influence of low doses of chronic irradiation on the functional state of the sympathicoadrenal system, in particular, its specific metabolism--the catecholamine metabolism. Therefore, in this work we made an attempt to study the content of catecholamines and their precursors--dopamine and dopa in various links of the sympathicoadrenal system in the case of chronic and fractionated irradiation. (tr-auth)

 Radiobiology. Irradiation for 18 hrs a day in the last third of pregnancy of rats in doses of 0.0008 to 10 R/day leads to a stimulation of the development of the higher divisions of the central nervous system in the fetuses. (tr-auth)
- 2892 (ERDA-tr--110, pp 119-123) INFLUENCE OF CHRONIC IRRADIATION AT LOW DOSES ON THE AGE CHANGES IN THE RADIORESISTANCE OF WHITE MICE. Lisenkova, L.N. (Leningrad Scientific Research Inst. of Radiation Hygiene). 1975. Translated from *Radiobiologiya*; 15: No. 4, 589-592(1975).
 Radiobiology. The results of a study of chronic irradiation with the γ rays of ^{60}Co at doses of 6, 17, and 50 mR 6 to 7 hrs daily on the age changes in the radioresistance of white mice are cited. It was shown that under the influence of chronic irradiation at low doses, the degree of expression of the age peculiarities of the resistance of the animals to a supplementary test irradiation at a dose of 570 R is changed. (tr-auth)
- 2893 (ERDA-tr--110, pp 162-165) ASCORBIC ACID SUPPLY OF MONKEYS SUBJECTED TO PROLONGED IRRADIATION AT LOW DOSES. Solov'eva, G.A.; Dzhikidze, E.K. (Inst. of Experimental Pathology and Therapy, Sukhumi, USSR). 1975. Translated from *Radiobiologiya*; 15: No. 4, 624-627(1975).
 Radiobiology. Keeping in mind, on the one hand, the data on the influence of the vitamin C balance on the natural resistance of the organism to infections, and, on the other hand, the disturbance of the vitamin C metabolism under the influence of acute irradiation, we undertook to determine the state of supply of the indicated vitamin in the case of a repeated influence of relatively low doses of external irradiation of the organism of monkeys, which, like man, need an exogenous intake of vitamin C, and also to follow the dynamics of the restoration of the ascorbic acid content in monkeys that had been subjected to irradiation. The beginning of the decrease in the vitamin C content in monkeys according to these two tests was already noted when they were irradiated at a summary dose of 800 R; moreover, the level of the indices fluctuated within narrow limits throughout the entire period of irradiation, regardless of the value of the dose received. Despite the fact that after the cessation of irradiation, the vitamin C content in the whole blood was increased to the initial values, the low ascorbic acid content in the leukocytes was evidence that chronic irradiation so disturbs the ascorbic acid metabolism in the organism of irradiated monkeys that in our experiments, even after two years, its content cannot reach the norm. Evidently the restoration of the disturbed balance of vitamin C requires a longer time. (ERB)
- 2894 (ERDA-tr--110, pp 166-169) INFLUENCE OF VARIOUS DIETS ON THE RADIOSENSITIVITY OF GUINEA PIGS. Darenskaya, N.G.; Kuznetsova, S.S.; Lebengarts, Ya.Z.; Il'in, V.V. 1975. Translated from *Radiobiologiya*; 15: No. 4, 627-630(1975).
 Radiobiology. The influence of seven different diets on the radiosensitivity of guinea pigs was studied. The diets varied in protein content and cellulose content. Mortality following γ irradiation was the criterion used to determine radiosensitivity. No significant increase in the radiosensitivity of the guinea pigs was detected with any of the diets tested. (ERB)
- 2895 LATE EFFECTS OF SELECTED IMMUNOSUPPRESSANTS ON IMMUNOCOMPETENCE, DISEASE INCIDENCE, AND MEAN LIFE-SPAN. II. CELL-MEDIATED IMMUNE ACTIVITY. Peterson, W.J.; Perkins, E.H.; Goodman, S.A.; Hori, Y.; Halsall, M.K.; Makinodan, T. (Oak Ridge National Lab., TN). *Mech. Ageing Dev.*; 4: 241-249(1975).
 The late effects of various immunosuppressive insults on cell-mediated immunity in mice were studied in an attempt to assess the role of immune surveillance in the aging process. Results were obtained using susceptibility to allogeneic tumor cell challenge, graft-versus-host reaction (GVHR), blastogenic response to PHA, a thymus derived T cell-specific plant mitogen, and cytolytic activity against allogeneic tumor cells as measures of immunologic activity. In vivo studies late in life show that resistance to allogeneic tumor cells is significantly decreased in thymectomized mice, whereas those treated with cortisone, cyclophosphamide and sublethal x-ray remain unchanged. Spleen cells from only the thymectomized and the sublethally irradiated mice show reduced activity in the GVHR. No difference is seen in the activity of bone marrow cells. Results consistent with these findings were obtained in in vitro studies. Thus spleen cells from thymectomized or sublethally irradiated mice show decreased activity in response to PHA, whereas no change is seen in spleen cells from other treated groups. Hence, surgical and physical insults are more likely to induce long-lasting immunosuppression in those immunocompetent tissues whose activity normally diminishes with advancing age. Furthermore, the degree of immunosuppression seen in this study is not of the order of magnitude that one could reasonably predict a significant decrease in mean life-span.
- 2896 LATE EFFECTS OF SELECTED IMMUNOSUPPRESSANTS ON IMMUNOCOMPETENCE, DISEASE INCIDENCE, AND MEAN LIFE-SPAN. III. DISEASE INCIDENCE AND LIFE EXPECTANCY. Peter, C.P.; Perkins, E.H.; Peterson, W.J.; Walburg, H.E.; Makinodan, T. (Oak Ridge National Lab., TN). *Mech. Ageing Dev.*; 4: 251-261(1975).
 The effect of various immunosuppressive treatments on mean life-span and disease incidence have been studied. Significant life shortening was seen only in mice which received

X-irradiation early in life and can be ascribed primarily to an increased incidence of certain malignancies. Marginal life shortening was seen in cyclophosphamide-treated animals, however, survival patterns between those and control animals did not differ until 30 months of age and the magnitude of life-shortening never approached that seen in X-irradiated animals. Thymectomy, splenectomy or cortisone treatment did not alter survival. All immunosuppressive treatments enhanced mortality due to non-neoplastic diseases, however, only a small percentage of animals die with these disease entities. With the exception of cortisone all immunosuppressive treatments increased the incidence of neoplastic disease. However, their effects on various neoplastic processes were variable and unpredictable. Four primary patterns in terms of relative immune competence, disease incidence and life expectancy were seen. Thus, immunodepression may or may not correlate with increased disease incidence, which in turn may or may not have a life-shortening effect. These findings are discussed in terms of the marked reduction of both humoral and cell-mediated immunity normally seen in aged mice and the significance of postulated immune surveillance mechanisms to survival.

- 2897 COMPARATIVE ENVIRONMENTAL PHYSIOLOGY OF MAMMALIAN LONGEVITY: METABOLIC AND THERMOREGULATORY EFFECTS OF IONIZING RADIATION. Braham, H.W. Columbus, OH; Ohio State Univ. (1975). 152p. University Microfilms Order No. 76-9941.

Thesis (Ph. D.).

The comparative environmental physiologies of two species of wild rodents with different longevity were studied; the wild house mouse (*Mus musculus* Linnaeus) the short-lived species, and the white-footed mouse (*Peromyscus leucopus noveboracensis*) the long-lived species. The consequences of ionizing radiation and ambient temperature change were used to study differential effects of metabolic and thermoregulatory performance. *P. leucopus* expended less energy for thermoregulation and lost less heat to the environment than *M. musculus* during both active and inactive periods of the day. The amount of heat loss by *M. musculus* was 18.2 percent higher at 32°C, 9.3 percent higher at 27°C and 4.3 percent higher at 15°C than *P. leucopus*. Thermal conductance was shown to be a more effective mechanism to reduce heat loss in *P. leucopus* than *M. musculus*. At 27°C, *M. musculus* had a 13.3 percent higher metabolic rate than *P. leucopus* and at 32°C *M. musculus* had a 6.0 percent lower metabolic rate, suggesting that the optimal thermometabolic temperature in *P. leucopus* was lower than in *M. musculus*. The lower critical temperature in *P. leucopus* was determined to be about 1°C below that of *M. musculus*. The energetics of both species of mice have been shown to be significantly altered by sub-lethal acute gamma (⁶⁰Co) ionizing radiation. The predicted total metabolic output of nonirradiated *P. leucopus* and *M. musculus* fit Wunder's (1975) metabolic model to within 1 percent. Irradiated *M. musculus* had an 8 percent higher total metabolic rate than predicted, and irradiated *P. leucopus* a 20 percent higher metabolic rate than predicted. Irradiated mice lost 25 to 30 percent more heat to the environment than control mice. The difference in thermoregulatory capacity between irradiated and non-irradiated mice was expressed by higher metabolic rates, excess heat lost to the environment and 2 to 3°C lower deep body temperatures in the irradiated animals.

- 2898 (ERDA-tr--99, pp 103-107) EQUIVALENT CONDITIONS OF IRRADIATION OF MAMMALS. Tyazhelova, V.G.; Akoev, I.G. (Inst. of Biological Physics, Pushchino, USSR). 1975. Translated from Radiobiologiya; 15: No. 3, 411-414(1975).

Radiobiology. On the basis of a study of the change in the value of LD₅₀ with the dose rate in the series of mammals: mouse, rat, dog, man, and the previously derived results on the gradual involvement of the recovery systems of various biological levels of the organism in the repair process, methods were developed for the selection of equivalent conditions of irradiation of mammals of the indicated species. (tr-auth)

- 2899 (ERDA-tr--99, pp 132-135) CYTOGENETIC INVESTIGATIONS IN THE CASE OF SIX-YEAR IRRADIATION OF DOGS. Tsessarskaya, T.P. 1975. Translated from Radiobiologiya; 15: No. 3, 434-437(1975).

Radiobiology. The cytogenetic effect of continuous γ irradiation was studied in dogs as a function of the dose rate and dose. A distinct increase in the frequency of aberrations in the bone marrow cells was produced only by irradiation with the maximum rate of irradiation of the dose used in the experiment--125 rad/year, while at dose rates of 21 and 63 rad/year the radiation effect was detected only at certain periods. The absence of an unambiguous relationship between the value of the effect and the dose of irradiation is characteristic. (ERB)

- 2900 (ERDA-tr--99, pp 148-150) CHANGE IN THE NUMBER OF CELLS OF THE SMALL INTESTINE OF MICE UNDER THE INFLUENCE OF VARIOUS DOSES OF IRRADIATION. Semenov, L.F.; Altukhova, L.N. (Inst. of Experimental Pathology and Therapy, Sukhumi, USSR). 1975. Translated from Radiobiologiya; 15: No. 3, 447-449(1975).

Radiobiology. The dose dependence of radiation damage to the intestine was investigated in γ -irradiated mice. It was found that different forms of radiation damage to the intestine are based on a delay of the proliferation of the epithelium of varying duration, a dose-dependent phenomenon. (ERB)

- 2901 RADIATION-INDUCED CHROMOSOME ABERRATIONS IN MOUSE SPERMATOCYTES AND OOCYTES. Tsuchida, W.S.; Uchida, I.A. (McMaster Univ., Hamilton, Ont.). Cytogenet. Cell Genet.; 14: 1-8(1975).

ICR/Swiss males and females were exposed to 300 R whole-body γ irradiation. The frequency of aberrations in metaphase I chromosomes recovered from oocytes cultured in vitro was compared with those recovered from spermatocytes irradiated in pachytene and diplotene. The ability of oocytes collected 1 day postirradiation to mature in vitro was not affected, but significantly fewer oocytes cultured 5 days after irradiation matured. The frequency of aberrations in oocytes did not differ from spermatocytes irradiated during diplotene, but significantly more chromosome aberrations were found when pachytene spermatocytes were irradiated. Some variation in the relative frequencies of aberrations was also observed. (auth)

- 2902 STUDY ON CHANGED IN BLOOD PLASMA ELECTRIC CONDUCTIVITY AND DIELECTRIC CONSTANT IN X-IRRADIATED RATS. Bancheva, E. (Nauchno-Izslodovatel'ski Inst. po Radiologiya i Radiatsionna Khigiena, Sofia (Bulgaria)).

Sci. Publ., Res. Inst. Radiol. Radiat. Hyg.; 5: No. pt.1, 13-20(1975). (In Bulgarian).

The changes in plasma electric conductivity at different frequencies provide information on its electrolyte concentration; those of the dielectric constant reflect plasma protein pattern changes. Results are reported of measurements of plasma electric conductivity and dielectric constant in rats following single and fractional irradiation with 200, 400, and 600 R. Measurements were performed on the first, third and tenth day after irradiation at frequencies of 0.6 to 3.5 Hz. Statistically significant differences were recorded in plasma electric conductivity and dielectric constant on the third and tenth day for doses of 400 and 600 R, and on the tenth day for a 200 R dose.

- 2903 CHROMOSOMAL ABERRATIONS IN BONE MARROW OF CONTINUOUSLY IRRADIATED RATS. Chlebosky, O.; Praslicka, M.; Chlebovska, K. (Univerzita P.J. Safarika, Kosice (Czechoslovakia). Prirodovedecka Fakulta). Biologia (Bratislava); 30: No. 6, 427-433(1975).

Research on chromosomal aberrations of the bone marrow in continuously irradiated rats showed that chromosomal aberrations are a highly sensitive indicator of radiation injury. An increase in the chromosomal aberration frequency was already found on the 5th day at daily doses of 0.5 R, i.e. a 12% increase at a total dose of 25 R. In the steady-state stage at daily doses of 0.5; 1; 2.5 R, the number of chromosomal aberrations stabilized at values of about 20%; at daily doses of 5 and 10 R at values of 30%, at daily doses of 53 R at 45%, at a daily dose of 82.5 R, the number of chromosomal aberrations increased to 55%.

- 2904 MITOSIS DYNAMICS IN BONE MARROW OF CONTINUOUSLY IRRADIATED RATS. Chlebovsky, O.; Praslicka, M.; Chlebovska, K. (Univerzita P.J. Safarika, Kosice (Czechoslovakia). Prirodovedecka Fakulta). Biologia (Bratislava); 30: No. 6, 419-425(1975).

Values were investigated of the mitotic index (MI) and the metaphase/prophase ratio (M/P) in rats continuously irradiated with daily doses of 0.5 to 82.5 R. Changes resulting from the continuous irradiation were manifest in two stages, viz.: 1. adaptation stage up to the 30th day of irradiation - the values fluctuated considerably; 2. steady-state stage since the 30th day till the end of irradiation - the values stabilized at a certain level. During the adaptation stage, MI values decreased till the 25th day; then they increased and remained at a certain lower value till the end of the experiment. M/P values showed a considerable variability between the 5th and the 25th days and a significant increase in the steady-state stage, mainly at higher dose rates.

- 2905 AN ATTEMPT TO DETERMINE THE RELATIVE GENETIC EFFICIENCY OF FAST NEUTRONS BY THE INDUCED RECIPROCAL TRANSLOCATIONS IN MOUSE SPERMATOGONIA. Khadzheva, T. (Nauchno-Izslodovatel'ski Inst. po Radiologiya i Radiatsionna Khigiena, Sofia (Bulgaria)). Sci. Publ., Res. Inst. Radiol. Radiat. Hyg.; 5: No. pt.1, 87-91(1975). (In Bulgarian).

Sexually mature male mice of C57BL line are irradiated over a period of 10, 70 or 720 hours with 25 rad neutrons from plutonium-berilium source. Another series of mice is exposed to 200 rad gamma-rays from radium source, distributed over the same three lengths of time. The cytogenetic analysis of primordial spermatocytes in diakinesis metaphase I on the 60th post-irradiation day disclosed chromosomal

translocations resulting from injury to the hereditary structures of the spermatogonial cells. A dose power variation by one or two orders exerts no influence on the radiation effect. Under these conditions the relative genetic effectiveness of neutrons with an average energy of 41 MeV was 11 to 20 tending to be higher at decreasing the dose rate.

- 2906 STUDY OF CHANGES IN BLOOD PLASMA ELECTRIC CONDUCTIVITY AND DIELECTRIC CONSTANT IN MICE EXPOSED TO 4,1 MEV NEUTRONS. Paskalev, Z.; Khristova, M. (Nauchno-Izslodovatel'ski Inst. po Radiologiya i Radiatsionna Khigiena, Sofia (Bulgaria)). Sci. Publ., Res. Inst. Radiol. Radiat. Hyg.; 5: No. pt.1, 3-7(1975). (In Bulgarian).

The changes in the electric properties of blood plasma of mice, irradiated with 10, 15 or 20 rad of fast neutrons from plutonium-berilium source with an intensity of 5.6×10^6 neutrons/sec are investigated. Plasma high-frequency electric conduction and dielectric constant was measured with the aid of admittance measurer type SWM-2 at a frequency range between 0.1 and 17 MHz. The changes in the electric constant are attributed to conformation changes in the protein macromolecule; those of the high-frequency electric concentration - to changes in the amount of the basic electrolytes sodium, potassium and chlorides, as a manifestation of impaired electrolyte balance during the early post-irradiation period.

- 2907 CHROMOSOME ANOMALIES IN MOUSE OOCYTES AFTER IRRADIATION. Reichert, W.; Hansmann, I.; Roehrborn, G. (Heidelberg Univ. (F.R. Germany). Inst. fuer Anthropologie und Humangenetik). Humangenetik; 28: No. 1, 25-38(1975). 8 figs.; 4 tabs.; 20 refs..

We investigated the cytogenetic effects of X-rays on unfertilized mouse oocytes. NMRI females received an irradiation with 0, 22.2, 66.6, 200, and 600 R during the preovulatory phase 3 hrs after HCG (human chorionic gonadotrophin). This is a stage during oogenesis in which the oocytes pass from late dictyotene to diakinesis. Chromosome analysis was performed after ovulation at metaphase II. From these experiments we can draw the following conclusions: X-rays induced during the preovulatory phase a high number of chromosome anomalies. Among these, structural anomalies prevail. 7 out of 144 ovulated oocytes in matched controls carried such an abnormality, whereas after irradiation we observed with 22.2, 66.6, 200, and 600 R, 11 out of 72, 34 out of 108, 89 out of 102, and 122 out of 124, respectively. Irradiation seems also to affect the chromosome segregation during the 1. meiotic division, as we observed after 22.2, 66.6 and 200 R a total of 6 oocytes out of 204 with a supernummary chromosome. In controls, however, no hyperploidy was found in 143 ova. This increase, however, was not significant. Chromosome anomalies, e.g. breaks and deletions that go back to a one-break event increased linearly with increasing dose. Exchanges, however, going back to two-break events fitted best to the linear-quadratic dose-response model. The dose of 600 R seems to represent a kind of borderline in this experiment, because nearly all (122 out of 124) carried at least one structural chromosome anomaly. It is also this dose after which the highest frequency of reciprocal translocations was observed in a humpshaped slope in spermatocytes after irradiation of spermatogonia (Preston and Brewen, 1973). With an increasing dosage up to 1,200 R the frequency of translocations decrease again. The elimination of cells, crossing this borderline,

might be due to genetic or non-genetic effects.

- 2911 (ERDA-tr--151, pp 82-88) EFFECTS OF SMALL DOSES OF RADIATION OF SPERMATOGENESIS. Kondratenko, V.G.; Ganzenko, L.F. (Inst. of Biological Physics, Pushchino, USSR). 1975. Translated from Radiobiologiya; 15: No. 6, 861-865(1975).

Radiobiology. Cytological and cytochemical investigations were made of the testes of dogs subjected to the chronic action of irradiation at doses of 21, 62.5 and 124.5 rad per year for various periods from two to six years. Quantitative analysis showed that there is a dose and time dependence of the inhibition of the process of spermatogenesis, caused by a disruption of the state of the nuclear chromatin of the germ cells. It was shown that the observed decrease in the weight of the testes is due to a loss of spermatogenic cells. It was established that the process of spermatogenesis possesses an adaptation to the effect of low doses of radiation and can compensate for their action.

EMBRYOS WITH X-RAYS AND CHEMICAL MUTAGENS. Fahrigh, R. (Deutsche Forschungsgemeinschaft, Freiburg (F.R. Germany). Zentrallaboratorium fuer Mutagenitaetspruefung). Mol. Gen. Genet.; 138: No. 4, 309-314(1975).

1 fig.; 1 tab.; 9 refs..

Embryos heterozygous for five recessive coat-color genes from the cross C57 BL/6 J Han x T-stock were X-irradiated with 100 R or treated in utero with 50 mg/kg methyl methanesulfonate (MMS) and ethyl methanesulfonate (EMS), respectively. Controls consisted of irradiated embryos of C57 BL x C57 BL matings homozygous wild-type for the genes under study, and non-treated offspring of both types of mating. The colors of the spots observed in the adult fur were either due to expression of the recessive coat genes or were white. 1) Irradiated and mutagen-treated offspring of C57 BL x T-stock matings had almost exclusively nonwhite spots, distributed randomly over the mouse surface. 2) Irradiated offspring of C57 BL x C57 BL matings had only white spots which were always midventral. 3) In non-treated offspring of both types of mating no spot could be observed. It is discussed that the white midventral spots are preferentially the result of pigment cell killing, while the nonwhite spots are preferentially the result of gene mutations or recombinational processes like mitotic crossing over and mitotic gene conversion.

- 2913 USE OF THE MOUSE TO FILL GAPS IN OUR RISK ASSIGNMENTS. Searle, A.G. (Medical Research Council, Harwell, Eng.). pp 947-956 of Radiation research. Biomedical, chemical, and physical perspectives. Nygaard, O.F. (ed.). New York; Academic Press, Inc. (1975).

From 5. international radiation research congress meeting; Seattle, WA, USA (14 Jul 1974).

See CONF-740715--.

The use of data on mice to fill gaps in our risk assignments of genetic radiation hazards to man is discussed. The following topics are included in the discussion; dominant mutations; recessives and their heterozygous effects; threshold variants; somatic mutations; and losses and gains of chromosomes. (ERB)

- 2914 COMPARISON OF THE MUTAGENIC EFFECT OF CHEMICALS AND IONIZING RADIATION IN THE SPERMATOGENIC CELLS OF THE MOUSE. Cattanaach, B.M. (Medical Research Council, Harwell, Eng.). pp 984-992 of Radiation research. Biomedical, chemical, and physical perspectives. Nygaard, O.F. (ed.). New York; Academic Press, Inc. (1975).

From 5. international radiation research congress meeting; Seattle, WA, USA (14 Jul 1974).

See CONF-740715--.

The problems involved in chemical mutation work are both complex and varied. With ionizing radiation it is known that genetic effects are produced in all organisms, in all cells, and the assessment of genetic risk is thus one of ascertaining how much damage is being induced: It is a quantitative problem. By contrast, chemical mutagens may be highly mutagenic in one organism, or one cell type, but totally ineffective in another. In cases where mutagenic effects are produced, all those classes of mutation recovered following radiation may occur, or only a few. Where no mutagenic effects can be detected, this may be due to any one of a variety of different causes.

Almost as soon as the biological effects of ionizing radiation were discovered, attempts were made to explain some of their basic characteristics in terms of the physical process of energy absorption in the irradiated tissues. The classical target theory and a variety of other approaches, although occasionally useful in simple situations, have had little success when effects on higher organisms were under consideration. It seems apparent that such failures were due to the fact that many of the radiobiological experiments were designed from a phenomenological point of view; that the radiations employed were usually X or gamma rays which have complex inactivating mechanisms; and that the physical concepts employed in the analysis (such as absorbed dose and LET) were inadequate. The results of systematic experiments in which the effects of neutrons and electromagnetic radiations were compared coupled with the development of microdosimetry have in recent years resulted in advances which are the subject of this presentation.

- 2916 CHARACTERISTICS OF CELL SURVIVAL CURVES FOR DIFFERENT RADIATIONS IN RELATION TO ISO-EFFECT CURVES FOR FRACTIONATED TREATMENTS OF A RAT RHABDOMYOSARCOMA. Barendsen, G.W. (Gezondheidsorganisatie TNO, Rijswijk (Netherlands). Radiobiologisch Instituut TNO). pp 270-277 of Cell survival after low doses of radiation: theoretical and clinical implications. Proceedings of the sixth L.H. Gray conference, held at Bedford College, London, 16-21 September 1974. Alper, T. (ed.). London; Institute of Physics and Wiley (1975).

From 6. L.H. Gray conference; London, UK (16 Sep 1974).

Shapes of survival curves for mammalian cells treated with low doses of x-rays are discussed, starting from the observation that with high-LET alpha particles survival curves were within experimental errors indistinguishable from exponential. An interpretation of this result can be given based on the assumption that reproductive death can be induced by the traversal of a single particle through part of a critical structure in the cell. Since x-rays, gamma rays and fast electrons deposit part of their energy through low energy secondary electron at LET values in excess of $20 \text{ keV } \mu\text{m}^{-1}$, it is expected that survival curves for these radiations which deposit energy through particles of low mean LET have an initial negative slope at low doses. This is supported by results of experiments with synchronized cultured cells. Insights obtained from the data on cultured mammalian cells have now been applied to the interpretation of dose-response relationships of an experimental R-1 rhabdomyosarcoma transplantable in an inbred strain of WAG/Rij rats. Cells from these tumours can be plated in vitro and grow quantitatively into colonies. With this technique fractions of clonogenic cells have been analysed after treatments of the tumours with single and fractionated doses of 300 kV x-rays and 15 MeV neutrons. Data have been obtained for fractionated treatments with daily doses of 300 kV x-rays, doses given for several weeks. These data are used to derive iso-effect curves, which can be interpreted on the basis of data for in vitro survival curves

measured for doses between 100 and 500 rad and by taking into account the repair of sublethal damage, reoxygenation and proliferation of cells.

- 2917 THE RESPONSE OF MOUSE SKIN TO MULTIPLE SMALL DOSES OF RADIATION. Denekamp, J.; Harris, S.R. (Mount Vernon Hospital, Northwood (UK)). pp 342-350 of Cell survival after low doses of radiation: theoretical and clinical implications. Proceedings of the sixth L.H. Gray conference, held at Bedford College, London, 16-21 September 1974. Alper, T. (ed.). London; Institute of Physics and Wiley (1975).

From 6. L.H. Gray conference; London, UK (16 Sep 1974).

The response of mouse skin has been tested by irradiating the foot of albino mice and scoring erythema and desquamation during the following month. Multiple small doses of 150, 250 and 350 rad have been given 'daily', and the test dose necessary to achieve a given reaction has been determined one day after the last small fraction. This test dose has been compared with the single dose necessary to produce the same reaction level in previously untreated mice, in order to determine the ratio of the slopes of the dose-response curve at low and high doses: Slope ratio = (single dose - test dose)/total fractionated priming dose. In three separate experiments the slope ratio decreased as the dose per fraction was reduced from 350 to 150 rad. This conflicts with the data of Dutreix et al, who found a constant slope ratio over this dose range. The present data are compared with those obtained by Denekamp using 4, 9 and 14 fractions of 300 rad and by Douglas et al, using the same experimental technique, over the dose range 45 to 200 rad/fraction. In addition, the results from multifraction experiments in which equal dose increments were administered until the requisite skin reaction was achieved are also analysed in terms of their slope ratio (Fowler et al. Douglas et al). When all these results are plotted it is impossible to be sure whether the slope ratio is decreasing over the range 300 to 45 rad per fraction, although it seems likely. Most of the values at low doses lie in the range 0.15 to 0.25, indicating that at low doses the radiation is only 15 to 25% as effective per rad in causing cell death as at higher doses.

- 2918 THE EFFECT OF MULTIPLE SMALL FRACTIONS OF X-RAYS ON SKIN REACTIONS IN THE MOUSE. Douglas, B.G.; Fowler, J.F.; Denekamp, J.; Harris, S.R.; Ayres, S.E.; Fairman, S.; Hill, S.A.; Sheldon, P.W.; Stewart, F.A. (Mount Vernon Hospital, Northwood (UK)). pp 351-360 of Cell survival after low doses of radiation: theoretical and clinical implications. Proceedings of the sixth L.H. Gray conference, held at Bedford College, London, 16-21 September 1974. Alper, T. (ed.). London; Institute of Physics and Wiley (1975).

From 6. L.H. Gray conference; London, UK (16 Sep 1974).

Multiple fraction experiments have been carried out to determine the response to repeated small doses of 240 kV x-rays down to 107 rad per fraction, using mouse skin desquamation reactions. In one series of experiments the overall time was kept shorter than 8 days so that proliferation was negligible. Up to 64 fractions were given. It was found that the total dose required to produce a given reaction continued to rise with number of fractions up to 64 fractions, in contradiction to the conclusions of Dutreix and Wambersie. The plot of reciprocal total dose

against size of each fraction was linear. This finding led to an analysis in terms of a function $F_{sub}(e)$ which is proportional to the slope of the chord from the origin to the point corresponding to the dose per fraction on the derived cell survival curve. On the assumption that the effects depended on cell killing, the initial slope of the survival curve was calculated as 1/690 rad, and the slope at 2340 rad was 1/126 rad. Thus one rad at a dose approaching 0 rads has 18% of the effect of one rad at a dose of 2340 rad for 'tolerance' skin desquamation. The derived cell survival curve is well fitted by an equation of the form $s = \exp[-(\alpha D + \beta D^2)]$.

- 2919 DEDUCTIONS ABOUT SURVIVAL-CURVE PARAMETERS FROM ISO-EFFECT RADIATION REGIMES. OBSERVATIONS ON LETHALITY AFTER WHOLE-BODY IRRADIATION OF MICE. Mole, R.H. (Medical Research Council, Harwell (UK). Radiobiological Research Unit). pp 299-306 of Cell survival after low doses of radiation: theoretical and clinical implications. Proceedings of the sixth LH. Gray conference, held at Bedford College, London, 16-21 September 1974. Alper, T. (ed.). London; Institute of Physics and Wiley (1975).

From 6. L.H. Gray conference; London, UK (16 Sep 1974).

Criteria which permit iso-effect radiation regimes to be regarded as equivalent in terms of cell depletion are briefly discussed. Observations on whole-body irradiation of mice by split and multiple exposures suggest that $D_{sub}(Q)$ for haematopoietic stem cells in the non-cycling state is approximately 100 rad but about zero when they are cycling. Corresponding changes in radiobiological properties of cells are to be expected during the course of fractionated and protracted exposures in vivo when the iso-effect of interest is relatively gross tissue damage. Responses to ionizing radiation in vivo are dependent on aspects of cellular organisation which are missing from in vitro experimentation.

- 2920 RESPONSES OF SOME NORMAL TISSUES TO LOW DOSES OF γ -RADIATION. Withers, H.R. (Anderson (M.D.) Hospital and Tumor Inst., Houston, Tex. (USA)). pp 369-375 of Cell survival after low doses of radiation: theoretical and clinical implications. Proceedings of the sixth L.H. Gray conference, held at Bedford College, London, 16-21 September 1974. Alper, T. (ed.). London; Institute of Physics and Wiley (1975).

From 6. L.H. Gray conference; London, UK (16 Sep 1974).

The response of four normal tissues to low doses of γ -radiation was measured in mice using three indirect methods. The survival curves for cells of the tissues studied (colon, jejunum, testis and haemoleucopoietic system) may be exponential over an uncertain dose range (from zero to between 100 to 230 rad), the slope being about one third of that in the high-dose region. Some of the uncertainties in the data probably reflect variations in age-density distribution.

- 2921 ERYTHROPOIESIS IN THE X-IRRADIATED, BLED RAT. Marchetti, D.L.; Glomski, C.A. (Buffalo Univ., N.Y. (USA)). Exp. Hematol.; 3: 375-382(1975).

Exposure to low levels of x irradiation (50R) followed by phlebotomy (50% blood volume) one month post-irradiation, resulted in identifiable alterations of the erythropoietic status of the rat. The red cell indices revealed a decrease in mean corpuscular volume and an increase in mean corpuscular hemoglobin

concentration. The half-life of ^{51}Cr -labelled erythrocytes was 16.7 days versus 14.4 days for the untreated controls. These subjects also demonstrated hyperplastic marrows with an approximate 60% mean increase in marrow cellularity. A reproducible mortality of 25% was seen at 17 weeks post-irradiation. The one group of animals followed for an extended period exhibited an 86% cumulative mortality at 23 weeks. The observations supported the concept that x-irradiated rats exposed to a relatively low dose of X-rays ($< 10\% \text{ LD}_{50}$) maintain a latent or residual injury of the bone marrow. These animals, when subsequently challenged by phlebotomy, are placed at greater risk with respect to their ability to survive.

- 2922 PATHWAYS IN THYMUS- AND BONE MARROW-DERIVED LYMPHATIC LEUKEMIA IN MICE. Haran-Ghera, N.; Ben-Yaakov, M.; Chazan, R.; Peled, A. (Weizmann Inst. of Science, Rehovot, Israel). Bibl. Haematol.; 40: 133-141(1975).

The radiation- and radiation leukemia virus-induced leukemias in C57BL/6 strain mice were found to be of the thymus-derived (T) lymphocyte origin. Experimental evidence indicated that the interaction of the radiation leukemia virus with thymus-derived lymphoid cells and specifically with the thymus subpopulation bearing high levels of H-2 alloantigens were prerequisites for the development of high leukemia incidence in these test systems. In radiation leukemogenesis in C57BL/6 mice it was shown that within several days following the radiation treatment a "released" leukemogenic agent was found in the irradiated bone marrow; whereas, several days following chemical carcinogen leukemogenesis in SJL/J mice, established preleukemic or leukemic cells could be detected in the bone marrow. The analysis concerned with the lymphoid origin of chemical carcinogen-induced lymphatic leukemias in SJL/J mice indicated clearly that the carcinogen could affect different lymphoid populations. The majority of the chemical-induced leukemias were of the bone marrow-derived (B) lymphocyte origin, although some leukemias were of T lymphocyte origin, and some tumors could not be classified as either T or B leukemias, perhaps representing stem cells which do not carry the characteristic surface antigens for mature T and B cells.

- 2923 Beitrage zur Frage der Erholung von Strahlenschaden. (CONTRIBUTIONS TO THE QUESTION OF RECOVERY FROM RADIATION INJURIES). Bad Honnef, F.R. Germany; Osang (1975). 107p. (In German).

With figs., tabs. and refs..

This book presents the results of research work of the committees III 'radiation dose and radiation effects' and IV 'radiation damage and diseases due to radiation' of the Schutzkommission beim Bundesminister des Innern (Safety commission at the Federal Ministry of the Interior) to the interested public. The reports and papers deal with the phenomenon of the recovery of mammals after exposure to ionizing radiation. During the last few years, these problems of recovery from radiation damage have become of focal interest. This is due, above all, to our increased knowledge in the fields of radiochemistry and radiobiology. As an example various repair mechanisms have been identified in irradiated mammal cells in the last few decades. Most of the investigations carried out afterwards, some of which were made by committees III and IV of the Schutzkommission, had practical purposes. There is a hope that the effective radiation damage after a certain radiation dose can be

considerably reduced by utilizing the natural ability of animal and human cells to recover, if necessary in combination with the application of chemical radioprotective substances.

- 2924 (ERDA-tr--36/7-12, pp 1-5) BIOLOGICAL ACTION OF IONIZING RADIATION ON GONADS. VIII. THE SURVIVAL OF OOCYTES IN MICE IRRADIATED DURING FETAL DEVELOPMENT. Rudnicki, T.; Trojczuk, D. 1975. Translated from Nukleonika; 20: (1975).

Nukleonika. The irradiation of the ovaries in mice on the 17th day of their fetal development results in a gradual decrease in the number of oocytes in the extrauterine life primarily at the expense of the primitive ones. In the course of sexual maturation the process becomes stabilized at a level of 40% of controls, and the relative number of growing oocytes increases. The number of matured and maturing oocytes remains unchanged. Reproductive capacity of mice appears to be essentially unaffected despite the decreased number of oocytes observed.

- 2925 (ERDA-tr--36/1-6, pp 40-46) BIOLOGICAL ACTION OF IONIZING RADIATION ON GONADS. V. EARLY AND LATE CHANGES IN THE SEMINIFEROUS EPITHELIUM OF MICE AFTER 100-RAD FRACTIONATED IRRADIATION. Rudnicki, T.; Kochmanska-Twardowska, A. 1975. Translated from Nukleonika; 20: (1975).

Nukleonika. Maturation of the seminiferous epithelium was studied in mice x-irradiated at 50 rads on the 17th day of intrauterine life. Up to the 14th day of life, the quantitative changes in the cell populations of the sexual cords and seminiferous tubules were relatively slight. Attention was attracted, however, by the distinct late effects, noticeable when the testicle was passing into the mature state. They could be seen even on the 60th day of life.

- 2926 (ERDA-tr--36/1-6, pp 47-50) BIOLOGICAL ACTION OF IONIZING RADIATION ON GONADS. VI. MATURATION OF THE SEMINIFEROUS EPITHELIUM OF MICE AFTER IRRADIATION OF THE FETAL GONAD. Rudnicki, T.; Trojczuk, D. 1975. Translated from Nukleonika; 20: (1975).

Nukleonika. The effectiveness of fractionating exposure to ionizing radiation was analyzed quantitatively in six populations of mice spermatogonia. The effects of deranged spermatogenesis on the maturation of spermatids was studied at the same time. The total dose of 100 rads was given in 2--9 split doses during 24--96 hr. The spermatogonia populations differed in their radiobiological response. Methods of evaluating the effectiveness of fractionation were shown to be relative in character. In general, the effects of single and fractionated irradiation were found to be the same, notwithstanding some differences in the dynamics of radiation damage.

- 2927 OCCURRENCE OF CONCEALED BLOOD IN MICE FAECES FOLLOWING ABDOMINAL IRRADIATION WITH IONIZING RADIATIONS, CHEMOTHERAPY AND RADIO-CHEMOTHERAPY. Hilmer, W. Giessen, Germany; Giessen University (1975). 57p. (In German).

Thesis.

In a model experiment using the Heglostix-Ames test shpe method, concealed blood could be detected in the feces of mice after an abdominal partial irradiation with differing penetrating doses of 100 R - 1,100 R or after

i.m. injections of 120 and 90 mg/kg Endoxan or 110 and 840 mg/kg Proresid. The beginning of positive reactions and their duration were proved to depend on the dose. Untreated controls always showed negative reactions, even if the experimental animals were not kept and fed without iron. Cumulative effects could be made up in simultaneous as well as alternating radio-chemotherapy. It would be useful to try the Heglostix method for the early diagnosis of radiogenic or chemogenic haemorrhagic enterocolitides in clinical practice.

- 2928 INVESTIGATIONS ON THE QUESTION OF RADIATION-INDUCED INTRACELLULAR ION TRANSLOCATIONS IN THE LIVER OF RATS. Wenning, J. Bonn; Bonn Univ. (1975). 93p. (In German). INIS.

Thesis.

Radiation-induced ion translocations in cellular and/or subcellular units can be detected in the course of the examination of whole organs. The present paper attempts to study this problem in the liver of rats. The size and ion composition of the extracellular space and its subunits (interstice, intravascular space, biliary discharge system) must therefore be known in order to obtain purely cellular electrolyte values. They can be determined with the aid of dilution methods and by applying Donnan's law. For measuring radiation-induced ion translocations in nuclei and mitochondria, they must be isolated in an aqueous phase. Processing in 0.25 mol l⁻¹ saccharose yields the best results with regard to ion losses, since the vitality of the membranes is largely preserved when using this method. During suspension, some of the nuclei and mitochondria obtained in saccharose solution show considerable ion translocations, depending on the composition of the medium. Irradiation up to 10 kR showed that relatively low doses (100 R) already cause further changes of the electrolyte concentrations of nuclei and mitochondria. In-vivo irradiation of the liver also caused definite potassium-sodium translocations in the nucleus and the mitochondria at doses as low as 100 R. These intracellular electrolyte translocations cannot be detected in examinations of the whole organ. All in all, it is shown that intracellular ion translocations can be found at relatively low radiation doses already. The present paper discusses the possible methods by which they can be detected.

- 2929 (AD-A--028273) PROBLEMS OF POSTRADIAL RECOVERY. Akoev, I.G. 1975. Translation of unidentified Russian language article, 368p, 1970. (USAMIIA-K--0424). 307p. NTIS \$9.75.

The monograph is devoted to the restoration of the organism following the effects of ionizing radiation. The fundamental quantitative laws have been determined for the restorative processes for various conditions of radiation effect. Relationships have been established for the first time determining the rate of restoration of dosages and power of radiation dosages, fractioning, and repetitiveness of radiation. The evolution of radiation damage by time, detected by the method of double irradiation and other methods, is reviewed as associated with clinical and pathophysiological aspects of the problem. Factors are reviewed which define the clinical 'manifestation' of radiation aftereffects. The effects of means of chemical prophylaxis and hormonal preparations are clarified. Elements of compatibility and divergence are described in the processes of damage development and restoration in various biological types. (GRA)

- 2930 EFFECTIVENESS OF ANCESTRAL IRRADIATION IN THE DIRECT AND CORRELATED RESPONSES TO SELECTION FOR BODY WEIGHT IN RATS. Gianola, D. Madison, WI; Univ. of Wisconsin (1975). 102p. University Microfilms Order No. 76-6865.

Thesis (Ph. D.).

The effects of ancestral irradiation of rat spermatogonia (a cumulative total of 4050 r of x-rays) were studied in a highly inbred line of rats to explore the feasibility of using irradiation to enhance the effectiveness of selection. Six generations after irradiation was terminated, a selection experiment for body weight at six weeks of age was started in both ancestrally irradiated and non-irradiated populations. There were two non-contemporaneous replicates in each of the populations. Within each of the ancestral treatment-replicate combinations one line was selected for high, one for low body weight at six weeks of age, and a third line was maintained by random selection. In each line, avoidance of mating of animals with grandparents in common was attempted. Data on the first ten progeny generations of selection were included in this study. Five types of covariances among relatives were used to estimate causal components of variance for five different genetic models within the "non-irradiated" and "irradiated" randomly selected models. The parameters in the genetic models were estimated by generalized least-squares. This analysis suggested that a genetic model including direct genetic and maternal genetic effects was adequate to describe the body weights at 3, 6 and 10 weeks of age and the weight gains between these ages. Ancestral irradiation seemed to have enhanced the maternal genetic variance and the covariance between the direct genetic and the maternal genetic effects. On the basis of the above analysis, it was deduced that mass selection should have been more effective in the descendants of irradiated males than in those of the non-irradiated males as a consequence of greater phenotypic variability in their progeny and an enhancement in the regression of the genetic value on the selection criterion.

- 2931 ULTRASTRUCTURE OF RAT CEREBRAL VESSELS 4 MONTHS AFTER GAMMA IRRADIATION. Iwanowski, L.; Ostenda, M. (Medical Research Centre, Warsaw). *Neuropatol. Pol.*; 13: No. 3/4, 527-530(1975).

The purpose of this paper was to check the current opinion that one of the late postirradiation changes is early senility (Maxwell, Kruger, 1964). The postirradiation changes of the brain parenchyma are well known from the literature; therefore our investigation is limited to brain capillaries and their closest vicinity. This paper constitutes a fragment of a larger work on the role of connective tissue in the aging brain. Six Wistar male rats of the same brood, about 3 months old, were irradiated over the whole body with gamma rays. Three rats were exposed to a dose of 400 R and three to 800 R. The chosen doses were the lowest and the highest, provoking brain edema but still not lethal. Four months after the exposure the rats were perfused with 4% glutaraldehyde intracardially and decapitated. Brain specimens were taken from frontoparietal cortex, lateral ventricle wall, from corpus callosum and griseum pontis. The samples were routinely handled for ultrastructural studies. Observations were performed under electron microscopes showed that the cerebral vessels of both groups of animals were similar.

- 2932 INTERACTION OF X-RADIATION, DIETARY FAT, AND α -TOCOPHEROL ON TISSUE LIPID PEROXIDATION IN RAT. Abu-Irmeileh, N.M. Madison, WI; Univ. of Wisconsin (1975). 249p. University Microfilms Order No. 76-8187.

Thesis (Ph. D.).

The influence of multiple sub-lethal doses of x-radiation, dietary fat, and α -tocopherol supplementation on lipid peroxidation in various rat tissues was investigated. Following x-radiation, both heart and lung tissues had elevated lipid peroxidation levels. A further increase was obtained when the rats were pre-fed diets high in polyunsaturated fats. In contrast, the level in hepatic tissue did not change dramatically. Administration of α -tocopherol decreased lipid peroxidation level in both the heart and the lung following their exposure to ionizing irradiation. It is significant that the level of lipid peroxidation in lungs of control animals maintained under standard U.W. Medical School Animal Care conditions was markedly reduced following α -tocopherol administration. In addition, the level of lipid peroxidation in the hearts of these animals was reduced but to a lesser degree.

- 2933 ULTRASTRUCTURAL CHANGES IN RABBITS LIVER AFTER IRRADIATION. Cieciura, L.; Bartel, H.; Orkisz, S. (Military Medical Academy, Lodz, Poland). *Ann. Med. Sect. Pol. Acad. Sci.*; 20: No. 2, 67-73(1975).

Ultrastructural changes in hepatocytes observed 1 to 30 days after irradiation are presented. The dose absorbed was 550 rad (LD 33/30). Electron microscopy studies showed that early and more distinct changes were observed in mitochondria within 24 hours. Disintegration of endoplasmic reticulum and vacuolization of cytoplasm were seen on the 3rd day after irradiation. From the 9th day, the ultrastructural picture of hepatocytes became normal. In the liver in this period the increase in number of large hypertrophic macrophages was noted.

- 2934 (ANL--76-99, pp 95-107) EXPERIMENTAL RADIATION PATHOLOGY AND ONCOLOGY. Finkel, M.P. 1975.

Division of Biological and Medical Research annual report, 1975.

The program goal is to provide basic data for evaluating the hazard to man from radioactive materials deposited within the body. The original objective, to obtain dose-response information and to provide data from several species for extrapolating animal data to man, is receiving less attention at present as effort is being put into determining how radiation causes bone cancer and whether viruses play a role. The program began with the very early radiotoxicologic investigations of materials important in the development of the atomic bomb and the necessity to establish maximum permissible levels of exposure to these materials. With the demonstration that bone cancer is the most sensitive indicator of damage from transuranic elements and some of the fission products, bone pathology became the focus of attention. When it became evident that questions of human hazard cannot be answered unequivocally on the basis of dose-response relationships, different approaches were considered, and one based on knowledge of mechanisms of cancer induction seemed most likely to be successful. The detection of viruses in both radiation-induced and spontaneous bone cancer of mice, and the present evidence for a similar virus in bone

cancer of man, support the hypothesis that radiation causes cancer by activating endogenous neoplastic information, which can also be expressed as oncornavirus. Present emphases therefore concern understanding the biological, biochemical, and physical attributes of the five murine oncornaviruses that have now been isolated in the course of the program; demonstrating the existence of a comparable human oncornavirus; and discovering how radiation and virus interact in the induction of bone cancer.

- 2935 (DHEW/FDA--76-8026, pp 110-113) SOIL DENSITY METER INCIDENT. Dolezal, A. 1975.

From 7. annual national conference on radiation control; Hyannis, MA, USA (27 Apr 1975).

7th annual national conference on radiation control.

As packages were being transferred from one plane to another at a metropolitan airport, an instrument fell from a package and was picked up by a cargo handler. The instrument was a soil density meter containing a $^{137}\text{Cs}/^{241}\text{Am}/\text{Be}$ source. Monitoring of the package and hands of the cargo handler revealed very little contamination. Photographs of the incident were taken by a television crew and a news report contained several inaccuracies and misinterpretations. (HLW)

- 2936 (DHEW/FDA--76-8026, pp 114-116) COBALT INCIDENT. Fisher, E. 1975.

From 7. annual national conference on radiation control; Hyannis, MA, USA (27 Apr 1975).

7th annual national conference on radiation control.

A hot cell operator entered a hot cell containing an exposed ^{60}Co source of 120,000 curies. The source had been irradiating 30-gallon drums of teflon for 12 hrs. The monitoring system of the facility is described in detail. The cell operator was using a 50,000 curie source in addition to the 120,000 curie source. As he entered cell No. 2 he saw either the primary source or certain physical barriers that normally are not seen. As he exited he saw that two alarms had been tripped. The exposure was estimated to be 40 R per second for 6 seconds. He was admitted to the hospital and the whole body dose was estimated to be 400 rad based on chromosomal aberration studies. Various aspects of the incident are discussed. (HLW)

- 2937 (DHEW/FDA--76-8026, pp 120-127) REGULATION OF RADIOACTIVE DRUGS. Halperin, J.A. 1975.

From 7. annual national conference on radiation control; Hyannis, MA, USA (27 Apr 1975).

7th annual national conference on radiation control.

The following topics are discussed with regard to activities of the Bureau of Drugs: the final order of the regulation on radioactive drugs and biologics; the nuclear pharmacy issue; the interrelationships between the Bureau of Drugs and the Bureau of Biologics on the control of radiobiologics; the January 1975 meeting between representatives of the Bureau and the Task Force on Radiopharmaceuticals of the Conference of Radiation Control Program Directors; activities with specific products; and a description of the Bureau's actions with regard to the NCRP report on thyroid blocking. (HLW)

- 2938 (DHEW/FDA--76-8026, pp 166-169) NATURAL RADIOACTIVITY IN THE ENVIRONMENT: THE FLORIDA PHOSPHATE STUDY. Clark, U. 1975.

From 7. annual national conference on radiation control; Hyannis, MA, USA (27 Apr 1975).

7th annual national conference on radiation control.

Some topics discussed are: effects of phosphate mining on public health and the environment; concentrations of uranium and daughter products in phosphate ore; investigations of phosphate mining areas by the Florida Division of Health; development of an instrument for aerial survey of background radiation; evaluation of drinking water supplies; and use of waste products from mining operations for construction material. (HLW)

- 2939 (DHEW/FDA--76-8026, pp 174-179) RADIOACTIVITY STANDARDS FOR THE SAFE DRINKING WATER ACT OF 1974. Ellett, W.H. 1975.

From 7. annual national conference on radiation control; Hyannis, MA, USA (27 Apr 1975).

7th annual national conference on radiation control.

Some topics discussed are: maximum contaminant levels and monitoring requirements of the EPA; technical considerations on which proposed regulations are based; detection limits for ^3H , ^{89}Sr , ^{90}Sr , ^{131}I , ^{134}Cs , and gross beta; limitations of monitoring to systems distributing surface water to more than 100,000 persons and systems downstream from nuclear facilities; ratio of allowed limits for ^{226}Ra and ^{228}Ra in drinking water; Ra dose to bone surfaces based on chronic ingestion of ^{226}Ra and ^{228}Ra ; application of radiation risk estimates to the case of radium ingestion; and comparison of task force report and EPA estimates of estimated total risk from radium. Symposium on key questions about the fast breeder reactor.

Risks for inhalation of plutonium aerosols are reviewed with criticizing the maximum permissible lung burden (MPLB) for plutonium. The existing risk model assumes a uniform dose distribution neglecting the possibility that aerosols will cause radiation injuries and lung cancer forming hot spots in the lung epithelium (hot particle hypothesis). The conclusion is that the MPLB has to be lowered by a factor of at least 2000 if this hypothesis is true and that the construction of plutonium based breeder reactors is premature and not advisable until more knowledge is gained in this matter. Finally, with the hot particle hypothesis as an example, an analysis is given of the irrational way these matters are sometimes discussed. A plea is given for a more relevant discussion.

- 2943 RADIATION ABSORBED DOSE FROM MEDICALLY ADMINISTERED RADIOPHARMACEUTICALS. Roedler, H.D.; Kaul, A. (Freie Univ., Berlin). pp 655-665 of Biomedical dosimetry. Vienna; International Atomic Energy Agency (1975).

From International symposium on advances in biomedical dosimetry; Vienna, Austria (10 Mar 1975).

See STI/PUB--401; CONF-750331--.

The increasing use of radiopharmaceuticals for medical examinations implies an increased genetic and somatic radiation exposure of the population in general. Determination of radiation exposure requires a knowledge of the radiation dose absorbed by each organ. Survey of the literature revealed widely different dose values for the same defined examination methods and radiopharmaceuticals. The authors recalculated some of the dose values published for radiopharmaceuticals used in patients by applying biokinetic data obtained from exponential models of usable metabolism data reported in the literature. The calculation of organ dose values was done according to the concept of absorbed fractions in its extended form. For all radiopharmaceuticals used in nuclear medicine the energy dose values for the most important organs (ovaries, testicles, liver, lungs, spleen, kidneys, skeleton, total body or residual body) were recalculated and tabulated for the gonads, skeleton and critical or examined organs respectively. (auth)

- 2944 DOSIMETRY AND RADIATION PROTECTION PROBLEMS OF USING RADIONUCLIDES FOR DIAGNOSTIC PURPOSES. Conte, L.; Mombelli, L. (Univ., Milan). pp 667-681 of Biomedical dosimetry. Vienna; International Atomic Energy Agency (1975). (In Italian)

From International symposium on advances in biomedical dosimetry; Vienna, Austria (10 Mar 1975).

See STI/PUB--401; CONF-750331--.

An evaluation of the overall risk to which the use of radionuclides in medical diagnosis exposes patients and the population as a whole is presented. The whole-body doses, the accumulating-organ doses, the mean bone marrow dose, and the genetically significant dose due to the use of radionuclides in medical examinations during 1972 in the province of Varese, Italy, were determined. Analysis of the results showed that the risk of cancer due to whole-body irradiation is virtually negligible. The genetic risk and the risk of leukemia associated with irradiation of the gonads and of the bone marrow are small relative to the risks associated with the use of x rays for

diagnostic purposes. On the other hand, the risk due to the irradiation of accumulating organs must be examined closely. In particular, the risk associated with irradiation of the thyroid does not appear to be negligible; an appreciable increase in the probability of thyroid cancer may result from such irradiation. On the basis of the authors' findings it is possible to give advice designed to reduce the risks mentioned and to avoid those which are avoidable at all. (auth)

- 2945 RADIATION DOSE PATTERNS FOR INHALED RADIONUCLIDES. Snipes, M.B.; Hulbert, A.J.; Runkle, G.E. (Inhalation Toxicology Research Inst., Albuquerque, NM). pp 683-694 of Biomedical dosimetry. Vienna; International Atomic Energy Agency (1975).

From International symposium on advances in biomedical dosimetry; Vienna, Austria (10 Mar 1975).

See STI/PUB--401; CONF-750331--.

This experimental work was designed to examine two major assumptions used in lung dosimetry for relatively insoluble lung burdens of energetic β - γ emitters. The first assumption is that inhaled radioactive particles are deposited uniformly in the lung and remain uniformly dispersed with time after exposure; the second is that the resulting absorbed radiation dose pattern is uniformly distributed throughout the lung mass. These assumptions have important implications in experimental animal studies and in the use of radioactive lung burdens in medical diagnosis of pulmonary disease or injury. For instance, it is of interest to know the degree of uniformity of the lung dose resulting from use of ^{131}I human serum albumin macroaggregates in nuclear medicine. Two experiments are concurrently in progress to examine these assumptions. In both experiments, Beagle dogs were exposed once by inhalation (nose-only) to achieve lung burdens of heat-treated aluminosilicate particles labelled with either ^{90}Sr - ^{90}Y or ^{147}Pm . The ^{90}Sr - ^{90}Y was chosen as representative of relatively energetic β - γ emitters, the ^{147}Pm was chosen for its slight penetrating ability. At prescribed times after exposure, the dogs were sacrificed and frozen, their thoraxes removed and encased in a block of polyurethane foam and sliced at approximately equal to 1 cm intervals. Photography, autoradiography, and computer techniques were combined to study the radiation dose to specific locations in the dog's thorax. Preliminary results from the ^{90}Sr - ^{90}Y experiment yielded a range of 3 to 4 for the ratio (observed absorbed dose)/(average thorax dose), indicating a wide range of absorbed dose levels throughout the Beagle thorax. Subsequent data analysis will yield retention patterns and absorbed dose patterns for individual lung lobes and other tissues of interest in the Beagle thorax as a function of time after exposure to these particulate lung burdens. (auth)

- 2946 (ERDA-tr--99, pp 76-81) STATE OF CERTAIN DIVISIONS OF THE DIGESTIVE TRACT OF RATS IN THE CASE OF CHRONIC INTAKE OF STRONTIUM-90. Boitsova, V.P.; Goloshchapov, P.V.; Soroka, L.P. 1975. Translated from Radiobiologiya; 15: No. 3, 389-393(1975).

Radiobiology. Chronic intake of strontium-90 into the rat organism with the feed causes distinct structural disorders in the wall of the small intestine. In this case the intestinal autoflora is sharply increased, there is a retrograde separation of it, and there is a change in the species composition. In the lower regions of the gastrointestinal tract, enterococci, *Bacillus pyocyaneus* and *B.*

perfringens predominated. Bacteriemia did not develop; symptoms indicating the presence of toxemia were present. (tr-auth)

- 2947 SAFE USE OF RADIOACTIVE TRACERS IN INDUSTRIAL PROCESSES. Vienna; International Atomic Energy Agency (1975). 54p. Sch. 48.00.

The principal objectives of this guide, sponsored jointly by the IAEA and WHO, are to identify the safety considerations in industrial radiotracing, to provide guidance to competent authorities in converting ICRP recommendations into appropriate policies and regulations applicable to radiotracing, to assist competent authorities in implementing an appropriate program for control of industrial radiotracing, and to provide users with guidance in the planning and safe implementation of radiotracer investigations. Contents: basic radiation safety considerations; determination of radiation dose; role of competent authority; planning and design; operational procedures. Examples of tracer applications are appended (measurement of flow rates of liquids, steam, gases; measurement of dispersion of industrial effluent in a river; measurement of mixing in a large tank; ventilation studies; continuous measurement of lining wear in a steel furnace; investigation of wood-chip transport in a continuous digester).

- 2948 TOXICITY OF PLUTONIUM. London; H.M. Stationery Office (1975). 38p. pounds0.45.

The following aspects of the report of the British Medical Research Council Committee on Protection against ionizing radiations on the present knowledge of the potential hazards to man of plutonium and its compounds are examined: radiological protection standards; recommendations relating specifically to plutonium; and acceptability of the basic radiation standards. It is concluded that the standards in general fulfil the intentions of the International Commission on Radiological Protection although small adjustments may be needed. The principal criticisms concern the current methods of estimating values for acceptable limits of exposure to plutonium-239. The technical considerations relating to the critical tissues and the dosimetry of plutonium are outlined in an appendix.

- 2949 EFFECTS OF TRITIUM ON THE HUMAN ORGANISM. Feinendegen, L.E.

(Kernforschungsanlage Juelich G.m.b.H. (F.R. Germany). Inst. fuer Medizin). J. Belge Radiol.; 58: No. 2, 147-155(1975).

The radiation and transmutation effects of tritium are studied on the basis of documents found in the literature. Only few examples can be cited indicating the effect of tritiated water and tritiated thymidine in mammals. Direct extrapolation from such data to the human being are not permissible. Radiation effects from incorporated tritiated water, are comparable to those caused by an equivalent dose from external X radiation. Conventional dosimetry is not applicable in the case of heterogeneous distribution of tritium within living organisms. Late effects and dose calculations are discussed based on the critical cell concept.

- 2950 PREDICTED RADIATION EXPOSURE OF THE POPULATION OF THE EUROPEAN COMMUNITY RESULTING FROM DISCHARGES OF KRYPTON-85, TRITIUM, CARBON-14, AND IODINE-129 FROM THE NUCLEAR POWER INDUSTRY TO THE YEAR 2000. Kelly, G.N.;

Jones, J.A.; Bryant, P.M.; Morley, F. Luxembourg; Commission of the European Communities (1975). 108p.

The exposure of the population of the European Community from the predicted discharges of krypton-85, tritium, carbon-14 and iodine-129 from the Community and world nuclear power programs up to the year 2000 is assessed. These nuclides, owing to their relatively long half-lives and their widespread dispersion, accumulate in the environment and represent long term sources of irradiation to essentially the whole of the world population. Consideration is given to the exposure of individuals and the Community population as a whole from each of the four nuclides; the relative significance of each nuclide in this context is evaluated. The levels of exposure are compared with ICRP recommended dose limits and with exposure from other sources such as natural background radiation. A comparison is also made between the natural inventories of these nuclides in the environment and those arising from discharges from the nuclear power programs. The assessment is based on the continued application, to the end of this century, of current waste management practices; the implications and likelihood of the implementation of improved practices prior to the year 2000 are also discussed.

- 2951 EFFECT OF ^{137}Cs ON IMMUNOLOGICAL REACTIVITY. Shubik, V.M. (Inst. of Radiation Hygiene, Leningrad). J. Hyg., Epidemiol., Microbiol., Immunol.; 19: No. 3, 271-278(1975).

An important role of ^{137}Cs as a new ecological factor was shown by analyzing the works of 31 authors. This radioisotope may at present be detected in the organisms of all the inhabitants of this planet. The migration of ^{137}Cs along the chain lichen-deer-man leads to its accumulation in the organism of human subjects living in the Extreme North and utilizing venison in their diet. Although the high sensitivity of immunological reactions to various unfavorable environmental factors is well known, the materials on the effect of incorporated ^{137}Cs on immunity are scanty. Experiments on animals have shown changes in factors of nonspecific immunity (phagocytic reaction of blood neutrophils, bactericidal activity, lysozyme and complement titres of blood serum) and specific immunity (formation of antiviral antibodies). The blood of animals injured by the isotope displays complete and incomplete autoantibodies. A dependence between the immunobiological changes and the dose absorbed by the organism was demonstrated. The entry of ^{137}Cs into the organism of the inhabitants of the Extreme North who use venison in their diet did not, with the absorbed dose equaling up to 50 Mrem per year, lead to changes in their immunological reactivity.

- 2952 RISK OF MALIGNANCY FROM INTERNALLY-DEPOSITED RADIOISOTOPES. Rowland, R.E. (Argonne National Lab., IL). pp 146-155 of Radiation research. Biomedical, chemical, and physical perspectives. Nygaard, O.F. (ed.). New York; Academic Press, Inc. (1975).

From 5. international radiation research congress meeting; Seattle, WA, USA (14 Jul 1974).

See CONF-740715--.

The somatic effects of the internal emitters is considered. The shape of the dose-response function is deduced from the data itself. It is concluded that the major long-term somatic effect of radiation on man is cancer. Much of the data used in the study is taken from radium

studies.

- 53 CASE OF AN ACCIDENTAL IRRADIATION WITH IRIDIUM-192. Krushkov, I.V.; Mikhailov, M.A.; Nacheva, V.; Ivanova, M.; Serafimov, A.; Kalchev, K.T. Nauchni Tr., Nauchnoizsled. Inst. Radiobiol. Radiats. Khig.; 5: No. 1, 135-138(1975). (In Bulgarian).

It is estimated that a worker operating with a 15-curie, ^{192}Ir source obtained a surface skin dose of 2000 to 3000 rads, 1200 to 2000 rads at a depth of 7 mm, 21 to 26 rads at the wrist, and 1.5 to 2 rads at the humeral joint. The patient did not seek medical aid, until on the tenth day after irradiation a dull ache, numbness of surface sensitivity and lack of mobility was noted on the first three fingers of the right hand. Damaged parts of the skin were whitish-yellow in color. The blood chemistry was at the boundary of normal: erythrocytes - 4.2 million; hemoglobin - 80 percent; leucocytes - 7600. On the 20th day necrotic zones of size 16/16 mm were noted on the first finger, of size 17/17 mm on the second finger, and of size 7/7 mm on the third finger. Skin darkening and hardening of the epithelium were noted by the 30th day. Necrosis started to decrease in the third month. Chromosomal analysis showed 18 percent structural changes in the skin cells. 13 refs.

- 2954 (ERDA-tr--110, pp 87-91) MORPHOLOGICAL CHANGES IN THE CENTRAL NERVOUS SYSTEM OF DOGS CHRONICALLY IRRADIATED AT AN EARLY AGE WITH INCORPORATED RADIOPHOSPHORUS. Chervinskaya, A.F. (Rostov State Univ., USSR). 1975. Translated from Radiobiologiya; 15: No. 4, 560-565(1975).

Radiobiology. Dogs were given ^{32}P in doses of 5, 10, and 20 $\mu\text{Ci/kg}$ with their food twice a month for a year starting with five weeks of age. It was shown that the degree and nature of the histological changes in the nerve tissue depend on the clinical state and age of the irradiated animals. Possible mechanisms of this phenomenon are discussed. (tr-auth)

- 2955 (ERDA-tr--99, pp 92-97) DEPENDENCE OF THE AVERAGE LIFETIME, MORTALITY, AND FREQUENCY OF OSTEOSARCOMAS IN RATS ON THE ABSORBED DOSE DUE TO STRONTIUM-90. Shvedov, V.L.; Pantelev, L.I. 1975. Translated from Radiobiologiya; 15: No. 3, 402-406(1975).

Radiobiology. The dependence of the mortality and frequency of development of osteosarcomas on the dose was studied on white rats that had received 0.00005 to 5.0 $\mu\text{Ci/day}$ of ^{90}Sr daily throughout their lifetime. It was shown that the general mortality in the dose range 0 to 10 krad is a more sensitive test than the frequency of osteosarcomas; moreover, osteosarcomatosis practically does not shorten the average lifetime of the irradiated rats. (tr-auth)

- 2956 SOME EFFECTS OF THE COMBINED INHALATORY ACTION OF TOBACCO SMOKE AND RADON 222 ON THE ORGANISM (EXPERIMENTAL STUDY). Ivanov, Z.; Vasiliev, G.; Dermendzhiev, Kh.; Nikolova, M.; Khadzheva, T.; Dimitrov, T. (Nauchno-Izledovatelski Inst. po Radiologiya i Radiatsionna Khigiena, Sofia (Bulgaria)). Rentgenol. Radiol.; 14: No. 3, 188-192(1975). (In Bulgarian).

The effect of combining radon-222 inhalation exposure with two non-radiological factors, cigarette smoke and indifferent dust, is studied in terms of lung tissue dose and histomorphology. The experiments are carried out on rat males given a 6-month treatment, 4

hours per day, 6 days of the week, with: radon-222 at a concentration of 1×10^{-9} Ci/l (Group I), cigarette smoke (Group II), amorphous dust (Group III), radon plus cigarette smoke (Group IV) or radon-222 plus cigarette smoke plus amorphous dust (Group V). After cessation of exposures, lung tissue dose D from a single 4-hour inhalation of radon and its decay was determined from activity measurements to serve as an integral criterion for entry and retention of the radioactive aerosol in the respiratory tract. For groups I and II compared to controls receiving no pretreatment, D dose by a factor of 3.3 and 2.1, respectively. For exposure to radon-222 plus cigarette smoke (Group IV, more than two-fold increase is established in D; a similar effect is observed with exposure solely to amorphous dust (Group III). The peak value for D, 12.6 Mrad, is obtained with simultaneous exposure to the three factors tested (Group V). The D data are supported by observations of histomorphological changes. The experimental results are discussed from the standpoint of the hypothesis of the importance of non-radiological factors for lung carcinogenesis in uranium miners and, on the other hand, absence of excess lung cancer incidence in personnel employed at radon spa baths.

- 2957 GENETIC EFFECTS FROM RADIOACTIVE ISOTOPES. VI. EMBRYONAL LETHALITY IN FIRST PROGENY OF MALE MICE TREATED WITH PHOSPHORUS 32 IN THE PREMEIOTIC PHASE. Baev, I.; Bajrakova, A.; Manchev, V. (Nauchno-Izledovatelski Inst. po Radiologiya i Radiatsionna Khigiena, Sofia (Bulgaria)). Sci. Publ., Res. Inst. Radiol. Radiat. Hyg.; 5: No. pt.1, 97-100(1975). (In Bulgarian).

Sexually mature male mice of BAL B/C line were given by single intraperitoneal injection different activities (25, 50, 75, and 135 μCi) of phosphorus-32 as aqueous Na_2HPO_4 solution. Ninety days after treatment each male was coupled for four weeks with five intact sexually mature females of C57BL line. Dissection of fecundated females was made, and the pre- and post-implantation mortality was estimated together with the overall loss in the first progeny and the incidence of induced dominant lethal mutations. Phosphorus-32 displayed mutagenic effectiveness for mouse spermatogonial cells. The degree of induced genetic injury differed depending on the incorporated activity; it was not demonstrable at 25 $\mu\text{Ci/mouse}$, reached a maximum at 75 $\mu\text{Ci/mouse}$ and tended to decrease at 135 $\mu\text{Ci/mouse}$.

- 2958 GENETIC EFFECTS FROM RADIOACTIVE ISOTOPES. II. CHROMOSOMAL ANOMALIES (TRANSLOCATIONS) INDUCED BY IODINE 131 AND STRONTIUM 89 IN RATS MALE GERM CELLS. Baev, I.; Bajrakova, A.; Benova, D. (Nauchno-Izledovatelski Inst. po Radiologiya i Radiatsionna Khigiena, Sofia (Bulgaria)). Sci. Publ., Res. Inst. Radiol. Radiat. Hyg.; 5: No. pt.1, 101-104(1975). (In Bulgarian).

Male sexually mature rats are treated intraperitoneally with a single dose of 3.5 $\mu\text{Ci/g}$ bodyweight of iodine-131 or 1.0 $\mu\text{Ci/g}$ bodyweight of strontium-89 in the form of aqueous sodium iodine, resp. strontium bichloride solution without carrier. Cytogenetic analysis is performed after six months on primordial spermatocytes in diakinesis metaphase I. The chromosomal translocations - 3/230 and 16/420 demonstrable in the gonadal cells of iodine-131, resp. strontium-89 - treated rats are a manifestation of severe damage to hereditary structures in gonadal cells of premeiotic (spermatogonial) phase.

2959 PERSISTENT CHROMOSOMAL TRANSLOCATIONS IN MICE SPERMATOGENIA AFTER INCORPORATION OF DIFFERENT PHOSPHORUS-32 ACTIVITIES.

Bajrakova, A. (Nauchno-Izslodovatel'ski Inst. po Radiologiya i Radiatsionna Khigiena, Sofia (Bulgaria)). Sci. Publ., Res. Inst. Radiol. Radiat. Hyg.; 5: No. pt.1, 93-96(1975). (In Bulgarian).

Sexually mature male mice of BAL B/C line are given by single intraperitoneal injection different activities (25, 50, 75 and 135 μ Ci) of phosphorus-32 as Na_2HPO_4 . Cytogenetic analysis is made six months later on primordial spermatocytes in diakinesis-metaphase I. It is found that phosphorus-32 induces chromosomal translocations in spermatogonia of treated animals, manifested in primordial spermatocytes as multivalents in the form of rings or chains. The yield of chromosomal translocations depending on incorporated activity may best be described by the model $Y = a + bD + cD^2$, Y being the yield of translocations per cell $\cdot 10^2$, D - incorporated phosphorus-32 per mouse in μ Ci; the coefficients 'a', 'b' and 'c' have the following values: 0.04, 0.0375 and 0.0002 respectively.

2960 A STUDY OF THE ALKALINE AND ACID PHOSPHATASE ACTIVITIES IN ACUTE URANIUM INTOXICATION.

Bokova, N.; Pavlova, V.; Stancheva, Yu.; Khadzhirusev, S.; Kiradzhiev, G. (Nauchno-Izslodovatel'ski Inst. po Radiologiya i Radiatsionna Khigiena, Sofia (Bulgaria)). Sci. Publ., Res. Inst. Radiol. Radiat. Hyg.; 5: No. pt.1, 31-35(1975). (In Bulgarian).

Comparative study of the ability of the sodium salt of diethylbarbituric acid and acetazolamide to protect the kidneys is conducted under conditions of acute uranium intoxication in rats. The parameters studied are alkaline and acid phosphatase activities in the serum and urine and phosphatase activity in the kidneys (histochemically as described by Gomori) followed up until the 30th day after the total uranyl acetate dose was reached (2 or 7 mg per kg bodyweight). Either compound exerted only minor effect on serum alkaline phosphatase activity. Sodium diethylbarbiturate induced distinct fluctuations in urinary alkaline phosphatase activity throughout the entire study period, but the differences never reached statistical significance. Acetazolamide caused essential decrease in urinary alkaline phosphatase activity. In either case renal tissue protection from the action of the uranyl ion may be suggested. This assumption is supported by the histochemical analysis. The compounds appeared to have no effect on serum acid phosphatase activity which showed high variability both in control and in treated rats.

2961 (ERDA-tr--146, pp 62-66) PROBABILISTIC DISTRIBUTION OF DOSE RATES IN THE BONE AS A FUNCTION OF THE RHYTHM OF THE STRONTIUM-90 ADMINISTRATION AND AGE OF THE ANIMALS. Rasin, I.M.; Sarapul'tsev, I.A. 1975. Translated from Radiobiologiya; 15: No. 5, 691-694(1975).

Radiobiology. The probabilistic distribution of tissue doses in the skeleton was studied in experiment on pigs and dogs. It was established that in the case of oral administration of ^{90}Sr from birth up to 90 days, the probabilistic distribution of the dose rate is characterized by one set, and in adult animals by two independent sets, each of which corresponds to a normal law; in the case of prolonged excretion, both for growing and for adult animals, the probabilistic

distribution of tissue doses in the tubular bones is characterized by two sets, and in the ribs and vertebrae by one independent set, each of which also corresponds to a normal law.

2962 LATE EFFECTS OF INHALED PLUTONIUM IN DOGS.

Park, J.F. (Battelle Pacific Northwest Labs., Richland, WA). pp 1233-1247 of Radiation research. Biomedical, chemical, and physical perspectives. Nygaard, O.F. (ed.). New York; Academic Press, Inc. (1975).

From 5. international radiation research congress meeting; Seattle, WA, USA (14 Jul 1974).

See CONF-740715--.

An overview is presented summarizing the effects of inhaled $^{239}\text{PuO}_2$ and $^{238}\text{PuO}_2$ in dogs with emphasis on dose-response relationships at low exposure levels. With the dose levels studied to date, pulmonary neoplasia was the primary cause of death in beagles 5 to 10 years after inhalation of $^{239}\text{PuO}_2$. None of the dogs exposed to $^{239}\text{PuO}_2$ developed bone tumors. Bone neoplasia was the primary cause of death 5 to 6 years after inhalation of $^{238}\text{PuO}_2$; however, one of the dogs had pulmonary tumors in addition to bone tumors. The earliest indication of a biological effect after the inhalation of $^{239}\text{PuO}_2$ or $^{238}\text{PuO}_2$ was dose related lymphocytopenia. (ERB)

2963 STUDY ON ALKALINE AND ACID PHOSPHATASE ACTIVITY IN ACUTE URANIUM INTOXICATION.

Bokova, N.V.; Pavlova, V.B.; Stancheva, Yu.A.; Khadzhirusev, S.B.; Kiradzhiev, G.D. (Nauchno-Izslodovatel'ski Inst. po Radiologiya i Radiatsionna Khigiena, Sofia (Bulgaria)). Rentgenol. Radiol.; 14: No. 4, 236-240(1975). (In Bulgarian).

The protective potential of diethyl barbituric acid sodium salt is studied, in comparison with that of acetazolamide, on kidneys under acute uranium intoxication. Experiments involved rats given intraperitoneal injections with uranyl acetate on 12 successive days up to a total dose of 0.5, 2.0 or 7.0 mg/kg. The resulting effects are measured by chemical assays of serum and urine for alkaline and acid phosphatase and histochemical assays for phosphatase activities in kidneys, kinetics being followed over a 30-day period after total dose administration. Protection of kidneys from toxic uranium effects was found to be of about the same degree with sodium diethyl barbiturate as with acetazolamide.

2964 TUMORS IN SOFT TISSUES AND INTERNAL ORGANS IN NEPTUNIUM-237 INDUCED LESION.

2965 (AED-Conf--75-780-000, pp 237-239) SUPPRESSION OF RADIOIODINE INCORPORATION IN MAN.

Gloebe, B. 1975. (In German).

From Meeting of the Schutzkommission beim Bundesministerium des Innern; Erlangen, F.R. Germany (May 1975).

1 tab. Available from ZAED.

Meeting of the Schutzkommission beim Bundesministerium des Innern.

The author discusses various possibilities of reducing the building-in of incorporated radioactive iodine into organic compounds, thus also reducing the resulting radiation load. Suitable methods should involve no harm to humans. In healthy test persons, 6 mg/d of D-

tetraiodothyronine (D-T₄) reduced the iodine incorporation into the thyroid by a factor 8 without any discomfort. A possible improvement of the results by combining L- and D-T₄ will be investigated.

- 2966 (SSI--1975-004) THE PROPORTION OF CESIUM-137 IN THE CONTROL GROUP OF THE NATIONAL INSTITUTE OF RADIATION PROTECTION, IN 1974. Schnell, P.O.; Eklund, G. (Statens Strålskyddsinstitut, Stockholm (Sweden)). 1975. 7p. (In Swedish). INIS.

Measurements of the proportion of cesium-137 in a control group, consisting of about 20 persons employed by the institute, have been made since 1959. Individual factors have been determined and used in the calculation of the mean value of the Cs 137-level, since the composition of the group has not been the same on every measuring occasion. Thereby this mean value can be used to study the time variation of the Cs 137-level of the group. Since the group is not selected haphazardly the Cs 137-level cannot be regarded as representative of the Stockholm area.

- 2967 ASSESSMENT OF HUMAN SKIN DECONTAMINATION FROM RADIOACTIVE CONTAMINATION. Mikhajlov, M.G.; Vasilev, G.; Sharov, P. (Nauchno-Izledovatel'ski Inst. po Radiologiya i Radiatsionna Khigiena, Sofia (Bulgaria)). Sci. Publ., Res. Inst. Radiol. Radiat. Hyg.; 5: No. pt.2, 189-191(1975). (In Bulgarian).

A suitable and practicable means for assessing skin decontamination and percutaneous adsorption of radioactive skin contaminants is developed by comparing the streams of beta-particles and gamma-quanta characterizing the penetration and distribution of radioactive skin contaminants. The principal requirements which a preparation for human skin decontaminants should meet are: effectiveness of the preparation, minimal percutaneous absorption, broad activity spectrum on compounds and radionuclides, preservation of integrity of the treated skin and a simple method of use of the decontaminant.

- 2968 POLONIUM-210 IN HUMAN HAIR, BONES AND TEETH. Novakova, E.; Kerteva, A.; Boyadzhiev, A. (Nauchno-Izledovatel'ski Inst. po Radiologiya i Radiatsionna Khigiena, Sofia (Bulgaria)). Sci. Publ., Res. Inst. Radiol. Radiat. Hyg.; 5: No. pt.2, 201-205(1975). (In Bulgarian).

Polonium-210 concentration in hair, bones and teeth of human individuals of different age groups (1 to 10 yrs, 10 to 20 yrs and older than 20 yrs) is studied. Samples were collected in 1972 and subjected to wet combustion. Radiochemical determination of polonium-210 is performed after a method based on its spontaneous deposition on a silver plate. It is found that the content of polonium-210 in bones varies from 0.7 to 4.0 pCi/100 g fresh tissue. In hair and teeth the concentrations vary within broader limits - from 2.3 to 11.9, resp. from 6.2 to 14.0 pCi/100 g fresh tissue. These values match the ones published in the literatures. Peak mean radionuclide concentrations - 9.7 pCi/100 g fresh tissue - were found in the teeth. In all three samples the content of polonium-210 was maximal in the youngest age group, probably due to the intensive mineral metabolism in the growing organism. On the basis of the polonium-210 content the intensity of the dose incorporated in different areas of the skeleton (Havers canals, osteocytes and canaliculi) is calculated. Radiation loading was most intensive in the youngest age group.

- 2969 BLOOD AND URINARY POLONIUM 210 LEVELS IN PERSONNEL EMPLOYED AT THE NARECHEN SPA. Novakova, E.; Kerteva, A.; Boyadzhiev, A. (Nauchno-Izledovatel'ski Inst. po Radiologiya i Radiatsionna Khigiena, Sofia (Bulgaria)). Sci. Publ., Res. Inst. Radiol. Radiat. Hyg.; 5: No. pt.2, 207-210(1975). (In Bulgarian).

In an effort to study the integral contamination with radon and its degradation products of individuals employed at the Narechen Spa, the authors determined their urinary and blood concentration of polonium-210. In the 10 persons admitted to the study the radionuclide values were essentially elevated - from 0.58 to 2.12 pCi in diurnal urine samples, against 0.2 - 0.4 pCi in radon-noncontaminated persons. The degree of contamination with radon and its degradation products did not correlate with the length of service. There was close correlation between blood and urinary polonium-210 concentrations in these individuals. A regression equation for a rectilinear dependency was formulated: $Y=0.2+5.2X$, Y being polonium-210 concentration in the blood (pCi/l) and X its urinary concentration (pCi/24 hours' urine). The errors in determining the coefficients are accordingly 0.02 and 1.0.

- 2970 INTERNAL CONTAMINATION WITH STRONTIUM 90 IN MAN. Boyadzhiev, A.; Mikhajlov, M.A.; Jotov, M.; Novakova, E.; Kerveta, A. (Nauchno-Izledovatel'ski Inst. po Radiologiya i Radiatsionna Khigiena, Sofia (Bulgaria)). Sci. Publ., Res. Inst. Radiol. Radiat. Hyg.; 5: No. pt.2, 179-183(1975). (In Bulgarian).

A case of accidental contamination with strontium-90 is reported. The person was working with a standard containing strontium-90 in the form of $Sr(NO_3)_2$ with activity of 400 μ Ci. The integrity of the standard had been broken and about half of its content was spilled on the work place. Contamination was recognized on the third day of the accident. Urinary radionuclide excretion was determined several times over a period of 184 days. Proceeding from the data obtained, the authors were able to find the "urinary strontium-90 excretion curve" and herefrom the "unloading function" which makes feasible the determination of strontium 90 content in the body at any moment selected at random. The analysis showed that urinary strontium 90 excretion proceeds in several stages with essentially different rate. The internal irradiation dose was calculated by the exponential "unloading function", by the mixed (exponential and degree) function recommended by the International Committee for Radiation Protection and by the exponential function obtained for this very case. The dose uptaken by the bones for 50 years will amount to 3.8, 5.3 and 0.3 ber accordingly.

- 2971 (ERDA-tr--146, pp 187-190) CONTENT OF CA, ⁹⁰SR, AND ¹³⁷CS IN THE HUMAN PLACENTA. Makarova, V.P.; Piskunov, L.I.; Treiger, S.I. (Sverdlovsk Regional Sanitary-Epidemiological Station, USSR). 1975. Translated from Radiobiologiya; 15: No. 5, 778-780(1975).

Radiobiology. The content of Ca, ⁹⁰Sr, and ¹³⁷Cs was determined in placental tissues of women from a city of the northern Urals. The data were used to estimate the migration of ⁹⁰Sr and ¹³⁷Cs through the placental barrier into the fetus. The kinetics of distribution of ⁹⁰Sr, ¹³⁷Cs, Ca, and K in the placenta and fetal tissues is discussed and it is concluded that the content of ⁹⁰Sr and ¹³⁷Cs in the placenta may be used as a method of indirect

dosimetry of neonates. (HLW)

- 2972 RADIOPROTECTION STANDARDS AND DERIVED LIMITS FOR TRITIUM. Dousset, M. (CEA Centre d'Etudes Nucleaires de Fontenay-aux-Roses, 92 (France). Service de Protection Sanitaire). J. Belge Radiol.; 58: No. 2, 167-171(1975). (In French).

After reminding the fundamental standards from which the actual derived limits about tritium were determined, the author considers in view of the various studies published in the last decade, how the values of these derived limits may evolve in the future.

- 2973 CURRENT STATUS OF INFORMATION OBTAINED FROM PLUTONIUM CONTAMINATED PEOPLE. Richmond, C.R. (Los Alamos Scientific Lab., NM). pp 1248-1265 of Radiation research. Biomedical, chemical, and physical perspectives. Nygaard, O.F. (ed.). New York; Academic Press, Inc. (1975).

From 5. international radiation research congress meeting; Seattle, WA, USA (14 Jul 1974).

See CONF-740715--.

Data on various personnel exposed to plutonium over the last three decades is summarized. No adverse biological effects are evident from the data obtained so far. Although this does not mean that we may not see adverse effects in future cases, it is reassuring in the sense that the radiation protection standards which have been followed for many years are very probably quite adequate and do not misrepresent the potential risk by many orders of magnitude, as has been suggested. (ERB)

- 2974 TRANSURANIUM ELEMENT TOXICITY: DOSE RESPONSE RELATIONSHIPS AT LOW EXPOSURE LEVELS. SUMMARY AND SPECULATIVE INTERPRETATION RELATIVE TO EXPOSURE LIMITS. Thompson, R.C. (Battelle Pacific Northwest Labs., Richland, WA). pp 1278-1284 of Radiation research. Biomedical, chemical, and physical perspectives. Nygaard, O.F. (ed.). New York; Academic Press, Inc. (1975).

From 5. international radiation research congress meeting; Seattle, WA, USA (14 Jul 1974).

See CONF-740715--.

Dose-response relationships at low exposure levels for transuranium elements (particularly plutonium) are discussed. The author concludes that because of the nonuniform nature of the dose distribution in organisms, it is very difficult to establish meaningful dose limits. Our present capabilities seem to be limited to the setting of upper limits, while we are ignorant of the actual dose-effect relationship at the levels of concern. (ERB)

- 2975 STUDY OF THE EFFECTIVENESS OF MUCOLYTIC AGENTS ON THE ELIMINATION OF ¹³¹I-HSA MACROAGGREGATE. Kutas, V.; Benko, G.; Kocsar, L.; Farkas, G. (Orszagos Frederic Joliot-Curie Sugorbiologiai es Sugaregeszsegugyi Kutato Intezet, Budapest (Hungary)). Radioprotection; 10: No. 4, 223-228(1975). (In French).

The elimination of ¹³¹I-labelled human serum albumin macroaggregate used for lung scanning by inhalation of mucolytic aerosols was studied in rats. Among the mucolytic aerosols studied, N-acetyl-L-cysteine (Mucosolvin) appreciably reduced radioactivity in the lungs and in the liver following inhalation for 40 min (diameter of the particles: 3µm). The alcoholic solution of dimethyl-polysiloxane (Sicol) proved to be less effective in reducing the radioactivity of

the lungs, however, it also accelerated the elimination of the macroaggregate. No results were obtained with Tacholiquin having a detergent as active principle. The inhalation of mucolytic aerosols after scanning is an important means of reducing radiation body burden.

- 2976 INTERNAL CONTAMINATION OF A MAN WITH STRONTIUM-90. Boyadzhiev, A.; Mikhailov, M.A.; Iotov, M.; Novakova, E.; Kerteva, A. Nauchni Tr., Nauchnoizsled. Inst. Radiobiol. Radiats. Khig.; 5: 179-183(1975). (In Bulgarian).

It was established that the contaminated person was working with a Sr-90 standard containing about 400 microcuries of activity. About one-half of the activity in the source was dispersed at the working site, as determined on the third day of the incident. A urine analysis on the seventh day of the incident showed high activity. The Sr-90, urine elimination was determined over a period of 184 days. The data were fitted to a three-term, exponential function. A total of 10.5 nanocuries of Sr-90 was eliminated by way of the urine with a biological half-life of 2 days; 2.7 nanocuries were eliminated by the urine with a biological half-life of 7.5 days, and 9.2 nanocuries were eliminated with a biological half-life of 155 days. The total activity of Sr-90 eliminated via the urine was 22.4 nanocuries. It is concluded that the maximum amount of Sr-90 entering the bloodstream is about 0.1 microcuries, and the probable amount absorbed perorally is about 0.3 microcuries. The dose to the bone marrow over 50 years is calculated to be 5.3 ber. 5 refs. (SJR)

- 2977 DECONTAMINATION OF RADIOACTIVELY CONTAMINATED SKIN IN VIVO. Sharov, P.; Vasilev, G.; Mikhailov, M.G. Nauchni Tr., Nauchnoizsled. Inst. Radiobiol. Radiats. Khig.; 5: 185-188(1975). (In Bulgarian).

A skin-decontaminating agent was made up by heating 50 grams of a thermoplastic gel ("LAV" from an East German firm) on a water bath to a thick solution. Then 3 grams of triethanolamine and one gram of EDTA in 8 to 10 ml of distilled water were added and mixed until homogenized. Experiments with this gel were run on volunteers whose hands were contaminated with a count of 50,000 beta particles/cm².min. On using the decontaminating agent the gel hardens and forms a film which can be peeled off. About 80% of the activity (¹³¹I, ¹³⁷Cs, and ⁸⁵Sr) is removed per pass compared to 60% for two other skin decontaminating agents used in the Soviet Union and Bulgaria. 7 refs. (SJR)

- 2978 ESTIMATING THE DECONTAMINATION OF HUMAN SKIN FROM RADIOACTIVE CONTAMINATION. Mikhailov, M.G.; Vasilev, G.; Sharov, P. Nauchni Tr., Nauchnoizsled. Inst. Radiobiol. Radiats. Khig.; 5: 189-191(1975). (In Bulgarian).

Skin decontamination experiments were performed on the hands of volunteers contaminated with iodine-131, strontium-89, cesium-134 and cesium-137 with exposure times of 30 to 60 minutes. The decontaminating agents used to remove the activity were a Soviet preparation "11B", a Bulgarian paste "RV-2", and a new agent "TkhG" containing a thermoplastic gel with 6% triethanolamine and 2% EDTA. The decontamination coefficient (percentage of activity removed per pass) was found to vary from 50 to 80%. The variation was ascribed mainly to differences in percutaneous resorption of activity by the skin. 2 refs. (SJR)

- 2979 POLONIUM-210 CONTENT IN THE HAIR, BONE, AND TEETH OF MAN. Novakova, E.; Kerteva, A.; Boyadzhiev, A. Nauchni Tr., Nauchnoizsled. Inst. Radiobiol. Radiats. Khig.; 5: 201-205(1975). (In Bulgarian).

Po-210 was determined on samples of hair, bone and teeth taken from three age groups of 1 to 10 years, 10 to 20 years, and over-20 years. Values of Po-210 from the bone are given in picocuries per 100 grams of bone as follows: 2.74 for 1 to 10 years, 1.93 to 10 to 20 years and 1.43 for over-20 years. Values of Po-210 found in hair samples in picocuries per 100 grams of hair were: 7.8 for the 1- to 10-years group, 4.6 for the 10- to 20-years group and 5.55 for over-20-years group. The Po-210 values for the teeth in picocuries per 100 grams of teeth were: 9.75 for 1 to 10 years, 8.58 for 10 to 20 years, and 9.0 for over-20 years. The dose to the osteocytes in ber/year was calculated to be 35.5 for the 1- to 10-years group, 24.9 for the 10- to 20-years group, and 18.52 ber/year for the over-20-years group. 6 refs. (SJR)

- 2980 POLONIUM-210 IN THE URINE AND BLOOD OF THOSE WORKING AT THE NARECHENSKI MINERAL BATHS. Novakova, E.; Kerteva, A.; Boyadzhiev, A. Nauchni Tr., Nauchnoizsled. Inst. Radiobiol. Radiats. Khig.; 5: 207-210(1975). (In Bulgarian).

Urine and blood samples were taken from 10 people working at the above mineral baths, and Po-210 was determined radiometrically. The following correlation was obtained between the concentrations of Po-210 in the blood and urine: $y = 0.2 = 5.2 \text{ chi}$. Here y is the concentration of Po-210 in the blood, and chi is the concentration of Po-210 in the urine. The urine values are in picocuries per 24 hours, and the blood values are in picocuries per liter. Thus, if the Po-210 content in the urine is known, the amount of Po-210 in the blood can be calculated readily. 5 refs. (SJR)

- 2981 STRONTIUM-90 AND CESIUM-137 CONTENT IN MAN'S TEETH AND HAIR. Byrborska, D. (Khigienno-Epidemiologichen Institut, Vratsa (Bulgaria)). Letopisi Khig. Epidemiol. Inst.; 9: No. 1, 115-118(1975). (In Bulgarian).

In 1972, samples from teeth and hair were collected from the following age groups: 1-10 years of age, 10-20 years of age, over 20 years of age. The data show highest concentration of strontium 90 in children's teeth, followed by the second group (10-20 years of age) and the lowest concentration in the age group over 20 years. No reliable age related differences in the hair concentrations of strontium 90 and cesium 137 are found. The data for strontium 90 and cesium 137 content in teeth and hair are in good agreement with the literature data for other European countries.

- 2982 BIOLOGICAL HALF-LIFE OF POTASSIUM IN MAN. Rahola, T. (Helsinki Univ. (Finland). Dept. of Radiochemistry); Suomela, M. (Institute of Radiation Physics, Helsinki (Finland)). Ann. Clin. Res.; 7: No. 2, 62-65(1975).

The highly sensitive whole-body counting technique makes quantitative determinations of nanocurie amounts of gamma-emitters within the body possible. So such counters are especially suitable for the long-term measurement of tracer retention and excretion rates. In the present study, the biological half-life of body potassium in ten male volunteers was determined using ^{42}K as tracer. The group was measured

using two different types of whole-body counters. A 43-cm standard chair technique was used with counter A and a multidetector linear scanning technique with counter B. The oral tracer dose of 12-15 μCi ^{42}K to volunteers made it possible to estimate the biological half-life of potassium, which varied from 10 to 28 days, the mean being 16 days. The total body potassium determinations were carried out with the ^{42}K - and ^{40}K -methods. The results of the parallel determinations performed with Counter A agreed well with those of Counter B. A good consistency was also found in the body potassium values of individual subjects, obtained using both the methods separately for each counter.

- 2983 (ERDA-tr--151, pp 197-201) OSTEOSARCOMOGENIC EFFECT OF PLUTONIUM-239 AS A FUNCTION OF THE AGE AND SEX OF THE ANIMAL. Sinyakov, E.G. 1975. Translated from Radiobiologiya; 15: No. 6, 937-940(1975).

Radiobiology. Experiments were conducted on 520 rats of both sexes and different ages. Plutonium-239 was injected intraperitoneally and the skeleton content of ^{239}Pu was determined at intervals up to 256 days. After 200 days the bones were examined for osteosarcomas by radiography. The largest number of osteosarcomas was detected in animals that received the isotope at six months of age and the frequency of bone tumors in males of all age groups was almost twice as high as that of females. (HLW)

- 2984 METABOLISM AND BIOLOGICAL EFFECTS IN RODENTS OF PLUTONIUM AND OTHER ACTINIDE ELEMENTS. Moskalev, Yu.I.; Ldevdik, T.I.; Lyubchanskii, E.R. (Inst. of Biophysics, Moscow). pp 1214-1232 of Radiation research. Biomedical, chemical, and physical perspectives. Nygaard, O.F. (ed.). New York; Academic Press, Inc. (1975).

From 5. international radiation research congress meeting; Seattle, WA, USA (14 Jul 1974).

See CONF-740715--.

The metabolism and late effects of inhaled actinides in rodents is discussed. Among the topics included in the discussion are: tissue distribution of inhaled actinides; local radiation dose in lung from inhaled plutonium; late effects of deposited actinides; assessment of the late effects arising from low doses of alpha-emitters; factors that influence development of late effects; consideration of time of observation and life span; and evaluation of safe levels of deposited actinides. (ERB)

- 2985 DOSE-RESPONSE RELATIONSHIPS FOR BEAGLES INJECTED WITH $^{239}\text{Pu}(\text{IV})$ OR $^{241}\text{Am}(\text{III})$. Stover, B.J. (Univ. of North Carolina, Chapel Hill). pp 1266-1277 of Radiation research. Biomedical, chemical, and physical perspectives. Nygaard, O.F. (ed.). New York; Academic Press, Inc. (1975).

From 5. international radiation research congress meeting; Seattle, WA, USA (14 Jul 1974).

See CONF-740715--.

An experiment on the dose-response relationship for beagles injected with $^{239}\text{Pu}(\text{IV})$ is completed. The author concludes that after 24 years of research the results are inadequate to determine a radiation dose-carcinogenic response relationship. A second study is in progress. A companion study on $^{241}\text{Am}(\text{III})$ is in progress. Results are beginning to come in, but definitive results at lower doses will require about ten more years.

(ERB)

- 2986 COMPARATIVE KINETICS OF ⁴⁵CA AND ⁸⁹SR IN CHRONIC UREMIC SYNDROME IN THE RAT. Remagen, W.; Heutz, Ph.; Weidmann, D.; Schuppler, J.; Ohnacker, O. (Basel Univ. (Switzerland). Inst. fuer Pathologie); Luethy, H. (Basel Univ. (Switzerland). Inst. fuer Roentgendiagnostik und Strahlentherapie); Del Pozo, E. (Sandoz A.G., Basel (Switzerland). Abt. Experimentelle Therapie). Res. Exp. Med.; 165: No. 3, 271-284(1975).

1 tabs; 23 ref..

In rats a chronic uremic syndrome was induced by 5/6 resection and subsequent X irradiation of the kidneys. After 5 weeks ⁴⁵Ca and ⁸⁹Sr were injected simultaneously, and the different metabolic handling of the two elements was determined applying an open two-compartment model of Calcium kinetics. The uremic animals were compared with two groups of rats which were pairfed, and fed ad libitum, respectively. Besides an elevenfold faster urinary excretion when calculated with Sr, and which was reduced to about one half in the uremic rats, a significant discrimination by bone in favour of Ca was found, with a rather stable factor of 1.2 in the three groups. This is considered to evidence that urinary excretion and bone uptake of Sr are independent processes.

- 2987 ACCUMULATION AND ELIMINATION OF STRONTIUM 85 IN RATS PREVIOUSLY TREATED WITH IODINE 131. Slavov, S.; Kiradzhiev, G.; Kharzhirusev, S.; Nikolov, I. (Nauchno-Izslodovatel'ski Inst. po Radiologiya i Radiatsionna Khigiena, Sofia (Bulgaria)). Acta Med. Bulg.; 3: No. 2, 27-30(1975).

Strontium 85 deposition and retention rates up to day 25 posttreatment were studied in rats previously given ¹³¹I activities (2 µCi/g body weight) disruptive to the thyroid gland. Such antecedent administration of radioiodine was found to bear on ⁸⁵Sr kinetics. The extent of this effect depends on time interval between iodine and strontium treatments. Femur strontium concentrations were higher at a 15-day interval and lower at a 45-day interval, as compared to controls receiving strontium solely. Accordingly, doses delivered to the femur were higher by a factor of 1.6 and 1.3 for administrations 5 and 15 days apart, respectively, and lower by a factor of 0.95 for the 45-day interval. The shifts in ⁸⁵Sr kinetics observed under these treatment conditions are presumably related to thyroid lesion, as indicated by a functional test (Shivachenko-Modestov) of the gland, where initial increase in hormone secretion was eventually followed by failure of thyroid function. Possible involvement of parathyroid hyperfunction is discussed.

- 2988 EFFECT OF METHYL MERCURY ON GROWTH, REPRODUCTION AND METABOLISM OF GUINEA PIGS. Hugunin, A.G. Madison, WI; Univ. of Wisconsin (1975). 248p. University Microfilms Order No. 76-6089.

Thesis (Ph. D.).

Methyl mercury hydroxide was added to a commercial guinea pig ration to determine effects of daily consumption of methyl mercury and fed ad libitum to weanling male and female guinea pigs. After 28 to 36 days, guinea pigs fed a diet containing 20 ppm mercury displayed signs of neurotoxicity. Weight losses were recorded in guinea pigs after 17 days on the 20 ppm mercury diet. Alkaline phosphatase activity of serum was less than half that detected in guinea pigs without signs of neurotoxicity.

Guinea pigs fed diets containing <0.01, 0.05, 0.29 and 1.9 ppm mercury for 188 to 190 days did not display signs of neurotoxicity. The concentrations of mercury in hair samples, determined by neutron activation, were directly related to the mercury content of the diet and were stabilized after 110 days.

- 2989 (EUR--5360(Vol.1), pp 313-331) PREDICTIVE MODELS FOR ESTIMATING THE HEALTH IMPACT OF FUTURE ENERGY SOURCES. Carnow, B.W. 1975.

From International symposium of recent advances in the assessment of the health effects of environmental pollution; Paris, France (24 Jun 1974).

Recent advances in the assessment of the health effects of environmental pollution. Vol. I.

Models for quantitating health effects on varying populations and the predictive capacity for assessing these effects have been developed. Results of a study examining visits to the emergency rooms in eighteen major hospitals in the City of Chicago during twenty-four hours on the same day of the week that was carried out for a period of eighteen months will be presented. Documentation of all admissions to the emergency rooms for cardiac, respiratory, and other diseases was maintained and levels of various air pollutants at the hospital and in the area of the residence from which the patients came to the hospital were evaluated. The study examines these relationships and their effect on the cardiopulmonary system and how these results can be used in the predictive model being developed. The model is based on the concept of a continual dose-response relationship between air pollutants and health and requires definition of various categories in the population at high risk. By quantitative definition of differences in disease at low and high pollution levels in those at high risk and determination of the total numbers of these individuals in the population, the numbers that are affected at varying levels of pollution can be ascertained.

- 2990 (EUR--5360(Vol.1), pp 181-191) DESIGNING THE EXPOSURE/RESPONSE MATRIX IN ENVIRONMENTAL HEALTH STUDIES. Knelson, J.H. (National Environmental Research Center, Research Triangle Park, NC). 1975.

From International symposium of recent advances in the assessment of the health effects of environmental pollution; Paris, France (24 Jun 1974).

Recent advances in the assessment of the health effects of environmental pollution. Vol. I.

Assessing the influence of an environmental agent on public health is a difficult multifactorial problem. However, some unifying concepts in research design are now being used to provide a better data base for emission control strategies. The Exposure/Response Matrix is essentially a three-dimensional approach to determining the relationship between environmental stress or insult, and the resulting health effect. One dimension represents pollutant concentration gradient, the second is range of susceptibility within a population and the third is the spectrum of response within population subsets of different susceptibility. This method of approaching study design and interpreted results is applicable to classic toxicology, epidemiology and clinical research. The pollutant concentration gradient, ranging from background through levels actually occurring in varying geographic areas to those levels recognized as

producing overt toxicity must be measured unambiguously and accurately for population studies and reproduced in controlled environmental laboratories for toxicologic and clinical studies. The pollutant gradient or a body pollutant burden is usually treated as the independent variable.

- 2991 (WASH--1192(Rev.)) OPERATIONAL ACCIDENTS AND RADIATION EXPOSURE EXPERIENCE WITHIN THE UNITED STATES ATOMIC ENERGY COMMISSION, 1943--1975. (USAEC Division of Operational Safety, Washington, D.C.). 1975. 150p. Dep. NTIS \$6.75.

The occupational injury and fatality experience during 32 years of the development of the atomic energy industry under the direction of the Atomic Energy Commission (AEC) and its predecessor, the Manhattan Engineering District, is reviewed. Data are included on the cause of all accidents, including fires and transportation accidents, and the cost of AEC property damage. Fatalities of AEC and contractor personnel from all causes during the 32-year period totaled 321, of which 184 occurred in construction; 121 in AEC operations such as production, research, and services; and 16 in Government functions. There were 19,225 lost-time injuries attributable to all accidental causes, or a 32-year frequency rate of 2.75 based on the number of injuries per million man-hours. There were six deaths attributable to nuclear causes, three of which were due to blast and flying missiles and three caused by whole-body radiation exposure. Forty-one workers were involved in lost-time radiation accidents, of whom 26 showed clinical manifestations attributable to radiation, resulting in permanent partial-disability of three workers and the loss of a digit by four workers, while the others did not develop evidence of radiation injury. (CH)

- 2992 (INIS-mf--1905) PIONEER 10 JOVIAN ENCOUNTER: RADIATION DOSE AND IMPLICATION FOR BIOLOGICAL LETHALITY. Miller, M.W.; Kaufman, G.E.; Maillie, H.D. (Rochester Univ., N.Y. (USA). Dept. of Radiation Biology and Biophysics). 1975. 10p. INIS.

From 18. COSPAR plenary meeting. Radiation biology; Varna, Bulgaria (29 May 1975).

Pioneer 10 in its recent Jupiter flyby passed through a belt of intense particulate radiation. The radiation dose to the outer surface of the spacecraft was at least 4.9×10^5 rad from electrons plus 2.9×10^6 rad from protons, sufficient to cause significant microbial decontamination. The radiation dose inside Pioneer 10, approximately 2.8×10^5 to 4.9×10^5 rad, was less effective for microbial decontamination but would be lethal to man and to most multicellular biological organisms. (auth)

- 2993 SHIELDING FROM X-RADIATION. Ewen, K. pp 120-141 of Fundamentals of practical radiation protection in medical X-ray installations. Ewen, K. (Gewerbeaufsicht des Landes Nordrhein-Westfalen, Duesseldorf (F.R. Germany). Zentralstelle fuer Sicherheitstechnik, Strahlenschutz und Kerntechnik); Schmitt, G. (Essen Univ. (Gesamthochschule) (F.R. Germany). Radiologisches Zentrum). Stuttgart; Enke (1975). (In German)

18 figs.; 15 tabs.; 6 refs..

Following an explanation of the physical fundamentals of the shielding diagrams, examples for shielding materials as well as measurements of the connection times of X-ray equipment are given. Furthermore, important

terms such as load equivalent, penetration factor, residence factor, dose rate constants and highest permissible local dose are dealt with. By means of application cases frequently occurring in practice, the determination of shielding is illustrated with the help of tables. Finally, X-ray protective clothing and special shielding systems are described.

- 2994 (DHEW/FDA--76-8026, pp 247-248) REPORT OF THE TASK FORCE ON GENERALLY LICENSED DEVICES. Lacker, D.K.; FitzRandolph, L.A.; Neuwig, M.; Smith, D.A.; Kerr, G.W. 1975.

From 7. annual national conference on radiation control; Hyannis, MA, USA (27 Apr 1975).

7th annual national conference on radiation control.

The Task Force was established to resolve problems associated with the proposed rule change to 10 CFR and 32 in the following areas: preregistration requirements; transfer of G. L. devices from one general licensee to another general licensee; and performance of leak testing by mailable kits. Summaries of discussions of these areas are presented. (HLW)

- 2995 (INIS-mf--3135) OCCUPATIONAL RADIATION EXPOSURE IN WORK WITH RADIOACTIVE MATERIALS. Georgiev, G.V. (Meditsinska Akademiya, Sofia (Bulgaria); Nauchno-Izledovatelski Inst. po Radiologiya i Radiatsionna Khigiena, Sofia (Bulgaria)). 1975. vp. (In Bulgarian). NTIS (US Sales Only).

Copies available from Nauchno-Izledovatelski Institut po Radiobiologiya i Radiatsionna Khigiena, Sofia 56, Bulgaria.

Radiation exposure to personnel dealing with radioactive materials is studied on a national scale. The survey covers any type of radiation work except for mining and milling of radioactive ore, fuel production, and nuclear reactor operation. Assessments are based on a decade's collection of personnel monitoring data obtained by film dosimetry techniques, as well as on data from systematic operational site monitoring. Statistical analysis indicated exposures based on personal records to follow a normal distribution pattern and, hence, arithmetic averages to be representative. Airborne concentrations of radioactive materials and aerosols in working areas are shown to follow a logarithmic normal distribution pattern, so that geometric means are representative. Radiation exposures are generally found to be well below annual maximum permissible doses for radiation workers. However, their distribution among employee groups is nonuniform. Group A, comprising about 700 subjects, received mean annual gonad doses of more than 1000 mrem; group B, about 670 subjects, had doses ranging from 100 to 500 mrem per year; and group C, 1610 subjects, received less than 100 mrem per year. Most of the radiation dose is accounted for by external radiation, which contributed 0.327 mrem to the genetically significant population dose (0.227 from exposure to males, and 0.025 mrem from exposure to females). Analysis of accidental exposures occurring over the period 1963-1973 indicated that the contribution of this source is substantial as compared to routine work (1.0: 0.3). Based on the results obtained, a number of preventive measures are developed and introduced into practice to improve radiological safety in work with radioactive materials.

- 2996 RADIATION PROTECTION IN NEUTRON THERAPY. Rossbender, W. (Zentralinstitut fuer Kernforschung, Rossendorf bei Dresden (German

Democratic Republic)). pp 105-112 of Grundlagen der Neutronentherapie. Graffi, A. (ed.). Berlin; Akademie-Verlag (1975). (In German)

From Symposium on neutron therapy; Rossendorf, Dresden, German Democratic Republic (26 Apr 1973).

Gamma and neutron doses were measured in a neutron therapy facility considering the design of the facility, the arrangement of shields and the positions mainly occupied by patients and personnel. The radiation dose to the patient outside the useful beam and the surface dose distribution in thorax irradiation was studied with the aid of a paraffin phantom.

- 2997 (ERDA-tr--267) COMPARISON OF THE RADIATION HAZARD OF FISSION AND FISSION REACTORS. Sivintsev, Yu.V. Translated from At. Energ. (USSR); 39: No. 3, 173-176(1975). 7p. Dep. NTIS, PC A02/MF A01.

An earlier paper (Hafelc, W. and C. Starr, J. Brit. Nucl. Energy Soc., Vol. 13, No. 2, 1974, p. 131) on the hazards of fission and fusion reactors examined only the exposure of the population during emergency situations and as a result of waste removal. This paper claims a more detailed analysis than the earlier paper. More radioisotopes are considered in this study. (MDW)

- 2998 Strahlenschutzpraxis. (RADIATION PROTECTION PRACTICE). Sitzlack, G. (ed.) (Staatliches Amt fuer Atomsicherheit und Strahlenschutz, Berlin (German Democratic Republic)). Berlin; Verlag Tribuene (1975). 416p. (In German).

Proceeding from the physical fundamentals, this manual summarizes practical aspects of radiation protection including radiation doses to man, maximum permissible levels, responsibility, training, licensing, X-ray application, handling of sealed and unsealed sources, radiation monitoring, medical surveillance, and emergency measures. Small chapters are devoted to the transport of radioactive materials, to the management of radioactive wastes and to radiation protection problems associated with the construction and operation of nuclear power plants. The appendix contains a compilation of titles of current GDR regulations and standards in radiation protection.

- 2999 (TNO-RD-I--7501-155) PRELIMINARY INVESTIGATIONS ON THE LOCAL RADIATION DOSE IN PATIENTS UNDERGOING DENTAL X-RAY EXAMINATIONS. Julius, H.W.; Stutterheim, H.J. (Gezondheidsorganisatie TNO, Arnhem (Netherlands). Radiologische Dienst). Dec 1974. 19p. (In Dutch). NTIS (US Sales Only).

15 figs..

Preliminary data are presented on the local radiation dose delivered to patients during X-ray investigation of the teeth, performed with a Philips oralix-dental X-ray tube. Measurements were carried out in a phantom using thermoluminescent dosimeters.

- 3000 SUPPORTING IMPLEMENT OF THE PEDIATRIC RADIOGRAPHY. Sakakibara, T.; Takahashi, R.; Baba, K.; Takegoshi, R. (Nihon Univ., Tokyo. School of Medicine). Shoni Geka Naika; 6: No. 12, 1117-1121(Dec 1974). (In Japanese).

The exposure to radiation must be naturally taken into consideration. Especially, the x-ray diagnosis should be carefully done in infants, because the exposure dose must be decreased. In addition, it is to be desired that x-ray

examination in infants should be done by a group who are practiced in the equipment and exposure technique, and well know the protection. From the point of dealing and protection of x-rays, it is important to use the supporting implements for x-ray diagnosis, especially in infants.

- 3001 ANALYTIC METHODS FOR BIOCHEMICAL INDICATORS OF RADIATION INJURY. Gerberg, G.B.; Decock, J.P. (Centre d'Etude de l'Energie Nucleaire, Mol (Belgium)). Acta Radiol., Ther., Phys., Biol.; 13: No. 6, 556-571(Dec 1974).

Since the development of biochemical indicators of radiation injury has been hampered often by the lack of simple and rapid methods of determination, techniques for the measurement of 30 urinary compounds are presented. These methods have been in part taken from the literature, in part they have been modified or developed by us. They represent a compromise between speed and simplicity of execution and specificity of assay.

- 3002 RADIATION PROTECTION OF PATIENTS IN X-RAY DIAGNOSIS. FROM A RESEARCH ON ACTUAL CONDITIONS OF X-RAY DIAGNOSIS IN IWATE PREFECTURE. Yanagisawa, T. (Iwate Medical Coll., Morioka (Japan). School of Medicine). Iwate Igaku Zasshi; 26: No. 6, 640-650(Dec 1974). (In Japanese).

The author mentioned the changes of radiation hazards and the outlook of X-ray diagnosis in Iwate prefecture, and made comments on the technical factors of diagnostic X-ray exposure. Although comparatively large equipment was used, there was a tendency toward low voltage exposure for a duration of several minutes. Concern for the patient's protection has reached a national level. The technical factors of high voltage radiography, irradiation field limits, and gonadal protection were explained on the basis of reports made by the ICRP and the Investigation Committee of the Japan Medical Association. Appropriate radiographical procedures for the each factor were introduced. The author emphasized that it is important for doctors to give an X-ray examination only after making a thorough physical examination, determining the necessity for X-ray examination(Why), deciding the purpose of the examination from the previous findings(What), and selecting the test which is the most useful and has the least exposure dose for the patient(How). Hasty, aimless radiography should be avoided. It should also be kept in mind that now is the time to reduce the exposure dose, and that the first radiography decided by the first line doctor will be a significant factor.

- 3003 DOSIMETRY OF INTERNAL IRRADIATION AT THE NUCLEAR CENTERS OF CSSR. Sivintsev, Yu.V. At. Tekh. Rubezhom; No. 12, 18-27(Dec 1974). (In Russian).

Short communication only; 32 refs..

CONTAMINATION;CZECHOSLOVAKIA;DOSE LIMITS; EMANOMETERS;ENVIRONMENT;FISSION FRAGMENTS; FISSION PRODUCTS;INTERNAL IRRADIATION;IONIZING RADIATIONS;LUNGS;MAXIMUM PERMISSIBLE DOSE; MORTALITY;NEOPLASMS;NUCLEAR INDUSTRY;PERSONNEL DOSIMETRY;PROGRAMMING;RADIUM 226;RADON; STRONTIUM 90;THORIUM OXIDES;TRITIUM;URANIUM; URANIUM COMPOUNDS

- 3004 CHRONIC RADIUM INTOXICATION: CLINICAL AND AUTOPSY FINDINGS IN LONG-TERM NEW JERSEY SURVIVORS. Sharpe, W.D. Environ. Res.; 8:

No. 3, 243-383(Dec 1974).

After briefly tracing the development of investigations into radium intoxication in the 1920s, the author presents detailed clinical and autopsy findings from each of the 42 people associated with the New Jersey radium industry during the second and third decades of this century who survived their initial occupational exposure to ^{226}Ra and ^{228}Ra for 25 years or longer. Preterminal ^{226}Ra burdens are known for 31 cases. 24 of the 42 had malignant tumors or blood dyscrasias. Female, but not male, life spans were shortened and fertility possibly reduced. These and a variety of additional findings are discussed and deductions suggested. It was not possible to identify dose-response patterns and the study neither confirms nor challenges the current lifetime maximum permissible human ^{226}Ra content of 0.1 μCi . Clinical and laboratory data are presented in 52 tables in an appendix.

- 3005 ENVIRONMENTAL RADIATION AND THE LUNG. Hamrick, P.E.; Walsh, P.J. (National Inst. of Environmental Health Sciences, Research Triangle Park, NC). Environ. Health Perspect.; 9: 33-52(Dec 1974).

Environmental sources of radioactive materials and their relation to lung doses and lung burdens are described. The approaches used and the problems encountered in estimating lung doses are illustrated. Exposure to radon daughter products is contrasted to exposure to plutonium as particular examples of the hazards associated with radioactive materials of different chemical and physical characteristics.

- 3006 RADIOACTIVE DECONTAMINATION. Wadachi, Y. (Japan Atomic Energy Research Inst., Tokai, Ibaraki. Tokai Research Establishment). Radioisotopes (Tokyo); 23: No. 12, 723-728(Dec 1974). (In Japanese).

It discusses radioactive decontamination from the practical point of view with aim of contributions to safety control of radioisotopes. As general knowledges, contamination forms are explained from physical states of solid materials' surfaces and classification of contaminative mechanism are conducted in each contamination form. Furthermore, the decontaminants selected for each classified contaminative mechanism are indicated from pH-effect and concentration effect. Decontamination on laboratory, using wet method generally as a decontamination technic includes irrigation method by decontaminant solution and scrubbing method. Decontamination of machinery and tools includes scrubbing method and the methods using ultrasonic decontamination equipment and semiautomatic decontamination equipment of which flow-diagram is illustrated. The methods of decontamination of clothing include its disposal or the use of tightly-closed full automatic washing machine. The general irrigation method are indicated as decontamination of skin. Furthermore, neutral cleaning material method for elimination of short-term elapsed contamination and Titanium oxide paste method for elimination of long-term elapsed contamination are explained.

- 007 (NIOSH--75-117) EVALUATION AND CONTROL OF RADON DAUGHTER HAZARDS IN URANIUM MINES. Holaday, D.A. (National Inst. for Occupational Safety and Health, Rockville, Md. (USA)). Nov 1974. 64p. GPO.

This monograph discusses primarily those health hazards to uranium miners which are produced by exposure to ionizing radiation.

Emphasis is placed on the areas of evaluation of exposures to the radioactive gas radon-222 and its short-lived transformation products, and methods of controlling such exposures. A limited discussion of the biological effects of radon and radon daughters is undertaken, and some procedures are given for evaluating hazards created by other common contaminants of mine atmospheres. A large amount of information exists on these topics, some of which is unpublished or is not readily available. While efforts were made to obtain data from all sources, undoubtedly some valuable work was overlooked. The monograph is an endeavor to assemble pertinent information and make it available to those who are concerned with producing uranium at minimal risks. Where they were available, a variety of procedures for evaluating hazards are given, and examples of systems for controlling hazards are included. 154 references.

- 3008 CYTOGENETIC ANALYSIS OF BONE MARROW PROTECTION WITH MEXAMINE DEPENDENT ON DIFFERENT IRRADIATION DOSES. Voitkevich, N.D.; Palyga, G.F.; Yarmonenko, S.P. (Akademiya Meditsinskikh Nauk SSSR, Obninsk. Nauchno-Issledovatel'skij Inst. Meditsinskoi Radiologii; Akademiya Meditsinskikh Nauk SSSR, Moscow. Inst. Eksperimental'noj i Klinicheskoi Onkologii). Med. Radiol.; 19: No. 11, 12-17(Nov 1974). (In Russian).

The effect of mexamine of radiation-damaged chromosomes of bone marrow cells during metaphase was studied using 82 white non-linear male mice exposed to total-body radiation in single doses of 150, 300 or 450 rad from the "Gamma-Cell-220" facility. The antiradiation effect of mexamine depending on its concentration, the radiation dose and the time elapsed after irradiation was measured.

- 3009 DEVELOPMENT OF TUMOURS IN DOGS EXPOSED TO LOW DOSES OF GAMMA RADIATION FOR A LONG TIME. Yakovleva, V.I. Kosm. Biol. Med.; 8: No. 6, 20-25(Nov 1974). (In Russian).

For English translation see the journal Environ. Space Sci..

150 animals were exposed to chronic (doses 21, 63 and 125 rad/year, with dose rates of 0.06, 0.17 and 0.34 rad/day, respectively) or combined γ -irradiation (chronic irradiation at 63 rad/year and acute irradiation at 58 and 126 rad/year) for a total period of 6 years. Post-mortem examination of 74 irradiated animals revealed malignant neoplasms in 5 (flat-cell pulmonary carcinoma, hepatocellular liver carcinoma, skin basaloma, osteogenic costal sarcoma, and eye melanoma) and benign neoplasms also in 5 (3 leiomyomas, parenchymatous thyroid struma and angiofibroma of hypodermic tissue). Of the 19 dogs in the control group, 2 had mammary tumours (cystadenoma and adenofibroma that changed to adenocarcinoma). Most of the neoplasms were seen in animals exposed to chronic irradiation with the highest dose rates as well as in those which received the highest total doses used in chronic irradiation. Acute effects were noted twice as often as chronic ones.

- 3010 (CEA-R--4604) RADIOTOXICOLOGICAL MONITORING OF PERSONS EXPOSED TO TRITIATED WATER. (CEA Centre d'Etudes Nucleaires de Saclay, 91 - Gif-sur-Yvette (France)). Nov 1974. 13p. (In French).

The purpose of this report is to serve as a basis for standardising the procedure, interpretation and minimum frequency of toxicological and radiotoxicological examinations; reviewing the treatment of

external and internal contamination; and harmonising methods of calculating the dose received. Brief review of the physical properties of tritium and of the metabolism of tritiated water. Radiological protection standards and maximum permissible concentrations in air ($2.20 \times 10^{-6} \text{Ci/m}^3$) and in water ($3.10 \times 10^{-2} \text{Ci/m}^3$). Principles of radiotoxicological supervision, the aim of which is to determine the dose equivalents delivered by tritiated water, both for routine screening and in the event of accidental contamination; routine examination (sampling of urine every 14 days in persons subject to regular exposure, weekly in high-risk situations) and procedure in the event of an accident.

- 3011 SURVEY ON TECHNICAL FACTORS IN MEDICAL EXPOSURE. Yoshimura, S.; Watanabe, T. (Niigata Univ. (Japan). School of Medicine); Miyaji, T. Nippon Hoshasen Gijutsu Gakkai Zasshi; 30: No. 4, 353-358 (Nov 1974). (In Japanese).

The present status of technical factors for radiation dose of the patients in X-ray examination was studied in hospitals and clinics in the Niigata prefecture. The following four points are mainly treated. 1) Exposure factors in the chest and digestive organ examinations. 2) Exposure factors in roentgenography of the organs or neighboring to the gonads. 3) Difference between light and X-ray field size in usual X-ray machines. 4) Excess of radiation field size in automatic beam limiting X-ray TV machines.

- 3012 ANTI-RECEPTOR ANTIBODY AND RESISTANCE TO GRAFT-VERSUS-HOST DISEASE. McKearn, T.J.; Hamada, Y.; Stuart, F.P.; Fitch, F.W. (Univ. of Chicago). Nature (London); 251: No. 5476, 648-650 (18 Oct 1974).

Investigations were conducted to discover whether the natural resistance of adult F_1 hybrid rats to graft-versus-host (GvH) disease is associated with the production of anti-receptor antibody (ARA). ARA was found in rats not developing the disease while those rendered susceptible to the disease by irradiation did not produce ARA.

- 3013 EQUIPMENT AND A METHOD FOR MEASURING THE ADMINISTRATION OF A RADIATION. Vogel, T.M. (to Varian Associates). French Patent 2,247,736/A/. 14 Oct 1974. Priority date 12 Oct 1973, United States of America (USA). 29p. (In French).

The equipment establishes a cumulative count of the amounts of radiation emitted by the source in the direction of the patient during each of the successive equal incremental movements of the source, moving around the patient. When each of said cumulative counts reaches a pre-determined value, the source stops radiating until the beginning of the next incremental movement. The cumulative count is re-started at the very moment the source stops radiating so as to ascribe any remanent radiation to the next incremental movement. The equipment is brought to rest by various safety interconnections, in various cases of faulty operations. Means for controlling the displacement speed of the source and/or the intensity of its radiation are also provided.

- 3014 (AD-A--017201) THERMAL MODEL OF LASER-INDUCED EYE DAMAGE. FINAL REPORT, OCT 1973--SEP 1974. Takata, A.N.; Goldfinch, L.; Hinds, J.K.; Kuan, L.P.; Thomopoulos, N. (IIT Research Inst., Chicago, Ill. (USA).

Engineering Mechanics Div.). 8 Oct 1974. Contract F41609-74-C-0005. 400p. (IITRI-J-TR--74-6324). NTIS \$10.75.

This report describes the development of computerized models for predicting the temperatures and thermal damage (protein denaturation) caused by the exposure of eyes to laser beams. The extent of thermal damage or the threshold level for thermal damage may be predicted either for the cornea, lens or retina of the eye -- wherever the energy deposition is greatest. Included is a description of the models and data for predicting the thermal damage to monkey and human eyes for known laser exposures. Model predictions were found to be in reasonably good agreement with experimental results for pulse durations ranging from about 10 to the minus 7th power sec to 1000. However, major discrepancies arise with pulses less than about 10 to the minus 7th power sec. With such short pulses, the predicted temperature rises are much too small to cause thermal damage. Therefore, some other damage mechanism at present unidentified, appears responsible for the damage caused by the very short pulse. (GRA)

- 3015 (SSI--1974-030) THE NATIONAL INSTITUTE OF RADIATION PROTECTION INFORMS ABOUT RADIATION IN BUILDINGS. (Statens Straalskyddsinstitut, Stockholm (Sweden)). Oct 1974. 53p. (In Swedish). INIS.

There is a risk of radiation from the building material 'ytong' (concrete). The radiation consists of radon, oozing out of the walls, roof and floor and of a direct radiation from the concrete. The radiation is insignificant, though, as a high concentration of radon is not possible with a ventilation of about 0.7 changes of air per hour. This ventilation is normally obtained without any specific arrangement, such as fans, as normal vents and fissures are sufficient.

- 3016 ESTIMATION OF ABSORBED DOSE IN THYROIDS AND GONADS OF SURVIVORS IN HIROSHIMA AND NAGASAKI. Hashizume, T.; Maruyama, T.; Nishizawa, K.; Nishimura, A. (National Institute of Radiological Sciences, 91-1, 4-Chome, Anagawa, Chiba (Japan). Div. of Physics). Acta Radiol., Ther., Phys., Biol.; 13: No. 5, 411-424 (Oct 1974).

Ratios of the absorbed dose in the thyroid and gonads to in-air tissue absorbed dose were determined using simulated radiation sources for the initial gamma-rays and neutrons from the atomic bombs. The absorbed dose in these critical organs of the survivors exposed to gamma-rays and neutrons from the 1945 atomic bombs in Hiroshima and Nagasaki was estimated as a function of distance from the hypocenter.

- 3017 EFFECT OF GAMMA RAYS ON THE TOTAL PROTEIN CONTENT OF ALDOLASE, GLUTAMIC ACID TRANSAMINASE AND GLUTAMIC ACID-PYRUVIC ACID TRANSAMINASE IN THE RABBIT LENS. Zygulska-Mach, H.; Mach, Z. (Akademia Medyczna, Krakow (Poland). Clinic for Eye Diseases; Akademia Medyczna, Krakow (Poland). Inst. fuer Klinische Analytik). Klin. Monatsbl. Augenheilkd.; 165: No. 4, 633-638 (Oct 1974). (In German). 3 tabs.; 19 refs..

The author subjected rabbit eyes to gamma rays using the Stallard applicators which are also employed in the treatment of intraocular tumors in human eyes. In the radiated eyes there was a reduction of activity of aldolase and GOT in the lenses which was indirectly proportional to the applied dose of ionized rays. The lens of the fellow eye which was not directly subjected to radiation showed also a

lowering of enzyme activity which was however of only a low degree. In the material examined there were no changes in total protein content. There were however slight changes in the activity of GPT. In the discussion special attention is paid to radiation damage to the fellow eyes which were not subjected to direct radiation.

- 3018 (AD-A--028735) INVESTIGATIONS CONCERNING THE PATHOGENESIS AND THERAPY OF COMBINED INJURIES. Messerschmidt, O.; Henneberg, R.; Metzger, E.; Schick, P.; Sedlmeier, H. 6 Sep 1974. Translation of Armed Forces Medical Research Report. 8 (West Germany), Munich, Feb 1974, p. 1-71. (USAMIA-K--4997). 64p. NTIS, PC A04/MF A01.

In preliminary tests, the question was investigated in how far the radiation lethality of test animals (NMRI mice) was modified not solely by open wounds but also by closed wounds (aseptic muscle necrosis), by the effects of heat and low temperatures as well as by a physical state of severe exhaustion (having forced them to swim). Although the influence of the individual types of stress being different, a trend was ascertained with combined injuries, demonstrating that the radiation lethality increased either not at all or just a little or even decreased significantly in the presence of simultaneously or prior to irradiation inflicted traumata, whereas traumata inflicted after irradiation mostly resulted in a high degree increase in radiation lethality. In subsequent tests the question concerning the causes for these changes in lethality were investigated. (GRA)

- 3019 (PB--246225) USE OF ELECTRON LINEAR ACCELERATORS IN MEDICAL RADIATION THERAPY. OVERVIEW REPORT NO. 1. PHYSICAL CHARACTERISTICS. TECHNICAL REPORT. (Safety Sciences, San Diego, Calif. (USA)). Sep 1974. Contract PHS-223-74-6211. 159p. NTIS \$6.75.

See also report no. 2, PB--246226..

The report is the first of a series of four overview reports prepared during the course of study regarding the use of electron linear accelerators in radiation therapy. The purpose of the study was to provide a data base which will assist BRH to decide whether the development of a performance standard concerning the radiation safety of medical linear accelerators is necessary, and if so, the priority which should be assigned to such a standard. The purpose of this report is to present an overview of the physical characteristics of electron linear accelerators used in medical radiation therapy. Particular attention is given to those physical characteristics and performance parameters which are related to delivery of a useful properly controlled prescription dose of radiation to the patient and to delivery of a potentially harmful dose of radiation to the patient, machine operator or others in the vicinity of the accelerator. (GRA)

- 3020 PREGNANCY AND X-RAY. Katayama, H.; Kimoto, T. (Juntendo Univ., Tokyo (Japan). School of Medicine). Juntendo Igaku; 20: No. 3, 287-292(Sep 1974). (In Japanese).

Radiation effects in the gynecologic and obstetric fields were discussed. In mammals, radiation sensitivity was high in cells which had frequent cell division, and in undifferentiated cells. The prenatal growing phase was classified in three periods, i.e. the preimplantation period, the period of organogenesis, and the fetal period, according to the effects of radiation. Radiation exposure

of the genital gland during x-ray examination was classified in three volumes ranging from 100 to 1,000 mrad, and a genetically significant dose ranged from 10 to 60 mrad. In order to maintain the exposure dose at a minimum amount, concrete warnings of the x-ray examination should be observed in addition to the three rules for radiation hazard protection i.e. short time, long distance, and protection equipment. Although, physicians need to have a deep understanding about radiation hazards, they should make an effort to let patients relax from their anxiety.

- 3021 PLUTONIUM AND THE HOT PARTICLE PROBLEM. Eto, H. (National Inst. of Radiological Sciences, Chiba (Japan)). Hoshasen Kagaku; 17: No. 9, 161-165(Sep 1974). (In Japanese).

The hot particle problem was discussed from the standpoint of carcinogenic dose. The calculation of the maximum permissible lung burden from maximum permissible dose adopted by ICRP was summarized. A model for composition of deep respiratory tissue was attempted. An estimation of cell group reaction to various radiation levels was made. Animal experiments for study of tissue injuries by local irradiation were reviewed. The method for calculation of mean carcinogenic dose of hot particle, which was designed by Tamplin--Cochran, was described.

- 3022 HISTORY AND ACTUAL STATE OF STUDY ON THOROTRAST DELAYED INJURIES. Mori, Takesaburo (Kanagawa Prefectural Junior Coll. of Nursing and Medical Technology, Yokohama (Japan)). Hoshasen Kagaku; 17: No. 9, 173-175(Sep 1974). (In Japanese).

Disorders caused by thorotrast have been paid attention recently from the aspect of the relationship of radiation delayed injuries and it will be called into question in the future. It is regarded as important as one of the basic data of ultra-uranium element disorders which induced alpha disintegration. Reports from each country such as epidemiological study, clinical and pathohistological examinations presented at the third international meeting on the toxicity of thorotrast held in April of 1973 were given an outline. Being too late in the study of thorotrast injuries in Japan as compared with that in Europe and America each country was pointed out.

- 3023 EXPOSURE DOSE IN RECENT TREATMENT OF NUCLEAR MEDICINE AND COUNTERMEASURES. Iio, M. (Tokyo Metropolitan Geriatric Medical Center (Japan)). Proc. Jpn. Conf. Radioisot.; No. 11, 283(Aug 1974). (In Japanese).

From 11. Japan conference on radioisotopes; Tokyo, Japan (13 Nov 1973).

Radioactive pharmaceuticals widely used for the diagnosis in nuclear medicine utilize radiation as tracer for dynamic behavior measurement and locality diagnosis, and the exposure due to their use has very little chance to attain the maximum permissible dose of ICRP. The MIRD (Medical Internal Radiation Dose) method tends to be adopted for the measurement of internally absorbed dose due to radio-pharmaceuticals in future. The feature of the MIRD method is that the targeted object is not a critical organ but the region of interest, and the source organ and target organ are fully taken into consideration. Recently, the exposure of patients has been significantly lowered by applying sup(99m)Tc and the like. Though the contribution to national dose is small, it is required to perform immediate conversion from the older nuclear medicine typified with conventional ¹³¹I, ¹⁹⁸Au and

^{203}Hg to modern one centering around $^{99\text{m}}\text{Tc}$. The problems in calculating the absorbed dose due to nuclear medicine diagnosis are very low accuracy of biological data though the high accuracy of data in physics has been achieved, and the difficulty to obtain data for calculating patients' absorbed dose in routine inspection.

- 3024 PLENARY SESSION OF THE COMMISSION "SCIENTIFIC FUNDAMENTALS OF MEDICAL RADIOLOGY AND ROENTGENOLOGY". Palyga, G.F. Med. Radiol.; 19: No. 8, 72-73(Aug 1974). (In Russian).

An account of reports heard at the plenum and of the draft 5-year plan of subjects and problems for 1976-1980 is presented. It is pointed out that the research into the basic problems of biological effects of ionizing radiation on different organizational levels of organism will continue in this time period. A special consideration will be given to pathogenesis, development, treatment, diagnostics and prevention of chronic radiation injuries and to remote effects of exposure to radiation. It is stressed that a thorough investigation of problems concerned with selective control of radiosensitivity of normal and tumour tissues is necessary in developing new and refining conventional methods of radiotherapy of various organ and system diseases. It is also necessary to investigate the effectiveness of radiotherapy and to develop new methods of radiotherapeutic planning and control, based on the data of clinical dosimetry.

- 3025 RADIATION DOSE DISTRIBUTION DURING TOMOGRAPHIC EXAMINATION OF VARIOUS PARTS. Hinata, H.; Kitabatake, T.; Yoshimura, S.; Ito, T. (Niigata Univ. (Japan). School of Medicine). Danso Satsueiho Kenkyukai Zasshi.; 2: No. 1, 100-101(Aug 1974). (In Japanese).

In linear, elliptical, circular and hypocycloidal tomographies of the head, chest and abdomen, the author determined skin surface dose, gonad doses, and relative dose distribution on the surface of the phantom and relative dose distribution in the longitudinal and the transverse sections of the phantom. As regards the skin surface dose in the circular tomography, geometrical maximum radiation field roughly corresponded to the 10%-dose area. With an increase in the exposure angle the 80%-dose area was reduced. The author observed no marked difference between the relative dose distribution on the longitudinal section and that of the transverse one. Radiation doses in circular or elliptical tomography were greater than those in linear tomography. The female gonad dose in the radiation beam was 1/4-1/5 of the skin surface dose. This result accorded with that of the surface dose distribution previously determined.

- 3026 RADIATION DOSE OF GONAD AND EYE RECEIVED BY TOMOGRAPHY. Tarusawa, K.; Shinozaki, T.; Jin, K.; Ishida, A.; Sugawara, K. (Hiroasaki Univ., Aomori (Japan). School of Medicine). Danso Satsueiho Kenkyukai Zasshi.; 2: No. 1, 97-99(Aug 1974). (In Japanese).

The author measured radiation dose of the chest, eye and male gonad during chest tomography. In 86 cases which underwent tomography, radiation dose, voltage, and site of the measurement were recorded in each tomography. These results were compared with those of the phantoms. The radiation doses were 550-880 mR in the chest, 2-10 mR in the eye and 1-2 mR in the male gonad. The distance between the focus and the site of the measurement was

more responsible for the variation of radiation dose than the voltage. Thus a reduction in the distance had greater effect on the dose than an increase in the voltage. Especially in the eye the radiation dose increased up to more than 10 mR at the site within 10 cm from the radiation field, and further increases up to 20 mR at the site 3 cm apart from the radiation field. From the above results, the author considers that an appropriate choice of radiation field and a diaphragm in tomography can be of much help in reducing the radiation dose.

- 3027 EXTENDED MANTLE RADIOTHERAPY IN HODGKIN'S DISEASE AND MALIGNANT LYMPHOMA. Marks, J.E.; Moran, E.M.; Griem, M.L.; Ultmann, J.E. Am. J. Roentgenol., Radium Ther. Nucl. Med.; 121: No. 4, 772-788(Aug 1974).

From 55. Annual meeting of the American Radium Society; Colorado Springs, CO, USA (22 Apr 1973).

Results from 95 cases show that patients tolerate radiotherapy to an extended mantle field, and that treatment results are satisfactory with its use. Our experience with such a field is analyzed in terms of technique, relapse, survival, morbidity, hematologic tolerance, and mortality.

- 3028 THREE AUTOPSIZED CASES OF THOROTRAST. Takeichi, S.; Akagi, G. (Tokushima Univ. (Japan). School of Medicine). Nippon Rinsho; 32: No. 8, 2728-2735(Aug 1974). (In Japanese).

Three autopsized cases of serious hepatic pathology such as tumor, fibrosis, and atrophy involved by thorotrast which was used for angiography about 30 years ago were examined, and its influence of internal irradiation was discussed in the paper. Hepatic tumor occurred in two cases; a case of hepatocellular tumor in the liver and a case of malignant hamangioma. There were fibrosis of the liver in three cases, remarkable atrophy of the spleen in case 2, and atrophy of the lymph node caused by thorotrast deposition was seen in all the cases. Remarkable increase of plasmic cell was suggestive of hyperglobulinemia.

- 3029 EFFECTS OF IONIZING RADIATIONS ON PHYTOHEMAGGLUTININS OF LEGUMINOSAE. Mancini, J.F.; Lajolo, F.M.; Vizeu, D.M. (Sao Paulo Univ. (Brazil). Faculdade de Ciencias Farmaceuticas). Cienc. Cult. (Sao Paulo); 26: No. 7, 510(Jul 1974). (In Portuguese).

- 3030 LOCALIZATION ERROR IN THE RADIOTHERAPY OF HODGKIN'S DISEASE AND MALIGNANT LYMPHOMA WITH EXTENDED MANTLE FIELDS. Marks, J.E.; Haus, A.G.; Sutton, H.G.; Griem, M.L. Cancer; 34: No. 1, 83-90(Jul 1974).

From 15. Annual meeting of the American Society of Therapeutic Radiologists; New Orleans, LA, USA (24 Oct 1973).

In a review of 902 treatment verification films for 99 lymphoma patients receiving radiation therapy with extended mantle fields, 330 localization errors were detected. We found that 50 percent of the localization errors occurred in the axillae and that the axillae were the sites of most frequent clustering and recurrence. These facts suggest that

localization errors caused sufficient reduction in dose to explain the recurrence of lymphoma in the axillae of several patients. Technical modifications of the blocks in relation to the axillae are discussed. Of 10 patients with local recurrence of Hodgkin's disease or malignant lymphoma, 2 had enough documented localization errors at the site of recurrence to account for a dose reduction sufficient to explain the recurrence. For the remaining 8 cases, we lacked sufficient films to determine the incidence of localization errors and thus to make estimates of reductions in dose. We observed a reduction of localization errors from 55 percent to 29 percent over the last 2 years of the study. This gratifying result is best explained by technical refinements and by the increased use of treatment verification films. On the basis of the data gathered in this study, we feel that treatment verification films are invaluable in the detection of localization errors in the treatment of lymphoma, and that they can lead to a reduction in localization errors if they are used regularly.

- 3031 (LURI--1974-02) GAMMA RADIATION AND CONTAMINATION OF PERSONS IN THE SURROUNDING OF A NUCLEAR POWER STATION: A RESEARCH PROGRAM. Liden, K. (Lund Univ. (Sweden). Radiofysiska Institutionen). Jun 1974. 11p. (In Swedish). (CONF-740671--2). INIS.

From Meeting of Nordic Society for radiation protection; Helsinki, Finland (5 Jun 1974).

A project for environment control in the surrounding of a nuclear power station is described. The project includes gammaspectrometric field studies of natural and artificial radionuclides in the ground and in the air, studies of contamination of people in the surroundings of nuclear power stations, and a few food chains. The Swedish nuclear power station Barsebaeck is chosen as an example. The apparatus for the gammaspectrometric field measurements is described. For the activity measurements a whole-body counter is used. It is concluded that environment control of this kind is important because it can be carried out independently of the administration of the nuclear power plant.

- 3032 RECENT INCIDENCE OF LEUKEMIA IN HIROSHIMA ATOMIC BOMB SURVIVORS. Takahashi, H.; Ohkita, T.; Enzan, H. (Hiroshima Univ. (Japan). Research Inst. for Nuclear Medicine and Biology). Hirosaki Igaku; 27: No. 6, 538-544 (Jun 1974). (In Japanese).

On the recent trend of leukemia in atomic bomb survivors in Hiroshima City, the onset of leukemia in the survivors was outlined and the epidemiological survey for the incidence was described, which showed a fall in recent years. However, in comparison with the non-exposed cases, the rate is still high, indicating that the survivors are not yet clear from the risk of the onset of leukemia due to exposure. The incidence of survivors exposed at high age continues to be high, and they have chromosome aberration. Those exposed in youth showed a marked fall recently but still require a long-term, deliberate observation.

- 3033 SENSITIVITY OF MITOCHONDRIA OF THE MOUSE LIVER CELLS TO RADIATION. Shima, A. (Tokyo Univ. (Japan). Faculty of Science). Hoshasen Seibutsu Kenkyu; 9: No. 2, 92-94 (Jun 1974). (In Japanese).

In order to study the sensitivity of mitochondria (Mt) of the liver cells to radiation, 0.4 mg of riboflavine (RF) was intraperitoneally injected into mice which had

been fed RF deficient food for 13 weeks. Three hours later 400 R of X-ray (190 KVP, 25 mA, 0.5 mmCu, 0.5 mmAl filter, FSD 61.5 cm, and HVL 0.80 mmCu) were irradiated to the whole body, and giant Mt of the liver cells were observed. When the liver cells were observed 24 hours after injection, neither giant Mt nor mitotic findings of Mt were found. All Mt observed were small (1.2μ), although mice received 400 R of X-ray.

- 3034 (IEA--346) MONTE CARLO ESTIMATION OF DOSE FROM INTERNAL SOURCES OF PHOTONS IN A ANTHROPOMORPHIC MODEL OF HUMAN BODY. Snyder, W.S. (Instituto de Energia Atomica, Sao Paulo (Brazil). Divisao de Ciencia e Tecnologia de Materiais). Jun 1974. 22p. NTIS (US Sales Only).

To estimate the dose from a source of photons within the body, attempts are made to model the body and its principal organs approximately, taking into account their sizes, shapes, compositions and densities. Monte Carlo Method is used. Using this technique it is attempted to computer represent 'histories' of photons originating in the source. At each point of interaction, the type of interaction, the energy loss in the tissue and the new direction of the photon are determined using the well established laws of physics.

- 3035 ALL-UNION SYMPOSIUM ON THEORETICAL AND PRACTICAL ASPECTS OF LOW DOSE IONIZING RADIATION EFFECTS. Kondratenko, V. Usp. Sovrem. Biol.; 77: No. 3, 464-465 (May 1974). (In Russian).

- 3036 IMMUNOLOGICAL ASPECTS OF IONIZING RADIATIONS. Brizola, I.P.; Schunke, A.; Fiori, A.M.C.; Langeloh, A.; Finkelfarb, E.; Pagnoncelli, C.C.K.; Sieczkowski, F. Cienc. Cult. (Sao Paulo); 26: No. 5, 493-498 (May 1974). (In Portuguese).

Seven groups of rabbits have been whole-body irradiated with doses ranging from 100 to 1200 rad. Both, the irradiated groups and the control one were immunized against human albumin and studied regarding the hematological reactions, phagocyte response, and antibodies presence. Hematological results showed no repercussion on the series concerning the different groups. Lethal results appeared with 1200 rad doses and necropsy showed the occurrence of generalized hemorrhage. The results have made possible to determine some parameters regarding doses and responses of rabbits related to radiation and immunization.

- 3037 (NRPB-R--19) IDENTIFICATION OF AN HOMOGENOUS CRITICAL GROUP USING STATISTICAL EXTREME-VALUE THEORY: APPLICATION TO LAVERBREAD CONSUMERS AND THE WINDSCALE EFFLUENT DISCHARGES. Beach, S. (National Radiological Protection Board, Harwell (UK)). Apr 1974. 19p. TIC.

Available from H.M. Stationery Office, price Pound0.50.

The International Commission of Radiological Protection states that a critical group should be representative of those individuals in the population expected to receive the highest dose. The appropriate dose limit should then be applied to the mean dose of this group. The edible seaweed *Porphyra* (laverbread) has been identified as the link in the critical exposure

pathway limiting discharges of controlled low-level radioactive liquid waste from Windscale. The frequency distributions of the largest values of samples of 10, 20, 30, 40 and 50 male and female, child and adult consumers of liverbread are determined from the parent distributions by Monte Carlo sampling methods. From these results the extreme-value distribution of adult males of samples of 30 is taken to be a good estimate of the critical group, from which the median consumption rate of liverbread consumed per day is 55 g. The annual collective organ dose delivered to the lower large intestine of the total liverbread consumer group is estimated to be 266 man-rem.

- 3038 (NRPB-R--22) DETERMINATION OF THE RATES OF CLEARANCE OF INSOLUBLE COMPOUNDS OF PLUTONIUM FROM THE LUNG. Watts, L. (National Radiological Protection Board, Harwell (UK)). Apr 1974. 16p. NTIS (US Sales Only).

Available from H.M. Stationery Office, price Pound0.50.

There are indications that the process of clearance of inhaled insoluble plutonium compounds from the lung may be represented by a model consisting of three exponential phases. A survey of published data on 'in vivo' and bioassay measurements made after $^{239}\text{PuO}_2$ inhalation by men and dogs has been carried out, and the half times of the three exponential phases determined as approximately 1 day, 30 days and 500 days.

- 3039 RADIATION EXPOSURE BY RADIOPHARMACEUTICALS. DEVELOPMENT OF A MATHEMATICAL DOSE CONCEPT AND RESULTS OF RECALCULATIONS OF THE ENERGY DOSE. Roedler, H.D. Freie, Germany; Freie University (13 Mar 1974). 133p. INIS.(In German).

39 refs.; with figs. and tabs. Available from ZAED.

Thesis (Ph. D.).

New dose calculations for the most important radiopharmaceuticals used in nuclear medicine are performed in connection with the increasing application of radioactive materials in medicine, and the results are compared with the magnitude of the natural radiation effect and the remaining exposure to man-made radiation, especially due to X-ray diagnostics. Following a discussion of the physical and biokinetic fundamentals of the dose calculation of incorporated radioactive materials, the three available concepts, mathematically completely differing from one another, are arranged in a uniform formalism which is characterized by the term of the absorbed fraction. The most important parameters are discussed and criteria for approximation solutions are given. A FORTRAN programme was developed for the calculations. The results include dose values for whole and remaining body as well as the most important organs including the gonads.

- 3040 HAZARDS FROM THE INDUSTRIAL USE OF RADIOACTIVE STATIC ELIMINATORS. Robertson, M.K.; Randle, M.W. Health Phys.; 26: No. 3, 245-250(Mar 1974).

It was suspected that a commercial air-ionizing device for the elimination of static electricity, employing ^{210}Po incorporated in nickel-plated ceramic microspheres, might constitute a radiation hazard to persons working in its vicinity. Tests were carried out to determine possible hazards from the release of radioactive material under conditions of industrial use. It was found that a severe hazard could arise from the accidental crushing of a microsphere, thus releasing radioactive

particles which could be readily inhaled. The administrative measures taken by the authorities in New Zealand to control this hazard are described.

- 3041 INTERNATIONAL INQUIRY CENTRE OF WHO ON EXTERNAL RADIATION. Shalmon, E. (World Health Organization, Geneva (Switzerland)). Khron. VOZ.; 28: No. 3, 166-168(Mar 1974). (In Russian).

- 3042 EXPERIMENTAL CEREBRAL DYSPHASIA PRODUCED BY X-RAY. CEREBROCORTICAL DYSPHASIA OF MICE DUE TO EXPOSURE TO 50 R OR 100 R IN THE EMBRYONIC STAGE. II. Kameyama, Y.; Hayashi, Y.; Hoshino, K.; Ito, Y. (Nagoya Univ. (Japan). Research Inst. of Environmental Medicine). Nagoya Daigaku Kankyo Igaku Kenkyusho Nempo; 25: 193-195(Mar 1974). (In Japanese).

One irradiation of 50 R or 100 R of X-ray was given to mouse embryos on the 10th, 13th, and 15th embryonic days. By measuring the weight of brain, the thickness of cortex, and density of cortical cells of the exposed litters 6-24 weeks after birth, the relationship between the shortage of cortical cell count and the embryonic age of exposure was examined. In the 100 R exposure group the shortage of cortical cell count was relatively pronounced in litters exposed on the 13th embryonic day. In the 50 R exposure group also, the shortage was observed in 6 week and 12 week old litters which were exposed on the 13th embryonic day. The preceding paper on histologic observations reported that the shortage of cell count was remarkable in litters exposed on the 10th embryonic day. It is to be corrected to be in litters exposed on the 13th embryonic day.

- 3043 ESTIMATED USE OF ^{131}I AT DIAGNOSTIC AND TREATMENT IN NUCL. MED. IN GB (BRAZIL). Calegario, J.U.M. (Centro de Analises Clinicas e Medicina Nuclear); Alves, R.N. (Instituto de Radioprotecao e Dosimetria, Rio de Janeiro (Brazil)). Radiol. Bras.; 7: No. 3, 129-137(Mar 1974). (In Portuguese).

From 5. Latim-American congress on Biology and Nuclear Medicine; La Paz, Bolivia (3 Nov 1974).

The ^{131}I -radioiodine use in Guanabara area, during 1972-1973 is studied. References are made to the radiation levels delivered to thyroid, bone marrow, and gonads in a population of 27000 peoples examined by tracer techniques, 190 submitted to hyperthyroidism treatment and 50 treated for thyroid data concerning radiation induced cancer (Leukaemia and thyroid cancer). By this, it was possible to estimate the probability of tumor occurrence in that population, assuming a linear relationship between dose and effect. The conclusions are the following: there are many duties in this field at the present; the Leukaemia incidence related to the ^{131}I - radioiodine use is negligible, either in diagnostic or therapeutic modalities; the possibility of thyroid tumors induced by radiation is real, specially in hyperthyroidism treatment; the use of tracer techniques that causes lower irradiation to the patient is advisable, because we can't exclude thyroid carcinogenesis at this level.

- 3044 (CONF-730907--P1) PROCEEDINGS OF THE THIRD INTERNATIONAL CONGRESS OF THE INTERNATIONAL RADIATION PROTECTION ASSOCIATION, WASHINGTON, D.C., SEPTEMBER 9--14, 1973.

VOLUME 1. (USAEC Technical Information Center, Oak Ridge, Tenn.). Feb 1974. 832p. (In several languages). NTIS \$13.60.

From 3. international congress of the International Radiation Protection Association meeting; Washington, DC, USA (9 Sep 1973).

Complete texts of 123 communications to the Congress (in the original language; the majority in English, some in Russian, French), on the following topics; radiation perspective in the U.S., radiation and man, non-ionising radiation, radiation effects on animals, radiation quantities, radioecology, reactor experience, late radiation effects, dose calculations and radiation accidents.

- 3045 (LBL--2654) PRELIMINARY EXPERIMENTS WITH HELIUM ION RADIOGRAPHY AT THE 184-INCH CYCLOTRON. Budinger, T.F.; Crowe, K.; Kanstein, L.L. (California Univ., Berkeley (USA). Lawrence Berkeley Lab.). Feb 1974. Contract W-7405-ENG-48. 9p. Dep. NTIS, PC A02/MF A01.

In preliminary experiments with 840-MeV helium ions and x-ray film as a detector, we have been able to assess the range sensitivity and spatial resolution for eventual patient studies wherein the range is approximately 30 g/cm². These experiments show spatial resolution of less than 2 mm is obtainable, and a sensitivity in range or mass thickness of 0.045 percent can be achieved with a total flux of 3×10^7 ions/cm² through a range of 28 g/cm². Future experiments will include use of wire chambers and single-particle trajectory detection for a comparison of the advantages of helium ions over protons for radiography of human tissues.

- 3046 RADON-222 AND ITS DAUGHTERS: A REVIEW OF INSTRUMENTATION FOR OCCUPATIONAL AND ENVIRONMENTAL MONITORING. Budnitz, R.J. Health Phys.; 26: No. 2, 145-163 (Feb 1974).

A survey is made of the techniques developed for measuring ²²²Rn and its daughters in various media, in particular for monitoring and protection in occupational and environmental situations. Individual sections are devoted to: physical characteristics of ²²²Rn and its decay chain, radiation protection guides laid down in the USA for radiological protection of the lungs in the uranium mining industry, and sources of radon and its daughter products and typical concentrations encountered in the natural environment and in occupational exposures. Measurement techniques are described: measurements of radon (gas) concentrations, measurements of working level, measurements of individual radon-daughter concentrations, and working level dosimetry.

- 3047 ASSAY OF STRONTIUM-90 IN HUMAN PERMANENT TEETH IN THE UNITED KINGDOM 1966 TO 1971. Starkey, W.E. (Inst. of Naval Medicine, Gosport, Eng.); Brooks, W.L. J. R. Nav. Med. Serv. (London); 60: No. 3, 145-148 (Win 1974).

A survey of the accumulation of ⁹⁰Sr in human teeth has been carried out by the Royal Navy. It covers the 13 years 1959 to 71 in which fallout levels rose to a peak and declined again. Correlations have been established between the uptake of ⁹⁰Sr in developing tooth and bone, related to fluctuating ratios of ⁹⁰Sr/Ca in the diet. Since mineral ratios are permanently fixed in teeth by irreversible deposition they constitute an indelible record of the levels of bone-seeking elements (including contaminants) that existed when the teeth were being laid down. Thus it becomes possible to estimate former bone ratios persisting in the teeth, no

matter how much prevailing levels of contamination may have altered in the meantime. The present study provides general parameters whereby this may be done.

- 3048 (INIS-mf--3363, pp 51-55) HEAVY METAL RISKS IN URANIUM MINERS. Nosek, J. (Zavodni Ustav Narodniho Zdravi Trineckych Zelezaren (Czechoslovakia)). 1974. (In Czech).

From 8. seminar on the methodology of determination and on the significance of trace elements in biologic material; Prague, Czechoslovakia (7 May 1974).

Proceedings of the 8th seminar on the methodology of determination and on the significance of trace elements in biologic material.

Studies are briefly reported related to the retention by erythrocytes in uranium miners of uranium and lead and to health risks thereof for the miners' organisms. Uranium in the erythrocytes was studied by activation analysis, lead was determined by polarography. It was found that as compared to controls, significantly higher retention of both heavy metals was shown by the uranium miners' erythrocytes, directly proportional to the duration of their work in the mines. The findings justify the hypothesis that the blood is gradually contaminated by the heavy metals studied. It is believed that the miners' organisms are altered by the effect of heavy metals, thus being made susceptible to other harmful effects, such as that of ionizing radiation.

- 3049 (KURRI-TR--125, pp 1-5) FALLOUT BY NUCLEAR EXPLOSION EXPERIMENT AND THE RADIOACTIVE IODINE IN ANIMAL ORGANISM. Tanaka, G. (National Inst. of Radiological Sciences, Chiba (Japan)). 1974. (In Japanese).

From Symposium on radiiodine; Kumatori, Osaka, Japan (24 Oct 1973).

Symposium on radiiodine.

Radioactive iodine (mainly ¹³¹I, ¹³²I, ¹³³I, and ¹³⁵I) was measured with fallout, cow milk, human urine, and thyroid glands (human and cattle) after the first nuclear explosion experiment in China. Analysing method was determined by placing emphasis on rapidity and perfect separation from other nuclides. The detectable limit employing this method was about several pCi. The identification of radioactive iodine was performed with a simultaneous counting type β -ray spectrometer, and ¹³¹I, ¹³²I, and ¹³³I were identified by their half lives. ¹³¹I in cow milk increased from around the 4th day after the experiment, and it had been detected for a month continuously, the maximum amount being 437 pCi/l. In thyroid glands, ¹³¹I was detected for 100 days in a milch cow, the maximum being 88, 1pCi/g, while it was somewhat low in Japanese cows and pigs. ¹³¹I in the thyroid gland of a human infant (accidentally died after 12 days) was 1.29pCi/g. ¹³¹I in human urine was 6.3pCi/l on the 7th day.

- 3050 MEASUREMENTS OF IODINE-131 IN MILK SUPPLIES. Duggleby, J.C.; Kotler, L.H.; Wilks, M.J.; Wise, K.N. pp 23-25 of Fallout over Australia from nuclear weapons tested by France in Polynesia during July and August 1973. Canberra, Australia; Aust. Govt. Publ. Serv. (1974).

As with previous series of French nuclear tests in Polynesia, a program was instituted to monitor major milk supplies for iodine-131. This program extended from 25 July to 23

October 1973, and was terminated only after there was no further possibility of iodine-131 reaching the milk supplies. The program covered the nine major population centres and effectively monitored the milk consumed by 80 per cent of the entire Australian population. The method employed for iodine-131 assay of milk supplies is described, and the final results obtained are presented.

- 3051 NUCLEAR STANDARDS IN MEDICAL USE OF RADIOISOTOPES AND INSTRUMENTS. Failla, L. (CNEN, Rome). Ig. Sanita Publica; 30: No. 11/12, 378-394 (1974). (In Italian).

A catalogue of nuclear regulations is presented which includes three synoptic tables containing radiation protection standards. The fundamental structure of the regulations is examined. A summary of regulations in medical uses includes the following: field of application; communications and authorizations; radiation protection; and control. Under the heading communications and authorizations the following activities are given: detention; use; commerce; transport; and waste. The law indicates provisions of radiation protection that can be defined technologically for the health of people in the above activities. (HLW)

- 3052 FLUORESCENT IMAGING IN PEDIATRICS.

Hendrix, R.W.; Hoffer, P.B. pp 78-84 of Pediatric nuclear medicine. James, A.E. Jr.; Wagner, H.N. Jr.; Cooke, R.E. (eds.). Philadelphia; W. B. Saunders Co. (1974).

Since 1969 we have routinely used the fluorescent thyroid scanning technique for pediatric and adult patients. Our findings in the pediatric age group are similar to those recorded earlier in adults. Numerous advantages favor the fluorescent technique over radionuclide scanning in pediatric patients. The patient receives no total body or gonadal radiation, and the thyroid receives approximately 15 millirads, as compared with multirad doses for a radionuclide scan. Specific information about iodine content of the gland is available only with the fluorescent technique. This information makes it possible to distinguish primary from secondary hypothyroidism. The image quality of the fluorescent scan appears to be about the same as that of the nuclide scan whenever both are available.

- 3053 EXTERNAL EXPOSURE BY TERRESTRIAL RADIATION IN THE OPEN AIR. Franke, T.

(Westinghouse Electric Nuclear Energy Systems Europe (WENESE), Brussels (Belgium)); Schales, F. (Gesellschaft fuer Strahlen- und Umweltforschung m.b.H., Neuherberg/Muenchen (F.R. Germany). Inst. fuer Biologie); Keil, R. pp 62-69 of Die natuerliche Strahlenexposition des Menschen. Grundlage zur Beurteilung des Strahlenrisikos. Aurand, K.; Buecker, H.; Hug, O.; Jacobi, W.; Kaul, A.; Muth, H.; Pohlitz, W.; Stahlhofen, W. (eds.). Stuttgart; Thieme (1974). (In German)

3 figs.; 2 tabs.; 12 refs..

Based on the present measured results in the Federal Republic of Germany, the energy dose rate for the population due to terrestrial radiation was determined to be 4.4 ± 0.8 J/kg a (44 ± 8 mrd/a).

- 3054 LESIONS AND LUNG CANCERS INDUCED IN RATS BY INHALED RADON 222 AT VARIOUS EQUILIBRIUMS WITH RADON DAUGHTERS. Chameaud, J. (CEA, Razes, France); Perraud, R.; LaFuma, J.; Masse, R.; Pradel, J. pp 411-421 of Experimental lung cancer: carcinogenesis and bioassays.

Karbe, E. (ed.). New York; Springer-Verlag New York Inc. (1974).

From Symposium on experimental respiratory carcinogenesis and bioassays; Seattle, WA, USA (23 Jun 1974).

See CONF-740648--.

To investigate the dose-effect relationships, rats were exposed to several dose levels of radon at different levels of equilibrium with radon decay products, after inhalation of stable cerium hydroxide, and in combination with uranium ore dust. Lung cancers were induced with exposures ranging from 500 Working Level Months (WLM) to 14,000 WLM. Exposures of 3,000 WLM to 9,000 WLM delivered over 300 to 500 hours during a 3- to 4-month period, produced the highest incidence of tumors (50 percent). The cancers appeared from the 12th to the 24th month after the beginning of exposure. Above 14,000 WLM, the animals died due to pulmonary fibrosis by the 12th month and the cancers may not have time to develop. At the lowest dose (500 WLM), the first cancers appeared in the 24th month. They appeared earlier as the dose was increased. The lesions appeared in the following chronological order: metaplasia, adenomatous lesions, adenomas, and cancers. Exposure to stable cerium hydroxide prior to radon exposure shortened the induction time of the tumors by 2 to 3 months. Uranium ore dust appeared to have little influence on the tumorigenic process. The incidence of lesions was related to total exposure time, expressed as cumulative WLM. The different equilibrium levels of radon and radon decay products had no specific effect.

- 3055 HISTOLOGIC OBSERVATIONS ON THE PATHOGENESIS OF LUNG CANCER IN HAMSTERS FOLLOWING ADMINISTRATION OF POLONIUM-210.

Lisco, H.; Kennedy, A.R.; Little, J.B. (Harvard Medical School, Boston). pp 468-474 of Experimental lung cancer: carcinogenesis and bioassays. Karbe, E. (ed.). New York; Springer-Verlag New York Inc. (1974).

From Symposium on experimental respiratory carcinogenesis and bioassays; Seattle, WA, USA (23 Jun 1974).

See CONF-740648--.

A serial sacrifice experiment was carried out to study the site of origin and the stages in development of lung cancer in hamsters induced by polonium-210 (^{210}Po). 1 or 2 animals were sacrificed weekly during and after a course of 7 intratracheal instillations of 0.1 μCi of ^{210}Po in saline. This exposure produced a transient radiation pneumonitis of moderate severity during, and for several weeks after, the instillation period. Subsequent pathological changes included hyperplasia of bronchiolar epithelium, and focal proliferation of epithelial cells in peribronchiolar and more remote alveoli, termed epithelialization of alveoli. Hyperplastic bronchiolar epithelium frequently showed numerous Clara cells which exhibited pleomorphism of cells and nuclei, multinucleated cells, and striking changes in staining characteristics of secretory granules. Epithelialization of alveoli showed steady progression from well-circumscribed small foci to larger confluent lesions which were composed of various cell types and resembled tumors. Malignant tumors occurred in many animals surviving more than 24 weeks after the last instillation of ^{210}Po .

- 3056 INTERACTIONS BETWEEN RADIATION AND BENZO(A)PYRENE IN AN IN VITRO MODEL FOR MALIGNANT TRANSFORMATION. Terzaghi, M.; Little, J.B. (Harvard School of Public Health, Boston). pp 496-506 of Experimental lung cancer: carcinogenesis and bioassays.

Karbe, E. (ed.). New York; Springer-Verlag New York Inc. (1974).

From Symposium on experimental respiratory carcinogenesis and bioassays; Seattle, WA, USA (23 Jun 1974).

See CONF-740648--.

Malignant transformation, confirmed by reinjection of transformed cells into syngeneic mice, has been induced by both BaP and X-irradiation in a C3H mouse embryo cell line (10T-1/2). A synergistic effect was found when both agents were given sequentially; maximum synergism occurred when 15 to 20 hours elapsed between treatments. Both survival and transformation frequency per surviving cell were enhanced by maintaining cells in conditions of growth inhibition for 4 hours after radiation, suggesting that repair processes may be involved in the transformation process. Such an in vitro transformation system, particularly involving plateau phase cultures, appears to be valuable adjunct to the study of interactions between chemical carcinogens and radiation that may occur in critical cell populations in the lung.

biological properties of californium-252, its health physics aspects are reviewed in detail. Its external and internal radiation hazards can be minimised through control of radiation and contamination and proper shield design. Use of various shielding materials is evaluated. The following aspects are also discussed: (1) radiation detectors for neutrons and gamma radiation (2) personnel monitoring techniques (3) bioassay and (4) storage and transportation.

- 3057 CELLULAR TRANSFORMATION IN VITRO INDUCED BY HERPES SIMPLEX VIRUS. NOTE II. TRANSFORMATION OF HAMSTER EMBRYO CELLS. Sahnazarov, N.; Mutiu, A.; Athanasias, P.; Gruia, M.; Cajal, N.; Gologan, R. (Inst. of Virology, Bucharest). Rev. Roum. Virol.; 25: No. 4, 355-360(1974).

Golden hamster cell cultures inoculated with two autochthonous uv-irradiated herpes simplex virus strains (type 1 and 2) showed growth capacity, morphologic and antigenic modifications characteristic of in vitro cell transformation. Re-infection with various herpes virus strains of 4 transformed cell lines made evident their partial susceptibility, in most of the cases persistent infections being obtained.

- 3058 (AED-Conf--74-736-000, pp 7-30) RADIATION INJURIES AND RECOVERY. Pauly, H. 1974. (In German).

From Meeting of the Schutzkommission beim Bundesministerium des Innern; Munich, F.R. Germany (May 1974).

8 figs.; 1 tab.; with refs..

Meeting of the Schutzkommission beim Bundesministerium des Innern. Lectures.

In memory of Prof. Dr. Langendorff, a survey and a cross-section are given of the development of radiobiology during the last 40 years. The importance of radiobiology is shown using several examples. The mechanisms and effects of radiation on man, animals and plants are discussed. Effects of radiation and radiolesions are explained down to the molecular field, and their importance is discussed quantitatively with stochastic considerations. Stress is laid upon recovering from radiolesions. It is tried to explain recovery quantitatively in all its several sorts. Using all these deliberations, the author also tries to give a wide spectrum for radiation protection. These fundamental deliberations and works of Prof. Dr. Langendorff are guidelines of great importance also for radiation protection in connection with the protection of the civil population.

From 1. Asian regional congress on radiation protection; Bombay, India (15 Dec 1974).

Abstracts of some 200 papers presented at this Congress are included. Subjects discussed included radiation protection, biological effects of radiation, dosimetry, radiation sources, and various other aspects of health physics. (CH)

- 3061 (CS-INIS--12) APPLICABILITY OF CHROMOSOMAL ABERRATIONS IN PERIPHERAL BLOOD LYMPHOCYTES IN DETERMINATION OF RADIATION BURDEN IN MAN. Tuscany, R.; Globocnik, E.; Sedlak, A.; Ruzickova, V.; Kotaskova, Z. (Institut Hygieny a Epidemiologie, Prague (Czechoslovakia). Ustav Hygieny Zarení). 1974. 83p. (In Czech). Dep. NTIS (US Sales Only), PC A05/MF A01.

Available from Institut Hygieny a Epidemiologie, Centrum Hygieny Zarení, Prague, Czechoslovakia.

Chromosomal aberrations in man as a result of radiation exposure are considered and the possibility is discussed of applying the knowledge of radiation-induced aberrations as a biological indicator in the radiation protection practice. Methods of karyological examinations were tested and an analysis was made of the application of stimulated peripheral blood lymphocytes as biological indicators of radiation dose. Experience is reported gained with the karyological examinations of hair follicles as a suitable method of radiation dose assessment.

- 3062 (ERDA--76/119) SEVENTH ANNUAL REPORT OF RADIATION EXPOSURES FOR AEC AND AEC CONTRACTOR EMPLOYEES. (Energy Research and Development Administration, Washington, D.C. (USA). Div. of Safety, Standards and Compliance). 1974. vp. Dep. NTIS \$4.00.

Data are presented on the radiation exposure for the last 11 years of the Atomic Energy Commission (AEC) and its contractor employees. As time progressed, the number of personnel receiving large dose equivalents was reduced, and fewer employees were being monitored each year. Monitoring is required where the potential exists for the individual to receive a dose or dose commitment in any calendar quarter in excess of 10 percent of the quarterly standards as prescribed in AEC Manual Chapter 0524 and most of the personnel receive an undetectable dose equivalent. Prior to 1974, contractors were asked only to report the number of personnel in the 0 to 1 rem range making a total man-rem dose equivalent estimate difficult. A breakdown of the 1974 whole-body dose equivalents according to facility type is presented. This was the first year that the contractors were asked to submit data of this kind and many were unable to adjust their

reporting systems in time to fully comply. They instead reported as a group under the General Research facility type. It was intended that the General Research facility type would include only those that received their radiation exposures from a variety of sources. It is expected that subsequent reports will more truly represent the source of the radiation exposure than does this 1974 report.

A general review of the radiation protection requirements common to all medical applications of ionizing radiation and radionuclides is presented in the first volume of a three-part series dealing with the radiation protection of patients, occupationally exposed persons, and the public. The series is directed to national authorities, hospital administrators, supervisors, hospital workers, teachers, and others who have responsibility in the area of radiation protection. A general knowledge of radiation and biology on the part of the reader is assumed. The first volume opens with a general discussion of X-rays, electrons, radiation from radionuclides, interaction of radiation with matter, basic dosimetry, the biological effects of ionizing radiation, and risk evaluation. Principal objectives of radiation protection are identified, and data on maximum permissible levels are presented. Subsequent chapters address the following topics: (1) radiation equipment and operating procedures (diagnostic X-ray installations, X-ray beam therapy, gamma-ray installations for teletherapy, brachytherapy, unsealed sources for therapeutic use, and diagnostic use of unsealed sources); (2) planning of radiation facilities, (levels of medical care, centralization and decentralization of radiation facilities, diagnostic X-ray facilities, therapy facilities, and nuclear medicine and therapy with unsealed sources); (3) shielding design (diagnostic radiology, radiotherapy, and nuclear medicine and therapy); and (4) the organization of radiation protection (assignment of responsibilities and general duties, legal responsibilities, safety checks, and refresher courses and symposiums). The implementation of radiation surveys before, during, and after the installation of radiation equipment is described, as are elements of personnel monitoring and health supervision. A list of commonly used radionuclides and illustrations of a design for protective shielding are appended. An index is provided.

- 3064 (INIS-mf--1840, pp 101) AN ATTEMPT TO USE CONFORMATION CHANGES OF PROTEIN BLOOD PLASMA FRACTIONS OF IRRADIATED ORGANISMS AS AN INDICATOR FOR THE ABSORBED RADIATION DOSE. Paskalev, Z. 1974. (In Bulgarian).

From National conference "Physics-Manufacture"; Kazanlyk, Bulgaria (14 Oct 1974).

Published in summary form only. Abstract available in English.

National conference "Physics-Manufacture", October 14-17, 1974, Kazanlyk. Abstracts of reports and communications.

Recently some reactions of biological systems were successfully applied as an indicator for the absorbed exposure dose. Dose-effect relationship between absorbed dose (rad)

and the level of conformation changes of blood plasma protein fraction is examined. Clearly expressed linear relationship between absorbed doses and the level of conformation protein fraction changes is established in the range 5 to 150 rad. The conformation changes in biomolecules begin at comparatively low radiation doses while at higher doses (above 150 to 200 rad) deeper structural changes are ensured. This peculiarity gives an opportunity to use the conformation changes of protein blood plasma fractions as an indicator for the absorbed dose in low dose range up to 150 rad. Determination of blood plasma protein conformation changes is based on measuring dielectric constant of blood plasma at high frequencies (0.4 MHz to 17 MHz) by means of defining the electrostatical components of free energy as well as some other methods. - 3065 (INIS-mf--2013) LYMPHOCYTE AS A BIOLOGICAL DOSIMETER: A DIFFERENT APPROACH. Madhvanath, U. (Bhabha Atomic Research Centre, Bombay (India)). 1974. 7p. NTIS (US Sales Only).

From 1. Asian regional congress on radiation protection; Bombay, India (15 Dec 1974). 12 refs..

Chromosome aberration frequency as a measure of radiation exposure in human blood lymphocytes following a short term culture is well known and the technique is in use at several laboratories in the world to determine accidental exposures. Results of an entirely different approach to arrive at the exposure is presented. Time course of interphase death of human peripheral blood lymphocytes was followed for 6 days after exposure to cobalt-60 gamma radiation. Trypan blue dye exclusion method was used for scoring viable cells. Survival curves at 5 days post irradiation were exponential and had two components: an initial sensitive component representing a major sub-population of lymphocytes with a mean lethal dose (D₀) of 75 rads and the other an apparently more resistant population with a D₀ of about 300 rads. The initial part of the survival curve which spans to about 100 rads reaching a survival level of 15 percent, can be used to read off the extent of exposure in accident cases. Although 60 percent of the initial lymphocytes survive in the unexposed control cultures, the method is sensitive to exposures of the order of 20 rads and reproducible results have been obtained. The response is independent of dose-rate from 65 rads/min to 65 rads/hour. Other aspects of the dosimetry system such as the neutron response, in vitro and in vivo correlation are discussed.

- 3066 (N--75-24329) INFLUENCE OF IONIZING RADIATION ON THE IMMUNE RESPONSE. Brocadeszaalberg, O. (Rijksverdedigingsorganisatie TNO, Rijswijk (Netherlands). Medisch Biologisch Lab. TNO). 1974. 17p. (MBL--1974-28; TDCK--65585). NTIS \$3.25.

The effects of ionizing radiation on the immune response are reviewed. Following an introduction on the function of the immune apparatus, the effect of radiation in the different cell types of the immune system is described. The possible consequences of these effects on the prognosis of radiation victims are discussed. (GRA)

- 3067 (N--75-32733) STUDIES RELATIVE TO THE RADIOSENSITIVITY OF MAN: BASED ON RETROSPECTIVE EVALUATIONS OF THERAPEUTIC AND ACCIDENTAL TOTAL-BODY IRRADIATION. FINAL REPORT. Ricks, R.C.; Lushbaugh, C.C.

(comps.). (Oak Ridge Associated Universities, Inc., Tenn. (USA). Medical Div.). 1974. Contract E(40-1)-GEN-33. 229p. (NASA-CR--144439). Dep. NTIS \$8.00.

Data from human radiation accident victims, patients undergoing therapeutic whole-body irradiation, and astronauts during space flight are reviewed for radiation dose response relationships. The effects of whole-body irradiation at various doses and dose rates on the hematopoietic system, response to physiological stress, and gastrointestinal side effects were related to man's ability to repair radiation damage. Methods used for the evaluation of the physiological response to irradiation are discussed. Simultaneous studies of the hemic responses of mice and humans to the same low dose rate and daily doses showed a threefold greater radiation resistance of mice over man. (CH)

3068 (PB--244781) ADMINISTRATION OF THE RADIATION CONTROL FOR HEALTH AND SAFETY ACT OF 1968, PUBLIC LAW 90-602, APRIL 1, 1975. ANNUAL REPORT, JAN--DEC 1974. (Bureau of Radiological Health, Rockville, Md. (USA)). 1974. 100p. NTIS \$4.75.

The Secretary of Health, Education, and Welfare is required, Subpart 3, Section 2, Part F of Title III of the Public Health Service Act; 42 USC et seq. (Public Law 90-602), to submit an annual report to the President for transmittal to the Congress on or before April 1 on the administration of the Radiation Control for Health and Safety Act. The detailed information required to be included in the report is outlined in Section 360D of Public Law 90-602. The Food and Drug Administration, through its Bureau of Radiological Health, has been delegated the authority for the day-to-day administration of the Act. This report covers the detailed operation of the Agency in carrying out that responsibility for calendar year 1974. (GRA)

3069 ENVIRONMENTAL THREATS FROM NUCLEAR WEAPONS. Mann, L.R.B. (Auckland Univ. (New Zealand). Dept. of Biochemistry). N.Z. Sci. Rev.; 31: No. 4, 89-100(1974).

Somatic and genetic health hazards from ionizing radiation are outlined, with quantitative estimates of damage productivities based on recent authoritative reviews. The concept is stressed that, in a large population, fallout is predicted to harm millions of people while remaining statistically undetectable. The linear extrapolation to low doses (as adopted by all standard-setting bodies) is explained, in contrast to the threshold of "safe dose" assumption of some apologists for nuclear bombs. The "no public health hazard" policy with regard to fallout of the N.Z. Government National Radiation Laboratory and Institute of Nuclear Sciences is strongly criticized. There is no "permissible dose" of fallout, and the fact that the potential victims receive it without any choice or benefit sets it apart from occupational permissible doses where the irradiated person gets both a choice and some compensating benefit. The main objection to nuclear bomb tests is, however, not fallout but the nuclear arms race with its increasing risk of a catastrophic nuclear war. The U.S.A. has over 7,000 and the U.S.S.R. over 2,000 strategic nuclear warheads. New delivery systems, especially multiple independently-targetable re-entry vehicles (MIRV), and new strategies, notably counterforce targeting, seriously increase the risk of nuclear war. Links between nuclear weapons and the "peaceful atom" are outlined. Diversion of a

small fraction of the plutonium from civilian nuclear power programs may afford enough to make one or more bombs; and it is unfortunately easy to design and make a crude bomb or other weapon of mass destruction. Actions are proposed for New Zealand to take against the nuclear arms race. A substantial list of references is given. (auth)

3070 GONADAL RADIOPROTECTION IN MEN.

Penchev, V.; Pomakov, P.; Kolev, K. (Meditsinska Akademiya, Sofia (Bulgaria). Katedra po Rentgenologiya i Radiologiya). Rentgenol. Radiol.; 13: No. 4, 231-235(1974). (In Bulgarian).

In 60 patients, subjected to a contrast X-ray examination of the colon by enema using apparatus with and without an image converter, the testes were protected by a lead capsule for the scrotum. The capsule is a personal construction of the authors manufactured from lead sheet one mm thick. By use of condensor ionizing chambers of the integral dosimeter "Condiometer" scrotum exposure was measured with and without application of protective capsule. It was found that, unless measures are taken to limit the irradiated field so that the gonads remain out of it, even with the use of the image converters, scrotum exposure will be greater than the one without image converters, but with adequate limitation of the field. Observations have demonstrated essential decrease in testicular irradiation with the use of protective capsule for the scrotum. This is particularly important in roentgen diagnostic procedures in which the gonads come under or in close proximity to the direct ray beam. (auth)

3071 NUCLEAR POWER PLANTS AND THE ENVIRONMENT. Rossi, L.C. (CNEN, Rome). Ig. Sanita Pubblica; 30: No. 11/12, 371-377(1974). (In Italian).

The present energetic crisis has drawn the attention of the public opinion both to the Nuclear Power Plants and to the influence they may exert on the Environment and on man. The criteria followed in order to prevent radiation damages to populations and ecosystems are briefly summarized. A high degree of safety is being reached thanks to the technological progresses and by means of careful studies on the surroundings of a nuclear plant and strict controls for the sake of containing the radioactive discharges well below the limits allowed by the international norms. Another problem connected with the operation of Nuclear Power Plants is caused by the discharge of the cooling waters which have a higher temperature than that of the receiving water. This aspect also is carefully studied in order to propose the utilization of such waters for different domestic and industrial purposes.

3072 BIOLOGICAL HAZARD AND MEASUREMENT OF PLUTONIUM. Myers, D.S. (Univ. of California, Livermore). pp 117-141 of Radiological defense officer conference. Sacramento, CA; Office of Emergency Services (1974).

From Radiological defense officer's conference; Lake Tahoe, CA, USA (23 Oct 1974). See CONF-7410106--.

The basic characteristics of Pu, its physical and chemical properties, the uses and decay schemes of ^{238}Pu and ^{239}Pu , and techniques for monitoring Pu in the field using portable instruments are discussed. The hazards to personnel from a criticality accident involving Pu are considered and protection procedures are suggested. It is pointed out that the major biological hazard from Pu arises

- when it is deposited internally following inhalation, ingestion, injection or wound contamination, or skin absorption, with inhalation of ^{239}Pu oxides or nitrates being the greatest hazard. It is estimated that approximately 25 mg of inhaled ^{239}Pu deposited in the respiratory tract would result in a LD_{50} dose of a radiation and 500 mg of ingested ^{239}Pu would result in a LD_{50} dose to the GI tract. Based on animal studies, it is concluded that if a person inhales or ingests a quantity of ^{239}Pu which results in a body burden considerably more than the maximum permissible body burden but less than the quantity required to produce acute symptoms, his chances of developing cancer some 10 to 20 years later are greatly increased. Personnel with known body burdens of ^{239}Pu acquired 10 to 20 years ago are being carefully watched but so far no signs of cancer have been observed. (CH)
- 3073 Einführung in den Strahlenschutz. Lehrbuch fuer die Berufsbildung. (INTRODUCTION TO RADIATION PROTECTION. COMPENDIUM FOR VOCATIONAL TRAINING). Sitzlack, G. (Staatliches Amt fuer Atomsicherheit und Strahlenschutz, Berlin (German Democratic Republic)). Berlin; VEB Verlag Volk und Gesundheit (1974). 214p. (In German).
Following a historical outline of radiation protection and a review of radiation exposure of man, the present third revised edition deals with types and properties of ionizing radiation and its interaction with matter, dosimetry and dose units, radiation measurements, tasks and measures of radiation protection including legislation, licensing, responsibility, dosimetric and medical supervision of occupationally exposed personnel in the GDR, and safe handling of sealed and unsealed sources with special regard to X-ray application in medicine. In an appendix a compilation of titles of current GDR regulations and standards in radiation protection is given. (INIS)
- 3074 (SLAC-Trans--171) RADIOLOGICAL PROTECTION AND NUCLEAR POWER PLANTS. Delpla, M. 1974. Translated from the French. (CONF-740603--2). 17p. Dep. NTIS \$3.50.
From 2. international conference on radiation protection - philosophy and implementation; Aviemore, Scotland, UK (2 Jun 1974).
Dosimetric results obtained inside and outside nuclear power plants are examined with a review to proposing revision of the radiological protection standards. Dose limits are considered with regard to leukemia and genetic effects. Other topics discussed are: observed collective damage and mean risk; lethal exposure; healing and sign change of additional risk; and genetic effects of radiation on mice. (HLW)
- 3075 SHIELDING OF ORGANS LYING INSIDE THE TREATMENT VOLUME IN COBALT 60 RADIOTHERAPY. Tveraa, K. (Norske Radiumhospital, Oslo). pp 205-211B of Proceedings of the seventh Nordic meeting on clinical physics. Jähren, R. (ed.). Oslo; Dept. of Medical Physics, the Norwegian Radium Hospital (1974).
From 7. Nordic meeting on clinical physics; Tretten, Norway (14 Jun 1973).
In megavoltage therapy the shadow method of ocular protection is used in most cases. Measurements have been carried out to investigate the influence of the distance between the block and the patient on the surface doses and the dose levels at different depths, using a Mobaltron 80 ^{60}Co machine and a phantom. It is concluded that the shielding should be placed as near the patient as possible.
- 3076 RADIATION HYGIENE IN PHOTOFLUOROGRAPHY. Welde, F. (Statens Institutt for Strålehygiene, Oslo (Norway)). pp 41-56 of Proceedings of the seventh Nordic meeting on clinical physics. Jähren, R. (ed.). Oslo; Dept. of Medical Physics, the Norwegian Radium Hospital (1974).
From 7. Nordic meeting on clinical physics; Tretten, Norway (14 Jun 1973).
Photofluorography is used for mass chest X-ray examinations. There is, however, a trend towards more selective examinations. Doses to patients and staff are discussed and the use of a lead rubber apron for reduction of gonad doses to female patients shown to be ineffective. The radiation levels around a photofluorographic unit are shown in diagrams for various configurations.
- 3077 THE CYCLOTRON IN RADIATION THERAPY AND MEDICAL DIAGNOSIS. Bozoky, L. (Országos Onkológiai Intézet, Budapest (Hungary)). Fiz. Sz.; 24: No. 3, 65-69(1974). (In Hungarian). 4 figs.; 4 refs.; 1 tab..
A review is given on the present state of the use of cyclotrons in medicine. The differences in the biological effects of neutron and X-ray or gamma radiation make it possible to use fast neutron radiation to kill tumour cells without inflicting irreversible damage to the necessarily irradiated normal cells. Neutrons transfer their energy to the medium by colliding with protons and thus their linear energy transfer [LET] is high. The high LET radiations have similar effects on the cells with normal or low oxygen supply. In addition, the relative biological effectiveness [RBE] of neutron radiation is dependent on the doses used in the various fractions. The depth dose curves of fast neutron radiation generated by D-Be nuclear reaction with deuteron energies above 35 MeV is more advantageous than the depth dose curves of ^{60}Co . The cyclotrons can also be used to produce at the site of use the radioisotopes with very short half-life. These isotopes have several advantageous properties when used in medical diagnosis: the radiation load to the patient is much lower than with isotopes with longer half-life, the precision of the measurements can be increased without health hazard to the patients, the diagnostic procedures can be repeated after a short time, and isotopes emitting gamma radiation without the joint emission of beta radiation can be produced.
- 3078 RADIATION DOSIMETRY: ELECTRONS WITH INITIAL ENERGIES BETWEEN 1 AND 50 MEV. Washington, DC; International Commission on Radiation Units and Measurements (1974). 64p. \$4.00.
The purpose of the report is to examine how certain radiation quantities, particularly the absorbed dose, can be determined for electrons with initial energies between 1 and 50 MeV. This energy range was chosen to include those radiations produced by linear and circular accelerators in medical, radiochemical and radiobiological applications. The determination of basic parameters of electron beams, especially electron energy, energy spectrum, and electron fluence, is dealt with. Individual chapters cover different methods for determination of the absorbed dose (including solid state dosimetry with thermoluminescent materials), construction and use of monitor

systems, measurement and control of electron beam characteristics and practical problems in determination of the absorbed dose. (CIS Abstr., Vol. 2)

- 3079 RADIOPROTECTION OF HOSPITAL WORKERS IN CONTACT WITH RADIOACTIVE PATIENTS. Jean-Claude, D. (Univ., Liege). pp 303-305 of Recent advances in nuclear medicine. Tokyo; First World Congress of Nuclear Medicine (1974).

From 1. world congress of nuclear medicine and exhibition meeting; Tokyo, Japan (30 Sep 1974).

See CONF-740926--.

Some topics discussed are: patients as sources of external radiation and contamination; assessment of exposure of nursing personnel; maximum permissible dose for hospital staff; responsibility of hospital for administrative and physical control; and recommendations for reducing doses and organization of information of hospital staff to provide signaling system of radioactive patients and development of safety measures. (HLW)

- 3080 RADIATION PROTECTION PRINCIPLES IN RADIOIODINE THERAPY. Nemec, J. pp 156-161 of Radioiodine therapy of thyroid diseases. Prague; Avicenum, Zdravotnicke Nakladatelstvi (1974). (In Czech)

The principles are listed reducing the risks to medical personnel of external irradiation and internal contamination during radiiodine treatment.

- 3081 HIROSHIMA AND NAGASAKI: THE GENETIC CONSEQUENCES OF THE ATOM BOMBS. Frydenberg, O. Nat. Verden; No. 10, 305-328(1974). (In Danish).

A summary of results published in reports from the Atomic Bomb Casualty Commission concerning the genetic consequences of the use of atom bombs on Hiroshima and Nagasaki.

- 3082 POSSIBLE RISKS OF LOW-DOSE IRRADIATION. Hug, O. (Muenchen Univ. (F.R. Germany). Strahlenbiologisches Inst.; Gesellschaft fuer Strahlen- und Umweltforschung m.b.H., Neuherberg/Muenchen (F.R. Germany). Inst. fuer Biologie). pp 140-158 of Die natuerliche Strahlenexposition des Menschen. Grundlage zur Beurteilung des Strahlenrisikos. Aurand, K.; Buecker, H.; Hug, O.; Jacobi, W.; Kaul, A.; Muth, H.; Pohlit, W.; Stahlhofen, W. (eds.). Stuttgart; Thieme (1974). (In German)

13 figs.; 38 refs..

The survey on more recent experimental and epidemiological data and newer concepts for a realistic estimation of the radiation risk leads to the conclusion that for radiation late damages and possibly also for genetic damages with a chronic radiation exposure in the order of magnitude of the natural radiation exposure and probably also in the order of magnitude of the maximum permissible radiation dose, the risk is very probably lower than is to be expected based on the findings after relatively high doses and dose rates. A few less direct comparative studies have detected a time factor of 3 to 5. Considering the analysis of the RBW demely ionizing radiation which at high doses is not greater than 3, increases with decreasing dose and according to biophysical considerations, can possibly reach a value of 30, an effectiveness reduced by a factor of 10 of small doses and dose rates of loosely ionizing radiation would be even to be expected. All radiobiological knowledge on the effect of ionizing radiation allows one to

expect that even smallest radiation doses can cause cellular damages due to the linear irreversable components of the radiation effect and probably that these damages can even be the starting point of a malignant tumour. Regarding this cancer-initiating effect however, the effectiveness of loosely ionizing radiation per rad in the region of natural radiation exposure lie considerably below that existing at high doses and dose rates. Whether however this initial carcinogenic effect of very small doses is at all noticeable during the average life duration in an increase of the spontaneous age-specific tumour rate is questionable if the assumption is confirmed that with decreasing dose, the time manifestation of the radiation induced tumours is delayed.

- 3083 SAFE HANDLING OF RADIATION SOURCES.

Oberhofer, M. (Commission of the European Communities, Ispra (Italy). Joint Research Centre). Munich; Thieme (1974). 252p.

116 figs.; 9 tabs.; 65 refs..

This book does not present regulations and explanations, but offers guidance in the practical procedures of radiation protection. It describes how man, who cannot perceive the danger of radiation with his natural senses, should conduct himself in a radiation field - how we should work with sealed and unsealed radiation sources. The book describes the appropriate equipment and discusses typical incidents and accidents.

- 3084 CONSIDERATIONS ON THE ESTABLISHMENT OF MAXIMUM PERMISSIBLE EXPOSURE OF MAN. Jacobi, W. (Gesellschaft fuer Strahlen- und

Umweltforschung m.b.H., Neuherberg/Muenchen (F.R. Germany). Inst. fuer Strahlenschutz). pp 170-186 of Die natuerliche Strahlenexposition des Menschen. Grundlage zur Beurteilung des Strahlenrisikos. Aurand, K.; Buecker, H.; Hug, O.; Jacobi, W.; Kaul, A.; Muth, H.; Pohlit, W.; Stahlhofen, W. (eds.). Stuttgart; Thieme (1974). (In German)

7 figs.; 3 tabs.; 18 refs..

An attempt is made in the information lecture to give a quantitative analysis of the somatic radiation risk and to illustrate a concept to fix dose limiting values. Of primary importance is the limiting value of the radiation exposure to the whole population. By consequential application of the risk concept, the following points are considered: 1) Definition of the risk for radiation late damages (cancer, leukemia); 2) relationship between radiation dose and thus caused radiation risk; 3) radiation risk and the dose limiting values at the time; 4) criteria for the maximum acceptable radiation risk; 5) limiting value which can be expected at the time.

- 3085 EXTERNAL EXPOSURE BY TERRESTRIAL RADIATION IN BUILDINGS (BUILDING MATERIALS).

Keller, G. (Universitaet des Saarlandes, Homburg/Saar (F.R. Germany). Inst. fuer Biophysik); Schmier, H.; Seelentag, W. Jr. (Bundesgesundheitsamt, Berlin (F.R. Germany). Abt. fuer Strahlenhygiene). pp 70-79 of Die natuerliche Strahlenexposition des Menschen. Grundlage zur Beurteilung des Strahlenrisikos. Aurand, K.; Buecker, H.; Hug, O.; Jacobi, W.; Kaul, A.; Muth, H.; Pohlit, W.; Stahlhofen, W. (eds.). Stuttgart; Thieme (1974). (In German)

7 tabs.; 7 refs..

The external exposure by terrestrial radiation from outside should be due to the greater exposure in buildings, on average about 10 to 20 mrem per annum higher than was assumed

sofar. According to the hitherto results of site dose rate measurements in flats, the extreme values should be about 40 to 200 mrem per annum for the total external exposure. Sofar no extremely high value has been found in the determination of the content of radioactive materials in building materials. Besides the content of radioactive materials, other criteria too, such as radiotoxicity and the dose rate constant, have to be considered in fixing a limiting value of radioactivity in the building materials which are allowed to be used.

- 3086 BALANCE OF EXTERNAL AND INTERNAL NATURAL RADIATION EXPOSURE. Muth, H. (Universitaet des Saarlandes, Homburg/Saar (F.R. Germany). Inst. fuer Biophysik). pp 129-139 of Die natuerliche Strahlenexposition des Menschen. Grundlage zur Beurteilung des Strahlenrisikos. Aurand, K.; Buecker, H.; Hug, O.; Jacobi, W.; Kaul, A.; Muth, H.; Pohlit, W.; Stahlhofen, W. (eds.). Stuttgart; Thieme (1974). (In German)

5 tabs.; 20 refs..

Data from UNSCEAR 1972 and a few new data are the basis of the summarizing survey. The tables contain average values of the dose rates in the organs of particular interest through the single exposure components and a summing-up for the average total dose rate.

- 3087 SOCIAL LEGISLATION: ARTICLES 548, 551 RVG. Fischerhof, H. Soz.- Praeventivmed.; No. 6, 247-251(1974). (In German).
A physicist who had been concerned with the nuclear photoelectric effect of deuterons at a university became ill 2 years after completing the work and died a year later. The widow sued for a pension out of the official compensation fund. The case went through a lower instance to the Bundessozialgericht (BSG). This court passed the first judgement - as far as is known - on legal insurance against accidents with regard to the handling of radioactive materials (judgement of the 8th senate of the 'Bundessozialgericht' dated 29.1.74 - 8/7 RU 18/72): The principle of objective onus of the proof with regard to social jurisdiction (BSG 1957-10-24 10 RV 945/55 = BSGE 6, 70) is also valid in the case of a possible but not probable causal connection between occupational radiation effect and illness according to the taking of evidence. The exact wording of the reasons for the judgement is given. The author comments on the judgement and holds out hope that the case before the court induces the legislator to give a better protection to those employed in establishments concerned with radiation by a legal supposition of causality. - Personal remark by the abstractor: How will a plaintiff objectively prove causality - perhaps even after many years.

- 3088 RESULTS OF THE RADIATION TREATMENT OF PATIENTS WITH CANCER OF THE DISTAL SECTIONS OF THE COLON. Galstyan, A.M.; Grigoryan, G.T.; Sarkisyan, E.Kh.; Papazyan, Sh.A.; Galcyan, I.S.; Dadoyan, G.S. Zh. Eksp. Klin. Med.; 14: No. 4, 60-66(1974). (In Russian).

Results are presented on the telegammatherapy of 270 patients having cancer of the distal sections of the colon. Preoperational irradiation led to significant regression of the tumor so that it was possible to perform radical operations on 31.5 percent of the patients with locally propagated forms of the tumor. The effectiveness of fractionated and continuous techniques of irradiation therapy were almost the same, but the patients endured the fractionated therapy significantly

better. The most sensitive to radiation was glandular cancer, while the most resistant to radiation was colloidal cancer. The radiosensitivity of healthy and cancerous tissues is different. With radiation therapy (not less than 4500 rad) a decrease in parenchymal elements of the tumor sets in with the appearance of vacuoles and necrotic spots. Recidivists were resistant to irradiation. Thanks to preoperational gamma therapy the percent of recidivists in comparison with nonirradiated patients with 28.4 fell to 19.2. 15 refs. (SJR)

- 3089 ACTIVITY DYNAMICS OF LYSOSOMAL ENZYMES AND PROTEOGLYCAN-LIKE COMPOUNDS IN PATIENTS WITH PRIMARY DEFORMING OSTEOARTHRITIS UNDER THE EFFECT OF RADON BATHS HAVING RADON CONCENTRATIONS OF 100 (36.4 NANOCURIES/L) AND 300 (102.2 NANOCURIES/L) MACH UNITS. Aryppaeva, T.T. (Central Inst. of Health Resorts and Physioger., Moscow). Vopr. Kurortol., Fizioter. Lech. Fiz. Kul't.; 6: 509-512(1974). (In Russian).

Determination of the activity of acid phosphatase and of the acid proteinases in the blood serum is an additional criterion of the course of a pathological process during primary deforming osteoarthritis. Radon baths with a radon concentration of 100 Mach units cause a decided lowering in the activity of acid hydrolases and proteoglycan-like compounds in the blood serum. Radon baths with a radon concentration of 100 (36.4 nanocuries/liter) Mach units promote a favorable decrease in the destructive effects on the epiphyseal cartilage, and an increase in the nonspecific resistance of the organism. 6 references. (SJR)

- 3090 EFFECT OF RADON BATHS HAVING A RADON CONCENTRATION OF 100 MACH UNITS (36.4 NANOCURIES/LITER) ON PATIENTS HAVING A DEFORMING OSTEOARTHRITIS WITH MYOCARDIAL DAMAGE. Tsarfis, P.G.; Kostrova, V.D.; Gerasimenko, V.N.; Fifeiskaya, A.A. (Central Inst. of Health Resorts and Physioger., Moscow). Vopr. Kurortol., Fizioter. Lech. Fiz. Kul't.; 6: 506-509(1974). (In Russian).

The patients took the radon baths at a temperature of 36°C for a period of 15 minutes. The treatment consisted of 14 to 16 baths with a break of one day between baths. After completing the baths, pain in the limbs subsided significantly and disappeared in three-fourths of the patients. Locomotor function improved. Muscle tone increased. Improvement in physical function was noted in 75 out of 80 patients. 3 references. (SJR)

- 3091 EVALUATION AND CONTROL OF RADON DAUGHTER HAZARDS IN URANIUM MINES. Holaday, D.A. Cincinnati; National Institute for Occupational Safety and Health (1974). 64p.

Technical information report covering the following subjects: physical and chemical characteristics of radon and daughter products; biological effects; dosimetric considerations; evaluation of uranium mine atmospheres; control of exposure; evaluation of individual exposures; personal protection devices; glossary of terms.

- 3092 RADIATION LOADS OF PHYSICIANS-SURGEONS AND PARAMEDICAL PERSONNEL IN CATHETERIZATION OF THE CARDIAC CAVITIES AND VESSELS WITH THE USE OF ELECTRON-OPTIC AMPLIFIERS AND X RAY TV UNITS. Zolnikova, N.I.; Zaretskii, V.V.; Petrosyan, Yu.S. Grud. Khir.; 1: 41-47(1974). (In Russian).

The article presents the materials of radiative-dosimetric investigations of the

working conditions of physicians-surgeons, paramedical and auxiliary medical personnel, who use electron-optic amplifiers, roentgenotelevision and roentgenocinematographic units in the present-day roentgenodiagnosis of cardiovascular diseases.

- 3093 EFFICACY OF PROPHYLACTIC IRRADIATION IN ALTERING RENAL ALLOGRAFT SURVIVAL. Faber, R.; Johnson, H.K.; Braren, H.V.; Richie, R.E. (Vanderbilt Univ., Nashville). Proc. Clin. Dial. Transplant Forum; 4: 135-137(1974).

Renal allograft rejection is a complex phenomenon involving both cell-mediated and humoral antibody responses. Most transplant programs have used a combination of therapeutic modalities to combat the immune system in an attempt to prolong both allograft and patient survival. Corticosteroids (methylprednisolone (Solu-Medrol) and prednisone and azathioprine (Imuran) are widely accepted as immunosuppressive drugs; however, both are non-specific and have the disadvantage of compromising the recipients' defense mechanisms. Nevertheless, these drugs have proved to be essential to the success of renal transplantation and they are routinely used while the efficacy of other modalities continues to be evaluated. We could find no reports of a prospective study to evaluate the efficacy of prophylactic irradiation in the complex therapeutic situation of renal transplantation with the only variable being the administration of local graft irradiation. The purpose of this study was to evaluate prophylactic graft irradiation for its effectiveness in preventing graft rejection in conjunction with Imuran and corticosteroids.

- 3094 ALTERATIONS OF BLOOD AND BLOOD COAGULATION BY EXTRACORPOREAL IRRADIATION IN LEUKEMIA AND RADIOPHOSPHORUS THERAPY IN POLYCYTHEMIA. Huhn, D. (Gesellschaft fuer Strahlen- und Umweltforschung m.b.H., Muenchen (Germany, F.R.). Inst. fuer Haematologie); Kaboth, W.; Theml, H.; Murr, H.; Schramm, W.; Leisner, B. pp 89-102 of Strahlen, Blutgerinnung und Haemostase. XVI. Hamburger Symposium ueber Blutgerinnung. Marx, R. (ed.) (Muenchen Univ. (Germany, F.R.). 1. Medizinische Klinik); Thies, H.A. (ed.) (Staedtische Krankenanstalten Heilbronn (Germany, F.R.). Chirurgische Klinik). Stuttgart, Germany, F.R.; Schattauer (1974). (In German)

Animal experiments prove a high radiation resistance of megakaryocytes and thrombocytes. Radiophosphorus is thought to influence mainly the megakaryocytes in their beginnings; an effect on the vessel system of the bone marrow is particularly to be discussed in the case of very early and quickly reversible drop in thrombocytes. In the very first week after radiophosphorus administration, a considerable drop in thrombocytes is already seen in some patients, the number of patients remaining the same during the following 3 weeks. After blood irradiation, the thrombocytes are for a certain period reduced due to the influence of the extracorporeal circulation, but in general their number increases again during the following months. A considerable disfunction of the thrombocytes or a disturbed coagulation is not found either after radiophosphorus treatment or after extracorporeal blood irradiation.

- 3095 TYPES AND EFFECTS OF RADIATION COMING FROM NUCLEAR WEAPONS. Messerschmidt, O. (Laboratorium fuer Experimentelle Radiologie, Neuherberg/Muenchen (Germany, F.R.)). pp 9-27

of Strahlen, Blutgerinnung und Haemostase. XVI. Hamburger Symposium ueber Blutgerinnung. Marx, R. (ed.) (Muenchen Univ. (Germany, F.R.). 1. Medizinische Klinik); Thies, H.A. (ed.) (Staedtische Krankenanstalten Heilbronn (Germany, F.R.). Chirurgische Klinik). Stuttgart, Germany, F.R.; Schattauer (1974). (In German)

The article shows which effects can be expected from an atomic explosion, such as neutron and gamma rays, pressure surge, thermal radiation and at which KT-values and at which distance from the centre influence the individual noxious substances is most pronounced. Combined effects and delayed effects are discussed. The results of the numerous studies on the effects of the A-bomb dropping on Hiroshima and Nagasaki are shown. Results of animal experiments are used for explanation. Furthermore, the effect of radioactive fallout is described. As an example, the author points out the Marshall islands on which radioactive fallout was noticed after a nuclear weapon test by the Americans.

- 3096 BLOOD AND BLOOD COAGULATION DISTURBANCES BY NUCLEAR WEAPONS. Uchino, H.; Kamada, N. (Hiroshima Univ. (Japan). Research Inst. for Nuclear Medicine and Biology). pp 45-72 of Strahlen, Blutgerinnung und Haemostase. XVI. Hamburger Symposium ueber Blutgerinnung. Marx, R. (ed.) (Muenchen Univ. (Germany, F.R.). 1. Medizinische Klinik); Thies, H.A. (ed.) (Staedtische Krankenanstalten Heilbronn (Germany, F.R.). Chirurgische Klinik). Stuttgart, Germany, F.R.; Schattauer (1974).

The paper reviews the summarized results of investigations on the effect of atomic bomb on hematology which were obtained in inhabitants of Hiroshima and Nagasaki in the early stage after detonation and, furthermore, the results of studies on late effects which were investigated at the authors Institute. Emphasis is given on the fact that the effects of irradiation on bone marrow could continue for more than 25 years.

- 3097 CERTAIN PROBLEMS IN THE DETERMINATION OF ACCEPTABLE EXPOSURE TO RADIATION. Musialowicz, T. (Centralne Lab. Ochrony Radiologicznej, Warsaw (Poland)). Probl. Tech. Med.; 5: No. 2, 113-119(1974). (In Polish).

National regulations, according to international recommendations determine three categories of exposure of persons to ionizing radiation. These categories are limited by different maximal permissible doses. In practice there exist, at times, difficulties in the classification of persons into the different categories and the establishing of the acceptable risk for them. Such situations concern in general the risk, present in accidental situations. The paper presents suggestions to delineate the acceptable exposure for personnel, working with radiation sources and for other persons acting in diverse atypical, but met in practice, situations.

- 3098 ANATOMIC AND GEOMETRIC PRECISION IN RADIOTHERAPY. Marks, J.E.; Davis, M.K.; Haus, A.G. (Univ. of Chicago). Radiol. Clin. Biol.; 43: 1-20(1974).

Localization error or geometric miss as a cause of local failure in the radiotherapeutic management of cancer is generally known but inadequately studied. Using a film technique for treatment verification, a systematic study of localization error, its causes and incidence, was undertaken. Out of a total of

- 173 patients included in the study, a cumulative localization error of 27 percent could be ascribed to physicians, technicians and patients. No attempt was made to correlate localization error with local failure to control tumors but such a study is feasible with preservation of treatment verification films.
- 3099 (AED-Conf--74-736-000, pp 121-131) INVESTIGATIONS ABOUT THE EFFECT OF RADIOPROTECTIVE SUBSTANCES AFTER IRRADIATION OF MICE WITH FAST NEUTRONS. Langendorff, H.; Langendorff, M.; Moenig, H. 1974. (In German).
From Meeting of the Schutzkommission beim Bundesministerium des Innern; Munich, F.R. Germany (May 1974).
2 figs.; 3 tabs.; 19 refs..
Meeting of the Schutzkommission beim Bundesministerium des Innern. Lectures.
Several protective substances and their effects were tested within the frame of a radiobiological investigation with fast neutrons on mice. The following substances with an obviously resistance-raising effect in X-ray or γ -radiation were tested: p-aminopropionic phenon (PAPP), cystamine, 5-hydroxytryptamine (Serotomine), liposaccharide of E-coli (LPS), chlortrianisen, and 5-2/3 aminopropylaminoethylthiophosphate. The substances were all but one injected inhaperitroneally; chlortrianisen was given subcutaneously. The LDsub(50/30d) was chosen as a basis for the evaluation of the test results. The dose reduction factor (DRF) was used as quantitative measure for the protective effect of a substance. The results show that the radiation-resistance-raising effect of the substances mentioned above is clearly lower in neutron radiation of mice than in X-ray radiation. Some experiments showed no resistance-increasing effects at all. The corresponding mechanisms of the substances and their protective effect one discussed on various tissues. The results obtained might help to find substances inducing an increased radiation resistance in the future even if cells and tissues of mammals are exposed to radiation of high LET.
- 3100 CHANGES OF MAO ACTIVITY IN THE BRAIN FOLLOWING RADIATION EXPOSURE. Goksadse, G.K. pp 52-63 of Radiatsionnye issledovaniya. I. Nadareishvili, K.Sh. (ed.). Tbilisi, USSR; Metsniereba (1974). (In Russian)
The effect of whole-body x-irradiation on the monoaminooxidase activity in the cortex, thalamus, medulla, and cerebellum has been studied in rats. It has been established that after x-irradiation the activity of total monoaminooxidase in all the brain areas studied first increases, then decreases, and keeps at this level over several days. Monoaminooxidase, specific to serotonin, has also been found to be highly sensitive to x rays. (auth)
- 3101 CYTOPHOTOMETRY OF THE ADRENAL CORTEX IN THE X-IRRADIATED RABBITS. Gelashvili, N.A. pp 80-110 of Radiatsionnye issledovaniya. I. Nadareishvili, K.Sh. (ed.). Tbilisi, USSR; Metsniereba (1974). (In Russian)
According to the decrease in the total number of cells, structural changes in nuclei and cytoplasm, nuclear content of DNA, the cellular populations of various lamina in the adrenal cortex varied in radiosensitivity. The cells of the reticular and medullar areas appeared in this respect most sensitive, then those of fascicular and arched areas. At stimulation of the retina with blinking light during irradiation according to their radiosensitivity the adrenal lamina responded as follows: medullar, reticular, fascicular and arched areas. On the 15th day after the exposure hypertrophy and widening of the cortical and brain areas accounting for the increase of the volume of the adrenal cortex were observed. Stimulation of the retina with blinking light during irradiation enhances the effect of exposure in all the adrenal cells of the rabbit. (auth)
- 3102 EFFECT OF OVERCOOLING OF THE ORGANISM DURING X-IRRADIATION ON THE RADIORESISTANCE OF THE ANIMAL AND EMBRYO. Partskhaladze, N.N. pp 111-130 of Radiatsionnye issledovaniya. I. Nadareishvili, K.Sh. (ed.). Tbilisi, USSR; Metsniereba (1974). (In Russian)
Studies made on the overcooling effect in warmblooded animals (rats) have demonstrated that only deep hypothermia with a breath arrest during x-irradiation yields a vivid radioprotective effect; hypothermia itself with no decrease in oxygen consumption has no antiradiation effect; i.e. oxygen effect is a major factor in the defence mechanism; at absolute lethal doses of x-irradiation hypoxia without a considerable hypothermia has no radioprotective effect. Overcooling of the organism to the arrest of the heart beat was found to have no radioprotective effect in poikilothermal animals and embryos. (auth)
- 3103 DARK RETICULAR CELLS IN THE THYMUS OF MICE. Jaerplid, B. (Foersvarets Forskningsanstalt, Stockholm (Sweden)). Acta Radiol., Ther., Phys., Biol.; 13: No. 4, 319-328(1974).
The morphology and distribution of dark reticular cells in the thymus of normal mice, of irradiated mice, and of mice with thymic lymphoma are described. It is concluded that dark cells are epithelial reticular cells and the hypothesis is suggested that dark and light epithelial reticular cells may be different modes of expression of the same cell type. (auth)
- 3104 Radiobiologiya. Uchebnik za studenti po zhivotnovydstvo. (RADIOBIOLOGY. A TEXTBOOK FOR STUDENTS IN ANIMAL BREEDING). Dryanovski, P. Sofia; Zemizdat (1974). 192p. (In Bulgarian).
46 refs..
The book represents a textbook of radiobiology adapted to the needs of veterinary medical sciences and practice, where some of the examined questions concern interests of other agricultural specialists. Physical properties of ionizing radiation, its interaction with the substance and hypothesis explaining biological action of radiation are consistently looked into. Effects of radiation on cells and animal and plant organisms are described as well as factors involved in radiation effect. Furthermore, symptoms of acute radiation illness in man and some domestic animals are examined. Information is given concerning radioactivity in the biosphere: natural radioactive background and sources of artificial radioactive contamination as well as a more detailed information about radioactive contamination of man and animals and that of food products of animal origin. Peculiarities in biologic action of radioactive substances are shown. A special attention is drawn to the question of veterinary radiometric expert examination of the environment and food products and methods used in deactivation of fodder, food products and water as well as the question about applying radioactive isotopes in

diagnostic practice and therapy and its use in sterilization and conservation of food products and other materials. (INIS)

- 3105 ANTIRADIATION EFFECTIVENESS OF PHOSPHORUS-CONTAINING DERIVATIVES OF S-ALKYLSITHIURONIUM. Kozhevnikov, V.V.; Suetina, G.N.; Afonina, T.D.; Shinyaeva, V.N.; Mizrahh, L.I. *Izv. Estestvennonauchn. Inst. Permsk. Gos. Univ.*; 15: No. 2, 114-118(1974). (In Russian).

A study was made of 8 new substances from the series of phosphorus-containing derivatives of S-alkylisothiuronium, most of which fall in the betaine class. To make the evaluation, two tests were performed: 30 day survival of lethally irradiated animals [mice--hybrid F₁ (CBA x C₅₇Bl)] and the dynamics of change in total bone marrow cell count within 30 days after γ irradiation at low dose rates. The standard in the first case was S-ethylisothiuronium (ethirone), in the second case-- α -mercaptoethylamine (MEA). A slight protective effect (10-17 percent) was found for two substances in the survival test, while the other substances in the series showed no effect at all. These two substances had a clear normalizing influence on the bone marrow, equal to the effect of the mercamine standard.

- 3106 LOW-DOSE RADIATION EFFECTS ON THE DEVELOPING BRAIN OF THE MAMMALIAN FETUS. Kameyama, Y.; Hoshino, K. (Nagoya Univ., Japan). pp 1215-1217 of *Recent advances in nuclear medicine*. Tokyo: First World Conference of Nuclear Medicine (1974).

From 1. world congress of nuclear medicine and exhibition meeting; Tokyo, Japan (30 Sep 1974).

See CONF-740926--.

X radiation at a single dose of 25 R prolonged significantly the cell cycle time of matrix cells of telencephalon in 10-day CF 1 mouse embryos. The prolongation was due to lengthening of G₂ period. At the same time, pyknotic cells in the matrix layer increased more than five times of control level, indicating a threshold dose of x-ray for causing acute cell death in embryonic brain is lower than 25 R in mice.

- 3107 BIOLOGICAL IONIZING RADIATION EFFECTS ON GONADS. IV. THE EFFECT OF DOSE FRACTIONATION ON SURVIVING OF OOCYTES IN THE OVARY OF MICE. Rudnicki, T.; Sloninska, B. (Akademia Medyczna, Poznan (Poland)). *Nukleonika*; 19: No. 10, 941-947(1974). (In Polish).

The mice were irradiated with single and fractionated dose 100 rad, using 2-9 split doses in 24 or 96 hours. Qualitative estimation of surviving of oocytes was carried out in 1-90 days after irradiation. The number of degenerated oocytes does not depend upon the number of split doses or the time of protraction. The final effect of irradiation depends on accumulated dose only.

- 3108 EFFECT OF RADON INHALATIONS ON CERTAIN OXYDA-REDUCTIVE ENZYMES IN ADRENALS OF WHITE RATS. Robaczynski, J.; Kaplonska, J.; Lozinska, E. (Akademia Medyczna, Wroclaw (Poland)). *Pol. Tyg. Lek.*; 29: No. 50, 2173-2176(1974). (In Polish).

Histochemical investigations were carried out on adrenals of white rats after radon inhalations from inhalers in Swieradow-spa. Increased reactions of oxydo-reductive enzymes: NAD tetrazolium reductase, succinic dehydrogenase and glucose-6-phosphate dehydrogenase were observed in the adrenal

cortex, particularly in the zona reticularis which was hypertrophied. Raised activity of oxydo-reductive enzymes in the cells of adrenal cortex evidences increased metabolism in these cells which may reflect increased production of hormones. Finding of stimulation of adrenocortical cells after radon inhalations is of essential importance for explanation of the biological mechanism of action of radon used in balneotherapy.

- 3109 RADIATION EFFECTS ON PLATELET FUNCTION AND ON SOME SUBSTANCES IMPORTANT FOR THE PRIMARY HAEMOSTASIS. Marx, R. (Muenchen Univ. (Germany, F.R.)). 1. Medizinische Klinik; Bunde, E.; Murr, H.; Schramm, W. pp 109-115 of *Strahlen, Blutgerinnung und Haemostase*. XVI. Hamburger Symposium ueber Blutgerinnung. Marx, R. (ed.) (Muenchen Univ. (Germany, F.R.)). 1. Medizinische Klinik; Thies, H.A. (ed.) (Staedtische Krankenanstalten Heilbronn (Germany, F.R.)). Chirurgische Klinik. Stuttgart, Germany, F.R.; Schattauer (1974). (In German)

Human thrombocytes in citrated plasm are only little sensitive to x rays or γ rays extracorporally. Non-fibrillary collagen is rather sensitive to γ rays. Whole-body irradiation with higher doses in experimental animals can lead (in phases) to radiothrombopathy, the megakaryocytic or plasmatic genesis of which has not been examined yet. According to the results available, γ rays can lead to ambivalent haemostaseotropic effects depending on the dosage. The minus-radio-haemostaseopathy in the case of radiation syndrome is potentially due to complex causes, quantitative as well as potentially qualitative platelet alterations playing the main part, and vessel alterations (endotheliopathy, hyperpermeability etc.) being also of importance.

- 3110 STUDIES ON THE RADIOPROTECTIVE EFFECT OF DIANABOL AND TRASYLOL DURING FRACTIONATED IRRADIATION OF RATS. Kocmierska-Grodzka, D.; Daniluk, J.; Radwan, J.; Danysz, A. (Akademia Medyczna, Bialystok (Poland)). *Postepy Fiz. Med.*; 9: No. 4, 185-191(1974). (In Polish).

Studies were made on the radioprotective effect of Dianabol using two different modes of irradiation. It was found, that Dianabol did not have any effect on the dynamics of the survival of the rats irradiated daily with the dose of 75 and 150 R (up to the time of their death). By limited fractionated irradiation (5 x 150 R) Dianabol had a slight protective effect in the survival estimation. This was found to increase by using Trasylool.

- 3111 CASE OF EXTERNAL CESIUM-137 EXPOSURE OF RARE ANATOMICAL LOCALIZATION. Krushkov, I.; Daskalov, A.; Kusmanova, P.; Konstantinova, B.; Mikhailov, M.; Kodjeikova, A. (Inst. of Radiology, Sofia). pp 1404-1406 of *Recent advance in nuclear medicine*. Tokyo: First World Conference of Nuclear Medicine (1974).

From 1. world congress of nuclear medicine and exhibition meeting; Tokyo, Japan (30 Sep 1974).

See CONF-740926--.

A 30-yr old man placed a metallic capsule containing ¹³⁷Cs in his shirt pocket and handled the capsule with both hands. Four days later he noticed erythema and vesiculation of the skin of the chest and he noticed pain and numbness of the fingers 11 days after exposure. At 19 days gastrointestinal symptoms appeared and at 22 days he consulted a physician and was hospitalized. Changes in blood, bone marrow, chromosomes, and skin of the chest, neck, and

- hands are described up to 40 days post-exposure. Daily EKG observations revealed no pathologic changes in the heart. (HLW)
- 3112 CHARACTERIZATION OF RECIPIENT RADIATION DOSE FROM A PLUTONIUM-238 PULSE GENERATOR. Brackenbush, L.W.; Endres, G.W.R.; Griffin, B.I.; Nelson, I.C. (Battelle Pacific Northwest Labs., Richland, WA). pp 1410-1412 of Recent advance in nuclear medicine. Tokyo; First World Conference of Nuclear Medicine (1974).
From 1. world congress of nuclear medicine and exhibition meeting; Tokyo, Japan (30 Sep 1974).
See CONF-740926--.
Measurements were made of photon and neutron dose equivalents of a ^{238}Pu pulse generator used in nuclear heart pacemakers. Dose equivalents to various organs of a simulated recipient are presented. Doses to those associated with the recipient were estimated and it was concluded that an individual could be located within 25 cm of a pacemaker recipient for one year and receive a total dose including background radiation of only twice the background radiation dose. (HLW)
- 3113 FURTHER APPRAISAL OF DOSIMETRY RELATED TO URANIUM MINING HEALTH HAZARDS. Nelson, I.C.; Parker, H.M. Cincinnati; National Institute for Occupational Safety and Health (1974). 106p.
The contents include: introduction; characterization of mine atmosphere; lung model and breathing patterns; deposition of active material in the respiratory system; regional translocation and equilibrium activities; target tissue and dose; subjective basis of dose comparisons; conclusions and recommendations. Appendices are devoted to: radon (^{222}Rn) decay scheme; comparison of lung models; regional translocation and equilibrium activities; development of dose; dose equations and calculated results; subjective dose calculation, etc., much of this information being given in tabular form.
- 3114 INTERNAL RADIATION EXPOSURE BY URANIUM. Aurand, K.; Gans, I.; Ruehle, H. (Bundesgesundheitsamt, Berlin (F.R. Germany). Inst. fuer Wasser-, Boden- und Lufthygiene). pp 80-84 of Die naturliche Strahlenexposition des Menschen. Grundlage zur Beurteilung des Strahlenrisikos. Aurand, K.; Buecker, H.; Hug, O.; Jacobi, W.; Kaul, A.; Muth, H.; Pohlit, W.; Stahlhofen, W. (eds.). Stuttgart; Thieme (1974). (In German)
6 tabs.; 11 refs..
The ubiquitous occurring natural uranium in the biosphere is contained in human tissue in concentrations of the magnitude of ng/g where the kidneys with 5.6 ng/g and the bones with 3.1 to 7 ng/g exhibit the highest concentrations. The annual equivalent dose resulting from the α -decay is between 0.1 and 8 mrem/a for individual organs. An enrichment of uranium in areas of greater uranium uptake in drinking water could sofar not be observed.
- 3115 INTERNAL RADIATION EXPOSURE BY ^{226}Ra . Gloebel, B.; Muth, H. (Universitaet des Saarlandes, Homburg/Saar (F.R. Germany). Inst. fuer Biophysik); Oberhausen, E. (Universitaet des Saarlandes, Homburg/Saar (F.R. Germany). Abt. fuer Nuklearmedizin und Medizinische Physik). pp 90-94 of Die naturliche Strahlenexposition des Menschen. Grundlage zur Beurteilung des Strahlenrisikos. Aurand, K.; Buecker, H.; Hug, O.; Jacobi, W.; Kaul, A.; Muth, H.; Pohlit, W.; Stahlhofen, W. (eds.). Stuttgart; Thieme (1974). (In German)
1 fig.; 3 tabs.; 30 refs..
The natural internal radiation exposure of man by ^{226}Ra can be estimated from literature data for an average whole body content of 10^{-10}Ci ^{226}Ra to 0.08 mrad/a for soft tissue share and to about 1.7 mrad/a for bones.
- 3116 INTERNAL RADIATION EXPOSURE BY ^{222}Rn , ^{220}Rn AND THEIR SHORT-LIVED DAUGHTER PRODUCTS. Jacobi, W. (Gesellschaft fuer Strahlen- und Umweltforschung m.b.H., Neuherberg/Muenchen (F.R. Germany). Inst. fuer Strahlenschutz); Schraub, A. (Giessen Univ. (F.R. Germany). Inst. fuer Biophysik). pp 118-128 of Die naturliche Strahlenexposition des Menschen. Grundlage zur Beurteilung des Strahlenrisikos. Aurand, K.; Buecker, H.; Hug, O.; Jacobi, W.; Kaul, A.; Muth, H.; Pohlit, W.; Stahlhofen, W. (eds.). Stuttgart; Thieme (1974). (In German)
3 figs.; 2 tabs.; 33 refs..
The lung dose due to ^{222}Rn and ^{220}Rn is negligible compared to the dose through inhalation of its short-lived decay products. In the average natural activity level of these nuclides in the air, the following average values of the average α -dose rate or equivalent dose in the respiratory tract for the reference human are obtained: 1) pulmonary region 6 mrad/a or 60 mrem/a; 2) tracheal bronchial region 12 mrad/a or 120 mrem/a, i.e. the ICRP recommendations of 1959 still valid today must be partly revised.
- 3117 INTERNAL RADIATION EXPOSURE BY ^{40}K . Kaul, A.; Roedler, H.D. (Freie Univ. Berlin (F.R. Germany). Klinikum Steglitz); Oberhausen, E. (Universitaet des Saarlandes, Homburg/Saar (F.R. Germany). Abt. fuer Nuklearmedizin und Medizinische Physik); Werner, E. (Gesellschaft fuer Strahlen- und Umweltforschung m.b.H., Neuherberg/Muenchen (F.R. Germany). Inst. fuer Biologie). pp 103-111 of Die naturliche Strahlenexposition des Menschen. Grundlage zur Beurteilung des Strahlenrisikos. Aurand, K.; Buecker, H.; Hug, O.; Jacobi, W.; Kaul, A.; Muth, H.; Pohlit, W.; Stahlhofen, W. (eds.). Stuttgart; Thieme (1974). (In German)
2 figs.; 3 tabs.; with refs..
Single values and the sum of the energy dose rate in various human organs are calculated from the distribution of ^{40}K in the whole body, its variation and age dependence.
- 3118 INTERNAL RADIATION EXPOSURE BY LOW ATOMIC NUMBER RADIONUCLIDES ^3H , ^{14}C AND OTHERS EXCEPT ^{40}K . Scheuermann, W. (Bochum Univ. (F.R. Germany). Arbeitsgruppe Molekulare Pflanzenzytologie). pp 112-118 of Die naturliche Strahlenexposition des Menschen. Grundlage zur Beurteilung des Strahlenrisikos. Aurand, K.; Buecker, H.; Hug, O.; Jacobi, W.; Kaul, A.; Muth, H.; Pohlit, W.; Stahlhofen, W. (eds.). Stuttgart; Thieme (1974). (In German)
2 tabs.; 23 refs..
The average dose rate for the whole body is calculated to be 1.02 mrad/a (^{14}C), 7.2-81.5 $\mu\text{rem/a}$ (T) and 0.6 mrad/a (^{87}Rb) from literature data.
- 3119 INTERNAL RADIATION EXPOSURE BY ^{210}Pb AND ^{210}Po . Stahlhofen, W. (Gesellschaft fuer Strahlen- und Umweltforschung m.b.H., Frankfurt am Main (F.R. Germany). Abt. fuer Biophysikalische Strahlenforschung); Sattler, E.L. (Giessen Univ. (F.R. Germany). Strahlenzentrum); Gloebel, B. (Universitaet des

Saarlandes, Homburg/Saar (F.R. Germany). Inst. fuer Biophysik). pp 94-102 of Die natuerliche Strahlenexposition des Menschen. Grundlage zur Beurteilung des Strahlenrisikos. Aurand, K.; Buecker, H.; Hug, G.; Jacobi, W.; Kaul, A.; Muth, H.; Pohlitz, W.; Stahlhofen, W. (eds.). Stuttgart; Thieme (1974). (In German)

2 tabs.; with refs..

For an average specific surface activity of about 13×10^{-4} pCi/cm², a dose rate region of about 2.6-13 mrad/a is calculated for the bronchial system obtained from own measurements and literature data of the α -activity and the distribution of ²¹⁰Pb/²¹⁰Po in the human body.

- 3120 CHANGES IN BLOOD COAGULATION AND BONE MARROW DUE TO THOROTRAST. Thies, H.A. (Staetdtische Krankenanstalten Heilbronn (Germany, F.R.). Chirurgische Klinik); Kuder, E. pp 273-279 of Strahlen, Blutgerinnung und Haemostase. XVI. Hamburger Symposium ueber Blutgerinnung. Marx, R. (ed.) (Muenchen Univ. (Germany, F.R.). 1. Medizinische Klinik); Thies, H.A. (ed.) (Staetdtische Krankenanstalten Heilbronn (Germany, F.R.). Chirurgische Klinik). Stuttgart Germany, F.R.; Schattauer (1974). (In German)

Delayed effects after application of thorotrast are reported on. Two thorotrast carriers are examined with regard to the plasma clotting factors to the thrombocytopcrosis of the bone marrow, and the capillary resistance. Both patients have a strongly reduced resistance of the capillary walls; the ascorbic acid test in the urine is negative. Thrombopenia is seen in one of the patients, plasmatic coagulation disturbance is not found. Thorotrast crystals are found in the sternal puncture fluid of both patients, once with reduced megakaryocytes as thrombocytes and once without any disturbance of haematopoiesis.

- 3121 STUDIES OF PULMONARY CARCINOGENESIS IN RODENTS FOLLOWING INHALATION OF TRANSURANIC COMPOUNDS. Sanders, C.L.; Dagle, G.E. (Pacific Northwest Labs., Richland, WA). pp 422-429 of Experimental lung cancer: carcinogenesis and bioassays. Karbe, E. (ed.). New York; Springer-Verlag New York Inc. (1974).

See CONF-740648--.

The influence of radiation dose and its distribution on pulmonary carcinogenesis in rats was examined following inhalation of ²³⁸Pu from crushed ²³⁸PuO₂ microspheres, ²³⁸PuO₂, ²³⁹PuO₂, and ²⁴¹CmO₂. A more uneven dose-distribution (e.g., ²³⁸PuO₂ or ²³⁹PuO₂) favored squamous carcinoma induction at high doses, while adenocarcinoma induction was more frequent at lower doses or at all doses having a more even dose-distribution in the lung (e.g., ²⁴¹CmO₂). Squamous metaplasia and adenomatosis preceded the development of squamous carcinoma and adenocarcinoma, respectively. Pulmonary hemangiosarcomas were found only after high doses of inhaled ²³⁹PuO₂. These results suggest an influence of dose and dose-distribution on the type and incidence of pulmonary tumors from inhaled alpha emitters.

See CONF-740648--.

Hamsters are exposed to selected lung burdens of plutonium contained in 10 μ m diameter inert microspheres of ZrO₂ ceramic. Injected into the jugular vein, the microspheres lodge quantitatively in the lung capillaries and remain immobile for the life of the hamster. Distribution through the lung is essentially random but shows a systematic variation through a factor of about 2 from lobe to lobe. The specific activity of the microspheres is varied from 0.01 to 100 pCi per sphere, spanning the range of respirable particles of ²³⁸PuO₂ and ²³⁹PuO₂. The number of spheres per animal varies from 2,000 to 1,000,000 and the lung burden from 0.1 to 1000 nCi. The fraction of lung irradiated ranges from 0.01 to 0.98, and the calculated median dose rate to the tissue exposed is from 0.5 to 700 krad per year. The spheres are completely inert and provoke no foreign-body reactions. In contrast to most methods of exposure by inhalation or insufflation, the radiation is delivered essentially 100 percent to the lung. Because of the immobility and uniformity of the microspheres, the distribution of energy deposition can be calculated with precision on a microscale.

- 3123 REPIRATORY CARCINOGENESIS IN RATS AFTER INHALATION OF RADIOACTIVE AEROSOLS OF ACTINIDES AND LANTHANIDES IN VARIOUS PHYSICOCHEMICAL FORMS. LaFuma, J.; Nenot, J.C.; Morin, M.; Masse, R.; Metivier, H.; Nobile, D.; Skupinski, W. (EURATOM-CEA, Fontenay-aux-Roses, France). pp 443-453 of Experimental lung cancer: carcinogenesis and bioassays. Karbe, E. (ed.). New York; Springer-Verlag New York Inc. (1974).

From Symposium on experimental respiratory carcinogenesis and bioassays; Seattle, WA, USA (23 Jun 1974).

See CONF-740648--.

To study the role of the distribution of local tissue irradiation on the toxicity of alpha emitters, groups of 50 to 165 rats were exposed to aerosols of ²⁴¹Cm(NO₃)₃, ²⁴¹Am(NO₃)₃, ²³⁸Pu(NO₃)₄, ²³⁹PuO₂, and ²⁴¹AmO₂ and observed for effects. Curium-244 was most evenly distributed in the lung and most effective in reduction of survival time followed in descending order by ²³⁸Pu(NO₃)₄, ²⁴¹Am(NO₃)₃, ²⁴¹AmO₂, ²³⁹Pu(NO₃)₄, and ²³⁹PuO₂, which was more heterogeneously distributed in the lung as particulate. The toxicity had 2 results: shortening of life span and cancer induction (about 50 percent bronchogenic carcinoma and 40 percent bronchiolo-alveolar carcinomas). There appeared to be no correlation between survival time and cancer induction or localization of the element in the lung and the starting point of the tumors. This histologic type of cancer was independent of the nature of the element. Toxicity and cancer induction appeared to depend on the homogeneity of radiation dose with the more evenly distributed dose being most effective.

See CONF-740648--.

Light water nuclear power reactor fuel cycles at various stages contain substantial quantities of β -emitting radionuclides. Thus, in the event of an accident, there is potential for inhalation exposure of man to various types and forms of β -emitting radionuclides. In order to study the biological effects of such potential exposures, a series of life span studies have been initiated in which beagle dogs have been exposed to inhalation to achieve graded lung burdens of a relatively insoluble fused clay form of β -emitting radionuclides. The specific radionuclides, ^{90}Y , ^{91}Y , ^{144}Ce , or ^{90}Sr , were selected on the basis of physical half-life to produce a variety of radiation-dose patterns to the lung. Early effects have been the development of radiation pneumonitis and progressive pulmonary fibrosis. In general, dogs which receive high- and rapidly-declining dose-rate exposure from ^{90}Y or ^{91}Y die earlier and at lower cumulative doses than dogs exposed to ^{144}Ce or ^{90}Sr . By contrast, the incidence of later-occurring malignant lung tumors and the degree of inflammatory response is greater in dogs which received protracted low dose-rate exposure associated with ^{144}Ce and ^{90}Sr . Of particular note is the nature of the lung tumors thus far observed.

- 3125 EXPERIMENTAL RESPIRATORY CARCINOGENESIS: INTERACTION BETWEEN ALPHA RADIATION AND BENZO(A)PYRENE IN THE HAMSTER. McGandy, R.B.; Kennedy, A.R.; Terzaghi, M.; Little, J.B. (Harvard School of Public Health, Boston). pp 485-491 of Experimental lung cancer: carcinogenesis and bioassays. Karbe, E. (ed.). New York; Springer-Verlag New York Inc. (1974).

From Symposium on experimental respiratory carcinogenesis and bioassays; Seattle, WA, USA (23 Jun 1974).

See CONF-740648--.

We have previously shown that a high incidence of lung cancer can be induced in hamsters by multiple intratracheal instillations of either benzo(a)pyrene (BaP) or polonium-210 (^{210}Po). The present experiments have used low doses of these 2 carcinogens, singly and together, in simultaneous and sequential designs. In terms of unequivocal lung tumors, 15 weekly instillations of ^{210}Po (total 0.05 μCi) and BaP (total 4.5 mg) given simultaneously on the same carrier particles induced twice the prevalence of lung tumors expected from the additive effect of either carcinogen alone. In a separate experiment, a single instillation of 0.04 μCi ^{210}Po led to only 1 tumor in 139 animals (0.7 percent) in contrast to 23 tumors among 135 animals (17 percent) when it was followed 18 weeks later by 7 weekly instillations of BaP (total 2.1 mg). These results suggest synergistic action between alpha radiation and BaP in the induction of lung cancer.

Phosphorus-32 was injected into mice aged 1 day to 4 weeks in a dose of 1 $\mu\text{Ci/g}$ body weight. No radiation sickness was observed during the experimental period. The animals were autopsied at weekly intervals for 6 weeks. Histochemical examinations of the testes were made for succinic dehydrogenase, esterase, alkaline phosphatase, lipids, nucleic acids, and carbohydrates. The significance of the results in relation to metabolism of the testes is discussed. (HLW)

- 3129 FUNCTIONAL STATE OF THE THYROID GLAND IN RATS WITH URANIC INTOXICATION. Malenchenko, A.F.; Kozyuk, G.V. (AN Belorusskoj SSR, Minsk. Inst. Yadernoj Energetiki). Eksp. Med. Morfol.; 13: No. 3, 148-153(1974). (In Bulgarian).

The influence of nitric acidic uranium on the functional state of the thyroid gland in rats by means of radioiodine tests and neutronic activatory method for determination of serum binding iodine 127 (SBI 127) was studied. The treatment with nitric acidic uranium (0.1, 0.5 or 2.0 mgr/100 g body weight once or 0.5 mgr/100 g body weight for 4 successive days) caused prominent reduction of the nonorganic and organic phase of iodine metabolism in the thyroid gland in correlation with the dose applied. The dynamics of the changes of SBI 131 and SBI 127 indicated that during the uranic intoxication the secretory phase prevailed over the phase of storage of the thyroid hormones. The morphologic changes in the thyroid gland during the uranic intoxication were the colloid evacuation of the follicles, focal proliferation and desquamation of the thyroid epithelium. (auth)

(Ustav Hygieny Prace Uranoveho Prumyslu, Kamenna (Czechoslovakia)). 1974. 105p. (In Czech). Dep. NTIS (US Sales Only), PC A06/MF A01.

Available from Nuclear Information Centre,

Praha-Zbraslav, Czechoslovakia.

The development is described of methods used for determining the contamination of urine without correction for ^{40}K content and with a correction for ^{40}K which is by one order more sensitive but more time-consuming. The statistical processing of the results of activity measurements made possible the determination of the contamination limits. In different control groups the dependence was observed of the sensitivity of the method on the amount of urine analyzed, on the length of measurement and on the parallel determination of the activity in one and the same urine sample. A method was elaborated for determining ^{35}S and ^{106}Ru in urine consisting of mineralization of the urine by nitric acid, further chemical processing, separation and final activity measurement by a low-background measuring set. 2000 pCi ^{35}S /l of urine and 15 pCi ^{106}Ru /l urine may reliably be determined. For these methods mineralization losses were studied for 27 chemical elements. Losses were found only for Ru, Os, Hg, S, P, I, Br, Cl and F. For Ru the losses are 13 to 26%, for S 7 to 8%.

Three volunteers, representing subjects of small, intermediate and large physique, inhaled aerosols of polystyrene microspheres which incorporated the nuclides ^{103}Pd (17.0 days half-life) and ^{51}Cr (27.8 days). ^{103}Pd decays by electron capture, emitting x-rays of 20.2 keV, similar in energy to those of ^{239}Pu (13.6, 17.2 and 20.2 keV), while the ^{51}Cr , emitting γ -rays at 323 keV, serves as a marker; through established methods of body radioactivity measurement it can be used to calculate the retention of the particles at a particular time after intake and hence, given the radioactive composition of the inhaled aerosol, the x-ray emission from the ^{103}Pd . Fourteen laboratories assessed Pd-contents for the estimation of ^{239}Pu in the lungs. If a standard configuration of detectors for use on all subjects is required, offering the highest sensitivity in most individuals, the choice should be a pair of phoswich detectors viewing the left and right anterior surfaces of the upper thorax. Several methods of calculation have been devised in order to derive, from the detection efficiencies reported for ^{103}Pd , calibration data for ^{239}Pu .

3132 (INIS-mf--2015) A STUDY OF THE BEHAVIOR OF 0.5 μM AEROSOL PARTICLES IN THE HUMAN LUNG. Subba Ramu, M.C. (Bhabha Atomic Research Centre, Bombay (India). Health Physics Div.). 1974. 16p. NTIS (US Sales Only).

From 1. asian regional congress on radiation protection; Bombay, India (15 Dec 1974). 18 refs., 4 figures.

The evaluation of the tissue dose of inhaled aerosol particles (including radioactive particles) requires a study of the behavior of particles in the human lung. Half-micron particles (unit density spheres) of di-2-ethyl hexyl subacate have been used for carrying out the study since their deposition is mostly in the pulmonary region and they are good tracers of air flow in the lung. The deposition

measured is the lowest reported so far and is affected by physiological parameters like the tidal volume, the breathing frequency and the resting expiratory level. Steady-state and single-breath aerosol experiments show that the particles inhaled remain airborne in the lung during several breaths and support the view that mechanical mixing is completely absent in the alveolated airways of the lung. Studies of the effect of breath-holding on the deposition of 0.5 μm particles in the lung show that these particles may be used for the calculation of the diameter of the alveolar space in life.

3133 (KURRI-TR--125, pp 40-46) IODINE METABOLISM WITHIN THE HUMAN BODY. Mori, T. (Kyoto Univ. (Japan). Faculty of Medicine). 1974. (In Japanese).

From Symposium on radioiodine; Kumatori, Osaka, Japan (24 Oct 1973).

Symposium on radioiodine.

This paper summarized the iodine metabolism, particularly that of a large amount of iodine, in Japanese using radioiodine as a tracer. In the patients with hyperthyroidism, hourly variation of ^{131}I distribution within the body was examined when the iodine intake in meals was high and low respectively. The relationship between ^{131}I -thyroid uptake rate and the amount of iodine taken at meal was also studied. The ideas of organic and inorganic iodine tank in the thyroid gland and four compartments model were devised in order to analyse the iodine metabolism within the body. In addition, long-term observation of iodine metabolism within the body was carried out after the administration of ^{131}I , and the process of the metabolism including the form of its presence in the blood and the central government was outlined. Considering above results, countermeasures against human body contamination with ^{131}I were mentioned.

3134 (KURRI-TR--125, pp 47-52) THYROID FRACTIONAL DEPOSITION AND HALF LIFE OF RADIOIODINE. Fujita, M. (Japan Atomic Energy Research Inst., Tokai, Ibaraki. Tokai Research Establishment). 1974. (In Japanese).

From Symposium on radioiodine; Kumatori, Osaka, Japan (24 Oct 1973).

Symposium on radioiodine.

In order to measure the absorbed dose of radioiodine in the thyroid gland, which was incorporated by inhalation or ingestion, iodine intake (fa), ^{131}I thyroid uptake rate (fw), ^{131}I thyroid uptake rate compared to the rate in the whole body (f_2) and the half life of iodine in the thyroid gland (T_{eff}) were examined. Thyroid fractional deposition of ^{131}I was compared between Japanese and European. The rate of ^{131}I which moved from the blood into the thyroid gland in children (f_2') and the effect of the iodine in meals on ^{131}I thyroid uptake (fw) were also studied. In Japanese, f_2 was 0.28 and the mean T_{eff} was 6.9 $\pm$ 0.7 days in 11 Japanese adults. There was an individual difference in these biological parameter and the values in adults were different from those in children. A little difference in value between Japanese and European suggested to be caused by the greater amount of stable iodine in meals in Japanese.

3135 POTASSIUM IODIDE AND OTHER BLOCKING AGENTS CAN COUNTERACT THE EFFECTS OF RADIATION EXPOSURE. Grendon, A. (Univ. of California, Berkeley). pp 75-82 of Radiological defense officer conference. Sacramento, CA; Office of Emergency Services (1974).

From Radiological defense officer's conference; Lake Tahoe, CA, USA (23 Oct 1974).

See CONF-7410106--.

The effectiveness of the administration of potassium iodide for blocking the uptake of ^{131}I by the human thyroid is evaluated. The value of this treatment for the radiation protection of human populations in the event of the release of ^{131}I to the environment is discussed. (CH)

- 3136 MEASUREMENT OF RETENTION OF AN ORAL DOSE OF CA-47 BY WHOLE-BODY COUNTING. Baerenholdt, O.; Pors Nielsen, S.; Munck, O. (Glostrup Sygehus, Copenhagen (Denmark)). pp 221-224C of Proceedings of the seventh Nordic meeting on clinical physics. Jähren, R. (ed.). Oslo; Dept. of Medical Physics, the Norwegian Radium Hospital (1974).

From 7. Nordic meeting on clinical physics; Tretten, Norway (14 Jun 1973).

Twenty normal fasting subjects were given an oral dose of $3\mu\text{Ci}$ of Ca-47. Whole-body counting was performed after 5, 6, 7 and 8 days and immediately after the counting on day 8 an intravenous injection of Ca-47 was given. New counts were made on days 13, 14 and 15. It is assumed that geometry problems are negligible, and that the retention is not dependent on losses of calcium from the kidneys or intestine as the subject is used as his own standard. The method also supplies the slope of the whole-body curve indicating the calcium turnover of the subject.

2 figs.; 1 tab.; 3 refs..

Investigations on the regional kinetics of the transport of radioactive technetium in the individual sections of the lacrimal ducts are important as a basis for the clinical application of radionuclide dacryocystography. We were able to show that technetium, in spite of its low resorption during a 15-minute study, can be applied in functional tests of the lacrimal system. The varying size of the Tc-labelled particles leads to a delay in the transport through the lacrimal ducts, while free technetium in the form of pertechnetate is best for an assessment of the physiological and pathological drainage of tears.

^{67}Ga would seem to be unique in many ways as a diagnostic agent, since it not only can be used as such for detection of cancer, but may

also be of potential use in a number of other fields as well. The overall processes involved in the in vivo distribution of ^{67}Ga appear to be similar in tumor and normal tissues. However, the higher rate of uptake by malignant tissues provides the basis for a valuable diagnostic procedure. Among the factors that may play a role in the greater uptake and binding of ^{67}Ga by certain tumors are the greater permeability of these cells and the presence of a higher level of a specific macromolecular gallium-binding component.

The complicated changes that the primary cosmic radiation undergoes on its path through the atmosphere are discussed, and the altitude profile of the total equivalent dose compiled from the individual components is shown in tables. The contribution of the civil air travel to the population dose is estimated from this.

- 3141 Grazhdanskaya oborona. (CIVIL DEFENSE). Titov, M.N.; Egorov, P.T.; Gaiko, G.A. Moscow; Vysshaya Shkola (1974). 215p.

The textbook is written for programs for training students of intermediate special education institutions and professional-technical students in civil defense. The role of civil defense in a system of general state defense measures, implemented in peace and war for the defense of the population and items of national economy from massive strike weapons; the civil defense objectives and organizations for items of national economy and in educational institutions are reported; the characteristics of massive strike weapons and of infection (contamination) sites are given; the purpose, layout, and operation of devices for radiation and chemical surveillance are examined. Some questions on the improvement of the operational reliability of national economy items in wartime are examined. The principles of the organization and management of surveillance, rescue and emergency recovery work in infection (contamination) centers, and some other special problems are discussed. The textbook is intended for students of all middle special educational institutions and professional-technical schools.

- 3142 MANHATTAN PROJECT PLUTONIUM WORKERS: A TWENTY-SEVEN YEAR FOLLOW-UP STUDY OF SELECTED CASES. Hempelmann, L.H.; Langham, W.H.;

Richmond, C.R.; Voelz, G.L. Health Phys.; 25: No. 5, 461-479 (Nov 1973).

Twenty-five males who were heavily exposed to plutonium while working under very crude conditions during World War II were followed up medically for 27 years. Examinations included physical inspection, laboratory studies, chest, pelvis, knee and teeth roentgenograms; chromosomes of lymphocytes cultured from the peripheral blood and cells exfoliated from the pulmonary tract were also studied. The findings are described in detail. Because of the small body burdens in these men so heavily exposed to plutonium compounds, it is concluded that the body has protective mechanisms which are effective in discriminating against these materials. This is probably explained by the insolubility of many plutonium compounds.

3144 (HRP--0003170) RADIOLOGICAL HEALTH IN THE GENESSEE REGION. (Genesee Region Health Planning Council, Rochester, N.Y. (USA). Radiologic Health Task Force). Oct 1973. 128p. NTIS, PC A07/MF A01.

Potentially harmful sources of ionizing and nonionizing radiations in the 10-county Genesee Region of New York State are identified in a task force report. All sources of radiation considered to be of importance to the general population were studied. Occupational radiation exposures were excluded. The radiation levels from major sources in the Genesee Region were found to be comparable to those for the nation as a whole. Current methods of protecting the public from radiation hazards were also examined, and recommendations were made concerning the enforcement of existing codes. Areas of ionizing radiation examined in the Genesee Region include natural sources, X-rays, nuclear medicine, nuclear power general, transportation of radioactive material, disposal of radioactive material, miscellaneous sources of radioactivity and radiation producing equipment. Civil defense programs and activities concerned with radioactivity are noted. Nonionizing radiation sources include the sun, sun lamps, lasers, microwave ovens, microwave communications and radar, and radio and television stations. A glossary, tabulation of the Genesee Region population density, a map of the surrounding area, and a list of references are appended.

3145 INVESTIGATION OF RADIATION DOSE RATES AROUND GAMMA RADIOGRAPHY EXPOSURE CONTAINERS DURING USE. Atherton, N.J. Br. J. Non-Destr. Test.; 15: No. 8, 143-145 (Sep 1973).

A report of experiments conducted as part of an investigation into the reasons for the higher doses of radiation received by site radiographers as compared with factory employed radiographers is given. Radiation dose rate measurements were made around 6 types of gamma radiography exposure container. The results, which are tabulated, indicate wide variations of dose rates around each container and between different containers. Shutter type exposure containers afford much better protection to operators than the manual extraction types.

3146 (DHEW/FDA--75-8017) APPLICATION OF AUTOMATIC DATA PROCESSING TECHNIQUES TO SELECTED DIAGNOSTIC RADIOLOGY OPERATIONS. Gitlin, J.N. (Bureau of Radiological Health, Rockville, Md. (USA)). Jun 1973. 151p. GPO.

Following a preliminary review of diagnostic radiology operations at the Johns Hopkins Hospital, in which several major activities were identified as amenable to automatic data processing (ADP) techniques, a pilot study of computer applications was undertaken with the cooperation and support of the National Center for Radiological Health. The pilot study was designed to test the feasibility of applying ADP techniques to the reporting of diagnostic radiology findings and to the control of x-ray film library transactions. The results of the pilot study demonstrated the feasibility of applying ADP techniques to the reporting of radiographic diagnoses with a significant reduction in the elapsed time associated with the x-ray consultation request-report cycle. The tests also provided a basis for evaluating the remote terminal configuration and the procedures developed to implement the systems design. In general, the findings were sufficiently encouraging to proceed with further development of the system, with the knowledge that specific modifications were required, particularly with regard to remote terminal devices, before the application of ADP techniques could be considered operational in diagnostic radiology.

3147 (NCRP--32) RADIATION PROTECTION IN EDUCATIONAL INSTITUTIONS. (National Council on Radiation Protection and Measurements, Washington, D.C. (USA)). 1 May 1973. 56p. National Council on Radiation Protection and Measurements, Washington, DC \$2.00.

The report provides information on the hazards involved in the use of radiation-producing equipment or radioactive material in science demonstrations and experiments, and recommendations on the means of protection. Following biological considerations, there are 3 chapters on radiation sources used in schools, basic principles of radiation protection, and the radiation protection programme. Appendices contain definitions of radiation units and terms as well as findings of a survey and a radiation safety check sheet. (CIS Abstr. Vol 2)

3148 (GSF-K--75) RADIATION PROTECTION IN ACCELERATORS IN MEDICAL USE. Betz, B.; Loester, W.; Niklas, K. (eds.). (Gesellschaft fuer Strahlen- und Umweltforschung m.b.H., Neuherberg/Muenchen (Germany, F.R.)). Inst. fuer Strahlenschutz. May 1973. vp. (In German). INIS.

15 figs.; 1 tab.; 14 refs..

Radiation protection in accelerators in medical use.

Following an introduction into the field of cellular radiation effect considering the most important experimental results, the biological significance of the colony formation ability is brought out. The inactivation concept of stem cells does not only prove to be good, according to the present results, in the interpretation of the pathogenesis of acute radiation effects on moult tissue, it also enables chronic radiation injuries to be interpreted through

changes in the fibrous part of the organs. Radiation therapy of tumors can also be explained to a large extent by the radiation effect on the unlimited reproductiveness of tumor cells. The more or less similar dose effect curves for healthy and tumor tissue in practice lead to intermittent irradiation. The dependence of the intermittent doses and intervals on factors such as Elkind recovery, synchronisation, redistribution, reoxygenation, repopulation and regeneration are reviewed.

- 3150 (GSF-K--75, pp vp.) STRUCTURAL RADIATION PROTECTION MEASURES FOR MEDICALLY USED ELECTRON ACCELERATORS. Frost, D. May 1973. (In German).

12 figs.; 2 refs..

Radiation protection in accelerators in medical use.

Recommendations are given for radiation protection measures when operating electron accelerators. They start from the DIN-regulations with the title 'Medical electron accelerating plants; radiation protection rules for the set-up' (standards proposal; draft from DIN 6847, sheet 2). According to the specifications for minimum radiation exposure to the personnel and that absolutely necessary to the patient, the radiation exposures which should be considered in the concept of the structural measures are dealt with. So besides the radiation due to neutron activation of materials and air, the higher power of modern accelerators at start-up time must be considered. Aside from useful structural measures, material problems for shielding are also discussed.

- 3151 (GSF-K--75, pp vp.) RADIATION PROTECTION. Hoefer, G. May 1973. (In German).

9 figs..

Radiation protection in accelerators in medical use.

The most important measurements required in practice on electron accelerators to protect the patient, personnel and other persons from undesirable, uncontrolled and non-permissible ionizing radiation is described using the example of the 42 MeV betatron. Starting with the radiation protection of the patients, the control of the exact beam aperture is given. The determination of the dose rate outside the field, measurement of neutrons which occur as a result of (γ, n) and ($\gamma, 2n$) effects, as well as the ensuing air activation is then given. The continuous control of the operational data of the accelerator is not to be neglected as failures lead to deviations from the fixed data in the irradiation plan and thus to damage to the patient. Furthermore, perfect visual and speaking contacts must be ensured. For the safety of the personnel, there are additional contamination controls such as personnel dosimetry, for other persons, the monitoring of adjacent rooms, control of the vent air and protection from activated patients as well as general measures.

- 3152 (GSF-K--75, pp vp.) PATIENT RADIATION PROTECTION IN MEGAVOLT THERAPY. Scherer, E. May 1973. (In German).

13 figs.; 53 refs..

Radiation protection in accelerators in medical use.

A survey is given on the practically important organs and organ systems whose radiation sensitivity and type of reaction are of significance regarding irradiation planning.

- 3153 (GSF-K--75, pp vp.) RADIATION PROTECTION IN MEGAVOLT THERAPY. Wiedersee, R. May 1973. (In German).

26 figs.; 2 tabs.; 35 refs..

Radiation protection in accelerators in medical use.

Following brief data on the radiation protection standards of today and the aspects which determined the requirements, short data on neutrons are given. The fast neutrons occurring with betatron radiation are particularly dealt with here. Data on the radiation protection of the patient then follow where the relative volume dose (i.e. the relative radiation exposure) as well as the radiation given off besides the signal field (secondary radiation) of the betatron are dealt with. The protective measures to be met in order to keep the secondary radiation within permissible limits are discussed, and finally data on plants equipped with 35 MeV betatrons and linear accelerators are given.

- 3154 (GSF-K--75, pp vp.) PHYSICAL IRRADIATION PLANNING. Leetz, H.K. May 1973. (In German).

7 figs.; 1 tab.; 6 refs..

Radiation protection in accelerators in medical use.

Following a definition of the physical irradiation plan, the methodics of the procedure are explained. Starting with the simplest case, irradiation where only the depth of the focus is known, the depth dose curves for single fields are calculated and extended to the overlapping of several single fields on the basis of a body cross-section. In addition to this calculation-graphical irradiation planning, the possibility of experimental determination of a dose distribution on the phantom is indicated. In addition, the possibilities resulting from the use of modern computers are shown in the individual calculation of dose distributions.

- 3155 (GSF-K--75, pp vp.) FUNDAMENTALS OF THE DOSIMETRY OF ENERGY-RICH RADIATION. Pohlitz, W. May 1973. (In German).

8 figs.; 3 tabs.; 11 refs..

Radiation protection in accelerators in medical use.

Following an illustration of the individual development phases in the dosimetry of ionizing radiation, the definitions of the physical parameters belonging to the unit X-ray are described. They are divided into 3 classes, namely into parameters of radiation sources, those of the radiation field as well as parameters in the interaction with matter and in connection with the measuring principle where various types of radiation and energy regions are considered. The conditions contained in the definitions for the measuring methods are shown in detail.

- 3156 (GSF-K--75, pp vp.) CLINICAL DOSIMETRY. Rassow, J. May 1973. (In German).

25 figs.; 33 tabs.; 19 refs..

Radiation protection in accelerators in medical use.

The main point of this paper on clinical dosimetry which is to be understood here as application of physical dosimetry on accelerators in medical practice, is based on dosimetric methodics. Following an explanation of the dose parameters and description of the dose distribution important for clinical practice as well as geometric irradiation parameters, the significance of a series of physical parameters such as accelerator energy,

surface energy of average stopping power etc. is dealt with in detail. Following a section on field homogenization with bremsstrahlung and electron radiation, details on dosimetry in clinical practice are given. Finally, a few problems of dosimeter or monitor calibration on accelerators are described. The explanations are supplemented by a series of diagrams and tables.

PROTECTION FOR ENERGIES UP TO 10 MEV: EQUIPMENT DESIGN AND USE. (National Council on Radiation Protection and Measurements, Washington, D.C. (USA)). 1 Mar 1973. 66p. National Council on Radiation Protection and Measurements, Washington, DC \$2.00.

The report contains a number of recommendations concerning the design and performance characteristics of medical radiation-producing equipment and the operating conditions. Following general guidelines on the clinical use of radiation, recommendations and guidelines are given for X-ray and gamma-beam therapy equipment. Further sections give guidance for calibration, radiation protection surveys and working conditions. Definitions of terms, tables with biological and technical radiation data, and an example of emergency procedure are appended. (CIS Abstr. Vol 2)

- 3157 ANIMAL EXPERIMENTS TO STUDY THE EFFECT OF IONIZING BEAMS ON THE BARRIER FUNCTION OF LYMPH NODES. THE INFLUENCE OF VARIOUS SURVIVAL TIMES. Aguilar, H. Hamburg; Hamburg University (11 Apr 1973). 57p. INIS.(In German).

1 fig.; 11 tabs.; 35 refs. Available from ZAED.

Thesis (Ph. D.).

The barrier function of a lymph node chain was examined on 48 female albino rats 20 weeks after applying a radiation dose of 2×100 R (telecobalt-gamma radiation). In addition, Cr^{51} labelled erythrocytes were intralymphatically injected at minimum pressure. The results obtained by ENGESET (1964), each only on one lymph node of dead rats, were confirmed, as a highly significant or significant influence on the barrier function of the investigated lymph node chain was observed compared to a non-irradiated collective of animals.

- 3158 STATISTICAL INVESTIGATION ON FREQUENCY, DURATION, NUMBER OF X-RAY INVESTIGATIONS AND RADIATION EXPOSURE TO THE PATIENTS OF A DISTRICT HOSPITAL ON THE OUTSKIRTS OF MUNICH. Nordmann, W. Muenchen, Germany; Muenchen University (10 Apr 1973). 110p. INIS.(In German).

16 figs.; 33 tabs.; 53 refs. Available from ZAED.

Thesis (Ph. D.).

Within the framework of a dissertation, X-ray examined patients were statistically surveyed during one month at the district hospital. The radiation exposure of the patients increased strongly particularly with men of the age of 21 to 30 and of 61 to 70. The causes are the multiply performed investigations after accidents as well as angiography at greater ages. The exposure is in the case of women particularly high between the ages of 66 and 70. In determining the gonadal exposure, the average values for the X-ray investigation at the time were referred to. The numbers give an approximate idea of to what extent single investigations with varying investigation or picture frequency can contribute to gonadal exposure.

- 3159 PERSONNEL EXPOSURES DUE TO INADEQUATE LEAK TEST METHODS FOR ^{125}I SOURCES. Murphy, P.C.; Burson, Z.G. Health Phys.; 24: No. 4, 443-444(Apr 1973).

A description is presented of a series of personnel exposures due to leakage from a sealed ^{125}I source which went undetected for a considerable time even though routine wipe tests were carried out on the source each time it was removed from storage for use. It was found that the ^{125}I was evolving in gaseous form and being released from the plastic bag in which the source was stored each time the bag was opened. The danger has now been controlled by monitoring the source storage cabinet with activated charcoal filters and by taking air samples in the immediate area when sealed sources of ^{125}I are used.

- 3161 (AAEC/E--290) ASSESSMENT OF RADIOACTIVE FALLOUT ARISING FROM TESTING OF NUCLEAR WEAPONS IN THE SOUTH PACIFIC AND THE PROBABLE EFFECTS ON THE AUSTRALIAN POPULATION. Fry, R.M.; Symonds, J.L.; Watson, G.M. (Australian Atomic Energy Commission Research Establishment, Lucas Heights). Mar 1973. 32p. NTIS (US Sales Only).

A discussion is given of the measurement of radiation and what dose units are appropriate for assessment of the significance of fallout exposure to man, and an outline is given of the background of natural and man-made radiation to which man is inevitably subject. The principal biological effects of radiation are then examined and the nature of the relationship between radiation dose and the incidence of effects is examined. The final section assesses the magnitude of fallout in Australia from the French and Chinese series of tests and expresses this in the form of dose commitments to man; the dose commitment for any radionuclide being the dose received to date plus the dose to be received in the future from residual long lived activity already incorporated in the body and remaining in the environment. From these dose commitments, using generally accepted risk coefficient estimates of the upper limits of the magnitude of the harmful effects, carcinogenesis and mutagenesis, which may be attributed to fallout from the respective series have been derived for the Australian population.

- 3162 (AAEC/E--291) ESTIMATES OF RADIATION DOSE TO THE AUSTRALIAN POPULATION AS A RESULT OF EXPOSURE TO FALLOUT FROM THE FRENCH AND THE CHINESE NUCLEAR BOMB TESTS OVER THE PERIOD 1964-1972 AND ASSESSMENTS OF THE ADVERSE EFFECTS ON PUBLIC HEALTH. Cook, J.E.; Combe, V. (Australian Atomic Energy Commission Research Establishment, Lucas Heights). Mar 1973. 26p. INIS.

Measurements of fallout levels in Australia up to 1971 are reviewed and used to estimate Australian average individual dose commitments. An alternative set of numbers is given based on the most recent figures for global average dose commitments provided by the United Nations Scientific Committee on the Effects of Atomic Radiation. The two sets of numbers show reasonable agreement; the larger are adopted for use in estimating adverse effects. The contribution of the French and Chinese weapons tests relative to that from all tests is derived by inspection and extrapolation where necessary of data on the injection of strontium-90 into the northern and southern hemispheres and its subsequent deposition as a function of time. The risk data reviewed and summarised in the 1972 UNSCEAR and BEIR reports are used to derive estimates of adverse effects. It is

concluded that the French and Chinese test series to the end of 1972 may be responsible over the next 20 years for up to 1.4 and 0.2 cases of cancer per year respectively in Australia. Of these cases, 0.25 per year would be leukemia, 0.75 per year thyroid cancer and 0.6 per year all other forms. Available evidence on the mutagenic effects of radiation suggests that the total number of cases of severe genetic diseases produced may be of the same order as the total number of cases of cancer, with the former spread over many generations whereas the latter are not.

- 3163 (PB--246095) APPLICATIONS OF PROTON RADIATION TO CANCER THERAPY. QUARTERLY REPORT 1 JAN-31 MAR 1973. Preston, W.M. (Harvard Univ., Cambridge, Mass. (USA)). Mar 1973. 10p. (PR--73/1). NTIS \$3.50.

The preparation of the Harvard 160 Mv synchrocyclotron for general cancer therapy is discussed. The following projects are briefly described: Construction of a collimator with a 30 cm. aperture for the proton beam; methods to provide a uniform proton flux over a 30 cm. diameter circle; design of a method to produce a vertical beam; work on a computer program for calculation and graphic presentation of isodose distributions; dose measurements in a water tank phantom; and treatment planning. Possible applications of proton radiography to medical diagnosis are being investigated. Application of this technique to the visualization of cerebral vascular lesions and to tissue density measurements is discussed. (GRA)

- 3164 (CONF-730915-- , pp 4-19) ATMOSPHERIC CONCENTRATIONS OF FISSION PRODUCT NOBLE GASES. Bernhardt, D.E.; Moghissi, A.A.; Cochran, J.A. 1973.

From Symposium on noble gases; Las Vegas, NV, USA (24 Sep 1973).

Symposium on noble gases.

Electrical power production by nuclear reactors, in addition to other nuclear activities, results in the production of radioactive noble gases. The release of these radioactive gases, at their source of production or through reprocessing of the fissile materials, results in radiation exposure to the world population. This paper considers past, present, and future fission-related radioactive noble gas production and releases. These releases of noble gases are then related to atmospheric concentrations, population exposures, and appropriate feasible control technologies. Krypton-85, because of its long half-life and fission yield, presents the greatest potential radiation exposure to the world population. The primary sources of production are nuclear power generation and plutonium production reactors. Naval propulsion reactors, nuclear weapons testing, and the postulated peaceful uses of nuclear explosives are secondary sources of production. The other releases associated with reactors primarily take place during fuel reprocessing.

- 3165 (CONF-730915-- , pp 109-114) ENVIRONMENTAL RADON. Harley, J.H. (Atomic Energy Commission, New York). 1973.

From Symposium on noble gases; Las Vegas, NV, USA (24 Sep 1973).

Symposium on noble gases.

Of all the noble gases, radon has been the one which could be most easily measured in the atmosphere. This may very well be the reason why a bibliography of a thousand references to radon and its daughters can be easily assembled. Taking a more charitable view it may be that concern for the radiation dose to man

or the use of radon and its particulate daughters as tracers has brought on this flood of literature. Radon-222 is the most interesting of the three radon isotopes since its half-life is of the same order as many atmospheric processes. This allows tracing on a global scale and even the development of global inventories. While radon-222 and its daughters present the highest natural dose to man, we have been much more concerned by certain special cases of exposure. These include the occupational exposure of miners, the use of high radium content materials in housing, and the high radon content of certain local water supplies. These latter will be described briefly along with the more normal distribution of radon levels in the environment.

- 3166 (CONF-730915-- , pp 134-143) CONTRIBUTION OF RADON IN NATURAL GAS TO THE DOSE FROM AIRBORNE RADON-DAUGHTERS IN HOMES. Barton, C.J.; Moore, R.E.; Rohwer, P.S. (Oak Ridge National Lab., TN). 1973.

From Symposium on noble gases; Las Vegas, NV, USA (24 Sep 1973).

Symposium on noble gases.

Data have been obtained on the radon concentration in natural gas supplied to several metropolitan areas in the United States. The average value of 20 pCi/l was selected to estimate the contribution of this source of natural radioactivity to doses from radon-daughters received by individuals in homes. Radon-daughter concentrations in the home atmosphere were calculated by use of computer programs for an 8000 ft³ house in which 27 ft³ of gas per day was used for cooking in an unvented kitchen range. The total estimated dose to the bronchial epithelium included contributions from radon plus daughters in the outside ventilation air, each of which was assumed to be present at a concentration of 0.13 pCi/l, and from the radon plus daughters in the natural gas. The latter contribution averaged approximately 3 percent of the total dose. There was a 3.5 percent decrease in the estimated total dose when the air change rate increased from 0.25 to 2.0 per hour. We conclude that radon and radon-daughters entering the home with natural gas produce a negligible fraction of the total dose to the respiratory system of home occupants from airborne radon-daughters.

- 3167 (CONF-730915-- , pp 175-191) INTEGRATED ENVIRONMENTAL MODELING SYSTEM FOR NOBLE GAS RELEASES AT THE SAVANNAH RIVER PLANT. Cooper, R.E. (E.I. du Pont de Nemours and Co., Aiken, SC). 1973.

From Symposium on noble gases; Las Vegas, NV, USA (24 Sep 1973).

Symposium on noble gases.

The Savannah River Plant (SRP) is a large nuclear complex engaged in varied activities and is the AEC's major site for the production of weapons material. As a result of these activities, there are continuous and intermittent releases of radioactive gases to the atmosphere. Of these releases, the noble gases constitute about 11 percent of the total man-rem exposure to the population out to a distance of 100 km. Although SRP has an extensive radiological monitoring program, an environmental modeling system is necessary for adequately estimating effects on the environment. The integrated environmental modeling system in use at SRP consists of a series of computer programs that generate and use a library of environmental effects data as a function of azimuth and distance. Annual average atmospheric dispersion and azimuthal distribution of material assumed to be released

as unit sources is estimated from a 2-year meteorological data base--assuming an arbitrary point of origin. The basic library of data consists of: ground-level concentrations according to isotope, and whole body gamma dose calculations that account for the total spatial distribution at discrete energy levels. These data are normalized to tritium measurements, and are subsequently used to generate similar library data that pertain to specific source locations, but always with respect to the same population grid. Thus, the total additive effects from all source points, both on- and off-site, can be estimated. The final program uses the library data to estimate population exposures for specified releases and source points for the nuclides of interest (including noble gases). Multiple source points are considered within a single pass to obtain the integrated effects from all sources.

- 3168 (CONF-730915-- , pp 488-491) POSSIBLE EFFECTS OF NOBLE GAS EFFLUENTS FROM POWER REACTORS AND FUEL REPROCESSING PLANTS. Whipple, G.H. (Univ. of Michigan, Ann Arbor). 1973.

From Symposium on noble gases; Las Vegas, NV, USA (24 Sep 1973).

Symposium on noble gases.

The noble radioactive gas of principal interest in the nuclear industry is krypton-85 because of its relatively large fission yield and its long half-life. This paper considers the various ways in which krypton-85 can deliver radiation doses to the human body; external irradiation by beta particles and gamma rays, and internal irradiation from the gas inside the respiratory tract and dissolved in body tissues. Equilibrium and transient conditions are discussed. The calculations summarized in this paper indicate that the present maximum permissible concentration of krypton-85 in public air (3×10^7 $\mu\text{Ci}/\text{ml}$) delivers a dose rate of about $1/5$ of that recommended by the ICRP. The long-term significance of krypton-85 and other noble radioactive gases from the nuclear power industry is reviewed.

- 3169 (CONF-730915-- , pp 654-665) CONSIDERATIONS IN SITING LONG-TERM RADIOACTIVE NOBLE GAS STORAGE FACILITIES. Cohen, J.J.; Peterson, K.R. (Univ. of California, Livermore). 1973.

From Symposium on noble gases; Las Vegas, NV, USA (24 Sep 1973).

Symposium on noble gases.

Projections of future fission reactor capacity indicate that the present practice of releasing radioactive noble gases (primarily krypton-85) to the atmosphere cannot safely be allowed to continue indefinitely. Ongoing research programs are developing methods of extracting and concentrating these waste gases so they may be stored for extended periods, thereby allowing them to decay to relatively safe levels. Anticipating the need for facilities specifically designed for long-term storage of noble gases, we have reviewed some factors which might be considered in developing optimum siting criteria. Among these factors are, above- vs. below-ground storage, meteorology, geography, and demography. The objective used in these considerations is minimization of resulting population doses, both long- and short-term, from a major release, either instantaneous or continuous from the various facilities. Those sites considered are remote islands, continental shorelines, mountain tops, deep water, and inland low-population-density areas. Assuming an equal probability of containment failure at

each of the site options, we conclude that siting is relatively inconsequential for long-term population doses. Siting, however, is important for short-term exposures to local populations, especially where there might be a possibility of exceeding Radiation Protection Guides. The relative significance of long- vs. short-term doses resulting from exposures to radioactive noble gases is also discussed.

- 3170 (UERL--2) COMPARATIVE LEVELS OF ENVIRONMENTAL RADIOACTIVITY IN UTAH FROM INDUSTRY AND FALLOUT. A PROGRESS REPORT OF RADIOECOLOGICAL INVESTIGATIONS OF AIRBORNE RADIOACTIVITY IN THE UTAH ENVIRONMENT, JULY 1, 1972--JUNE 30, 1973. Pendleton, R.C. (Utah Univ., Salt Lake City (USA). Lab. of Environmental Radioactivity). 1973. Contract E(26-1)-0462. 194p. Dep. NTIS \$7.50.

Radioactivity in air, vegetation, soil, and wild animals in Utah was determined during July 1972 through June 1973, and results are presented. Methods for continuous measurement of the daughter products of radon and thoron were developed and used for calculations of the integrated dose to the lungs of humans.

- 3171 PROCEEDINGS OF THE 6TH CONFERENCE ON RADIATION HYGIENE, 1973. Hradec Kralove, Czechoslovakia; Purkyne Medical Research and Postgraduate Institute Press (1973). 340p.
The communications to this conference, held at Jasna pod Chopkom, reproduced in this volume, include: investigation of immunoglobulin levels in the blood serum of uranium miners; the influence of work stress on immunoglobulin levels of uranium miners; exposure to radiation of the hands of laboratory workers and medical assistants working with products labelled with radionuclides; excretion of tritium in workers preparing labelled compounds; individual dosimeter for fast neutrons; histological types of lung cancer at different exposures to radon daughters; radiation-induced lung cancer; relation between lung cancer and long-term exposure to radon daughters; determination of the radium 226 body burden on the sole basis of radon exhalation measurement of whole-body gamma radiation; use of biochemical indicators of exposure in the uranium industry.

- 3172 GENERAL PRINCIPLES OF RATING FISSION PRODUCTS UPTAKE INTO THE BODY OF FARM ANIMALS AND RADIONUCLIDE CONCENTRATION IN THE FORAGE. Skryabin, A.M. pp 172-180 of Radiobiologiya i radioekologiya selskokhozyajstvennykh zhivotnykh. Annenkov, B.N.; Dibobes, I.K.; Aleksakhin, R.M. (eds.). Moscow: Atomizdat (1973). (In Russian)
6 refs..

Some principles of establishing norms for the content of main fission products such as Sr^{89} , Sr^{90} , I^{131} and Cs^{137} in fodders for farm animals are described. These norms are established on the bases of the norms of radionuclide contents in human foods. It is emphasized that no generally applicable norms of radionuclide contents in the diets of farm animals can be worked out because of the great diversity of possible radiation situations, of geographical zones, and of conditions of agricultural production.

- 3173 (TID--27811) AEC INVESTIGATION OF TRITIUM RELEASE OCCURRENCE AT THE ROCKY FLATS PLANT. (USAEC, Washington, D.C.). 1973. Contract EY-76-C-04-3533. 14p. Dep. NTIS, PC A02/MF A01.

Eighteen conclusions are presented concerning tritium levels in holding ponds, evaporation ponds, and other locations; release of tritium from processing of plutonium scrap; occupational exposures; public health hazards; analyses of liquid process wastes; and the Colorado department of health surveillance program. Recommendations are presented concerning safety of accidental discharge prevention, environmental monitoring, and other procedures. (HLW)

- 3174 (AERE-R--7486) NUCLEAR ACCIDENT DOSIMETRY. PART 2. DOSE ASSESSMENT PROCEDURE. Delafield, H.J.; Dennis, J.A.; Gibson, J.A.B. (UKAEA Research Group, Harwell. Atomic Energy Research Establishment). 1973. 44p. UK pounds1.00.

The report provides detailed operational instructions on procedures of dose assessment with the UKAEA personnel criticality dosimeter, the installed neptunium dosimeter and the AERE/RPS personnel film dosimeter. Sections cover: general procedure for making a dose assessment; personnel monitoring; dosimeter measurements; body measurements; derivation of doses from dosimeter measurements; and estimation of doses from body, hair and clothing measurements. Appendices are devoted to measuring equipment and calibration procedures, and radiochemical analysis procedures for wool and hair.

- 3175 (CONF-730915-- , pp 261-268) ENVIRONMENTAL RADIATION MONITORING WITH THERMOLUMINESCENT DOSIMETERS. Geiger, E.L.; Sanchez, E.A. (Eberline Instrument Corp., Santa Fe, NM). 1973.

From Symposium on noble gases; Las Vegas, NV, USA (24 Sep 1973).

Symposium on noble gases.

Thermoluminescent dosimetry (TLD) provides one method of documenting environmental radiation dose rates near nuclear facilities. Factors that affect the accuracy and precision of TLD measurements have been evaluated using badges with five solid lithium fluoride dosimeters sealed in plastic. Data obtained from 1968 to date (July 1973) indicate that careful attention to annealing and reading can provide an accurate and precise documentation of background radiation dose rates. In-transit exposure was found to be the largest variable, and this error can be eliminated by local annealing and reading. With the TLD program described, a change at the site perimeter as small as 10 mrem/year can be measured, but the problem is to identify the reason for the change. Changes in background radiation dose rates due to snow cover, soil moisture, and various other natural phenomena, and natural differences in dose rates at various locations near a nuclear power station complicate the interpretation of TLD data. For best results, the monitoring program should be designed to compare indicator and reference station measurements as well as pre-operational and operational measurements.

- 3176 (CONF-730915-- , pp 432-438) DOSIMETRY FOR RADIOACTIVE NOBLE GASES. Soldat, J.K.; Bramson, P.E.; Parker, H.M. (Battelle Pacific Northwest Lab., Richland, WA). 1973.

From Symposium on noble gases; Las Vegas, NV, USA (24 Sep 1973).

Symposium on noble gases.

This is a survey of conventional methods and results in the dosimetry of the noble gases, with special reference to the environmental considerations relating to nuclear energy applications. Radon problems will be excluded, as will all issues specific to medical

applications of the gases. (Physiological input data from medical work is, of course, an important part of the required dosimetry information.) Among the dosimetry methods is the well-known Monte Carlo method of W. Snyder, et al., at ORNL. This will be briefly put in perspective, as a relevant paper by the ORNL group is included in this volume. The normally low and variable concentrations of the mixed noble gases in the environment lead to problems both in "calculational dosimetry" and in field measurements. The phases selected for comment will mainly relate to reasonable perspective in accounting for such secondary and tertiary intake pathways as the drinking of water containing dissolved noble gases.

- 3177 (CONF-730915-- , pp 420-431) CALCULATIONS OF THE ABSORBED DOSE TO A MAN IMMERSED IN AN INFINITE CLOUD OF KRYPTON-85. Snyder, W.S.; Dillman, L.T.; Ford, M.R.; Poston, J.W. (Oak Ridge National Lab., TN). 1973.

From Symposium on noble gases; Las Vegas, NV, USA (24 Sep 1973).

Symposium on noble gases.

A person exposed to an infinite cloud of krypton-85 is exposed to at least seven sources of radiation: (1) photons emitted in air, (2) beta particles emitted in air, (3) photons and beta particles emitted by krypton-85 present in the air passages of the lungs, (4) photons and beta particles emitted by krypton-85 present in body tissues, (5) bremsstrahlung produced in air, (6) bremsstrahlung produced by beta particles incident on the body, (7) bremsstrahlung produced within the body. The energy spectra of scattered photons are calculated by the method of Dillman and half these spectra are taken as incident on the body, producing doses to body organs as in MIRD Pamphlet No. 5. Doses to various organs, e.g., red bone marrow, gonads, etc., from sources (1) and (5) above are calculated by interpolation from these results. Dose to skin from source (2) is calculated by integration of Berger's point kernel (MIRD Pamphlet No. 7) in air. Doses from sources (3), (4), (6), and (7) are calculated by methods developed by the authors of internal sources of photons and beta particles. If the intensity in the cloud is 1 $\mu\text{Ci}/\text{m}^3$, a dose to skin at a depth of 7 mg/cm^2 is approximately 1.8 rad/a; to the lungs, 32 mrad/a; ovaries, 6.2 mrad/a; and testes, 16 mrad/a.

- 3178 (FRNC-TH--681) GAMMAGRAPHY IN ODONTOLOGY. Faure-Baumann. (Paris-7 Univ., 75 (France)). 1973. 54p. (In French). Dep. NTIS (US Sales Only), PC A04/MF A01.

Copies available from Service de Documentation, CEN Saclay, B.P. No.2, 91190 Gif-sur-Yvette (France).

The application of gammagraphy to odontology, using a miniaturized gamma source, was studied. The new portable system presented, consisting of a sealed source of ^{125}I and its shielding, is 7 mm wide and 10 cm long. The operation and advantages of this apparatus are described.

- 3179 (HRF--0003704) RADIATION THERAPY. SUBCOMMITTEE REPORT. (Health Planning Association of Northwest Ohio, Maumee (USA)). 1973. 8p. NTIS \$3.50.

Availability of radiation therapy services within Lucas County, Ohio, was investigated. No hospital-based cobalt unit exists in the county, which incorporates Toledo, Ohio; three units exist in private physicians' offices. There is one full-time radiotherapist in the

entire northwest Ohio area. Centralization of radiotherapy in centers with a minimum case load in compliance with recommended guidelines is the suggested approach to eliminating deficiencies in availability of radiation therapy services. Criteria for such centralized centers are set forth. The development of a major radiotherapy center at the Medical College of Ohio is recommended, as is the addition of a cobalt unit at two local hospitals. No additional cobalt units -- private or hospital based -- are recommended for Lucas County without further consideration of utilization data. Portions of this document are not fully legible. (GRA)

- 3180 SAFE USE OF IONIZING RADIATIONS. London; Dept. of Health and Social Security (1973). 17p.

Based on the "Code of Practice for the protection of persons against ionizing radiations arising from medical and dental use" (CIS 74-423), this handbook shows how hospital staff can avoid exposing themselves and others to these hazards. It is designed particularly for junior and student nurses. Contents: ionizing radiations, their types and characteristics; their uses and dangers; basic principles in their safe use; safe use in practice; explanation of terms.

- 3181 NATURAL RADIATION EXPOSURE IN THE UNITED STATES. Oakley, D.T. (Environmental Protection Agency, Washington, D.C. (USA)); Moeller, D.V. (Harvard School of Public Health, Boston, Mass. (USA)). pp 407-412 of Health physics problems of internal contamination. Bujdosó, E. (ed.). Budapest; Akadémiai Kiadó (1973).

3 figs., 1 ref., 1 table.

An estimation of the population dose from radiation of natural origin and its variation was made on the basis of the series of Aerial Radiological Measurement Surveys (ARMS) conducted over major areas of the U. S. The mean terrestrial dose equivalent was calculated to be 40 mrem/year. On the basis of knowledge of the distribution of population with elevation the average dose equivalent from cosmic radiation was found to be 44 mrem/year. In order to get an estimate of the gonadal dose equivalent, the influence of housing, biological shielding, and the DE contribution from internal emitters was also considered, and it was calculated to the U. S. population to be 88 mrem/year. (INIS)

- 3182 Radiopharmaka - biokinetische Daten und Ergebnisse von Neuberechnungen der Strahlendosis. (RADIOPHARMACEUTICALS: BIOKINETIC DATA AND RESULTS OF RADIATION DOSE CALCULATIONS). Deff, K.; Kaul, A.; Roedler, H.D.; Vogelsang, T. Berlin, F.R. Germany; Informationsdienst fuer Nuklearmedizin der Freien Universitaet Berlin (1973). 654p. (In German).

With tabs. and refs..

By the submitted compilation for the first time values of absorbed doses for most radiopharmaceuticals are available, for which the retention in the different organs has been described according to a uniform mathematical model and for which the absorbed dose calculations have been performed by means of an extended 'concept of absorbed fractions'. The biokinetic data taken as a basis for absorbed dose calculations represent the majority of the data available from literature and suitable for absorbed dose calculations. Contrary to earlier

tabulations of absorbed doses without presentation of biokinetic data and methods of calculation the submitted publication enables the reader not only to look up target doses, but also to get detailed information on the biokinetics of radiopharmaceuticals.

- 3183 (BMVg-FBWT--73-24) BIOLOGICAL EFFECT OF FAST NEUTRONS. NUMBER OF RETICULOCYTES AND WEIGHT OF SPLEEN OF MICE FOLLOWING WHOLE-BODY IRRADIATION. Otto, F.J. (comp.). (Bundesministerium der Verteidigung, Bonn (Germany, F.R.). Abt. Wehrtechnik; Bundesministerium der Verteidigung, Bonn (Germany, F.R.). Dokumentationszentrum der Bundeswehr). 1973. 20p. (In German). INIS.

6 figs.; 4 tabs.; 19 refs..

The efficiency of fast neutrons of the energy range from 1.7 to 5 MeV in reducing the reticulocyte count and in diminishing the spleen weight was studied in male NMRI mice and compared with the effects of 250 kV X-rays. The neutron induced decrease of reticulocyte number in the peripheral blood is complete two days after irradiation. At this time even low doses cause a maximal effect. The relation between the rise of effect and the increase of exposure is great in the range of low doses and small in high doses. The relative biological effectiveness of neutrons in reducing the reticulocyte count is 2.5 after low doses and 1.2 after high doses. The spleen of irradiated mice shows a marked loss of weight, the lowest weight values are observed at the second day after irradiation. The relative effectiveness of neutrons in diminishing the spleen weight is 2.1 at low doses, the RBE decreases to 1.4 and rises again to 1.9 at higher doses. These results are compared with previous findings on mortality response and leucocyte and lymphocyte decrease in mice after neutron irradiation. Reticulocyte and lymphocyte count are found to be useful indicators for the detection and evaluation of neutron damage in the sublethal dose range.

- 3184 ACTION OF LOCAL IRRADIATION OF BONES ON THE ALKALINE PHOSPHATASE ACTIVITY. Wawrzekiewicz, M. Radiobiol. Radiother.; 14: No. 4, 385-391(1973). (In Russian). ALKALINE PHOSPHATASE; BIOLOGICAL RADIATION EFFECTS; BIOLOGICAL REPAIR; BONE MARROW; DIAGNOSIS; DOSE-RESPONSE RELATIONSHIPS; INACTIVATION; PARTIAL BODY IRRADIATION; RATS; SKELETON; TIME DEPENDENCE; X RADIATION

- 3185 RESPIRATION AND PHOSPHORYLATION IN LIVER AND KIDNEY MITOCHONDRIA OF RATS EXPOSED TO HIGH-ENERGY GAMMA AND BETA RADIATION. Mokhoreva, S.I.; Vetlugina, N.S. Aktual. Probl. Onkol. Med. Radiol.; 3: 364-367(1973). (In Russian).

The effect of whole-body irradiation with γ rays (radiation source ^{60}Co) at 40 rad and β rays (source, a linear accelerator, electron energy 25 MeV) at 43 rad on oxidative phosphorylation in liver and kidney mitochondria was studied in rats. Gamma radiation gradually slowed the esterification of phosphate and respiratory rate during the oxidation of succinate in the liver and kidney mitochondria. The decrease was largest on day 15 after irradiation. However, the P/O ratio did not decrease by more than 10 to 12 percent. Despite the oxidation of glutamate in the mitochondria, respiration, phosphate consumption, and P/O ratio scarcely changed. Irradiation with electrons slowed the rate of oxidation of succinate and glutamate in liver mitochondria within 3 to 7 days. Phosphate

consumption decreased at the same time so that the P/O ratio remained unchanged. Beta irradiation had virtually no effect on liver mitochondria. There is a discussion of the mechanism of action of high-energy radiation on the phosphorylation system of the mitochondria.

- 3186 RADIATION--BIOCHEMICAL MECHANISM IN THE DEVELOPMENT OF RADIATION DAMAGE TO THE GENETIC APPARATUS IN ANIMAL CELLS. Grigorovich, N.A.; Monastyrnaya, P.L.; Aleksa, T.F. Aktual. Probl. Onkol. Med. Radiol.; 3: 330-335(1973). (In Russian).

In experiments on rats, the effect of irradiation at 50 to 500 rads on some properties of chromatin isolated from the spleen and thymus was investigated. Irradiation of DNA solutions resulted in the appearance of single-strand breaks at a frequency of 0.2 break/molecule (mol. weight DNA = 6 - 8.10⁶). Breaks were not found in DNA isolated from mouse spleen 10 minutes after irradiation, but 1 to 1.5 breaks per molecule were found in the DNA of irradiated animals 1.0 to 1.5 days after irradiation. Irradiation of isolated chromatin had no effect on its hydrodynamic characteristics, but chromatin from tissues of irradiated animals was characterized by structural anomalies only in the later periods of irradiation when the lysosomal enzymes (acid DNase and kathepsin) were activated. There is a discussion of the role of lysosomal enzymes in injuries to the genome during irradiation of animals.

- 3187 EFFECT OF γ RADIATION IN RELATIVELY LOW DOSE ON THE ACTIVITY OF GLUTAMINASE IN SUBCELLULAR FRACTION OF BRAIN AND LIVER CELLS. Tkach, V.M. Aktual. Probl. Onkol. Med. Radiol.; 3: 385-389(1973). (In Russian).

The effect of γ -irradiation at a dose of 40 rads was studied on the exchange of glutamine in rats. It has been shown that the irradiation leads to a significant lowering of the activity of glutaminamidohydrolase (I) in brain mitochondria and in the liver after 1, 3, 7, 15, and 30 days post exposure. In the fractions containing nuclei, fraction of myofibrillae and connective tissue, a slow down of the deamidation of glutamine also takes place, and only after 7 days the ammonium separation from glutamine increases and returns to normal. At the 15 and 30 days a second wave of the lower rate of the activity of I takes place. The type of the changes of I is the same in both organs, but in the liver it is expressed to a lesser degree. (JPRS)

- 3188 EFFECT OF X RAY IRRADIATION ON A NUMBER OF ASPECTS OF KIDNEY FUNCTION. Minasyan, G.N.; Uganesyan, A.S. (Inst. of Biochemistry, Erevan). Zh. Eksp. Klin. Med.; 13: No. 6, 22-23(1973). (In Russian).

The experiments were carried out on white rats, 3 to 5 months in age, who were subjected to a whole-body, x ray dose of 700 R. All the animals died on the 6th to 7th day. The results of the study showed that starting from the second day after irradiation the content of ammonia and urea in the urine increased significantly over a period of 4 to 5 days with a subsequent gradual decrease which was associated with a sharp decrease in daily diuresis. The content of ammonia in the blood and tissues hardly changed, while the content of glutamine increased significantly. Beginning from the third day after irradiation the amount of urea in the blood and liver increased to significant values before death of the animal. It was established that after irradiation the content of free amino acids (glutamine,

aspartic) in the blood and in a number of tissues (brain, liver, muscle, kidney) increased slightly, while a significant increase was noted in the urine. The irradiated animals showed a significant increase in the content of endogenous glutamine in the bone marrow, liver and kidney tissues. (SJR)

- 3189 QUANTITATIVE HISTOLOGICAL STUDIES ON AGING CHANGES IN CEREBRAL CORTEX OF RHESUS MONKEY AND ALBINO RAT WITH NOTES ON EFFECTS OF PROLONGED LOW-DOSE IONIZING IRRADIATION IN THE RAT. Brizzee, K.R. (Delta Regional Primate Research Center, Covington, La. (USA). Dept. of Neuropathology and Anatomy). pp 141-160 of Neurobiological aspects of maturation and aging. Ford, D.H. (ed.). Amsterdam, Netherlands; Elsevier (1973).

From Symposium on neurobiological aspects of maturation and aging; Brooklyn, N.Y., USA (26 Jun 1972).

Brains of a series of eight young adult control (150 days) and eight middle-aged control (550 days) rats were fixed by a two-stage perfusion procedure employing Heidenhain's 'susa' solution. An equal number of rats were exposed to γ irradiation at 6.5 R/day beginning on the 50th postnatal day and were sacrificed in the same manner and at the same age levels as the previous group. Paraffin sections were cut at 20 and 6 μ from cerebral cortical area 3 in the rat brains. Sections used for cell counts were stained with Harris' hematoxylin and eosin or iron hematoxylin, gallocyanin, acid fuchsin and ponceau de xylidene. Counts of neurons and glia were carried out at 20 equally spaced submolecular depth levels, and cell frequency profiles were plotted for each of the two cell types. The mean neuron and glial packing density for the total depth of the submolecular cortex of area 3 was not significantly different in young adult and middle-aged controls or in young adult irradiated (total dose 650 R) and control animals. However, statistical evaluation of data for relative depth levels 7 through 20 indicated that the packing density in this zone was significantly less ($P < 0.02$) in middle-aged controls than in young adult animals. In middle-aged irradiated rats (total dose about 3250 R) neuron and glial packing densities for total depth of submolecular cortex were not significantly different than in control animals at the same age level. However, the values obtained for neuron packing density at relative depth levels 1 through 8 were significantly lower in middle-aged irradiated than in middle-aged control rats. The neuron packing density in middle-aged irradiated rats was significantly lower than in the young adult irradiated males. In electron micrographs, an increase in the amount of glycogen granules in astrocyte cell processes in cerebral cortex of irradiated middle-aged rats was noted, but there was no evidence of any other ultrastructural alterations.

- 3190 (CONF-730915--), pp 469-471 BIOLOGICAL EFFECTS OF THE RADIOACTIVE NOBLE GASES. Morken, D.A. (Univ. of Rochester, NY). 1973.

From Symposium on noble gases; Las Vegas, NV, USA (24 Sep 1973).

Symposium on noble gases.

The biological effects of the noble gases depend on the physical properties of these gases, since they are nonreactive chemically under physiological conditions. A property of interest for the non-radioactive gases is their solubility in the various body tissues and fluids. Some of these noble gases have the additional property of radioactivity. The

combination of radioactivity and solubility permits the identification of a critical organ according to established procedures. The pathological response is not always greatest, or even of singular importance, in the organ so identified by calculation. Biological responses are desired for a prudent evaluation of the biological effect, but the choice of response and the mode of irradiation pose a large problem. The radioactive gases decay schemes include the emission of alpha particles, beta particles, positrons, and electron capture; and this decay is sometimes accompanied by gamma radiation. The resulting daughter products may be foreign or natural to the body; whether stable or radioactive, all are reactive chemically. The effects due to the radiation, however, probably exceed those chemical effects which may result. Radon has no stable isotope. The radon isotopes decay primarily through the emission of alpha particles. The biological effects from radon may arise in greater measure from its daughter products, which include alpha particle, beta particle, and gamma ray emitters, than from the parent radon. The consequences of these properties are discussed with particular reference to krypton-85 and radon-222.

- 3191 (CONF-730915-- , pp 492-500) RELATION BETWEEN CUMULATIVE EXPOSURE TO RADON-DAUGHTERS, LUNG DOSE, AND LUNG CANCER RISK. Jacobi, W. (Inst. for Radiation Protection, Munich). 1973.

From Symposium on noble gases; Las Vegas, NV, USA (24 Sep 1973).

Symposium on noble gases.

The dose/exposure-ratios regarding the influence of uncombined radon-daughters for the bronchial region resulting from different dosimetric models are compared. For dose evaluation, the uncombined fraction of the total potential α -energy in the inhaled air seems to be a more suitable parameter than the uncombined activity-fraction of RaA only. The mean dose to the basal cell layer in the medium bronchi is probably not considerably higher than the mean dose to the total bronchial tree. Under normal conditions in mines, a ratio of 0.4 to 1.0 rad/WLM can be expected. In the second part of the paper, the observed lung cancer-risks among uranium miners in the USA and the CSSR are discussed. Although the relative risk coefficient is similar for both groups, the absolute risk coefficient in the CSSR-group is significantly higher than in the USA-group of miners. On the basis of these data, an absolute lung cancer-risk of 10 to 20 cases/ 10^6 person-years per WLM is recommended for radiation protection purposes. Finally, the risk concept for the assessment of an exposure limit for uranium miners is discussed. The derived life time limit of 100 to 200 WLM for occupational exposure is comparable with the limit derived from the 15 rem/year-concept.

- 3192 (CONF-730915-- , pp 501-506) BIOLOGICAL EFFECTS OF RADON ON THE LUNG. Morken, D.A. (Univ. of Rochester, NY). 1973.

From Symposium on noble gases; Las Vegas, NV, USA (24 Sep 1973).

Symposium on noble gases.

The biological effects of radon on the lung arise primarily from the alpha decay of the short-lived decay products of radon inhaled. Radon is chemically inert and so is distributed throughout the body according to its solubility in the various body tissues. The daughter products are isotopes of polonium, bismuth, and lead, which are treated individually by the tissues and fluids, within the confines of their brief half-lives. Experiments with

inhaled decay products indicate the dose to lung is much greater than to the rest of the body. Extensive injury was done to the bronchial tree, but the lesions did not lead to bronchial tumors. After irradiation ceased, these lesions were quickly repaired. Permanent changes, but no cancer, were seen in the region of the respiratory bronchioles. Compared to other alpha emitters in the lung, the alpha radiation from radon is particularly inefficient in producing radiation-specific tumors. The conclusion is taken that the radiation effects of alpha emitters may be inconsequential compared to the chemical effects of the alpha emitters.

- 3193 (CONF-730915-- , pp 527-531) REVIEW OF THE URANIUM MINER EXPERIENCE IN THE UNITED STATES. Hilberg, A.W. (National Academy of Sciences, Washington, DC). 1973.

From Symposium on noble gases; Las Vegas, NV, USA (24 Sep 1973).

Symposium on noble gases.

Mining of uranium ores on a very small scale began in the United States in 1898. In 1948 mining of uranium ores increased significantly as a result of the increasing demands of the atomic energy program, particularly, the weapons program. It was well-known that radioactivity was associated with uranium ore and potential health hazards had been identified as early as 1921. It was then suggested that the large number of lung cancers found in the Schneeberg miners could possibly be caused by ionizing radiation. Radiation exposure to the lungs of uranium ore miners comes about because of varying concentrations of radon decay products in the mine atmosphere. Measurements of the amount of radioactivity in mine atmospheres began in the United States in 1950 and between 1951 and through 1968, approximately 43,000 measurements were made in about 2,500 uranium mines. Periodic medical surveys were made starting in 1950, but it was not until 1954, that a concerted effort was made to examine all miners. At this time an epidemiological study was begun by the U.S. Public Health Service to determine the effects of uranium mining with particular emphasis on the problem of lung cancer induction. The study of the miners, the results of which have been published, revealed a distinct and somewhat dramatic increase in lung cancer. This increase has been ascribed to the radiation exposure to radon-daughters. Because of the presence of a number of other potential occupational carcinogens in the dust of underground mines, there has been some question as to whether radon and radon-daughters constitute the principal cause of increased lung cancer risk among these miners.

- 3194 (CONF-730915-- , pp 532-539) RADIOLOGICAL HEALTH SIGNIFICANCE OF RADON IN NATURAL GAS. Johnson, R.H. Jr.; Bernhardt, D.E.; Nelson, N.S.; Calley, H.W. Jr. 1973.

From Symposium on noble gases; Las Vegas, NV, USA (24 Sep 1973).

Symposium on noble gases.

Natural gas contains varying amounts of radon-222 which becomes dispersed within homes when natural gas is used in unvented appliances, such as kitchen ranges and space heaters. The average dose equivalent to the bronchial epithelium of an individual from use of natural gas in these appliances was estimated for typical exposure conditions to be 0.015 and 0.054 rem per year respectively. When extrapolated to the United States population at risk, the estimated population tracheobronchial dose equivalents were 1,874,000 and 854,000 person rems per year for these appliances, or a

total of 2,728,000 person-rems per year. A review of exposure conditions, lung model parameters, dose conversion factors, and health effects data indicated this population dose could possibly result in up to 15 deaths per year. For perspective, the concentrations and health effect consequences from use of natural gas containing radon were compared to current radon guides, natural background radon, and normal lung cancer mortality statistics. These comparisons indicated that natural gas represents about 0.9 to 1.5 percent of the guide of 0.33 pCi/l derived from ICRP No. 2, 0.3 to 3 percent of normal radon background, and 0.03 to 0.08 percent of normal lung cancer mortality. It was concluded that radon in natural gas does not contribute significantly to respiratory cancer mortality in the United States.

- 3195 (CONF-730915-- , pp 602-604) RADIATION PROTECTION IN URANIUM MINES: A REVIEW. Holaday, D.A. (City Univ. of New York). 1973.

From Symposium on noble gases; Las Vegas, NV, USA (24 Sep 1973).

Symposium on noble gases.

The consequences of the exposures to external and internal radiation which can occur in the mining of uranium ores are well-documented. Methods for evaluating and controlling these hazards have been developed by health protection agencies and the uranium mining companies. These procedures have been described in numerous reports from a number of the uranium-producing countries. The only feasible procedure for reducing exposure to external radiation is limitation of working time. Controls of radon and radon-daughters are directed at reducing influx of radon and dilution ventilation to supply uncontaminated air to working areas. Many different methods are employed depending on the particular circumstances. There is no "typical" uranium mine so the health protection group must adjust procedures to fit the conditions in each situation. Control of long-lived radioactive dust is usually accomplished by the dust-suppression methods used to control silica dust. In some circumstances, where high-grade ore is being mined, additional controls may be required to reduce concentrations of long-lived alpha emitting elements to acceptable levels.

- 3196 (CONF-730915-- , pp 605-611) RADON PROTECTION IN URANIUM MINES. Pradel, J. (Atomic Energy Commission, Fontenay-aux-Roses, France). 1973.

From Symposium on noble gases; Las Vegas, NV, USA (24 Sep 1973).

Symposium on noble gases.

In uranium mines, radon is present with its daughter products which may be fixed on different particles, the form of which is described. It is well-known that uranium miners may contract some pulmonary diseases when radon-daughter concentrations are too high during long periods. The origin of lung cancer is confirmed by animal experiments. To have a good protection, practical limits for radon and radon-daughter concentrations are established and individual monitoring is initiated. This monitoring must be well-fitted because the actual levels are almost up to maximum permissible levels. Ventilation is the most important technique to control radon and radon-daughter concentrations. Some ventilation investigations in an experimental mine are described.

- 3197 (CONF-730915-- , pp 612-629) SOME

RADIOLOGICAL HEALTH ASPECTS OF RADON-222 IN LIQUIFIED PETROLEUM GAS. Gesell, T.F. (Univ. of Texas, Houston). 1973.

From Symposium on noble gases; Las Vegas, NV, USA (24 Sep 1973).

Symposium on noble gases.

Natural Gas (NG) produced at the wellhead contains varying quantities of radon-222. Previous studies of wellhead gas from several gas fields have indicated concentrations ranging to 1450 pCi/l at standard temperature and pressure. When natural gas is processed to remove impurities and heavier, more valuable hydrocarbons, the radon becomes concentrated in the ethane and propane fractions. This concentration apparently takes place during fractionation because of the similar boiling points of radon, propane, and ethane. Liquified Petroleum Gas (LPG), which is widely used as a domestic fuel and as a chemical feedstock, is composed principally of propane and ethane. Potential human exposure to radon-222 and its progeny contained in NG and LPG can occur in a variety of ways to both occupational groups and to members of the general public. The paper includes an identification of the pathways of human exposure, the results of approximately 400 measurements of radon-222 concentrations in retail LPG and domestic NG supplies, and measurements of radon-222 concentrations in gas processing plant streams. An exposure model for the domestic fuel usage pathway is also presented.

- 3198 (CONF-730915-- , pp 630-636) PERSONNEL DOSIMETRY OF RADON AND RADON-DAUGHTERS. Becker, K. (Oak Ridge National Lab., TN). 1973.

From Symposium on noble gases; Las Vegas, NV, USA (24 Sep 1973).

Symposium on noble gases.

During the past five years there has been increasing interest in monitoring the individual exposure of persons to radon and, more importantly, the radon progeny attached to aerosol particles. Several devices have been proposed. These include the following: passive detectors based on nuclear track emulsions and track etching foils; semi-active systems in which the aerosols are collected electrostatically and detected by scintillator/film combinations or track etching; and active systems based on the collection of aerosols on a filter, and integrating measurement of the alpha flux from the filter by TLD or track films. All these systems have drawbacks, which have been minimized in a small active system based on alpha particle track etching which was originally developed at ORNL in 1969. Since then it has undergone substantial laboratory and field testing, and has been subjected to various improvements. The system is briefly discussed.

- 3199 (CONF-730915-- , pp 647-653) ENVIRONMENTAL RADIATION STANDARDS CONSIDERATIONS FOR KRYPTON-85 AND RADON. Martin, J.E.; Mills, W.A. (Environmental Protection Agency, Washington, DC). 1973.

From Symposium on noble gases; Las Vegas, NV, USA (24 Sep 1973).

Symposium on noble gases.

To ensure adequate public health protection, the Environmental Protection Agency is charged with the responsibility of establishing appropriate standards for controlling radioactive materials in the environment. Two noble gases are presently of interest to EPA, namely naturally occurring radon (radon-222) and fission-produced krypton (krypton-85). To establish standards pertaining to these gases, information on source concentration, source

control and effectiveness, and estimates of health effects must be utilized when available. From this viewpoint, the control of krypton emission from nuclear fuel reprocessing plants and the concentrations of radon in natural gas will be discussed.

3202 (CONF-730915-- , pp 472-483) KINETICS AND DISTRIBUTION OF XENON-133 AND KRYPTON-85 IN THE HUMAN BODY. Turkin, A.D.; Moskalev, Yu.I. (Inst. of Biophysics, Moscow). 1973.

From Symposium on noble gases; Las Vegas, NV, USA (24 Sep 1973).

Symposium on noble gases.

The kinetics of ^{85}Kr and ^{133}Xe metabolism were studied in experiments on 15 male human beings whose ages ranged from 25 to 50 years. The half-life of ^{133}Xe in the lungs varied from 18 to 42 seconds, with an average half-life of 30 seconds. The elimination of ^{133}Xe from the blood is nearly the same as that for the lungs. The half-lives of ^{133}Xe in the muscle and fat tissues ranged from 0, 1 to 0, 42 and 4.6 to 7.4 hours, respectively. The ^{133}Xe uptake by the skin does not exceed 0.4 percent. The elimination of ^{85}Kr from the human body is well described by the sum of exponents. The average half-life of ^{85}Kr in the blood and lung is the same as those for ^{133}Xe , however, in the fat tissue it ranged from 1.8 to 3.7 hours, with an average half-life of 2.7 hours, and in the muscle tissue it ranged from 4 to 11 minutes.

3203 (CS-INIS--13) INTERNAL THORIUM CONTAMINATION IN THOROTRAST PATIENTS. Dvorak, V.; Malatova, I.; Tuscany, R.; Ruzickova, V.; Klanova, K.; Kaufman, B.; Pazderova, J. (Institut Hygieny a Epidemiologie, Prague (Czechoslovakia). Ustav Hygieny Zarení). 1973. 115p. (In Czech). Dep. NTIS (US Sales Only), PC A06/MF A01.

Available from Institut Hygieny a Epidemiologie. Centrum hygieny zarení, Prague, Czechoslovakia.

The results are presented of a radiotoxicological study in the internal contamination with thorium of thorotrast patients administered ThO_2 within 1930 to 1950 in Czechoslovakia in X-ray examinations. Dosimetric information was obtained using a whole-body counter; the information obtained by excretion analysis on the content of ^{232}Th daughters, such as ^{212}Pb , ^{212}Bi , and ^{208}Tl in the blood, urine and feces was completed with karyological examination of selected patients. Detailed information on ^{208}Tl organ distribution in 10 thorotrast patients showed that 62% of the whole-body activity of the radionuclide was retained in the liver and in the spleen.

3204 (ORNL-tr--4499) METHOD OF EVALUATING THE CONTENT OF NATURAL RADIOACTIVE ISOTOPES OF THE URANIUM AND THORIUM FAMILY IN DRINKING WATER AND FOOD. Mordberg, Ye.L.; Shalayev, I.L. Translated by G.D. Lord from Gig. Sanit.; No. 8, 52-55(1973). 6p. Dep. NTIS, PC A02/MF A01.

Methods for calculating the annual maximum permissible intake limits for naturally-occurring radioisotopes found in drinking water, soil, and agricultural products are discussed. It is pointed out that these radioisotopes occur in mixtures with daughter products, and it is suggested that analysis be limited to those members of the uranium and thorium family with the highest radiation danger, including ^{238}U , ^{235}U , ^{234}U , ^{231}Pa , ^{234}Th , ^{232}Th , ^{230}Th , ^{228}Th , ^{227}Th , ^{227}Ac , ^{226}Ra , ^{224}Ra , ^{223}Ra , ^{210}Po , ^{210}Bi , and ^{210}Pb . Maximum permissible intake data are included.

3205 (CONF-730915-- , pp 439-468) BEHAVIOR OF KRYPTON-85 IN ANIMALS. Kirk, W.P. (Environmental Protection Agency, Research Triangle Park, NC). 1973.

3200 A COMPARATIVE STUDY OF TWO METHODS OF ESTIMATING HUMAN INTERNAL EXPOSURE HAZARDS RESULTING FROM THE INGESTION OF SEA FOODSTUFFS. Bittel, R. (Association Euratom-CEA, Centre d'Etudes Nucleaires de Fontenay-aux-Roses, 92 (France). Niveaux de Contamination Radioactive du Milieu Ambiant et de la Chaine Alimentaire). pp 413-416 of Health physics problems of internal contamination. Proceedings of the IRPA 2nd European Congress on Radiation Protection organized by the Eotvos Lorand Physical Society, Health Physics Section. Bujdosó, E. (ed.). Budapest; Akademiai Kiado (1973).

From IRPA 2 European Congress on Radiation Protection; Budapest, Hungary (3 May 1972). 5 refs., 1 table.

A discussion is presented on the advantages and drawbacks of two methods (the concentration factor and the specific activity methods) of estimating human internal exposure hazards resulting from the ingestion of contaminated sea foodstuffs. The methods have been applied to several different diets to be considered as critical in the European Community. The agreement between the two methods was fairly satisfying; but a deviation over one magnitude was found in the case of ^{45}Ca (in bone), ^{90}Sr (in bone), ^{137}Cs (whole body), ^{131}I (in thyroid), and ^{54}Mn (in liver). (INIS)

3201 (CONF-730915-- , pp 507-519) BIOLOGICAL EFFECTS OF DAILY INHALATION OF RADON AND ITS SHORT-LIVED DAUGHTERS IN EXPERIMENTAL ANIMALS. Palmer, R.F.; Stuart, B.O.; Filipy, R.E. (Battelle Pacific Northwest Labs., Richland, WA). 1973.

From Symposium on noble gases; Las Vegas, NV, USA (24 Sep 1973).

Symposium on noble gases.

Syrian golden hamsters, C57BL mice, and specific-pathogen-free rats were exposed simultaneously in groups of 16 animals each for 90 hours per week to aerosols consisting of radon plus 3000--6000 Working Levels of radon-daughters with and without 18 mg/m³ carnotite uranium ore dust. Condensation nuclei concentrations ranged from 2000--4000 per ml and from 90,000--120,000 per ml in the chamber without and with uranium ore dust, respectively. At 4 months of exposure only one of the rodents remained alive. Histopathology of radon-daughter exposed mice includes acute interstitial pneumonitis, severe pulmonary congestion, and suppurative rhinitis; mice inhaling radon-daughters with ore showed these lesions plus macrophage proliferation, alveolar septal cell hyperplasia, and bronchial epithelial hyperplasia. Hamsters inhaling radon-daughters showed proliferating lesions characterized by alveolar septal thickening, bronchiolar epithelial hyperplasia, septal fibrosis, and occasionally adenomatoid metaplasia and squamous metaplasia. Hamsters inhaling radon-daughters with ore dust showed similar effects plus granulomatous response and intense septal fibrosis. Rats inhaling radon-daughters showed lesions similar to those of hamsters but more focalized with classic radiation pneumonitis; rats exposed to radon-daughters with ore showed similar lesions, with greater consolidation and pneumoconiosis. These findings will be discussed in relation to pulmonary pathology in uranium miners.

From Symposium on noble gases; Las Vegas, NV, USA (24 Sep 1973).

Symposium on noble gases.

The in vivo behavior of ^{85}Kr can usually be predicted if the protein/water/fat composition of a body or tissue and its blood perfusion characteristics are known. The amount of isotope taken up by the tissue is the weighted sum of component tissue: air partition coefficients multiplied by the concentration of ^{85}Kr in alveolar air, while the rates of saturation or desaturation are determined by perfusion. Equations describing postulated kinetic behavior of noble gases are presented and compared with ^{85}Kr data reported for individual organs and tissues from several species in the literature, and data obtained with whole guinea pigs and rats. Partition coefficients are discussed and theoretical values compared with in vitro data from this laboratory and the literature, and with in vivo data for blood and 22 other organs/tissues obtained with guinea pigs in current work. Equilibrium beta radiation doses to various organs/tissues from a contained isotope in guinea pigs breathing ^{85}Kr at present MPC/sub a/ are given.

- 3206 (NRPB-R--6) ATOMIC ENERGY AND THE ENVIRONMENT. Marley, W.G. (National Radiological Protection Board, Harwell (UK)). Dec 1972. 18p. NTIS (US Sales Only). Available from H.M. Stationery Office, price Pound0.50.

A review is given of the radiation doses used as criteria for protecting populations from the effects of a nuclear power programme. These include the levels recommended by ICRP for doses to the population and the acceptable variations in the natural background. The latest available data on risks of radiation-induced biological effects are discussed. Estimates of the radiation doses to the public from the current nuclear power programmes are very low and even the predicted values in the year 2000 are only 2×10^{-3} of the dose from natural background. This level of dose taken in conjunction with our present knowledge of risks shows that the biological impact on the world population is negligibly small. Finally, a comment is made on the sources of population exposure from radioactivity associated with possible thermonuclear reactors.

- 3207 (NRPB-R--8) FUTURE IMPLICATIONS OF SOME LONG-LIVED FISSION PRODUCT NUCLIDES DISCHARGED TO THE ENVIRONMENT IN FUEL REPROCESSING WASTES. Bryant, P.M.; Jones, J.A. (National Radiological Protection Board, Harwell (UK)). Dec 1972. 21p. NTIS (US Sales Only).

Available from H.M. Stationery Office, price Pound0.50.

Current reprocessing practice leads to the discharge to the environment of virtually all the krypton-85 and tritium, and a large fraction of the iodine-129, formed as fission products in reactor fuel. As nuclear power programmes expand the global inventory of these long-lived nuclides is increasing. The radiological significance of these discharges is assessed in terms of radiation exposure of various population groups during the next few decades. The results of this assessment show that krypton-85 will give higher dose rates than tritium or iodine-129, but that on conventional radiological protection criteria these do not justify taking action to remove krypton-85 from reprocessing plant effluents before the 21st century.

- 3208 RENAL SCINTISCANNING WITH $^{99\text{m}}\text{Tc}$ -IRON ASCORBATE IN CHILDREN. Mussa, G.C.; Martini-Mauri, M.; Bacolla, D.; Bona, G.; Favetta, S. (Univ., Turin). *Precis. Met. Molding*; 14: No. 11, 359-364 (Nov 1972).

A comparison is made between renal scintiscans obtained with ^{197}Hg and $^{99\text{m}}\text{Tc}$ -iron ascorbate with a view to determining whether the latter tracer gives more significant data. In some cases, both isotopes were experimented in the same subject. Illustrative examples from a large series are given for 2 normal children, 2 with congenital deformities and 3 with unilateral or bilateral nephroblastoma. The conclusion is reached that both isotopes offer the same results. The $^{99\text{m}}\text{Tc}$ complex is responsible for a much lower kidney irradiation dose, but practical difficulties militate against its routine use.

- 3209 COLOUR SCINTISCANS IN THE DIAGNOSIS OF HEPATIC TUMORS IN CHILDREN. Mussa, G.C.; Martini-Mauri, M.; Bacolla, D.; Bona, G.; Favetta, S. (Univ., Turin). *Panminerva Med.*; 14: No. 10, 314-319 (Oct 1972).

Attention is drawn to the use of $^{99\text{m}}\text{Tc}$ sulfur colloid for liver scintiscans in paediatric practice. In addition to providing the most satisfactory results from the technical point of view, this tracer enables the attainment of virtually negligible whole body and liver radiation absorption dose levels. The examination is of particular importance as a means of detecting the presence of primary or metastatic liver tumors. Personal cases of liver tumor (1 primary; 5 metastatic) in children aged 3 months to 12 years are presented. Emphasis is laid on the fact that in paediatric subjects, particularly those in the first few months of life, scintiscanning with $^{99\text{m}}\text{Tc}$ sulphide colloid led to the solution of diagnostic problems that would otherwise have involved the employment of more laborious and traumatic techniques. A further important facet of the use of scintiscanning is that the efficiency of antitlastic treatment can be followed.

- 3210 ESTIMATING THE PRECIPITATION OF RADIOACTIVE AEROSOLS IN THE RESPIRATORY SYSTEM. Bykhovskii, A.V.; Zarayev, O.M.; Rakhmanov, B.N. *Gig. Sanit.*; 37: 46 (Sep 1972). (In Russian).

A method for estimating the accumulation of radioactive aerosols in the respiratory system of workers occupationally exposed to such conditions is described. The method utilizes a six-stage impactor such that the data obtained characterizes the distribution of aerosol radioactivity directly, i.e., by the aerodynamic diameter of the particles. A pulmonary dynamics model in conjunction with a logarithmic normal characterization of radioactivity distribution is used to determine the relative portion of radioactive aerosol retained in different sections of the respiratory tract (nasopharynx, tracheo-bronchial section, and lower section of the lungs). Coefficients of the retention of radioactivity, calculated with a logarithmic normal distribution and the aid of a linear programming method are given in tables. If aerosol radioactivity is more or less equally distributed throughout a controlled room, then readings from a stationary or portable aerosol sampler can be accepted as a satisfactory estimate of the true concentration and physicochemical properties of radioactive particles in air breathed by working personnel.

- 3211 (UERL--1) COMPARATIVE LEVELS OF

RADIOACTIVE AIR POLLUTANTS FROM INDUSTRY AND FALLOUT. A PROGRESS REPORT OF RADIOECOLOGICAL INVESTIGATIONS OF AIRBORNE RADIOACTIVITY IN THE UTAH ENVIRONMENT. Pendleton, R.C. (Utah Univ., Salt Lake City (USA). Lab. of Environmental Radioactivity). 31 May 1972. Contract E(26-1)-0462. 354p. Dep. NTIS \$10.50.

Results are reported of measurements carried on during the year 1971 and the first two months of 1972 on the radioactivity from natural as compared to artificial radiation sources in the environment in Utah. During this time, a major portion of our work was devoted to analyses of the data and preparation of a report related to the Baneberry venting event and the accumulation of data on fallout from the January 7, 1972 Chinese nuclear explosion. Calibration procedures were developed for air samplers for the establishment of the numbers of pCi/m³ in air. The responses of the air monitors in relationship to the ventilation index, seasonal effect, and the industrial complexity of the area were analyzed. Continuous measurements were made of the levels of radioactive materials in soils and vegetation and the results of these studies are presented mainly in tabular form. Comparisons have been made of the levels of radioactive materials in soils on the basis of square mile levels and the distribution of the radioactive materials in the soil profiles. Measurements of farm crops, including the major sources from which dairy products would be produced, have been made, and some comparisons by year and location have been made. Studies of secondary aerosols have been made using the dust accumulated on farm implements as the indicator of the kinds of secondary aerosols to which farmers and outdoorsmen might be exposed. These results would also be indicative of the kinds of dusts produced when high winds resuspend soil deposited radionuclides.

3212 (UCRL-Trans--11093) INTEGRAL METHODS OF PERSONAL DOSIMETRY OF FAST NEUTRONS. I. SURVEY OF EXISTING METHODS. Spurny, F. Translated from Jad. Energ.; 18: No. 10, 332-341(1972). 45p. Dep. NTIS \$4.00.

The paper is devoted to a survey of integral methods used in personal dosimetry of fast neutrons. The first part deals with methods currently used in practice. It discusses nuclear emulsions, sets of activation detectors, methods based upon moderation of fast neutrons, gas ionization, and radiation damage to semiconductors. For each method, the basic dosimetric characteristics are discussed, such as the energy dependence, dose, influence of dose rate, fading, γ -radiation effects. Some are characterized by directional dependence and the method of evaluation.

3213 (ORNL-tr--4339) LINES OF EXPERIMENTAL RESEARCH IN DEVELOPING MATHEMATICAL MODELS FOR ESTIMATING INTERNAL RADIATION. Bad'in, V.I.; Ermilov, A.P.; Margulis, U.Ya.; Khrushch, V.T. (Institut Biofiziki, Moscow (USSR)). 1972. Translation by S.D. Blalock Jr. from pp 81-86 of SZS--148. (CONF-7206102--1). 7p. Dep. NTIS \$3.50.

From Working meeting on the question of radiation protection; Berlin, F.R. Germany (8 Jun 1972).

The report presents material involved with the statistical approach to the problem of modeling internal radiation and the trend of experimental research dictated by that approach. The content of a radioactive isotope in an organ must be viewed as a random function for which the ratio of two independent incorporations, on the average by probability,

corresponds to the ratio of the corresponding amounts of the isotope that have accumulated in the organism. This tenet determines the principle of similarity. Specifically, it follows from it that the distribution of the arbitrary amount in the organism with multiple repetition of the experiment will be subordinate to a log-normal law. Second, the vital condition for creating the quantitative statistical model of the metabolism is a large volume of experimental data. This requires perfection of the unified rapid methods of research.

3214 (PB--244163) PION DEPTH-DOSE DISTRIBUTION INCLUDING THE EFFECT OF INTERACTIONS IN FLIGHT. Boyd, D. (Stanford Univ., Calif. (USA). High-Energy Physics Lab.). Feb 1971. 18p. (HEPL-TN--71-1). NTIS \$3.25.

The computer design of a toroidal superconducting pion channel is described. The design is aided by means of an interactive graphic display of pion trajectories through the system. Several examples of such pion trajectory groups are presented and these illustrate the focussing quality of the channel under various conditions of interest. The computer ray tracing program is described and listed in the appendix. The final design parameters of pion channel are: solid angle greater than 1 sr, delta p/p of several per cent, and final focal spot dimensions of 1 cm. These parameters are suitable for the proposed applications in cancer therapy. (GRA)

3215 EXPERIENCES IN THE COUNTRY-WIDE RADIOLOGICAL PROTECTION SURVEYS IN INDIA. Bhargava, V.K.; Supe, S.J.; Samuel, K.M. (Bhabha Atomic Research Centre, Bombay (India). Div. of Radiation Protection). Indian J. Radiol.; 31: No. 1, 12-19(Feb 1971).

The radiological protection surveys constitute an essential part of the radiation safety program of any country. The surveys are arranged for on-the-spot monitoring of areas in the vicinity of the radiation sources and the inspection of source, housing and storage facilities and scrutinising the work practices of the personnel handling these sources. In India the program of conducting radiological protection surveys was taken up by the Division of Radiological Protection, Bhabha Atomic Research Centre, in the year 1958. An analysis of 1612 surveys covering 750 x-ray medical diagnostic units, 255 gamma radiography units, 108 x-ray radiographic units, 156 isotope laboratories, and 75 brachytherapy installations is presented. These surveys were carried out during the period from 1958 to 1973. The analysis shows that the percentage of installations unsatisfactory from the radiation safety viewpoint for various common inadequacies ranged between 20 % and 40 %. It further reveals that 5 % of the total radium stock in the country is either damaged or in leaking conditions.

3216 (AD--888503) BETA-RADIATION DOSES FROM FALLOUT PARTICLES DEPOSITED ON THE SKIN. FINAL REPORT, 17 APR 1970--30 JUN 1971. Mikhail, S.Z. (Environmental Science Associates, Burlingame, Calif. (USA)). Jan 1971. Contract DAHC20-70-C-0289. 105p. (ESA-TR--71-01). NTIS \$5.50.

Absorbed beta-radiation dose expected from fallout particles deposited on the skin was estimated by use of the Beta Transmission, Degradation and Dissipation (TDD) model and a Condensed-State Diffusion-Controlled model that describes the mechanism of fission-product

absorption in fallout. A fission density of 10 to the 15th power fissions per cubic centimeter of fallout material was assumed. Comparison of computed doses with the most recent experimental data relative to skin response to beta-energy deposition leads to the conclusion that even for fallout arrival times as early as 1000 seconds (16.7 minutes post-detonation), no skin ulceration is expected from single particles 500 micron or less in diameter. Absorbed gamma doses calculated for one particle size (100 microns) show a beta-to-gamma ratio of about 15. Dose ratio for larger particle sizes will be smaller. Doses from arrays of fallout particles of different size distributions were computed, also, for several fallout mass deposition densities; time intervals required to accumulate doses sufficient to initiate skin lesions were calculated. These times depend strongly on the assumed fallout-particle-size distribution. Deposition densities in excess of 100 mg per square foot of the skin will cause beta burns if fallout arrival time is less than about three hours, unless the particles are relatively coarse (mean particle diameter more than 250 microns). - 3219 (RFP-Trans--222) QUANTITATIVE THORIUM DETERMINATION IN 30 ORGANS DURING HUMAN THOROTRASTOSIS. Kampmann, H.; Wesch, H.; Wegener, K. Translated from Nucl.-Med., Suppl. (Stuttgart); No. 9, 579-585(1971). 7p. Dep. NTIS, PC A02/MF A01.

Using neutron-activation analysis, quantitative thorium determinations were carried out in 30 organs and tissues of 5 thorotrast patients. The measured results were compared with autoradiographic findings. With one exception, neutron-activation analysis was able to detect measurable, quantitative but very variable thorium concentrations in the various organs and tissues. The detection limit was around 0.2 μg thorium per g of tissue. With the autoradiograph, thorium could be found in organs with a thorium content above 10 μg per g of tissue, as indicated by neutron-activation analysis. The highest thorium concentrations were found in the spleen, liver, bone marrow and lymph nodes and adrenal glands. The measured results are in agreement with findings of recent animal experiments and clinical studies.

- 3220 CYSTEAMINE PROTECTION AGAINST LETHAL AND GROWTH-INHIBITING EFFECTS OF PRENATAL X AND GAMMA IRRADIATION. Roberts, J.M. (Univ. of Detroit). Teratology; 3: No. 4, 319-324(Nov 1970).

Exposure of pregnant rats to gamma radiation on day 16 of gestation produced nearly double the number of neo- and postnatal offspring deaths as did x irradiation. Dose level (185 R), dose rate (10-12 R/minute), and distance

from the source were the same in both groups. Cysteamine given prenatally prior to either gamma or x irradiation significantly decreased mortality. In the gamma-irradiated group the mortality rate remained significantly higher than in the control group, but in the x-irradiated group it was reduced to the control level by pretreatment with cysteamine. Cysteamine given to pregnant rats immediately following gamma irradiation had no effect on offspring mortality.

- 3221 POSSIBILITIES OF THE TEST OF INHIBITION OF ^{131}I STORAGE IN THE THYROID GLAND. Vlahov, N. Folia Med. (Plovdiv); 10: No. 3, 176-181(1968). (In German).

Results are reported on the use of the inhibition test for ^{131}I absorption in which on six successive days thyroid extract was administered in 30 cg pills containing 0.51 to 0.69 mg I. The test results on 102 patients showed that in thyreotoxicosis the ^{131}I accumulation was reduced only slightly with a variation W in the limits from 0.53 to 4.74. In illnesses in which the increased absorption had an extrathyroid character W varied between 31.88 and 52.95. The normal accumulation oscillates between 5.91 and 16.08. The differential diagnostic value of the tests for the determination of the proper therapy was discussed. (JSR)

- 3222 (AD-A--036044) RADIATION MEASUREMENTS UTILIZING THE USAF CHEMICAL DOSIMETERS. FINAL REPORT. Sigoloff, S.C.; Logie, L.C.; Borella, H.M.; Pickering, J.E. (School of Aviation Medicine, Randolph AFB, Tex. (USA)). Mar 1960. 84p. (SAM--59-21). NTIS PC A05/MF A01.

The Operation Teapot program for the correlation of prompt-neutron and prompt-gamma radiation dose with biologic effects includes: (1) Prompt-neutron and prompt-gamma angular distribution measurements as a function of distance; (2) prompt-neutron spectra measurements; (3) the determination of neutron and gamma attenuation coefficients for structural and other shielding materials, including terrain; (4) correlation of radiation dose measurements with effects in several species of animals; (5) gamma air-phase propagation measurements; (6) gamma and neutron depth-dose measurements. To accomplish these objectives two dosimeter technics were used. One (the water-equivalent, single-phase dosimeter) is sensitive to fast neutron and gamma rays. The other (the 2-phase, fast neutron insensitive gamma-ray dosimeter) is less than one percent sensitive to fast neutrons but responds to gamma radiation. Both systems are sensitive to thermal neutrons but can be shielded with lithium to reduce this response. These two systems were used primarily for gamma measurements.

- 3223 (AD-A--036099) LATE EFFECTS OF TOTAL-BODY ROENTGEN IRRADIATION. LONGEVITY AND INCIDENCE OF NEPHROSCLEROSIS AS INFLUENCED BY PARTIAL BODY SHIELDING. Lamson, B.G.; Billings, M.S.; Bennett, L.R. (School of Aviation Medicine, Randolph AFB, Tex. (USA)). May 1959. 16p. (SAM--59-33). NTIS PC A02/MF A01.

Two hundred forty-two female Wistar rats were observed throughout their life span following 1,000 R hypoxic total-body or partial-body irradiation. Hypoxic radiation superimposed anesthesia resulted in 67 percent 30 day mortality, compared to 9 percent mortality without anesthesia. Selection of the colony by acute postirradiation deaths did not

influence the magnitude of late radiation sequelae as measured by life shortening. Growth retardation during the second postirradiation year was well correlated with life-shortening. Life-shortening was observed after partial-body irradiation to an extent approximately proportional to the weight of radiated tissue. Nephrosclerosis was not observed unless the upper abdomen was included within the radiation field. Other than nephrosclerosis, a similar incidence of disease was observed at death in control and irradiated rats whether partial-body or total-body irradiated.

- 3224 (AD-A--036166) SOME EFFECTS OF NUCLEAR RADIATION EXPOSURE ON PRELIMINARY WGTA TRAINING PERFORMANCE OF RHESUS MONKEYS. McDowell, A.A.; Brown, W.L.; Wicker, J.E. (School of Aviation Medicine, Randolph AFB, Tex. (USA)). May 1959. 7p. (SAM--59-53). NTIS PC A02/MF A01.

Sixty-four naive rhesus monkeys, divided into three radiation subgroups, were studied with respect to progression through a series of training stages designed to prepare the subjects for object discrimination testing on the Wisconsin General Test Apparatus (WGTA). The subgroups were also compared on simple object-quality discrimination learning. The exposure to a nuclear radiation predated the present study by approximately 11 months. The results were as follows: (1) The higher the previous radiation dosage, the faster the response to food when initially placed in the WGTA. (2) The higher the previous radiation dosage, the slower the response to a wooden object block as a sign for food. (3) The higher the previous radiation dosage, the faster the discrimination of a food-rewarded object block after object blocks has acquired the stimulus value of food.

- 3225 (AD-A--036039) STUDIES ON THE MECHANISM OF LEUKEMOGENESIS BY IONIZING RADIATION. Upton, A.C. (School of Aviation Medicine, Randolph AFB, Tex. (USA)). Jan 1959. 16p. (SAM--59-17). NTIS PC A02/MF A01.

The induction of leukemia by ionizing radiation is influenced by many variables, including radiation intensity, radiation dose, fraction of the body irradiated, genetic differences in susceptibility, age at irradiation, sex, and other physiologic factors. The influence of these variables on the induction of leukemia varies with the hematologic type of leukemia induced. Irradiation increases the susceptibility of adult mice to filterable leukemogenic agents that, administered after irradiation, enhance the development of leukemia.

- 3226 (AD-A--036097) EFFECTS OF IONIZING RADIATION UPON HUMAN PSYCHOMOTOR SKILLS. Payne, R.B. (School of Aviation Medicine, Randolph AFB, Tex. (USA)). Dec 1958. 11p. (SAM--59-29). NTIS PC A02/MF A01.

With the possible exception of the quadratic component of the 10-day performance sequence, there is no evidence that exposure to ionizing radiation has affected the psychomotor skills in question. Whether this exception is a true radiation effect is debatable. It could just as well have been a disease effect, for it must be presumed that the prescribed exposure intensity bore some relationship to the severity of the disease. This confoundment, of course, was unavoidable. What may be present in this analysis of the curvature aspect of performance sequence is some combination of radiation effect and the general debilitating effect of

the disease. In any event, the absolute magnitude of change from group to group seems too slight to be of any practical significance.

- 3227 (HW--51317) SURFACE DOSE FROM PLUTONIUM. Roesch, W.C. (Hanford Works, Richland, Wash. (USA)). 10 Jul 1957. 22p. Dep. NTIS \$3.50.

The surface dose rate for plutonium metal was studied to provide a basis for estimating what the surface dose rate would be for any relative isotopic composition. The chief practical conclusion of this report is that there is an advantage of smaller total dose rate if Pu is processed immediately after its purification from other radioactive materials. If this is done, the main dose rate will come from neutrons emitted during spontaneous fission. In general, the total dose rate will be so high as to rule out manual handling of the Pu. To show how this report can be used and to supply the above conclusions, the surface dose rate was calculated for Pu made from uranium that had received high reactor exposure (megawatt-days/ton, MWD/T). For freshly purified Pu, the surface dose rate from α and γ rays rises from about one rad/hr at low exposure to an equilibrium value of a little over four rad/hr at about 10,000 MWD/T. The neutron dose rate rises from zero to an equilibrium value of about one rem/hr. The α rays from Pu are quite low energy. If they are absorbed in some way, the remaining hard component rises from about 0.1 rad/hr to an equilibrium value of about 0.2 rad/hr. This is small compared with the neutron dose rate, but as the decay products of plutonium begin to emit significant numbers of gamma rays, the hard component increases rapidly. At the end of a week the hard component may be as much as twice the neutron dose rate. The same general behavior may be expected for all reactor methods of handling Pu. The main part of the dose rate of freshly purified plutonium will come from neutrons. The hard component of the γ rays will increase rapidly and within a few days will exceed the neutron dose rate. A general theory for calculating surface dose rate due to γ rays from a high atomic number emitting material in contact with tissue is discussed. (auth)

- 3228 (CH--3783) TOXICITY AND METABOLISM OF PLUTONIUM IN LABORATORY ANIMALS. Finkle, R.D.; Jacobson, L.O.; Kisielleski, W.; Lawrence, B.; Simmons, E.L.; Snyder, R.H. (Chicago Univ., Ill. (USA). Metallurgical Lab.). Aug 1946. Contract W-7401-ENG-37. 97p. Dep. NTIS \$5.00.

Separate abstracts were prepared for five sections included in this reissue of a 1947 report on the tissue distribution and biological radiation effects of injected Pu in mice, rats, and rabbits. (CH)

- 3229 (CH--3783, pp 33-45) SURVIVAL AND GROWTH OF PLUTONIUM-INJECTED ANIMALS. Snyder, R.H.; Kisielleski, W.; Finkle, R.D. Aug 1946. Toxicity and metabolism of plutonium in laboratory animals.

The experiments showed that the lethality of Pu in rats and mice does not depend greatly on the valence state or on the salt administered. Only slight differences were noted in the lethal effects on mice as compared with rats. From the mortality curves there was some indication that the mice (ABC and CF₁ averaged) were somewhat more sensitive than rats to doses that were acutely lethal but somewhat less sensitive to doses that caused death after several months. Further study with larger

numbers of animals and smaller increments in the doses of each salt might well bring out differences which were not detected here. This is suggested particularly since the metabolism of Pu has been found to be very similar but quantitatively different for rats and mice. In rats, the 30-day LD₅₀ was about 0.09 μ Ci/g. The 60-day LD₅₀ was only slightly less, while at 90 days it was 0.06 μ Ci/g. At 220 days the LD₅₀ was about 0.03 μ Ci/g. Some of the lower doses (0.016 and 0.0038 μ Ci/g) appeared to be lethal, but in those cases death was believed to be due to secondary infections. It is possible that the Pu in the animal increased the susceptibility to these infections. For mice, the corresponding values were: 30-day LD₅₀ = 0.08 μ Ci/g, 50-day LD₅₀ = 0.07 μ Ci/g, and 210-day LD₅₀ = 0.05 μ Ci/g. (auth)

- 3230 (CH--3783, pp 47-52) EFFECTS OF INGESTED PLUTONIUM. Snyder, R.H.; Lawrence, B.; Finkle, R.D. Aug 1946.

Toxicity and metabolism of plutonium in laboratory animals.

The first of the three Pu ingestion experiments indicated that less than 0.5 percent was absorbed from the G. I. tract of the rat, and that there was no large difference between the plus-4 and plus-6 states. The activities measured were extremely low, most of the samples yielding only 1 or 2 counts/min over the background count. The experiment was designed to detect absorption in amounts greater than 0.5 percent, and absorption of this magnitude was definitely ruled out. The second experiment, in which rat femurs only were measured, is a more accurate measure of the actual absorption, although it is based on a femur-to-carcass ratio of 1 to 30, whereas experiments with injected Pu showed that this ratio may vary over a wide range. Although the mouse experiment was based on just one animal, it was the best controlled, and was at such a level of activity that accurate measurements were possible. It was found that the retention at 26 days was 0.06 percent; hence the amount absorbed was equal to this figure plus the amount excreted in the urine. This absorption may be higher than normal as a result of the temporary damage to the intestinal tract caused by the large dose of alpha radiation. (auth)

- 3231 (CH--3783, pp 53-92) HEMATOLOGICAL EFFECTS OF PARENTERALLY ADMINISTERED PLUTONIUM IN MAMMALS. Jacobson, L.O.; Simmons, E.L. Aug 1946.

Toxicity and metabolism of plutonium in laboratory animals.

Hematological studies of the peripheral blood after the administration of Pu as the citrate in the plus-6 state or nitrate in the plus-4 or plus-6 states were made on mice, rats, and rabbits. The doses given were 0.001 to 0.119 μ Ci/g intravenously and intracardially to mice, 0.0006 to 0.006 μ Ci/g intracardially to rabbits, and 0.0003 to 0.125 μ Ci/g intravenously and intramuscularly to the rats. Morphological changes which were largely comparable to those previously described in animals after external irradiations with x rays, gamma rays, and fast neutrons, were seen in the nucleated cells of the peripheral blood after Pu administration. As evidenced by an increased erythrocyte diameter and increased mean corpuscular hemoglobin, a macrocytic anemic became apparent in rats after the parenteral administration of doses of plutonium between 0.0063 and 0.063 μ Ci/g. This effect was less significant in mice and rabbits after comparable doses. The acute and subacute hematological changes seen in the peripheral blood following plutonium administration were

paralleled by concomitant histological changes in the hemopoietic tissues. (auth)

From International symposium on radiation protection in mining and milling of uranium and thorium; Bordeaux, France (9 Sep 1974).

Translation of a paper presented at an international symposium. Available from Vyvojovy zavod uranoveho prumyslu, Kamenna, Czechoslovakia.

The maximum permissible levels pertaining to radiation hazards in the mining and processing of uranium and thorium ores are discussed. The results are summed up of various authors related to this subject.

3237 (DOCKET-50219--1083) OYSTER CREEK
NUCLEAR POWER PLANT, UNIT 1. ANNUAL OPERATING
REPORT NO. 1: JANUARY--DECEMBER 1976.
(Jersey Central Power and Light Co.,
Morristown, N.J. (USA)). [nd]. 49p.

Net electrical power generated was 3,860,347
MWH with the reactor on line 6,967.3 hrs.
Information is presented concerning operations,
power generation, shutdowns, corrective
maintenance, chemistry and radiochemistry,
occupational radiation exposure, release of
radioactive materials, reportable occurrences,
fuel performance, and leak rate testing. (FS)

3238 (DOCKET-50266--599) POINT BEACH
NUCLEAR PLANT, UNITS 1 AND 2. ANNUAL
OPERATING REPORT: JANUARY--DECEMBER 1976.
(Wisconsin Electric Power Co., Milwaukee
(USA)). [nd]. vp. (DOCKET-50301--579).
TIC.

Unit 1 generated 227,877 MWH with the
generator on-line 540 hrs and Unit 2 generated
324,954 MWH with the generator on-line 696 hrs.
Information is presented concerning operating
experience; procedure changes, tests, and
experiments; maintenance, licensee event
reports and other events of interest; data
tabulations of electric power generation, unit
shutdowns, forced power reductions, and number
of personnel and Man/Rem exposure; eddy current
testing of steam generator tubes; and fuel
history. (FS)

3239 (DOCKET-50293--806) PILGRIM NUCLEAR
POWER STATION, UNIT 1. ANNUAL OPERATING
REPORT FOR 1976. (Boston Edison Co., Mass.
(USA)). [nd]. 54p.

Net electrical power generated was 2,415,511
MWH with the generator on line 5,333.6 hrs.
Information is presented concerning operations,
procedure changes, tests, experiments,
maintenance, unit shutdowns and power
reductions, and radiation doses to personnel.
(FS)

3240 (DOCKET-50334--474) BEAVER VALLEY
POWER STATION, UNIT 1. ANNUAL OPERATING
REPORT FOR 1976. (Duquesne Light Co.,
Pittsburgh, Pa. (USA)). [nd]. 300p.

Net electrical energy generated was 441,530
MWH with the generator on line 1714.9 hours.
Information is presented concerning operations,
maintenance, changes, licensee event reports,
power generation, shutdowns and forced power
reductions, personnel radiation exposures, and
unique reporting requirements. (FS)

- 3249 (KR--153) LITERATURE SURVEY: HEALTH EFFECTS OF RADIATION. Tveten, U.; Garder, K. (Institut for Atomenergi, Kjeller (Norway)). [nd]. 66p. NTIS (US Sales Only).

49 references.

This report was originally written as a chapter of a report entitled 'Air pollution effects of electric power generation, a literature survey', written jointly by the Norwegian Institute for Air Research (NILU) and the Institutt for Atomenergi (IFA). (INIS RN242406). A survey is presented of the health effects of radiation. It has not, however, been the intention of the authors to make a complete list of all the literature relevant to this subject. The NILU/IFA report was meant as a first step towards a method of comparing the health effects of electric power generation by fission, gas and oil. Consequently information relevant to quantification of the health effects on humans has been selected. It is pointed out that quantitative information on the health effects of low radiation and dose rates, as are relevant to routine releases, does not exist for humans. The convention of

linear extrapolation from higher doses and dose rates is used worldwide, but it is felt by most that the estimates are conservative. As an example of the use of the current best estimates, a calculation of normal release radiation doses is performed.

- 3250 (PUB--107) INTRODUCTION TO RADIATION PROTECTION AT THE LAWRENCE BERKELEY LABORATORY. Thomas, R.H.; Haley, J.T. (California Univ., Berkeley (USA). Lawrence Berkeley Lab.). [nd]. Contract W-7405-ENG-48. 24p. Dep. NTIS, PC A02/MF A01.

The script given here has been incorporated into a synchronized slide show, which will be of value in presenting to new personnel the basic information necessary to work efficiently and safely with ionizing radiations. It is also hoped that the slide-show will provide interesting information to personnel who do not, in the normal course of their employment, work with ionizing radiations. This script will be most efficiently used after seeing the slide show and is provided to refresh the viewer's memory.

1974 scientific works.

The purpose of this study is to determine, during 30 days, what becomes the animal whose enzymatic co-ordinates are well known. Both 100, 160, 200, 325, 400, 650, 850, 975, 1000, 1300 rads irradiated rabbit serum enzymatic evolution and that of two 1000 rads in toto irradiated leukemic men for a cord graft are studied.

- 3252 (CRSSA--1974, pp 85-89) PRELIMINARY STUDY OF HAEMOSTASIS IN IRRADIATED ENTERECTOMISED DOG. DYNAMIC ASPECT OF COAGULATION: THROMBELASTOGRAM. Dubos, M.; Hainaut, J.; Drouet, J.; Niauxsat, P.M.; Nguyen, T.L.; Neveux, Y. [nd]. (In French).

1974 scientific works.

Some hematological changes due to the combined effects of ionizing radiations and surgery were studied in dogs irradiated at 250, 300 and 350 R. A constant hemorrhagic syndrome was observed with a dose-response relationship for 250 and 300 R and an increase or hypocoagulability for dose higher than 300 R, till total incoagulability.

1974 scientific works.

Some hematological changes due to the combined effects of ionizing radiations and surgery were studied in dogs irradiated at 250, 300 and 350R. A constant hemorrhagic syndrome was observed with an impairment of the platelets functions and a depletion of several coagulation factors.

- 3254 (CRSSA--1974, pp 117-119) INFLUENCE OF RADIOPROTECTORS ON PLASMATIC CORTICOSTEROID RATE OF WHOLE-BODY IRRADIATED MOUSE. Fatome, M.; Roge, C.; Andrieu, L. [nd]. (In French).

1974 scientific works.

Whole body irradiation of mammalia provides two increases of plasmatic corticosteroid rate: the first one, few hours after irradiation, is taken as a non specific response to irradiation stress; the second one is taken as a reaction of suprarenal-hypophyso-hypothalamosystem to radiation injury. Cysteamine injected before irradiation seems to decrease significance of this second increase. Therefore plasmatic corticosteroid assay seems to be an interesting test in biological dosimetry.

- 3287 (ORO--2401-95) MODEL OF IODINE METABOLISM IN A T_3 -THYROTOXIC PATIENT UNDERGOING I-131 THERAPY. Ahuja, S.; Price, R.; Brill, A.B.; Dobyns, B.M.; Berman, M. (Vanderbilt Univ., Nashville, Tenn. (USA). Div. of Nuclear Medicine and Biophysics; Cleveland Metropolitan General Hospital, Ohio (USA); National Cancer Inst., Bethesda, Md. (USA). Lab. of Theoretical Biology). [nd]. 30p. Dep. NTIS \$4.00.

Data on radioactivity in the thyroid, urine, serum, butanol-extractable iodine (BEI) and chromatographic fractionations of BEI, obtained during four I-131 therapeutic treatments of a T_3 -thyrotoxic patient, have been analyzed and simulated with the help of a 7-compartment model. Good fits to most of the data can be obtained with both the dose-independent and dose-dependent models. A model with 3 or 4 compartments, which provides adequate fits to iodine kinetic data in most euthyroid and hyperthyroid patients is not satisfactory in the case of this patient. Thus, to represent iodine metabolism during T_3 -thyrotoxicosis therapy, we find that it is necessary to provide for separate biochemical pathways for the BEI components as well as the butanol-insoluble compounds released by the thyroid gland. (auth)

- 3288 (CRSSA--1973, pp 54-59) CALCULATIONS OF LOADS AND DOSES DELIVERED, FROM RADIOCHEMISTRY AND HUMAN SPECTROMETRY EXPERIMENTAL RESULTS IN A CASE OF INTERNAL CONTAMINATION IN MAN. (VALIDITY OF MORROW'S TEST AND RETENTION EQUATIONS). Fatome, M.; Frossard, H.; Gueguen, J.P.; Prat, G.; Quentric, Y.; Rocquet, G. [nd]. (In French).

Centre de Recherches du Service de Sante des Armees 1973 scientific works.

The results of a previous study giving fecal and urinary excretion curves of five radioelements (cesium 137, cobalt 60, cerium 144, strontium 90, and plutonium 239) after radioactive aerosol inhalation by a man were interpreted. It is tried to draw conclusions on the validity of the theoretical parameters needed for calculating the load and the dose in man.

- 3289 (CRSSA--1974, pp 129) EMERGENCY PROCESSING OF RESPIRATORY RADIOCONTAMINATIONS: DTPA AEROSOL AUTONOMOUS GENERATORS. Ducouso, R. [nd]. (In French). 1974 scientific works.

Previous studies have shown the need of inhaling a DTPA aerosol as soon as possible when a respiratory contamination by radionuclides such as plutonium and transplutonium elements, yttrium and rare earths is supposed. In order this emergency processing was applied, exposed people must have a portable and personal aerosol generator. Two devices able to respond to imposed criteria are described.

- 3294 (ERDA--76-23) EMERGENCY HANDLING OF RADIATION ACCIDENT CASES: FIREMEN. (Energy Research and Development Administration, Washington, D.C. (USA)). [nd]. 16p. TIC.

Procedures for the emergency handling of persons exposed to radiation or radioactive contamination are presented, with emphasis on information needed by firemen. The types of radiation accident patients that may be encountered are described and procedures for first aid, for preventing the spread of radioactive contamination, and for reporting the accident are outlined. (CH)

CORPORATE INDEX

In the Corporate Index, report literature is indexed using the name of the organization or institution responsible for issuing the report. Headings are provided for all report literature and for published literature for which a corporate approach is especially desirable, e.g., symposium and conference proceedings.

Each entry under a corporate heading gives the report title and the volume and abstract numbers. Report numbers, if applicable, are given in parentheses at the end of the entry.

DOE Energy Information Data Base: Corporate Author Entries (TID-4585) is used in the standardization of corporate entries. TID-4585 is available for purchase from the National Technical Information Service (NTIS), U. S. Department of Commerce, Springfield, Virginia 22161.

Donald C. Cook Nuclear Power Plant, Units 1 and 2. Reply to IE circular No. 76-03: "Radiation Exposures in Reactor Cavities", 834 (DOCKET-50315--625)

INDIAN ASSOCIATION FOR RADIATION PROTECTION, BOMBAY
First Asian regional congress on radiation protection, Bombay, India, December 15--20, 1974. Programme and abstracts, 3060 (CONF-741219--(Absts.))

Protection from modern industrial and environmental risks. lessons from nuclear industry: programme and synopses, 1960 (INIS-mf--3789)

Third annual conference on radiation protection, Vigyan Bhavan, New Delhi, January 19--21, 1976. Programme and synopses, 1940 (CONF-760114--(Absts.))

INSTITUT BIOFIZIKI, MOSCOW (USSR)
Lines of experimental research in developing mathematical models for estimating internal radiation, 3213 (ORNL-tr--4339)

INSTITUTE FOR ENERGY ANALYSIS, OAK RIDGE, TENN. (USA)
Repair and dose-response at low doses, 287 (GRAU/IEA(O)--77-11)

INSTITUT FUER REAKTORSICHERHEIT DER TECHNISCHEN UEBERWACHUNGS-VEREINE E.V., KOELN (GERMANY, F.R.)
Environmental impact of nuclear power stations. Attempt at a risk assessment, 2716 (AED-Conf--75-631-001)
Recent developments in the radiological environmental protection of nuclear facilities. IRS experts' talk 1976. Lecture manuscripts, 1933 (AED-Conf--76-447-005)
Studies for a comparison of the maximum possible consequences of accidents in a reprocessing plant and a nuclear power station, 1146 (IRS--290)

INSTITUT HYGIENY A EPIDEMIOLOGIE, PRAGUE (CZECHOSLOVAKIA). USTAV HYGIENY ZARENI
Applicability of chromosomal aberrations in peripheral blood lymphocytes in determination of radiation burden in man, 3061 (CS-INIS--12)
Internal thorium contamination in thorotrast patients, 3203 (CS-INIS--13)
Late effects and risks of short-lived alpha-emitting bone seekers. Animal experiments, 2298 (AED-Conf--76-430-012)

INSTITUTO DE ENERGIA ATOMICA, SAO PAULO (BRAZIL). DIVISAO DE CIENCIA E TECNOLOGIA DE MATERIAIS
Monte Carlo estimation of dose from internal sources of photons in an anthropomorphic model of human body, 3034 (IEA--346)

INSTITUTT FOR ATOMENERGI, KJELLER (NORWAY)
Literature survey: health effects of radiation, 3249 (KR--153)

INTERNATIONAL ATOMIC ENERGY AGENCY, VIENNA (AUSTRIA)
Bases for establishing radiation exposure limits, 568 (IAEA-CN--36/488)
Collective dose commitments from nuclear power programmes, 565 (IAEA-CN--36/9)
Computerization of the isodose distribution of high-energy electrons in human tissues. Final report for the period 15 May 1973 - 14 May 1974, 2671 (IAEA-R--1365-F)
Diagnosis and treatment of incorporated radionuclides. Proceedings series. Proceedings of an international seminar, Vienna, Austria, December 8--12, 1975, 2346 (STI/PUB--411)
Different radiosensitization effects of the halogenated compounds on the human chromosome in vitro., 1750 (IAEA-

R--1160-F)
Differential cost-benefit considerations in connection with global collective dose commitments from release of long lived radio nuclides, 567 (IAEA-CN--36/205)
Effects of fast neutron irradiation on mouse and leukemic. Final report for the period 1 June 1972--30 September 1975, 1652 (IAEA-R--1189-F)
Environmental impacts of the nuclear fuel cycle, 2705 (AED-Conf--75-769-043)
Estimation, prediction and standardization of radiation dose levels to the population in connection with nuclear power station operation in the USSR, 615 (IAEA-CN--36/351)
Fuel reprocessing and waste treatment activities at the Karlsruhe Nuclear Research Centre, 560 (IAEA-CN--36/571)
Interlaboratory comparison of techniques for measuring lung burdens of low energy X-ray emitters. Part of a coordinated program on the calibration of burdens of inhaled plutonium by external counting. Final report for the period 16 August 1972 - 14 August 1974, 3131 (IAEA-R--1260-F)
Methods and practice in the evaluation of potential radiation exposure around nuclear installations in the Federal Republic of Germany, 566 (IAEA-CN--36/114)
Methods of establishing limits on discharge to the environment of radioactive material emerging from the fuel cycle, 563 (IAEA-CN--36/292)
New approaches to deriving limits of the release of radioactive material into the environment, 562 (IAEA-CN--36/280)
Perspective on the radiation protection problem and risk analysis for the nuclear era, 616 (IAEA-CN--36/395)
PHENIX liquid metal fast breeder power plant. Radioactive effluents release and operation team irradiation results after two years of industrial operation, 573 (IAEA-CN--36/233)
Problems raised by the application of the recommendations of the International Commission on Radiological Protection, 613 (IAEA-CN--36/232)
Radioactive effluents and present and future radiation exposure to the population from nuclear facilities in the Federal Republic of Germany, 569 (IAEA-CN--36/557)
Some approaches to the problem of determining standards for population irradiation due to radioactive releases from atomic power stations, 614 (IAEA-CN--36/347)

INTERUNIVERSITAIR REACTOR INSTITUUT, DELFT (NETHERLANDS)
Gonad dosage in males resulting from X-ray diagnostics, 2647 (N--76-19801)
Radiation dose to the ovaries caused by three specific X-ray investigations, 1607 (IRI--190-76-01)

IOWA ELECTRIC LIGHT AND POWER CO., CEDAR RAPIDS (USA)
Duane Arnold Energy Center, Unit 1. GALE input to cost-beneficial case for information required by section V.B of appendix I to 10 CFR part 50, 1134 (DOCKET-50331--784)
Duane Arnold Energy Center, Unit 1. IE inspection report No. 76-04, 1570 (DOCKET-50331--650)

IOWA UNIV., IOWA CITY (USA). RADIATION RESEARCH LAB.
Comparison of the cytological effects produced by ionizing radiations of different LET. Progress report, April 1975--April 1976, 1536 (CGO--1024-55)
Comparison of the cytological effects produced by ionizing radiations of different LET. Three-year summary of project activities from April 1973--April 1976, 1537 (CGO--1024-56)

ISOTOPEN TECHNIK DR. SAUERWEIN G.M.B.H., DUESSELDORF (GERMANY, F.R.)
Short-distance tumour irradiation system for interstitial and intracavitary use, with preselectable isodose programme, 1914 (AED-Conf--76-134-027)

J

JACKSON LAB., BAR HARBOR, MAINE (USA)
Effect of aging and radiation in mice of different genotypes, 2136 (CONF-760947--3)

JERSEY CENTRAL POWER AND LIGHT CO., MORRISTOWN, N.J. (USA)
Oyster Creek Nuclear Power Plant, Unit 1. Annual operating report No. 1: January--December 1976, 3237 (DOCKET-50219--1083)
Oyster Creek Nuclear Power Plant, Unit 1. IE inspection report No. 76-01, notice of violation and reply, 1567 (DOCKET-50219--845)
Oyster Creek Nuclear Power Plant, Unit 1. Semiannual report No. 13, July--December 1975, 2713 (DOCKET-50219--818)

JOHNS HOPKINS UNIV., BALTIMORE, MD. (USA)
Study of the radiation effects on nucleic acids and related compounds. Annual progress report, August 15, 1974--August 14, 1975, 2738 (CGO--3286-11)

 Therapeutic results in a follow-up study on Ra-224 therapy of a. sp., 1930 (AED-Conf--76-430-018)

AUTHOR INDEX

Authors' surnames are indexed in the form appearing in the abstracted publication; given names are reduced to initials. Each author entry gives the publication title and the citation number. Report numbers, if applicable, are given in parentheses at the end of the entry. For publications with multiple authors, an author entry is provided for each. Entries for the second and succeeding authors give references to the first author.

Because of problems involved in the mechanical preparation of this index, all accent marks are omitted. Changes in spelling introduced as a result of accent omission follow standard conventions.

SUBJECT INDEX

The subject index is based on the use of subject descriptors selected from a controlled thesaurus of terms. Subject descriptors and qualifiers (subheadings) are selected and presented in the following format:

SUBJECT DESCRIPTOR/QUALIFIER

Title, (supplementary information), citation number, (report number)

The title may be supplemented with additional words, or a phrase, if it appears additional information would be helpful. In cases for which the title contains little or no information related to the subject entry, it may be replaced entirely by the supplementary information. A qualifier is not always required, and in such cases the title will follow the unqualified subject descriptor.

The descriptors selected for use as subject terms are generally the names of specific materials, things, or processes. To the extent possible, a qualifier is selected to describe the properties of, or processes applied to, the subject term.

Index entries are selected to indicate the important ideas and concepts presented in a document, rather than words that may appear in the text. Within the available thesaurus terms, the most probable or logical place to look for typical information is selected. "See references" are included to guide users from synonymous terms or phrases to the descriptor selected as a subject heading for the concept. (e.g. Pipeline Quality Gas see HIGH BTU GAS). "See also references" are used to indicate where to find references to subject concepts that are narrower, broader, or related to a particular subject heading. To complete an exhaustive search of a given subject, all such headings should be reviewed.

ABDOMEN/BIO MEDICAL RADIOGRAPHY

Radiation exposure in radiographic examinations of the newborn, 461

ABDOMEN/DELAYED RADIATION EFFECTS

Para-aortic lymph node irradiation for carcinoma of the uterine cervix using split course technique, 2585

ABDOMEN/RADIATION DOSES

Radiation exposure in radiographic examinations of the newborn, 461

A-BOMB SURVIVORS/ACUTE IRRADIATION

Comments on the exposure distance as a factor of severity of A-bomb cataracts, 1069

A-BOMB SURVIVORS/ANEMIAS

Patient with pure red cell aplasia who was exposed to the atomic bomb near the site of blast, 1633

A-BOMB SURVIVORS/BIOLOGICAL RADIATION EFFECTS

Histological changes of salivary glands in autopsy cases among atomic bomb survivors. I. Young aged and proximally exposed cases, 1071

Ichiban: radiation dosimetry for the survivors of the bombings of Hiroshima and Nagasaki, 625 (TID-27080)

A-BOMB SURVIVORS/CARCINOGENESIS

Clinical statistics in a four-year period (1971-1974) and incidence of malignant tumor in general patients and A-bomb exposed patients in the Japan Red Cross Nagasaki Atomic Bomb Hospital, 2509

Multiple simultaneous event model for radiation carcinogenesis, 1769

A-BOMB SURVIVORS/CARCINOMAS

Parotid gland tumors, observed in Research Institute for Nuclear Medicine and Biology, Hiroshima University, 1631

Relation of radiation of gastric carcinoma observed in autopsy cases in a fixed population Hiroshima and Nagasaki, 1639

A-BOMB SURVIVORS/CHROMOSOMAL ABERRATIONS

Chromosomal estimation of radiation effects in man, 1634

Cytogenetic study of A-bomb survivors and their children in Hiroshima and Nagasaki, 1181 (CONF-751158-)

Genetic effects, 2. Cytogenetic study, 2525

Sister chromatid exchange rate in peripheral human

lymphocytes exposed to radiation and chemical agents, 1063

A-BOMB SURVIVORS/CONGENITAL MALFORMATIONS

Effects from placental exposure, 2405

A-BOMB SURVIVORS/DATA COMPILATION

Breast cancer incidence among atomic bomb survivors, Hiroshima and Nagasaki, 1950-1969 (Neutrons, gamma radiation), 63

A-BOMB SURVIVORS/DELAYED RADIATION EFFECTS

Autopsied case of myelofibrosis which had been exposed to the atomic bomb near the site of blast (1,112m from that area), 1628

Autopsy case of myelofibrosis seen in a proximally exposed survivor, 539

Benign tumors of the digestive tract among atomic bomb survivors, 1961-1970 Hiroshima, 342

Cancer developing among atom-bomb survivors, 2411

Cancers other than leukemia, 2522

Case of Hiroshima atomic bomb survivor with CLL and lung cancer, 871

Cataracts, 2513

Chromosome abnormalities in atomic bomb survivors, 1073

Clinical experience of the liposarcoma found in atomic bomb victims, 1640

Clinical observations over 20 years period of Bikini victims, 1627

Clinical picture of chronic granulocytic leukemia in the early stage. A retrospective analysis from atomic bomb survivors, 1067

Clinical studies on gastric cancer and breast cancer among A-bomb survivors, 308

Clinical survey of blood dyscrasias among Hiroshima A-bomb survivors by the periodical health examination, 2, 1081

Clinical survey of blood dyscrasias among Hiroshima A-bomb survivors by the periodical health examination, 1636

Comparative study on atomic bomb survivors who were exposed proximally, 4. Clinical and laboratory findings, 1079

Cytogenetic study on peripheral leukocytes of A-bomb survivors with cancer, 1078

Cytogenetic studies on bone marrow cells of the atomic bomb survivors in Nagasaki, 1632

Effect of exposure on health of atomic bomb survivors, 1624

Estimation of biological age on atomic bomb survivors by multivariate analysis, 1077

Future Research, 2523

Hiroshima and Nagasaki: the survivors. The reckoning, 80

Hiroshima and Nagasaki: the survivors. The puzzle of absent effects, 81

Hiroshima and Nagasaki: the genetic consequences of the atom bombs, 3081

Investigation of stomach diseases in atomic bomb survivors, 540

Investigation of stomach diseases in atomic bomb survivors, 1076

Investigation of lung cancer in atomic bomb survivors, 1080

Late and latent effects of atomic bomb on chromosomes in the exposed population, 1072

Leukemia, malignant lymphoma and multiple myeloma in atomic bomb survivors treated in this hospital lately, 1645

Leukemia among Hiroshima A-bomb survivors from 1971 to 1975, 1068

Literature survey: health effects of radiation, 3249 (KR-153)

Malignant tumors in people exposed as children to atomic bomb in Nagasaki, 1626

Preliminary states in atomic bomb survivors in Japan, 2121

Radiation effects on cancer mortality among A-bomb survivors, 1950-72. Comparison of some statistical models and analysis based on the additive logit model, 754

Recent incidence of leukemia in Hiroshima atomic bomb survivors, 3032

Relationship between radioactivity from atomic bomb and leukemia, 2412

Environmental radon, 3165 (CONF-730915-)
Environmental monitoring in the vicinity of the Savannah River Plant. Annual report, 1976 (^3H , ^{137}Cs , ^{90}Sr), 1857 (DPSPU-77-30-1)
Environmental monitoring report for the Nevada Test Site and other test areas used for underground nuclear detonations, January-December 1975 (Gamma radiation, ^{133}Xe , ^{85}Kr , ^3H), 1477 (EMSL-LV-539-4)
Environmental surveillance at Los Alamos during 1975, 1478 (LA-6321-MS)
Environmental surveillance at Los Alamos during 1976, 272 (LA-6801-MS)
Environmental monitoring report: United States Energy Research and Development Administration, Oak Ridge facilities, calendar year 1975, 1399 (Y/UB-4)
Environmental monitoring report: United States Energy Research and Development Administration, Oak Ridge facilities, calendar year 1976, 208 (Y/UB-6)
Integrated environmental modeling system for noble gas releases at the Savannah River Plant, 3167 (CONF-730915-)
Review of the uranium miner experience in the United States, 3193 (CONF-730915-)

AIR/RADIOACTIVITY

Emergency reference levels for reactor accidents. A re-examination of the Windscale reactor accident, 1480

AIR POLLUTION

Cancer and Toxicology Section, 876 (ORNL-5195)
Diffusion-type model of the global carbon cycle for the estimation of dose to the world population from releases of carbon-14 to the atmosphere, 213 (ORNL-5269)

Environmental surveillance at Hanford for CY-1975, 1476 (BNWL-1979)

AIR POLLUTION/BIOLOGICAL EFFECTS

Carcinogenic risks associated with radiation pollution (UV radiation, sunlight), 2119

Testimony presented to the Committee on Science and Technology's Subcommittee on Environment and the Atmosphere, 1671 (ORNL/TM-5277)

AIR POLLUTION/ENVIRONMENTAL EFFECTS

Testimony presented to the Committee on Science and Technology's Subcommittee on Environment and the Atmosphere, 1671 (ORNL/TM-5277)

AIR POLLUTION/HEALTH HAZARDS

Predictive models for estimating the health impact of future energy sources, 2989 (EUR-5360(Vol.1))

AIR POLLUTION/LEGAL ASPECTS

Atmospheric transport of radionuclides, 587 (DP-MS-77-116)

AIR POLLUTION/SIMULATION

Simulated atmospheric dispersion of radioactive material released in an urban area, 588 (SAND-77-0854C)

AIR QUALITY/STRATOSPHERE

Transnational air quality: the case for the stratosphere (Radiation dose to Concorde crew and passengers), 101 (UCRL-79428)

AIR SAMPLERS/PERFORMANCE TESTING

Comparative levels of radioactive air pollutants from industry and fallout. A progress report of radioecological investigations of airborne radioactivity in the Utah environment (1971 and first two months of 1972), 3211 (UERL-1)

Comparative levels of environmental radioactivity in Utah from industry and fallout. A progress report of radioecological investigations of airborne radioactivity in the Utah environment, July 1, 1972-June 30, 1973 (July 1972 through June 1973), 3170 (UERL-2)

High efficiency mixed species radioiodine air sampling, readout, and dose assessment system, 586 (BNL-22307)

AIRCRAFT/RADIATION MONITORING

Soil density meter incident, 2935 (DHEW/FDA-76-8026)

AIRPORTS/RADIATION MONITORING

Soil density meter incident, 2935 (DHEW/FDA-76-8026)

ALARM DOSEMETERS

See RADIATION MONITORS

ALBUMINS/BIOLOGICAL RADIATION EFFECTS

Oxygen-dependent effect of dose rate in γ -irradiated proteins, 2680

ALKALINE PHOSPHATASE/ABUNDANCE

Distinctive features in postnatal development of rabbit adrenals following intrauterine radiation, 672

ALKALINE PHOSPHATASE/BIOLOGICAL RADIATION EFFECTS

A study of the alkaline and acid phosphatase activities in acute uranium intoxication, 2960

Action of local irradiation of bones on the alkaline phosphatase activity, 3184

Applicability of alkaline granulocyte phosphatase determination in the diagnosis of radiation damages caused by low doses, 2135

Body tissue enzymes in radiation effects, 1724

Distribution and biological effects of intratracheal administration of californium-252, 2370 (ERDA-tr-266)

Histochemical studies of the effect of radiophosphorus on testis in Swiss albino mice during postnatal development (^{32}P), 3128

ALKALINE PHOSPHATASE/CHEMICAL RADIATION EFFECTS

Assessing the diagnostic value of alkaline granulocyte phosphatase and of the Beutler test for early diagnosis of radiation injuries in the low-dose range, 740 (SAAS-204)

ALKALINE PHOSPHATASE/METABOLISM

Body tissue enzymes in radiation effects, 1724

ALKYLATING AGENTS

See also ENDOXAN

MYLERAN

ALKYLATING AGENTS/BIOLOGICAL EFFECTS

Mutagenesis and Teratogenesis Section, 875 (ORNL-5195)

ALKYLATING AGENTS/MUTAGENESIS

Application of mammalian cytogenetics to mutagenicity studies (Triethylamine, x radiation, gamma radiation, LET), 598 (CONF-770718-4)

Chemical and radiation-induced mutagenesis of the rat liver chromosomes, 2487

ALPHA BEAMS/BIOLOGICAL RADIATION EFFECTS

Comparison of the light flash phenomena observed in space and in laboratory experiments, 1936 (BNL-22841)

ALPHA PARTICLES/BIOLOGICAL RADIATION EFFECTS

Biological effects of the radioactive noble gases, 3190 (CONF-730915-)

Biological effects of radon on the lung, 3192 (CONF-730915-)

Experimental research on the effects of inhalation of two beta emitters: cerium-144 and cerium-141. Study of shortening of life and induction of cancer. Effect of dose and carrier, 1660 (LF-tr-121)

Irradiation of blood by ^{238}Pu alpha particles, 1807 (BNWL-2000(Pt.1))

Theory of the induction of bone cancer by alpha radiation (^{226}Ra , ^{228}Ra , ^{228}Ra), 146

Tumorigenic action of beta, proton, electron and alpha radiation in rat skin. Comprehensive progress report, August 1, 1973-July 31, 1976 (UV radiation), 2139 (COO-3380-26)

ALPHA PARTICLES/DEPTH DOSE DISTRIBUTIONS

Alpha particle dose to respiratory airway epithelium, 385

ALPHA PARTICLES/HEALTH HAZARDS

Radiation protection in uranium mines: a review, 3195 (CONF-730915-)

ALPHA PARTICLES/INHALATION

Experimental research on the effects of inhalation of two beta emitters: cerium-144 and cerium-141. Study of shortening of life and induction of cancer. Effect of dose and carrier, 1660 (LF-tr-121)

ALPHA PARTICLES/RADIATION HAZARDS

Quantitative assessment of carcinogenic risks associated with 'hot particles', 1682

ALPHA PARTICLES/RADIATION MONITORING

Personnel dosimetry of radon and radon-daughters, 3198 (CONF-730915-)

ALPHA PARTICLES/TEMPORAL DOSE DISTRIBUTIONS

Influence of temporal distribution of alpha dose in bone tumor induction (^{239}Pu , ^{235}Es , rats), 1802 (BNWL-2000(Pt.1))

ALPHA SOURCES/RADIATION DOSE DISTRIBUTIONS

Radiation dose to mouse testes from ^{239}Pu , 2344

ALPHA SOURCES/RADIOISOTOPE SCANNING

Calibration techniques for the in vivo measurement of alpha-emitting actinides (In lungs), 1109 (BNWL-2088)

ALPHA SOURCES/RBE

Changes in chromosome aberration frequency in Chinese hamster liver related to LET and microdose distribution, 2148

AMENORRHEA

See MENSTRUATION DISORDERS

AMERICIUM/BODY BURDEN

Wound-counting systems for the measurement and isolation of plutonium and americium, 259 (RFP-2570)

AMERICIUM/CHEMICAL STATE

Chemical form of americium and curium in urine, 812

AMERICIUM/EXCRETION

Chemical form of americium and curium in urine, 812

AMERICIUM/RADIATION HAZARDS

Calculated doses from inhaled transuranium radionuclides and potential risk equivalence to whole-body radiation, 2365

AMERICIUM/RADIOISOTOPE SCANNING

Preliminary evaluations of a high-purity germanium detector system for in vivo measurement of inhaled transuranium elements, 1120 (BNWL-2088)

AMERICIUM/TISSUE DISTRIBUTION

Preliminary evaluations of a high-purity germanium detector system for in vivo measurement of inhaled transuranium elements, 1120 (BNWL-2088)

AMERICIUM 241/BIOLOGICAL RADIATION EFFECTS

^{241}Am induced thyroid lesions in the beagle: interim observations, 1564 (COO-119-251)

Changes in chromosome aberration frequency in Chinese hamster liver related to LET and microdose distribution, 2148

Current census of the beagle colony (Clinical status of beagles following injection of ^{226}Ra , ^{239}Pu , ^{228}Ra , ^{228}Th , ^{90}Sr , or ^{241}Am), 1563 (COO-119-251)

Respiratory carcinogenesis in rats after inhalation of radioactive aerosols of actinides and lanthanides in various physicochemical forms (^{244}Cm , ^{241}Am , ^{238}Pu , ^{239}Pu , ^{235}Pu), 3123

Toxicity of inhaled polydisperse or monodisperse aerosols of $^{241}\text{AmO}_2$ in Syrian hamsters. III, 769 (LF-56)

Toxicity of inhaled alpha-emitting radionuclides: an experimental approach, 805 (LF-56)

AMERICIUM 241/BODY BURDEN

Measurement of transuranic elements in vivo at CRNL (Personnel monitoring at nuclear fuel fabrication plant), 1110 (BNWL-2088)

Proceedings of the workshop on measurement of heavy elements in vivo, 1100 (BNWL-2088)

AMERICIUM 241/CARCINOGENESIS

Dose-response relationships for beagles injected with ^{239}Pu (IV) or ^{241}Am (III), 2985

Induction of cancers in the rat after inhalation of alpha-emitting radionuclides, 2323

AMERICIUM 241/EXCRETION

Diagnosis and treatment of incorporated radionuclides. Proceedings series. Proceedings of an international seminar, Vienna, Austria, December 8-12, 1975, 2348 (STI/PUB-411)

Unusual case of internal contamination with ^{241}Am , 2345 (ANL-76-88(Pt.2))

AMERICIUM 241/INGESTION

Unusual case of internal contamination with ^{241}Am , 2345 (ANL-76-88(Pt.2))

AMERICIUM 241/INHALATION

Experimental study of inhaled radioactive pollutants. I. Present data. II. Inventory of lesions. III. Validity of the animal model dose-effect relationships (Radon, ^{239}Pu , ^{241}Am , and ^{244}Cm), 3126 (LF-tr-111)

Theory of the induction of bone cancer by alpha radiation (^{22}Ra , ^{226}Ra , ^{228}Ra), 146

BIOLOGICAL RADIATION EFFECTS/DATA COMPILATION
Evaluating the effects of low-level chronic exposures, 1028 (BNWL-SA-5992)
Role of animal toxicity studies in the evaluation of human health risks from internally deposited transuranics (Problems in extrapolation of animal data to man), 480 (BNWL-SA-5881)

BIOLOGICAL RADIATION EFFECTS/DOSE-RESPONSE RELATIONSHIPS
Comparability of the natural radiation exposure with the radiation exposure caused by nuclear facilities, 355
Effects of prolonged irradiation at low daily dose rates on hemopoietic stem cells and peripheral blood of mice (Gamma radiation), 2200 (ERDA-tr-222)

BIOLOGICAL RADIATION EFFECTS/DOSE-RESPONSE RELATIONSHIPS
Ichiban: radiation dosimetry for the survivors of the bombings of Hiroshima and Nagasaki, 625 (TID-27080)
Studies relative to the radiosensitivity of man: based on retrospective evaluations of therapeutic and accidental total-body irradiation. Final report, 3067 (N-75-32733)

BIOLOGICAL RADIATION EFFECTS/EXTRAPOLATION
Role of animal toxicity studies in the evaluation of human health risks from internally deposited transuranics (Problems in extrapolation of animal data to man), 480 (BNWL-SA-5881)

BIOLOGICAL RADIATION EFFECTS/FRACTIONATED IRRADIATION
Oncogenic transformation in vitro after split-dose x irradiation, 1364

BIOLOGICAL RADIATION EFFECTS/LECTURES
Nuclear power: should we have doubts: what do the experts think. Proceedings of lectures held Autumn 1974-Spring 1975 in Oslo, Norway, 2569 (INIS-mf-2010)

BIOLOGICAL RADIATION EFFECTS/RADIOPROTECTIVE SUBSTANCES
Inferences from the collaboration in the field of pharmaco-chemical protection and treatment of

- radiation injury according to the 'Interkosmos' program. Study of new prophylactic and therapeutic agents to manage radiation disease from protracted exposure. Topic 5, 2223
- BIOLOGICAL RADIATION EFFECTS/RESPONSE MODIFYING FACTORS**
Radiation safety (Criteria for radiation protection standards), 612 (CONF-770615-2)
Radiation carcinogenesis. Progress report III, 15 March 1975-15 March 1976 (Pathological response to external irradiation), 1651 (COD-3017-25)
Toxicity of inhaled ^{144}Ce in fused aluminosilicate particles in immature beagle dogs. V, 798 (LF-56)
Toxicity of inhaled ^{144}Ce in fused aluminosilicate particles in aged beagle dogs. V, 799 (LF-56)
- BIOLOGICAL RADIATION EFFECTS/SEASONAL VARIATIONS**
Ultraviolet exposure patterns, 949
- BIOLOGICAL RADIATION EFFECTS/STANDARDS**
Use and misuse of the Beir Report and NCRP Report No. 43, 2792 (DHEW/FDA-76-8026)
- BIOLOGICAL RADIATION EFFECTS/TEMPERATURE DEPENDENCE**
DNA damage and its repair in hyperthermic mammalian cells: relation to enhanced cell killing, 2750
- BIOLOGICAL RECOVERY**
See also BIOLOGICAL REPAIR
- BIOLOGICAL RECOVERY/FRACTIONATED IRRADIATION**
The effect of repeated small doses of radiation on recovery from sublethal damage by Chinese hamster cells irradiated in oxic or hypoxic conditions in the plateau phase of growth, 2751
- BIOLOGICAL REPAIR**
Radiation damage and repair, 2220
- BIOLOGICAL REPAIR/AGE DEPENDENCE**
Aging and DNA repair capability (Review), 661 (BNL-22463)
- BIOLOGICAL REPAIR/TEMPERATURE DEPENDENCE**
DNA damage and its repair in hyperthermic mammalian cells: relation to enhanced cell killing, 2750
- BIOLOGICAL SHIELDING/COST**
Implementing the requirement to reduce radiation exposure to 'as low as practicable' at the Lawrence Berkeley Laboratory, 1619
- BIOLOGICAL SHIELDS**
Prediction of increased gamma fields after application of a radon barrier on concrete surfaces (Covering uranium mine tailings), 1308
Radiological protective screen, 1587
- BIOLOGICAL STRESS/RADIOSENSITIVITY EFFECTS**
Rationale for nonlinear dose response functions of power greater or less than one (Relation of multiple stresses to effects of low-dose irradiation in man), 95 (BNL-23150)
- BIOLOGICAL VARIABILITY**
See also GENETIC VARIABILITY
- BIOLOGICAL VARIABILITY/RADIOSENSITIVITY EFFECTS**
Relationship of strain, sex, and body weight to survival following sublethal whole-body x-irradiation (Mice), 1436
- BIOMEDICAL RADIOGRAPHY**
