Summary

The existing and projected thermally treatable radioactive mixed waste inventories are identified and analyzed with the objective of establishing a design basis for the low level mixed waste thermal treatment activity. Detailed statistical analyses of the existing radioactive mixed waste inventory are presented that consider hazardous materials, radionuclides, and physical properties. 30 year projections of RMW are analyzed considering waste generators and waste classifications.

The total thermally treatable radioactive mixed waste inventory was determined to be 25,902 cubic meters. The existing waste inventory has a volume of 890 cubic meters and a weight of 265,590 kg.

Over 500 hazardous materials are identified. Of these about 30 hazardous constituents are in significant quantities. PCBs constitute about 38 percent of the total hazardous material weight.

Containers of PCB, asbestos, lead, and mercury have been individually identified.

All dangerous waste codes assigned to the subject inventory have been listed.

All labpack containers in the subject inventory have been identified.

A total of 90 radionuclides are identified. Analyses of the radionuclide inventory have distinguished between fission products and alpha-bearing radionuclides. 99 percent of the fission product curie content is contributed by 10 radioactive constituents.

The inventory of mobile radionuclides, C-14, I-129, Se-79, Tc-99, and uranium isotopes is also analyzed.

A total of 74 physical properties are identified. The metallic content of the waste is approximately 17 weight percent. Analysis of the physical properties of the subject inventory allowed an estimate of the amount and composition of the thermal treatment ash.

Container types are also analyzed.

Introduction

Detailed characterization of the existing and projected Hanford Site Radioactive Mixed Waste (RMW) inventory was initiated in 1993 (Place 1993). This report presents an analysis of the existing and projected RMW inventory. The subject characterization effort continues to be in support of the following engineering activities related to thermal treatment of Hanford Site RMW:

- ♦ Contracting for commercial thermal treatment.
- ♦ Installation and operation of an onsite thermal treatment facility (Project W-242).
- ♦ Treatment at another Department of Energy (DOE) site.

The collation of this characterization information (data) has emphasized the establishment of a common data base for the entire existing RMW inventory so that the specification of feed streams destined for different treatment facilities can be coordinated.

Statistical Analysis of the Thermally Treatable CWC Inventory

The subject characterization analysis identifies the existing and projected thermally treatable RMW and includes a statistical correlative evaluation of the existing thermally treatable RMW. Analyses results are catalogued in tabular format. It is anticipated that the results of these statistical analyses will allow generalizations regarding waste quantity and composition useful in the design and engineering of waste treatment facilities.

Statistical analysis was performed for the following parameters for the thermally treatable Central Waste Complex (CWC) inventory:

- a. Hazardous Materials
- b. Radionuclides
- c. Physical Properties¹

The number of containers analyzed for each of the parameters was nominally 2,300. The actual number of containers analyzed for each parameter varied because of variations in the availability of data for the specific parameter.

The criterion employed for identifying a waste container as being thermally treatable was that it contain one or more constituents that required thermal treatment as a hazardous waste as specified under RCRA or as a PCB waste as specified under TSCA. This criterion pertained primarily to wastes

¹In this report, the terminology, "Physical Properties," refers to the qualitative descriptors of physical waste characteristics provided by generators.

contaminated with organic chemicals, although some hazardous constituents identified only by trade name were also included. The waste inventory analyzed also included containers of lead, asbestos, and mercury contaminated with organic chemicals requiring thermal treatment.

Statistical Analysis of the thermally treatable CWC inventory has the following scope:

<u>Parameter</u>	<u>Number of Containers Analyzed</u>	<u>Number of Uniquely Identified Constituents</u>
Hazardous materials	2307	518
Radionuclides	2278	90
Physical Properties	2319	74

Hanford Site Solid Waste Acceptance Criteria requires that waste generators provide characterization data on the Waste Storage/Disposal Request (WHC 1993). The data reported by generators is routinely coded into electronically stored files. The waste container data provided by the waste generators, form the Solid Waste Information Tracking System (SWITS) data base.

The data was analyzed using commercial data base management software. The SWITS data for the existing inventory of Hanford Site RMW has been collated for analysis with commercial data base management software (Sheriff and Tran 1994). The statistical analyses were similar in configuration and scope to analyses performed during FY 1993 (Place 1993). The statistical analyses allowed the determination of a constituent's contribution to total waste quantity with the use of sorting algorithms based on statistical quantities. Using these sorting algorithms, the statistical data have been correlated in the following ways:

1. The data have been correlated in ascending order based on the container count for a given constituent.
2. The data have been correlated in ascending order based on the total accumulated weight or activity of a given constituent.

The arrangement of the data in these two ways facilitates an assessment as to whether or not the presence of a given constituent will significantly influence the design and/or the operation of a thermal treatment facility. The above correlations are catalogued in tabular format and are briefly discussed in this report.

In addition to the above analyses, additional waste characterization requirements have been identified during the conduct of engineering activities related to thermal treatment. The analyses of the following waste characterization problems have also been included in this report:

1. The characterization of specific waste constituents such as PCB's, lead, asbestos, and mercury.
2. The metal content of the waste has also been determined because it is significant in the specification of the type of thermal treatment technology that will be suitable for this application.
3. All dangerous waste codes have been identified.
4. All labpack containers have been identified.
5. The analyses of radioactive constituents have distinguished between fission products and alpha-bearing radionuclides.
6. Container types are analyzed.
7. Containers with the mobile radionuclides, C-14, Tc-99, Se-79, I-129, and uranium have been specifically identified and analyzed.

Analysis of the Hazardous Material Inventory in the CWC Thermally Treatable RMW

Table 1 presents the results of a statistical analysis of uniquely² named hazardous materials in ascending order based on container count. For a total of 2,307 containers, 518 hazardous materials were identified. Table 1 presents the complete reported name of each hazardous material. The parameters tabulated in Table 1 include the container count, the accumulated weight, the average weight, the standard deviation, the minimum reported weight, and the maximum reported weight.

Inspection of Table 1 shows that more than half of the listed hazardous materials (287) have only been reported once. Furthermore, there is redundancy in the list of hazardous materials owing to spelling variations. For example, "2,5-DIPHENYL OXAZOLE", "2,5-DIPHENYLOXAZOLE", and "2,5-DIPHEYLOXAZOLE" all appear to be the same chemical.

The data presented in Table 1 indicate that only about 50 hazardous materials constitute more more than one percent of the total number of reports, i.e., $N > 20$.

Table 2 presents the statistical data arranged in ascending order based on total accumulated hazardous material weight. The parameters tabulated in

²A computer sorting algorithm was used to identify uniquely named hazardous materials, radionuclides, and physical properties. This algorithm considers all character differences that are unique, including trivial differences such as spaces and hyphens. Therefore, manual inspection of the hazardous material list will always be required to avoid redundancy in component naming.

Table 2 include the container count, the accumulated weight, the average weight, the standard deviation, the minimum weight, the maximum weight, the percentage of the total accumulated weight, and the accumulated weight percent. The data in Table 2 indicate that 90 percent of the hazardous material weight is comprised of about 30 hazardous materials (five percent of the total number of hazardous materials reported). PCB constitutes 38 percent (10,000 kg) of the total hazardous material weight. However, Table 2 shows that a single container contains 4,940 kg, or 49 percent, of this PCB.

Table 3 presents the hazardous material inventory correlations in terms of concentrations by weight (parts per million or ppm). Effluent limits on hazardous materials listed in the environmental regulations are generally reported in those units. The parameters tabulated in Table 3 include the number reported, the average concentration, the standard deviation, the minimum concentration, and the maximum concentration. Table 3 correlates the data in ascending order based on maximum concentration. The correlation presented in Table 3 can be used to identify containers that can possibly be delisted because the hazardous material concentration is less than the RCRA treatment effluent concentration.

Certain waste characterization problems have been identified that are related to thermal treatment. These specific characterization problems are listed above. The first of these problems has involved the characterization of the specific waste constituents, PCB's, asbestos, lead, or mercury. Characterization of these specific contaminants is discussed below.

Table 4 presents an analysis of containers with PCB's. A total of 261 containers were identified. Table 4 presents the container PIN numbers, the weight, and the concentration of pcbs in parts per million (ppm) by weight of PCB's. TSCA regulations regarding PCB's require that waste having greater than 50 ppm be thermally treated. Of the 261 containers identified, 230 containers will require thermal treatment.

Table 5 presents an analysis of containers with asbestos. A total of 12 containers were identified. A total of 12 containers were identified. Table 5 presents the container PIN numbers, the weight, and the concentration of asbestos in parts per million (ppm) by weight of asbestos. These containers may require special pretreatment before the waste can be thermally treated or they may require a special thermal treatment technology.

Table 6 presents an analysis of containers with lead and also contaminated with RCRA or TSCA wastes. A total of 244 containers were identified. Table 6 presents the container PIN numbers, the specific lead contaminants, the weight, and the concentration of lead in parts per million (ppm) by weight of lead. These containers may require special pretreatment before the waste can be thermally treated or they may require a special thermal treatment technology.

Table 7 presents an analysis of containers with mercury and also contaminated with RCRA or TSCA wastes. A total of 191 containers were identified. Table 7

presents the container PIN numbers, the weight, and the concentration of mercury in parts per million (ppm) by weight of mercury. These containers may require special pretreatment before the waste can be thermally treated or they may require a special thermal treatment technology.

Table 8 presents an analysis of containers with PCB's only. A total of 38 containers were identified. Table 8 presents the container PIN numbers, the weight, and the concentration of pcbs in parts per million (ppm) by weight of PCB's. TSCA regulations regarding PCB's require that waste having greater than 50 ppm be thermally treated. Of the 38 containers identified, 25 containers will require thermal treatment. All the containers listed in Table 8 are also listed in Table 4.

Table 9 lists all the dangerous waste codes specified in the inventory, and Table 10 lists all the labpack containers. A total of 250 labpack containers were identified. Specific identification of these items will facilitate the operation and regulation of commercial thermal treatment facilities.

Analysis of the Radioactive Constituent Inventory in the CWC Thermally Treatable RMW

The analyses the radioactive constituent inventory presented in this report distinguishes between fission products and alpha-bearing radionuclides. Alpha-bearing radionuclides include the following categories: thorium radionuclides, uranic radionuclides, and transuranic radionuclides. Fission product quantities are reported in units of curies, and alpha-bearing radionuclides are reported in units of grams. The statistical analysis of the radioactive constituents is for a total of 2,278 containers. The statistical analysis identified a total of 90 radioactive constituents.

Table 11 presents the results of a statistical analysis of the fission products arranged in ascending order based on container count. The parameters tabulated in Table 11 include the container count, the accumulated activity, the average activity, the standard deviation, the minimum reported activity, and the maximum reported activity. "TOTAL BETA/GAMMA" is the reported total activity of fission products.

Table 12 presents the statistical fission product data arranged in ascending order based on total accumulated activity for the fissions products. The parameters tabulated in Table 12 include the container count, the accumulated activity for each constituent, the average activity, the standard deviation, the minimum activity, the maximum activity, the percentage of the total accumulated activity, and the accumulated activity percent.

Table 13 presents the results of a statistical analysis of the alpha-bearing radionuclides arranged in ascending order based on container count. The parameters tabulated in Table 13 include the container count, the accumulated weight, the average weight, the standard deviation, the minimum reported weight, and the maximum reported weight.

Table 14 presents the statistical data arranged in ascending order based on total accumulated constituent quantity of alpha-bearing radionuclides. The parameters tabulated in Table 14 include the container count, the accumulated weight for each constituent, the average weight, the standard deviation, the minimum weight, the maximum weight, the percentage of the total accumulated weight, and the accumulated weight percent.

For the fission product data, reported "TOTAL BETA/GAMMA" curies was 121.82 curies. Total accumulated curies based on reported isotopes was 61.06 curies. Based on a total waste weight for the subject inventory of 265,590 kg, the average curie content ranges between 230 and 459 nCi/gm. Table 12 shows that 99 percent of the fission product curie content is contributed by the first ten constituents.

For the alpha-bearing radionuclides, Table 14 shows that 99.99 percent of the weight is contributed by the first eight constituents.

Analysis of the Physical Property Inventory in the CWC Thermally Treatable RMW

Table 15 presents the results of a statistical analysis of the physical properties uniquely² named in the waste storage and disposal data reported by waste generators. For a total of 2,319 containers, 74 physical properties were identified. The data in Table 15 are arranged in ascending order based on container count. The parameters tabulated in Table 15 include the container count, the accumulated weight, the average weight, the standard deviation, the minimum reported weight, and the maximum reported weight.

Table 16 presents the statistical data arranged in ascending order based on total accumulated weight of each physical property. The parameters tabulated in Table 16 include the container count, the accumulated weight, the average weight, the standard deviation, the minimum reported weight, the maximum reported weight, the percentage of the total accumulated weight, and the accumulated weight percent. The data in Table 16 indicate that 99 percent of the physical property weight is comprised of 32 constituents.

"DIRT/SOIL/DIATOMACEOUS EARTH" constitute 27 percent of the total physical property weight. "METAL/IRON/GALVANIZED/SHEET" constitutes 17 percent of the total physical property weight. "SLUDGES" constitutes 8 percent of the total physical property weight. "PLASTIC/POLYURETHANE" constitutes 8 percent of the total physical property weight. "ABSORBENT/KITY LTR/VERMICULITE" and "ABSORBANT/KITY LTR/VERMICULITE" combine to 8 percent of the total physical property weight.

Analysis of the Physical Property Inventory Contributing to the Thermal Treatment Ash Composition

Important to the design of a thermal treatment facility is the quantity of ash that will be generated. This quantity can be estimated by identifying the noncombustible physical properties in the waste feed. Table 17 presents the physical properties thought to represent noncombustible waste. A total of 28 noncombustible physical properties have been identified. Table 17 also

presents the statistical data for the ash physical properties arranged in ascending order based on accumulated weight of each ash constituent. The parameters tabulated in Table 38 include the container count, the accumulated weight for each property, the average weight, the standard deviation, the minimum weight, the maximum weight, the percentage of the total accumulated weight, and the accumulated weight percent. The data in Table 17 indicate that 99 percent of the ash constituent weight is comprised of eleven constituents. "DIRT/SOIL/DIATOMACEOUS EARTH" constitutes 44 percent of the total ash weight. "METAL/IRON/ GALVANIZED/SHEET" constitutes 28 percent of the total ash weight. "ABSORBANT/KITY LTR/VERMICULITE" and "ABSORBENT/KITY LTR/VERMICULITE" combine to constitute 13 percent of the total ash weight. Glass constitutes 4 percent of the total ash weight. These first five constituents account for 89 percent of the total ash weight. The total accumulated weight of ash constituents is 147,460 kg or 56 percent of the total physical property constituent weight.

Tables 18 lists the metallic components present in the ash. The total metallic component weight is 44,826 kg. This weight comprises 17 percent of the total waste weight and 30 percent of the total ash weight.

Analysis of containers of PCBs, Asbestos, and Lead

In the analysis of hazardous materials presented above, individual containers of PCB's, asbestos, and lead were listed. Evidently, some generators have chosen to list hazardous materials as physical property constituents. Table 19 lists containers that were reported to have PCB, lead, or asbestos contamination in the physical property listing that have not been reported in Tables 4 to 6.

Analysis of Container Types

Tables 20 and 21 present statistical analyses of the volumes and waste weights of containers used to package the existing inventory. Some thermal treatment technologies are designed to process both the container and the waste, and analysis of empty containers fed to such a technology will be required. The quantities presented in Tables 20 and 21 are tabulated in ascending order based on container count and include the accumulated value, the average value, the standard deviation, the minimum value, and the maximum value.

The analyses in Tables 20 and 21 is for a total of 2,656 containers. 55 gallon drums comprise 90 percent of the container count as well as 54 percent of the total tare weight. The total container tare weight is 121,630 kg. Depending on the process used to treat the waste, the container material could become part of the ash. Assuming that the container materials are virtually all metal (steel) and assuming that the containers are part of the waste, the metallic content of the waste would total 166,456 kg. This weight of metallic material comprises 43 percent of the total waste weight and 62 percent of ash weight.

Analysis of the Overall Physical Property Inventory Parameters

Table 22 presents total weights and volumes for 2656 containers. The total volume is 890 cubic meters. The total physical weight is 265,590 kg, and the total gross weight is 387,220 kg.

Analysis of the Mobile Isotope Inventory

Certain radionuclides are commonly found in chemical compounds that exhibit exceptional mobility, either because the compounds exist as gases at ambient conditions and will therefore probably be present in high concentrations in process vapors or because the compounds are sufficiently soluble in water to exhibit unacceptable leaching rates without encapsulation in a grout matrix. Five radionuclides have been identified as having excessive mobility characteristics, and as a result, Hanford Site-specific performance assessment criteria have been established for them. These five radionuclides are C-14, I-129, Se-79, Tc-99, and all isotopes of uranium. A total of 510 containers in the existing thermally treatable RMW inventory have been identified as containing one or more of these radionuclides. The Hanford Site-specific performance assessment criteria will apply to all waste forms (ash) having concentrations of these radionuclides greater than 0.0001 curies/m³. Table 23 presents a summary of the inventories for these five radionuclides. Table 24 identifies the containers which may exhibit isotope-specific, ash-based concentrations greater than 0.0001 curies/m³. Table 25 presents the same information as Table 24 for the total radionuclide concentrations. A total of 189 containers are listed in Table 25.

Analysis of Future Waste Projections of Thermally Treatable RMW

Table 26 presents the 30 year projection of RMW correlated by waste classification and waste generator. Table 27 presents the complete generator names for reference in Table 26. The total projected volume of LLMW is 25,012 cubic meters, which is about 97 percent of the total thermally treatable RMW. Thus thermal treatment facilities must rely almost exclusively on projection information for feed stream data. The total projected LLMW I is 23,724 cubic meters, and the total projected LLMW III is 1,288 cubic meters. The data in Table 26 indicate that there will be four major waste generators: Portsmouth, Tank Farm Restoration, Tank Farms, and Argonne National Laboratory - East. Approximately 70 percent of the RMW will be generated by Portsmouth. Analysis of the Portsmouth waste indicates that the Portsmouth waste will be about 25 percent spent solvent in labpacks and 75 percent solvent-contaminated soil.

Establishing a Design Basis for Thermal Treatment

WHC's RWM thermal treatment program includes three alternatives: commercial thermal treatment, W-242 thermal treatment facility (onsite facility), and thermal treatment at other DOE sites. This characterization effort supports all three of these thermal treatment alternatives. FY 1994 activities have emphasized the procurement of a service for the thermal treatment of a selected inventory of LLMW. The waste to be treated will include existing as well as newly generated waste. A request for proposal (RFP) was issued FY 1994, and contract award is scheduled for the first quarter of FY 1995. The

waste quantities to be specified in the commercial service contract are based on the characterization activities conducted in 1992 (Place 1993).

The subject analysis suggests that a much larger quantity of RMW may have to be thermally treated. The Portsmouth waste is the principal contributor to the increase in the total waste quantity requiring thermal treatment. The total thermally treatable RMW inventory is the sum of the existing and projected waste. This total is 25,902 cubic meters. FY 1995 activities include plans to discuss waste projections with major generators to establish accuracy and consistency in waste characterization.

Table 27. Generator Definitions.
Sheet 1 of 4

<u>ABBREVIATION</u>	<u>GENERATOR NAME</u>
AMES	Ames Laboratory-Ames, Iowa
ANL_E	Argonne National Laboratory-East
BAPL	Bettis Atomic Power Laboratory
BAPL_SHIPYDS	Bettis Atomic Power-Shipyards
BAT_CLBS_LAB	Battelle Columbus Laboratories
BRKHVN	Brookhaven National Laboratory
B_LEHR_DAV	University of California, Davis
EG&G	EG&G Rocky Flats Plant
FERMI	FERMI National Accelerator Laboratory
FUSRAP	Bechtel National, Incorporated
GEN_ATOM	General Atomics
HEHF	Hanford Environmental Health Foundation
KAPL_SHIPYDS	Knolls Atomic Power-Shipyards
KEH_100	Kaiser Engineers
LBL	Lawrence Berkeley Laboratory
LLNL	Lawrence Livermore National Laboratory
MIT_BATES	Bates Acceleration-Massachusetts
PADUCAH_ES	Paducah Energy Systems
PADUCAH_U	Paducah Utility Services
PNL	Pacific Northwest Laboratories
PORTSMOUTH	Gaseous Diffusion Plant
PRINCETON	Plasma Physics Laboratory
RKW_CANOGA	Rockwell-Canoga Park
STANFORD	Stanford Linear Accelerator Center
U_U	University of Utah
WHC_100K	K-Basin Operations
WHC_105DR	Large Sodium Fire Facility

Table 27. Generator Definitions.
Sheet 2 of 4

<u>ABBREVIATION</u>	<u>GENERATOR NAME</u>
WHC_1154_3000	1154 Radio Maintenance-3000 Area
WHC_1163	Procurement & Material Management
WHC_1171M	OSS Fleet Maintenance
WHC_1171T	OSS Transportation
WHC_202A	CP Purex & U03-224U Operations
WHC_202A_D&D	CP Purex & U03-224U_D&D
WHC_2101M	OSS Electric Utilities
WHC_221T	T-Plant Building 2706/221
WHC_222S	CP Analytical Laboratory
WHC_225B	B-Plant/WESF Facilities
WHC_2345Z	CP Pu Finishing Plant
WHC_2703E	Chemical Engineering Labs
WHC_2715EA	General Area Services North
WHC_2721EA	Fire Systems Maintenance
WHC_2724W Facility	Laundry-Equipment & Decontamination
WHC_284E	200 East & West Powerhouses
WHC_2ETF	Single Shell Tank Farms Operations
WHC_303K	Fuels Fabrication Transition
WHC_305	Engineering Testing Facility
WHC_306	306E Development Fab. & Test Lab.
WHC_308	Fuels Development Laboratory
WHC_335	Sodium Test Facility
WHC_340	Waste Neutralization Facility
WHC_3707C	Safeguards & Security Maint.
WHC_3717B	Standards Laboratory
WHC_377	Geotechnical Engineering Lab.

Table 27. Generator Definitions.
Sheet 3 of 4

<u>ABBREVIATION</u>	<u>GENERATOR NAME</u>
WHC_384	300 Area Power House
WHC_4843	Alkalai Metal Storage FacilityWHC_BKLOG Tank Farms Backlog Waste
WHC_BQUIP	Buried Equipment (OSS/TFS)1992
WHC_DSTPSRET	W315 Pilot Scale Retrieval
WHC_DST_RET	W343 DST Retrieval (17 Tanks)
WHC_EA_W025	SW RMW Disposal Facility
WHC_EA_W026	Wrap 1 Receive & Process Fac.
WHC_EA_W100	Wrap 2A Receive & Process Fac.
WHC_EA_W112	SW RMW Storage Facility
WHC_EA_W113	SW Retrieval Fac.-Phase 1
WHC_EA_W221	SW Retrieval Fac.-Phase 2
WHC_EA_W255	Wrap 2B Receive & Process Fac.
WHC_EA_W272	Module Storage Pad
WHC_FAB_SVC	OSS Fabrication Service
WHC_FED	BCSR Computer Service Fed Bldg
WHC_FFTF_MAINT	FFTF/FMEF Maintenance.
WHC_FMEF	Fuel & Materials Examination
WHC_HLVP HWVP	High Level Vitrification Project formerly
WHC_L045H	300 Area Water Treatment Proj.
WHC_LLBG	Low Level Burial Grounds
WHC_PX_C018H	Purex 242A Condensate Treatment
WHC_S300	300/200 General Area Services
WHC_SSTLLE	SST Long Length Equipment
WHC_SSTRET	SST Retrieval (149 tanks)
WHC_SURPLS_FAC	ENV Restoration Operations formerly WHC_ENV_RES includes WHC_100

Table 27. Generator Definitions.
Sheet 4 of 4

<u>ABBREVIATION</u>	<u>GENERATOR NAME</u>
WHC_TWP_W028	Aging Waste Transfer Lines
WHC_TWP_W030	Tank Farm Ventilation Upgrade
WHC_TWP_W058	Cross-Site Transfer System
WHC_TWP_W062	Tank AP-104 Upgrade
WHC_TWP_W151	DST AZ-101 Retrieval (1 tank)
WHC_TWP_W211	DST Retrieval Sys. (10 tanks)
WHC_TWP_W314	Tank Farm Restoration
WHC_TWP_W320	Tank 241-C-106 Sluicing
WHC_TWP_W339	Retrieval Training/Test Fac.
WHC_TWP_W340	Tank 241-C-106 Manipulator
WHC_TRUSAF	TRU Storage & Assay Facility
WHC_WELL_DRL	Environmental Projects
