Program Evaluation: Weatherization Residential Assistance Partnership (WRAP) Program

Volume II Appendices A, B, and C

*Prepared for
Northeast Utilities
WRAP Task Force*

*Prepared by
ICF Resources Incorporated*

December 1991

DISCLAIMER

This report was prepared as an account of work sponsored by an agency of the United States Government. Neither the United States Government nor any agency thereof, nor any of their employees, makes any warranty, express or implied, or assumes any legal liability or responsibility for the accuracy, completeness, or usefulness of any information, apparatus, product, or process disclosed, or represents that its use would not infringe privately owned rights. Reference herein to any specific commercial product, process, or service by trade name, trademark, manufacturer, or otherwise does not necessarily constitute or imply its endorsement, recommendation, or favoring by the United States Government or any agency thereof. The views and opinions of authors expressed herein do not necessarily state or reflect those of the United States Government or any agency thereof.

this evaluation report is dedicated
to the memory of

Charles R. "Tom" Dunklee

The complete program evaluation comprises five documents:

Principal evaluation document:

Program Evaluation: Weatherization Residential Assistance Partnership (WRAP) Program, ICF Resources Incorporated, December 1991.

Volume I: Final Report

Volume II: Appendices A, B, and C

Volume III: Appendices D, E, F, and G

Companion documents:

WRAP Program Evaluation, Steven Ferrey & Associates, 1990.

Process Evaluation, Weatherization Residential Assistance Partnership (WRAP Program), Technical Development Corporation, October 1990.

Key conclusions and documentation from both companion documents have been incorporated into the principal report.

Key Investigators:

ICF Resources Incorporated
9300 Lee Highway
Fairfax, Virginia 22031
(703) 934-3000

Bonnie B. Jacobson, Vice President
Barbara Lundien, Analyst
Jeffrey Kaufman, Analyst
Adam Kreczko, Associate

Stephen Morgan

ICF Resources would like to recognize the following organizations and individuals for their invaluable assistance to this evaluation:

Northeast Utilities

Sara S. Ellison
Alice Kelley
Pearl Bouchard
Marlene Martino
Steven Waite

CHIF/WRAP Unit

Jan Barnard
Dean Sandstrom

Table of Contents

A. Program Activity	A-1
B. Measures and Installations	B-1
B1. Index of Measures	B-3
B2. 1988 Installations	B-7
B3. 1989 Installations	B-21
B4. 1990 Installations	B-63
C. Savings Based on Engineering Estimates	C-1
C1. Engineering Estimates of Savings per Measure	C-3
C2. Savings from 1988 Installations	C-7
C3. Savings from 1989 Installations	C-21
C4. Savings from 1990 Installations	C-97

Appendix A: Program Activity

Appendix A contains the program summary pages of the WRAP Unit's monthly program financial goals/status reports. Program summaries from May 1989 through November 1991 are included.

Appendix B: Measures and Installations

Appendix B provides information on WRAP measures, and summarizes the measure installations that took place during 1988, 1989, and 1990.

Table of Contents:

B1.	Index of Measures	B-3
-----	-------------------------	-----

Section 1 indexes the measure codes used throughout this report with their WRAP numbers and descriptions. Also included is a description of the units used to describe quantity of installations.

B2.	1988 Installations	B-7
-----	--------------------------	-----

Section 2 presents tables, by participant group and by measure, of the number of times each measure was installed, the savings per measure installed, and the total savings from that measure. Only installations performed in 1988 are included.

B3.	1989 Installations	B-21
-----	--------------------------	------

B3.a.	Tables of Installations	B-21
-------	-------------------------------	------

Section 3.a. summarizes number of recipients of each measure, number of measures installed, and average quantity installed per participant.

B3.b.	Statistical Analysis of 1989 Installations	B-55
-------	--	------

Section 3.b. analyzes the frequency of each measure's installation among urban and rural participants of each plan. The purpose of this analysis is to determine whether there were any significant differences in the choice of measures to be installed between urban and rural households. Any difference in measure selection could reasonably be interpreted to indicate a difference in needs.

B4.	1990 Installations	B-63
-----	--------------------------	------

Section 4 is similar to section 3.a., but details only 1990 installation.

Appendix B: Measures and Installations

Section 1: Index of Measures

Index of Measures			
Measure Code (WRAPTRACK Database)	Audit Reference Code	Description	Quantity Unit
1	1	Set Water Heater Thermostat	Each
4	3	Install Electric Outlet Gasket	Each
5	4	Install Low-Flow Showerhead	Each
6	5	Wrap Water Heater	Each
7	6	Install Low-Flow Faucet Aerator	Each
8	7	Install Door Sweep	Each
9	8	Caulk Window(s)	Each
10	9	Caulk Exterior Doors	Each
11	10	Weatherstrip Window(s)	Each
12	11	Weatherstrip Door(s)	Each
13	12	Insulate Attic Hatchway	Each
14	13	Interior Caulk	Linear Foot
15	14	Basement Window Covering	Each
16	15	Insulate Heating Duct	Linear Foot
17	16	Insulate Vertical Attic Door	Each
18	17a	Install Pipe Insulation - Tube	Linear Foot
19	18	Sill Plate Caulk	Linear Foot
20	19	Insulate Pull-down Stair	Each
21	20	Replace Filter for Gas/Oil Warm Air System	Each
22	21	Hole in Wall (Minor Carpentry)	Each
23	22	Calibrate/Replace Thermostat	Each
24	23	Vent Damper (Gas)	Each
25	24	Pilotless Ignition System (Gas)	Each
26	25a	Increase Ceiling Insulation Levels	Square Foot
27	26	Replace Broken Window/Door Glass	Each
28	27a	Window Treatment	Each

Index of Measures			
Measure Code (WRAPTRACK Database)	Audit Reference Code	Description	Quantity Unit
29	28b	Heating System Repairs	Each
30	29	Burner Replacement	Each
31	30	Furnace Replacement	Each
32	31	Increase Sidewall Insulation	Square Foot
33	2a	Fluorescent (Compact 18 Watt)	Each
34	2b	Fluorescent (Twin 13 Watt)	Each
35	2c	Fluorescent (Quad 22 Watt)	Each
36	2d	Fixture (35 Watt)	Each
37	2e	Fixture (32 Watt)	Each
38	2f	Circline Fixture (40 Watt)	Each

**Appendix B:
Measures and Installations**

**Section 3:
1989 Installations
Part b:
Statistical Analysis of
1989 Installations**

The purpose of the analysis contained in this section is to determine whether there is a systematic difference in the installment pattern (e.g., square foot covered, number of windows insulated) between the urban customers and rural customers. This analysis only applies to the quantity installed for the average recipient; it does not analyze the number of participants who received each measure.

ICF's analysis employed a t-test by which the differences between two group means (i.e., urban and rural) were compared for their statistical significance. The t-test allowed for the determination of differences in the installation patterns between the urban and rural customers, and an indication of whether these differences were due to a systematic difference in the two groups or due to random error.

The hypothesis being tested under this t-test is that the urban and rural customers' installation patterns are not statistically significantly different. In other words, the hypothesis tests that there is no difference in the group means of installation patterns between urban and rural population. Any apparent difference in group means from the samples (i.e., participants) is tested for statistical validity.

The formula for the t-test is as follows:

$$t = \frac{X_U - X_R}{S_{XU-XR}}$$

where:

X_U = mean number of installation per participant (urban)

X_R = mean number of installation per participant (rural)

S_{XU-XR} = estimated standard deviation of the difference between means

The formula for the standard deviation of the difference between means is as follows:

$$S_{XU-XR} = \sqrt{\frac{S_U^2}{U} + \frac{S_R^2}{R}}$$

where:

S_U = standard deviation within the urban participants

S_R = standard deviation within the rural participants

U = number of urban participants

R = number of rural participants

The t-score calculated using the above formula is compared to the critical t-score. If the absolute value of the calculated t-score is greater than the critical t-score, the difference in mean installations between the urban and rural groups should not be attributed to random error and should be considered a statistically significant difference. In other words, if the t-score calculated falls in the shaded area in figure B3-1 below, the difference in means is regarded as statistically significant.¹ The critical t-score is determined by the confidence level and the degree of freedom². Table B3-2 is a t-distribution table. It shows the critical t-value at each confidence level for varying degrees of freedom.

FIGURE B3-1

¹ For a normal distribution, the critical t-score at 95% confidence is ± 1.96 . In other words, if the calculated t-score is greater than $+1.96$ or less than -1.96 , the difference in mean installations between the urban and rural participants should be considered statistically significant.

² The degrees of freedom is defined as $U + R - 2$.

TABLE B3-2

Two types of data analysis were conducted -- (1) a t-test per measure for all customers and (2) a t-test per measure across different fuel customers.

t-test Per Measure for All Customers

Before conducting a t-test, the installation data were filtered in several ways to make the comparisons more meaningful.

First, participation data were analyzed to identify the measures that were predominantly accepted by one of the two geographic groups. The analysis showed that lighting measures (measures 33 through 39) were installed almost exclusively for urban participants. Thus, these measures were not considered in the t-test. Second, the measures with total participants less than 20 were not considered for the t-test, since it is difficult to detect differences accurately with a small sample size. Third, because the total number of participants differs between the two groups as well as across different plans, the installation data were first converted to installation per participant. Finally, the t-statistics were computed for the variable "Number of Installations Per Participant". Following is a discussion of the results of these analyses for each program plan and fuel type.

Plan E1

Under plan E1, only the low-flow faucet aerator (measure 7) has exhibited statistically different installation patterns. That is, under the plan E1, there were significantly more low-flow faucet aerators installed for the average urban aerator recipient than for the average rural recipient. This finding may be the result of two phenomena. First, under the plan E1, the urban customers may have greater relative water heating needs than rural participants. Urban customers tend to live in smaller homes that occupy less space (e.g., apartments) than rural customers. Therefore, the urban customers may spend a higher share of their energy use on water heating than the rural participants. This point can be supported by the finding that the average urban recipient of water heating measures receives a consistently higher quantity of the measures than the average rural recipient. This is true for four of the five water heating measures offered under plan E1³. Second, among the water heating measures offered under E1, the low-flow faucet aerator is one of the least-expensive. Given a fixed amount budget (i.e., \$150 per household), the low-cost item such as the low-flow faucet aerator is often a choice of high priority.

Plan E2

Only four measures were offered under the plan E2, and none of them showed any statistically significant difference in the average number of installations between the urban and rural recipients.

Plan F3

The number of installations by urban participants was statistically significantly higher for two measures, low-flow faucet aerator (measure 7) and window weatherstripping (measure 11). For the faucet

³ Although only the low-flow faucet aerator (measure 7) proved to be statistically significant, the urban participants exhibited higher average installations in three other water heating measures including set water heater thermostat (measure 1), low-flow shower head (measure 5) and pipe insulation (measure 18).

aerator, we believe the same reasons for this finding are true as those found under plan E1. That is, the urban customers' needs for water heating measures (as opposed to space heating measures) and for low-cost measures are the primary reasons for this result.

For weatherstripping of windows, the urban recipients received more window weatherstripping than the rural customers under the low-budget plans such as E1 and E3. On the contrary, it is worth noting that the rural customers were allocated more window weatherstripping than the urban customers under the high-budget plans such as E4 and E5. This result can be explained by the fact that the rural households typically have more windows (since they tend to have larger living spaces). Accordingly, the rural customers were not provided with this measure unless there were significant subsidies such as found in plans E4 and E5.

Plan E4

No measure under the plan E4 exhibited statistically significant differences in the installation patterns between urban and rural customers.

Plan E5

The rural customer's installation of door sweeps proved to be statistically significantly higher than that of the urban customers as indicated by the t-statistics. It is unclear why this may be true. It may be explained by the fact that a greater percentage of the rural households live in single-family homes (with more doors) than the urban households.

t-test Per Measure Across Different Fuels

Before conducting a t-test, the installation data were filtered in the same manner as those explained above. This process precluded analysis on certain measures due to lack of adequate sample size. For instance, a complete analysis on electric customers was nearly impossible because most measures had less than 20 electric customers participating.

Plan E1

In plan E1, the only measure which demonstrated a statistically significant difference in installation pattern was piping insulation. A much higher quantity of insulation was installed for urban gas water heating recipients than for rural gas water heating recipients.

Plan E2

Under the plan E2, none of the four heating measures exhibited any statistically significant differences in installation patterns between urban and rural customers, regardless of the fuel types.

Plan E3

For plan E3, there were a number of water heating measures that had statistically significant installation differences. The low-flow faucet aerator (measure 7) was installed in urban homes with a much greater frequency than in rural homes for recipients with electric or oil water heating. Urban and rural gas water heating participants were evenly provided with this measure. Piping insulation (measure 18) was not evenly provided among urban and rural participants. It was provided to urban gas water

heating participants with a greater frequency than to rural households.

Also in plan E3, window caulking (measure 11) was provided unevenly to urban and rural electric space heating customers. Urban recipients received more of this measure. Among recipients with oil heat, more exterior door caulk (measure 10) was installed for urban recipients than for rural recipients.

Plan E4

In plan E4, only piping and ceiling insulation (measures 18 and 26, respectively) had inconsistent installation patterns between urban and rural participants. Both measures were installed more heavily in the homes of urban recipients. Piping insulation was installed more intensively for urban gas water heating recipients and ceiling insulation was installed more intensively for urban gas space heating customers.

Plan E5

None of the measures offered under the plan E5 exhibited any statistically significant differences in installation patterns between urban and rural customers, regardless of the fuel types.

Appendix C: Savings Based on Engineering Estimates

Appendix C provides supporting documentation for the engineering estimates of savings, as presented in chapter 4 of the main report.

Table of Contents:

C1.	Engineering Estimates of Savings Per Measure	C-3
------------	---	------------

Section 1 provides supporting documentation of the energy savings assumptions that were made in the development of engineering estimates of savings. The engineering estimates were made for typical residential customer weatherization measures.

C2.	Savings from 1988 Installations	C-7
------------	--	------------

Section 2 summarizes the engineering estimates of savings that resulted from 1988 installations, in greater detail than the savings presented in chapter 4 of the main report.

C3.	Savings from 1989 Installations	C-21
------------	--	-------------

Section 3 is similar to section 2, but includes data for 1989 installations only.

C4.	Savings from 1990 Installations	C-97
------------	--	-------------

Section 4 is similar to section 2, but includes data for 1990 installations only.

Appendix C: Savings Based on Engineering Estimates

Section 1: Engineering Estimates of Savings Per Measure

Engineering Estimates of Savings Per Measure				
Measure Code	Lifetime (years)	First Year Electricity Savings (kWh)	First Year Gas Savings (ccf)	First Year Oil Savings (gallons)
